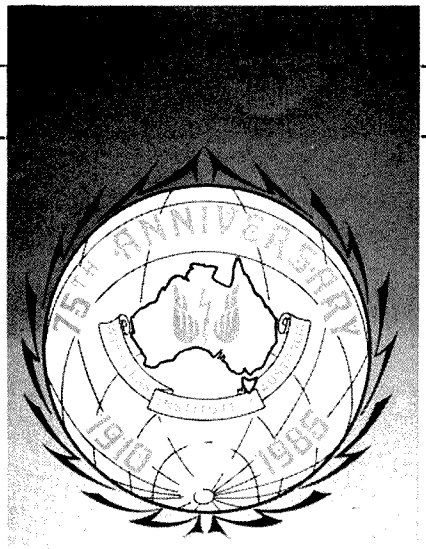
AMATEUR RADIO

Vol 53, No 1, January 1985

JOURNAL OF THE WIRELESS INSTITUTE OF AUSTRALIA



The feature of the cover for January is the Seventy Fifth Anniversary Logo. This logo will feature on the cover of each magazine this year.

TECHNICAL FEATURES

SPECIAL FEATURES

REGULAR FEATURES

AMATEUR RADIO

Published monthly as the official journal by the Wireless Institute of Australia, founded 1910. ISSN 0002 — 6659. Registered Office: 3/105 Hawthorn Road, Caulfield North, Vic. 3161. Telephone: (03) 528 5962.

This magazine is the first issue in this, the WIA's anniversary year, and the cover features the logo, which was devised from a design submitted by Don VK3DLV, in the Logo Competition last year. This logo will become familiar to all readers during the year.

The logo will feature on AR each month and will also feature on T-shirts, keyrings, pennants and self-adhesive labels which will be available to members. Members will find five complimentary labels included with their magazine this month.

Also included with your AR this month is a Planner Calendar which has some events and contests listed which were available at the time of printing. During the year it is anticipated to include updated information for marking in on the calendar.

The Main QSP, p5, also lists some of the exciting activities that will be happening during the 75th Anniversary.

Late last year Bill Hempel VK4LC accepted the position of Federal Awards Manager. Best wishes to you Bill. All applications for Australian Awards may now be sent to Bill at Southport Avenue, Eagle Heights, Qld 4271.

The rules for the 1985 John Moyle Field Day Contest will be printed next month. Read them carefully so you may note the change of date.

For members interested in RTTY-Morse, check out the feature technical article which begins on page 16. It has a full size PCB layout, circuits and computer programme which will relieve you of the 'old clanking Baudot machine'.

Historically, do you know the origin of 73? Max VK3ZS explains this on page 13. Max hopes to re-kindle some history during the year with some further articles about the past.

Further to the history of the Institute is a reprinted article about how the WIA came into being — see page 6. It is a very informative article, originally published in Monitor.

As there are no Ionospheric Predictions due to early publishing dates, Len VK3BYE has written a very informative article about the 'Sunspots' and their effect on propagation — page 55.

DEADLINE

All copy for March AR must arrive at PO Box 300, Caulfield South, Vic 3162, at the latest by midday 23rd January 1985.

★ Cartoons in this issue by Bill Martin VK2EBM

Enquiries and material to:
The Editor
PO Box 300, Caulfield South, Vic. 3162

Material should be sent direct to **PO Box 300, Caulfield South, Vic 3162**, by the **25th of the second month preceding publication. Note: Some months are a few days earlier due to the way the days fall. Phone: (03) 528 5962**
Hamads should be sent direct to same address.
Acknowledgement may not be made unless specially requested. All important items should be sent by certified mail. The editor reserves the right to edit all material, including letters to the Editor and Hamads, and reserves the right to refuse acceptance of any material, without specifying a reason.

a word from your EDITOR

A PROUD HISTORY

Welcome to the first month of the 75th Anniversary Year of the Wireless Institute of Australia. Those few enthusiasts, with their spark transmitters and coherers, laying in March 1910 in Sydney the foundations of the organisation which became the WIA, could not possibly have foretold how it would develop in 75 years. But because of their foresight we are the oldest amateur radio society in the world, while the great interest which unites us all has evolved into a means of international understanding which has no equal.

In 1910 those early pioneers envisaged the possibility of communicating with each other by Morse code over distances of only a few miles. Marconi had shown in 1901 that it was possible to span the Atlantic, but few of the other early amateurs could aspire to building or owning equipment as large and powerful as his. It was not until 1921 that amateurs, as we now understand the word, succeeded in repeating Marconi's feat. Another three years passed before amateur contacts were made from Australia to USA and England.

The amateur movement has grown tremendously since those early days. There are now licensed amateurs in virtually every country of the world, and their total is approaching one million. The technology has evolved over the years, with individual amateurs contributing at almost every step, until it is now feasible that any one of that million should be able to make contact on amateur frequencies with any other! Admittedly not all at the same time, but, as our use of satellites develops, even this may be possible.

More than any other interest with participants all over the world, amateur radio has the ability to bring people together. Such things as politics and religion are often divisive. This is why they may not, as a rule, be discussed on the amateur bands. Yet a common interest in radio not only unites us but provides the means whereby it can develop further. Amateur procedure (particularly on CW) can even go far towards bridging the barriers of language. And differences in rank or status traditionally play no part in our communications.

The evolution of this world-wide egalitarian fraternity did not occur by accident. It was made possible by the ingenuity of individuals and the negotiations of their societies with governments. Our own society, the WIA, has played no small part in this. We may justifiably be proud of our achievements, but we still have a long way to go. Our strength as an organisation will determine how effectively we can advance into the next 75 years. Every Australian amateur who joins the WIA helps add to that strength. All of us, already in the Institute, have a duty to recruit new members, to enhance still further our credibility as the voice of Australian amateurs. This is the message of our 75th anniversary. It challenges each of us to do even better from now into the next 75 years and beyond. *Let's go and do it!*

THUMBNAIL SKETCHES

Alan Shawsmith, VK4SS
35 Whynot Street, West End, Qld 4101

ROY P JONASSON — VK4NE (ex VK4NG)

This OOTer passed his AOCP in 1928 but, because of the great economic depression in Australia, it was 1931 before Roy could spare the cash to put himself on air on QRPp. Being fortunate enough to have a property at "Ageston" at the mouth of the Logan River overlooking the wide expanse of Moreton Bay, DX was a piece of cake. It would appear that Roy could be the holder of a couple of pre-WW11 QRPp records; they have never been officially recorded, simply because he's not the type to talk about them.

In 1932 he QSOd ZL4DT in Balclutha, South Island of New Zealand (the op incidentally was YL Kath Kirby). This was on 40 metres, using a receiver-type 201A valve Hartley oscillator driven from a car accumulator and 'B'+ batteries of approx 150 volts. The mode was loop modulation phone; input four-fifths of one watt or about .2 watt in the aerial. Report received QSA 3, R 4-5.

Prior to this a contact was made with the USA using a 3 watt SPARK transmitter. This rig was made up of an old Ford T model coil and driven by a car battery and vibrator and fed into the antenna via a spark gap. Roy was probably not the *first-ever* VK4 to work into W-land but quite likely the *first* to do it on QRPp, ie less than five watts DC input. The antenna for both these record-making QSO's was a 132 feet flat top end fed Zepp up 66 feet. As proof of the ideal QTH at Ageston, it was possible to hear both 2BL and 3LO nightly on a crystal set.

In 1935 Roy VK4NG played a big part in rebuilding and operating the official station of the Queensland Listeners League VK4QL which was situated in Paddington, close to the City of Brisbane. This station operated on approx 206 metres. Roy obtained raw quartz crystal directly from Mt Isa Mines, Queensland — this was claimed to be the first time such active mineral from an Australian source was used for electronic purposes. The quartz was cut and ground in Brisbane by a professional gem cutter who also had an interest in wireless. The finished product was forwarded to Mr Armstrong, O/C Radio Inspectors Dept, who found it to be spot on frequency, ie 206 metres — not bad for those using homebrew measuring equipment.

Roy moved to the Apple Isle in 1935 and took the call VK7NG; the year 1938 saw him signing VK3ND. After this, he went north to New Guinea and used VK9DP to attract the DX, then back to VK3 and finally retiring in the Sunshine State at Kingston less than thirty kilometres from whence he started out as VK4NG, over a half century earlier.

His working condition now includes an FT101Z; he homebrewed his equipment until 1970, which is longer than most. VK4NG joined the WIA and RAAF Wireless Reserve in 1929 and was also a member of the QRP Club of Gisborne, New Zealand. Long may he remain active and enjoy his memories.

Unfortunately we only have a photocopy of a photo of Roy which will not reproduce in the magazine printing process.
AR

OUR EMBLEM IS NOW STANDARDISED

The WIA emblem is believed to have been designed around 1920-21 with the wings and lightning motif derived from an Army Wireless Unit badge of World War 1.

Until now the emblem has been in a state of virtual constant change — but appropriately this stops in the Institute's 75th year.

At last year's Federal Convention, motion 84.10.01 proposed by VK3 and seconded VK2 said that: *"The Institute adopt for its 75th anniversary a winged emblem closer to the roots of the organisation such as appears on the 1980 Australian Callbook cover and the majority of WIA certificates."*

The proposer's comments were: *"The emblem is part of the Institute's heritage and has been drawn differently so many times that a number of versions are unfortunately in use throughout Australia."*

The comments continued to point out differences in various versions, *including the* wording, scroll, wings and lightning motif. Many of the variations are subtle, while some are quite obvious even to the untrained eye.

The Divisions were unanimous in support of 84.10.01 which has resulted in the standardised emblem shown here.

Admittedly it will take some time to phase out the use of non-standard emblems. But each Division aims to do this on its stationery and by encouraging members to use only the standard emblem on their QSLs.

The emblem is also a focal point of the WIA 75th logo — copies of which are Inserted in this month's AR for use by members.

AR

QSP

75th ANNIVERSARY OF THE WIRELESS INSTITUTE OF AUSTRALIA

Members should now be well aware that 1985 is the 75th Anniversary Year of the Oldest Radio Society in the World.

This news item is intended to inform all members of the plans made to celebrate this Anniversary Year. Some items are firm and others have yet to be finalised.

THE 1985 EVENT CALENDAR

The 1985 Event Calendar included in this issue, shows as many firm dates as was possible to include at the time of printing. As the year proceeds "*dates for your calendar*" will appear in "Amateur Radio" to allow you to update your event calendar.

75th LOGO

Each member has received, in this issue, some self adhesive 75th Logo Stickers. The intent for these are for members to use them on QSL cards, etc, going overseas, or to anywhere you consider it desirable to publicise the 75th Anniversary Year. Contact your divisional offices for further supplies.

75th AWARD

The rules for this event will be published separately (elsewhere in this issue) but suffice to say, at this time, that the award will open on the anniversary of the founding day 10 March and will close on 31 December 1985. The certificate itself will be of a high standard and even if you are not a regular entrant into contests or an awards buff, this special award will be worth the effort to obtain.

VK FOX HUNT CHAMPIONSHIP

The finals of this event will take place during October 1985, details of this event are yet to be finalised, further information will be published in later issues of AR.

RTTY ART CONTEST

The VK3 Division have this contest well under way, refer to page 28 of November AR.

CW CONTEST

During this year the VK2 Division will be running a CW Contest to further the ability of Morse knowledge, practice and skill amongst full calls, novices and "K" calls.

The dates and rules will be published in later issues of AR.

VK/ZL CONTEST

The VK/ZL Contest Manager will be making every effort to ensure that the VK winner will be known before the end of 1985, it is hoped that a suitable prize to commemorate the 75th Anniversary will be obtained. More about that at a later date.

PRE-STAMPED ENVELOPE

On 22nd May 1985 Australia Post will be releasing a pre-stamped envelope to celebrate the Institute's 75th Anniversary. At the time of writing the design is almost completed.

Displays of radio activities will take place in many post offices to co-incide with the launch of this envelope.

WORLD AMATEUR RADIO DAY, 18th APRIL 1985

This day is proposed as an activity day for the little used 10, 18, 24MHz bands. All members are requested to come up on these bands during WARD. *(The old adage still applies "use or lose").*

DO YOU OWN A PIECE OF HISTORY?

We are seeking the oldest working (authenticated) item of amateur radio equipment, send brief details, with a photograph to your divisional offices. During 1985 the responses to this will be published in AR. *(We realise that some old timers may be reticent in coming forward, so if you know of an interesting item have a chinwag with the owner).*

ARE YOU A PIECE OF HISTORY OR ARE YOU AWARE OF AN AMATEUR WHO COULD POSSIBLY BE?

(1) We are seeking the licensed amateur who has been active longest.

(2) We are also seeking the longest serving member. Send brief details of either to the Secretary at the Federal Office *(Again we realise that some old timers may need to be helped, so if you can do so.)* Some form of vertification is required in both cases.

FEDERAL 75th ANNIVERSARY DINNER

A formal dinner will be held in Melbourne at the Southern Cross Hotel on 9th November 1985. With many dignitaries attending, included will be all the members of the IARU Administrative Council, who will be in Melbourne for their council meeting and officers of the institute. A limited number of tickets will be available to members at an approximate cost of $40 per person. *(Apply in writing with your cheque to the Federal Secretary).*

REGALIA

To celebrate the 75th Anniversary the Executive Sub-Committee, tasked to co-ordinate this year, have commissioned several items of regalia for members.

WIA ties, WIA tee shirts (with two styles, either 75th or WIA Motif), WIA pennants, WIA keyrings.

These items will be available from your divisional offices in March 1985.

MEMBERSHIP DURING 1985

(1) Each 75th new member receive, from the Federal Office, a presentation clock for their shacks.

(2) Each 75th renewal before the cut off date ie: 21.2.85 will receive a small gift pack and will be placed in a draw for a clock.

(3) Each proposer of a new member will receive a small gift to recognise his/her efforts. *(exceptions are of course as usual, executive office staff etc).*

(4) For 1985 a specially prepared limited edition Membership Certificate will be issued to new members.

The decision regarding 1 and 2 will be computer controlled and no correspondence will be entered into.

The presentation clocks are "Citizen Quartz", which, amongst other features, have dual time zones and temperature readouts. The normal retail price of these clocks is $60.

We hope that you all enjoy participating in the events planned, proposed and yet to be announced. Please do what you can to publicise this Anniversary Year whenever you have the opportunity.

AR

Many amateurs and WIA members may not know how our existence came about, and the close relationship which exists between the Wireless Institute of Australia and the Institution of Radio and Electronics Engineers Australia (IREE).

In the early days of the formulation of our hobby and the WIA, both groups were in fact one, but its members had slightly different spheres of interest.

The following article was published in the IREE's Journal 'MONITOR' in December 1982, and is republished in AR by arrangement.

Regretfully the author H Murray Tyler passed away prior to seeing his work published.

THE BEGINNING OF IREE — HOW IT ALL CAME ABOUT

by the late H Murray Tyler, FIREE

The following historical document was carefully researched and written by the late H Murray Tyler, FIREE — a Foundation Member of The Institution of Radio and Electronics Engineers Australia — for many months prior to his death earlier this year, who was looking forward to having it published in this Jubilee Issue of MONITOR. We deeply regret he was not able to see its final publication.

Murray was well known to many members of The Institution in his home State of New South Wales and elsewhere throughout Australia. We are sure that this article will bring recollections of Murray Tyler himself as well as the early days of The Institution to many of our members.

The Institution of Radio Electronics Engineers, Australia, celebrating in 1982 what superficially appears to be its 50th birthday, is really a very much older body which, although passing through a series of name changes, has had a continuous existence since March, 1910. This article tells the story of why and how it all came about, and why it can claim to have its beginnings as the first technical radio association in the British Empire.

FIRST MEETING

Marconi had spanned the Atlantic with a wireless signal only nine years earlier when a group of technically-minded wireless experimenters, in Sydney, headed by George A Taylor, met at the Australia Hotel on 11th March, 1910, to found a body named "Institute of Wireless Telegraphy of Australia".

The glamour of wireless communication had gripped the imagination of wireless enthusiasts throughout the world. This wonderful new device proved an irresistible area of experiment for any who had a leaning towards technical matters.

HOOKED ON "WIRELESS"

They were hooked — they had to be in it. The leader of such a group in Sydney, George A Taylor, was a very remarkable man indeed, who lived an unbelievably exciting life. Commencing as an artist, he became interested in aviation and collaborated with Lawrence Hargraves in his early flights. He later established at Redfern the first aeroplane factory in the Southern Hemisphere, and, in 1909, he flew the first heavier-than-air machine built in Australia. Taylor also founded, in 1909 the Aerial League of Australia, and his wife Florence became the first woman in Australia to fly a plane. From such beginnings, however, he devoted his life to radio and to publishing. If it was technical and new, Taylor had to be in it, and he had to tell the world all about it.

In moving that a Wireless Institute of Australia be founded, he said:

"Investigators were today on the verge of an arena of wonder. They are like explorers in a strange country, where every step is a discovery, but as success could only be achieved after many failures, there was need of mutual co-operation between investigators to avoid making the same mistakes, and to climb together wherever any successful discovery would be achieved. The time was approaching when this age would not again have the stigma of a 'Waratah' going into the unknown without a wireless connecting link. There was further necessity for the formation of the Institute to protect legitimate experimenters."*

The first Council consisted of George A Taylor, Major Fitzmaurice, Capt Cox-Taylor, Dr Brissenden, Messrs Hannam, Pike, Bartholomew, Gosche, F Leverrier and H Leverrier, A Garnsey, F Cleary. All were well-known radio experimenters. Pike and Hannam had both been reported by the Sydney Morning Herald, a few weeks earlier, as receiving signals in Sydney from warships in the vicinity of Melbourne and Auckland, and that same paper was reporting plans of the Commonwealth Government to establish two wireless stations in Australia — one near Sydney and the other near Fremantle.

MARCONI SPONSOR

And so, radio had its beginnings in Australia. The Institute of Wireless Telegraphy of Australia was soundly established, and Guglielmo Marconi was delighted to grant his sponsorship to this unique body.

The Institute grew in numbers and influence as the intricacies of this latest wonder were unravelled. As time went on, the word "Telegraphy" was dropped from the name and it became "The Wireless Institute of Australia". Operation was continued after World War I and until 1932, when it re-formed itself as the Institution of Radio Engineers, Australia and the Wireless Institute of Australia ceased to operate.

We must be careful to avoid confusion with that fine amateur body, the present Wireless Institute of Australia which, in NSW, commenced operations as such in 1937, and carries on the kind of activity which, in the early days, did so much to develop the commercial application of the science.

HOW WIA DEVELOPED

This is the story of how it all happened.

The 20s was a glamour decade for radio. The thermionic valve had made its presence felt — telephony was opening up a new field, with much more appeal to the man in the street than Morse code signals had — amateur experimenters were conducting music broadcasts — Charles Maclurcan's regular Sunday night concerts had become an item of conversation on Monday, so that by next Sunday many more were trying to listen, mostly on crystal sets with headphones. The more sophisticated had built for themselves "valve" sets, some even with horn type loud speakers, and some of the broadcasters of the day were names well-known to their many listeners. Such names as Otto Sandel, Basil Cooke, R C Marsden, Brooker, Charlie Slade, Stevenson and O F Mingay were becoming household words. Flo Wallace's shop, in the Royal Arcade, had become a "Mecca" for the wireless-minded lads of the day. Here they bought the components to build their receivers, and many of these lads built a lifetime career in the industry from such beginnings.

EARLY DISASTERS

The greatest disaster, in those days, was when the "A" battery ran flat during the concert. This was even worse than when

somebody nearby rustled a newspaper while you were concentrating on the headphones listening to a signal, or searching with the "cat's whisker" for a sensitive spot on the crystal.

World War I was over, and a great deal of radio development had resulted from it. Many experimenters had enlisted and, because expert knowledge was scarce, they had been eagerly seized by the Defence authorities for service in Communication Units — in fact, about 75% of the members of the Wireless Institute of Australia had served in the Armed Forces, as most were of the appropriate age.

Many of those returning from the war had their appetites whetted for further development of radio and, as they resumed civil life, formed themselves into Radio Clubs. These sprang up mainly on a district basis in and around Sydney, and in some country areas. Several of these clubs affiliated with WIA, and examples were district clubs from Concord, Croydon, Northbridge, Balmain, Leichhardt, Marrickville, Artarmon, Waverley, Strathfield, Illawarra, Wahroonga. Job related clubs also came into being, examples being the "Railway & Tramway" and "Postal Institute". Records reveal that, by 1922, these clubs were very active indeed under the aegis of WIA.

Old records of Institute meetings offer a fascinating area for exploration and reveal a surprising degree of investigation into many things which we, today, find an accepted part of everyday life, but were then visions of the future.

NO BATTERIES?

For instance when O F Mingay lectured on "The Application of Electric Power Supply to Radio Equipment", he let his audience into the surprising fact that radio receivers of the future could be worked from electric mains, and horrible messy batteries could be eliminated. Another member, Dr W G Woolnough, who was, as well as being a radio experimenter, an eminent geologist, told how he had made the first automobile journey to Central Australia, and used a wireless set to communicate with Adelaide. During his lecture to the Institute in 1924, he forecast how, someday, wireless would bring entertainment to the lonely outback and would provide a vital need both in the fields of medical assistance and in education.

Charles Maclurcan, the best known of the amateur transmitters and, at the time, the President of WIA, achieved fame by communicating with New Zealand on a power of only nine watts. This was the start of a wide quest, thereafter, to achieve efficiency on low power, and many were the theories expounded at WIA meetings.

When it became known that the Commonwealth Government had allocated the sum of £800,000 to radio communication, WIA, at the suggestion of Mingay, urged the Government to use this "substantially in the public interest and not to return it to consolidated revenue", as the latter was what seemed likely at the time.

Meetings of WIA had, for some years, been conducted in the Marconi Schoolroom controlled by AWA, but in April, 1922, it secured for itself a club room at Queen's Chambers, Dalley Street, at a rental of two pounds per week, and there it installed the transmitter for which it had received an experimental licence. In retrospect, it is interesting to note that a claim was made at a WIA meeting, in 1923, to the effect that the WIA Headquarters was the location of the "Nucleus of the one and only Wireless Lab in Australia" — it had just procured a wave meter, complete with a Bureau of Standards (USA) Calibration Certificate, a Thermo-coupled Microammeter complete with shunts, and a Complete Valve Tester. We may well smile at some of these things today, but nearly 60 years ago, members were proud, indeed, of such equipment.

WIA WENT NATIONAL

While these things were happening in NSW, similar interest in radio had, of course, developed in other States, and by 1924, it was decided, largely as a result of urging by Mingay, that the time for a nationwide organisation had arrived, and so, on May 16, the first Australian Wireless Convention was held at Melbourne Town Hall, with the result that WIA became Federal, and a further integration of Radio Clubs and similar societies occurred on an intrastate basis. Each State had sent representatives from its major radio organisations, and it is interesting to note that, from Queensland two organisations were represented, viz, the Radio Society of Queensland and the Queensland Institute of Radio Engineers.

When the Commonwealth Government sought to frame regulations regarding national commercial broadcasting, valuable co-operation was given by WIA. The Chief Radio Inspector was a member of the Institute, and as it was, at the time, the main channel for the concentration of technical knowledge, some sound guidelines resulted.

"FATHER" OF IREE JOINS WIA

A matter worthy of note, at this stage, is that on February 14, 1922, Oswald F Mingay (later fondly known as Ossie) became a member of WIA. He was a remarkable man — a human dynamo — and one who had a very obvious hand in most of the important things that happened to WIA from that time on. Many consider him as the "father" of what IREE is now celebrating, and the reasons for this will be apparent as the story unfolds. He was, at the time of joining WIA, already the Honorary Secretary of the Military Radio Association of Australia (formed during World War I) and held the rank of Lieutenant. By September 1922, WIA had appointed him as Treasurer, and by December, also as Publicity Officer.

Most of the original 1910 members were still active in the early '20s and the foundation chairman, George A Taylor, was still lecturing to members in 1923.

During 1922, the radio art was accelerating very rapidly. Interest in joining WIA had become widespread, and the Institute felt that the time had come when it should initiate steps to secure recognition as an Incorporated body under the Companies Act. Up till that time it had been an unofficial organisation although a very active one, and its application for registration was granted on May 26, 1922.

Articles of Association were formulated and grades of membership, "Full" and "Associate" were introduced. This resulted in the necessity for a Qualifications

Committee, and the first such Committee consisted of Messrs Maclurcan, Cooke, and Stowe. This was well before the existence of recognised academic gradings in this new field, and led to the introduction later of the regular, annual examinations held by the Institute.

"KNOW-HOW" TEXT

Very few textbooks existed, and the Admiralty Handbook of Wireless Telegraphy 1925 later became the standard text and contained all the significant "know-how" of the time when it was published. It was used by the Institute as the basis for examinations. Not until 1933 did recognised professional radio engineering qualifications exist in NSW when the Sydney Technical College introduced their Associate Diploma in Radio Engineering, and it was a few years later before there were any who obtained the qualification. Electrical Engineering degrees at Sydney University included little specialised Radio content.

One of the highlights of the Radio Year in the '20s was the regular Annual Radio Exhibition at the Sydney Town Hall. These were subsequently organised by the Electrical and Radio Development Association (ERDA). However, the idea was the brainchild of WIA which pioneered and received an overwhelming response from the industry when, with O F Mingay as Director, they ran the first Exhibition from December 3-8, 1923. A profit of 750 pounds resulted, and over 12,000 visitors paid for admission. The success of the first Exhibition was such that, from then on, it had to become a matter for participation by the commercial houses.

A Papers & Publications Committee was formed in 1922, under the chairmanship of W H Newman and, although it was not until January 1924 that an official organ was announced, this committee earns recognition as the predecessor of today's IREE Publications Board. The first official organ was "Sea, Land & Air", and later, when the former ceased publication, the journal "Radio" was appointed. Both were privately published, at the time, and it was not until several years later that the body owned and controlled its own journal.

"IRE (AUST)" REGISTERED

The next event of interest happened on August 16, 1924 when Mr E T Fisk (later Sir Ernest), who was then a member of WIA, together with some of his colleagues from AWA Ltd., effected with the Registrar General of NSW registration of the name "Institution of Radio Engineers, (Australia)". No record of any activities of this group is extant, but the fact of the registration will become significant later in the story.

Each year, WIA became stronger as the industry exanded, and what had been an organisation of enthusiastic amateurs, had become, predominantly professional in a vocational sense. Radio receivers were no longer homemade, but had become the product of commercial manufacturers.

AMATEURS GO COMMERCIAL

The amateurs who had built up their technical competence, had been "bought" by the manufacturing companies, to head their laboratories and to supervise their manufacturing activities. Where else was the right kind of knowledge to be found?

Other experimenters had turned their hobby into profitable businesses in becoming sales agents and servicemen for manufacturers.

Except for use in remote country areas, receivers no longer operated from batteries, for the mains-operated receiver had been born, and everything in the radio garden was lovely — until the authorities "threw a spanner in the works" by decreeing that mains-operated radio receivers were classified as electrical appliances and, as such, could only be serviced or installed by persons licensed under the Electrical Contractors and Electricians Licensing Act.

A General Meeting was organised on November 23, 1931, by Mingay, who was then Secretary of WIA, to which were invited all interested persons, whether members of the Institute or not, for the purpose of alerting them to the danger to their jobs, of the new ruling, as very few of them possessed an appropriate licence. The industry had just expanded into what it was, and radio had unobtrusively moved from the realm of the enthusiastic amateur to that of the businessman. What was to happen to WIA, which had been in the forefront of all this growth, and was the body which included the technical experts of the day?

A TIME FOR CHANGE

The answer seemed obvious. WIA had to change also. Very few of the existing members were still purely amateurs. The commercialisation of the art had been so rapid that its tide had swept up almost all the experts and, as the depression at the time was squeezing most other callings, the prospects for this new thing were too good not to be in it commercially.

The name WIA had been associated with amateur activities for over twenty years — it was the epitome of amateurism — and so it had to go too.

To what could it be changed?

There were various suggestions, but one seemed obviously right. The Institution of Radio Engineers was the name of the professional body in USA with broadly similar aims, and one of WIA's own members, Mr E T Fisk, had wisely reserved the name, in Australia, seven years earlier. It has always been the writer's belief that Mr Fisk (later Sir Ernest) was a person of considerable foresight, who had unbounded faith in the inevitable bright future of radio, and who envisaged a fully professional institution becoming a reality in Australia at some future date, and it is perhaps interesting to contemplate whether his action might have been influenced in any way when the news of the apparently unregistered Queensland Institute of Radio Engineers surfaced at the National Convention in 1924, because within three months of that date, he had effected the registration of IRE Australia.

Be that as it may, "Ossie" Mingay, as Secretary of WIA, explored the possibility of this name with Mr Fisk, who was enthusiastic about the idea. When the mechanics of the change were investigated, it was found that there were no financial members of IRE, and the Registrar-General could only recognise Mr Fisk (President) and Captain Toombs (Secretary), who had been named as officers in the application, and so, a method had to be found — but that was not beyond the genius of Ossie Mingay, as will be seen.

All these matters had been the subject of a discussion, at Federal level, and a policy determined, at a Convention, which was in accord with the recommendations made by WIA (NSW Div). However, when it came to the moment of action, the other States were hesitant, and it became clear that if the NSW Council had the courage of their convictions and the support of their members, they must go it alone.

Consequently, on February 14, 1932, a notice was sent to all members in NSW calling for a Special Meeting on February 29 to vote on the recommendation of the Council. The meeting was attended by 64 members and 21 proxies were held, and the result was that the recommendation of the Council to form the WIA into the IRE was adopted by 79 votes to 6.

The nature of this decision required, of course, a Confirmatory Meeting and this was held on Tuesday, March 15, 1932 when a motion by Messrs Norville and Mingay was carried unanimously.

"That this meeting confirms the Special Resolution of February 29, 1932 authorising the Council to take all the necessary steps to form an Institute of Radio Engineers, Australia."

LAUNCH DATE

It now seems logical to pinpoint this meeting as the moment in time which represents the launching of what is now the IREE, and makes a good target date for treating March 15, 1982 as the 50th Anniversary, although, if one considers its worthy predecessor, a venerable 72 years can now be totalled up.

It might be an interesting exercise to contemplate the 21st century. Will IREE treat March 2010 as its centenary, or wait until March 2032? The writer pleads Leave of Absence from the ceremony.

Now came the task of implementing the decision, formulating a new policy and closing down WIA (NSW Div).

As explained above, there was some difficulty, as only the President and Secretary of IRE were officially recognised as existing, but Ossie Mingay, the WIA Secretary, had an idea. There were four other WIA members who had also been IRE members and, with this in mind, a meeting was called on April 26, 1932 as a meeting of IRE, which in addition to the two officials, included Messrs Hooke, McDonald, Reed and Crawford (the four IRE members referred to above) who together with the President and Secretary, constituted an IRE quorum, and as invitees to the meeting, were three other WIA members, Messrs Renshaw (President), Mingay (Secretary) and Norville (Treasurer).

This meeting passed two resolutions — the first, admitting as members the entire list of WIA (NSW Div) members who had en masse, applied for membership of IRE, and the second, appointing a provisional Council to manage the affairs of the Institute until a General Meeting could be held. The following Councillors were appointed: Messrs Fisk (President), Hooke, McDonald, Crawford, Renshaw, Gilmour, Norville, Mingay, Hill, Bean, Emmelhainz, Tyler, Thom, Kennell and Turner. Toombs

resigned as Secretary of IRE and Mingay, Secretary of WIA, became also Secretary of IRE.

INAUGURAL DINNER

The first activity arranged by the new Council was an Inaugural Dinner (many felt it was a coming-of-age party). This was held on May 30, 1932 and was attended by 123 members.

Then followed a well advertised Public Lecture in the State Theatre Conference Hall, at which the speaker was Major C W C Marr, Federal Minister for Health, who had been Commanding Officer for the Anzac Wireless Squadron during World War I. An honoured guest at this meeting was the Chief Engineer of the BBC, Captain Eccesley.

On June 11, 1932, a Final Meeting of WIA (NSW Div) Council was held for the purpose of officially closing it down. It was reported by Phil Renshaw, President, tnat all WIA members had formed the IRE. A motion was passed that it, WIA (NSW Div), be wound up forthwith, and the Institute's solicitor was named as Liquidator.

This became a story *in* itself, because when the liquidator came to the stage of seeking the registration certificate in order to return it to the Registrar-General, he seemed to meet with a series of delaying tactics because there was a growing feeling of goodwill toward a small amateur body called the "Association of Radio Amateurs" which had developed after the closure of WIA. This feeling was behind the Resolution of the IRE Council, on December 6, 1932, to place in the hands of the Trustees (Hooke and Norville) for use by ARA, its own Radio Transmitter and the Maclurcan Cup. This cup had, until recently, been eagerly competed for, on a regular basis by NSW amateur transmitters, and the condition of its transfer was that these competitions should be revived and continued. A "wait and see" attitude had developed about returning the WIA registration certificate, and hope was emerging that, some time in the future, amateur radio would again become significant in the State.

By 1934, the interest in electronic communication had become quite wide, and this year saw another technical professional body come into being with the inaugural meeting of the Institution of Engineers Australia, Communications Section, which was held on September 26, and still continues alongside IREE as a leading professional organisation.

It was reported at the Council Metting of April 3, 1935, that the Registrar General required the final liquidation of WIA to be completed, and the liquidator to consent to a new Company. O F Mingay, Secretary of IRE and also nominally Secretary of the defunct WIA (NSW Div) reported difficulty in holding the necessary meeting because there were no WIA financial members. On June 4, 1935, following another letter from the solicitors, the Secretary was empowered to call together sufficient members of the Council to re-form WIA with a temporary fee of one shilling per head to pass the necessary resolution required to carry into effect the legal requirements for winding up.

WIA REBUILT

Somehow, (and many would say, fortunately) this became a long-drawn-out process and never actually took place in its originally intended form, because by April 14, 1937, it was resolved by Council not to cancel, but to hand the original certificate of registration to IRE's good friends, a group of amateurs who had, by now, rebuilt themselves into a sound organisation. The plan originally adopted in 1935 was implemented and a meeting organised by O F Mingay, was held on June 2, 1937, in accordance with the solicitor's advice, and four resolutions were passed as follows:

1. "The Institute accepts from IRE Certificate of Registration 86355 issued on 26/5/22.
2. The Institute indemnifies IRE against any possible liabilities.
3. It undertakes to function solely as an amateur body.
4. It accepts the resignation of O F Mingay as Secretary in favour of W G Ryan."

The Wireless Institute of Australia (NSW Division) has continued to develop, and today, ably represents the amateur radio enthusiasts (Hams) of the State as their official authorised body.

IREE AND ROYAL CHARTER

Reverting back to the continued development of IRE, the Articles of Association were amended and new Articles adopted on February 20, 1933. It has grown and expanded as the science has developed. There have been name changes. Firstly, the original discussion had used the word "Institute" and the "birth" resolution used this term, but after the first meeting of the re-formed body, the word "Institute" was replaced by "Institution". Then, as the science expanded, the name was obviously too restricted adequately to describe the Institution, and it was changed to The Institution of Radio and Electronics Engineers Australia in January 1965. It continued as a Public Company, registered in NSW, until 1967, when it was honored to receive a Royal Charter.

If George A Taylor, who died in 1928, at the early age of 56, could see IREE today, or even to be a "ghostly visitor" at an IREECON Convention, do doubt he would be proud at what had grown from the seed he planted in 1910, and how true, still, is his call for mutual co-operation between those who professionally lead the world of electronics.

Name changes by this body have reflected the history of the science, which was originally introduced as "wireless telegraphy" — but then, telephony evolved, making the original title too restrictive, and so it became just "wireless" without any addendum. There were, originally, no specialist wireless engineers — they grew out of the science itself, and the professional man appeared as the necessity for him arose. Wireless and radio are synonymous terms and the latter became the preferred word for modern usage but then, as the science spread and produced specialists so widely outside the restricted field of radio, the word "Electronics" had to be added to the name.

FOLDED-ELEMENT COLLINEAR ANTENNA FOR 2 METRES

Desmond Greenham, VK3CO
16 Clydesdale Court, Mooroopna, Vic. 3629

The "Slim Jim" is a most popular 2 metre antenna for stations within reasonable distance from a repeater and where omni-directional characteristics are required. This was featured in a previous article by the author on the construction and operation of an updated "Slim Jim".

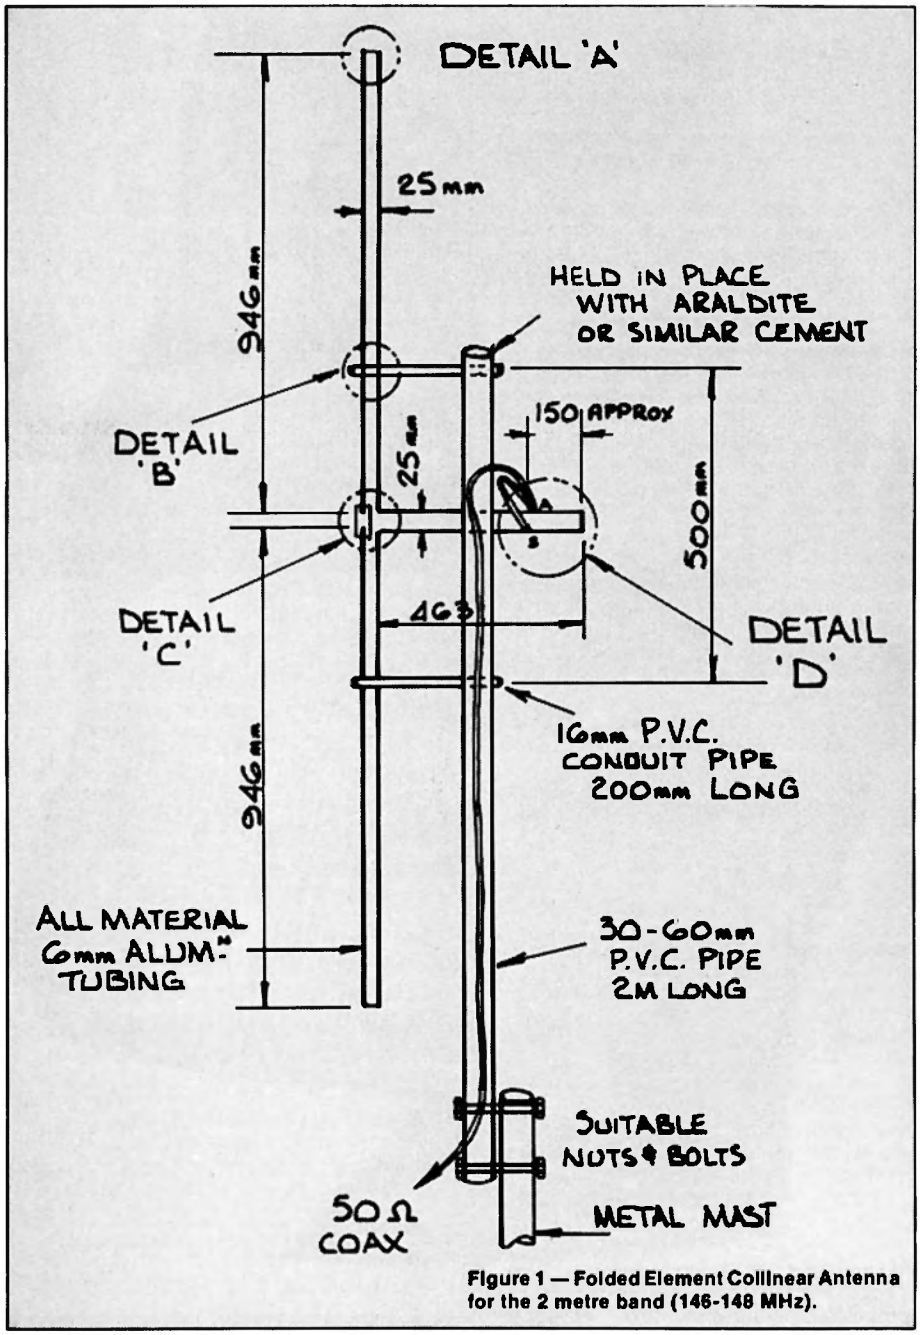

Figure 1 — Folded Element Collinear Antenna for the 2 metre band (146-148 MHz).

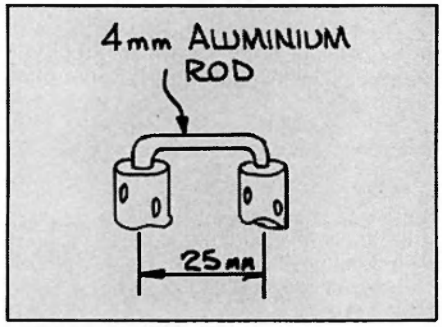
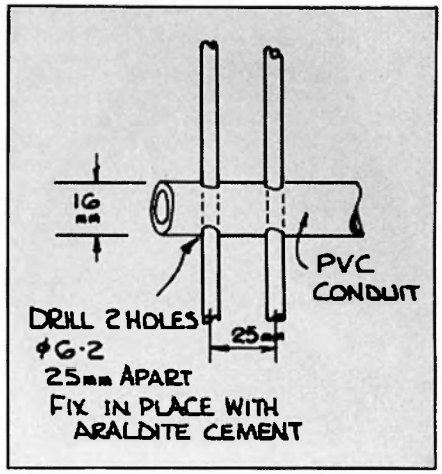
In an attempt to derive more antenna gain and still retain omni-directional properties, the old, still popular "two half waves in phase" antenna was revalued. This type of antenna is featured in many text books as the "Plumbers Delight" because it can be constructed with copper pipe using plumbing elbows etc. The antenna is claimed to have a slight gain over a "J Pole" or "Slim Jim", however, on test it has been found that whilst there is a "gain" there is also a problem in achieving a satisfactory impedence match resulting in a higher than desirable SWR.

DESIGN

The antenna to be described, was originally developed by F C Judd G2BCX for using a repeater in UK and is a variation of the original "two half waves in phase". This antenna uses two folded dipole elements fed in phase through a quarter wave stub and a co-axial cable "balun" matching system. The result is an antenna that is balanced and symmetrical, and exhibiting a very good impedence match resulting in a low SWR over the 2 m band and providing worthwhile gain.



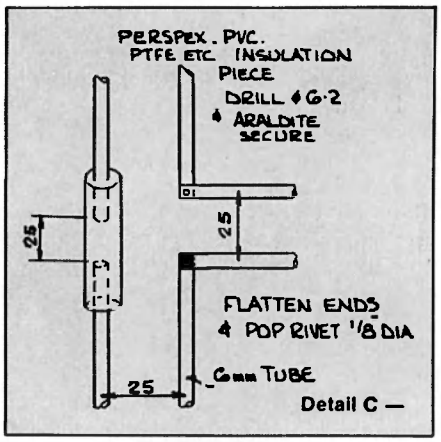
Detail A — Drill out tubes and press in end piece. Centre punch to locate and hold.

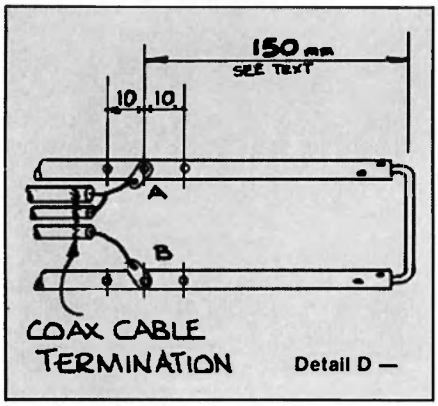


Detail B — Fix in place with Araldite.

CONSTRUCTION

The supporting frame for the antenna is made from electricians PVC conduit, a most suitable material for antenna construction and preferable to wood. The elements are made from (¼") 6 mm aluminium tubing. This is readily available and reasonably cheap to purchase.





The general construction is reasonably straight forward and details are shown in the sketches. The end sections of the dipoles and the matching stub are made from 4 mm aluminium rod.

Other metals, brass etc could be used, however, there is an electrolysis problem with dissimilar metals resulting in corrosion and consequent high resistance connection. All mounting of elements is achieved by drilling a neat clearance hole and securing with "Araldite" or other epoxy type cement.

Care must be taken when drilling 16 mm holes through the PVC support mast. A smaller hole can be drilled first and then enlarged with a round file or reamer.

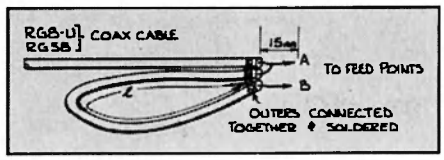
COAXIAL CABLE "BALUN"

The balun should be made from a section of the same cable that is used to feed the antenna. A cable with low loss is preferable and RG8 or equivalent is suitable. If the overall length of cable is not excessive, say, less than fifteen metres, then RG-58-AU "foam" dielectric is quite suitable. This cable combines low loss, thin diameter, and easy handling. The ½ wave section must be carefully cut to the correct length depending on the cable dielectric. If standard solid dielectric cable is used, the velocity factor is 0.66 resulting in a length of 673 mm measured from outer covering ends. (see sketch). If "foam" cable is used the velocity factor is 0.75 giving an overall length of 765 mm.

The section should be looped and taped as shown and carefully terminated. The termination can be water proofed by PVC tape or some sealing compound. If water enters the cable it will be damaged and characteristics altered considerably. The "balun" and cable ends are soldered to lugs and screwed with self tapping screws to the matching section.

TESTING AND ADJUSTMENT

After deciding on the final location of the antenna and the length of the feed cable, final connection should be made as shown in Detail D. The antenna with full length cable connected should be lifted as



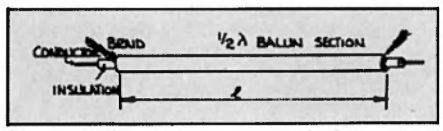
4:1 Balun ½ wave matching (see text)

l = ½ wave. If RG8 or RG58 standard polythene co-axial cable is used, velocity factor = 0.66.

l = 673 mm

If RG8-AU or RG58-AU foam insulated cable is used, the velocity factor = 0.75. l = 765 mm.

½ λ = 150 x .75
147 MHz = 765 mm
= 150 x 0.66
147 MHz = 673 mm



high as possible in the clear and the SWR checked. If all dimensions are correct, and construction details followed, an SWR figure less than 1.5 will result. An improvement can be made by moving the tapping point ± 10 mm from the point shown.

The author has obtained SWR results better than 1.2 over the band with the dimensions shown.

When testing is completed, the cable can be taped or clipped to the support mast and the antenna placed in its final position.

The SWR figure will not change significantly and the antenna will give good results over the entire 2 m band.

AR

TV LINE OSCILLATOR INTERFERENCE

The problem of TV receiver line oscillator interference on amateur bands is being examined in the WIA EMC and Standards areas.

Federal Executive is seeking information from Divisions which may assist in the preparation of a submission to the Standards Association of Australia proposing improvement in the relevant performance specifications for television receivers. A similar but more general request for information on the problem appeared in the National EMC Advisory Service feature in last month's AR (Page 66).

Duplication of information submitted in response to these requests is unnecessary, since the EMC Service and FE will collate all reports received from both sources.

AR

RSGB HF CONTESTS

The custom whereby each HF Contest organised by the RSGB has had a different adjudicator each year and therefore a different address for logs to be sent to has caused many problems for entrants from outside the UK who do not necessarily have the information needed. In future the procedure will be much simpler as entries for ALL RSGB HF CONTESTS from outside the United Kingdom may be sent to:—

PO Box 73,
Lichfield,
Staffs, WS13 6UJ,
England.

Please write the name of the contest being entered on the top left-corner of the envelope.

TECHNICAL CORRESPONDENCE

CURTAINS FOR WA AURORAL COMMUNICATION?

John Hawkins, VK6HQ
39 Glyde Road, Lesmurdie, WA 6076

Intrigued by something experienced by Bert VK6ZY during an aurora in Western Australia sometime previously, a study was commenced in January 1981 by John VK6HO under the auspices of the WA VHF Group.

The objective of the study was to gauge the possibility of communication from WA at VHF and UHF via the aurora.

Apart from an awareness that this form of communication had long been the norm in the northern hemisphere and that some observations may have been done in the south of the State during the International Geophysical Year (IGY) of 1957, the subject had to be tackled literally from the ground up. Some information was found in a report from New Zealand.[1] (All reports and papers that were drawn upon appear in the bibliography.)

What was the aurora really like and from where in the southern hemisphere might it simultaneously be seen? Few I asked had seen it. Even ZS stations in Capetown, lower in latitude than Perth, could not recall mention, let alone the sighting, of one, which immediately rules out big DX!

At this juncture I approached Perth Observatory who responded by loaning three books[2,3,4] and at the same time providing a list of auroral sightings. They emphasised that such occurrences were logged only if they coincided with their main observing operations and consequently the list was by no means complete.

While I pondered how to begin to predict the onset of an aurora, I read. As I read I concluded that auroral theory was still being written.

Certainly, when the auroral effect reaches the E-region in the atmosphere signals begin to bounce back, but *why do the magnetic fields at the poles "light-up" progressively outward, following a disturbance at the Sun?*

Akasofu, writing on the subject as far back as I could trace in 1960[5], describes in December 1982[6] the visual (northern) aurora thus:

"An astronaut looking down on Earth from high above the north pole in winter would see a huge glowing ring. This oval, about 4500 km across, is approximately centred on the geometric pole and passes across Alaska, northern Canada, Greenland, Scandinavia and Sibera.

"From ground level, one sees a gigantic curtain of light, intermittently curling up like a whirlpool of flame over the frozen Arctic Ocean and endless forest and tundra.

"This spectacle is the Aurora Borealis (Aurora Australis in the southern hemisphere) one of the magnificent natural occurrences on Earth."

Whilst taken perhaps out of context the "exploded view" of the aurora, Fig 1, as described by Gerhard Haerendal[7] shows the almost "frictional" effects resulting in the auroral generator.

Through an auroral "atlas"[8] I learned that the aurora can be classified visually under:

Condition — quiet, pulsing, etc
Structure — homogenous, rayed, etc
Form — arc, veil, etc
Brightness — indexed 0-4
Colour — classed a-f.

Earlier accounts suggested that the Sun flared throwing particles Earthwards, where they in turn "jiggled" the magnetic fields around the poles like gas in a flourescent tube. Akasofu, however, goes on to say[6] *"there is little doubt that the aurora is produced by a very high powered electrical discharge (as much as a million megawatts) in the polar atmosphere".* This makes sci-fi like "Siva!" almost credible!

Reports on the invisible aurora and its effect upon VHF communication were still, even in 1951, news, but the first reference appears to have been in QST, May 1939. After that, 56 MHz "aurora effects" reports

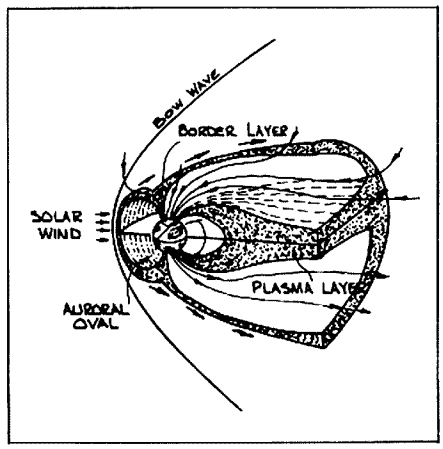

Figure 1 — Three dimensional section through the magnetosphere with the source area of the Aurora. The border layer at the magnetopause and the plasma layer in the tail. Acknowledgement to Sterne and Weltraum.

became commonplace. It was not until QST for March 1949 that two-way communication "via the aurora" on 144 MHz was reported.

R K Moore cites[9] the now famous QST report[10]:

"W2AMJ makes some interesting observations regarding conditions noted on 56 MHz: the Northern Lights were going to town on the night of 24th February. I got on 56 MHz at about 8.20 PM. I sent a CQ in ICW and was rewarded with a call from W8VO in Akron, Ohio, also on ICW. His carrier was S9 but had the most peculiar sound to it, with or without modulation . . . I swung over to phone and he advised me that the phone was unintelligible. Then he shifted to phone, and boy, if you ever heard inverted speech you should have heard this. It sounded nothing like voice modulation. We continued the contact on ICW-S9 both ways. At no time was there any appreciable fading. The signal was just like it was around the corner, except for the peculiar combinations of howl and roar that accompanied his carrier . . ."

Auroral disturbances can extend out from 80 km to 1000 km and influence radio signals in the HF, VHF and UHF range in several ways. Not only this but radio noise emissions in the VLF range and known as the "dawn chorus" occur with the onset of an aurora.

Both the Carmel and Mundaring observatories continued to be very helpful for subject documents. In addition, I arranged for the WA VHF Group to be added to the circulation of the weekly "Preliminary Report and Forecast of Solar Geophysical Activity" (PRF) originating from the US authorities in Boulder, Colorado. The PRF, amongst many other things, diarises Alerts in the past period, Soflares, 245 MHz Radio Bursts in flux units, and so on. It also makes predictions as to the effect of reappearing coronal holes.

It was hoped to correlate WA sightings with these reports and build up a pattern for predictions. Regrettably, there was insufficient auroral activity in WA to use this approach.

I then stumbled on an article in *Radio Communication*[11] mentioning twenty seven day auroral charts maintained at G8VR and reporting a discussion with Charlie G2FKZ, the IARU aurora co-ordinator. As I knew G2FKZ personally from IGY days I wrote to him and received charts, diagrams and a cassette tape in return.

G2FKZ has been associated with auroral communication and prediction for twenty five years or more. What follows is a resumé of his notes to me.

On either side of an eleven year solar cycle there are peak periods for the aurora. The peak on the upward side occurred in 1978/79 and we were, as at August 1982, at the peak on the downward slope.

There are about five causes of auroras. Auroras are indexed on an "A" scale. The big ones, A-100 plus, are nearly always caused by disintegrating filaments, virtually impossible to predict and of short duration. The other major cause resulting in about eighty per cent of auroras is the coronal hole. These auroras are usually in the A-10 to A-50 sort of order and provide the "bread and butter" auroras.

It would appear Perth needs an index of at least A-100 to get in the auroral communication ball park. G2FKZ was not surprised that the aurora of 6th September 1982 had made itself known in WA; it was the biggest of Cycle 21 and reached A-162. Ironically, I missed it and only deduced that an aurora had occurred through talking to some rather baffled Perth HF operators later on.

Because coronal holes grow, spawn auroras, and then decay, sometimes over three or four rotations of the Sun, the twenty seven day cycle is a useful guide. However, with relatively low indices on average the chances of working auroral QSOs from Perth, according to G2FKZ, are slim.

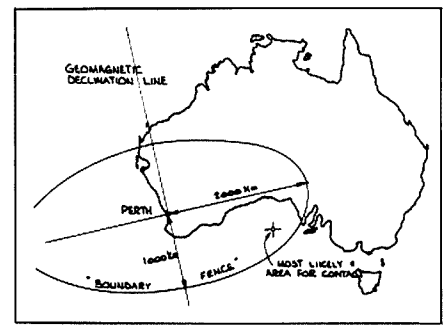

Figure 2 — G2FKZ's "Boundary Fence" conception. For all practical purposes communication outside area a physical impossibility.

G2FKZ considers that a "boundary fence" exists with regard to auroral communication generally. It will be seen from Fig 2 that an ovaloid area aligned with the station's longitude and approximately 2000 km deep by 4000 km wide surrounds any given station outside of which he cannot hope to contact a second station. Exceptions are few in practice. Distance/bearing graphs appear at Fig 3.

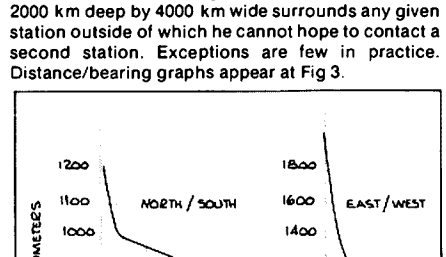

Figure 3 — Guide to QSO direction in the Northern Hemisphere.

Beam headings, see Fig 4, are aligned for minimum attenuation of the signal with one station or the other making the "long run" to cut down square law losses. The reflection point needs to be close to one station.

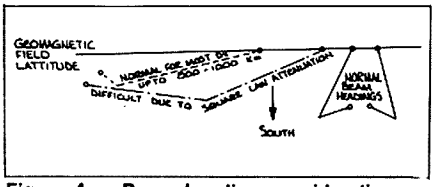

Figure 4 — Beam heading considerations — Northern Hemisphere. It does not matter which station is more south.

One antenna only need be elevated up to the E-layer height (about 300 or 400 kms minimum). The other operator then fires low and hits the same piece of sky 200 or 300 kms south of him. If both were to fire southwards they would hear much noise but not make contact.

If the "boundary fence" is the good news the bad news is that three quarters of the accessible area from Perth is out at sea. If Perth were "transplanted" no one in the northern hemisphere has put an auroral signal into the equivalent area. Two places were mentioned by G2FKZ as having supported research on the aurora by way of radar, MacOuarie Island and Heard Island.

Visual observations of auroras do not always mean that communication will be possible. Sometimes there might be good communication and no visible spectacle, sometimes the reverse and sometimes both.

From what G2FKZ relates, his rebroadcasted predictions coupled with other rapid alert systems keep interest in auroral propagation at a high level in the Northern Hemisphere: he has amassed something like 20 000 individual contact reports through which to sift and draw further conclusions. Clearly, however, our northern relations have a lot going for them with Northern Ireland singularly blessed with auroral sightings.

Going back to the occasion of 6th September 1982, 10 metres showed entranced propagation but shifted its skip rapidly from one DX region to another. On 80 metres several operators thought AC had got into their RX local oscillators such was the burbling effect of received signals. Perth Observatory, meanwhile, received several calls from commercial concerns in the country asking why they suddenly couldn't talk to one another by radio.

Perhaps these might all be pointers to the onset or existence of an aurora. I once asked a Norwegian station on 20 metres if he saw many auroras. He paused, looked from his window and reported, *"there's one there now! We usually know when they're about — we hear our repeater being triggered from Sweden!"*

So, with Cycle 21 ebbing slowly away, one last concerted effort was made from WA to "hear something on aurora". Perth Observatory agreed to call VK6HQ at any time during the period 1st to 31st March 1983 if an aurora were spotted.

That magic telephone call never came. Presumably if auroras had occurred the A-index failed to approach A-100.

Boulder were asked to send us further PRFs and with particular thanks to them and to Dr Nikoloff, Dennis Harwood and librarian Carmell of Perth Observatory and Peter Gregson of Mundaring Geophysical Observatory, the project was put into suspended animation.

Since then I note with great delight the reappearance of the publication *6UP* and in it a fine article on the aurora by Roger VK2ZTB[12]. Roger mentions that in August 1978 a dozen stations in VK3, VK5 and VK7 broke the auroral scatter propagation "drought" of some twenty years with a vengeance.

With this in mind, perhaps all is not lost. Roll on, Cycle 22 . . .

THE ORIGIN OF 73

G Maxwell Hull, VK3ZS
Federal Historian

Amateurs have used the term "73" to express — 'Best Wishes' — since as far back as can be remembered. Of more recent times the term "73's" has crept into amateur jargon, both on the air and in amateur literature. Although to a great extent this has been accepted by common usage, it is in fact quite incorrect. As recently as a couple of months ago, following a Divisional Broadcast, an amateur was heard to 'call in' and correct the announcer on the use of "73's" instead of "73". The announcer's comment (and also that of a 'breaker') left no doubt in the writer's mind that the amateur attempting to correct the situation was considered "old hat" or to be "flogging an unwilling horse" so to speak. And so for the record, here is some information on the origin of "73".

The origin of "73" as the telegrapher's conventional signal of greeting has been ascribed to a dinner given to Andrew Carnegie on his 73rd birthday by the Order of Military Telegraphers. The dinner referred to was given on 27th November 1908, and the signal "73" was played upon in connection with his 73rd birthday. However, investigation indicates that the term "73" was used for many years prior to that time. This information came from the December Bulletin from the Navy Department Office of the Chief of Naval Operations, USA.

The following material, believed to be authentic, is quoted from the "Telegraph and Telephone Age," dated 1st June 1934:

"It appears from a research of telegraph histories that in 1859 the telegraph people held a convention, and one of its features was a discussion as to the saving of 'line time'. A committee was appointed to devise a code to reduce standard expressions to symbols or figures. This committee worked out a figure code, from figure 1 to 92. Most of these figure symbols became obsolescent, but a few remain to this day, (well, in 1935 anyhow!), such as 4, which means 'Where shall I go ahead? Figure 9 means 'wire', the wire chief being on the wire and that everyone should close their keys. Symbol 13 means 'don't understand'; 22 is 'love and a kiss'; 30 means 'good night' or 'the end.' The symbol most often used now is 73, which means, 'my compliments', and 92 is for the word 'deliver.' The other figures in between the foregoing have fallen into almost complete disuse."

The following were still in effect in 1905 —

1 Wait a minute
4 Where shall I start in message?
5 Have you anything for me?
9 Attention, or clear the wire.
13 I do not understand.
22 Love and kisses.
25 Busy on another circuit.
30 Finished, the end (VA)
73 My compliments, or Best regards.
92 Deliver.

So there you are! This bit of history leaves no doubt that "73" is quite correct and even that has been changed to mean 'Best wishes'. So does "73's" mean Best-best wishes or 'Best wisheses' or what? And then "88" crept in somewhere too!

We'll leave the reader to think about it. 'Common Usage' of words and expressions has been the cause of some funny changes. 73.

EQUIPMENT REVIEW

Kevin Phillips VK3AUQ
Hereford Road, Mount Evelyn, Vic 3796

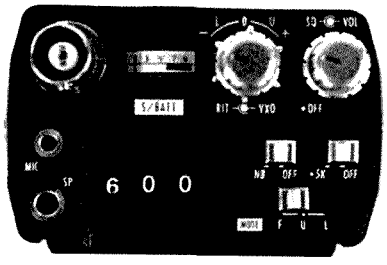
BELCOM LS-202E

The Belcom LS-202E is a compact, synthesised, two metre handheld transceiver featuring both FM and SSB modes of operation. The unit supplied for review was fitted with the optional NP-9 nicad battery pack (10.8 volt), CA-110E AC charger and SH-1 speaker microphone. It also comes as standard with a belt clip, carrying strap and a rubber flex antenna.

There are other multi mode rigs about, but not as a handheld unit, so it should have some appeal to those who do a bit of travelling and have no room for excess luggage. It is fairly small at 179 x 64 x 44 mm including all projections, and weighs about 500 g. Many FM only alternatives are no smaller or lighter.

APPEARANCE

Overall appearance is compact and fairly neat, until you try to use some of the controls. On the front, is a speaker and microphone, all else is blank apart from a label. Left side panel has a PTT lever, high/low power switch, repeater offset switch which can be either 600 kHz up or down, a tone switch which serves no useful purpose in Australia, and a button for lighting up the S meter. This side also contains the charging socket. Moving up to the top panel, there are two pairs of concentric knobs. One pair are the VXO and RIT controls which are only functional on SSB, and the other pair are volume/on off and squelch controls. VXO range is ±5 kHz, and RIT is ± 1 kHz. There are three slide switches for noise blanker, +5 kHz offset and mode selection. Modes are FM, USB and LSB. Next are the thumbwheel switches for selecting operating frequency in 10 kHz increments. These switches are small and fiddly to use, and would be difficult for anyone with big fingers to select a frequency with any speed. Next are two sockets for remote speaker and microphone. Each socket is a different size, so the two functions cannot be mixed up. A rubber bung fits into these sockets when not in use to keep out dirt and other nasties. Antenna connector is a BNC type. Last item on top is an "S" meter/battery condition meter.



Top view: From left — clockwise. BNC antenna socket, S meter/battery condition meter, RIT/VOX control, volume/on/off and squelch control, three slide switches, frequency selection thumbwheel and remote speaker and microphone sockets.

FREQUENCY RANGE

Frequency coverage is from 144.000 to 147.995 MHz on transmit, but I found that on receive it covered 144.000 to 153.995 MHz, not 140 to 149.995 MHz as I expected. It has an interlock to prevent transmission if MHz is 148 or above. The only exception is if the repeater offset is on, and a frequency less than 600 kHz from a band edge is selected. An example is

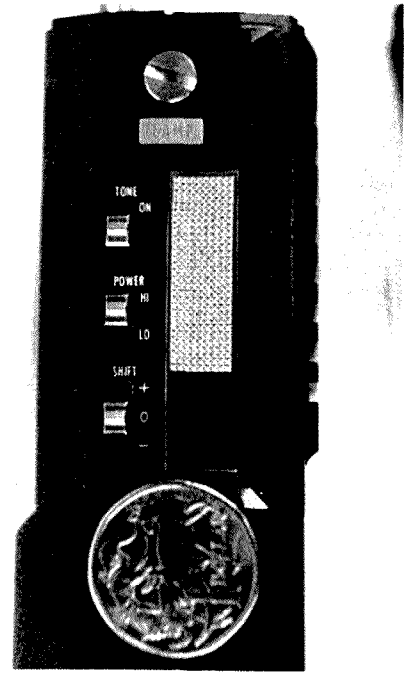
say 144.1 MHz selected, but you had last used the rig on the 146.7 MHz repeater. You had turned on the offset to 600 kHz low, so your new frequency is 143.5 MHz (out of band and very naughty). The same can happen at the other end of the band with offset high. The offset doesn't care what mode you selected.

Power output is claimed to be 3.5 watts when run on 10.8 volts, and the test rig ran at 3.8, and drew slightly less current than specified. On low power, it was still 1.7 watts, which is a bit excessive, but drops to a more reasonable 0.7 W when on 9 volts, or 2.7 W on high power. These figures are for the FM mode, and similar results occurred on SSB. It is very easy to drive it to full output on SSB, as mike sensitivity is reasonably high. FM deviation was measured at 5 kHz. I was a little disappointed in spurious response, as a number were just out of specifications. There were a couple either side of the carrier, at 10.695 MHz removed, and they varied in level depending on mode, power and frequency selected. Second and fourth harmonics were a bit high also, but third harmonic was very low. Most transmitters radiate broadband noise in the form of a noise plateau. This rig has a noise plateau of —80 dBr on SSB, and — 86 dBr on FM. All spurious should be able to be improved, and other units may be much lower.

RECEIVER

Receiver performance was better than specifications on most counts. Belcom claim better than .25 microvolt for 10 dB S/N, and test result showed 17 dB S/N for FM, and 17 dB SINAD on SSB, where specification is better than 12 dB. At low level signal input, audio output is not very high, but I found it adequate for my needs. The squelch control works on both FM and SSB, and worked fine. Like most receivers, this one has a few spurious responses, and they tuned at a different rate to the main signal except for image responses that tune normally.

The receiver is a conventional superheterodyne type with single conversion for SSB and double conversion for FM. First IF frequency is 10.695 MHz for both modes, and 455 kHz for FM. The RF amp is a 3SK114 dual gate FET, followed by a bipolar transistor mixer. After the mixer, the signal splits up and goes through a three stage amp for SSB, and then to a balanced demodulator. On FM the signal is mixed with a second local oscillator in an IC, and passes through two filters at 455 kHz, limited and then quadrature detected. A single IC is used for audio amplification.



Left side panel compared to a dollar coin.

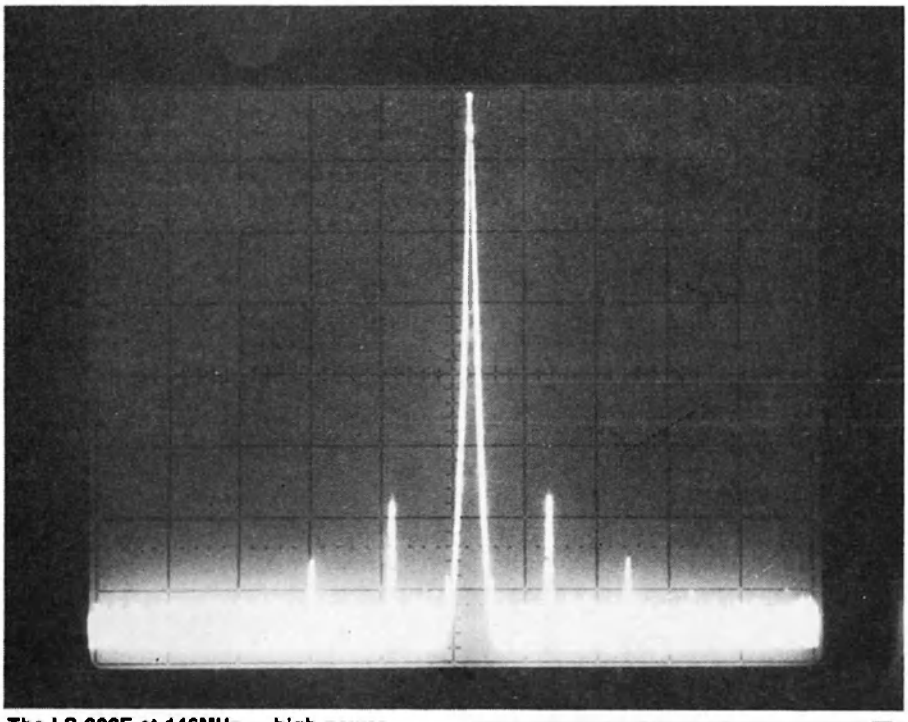
TRANSMITTER

On transmit, the SSB audio and 10.695 MHz carrier signals are fed to an IC balanced modulator, then to a crystal filter (same one as on receive), to eliminate the other sideband. From there it is heterodyned to the final frequency and amplified in several stages. For FM operation, the VCO is modulated, then mixed to final frequency and amplified as before.

This rig doesn't offer any frills such as scanning or memory facilities. If you want to tune around the band it must be done with the thumbwheel switches. On SSB that can be fairly hard, as to tune a segment of the band, you have to use a combination of thumbwheel switches, 5 kHz offset slide switch and VXO control. That can be somewhat frustrating, so I would suggest you tried leaving it on 144.1 MHz most of the time if you want to use SSB. That way you can establish a QSO on the calling frequency and then shift to another mutually agreeable frequency. On FM it is easier to tune around as most frequencies in use are about 50 kHz apart, but it is still easier to leave it on your favourite repeater.

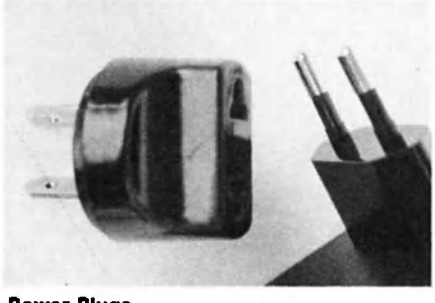
ANTENNA

The rubber ducky antenna supplied worked as well as any other I have tried, and put in adequate signals



The LS-202E at 146MHz — high power.

to several repeaters from the Box Hill area, and also from Mt Evelyn. I much prefer to use a real antenna on my rigs though. With the optional SH-1 speaker/microphone, the little rig can be hung on a belt with the belt clip, and only a light weight extra need be held. It's much easier to carry that way.



Power Plugs.

POWER

Now for power supplies. Belcom claim that maximum DC supply voltage is 12 volts. As such it should never be operated directly from a car battery or catastrophic rig failure may result. It runs on a nominal 9 volts, or for higher power operation 10.8 volts. The optional CA-110E AC charger supplied for the review was rated at 220 volts AC input, and had a non standard plug on it. As it is a plug pack type of supply, it needs an adaptor to fit it to Australian AC outlets. The charger tends to run a little warm, so it may have a limited life when run on 240 volts. The rig may be used while being charged.

OPERATIONAL BOOK

The instruction book seemed to say all that was necessary for normal use, except for the instructions that came with the SH-1 which were in Japanese, but operation is so simple as to not need interpretation.

CONCLUSIONS

This rig would seem to fit the bill for someone who wants a light weight multi mode two metre hand held, and doesn't mind not having scanning or memory functions like some of the FM only opposition. It does have shortcomings in its operation due to its type of

Belcom LS-202E
SSB&FM HANDY TRANSCEIVER
OPERATING MANUAL

frequency selection, but it can be very useful even so. It would be very useful for a traveller who likes to use both SSB and FM, but cannot find room for the larger multi mode rigs. Power and receiver sensitivity are adequate for most needs. I would suggest you try one and make up your own mind.

AR

VK3BFG RTTY — MORSE

Peter Cossins VK3BFG
14 Coleman Road, Wantirna South, Vic 3152

If you wish to relieve yourself of the old clanking Baudot machine in the amateur shack and you have a VDU or a quieter, more modern ASCII Teleprinter, on ASCII Keyboard and a Computer Lineprinter, this project may be of interest to you. It is not absolutely "state of the art" as far as microprocessor systems go but it works in both modes (Morse and RTTY) and is relatively cheap.

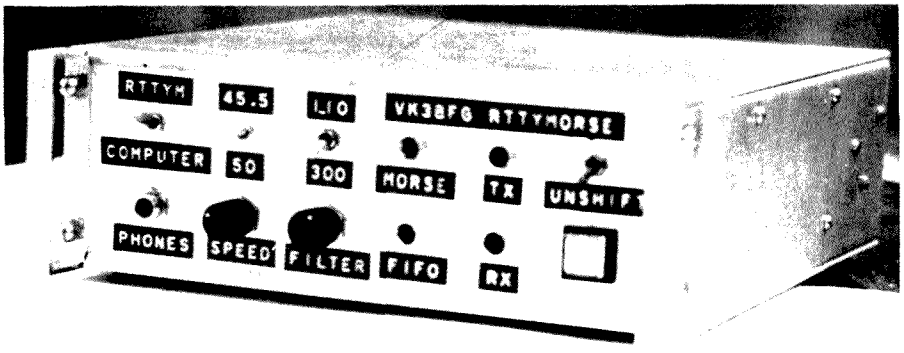
Programme continued p18



The design was dictated by the devices I could find in the junk box, as so often is the case, with equipment homebrewed by amatuers. If you wish to be more 'with it' the UART used in the design could be replaced by a more modern software programmable VIA. The software would need some minor adjustments to accommodate the new hardware lineup and obviously the printed circuit board layout would also need some surgery. There are a few Bytes of unused space in the ROM which could be used for additional keyboard control by the inclusion of appropriate routines within the software.

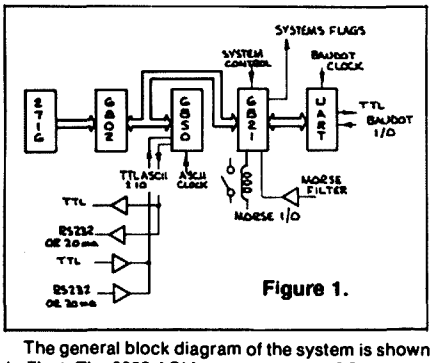


Figure 1.

The general block diagram of the system is shown in Fig 1. The 6850 ACIA accepts serial ASCII data at TTL level and is the interface between the VDU or ASCII teleprinter and the microprocessor. The 6821 PIA is used for control and flag functions in both the RTTY and Morse modes and also drives the UART in the RTTY mode. The UART performs the parallel to serial and serial to parallel conversion of the Baudot data.

The 2716 ROM contains the control software for the whole system and the 6802 is the microprocessor with 128 Bytes of on-board RAM. 555 clocks were used for both the Baudot and ASCII ports; again the junk box rules. Other clock systems can be used if you wish a wider selection of code speeds.

The software is a conglomerate of self written, re-assembled and modified routines from amateur sources.

In particular, the very clever ASCII-Baudot look-up tables originated from Ken Palliser VK3GJ as written for the RTTY repeater in Melbourne. A complete listing of software and associated flowcharts are provided for those who wish to hand load a ROM or conduct modifications to suit their own particular application.

I am prepared to programme 2716 ROMs if you send me a clean 2716 and a suitable SAE or jiffy bag for return mail. As the software can accommodate a variety of line formats you should also indicate the number of characters in a line in your system. I can also 'customise' the ROM with your own name if required.

The wiring of the system requires normal good soldering techniques but is fairly non-critical, but of course like all computers there is quite a lot of it to be done if you decide to use veroboard or similar. I have not included the microprocessor system wiring in this article so if you decide to go that way you need to be

20mA — RS232 Interface.

familiar with 6800 systems or find someone who can *fill in the details*'.

I recommend using the printed circuit board as provided as this leaves little source for error. My unit was actually wired on a micro-system prototype board but working units have been made using the final layout so it is not unproven. Note that the layout is positive and hence could be used as a photocopy transparency master for use with positive resist available from your local hobby shop.

Talking of printed circuit boards, Keith Haslam of Eastern Communications has a few available that he has populated. Give Keith a call if you are interested and if there is sufficient demand Keith may be able to supply PCBs only as well.

Full size PCB Layout on page 26.

PLEASE NOTE

Some PIAs exhibit faulty reading of the CA2 line; which is used to indicate Baudot data is ready for transfer to the 6821 from the UART. A modification is shown on the circuit diagram using a spare gate on the board. Cut the track between pin 6 of the appropriate 7400 and pin 39 of the PIA: Rewire as shown and all should be well.

FRONT PANEL MODES AND OPERATION

1 45.5/50 Baudot speed select. For amateur operation select 45.5. For commercial RTTY select 50.
2 110/300 ASCII speed selection is dependent on the VDU or teleprinter used. Other speeds are possible by suitable modification to the ASCII clocks on the board.
3 SPEED — Controls the speed of Morse in the transmit mode.
4 FILTER — Selects the 200 Hz, 40 Hz or processed CW audio from the receiver.
5 PHONES — Headphone output for tuning Morse.
6 MORSE LED — Output indicating correct tuning of the receiver for Morse.
7 FIFO LED — Output indicating storage buffer full. (This is also printed out on the VDU or ASCII teleprinter.)
8 TX LED — Output indicating transmit mode in both RTTY and Morse.
9 RX LED — Output indicating receive mode in both RTTY and Morse.
10 UNSHIFT — Controls the selection of unshift on space in the RTTY mode. Normally I leave this on.

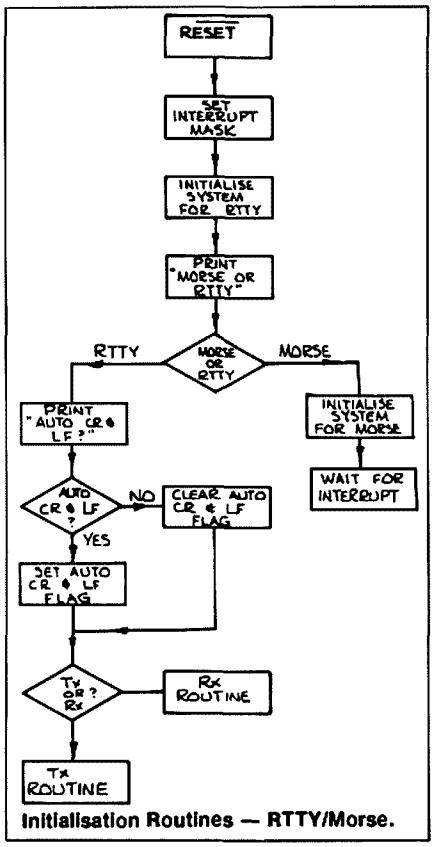
KEYBOARD OPERATION

The unit will automatically initialise when the power is switched on. Providing the ASCII clock is correct, the system will print 'VK3BFGRTTYMORSE' and then the question 'MORSE OR RTTY?'

There are only two valid responses.

Type the letter M — the system will initialise into the Morse mode and the VDU or teleprinter will print 'READY'.

In this mode the unit is automatically in receive but will go to transmit if any valid key is depressed. There are a number of ASCII codes that have no equivalent in Morse. If any of these keys are depressed the print will be an ASCII 'hash' and the system will remain in the receive mode. The unit is therefore set up for full break in operation for Morse code.



Initialisation Routines — RTTY/Morse.

Tuning of the receiver is quite critical. Listen on the headphones in the 200 Hz position of the filter switch. Centre the tuning and repeat in the 40 Hz and processed positions. The processed audio is a hard tone and with a little bit of practice you can recognise when the tuning is correct. Like all computer Morse receivers the accuracy of the print out is dependent on the quality of the Morse sent.

Type the letter R — the system will print out the question 'AUTO CR AND LF?' Again there are only two valid responses.

Type the letter Y — the system will automatically send CR and LF to you and the receiving station.

Type the letter N — the system will send CR and LF when those keys are depressed on your VDU or teleprinter.

In both modes any invalid response will simply cause a repeat of the previous printout.

Transmit and receive in the RTTY mode is *controlled* by a switch in my modem to pin 7 of the 6821 in the RTTYMORSE unit.

If you are starting from scratch there is no reason why the RTTYMORSE unit and the modem should not be in the same box.

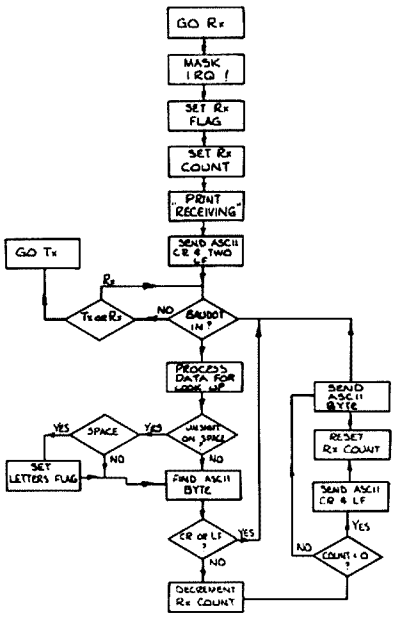
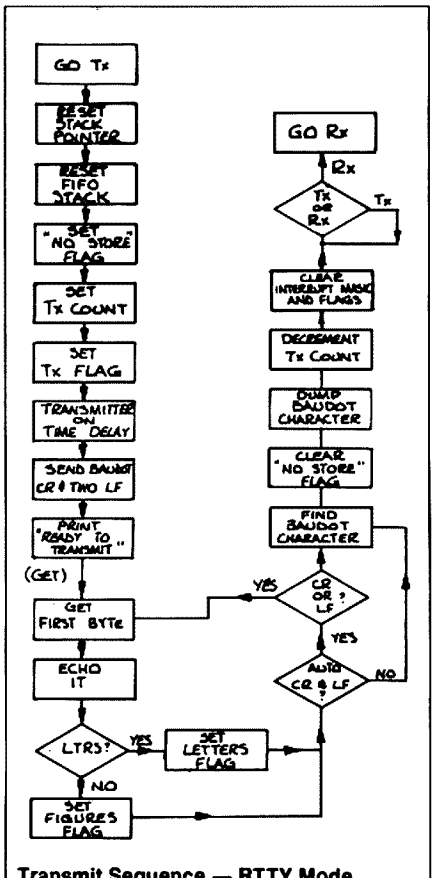
Programme continued p22



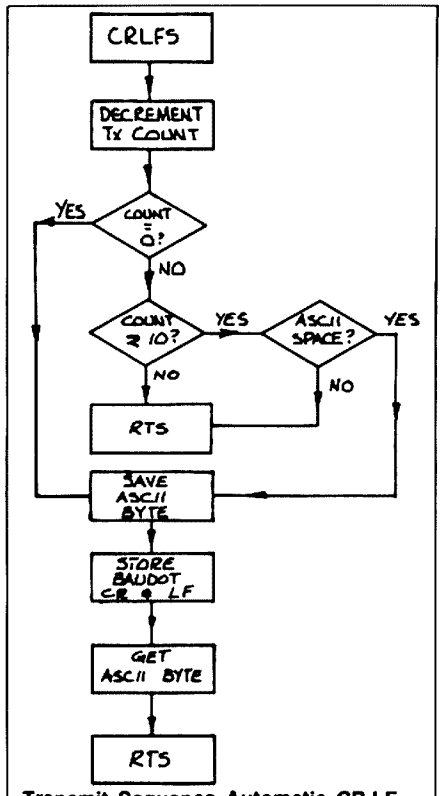
Receive Sequence — RTTY Mode.



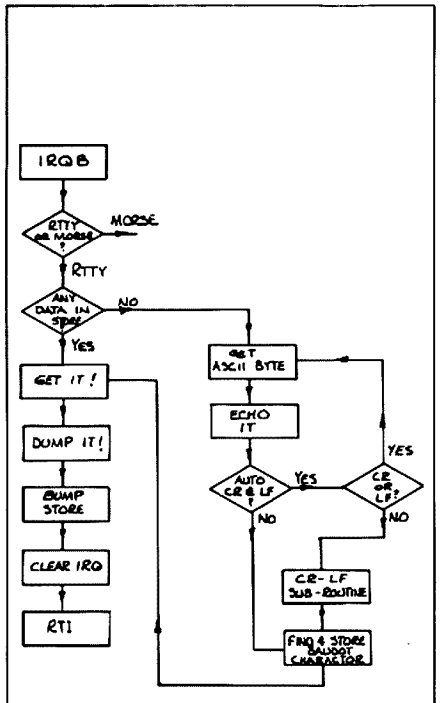
Transmit Sequence — RTTY Mode.

A short delay from receive to transmit is in-built in the system.

During this time the transmit key line will be active and an automatic CR and LF sent. 'READY TO TRANSMIT' and 'RECEIVING' printouts assist the operator.



Transmit Sequence Automatic CR-LF Subroutine — RTTY Mode.



Transmit Sequence IRQB Request — RTTY Mode.

Continued p23

VK3BFG RTTY — MORSE

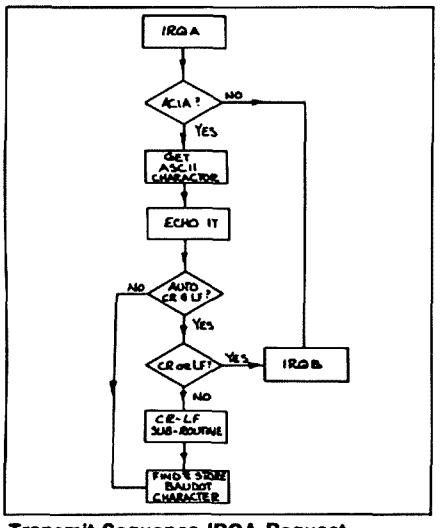
Programme continued p24



Transmit Sequence IRQA Request — RTTY Mode.

ADJUSTMENT OF CLOCKS

As described the RTTYMORSE is self booting and is controlled by subsequent keyboard entries. The only set-up adjustment needed is the 555 clocks.

Using a frequency counter on pin 3 of each respective 555, adjust the ten turn potentiometer as follows —
45.5 Baud — 728 Hz
50 Baud — 800 Hz
110 Baud — 1760 Hz
300 Baud — 4800 Hz
in all cases sixteen times the required Baud rate.

Well, that's about it. I would be happy to answer any queries that you may have but unfortunately I cannot supply printed circuit boards for the project.

73 DE VK3BFG SK SK

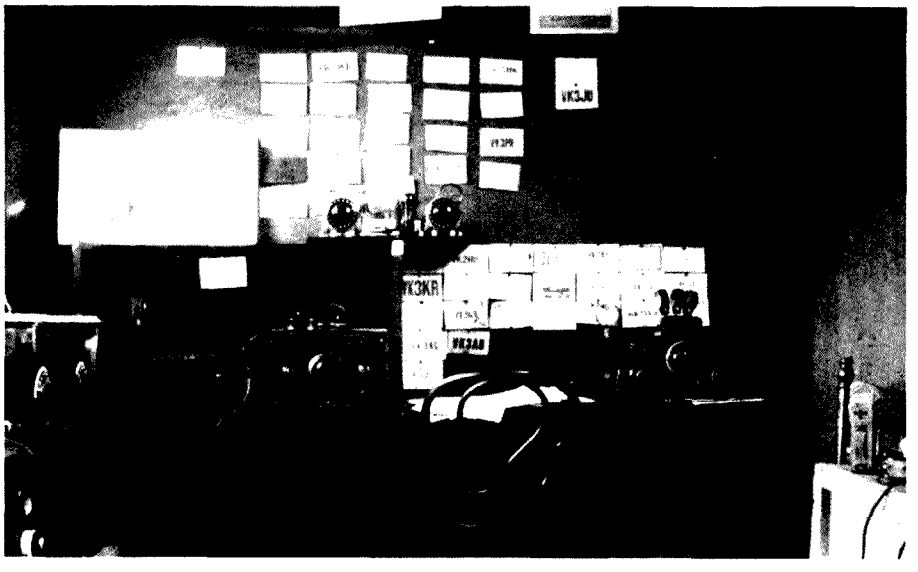
1 Editor's Note
These include address/data and control lines as well as the microprocessor and ROM. They are shown in Fig 1 but not on the schematic.

Schematic Diagram on page 25. Full size printed circuit board layout on page 26.

THUMBNAIL SKETCHES



STAN TONKIN VK5SG ex VK2SG

Stan's licence was issued in June 1929. He held the call sign VK2SG from 1929-1955 when he became VK5SG — a call he still holds today.

His working life was completely involved in radio —1931 at 2AY, Albury, 1933 International Radio Company in Sydney, 1934 2UW Sydney, 1936 2LM Lismore, 1941-48 was spent working for AWA in different positions and from 1955 to retirement in 1975 Stan was at EMI Electronics in SA.

The equipment at Stans station in 1930 consisted of L to R: Power supply, Hartley Oscillator (25W) and modulator, ATU, wet receiver HT battery, receiver regen detector, TPTG oscillator — Ross Hull QST version, long wave receiver detector and an audio amplifier.

Stan is still operational today using an FT290R and an FT101Z.

Great reasons to buy your

YAESU

from

DICK SMITH ELECTRONICS PTY LTD

(1) **We guarantee to match any genuine*, advertised price on Yaesu Amateur Radio products.**
*Offer applies only where the advert is current and where the advertiser has the goods in stock and is prepared to sell them at the advertised price.

(2) **You could win a UHF repeater for your club – AND an HF or VHF/UHF station for yourself! Full details from your nearest Dick Smith Electronics store.**

AND CHECK OUT THE NEW HAND HELDS FT-209R/RH: THE ULTIMATE!

Brand new from Yaesu – with everything you could ever want in a hand-held. Combining the best features of all the previous Yaesu hand-helds, giving you such things as:

- **Push button entry**
- **Huge LCD multi-message display**
- **10 memories**
- **Full scanning or memory scanning**
- **VOX facilities (with optional headset)**
- **Slip-on battery packs for instant change**
- **Memory and parameter retention**
- **Choice of power outputs and battery packs**

Check them out soon at your nearest Dick Smith Electronics Ham Shack (other Dick Smith stores can obtain within a couple of days).

FNB-4 battery shown not included in basic price.

WHICH COMBINATION?

Choose the battery you require for the power output you want!	Model No	Battery Pack	Power O/P
	FT209R	FNB-3	2.7W
	FT209R	FNB-4	3.7W
	FT209RH	FNB-3	3.7W
	FT209RH	FNB-4	5W

FT209R Cat D-3502 **$359.00**

FT-209RH Cat D-3503 **$399.00**

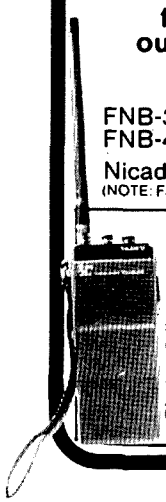
FNB-3 NiCad (10.8V, 450mAh) Cat D-3506 $59.00
FNB-4 NiCad (12V, 500mAh) Cat D-3507 $69.00
Nicad Charger (trickle charge only) Cat M-9517 $12.95
(NOTE: Fast charger available shortly – or roll your own! 2.5mm socket fitted to NiCad pack)

DICK SMITH ELECTRONICS PTY LTD

Complete range of Yaesu products stocked in all Dick Smith Electronics HAM SHACKS

● Sydney: 125 York St 267 9111 ● Sydney: Bridge St 27 5051 ● Chatswood: Chatswood Chase 411 1955 ● Gore Hill: 162 Pacific Hwy 439 5311 ● Gosford: 315 Mann St 25 0235 ● Melbourne: 291-293 Elizabeth St 67 9834 ● Richmond: Bridge Rd 428 1614 ● Springvale: Springvale & Dandenong Rds 547 0522 ● Brisbane: Buranda, 166 Logan Rd 391 6233 ● Townsville: Ingham Rd & Cowley St West End 72 5722 ● Toowoomba: Bowen & Ruthven Sts 38 4300 ● Adelaide: Wright & Market Sts 212 1962 ● Perth: William St & Robinson Ave 328 6944 ● Cannington: Wharf St & Albany hwy 451 8666 ● Hobart: 25 Barrack St 31 0800

(All other Dick Smith stores carry some Yaesu products, but will be able to obtain others for you at short notice).



OR TRY THE FT-203 ECONOMY 2m HAND-HELD!

Everything you ever needed – in a real economy workhorse. Thumbwheel switches for instant frequency setting, supplied complete with FNB-3 battery & charger, (FNB-4 is optional), even includes VOX with optional headset!
Ideal to throw in the briefcase or suitcase when travelling: just 35 x 50 x 160mm!
Cat D-3500 **$299.00**

VICTORIA'S 150TH ANNIVERSARY CONTEST

Chris Dimitrijevic VK3FY,
SECRETARY,
South Pacific Contest Club,
21 Belmont Avenue, Keilor Downs, Vic. 3038.

A unique contest, as part of amateur radio's involvement in the 150th anniversary of European settlement in Victoria, will be held this month. It's the first Australian contest to use the Maidenhead Locator System — a system fully explained later in this article.

The contest has been registered on the Victoria 150th Anniversary Committee official calendar of events and is being conducted by the South Pacific Contest Club VK3EZ — a member club of the WIA, Victorian Division.

RULES

1 *Contest period: 24 hours from* 0100UTC 26 January, to 0100UTC 27 January.
2 Bands: Australian novice segments of 80, 15, and 10 metres. All of 6 and 2 metres.
3 Mode: All modes permitted within individual amateur station licence conditions.
4 Classifications:
Novice
Limited
Single (fullcall, combined)
Multi-Operator/Single Transmitter
Multi-Operator/Multi-Transmitter
Shortwave Listener
5 Exchange: RS(T) plus Maidenhead Grid Location.
6 Restrictions:
a) No cross mode permitted.
b) No cross band allowed, exception satellite contacts.
c) Except Multi-Multi, transmitting more than one signal at the same time including cases of different bands is not permitted.
d) Points and Multipliers: Points: A required exchange with another Australian station will score one point. Multipliers: The number of different Australian grid locations worked on each band.
7 Scoring: The sum of contact points on each band, multiplied by the sum of multipliers on each band.
8 Summary and Log Sheets:
a) All times in UTC.
b) Indicate clearly all new multipliers worked on each band.
c) Use separate log sheets for each band.
d) A photograph of you operating during the contest, as well as your comments about the contest would be appreciated, but are not compulsory.
9 Awards:
a) High scores in each classification will receive a trophy.
b) Special award for the most exotic activated grid location.
10 Reporting:
a) Submit a summary and logs for one classification only.
b) Both log and summary must be postmarked no later than 27 February, 1985.
c) Send logs to: *South Pacific Contest Club, Contest Manager, 18 Jones Street, Thornbury, Vic. 3071.*
11 Disqualification:
a) Violation of contest rules.
b) False statement of report.
c) Taking points from duplicate contacts on the same band in excess of two percent of the total.
12 Announcement of Results: This will be done in November 1985. to coincide with the conclusion of Victoria 150 celebrations. Each entrant must abide by the decisions of the contest committee, which is final.

MAIDENHEAD LOCATORS FOR AUSTRALIA

The locator system is in use overseas and can be applied to field days, contests and awards.

Basically the system is based on breaking the world up into 324 major locators, these are of 20 degrees longitude and 10 degrees latitude with each being represented by two letters.

Within each major locator are 100 sub-locators, each numbered from 00-99. The sub-locators are of two degrees longitude and one degree latitude in size.

To give a clearer understanding of this concept a map of Australia is shown with all its major locators marked, and one major locator with its sub-locators.

Determining a Maidenhead Locator can be done in two easy steps. First find out the co-ordinates of your QTH, they should be available through the local municipal council. Then refer to the Maidenhead Co-ordinates Tables shown — and you're ready for the Victoria's 150th Anniversary Contest.

As an exercise let's pick some co-ordinates — longitude 137 degrees 56 minutes and latitude 26 degrees 37 minutes.

REFER TO THE CO-ORDINATES TABLES:

First part of locator: The main longitude location we find 137 lies between 120 degrees and 139 degrees 59 minutes, 59 seconds. First character is therefore P.

Second part of locator: The latitude in whole degrees is read. We find 26 degrees lies between 20 degrees and 29 degrees 59 minutes 59 seconds. Second character is G. Now we have the main locator of PG.

Third part of locator: The longitude is taken again, only the whole degree is required, giving the number 8.

Fourth part of locator: The latitude is now used, but this time only the second whole digit is used. In our example this is 6, which gives us the fourth part of the locator 3. Result: Mainhead Locator PG83. **AR**

HAMVENTION 1984

Ken McLachlan VK3AH
PO Box 39, Mooroolbark, Vic. 3138

Ballarat "Hamvention" 1984, held on the 10th and 11th of November was a success, a success which will stay in the minds of all those who attended for a long time to come.

Enroute to the venue the road was distinctly marked and backed up by directions on the local repeater and a nominated frequency on 80 metres. On arrival, ample and safe parking was available with explicit directions indicating where to find the registration desk, commercial displays and refreshments. From being greeted with a sincere welcome, organisation was spot on from registration to the end of the week-end.

Over pre-dinner drinks many old friendships and new acquaintances were made. After the serving of a sumptuous meal to the tunes from a talented organist, the 90 odd guests were treated to a very lively and humourous talk by a local barrister with many years experience representing the locals in times of trouble. Laughter at times drowned out the heavy thunder-storm overhead.

Paul VK3BW'C — organist.

Dancing and reminiscing carried on to the hours that some would like to forget, considering that in a few hours many events like scrambles, sniffer and fox hunts were to be decided.

Stan VK3BSR, proprietor of Bail Electronics, chats to Bill VK3PAL, whilst Bert VK3BH looks at the equipment.

Preparing for one of the Fox Hunts. This VK5 vehicle, and occupants, was a winner.

The many trade displays were stocked with the latest equipment, brochures and were beseiged by interested customers regarding state of the art developments and trends the hobby is taking.

There was always something to do. The barbecue lunch was excellent and prior to the presentations and trip home the estimated gathering of 250 were treated to a very filling afternoon tea.

Greg VK5ZGY and Geoff VK3ADB enjoy a quiet natter. Geoff is the President of the Ballarat ARC.

Tom VK5EE, David VK5FF and Greg VK5ZGY check out a trade exhibit.

The general opinion of many of the visitors I chatted with was that it was one of the best they had visited anywhere and, in my book, it had a five star rating.

Maurie VK3XEX checks over his home brew power supply prior to judging.

Many of the prizes went to the Mount Gambier group and a friendly challenge was issued to attend their attraction next year and win them back. The "Home Brew" competition was won by Maurie VK3XEX with work that could be attributed to a perfectionist.

Brian VK3KQB.

The committee must be applauded for the success of the social-hobby get together but they cannot accept all the accolades. The small, but extremely effective, newly formed Ladies Auxiliary are to be congratulated in supporting their partners hobby and making the event such a success.

Congratulations to all and I, like others, are already looking forward to next year's "Hamvention".

AR

HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

The prelude to start this column has been kindly written by Ivor VK3XB. Ivor and his XYL Mavis VK3KS are known world wide for their amateur activities particularly in the CW sections of the bands.

I had the pleasure of interviewing this charming couple recently on Feedback, an amateur radio orientated programme broadcast fortnightly on 3RPH, "Radio for the Print Handicapped" and it was only then that I found out some of the accomplishments of this happy duo.

Ivor licenced in 1934, has attained many honours from the hobby including being the winner of many world wide contests, the first winner of the Australian Contest Trophy (and a few thereafter) and being made a Life Member of the WIA, to name but a few.

Ivor in his profession with the Education Department attained the position of Principal before his retirement. He has always had and made time to put something back into the hobby he so much enjoys. He had the onerous task of being Outwards QSL Manager for some fourteen years and has taken an extreme interest in Intruder Watching, a facet of the hobby that is so important but often overlooked or taken for granted.

DXING OVER THE YEARS

Long distance communication has been the aim of amateur radio right from the very beginning. We can go back to the Trans-Atlantic tests of 1903. Marconi considered himself "only an amateur", and with him we must group Godley and many others. Their aim was DX though they did not call it such. Their enthusiasm fired the imagination of thousands of would be experimenters, and amateur radio was born.

On 110 metres in 1923, American amateurs achieved their first exciting DX. In Australia, our first real DXer was Max Howden VK3BQ, whose exploits have already been most capably handled by Max Hull VK3ZS in his story appearing in a recent issue of "Amateur Radio".

Comparatively isolated though Australia was, her amateurs, favored by a very friendly administration, soon established themselves as an internationally recognised body. As has often been mentioned by reminiscing amateurs, transmitting and receiving equipment in the twenties and thirties was practically all home built, most amateurs running less than 25 watts input which was the legal limit. As for receivers, the ownership of a Hammarlund or a Hallicrafters receiver was so unique that all Australia knew about the affluent possessor.

I started on .6 of a watt, but by 1936 had 7 watts to a pair of Type 19 two volt battery tubes, and was working DX regularly using a 7 wavelength aside vee beam. Other country amateurs also had huge vee beams or rhombics but metropolitan amateurs were restricted to end or centre fed Zepps or a single wire fed Hertz, until, a few years later, the Yagi surfaced and revolutionized DXing from the city. All manner of wire beams appeared.

In the thirties, CW operation predominated, but phone operators invariably answered anyone calling them on CW. What a contrast today! Crystal control was regarded as the ultimate in efficiency, but the TPTG was very popular. Calls on CW were longer and made in a more leisurely fashion. Answering on the other station's frequency occurred more by accident than plan. A South American calling "CQ DX" would have a number of stations responding anywhere in the band. By those suitably equipped, "Now try phone here" was the logical follow on from receiving a 579 report on CW.

The ARRL Worked All Continents Certificate was the goal of nearly every amateur. Though requiring only six contacts, the difficulty in gaining a South American contact in those times was such that the phrase, "Hooray, WAC at last" often hit the ether. After WAC came a further and often seemingly unattainable goal, the ARRL DXCC. Aids to gaining this were participation in the BERU Contest, begun in 1931, and later, thanks to Bob Cunningham VK3ML, the Centenary DX Contest and the VK/ZL Contest that followed. In Victoria, the Bureau, managed by Ray Jones VK3RJ, was almost exclusively the route for QSL card exchange.

While 10 metres already had its devotees, Clarry Castle VK5KL, being the first VK to gain WAC on that band, 20 metres was then, as now, the chief DX band. The presence of an "American Phone Band" determined where everyone else would be. In the thirties, this tract of howling heterodynes was located in the middle of the band. Hence the rest of the world was forced to sit on either side, the CW operators gathering on the high frequency end and the AM phone operators on the low frequency end, those of the latter who desired to contact American phones tending to cluster close to the phone boundary and tune inside for replies. But, after the war ended, amateurs world wide discovered the "American Phone Band" now on the high frequency half with the first SSB stations venturing in near the edge, and gradually creeping down. So the world's CW operators were now on the low frequency end. The much vaunted crystal controlled rigs gradually disappeared as Clapp VFOs came in. Now, calling the DX station on his or her own frequency saw the advent of a new phenomenon, the dogpile. And a valuable by-product of wartime communications development, the propagation chart now told us when to expect the DX. In Australia, commercially made equipment appeared; the Geloso and Eddystone gear comes readily to mind. A new incentive to DX chasing was provided when, in May 1948, the WIA instituted its own DXCC, and Bill Mitchell VK3UM, secretary of the Federal Awards Committee signified that Ron Tandy VK3KX would receive Certificate Number 1.

Through this period, our legal power was gradually being raised, and true transmitting valves became common in all transmitters. By 1950, SSB operation was well established. The six feet high and one and a half feet wide rack and panel rigs were disappearing. With the commercially produced compact transmitters rendering portable operation easier, the era of the DXpedition began, two of the first exponents being Dick McKercher and Danny Weil, followed by Gus Browning and Don Miller and many others. Competition for the exotic contacts became fierce and the standard of operating rose tremendously. After the dogpiles came the "tail ending techniques" and then the "QSX up" procedure. With QSL managers proliferating, and the race for DX credits almost frantic, the use of IRCs, CRCs and "green stamps" became established procedure for quicker return of cards.

For phone stations, the next innovation was "List working" with a "Master of Ceremonies", and this was followed by DX Nets, all of which were a boon to the less affluent amateur with modest equipment. Such are now well established. While some net controls meticulously observe dignity and correctness coupled with speed, others in their enthusiasm hand out too much information so that the wanted DX station knows practically everything before the person on the list has even made a transmission. In the case of some overseas controls, (but not Australian I am glad to note), the prompting and leading makes contacts rather too easy.

To sum up. Prewar, all operators gained their DX contacts on their comparatively simple gear by patience and perseverence alone. Postwar, with the tremendous rise in the amateur population and the ready availability of commercial equipment embodying striking scientific advances, accommodation pressures have given rise to the need for the techniques and aids already mentioned. But the CW operators still retain a nostalgic link with the past and continue to display a facet of the old amateur radio, gaining thereby the satisfaction of doing it by themselves.

I sincerely thank you Ivor, on behalf of all the readers, for a very interesting contribution to commence this column in 1985, the 75th Anniversary of our Society, and trust that during the forthcoming years you and your XYL Mavis will still continue to enjoy the hobby you both love so much.

NAME CHANGE

The country of Upper Volta, with the prefix of XT, has changed its name to Bourkina Fasso. The native translation of this unusual name means "Land of the Upright Men". Many DXers would like to see more upright operational antennas with signals eminating from them.

BHUTAN

Pradhan A51PN, is definitely not active, and it appears his call may have been pirated from time to time from reports received. Meanwhile A5 is climbing the much wanted ladder caused by newcomers that are either newly licenced or have caught the DX bug.

Pradhan, is a radio engineer by profession, employed by the government in the communications field. His main responsibility lies in the maintenance of some of the forty odd broadcast stations that are scattered around the undulating land east of the Himalayan mountains. At best there is little time for the hobby.

A recent business visit by Seiji JH1WXH to Bhutan allowed some operating with oral permission but no written documentation was available as foreign amateurs are not allowed to hold an A5 licence under the present operating regulations. This may change within the next few years.

Seiji, left a new FT-757GX in Thimbu for Pradhan. The question is now whether Pradhan, when in the capital, will make time to try the new rig out.

THE GLOBETROTTING COLVIN'S

Lloyd and Iris, the couple that have made nearly a million QSO's to their credit and received close to half a million alphabetically indexed cards which weigh over 5000 kilogrammes have jaunted over to the south of Africa until late March. They hope to activate a number of the unusual countries in that area but nothing is guaranteed.

SAN FELIX ISLAND

The operators returned safe and well, with the logs. The Club's aim was to commence posting QSL cards from the first week of last month. Perhaps many DXers have received their Christmas surprise already!

BANGLADESH

At present there are a number of JA amateurs working on radio communications in the country. The licences of S21JA, DX and FT have been issued for "testing" purposes and are not to be used for any DX working. This is strange as reports over the last

couple of years indicated that the licensing authority was relaxing some of their rigid conditions.

It is believed that negotiations to the authorities, in conjunction with the Bangladesh Amateur Radio League are still continuing for the allowance of nationals and foreigners to obtain full operating privileges.

CAUGHT BY THE CAMERA

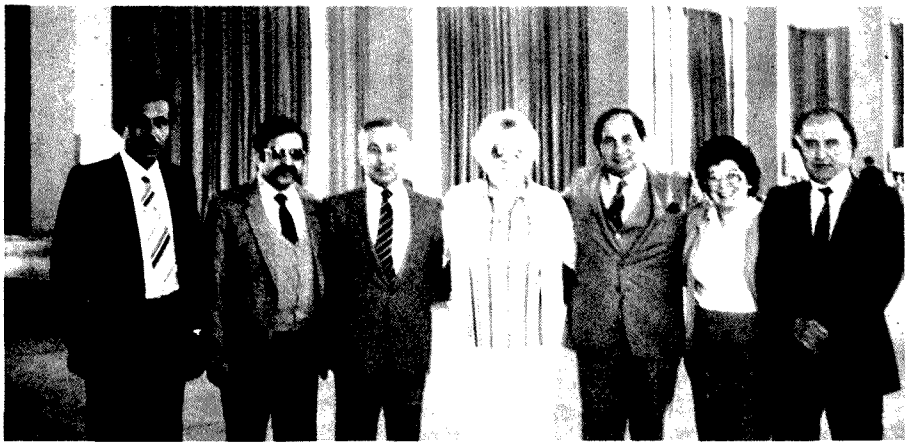
Photographs of Jordanian amateurs are hard to come by but this happy picture was taken when Mary Ann WA3HUP/JY9AA and Ruthanna WB3CQN/JY4CQ, both WIA members visited Amman early last year.

SOMALIA

It is believed that Marti OH2BH, has his credentials signed by the president for an operation to commence from T5 in the near future. Any operation from this area causes extreme interest and with Marti operating and at the helm re QSLing it would be a must.

BEEN THERE — DONE THAT!

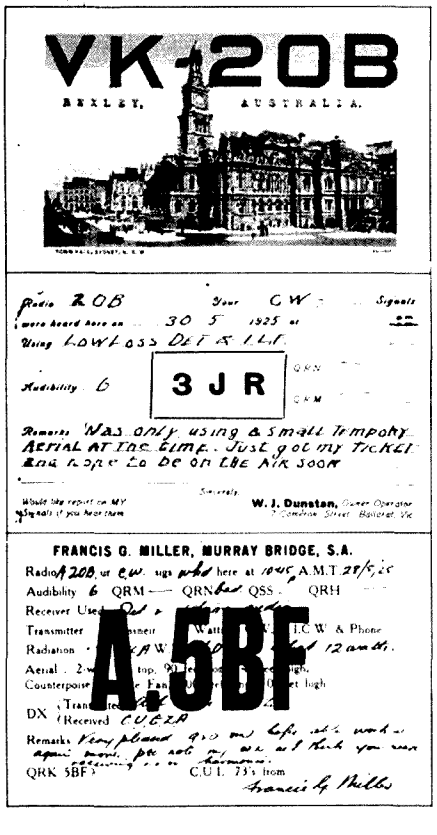
Sao Tome, a much wanted country was activated. Those that were waiting for Craig WB7RFA to sign S9 were confronted by a whistle stop of a few hours by PS7ABT/S9 who worked some European, JA and North American stations (which you could count on one hand).



From L to R Ibrahim JY4MB, Mohammed JY5ZM, Dr Zuheir JY5ZM, Ruthanna, His Royal Highness Prince Raad JY2RZ (Chairman of the Royal Jordanian Amateur Society), Mary Ann and Zedan JY3ZH (Conroller of the Arabian Knights Net).

CARDS OF YESTERYEAR

Again, some more cards of yesteryear which belonged to the late Lionel Mashmen VK2OB and have been kindly forwarded by Arthur VK2JM. All cards are from the 1925 era.



At the time of writing, no further information is avialable on Craig's whereabouts who is visiting the country on a contract to design new postage stamps for the authorities. All I require is good propagation and one minute of the time of a genuine operator in this much wanted country. What a start to the new year that would be!

KEEP AN EAR OUT FOB —

Over the New Year break it would pay to keep an eye out for Pradhan A51PN with his new rig. AX0PB operational in the Antarctic, VP8ASO on a quick trip to South Sandwich territory which may pre-empt a longer stay, Dr Sid ST2SA mobile on his "house" calls and anything that sounds like 3Y.

9L1CISV

This unusual call sign is from a special events station at the Childrens International Summer Village Camp in Freetown and is sponsored by the Sierra Leone Amateur Radio Society. QSL to Cassandra 9L1YL.

TWO AMATEURS IN SPACE

Tony W0ORE and John W4NYZ are expected to board Shuttle Mission 51F which is due for launch on the 17th April this year. The query is will they be taking any amateur equipment?

ZS/S4/S8/V9

A nice collection and Dave WA2HZR hoped to actuate the areas of Venda V9, Transkei S8, Ciskei S4 and ZS0 during late November and early December last year. OSL to WA2HZR, PO Box 592, Mexico, NY 13114 USA.

THE USE OF VI3WI

It was a pleasure to do a little operating instead of listening all the time and the use of VI3WI allowed me to catch up with a lot of old friends.

The bands were kind from fifteen metres down and with the help of voluntary list takers in Europe which allowed me to overcome the lower Mediterranian QRM, I was fortunate to have 700 contacts and snare over 60 countries in the 20 hours that the rig was actuated by me on the 1st and 2nd of November.

Net controllers greeted me like a long lost friend, the "dog piles" were music to ones ears and one was pounced upon when calling CQ after asking if the frequency was clear. At one time I operated in the Novice segment of fifteen metres, to give them a chance at the commemorative prefix, then I began to feel guilty when propagation opened to Europe but I trust the spill over of activity allowed a few to work some new countries. If the ploy did not gel, apologies boys and girls.

All QSL's for VI3WI are either via the bureau or direct to VK3WI as per the call book address.

IDENTIFICATION OF BY CALL AREAS

The People's Republic of China licensing authorities have allocated blocks of call signs to the following areas as below. This will allow easier identification as more stations become active.

BY1AA — BY1ZZZ Beijing
BY2AA — BY2IZZ Hei Long Jian
BY2JA — BY2OZZ Jilin
BY2RA — BY2ZZZ Liaoning
BY3AA — BY3FZZ Tianjin
BY3GA — BY3LZZ Nei Mongol Z
BY3MA — BY3SZZ Hebei
BY3TA — BY3ZZZ Shanxi
BY4AA — BY4IZZ Shanghai
BY4JA — BY4QZZ Shandong
BY8AA — BY8IZZ Sichuan
BY8JA — BY8QZZ Guizhou
BY8RA — BY8ZZZ Yunnan
BY9AA — BY9FZZ Ningxia
BY9GA — BY9LZZ Quinghai
BY9MA — BY9SZZ Shaanxi
BY9TA — BY9ZZZ Gansu
BY0AA — BY0MZZ Xinjian
BY0NA — BY0ZZZ Xizang
BY4RA — BY4ZZZ Jiangsu
BY5AA — BY5IZZ Zhejian
BY5JA — BY5QZZ Jiangxi
BY5RA — BY5ZZZ Fuzian
BY6AA — BY6IZZ Henan
BY6JA — BY6QZZ Anhui
BY6RA — BY6ZZZ Hubei
BY7AA — BY7IZZ Hunan
BY7JA — BY7QZZ Guanxi
BY7RA — BY7ZZZ Guangdon

BITS AND PIECES

Dave ZL1AMM and Aola ZL1ALE back home and around the bands after a world trip. **Another tripper and contributor to this column back in VK is Eric L30042. **VK0AK a licenced YL is active from Mawson Base in the Antarctice. QSL to VK2DEJ. **FT8 looks to be the new prefix for Kerguelen. **4K1CEY is located in the Antarctic. **6D1FIC was a special event station in Mexico. QSL to K9AUB. **More BY stations will appear early this year. **The query re 4K1H Russkaya Base has been answered. The base which has been in operation since 1979 is located at 80 S and 105 W. (Thanks Bob W5KNE).

MORE CHANGES

The French Authorities, as from the first of this month, have implemented their new prefix structure for the five classes of licence designated A through to E. Visitors will not be issued with a French call under the new system but will sign F/their home call.

Class A and C licences are issued for VHF and UHF only. Class B licensees will have VHF privileges plus certain CW segments in the 7, 14, 21 and SSB plus CW on the 28 MHz bands.

Class D and E are fully privileged to use all bands, the E being for amateurs that have held a D rating for three years.

The F part of the prefix will remain in mainland France with the licence class added. For example all F2, F3, F5, F8 and some F6 licences will become FE2, FE3, FE5, FE8 and FE9 respectively. Other F6 operators with less than 3 years experience will become FD6XYZ etc.

Corsica has already changed from FC to TK and the French Antarctic and associated islands have changed from FB to FT. Other stations outside of continental France will be indicated with a number 1 through to 5 to indicate the class of licence in the prefix.

Confusing? Yes, but apparently the suffixes will remain the same and recognition of old friends should not be so hard. To appreciate the difference and confusion one could listen between 14.100 to 14.120 MHz, where the French operators congregate.

The commercial enterprises that produce QSL cards in that country must be clapping their hands for the chance of the extra Christmas work that they received.

WILLIS ISLAND

Willis Island is presently being activated by Peter VK9ZR on all bands, including 6 metres, after the changeover from Andy VK9ZA, last month.

Peter has had extensive experience of amateur operations at various meteorological stations including stints at Mawson Base and Macquarie Island, where he held the callsign VK0AP.

Gil VK3AUI kindly arranged for an EPROM to be programmed with Peter's new call for the manned 6 metre beacon.

QSLs either direct or via the bureau will be handled by Jill VK6YL.

THANKS

Sincere thanks go to the following. The Editors of weekly, bi-weekly and monthly newsletters including the ARRL NEWSLETTER, RSGB DX NEWS, ORZ DX, LONG SKIP, DX FAMILY FOUNDATION NEWSLETTER, JAN and JAY O'BRIEN'S OSL MANAGER LIST and KH6BZF REPORTS. Magazines including CQ, cqDX, QST, RADCOM, JARL NEWS, KARL NEWS, OZ, JARL NEWS, REGION 1 NEWS, WORLD RADIO, 73, BREAK IN and VERON.

Members who have contributed include VKs 2JM, 3FR, KS, XB, YJ, YL, 4BHJ, 6NE, 9ZA and G3NBC. Overseas amateurs include G1EOD, I8SAT and W5KNE. Sincere thanks and a happy and prosperous New Year to one and all.

160 METRES IN THE NETHERLANDS

Since June 1984 the part of the 160 m band allocated to radio amateurs has been expanded to 1.825-1.850 MHz.

The following restrictions have to be observed:

1 1.825-1.835 MHz

(a) modes of transmission:

200HA1A	*2K20A2A*	*3K00R3E*	*1K20F1A*
200HA1B	*2K20A2B*	*3K00J3E*	*1K20F1B*
		3K00H3E	

(b) maximum output power 10 watts or 40 watts PEP.

2 1.835-1.850 MHz

(a) modes of transmission:

200HA1A

(b) maximum output power 10 watts

(c) no contest participation in this part.

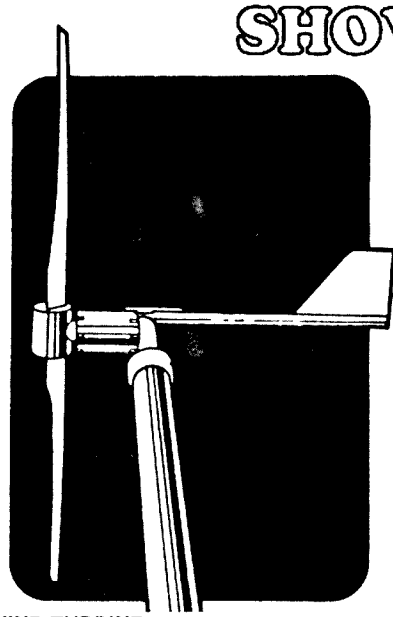
AR SHOWCASE



WIND TURBINE

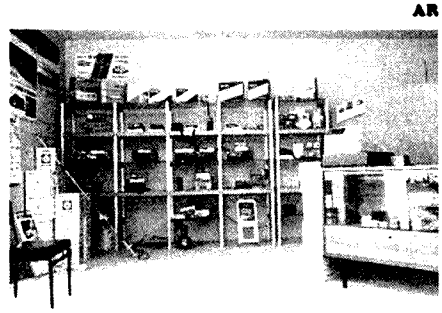
Wecam Communications are importing the Rikan Hornet Wind Turbine which is an ideal source of power for charging batteries. It is a boon to many farmers, campers and those living in remote areas or for that "get away from it all" holiday home and the manufacturers claim it to be 150 percent more efficient than solar panels when tests were conducted in Auckland.

The units are packaged as a complete kit including battery leads, full instructions for assembly with the only tools required being a screwdriver, spanner and pop riveter. The unit is designed to fit 50 mm threaded pipe and included with the instructions are designs for simple six metre towers.

The unit has a rated output of 20 watts with a 20 knot wind and is designed for maintenance free operation in the harsh environment, having a fully sealed stainless steel shaft running in ball races, corrosion resistant ultra violet stabilised PVC blades, mechanical overspeed control and a fail safe device in case of high winds. All units are guaranteed for twelve months.

Further information may be obtained from Wecam Communications, 11 Malmesbury Street, Wendouree, Vic 3355 or by telephoning (053) 39 2808.

AR



NEW EQUIPMENT SUPPLIER

Recently Fred Mackiewicz VK3ZZN returned to Melbourne to open new premises that will carry stock to serve the amateurs needs.

Fred was first established in 1976 and still provides the same standard of courteous service in 1985 and should make many friends with the stocking of major brands such as Icom, Kenwood and Yaesu equipment, as well as a quality range of accessories to suit.

For further details of the on-site full sales and service facilities that are available contact AM-COMM Electronics at 69 Canterbury Road, East Camberwell, Vic 3124 or telephone (03) 836 7634.

RTTY — CW TRANSCEIVE AS WELL

Two new data communications programmes for the TRS-80C color computer, are written in Australia by Locus Software. The programme Data Communication Monitor (Cat DCM) provides for the reception of CW, standard BAUDOT RTTY as well as SITOR (Broadcast Mode), FEC and ARQ mode B. Stations using these RTTY modes include Press, Interpol, Embassies, Meteorological, Coast Guard plus a number of others. The RTTY transceive programme (Cat RBM) allows its user to run full transmit or receive on RTTY (BAUDOT or ASCII). Both programmes have been written such that they are extremely user friendly, regularly displaying on screen operating prompts and require a minimum 4K basic TRS-80C computer.

The Data Communications Monitor provides a number of user selectable options. These include, data output to screen or printer at 2400 BAUD, clear screen using CLEAR key, BREAK key initiates a break in the programme while retaining data on screen, operating status is easily displayed using a single entry key. In the CW mode DCM provides auto speed adjustment. When receiving RTTY BAUDOT the speed may be user set at 45, 50, 75 and 100 BAUD.

Designed to comply with CCIR recommendation 476-2 for SITOR (FEC and ARQ mode B) DCM has a number of unique features including a special graphic tuning display to allow optimum receiver tuning. Speed is preset at the standard 100 BAUD required for SITOR. Automatic data rephasing is carried out after four continuous characters are missed.

The RTTY Transceive programme (RBA) includes four transmit buffers, one for CW identification plus three additional with a capacity of 255,512 and 512 characters each. Also included is an auto RY transmit command.

When using BAUOOT, speeds of 45, 50 and 75 BAUD may be selected. The ASCII speed is preset at 110 BAUD.

Price of Locus DCM programme is $75 plus $5 P&P while the RBA programme is $55 plus $5 P&P. For further information contact the Australian distributors, GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic, 3132. Phone (03) 873 3777.

PLAQUE PRESENTATION

From left are Michael VK3KI, Alf VK3LC and David VK3ADW.

At a recent executive meeting Alf Chandler VK3LC received an engraved plaque for his work as the Region 3 Intruder Watch Co-ordinator for the period 1975-1984.

This award is made available for amateurs who have contributed to the region's work.

The plaque was presented to Alf, on behalf of Region 3, by Michael Owen VK3KI, who is a Director of that body.

In presenting the plaque, Michael stated that "Intruder Watch involves a high degree of dedication and accuracy which not many amateurs are prepared to give for long periods. As a result of the work of Intruder Watch there are not too many intruders removed but raising the issue, and continuing to do so, many would-be intruders are deterred".

Alf replied, commenting that he had enjoyed his long association with the Region and the plaque was much appreciated.

? *The VK6 VHF Group also asked if VK6RVF on 10.3 GHz is operating? Do you know?*

ABOUT CHINA FROM JAPAN

Hatsuo Yoshida JA1VOK, a well known 6 metre operator from Japan has written with a few details of 6 and 2 metre activity from China where the prefix is normally BY. However, BT5RA is the call sign of a special VHF club in Fuz hou city, and JA1VOK contacted this station on 13/8 and 19/8/84. Others to work the station were JA1UT, JH4RUG and a group from the BY Club station. Signals were 5x9 both ways. It seems likely that BY5RA will also be on 6 metres.

On 2 metres, BT5RA worked a JR6 in Okinawa on 17/8 by tropo, which probably rates as a first for that band between those two countries.

As it appears the Chinese government only issues licences at present to club stations, it seems unlikely we will be rushed with keen VHF ops from there for the time being, but contacts should be possible when conditions permit operation with Japan.

Further information regarding BY operations was included on page 37 of November 1984 "AR".

SIX METRES

It's that time of the year again when one looks with expectation to the six metre band and hopes for Es openings to renew old acquaintances and make new friendships. Until the last few days the band has been relatively quiet, there have been the odd contact "out of the blue" but generally nothing consistent. Channel 0 mainly from Brisbane can be heard frequently, sometimes very strong, at other times in and out of the noise, but remarkably consistent.

Bob VK5ZRO (my very consistent band spy) advised that on 2/11 ZL worked FK8 on 6 metres but nothing heard here. On 7/11 (2230 UTC day 6/11) Ch 0 from Sydney was available in full colour. At 2250 Bob worked VK2AKU 5x8 and again at 2330 5x9; at 0002 VK7JG 5x9; 0005 ZL1AON 5x5 and 0016 VK7DC 5x6. For the next two hours signals drifted in and out but not lasting long enough for contacts. No signals were heard from the north.

Also on 7/11 VK2 were working ZL1, and VK2AKU worked VK3, 5 and 7. The VK2RHV beacon on 52.325 was audible at the same time (0000 UTC). At 0453 Bob VK5ZRO worked Graham VK6RO 5x3. At 1000 UTC VK8TM and VK8ZLX were up to 5x9 on 52.070.

It certainly looks as though there was a fairly large Es cloud around, which eventually involved the western areas and the north. With signals so good so early it may be that we will be in for a good Es season this year. And of course keep your ears on 2 metres as well, especially when the skip shortens.

ON 1296 MHz

Bob VK5ZRO and Don VK5ZRG at Whyalla, 210km apart, continue to exploit 1296 MHz. They have been having consistently good contacts at any time of the day or night. Both being on holidays helps of course! They have found the daytime signals are subject to more QSB than at night, frequently very heavy QSB varying the signals between S1 and S9+60dB! The same peak strength of signals applies at night but the signals do not drop as low when they fade down.

All these experiments have been carried out with a maximum power of 13 watts, and from 25/10 Don VK5ZRG has had an improved antenna system with four 27 element loop yagis, while VK5ZRO uses either one 27 element loop yagi or a 4 feet dish. Bob has found that with the two antenna systems about 4 metres apart he is getting some diversity effects, sometimes the signals are better with the loop yagi, at other times with the dish!

Recently experiments were conducted using 1 watt between the two stations with little apparent reduction in signals so one wonders just how far the signals on this band could be transmitted on a regular basis, perhaps double the present distance, who knows until it is tried.

The regular experiments between the two stations on 432 MHz has been temporarily suspended whilst they find out the vagaries of 1296. It seems these two operators have been having more success with the FM signals than originally anticipated. There does however, seem to be a ceiling above which the signals are not propagated satisfactorily, as Sid VK5ME has had some difficulty copying VK5ZRG from his elevated site in the Adelaide hills, although he receives tremendous signals from VK5ZRO.

Opening Ceremony of BY5RA.

NEWS FROM JAPAN

From the Japan "CO ham radio" magazine for September 1984, I note Graham VK6RO has acquainted JA operators with the latest DOC regulations regarding our operations on the 50 MHz end of the band, so they will now have some idea of where and when to look for signals.

I note also that the JA's haven't been working too far afield on six metres either. Stations worked included JD1DCK, HL1, 2, 3, 4 and 5, VS6 and VK8GB.

ON TWO METRES

The English "Short Wave Magazine" for September 1984 (per favour VK5AIM) has a photograph of a QSL card which confirms the present IARU Region 1 distance record of 2787 kms on 432 MHz between EA8XS, Canary Islands and GW8VHI, which was made on SSB on 5/7/84 at 2226 UTC.

Congratulations to the parties concerned, and it is good to see some of these distances being lengthened

in the European sector again.

The same magazine carries considerable information regarding contacts made particularly on two metres using auroras for propogation. Such occurrences are fairly rare in this country. Our northern friends also make good use of the various meteor showers throughout the year, something we don't seem to worry about here.

The annual CW ladder in "Short Wave Magazine" shows GW4TTU as heading the list with 247 contacts on two metres all with different stations on CW. He also has 53 on 70cm, and 10 on higher bands. G4ARI is next in line with 193 different stations on two metres, and in addition has 67 stations on four metres.

GW4TTU also heads the annual VHF/UHF table with 90 counties and 36 countries worked so far this year on two metres, 41 counties and 10 countries on 70cm, and 11 counties and 4 countries on 23cm! The penetration of VHF/UHF into Region 1 is quite remarkable, and surely 36 countries even in Europe must be considered quite an effort, especially as language problems must surely arise at times, and QRM due to station density in some places would not help either. Europe from Portugal/Spain to most of European Russia is about the same width as Australia is from west to east at the widest points!

BEACON FOR NEW CALEDONIA

John VK4ZJB has written a hurried note advising he worked Pierre FK8EM on the morning of Tuesday 6/11. During the six metre contact mention was made that a beacon would be operational from about 13/11 specifically beaming for VK stations.

Frequency: 52.020 MHz, power: nominal 5 watts; antenna: Swiss Quad with 12dB gain; direction: WSW from FK8; Time: 8 am to 10 pm FK8 time, which should be about 7 am to 9 pm EST or 2100 to 1100 UTC.

Distance wise, New Caledonia should be similar to working New Zealand for most, perhaps a bit closer for the east coast stations, but well within the capabilities of an Es opening. And remember to keep your contacts short with Pierre as there will be a lot of six metre operators wanting to work him and openings may not be of long duration. If they are, then there will be plenty of time to call him up later and talk about the latest piece of gear you have bought!

While on the subject of beacons I note from "Break In" that the Manawatu Branch are to close down their 70cm and 2 metre beacons for economic reasons! Apparently after a survey it was found people only looked for the six metre beacon which has been allowed to continue.

THIRTY YEARS OF BEACONS

The following is condensed from an interesting article in the "West Australian VHF Group Bulletin" for October 1984.

"Amateur beacons have been operating from Perth for nearly 30 years. The first amateur VHF beacon in Australia was VK6VF on 50.003 MHz in the mid 1950s. Built by the late Don Brown VK6ZAV, it had a neon valve relaxation oscillator feeding a 6V6 valve which screen modulated an 807. It was keyed by a notched disc driven by a synchronous motor through a rubber band actuating a mechanical switch. Unattended operation was not permitted at the time so VK6VF was heard irregularly when the operator was present and remembered to turn it on!

"The first two metre beacon was located at VK6BE in Kalamunda, then it was moved to VK6RX in Subiaco, to VK6HK in Wembley Downs and VK6AW in Tuart Hill. At this time a valve tripler was added, making it the first 70cm beacon in WA and possibly in Australia. The keyer was an SEC power meter to provide the slowly revolving disc, with tabs attached to interrupt a light beam which was detected by a transistor with the casing filed away to make it photosensitive. By informal agreement it was moved to the TVW7 site at Bickley where the antenna was only a few feet off the ground, so it was replaced by the current solid state dual band beacon relocated part way up the transmitter tower. It operated almost continuously for 13 years. Only recently the keyer was rebuilt by Phil VK6AD to change the ident to VK6RPH. A formal agreement is being made with TVW7 for it to be replaced on the tower.

"Another first for Perth was VK6RVF, constructed by Colin VK6CM several years ago and located at Roleystone, and transmitting on 10.3 GHZ. Then there was the recent addition of VK6RWA on 10 metres. Though strictly not VHF the ionosphere is currently ignoring it so it might as well be on VHF!

"The newest Perth beacon is VK6RPR at the Nedlands CAE transmitting on 70cm. A tripler is being built so it will also transmit on 1296 MHz. Perth will then have a set of beacons on all bands from 10m through to 1296 MHz.

"Beacons have also been erected at Busselton with the call sign VK6RBS and have been operational for about a year, and are designed to test propagation northwards along the coast and eastwards towards Adelaide. The 144 MHz exciter and 1296 tripler were built by Wally VK6KZ, the keyer and 432 tripler by Don VK6HK, the 144 MHz power amplifier built by Barry VK6ZSB and the power supply built by VK3TN/6ZK/8TN.

"The basic concept of the beacon is to generate enough power at 144 MHz and transfer it up the mast to a second module near the antenna. This module divides the power so that part is radiated and part is tripled to 432 MHz. This is again divided with part being radiated and part being tripled to 1296 MHz. The power dividers are ex NASA courtesy Bob VK6ZFY with 50 ohm dummy loads rated at 10 watts to absorb power if an antenna falls off.

"The antennas on 2 metres are 2 x 5 element yagis built by Bob VK6KRC and are aimed at Adelaide and Perth. On 432 MHz there is an extended 1½ wavelength dipole with a screen reflector giving a tri-lobed pattern aimed roughly at Adelaide, Bunbury and Perth/Carnarvon, and was built by Don VK6HK from a standard VHF broadcasting design. Don also built the antenna for 1296, a balun/dipole combination with a corner reflector aimed at Perth.

"The keyer, power and exciter modules are contained in a security box in the Geographe Bay Yacht Club. Output is around 40 watts at 144.019. This is transferred by good quality coax to the divider/multiplier module about 7m up the tower. After coax losses power delivered to this module is about 25 watts. The 2m antennas get about 5 watts each for an ERP of about 30 watts. The tripler produces about 5 watts on 432.057 MHz. After the power is divided there is about 2 watts for the antenna, producing about 5 watts ERP in the favoured directions. The second tripler is inefficient due to an ageing varactor and the output at 1296.171 MHz is only a few hundred milliwatts, boosted by an antenna gain to about 2W ERP.

"In less than a year VK6RBS has demonstrated remarkable propagation. It has been heard as far north as Exmouth on 144 MHz, and on 432 MHz has been heard by VK6ZPG at Gunyidi, north of Watheroo. VK6ZFY reports hearing it most days on 1296 MHz around Perth."

The congratulations of the VHF/UHF fraternity is extended to these good people who have spent so much time and effort in providing very useful instruments for your use, and the closer you are to them and thus the more reliable they are, the more useful you will find them. And many has been the time that a beacon has warned an alert operator that the band could be opening and possible contacts made. We are indeed fortunate in Australia that with a country as large as it is, there is such an all embracing network of beacons on so many bands ready and waiting to give warnings to anyone who cares to listen. Long live the beacons!

That about wraps it up for this month. Due to printing deadlines there is a shorter period for reporting this time, and most DX operating will start the day after this is posted!

Closing with the thought for the month: "A man is three people — what he is, what he thinks he is, and what others think he is." 73. The Voice in the Hills. Greetings for the New Year. **AR**

Bill Hempel VK4LC, QTHR.

PACKET RADIO

David Furst, VK3YDF
131 Church Street, Hawthorn, Vic. 3122

THE FUTURE

Packet Radio, as we have seen in previous articles on the subject, transmits information a few characters at a time, packaged, checked and addressed. This allows things like several QSOs at the same time, on the same frequency, without errors and without interference. (You really should have read the article in May '84 AR more closely.)

Because this information is all in the form of packages with labels on them we can identify each packet from the others and deal with it individually. All of Packet Radio is controlled by dedicated microcomputers — the rigs, the repeaters, etc and this makes it possible to programme these computers to do all manner of things.

A Packet Radio repeater listens to a given channel receiving, storing and checking all the packets that are flying past. If a packet has information within it which says that it is meant to be repeated then the repeater waits until the channel is free for a moment and then retrieves the packet from its memory, modifies it to say that it has passed through the repeater, then retransmits it. On the other hand, the repeater may see packets from a simplex contact. It will examine them as it sees them, but it will know that it is not meant to take any action.

An interesting situation appears when a station receives two packets from the other station with which it is having a contact: one from the other station direct, and one via the repeater (which is possible because this is all happening on a single channel). In this case the receiving stations microcomputer knows that it is supposed to be operating via the repeater, and it will ignore the packet it received direct.

If we consider the Packet Radio network like a postal system (which it emulates very closely) what we have been doing with the local repeater is just sending mail around our local postal district. This is all very fine, but occasionally we wish to send a letter to someone not in our own suburb. In this case we post it to our post office, it posts it to the post office in another district, and that post office posts it to the person we addressed it to.

Packet Radio allows us to send a packet to our local repeater, which sends it to the repeater in another area which delivers it to the person we addressed it to. This process takes only a matter of a second at most. A contact actually consists of many packets being sent back and forth through the system. This all operates in much the same manner as ongoing correspondence conducted via the postal system.

It bears pointing out at this point that this is where the similarity between Packet Radio and the postal system ends. Packet Radio works reliably.

The technology is developing such that it will be possible in less than twelve months to have a 'Packet Briefcase' containing a two metre rig, a Packet Radio rig, a portable computer and a battery which will allow us to tap into the local repeater.

At the same time interstate links have been developing, and it will be possible to ask the local repeater to 'connect' us to an interstate repeater. The interstate repeater can be asked to further connect us to a station in its local area. In 1985 we may be using our briefcase to play games on a computer which is in a different state!

Packet Radio combines radio and computer technologies to provide a reliable and efficient communications medium. This makes things such as the Computerised Bulletin Board System possible. The CBBS, as it is known, has become a fixture of the Amateur Computing community.

The CBBS is a computer system running a specially written programme which makes it imitate a bulletin board such as you would expect to find in a community centre. At the community centre you would stand back from the board and scan the headings on all the messages tacked onto it. Once you found a message of interest you would move forward to read it in more detail. The CBBS operates in a similar fashion.

The Packet network will let you use your own keyboard and screen to type instructions and messages into the CBBS. You might ask it to type out the headings of all the most recently placed messages. After scanning these you might decide that one or more messages sound interesting and ask it to type them out in full.

Many people find it interesting to scan all messages on a CBBS and reply to most of them. Some people prefer to simply read what everyone else is up to. Others like to correct the mistakes anyone else makes, while some correct the correctors. You may check the CBBS at any time of the day or night and receive messages from, or leave messages for, people who are not near a rig at the time. The CBBS becomes the hub of a community where no-one has to call another station all week on the repeater before they get them.

Another kind of service which has become popular in the amateur computing community is the Remote CP/M System or RCP/M for short. As well as having a small bulletin board facility it can act as a remote CP/M computer system which you can load programmes onto for others to download into their own computers. These systems have become an extremely efficient method of distributing public domain programmes around the hobbyist community.

There have been concerns expressed about people using Packet Radio for illegally copying programmes to which they have no right. In theory this is possible, however because of the public nature of Packet Radio transmissions, such conduct would be much too obvious for anyone to attempt it without being found out.

Other areas of amateur radio (notably two metre repeaters) have problems with policing reasonable standards of conduct. We believe that Packet Radio is inherently self policing. If anyone behaves irresponsibly, he is immediately identified by the signature in his packets thereby denying him anonymity. If this continues then comments will begin to appear on the Computerised Bulletin Board System. In the fullness of time this may become a full scale public debate on this persons behaviour, and if the community feels that action is warranted, they may bar this person from accessing the various systems hooked up to the network or perhaps even from the network itself.

The Amateur Computing community has been using CBBS and RCP/M systems for several years via the telephone system and appropriate modems hooked up to their computers. They are technical people after all the best traditions of amateur radio and we have much in common with them. They have as little knowledge about linear electronics as many of us have in the area of computing. We believe that there is an enormous amount to be gained from communication between these two communities and would like to see CBBSs and RCP/Ms which can be accessed from both the telephone system and the Packet network.

There is concern over CBBSs and RCP/Ms with access both by radio and by telephone. We agree that if it were possible to ring in on phone and go out on Packet this would be a most undesirable situation. It is not now, nor has it ever been our intention that this be possible.

A second area of concern is that there may be unsuitable material on the CBBS which should not be transmitted over the air. We do not see this as a insurmountable problem. No-one looks at all the messages 'blind'. All CBBSs have a summary of message titles which are scanned for material of interest and the messages are then selectively retrieved.

In 25,000 odd calls to the Microcomputer Club of Melbourne (MICOM) CBBS it has been extremely rare that any offensive messages have been left. The trend is now that much as anyone can look at the contents of a CBBS, only people with an appropriate password may leave messages, and any message left automatically has the name of its originator associated with it. This system can kill off distasteful messages entirely.

Other areas of Packet Radio which people are showing interest in are: Bulletin Boards on satellites, using meteor showers to reflect packet transmissions, store and forward satellites to hook countries and continents together, etc.

Many of us are working toward this bright future. We expect it to bring a flood of new techniques and people to enrich Australian Amateur Radio.

Note: David is most willing to answer any queries regarding Packet Radio that members may have. Drop David a note at the above address and he will answer any questions in this column.

ALARA

Australian Ladies Amateur Radio Association

Margaret Loft, VK3DML
28 Lawrence Street, Castlemaine, Vic 3450

Well our ALARA contest is over again for another year and I do hope by the time you are reading this that I have received your log, results will be out very soon.

Propagation was not too favourable but some very good scores were being passed on by some of the ladies. My very sincere thanks once again to all who participated and especially to the OM's, I overheard one say he was only worth 3 points so wasn't as popular as the YL's but those 3 points add up and help to boost our score. So come on fella's join us next year it's all good fun.

Mavis was very popular this year with the commemorative call VI3WI and logged up a good score. Unfortunately 80 metres was washed out by the electrical storms experienced on Saturday night so a lot of contacts were lost.

NEW MEMBERS

Welcome to new members Aimee FK8FA 22.10.84 and Mary KB6CLL 27.10.84.

Subscriptions are now due and Valda VK3DVT, PO Box 4, Middle Brighton Vic 3186 will be very happy to answer any enquiries and delighted to receive your subs. Australian membership is $5 per year; and if you would like to sponsor an overseas YL cost is $3 for the newsletters to go sea mail. $5 for airmail.

ALARA MERCHANDISE

ALARA also has available Badges and Charms (for keyring or chain) $4 each post paid, $3 if collected.

Teaspoons boxed $4.50 posted. $3.50 collected. These all depict our logo and are most attractive.

ALARA notepaper is also available 50 sheets $3 posted $2 collected.

YL DAY

On YL activity day 6th January a roster of VK3 members will be using the call VI3WI so look out for us on the usual YL frequencies 21.188, 14.288, 28.588 MHz and also on 3.588‡ QRM in the evening.

ALARA net times for daylight saving times are Monday 3.580 at 1000 UTC this will revert to 1030 UTC early in March.

LOOKING BACK

Looking back over 1984, the main highlight must be our first Annual Get-together and certainly this will be followed by others in the future.

YL's are becoming more active at zone and club levels and in the coming years I hope this continues. No I am not becoming sexist but feel that everyone has something to offer and a different approach will benefit all.

Publicity for our hobby has continued this past year. Jenny VK5ANW was interviewed on radio station 5SE; Joyce VK2DIX was interviewed for their local paper; Mavis VK3KS and Ivor VK3XB were interviewed for 3RPH the radio station for the print handicapped in Melbourne.

Mavis also was featured on the cover of 1984-85 Call Book. Other milestones in 1984 were the presentation to Austine VK3YL who has been licensed for 54 years.

The presentation to Helene VK7HD our president of The Mrs McKenzie CW Trophy who accepted this on behalf of ALARA and this will be suitably housed and a certificate presented to our top CW scoring novice YL in our contests.

Kim VK3CYL and Valda VK3DVT for receiving commendations for their entries in the WIA 75th Logo competition.

Judy VK5BYL conducts the slow Morse practise on Friday nights for the WIA on 3.550 MHz at 1030 UTC.

Above

Marlene VK5QO, Carol VK5PWA, Jenny VK5ANW and daughter Wendy, Joy VK5YJ and grand daughter Rebecca.

Below

Norma VK2DJO; Judy VK5BYL; Rae VK3AYL at Mildura.

Carol VK5PWA is president of the Lower Eyre Peninsula ARC. Val VK4VR is Junior Vice President and Liaison Officer in the VK4 Division.

Wishing everyone a very happy, healthy year for 1985.

Until next month 33,73,88 to all.

Margaret VK3DML

WICEN NEWS

Jim Linton, VK3PC
4 Ansett Crescent, Forest Hill, Vic. 3134

Recognition, restructure, & revival — the three Rs of WICEN Victoria since Ash Wednesday.

Continued from December AR

WICEN Co-ordinator Derek McNeil VK3BYA outlines the post-Ash Wednesday restructure of WICEN.

Ash Wednesday was undoubtedly the catalyst necessary to bring WICEN Victoria back to life again. Not that it had died, but its numbers were down to approximately thirty loyal dedicated members. Whereas there are a few good emergency operators who manage to retain their ability without practice, it was evident many people would be far more effective in the field if they had some training and took part in the occasional exercise between emergency call-outs.

Ash Wednesday also revealed the need for good administration of WICEN resources and standardisation of operating procedures to ensure maximum operability between WICEN members and between WICEN and other emergency agencies.

Apart from those issues, WICEN was no longer part of the Victorian State Disaster Plan and, naturally enough, few people knew what WICEN stood for, what it could do or how to use it.

So began the Three R's of WICEN Victoria.

On 12 November, 1983, a general meeting of WICEN (Vic) appointed a Steering Committee to review the present organisation, recommend improvements — and where necessary, recommendations should actually be implemented in view of the imminent high risk fire season.

The Committee set to work immediately addressing the following matters:

— to identify and confirm the role of WICEN,
— to renew contact with other emergency services,
— to re-establish WICEN in the State Disaster Plan,
— to create greater awareness and understanding of WICEN within the Amateur Radio Service and the general public,
— to prepare a set of base level, standard operating procedures for use by all operators,
— to set up administrative procedures for membership recording, operator rostering etc,
— to review and confirm the State structure and regional boundaries.

Many of these tasks were completed by 31 March, 1984, when the next WICEN General Meeting was held. Some tasks were still in progress and have been continued since then.

It's of major significance that WICEN representatives now take part in disaster planning meetings at Regional and State levels and have been invited to participate in a number of emergency services seminars.

RECOGNITION? Yes, WICEN is now looked upon as an essential communications resource and there's a great obligation on members of the WIA Victorian Division, who, of course, called for the WICEN review, to make sure they can respond to the demands likely to be placed upon them.

RESTRUCTURE? Regional boundaries have been defined, regional representatives nominated and a central co-ordinating group established. Administrative procedures are being formulated and installed. Communication hierarchies have been set-up to ensure a quick assembly of operating groups.

REVIVAL? Yes, a partial revival has been achieved and a number of new club-based groups have sprung up in the past twelve months preparing themselves fairly well. The ultimate test is the next emergency/disaster callout. There are many operators who, only awaiting the next Ash Wednesday, will submit to neither practice nor training and, until that day, make no contribution to the furthering of WICEN. They have their uses — in making cups of tea!

The (other) Three R's of WICEN Victoria: Responsibility, Reliability, and Readiness.

AR

PACKET VIA METEORS

The recent Perseids meteor shower provided a good opportunity for experimentation with packet radio operation via meteor scatter. Various stations in the USA took part in tests, and W0RPK and K1HTV completed what is believed to be the first packet radio contact on 144MHz using MS. The tests were performed at 1,200 Bauds using AFSK FM: this mode was used in order to allow as many stations as possible to take part in the tests, although a sacrifice in performance was involved.

WICEN NEWS

Ron Henderson VK1RH
FEDERAL WICEN CO-ORDINATOR
171 Kingsford Smith Drive, Melba, ACT 2615

NATURAL DISASTERS ORGANIZATION

During the first quarter of 1984 Air Vice Marshal John Lessels took over as Director General of the Natural Disasters Organization from Major General Ken Lachford, who retired. AVM Lesseis is a civil engineer and was formerly head of Air Force works. He was briefed on WICEN by the Federal Co-ordinator in early November.

NDO ANNUAL EXERCISE

WICEN was advised In late October that the annual NDO command post exercise for 1984 would be an all in-house activity and there would be no requirement for a WICEN communications demonstration. The exercise scenario is one of a disaster occurring on one of our South Pacific Island state neighbours and as it will be fully simulated in Canberra any communications to the nation might cause unnecessary alarm. Perhaps if procedures are tested this year NDO might extend their scope next exercise. You will recall that last year WICEN provided communications to an Australian Territory, Christmas Island, for the annual exercise.

COMMUNICATIONS EQUIPMENT CONNECTORS

You will recall that earlier in 1984 I reproduced a UK RAYNET article on communications connectors. Paul Webster VK2BZC has written in response to that item and his letter is reproduced below. Whilst interoperability is a worthwhile goal, it does not need to be achieved nationally, or even state wide as its greatest application is at the local WICEN group level.

Dear Ron,

I am most impressed by the (reprint) article in July AR '84. My interest stems not only from some small interest in WICEN, having taken part in a few City-to-Surf exercises while not a paid-up WICEN member (last year in fact, in my professional capacity instead), but also from considering the problem of patching together equipment in the shack, such as RTTY gear or a land-line interface, and the possibility (distant) of building a central control panel for a variety of rigs.

The Raynet idea as described sounds excellent, and for the moment, I an implementing it on my equipment for the above purpose. Discussion with my father, Jim VK2BZD who, as the Callbook would have him, lives in Sydney still and who IS a paid-up and active WICEN member, revealed a local standard already in use in Sydney. In case you are unaware of this, it consists of a 5 or 6-pin 270-degrees DIN *connection making, I assume, the same usage of the 'sexes' as the Raynet standard, and has the following pin allocations:*

1. +12V supply
2. Audio Output
3. Ground
4. Microphone
5. PTT
6. 'Busy' (Optional)

The 'Busy' control line is most useful, implemented in the rig by an NPN transistor switching to ground, with base drive current adequate to allow sinking of at least 200mA in the 'ON' state when the mute is opened. A suitable cross-connect lead (which must contain attenuators in each direction) then allows two rigs on different bands, or on the same band separated by a suitably great distance, to be used as a repeater. Back EMF protection should always be (and usually is) applied to the T/R relay in the set. Just in case, a 24V zener can be connected across the 'Busy' transistor.

The obvious extension of the Raynet plan, therefore, is to use 8-pin DIN connectors, which are at present (in Sydney) as readily available as the 7-pin variety, and which are compatible with them in the same way as the 6- and 5-pin 270 degree types. The (off-) centre pin then has the same function as in the Sydney standard.

Jim has, on my behalf, put this idea to Sydney WICEN who rejected it for several reasons:

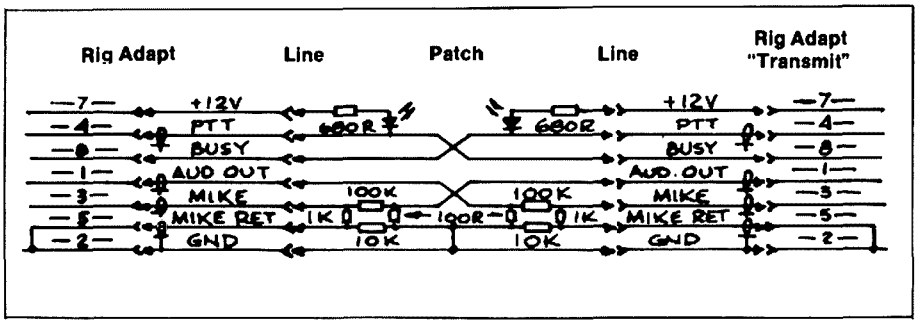
1. Multi-pin fittings too fiddley for OM's to wire.
2. Secondary output circuit is not necessary.
3. Nobody uses balanced mike circuits.
4. It doesn't follow DIN standard pin definitions.

I cannot completely agree, however, with these arguments, or to put it another way, I am still entranced by the Raynet plan, plus the obvious adaptation for the 'Busy' line. My replies are:

1) There is very little difference in pin spacing between 5- and 7-pin 270 degree fittings. The 'centre' pin is equally difficult to solder (and should be done first). If, however, one is only using 3- or 5-pin 180 degree fittings, these are quite easy to solder, decent quality ones having a separate large tab for pin 2.

2) The original article explains this.

3) While balanced mike circuits are rarely seen since the era of the AWA carphones, the mike return is of tremendous value in reducing interference and hum (whine etc). Careful analysis of the construction of attenuators reveals that if the ground legs are taken to their respective returns, then 'Earth Loop' signals are attenuated also:



(The resistor between the two earth lines in the patch is for compatibility with true differential mike inputs. The 100 ohm 'load' resistor is probably not required.)

4) A moot point. The DIN standard does define signal directions for the connector in stereo, balanced and mono modes, although function of a given pin as input or output depends on whether the device is an amplifier or recording equipment. Confusion regarding this leads to ready availability of interconnection cords with both 'straight' and 'reversed' connections. At least some of these, if chosen correctly, will be immediately useful in the minimum Raynet plan and others can be conveniently 'cannibalised' to produce 'rig-adaptors'. Also, using an appropriate ready-made lead, a tape recorder COULD be plugged directly into the paralled socket of the 'line', notwithstanding lack of conformity with the 'true' DIN standard. By comparison, very few ready-mades can be adapted to the Sydney convention!

In summary, then I am suggesting a natural extension of the Raynet convention as published, and remain sure that it offers significant advantages over, and greater versatility than the current Sydney convention, and is worth 'pushing'. A few further observations on the article and on conventions:

1) Four-core cable, RS catalogue 367-577 is equivalent to Dick Smith W-2038. I can't find a catalogue equivalent from Tandy. Radio Spares has branches in Perth and Sydney.

2) A common convention for 12V supply uses 2-pin polarised Extra-Low-Voltage plugs (Clipsal 495) and sockets with a 'T' orientation of the pins. Unfortunately, while common sense suggests that the vertical of the 'T' be the ground for conformity with the standard for 240V mains fittings, some renegades opt for the opposite. These connectors are an obvious, very rugged, choice.

3) I personally, along with many others use 6.5mm phone plugs for 12V connections as a matter of compactness and cheapness. The plastic fittings are not very rugged, however, while the cheaper line sockets short during insertion etc, and there is some danger of confusion with common audio appliances. Alternately, Telecom and military disposals plugs and jacks are EXTREMELY rugged.

4) A compact connector for a 12V supply is the 2-pin, 'arrow' profile Utilux connector set (Tandy 274-222) used to some extent by Sydney WICEN, as well as some CB sets. This fitting is adequately rated and convenient, but probably has a limited repetitive connect-disconnect life.

Perhaps you may discuss such standards for 12V power supply in a future column in AR? In any case I will hope to see to what extent the Raynet convention is adopted by the regional WICEN groups, as I feel that a widely accepted convention is of tremendous value.

73,

Paul B. Webster VK2BZC

MICROS PRODUCE THE COMPUTER-LITERATE GENERATION

By the time the current generation of school children and students complete their education, Britain will be the only country with an entire generation literate and versed in computers and computer technology.

Every single one of the country's 10.6 million pupils and every one of the 0.5 million students have access to a computer at some stage during their education — and mostly on a daily basis.

Due to the government's far-sighted programme "Micros in Primary Schools", launched a couple of years ago, 18,000 primary schools have been able to buy microcomputers for their classrooms. Higher up the age groups, 5,800 secondary schools have computers as do 868 polytechnics and 45 universities.

As if these figures are not impressive enough, Britain has the highest number of computers in the home in the world. An astonishing 2.7 million homes — 12 per cent of the total — own their own computer. Allowing an average of three people per home, this means more than one-third of the entire population uses and understands microcomputers.

LISTENING AROUND

Joe Baker, VK2BJX
Box 2121, Mildura, Vic 3500

Imagine yourself, as I was, an army switchboard operator on duty at Pine Creek in the Northern Territory, when suddenly the shutter signalling a call from the local area office drops, and an official voice asks *"We have a message for Sig Baker. Is he available?"* Of course, I was available and speaking. *"What is the message?"* I asked.

"You are to present yourself at the area office at 10 am tomorrow morning, escorted by two corporals with sidearms, before Area Commander Captain Pickett. This is an order, ***do not fail to obey it.***"

When I recovered my composure, I dared to ask the caller what the matter was all about. *"You will be informed when you present yourself. Just make sure of your presence,"* the caller said before hanging up.

The following morning, equipped with sidearms, and dressed in full regulation uniform, with one corporal in front, and the other at the rear, I was marched across the railway line at Pine Creek to the area office and there paraded before the august presence of the Area Commander. I hadn't a clue as to what I had done wrong, but it was evident that it must have been something very serious.

After throwing the usual ceremonial salute, and identifying myself, he produced a long envelope and asked if I had sent that envelope and its contents to the Australian Broadcasting Commission. I took one glance at the envelope, and said yes, that I had written that story and posted it to the ABC some days before. It was one of several stories that I had written about the Northern Territory, and I think this one concerned an Army race meeting (the army's version of a NT Melbourne Cup).

He then began to read the charge, which was in effect that I had by so doing **broken the National Security Regulations — which was about as serious a charge as one could be guilty of especially in wartime.** It appears that my story to the ABC had been intercepted by military police somewhere down south — probably in Adelaide, their interest having been sparked by the fact that the envelope bore no censors mark, and it was customary for all mail at that time to have to pass an official censor before it left the Northern Territory. He then asked me how I pleaded and I said *"Not Guilty, Sir."*

"May I remind you Signalman Baker that I am the official censor for this military area, and this piece of correspondence ***never came to me*** *for censoring. How did you manage to smuggle that envelope out of the Territory, was it by rail?"* he asked.

"I have no knowledge of how it got out of the Territory without being stamped by a censor," I replied. *"As you know sir, the railway line from Darwin finishes near Birdum, not Adelaide, and since you went on leave Sir, it has been the custom for signallers to send all outgoing mail to our own headquarters at Adelaide River (70 miles north of Pine Creek). All I know Sir, is that I put that piece of mail in the bag going to Adelaide River, and how it got down south without having been censored, I do not know."*

Captain Pickett admitted that this put a different complexion on things, and said that he would give me a remand of one week, so that he could check my story. That was the last I heard of the matter, for a short time later Captain Pickett was involved in a head-on collision between two military vehicles, in which both he and an RAAF driver lost their lives. I was on duty at the switchboard at Pine Creek when news of collision came through, and you will read about that later.

In the Northern Territory, when you are in at an isolated place like Pine Creek, facing long hours of boredom, all the days seem the same, and you resort to all sorts of rouses to pass the time. However I spent many an hour talking to other switchboard ops in other isolated areas. My particular mate was an operator at the army detention centre — a place called Brocks Creek, about 40 miles to the north of me. Known to all as "The Count" because of his classy voice, he had, I believe, before the war been a Yarra Bank orator, and he could rage on and on about Einstein's Theory of Relativity, the Cosmos and Religion for hours. He seemed to be a never-ending fund of knowledge, and utterly wasted operating his Pyramid switchboard at Brocks Creek. I don't think anyone ever won any argument in which he was involved.

I mention him not because of any particular incident or happening but just because he was a character in his own right. When, in the course of time, I was due to leave Pine Creek, I met him for the first time when he came to relieve me. He was as scrawny as they come — and came complete with about 100 or more books which were where he got his knowledge from.

Part of our communications system at Pine Creek included a pigeon loft containing about thirty birds and it was the job of one soldier to look after them.

At Pine Creek we also had a Cypher Clerk, who had been coached in the art of cyphering by a certain Lieutenant who used to visit Pine periodically for the purpose.

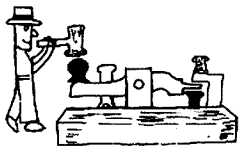
When he was visiting, he was closeted with the soldier he was training in a special room which was out of bounds to the rest of us. Knowing nothing about cypher work, I don't know what happened in that room, but it was all so very, very secret.

Although we didn't have any radio transmitters at Pine, at this time, the army did have what was called the "substitution code". It was a means by which if one radio operator became suspicious that "the enemy" might be listening, a word such as "apple" could mean that such and such a unit was moving, and hopefully the enemy wouldn't have a clue as to what "apple" meant. However it was a much more involved code than that and there was a system by which, taking into consideration the time and day of the month on which contact was being made, one operator could challenge the identity of another. All this was on the top secret list of course and in wartime what is known as "operators chat" was not permitted. Operators were also discouraged from having particular mannerisms of speech, for example if one operator had the habit of making a slight cough while using Radio Telephony and his unit moved to another area, the listening enemy could be sure that his whole unit had moved.

However, operators using sounders on the Overland Telegraph line were free from such restrictions. One operator that we had at Pine Creek used to crack jokes and another operator somewhere down south used to obtain the most up-to-date racing information and for a price, such news sheets were distributed to soldiers with racing interests all over the Northern Territory. "The Whispering Wire" as Mrs Anaeas Gunn called the Overland Telegraph line, had found a new use in World War Two.

This is not yet the full story of my army days in the Northern Territory, but for now the best of 73s from

Joe VK2BJX
AR



POUNDING BRASS

Marshall Emm, VK5FN
GPO Box 389, Adelaide, SA 5001

Whither CW?

During the brief history of amateur radio there have been occasions where a physical mode of operation has given way to something newer and better, just as the dinosaurs vanished when they were no longer suited to their environment (or vice versa). Spark gave way to CW, and AM gave way to SSB. Nobody has yet suggested that SSB should give way to FM, but scarcely an amateur magazine appears in print without someone suggesting that CW is a dinosaur that should have died out years ago, when microphones and code-free (technician) licenses were invented.

When spark and AM bit the dust, it was for a very good reason — amateurs as a group benefited from the transition to more efficient modes which made more effective use of the available spectrum. If spark and AM were still the going thing, there would be room for far fewer operators on any given band at any given time. But why be-labour this — very few operators would seriously argue that the status quo should be changed at this late date.

Even during the transition from spark to CW there were those who predicted an end to the hobby as a result. Spark was the mode they knew, and it was the only mode they wanted — at least till it was proved incontrovertably that CW was far more effective with far less power.

And of course AM is still alive and well — on 160m and wherever some budding 21st century Marconi has built himself an AM transmitter out of old TV parts.

The point is simply this — operating modes are very very difficult to kill — it takes a combination of superior technology and legislation, and even then there will be objectors. So to that limited extent, the future of CW seems reasonably assured, but those are surely very negative reasons for its retention.

What sort of superior technology will replace the human ear? CW can almost always out-perform any other amateur mode when conditions are poor, simply because the ear is more discriminating than any machine, and CW relies on the detection of the presence or absence of a tone (not it's pitch, or pronunciation, or any other form of modulation). Add to that the advantages that it is technologically simple, efficient, and inexpensive, that standard messages can be communicated between operators who cannot pronounce each other's languages, and you have a very attractive proposition — which is why there are so many enthusiastic users of the mode today. It is also the reason so much continuing technical effort is devoted to such operating conveniences as keyers and filters.

To some extent it is probably fair to say that CW operators belong to a traditional hard-core of amateurs whose primary interest is in communicating with other amateurs. This is where it gets a bit risky. The legal aspects of the hobby are always controlled by non-amateurs, who rely on amateur organisations for guidance. These organisations tend to be dominated these days by people who are more interested in current events (so to speak) and their own particular areas of interest. This means that the hobby as a whole can be controlled by people who have no particular interest in CW, and who may never even have used a key.

Don't think for one minute that we are not extremely fortunate to have our exclusive usage segments — they have come under attack before, and undoubtedly will again. Each time there are more trendy techniques around, and CW is that little bit older and more "antique" so it seems to many that our privilege is too great.

CW as a mode needs a higher profile if it is to survive into the next century. Every CW operator should make a point of working the slow newcomer occasionally, and of encouraging (on SSB, at WIA meetings, in the local press) as vocally as possible our non-vocal mode. Write a letter to the Editor of AR supporting the mode and retention of the Morse exam as a requirement for licensing. *Make Yourself Heard.*

Here endeth the reading . . . And on to signal reporting, as promised.

In CW operation, the standard report format is called the "RST Report," a three digit number representing an appraisal of Readability (R), Strength (S), and Tone (T), in that order.

READABILITY

Reported on a scale of 1 to 5, where 1 represents no readability and 5 equals perfect copy. Assuming that "copy" is our ability to derive intelligence from a received signal, perfect copy would represent 100 per cent reception with no difficulty. For the record, the scale is:

1 No readability
2 Barely readable (only occasional words)
3 Readable with difficulty
4 Readable with practically no difficulty
5 Perfectly readable

The word "difficulty" as used above presents some problems. Keeping in mind that we are talking about actual signals here, you should ignore "difficulty" that you might experience due to your own copying ability or the other station's sending speed.

Note that there is no provision for a report of Readability 0-R1 means no readability, and you can't get any lower than none!

STRENGTH

Reported on a scale of 1 to 9, where 1 represents faint signals and 9 represents extremely strong ones:

1 Faint, barely perceptible
2 Very weak
3 Weak
4 Fair
5 Fairly good
6 Good
7 Moderately strong
8 Strong
9 Extremely strong

A great degree of judgement is called for in giving a strength report. "S-points" cannot be measured objectively outside a laboratory, so meter deflection should be taken as a relative indication only. For example, my own S-meter is sluggish on 10 metres — if it twitches the received signal must be at least S8! As far as possible, give a report which indicates the strength relative to other signals on the band. It may seem strange to give an S9 report when the static noise level is S9+3dB, but there is scope in the report amplifications to explain that one, as we shall see next month.

Never, never, never give a report of S0. It just makes you look silly, because if there is no signal strength at all, there is no signal — and nothing for you to report on in the first place.

For practical purposes, readability can give a clue to the appropriate strength report, at least to this extent — if the Readability is 5, Strength can't be less than 3. Look at the tables and think about it.

TONE

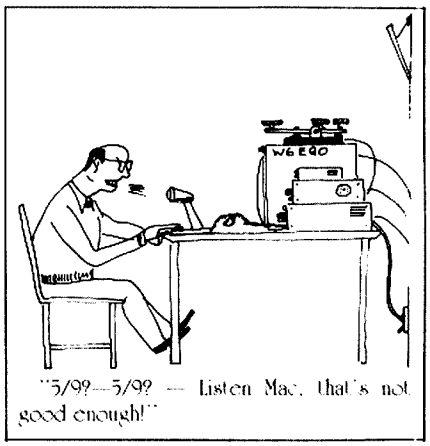
Yes, tone . . . Well, what can we say about tone? This report goes right back to the days of spark. T1 is defined as a rough, hissing note, while T9 is defined as a pure DC note with no trace of ripple. I think in technical terms a report of less than T9 would have to represent some form of modulation, but you don't often hear it.

***NOTE:** Technical faults such as Chirp, Drift and Clicks do not mean sub-standard tone. They will be covered separately next month.*

I once got a report of 5/9/8 and I was so shocked I nearly broke the paddles going back with *"WHY T8? WHY T8?"* The answer I got was *"SRI OM RCVR HR NOT VY GUD."* He knew the fault was in his receiver, but he still wouldn't change my report. Oh, well . . .

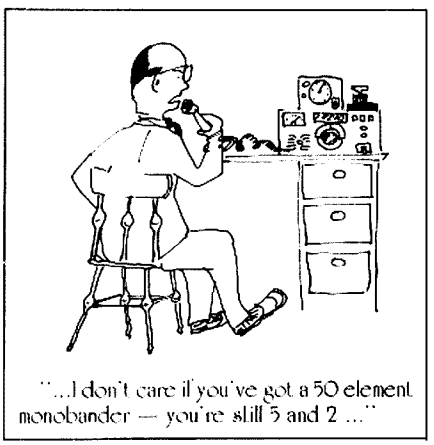
Till next month — may all your reports be 5/9/9.

AR



"5/9?—5/9? — Listen Mac, that's not good enough!"

"Yes OM — your QRG is 14214.6397413kHz!"



"...I don't care if you've got a 50 element monobander — you're still 5 and 2 ..."

AMSAT GENERAL MEETING

Graham VK5AGR and Peter VK7PF were attendees at the AMSAT Annual General Meeting held on the weekend 10th and 11th November 1984, at Los Angeles. Following the AMSAT AGM Graham and Peter were Planning to visit the University of Surrey, AMSAT-DL at Marburg and the Budapest University to ascertain the latest developments in the Amateur Satellite Service. We look forward to a detailed report in a future issue of Amateur Radio.

W3IWI COMPUTER PROGRAMME

Many readers will have a copy or variant of the Tom Clark Orbits Programme that utilises the Keplerian Element set. As users will be aware you do require a CURRENT YEAR set of Keplerian Elements. However they do take a few days into the New Year to filter through from the United States. Therefore until you get a 1985 Element Set for your favourite satellites here Is an operating hint to help you through and overcome the "Elements not from current year" Error.

If you wish to run the Programme using the 1984 Set on the 1st January 1985 insert the Date into the Programme as 32nd December 1984, similarly the 2nd January becomes 33rd December 1984.

PHASE 4 PROGRAMME

The following excerpts are from a paper prepared by Jan King W3GEY, AMSAT Vice-President, Engineering. It details a concept for the next generation of satellites. It is purely a discussion paper to gauge reactions from the worldwide Amateur Satellite Service. Any comments that you wish to make following a read of these excerpts would be greatly appreciated. Comments to Graham VK5AGR. The complete paper has link calculations and substantial technical discussion and derivation. Any person wishing to peruse the complete paper can obtain one by sending a request to Graham VK5AGR, QTHR and include $1 for Pack and Post.

AMSAT PHASE-4 CONCEPT

by Jan A King

INTRODUCTION: The following concept has occurred to me over the course of the past several months during the preparation of AMSAT's long range planning document. I believe the concept put forward here is, in fact, very ambitious and could be done only if an extreme commitment could be made by all international parties both in the area of financial contributions and in technical effort on the satellites and ground stations. I also believe that the effort would result in a mission that could change amateur radio in a major positive way. It must also be stated that this approach is the most ambitious concept of a family of such possibilities. I hope the ideas expressed here will be taken as constructive to the overall international programme; whether they ever evolve into a mission is entirely dependent on the people who must do the work. The concept must be traded against various national and international priorities.

MOTIVATION: The motivations of this concept result from my collective experience in over 15 years of work with the amateur satellite programme. The past two years, however, have been most formative. The following specific facts or impressions are most important:

1 The best communications capability for the amateur satellite service has not as yet been achieved. 24 hour per day service on a global basis has not yet been achieved. The successful launch of Phase 3-C will not accomplish this objective even if AO-10 lasts for another 5 to 6 years.

2 Different amateur satellite groups have different expectations as to how the amateur satellites should be used and operated. These differences should be accommodated and it is the right of each group to expect that the satellites be operated in accordance with their wishes.

3 No clear preference exists within any one satellite group (let alone among all of the groups together) as to the best mode of satellite transponder operation.

4 Satellite system complexity for high earth orbiting missions suggests that satellite construction groups work together internationally in order to accomplish goals that could not be reached by any group working by itself.

5 Unavoidably, but regrettably, the Ariane L-6 mission Sylda which contained P-3B was virtually empty. As an on site observer, knowing the value of such a vast mass margin, gazing into Sylda was nearly enough to make a grown man cry! At the same time I realize the level of effort required to achieve the completion of the P-3B project.

6 The Ariane-4 opportunity available to us will have an even larger wasted mass margin if we fly only a Phase-3C spacecraft in our proposed payload position.

7 The launch of a single synchronous satellite for the amateur service is simply unfair and would strain the relationships of the international satellite community.

8 The launch of multiple payloads on a single mission allows for cleaner segmentation of work while allowing for the advantages of a common design. Mass production and larger parts procurements provide cost savings due to economy of scale. This approach allows for participation on a single focused mission on a truly international scale.

9 Both the UOSAT and PHASE-3 programmes have demonstrated shortcomings in pre-launch planning for mission operations. This situation must be rectified if an international programme is to survive.

10 In the US where funds cannot be realistically raised via government sources and no University "umbrella" has been found to foster the programme, it is clear that powerful fund raising techniques must be used in order to raise the level of funding necessary to support each project. It will be more difficult to raise funds for a repeat mission than to raise money for an exciting new programme.

11 Discussions with Ariane planners have suggested that lower cost missions might always be available on Ariane provided that additive costs for the missions can be found and that the satellites themselves are within a load carrying structure for the primary satellite (P-3C case) or become the load carrying structure for a primary satellite (eg: Apple, Viking/Sweden).

12 It has been the goal for some years among members of the Phase-3 team to find a method of co-operation with amateurs of the USSR on an amateur space project.

MISSION CONCEPT: The proposed mission would effectively use the Ariane-4 mission (or a later launch) volume to place a constellation of six (yes, 6) satellites into geostationary orbit. The spacecraft would be transferred into geostationary orbit by a common "carrier" and would be ferried through the drift phase of the mission and would then be deposited, two at a time, into each of three geostationary orbit positions by the carrier. The mission would rely heavily upon Phase-3 technology. The six "subsatellites" are fitted into a seven topology hexagonal pattern and released much as with the FIREWHEEL mission planned by MPE. Fabrication of subelements of the satellites are accomplished by "groups" internationally. A group is the collection of workers within any country or geographic area who agree to co-operate as a single entity. It could also be two countries working together. One group, for example, the Technical University of Budapest, might build six BCR units. Once all of the hardware subassemblies had been completed, each of six groups would then integrate a subsatellite from the kit of equipment provided by the groups collectively during the first phase of the programme. A key feature of this proposal is that each satellite would carry one transponder agreed upon (by all) as the "international standard" — in the proposal I am suggesting mode-L — and one or more "experiment(s)" of the choosing of each group. The special experiment is to be of the group's own choosing and may not be influenced by the other groups so long as the performance of the internationally agreed transponder is not compromised. Once the satellite is "on-station" the operation of the satellite is the responsibility of the integrating group, however, it is strongly recommended that the team that physically built the satellite be separate from the team (within each group) that will operate the satellite.

APPROACH TO INTEGRATION GROUP PARTICIPATION:

APPROACH #1:
S/C #1: AMSAT-UK/UOS/SA AMSAT
S/C #2: AMSAT-DL
S/C #3: AMSAT-US/AMSAT-CANADA
S/C #4: JAMSAT/AMSAT-NZ/WIA
S/C #5: TECH UNIV BUDAPEST/DOSAAF-USSR
S/C #6: RACE-FRANCE
CARRIER: UNIVERSITY OF SURREY
POSSIBLE ADDITIONAL HELP: AMSAT-NL, AMSAT-SW, PACKET GROUP, SWEDEN

APPROACH #2:
S/C #1: RACE/FRANCE
S/C #2: AMSAT-DL
S/C #3: AMSAT-US
S/C #4: AMSAT-CANADA/SA AMSAT
S/C #5: JAMSAT
S/C #6: TECH UNIV BUDAPEST/DOSAAF-USSR
CARRIER: UNIVERSITY OF SURREY/AMSAT UK. The carrier could become a scientific platform carrying a variety of experiments.
POSSIBLE ADDITIONAL HELP: As above.

APPROACH #3:
S/C #1: AMSAT-DL/TECH UNIV BUDAPEST
S/C #2: AMSAT-DL/TECH UNIV BUDAPEST
S/C #3: AMSAT-US/AMSAT CANADA
S/C #4: AMSAT-US/AMSAT CANADA
S/C #5: AMSAT UK/UOS
S/C #6: SA AMSAT/AMSAT NZ/WIA
CARRIER: UNIVERSITY OF SURREY
POSSIBLE ADDITIONAL HELP: JAMSAT, RACE

PROPOSED SUPPORT PROVIDED BY GROUPS TOWARD THE COMMON PROJECT:

Integration (Assembly of Carrier and installation of subsatellites): University of Surrey
Structures for Subsatellites: AMSAT-US/AMSAT-DL
Carrier Module: Structure: University of Surrey. Propulsion: AMSAT-DL/MBB. Solar Arrays: AEG Telefunken or Solarex.
Sensors: AMSAT-DL
Reaction Control System Components: AMSAT-US
Batteries: GE/USA and/or Saft/France
BCR's (X2 Power Capability): Technical University of Budapest
Assembly of Battery Packs, IHU's, SEU's, LIU, Nutation Dampers, Antennas, Thermal Components, and other system small units could be shared among the groups participating.
Transponders: One of the problem areas. Clearly AMSAT-DL cannot build 6 Mode-L transponders on their own. A method must be found for sharing and "productionizing" this work.
Special Experiment (Transponder): The responsibility of each participating group to build or obtain their own special experiment(s).

USABLE PHASE-3 TECHNOLOGY:

Integrated Housekeeping Unit
Battery Charge Regulator (X2 increase in output capability, must be added).
Senesor Electronics Unit (See notes later in presentation).
Liquid Motor Ignition Unit (One unit on Carrier Mudule).
400 N Motor
Propellant Flow Assembly
Battery Packaging Technology
Sensors (Earth and Sun)
Nutation Dampers
Mode B Transponder (For those interested in using this as their special experiment).
Telemetry and Command Standards

NEW REQUIRED TECHNOLOGIES:

Mechanically Despun Antenna or Platform
MDA Drive Electronics
Reaction Control System
RCS Electronics
Mode-L Transponder/Antennas
Subsatellite Separation System
Synchronous Orbit Ranging and Orbit Determination System

POSSIBLE SPECIAL EXPERIMENTS:

Packet or Digital Communications Experiment/ Transponder
Mode B or Mode J Transponder
Microwave Transponder
Satellite-to-Satellite Communications Experiment
Synchronous (High B-Shell) Magnetometer; Partical or Radiation Detectors.
Data Storage/Mailbox/Advanced Beacon Experiments/Voice Synthesizer.
Mode-A Transponder (USSR?)

PROPOSED ORGANIZATIONAL ARRANGEMENT:

1 Each subsatellite will carry one 500 kHz Mode-L Transponder in support of the international satellite system.

2 Each subsatellite may carry one or more experiments that are of a regional nature defined by the group integrating that satellite. Experiment mass and power may not exceed established limits and the experiment may not interfere with the Mode-L transponder. Time sharing of experiments is addressed below.

3 Project has a single design authority — K Meinzer.

4 This authority includes the design of the subsatellites and the propulsion system of the Carrier Module.

5 This design authority does not include the specific design of the Carrier Module.

6 This design authority does not include the design of the ground control network.

7 A design review committee will meet periodically to review the overall project design. One design review member will be appointed from each group.

8 Each group will integrate one or more subsatellite(s).

9 Subsystems will be fabricated to AMSAT-DL specifications but, built by various groups according to their interests, abilities and expertise.

10 Piece parts are provided by various groups according to the best price and quality of equipment.

11 Each subsatellite will operate Mode-L and meet the standards of the international system. Mode-L will operate a minimum of 75% of the time per day. The special experiments can operate up to 25% of the time per day (or longer if they do not interfere with Mode-L and they do not exceed their power allocation of approximately 20 W).

12 The Mode-L OFF time must not occur simultaneously for two satellites at a common geostationary slot.

13 All subsatellites must have absolutely common external interfaces. The addition of special experiments cannot violate these interfaces.

14 The ground control network is managed separately in a team arrangement. This team acts in parallel with the spacecraft team. The ground control network is made up of members from each group.

15 Once the subsatellites are on station, each is maintained by its own organization (group). Backup arrangements can be made on a case by case basis.

16 University of Surrey/AMSAT-UK will act as the system integrator.

17 AMSAT-DL will act as single point of contact with the launcher authority.

18 An MOU is signed by all participating groups in advance of signature of the ESA contract.

19 Final ESA contract signed by K Meinzer but with counter signatures (of responsibility) by each group. The intent is not to cause AMSAT-DL to be responsible for any financial burden should problems arise.

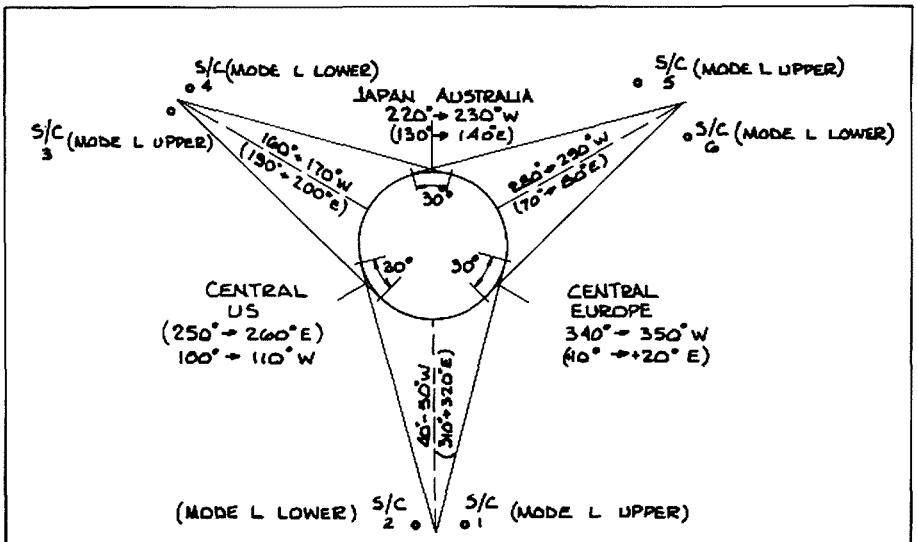
20 Metric standards will be applied for the project design. (Screws, nuts and bolts could be an exception.)

21 A fund raising quota system could be proposed for each group. Each group is not necessarily responsible for raising 1/6th of the total funding. Larger groups would be expected to pick up a larger percentage of the cost burden.

22 IARU, Regions 1, 2, 3 to support shipping, transport and travel costs (as a minimum).

23 Larger groups like IARU, ARRL, JARL, RSGB, DARC should get very excited about this kind of a system. They should be more prepared to pay.

de Colin VK5HI
AR



PROPOSED ORBIT POSITIONS

- Each S/C can view ±75° of longitude at 55°N latitude or 150° total longitude
- 3 S/C, equally spaced can see 450° (@55°N latitude or 55°S latitude)

∴ 3 S/C have 90° of overlap at 55°N or S or 3 zones of overlap each 30° wide.

NOT TO SCALE

- Major population zones can view 4 spacecraft and have access to 4 transponders totalling 2 MHz of bandwidth.

NEW ENDORSEMENTS FOR WAC

The Administrative Council has created two new endorsements for the Worked-All-Continents award: FAX and QRP.

Amateurs who have achieved two-way facsimile (A3C, F3C or J3C) communication with all six continents may request FAX-endorsed WAC certificates. In honour of the pioneers in this mode who may be now engaged in other activities, contacts of any date, past or future, are valid. FAX certificates will *not* be numbered, consistent with the practice for SSB, SSTV and RTTY certificates.

QRP endorsement will be available from 1985. The endorsement will be in the form of a sticker for affixing to a basic (CW or mixed-mode), SSB, SSTV, RTTY, FAX or 5 band certificate. QRP is defined as 5 watts output (10 watts input) or less. Only contacts made *on or after 1 January 1985* will be valid. The applicant must make the six contacts while running QRP; there is no restriction on the power of the stations contacted.

The other endorsement stickers that are presently available are for 1.8 MHz, 3.5 MHz, 50 MHz, 144 MHz, 432 MHz and 6-band operation. Please be also reminded that contacts made on 10, 18 or 24 MHz are *not* good for 5-band or 6-band WAC at present.

ANDORRA EXPEDITION

The Worcester Moonbounce Society (UK) has announced that its 1985 DXpedition will be to Andorra. Callsigns will be C30AKA, C30BTA and C30CMV. Activity will be on all bands from 1.8MHz to 1.3GHz, including 50MHz. Skeds can be arranged by writing to G6JNS, QTHR. The dates will be from 15 to 22 April, and the QSL manager will be G6JNS, PO Box 36, Worcester.

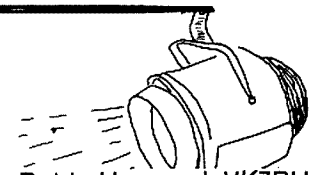
SPOTLIGHT ON SWLing



Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

Welcome to 1985! I sincerely do hope that this year will bring health and happiness to you and your family. I am also hoping that you will continue getting DX, although propagation will still be unpredictable, especially on the higher frequencies.

NEW 22 m BROADCASTING

At the time I am compiling this column, there have been several interesting developments. You may remember that in 1979, the WARC meeting, allocated a new international HF broadcasting band between 13.600 and 13.800 MHz. Operations on these new frequencies were expected to be commencing in about 1988, after existing users of the spectrum had been re-located on other frequencies. Now the Soviet Union has commenced utilizing the new 22 metre broadcasting allocation in a big way, as from the 1st October 1984. I have observed lately several strong signals, broadcasting Soviet Domestic and Foreign Service programming. Transmissions appear primarily directed to the Middle East, Africa and West Asia, indicative of the senders being located in Kazakhstan and/or Uzbekistan.

For example, on 13.600 MHz, I am hearing a domestic regional programme in the local evening hours in Russian. On 13.645 MHz, Radio Moscow is heard with foreign service programming in Asian/Middle Eastern languages and dialects, e.g. Punjabi at 1130 UTC was observed.

Transmissions also are beamed to Africa in various local languages on 13.625 MHz between 1500 and 2100 UTC as well as English/French and Portuguese. World Service and African Service programming in English have been heard between 1500 and 2100, with a transmission in Hausa at 1800, sandwiched in between. This presumably is being beamed to West Africa. 13.660 MHz has been noted with French (Radio Moscou Internationale) from 1700 UTC, with Arabic from 2100 to 2130 UTC. The World Service is reported on 13.680 MHz from 1400 to 1700 UTC followed by African languages until 2000, when English is observed. I have noted Indonesian in the past on 13.790 MHz from Moscow, but presumably other languages will also be utilized as the need arises.

This new 22 metre allocation has also been used by several other nations ahead of time. South Korea has been noted with test transmissions on 13.665 MHz between 0630 and 0830 UTC with identification announcements in various languages. The Gulf War between Iran and Iraq has also seen the 22 metre allocation used by both sides. Baghdad has been noted in Arabic between 11-12 and 20-21 hours on 13.700 MHz while Tehran has been noted on 13.745 MHz broadcasting in Farsi from 0330 till 1130 UTC in parallel with 9.022 and 15.084. Jerusalem has been using the new allocation for some time now, and programming in Russian as well as a relay of the commercial H/S in Hebrew has been on 13.720 MHz, accompanied by heavy jamming. Iceland has been heard by several on 13.797 MHz with a relay of the domestic MW programmes, yet I consider this to be a Utility Feeder as it is on SSB.

Now that the new allocation has come alive with activity, I shall not be surprised to see it fill up very rapidly with other broadcasters during the year. Concurrently with the expansion on 13 MHz, other allocations have also spread outside the allotted bands, particularly the 16 and 31 metre segments. My thanks to Bob Padula of the ARDXC News for most of the above information.

BBC WORLD SERVICE

Also as I am writing this up, the news from the Indian sub-continent is dominating the World News, following the assassination of Mrs Indira Gandhi, the Indian Prime Minister. I was alerted by a headline over the local TV channel, and commenced monitoring one of the international newsagency feeds on RTTY for the next few hours. Strangely enough, I had poor propagation from India, that night. So I mainly relied on the BBC World Service for the latest news.

And while I think of the BBC, now aided by the R70 receiver, I am now able to almost get a continuous coverage of "Bush House". These are via the various relay bases, as there are, in fact, times when UK sites are inaudible, when propagation should be reliable. I often had to rely on the Antigua relay in the Caribbean, but alas, a station has appeared alongside, causing a nasty heterodyne from 0700 UTC. The station is on 9.509 MHz variable, and aided with the notch and passband tuning controls, I was able to positively identify it as Algeria in French. It has been notorious for its frequency instability.

MODERN TECHNOLOGY TAKES OVER

The Radio Australia facility at Lyndhurst is to be closed. This is according to Robert Jones, in the November edition of the ADXN Station News. Already the RA feeder on 12.290 MHz USB has been discontinued as from the 20th September 1984, although it will remain on standby, if required. The proposed AUSSAT communications satellite will be feeding audio to the various sites, backed up by terrestrial microwave links in the future. Services at present stationed there, will be relocated to other sites, with the facility being closed later this year, or early 1986.

Well, that is all for this month. Until next time, the very best of DX and good listening! — Robin.

AR

BILL DESPAIRS

Ted Holmes VK3DEH 20 Edmunds Street, Parkdale, Vic 3195

Driving home from the supermarket, Bill Blitheringtwit felt mildly satisfied. Despite the fact that his brand new power supply was already looking a bit the worse for wear, at least he had a unit which would probably work. He could get back on air, anyway, after a few minor repairs had been done. He wondered where he put the masking tape. . . . Humming unmusically, he arrived back safely beneath his home carport.

Normally at this point his wife vanished indoors, leaving him to unload all the shopping. Today, however, she didn't. She hung around the car boot waiting for him to open it. This was awkward. If she spotted the battered (but plainly alien) carton containing the remnants of the power supply, nestling amongst the shopping, then he was a doomed man. Bill dawdled a bit, fiddled around, examined things in the car, but his wife never budged. Perhaps she had smelt a rat. Eventually he had to alight and he sidled around to the boot. He could see a distinct glint in his wife's eyes. Almost steely, he thought.

"Don't worry, dear," he said. "I can carry all this stuff in."

"I want to see," said his wife.

"See what?" Bill asked, all innocence.

"What you bought," she said.

"Bought?" echoed Bill, but it was no use. He realised immediately that he was a dead duck, a condemned man, doomed. Reluctantly, he opened the boot. There stood the carton, naked, blatant, made in Japan.

"Aha!" his wife exclaimed. "What's that?"

Bill cleared his throat. He knew what was coming.

"A power supply."

"A what?"

"A power supply. Real cheap too. Beat the chap down . . ." Bill rambled on, seeing a look of total disapproval forming on his wife's face.

"Indeed!" she said and then proceeded to give him a dressing down which lasted ten minutes.

As she spoke, Bill could feel the gloom pressing down on him. Utter depression possessed him and he shambled into the house like a zombie. What was the use? He couldn't fight it. All the spirit, the old fire, went out of him. He went into the shack and looked around. What did he see? An empty shell of what it was. Silent rigs, dust, disorder. There just didn't seem to be any point any more.

Suddenly, like dawn breaking across dark horizons, an idea came to him. He would give it up — at least for a while. Take up something else. What about bowls? He had heard that this was a good game and it had one great advantage — it would get him out of the house for long periods. Yes! He'd take up bowls and perhaps one day . . . one day he'd return to his old love — Amateur Radio.

Meantime he'd give it a rest, lay off for a bit and, when the time was right, who knows?

QRX . . . QRX . . . QRX . . . QRX . . . QRX . . . QRX . . . QRX.

AR

CONTESTS

Ian Hunt VK5QX
FEDERAL CONTEST MANAGER

P.O. Box 1234, GPO, Adelaide, SA 5001.

CONTEST CALENDAR

JANUARY

1. UBA SWL Competition, 1985 commences (Rules AR Nov) (I do not propose to list this contest further as it continues throughout the remainder of 1985.)
12 40 Metre World SSB Championship Contest
13 75 Metre World SSB Championship Contest
19-20 160 Metre World SSB Championship Contest
28 15 Metre World SSB Championship Contest
27 20 Metre World SSB Championship Contest
12 Hunting Lions In The Air. (Rules AR Dec)
25-27 CQ WW DX 160 Metre CW Contest.

Ross Hull Memorial Contest continues to finish 7th January. (Rules AR Nov)

FEBRUARY

9-10 OCWA CW QSO Party
9-10 YL-OM Phone Contest.
23 RTTY World Championship Contest. (Rules this issue.)
22-24 CQ WW DX 160 Metre SSB Contest
23-24 John Moyle Memorial National Field Day Contest.

MARCH

30-31 CQ WW WPX SSB Contest

There are various different types of contests but they all have a number of common features. Two, most important, are the overall technical capability of the station equipment, (will the gear perform at its best for the continuous hours operation?) and the skill of the operator to be able to keep his contact rate running at a maximum for the full duration of the contest. The latter is probably the most important factor of them all as it has been shown many times that a top class operator can produce a winning performance without access to high power, big beams etc.

It is great to have fun during a contest but for those who are truly contest-minded the whole thing becomes a really serious matter. In this vein I might expand on a point which I have been considering for several years now, but I accept the right of people to have differing points of view. I remember wondering about this when a number of years ago the current Federal Contest Manager, I think it was Peter VK4PJ (and no offence meant Peter) came out with a proposal that the Remembrance Day Contest should become known as 'The Friendly Contest'. Now this came as a bit of a shock to me. I had always pictured a contest as a bit of a battle, somewhat akin to a couple of fighters getting into a boxing ring. I somehow could not accept the philosophy of one giving the other just a friendly punch to the nose. You will certainly accept though, the fact, that even boxers have to fight within the rules and they may even be the very best of friends both before and after the contest. Such it is, I believe, with our contests. You fight as hard as you can although you fight fair. Cheating is obviously outlawed, dubious operating practices may well be questioned by the Contest Manager and in fact many contests contain provisos which allow disqualification of an operator who consistently departs from the well recognised code of operating ethics.

One important side of contest operating is speed, although this should never be such as to sacrifice accuracy. If this occurs you are not a good contest operator as it will undoubtedly lead to loss of points. Incidentally I can well remember an operator on RTTY replying to me when I asked why his transmission contained so many mistakes that it was not his fault as his teletype machine would not operate as fast as he wanted to type. There are some of the fraternity who join in a contest just to give out numbers for fun and in a contest such as the Remembrance Day to help their state along. If you are one of those I believe that you are welcome as the serious operator appreciates the additional contact which you provide to him. I would ask though that you also respect the fact that the other guy wants to make his contact as quickly as possible and move on to his next, so please do not aggravate him by adding extraneous detail such as my name is . . ., and I am running 50 watts here from my QTH at Oodnnawoop-woop to a dipole. Simply give him the number he desires and then you can usually find someone else who wants to rag-chew rather than contest. Similarly however the serious contester should be as patient as possible with someone who is somewhat slower than might be desired for various reasons. Remember you had to go through stages before you became a Hot Shot operator, and after all the other station is providing you with the courtesy of another contact which you otherwise would not have. Slowness may be due to inexperience, age maybe or even a state of temporary confusion. Please never let it be that you could not be bothered checking up as to what is required before joining in even if you personally are not all that interested in contests.

There is one situation which I have run across many times, particularly in our own local contests, and this is one which shows a lack of understanding on the part of many operators. I have just made a contact with an operator, whom I tuned to and called, and then I in turn am called by yet another station on the same frequency. I would agree that the use of the frequency is probably the right of the first station which occupied it, if such a right does exist, but it does no harm for him to stand by and allow me to make my very quick exchange with the station calling me before I shift away from his frequency. You might think that this sounds unlair, nevertheless I find that the most complaints about this practice seem to come from those operators who are actually pretty slow and ineffective. Most of the top operators will stand by and allow the other guy to make his quick contact and in fact are usually pleased to do so as it allows them a quick break before calling CQ again. If you do not believe me on this score ask about amongst the top scoring contest men as they realise that such quick contacts and courtesy and understanding benefit them. Deliberate ORMing to prevent such a quick second contact taking place smacks of a spoilt little boy attitude.

Usually a contest is not the place to be for the purpose of chasing rare DX contacts. But there are always exceptions to the rule, such as the annual WPX Contest which is fine for chasing and obtaining new prefixes for the WPX Award. However that is one thing that contest is specifically designed for. Unless there is a very good reason to believe otherwise don't expect the contester to appreciate your QSL card after the contest when he has probably worked hundreds of other stations in your call area.

Before a major entrant competes in a contest he has usually psyched himself up for a big effort. All his activity beforehand, preparing logs, check sheets, operating aids, cleaning up the shack, and even practising staying up all night or maybe getting in extra sleep and rest is accompanied by his thoughts and plans toward the various strategies he will adopt. Such things include planning which band to begin the contest on and then which band to QSY to next. *What will be the best direction to keep the beam pointed in for the majority of time? Which prefix or country to give priority to or which particular rig to use on which band and whether or not to use a particular microphone?* There is no doubt whatsoever that such an approach pays off and I recommend some thought on these aspects of operation.

Some operators tend to use the technique of staying as far as possible on one frequency and calling CQ. This is OK as long as replies are coming in however it becomes an obvious waste of time and does little else but produce unwanted QRM when the going gets slow. If no reply is received after about one-and-a-half minutes calling you will always do far better to tune the band and ascertain just what is going on. It may well be that propagation on the particular band is just going out. You can also pick up new contacts by carefully tuning a band from top to bottom and finding those who for some reason are not prepared to tune more than a few kHz one way or another. By and large the main aim is to be doing something all the time which might produce some worthwhile result rather than have no contacts.

A poor practice, adopted by some of the inexperienced in the false belief that they are operating faster, is to call a station and give him the serial number before he has acknowledged the first call. Mostly this practice merely slows things. Even the best operators are working to a fixed method and whilst fast and usually flexible they are not expecting this, so they will probably ask you to give the serial number again anyway. It also creates confusion, particularly when the station who has been called and sent the unsolicited number goes back instead to someone else. Thus your time in sending the serial number has been wasted whereas the short snappy call would more probably have produced a result.

Again I suggest that you observe the operating procedures of the top scoring operators and try to emulate them. They have proven their methods by the results they obtain.

Finally, another little story comes to mind as light relief. One operator told me he could not understand why his points score each year was not keeping up with the rest of the top operators. He explained that he planned very carefully each year and entered the contest with a really good organisation behind him. He had a whole band of helpers; one to run the two tape recorders sequentially so as to ensure that no contact missed being recorded, another to operate the playback machine to double check the number exchanges, another to scan the other bands with other receivers, yet another to keep the log and another the check sheet etc. It even came out that he had at least two other members of the team to produce the food and drink and chop the wood for the fire. The question followed as to how many my back up team comprised. He seemed absolutely staggered when I replied that I did all the work except that my XYL backed me by ensuring that I had a cold drink nearby all the time and something light to eat now and again. There was no doubt that all the extra planning in the case of my friend and the mammoth organisation behind him was in fact holding him further back all the time.

Best of luck with your contest operation next time you enter one.

In the December issue I raised again the matter of the dates of our various contests and proposed a plan to rationalise same. You will note that the date for the John Moyle Memorial National Field Day Contest has now been set to as late as possible within the month of February. The rules for same will appear in next months issue of AR. In changing the date to this extent I have gone as far as I can without actually moving the date to another month later, as proposed. I have done this for several reasons. Firstly the majority of feedback, indeed without exception, has been in favour of my proposal for this contest. This feedback has come from on air discussions with amateurs in both VK5 and other states, letters from individuals and various radio clubs and also personal discussion with other operators and representatives of clubs.

I recently paid a visit to Wagga in VK2 and was most kindly made welcome by amateurs there. I took the opportunity of raising the subject with the President of the Wagga Amateur Radio Club who immediately contacted various club officers and members and from them obtained an opinion. Needless to say that opinion was generally in favour of such a change also. It is such interest and action as this which is appreciated when one has a job to do.

Thus I trust that the aims advanced for a change may have, *at least in part*, been met. These are, to get the Field Day Contest away from the fire danger season and to remove it from the great WET period as far as the boys in the north of the country are concerned.

It would appear nevertheless that any such changes as proposed may not meet with the approval of all, Federal Councillors. The matter of contest dates was proposed for discussion by the VK5 Division at the 1984 Federal Convention, however the motion lapsed for want of a seconder thus no discussion was held on this subject.

I would therefore ask that if you have an opinion on this subject, and even if you have already written to me on your own behalf or representing a club, could you please put pen to paper again and make such opinion known to your Federal Councillor and the Council Members of your own Division. Maybe this way we can have it seen that a proper consensus of opinion is taken notice of.

REMEMBRANCE DAY CONTEST RESULTS

Pressure of work and other important activities has delayed the completion of results for this contest. You should see such appear in the February issue of AR as was the case last year.

One certainly learns by experience, and I feel that once having dealt with the large number of logs for this latest RD Contest I will be much better placed to handle such matters in future.

I would also like to express my appreciation for the advice and assistance provided by Peter VK4PJ and Neil VK6NE both of whom are previous contest managers. Peter in particular forwarded to me a copy of 'A Guide to Federal Contest Managers' which he had compiled several years ago.

REMEMBRANCE DAY CONTEST CERTIFICATES FOR 1983

Efforts to sort out the situation with regard to these certificates are still being made, so if you should have been the recipient of one of these do not yet give up hope of receiving same.

VK NOVICE CONTEST 1983

Certificates for this contest were mailed out several months ago so all concerned should have received same by now. Our thanks are due to our Secretary/Manager Reg Macey who arranged for new certificates to be printed at rather short notice once matters had been sorted out as to just what had occurred. We are still however looking for the trophy for that contest and I hope that by the time you are reading this we will have located it.

VK NOVICE CONTEST, 1984

The due date for receipt of logs of 29th October is now well past and a rather dissappointing total of about only 30 logs have been received. Coming right on top of the Remembrance Day Contest this perhaps may not be unexpected, probably as I have previously pointed out this is a good reason to move the date of the Novice Contest. If no more logs than this are received for a contest it makes it hardly worth the effort of organising. Checking of the logs and preparation of the results will take place as soon as the RD Contest work is completed.

CONTRIBUTIONS TO THIS COLUMN

As well as hearing from you regarding contest matters, rules etc, I would be very pleased to receive anything else in the way of material which you feel may interest others in connection with contest operation. I would also be very pleased to receive any photographs of contest operation stations both of individuals and clubs. There should surely be some good Field Day Contest photos somewhere about. *Do you have any favourite hints about the way you operate which you would like to pass along, or maybe details of a nice easy to assemble portable 5 element 40 metre yagi for a Field Day?* Any material along these lines will be welcome as I am sure that photos and diagrams etc, are a lot more interesting than just pages of print. I also have under consideration the idea of a guest writer from time to time, specifically someone who is well known as a regular and successful contester. So again if you think you would like to contribute in this way please let me know.

Now the 1985 contesting year is upon us and I like to think that it will be a year of both expansion and enthusiasm in this area of our hobby activities. Rest assured that if there is any way I can see in which things can be made more exciting or interesting I will do my very best to implement whatever is necessary. I do acknowledge that I have received quite a number of suggestions in connection with scoring for some contests, some members have suggested that larger states, eg: VK4 and VK6 should be divided up into smaller areas for contest purposes, differing methods of 'exchange' within contests have been proposed, many and varied are the suggestions overall. Whilst all such ideas are appreciated, and indeed I still welcome them, I must point out that it is not always easy to include them in the contest rules and that changes have to be carefully thought out before being applied. Thus it may take some time to sift and select from the many ideas and the changes possible will not happen overnight.

Another suggestion which I have made to the Federal Executive is that a standard log sheet should be developed and printed in quantity for issue for contests. It would be then be expected that entrants should all submit their logs on the standard form. I am awaiting comment from the Federal Office on this suggestion following which, if the idea is accepted, arrangements would be made to produce a suitable format. Any ideas on just what such a log sheet should look like would also be welcome. It would be necessary to decide how the matter of costs should be dealt with although it is my belief that if such a task was done on a national basis it should not turn out to be too expensive. Some individual Divisions already issue log sheets for such as the RD Contest. At the same time it could well be that the standard log sheet provides for the necessary declaration, entry details and operating summary etc as well as contact information.

So, here again are some of the ideas being turned over in my mind as a means of improving contest operation here in Australia. For now, I once again pass along my best 73 to you. I trust that you have had a enjoyable Festive Season and I wish you all the very best for a successful and satisfying 1985. May your contest operations provide you with much pleasure.

FOURTH ANNUAL RTTY WORLD CHAMPIONSHIP CONTEST

Sponsored By: The RTTY Journal and 73 Magazine.

Contest Period: 0000 to 2400 UTC 23 February, 1985.

Rules: The same station may be worked ONCE ON EACH BAND. Crossmode contacts do not count. Single operator stations may work 16 hours maximum, while the multi-operator stations may operate the entire 24 hour period. Off times are NO LESS than 30 minutes each and MUST be noted in your log(s).

Operator Classes: (A) Single Operator, Single Transmitter. (B) Multi-operator, Single Transmitter.

Entry Categories: (A) Single Band. (B) All Band, 10-80 Metres.

Exchange: Stations within the 48 Continental US States and Canada must transmit RST, and State, Province/Territory. All others must transmit RST and consecutive contact number.

OSO Points: 5 QSO Points for contacts with W/VE stations located within the Continental US and Canada. 10 QSO Points for all other contacts.

Multiplier Points: 1 Multiplier Point is awarded for each of the 48 Continental US States, (A District of Columbia contact may be substituted for a State of Maryland multiplier), Canadian Provinces/Territories and DX Countries worked on each band (excluding US and Canada).

Final Points: Total QSO Points multiplied by Total Multipliers equals CLAIMED SCORE.

Contest Entries: Entries must include a SEPARATE log for EACH BAND, a dupe sheet, a summary sheet, a multiplier check list, and a list of equipment used. Contestants are asked to send a SASE to the Contest address for Official Forms.

Entry Deadline: All entries MUST be POSTMARKED no later than 16 April, 1985.

Disqualifications: Omission of the required entry forms, operating in excess of legal power, manipulating scores or times to achieve a score advantage or failure to omit duplicate contacts which would reduce the overall score more than 2 percent are all grounds for immediate disqualification. Decisions of the contest committee are final.

Awards: Contest awards will be issued in each entry category and operator class in each of the US Call Districts, Canadian Provinces/Territories as well as in each DX Country represented. Other awards may be issued at the discretion of the awards committee. A minimum of 25 QSOs must be worked to be eligible for awards.

Contest Address: Enclose an SASE to: *RTTY World Championship Contest, C/- The RTTY Journal, PO Box RY, Cardiff, CA 92007.* **AR**

MICROCOMPUTER CONVERTS BRAILLE INTO PRINT

A microcomputer system which converts braille into print to help blind people at school or work has won an award, presented by the BBC for the best invention to help the unsighted.

The winner is Dr Tom Vincent, a physics lecturer, for his development of the Work Station, which enables a person to type in braille, produce a simultaneous printed version, and then, with the help of a voice synthesiser, to check the print version independently.

Dr Vincent, 49, has also devised ancillary software which enables a blind person to make use of word processing facilities, and keep personal braille records on floppy disks. *from Information Technology from Britain* **AR**

EDUCATION NOTES

Brenda Edmonds, VK3KT
FEDERAL EDUCATION OFFICER
56 Baden Powell Drive, Frankston, Vic 3199

This month "go to it" and see how you would fare with this sample AOCP Examination Paper.

Select the correct or most appropriate alternative.

1 The inductive reactance of a coil may be calculated from the
a resistance of the coil and the frequency applied
b frequency applied and the inductance of the coil
c frequency applied and the Q of the coil
d inductance and resistance of the coil

2 Chokes are not used in low voltage high current power supplies because
a of the excessive voltage drop across them
b they do not have a smoothing effect at low voltage
c they overheat with high current
d they have a very low inductive reactance

3 A dip oscillator is an instrument which:
a shows a rise in current when power is absorbed by the tuned circuit under test
b is sensitive and measures the exact resonant frequencies of L-C circuits
c can be used only on energised circuits
d is inductively coupled to an L-C circuit to measure its resonant frequency

4 A receiver requires a 12 volt DC power source. You could use:
a 12 nicad batteries
b 10 dry cell batteries
c 10 nicad batteries
d 8 nicad batteries

5 A vertical antenna may be described as
a being omnidirectional in a horizontal plane
b having a spherically polarized magnetic field
c having primarily a high angle of radiation
d having maximum radiation in the vertical plane

6 Capacitors with mica or ceramic dielectric are used in radio frequency circuits because they have
a low dielectric loss, low inductance, and low insulation resistance
b lower capacitive reactance than tantalum or paper capacitors
c low dielectric loss, low inductance and high insulation resistance
d low dielectric loss, high inductance and low insulation resistance

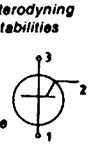
7 A power supply is designed to reliably provide an output of 12 volts DC at 20 amps. The main components rating should be:
a transformer — 20 V, 30 amps; capacitors — 2 x 32 µfd; bridge rectifier — 40 V, 10 amps
b transformer — 30 V, 20 amps; capacitors — 2 x 4000 µfd 50 V; bridge rectifier 20 V 20 amps
c transformer — 12 V, 30 amps; capacitors — 3 x 4000 µfd; bridge rectifier — 35 V 35 amps
d transformer — 20 V, 30 amps; capacitors 3 x 4000 µfd, 50 V; bridge rectifier — 50 V 35 amps

8 When using a resonant antenna, the voltage SWR measured at the transmitter output is 3:1. The SWR should be reduced by:
a shortening the antenna
b using heavy duty coaxial transmission line
c lengthening the antenna
d correcting impedance mismatching

9 In radio-teletype transmissions
a the message is conveyed by frequency shift keying
b hand keying is used to set the spacing
c grid block keying is used to reduce interference
d the keying is controlled by the phase shift

10 Variable frequency oscillator systems for use at VHF usually employ heterodyning rather than frequency multiplication because
a it is difficult to build crystal circuits to provide the required high order of overtones
b the stability of the oscillator is not important
c frequency measurement is made easier by heterodyning
d it avoids the multiplication of oscillator instabilities

11 This symbol represents a



a PNP transistor and 2 is the collector
b triac and 1 is the emitter
c zener diode and 3 is the cathode
d silicon controlled rectifier and 2 is the gate

12 In high level modulation, the audio signal
a modulates the carrier in the final stages of the transmitter
b is filtered to boost the lower frequencies
c is applied at the buffer stage
d is only amplified at the higher frequencies

13 When cathode bias is used in an RF amplifier stage a capacitor is connected in parallel with the bias resistor to:
a reduce the bias voltage
b double the bias voltage
c provide a low impedance path for RF
d block the DC flow between cathode and ground

14 When an alternating voltage is applied to a capacitor, the voltage and current are
a in phase
b 180° out of phase
c 90° out of phase, voltage leading
d 90° out of phase, current leading

15 At a frequency of 1 GigaHertz, each cycle occupies a period of
a 1 nanosecond
b 1000 nanoseconds
c $\frac{1}{100}$ milliseconds
d 1000 microseconds

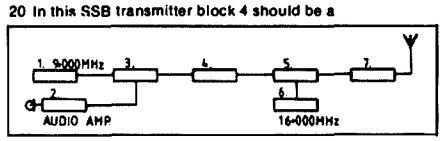
16 In a Class AB amplifier, the operating cycle occupies
a 360°
b between 360° and 180°
c 180°
d between 180° and 90°

17 To achieve adequate intelligibility in a telephony transmission the modulating frequency need not be more than
a 300 Hz
b 3 kHz
c 6 kHz
d 10 kHz

16 The specifications for an SSB receiver quote one feature as '0.5 V for 10 dB $\frac{S+N}{N}$'. The feature referred to is
a stability
b sensitivity
c image rejection
d squelch range

19 The Modulation Index of an FM transmission is calculated from the formula Modulation Index =
a Modulation frequency ÷ Carrier frequency
b $\frac{\text{Modulation frequency}}{\text{Carrier frequency}}$
c $\frac{\text{Carrier frequency deviation}}{\text{Modulating frequency}}$
d $\frac{\text{Modulating frequency x 2}}{\text{Carrier frequency}}$

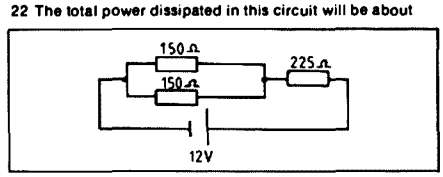
20 In this SSB transmitter block 4 should be a



a filter to separate the two RF oscillators
b narrow bandpass filter
c filter designed to suppress harmonics of 9.000 MHz
d frequency multiplier

21 An SSB receiver uses delayed AGC because
a the AGC system is slow to respond to a signal without a carrier
b a fast attack results in excessive audio output
c a slow release causes hum on the audio output
d a slow release gives a more constant audio output

22 The total power dissipated in this circuit will be about



a 2 watts
b 1 watt
c ½ watt
d ¼ watt

23 The PIV rating of a rectifier in a full wave rectifier circuit should be about
a 2.4 times the secondary RMS voltage
b 3.0 times the secondary RMS voltage
c 1.5 times the secondary RMS voltage
d 0.9 times the secondary RMS voltage

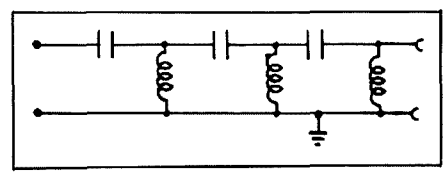
24 Power transistor performance ratings are generally specified at given current and voltage levels but these ratings may not apply if the
a input signal level is low
b operating temperature is excessive
c device is used at VHF or SHF
d resistance of the load is more than 1 KΩ

25 The use of broadband final amplifiers in modern amateur transmitters has made
a matching of the load more critical
b matching to the load more accurate
c the use of an antenna tuner unnecessary
d it possible to cover 1.8 — 450 MHz without any tuning

26 A VHF mobile operator is performing field strength measurements using quarter wave and ⅝wavelength antennas. Differences in performance are likely because the:
a quarter wave antenna has a higher angle of radiation
b input to the ⅝wave antenna is several dB greater
c feed impedance of the two antennas is different
d ⅝wave antenna has a larger tuning coil

27 In the event of thunderstorm activity, the risk of lightning strikes into an amateur installation may be reduced if:
a equipment is disconnected from mains power and transmission lines
b transmission lines only are disconnected at the receiver or transceiver
c equipment is disconnected from mains power only
d transmission lines are shorted to the AC earth line

26 This device could be used as a:



a high pass filter at the input to a television receiver
b matching stub on an antenna
c transmitter output filter to prevent radiation of harmonics
d trap in a multiband antenna

29 An amateur transmission on 28 MHz causes interference to nearby television reception on Channel 9 (196 MHz) but not on Channel 2 (64 MHz). It is likely that this problem:
a is the result of poor design in the television set
b can be cured by a low pass filter at the transmitter output
c will decrease if transmitter output power is increased
d can be reduced by better shielding of the transmitter

30 To enable an AM receiver to resolve CW signals it is necessary to add:
a an extra IF amplifier stage
b a narrow band filter before the detection stage
c a beat frequency oscillator stage
d a more efficient noise limiter

31 A received FM signal sounds weak but not noisy. This effect occurs if the:
a signal deviation is too wide
b signal strength received is low
c signal deviation is too narrow
d receiver is designed for phase modulation signals

32 Bipolar transistors require a bias current across the base — emitter junction. This can be achieved by using:
a a resistor network
b cathode bias
c negative voltage on the collector
d limiting of collector current

33 A 9.9 k ohm resistor is placed in series with a 100 ohm 0.1 mA meter. The scale will now read:
a 0 — 1 volt
b 0 — 10 volts
c 0 — 100 volts
d 0 — 1000 volts

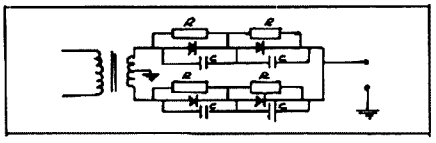
34 Amateur HF band reception is disrupted by a high ambient noise level. At the same time a television receiver shows two broad horizontal interference bands. It is likely that the cause is:
a noise from distant thunderstorms
b a continuous leakage path between nearby power lines
c local oscillator radiation from another television set
d power line leakage to earth occuring on line voltage peaks

35 Short term fluctuations in the strength of an HF signal received from an overseas station may be due to
a upper atmospheric turbulence
b simultaneous reception of ground wave and tropospheric wave
c phase differences between waves travelling different paths
d tropospheric temperature inversions over the ocean

36 A long wire antenna designed for use in the HF band
a should be fed with two-wire transmission line at a current maximum
b will radiate most of the power in a direction parallel to the wire itself
c should be cut accurately to an uneven number of half wavelengths only
d will always have a voltage minimum at the free end

37 A transformer has a Primary:secondary turns ratio of 10:1. An 8 ohm load is connected to the secondary. The primary impedance will be:
a 100 ohms
b 800 ohms
c 8 ohms
d 0.8 ohms

38 In this rectifier circuit the

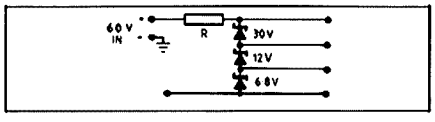


a ripple frequency of the output will be four times the frequency of the input
b capacitors are used to protect the diodes against voltage 'spikes'
c PIV rating of the diodes should be twice that required if single diodes were used
d resistors are used to provide output voltage regulation

39 The 'gain bandwidth product' of a transistor is the:
a frequency at which the gain becomes unity
b ratio of base current to collector current
c range of frequencies which can cause partial or complete phase shift
d ratio of output impedance to input impedance

40 Forward bias values required for solid state diodes to conduct are about
a germanium 0.2 volt, silicon 0.6 volt
b germanium 0.01 volt, silicon 1.6 volts
c germanium 0.6 volt, silicon 0.2 volt
d germanium 6 millivolts, silicon 2 millivolts

41 Regulated voltages obtainable from this arrangement could include



a 60V, 90V and 102V
b 30V, 18V and 5.2V
c 30V, 42V and 48.8V
d 30V, 12V and 6.8V only

42 The 'polarisation' of a radio wave refers to the
a direction of the magnetic field
b compass alignment of the antenna
c angle of radiation with respect to the earth's surface
d direction of the electric field

43 The sunspot cycle:
a recurs about every 27 days
b may be responsible for sudden changes in propagation conditions
c is caused by slight variations in the distance between the Earth and the Sun
d has an average period of about 11 years

44 Self oscillation in a vacuum tube or transistor stage
a may occur when its output and input circuits are tuned to the same frequency
b is usually due to negative feedback between output and input
c will not be apparent to the operator unless the signal is displayed on a cathode ray oscilloscope
d is rarely responsible for any radiation outside the amateur bands

45 The accuracy of a moving coil voltmeter will be adequate if:
a a diode is used in series with the meter
b a high resistance shunt is used across the voltmeter
c the internal resistance of the meter is as high as possible
d the internal resistance of the meter is as low as possible

46 The resonant frequency of a parallel tuned circuit
a is the frequency at which the circuit impedance is minimum
b will depend on the voltage applied
c will increase if the capacitance or inductance is decreased
d is the frequency at which reactance equals resistance

47 A television receiver suffers interference on all channels when a nearby amateur station transmits. This problem could be reduced by
a increasing the output power of the amateur transmitter
b inserting a low pass filter at the television input
c changing polarisation of the television antenna system
d using a high pass filter in the television antenna lead

48 A double conversion superheterodyne receiver usually
a has a low first IF for sensitivity and a high second IF for good stability
b includes a regenerative detector
c is less likely to suffer from cross modulation than a single conversion type
d has a high first IF for good image rejection, and a low second IF for good selectivity

49 FM receivers exhibit a characteristic known as 'capture effect'. This means that
a they can resolve a wide range of frequencies
b only small antennas are required because of their high efficiency
c a very narrow band filter has to be used to block unwanted frequencies
d only the strongest signal received will be demodulated

50 Tropospheric ducting may:
a cause HF signals to fade suddenly
b allow extended long distance VHF communications
c occur as a result of meteor showers or auroral activity
d occur more frequently at HF than at VHF

RADIO TELESCOPE BREAKS THE SPACE BARRIER

The origins of galaxies in deep space can now be examined for the first time with a new kind of radio telescope developed in Britain by a team of Cambridge astronomers.

Known as the Cambridge Low Frequency Synthesis Telescope, it consists of an array of 2-300 Yagi aerials dotted along a five km line. The Yagis pick up long, two-metre wavelengths which are converted by a central Nord computer into optical photographs for examination the next morning.

"This is a big advantage," says Dr John Baldwin, who is in charge of the project. *"Previously it has taken up to two weeks to analyse the results obtained with existing radio telescopes. Also it is the first telescope that has been designed to overcome the effects of the atmosphere which until now has always made the imaging of astronomical objects extremely difficult."*

Because the telescope opens up a new wavelength, Dr Baldwin is confident that it will reveal objects that are unlike objects seen on other wavebands. *"We might expect to find in our milky way quite new stars that give out radio waves specifically at these long wavelengths,"* he explains. *"Also, we can expect to see things that are particularly old. For example, after 10 to 20 million years many radio galaxies will disappear at short wavelengths, but will leave large clouds behind which will radiate at long wavelengths for perhaps 100 million years or so.*

"The problem we would like to sort out is where do galaxies come from and how does the Universe evolve to form the universe as we see it now."

According to Dr Baldwin, first results have come up to expectations with vast numbers of previously unrecorded objects being detected, including some very large objects measuring several million light years across, and in one case an age of 300 million years has been put on an electron cloud to indirectly reveal the galaxy's speed across the sky.

FORWARD BIAS

VK1 DIVISION

"Happy New Year" to readers and I hope you have a better year than last.

"HOW TO BECOME AN AMATEUR RADIO OPERATOR"

The VK1 Division of the WIA holds lecture classes each year for those people wishing to become amateurs, or those operators wanting to up-grade to a higher class of licence. There are two classes available. The Novice (NAOCP) and the Full Call (AOCP).

NOVICE CLASSES

These will begin on the 5th February 1985, at 6.30pm, in room 13 the Griffen Centre, Civic, and this course will continue until the 12th November 1985. The course will not have any breaks in it and will always be on Tuesday nights. The fee for this course will be approx $45, this also includes the text book that will be used throughout the year. The course provides basic electronic theory and Morse code practise at 5 WPM and constitutes the ground work for a beginner to enter the fascinating world of amateur radio.

FULL CALL CLASSES

These classes will commence 7th February 1985, at 6.30pm in room 13 the Griffen Centre, Civic on Thursday nights and will continue until the 8th August 1985. The fee for this course will be $40 and the student supplies his/her own text books. These books are available from the WIA bookshop at the general monthly meetings. This course is suited to the holder of a Novice Licence or the person that has knowledge in electronics and wishes to gain information on the finer points of radio theory, propagation, antennas and circuit analysis etc for the purpose of gaining an amateur radio licence. This course also provides tutoring in Morse code at 10WPM.

This year we are also offering something for the student that wants to do both courses. The fee will be $55, a massive saving to the student of $30.

People wanting to enrol in any of the courses offered should contact Alan Hawes on 58 2568 at home after 7pm, or contact one of the committee men at the monthly meeting.

1985 ANNUAL GENERAL MEETING

In accordance with the Division's Constitution, notice is hereby given that the AGM will be held on the 25th February 1985 at 8pm, at the Griffen Centre, Civic, and all are welcome to attend.

The order of business will be as follows:

"to receive from the Committee, Auditor, Federal Councillor, Public Officer and other officers, reports on the Divisions transactions and business during 1984;

"to elect the officers and committee members for 1985;

"to elect the Federal Councillor; and

"to appoint the Auditor and determine his renumeration, if any.

Nominations of candidates for election of officers of the Division or as a committee member, must be in writing, signed by two members of the Division, who are holders of a current Australian transmitting licence, and accompanied by the written consent of the candidate. The nomination is to be delivered to the Public Officer at least ten days prior to the date of the AGM. Nomination forms will be available at January's general meeting.

So, let's see those nominations arrive, and don't leave it to "SOMEONE ELSE" because he died a long time ago.

YOUR DIVISION NEEDS YOU!

MEMBERSHIP FEES

By now you should have paid your 1985 membership fee, remember our Constitution, if you're not financial, you're not a member, therefore you don't receive the benefits of the QSL bureau, and what would life be like if you couldn't receive Amateur Radio every month, delivered to your home. Life just wouldn't be the same.

MEETING DATES FOR 1985

All meetings will be held at the Griffen Centre, Civic, 21 Jan., 25 Feb., 25 Mar., 22 Apr., 27 May, 24 Jun., 22 Jul., 26 Aug., 23 Sep., 28 Oct., 25 Nov.

The meetings normally start at 8.00pm, however, the room is usually opened at 7.30pm, so that members can collect their QSL cards and look over the Book Shop.

VK1WK REPORTS

There is little doubt that 40 metres is going to provide some interest during the summer months in Eastern Australia; as I write there are brilliant, but rather noisy, openings to Europe at 1900UTC and the USA 1200UTC. Follow the "grey line" for maximum benefit.

Solar antics in the latter half of 1984 have played havoc with 20 and 15; the only regular openings of late on 20 have been 0930UTC to South America (short path), Europe 0500 (long path), and the USA, on 15, from 2300-0200UTC; nothing heard on 10!

By the time this literary gem receives publication your humble correspondent will be holidaying back in the Americas as VK1WK/W2/VE and resurrecting the old callsign as LU8EBI/PY/CE/CX and looking for VKs at 0930UTC on ± 14.104 MHz over the South Pole. So New Year greetings to all, signed John VK1WK.

My thanks go to John who always comes to my rescue when I need some interesting material to finish off with.

Well that's it for another month and in my case this will be the last time I will be writing this column, (who said thank heavens). However, before I hang up my typewriter, I would like to show my appreciation to Alan VK1KAL, the Committee, and the lecturers, and the members of the VK1 Division, especially Theo VK1KV, who was always prepared to lend his station to me and be my engineer on the weekly broadcasts. My sincere thanks to all, and my best wishes to the incoming Committee for 1985.

Cheers for now.

John VK1KJM. Editor.

AR

INTRUDER WATCH

Bill Martin, VK2EBM
FEDERAL INTRUDER WATCH CO-ORDINATOR
33 Somerville Road, Hornsby Heights, NSW 2077

It's nice to be able to open the column sometimes with congratulations to someone. This time it's to Don VK2JYI, formerly VK2VYI, a staunch supporter of the Intruder Watch, and nice to see him upgrade. Well done, Don.

During the period of daylight saving time, the Thursday evening 3.540 MHz Intruder Watch Net will be scheduled at 1000 UTC. Personally, I am looking forward to the end of daylight saving. How many times have I sat at the rig, awaiting a net or sked, only to realise that I'm an hour early!

Nice note from Brian L60099, who sent some useful information re the IW, and look forward to more from him, and other SWL's who may want to help out.

I would like to point out, by the way, that, for reasons of compilation, etc, for Amateur Radio, this column must be written two months in advance, and it can be difficult sometimes to get current news into the magazine while it is still topical.

The month of September last, saw good support from around thirty amateurs and SWLs, and reports arrived from every state of Australia, which is very gratifying.

News from the DOC is that they are monitoring the frequencies used by the USSR intruder, 'UMS', who has been active for a number of years on 14.141, 14.171, and 21.032 MHz.

Bearings on a RTTY intruder on 14.218 MHz would be appreciated from those who have beams, and we might be able to track down this nuisance, who operates nightly; he is always there around 0700 UTC, and comes into this shack at 10dB over S9. He is usually to be found idling for great lengths of time.

Any VK5 amateur might like to listen for the fourth harmonic of 5AN, Adelaide, on 3.564 MHz, and we'll see how wide-spread it is. Last heard at 0650 UTC.

I hope the support of VK amateurs and SWLs is as forthcoming in the new year as it was in the old, and will say 'all the best' for 1985, and hope the solar cycle makes an upward turn shortly; see you next month.

VK2 MINI BULLETIN

Tim Mills VK2ZTM
VK2 MINI BULLETIN EDITOR
PO Box 1066, Parramatta, NSW 2150

May I start the notes this year by wishing all members all the best for 1985, in this the Institute's 75th Anniversary Year. This Division, as will all others, is holding special events through-out the year to celebrate, more details in later issues.

TIMETABLE OF EVENTS

In a timetable of general events for this year. The VK2WI broadcasts will recommence on Sunday the 13th January. The Central Coast ARC Field Day will be held on Sunday the 17th February at the Gosford Showground. The next Conference of Clubs will be held in Sydney, the weekend after Easter, hosted by HADARC, and included In the agenda will be discussion of the Federal Convention agenda items. Should you or your group have items which need Federal or national discussion or involvement these should be submitted now to Divisional Council for consideration, checking that they have not been previously dealt with at a Federal Convention, and if suitable submitting to the next convention. The closing date for Federal items is late March. It is hoped to include the annual fireworks night at Dural on the Saturday night of the Conference of Clubs.

MEETING TIME

The start of a new year is also the time for Divisional business. The Annual General Meeting is held on Saturday the 30th March. The closing date for agenda items to the AGM, as well as the nominations for Council is 27th February. Several members of the present Council are not standing for re-election for the next term. It is also sometime since there has been an election. Don't let this keep you away, but "Member" involvement is required in the running of the Division and the more help received, the less the present personnel have to double up with various jobs. There are times when there are not enough hours in the day to do everything and this has happened to Sue VK2BSB. Sue has recently started a business venture and has had to drop off Divisional Council. Her place for the balance of the Council year has been filled by Roger VK2ZIG. I am sure that all will wish Sue the best in her new activities and thank her for the time she devoted to the Division.

HELP WITH CALL BOOK CORRECTIONS

Another position to be filled this year is JOTA liaison officer. Tom VK2PDT is not able to continue after the end of 84. If you can help, advise the Divisional office during office hours of 11 am to 2 pm week days, Wednesday evenings 7 to 9 pm on phone 02 689 2417 or via the box number. Stocks of the current Call Book are almost exhausted so you will have to wait until Spring for the next edition. *Do you have any corrections for the next edition?* If so, perhaps include them with your renewal to Melbourne. Everybody should have received their renewal about a month ago. These and matters about renewal go to the Federal Office, except those who need to apply for a concessional status for the first time. These enquiries should be directed first to the Divisional office. Additional information about renewals are included in Divisional broadcasts. It is important that anybody who may find that they are not in a position to renew advise the Federal office accordingly. It is a costly operation having to send reminder notices. I hope that there will be few in that position. In fact why not this year, **every member introduce a new member.**

REPEATER REPORTS

Now for some repeater news. Port Macquarie VK2RPM is to relocate to an elevated site to improve coverage; Goulburn ARC have submitted an application for a two metre repeater; Tumut have sought details for a two metre repeater; Orange, Bathurst and Nowra regions are in the process of applying for 70cm UHF repeaters. The last C of C brought up the high cost of insurance for repeater installations and currently investigations are under way to see if it is practical to have a single cover for multiple sites. For sometime now the Division has held a license for a 23 cm beacon and currently some stages of construction are underway. Help is required with this project and details may be obtained from John VK2EGI, the beacon officer. The assigned frequency is 1296.420 MHz which is in accordance with national band-planning. Recent issues of various electronic magazines have carried a listing for a VK6 beacon on the same frequency. It is hoped that there will be a slight frequency adjustment to take it up to what would be its band plan frequency of 1296.460 MHz, providing that the various reports to date have not been typographical errors.

Some newer amateurs appear to be unsure of the procedure of licensing repeater systems (this applies in other States as well). Co-ordination of an application is in the case of VK2 carried out by the State Repeater Committee. It is their function to have the intending group obtain and supply details about the proposed equipment, and site and permission to be there. They then assess the supplied information and determine channels for the system. Where an application reaches approval stage it is then passed on to Divisional Council and in turn to the Department of Communications. In addition, there is involvement with existing systems where changes or problems may occur. Periodically a news bulletin is produced to keep groups informed on developments. With new and variations to existing systems there is liaison with other groups where there are shared frequencies, both within the State and if required, over the borders. Any group who has a repeater matter should write or ring the Divisional office so that a set of the required paperwork may be sent out to you.

The March issue of AR will have a large involvement for NSW. If you have anything to contribute would you see that it reaches the Divisional Office by the 16th January. Until next month, which will be a few days later than other months.

73 Tim VK2ZTM
AR

Please remember to check the rules of the John Moyle Field Day Contest printed in February AR as there has been a date change.

VK3 WIA NOTES

VICTORIA 150

Jim Linton, VK3PC
DIVISIONAL PRESIDENT
VK3 DIVISION

WRITING FOR AR MAGAZINE

The Victorian Division actively encourages its members to contribute articles and/or photographs for publication in the Institute's journal.

Each year those contributions judged to be the best three are given cash prizes under the Kinnear Trophy scheme.

To make it even easy for a member to get started on the article of their choice a guide has been prepared.

Anyone thinking about contributing to AR Magazine and feel they could benefit from some guidelines — write to the AR Liaison Officer, 412 Brunswick Street, Fitzroy, Vic 3065.

REFERENCE LIBRARY

For the benefit of WIA members an extensive reference library is maintained at the Wireless Institute Centre.

Magazines including Amateur Radio. QST. Break-In, Radio-Communications, Ham Radio, 73 and others are available for reading or copying.

If you're looking for a circuit diagram, technical article, or other information — you'll probably find it in the WIA library.

With so many callsigns being re-issued there's been a trend of the new holders curious about the history of their call — this can be checked by using old callbooks in the library.

Photocopying facilities are available for members who want to take copies of magazine articles, and this service is also available to members at cost through the post.

1985 IS HERE

A New Year has arrived with this one looking like being both challenging and exciting.

Already we are half way through the Victoria 150 Award period which ends on 30th April.

This award has not only helped our hobby participate in the official celebrations of Victoria's 150th anniversary but has aided our relationships with the state and local governments.

Thank you to those who have gone out of their way to make this award a success by getting on air giving others the chance to work VK3, and qualify for the certificate.

With each New Year comes the tradition of making New Year resolutions — why not make one concerning your hobby and national radio society.

Make 1985 the year you personally encourage someone else to take up the world's best hobby — amateur radio.

It could be someone at work, a friend or even a relative — and the Institute has plenty of printed material to help you.

Just look at page 118 of the 1984/85 Call Book, or get a copy of the WIA leaflet "The Hobby For Everyone" and you'll be more than adequately equipped.

You enjoy your hobby — introduce it to others and let them join our fraternity.

AR

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

A very Happy New Year to you all. One place where it would be a bit warm this time of the year is Whyalla. News of this fairly new club comes from club secretary John Thompson VK5BWB. The President is Alan Flack VK5NRW and the club callsign is VK5BWR. The club meets every Saturday morning at 10.00am local time, at their leased club rooms in Rozee Street. They have established a "Mentor" system for those undertaking examinations. For example a novice would have a full-call "Mentor" to assist with examination preparation. They have also started a club net on Tuesdays at 7.30pm local time on 3.590 MHz ± QRM. Their sister city in Texas, USA, for Jubilee 150 is Texas City and they are looking forward to making contact with a radio club there.

STAY CLEAR

My attention has been drawn to the fact that some clubs are holding their club nets very near to the Slow Morse Practice sessions on 3.550 MHz at 1030 UTC and causing some QRM. If you are the person who is responsible for finding the clear frequency for your club's net (*and I am aware that it is not easy in that portion of the band!*) please spare a thought for those who are trying to copy the slow Morse in order to pass the exam. We have all been there and know what it's like, even if they are not there when you start your net please stay clear of 3.550 MHz. It will be appreciated.

SUCCESSFUL

The display at Morphettville in November turned out to be very successful DESPITE my organisation. There were several times during the previous week when I wondered if we would ever get it together —but we did. My very sincere thanks go to all of the following: Rowland VK5OU, Lindsay VK5GZ, Les VK5KLH, Don VK5ADD, Dave VK5BOB, Max VK5NMX, Ken VK5AGW, John VK5PJG, Ron VK5AAC, Bill VK5AWM, Cyril VK5KEM, Sam VK5TZ, Steve VK5AOZ, Joy VK5YJ, David VK5AMK and anyone else that I have inadvertently forgotten. Our special thanks to John VK5MG of International Communication Systems, for the loan of a brand new TR7950 2 m FM rig.

One special mention I have been saving till last. You may remember that some months back I made a plea for someone who could design posters for displays. Out of the three people who were good enough to contact me, Council decided to accept the offer of Peter Koen (no callsign yet but he's working on it, as is his XYL Pauline) who is a sign-writer by profession. Peter has up-to-date knowledge of the latest materials and persuaded us that a professional display board would be better for our image than a handful of posters and bits and pieces. Those of you who visited the stand couldn't fail to agree that he was certainly right as the stand was the focal point of our display. Our very grateful thanks to you, Peter, and to Pauline who came along to help set it up (and proved an invaluable asset when she and I were sent off to "scrounge" chairs and tables which weren't provided as promised!)

AR

VK4 WIA NOTES

Bud Pounsett, VK4QY
Box 638, GPO, Brisbane, Qld 4001

One of Queensland's radio clubs held their annual general meeting recently. The members examined the club's activities and found that some degree of stagnation had set in, same old programmes, same old committee members. It was time for some new objectives.

Two brilliant ideas evolved from the discussions. One was for the club to contact a scout group, the other to get very serious about intruder watching. Both, its is hoped, will benefit amateur radio. Other clubs around the country might like to follow suit.

Let us look at the scout programme. The members had found that in the recent Jamboree on the Air, the girl guides were much better communicators than the boys. So it was decided to seek out a willing scout group and train them in the art of expressing their thoughts via a microphone to another unseen person.

Do you remember back to when you first began to do this in the privacy of your shack with nobody watching? Generally at JOTA, the scouts have to do this in front of you, the expert, and some of his mates.

If all the clubs around Australia undertook such a programme, JOTA 85 would be a far better exercise for all concerned. It would also give scouts much more exposure to amateur radio and bring some of those scouts into our ranks. The far reaching effect of this would be to have many more amateurs in years to come with scouting experience.

Then the thoughts turned to intruders. It was resolved that members would each be allocated a segment of an amateur band. The member would concentrate his efforts on this one part of a band and regularly report to the state intruder watch co-ordinator. This way each person would become familiar with his allotted segment and readily recognise any signal that should not be there. This proposal has a lot of merit. It would appear to be a much better method of attacking this intruder problem. Intruder watching all of our bands can be a tedious business. If every club in Australia adopted this idea, we would become the foremost intruder watching country in the world.

VK4 DIVISION ANNUAL GENERAL MEETING

This takes place on Friday, the 15th of February 1985 at the Playground and Recreation Association Hall on the corner of Love and Water Streets, Fortitude Valley, Brisbane. The time is set down for 7.30 pm and the usual facilities will be available. Bookshop and OSL Bureaux. Doors open at 7 pm.

May I take this opportunity to wish you all a Happy and Prosperous New Year. I would also like to thank all of you for the help that I have received in 1984, not only in compiling these notes, but for OTC, our Queensland insert in AR and for material for the weekly news broadcast. Many thanks

Bud Pounsett VK4QY

AR

ANNUAL MIDLAND ZONE CONVENTION

Will be held at the KANGAROO FLAT LEISURE CENTRE on Sunday 17th February from 10 am onwards; talk in on 2 metres.

Morning tea; Lunch and Afternoon tea provided.

Competitions, the usual Trade displays, Steptoe's corner, ladies events, childrens lollyscramble, soft-drinks etc available.

A bus tour of Bendigo for the ladies for approx 1 hour after lunch. Full details and a map will be in a leaflet in February AR. All welcome.

See you there.

Margaret VK3DML

AR

DISTINCTIVE MARKS FOR TOP STUDENT

A Townsville amateur has become the first student to graduate with the highest distinction possible from the Australian Maritime College in Launceston, Tasmania. Norbert Trupp VK4FXP graduated Summa Cum Laude which means that he passed 75 percent of all subjects with distinction to gain his Associate Diploma in Marine Radio Communications.

Norbert, a former RAAF air traffic control officer, also received three awards sponsored by AWA during the two year course, which he finished last year.

He received a prize for the best first-year student, the best second-year student and the best communicator. His name was inscribed on the Honours Roll both years.

Norbert has just recently left Hobart to take up his position as Senior Communications Officer at the Antarctic Base of Davis for a period of sixteen months. His VK0 call has not yet been received.

LETTERS TO THE EDITOR

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publisher.

"HAPPY MOTORING IN VK LAND" No 2

In Greek history we read that as long ago as 600 BC it was known that amber rubbed with silk acquired the property of attracting small objects. Two thousand years later Dr Gilbert (1540-1603) discovered that many other substances behaved in a similar fashion when rubbed with suitable materials. He suggested that these substances should be called *electrics* (from the Green *electron*, meaning amber). Oh! what would we do without our Greek history.

Today we use electricity in many forms in our day to day living. One of these is the induction coil. Most amateurs will use one in the next twenty four hours when making a QSO to another amateur, be it in VKland, 9Vland or Gland. We also make good use of the induction coil in the motor car which has a petrol engine for motive power. The ignition system of the modern car incorporates an induction coil as a means of providing the high voltage required to produce the spark which in turn ignites the mixture of petrol and air vapour in the cylinders. The distributor, which is in fact a rotating selector switch, automatically connects the secondary of the coil to each spark plug in turn. When the projecting portion of the rotating cam, which is operated by the engine, pushes the contact arm it opens the contacts and interrupts the current in the primary coil. This in turn generates an induced EMF in the secondary and makes a spark at the particular plug which is joined to the coil via the distributor. The position of the cam relative to the engine is adjusted so that the spark occurs at the correct instant. When this happens we have the engine of the car running and turning over at the correct revolutions.

What has this got to do with motoring in VKland? PLENTY. During the second world war, a law was passed in the United Kingdom, which lasted until the war was over (1939-1945), that any person who owned or drove a motor vehicle which had a petrol engine was to make the vehicle immobile, be it for five minutes or five hours, when the vehicle was left unattended. Many people from all walks of life failed to comply with this law, so they were brought to court, fined and in some cases they went to prison, depending on the circumstances. Yes, they did lock up the vehicles, but that was not making them immobile, which could be used by an enemy agent.

Just think. You go for a trip into the bush or a tour of VKland and stop at a roadhouse for a meal, etc. After an hour or so, you come to continue your trip and find the vehicle has gone, along with all your gear. Not to mention the cost, bang goes your holiday. A few months later — a knock on the front door, you answer it, and standing there is the local policeman who tells you that they have found the remains of your car, burnt out, beyond repair. It will cost you plenty to replace it, even with the insurance payout. *Oh what was that, you're not insured.*

Well read on. *How to make your car thief-proof and it doesn't cost you a cent. The next time you park your vehicle, before you lock it up, lift the hood, undo the clips on the distributor and remove the ROTOR ARM. Replace the cap of the distributor and the clips, lower and lock the hood, now lock the car, and put the ROTOR ARM in your pocket with your key. When you come back your car will still be there, nice and safe where you left it. The only thing this small operation has cost you is the time of 45 seconds. Your car cannot be 'Hot Wired' and no tow-truck operator is going to help a thief to steal your car. If a thief breaks into the car, the only damage is a flat battery and a broken window, if the thief is dumb enough to stay in the car that long. Happy motoring!*

NOT ALL-SOLID-STATE

There are still many of us who are not all-solid-state and from time to time as we require to replace a vacuum tube or two, we find that the sources of supply are rapidly drying up, with many types not stocked or just not available in Australia.

When all else fails, I have found a reliable source of supply from: Edlie Electronics, 2700 Hempstead Turnpike, Levittown, NY, 11756, USA.

73,

Yours sincerely,
Jim George VK4AJG,
70 Campbell Street,
Sorrento, Qld, 4217.

IONOSPHERIC PREDICTIONS

Sunspots — or the lack of them

Len Poynter VK3BYE
14 Esther Court, Fawkner, Vic. 3060

All good things must end somewhere and Cycle 21 is no exception. The second highest on record is slowly spluttering out. What spots there are, appear close to the solar equator. September's mean just 15.4 with 0 count on nine days. The big question is *how long will these poor conditions last?* Recently the National Geophysical Data centre, Boulder, Colorado, USA published their predictions for the sunspot mimina.

See Table right >

SMOOTHED, OBSERVED AND PREDICTED SUNSPOT NUMBERS FOR CYCLE 21

	JAN	FEB	MAR	ARP	MAY	JUN	JULY	AUG	SEPT	OCT	NOV	DEC	MEAN
1983	93	90	86	82	77	71	65	66	66	68	67	64	75
1984	60	56	53	54	52	51	50	48	46	44	42	40	50
				(15)	(17)	(18)	(19)	(20)	(21)	(21)	(20)	(20)	(19)
1985	38	37	36	35	34	32	31	29	29	28	27	26	32
	(21)	(20)	(20)	(20)	(20)	(20)	(19)	(19)	(18)	(19)	(19)	(20)	(20)
1986	26	26	24	23	22	20	18	17	16	16	15	15	20
	(20)	(20)	(19)	(19)	(18)	(18)	(17)	(17)	(16)	(14)	(13)	(12)	(17)

The entries with the number in parentheses below them denote predictions by the McNish — Lincoln method. Adding the number in parentheses to the predicted value generates the upper limit of the 90% confidence interval; subtracting the number in parentheses from the predicted value generates the lower limit. Consider for example the Sep 84 prediction tabulated above. There exists a 90% chance that the actual smoothed number will fall somewhere between 25 and 67.

As it takes time to formulate the sunspot number, the delay is causing the sunspot figures to be relegated to historic records as historically the progress of the solar cycle has been measured in terms of "sunspot numbers".

Nowadays the 10cm (2800 MHz) solar radius flux which can be measured more easily and more consistently, has taken the place of the sunspot number.

Sunspot numbers and 10cm flux are similar in that they both indicate the level of solar activity but are different in magnitude. There is a good, but not perfect correlation between two indices. The scales of the two are different. In particular the sunspot number of zero corresponds to a ten centimetre flux of approximately 66.

MONTHLY AV VALUES

SUNSPOT N°	0	20	40	60	80	100	120	140	160	180	200
SOLAR FLUX	66	70	80	100	120	140	160	180	200	220	240

In recent months the 10cm flux has fallen below 70 and this corresponds to a sunspot number close to zero ie solar minima conditions. At this time the spectrum of frequencies available to the HF user has contracted.

Another phenomenon associated with the solar cycle are solar flares. The majority occur in the years across the solar maxima. Then influence in the form of blackouts to communication have eased during 1984 and are adopting the minima pattern.

To bring the indices up to date, the following data appears courtesy of the Ionospheric Prediction Service. Sunspot Index Data Centre and National Geophysical Data Centre.

SUNSPOTS — MONTHLY SMOOTHED NUMBER

PREDICTIONS:

	CLASSICAL METHOD	SIDC ADJUSTED VALUES
10/84	42	35
11/84	40	33
12/84	38	30
1/85	36	28
2/85	35	26
3/85	34	24

TEN CENTIMETRE RADIO FLUX: PREDICTIONS

MEASURING THE STRENGTH OF MAGNETIC DISTURBANCES — THE A INDEX

The disturbance level of the earth's magnetic field is measured by what is known as the "A" index. A indices can be defined on a daily basis by any magnetic observatory in the world. The indices from many observations may be combined to produce a "planetary index" called Ap.

IPS use an A index defined by the Fredericksburg Observatory, a typical mid latitude site in the USA. The A index from WWV is from the same source.

Magnetic field disturbances are assigned to five broad categories

A up to 7 Quiet
A 8 up to 15 Unsettled
A 16 up to 24 Active
A 25 up to 35 Minor Storm
A 36 and above Major Storm

The A is yesterdays index. It is derived from the mean of the K scaling over the 24 hour period and a typical scale looks like

K = 0 1 2 3 4 5 6 7 8 9
a = 0 5 10 20 40 70 120 200 330 500 gamma.

The K index is relatively unknown but it is available from one source. WWV calls the K index just after the Solar Flux and A index is read as: ie "The K index at 0600 hrs UT is 3 repeat 3". If you have recorded your A for the previous days, the K will give you an idea of the movement of this index. As 3 = a20 it can be noted that the field is in an active condition and generally conditions will be poor. If the K was to read 3 across the whole 24 hours as

	0000	0300	0600	0900	1200	1500	1800	2100	0000 UTC
K	3	3	3	3	3	3	3	3	3
a	20	20	20	20	20	20	20	20	20

total 160 ÷ 8 = a20. It's seldom this simple but if you can hear two or perhaps three WWV reports then the trend can be noted — steady as in the example rising, or falling. However this "a" reading is some 120° away from us, in the northern hemisphere and is during the darkness hours when the K is liable to increase. So some compensation should be made and just what you can hear across the spectrum will help analyse conditions.

Probably the best conditions follow a peak in the Solar Flux. As it starts to fall and coinciding with a fall in the A index and very low K figures. These often result in an enhancement effect where there is an increase of some 10-20% over predicted MUFs. I have found that the upward movement of the solar flux tends to restrict rather than enhance. It does depend a lot on what is actually happening on the sun.

If you're charting the indices, any additional information you may come across should be noted in your records to further assist; VK2WI, during their Sunday news service at 11 am local time, give a summary of the weeks solar activity provided by IPS, and you can fill in gaps should you miss out earlier.

WWV at 18 minutes past each hour. IPS phone in service on (02) 269 8614 will provide you with all the details. Changed daily around 0000 UTC. There is no reason why you shouldn't know what is going on from a propagation point of view.

For those interested. The National Geophysical Data Center Solar — Terrestial Physics Division (E/GC2) 325 Broadway Boulder Colorado 80303 USA offer a Monthly Information Product containing Daily Radio Flux of Quiet Sun. Summaries of the entire current sunspot cycle. List predictions of smoothed sunspot numbers Daily sunspot numbers for previous month and includes explanatory text. Cost $US20 for a 1 year subscription. Call 0011-1-303-497 6136 or write. Payment may be made through one of three credit cards VISA, AMERICAN EXPRESS or MASTERCARD. Postage to Australia would be extra no doubt.

Best wishes for 1985. 73 VK3BYE

Ionospheric Predictions were unavailable due to early printing dates this month. Look for them again in February AR.

NOTICE

All copy for inclusion in the March magazine must arrive at Box 300, Caulfield South, Vic 3162 no later than midday 23rd January.

HAMADS

PLEASE NOTE: *If you are advertising items FOR SALE and WANTED please write on separate sheets, including ALL details, eg Name, Address, on both. Please write copy for your Hamad as clearly as possible, preferably typed.*

*** Please insert STD code with phone numbers when you advertise.**

- Eight lines free to all WIA members. $9 per 10 words minimum for non-members.
- Copy in typescript please or in block letters double spaced to PO Box 300, Caulfield South 3162.
- Repeats may be charged at full rates.
- QTHR means address is correct as set out in the WIA current Call Book.

Ordinary Hamads submitted from members who are deemed to be in the general electronics retail and wholesale distributive trades should be certified as referring only to private articles not being resold for merchandising purposes.

Conditions for commercial advertising are as follows: The rate is $15 for four lines, plus $2 per line (or part thereof) minimum charge $15 pre-payable. Copy is required by the deadline as stated below indexes on page 1.

AMIDON FERROMAGNETIC CORES: Large range for all receiver and transmitter applications. For data and price list send 105 x 220 SASE TO: RJ & US IMPORTS, Box 157, Mortdale, NSW 2223. (No enquiries at office: 11 Macken Street, Oakley, 2223).

□ WANTED — NSW □

HAND BOOK OR CIRCUIT DIAGRAMS for ATU MFJ versa Tuner II model MFJ-941B to photocopy. Please write VK2PWS Wayne Smith, C/- COMCEN HMAS Creswell, Jervis Bay, NSW, 2540.

□ WANTED — VIC □

ATU DRAKE MN 2000, MURCH, KW or similar. Must be in good condition and capable of handling 2 kW. Pay freight. Accept reverse charges. Barry VK3XV. Tel: (03) 527 4029.

KLEINSCHMIDT PERFORATOR. Technical info relating to the adjustment and/or maintenance for the restoration of Kleinschmidt Morse Tape Perforator. Please write or call Dick Hope, VK3DLJ, QTHR. Tel: (03) 528 3380.

□ WANTED — QLD □

SOLDERING IRON TIPS. One or two tips only for Mico 6 V/10 W soldering iron. J George, VK4AJG, 70 Campbell St, Sorrento, Qld, 4217.

□ WANTED — SA □

AT-120 OR AT-130 antenna tuner/SWR meter combination or similar. Also mobile antenna for a Kenwood TS-120V transceiver. Paul Frost VK5KFP, 9 Donald Street, Highbury, SA, 5089. Tel: (08) 337 6268.

□ FOR SALE — NSW □

KENWOOD TR-2500 2 m h/held complete with accessories: PB-25 bat pack, BT-1 bat case, MS-1 mobile stand, LH-2 leather sheriffs case, SMC-25 spkr/mic, VB-2530 25 W AMP. All exc cond. $495 ONO VK2AQW. Tel: (02) 635 6572 BH, (02) 969 2160 AH.

KENWOOD TS-820S digi readout, CW filter, MC50 mic, 12 V DC or 240 V AC, original carton and manual. New cond, best offer around $500, Norman, VK2DLG, QTHR. Tel: (063) 37 3820.

VICOM SWR-RF METER freq 3.5-150 MHz $25. 6 m, 5 el beam, 15 metres coax $35, WW2 Army Morse key $10. 34 AR Actions, 16 CQA Radio, 7 Everyday Electronics, 4 Practical Wireless, 6 Electronic Aust, magazines $20. All of above VG cond. Tel: (067) 92 2666 (BH). Ask for Brian. VK2AKU, (il unavailable leave ph no).

□ FOR SALE — VIC □

ANTENNA TET HB-35C, 5 el. As new. Shifting interstate. To inspect. Tel: (03) 890 4645.

BEAM VS33 20/15/10 Rotator 502CXX. Both new in cartons. $200 each ONO. Also Multiband trap dipole $20. David VK3OD. Tel: (03) 509 2870.

COMPUTER — SINCLAIR SPECTRUM 48 K. With professional keyboard, joystick, tape deck, amplifier, manuals etc. Loads of software including arcade games, word processor, toolkit and compiler. Bargain $380. 2 m handheld AR240. Fully synthesised 140-150 MHz tx/rx, helical antenna, nicads, charger, carry-case, only $210. Exchange either/both for 70 cm transceiver or HF rx/tcvr. VK3CVA QTHR. Tel: (051) 49 4123.

FT209R 2 m hand held tx $330. FT7 never used mobile $350. Realistic Patrolman rx $80. All equipment in mint cond. Stan VK3BNJ. Tel: (03) 743 6708.

RADIO SHACK LINE PRINTER VII: Microprocessor-controlled, dot-matrix impact printer with full ASCII set, dot-addressable graphics, programmable line density and double-width mode, addressable print position, 90 character buffer and more. Centronics parallel or RS232C serial interfaces, TRS80 compatible. Uses 11 cm-25 cm tractor-feed paper. $350 ONO. VK3BLN, QTHR. Tel: (03) 459 1151.

SHACK SELLOUT — Yaesu FT107M tcvr and FV107 VFO, with CW filter, service manual $875 ONO, Kenwood R-1000 Comm rx and matching speak $300, Icom ICPS15 20 amp power supply $180, Icom IC22A 2 m FM rig c/w 3 simplex and 3 repeater channels $145, Icom IC2A 2 m hand held $225, Yaesu XF30C CW filter suits FT101 series $28, Yaesu YM38 scan mic suits FT757, 107, 707 etc $28. Contact Ken Jewell VK3AKK. Tel: (03) 688 9211.

□ FOR SALE — QLD □

DECEASED ESTATE VK4DO — T/S 520 T/C with CW filter, T/S 520 T/C, Kenwood TV 506 T/V, Kenwood TR 2200G FM T/C, Icom IC502 T/C, Swan SW240 T/C, Arlec regulated P/S, Kyoritsu K109 SWR meter, Sansei SE405 SWR meter, Yaesu FLDX2000 HF linear, Copal digi clock, 2 Morse keys, Peak 7200 multimeter, VTVM meter, 2 12 volt batt chargers. Quantity sundry radio equipment. All offers considered. Send SAE for further particulars, to Mrs Hobler, 141 Hyde Street, Nth Rockhampton, Qld, 4701.

KENWOOD TS520, 240 V AC/12 V DC, SP520, handbook, mic set new spare valves (3) — $480. TV5066 m transverter complete $180. Trio comm rx 9R-59DS 550 kHz-30 MHz manual, other data $100. All good wkg order. VK4YO QTHR. Tel: (07) 376 2343.

KENWOOD TR-7400A 800 channel 2 m, 25 watts output with mounting bracket if used as mobile, $260. Keith VK4KS QTHR. Tel: (07) 353 1968.

ADVERTISERS' INDEX

NEW 2m FM HANDHELDS from YAESU

FT203R

2.5 watt
144-148 MHz

VOX operation with optional YH-2 Headset.

Thumbwheel Channel Selection.

PA-3 DC/DC Car Adapter/Trickle Charger (option)

FT209R

3.5 watt/350 mW

FT209RH

5 watt/500 mW

Microprocessor controlled
10 Memories
Reverse Repeater
Power Saver to extend battery life
VOX operation with optional YH-2 Headset

PA-3 DC/DC Car Adapter/Trickle Charger (option)

The HF Allmode Transceiver you have been waiting for — from **YAESU**

FT-757GX

100 watts Output PEP/DC — 25 watts AM Carrier — 13.4 volts DC (19 amps for 100 watts output) — Weight 4.5 kg

FEATURES:

- *Dual VFOs and eight memories*
- *Programmable Memory Scanning*
- *SSB AM-FM Modes Standard*
- *Squelch on all Modes*
- *Full Break-in CW.*
- *Accessories installed include 600Hz CW Filter, iambic keyer with dot-dash memory, marker, IF shift and width. N.B. (only option is CAT interface to extended computer control)*
- *High performance General Coverage Receiver*

Great reasons to buy your

YAESU

from

DICK SMITH ELECTRONICS PTY LTD

(1) **We guarantee to match any genuine*, advertised price on Yaesu Amateur Radio products.**

*Offer applies only where the advert is current and where the advertiser has the goods in stock and is prepared to sell them at the advertised price.

(2) **You could win a UHF repeater for your club – AND an HF or VHF/UHF station for yourself! Full details from your nearest Dick Smith Electronics store.**

AND CHECK OUT THE NEW HAND HELDS

FT-209R/RH: THE ULTIMATE!

Brand new from Yaesu – with everything you could ever want in a hand-held. Combining the best features of all the previous Yaesu hand-helds, giving you such things as:

- **Push button entry**
- **Huge LCD multi-message display**
- **10 memories**
- **Full scanning or memory scanning**
- **VOX facilities (with optional headset)**
- **Slip-on battery packs for instant change**
- **Memory and parameter retention**
- **Choice of power outputs and battery packs**

Check them out soon at your nearest Dick Smith Electronics Ham Shack (other Dick Smith stores can obtain within a couple of days).

FNB-4 battery shown not included in basic price.

WHICH COMBINATION?

Choose the battery you require for the power output you want!

Model No	Battery Pack	Power O/P
FT209R	FNB-3	2.7W
FT209R	FNB-4	3.7W
FT209RH	FNB-3	3.7W
FT209RH	FNB-4	5W

FT209R Cat D-3502 **$359.00**

FT-209RH Cat D-3503 **$399.00**

FNB-3 NiCad (10.8V, 450mAh) Cat D-3506 $59.00
FNB-4 NiCad (12V, 500mAh) Cat D-3507 $69.00

Nicad Charger (trickle charge only) Cat M-9517 $12.95
(NOTE Fast charger available shortly – or roll your own! 2.5mm socket filled to NiCad pack)

OR TRY THE FT-203 ECONOMY 2m HAND-HELD!

Everything you ever needed – in a real economy workhorse. Thumbwheel switches for instant frequency setting, supplied complete with FNB-3 battery & charger, (FNB-4 is optional), even includes VOX with optional headset!
Ideal to throw in the briefcase or suitcase when travelling: just 35 x 50 x 160mm!
Cat D-3500 **$299.00**

This is the last magazine to be sent to unfinancial members and it cannot be guaranteed there will be missing copies available. Pay now to ensure continuance of your magazine.

a word from your EDITOR

THE BEGINNING

In March 1910 a small group of Australian radio pioneers met in Sydney to form the "Institute of Wireless Telegraphy of Australia". The name was changed several times in the ensuing years, *see last month's article reprinted from the IREE journal "Monitor"*, but this was the beginning of the Wireless Institute of Australia, whose 75th anniversary we now celebrate.

What kind of a world did these pioneers know? What was radio in 1910? Why should Australia have been the first country in the world to form an amateur radio society?

Picture the Australia of 1910. The city of Sydney had only been lit by electricity a mere six years before, the last Australian capital to introduce this modern marvel, although NSW could boast that the town of Tamworth was the first in Australia to have electric light, in 1888. There were barely four million people in the whole country. There were motor-cars, but they were primitive. Aeroplanes, even more primitive, only 7 years after the Wright brothers first flew at Kitty Hawk.

Marconi and those who followed his experimental lead, our founders among them, had by 1910 shown the ability to send spark-generated signals thousands of miles. But electron tubes did not appear for another three years. The transistor was 38 years into the future. There was no broadcasting, eventually, the early amateurs were the first broadcasters.

And why was the WIA first? We may presume that many of those four million felt that they were the farthest-flung outpost of the British Empire. Communication, by wire telegraphy and submarine cable, to the Mother Country was slow and expensive. Was there more incentive here to develop the new field of wireless, rather than in America or Europe, each relatively self-sufficent? Certainly, at that time, Australia enjoyed perhaps the highest living standard of any country in the world, mainly earned from wool and wheat, gold and silver, with other minerals coming up fast. Prosperous times encouraged initiative.

Next month we will look at the part played by amateurs, and the WIA, during the last 75 years.

WIA NEWS

BAND PLAN PROPOSALS

The following band plan proposals from the Federal Technical Advisory Committee will be discussed in detail prior to ratification at the WIA Annual Convention in April this year.

Would members study the following plans and pass any comments or counter proposals to their Divisional Officers as soon as possible.

FM REPEATER OUTPUT FREQUENCIES AND RECOMMENDED USAGE

Output: 1253.025-1255.000 MHz at 25 kHz
Input: 1241.025-1243.000 MHz (12 MHz split)

Frequency MHz	Usage
1253.050	*RTTY*
1253.100	*Mobile Voice*
1253.150	*RTTY*
1253.200	*Mobile Voice*
1253.250	*Data*
1253.300	*Mobile Voice*
1253.350	*Data*
1253.400	*Mobile Voice Secondary*
1253.500	*Mobile Voice Primary*
1253.600	*Mobile Voice Secondary*
1253.700	*Mobile Voice*
1253.800	*Mobile Voice*
1253.850	*ATV Liaison*
1253.900	*Mobile Voice*
1253.950	*ATV Liaison*
1254.000	*Mobile Voice*
1254.100	*Mobile Voice*
1254.150	*RTTY*
1254.200	*Mobile Voice*
1254.250	*RTTY*
1254.300	*Mobile Voice*
1254.350	*Data*
1254.400	*Mobile Voice*
1254.450	*Data*
1254.500	*Mobile Voice*
1254.600	*Mobile Voice*
1254.700	*Mobile Voice*
1254.800	*Mobile Voice*
1254.900	*Mobile Voice*
1255.000	*Mobile Voice*

The above band plan was prepared after a detailed examination of the effects of transmission from amateur equipment on the Melbourne Radar Installations. Accordingly, FTAC is proposing a 12 MHz split for 23 cm repeater operation.

PROPOSED 23 CM BAND PLAN

Frequency Range MHz	Usage
1240 — 1241	*FM Relays and links*
1241 — 1243	*FM Repeater inputs*
1243 — 1252	*ATV Channel 1, sound 1251.75, vision 1246.25*
1252 — 1253	*FM Simplex*
1253 — 1255	*FM Repeater outputs*
1255 — 1256	*FM Relays and links*
1256 — 1257	*Digital and Packet Radio*
1257 — 1260	*In-band and Cross-band Linear Transponder*
1260 — 1270	*Satellite Communication (WARC 79)*
1270 — 1280	*DOA RADAR*
1280 — 1293	*ATV Channel 2, sound 1292.75, vision 1287.25*
1293 — 1295	*In-band Linear Transponder*
1295 — 1297	*Weak Signal Modes*
1297 — 1300	*DOA RADAR Guard Band*

FM SIMPLEX FREQUENCIES AND RECOMMENDED USAGE

1252.025-1253.000 MHz at kHz spacing.

Frequency MHz	Usage
1252.100	*RTTY*
1252.200	*RTTY*

PRE-STAMPED ENVELOPE

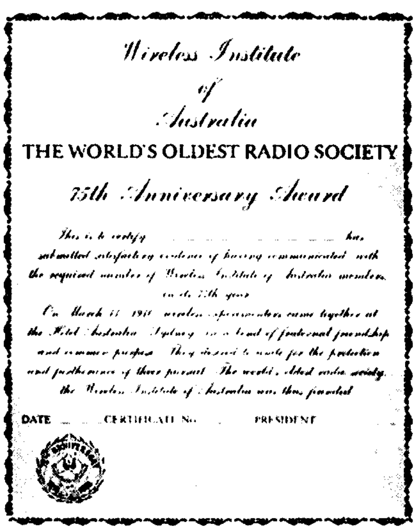
Officers of the Institute met recently with a member of the Graphics Department of Australia Post to preview the design of the envelope which will be issued to celebrate the 75th Anniversary in May this year.

CW CONTEST

This copy of AR carries the rules of a special CW contest which the VK2 Division are organising for this Anniversary year. The overall VK winner will receive the FEDERAL PRESIDENTS CUP, a handsome piece of silverware, to hold for one year. Every member who enters a log with more than 75 contacts will receive a special 75th Anniversary memento.

75TH AWARD

The rules for this contest will be printed in the March issue.



VK7 CELEBRATIONS

The 1985 Tasmanian Amateur Radio Convention will be held over the Queen's Birthday weekend the 8th to 10th of June 1985. This "Hamfest", as it is more usually known, is under the organisational auspices of the Southern Branch of the Tasmanian Division of the WIA and will be centred around Hobart.

The "Hamfest" will provide an opportunity for amateurs to share their hobby with other enthusiasts and hopefully with the public at large. The theme of the "Hamfest" will be "Amateur Radio, Yesterday, Today and Tomorrow."

1985 is the 75th Anniversary of the WIA's foundation and is also the 60th Anniversary of the formal establishment of the Tasmanian Division. This year is also the 40th Anniversary of the re-activation of WIA activity in this State after the suspension of amateur activity for the duration of World War One.

It is therefore intended to make this "Hamfest" the focal point of the celebrations of these anniversaries. A number of historical (and maybe hysterical) re-enactments of some wireless communication landmarks are proposed.

1 To begin with permission has been sought to activate briefly a "spark transmitter" to recreate the "POP MEDHURST" experiments of 1901.

It is interesting to note that as early as 1896 Australia was to the fore in wireless experimentation. The Chief Electrical Engineer of the Victorian Postal Department, a Mr H W Jenvey, played an important role in the early development work. Professor W Bragg gave a lecture (entitled 'telegraphy without wires'), at the Adelaide University on 21st September 1897. During the visit of the Duke and Duchess of Cornwall and York in the vessel R M S 'OPHIR' in 1901, the naval escort vessels H M Ships 'St George' and 'Juno' established the first marine radio communication in Australia with shore stations at Queenscliffe lighthouse, Victoria in May 1901, and at Longbeach lightstation, Sandy Bay, Tasmania in July 1901.

Local Government and Service clubs are supporting this venture.

2 In the northwest of Tasmania work is proceeding on a trans Bass Strait net to re-enact the establishment of the first land station licensed in 1906 and located at Devonport.

The initial step towards inaugurating wireless telegraphy as an official communication medium in Australia was taken with the passing of the Wireless Telegraphy Act in 1905. The first fixed land station was licensed by

the Post Office on 7th June 1906. Located at East Devonport, Tasmania, it was owned by the Marconi Wireless Telegraphy Co and was used to communicate with a similar station later established at Point Lonsdale, Victoria. On the 12th July 1906, when both stations were fully operational, the Governor-General of the period sent what is believed to be the first Australian official wireless telegram to the Governor of Tasmania: *"The Commonwealth greets Tasmania and rejoices at the establishment of the means for knitting the people of Australia more closely together-Northcote."*

The organisers of this proposed net are open for ideas on the actual mechanics of marking this historic event and await the avalanche of advice and other constructive comment. Contact Barry Risely VK7KAD who will pass on your ideas.

3 In the northern part of the state it is hoped to recreate the early trans Bass Strait VHF experiments when on Sunday 5th March 1950 VK's 7PF, 7DB, 7AM and associate Rex Summers operated from Mt Barrow using 144 MHz portable equipment and attempted to contact VK's 7DH and 7AJ. Although the transmitter caused the team problems due to lack of voltage from the generator, the reception of signals from 7AJ/7DH at S8 and 7LH from Western Junction at S7. Part of the equipment used on Mt Barrow is still available and will be brought out from retirement for the occasion.

The "Hamfest" will not be just a nostalgic journey into the past but will, if all plans succeed, be an up to date display of amateur radio techniques and equipment. The NW coast UHF ATV group, the RTTY, Satellite and Computer Groups will be displaying their equipment and skills. Trade exhibitors have been invited to attend. There will be some informal social functions on site and the whole weekend will be a season for special awards and certificates for amateur radio activities. All are asked to give support, assistance and participation to ensure this "Hamfest" is worthy of celebration 75 years hence.

Ken VK7DY is QTHR in the callbook and is the Hamfest Convenor. Contact him today.

The above notes supplied by Barry VK7KAD, Publicity Officer, TARC 85

75TH ANNIVERSARY YEAR POSTER COMPETITION

The "William Otty Displays" being prepared by the Federal office for use by Divisions/Clubs/Groups for displays, open days etc, require some fresh poster material.

In order to meet this need it was decided to run a competition aimed at finding, amongst our members and their immediate families, ideas for posters that would have a "timeless" theme to promote amateur radio and the Institute in the years ahead.

The rules have been kept as simple as possible:

The designs submitted can show any facet of the hobby, but must include some reference to the Institute, ie the "official" badge and the words "amateur radio".

Colours of course will be expected, but these could be added later by a ghost artist.

Size: The final posters will be of a uniform size, 18" x 30". It is possible to have smaller designs redrawn, but it is preferable that entries be to this size.

All designs submitted become the property of the Institute.

More than one entry can be submitted.

Entries close first post on 11th March 1985 and should be sent to the Secretary WIA, PO Box 300, South Caulfield, Vic. 3162.

Each entry must carry the name and address of the designer followed by the sponsoring members callsign, name and address.

The decision of the judges will be final and no correspondence will be entered into.

A prize of a voucher for $100 will be awarded to the design considered by the judges to reflect the aims of the contest. Minor prizes will be given.

75TH ANNIVERSARY SUBSCRIPTION RENEWALS

It was announced in the January issue of AMATEUR RADIO on page 5 that each 75th subscription renewal for 1985 would receive a small gift pack and be placed in a draw for a Citizen Quartz clock, featuring dual time zones and temperature readouts.

Further to this, during the handling of subscription renewals for 1985, the Federal Office have established the following list of members who have qualified so far:

G P Smith VK1ZEI, L N Tate VK3KLT, R W Elliott VK1ZAH, J Curran VK2AAV, R H Banks VK2DHY, R J Richards VK2BRR, P G Spain L20311, C S Wallis VK2DQE, A S Rowe VK2XAJ, D G McPherson VK2NKM, C F G Withers VK2BVI, B G Gillard VK2VSN, F W Tam VK2TAM, Mrs J Daridge VK2VYP, P D Cannon L20284, D F Wickens VK2DWX, G W Alderton VK2YET, A L Ward VK3DAW, A Kadenbach VK3PBN, S E Widgery VK3SE, EJA Chittick VK3AUB, D L Park L30003, S P Martin VK3DQL, A E Mensforth VK3AAB, H C Thomson VK3BZE, A M Carman VK3AQH, T E Manks VK3TZ, L R Ferris VK3ZLL, H J Masefield VK3NXQ, S G Jones VK3YVL, J T Low VK3NNJ, J D Cash VK4VBQ, E K Chippindall VK4XR, L Eliason VK4EH, K J McKenzie L40114, J H Jones VK4QR, D C Inall VK4VLJ, G J Westcott VK4KCW, L J Murray VK4LO, S Demchenko VK6UC, G L Rogers VK6RO, F A Page L60354, K E C Gillon VK6ZA, M K Johnson VK6LC, F J Walsh VK5NJW, B S Clarke VK5BS, H R Hodgson VK5AP, C R Willmer VK5NWE, T L Greig VK5PTL, L F Battersby VK5NEN, T M Dangerfield VK5ATD, A C Barwick VK7TD, A J Tulk VK7ZTA.

REMEMBER:

The final date for members to be eligible for this gift pack draw is the 21st February, 1985, and your membership renewal must be received at the Federal Office before this closing date.

AR

ANNUAL SUBSCRIPTION, THE WHY OF IT.

Why should I renew my subscription? You have heard that question before, a dozen times.

Apart from the obvious answers — you get AR, the QSL bureau, the bookshop facility, the repeater networks and other facilities — a very significant reason is buying insurance in your hobby. *Without the WIA would there be an amateur service in Australia today?*

Possibly, but not the service we enjoy. Certainly not all the privileges that we enjoy that make us the envy of amateurs in most other countries. It comes as a bit of a surprise to read and hear of the restrictions placed on amateurs in other countries.

Did you know in Japan, an amateur has to receive permission to modify his/her station — have it inspected — and pay for it.

Many countries do not have a novice licence.

Some countries, including the USA, have phone and CW segments designated by regulation, not by Gentlemen's Agreements.

In the UK and some European countries only the licensee can use the microphone at the station.

WARC79 bands (10, 18, 24MHz) were allocated some years ago to VKs, but other countries, amateurs have only portions or none at all.

It goes on and on.

So you "lucky country" amateurs, lend your weight to the organisation that has done so much in the past and is continuing to do so at all levels of Government, both National and State, now and in the future. Make your Institute strong with your support, renew your subscription now, then enrol a friend.

REMEMBER THE FEBRUARY ISSUE OF AR IS THE "CUT OFF" EDITION FOR UNFINANCIALS, please renew as promptly as you can to ensure that your privileges of membership are not interrupted.

THE VK5 LOW NOISE 2 METRE PREAMPLIFIER

Craig Maitland VK5ZAW
10 St Albyns Avenue, Toorak Gardens, SA 5065

This kit has been produced after many requests for an easily constructed low noise high performance switched preamp for use in all situations. These include mast-head mounting (the best position), shack mounted, or inside transceivers if room permits. All components required are supplied by the VK5 Equipment Supplies Committee as a complete kit.

In use this preamp has shown its value by lowering overall system noise figure as much as 10 dB in some cases and a minimum of 3 dB when put in front of an already modified unit using a 3N210 dual gate FET in the front end. A typical amateur transceiver was improved by 4-5 dB.

Performance specifications are as follows, measurements being made using a HP8970A automatic noise figure meter.

Gain — nominally 20 dB with 6 dB pad supplied.
Noise figure — less than 1 dB, typically 0.6 — 0.7 dB.
Through loss 0.2 dB.
Through SWR — 1.05:1 at 50 ohms.
Maximum power handling 100 W — limited by relay isolation. For higher power use separate coaxial relays.
Size — 50 mm x 68 mm.

Normally DC switched but has inbuilt RF sensing for safety. Can be RF switched for AM or FM but must be DC switched for SSB as no hang switching was incorporated; this mode is undesirable. Circuit board may be cut in half if straight pre-amp without relay switching is desired.

CIRCUIT

The ubiquitous Philips BF981 is used. At a price of about $1.50 it is difficult to beat for performance/dollar. The input uses an adjustable matching system that will match for minimum noise figure and allow for inconsistencies in coil winding, FET spreads and varying antenna loads. This is preferable to the tapped coil method which is very difficult to adjust for optimum performance without the aid of specialised test equipment.

The 6 dB attenuator can be varied in size according to the requirements but less than 6 dB is not recommended as any gain over 20 dB gives diminished improvements even for the deafest systems.

How much gain is actually needed? Assume a typical transceiver has a noise figure of 6 dB. If we use a preamp of 20 dB gain and 0.7 dB noise figure then the overall noise figure will decrease to 0.81 dB — a large improvement. If we lower preamp gain to 15 dB, the total noise figure would now be 1.04 dB, still an excellent figure. If we run the preamp at maximum gain of 26 dB, the system noise figure is now 0.73 dB, only 0.08 dB better than at 20 dB.

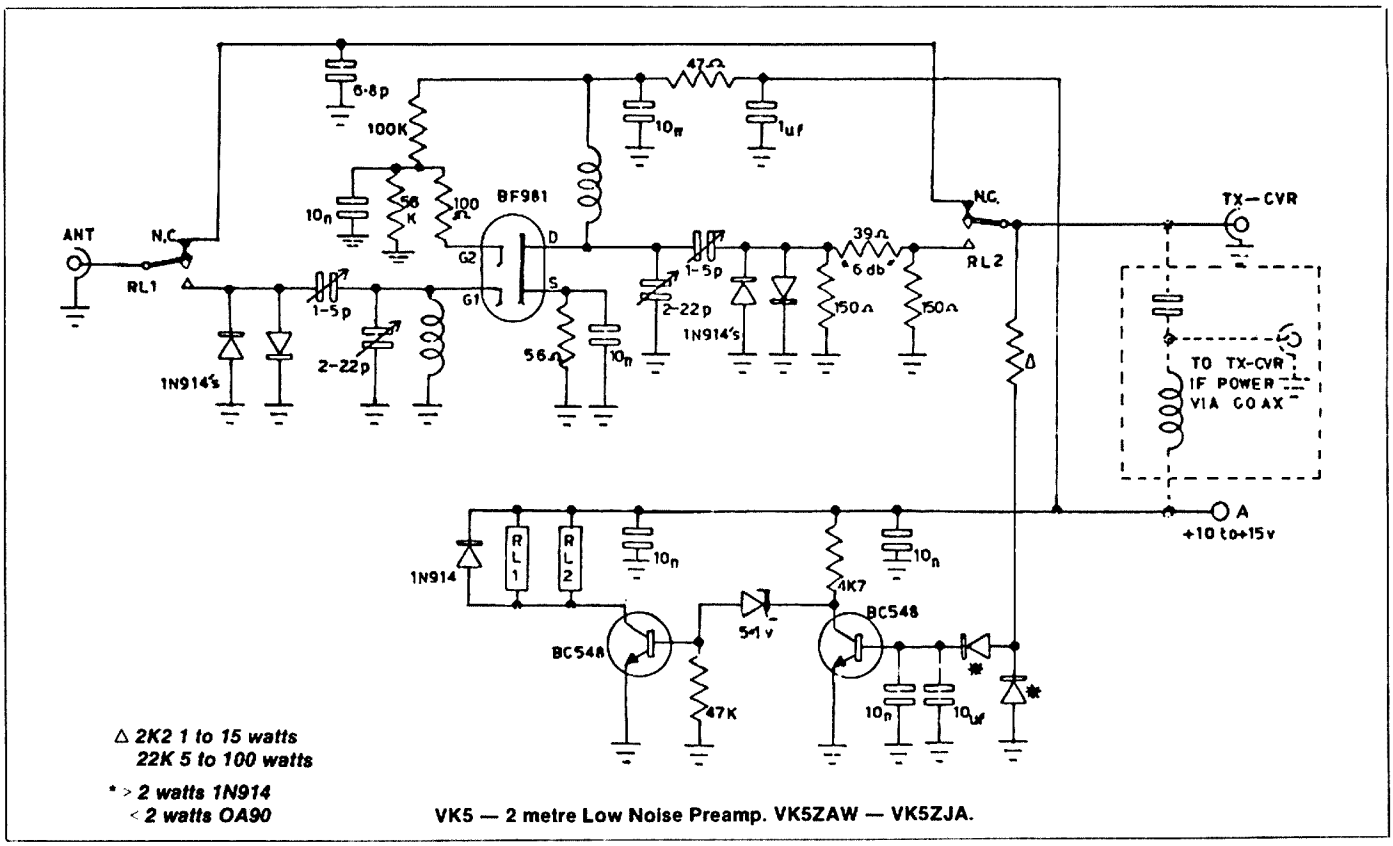
If you have a quiet location in the country, then use all the gain you want but in the city, use the lowest gain possible consistent with low overall noise figure or the receiver front end will suffer from adjacent strong signals, paging systems etc.

Typical gain required during testing was about 15 — 18 dB. A few words about the preferred mounting position may now be in order. With any system, any attenuation of the signal between antenna and receiver will degrade overall noise figure by that amount. If we have 3 dB loss in coax, connectors, diode switching etc. then we cannot obtain a total noise figure of less than about 3.8 dB. But if the preamp is mounted at the antenna, then a minimum noise figure of about 0.8 dB is achieved. These figures are used as an example only to show how important it is to mount the preamp as close to the antenna as practicable. More details on how to find the required gain figure are explained with the kit.

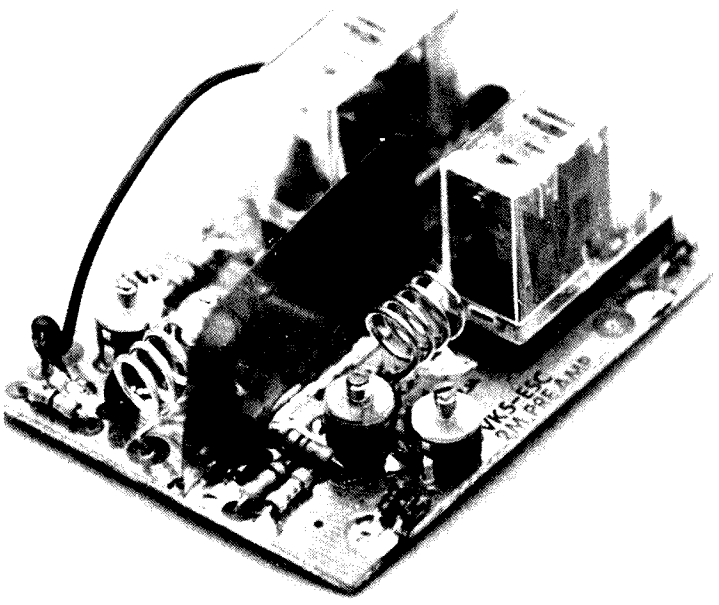
RELAYS

The relay switching system used has been made flexible to suit varying requirements. Obviously the best system is to switch the relays on and off the receiver PTT line. If this mode is used, +10 to 15 V is switched to point A during receive.

If the preamp is required to be powered via the coax, a decoupling network is used in the preamp and also at the transmitter. Unswitched +10 to 15V can also be used, relying on the RF sensing network to do the switching. This part of the circuit will then deactivate the preamp during transmit, connecting input straight though to output. The RF network will switch from as low as 1 watt to a max of 100W by



VK5 — 2 metre Low Noise Preamp. VK5ZAW — VK5ZJA.



altering one resistor and two diodes to suit the power used.

Why have not we used a new technology device such as a GaAsFET? One good reason is the cost of the device used is about $1.50, whereas even when bulk-purchased GaAsFETs are still about $6.00. At the design frequency of 144 MHz, the BF 981 has so far proved to be the equal of any other devices yet measured. This may not be the case at higher frequencies but at 2 metres the BF 981 is more than adequate.

.The full kit, PCB, components, coil winding wire etc, is available for a price of $25.00. Full construction and alignment details are given with the kit.

Postage is included in the price for SA members, $2.50 elsewhere. Orders should be addressed to the VK5 Equipment Supplies Committee, 3 Coral Sea Road, Fulham SA 5024.

ADDENDUM

It has come to our attention that some amateurs have experienced difficulty with powering the unit via the coax. This is due to a combination of poor selection of decoupling components and high power output transmitter.

As these components were not supplied with the kit, no suggestions were made on how to decouple the coax.

The suggested ferrite to use is an F29 slug with 12 turns of fine enamelled wire approximately 30 gauge wound around the outside in the threads, held in place with a drop of superglue if necessary. The decoupling capacitors must be good quality RF types such as chip capacitors, discs, polyester types — not greencaps, as they are only good for audio frequencies. The same network is used at both ends.

If top quality capacitors are not available, try paralleling a couple of different values or types and keep all leads extra short.

There have been a few reports of the preamp not switching when RF actuated. Investigations show that in most cases this has been due to the SWR protection being too fast in the transceiver and actuating during the changeover of the relay contacts of the preamp. The 10 uF on the base of the switch transistors was put in to help but in some cases the only cure is to DC switch the preamp, which is to be preferred anyway. As most transceiver PA transistors are very rugged, slowing down the SWR protect sensing circuit will cure the problem if RF switching is essential.

Don't forget that the absolute maximum power rating is 100 W — due to the limited isolation of the relays used. Any higher power and the FET could be damaged. Use proper coaxial relays with sequential switching if you want to run greater than 100 W.

AR

HAVING FUN IN A FUN RUN

Sam Voron recently participated in the "Bridge to Breakers" Fun Run. During the run Sam operated on 147 MHz FM.

Sam's certificate of achievement read "This is to certify that Sam, with 2m amateur radio backpack, completed the run of 14 km from the Sydney Harbour Bridge to Manly Beach on Sunday 26 August 1984 in 92 minutes."

During the run Sam stopped to speak with SES volunteers using VHF to co-ordinate the run.

Many runners were quite amazed to see this new twist to their sport.

Sam is now eager to know when the next run will be on.

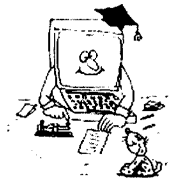
56 Sherwin Avenue, Castle Hill, NSW, 2154



The majority of amateurs have greatest difficulty in Morse receiving and this programme uses the Commodore 64 to produce good Morse at any speed and with a number of good learning aids included.

The main menu of the programme has the following options.

f1 . . SEND CW FROM KEYBOARD
In this mode, the speed is selected and the CW of typed letters is generated by the computer. You may type-ahead to the limit of the keyboard buffer.

f2 . . RECEIVE PLAIN TEXT
When selected, this mode sends plain text from memory at the speed selected. It is possible to increase the spacing between each character whilst maintaining character speed. The text in memory begins with the sample exam for 10WPM listed in the Amateur Operators Handbook.
You may add your own text in DATA statements at the end of the programme in lines beginning at 4210 etc. If you do so, you should increment the two "11" in line 200 by the number of DATA lines you add.

f3 . . DISPLAY CODE ON SCREEN
This is a graphic display of the code.

f4 . . RECEIVE RANDOM GROUPS
This is possibly the most useful mode because it generates Morse for groups of five "words" either letters only or letters and numbers. The speed may be varied and the spacing between each character may be varied which allows the student to hear the character at the correct speed but gives a little more time for recognition. The number of "words" in a session can be varied and at the end of the session the "words" are displayed together with the time taken for sending. It should be noted that because random groups have more of the longer Morse characters than plain text, the time taken for say, ten "words" at 10WPM, is a little longer than one minute.

f5 . . RECEIVE RANDOM CHARACTERS TWICE
The random characters can be letters only or a mixture of letters and numbers. Details as for f4.

f6 . . PRACTICE TAPE MAKER
In this mode, you may enter some text at any selected speed and then the computer will generate the CW for that text. This is useful in making practise tapes or for educators who wish to prepare lesson tapes. The output can be recorded on a simple cassette recorder.

f7 . . RANDOM GROUPS OF SELECTED LETTERS
Here you can input the letters or numbers which you find difficult and the computer sends random groups of the selected characters only. Details as for f4.

f8 . . FINISHED WITH PROGRAMME
No explanation required.

Generally, when the computer is about to send Morse, a five second countdown on the screen is given and the CT and AR codes are sent to indicate the start and end of the test. From within each mode, return to menu is achieved with f7 and alterations of speed, spacing etc with f8.

If you can't hack the typing, $5 for a tape or $10 for a disk to the author will get you the programme. A VIC-20 version is also available. **AR**

BATTERY DANGER WARNING

Only quick action by doctors had prevented several fatal poisonings after children swallowed small mercury batteries which were now used to power calculators and electronic games.

Dr Geoff Davidson, director of gastroenterology at Adelaide Children's Hospital said stomach acid quickly corrodes the metal casing of the battery.

The result can be battery contents including toxic mercury being released in the stomach.

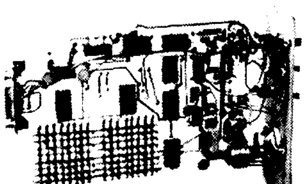
Dr Davidson said his hospital had had about a dozen cases of children aged between two and seven swallowing the batteries in the past year.

The usual procedure when a child swallowed an object was to wait until it passed through the body naturally.

But Dr Davidson said this could be fatal because after five hours the strong acid in the stomach starts to digest the metal battery covering.

He has devised a technique to push the batteries through the stomach into the bowel and then gives the child drugs to induce bowel movement.

AR



ADAPTIVE KEYER

A Van Der Byl VK2EDB
13 Brahma Close, Bossley Park, NSW 2176.

This project arose out of a need to maintain a presence on the 6 m band with a view to getting more contacts especially during times of sporadic E propagation and the band appears dead through sheer lack of occupancy.

With this mind a facility was required such that it would stop keying should the calling frequency become occupied by another station, something that has sorely been lacking in the past.

OPERATION

Relerring to the block diagram the operation is as follows: A clock which is a 555 which is used as an astable multivibrator drives a twelve bit counter which is a CD4040BP. Output Q1 to Q12 go to logic high in order of binary notation. Q1, Q2 and Q3 drive a de-multiplexer, whose eight outputs, which are normally high, go low in turn as the clock pulses are fed into the counter.

Q4 to Q7 control the multiplexer whose sixteen inputs are selected in turn each time the de-multiplexer goes through a cycle.

When a diode is inserted into the matrix as shown on the block diagram a low logic level is seen by the multiplexer whose output causes the keying relay to operate and either a LED to light up or side tone oscillator to operate depending on S2.

Q8 to 12 of the twelve bit counter are used to control the periodicity of the call, (not necessarily regular) when the required outputs are connected to the AND gate whose output enables the de-multiplexer to produce an output to be keyed.

The calling periodicities can be envisaged from the following table, showing when Q8 to Q12 become logic one.

Q12	Q11	Q10	Q9	Q8	
0	0	0	0	0	← TURN ON
0	0	0	0	1	
0	0	0	1	0	40 seconds
0	0	0	1	1	← 1st call
0	0	1	0	0	
0	0	1	0	1	
0	0	1	1	0	
etc		etc			
1	1	1	1	1	

For example, if the time taken to scan the matrix is 10 seconds and Q8 and Q9 is connected to the AND gate the first call would be at 40 seconds from turning on the power, UNLESS sufficient audio level from the receiver causes the reset relay to operate in turn forcing the counter to reset.

During the time in which the keyer is keying the high logic level from the AND gate is used to inhibit the reset relay from operating. For example in some transceivers a side tone oscillator is used in the CW mode. This would cause the counter to reset when it should not.

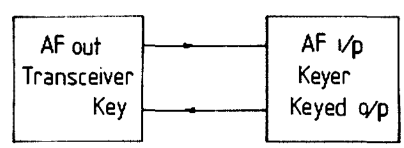


Figure 2 — Adaptive Keyer Utilization

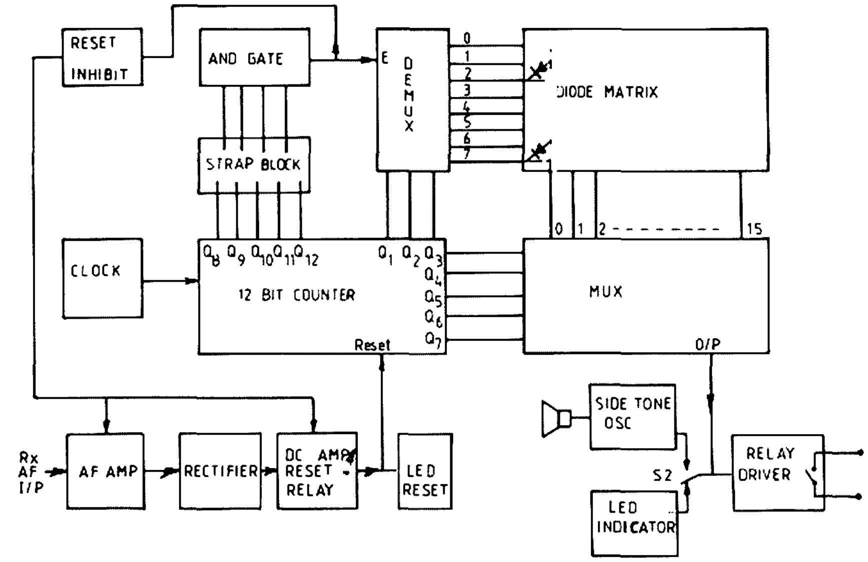

ADAPTIVE KEYER UTILIZATION
Figure 1 — Flow Chart — Block Diagram

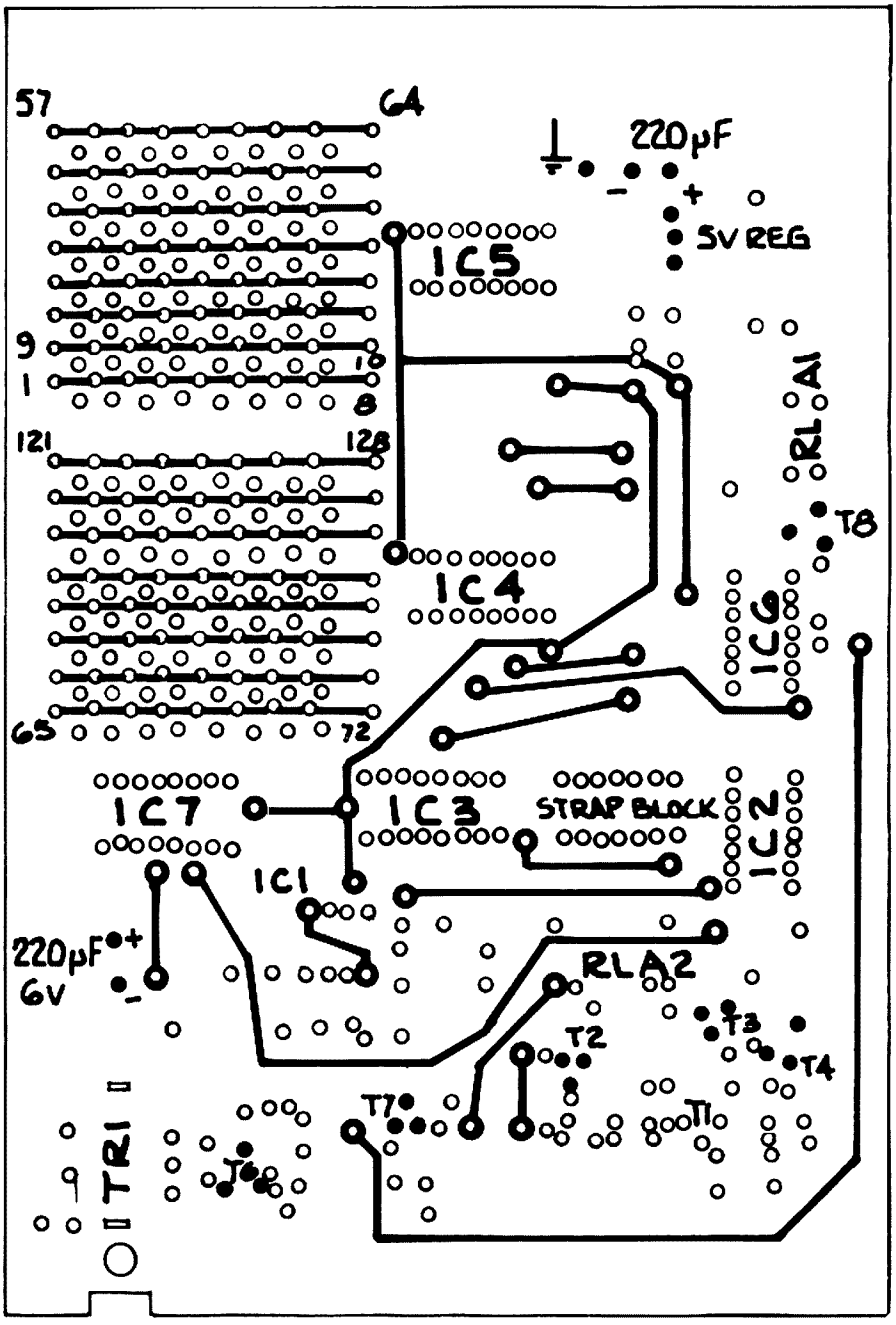

Figure 5 — PC Pattern (component side)
Note: Strap Block could be replaced by DIL switch

The reset inhibit is achieved by causing the 12V rail to be turned off during calling period.

CIRCUIT DETAILS

1) CLOCK — IC1 a 555 used as an astable multivibrator whose speed determines the CW speed.
2) COUNTER — IC3 — 12 bit binary counter. CMOS CD4040BP.
3) MULTIPLEXER — IC4 AND IC5 74LS151 and IC6 74LS00 quad 2 i/p AND gate. Gates 1a and 1b cause either IC4 or 5 to be selected under control of Q7. 1d and 1c combine the outputs of IC4 and 5.
4) DE-MULTIPLEXER — IC7 — one of eight demultiplexers. 74LS138.
5) AND gate — 74LS08 here used as a 4 input AND gate.
6) RESET INHIBIT — consists of T3 and T4 when the AND gate output goes high T4 conducts causing the base of T3 to go low hence no supply voltage for RLA2 and T1 and T2.

T5 buffer switch for either side tone oscillator or the green LED.

T7 buffer switch for the Reset LED indicator.

The value of this project in the enjoyment of amateur radio to me is that it saves a lot of calling CQ when this machine does it for me. I simply reap the benefits when a call is received.

PROBLEMS —

No claims are laid upon the use of a diode matrix in a keyer but rather the use of a keyer in a manner that would not drive every other user of 6 metres around the bend.

The greatest amount of time was spent on producing a circuit board pattern that didn't require a myriad of wire straps. Full sized circuit board patterns

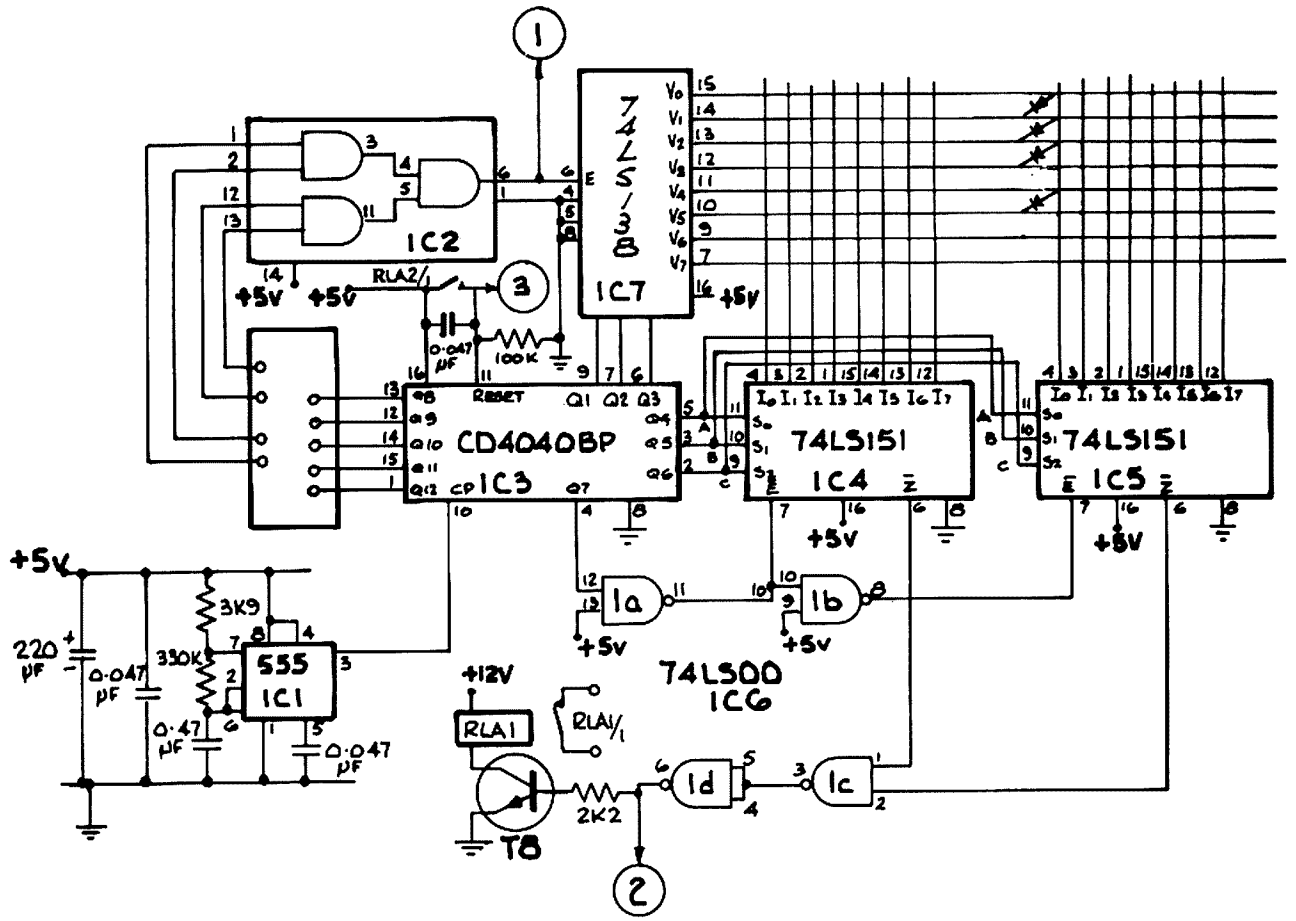

Figure 3 — Circuit Diagram

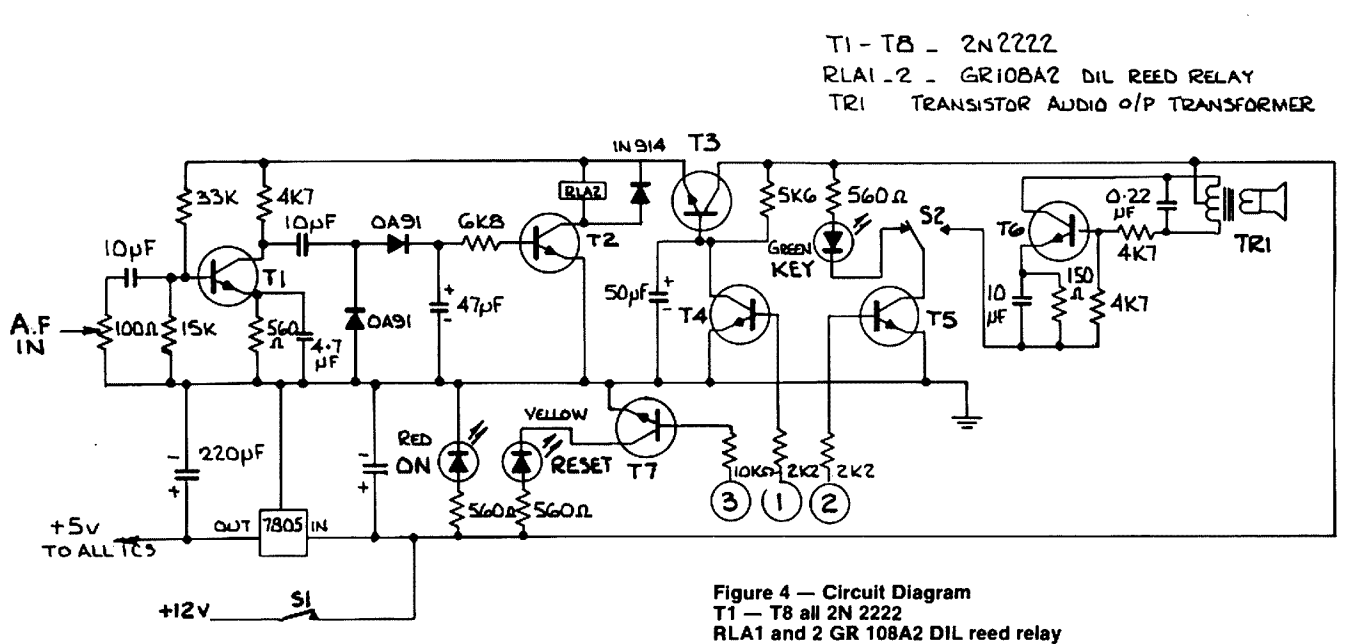

Figure 4 — Circuit Diagram

RLA1 and 2 GR 108A2 DIL reed relay
TR1 Transistor audio o/p transformer

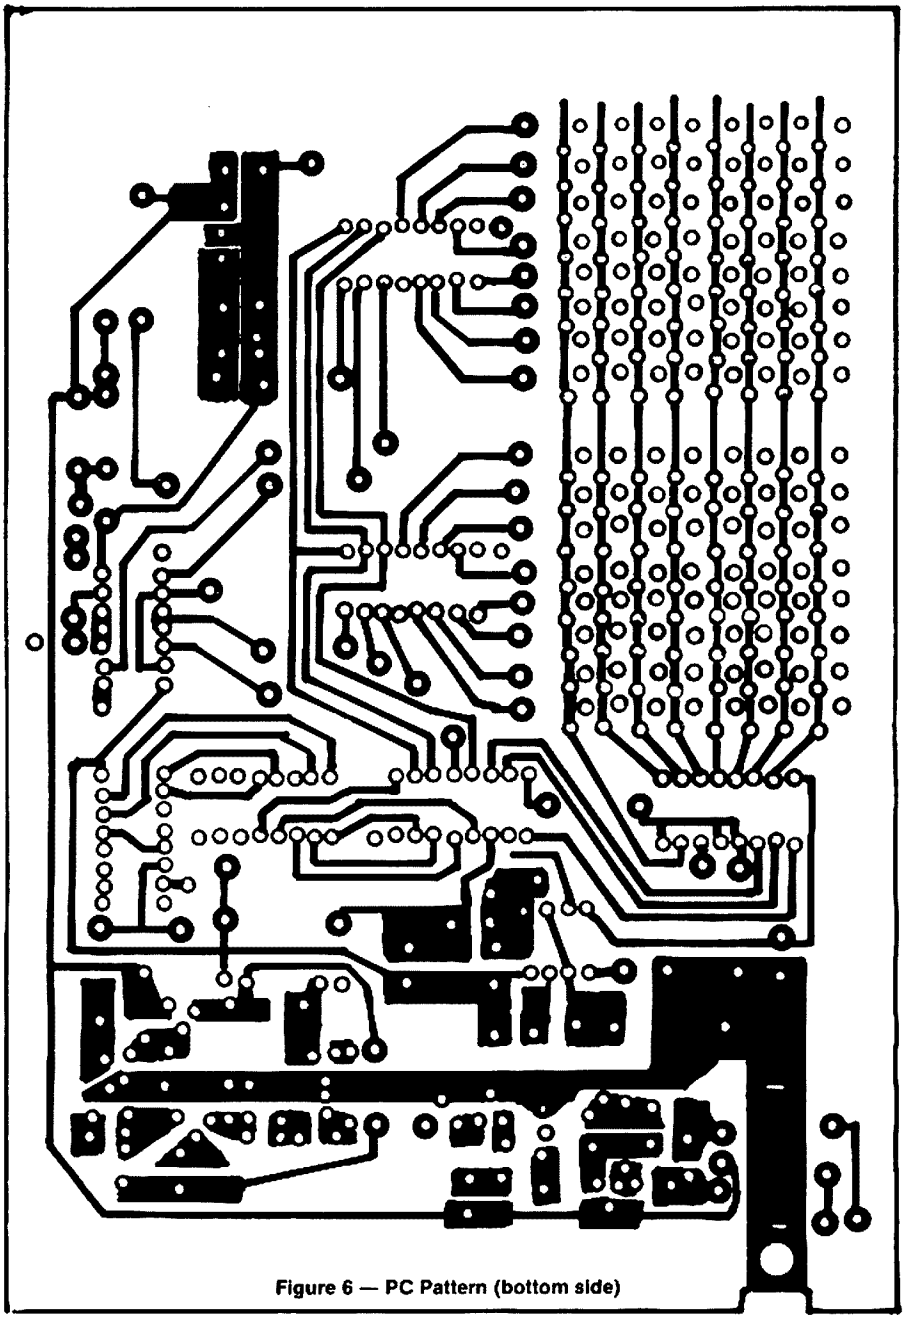

Figure 6 — PC Pattern (bottom side)

are shown in Figures 5 and 6, should any attempt be made to reproduce this project.

BRIEF SPECIFICATIONS

Power consumption @ + 12 V Idle = 50 mA
Keying = 80 mA
Maximum Reet Sensitivity = 100 mV Pk-Pk
Memory Size = 128 bits
Clock Frequency = 8.5 Hz
Message Length = 15 Seconds
Max Call Cycle Length =
32 x Message Length = 8 Mins.

Comments Reusage

I have found that a period between calls of about 5-6 mins to suit me best.

A mute on the receiver which has good noise immunity is necessary to prevent false resetting of the keyer.

Do not leave it running, unattended lest ye be reproved and proved a nuisance.

BEST PHOTOGRAPHS

DECEMBER & JANUARY

The judges selected the cover photograph of the December magazine and the photograph of Norbert Trupp VK4FXP — page 52 in January's magazine.

Other clubs and groups may like to use some of these ideas or devise some of their own from the following information, to help promote amateur radio and the Wireless Institute of Australia in this — our Anniversary Year.

CATCH-22

Or . . . One club's approach to public relations.

Charles Ivin, VK4BPI
36 Tulloch Street, Mackay, Qld 4740

Never move motions at VK4 Divisional Conferences. The Mackay club did. It read, "That the WIA Queensland Division, in co-operation with the Federal body, produce portable visual displays to promote the variety of benefits of amateur radio." The Mackay Amateur Radio Club is small and it was felt the availability of such displays would help in its membership drives. No sooner was the motion accepted on the agenda than the chairman, David Jones VK4NLV, by a combination of sheer flattery and low skullduggery talked the Club into preparing an audio-visual display for presentation at the Conference.

This should have been a warning. After spending long hours in preparation, a slide presentation was shown at the Conference, with pre-recorded commentary extolling the joys of being a member of the radio club. The response was overwhelming . . . so much favourable reaction that the club delegates, in reporting back to the next meeting, made their second big mistake . . . *"Why don't we present a public display in our own city, complete with static display, radio exhibits, video films and a live amateur radio station?"* Suddenly, reality hit. It's easy enough to move motions at Conferences, but somehow, when you find yourselves having to help make them work it seems more difficult!

"No worries!" said President Wally VK4AIV. A sub-committee was set up and a clear plan of attack was mounted. The following comments outline the approach to the challenge.

VENUE

It's important to pick a place where plenty of people visit and facilities will show the display at its best. There seemed to be two possibilities. Shopping centre complexes attract a good cross section of the public but usually have limited room and require a rostered attendance of members to guard the display from undesirable QSOs during working hours. Alternatively, the City Library, which has a large safe display area, plentiful boards and glass presentation cases, a separate small auditorium suitable for video presentations and portable amateur radio stations. Even more, it has an enthusiastic Librarian who'd rather say "CQ" than "QRT"! Therefore, the Library was selected to mount a display over the period of 22-29th September 1984, incorporating two weekends.

STATIC DISPLAY

There were about nine double sided display boards. Each side was given a theme or message to convey to the public. Where the subject was more complex, additional sides were used. To facilitate the setting up, all presentations were made on cardboard sheets of various colors, of approximate dimensions 550 x 750 mm. The headings used were:

"Welcome to Mackay Amateur Radio Club", "What is Amateur Radio?", "Spanning the Years" (good for young and old), *"Raising a Tower — A photographic sequence of construction", "Community Service — WICEN, Service groups, JOTA, Handicapped, Trials", "Shortwave Listening and DX", "ALARA . . . even little ladies do it! . . . Let's QSO!", "Amateur Radio Spans the World", "WIA . . . What is the WIA", "Licensing Requirements", "Department of Communications", "ITU, IARU, Interference, Pirates", "A Progressive Hobby", "Satellites, Microcomputers, Home-brewing, VHF, ATV, RTTY, Packet Radio", "The Morse Code —How to tackle it".*

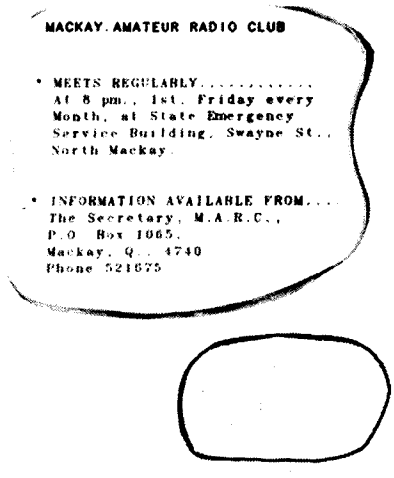
Two main tools were used for the displays to avoid the need for sign-writing by hand. A computer was used with a programme producing ten different printing styles on a graphic copier. These typed headings were then enlarged on a photocopier to a suitable size for visual impact. The latter was also handy for the many articles "borrowed" from technical sources and WIA Publications. Care was taken to acknowledge source data with occasional printed references.

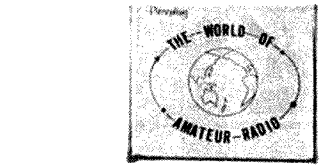
Cartoons were particularly handy to lighten up what might have become an over serious display. Although the photocopier produced excellent copies of pictures, actual magazine covers, enlarged colour photos and posters were used to provide colour contrast throughout the display.

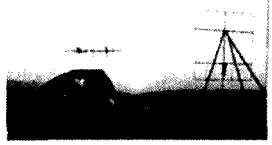
A special deal was struck at a local colour developing firm for cut prices, given a small acknowledgement near the enlargements. Six colour posters from WIA Federal sources were invaluable in giving additional impact amongst the smaller illustrations.

Probably the most important aid in presentation was the artistic hand of the writers XYL, Jenny, who added coloured borders, etc as well as organising the actual layout of each sheet.

A monster world map surrounded by QSL cards was used by Bruce VK4NPF, to relate the interesting contacts made between amateurs around the world.

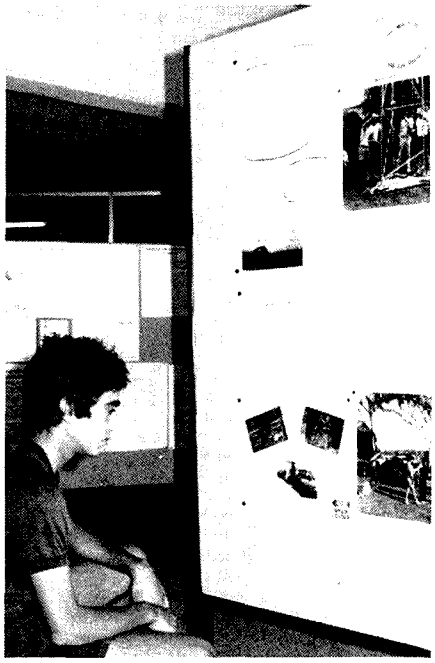






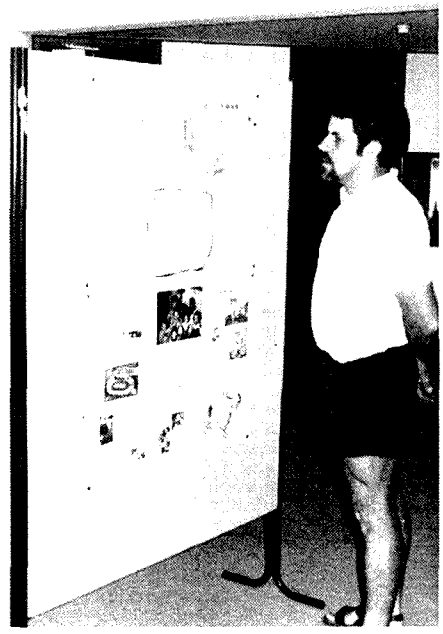
Club members provide mutual help not only in technical matters, but also in equipment instal--ations. These occasions may also provide suitable excuses for celebrations.

Static Display.



A Visitor views the Display Boards

John VK4VAE demonstrates the Club Station, VK4WIM/P, to the Moody family in the Auditorium ot the Mackay Library. Bob VK4TKA and his Harmonics look on.



Bruce VK4NPF views the Display Board on Community Service.

EQUIPMENT EXHIBITS

Popular couple Betty VK4BET and Bernie VK4KBF, presented a range of radio equipment progressing from that fully dependent upon valves through to the latest developments incorporating computer designed circuitry. Complementary displays showed the decreasing size of circuit components to integrated circuits.

Vintage QSL cards filled out the gaps between assorted items such as carbon microphones, army communication rigs, world clocks and micro-processor controlled CW/RTTY receivers.

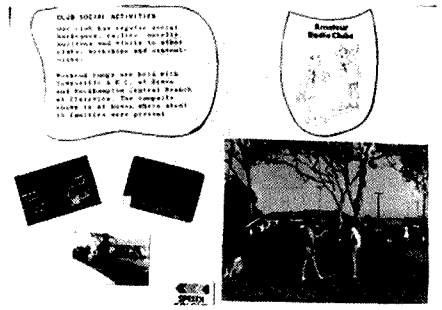
VIDEO PRESENTATIONS

Federal Video Tape Co-ordinator, John Ingham, was particularly helpful in promptly returning a copy of a number of programmes Rick VK4AIM, selected from the comprehensive range available from the WIA Library. All John required was a video cassette of compatible format with a stamped return addressed padded mailbag.

The "box"-like moving pictures of the video display put the young immediately at home and we found the audio often provided the first attraction to people from the main library rooms.

AMATEUR RADIO STATION DEMONSTRATION

At the two main peak periods, Thursday night and Saturday morning, the club station, VK4WIM/P, under the control of John VK4VAE, was operational in the auditorium. Earlier, the installation of a vertical trapped antenna on top of the library television supports was arranged to cover the bands of 80 and 20 m. A number of local amateurs were on air to ensure that definite contacts were available for any interested visitors. In fact, contacts were made from Canberra in the south to P29 in the north. Band conditions did not enable true DX but a strong friendly signal seemed to be the most important factor in introducing the hobby to the public.



Display Board showing Club Activities.

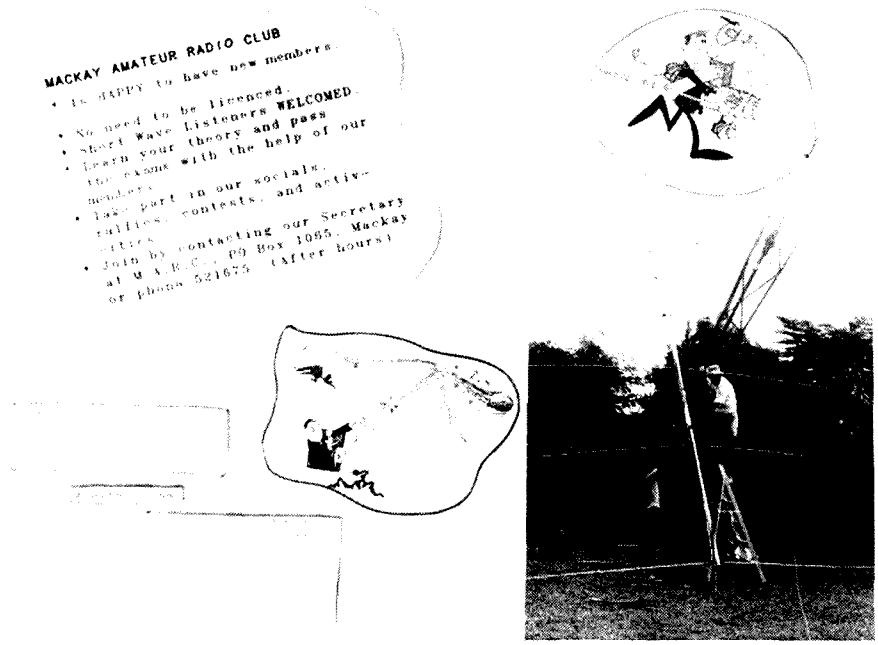
HANDOUTS

A number of handouts were available through the WIA Federal and State Divisions as well as from the Department of Communications via the friendly Radio Inspector. A number of old AR magazines and call-books were also useful, particularly to give to well selected potential members. It was found that those people drawn towards the hobby wished to take something with them to help them keep the contact alive until their next contact, possibly the next monthly meeting.

CONCLUSIONS

It was found that plenty of material is already available in WIA Publications and other technical literature. However, it did take imagination, unusual resources and plenty of time to put this available information into a more palatable form for the public. Much of the preparation would have been similar to that used by other groups in the same position. This leads one to wonder how much time could be saved if a more professional set of basic posters were available for use by all Clubs and Divisions. These would greatly enhance the presentation of all displays.

In retrospect, the Club believes that they could have given more consideration to the timing of the display. This presentation, made during the school holidays,



Cartoon lightened up the Display Boards

missed out reaching a greater number of younger people (possibly new members).

Never mind, we've broken the back of that one! What's next? After the Jamboree on the Air, there's the "4MK Spare Time Activities Expo" and I think that will just about fill this year's public relations requirements.

What's this about moving motions for the next WIA Conference?

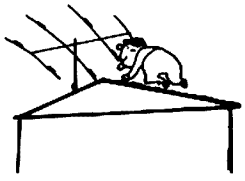
AR

FOR BEATLE FANS

From 1st December to 31st December 1984 Merseyside Special Event Group were operational using the callsigns GB 0, 1, 2, 6, 4 and GB8BCL (Beatle City Liverpool), to celebrate the opening of the Beatle City Museum in Liverpool.

For those fortunate enough to work them QSL to G4VKV, c/- Beatle City, PO Box 12, Liverpool, UK.

AR



MURPHY V MOSLEY

Allan Doble VK3AMD
206 Poath Road, Hughesdale, Vic. 3166

Adventures with a "MOSLEY JUNIOR" beam.

My Mosley Junior beam is fairly old but was always reliable with a low SWR on the 10/15/20 metre phone bands and only required the use of an ATU at the CW ends of the bands.

I suddenly found that reports I was getting were way down on those I was giving. So I checked the SWR. SHOCK! HORROR! It was over 3:1 and hard to improve even with the ATU.

SWR on 10 metres was about normal but on 15 metres three different SWR meters went to 75 percent of full scale (10:1 or more?) and could not be reduced.

First thoughts were that there might be moisture in one or more traps as it had been raining but it was too late in the day to investigate. A few warm days later nothing had changed. A borrowed linear was fed up the line to see if something would burn out but without success.

Meanwhile the LP filter, monitorscope and ATU were all disconnected so that only the built in SWR meter of the FT107M remained. No change!

Several friends consulted agreed that a fault in one of the driven traps — probably a 15 metre one — was the most likely cause of the problem.

The hard work now started as the antenna is mounted above the roof of the house and is not on a tilt-over tower.

Every visit to the antenna meant a three metre climb up the extension ladder then a six metre walk up the tiled roof and back down again.

After about twenty or thirty of these tiring journeys the beam is working properly again. *So what happened*?

All six traps were opened up and carcfully examined. Traces of moisture were found in all of them. They were dried out, checked for shorted turns and for leakage from coils to elements, carefully re-assembled and sealed against moisture.

The insulation resistance of the coil formers was checked and found to be several megohms. The (commercial) balun was opened up, checked and re-sealed. The dummy load was carted up the roof to check that SWR was OK at both the end of the coax and the far side of the balun. All were found to be OK on all bands.

Apparently solid telescoped joints in the elements were found to show quite a few ohms resistance due to corrosion, so these were all cleaned and re-assembled.

The darn thing just had to work now but, you've guessed right, nothing had changed!

The next move was to do what I had been running away from. Open up the 15 metre driven element traps and unwind them.

First one — nothing found. Second one — would you believe about 10 turns in from one end, a lump of black, charred looking crud came out of the former attached to the wire leaving a hole about 5 mm in diameter. The aluminium at the bottom of the hole was very bright and had probably been subject to some electronic etching.

Both traps were rewound with new enamelled wire and heavily sealed with epoxy resin after a careful count of the turns.

This time I had the problem licked for sure!

Up the roof for the umpteenth time, traps re-assembled and sealed, down again, switch on. Result — SWR had come back to a reasonable figure but the resonant frequency on both 15 and 20 metres had gone outside of the low end of the bands.

Thinks! It must be the heavy doping with epoxy.

So, two traps unwound, rewound and ends sealed using only a small dab of epoxy to hold the ends. This is necessary because of the construction of the Mosley traps. *(see "AR" November 1982 page 25.)*

Up etc, down etc, switch on. Eureka! It works.

SWR as measured on the built-in SWR meter of the FT107M rig is now:

MHz	SWR	MHz	SWR	MHz	SWR
14.005	3:1	21.005	2.5:1	28.005	1.5:1
14.250	1:1	21.250	1.1:1	28.500	1.1:1
14.345	1.05:1	21.345	1.5:1	29.000	1.1:1

There should be a moral in this tale somewhere and I think it's this:

I should have tested for insulation breakdown with a lot more voltage than that in my ohm meter — say 250 volts in series with a resistor and a milliameter!

AR

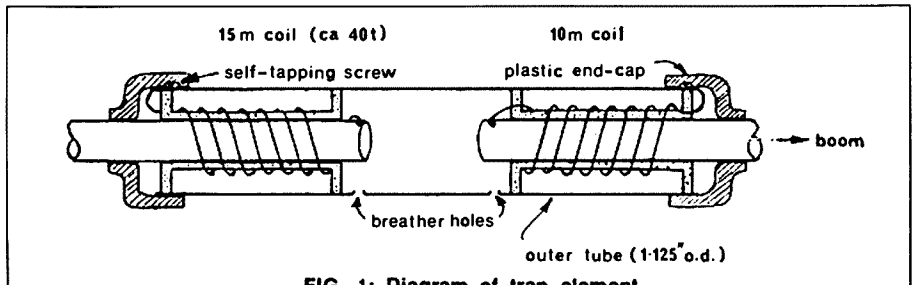


FIG. 1: Diagram of trap element

CLANDESTINE NAVIGATION AID

Reg Glanville, VK2ELG
63 Buffalo Crescent, Thurgoona. NSW. 2460.

The events in this narrative occurred in the same Prisoner-of-War work camp at the Beet Sugar factory in SE Germany where I built the short wave radio which was the subject of the March '84 article. This radio indirectly triggered the happenings of the following story, and basic electro magnetism is involved.

The complimentary responses to my article "Clandestine SWLing" in March 1984 AR, from VK1-2-3-4-5-7 per letter, telephone and during QSO's was quite unexpected, with several requests for another one in similar vein. After much thought, I decided to once more impose on my XYL's typing skills and "give it a go" — hence this submission.

For over two years the sole source of world news available to our party of approx 50 (Aust, NZ and British) was German. The radio heard while working near their lunch room, newspapers retrieved from a war effort salvage bin, plus the occasional copy of "The Camp", an English language news sheet printed in Berlin for Allied POWs. Naturally, the German media was subtly biased in their favour (as was ours) — isolated as we were in central Europe. After two years our morale and optimism was surreptitiously eroded. "Fortress Europe" appeared impregnable, and thoughts of escape from our location waned.

By mid 1943 I was receiving news from Daventry on my radio (see AR March 1984) — the German "1,000 year Reich" was crumbling after only four years! —the first ray of light since becoming a guest of the enemy two years before. Our morale was infused once again with optimism. The possibility of escape seemed viable, albeit tenuous, and thoughts trended in that direction.

An escape plan with any hope of success could not be formulated without a reasonably accurate map of Europe, indicating various military front lines and "friendly" boundaries. An attempt to draw one proved a failure. German newspaper sketch maps of various European military and political situations appeared to be the obvious.

The prison compound gates were locked most of the time, and the barrack's doors were locked and barred from 8pm to 5am — the period for clandestine activity!? After a month I was able to draw a rough map of Europe but the main problem was to strike a common distance scale.

I sat "glued" to the headphones, seeking information on geographical distances mentioned in news services, and logged quite a few over the period. Another source was discharged wounded German soldiers working at the facory — a disillusioned lot. Casual questions, such as *"Well, how far is it from Munich to Belgrade?"* were usually answered without suspicion.

The map finally showed the approximate distances from our camp as Belgium 450 miles, Switzerland 400, Italian and Russian fronts 550, Yugoslavia 400. The first three were ruled out because of a long trek through enemy Germany, the Russian front because of massive enemy forces, so we opted for Yugoslavia, despite is waring factions.

The route was through friendly Czechoslovakia, and unpredictable Hungary. This route was then redrawn with greater accuracy and the rest of the maps destroyed. We were faced with mountains, rivers and cities — a compass was essential.

By now I had selected a New Zealand partner, who had a fair knowledge of the German language and was a dependable type. I was camp interpreter, and also had a brief smattering of Polish and the Czech language — we maintained secrecy over our plans. My partner's responsibility was food, clothing, first aid, — mine, time schedule, map, compass and route. Procuring a compass proved a major problem — the multinational civilians forced to work at the factory had pitifully few possessions, certainly not a compass, even the friendliest German would not risk supplying a compass to a POW — the only avenue was design and build one. The utmost secrecy must prevail, a compass could only mean ESCAPE — our guards major concern.

For the next few nights my thoughts were fully occupied by the project — *where does a prisoner, deep in enemy terrority, find the materials for a magnetic compass?* My partner suggested that we adopt 'qui vive' for any broadly suitable materials and allow this to dictate design — however, I opted for prior theoretic design, and then seek the required bits and pieces.

The format that evolved was as follows: the compass case had to be non-magnetic, compact, robust, with a removable screw lid and clear celluloid viewing insert — a short, vertical needle glued to the bottom would serve as a pivot. On this pivot the rotating platform with magnetized needle would be mounted, hopefully to indicate north!

THE CASE

Two weeks of nonchalant peering into factory garbage produced nothing within our requirements. Curious Germans were assuaged by *"Thought I saw a rat"* — *"Looking for a bootlace!"*

Suddenly the problem was solved — a consignment of British Red Cross parcels arrived at our work camp, and some of them included cakes of Gibbs Dentifrice, in the perfect container for our compass! Approximately 2.5 inches in diameter by .75 inches deep, screwed lid of dark brown bakelite.

These food parcels, in a standardized carton, were issued through the International Red Cross to prisoners of war of all nationalities who were undersignatories to the Geneva Convention. The route to us was Portugal, Switzerland, Berlin.

BACK TO THE COMPASS

First job was to cut a circular piece out of the lid through which to view the needle — quite a task through hard, brittle bakelite, without tools. A two inch nail was obtained from the carpenter's shop, and when the barracks were locked, action commenced.

A circle, was carefully scribed leaving about a .25 inch annulus at the rim to strengthen the thread, and as a mounting flange for the celluloid window. Following this circle round and round, the nail became blunt after about ten laps, and was re-sharpened on the concrete floor, under our bunks to minimize risk of suspicious guards sighting the marks.

Because of my association with things of an electrical nature, my nickname was "Sparks", but during this period of scratching around, the pseudonym became "Chook"!

The brittle fragility of the bakelite negated the use of any pressure on the nail — the job seemed endless, the fingers numbed. A week passed before the window appeared, albeit with a section of the annulus rim broken away.

Clandestine SWLing on my radio at night indicated our advance in Italy had slowed. Escape to me was essential.

My partner had assembled clothing — one set each of new underwear and socks, to be worn — another set, well worn, to be carried. Sound, but well worn and faded uniforms and boots, plus grubby cloth dilly bags, hopefully to be less discernable amid the motley myriads of polyglot tongues of foreign forced labourers who propped up the enemy's war economy. All tags, badges and military type buttons were removed, but our clothing could still be proven as British uniform if this were necessary, should we be apprehended and accused of nefarious spy type activities, for which there was only one penalty.

I found a scrap of clear celluloid and a small cork in the factory laboratory trash bin, glue from a friend in the carpenter's shop and a sewing needle from a Polish girl worker. The needle was broken off short, inserted through the piece of cork glued to the bottom of the case, point upper most. Hey presto, the compass case with pivot and transparent lid was complete. Now for the magnetic "works!" The frustration and time consumption to produce the needle assembly was massive.

The bearing for the magnetic needle was to be the tip of a small glass phial, which positioned over the vertical needle pivot would provide almost friction free rotation — the source once again the laboratory, where small sealed phials of chemicals were used in quality control testing.

Normally I was called to the lab at least once a week, for minor electrical problems — such as a blown globe or fuse.

For three weeks the silence from the lab was deafening not the slightest need for an electrician — but finally, a faulty desk lamp.

In departing I passed the assay bench — three opened, empty glass phials thereon — my offer to dump them was accepted — two of the tapered tips appeared suitable, but they were too long, and the open ends were jagged. The restricted height of the compass case limited the glass bearing to .25 inch. So commenced the onerous task of grinding the fragile piece down to size, another "under the bunk" operation on the concrete floor of the barracks.

Half an hour later it shattered — obviously the smoothest patch of concrete was too rough. So the sole remaining tip, tied in handkerchief, was taken to my workplace in the electricians shop, where I had access to a fine emery stone.

There followed the delicate operation of grinding, whenever the German staff were absent. Days passed before the desired length was attained, a smooth true edge to the open end. Back in the barracks, using a nail, a hole was drilled through a rectangular piece of celluloid, the glass tip was pressed in and glued, the magnetic needle platform was a reality!

The compass accuracy depended on completely unimpeded rotation of the platform on the vertical pivot needle point — thus it was essential that this platform be perfectly balanced. This could only be achieved by using two precisely positioned magnetized needles, one each side of the pivot bearing. Sounds simple — try it some time!

Sewing needles were at a premium in our barracks,

so this time a lassie labourer obliged on a barter basis — four needles for a small piece of chocolate, which was literally unavailable in Germany. Three of them were identical in size, but displayed not a vestige of magnetism — how to achieve this under the circumstances?

I realized then, that up to that point in time, magnetism had been taken for granted, and my knowledge thereof was vague. A steel needle, exposed to a magnetic field should become magnetized, so the hunt for a permanent magnet commenced. I well recall the morning when, on a slim pretext, I entered the factory machine shop and my presence there was questioned by a German worker. His startled expression, bordering on pity, was worth seeing, when I replied *"I'm looking for a magnetic field"!*

Eventually a friend working in the boiler room "procured" a small weak horseshoe magnet (another barter deal). Across the poles I laid two of the needles, one responded but showed only faint traces of magnetism, the other one remained totally oblivious to the magnet, despite my efforts over two evenings, to then discover it was plated brass! The third needle was magnetized, and the compass was ready to make its debut! The two needles were painstakingly positioned on the platform and the north polarized points slowly, sluggishly turned north — victory, almost! But stronger magnetism was essential.

The molasses content of brown sugar at our factory was removed per medium of centrifuge machines, equipped with DC electromagnet operated brakes — worth investigating? For a few days the needles were embedded in my jacket lapel — then luck. I was sent to the centrifuge room to clean the cast iron fuse boxes and surreptitiously left the needles on the magnet core laminates of a nearby machine. Never were fuse boxes subjected to such meticulous cleaning especially by an enemy alien. I made sure the job was not completed that day and returned at 6am the next morning.

The needles were conspicuous by their absence! — they had become dislodged during night shift. I spent some time nonchalently seeking around the machine, the aged, friendly German operator showing only bored indifference.

The needles had fallen down into the sugar, during braking vibration. That put me back to square one.

Another pair of needles were scrounged and my decision was to try a method I had earlier discarded because of certain inherent difficulties — to wind a coil around the needles and flash across it a 240 volt AC power source. I retrieved some 22SWG cotton covered wire and a broken light globe base from the factory salvage bin, and that night embarked on the project. Two leads about three feet long were attached to the globe base and anchored the bared ends between the teeth of a comb, about two inches apart. A fifteen turn coil was wound around both needles, leaving two feet long pig tails, with bared ends.

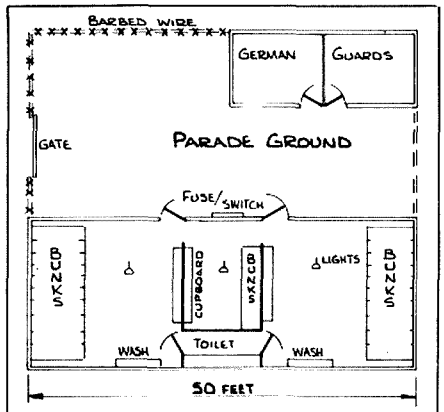
For the previous four years, my life style had been totally remote from civilized normality which had further dimmed my knowledge of electro magnetism. I remembered that a full AC cycle commenced at zero current, rose to a positive peak, fell to zero, reached a negative peak and returned to zero, fifty times per second. The magnetic flux reacted in accordance with the AC current of course.

I had to be lucky enough to strike the split second when current was just before one of the peaks — I presumed that if the dwell included current reversal after the peak, demagnetization, or polarity reversal of the needle would commence.

Our barracks fuse was outside (see sketch 1) and anticipating the possibility of blowing the sole fuse, I had deliberately shorted our lights a few days earlier. This gave me "official" access to the box to replace a fuse, which I did with one of 20 amperes rating.

NOW FOR EXERCISE MAGNETIZE!?

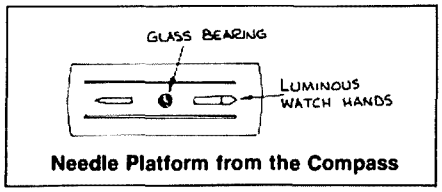
Joining one end of the needle coil to a wire protruding from the comb, unscrewing a light globe (most of Germany Edison Screw Base) and replacing it with my globe base with wires attached. These were then "live" — no switches in the barracks. Under our existence safety standards had low priority. Holding the comb rigidly on our barracks table, and tongue in cheek, the two bare wire ends were flashed across



POW Barracks

each other — the entire barracks plunged into darkness!! My contraption was unscrewed, tossed under a bunk, and the globe replaced, all by sense of touch, then I pounded on our barred door to attract guards.

I muttered something relative to 'German aluminium wiring and inferior synthetic rubber insulation' as I dashed out into the snow (only slightly colder than our barracks), replacing the fuse.



Needle Platform from the Compass

Next night I slid the two needles out of the coil and tediously positioned them on the compass rotatable platform — no luck, the platform wallowed about, showing no inclination whatsover for either N or S pole. I presumed that the split second of current flow through the coil must have coincided with either a zero or part positive, part negative phase of the cycle. It was painfully obvious that the chances of successfully magnetizing the needle points north would be very slim. However, I had learned the virtue of patience when building the radio some months before, and decided to press on.

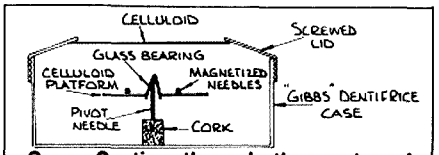
The blown fuse indicated that the time span and current were too great. The time span could be reduced by greatly increasing the speed at which I flashed the wires across each other, and the current by using a 'tail' of hair-thin wire on the end of the coil wire. This wire took some finding, but a week later a multistrand connector wire on a variable RF tuning coil from a cannibalized set in the workshop filled the need. So the endeavour resumed, night after night — no more blown fuses thank goodness. The wire dutifully melted at the tip, greatly reducing current and time. After each try, the needles had to be tested in the compass — but never a north pole!

Unfortunately, at this point, my partner was transferred to another sugar factory, ten miles distant. Totally unanticipated, this disturbed our well laid plans. Eventually contact with him was established via a French farm worker, who had some freedom of movement, especially on Sundays. No need to guard the French — the whereabouts of their relatives in France was known to the Germans!!

Finally EUREKA! — at long last the needles pointed north, the platform rotated freely and responded quickly. The last flash must have coincided with the rising positive peak of the AC cycle. Carefully I glued the needles to the celluloid platform (which is still holding forty years later!) and cut a cardboard packing piece to place under the lid to stabilise the needles to avoid bearing damage when carried in my pocket. I had hoped that the bright needles against the matt black case bottom, would be visible in near darkness, but a test made before dawn on my way to work proved this incorrect.

I still had a pocket watch which my parents had posted to me for my twenty first birthday when in Egypt (the engraved inscription had saved it from being taken from me on several occasions). It had luminous hands, the tips of which I removed and glued between the needles.

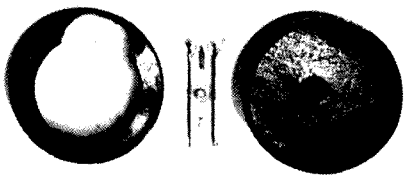
The compass was near perfect. I was ready to go — was my friend? Verbal messages were sent via French 'underground' that all was ready. A month passed, and then the reply — he would attempt to escape off night shift, reach our factory on the same night, and be smuggled into our barracks during a shift change. We thought the authorities would not search another prison compound for an escapee!



Cross Section through the centre of the Compass.

Some time later our guards informed us that a POW from that factory had been wounded and apprehended during an escape attempt — I did not see him again. Soon after this the German radio reported the allied invasion of France and all our bridgeheads held. The risks entailed in an escape attempt now seemed pointless, so the plan was abandoned.

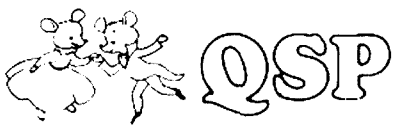
This is a factual narrative of events that occurred around 1944 — I have striven to minimize tendencies for this to become an "escape" story. It is primarily an account of elementary use of electricity under adverse circumstances, to achieve an objective, made possible by my pre-war radio knowledge. Furthermore it is yet one more example that electricity is taken for granted, always available to serve mankind.



Clandestine Compass — 1984.

Irrespective of the 'whys and wherefores' of magnetizing an object with 50 cycle AC, eventually a device was produced that indicated magnetic north. When the decision was made to write this, my XYL retrieved the compass from family archives — its first exposure to daylight for thirty five years — still intact, and operating perfectly!

AR



RUSSIANS DEVELOP MINIATURE TV CAMERA

Soviet manufacturers have produced a television camera one-and-a-half times the size of a cigarette packet.

Tass news agency reported that the camera, called the KT86, could be used with any TV set and produced a crisp and clear image.

Only monochrome cameras were being made initially but colour models of the same size were expected soon.

Tass said the camera had scientific, economic research, and domestic applications, but the report did not say when it would be available commercially.

AR

USER REPORT — THE TET HB-433DX QUAD BAND BEAM

Brian Warman VK5 BI
Box 677, Whyalla, SA, 5600

Having been a Cubical Quad user for 15 years or so I only gave this antenna away (literally!) due to moving to a city and was compelled to look for something looking a little less like a CB antenna. Favoured American antennas cost an arm and a leg so when the TET range was investigated, these antennas looked like the answer. The antennas are made in Japan and are very favourably priced in this country. An added attraction was coverage of the 7MHz band — one of my favorites of DX.

I rang the agent who unfortunately is not really amateur oriented, and could not offer me such information as — *does it come with a balun?* But they were very helpful and the box eventually arrived per passenger rail.

I picked up the box and took it home. The antenna is well packaged in a fibreboard container of about 2 metres length. When I opened the box I was greeted with a conglomeration of aluminium packed in little pieces of polyprophelene. Full marks for packaging.

I laid the bits out on the patio. The elements and traps are all labelled. Hardware is packed in plastic bags and all bolts, screws etc are stainless steel. A little booklet is included showing construction details.

One requires a large area in which to assemble the beast. The longest element is 9.25 metres, that's 30.5 feet long! Configuration of this antenna is three elements including two phased driven on all bands 40 through 10 m and a director which is functional on 20-15-10.

The boom is assembled first. This is a solid piece of thick walled aluminium and comes in two sections in 2 m lengths. I assembled the director (easy since all traps and elements are labelled), and attached it to the boom. Then measuring from this element the two driven elements may be assembled and attached as per the measurements given in the instruction package. It is as well to keep the third element loose so that the phasing line will slip into place easily. Once the phasing is attached the whole lot may be bolted together. I used petroleum jelly on all element joints, and all screws and bolts. All elements are pre-drilled and the self-tapping screws (which have generous thread depth) go in with no trouble.

The antenna assembled I put it out of the way for the moment so that I could think about getting the tower ready. I stood it against the fence standing on its director.

The antenna comes with a stainless steel mounting plate together with necessary grooved wedges which should ensure the boom stays in correct alignment. Included in the package is a well constructed coaxial balun and male connector.

One point of some concern relates to the correct point for attaching the antenna to the tower. The instructions supplied, and all of the illustrations in the advertisements for this antenna show it attached in front of the middle element. This means the mass is unbalanced. I can only assume the intention is to keep the phasing wires all clear of the mast. This is the way I attached mine anyway.

Checks of the antenna at 10 metres confirmed the advertised specifications. In fact this antenna exceeds them in most instances. Any fears I may have had of narrow bandwidth compared with my quad have been dispelled. I believe this is due to the antenna having two driven elements.

The antenna is rated to 1 kW/CW and, by the look of the wire used for the traps I have no doubt there would be no problems with cooked traps at this level.

Note: A review of the TET HB443DX Quad Beam appeared in December AR, page 30. The HB443 is a four element beam whilst the HB433 is a three element beam. **AR**

THUMBNAIL SKETCHES

Alan Shawsmith, VK4SS
35 Whynot Street, West End, Qld 4101

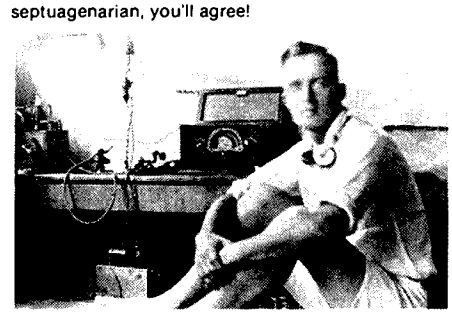
WILLIAM JIM BERRY — VK4WB

Jim VK4WB was licensed 18th May 1934 at Buranda, Brisbane. He has the honor of belonging to that select group of OOTers who've been active for over half a century and for all of this time he is conscious of the fact that he has used the callsign of one of VK4's earliest famous pioneers, viz OA4WB

OA4WB was first used in the years 1919/20 as a temporary call by William Bright, a 'gun' telegraphist with the Queensland Railways and an ex-Army Signaller WW1. (The VK prefix was to come later). At the immediate post-WW1 period of amateur radio's history, the PMG was reluctant to issue a call to a private individual — only the intervention of the then Prime Minister Billy Hughes made it possible for OA4WAB. A commemorative wall plaque inscribed with his name and call can be viewed in the vestibule of the Toowoomba City Hall.

Jim VK4WAB kicked off in 1934 with the ubiquitous Hartley 45 oscillator and an O-V-1 Reinartz receiver. The photo shows him, still in his teens, on a camping holiday at Woy Woy, NSW in 1934/5 using the call VK2BI; a 15 watt transmitter is at left and the receiver is in the centre of the photo. He clearly remembers working into VK7 with 15 watts input and loop fone.

Another of Jim's interests is that he gets his mobility from two powered wheels — not four. When I queried the safety of his means of locomotion in and around the busy parts of Brisbane at his age, his reply was, *"I'm just about to buy a new motor bike"*. Not bad for a septuagenarian, you'll agree!



QSP

TWO NEW DXCC COUNTRIES?

The ARRL DX Advisory Committee has voted to recommend separate DXCC country status for the British military base areas on the Mediterranean island of Cyprus. The case for country status is based on the following: when the Republic of Cyprus (formerly a British possession) was established by treaty in 1960, the United Kingdom retained sovereignty over both the Akrotiri military base and the Dhekelia military base, which continues to the present. The area of these two British bases total approximately 100 square miles on the 3572-square-mile island. Amateur Radio operations from the bases use ZC4 callsigns issued by British authorities, while all other amateur operations from Cyprus sign 5B4 calls issued by the government of Cyprus. Under the DXAC recommendation, the two bases would together count as one new DXCC country in accordance with DXCC Criterion Three — separation (from Great Britain) by foreign land. Note that the bases would be considered as one DXCC country because they are about 50 miles apart. Under Rule Three, the two bases have to be separated by at least 75 miles to be considered as two new ones. The DXAC recommendation now goes to the ARRL Awards Committee for action. Readers might remember that the last DXAC new-country recommendation — separate country status for the Baker and Howland Islands in the Pacific — was emphatically rejected by the Awards Committee. So stay tuned!

In other DXCC news, Minute 68 of the October 1984 Board Meeting instructed the DX Advisory Committee to reconsider DXCC country status for the Vienna International Center, 4U1VIC, in light of a briefing paper to be prepared by ARRL staff. A comprehensive briefing paper has now been completed and distributed to the DXAC. The Committee was asked to respond by 20 January 1985 (the deadline called for in Minute 68), so work could be completed on the issue prior to the 1985 Annual Meeting of the ARRL Board, January 24-25.

CHINA MODERNISING PHONE SYSTEM

Direct dialling to foreign countries from Beijing (Peking) and other major cities were part of a planned new communications network for China.

The present overtaxed and problem-prone phone system which allows no direct dialling, internally or overseas, is to be upgraded using advanced technology.

Minister of Post and Telecommunications, Yang Taifang said the number of phones would double to more than 10 million by 1990 and be more than 33 million by the end of the century.

Three million new lines, 1.2 million controlled by computer, and 60,000 long-distance cables will be laid.

THIS IS GB2SDD CALLING THE WORLD

The Saint David's Day Special Event Station will again be operational on the 1st March 1985 to celebrate the National Day of Wales.

In 1984, 1300 contacts were made in 24 hours. With this record in mind the BSC Port Talbot Amateur Radio Society are preparing to celebrate SDD on the amateur bands in 1985.

The Special Event Station will be operational from midnight the 28th February to midnight Friday 1st March 1985. Activity, conditions permitting, will be on all HF and VHF amateur bands. A team of enthusiastic operators will be pleased to make contacts, and as ever they will endeavour to pass a message of friendship and goodwill to all countries of the World. All are cordially invited to join in on the proceedings.

The Special Event QSL card will be sent to all amateurs making contact with the SDD Station and we will also be pleased to respond to reports sent in by Short Wave Listeners. IRC's would be appreciated if a card is required by return post.

All amateur licenced operators interested in the attractive Saint David's Day Award should aim to meet the following requirements.

Contact should be made with the Special Event Station on Saint David's Day (1st March 1985) and any 5 other Welsh amateur stations during the months of February and March 1985.

To claim the Award please forward copies of your logged contacts along with your cheque or Postal Order to the value of 6 IRC's to cover P&P made out to SDD Station and addressed to the Event Co-ordinator: Mr R. R. Jones, GW4HOQ, 'Bryn-Ynys', Strawberry Place, Morriston, Swansea, West Glam., SA6 7AG.

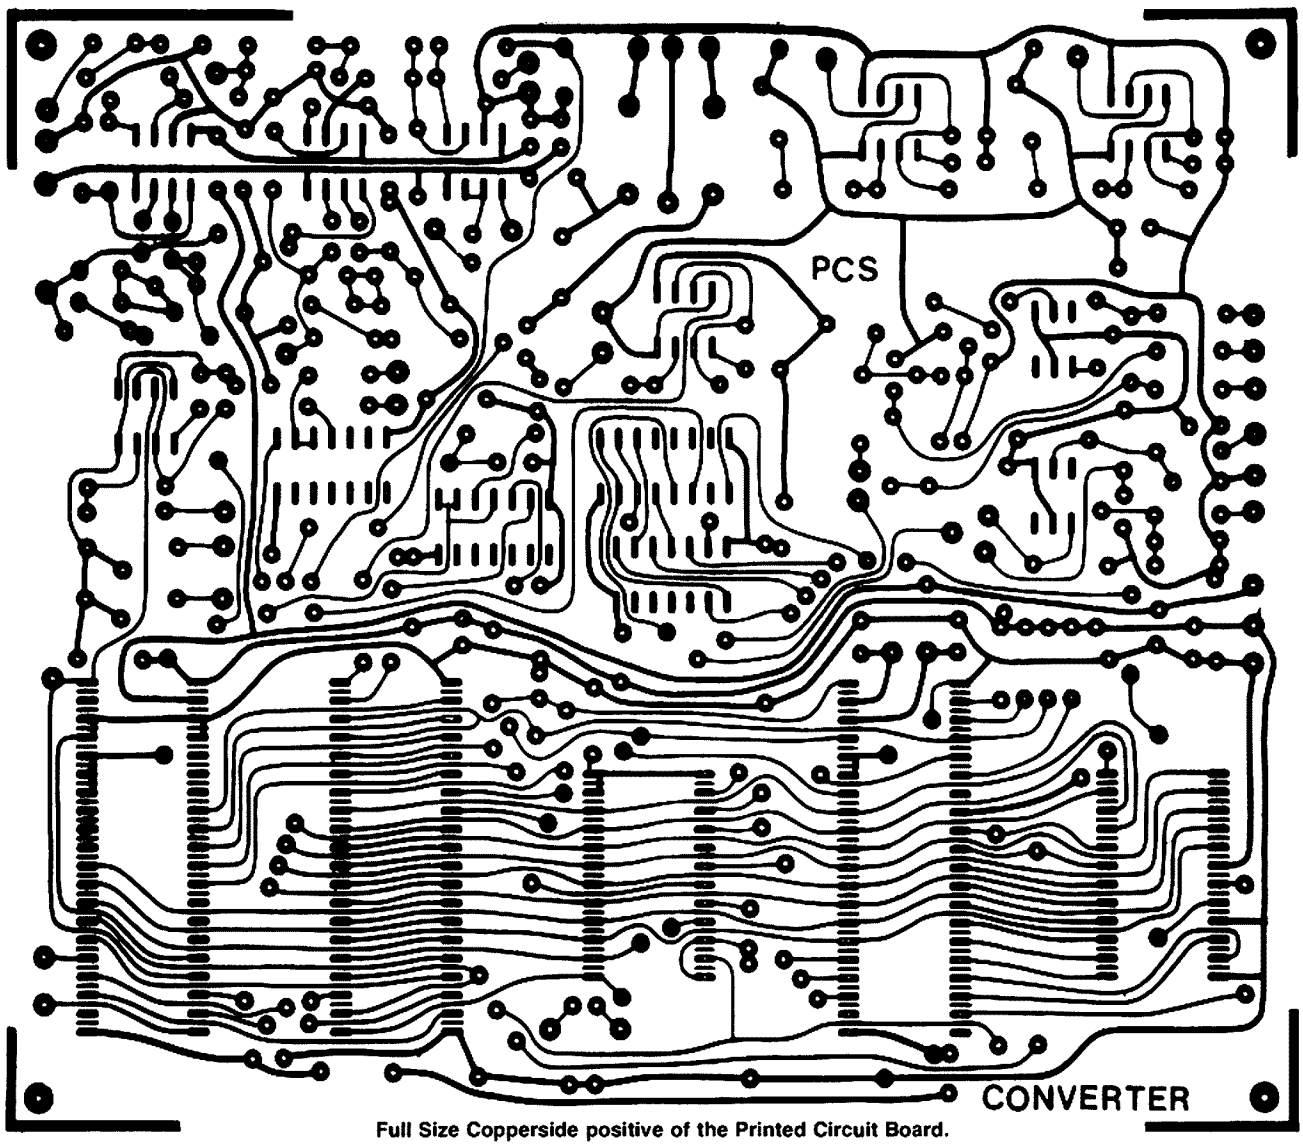
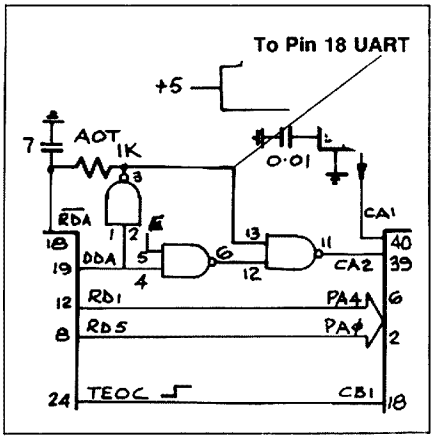
MODIFICATIONS & ADDITIONS TO VK3BFG RTTY-MORSE ARTICLE

*see page 16, December AR.



Full Size Copperside positive of the Printed Circuit Board.



TRACY

The Cyclone Tracy 10th anniversary story in AR last December has created some interest and stirred up memories.

It concentrated on the recollections of Slim Jones VK6ATJ (ex VK8JT) and Ken McLachlan VK3AH and the roles they played.

An article on our hobby's involvement in the Darwin disaster recovery was well overdue.

In a disaster of that size other radio amateurs would be involved and hopefully they will put their thoughts on paper so a complete record of events can be compiled.

An error in the story has since been found. It was not Mal Westwood 9M2MW involved in the emergency communications but Mike Paget then 9M2ML (now VK3CDB) — apologies to both Mal and Mike.

Jim Linton VK3PC

AR

AMSAT

While the traditional way of working stations through amateur satellites has been to set up and operate one's own earth station, more and more amateurs are now being introduced to satellite communications through the use of "gate way" stations. Simply put, a gateway station is an earth station that takes your signal and retransmits it to a satellite for you. The signals received from the satellite at the gateway station in turn are retransmitted by that station for you to hear.

Gateway stations often operate using local terrestrial repeaters. Thus, even those amateurs using hand-held transceivers can participate in contacts through satellites such as OSCAR 10.

From CO — October '84.

AR SHOWCASE

VICOM — ON THE LEADING EDGE OF TECHNOLOGY

Vicom Australia is ten years old and owes its huge success to amateur radio.

Incorporated in November 1974, Vicom quickly became a force in the resurgence of amateur radio during the 70's. Today, Vicom is essentially a communication and engineering company specialising in HF and other radio communications as well as sophisticated electronic test equipment.

With an annual growth rate of some 30 percent in Australia, Vicom is a major force in its field and is in direct competition with many of the world's largest multi-national electronics groups.

Australian-owned, it opened, in 1980, a New Zealand Office that is experiencing a 50 percent annual growth rate.

Whilst it has concentrated largely on Government business in Australia, New Zealand, Papua New Guinea and Singapore, Vicom has now released the GRID Compass Computer which will see the development of strong marketing initiatives within the business community.

Vicom's Chairman and Managing Director is Russell Kelly VK3NT, an accountant who has had extensive financial and computing experience with several large companies. Russell has lectured and consulted in Accounting, and Computer Science and has been actively involved in communications and electronics.

Other founding Board Members of Vicom Australia include Michael Goode VK3BDL of the stockbroking firm A C Goode and Company; Peter Williams VK3IZ who is the Company's Director of Technical Services and Neil Lambert ZL2JO, who is responsible for the New Zealand operations.

Peter was for some time WIA Federal Secretary and IARU Region 3 Secretary.

In the early days of the Company, Vicom was exclusively involved in amateur radio and used this as an entree into the professional communications and electronics industry. Russell said that the main reason for parting with amateur radio was because of the poor margins being offered and the ultimate slump in consumer demand caused by the recession. He said that this trend was evident world-wide and most of the amateur radio manufacturers had been forced to diversify into the commercial and professional communications markets.

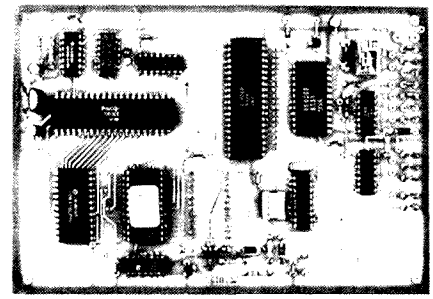
Russell believes that Vicom's success is principally due to the sourcing of only quality products which are backed-up technically by both the Principal and Vicom.

The next few years will be even more challenging as Vicom intends to set up a manufacturing base in Australia and New Zealand for the production and world-wide distribution of specialised communications equipment. In addition, Vicom is becoming increasingly involved in sophisticated Government communications and electronic warfare systems and complex HF Embassy communication systems.

INTELLIGENT DIGITAL COMMUNICATIONS INTERFACE

GFS Electronic Imports recently announced the availability of a new digital communications interface unit, the model CPU-100. It's design lends it primarily to interfacing a dumb ASCII terminal with a radio transceiver via a modem, which GFS can also supply.

Using a 6809 microprocessor the CPU-100, via ROM software, is able to perform a wide variety of functions. These include transmission of both BAUDOT and ASCII at user definable speeds, digital selective calling, as well as a number of built-in buffers. SITOR transmission may also be possible given the appropriate software.



Because of its built-in intelligence the CPU-100 is extremely flexible. For example it may be configured for either simplex or full duplex operation depending on its end users' requirements.

A wide variety of applications exist. These include accessing a mainframe computer from a vehicle or aircraft, radio teletype operation where a number of stations operate on the one frequency and the calling station wishes to address each one separately via selcall.

GFS are able to supply the CPU-100 on OEM basis as a pre wired and tested PCB or as a fully housed unit including their MDK-17 modem. Special applications software can also be made available.

For further details contact the manufacturers, GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic 3132, PO Box 97, Mitcham, Vic. Phone (03) 873 3777.

PCB — THE VERY DIRTY INITIALS OF PRIORITY POLLUTANTS

Jim Linton, VK3PC
4 Ansett Crescent, Forest Hill, Vic 3131

This article, written using a number of sources, aims to inform the hobby radio community about hazardous PCBs — the most insidious chemicals ever made by man.

Polychlorinated Biphenyls (PCBs) were first discovered in the 1680s, but it wasn't until 1960 when people monitoring the effects of the insecticide DDT found they were getting other chlorides which turned out to be PCBs.

Their stability combined with di-electric and fire resistance properties led to widespread use in industry.

They have been used in electrical components such as capacitors and transformers, and a variety of other products ranging from carbonless copy paper to kiss-proof lipsticks.

REASONS FOR WORLDWIDE CONCERN

Polychlorinated Biphenyls are dangerous because they can cause medical problems and biomagnify in the ecological food chain.

In the long term heavy doses of PCBs cause liver damage, thyroid gland disorders, disease in the newborn, and are regarded by the World Health Organisation as being carcinogenic to humans.

The Victorian EPA's chemical division director, Dr Brian Robinson has warned direct skin contact with PCBs may result in chloracne, a severe skin disease which can disfigure. Another problem is swelling of eyes exposed to PCBs.

Telecom Australia workers dealing with the disposal of electrical components containing PCBs are given protective clothing including oil proof gloves.

Even with these safety precautions they have been warned to thoroughly wash their hands before smoking, eating, or using toilet facilities. PCBs can also enter the body through inhaling.

To safely dispose of PCBs they have to be incinerated at 2,200 degrees ceisius.

A special incinerator ship named the Vulcanus, run by a European company, visits a number of countries, including Australia, by appointment to take on board quantities of PCBs for disposal.

Meanwhile microbiologists were trying to find effective methods of disposing PCBs which could have long-term effects on the world's environment.

WHERE PCBs ARE FOUND

While importation into Australia of PCBs stopped in 1978 they can still be found in old oil cooled transformers and capacitors.

An article in Teletechnician, May 1983, said PCBs had been used in high voltage non-polarised capacitors which are liquid filled, liquid cooled power transformers, and fluorescent lighting circuits (power factor correction capacitors, liquid filled).

This publication is the official journal of the Australian Telecommunications Employees Association, whose members are employed by Telecom Australia.

The Teletechnician article deals with identifying possible sources of PCBs, their safe handling and disposal.

A check with some Telecom technicians recently found components containing PCBs were still in equipment.

The practice in Telecom is for weeping or leaking components to be removed and replaced with those not containing PCBs.

This means radio amateurs should be alert for components with PCBs in disposals equipment from all sources — particularly broadcasting or transmitting equipment which use high power capacitors.

Ham Radio said that apart from the obvious risk in headed *"When hazardous waste comes home — PCBs in the ham shack"*.

This was a follow-up to other reports in the US amateur radio press about dummy loads as a potential source of PCB contamination in the shack.

Concern was about PCB in the form of transformer oil being used as the coolant in dummy loads.

Ham Radio said that from the obvious risk in handling a leaking dummy load containing such oil, the heat in a dummy load could release invisible airborne PCBs.

While sniffing suspect dummy loads is strictly discouraged due to the hazard of inhaling — the article added the smell of PCBs was similar to that of moth balls.

It appears to be a remote possibility commercially-made dummy loads with PCBs have been imported into Australia.

But someone in Australia could have homebrewed a dummy load and used second-hand transformer oil containing PCBs.

The suspect oil is a straw color, and the liquid has also been used in industry as a hydraulic fluid.

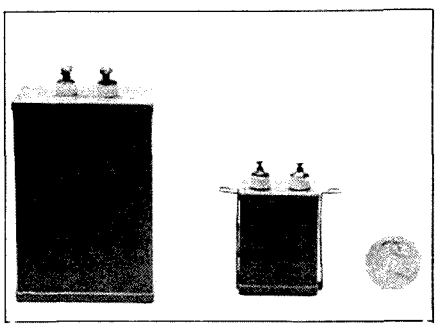
It would be wise for everyone to check around their shacks and through junk boxes for possible components containing PCBs.

To dispose of or obtain further advice about PCBs — contact the environmental agency in your state or territory.

PCB COMPONENT REGISTER — ISSUE 4 SEPTEMBER 1984

(version adapted by this article's author)

Parts list of components and equipment known to contain PCB (Polychlorinated Biphenyl) from sample testing, or believed to contain PCB from the advice of manufacturers or suppliers.



Two examples of capacitors known to contain PCB oil. The type 3S160 is the smallest in a series which has some physically large capacitors.

CAPACITORS

AEE (now Rifa) — FW series, FG.
DUBLIER — PO 19941/1
DUCON — S, N, and P series, Type 10N40, 11, 12P01, APT 4300N, GPM 2500 HCR, 3S 12B, 3S05, 4S50, 4S80, 10S80 12 P01.
DUCONA 2840
GENERAL ELECTRIC — 45F
PLESSEY — APF 250 series
SPRAGUE — Type 271 P277

EQUIPMENT

Various HF, MF, and TV transmitters in all states, the Northern Territory and ACT.

Power Conversion Units (rectifiers, invertors etc), probably thirty to forty different models in use supplied by a number of manufacturers. No specific check has been made on any of them to date. However if the date of manufacture was prior to 1975 then the capacitors in the units may contain PCB and should be checked against the capacitor list above.

Miscellaneous equipment: If capacitors in the following units are PLESSEY and have a metal case with the last two digits of the four digit manufacturing date code ending in numbers 60 to 75 inclusive, then the probability of them containing PCB will be very high,

Fluorescent light fittings
Air conditioning compressors
Air conditioning fan motors
Electric motors generally
Power factor corrected electrical circuits
Discharge lighting units
Evaporative cooler units
Rural pumps
Dishwashers
Washing machines

AR

ILLEGAL RADIO USERS ENDANGER LIFE

The Department of Communications is to seek out unauthorised users of marine radio channels on and around Port Philip Bay who may be putting human lives in danger.

A spokesman for the Department said: *"We'll be inviting unlicensed operators of radio equipment to take out licences.*

"If we can't get co-operation then I'm afraid we'll have to begin prosecutions. Confiscation of equipment could result."

The spokesman said unlicensed operators in boats were jeopardising the safety of themselves and others. They were putting human life and the safety of small craft at serious risk, because they often transmitted messages on the marine 27.88 MHz (Channel 88) frequency, commonly used for distress calls at sea.

The Department allocates radio channels according to user categories. These provided a legal means of communication between licensed shore stations and boats and between boats.

Further information may be obtained from Ian McDonald on (03) 266 8921 re radios in boats.

(1) Norman Fitch G3FPK advises of this beacon in Greenland.

(2) Norman also reports this new UK beacon which started continuous operation on 30th August 1984, running 15 watts to crossed dipoles. It sends its call sign and its "Maidenhead Locator" code — IO91VQ.

(3) Federal Councillor for the ACT Fred Robertson-Mudie VK1MM advises VK1RCC is back on the air on its correct bandplan frequency. Antenna is a stainless steel halo giving omni-directional horizontal polarisation. Fred also advises a 6 metre beacon is being installed on the same site, Mt Majure, and should be operational before long.

While on the subject of beacons it is interesting to note that Bill Tynan W3XQ in QST's "The World above 50 MHz" takes his VHF/UHF fraternity to task for generally failing to provide any worthwhile number of beacons throughout the US. On 3rd January 1983 unattended automatic beacon operation was permitted by the FCC but it seems little interest has been generated. Perhaps they are not as necessary in the US with its large population and densely distributed amateurs — probably there are signals on the bands at all hours anyway — whereas here in VK, with a small population, continuously operating beacons have long ago proved their worth for alerting to band openings. It would be a very dead world without the beacons! *ROCKHAMPTON BEACON*: Harry VK4LE advises there is a beacon on Mt Archer near Rockhampton, on 432.540 MHz and running 200 milliwatts, which he can copy quite often from his QTH at Springsure. He didn't mention the callsign!

NEWS FROM QUEENSLAND

Harry VK4LE in his letter dated 11/12 said 6 metres had been very quiet, but he has been keeping 2 metres SSB alive, by contacting VK4ZWH in Bundaberg almost every morning, also VK4AEW in Rockhampton, with VK4ZEI and VK4ZHL joining in sometimes. Another regular is VK4KAL at Rubyvale. He says the east-west all land path is more difficult than the north-south coastal path.

Not too many stations on 70 cm but Harry has worked VK4ZHL and VK4ZEI at Rockhampton and a crossband QSO with VK4AEW. Also worked VK4ALW at Mackay, which being further than Rockhampton signals are usually weaker. VK4LE runs 60 watts on 70 cm to four 11 element yagis at 40 feet. Thanks Harry.

GREETINGS FROM MAWSON

Mark VK0AQ (ex VK5AVQ) has written a letter dated 26/11 after arriving at the Mawson Base on Antarctica, and said the journey of ten days down (from South Africa) was fairly smooth. The base is quite large taking half an hour to slowly walk around. It is located on a rocky outcrop and the snow/ice disappears off the base in summer. Up to writing weather had been nice with a maximum of 1°C, with no wind and sunny. He said those who had passed through the 1984 winter were wearing little more than T shirts!

Mark was rather pleased to have already had a 20 metre contact with me (VK5LP), and also a rare Macquarie Island contact per VK0CK. The other amateurs at the base thought the Collins linear was "crook" — Mark says it wasn't — when all else fails, read the instructions. The KWM2 only puts out 80 watts (sleepy valves?) which is probably just as well as the V beam antenna has a VSWR of 3 to 1. One leg of the V beam goes over the science building, picking up computer EMI. When his own gear arrives he will be seriously thinking of putting it in the main transmitting room where he can plug into the rhombics, which have leg lengths of about 100 metres.

On the question of the former IPS beacon, VK0MA, Mark says the equipment line-up consists of 6AK5, 5763, 4-65 with 120 watts output, originally on 53.1 MHz but Mark would like to shift it to about 52.4 MHz, or at least to a frequency which causes no problems with the riometer. Due to a road being built the beacon tower must be moved, which will be a good thing as it is far too close to the riometer. The obvious place for the antenna is behind a hill from the riometer, and this can be arranged if the beacon is shifted to an old transmitting building. Reducing power to 10 watts should help the interference problem, but all this takes time, and maybe pointless if QRM in the riometer continues. One can but try Mark says!

Dry air static is a problem, but advantageous in that wet clothes dry quickly and biscuits don't soften. A PS at the end of the letter says after the generally fine weather, today the wind is varying from 30 to 50 knots with fine wet snow, visibility 100 to 150 feet — a mini blizzard! He says *"You thought rain static was bad, you should hear blizzard static! Perhaps we will be having a white Christmas after all!!"*

As other news from Mark comes to hand it will be passed on to readers. As QSL manager for both VK0CK and VK0AQ I am fortunate that it is mostly possible to maintain a weekly sked with both of them on 20 metres, despite the great distances between them. By the way, Mawson time is UTC plus 6 hours — the longitude indicates it should be 4 to 5 hours. *Oh, well, who am I to question such variations!*

QSL arrangements for both stations are the same: a stamped self addressed envelope is all that is required together with your QSL card of course. No other money should be sent, we aren't in the profit making business. Any QSLs requested without the envelope may eventually be sent through the Bureau, but as I don't get to the Bureau very often it may be a long process!

NEW SOUTH WALES

Nev VK2QF has sent in an amended list of six metre countries confirmed and added a few other comments which may be of interest.

The three weeks up to about 10/12 saw VK2QF working all VK States 1,2,3,4,5,7,8,9,0 but no VK6, also ZL1,2,3,4, FK1, FK8, ZL7OY, VK9ZA. Not a bad effort one would suggest.

Nev says *"I have set up a small monitoring station using an IC505 at my house to tune about on 6 metres using a 3 element beam at 24 feet, and a gear drive rotator which is cranked around from inside my office. Very handy.*

"Superb to hear the Macquarie Island 52.150 beacon on Saturday morning (8/12) when it was in for about 2 hours at 539. At 0830 the beacon was 599 and had been for some time. David turned it off at 0845 and I worked him at 0859. He was still 5x1 on the monitor in the office at 1230. Seems most of the QSOs with various stations were 5x9.

"Missed the Friday opening (7/12) but heard from VK2BA that it was not too good in Sydney but much better to VK1 and 3 etc. Incidentally, the beacon was 599 in Sydney during the morning of Saturday but took over one hour to be audible here 300 km NW of Sydney. One wonders what size the cloud of Es was on the Saturday which produced ZL7, ZL1 and 4 and VK0 all in one large opening from here.

"My praise and gratitude to those behind the activities from Macquarie Island, to David VK0CK for staying on the air for so many hours to give as many as possible a contact, and to you for the QSL job." Thanks Nev.

EME ACTIVITIES

Doug VK3UM continues with his experiments on 432 MHz and advises 17/11 was his first chance to try the newly completed EME set up antenna system. Sent a couple of Vs at 0600 and back came the echoes, from 4 to 8 dB above the noise for 90 per cent of the time.

Doug took a break at 0800 to speak to John VK5DJ on 2 metres then worked the VK1 gang, about 6 of them, on 432.1. During this time Gordon VK2ZAB called and they had a Q5 S1 to 3 QSO for about 2½ minutes via aircraft enhancement on 432.1, so they are now able to claim the first Sydney to Melbourne 432 contact, the previous one being a bit doubtful. Gordon was running 10 watts only!

Back on the moon at 1000, called CQ and back came ZL3AAD and gave him 529. Then DF3RU called for an exchange of "O" reports.

Next morning, Sunday, 18/11, called CQ a few times, echoes OK but no answers. Doug wondered where the Ws were. Chris VK5MC informed him later that the Ws and JAs wanted to know who this VK3UM was with the big mouth and wax in his ears. Turns out he had not allowed enough for doppler shift!! Next time.

Since all this has taken place Doug has replaced the feeder with ⅞" new heliax which should give nearly 2 dB improvement. Moreover, he found a type N socket at the RF output had melted and fused the contacts! Looking at the cause it seems the unbranded type of connector had too high a contact resistance. Replaced with genuine Acme type C.

Doug says he is very satisfied with the ATN type antennas he is using and is looking forward to plenty of contacts via the moon as time permits.

Another area of EME activity is VK2AMW under the leadership of Lyle VK2ALU. Appeals were made for a new 3CX100A tube, and typical of the *tremendous* spirit which exists world wide in the EME group, an

airmail parcel of tubes arrived from OE9XXI in Austria, who had heard of the problem from HB9BM in Switzerland. This was followed by good tubes sent by VK5ZO and VK5MC. A letter has now been received from Peter ZS6JT (ex Z25JJ) in South Africa indicating he also is sending tubes. Lyle certainly thanks everyone for their helpfulness. After the defective tube was replaced the transmitter output was measured at 140 watts.

Also from "The Propagator" comes news that hurricane force winds totally destroyed the antenna for EME contacts at HB9BM in Switzerland on 17/11, and there are reports of other European EME stations suffering damage as well.

SIX METRES

As expected, the six metre band has been pretty good to most of us again this year. The Es contacts have been widespread and most signals very strong. Those with good antenna systems have been treated to some extra contacts not normally available to others, as the antenna works both for transmitting and receiving!

The following listings shows a fair cross section of the stations who have been operating six metres during the latter part of 1984. The call signs indicate the spread of the contacts, and there are quite a few stations who like to see their call sign mentioned occasionally, and I see nothing wrong in that!

13/11: from 0808: VK2AKU, VK2XJ, VK2HT, VK2YKG, VK2ZTW, VK2ZWE, VK2CN, VK2QF, VK2ZRV, VK2XDW, VK2XDH. 1045: VK4LE, VK4FNQ.

24/11: 0109 VK4ALM, VK6YA, VK6KHD, VK8TM, VK7ZIF, VK7ZAP, VK7ZOT, VK7AN, ZL2CD. 25/11: 0050 VK4ALM, VK4JH, VK4FXX, VK4KAA, VK8TM, VK8ZLU. 26/11: 1050 VK7KXA, VK7RR, VK4TUA. 27/11: 0005 VK4FNQ, VK6RO, VK4LE.

1/12: 2153 VK4RO. 2/12: 0015 VK4ALM. 8/12: 0018 VK2HT, VK2ZZV, VK4FNQ, VK4ALM, ZL4AS, ZL2UFN, ZL4CN, ZL2TFY, ZL4LV, ZL2QS, ZL3TIC, ZL3ADT, VI3WI, VK7ZIF, VK7KJ, VK7RR, ZL3TIC, ZL3ADP, VK0CK, VK1GL. 9/12: 0430 VK7ZAR, VK6ZPG. 10/12: 2322 ZL2TJX. 11/12: 0020 VK1EP, VK2ZRE, VK1ZQR, ZL3AQ, VK3VD, VK2AWQ, VK3DQJ, VK3ZKP, VK3KMA, ZL2TUV, ZL2AQR. 12/12: 0123 VK8ZCV, VK7ZIF, VK7ZJJ, VK7ZAJ, VK7AL, VK6RO, VK6ZPG, VK6WG. 14/12: 0105 VK4ALM, 0535 VK4FNQ. 15/12: 0050 VK4YJF, VK2DLR, VK2AKU, VK6ZPG, VK4BTN, VK4AMF, VK8TM. 16/12: 0235 FK8EB, VK4KAA, VK8ZCU, FK8EB, FK1TK and 0700 VK8ZLX. 18/12: 0127 VK6BA, VK6VP, VK4ALM, VK2XJ, VK2DDC, VK8GB, VK8TM.

19/12: 0435 VK6RO, VK2DE. 20/12: 0215 VK6PR, 0605 VK6RO, VK6ZRY. 21/12: 0950 ZL3OF, VK7ZAR and at 2156 VK4ZJB. 22/12: 0345 VK6HK, VK3VF, VK3ZBJ, VK6RO, VK6ZPG. 24/12: 0110 VK2HT, VK2QF, VK6ZPG, VK6WG. 26/12: 0155 ZL2CD, ZL2TPY. 28/12: 0015 VK2XJ, VK2DDG, 0346 ZL2CD, ZL2TPY.

It is interesting to note that this year anyway there seems to have been a tapering off of Es in the latter part of December, especially around Christmas which is often a very good period for contacts, around 26/12 and 28/12. The more intense Es period seems to have been in the early part of December, with special mention having to be made of 8/12, the day VK0CK ran up more than 120 contacts covering VK1, 2, 3, 4, 5, 7, 8 and ZL. The fact that David was available for so many hours at 5x9 indicated a very intense Es cloud and I am very glad he took my advice to get on early in the month as there were more possibilities for him to be heard than if he left it until the last week as before.

Also of interest has been the contacts to VK9ZA, FK1TK, FK8EM, FK8EB and ZL7OY. These serve to keep an interest in the Pacific areas. P29 has been a rare commodity in VK5 this year although there are reports of other States working into there.

I note from the log of Brian VK2AKU that in addition to many ZLs he has also worked VK9ZA and JA2DDN (16/11), VK9ZA again on 17/11, also FK1SB. On 4/12 FK8EB, and on 7 & 8/12 VK0CK. Ross VK2ZRU said it took him over two hours to finally work VK0CK through the dogpilel David VK2BA had a number of exotic contacts leading up to mid November, with A35RS, ZK2SIX, JH4, YJ8RG, many FKs, ZLs 1 to 4, VK9ZA as well as all VK States except VK0 at time of writing (21/11).

A letter from Gordon VK4GM with a QSL for VK0CK also mentioned his XYL is VK4PZ. We welcome Mary to the VHF bands and note she has been working quite a bit of DX. eg 21/11 1000 to 1029 she worked six ZL1 stations; 6/12 0853 ZL2TJX, 0909 YJ8RG, 0912 ZL3TIC, 1120 FK8EM and 1202 VK0CK. I would imagine those contacts would make her very happy!

Other brief letters to arrive have been from Ross VK2ZRU who mentioned the opening on 144 and 432 MHz to ZL on 27/11. On 144 he worked ZL2TAL and ZL2TPY and on 432 ZL2TAL from 0930 to 1116 when signals faded out.

John VK4ZJB registers his thanks to David VK0CK for his marathon effort on 8/12 in providing contacts for so many stations. He also confirms Chris ZL7OY is still active on Chatham Island.

OTHER BITS OF NEWS

That 50 MHz long range DX has fallen away in the northern hemisphere is indicated in "CQ Ham Radio" from Japan via Graham VK6RO. Stations being worked include HL1, HL2, HL5, HL0, BT5RA, VS6, H44, and that's it! Good to see BT5RA on 50.110 on SSB. Last month mention was made of this station on 2 metres.

A report to hand that during late November Jeff VK8GF heard some Sydney stations on 2 metres FM. About the same time Don VK5ZRG in Whyalla heard two FM stations from VK6 via the Ch 4 repeater. Also heard of VK2AKU working VK3XEX on 2 metres SSB recently.

Bob VK5ZRO reports that on 29/12 VK5KBU worked VK5ZRG (Adelaide to Whyalla) and received a report of S9 + 60 dB! That may not be unusual you say, but it was on 1296 MHz and VK5KBU was running 1 watt to a bay of four 27 element yagis. Distance nearly 200 km. Sid VK5ME has finally worked VK5ZRG on that band, his QTH does not favour the Whyalla path.

On 25/11 at 0140 through to 0340 heard a number of JAs around 50.225 MHz at S5/6. Don't usually hear JAs this high.

18/12: VK8GB reported working 17 ZLs. Quite a good haul for that distance. Also, talking with Bill ZL2CD, he mentioned more ZLs had been able to work VK6 this year than usual, and VK8 was becoming more common!

NEWS FROM THE UK

Norman Fitch G3FPK advises of happenings in Region 1. He says that finally the Department of Trade and Industry have issued the long awaited extra 60 permits to Class A licencees to operate on 50 MHz bringing the total to 100. At present operators are limited to working outside TV hours, but there may be some improvement in this after the Band 1 transmitters close down on 6/1/85, although there are still some problems to sort out with European countries still using Band 1.

The Norwegian licensing authorities have granted permission for 25 LAs to operate on 6 metres outside of TV hours, which means they and the UK can experiment via auroras, MS and other modes.

Norman also mentions the two beacons already listed earlier, and says that during an aurora on 15/11 the OX3VHF beacon in Greenland was copied S9 + by GM3DOD between 1927 and 1935 UTC. Some amateur QSOs took place later that night after TV hours with GM and GI stations from 2310 to 2350.

The good news of course is that there is being a slow recognition on a world wide basis of the need for the amateurs to have some portion of the 50 MHz band and this first move in the Region 1 area could help other countries decide.

50-54 MHz DX STANDINGS

DXCC countries based on information received up to 15th December 1984. Crossband totals are those not duplicated by 6 metre two-way contacts. Credit has not been given for contacts made with stations when 50 MHz operation was not authorised.

Column 1: 6 metre two-way confirmed
2: 6 metre two-way worked
3: Crossband (6 to 10) confirmed
4: Crossband (6 to 10) worked
5: Countries heard on 50 MHz
6: Countries heard on 52 MHz

Call sign	1	2	3	4	5	6

VK3NM	15	15				
VK3AUI	14	15				
VK60X	10	10	1	1		
VK6RO	9	9	3	3	2	

The minimum number of countries confirmed for an operator to commence being listed is five, including VK.

The next list should appear in August 1985 and entries will need to be on my desk no later than 15th June 1985. Claimants are reminded full details of all contracts are required, the details having been published several times before.

LATE NEWS

As these notes were being completed I received a phone call from Bob VK5ZRO that 2 metres was starting to open to VK4. Switching off the typewriter I rushed to the shack and heard Mick VK5ZDR in contact with VK4ACE. Bob VK5ZRO had already worked VK4ZAZ and VK4KHZ. I was lucky to work Bill VK4LC at 5x9 at 0737. The band then closed! As I have said on many occasions before, you have to be quick to work stations on 2 metres over those distances especially using Es. Apparently the band had been trying to open for some time but those who had been around the longest were finally rewarded.

Special thanks again this month to Bob VK5ZRO for filling in the gaps in my operating information, and especially for alerting me of the two metre opening. Good to have friends like that!

Six metres is still active. On the morning of 30/12 (29/12 UTC) at 2258 VK2ZRE, 2304 ZL3NE, 2332 ZL4AI and 0150 on 30/12 ZL3ADT. Later in the day at 0508 VK8KK.

A note from John VK4ZJB which was too late for inclusion in the last notes mentions that Pierre FK8EM had advised there is a beacon from FK8 operating on 52.020 with a nominal power of 5 watts, antenna Swiss Q approximately 12dB gain, direction WSW from FK8 especially set up for contacts with VK stations. Operating times will be 2100 to 1100 UTC.

Although I do not have a call sign at present for this beacon I have tentatively listed it at the start of the column.

Closing with the thought for the month: "Why is it that political leaders don't seem to have all the answers until they write their memoirs?" 73. The Voice in the Hills. **AR**

HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

QSLing to Short Wave Listeners is an important part of our hobby. It is courteous for an operator to QSL accurately and promptly on receipt of a valid SWL card that has been logged as a legitimate report.

What is a legitimate report that one could expect to receive from an SWL? I, speaking as an amateur and a QSL Manager expect an accurate date and time group to be given to the station the card is being requested from, the station that the operator was in contact with, the reports exchanged and if possible some of the "dialogue" of the QSO.

My conscience would not allow me to generate a reply without the above as a minimum. The reasons being that the listener requesting the card in my mind has to have genuinely heard the full contact and it is therefore then a valid report. This alleviates the problems associated with some SWLers of when they receive a card, they pass the info onto their mates, friends, acquaintances and sundry acquaintances of acquaintances. Within months the Bureau cards arrive and one finds that you have a multitude of cards to send out to people for the one contact who are building up the score on the "mate" system.

I know that these remarks are going to generate a "storm", but one, it is felt, has to be logical in such a situation.

VOLUNTEER REQUIRED

In the July magazine this year I will have completed four years of writing this column. Up to the present I have enjoyed, and still hope to until the end of that period, writing the notes. The generation of the notes has been at times fun, frustration, the occasional scoop, magnificent co-operation from many participating members, innumerable letters with information, some seeking QSL data, many of praise from readers who have gained a new one or have got a much wanted card by the info that has been printed. On the other side of the coin one could count the letters received from the disgruntled on one hand.

Not to be overlooked is the valuable information that has been gained from reading newsletters and magazines, receiving telegrams, telexes and the occasional international phone call or a call whilst on the band.

This prelude adds up to the fact that I would like to see a fresh approach to the column in the August issue and that means a new DX Editor who is willing to generate, in typewritten or neatly written form, the information that the reader requires, ready for typesetting by the deadlines each month.

I appeal for anyone interested to contact me at the above address for further details or contact the Editor, Bill VK3ABP, via the Executive Office.

ZAIRE

Johannes 9Q5JE is still active on 10 and 15 metres and expects to go QRT in April this year. QSL to the Club Station DK0HT either direct or via the Bureaux.

SAO TOME

Dias PS7ABT/S9 was by all accounts duly authorised and he is unlikely to appear again. This operator was from a Brazilian Naval vessel and he operated from the island of Principe. By all accounts another vessel will visit the area within the next year and it is trusted that an amateur orientated ship's Radio Officer can be persuaded to take a rig ashore and obtain a licence.

The S9 and PY authorites have an understanding on reciprocal licencing. I, like many others, would appreciate knowing the secret! It is a case of observe, wait and trust that it is acceptable!

SYRIA

Two more YLs licenced. SU1RR Rehab and SU1SR Sally, both daughters of SU3AM. Others are SU1HK Hosni and SU1IA Ibrhim. Congratulations to the newcomers.

WARC BANDS

The FCC, the governing authority on licensing in the United States has released the entire 10MHz WARC allocation to American amateurs. The 18 and 24 MHz bands will not be released before 1989 at the earliest!

ETHIOPIA

The stations ET3PG and ET3PS are not at present good for DXCC. The QSL Manager could be Franz OJ9ZB and if he is handling the cards there is a good chance that these calls will receive the "nod" as being acceptable.

Franz is well known and is a stickler for doing the right "thing" by ail and he could extract the necessary documentation for forwarding to Don Search at the ARRL DXCC Desk.

It is possible the operators are using the Police Radio system and it can be appreciated that the hobby would have a very low priority in that country according to all the media reports.

UNITED ARAB EMIRATES

A61AA has been quite QRV from this area using a commercial log periodic antenna system. All QSLs go to ever "Mr Reliable" Roger G3LQP. Contrary to rumours, Roger has a translation of the licence and other documentation which is being forwarded to the ARRL.

A PIRATE

In a letter from the Botswana Amateur Radio Society (BARS) dated 15/11/1984 to DX Editors is reprinted in full for all operators' information as hereunder.

"SUBJECT: ZS6BUX/A22 or ZS6DM/A22 ILLEGAL OPERATIONS.

"Gentlemen,

The Botswana Amateur Radio Society, would like to bring to your attention, Mr Miodras Jovanovic, ZS6BUX/A22 or ZS6DM/A22 who was illegally practicing a DX-Expedition Operation within the borders of the Republic of Botswana on October 27, 1984.

"The Botswana Telecommunications Corporation, along with the Ministry of Public Works and Communications REVOKED Mr Jovanovic's Temporary Botswana Amateur Radio Licence as of the 27th September 1984.

"The Botswana Amateur Radio Society, strongly urge the American Radio Relay League to withdraw Mr Jovanovic's calls ZS6BUX/A22 or ZS6DM/A22 from the DXCC list of stations.

Signed A22ME Secretary."

Quite harsh words one would say but the Botswana Telecommunication Commission were more explicit in their letter of cancellation as the following extracts show.

"I would like to make one thing quite clear to you, and that is the destruction that you have caused to the Botswana Amateur Association and the Government of Botswana to the world is irreparable.

"My office cannot tolerate or comprehend why you chose to brand our nation so badly moreover the hospitality of the Selibe-Phikwe Radio Association that hosted you into their town.

"Please be aware that your temporary licence operation privileges are revoked as of the 27th September 1984 for ever.

Yours faithfully,

Signed: J. M. B. Skeete."

One must admit that these strong words supporting the positive action removed the "man" from the bands but I really would like to know what he said or did to incur their wrath. *Does any reader know the facts?*

PIRATES AGAIN

Edmund who is in charge of HV2VO would like it known that he is being impersonated. In other words some Italian station or stations are using HV2VO on CW. Brother Edmund does not use this mode and if he has a visitor who desires to use CW, he announces the fact on SSB at the same period. *Any VK been caught yet?*

Father Edmund operator at HV2VO pictured with Jan K6HHD co-editor of Jan and Jay O'Briens QSL Manager LisL

Photo courtesy of QRZ DX.

ANOTHER WORD ON PIRATES

There have been several pirates "active" from Cape Verde over the last decade since the country was granted independence. Only two licenced amateurs are acceptable, those being Julio D44BC and Angelo D44BS who are duly licenced with the authorities in the Republic and all cards should be sent direct, as there is no QSL Bureau and neither of the gentlemen have Managers.

KERGUELEN ISLAND

A late letter has been received from Rousselet Michel to say that FT8XB will be operational from Kerguelen this year. The letter is as follows:

I'm a French amateur and will be making an expedition to Kerguelen Island in the South Indian Sea during 1985. My call is a new prefix for DXCC; FT8XB and I will be QRV all HF bands 80m, 40m, 20m, 15m, 10m, with a DX frequency of 14.190 MHz ± 5 kHz. Equipment will be a FT 757 GX + linear + a 3 element 20m beam and dipoles on all bands. I'm also QRV on OSCAR 10 with 60 W with a 21 element yagi and EME (Moon Bounce) on 144 MHz with a 4 x 20 element antenna 2 kW (beginning in April).

PSE QSL ONLY direct with 3IRC's to FT8XB, PO Box 83, 95101 ARGENTEUIL Cedex, FRANCE, Europe.

CLIPPERTON 1985

The Clipperton 1985 DXpedition is due to leave San Diego on the 27th March, returning on the 18th April. Revilla Gigedo XF4 may be activated for twenty four hours on the outward and return voyages.

It is hoped that the very dedicated operators who lost some $US14,000 over the last venture, and this didn't include air fares, make it this time and propagation is very kind to them. It is anticipated that this trip could cost in the vicinity of $60,000 all up. Quite a sizable expenditure considering conditions of late!

24 MHz

A direction has been issued by the ARRL Board of Directors to the Plans and Programmes Committee to study what existing and/or new DXCC awards, if any, should apply to the 24 MHz band and what considerations should apply to such awards.

VANUATU

New regulations permit the YJ0 prefix to be allo-

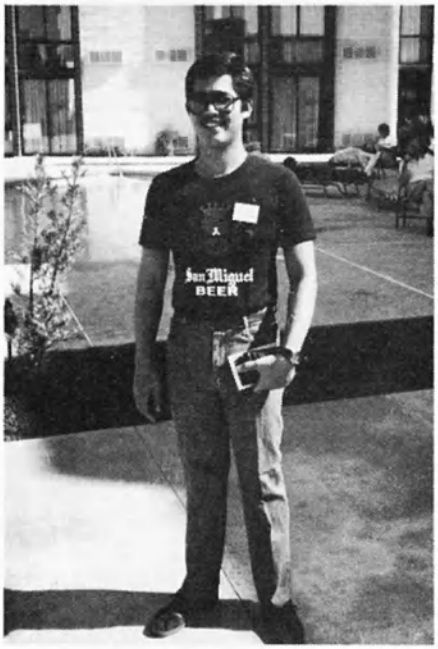
cated to non-resident or short term resident bonafide amateurs. Long term residents, including expatriates on long term employment, will continue to be allocated two letter suffixes with the YJ8 prefix. Any /MM calls will only be legitimate for use within Vanuatu territorial waters.

FAMOUS FACES AT VISALIA 1984

Bill W6VZZ (L) chats with Mario I0MGM.

Mario I0MGM, an Attorney of Law in his home country, is widely known for his dedication in gaining DXCC status for the Knights of Malta amateur station 1A0KM, and the ensuing efforts of keeping it activated whilst also being its main QSL Manager.

The "terrible trio" TI9CC, TI9CF and TI9JVA.

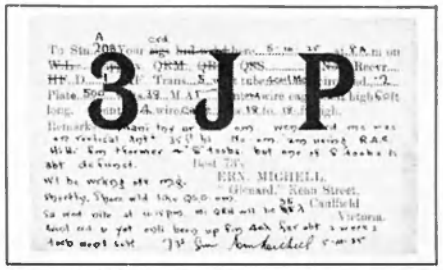


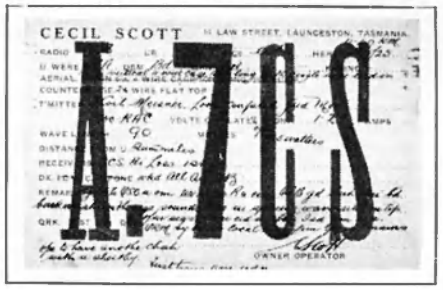
Chito DU1CK.

WB6DXU and Gopal VU2GDG.

CARDS OF YESTERYEAR

Nostalgia again! Some more cards that confirm QSOs of over half a century ago. The cards have been supplied by Arthur VK2JM.





Photographs courtesy of QRZ DX.

QSL MANAGERS

Mark WA60TU has advised that he is QSL Manager for 9K2DX, 8P6CW, 8P6J, KV4FZ 1983 CQWW CW only, N6TJ/TI2, N6TJ/EA9, EA9KF 1984 CQWW CW only and his new QTH is 789 Brookside Lane, Sierra Madre, California 91024 USA.

Bill N4NX, has written a note and included the stations he acts as Manager for. These include all of Martha Henderson's DXpeditions which include WN4FVU/5X, 3D6, A22, TT8AC, 3C0AC and the two stations FR7ZL/T and ZL4LR/A.

IRC'S NOT PROCURABLE

A note from an amateur in Poland advises that IRCs are no longer available in that country also that foreign currency is impossible to obtain. It looks like a 100 percent Bureau mailing for all cards from this country in the future!

LARGE ENVELOPE PLEASE

Denise VK0YL's QSL card is 160 by 100 mm and will not fit in an Australia Post preferred size envelope. For those amateurs and SWLs requiring a direct card please send a self addressed envelope to suit and adequate postage. Thankyou.

CARD OF INTEREST

A special card of interest has been submitted by Stephen VK2PS. Stephen held the SWL allocation of YRR 57 during the years of 1936-1939 and the card reproduced was his first encounter with the VK/ZL contest. The reverse side of the card notes *"THE CONTEST COMMITTEE thank you for your co-operation in making the 1938 VK-ZL the "Contest of*

Contests" — WG Ryan VK2TI, Contest Manager. VK2RA, VK2HP, VK2YC, VK2PX, Committee". Stephen topped the section in YR (now YO) that year of the "Australia's 150th Anniversary Celebrations".

Stephen is now the VK2 Federal Councillor who will assist in celebrating the 75th Anniversary of the WIA on the other side of the world as a member. Congratulations Stephen for your initial achievement and persistence over the years with the hobby.

BITS AND PIECES

The QSLs for CE0AA did not come as a Christmas present as predicted as they were to be held until the festive season mail rush was over so they would not be lost! **** UA9OO/YA was heard in Europe. He claimed to be near the Soviet/Afghan border?? **** Jukka OH2BJL made many QSOs as T52JL before going QRT late last year. **** Malta was well represented on the bands when 9H3DH (DF8ZH), 9H3DI (DL1RK), 9H3DJ (DL1ZQ) and 9H3DK (DF4ZL) made an CW onslaught late last year. All QSLs to DF8ZH. **** Alain 5R8AL has been very active on CW and SSB. **** Do not discard (which would be sacrilege) your 4U1VIC card, it may yet come good. **** The Pribilof Island debate still drags on but I would also file those cards in a safe place to keep the cobwebs off them. **** Nice to hear 1A0KM on as a Christmas present for those requiring it. **** Gerry 5X5GK has still not untangled his problems which have been generated within and between Ugandan Government Departments. **** HU1DX is sponsored by YSDX, a new DX club in El Salvador. **** Father Dave CE0AE still plugging away at 10 metres and having a little success. **** Marion Island ZS2MI, should be activated by a permanent operator this year. **** More BY stations to be activated soon. **** Don't overlook a 3Y Bouvet operation of unknown duration at any time in the next few weeks. **** GB4DIS/MM is a group of Welsh expeditioners aboard the RRS Discovery whilst in Antarctic waters. **** Some VK0 6 metre operation heard in VK and ZL **** The call ZX0ECF is being used by a Brazilian expedition to the South Pole. **** 8J1RL is the call of a Japanese scientific expedition in Antarctic waters. The operator is JR1FVH who is also responsible for the cards. **** Remember Feng who operated XW8BP more than a decade ago? He has just passed his licence test, the first to be held in BV, in October last year and should be active again soon. Massy JH1ARJ, still has the logs for that operation if anyone still requires a card. **** "Project Blizzard" station AX0PB will be returning home early next month and preparing for the next voyage scheduled for November. Neil VK6NE, the group's QSL Manager, requests no direct cards until he receives the logs in April this year. **** 3Y0AA (whereabouts unknown) has been heard but the licencees JF1IST and JR1HHL at the time of writing were still in JA with transportation worries!!! Their other worry is how to land even if conditions are ideal. **** The Japan Radio Ladies Society (JLRS) will make their first DXpedition this year. The venue is the Maldives and they hope to be operational on CW and SSB the 12th and 17th of this month.

OOPs! AN ERROR

Inadvertently the QSL information for OY8R was given in the November magazine as PO Box 88, Moscow. This is definitely a NO NO and it should have read PO Box 343, DK-3800 Torshavn, Faroe Islands or preferably now to Ray at his home call of W0IIM. Apologies to all those that were inconvenienced.

THANKS

Sincere thanks go to the following. The Editors of weekly, bi-weekly and monthly newsletters including the ARRL NEWSLETTER, RSGB DX NEWS, QRZ DX, LQNG SKIP, DX FAMILY FOUNDATION NEWSLETTER, JAN and JAY O'BRIEN'S QSL MANAGER LIST and KH6BZF REPORTS. Magazines including CQ, cqDX, QST, RADCOM, JARL NEWS, KARL NEWS, OZ, WORLD RADIO, BARS, 73, BREAK IN and VERON.

Members who have contributed include VKs 2JM, PS, 3BY, EW, FR, XB, YJ, YL, 4BHJ, and G3NBC. Overseas amateurs include A22ME, G1EOD, I8SAT, JH1KRC, N4NX, WA6OTU, OH2BBF and ON7WW. Sincere thanks to one and all.

MURPHY'S LAWS

As someone once said "Murphy's laws and electronics were so obviously made for each other!" For the benefit of those who have heard of Murphy but not seen his work before, here it is, kindly submitted by Russell Lemke VK3ZQB, 22 Villiers Street, Port Fairy, Vic 3284). The original source is lost in history.

GENERAL

[1] In any field of scientific endeavour, anything that can go wrong, will.
[2] If the possibility exists of several things going wrong, the one that will go wrong is the one that will cause the most damage.
[3] If nothing can go wrong, something will.
[4] Left to themselves, things always go from bad to worse.
[5] Nature always sides with the hidden flaw.
[6] Given the most inappropriate time for something to go wrong, that's when it will occur.
[7] Mother nature is a wench.
[8] If everything is going well, you have obviously overlooked something.
[9] Never make anything simple and efficient when a way can be found to make it complex and wonderful.
[10] If it doesn't fit use a bigger hammer.
[11] In an instrument or device characterized by a number of plus-or-minus errors, the total error will be the sum of all the errors adding in the same direction.
[12] In any given calculation, the fault will never be placed if more than one person is involved.
[13] All warranty and guarantee clauses become void upon payment of final invoice.

DESIGN

[1] In any given price estimate, the cost of equipment will exceed estimated expenditure by a factor of three.
[2] Dimensions will always be expressed in the least usable terms. For example, velocity will be expressed in furlongs/fortnight.
[3] If the breadbox trial model functions perfectly, the finished product will not percolate.
[4] In a mathematical calculation, any error that can creep in, will. It will be in the direction that will cause the most damage to the calculation.
[5] In any given computation the figure that is most obviously correct will be the source of the error.
[6] The probability of a dimension or value being omitted from a drawing is directly proportional to its importance.
[7] In specifications, Murphy's law supersedes Ohm's.

ASSEMBLY

[1] If a product requires *n* components, there will be n–1 components available.
[2] Interchangeable components won't.
[3] Components that must not and can not be assembled improperly will be.
[4] The most delicate components will be dropped.
[5] The construction and operation manual will be discarded with the packing material. The garbage truck will have picked it up five minutes before the mad dash to the rubbish can.
[6] The necessity of making a major design change increases as the assembly and wiring of the unit approach completion.
[7] A dropped tool will land where it can do the most damage (also known as the law of selective gravitation).
[8] A component selected at random from a group having 99% reliability will be a member of the 1% group.
[9] Tolerances will accumulate unidirectionally toward maximum difficulty of assembly.
[10] The availability of a component is inversely proportional to the need for that component.
[11] If a particular resistance is needed, that value will not be available. Furthermore, it cannot be developed with any series or parallel combination.
[12] After an instrument has been assembled, extra components will be found on the bench.

WIRING

[1] Any wire cut to length will be too short.
[2] Milliammeters will be connected across the power source, voltmeters in series with it.
[3] The probability of an error in a schematic diagram is directly proportional to the trouble it can cause.

TESTING

[1] Identical units tested under identical conditions will not be identical on the final test after being buried under other components.
[2] A self starting oscillator won't.
[3] A crystal oscillator will oscillate at the wrong frequency — if it oscillates.
[4] A P-N-P transistor will be found to be N-P-N.
[5] A fail safe circuit will destroy others.

OPERATION

[1] If a circuit cannot fail it will.
[2] A circuit protected by a fast acting fuse will protect the fuse by blowing first.
[3] Probability of failure of a component is inversely proportional to the ease of repair or replacement.

TROUBLE SHOOTING

[1] After the 24th cabinet to chassis screw has been removed to replace the under chassis fuse, it will be observed that the line cord plug has become disengaged from the AC receptacle.
[2] After the 24th cabinet to chassis screw has been assembled, the driver tube will be found under the schematic on the bench.
[3] The bleeder resistor will quit discharging the filter capacitors, as the operator reaches into the power enclosure.

PROGRAMMING (PECK'S PROGRAMMING POSTULATES — WITH ADDENDA BY GLASSER);

[1] In any programme, any error that can creep in eventually will.
[2] Not until the programme has been in production for at least six months will the most harmful error be discovered.
[3] Any constants, limits, or timing formulas that appear in the computer manufacturer's literature should be treated as variables.
[4] The most vital parameter in any sub-routine stands the greatest chance of being left out of the calling sequence.
[5] If only one compiler can be secured for a piece of hardware, the compilation times will be exorbitant.
[6] If a test installation functions perfectly, all subsequent systems will malfunction.
[7] Job control cards that cannot be arranged in improper order will be.
[8] Interchangeable tapes won't.
[9] If more than one person has programmed a malfunctioning routine, no one is at fault.
[10] If an input editor has been designed to reject all bad input, an ingenious idiot will discover a method to get bad data past it.
[11] Duplicated object decks which test in identical fashion will not give identical results at remote sites.
[12] Manufacturer's hardware and software support ceases with payment for the computer.
[13] At least one critical tape will be lost, misplaced, destroyed or written over.
[14] What goes up must come down — and can be expected to do so in the middle of your job.

FINAGLE'S LAW

[1] No matter what result is anticipated, there is always someone willing to fake it.
[2] No matter what the result, there is always someone eager to misinterpret it.
[3] No matter what happens, there is always someone who believes it happened according to his pet theory.

FINAGLE'S CREED

Science is truth; don't be misled by facts.

ALLEN'S AXIOM

When all else fails, read the directions.

GUNNERSEN'S LAW

The probability of a given event occurring is inversely proportional to its desirability.

GLASSER'S COROLLARY

If of the 7 hours you spend at work, 6 hours 55 minutes are spent working at your desk, and the rest of the time you chat with your cubicle-mate, the time at which your supervisor will walk in and ask what you're doing can be determined to within 5 minutes.

SOME VITAL THINGS TO REMEMBER WHEN DOING LAB WORK

[1] When you don't know what you are doing, do it neatly.
[2] Experiments must be reproduceable. They should fail the same way each time.
[3] First draw your curves, then plot the data.
[4] Experience is directly proportional to equipment ruined.
[5] A record of data is essential, it shows that you were working.
[6] To study a subject best, understand it before you start.
[7] If you can't get the answer in the usual manner, start at the answer and derive the question.
[8] To do a lab job really well, have your report done well in advance.
[9] If it doesn't work, start at both ends and try and find a common middle.
[10] In case of doubt, try and make it convincing.
[11] Do not believe in miracles, rely on them.
[12] Team work is essential, it allows you to blame someone else.

FURTHER HINTS ON WRITE-UPS

[1] In any collection of data, the figures that most closely confirm the theory are wrong.
[2] No one you ask will see the mistakes either.
[3] Everybody who stops by with unsought advice will see them immediately.
[4] If an experiment works, you must be using the wrong equipment.
[5] An experiment may be considered successful if no more than half the data must be discarded to agree with the theory.
[6] No experiment is ever a complete failure. It can always serve as a bad example.

"I'm sorry OM — did you say WWV?" — VK2COP

LISTENING AROUND

Joe Baker, VK2BJX
Box 2121, Mildura, Vic 3500

During my time at Pine Creek, when the Northern Territory was still being raided by Japanese Zeros, there occurred two incidents which have left a life-long impression on me. Both incidents occurred in the one week, but at this distance of time, I'm not sure of the chronological order in which they occurred. The two incidents concern, Spitfire pilots that were in trouble and a head-on collision of military vehicles at Pine Creek in which one of our officers, and an RAAF truck driver were killed.

Let's take the story of the "Spitties" first. At about this time, there were a number of English Spitfire pilots flying aircraft in the Northern Territory. This particular day, a Sunday morning, we heard the omnious drone of an aircraft approaching the Pine Creek airstrip at the back of our Signal Office. It was the normal custom of an army mail plane (which was the way we despatched and sent letters home) to land here about 11 am on week-days but never on Sunday, so we realised that the visitor was not the regular mail plane. Looking up at the circling aircraft, it was obvious that it was in trouble, so as it headed for the landing strip, a number of sigs took off for the strip also. We ran fast and got there just as it touched down. When the plane came to a stop, a very frightened fighter pilot emerged from its controls and asked who we were. He was as white as a sheet, with good reason.

From his story, it appeared that a short time earlier, he and a mate in another Spitfire had passed over Pine Creek on the way to Gorrie (near Katherine) where they were taking the two aircraft for some sort of overhaul. As they passed over the Ferguson River, our pilot said the other plane appeared to be in trouble as its engine was spluttering, and he quickly decided to bail out. Our man tried to frantically call Darwin by radio but received no answer, he then had the awesome spectacle of seeing his mate landing in the flames of his crashed plane. To add to the strife, just as our pilot was returning to Pine, his own engine started to cut out. He asked us could we get a message off to his base, letting them know what had happened, and to send a part for his aircraft.

We lost no time in getting the message off, and in arranging for the replacement part to be sent, which arrived by train the following day. We also arranged for the RAAF at Pine Creek to give the English pilot overnight accommodation.

The following day, we sigs followed the pilot down to the strip where he fitted the replacement part. He thanked us for our assistance, and although still nervous because of the happenings of the previous day, said he'd attempt a take off, but, just to make sure that all was OK, would fly over our strip several times before going on his way. Reassured that all was now OK with his Spitfire, the last we saw of him was disappearing into the clouds.

The second incident occurred a few days later about 7 pm just as I had started the night shift in front of the switchboard. Because there was an open air picture-show at Pine that night, I thought that I would have a quiet night, and settled down to read some books. It had been the custom of any sigs attending the open air pictures to take the portable telephone to the site, in case anyone at the show was wanted. But this time the portable telephone **was out of order.**

Somewhere about 8 or 9 pm, my reverie in front of the board was shattered when the shutter connected with McDonnel Strip dropped, and a very excited voice cried out *"Accident — accident — get the army and RAAF ambulances!"* and then hung up. I tried to call McDonnel Strip back but there was no answer. Suddenly I realised that army and RAAF personnel would be at the open air pictures — and the portable phone was out of order. What to do? Not realising at that time that Pine Creeks sole civilian Constable was involved in the accident, I tried to raise the Pine Creek Police station, because it was near the site of the open air picture show. Instead of the Constable answering I was greeted by the voice of one of our army linesmen who happened to be up a telephone pole working on the line. When I told him that I wanted an urgent message sent to the picture show site immediately, the linesman said that he himself, would deliver it.

From my location in front of the switchboard I could hear the sound of the picture show. Suddenly the sound was interrupted, and an unknown voice summoned Army and RAAF ambulance crews to McDonnel Strip as soon as possible. About 9 or 10 pm when the show ended and the picture goers returned to their units, I began getting a series of calls, asking if I had any further news as to what had happened at McDonnel Strip. Everyone was still thinking in terms of the Spitfire incident. But I was still unable to raise them.

A couple of hours later, a military vehicle drew up outside the signal office and out stepped the police Constable **covered in blood.** *"Captain Pickett (area officer of Pine Creek) and an RAAF truck driver are dead. Please Joe, listen in on all calls to Katherine, and if anyone mentions me, cut them off will you?"* I asked him for further details and it appears the policeman, and Captain Pickett were returning from a Tivoli concert party, when they rounded a bend and crashed head-on into the RAAF vehicle. Johnno, the policeman, said that his wife was in hospital at Katherine having a baby and that's why he didn't want her to know about what had happened. I offered him a cup of tea but he declined saying that they would have to drive through the night (no streetlights up there then) to take the two bodies to Katherine.

When he left our signal office, I asked permission of our corporal to phone Katherine hospital alerting them to the arrival of Constable Johnstone and the deceased, as Constable Johnstone would need medical attention himself. Permission for me to make the call was **REFUSED,** but after our corporal was out of sight, I took it upon myself to defy this order. The matron at the hospital thanked me very much for alerting them, assured me that she personally would ensure that Constable Johnstones wife was not told that her husband was injured and on the way to the hospital.

A few days later, Constable Johnstone was back in Pine Creek and none the worse for the incident despite some superfluous injuries.

In due course, the baby was born, and according to what I later heard, in its own right it became famous as being the first baby born to a civilian in the Northern Territory since the bombing of Darwin. Because of the war, war correspondents were everywhere and it appears that a BBC correspondent in the Northern Territory got wind of the birth, and it was announced by the BBC in London.

I was very pleased to make contact on air on 80 recently with Mike VK3PID, of the Basin, in the Dandenongs. Mike had not had his call for very long and when I first heard him he was using an ex World War Two Type 122 set on AM. I was at first listening on sideband, but could hear his AM signal, but eventually I found it best when I switched to AM for his signal and came back on sideband. He said that although 40 years old the 122 was in what currency dealers would call "mint condition." Mention of the 122 brought back my own memories of when I saw one of these first while at the Marconi School of Wireless for army personnel then being conducted in a building above Broadway Motors in Sydney. The sets we saw there were also in mint condition, and were there for **show** only while instructors tried to explain how they worked. How were we supposed to know all about these sets while being forbidden to use them is one of the mysteries of World War Two. Anyway, relying on my memory of this set, with nearly half a century having passed since I saw one, according to Mike, my description of the set, was correct in every detail, even to the color-coding system of the locknuts on the two dials — all of which goes to show that my memory is not too bad even after all the things that have happened to me over these past years. **AR**

QSP

PRIME MINISTER IS AN AMATEUR

Rajiv Gandhi VU2RG became Prime Minister of India in the evening of 31st October 1984.

Rajiv passed the 1st Grade amateur examination in 1974 and was allotted the call sign VU2RG on the 1st January 1975. Since this time he has remained active generally on 21/28 MHz but over the past two years, has been active on 144-146 MHz also.

During and after school days Rajiv's interests were aviation and electronics, he became a keen home-brewer in electronics after witnessing amateur radio in action at the home of his uncle. Within three months of obtaining his call sign he made his first homebrew HF CW/SSB transceiver and a two element quad antenna which he used until 1980 making many contacts.

From the time Rajiv became a Member of Parliament in June 1981 he has constantly been working for progressive developments in aviation and electronics, including amateur radio, in India. Due to his constant efforts computer training is available in Indian schools and several relaxations have been given to the electronic trade/industry which benefit the masses.

In amateur activity Rajiv has taken up the cause of amateurs individually and collectively and organised fast amateur participation to maintain communications during a cyclone/flood on the west coast of India at a time when all known channels of civil communications had failed. He also persuaded the Government of India to consider a request from the Amateur Radio Society of India to allow custom duty free import of amateur equipment. Such facilities will be available to Indian amateurs until 31st March 1985.

In 1975 Rajiv's XYL Sonia passed the 1st Grade amateur examination and was allotted the call sign VU2SON. She is also active on 21, 28 and 144-146 MHz.

During early 1985 it is hoped their son Rahul (14) and daughter Priyanka (12) will have call signs and be 'on the air'.

Rajiv is a very avid reader of amateur radio literature and journals and is always endeavouring to keep abreast of the latest developments and modern techniques. In July 1984 he was granted permission to install a 'close repeater' on 144-146 MHz with the call sign VU2RRG. The equipment for this repeater is still awaited from abroad but when installed it will be the first amateur repeater station in India.

from material submitted by Amar Banerjee VU2CZ.

SIGNAL REPORT AMPLIFICATION

Last month we talked about Signal Reporting in terms of the basic Readability/Strength/Tone report. Sometimes there are factors which need to be reported, but simply cannot be considered as matters of readability, strength or tone.

(By the way, if this sounds familiar, it is largely a reprint of a column which appeared about two years ago. It is being repeated for the benefit of newcomers who keep asking me to write about basic CW operations. The great advantage of a word-processor is that chunks of earlier columns can be inserted wherever desired, in the midst of new material. This time, however, the entire column has come across virtually unaltered, so I thought I should explain why it might seem familiar.)

Even when an extremely strong (S9) signal is perfectly readable (R5) it can still have technical attributes which may (or should) be of interest to the other operator. There are a number of one-letter signal report amplifications for this purpose, advised in standard format. They don't take up much space, but convey a lot of information. Typical reports might be 5/9/9X, 5/9C or 3/7 QRN3. The amplification symbols which should be at every op's fingertips are described below.

X Fortunately, most signals could be reported as -/-/9X, for their tone is pure and their frequency is stable. If received signals do not vary in pitch, meaning there is no variation in transmitting frequency, then X can be used to indicate that the signal is as stable as a crystal — (Xtal!) controlled one.

C The symbol C represents "chirp," and is used to describe the sound of a signal in which each character element (dit or dah) changes in pitch in a repetitive fashion. If you hear a CQ which sounds like "cheow-chi-cheow-chi, cheow-cheow-chi-cheow," you are hearing "chirp." The problem is usually caused by an unstable VFO or oscillator which gets drawn off frequency each time it comes under load. Most commercial gear is chirp-free, but you can often hear chirpy signals coming from the USSR, where a lot of gear is home-brewed by members of the Ham Gear Collective of the Lenin Institute of Tractor Repair and Plumbing Radio Sport Club. A stable oscillator with adequate buffering between it and the keyed stage should solve the problem, but is not always possible, particularly in QRP work. When you hear it — report it. The other op may not be aware of it and it may be something he can fix easily if someone tells him it's there.

D Sometimes a signal will drift in frequency (the pitch gradually rises or falls), in which case the symbol D is used. This is often a problem where a VFO or oscillator is subject to temperature changes such as the rig heating up as a transmission progresses. I once heard an op in a contest who sounded like a sports-car going up a steep hill. Each time he transmitted he started zero-beat, then took off for the wild blue yonder, sometimes dropping down a bit between words before taking off again. Most drift is more gentle, and of course you should be sure it is not your receiver which is drifting before you send D. Experience is the best teacher in this regard, but as a general rule, it is probably best to ignore a small amount of drift, especially if you only notice it five minutes into the QSO.

K Key clicks (K) can be a real problem because they are spurious transmissions which may appear quite some distance from the QSO frequency. They are a clicking, static-y noise which occurs in time with someone's sending. They often result from overdriving the transmitter, so it is a good practice to refrain from running flat-out. Just backing off a little bit from full power can make the world of difference.

Interference, in contrast with technical faults, can be either man-made or natural (QRM or QRN, respectively). The basic principle in reporting QRM/QRN is that if it is causing no problems in copying, don't report it. Just because you can hear it doesn't mean it is causing interference, and you should think in terms of readability. A report of 5/9 ORM, for example, means "your signal is perfectly readable with no difficulty, and the difficulty is caused by man-made interference (!)."

The main reason for reporting QRM or QRN is so the other station can adjust his sending to suit. Accordingly, the QRM or QRN should be followed by a number from 1 to 5, representing the degree of interference. For example, if you send a report 3/7 QRN 3, the other operator knows you have noisy conditions and will (theoretically) slow down and/or repeat key words. For that matter, there is nothing to stop you from sending —

"RST 3 7 9 QRM 3 ? RST 3 7 9 QRM 3 PSE QRS 10 ES QSZ 2 QSZ 2" — which translates as "your readability is 3, your strength 7, and your tone 9, with man-made interference causing significant but not overwhelming problems, please slow down to 10 WPM and send everything twice." Your chances of copying his next transmission are a lot better than if you had sent "RST 3 7 9 QRM."

If the strength report is high, but the readability is less than 5, some amplification really should be given.

One last aspect of reporting deserves comment, and that is the tendency for award and certificate managers to demand "minimum reports." To my mind this is about as silly as you can get, especially when some lid keeps you from qualifying for something by giving you a 5/0/9 report. I personally do not chase paper, at least not much, but I would have to rule out anything requiring minimum reports. After all, the purpose of it all is communications, and there have been many occasions where a 3/2/9 report has meant more to me than other QSO's where I was "given" 5/9/9 PLUS 40 dB. If you have exchanged calls, reports, and names you have certainly communicated, and there is much more virtue in having done it under difficult conditions. What do you think?

Keep communicating . . . ES CUL

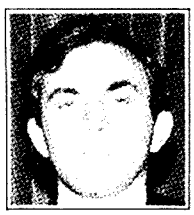
AMATEUR RADIO MAGAZINE AWARDS



Tony VK3QQ

Reg VK2ELG

Rob VK5RG.

The awards for 1984, which are selected by the Publications Committee are as follows:

The Higginbotham Award for service to amateur radio was awarded to Tony Tregale VK3QQ for his dedication to the subject of EMC.

The Alan Shawsmith Journalistic Award was awarded to Reg Glanville VK2ELG for his excellent article "Clandestine SWLing".

Technical Award — which is awarded for the best technical article published in Amateur Radio went to Rob Gurr VK5RG for Rob's Wire Antennas article.

Congratulations and best wishes to all three winners.

EDUCATION NOTES

Brenda Edmonds, VK3KT
FEDERAL EDUCATION OFFICER
56 Baden Powell Drive, Frankston, Vic 3199.

I have been asked at times for advice about organising and running classes.

There are no set rules or procedures, so I can only offer some ideas from our own experience and comments collected from other instructors or students.

There are so many variations between classes — level required, numbers and backgrounds of students time available, physical location and facilities, and lecturers available — that each class is different, but there are a few considerations that apply to all.

FIRSTLY — THE COURSE TO USE

Stick to the published syllabus, but be aware that there is a tendency to a change of emphasis as technology develops. When modifications to the syllabus are made, they will be publicised.

THE CLASS

From our experience the one factor most responsible for success of a class is the enthusiasm and dedication of the students themselves. If they are aware that the two or three hours of lectures each week must be backed up with several hours of homework, and are prepared to spend this time on it, their chances of success will be good, and the class will be stimulating and rewarding for all concerned.

Numbers may be limited by the facilities available or by lack of publicity. Notices placed in local shop windows frequently collect new students. There is no minimum number, but more than about 30 is getting too big even in standard classroom conditions. My personal preference is for about 12-20, but remember that there may be a drop-out rate of 10-30 percent of starters. A small group ensures that members are able to ask questions or request repetition without feeling that they are wasting everyone's time.

LOCATION AND FACILITIES

These depend on what is available and the class size. Three or four students can be seated around one table with the instructor — but unless the instructor can write upside down, a better arrangement is to have a lecture type situation, with the assistance of some sort of chalk board or overhead projector. Inexperienced lecturers may need to practise writing so that it can be read from some metres distance.

The instructor may be covering the whole course or just one topic, depending on the people available and their competence/confidence. Ideally, the lecturer should be competent to deal with any likely questions from the class (and there are usually a few curly ones) but more importantly must be able to appreciate the difficulties and limitations of the students. Too often the 'expert' is unable to explain his specialities in the simple language needed by the newcomer. (This complaint is by no means restricted to amateur radio.) This problem is compounded by the different levels at which students may be starting. It is worth spending some time sorting out the backgrounds of the students, and, if necessary, putting in a few extra sessions with those who need, for example, some maths revision.

THE LENGTH OF THE COURSE

Can be varied to some extent. We have found that about eight months of two hours per week adequately covers the Novice syllabus.

Do not try to cram too much into one session. The new science graduate will cope, but the middle-aged truckdriver will become bogged down and lose interest. A break every hour is essential for both students and instructor — preferably with tea or coffee facilities to encourage movement and interaction.

FINALLY, QUESTIONS AND EXAM TECHNIQUE

Most students will need practice in reading and answering multi-choice questions. This should begin early in the course — perhaps a few questions on the previous week's topic before starting the next. Questions can also be set for homework, but I think new questions tackled under exam conditions and against the clock are better practice. A full scale one hour exam on the work covered so far can be given two or three times during the course, with a full scale trial exam at the end. In each case, check the questions where most failures occur, and use this as the basis for revision sessions.

I would be interested to hear other peoples' ideas on classes, either by mail or on the Education Net (Thursday 1030 UTC near the top end of the Novice band on 80 metres or 1130 UTC at about 3.685 MHz).

Best wishes to all who are getting involved with classes for the first time this year, and best of luck to those preparing for the February exams.

73 Brenda VK3KT.

AR

ALARA

Australian Ladies Amateur Radio Association

Margaret Loft, VK3DML
28 Lawrence Street, Castlemaine, Vic 3450

This report is coming to you from a caravan park at Portland. George and I will be here for 2 weeks until mid January.

We are looking forward to some nice sunny calm weather to enjoy all the area has to offer.

The contest results will be in the next months comumn sorry to say but we left home before the deadline. Up to date 40 logs have been received — more from OMs this time and it is very pleasing to have the response from the men folk. Thank you for taking the time to encourage the YLs and we do look forward to having you join in again next November, for No 5.

Some comments I received with the logs, *we were disappointed in lack of ALARA members on CW.* Come on girls, it's not too hard, so start practising for this years contest.

The certificate for the Mrs McKenzie CW section of the contest is making slow progress but hopefully will be on its way to the lucky YL very soon now. She will have been notified prior to this article.

SUBSCRIPTIONS

Were due and payable by 31st December 1984. $5.00 for Australian members and also for overseas with Newsletter going air mail. $3.00 if sent by sea mail.

Membership now is very close to 200. We have 4 new G-land YL's who have been sponsored into ALARA (call signs next month).

Good luck to all who are sitting exams again this month, do hope this is the lucky one for you. If not, well keep trying. It really is worth it in the end.

VK3 State Co-ordinator — Bron VK3NDT/XTD has very kindly volunteered to be our VK3 state representative. Marilyn VK3DMS was trying to wear 3 hats at once and asked for a volunteer in the Melbourne area. So many thanks Bron for the offer and we hope you enjoy your new job and welcome to the committee of ALARA.

Good to catch up with you at Echuca in December too Bron, always nice to say hello in person.

Thank you also to Marilyn for your time as State Representative — and hope this has eased the load somewhat. It is better to share the load around, all the more the merrier.

While I am saying thank you — a very special thank you to all associated with AR. It was a lovely surprise for me when I found the page of Mildura photos in December AR.

My little contribution is always well presented and the photos do add a lot of interest. Still have quite a few to be printed this year, so if you have one of some YL who hasn't appeared I'll use it then return to you if wanted.

ALARA by now has stickers printed for use on QSL cards, stationery etc, these will be for sale. Price on application (until I can get them from Valda and they appear in AR) to Valda VK3DVT, PO Box 4, Brighton Vic 3186.

Also still available are charms, badges and teaspoons all with ALARA logo depicted.

1985 is ALARA's tenth year and we are hoping to celebrate in some way. Possibly in each State a lunch or afternoon tea will be held. A pity our get-together in Mildura did not co-incide with this year but we will be holding national get-togethers at intervals. A poll has been organised in the Newsletter and no results as yet.

Until next month 73/33/88. Margaret VK3DML

AR

MAX LOVELESS MEMORIAL COLLECTION

This collection of valve era communications equipment was briefly outlined in the August 1984 AR.

Barry Riseley, the collection co-ordinator has advised us that the collection is now definitely underway and has begun to get together some really fine examples of valve era equipment.

Hopefully as the collection becomes more organised and developed it will be possible to run some pictorial articles, which judging from the correspondence Barry has received arising out of the initial article would be of considerable interest to many WIA members.

At the moment the collection is anxious to obtain "Ham Band" crystals in the old FT243 and/or RAAF "D" type holders. These ARE URGENTLY REQUIRED to enable some of the old gear to be reliably operated on air and if you have old "Ham Band" crystals or empty holders or any frequency crystals in older type holders that are outside ordinary amateur bands then they could be put to good use by the Loveless Collection.

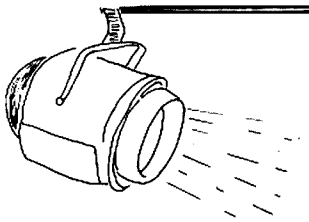
We are also most anxious to get hold of some old type plug-in coil formers with 4, 5 or 6 pin bases, as marketed by Marquis, RCS, Jabel and probably others over the years.

Another item required is a "plate" modulation transformer suitable for use in a small "demonstration" AM transmitter of say 38-50 watts or thereabouts.

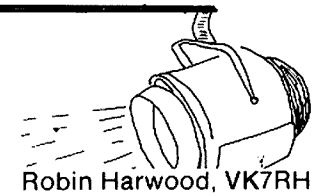
MOST IMPORTANT PLEASE — before your toss out your old junk valves, components, books, magazines, etc. give the Max Loveless Pioneer Memorial people an opportunity to take it off your hands. Your assistance will help ensure that at least part of our communications heritage is preserved for posterity.

Should you feel able to assist us in this most worthwhile venture please contact VK7KAD by telephone in Hobart (002) 28 6351 BH or (002) 43 7504 AH or perhaps write to GPO Box 215C, Hobart. Collection anywhere in Australia could be arranged.

AR



SPOTLIGHT ON SWLing



Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

Most of the monitoring I do these days is of Utility or Non-broadcasting services. These stations extensively use HF to conduct their everyday communications and are specifically designed for the broadcast listener. The majority of these services can be found between the various international allocations assigned for broadcasting stations, although with the crowded spectrum, they have been known to increasingly utilize both exclusive broadcasting and amateur allocations.

One indispensable aid to the Utility DXer/Monitor is the Confidential Frequency List published by Gilfer Associates Inc. This contains an extensive listing of Utility Services from monitoring by the author, Oliver Ferrell, aided by reports submitted from fellow enthusiasts from throughout the world. All utes above 4 MHz are listed in frequency order. Because of the number of service employing RTTY, a separate guide was published dealing with RTTY services.

It was the wish of "Perry" Ferrell that these two lists be combined in one volume, and to this end, he set out to compile and update material for the sixth edition of the Confidential Frequency List. Tragically, in April of last year, "Perry" was killed in an automobile accident before the basic research and checking had been completed. Several well-known communications monitors stepped in, working in close co-operation to complete the Sixth Edition out of regard for "Perry" and also to see the CFL continue as a viable information and data source for other enthusiasts.

I recently obtained my copy of the CFL Sixth Edition through one of the DX Clubs in Australia. This volume contains the listing of Utility stations by frequency order from monitoring observations. Another aid is the inclusion of some international broadcasting stations transmitting on allocated frequencies normally reserved for utility services, although in some instances the location and/or identity of these is incorrect. However, it serves as a propagational indicator to have some of these listed.

The volume also has background articles on the various modes employed by utes such as Piccolo, AMTOR, RTTY both standard and non-standard, non-synchronous formats. Also an article was reprinted from the RTTY Guide on deciphering Russian language shifts.

I have found that the listings are fairly up to date, although it can readily be appreciated that there are considerable alterations made by utility services on a more frequent basis than the international broadcasting stations. It is to be anticipated that the CFL will continue in the future with further updates from monitoring. I myself do regularly update the information by scanning the Utility trails from DX magazines such as ADXN or DX Post, both of whom have a very good utility section.

Another Utility Guide has been edited by Joerg Klingenfuss. This Guide contains 27 pages of addresses of Utility Stations world-wide. But a word of warning: it is an offence in the majority of countries to reveal or divulge the contents of any traffic passed by any non-broadcasting transmissions including within Australia. So if you do wish to forward reports to these services, please confine your details to Callsign(s) Date, Time, Frequency etc. However, as the majority of utility stations are not interested in receiving or obtaining reports, or to know that for that matter, unauthorized persons are monitoring their transmissions, I would strongly recommend that you desist from forwarding them reports, confining your activity to sending reports to amateur or broadcasting services.

Both of these guides are extremely helpful to the identification of Utility Services together with their approximate location, especially in my IW monitoring. As well, GFS Electronics have, I believe, several utility guides available. The addresses for these Guides are as follows:

CFL'6 Gilfer Associates INC, PO Box 239, Park Ridge NJ 07656 USA.	Guide to Utility Stations Joerg Klingenfuss, Panoramastrasse 81, Hagelloch D-7400 Tuebingen Federal Republic of Germany.

On the 15th of December last year, as part of a five hour Talk Show over the giant ABC Network in the USA, there was a phone-in devoted to shortwave listening. Participating in it were Arthur Cushen, Glenn Hauser as well as other well-known DXers, all publicizing the hobby. However, the programme was scheduled from midnight and 5 am local time, when the majority of the listening audiences would be insomniacs or night shift workers. However, it is perhaps a concept that the WIA could put into practice to publicize amateur radio, and the 75th Anniversary of the Institute in particular, as there are plenty of similar programmes on our domestic stations in Australia.

Radio Australia's programme "Australia Tonight" hosted by Barry Seeber was voted by the SPEEDX Club of North America as the most popular SW programme by its members. Barry was also in equal top position as personality of the year with Clayton Howard of Radio HCJB, who is now retired. RA's popular programme devoted to SW listening, continues to be popular. As part of their recent first anniversary programme, they conducted an experimental slow-scan TV transmission and pictures were received in many parts of the world.

You may remember that last year, the BBC conducted a competition amongst their listeners to pick out the Seven Wonders of the Modern World. Hundreds of listeners sent in their suggestions and these will be considered by a panel of judges who will decide which are the Seven Wonders of the Modern World. Paddy Feeny will chair the discussion as well as present the series of eight programmes devoted to finding out as from the 12th of February at 0730 UTC in the BBC World Service.

While we are with the BBC World Service, there will be a series of programmes devoted to two Giants of Music, Georg Friedrich Handel and Johann Sebastian Bach, both being born 300 years ago exactly. There will be a series of concerts and documentaries celebrating the tercentenary. During February, Handel will be featured, while Bach will be featured later in the year.

Drama of the Month on the BBC W/S will be Robert Bolt's play "A Man For All Seasons", telling of the story of Sir Thomas More and Henry the VIII and of the struggle between the two, leading up to More's execution on the scaffold in 1535. I seemingly recollect hearing this not so long ago, but it is worth hearing it again.

For those lucky owners of a Racal receiver, regarded as the cream of professional receivers by many, there is now a non-profit organization with the aim of providing a mutual service to owners of surplus RACAL equipment. Known simply as the RACAL User Group, they issue a quarterly newsletter to keep the owners informed. Further details can be obtained from Peter Barker G8BBZ, 8A Alwynne Place, London N1 2NL, England.

Well, that is all for this month. Until next time, the best of 73 and good monitoring! — Robin VK7RH.

AR

INTRUDER WATCH

Bill Martin, VK2COP
FEDERAL INTRUDER WATCH CO-ORDINATOR
33 Somerville Road, Hornsby Heights, NSW 2077

You will have noticed by now that I have changed my call-sign to that appearing at the top of the column. I have not changed QTH, however, and any enquiries can still be directed via my call-book address, listed under my old call, VK2EBM.

Another change to report, this one unfortunate, is that we have lost our IW Co-ordinator for VK1, as he has moved into VK2. I won't make any comment as to whether that was a good move or a bad move! Grahame VK1GP, has been with us quite a while, and will be hard to replace. Thanks, Grahame, for your assistance with the IW in the VK1 area.

Good news from ZL1BAD, is that he has had a reply to his letter to the "Office des Postes et Telecommunications, Polynesie Francaise". Bob wrote to them, after having amassed quite a deal of information through the Intruder Watch, on carrier and telephone activity spilling over onto the lower end of the 40 metre band. These transmissions have been heard daily for months, and the French Polynesian Office in Papeete has written to say that they have moved frequency from 6.999 MHz, and, hopefully, they will no longer interfere with this section of the band, which had been successfully wiping out from about 7.0 MHz to about 7.006 MHz. Many thanks to those observers who took the time to report this particular intruder.

In an interview in CO Magazine, July 1984, Dr Robert S Powers, Jr, Chief Scientist of the Office of Science and Technology, FCC, was asked by the magazine to comment on some aspects of the 'Woodpecker'. As early as 1976, the USA Administration sent telegraphic messages to the USSR re the Woodpecker, and received no reply. (*Sound familiar?*). They then went to the IFRB, who also complained in writing; the USSR replied that "*the operations involved were experimental-; that they would cause interference of short duration-; and that action was being taken to decrease the incidence of interference.*" *(Hl)* . . . The important thing that comes to our attention as a result of this interview, is that Dr Powers has said that the Department is maintaining a file of complaints which can be drawn upon for negotiating purposes when the appropriate occasion arises. This means to me that we should continue to report intrusions into the amateur bands by the Woodpecker, for the information of the USA Administration.

So let's hear from you on all intruders, and keep the reports on the Woodpecker coming.

See you next month.

Participating stations and listeners are able to obtain basic orbital data including Keplerian elements from the AMSAT Australia net. This information is also included in some WIA Divisional Broadcasts.

ACKNOWLEDGEMENTS

The only contribution this month is from Bob VK3ZBB, to whom I am greatly indebted for his monthly Ups and Downs listing.

OSCAR 10 APOGEES

A careful survey of the Oscar 10 Apogees listed this month highlights the significance of things to come, a look at both orbits of the day. Refer to Sydney and Perth Apogees around the 12th, 13th and 14th February. At this time the prospect is insignificant, time-wise, however as the apogee drifts slowly southwards total hours of operation through Oscar-10 will be extended over those currently enjoyed.

HELP

A WAYWARD TROPHY FIND ITS WAY HOME

The VK Novice Trophy has slipped away whilst no one was looking and has now got itself lost. The where-abouts of this trophy were last known in 1982. Anyone who may be able to assist please contact the Federal Office on telephone (03) 528 5962 or write to the Federal Secretary at PO Box 300, Caulfield South, Vic., 3162.

AWARDS

VICTORIAN NATIONAL PARK ACTIVITY WEEKEND — 9-11 MARCH 1985

A former Victorian Division President, Keith Roget, originally suggested an award to encourage amateur radio activity from Victoria's National Parks. In the early 1970s a number of radio amateurs activated Victoria's National Parks and the award was popular.

Following the untimely death of Keith Roget, the WIA Victorian Division Council was given permission by his widow to re-name the award in his memory. In 1984 the award was revised to reflect the increase in National Parks and the first and only recipient of this award in 1984 was Ralph VK3BRF.

As a special event to help celebrate Victoria's 150 years anniversary, the Victorian Division is asking Clubs and individual radio amateurs to support a National Park Activity weekend. This will be held over Victoria's Labour Day holiday long weekend, the 9th-11th March 1985. The purpose is to promote activity from Victoria's 31 National Parks and to promote the Keith Roget Memorial National Park Award. Clubs and individual radio amateurs are asked to operate from Victoria's National Parks to help shortwave listeners and fellow radio amateurs to make contact to and/or from a specified number of National Parks for the Award. For those living in VK3 call area this is 16 Parks. Award claimants in Papua New Guinea, New Zealand and VK call areas other than VK3 require 5 National Parks, while overseas (other than P29 and ZL) need only 2 parks.

A brief outline of the 31 National Parks in Victoria follows:

East Gippsland
Alfred — On Princes Highway between Cann River and Genoa.
Croajingolong — South of Princes Highway between Cann River and Genoa.
Glenaladale — 30 km north of Princes Highway from Fernbank.
The Lakes — East of Loch Sport.
Lind — Off Princes Highway between Orbost and Cann River.
Snowy River — South of Mackillop Bridge.
Tingaringy — North of Mackillop Bridge on the Buchan-Delegate Road.

West Gippsland
Baw Baw — Approach via Yarra Junction or Moe or Erica.
Bulga — Eastern end of Grand Ridge Road, near Balook.
Morwell — 16 km south of Morwell. Approach via Jeeralong Junction and Junction Road.
Tarra Valley — On Tarra Valley Road, 30 km from Yarram.
Wilsons Promontory — Approach on South Gippsland Highway via Meeniyan or Foster.
Wonnangatta-Moroka — Via Licola or Mansfield.

North East Victoria
Bogong — Via Ovens Valley Highway to Harrietville or Myrtleford, or via Omeo on Alpine Tourist Road.
Burrowa-Pine Mountain — North West of Corryong. Approach from Cudgewa or Walwa.
Fraser — On the western shores of Lake Eildon 17 km from Alexandra.
Mt Buffalo — 30 km from Porepunkah.

North West Victoria
Grampians — Via Stawell, or Horsham, or Hamilton.
Hattah-Kulkyne — 36 km north of Hattah township.
Little Desert — South of Western Highway between Dimboola and Nhill.
Wyperfeld — 50 km north of Rainbow.

South West Victoria
Lower Glenelg — North of Portland-Nelson Road, along the Glenelg River.
Mt Eccles — 9 km west of Macarthur which is 33 km south of Hamilton.
Mt Richmond — 32 km west of Portland.
Otway — Via Great Ocean Road, or Princes Highway to Apollo Bay.
Port Campbell — South of Great Ocean Road between Princetown and Port Campbell.

Metropolitan
Brisbane Ranges — Off Anakie-Ballan or Anakie-Marsh Roads.
Churchill — Rowville, off Stud Road near Wellington Road north of Dandenong.
Fern Tree Gully — Just north of Upper Fern Tree Gully.
Kinglake — West of Kinglake township. Approach from Whittlesea or Yarra Glen.
Organ Pipes — Off Calder Highway, 8 km past Keilor.

Many of these parks are within easy range of 2 metre repeaters, and with plenty of trees and natural supports for field day type antennas, HF operation can be very rewarding. The Mildura Radio and Electronic Club members will be operating from the Hattah-Kulkyne National Park and you are asked to join them from any National Park and make this long weekend not only an enjoyable break in pleasant surroundings, but a rewarding one with plenty of National Park contacts for everyone.

Contributed by Peter Barclay VK3FR
National Parks Award Manager, WIA Vic. Division.

AR

Radio Amateur Old Timers Club

Each year, two QSO parties are held for members of RAOTC Australia, and Old Timers' Club New Zealand.

Members are requested to cut out this notification and keep it before them as the days, times, and bands will remain fixed.

RULES

ELIGIBILITY — The parties/contests are open to members of RAOTC (Australia) and OTC (New Zealand).

Note — There are members of the Australian Club in overseas countries who could possibly participate at the times laid down.

CONTEST EXCHANGE — Members will exchange:

1 Their Club membership number. VKs prefixed by "A", ZLs prefixed by "Z".
2 Year of first licence.
3 Name.
4 Age.

Eg Number A256 1951 Bill 49
Number Z128 1923 Harry 78

SCORING — One completed contact with a member on CW or SSB but not both, will score 5 points.

MULTIPLIER — the total of VK, ZL and Overseas call areas contacted.

FINAL SCORE — Contact points times multiplier.

DATES, TIMES, AND BANDS

No 1 — Second Monday in March — 20 metres 0200 to 0500 UTC.

Please spread out around centre frequencies CW 14.050 and SSB 14.150 MHz.

No 2 — Second Monday in August — 40 metres 0800 to 1100 UTC. Centre frequencies CW 7.035, SSB 7.100 MHz.

ENTRIES — Claimed scores showing mode (CW, SSB or CW/SSB), number of QSOs and multiplier should be forwarded to John Tutton VK3ZC, 11 Cooloongatta Road, Camberwell, Vic. 3124.

All amateurs who have been licensed for a period of 25 years or more are eligible to join the Radio Amateur Old Timers' Club. A self-addressed envelope (9 x 4) to the Secretary, Harry Cliff VK3HC, PO Box 50, Point Lonsdale, Vic 3225 will bring you a membership application form.

1985 Contests — 11th March and 12th August.

CONTESTS

Ian Hunt VK5QX
FEDERAL CONTEST MANAGER

P.O. Box 1234, GPO, Adelaide, SA 5001.

CONTEST CALENDAR

FEBRUARY

9-10 QCWA CW QSO Party
9-10 YL — OM Phone Contest
16-17 ARRL DX CW Contest
23 RTTY World Championship Contest (Rules AR Jan 85)
22-24 CQ WW DX 160 metre SSB Contest (Rules AR DEC 84)
23-24 John Moyle Memorial National Field Day Contest (Rules this issue)

MARCH

9-10 Commonwealth Contest 1985 (Rules this issue)
10 WIA 75th Anniversary CW Contest (Rules this issue)
23-25 BARTG Spring RTTY Contest 1985 (Rules to appear March issue due to large volume of contest material for this issue)
30-31 CO WW WPX SSB Contest

In this issue are provided the rules for the John Moyle Memorial National Field Day Contest. It might be suggested that you read these rules very carefully as they differ in many ways from previous rules laid down for the annual field day contest. Such changes as are embodied in the rules for this year are not necessarily radical and indeed merely reflect the implementation of some of the items which have been Federal policy of the WIA for quite some time. *Please look most carefully at the rules concerning QSO Points, Multipliers, Bonus Points and Repeat Contacts.*

You will note that there is now another category for home stations using emergency power. This means that such stations must be operated independently of power mains and serves to further the aims of the WIA to prepare operators for emergency situations.

I have also attempted to make things more interesting for VHF/UHF operators by introducing the multiplier system for varying distance contacts. I have also deliberately tried to deter stations from operating along the lines of working strings of overseas home stations, an approach which seems to be somewhat against the overall aims of the Field Day contest.

I have only recently received the rules for the British Amateur Radio Teleprinter Group (BARTG) Spring RTTY Contest, 1985. Just a little advance information so that you can make arrangements to have the necessary time made available for this contest. This contest will be held from 0200 UTC Saturday 23rd March until 0200 UTC Monday 25th March 1985. The total contest period is 48 hours but not more than 30 hours of operation is permitted. Time spent as listening periods counts as operating time. The 18 hours of non-operating time can be taken at any time during the contest period, but off periods may not be less than 3 hours at a time.

CERTIFICATES

I am still having quite some difficulty in catching up with the backlog of certificates to be issued for past contests. Final sorting out of the problems associated with certificates for the 1983 Remembrance Day Contest has yet to be reached. I sent out all the certificates for the 1983 VK Novice Contest only to find that none had been sent out for the 1982 VK Novice Contest. I also discover that no certificates were sent out for the 1984 Field Day Contest. If you are amongst those who have not yet received a certificate which you were entitled to please do not give up hope. Be patient.

Just a final word regarding the Field Day event this month. Might I modestly suggest that you review my comments regarding Field Day operations which appeared in this column in the November issue of Amateur Radio. I will look forward to working you in this contest and hope that there will be plenty of activity.

1983 VK NOVICE CONTEST

Photograph by Ken McLachlan VK3AH

Pictured is David McAulay, VK3EW, (now updated from VK3KHI), receiving his Certificate for this event from Jim Linton, VK3PC, the Victorian Division President.

David should have also held for 12 months the Novice Trophy, as he scored 1652 points thereby being the overall winner, but unfortunately, as readers are aware, we are currently having difficulties locating this trophy.

JOHN MOYLE MEMORIAL NATIONAL FIELD DAY CONTEST 1985

Contest Period: From 0100 UTC 23rd February 85 to 0700 UTC 24th February 85.

Object: To encourage portable operation on the amateur bands by Australian operators. This form of activity is intended to help operators become familiar with portable operation and thus assist in training them for preparedness in emergency situations.

Call Area Definition: (a) Within one's own call area. VK1 to VK1 etc. (b) Outside one's call area VK1 to VK2. VK1 to ZL etc.

RULES:

1 Divisions: There will be TWO divisions. (a) 24 Hour. (b) 6 Hour. In each division the operating period must be continuous within the time period allocated for the contest.

2 Sections: In each division there will be separate sections as follows:

(a) Portable field station, transmitting phone, single operator.
(b) Portable field station, transmitting CW, single operator.
(c) Portable field station, transmitting open, single operator.
(d) Portable field station, transmitting phone, multi-operator.
(e) Portable field station, transmitting CW, multi-operator.
(f) Portable field station, transmitting open, multi-operator.
(g) Home transmitting stations, emergency powered.
(h) Home transmitting stations, mains powered.
(i) Receiving stations.

3 Station Definition: A portable field station is one which operates from a power supply which is independent of any permanent installation. The power source must be fully portable, ie batteries, solar panels, wind or motor generators etc. A station located in an automobile and completely self contained, apart from antennas, is classed as being portable whether in motion or not.

4 Installation: No radio apparatus, including masts, antennas, feeder cables etc, may be erected on the site more than 24 hours before the contestant(s) begins operating.

5 Bands: All amateur bands may be used WITH THE EXCEPTION of the 10, 18 and 24 MHz HF bands.

6 Contacts: Cross band contacts are not permitted. Cross mode contacts are permissible, however they will count only as phone contacts for scoring purposes.

7 The size of any portable field station shall be restricted to approximately that of an 800 metrre diameter circle.

8 Multi-operator Stations: Such stations will provide a separate log for each band. Only one transmitter may be used on a given band at any one time, be it operating in a phone or CW mode. Only ONE callsign may be used from a multi-operator station.

9 Number Exchange: The exchange between stations will consist of a number/letter combination comprising the RS or RST report as applicable, followed by a serial number commencing with 001 and increasing by one for every contact. Should the number 999 be reached the series must then be re-commenced at 001. Following the serial number a letter must be added indicating the Section (a) through (h) in which the station is competing. eg Number sent by multi-operator station transmitting phone for the first contact would be 59001D.

10 Scoring

For Portable Field Stations. Contacts within Australia.

(a) Portable/Mobile outside entrants call area — 20 points.
(b) Portable/Mobile within entrants call area — 15 points.
(c) Home Stations/Section G outside entrants call area — 10 points.
(d) Home Stations/Section G within entrants call area — 5 points.
(e) Home Stations/Section H outside entrants call area — 2 points.
(f) Home Stations/Section H within entrants call area — 1 point.

Contacts outside Australia.

(g) Contacts with overseas stations, ie other than VK — 2 points.

For Home Stations/Emergency Powered. Contacts within Australia.

(a) Portable/Mobile outside entrants call area — 15 points.
(b) Portable/Mobile within entrants call area — 10 points.
(c) Home Stations/Section G irrespective of call area — 5 points.
(d) Home Stations/Section H irrespective of call area — 1 point.

For Home Stations/Mains Powered. Contacts within Australia.

(a) Portable/Mobile outside entrants call area — 10 points.
(b) Portable/Mobile within entrants call area — 5 points.
(c) Home Stations/Section G irrespective of call area — 1 point.

11 VHF/UHF Multipliers

For contacts made on frequencies from the 50 MHz band and upwards the QSO points score for each contact is multiplied as per the following table:

[illegible]	[illegible]
Under 50 kilometres	2
50 to 150 kilometres	5
150 to 300 kilometres	10
over 300 kilometres	20

12 Bonus Points

For any contact made using a 'Natural' Power Source a bonus score of 10 points may be added to the QSO points score. added A 'Natural' Power Source is regarded as one where power is derived from such as solar cells, wind, methane gas etc, as well as from batteries completely charged by 'natural' means. All power produced under this category must have been derived independently of

commercial mains or the use of petroleum derivatives.

13 CW Contacts CW to CW contacts earn double points. These points must be shown as claimed on the log sheet prior to the application of any multiplier or bonus points.

14 Repeat Contacts Portable Field Stations and Home Stations under Section G may contact other stations within these categories (Sections A to G) for repeat contacts provided that a period of at least 3 HOURS has elapsed since the last contact with the station concerned. Home stations operating under Section H may be contacted on a repeat basis provided that a period of at least 6 hours has elapsed. This applies for each band and mode.

15 Receiving Stations Stations in this section must record the serial number being sent by any of the stations operating in the contest within Sections (a) to (g) inclusive. QSO Points Scoring will be on the same basis as for Home Stations/ Section H as per Rule 10 above. VHF/UHF Multipliers and Bonus Points as indicated under rules 11 and 12 also apply.

16 Repeaters Operation through any active earth repeaters is not allowed for contest contact purposes, however, the use of such is allowable for the purposes of making contact arrangements. Contacts made using orbiting satellites or EME as a medium are acceptable.

17 Modes of Operation AM, FM and SSB all count as PHONE operation. RTTY and CW are regarded as being CW. It would not be expected that more exotic modes such as SSTV or Fast Scan TV would be used in this contest.

18 Log Format All logs shall be set out under the following headings and in the order shown. *Data, Time UTC, Callsign, Band, Mode, RST No Sent, RST No Received, QSO Points, Multiplier, Bonus Points, Total Points Claimed.* NB: The last three columns need only be shown where applicable. Contacts must be listed in order of time and serial number. Each log page must also carry a progressive Total Points Score Claimed at the bottom of each sheet.

19 Summary Sheet A summary sheet must be included which indicates the following details: *For each contact to which a multiplier is applicable the serial number of the contact and also details of the respective station locations which apply to the contact. Such details must include either latitude/ longitude references for each station or some satisfactory proof, by such as map reference or distance calculation, as to the distance over which the QSO was conducted. For bonus points to be claimed suitable evidence must be provided as to the method of natural power generation employed. Such evidence could take the form of a photograph of the generating equipment used or a signed statement by another amateur showing his callsign declaring that he has inspected the generating equipment referred to.*

20 Front Sheet Each log must be accompanied by a FRONT COVER SHEET which provides the following information: *Name, Address, Callsign, Division, Section, Number of Contacts, Claimed Score.* This sheet must also indicate station location, equipment used, power generating system employed and in the case of MULTI-OPERATOR stations a list of operators names and callsigns together with their signatures. This front sheet must also carry a declaration signed by a licensed operator as follows: *DECLARATION: I hereby certify that this station was operated in accordance with the rules and spirit of the contest. Signed* .....
Date .....

21 Multiple Station Operation In the case of operators who have entered the contest in the *6 Hour Single Operator Section* it is allowable for them, upon their return to their home station, to make contacts with portable field stations. For this purpose they must submit a separate log which will be regarded as a Check Log only. ie they cannot enter into more than one section of the contest for competitive purposes. Operators who are interested in providing more field day activity are however encouraged to adopt this practice where possible.

22 Certificates Certificates will be awarded to the winner of each section in both the 6 and 24 hour divisions of the contest. The 6 hour certificates cannot be won by the 24 hour entrants. The Contest Manager also reserves the right to award other certificates where the effort made by a particular station is of special worthiness in his opinion.

23 Disqualification The general 'Contest Disqualification Criteria' as published on page 44 of the Amateur Radio for August 1984 apply to this contest. It is again pointed out that you should read the above rules properly so as to understand them and ensure that your log does comply with the contest rules laid down. See particularly rule numbers 18, 19 and 20.

24 Log Submission Logs should be forwarded to the Federal Contest Manager, Box 1234, GPO Adelaide, SA 5001. The front of the envelope containing the log should be marked 'John Moyle Memorial Field Day Contest'. Closing date for entries is 5th April 1985.

REMEMBRANCE DAY CONTEST 1984

CONGRATULATIONS TO VK2 DIVISION — WINNERS FOR 1984

The 1984 Remembrance Day Contest was won by the VK2 Division. Listed as part of the results below are various statistics for your interest together with totals of Divisional scores and a complete listing of individual scores by call area. The statistics will allow a comparison of operations in the contest for 1984 compared with the entries in the previous year, 1983. You may be able to draw some conclusions from such figures, however, I personally shudder at the thought of anybody suggesting any other schemes to make the contest more equitable. A great deal of work in the past has gone into solving this problem and those who have attempted such are very much to be admired. Nevertheless, should you have any useful comment to make I would be pleased to hear from you.

It will be noted that the number of logs submitted as against last year is down (by 60) making a percentage participation drop overall from 4.56 percent down to 3.9 percent. This to my mind seems to indicate that even though the Remembrance Day Contest is our main national contest each year it really does not receive the amount of support it deserves. You might also like to ponder this fact whilst looking at the state by state figures. One of the tables of interest is the number of logs per mode, Phone, CW or Open. This indicates very clearly that phone is the mode most favoured. It is interesting to note that whilst the number of operators using CW exclusively decreased significantly the number operating in the Open section, and thus employing both modes, did increase. One wonders whether or not this backs the argument for double points for CW. Personally I do not accept that this is so as the CW operators in each contest are only competing one against the other, however, for the time being I will hold any further opinion on this and ask rather that you let me know what you think. Maybe some of the operators in the Open section could throw some light on this aspect.

Many complaints were received about the mistakes in the rules. Apologies are proffered in this regard and I would again point out that I did my best to correct same. I would hope that this situation will not exist in the future. Very few stations submitted 'dupe' sheets as called for, however I have not penalised anyone for this. I believe that such are not necessary except perhaps for stations which submit larger logs. In general stations submitting larger logs seem to do their best to provide a log of better than average quality thus showing some pride in their entry. There are always some exceptions and several logs have been disqualified. *Many* entrants did not seem to understand that Section (d) All modes, as shown in the rules, was in fact the Open Section in which one operates using a mixture of Phone and CW and that this section did not apply to an operator who simply used a transceiver which was capable of 'multimode' transmissions. This rule will thus be made much clearer for the next contest. With regard to disqualified logs I would like to make it clear that such were only disqualified after consideration by a panel deliberating on an independent basis and that in almost all cases the decision was unanimous. It may seem significant that no logs from VK5 were in this category. I hasten to assure you that the VK5 logs received extra attention on this score.

I would hope that provided I can convince the Federal Authorities of the need to make a standard log sheet available for contest purposes the use of same together with a properly printed Summary and Front sheet will go a long way to solving many of the problems encountered with logs. Harking back to the 'dupe' sheet issue, it may even be possible to have suitable sheets for this purpose printed up although I would believe that you should be expected to do something for yourselves and the sheets as described in the December issue of this contest column are really not too difficult for you to produce.

As intimated in last issues column I have already learned a great deal about handling quantities of logs from my experience of this Remembrance Day Contest and have been able to realise some of the mistakes I have made this time. As a result I would hope in future to be able to present results somewhat sooner than on this occasion. Due to the fact that the Novice Contest follows right on the heels of the Remembrance Day contest the checking of logs and production of results have been held up too. I should have those results ready in time for the March issue of the magazine. I would also hope that in the not too distant future the dates for our Australian contests will be on a much more rational basis and that will also help to solve many of the problems encountered time wise.

For your interest here are some extracts from letters received with log entries.

'I have never entered any contest before . . . I'll do better next time.' 3DVW

'I would suggest that all concerned have an early consultation and make sure the rules are cleaned up well before next year.' 2RP

'Many stations did not observe 15 minutes silence at the beginning of the contest.' 1RM

'I almost did not enter this year as a protest over the way the RD has been messed about over the last few years . . . I may sound pedantic but I refuse to use the term "full call" anybody can be that if they have enough 807s under the belt. HI.' 3WW

'I enjoyed the contest thoroughly as it is the only contest I enter because my mum's husband was killed in action in WWII . . . My husband Adrian is VK2DZF as he deserves a special thanks for taking care of our kids, from 5-14 years, getting the meals etc, so I cud enter the contest hi!' 2ELF (2DZF is obviously a real gentleman — FCM)

'Because of declining activity . . . bonus points for operation on say 21 to 30 MHz could be considered.' 2RJ

'Many thanks for a beaut contest.' 2BO

'You will note that there is no column provided to show the frequency band used . . . Several operators new to RD were confused about this point but I put them right.' 2AGF re sample log.

'Not to have to log RST as well as a number was also appreciated.' 5KEN

'I was most impressed with the good natured spirit of the contest.' 5ATN

'Enjoyed contest as always but condx on 15 m poor . . . 10 m hopeless as anticipated.' 4LT

'Things started OK, then at contact 018 the computer had a hardware failure (terminal), next the HF transceiver would not receive, finally traced to faulty relay. But luck was with me . . .' 3VT. (He had a spare relay and backup dupe sheets —FCM)

'I hope the sample logs dupe sheet material is not repeated again next year.' 3FR

'We noted that activity was considerably down on last years . . . had a fine time just the same.' Wickham Amateur Radio Club. VK6

Now to list some of the many comments regarding the six hour rule. These are in proportion as received in favour and against.

'I own only VHF gear and in previous years have found the RD to be a hard but very satisfying contest. This year . . . found the contest still hard work but very satisfying, hence would like to see the one hour rule re-instated.' 3BMV

'. . . For these reasons we ask you to either return to one hour between contacts or reduce the time from 6 to 2 hours.' 3CNE North Eastern Radio Group.

'I didn't think I would enjoy the contest as a Z call with the new 6 hour rule and nearly didn't enter. I did however and enjoyed what there was of it but the interest and challenge is gone. The only reason I heard for the 6 hour rule was that the city operator had an unfair advantage. As it's a state (Division) contest I don't see the logic in this as all states have cities. I wonder how many Z calls enter the contest and reside in the bush?' 1ZAR

'I wish to protest in the strongest possible way to the restriction of VHF calls to 6 hourly . . . I reside 180 miles from Sydney. The new rule has reduced my score — and involvement — to insignificant proportions. If you wish to deter VHF operators just leave the rules the way they are.' 2ZZX

'If this method is continued I feel it will make the Remembrance Day contest a non event.' 5ZBC

'Given that it needs to be more than one hour, possibly even more than two hours but surely not as much as six hours.' 3YRP

'. . . predominantly a VHF station, the new rule virtually eliminated any prospects for anything other than a fairly boring contest.' 3CGH

'I could not help feeling during the weekend that the people we remembered on this day would have been totally opposed to any rule restricting the activities of some of our amateur friends who were unable to operate on DX bands. As a result many 'Z' calls were very conspicuous by their absence on the VHF bands . . . so next year could we have a less restrictive rule . . . even at one hour restriction I'm sure none of the VHF contestants gave any of the section winners any kind of fright.' 4BNL

'Limited Licencees and to only a slightly lesser extent full calls were vocal in their criticism of the "6 hour limit" for local VHF.' 5EA

The final word is given by Harry VK6WZ who indicates that he is a little bashful about my quoting from his letters, however I believe it is worth it.

'I missed out for 20 years 1958-1978 because of family and business commitments when I gave everything to do with amateur radio away, except the callsign and licence, but I'm "back in business" now and retired (contradiction?) and mean to go on supporting this great once-a-year event till my key becomes officially and permanently silent.'

COMPETITION RESULTS

The formula for the determination of results for each Division is:—

Total Points/Total Divisional Licences multiplied by weighting factor.

VK1	5456/ 315	x	1.48	25.63
VK2	14959/4652	x	11.91	38.29
VK3	15207/4431	x	8.21	28.18
VK4	9578/2439	x	7.55	29.65
VK5	24380/1709)	x	1.72	24.54
VK8	448/ 160)			
VK6	13608/1324	x	1.54	16.06
VK7	4641/ 160	x	1.43	12.70

Note: VK8 points and licence totals added to VK5.

Statistical Data Comparison 1984 to 1983

1984	No of Logs	Total Score	Avg Score	Licences	% Entry

Logs listed below were not accepted for the 1984 Remembrance Day Contest for two or more of the following reasons:—

No Front Summary Sheet, No Declaration, No total Claimed Score Shown, Untidy or Illegible, Incorrectly Claimed Score.

None of these logs incur any other penalty prescribed under the general 'Contest Disqualification Criteria'.

VK1BM, VK2ZL, VK2BQO, VK2AXT, VK3BIT, VK3YNB, VK4ACC, VK4NUP, VK6YG, VK6WU, VK6IM, VK7RX, VK7WZ, VK7WZ.

A total of at least 24 logs were closely scrutinised for possible disqualification, quite a number of them being logs submitted by radio clubs. I can only indicate this as a warning chaps that you must improve greatly on the quality of the logs and other necessary data required by the rules of the various contests as in future a much stricter approach will be adopted by the Contest Manager.

THE WIRELESS INSTITUTE OF AUSTRALIA CW CONTEST

This contest was inaugurated to celebrate the 75th Anniversary of the formation of the Wireless Institute of Australia — the oldest radio society in the world.

It was considered that with the advent of modern equipment and methods, there was a need to further the ability of Morse knowledge, practice and skill.

This contest is not directed at speed but at promoting CW — the communication mode used by radio amateurs since the very first days.

A suitable certificate has been prepared but for this special year all logs returned by VK amateurs with more than 75 contacts will receive a specially prepared commemorative memento.

The overall VK winner will also receive the "FEDERAL PRESIDENTS CUP". This cup was first

Photograph by Ken McLachlan VK3AH

presented in the year 1930 to the "KEY SECTION WIA".

RULES

PERIOD 0000 UTC 10th MARCH to 2359 UTC 10th MARCH 1985
MODE CW-CW ONLY, single operator
CALL CQ 75 TEST
EXCHANGE RST+ 3 FIGURE SERIAL NUMBER
BANDS ALL EXCEPT 10, 18, 24 MHz
SECTIONS (a) FOREIGN — single band
(b) FOREIGN — multiband
(c) AUSTRALIAN — single band
(d) AUSTRALIAN — multiband.
OBJECTS FOREIGN — one contact per band with any Australian station.
AUSTRALIA — one contact per band with any other station.
POINTS 3 points for contacts on 1.8 and 3.5 MHz
2 points for contacts on 7 MHz
1 point tor contacts on all other bands
SCORING SINGLE BAND points on that band multiplied by the number of dilterent prefixes worked on that band. WPX RULES APPLY.
MULTIBAND as above for each band added together.
LOGS TO: CONTEST MANAGER, CW75, BOX 1065, ORANGE, NSW 2800.

COMMONWEALTH CONTEST 1985

WHEN 1200 UTC Saturday 9th March to 1200 UTC Sunday 10th March.

MODE CW (A1A) only in the 3.5, 7, 14, 21 and 28 MHz bands. Call is CQ BERU. The Commonwealth Contest is a single operator, single transmitter event.

Eligible entrants are radio amateurs licensed to operate in British Commonwealth call areas as listed below.

A Contest exchange consists of RST plus a three figure serial number commencing with 001 and increasing by one for each successive contact throughout the contest, irrespective of band in use. Serial numbers sent from non-competing stations must be recorded.

SCORING 5 points for each contest exchange 20 bonus points for each of the first, second, and third contact in each call area, as listed, on each band. Contacts with ones own call area do not count at all. Note that G, GD, GM etc are counted as one area.

LOGS Separate logs are required for each band showing columns

1 Date and time UTC
2 Station worked
3 RST/Serial number sent
4 RST/Serial number received
5 Band
6 Leave blank (for checking)
7 Contact points claimed
8 Bonus points claimed

Separate band totals should be added together and the total claimed score entered on a cover sheet giving particulars of station, QTH, equipment, power, antenna and a declaration that the rules and spirit of the contest have been observed.

It is important that logs are carefully checked for duplicate contacts. Unmarked duplicate contacts for which points have been claimed will be heavily penalized, and logs containing in excess of five will be disqualified.

Entries may be single or multiple band. Single band entries should claim contacts on one band only, but details of contacts on other bands should be submitted for checking purposes only.

Entries should be addressed to

AK GRAY G4DJX,
44 Sherwood Avenue,
St Albans Herts AL49PO, UK

Closing date 13th May 1985.

All entries become the property of the RSGB. In the event of any dispute, the ruling of the Council of the RSGB shall be final.

AUSTRALIAN AWARDS

1 An individual award to the highest VK scorer — a gold medallion.
2 A State Team award — 4 silver medallions to the state team of 4 which achieves the highest aggregate total. If the "individual" winner is a member of this team, he will receive the gold medallion instead of the silver one.
3 An award to the middle placing among VK entrants i.e. to, say the 27th placing among 53 or 54 entrants — a bronze medallion.

Note that there have been a number of additions to the call areas this year — ZC4 and 5B4, 9H and 9H4, VO1 and VO2, and ZL0 are now separate areas.

It is to be hoped that conditions have picked up a little by BERU week-end. Let us see if last year's record entry of 66 VKs (VK1-2, VK2-13, VK3-23, VK4-8, VK5-7, VK6-7, VK7-6, VK8-9-0 nil) can be improved on in 1985.

COMMONWEALTH CALL AREAS

The following call areas are recognized for the purpose of scoring in the 1985 Commonwealth Contest:

A2	Botswana
A3	Tonga
A5	Bhutan
C2	Nauru
C5	Gambia
C6	Bahamas
G/GB/GD/GI/GJ/GM/-GU/GW	
H4	Solomon Is
J3	Grenada

8P	Barbados
8Q	Maldives
8R	Guyana
9G	Ghana
9H	Malta
9H4	Gozo & Comino
9J	Zambia
9L	Sierra Leone
9M2	W Malaysia
9M6/9M8	E Malaysia
9V	Singapore
9Y	Trinidad & Tobago

* Due to recent changes in the New Zealand licence allocations ZL0, ZL1, ZL3, & ZL4 will count as separate call areas for the purpose of this contest

1985 CLARA AC/DC "MYSTERY" CONTEST

SPONSORED BY THE CANADIAN LADIES AMATEUR RADIO ASSOCIATION.

STARTS: 0000 UTC TUESDAY 28TH MAY, 1985.
ENDS: 0000 UTC WEDNESDAY 29TH MAY, 1985.

The AC/DC Mystery Contest is open to all YL and OM amateurs as well as SWLs. Each CLARA station may be worked twice, once on CW and once on PHONE, or same mode on two different bands. Exchange name, serial number starting with 001, RS(T), QTH and if a CLARA member. Three unidentified "Mystery" stations will be operating.

SUGGESTED FREQUENCIES: PHONE
28.488 28.588 21.300 14.160 14.280 7.150 3.775 3.900 MHz

SUGGESTED FREQUENCIES: CW
28.035 21.035 14.035 7.035 3.690 MHz

All contacts must be made in accordance with operator and station licence regulations. No net or list operations, no crossmode. No 10 m or 2 m repeater contacts.

SCORING: For the base score, CLARA members score one point per contact with non members (whether OM or YL), two points per contact with CLARA members, and three points for each CW contact.

NON-MEMBERS: For the base score count two points for each CLARA contact, three points for CW contacts. Multiply the Base Score Points by the number of Canadian Provinces/Territories worked for the total score. The Contest Manager will add ten points to the base score of each log for every "MYSTERY" station contacted.

AWARDS: CLARA MEMBERS:
1st place. "CLARA CUP" and certificate.
2nd place. Certificate.

NON-MEMBERS:
1st place. Plaque.
2nd place. Certificate.
SWL. Certificate.
DX station. Certificate.
All logs submitted are eligible for the Mini prize draw.

LOGS: Single log entry. Logs must show DATE/TIME UTC, BAND, MODE, CALLSIGN WORKED, REPORT AND SERIAL NUMBER SENT, REPORT AND SERIAL NUMBER RECEIVED, NAME OF OPERATOR OF STATION WORKED, QTH and points claimed.

LOGS MUST BE SIGNED. Logs also to show full name, callsign and address of operator, and show final score (points claimed not including mystery stations). Logs must be legible. No carbon copies. No logs will be returned. Decision of the Contest Manager will be final. Logs must be received by the contest manager before 15TH JULY, 1985.

CONTEST MANAGER: Muriel Foisy VE7LQH
RR#1, PENDER ISLAND, BC,
CANADA V0N 2M0

AR

USE OF DUAL CALL SIGNS

The Department of Communications does not wish to encourage this practice, but confirms that there are no basic objections to a qualified amateur holding more than one amateur station licence (call sign). It is stressed, however, that in such cases it is the amateurs responsibility to ensure that operation is in accordance with the conditions applicable to the class of licence in use.

AR

VIDEO TAPES — BETA

A reminder to all amateurs. Video tapes from the WIA Video Cassette Library are now available in the BETA format as well as VHS.

Full information for using the Video Library appeared in October AR, page 36 or contact the Video tape Co-ordinator, John Ingham VK5KG, 37 Second Avenue, Sefton Park, SA, 5083. **AR**

CLUB CORNER

CENTRAL COAST AMATEUR RADIO CLUB

AN INVITATION: All amateur radio operators, their families, friends and all interested in amateur radio are invited to attend the Club's 28th Annual Field Day on Sunday, 17th February 1985 at the Showground, Showground Road, Gosford, NSW.

REGISTRATION: Men: $4, Women: $2, Children 16 years and under: $1 (Includes morning and afternoon tea, event entry and outings).

FAMILY GROUPS: Mother and father plus two or more children 16 years and under together: $7.

PENSIONER CONCESSION: 50 percent on production of appropriate pensioner concession cards.

FOOD SERVICE: Tea, coffee and biscuits 08:00 — 17:00 hrs in the Dining Room at no additional charge. Takeaway food will be available in the Showground. You may bring your own lunch and avail of tea or coffee from dining room at lunch time.

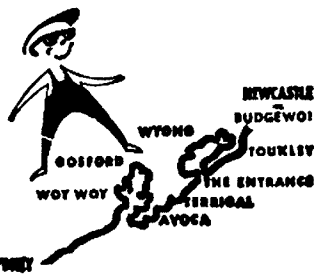
EVENT ENTRY: If you are planning to enter any radio event (including junior events) please fill in an EVENT REGISTRATION card. Cards will be available after entry to the Showground.

SCRAMBLE RULES: No operation in Showground or 1 km radius. No operation on Gosford repeaters or within 1 km radius of repeater sites. Log extract to "EVENT ENTRY REGISTRATION" before 10:00 showing time of contact, station worked, mode, band and full serial numbers. Incomplete or late logs are not eligible. Scoring 1 point per station per band regardless of mode. You may rework the same station on several bands.

OUTINGS: (a) Reptile Park (b) Bus Tour (departs 12:30). Obtain complementary tickets for either outing by presenting registration card to "TICKETS". Transport to and from Reptile Park is by private car. Reptile Park tickets are valid for any time of the day 17.2.85 only. Bus Tour tickets are limited to one bus load on a first come basis.

DISPOSALS: Obtain catalogue forms and lot numbers in advance of the Field Day from Bill Smith VK2TS, RMB 4525, Mangrove Mountain, NSW 2250 (phone after hours (043) 74 1207). Forms and lot numbers also available at the Showground on Saturday afternoon, 16.2.85. All items for disposals must be booked in before 09:30 17.2.85. Late arrivals or equipment improperly tagged or catalogued may be refused.

CENTRAL COAST



TRAINS: The following trains will be met by a special complementary bus at Gosford Railway Station: 07:15, 08:15 and 09:15 from Sydney; 07:47 and 09:03 from Newcastle. For return transport to station in the afternoon, contact "INFORMATION" at least one hour before departure time.

IF IT RAINS? The Field Day will be held wet or dry; there is plenty of shelter in the Showground.

CALLS PRESENT: Bring your QSL card for the "CALLS PRESENT" board.

PARKING: Off street at Showground. Please observe IN and OUT gates.

SPECIAL ATTRACTIONS: Trade Displays, Ladies Stall, Children's Events.

AR

NATIONAL PARKS (FUN WITH A GOAL)

The Mildura Amateur Radio Club set out for a fun-filled weekend of camping and radio operating — the goal set was to activate the National Parks Award. Participation and interest proved to be beyond our wildest dreams. Unfortunately, with the minimal research conducted, we found the award had not been active for some time. However, since then the award has been reactivated including a new park.

As said before, this activity raised a lot of interest, and the camp-out was so enjoyable it was decided to make the outing an annual event, on the Labour Day long weekend in March.

The camp on the banks of the Murray River, at a place called Chalker Creek, is not so hard to find if you turn off the highway at the Hattah Store and follow the signs. It's easy, as the Park Ranger found. We were confronted by a six foot individual in uniform — very official looking — saying *"Is this VK3BUR?"* Our first thought was *"What have we done wrong?"*, only to be congratulated on keeping a tidy camp. It was at this moment he made a monumental mistake and asked if we had any rubbish. We then proceeded to place truckloads of full rubbish-bags into the back of his four wheel drive, and he hasn't been seen since.

One essential for a successful camp is a raging great camp fire and ours was no exception, with a communal hotplate. After the noon meal, we set out fishing. The evening brings a satisfying meal and a lot of conversation around the campfire.

You might ask one question — *who operates the radio, and when?* Well, whoever feels like it, and when someone relinquishes the operating chair. The frequencies used are 40 metres during the daytime, 80 metres at night and channel 50 on 2 metres for directions to incoming parties to our camp of merriment.

Obviously our club alone cannot offer award-seekers a large amount of assistance, but if other clubs were to participate in similar activities it would make a near impossibility a reality.

So, the obvious thing is we would like other clubs to participate finding the closest mutually agreeable National Park and operating from that location. Details of the award are available from the WIA Vic Div or see page 42, August 1984. Any individuals wishing to participate are more than welcome to join us at Hattah National Park. An amateur call sign is not necessary to participate. Non-licensed operators will be supervised by licensed amateurs using the club call VK3BUR.

Any further enquiries relating to the weekend can be directed to — David Norris VK3DWN, PO Box 231, Mildura, Les VK3BPW, Marlene VK2KFQ, Ron VK2EFJ or Maurie VK3CWB.

* See Awards column on page 40 for an update of the National Parks in VK3.

CAIRNS AMATEUR RADIO CLUB

For amateurs in the Cairns area of Queensland please note that the Cairns Amateur Radio Club meets on the second Tuesday of each month except January when there is no scheduled meeting.

At a recent Annual General Meeting, Colin Swinburn VK4EX was re-elected President and Anne Benson VK4FAB was re-elected Secretary.

Monthly meetings are held in the State Emergency Service building, McNamara Street, Cairns at 8 pm.

Secretary
AR

THE SEVENTH ANNUAL GOLD COAST ARS HAMFEST

This function is held annually to raise funds for the building of the Society's Club Rooms and Headquarters, which have now reached the stage of having the roof put onto the building.

The Hamfest raised over $700 and was attended by between 600 and 1000 persons, including several overseas amateurs.

A very good media coverage of the Hamfest and amateur radio in general was given by the Gold Coast Bulletin by their feature journalist John Dwyer.

Prior to the Hamfest the GCARS received two generous donations — for the building fund — $3000 from the QEII Jubilee Trust for Young Australians because of the Society's interest in training youth, Girl Guides, Scouts etc in communications and for upkeep of the repeater station — $200 from the Gold Coast City Council.

Contributed by Bill Stevens VK4YN
President.
AR

TOWNSVILLE ARC

Late last year the TARC elected office bearers for the next twelve months. President is Bob Mann VK4WJ and Secretary is Arnie Katarzynkski VK4JXZ.

AR

GYMPIE ARC

See cover photograph

On Sunday the 25/11/84 it was working bee day at the repeater site of the Gympie Amateur Radio Club at Boulder Mountain, 20 km SE of Gympie.

The club has been operating a 2 metre repeater on the site for one year and recently finished construction of a 70 cm repeater for the site.

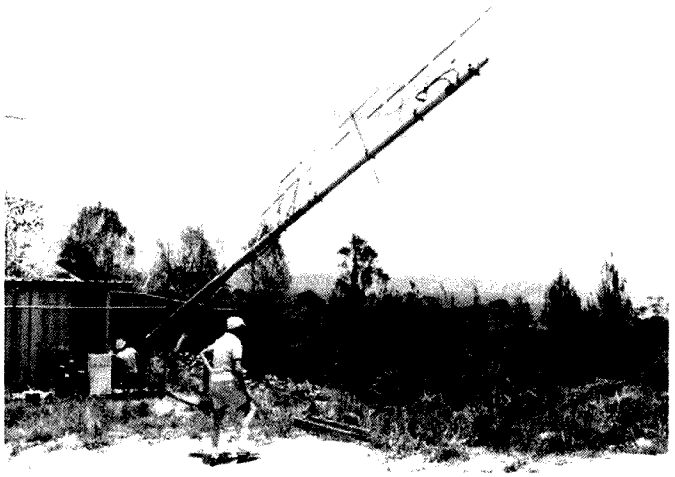
It was decided to extend the height of the metal free standing tower another 6 metres to allow for the extra antennas and separation.

A special hydraulic ram machine was made by one club member for the lowering of the 15 metre tilt over tower and it was with a great deal of enthusiasm members left Gympie on the 28 km drive to the mountain.

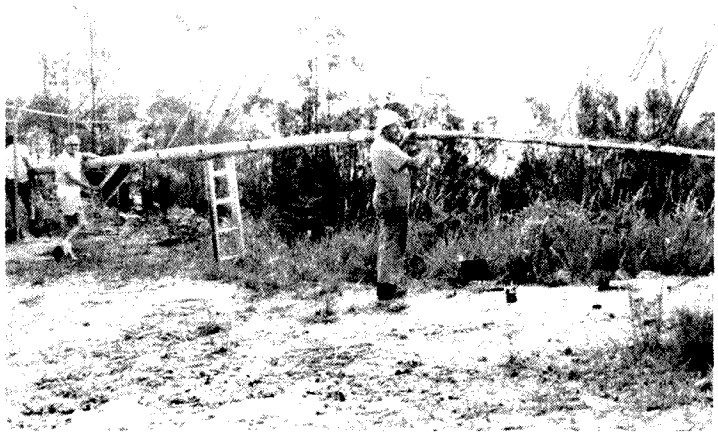
The Hydraulic lifter in place to lower the tower.

Upon arriving, we removed the 70 cm test antennas and proceeded to gingerly test our lowering device. All went well and within 10 minutes of arriving, we were working on the antennas.

With the extension in place, the 2 metre colinears



Harry VK4KHG supervising the final lowering of the tower.



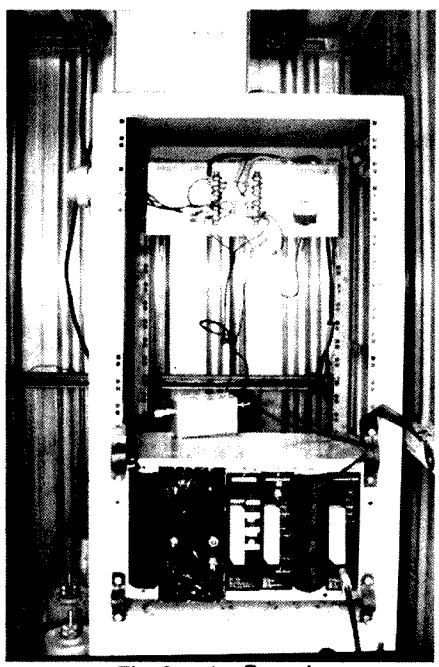
Working on the tower.

were given a little extra separation.

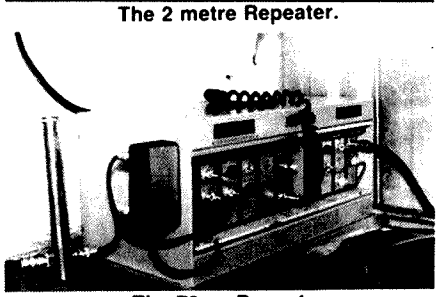
The site is quite isolated so the only power on the site is from solar energy, and the club is using a solar panel with an output of 2 amps maximum charging a 200 AH 12 volt battery.

The solar panel was mounted on the tower also, so that it would be uneffected by shadows.

The 70 cm antennas were home-brew coaxial colinears, sealed inside fibreglass fishing-rod blanks, and were mounted on 50 cm stand-offs. These were clamped to the tower at 10 foot vertical separation, and 2 runs of heliax installed in place. Everything was clamped up and the hand pumping of the lifting gear commenced. Within 10 minutes the tower, now with an all up height of over 65 feet, was again vertical.



The 2 metre Repeater.



The 70cm Repeater.

The coax was first connected to the 2 metre unit and was checked. All was as before. Then the 70 cm coax was connected to the Philips SC-9, through the GaAsFET pre-amp, and with a bit of tuning, was found to be performing very well, with little or no desensing on the input signal.

To date, regular callers as far as Surfers Paradise (250 km) to the south and Bundaberg to the north (160 km) have been working through the 70 cm repeater, and performance has been at least on par with the 2 metre repeater.

In future projects, the Gympie club is looking towards the possibility of a beacon of some type, but at this stage it is only a pie in the sky, not an antenna.

Story and photographs contributed by Tony Clarke VK4AJB

FORWARD BIAS

VK1 DIVISION

Ken Ray
PO Box 710, Woden, ACT 2606

This month, as in every February, the VK1 Division will hold its annual general meeting. This will be on Monday, 25th of February, commencing at 8pm in the Studio room, Griffin Centre, Bunda Street, Civic. Anyone who wishes to nominate for a committee position should contact Alan Hawes, in his role as Public Officer, soon. Alan can be contacted on 58 8115 (BH) or 58 2568 (AH).

VHF BEACONS

The VK1 2 metre beacon has been reinstalled at its Mt Majura site, to the north-east of the centre of Canberra, operating on a new frequency of 144.410 MHz. It runs 10 watts into a "halo" antenna, and identifies as VK1RTA. The 6 metre beacon, on 52.410 MHz, will hopefully be installed at the same location in the next month or two. Any reception reports would be greatly appreciated, either via the QSL bureau, or direct to PO Box E46, Queen Victoria Terrace (or QVT), Canberra, ACT 2600.

AOCP AND NAOCP CLASSES

Provisional dates for the start of this year's classes are: AOCP: 7 February
NAOCP: 5 February

These will be held in the Griffin Centre, the same as last year.

FIELD DAY CONTEST

Once again, VK1WI will hit the airwaves for the annual John Moyle Field Day Contest. Previous year's efforts have been reasonably successful, as well as being a good way to demonstrate our hobby. If you would like to assist with the running of this station, contact any of the committee. It is good fun, so if you haven't tried a field day activity before, why not give it a go?

AR

VK2 MINI BULLETIN

Tim Mills VK2ZTM
VK2 MINI BULLETIN EDITOR
PO Box 1066, Parramatta, NSW 2150

A new year also is the start of a new Divisional year. This month we call for nominations for next year's Council as well as agenda items for the AGM. The closing date for both is 27th February at the Divisional Office, 109 Wigram Street, Parramatta. Council nomination forms are available from the office. The following week is the production and enveloping of the annual report, notice and business paper for the AGM and hopefully the ballot papers for the election. I say hopefully an election because as mentioned in last months notes the Division has not had sufficient Council nominations to require one for some years. The AGM will be held on Saturday afternoon the 30th March.

27 Feb — Close of Council nominations
Close of AGM agenda items
30 March — Annual General Meeting.

REMINDERS

Don't forget the John Moyle National Field Day on 23/24 February, help VK2's score. In March the programme is starting to fill up. Besides being the 75th year of the formation of the Institute in March 1910 it will see the running, by the Orange Amateur Radio Club, of the State Fox Hunting Championship as a forerunner to the National Event in VK1 later in the year. Write to OARC at PO Box 1065, Orange NSW 2800 for details.

The next Conference of Clubs will be held over the weekend 13/14th April in Sydney. Business will include the usual Club submissions, together with discussion on agenda items for the Federal Convention. As part of the weekend the annual Dural fireworks evening has been scheduled for Saturday evening at VK2WI.

A reminder that the best way to be up to date and informed on events and happenings is to listen to one of the Sunday broadcasts. The printed lead times (the majority of these notes were written last year) means that we have to know well in advance what is happening. At the same time we can only put on the broadcasts those things that we know about, so club publicity officers and all amateurs, if you have something that you think others should or would like to know about then write up the item and send it via the Divisional postal address. If you prefer, a cassette tape (up to 3 minutes) may be submitted. Dates for your club events are also required for the AR Event Calendar.

WICEN

Coming events for WICEN will be the annual Co-ordinators Conference to be held in Sydney on the weekend of 23/24 February. There is the annual caving exercise in March. Annual dues to WICEN became due on 1st January. Reminder notices have been sent. For further information about WICEN check in on the Thursday evening Sydney net on repeater VK2RWS 7150 at 9 pm, or drop a line via the office for some printed details.

FIELD DAY

The first post-war Divisional Field Day was held at the Wyong Golf Club on Sunday the 26th January 1947. The programme for the day was to meet at the Club by 11 am for golf, tennis, table tennis and a novel Morse receiving contest. Then there were 2 sessions of luncheon. The afternoon was a 7 Mc (MHz) hidden transmitter hunt with the day ending with afternoon tea at 4.30 pm. Trains from Newcastle and Sydney were met. The cost for the day was 7/6 (75 cents) per head and included food, beer (18 gallons) and soft drink. It appears that the day was very successful for the 85 who attended. The Morse receiving contest 'provided a great deal of amusement' and the transmitter was so well hidden that it was not found in the prescribed time.

Twenty eight years on the tradition continues when the Central Coast Amateur Radio Club hold their Field Day at the Gosford showgrounds. With an invitation to all, the packed programme of events gets underway at 8 am on Sunday the 17th February 1985, and concludes with prize giving at 4.15 pm. There is good cover at the showgrounds so the event is held regardless of the weather. A copy of the full programme may be had by sending an SAE to CCARC, PO Box 238, Gosford NSW 2250. The entry fee is $4.00 for OM, $2 for XYL and $1 for harmonics. Family at $7. Pensioner concessions are available. Tea, coffee and biscuits available through the day, event entry and outings included in registration fee.

There is an 'Open Mobile Scramble' on the way there between 7.45 — 8.15 am. Once there the radio events are a range of short and long Pedestrian Fox Hunts on 2 metres, sniffers required, in both AM and FM modes. There is the usual range of commercial displays and trade tables, ladies stall and children's events. The Disposals is on as usual, but remember to obtain lot numbers in advance from Bill Smith VK2TS, RMB 4525, Mangrove Mountain, NSW 2250 or phone after hours 043 74 1207. The trains will be met and bring your QSL card for the 'Calls Present' board. Further details and reminders will be given on the Divisional broadcasts.

CENTRAL COAST AMATEUR RADIO CLUB
28th ANNUAL FIELD DAY — Sunday 17th February
Gosford Showground.

TWO UP

Recently in Melbourne, a driver came alongside me as we pulled up at an intersection.

He gave me what I mistook to be the two-finger salute and I thought "what a rude man". So I returned it!

We met up again at the next set of traffic lights by which time his passenger, presumably XYL, had scribbled out his call-sign on a card which he held high out the window along with his mike stretched to the limit!

Then the penny dropped. He'd seen my small whip and the call-sign on the back of the van and was asking me if I could come up on TWO METRES!

How naive can you get? Perhaps I could be excused though because I wasn't into two metres then.

Contributed by Alan Campbell-Drury VK3CD

AR

AMATEUR POPULATION IN CANADA

As of the 24 August 1984 the breakdown of amateurs in Canada is as follows:

British Columbia — 3916, Alberta — 1928, Saskatchewan — 791, Manitoba — 791, Ontario — 8633, Quebec — 4016, New Brunswick — 722, Nova Scotia — 1118, Prince Edward Island — 206, Newfoundland and Labrador — 456, Yukon Territory — 51, and Northwest Territories — 69, for a total of 22,697 amateurs in all.

The Amateur Service is growing, but only by 3-4% a year. Total amateur population for 31 March, 1983 was 21,822, for 31 March, 1982 was 21,225.

from The ARRL Letter — Vol 3, No 22

AR

Unfortunately there are no Ionospheric Predictions this month due to the Holiday Season.

VK3 WIA NOTES

Jim Linton, VK3PC
DIVISIONAL PRESIDENT
VK3 DIVISION

VICTORIA 150

VK3 BEACON FREQUENCIES

FREQ. IN MHz	CALLSIGN	LOCATION
52.330	VK3RGG	Geelong

432.435	VK3RMV	Hamilton
432.530	VK3RGG	Geelong
432.425	VK3RMB	Ballarat

A completely integrated education service is now provided through WIA Victorian Division.

Following the decision last year by the Department of Communications to have quarterly theory exams, the WIA classes were restructured. Education Officer, Fred Swainston VK3DAC scheduled both the Novice and AOCP thoery and Morse classes so they would run six months, ending in time for the DOC exams.

This has made it possible for someone to start in the Novice classes, pass the exams, then move straight into the next AOCP class. The previous practice of having theory classes run nine or twelve months has been proved unnecessary — and the same amount of theory is being taught by slightly extending class nights.

Family and work commitments had also made it impossible for some aspiring radio amateurs to attend night class for up to twelve months.

Morse classes run by Ron Cannon VK3BRC are popular with not only the WIA theory class students attending. Novices who want to get their CW speed up to the AOCP level and Limited Call holders wanting a K-Call and Full Call are also taking advantage of Ron's excellent tuition.

Theory revision weekends, pioneered by Fred VK3DAC, are held just prior to the DOC exams, giving candidates an opportunity to brush up on their theory knowledge.

The VK3 Division also has a range of theory text books at discount prices for members.

Revision weekends:
Novice — 2nd and 3rd February.
AOCP — 9th and 10th February.
Classes commence:
Novice — 26th February.
AOCP — 25th February.
To enrol or for further inquiries, contact:
Education Officer,
Wireless Institute,
412 Brunswick Street,
Fitzroy, Vic 3065 or
Phone (03) 417 3535.

FEDERAL CONVENTION

Work has begun in preparation for the WIA Federal Convention to be held in Melbourne on the weekend of 26th-28th April.

This convention is the coming together of representatives from seven WIA Divisions to consider national and international matters affecting our hobby.

At the 1984 Federal Convention this Division put up twelve policy motions which were passed. These covered a range of topics, including WARC bands, Packet Radio, RTTY Speed, the WIA Federal Tapes, Special Callsign Prefixes, Certificates of Proficiency, the Call Book and AR Magazine.

Any Zone, Club or individual wanting to suggest a VK3 motion for this year should contact the Federal Councillor, preferably in writing, complete with supporting argument, and not of a subject already rejected by an earlier Federal Convention, unless it adds something new.

For example, suggestions of increased Novice allocations and operating privileges have been fully discussed, but not supported at Federal Convention.

MEMBERSHIP SUBSCRIPTION RENEWAL

Renewal notices were sent to members in October/November, and if you haven't paid please do so immediately.

This Division has the highest number of WIA members numerically when compared with the other Divisions. The Vic Div Council believes this situation is due to the strong active role VK3 plays in Institute affairs, and the value-for-money service it gives to members.

YOUR SUBSCRIPTIONS — AN EXPLANATION

Why has the membership subscription gone up and why is VK3 dearer than other divisions?

This double-headed question has been put to several Vic Div Councillors by members since the membership renewal notices were posted.

The WIA like everyone else is faced with cost increases — postage, power and municipal rates are just a few. Putting cost increases aside, there are many other good reasons why fees have gone up.

Looking at the Division's financial situation it can be seen we have no debts, own the Wireless Institute Centre, but we are in need of money to get things done.

During 1984 $10,000 was spent on maintaining and upgrading the network of more than 30 VHF/UHF repeaters and beacons in Victoria. This network is vital to enable the Amateur Radio Service, through WICEN, to play its rightful role in disaster preparedness, and at the same time is part of amateur radio in the 1980s.

Repeaters are but just one of the capital works projects being tackled in Victoria.

The weekly broadcast through VK3BWI is due for new equipment, and it's planned this year it will get a modern operating console.

A WICEN control centre and the broadcast studio will also hopefully share a new suburban site later this year enabling further improvements from VK3BWI as a service to all of which radio amateurs can be proud.

A minimum of maintenance has been done on the Wireless Institute Centre and 1985 will see refurbishing work undertaken within restraint of our budget.

About $2 of your subscription will be used on public relations and membership recruiting activities during the Institute's 75th Anniversary year.

Our hobby is international and through the International Amateur Radio Union the WIA contributes financially and participates in matters affecting the Amateur Radio Service.

Negotiations with the Department of Communications cover every aspect of amateur radio in Australia.

As a member you know the WIA represents the radio amateur at a local, national and international level.

However you deserve an explanation of why (apart from cost increases and the capital works projects) the subscription rates are higher than other Divisions.

It's not possible to simply compare the various fees without considering the free services and level of service provided by your Division.

We have a free QSL bureau service to members — others charge their members on every card handled.

The Victorian Division pays the licence, insurance, power and site costs of most repeaters.

The Divisional Headquarters is open five days a week to handle book sales at a discount price, disposals sales and membership inquiries.

We maintain a library of reference books, magazines and publications of interest to radio amateurs and shortwave listeners.

Members from throughout the Division take advantage in person or by mail of the photocopying facility for published articles and circuit diagrams.

If you live in one of the six WIA country zones, part of your subscription goes in funding local activities through Zone committees.

The Vic Div Council considered all aspects when setting the fees to finance the Division in 1985 and for the future.

I'm sure you'll agree WIA membership which costs 75 cents a week (even less for pensioners, students and family members) is value for money in terms of service provided and as an insurance policy for your hobby.

VICTORIA 150

As previously announced on the VK3BWI broadcast and through various nets — Victorian radio amateurs can use the alternative prefix VI3 until March 31.

Following representation from the WIA, the Department of Communications approved use of the prefix as part of the Victoria 150 celebrations.

The commemorative callsign VI3WI has been highly successful and continues to be activated by various WIA zones and member clubs.

If you intend to use the VI3 prefix, remember your QSL will be sought after so in the best interests of Australia's image overseas plan to have a card bearing the special prefix.

Keith Heemskerk VK3AIH using the callsign VI3WI from Victoria's birthplace, Portland, on the state's birthday, 17 November. He shared activation of the commemorative callsign with others in the Portland area, Jack Heaver VK3VNQ, Ray Elliot VK3LK, and David Armstrong VK3XJP.

ATTENTION RSL MEMBERS

The hobby of amateur radio is going to be promoted among returned servicemen and women.

Already four WIA members, who are also Returned Services League members, have volunteered to help with this project, but more RSL members are needed to make this special effort a success.

To enlist in this project, aimed at helping returned servicemen and women join the ranks of radio amateurs — submit your name to the WIA Public Relations Officer, 412 Brunswick Street, Fitzroy, Vic 3065.

AR

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

Back in December I mentioned the history of the WIA which Marlene Austin VK5QO had compiled for this Division. Council decided that one means that we had at our disposal to thank Marlene was the ICS Award, which for the December quarter, is for services to amateur radio. The only problem was, how to get Marlene to the Christmas meeting in order to present it to her. We enlisted the help of her OM Brian VK5CA and also Joy VK5YJ. I'm not sure when Marlene started to get suspicious, but even Joy inviting both of them to tea and then suggesting that they go on to the meeting from there (after tea had been eaten) was to no avail. However, it was presented to Marlene later that same week when President Dick Boxall VK5ARZ and I took it up to their QTH. A start has been made on copying the original manuscript so hopefully it won't be too long before it can be viewed by everyone, and copies will also go to Federal Office, the State Library, DOC, etc.

JUMPED THE GUN

Also back in December I made comments regarding a new broadcast announcer. Apparently I was a little previous with my news as things were still being negotiated and had not, as I thought, been finalised. My apologies to anyone who might have been embarrassed by this.

CLUBS

Club news this month comes from the South Coast ARC my thanks to President John Gill VK5AJG for copies of their interesting newsletter "SCARCHAT". Club meeting nights are the first and third Thursday every month, at 12 Baden Terrace, O'Sullivan Beach, the kettle is always boiling, visitors are welcome — BUT — *"prospective members they positively embrace"* (sounds like a very friendly club!) Club Secretary is Graeme Langshaw. The club net, known as the Southern Vales Net, is on 3.595 MHz +/-, at 0930 UTC — every Tuesday. Their Southern Vales Award can be yours if you QSO with 10 club members (or 8 and the club station, which counts double).

The Port Adelaide ARC have also sent me an update on their information. The President is Donald Hobbs VK5AS and Secretary/Treasurer is Harry Hillard VK5PIH. Club callsign is VK5APC and a net is held daily on 28.440 MHz at 7.00pm local time. Meetings are alternate Wednesdays at 7.30pm local time, at 155 Hart Street, Glanville.

DIARY DATE

General Meeting — 26th February. The speaker will be Ted Dobrzynski (from the Walkerville Car Club, and organiser of many of the major car rallies) who will speak on "Map Reading and Navigation".

AR

WA BULLETIN

Fred Parsonage VK6PF
Acting Secretary
Box 10, West Perth, WA 6005

Since the arrival of the 1985 subscription renewal notices, there has been many queries as to "where the money goes". To attempt to show how the subs are divided, note the table headed Subscription Rates and Joining Fees 1985 in Amateur Radio dated December 1984.

Briefly, this shows that for WA the basic rates are:

Full Member	*$31.50*
Associate	*$30.50*
Pensioner	*$24.50*

Unfortunately the table fails to show a breakdown which is:

Federal		*$12.27*
Amateur Radio		*$11.76*
IARU		*.47*
	Total	*$24.50*

Which leaves the Division:

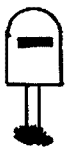
Full Member	*$7.00*
Associate	*$6.00*
Pensioner	*$0.00*

From this the Division places 50 cents per member into a contingency fund for WARC 99 leaving:

Full Member	*$6.50*
Associate	*$5.50*
Pensioner	*-50*

There has been no increase in the Divisional portion of the subs for four years and in this time we have absorbed the Federal increase twice and passed it on in the other two.

AR



LETTERS TO THE EDITOR

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publisher.

MURPHY STRIKES

I note an error in my article "A Horizontal Loop Antenna" (Dec AR) due to incorrect conversion to metric measurements by the Technical Editor. In the article in the first column I read — "The poles are at each corner of the yard which is about **28 metres square** thus giving a loop of about **112 metres total length**" — The remaining measurements are near enough but the above could cause confusion.

The measurements should have been 18.3 metres square and 73 metres total length.

Best regards
Bruce Hannaford VK5XI
57 Haydown Road,
Elizabeth Grove, SA 5112
AR

THANKS FOR JOTA

Thank you once again on behalf of all members of the Girl Guide Association of Australia for assistance given by members of the Institute during the 27th Jamboree on the Air.

All may be assured that members contribution to this major event in the Girl Guide year is appreciated by all of our members who took part.

Yours faithfully,
Mrs WP (Irene) Daniel,
Australian Guide Liaison for JOTA.
4 Cypress Drive,
Cypress Gardens, Qld, 4217
AR

FEELING PROUD

Thanks for the fine effort of all the people who give so much each year to us, the radio amateurs, through the excellent journal.

One feels proud to be a member of such a prominent organisation that has done such magnificent work, in particular for the novice cause and with the government bodies for radio in general.

James McLeod VK2LVQ,
43 Westbrook Street,
Beverly Hills, NSW.
AR

EMC VERSUS AMATEUR RIGHTS

Dave VK2BBT (letter September 1984) cautions against the view that being in the right is all that matters and that anything which degrades a good public image should be avoided unless there are powerful arguments for it. I can appreciate the idea that we live in a community and must balance our rights but what is the result?

A survey by RSGB of amateurs in the London area showed a quarter had voluntarily given up HF operation because of EMC problems. Did they give up their operating rights to give our hobby a better image or because others exercised their rights and amateurs were prepared to give them up? Should we amateurs give up our right to erect an aerial mast on our own property because neighbours complain and we don't want them or council to have a bad image of us?

Sometimes compromise is possible but many times the new amateur is intimidated by the situation or an amateur just does not want the hassle of the approaching conflict and is forced to give up the hobby.

If we cannot freely exercise our right to enjoy this hobby then for all practical purposes we will end up with no rights or rights which can be unjustly suppressed. We should not be deflected from paths which increase the diversity and breadth of our hobby. The higher power being proposed for AOCP is within the rules for amateur radio as laid down by the ITU. It is yet another extension to the capability and diversity of our experimenting and communicating endeavours.

The USA, having the same EMC problems as Australia, is a place where the power level of 1000 W has been part of amateur radio for over 80 years. Based on this experience, amateur operators via ARRL and the licensing authorities via FCC did not hesitate to introduce still higher power levels for all amateur radio classes in the USA. The Novice power level rose from 75 W input to 200 W output (more CW output than permitted to an Australian holder of the AOCP!) and all other licence classes were raised from 1000 W input to 1000 W output CW and 1500 W output SSB.

73, **Sam Voron VK2BVS,**
2 Griffith Avenue,
Roseville, NSW, 2069
AR

HIGHER POWER

Neil VK6ANB, re your letter October 1984. You reported that several amateurs within a 3 km radius appeared to have broad signals and that increasing AOCP privileges to 1000 W CW, 1500 W SSB as used in the USA would broaden signals so much that only one could use the band at a time.

It sounds like the problem is one of overload in your receiver. In fact a 30 W or a 1500 W signal should occupy the same bandwidth.

A product review on the receiver in the FT102 (QST October 1983 page 44) demonstrates that the bandwidth of a signal is dependent not on output power level but on receiver performance.

From a listening test two blocks from the "high power onslaught of W1AW" (the ARRL HQ station, presumably using their full 1500 W) came these results *"No problems were noted when the preamplifier was not in use. In fact I was able to copy weak signals within 5 kHz of the W1AW frequency."*

73, **Sam Voron VK2BVS,**
2 Griffith Avenue,
Roseville, NSW, 2069
AR

HIGH POWER PERMITS

I wish to express support for the view of Neil Basden VK6ANB and others regarding high power licences as proposed by Sam Voron VK2BVS.

Licences are issued for the purpose of experimentation with radio communication on the amateur bands. In keeping with this, if communication cannot be established with another part of the globe, a number of remedies can be tried. These would include different bands, antennae, and/or modes of transmission. In certain circumstances, high power transmission can be useful as an experimental technique, and a permit can be obtained for this from the Department of Communications.

Amateur radio is not about the establishment of global third party traffic nets. If this can be done within the limits of existing licences, to the public benefit, (ATN, WICEN, etc) well and good. However, except in emergency, amateur radio is not a vital communications link and the potential threat to low-power band users is far too great to allow large numbers of high power transmitters on air.

If the traffic to be sent is vital enough to require absolutely reliable global transmission, amateur radio is the wrong medium. Telecom and OTC exist purely for such traffic and if the traffic should be handled by them, don't clog up the already congested amateur bands with it.

Yours faithfully,
Colin de Kantzow VK2JCD
42 Nelson Street,
Gordon, NSW, 2072
AR

ATTENTION ALL AMATEURS — ESPECIALLY THOSE INTERESTED IN WICEN

During the WICEN involvement with the Alpine Car Rally in November, I had discussions with Mr Tom Snooks of NSW. Tom is a partner with Mr Hans Tholstrup, both of whom are organising a Safari from Melbourne to Darwin on 24th to 29th August 1985 with motor vehicles consisting of trucks, car, cycles, four wheel drives, etc.

The proposed route is via: Mildura, Broken Hill, Birdsville, part of Simpson Desert, Alice Springs, part of Tanami Desert, Katherine to Darwin. This route will avoid main roads as much as possible but seems accessible to 2WD vehicles.

In the time allotted it is obviously a fast journey with long driving hours — an endurance test at least!

I asked his opinion about a possible WICEN involvement for ongoing communications, and although expressing surprise at the suggestion thought the idea first class. This letter is to sound out amateurs in all states, particularly WICEN groups, for their thoughts on the matter, thinking along the lines of a series of portable and perhaps mobile points along the route, to pass progress, and other information during the trial.

If such could be organised, and I'm sure it could be, it would provide a unique and valuable exercise demonstrating the effectiveness of amateur radio from bottom to top of Australia in conditions removed from fixed home locations.

At the same time the interest in visiting some of the remoter areas in the Centre and Northern Territory, should have considerable appeal.

I do not wish to organise such an undertaking, but am able to offer considerable assistance, and would be willing and able to go to any part of the route.

Is my idea interesting, or in dreamland?

Could this letter provoke some answers via the magazine?

73, **Keith Scott VK3SS,**
34 Henry Street,
Maffra, Vic. 3860
AR

BROWNIE MORSE

Early in March 1984, in course of conversation, the possibility of teaching practical Morse to a Brownie pack became the subject. The Brownie/Guider, Mrs Nelson, considered it could be a very good challenge for the first Brownie Pack.

The group consisted of quite a number of young girls, only four decided to go the distance.

One night per week was available, and for one hour only. The standard aim was for five words per minute, sending and receiving under novice conditions laid down in the DOC Amateur Handbook. However, as I believe in letter speeds of not less than ten words per minute, I used a double barrel method.

The results were fascinating, as while they could handle the computer style slow speed spacing and letter formation, they did not like it at all.

Around October we went to two periods per week of approx 45 minutes, and finished in early November.

As their letter recognition speed was amazing, it became greater than their ability to write. There is a message in here somewhere in relation to cursory script or block letters as against running hand.

However, the final result was that three girls completed the course at 5WPM in fine style. (One unfortunately lost interest in the last month.) The exercise was immensely rewarding to me, the girls enjoyed it, and it was an association that I will remember for the rest of my life.

As an OLD TIMER may I suggest that other old pre-war amateurs try this as it is quite the most

From left — Bill VK3XC, Karen Little aged 11, Kellie Adcock, 11, and Melissa Humphrey aged 10½ years.

refreshing thing I have done in years.

Mrs Nelson took them on a visit to OTC where the operators really opened their eyes to traffic speed.

The girls presented me with a beautiful book as a token of thanks.

C (Bill) HOLLAND, VK3XC.
Box 12,
Maryborough, Vic, 3465.
AR

Footnote: Bill would be interested to compare notes with others on this subject.

RIGHTFUL RECOGNITION — BUT . . .

In an article on p. 14 of 'AR' for December 1984 titled "Cyclone Tracy — 10th Anniversary", the author, Jim Linton, VK3PC, rightly recognises the efforts of some of the operators who participated in the WICEN National Net for Darwin.

The dedication displayed by 'Slim' Jones VK8JT, is recognised and praised by all those who operated with him during this epic network.

The author has given his version of the operational details of the net. However the true version based on the facts, is as follows:

1 The first amateur radio signals to come out of Darwin were transmitted at 250001 UTC by VK8RR, Bob Hooper, the manager of the OTC communications facility which was completely destroyed.

2 Many amateurs in five states were on the air between 250001 and 250115 UTC to contact and help Bob who was describing the general destruction.

3 The WICEN National Net for Darwin was activated at 250115 UTC by the Cairns controller of the North Queensland WICEN group [VK4YG] in response to an appeal by Bob, VK8RR, for an urgent message to be passed to OTC HQ in Sydney concerning Darwin Radio, VID.

4 Nth Qld WICEN arranged for the Cairns OTC manager, VK4VI, Keith Parker to talk to Bob and swift action resulted in the restoration of VID Darwin Shipping Radio using equipment on board the MV 'Nyanda' in Darwin harbour.

5 At 250230 UTC, VK8OM, Owen Marshall [now ZL1BKF], mine manager at Koongarra NT checked into Cairns control with weather reports and site status.

6 'Slim' Jones, VK8JT, after salvaging equipment and erecting aerials, came on air at 250430 UTC and checked into the net.

7 Later in the afternoon WICEN COMCEN at Police Headquarters in Melbourne came on air and net control was passed to Ken, VK3AH by VK4YG.

8 The statement: "History-making permission was then given to handle Third Party Traffic telegrams" is NOT correct.

Amateurs in NSW and Qld handled TPT telegrams in emergency networks in 1948-50-54 and 56 during floods and cyclones and received letters of thanks from the Postmaster General of the day to testify to this fact.

9 The telegram which was sent to the PMG and the PM was to prevent the net from being closed down by an officer of the Victorian Radio Branch — not primarily to get permission to handle TPT telegrams — that followed later.

10 After WICEN COMCEN was closed down on 29/12/74 Nth QLD WICEN continued to operate in a WICEN-SES-NDO operation until all communications were restored.

This group operated for seven days with an 'on air' time exceeding 85 Hours.

The WICEN national net for Darwin following "Cyclone Tracy" December 1974 finally closed on 31/12/74 after a marathon emergency effort by many Australian Amateur Radio Operators.

Ravenshoe, Qld, 4872.

WICEN

I am in the process of writing an article of historical value concerning the role of WICEN in the national communications network for the city of Darwin following Cyclone 'TRACY' on Christmas Day 1974.

I would appreciate the assistance of fellow amateurs who may have tape recordings, media cuttings, log book information or personal recollections of this major event.

All contributions will be acknowledged and, where needed, material returned.

Since the facts of this network and the work of those who participated have never been fully documented it is therefore fitting that it should be recorded in this, the 75th anniversary year of the WIA.

Regards
Ted Gabriel VK4YG

WHAT'S YOUR VALUE?

I think it is rather urgent that the matter mentioned below be given some publicity.

I wonder how many amateurs have assets test problems? As the typical pensioner amateur looks over his beloved equipment and mentally adds all the purchase prices he might well be surprised to get a total of five to ten thousand dollars. Added to other things it might well push him over the assets threshold and mean a much reduced pension. Of course we tend to think of our gear being worth much the same as when we purchased it but this is not really the case.

In the assets test you are asked for YOUR estimate of what things are worth. You are asked to use a value for things such as you would get if you sold them NOW. The key words are YOUR estimate, and sold NOW. Don't value your items with a loving eye. Do a role change and think of yourself as a professional Auctioneer Valuer come to buy all your goods as a job lot. This steely eyed emotionless professional valuer will see your possessions in a quite different way and if such a person did give you a price you would probably faint at how low it was. Such a price would be far more accurate than yours and would be perfectly legitimate to use for the assets test.

With professional valuers the idea of non-professionals making their own valuations is a great joke. They say things like — "It took me 20 years to learn the trade, what hope have inexperienced old people got of making a reasonable valuation?" Yes indeed, your valuation will not be very accurate. But even if you are a bit out, YOUR valuation will be accepted and no one will enter your house to check it.

Your valuation should be as if you sold NOW. Not waiting for a good buyer. More like you would get at auction with no reserve price, to sell without delay. At auctions, often goods don't bring anywhere near what they could have if the seller had waited for a keen buyer.

The assets people say advertised prices for similar items are a good guide. Maybe, but don't forget that most people optimistically advertise goods at prices they only hope to get and usually finish up selling at a much lower figure.

I trust all this will help you take off those rose-coloured glasses as you value your beloved gear etc. so you will see things as they really are and estimate accordingly.

Best regards to all.

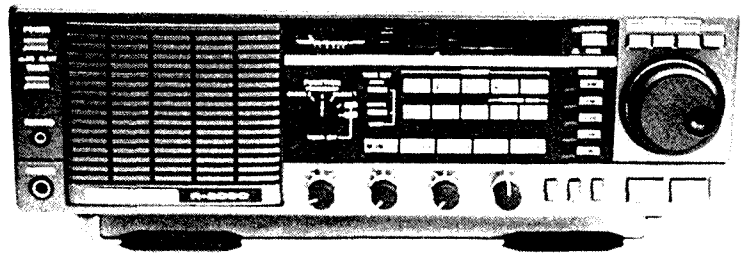
KENWOOD

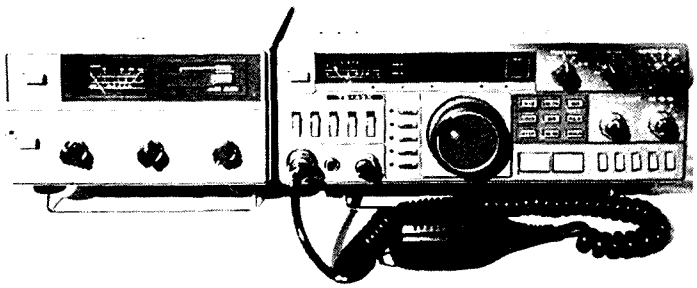
R-2000 COMMUNICATIONS RECEIVER

THE WORLD AT YOUR FINGERTIPS



The R-2000 provides outstanding performance through use of micro-processor controlled operating functions, allowing maximum flexibility and ease of operation throughout its operating range. An all mode receiver, it covers 150 kHz-30 MHz in 30 bands, on SSB, CW, AM, and FM. Key features include digital VFO's, ten memories that store frequency, band, and mode information, memory scan, programmable band scan, digital display with 24 hour dual clock, plus timer, and a host of other features to enhance the excitement of listening stations around the world.

THE MOST VERSATILE HF TRANSCEIVER OF THE 80s TS-430S HF TRANSCEIVER



The TS-430S combines the ultimate in compact styling with its counterparts in advanced circuit design and performance. An all solid-state SSB, CW, and AM transceiver, with FM optional, covering the 160–10 metre Amateur bands including the new WARC bands, this remarkable radio also incorporates a 150 kHz — 30 MHz general coverage receiver having an extra wide dynamic range. Key features include dual digital VFO's, eight memory channels, memory scan, programmable band scan, IF shift, notch filter, fluorescent tube digital display, built-in speech processor, all-mode squelch circuit, and a host of other features designed to enhance its versatility and flexibility of use in Amateur operations.

Obituaries

JOHN ERNEST TELFER VK2BTQ

It is with deep regret that I advise of the death of the Past President of Mid South Coast ARC, John Ernest Telfer VK2BTQ on 14 October 1984.

John Ernest Telfer was born on 15 January 1910 in Subiaco, WA. He subsequently moved to NSW and served with AWA for 50 years and retired from the position of "Special Projects Manager and Trouble Shooting Officer".

He retired to Mollymook on the south coast of NSW and obtained his AOCP on 17 July 1975 with the call sign VK2YDQ.

He was the founder of the Mid South Coast Amateur Radio Club and the instigator of the current repeater, VK2RMU. He worked tirelessly for the club magazine, Lyrebird, producing it for many years and was club president for the year 1982/83.

His main interest was in the two metre band and he was proud of the fact that he had had in excess of 400 ZL contacts.

Although he had recently returned to Sydney to live, he attended the quarterly meetings at the club and had in fact attended the last meeting on the day he died.

Deepest sympathy is extended to his wife Gwen and their children.

David Parry,
Hon Sec.
Mid South Coast ARC
AR

ANDRE DOMJAN VK1XX

Andy passed away at Royal Canberra Hospital on 7th December 1984 after a short illness, aged 66 years.

VK1XX joined the VK1 Division in February '84 when he came to reside in Canberra to be near his family. He held the call VK3AEW when living at Box Hill, Victoria.

Andy was a keen CW operator and was close to gaining his DXCC Award. He will be sadly missed by his many amateur radio friends in Australia and overseas.

To his wife Gabriella, sons Andrew and Peter and daughter Gabriella, amateurs extend their deepest sympathy.

Jock Fisher VK1LF
AR

BRUCE MILLER VK2VRG

Bruce died in a motor accident early on the 28th of December 1984, aged 21. One of the first YRS student members of the Liverpool and District Amateur Radio Club, Bruce attended the novice classes and obtained his callsign at the age of 15.

He assisted in club activities and later served a term as secretary. Continuing his interest in electronics, he became a trainee technical officer with OTC.

Bruce was notable for his cheerful outgoing personality, always prepared to assist and brightening any occasion. A regular field day participant, he was known as a considerate and fair competitor. He was a true and inspiring friend.

His death at 21 is a sad loss to his family and friends.

Athol Tilley VK2BAD

HANS THUMFORT VK6ATT

We regret to announce the passing of Hans Thumfort VK6ATT in November. He was known only to a few operators in WA as he was relatively new to the state, having only obtained his resident visa in January 1982.

Hans arrived with his wife Hilde VK6AHT, his son Hans VK6ZBA and wife Barbara and son Mark and his younger son Peter who is at present doing his BA in Chemistry at Perth University.

We first met Hans and Hilde on the 28 MHz band in 1980 as OE6TT and OE6YBG respectively and those who might have tuned into 28.340 at 4 pm local time would have heard us waffling away in German daily.

He had a zest for life and was a keen amateur, having been a Sparks in the German Navy.

Nothing was too much trouble for Hans to help his fellow amateur. He also had a wonderful sense of humour. He was also a keen slow scan enthusiast. He was a very colourful character, sadly missed by all his close friends.

Heartfelt condolences and sympathy go out to his surviving family Hilde, Hans, Barbara, and young Mark and Peter.

Goodbye Hans and thank you for your friendship. We all miss you and you will always be in our thoughts.

Norman Schroeder VK6NS and Helene VK6HI
AR

CLEMENS EDGAR SCHMIDT VK5WG

Clem was born at Point Pass SA on 21/12/1911 and fanned his father's property at Ngapala during World War II until his marriage to Joyce in 1950 when he built his first home at Eden Hills SA.

His business interests consisted of breeding tropical fish and the culture of aquatic plants. He won many prizes at the Adelaide Royal Show and was a member of the Aquarium Society.

In June 1962 he passed his AOLCP and was first licensed as VK5ZES. In December 1963 he passed his AOCP and received his full call of VK5WG ("Witchety Grub") as he was affectionately known to his amateur friends.

In 1967 he moved back to Ngapala, on the farm, where he built his present home.

Clem was widely travelled overseas, including Israel which he visited a number of times.

He made many friends among the amateur fraternity particularly on the daily 40 metre net.

Over the last few years he did not enjoy good health and received many and varied treatments (one of which he called "weedkiller") for the disease which was to claim his life. He passed away on 6th November 1984.

Throughout his sickness he never lost his sense of humour.

He will be greatly missed by his many friends.

To his wife Joyce and only daughter Carolyn we extend our sincere sympathy.

Vale Clem

ADVERTISERS' INDEX

NEW YEAR SALE

TELEREADER, CWR-675 with MONITOR and PRINTER. CW, RTTY and ASCII reception.

An entire new world is opened to those who are willing to explore it. Monitoring weather, press, ship traffic, embassies, Interpol and many unusual services can prove to be fun! and for permanent record, just press the button and the inbuilt 40-column printer will do the rest for you.

$990 NOW ONLY $790

THP: HL-32V VHF LINEAR AMP FOR HAND HELD TRIX

Feature: A compact and light-weight 144 MHz band amp with 30 W output. Drive power of 1 W to 5 W from hand-held radio. Hi/Lo output selection.

$99 NOW ONLY $79

ICS: AMT-1 TERMINAL UNIT

Convert your computer in a sophisticated RTTY-AMTOR-CW-ASCII communications system. AMT-1 definitely makes COMMODORE 64 or VIC 20 computers the best systems on the market.

$599 NOW ONLY $470

KANTRONICS: RADIOTAP

If you are a SWL and happen to have a COMMODORE 64 — VIC-20 then join the new "MONITORING CRAZE", with "RADIOTAP" you can now eavesdrop on coded signals from police, commercial marine, embassies and amateur traffic.

$315 NOW ONLY $290

FAMOUS EMOTATOR ROTATOR — 105TSX!

This medium duty antenna rotator with a turning torque of 500 kg cm and breaking torque of 3000 kg cm as well as 360° position indicator is much superior to all other medium duty rotators. Top and bottom brackets included

$210 NOW ONLY $190

TOP OF THE LINE EMOTATOR — 1103 MSAX

with 360° direction indicator and many other features but same specs as 1103 MXX

$577 NOW ONLY $499

UM-PRODUCTS: THREE BAND TRAPPED DIPOLE TYPE A-458

This excellent German antenna manufactured in Japan is an ideal novice antenna. It covers 80, 40 & 15 metre bands.

$99 NOW ONLY $79

OPEN WIRE 450 OHM

Low loss transmission line. Ideal for "ALL BAND" antennas.

$26/100 FT

MAXCOM — AUTOMATIC ANTENNA MATCHER. TUNES ONE ANTENNA

from 300 kHz to 7 MHz with SWR less than 1.5:1 No. mounting points instant switching, small size, low noise. Suitable for DIPOLE, LONG WIRE, MARINE MILITARY

$980 NOW ONLY $659

CERAMIC HIGH QUALITY VARIABLE CAPACITORS

For 1 to 2 kW linear amplifiers now available
Plate tuning 275 Ps. 3500 V ONLY $42
Loading capacitor 1100 Ps. 3500 V ONLY $49
Also stock capacitors for high power antenna tuners

AKIGAWA PM-2H SWR/POWER METER

with flat response from 1.8-60 MHz and power ranges 0-200,1000 watts. It is your last opportunity to buy one of these fine instruments for your shack.

$89 NOW ONLY $50

THP: HL-20U UHF UN AMPLIFIER FOR HANDHELD TRANSCEIVERS

Feature: A compact and light-weight 430 MHz band amp with 20 W output. Drive power of 1 W to 3 W from hand-held radio. Hi-Lo output selection.

$109 NOW ONLY $79

TELEREADER: AMTOR 10A CONVERTER

Do you currently have a CWR685 or TONO RTTY system? Then you can convert it for AMTOR operation with the new AMTOR 10A converter.

$359 NOW ONLY $259

AEA INC: CP-1 COMPUTER PATCH TM INTERFACE

This most advanced interface unit will make your computer communication terminal have incredible capabilities. You can receive and transmit AMTOR, RTTY, CW and ASCII.

$375 NOW ONLY $359

FAMOUS EMOTATOR ROTATOR — 502 SAX

MEDIUM TO HEAVY DUTY ANTENNA ROTATOR. with turning torque of 600 kg cm and breaking torque of 4000 kg cm with rotary direction indicator.

$319 NOW ONLY $289

EMTRON ENB-1 NOISE BRIDGE	$89
EMTRON EAT-300W TUNER	$169
EMTRON EAT-1000 1 kW TUNER	$359
EMTRON EAT-2000 2 kW TUNER	$489

CERAMIC EGG ANTENNA INSULATOR

Yes good old fashioned hard to get high quality egg insulators — plenty in stock

ONLY $1.00 each

KAUFMAN 1:1 BALUN

This 2 kW balun is ideal for dipoles

$33 NOW ONLY $29

TERMINATING RF WATT METER & DUMMY LOAD RW-151D

Freq-range 1.9 MHz-500 MHz power range 5/25/150 watts SWR at 500 MHz 1:1.5 with a BNC connector for sensor.

$199 NOW ONLY $179

NEW ROLLER INDUCTORS

28 Micro Henry for your high power antenna tuner. This is a high quality roller inductor as used in our EAT-2000 2 kW Antenna Tuner

$75 NOW ONLY $69

AKIGAWA PM-5H SWR/POWER METER

This unique instrument has been specially designed for mobile installation. A separate directional coupler and control unit, illuminated meter, 1.8-30 MHz, 0-20, 200 watt range.

$59 NOW ONLY $39

THP: HRA-7. New GAaSFET mast mount RX pre-amplifier for your UHF base station.

18 dB gain, 0.8 dB noise fig, 100 watts max input power, automatic Tx/Rx switching.

$179 NOW ONLY $99

JIL: SX200 SCANNER

This popular scanner used to be the best seller in Australia. The price was $599. NOW AVAILABLE FROM EMTRONICS AT THE UNBELIEVABLE PRICE OF $429.

$599 NOW ONLY $429

KANTRONICS: "INTERFACE II"

VIC 20, COMMODORE 64, APPLE, ATARI, TI-99/4A, TRS-80C — all these computers can be used as "SOPHISTICATED COMMUNICATIONS TERMINALS" for AMTOR-RTTY-CW-ASCII modes. With appropriate software also in stock. This remarkable machine does wonders.

$399 NOW ONLY $369

TOP EMOTATOR ROTATOR — 1103 MXX

Extra heavy duty economy type antenna rotator with turning torque of 1000 kg cm and breaking torque of 10,000 kg cm is yours at

$399 NOW ONLY $369

TET — VERTICAL TRAP ANTENNA — MV5BH

A complete five band (10, 15, 20, 40, 80 metres) vertical trap antenna.

$179 NOW ONLY $129

CERAMIC — DOG BONE ANTENNA INSULATORS

These high tensile insulators are ideal for counter insulators as well as end insulators.

ONLY $1.50 each

COAX-SEAL

Protect your coax fittings from moisture corrosion with hand mouldable plastic, non conductive MDM, contaminating. Insure low SWR.

$3.50

EDDISTONE-TYPE 817

Silver plated, ceramic insulated variable capacitors 255 Ps-1500 V. This capacitor is ideal for 300 W antenna tuner and 2 capacitors can be coupled together if required. THE BEST IN THE WORLD

$28 NOW ONLY $22

ARE YOU BUILDING A LINEAR AMPLIFIER?

We stock . . . valves, 3-500Z, 572, sockets for 3-500Z, filament choke, plate choke, high voltage electrolithic capacity etc.

TECHNICAL FEATURES

SPECIAL FEATURES

REGULAR FEATURES

It has been very exciting putting this magazine together as there is so much diversified information in it.

Firstly this issue has a special VK2 Anniversary feature with much information which is not just VK2 orientated. Tim VK2ZTM and his helpers are to be commended for the amount of time and work they have put into this special section.

It is to be hoped to have a special feature from each division throughout this 75th Anniversary year. Next month's feature will be contributed by VK1 and from the copy that has already arrived from Fred VK1MM it will be well worth watching for.

For the Drew VK3XU fans, this month, page 14 is a construction article for an 80 metre transmitter. It is believed Drew has a special following for his well-designed gear and this transmitter is up to his usual excellence.

The Red Cross Marathon was staged again from Boxing Day and last month Gil VK3AUI gave us a photographic view of the race. This month we have another look from a different angle. David VK3YDF and the Melbourne Packet Radio group were in charge of the computers which were used for placings etc. On page 44 David shares the trials and tribulations of keeping computers cool and dust-free on the banks of the Murray.

STOP PRESS: *Ian VK5QX finally received the rules for the CQ WW WPX SSB contest after the magazine had gone to the printer. The rules are however the same as last year. See Ian's column, page 54, for his prior comments and the dates for this contest.* (BP)

DEADLINE

All copy for May 1985 AR (including Hamads, columns) must arrive at PO Box 300, Caulfield South, Vic 3162 at the latest by midday 22nd March 1985.

BEAT THE PRICE RISE!

Here's the equation:

US Dollar all time high against Aust. dollar
+ Japanese Yen all time high as well
+ Factory price rises in Japan last year

= Massive price rises on amateur gear: immediately!

That's right: no matter which currencies amateur gear is purchased in, it is all imported. And because of the weakening Aussie dollar PLUS hefty price increases overseas last year, prices of all amateur gear in Australia will increase – drastically – very shortly.

A word to the wise: if you want to re-equip your station, do it this month!

Even if you have to obtain credit (Bankcard, Visa, Mastercard or even personal finance through Custom Credit Corp*) you'll be much better off buying now and paying interest than waiting!

AR85

a word from your EDITOR

1910 TO 1985

On the 11th March 1910 the foundation meeting of our Institute was held in Sydney. This is the month of the 75th anniversary of the oldest amateur radio society in the world. And as you may have realised by now, we are celebrating!

How has radio evolved over those 75 years? Broad-band brute-force spark telegraphy was succeeded by pure CW as the advent of valves in 1913 and developments during the 1914-1918 war made stable frequencies possible. Telephony appeared at this time, and by 1920 the first broadcasting stations, many run by amateurs, were on the air.

As the new entertainment medium expanded enthusiasts built their own broadcast receivers, and were motivated to transmit as well. The number of amateurs increased steadily. Ships, aircraft, as they progressed from wood and wire, and later, automobiles, were to gain much in safety and profitability by the evolution of mobile radio. Much of the improving technology was initiated and developed by people who were operators, technicians and engineers during working hours and amateur experimenters as well.

Television came, with the first regular programmes, from London, in 1936. Then the world erupted into the 1939-1945 war. Amateurs became military technicians and operators, and the pace of development accelerated tremendously. Pre-war, the amateur market had been the main source of income for many manufacturers, and their amateur-band gear was often the prototype on which military equipment was based.

Of the thousands of amateurs in uniform during the war, many sacrificed their lives in action. Each August the WIA renews their memory in the Remembrance Day Contest.

Peace had barely succeeded war, when in 1948 came possibly the greatest development ever to shape the course of history. Without the transistor there would be no airborne or spacecraft computers, no spacecraft, no satellites, no world-wide TV, little international telephone traffic, no pocket radios and calculators. Our present lightweight mobile radios, with digital synthesizers and readouts would simply be impossible. Personal computers? Ridiculous!

Amateurs joined the Space Age in 1961 with OSCAR 1. The WIA was involved with the construction of OSCAR 5 in Melbourne in 1969. We now have OSCAR 10 relaying amateur messages internationally.

If there is one word which crystallizes the aims of the WIA in 1985 it is "international". Yes, we now have members from several overseas countries. But our purpose is to join together all Australian amateurs in working towards consistent international frequency allocations, regulations, licensing, satellite system standards and so on. This will increase international understanding by facilitating contact between more and more amateurs in all countries.

You can help! Join the WIA. If you are a member, but only passively, there may be a place for you in your Divisional Council, on Executive, or in one of many committees. We want to hear your ideas and opinions. There's a whole future in front of us!

Bill Rice VK3ABP
Editor
AR

SPECIAL DEPARTMENT OF COMMUNICATIONS RELEASE

Robert Lionel Lear of Blaxland, a suburb of Sydney, was convicted in a Parramatta court on Monday, 14th January 1985 of two counts of erecting and establishing a transmitter without authorisation, and two counts of using a transmitter without authorisation for the passing of messages.

Mr Lear was sentenced to six months gaol on each of the four counts, to be served concurrently.

Mr Lear had previously been convicted of an offence of establishing an unauthorised transmitter, in February 1984, and was then fined $100.

The Department of Communications has seized 78 items of radio equipment from Mr Lear. Some or all of these items may be forfeited to the Commonwealth under the provisions of the Wireless and Telegraphy Act 1905.

Mr Lear was prosecuted under the Wireless and Telegraphy Act. A new Act governing use of the radio frequency spectrum, The Radiocommunications Act, will soon come into force and provide for far higher penalties for breaches.

This new Act also contains provisions for seizure of and forfeiture of equipment used in committing offences.

The Department is stepping up its investigations of illegal use of the radio frequency spectrum across Australia because of the extent of interference to other services caused by these activities.

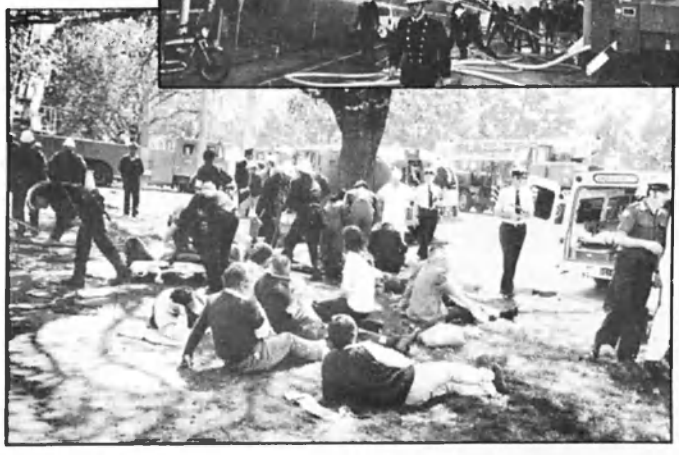
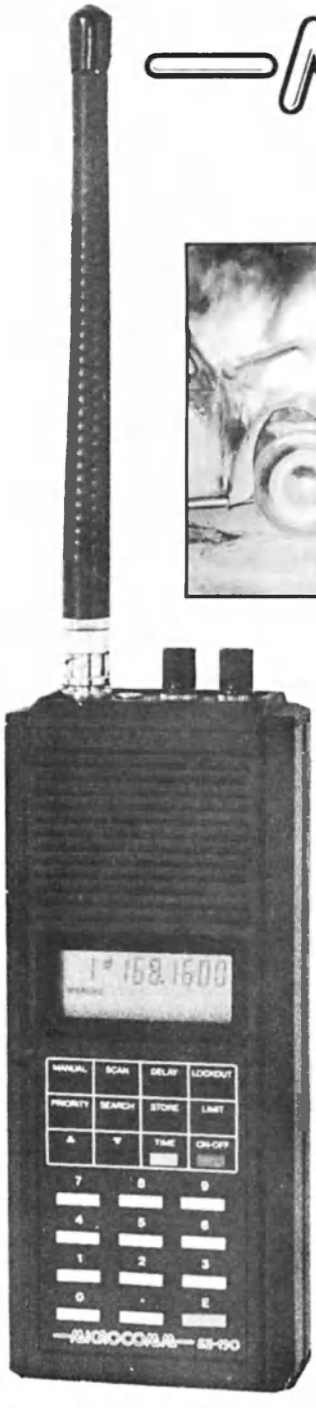
MICROCOMM

gives you . . .

ACCESS TO ACTION





26 to 32, 68 to 88, 138 to 176 and 380 to 512 MHz

SPECIAL PRICE $399 NEW FOR 85

SX-155
with
improved performance
and
long battery life

PROGRAMMABLE POCKET SCANNER WITH OVER 16,900 CHANNELS & 160 MEMORIES

SX-155

The Microcomm SX-155 represents the latest developments in State-of-the-art LSI CMOS technology as applied to scanning monitor receivers. It incorporates many features, a lot of which are not even found in today's larger base scanners.

For example the SX-155 has 160 memory channels which can be programmed in either of two modes. The first allows you to manually program the entire 160 channels. The second mode provides for manual programming of the first 40 channels with the top 120 reserved for use by the SX-155 while in its SEARCH mode. It uses these channels to automatically store frequencies on which it has found signals during the search phase.

The SX-155 also features a Priority Channel (for that important frequency). An LCD display providing readout of all receiver functions including an accurate crystal controlled 24 hour clock. Supplied complete with rechargeable Nicad batteries, charger, and BNC rubber duck antenna, the SX-155 is a must for anybody with an interest in monitoring.

Marconi is acknowledged as being the first to demonstrate the ability to communicate without *wires* between two points. That was in 1895, only 90 years ago. His discovery started to end the isolation of the (then) remote parts of the world like Australia and in less than a century our lives are almost totally dominated by electronic technology.

Isolated though Australia may have been at the start of this century it is a credit to our early experimenters that they appeared to be ahead of their counterparts in other parts of the world. That they found the need to come together and form an *Institute* is amply demonstrated in the newspaper report "A WIRELESS ENTHUSIASTS' INSTITUTE" reproduced elsewhere in this Amateur Radio.

That first meeting — the records indicate — was this month in 1910 and resulted in an organisation almost as the 'science' itself. That meeting in 1910 was the first in the world to result in a national organisation and was two years ahead of Great Britain and four years before American experimenters decided that they had a need for a national representative body.

One wonders, as we enter the fourth quarter of this century, what it holds in store for both the Institute and the hobby in general. The end of each previous quarter saw a change in direction:

1935 ended the period of the Great War, start of broadcasting, the Great Depression and the formation of a professional body from our ranks (See IREE story Jan A R.)

1960 ended the period of another war and its resulting electronic development which provided an endless supply of 'disposal equipment'. It was also the start of television, space communications and 'off the shelf equipment' which changed many from constructor to purchaser and perhaps from experimenter to user.

1985 ends a period almost too complex to record and although we are living in it one can only speculate what it will be like in 2010.

This year should see the Radio Communications Act coming into effect, hopefully to the benefit of our hobby. At the Division's seminar last year on "Amateur Radio — towards new horizons", Roger Harrison VK2ZTB postulated on the future trends in amateur radio and predicted that increasing leisure time together with higher education standards would lead to unprecedented growth, particularly in the field of digital communications.

As David VK3ADW, Federal President, outlined in his Christmas message, the hobby of amateur radio has become diverse and complex. The Institute was formed to represent the experimenters movement and right through its history — while every amateur may not have been a member — it has tried to determine and represent their views. The common point of contact and ideas exchange allows the Amateur Radio Service to follow a united, rather than a fragmented course, for I am sure that the Institute will celebrate many more multiples of its 75th.

May I wish the Institute and its Members all the best as it enters the last quarter of its first century.

Jeffrey L. Pages VK2BYY
President — NSW Division of the WIA.
10th January 1985.

TREASURY REPORT

YOU AND YOUR SUBSCRIPTION

When you pay your subscription to the WIA what happens to your hard earned cash?

At each annual convention, held in April, the Federal Finance Committee presents a budget for the year ahead concerning income and expenditure of the Federal Executive.

In August the budget is revised and the figures are used as a base for setting Federal dues payable from Divisions for the following year. In turn this enables Divisions to calculate the subscription rates for their members.

From the chart below you will see the largest income component is subscriptions and on the expenditure side "Amateur Radio" magazine.

This magazine accounts for approximately $12 of the Federal Component ($24.50 for 1985) of your annual subscription.

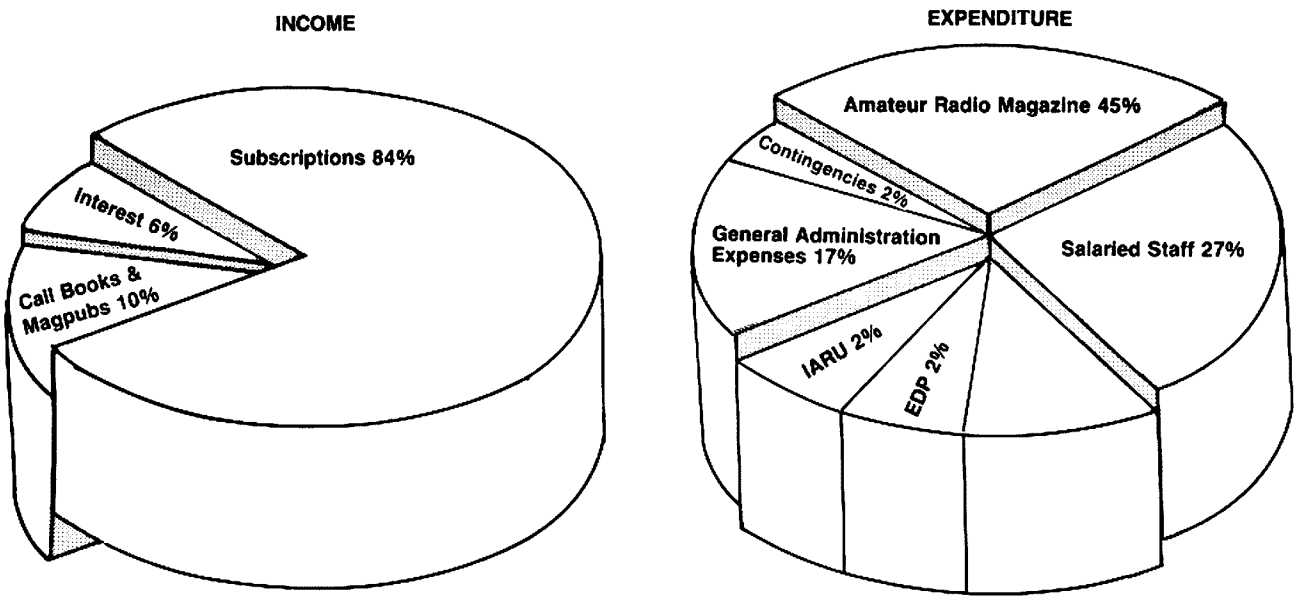
IARU membership absorbs approximately 50 cents per member of the Institute and the balance of the Federal Component is used by the Federal Executive in the performance of their various functions. One of their major expenses is the operations of the Federal Office, which assists the Federal Executive in their major function of acting in the interests of members by co-ordinating and dealing with Federal matters and major issues, so that our hobby is enhanced and does not go backwards, which could be so easy in this day and age. The remaining amount of your subscription goes to your Division who also need to act in our interests at a local level.

We need more members to make sure our hobby is never in jeopardy. Please endeavour to join a new member today. Approx 50 per cent of all amateurs are members of the WIA. Additional members will also help to keep our subscriptions down by sharing the costs.

Ross Burstal VK3CRB
FEDERAL TREASURER

AR

FEDERAL INCOME & EXPENDITURE FOR YEAR ENDED 1984



Amateur History

Alan Shawsmith VK4SS
35 Whynot Street, West End, Qld, 4101.

As the history of early OOTers is researched, it is apparent that many outstanding DX achievements occurred pre-WW11; it is a pity no official record book was created to register them for posterity. Almost all were made on QRP or QRPp — simply because those who used big bottles (QRO) were very much in the minority.

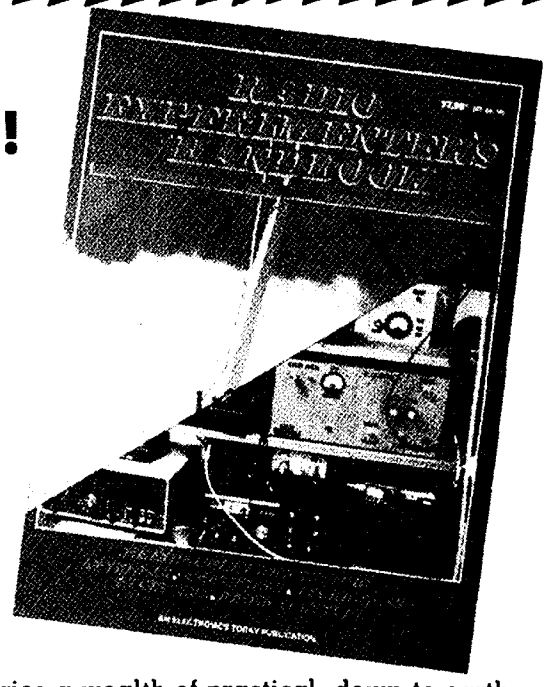
The three watt SPARK VK-W QSO by Roy Jonasson VK4NG is an outstanding effort; Marconi would have beamed with satisfaction. There were many others of equal merit, of course, Eric Lake VK4EL, credited with working more Gs than any other VK pre-WW11, also WACed with one-half watt into a simple vertical antenna, during a period when sun spot activity wasn't all that good. My next door neighbour of early days, George (Len) Greenhill VK4LE worked regularly into Europe LP 0700 UTC using loop modulated five watts phone (at best 1½ watts in the aerial which was a 66 feet end fed Zepp with fairly long 600 ohm feeders). Even the first Down Under DJs, ie those who operated on MW received some remarkable reports on their Broadcast Band activities. The official station of the Queensland Listeners League VK4QL was heard at good strength in the Eastern and Southern States, New Zealand, Fiji and Papua New Guinea — all on QRP.

It is only natural to ask, "*How was it all accomplished?*" That, like Marconi's spanning of the Atlantic Ocean in 1901, is something of a sixty-four dollar question. Lack of QRM and QRN (man made) no doubt played a big part. Most city suburban amateurs are now knee-deep in appliance pollution; this and low solar activity presently make QRPp DXing virtually impossible.

A record of another kind must be the re-joining of the WIA by an OOTer after a lapse of forty years. Norm VK4NR became an Institute member back in 1932 but let his membership lapse early post-war — now, after four decades, he has 'come in from the cold'. DOC would not re-issue him with a call until he sat for and passed his AOCP again. A stout effort for any OOTer, you'll agree! Norm's new call is VK4BNR.

AR

THE ONE YOU'VE BEEN WAITING FOR!



The Radio Experimenter's Handbook, Volume 1, from Electronics Today International is 132 pages chock-full of circuits, projects to build, antennas to erect, hints and tips. It covers the field from DX listening to building radioteletype gear, from 'twilight zone' DX to VHF power amplifiers, from building a radio FAX picture decoder to designing loaded and trap dipoles.

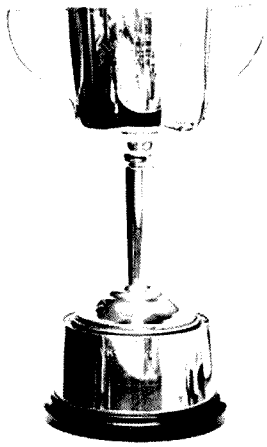
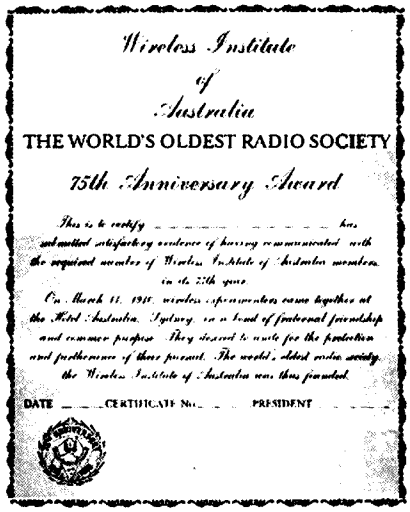
WIA Seventy Fifth Anniversary News





This month — March 1985 is the ANNIVERSARY founding month of the Wireless Institute of Australia and is the real start of the celebrations of our 75th ANNIVERSARY year.

To celebrate the opening of the year the Institute has arranged that major events take place:

ANNIVERSARY CALLSIGN

After lengthy negotiations with the Department of Communications, a special callsign VK75A has been issued to the Federal body to celebrate the 75th anniversary.

This callsign will be activated for special events during the year.

The approval for the use of this callsign has been given subject to special conditions:

This station is authorised for use by a single "anniversary" station.

This station may, at the discretion of the WIA Executive, be rotated to locations in all states of Australia. Use of the station in this manner will be subject to normal operating conditions relating to amateur stations operating in a mobile capacity.

Approval for the use of this special non-standard callsign is given on a strictly "one off" basis, in the light of the exceptional circumstances of the 75th Anniversary of the Institute.

This special callsign will be used in the first instance during the 75th Anniversary year CW contest and then during special events and contests during the year. A special QSL card is being produced, and will be despatched to amateur stations contacted by this anniversary station.

There is no need for QSL cards to be sent to VK75A. Validated SWL reports will be QSLed.

CW CONTEST

Over the period from 0000 UTC to 2359 10 March 85 a CW contest is being run on behalf of the Institute by the VK2 Division. Rules for this event were published in the February issue of AR. The overall VK winner will hold the "Federal Presidents Cup" for 12 months, certificates and momentos will be awarded to all entrants whose logs show the necessary 75 contacts.

75TH AWARD

This award being run by the VK3 Division, on behalf of the Institute, commences this month – rules are published elsewhere in this issue.

Those entrants who qualify will receive a special certificate.

Be sure to make a note of the number primed on your AR address label for use during this award.

BOOK PACKS

To celebrate the 75th Anniversary of the Institute it has been decided to make book packs available for presentation by Divisions, Clubs and groups of amateurs to local schools and colleges.

These packs, provided at cost price to the donors, will contain basic readers and information on amateur radio for schools to hold in their libraries to enable study to be carried out. Included in the package will be material for use by the club or group making the presentation, on how to obtain some publicity for their club or group and amateur radio.

Two standards of book packs are available, $30 and $50 post free from the Federal office. To participate in this scheme, groups who wish to donate a book pack to a school should write to the Federal Secretary giving details of the proposal with a cheque for the pack required.

We would remind members that 1985, beside being the 75th Anniversary of the Institute, has also been declared the International "Year of Youth". This book pack scheme is one way that the Institute and its members can make a contribution to the Year of Youth.

NATIONAL FOXHUNT CHAMPIONSHIP

Supported by ICOM (Australia)

This event programmed to take place over the weekend 5/6th October 85 is being supported by ICOM (Australia) Pty Ltd. For this anniversary year the winning team will receive a handsome prize donated by ICOM (Australia) as well as an Institute Trophy and certificates.

FORMAL DINNER

As announced in the January edition of AR plans are going ahead for an Anniversary Dinner to be held in Melbourne on 9th November 1985. Invitations are at this time being prepared for posting to the presidents of all our sister societies, along with many for distinguished personalities in Australia and overseas. As previously mentioned in earlier editions of AR any member of the Institute who wishes to attend this important function should register their interest with the Federal Secretary. Space is limited, but a percentage of tables at the dinner are naturally being reserved for members who wish to attend.

DO YOU OWN A PIECE OF HISTORY OR ARE YOU A PIECE OF HISTORY?

As a result of the January article a number of members have contacted the Federal Secretary giving information.

Alan VK4SS has notified that he is aware of a couple of amateurs who are still active, Harry Angel VK4HA, 93 years young with a clear wit and voice who has held a licence since 1935 and is on air each day. Also Ock Alder VK4JB who was licensed in 1920.

Norman VK4BHJ writes to say that he celebrates his Silver Jubilee on air in June this year, having held a licence since 1925. He also mentions that he has some original papers from the GPO regarding his licence, one in particular from the Postmaster General authorises Norman, through his father to carry out experiments at 150 to 200 metres, shorter wavelengths could only be allowed where special justification could be shown.

The Federal office was visited by Bill Sievers VK3CB to pay his subs and during a quick chat it was discovered that Bill was operating as an amateur in Australia during 1918 and joined the Institute in 1922. *Is this a record?*

AR

SOME THOUGHTS ON RADIO FREQUENCY OSCILLATORS.

Harry Voake VK3AVQ
21 The Cresent,
Invertoch, Vic. 3996

For some time the writer has been interested in constructing a low drift 7 MHz variable frequency oscillator with its obvious advantage of shift as the frequency source of a low power (QRP) transmitter. With this in mind, considerable reading was done on the subject before attempting the construction of Hartley, Colpitts, Clapp, Seiler and Varkar oscillators. After several months, it was found that the last three configurations gave the best results but they failed in the goal set, which was less then 100 Hz frequency drift in the first hour from switch on.

All the oscillators used a field effect transistor (FET) either a 2N3819 or MPF102 as the active component followed by a two transistor buffer amplifier whose output was fed to a frequency counter. The unit was mounted on a printed circuit board made by the masking tape method (1). The power supply was a regulated 12 volt supply and the oscillator supply was further regulated by a 9 volt zener diode.

The capacitors in the tank circuit were of polystyrene type and the capacity values were made up by at least two smaller capacitors in parallel to reduce heating caused by circulating radio frequency current. (*Probably not significant — Tech Ed.*)

The tank coil was of square dimensions, ie the diameter and winding length were approximately equal. I used 24 SWG enamel copper wire for a high Q value without the use of a ferrite core; which is a potential source of drift. The wire was close wound on a thin wall plastic former and glued with Araldite. The inductor was found to have a positive temperature co-efficient — it caused a large frequency decrease in drift. So the coil was rewound on a ceramic former, obtained from a stripped down 20 watt wire wound resistor, and this gave considerable improvement by reducing the frequency decrease.

The unit was housed in a metal box bent up from 26 gauge galvanized iron sheet and pop rivetted/soldered together. Holes were drilled in both top and bottom to provide adequate ventilation.

The ceramic former coil and the associated polystyrene capacitors produced a drift of increasing frequency of about 300-400 HZ in the first hour. Many other capacitors — styrene, mica and NPO ceramic were tried in turn but no consistancy was obtained. the ceramic types were not satisfactory in that they occasionally caused frequency jumps of approximately 500-1000 HZ.

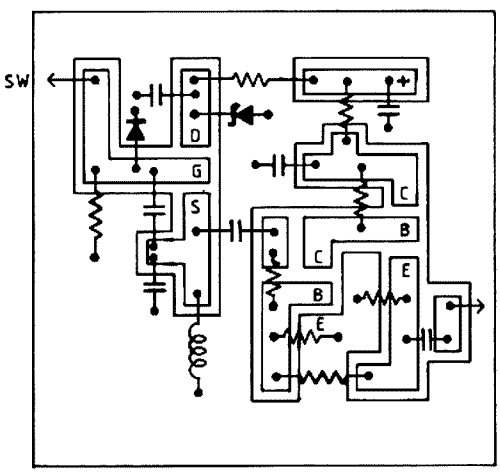


Figure 2 — VXO Board — copper side — full size

The internal heating of the FET was then considered and a flag heat sink using silicone grease was fitted around the plastic body. Also the clamping diode was changed from a silicon diode to a hot carrier diode. These actions made no detectable reduction of drift.

As a last resort, ceramic capacitors of suitable value and positive temperature co-efficient to cancel the small negative temperature co-efficient of the polystyrene capacitors were sought but could not be bought from radio retailers.

By this time — *The constructor's brow was furrowed*
The constructor's brow was low
Darkly looked he at the counter
And darkly at the VFO.

So the search for a low drift VFO was abandoned and a variable crystal oscillator (VXO) with its greater stability but less frequency shift was next considered.

The VXO circuit decided upon was published some time ago in this magazine (2) and appealed to the writer because no special parts were required apart from suitable crystals (3).

The circuit diagram is shown in fig 1 and the printed circuit board, full size in fig 2, was made by the masking tape method (1) and mounted on 1/4 inch metal pillars in a metal box described above.

Some explanation of components might be helpful. The variable capacitor C1 is a small single bearing Polar type, approximately 5-50 pF which is mounted on the box wall through a 3/8 inch hole. This straight line capacity type will not produce a linear frequency scale unfortunately but is somewhat crowded towards the high frequency (low capacity) end.

The three crystals used are soldered directly to a two pole, five way wafer switch without the use of sockets to reduce interwiring capacities. Locate both the switch and the variable capacitor in the box in such a way as to reduce capacity to earth, for in keeping these unwanted capacities small, the fre-

Figure 1 — Circuit Diagram of 7 MHz VXO.

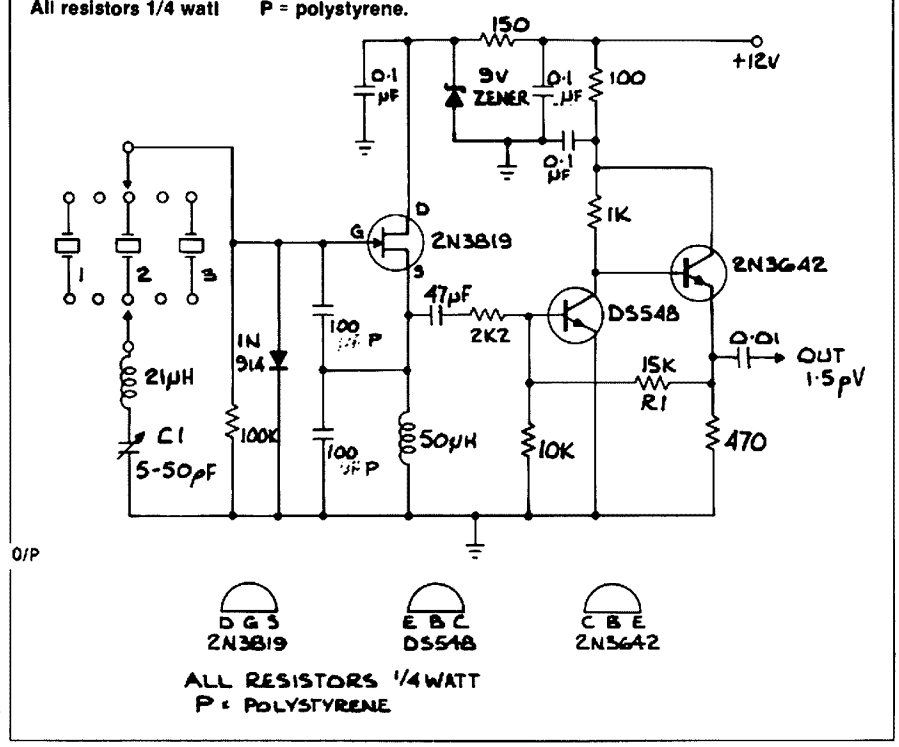
Crystal 2 — 7.008 MHz
Crystal 3 — 7.017 MHz
All resistors 1/4 watt P = polystyrene.



quency shift is inceased.

The 21uH inductance is made by winding twenty six turns of 24 SWG enamelled copper wire on a Neosid 4327R/1/F25 toroid. The use of a toroid here is justified in that a small unit results with bearable drift. This inductance value in conjunction with the variable capacitor C1 produced the frequency shift that the writer required.

It should be noted that if an inductance alone were used in series, the crystal would be pulled to a frequency lower than its fundamental and the greater the inductive reactance (a larger inductance) the more the pulling effect. Similarly with a capacitor only in series, the crystal would be pulled to a higher frequency than its fundamental and a larger capacitive reactance (a smaller capacitor) produces more pull.

Therefore with both inductive and capacitive reactances in series with the crystal, the action of tuning the capacitor C1 will ensure that the reactances that are naturally in opposition will predominate in their turn and so produce a frequency shift spanning below and above the crystal fundamental frequency. If this pulling effect is carried too far, the oscillator will be no longer crystal controlled but rather a VFO with its greater drift problems.

Nominal Crystal Frequency	C1 — maximum Frequency	Drift	C1 — minimum Frequency	Drift	Frequency Shift
7.002 MHz	6,999,170	.39	7,005,160	-18	5990
7.008 MHz	7,004,850	-52	7,013,804	-22	8954
7.017 MHz	7,014,735	-23	7,019,715	-11	4980

FIGURES ARE IN HERTZ
DRIFT IS FOR FIRST HOUR AFTER SWITCH ON.

Figure 3 — Frequency shift and drift of VXO.

Fig 3 shows the results obtained and that the goal of less than 100 Hz drift in the first hour of operation is realized. The figures arrived at are an average of three experimental runs. Crystals 1 and 3 were bought recently and crystal 2 was a Pye type bought from disposals many years ago. Possibly this fact could explain the difference in drift figures.

The buffer amplifier is the well known shunt feedback, direct coupled amplifier. The combination produces a reasonably constant output level (a 10 percent decrease at the high frequency end). The radio frequency voltage output can be varied within limits by changing the value of the feedback resistor R1.

The frequency stability of the VXO is relatively insensitive to changes of supply volts, variations of voltage from 10 volts to 15 volts did not have any effect but did have an effect on output voltage as expected.

The tuning control can be calibrated with a frequency counter, or perhaps a reliable receiver to make sure the oscillator stays in the 7 MHz amateur band but nothing is better than continuous monitoring of the signal by a counter. Direct adjust of tuning is critical so if possible use a vernier drive to make things easier.

THUMBNAIL SKETCHES

Mark and Verle.

MARK WESTON — VK4XO

Mark Weston VK4XO (presently VK2CM Bateman's Bay, NSW) is an OT amateur who, until his retirement, was usually going somewhere — in almost every sense of the phrase he seems to have been forward bound in a positive manner. Here is a verbatim extract of some of his activities in AR. He says:

"First became interested in amateur radio in 1936 when I used to potter around in the projection room of the Paramount Theatre in Bundaberg and a chappie named M Laurie-Rhodes had an AR station set up in the back of the theatre. He used to broadcast on the Broadcast Band on Sunday mornings, callsign VK4XU. I enrolled with VK4 WIA for a correspondence course (Instructor Eric Lake VK4EL) CW; used to have three lessons a week (sixpence an hour) from Terry Tunny VK4TN who was a clickety-click on the Railways. I passed my AOCP late 1937 and first transmitter was 42ECO-42-42/42 with 10 watts input and a Hertz antenna — all CW. Had a 6pm sked daily with Cedric Marley VK4CJ until we were put off air late in 1939.

"During my pre-WW11 amateur days I used to go down and chat with the wireless operators on the sugar ships that came into Bundaberg and saw that was my future — so enrolled with The Marconi School in Sydney for a correspondence course. Obtained my Second Class COPC early 1940 and a couple of weeks later was a 'seagoing wireless operator'. Spent the war years mainly overseas on loan from AWA Marine Dept to Marconi Co and Notraship (Norwegian Government) — then later left the sea and joined Qantas Airways.

"My post-war equipment — well'. Until 1964 — Homebrew! Actually spent a lot of time with Screen-grid and Suppressorgrid Modulation. Then with the Geloso 209 Twins. Then in 1964 my wife got her AOCP — so we went into commercial sideband with a Swan 240. Have been retired for eight years. We now have a Yaesu FT77 and dipoles all over the place, ha!"

After the war Mark held the calls VK2WE, VK2AWE, VK2AYK and since 1964 VK2CM. His main interest is on 80, 40 and 15 metres using both modes. He doesn't chase DX much now, mostly relaxes and rag chews. His outside interest is lawn bowls.

Mark feels that future AR will tend towards CB-type operation — and this will be unfortunate (I agree — AI).

An OM and YF team is always an asset in amateur radio; there should be many more such combinations — so, if you should hear Mark VK4XO/VK2CM or Verle VK2MR on air, give them a shout!

AR

DSB/CW TRANSMITTER FOR 80 METRES

Drew Diamond, VK3XU
Lot 2 Gatters Road, Wonga Park, Vic 3115.

Like to try your hand at building a little double sideband/CW transmitter? A DSB signal is easy to generate, and is a permitted mode (8K00A3E) on all bands. The only difference between DSB and SSB is that both sidebands are transmitted for the DSB signal. By ensuring that the audio is shaped or tailored before it is applied to the balanced modulator, tuning at the receiving end is easy, and an ordinary SSB receiver will resolve it. In addition, the listener has the choice of LSB or USB!

This transmitter was empirically designed using locally available parts. Output power is sufficient to drive previously described linear amplifiers.

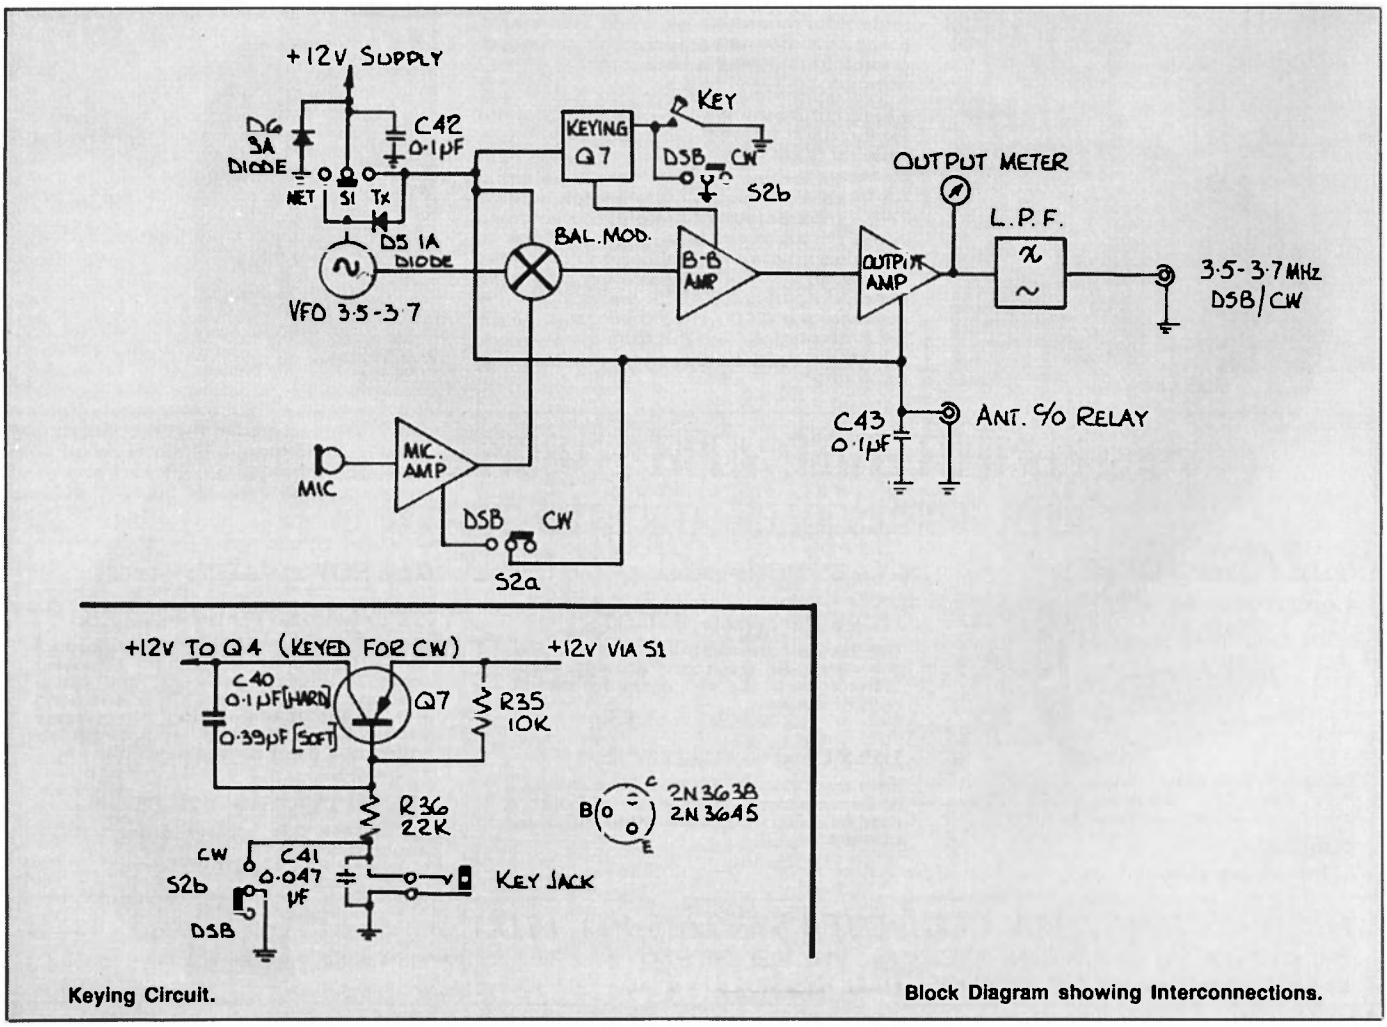
PERFORMANCE

Frequency Range:	3.5 to 3.7 MHz.
Modes:	DSB or CW.
Output Power:	1W PEP DSB, 1W rms CW.
Spectral Purity:	All harmonics at least -50dBc.
Carrier Suppression:	At least 35dB.
Frequency Stability:	Less than 50Hz/5min from cold.
Power Supply:	Nominally +12V at 300mA.

BLOCK DIAGRAM DESCRIPTION

The VFO generates the output frequency, which is adjustable from 3.5 to about 3.7MHz. This frequency is applied to the RF input port of the balanced modulator. Amplified audio energy from the microphone is applied to the AF input port differentially. For DSB operation; the balanced modulator operates in the balanced mode, and produces a DSB signal at the output port. This signal is then raised to about the 1W PEP level by a two-stage broadband amplifier. A low-pass filter is provided to attenuate any harmonics of the RF output signal.

For CW operation; the balanced modulator is deliberately unbalanced to supply a carrier. Keying is obtained by interrupting the +12V supply to the first



Keying Circuit.

Microphone Amplifier and Balanced Modulator.

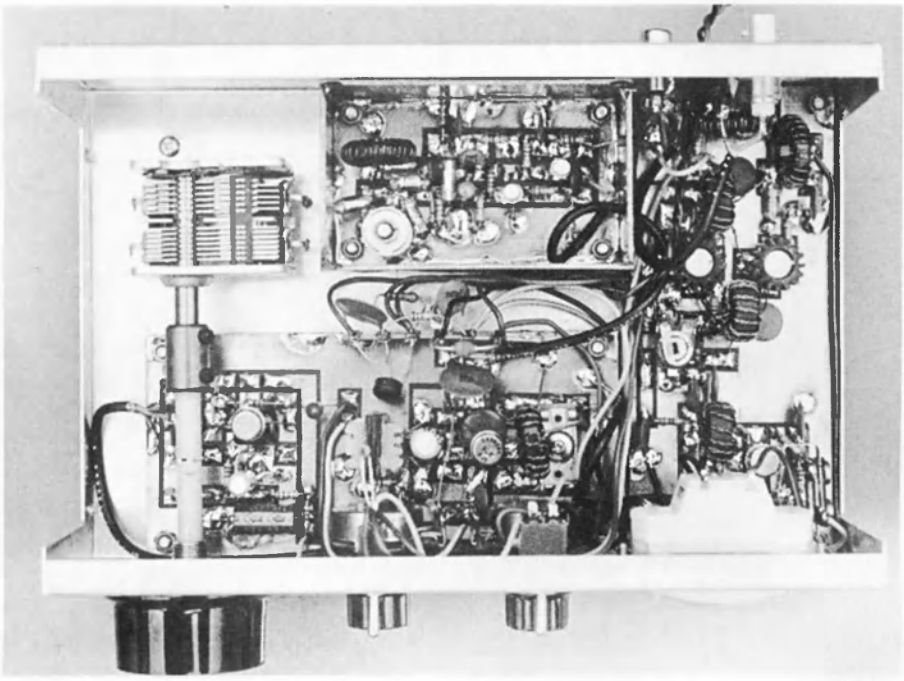
stage of the output amplifier. The AF amplifier +12V supply is removed during CW operation to prevent spurious microphonic noises from being applied to the carrier.

CIRCUIT DESCRIPTION

A Colpitts VFO at Q1 produces the chosen frequency between 3.5 and 3.7MHz, and is buffered by Q2 and Q3. The balanced modulator consists of a CA3028 differential amplifier IC. The speech signal from the microphone is amplified and shaped at U1. High and low audio frequencies are rolled off in this stage to provide a telephony type signal with a minimum of redundant frequencies. This is done so that the DSB signal occupies a minimum of spectrum. The response of the microphone amplifier is determined mainly by C13 (lows) and C14 (highs). T1 applies a differential (or push-pull) signal to the differential input of the balanced modulator at U2. "Carrier" frequency from the VFO is applied to the bal mod in common-mode at pin 2. Precise carrier null is obtained by R20. The resulting DSB signal is extracted with a bifilar tuned circuit at L3 C24 C25, which is tuned to the middle of the band; 3.6MHz. The single-ended broadband amplifier at Q4 has about 20dB gain, and the signal level is raised by this amount before it is applied to the push-pull broadband linear amplifier at Q5 Q6. This output amplifier is very stable and tolerant of poorly matched loads. The amplified signal is passed through a lowpass filter to attenuate any harmonics. For CW operation; the microphone amplifier is switched off, and the bal mod is unbalanced by adjusting R20 to allow some carrier to leak through to the B-B amplifier. This potentiometer is also used to adjust the drive level for the CW mode, so R20 has a dual function. Keying is implemented by interrupting the 12V supply to Q4 in a shaped manner by Q7. The rise and fall time for keying is largely determined by the value of C40. The value shown; 0.1uF, gives hard crisp keying. A larger value, eg 0.39uF would give softer keying.

CONSTRUCTION

Case size depends upon whether an internal or external power supply is required. The prototype uses an external supply, and is housed in a factory-made



case measuring 204mmW x 65mmH x 130mmD. The photo shows how the boards should be arranged inside. It is important that the VFO is kept separated from the output amplifier to prevent leak-through or feedback problems. The placement of an internal supply is not critical but it must be remembered that the power transformer should be located as remotely as practicable from the toroidal inductors, and particularly the audio transformer T1. The cover must have some holes in the top and sides to allow ventilation of Q5 Q6. Protection diode D6 is only required if an external supply is employed.

All components except those for the keying circuit are accommodated upon the copper side of home-made printed wiring boards. The keying circuit components, and D6 C42 may be installed upon a 7-lug tag strip. Diode D5 may be soldered to the tags of S1.

To ensure VFO stability it is necessary that styroseal (poly) and NPO capacitors are used where specified. Of course, silver-mica capacitors may be used if they are available. The same applies to those in the low-pass filter (ordinary disc ceramic capacitors are rather lossy and change their value greatly with temperature, and should therefore be avoided in these applications).

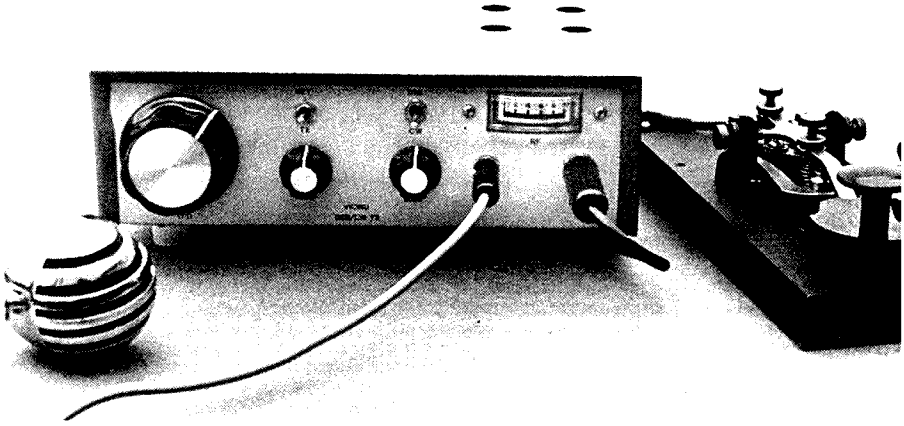
Output Amplifier.



The PWB's may be mounted upon standoffs. Ideally, the VFO should be enclosed in its own little box; but the construction of such a box may be difficult for some, and the cost of die-cast boxes has become rather expensive. The photo shows the compromise reached; The PWB for the VFO has four 25 mm high walls around it as a shield. These are made of double-sided board material. Any other conducting sheet material, such as tinplate, would do. Three holes are required in the walls; one to allow connection to C1, one to admit the coaxial cable carrying the VFO signal, and another to accommodate the +12V VFO supply feedthrough capacitor, C12. VFO inductor L1 should be painted with shellac or dipped in Estapol to ensure mechanical rigidity of the windings.

Broadband transformers T3 and T4 are made as follows: Take three 300 mm lengths of 24 B&S enam wire. Lay them parallel to each other, twist them together at one end and fix that end in a vice. Draw a cloth through the wires to remove any wrinkles, then twist the other ends together and fix the group into the chuck of a hand drill. Whilst keeping the wires taut; turn the drill until there are about three twists per cm. Give the drill a pull to set the twists, then remove the group. Carefully thread them through the specified core until there are about 11 loops. It is essential that the end ol one winding is connected to the start of another winding to form the centre tap (ct). Respective windings may be identified with a multimeter set to ohms. Connections should be double checked before the transformers are soldered into circuit. T2 and L3 are made in a similar way, but with two wires. Once again it is essential that the end of one winding is connected to the start of the other winding. The start of a winding is represented schematically with a dot. L3 is a bifilar wound inductor to provide a balanced load to the output of U2. If Amidon cores are used for T2-T4, they should first be coated with some kind of enamel such as Estapol or shellac to prevent losses due to scratching of the wire enamel. Neosid cores require no treatment. Choke L2 is available ready made from several sources.

The choice of dial drive for the VFO capacitor must be left to the individual constructor. Indeed, it is possible to get by without a reduction drive, and accurate netting is not difficult. If a drive is used, it should be connected to the capacitor shaft via a flexible coupler. As these also have become difficult to obtain, a short length of plastic number 3 (6.5 mm) knitting needle will do the job. Four slots may be cut at right-angles with a hack-saw to give some flexibility.

All tests and adjustments must be carried out with a dummy load connected to the output. This could consist of 2 x 100 ohm 1 W Philips cracked carbon or metal-film resistors connected in parallel and soldered to a male coax connector to suit.

ADJUSTMENT

When construction is complete, and component locations/wiring checked; bias pot R30 must first be adjusted so that the output amplifier draws a quiescent current of about 100mA. This may be done by measuring the current drawn from the 12V supply with S1 in the Tx position and S2 in the DSB position. R20 must first be adjusted as described in Operation below. As this current forms the major component, that drawn from the other parts of the transmitter may be ignored for this purpose (provided of course that no fault exists).

The VFO tuning range is adjusted as follows: With C1 set at full mesh; C4 is adjusted so that the VFO generates 3.500MHz. It should be found that when C1 is at minimum C, the frequency is about 3.7MHz. If greater range is required, C2 may be increased to the next higher value (180 or 220pF). If for some reason C4 does not bring about the required frequency as described above. C3 may be changed to correct the problem. 82pF would raise the frequency, and 180pF would lower it.

L3 is brought to resonance by unbalancing the bal mod with R20 and peaking C24 for maximum output as indicated on M1. This adjustment should be done at about mid-band (3.6MHz).

Feel the heatsinks of Q5 Q6 occasionally to make sure that they are not running too hot to touch. If they do get too hot after some minutes of keyed CW operation; reduce the quiescent bias current.

OPERATION

To operate DSB; S2 is placed in the DSB position, and the carrier bal pot R20 is adjusted for a null as indicated on M1. A more precise null can be obtained by listening to the signal on the station receiver. Whilst speaking in a normal voice; mic gain pot R16 is advanced until M I flicks up to about 3 on a scale of 10. If an oscilloscope is available, the DSB output waveform can be viewed and R16 adjusted to the point where flat-topping just occurs then backed off slightly from that point. The signal should sound clean with a minimum of splatter when it is checked on the station receiver. The operator will have to wear headphones during this set-up to avoid audio feedback problems. Better still — have another person listen to the signal and adjust R16 to a point where maximum undistorted output is obtained.

Incidentally, AM operation is possible by inserting an appropriate level of carrier by careful adjustment of R20.

To operate CW; S2 is placed into the CW position and bal pot R20 is adjusted out of the null position to set the output level required between 0 and 1W.

CONCLUSION

Although 1W may be considered a very low level of power, it is possible to work stations far and wide, and interstate QSO's should be obtained. Later, if desired, a linear amplifier can be added as an "afterburner". Details of two amplifiers have been published, and the author can supply information on these if required.

Send a large SASE, with two stamps please, to the author for a copy of the PWB artwork, component location diagrams and a list of parts and parts sources.

A TELEPHONE THAT DOES WHAT IT'S TOLD

Dials and even push buttons may become a thing of the past on telephone. Instead you will simply tell them to make a call.

Such a phone has already been developed by engineers at the British Telecom (BT) research laboratories at Martlesham Heath in eastern England. It is known there as ASCOT which is short for automatic speech controlled telephone.

ASCOT looks a fairly normal telephone but has a built-in-microcomputer and a tiny display screen which displays the numbers being automatically dialled in response to voice commands spoken into the mouthpiece of a normal handset. The next step Is to get rid of the handset so that users simply speak to the unit.

Up to 50 useful words such as "dial" and "home" can be stored in the telephone's computer memory. Each instrument is at present programmed to respond to the voice of a particular user but eventually the phone is expected to accept instructions from anyone. At the moment, each time it receives verbal instructions it compares the voice pattern with its computer "template" before making the call.

The phone will take over once the user has given the command "dial" followed by the wanted number. Alternatively, frequently used numbers can be stored under a name. This means, for instance, the user simply says "dial home" to get the phone to make a call automatically to his home.

The secret of the new phone is its computerised vocabulary memory which engineers have succeeded in getting into a neat table-top unit little bigger than an ordinary telephone.

BT believes ASCOT is likely to be used initially to help physically disabled people who may not be able to move an ordinary telephone dial or press buttons.

ASCOT could also become a lifesaver by enabling the disabled simply to say "emergency" to the phone, which would be programmed to respond by calling up the police, fire brigade or an ambulance.

FEBRUARY BEST PHOTOGRAPH

In February the judges selected the group of photographs depicting the Red Cross Murray River Marathon. in the centre pages.

The winner at the end of the competition in June will win the Agfa-Gevaert prize of film and video tapes to the value of $100.

CASSETTE LOG PROGRAMME

Neil Cornish, VK2KCN
56 Sherwin Avenue, Castle Hill, NSW, 2154

High on the list of tasks that amateurs purchased a computer for, is log-keeping. To be able to store such information and quickly retrieve it, is the aim of most amateurs. To do so quickly, it is desirable to have a disk-based programme such as my DISKLOG programme printed in AR in December. Programmes that rely on tape storage tend to be too slow to be practical, however, this programme overcomes the speed problem.

```
           AMATEUR CASSETTE LOG
        DE, NEIL CORNISH - VK2KCN

         JAPAN FILE IN MEMORY

  F1 .. LOAD   LOG FILE FROM TAPE
  F3 .. SEARCH LOG FILE IN MEMORY
  F5 .. UPDATE LOG FILE IN MEMORY
  F7 .. ADD TO LOG FILE IN MEMORY
  F2 .. SAVE   LOG FILE IN MEMORY
  F4 .. START  NEW FILE FROM SCRATCH
  F6 .. QUIT   RETURN TO BASIC

 SELECT FUNCTION F1,F2,F3,F4,F5,F6,F7
```

Screen Dump of the Programme Menu.

The TAPELOG programme is designed to store references to your written log in such a way that you can find the details of a prior QSO with any other station in the first minutes of a QSO.

So that the files do not become huge and take time to load, a number of cassettes are used, each with a section of the world on file. The number of cassettes that you choose to use will vary on your operating habits. You could simply have one cassette per continent, or one cassette per ITU zone. For the more active amateur, you may need one cassette per countries, or even one cassette per call area. Probably, you will need a mixture of the above, with some countries needing to be broken up into call areas, whilst some continents (eg. South America) would not make too great a file on one cassette.

Having decided the general outline of the cassette file you wish to create, you will be facing the task of entering your current logbook(s) into the file. The programme has a special function for this task of setting up your computer log, suppose you decide that you need one cassette file for ZL. Run the programme; select the START A NEW FILE function and go through your log entering ZL callsigns and the log page number. When you have entered all the ZL calls in your log the file is SAVED on tape by the programme.

Next you enter, say, previous VK QSO's and perhaps you may need separate cassettes for each call area. This process is repeated until all the log is neatly stored on cassettes. The *programme* is *now ready* to use and as you work DX and make contact with, say, a ZL, you simply LOAD the ZL file from the ZL tape; SEARCH the file for the log page of any prior QSO and then UPDATE the file if the prior QSO is found or ADD to the file if this is the first QSO.

As you can see, a written log is still required, but the restriction of the tape files is paramount and thus the files are kept as brief as possible. The programme is written for the Commodore 64 and allows 500 callsigns per cassette file. More will fit in the 64, but the tape takes longer to read. Splitting your log up as described above will give the SEARCH part of the programme its great advantage . . . SPEED.

For the past active amateur, there is a lot of typing ahead, so, as usual if you would rather use it than type it, $5 for a tape to the author will get one for you. A highly abridged version for the unexpanded VIC-20 (max 250 calls per cassette) is also available from the same source.

AMATEUR RADIO OPERATORS IN THE USA AGREE ON PACKET-RADIO PROTOCOL

The Board of Directors of the American Radio Relay League (ARRL), Newington, Connecticut on 26 October, 1984 approved a standard protocol for amateur packet radio. A document with detailed specifications, *AX25 Amateur Packet-Radio Link-Layer Protocol*, by Terry Fox, is available from ARRL Headquarters for $8.00 US, $9.00 Canada and elsewhere.

This protocol was *developed over a* three-year period by amateur volunteers and amateur packet-radio clubs throughout North America. Earlier versions of the protocol have been in daily use since early 1983 by the approximately 2000 amateur packet-radio stations. Many of these are in populous areas of the US, such as San Francisco, Boston, Miami, and Washington, DC, and others are active in Europe, Africa, East Asia, Australia and New Zealand. Amateur packet-radio enthusiasts ("packeteers") have a wide choice of transmission modes: high-frequency ionspheric, very-high-frequency terrestrial, amateur satellite, and meteor-scatter communications. Transmission speeds are now in the 300 to 1200 word-per-minute range and will be much higher in the near future as new equipment designs are completed.

Although it is early in the development of amateur packet radio, it will eventually become an international integrated network offering a wide variety of data communications services to amateur radio operations. It will be capable of providing the public with emergency communications in times of disaster as amateurs have done for many years by manual message processing. Other network services will be automatic weather reporting, data bases, still photographs, and compressed-bandwidth television.

THUMBNAIL SKETCHES

Alan Shawsmith, VK4SS
35 Whynol Street, West End, Qld 4101

HARRY S DEARNESS VK4KW

Harry S Dearness convinced the PMG he should be allowed to go on air by attaining his AOCP in Mackay, Queensland in May 1939. Unfortunately, as Australia's participation in WWII began in September 1939, like so many others, Harry just got started when he had to 'pull the big switch'; a most frustrating move for those at the height of their enthusiasm.

Again, like so many others, VK4KW enlisted and saw service with the 2/122 Aust Brigade AIF 9th Division 1941-1946.

The war over, Harry continued professionally with electronics as a Radio and TV technician until his recent retirement to the near coastal town of Strathpine, thirty kilometres north of Brisbane.

As an amateur he has remained most active, participating in almost all aspects and activities, one of the latter being JOTA. An all moder, after a period of homebrewing, he now uses Yaesu gear to good effect in DX and contests. A visit to the shack of VK4RM was the catalyst to his interests in AR.

Harry VK4KW lists his other hobby as gardening — which, combined with amateur radio, seems to this writer an *ideal* way to spend one's later years.

AR

HARRY (TIBBY) SCHOLZ VK4HR (SK)

VK4HR was yet another unforgettable character of AR's halcyon days. He was first licensed in Gladstone in 1933 and shortly after moved to Brisbane where he soon made his mark on the local scene.

Harry participated with much success in all levels of the hobby, viz administration, technical and social. He served on the WIA Council in VK4 in more than one capacity; a homebrewer of ability, he constructed both his amateur and broadcast band gear and he was the creator of the very active South Brisbane Radio Club. His DX achievements were legion and many trophies graced his shack.

VK4HR was a good socializer and popular but he possessed a sharp and sometimes cutting wit and the urge to instigate practical jokes. May I relate just one of many — *'Tibby' VK4HR and yours truly worked together for a period as PMG Broadcast Technicians. Another amateur workmate, who shall remain nameless, habitually wore the most outrageous ties to work — vulgar by any standards. 'Tibby's' incisive comments about this enraged him.*

"Aw, cut it!" said the nameless amateur heatedly, unable to stand the jibes any longer.

It so happened that VK4HR was standing at a workbench with a large pair of scissors in his hand. "You said 'Cut it'," inquired 'Tibby'.

"Yes," said the amateur, "I meant it!"

Whereupon, VK4HR simply reached up and cut off the offending necktie at the knot. What followed is not for the print media.

How Harry VK4HR came by his nickname is not known. It could be related to his lack of 'tibia' (shin bone) length. He was slightly shorter than average.

Sadly, post-WWII he fell ill and prematurely went into a long physical decline; his wit, however, remained with him to the end. AR is much the poorer for his passing.

HOW TO CONVERT COMMODORE SYMBOLS FOR USE ON OTHER COMPUTERS

Hove you ever seen a programme that will do just what you always needed only to discover that it was written for the Commodore 64 with all those odd looking symbols that you can't make head or tail of?

So to help in converting C-64 programmes to other micro computers, here are some commonly used symbols, POKEs and other commands for the '64 that must be changed or disused on other computers.

USED IN A PRINT STATEMENT

CLEAR SCREEN HOME - TOP LEFT CORNER OF SCREEN
CURSOR UP CURSOR DOWN CURSOR LEFT
CURSOR RIGHT

REVERSE ON - PRINTS WHITE ON BLACK
REVERSE OFF - PRINTS BLACK ON WHITE

INSERT DELETE

BLACK	WHITE	RED	CYAN
PURPLE	GREEN	BLUE	YELLOW
ORANGE	BROWN	LT RED	DK GREY
MID GREY	LT GREEN	LT BLUE	LT GREY

THESE ARE MOST LIKELY TO BE USED WITH AN IF STATEMENT

F1 KEY	F2 KEY	F3 KEY	F4 KEY
F5 KEY	F6 KEY	F7 KEY	F8 KEY

EACH COLOR ALSO HAS A NUMBER STARTING FROM 0 (BLACK), 1 (WHITE)
ETC IN THE ABOVE ORDER.

POKE 53281,X CHANGES THE INNER SCREEN COLOR.
POKE 53280,X CHANGES THE OUTER SCREEN COLOR.

ANY VALUES POKED BETWEEN 54272 AND 54296 CONTROL THE
THREE VOICES IN THE C-64.
EG. POKE 54296,X CONTROLS THE VOLUME. X MAY BE FROM 0 (OFF) TO 15 (LOUDEST).

EVERY PERIFERAL CONNECTED TO THE COMPUTER HAS ITS OWN DEVICE NUMBER.

1 - CASSETTE 2 - MODEM 3 - SCREEN 4 - PRINTER 5 - 2ND PRINTER
8 - 1ST DISK DRIVE 9,10,11 - ADDITIONAL DISK DRIVES

OPEN 2,4 WOULD OPEN FILE NO. 2 TO THE PRINTER.
PRINT#2,A$ WOULD PRINT A$ ON THE PRINTER.

OPEN 3,8,3,"0:15/12/84,S,R" MEANS ...
OPEN FILE#,DEVICE#,CHANNEL#,"0:FILE NAME,FILE TYPE, DIRECTION"
FILE TYPE IS S FOR SEQUENTIAL.
DIRECTION IS R FOR READ OR W FOR WRITE.

INFORMATION IS READ BY INPUT#3,A$ (OR GET#3,A$ FOR A SINGLE CHARACTER)
OR WRITTEN TO DISK BY PRINT#3,A$

OPEN15,8,15 OPENS THE DISK COMMAND CHANNEL.

INPUT#15,E1$,E2$,E3$,E4$ READS THE DISK ERROR CHANNEL.

E1$ - ERROR NO. E2$ - ERROR NAME E3$ - TRACK NO. E4$ - BLOCK NO.

PRINT#15,"N0:NAME,ID" - REFORMATS THE ENTIRE DISK.
PRINT#15,"C0:NEWFILE=0:OLDFILE" - COPIES A PROGRAM ON THE DISK.
PRINT#15,"R0:NEWNAME=OLDNAME" - RENAMES A FILE.
PRINT#15,"S0:NAME" - ERASE (SCRATCH) A FILE.
PRINT#15,"I" - INITIALIZE.
RETURNS THE DISK TO THE SAME STATE AS WHAEN POWERED UP.
PRINT#15,"V" - VALIDATE.
REORGANIZES DISK TO ENSURE THAT AVAILABLE BLOCKS ARE FREE.

THE @ IN SAVE"@0:XXXXX",8 MEANS THAT THE FILE XXXXX IS TO BE SAVED
OVER THE EXISTING FILE XXXXX

LOCATIONS 1024 TO 2023 ARE SCREEN POSITIONS.
EG. POKE1024,1 WOULD PUT THE LETTER A IN THE TOP LEFT CORNER OF THE SCREEN.

A - Z ARE NUMBERED 1 - 26.
32 TO 63 ARE THE SAME AS THE ASCII/CHR$ CODE.
NUMBERS ABOVE 63 ARE THE SYMBOLS DISPLAYED ON THE C-64 KEYBOARD.

LOCATIONS 55296 TO 56295 CONTROL THE COLOUR OF THE SCREEN POSITION.
EG. POKE55296,1 WOULD CHANGE THE COLOR OF THE LETTER A TO WHITE.

SO YOU'VE BOUGHT A PERSONAL COMPUTER?

Bill Martin VK2COP
33 Somerville Road, Hornsby Heights, NSW 2077

Well, so have I . . . and of course, the first thing you find out is that you're not as smart as you thought you were. Many months of agonising over *which* PC to buy, *what* I wanted it to do for me, what *I* wanted to do to it, and whether the PC and I could come to some arrangement, suitable to both of us. Well, the computer has come to some arrangement alright — it does what it wants to do, when it wants to do it! But, let me say this in my defence; I have learnt a few things about it — let me enumerate them;

I have learnt what a Syntax error is; an illegal variable error; and unpaired bracket error; a multiple statement; a nothing to exec; a mixed mode; a next without for error; an unknown function (?); a bad load (this is a cardinal sin); a can't continue; a gosub stack error, but have not yet received the 'Option Not Fitted' error message.

Not bad, eh? So you can see I've learnt quite a few things about it. (I hope it's not listening at the moment.) I've learnt what 'Hardware' is; I've learnt what 'Software' is; I've learnt all sorts of computer nomenclature and the only thing left to learn about it is **HOW TO OPERATE THE BLASTED THING!**

And I must put a 'pot' across the speaker to wind down the audio on the speaker a little. A couple of times, when I've really been concentrating on serious programming, the rotten thing has BEEPED at me, causing me to nearly fall off the chair! Actually, even today, I took the thing to pieces to do just that, and must admit I was tempted to leave it in pieces, so it couldn't insult me any further! Anyway, there I was, with the covers off, and still no evidence of the speaker, or it's connections. Not being a person who is easily daunted, (I am the holder of the AOCP), I continued with the screwdriver, and removed the top board . . . HORRORS! The speaker is under the 'Mother board'.

Consider, for a moment, the situation . . . here I am, with the computer in complete disarray on the bench; my brain working overtime to try and keep up with what I'm trying to do; a top board full of IC's shaking in my trembing hands, AND STILL CAN'T GET AT THE SPEAKER.

By this time, you're probably thinking *"Well, he's outsmarted himself this time."* Not so . . . I have exigency plans for just this type of situation: I simply put every bit back together, and attack on a future occasion, when I have had time to think about it.

And that is exactly what the situation is at the moment. As a matter of fact, when I come to think about it, the audio level of the speaker is not so bad — I think I could learn to live with it, in time . . . But the BITS, BYTES, POKES, PEEKS, PIXELS, et al, I think (on reflection) may just prove too much for me. However, my address is in the call-book, and I am always open to advice and suggestions from those who have more of a flair in these matters than I do.

On the plus side, (in case you thought I had been regretting the purchase of the PC), my children think it's marvellous, with it's games, etc. And it looks good in the shack — impresses the itinerant visitor; dresses up the decor; and leaves friends with the impression that *"he must be smarter than I thought"*. As is my wont, I don't relieve them of their erroneous ideas — I simply blind them with computer double-talk and leave them thinking that I am some sort of electronic high-brow. (HI HI). If only they knew — Of course, anyone who knows me won't be fooled. They all realise my capabilities, as I do (SIGH).

IN CONCLUSION: (As they say in the equipment reviews), I would certainly recommend the purchase of a personal computer for the average amateur, and, everything else aside, it is a good companion when the solar cycle is at the bottom of the graph. In short, you have HF, SSB, CW, VHF possibly, and NOW — computership, glass RTTY, Keyboard CW, and all sorts of goodies.

Buy a computer, by all means, just don't ask me what brand to buy, or how to operate it!

AR

DOC WARNS ABOUT ILLEGAL LINEARS

An investigation had found that a number of taxis in the Sydney area had been installed with linear amplifiers in an effort to increase the range of their radio and as a result get more jobs.

A DOC spokesman said use of linear amplifiers by some Sydney taxis caused interference to other radio communications services, harmed radio frequency management, and made taxi drivers liable to prosecution.

The problem had first arisen about two years ago, but reports of interference had increased significantly over the past six months.

DOC had warned it would crack down if the amplifiers were not voluntarily withdrawn.

Unauthorised use of a linear amplifier is illegal under the Wireless Telegraphy Act 1905 and operators can face penalties including confiscation of equipment and a fine of up to $1,000.

Fines would increase to $10,000 under the new Radiocommunications Act which will take effect this year. Under this Act it will also be illegal to install such equipment without authorisation.

MORE ON MURPHY

I have always been curious to know just how it came about that Murphy got lumbered as the poor fellow responsible for all the snags that seem to be an intrinsic part of electronics.

Readers may remember, that in an earlier column, I described how a social misfit named MUR-FE, deported from the land of the Pharaohs of Egypt, finally found his way to the 'Land of the Shamrocks'. Finding the Emerald Isle very much to his liking, he set about this favourite pastimes of procreating, imbibing and spoiling others fun. It is claimed that all those going under the name of Murphy are descendants of this particular Arab.

Now, by another stroke of luck, I have come across the activities of one of his twentieth century descendants. Christened Michael Meehan Murphy, born into the modern era of Science and Technology and claiming to be an electronics engineer, he developed one of the most profound concepts of this new age — MURPHY'S LAW. His real contribution to S&T lay not merely in its discovery but in its universality, application and impact. The law itself is inherently simple but it will form the foundation on which future engineers will build.

In short the law says: "If anything can go wrong, it will".

Michael Meehan Murphy has provided endless examples of the universality of Murphy's Law.

Unfortunately, Mr Murphy fell victim to his own law. He overlooked the fact it applies to *all* things — and not solely to inanimate objects. While avidly courting a lady to whom he had no intention of honorably pledging his troth, she informed him one day there was to be an heir to his hard-won estate. The photo of Mr Murphy was taken just after he received the news. His expression reminds this author of the fellow who read the following in his local village rag —

"Would the young gentleman with moustache and thinning hair, who met the small blonde lady in Brighton last year, please contact her . . . he will hear something that will wipe the smile from his face!"

AR

MURPHY

Beware the fate of Harry Steed,
— was warned, but wouldn't heed;
That Murphy does his nasty best,
Just before a big contest
He's out, a-spoiling bent
Sabotaging some event —
Or messing up the beam, or gear.
So have a thought and a fear
Touch naught that has no need —
Lest you wind up like Harry Steed,
Who spent the week-end on repair
But never did get back on air.

"FORGOTTEN GENIUS"

By G. Mowat, ZS5KL

History praises such pioneers as Marconi, Edison, Graham Bell to name a few, but one man, Nikolas Tesla often unknown and delegated to the back pages of scientific journals, is responsible for a gigantic measure of scientific and industrial progress that has taken place during the past eighty years.

In the words of Tesla's biographer, John O'Neill, this is the man who gave us the twentieth century. This truly remarkable genius invented or described in detail alternating current, the modern AC induction motor, the electron microscope, the turbine, a system of arc lighting, neon and fluorescent lighting, radar forty years before it was "invented", high frequency currents that are in universal use in the medical and industrial fields, remote control by radio, harnessed the mighty power of Niagara falls, produced huge artificial lightning bolts, described the laser sixty years before it became a reality. He also lit 200 electric lights at a distance of twenty five miles WITHOUT connecting wires and in 1898, demonstrated the working principles of wireless and described in detail the radio controlled rocket forty five years before the Germans used it in World War 2.

Tesla rejected the Nobel Prize, not from vanity, but because he would have shared it with Edison who, much to his later regret, had spurned alternating current and belittled Tesla's work in this new sphere. Living in poverty, Tesla tore up a contract worth many millions of dollars because it would have caused heavy financial loss to a friend.

Tesla died in 1943, alone and in poverty in a seedy hotel room in New York, ignored and swindled by the twentieth century world he helped create.

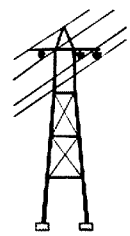
A strange, lonely man who never married, Nikolas Tesla was born in 1856 in the town of Smiljan, Austria Hungary (now Yugoslavia). He choose electricity as a career and attended the University of Prague. After graduation he secured employment as a draughtsman in Budapest and later moved to Paris where he worked as a telephone engineer. It was at this time Tesla worked out his idea of an induction motor that ran off alternating current, hitherto declared impossible by the scientists of the period as it necessitated a rotating magnetic field. Direct current motors then in use were cumbersome and heavy, the commutator and brush assembly an additional drawback which required frequent cleaning and replacement as they used a form of soft carbon. Tesla constructed his first AC motor in 1883 which he immediately patented.

In 1884 he emigrated to the United States where he shrewdly realised all future, major electrical development would take place.

After landing in New York, Tesla through a letter of introduction, secured employment with Edison. Their characters were in direct contrast with each other and inevitably, friction developed. Thomas Edison was dedicated to his direct current system and refused even to consider the alternative AC method. Tesla realised the severe limitations of the DC network with a generating station in each precinct. Power distribution outside a relatively small area being impossible without voltage loss and heavy, cumbersome power lines.

In 1887 Tesla parted company with Edison and for a period worked as a ditch digger before opening a very modest workshop which he named, The Tesla Electrical Company. It was here, although hamstrung by very limited finances, he produced many improved motors working on single, two and three phase AC systems. At this time Tesla was contacted by George Westinghouse of the Westinghouse Electric Company who offered to purchase the existing AC patents for a million dollars, plus royalties of one dollar per horsepower of future generating potential. Tesla accepted the offer and the foundations of a giant nationwide electrical network were laid. A firm friendship sprung up between the two men in direct contrast to those which existed between Tesla and Edison.

In 1893 the huge World Exposition in Chicago was illuminated by alternating current and Westinghouse secured the contract for development of the Niagara Falls power system. It was not that the full implications of the Tesla contract was realised by attorneys acting for George Westinghouse. They pointed out that the dollar/horsepower clause was not feasible when huge power systems were constructed. It was impractical and would bankrupt the Westinghouse company. Reluctantly Westinghouse explained the predicament to Tesla who immediately tore up the contract, thereby giving up claims to many millions of dollars of future income.



Nevertheless, Tesla threw himself into new development work and produced many inventions, especially in the high frequency current fields. He unfortunately failed to file patents for these, much to his everlasting regret and in later years these same developments were blatantly pirated around the world. Even the famous Tesla HF coil was not protected by patents.

After discovering "terrestial stationary waves", Tesla's burning ambition was the transmission of power without wires and the broadcasting of intelligence by wireless waves, culminating in a world wide power and broadcasting network. In 1892 he described in minute detail the electronic valve several decades before it was "invented". It was during this period that Tesla was able to demonstrate publicly the transmission of HF power without wires to light two lamps. Neon and fluorescent tubes were illuminated in public, all without the vital patent protection. He was able to demonstrate in his laboratory what he called "special radiation" waves which were able to penetrate metal and register on a photographic plate. Again he had made a revelation three years before Rontgen in Germany announced his discovery to the world of X-rays.

Another of Tesla's inventions was what he called his "telegeodynamic oscillator". This device, operated principally by compressed air, was able to shake buildings violently in the immediate neighbourhood of his laboratory identical to an earthquake. As the oscillations built up in strength, complete buildings rocked about shattering glass and peeling plaster off in sheets, water and gas pipes sheared and the panic stricken populace rushed into the streets convinced New York was in the grip of a major seismic quake. Only police intervention stopped the experiment and the destruction of the area. It is not recorded what the aftermath of the experiment produced, but Tesla claimed he could destroy the tall Chrysler building (then New York's highest) in thirty minutes using a total of 2½ horsepower to drive his oscillator.

He also claimed by using a modified version of his oscillator, it could be used to locate ore and oil deposits far underground. Another "first" by over forty years when a similar method using small controlled explosions was used by geologists to locate ore, water and oil.

In 1898 he publicly demonstrated his remote controlled model boat at Madison Square Gardens using "wireless" control and power. The demonstration was an unqualified success and the experts were agog over his servo mechanisms which altered the direction and speed of his model boat. The transmitter and receiver were separated by several hundred feet and the boat carried bow and stern lamps lit by remote power. Again this experiment was forty years ahead of identical methods used by guided missiles, pilotless target planes and torpedoes. Once again patent rights were not taken out to protect these important developments.

In 1899 Tesla, with finance provided by J P Morgan, moved his workshop to Colorado Springs. The building was constructed on the summit of a small mountain with power supplied by the local generating station in the nearby town. Here he constructed a giant Tesla coil which built up a potential of 12 million volts creating miniature lightning flashes 135 feet long. During one experiment he delayed throwing the discharge switch and promptly burnt out the alternators at the town generating plant. Nothing daunted, he rewired the damaged alternators within a week and carried on with his experiments! Further finance was provided by Colonel John Astor and eventually Tesla moved his laboratory back to New York. As his work failed to show returns over the investments provided by Morgan and Astor and coupled with the failure to secure patent protection, both these wealthy men withdrew their sponsorship and Tesla found himself without a backer. Only very small occasional grants were forthcoming and Tesla was forced through circum-

stances to abandon his dream of a world power and broadcasting network.

In the period between 1906 and 1914 Tesla began to develop the turbine. He joined forces with the Allis Chalmers company in this venture which after a period, failed because of his abrasive personality and his determination not to commit anything in writing or on paper. Although the Tesla turbine was different in design to the now accepted type, it differed only with the blade construction. Once again, Tesla made nothing out of his work on the turbine.

In 1917 during a lecture tour he theoretically demonstrated the main principles of radar and earlier, had demonstrated in his laboratory, how wireless waves could be deflected by metal objects. Again, radar was anticipated by over thirty years.

Following a disastrous fire which destroyed his New York laboratory and workshop, Tesla was hamstrung by lack of finance which prevented him from developing new inventions. His cardinal error was failure to secure patent protection and whilst manufacturers made fortunes from his ideas and developments, the man who had invented them grew poorer and poorer.

In 1915 Tesla made an unsuccessful attempt to obtain a court injunction against Marconi. Tesla maintained he had demonstrated in theory and in practice wireless transmission as far back as 1890. However, in later years the US Supreme Court reversed the decision and upheld Tesla's claim and cancelled Marconi's patents on the grounds that they had been anticipated and demonstrated by Tesla long before the patent rights had been issued. This momentous decision by the courts did nothing to aid Tesla financially.

His last serious work was the development of the so called "death ray", which some believe was an early attempt to produce a laser. Others maintain it was a development of a high frequency, concentrated beam of some sort that was powerful enough to stop an internal combustion engine or cause serious burns and even death, to anyone who stood in its path. Unfortunately, Tesla never committed anything to paper except for a few odd notes. His agile brain stored every detail of his many creations and he could totally recall ideas and data years later.

Even his own laboratory assistant knew little of a particular project as Tesla never discussed anything in detail. The assistant worked under direction and instruction knowing almost nothing of the details until the particular scheme was completed. With very good reason Tesla was highly suspicious of having his ideas stolen and pirated by others.

As he was unable to develop genuine friendships with others, particularly women, he was branded as distant, cold and without emotion. Shunned and cheated by the industrial world he helped create, plagued by poor health and almost penniless — his only friends were the pigeons of New York. With these birds he was able to demonstrate an unknown side of his character — that of love and affection. The answer to this enigma possibly lies in his complete lack of faith and trust with his fellow men who, almost without exception, openly used him and his remarkable talents, discarding him when his usefulness was over.

When he was unable to feed the pigeons himself because of illness, Tesla engaged a messenger boy to perform the duty for him. He befriended these birds and went to any length to provide them with food and care, sometimes to his own detriment. To one particular white pigeon Tesla was very attached and a special understanding and bond developed between them; almost a unique relationship, but founded on complete trust between man and bird.

One day this bird flew into the room and Tesla instinctively knew it was dying and had come to bid its friend farewell. He was heartbroken and disconsolate over its death and for days he wandered moodily about the streets grieving his loss.

His health gradually deteriorated and he breathed his last on a frosty morning in January, 1943. It is said that when he died a great wave of pigeons rose up into the cold, wintry New York sky as a farewell and tribute to their friend and benefactor.

When next you are out beyond the city limits, observe the power lines with their sentinel pylons that march across the countryside bringing power to homes and industry. These are indeed a reminder, as well as a lasting monument, to the man who gave us the twentieth century.

Nikolas Tesla, the forgotten genius . . .

Amateur Radio Abbreviations

These abbreviations are frequently used throughout this magazine and other amateur radio publications. They are printed here to assist new amateurs and amateurs-to-be. The abbreviations appear throughout many articles and also in Hamads.

A — ampere
AC — alternating current
ACNF — **AMSAT** co-ordination and network frequency
A/D — analog-to-digital
AF — audio frequency
AFC — automatic frequency control
AFSK — audio frequency-shift keying
AGC — automatic gain control
AH — ampere hour
AH — after hours
ALC — automatic load (or level) control
AM — amplitude modulation
am — morning
AMSAT — Radio Amateur Satellite Corporation
AMTOR — amateur teleprinting over radio
ANL — automatic noise limiter
AOCP — Amateur Operator's Certificate of Proficiency
AOS — acquisition of signal
AR — Amateur Radio Magazine
ARA — Amateur Radio Association
ARC — Amateur Radio Club
ARES — Amateur Radio Emergency Service
ARRL — American Radio Relay League
ARS — Amateur Radio Society; Amateur, Radio Station, amateur radio service
ASCII — American National Standard Code for Information Interchange
ASSC — Amateur Satellite Service Council
ATV — amateur television
AVC — automatic volume control
AWG — American wire gauge
az-el — azimuth-elevation

BASIC — beginner's all-purpose symbolic instruction code (computer language)
Balun — balanced to unbalanced transformer
B — Byte; a group of bits or binary digits, usually eight
BC — broadcast
BCD — binary-coded decimal
BCI — broadcast interference
BCL — broadcast listener
BH — business hours
BIT — binary digit
BFO — beat-frequency oscillator
BPF — band-pass filter
BPL — Brass Pounders League
Bps — bits per second
BPT — bipolar transistor
BW — bandwidth
BWL — loaded bandwidth

C — Celsius
CAC — Contest Advisory Committee
CATVI — cable-television interference
CB — citizens band
CCIR — International Radio Consultative Committee
CCITT — Consultative Committee for International Telegraph and Telephone, a part of **ITU**
CCW — coherent cw; counterclockwise
Ch — channel
cm — centimetre
CMOS — complementary-symmetry metal-oxide semiconductor
coax — coaxial cable or connector

COR — carrier-operated relay
CPU — Central Processing Unit
CRRL — Canadian Radio Relay League
CRT — cathode-ray tube
CSMA — carrier sense multiple access
CT — center tap
CTCSS — continuous tone-coded squelch system (**PL**)
CW — continuous wave (code); clockwise

D/A — digital-to-analog
dB — decibel
dBc — decibels referenced to carrier level
dBd — antenna gain referenced to a dipole
dBi — antenna gain referenced to isotropic; a dipole has a gain of 2.14 dBi
dBm — decibels referenced to 1 mW
DBM — doubly balanced mixer
DC — direct current
DEMUX — demultiplexer
DF — direction finder; direction finding
DIP — dual in-line package
DOC — Department of Communications
DPDT — double-pole double-throw
DPST — double-pole single-throw
DSB — double sideband
DTL — diode-transistor logic
DTMF — dual-tone, multi-frequency
DVM — digital voltmeter
DX — long distance
DXAC — DX Advisory Committee
DXCC — DX Century Club

E — voltage
EAROM — electrically alterable read-only memory
ECL — emitter-coupled logic
ECO — electron-coupled oscillator
EHF — extra high frequency
EIRP — equivalent isotropically radiated power; erp referenced to an isotropic antenna
el — element
EME — earth-moon-earth (moonbounce)
EMF — electromotive force (voltage)
EMI — electromagnetic interference
EMP — electromagnetic pulse
EOC — emergency operations center
EPROM — erasable programmable read-only memory
EQX — equator crossing
ERP — effective radiated power
EUV — extreme ultraviolet radiation

f — frequency
F — farad; Fahrenheit
FAX — facsimile
FCC — Federal Communications Commission
FD — Field Day
FET — field-effect transistor
FF — flip-flop
FL — filter
FM — frequency modulation
FMT — Frequency Measuring Test
FSD — full-scale deflection
FSK — frequency-shift keying
ft — foot

g — gram
GaAs FET — gallium arsenide field-effect transistor
GDO — grid-dip or gate-dip oscillator
GHz — gigahertz
gnd — ground

h — hour
H — henry
HAAT — height above average terrain
HDLC — high-level data link control
HF — high frequency
HFO — heterodyne-frequency oscillator
HI — greetings
HPF — highest possible frequency
Hz — hertz

I — current
IARU — International Amateur Radio Union
IC — integrated circuit
Id — identification, identifier
ID — inside diameter
IF — intermediate frequency
IMD — intermodulation distortion
In — inch
In/s — inches per second
I/O — input/output
IRAC — Interdepartment Radio Advisory Committee
IRC — International Reply Coupon
ISB — independent sideband
ITU — International Telecommunication Union
IW — Intruder Watch

J — joule
j — indicator for reactive component of an impedance (+j inductive; −j capacitive)
JFET — junction field-effect transistor

K — kilobyte, Kelvin
k — kilo, 1000
KB — keyboard
kg — kilogram
kHz — kilohertz
km — kilometres
km/h — kilometres per hour
kV — kilovolt
kW — kilowatt
kWh — kilowatt hour

LAOCP — Limited Amateur Operator's Certificate of Proficiency
L — inductance
lb — pound
LC — inductor-capacitor
LCD — liquid crystal display
LED — light-emitting diode
LF — low frequency
LMO — linear master oscillator
LO — local oscillator
Loran — long-range navigation
LOS — loss of signal
lp — log periodic
LPM — letters per minute
LSB — lower sideband
LSI — large-scale integration
LUF — lowest usable frequency

m — metre (distance or band)
M — mega
mA — milliampere
mAh — milliampere hour
MARS — Military Affiliate Radio System
MDS — minimum discernible signal
MF — medium frequency
mH — millihenry
MHz — megahertz
mi — mile
mic, mike — microphone
mini-DIP — dual in-line package, 8 pins
mph — miles per hour
mps — miles per second
mix — mixer
mm — millimetre
MO — master oscillator
modem — modulator/demodulator
MOS — metal-oxide semiconductor
MOX — manually operated switching
ms — millisecond
m/s — metres per second
MSB — most-significant bit
MSI — medium-scale integration
MSTV — medium-scan television
MUF — maximum usable frequency
MUX — multiplex; multiplexer
mV — millivolt
mW — milliwatt

NAOCP — Novice Amateur Operator's Certificate of Proficiency
NBFM — narrow-band frequency modulation
NBVM — narrow-band voice modulation
NCS — net control station
NF — noise figure
nH — nanohenry
NiCd — nickel cadmium
NL — noise limiter
NMOS — n-channel MOS device
NPN — negative-positive-negative
NPRM — Notice of Proposed Rule Making
ns — nanosecond
NTS — National Traffic System (ARRL).
NZART — New Zealand Amateur Radio Transmitters
OD — outside diameter
OM — old man
op amp — operational amplifier
osc — oscillator
OSCAR — Orbiting Satellite Carrying Amateur Radio
OTA — operational transconductance amplifier
OTC — Old Timer's Club
oz — ounce

p/pp — page/s
P — power
PA — power amplifier
PC — printed or etched circuit
PCB — printed circuit board
PEP — peak envelope power
PEV — peak envelope voltage

pF — picolarad
Ph — phone
PIV — peak inverse voltage
pk — peak
pk-pk — peak-to-peak
PLL — phase-locked loop
PM — phase modulation
pm — afternoon/night
PMOS — p-channel MOS device
PNP — positive-negative-positive
pot — potentiometer
ppd — postpaid
PROM — programmable read-only memory
PRV — peak reverse voltage
PSK — phase-shift keying
PSU — power supply unit
PTO — permeability-tuned oscillator
PTT — push-to-talk
PV — photovoltaic
PVC — polyvinyl chloride

Q — reactance — resistance ratio
QCWA — Quarter Century Wireless Association
QRP — low power (less than 10-W input)
QTHR — address correct in current WIA Call Book

R — resistance
RAM — random access memory
R/C — radio control
R-C — resistor-capacitor
RCC — Rag Chewers Club
rcvr — receiver
rev/min — revolutions per minute
RF — radio frequency
RFC — radio-frequency choke
RFI — radio-frequency interference
RI — radio inspector
RIT — receiver incremental tuning
RM-(number) — number assigned by FCC to a petition for rule making
RMS — root-mean-square
ROM — read-only memory
RS — Radiosport Satellite (USSR)
RSGB — Radio Society of Great Britain
RST — readability-strength-tone
RTL — resistor-transistor logic
RTTY — radioteletype
Rx — receiver

s — second
SAE — self-addressed envelope
SASE — stamped s.a.e.
SCR — silicon-controlled rectifier
SET — Simulated Emergency Test
SHF — super-high frequency
SM — silver mica (capacitor)
SNR or S/N — signal-to-noise ratio
SPDT — single-pole double-throw
SPST — single-pole single-throw
SS — Solid State
SSB — single sideband
SSC — Special Service Club/AMSAT Phase III special service channels
SSTV — slow-scan TV
STD — subscriber trunk dialling
SWL — shortwave listener
SWR — standing-wave ratio

sync — synchronous, synchronizing
SYNCART — synchronous satellite carrying Amateur Radio transponder
TA — technical advisor
TC — technical co-ordinator
TCA — time of closest approach
Tcvr — transceiver
THz — terahertz
THD — total harmonic distortion
tpi — turns per inch
T-R — transmit-receive
T-T — Touch-Tone
TTL — transistor-transistor logic
TTY — teletypewriter
TV — television
TVI — television interference
Tx — transmitter
UHF — ultra-high frequency
UJT — unijunction transistor
UoSAT — University of Surrey educational/research satellite (Great Britain)
USB — upper sideband
UTC — Universal Co-ordinated Time
V — volt; voltage
VCO — voltage-controlled oscillator
VCXO — voltage-controlled crystal oscillator
VFBO — variable-frequency beat oscillator
VFO — variable-frequency oscillator
VHF — very-high frequency
VLF — very-low frequency
VMOS — vertical power FET
VOM — volt-ohm-milliammeter
VOX — voice-operated switching
VR — voltage regulator
VSWR — voltage standing-wave ratio
VTVM — vacuum-tube voltmeter
VXO — variable crystal oscillator
W — watt
WAC — Worked All Continents
WARC — World Administrative Radio Conference
WAS — Worked All States
WBFM — wide-band FM
WPM — words per minute
wVOC — working voltage, dc
X — reactance
xcvr — transceiver
xvtr — transverter
xmtr — transmitter
xtal — crystal
XYL — married lady
YL — young lady
Z — impedance
Z — see UTC
5BDXCC — Five-Band DXCC
5BWAC — Five-Band WAC
6BWAC — Six-Band WAC
5BWAS — Five-Band WAS
° — degrees
α — alpha; angles; common-base forward current-transfer ratio of a bipolar transistor
β — beta; angles; current gain of common-emitter transistor amplifiers
γ — gamma; angles
Δ — delta; increments
ο — gamma; angles
ε — epsilon; base of natural logarithms (2.71828)
θ — theta; angles
λ — lambda; wavelength; longitude
μ — mu; micro (10^{-6}); amplification factor; permeability
μP — microprocessor
π — pi; 3.14159
Σ — sigma; summation
τ — tau; time constant; time phase displacement
φ — phi; angles; latitude
Ψ — psi; angles
Ω — omega; resistance in ohms
ω — omega; angular velocity, $2\pi f$
33 — fondest regards (between females)
73 — best regards
88 — love and kisses

THUMBNAIL SKETCHES

Alan Shawsmith, VK4SS
35 Whynot Street, West End, Qld 4101

R JOHN THORLEY VK4RT

There are those amateurs who, into whatever era they are born, are destined to leave their mark upon it. One such was R. John Thorley VK4RT who first gained his AOCP in 1936 while residing at the suburb of Annerley, Brisbane.

John was a Mechanical Engineer by trade, consequently homebrewing presented few problems to him. His immediate post-WWII four element wide spaced Yagi atop a tall slender lattice tower, built by his own hands down to the last nut and threaded bolt, stood as a symbol to his ability. His first receiver and transmitter was the usual 1-V-1 and MOPA —but he soon advanced to using war disposals gear and a Hallicrafters SX28 Receiver (one of the most popular amateur sets ever produced).

VK4RT had the honor of serving a term as VK4 WIA President, early post-WWII. He also capably handled the Disposals Equipment Department. John was a very able 'after dinner speaker' — an ability which qualified him admirably for the job of President and one he used on every possible occasion to promote the WIA and AR.

He was a keen DXer, close to the top of the ladder when active and always maintained that his interest in AR was first stimulated by Fred VK4RF, another keen DXer.

Professionally, John VK4RT was self-employed, running his own engineering shop for many years. Eventually he sold out and accepted work less exacting and taxing, ie: a commercial traveller in mechanical hardware. It was in the course of this duty that he met with a fatal road accident, thereby sadly cutting short a promising career in his work and amateur radio, in the prime of his life. He was acutely missed by this writer, a personal friend. **AR**

Newspaper Clipping of John's Exploits.

Spoke to 70 friends in 35 countries—all in 24 hrs

By a Staff Reporter, who "sat in" with a "ham" during the week-end's long-distance contest.

JOHN THORLEY, of Emma Street, Holland Park, yesterday "travelled" the world scores of times at 669,600,000 miles an hour.

And he had plenty of time to stop and talk to more than 70 friends in 35 foreign countries.

John is not a miracle man. He is just one of about 1000 radio "hams" in Australia and New Zealand who did the same thing yesterday.

They were competing in a long-distance contest arranged for all Australasia "hams" by the wireless associations of both countries.

Their aim was to log the most foreign stations in 24 hours.

Five-hour break

John began at 6 pm on Saturday, and apart from a forced five-hour break due to interference, did not leave his transmitter until 6 pm last night.

Yesterday I watched him steer his 186,000 miles-a-second voice waves to all parts of the globe.

Walo, in Chile (South America), 8000 miles away, was "just going to bed." He apologised for his bad English, and wished John the best of luck.

"Charlie" in Portugal, 12,000 miles away, wished Brisbane "good morning" in broken English. It was good weather in Lisbon, he said.

"Good hunting"

Glib American "Harry," from Honolulu, said: "Good hunting, John. Boy, you're sure coming over fine."

John wished them "all the best from Brisbane" and promised to "see" them again when he had more time to "yarn" at length.

He exchanged a number with each station operator he contacted, and they exchanged one with him.

All foreign "hams" will forward their logs to the Australian Wireless Institute and John's final tally of calls can be confirmed.

Among countries he spoke to yesterday were: Germany, Japan, French Morocco, Switzerland, Israel, Spain, Lebanon, France, Italy, Brazil, Ecuador, and Peru.

Results of the contest will not be known until about March next year.

FOOTNOTE: John, who owns a small city engineering shop, bought about £200 worth of equipment from army disposals to build his home radio station. "It is purely a hobby," he said

HOLLAND PARK radio "ham" John Thorley did not leave his radio set for lunch yesterday during his marathon talk with overseas enthusiasts.

SAFETY RECALL NOTICE

Purchasers of **Six Outlet** power boards marketed under the 'Click' brand name and marked **Series 106** are warned that they are unsafe to use. Purchases may have been made between 21st September, 1984 and 14th December, 1984 from Target Stores. Please return for free replacement from the store of purchase. The new model marked Series 106B now on sale is completely safe to use and is covered by Certificate of Suitability CS/436/Q.

Please note: This Safety Recall applies only to 'Click' 6-way White Power Boards marked Series 106, not to 'Click' 4-way Power Boards or any other 'Click' product. The replacement model Series 106B is completely safe to use.

Click Industries Pty Ltd 297-305 Victoria Street, Brunswick Victoria 3056. Phone (03) 387 2499

NOVICE NOTES

JUST A PIECE OF WIRE

Ron Cook, VK3AFW
Technical Editor

Well here I am for my first appearance in 1985 — better late than never! As I first started out in amateur radio on VHF at a time when home-brewing was essential I automatically cast a critical eye over any piece of wire carrying RF. Consequently I have avoided some problems which can be very puzzling to those that encounter them.

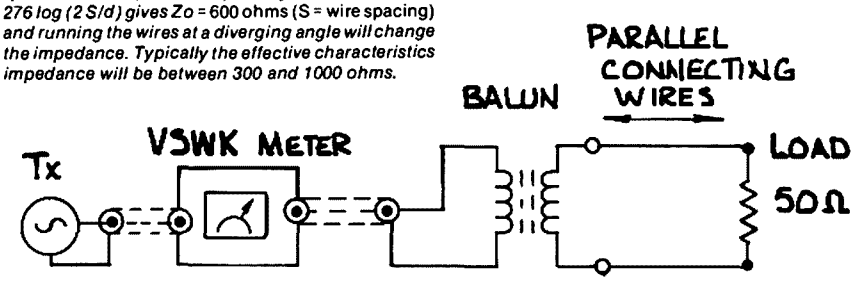
Any piece of wire has inductance, even if it is quite straight; the longer the wire the greater the inductance. A piece of wire only 100 mm long and 0.1 mm in diameter has an inductance of 0.1 microhenry. Further all pieces of wire have some capacitance associated with themselves and their surroundings. When you build equipment such as an ATU or antenna you are likely to use some reasonably heavy gauge wire for interconnections. The wire makes the connections but also adds some unwanted inductance and capacitance. In the case of the ATU it is unlikely to be noticed as the ATU will tune it out. In the case of an antenna you may not be so lucky. Suppose you have bought or built a balun to match your 50 ohm coaxial cable to the dipole of a beam. You will use some wire to connect the appropriate terminals of the balun to the dipole element. *What can go wrong?*

Well if that is all you do, and if the wires are of equal length and as short as you can conveniently make them, probably you will notice no ill effect. The beam may be resonant a little lower than you expected but it will probably work very well. Now suppose that you wanted to check the balun prior to installation, which you would probably want to do if it were home brew.

Firstly you would obtain a balanced 50 ohm load that was non-reactive at the test frequency. Next you would get a VSWR meter that was reasonably accurate at the test frequency, you would connect the load to the balun with two equal length pieces of wire and measure the VSWR with the lowest power level necessary to give accurate readings. Remember that most VSWR meters use diodes and these need up to 0.6 volts to make them conduct. Using too little power can give a better VSWR reading than actually exists. Test this out yourself by comparing the results for a VSWR of about 1.3:1 measured with just enough power to get FSD in the "Set" condition and again with the power level at maximum. Most VSWR meters will give a more optimistic reading at the lower powers.

Well let's assume that you can make accurate VSWR measurements. You may be dismayed to find that your "Yewbeaut" balun appears to introduce a VSWR of 1.3:1 or more. Actually the problem is most likely those two short pieces of wire. If they are around 40 mm long and the test frequency is 28 MHz then they would account for all of the VSWR.

Figure 1(b) Assumed Test Arrangement
The connecting wires were taken to be 14 SWG spaced 121 mm (4.8 inches). Using the formulae Zo = 276 log (2 S/d) gives Zo = 600 ohms (S = wire spacing) and running the wires at a diverging angle will change the impedance. Typically the effective characteristics impedance will be between 300 and 1000 ohms.



What happens is that the two pieces of wire appear to be a short length of open wire transmission line. To analyse what happens I chose two 14 gauge wires spaced 121 mm apart. This gives an impedance of 600 ohms. Next, using a programme supplied by Evan VK3ANI, I set to work with my calculator. Fig 1 shows the assumed test setup which is as discussed earlier.

Electrical length (degrees)	Length at 28 MHz		VSWR seen by balun
	mm	inches	
0	0	0	1.00
1	29.8	1.17	1.23
2	59.5	2.34	1.51
3	89.3	3.5	1.85
4	119.0	4.7	2.25
5	148.8	5.9	2.71
10	297.6	11.7	6.12
12	357.1	14.1	8.01
15	446.4	17.6	11.4
20	595.2	23.4	18.6

Table 1: Calculated VSWR for circuit in Fig 1(b).
The lengths can be calculated at any frequency by finding the length equal to 1 electrical degree. The formulae for the length of 1 electrical degree is: length = 5/6f metres where f is in MHz. eg at 1.84 MHz 1 electrical degree is 453 mm.

Table 1 shows the results of the calculations. If the wires have no length at all they have an electrical length of 0 degrees. An electrical quarter-wavelength is 90 degrees, a half-wavelength is 180 degrees and so on. To give a better insight into what this means, physical lengths for a frequency of 28 MHz are included in the table. I was surprised to see how short the wire had to be to introduce a VSWR of less than 1.5:1. Indeed the whole exercise was triggered by the experiences of another amateur who was carrying out some tests on several baluns, all of which seemed to be poor on 28 MHz. Changing the connections to the balun made a tremendous improvement.

The moral is, of course, keep connections short. As mentioned at the beginning, the problem is not so noticeable when the balun is connected to an antenna. The centre of the antenna is moved to the balun and the dipole is made longer by about the length of the wires. Two pieces of wire 40 mm long could move the resonant frequency of a dipole out of the novice segment on 28 MHz. Trimming the outer ends will of course bring the resonance back quite easily.

Well that's all until next time. *73 de VK3AFW.*

BRITISH PARTNER FOR EUROPE'S LARGEST COMPUTER CHAIN

A $12.6 million joint venture company has been formed by Applied Computer Techniques (ACT) of Birmingham, in the English midlands, and the Tandy Corporation of the United States to form Europe's largest retail computer chain with some 500 outlets.

In Australia, ACT is represented by Barson Computers Pty Ltd, a distributor which recently won several major contracts to supply Apricot computers to the Government of New South Wales.

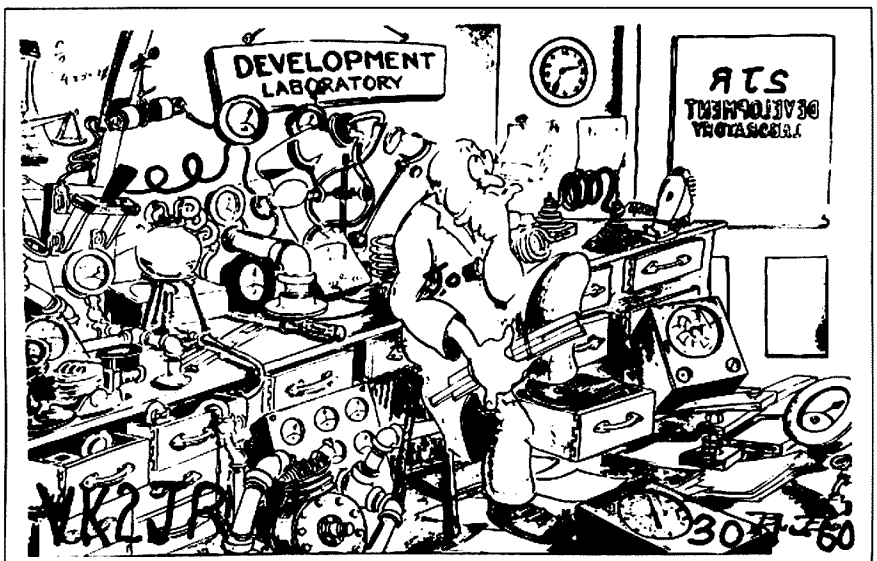
VK2 MINI BULLETIN

Feature

EVERYTHING HAS A BEGINNING



"Let's See, Now — What Is It I Am Developing?"

It is understood that dissatisfaction with the treatment from authorities in 1910 forced the 'experimenters' together to improve their lot.

The late Joe Reed VK2JR presented the newspaper cutting in article "The WIA in VK2" this issue to the Division in 1960 — at the 50 year point — which seems to fix the commencement date.

Does any reader have any material which has historic significance to the early Institute activities as well as amateur radio in general? Are you in a position to donate it or allow copies to be made of same? Perhaps the best thing to do in the first instance is to contact your local Division's Historian.

Some of the VK2 Division's current research is being undertaken by Jo Harris VK2KAA. Her particular interest is tracing early amateurs and the callsigns in use. To date there is a gross indexed collection of over 8000 names. Jo will have an article on her findings in AR later this year.

A lot of material that comes to hand covers amateur radio from the national point of view and this work is being done by the Federal Historian Max Hull VK3ZS.

There are many others who, in their own way, are collecting or recording history. The Institute would like to hear from you so that your work may be noted in a master record of research that is being undertaken. Those interested in some recorded history will find a wealth of information in the WIA Book Volume 1 which came out in 1982. Copies are available from Divisional bookshops. By now there should be sufficient material on hand for the next edition.

The VK2 and Federal Historians are as follows:

VK2 Jo Harris VK2KAA, c/- PO Box 1066, Parramatta, NSW, 2150

Federal Max Hull VK3ZS, c/- PO Box 300, Caulfield South, Vic, 3162

The late Joe Reed VK2JR (he passed away on 23rd July 1969) was a wealth of information. An excellent speaker and story teller, much of his knowledge has been retained by way of the reel to reel tapes and slides in the Division's lecture collection. These were developed during the late 50's and early 60's period when Harold VK2AAH was the Lecture Officer. It is pleasing to be able to report that the majority of the collection remained intact during many years at Atchison Street when many must have felt anything no longer in use or state of the art recontents was so much junk. It will only be a matter of time when researchers and historians will find their contents invaluable.

The sketch above Joe appears to have considered as perhaps a self portrait for written on the back is *"This amusing QSL card illustrates a typical scene in VK2JR's development laboratory at his Northbridge QTH . . . JR. 30.1.60"*

AR

VK2 MINI BULLETIN

Tim Mills VK2ZTM
VK2 MINI BULLETIN EDITOR
PO Box 1066, Parramatta, NSW 2150

It is an honour for VK2 to have a feature section in the March issue, 75 years on, since that meeting in the Hotel Australia on the afternoon of the 11th March 1910. Regrettably that grand old hotel has fallen, in the name of progress, to the wrecker's hammer. In its place is part of the skyscraping MLC Centre. This month it was our turn to provide some extra content, each Division having been asked to provide something in their nominated month. There is a considerable volume of material available, the enclosed is but a small part of it. It is hoped that a further selection will be presented later in the year.

CAUGHT/COURT

Several VK2s have been approached to contribute something and more yet to be approached. If you are missed don't let that deter you for a magazine like "Amateur Radio" is not just for the regular contributors but every member. Preparing for this month required considerably more involvement than the usual Mini Bulletin. As the deadline approached the 'main stories' kept changing. First, following months of problems with abuse on and at the Sydney repeaters, in particular VK2RWI 7000, several offenders have been apprehended. In particular, one was detained on 10th January, and held in custody until a further court appearance on 14th January. Found guilty by the court, he was sentenced to two concurrent terms of 6 months with hard labour for some of the offences. In recent times other offenders have been apprehended and have yet to face the courts. When these matters have been finalised some background information can be released, however because of matters and investigations pending such details must remain suppressed, for the moment. *See special report elsewhere in this issue.

CHANGES

On Wednesday 16th January an adjourned Council meeting, to discuss planning for the 75th commemorations, had some extra business. A couple of days previously Divisional Secretary Peter VK2PJ had been advised by his employer to prepare for a training course in east coast USA, leaving before the end of January. As the trip would extend past the end of the Divisional year, Peter requested leave of absence from Council and his secretarial duties. To complete the balance of the Divisional year, council considered several options. It was decided to make some position changes in that Jeff VK2BYY would take over secretarial duties and relinquish the presidential role. Tim VK2ZTM would move up from Vice President to President. Roger VK2ZIG/NWH added Vice President to his duties. Other Council positions remained unaltered. The other Members being Les VK2KCP, Max VK2YKF, Mike VK2AUE and Peter VK2PJ (on leave of absence).

I personally would like to thank Jeff for a difficult year in the presidential role, having been in the position before myself. With so little of the year left I would like to see the records show the positions held by each Council Member for the majority of the year, otherwise the future historians may 'become confused'. Jeff is also about to change his occupation to an even more demanding role which will force him to forgo some of his Institute involvement.

FEDERAL CONVENTION

The Federal Convention is to be held in Melbourne 26th-28th April. Agenda items should reach Divisional Council by mid March. They have to be checked before submission to ensure that they are not existing policy etc. The Conference of Clubs (13/14 April), at Amateur Radio House, includes discussion of all Federal items, not just those submitted by VK2. Some of the early items are included in Amateur Radio, the later ones aired on broadcasts. Copies of all are circulated to affiliated clubs. Any member who would like to express comment on the agenda items should seek out their club delegate prior to 13th April. Council renominated the present Federal team for 1985, being Federal Councillor Stephen Pall VK2PS, and alternates Tim Mills VK2ZTM and Wally Watkins VK2DEW. Stephen has given notice that he will not be seeking renomination after the end of 1985.

HISTORICAL RESEARCH

This is a time consuming function. For some months now Jo Harris VK2KAA has undertaken an aspect of this in VK2 and has specialised in callsigns — current and previous — and into the people who are or were their holders. Now some of the time spent is starting to show results as there are over 8,000 cross indexed references. Jo would like to hear from everyone in due course and a questionnaire form is available (inquire from the Divisional Office). In turn Jo can assist you. Perhaps you are the new holder of a callsign and would like to know of its previous holders. Get in touch with Jo VK2KAA. It is hoped that later this year a short article will be written of aspects of Jo's research.

As mentioned elsewhere, if you are doing any research please log into the Division so that the knowledge of who is doing what is centrally co-ordinated.

SEARCHING FOR ANSWERS

In preparing some of the material for this issue I kept coming across interesting things. These are some of the questions I would now like to find an answer to —

George A Taylor called the first meeting in 1910 and still appeared to be involved during the 1920 s, however no record can be found of callsigns he may have held . . .?

The Division has held many postal and (VK2WI) station addresses. The longest appears to be Box 1734 GPO, the 30's to the late 70's. At one stage it was also 1734 JJ. What others have been held?

VK2WI is listed in callbooks in the 50s as having station addresses of Kingsford, Castlereagh Street, and Clarance Street before it was transferred to Dural about 1957. What were these locations?

What was the Co-op during the 1950's?

In a 1938 callsign list there were about 25 radio clubs. After the war (1946) there were only two listed — in many cases the previous callsigns were not listed — and by 1950 only VK2BV and VK2WI carried on. In a future article club calls over the years will be featured in the hope that some old timers will remember and advise before all details escape.

LIBRARY TARDINESS

Council has recently looked at the library facilities at Amateur Radio House. It was noted that some items are not being returned within the borrowing time limits. It was also found that many of the new issues were being borrowed for up to a month at a time which reduced their availability to others. To make these new editions available to a wider range of the membership they will only be available for reading within the library for the first few months of their life. The Divisional Librarian will monitor these arrangements during the next few months. Members comments are sought on ways of improving facilities.

HISTORIC DISPLAY

For some time consideration has been given to mounting a display area for historical items of amateur radio at Parramatta. It had been considered that a range of display cabinets be obtained. It is now felt that the section towards the front windows at the head of the stairs may be more suitable if it is glassed in to provide a large secure area. Further thoughts will be given, as a project like this could be a fitting finale to the 75th celebrations.

The WIA in VK2

Tim Mills VK2ZTM,
Box 1066, Parramatta, NSW, 2150

The foundation for this article was first published in Amateur Radio for June 1980. The format has been retained and expanded to cover the past five years in the Division's life.

It is seventy five years this month since a group of "Wireless telegraph experimenters and enthusiasts" met to co-operate and improve their lot with the government of the day. From records to hand, the meeting was held on the 11th March 1910, in the Hotel Australia, Sydney, and as a result of that meeting the Wireless Institute of Australia was born. *See newspaper cutting of the meeting.* Soon after groups began forming in other States.

The WIA was formed two years ahead of what is now the RSGB and four years before the ARRL.

REGISTERED ASSOCIATION

In the early 20s the amateurs in the group drew up the Memorandum of Association of the Wireless Institute of Australia, New South Wales Division. In doing so it took over the effects and liabilities of the then unincorporated club of the same name. Seven amateurs moved to form a company on the 26th of May 1922, and on the same day registered an Association of the above name as a limited company.

NEW SOUTH WALES.

Certificate of Incorporation.

No. 86355

The Companies Act, 1899.

I Certify that an Association styled Wireless Institute of Australia New South Wales Division has been registered this day as a limited company, the Governor-in-Council having directed such Association to be registered with limited liability without the addition of the word "limited" to its name, pursuant to the provisions of Section 32 of the Companies Act, 1899.

Given under my hand, at Sydney, this Twenty sixth day of May, one thousand nine hundred and twenty two

Registrar of Joint Stock Companies

Exd.

A copy of the Company Certificate.

DIFFERENCES AROSE

In the early 1930s differences arose between the professional and hobbyist within the Division and for some time the hobbyists became the "New South Wales Amateur Transmitters". The professionals became the IRE (now the IREE), and the Division absorbed the hobbyists to again become the WIA NSW Division.

See the 'beginning of IREE' in January 1985 issue of Amateur Radio for details about this period.

In 1939 permission was granted by the Radio Branch for Divisions to conduct broadcasts to inform their country members of happenings. Outbreak of war, however, stopped amateur activities and during this period the WIA was kept operational by the Federal Executive, who were located in Sydney.

A WIRELESS ENTHUSIASTS' INSTITUTE.

THE GOVERNMENT AND LICENSES.

"THREE GUINEAS FOR THE USE OF THE AIR."

Wireless telegraphy experimenters and enthusiasts are beginning to co-operate, and a number met last afternoon in the Hotel Australia in order to take the preliminary steps towards forming an institution. Vigorous comment was made upon the Government's action in regard to experimental licenses, and it was plain that besides a feeling for mutual help and interest, the restrictions alleged had had a large share in hurrying on the movement. Two ladies were among those present.

Mr. G. A. Taylor, who was elected chairman, explained the object of the meeting, and touched on the wonderful future ahead of the movement. "It is wise," he said, "to put our heads together and profit by each other's discoveries. Experimenters did not think the authorities were giving them fair encouragement. Every experimenter was at the beck and call of the military, naval, and postal authorities, and was allowed no legal redress if departmental officers thought he was breaking the rules. Mr. Taylor proposed the formation of an institution amongst experimenters and enthusiasts in wireless, for their mutual benefit. The object of founding the institution was to obtain justice, he explained; it would not be founded in opposition to any Government institution or department.

Mr. W. H. Hannam, seconding the motion, repeated the account of his attempts to obtain a Government license, which were described in "The Daily Telegraph" last week. "I have had a great deal of trouble with three Postmaster-Generals," said he, "and haven't got my license yet. They're still quibbling. We have all been treated in the same way, but no one has said or done anything until lately. Seventeen months of my time have been wasted since I was ready to erect my plant. Why should we have to pay three guineas for the use of the air, so far as experiments are concerned? The aerial navigation experimenters are charged nothing." One regulation, he complained, penalised an experimenter if the chief electrical engineer of the Postmaster-General's Department should certify telegraphic communication had been interfered with by his wireless appliance used "or intended to be used"!

Mr. J. H. A. Pike also supported the motion, which was carried, and a provisional committee was appointed to arrange for the next meeting.

Later, a general meeting of those interested will be called, and officers elected. It is proposed to assist in the formation of, and perhaps affiliate with, similar organisations in other States. The provisional committee is as follows:—Messrs. J. H. A. Pike, W. H. Hannam, F. Bartholomew, W. H. Gosche, F. and H. Leverrier, C. A. Cleary, and A. Garnsey, Major Rosenthal, Captain Cox-Taylor, Dr. Brisenden, and the chairman. Mr. Hannam will act as hon. secretary pro tem. Besides these gentlemen, the Misses Perratt Hill, and Messrs. R. B. Armstrong and J. A. Henderson attended, and gave in their names as prospective members.

PRESENTED BY JOE REED. VK2JR.

See also page 27.

A HOME FOR VK2WI

At war's end amateur radio boomed with trained personnel from the Services coming into the ranks. The early 1950s saw many activities in the Division. Meetings at this stage were held at Science House in the city. A move was begun to establish a "Home for VK2WI" and a five acre property, on what was then very much the edge of Sydney, was purchased at Dural. Work commenced around 1953 and the building formally opened in 1957, after untold hours of work by members and friends. The property is the site of the Division's repeater and beacon facilities, . . . *together with a broadcast network from 160 metres to 70 cm. See the report "DURAL — 25 years of service" by Jeff Pages VK2BYY in AR for May 1982.*

The Official Opening on the 15th May, 1957.

The First Station as it was at Dural in 1957.

In 1954 the amateur service saw the introduction of a new class of licence, the Limited. This licence enabled those not proficient in Morse telegraphy to participate in the wonderful hobby of amateur radio, thus swelling the ranks with many more operators aspiring for the "Full" ticket.

DISPOSALS FOR MEMBERS BUY A PROPERTY

During the same period interest was shown in obtaining a city property for the Division and a Co-op was formed. However, nothing came of this venture. The end of WW2 had left this country with enormous stocks of radio equipment, and the Division set up a disposal buying and selling section for its members. The operation of this section produced the money used to purchase the Atchison Street property in 1960. With surplus funds the hall and basement area were soon added. Since then considerable development has occurred in the area with several highrise buildings nearby.

Many new clubs had been formed in Sydney to cater for the needs of amateurs, as the Crows Nest location of the WIA was prohibitive to some.

The property was sold in 1982 and the headquarters of the Division moved to the present location at Parramatta. The old 14 was demolished and in its place a three story structure similar in concept to that which existed at number 16. In early 1985 the remaining old properties on the railway side of 14 (# 6 to 12) are in the stage of being demolished, no doubt for a high rise. One of these old properties was where the "Dick Smith" chain had its first retail outlet.

THE OLD ATCHISON STREET PROPERTY

EDUCATION

The Division has for many years been heavily involved in education with personal classes. For twenty years the Correspondence Course has helped thousands both in Australia and overseas to join the amateur ranks. The Division pioneered the CW practice format and still conducts nightly on-air Morse training. To supplement this HF session one of the Sydney clubs developed a continuous transmission VHF Morse training facility which utilizes a microprocessor for programme control. To cater for training the younger members of our community the Youth Radio Scheme came into being during the 60s. With the explosion for knowledge during the mid-1970s the YRS expanded to become the Division's Education Service, who have since published several books to help intending amateurs with studies.

EMERGENCIES

The Division has an active WICEN facility at the moment. Over the years it has had its ups and downs. The Amateur Radio Service has always been available in times of communication needs. This Division's WICEN has become recognised by our State's authorities as a trained, reliable reserve communication facility.

ALWAYS CHANGING

Amateur radio is always changing, new modes, new equipment, but perhaps the area which technically altered amateur radio the most in recent times was the granting of permission in 1968 for VHF repeaters. VK2, considered at times by other States to be out of step, has always been in the middle of band planning (??) and utilization of more channels than most of the other areas put together. We cannot help it if they did not smooth off the hills when "they" made the place. (It's always "they" who did it.) Also in 1968 the Division hosted, during the Federal Convention held at Atchison Street, the formation of the Region 3 section of the IARU.

The 70s saw the introduction of the third class of amateur licence — the Novice — and VK2 quickly took the lead in numbers. Only now in ratio are other areas catching up. VK2 now has a little over one-third of the nation's amateur population. This number has expanded the OSL bureau from a few cards a week to a thousand plus a day.

MOVING BUREAU

The VK2 Bureau has had many homes in Sydney. During the 50s it shared space between the bottles in the late Jim Corbin VK2YC chemist shop at Eastlakes. It then spent some years with various other Sydney amateurs as well as a time at Atchison Street. It next found a home in Newcastle for many years with the Hunter Branch before a brief trip back to Atchison Street. It finally returned to Newcastle where it is today under the guidance of the Westlakes Amateur Radio Club. *(See item elsewhere this issue.)*

Expansion of the scale of the last few years means that we no longer know everybody and the Institute may appear to some to have become a little distant or impersonal. The last decade has seen the great expansion of interest in radio spectrum utilization by others, and the Division has done what it could to knock on the doors of the government to put the amateur case. And what of the 80s?

THE LAST FIVE YEARS

The last five years has seen a direction change for the Division. A new 'Constitution' was introduced in the latter part of the 70's. It was felt that the monthly meeting — in a capital city — did not enable all members access to decision making, so they were replaced by club affiliation with the Division. This concept is for these clubs to provide representation for members through the club. Delegates from the clubs meet twice a year in a "Conference of Clubs". The Constitution changes were not without their hassles. An interpretation of a meaning of one part ended up being resolved in a Court of Law.

An ever increasing range of amateur equipment enabled one to become easily involved in any facet of the hobby. Computers are a rapidly increasing electronic hobby facility in the 80's and have many applications in todays equipment. Also the computer integrates with amateur radio, none more so than the 'packet radio' systems which are just starting in this country.

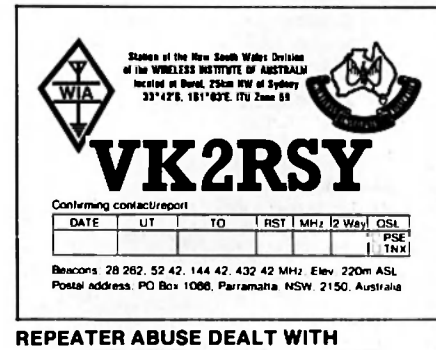
HEADQUARTERS

For over 20 years the Division had maintained a headquarters at Crows Nest. During that time Sydney grew and spread in the only direction it could — west. Faced with a changed role and a building in need of ultimate redevelopment, the membership decided it was time to move. In 1982, Crows Nest was sold and after looking at several Parramatta area properties, 109 Wigram Street was purchased. This is a new building of two levels. The ground floor contains car parking with access from a side lane, toilets and a small office, which has been rented out. The upper floor is the NSW Headquarters. There is an office and storage facilities but the majority of the area is devoted to an open members' lounge/library. While monthly meetings are no longer held, there is sufficient space to hold functions like the Seminar last year (see page 18, November AR). The building was officially opened by The Honourable Gary Punch, MHR, Member for Barton, on 28th May 1983. This months AR cover features the front of the building, named 'Amateur Radio House'.

Photograph courtesy Les Pall VK2KCP.

REPEATERS

Expansion of the Divisions technical facilities has continued at VK2WI — Dural (see AR, May 82). There is an extensive range of transmitters for the two Sunday broadcasts. The beacon installation has continued to be expanded (VK2RSY) from 10 metres on HF, 6 and 2 metres on VHF and 70 cm on UHF. Work is underway for 23 cm and will continue into the higher frequencies as circumstances permit. While some Divisions have largely provided all their States' repeater facilities, most of the VK2 fifty odd systems have been set up by local clubs and groups. The Division has VK2RWI at Dural on 7000 and 8525. WICEN has established VK2RWS on 7150 and 8275. To date VK2 have not ventured into 6 metre repeaters, but this is to change with a joint venture between WICEN and the Dural committee.



REPEATER ABUSE DEALT WITH

The 80's have unfortunately seen some changes in societies attitude and behavioural patterns. Sydney in particular has just been through a period of repeater abuse, most frequently on VK2RWI 7000. The authorities, despite the difficulties the old act presented, have located and prosecuted several offenders. Last January, one offender was jailed for some of these offences. There are more cases pending.

ONGOING EDUCATION

Educating the new generation of amateurs is an ongoing function of everybody. Many clubs have and still do conduct a range of courses. While at Atchison

Street the Division, under the guidance of Cec VK2IR, conducted an annual personal class as well as the Correspondence Course which hundreds, maybe thousands of amateurs have utilised over the years. The Correspondence Course continues today, with both a full theory as well as a Novice bridging section. For perhaps even more years, various members have provided nightly on air Morse training on 80 metres through VK2BWI, which is followed by the VK5 session. The Hornsby and District ARC some years ago, combined computers and amateur radio and produced an automatic Morse sender — VK2RCW — on 2 metres. At present attempts are being made to extend the facility to HF.

THE FUTURE

Roger Harrison VK2ZTB speaking at last years Seminar, used as his theme the possible development of amateur radio for the remainder of this century. While Roger predicted that we would all end up with more leisure time, it seems that the requirements to conduct the affairs of the Division are becoming more complex and demanding. Circumstances have made the workload of Council and its other office bearers rather less than enjoyable at times. Many spend a lot of time in travel and this and other costs mount up by the end of a year, all coming from his pocket as he serves his fellow amateurs. This should not deter everybody from doing their bit from time to time, for it provides an insight into the affairs of the Division and the Institute as a whole.

TIME CAPSULE

Recording and retaining history is hard. Todays papers are tomorrows rubbish but next years forgotten information. As part of the Division's celebrations a *Time Capsule* is to be started on 10th March at Dural. Throughout the year it will be added to and then sealed on 11th March next year. We intend that it remain sealed until 11th March 2010. A range of Divisional material will be included. Members are being invited to submit one of their QSL cards for inclusion. It will be interesting for the Institute's members during the centenary to have a year of history already there for the 'reading'.

It is an important year ahead for all members of the Institute and the Amateur Radio Service in general. During this year there will be further articles from VK2 as well as all other Divisions. Read again this monthly 'Editorial' by Jeff VK2BYY. At regular intervals the Division will hold functions to commemorate the year. Divisonal Council and its office bearers look forward to meeting you at one of them, so do come along and join in where practical and celebrate entry into the last quarter of the Institute's first century.

Amateur Radio House, 1st floor, 109 Wigram Street, Parramatta. Postal — PO Box 1066, Parramatta, NSW 2150. Phone (02) 689 2417 Office hours 11 am to 2 pm. Mon to Fri Wed evening 7 to 9 pm.

BROADCASTS AND DIVISIONAL STATION

VK2WI — 63 Quarry Road, Dural. Phone (02) 651 1489 Broadcasts 11 am and 7.30 pm (local time) Sunday. HF: 1.825, 3.595, 7.146 and 28.320 MHz. VHF: 52.120, 52.525 and 144.120 MHz and several relays are made to both HF and repeaters by arrangements with local clubs. Beacons: VK2RSY on 28.262, 52.420, 144.420 and 432.420 MHz. Repeaters: VK2RWI on 7000 and 8525.

QSL BUREAU

Conducted on behalf of the Division by the Westlakes Amateur Radio Club. Postal — PO Box 73, Teralba, NSW 2284. Phone (049) 58 1588.

CORRESPONDENCE COURSE

Details from Divisional Office at PO Box 1066, Parramatta, NSW 2150.

EDUCATION SERVICE

A range of publications written in recent years by members of the Education Service, to aid those studying for a licence. Inquiries via the Divisional Office (as above).

MORSE TRAINING

Nightly sessions on 3.550 MHz under the call VK2BWI. In Sydney, HADARC maintains VK2RCW, an automatic various speed transmission on 147.400 MHz.

DIVISIONAL LIBRARY

An extensive range of magazines and reference books are maintained at the Divisional Office.

WICEN

A state group as part of the Institute's role of personnel available to supplement communications in times of overload or breakdown in other authorities systems. Information from the Divisional Office or PO Box 154, Roseville NSW 2069. WICEN maintains repeaters VK2RWS 7150 and 8275. Training courses are periodically held in Sydney and country regions.

AFFILIATED CLUBS

Many clubs have become affiliated with the Division, as outlined in the Constitution, to provide a local liaison point for Members of the Institute. Conferences are held twice a year.

AWARDS

The Division does not currently have any awards. There are several available from VK2 groups and details may be found on page 164 of the 1984/85 Call Book.

INTRUDER WATCH

A small active team look after the VK2 region. More personnel are required for the team. Details from the office.

PUBLICATIONS AND SMALL COMPONENT SERVICE

The Divisional Office has a range of amateur publications. In addition there is a small range of components. Space precludes the handling of a large range. Visit or call the office for details.

STOLEN EQUIPMENT REGISTER

For those who have the misfortune to have equipment stolen, the Division (as do others — the Federal office maintains a central register which is regularly published in AR) maintains a file which can aid those checking on possible purchases. Stolen items reports are included in the Sunday morning broadcasts.

Photographs courtesy Les Pall VK2KCP.

Display Boards at 109 Wigram Street, Parramatta.

VIDEO TAPE LIBRARY

A range of the material available from the Federal Videotape facilities is maintained at the office in the VHF and Beta formats for club and member borrowing.

T THE VK2 QSL BUREAU

en record of all cards, both inwards omputer keeps a tally available for are sorted into first and subsequent ays at least four volunteers are kept me of the thousands of uncollected records on disc. A custom prepared keeps track of 4,000 files. 6 The aling machine used for wrapping all postings. 8 Every member has their NK checks the "P" file. 9 Overseas d in plastic bags before having a ed. 10 All DX cards are sorted for ureaus, like JA and UA are cleared

A MEMO FROM THE VK2 QSL BUREAU

With some 5000 collsigns in the VK2 coll area a percentage of these belong to active DX type persons who make full use of the QSL Bureau. There are others who DX, may not be interested in QSLing and forget to tell the overseas contact accordingly, so become recipient of cards. Then there are the cards which just seem to arrive and the bureau has no instruction from the addressee as to what action is required. A card takes up some space and only so many will fit into a bureau, so in due course its destiny has to be determined. The message from this is every amateur, regardless of their QSLing habits should keep their bureau advised on cord handling requirements and callsign changes should they occur.

Notification forms are available from both the VK2 Divisional office and the VK2 Bureau, but if not to hand just write to them and the details will be upgraded in the computer. You may prefer to ring the bureau answering machine on (049) 58 1588 and tell it everything in 30 seconds.

The VK2 Bureau is operated on behalf of the Division by members of the Westlakes Amateur Radio Club from their *club rooms located in the Newcastle* suburb of Teralba. Needless to say the bureau is the biggest customer of the local Post Office facility.

Phil VK2JPC on behalf ol the VK2 Bureau, would like to remind all bureau users of a few points many which apply to other bureaus. The facilities are available to any amateur within VK2 whether a member or non member of the Division. Full details and requirements may be obtained from the Divisional office or the bureau. Check also with your local club since many have a handling arrangement with the bureau. Interstate readers are encouraged to read on but as there may be some slight differences with your bureau please check with them should you be unsure of their requirements.

Now here are the comments from Phil:

Members now report few problems with the operation of the bureau. There are however some difficulties which are best explained in detail.

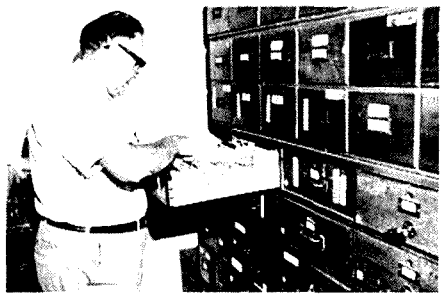
CHANGES OF CALLSIGN:

Unless a change of callsign is notified to the Divisional Office, which then reports the change to the bureau, there is no way that the bureau knows of a callsign alteration. When a callsign is changed, a note to the Parramatta office will be sufficient to alert both the Federal Office and the bureau, both the new and old callsigns together with the date of changeover need to be notified.

The most frustating situation occurs however when a callsign is cancelled and immediately reissued by the DOC. This leads to all kinds of administrative problems in the bureau. It is just impossible for sorting staff to know that a QSL is for either the "old" or "new" holder. What is more, the new callsign holder is frequently unaware that the call has ever been used before and the old callsign holder that it will be used again. Until the DOC amends this practice, the problem will continue to arise. Please remember that the confusion is not the fault of the bureau.

OVERDRAWN ACCOUNTS:

The bureau computer is set to exclude all accounts which are overdrawn. No "final notice" or anything of this kind is sent to the member as a reminder. However, a posting which will result in an overdrawn account will have the callsign and balance "highlighted" on the label as a reminder. If this is disregarded — no more cards. It's as simple as that. Every debt incurred by a member is a charge against the membership in general as the bureau works on a non profit basis.



Sorted QSL cards are placed in file drawers.

Please check your label, the top line gives your current balance. If it is near zero, please send a remittance with your next batch of cards.

MONEY SENT WITH CARDS:

The best ways to remit money to the bureau is by cheque or money order however stamps may also be used. Whatever method of payment is used, please *do not put* the remittance *amongst the cards.* The bureau is not a one man operation and, although all receipts of cards and money are carefully logged a stack of cards is sent on from the receipts desk to sorters. Imagine the confusion when a cheque, some stamps, or even a money order falls to the floor as a group of cards is picked up. There is no knowing where it may have come from.

Please pin or otherwise affix your remittance to a slip of paper bearing your callsign and the amount enclosed.

SAVING POSTAGE:

It is amazing how many members overcharge themselves when sending cards to the bureau.
The "steps" for charging are:
standard article (bureau sized envelope which will pass through the Australia Post gauge)
100g; 250g and 500g.
Above 500g mass the parcel rates apply and it is always cheaper to send 2 x 500g packets than a 1 x 1kg parcel!

Unsuspecting members extrapolate this theory to small mass packets *and it doesn't work.* It is definitely not cheaper to send 2 x 100g packets than 1 x 200g! Nor any other combination either. It is very worthwhile using the kitchen scales to get your cards as close as possible to the 100g, 250g or 500g steps if the despatch is more than about 18 cards (standard). But, don't make the mistake of trying to cheat Australia Post because the sorters in the Newcastle exchange are extremely vigilant and all over mass or non standard packets are taxed at *double* the deficiency. This tax is passed *on* to the bureau and, yes, you've guessed it — the tax paid is debited against the member's account. It just isn't worth it.

PRE SORTING:

The volunteer sorters at the bureau just love to receive 500g packets of cards in *logbook* order. After sorting a few, the rest are put in the "sort later" stack where they could remain for weeks. After all, who wants to dash back and forth along the DX pigeonholes when the next packet, sent by a considerate amateur, has all the cards in *prefix* order. Although some members band each callsign prefix this isn't really necessary but it certainly speeds the process of getting your cards up and away if they are in prefix sequence and, for those most difficult of all cards, the "W" lot, in numerical sequence as well. It won't take you very long but if it isn't done it will at least double the sorting time at the bureau.

THE FAMOUS FIVE WORDS RULE:

The old story about "no more than five words" on a card is a myth — via the bureau anyway. If you want the whole story, drop a line to the bureau and you can have a copy of the postal regulations — free!

Briefly, you can write all you like on the QSL but, here's the strange thing. Try to send this card as a "postcard" or "greeting card" singly to a DX address and you'll discover that it costs just like a letter. Through the bureau — in bulk, no problem but please *don't* send sealed letters for transmission with cards in bulk. This definitely contravenes Universal Postal Union rules.

If you don't know the address of a DX contact and you want to send the letter sealed, the bureau will find the address for you if it is held at the bureau and send it as a single letter, air mail or surface as directed by the member.

NEW POSTAL CHARGES

The new postal charges are programmed in the bureau computer and will be adjusted automatically. There is no need for members to take any action. There will be a minor service charge adjustment also because of an increase in stationery costs. Full details are available on request. A standard article gauge and a rate card will be sent on request. Extracts from the postal regulations as they apply to QSL cards are available on request. A complete printout of a member's bureau listing is available. Bureau standard pre-addressed envelopes and self adhesive labels are available for a small charge. A standard envelope is sent with each posting but if you require more, just ask. Of course they are not free.

Finally, if you are interested in economics, can you imagine how far you can drive your car or travel by train or bus for 33c? Sending and collecting cards by post has got to be cheaper than any other way.
For "Via the Bureau" service:

AR

SPECIAL EVENTS FOR 1985 IN VK2

10th March

The closest weekend to the formation date. There is to be an informal gathering at VK2WI Dural. Meet after the morning broadcast and partake in the monthly barbeque (bring your own basis.) At 2 pm a short ceremony will be held with a 'Time Capsule'. It is planned to start the Time Capsule on this day and hold it open for a year. It will then be sealed, to be opened again on 11th March 2010. During the year it will have added to it Divisional material of happenings during the year. On the 10th we invite all members to take part by submitting their QSL card for inclusion. Include on your card information like the date you obtained your call, together with calls held, etc. If you live within the metropolitan and surrounding area, attend in person or have someone bring it along for you. For those living further out in the country, you can post it to — Time Capsule, PO Box 1066, Parramatta, NSW 2150. On the back of the envelope name and callsign/s. Do not include any normal mail matters or it may be a while until you receive a reply. If there is not room on the card for all you might like to include, enclose further information on a sheet of paper, attached to the card, pertaining to yourself and activities within amateur radio. Clubs and groups are also invited to supply material about their organisation. Material will be date stamped on the day. 11th March starts the years activities and a lot will happen before 11 March 1986 arrives. Material will continue to be collected during the year.

10th March

The Division is managing the 75th Anniversary CW Contest on behalf of the Institute — rules published in the January issue of AR.

17/18th March

State Fox Hunting Championship hosted by the Orange Amateur Radio Club, PO Box 1065, Orange, NSW 2800. Programme and details on receipt of an SAE. 80 metres, 10 metres and 2 metres. National championships will be conducted by the VK1 Division later in the year.

30th March

Annual General Meeting at 2 pm. A separate posting is being made to members with annual report, accounts and matters relative to an AGM.

Easter 85

Urunga Field Day weekend on the North Coast. No details where to hand as these notes were prepared. Details via Sunday morning broadcasts when available.

13/14th April

Conference of Clubs to be held at Amateur Radio House, Parramatta. Discussion includes club submitted as well as the Federal Agenda items. Details will appear on early items in AR, later ones via broadcasts and copies will be sent to affiliated clubs. Check with them for details.

13th April Evening — Dural

Annual fireworks night at VK2WI. Details will appear in April AR. There will be limited catering available on the grounds. Bring family and friends. Conditional on fire restrictions at the time, it should be the first fire works display for the year rather than being one of many in June.

26/28th April

Melbourne Federal Convention. Members or groups with items for discussion please arrange that they arrive at the Divisional Office by mid March for checking and submission.

25th May (tentative)

Seminar. Four speakers on a range of topics.

8/9th June

Port Macquarie. Annual field day. Programme to follow.

Photograph courtesy Ken McLachlan VK3AH.

22nd June (tentative) Sydney

75th Anniversary Dinner and associated events.

5/6th October

Wagga Wagga. South West Zone Convention.

Clubs and groups with coming events, field days etc, please send details early (at least three months) for publication. Later items will only receive broadcast coverage.

The input to the next Callbook will be closing soon. Clubs, groups and amateurs should check the current listings and submit any changes required. Remember that callsign listings are taken from the Department of Communications records, so adjust records with them and send a copy to the Federal Office so they may update their records.

Rig in for service. —VK2COP

BEACONS in VK2

The Division maintains a beacon network at VK2WI — Dural. Currently there are four bands with 23 cm under construction. Additional UHF/microwave bands will be added as circumstances permit. Help is required in their construction. Contact the Beacon Officer, John Marshall VK2EGI with any offers of assistance. In addition there are 6 metre beacons at Gunnedah and Newcastle sponsored by local clubs. VK2RSY run constant carrier with identification every 30 seconds. Due to broadcast requirements they are turned off at 10.45 am and 7.15 pm Sundays for 1½ hours.

2 metres 144.420 MHz. 2 stacked Horizontal Crossed Dipoles at 15 m 20 watts FSK.

10 metres. 28.262 MHz. Vertical ¼ wave at 20 metres. 25 watts Keyed carrier (not FSK).

23 cm 1296.420 MHz. Under construction.

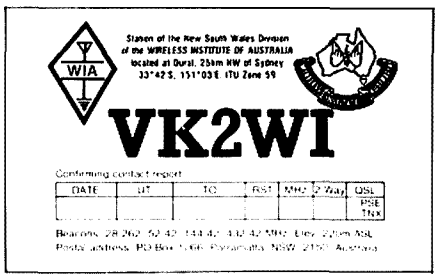
6 metres 52.425 MHz. VK2RGB — Gunnedah.

23 cm Planned Central Coast.

6 metres 52.420 MHz. Horizontal Crossed Dipoles at 14 m 40 watts FSK.

70 cm 432.420 MHz. 2 Stacked Horizontal Crossed Dipoles at 16 m above ground 15 watts FSK.

6 metres 52.320 MHz. VK2RHV — Newcastle.



There is one allocation left for a 6 metre beacon, in addition to all our Ch 0 TV systems in VK2. Three each at 2 metres and 70 cm and two at 23 cm. Any clubs or groups with an interest in establishing a beacon should contact the State Repeater Committee. There are no additional 10 metre allocations as these are part of a world wide system. The Australian 10 metre beacon allocation is the block from 28.260 to 28.270 MHz inclusive.

AR

REPERTERS — Friend or Foe!

Tim Mills VK2ZTM
PO Box 204, Willoughby, NSW, 2068.

It is one third of the Institute's life span since I first found myself the owner of a black or was it silver box, in the form of a low band TCA unit which had seen better days in a taxi. Having watched the FM scene ever since through conversions to the desired band, then simplex, repeater permission, planning, disagreements, going it alone and back with the majority (?) I would like to take every amateur through the evolution of Australia's development of today's facilities before some of the events become history that failed to be recorded. Many of the accounts detailed will be as I saw them but I do ask everyone to join in with a contribution of an event they feel should be part of the recorded history. A line to me at the above address would be most welcome.

Many of the newer (and perhaps older) amateurs may take for granted the facilities that repeaters offer without a thought of how or when they came into existence, both in terms of permission as well as their physical installation.

FM is not new but the first general form of modulation used was AM. In the late 40s it appears the first general useage FM commercial mobiles in this country came into service on the 70 MHZ band for general use. These took the form of large valve units, often in several boxes, transmitter — receiver — vibrator power supply to fill the boot of even the largest car of the day, which in turn rapidly drained its 6 volt battery. The base stations were even bigger, often a 2 metre high rack cabinet with a .25 kW output. The channel spacing of the day was 240 kHz. During the same period amateurs intentionally experimented with FM, usually in the narrow mode, or unintentionally when their supposed stable transmissions weren't and the local amateur advisory committee sent them a 'blue' — please explain/correct memo!

By the late 50s the commercial network had expanded and the 240 kHz channel spacing had been halved to 120 and then again to 60 kHz. While predominantly FM, there were a few AM services. (The Aviation industry was and in most cases still today is an AM service in the 108/136 region.) Equipment design became smaller and one usually saw it in taxis so it acquired the "Taxiradio" handle. In those days there was more room under the the dashboard and the taxi operator's radio was installed in most cases, under the fare meter. The radio — valve era — produced heat, the fare meter was well lubricated in oil so when one obtained a 'taxiradio' from disposals there was no doubting the previous owner. In another episode I will relate the story of cleaning 'these things' to an 'as new' state. Early 60s saw a few units appear on the surplus market. Amateurs — being what they were (or are) — acquired these and moved them to either of the VHF bands at 6 or 2 metres.

The first unit I had was a low band (70 MHz) unit and going to 2 metres (high band) was a case of physically moving the multiplier coil cans down one position and fitting a 4 MHz crystal in place of the original 2 MHz one. In those days operation was simplex and limited planning required. Most aimed for the centre of the band, 146 MHz. For reasons now starting to be lost in the past — some say it was the slide rules of the day —the era between where one had to use the brain controlled long hand calculations and today's pocket calculator — no two groups ended up on the same frequency.

VK3 it is thought aimed for 146.000 but ended up 146 kHz low on 145.854 which became known as channel 'A'. VK2 found their way to 146.000. To compliment 145.854 on the low side, VK3 balanced it on the high side at 146.146. This channel group became known as channels A, B and C. In the mid 60s, VK2 started to obtain some further equipment from a source and that group headed for a common channel and ended up on 146.100.

During the 50s, the 50 MHz region had the old 5 metres, 56 to 60, destined to become channel 1 TV and the newly acquired 6 metre band. This period was a good time for DX on the CW and AM modes. A few of the FM units found their way down to these bands. An easy conversion usually was to squash a coil here, perhaps wind another, or add a capacitor for the transmitter conversion. A similar crystal line up and you had some RF out. The receiver usually meant a bit of front end realignment and running the crystal oscillator injection on the other side of the 10.7 MHz IF chain. Commercially it may have been multiplied up to 60 + 10.7 for a 70 MHz frequency. Amateur wise it was still at 60 but — 10.7 to 50 MHz. While many crystal locked systems developed along the (to the amateurs involved) logic, *"I have a crystal, lets use it"*, some did follow international useage. 52.525 was one such case. Popular almost where ever 6 metres was allowed, it was even used by Radio China as a broadcast link — at least one knew where the band was open to when you heard it.

6 metres has never developed to the extent of 2 metres in VK2. While interstate it was very popular in the 50s and early 60s some well placed Ch 0 TV stations at regular skip distances in major activity centres like Melbourne and Brisbane soon killed off the then high usage. There were more AM than FM net frequencies.

These included (AM) 53.032; 53.035; 53.100; 53.866 and 53.982. On FM there was 52.525; 52.656 in VK6. and 52.700 and 53.950 in VK2. Before this era fades into unrecorded history I would like to log those frequencies so if you had a small (or large) club or group net on 6 metres drop a line to the above address and tell me about it, your location and what equipment you generally used.

Mid 60s found that the commercial spectrum had become so crowded that a major change was planned. Channel spacing was to be reduced to 30 KHz and new equipment specifications introduced. This obsoleted a vast range of — in many cases — modern two way units onto an eager amateur market and whether we like it or not the 'net channel' era began. Now you could leave a squelched (muted) radio running to listen to whoever was about — no more tuning and perhaps missing a snippet of gossip . . . oops I meant news. (Squelch was the term printed under the knob if it was an AM set, Mute if it was FM.) Most people had a single channel unit, some had a 3 channel set, but you had to know someone for the occasional 6 channel unit.

The amateurs became restless, the systems were good. VK2 units were often high power 25 watts to combat Sydneys terrain. Melbourne needed less power so there were many popular 6 watt units. This was still not enough. Those in high locations talked to the world. Somewhat naturally but not necessarily with permission they started repeater experiments. One I became aware of had found a nice high 'country' hill. From the same building, without refinements of things like filters, two units and two aerials appeared. With an input on ch 'B' and the output on 'A' — a mere 146 kHz spacing it worked well. However, a mix between a couple of local services nearby produced a signal on ch 'B' so the input was moved to a 146.100 frequency, which was to have a significant bearing on later repeater channel planning.

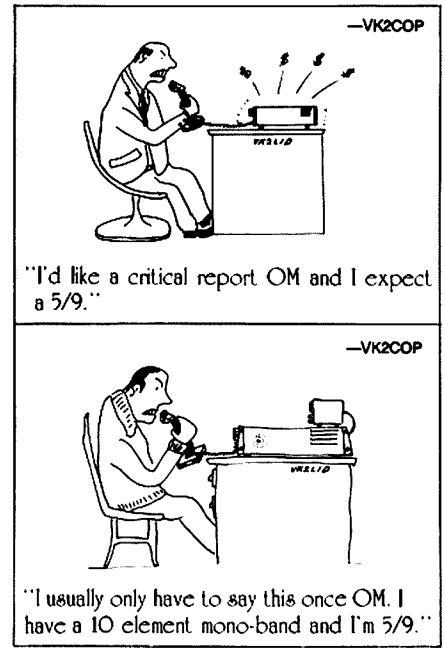
The "experimental" system was a 'well kept secret'. Some years later, during the course of discussion on repeater licensing, I had an occasion to ask if the authorities were ever aware of Its existence. *"Oh yes, about 24 hours after it first went to air"* was the reply. Then followed a detailed discription which indicated they had come to know it on a better than a casual basis. I do believe that this and 'other' experiments helped show that the amateurs could handle repeaters for, when approval was granted, Australia received the then and I still believe the best set of operating conditions (from the repeater committees' point of view) in the world.

That permission came to our notice in VK2 on the first Friday in July 1968 when our Federal Councillor, Pierce VK2APQ attended the VHF and TV Group meeting to tell us the good news.

Well we had permission but no plans, it was all such a surprise. In a short space of time agreement nationally was reached to hold a planning meeting. The location was to be at Wodonga on the VK2/3 border during September 1968.

To be continued.

AR



DURAL REPEATERS

The Wireless Institute of Australia NSW Division operates repeaters in the 2 metre and 70 centimetre bands from its Dural site, under the callsign VK2RWI. This short article describes the operation of these repeaters.

General Information	2 metre	70 centimetre
Output frequency	*147.0 MHz*	*438.525 MHz*
Input frequency	*146.4 MHz*	*433.525 MHz*
Output power	*35 W*	*10 W*
Antenna gain	*10 dBi*	*8 dBi*
Antenna pattern	*Cerdioid (max south)*	*Omni*

CONTROL FUNCTIONS

Both repeaters are controlled by a central microprocessor and operate as follows:

Tail: Normally 0.6 seconds, but extended to 1.2 seconds on weak signals.

Timeout: 3.5 minutes. Timeout is indicated by a 1 kHz tone transmitted for one second. This tone, preceded by an ident, is sent every two minutes while the repeater is timed out. When the incoming transmission ceases, the repeater sends a "raspberry" followed by an ident. Note that the timer resets at the end of the tail, so allow the repeater to drop out fully between overs. Timeout is inhibited automatically at broadcast times, and may also be manually inhibited at other times, and this mode is indicated by a short 1 kHz tone burst at the end of the tail. Timeout is reduced to 20 seconds when the battery voltage is low.

Anti-button-push: All incoming transmissions are checked for modulation content. After four transmissions lacking suitable modulation the repeater shuts down. This is reset on receipt of a suitably modulated transmission — the recommended procedure is to announce your call sign. Note that button-pushing, as well as being annoying to those listening, contravenes the regulations relating to identification of transmissions, Ie. DON'T!

Off-frequency indicator: Transmissions more than 2 kHz off frequency receive a tone during the tail — a high tone (1.6 kHz) meaning high in frequency and a low tone (600 Hz) meaning low in frequency. This function is disabled when the timeout inhibit mode is activated, as a result of abuse during broadcast callbacks.

Low power (2 m only): When switched to low power mode (10 W), the callsign is sent using 600 Hz instead of the normal 1 kHz tone.

Faults: The performance of the repeaters is continually monitored, and abnormal operation of the power supply or transmitter is indicated by a "B" (for battery) or "F" (for fault) respectively being sent at 80 second intervals. The pitch of the tone used indicates the nature of the condition, as in Table 1.

Maintenance: These repeaters are maintained by the WIA Dural Committee, and extensive remote control and telemetry facilities have been provided for this purpose. Note that maintenance and testing operations have priority over normal use (other than emergency traffic). Routine maintenance includes battery cycling several times each year.

AR

	600 Hz	*1 kHz*	*1.6 kHz*
Power Supply ("B")	*Low voltage*	*Mains failure*	*Bat charging*
Transmitter ("F")	*Low output*	*High TX current*	*High SWR*

TABLE 1

A HISTORY OF SOS

G Maxwell Hull, VK3ZS
Federal Historian

During World War II in 1940 dispatches from the wor zone reported that "SSSS" wos rivalling "SOS" as the maritime operators call of distress. If it was fact at the time, the former was not internationally recognised as was the "SOS" signal in the International Morse Code.

In any event, the "SSSS" did not officially mean "Submarine Sighted" or any other words beginning with "S". The explanation was that the dot-dot-dot four times repeated (... ... ...) representing these letters, has a characteristic swing and through common understanding and usage identified the nature of the distress case.

"SOS" does not mean literally "Save Our Souls" or "Save Our Ship" as is sometimes claimed, and more than a previous international distress call "CQD" meant "Come Quick Danger". All such calls are based on the speed and clarity with which they can be transmitted.

There was no special wireless call for sea emergency prior to the turn of the century, according to Federal Communication Records. About that time the Marconi International Marine Company Ltd began equipping ships for radio telegraph communication. In doing so it adopted "CQ", which had been in use in wire telegraph as a "general call" for many years, as a precedence signal for any ship desiring to communicate with another ship or shore station.

The need for a common distress call was recognised at the preliminary International Radio Conference held at Berlin in 1903. Here the Italian delegation suggested that in emergency a ship should send at intervals the signal "SSSDDD". No action was taken at this conference.

In 1904 the British Marconi Company instructed its ship radio stations to substitute "CD" for "CQ". Subsequently, the "D" was substituted in the old "CQ" call. At the 1906 International Radio Conference at Berlin, however, "SOS" was formally adopted. This combination was the outgrowth of "SOE" (... ——— .) which had been used by German ships but which was somewhat unsatisfactory because the final dot was easily obliterated by interference.

Even so, "CQD" was so firmly established with some operators that its use continued for some years thereafter. A notable example was its employment in summoning aid for the steamship "Republic" in 1909. "CQD" finally passed from the sea calls when the international conferences continued to approve "SOS".

From RADIO magazine, May 1940.

AR

INTERNATIONAL YOUTH YEAR

In 1979, the United Nations General Assembly, declared 1985 to be International Youth Year with the theme being "Participation, development and peace".

Let us, in our Seventy Fifth Anniversary Year", as the oldest radio society in the world also remember youth in their year.

May we encourage them to participate in the wonderful hobby of amateur radio and also help them to develop and further the particular facet of the hobby which claims their interest.

The youth of today are the OTs of tomorrow. **AR**

IT BEGAN 185 YEARS AGO

Alessandro Volta is the recognised founder of electrochemistry which has remained a major source of electricity.

The physicist experimenting in Italy developed the first electric cell in 1800 — his name has been given to the unit for electromotive force — the volt.

Although the phenomenon of electricity generation was not completely understood in those days Volta received full recognition for his discovery.

After demonstrating it to Napoleon, the French Emperor made him a count and senator of the Kingdom of Lombardy.

Later in 1815 the Emperor of Austria appointed Volta director of the philosophy faculty of the University of Padua.

Following on from Volta's work dry batteries were developed by Leclanche and rechargeable lead accumulators by Plante.

Without electrochemical cells there would be no portable radios or tape recorders, electrically powered vehicles, portable torches, heart pacemakers, electric watches and clocks, and even hydrogen fuel cells which power spacecraft. **AR**

HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

Well into the year and the sunspot activity is still declining, making contacts harder to get on the higher bands on which I normally operate. The signals are there, but not as strong and not as regular, so one has to work harder, improve their station efficiency and vary their techniques.

Of the times I have listened and monitored a rare station for a considerable time, it never ceases to amaze me the number of VKs that I can hear call and after a couple of calls, they give it away. On occasions I have called the station and alerted them to the fact that VKs are listening and calling. Invariably the called station will then look for the nominated station he or she has been advised of, work them and then seek other VKs.

Amateur radio is a hobby to share, and if I have the resources and luck to work a rare station, I am only too pleased to assist others and probably get as big a thrill out of seeing a newcomer or someone who wants it for a new country, get it, as the operator themselves. It is called sharing and from my point of view there could be a lot more of it heard across the amateur spectrum.

In my book, self satisfaction is directly proportional to what one receives in unsolicited personal rewards from what they do, to the amount of time, work or energy that they put into it.

MOUNT ATHOS

Nicola I0SNY, is still having trouble in organising the Mount Athos trip which was intended to be prior to Christmas 1984, but apparently documentation went astray.

As has been said many times SV/A is a very difficult area to gain accredited permission to operate from, and it all depends on the approval of the Council of Abbots which control the area.

Nicola is an experienced UHF orientated gentleman and in August last year established a 24 GHz record of 331 km, from Mount Epomeo on Ischia Island, off the coast of Naples, to Montalto in the Calabria region of Italy. (Refer QST December 1984, p69)

A late news item indicates that the group has the permission and the Easter Bunny could be hopping around while they are operating.

KERGUELEN

FT8XA is quite active on twenty metres. If you are lucky to catch up with him, QSL to F6FYD, Vannick Delatouche, P.O. Box 8, Andresy, France, F-78570.

DON'T FORGET CLIPPERTON

Due to be operational from 3rd to 10th April. More details next month.

ANTARCTICA

The station 4K1CEY, now QRT, was located at Molodezhnaya Base Antarctica, having co-ordinates of 67°S and 45°E which locates it in ITU Zone 69 and CQ Zone 39. QSL to UY5DJ via P.O. Box 88, Moscow or preferably via the Bureau.

PROFILE OF A MODERN DXER

Thirty eight year old Ghis ON5NT (affectionately known as "No Trouble") in nineteen years of operating has accomplished many amateur lifetime ambitions.

Ghis is on the ARRL DXCC Honour Roll and as at the end of 1984, whilst still awaiting the San Felix card his standings were Phone 310/309, Mixed 310/309, CW 306/305 and his figures of countries worked were Phone 325/324, Mixed 325/324 and the CW list was 311 worked with 310 confirmed.

Ghis' wanted list includes XZ, YA, ZA and 7O on both the Phone and Mixed sectors whilst on CW this very keen and astute operator needs A6, C9, XV, XZ, YA, ZA, 5A and 7O prefixes to capture a "full bag".

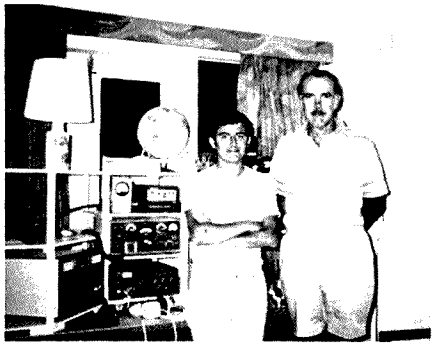
Awards have come his way also as he holds 5BWAC which was gained in 1977, 5BDXCC #487 (1976), 5BWAS #1022 (1982) and he worked and had confirmed the 200 contacts to achieve certificate #35 for 5 Band Worked all Zones also in 1982. Also Ghis proudly displays certificate number 7 for WAZ single band 80 metres SSB and WAZ single band CW on 40 metres, the certificate number is 16. It is a pity that 160 metre operation is not allowed in Belgium or there, I am sure, would be a certificate for that too.

The low bands score is swelling and forty metres has 288 worked with 286 confirmed, eighty metres follows closely with 246/244 on SSB/CW.

Not one to stand still, Ghis has operated 4U1ITU (1975), ON5NT/LX (1976), 10,000 QSOs from TYA11 in 1982, ON5NT/IT4 (1984) and ON5NT/HB0 also in 1984. He is also QSL Manager for a number of stations.

When one reflects on these accomplishments and considers all the hours including the seeing of innumerable sunrises for the low band contacts, any reader would have to agree that Ghis is a dedicated DXer.

Ghis is ably supported in his hobby by his charming XYL Monique and 11 and 7 year old daughters Maggy and Heidi.



Two famous DXers Ghis ON5NT (L) and Bull 9U5JB, presently US Ambassador in Burundi. The photo was taken in 1981 at the TYA11 QTH.

BURUNDI

Ghis ON5NT, hopes to be able to operate 9U5JB over the Easter period. Look on the usual DX frequencies and all QSLs to ON5NT.

NEW BEACON

Another beacon on twenty metres has been activated and will join 4U1UN/B, W6WX/B, KH6O/B, JA2IGY, 4X6TU/B, OH2B, CT3B and ZS6DN/B on 14.100 MHz. The beacon is HK4LR/B and will be operating in number nine time slot. Apart from a guide to propagation a QSL would be appreciated by the sponsors, the Northern California DX Club via W6RQ.

NO GUARANTEE

For those keen DXers who have still not received a card from Ron LU2AH, for AZ5ZA. Ron recommends that one QSL to Gorostiaga 2320, Buenos Aires 1426, Argentina may work as he comments that mail destined to him is being intercepted by a postal worker. Beware, there is no guarantee that you will still receive a card.

YEOVAL-YEOVIL

Joy VK2EBX, whose QTH is Yeoval and is a regular contributor to this column has received a beautiful certificate from the Yeovil Amateur Radio Club confirming her as an Honorary Life Member. Congratulations Joy, and I am sure it takes pride of place near the transceiver. (See page 43 — Nov AR).

MARION ISLAND

ZS2MI back on the air!!! It is believed that ZR6AOJ, has permission to operate ZS2MI for a fourteen month stint. All QSLs will be handled by ZS6BCR. Let us hope that this operation will be a success story as ZS2MI has not appeared in that many DXers logs, particularly VKs.

Marion Island, located nearly 2000 kilometres south-east of Capetown in the Indian Ocean, is the larger of the two islands of the South African dependent Prince Edward Island Group. This sub antarctic island, which is entirely volcanic, has an area of 390 square kilometres and its highest mountain is a dome like shape rising to Jan Smuts Peak, which is snow covered and has an elevation of 1190 metres. In a description of the island, QRZ DX Editor Bob Winn W5KNE, wrote, research has shown that the coastline is very rugged and exposed with steep cliffs rising to around the 150 metre mark.

Bob says, that the climate is cool, with a mean annual temperature of 4 degrees and the island is continually swept by gales which bring heavy rains, up to 2500 mm annually. On average only a few hours of weak sunshine is seen daily as the cloud cover is at about 300 metres.

NEW PREFIX

A new prefix, HW is appearing on the bands and it is a special prefix for the 20th anniversary of UNARAF in France, an association for the visually impaired. Prefix HW3 will substitute a FC prefix, HW4 for FD and HW5 for FE.

ZC4 A NEW COUNTRY

The ARRL DX Advisory Council had recommended on a 15 to 1 vote that ZC4 becomes a separate DXCC country. The ARRL deliberated further and the Awards Committee voted 6 to 1 in favour of the UK Sovereign Base Areas on Cyprus (ZC4) becoming a new DXCC Country.

No credits will be accepted until the 1st of June 1985 but now it becomes difficult. Credits for ZC4 contacts made before the 16th August 1960, will continue to be credited to the Cyprus listing. All 5B4 credits count for the Cyprus listing. All ZC4 contacts made after the 1960 date were not necessarily from stations operating within the Sovereign Base Areas. Cards that show operation from within the Bases will be credited. The ARRL DXCC desk will make every effort to ascertain the location if it is not clearly indicated. If in doubt applicants may submit a number of ZC4 cards (if you have them) and every assistance will be given. More headache powders for the DXCC Administrator Don Search, I would venture to say.

NOT IN THE LOG???

Many amateurs, world wide, seeking a confirmation of the contact with VU7WCY have received the following note.

Dear Friend,

We are sorry to inform you that we have not been able to find your call sign in our log book, although we even checked the day before and the day after for any mix up in dates. We even went to the extent of checking the log books of the other operators to see if you have worked them.

The delay in acknowledging your QSL card was due to the time consumed in going through all the log books.

Wishing you the best of luck the next time.

73's,

GOPAL

(VU2 GDG)

"Boy" VK2DTH, contacted this group twice, on different frequencies and sent the cards off with the usual remittance. No reply, so he sent off again with "green" stamps and in return this carefully and professionally printed explanation.

A VU YL on twenty metres went clear, with many excuses that urgent chores had to be attended to, after having four consecutive calls regarding the cards one evening. Within five minutes she was calling CQ North America, 100 kHz up the band and got many takers. Each very short QSO ended in the phrase "please QSL direct to . . ."

"Boy" at least received recognition that his letter was received, mine with a letter asking for a story and photographs and my card included along with ample funds for return, still remains unanswered.

Many QSOs, lots of IRCs and other good things and no cards. No one could miss that many entries in the log, surely or could they???

JOTA IN MALAYSIA

Peter 9M2PW, now back in Australia after a three year tour of duty at the RAAF Butterworth Air Base, assisted the multitude of Malaysian stations that took part in JOTA 1984.

Peter 9M2PW with 14 year old Debbie Gavin of the 1st Tanjong Bungah Guide Company.

SAN FELIX

The Radio Club de Chile members were so incensed by the bogus operation by Bob Read KF10 (refer AR September 1982 p30) that it was their ultimate goal to make amends to the world wide amateur fraternity with a genuine DX operation from one of the rarest DXCC countries in the world.

Patricio CE3GN, the International Co-ordinator of the Club kindly prepared the story of the expedition for Amateur Radio and it has been professionally and expertly translated by Louis VK3ZLD, a gentleman that has five languages at his finger tips.

SECRECY

All amateurs were bewildered as to why no advance information had been forthcoming as to this important expedition but it was the culmination of seven years of negotiations, always stressing the importance of this country being allowed on the amateur bands, with the Military who control the island, and the government that the final authorisation, with certain conditions, was given on the 21st August 1984 by a telephone call to the Club's President.

The conditions of operation were that the amateurs must be service personnel, be prepared to stay for two months, operate from a specific location and not stray from that area. The reason for these limitations is that San Felix is under strict military control and no civilians are allowed on the area.

PROBLEMS ALREADY

The chosen couple, Fernando CE3GXY and Max CE9DUN, both amateur operators in the Chilean Navy, though expert on CW were not conversant with the English language for SSB operation. The second problem was that they had ten days to arrange leave of absence from the Navy and arrange their transport to the island. These were apart from the organisation of equipment. Not easy tasks to overcome!

L to R: Fernando CE3GXY, Mickey CE3ESS and Max CE9DUN.

PROBLEMS OVERCOME

Fernando and Max had many helpers in assisting them to improve their English vocabulary. Amongst these were German CE3CBG, Enrique CE3BBW, Mickey CE3ESS, Edwardo CE3BOC, Jorge CE3CTI, Marcelo CE3BXP and Celso CE3ACA.

The equipment that was to be used for the expedition was partly supplied by the Club, with further assistance by loans from Club members particularly Pablo CE3JN, Enrique CE3BBW who supplied transmitting equipment, Mickey CE3ESS who supplied the three band antenna and rotator, Celso CE3ACA and Edward CE3BOC, who constructed the dipoles. German CE3CBG, Michel CE3DPD and Marcelo CE3BXP packed and prepared the equipment which consisted of 1 x TS-600, 2 x 830-Ss, with an external VFO, 1 x 130S and an AT230, 1 Honda E-500, 1 TET three band antenna and inverted Vees for 160, 80 and 40 metres, for transport to the island.

The operators getting in practice at the Club.

FAREWELLS

During the week prior to departure Fernando, Max and all the helpers involved in the preparations were treated to a celebration organised by the Club in appreciation of their untiring efforts of assistance.

Fernando making a point to Patricio CE3GN.

L to R: Standing. Patricio CE3GN, Mickey CE3ESS, Max CE0AA, Sitting. Fernando CE0AA and Enrique CE3BBW.

On the 30th August, a farewell was hosted to both expeditioners at a well known Santiquino restaurant, where they made a promise to be dutiful operators. Toasts were made in Chilean wine. Next day the two operators departed for San Felix Island with a feeling that they were doing something worthwhile for all amateur operators.

The island as depicted on the card.

THE ISLAND

The island of San Felix, located at 80 degrees parallel and 880 kilometres from the Chilean coast is 800 metres long and 2400 metres wide, being the result of a volcanic eruption and the surface is nothing other than rocks, with no vegetation of any kind.

The day after their arrival, both operators, by working through the night, had all the equipment operational. The same day at 2207 UTC they established their first contact to test the equipment. A historic occasion, CE0AA, a legitimate station, operational from this lonely and barren island, that would give a multitude of DXers a new DXCC credit.

Fernando starting to climb the tower. San Ambrosia Island can be seen in the background.

Max, at the top of the tower adjusting the rotator.

All contacts were kept short and to the point, so that it would give operators from all continents a chance of working one of the top ten most wanted countries. The

first few days were chaos, then when things settled down, operating was easy and times on all bands were adhered to as close as practicable.

THE CONTROLLERS

The controllers like Enrique CE3BBW, Mickey CE3ESS, Carlos CE3EEO, Michel CE3DPD, Ralf CE6EZ, Mario CE6COR and Carlos CE3NR were magnificent in their handling of the situations. Many other stations spent six to eight hours per day controlling the operation. Many international operators assisted and included Eva PY2PE, Toshi JA1ELY, Phineas W6BF, Ron KB7SO, Jack WB4GCP, Gail KF4IL, Jim KB7OC, John KC0YI, Loren K6EDV, Tex W6AHV, James NB7R, Nell HK0HEU, and many others who voluntarily gave their time to participate.

Patricio CE3GN, on behalf of the Club and its members, expresses his appreciation to the Chilean, international operators and many others that gave their time to participate and says "I cannot express enough happiness at the greatest effort put in by everyone for the common community cause and we also express our gratitude to the operators for the enormous amount of contacts made 6 to 160 metres, which were above our expectations".

RTTY

The 28th September saw another historic event, thanks to Fernando. This operator had received permission from the authorities on the island to operate the RTTY mode and many amateurs were able to conduct two way transmissions on the amateur bands with San Felix.

CLOSING DOWN

Enrique CE3BBQ, was the controller responsible for the expendition and at the beginning of October due to the fact of his commitments overseas, operations had to cease.

In excess of 31,000 contacts were made using the modes of CW, SSB and RTTY on all DXCC bands from 6 to 160 metres and in Patricio's words "The whole expedition came to a perfect ending which cannot be criticised. We are pleased that amateur operators all over the world are happy and to those responsible for the operation we are grateful that during the first few days, despite all the criticism, all went well and we were able to keep over 31,000 operators happy and give them a new country for their DXCC, the Island of San Felix".

It would be ungracious of me if I didn't endorse the last remarks and express sincere thanks to all concerned with the operation on behalf of particularly VK amateurs and amateurs world wide for the dedication of the club and its members in bringing about the activation of this rare DXCC country. (VK3AH).

BITS AND PIECES

News reports indicate that Ampil, the home of XU1SS and gang has been seized by the enemy. **160 metre enthusiasts could look for CE3DPD and CE3EEO who operate around1.835 MHz most days. **Gerry 5X5GK, it appears has some written documentation which will be forwarded to the ARRL DXCC Desk. He gets 100 percent in my book as trier. **Many EM, EO, EU, EW, ER and EV prefixes from the USSR which may be claimed for a special award, the details of which are unclear. Their use is to celebrate the cessation of hostilities of WWII, forty years ago, and apparently the suffix R designates that the operator was one of the veterans. **ZA1ST is working Europeans and advising them to QSL via OH2BDM. One wonders if OH2BDM knows about it, he soon will when the mail arrives. **VK3AH is not QSL Manager for VK0GC whose cards should go to P29JS. Cards for Denise VK0YL go to VK3AH. **OE stations may now use 100 watts CW from 1.850 to 1.950 MHz. **Many HI8 operators using HI0 prefix. **ARRL DX-CC Desk has had no documentation from PS7ABT/S9. Was he "alongside" when he made the calls?? **Betty, XYL or Tom VR6TC is believed to have passed the amateur licence and will appear with the call VR6YL. More operating hours from that QTH, that is for sure. **Les 7Q7LW, due back on the bands after holidays in the UK. **More operating hours from that QTH, that is for sure! **The LA group cancelled their plans for Bouvet earlier this year due to economics, politics and safety. **QSL cards for the special Olympic stations should now go to W6SZN or N6AUV. The P.O. Box has been closed. **The JAs hoped for a few hours operating last month from Bouvet after landing from a fishing boat and the LAs were still hopeful of a few hours operation as 3Y4FG. **RSGB Headquarters is located in Alma House. They have changed the name to Lambda House. Significant? **Dieter DK9KD, advises he is not the QSL Manager for the bogus stations DK9KX/5A or 5A1AA. **Genuine C9 operators may be heard more frequently in the near future. **BY5RF, a newly commissioned station from the Peoples Republic of China is quite active. **YI1BGD say they can now operate on 18 and 24 MHz.

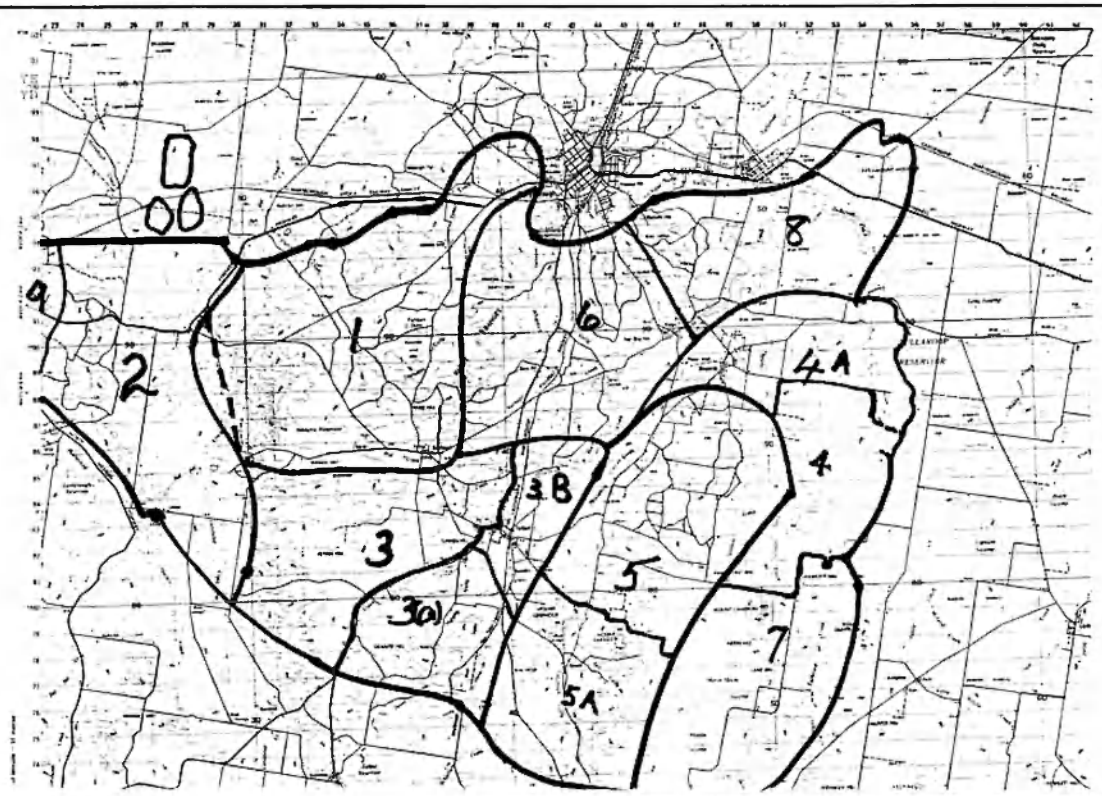
Again is reproduced another card of yesteryear. The card was supplied by Arthur VK2JM.

THANKS

Special thanks go to the following. The Editors of weekly bi-weekly, and monthly newsletters including the ARRL NEWSLETTER, RSGB DX NEWS, ORZ DX, LONG SKIP, DX FAMILY FOUNDATION NEWSLETTER, JAN and JAY O'BRIEN'S QSL MANAGER LIST and KH6BZF REPORTS. Magazines including CQ, cqDX, QST, RADCOM, JARL NEWS, OZ, WORLD RADIO, 73, BREAK IN and VERON.

Members who have contributed include VKs 2JM, PS, DTH, EBX, 3BY, EW, FR, YJ, YL, ZLD, 4BHJ, 6NE, G3NBC, WA3HUP and L30042. Overseas amateurs include CE3GN, DK9KD, G1EOD, 18SAT, ON5NT and ON7WW. Good DXing and sincere thanks to one and all. **AR**

Overseas Amateurs are welcome to join the WIA. Meet one who has on page 23.



Approximately 30,000 head of stock were burnt and destroyed in the fire area bounded by the black line. Smaller divisions indicate the area of operation for each field team.

WICEN NEWS

Geoff Smith VK3ADB
PRESIDENT OF BALLARAT ARG
829 Laurie Street, Mount Pleasant, Vic. 3350

WICEN INVOLVEMENT IN THE MARYBOROUGH (TULLAROOP SHIRE) BUSHFIRE AREA ON 14TH JANUARY 1985

On Wednesday 16th January 1985 operators from Bendigo ARC and Ballarat ARG were called out on stand by for WICEN work with the bushfires at Maryborough. Operations began at 0730 EST on 17th January and concluded at 1800 EST on 18th January.

Amateurs participating from Bendigo were VK3's — XBL, DTY DML and DOV whilst from Ballarat — VK3s — ADB, VU, BNC, PAF, NIH, AEX, YMW and ANH.

A base station was set up in the Shire of Tullarbop offices using 146.500 MHz Simplex. To cater for difficult reception in outlying areas a manned relay station was set up on Bristol Hill (about 609.6 metres ASL) approx. 1 km from the base station.

Bristol Hill has a lookout tower about 21.34 metres high on its peak. An antenna (a Slim Jim) was erected on top of the tower which gave an excellent take-off to cover even the remotest corner of the Shire.

Individual field operation was required, in that the operators travelled in a Department of Agriculture/ RSPCA vehicle to various parts of the Shire to assess burnt stock and farm problems such as fencing, feed and fodder needs, arrangements for earth moving equipment to dig disposal pits for stock destroyed on site, location of portable yards and assistance with the personal needs of farmers affected by the fire.

The problem of portable/mobile operation was overcome by the use of magnetic mounted and gutter grip antennas. Rigs used were handhelds and various VHF transceivers powered from the vehicles cigarette lighter sockets. Problems were anticipated and catered for.

HF operation was not used but equipment was available if required.

Photograph courtesy of the Sun News Pictorial. Photographer Janine Eastgate.

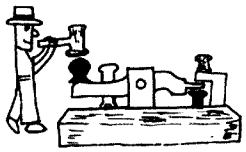
The Aftermath of the Maryborough Bushfire.

In actual operation no problems were encountered with messages due to the excellent location of the relay station.

At the end of each day, at the debriefing session, department heads and field officers stated that the standard of operation was highly professional and enhanced the performance of all in ensuring the various needs were promptly dealt with.

The contribution made by the WICEN operators from Bendigo and Ballarat helped relieve some of the misery endured by the strickened animals in this disaster.

The operation was co-ordinated by Dick VK3AEX and Don VK3XBL. **AR**



POUNDING BRASS

Marshall Emm, VK5FN
GPO Box 389, Adelaide, SA 5001

WHY USE CW?

Quite often people ask me why I am so interested in CW — how can anyone enjoy something so unnatural and so "difficult to learn?" I suppose the easy answer is that people are by nature contrary, and I enjoy doing all sorts of things that other people find a bit odd. Playing tennis, for example, is not natural and for most of us difficult to learn.

In my case, the main reason is that I spend too much time talking at work during the day, and smoke too much (New Year's Resolutions not withstanding) and the last thing I want to do of an evening is sit around yacking into a microphone!

In the January issue of this column I talked about the future of CW as an amateur mode, and now I'd like to devote a little more space to the nifty reasons why people enjoy it, why it is useful, and generally why it deserves to have a future.

The virtually iron-clad arguments which follow were in a large part suggested by a European amateur who can often work VK on CW when the phone bands are dead.

1 The bandwidth argument

Power relationships based on nominal signal bandwidth are summarised from a professional engineering journal in the following table:

Mode	Bandwidth	Power
CW	100 Hz	100
RTTY	400 Hz	96
RTTY	1000 Hz	90
SSB	2500 Hz	75
AM	5000 Hz	50
FM	12000 Hz	1

In addition, it is fairly obvious that detection of the presence or absence of an unmodulated tone is much easier to detect than making sense of human speech in all its various forms. You can filter a CW signal down to as little as 60 Hz width using readily available technology — dots can still be discriminated at 50 WPM. This means theoretically that something like thirty CW QSO's could take place simultaneously in the bandwidth occupied by a single SSB QSO! Thus the essence of the argument is minimal pollution in terms both of power of required bandwidth.

2 The speed of argument

Often turned against CW operation, the speed argument case comes into play once reasonable speeds can be worked with effective use of abbreviations, procedural symbols, and the Q-code. By reasonable speeds I mean as little as 15 WPM, though of course that can be improved upon! Listen to a phone QSO game some time and see just how long it takes to communicate how little.

3 The discipline argument

Learning the code requires a certain amount of self-discipline, as does using it properly. Amateur radio is generally deemed to be "self-regulating". It is also international, and a poor operator brings not only himself into disrepute, but all his countrymen. In my opinion it is not mere coincidence that the pressure for elimination of CW exams has gone hand-in-hand with degradation of manners on the amateur bands.

4 The language argument

It may well be that English is the official language of radio, but sometimes it is all but unrecognizable. Since it is by its very nature a symbolic language, Morse Code represents a far easier means of communicating with foreigners than speech. A Russian operator, for example, may well be thinking "spasibo" as he sends "TNX". Or put it slightly differently — if he wants to say "pagoda xoroshaya" he has to translate into "the weather is fine" if he's working phone, but "WX FB" is all he needs for CW.

5 The homebrew argument

The amateur is supposed to be an experimenter, but who has the money and the skills to homebrew something like a TS 930 or FT One? You can get pretty close to the CW equivalent with homebrew gear.

6 The emergency argument

Put arguments one through five together and you have a pretty useful tool when it comes to an emergency. If your car gets wrecked in the desert, smashing the CB to bits, and you have a good CW operator handy, odds are he can build a transmitter from odds and ends, get it on air, and get help on its way. But seriously, folks, it is a simple and effective means of communication, so long as people take the trouble to learn the skills. **AR**

Note: The call signs are in order of placings.

Check logs were received from VK5YL; VK3KS; VK3XB; VK3LC; VK8NW; VK3FG; ZL2BOD and VK5QO.

My very sincere thanks to all who continue to support ALARA through the contest and I do hope to hear from everyone again in November.

Congratulations to Wendy VK4BSQ for a very creditable score with the trying conditions we had, well done.

Jill VK4VNK is our very first winner of the Mrs McKenzie Trophy; it seems appropriate that our first winner is from Queensland and the trophy came from Townsville. Jill's CW score was 162. Congratulations Jill.

This year ALARA will be 10 years old and the Committee are presently looking at having a get-together in Melbourne to celebrate this special birthday. As ALARA was first activated in Melbourne, that would be a good place to meet again. Further details after our next committee meeting.

No definite decision has been made on how often get-togethers will be held as subscriptions are still coming in, questionnaires with them.

Austine VK3YL has asked me to pass on her thanks and best 33 to all ALARA members, she is delighted with her special log book cover and is using it with very happy memories of her surprise afternoon.

Until next month take care and good DX to all.

33/73/88

Margaret VK3DML **AR**

STOLEN EQUIPMENT REGISTER

In accordance with 1984 Convention Motion 84:17:01 the Federal Office has established a stolen equipment register.

Members wishing to take advantage of this register, either to publicise their loss or to check equipment offered to them may write or telephone to the Federal Office their enquiries.

To update the list published in the JANUARY issue:

MODEL	SER NUMBER	FROM
ICOM IC25A	03831	VK2DPM
ICOM IC45A	01876	VK2DPM
ICOM IC211	6804309	VK3BRV
KYOUTO FM144/10	5027	VK2KUR
OS EXPLORER	70 cm Transceiver (has extensive internal mods	
ICOM IC215	05156	VK2AMX
YEASU FT 209RH	4K050838	VK3CE*

*(Blue vinyl case complete with handbook the outside of which is stained)

AR

INPUT FROM MEMBERS

The 1985 Federal Convention will be held in Melbourne from 26-28 April.

Items which members wish to bring to the attention of the Convention should be submitted to their Divisional Office or Federal Councillor immediately.

As agenda items must arrive at Federal Office thirty days prior to the Convention — 26th March 1985 — it is imperative to move quickly so you don't miss out.

AR

Lost month we viewed rhe Red Cross Murray River Marathon from the camera lens of Gil Sones VK3AUI, a stalwart of the Marathon for many years on the radio side. This month David gives us a look at rhe computer side of things which for rhe past two years have been provided by the Melbourne Packet Radio Group. Read on . . .

PACKET RADIO

David Furst VK3YDF
57 Laity Street, Richmond, Vic. 3121

What I did on my Christmas Holidays

by the Melbourne Packet Radio Group

As many of you will be aware, the WICEN group were assisting the Red Cross after Christmas in running the Murray River Marathon. (see centre pages February) So were the Melbourne Packet Radio Group. This article is not about packet radio as such, but about the type of people and the variety of talents that we hope packet radio will bring to the ranks of amateur radio.

WICEN were up on the Murray because it is vitally important that communications are passed up and down the river as to the state of the race in general and most particularly to make sure that if there are any injuries or mishaps the safety network can respond quickly.

The MPRG is composed of people who have been radio amateurs for many years as well as computer hobbyists. It was in this latter role that we were called upon by the Red Cross to provide a mobile computer centre.

In recent years the Red Cross have had increasing problems producing the results for this race which has been growing steadily. The problem is one of a complex system which grew beyond the means of humans to control it. There are approximately forty classes of entry in the race, 350 competing canoes, 500 entrants in those canoes, and the canoes start each morning in up to 15 starts spread over nearly two hours. All this would be complicated enough, however the race runs over five days and times and placings must be worked out each day. They must be produced quickly and they must be accurate to the last second. (*Unless you don't mind 4,000 irate canoeists and supporters on your back!*)

Originally the Red Cross approached the Micro Computer Club of Melbourne in April of 1983 with a request for help. The two founding members of the MPRG, Peter Jetson and myself, volunteered for this job. It was just as well that we had no idea of what was before us or we would never have done so.

Over the months that followed there were endless meetings so we could form some idea of what had to be done, in what time frame, and how.

Very early in the piece we realised that computer reliability was going to be paramount. This instantly ruled out using one large multi-user machine. These things are difficult to fix and if you have just one and it dies, then all of a sudden you have no computers any more. We decided to use a number of smaller machines because we could theoretically still do the job even if we lost one or two of them — though more slowly of course.

During the mid afternoon we could expect to have boats arriving at the rate of one every 20 seconds or so. As computers are sometimes just plain temperamental (remember Murphy?) we had to come up with a fail proof way of running a computer so that it just could not break down. This seemingly impossible task was accomplished by hooking up two computers so that whatever was typed into the keyboard of one also appeared on the other. If one died, the other would still have the results up to the last second. We used separate power generators and separate power filtering boxes for each machine so that whatever else happened we could only lose one machine at a time.

All this gave us enough computer power to be able to enter the finishing times each day, but when would we have time to do periodical printouts of results during the race? Another computer was added to the plan. This one was to be used to do printouts, to write new programmes and modify old ones as needed.

It was somewhere about this stage of the planting that a realisation struck us: we had to be loco to be trying something like this. Alternative plan Q was put into place. In case everything fell down in a shambles we would leave the cars pointing towards Sydney with the motors running. We don't live in Sydney; we just thought that Melbourne would be the first place that they'd look for us.

More potential problems surfaced: How do you enter 350 boat numbers and times quickly, each day for five days and without errors? The scheme settled upon was where one person read out the information while another keyed it into the computer and both people checked in. As a further check, when the data was entered into the computers one of them printed it out there and then. The numbers on this printout were always compared to the numbers we thought we'd entered.

In 1983 we had the computers travelling in separate cars and we went from site to site finding a room where we could set up a computer centre. In 1984 we thought that it would be better to have everything set up in a travelling computer centre which could be set up on the river bank next to the finish line. Here was another set of problems awaiting solution. First we needed a caravan or bus to put the computers into. National Business Systems were approached and agreed to lend us the bus they normally use around the suburbs demonstrating their range of computers. They sell Sharp computers and the model 3500 was just about perfect for what we were doing; they were kind enough to lend us three of them, plus a fast printer. We added a fast printer of our own plus a slower printer so we had plenty of spares. Having so many computers and printers gave us the ability to produce heaps of reports when called upon — which was surprisingly often.

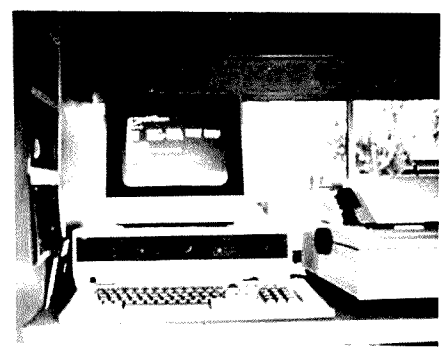
The Micom/NBS Mobile Computer Centre at Yarrawonga.

Since this was the only computer centre we had we protected it jealously. We travelled in convoy with cars preceding and following the bus at all times. We have lots of amateurs in our ranks so each car had a two metre rig running on 147.6 MHz (the Packet Radio channel — remember Packet Radio? This article is supposed to be about it).

Up on the Murray it's pretty dusty. You and I might not like that, but computers positively hate it. Next problem: how do you keep the dust out of the bus and not suffocate or burn up in 40 degrees plus heat? Simple! — get an air conditioner.

Have you ever tried to borrow an air conditioner in mid summer? We spent three weeks phoning around before Ounn Air came to the rescue. Of course buses are not like houses and you cannot mount air conditioners in their walls — particularly when you have to give the bus back in pristine condition. Rayson Industries helped out with some cunning ductwork which allowed us to sit the air conditioner on the ground and pipe the air into the bus. It looked pretty weird, but there was always competition to sit next to the duct where the cold air came out.

Just to finish the list of companies who helped us out so generously. I would like to thank Dabo Computer Supplies of Melbourne who provided the diskettes to put the information and programmes onto. We needed disks that were near bulletproof and their Dysan disks are the best there is.



One of the Sharp Computers lent by NBS for the Marathon.

Liz Moss of National Business Systems went to great efforts on our behalf and I would like to acknowledge them specially. Australian Industrial Publications (my employers) were good enough to provide a petty cash fund for all the various small expenses involved with this project and the State Emergency Service provided generators to provide power (No Matilda, there are no power points installed on the trees next to the Murray).

It is impossible to do something like this without the assistance of others and heartfelt thanks go to those people and companies who have helped so generously.

Of course all the above is only the logistics of getting the right gear in the right place at the right time. Computers won't run without programmes. Our specialist programmer is Peter Jetson from the MPRG. Without Peter's particularly practical way of seeing a computing task and writing particularly practical programmes to do the job all the above would have been wasted.

Peter chose CP/M as the operating system to use. This allowed him to do some rather cunning things with fake submit files to run a few progammes in a row and end up back at the main menu.

The Computer Centre with David VK3YDF, holding Shorty the dog, Sue, David and John.

The computer language he chose was Microsoft Basic. This is easy to write with, will allow a programmer to do almost anything, is understandable to the whole team and lets you easily modify programmes as needs arise.

To print anything you first have to get it in the right order. This is done by sorting it. Peter selected Supersoft because it runs quickly and is a good reliable piece of software.

The programming task was still prodigious. A programme had to be written to get all the names of the competitors, their canoe numbers and their classes into the computer. Another programme had to be written to be able to change any of the above details if conditions changed. A programme had to be written to allow us to enter daily times and points scored as the race progressed.

Other programmes had to be written to produce the various reports needed by the people who run the race.

The people who put the canoes onto the water needed starting lists to tell them which canoes to set off at which time. The chap who decided the starting order needed a similar list, but with the names of all the competitors included. The Race Information Office needed race result printouts for the competitors — two separate formats depending on whether it was a preliminary result during the race or a final printout at the end of the day; he also needed a list of all the canoes in the race in absolute finishing time order, as opposed to printing them out by class. The publicity people needed a list of the fastest twenty canoes for the day and another list of the fastest three canoes in each class. The finishing line people needed a list of which canoes were not accounted for at the end of the day both for accuracy of results and for safety reasons. Everybody needed lists of all the competitors in boat number order and in alphabetical order. We needed programmes just to look after all the other programmes.

The length of a computer programme is measured in K — K stands for 1024 (which is two to the power of ten). Peter wrote 150 K of programmes to do the job. This means that he pressed the keys of his computer terminal about 153,600 times as he wrote these programmes in three weeks of his spare time. It is worth mentioning that if you or I tried to write a couple of K of programmes it would probably be full of errors — 'bugs' in computer terminology. Peter's programmes were error free when we got them to the Murray.

So how did it all go? Well 1983 was our first try at doing this job and we had our troubles. One day we spent the entire night pulling apart every piece of computer gear and extracting the dust from its innards; hence the bus in 1984. The rest of the 1983 Masochism Special went increasingly smoothly, culminating in our team being able to set up the computer centre in any room anywhere in about seven minutes.

In 1984 things went even better, with a couple of minor exceptions. One of our generators went west which forced us to (HORROR!) half air conditioning. Someone had changed the gearbox in the bus a couple of weeks prior to the race and forgotten to tighten the bolts which hold the driveshaft to the gearbox. Naturally this broke down at an inopportune time. A combination of a couple of our people, one of the Land Patrol people from the Land Rover Club and

"Dead Bus Blues".

some help from the people of Yarrawonga put it right in two and a half hours. The rest of that day passed in a pleasant flurry of action culminating in a mess because someone on the finishing line gave us numbers which didn't make sense. This is where it is appropriate to mention a golden rule of computing — GIGO (Garbage In — Garbage Out). None the less everything was sorted out and final results for the day were duly printed.

At this point it was decided to change the starting times for all the canoes but eighteen. Having a computer centre allows the marathon officials to change the starting times so that the slowest canoes get onto the water earliest and consequently finish earlier than they otherwise might. This is useful as it lets all the safety people and other officials get back to camp for dinner before 10 pm. This took until almost two the next morning which happily provided us with an excuse to get up late.

Getting up late at the Marathon is not as easy as it sounds. At about 5 am a guy with a nasty sense of humour drives around the whole camp alternatively playing various renditions of 'Morning Has Broken' and cracking jokes about early mornings. We learned two lessons from this. 1 We have all developed an aversion to 'Morning Has Broken' and 2 Any joke is bad at 5 am.

Any article about the Red Cross Murray River Canoe Marathon is not complete without honouring the especially brave amongst the paddlers — remember them? They're the people we're all there to look after. In 1983 Wendy Asche — a young lass from Melbourne was last every day without fail. We all looked forward to her arrival partly because it meant that all the paddlers were in, but mostly because we admired her for doing what we couldn't have. Wendy was back in 1984 paddling a double with her cousin Allison. Thank you Wendy for the inspiration that you gave us.

The 1983 Marathon raised about $90,000 towards the good work of the Red Cross organisation. As this is being written the figures are not yet in for the 1984 Marathon, though we hope to have bettered last year

Wendy Asche at the Final Finishing Line.

The Fastest Boat.

The Red Cross Murray River Canoe Marathon is billed as 'The Great Adventurer' and I commend it to you as one of the most enjoyable and most valuable experiences you could have.

AR

USING MORSE

As from 1st April 1985 to 31st March 1986 United Kingdom amateurs holding a Class B licence will be able to conduct QSOs in Morse code.

It is hoped that this experiment will encourage more to pass the amateur Morse test and upgrade their licences.

NEWS FROM VICTORIA

It's not often I get a letter from Victoria, but one has arrived from Eric VK3BXA who lives at Thoona, about 35km north of Benalla. Eric came on 6 metres first in 1979 with an IC502 but found the lack of a suitable antenna quite a problem. Since 11/12/84 he has been able to use a 50 to 600 MHz log periodic antenna at 17m, and his first DX on that date was to hear the VK0CK beacon and then called VK0CK at 0639 but no reply! Although hearing many stations in QSO his first successful contact was VK4ZWH at 0112 on 15/12 followed by VK4ALM at 0134 and VK8ZLX at 0612.

Somewhat elated with the contacts he was having, Eric took his IC560 to work, made up a dipole antenna mounted 2m above the ground, and worked VK8ZLX at 0612. Subsequent contacts were: 16/12: VK8TM, VK4TKA and VK4LE between 0340 and 0400. 19/12: VK4ALM at 0016, then VK3APF followed by his first ZL, ZL1BHX, then ZL2AQR at 0529. 20/12: VK6ZPG; 21/12: VK2HT, VK3UG, VK5PZ (first VK5) at 0347, VK5KPM, VK8GB, VK4ZWH, VK4ALM, VK8VV, VK4AEW. 30/12: ZL2AQR at 0002, ZL2TJX, VK3ANP, ZL2CD, ZL2BGE, VK4PG/P and VK4ZKE.

Eric is nearing completion of the construction of a QQEO6/40 linear for 6 metres which should help. Amongst other things he also lists hearing quite a number of beacons, particularly from New Zealand, and this has allowed me to confirm that a number of those I have listed are in fact working and on frequency.

Eric also listed a number of call signs of 6 metre stations he has heard operating SSB in the CW segment which according to the WIA Band Plan is from 52.000 to 52.050, with the first 10 kHz being for EME only, and *accordingly* has asked *me to* list his objections to this useage.

My comment: Eric's objections as a CW operator are valid but he may have a long hard journey trying to enforce compliance. I have been operating on the VHF bands for 25 years and subject to being corrected, I believe il has only been of recent years that a band plan for VHF and UHF has been produced, and wherein it was natural enough to follow the trend of HF and have the lower part of the band for CW operation. However, as in a lot of other areas and fields of endeavour, useage tends to dictate acceptance, and the level of CW operation on 6 metres has been so fow and still is after many years, that you would have a major task achieving compliance.

Further, with the now world wide acceptance that 52.050 is the VK calling frequency, which took years to be acknowledged in other countries, it seems unlikely those interested in the band will push for it to be changed. The position is entirely different on HF where the CW segments are in constant use, often on a world wide basis, but it is difficult to justify 50 kHz on 52 MHz for the same reasons. It seems to me that the lower portion of 52 MHz, say below 52.020, is not greatly used by SSB stations and I wouldn't know when I last had a contact down there. If I make a contact by using the calling frequency of 52.050, and the contact is going to be more than a few moments, I invariably suggest shifting higher up the band rather than going lower, and I note many other stations do this too.

It is interesting to campare the present day with the days when AM operation reigned supreme. Stations then, during a big Es opening, would be spread from 50.000 to 50.600 (later 52.000 to 52.600) and you could often identify a station by his frequency. Mainly due to the lack of good VFO's and transceivers, split frequency operation was the order of the day. Today, with so much commercial equipment in use, the tendency to follow the HF pattern of both stations working on the same frequency is the norm hence less spectrum space generally is involved. Whilst this may be a pity in some ways when considering the need to use the bands, that's how it is at the moment, if you want a contact you call on the other operators frequency.

To round off the discussion, I think it would be unwise to try and change the present 52.050 calling frequency. Some measure of success might be gained by trying to keep say the first 20 or 25 kHz of the band for CW despite what the band plan indicates. Myself, I *am not* against CW at all, in fact, some of my most prized VHF and UHF contacts have been made using CW. I recall successfully working FO8DR once on 52.010 with signals too weak for any hope of SSB getting through. However, generally speaking, I think 6m is still not too cluttered for CW to be unsuccessful wherever used, and the least useage by SSB stations is certainly towards the zero end of the band. I expect to receive some flak because of the sentiments expressed, but that won't worry me providing views expressed are based upon a realistic approach to the situation and are constructive. A dogmatic approach purely based on a set of figures quite out of touch with reality will not receive very much support from the VHF fraternity. Thanks for an interesting letter Eric.

NEW VK — ZL CLAIM

Wally VK2DEW at Orange would like to lay claim to being the first operator to work both ways across the Tasman on 144 MHz tuneable. Before some of you start looking at dates this refers to someone who first of all worked across the Tasman FROM New Zealand, and has now worked across the Tasman FROM Australial

Wally worked Hughie VK5BC on 23/12/65 when Wally had the call sign of ZL2TCW (Tea Cup Wally!). On 29/12/84 at 0740 Wally, as VK2DEW worked ZL1BHX at Kaitaia on 144.100 SSB, which incidentally was the strongest signal Wally had ever heard on 2 metres, with the needle of the S metre refusing to leave the stop!

In 1965 the contact was on AM using 30 watts to an 832 and a 4 over 4 slot antenna and a 6CW4 Nuvistor pre-amp and a R and H convertor to a homebrew receiver. The 1984 contact was 30 watts from a homebrew amplifier solid state to an 11 element swan type yagi, masthead pre-amp and an IC202.

The opening lasted only 10 minutes into Orange and Tony called on "Fred" the Orange repeater and Wally worked him again 5 minutes after the initial contact. Congratulations Wally. Can anybody take up the challenge, if so, please let me know with relevant dates for verification.

VK3UM AND EME

Doug VK3UM continues to have much success with his 432 MHz EME setup. All of his contacts have been random QSO's. This indicates both the high degree of activity which exists on the band and the fact that his large EME antenna array must be working very well.

On 7/12/84 he worked JR4AEP at 1700; 8/12 JA4BLC at 1756 and again at 1810. On 15/12 at 2325 he was echo testing and was called by G3LQR; 30/12 HB9SV at 1350. On 2/1/85 JA3IAF at 0617 and JR9AOH at 0645; 4/1 ZL2AQE at 0922; 5/1: N4GJV 0910, JA4BLC 1015, OH2DG 1440, OK1KIR 1500, I5MSH at 1618 with 549 reports both ways, the I5 station was using a 35 foot dish, 1635 F1FHI 539 and then G3SEK. 6/1: K2UYH 0950; at 1600 conditions were rather poor and no echoes were heard. 11/1: at 2300 HB9SV and others were very good with reports up to 569. Between 2315 and 2337 they tried SSB (to HB9SV) and reports were 5x3 both ways. 16 yagis were in use at both ends of the contact!

Overall, not a bad effort for random contacts. Thanks Doug.

METEOR SHOWERS

A letter to hand from John Moen VK2KA, of 6 Gordon Street, Armidale, NSW 2350, raises the subject of possible VHF wave propagation by reflection from meteor showers, when, we are told, distances of 2000km or more can be covered. He is particularly interested in the Eta Acquarids which come within the limits of 1st and 8th of May, and are a type D stream, considered to be a major stream but owing to their latitude give very weak displays in north temperate latitudes, and the Orionids from 15 to 25 October and are considered to be an A stream and giving regular annual meteor showers of good strength. There is evidence that these two streams are associated with Halley's Comet, and reference can be found in Dennis Di Cicco's article in "Sky and Telescope" September 1983, page 212.

John is hoping to be able to arrange some skeds in advance of May 1985. Even negative results in the way of observation would be important, as comparison could then be made with the same period in 1986, which almost coincides with the closest approach of Halley's Comel to the earth at only 0.42 AU distance, on 24th April 1986. Angles of altitude and azimuth would have to be calculated for the observer of his particular longitude and latitude. The optimum times would occur on 5th and 6th May between 1.30 and 5.30 am local time. Aquarius rises due east at 1.30 am. As an example, early on Sunday morning at 1930 UTC

on 4/5/85, for communication between Adelaide and Sydney, the following beam headings would be required: Adelaide: 58° 9' AZ and 37° 6' EL. Sydney: 46° 0' AZ and 45° 58' EL.

John says he is in regular contact with Cyril Rice VK6MY, Co-ordinator of the WIA Comet Sub-committee, and Mostyn Lower VK5ALH is the representative in SA.

If you are interested in arranging skeds for attempts to make any VHF contacts via these meteor showers, then it is suggested in view of the rather short notice you contact John direct at the address given above.

THE ANNUAL TWO METRE OPENINGS

For quite a few years now January has provided conditions suitable for an excellent range of contacts right across the southern portion of Australia on two metres and 70cm. January 1985 was no exception.

Owing to the lack of a two metre beacon in Mt Gambier it was a little more difficult to judge the conditions, but the weather maps seemed to show something was about to happen. My first indication was a 5x7 contact with Chris VK5MC at Hatherleigh near Millicent in the south east at 0942, followed later at 1035 by Trevor VK5NC in Mt Gambier at 5x2, the conditions not having got quite as far as Mt Gambier at that time. Weak signals were also heard from VK5ADT, VK3ZHP and VK3ZBJ around 1240. About this time Colin VK5DK was 5x6 with his antenna on Melbourne which probably would have been 5x9 if turned my way. At this time, as far as I was concerned, there was no sign of any activity from Albany and the two metre beacon from there was not audible, although with my 30dB hill attenuator this never really surprises me!

Throughout the next day, 8/1, a few signals were noted here from the Melbourne area but they were weak. It looked to me as a prime example of coastal ducting because it was not reaching far enough inland for me to enjoy enhanced signals. Bob VK5ZRO at 1120 on 8.1 worked Wally VK6WG on 144 at 5x9 and 70cm 5x3. At 1207 he worked Aub VK6XY on both 144 and 70cm but there was no sign of either station here! Bob reported later to me that the band had been open on 2 metres all day on the 8th and 9th, and he had a number of contacts from time to time into Albany.

10/1: This seemed when condilions really peaked. At 1045 Bob VK5ZRO had a contact with Rob VK3BHS at 5x3/5 on 144.080, and Bob has a very difficult path to VK3. At 1052 Bob worked VK6WG and at odd times throughout the night whenever he felt like it, signals were so consistent. At 1114 even VK5LP managed to work VK6WG on 144.1 at 5x4! Rob VK3BHS was also 5x4 at 1118. At 1146 I worked Aub VK6XY on 144 at 5x7.

1296 MHZ FM

A number of contacts have been made between Albany and Adelaide on 1296 in the past, but on 10/1 at 1215 Wally VK6WG transmitted a signal to Bob VK5ZRO on 1296.1 on FM and was received at the Adelaide end 5x9 + 60dB! Bob's return signal was also S9 but Wally was unable to adequately resolve the FM, desperately trying to slope detect the signal on his transceiver! They tried on and off for some time as the signals were available for hours. How frustrating!

FIRST TIME INTO PERTH

The next morning still on 10/1 (UTC day) at 2247 VK5ZRO and VK5KBU were still working VK6WG when VK6KRC in Perth was heard calling by Brian VK5KBU. They quickly concluded a 144 MHz contact then went over to 70cm and at 2248 VK5KBU worked VK6KRC for the first ever 70cm contact into Perlh, the distance being about 2280 km. VK5ZRO worked VK6KZ at 2301 on 144 at 5x6 and then 70cm at 2305 5x7, and at 2310 VK6HK on 144 5x7 and 70cm at 2315 5x5. At 2318 VK5ZRO also worked Bernie VK6KJ in Albany on 70cm at 5x7, indicating the band was open to both Perth and Albany at the same time. At 2330 VK6KZ was worked again by Bob on 70cm at 5x6. Others to work into Perlh around those times included VK5ZTS, VK5ATV and VK5ZDR. Although alerted by telephone to what was happening by VK5ZRO there was no sign of any signals from the west on either band at the VK5LP OTH! Later VK5 worked to VK6ZFY at 2334 and 2345 at 5x5.

Congratulations to Brian VK5KBU for being the first to work from VK5 to Perth, generally acknowledged as being a fairly difficult path.

While all the excitement was going on in the west on 70cm VK5LP had to be content by working Roy VK3AOS at 2306 5x7 and Les VK3ZBJ at 2320 and David VK3AUU 5x3, the latter two being in Melbourne metropolitan area and 50 miles east of Melbourne respectively. But I don't mind, I take what comes!!

PORTABLE OPERATION

In view of all the happenings on 10/1 and with VK5ZRO working VK6FM 5x5 at 0003 on 11/1, it appeared the band might still be in good shape. Accordingly, VK5LP decided a spot of portable operation might be in order so the Kombi van was loaded up with 144 and 432 MHz gear and on the evening of 11/1 a trek was made out to my favourite No 1 hill to see what transpired. A 125 AH battery supplied 12 volts for all the equipment which allowed me to run either 10 or 80 watts on 144, and 10 or 50 watts on 432, each case depending on whether the solid state linears were used. An 8 element yagi on a 14 foot boom sent the signal out on 144 and an ATN type 16LB yagi was used on 432, mounted 15 and 20 feet high respectively.

A check with Steve VK5AIM at 0900 confirmed everything was in order, and Steve agreed to come out and keep me company for the evening. First distant contact was with Trevor VK5NC in Mt Gambier on 144 at 5x9 at 0915. At 0956 it was VK5EE also in Mt Gambier at 5x4. At 1010 worked VK5CI at Port Pirie 5x9, VK5AAC Ron 5x6, then Don VK5ZRG at Whyalla 1025 5x8 and VK5ZGV Graham 5x3 at 1030. All these contacts were on 432.1 which was a big thrill for me as I had never ever been able to hear VK5ZRG on 432 before from home.

At 1112 worked Roy VK3AOS 5x7 on 144, 1130 VK5ZO Des 5x7, and 1142 VK3BVS Bob 5x3 both on 432. At 1288 worked Colin VK5DK in Mt Gambier at 5x9 on 144 who then called up David VK7DC in Burnie whom he had worked on 144 and 432, and I was then fortunate enough to have 5x4 contacts both ways with David on 144 and 432. That was my first 432 contact ever into VK7 so if nothing else the effort had been worth while. 432 contacts with VK5DK 5x6 at 1306 and with Jim VK5ZMJ 5x9 at 1312 ended the nights operations. Steve VK5AIM was very happy to make some /P contacts using his own callsign, particularly to VK7DC.

The antennas were left up over night, and the van was brought out again next morning and at 2105 promptly worked Rob VK3BHS on 144 at 5x9 and at 2116 he was 5x9 on 432. A 432 contact with Roy VK3AOS at 2121 was 5x6, then followed 5x9 contacts on 144 with VK3BHS at 2125, VK5DJ Millicent, VK5ZRO. At 2221 a 432 contact with VK3BVS 5x3, finishing on 144 at 2222 with VK5BMW and VK5DK again all 5x9.

What all this means of course is that the favourable conditions made it worthwhile for me to go to the trouble of going portable (and it is quite a deal of trouble I assure you) but it also meant that people favourably situated like Colin VK5DK in Mt Gambier were *able* to stir up a degree of *interest* in VK7 by working several stations there with 5x9 signals, and of course many contacts into Melbourne. Such a shot in the arm helps to maintain interest in 144 and 432 MHz operations and I certainly was grateful for so many stations being on.

By the night of 12/1 the enhancement had disappeared for most of us so we had to be content working into VK4 on six metres!

OTHER SMALL ITEMS

John VK5KLJ phoned me to say he had worked VK6NE on 144 and 432, and that it was exactly 12 months since his last VK6 opening. He also worked VK6XY at 5x9 on 144 running 2½ watts, all on 10/1.

John also reported on the remarkable coincidence when he worked Frank VK6DM on 14/1 from 1354 to 1401. He said it was 12 months to the day and time that he last worked him, last year the time was 1400 to 1403. You couldn't get much closer than that if you were really trying!

Lance VK4ZAZ was 5x9 on 6 metres on 12/1 at 0101 and mentioned working a FK1 who was running 2 watts from an IC502. VK4LE had worked a ZL on two metres and also P29 on six metres. Mary VK4PZ had worked FK8EM and ZL. The FK8 had been at 1100 UTC on 10/1 which is fairly late for Es.

On 9/1 VK4FU worked into Brisbane on two metres and the same day Russian TV on 49.750 was observed in VK4. Same day George FK1SB was 5x9 into Sydney around 2300. And ZL2TPY worked VK1VP and a station in Dalby, Old on 2 metres.

BAND CONDITIONS

Brian VK2AKU at Narrabri, about 430km north of Sydney, has sent copies of his log for perusal and as he lives in an area with some prime DX potential I thought you might like to know the spread of his contacts on six metres starting from November when the band starts to open.

2/11: VK4 and VK8; 6/11: VK2, 3, 5, 7, 8; 7/11: VK2, 5; 9/11: VK2, 3, 5; 12/11: VK2; 13/11: VK3, 5, 7; 15/11: VK3, 5, 7; 16/11: VK4, ZL1, VK9ZA, JA2DDN; 17/11: VK2, 4, 6, 9ZA, FK1SB; 18/11: VK8; 19/11: VK3, 5; 21/11: ZL2, 3, 1, VK2, 3, 5, 7, 6; 22/11: VK5; 23/11: VK3, 5, 7; 25/11: FK8EM; 26/11: VK7; 27/11: VK6, 7, ZL2.

1/12: VK4, 7; 2/12: VK4; 4/12: FK8EB; 7/12: VK7, VK0CK; 8/12: VK2, 3, 7, VK0CK; 13/12: ZL2; 14/12: VK8; 15/12: VK3, 4, 5, 6, 7; 16/12: VK3, 4, 5; 18/12: P29BH; 19/12: VK7, 8; 21/12: VK5, ZL2, 3; 22/12: VK5, 7; 23/12: ZL2; 24/12: VK6, 8; 25/12: VK4, ZL1, 2; 26/12: VK4.

Brian also operates on 2 metres and says he works Gordon VK2ZAB in Sydney every night at 1030 UTC. Others include VK2KFE, VK2BQW, VK2DFY and VK3XEX.

HF AWARDS AND STANDINGS

After the publication of the Two Metre Standings List awhile back I received a few comments directed towards what could be some reasons for what seemed an apparent lack of interest in submissions for inclusion in the two metre list.

The question was asked of me whether it was allowable for an operator (in this specific case Steve VK4ZSH) to travel around Queensland picking what seemed the most favourable and/or closest spots to other areas and then being able to claim having worked all States. *Were there not limitations on how far an operator could move from his home QTH and still claim to be in the same area?* In Steve's case he had made a contact to VK6 from the western border area of Queensland, also to VK8.

In the back of my mind I seemed to recall years ago that one could only operate within an area of 150 miles of home but not being sure, I wrote to the WIA Awards Manager requesting his views on the matter. A subsequent phone call from him brought the advice that there appeared to be nothing laid down to prevent the contacts Steve had made, but generally fair practice would tend to indicate one would expect an operator to make his contacts within a fair and reasonable distance from the same point. One might then suggest that 250km (about 150 miles) would allow operators some flexibility and overcome the problems of those people having poor locations and still be seen by others to be a reasonable distance from the home QTH. Just how they view this situation will be up to Steve and any others concerned, but I do suggest future claimants ought to consider making all their contacts within those limits, or if having moved permanently to another location a dispensation sought for the new location.

GOOD CONTACTS FROM SYDNEY

Ross VK2ZRU has written to say that on checking the bands on 17/1 he found two metres open to ZL during the afternoon and building up to a peak around 1100. He contacted Brian ZL1AVZ on 70cm at 1040, others who worked Brian included VK2BDN, VK2DFM, VK2YYO and VK2BXT.

At this time signals were over S9 so they went to 1296.1 MHz and contact was made around 1050 between ZL1AVZ and VK2ZRU and VK2BDN with signals to 5x8/9 both ways. ZL1AVZ was running 0.5 watts to a 3m dish and VK2ZRU 1.5 watts to 4 x 25 element loop yagis. MMW transverters at both ends.

The first such contact was made across the Tasman in February 1983 by Dick VK2BDN and Brian ZL1AVZ. The path is most likely open on 1.2 GHz when such conditions exist on 144 and 70 cm. There are at least six stations active on 1.2 GHz in Sydney. Congratulations to all the operators, a good effort indeed.

END OF THE CARNARVON BEACONS

Andy VK6OX has advised that the Carnarvon beacons operated for the last time on Christmas Day 1984, and the reasons for their closure are included in the following statement.

"After several years of almost faultless operation, the decision to cease operation of the Carnarvon beacons came as a result of several factors which I shall briefly describe.

"I have personally maintained the beacon equipment for some years, since the Carnarvon Amateur Radio Club exists now, only on paper. In early 1986, the operation of the OTC Satellite Earth Station, where I am employed, will cease for all practical purposes, and employees will be transferred to other stations.

"As the number of active amateurs in Carnarvon is extremely low, it would be very difficult to engage the services of a beacon custodian.

"In November 1984, the Carnarvon Shire Council advised that as Council-provided accommodation was at a premium, they had no alternative but to utilise the room in which the beacons were located, for another local organisation. The Council had allowed the operation of the beacons on their premises 'gratis', so I agreed to the equipment's removal.

"On Boxing Day, the beacons were de-powered, in preparation for removal. Not wishing to see the beacons 'die an un-natural death', I made enquiries to determine whether any other amateur clubs in the north-west would be interested in operating beacons. John VK6AFA, of the North West Radio Society, indicated their interest, and arrangements were made for members passing through Carnarvon to pick up the equipment. On 14th January, Graham VK6KAE, en route from Perth back to the Pilbara, dropped in, and the equipment was soon after uplifted for delivery to the NWRS.

"I realise many people in the south (and elsewhere) will regret the passing of VK6RTT from Carnarvon, as its monitoring resulted in many contacts on 2m, 6m and 70cm. However, there is not much to be gained when so many people, reporting VK6RTT signals from far afield, are unaware of the fact that no-one is available at the other end of the circuit, to provide two-way communications. With this in mind, the relocation of VK6RTT will open up new possibilities for propagation experimentation, with at least a few amateurs at both ends of the path!

"Finally, I would like to take this opportunity to thank all those who reported the reception of VK6RTT beacon signals over the years, and also to those amateurs with which I personally made contact, as a result of the beacon monitoring. The path between the Pilbara and down south will be a lot more difficult to work, but that's part of the fun of VHF!"

Thankyou for the information Andy, and as representing those people who have been on the receiving end of the VK6RTT signals, may I thank you for your efforts in the past to provide a medium which obviously has assisted so many to make contacts on the VHF bands. We wish you well wherever you may finish up, and hope to hear you on the VHF bands from time to time.

Incidentally, Andy reported six metres was relatively quiet during 1984, with December providing the only Es contacts to VK2, 3, 5, 6, 7 plus one ZL.

CLOSURE

Just before closing may I suggest you be vigilant at least on six metres during March and April as there may still be a few long distance contacts available, particularly out across the Pacific.

Closing with the thought for the month: "You can get friction for nothing — harmony costs courage and self control."

WICEN NEWS

WICEN VK3 ATTENDS "DISPLAN" DISASTER MANAGEMENT SEMINAR AT CROYDON

The format of the seminar was to pose four disaster scenarios over the two days and to split into syndicate groups to discuss how each part of the scenario would be handled by all combating authorities.

The disasters ranged from a rail car carrying LP gas exploding to bush fires and car accidents and chemical spills with toxic gas release.

Groups attending include: *Victorian Police, CFA, SES, Forestry Commission, Red Cross, Public Works, Road Construction Authority, Metropolitan Fire Brigade, MMBW, St John Ambulance, SECV, Community Welfare Services, and a number of shire and council officials.*

Police Superintendent, Don Boisen convened the sessions and the overall conduct of the seminar was by Inspector Bruce Bingham.

Some films were used to graphically illustrate disaster situations. The most horrific one was probably the scene of devastation caused by a "BLEVE" which is the term for a LP gas cylinder which has 'gone-up'. We were told that one of these large rail car tanks are highly dangerous at over 304.8 metres! So the name of the game is to evacuate the area. With chemical spills the same procedure is also the best action.

One scenario included total loss of roads, bridges, power and phones. This one caused considerable discussion as can be imagined! WICEN was asked to put its views on a number of occasions and it was obvious that most of those attending were knowledgeable of WICEN and had a high regard for the role that radio amateurs could play under such circumstances.

At the end of the two days, I was asked to brief the meeting on WICEN's role and so I concentrated on these points:

1 we are a large force of volunteer operators
2 we can provide emergency radio links fairly quickly and easily
3 we have access to our own network of VHF and UHF repeaters
4 we can provide UHF and VHF mobile/portable stations
5 we also can establish HF radio links for short and longer range communications
6 we have operators trained in message-handling and efficient procedures.

DO WE LIVE UP TO ALL OF THESE ATTRIBUTES?

Not always, but we aim for them and more, don't we?

What are we doing about it in VK3? Well, we are embarking on a series of training programmes in the regions.

One was conducted at Pakenham in May 1984. There were sessions on: message-handling procedures, how to set up a station easily in the field, and practical message-handling exercises using 2 metre hand-held sets.

The programme was highly successful and all those attending learned a lot from the experience.

VIDEOTAPE:

An attempt was made to produce a videotape on the spot but due to microphone problems it was not considered successful.

A decision was then made to assess the feasibility of producing at least four training tapes as it was felt that all regions could use them when conducting training sessions.

The proposed format was to design each tape for a playing time of about 10 minutes and to have a response sheet afterwards to recap the key points and to promote discussions. This project has now become a "financial planning" issue to be addressed in 1985.

SOME THOUGHTS WHICH STEM FROM THE MAY EXERCISE, THE OCTOBER DISPLAN SEMINAR AND OTHER DISCUSSIONS:

Should WICEN have more portable repeaters for quick deployment when needed?
WICEN should have a central control location from which stations and operators can be co-ordinated. (Phones and other links can then be established with least chaos under pressure)
Operators need training in efficient message handling
WICEN needs to define its most important user groups and establish close links with them on a personal basis
WICEN stations need to be set up at such places as: St John's HO, Red Cross HO
We need battery back-up at repeaters as 240 V power can often fail in disasters
Key WICEN personnel need a clear chain of command and relief staff to cope with prolonged disasters such as Ash Wednesday.
Should WICEN have scanner receivers to allow it to monitor other services traffic.
WICEN can encourage general community awareness of what to do in case of emergency — one good way is to get involved with groups who need communications such as the Alpine rally, bike rides, car rallies, walkathons etc. These all provide us with training experiences in establishing portable stations and operating them. As well, we get message processing practice and in the process build-up good public relations!
WICEN should have a plasticised card (or cards) to give each operator for quick reference on such things as: frequencies, prowords, phonetics etc
Should we identify with abbreviated callsigns? eg "WICEN Warburton calling WICEN SES." This would reduce the length of callsigns and identifies you by ACTUAL location. Then there is NO error in your location! There is a precedent in this procedure; I am told that the Fire Brigade is permitted this type of procedure.

In conclusion I guess we could use the scouts motto — BE PREPARED.

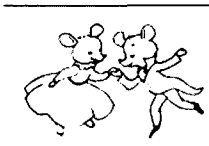
AR



QSP

THE ROYAL WE

I know you have to be rich to afford radio amateur equipment these days, but how is it so many amateurs are rich enough to have a staff to run their station? Clearly they have a staff of technicians as they refer to themselves in the plural "we". "We have a tribander Yagi, and our rig is a Fox Tango 107. We should be happy to QSL via the bureau."

The other possibility is that they are royals and thus have a legitimate right to the use of the plural. But how can I tell whether to say "73 to all of you" or "73 your Majesty"?

LISTENING AROUND

Joe Baker, VK2BJX
Box 2121, Mildura, Vic 3500

It's late afternoon Sunday 11 November, 1984 (Remembrance Day) and earlier, by invitation, I was at the annual break-up of the Buronga Sunday School, where my special job was to run one of my silent films called "The Three Musketeers." It's a job that I take special delight in doing every year as the Buronga Sunday School kindergarten kids, are a wonderful lot. Their teacher is Mrs Cox. They had been awaiting my arrival, and as soon as I got there, I was ushered into a classroom and had my Bolex Palliard 18-5 connected up and operative in a fairly short time. And while I was preparing the machine, Mrs Cox and her assistants tuned the kids up by getting them to sing "We Wish You a Merry Christmas" and other seasonal songs.

The Eleventh Hour of the Eleventh Month came and went without any significance for the kids, and I must confess that I forgot about it also, yet later when I did remember, my mind went back to other places and other years where I have been when Remembrance Day came around.

In other years, when doing this show for the kids I've usually brought along a comedy, for no matter how corny these old silents are, they always get some really good laughs from the kids. One of the most popular has been one, originally made somewhere about 1928 by Stan Laurel and Oliver Hardy called the "Christmas Tree." In this low budget slapstick film, Laurel and Hardy decide to make some Christmas cash by becoming door-to-door salesmen selling Christmas trees from their old jalopy. One customer proves to be a bald man who refuses to buy their trees, so they squirt him with a hose (the kids love seeing that bald-headed man getting a "right dousing"), thereupon he chases them out on the road and proceeds to dismember their jalopy while a sleepy headed local policeman looks on.

Not to be outdone, Laurel and Hardy then proceed to chop his house down with the local constabulary watching with puzzled amazement. It was only a 15 minute film, and its final scene shows a local bobby chasing everyone into a distant horizon. *Why don't they make films like that now?* We could do with a few Mack Sennett comedies, particularly when what we see on the 7 o'clock news is all bad.

Now I've side-tracked myself — let's get back to the original theme — Remembrance Day.

Remembrance Day and Sundays at Pine Creek in the Northern Territory during World War Two was not much different to any other day.

We were surrounded at all times with everything that seemed to be painted khaki in color, with rarely a civilian in sight, except for the periodic visit of an area chaplain such as the Catholic priest who occasionally said Mass at Pine Creek. His parish extended from Darwin almost as far south as Katherine. I can remember attending Mass at Pine Creek in the small tent that had been provided for the chaplain. His alter was his bed on which he had placed a suitcase, with the chalice and Bible on top. His audience consisted of two soldiers — myself and another, and a bicycle bell was used at the Consecration. When the padre was not able to be present, a Corporal held a Bible reading class and all of us — irrespective of religion took part in that.

The monotony of life in the Territory during wartime is something that would be difficult for anyone to appreciate, so when it came time for a soldier to go on leave, it was looked forward to months in advance. In wartime, it was said that the only way you could get out of the army was to die, for there was no other way out. So the next best thing was not to turn your nose up at a spot of leave.

There was this night when I was on duty at the switchboard, when a troop train carrying some hundreds trundled through Pine Creek station on its way south. Heavy rain was falling, and I didn't take much notice of the train with all those lucky fellows on their way to freedom. The train, trundled through and after it was gone — I went back to sleep in front of the switchboard, dreaming that perhaps one day I might be on that train also.

Several hours passed and about midnight I was awakened again by the sound of a train grinding to a halt. Soon an officer presented himself at the signal office, saying that he was the officer in charge of that train. It was the same train that had passed through some hours earlier. It appears that the train had gone on past Pine, to the Ferguson River. On reaching there it was discovered that the river was in flood and the railway bridge impassible. As the line, was a single-track, the train had shunted all the way back to Pine Creek. The officer said that he wanted his troops billeted at Pine Creek, and instructed me to telephone all nearby units to see what could be arranged. The troops were still asleep in the train as it back-tracked to Pine Creek, yet the officer awakened them all requiring them to awake from their peaceful sleep and disembark in the drenching rain so that they could be quartered elsewhere.

The local Area Officer was anything but pleased at this situation, which required the troops from the train to be marched in the dead of night to wherever accommodation could be found for them. Many of them dossed down on whatever floor space was available at the Signal Office as we had no extra beds. Within a few days food supplies in the units that had extended hospitality to the visitors began to run out and there was much discontent in the area.

The empty train remained at the Pine Creek station for almost a week, while our linesmen, using railway trollies, did periodic forays down towards the Ferguson river to see how the flood position was. Eventually one day, a linesman climbed a pole and cut in on a circuit to Pine Creek, to ask me to tell the officer in charge that the bridge over the Ferguson was now safe for the train to cross.

Did I tell you about the way I used to do a daily check of the phone lines outgoing from Pine Creek? Well it was a routine every morning that the switchboard operator on duty check all 30 lines at 9 am Adelaide River Time. I say Adelaide River Time because we used to have to obtain a daily time check from 17 lines of Communication HO at the River, and very often the time as given by them, did not coincide with the time signals from Radio Australia. It was obligatory when doing the daily check, for me to give the Adelaide River time check to the units on the other end of the line, yet I was conscious that Adelaide River Time (official military time) was not always right. So I used to solve the problem by saying something like this *"The time by Radio Australia is XYZ by Adelaide River time is ZYX"* and let them take their pick.

That's all for this time. I've got one or two more stories about my adventures in the Northern Territory, and later there will be much about what happened when I was on Morotai Island in what was then the Netherlands East Indies (now Indonesia). Thanks for all your encouraging remarks, and for those I haven't yet spoken to — I'm usually on every night round about midnight on or near the Cocktail Net on 3.584 MHz.

73 from Joe.

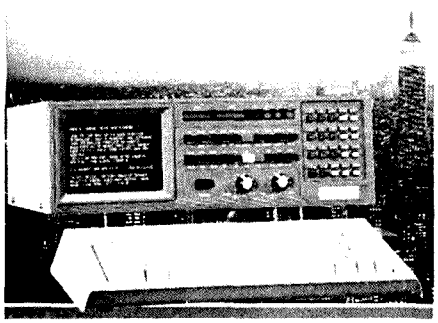
AR SHOWCASE



TONO PRODUCTS

The name TONO is well known to radio amateurs all over the world.

Their latest products, the O -5000E and the 9100, are new additions which would be an asset to any amateur station.

To mention a few of the 5000E features:

AMTOR-mode. Offering error free communication
Selcal
Pre-load function
Automatic CR/LF
Word-wrap around
"Echo"-function
Printer interface
Morse code practice function
Morse code random generator

The last two items are particularly suitable for Morse code classes and individual learners.

The 9100E keyboard and terminal unit with AMTOR offers the most up-to-date computer technology allowing complete automatic send/receive of Morse code, RTTY (Baudot and ASCII) and AMTOR (ARQ and FEC).

The unit can be used as a CRT terminal with RS232C serial interface and can handle up to 9600 Bauds in send/receive.

Using a light pen, graphic patterns can be drawn on the screen and easily sent.

Emtronics, at 94 Wenlworth Avenue, Sydney have these units in stock and will only be too pleased to supply you with further details. Emtronics phone number (02) 211 0988.

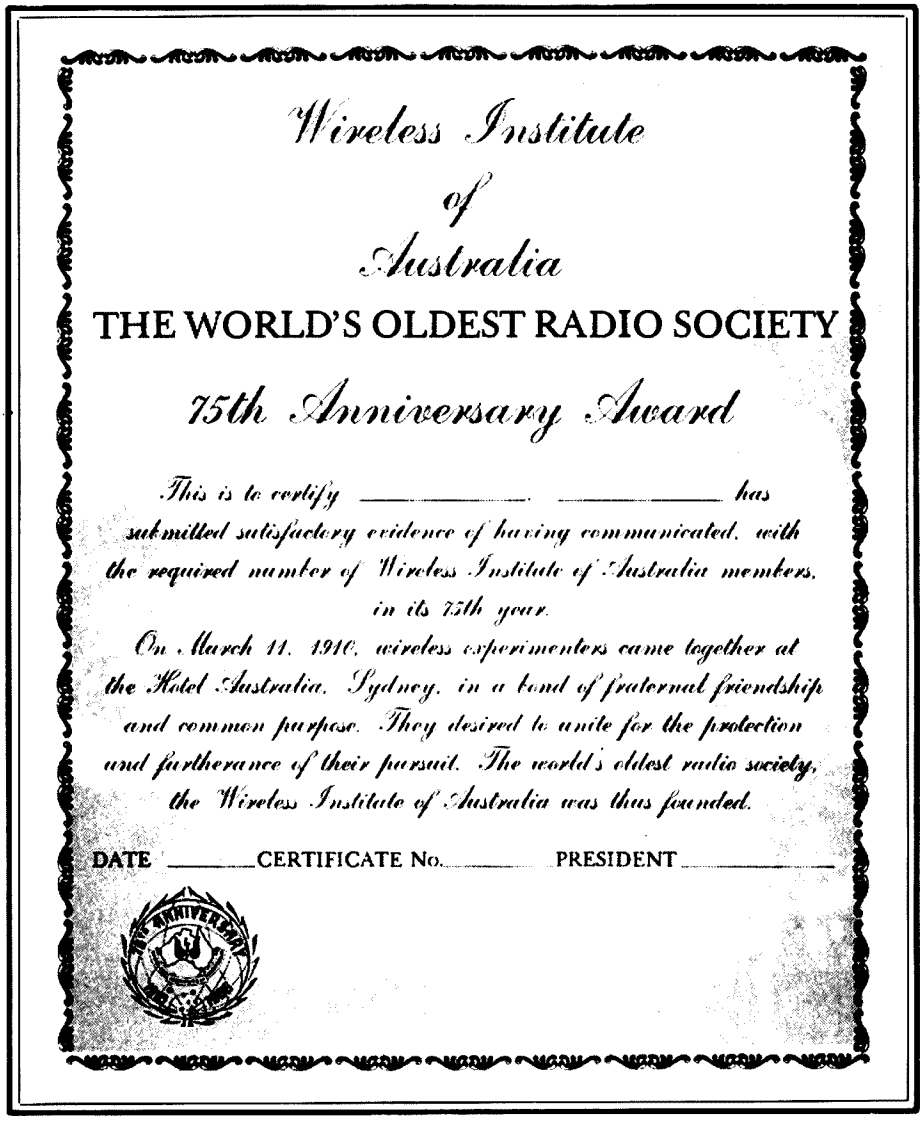
AWARDS



ANNOUNCING THE WIA 75 AWARD

A special award certificate has been struck to mark the 75th anniversary of Australia's and the world's oldest national radio society.

Called the WIA 75 Award it will be sought after by both award chasers and those who have not gone in for awards previously.

The handsome award certificate features a sepia background depicting a radio amateur during the pioneer days of our hobby — taken from an actual historic photograph of the late Max Howden VK3BQ in the early 1920s.

The certificate citation encapsulates the scene, desires and aims of those wireless experimenters who met at the Australia Hotel, Sydney, on 10 March 1905.

Nearly two years planning has gone into the award including input from award chasers and DXers aimed at making it a success.

The rules (detailed below) were basically the idea of Gray Taylor VK3JQ/VK4OH — and his daughter Grayleen Taylor used the award artwork as her school art studies assignment.

The WIA Victorian Division took on the task of developing and conducting the award — printing of the certificate has been paid for federally.

At the 1984 WIA Federal Convention a motion proposed by the Victoria Division which spelt out the award's concept was passed unanimously.

RULES:

To qualify, radio amateurs (and shortwave listeners) need to contact (log) 75 WIA members during the period 1 March-31 December 1985.

A contact will only be valid if the WIA membership number is logged. The membership number can either be the one on your WIA membership certificate, or the special number appearing for the first time this month on Amateur Radio magazine address labels.

MR W.M. RICE
54 MAIDSTONE STREET
ALTONA VIC 3018
F 3 00 1 00 VK3ABP
142123

All WIA stations, VK1WI, VK2AWI, VK3BWI, VK4WIA, etc, will use 75 as the membership number.

No more than 30 WIA members may be logged in any one callsign area by radio amateurs permitted to use HF bands and shortwave listeners — this restriction does not apply to Limited Licensees.

Contacts can be made through repeaters, and this is encouraged to enable maximum participation in the award.

CLAIMS:

A log extract of the required contacts and $2 should be sent to:
WIA 75 Award,
Wireless Institute of Australia,
412 Brunswick Street,
Fitzroy, Vic 3065, Australia

PARTICIPATION:

Duration of the award is 10 months which should be more than adequate for anyone to qualify.

Every member no matter where they live can actively support the WIA in its anniversary year by being ready to give their membership number over the air.

Exchange your number during routine contacts or put out a special call "CQ CQ CQ WIA 75" to indicate you're looking for WIA membership numbers.

Some WIA members intend to chase numbers on nets and during/after divisional broadcast callbacks.

This is an international award available to all radio amateurs and SWLs — mention the WIA 75 Award and its rules during your DX contacts.

AR

THE QUEENSLAND GOLDEN ATV AWARD

This award is introduced to commemorate 50 years of experimental television in Queensland and is for 70 cm contacts made using fast scan, high definition television systems only.

Successful applicants will receive a certificate awarded by the South East Queensland Amateur Television Group for the accrual of 50 points according to rules.

Award Year: This award shall be available for contacts made between 1 January 1985 and 31 December 1985. No contact points will be considered outside of these dates.

Contacts: A station may be worked once only per day for the purpose of this award. However the same station may be worked many times. Contacts through repeaters or on other than 70 cm do not count. To encourage portable activity, one contact among those claimed **must** exceed 50 km.

Sections: This award is available to both transmitting and receiving enthusiasts in any part of the world as follows:

(a) Transmitting: For 70 cm pictures transmitted which have been successfully identified by another station; claim five points. When the transmission path exceeds 50 km, count ten points instead.

(b) Receiving: For successfully identifying and reporting 70 cm pictures transmitted by another station; claim points as for transmitting.

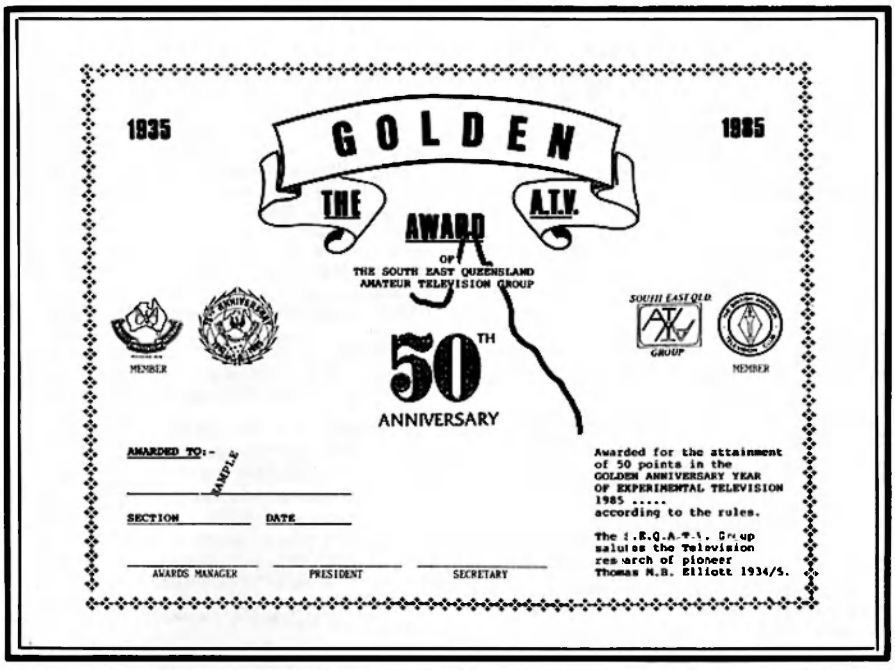
Applications: Applications for this award should include log details consisting of claimant's call sign, call sign and location of station worked (including distance), date and time, points claimed and IRC's or $1.00 to assist with tube postage.

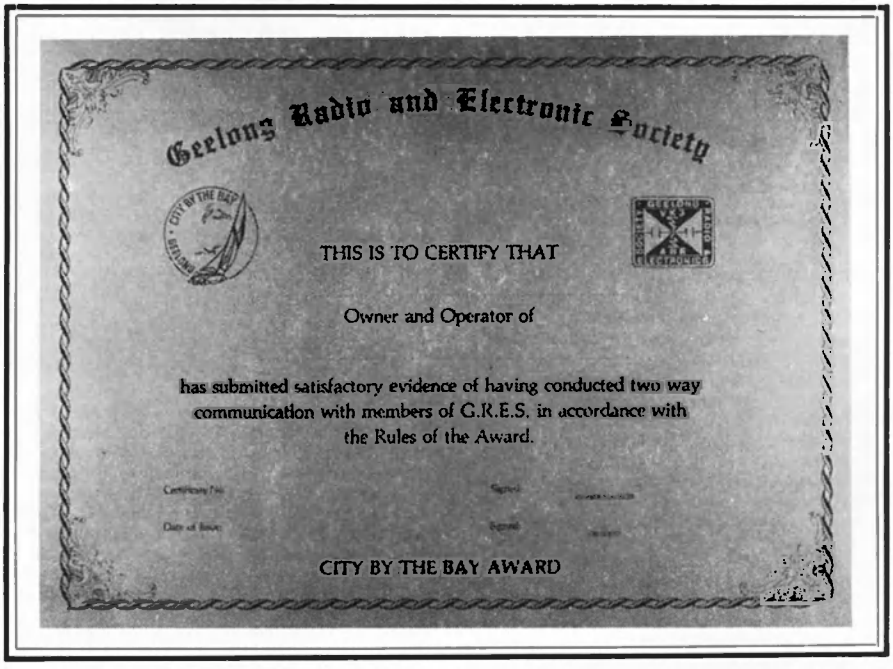
A claim form is available from the SEQATV Group but is not essential provided details as requested above are provided.

QSL cards are not required, but the application should be checked and signed by another amateur.

Applications should be made to: *The Awards Manager, South East Queensland Amateur Television Group, Post Office Box 3, Chermside, Qld. 4032, Australia.*

AR





GEELONG "CITY BY THE BAY AWARD"

The Geelong Radio and Electronic Society is starting an award and hope this effort will be a real success both for the Geelong Club and for amateur radio.

The name will be "CITY BY THE BAY AWARD" and will be on a bronze background, the idea behind this is, that there may be a silver award and a gold award sometime in the future. CITY BY THE BAY is the slogan for the City of Geelong, with a logo and the necessary permission in writing from the Geelong Regional Commission to use the heading and the logo has been received.

The Geelong Radio and Electronic Society has been going for 21 years, as a teaching club for candidates for the DOC exams. There are also special interest groups to cover RTTY and computers.

RULES:

Points will be awarded as follows

Contact with club station VK3ANR	*5 points*
Contact with club members (mobile)	*2 points*
Contact with club members (fixed station)	*1 point*

Number of points needed to gain the award

Club members require	*20 points*
Non club members require	*15 points*
Oversees station require	*10 points*
SWL Stations require	*8 points*

The award will be worked on all amateur frequencies and include, CW, RTTY, ATV and SSTV. A combination of different modes will be accepted. Each award station can only be logged once.

Amateur stations seeking this award, should submit a copy of their log entry to have their contacts confirmed.

SWL stations who wish to gain points towards this award must maintain a record in log form of contacts that they have monitored between the amateur station seeking the award and the club member or club station.

Points will only be awarded to SWL stations which monitor amateur stations actually seeking this award and not ordinary communications between club members.

The cost of the award will be $3.00.

All awards are numbered and the award will finish with the issue of number 500.

RON WILKINSON ACHIEVEMENT AWARD

There were two nominations this year from the VK2 and VK3 Divisions.

The Executive decided that the award should be given to **LYLE PATISON VK2ALV.**

For well over a decade Lyle has been the driving force behind the Illawarra Amateur Radio Society's Moonbounce Group.

Lyle's achievements in the Moonbounce area of our hobby, represents and exemplifies the spirit of technical investigation associated with the late Ron Wilkinson.

The Executive, in making this award, are recognising the high standards set by Lyle. **AR**

CONTESTS

Ian Hunt VK5QX
FEDERAL CONTEST MANAGER

P.O. Box 1234, GPO, Adelaide, SA 5001.

CONTEST CALENDAR

MARCH

2-3 ARRL DX Phone Contest
9-10 Commonwealth Contest (rules February)
9-10 QCWA Phone QSO Party
10 WIA 75th Anniversary CW Contest (rules February)
16-17 YL-ISSB CW QSO Party
16-17 Bermuda Contest
23-25 BARTG Spring RTTY Contest
30-31 CQ WW WPX SSB Contest

APRIL

No firm dates or rules for contests to hand for this month. It's anticipated that the Polish CW Contest will be held on the weekend of 6th April and the Phone Section later in the month.

I note from last years calendar that the DX YL North America phone and CW contests were also held in April.

MAY

28-29 CLARA AC/DC Mystery Contest (rules February)

It's also anticipated that the CQ WW WPX CW contest will be held probably on the weekend of 25th May.

RULES FOR ARRL DX CONTEST

Unfortunately I do not have to hand a copy of the rules produced by the ARRL for this contest, however I would like to quote to you from the column produced for CQ magazine by Frank Anzalone WIWY. Incidentally, Frank is most helpful each month as he regularly sends a copy of information contained in his column and I hereby acknowledge his assistance in this regard.

The CW Section of the contest will have been run before you read this and the Phone Section is as listed in the above calendar. Frank writes, *"Rules are the same as last year. However, I strongly recommend that you study the announcement in the December issue of QST for more details.*

"All bands may be used 1.8 thru 28 MHz, but not 10 MHz. Aeronautical or maritime mobile stations cannot be worked for contest credit. Following is a brief outline.

***"Categories:** Single operator, both single and all band. Multi-operator, one transmitter and two transmitters. Also multi-operetor, multi-transmitter. QRP all band only. Multi one and two transmitter stations must remain on a band at least 10 minutes once a contact is made. Multi-transmitter stations no limit, but only one signal per band.*

***"Exchange:** RS(T) and state or province for W/VE. RS(T) and power input for DX stations. (Three digit number).*

***"Multiplier:** Each DXCC country worked on each band for W/VEs. DX stations use US States (48) and VE districts VE1-8, plus VO for their multiplier. (9). (Maximum multiplier of 57 per band.)*

***"QSO Points:** W/VE stations earn three points for each DX contact. DX get three points for each W/VE contact.*

***"Final Score:** Total QSO points times the sum of the multiplier from each band. Entries with 500 or more QSOs must include QSO Check Sheet.*

***"Awards:** Certificates given in each category, in each country, and in each ARRL section, plus a wide selection of plaques. Also certificates to DX stations making over 500 QSOs.*

"Disqualification regulations will be strictly enforced and are listed in the official rules. Logs are to be mailed to ARRL DX Contest, 225 Main Street, Newington, CT. 06111."

YL ISSBers QSO PARTY

In this case the phone section will have been held last month, so for those interested in the CW Section here are the details also from Frank's WIWY column.

"CW on 16-17 March. 0001UTC Saturday to 2359UTC Sunday. Rules are quite lengthy. Therefore I suggest you send and SASE to K0RDJ for a detailed copy. The party is open to all, but the emphasis is on membership participation.

"The same station may be contacted on each band for QSO points, but it counts only once as a multiplier. You are required to take two rest periods of 6 hours each during the 48 hour contest period.

***"Exchange:** Name RS(T), SSBers Number, US State, VE Province, country and DX/WK partner, (non members send no number).*

***"Categories:** Single operator, DX/WK partners and OM/YL teams.*

***"Points:** Three points for each member contacted on own continent, six points if on a different continent. Non-member QSOs count only one point.*

***"Multiplier:** Only member stations count as a multiplier. One for each of the following both DX/WK partners worked, each US State, VE Province and DX country worked. Two when DX/WK partners work each other and two if your DC power input is 250 watts or less.*

***"Frequencies:** Use the general class portions of the US bands for both phone and CW. On 20 metres avoid the net frequencies on 14.313, 14.332 and 14.336 MHz. Check 40 and 80 metres on the hour. VHF and UHF may also be used, but simplex only.*

***"Awards:** Special certificates to the overall winners in each category. Regular certificates to the winners in each US State, VE Province and DX country.*

"Logs should be set up as outlined in the 'Exchange' section above. They go to Rick and Minnie Connolly K0RD and NA0V, Star Route No 1, Crocker MO. 65452. USA."

BARTG SPRING RTTY CONTEST 1985

The rules for this contest have been forwarded to me by Peter Adams G6LZB who is the BARTG Contests Manager. Peter writes also regarding RTTY contests. *"At the moment I am preparing my 'RTTY Contest Calendar' for next year, but in order to complete this, I need to know the dates of the major RTTY Contests.*

"It would be very much appreciated if you could let me know, as soon as possible the date(s) of any RTTY contests sponsored by your organisation during the coming year.

"For the moment I just need the title of the contest together with the date(s). Further details and information will be needed later on so that BARTG can give the events as much publicity as possible in our quarterly magazine DATACOM and also via the regular RTTY news — GB2ATG.

"I thank you for your help in this matter and look forward to hearing from you in the near future. In the meantime I close with best wishes to you and the members of your group."

Well, it so happens that whilst the WIA does not directly sponsor any RTTY contests there are at least a couple of RTTY groups operating within Australia. Therefore, if they have not already provided their information to the BARTG as requested above they may wish on the basis of this detail to do so. Any such information may be sent to Peter at the address shown for contest logs as listed in the following rules.

RULES FOR BARTG RTTY CONTEST

(As per copy supplied direct from BARTG)

WHEN — 0200 UTC Saturday 23rd March until 0200 UTC Monday 25th March 1985. The total contest period is 48 hours but not more than 30 hours of operation is permitted. Time spent as listening periods counts as operating time. The 18 hours of non operating time can be taken at any time during the contest period, but off periods may not be less than 3 hours at a time. Times ON the air must be summarised on the summary sheet.

WHO — There will be separate categories for single operator, Multi operator and short wave listener stations.

BANDS — 3.5, 7.0, 14.0, 21.0 and 28MHz amateur bands.

STATIONS — Stations may not be contacted more than once on any one band but additional contacts may be made with the same station if a different band is used.

COUNTRIES — The ARRL DX COUNTRIES LIST will be used, and in addition, each W/K, VE/VO and VK call area will be counted as a separate country.

NOTE: W/K, VE/VO and VK count once each only for QCA purposes.

MESSAGES — Messages will consist of:
(a) Time UTC. This must consist of a full four figure group and the use of the expression "same" or "same as yours" will not be acceptable.
(b) RST and Message number. The number must consist of a three figure group and start with 001 for the first contact made.

POINTS — Points can be claimed as follows:
(a) ALL two-way RTTY contacts with other stations within one's own country will earn TWO points.
(b) ALL two-way RTTY contacts with other stations outside one's own country will earn TEN points.
(c) ALL stations can claim a BONUS of 200 points for each country worked, including their own. Note that any one country may be counted again if worked on a different band but continents are counted once only.
NOTE: Proof of contact will be required in cases where the station worked does not appear in any other contest log received or the station worked does not submit a check log.

***Scoring** — (a) TWO-WAY contact points times the total of countries worked.*
(b) TOTAL country points times 200 times the number of continents worked (Max 6)
(c) Add (a) and (b) together to obtain the final score.

LOG AND SCORE SHEETS: Use a separate sheet for each band and indicate all times on the air. Logs to contain: Date, Time UTC, Callsign of each station worked, RST and message number sent, Time, RST and message number received and the points claimed.
NOTE: Logs received from short wave listeners must contain call sign of station heard, report sent by that station and call sign of the station being worked.

ALL LOGS MUST BE RECEIVED BY 31ST MAY 1985 IN ORDER TO QUALIFY.

Send your contest or check log to: PETER ADAMS G6LZB 464 WHIFFENDELL ROAD, WATFORD, HERTS, ENGLAND WD1 7PT.

If you are one of those readers who take note of just what is mentioned in this column, and not just scan it through quickly, you will have gathered that I seem to be slightly perturbed at the very poor quality of logs which I am receiving for contests. At this stage I would like to retail to you a true story about one occurrence since I began the task of Contest Manager. I use this story as an example only of the type of thing which happens and which is in some ways somewhat disheartening when one tries to do the right thing by a contest entrant and with proper motives for the benefit of all other contesters.

After the Remembrance Day Contest in August 1984 I began to receive logs for that contest. Amongst the logs received early was one, the callsign and name for which will always remain anonymous, which did not measure up in a number of ways to what was required and laid down in the rules. I then sought to

'kill two birds with one stone' and wrote the entrant a letter which was worded as follows: *"Dear . . ., I received your Remembrance Day Contest log In the mail today. I am however returning it to you for the reasons explained below. I wish to explain to you that under the rules of the contest your log in its present form is unacceptable and would be disqualified.*

"The rules for the contest appeared in the July issue of Amateur Radio magazine with corrections to mistakes contained in an insert to the August issue. (I would hasten to point out that I have only just stepped into the post of Federal Contest Manager . . .)

"The sections of the rules with which your log is not in compliance are however quite clear.

"Rule 9. Cyphers: The serial number will consist of THREE figures that will be incremented by one for each successive contact, etc. In other words no RS(T) figures should be added. You have in fact listed VK5QX in two places in your log and claimed that he provided you with 5 figure serial numbers. I can assure you that this was not the case. The same applies to your listing of contacts with VK . . . and VK . . .

"This may appear to be a minor point, and I agree that it is, however, a couple of principles apply here. Firstly if I wish to be pedantic I could simply say that the rules as written should be complied with, (and that also is probably a fair enough requirement) however secondly, and more pointedly I would say that the addition of the extra figures printed amongst a mass of figures simply complicates the issue and makes it somewhat harder when it comes to cross checking of the logs entered for the contest. I will also admit that I heard a number of stations using 5 figure serial numbers, so I guess that I can expect other offenders in this regard. You may well have also used the example Tx log shown in the July issue. This example was definitely incorrect, both as pointed out in the insert referred to and as can be observed by reading the rules.

"Rule 13. ALL LOGS shall be set out as in the example shown and, in addition, MUST CARRY A FRONT SHEET showing the following information in this order: Section, score, callsign, mode, name, address and page tally. Declaration. "I hereby certify that I have operated in accordance with the rules and spirit of the contest." Signed . . . Dated . . .

"It is mainly with respect to this latter rule that your log does not conform and I maintain that with this information spelled out so clearly in the rules it should reasonably be expected that people abide by same. Further, you claim 61 contacts on the SSB mode and then a points score of 20.33 points. How you obtain this I cannot imagine as the rules quite clearly indicate that each contact on this mode is worth ONE point. (See Rule 5 as originally published and also as more completely explained in the insert in the August issue of AR.)

". . ., yours was the very first log which I opened and looked at. It is in its basic form neat and tidy and probably in a number of ways superior to quite a number of logs which I will encounter when I open up other entries. I had decided though to write to you about your entry as an example, and explain where you had not complied. I discussed the matter with a couple of my assistants on the Contest Committee which I have formed and they agreed first of all that your log could be ruled invalid, and one member independently suggested that I write to you.

"Now . . ., I wish to enlist your co-operation, having seemingly been somewhat hard on you to this point with some criticism implied.

"You can imagine that as the new Federal Contest Manager I do not wish to appear either harsh or unfair to entrants. I might also point out though, that if everybody or even a fair proportion of entrants fail to observe the rules, particularly with respect to their log entries, it can make the Contest Manager's job so much more difficult.

"I would thus request that you complete the necessary extra paperwork for your entry, correct the log as necessary and return it to me so that I can accept it as a valid entry.

"I would then propose that I publish a copy of this letter to you, with any item which would tend to identify you removed from the context, in Amateur Radio magazine. This I would intend as a warning and a means of pointing out to others that IF THEIR LOGS DO NOT COMPLY with the rules I will be quite ruthless and disqualify such logs without further ado.

"Whilst I have singled you out for special treatment I can assure you that I have no intention whatsoever to write to each individual who submits a log which is not according to the rules.

"I simply ask that those who enter contests PLEASE read through the rules properly, do their best to understand and comply with them and ensure that their log entries are correct. This will make the job of myself and my assistants so much easier. Yours faithfully etc.

"PS: I realise that I am not aware of your personal situation and that such could perhaps have some bearing on the above situation. So please don't think me too rude in taking this action. I have also made a copy of your log as so far provided by you."

I did receive a reply to my letter, however the person concerned apparently did not properly recognise my motives in writing to him and did not take the opportunity offered to him and nobody else in this way to send back a corrected log. He seemed to still blame both myself and AR for the mistakes which were originally made in the publication of the rules, suggested that as he had not complied with same the best course of action I could take was to disqualify his log and intimated that if he ever went in another contest "and that's a big if" etc.

So, obviously one of my aims, that of offering an opportunity for him to correct the situation as far as his log was concerned, was not achieved. My second aim of obtaining his co-operation to provide a lesson and example to others was only partially successful, however I decided that my effort would not go entirely to waste as I could still use my letter to him as an example to many as to what can go on in the matter of logs. Please allow me just a couple more comments in the way of explanation and to make a few final points.

The log submitted in this instance was apparently done with the aid of a computer. I have a pretty fair understanding of the capability of computers in general although I also realise that not everybody can afford to buy, for their own use, the most expensive units. I do see through the logs submitted, which have been computer generated, that there are some excellent programmes which produce beautiful logs which fit exactly to the rules laid down. There are also many which do not.

The suggestion here is that some entrants may not be as good at programming their computers as are others therefore I suggest that they keep working at the problem but keep their computer generated logs until they get them right. If your computer is not up to it please send instead a properly laid out manually produced log and just use your computer for your own duplicate contact checks etc.

My PS to the letter incidentally was due to the fact that I realised the possibility that the operator concerned may have had some disability unknown to me which may be the reason for his log not fitting the rules. In any case I feel that in this instance I was more than fair in my actions.

I hope that by providing this story I may have been able to awaken in the minds of all of you who enter contests, and not just contests organised by myself for Australian contesters but contests which are conducted and sponsored by overseas organisations, an understanding of the need for logs submitted to be in accordance with the rules and format laid down. After all, I have yet to see rules published for any contest where a log format has not been included as part of same.

Those people producing contest rules do so for good reasons otherwise why bother having any rules at all. Once again my plea, PLEASE DO READ PROPERLY the rules for all contests, make sure that you understand them thoroughly and then follow through by carrying them out to the letter.

If any rules seem to you to be capable of misinterpretation by all means bring such fact to the attention of the applicable contest manager. I am sure that he will be most happy at your show of interest.

VK NOVICE CONTEST 1984

In this issue is contained the results of the VK Novice Contest for 1984. I would like particularly to make some comments regarding the logs submitted for this contest. Vic VK5AGX assisted me greatly by going through the logs initially and pointing out to me a few areas where a number of operators had slipped up. Many of the logs left a great deal to be desired and came very close to receiving disqualification by not adhering to the format laid down in the rules. I will descibe some of the problems encountered along these lines.

One log, the operator will recognise my description, was set out in such a complicated manner that it made it most difficult to check. This operator had gone to a great deal of trouble too. He had a different section of the log for each band and mode and then had split the log up further by breaking each of these sections down into separate pages for each call area. All this was done in a very neat fashion too. Such a log whilst perhaps well intentioned simply does not comply with the rules and although I was loath to do so I decided that I had no recourse other than to disqualify same. Incidentally, this log did not show the full RS(T) number exchange either. Another log was simply a carbon copy, in blue, and so smudged that in some places it was all but illegible. This log was almost disqualified. Another listed times as infrequently as up to 53 minutes apart and some mixed both modes together in the one log despite the fact that the contest rules showed each mode as being a separate section in the contest. Perhaps the need for separate logs for each section must be spelled out more fully although almost everyone else seemed to have recognised this fact.

At least two operators completely ignored the requirement for a front sheet containing details of the entry and the declaration called for. One station incorrectly claimed points for the contacts made totally different to the method laid down. I find it embarrassing to have to disqualify logs but unless the rules are adhered to I have no other alternative except to do so. It certainly would pay for would be contesters to read the rules more carefully and make sure that their log formats do agree with that laid down. As per the disqualifications for the Remembrance Day Contest and again with this contest I am virtually serving notice that if entrants do not conform to the rules their logs will be disqualified. Those concerned this time may perhaps be able to console themselves with the thought that they are simply being made examples of, without any animosity, and perhaps are victims of a situation which has been allowed to develop over the years where contest managers seem to have been prepared to accept almost anything. Again I would re-iterate my opinion that a common standard log sheet made available by the WIA would go a long way to alleviating this problem.

It would appear to be disappointing that so few logs were sent in, a total of only 40, whilst quite a number more did operate in the contest period exchanging numbers. This number is considerably down on last year's entry of 61 and should this state of affairs continue I would query as to whether or not such a contest is at all worth the trouble of organising. Perhaps if this contest can be changed to a date further removed from other contests as I have been trying to ask for it may become much more popular. Only time will tell.

KEITH HOWARD VK2AKX TROPHY

The winner of the contest as top Novice scorer for 1984 is VK5NOD with a total score of 807 points. To achieve this score he operated consistently for somewhat in excess of 19 hours of the total 24 hour period to make 231 contacts. He is to be congratulated on this fine effort and also on his log entry of which he can be proud. It was one of the most tidy logs received. When the trophy is available it will be forwarded along, meantime I will arrange for his certificate to be forwarded to the VK5 Division so that arrangements can be made for it to be presented, possibly through the auspices of the South East Amateur Radio Group at Mt Gambier.

One other most meritorious entry and extremely neat and tidy was that of VK3PFG who was runner up in the contest. He deserves a special mention. Whilst not attempting to take away anything from any of the past winners of the VK Novice Contest I would like to

broach the possibility of changes to the contest rules. Reading into the rules the intent to promote the art of CW Operation, as well as provide a contest basically for Novice operators, it would seem to me that the trophy winner should also have to qualify for same by having submitted a log for both the CW and Phone sections of the contest. I would note that unfortunately several of the logs which were disallowed for this year's contest included both CW as well as phone operation.

INDIVIDUAL SCORES — VK NOVICE CONTEST 1984

PHONE/NOVICE

EDUCATION NOTES

Brenda Edmonds, VK3KT
FEDERAL EDUCATION OFFICER
56 Baden Powell Drive, Frankston, Vic 3199

ATTENTION TO ALL INSTRUCTORS IN PARTICULAR

Last month I passed on a few hints to those wishing to run classes for novice or AOCP students. Many experienced instructors would be able to add considerably to those ideas.

LET'S SWAP IDEAS

It is very easy to decide that one's own methods and opinions are the best if we have not considered any others. We do not often get the chance to sit in on someone else's class and see their different approaches of explaining a technical point or interpreting a section of the syllabus.

FORTY CLASSES — NO MORE?

I have, on record, the addresses of about forty clubs or individuals involved in some sort of radio class, and there must be many more of which I am unaware.

LET'S HELP NEW INSTRUCTORS TO HELP WOULD BE AMATEURS

It seems to me that there must be a vast store of knowledge and experience around the countryside which could be put to good use, and which would be of great benefit to those trying to set up their first course.

It may be my natural laziness showing through or it may be my personal indebtedness to those who have helped me, but I cannot help feeling that the newcomers should be given as much assistance as possible.

Instructors are not competing against each other — there is no pre-arranged pass rate of say 35 percent of candidates sitting. So anything we can do to improve the quality of instruction available can only benefit the students as individuals and the amateur body as a whole.

REGULAR CONFERENCE ONCE A WEEK

Ideally, I would like to be able to hold regular conferences of all instructors to discuss syllabus interpretation, exam procedures and mutual problems but I realise this is hardly possible with such a number of volunteers scattered throughout Australia. However, as the majority of our teachers are licensed amateurs, we have a communication resource to which no other group of teachers has access.

It is with this in mind that I have been trying to establish a weekly Education Net on 80m, but I have been disappointed with the response.

I have been calling 'CO Education Net' at 1130 UTC on about 3.685MHz each Thursday evening for some time now.

In response to several comments I have also tried calling near the top of the novice section — 3.610-3.625MHz wherever I can squeeze in — at 1030 UTC, but have had very few replies on either frequency.

Is this just a sign of poor publicity? Are the instructors uninterested in sharing ideas? Or am I just too over optimistic?

DON'T WHINGE

This net could also be valuable when I need some informal input on matters such as syllabus revision, text books to recommend or exam procedures. It is a chance for those who are most concerned with such matters to be heard. I cannot act on secondhand or overheard WHINGES!!!!

JOIN THE EDUCATION NET AND ADD YOUR POINT OF VIEW

It is also an easy way for you to let me know of classes being run. I would greatly appreciate ANY information about classes for 1985 as soon as possible. In return, you will be rewarded by having your club or class put on the mailing list for sample examination papers as they are produced. SURELY AN OFFER TOO GOOD TO MISS.

AR

SPOTLIGHT ON SWLing

Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

Several DXers were recently surprised to hear Asian and African signals coming through at around 0200 UTC, which corresponds to midday in the eastern states, over the Christmas-New Year period. Naturally, reception only lasted for a short period, but normally DX signals are absent at that time. The frequencies involved were between 5 and 7 MHz, where very few signals, let alone any from these areas, can be easily heard.

STRANGE PROPAGATION

Naturally, several theories have been advanced explaining why DX from these regions have been observed. They all have credibility but the low sunspot count figures prominently in all theories. I believe that propagation from Africa comes from the Antarctic regions. Transmissions, in particular from Radio RSA in Johannesburg, I have heard, are directed to North America, and the signals on 9.630 MHz around 0200 UTC would therefore be coming off the back of the beams. But propagation is fickle and is not as reliable as the normal transmission paths. All this highlights the unpredictability of shortwave propagation.

Over the summer months, I was unable to receive any worthwhile DX, particularly on the lower frequencies, because of the incessant levels of atmospheric static and noise. Fortunately, propagation opened up on the higher frequencies to give some interesting listening, especially around 1300 UTC. This more than compensated for the loss of the tropical bands. Hopefully by now, the static levels will have quietened down as the equinox is on the 21st of this month, allowing the lower frequencies to be monitored once more.

FREQUENCIES SHIFT

Don't forget that the M-85 period commenced on Sunday 3rd March. That is when there is a major shift of frequencies to take account of seasonal fluctuations. Also, I have frequently noted that the Utility Services alter their schedules to take account of other variables. This is primarily because they are engaged in point to point service and not designed for the general or casual listener. You will have noted that stations are beginning to come in from different locations from that during the summer months. On the 60 metre band in particular, you will begin to observe Latin American as well as Indonesian low powered senders.

SUMMERTIME COMMENCES

Also don't forget that Summer Time commences on Sunday 31st March throughout Europe and in the USSR on the 1st April. Programmes for audiences within Europe will be one hour earlier, which will mean some frequency re-arrangement. Traditionally the USSR makes extensive frequency alterations on the 1st April and the 1st October as well.

NEWS AROUND THE WORLD

I would surmise that the majority of listeners to shortwave broadcasts would mainly tune in for news programmes. Many who have emigrated wish to keep in touch with developments in their homelands. But many others are listening to gain a wider perspective than is provided by their local media sources. One can readily come to an accurate assessment of a situation by comparing coverage of the news from a variety of sources. As the output from the local media sources does somewhat tend to exclusively concentrate on local rather than international issues, it is becoming mandatory to gain a wider base of information before forming an opinion. We do have a wide variety of news and information at our fingertips, instantaneously, instead of relying exclusively on a very narrow, brief encapsulation of what the news is from your local media source.

Now with the advent of RTTY demodulators interfacing with your home computer and TV set, more are tuning in to press services to print up the news before it is broadcast over the electronic media, or later see it included in the print media. But alas, these services are relying more on satellite or cable facilities to transmit their data. Only about 35 per cent of RTTY signals currently being monitored on HF will easily print out, for increasingly the traffic is encrypted or encoded. However, there are still a number of press frequencies still operational. I will not include them here, because they frequently alter both their transmission times and frequencies, depending on the availability of copy. Reuters, for example, has reduced their output on HF to a single operational channel of 18.338 MHz at about 1200 UTC.

Also the French News Agency (AFP) recently discontinued their newscasts from their Hong Kong relay, although reportedly still utilising sites from France and elsewhere. The Korean Central Newsagency (KCNA or ATCC) in Pyongyang, North Korea is a prolific source with several senders comparatively close to the 20 metre amateur band. Try either 13.790 or 13.580 MHz at around 0900 UTC or 14.350 MHz at 1130 UTC. They are usually at the standard 50 Baud rate with a shift of 525 Hz. The Soviet TASS agency can also be frequently observed on a number of channels simultaneously. Try 14.700 MHz around 1200 UTC. They are at 50 Baud with a 425 Hz shift. Other smaller newsagencies are occasionally observed from time to time, yet I find the broadcasting news sources far more reliable than expensive demodulators or VDUs, as one's ears are less expensive and more reliable.

ANTENNA WORKING

Radio HCJB has recently begun to utilise their new 49 metre antenna array. Signals to Europe and the South Pacific will hopefully improve with this latest addition. I have noted HCJB on a new frequency of 6.205 MHz, broadcasting to Europe in English. As well, the station has continued the "Open Line Programmes" where the listeners can phone in and participate. The "Open Line" this month will be on the 23rd March at 0700 UTC on 6.130, 9.745 or 11.925 MHz to the South Pacific, and simultaneously on 6.205 and 9.655 MHz to Europe.

Well, that is all for this month. Until next time, the best of 73 and good listening! — Robin VK7RH. **AR**

INTRUDER WATCH

Bill Martin, VK2COP
FEDERAL INTRUDER WATCH CO-ORDINATOR
33 Somerville Road, Hornsby Heights, NSW 2077

As I type this column, the temperature in the shack is 35 degrees celsius . . . As a matter of fact, it's so hot that the fan on the FT107 came on, and the rig isn't even switched on! I look forward to winter for cooler weather, and for tolerable conditions on 80 metres.

Was waitng last night to check into a net, and the noise was so bad on 80 metres, that the signal only improved about one 'S' point in half an hour, which brought it up to S1! I didn't get into the net.

Not much in the way of reports on 5AN, Adelaide lately, *so can I assume that the harmonic is no longer being heard*? Radio Budapest came up on 14.160 MHz, but am of the opinion this was an honest mistake.

Radio Moscow seems to be having trouble with their spurii again, this time on 7.070 MHz. It's about time their engineers looked to their laurels. SGJ is still operating on 7.060 with CW, in spite of ARRL protests. Am also receiving more and more reports on apparently cordless phone operations, which are causing a problem.

In spite of a well-planned and exhaustive campaign against USSR intruder UMS, the DOC has not replied to my correspondence on the matter.

Have been using the newly-acquired personal computer to assist with Intruder Watch paperwork, which is a help, but am not realising the full potential of the computer yet, as the operator, I'm afraid, is a bit hopeless so far! However, intruder reports are put into the computer as received, which nicely does away with the 12 hour typing job at the end of each month as was the case before the computer.

Received a letter from ZL1BAD recently, and, amongst other things, he mentions the 80 metre band, and repeats that "*. . . in Region 3, the band 3.5 to 3.9 MHz is allocated to the fixed, mobile and amateur services on an equal footing, mutual non-interference, basis. THE ONLY INTRUDER THAT CAN EXIST ANYWHERE IN THE WORLD ARE STATIONS OF THE BROADCAST SERVICE.*"(Bob is Region 3 IW Co-ordinator)

Incidentally, saw a picture of Bob's shack, and am green with envy! Just in passing, this was nearly the last column by this amateur, as only this morning, whilst working on an oscilloscope, I took 240 volts across the chest! Left me with sore arms for a while. Let this be a lesson to us all . . . observe the "one hand in the pocket rule", and never become blasé about mains-supplied gear. It doesn't often give you a second chance.

Been hearing quite a lot of activity on SSTV lately, on 14.231 MHz. Don't mistake these strange signals for intruders, as this is a common frequency for this mode, and I know at least ZL1BT and VK4ZG won't appreciate any deliberate QRM!

Better wind-up now, or the AR Editor will get upset, so 73 for now, please keep the intruder reports coming, and, next time you are QRM'ed by an intruder, don't mumble to yourself in the shack — make a note, and send in an intruder report. All reports are welcomed, and help us to help all other Amateur Operators. See you next month.

L to R — Jeff VK2EJJ, Stan VK3BSR and Norman Lange at the Bail Electronics trade display.

A good attendance, and weather on the Sunday was enjoyed by all, with keen interest shown in the various fox and hidden transmitter hunts. An interesting incident being that one of the hidden transmitters was left behind on the outskirts of Young near where it was hidden. Luckily enough it was still there when Peter VK2APP, went to pick it up 2 weeks later.

The evening dinner was held at the Guide Hall and enjoyed by all who attended.

Returning from the Fox Hunt.

DOCTOR DX™

For the active CW operator, there is nothing more fun than operating with the "Doctor DX" CW DX simulator. For the person who has never liked CW, Doctor DX will show you what real fun is. Doctor DX has something for everyone from the aspiring novice to the experienced amateur licensee. And you need no DOC licence to operate Doctor DX!

With Doctor DX, all you need is a Commodore 64 computer, a key (or keyer), and a TV set or monitor. There is no need for an expensive transceiver, amplifier and antenna farm to enjoy the thrill of working "rare DX". No more TVI or dead bands! Doctor DX is more than the most sophisticated CW trainer ever developed, it is your DXpedition ticket to anywhere in the world at a very affordable price.

Doctor DX simulates real HF CW band conditions. All the stations you will work are generated by the computer. As you tune up and down the particular band you have selected, you will hear realistic sounding stations in contact with other stations (some within your skip zone). There is also the normal QRN and QRM one would expect to hear in the real world. All call letters heard are totally random (subject to the country's callsign assignment rules). The prefixes are weighted according to the amateur radio population density, with 304 possible countries represented. The speed of stations operating in the lower portion of the bands is much faster than those operating in the upper band segments. The "operators" are also more polished in the lower portion of the bands.

Radio propagation (programmed for each band) represents what you would expect to hear on a good propagation day at the peak of the sunspot cycle. The propagation follows the internal real-time clock that you set before beginning operation. All the simulated stations you hear (with proper prefixes) are at distances you would expect to hear for the time of day and band selected.

You can learn and enhance your CW operating skills with Doctor DX. Doctor DX will not reward bad habits. Advanced Electronic Applications even offers an awards programme to owners of Doctor DX that work all zones, 100 countries, 5 band Dr DXCC, or Doctor DX Honor Roll.

The Doctor DX CW trainer is a totally new concept in amateur radio. See what all the excitement is about. Send for full details.

VK4 WIA NOTES

Guy Minter VK4ZXZ
FEDERAL COUNCILLOR
Box 638, GPO, Brisbane, Qld 4001

This year for the first time in a few years VK4 have forwarded two motions to be considered at the Federal Convention.

The motions are as follows:—

MOTION 1

Moved VK4 that all Australian Amateur Radio Contests be frequency restricted such that scoring contacts be limited to no more than two-thirds of each of the amateur bands, with specific frequency limits on each band to be determined by the FCM.

Supporting Comments

1 Contests encourage the use of our Amateur Radio Bands and therefore must be supported by the majority of operators. However the right to use non-contest spectrum by those who do not wish to participate in contest operation should, at all times, be respected, and as such, reasonable spectrum allocation should be made for each group.

2 Participation in Amateur Radio Contests does improve the skills of contacting, operating, log keeping and QSLing and in the best traditions of amateur radio must therefore be supported.

3 It is known that a significant proportion of Amateur Radio Operators enjoy lengthy OSOs, and do not wish to be involved in time-efficient contest-type QSOs. These operators do not fully enjoy their chosen hobby during contest periods. The specifying of at least one-third of available spectrum/per band for non contest use will ensure that amateurs who are not involved in contests will still be able to enjoy their hobby.

4 For some time now radio amateurs throughout the world have been requesting some contest-free operating spectrum space. Whilst the WIA strongly supports the concept of contests, the rights and privileges of the individual must, at all times, be respected, and as such, this proposal will receive the support of all operators.

MOTION 2

Moved VK4 that an Australian Standard on packet radio be established, such protocols to be widely circulated to ensure full Australian participation in this aspect of our hobby.

Supporting Comments

1 Through the use of satellite systems, all such user systems should be fully compatible with recognised international standards.

2 Unattended operation is now a vital part of our hobby eg repeaters, and as it is an integral part of packet radio, suitable protocols should be established by user groups (to be further co-ordinated by FTAC) to ensure efficient use of our spectrum.

WA BULLETIN

Fred Parsonage VK6PF
Acting Secretary
Box 10, West Perth, WA 6005

NOTICE OF AGM

Notice is hereby given that the AGM of the West Australian Division of the Wireless Institute of Australia will be held on Tuseday the 16th April 1985 at the Institute of Engineers, 712 Murray Street, West Perth at the conclusion of the General Meeting. Business to be transacted will be:

1 Consideration of Councils Annual Report
2 Election of Office Bearers vis:
a President.
b Vice President.
c 7 Other Councillors.
3 Election of two Auditors.
4 Appointment of a Patron.
5 General Business which has been duly notified.

Agenda items will be advised on the Divisional news broadcast on the three Sundays prior to the AGM.

Members unable to attend may appoint a proxy in writing in the following form:

I ..... being a member of the Institute hereby appoint ..... also a member of the Institute to act for me as my proxy and in my name to do all things which I myself being present could do at the AGM of the Institute to be held at the Institute of Engineers, West Perth on Tuesday the 16th April 1985.

Signature .....

Witness .....

Date .....

Nominations for Council must be tendered in writing to the Secretary, signed by two members and the nominated members acceptance 42 days prior to the AGM.

General Business Agenda items must be tendered in writing to the Secretary signed by three members 42 days prior to the AGM.

AR

TASMANIAN NEWS

NOTICE OF MEETING

The Annual General Meeting of the Tasmanian Division of the Wireless Institute of Australia will be held on Saturday, 16th March 1985, commencing at 2pm.

The venue will be the Beaconsfield Council Chambers in Eden Street, Riverside, Launceston.

All welcome. Come along and have your voice heard in your Institute.

NOTICE

All copy for inclusion in May 1985 Amateur Radio must arrive at Box 300, Caulfield South, 3162 no later than midday 22nd March.

The VK2 Mini Bulletin, usually on these pages, has been incorporated into the special Seventy-Fifth Anniversary Feature. See pages 27 to 37.

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

**Standing L to R — Dick Boxall VK5ARZ, Janet Bulling VK5NEI, John Bulling VK5KX.
Seated L to R — Pat Boxall and Gillian Wardrop at the WIA Picnic, November 1984.**

From left — Trevor Wrigley VK5ATW, John Butler VK5NX, Ian Fisk VK5IF and Mitch Hamilton VK5AZM at the Picnic.

At the November General Meeting we were unable to conduct a business meeting after the speaker because everyone (or most) left with the speaker and we were unable to raise a quorum. As we cannot run the Division without the business side, it has been decided to start the meetings at 7.45 pm in future, and to hold the business first. The speaker will start around 8.30 pm (earlier if there is less business) and if the business looks like going over time, then it will have to be postponed until later that night or some other appropriate time.

DIARY DATES

26th MARCH General Meeting (speaker unknown, listen to the Broadcast for details) (and don't forget those nominations for Council positions).
18th-23rd MARCH Jubilee 150 Launch in Rundle Mall. Listen to the Broadcast for details.
23rd APRIL. AGM (not 25th as published in the Events Calendar).

AR

PRESTIGIOUS AWARD FOR AWARD CUSTODIAN

Dr Peter Barclay VK3FR, was the recipient of a prestigious Australia Day inscribed medallion presented by Dr John Zillman, Director of the Bureau of Meteorology, at a gathering in excess of 150 staff members on the 25th January, 1985.

The award was instigated by the Australia Day Committee in 1984 for ones leadership and dedication to their chosen profession. In presenting Peter's medallion, the only one presented within the Meteorological Bureau this year, Dr Zillman praised the work of Peter and his colleagues on a specific project over the last few years and stated "While I know you see that these are very much team achievements, I am sure there is a universal agreement that the most significant contribution over the years has come from your personal leadership and high professional standards which have set an excellent example to your colleagues throughout the Bureau".

Peter, well known in amateur circles, including being custodian of the Keith Roget Memorial National Parks Award, has been with the Bureau for 22 years. In that time, apart from being with many departments, he has seen service overseas, firstly as an exchange scientist for twelve months in the USA in 1969 and later in Pakistan in 1978.

Congratulations Peter.

AR

LETTERS TO THE EDITOR

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publisher.

MORE DRIVE IN 85

We, as licensed Novices, wish to raise a few ideas which we believe, if addressed, could lead to an increase in WIA membership and more enjoyable participation of amateurs who are striving to broaden their knowledge.

In the June 1984 AR, it was stated that we need to get new members or there will be an increase in subscription. Again in January 1985 AR, we find the Federal Office offering incentives to join or re-new subscriptions to WIA — yet another plea for membership.

It is contended that the greatest potential area for new members is the "new novice" and especially one who is from "outside" the electronic world. These people wish to learn and enjoy their new hobby and one or two complimentary copies of AR could help encourage these people to become members.

To do this there is a definite need to cater to his bands. What good is VHF, UHF, RTTY, Satellites, Computers, Competitions and the many aspects of advanced (Full Call) activities if the reader fails to understand terms like Keplerian elements; Points and Multipliers; or the time variations between satellites. They may have some passing interest but do not help the new or old Novice who finds the full call beyond his aptitude and time available with other commitments of family and possibly even finances. Look at last year's issues of AR and work out the percentage of articles directed to the Novice or SWL who is feeling his way into their chosen hobby. What we ask is that the experienced remember that they were once new, when maybe the pace was slower — your problems, aspirations and queries are ours today. Help the many new or outside Novices because we are the membership of the future.

We realise the cost of running the WIA and these costs must be paid by the members, but give the illusion of providing something more than a $35 pa magazine subscription. Perhaps the possibility of extra benefits to members could be explored for example, perhaps the retail price of the call book should be more ($10) with a reduction (half price) for WIA members.

The figures clearly show that many do not consider the WIA worthwhile as they have either left or not joined because nothing of interest was offered, or they were told it was of no value. Obtaining articles is an acceptable and real problem which will require some effort.

Both of us are office holders in our local amateur radio club and support the WIA so we hope this will be taken in the spirit in which it is written because we have thought about this for many months. At a recent club meeting we outlined to members the points covered in this letter and those present could accept the points raised.

In this 75th Anniversary Year there could well be a renewal of interest that could give the WIA the opportunity to bring new members to the fold.

Yours in radio,
Concerned Novices,
VK5NIK VK5PWA

POLARISED SOCKETS

May I congratulate VK2BZC on bringing up the subject of orientation of pins on Clipsal 495 polarised sockets in WICEN News AR, Jan. 1985.

I have had it pointed out to me, rightly or wrongly, over many years, that in the world of amateur radio, the vertical portion of the T is positive and the horizontal is negative.

Would someone care to give the amateurs, present and future, a definite and authoritive ruling so that an Amateur Radio Operators Standard, may be applied.

In the interests of equipment safety, and otherwise, the standard for radio use of 2 pin polarised Extra Low Voltage plugs and sockets should be recorded under Data Sheets in catalogues and handbooks and be given far more publicity.

More and more of these fittings are coming into use with the construction of heavy duty 13.8V regulated power supplies.

REPEATER MOUNTAINS

In the north east of Victoria there are two 2 metre repeaters, one at Mount Wombat VK3RGV Channel 6650 and much further up into the mountains to the east of Wangaratta and south of Wodonga on Mount Big Ben is VK3RNE Channel 7000. Mount Big Ben will be joined by another repeater on Mount Mittamatite, which may even be coupled to Mount Big Ben providing approval is given.

Mount Big Ben repeater, uses a Philips FM-828 transceiver, has an Effective Radiated Power over a ½ wave dipole of about 35 to 40 watts. In the near future an improved antenna will be placed on a new tower about 30 metres higher than at present and will have an ERP of about 120 watts.

All of the above work is expected to give the repeater a better range and make copy solid in some doubtful areas. As most would be aware the north east of Victoria is mountainous and as such many areas do suffer with weak signals. The use of efficient antennae on vehicles and at least 10 watts is desirable if you want to be heard. A handheld sitting on the seat of a car with a rubber ducky antenna is not the way to work this repeater. When climbing mountains on foot, however, handhelds have proved very useful and have featured in rescue situations. Yours faithfully,

RD Champness VK3UG
(Sec/Treas NE Zone Repeater Group)
31 Helms Court,
Benalla, Vic. 3672.
AR

CONGRATULATIONS

I was sorry to see just recently that Tony Tregale VK3QQ was relinquishing his post as Federal EMC Co-ordinator. From what I have seen of Tony's efforts I believe we have been most fortunate in having someone as enthusiastic as he has been, over what is probably one of the most critical periods in the on going battle to achieve reasonable Electro-Magnetic Compatibility between various electronic equipment, eg Video Recorders and radio transmitting stations.

Congratulations Tony on the work you have done, I hope that we can find another keen and capable person to fill your shoes. Yours faithfully,

RD Champness VK3UG,
31 Helms Court,
Benalla, Vic. 3672.
AR

THANK YOU AMATEUR OPERATORS AND RADIO CLUBS:

1984 has come and gone, and with it the 27th Jamboree on the Air, which once again, has been an outstanding success, thanks to the support of amateur radio operators and radio clubs.

27,800 Scouts, Guides, Leaders and supporters took part in the 27th Jamboree on the Air from just over 500 amateur radio stations, thanks to the generosity of 1,050 operators who gave so freely of their time and facilities. 5,700 contacts were logged, of which 1,000 were DX, down 50 percent on last year, and due no doubt to the poor propagation conditions this year. However, ever resourceful and "prepared" the Scouts and Guides turned these conditions to their own advantage by enjoying longer contacts with Australian stations and some extremely long QSOs were reported.

Some idea of the contribution by amateurs in Australia can be gauged from the results of a survey conducted last year by the World Scout Bureau into participation in JOTA in the various scouting nations. Not surprisingly Australia polled very well, as will be seen from the following figures given by the Bureau with amateur station involvement indicated in parenthesis in each case. When one looks at the population of some of the other countries, particularly the USA and the UK, Australia did very well. Figures for the five leading countries were as follows — United States, 75,000 (2,500); Australia, 20,000 (460); Netherlands, 15,500 (210); Brazil, 15,000 (650); and United Kingdom, 12,500 (455).

The National Opening Ceremony from the grounds of Government House, Canberra, again played a significant part in this year's Jamboree, with technical facilities again provided by the Royal Naval Amateur Radio Society, under the direction of Rear Admiral Jim Lloyd (Ret) — VK1JL. Again Their Excellencies gave the Opening Addresses supported by the Australian Chief Commissioners of Scouts and Guides.

Some operators were again confused by the operating procedures during the call backs after the Opening Ceremony. Perhaps it should be pointed out that to provide the widest possible coverage and to include facilities for novice operators, the National Opening Ceremony and call backs go out simultaneuosly on three separate tranceivers (live) on three separate frequencies — 7.090, 14.190, and 21.190 MHz. There does not appear to be any problem with the Opening Ceremony itself, but when all the call backs are accepted they are acknowledged on the three frequencies but accepted on a single frequency when the Official Guests reply. The silence on the other two frequencies apparently causes some concern and we will be looking at ways in 1985 of keeping the listening stations on the "quiet" frequencies informed as to what is happening at that time. However, despite all that, the call backs in 1984 were the best ever, and we were, in fact, inundated being able to accept only a representative number from each State in the limited time available.

The Report on the participation in the 27th Jamboree on the Air was my last report as National Co-ordinator. After 21 years in that appointment, I tendered my resignation as from 31st December 1984. I am very pleased to be able to announce that my successor is the Branch Commissioner for Radio Activities in the Western Australian Scout Branch — Peter Hughes VK6HU, a well respected Scouter and well known amateur radio operator in the VK6 Division. Like myself, Peter has been associated with JOTA since the first one in 1958 and is Australia's longest serving Branch JOTA Organiser, having held that appointment since 1969. Peter takes over my appointment from 1st January 1985 while I continue in my support role only until after the next National Opening Ceremony.

So let me express once more my appreciation for the efforts of the amateurs in supporting not only the 27th JOTA but for the invaluable help and support since my appointment as National Co-ordinator in 1964, and for the 6 years prior to that when I was associated with JOTA at state and scout group level in Queensland. Please continue to give Peter Hughes the same support in the years ahead!

Noel Lynch VK4BNL,
National Co-ordinator 27th JOTA,
15 Noeline Street,
Dorrington, Qld, 4060

Bill Goes Shopping

Ted Holmes VK3DEH
20 Edmunds Street, Parkdale, Vic. 3195

Bill Blitheringtwit managed to locate the building housing the famous Richard Smith establishment and felt happy with anticipation as he wedged his ancient Holden into the car park. In his pocket he had a list of things he wanted and he had even remembered to bring some money. He hadn't forgotten that argument last time about the out of date Bankcard!

He entered the swing doors and almost immediately found himself trapped in the revolving turnstile. Pushing this vigorously aside, he instantly discovered himself out in the street again. Another attempt and he succeeded in entering the shop.

It was quite some time since he had been in the place. He hadn't been game enough to return since that unfortunate incident with the loudspeaker unit. It had been standing on the floor and Bill had, quite inadvertently, put his size nine boot through it whilst wandering around gazing skywards. The speaker had sailed through the tair, as though propelled from a gun, and demolished a plate glass display cabinet. The result had been rather spectacular. Crashing glass fragments flew in all directions and the silence afterwards could be felt, as all eyes turned towards him. Luckily for him, nobody was quite sure what had really happened and Bill, of course, was all innocence.

This time most of the assistants seemed to be new. All, that is, except one. He spotted Bill, frowned, and came over to him.

"Can I help you, sir?" he enquired politely. But his eyes never left Bill's boots.

"Looking for a few bits," said Bill, handing over his now crumpled list.

The assistant took out his glasses and read it. Then he went to some shelves and pulled out some boxes, taking components out as he did so.

"There we are, sir," he said. "Anything else?" It was obvious that he wanted Bill out of the place as rapidly as possible, but Bill had other ideas.

"Think I might have a wander round," said Bill, handing over his money and collected his tightly stapled plastic bag of bits.

The assistant said nothing. Instead, a grey ashen look came over his normal healthy features and he turned and he turned and whispered something to a fellow assistant. The latter reached down and switched on a surveillance camera and both gazed fixedly at a TV screen as the overhead camera followed Bill's progress around the store.

However, the camera couldn't follow Bill everywhere and it was whilst he was out of camera view behind some shelves that there was a sliding sound, followed by a heavy thump. Assistants rushed from all directions and they found Bill staring down at the remains of an expensive oscilloscope draped over one of his boots. Whilst they watched, almost paralyzed with amazement, a piece of the tube fell from the number 9 with a gentle tinkle.

"Didn't touch it," Bill declared firmly. "Damned near broke my toes. Lucky for you it didn't!" Indeed this would have been a miracle, since Bill's boots were lined with steel toecaps.

Then he strode decisively out, with numerous sets of eyes following him. A brief struggle with the turnstile and he was out in the street again. He felt slightly annoyed. What was the matter with them all? Couldn't a fellow just look at things and occasionally try some of the knobs and switches? Damn it all! they never seemed to worry in disposal stores. . . .

Silent Keys

It is with deep regret we record the passing of —

HAMADS

PLEASE NOTE: *If you are advertising items FOR SALE and WANTED please write each on separate sheets, including ALL details, eg Name, Address, on both. Please write copy for your Hamad as clearly as possible, preferably typed.*

- **Please insert STD code with phone numbers when you advertise.**
- Eight lines free to all WIA members. $9 per 10 words minimum for non-members.
- Copy in typescript please or in block letters double spaced to PO Box 300, Caulfield South 3162.
- Repeats may be charged at full rates.
- QTHR means address is correct as set out in the WIA current Call Book.

Ordinary Hamads submitted from members who are deemed to be in the general electronics retail and wholesale distributive trades should be certified as referring only to private articles not being resold for merchandising purposes.

Conditions for commercial advertising are as follows: The rate is $22.50 for four lines, plus $2 per line (or part thereof) minimum charge $22.50 pre-payable. Copy is required by the deadline as stated below indexes on page 1.

AMIDON FERROMAGNETIC CORES: Large range for all receiver and transmitter applications. For data and price list send 105 x 220 SASE TO: RJ & US IMPORTS, Box 157, Mortdale, NSW 2223. (No enquiries at office: 11 Macken Street, Oakley, 2223).

"FROM PASTURES GREEN TO THE SILVER SCREEN" A 20th century autobiography comprising 156 episodes and 273 illustrations by John W Gerard VK2ADN (since 1936), a wireless experimenter since 1917, who joined the original 'Picture Show Man' (Lawrence Penn) in 1924 and became a radio amateur in 1936 and an active member of Lions International since 1953. After almost a lifetime devoted to wireless, moving pictures and scientific achievements, the author spent 5 years transferring memories of a series of exciting experiences and remarkable events to paper. Price $14.95 plus $2.50 postage and packaging. Available from John W Gerard, East Bonville Road, Bonville, NSW. 2441.

□ WANTED — ACT □

CATSWHISKER CRYSTAL DETECTOR. Prefer barrel type. Ted VK1AEP, QTHR. Tel: (062) 41 7376.

ICOM HF LINEAR AMPLIFIER, solid state. Barry VK1ABR, QTHR. Tel. (062) 72 4172 BH or (062) 86 5652 AH.

TOWER. A 35-45' tilt-over or crank-up tilt-over tower for HF Yagi installation. Details of condx, age, price and estimate freight costs to Canberra are requested. Also any of the following valves wanted. 6AZ8, 6BN8, 6CL6, 6CD6, 6EB8, 12AT7, 6CQ8, 6U8 and 811. Info to Dan VK1ST, QTHR. Tel: (062) 58 5664 AH.

□ WANTED — NSW □

COMMERCIAL LOW BAND FM TCVR — converted to or suitable for conversion to 6m. Also Kenwood SP-520 or SP-820 spkr unit. Peter VK2APJ, QTHR. Tel: (047) 59 1651.

KENWOOD 2400 HANDHELD or similar unit. Also Kenwood 599 tx. VK2BYK, QTHR. Tel: (047) 21 4205.

SOLID STATE LINEAR AMP — 200/250W. Needed for RTTY contacts. Exchange "Microbee" IC32 computer, stacks software. Cash either way or purchase outright. Quote price to VK2BBD, Longford, Bendemeer, NSW. 2352.

YAESU QTR 24 CLOCK. In good condx. R Murphy VK2ERM. Tel: (075) 36 4915.

□ WANTED — QLD □

CIRCUIT DIAGRAMS of AMR-300 rx, 62 and A-510 tx/rx, AT-21 tx, Type 5 pwr supply for ex-serviceman/restorer. Pay good price. VK4EF, QTHR. Tel: (07) 38 1803.

FR-100B/FL-200B — FRDX-400/FLDX-400 or **FTDX560** or similar. Also Eddystone GC rx EG-680. State price and condx to VK4CB, QTHR. Tel: (07) 202 6566.

VALVE TESTER, old valves (any condx) for collection. Old radios, JR colour TV circuits publications, Dick Smith 27MHz rx and tx tester for CB radios. VK4DY, QTHR. Tel: (071) 96 1186.

□ WANTED — WA □

ANY INFORMATION on Heathkit general purpose CRO, Model 10-21. Arthur VK6SY, QTHR.

□ FOR SALE — ACT □

COLLECTOR ITEMS: Crystal set, a good example of home-brew, probably 1920s vintage. Has varicouple honeycomb coils, square busbar, Hiz phones etc. WWII army telephones. One each JAP, Aust'set "F" MKII, teleset "D" MKV. Philips batt charger type 1016/1017, probably 1920s or early 30s vintage. Prices negotiable. Ted VK1AEP, QTHR. Tel: (062) 41 7376.

ICOM 740 fitted with 455kHz SSB and CW narrow filters. $850 ONO. Barry VK1ABR, QTHR. Tel: (062) 72 4172 BH or (062) 86 5652 AH.

□ FOR SALE — NSW □

FT-901 WITH MEMORY. CW filter and YD-148 desk mic. $795. FL-2100B linear amp. $300. VK2AAB. Tel: (02) 487 1428.

DECEASED ESTATE OF VK2ETV — Kenwood PS-30 power supply, Kenwood TR-7800 2m tcvr, Kenwood 530S tcvr, Kenwood VFO-230, Kenwood AT-230 ant tuner, Kenwood HC-10 digi world clock, Kenwood DM-81 dip meter, Kenwood MC-50 mic, Yaesu YM-38 mic. Clipsal brass key, Centron "Big Dummy" 1kW dummy load, National DR-48 comm rx. Black CTW all band ant. Rob VK2ERA. Tel: (02) 692 0886.

KENWOOD TR-2500 2m **FM** h/held complete with access. 240V charger, hel ant, LH-2 leather sheriffs case, PB-25 batt pack, BT-1 batt case, MS-1 mobile stand, SMC-25 spkr/mic, h/book. $395 ONO. VB-2530 25W linear amp to suit. $85 ONO. **TM-201A** compact **2m FM** 25W mobile tcvr complete with hand mic, boom mic, SP-50 mobile spkr, h/book. $385 ONO. All exc condx VK2AQW, QTHR. Tel: (02) 969 2160.

KENWOOD TS-130S TCVR — power supply, desk mic and headphones. $595 ONO. Fred Jenkins VK2BFJ.

KENWOOD TS-520S TCVR. Very good condx with CW filter, ext VFO, digi readout, mic and manual. $575 the lot. John VK2NV, QTHR. Tel: (02) 525 4652.

MICROBEE IC-32 COMPUTER — lots cassette software. All manuals plus working RTTY decoder. $375 post paid. Will exchange 2m all mode tx/rx. VK2BBD, Longford, Bendemeer, NSW. 2352. All mail answered.

OSCAR 10 ORBITAL DATA FOR YOUR OTH, 1 mth $10, 2 mths $18, 3 mths $25. Send SASE for sample printout. FT-243 xtals. 20 diff freq between 3.5 and 6MHz. $10. Ian VK2ZIO, QTHR. Tel: (02) 680 2112.

SHACK CLEARANCE. Hustler LBTV with 80m resonator. $65. Kenwood TR-2200G 2m, 12 ch and MC-10 mic $90. MFJ-410 professor Morse $110. Random CW and keyer $110. MK-701 sideswiper CW paddle $25. Denis VK2AOO. Tel: (063) 62 5977.

SWAN 240 SSB TCVR — 80, 40, 20m with ext VFO, power supply and spkr. Manual included. $150 ONO. Comms rx DX-150A, 0.5-30MHz. Ex condx $100. Calculator Hewlett Packard HP-38E with power supply. Faulty display. Also 2 incomplete AWA MR-6A low band tcvrs with circuit diagram. What offers? Bruce VK2BHW. Tel: (02) 46 3706.

□ FOR SALE — VIC □

IAMBIC KEYER — MFJ-408 delux, as new. Full Iambic or semi-auto modes. 8-50 WPM, speed meter, weight control, practice side-tone. $150. Graeme VK3BGH. Tel: (03) 870 4371 AH.

IC-251A — 144MHz all mode tcvr. 12 mths old and little used. Mutek frontend for IC-251A, new and boxed. Belcom 70A 432MHz tcvr, all mode base station. Have worked 67 countries on Oscar 10 with this rig. VK3XEX, QTHR.

ICOM IC-560 6m FM/SSB/CW tcvr $350. Yaesu FT-901D tcvr, fitted with AM/CW filters, 10/24MHz WARC bands $720 ONO. Ten Tec Argonaut 509 tcvr $240 ONO. Icom IC-290A 2m FM/SSB/CW tcvr $350. Trio 9R59D rx $80. Yaesu FRV-7700 118-130, 140-150, 50-59MHz converter $75. Helray Mk11 peak power indicator. 200W model $20. Hi-Mound HK-702 Morse key (marble base) $25. 2 Type 15 teletypes $25 each. Creed 7B teleprinter $15. Swap 4CX350A valve for 4CX250B valve or sell for $20. Eric VK3BXA, QTHR. Tel: (057) 65 2384.

ICOM 22S. As new, no mods. $200. Hy-Gain TH3 jnr. Good condx $170. VK3EC, QTHR. Tel: (03) 541 2598 BH.

SHACK CLEARANCE. Superb DX rig. FT-102 as new. 1.8 kHz SSB narrow filter. Full workshop manuals. Will demo $750. FT-101ZD as new, used only as stby rig. Full shop manuals $550. Yaesu YM-38 desk mic $30. Shure 444 desk mic $75. Barry VK3XV, QTHR. Tel: (03) 527 4029 after 5 pm.

SYSTEM 80 COMPUTER — w/expansion unit, monitor, 2 disk drives. NEWDOS-LDOS-many programmes. $900. John VK3WZ. Tel: (03) 557 1771 AH.

□ FOR SALE — QLD □

ICOM 502 in good condx with h/book. Home brew transverter 52-144MHz. Lin amp 25W, 52MHz. Lin amp 25W 144MHz. All transistorised, neat clean units. All for $225. New 866A valves. Many others new and used. Enquiries welcome. VK4ZAL, QTHR. Tel: (07) 269 5832.

YAESU FT-7B. Less than 2 hrs tx time. Ideal for novice ot mobile. No mods. 13.8V. $400. VK4UQ, QTHR. Tel: (075) 45 1708 evenings.

□ FOR SALE — SA □

COMPUTER — TRS 80 — MOD 1 — LEV II — 16k and monitor. Ex condx $250. Siemens printer in ex condx $60. Self contained portable (typewriter k/b) CW generator FIFO mem/buffer. 5-60 WPM $120. FRG-7 gen com rx $250. All ONO. Sundry components (new and used) all in good condx with other items. Tom VK5NTJ. Tel: (08) 356 3078.

PHILIPS FM-321 70cm **FM** tcvr. 80ch mod. Remote control and rx preamp fitted. $200 ONO. Good condx Trevor VK5ZTJ. Tel: (08) 254 7876.

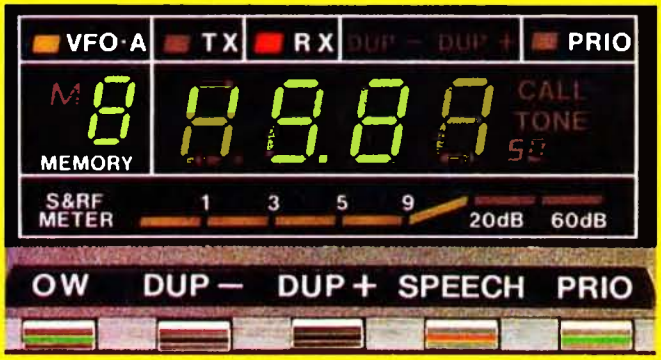
ICOM IC-27A

The Most Compact 2 Meter Mobile!

Now ICOM presents an important breakthrough in two-meter mobile communications, the IC-27A. The smallest two-meter mobile available, the IC-27A measures only 38 millimeters high by 140 millimeters wide. As an added bonus, the IC-27A, through ICOM engineering, is able to contain an internal speaker to provide ease of mounting and make the unit one small compact complete package.

25 Watts. In such an incredibly small package, the IC-27A is able to provide 25 watts of output power. And even though the IC-27A is the smallest available two-meter mobile unit, it has sacrificed none of the features found in fully featured VHF mobiles.



32 PL Frequencies Option. The IC-27A is available with optional 32 PL frequencies ready to go and controlled from the front panel knob. Each PL frequency may be selected by the main tuning knob and stored into memory for easy access along with frequency.

10 Memories. The IC-27A has 10 tunable memories available to store receive frequency, transmit offset, offset direction, and PL tone.

Memories are backed up by a lithium backup battery, which will store memories for up to seven years

Speech Synthesizer. As an added plus, the IC-27A features an optional speech synthesizer to verbally announce the receiver frequency of the transceiver through the simple push of a button. This allows the operator to hear what frequency he is operating on without looking at the transceiver.

Scanning. Included with the IC-27A is a scanning system which allows scanning of memories or scanning of the band. Each memory may be scanned between programmable limits

Priority Scan. Priority may be selected to be either a memory channel or a VFO channel. By using sampling techniques, the operator can determine if a frequency he is interested in using is free or busy

Microphone. Each IC-27A comes complete with a microphone which includes a 16-button touchtone pad for access to your favourite repeater or for dialling through an autopatch

THE ICOM 27A is a superior piece of amateur equipment engineered and built by ICOM to provide superb performance in the mobile radio environment. See the IC-27A at your local ICOM dealer.

The IC-27A comes complete with microphone. Note that the microphone shown is an optional model

SPECIAL FEATURES

TECHNICAL FEATURES

REGULAR FEATURES

This month's magazine features an exclusive article, written by Ian VK5QX, about Australian Over the Horizon Radar. Ian had to receive special dispensation with the article and explains how it works and what it is used for. Included are some marvellous colour photographs which we trust will not lose too much impact when they are printed in black and white. See p8.

It is sad to report the untimely passing of Peter VK3CIF on the 4th March. Peter was Secretary/Manager of the WIA for many years and since his retirement has contributed many titbits to the How's DX column, the most recent being in December page 46. Peter was a much travelled man and held many call signs. Deepest sympathy is extended to Peter's wife, Barbara, and children. (BKP)

DEADLINE

All copy for June 1985 AR (including Hamads, columns) must arrive at PO Box 300, Caulfield South, Vic 3162 at the latest by midday 22nd April 1985.

KENWOOD

THE NEW GENERATION IN HF TRANSCEIVERS

TS-940

NOW WITH AM – FM – SSB – FSK – CW
KEYBOARD ENTRY – OPTIONAL VOICE SYNTHESIZER

TS-43X HF TRANSCEIVER

The most versatile transceiver of the 80's.

TRIO-KENWOOD (AUSTRALIA) PTY. LTD.

NEW 2m FM HANDHELDS from YAESU

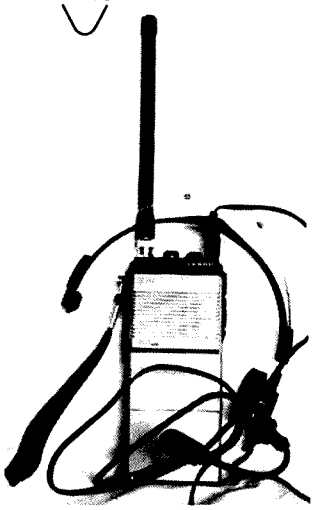
YAESU

bail

FT203R

2.5 watt
144-148 MHz

VOX operation with optional YH-2 Headset.



Thumbwheel Channel Selection.

PA-3 DC/DC Car Adapter/Trickle Charger (option)

FT209R

3.5 watt/350 mW

FT209RH

5 watt/500 mW

Microprocessor controlled

10 Memories

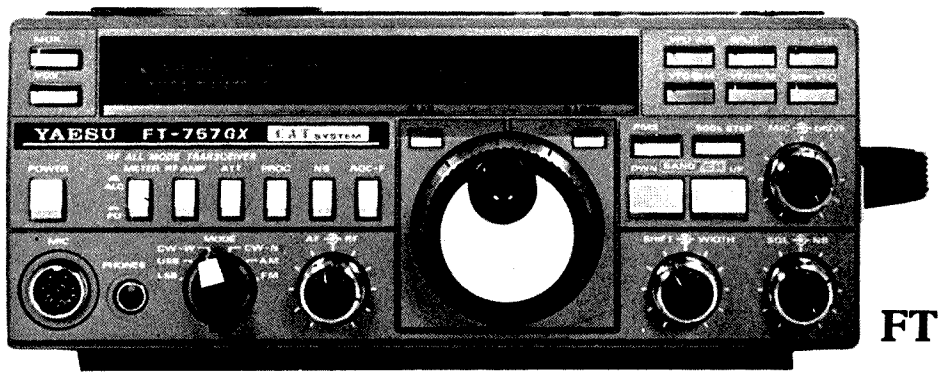
Reverse Repeater

Power Saver to extend battery life

VOX operation with optional YH-2 Headset

PA-3 DC/DC Car Adapter/Trickle Charger (option)

The HF Allmode Transceiver you have been waiting for — from **YAESU**



FT-757GX

100 watts Output PEP/DC — 25 watts AM Carrier — 13.4 volts DC (19 amps for 100 watts output) — Weight 4.5 kg

FEATURES:

- *Dual VFOs and eight memories*
- *Programmable Memory Scanning*
- *SSB AM-FM Modes Standard*
- *Squelch on all Modes*
- *Full Break-in CW*
- *Accessories installed include 600Hz CW Filter, iambic keyer with dot-dash memory, marker, IF shift and width. N.B. (only option is CAT interface to extended computer control)*
- *High performance General Coverage Receiver*

a word from your EDITOR

CRYSTAL BALL

We have looked briefly at the radio world in 1910, the year of our Institute's foundation. We have touched lightly on the tremendous expansion of radio and electronics up to this, our 75th Anniversary Year. Now, in this historical light, can we guess what may evolve over the next 75 years.

Many have tried to foretell the future, before and since Tennyson wrote, over a hundred years ago, "*For I dipt into the future, far as human eye could see . . .*". Some have been remarkably successful. Arthur C. Clarke in 1945, before transistors or any but extremely sub-orbital rockets, suggested the geo-synchronous communications satellite. Forty years later, the world's communications largely depend on such satellites. Real-time international colour TV, complex computers exchanging data at incredible speeds, Smith chatting to Jones 3 continents away. Parking space 36,000 km above the Equator is the most valuable real estate "off Earth".

By 2060, we may expect space travel within the Solar System to be frequent, if not scheduled. There will be a flourishing human community on the Moon, and space stations in many orbits in between, serving all kinds of constructional and technological purposes. There may be a colony on Mars, and we may have begun to cool the climate of Venus. Communication with intelligent life elsewhere in the Cosmos may be a reality. Instantaneous electronic translation will have unified languages. Nuclear fusion will be the major source of energy for all, and the problem of radio-active waste will have been solved.

But all of this may never be, unless, as Tennyson hopefully proclaimed, "*. . . the war drums throbbed no longer, and the battle flags were furled. In the Parliament of Man, the Federation of the World.*" The terrible alternative is that because of national misunderstanding, jealously and hate, the human race may have obliterated itself in nuclear war.

We, the radio amateurs of the world, may well play a key part in saving this planet from destruction. Unique among communicators, we are ordinary citizens of all countries, able at will to reveal ourselves to each other as sharing the same interests and aspirations and a common humanity. May we hope that there will never be a 150th anniversary of the WIA as a sovereign national body, but that by then a fully international World Society will have united the interests of all mankind.

In the meantime, all Australians amateurs should be members of the WIA. In every aspect, nations must reflect the wishes of *all* their people, before a global society can unite all nations. There may be a future for "lone voices", but not when they are "crying in the wilderness". Most of you, reading this, are members. But if not, join us and play your part in the Federation of the World!

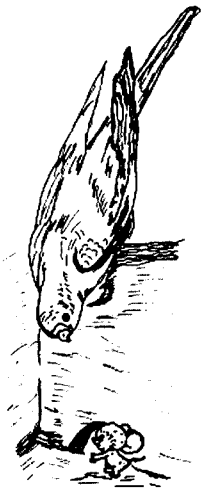
QSP



WHAT IS A RADIO AMATEUR?

This is a very difficult question and after serving two years as the Divisional President for VK1 I am still unable to answer it.

From one end of the spectrum of amateur radio we have the amateur who spends a considerable amount of time and money building and experimenting with equipment. At the other end we have the amateur who gains enjoyment from his hobby by chatting with amateur friends, either within Australia or overseas.

There are many facets of amateur radio — CW, VHF, HF, RTTY, Contesting, Seeking Awards, ATV — to name but a few. No matter which part we enjoy we should always be aware of our fellow amateurs point of view.

With our hobby we claim we can communicate all over the world but *do we communicate?* I think not!

There have been times when differences of opinion on various subjects have arisen between amateurs which, with better communication between them, could have been solved amicably.

Let us therefore — in our 75th Anniversary Year — resolve to communicate points of view within Clubs, Groups or Divisional Council, instead of complaining when decisions are made.

Without communication the many volunteers who work untiringly for your benefit in the hobby cannot be expected to perform as you would like.

COMMUNICATE AND BE HEARD!!

Alan Hawes VK1KAL
President VK1 Division
AR

CONGRATULATIONS RECEIVED

A cable has been received from JARL wishing the WIA well for the 75th Anniversary of its founding. The cable reads:

On the occasion of the 75th Anniversary of the founding of the Wireless Institute of Australia, I wish to express our heartiest congratulations on behalf of the JARL with best wishes for the success of the celebration and all other events.

Shozo Hara,
President of JARL.

WIA Seventy Fifth Anniversary News

BOOK PACKS

As announced in the March issue of AR, the Institute is making Book Packs available for presentation to school libraries.

Since the announcement in March the VK2 W1A Education Service has joined with the Federal body and as a result of this we are combining resources and are now in a position to offer a third book pack for $15 which will enable smaller clubs to participate in this scheme.

As 1985 has been proclaimed the Year of Youth, an event which is sure to gain more attention than World Communications Year, what better time to bring our pastime to the attention of the youth of Australia.

We would encourage you to get together and make a presentation pack of books on our hobby available to your local school or college.

SEVENTY FIFTH SUBSCRIPTION RENEWALS

As announced in the January issue of Amateur Radio on page 5, find below the second listing of members who have qualified for the gift packs and draw.

D Gibson VK1DG, K Pyett VK1NDK, D Thorne VK7MR, J Oliver VK7JO, J Davis VK7OW, B Wilson, VK8UW, S McNamara VK5ZH, C Judd VK5HQ, K Lord VK5NKN, D Shinkfield VK5BDS, D Robb VK5NDX, J Andersen VK5ZFO.

C Nielson L20065, B Connolly VK2BJC, P King VK2QK, J Crisp L20278, L Christensen VK2BLZ, A May VK2DHF, G Oates VK2DJA, G McLeod VK2FF, M Gunning VK2XAV, D Foster VK2VE, B Wade VK2AXI, P Malaney VK2AXU, N Cosby VK2ZBT, M Austin VK3DPG, R Magilton VK3DRC, D McManus VK3NG, P Lee L30172.

WGS Smith L30550, K Benson VK3ZGX, M Dods VK3ACX, J Martin VK3DEK, N White VK3NZ, P Milne VK3BEJ, C Baker VK3BXS, B Boyce L30425, A Woodward VK3BCJ, G Eves VK4JGE, V Lamprecht VK4MK, A Kearney VK4UH, M Downing VK4FX, G Cullen VK4NNA, G Dew VK4BOG, C Everdell VK4ZAO, K Aumann VK4NKR, L Buchbinder L60118.

W McGeogh VK6WL, J Lampert L60266, Mrs P Bradshaw VK6YF, J Sime VK6HN.

The Seventy Fifth Anniversary Sub-Committee, at its meeting in the Federal Office on the evening of the 21st February, supervised the selection of the draw for the Citizen Quartz Clocks and the recipients are listed below.

RW Elliot VK1ZAH, G McLeod VK2FF, FW Tam VK2TAM, J Martin VK3DEK, AL Ward VK3DAW, C Everdell VK4ZAO, J Jones VK4QP, HR Hodgson VK5AP, K Lord VK5NKH, P Bradshaw VK6YF, FA Page L60354 and J Oliver VK7JO

The clocks and gift packs will be dispatched to the members listed shortly.

FEDERAL SEVENTY FIFTH ANNIVERSARY DINNER

This function, as previously announced in earlier editions of AR, will be held at the Southern Cross Hotel in Melbourne.

Mr Richard E Butler, Secretary General of the International Telecommunication Union, has confirmed with the Federal Secretary that he will be attending. As many members will be aware, Dick Butler is an Australian holding this high ranking position in Geneva.

Other personalities have also indicated agreement to attend.

Members are again reminded that any who wish to attend this function should register their interest with the Federal Secretary. Again to remind you, space is limited, but a percentage of tables have been reserved for members who wish to attend this important function.

For out of state members negotiations are taking place with the internal airlines to obtain concession fares for this function. Details of the result of these talks will be printed in a later edition of AR.

WARD — WORLD AMATEUR RADIO DAY

The 18th April 1985 is World Amateur Radio Day and this day is proposed as an activity day for the 10, 18 and 24MHz bands.

During this day these bands will be monitored by executive members and by your Divisions. A random selection of call signs heard on these bands during the twenty four hours will be placed in a draw for commemorative momentos.

MEMBERSHIP DRIVE REMINDER

As announced in the January edition, members are reminded that proposers of new members will receive small gifts during this anniversary year.

There is also the opportunity for each seventy fifth new member to receive a presentation clock for their shacks from the Federal Office.

Also the special limited edition Seventy Fifth Anniversary Membership Certificate is being issued to new members in this anniversary year.

CHRISTMAS ISLAND

Dennis Hardie VK9XZ/VK6CZ
Box 99, Christmas Island, WA. 6798

Christmas Island is a small island in the Indian Ocean at 105.6 degrees east by 10.5 degrees south and is about 2300 km NNE of Perth, WA. The Island was sighted in 1643 on Christmas Day by Captain William Mynors of the East India Company. A party from the Cygnet is reported to have landed in 1688. Later, members of the Clunies Ross family visited the island to cut timber for boat building.

L to R: Charles VK9ZAB, Dane VK9XD, Ron VK9XA, Tony VK6ATI, Ron VK9XJ, Lindsay VK6LJ. Front: Craig VK9XW and Dennis VK9XZ.

In 1887 an expedition from HM Egeria collected the first phosphate specimens. Then in 1888 the Island was annexed by Captain W H May of HMS Imperieuse as part of the British Dominions and placed under the supervision of the Straits Settlement's Government for administrative purposes. Later a small settlement was established by Mr Clunies Ross and in 1891 he and Sir John Murray were granted a 99 year lease of the Island. The lease was transferred to the Christmas Island Phosphate Company Limited, with Murray as chairman and shares divided between the Clunies Ross and Murray families. In 1900 the Island was incorporated with the Settlement of Singapore and Chinese phosphate workers were recruited to the Island. In 1919 the railroad across the Island's central plateau to phosphate deposits in the south was completed.

The Island was occupied by the Japanese from 1942 to 1945. They were unsuccessful in their attempts to export phosphate during the war years. In 1949 the British Phosphate Commissioners became the managing agents for the Christmas Island Phosphate Commission, a joint enterprise of the Australian and New Zealand Governments.

On 1 January 1958 the Island was gazetted a British Crown Colony then finally on 1 October 1958 it became an external Territory of the Commonwealth of Australia. On 24 June 1981 the Phosphate Mining Company of Christmas Island Limited, a company with limited liability with the Australian Government being the only shareholder, became the successor organisation to the British Phosphate Commissioners.

Lastly and most importantly on 27 November 1984 Christmas Island saw its most significant achievement — the greatest number of amateur radio operators ever on the Island at any one time. For quite some time there had been three operators, Craig VK9XW, Dane VK9XD and Ron VK9XA then Charles passed his exam to become VK9ZAB. November was to see the arrival of two more amateurs who were to work for the mining company. They were Dennis VK9XZ and Ron VK9XJ but on the day that Ron arrived there was a surprise. Tony VK6ATI had been on the Island for a week and the pilot of the Airlines of Western Australia F28 was Lindsay VK6LJ which made a total of eight amateurs on the Island, for a short time anyway.

Since the arrival of the two new amateurs there has been an increase in activity on air, especially to the mainland, however the conditions are a little primitive at the moment as all are operating off 80 metre dipoles through antenna tuning units. In the near future there should be a dramatic improvement as towers are under construction which will mean that better signals will be heard from this beautiful tropical island in the Indian Ocean. If you hear Christmas Island then please call in, we will try to give as many people as possible a QSL card from VK9X. **AR**

HIGH FREQUENCY RADAR AND THE AUSTRALIAN AMATEUR RADIO OPERATOR

Ian Hunt,

Electronics Research Laboratories,
Defence Science & Technology Organisation,
Department of Defence,
Box 2151, Adelaide, SA 5000.

All amateur radio operators are conversant with the term 'propagation' and most of them have some understanding of the subject. It is likely that candidates for amateur radio certificate examinations will encounter questions designed to ensure some knowledge of radio propagation. This knowledge may at first be small, but when an operator expands their interests into more serious aspects of communicating and experimentation they find that a more detailed study of what propagation is about can help. Such an understanding can make all the difference between success and failure.

Many amateur radio magazines regularly publish predictions for 'Ionospheric propagation' for various paths of interest. These refer to the expected way in which radio signals will travel via the ionosphere to be reflected or refracted so as to return to the surface of the earth at the location desired. The predictions which appear in Amateur Radio magazine are provided on the basis of data gathered by the Ionospheric Prediction Service here in Australia. This service is provided by the Commonwealth Department of Science with its headquarters located in Sydney. The service even provides up-to-date information in the form of recorded announcements on a Sydney telephone number. The American National Bureau of Standards provides a similar service via their Time and Frequency Standard stations WWV and WWVH which operate continuously in the high frequency portions of the radio spectrum.

As one learns about propagation and how it occurs it becomes apparent that radio signals can be reflected from various objects and under varying conditions and that sometimes rather strange effects may be noted. For many years amateur radio operators, and particularly professional scientists have studied these effects both to increase knowledge and to use the effects to good purpose Most people are aware of the use of reflected radio signals for the purpose of 'radar'. The most obvious uses are the tracking and positioning of aircraft for safety purposes, the location of other ships at sea so as to avoid collision and even the rather unpopular use of the effect to detect speeding drivers. Most of these uses involve frequencies in the higher UHF and microwave regions of the spectrum.

At high frequency, particularly on those bands regarded as best for DX operating, we soon discover that the method whereby our signals travel to distant parts of the earth is rather complex. We begin to hear terms such as Sunspot Number and Eleven Year Cycle Enquiries soon elicit the fact that these terms refer to the effects which the sun has upon those layers of the earth's atmosphere known as the ionosphere Around the earth, at varying heights ranging from 80 to 800 kilometres are layers of atmosphere which become ionised due to the effects of ultraviolet radiation from the sun. These layers are fairly well defined and each has a central region of relatively dense Ionisation with density tapering off both above and below.

It is not the intention of this article to give a detailed description of how the ionospheric layers work. Suffice to say that the subject is very interesting. Much can be learnt about the ionosphere by reference to handbooks such as the ARRL Handbook and by reading back issues of Amateur Radio, QST etc, and reference to learned papers presented in various widely available scientific journals.

It will be sufficient, although a simplified approach, to regard the ionosphere as a large mirror which reflects radio signals. The reflecting capability of this mirror does not remain as stable as we perhaps would like and this leads to a number of problems when it comes to the ability to bounce a constant signal off this distant mirror back down to the earth's surface Much experimentation has been conducted over the years addressed to these problems. The references at the end of this article will give the reader some insight as to the nature of these experiments. As a result it has been discovered that the ionosphere as a reflecting medium is suitable for radar work at High Frequencies. For example the author was some years ago involved in the operation of a sounder which swept through most of the frequencies in the HF portion of the spectrum and made continuous measurements, on virtually a twenty-four hour basis, for a period of eighteen months. The transmitting equipment for this experiment was located in the north of South Australia and the receiving gear located at Broome on the north-west coast of Western Australia. The system employed used low power and very narrow bandwidths and was such that other users of the HF spectrum either were not aware of its existence o· would not be troubled by the momentary appearance of the signal as it passed by the frequency they were using. This ionospheric sounder was one of many which have operated continually all over the world gathering various types of information as to just what our somewhat fluid reflecting mirror is doing. Work to develop radar systems using the HF portion of the spectrum is of great interest to the scientific and military sectors of many nations as such systems have a great potential for surveillance of wide areas of land and sea at great distance Further comments on this will be provided later in this article

Any operator who has used HF receiving equipment for a reasonable time will have encountered, what has been dubbed by amateurs as, the 'Russian Woodpecker'. This nickname for a most objectionable interfering signal describes well the harsh repetitive tapping sound produced by the signal which emanates from one of apparently several installations at which HF Radar experiments are being conducted by the USSR. You may wonder why it is that you hear such signals here in Australia so distant from their source This may be because such radar systems are intended to be capable of seeing objects at such large distances. The nature of the radars referred to earlier, working at UHF and above, is such that detection can only be carried out over a fairly short range (ie to the horizon) despite the use of high power and large high-gain antenna arrays and dishes at those frequencies. In connection with the HF radars in use the terms Over-The-Horizon-Radar (OTHR) and Over-Horizon-Detection (OHD) have come into common use

Following the World Administrative Radio Conference (WARC) held in 1979 the Wireless Institute of Australia Representatives reporting on the Conference to the Annual Federal Convention of the WIA, in Melbourne referred to the Russian Woodpecker. Complaints have been formally made by various nations through WARC procedures and the USSR delegation replied to the effect that the signals complained of were simply those produced by a system studying Ionospheric propagation. Other countries were stated as being involved in similar experiments and the USSR intended to continue these scientific investigations until such time as it no longer saw the need.

It is no particular secret that some other countries have in fact been carrying out studies for the development of Over-Horizon-Radars, however it certainly does not seem that experiments by these other countries, included amongst which are our own country, Australia, as well as the USA and the United Kingdom, have created any interference along the same lines and to the same extent has occurred with the very much disliked 'Russian Woodpecker'.

Here in Australia we have only one OTHR Facility. This is located in two sections, for fairly obvious technical reasons. Both are in the general area of Alice Springs in the Northern Territory. The receiving site is in an area known as Mount Everard and fairly close to Alice Springs with the transmitter site at the location of Harts Range some 100 kilometres to the north east. Separation of the sites in this manner overcomes the difficulties of having sensitive receiving equipment close to powerful transmitters.

An extremely good description as to just what was being done in the USA in this field was provided in an article by O G Villard published in QST magazine for April 1980. In general the description of the methods used by the USA explained in that article also applies to the methods adopted by Australia particularly in regard to interference to other services.

I well remember the subject of interference from the Russian OTHR being discussed at a Federal

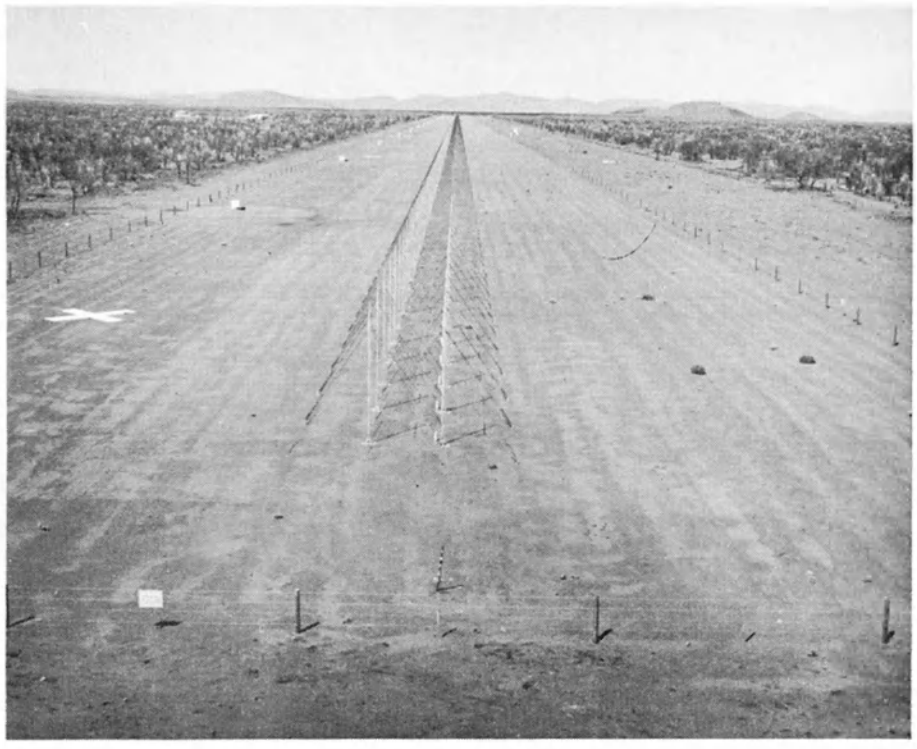
Convention of the WIA. One theory was put forward that by placing your amateur transmitter on the frequency where the signal appeared to be loudest and keying your signal on and off at the same rate as the pulsing 'Woodpecker' signal you could cause interference to the radar receiver and thus cause the operators of the 'Woodpecker' to change to another frequency. However this suggestion was not accepted as a recommended practice as reason fortunately prevailed. Anyone familiar with signal processing methods in use today would realise almost immediately that with advanced modern techniques such interference could often be easily discerned and separated from the required signal. It was also pointed out that it was not a good approach to try and fight pollution with pollution. The situation could easily exist where, even though the 'Woodpecker' intertered with you, it might not do so to some other operator some distance away. Your deliberate interference could however in turn present a problem for him where otherwise he would have no trouble. So, we should stop and think carefully about what we are doing. However back to the matter of our own OTHR.

The Australian OTHR project was given the name Jindalee and was announced by the then Minister for Defence, the Honourable Lance Barnard MP, on 11th April 1974. Around 1978 the first (Stage A) portion of the project was completed. This stage had proved the approach adopted and had successfully tracked such targets as commercial aircraft flying along the air route from Singapore Much data was also collected from associated experiments on the various conditions of the Ionosphere

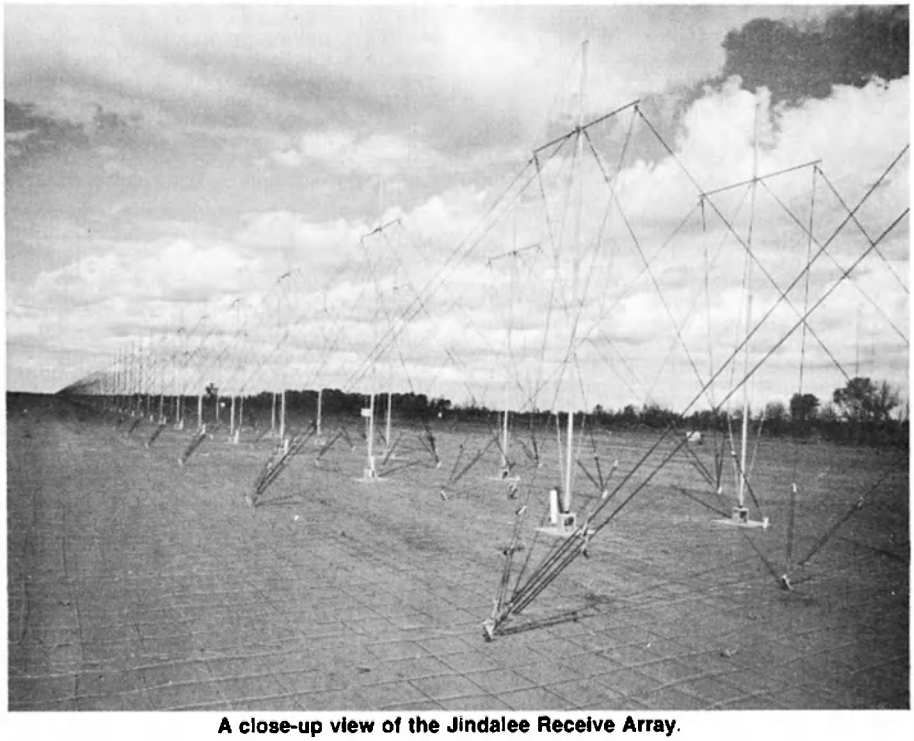
Following this encouraging success the project was then expanded (Stage B) and a much larger receiving antenna array was installed which has the capability of beam steering. Such an antenna system is certainly spectacular to see as it comprises a total 486 pairs of broadband monopole antennas with each pair phased and sitting on top of a very large ground mat. This receiving array stretches over a distance of 2.8 kilometres.

The pairs of monopoles (or aerial elements) feed via very high quality coaxial cables to underground bunkers where groups of elements can be controlled through sets of many relays which switch in and out additional phasing lengths of cable With all this controlled by computers it can be imagined the complexity required to provide the switching and phasing apparatus to be able to steer the radar receiving beam to aim in the direction necessary to receive a particular reflected signal. The cables and switching equipment are installed underground as this approach undoubtedly assists in stabilising the system temperature. Also running cables and placing equipment underground improves the shielding of equipment and thus produces an advantage both regarding normal reception and pick up of unwanted signals. The signals which are received are generally at very low level. This is understandable since the wanted signals are those sent out by the transmitter, reflected by the ionosphere back to earth at a distance of perhaps 3000 kilometres away and then scattered again from the earth's surface or target object to arrive back at the receiver site again via the Ionosphere These signals are called Back-scatter signals and from this comes another term also used to describe the radar, that being an Over-The-Horizon, Backscatter System. (OTHB).

The power output of the transmitter located at Harts Range is not officially disclosed, although one publication has given it as being in the order of 400 kilowatts This transmitter feeds into an array of vertically polarised log periodic antennas. These antennas, like those at the receiver site, are aimed generally north-west, the beam being again steerable in azimuth. The transmitted signal covers an area dependent upon the height of the Ionosphere and the frequency in use Transmitter parameters can be altered by control from the receiving site VHF links are provided between the transmitting and receiving sites for control purposes. The system allows the receiving beam to be steered so as to only receive



Jindalee Receive Array.



A close-up view of the Jindalee Receive Array.

or look at signals coming back from a small sector of the area being illuminated by the transmitter. The area under total surveillance illuminated by the transmitter is known as the radar 'footprint'.

While all the action described above is going on, the received signals and the data they contain are being analysed by the powerful computers associated with the receiving site Frequency shifts on the returned signals caused by targets which are moving are known as doppler shifts, and the amount of shift gives an indication of the radial speed of the target. Thus the return signal and its shift for a large and fast commercial aircraft will be fairly easily detected as against the return from a small ship or other surface vehicle.

To make the most effective use of the Ionosphere a backscatter sounder examines the HF spectrum continuously to determine the state of propagation conditions and from the information thus obtained to decide the best operating frequency for the

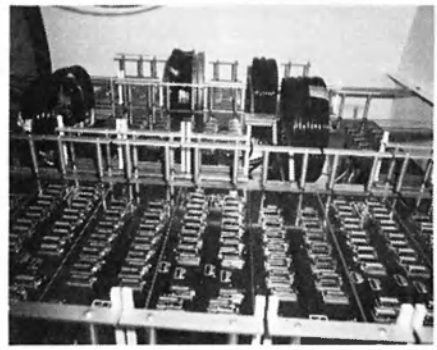
Entrance to an underground bunker.

transmitter. Concurrently a frequency surveillance system provides a continuous monitor of HF spectrum occupancy. This system ensures that interference is not suffered by other users, as the transmitter is barred from operating on any occupied channel. The computer systems also contain information of other frequencies on which it is required that the transmitter must not operate. I can state with certainty that such frequencies include the whole of the HF amateur radio bands. This fact, as well as the information so far given, should make it obvious that statements that OTHR signals emanating from the Jindalee system are observed in the amateur bands would be ill advised, alarmist and irresponsible in nature. The same can be said of such uninformed comment referring to 'portable' Jindalee systems. Many experiments, such as those conducted with the Jindalee system, and other projects associated with ionospheric studies which employ wide frequency ranging equipments in the HF region have been carried out and in fact produced very little, if any, harmful interference over many years. Most programmes of this nature are sponsored or carried out by Government organisations and Universities. Such agencies, particularly in the Western world, would be very sensitive to any suggestions that they were likely to cause any interference to essential and emergency services operating anywhere in the radio spectrum let alone on internationally allocated HF portions of the spectrum.

The modulation system for Jindalee is such that it does not provide rapid rise and fall times with pulses as does the 'Woodpecker'. It would seem unlikely that an observer would confuse one with the other. I have heard of no word of complaint from any amateur radio sources about Jindalee operations to date during either Stage A or Stage B.

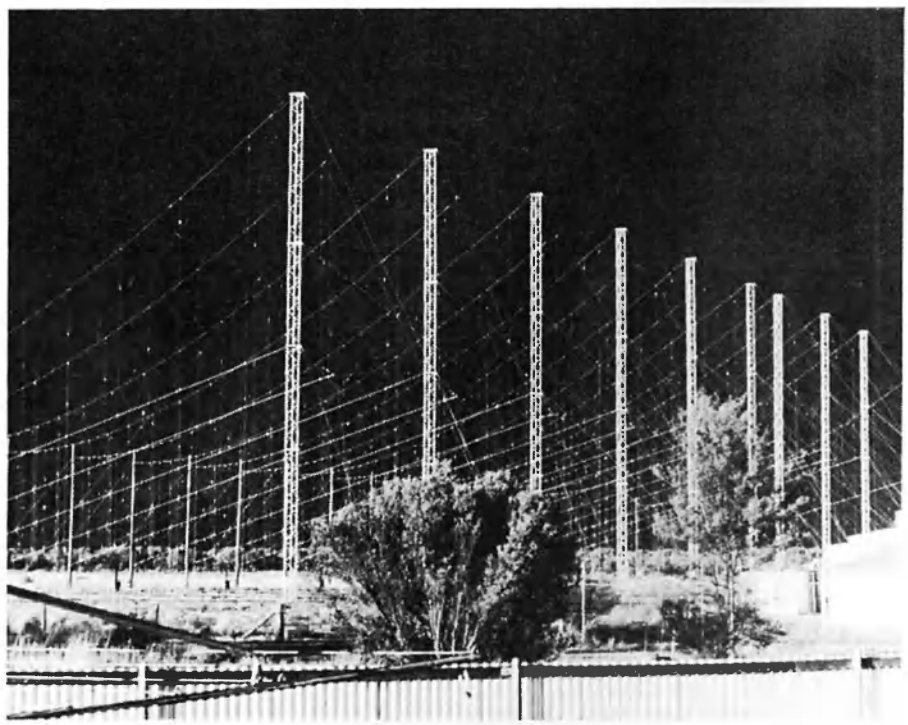
Many of the uses of OTHR would seem to be associated with defence work, however there are probably other benefits which can be realised. Surveillance is not only necessary for military purposes. Observation of aircraft on commercial routes can be of great importance from a safety point of view. Very early in the development of the Jindalee concept, referring to a watch on our Australian coastline, the possibility was suggested of detecting unauthorised flights such as by drug-runners crossing our shores by aircraft and landing on small hidden or disused strips.

Another aspect of great interest is the fact that waves travelling on the surface of the ocean can be detected by such radar systems. This could assist with the safety of shipping and also in connection with the detection and tracking of tropical "lows" and cyclones. An increase in the knowledge of the characteristics of the Ionosphere and its behaviour resulting from the associated experiments could be of benefit to all who use radio for long haul communication. The techniques involved in dealing with detection of small signals and other problems such as cross-modulation free front ends for sensitive receiving gear as well as the use of broadband radiators and active receiving antennas are other spinoffs which can benefit our society, including amateurs, in many ways. Computers are playing an ever increasing part in the handling of our communication systems and in controlling the units which we use even in the amateur radio shack, so more information may become available to assist in updating and improving our technology in general.



Relays and Phasing Cables in Bunker.

In conclusion just a little more information regarding our own Australian OTHR Jindalee. The design and development of the system has been mainly carried out by the Electronics Research Laboratory which forms part of the Defence Research Centre, located at Salisbury, South Australia. It is rather interesting to note that from its inception there have been a number of workers who are also amateur radio operators on the project technical team. I am sure that in their own way they have made a useful contribution to this project and at the same time have gathered knowledge which they have put into practice in their pursuit of our hobby. Much of this knowledge will be passed on to others of our fraternity. Also, this project has, to a very large extent, made use of Australian industry and materials locally available.



The Transmitting Aerials.

I am indebted first of all to the Superintendent of Radar Division, Mr Lester Soden for his advice and encouragement in the preparation of this article I wish to acknowledge the benefit of being able to talk in general with various professional and technical officers (who I regard as both friends and colleagues) with whom I have been associated both in connection with Project Jindalee as well as some of the preliminary projects and other activities far removed from this field.

Approval by the Director of the Electronics Research Laboratory, Defence Research Centre, Salisbury for publication of this article is acknowledged.

Should readers wish to view a video-tape which provides a good background to better understanding of Project Jindalee I am sure that the WIA Federal Videotape Co-ordinator would be very pleased to accept requests for a copy of the videotaped lecture which was given to a Divisional monthly meeting of the South Australian Division of the WIA by a member of the Jindalee Team from the Electronics Research Laboratory.

I trust that this article has perhaps given a small insight into just what is occurring in the field of High Frequency Radar in Australia and that it will also allay some of the unnecessary fears about its impact upon amateur radio activities. I must however add that, as there are a number of aspects associated with Project Jindalee which are classified for reasons of national security, I would not be prepared to enter into a discussion of the subject on the air via amateur radio. Should readers wish to ask questions of a reasonable nature I would be prepared to receive any letters and endeavour to reply in writing as and when time and need permit.

ABOUT THE AUTHOR

Ian J Hunt VK5QX has held an amateur licence for 26 years. His previous callsign was VK3ZX. He is an Honorary Life Member of the Wireless Institute of Australia and has served on both the Victorian and South Australian Divisional Councils. He is a Past President of the South Australian Division and was also a Federal Councillor. He is a keen contest operator and DXer. Ian says that he is only five countries off having worked 300 on one band, one mode since 1981. He has been employed by the Federal Government since 1954 following service in The Royal Australian Signal Corps. He was stationed at Woomera for a period of seven years and whilst there worked at the NASA Satellite Tracking and Data Acquisition Network Station at Island Lagoon as well as at the Missile Range where he was involved in Telemetry work. He is currently a Technical Officer and employed with the Electronics Research Laboratory, Defence Research Centre, Salisbury, South Australia.

THE VK6NMS HALO

(A 1 wavelength loop)

© 1984

"Rev", VK6NMS,

Box 261, Mandurah WA 6210

I am prepared to wait for my harp, but I thought I would try to make a halo for myself that could be used until (if ever) I qualify for a smaller, mode-to-fit variety.

SHAPE SELECTION

There is common accord that the best shape for a loop antenna is the one that encloses the greatest area for a given perimeter. The practicalities of construction limit the number of possible shapes to several simple geometric figures.

If we take a perimeter of 10 metres we find that an equilateral triangle embraces 5 square metres, a square 6 square metres and a circle 8 square metres. Expressed in ratios this is 1, 1.2, and 1.6 as illustrated Fig 1.

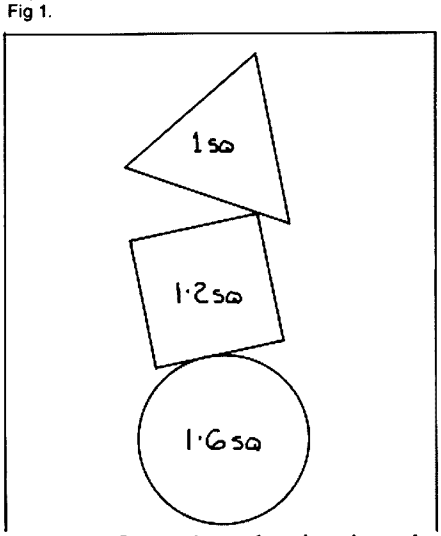

Figure 1 — Comparison of enclosed area for different shapes with the same circumference.

Delta loops and quads have their devotees whose signals boom around the world in cascading cacophony, but why can't a purist have a "halo".

DESIGN DETAILS

You could do as I did and read a text and follow the formulae. For 28 MHz the appropriate sizes are:

Reflector 11.0 m
Driven ele. 10.68 m
Spacing 1.3 to 1.5 m

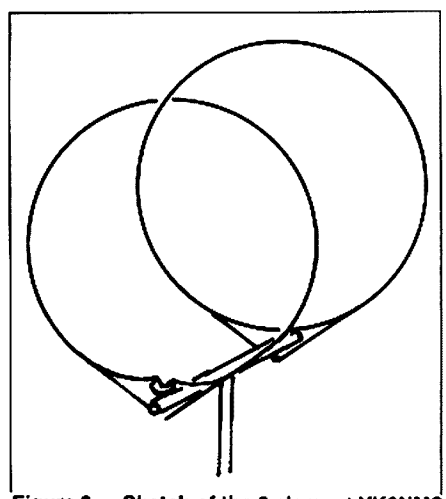

Figure 2 — Sketch of the 2 element VK6NMS "Halo".

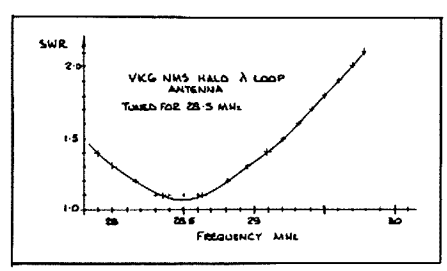
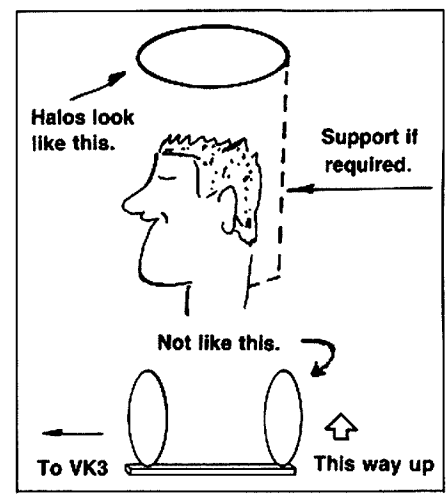


CONSTRUCTION DETAILS

Deltas and quads can use wire elements supported by straight lengths of fibre-glass rod but the construction of a wire loop needs a different approach. My solution involves bending two glass-reinforced plastic (fibre-glass) fishing rod blanks and placing the wire elements inside the blanks.

The longest fishing rods I could find were 6.4 m long telescoping blanks, known by name as "Shakespeare" and "Wonderpole". They were obtained locally for $23 each.



The thinner ends of the blanks were joined together and the wire threaded through. The wire element's ends were brought out through small holes about 0.5 m from the large ends.

The large ends were butt-opposed and fitted into a .91 m length of 50 mm waterpipe which had been bent to an angle of 100 degrees. Silicone filler was used to cushion and hold the butts.

The wire ends of the reflector were joined and a 1:1 balun used to connect the driven element to 50 ohm coax.

Now assuming you have followed my method you would be ready to hang the loops off your boom and, as they say in the bush, "Bob's yer quagmire". But why hang it? Why not stand it on the boom? This gives some extra height. If you go mobile this is important — but watch out, you could swallow every truck on the Nullarbor.

(Tech Ed's Note: The "halo" antenna is traditionally a horizontal half-wave dipole, bent to form a circle with the ends mechanically constrained by an insulator. It is often used on 52 MHz and 144 MHz and occasionally on 28 MHz as an omni-directional antenna. A gamma match is generally used to match to 50 ohms.)

TALKING ROPE THAT COULD SAVE LIVES

A mountaineering rope that carries an integral communications cable has been developed by a British manufacturer.

The Elite Contact 2000 talking rope system utilises a climbing rope, tested to 2200 kg, in which is a spirally coiled cable, allowing it to be stretched, knotted and shocked loaded without loss of transmission. The basic system consists of two individuals linked together via the rope. Each man wears a throat microphone and a hardhat with a built-in headset. Communication is possible up to 4 km.

PORTABLE AROUND SYDNEY

or how to promote amateur radio . . .

Sam Voron VK2BVS
2 Griffith Avenue, Roseville, NSW, 2069

GOING TO THE BEACH? One table, some chairs, dipoles for 1.8 to 30MHz, Mark VK2PIX at the controls shows how it's done. A 12 volt generator to a regulator, a bag with 10amp battery as back-up (all on grass) ensure a great weekend day and night away from it all on the North Cliff side of Coogee beach overlooking Wedding Cake Island.

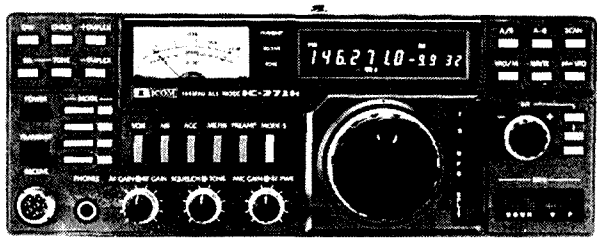
SHOPPING PLAZA PORTABLE. One day local shoppers stared with amazement at the 9.1 metres aerial mast under all that radio gear. A simple request to Bankstown Council *"Can I set up a radio display day and night for 48 hours in the middle of Bankstown Plaza?"* The answer *"Would you like us to provide 240 volts?"*

THE PUBLIC LOVE SENDING MESSAGES VIA AMATEUR RADIO. Sending greetings to friends and loved ones is a lovely way for people to come in contact with our hobby for the first time. It encourages people to learn more about the diversity of our hobby.

MESSAGE HANDING, SSTV AND BEING FRIENDLY. Were all combined outside the Grace Brothers store in the middle of Chatswood Shopping Centre to celebrate with the public "World Telecommunications Day" and activate the AX prefix from this spot for 24 hours.

Sam's Home Antennas.

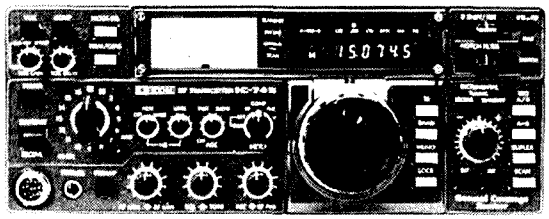
AT HOME.



All mode 2m 100 watt base
The Ultimate in two metre communications, large dynamic range receiver and a full 100 watt output combine with the microprocessor control system to give you the best in VHF performance. 32 memories, scanning, VOX, all the features you have come to expect from ICOM.

ICOM IC-271H

Frequency Range	144Mhz to 148Mhz all mode
Power Output	100 watts (IC-271A 25 watts)
SSB Sensitivity	Less than 0.5μV for 10 dB S + N/N
Stability	10ppm (−10 to +60 c)
Audio Power	2.0 watts



Your new work horse
An easy radio to use. The general coverage receiver, and multi step memories are a part of the system concept ICOM engineers employed when they designed the IC-745. IF shift, PBT, and a Notch filter will help you clear the air for that unique QSO. In spite of all the features built into the 745, it is very easy to use.

ICOM IC-745
Take a look at the front panel. The sensible layout is segmented into the logical control sectors ... Phew. Built in scanning will help you find that clear spot in the band, or listen for the rare voice from Verkhoyansk. Where?

ON THE ROAD.

The Fabulous IC-27A
A 25 watt mobile that will fit just about anywhere. Nine memories available are backed up by lithum battery providing approximately seven years life. Scanning and priority scanning allow you to get the best from this tiny package. As an added feature, a digital voice synthesizer is available as an option. Check it out now.

Typical Specifications

Frequency Coverage	144Mhz to 148Mhz
Power Output	25w (high) 5w (low)
Sensitivity	Less than 0.4μV for 20 dB Noise Quieting
Audio Output	2.0 watts
Size	140mm (w), 38mm (h), 177mm (d)

Check out these and other ICOM radios at your local authorised ICOM dealer. Write for product catalogue today.

TUNED FEEDERS FOR VERSATILITY AND EFFICIENCY

Vic Joyce VK2EVJ, ex VK2AEN

After a break of 25 years the little "black boxes" appeared miraculous!! Ten bands!! and receiver too!! But ten bands called for serious antenna study. The result — the "Centre Fed Zepp" wins hands down as the only antenna to work perfectly on any frequency on any band! Not with an SWR up to 2:1 on what should be a flat line, but perfectly tuned to any chosen frequency.

To get on the air I put up a "Centre Fed Zepp" with 24m flat top and feeders approx 18m. One end was over a neighbour's tree, the other on the TV mast on the house.

The results exceeded expectations and it operated on all bands from 160m to 10m.

The tuner circuit I chose had a split-stator capacitor and tuned primary as this gives tightest coupling. I found it necessary to short all of the taps for the 10m band, probably due to the large size for 160m. The coil was wound on a former of 13mm perspex, grooved every 1/8 inch and glued in the form of a cross. While winding the corners were filled with pieces of broom-stick. Pending finding suitable switches I use a banana plug and sockets on the primary and sockets only *on* the secondary for the tuning and the antenna. The leads are jammed into them with knitting needles! There are two each side for shorting down and another pair for the antenna feeders.

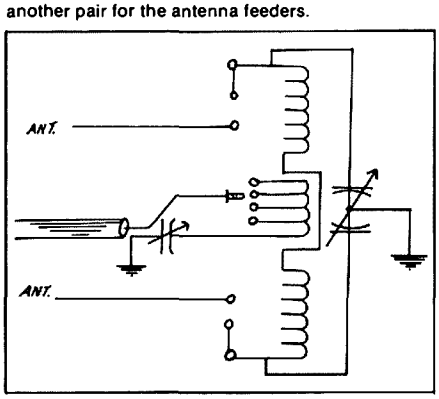

Figure 1 — Tuner Circuit Coil details: Diameter 70mm; Wire 14 gauge; Length, total 300mm; Primary 10 turns tapped at 5, 3, 2 turns; Secondary, each half 33 turns tapped at 26, 11, 7, 6, 5, 3, 2, 1.

Tuning can be very frustrating at first; especially if using clips on enamel covered wire! It is a miracle if all of the clips make contact at the same time and you have to find the tuning too. Then the performance becomes variable and you find one of the clips hot.

Proper tuning depends on the ratio of the primary to the secondary and the ratio of the antenna section to the secondary in use. It is possible to find resonance with almost any combination, but the right one will give an SWR of 1:1, good loading with stable, even broad tuning and primary and secondary tuning basically independent of each other. If the SWR meter moves on CW then you can do better! I would strongly recommend making a tuner for 160m-40m and one for 40m-10m. In fact a separate tuner could be used for each antenna and/or band and then changes can be made using a coaxial switch.

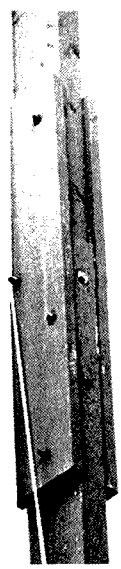
If you consider the length of the feeders as an extension of the antenna you can tell whether you have a current or voltage point at the coil.

I recently made an air wound balun 4:1 ratio and use it with a commercial ATU. To my surprise it appears more efficient than my tuner. This is probably due to even more exact matching.

THE MAST

With the above antenna only 6-8m high I had great success on CW, but couldn't get a good QSO on SSB on 20m or 40m DX. Therefore a mast was necessary! The space I had was 62ft by 50ft, so the tallest it could be was 50ft and it would have to be 12ft from the back fence. Wood was chosen for convenience of manufacture, economy and experience. I feel it proved to be a very lucky choice.

Construction consisted of 2m of 150mm x 50mm hardwood set in the ground with provision for two bolts. 6m of 100mm x 50mm Oregon for the bottom, 3.3m of 100mm x 50mm in the centre and 6m of 75mm x 50mm on top. Each piece was stepped into the next, bolted through and then 125mm x 25mm plates bolted each side. I only used two sets *of guys*, but it really needs three; I use two of the halyards as extra guys now.



Mast joint, showing how plates were used to give them full strength.

Two pulleys were put on the back 1.5m apart in case I wanted to pull up a spike of some sort. Next time I will put a double pulley at the top front and a single one 3.3m down.

The mast was raised using the jury mast principle and some help from friends as a 12ft jury mast is a bit short to pull up a 50ft stick! Lay out the mast dressed with guys, pulleys and halyards, fix two sets of side guys to their pegs loosely, fix a 12ft stick to the base, lying on the ground at right angles and fix the back guys to it. Lift the jury mast with a rope attached to it, fix the mast to the post, put a friend on each side guy and a third on the mast itself. Now cross your fingers and start pulling! You will find it is good when it is up! Hi! The guys are steel and broken every 3m with egg insulators.

Now the mast was in my own yard and only 20m from the TV mast. I thought that probably a 24m antenna with a 4m overhang would be better than a shorter one. Feeders were 14 gauge with perspex spreaders of 13mm dia and spacing 100mm.

Well, it certainly worked OK and signals jumped 2-3"S" points everywhere!! It runs east and west and is ideal for north and south, but also constantly received outstanding signal reports from the USA on 40m CW. On 20m it has some gain to the north. *Moral — Antenna height of 50ft is dramatically better than 25ft.*

THE "CENTRE FED ZEPP" VERTICAL

I still felt it should be possible to do better to the east. My first thought was two verticals in the form of a beam, so up went a vertical on the mast itself. I was glad it was wood! The antenna is 12m long centre fed with the same type of open wire feeders, approx 18m long and pulled out at right angles for 12m. Then I started to learn something about mast and halyard loading!

I could not pull the antenna up straight against the feeders. The spreaders were changed to 6mm and spacing increased to 1m. The effect was great for both antennas and halyards, but I still could not pull the vertical straight. This was eventually solved by pulling up another pulley on the mast for a halyard to the antenna centre.

The results were amazing. On 20m first up reports were S7-9 from Europe to the USA which was impossible off the end of the horizontal antenna. On 40m reports were 1/2 "S" points better in the States although this fell off later for some unknown reason.

Notice that antenna lengths are not critical, be very careful with halyards, polypropylene appears susceptible to ultra-violet rays, so choose dark colours and heavy gauge and check frequently. I did provide a 2m fold back at each end in case I wanted to increase the effective length by pulling them out sideways. At this stage I could see it would be impossible to support another vertical from the horizontal for a beam, but there had to be some way to aim more to my many friends in the States!

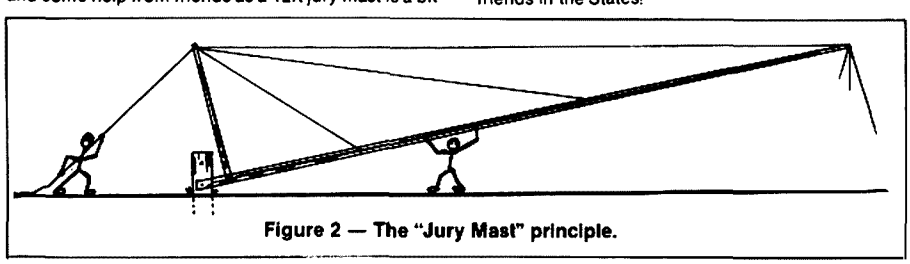


Figure 2 — The "Jury Mast" principle.

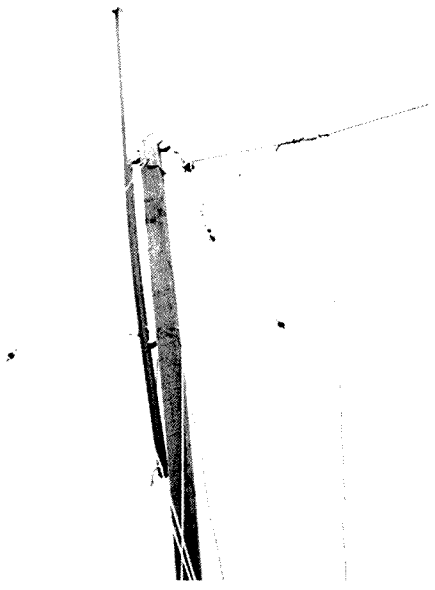
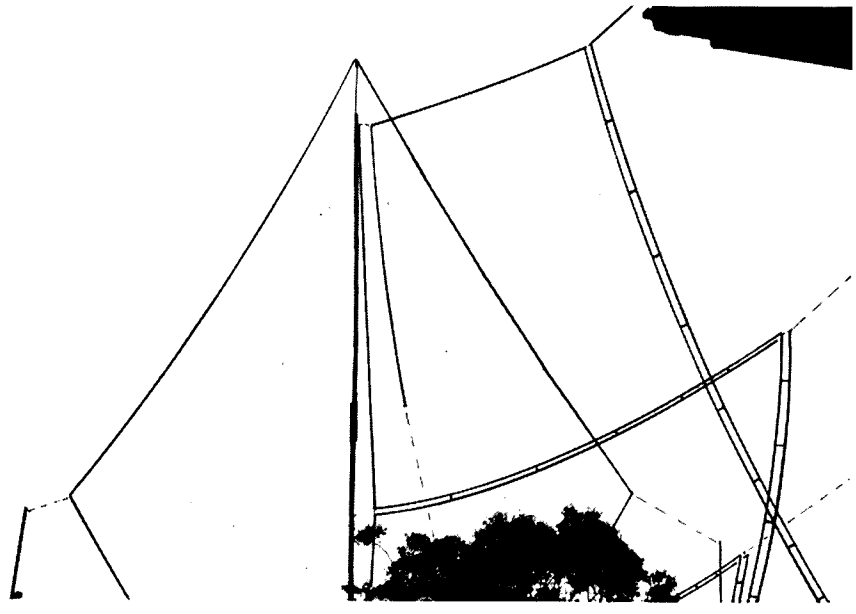


Extra pulleys on the back of the mast can be useful.



The Antenna "Farm" at VK2EVJ

THE DIAMOND QUAD

There it was — the solution to my problem — in the ARRL Antenna anthology! A 6m piece of 50mm x 50mm tied to each fence and I had supports for the sides, guys were not needed. These can be extended further with 50mm x 25mm if desired. A 4m stick was pulled up the back of the mast to gain another 2m for the peak. The antenna now looks east and is made of 14 gauge soft copper as were the open wire tuned feeders which were attached at the bottom of the diamond. Tuning was no trouble at all.

Reports indicate ½ to 1 "S" point improvement over the horizontal in the States, though it may have been better, but usually seems 2 "S" points better on receive. The most amazing thing is the very deep null to the north which is extremely convenient. Now my thoughts turn to a beam again, it must be highly possible to support another Quad from the horizontal! My next project! I think too that by using tuned feeders a quad could be reduced in size by the addition of loading coils on the sides of the diamond. This would tend to make the tuning too sharp for a constant impedance line. Possibly a 2 element rotatable quad would then be feasible for 40m!

While the quad does not compare with a 4 element Yagi at 30m the results certainly justified the comparatively small effort. It is basically a one band antenna, but probably OK for 80m. Actually my next project might be 20m and 10m elements inside the present 40m one.

SHIFT LIGHT FOR MECHANICAL RTTY

Bruce Hannaford VK5XI
57 Haydown Road, Elizabeth Grove, SA, 5112

Those who touch type watching the print out as they type will not need this aid as they will immediately notice any failure to shift from one case to the other. However a major problem for not-so-good-typists who do need to watch the keys as they type is to always remember whether they are typing in letters or figures.

Sometime ago a RTTY friend of mine Len VK5VM alerted me to a signal light system to show carriage return, letters or figures. Len whose hearing is rather poor often did not hear the end of line bell, rigged up an indicating light so even when watching the keyboard he knew when he had reached the end of a line. For most of us poor typists with good hearing we know when a line is ending but we do need something such as a signal light system to remind us whether we are typing letters or figures.

In my case I found all I needed was one light showing when I was in figures and I will now describe this system. A micro switch or magnetic reed type switch that will operate a light when the typing carriage is in the figures position is all that is required.

A look at the "works" of your teleprinter when changing from letters to figures will indicate many spots where a switch can be mounted without interfering with normal functions. With the signal light mounted very close to or even under the keys a reasonably bright dial light or LEDs will do fine.

With my Siemens M100 I mounted a micro switch having a long lever and roller on its end on the side of the transformer cover so that the roller would be hit when the bar carrying the typing carriage lifts for figures. The transformer has a 6V winding used for the copy reading light so this is additionally connected through the micro switch to a 6.3V dial light mounted just to the right of the keyboard about 7 cm below the Baud rate window. As all is fixed to the machine proper its cover can be replaced or removed without any problems.

To use the system you just train yourself to look for the light from the corner of your eyes when typing figures or punctuation marks etc. Spend a few moments typing your call sign and you will soon get used to expecting to see the light for figures and not seeing it for letters.

A simple and very useful modification, many thanks to Len VK5VM for the original idea.

AR

QSP

SUPER RADIO!

The 1st February 1985 was yet another monumental step for radio in Australia. On this date all AM stations on the Broadcasting Band became licensed to broadcast in stereo.

Stereo AM is the most important technical development in the sixty year history of Australian radio.

Although achieving the same result — stereo broadcasting — the FM and AM modes behave differently when transmitted. FM travels in tight lines which bounce off objects like tall buildings and fly off in various directions whilst AM carries through the atmosphere in broader waves which go around obstacles, is not disrupted by solid masses and produces a continuous, strong signal.

It is necessary to have a stereo AM receiver to receive stereo which are now available however stereo AM may still be heard on mono receivers.

AR

ANOTHER CELEBRATION

The Korean Amateur Radio League are celebrating the Thirtieth Anniversary of KARL with a special ceremony on April 28th, 1985.

A special station, HL30HQ, will be operating from 25th April to 1st May, 1985. Special QSL cards will be issued to those stations who make contact with HL30HQ.

Also to promote KARL a 30th Anniversary Award will be issued to amateurs making contact with thirty HL stations during the period 1st January to 30th April, 1985.

Applications should be submitted to KARL, GPO Box 162, Seoul, Korea 100 no later than 31st August, 1985 with 8 IRCs and GCR.

Hyung Suk Song HL1CG
President of KARL

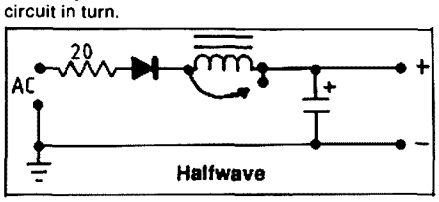
DIODE POWER SUPPLY CIRCUITS

Bruce Hannaford VK5XI
57 Haydown Road, Elizabeth Grove, SA 5112

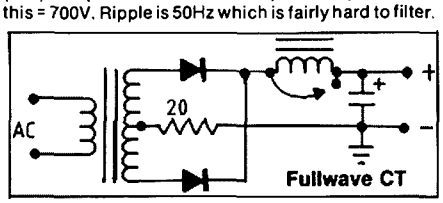
I well remember the valve era with bulky heat producing rectifiers and how difficult it was to use bridge or voltage doubler circuits etc because many separate, well insulated rectifier heater windings were needed. In the present solid state era all sorts of fancy power supply circuits are now possible with very few problems indeed. Over the years I have gathered a collection of useful circuits some of which will be new to many amateurs.

In this article I am describing medium and high voltage circuits such as are required for valve plate and screen supplies etc but of course the same circuits can be used for low voltage solid state supplies with suitable component value changes. In all the circuits shown the AC supply is 50Hz and is 250 volts except where transformers are shown and in this case the secondary windings are 300 volts each side of the centre tap. The rectifiers are 1000V PIV 1 amp types and all electrolytics are 33 microfarad 500V. Where electrolytics are shown connected in series to increase voltage ratings the resistors shown across them are 470k. The 20 ohm resistor is not an exact calculated value and normally will not be required if the secondary of the transformer supplying the AC has a reasonable amount of DC resistance. This 20 ohms resistance is a typical value where such a resistance is actually required for medium or high voltage supplies.

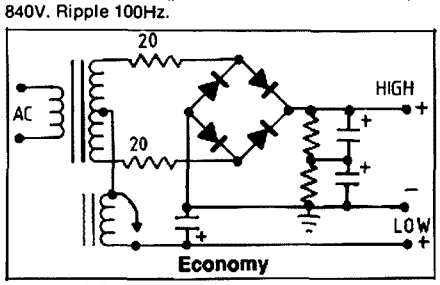
Looking at the circuits you will note that the first three show a filter choke that can be shorted out to make the filter capacitive input instead of inductive input, the reason for this is as follows. When the voltage obtained with capacitive input is too high it is often handy to use a filter choke rather than a resistor voltage drop to reduce output to the required lower voltage. The choke will decrease the voltage without any appreciable power loss and may often be preferable to a large power wasting, heat producing resistor. The choke shown is 10 H 250mA and 140 ohms. With each circuit I will give some approximate DC output voltage readings at different load values and these readings will give you a chance to compare the efficiency of each circuit. Now let's deal with each circuit in turn.



In circuit 1 we have the half wave circuit, it will be noted that the voltage regulation is very poor indeed especially with the filter choke in circuit. With 250V RMS AC input the no load (NL) output volts will be about 340V with or without the choke. With the choke in, the voltage drops rapidly with increasing load. At 10mA 185V, at 20mA 125V and at 40mA 40V. With the choke shorted out NL = 340V, 50mA = 315V, 100mA = 305V and 200mA = 290V. The diode peak inverse volts (PIV) is equal to twice the AC input volts peak value this = 700V. Ripple is 50Hz which is fairly hard to filter.

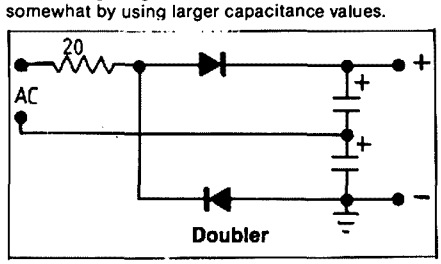


In circuit 2 we see the well known full wave centre tapped circuit each half of the 300V secondary winding with its diode supplies half the total output current. With the choke in circuit NL = 400V, 50mA = 255V, 100mA = 250V and 200mA = 235V. Without the choke NL = 430V, 50mA = 400V, 100mA= 390V and 200mA = 365V. PIV (peak volts of entire secondary) = 840V. Ripple 100Hz.

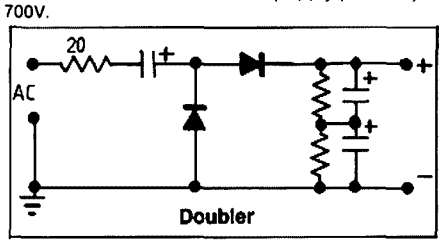


In circuit 3 we have the well known economy power supply giving both full and half voltage outputs from the one centre tapped transformer. This circuit is often used with a transformer salvaged from an old valve type TV. The voltage each side of the CT is usually about 300 to 350 volts, 350V is a bit high for safety with single 1000V PIV diodes so I have shown a 300V transformer. You will note the high voltage circuit is the well known bridge circuit and the low voltage circuit is normally a bit high for receiving type valves and in this case the choke input is very useful. First the high voltage circuit. NL = 840V, 50mA = 800V, 100mA = 760V and 200mA = 720V. Low voltage with choke. NL = 400V, 50mA = 250V, 100mA = 240V and 200mA = 220V. Without choke. NL = 430V, 50mA = 400V, 100mA = 385V and 200mA = 365V. PIV for any diode (peak volts of entire secondary) = 840V. The left side diodes carry both high and low voltage load currents and the right side diodes only high voltage load current. There is very little interaction between the two outputs. With the high voltage supply delivering 200mA changing the low voltage supply current by 100mA only altered the high supply voltage by 7 volts. Ripple is 100Hz for both supplies.

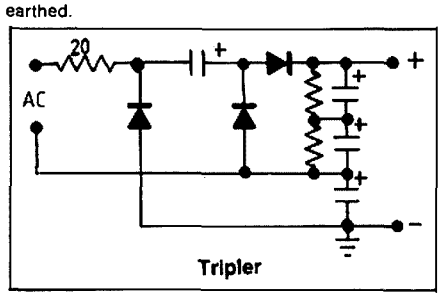
In circuits 4 to 9 we see voltage multiplier circuits. In these circuits capacitors and diodes are arranged so capacitor charges add either with each other or by their being in series with the instantaneous AC input voltage. Generally speaking many of the circuits give poor voltage regulation and this can be improved somewhat by using larger capacitance values.



Circuit 4 is easy to understand. One capacitor charges for one half of the AC input cycle and on the opposite half cycle the other capacitor is charged. The capacitors are in series aiding so the output voltage is doubled. Both half cycles are fully used, the voltage regulation is fairly good and the ripple is 100Hz. However it will be noticed that with the negative output earthed both AC input terminals are above earth and this is sometimes a disadvantage. This is the preferred doubler circuit giving best voltage regulation and using less components. With 250V RMS AC input. NL = 690V, 50mA = 652V, 100mA = 605V and 200mA = 578V. PIV (supply peak x 2) = 700V.



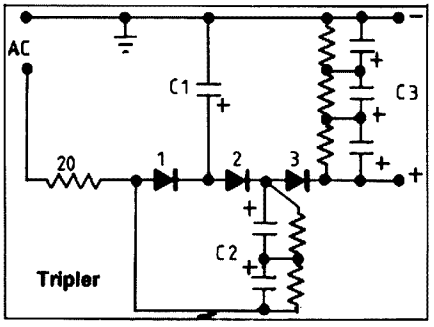
In circuit 5 we have a doubler circuit with one input and one output in common, in this case both being earthed. On one half cycle of AC input the first capacitor on the left charges to the polarity shown, on the next half cycle the lower diode in non conducting, the AC input voltage for this half cycle is in series aiding with the left hand charged capacitor and so the output capacitor (two in series) is charged through the top diode to twice the peak AC input volts. These statements, of course neglecting slight losses in the 20 ohm resistor, the diodes and assuming no load current is drawn. With 250V RMS AC input. NL = 690V, 50mA = 625V, 100mA = 565V and 200mA = 465V. The PIV for each diode is peak AC input x 2 = 700V. Ripple is mainly 50Hz and voltage regulation is poor compared to circuit 4. The main advantage of this circuit is the common input and output terminals which may be earthed.



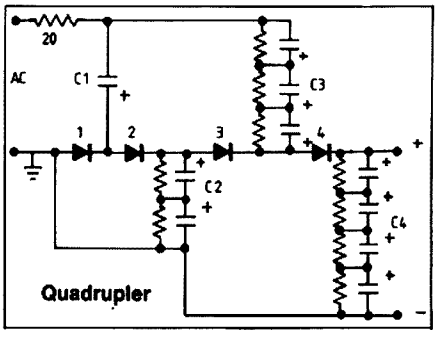
In circuit 6 we see an extra diode and capacitor have been added to the circuit 5 doubler. The extra capacitor at the bottom of the output string of capacitors is charged independently of the doubler circuit and its charge is added in series with the doubler output making this circuit a voltage tripler. It will be noted that both AC input terminals are now

above earth. This circuit is the preferred circuit if both input terminals can be above earth. The voltage regulation for a tripler is quite good. With 250V RMS AC input. NL = 1040V, 50mA = 940V, 100mA = 800V and 200mA = 710V. PIV for all diodes 700V. Output has both 100 and 50Hz ripple components.

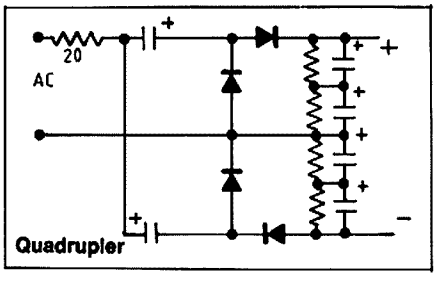
In circuit 7 and 8 one input and one output terminal are common and can be earthed as shown. These circuits have been drawn in an unusual non draughtsmanship like way, but this is done to help you understand how charges are passed from left to right, to emphasise how all diodes are in series and how all electrolytics have their positive ends towards the diode string. In 7 and 8 the diodes have been numbered from left to right and likewise the capacitors.



In circuit 7 giving a very brief explanation, C1 is charged through diode 1 to the peak volts of the AC input this capacitor charge is then added to the AC input volts peak on the next half cycle of AC input this then charging C2 to twice the AC input peak voltage. On the next half cycle C2 with its x 2 voltage is in series with the mains voltage and C3 is then charged to x 3 AC input peak volts. Once again we have neglected slight losses and assumed no output load current. Under operating conditions actually C1 and C3 charge on one half cycle and C2 on the other. As you study output voltage under load you will note voltage regulation is rather poor compared with circuit 6. With 250V RMS AC input. NL = 1030V, 50mA = 900V, 100mA = 870V, and 200mA = 600V. PIV for each diode = 700V.



In circuit 8 the charges from C1, C2 and C3 are passed on in the same way as in circuit 7 but an extra stage has been added and C4 will charge up to x 4 the peak AC input volts (if no losses and load). When this passing on charges from one capacitor to another has been done so many times as in this type of quadrupler circuit considerable losses occur and voltage regulation becomes very bad. The circuit is useful where a common input and output terminal are needed and voltage regulation is not very important. With 250V RMS input. NL = 1370V, 50mA = 1120V, 100mA = 930V, and 200mA = 700V. PIV for each diode 700V.



In circuit 9 we have the preferred quadrupler circuit however both input terminals are above earth. This circuit is actually two doubler circuits back to back (compare with circuit 5) the lower doubler having diodes and capacitor polarities reversed. As the outputs of the two doublers are in series the voltage is quadrupled. Because the capacitor chargers are not handed on so many times the regulation is much better than circuit 8, also note less components are used. With 250V RMS AC input. NL = 1380V, 50mA = 1240V, 100mA = 1080V, and 200mA = 920V. PIV each diode 700V.

As mentioned earlier these circuits can also be used for low voltage solid state supplies if component values are changed to suit. This usually means hundreds of microfarads for the capacitors. The number of capacitors in series will give you a clue to how the voltage builds up in each circuit I have shown so you can determine the ratings required in any part of a circuit. The 20 ohm resistor will of course need to be much reduced to probably a fraction of an ohm. With such large capacitors being used it is Important that this resistor be of sufficient size to protect the diodes. Most low voltage transformer windings will not have sufficient resistance to protect the diodes.

Finally when diodes have their ratings exceeded they usually short circuit and often explode taking filter capacitors with them. Often junk box diodes have no visible markings and a test is needed to determine the PIV ratings. I find the following method useful — Connect the diode in series with a voltmeter 0 to 1000 volts range with the diode in the non conducting direction. Connect this combination across different values of DC voltage, at low voltages you get no reading on the voltmeter but when the PIV rating of the diode is exceeded you do get a reading as the diode breaks down passing current in its reverse direction. because the resistance of the voltmeter is so high very little current is passed and the diode will not be damaged. Try this test with some diodes of known ratings so you will know what to expect as usually the break down point is considerably higher than the official ratings. Note diode ratings decrease as operating temperature is increased.

FOSTERING INTERNATIONAL FRIENDSHIP

Recently the writers had the pleasure of playing host to a team of Japanese Scientists, some of them amateurs, enroute via Fremantle to the Antarctic.

Although the Japanese spoke little English, entertaining them proved no problem. They showed a great preference for Australian sausages as in Japan sausages are gourmet food.

The visitors, some were physicists, rocket engineers, medical doctors and communications experts, enjoyed a visit to the "Wireless Hill Communications Museum" and the "Fremantle Maritime Museum."

Whilst in the Antarctic the JAs will be operating 8J1RL from Syowa Base and 8J1RM from Mizuho Base.

AMATEUR CELEBRATES ANNIVERSARY

On All Saints Day a special Eucharist was held at St Nicholas' Church, North Goulburn to celebrate the 60th anniversary of the ordination as a priest of Canon Monty Nell VK2JQ.

Monty was ordained at Glen Innes and has served in Canberra, Moruya, Binda, Crookwell and Junee. He was elected a Canon in 1943.

Congratulations and best wishes Monty.

Australian Traffic Network

international third party traffic exchange between ATN and the National Traffic System of the US and Canada have taken place over the International Assistance and Traffic Network at 1130 UTC on 14.303 MHz daily over a 4 year period 1981-84. Due to poor propagation over a 3 month period two new networks are now carrying this traffic — effective January 1985.

The International Morse code section of the ATN daily at 0700 UTC on 7.037 MHz ± QRM.

The International phone section of the ATN daily except Sundays 0800 UTC between 7.225 to 7.300 MHz.

Several operators in Canada and the US pass traffic using RTTY, AMTOR, FEC or Packet. If you wish more information check into the national phone section of the ATN daily 1030 UTC 3.570 MHz ± QRM.

APPROVAL FOR AERIAL TOWERS

Sam Voron VK2BVS
2 Griffith Avenue, Roseville, NSW. 2069

Is the obtaining of approval to erect aerial towers a dream, a nightmare, or our right? Read how Sam Voron overcame the objections of 79 neighbours and persuaded his local council to approve his application.

Using aerials at 18.29 metres I have, over three years, built up friendships with people around the world who operate daily on the International Assistance and Traffic Network (IATN). Recently repairs taking some months were necessary to my aerial mast. Temporarily, I set up a dipole on the roof to get back on air. But even with the 400 watts legal power limit my friends worldwide could not hear me. Consequently my international public service message handling capability was gone. The value of a tower as part of one's amateur station is evident.

Here is advice about obtaining a tower approval despite; as in my case, a counter petition signed by many local residents. I know of other amateurs fighting for this right and hope this information will assist. Although each local council has its own guidelines for examining tower applications much of this material should be relevant.

(1) Fill out the building application form, include manufacturer's tower design plans and site plan. Do not include aerial details unless requested. Make friends with council employees. In my case the clerk was a CB operator and very helpful.

(2) Find out what the voting procedure is. In my case 5 out of the total 10 councillors sit on the building sub-committee. If all 5 vote unanimously then that's council's decision. If not unanimous the application goes before the whole council for a majority decision. If they vote against, you can appeal to the Land and Environment Court, in NSW.

(3) Ask the building department council employees if they see any problems. They are responsible for preparing the application details for the council meeting. I was told the following petition signed by 79 local residents had been lodged.

'We, the undersigned, vehemently object to the radio-transmitting aerial tower on the following grounds:

(a) The unsightly nature of the structure constitutes visual pollution.

(b) The structure is not in keeping with the residential nature of the area and the surrounding development.

(c) The presence of the structure lowers the value of the surrounding properties.

(d) The structure detrimentally affects the amenities of the local population.

(e) The transmission of radio signals interferes with TV reception and use of other electronic apparatus in the immediate neighbourhood and reduces the enjoyment of the lifestyle of the nearby residents.

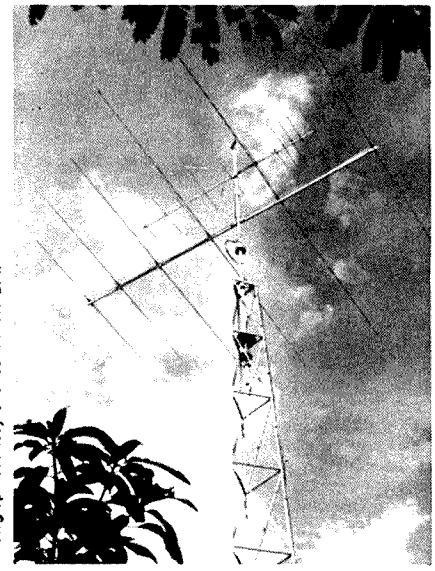
(f) The structure is likely to cause danger through lightning unless suitably earthed . . .'

(4) Provide council with a written response to any objections. Point by point, mine were —

(a) Just as power poles are needed to carry electricity, just as TV aerials are needed to watch TV, the structure is needed to participate in the hobby of worldwide communications.

(b) Amateur radio is a residential recreational hobby activity.

(c) ***(As heard on WIA Federal tape and received from FE office).*** In January 1984 Mr and Mrs Dale Green won the 'house of the month' award after being selected by the Sierra Vista beautification commission. Clearly the commission did not see the hobby of amateur radio detracting from the value of surrounding properties. On receiving the award, the owner Mr Green said his antenna a top a 18.5 metre



Photograph courtesy Charles Irvin VK4BPI.

tower enhances his ability to provide community service using amateur radio.

(d) The hobby of amateur radio enhances the amenities of the local area because it enables people especially the young, retired or handicapped to enter into a unique recreational modern day activity.

Having myself been introduced to the hobby at the age of 11, I have always enjoyed encouraging others to the hobby; But it is a unique hobby which requires the sitting of an examination in International Morse Code, International radio regulations and radio theory.

My father, brother and myself are all licensed radio enthusiasts. Amateur radio is a worldwide hobby. It is a local, national and international amenity which encourages people to communicate with each other irrespective of colour, race, religion or national boundaries, from the comfort of their own homes.

In a disaster, amateur radio operators make themselves and their equipment available to their local community at no charge. For example, during the Darwin cyclone, Victorian bush fires, NSW floods and in Sydney during the 1981 STD telephone breakdown. Here I was involved in sending 100 urgent health and welfare messages from distressed members of the public to their friends and relatives around Australia and overseas.

I have a letter from President Reagan, referring to the International Assistance and Traffic Network. In this my station has faithfully represented Australia almost daily since 1981, helping to link the world particularly during times of disasters, to help relay messages from the public to their loved ones during times when all commercial and government services have been disrupted or overloaded.

Local activities include communications assistance for the Red Cross, Salvation Army, Fun Runs, Autistic Childen's Association Bicycle Race and other community groups requesting such help. I have made my home available every second Friday for newcomers to meet and organise activities, in a club called the Amateur and Citizens Radio Club, formed in 1977. Our club patron is David Connolly, a member of Federal Parliament, who has supported our community activities.

(e) As regards interference, two inspection reports dated 1980 and 1984 verify my station complies with all regulations. These regulations require my station not to be the cause of interference. Where interference does occur, the complainant should refer the problem to the Department of Communications, Interference Division, who will determine the source of the interference and whether the fault lies at the transmitting station or is the result of poorly designed and/or faulty consumer equipment.

(f) The structure conforms to all requirements regarding earthing.

The petition, advocating a prohibition on any structures, towers or aerials, in effect seeks to outlaw the hobbies of amateur radio, citizens band radio, worldwide shortwave listening, improved VHF/UHF TV reception and extended range AM/FM radio reception. All these are legitimate recreational activities within the domestic environment and should not be prohibited.

(5) *Ring the councillors (5 in my case) who will vote on your application. This is a most important step to ensure each knows what amateur radio is and the necessity of the proposed structure for the pursuit of your hobby. I was surprised that all at least knew of an amateur; one's wife was studying for a licence and another's son was "into CB". During daytime working hours, council buildings are normally manned by employees. Councillors themselves have ordinary outside jobs, so are used to being telephoned at reasonable hours after work at home. Their numbers are listed in council information booklets. As a resident you are entitled to seek the help of these elected officials. Explain the hobby, the importance of the tower, ask if they see any problems and say you will be at the meeting.*

(6) *Find out the time and place of the council meeting and be there. These are normally open meetings and all may attend.*

I hope my experience will encourage others who may have been intimidated by such situations, and not proceeded, to try again.

Were the results worth it?

To begin with, the neighbours stopped complaining once the council decision was made. I have a 7 element TH7DXS for 20, 15 and 10 metres at 15.24 metres a 2 element 402 beam which works into the USA every day on 40 metres from the 18.29 level, a 6.1 metre 27MHz CB vertical which could be a "beaut" lightning rod to save my more expensive aerials below as well as put out 'Sydney hobby newsbroadcast' each Sunday. Quarter wave slopers for 1.8 and 3.5MHz towards USA and Europe give me S7 to 9 many nights a week to USA on 75 metres.

After several months using 1.8 to 30MHz daily and 400 watts no one has reported interference except to video recorders. Here I have referred to the Minister's warning to consumers and advised them to sort out the problem under the VCR warranty.

By the way, one VCR picked up 5 watts AM on 27MHz the other 2 metres FM. The 1.8 to 30MHz 400 watt SSB which I use extensively with my new set up does not worry any of the 80 neighbours here in residential Sydney.

AR

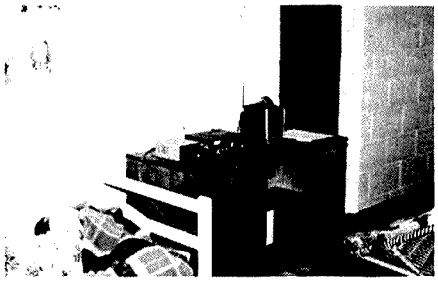
HAVE SIX — WILL TRAVEL

Lionel Curling VK3NM/ZL1SW
18 Lexington Street, Vermont, Vic. 3133

Lionel has recently returned from o six week trip to New Zealand, Norfolk and Lord Howe Islands. On the trip he took an IC-505 6 metre transceiver, homebrew two element, 6 metre quad made of PVC conduit fittings and an IC-25A 2 metre FM mobile transceiver in the hope of hustling some VHF activity.

Upon arrival in Auckland a rental car was collected and I drove off to my cousin's home in Whangarei to arrive at 12.30 am Christmas Day. Several 2m FM contacts were had en route.

After a scrumptious meal of turkey, Christmas pudding and all the trimmings it was time to erect the quad up on the balcony using willow branches and doweling, which was handy, for a mast. By 2pm I was listening on 6m and had the first of many OSOs with Roger VK2XJ.



The Shack — NZ.

Kirk ZL4PX very kindly loaned his HF transceiver but due to a poor aerial and poorer conditions very few HF contacts were made.

From Boxing Day to New Years Day we all went for a trip to Devonport, Auckland and using 6m from the car with a 2m magnetic mount five-eighth whip, contacts were made with VKs 2, 3, 5 and Chris ZL7OY. Most contacts were in the evenings. Most of the daytime was taken up with sightseeing around Auckland and Rangitoto Island.

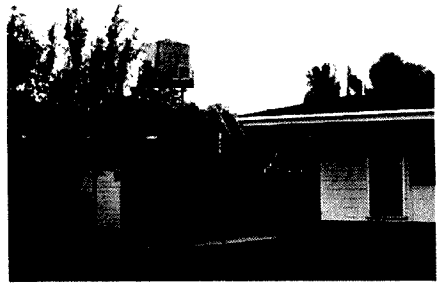
Old Signal Station at Mt Victoria, Auckland.

The rest of the stay in New Zealand was spent around the Onerahi, Whangarei area working VK2,4 and Pierre FK8EM. VK TV was heard nearly every-day, sometime with TV "crud" so strong it lifted the S meter well into the red. One morning channel 0 in Brisbane was so strong that it sounded like a local station however it was impossible to raise any VK4 amateurs.

With all the openings across the Tasman I did not work any South Island stations on Es although a very weak ZL4 was heard but was unreadable for contact purposes.

After a four week sojourn in New Zealand it was time to dismantle the quad, donate the HF dipole to my uncle for use in his garden, send the HF rig back to Kirk ZL4PX, pack the bags and set off for the next stop, Norfolk Island arriving there around 9am.

I arrived at the hotel at 10am and immediately set about making 6m operational. By noon the rig was running and contacts were made with VK2 and ZL in two very good openings during the stay. VK and ZL TV was heard most days.



6m Quad — Norfolk Island.

Norfolk Island has a local radio station, VL2NI, operating on 1.566MHz and 93.9MHz FM. The station relays Radio Australia during the afternoons until 7pm in the evenings.

During the stay on Norfolk I met with local resident John VK9JA who operates a slide commentary on Norfolk Island wildlife and a movie on Pitcairn Island. It was very interesting to listen to John's talks. John keeps regular scheds with Tom Christian VR6TC on Pitcairn.

Norfolk Island is eight km long by five km wide with Burnt Pine as the main town. There are many modern shops, car rental firms with very reasonable rates and unlimited mileage, duty free goods, restaurants, etc and the lifestyle is pleasant with friendly people and is free of crime.

Cows have right-of-way on all roads and there is a $200 fine if you should run into one.

Norfolk is steeped in history. Pitcairners arrived in 1856 after a 4000 mile sea voyage to settle on Norfolk, hence a lot of the present Norfolk Islanders are direct descendants of Fletcher Christian who settled on Pitcairn Island after the Bounty Mutiny.

Things became very harsh on Norfolk during the two convict settlement days with the second settlement being so ruthless it was closed down after word about it got back to England. Many of the convict buildings can still be seen in Kingston.

Kingston.

Norfolk is famous for its Norfolk Island Pine, a conifer which grows to great heights and is great for the stringing of high dipole antennas.

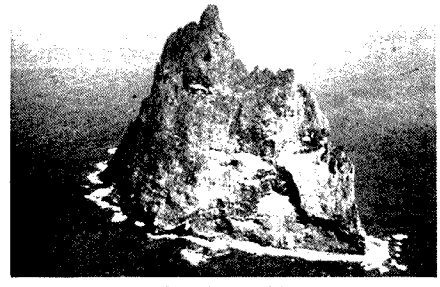
Anson Bay and Norfolk Island Pines.

From Norfolk I flew to Lord Howe in a small Beechcraft plane, sitting up in front with the pilot.

Upon arrival the first priority was setting up the 6m gear but due to the short distance to VK2 I only managed to work a couple of ZLs one morning and there were very few bursts of VK TV.

Lord Howe is a moon shaped island, 11 km by 1-2 km wide with two large mountains, Mount Lidgbird and Mount Gower. There are plenty of bush walks for the energetic as two thirds of the island is kept in its natural state.

One day I took a plane ride out to Ball Pyramid, which is a jagged pinnacle jutting out of the sea, and the next day took a six hour fishing trip there however the fishing trip was not a great success due to sea-sickness.



Ball Pyramid.

A fascinating bird that lives on Lord Howe is the wood hen. It comes to investigate if one bangs two rocks together. It is brown in colour with wings like a domestic fowl but cannot fly and has a long beak which it uses to forage food similar to a New Zealand kiwi.

Whilst on the island I met with Dick VK9LH and Ken VK9LK. Ken is the islands doctor and Dick runs an art gallery. Both are not very active at present but Dick does show an interest in 6 metres which could be a good indication.

Radio Lord Howe transmits on 1.494MHz usually with a relay from a Brisbane radio station.

Power is generated from diesel at the Department of Transport building with a capacity of 700kVA from three generators.

Finally it was time to head for home via Sydney but I would highly recommend an amateur holiday to these islands as there are no ugly high-rise hotels and other typical tourist traps.

AR

REPERTERS — Friend or Foe!

Tim Mills VK2ZTM
PO Box 204, Willoughby, NSW, 2068.

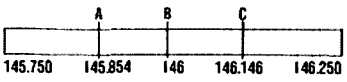
Last month I traced the early FM era up to the permission to develop repeaters in Australia. A meeting of interested amateurs had been arranged.

Wodonga — Saturday afternoon 21st September 1968. An assortment of amateurs from the eastern states of Australia gathered in a hall (hut) on the army base at Wodonga, the twin town with Albury on the VK2/3 border. In addition, members of Federal Executive were present. Upon opening the meeting the delegates were welcomed and congratulated on the generation of such a gathering to develop a technical standard and agreement for a new mode. The minutes of the meeting were later formally ratified as a Federal meeting and became the basis of policy.

It was agreed by all that the repeater era was arriving and while each system was for local area coverage, mainly to extend mobile range, people were travelling about and hence standard frequencies were required. It was a crystal locked era but the Channel "B" in each mobile showed that each general region relied on a slightly different standard reference. It usually showed who was the visitor in the group.

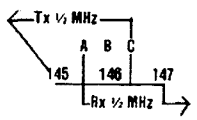
Meeting introductions soon gave way to technical discussion. Most of the equipment coming into service was ex commercial and tended to be 'peak aligned' so that it had a switching range of ⅞ .25 MHz of the centre frequency in use, before receiver sensitivity or transmitter tuning dropped off. (The day of the broad tuned front ends had yet to be developed and Japan's electronic industries had not discovered the VHF amateur market. The American repeater scene was similarly based on the ex commercial equipment market.)

The obvious frequency sub-band was that already in use, based on channel 'B', 146.000 MHz. Taking ⅞ .25 MHz, would be a range of 145.750 to 146.250. This covered the existing simplex channels A — B — C (145.854 — 146.000 — 146.146). In order that a system could operate in a — talk through — repeating mode, different frequencies had to be used, for the receiver and the transmitter, since both are on at the same time. A transmitter will desence a receiver, which becomes worst with the closer the frequency spacing. In the commercial world of the day, the few systems (repeater/duplex) then in use had a separation of several megahertz. Amateurs however still wanted to retain their simplex ability for when they were out of the range of repeaters.



Most felt it was unlikely that many channels would be required but it would be nice to retain the existing simplex. It was decided to have the (repeater) transmitter to operate on the low side of 146 MHz and the receiver to listen high.

A bit of drawing on the blackboard soon made clear the discussion at hand.



(As seen from the repeaters point of view. It is the reciprocal for the user.)

Accurate frequency measurement was difficult in 1968 for the average amateur and ideally frequencies should end in hundreds. The lowest practical transmit frequency was 145.600 and the highest receive was 146.400. The 50's were out since these were where A and C occurred.

Tx	145.6	145.7	145.8	145.9
Rx	146.1	146.2	146.3	145.4

With that it fell into place. By using an input — output spacing of 500 kHz there could be 4 channels, and still have the (3) existing simplex.

Discussion then came round to what was a practical utilisation. It was felt that 3 channels in the rig was about the limit, since many existed or could be modified from single channel units. In addition there was the crystal costs. There were large distances between sites etc. hence sharing was practical. (The total band plan now has 31 channels. In major population regions most are in use.)

Different simplex frequencies prevented a national calling channel so it was decided to adopt "B". This left two spaces on the channel selector. To tell the difference it became 'alpha' for simplex and numeric for repeaters since there was 146.1, 146.2 etc *but which two to pick?* In part 1 mention was made of the 'VK2' experimental system. It was suggested to the meeting that since they had already done a frequency change — B-A which moved to C-A, they should not be subject to a further major change. So channel 1 was chosen and from the other end channel 4. To further provide standardisation it was suggested that ch 4 be used in each capital city and ch 1 in country regions. Not everybody remembered that and in due course when each State came to develop their first system, some thought it meant the first used was to be ch 4. (In todays numbering ch 1 is 6700 and ch 4 is 7000). Geelong was the first VK3 system and Mt Barrow in VK7, both were ch 4s. At least Adelaide, Brisbane and Sydney ended up with a ch 4, Hobart, Melbourne and Perth have ch 1s. Channel 2 and 3, by a policy decision, were not to be used at that stage. Something to be misunderstood later and helped lead to a further meeting in 1972. In 1968 the amateur satellite programme had not settled internationally in 145.8 to 146.0 MHz.

The meeting then went on to other business. They moved to adopt 438.000 MHz, the 3rd harmonic of 146.000, as the FM simplex in the new 70 cm band (acquired in 1964). They also decided that a national co-ordinating body was required. Since VK2 had arranged the meeting, the meeting suggested VK2 should fill the role. Later Federal Executive confirmed the appointment and this committee became known as the Federal Repeater Secretariat, with a set of guidelines drafted by FE. (A 3 person committee.)

The meeting went on to discuss grandiose schemes for the new found mode, like a link from Melbourne to Sydney. The meeting then closed and the various State delegates went home fired with enthusiasm, most soon submitted their first repeater applications. It was to be a long wait for many however. In VK2, permission came through in September 1970.

To be continued.

GLOSSARY OF REPEATER TERMS

In these articles I make use of a selection of terms to describe operations. My meanings in the context used are:

SIMPLEX — To receive and transmit on the same frequency.

REPEATER — The device at the heart of the system. Usually frequencies referred to are those in the repeater. Where a channel number is used — eg 6700 this is the transmitter frequency and is short for 146.700 MHz.

DUPLEX — A commercial term for a system which works like a telephone in that the user can talk and listen at the same time.

OPERATOR — My term for the group who set up and maintain the repeater system.

SPLIT — A slang term for repeater offset. On 2 metres Australia tended to follow America in that the planners felt that a users receiver had less bandwidth than the transmitter. By basing the centre of the 2 metre band on 147 MHz. (Part of the thinking at the 1972 meeting), the receiver only had to cover ⅞ .25 MHz of 147.000 while the transmitter had to go from 146 to 148. The offset became 600 kHz and except for 7000 any channel number starting with 6 is a minus offset and anything with 7 is a plus offset.

TRANSLATOR — Term used in the handbook. My understanding is that a system which receives on one frequency and retransmits on another without demodulating the RF signal is a translator. The principle used in most TV service translators. If the signal is demodulated to audio which is then used to remodulate the transmitter this is a repeater, when used in the Amateur Service. The TV service uses this term for systems at remote mining sites where the TV programme is prerecorded elsewhere, taken to the region and used to modulate a local low powered Tx. It was usually a day behind major centres in programme content. Now mostly phased out of service since most areas have satellite or terrestrial links.

HAPPY ANNIVERSARY

As the WIA celebrates the Seventy Fifth Anniversary of its inception this year so too are celebrations in order in the UK.

The July issue of Radio Communications will mark the diamond anniversary of the RSGB journal which was first published as T&R Bulletin in July 1925.

Shortwave Magazine also celebrates its fiftieth birthday this year.

from Radio Communication — February 1985

AR

NEW VHF CONFERENCE FORMAT AT DAYTON

The Dayton Hamvention's International VHF/UHF Conference will have a new improved format for 1985. The dates this year are 26, 27 and 28 April.

- *There are no VHF Conference forums scheduled on Friday this year so that attendees are free to explore the giant Flea Market and Exhibits during the day.*
- *The unique Noise Figure Contest will be held at Hara Arena beginning at 1800 on Friday. The Arena will be closed to all other Hamvention activities so that the potential RF interference is eliminated. Prizes awarded to winners in the Homebrew category for 144-2304 MHz.*
- *Technical Forums begin at 0900 on Saturday with topics covering Antennas, Propagation, Contesting, Dynamic Range Measurements, and much more.*
- *The Antenna Gain Measurements begins at 0900 on Sunday behind the Arena. Certificates awarded for Highest Gain and Best Figure of Merit, and prizes for winners in the homebrew category. Bands covered are 144, 220, 432, and 1296 MHz.*
- *THERE ARE NO VHF CONFERENCE ACTIVITIES AT THE IMPERIAL HOUSE THIS YEAR.*

For further information contact Jim Stitt WA8ONQ, VHF/UHF Conference Moderator, 311 N. Marshall Road, Middletown, OH 45042.

G-GEORGE PART 2

Alan Hawes VK1KAL
35 Jacobs Street, Evatt, ACT 2617

G-George was given to the Australian War Memorial in 1955 after being flown from the UK. When it was handed over to the Memorial it was only a shell with most of the internal equipment missing. However, recently Eric Gledhill was engaged by the memorial to begin the task of restoring and maintaining the aicraft.

Eric is a former RAF airframe fitter who had by chance, extensive experience on Lancaster planes and the sister aircraft the Lincoln.

The Memorial would be pleased to hear from anyone who knows the whereabouts of any original equipment for Lancasters or Lincolns. Items they are on the look out for are, instruments, fuel cocks, switches, internal lights etc.

During September 84 Morrie O'Keefe VK3KO contacted the VK1 Division to ask for assistance in providing local contacts and operators for the proposed handover of the restored radio equipment for G-George.

Contact was made with the Memorial staff to investigate possible sites for an antenna. At first the Memorial staff where less than enthusiastic about the prospect of an antenna being mounted on the building, but it was explained to them that the antenna was designed to sit on a flat roof with weights to stabilise the mounts.

On Thursday 15th November Alan VK1KAL, Ken VK1NDK met with Morrie to erect the antenna. The selected site was a 20m x 30m flat zinc roof, an excellent ground plan for the 5 band trap vertical antenna. During the erecting process it was decided to add extra weight to the base, which took the form of a "25lb bomb" dating from 1914 which just happened to be at hand.

The most interesting moment for the writer was clambering along the wing of the Lancaster to catch the coax cable being lowered from the upper windows of the aircraft hall. While on the wing I was encouraged by cries of "don't slip", "mind the canvas", "the wings are moving", etc. I need not have worried as after the event I was shown a photograph of the entire squadron's air crew standing on both wings of the Lancaster, a small testimony to the strength of the plane.

The antenna and power were connected ready for a test to see if the equipment had survived the journey from VK3. The first contact on the set up was with Dave VK1DG not exactly rare DX but at least it proved everything was operational.

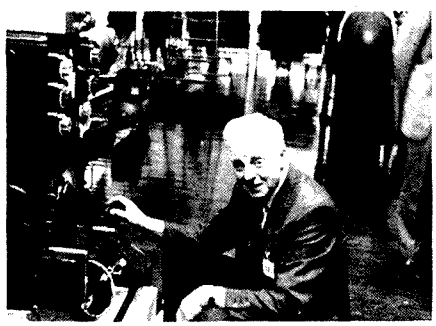
L to R: Jack Wilson and Peter Burnham.

The following day at midday Morrie and approximately forty fellow members of No 460 Sqd Association, together with visitors and friends from NSW, Victoria and the ACT assembled in the aircraft hall of the War Memorial for the presentation. On behalf of the No 460 Sqd, Jack Wilson presented a bound volume to Peter Burnham, curator of Heraldry. Contained in the volume are the names of the 978 members who died while serving with the Squadron.

The voice for G-George, the Marconi Radio Equipment was presented to Jim Heaton, curator of weapons by George Kirk, President of the Victorian Branch of the Association.

L to R: Jim Heaton and George Kirk from Marconi Equipment Centre.

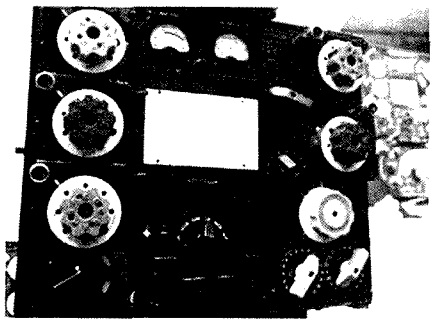
Now all of Morrie's work was to be put to the test. Morrie made contact with the following stations *John VK1NCO operating VK1RM from the Royal Military College, Duntroon, Ces VK1NCX operating VK1WI and Roy VK2DO in Yass.*



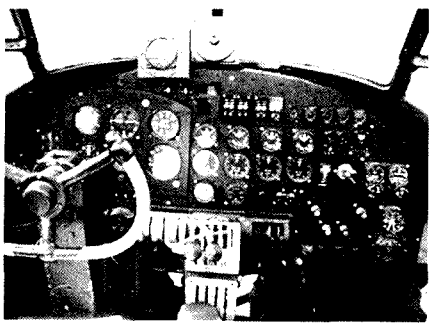
Morrie O'Keefe VK3KD with the radio gear.

Contact was attempted with the No 460 Sqd National President in Adelaide, but unfortunately band conditions were not good not to mention the mercury vapour lighting in the aircraft hall.

The Marconi equipment restored by Morrie was a T1154 transmitter and its companion receiver the R1155. It is interesting to note that these types of equipment provided the mainstay of equipment for amateurs after the Second World War. I have seen advertisements in English post war magazines advertising these items of equipment complete with spare valves for 13/6d, a far cry from today's prices.

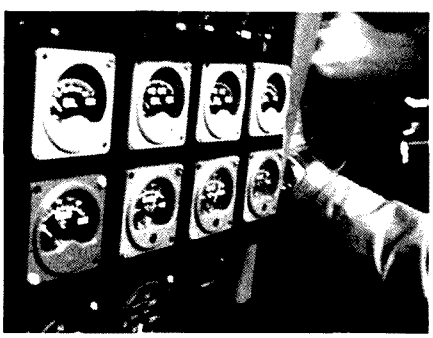


Marconi T-1154.



G-George Cockpit.

Looking towards the Radio/Navigators Post from the Cockpit. On left is Eric Gledhill.



Engineers Panel.

At the moment the radio equipment is on display beside G-George. It is intended to eventually install the equipment in its correct position in the aircraft. When the interior of the aircraft is more fully restored a walkway is to be built up and around the aircraft so that visitors may view the interior.

ICOM-04

Hand-held transceivers are getting smaller. In the Bad Old Days the rule was the higher the frequency the bigger the rig, but not any more. The IC-04 is the latest in a line of high quality, high performance hand-held FM transceivers from Icom. It is only 157 mm (h) x 65 mm (w) x 35 mm (d) and weighs in at around 0.5 kg with battery pack attached. And it can produce up to 5 watts of output with the appropriate battery pack!

I found this unit to be easy to use once I had a little practice and was pleased with the reports on both simplex and repeater operation. Setting the repeater channels into memory gave me some problems initially but this was overcome after re-reading the manual and trying again. The rig came complete with the ubiquitous "rubber ducky" flexible whip. Using this and 3 watts I was able to operate through the repeaters on Mt Dandenong and Mt Macedon from Oakleigh. Mobile operation, using a 1/4 wave 2 m whip was also surprisingly effective. The programmable scan is a nice feature as is the ability to set up a "priority" channel. In use, this last feature allows you to scan channels set in memory yet not miss a call on your special channel. Another fine design point is the battery back up of memory channels — no longer do you need to key in all those frequencies and their offsets every time you switch battery packs or change to another power source.

The only performance parameter that I could check with any useful accuracy was the power output. This was 3 W or slightly more across the band.

Should you wish to operate in the shack or from the car then this little rig can be plugged directly into a 12 V supply or into the cigarette lighter outlet. (Ah ha — a use for it at last!). While you operate the batteries are charged — another nice feature. A range of accessories such as a leatherette case, seven alternative battery packs, headset with boom microphone, variable rate chargers and external speaker/microphone make this a very versatile UHF station.

The construction is solid and professionally finished. The aluminium back is used as a heatsink — very necessary when running 5 W. Because the unit is so compact I would not be keen to service it. Of course full back-up is available from Icom (Australia) Pty Ltd should you be unlucky enough to need a repair.

The world of UHF is something like two metres was twenty five years ago. It is not difficult to get a contact but the pace is noticeably slower and the operators seem friendlier. The dreaded "kerchunka bird" has not yet come to roost on UHF. So if you are interested in UHF FM then I recommend this rig as being worthy of consideration.

The unit evaluated was kindly provided by Icom (Australia) Pty Ltd. For the current price, check the advertisements in this magazine or enquire at your nearest dealer.

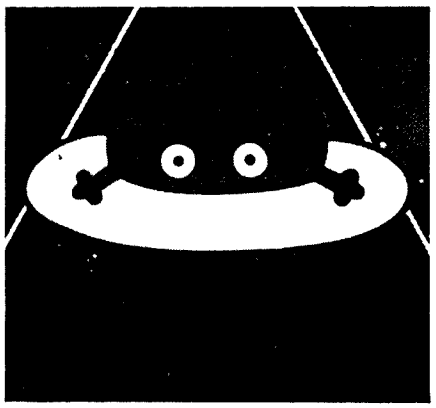
AR SHOWCASE



TOUR TO EXPO '85

Travelaw, the travel agency which organised some very interesting tours for radio amateurs, is planning another tour to Japan.

This tour will include the Expo '85 exposition which is based on "Science and Technology — in the Service of Man".

For further information refer to their advertisement in this issue.

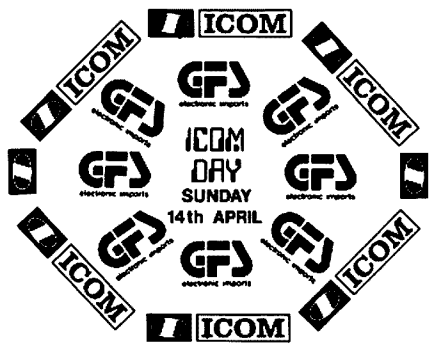
AR

ICOM DAY AT GFS

Icom Australia in conjunction with GFS Electronic Imports are staging, on Sunday 14th April an event unique in Australia to amateur radio. Known as Icom Day, it will be held between 10 am and 4 pm in GFS's showrooms at 17 McKeon Road, Mitcham.

All are welcome to take part in this free event. An I-2A 2 metre handy talky will be provided as a door prize along with free refreshments.

Apart from the chance to meet many other amateurs and SWLs it will provide an opportunity for viewing the latest equipment releases from Icom. Included will be their new HF transceiver, new VHF/UHF



Duoband transceiver as well as Icom's latest entrant to the programmable VHF/UHF scanning receiver market.

Additionally GFS and Icom hope to be able to demonstrate satellite TV from the USA.

Some of Icom's popular products will also have their prices marked down especially for the occasion. All things considered, Icom Day promises to be an interesting and entertaining day. If you would like further details contact either GFS Electronic Imports on (03) 873 3777, or Icom Australia on (03) 51 2284.

AR

HF TRANSCEIVER — THE TS-940S

A new exciting product from Kenwood the TS-940S will be available in Australia very soon.

The TS-940S is a competition class HF transceiver having every conceivable feature, and is designed for SSB, CW, AM, FM and FSK modes of operation on all 180 through 10 metre amateur bands, including the new WARC bands. It incorporates an outstanding 150 kHz to 30 MHz general coverage receiver having a superior dynamic range (102 dB typical on 20 metres, 50 kHz spacing, 500 Hz CW bandwidth).

Engineered with the serious DXer/contest operator in mind, the TS-940S features a wide range of

innovative interference rejection circuits, including SSB IF slope tuning, CW VBT (Variable bandwidth tuning), IF notch filter, AF tune circuit, Narrow/Wide filter selection, CW variable pitch control, dual-mode noise blanker, and RIT plus XIT. The use of a new microprocessor with advanced digital technology controlled operating features, plus two VFOs, 40 memory channels, programmable memory and band scans, a large fluorescent tube digital display with analog-type sub-scale for frequency indication, and a new dot-matrix LCD sub-display for showing graphic characteristics and messages, all serve to provide maximum flexibility and ease of operation. In addition, a CW full break-in circuit, switchable to semi break-in, a built-in automatic antenna tuner, a solid-state final amplifier that is powered from a higher voltage source, a speech processor, all-mode squelch, and a host of other convenience features all add up to even greater versatility of use in fast-paced DX operations. With its power supply and antenna tuner built-in, and with its new whisper-quiet cooling system, the TS-940S is a complete, all-in-one type transceiver that brings tomorrow's sophistication to today's serious enthusiast. The unit may be ordered with the antenna tuner installed or available as an option.

BOOK REVIEW

FROM PASTURES GREEN TO SILVER SCREEN

Autobiography by John W Gerard VK2ADN

Published by the Author

PETER WOLFENDEN VK3KAU

Wireless and Cinematography, two spectacular achievements, paralleled themselves in development. They both became realities during the late eighteen hundreds.

The year that a Lumiere Cine-cameraman, Maurice Sestier, cranked his machine to record the 1896 Melbourne Cup; Melbournian, George Selby, was corresponding with Sir Oliver Lodge about "wireless". During the following year Marconi successfully demonstrated wireless over an eight mile path.

For the next twenty years or so both sciences developed greatly with major improvements being made — often in spectacular ways, much to the delight of a fascinated public. It could be said that both wireless and cinematography converged on each other during the late 1920s with the advent of sound on film.

John Gerard VK2ADN witnessed the spectacular growth of both wireless and motion pictures and has recorded his involvement through the pages of his recently released autobiography.

There is little doubt that John lived a full and interesting life. Growing up in the country with all of its advantages — and many disadvantages — working for and later as a partner with Lawrence (Pop) Penn of "Penns Pictures on Tour" (The Original Picture Showman), hearing the birth of broadcasting and later in life operating and managing the famous Tasma Picture Theatre in Coffs Harbour, NSW. John is also a life member of Lions International.

This autobiography is certainly extensive covering a large range of topics. The contents include 156 episodes with some 270 illustrations. Some of the titles to the episodes are as intriguing as their subject matter. Episode 61 recalls the Monopole Cigar which cost ten pence to buy but 24,000 pence to light. A naked bird — featherless type — is featured in Episode 150.

Amateurs, however, will be most interested in the sections dealing with the first wireless receivers and broadcasting, together with John's involvement in amateur radio. Many old timers — and some not so old! — had associations with Australia's motion picture industry, both in the production of films and the operation of picture theatres. A few amateurs were involved in the development of early Australian sound film equipment. I personally found John's experiences of running film shows and the description of film projection equipment of great interest.

The autobiography is easy to read, covers a wide range of subjects and should appeal to both OMs and YLs wishing to glance back through the first eighty years of this century, through the eyes of John VK2ADN.

Our review copy was made available by the author, John Gerard VK2ADN, QTHR, from whom copies may be obtained. Price is $14.95 plus $2.50 postage and package.

AR

CONFIDENTIAL FREQUENCY LIST by Oliver P. Ferrell

Ron Cook VK3AFW
TECHNICAL EDITOR

If, like me, you are inclined to tune over frequencies other than amateur ones, you may have wished to identify some of the many signals that are without obvious identification. The international broadcast stations always give periodic identifications, but many of the point-to-point or ship to shore stations use callsigns which are less informative. Well help is at hand in the form of Ferrell's book. Unfortunately Ferrell was killed in an accident just before the 6th edition of his book was printed.

This edition is also significant because it includes RTTY stations as well as CW, FAX and of course SSB and AM. It is perhaps stretching the point to call this a confidential frequency list as it is the sixth edition to go on sale to the public however much of the information would be difficult to obtain otherwise. The author and associates have used both government documents and reports from SWL's to check and cross check the listing to ensure that it is as accurate as possible. Of course the nature of utilities is such that some changes occur every day. The 300 pages of listings are quite comprehensive and are accompanied by some 35 pages of explanatory notes.

The advent of little boxes to add to home computers to allow copying of CW, RTTY etc, has increased the appeal of listening in to the utilities and other transmissions not intended for public broadcasting. (Provided you make no use of the information you overhear — other than to entertain yourself — then there is no reason why you should not listen in.) Many SWL's have specialised in listening to utilities around the world. They don't usually get QSL cards for reports on signals from suspected CIA operatives! You might doubt whether these would be on HF but according to this book certain bands often have badly sent CW signals which consist of code groups and whose source seems to be Central America, etc. These are more likely to originate from military or similar exercises although some covert or illicit activity cannot be ruled out.

I found the listings of shore stations running regular weather forecasts to be most Interesting. These p· CW and operate in a similar manner to a beacon in between bulletins. While checking some of these from interstate (to predict band openings into particular areas) I noted a weak signal in the background. The book under review enabled me to quickly identify the signal as being of Canadian origin and having a power level of 1 kW. The region 4.5 to 11.5 MHz is apparently good for working VEs for many hours of the late afternoon and through the evening. Regular DXers are probably aware of this but amateur signals are not sent on a continuous basis and surveying band conditions at times of low activity is difficult.

The listing is in ascending frequency from 4.000 to 25.000 MHz. The stations's mode, call, location, type of service, power and some clarifying remarks are given.

I recommend this book to anyone with a general coverage receiver. Get your copy from AR advertisers such as GFS. The review copy was kindly provided by the publishers Gilfer Associates.

OVERWHELMING RESPONSE

All involved would like to thank all relevant members for returning the AR Questionnaires.

The response was far beyond expectations and must almost collect the record for the most returns for a voluntary return. As soon as the information is formulated on the WIA computer we hope to publish the results in the magazine.

Overall it appears most members are basically satisfied with the magazine, with only a few minor alterations.

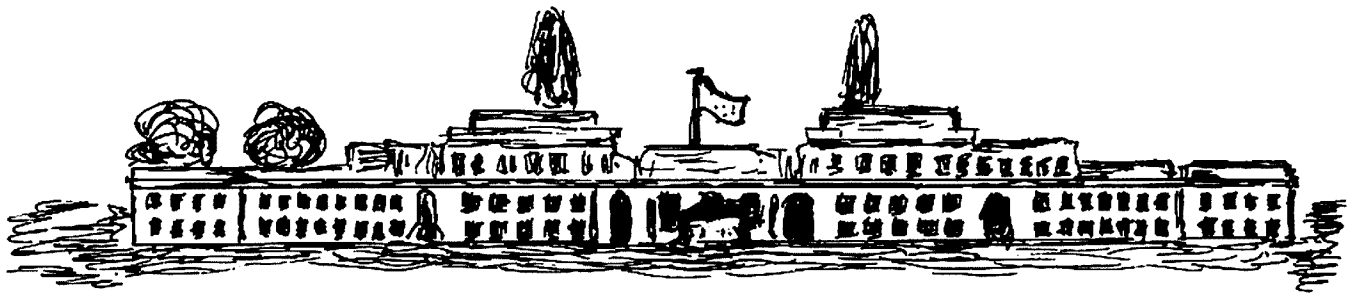
THANKYOU ALL.

Special 75th Anniversary

FORWARD BIAS

VK1 DIVISION

Contribution



AMATEUR RADIO IN THE ACT

Ron Henderson VK1RH
171 Kingsford Smith Drive, Melba, ACT 2615

In preparing this contribution on amateur radio in the ACT for the WIA's Seventy Fifth Anniversary it was the writers aim to concentrate upon the VK1 Division, or to give it its formal name — The Wireless Institute of Australia (ACT Division) Incorporated. However, as the historical research progressed, it was soon obvious that the history of the Division, although in excess of ten years, extended over only portion of the thirty three years that amateur radio has had representation in the Territory. Consequently this article starts with the formation of the Canberra Radio Club, which after five years was renamed the Canberra Radio Society, follows its history briefly through the Riverside Hut Clubroom days and an early abortive effort to form a VK1 division, to the successful establishment of the Division in 1974. The influence of the CB boom is then examined and the history concludes with the current era of stability arising out of maturity.

THE EARLY DAYS OF THE CANBERRA RADIO SOCIETY

We read in the NSW Divisional notes in Amateur Radio in the late forties and early fifties that Roy Rayner VK2DO, of Yass was the zone correspondent and he reported activity from the ACT by VKs 2PM, 2PI, 2TV, 2GU and 2ANR (*remember until 1956 all ACT amateur stations had VK2 callsigns, VK1 being allocated to the Antarctic Territories*).

By December 1951 AR was reporting the formation of the Canberra Radio Club with Ron VK2PM as President, Les VK2PI as Vice-president, Stan VK2ASB as Secretary and twelve other foundation members. The club had some early achievements such as the first Sydney-Canberra two metre contact on 5 December 1951 between VKs 2GU and 2ANF, participation in the VK2 Field Day in October 1952 and allocation of the distinctive club call VK2ACA in November 1952 at which time the membership reached a total of 40. In September 1953 we read of a Canberra get-to-gether, the fore-runner of the famous Canberra conventions. This one was at "*the club-rooms with all mod cons*", Riverside Hut 4, and was attended by the VK2 Divisional President.

From 1954 to the early sixties little can be gleaned of the CRC's activities, no regular notes were submitted to the VK2 Divisional column in AR and the minute books have still to be located. During that period, 1956 to be precise, all ACT amateur station call signs changed to the VK1 prefix, largely through the efforts of Les Pitts VK1PI and Arch Cox VK1GU. The Club's name change also took place in that year.

Photograph courtesy E Penikis VK1VP

The late Les Pitts VK1PI.

By 1961 we find moves afoot to create a VK1 Division, indeed it became an agenda item for the 1962 Federal Convention in Perth. The Convention directed the Executive together with the VK2 and VK3 Federal Councillors to visit Canberra in 1962 to negotiate the matter, but at the 1963 Convention the Federal President reported that the CRS advised they did not wish to pursue the matter at that time.

It was late in 1961 that the President of the CRS received a mild letter of reprimand for his annual report in the CRS Journal which was considered outspoken on Geneva WARC matters by the Federal President.

By the 60s the regular pattern of weekly meetings at the Riverside Hut 4 clubrooms was established, construction of a club station was underway and the first 6 metre contact from VK1 was achieved by VK1PM in February 1962.

The first Canberra Easter Convention was held in 1964 at the Riverside clubrooms and this set the pattern for a series of such activities.

On the VHF front AR for December 1964, in the VHF notes, records three active VK1 stations, 1CR, 1VP and 1ZRX, also that there was an OSCAR 3 satellite capability. In the second half of the sixties we find efforts to make the ACT a separate call area for contests and awards, a growing dis-enchantment with the VK2 Division which was entering a VHF expansion phase and in the view of country members not providing them much support or service.

Near the end of the decade the WIA held a successful 1969 Federal Convention in the ACT but even this action provoked some acrimonious correspondence between Sydney, Melbourne and Canberra.

RIVERSIDE HUT 4 CLUBROOMS

Very early in its existence the CRS was able to

Photograph courtesy E.Penikis VK1VP

Canberra Radio Club outing near Mount Gingera in September, 1952.

obtain a lease of Riverside Hut 4 as a clubroom. The area had originally been a hostel but was later utilised by the Department of the Interior as accommodation for clubs, societies and civic groups.

With the formation of the Council of Cultural Societies and construction of the Griffin Centre in Civic, the Department commenced a demolition programme at Riverside. The CRS correspondence files show letters dating from 1964 requesting vacation of Hut 4 but alternative premises, at no or low cost, were not easy to come by. Indeed it was not until June 1971 that the Society vacated its old clubrooms after negotiating with Civil Defence to use their training room in Civic on a weekly basis. Interestingly enough one very sub-standard Riverside hut remains today, as a snackbar/canteen for government workers in the area.

FORMATION OF THE VK1 DIVISION

Following involvement in the WIA novice licence Inquiry and re-forming of a WICEN register of interested amateurs, the CRS turned its attention to the formation of a VK1 division. The minute book records that in June 72 Federal Executive was asked about the requirements to set up a division and VK2 support was requested. The club membership list showed 40 names (39 callsigns) and the majority were in favour of forming an ACT division.

The mechanics of forming a division first called for the creation of an incorporated body separate from the CRS and at the October 1972 AGM the membership voted for this action. In April 1973 the constitution was forwarded to Federal Executive and the 1973 Federal Convention specified several matters requiring resolution prior to formal admission as a new division. Despite this affirmative decision the 1974 Federal Convention spent a considerable time in committee discussing the pros and cons of small divisions with equal voting rights and an inability to bear a large proportion of WIA convention expenditure before voting for the immediate admission of the ACT Division to the Federal body. The new Federal Councillor and Alternates then took an active part in the Convention.

Up until this time the CRS was obliged to tread a wary path in its dealings with the VK2 Division. Much concern had built up nationally over 2 metre repeater band plans coupled with a lack of confidence in the management of the VK2 Council. Indeed on at least two occasions in two years the CRS was represented, with large proxy lists, at Special General Meetings in Sydney.

Upon formation of the incorporated, but not yet Federally accepted VK1 Division the CRS handed over all its assets except for a token sum of cash, with provisos, including one that the Division renew the VK1ACA callsign for a number of years. The beacon and repeater projects were also handed over and the CRS went into recess in August 1973.

Some of the early actions of the new Division were to replace the CRS bulletin "The Repeater" with a new newsletter "Forward Bias" so named to indicate leadership rather than reiteration; to obtain a licence for VK1WI and to originate news broadcasts weekly on Sunday evenings at 8pm local time on 80 and 2 metres. A WICEN co-ordinator was appointed and AOCP classes were commenced.

An Easter Convention was held in 1975 and that year saw the expulsion of a member for unlicenced CB operations culminating in a prosecution. At the request of the membership the monthly meeting format was revised to reduce business matters and place increased emphasis on technical lectures and presentations. Fox hunting commenced in 1976 and hunts were held regularly, both of the direction finding and talk-in variety. These afforded members practice which showed up at amateur radio conventions in NSW and the ACT.

Once again the matter of a home or clubrooms for the Division was raised and a sub-committee was formed to examine the situation; sadly their recommendations led to no permanent solution and monthly meetings continued at the Griffin Centre, Civic.

THE CB ROOM

The mid seventies brought with them the Citizens Radio boom and its inevitable impact upon amateur radio. The ACT Division was very active in the formulation of a WIA policy on CB, extending to liaison and technical advice to the newly formed National Citizens Radio Association in their quest to legalise CB. The Division and indeed most thinking members of the WIA saw the citizens radio boom as a potential source of expanded WIA membership, despite its attendant interference and "pirate" operator problems, due in part to an out-of-date Wireless Telegraphy Act which severely constrained Departmental control of illegal operating.

Following a good start with CB liaison an incident arose which led to the resignation of the Divisional President of the day and an attempt to *reform the* Canberra Radio Society as a society of amateur radio "excellence". The President held strong views on the value to the Division of its own clubroom premises, indeed some ten years earlier when President of the CRS he had proposed a similar course of action, without success. The Division entered into negotiation with the WIA Federal body with the aim of

building a National Headquarters in Canberra; utilizing a portion of the building eventually for a Federal office, a portion for an ACT Divisional office and letting the remainder to secure income to finance the investment. In the event the proposal caught the WIA at a time of expanding inflation accompanied by budget over-runs which meant they were unable to pursue the scheme. The President then consulted with CB organizations as to their interest, but this was considered by the membership beyond his terms of reference and his resignation was accepted.

STABILITY WITH MATURITY

Following the CB boom the VK1 Division settled down to steady progress on several fronts. VHF enthusiasts were catered for by the installation of a second 2 metre repeater, this time located on Mt Ginini in the Brindanella Range. The repeater, having one of the highest sites in Australia, provides a coverage extending from Albury in the south to Newcastle in the north east and Tathra on the south coast when conditions are good. Interest in WICEN was revived and a portable generator was purchased, financed partially by a community assistance grant.

April Fools Day 1978 brought a major setback to the Division, the Mt Ginini repeater was stolen and use of the site came into jeopardy. The same year VK1PA sailed as a radio operator/scientist crew member of Solo on a voyage to Antarctica, "Forward Bias" went bi-monthly as, in the editors words, *"a measure of the apathy in the Division"*, then to cap it all VK1 won the Remembrance Day Contest and coveted trophy.

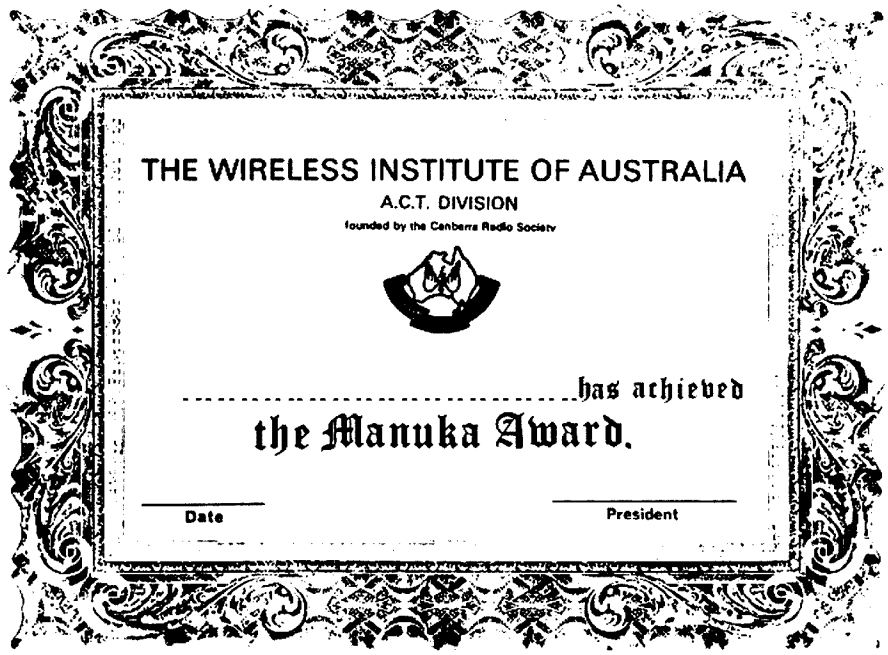
The membership voted unanimously to restore the repeater, an appeal for donations was launched and construction of a replacement unit commenced. In parallel a concrete block house was constructed on Mt Ginini by volunteer labour to guard against a repeat of the theft. Much later the original repeater was recovered by police in Melbourne and the Division ended up with a reserve unit which permitted maintenance by exchange of major assemblies.

As part of a move to publicise the VK1 call area and ensure that VK1 stations were available for contacts, a sub-committee was set up to plan a VK1 award. The Award which was introduced in 1980, has higher level endorsements for contacts with greater numbers of VK1 stations. A net has operated on 80 metres after the Divisional Broadcasts on Sunday evenings for over four years and several Australian stations have achieved the 100 contacts endorsements, no mean achievement when there are only some 320 licences total in the ACT.

Late 1979, early 1980 interest in UHF led to the commissioning of a temporary 70cm repeater by the CRS. This project was later taken up by the Division, however the repeater is still not operational on its final site, Mt Ginini. This long gestation is indicative of activities of a complex nature when supported by a small active UHF membership base.

An original Gestetner quality QSL.

By 1980 the *"Worked All Manuka Mobiles"* or *"WAMMY"* Award had arisen to bring a degree of levity to serious award hunting. To achieve the award stations must contact other stations mobile in the Canberra suburb of Manuka and exchange odometer readings. Gestetner quality paper QSL's frequently are issued by the activating station at Manuka and the award is a high quality photo copy of a "rare master" certificate. With the incorporation of Divisional newsletters as columns in the journal, Amateur Radio, June 1980 saw the last local issue of "Forward Bias". Even so news sheets have appeared from time to time at monthly meetings to bridge the leadtime gap of the magazine.



The year also saw the relocation of the Mt Majura 2 metre repeater to Black Hill, near the Tidbinbilla tracking station and installation of the 2 metre beacon at the vacated site.

In the International Year of the Disabled, 1981, Chitary Moriyama JH6THP visited Australia and coupled with his visit a radio club and station VK1WVH was set up in the rehabilitation unit of the Woden Valley Hospital.

By now the Division had formed strong views on its operations and objectives. A membership drive was made and free QSL services restricted to members. The annual JOTA involvement brought co-ordination difficulties, lack of control of youthful participants and a perceived lack of awareness in the scouting organization, a situation fortunately not as apparent with the guiding movement.

Prudent financial management, based upon an annual budget, allowed surplus funds to be invested in both 1982 and 83; perhaps this is a small beginning to realisation of the vision of Divisional clubrooms.

In 1982 the first of a successful annual public relations exercise was conducted with the operation of a special event amateur station, AX1ITU, in a public shopping mall on 17 May, ITU day. This first display station was manned by the local 10-X Chapter but the Division has organised it in recent years. Public exposure of amateur radio has also been achieved by operating the Divisional station VK1WI from a public recreational park each John Moyle National Field Day, utilising a roster of volunteer operators to submit a 24 hour multi-operator contest log entry.

Amateur television and amateur satellites came to the forefront in 1983 and 84. The Division, after a successful ATV demonstration night by the VK3 roadshow, formed an ATV group whose efforts will culminate shortly with the commissioning of an ATV 70cm to 50cm repeater at the Black Hill site. An amateur satellite interest group, which included several tracking station employees amongst its numbers, set up and operated a special station, VK1ORR, for the STS-9 Shuttle Mission in which Owen Garriott, W5LFL made contact from space with amateur operators around the world.

By 1983 sizeable elements of the Department of Communications had moved to Canberra, a move to be completed in June 85 when the last branch, the Operations Branch relocates. The VK1 Division, perceiving a need for the WIA to maintain close relations with the Radio Frequency Management Division policy makers of the Department, offered to assist the Federal Executive by providing two Canberra liaison officers, VK1RH a former Federal Councillor and VK1JL (formerly VK1CDR) a former member of Executive.

The Division holds the view that much of the routine supportive work for amateur radio in Australia can be carried out by small informal, as well as formal, sub-committees of the Federal Executive, tasked to progress specific issues. This approach utilises the existing specialist and diverse skills of members and reduces the demands on the VK3 membership who must not only appoint office bearers for their own Division but also provide the greater number of Federal Executive members. It also delays the time when further paid staff need to be employed by the Institute.

SUMMARY

Amateur radio has been alive, well and represented in the ACT for over thirty three years. For the greater period the voice of the amateurs was the Canberra Radio Society. Building upon that foundation the ACT Division, the newest division in the WIA, is now in its eleventh year and has passed through the restless years of adolescence to become a mature responsible body, not afraid to voice its opinion and contribute to the future of our hobby.

CANBERRA'S PIONEER BROADCASTER

Fred Robertson-Mudie VK1MM
Box E46, Queen Victoria Terrace, ACT 2600

Jock Ryan, who was the founder of Canberra's first radio station 2CA, died in June 1984 at the age of 87. He left behind a tape of memoirs which provides a delightful insight into the early days of radio in Australia. The tape has been transaibed into a booklet by 2CA.

Ryan's first contact with wireless was during the Great War when he served for about six months with the 1st AIF Wireless. This was totally CW, of course, and using spark equipment. He later gained a Marconi Marine Operators Certificate, also on spark equipment, as he noted, he had never seen a valve. He also did about seven years in the Post Office as a cadet mechanic, doing just about everything that could be done in telephony and telegraphy at that time. Ryan mentioned that his other 'qualifications' included having done a little electrical contracting, a Mines Department certificate to drive a steam engine and a diploma for playing the piano!

OUTSTANDING RESULTS

By the late 1920s, Ryan was running a small radio, electrical and musical business in the Canberra suburb of Kingston, and struggling to make a living — the population of the "Bush Capital" was then around 8,000. About 1930 he was "bitten by the mad wireless bug" and, with his Marconi certificate, obtained an amateur licence. In those days, of course, the amateur licence was still called an experimental licence (in both Australia and the UK the experimental licence became an amateur licence after World War II), and he was issued with the callsign VK2LE. This must have been one of the first VK prefix callsigns in this area as the VK prefix was adopted in 1929 to replace the OA series, and, of course, the ACT was not allocated the VK1 prefix until 1957. As Ryan had to rely on his memory to make the above mentioned tape (most of his radio related records were destroyed in a fire at 2CA in 1955) he was not able to recall too much detail of his purely amateur activities. He did note though, that his equipment was home brewed and "very primitive", and that he started operating on the 40 metre band with about 2 watts on CW. He had a lot of fun with a lot of other amateurs in the same position, particularly on their Sunday morning sessions. They were all very keen, all experimenting, and some achieving outstanding results.

MAN IS KING

Around that time, the news came out that radio station licences were to be issued for country areas and Ryan applied for a licence for Canberra as he thought "*it wouldn't be a bad idea to help sell radio sets and records*". Whilst he didn't consider himself to be qualified to run a radio station, he relied on the fact that "amongst the blind, the one-eyed man is king"! In his application he promised to give them church services and whatever else seemed, at the time, to be the proper thing to be put in an application for a radio station licence.

LOAN OF A JAR

When the licence was issued for 2CA, with a power of 50 watts, Ryan was deluged by people trying to sell him a transmitter, including AWA, but he decided to build it himself. He then turned his attention to acquiring equipment and parts, and bought a 5kV oil filled transformer from the Department of the Interior "for a song", two towers from the Royal Military College for a similar price, and steel cable for guy wires from a rain making balloon experiment. He also acquired various second-hand parts from disposals stores, the Post Office, the Navy or from wherever he could get it. The Institute of Anatomy lent him a large glass jar to make a variable condenser for his linear after two had broken on the way up from Melbourne. Ryan recalled that "*In desperation, they took a body or something out of one of their jars and lent it to me until a third jar successfully arrived unbroken*". He had to buy some of the equipment new, including the valves, but at a total cost of £200, 2CA officially opened on 14 November 1931 from his shop in Kingston.

FROM THE LION'S DEN

Ryan estimated his listening audiences at that time was around 800 but, despite this, he did everything he could to get as much variety into his programming as possible, musically, topically and to an extent politically. He broadcast concerts from the Albert Hall, regattas from the aerodrome, political broadcasting from Parliament House, and a broadcast from inside a lion's cage at a local circus (and even managed to get in an advertisement for Arnott's biscuits whilst doing it). He did what was probably the first Australian broadcast for the Communist Party, and charged their President, Lance Sharkey, the unheard of sum, in those days, of £10 for a ten minute broadcast.

HERE IS THE NEWS

It was not long before 2CA decided to start a news broadcast, and Ryan hoped to buy news from the local paper, the Canberra Times, but this fell through due to the paper's news being under contract thus not allowing them to sell it to a third party. Ryan's solution to the problem was simple, he picked up a copy of the Sydney Morning Herald at the railway station on his way to the transmitter, which was by now located at Molonglo, took what he wanted from the paper and paraphrased it here and there to avoid any copyright problems. The station also began another practice which, nowadays, would be considered highly unethical. Every now and then, in among the general news, they'd say things like "*There's no truth in the rumour that hats can be bought anywhere cheaper than at Maloney's*". They would then go on with the next news item. In Ryan's words "*Nobody seemed to mind and I think that Reg Maloney sold quite a few hats out of things like that*".

THE SPORT OF KINGS

The Melbourne Cup was another feature which was unethically acquired. Ryan used to go a few miles out into the bush away from interference, pick up an appropriate station broadcasting the Cup, dial 2CA from a handy telephone and hook the radio receiver across the telephone line. This resulted in a no noise, no interference perfect broadcast of the Cup from 2CA.

COOKING BAKELITE

By about 1935 the station was still broadcasting in sessions, usually at breakfast time and lunchtime, and the station was given permission to up the power to 500 watts. Ryan, like many amateurs since, found out what RF can do by way of heating. They had a fixed condenser made of fragile zinc plates and, to provide a bit of strength, had slips of bakelite placed between the plates. The bakelite started to cook so they had to pull it out smartly and put in slips of glass instead. This had the happy result of causing a great improvement in the power output, but also resulted in the insulation on the jumper wires between the tank coil and the variable condenser bursting into flames.

METEOROLOGY SERVICE

In between sessions, the station also doubled as Canberra's first Air Traffic Control centre. The notorious winter fogs in Canberra made it difficult for aircraft to find the airfield and the Department of Civil Aviation made a contract with 2CA to work the Sydney flight into Canberra. This continued for about eighteen months from 1935. As the station broadcast on 285 metres and the aircraft were on 900 metres,

they made a receiver to cover the aircraft's frequency and the Department installed receivers in the aircraft to cover the 2CA frequency. The arrangement should, in theory, have made two-way conversations, most of which were in CW, possible but the 2CA carrier tended to swamp everything including the broadcasts of the horse racing by inter-state stations which were avidly listened to by Canberrans when 2CA had shut down between sessions. This problem was solved by working the aircraft between races! Ryan and his off-sider even provided weather reports for the aircraft, and swotted up on sufficient meteorology to be able to provide this service. They were, however, always 610 metres out in their cloud heights as they gave the heights above sea level instead of above airfield level, but all the pilots had instructions to make allowance for the error.

Ryan's interest in aviation may have arisen out of this branch of his broadcasting career, and he became a foundation member of the Canberra Aero Club — although he almost put the club out of business when he crashed its only aeroplane.

INK RECORDER

By 1938 the station had increased its power to 2,000 watts and had shifted the transmitter to the present site at Belconnen — though the first site they chose at Belconnen was gazumped by the ABC. They imported a Blawknox tower from America, believed to be the first and only one ever imported here, for the cost of £1,200 installed. It had no guys and was supported on large insulators which would take either pressure, compression or tension, according to the wind. It was of sufficiently unique design that all the mast and tower manufacturers came and had a good look at it. By this time 2CA had become part of the Macquarie Network, and they installed what was called a Caihlo circuit on the line to 2GB in Sydney. This circuit allowed a Morse key to be used for sending messages over the line without interrupting the programme. An ink recorder was installed in the studio to give a hard copy of any messages and to allow anyone to decode the messages.

THE END OF AN ERA

Ryan sold most of his holdings in 2CA, but stayed with the station as Chief Engineer. During the Second World War he joined the RAAF where his talents were quickly recognised and he made contributions in the radar section. After the war he taught electronics in the Newcastle area with an outstanding pass rate among his students. His death last year marks the passing of an era in both the amateur and broadcasting history of Australia.

AR

THE BLACK HILL ATV REPEATER — VK1RAC

Kevin Olds VK1OK
238 Southern Cross Drive, Latham, ACT, 2615

They say everything comes to those who woit which, it is hoped, will be true when the VK1 ATV repeater goes to oir early this year. This is the story of the repeater thus far.

The story began in mid 1962 when it was decided by the ACT Division of the WIA to bring the ATV roadshow gang from Melbourne to speak at the October 1982 General Meeting. This involved a host of arrangements including changing the usual meeting night from a Monday to Saturday. This was all duly accomplished and a very successful meeting was held which lit the spark of ATV in VK1 land.

A group of those interested in ATV got together and began the process of getting active on 70cm ATV. Before any transmitters were on air it was known that Canberra's terrain was going to make simplex ATV a difficult proposition. Thus was the repeater born.

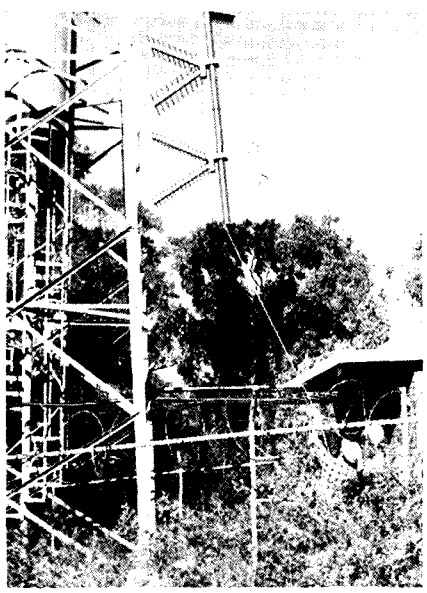
As the Division already had two active repeater sites it was decided to use one of these, Black Hill the site for VK1RAC the 2 metre repeater on CH 6900. Black Hill is the site for the collimation tower for the Tidbinbilla Deep Space Communications Complex and also houses Telecom equipment. The site is closer to the city than Mt Ginini and despite its lower elevation is a far better prospect for ATV. A 90 degree beamwidth antenna could cover all Canberra. The site owners agreed to our use subject to one condition — the fourth harmonic of the repeater's output frequency, which falls in the 2300 MHz band, must be unmeasurable on the Tidbinbilla equipment. This equates to being — 184dBW! The 2300 MHz band is of particular interest to the Tidbinbilla complex hence the condition.

Undaunted by this constraint planning continued. Contacts were made with the VK3 and VK5 ATV repeater groups and ideas gathered. The basic design principles were then laid down:

- *Input 426.25 MHz ATV with output on 579.25 MHz.*
- *A voice input would also be provided on 147.4 MHz to permit full duplex audio operation.*
- *All control would be by microprocessor, thereby allowing for greater facilities largely by software development.*
- *Repeater control would be via touch-tones on either audio input.*

Facilities to be provided ultimately include:

- *full duplex audio using 2m*
- *test pattern generation*
- *walking board displays to publicise coming events etc*
- *audio source selection*

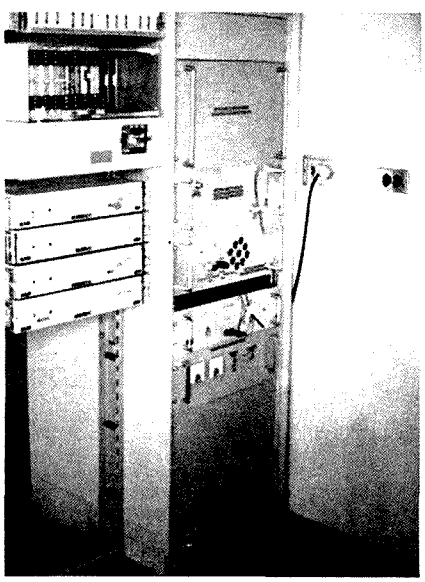


The Corner Reflectors being raised up the Collimation Tower.

- *video source selection*
- *video processing*
- *display of repeater command codes etc*

Detailed design and construction work commenced during 1983 and efforts to date were shown to the Division at the October 1983 meeting — the October meeting had become ATV night. Test transmissions using portable equipment had confirmed the suitability of Black Hill for an ATV repeater.

Work continued in 1984 as the small group pressed on. Some antenna hardware was erected on site and coax cables installed before winter set in. A recent change in antenna design due to feed problems will mean some changes to the hardware already installed but such is life. The microprocessor controller has grown to two, one for control purposes and one for the video display functions. October 1984's ATV night saw the demonstration to the membership of the receiver, audio and video selection and micro-processor controller. The transmitter was also displayed in its non-working state. Work is now (Jan 1985) almost complete on the transmitter stages and filters and systems testing will begin soon.



The VK1RAC equipment rack.

It's been a long hard road but there is light at the end of the tunnel. In true amateur tradition the repeater is largely home brew which adds to the development time but keeps the cost down, the knowledge level up and guarantees that the end product will do exactly what we want. When complete the repeater will be a valuable asset to the Division. Most members will be able to watch its output on their home television sets. Proposed uses already include Divisional broadcasts, broadcast of educational material for members as well as delayed broadcasts of the monthly meetings. No doubt other applications will suggest themselves.

Top Left
From left: Dick VK1ZAH, Bill VK1MX and Neville VK1NE starting to haul all the equipment out of the truck.

Bottom Left
VK1MX and VK1ZAH with some more equipment including the corner reflectors.

The corner reflectors being raised up the collimation tower. Various other NASA antennae is on the tower and the channel 6 repeater VK1RAC antenna is at the very top.

The collimation tower.

This story wouldn't be complete without mentioning the people whose hard work and effort have made the repeater possible — Paull Bell, Greg Black, Jim Clark, Reg Dwyer, Dick Elliot, Neville Eyre, Dennis Gibson, Ron Henderson, Bill Maxwell, Kevin Olds, Brian Rhynehart and Richard Siede plus those others who have helped in many small ways.

AR

COMPANY ANALYSIS BY COMPUTER

The first phase of a $36.75 m computerised business reporting service, which delivers print-out assessments on 250,000 UK businesses directly to its international customers' print terminals and personal computers has been inaugurated by Dun and Bradstreet, the London-based commercial information agency.

Named DunsPrint, the service is claimed to be the first of its kind in the world. Separate European databases will be computerised on a phased basis with the Netherlands, France, Belgium and Eire having their own centres by 1985. By that time, DunsPrint files will have information on more than five million European businesses. Information can be cross-referenced and transmitted internationally.

Other European countries, including West Germany, Italy, Spain, Switzerland and Portugal, will be brought into the DunsPrint scheme by 1986.

A customer needs a print terminal or personal computer and a telephone. He or she dials an assigned telephone number which connects to the firm's database in London. Hard-copy business information can be printed in seconds, providing a summary of a company's history, status and credit-worthiness.

AR

BLACK MOUNTAIN TELECOMMUNICATIONS TOWER

Fred Robertson-Mudie VK1MM
Box E46, Queen Victoria Terrace, ACT, 2600

The ACT hos quite a number of important communications facilities in both Canberra city and the surrounding territory ranging from the Naval and RAAF stations at Belconnen (both of which are well known to amateurs due to their potential and actual interference abilities at times), to the Space Tracking stations in the southern ACT and the Department of Aviation facility on Mt Ginini. In fact, a large number of the hill tops have antennas of some form or description on them. However, the most outstanding and arguably the most important facility is the Telecommunications Tower on Black Mountain. The tower itself is not unique, there being at least two dozen others in various ports of the world, nor is it the tallest as at 183 metres it is only about one third the size of the Toronto tower. It is though, one of the most outstanding due to its award winning design and its location on a mountain top in the middle of the city, and provides Canberra with a unique land-mark.

The necessity for the Tower came about through the dramatic growth in telecommunications traffic in the region over the past thirty years. Canberra is a significant source and sink for trunk line traffic as well as a major repeater in the main Sydney-Melbourne trunk route. The increasing traffic on the trunk route, in the SE region and in Canberra itself was liable to be severely inhibited by the limitations imposed by the finite number of lattice type towers that could be accommodated on the various hill tops around Canberra. The only options open were to further clutter up the hill tops or to try and centralize as many of the facilities as possible in the one unit — with the added advantage of being able to remove quite a number of the existing lattice towers some of which were beginning to look like veritable hedgehogs due to the number of antennas on them.

The desire for a centralized facility evolved into the concept of a single aesthetically acceptable tower which would meet all requirements known and predicted, and flexible enough in design to cater for shifts in emphasis between the types of services to be catered for. These services included telephony and TV relays, mobile radio and paging and TV/FM broadcasting. It was also considered that such a tower should provide facilities for all requirements for up to fifty years, without any significant extension to the tower structure or associated buildings.

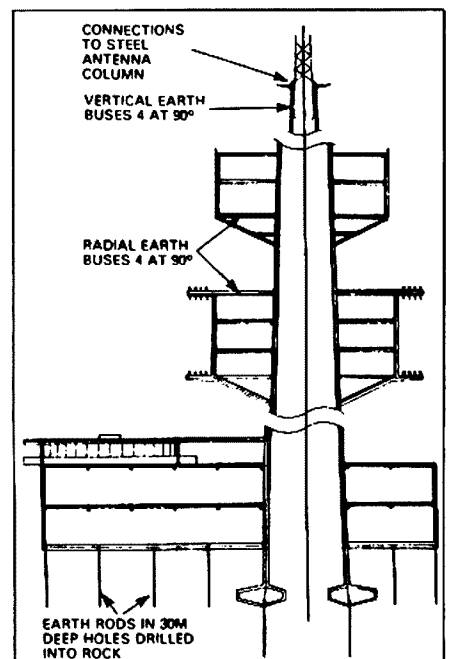
The design of the tower had, among other things, to take into consideration the number of antennas likely to be required as well as the types of antennas needed to achieve the ERP's required for TV and FM broadcasting. In view of the rather broad vertical radiation patterns needed, it was not possible to use very high gain antennas which would have given narrow vertical radiation patterns with resultant difficulties in achieving sufficient "null fill" down to the 10 degree depression angle specified. It was also desired to minimise the cross sectional size of the tower to reduce the visual impact and, as the antennas for the broadcasting services were to be co-masted, each had to be limited in vertical aperture and hence gain. In view of the large number of TV and FM channels to be catered for, it was decided that multi-channel systems should be employed as much as possible. The solution adopted was to design for four stacked antenna systems as follows:

- *TV band II (channel 3 and 5 later changed to channel 3 and FM)*
- *TV band III (channel 7 and 9 later changed to channels 7, 9 and 10)*
- *TV band IV (up to four channels)*
- *TV band V (up to four channels)*

The design also had to take into account antennas for around 80 channels mobile and radio paging, and the parabolic dishes required for the full deployment of the microwave frequency bands between 2 GHz and 15 GHz in each of three directions. In the case of the microwave dishes it was considered essential to reduce waveguide losses and intermodulation noise as much as possible by locating the transmitters as close as possible to the dishes. Thus, the three floor "drum" design evolved, with the height of the bottom of the drum being set by the minimum height needed to give satisfactory paths to existing and future repeater sites. The required co-masting of a number of antenna systems with the electrical requirement to have a decreasing maximum cross-sectional size of column with increasing frequency band of operation resulted in the need for a long and fairly slender structure which would have to take account of the effects of wind loading, solar heating and the low temperatures experienced in the Canberra area. The resultant tower design is shown in figure 1.

Another design problem to be overcome was to allow for sufficient space inside the tower column for cables, feed systems and access, particularly for the large diameter TV/FM broadcasting feeder cables. The usual practice was to feed each antenna with two cables and, in the case of the UHF bands, this involved plastic jacketed corrugated outer co-axial cables of 6 1/8 inches diameter with a large bending radius. For runs from the microwave equipment to their associated dishes, flexible corrugated plastic jacketed elliptical waveguides were adopted. There was also the need for, where cable penetrated through the concrete tower shaft, floor slabs and building walls, the penetrations be fire rated and weatherproof. Eventually an existing commercially available multi-cable transit frame (MCT) system was adopted which consisted of a cast-in steel frame with modular silicon rubber locks, either solid or in two halves, with an appropriate sized hole in them to seal the cable to be installed.

An important aspect of the tower design was the need for the protection of both personnel and equipment from lightning strikes. This was accomplished with a standard lightning rod atop the antenna column, with the column tied to the reinforcing steel of the tower structure, various radial earth buses and 30.5 metre earth rods at the base of the tower. The system was also tied to various vertical down conductors, reinforcing in wall columns, antenna mounting rails, window frames and other metal components. The resultant system encloses both the public and communication drums in a Faraday cage. The system is shown in figure 2.



Lightning Protection System

Figure 2.

Apart from its importance as the transmitting station

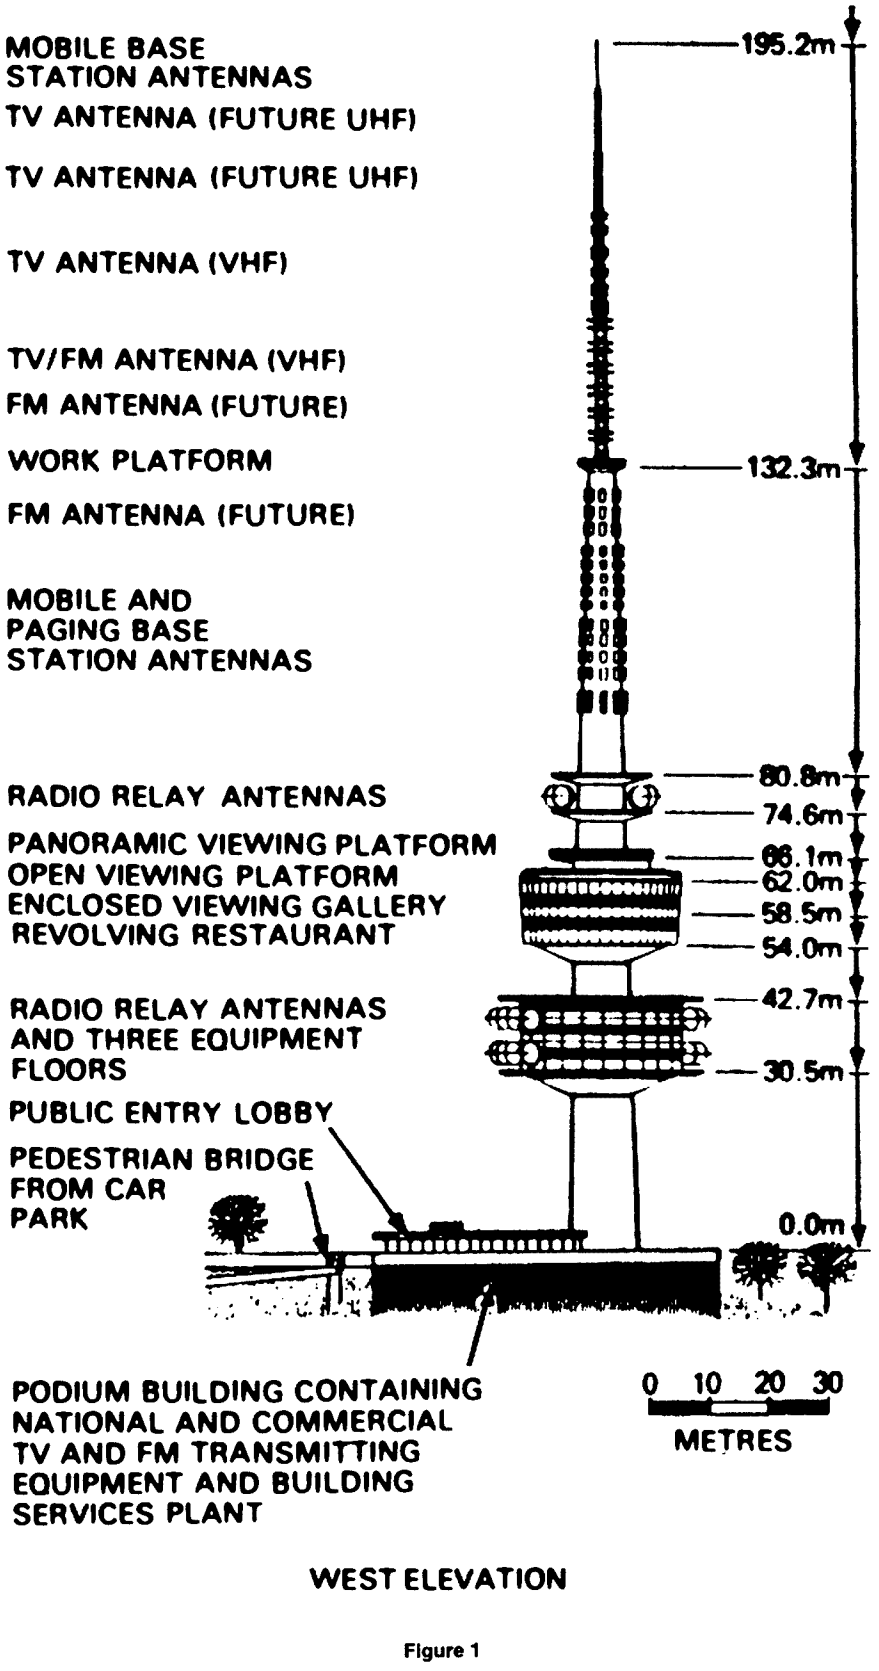


Figure 1

for Canberra's TV and FM broadcasting services and as a base station for other radio communication facilities, the tower is, as mentioned above, a key station in trunk communications for Canberra and an important node in the intercapital broadband network. Digital and analogue bearers routed through the tower are carried on both co-axial cable systems and on microwave radio links and, in addition to the telephony links cater for up to five simultaneous interstate television relays as well as national regional relays from Sydney and Melbourne and relays originating in Canberra. It is expected that many of the TV relays will transfer, in due course, to the national communications satellite and that, in the longer term, a trunk optical fibre cable system will be installed on the route. This will allow for recovery of some of the capacity for other services which, at the current rate of growth will be completely taken up in five to ten years. There is also expected to be considerable growth in the mobile radio services on the 80, 160, 450 and eventually 900 MHz bands, and the tower will accommodate the public mobile telephone service which is scheduled for Canberra in May 1985.

Briefly, in regard to the technical side of the broadcasting equipment in the tower, the national television service is provided via two AWA type TVB-10C transmitters operating in a parallel arrangement with an output power rating up to 12 kW peak vision power. The associated sound transmitters are frequency modulated and produce 1 kW output power. The Marconi driver stages of the transmitters are IF modulated with the VSB shaping done at low level with an IF of 38.9 MHz. The FM sound and VSB outputs are combined into one feeder in an external diplexer. Each complete transmitter uses three air cooled valves, one each for the vision and sound amplifiers and one for the driver stage vision output.

The FM transmitter is a Siemens type SU 10/6209, though the spare NEC unit is currently in use. The stereo multiplexed signal is fed to a 50 watt VHF FM modulator which is used to drive a 10 kW PA stage. The output is fed via a directional coupler to the TV/FM diplexer and then to the antenna system via a patch panel/antenna splitter.

The antennas for the national and commercial services are identical designs and comprise sixteen broadband dipole panels, four on each face at four levels. Each panel contains two or four full-wave dipoles on a reflecting screen and are fed in parallel to obtain the desired radiation pattern. The antennas have approximately 10 dB gain.

The commercial transmitters are in a separate, locked area and are remotely controlled from the studios of the commercial station. Their transmitters comprise a pair of NEC units rated at 20 kW. The SBS UHF transmitter, which utilises a water cooled 40 dB gain Klystron, is also an NEC unit, and is rated at 30 kW. It is, however, run at 20 kW due to antenna problems.

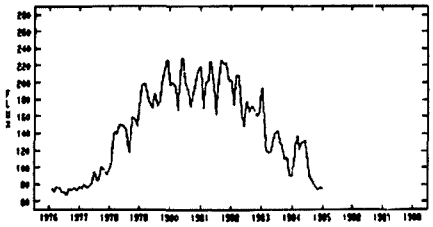
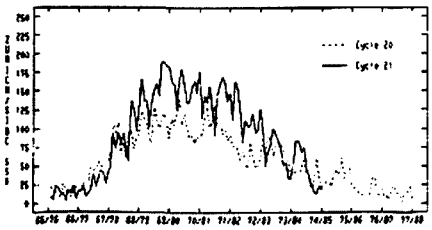
HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

Is it possible for band conditions to become less productive than they are at the present time? Well according to Lee in KH6BZF Reports and by looking at the graphs he has produced, they can and will. The graphs reproduced from Lee's publication indicate that we have not reached the bottom of the barrel yet. Not a pleasant thought but the bands do behave unnaturally at times and one can be quite surprised. 28 MHz, for example, should never be overlooked. For proof, listen when a JA contest is on, and at times like this, it can be quite active.



SOLAR CYCLE 21 — 10.7 cm FLUX



SUNSPOT CYCLES 20 and 21

Reproduced by courtesy of Lee KH6BZF and KH6BZF REPORTS

Newcomers need not be deterred, there is plenty of DX around for the patient operator with the correct technique. Listen and join in some of the contests this year. You will increase your operating skills, make new friends and formulate your own style of chasing the elusive countries that you need. Good luck and good hunting.

A tip of good news from Lee is that good HF possibilities could occur between the 4th and 12th of this month. That would be a nice Easter present for all DXers!

CLIPPERTON

At the time of writing these notes, the countdown for the Clipperton Expedition was still proceeding. The boat, a 35 metre sport fishing vessel named the "Royal Polaris" was due to leave San Diego, duly loaded with all the necessities for a successful expedition, on the 27th of last month, picking up the operators who include W6s-SZN, OAT, RGG, N6GJ, KK6X, N7NG, K3NA, WA7NIN, F6GXB, F9LX, DJ9ZB, TI2CF, XE1ZZA, JG3LZG, FO8GW and HL, in Mexico three days later and an estimated time of arrival at Clipperton is the 3rd of this month.

All QSLing will be done through the Yasme Foundation, PO Box 2025, Castro Valley, CA 94546. Cards with no return self addressed envelope will be sent via the bureau.

The operators are planning for three stations to be on air around the clock and hope to utilise all bands from 160 to 10 metres on CW and SSB with maybe some RTTY. If the equipment can be obtained Oscar will be catered for too.

The cost per operator is in excess of US$3,500 and that will not cover even a small proportion of the total expenditure. Donations are sought and in the event of a non event they would be returned immediately.

Let us hope we hear Clipperton activated for the first time in more than half a decade.

Those that have worked it and have it confirmed please give the "newer" licensees a big chance at this one!

NAVASSA

Another DXpedition scheduled for the 4th to 9th of this month is Navassa, which is being actuated by mainly Jamaican amateurs. According to all reports the US Coast Guard has given approval and it will not be like the HH0N operation, which didn't obtain accreditation.

SILENT KEY

Hilda "Gem" Collins VE3COA/G3YXT passed away on the 30th January. "Gem" as she was affectionately known by DXers world wide, from the various areas she operated, will be sadly missed. Condolences to George VE3FXT.

GOING HOME

John ZD9CC, who has been the School Principal at Tristan de Cunha, has completed his tour of duty. QSLs to ZS2DK.

CHINESE STATIONS ACTIVE

The Chinese stations are very active, including the latest addition, BY5RF, the station of the Chinese Science and Technology Association of the Fujian Government. This well equipped station also runs Oscar 10, Mode B.

CZECHOSLOVAKIA

The licence structure in OK falls into the three following categories "A", "B" and "C". The "A" licences is allowed 300 watts output whilst the "B" type is allowed 50 watts on all modes. Class "C" are allowed use of part of the 1.8, 3.5 and 28 MHz band with 25 watts output. There are also phone only 144 MHz licences and "youth" type permits for those between 15 and 19 years of age who use 1.8 and 144 MHz with 10 watts output.

The prefixes denote the following: OK1 Bohemia, OK2 Moravia, OK3 Slovakia, OK4 is used for maritime operation (/M for rivers and /MM for the open sea), OK5, 6 and 7 are special stations, OK8 are guest licensees, OK9 denotes an experimental station and OK0 is used by beacons and special stations.

AUSTRALIA POST

Much criticism is often needlesly attributed to the shortcomings of our postal system. I have had two problems in ten years with missing mail and have the highest praise for the staff of my local Post Office, where I get excellent service.

An approach was made to Mr Jim Foley, Public Relations Manager for Australia Post, as to the best methods of dealing with certain problems that are pertinent to our hobby. Jim in his amiable and meticulous fashion has written the following pointers for the readers of this column.

POSTAL POINTERS

Amateur radio operators have a fair amount of overseas correspondence so some overseas posting advice could be of help.

Australia Post has a range of overseas mail services designed to meet the requirements of most customers.

The most widely used is the Air Mail Service for envelopes bearing the familiar blue sticker.

Charges vary according to size and destination.

Postcards are cheaper and the popular aerogrammes are a standard rate no matter what their destination.

The fastest international mail service, indeed the fastest mail in the world, is INTELPOST.

INTELPOST is a document facsimile system that enables typed or handwritten documents, drawings, sketches and, yes, even radio circuit plans, to be transmitted to a wide range of countries in minutes.

Material can be collected and delivered by Australia Post Express Courier at this end and, where possible, arrangements can be made for delivery at the other.

On the heels of INTELPOST comes International Priority Paid, a premium service for very urgent items to a number of countries. IPP delivers articles as fast as possible.

The charges for this service will be refunded if the article is not delivered by the scheduled time.

Overseas Express Delivery is designed to expede delivery of postal articles from the delivery post office to the addressee.

The Surface Air Lifted service provides an "in between" service for a number of countries. The mail travels by surface within Australia and within the delivery country and by air in between.

If there is no great rush then mail can be sent by surface at a considerable saving on the rates for the faster service.

Australian stamps depict many aspects of our national life and are well regarded overseas. They are often referred to as our nation's calling cards.

Alternatives to stamps are available in the form of post office cash register receipts or postage labels.

Should you wish to send parcels overseas there is a wide range of packing materials available from post offices in the Post Pak range.

They include padded bags, boxes, tubes and packing and sealing materials.

International Reply Coupons are a popular service and are exchanged in the country of destination for a stamp to prepay surface mail postage on a return letter.

Your *local* post office will be pleased to provide further information on any of the above services.

From time to time articles of overseas mail can go astray.

Although very few articles disappear altogether, delays can occur in all postal systems.

Unexpected high volumes of mail can lead to temporary backlogs and human error can result in a few articles being missorted.

However, Australia Post's "on time" delivery rate is generally in the 90 percents.

Delays outside the postal system can include industrial action in other areas and poor addressing by senders.

Dead Letter Offices the world over contain mute evidence of partly addressed letters or articles not addressed at all.

Yet every sender, if asked, would swear the envelopes had been correctly addressed.

Anyone concerned about the non-arrival of an article can make enquiries at Post Offices as Australia Post has procedures to help in these cases.

Mr Jim Foley

Thank you Jim, for setting out the above hints and where to get help if you need it. It is much appreciated.

What Jim didn't mention was that Australia Post in 1984 employed a staff approaching thirty three thou-

sand full time employees and had in excess of six million delivery points from 4843 Post Offices, handling the staggering amount of 3,035,060 million articles in the financial year 1983/1984 of which 164,362 million articles were received from abroad.

Quite staggering figures which cause me to forget about my two lost letters in ten years!

CARDS GOOD!!!

As predicted the A61AA cards are good for the ARRL DXCC and also the operation F0ICR/FO8 pasteboard is being accepted. New countries for a lot of operators.

CARDS ARRIVING

According to all reports the CE0AA cards are drifting through and most should have their new country confirmed by now. Those who have not received a reply by this month should apply again, firstly checking the log as to the correct date UTC time group of the contact and marking the card that it is the second attempt!!

A STRANGE CLAIM

Unal, TA1A, claims to be the first officially authorised Turkish amateur with Licence No 0001. No QSL information as yet but the authorities are evidently allowing for a lot of licensees by starting with a four figure number!!! Let us all hope that genuine operations will tend to increase the amateur population in that country as they have suffered problems for a long time now.

ANTARCTICA

The US Bases in Antarctica are quite active on 14 MHz SSB. KC4USX and KC4USV on McMurdo and KC4USB at Byrd.

TRINDADE

Luiz is PY1CR but was allocated PY0TE whilst on assignment with the Navy as a physician and subcommanding officer of troops on the island. Luiz went QRT in early February and his QSL Manager is PT7WA, Rua Ageu Romero 83, Fortaleza, CE 60000, Brazil.

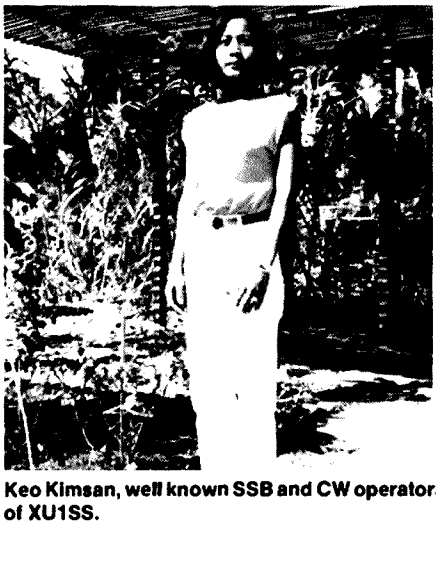
WARC BANDS

YI1BGD and Y2 stations are now permitted to operate on these bands. The East German stations are allowed 500 watts on both CW and SSB.

XU1SS

A letter from the very attractive 26 year old Keo Kimsan who operated both CW and SSB from this station has advised that the Ampil Village is now occupied by the enemy. All the amateur equipment was left behind in their hurry to escape.

I am sure Kimsan, due to her love of the hobby, will reappear from another QTH later this year.



Keo Kimsan, well known SSB and CW operator of XU1SS.

BIG SIGNAL FROM PA6FLD

The weekend of the 16th and 17th of February saw normal transmitters coupled to 20dB high gain arrays which will be used as from the 1st of this month by Radio Nederland Wereldomroep at their new transmitter site.

The antennas are claimed to be some of the largest directional arrays in the world and judging by the signal on 14 MHz I can believe it. It stayed on S9+ at this QTH for hours.

A special commemorative QSL card is available for contacts and SWLs on a heard basis.

FIJI HONEYMOON

Isao JH1RNZ, a medico, is expecting to do a lot of DXing during his honeymoon in Fiji between the 15th and 23rd of this month.

DXpeditions are not new to Isao as he has held the calls of KC6RN and T30RN, hoping to make the trio with 3D2RN. He is taking an FT757 and a FL2100B linear and hopes to operate on 180 through to 10 metres on CW and SSB. Spot frequencies to look for Isao are 1.803, 1.832, 3.507, 7.003, 10.111, 14.025, 14.195, 21.125, 21.295, 28.025 and 28.495 MHz.

QSP's for scheds may be made through Toshi JA1ELY, JH7DNO, JH6SOR and KD7P/KH2 on 14.195 and 7.085 MHz during the expedition. All QSLs to JH1RNZ.

ZC4 CONFUSION

Have I worked it? Is the problem in most peoples mind I am sure and if not, *when will I be able to?*

According to Bob Winn Editor of QRZ DX there appears to be a lot of confusion which stems from the misconception that all ZC4 stations operating after the 16th August 1960, the date of independence, were located within the Sovereign Base Areas. The ARRL News Release that announced separate country status for ZC4 stated "All ZC4 contacts made after the 1960 date were not necessarily operating from within the Sovereign Base Areas".

Bob has published a list, adapted from the DX News Sheet of some of the stations known to be active during this period and the calls noted with an asterisk (*) should be acceptable. Please bear in mind that this is not a complete list nor is it infallible but it is intended as a guide to what could be "good".

ZC4AK* 1967 Akrotiri, ZC4ASG* 1982 Akrotira, ZC4AVU* 1971 Akrotira, ZC4BP* 1969, ZC4CB* 1970 Akrotire, ZC4CI 1966 Famagusta, ZC4CN Famagusta, ZC4DA* 1968 Dhekelia, ZC4EPI* 1960 Episcopi, ZC4GB* 1966 Akrotiri, ZC4IK* 1970 Akrotiri, ZC4JU* 1965 Akrotiri, ZC4MO 1965 Mount Olympus, ZC4PC* 1966 Dhekelia, ZC4RAF* 1970 Akrotiri, ZC4RB 1967 Akrotiri, ZC4RS 1970 Limasol, ZC4SS 1965 No OTH, ZC4TK* 1966 Akrotiri, ZC4TX* 1965 Episcopi.

Well, it is now a hunt in most shacks to sit down and find one that may be good, if in doubt send a selection but not before the 1st June. If all fails and the silverfish have beaten you to the pasteboard, then possibly the best bet is to listen for Martin ZC4MR who is definitely in the new DXCC Country. Good luck and wish me the same.

BITS AND PIECES

DJ4IJ/XZ still operating but not recognised by the ARRL DXCC Desk. **VK75A is a special 75th WIA Anniversary Call that will be heard from all states for selective occasions. **On a four year round the world voyage is the "Sir Walter Raleigh" using the call GB0SWR/MM. **The new Norfolk Island signal is from Les VK9NI. **Two ZC4 stations quite QRV. ZC4MR around 14.213 MHz and ZC4ESB is QRV from Dhekelia **John VU7GV was supposedly active from the Laccadives. QSL via HB9MVW. **The CG3 prefix, in mid February was to commemorate the anniversary of the Girl Guide Movement in Canada. **DP0GVN at George Neumayer Base or (70°36' 15"S, 8° 17' 14"W) will be active until March 1986 on all bands and CW/SSB/AMTOR/OSCAR 10. QSLs via DJ4SO. **The Yaesu Bangladesh team did not work any DX stations during their tests for the government. **Well known DX Editor of NZARTS Break In, Ron ZL1AMM, has not enjoyed the best of health of late. Best wishes from all for a speedy recovery Ron. **JW5E was a group of YL's who entered the CQWWDX Contest. **Still hope for 4U1VIC as a new DX Country. **C73AA if you worked it was a "phony". This call is allocated to the World Meteorological Organisation. **S9 may be have a genuine expedition in early 1986. **Due to business commitments, the "Globe Trotting Colvins'" have deferred their trip to Africa indefinitely. **Activity from Thailand should recommence on a more permanent basis in the near future. **Speedy recovery to Lee KH6BZF after his sojourn in hospital.

THANKS

Sincere thanks go to the following. The Editors of weekly, bi-weekly and monthly newsletters including ARRL NEWSLETTER, RSGB DX NEWS, QRZ DX, LONG SKIP, DX FAMILY FOUNDATION NEWSLETTER, JAN and JAY O'BRIEN'S OSL MANAGER LIST and KH6BZF REPORTS. Magazines including CQ, cqDX, OST. RADCOM, JARL NEWS, KARL NEWS, OZ, 73, BREAK IN, WORLD RADIO and VERON.

Members who have contributed include VKs 2JM, PS, DTH, 3FR, YJ, YL, 4BHJ, 6NE, G3NBC, WA3HUP and L30042. Overseas amateurs include G1EOD, I8SAT, ON7WW AND ZL1AMM. Sincere thanks to one and all. Good DXing and I am going looking for my ZC4 cards.

(1) A report in January 1985 "WA VHF Group Bulletin" says VK6RPH will OSY to 52.460 MHz when it goes back on the air, so the 52.300 MHz frequency is probably wrong. No decision has been made yet regarding the two metre frequency of their beacon.

Also, at the time of writing, it appears VK5RSE in Mount Gambier is not on as I have not heard it and it is always normally available here. We await news.

FIRST PERTH/ADELAIDE CONTACTS ON 432

Wally VK6KZ has sent me details of those contacts which were mentioned somewhat briefly last month and I quote:

"On 10/1/85 Bob VK6KRC in Perth was in contact with Max VK6FN in Manjimup (250km south of Perth) on 144.100 MHz and Max asked 'who broke in?' Bob listened and heard a voice. Thinking it may have been Peter Grumball VK6ZPG (210km north of Perth), Bob swung his beam only to hear unfamiliar voices to the east. He proceeded to work Brian VK5KBU at 2247 UTC on 144 MHz exchanging 5x9 reports. Bob then rang a number of Perth amateurs alerting them to what was going on. Thanks Bob!

"At 2302 Bob made the first ever 432 MHz contact between Perth and Adelaide (2137km from Perth) with Brian VK5KBU with reports 5x9 sent and 5x3 received. Wally Howse VK6KZ was thrilled to work from his home in Perth at 2258 VK5KBU on 144 MHz and then VK5ZRO and VK5ZTS before working VK5ZRO at 2304 and then VK5ZTS on 432 MHz. Mick VK5ZDR and Wally VK6KZ heard each other on 432 MHz but did not make a two-way contact. Other 144 MHz contacts by VK6KZ included VK5ZDR, VK5NY and VK5ZPS. Bob VK6KRC had to go to work (twenty minutes late) at 2320.

"Don Graham VK6HK worked four stations on 432 between 2303 and 2312 viz VK5KBU, VK5ZTS, VK5ZRO and VK5ZDR. Bob Pine VK6ZFY worked Mick VK5ZDR on 144 MHz. I am not sure how successful Jack VK6KDX and Ron VK6FM were. Both were heard calling when VK6KZ left for work at 0015, signals were still there but weaker.

"There was no 6 metre DX in evidence throughout the opening. Peter VK6ZPG at Gunyidi (210km north of Perth) did not hear VK5s nor was he heard by them despite liaison with Bob VK6KRC. Max VK6FN in Manjimup made one contact on 144 MHz to VK5KBU. Max had gone back to bed (!) when Bob had turned his beam east at 0645 local time and hence missed most of the DX.

"Mick VK5ZDR reported no sign of the Busselton 144 MHz beacon VK6RBS (200km south of Perth). Tests on 1296 MHz between VK5ZRO and VK6KZ were unsuccessful.

"It is understood that during the opening to Perth, the path between Albany and Adelaide was also open on 144 and 432 MHz. Some Perth stations including Roy VK6BO and Art VK6ART accessed the Kambalda FM repeater VK6KRB on 146.35/85 and 550km east of Perth working Ray VK6ET in Kambalda and Graham VK6RO in Bunbury 150km south of Perth."

Thanks for writing Wally, but it doesn't make me feel any better to know what was going on but being unable to share in the contacts due to being far enough inland not to be getting any benefit from what was obviously fairly closely associated with the coast over most of its course. *"Them's the breaks so I was told!!"*

PERTH TO ADELAIDE OPENINGS ON 144 MHz

The January 1985 "The West Australian VHF Group Bulletin" also has the following which relates to the above and was also prepared by Wally VK6KZ and should be of interest to readers.

"Further to the WA Interstate VHF/UHF story published in the VHF Group Bulletin from September to December 1980, the following is a summary of the dates and times of openings on 144 MHz between Perth and Adelaide. Times in UTC."

30/12/1951: 0705 to 0712 (1) — two way contact VK6BO/VK5GL
09/02/1952: 0312 to 0323 (1) — two way contact VK6BO/VK5GL/VK5QP
01/01/1967: 0305 — VK6VF heard by VK5ZBR and VK5ZMU
0435 — VK6BO heard by VK5RO
14/02/1969: 2305 — VK5VF heard by VK6ZCB (2)
14/02/1970: 2225 to 0225 — VK5VF heard by VK6ZCB (2)
2315 — VK5VF heard by VK6BO
23/01/1980: 0003 to 0110 — two way contacts by four Perth stations
28/12/1980: 2237 to 2257 (1) — two way contacts by two Perth stations
02/01/1981: 2228 – VK5VF heard by VK6ZKO
03/01/1981: 2107 to 2218 — VK6VF heard by VK5ZPE
10/01/1985: 2247 to 0015 — two way contacts by at least six Perth stations

(1) During six metre openings — Sporadic E related?
(2) Now VK6AB

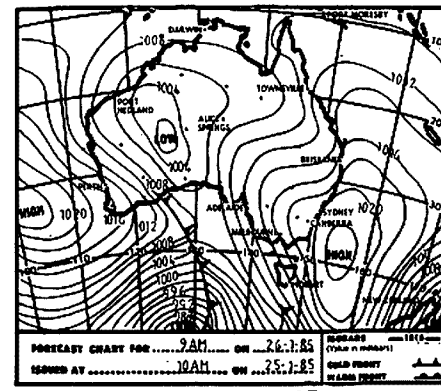
One can soon see from the above chart that contacts such as those which occurred on 10/1/85 are indeed rare, and really very few two-way contacts have actually been made, and even the number of times the beacons at both ends have been heard are equally as rare. In some 34 years there have been only five occasions noted when two-way contacts actually took place. No doubt there have been other times when no one was around but they do not count! All contacts have taken place in a six weeks period from around the end of December to mid February and would appear to coincide with a stable high pressure system across the Great Australian Bight, and would also seem to tie in with the declining Es of the summer season by some means but this is only a suggestion.

NEWS FROM AN OIL RIG!

A very interesting letter has come from Pete Robinson VK3DMX who gives an address as Sale, Victoria, and here are the relevant matters.

"I have been an avid VHF/UHF fan since 1963 holding a variety of call signs throughout the world from that time on, being in the oil business, and having spent the past three years in Bass Strait where there are many opportunities to observe the vagaries of propagation on the commercial VHF/UHF bands as well as the amateur bands. Although I usually bring one rig or other out each shift, I do not do a lot of transmitting, mainly due to TVI — those accursed broadband preamps on the ship's TV. antennas being the major problem!

"But I do a lot of listening and am especially alert to VHF/UHF openings. Being on a ship, one naturally keeps a good eye on the weather charts, and I often find a direct correlation between the charts and the VHF/UHF openings. Regions of high pressure seem to be the most notable indicators of openings. Such a 'high' swept across the Great Australian Bight, over Victoria and out into Bass Strait (see weather map). This was accomplished by VHF/UHF DX propagation, especially from Tasmania up into the Bass Strait oil rig area on all bands. It's just a pity there isn't more activity, especially on 70cm. I have had some fabulous contacts both on two metres and 70cm down to VK7 (simplex) with 70cm often holding in long after two metres has dropped out. 5x9 70cm contacts with 100mW to a 'rubber duck' are not uncommon. The CB boys on the Bairnsdale CB repeater have also had some fun working down to Tassie for protracted periods on 476.550 MHz.



WEATHER MAP

"As well as the weather charts I keep a lookout on a small portable TV I have on board. Any sign of Tassie TV and I'm out having a scan around the amateur bands, invariably triggering some repeaters even if there are no replies.

"Occasionally, especially around October and November, the 'ducting' becomes so intense as to be seen visually across the ocean. Similar to a mirage effect I guess, noticeable by a strong line visible just above the horizon. Oil rigs sometimes 80km away can be seen clearly, and seem to hover above the water. Turn around, and sometimes you can't see rigs only 15km away. It's really weird! One notable day last December I could see inverted freighters way off the coast, well over the horizon, seemingly hanging upside down in mid-air, about two to three degrees above the horizon to the east. Noticeable too was the strong line mentioned before.

"On these occasions the ships' radar is often showing funny things, as one would expect. 156.800 MHz (Maritime Marine Ch 16) often shows a lot of traffic, Melbourne being heard quite regularly.

"I am pretty sure most of the weather related DX is due to ducting, several times I have worked VK7 on simplex, the stations on the coast predominating, whereas the repeaters, being up on mountain tops could be heard only weakly or not at all.

"I would love to see a multiband beacon out here on one of the platforms, 2m, 70cm and 1296 MHz. I am not here often enough, and when I am, I'm often too preoccupied with work to provide a regular signal from this region. However, I am sure a beacon would provide many surprises, especially if monitored from various locations with computer-aided scanners with print-outs . . . oh! if I only had the time available!

"Rigs I use are an FT290R, FT790R and an AR2001 scanner covering 25 to 550 MHz. Antennas by necessity are usually just vertical whips, tacked on

when nobody's looking!" Thanks for writing Pete.

Readers at least now know there is someone often listening off our southern coast but the lack of transmitting power coupled with a limited antenna system will make it difficult even under relatively good conditions to make contact with stations any considerable distance away plus the fact that much of the more sustained DX is done on SSB and horizontal polarisation of the antennas. But now you are known to be there, Pete, a few more contacts could eventuate.

ISLAND HOPPING

Lionel VK3NM has just returned from a six weeks tour of New Zealand, Norfolk Island and Lord Howe Island. He took an IC505 and a 2 element quad made out of PVC conduit with PVC fittings as this was easier to handle on the six air flights he made. The following is a summary of contacts.

From New Zealand: 25/12/84 VK2XJ; 26/12: VK2BQY; 28/12: ZL7OY, VK2DDG, VK2XJ; 29/12: VK2BHO, VK2GS (52.525 FM), VK5DK, VK3AZY, VK3YDE, VK3ZYN, VK3YY. Heard VK3AKK, VK3ZBJ, VK6OX and VK8ZLX. All the above contacts were from Devonport, Auckland. 3/1/85: VK2XEA, VK2XJ; 9/1: FK8EM, VK4JXZ; 10/1: VK2DDG, VK2KAA; 12/1: FK8EM (52.525 FM); 13/1: VK2XJ; 18/1: VK2DDG.

From Norfolk Island: 20/1: ZL1ADP, ZL2TJX, VK2XJ, VK2BA, VK2KYL; 24/1: VK2BA, VK2AYF, VK2BNN, VK2LM, VK2XEA, VK2XJ, VK2ADV.

From Lord Howe Island: 30/1: ZL2CD, ZL3AFN, also heard a ZL1 plus ZL1UHF beacon plus ZL TV.

Lionel commented he heard VK TV on many days with very strong signals whilst in New Zealand and on Norfolk Island, but only short bursts from Lord Howe Island. He hopes to go back to ZL next year around Christmas with 6 and 2 metre SSB and better beams with the idea of trying to work trans-Tasman DX particularly on 2 metres. This year Lionel also carried some HF gear but due to his low aerial could not work much DX, in fact, finding 6 metre DX a lot easier than 20 metres! Thankyou for the letter Lionel, hope you enjoyed yourself.

1296 MHz . . . AT LONG LAST!

After eight months or more of talking about it, Dick VK5ARZ, President of the WIA (SA Division), finally got around to making his 1296 MHz two by 27 element loop Yagis rotatable and replaced the RG8 feedline with a piece of heliax with the result that for once he could be heard further than his letter box!

Contacts were managed with Bob VK5ZRO, Brian VK5KBU at 5x9, then to Don VK5ZRG at Whyalla for a 5x9+ report from 1 watt! Then to just round things off there developed what was probably the first three way 1296 MHz round-table between VK5ARZ, VK5ZRO and VK5KBU. Dick's location gives indications of being perhaps even better than that of Bob VK5ZRO as Don VK5ZRG seems to be hearing Dick a little better than Bob at times. Interesting, especially as Bob is running 10 watts to a 1.2 metres dish compared with Dick's 1 watt and two 27 element Yagis.

144 and 432 MHz STILL GOOD

One might have been excused for thinking that perhaps 144 and 432 MHz would go quiet after all the happenings of 10/1 and 11/1 but this was not so. The following is a brief summary of what Mick VK5ZDR worked this month.

12/1: VK3BHS 144 & 432; 14/1: VK3AOS both bands; 15/1: VK3KJB and VK3ZBJ on 144; 19/1: VK3BHS 144 & 432; 21/1: VK3BEH 5x9 on 144 with 2¼ watts, VK3AMH on 144; 22/1: VK3BRB (Mildura) and VK3ZBJ both 144; 23/1: VK3BRB 5x9 144; 24/1: VK3BRB 144; 27/1: VK3AMH, VK3XBB on 144; 28/1: VK3KVW, VK3KJV, VK3BEH, VK3BRB, VK3AUG, VK3AUU, VK3ZQB, VK2BY (Broken Hill), VK2YEZ (Griffith), VK2ZMP (Wagga), VK3ZHP, VK3ZHG and VK3KVW ail on 144. Then on 432 he worked VK3ZQB, VK5ATD, VK2YEZ, VK3ZHP, VK3ZBJ. Quite a day! VK5RO worked VK2ZTH in Gosford as well.

1/2: VK3ZBJ on 144; 6/2: VK3ZBJ 144 and 432; 16/2: VK3ZBJ on 144 and 432, VK3ZHP, VK3ZEM, VK3AZY and VK3ACL on 144; 17/2: VK3NM, VK3KEG, VK3AUU all on 144, VK3ZBJ 144 and 432. After that the bands went quiet!

On 28/1 (UTC) but actually 29/1 the band on 144 must have been in fairly good shape as even VK5LP was able to share in some contacts. At 2251 on 28/1 VK2BY in Broken Hill 5x6, 2305 VK3APF Wangaratta 5x5, 2311 VK2YEZ Griffith 5x5, 0031 (29/1) VK3AUU 5x3 and 0043 VK3ZBJ 5x5.

It was even noted that Bob VK5ZRO who bitterly complains about my hill (in reverse) blocking his signals to the east, shared in some contacts. On 24/1 he worked VK3BRB in Mildura at 2210 on 144. On 28/1 at 2233 he worked VK2BY on 144, then at 2258 VK2YEZ on 144 and 432!

SIX METRES QUIET

There have been the occasional Es openings during the month on 12/1 VK4ZAL 0121; 16/1: VK8ZLX at 0315; 18/1: VK2; 23/1: 0131 VK2XJ, VK4FNQ; 25/1: VK9ZR Willis Island worked by VK5ZRO and VK5ZDR at least around 0218, then at 1030 VK2KFB, VK2YHN; 26/1: VK4YJH at 0136; 8/2: 0402 VK8ZCU; 9/2: VK6KZ at 0240.

THE HIGHER BANDS

A bit of news picked up on 144 MHz from Les VK3ZBJ when I was fortunate enough to work him recently was that he and Garry VK3ZHP had had a contact on 2.3GHz on 12/1 at 1021 signals 5x2 and 5x9, FM both ways but SSB soon. Also worked was Lionel VK7HL who was running 1 watt to a 1.8 metres dish, VK3ZHP 12 to 14 watts to 3.6 metres dish, Les VK3ZBJ about 15 watts output. Congratulations!

TECHNICAL ITEMS

A couple of items from the November 1984 "The Short Wave Magazine" courtesy VK5AIM.

"John Hunter G3IMV, uses a 21 element Tonna Yagi and mentions the considerable detuning caused by rain. In dry periods, his antenna resonates at 431-432 MHz with a VSWR of 1.2:1. However, after heavy rain, the VSWR went up to 5.9:1 with minimum VSWR at 438 MHz. He took measurements over some hours after the rain had stopped and the VSWR and resonant frequency gradually dropped. Have other readers noted such dramatic changes with Yagis?"

One would tend to query whether in reality the VSWR is as good as suggested, and whether it is being read at the end of the cable run rather than at the antenna? If there are standing waves on the line then there could be drastic changes if the line was in contact with other materials for any appreciable length, especially when wet. I recall some years ago a customer who lost almost all their TV signal when it rained. The coaxial cable was relatively new and no rain was able to enter at the antenna, but the cable lay along the top of the roofing iron for about 10 metres. Lifting the wet cable off the roof immediately restored most of the signal. As in most TV installations the VSWR was relatively high as most such installations are a compromise anyway. Re-routing the cable under the roof cured the problem, and I think something similar would help G3IMV. More importantly though, it would tend to illustrate the proven statement that you check for best SWR at the antenna, then note the reading at the bottom and any variations should then be apparent with the passage of time, rain etc.

The other item from "The Shortwave Magazine" is that G4CQM suggests plumber's PTFE thread tape, wrapped around coaxial cable to the appropriate thickness, is a successful way to replace damaged rubber rings in "N" type plugs to restore their waterproof properties. And that sounds like a very good tip.

Incidentally, while on the subject of coaxial cables, did you know the original patent was taken out on 27/3/1884 by Werner Siemens. The first known use of coaxial cable was for the 1936 Olympic Games in Berlin when it was used for a link between Berlin and Leipzig to carry 200 telephone channels. This item from "Break In" December 1984. So 1984 was the "Coaxial Centenary".

CLOSURE

That's it for this time. As everyone knows, there is always a lot of individual VHF activity occurring throughout our continent which is unreported because I don't know about it. If you do something a bit special why not drop me a line and tell me about it so I can pass the news on to others. I have my more or less regular correspondents but my desk is always able to accept more and the wider coverage I can give the wider the interest.

Closing with the thought for the month: "How strange it is that you can't get 20 people to attend an early evening meeting to improve the community, while half the town will turn out at 3.30 in the morning *to watch a goodly portion of it burn to the ground!"* 73. The Voice in the Hills.

AR

OH DEAR!!!

In the March magazine the figures missing from the pi graphs were Convention 5%.

CONTESTS

Ian Hunt VK5QX
FEDERAL CONTEST MANAGER

P.O. Box 1234, GPO, Adelaide, SA 5001.

CONTEST CALENDAR

APRIL

6-7 GARTG SSTV Contest
20-21 ARCI QRP SSB Contest
20-21 VIGO World Fishing Contest

MAY

4-5 County Hunters SSB Contest
18-19 ARI International Contest
25-26 CO WW WPX CW Contest (Rules this issue)

The Contest Calendar certainly seems to be rather sparse as shown above. I have not received any confirmation of contests as forecast in last months issue therefore I have not included the Polish Contests or DX YL to North America Contests.

Provided the Federal Council vote to allow the Federal Contest Manager to continue the right to fix the dates of contests In a Postal Motion currently being circulated I would like to indicate the likelihood that I will try to improve the contest scene by placing the VK Novice Contest for this year on the weekend of 29th and 30th of June. This will allow a reasonable spacing between the Novice and Remembrance Day Contests and should also provide more suitable conditions for operation on the 80 metre band which Is obviously the prime band for novice operation.

I recently received a letter from 'Jock' White ZL2GX who is the Contest and Awards Manager for NZART. I would like to quote a few excerpts from his letter. Jock writes, *'Delighted to hear from you . . . and, I'm taking time out from log checking to write . . . just as well too as my "fuse" gets a little short when log checking . . . it's a soul destroying task as you know, for sure!! It's a strange thing . . . "some" fellows complain that rules are changed from time to time in the VK/ZL/O . . . BUT . . . it's obvious that MANY do not read the rules at all . . . or, if they do, this is done in a very perfunctory fashion. No real harm done I guess, but it becomes obvious when things are omitted or even ADDED.*

"Yes . . . I've been associated with contests for quite a long time . . . with the VK/ZL for some 40 years and I was involved with contests before the war . . . maybe too long!! BUT I try to be innovative and for this sometimes run into real "flak" . . . you can't win. Of course this is natural . . . we ALL know best . . . Hl. Like in teaching . . . I spent over 40 years in the education service . . . some 30 plus in senior positions and ALWAYS . . . everyone else knew more about everything than the principal himself . . . GREAT stuff.'

So, there for a start we hear from Jock words which may not seem to be unfamiliar the world over. It certainly appears that things are not much different just over the Tasman Sea to what they are here. And this applies, as Jock points out, not only to the hobby of amateur radio either. The callsign ZL2GX has been a most familiar one on the bands for a long time. Some of you may be interested in a few more details about 'Jock' White. He has been an Honorary Life Member of NZART for over 20 years, been a Vice-President, a Councillor etc, etc, . . . WAS (years ago) a keen contester . . . was world first DXCC 300 in 1960, in RAF during war with night fighters . . . an avid collector of NZ coins and stamps and Maori artefacts . . . has a large electronics museum with emphasis on amateur radio . . . has specialised in the famous "HRO" genus and has over 20, mostly from the USA but also versions from NZ, Australia, Japan, Germany and has been trying for years to get one from East Germany, made after the war.

Unfortunately I have never had the priviledge of meeting Jock in person or seeing what must be a remarkable collection of equipment owned by him. I have however spoken to him from many locations both from within VK and from overseas, and have also been the recipient of quite a number of very nice awards and certificates taken care of by him.

In another portion of his letter Jock also says *'I've had so much from amateur radio that it I lived to be 100, I'd never be able to repay all I owe.'* There is certainly no doubt in my mind that Jock is one of those small band of stalwarts who have tried to give back to the hobby some of what they have received from it. Perhaps you might like to consider the various aspects of this subject and recall such things to mind next time you are asked to stand for office within the organisation of the WIA, when your next Club elections come along or some volunteers are called for in connection with other aspects of our hobby. I too feel that I owe some kind of debt due to all the fun I have had in my 26 years on the air, otherwise I would probably not be doing the job of FCM. I would repeat a well known but very true phrase to the effect *'that you always get out of anything no more than you put into it.'*

I would like to thank Jock for his most interesting and friendly letter in which he answered quite a few questions for me, and I hope that the Information and comments from such a very experienced and well known Old Timer will have been of interest to you. By the way, he did indicate that the results for the 1984 VK/ZL Contest should probably be available some time in April.

Now that all the action concerning the 1984 Remembrance Day Contest is over I would like to include in my column some material which I wrote in June 1984. As a result of the time which has passed since the material was compiled some of it might seem to be dated, nevertheless I feel that the material contained therein should be aired, if only to provide the basis for further discussion of contest matters. You will note that some ideas expounded have already been acted upon.

Several years ago it used to be quite common during the Remembrance Day Contest to hear stations giving their call sign as VK5XYZ log VK5XYX. This meant that the operator was using the station of VK5XYZ but that he held the call sign VK5XYX and the latter call was the one which should be logged for the purposes of the contact and serial exchange. The reason for this procedure was twofold. It provided an answer to the problem of regulations governing operation from another station and it was a way of encouraging those who were not particularly active and did not have a station of their own, to join in the contest with co-operation from a friend. This approach also allowed operation from one station by several operators when carried out at a club station. During my time spent at Woomera working at the Space Tracking Station and at the Missile Range, individual operation of an amateur radio station was not permitted for security reasons. So for each Remembrance Day Contest there was almost a queue of operators wanting to air their call sign, if only to make the minimum of five qualifying contacts. At the same time there was usually some particularly keen operator who had the enthusiasm and could spare the time to try and make as big a score as possible for the Club Station and who also wished to make as respectable a score as he could using own call sign.

In our amateur community today there are quite a number of club stations and as well there are operators who, for one reason or another hold more than one call sign. It was with this knowledge, as well as my past experience in mind, that I very strongly queried the addition to the rules of the Remembrance Day Contest which stated that an operator could only operate using one call sign during any single period of the contest, and that operation using two call signs more or less simultaneously was considered to be against the spirit of the contest.

I now take the opportunity through this column of expressing my own personal view, both as the current FCM and as an experienced contest operator. I do this to stimulate discussion on contest matters of this kind. I wish to hear your views on such subjects, but I would not presume to alter what I consider to be important aspects of the contest rules without there at least being some opportunity offered for 'public' discussion of the matter. Let me quote from some previous correspondence on this subject, just to present some points of view.

". . . no one managed to explain just how, by operating with two call signs on a more or less simultaneous basis one is not operating within or accordance with the rules and spirit of the contest. Why is it a matter of 'wanting your cake and eating it too.'??? This Is just so much ballyhoo. Who also said that this applies only to club call signs?"

"If I have the authority and right to operate under two different call signs I maintain that as long as I am operating according to the regulations I should have the right to air both call signs in the contests in any manner and at any time I wish. Some people have two call signs. How does the use of both these call signs constitute a situation which is against the spirit of the contest?"

"Let us please face some facts. A contest is just that, A Contest, and where rules are printed they should be adhered to, however let us also realise that people in general will adhere to rules which are reasonable and of benefit to either, all or the majority. Let us look at this in practice. Say I use one call sign for four hours and another for four hours. If I am a good contest operator I will be working at a rate of one contact per minute. With the first call sign I have made 240 contacts and with the second also 240 contacts. This means that I have given out a total of 480 contacts to other people. Assume that I work at the same rate using both call signs for a period of eight hours. How many contacts will I have made for myself and how many will I have provided to others? If I am a really good operator it will not be quite like this as by using the two calls to the best advantage I will probably be able to increase the overall total somewhat, however to whose advantage? I will most likely have a higher score for one of the two call signs by using that particular call sign more often in a 'run' of contacts whilst the other call sign is used as a 'till in' where the going becomes a little slow or where another operator who is a wake up has requested that I provide him with an extra contact, to his advantage, where he knows that I can do so. So lor goodness sake, where is this against the spirit of the contest? This I can assure you is exactly just what does happen in practice and in fact I believe that it actually adds to the fun and the spirit of the contest. If I am an operator who has the ability to do just what I have described why should I be deprived of the opportunity to use my skill? What is more, let us also look at the fact that one of the often much vaunted reasons lor us having contests is that it allows our operators to practice and advance their skills with the end result in view that it will be to long term benefit for such occasions as emergency operations etc."

A note was added to the above that *"In many cases though the use of two logs may also slow up the contact rate."* This statement applies in the case of unskilled operators making their first attempt at such an operation and I do believe that they should also be allowed to make their attempts in this way.

My firm belief is that our contest rules should always be such as to encourage entrants to be as versatile as possible whilst still operating within the regulations applicable to the amateur service and in accordance with the contest rules laid down. In line with this belief it follows that contest rules should be kept as simple as possible and that where additions and deletions to rules occur they should not be instituted without very serious consideration as to their effects on those most concerned, namely the operators themselves.

Thus I have adopted this policy of opening up to you through my own thoughts the opportunity for

comment and discussion on any aspect of the running and organising of our contests here in Australia. Do not be afraid to make your opinions known, they are in fact really welcomed. Let me specify where, apart from the particular subject dealt In detail above, your comment and advice can assist in improving the contest scene here.

Are our contests held at the right time of the year? Should we, for example, make a major change with our Field Day date and have it in June so as to coincide with the ARRL Field Day Contest? That way the potential would exist for many more portable/portable overseas contacts than occur with the ZL Field Day co-inciding with ours. Would the cold weather be worse than the extreme heat of summer with the Field Day in February?

Shoud we consider changes to the scoring system used for the Remembrance Day Contest? Should we apply a scoring table for all Australian contests designed to take account of differences in propagation and population spread etc?

Should we include added incentives for use of natural power in field day contests and have a section for home stations on emergency power? Should VHF operation in each contest, including the Remembrance Day Contest, become a completely separate portion? Should check sheets have to be sent in by every station operating in each contests?

How about an entirely different approach? For some contests no log entries are required at all. Instead entrants merely send in a summary sheet showing their claimed scores etc, together with check sheets which allow the Contest Committee to compare them and observe any major anomalies which might have occurred. If necessary, logs from various stations may then be called for. What is your opinion on this? Should there be consideration to having a winner from each State for each contest so as to overcome problems of population density? Should we have any contests at all?

So keep those cards and letters coming along with your ideas. That way we might be able to come up with ideas which will please most of you. I will certainly see that your ideas are not ignored and will most definitely publicise those most worthwhile of comment. Meantime best of luck with all your operations be they contesting, DXing, ragchewing or whatever. I hold strongly to the opinion that there is a place within our hobby for all the many varied activities it allows.

SUBMISSION OF LOGS FOR CONTESTS

I have received letters from two entrants who sent off logs for the Remembrance Day Contest. These are Ken VK3AH who is well known for his DX Column in this magazine as well as for his work in other ways connected with the magazine and the other from Jo VK2KAA. In each case these people were most disappointed that their callsigns did not appear in the results for the contest. The reason for this is that neither of their logs were received at this QTH. Why this should be so I just do not know and as I have explained in a personal letter to each of them, there is little I can do about it.

Most logs seem to make it OK, however I suppose that the law of averages says that some will go astray. Maybe from this we can learn a lesson. In the past I have always sent my logs to the Contest Manager by Certified Mail. (Registered Mail would be better, however it is rather expensive.) In this way there is at least some check and evidence that the log was posted at a certain place and time. So I would suggest that if you are very concerned you might follow this approach.

It is interesting to note that I have received QSL cards from overseas which were 'Registered'. Another matter to keep in mind is that the package containing the log should be secure and firmly sealed. If there are more than a few log sheets enclosed make sure that the outer wrapping or envelope is strong enough to retain them even when somewhat knocked about, as can happen.

Another matter to watch is to ensure that sufficient postage is placed on the item. Try and use standard sized envelopes and if not sure as to what the mailing charge should be check it with your local Post Office.

I had to refuse delivery of some logs sent in for the Remembrance Day Contest and have them returned to the sender as I was not prepared to pay for the additional postage as well as the extra service charge required by the Postal Authorities.

Should mail go astray you can ask for a check to be made from your end to try and locate same by filling in a form at your Post Office.

It is not only disappointing to the person who has gone to the trouble to operate in a contest and make out a log to send in only to learn that it has gone astray. It is also disappointing to the Contest Manager and it does take some additional time for him to prepare and type out replies to queries as to where the log has gone. Jo VK2KAA sent me a copy of her log which I must commend as being indeed a very neat computer entry. I also know that Ken VK3AH was most upset with his having been lost as I know that he was doing his very best to support his Division in the contest.

Whilst on the subject of letters I would like to acknowledge the fact that I have received correspondence from quite a number of members who are interested in the contest scene and many who have provided me with interesting comments and constructive criticism. It is not practical for me to try and answer all letters personally, therefore I would like you to accept this acknowledgement in general of your contributions. I can assure you that I am not just relegating your letters to the waste paper basket, rather I keep them on file as a useful reference to opinion and comment. I really do welcome your opinions on matters to do with contests, so please keep them coming. At the moment the logs for the Ross Hull Contest are just trickling in slowly, however I have already received some very interesting comment on that contest.

I have received a very interesting letter from Ted VK6ED whom I always meet at least on an annual basis in the Remembrance Day Contest. Ted takes me to task to some degree regarding the practice which could be described as 'claim jumping', referred to in my column in the January issue of the magazine. Ted quite rightly criticises the type of operator who tries to jump in on a frequency which has been CONSTANTLY occupied by another station, perhaps under the guise of having first of all a contact with that station and then attempting to continue to use the frequency for contacts with other stations. I certainly agree whole heartedly with Ted that this constitutes a most impolite operating practice and cannot be condoned. I might however clarify my comments by explaining further just what I was referring to. Again for clarity I must repeat the scenario. *'I have just made a contact with an operator whom I tuned to and called, and then I in turn am called by yet another station on the same frequency'. So, what should I do then?* I can suggest that we QSY. This may be OK, however in the heat of a contest not really a good move. Courtesy should prompt me to ask the original station in a polite manner whether I might use the channel to make the one short contact and this approach may be OK. This latter does however take up as much time as would be used in going ahead and making the quick number exchange desired. Thus the situation becomes a matter of judgement. If good operating, and courtesy prevails it would be possible for me to make that quick contact without any problem, provided each operator recognises the other as being both capable of good operating practice and courtesy. If I have made just such a quick contact under these circumstances I should make it quite clear to all concerned that the frequency rightly is occupied by another station and I should QSY elsewhere. So in this Ted is quite correct and 'claim jumpers' should not be tolerated. There are just a couple of other points to consider. My main complaint is against the operator, namely the first occupant, who does not have the perception (or nouse) to note that I am both a good and courteous operator and who instead either refuses to allow me that additional contact, even though I asked about same, and goes ahead continually calling CQ, causing useless QRM and achieving nothing either for himself or others. I would repeat my previous assertion that *'MOST of the top operators will stand by and allow the other guy to make his quick contact . . .'* To observe this in practice you need only listen to a few of the world's top operators in action to see that this approach can work without any problems at all. However, I would stress again that I agree with Ted that courtesy is the major factor all round.

As to the 'ownership' of a particular frequency and the right to same Ted writes, *'Of course such a right exists — so long as the station first occupying it is continuing to use it. If it didn't operating would be virtually impossible. Breaking in on an obviously occupied frequency must therefore by accompanied by an acknowledgement that it is an occupied frequency, and the stations so using it must vacate it as quickly as possible, with an accompanying word of thanks to the intitial user of the frequency.'*

To all of this I say *'Hear, Hear.'* Nevertheless I have heard arguments from time to time in the middle of a contest to the effect that *'This is my frequency. Get off.'* from another station whom I know for a fact has not uttered a sound on the frequency for anything up to five minutes and indeed whom I have just heard making contacts on 2 metres or another HF band. My thoughts are that when such cases are met as described it is far better not to waste ones time arguing about it, nor by staying on the frequency and either causing or putting up with QRM. You are much better served by going to another channel and keeping the QSO rate up by searching for other stations you need.

CORRECTIONS *(or mistakes made by this Contest Manager.)*

I have on hand a letter from Allan VK4VAT who points out that he did not enter a log in the Remembrance Day Contest even though he was listed as the highest scorer for VK4 in the Phone Section. Allan's log was actually intended as an entry in the Novice Contest and with the score of 665 points places him third in the Phone Section of that contest. I might however point out some slight difficulty with Allan's log, which I have mentioned in a personal letter to him. The front sheet did not have shown on it just which contest the log was for and the only indication that it was intended for the Novice Contest was the date written in rather small figures at the top of the left hand column of the log sheets. This small fact was inadvertently missed. At the same time the log had been received together with the extremely large volume of incoming mail comprising the logs for the Remembrance Day Contest. Maybe this simply adds fuel to the argument that the contests at that time of the year are too close together. Please always indicate on your log the name of the contest.

Included with this months notes are the rules for the well known CQ World Wide WPX Contest. These rules were received here rather belatedly and by the time you read this the SSB Section will have been held. My understanding is that the rules have not been changed from last year, so I hope that you have not had too much difficulty with any SSB operation you wished to enjoy. I will try to enlist the co-operation of my overseas correspondents to ensure that the rules for contests are provided to me sooner so that I can give you plenty of advance warning of such contests.

THE 29TH ANNUAL CQ WORLD WIDE WPX CONTEST

CW: 25-26 May 1985
Starts: 0000 UTC Saturday
Ends: 2400 UTC Sunday

I Contest Period: Only 30 hours of the 48 hour contest period permitted for Single Operator stations. The 18 hours of non-operating time may be taken in up to 5 periods anytime during the contest, and must be clearly indicated on the log. Multi-operator stations may operate the full 48 hours.

II Objective: Object of the contest is for amateurs around the world to contact as many amateurs in other parts of the world as possible during the contest period.

III Bands: The 1.8, 3.5, 7, 14, 21 and 28 MHz bands may be used.

IV Type of Competition: 1 Single Operator (a) All band, (b) Single band 2 Multi-operator, All Band *only*.

(a) Single Transmitter (only one transmitter and one band permitted during the same time period, defined as 10 minutes, no exception), (b) Multi-Transmitter (one signal per band permitted). *NOTE:* All transmitters must be located within a 500 metre diameter or within the property limits of the station licensee's address, whichever is greater. The antennas must be physically connected by wires to the transmitter.

V Exchange: RS(T) report plus a progressive three-digit contact number starting with 001 for the first contact. (Continue to four digits if past 1000.) Multi-transmitter stations use separate numbers for each band.

VI Points: Contacts between stations:
Europe, Asia, Atrica, Oceania, S America

A) Contacts outside of own continent count 3 points on 28, 21, 14 MHz, and 6 points on 7, 3.5, 1.8 MHz.

B) Contacts with other countries on own continent count 1 point on 28, 21, 14 MHz, and 2 points on 7, 3.5, 1.8 MHz.

C) Contacts within own country count *0* points but are permitted for prefix multiplier credit.

VII Multiplier: The multiplier is determined by the number of different prefixes worked. A *"PREFIX"* is counted once during the entire contest regardless of how many times the same prefix is worked.

A *"PREFIX"* is considered to be the three letter/number combination which forms the first part of an amateur radio call (N1, W2, WB3, K4, AA6, WD8, 4X4, DL7, G3, IT9, KH2, AL7, NP2, WP4, 9M2, CT9, 4J9, PY7, VK4, JE3, VE3, Y32, Y33, Y45, AN8, AB8, H44, KT4, etc). *A station in a call area different than that indicated by its call sign is required to sign portable.* The portable prefix would be the multiplier. Example: W8IMZ/4 would count for prefix W4 only and W8IMZ/LX would count for prefix LX0 only.

Special event, commemorative, and other unique prefix stations are also encouraged to participate.

VIII Scoring: 1 Single Operator (a) All Band score, total QSO points from all bands multiplied by the number of different Prefixes worked. (b) Single Band score, QSO points on the band multiplied by the number of different Prefixs worked. See VII.

2 Multi-Operated stations. Scoring in both these categories is the same as the All Band scoring for Single Operator.

3 A station may be worked once on each band for QSO point credit. However, prefix credit can be taken only once regardless of the number of different bands on which the same station and/or prefix has been worked during the entire contest.

IX QRPp Section: (Single Operator Only). Power must not exceed 5 watts output to qualify for QRPp section competition. *You must denote QRPp on the summary sheet and state the actual maximum power output used for all claimed contacts.* Results will be listed in a separate QRPp section and certificates will be awarded to each top scoring QRPp station in the order indicated in Section X. These certificates will be marked QRPp and will show your power output. QRPp stations will be competing only with other QRPp stations for awards. All other information contained in these rules is applicable to this section.

X Awards: Certificates will be awarded to the highest scoring station in each category listed under Section IV.

1 In every participating country.

2 In each call area of the United States, Canada, Australia, and Asiatic USSR.

All scores will be published. However, to be eligible for an award, a Single Operator station must show a minimum of 12 hours of operation. Multi-operator stations must show a minimum of 24 hours.

A single band log is eligible for a single award *only*. If a log contains more than one band, it will be judged as an all band entry, unless specified otherwise. However, a 12 hour minimum is required on the single band.

In countries or sections where the returns justify, 2nd and 3rd place awards will be made.

XI Trophies, Plaques and Donors: Trophy and Plaque winners may win the same *award only once* within a *TWO* year period. This does not apply to any QRPp, Club, Expedition or *CQ* Special Awards. A station winning a World Trophy will not be considered for a sub-area award. That Trophy will be awarded to the runner-up for that area.

XII Club Competition: A trophy will be awarded each year to the club or group that has the highest aggregate score from logs submitted by members. The club must be a local group and not a national organization. Participation is limited to members operating within a local geographical area. *(Exception: DXpeditions especially organized lor operation in the contest and manned by members.)* Indicate your club affiliation. To be listed, a minimum of three logs must be received from a club.

XIII Log Instructions: 1 All times must be in UTC. The 18 hour non-operating periods must be clearly shown.

2 Prefix multipliers should be entered only the FIRST TIME they are contacted.

3 Logs must be checked for duplicate contacts and prefix multipliers. Recopied logs must be in their original form, with corrections clearly indicated. Computer logs must be checked for typing accuracy.

4 An alphabetical/numerical check list of claimed PREFIX multipliers must be sent along with your contest log. (A prefix is counted one time only.)

5 Each entry must be accompanied by a Summary Sheet listing all scoring information, the category of competition, and the contestant's name and mailing address in BLOCK LETTERS.

Also submit a signed declaration that all contest rules and regulations for amateur radio in the country of the contestant have been observed.

6 Official log and sample summary sheets are available from *CQ*. A large self-addressed envelope with sufficient postage or IRCs must accompany your request.

If official forms are not available, you can make your own with 40 contacts to the page.

XIV Disqualification: Violation of amateur radio regulations in the country of the contestant, or the rules of the contest, unsportsmanlike conduct, taking credit for excessive duplicate contacts, unverifiable QSO's or multipliers will be deemed sufficient cause for disqualification. Actions and decisions of the *CQ WPX Contest Committee* are official and final.

XV Deadline: All entries must be post-marked no later than *10 May 1985* for the SSB section and *10 July 1985* for the CW section. *Indicate SSB or CW on the envelope.* From isolated areas the deadlines can be made more flexible.

All logs go to: CQ Magazine, WPX Contest, 76 N Broadway, Hicksville, NY 11801 USA.

Questions pertaining to the WPX Contest can be sent to: WPX Contest Director, Steve Bolia, N8BJQ, via CQ Magazine, 76 N Broadway, Hicksville, NY 11801 USA. **AR**

WICEN NEWS

Derek McNiel
17 Manning Road, Malvern East, Vic. 3145

WICEN — VICTORIA LEARNS A LESSON OR TWO EARLY IN 1985

Last month you heard about the activity at Maryborough where WICEN operators from the Ballarat and Bendigo regions were called in to assist Department of Agriculture veterinary officers in their post-fire assessment and clean-up operations. High praise for the performance of those operators was still being handed out in Melbourne when the State Emergency Service requested WICEN support for the activity in the Bright/Porepunkah area. The response was immediate with operators from Shepparton and the north-east taking up the first shift. Lack of numbers in that region necessitated a call to other WICEN regions for reinforcements: Region 13 (East Metropolitan) came to the party. The activation lasted five to six days and consisted of a 'round-the-clock' communications link between the Operation Headquarters at Bright and the Relief Centre at Porepunkah. In all, sixteen operators took part including two from across the border in New South Wales.

Some valuable lessons were learned during this activation and are summarised below:

- *Always travel two to a car and two cars to a convoy, if at all possible.*
- *Maintain radio contact between vehicles on one frequency and stick to it. The WICEN simplex frequency, 146.500 MHz is recommended as this will enable other WICEN stations to contact you when you come into range.*
- *Always be prepared to be totally self-sufficient; you never know what facilities and comforts will or will not be provided.*
- *BEWARE the Low Voltage T-plug; not everyone conforms to the same polarity convention. It is recommended that you carry in your WICEN kit a T-plug with a LED and Resistor to indicate when the polarity of a 'foreign' T-socket is compatible with yours. WICEN convention is: vertical pin is POSITIVE, horizontal pin is NEGATIVE.*
- *Always take warm clothing even when going into supposedly hot areas; in the Victorian countryside very hot days may be followed by very COLD nights.*
- *An observation from the Great Victorian Bike Ride — there is no excuse for any Aussie to get a sunburnt nose or bald-patch! Remember, this is the land of the sunhat and zinc-cream. No sympathy from me if you don't go prepared.*
- *Have you got a space-blanket in your WICEN kit? Do you carry a WOOLLEN blanket in your car at all times?*
- *A message for the co-ordinators — eight-hour shifts are too long even when traffic is light. A maximum of four hours is recommended with a half-hour hand-over period prior to the official start time of the shift.*

Well, if you can remember that lot you should be able to keep yourself out of some trouble. Many of the tips may be 'old hat' to many experienced WICEN operators; they are recorded here for the benefit of those less experienced people who are keen to learn. *Is there any old hand out there who could manage to stir his/herself sufficiently (no not the cups of tea!!) to provide a regular column of WICEN tips?* I could anticipate zero response between now and 1986 but, on the other hand if no one else offers, I don't mind betting Harry (Region 13 Co-ord) will appoint someone to do it!

Space does not permit detailed reports on February activities but it has been a busy time on the training and community support scene. Bob Hose (Shepparton and NE Co-ord) covered the Moama Ski Race on 10th February, Col Pomroy (Regions 9 and 10) covered a car rally on 16th February, and Mark Stephenson displayed a multitude of WICEN operators at Tullamarine for the Open Day weekend of 23rd and 24th February. Down in the West Country (Hamilton), Regions 4, 5, 17 Co-ordinator, Ken Taylor organised a training session on 16th February which attracted 13 participants from as far away as Port Campbell, Warrnambool, Portland, Poolaijelo and Strathdownie. All in all a pretty busy month . . . at the time of writing it's not yet over!

One final note: if you sent in your questionnaire in November 1983 and haven't heard a word since, first of all blame the COMPUTER (everyone else does!) then contact your regional co-ordinator.

AR

INTRUDER WATCH

Bill Martin, VK2COP
FEDERAL INTRUDER WATCH CO-ORDINATOR
33 Somerville Road, Hornsby Heights, NSW 2077

It's nice to be able to open the column with congratulations once more for another call up-grade . . . this time to Bruce, formerly VK6KVV, the VK6 Divisional IW Co-ordinator, who now proudly signs VK6XZ. Well done, Bruce, and nice to see another amateur who has mastered the mysteries of CW. Bruce is always looking for reports of intruders on the bands from those in Western Australia.

Incidentally, Bruce is heading for 3D2 country shortly, so keep an eye out for intruders on the way, Bruce.

No news yet from VK1 as to whether they have found a replacement for Grahame VK1GP, who had to resign the IW post to move interstate. Any VK1 readers who are interested in helping out with the Intruder Watch, which entails a minimum of work, may like to indicate their desire to the VK1 Divisional Office. I can supply information on what is entailed if you care to write to the address at the top of the column.

Queensland, always innovative in their ideas, have come up with a good one for the Intruder Watch. They are assigning each member a segment of the amateur bands, and that member will report his findings to the Divisional IW Co-ordinator, Gordon VK4KAL. This idea certainly has merit, and we look forward with great interest at the results of the enterprise. Having finalised all reports and summaries for last year, a few statistics are presented for the information of interested parties:

STATISTICS FOR 1984

The figures in brackets are for 1983

No of Intruders reported:	*7468 (6908)*
No using RTTY:	*1348 (986)*
No using AM:	*5157 (5339)*
No using CW:	*963 (583)*
No of Identifications:	*727 (585)*
No of Observers Reporting:	*98 (94)*

621 pages of reports were received at this OTH, (605), and VK4 continues to supply most reports, with VK2 coming a close second. The number of reports has increased for 1984, but so has the number of intruders. Happily, the number of contributing observers has increased also. Let's hope we can report a further increase in Observer stations at the end of 1985.

Just had a phone call from the DOC in Melbourne, to the effect that they have been monitoring 21.032 MHz, and are satisfied that the USSR Intruder 'UMS' is in fact operating there. DOC has sent a telex to the USSR Administration, asking for their co-operation in causing the offending station to cease the interference on the 21 MHz Amateur Band. If no reply is received, they intend to go to the International Frequency Registration Board, for further action.

Chalk one up for the DOC, and our protests apparently do not fall on deaf ears. If the USSR fails to co-operate, there is very little else we can do about it. But at least we've done as much as we can.

That's all for this month, 73 till next time.

AR

ALARA

Australian Ladies Amateur Radio Association

Margaret Loft, VK3DML
28 Lawrence Street, Castlemaine, Vic 3450

Freda VK2SU, Dave VK5RN, Brian VK5CA, Stan VK2DZP and Denise VK5YL.

Hello again, the months are getting shorter or else I am getting slower.

Well the contest certificates are all out except for the Mrs McKenzie Trophy Certificate which was still at the printers to be picked up on 22nd February so it will have been sent before you are reading this report.

The winner of the Mrs Mac segment Jill VK4VNK is one of the new ALARA members as a result of the article which appeared in New Idea Magazine in October 1983. Jill was advised to contact Wendy VK4BSQ for tuition in radio theory; so in less than a year Jill studied, sat for and passed her novice exams and was proficient enough in CW to win the inaugural certificate.

Congratulations on a very fine achievement Jill and I have heard a new call sign is soon to be heard from your QTH.

Congratulations also must go to Wendy VK4BSQ for her teaching ability as I am sure she was a great help to Jill. With her own busy programme Wendy has been doing a teaching diploma course in her "spare" time over the past couple of years, and has been knee deep in study at contest time.

In the last contest in 1983 Wendy was runner up overall and this year outright winner so a very good example to us all.

WELCOME TO NEW MEMBERS

Etsuko JA6KYP, Gail XL2TZG, Darleen WD5FQX, Junia YJ8NJW, Akiyo JH1GMZ, June KM8E.

Marilyn VK3DMS has had a request from Marie ON4AYL for slides of YLs for a convention they are having later this year; so if you have slides taken at local radio gatherings please contact Marilyn.

ALARA will be ten years old this year and to celebrate this each state is going to arrange, if possible, an afternoon where members can meet. The majority have indicated in favour of two or three yearly get-togethers for national gatherings.

AMSAT AUSTRALIA

Colin Hurst VK5HI
8 Arndell Road, Salisbury Park, SA 5109

NATIONAL CO-ORDINATOR
Graham Ratcliff VK5AGR

INFORMATION NETS

AMSAT AUSTRALIA
Control: VK5AGR
Amateur Checkin: 0945 UTC Sunday
Bulletin Commences: 1000 UTC
Winter: 3.680 MHz Summer: 7.064 MHz

AMSAT PACIFIC	AMSAT SW PACIFIC
Control: JA1ANG	*Control: W6CG*
1100 UTC Sunday	*2200 UTC Saturday*
14.305 MHz	*21.280/26.876 MHz*

Participating stations and listeners are able to obtain basic orbital data including Keplerian elements from the AMSAT Australia net. This information is also included in some WIA Divisional Broadcasts.

ACKNOWLEDGEMENTS

Contributions this month are from Bob VK3ZBB, Amateur Satellite Report and UOSAT Bulletin Number 113, February 1985.

RS SATELLITE STATUS

Tests of batteries of RS-5, 7 and 8 show various results — RS-5's battery is almost ruined. Anomalistic telemetry from RS-5 was reported during early January when the Russian spacecraft were experiencing eclipses. RS-5 was falsely identifying itself as RS-3 and sending garbled telemetry. RS-7's battery is in mediocre condition while RS-8's is in excellent condition. RS-5 and 8 will be in transponder mode while 7 will be in robot and bulletin mode for the next period. All satellites will be off on Wednesday Moscow time which is from 2100 Tuesday to 2100 Wednesday UTC. Telemetry has been reported from RS-t recently . . . Tnx UoS.

UoSAT-OSCAR-9 OPERATIONS

The UoS Ground Station has recovered and returned the operating schedule of UO-9 back to normal. The UoSAT-1 Experiment Schedule changed from 180185 to reflect majority interests of the user community derived from an analysis of the many reports and suggestions received during 1984. The Bulletin/Digitalker/Telemetry mode at weekends has been changed to transmit approx 3 mins of 1200 Bps telemetry alternating with approx 6.5 mins of Bulletin — to make it easier to receive complete copies of the Bulletin! The Bulletin 'right justification' has been removed experimentally to save space — any comments? The Digitalker experiment has been moved to Mondays where it will alternate with 1200 Bps Telemetry, as it is primarily intended for educational demonstrations. The schedule is as follows:

Friday — load Bulletin
Saturday — Bulletin/1200 Bps telemetry
Sunday — Bulletin/1200 Bps telemetry
Monday — DIGITALKER/1200 Bps telemetry
Tuesday — Radiation data — next week CCD data
Wednesday — Computer check-summed telemetry
Thursday — Whole orbit telemetry survey

UoSAT-OSCAR-11 OPERATIONS

The data 'bypass' was successfully loaded into the DCE last week and shortly afterwards the 1802 OBC operations software was reloaded. The OBC 'bypass' facility has been checked and handover from the DCE to the OBC will occur when the next phase of DCE evaluation tests are ready to go. The reloading operation of the DCE and OBC software has been refined and future requirements should be completed within only a few orbits. The DCE is intended to provide an experimental facility to evaluate the hardware, software and operational protocols that will be required for a fully operational satellite 'mailbox' system called PACSAT — **PA**cket **C**ommunications **SAT**ellite.

The next phase of DCE tests will comprise memory integrity checks and a current draw baseline experiment should be ready to try later in the following week. The latter part of this week has seen considerable activity on the CCD and DSR experiments. A number of images have been taken during the night and day to attempt to establish the dynamic range of the system. The images were dumped slowly at 1200 Bps on the 145 MHz downlink and are being analysed.

For those interested in following these Preliminary tests, the data format is as follows:

CCD Imager size . . . 384 horizontal x 256 vertical (Pixels)
DSR Data Format (note: the same for CCD and P/Wave data)

One horizontal line comprises three 128 Byte blocks, i.e. line 1 has blocks 0, 1, 2; line 2 has blocks 3, 4, 5 etc.

The DSR data is transmitted as 128 Byte data blocks with sync, CRC, Hamming and Fire error detection and correction codes. When the end of a DSR dump is reached (i.e. block 767) then the dump cycles round again from block 0.

The block format is:

Sync code (30, 7B, 91 hex); 16 bit address (including Hamming); 128 Bytes of data; CRC; Fire Code.

The data is normally sent at 1200 Bps with 1 start; 8 data; and 1 stop bit.

The 16 bit address comprises the following:

P h3 h2 h1 h0 A10 A9 A8 A7 A6 A5 A4 A3 A2 A1 A0 (Hamming bits) (MSB . . . address bits . . .)

The Hamming bits are formed by the exclusive OR of 7 bits each

h0 = EXOR(A0 A1 A3 A4 A6 A8 A10)
h1 = EXOR(A0 A2 A3 A5 A6 A9 A10)
h2 = EXOR(A1 A2 A3 A7 A8 A9 A10)
h3 = EXOR(A4 A5 A6 A7 A8 A9 A10)
P = EXOR(A0 A1 A2 A4 A5 A7 A10)

PACSAT

A meeting will be held in Washington DC (USA) between 9-11 March 1985 to formulate detailed proposals for the PACSAT mission and fund-raising operations. With the successful demonstration of the Digital Communications Experiment on-board UoSAT-OSCAR-11, it has now become imperative that the fundamental design philosophies, resource requirements, schedules and launch interfaces for PACSAT are defined. Perhaps the overriding problem at this stage is the identification of funding sources — without which the technical problems become somewhat academic. The March meeting will address this problem specifically . . . UoS.

MANNED MISSIONS

The launch of the next radio amateur-in-space is holding at 9 July 85 according to AMSAT's VP-Manned Space, Bill Tynan W3XO. W0ORE will carry a sophisticated equipment suite if the approval cycle goes as expected . . . UoS.

MODE L REPORT

The improvement in AO-10 Mode L performance over the last year has been astounding according to several veteran satellite users. Recent tests show surprisingly moderate power levels are adequate for enjoyable QSOs on the newest OSCAR mode.

When first launched in 1983, AO-10 Mode L showed disappointing performance. The required uplink power was about 10dB higher than anticipated according to Engineering Vice President Jan King W3GEY. Failure analysis first focused on an antenna relay used to select either the 1269 helix or omni antenna for the Mode L receiver. Subsequent analysis, however, now makes this possibility seem less likely according to W3GEY. On the other hand, diagnosis by specialists in AMSAT DL as well as by AMSAT now points towards the HELAPS (High Efficiency Linear Amplification by Parametric Synthesis) amplifier as the culprit. According to W3GEY, DJ4ZC and his team at AMSAT DL strongly suspect a bias regulator in the HELAPS, a JANTXV 2N2222, as the failure locus. The HELAPS is consequently running as a Class C amplifier rather than its linear mode as designed. This reduces the output which in turn forces a stronger uplink for a given downlink signal. Some estimates a year ago suggested upwards of 30 kW EIRP were required for usable QSOs. That value compared with the pre-launch estimates of 2 to 3 kW EIRP.

Now, however, due to a number of favorable circumstances, performance appears to have improved to not only pre-launch expectation but beyond. According to K0RZ, the improvements in Mode L performance derive from several sources. "Since Mode L comes on well before apogee now, as compared to previously, the satellite is closer. The path loss improvements add up to about 5dB improvement," Bill told ASR recently. "The major improvement is pointing angle," he added. "The Mode L receive helix has a fairly narrow beam width and the choice of Mode L operating times is absolutely critical if reasonable performance is to be attained. The other major improvement comes from the re-biasing of the faulty output stage with heavy loading. For example, as an experiment, Cor VE7BBG, would aim his big EME array at AO-10 and transmit. Instantly signals which were not heard before come up by many dB. The output stage is self-biasing to an extent with load so that it is running in a more linear regime. The same effect is noticed to a degree when the RTTY beacon comes on to replace the PSK beacon."

K9CIS says the improvement in downlink when the RTTY telemetry is on can amount to as much as 6 dB. AMSAT is looking into ways to keep the RTTY beacon on more of the time according to W3GEY.

Meanwhile, satellite controller VE1SAT says that we can look forward to continued favorable pointing angles for Mode L for the foreseeable future. K9CIS adds that he is aware of Japanese Mode L operators having successful CW QSOs with only 10 watts to a single loop Yagi! In other words, if you do it right, you can get along with 1 kW EIRP or less. The point is that it would appear that at present Mode L performance can be not only as good as but superior to pre-launch estimates.

. . . ASR

UPS AND DOWNS

Courtesy of Bob VK3ZBB we have the latest list of launches and re-entries.

de Colin VK5HI

"They're Checking Out Satellites on the Ground"

by B. Lebedev
(Translation from Russian by Dex Anderson W4KW of an article in the "Sovetskiy Patriot" of 16 Jan, 1985)

The successful operation over a period of three years of radio amateur satellites 'Radio-5' through 'Radio-8' has stimulated further work by radio electronics enthusiasts in creating new, improved on-board satellite equipment. In the volunteer space-technology laboratory of the Zhdanov Rayon Radio Club in Moscow city, tests have begun of one variation of on-board repeater and automatic operator-'robot'. The following members of the laboratory took part in creating them: A Leonov, B Lebedev, A Papkov, V Solovyev, B Omel'chenko, A Savchenko, Yu Kornilov, V Mironov, S Rodin, and many others.

In November of last year, in the 'satellite' segment of the radio amateur 10 metre band (frequency 29.402 MHz) the 'RS-9' beacon went on the air. It transmits telemetry information analogous to that sent into the airwaves from orbit by the 'Radio' series of satellites. At year's end the repeater too was switched on translating the band of frequencies 145.860-145.900 MHz to the segment 29.360-29.400 MHz. Many shortwavers and ultrashortwavers from Moscow and the Moscow area (UK3A, RS3A, RA3AHM, RA3AMM, and others) have already made initial contacts via this repeater. The principles for the use of the terrestrial repeater are the same as those for the use of those now operating from space orbits. The basic principle is choice by the operator of a transmitter power level such that the translated signal level does not exceed that of the beacon signal, in which event mutual interference will be minimised.

The repeater is switched on around the clock, but the 'robot' is on the air irregularly. It transmits its own CQ on the frequency 29.320 MHz, announcing at that time the frequency on which it should be called. Operation with the 'robot' is conducted in accordance with the same programme as with the 'robots' of the 'Radio' series of satellites. **AR**

SATELLITE ACTIVITY FOR PERIOD NOVEMBER 1 TO NOVEMBER 27, 1984

LAUNCHES

Initial Data

On board Discovery STS 51-A were astronauts F Hauck, D Walker, J Allen, D Gardner and A Fisher. The payload included ANIK-D2 and SYNCOM IV-1. The mission recovered spacecraft PALAPA-B2 and WESTAR 6.

RETURNS

During the period thirty-three objects decayed including the following:—

1973 — 106A Molniya 2-8
1984 — 011B Westar 6
1984 — 045A Cosmos 1552
1984 — 113A STS 51-A
1981 — 085A OPS 3984
1984 — 011D Palapa-B2
1984 — 102A Cosmos 1599
1984 — 117A Cosmos 1609

SATELLITE ACTIVITY FOR PERIOD NOVEMBER 28 to DECEMBER 24, 1984

EDUCATION NOTES

Brenda Edmonds, VK3KT
FEDERAL EDUCATION OFFICER
56 Baden Powell Drive, Frankston, Vic 3199

All readers are invited to "have-a-go" at this Novice Theory Trial Examination, then check the answers at the end of the Hamads.

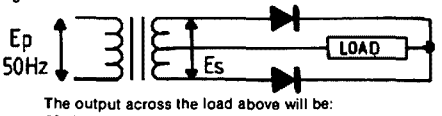
TRIAL EXAMINATION NOVICE THEORY

Select the correct or most appropriate answer.

1 Of the substances aluminium, carbon, sllicon and distilled water, the best conductor of electricity is:
a aluminium
b carbon
c sillcon
d distilled water

2 The frequency at which a quartz crystal oscillates is affected by:
a the voltage applied to the circuit
b the mechanical stability of the surrounding components
c the way it is cut
d whether or not is has impurities incorporated into it

3



The output across the load above will be:
a 50 Hz at E_S
b 50 Hz at $\frac{E_S}{2}$
c 100 Hz at $E_S \times 2$
d 100 Hz at $\frac{E_S}{2}$

4 The type of transmission which requires the least bandwidth is:
a CW
b amplitude modulated carrier
c single sideband suppressed carrier
d double sideband suppressed carrier

5 A radio signal having a wave-length of 10 metres corresponds to a frequency of:
a 28 MHz
b 21 MHz
c 10 MHz
d 3.5 MHz

6 The inductance of a coil can be lowered by:
a lowering the voltage across it
b adding more turns
c making the turns closer together
d using an air core instead of an iron core

7 A receiver is tuned to a frequency of 28.145 MHz. If the first IF is 10.700 MHz, the local oscillator would be tuned to:
a 10.700 MHz
b 28.145 MHz or 10.700 MHz
c 38.845 MHz or 17.445 MHz
d 18.845 MHz

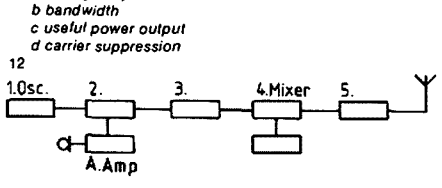
8 When transmitting, the feed point of a quarter wavelength mobile antenna will:
a be at earth potential for RF
b have an input impedance of about 150 ohms
c be at a voltage peak
d be at a current peak

9 A moving coil meter can measure alternating current by use of a :
a resistor in series
b diode in series
c shunt diode
d capacitor in parallel

10 The SWR of an antenna is a measure of the ratio between:
a maximum and minimum voltages on the leadline
b voltage at feedpoint and voltage at end
c voltage at feedpoint and current at feedpoint
d forward resistance and reflected resistance

11 If a Single Sideband transmission is over-modulated, the effect will be an increase in:
a intelligibility
b bandwidth
c useful power output
d carrier suppression

12



The output from stage 3 of this single sideband transmitter should consist of:
a full carrier plus one sideband
b one sideband and a low level of carrier
c two sidebands with a low level of carrier
d one sideband only

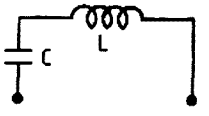
13 A Yagi antenna for use on the 10 metre band would have a:
a driven element approximately 10 metres long
b director slightly longer than the driven element
c reflector slightly longer than the driven element
d driven element approximately 2.5 metres long

14 High frequency communication over long distances is possible at night because of:
a ducting through the upper layers of the atmosphere
b reflection of signals by the D layer
c refraction of signals by the F layer
d intense ionisation of the troposphere by solar flares

15 To achieve maximum power transfer between a transmitter of 50 ohms output impedance and an antenna of 75 ohms feed impedance it is necessary to use:
a an antenna tuning unit in the transmission line
b a dummy load
c balanced transmission line
d a change over relay

16 A marker crystal oscillator may be used to:
a measure the intermediate frequency of a receiver
b produce harmonics for multi-band operation
c calibrate a transceiver frequency range
d resolve a CW signal on a SSB receiver

17



In this tuned circuit:
a impedance is maximum at resonance
b resonance occurs when the reactances of C and L are equal
c resonant frequency will decrease as the value of C rises
d total impedance is the sum of the reactances of C and L

18 In a triode vacuum tube:
a a space charge is developed when the anode is made sufficiently positive
b conduction occurs whenever the anode potential rises slightly above the cathode potential
c electron flow is controlled by the potential applied to the control grid
d the grid is always kept at earth potential.

19 A transformer primary winding draws 10 amps at 240 volts from the mains supply. If the load on the secondary draws 16 amps at 100 volts, the transformer is operating at an efficiecy of about:
a 16%
b 48%
c 67%
d 160%

20 An RF amplifier operating in Class C:
a should have an efficiency of about 30%
b will conduct for about 30% of each cycle
c could be used as a linear final amplifier
d will have the bias on the grid (or the base) set to cut-off

21 A P-N junction is forward biased when:
a electrons flow from P type to N type material
b a positive potential is applied to the P type layer
c the voltage across the junction exceeds the leakage current
d the depletion layer is saturated with current carriers

22 Parasitic oscillations may be:
a produced by overdriving linear amplifiers
b prevented by neutralising the audio amplifier stage
c prevented by use of a high pass filter at the transmitter output
d caused by unwanted resonances in the final amplifier

23 In a Field Effect Transistor (FET) the major electron flow is from:
a Source to Drain and controlled by Gate Voltage
b Source through Gate to Drain
c Source to Drain and controlled by Gate current
d Drain to Gate and controlled by the Source-Gate resistance

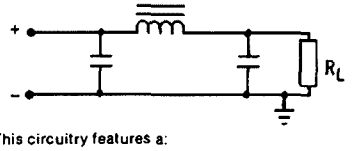
24 A simple 28 MHz transmitter using a 3.55 MHz crystal in the oscillator stage would also need to have:
a two tripler stages
b one doubler and one tripler stage
c one quadrupler stage
d three doubler stages

25 A resistor of known quality is colour coded red, violet, orange, silver. Its resistance should be between:
a 3500 and 3900 ohms
b 22,000 and 31,000 ohms
c 25,000 and 29,000 ohms
d 360,000 and 400,000 ohms

26 The final amplifier stage of a single sideband transmitter must be:
a linear
b operated in Class C for efficiency
c directly coupled to the modulator
d capacitively coupled to the preceding stage

27 A solid state device which can be used to provide a regulated DC voltage could be a:
a varicap diode
b zener diode
c lead-acid battery
d unijunction transistor

28



This circuitry features a:
a voltage doubler
b high pass filter
c parallel tuned circuit
d capacitor input filter

29 Unwanted harmonics in a transmission could be detected by using a:
a dip meter as a tunable absorption wave meter
b standing wave ratio meter
c broadcast band receiver
d beat frequency oscillator

30 A double conversion superheterodyne receiver must have two:
a radio frequency amplifier stages
b different intermediate frequencies
c detector stages
d audio amplifier stages

31 The type of microphone which functions by movement of a coil inside a magnetic field is the:
a dynamic
b carbon
c crystal
d condensor

32 Key clicks can be prevented by:
a keying the oscillator stage
b using a low pass filter at the transmitter output
c using a smoothing filter in the key circuit
d regulating the transmitter power supply output voltage

33 The Maximum Usable Frequency:
a is always below the upper limit of any HF amateur band
b is generally lower during periods of sunspot maxima
c depends on the SWR of the antenna
d varies according to time of day, season and latitude

34 Three pin mains plugs should be wired so that the:
a red conductor is connected to the earth pin
b brown conductor is connected to the active pin
c green conductor is connected to the neutral pin
d fuse, if any, is in the blue conductor

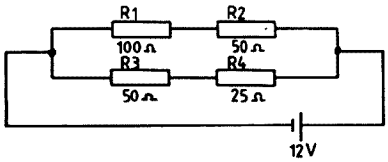
35 In a direct conversion receiver selectivity is provided by:
a the audio stages
b a high second IF stage
c a very sensitive Automatic Gain Control system
d the RF amplifier stage

36 Fading of HF signals during a long distance contact is often due to:
a changes in the sunspot pattern
b a decrease in the ionisation of the troposphere
c a change in the radiation pattern of the transmitting antenna
d multiple path signals arriving at the receiving antenna out of phase with each other

37 When soldering some types of transistor into a circuit it is good practice to hold the leads with pliers to:
a avoid damage due to overheating
b prevent solder resin from affecting the transistor case

c avoid handling the transistor which may contain harmful material
d prevent the leads from being tinned over their whole length

38



The voltage drop across R_2 will be:
a the same as across R_3
b twice that across R_4
c the same as across R_4
d 6 volts

39 A keying relay may be used in a CW transmitter:
a to prevent formation and radiation of key clicks
b to avoid having high voltages across the key contacts
c to switch the antenna from the receiver to the transmitter
d when the operator wishes to transmit a pre-recorded message

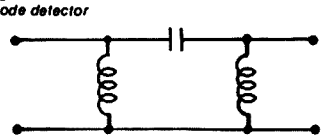
40 A television receiver suffers interference on all channels when a nearby Novice amateur transmits. The problem could be reduced by:
a using a high pass filter at the transmitter output
b using a high pass filter at the receiver input
c inserting a parallel tuned trap in the transmitter leadline
d improving the shielding of the transmitter

41 When testing a transmitter for prolonged periods an artificial antenna should be used because:
a it provides lower load impedance than a transmission line
b it efficiently radiates a steady signal
c most modern transmitters require regular checking of the output impedance
d this prevents interference to other stations

42 Cross modulation may occur in a broadcast receiver:
a if the receiver has inadequate sensitivity
b by mixing of a strong local signal with an amateur signal
c by rectification of an amateur signal in the audio stage
d when an amateur signal mixes with the receiver IF

43 Which circuit can efficiently detect both SSB and CW signals?
a BFO and diode
b crystal set
c regenerative detector
d diode detector

44



This circuit could be used as a:
a trap in a multiband dipole antenna
b low pass filter
c high pass filter
d safety device in a high voltage power supply

45 A simple method of matching a balanced dipole antenna to co-axial cable may use a:
a change-over relay
b balun
c series tuned output circuit at the transmitter
d pair of diodes back to back

46 The ability of a receiver to remain tuned to the desired frequency is known as:
a stability
b sensitivity
c selectivity
d suppression

47 A 47 k ohm resistor through which 10 milliamps flow should have a power dissipation rating of at least:
a 0.5 watts
b 1.0 watts
c 2.5 watts
d 5 watts

48 The 'Beta' of a junction transistor refers to its:
a current amplification
b biasing arrangement
c tendency to thermal runaway
d internal capacitance

49 Five capacitors, each of 22,000 pF are connected in parallel. The total capacitance will be:
a 0.01 µF
b 0.11 µF
c 4,400 pF
d 11,000 pF

50 'Sound bars' may appear on a television screen:
a as a result of receiver overload in the AGC section
b as dark vertical lines with cross-hatching between them
c when a strong interference signal is amplitude modulated
d when two or more harmonics of an interfering signal are received

AR

SPOTLIGHT ON SWLing

Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

Well, April is here and already a quarter of the year has gone. As expected, conditions have been unpredictable on HF. Signals on the EW path have been well down while propagation on the NS path have been quite exceptional. I have been copying Asian stations around midday local time on the 19 and 25 metre bands, which is somewhat unusual for this far south. It can be said that this could be rightfully attributed to the upgrade of my receiving equipment rather than propagation alone. Yet signals from Europe on the LP as well as North America have been frequently noted by their absence.

I believe that listeners in northern Australia often hear Asian signals in the daytime, yet miss out hearing LP signals in South America that we frequently observe in the late mornings-early afternoons here in south eastern Australia over the winter months. I myself have witnessed this while in Brisbane a few years ago, especially on 9 and 11 MHz. Asian signals dominated the bands with the usual Europeans I usually copy in Tasmania not heard at all. So I have been surprised to catch these Asians in the daytime here, due primarily to the low sunspot count.

And talking of propagation, I must say that I was very surprised to hear the upsurge of activity in the CW section of the ARRL Contest on the 16th and 17th of February. Stateside stations were copied at quite exceptional levels on both 7 and 14 MHz around 2100 UTC, where normally no propagation exists on the LP from North America. Even as late as 2200 UTC the LP signals were quite readable on 7 MHz. This makes me wonder if the amount of traffic keeps the bands open longer, or is it that amateurs no longer try to see if there is any propagation. I somehow suspect the latter, as the amount of traffic within the phone allocations was considerably well down in comparison with CW activity.

The 160 metre band was also an eye-opener to me with propagation to the US West Coast around 1330 UTC on the 17th. I didn't hear any VKs working them around 1.825 MHz, but the JAs were heard up on 1.910-1.915 MHz working them split. There were some VKs active on SSB around 1.815.5 nattering amongst themselves, seemingly unaware of the DX wealth just a few kilohertz away. I think that more attention could be paid to the DX windows on 1.8 and 3.5 MHz as propagation should be exceptional during this sunspot minima. You may be surprised. Unfortunately I don't have operational capability on top bands but that doesn't prevent me listening in.

The Radio Nederlands Lopik site ceased operating on the 31st of March, when the new Flevoland site became fully operational. Incidentally Dutch radio amateurs were allowed to use the antenna arrays to conduct experiments on the 16th and 17th of February. They were primarily operating on 7 and 14 MHz on SSB, but after numerous requests from European amateurs, they did transmit around 3.790 MHz at around 0900 UTC. They were successful in matching the 100 watt amateur rig to the antenna arrays. I heard them call on 14.220 MHz as PA6FLD working several Europeans. They were especially looking for VK3BLZ around 1300 UTC, so I called them up. Alas I had no success.

From time to time you have probably heard stations with a mode that resembles either a buzz saw or a jet engine. These are utilising the Frequency Division Multiplex (FDM) mode. It consists of 16 channels of RTTY spaced 170 Hz apart, employing a very narrow shift of 85 Hz. It is virtually impossible to decipher these using conventional demodulators, although specific equipment is obtainable in the US from military surplus but is not accessible easily to the radio amateur. Tuning across these buzz saw like sounds, you will hear the RTTY signals, but will find it difficult to separate them into individual channels using your conventional demodulator. Most FDM's are military based, although other users requiring security such as diplomatic missions also reportedly use it.

Another unusual signal that is rarely encountered these days is Piccolo. This consists of several high pitched tones that resembles the flute like instrument of that name playing a fast tune. This audio device was developed by the British in the early sixties and reportedly used primarily on diplomatic traffic.

Most of the RTTY traffic on HF today is either encrypted or encoded for greater privacy. Many utilise Bit Inversion, ie where the mark and space are swapped around in the middle of a word. The number of bits can be many, so unless you happen to known the order of the Bit Inversion, your demodulator will only print up rubbish.

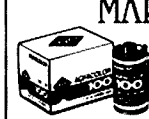
Another mode you will have heard being transmitted on HF is FAX. This is commonly used to transmit weather pictures to marine and other meteorological offices. FAX can easily be identified by their synchronous pulses or "ticking" in one second. You can hear a Japanese Meteorological FAX station on 80 metres on 3.623 MHz most evenings. Michiel Schaay, the Dutch RTTY enthusiast who has compiled a schedule of RTTY press broadcasts, recently announced that he has published a FAX Directory. It has operating times together with frequencies used. I imagine that interest in receiving facsimile pictures will increase now that printers have become more readily available to the amateur. The quoted price for the FAX Directory was around 50 Dutch Guilders plus postage.

Schaay has also announced the publication of a list of US military frequencies. He even has claimed that some of these even issue QSL cards, which I personally find a little preposterous. I would expect that the opposite would be the case, as their transmissions are certainly not designed for the average SWL, for their traffic would be fairly classified. The only military radio network that I do know that definitely welcomes reception reports from the SWL, is the US Armed Forces Radio and Television Service (AFRTS) which is based in Los Angeles.

While accidentally tuning across the bands, I happened to come across Radio Moscow's DX programme. It is aired on Sundays at 0625 repeated at 1225 UTC. The programme doesn't contain any startling tips, concentrating on schedules of other Eastern European broadcasts. Yet it is a little puzzling that gospel and other religious broadcasters are mentioned frequently. After all, I have heard Moscow a number of times state that the state actually encourages atheism!

AR

MARCH'S BEST PHOTOGRAPH



This time the judges voted the front cover as the best photo for March. Henry Lundell VK2ZHE is now eligible for the prize of $100 worth of film and video tapes from Agfa-Gevaert in June.

AWARDS

Joe Ackerman, VK4AIX
5 Koomooloo Court, Mermaid Waters, Qld 4218

Meet your new Federal Awards Manager, Bill Hempel VK4LC.

He was first licensed in May 1957 with the callsign VK3AHO. During this period he was farming at Kyvalley, Victoria after retiring from service with the RAAF as a Commissioned Officer, GD Signals with service in Europe, Malaya and Japan.

Many will recall his signal on all bands emanating from his V beams with 226.64 metres on each leg suspended on towers 30.48 metres high, with DXCC on 80 metres and 320 countries on HF by 1970.

Beginning in 1962, Bill undertook the first DXpeditlon of the month as a member of the Certificate Hunters Club and was the first VK to operate single handed a DXpeditlon to Wallis Island with the call sign FW8BH, followed by YS1BH, VR1N Ocean Island, CR8BH Portuguese Timor, VK9BH Nauru Island.

Among the many prestigious world wide awards, totalling over 100, two have pride of place. His WAZ-No 8 and the A 1 Operators Award. This indicates his very keen interest in this facet of our hobby.

Between DXpeditions Bill obtained his Private Pilots licence which he still holds.

Following the death of Alf VK3KB, in 1967, Bill took over the position of Federal Awards Manager until a replacement from VK3 was found.

After his stint as a farmer he moved back into the RAAF as a civilian in the Department of Defence, Canberra, ACT where he was OIC of the Air Historical Section for over 5 years until he was promoted to the position of Parliamentary Liaison Officer in charge of VIP Aircraft Records.

He retired to Queensland where he is still up in the clouds at Eagle Heights on Mount Tamborine overlooking the Gold Coast. He maintains regular skeds to Sydney on VHF and UHF, operates Oscar 10 and of course is still chasing those elusive countries on HF.

We wish Bill good luck and success as our FAM.

TAMAR VALLEY AWARD

The Northern Branch of the Wireless Institute of Australia, Tasmanian Division has instituted a new award.

The purpose of this award is to encourage all amateurs to make contact with amateurs resident in the Tamar Valley Region of Northern Tasmania. Short wave listeners may also qualify for the award in the usual manner.

You may qualify for the award in any of the following sections and you may qualify for more than one award.

SECTION 1 — OPEN: By the use of any combination of bands and modes available to the applicant. (Split banding is permitted but cross banding is not except between NAOCP and ALOCP holders.)

SECTION 2 — HF ONLY: By the use of any combination of bands up to 30 MHz available to the applicant.

SECTION 3 — VHF/UHF/SHF: As for Section 2 but above 30 MHz.

SECTION 4 — SINGLE BAND: Any one band of those available.

SECTION 5 — SINGLE MODE: Any one of those available.

SECTION 6 — ALL NOVICE: Contact with Novices only (Including 'K' calls below 30 MHz.)

SECTION 7 — REPEATER: Via in-band repeaters.

SECTION 8 — SATELLITE: Via amateur satellites. Cross banding to HF allowed if permitted under licence terms.

SECTION 9 — SWL'ing: For Short Wave Listeners.

Section 4 and 5 may be combined with other sections.

Applicants must earn twenty points to qualify for the award. Stations can only be worked once for each award.

Points are earned as follows:

CALL AREA	ON HF	ON VHF/UHF/SHF
Tasmania	1 point (20 stations)	2 points (10 stations)
Australia	2 points (10 stations)	4 points (5 stations)
All others	4 points (5 stations)	10 points (2 stations)

Stations in the following municipalities (shires) are eligible as contacts for the award.

City of Launceston
Beaconsfield
Evandale
George Town
Lilydale
St. Leonards
Westbury

Applications in the form of log extracts should show the applicant's Name, Callsign, Section applied

for, Callsign of the station contacted, Date, Time, Band or frequency, Mode and Municipality.

Claims are to be signed by the applicant only. Spot checks may be made with stations in VK7 for confirmation. QSL CARDS ARE NOT REQUIRED.

Only contacts made after 1st September, 1984 are eligible as claims and applications for the award should be made to the Awards Manager, PO Box 168, Launceston, Tas 7250.

A fee of $2 or five IRCs should accompany the claim.

RL AWARD

The RL Award shall be issued by the "Japan Amateur Radio League — Club Zoo" for all amateurs and SWLs who have the proof of 2 way communications (or SWL Cards) with the following stations.

Class AA: 12 QSLs from JA1RL through JA0RL, 8J1RL, JR6RL plus 1 QSL each having RL in suffix from six continents. (Total 18 QSLs)

Class A: 10 QSLs from RL stations in JA (Example: JA1RL) and 8J1RL. (Total 11 QSLs)

Class B: 5 QSLs from RL stations in JA.

Class C: Spelling out "JAPAN AMATEUR RADIO LEAGUE CLUB ZOO" — 30 Characters — with tail-letter of any QSL cards.

Logs: Call sign, Date, Time, Band, Mode and Signal RST.

Fee: 10 IRCs or US $5.00.*

(A physically handicapped person is exempted from paying the Fee)

** 10 percent of the application fee shall be contributed to the UNISEF.*

Endorsement: Single Band, Single Mode

SWL: Same rule

Note: One of the undermentioned Club Zoo members QSL cards can be utilised in place of only one RL station's QSL except Class AA.

Application must be sent to:

Hiroshi Toyoshima
1-8-10, Fujisawa, Fujisawa-city,
Kanagawa-Pref, 251, Japan.

Club Zoo members:

JH1NXU, JH1XUP, JR1CYI, JF1IQC, JG1QZC, JG1XNF, JI1ODR, JI1RPC, JI1RRE, JI1RRM, JI1VLP, JI1XSI, JJ1NII, JK1FLR, JK1GCK, JM1GIQ, JM1GIR, JM1RIG, JQ1DJX, JO1NCX, JQ1IUD, JR3RMR, 4S7VL, 4S7EA

BELGIUM WABP AWARD

The award is available to licensed amateurs and SWLs.

There is no date limit.

Do not send QSLs. A list showing full details of the contacts should be verified by the Awards Manager of the National Society.

Any bands and modes may be used.

The fee for the award is 5 IRCs.

The address for applications is:

ON5TO
UBA Awards Manager
PO Box 634,
Brussels, Belgium.

Requirements

Confirmed contacts are required with each of the nine provinces on two bands.

Provinces for WABP Award

WW West Flanders	LX Luxembourg
QV East Flanders	NR Namur
AN Antwerp	HT Hainaut
LM Limburg	BT Brabant
LG Liege	

THE VIENNA AWARD

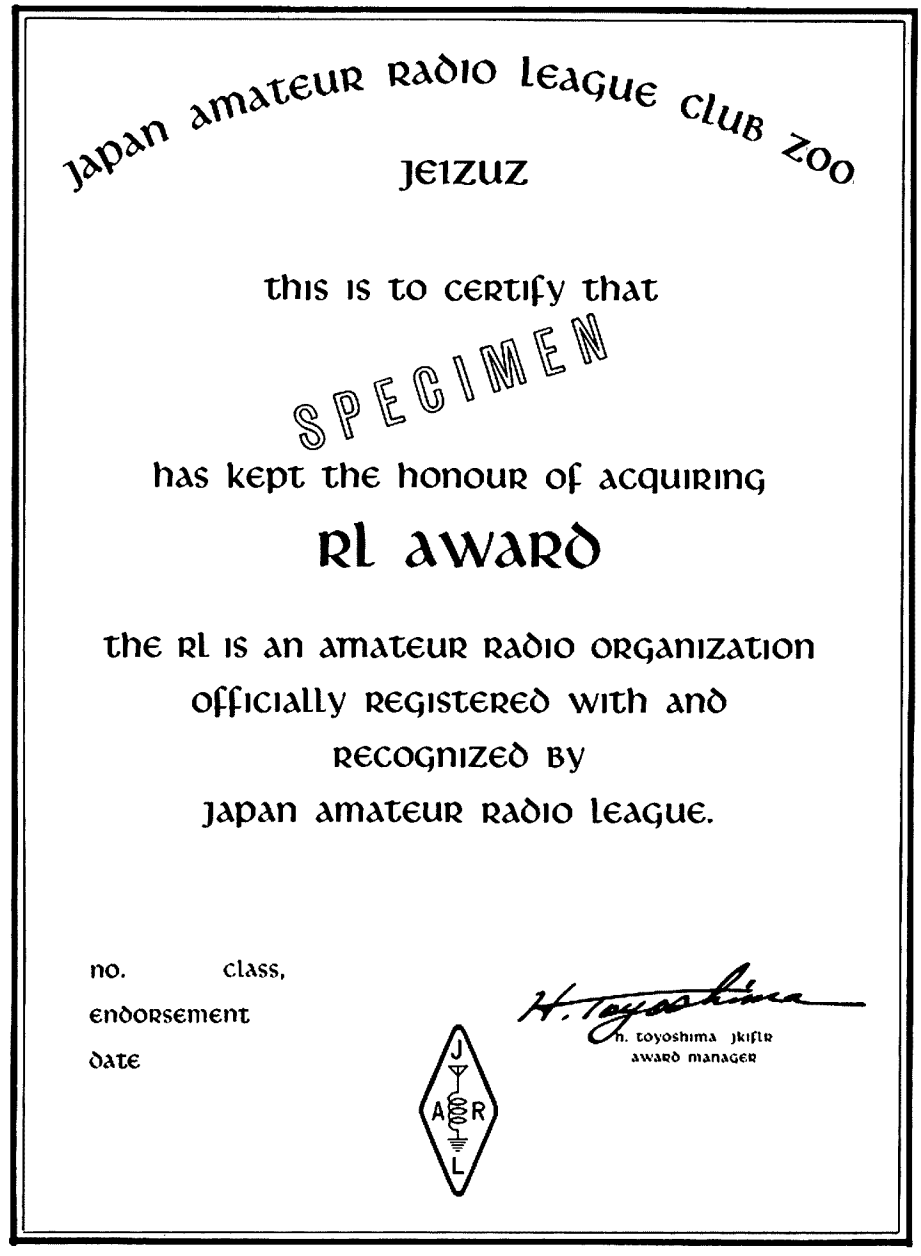
This award is sponsored to all amateurs and SWLs In two classes.

Class 1: 23 Vienna districts.

Class 2: 15 Vienna districts.

All bands, all modes and mixed. Cards since 1st of April 1954 are valid. The districts of Vienna you will find in the second and third number of the four-digit Zip Code.

Send 10 IRCs and GCR list to: *OVSV, 1060 Vienna, Eisvogelgasse 4, Austria.*



YO-DANUBE RIVER AWARD

This Award Is issued for working on two bands different stations located in countries along the Danube River. Federal Republic of Germany, Austria, Czechoslovakia, Hungary, Yugoslavia, Bulgaria, Romania and USSR as follows:

DX stations 3 QSOs with YO and 2 QSOs with other countries.

At least 3 QSOs out of the above mentioned contacts must be with stations located in cities just on the Danube River.

Valid contacts after 23rd of August, are needed together with 7 IRCs or the equivalent foreign currency should be mailed to:— Romanian Radioamateur Federation, PO Box 1395, R-76.100 Bucuresti 5, Romania.

THE REDCLIFFE CITY AWARD

The Redcliffe City Award was first applied for in 1972 by VK2APH, who is the proud possessor of Redcliffe City Award Number One. In February this year Number 490 was issued to VK4MUQ.

Those wishing to qualify and apply for this award need six points for a VK or ZL station and four points for any other international. To obtain these points stations you must contact stations that are members of the Redcliffe Radio Club which are worth one point. The Club stations are worth two points.

The Club stations are VK4RC, VK4VRC and VK4IZ. A list of member stations can be obtained by writing to the Awards Manager, enclosing return postage.

The Redcliffe Radio Club conducts two Awards nets to assist operators and SWLs to obtain the Award. Saturday from 0400 UTC on 21.190 MHz and Wednesday from 0930 UTC on 3.612 MHz.

Members also use these two frequencies on a regular basis for Club traffic at other times including the Sunday Club Net at 0930 UTC on 3.612 MHz.

To apply for the Redcliffe City Award send a log extract listing the stations contacted and enclosing $A2 to cover costs to: The Awards Manager, Redcliffe Radio Club, PO Box 20, Woody Point, Old, 4019. Short Wave Listeners are also actively sought after.

Contributed by Kevin Jones. VK4AKI Awards Manager, Redcliffe Radio Club.

"VICTORY-40" AWARD

The "Victory-40" award is sponsored by the Radio Sports Federation of the USSR, the E T Krenkel

Central Radio Club of the USSR and "Radio" magazine to commemorate the 40th Anniversary of the historic victory of the soviet people and the Soviet Army in the Great Patriotic war of 1941-1945.

The "Victory-40" award is for radio amateurs all over the world for QSOs (SWL reports) with veterans of the Great Patriotic war and special memorial radio stations from 1st January to 9th May 1985.

Within this period the following prefixes will be used by special memorial radio stations operating from:

— *capital of the USSR: ER*
— *hero-towns of the USSR: EW*
— *capitals of Union Republics: EU*
— *capitals of Autonomous Republics: EV*
— *former centres of partisan warfare: EM*
— *towns decorated with the orders of the USSR for their contribution to the victory in the war: EO*

OSOs with memorial radio stations operating in socialist countries will also count for "Victory-40" award.

Veterans of the war will use their regular call signs plus "R" (For example: UA3DA/R).

To receive the above award one must gain 40 points for QSOs with different memorial radio stations and veterans of the war. Each QSO is valued as follows:
— *5 points for radio amateurs operating in Australia and Oceania.*

The "Victory-40" award will be delivered free of charge on receiving the extract from the log verified by the national amateur radio society or 2 licenced radio amateurs.

Any band and any mode including that through amateur radio satellites will count.

Applications for the "Victory-40" award are to be sent to the E T Krenkel Central Radio Club of the USSR, PO Box 88, Moscow, USSR not later than 1st January 1986.

KARL AWARD PROGRAMME

The following Korean Amateur Radio League (KARL) awards are available to all amateurs and SWLs.

HLA (HL Award). Issued to all who received QSL cards from any HL stations (except HL9s), depending on the number of contacts made (heard) with (from) HL stations (except HL9s). Depending on the number of contacts made (heard) with (from) HL stations, one or more of the following classes may be claimed.

Class K: 5 QSLs Required
Class O: 10 QSLs Required
Class R: 20 QSLs Required
Class E: 30 QSLs Required
Class A: 50 QSLs Required

Stickers for affixing to certificates endorsing additional credits are available in multiples of 50 upon submission of QSL cards.

AKA (All Korea Award): Issued to amateurs/SWLs who received QSL cards from HL stations. At least one from each of seven different call areas, (ie) 1, 2, 3, 4, 5, 8 and 0.

KDN **(Korean District Number Award):** Issued to amateurs/SWLs who received at least one QSL card from HL stations located in each of the 50 different cities, Guns or Gus in Korea.

The awards will be issued in multiples of 50, (KDN 50, 100, 150) upon submission of cards with list prepared in order of KDN reference numbers.

APA (All Province Awards): Issued to amateurs/SWLs who received QSL cards from HL stations located in each of different special cities and provinces in Korea.

Area codes for each City and/or Province are as listed below:

Area Code	Province and/or City
1	City of Seoul
2	Inchon City, Kyonggi-do, Kangwon-do
3	Chungchongnam-do, Chungchongbuk-do
4	Chollanam-do, Chollabuk-do, Cheju-do
5	Pusan city, Taegu city, Kyongsangnam-do Kyongsangbuk-do

General rules and requirements

1 8 IRCs will be charged per award and 4 IRCs for each HLA sticker.
2 If QSL cards are submitted, they must contain enough IRCs for return postage.
3 Endorsements for such operating distinctions as bands, modes and QRP may be applied for.
4 Proof of contacts/receptions made with any HL stations (except HL9s) on/or after 3rd February 1959 will be acceptable.
5 Proof of contacts/receptions made with US Army stations in Korea (HL9 call area) will not be acceptable.
6 All contacts must be made within the same call area.
7 Mail your application to: Korean Amateur Radio League, CPO Box 162, Seoul 100, Korea.

POUNDING BRASS

Marshall Emm, VK5FN
GPO Box 389, Adelaide, SA 5001

SPEED PRACTICE FOR THE NOVICE OPERATOR

Before any of you real brass-pounders decide not to read the column this month because of its title, please note: *by novice operator I mean one who is new to CW operation — not necessarily a novice in other areas of amateur radio endeavour* — and if you 30 WPM men want to have somebody to work with when all your old mates go QRT for the last time you had better realise you have a role to play in the development of new operators. So read on!

In the November issue of the column I offered to print a "schedule" of operators who would be prepared to commit themselves to operation at a certain time and frequency to provide the opportunity for slower operators to engage in QSOs with operators who would not leave them in the dust. Well, here is the list:
VK3PGY Op: Vic, Freq: 80m, Speed: 7 WPM
Times: Mon-Fri 1300 and 1400, Sun 1100-1200, local time.

That's it. One novice, prepared to help his fellow operators. *Where are all the brass-pounders?* A lot of you read this column, as I can tell from the volume of correspondence (for which thanks). Surely it's not impossible for some of you to set aside a single hour a week (or fortnight) to help the struggling beginner. We all know how easy it is to meet the examination requirement (at least in hindsight) but seem to forget how difficult it is to make the transition from exam-style textual material to competent CW operation on air.

One more chance, guys — send me the details of call, frequency, time and speed range and do your bit!

In point of fact, it should not be necessary for the novice operator to concern himself with finding slow CQs on 80 metres. I will refer once more to the Golden Rule of CW speed — *"Call at the speed you want to work; Answer at the speed of the other station or at your own speed if he is faster."* If everybody does this you will never ask or be asked to QRS.

There is no valid reason for a slow operator to avoid answering a fast CQ, so long as he can read the callsign. If you are looking for a contact, and hear a CQ far faster than your competent speed, by all means answer him — at your own speed. The faster operator is honour bound (by tradition, anyway) to answer any response to a CQ, and to answer at the speed of the responding station if it is slower. If the truth be told, I often call CQ at very slow speeds on 80 to give the newcomers a chance, because I know full well that they will not answer a fast CQ. On those occasions when I *do* get a slow answer to a fast CQ, I have no hesitation in slowing down to the other guy's speed. This results in some funny situations — following the rules means that if I call at 8 WPM an answer should be no faster. Not long ago an unfamiliar full call answered, and we carried on for half an hour before we finally got up to our "natural" speeds.

Of course the slower operator has some responsibilities too. Use of the Q code and *appropriate* abbreviations is good procedure at any time; they are almost mandatory if you are slower than the guy you are working. Words like "THE", "MY", "IS", and any others that are *not essential to the sense* of what you are sending should be left out.

If you have received a 5/9/9 report there is no need to repeat *anything* — not your name, your QTH, or the other guy's report. After all, he has said he can copy 100 percent, and if you mess something up he will undoubtedly ask for a repeat. As a general rule, repeat (once only) if readability is poor. A sign of a good operator is that he will slow down if conditions are less than perfect because a slower speed is still more efficient than repeating. Tom VK4NUN recently wrote to me about this as one of his pet aversions. He was working an American novice at about 4 WPM who sent "QTH IS ALBUQUERQUE, NEW MEXICO, USA". He sent it three times, and poor old Tom was just about asleep by the end of it.

Another of Tom's aversions ties in neatly with what I said above about avoiding unnecessary words. *Why spell out KENWOOD or YAESU when the whole world knows what a TS830S or a FT101E is?*

Just to summarise the main points so far — we need more ops who can make themselves available for QSOs with beginners; slow ops should not hesitate to call faster ones, who in turn should slow down; and slower ops should use efficient (brief) ways of saying things.

One last bit of food for thought. The only place the VK and USA novice allocations overlap is 28.100-28.200 MHz, which rules out a lot of potential slow-speed QSOs. *Why not allow them to operate CW only on 7.100-7.150 MHz? I know every suggestion for increased privileges for novices gets knocked on the head, but this one would cause little or no inconvenience for current users (ie full-calls) and would be a great help to potential brass-pounders. If this idea generates sufficient interest, I'll gladly put it through the proper channels. Expressions of interest (for or against) should be addressed to me at the above address.*

73 till next month.

AR

MOORABBIN AND DISTRICT RADIO CLUB

The Club has given much thought to ways in which it could assist the Institute on the occasion of its 75th Anniversary.

It has been decided that the Clubs Annual Trade Day, usually a fairly low key event, will be considerably upgraded this year, firstly to bring in other than simply radio aligned activities and also to make it more attractive to the general public, so, hopefully, giving amateur radio and its Australian longevity a wider exposure.

There will be the usual large number of trade exhibitors so that amateurs can have a good look at what is currently on offer without having to traipse all over the place before making their buying decisions.

There will also be other attractions. For example the Southern Archery Club will be giving demonstrations of their Robin Hood skills, and perhaps a bit of 'hands on' experience as well.

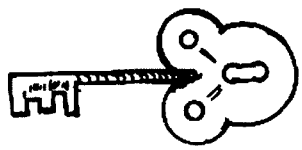
The Fly Fishers Club will be giving demonstrations of casting techniques and the Moorabbin City Band will be playing during the afternoon.

The 1985 Trade Day will be held on Saturday the 13th April at the Combined Clubs Complex on the Turner Reserve, Turner Road, Highett. Proceedings commence at 10 am and go on till approximately 5 pm. During the morning the Mayor of Moorabbin will officially open the event.

There is no charge for entry and all are welcome. There is plenty of off road parking space.

Contributed by Harold Hepburn VK3AFQ Assistant Secretary

AR



WESTLAKES ARC COMES OF AGE

One of Australia's best known radio groups, the Westlakes Amateur Radio Club, is celebrating its twenty-first birthday this year.

The first official meeting took place on the 22nd April 1964.

We hope to publish the "Westlakes Story" in the near future.

AR

COFFS HARBOUR AND DISTRICT AMATEUR RADIO CLUB

At the Annual Christmas Party of the Coffs Harbour and District Amateur Radio Club, the first presentation of the "PERCY SARA Memorial Trophy" was held. The trophy is awarded for outstanding service to the Club in the preceding year and is decided by nomination and ballot by club members.

The recipient for 1984 was the very popular net controller and "sergeant-at-arms" — Arnold VK2ADA. Pictured is Betty Sara, XYL of the late Percy Sara VK2QV, presenting the trophy to a surprised Arnold.

Betty kindly donated the perpetual trophy to the club and has kept in close contact with members by attending club outings. Arnold and club members operate the Club net on Monday nights . . . 1000 UTC . . . 3.610 MHz.

Contributed by Rick Fletcher, VK2BKV Secretary, Coffs Harbour & District ARC

WANTED ARTICLES

Write up your pet project or technical idea so others may share your knowledge through the pages of AR.

BITS AND PIECES FROM VK4SS

In an earlier Thumbnail, Eddie White VK4EW and VK4OW was described as living alone. Eddie points out that this is not so and that he is happily shoring life with the YF. Long may it be so Eddie.

A Call For Help!! Can anyone please help with photos of the following amateurs, all active in VK4 in the 1930s: Frank Nolan VK4JU, Vince Jeffs VK4VJ, Eric Rielly VK4ER and Bob Campbell VK4RC.

Does anyone have an AOCP exam paper set in the 1930s? Any costs of photostating, postage etc will be gladly met. Contact VK4SS (07) 44 6526 (before 10am) or write.

Please be reminded: The deadline for material for book on History of AR in Queensland is 30th April 1985.

LISTENER NUMBERS

WIA Associate Members are allocated a WIA L-number which allow them to use the QSL bureau service provided through the divisions.

Shortwave listeners have QSL cards bearing their WIA L-number which they send via the bureau to amateur radio stations they hear, particularly those in DX countries.

An Associate unsure of his/her number will find it either in the WIA Call Book or on their AR address label.

Inquiries about using the QSL bureau or how SWLs go about QSLing can be made to your division.

AR

BOOM SALES

Sales of home entertainment equipment in the United States is going through a boom period.

Industry executives at a recent Las Vegas consumer electronics show said there was a growth in demand for new and improved equipment including colour TV sets, video cassette recorders and compact disc players.

The consumer electronics business sold more than $30 billion worth of gadgetry for the home to the American public last year and was expected to sell another $34 billion this year.

AR

EDUCATION WANTED

Brenda VK3KT, Federal Education Co-ordinator, is attempting to correlate a list of all classes teaching amateur radio throughout the length and breadth of Australia. At present she has a list of forty, but surely there must be more.

This list is needed so that when she gets enquiries she may direct the would be amateur to the nearest class or instructor as learning with an instructor is quite often much easier than trying to swat alone.

Brenda also runs an education net on 80 metres each Thursday night, with minimum success. This net is conducted for many reasons but it is particularly a forum for educators to exchange ideas re teaching methods, syllabus interpretation, examination procedures and discuss problems etc. (One instructor may have run into a particular problem which, by discussing it with other instructors, it may not be a problem.)

Do instructors feel a net is worthwhile? Has anyone any ideas at all about educating the would be amateurs? If so please let Brenda know. She is awaiting your letters and calls.

Contact Brenda on the Education Net 3.610-3.625 MHz at 1030 UTC or 3.685 MHz at 1130 UTC or write to Brenda Edmonds via the Federal Office or to 56 Baden Powell Drive, Frankston, Vic 3199.

VK2 MINI BULLETIN

Tim Mills VK2ZTM
VK2 MINI BULLETIN EDITOR
PO Box 1066, Parramatta, NSW 2150

Major activities this month in VK2 include the Conference of Clubs to be held at Amateur Radio House, 109 Wigram Street, Parramatta over the weekend of the 13-14th April. On the Saturday evening there will be the annual fireworks evening at VK2WI Dural. Gates will open at 6 pm. The bonfire will be lit at 7.30 pm and fireworks starting at 8 pm. There will be a limited range of takeaway food available on the grounds. Should you wish to bring your own, please limit it to something which does not require the barbecue. For safety reasons no barbecue or personal fireworks permitted within the grounds. Ticket sales may be obtained in advance from the office at Parramatta or at the gate on the night. Adult $4, children $2 and family $10.

It is expected that the usual function will be held at Urunga over Easter but no details had been received by the time these notes were prepared. During May there is to be a Seminar, most likely the 24th. In June there will be the Oxley Region Field Day at Port Macquarie over the 8th and 9th. This is the Queens Birthday weekend. Headquarters will be the Youth Hall at Oxley Oval. There will be seven foxhunts, a CW receiving contest for both novice and full calls. Other events will be the Home Brew, QSL card, Old Gear, Handy Kink and best presented fox hunt vehicle contests. Don't forget to round up your collection for the disposal sales. There will be further details next month but should you require further information contact Lew VK2LS, Publicity Officer via PO Box 712, Port Macquarie, NSW, 2444. At the end of June, either the 22nd or 29th, the Division will be holding a 75th Dinner. Additional details will be given later and on the Sunday broadcasts.

On 8th February last was an early fireworks display at Dural, when the main tower received a lightning strike. The 70cm repeater suffered the main damage. Most other systems suffered various degrees of damage. Thanks must go to the members of the Dural team who spent Saturday carrying out repairs which enabled the station to transmit on some frequencies for the broadcast on the 10th. It then took Jeff VK2BYY and the other members a couple more weeks to return the station to normal operation. The repairs were covered under the Division's insurance, but it is annoying to have to redo much of the effort previously put into the installation. Still it is a fact of modern life, lightning and semi-conductors don't mix. As far as we know this is the first major lightning damage to the Dural installation since the property was developed.

The Central Coast Field Day at Gosford on 17th February attracted over 750 to the Showgrounds during the day. The day was overcast with a little light rain at times. The area has good cover so it did not worry anyone. There was a good range of trade displays and the disposals area kept all interested. Congratulations must again be extended to members of the CCARC for the hard work put into this annual event.

A range of 75th material — tee shirts, windcheaters, stickers etc. are available from the Divisional Office during the hours of 11 am to 2 pm on Monday to Friday and Wednesday evenings 7 to 9 pm. (Phone 02 689 2417.) There is the usual wide range of publications, including both USA and Foreign Callbooks. There are no Australian Callbooks left but it is now getting near the release time of the 1985/86 edition — expected in the spring. A reminder that now is the time to make any alterations to your entry. Should it be incorrect, write to the Department at PO Box 970, North Sydney, NSW, 2060 requesting the correction and also send a copy to the Callbook Editor, PO Box 300, Caulfield South, Vic. 3162. The same procedure should be followed when you change an address. When you change a call sign this should be notified to the Divisional Office so that the QSL Bureau, the Historian and the records can be amended.

Repeater groups and clubs are reminded that now is also the time to submit any changes to your details in the Callbook. Check the current edition and notify any changes to the Divisional Office. A reminder to repeater groups that should you intend to make any changes to your present system or wish to develop an additional system you should contact the Divisional Office for the necessary assessment forms. Should you send it direct to the Department delays can occur as all repeater matters are referred back to the Division for co-ordination. Applications have recently been received from Armidale and Coffs Harbour to develop UHF repeaters. Port Macquarie is currently relocating VK2RPM to a site which will provide extended coverage along the coast. Newcastle region have indicated interest in developing an ATV repeater and RTTY systems. There is also interest in a 6 metre repeater. Goulburn are in the licensing stages of a 2 metre repeater. Interest has been expressed from Broken Hill to develop a beacon. It is expected that it will be on 6 metres.

The fires in the Orange district early this year stretched the local WICEN group to the limit and additional support was obtained from the Sydney region. The WICEN postal address is being changed to PO Box 123, St Leonards, NSW, 2065. This was the previous Divisional postal address and like any address is taking a long time to be forgotten. There are still a couple of letters a week being received through it. WICEN have available a range of collared tee shirts. White with green trim on the collar and sleeve ends. $11.50 posted.

Does your group or club plan any field days this year? Early notification will help with publicity. The South West Zone will be holding theirs at Wagga over the October long weekend — the 5th-6th.

By the time these notes appear the Division will have conducted the Annual General Meeting. As the notes are being prepared it is a week from the closing date for Council nominations and there are still plenty of vacancies. Like all Divisions and groups it takes many people to carry out the general day to day running — we are always looking for help.

As outlined in last month's notes this year the VK2 Division is collecting material to form part of a year of history. No matter whether you are new or old to amateur radio there may be something that you can contribute. While it is nice if you can present it in a written form like an article for amateur radio, any form of recording will help retain your information. You may prefer to just write short notes, even speak the items onto a cassette tape, it will retain the information. Should you have a photo or slide collection on radio matters, don't forget to write a description on them. You may remember what the subject matter was but in years to come it can be forgotten. Without it, a good photo is just a pretty picture of unknown subject matter.

Jo Harris VK2KAA is carrying out historical research into VK2 call signs and the people who held them. A questionnaire is available both from her or the Divisional Office. To date she has over 8000 cross-referenced entries but naturally some holes still remain. The basic information required is the date you were first licensed and the call sign. Then the dates of any call sign changes that you may have made up to the present time. You might like to include other details about yourself, areas of interest over the years and a photo of yourself, preferably on your own. If it is a group photo indicate which is you and who the other people in the photo are. In turn Jo may be able to help you if you are the recent holder of a call sign. Drop her a note with a SAE quoting your new call — plus any old ones — and she will advise what information there is about your new call — who held it and when etc. Jo has indicated that she may finish the project this year. She intends to write a short article for AR later this year about her research. You can contact Jo at her Callbook address or via the Divisional Office.

While on the subject of collecting what will become historical material, many clubs and groups produce their own newsletters and bulletin but the Division is not on everybody's mailing list. The Divisional Librarian would like a copy of your publication for the Library records. Please add an extra label to your printout.

13th April — Fireworks night at Dural.

27th April — Westlakes ARC 21st Anniversary Dinner Dance

73 until next month. TIM VK2ZTM

AR

STOP PRESS

Uranga Convention will be held over the Easter weekend, beginning the 5th April. Plenty of accommodation is available.

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

This month I have been contacted by two entirely unrelated sources, regarding one of our best known VK5s. I am talking about Alf Traeger VK5AX/8XT who, if not known by name, is known world wide as the inventor of the pedal radio, which brought communication — medical, educational, and social — to the people of outback Australia. Alf Traeger was born in Glenlee in Victoria (NE of Nhill) on 2nd August 1895 and died on 31st July 1980. A plaque is about to be unveiled in his memory at Glenlee and I was asked if we could provide information regarding his radio activities. The other suggestion came from the Summerland ARC Lismore NSW, and had been sent to the VK2 Divisional Council who had forwarded it to us. The suggestion is that we should do something to commemorate this famous Australian Radio Pioneer, perhaps with a field-day, a contest, a dinner, or something else. So we would like to hear your thoughts on the subject.

This month will be a busy one for members of the Divisional Council and others. The Clubs Convention will be held over the weekend of 12th-14th and once again our grateful thanks to the ladies who give up their entire weekend to do the catering. Our AGM will be held on Tuesday 23rd at 7.45 pm, and I hope that this year we receive a few more nominations. It would be nice to see some new faces on Council (not that we don't like the old ones!), after all, the more people there are to do the work the less we all have to do!! And if you would like to help but have left it too late to nominate, never fear, there are still some "off Council" jobs to be filled (or we could co-opt you!). Two days later our delegates will be leaving to attend the Federal Convention. David Clegg VK5AMK, has found that being in charge of ESC is a full time job (despite the help he gets from John Crawshaw VK5AJE) and so he has decided to concentrate on that and make this his last time as Federal Councillor. Graham Ratcliff VK5AGR will be the Alternate FC but as Graham is already well "snowed-under" with his jobs as Treasurer and Federal Satellite Co-Ordinator, he is also in no position to take over from David. However, Rowland Bruce VK5OU has volunteered to take over the Federal Councillors job, so he will be going this year as 2nd Alternate, to "learn the ropes". Knowing Rowland I think he will be an excellent choice for the job.

AR

VK3 WIA NOTES

VICTORIA 150

Jim Linton, VK3PC
DIVISIONAL PRESIDENT
VK3 DIVISION

MORE WANTED!!

A warm welcome to the following who have recently joined the WIA Victorian Division.

L Allen, J Barrett, Arnold Bennett VK3CVG, Ian Bradley VK5PXA, Elizabeth Campbell VK3PTR, Geoffrey Clancy VK3DNJ, I Coots, Stephen Cotterill VK3CSC, Alfred Coupe VK3CQE, Robert Curtis VK3NRC, Mario Dolfen VK3PIW, Douglas Fairbairn VK3DJY, Frank Feldman VK3DAF, J Ferguson, John Friend VK3ZAB, Victor Hearne VK3PXC, Edward Howell VK3ZKP, John Ingram.

Peter Jetson VK3ZMB, Leslie Jordan VK3PYD, R Joseph VK3VRJ, Ronald Knight, A Knox VK3KEK, John Kuhn VK3PJK, Paul McMahon, Stephen McMillan VK3VNI, M Matthews, John Mayor VK3PTC, Leslie Mighalls, Robert Parsons, Raymond Peverill VK3CVP, Tom Peyton VK3XTP, Phillip Portelli VK3AWG, Andrew Power, Robert Rand VK3PTO, Alexander Robertson VK3VTL.

Robert Seal VK3RS, Karl Siegel, Glen Sneddon VK3YY, Mario Surya YC4FS, J Thurman VK3VGX, W Thurman VK3VGY, Charles Warren VK3CSW, Noel Watkins VK3YNW, James White, Kevin White VK3ZI, Charles Whitling VK3AHP, Charles Williams VK3NCW, Maxwell Wroe VK3YMW, Joshua Silberman, Gil Ben-Galim, Joseph Bonavia VK3PHI, John Belenski W7NEJ.

TIME CAPSULE

As part of WIA 75 activities the Victorian Division is gathering material for a time capsule to be opened in 25 years time — the Institute's centenary year.

Any member who would like to contribute material or ideas should give a little thought to what could be interesting to those WIA member's who open the capsule in the year 2010.

SUNDAY BROADCAST

The WIA broadcast on Sunday at 1030 local time through VK3VWI has changed its 40m and 80m frequencies — they're now 7.130MHz and 3.615MHz both SSB.

These changes were necessary to avoid interference from a foreign broadcasting station on 7MHz and to clear 3.600 MHz which is used by WICEN.

Other frequencies in use by VK3BWI are 1.840MHz (AM), 52.525MHz (FM), 144.200MHz (SSB), 146.850MHz (VK3RMM) or 146.700MHz (VK3RML) when VK3RMM is required by WICEN.

CAMPAIGN 3000

The Division ended 1984 with a good level of membership and had a flying start to 1985 boosted by a membership recruiting drive.

Special thanks to those individuals, clubs and zones who have supported the WIA by encouraging others to join the Institute.

Your results are to be seen in the now regularly published new members list appearing in the VK3 notes. See last months AR for the first list.

As an extra incentive a year's free membership will be given by this Division to any member or club who recruits in any seven month period, five new members.

There are two main things to remember when asking non-members to join:

1) The services provided through the Victorian Division for members.

2) The WIA our national radio society supports you and your hobby — you should support it by being a member.

Adequate printed material suitable for recruiting both new members and attracting people to our hobby is available through the WIA Public Relations Officer, via the VK3 Wireless Institute Centre.

WIA 75 AWARD

This award to mark the Institute's 75th Anniversary began last month — see details in March AR magazine.

Listening around the HF bands and repeaters, WIA members in VK3 have been caught up in the spirit of the award and are freely giving their WIA membership number when asked, or are chasing numbers themselves.

To make the award a success, every member should have their membership number ready to exchange.

Even if you've never gone in for award chasing previously, during the remaining nine months of 1985 give it a try and log the required 75 WIA members to qualify for the WIA 75 Award.

RESULTS OF VK3 TWO METRE SCRAMBLES — 1984

The Scrambles are held each second Sunday evening at 8.30 pm on 144.250 MHz USB. Any licensed radio amateur is welcome to take part.

Throughout 1984 51 stations took part in 21 Scrambles. Call signs and total points follow.

Outright winner with a score of 63 points was Rob VK3XQ. He was presented with the Eastern Communications Trophy by Jim VK3PC, VK3 Divisional President. The connector in Jim's hand is a perpetual trophy donated by Lionel VK3NM.

VK4 WIA NOTES

Guy Minter VK4ZXZ
FEDERAL COUNCILLOR
Box 638, GPO, Brisbane, Qld 4001

ONE AMATEUR'S 1984

Rob Green VK4KUG, can look back on 1984 with some satisfaction. He started the year as VK4NBJ, studied hard and entered a competition. The prize for the devotion to study was a new callsign and for the competition, a trip for two to Bali in Indonesia. Not only did Rob pass that examination, AOCP theory, he also won the competition, but the story does not end there. He was notified of both his successes on the same day! By chance, all this excitement coincided with a visit by Kanji JA1TBX, to Rob's place of work. Kanji is an electronics engineer and is head of research and development at the Hochiki Corporation, makers of heat and smoke detectors for fire alarm systems, in Japan.

Rob Green VK4KUG tells Kanji JA1TBX about his good fortune.
Photograph courtesy of Bud Pounsett VK4QY.

While Kanji was in Brisbane, Rob took him home to meet his family and sample Australian cooking and our lifestyle. At Rob's home, Kanji was able to talk to his boss, Shoji JN1PEO, and two other friends, a YL, Adachi JN1QNG and Shishida JH1HPH on 15 metres SSB.

So 1984 was quite a year for one Queensland amateur, a licence upgrade and an enjoyable free trip to Bali.

TOWNSVILLE AMATEURS BIG ON PUBLIC SERVICE

With the more common usage of VHF transceivers for the boating fraternity, the Coast Guard found themselves needing to expand their services, and so it was that Barry VK4BH as co-ordinator for this purpose approached the TARC for help. It was ultimately decided to allow the Coast Guard access into our repeater site, and that a yearly rental would be charged.

John VK4AFS and Barry VK4BH did the actual installation of the equipment. Unfortunately there were a few bugs to straighten out, but all went well for the grand opening. In preliminary tests, things were working out very well with one contact with a boat at Cape Bowling Green, and then at midnight the same day from the Whitsunday Passage. It certainly augers well for the future.

At the official opening ceremony, Bob VK4WJ and Jeanette represented the TARC. Bob said later that it was a very pleasant afternoon, with the Mayor, Alderman M Reynolds and Mr Doug Taylor of Philips (Brisbane) performing the necessary ceremony.

Guests were invited to view the ATV being broadcast from Mt Stuart where Ian VK4ZT was transmitting pictures of the actual site, and the equipment and aerials, etc . . .

The actual equipment consists of a UHF link from the Coast Guard to Mt Stuart and the messages are retransmitted on VHF to the shipping. Four channels are available.

From TARC "Backscatter"

PRESIDENT'S REPORT 1984

In presenting this Annual Report I would like to thank first my fellow Council Members for the tremendous work they have put into the running of the affairs of the Queensland Division of the WIA.

Secondly, my thanks to all Members for their continuing support.

In effect, one can say that 1984 was more or less a year of consolidation and learning, since quite a few new Council Members took up their positions for the first time. As Guy Minter VK4ZXZ, the Immediate Past President, stated in his 1983 Report, Council continued to maintain an even-handed approach to its decisions, many of which were guided by the results from the highly successful 1984 Radio Club Conference.

COUNCIL

Your Council Members for 1984 were:
Harold Bremerman VK4HB, Ken Avers VK4KD, Alan West VK4KWK, John Aarsse VK4QA, Bud Pounsett VK4QY, Theo Marks VK4MU, Bill Dalgleish VK4UB, Val Rickaby VK4VR, Ross Mutzelburg VK4IY, Ross Marren VK4AMJ, Hugh Shaw VK4BHS and David Jerome VK4YAN.

Barry Ker VK4BIK, continued as ex-Officio Council member for Publicity and as Convener for the General Meetings.

Others associated with Council were:
Dave Richards VK4UG, Membership Secretary, Gordon Loveday VK4KAL, VK4 Intruder Watch Co-ordinator.

MEMBERSHIP

Membership remained constant compared to the 1983 figures probably because of the fairly bad examination results we've had during 1984.

It appears that very few "students" enrol while studying for their examinations, waiting until they have received their much awaited call before joining the Institute.

A reason for the small growth in membership can also be attributed to present economic climate, with so many of us out of work. A survey, conducted earlier this year, disclosed that many of those interviewed had been members of the WIAQ, but because of unemployment, found it hard to continue.

EDUCATION

There is not much progress to be reported in this field. Ron has been in regular contact with the Federal Education Officer, questioning various aspects of the examination standards. In this, he was ably supported by our Federal Councillor, Guy VK4ZXZ and Ross VK4IY, who took every opportunity to discuss examination matters with Brenda, while at the Federal Convention.

It is hoped that in 1985 we may resume our programme of "Training the Trainer", which was a very successful venture way back in 1983.

OUTWARDS QSL BUREAU

Bill Dalgleish VK4UB took on the job from Mick and Chris Bentley VK4AMB, VK4ABM. He is still at it, so must like it to be able to assist the Institute and its members in this vital part of Member Services.

The new system of including the address label from "AR" with your cards as proof of membership works fine and is a great help to Bill. Saves him going through reams and reams of computer print-outs to check on membership status. After all, you pay for the service indirectly and it would be a shame if someone else bludged on you.

INWARDS QSL BUREAU

Dr Murray Kelly VK4AOK, and his band of helpers have a very difficult task to perform. Although many complaints have been received, one must not forget the following:

(a) The number of licensees changing their call sign in a very short period of time is very high indeed. Considering the fact that many overseas QSL cards take up to two years to arrive in Brisbane, imagine the traumatic experience to go through one, two or even three year old callbooks to find out who belongs to what card.
(b) Despite numerous requests for updating of new calls, with the inclusion of the previous call, very little response was forthcoming.
(c) As a suggestion, if you are a member of a radio club, or if you live near an area with a radio club, why not ensure that your QSL card from overseas also includes your QTH. This will make life of sorting the cards by QTH much easier and speedier. Certain overseas QSL bureaux actually make this a mandatory requirement.

NEWS AND INFORMATION SERVICE

This very important service is very well maintained by Bud and Bonnie Pounsett VK4QY and his (x)YL, and Jack Gayton VK4AGY, with his faithful band of helping rebroadcasters. The call back lists are steadily growing, an indication that more and more take the trouble to notify net control that they have listened to the "News". Our News Service reaches beyond the boundaries of VK4-land, as many of the HF call backs show.

Besides correlating the News, Bud also prepares the VK4 notes for *Amateur Radio* and *QTC.*

PUBLICATIONS

Anne Minter VK4KZX continued to manage the WIAQ Bookshop. Although there appears to be a drop in the number of students, the sale of books continued to maintain a steady flow. There are a few problems in receiving books from overseas, mainly in the area of Custom clearance and collection from the wharves.

Even the "bookshop" is hit by the present economic situation. Many prices will have to be increased in 1985, due to the unfortunate fluctuations of the Aussie dollar. Sales through the clubs have increased to the extent that the bulk of sales is now done via the clubs.

INTRUDER WATCH

This is a typical "Churchillian" department.

The sweat and blood of so few in defence against so many intruders.

It is often said that we are fighting a losing battle. This is correct, because there is just not a battle going on. Just a few little "Davids" against all those "Goliaths" and a lot of non-participating spectators. What can you expect? All the same, the Intruder Watch Service does get results. It is only with certain stations that problems exist.

VHF/UHF ADVISORY COMMITTEE

1984 saw a small change in this Committee. Ross VK4AMJ was the Council liaison officer, with Paul VK4ZBV and Brian VK4RX the principal committee members. Some minor problems were encountered but, generally, all questions and requests were more than adequately dealt with.

HISTORIAN

Due to family commitments, Peter Brown VK4PJ tendered his resignation as Official Historian of this Division. Council accepted this with deep regret as it leaves a gap which can be filled with great difficulty, specially since Peter "specialised" in the field of amateur radio prior to 1930.

The material that Peter collected through the years has now been stored in a special store room, accessible only by two Council members, so if anyone has material of historical importance, please contact Council. This material will eventually be taken over by the proposed Technology Museum. Certain negotiations have already commenced and are continuing.

The period after 1930 is the "baby" of Alan Shawsmith VK4SS. He is continuing the good work of Peter by providing AR with regular Thumbnail Sketches of pioneer amateurs from 'yesteryear'.

During the latter part of 1984 Alan undertook to compile a history of amateur radio in Queensland as part of the 75th Anniversary contribution of the VK4 Division.

AWARDS

John Moulder VK4YX continues to be the VK4-Award custodian and reports that there was a slight increase in applications. Many interstaters are becoming interested, so are quite a few overseas amateurs. It's a very difficult award to gain.

CONTEST MANAGER

Joe Ackerman VK4AIX still looks after the VK4 contest side. The 1984 Jack Files Memorial Contest drew this year many more log entries than ever before. This is a good sign and bodes well for 1985.

WICEN

Ken Ayers VK4KD continued as State WICEN Co-ordinator for the fifth year running and reports that the North Queensland Regions were called out by SES on a number of occasions to assist with extra communications.

In the Southern Region, Ipswich took part in an exercise with their local SES and performed so well that they have now become an integral part of SES Ipswich CD plan. The Gold Coast area and the Southern part of Region 4 also participated with SES on a number of occasions. Various events during the year kept up tne operational expertise of WICEN members to a high degree of efficiency.

Final preparations have been made to a WICEN Handbook for VK4 WICEN operators and the publication should be ready in 1985.

We thank the VK2 WICEN organisation for their assistance in using their handbook as a guide.

TREASURER'S REPORT

This Report will be issued separately. The figures are all well within budget and Ross Mutzelburg VK4IY is to be congratulated for a job well done.

It is with regret that Council accepted Ross' resignation with effect as from the 1st of January 1985.

Thanks for a sterling job, Ross.

RADIO CLUB CONFERENCE

Under the firm hand of Dave Jones VK4NLV the 1984 Conference proceeded smoothly and, as usual, provided your Federal Delegates with much needed support.

It is gratifying to learn that the VK5 Division has had a "trial" Club Conference in 1984 along the lines of our own Conference.

Being one of the original instigators of the original concept of the Radio Club Workshops, way back in the middle '70s, I am very proud with the way this concept has developed. Perhaps, in the not too distant future, this Annual Conference may achieve the same "power" as the Federal Convention, albeit on State level, along modified lines of the famous "Arnold Report".

This year's Conference was honoured to have as its special guest the new Secretary-Manager of the WIA, Reg Macey.

I understand that his impressions of the Conference were very favourable.

FEDERAL REPRESENTATION

On behalf of Council and Members I would like to express my thanks to Guy VK4ZXZ and Ross VK4IY for the tremendous amount of work they have done to present this Division's viewpoint to Federal Executive and the other Divisions.

The 'easy' days of yesteryear have gone and the present requires a business-like approach to the many problems confronting the amateur fraternity in this day and age.

Our relations with Federal Executive are very cordial and our approaches are always attended to in a most effective manner.

THE FUTURE

The immediate future, 1985, will be devoted to the celebration of the WIA's 75th Anniversary. Some plans are in the process of being executed, others will be announced as the year continues.

On an international level, it appears that WARC 1999 may not be WARC 1999, but instead, could well become WARC 1990. Thus the time is NOW to get ready for this all-important conference. The future of amateur radio depends on the co-operation of all amateurs to achieve what we would like to have. WARC 1979 proved that, in no uncertain terms.

CONCLUSION

Due to circumstances beyond my control I was not able to visit many clubs, as much as I would have liked it. So, clubs, specially those in the regional centres, please accept my apologies.

Finally, I would like to thank you all again for your support — the Members, the Clubs, Department of Communications and my fellow Council Members.

May 1985 be even more successful than 1984.

Signed: John Aarsse, VK4QA
President, VK4 Division

ARTHUR R BURTON VK4FE (SK)

The life of this amateur typifies the Australian way more than most. He was certainly prepared to give anything a go — and go anywhere to do it! Arthur VK4FE obtained his AOCP in Brisbane in the year 1936; he operated firstly from the Valley and then from the suburb of Dutton Park. His main interest in AR was DX which he worked aplenty.

During WWII he enlisted in the AIF (15th Div) and saw action in the Middle East, Greece and Crete. When Warrant Officer Burton was being evacuated from Crete his ship the HMS York was bombed and sank. Seeing the white ensign still flying at her masthead, he swam back and retrieved it — an act typical of the dare-devil Aussie soldier. The battle-scarred flag, 16ft x 18ft, was subsequently donated to the Navy and hung in the Petty Officers Mess, Alice Street, Brisbane.

After his discharge from the Service he joined the PMG Department, then in 1949 he successfully applied to be a member of The National Antarctic Research expedition to Heard Island. His official tasks were those of W/O and maintenance of all diesel and other machinery. This work load was considerable. The gourmet may be interested to know that the tinned food diet on Heard Island was supplemented by the delicacies of liver and steak of sea elephant, the breast of petrel and skua bird and penguin eggs. The latter are about the size of a turkey egg and, to the palate of VK4FE, tasted similar to a hen's egg. The bondwood huts were twelve sided double-walled in construction, in order to offer maximum resistance to the wind. During the height of a blizzard it took a quarter of an hour to crawl between huts.

Arthur was the first Australian amateur to venture into the Antarctic and anyone holding his QSL for this sojourn to Heard Island now possesses a collector's piece. On his return to VK he took up the position of PMG Broadcast Technician on Thursday Island and shortly after was transferred to Normanton on the Gulf of Carpentaria, where he remained until 1964.

VK4FE retired to the Gold Coast where he played an active part in organising the Coastguard. He was a member of the Gold Coast AR Club and remained active on the bands right up to the time of his death on 30/11/82. He had an endless variety of tales to tell; the fraternity is the poorer for his passing.

AR

JACK FILES VK4JF (SK)

Who was Jack Files? It is only natural that those fairly new to amateur radio would want to ask this question about one whose name is perpetuated by a yearly contest.

Jack VK4JF obtained hia AOCP in 1933 and from that time until his death on 20th July 1968 (WWII excepted) he was engaged in honorary duties of one kind or another for the WIA (Old Div). Pre-1939 he held more than one council position; one of his early tasks was to write the WIA notes for the very popular weekly "TELERADIO" magazine and there is also reference to his position as code instructor in the AOCP classes.

When the Institute was re-formed post-war, he was again elected to council and in the year 1949 became Inwards OSL Officer for the VK4 Division. Eventually he was responsible for both VK4 QSL Bureaus (Inwards and Outwards) and he discharged these tasks with considerable efficiency and reliability for well over a decade and a half. The job of librarian was another of his many services to the fraternity.

VK4JF's personal amateur activities centred largely around DXing — mostly on CW. However, he always found time to compete in field days and contests of the day.

By nature Jack was an amiable, unassuming type of person, one who lived up to the 'amateur code' in every way. It is only just and right that the VK4 Division saw fit to organise a yearly contest to honour the memory of one who gave thirty-five years of unselfish service to the Institute — and with no thought for his own gain.

May the Sunshine State Jack Files Memorial Contest (VK4) grow annually in strength. I urge all to pay their respects by participating. There's a section in it for everyone. Good Hunting!

AR

LETTERS TO THE EDITOR

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publisher.

NO NOVICE

May I point out that one of your articles in Amateur Radio stated that there was no novice classification in America?

I received a letter stating that they have five classes — Novice, Technician, General, Advanced and Extra.

Novice and Technician allows only code CW on 180 — 10 metres frequencies; these two classes can use 80, 40, 15 and 10 metres MCW. Technicians can use 2 metres.

Yours faithfully,
Alf Gover, VK4NAD
42 Salisbury Street,
Buranda, Qld 4102
AR

UNWARRANTED AND SHAMEFUL

Recently I made a purchase through "HAMADS", having been assured (interstate telephone call) that the item was complete and in working order. On receipt of my purchase, a dipmeter, I found one coil was missing.

I contacted the seller only to be told that the value of the missing part was about 10¢ — not worth the 'phone call. On reminding him of his earlier assurance that the instrument was complete, he became somewhat flustered and ruffled, suggesting I could easily make such a coil.

When I pointed out that I was a newly-licensed novice with no expertise in instrument construction, he bellowed "p... off" and replaced the receiver.

I can only conclude this unwarranted and shameful outburst was triggered by a guilt complex, based on a planned disreputable and unprincipled transaction.

Sincerely yours,
Frank Walsh

Hawthorndene, SA 5051
AR

DO YOU REALLY WANT MORE AMATEUR RADIO OPERATORS?

Last year, with encouragement from my wife, I studied for and obtained my limited call.

After the ignorance shown to me on the Adelaide 2m repeater both of us wonder why I bothered.

I thought I only had to pass the DOC examination to join the "friendly" amateur fraternity, but there appears to be some other requirements needed to join the "drive time radio group" who monopolise this repeater.

After studying the operating conventions of repeater use, I called every day for a week, including seven times in one day. Not one of the many VK5 operators deemed it worth their while to welcome a new operator.

I point out to this group that 2m is possibly the first contact a 'Z' call will have with other amateurs. If you do not want any more amateurs — so be it. But by your attitude you have wasted my time, and undermined the efforts of the WIA Education Department.

To those people reading this and saying to themselves, "It is different on HF", I point out that most of the group of which I refer, are full calls and I cannot see that changing their frequency is going to change their attitude. Please correct me if I am wrong.

Perhaps I should have given up and sold my equipment, but I suspect others before me have done just that, and that is why the situation now exists.

To those inactive operators who still have their trusty handys, I say dust them off and show me and possibly a few other disillusioned operators how amateur radio is indeed a friendly hobby.

Before I am admonished for daring to question the status quo note that I care enough for my hobby to write this letter.

Finally, to those few gentlemen still with the spirit of amateur radio at heart, who answered my calls and in so doing, made me feel that this letter is not a waste of time, I thank you.

Yours faithfully,
B R Scholz VK5ZSB
39 Longview Avenue,
Belair, SA. 5052.
AR

RECOGNISE THE RIGHTS

Referring to the letters from Dave VK2BBT (Sept 84) and Sam VK2BVS (Feb 85) and EMC in general.

The survival of the international agreement which allocates spectrum space for amateur "research, investigation and instruction in the art of radio communication" and the supporting national laws and regulations to ensure proper useage of the allocated space is proof that communities continue to recognise the "rights" of radio amateurs.

We are often reminded that ignorance of the law is no excuse and those citizens who are ignorant of the laws applicable to the operation of amateur operations should not be excused. Amateurs who take the trouble to explain to a complainant the proper procedure for them to obtain redress of their complaint are behaving generously and commendably but they well do their fellow amateurs a disservice by extending their generosity to a suspension of operations beyond the time required to prove that their transmissions are within lawful limits (a fortnight should be enough).

Amateurs have contributed significantly to the development of techniques to immunise electronic equipment from unwanted radio reception, and application of these techniques now ensures a high degree of probability for a successful remedy for any EMC problem. It is now up to the non-amateur citizens to exercise their "rights" as consumers and demand that adequate immunity to unwanted radio reception be a legally enforceable performance characteristic of radio and TV receivers and other electronic products.

The use of higher power amateur transmitters does not pose insoluble spectrum management or technical problems and we should not evade the challenge (new challenges are a bit "light on" these days).

Yours faithfully,
Lindsay Lawless VK3ANJ,
Box 112,
Lakes Entrance, Vic 3909.
AR

FAKE!!!

I would like to draw all amateurs' attention to the fake antenna matcher "Maxcom" which is made in the USA.

This unit performs as a good dummy load. Refer QST, November 1984, pp 53 & 54.

BEWARE.

Yours faithfully,
Geoff Campbell VK2ZQC,
279A Victoria Place,
Drummoyne, NSW. 2047.

EDITOR'S NOTE:

The product review by QST describes in detail the sealed and potted construction of the four Maxcom models rated for 200, 500, 1000 and 2000W PEP. External electrical measurements, supported by Xray photographs, show the units to be toroidal balun transformers shunted by high power load resistors. SWR was measured as better than 1.4 on all bands to 30 MHz, with no antenna connected! At prices from US$600-1000 these are expensive dummy loads.

AR

BE HEARD!!!

I heartily support Sam Voron VK2BVS in his letters in AR regarding higher power for amateur novices even though page 50 of the February issue indicates the Federal WIA does not support the matter.

If we are looking for more members for our WIA institution then this attitude by the Federal body needs to be remedied so that they represent all amateurs —novice and full call alike.

It is up to all amateur novices to write to their delegates for this concession to be presented at the next convention on the 26th-28th April as well as access to 2m operation on a similar limited basis we as novices enjoy on restricted bands.

After all, our USA counterparts, with many more amateurs, have had their power limit extended, then why not Australia?

Considering our remoteness in the world today, more power in DX competitions must encourage more people to enter amateur radio as well as assist the amateur novices.

73,
R A Davey VK6NND,
12 Lillian Street,
Cottesloe, WA. 6012

SOUTH AFRICAN 6 METRE AURORA PROPAGATION TESTS

Tests stopped at the end of November 1984 but will be continued from the beginning of March 1985 until May. They will again be conducted from 1700 to 1900 UTC every night of the week and special skeds on Friday and Saturday nights from 2200 to 2400 UTC. We will concentrate mostly on the six metre channel of 50.600 MHz but will try two metres if the conditions are suitable. There are four coastal regions which will participate and each area will transmit, for a period of 15 minutes, a beacon signal with their identification. For example, Durban region will transmit during the first 15 minute period of the hour, followed by the East London region, and at half past the hour, region Port Elizabeth will take over until quarter to when the Cape Town region will complete the final 15 minute slot. This process is repeated during the next hour. We are of course all beaming towards the magnetic South Pole. So far we have heard the other regions on (1) Meteor Scatter and (2) on Backscatter after midnight. We have already heard signals from ZS2CO of East London, on (3) what we believe to be traces of Aurora signals with very deep ripple. These signals we have only heard after midnight on a few occasions when Aurora activity was present at the South Pole.

Any interested amateur may contact me directly. We are also interested in conducting direct skeds on other forms of propagation on say 50.100 MHz CW or SSB, over weekends, ie Saturday and Sunday mornings between 0400 to 0700 UTC. Times will be arranged with interested parties.

Mike Bosch ZS2FM
PO Box 1614,
Port Elizabeth, 6000
South Africa

PS The group consists of ZS1ABD, ZR2EC, ZS2BE, ZS2CO, ZS2FM, ZS2NR, ZS2OD, ZS5AV, ZS5CU, ZS5QM etc.

AR

ATTENTION OLD, OLD TIMERS

I am a radio astronomer and historian of science currently writing a book for Cambridge University Press, based on a decade of research, on the early development of radio astronomy. Some draft pages give the story of the important role in the discovery of the radio sun which amateur radio operators, particularly in England, played during the late 1930s. During the solar maximum of 1935-7, many of them,

in particular Denis Heightman G6DH, studied the strange hiss often associated with the newly recognised phenomenon of sudden shortwave fade-outs. Although these studies convinced them that the sun was somehow responsible for the hiss, their antennas lacked the directivity required to demonstrate that the shortwave radiation was being emitted directly by the sun, and that it was not a secondary effect, say, of particles from the sun. It was not until World War II that James Hey, in embattled England, finally did (accidentally) make the definite discovery of radio waves emitted by a great solar outburst in February 1942.

I am writing to ask whether readers of Amateur Radio could send me any further information on detection and study of this hiss before World War II, in particular for the previous solar maximum in the late 1920s, when I have heard that the hiss was indeed picked up by amateurs, but I have no specific citations or other testimony. (By the way, R A Ham [this is his real name!] has written an interesting article on the work of Heightman and other amateurs: "The hissing phenomenon", J Brit, Astronomical Assn 85, 317-23, 1975.) I would appreciate it very much if readers send any information, in particular from the late 1920s, to me. Thank you very much for all assistance.

Sincerely yours,

Woodruff T Sullivan, III
Associate Professor of Astronomy
University of Washington,
Seattle, Washington, 98195, USA

AR

CONSIDERATION

I am anxious to see what feedback you get from readers of AR to this letter.

Because of the microscopic print you are now using in Amateur Radio, I am unable to read the magazine without the most extreme eye discomfort.

This debars me from valuable technical information, interesting articles and information from advertising.

I quote as typical examples from the December issue (1) The Annual Index pages 42-43 (2) the ICOM advertisement page 23.

Your earnest consideration of this problem would be greatly appreciated.

Yours truly

N A Loflman VK2APL,
27 Low Street,
Mount Kuring-gai, NSW, 2080

AR

PUTTING THE AWA MTR-25A ON 52.525

The article in November AR, page 17, I feel can be simplified. Following is my article from "QRM".

Firstly if you mix on the high side the oscillator chain remains unchanged.

By placing additional capacitors across the originals it saves the problem of removing the existing ones.

Apart from that the article was very good.

In no way do I wish to criticise the original by VK3ANP. There are approximately 20 sets operating along the NW coast of VK7 on 52.525 MHz.

73,

Joe Gelston VK7JG,
Box 1311,
Launceston, Tas, 7250

These radios are available for around $15.00. With about one hour's work you can get them going on six metres. If you are not familiar with the set, you will need a handbook. The receiver will go as soon as it is modified. However, the transmitter is a little off tune and will require a test meter to tune it correctly. The receiver oscillator remains unchanged, ie mix on the high side. If possible, check the radio before modifying it as a lot of them are U/S. Fit an additional 18pF capacitor across C2, C8, C11, C16, C18. Increase coupling capacitors C10 and C17 to 3.3pF. Replace the RF head and the radio should work.

The transmitter takes a little longer but is just as simple.

$f_{xtal} = \frac{f_e}{24} = \frac{52.525}{24} = 2.18854$ *spec D63.*

Receive xtal $= \frac{f_e + 10.7}{2} = 31.6125$ *spec D66.*

Fit a 220pF capacitor across C6, C21, C22.
Fit a 33pF capacitor across C13.
Fit 100pF across C26.
22pF across 12BY7 grid coil.
10pF across 12BY7 plate coil.
18pF across 12AQ5 plate and grid coils.
10pF across 6883B grid coil.
Rewind plate coil to 10 turns.
Align radio as per handbook. The receiver should receive .5 μV for 20dB quieting. The transmitter power is 20 watts at 13 volts for 150mA plate current. Adjust deviation to ±5 kHz.

NEWS FROM AUSTRIA

The OVSV reports changes to the amateur radio regulations for Austria.

1. **Operation on the 160m band:**
   Additional allocation from **1.850-1.950 MHz** on sec basic, max output power 100 watts, restricted for A1A (CW) only. This new allocation is presently terminated by end of 1985.
2. **Additional allocation** between **2305-2320 MHz** on sec basis, terminated by end of 1988.
3. **Additional allocation** between **10.368-10.370 MHz** on sec basis, power limitation 40 dBW. Operation terminated by end of 1988.
4. Operation-permission for licensed radio amateurs without CW examination on the 2m band between 144.025-144.100 MHz for training purposes only. This regulation is terminated as a test-phase by the end of 1985.
5. According to the recommendations of IARU region 1 conference — Cefalu CW identification on the beginning and the end of RTTY, FAX and SSTV transmission is no longer obliging.
6. For **mobile operations** on frequencies higher than **30 MHz** a **simplified** form of the **log-book** is permitted. The simplified form **has** to contain:
   (a) Used frequency band
   (b) Route or operation area
   (c) Begin and end of the mobile operation.
   All other information may be omitted. This rule does not apply for portable operation or operation from a fixed location.
7. The use of radio amateur equipment with a nominal frequency range from 143.400-148 MHz is now permitted. Any operation (transmit and receive) outside 144-146 MHz is **strictly** prohibited.

Dr Ronald Eisenwagner, OE3REB
President of OVSV

Obituaries

GEOFF SAMUEL VERNON FREW VK3PM

Geoff passed away on 8th December 1984 after a long illness. He will be sadly missed by all in the amateur fraternity and his many friends in the electronic industry.

He was first licensed as VK3PM on 24th April 1928. Geoff was a dedicated experimenter and in 1928 won a contest run by the Victorian Radio Transmitters League for experimental work and communication on 10 metres. In 1928 10 metres was virtually unknown and to work over long distances was quite an achievement on this band.

During WWII Geoff was a design engineer in the Special Products Laboratories of Radio Corporation developing equipment for the Army and Air Force.

manufacturing specialised equipment for industry and Government Departments. During the early 1960s the CSIRO licensed him to develop and market their world-wide patents for Atomic Absorption Spectroscopy.

Geoff retired from an active business life in the early 70s and in co-operation with the Australian Academy of Science founded the Geoffrey Frew Fellowship to provide for a noted fellow to visit Australia every 18 months to present scientific papers on physics and chemistry.

Geoff did not renew his amateur licence after the war, until 1969, with the callsign VK3JK, but on 4th August 1971 he regained his original call of VK3PM.

His great interest was experimenting — concentrating on antennas and feed systems. He gained much satisfaction in practical tests on air, particularly on the ANZA net on 21MHz.

Geoff was a gentleman and a brilliant and practical engineer who always found a solution to any problem. He was a wonderful person to work with, ever helpful and patient in giving help and information to the team.

Sincere sympathy is extended to his wife Thel and family.

John Heine VK3JF
AR

FREDERICK ALEXANDER MURRAY VK2FM

It is with deep regret to advise the passing of Alec VK2FM on 23rd January 1985. Alec was born in Scotland on 26th September 1907. At the age of nine, he journeyed to Australia with his family and settled in Melbourne, where his father took up a senior position with Metropolitan Vickers. Like many young boys of that era, Alex experimented with wireless.

Alec then settled in Sydney in the Mosman area and took out the call sign VK2FM. For many years, he was CW only. After a jibe from the late VK2BG Bruce, Alec then built a modulator. From that time on, he was almost exclusively phone. His voice was well known overseas, particularly in the USA.

Alec built a home and settled in Carramar. Soon afterwards, it was followed by the erection of a tower and a 2 element beam and the DX hunt was on.

After retiring from work, Alec finally moved to Blayney. A tower and beam were built and back to DX again.

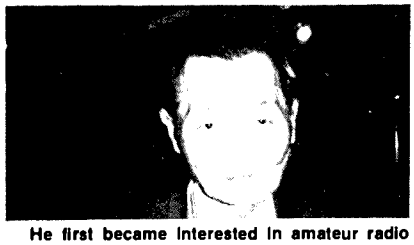
To Emily, Ronald and his family, brother Doug and sister, Olive, all of Alec's friends extend their deepest sympathy.

K J Ledsam, VK2ST.
AR

SHIGETAKE MORIMOTO JA1NET

It is sad to report the passing of Shigetake Morimoto at the age of 77.

He was one of the IARU observer team at WARC 79, helping the IARU team achieve success at the Conference. He also participated in the second Regional Conference in Tokyo 1971 and the fourth in Bangkok in 1978.



He first became interested in amateur radio during his high school days in the early 1920s. He took part in the foundation of the JARL in 1926.

During the past decade he made considerable contributions to the promotion of amateur satellite communications in Japan, acting as president of JAMSAT and chairman of the JARL satellite committee which has been playing a very important role in launching the JAS1 satellite planned for early 1986.

He was an internationally minded person. He participated in several CCIR meetings in the 1960s and 1970s and was Japanese delegate at WARC 59 and WARC in 1971.

His contribution to CCIR was such that he was one of the recipients of a special award that was presented as part of the celebration of the Fiftieth Anniversary of CCIR.

The amateurs of Region III have lost a great contributor to amateur radio.

David Wardlaw, VK3ADW
AR

GEORGE NAFTZINGER W4PPC

George's on air enthusiasm and daily example contributed to the development of the Australian Traffic Network and received a commendation from President Reagan for initiating and maintaining the International Assistance and Traffic Network. George W4PPC became a silent key on 5th February 1985.

George through his activities has had a big impact on Australian amateur radio because his daily example 1981-85 had shown many how one can enjoy one's hobby and help others at the same time. He would telephone the US State Department and the Office of Disaster Assistance whenever a problem struck some part of the world and offer the facilities of amateur radio. When hurricanes hit the Caribbean, during the Grenada crisis and when communications were cut to El Salvador, George and the net were there.

Many Australians will remember George because his net was the gateway for daily US, Canadian and Australian third party traffic over all those years.

George initiated the first Simulated Australian Emergency Test which has become an annual event for evaluating emergency message handling capability within Australia and with the US and Canada. George also arranged for Australia to be involved in the US National Communications System exercise which resulted in the ARRL and NCS including amateur radio in the national US emergency communications plan.

He will be remembered by all of his friends on the ATN.

Sam Voron, VK2BVS
AR

DON TAYLOR VK5DX

It is with deep regret that we announce the passing of Don Taylor VK5DX on 21st January 1985 after a long period of failing health which culminated in a stroke. Don had not been on air for approximately 10 years due to a loss of hearing.

He was licensed sometime prior to 1932 as VK5DX, and was one of a group of amateurs who broadcast programmes, including playing records, on the broadcast bands. Even in those days he was known as "the voice in the Black Forest" (Black Forest being the suburb of Adelaide where he lived and not the "rare DX" that many hoped they had found when they heard him!) and the title stayed with him for the rest of his life.

In April 1932 he was nominated to the VK5 Divisional Council and in May that same year was appointed 'Official 200 Metre Publicity Officer'. He held the title of Technical Director in February 1933 but resigned in July '33. Don is survived by his wife and five children.

Bill Plans His Project

Ted Holmes VK3DEH
20 Edmunds Street, Parkdale, Vic. 3195

All things considered, Bill Blitheringtwit now felt he had accumulated sufficient bits and pieces to enable him to get busy and build himself a brand new super duper power supply to replace the old one which, owing to the injudicious application of a glass of beer, was now defunct. He knew where to find the case: it was still lying underneath his workbench and still contained the shrivelled remains of some beetroots he had pulled up several years before and then forgot where he had put them. The rest of the items were scattered here and there amongst the general junk, but shouldn't be too hard to lay his hands on.

The only thing was that he was not too happy about these transistor devices. They looked so small and helpless, compared with the good old bottle, as he referred to valves. With a bottle you could do all sorts of horrible things to it and it wouldn't complain. And Bill could truthfully say that he had certainly put his bottles to a severe test over the years. But a transistor . . . He had heard that they were rather fragile, like Dresden china, and didn't like thinks like a bad SWR, or too much heat. Bill wasn't sure he could quite cope with this.

For Bill was "a full power at all times man". You hear them on the bands occasionally, particularly on the lower frequencies. To reach a station only a few miles away they use 400 watts and turn up their speech processors so as to make their voices almost impossible to distinguish from speaking into a milk bottle. On each side of their frequency for some considerable number of kHz it is impossible to insert a humble call sign because of the frightful splatter. They talk constantly of the number of years they have held their licence and mumble (if you can understand them) of current licence holders, who took the multi-choice exam, getting their licences with the aid of the appropriate number of Weetie packet tops.

So Bill, who was also a "tuner upper" on full power, was not sure how he would go with a power supply functioning with these new fangled transistor things. He knew that if you gave them plenty of heat sinking you were usually OK, but he had not forgotten the incident with the 120S some little while earlier. This unit he had borrowed for a couple of nights, after giving an assurance that no harm would come to it. In the brief time he had the device, Bill had managed to turn the finals into smouldering wrecks, merely by dint of prolonged and persistent tuning into his apology for an antenna. Such tuning, it should be mentioned, was bang over the top of a weekly net, which did not appreciate this at all and must have been relieved when the poor little 120S eventually expired.

Anyhow, Bill, if nothing else, was a trier and even he realised that valves were really things of the past, dearly as he loved them for their sweet and forgiving nature.

Then there was the regulation system. The puny device handed to him at the Richard Smith emporium didn't look capable of regulating anything! His old power supply had one that used to turn a lovely shade of blue when things were going well! This miserable object with its three spindly legs didn't look able to stand up by itself, let alone anything else!

All the same, Bill was determined to have a shot at putting all these ineffectual components together and to build himself a modern and up to date power supply so that he could once more get on the air and call up his cronies. That is, when they were available, for the air had a habit of mysteriously going very quiet whenever Bill hit his microphone button. He made a mental note to find out some time why this was so, although, at present, the reason quite eluded him.

Climbing into his oldest overalls, Bill set about gathering the bits to begin his newest project.

HELP US TO HELP YOU OR THE TWENTY QUESTIONS GAME!!!

Information is now being sought for alterations and updates to the 1985-86 WIA Call Book.

Is your call sign, name and address correct in the current issue?

Do you know an amateur who is not a member of the WIA whose information is incorrect?

Is your radio club or group information correct — not only in the call sign listing but also in the Club Directory?

Has your club or group any planned activities which could be entered into the Calendar of Events or are the awards managers/addresses of you club correct in the Awards pages?

If you are a member who requires your information suppressed from the call sign listings it is beneficial and preferable to re-submit your request, stating your call sign and the information to be suppressed. Please use a large sheet of paper — A4 or similar — as small shopping notes have a habit of becoming mis-placed or lost in the large volume of paper work concerning the Call Book.

Don't leave it to SOMEBODY ELSE — act now. All information is required by the last day of April at the Federal Office.

HAMADS

PLEASE NOTE: *If you are advertising items FOR SALE and WANTED please write each on separate sheets, including ALL details, eg Name, Address, on both. Please write copy for your Hamad as clearly as possible, preferably typed.*

- **Please insert STD code with phone numbers when you advertise.**
- Eight lines free to all WIA members. $9 per 10 words minimum for non-members.
- Copy in typescript please or in block letters double spaced to PO Box 300, Caulfield South 3162.
- Repeats may be charged at full rates.
- QTHR means address is correct as set out in the WIA current Call Book.

Ordinary Hamads submitted from members who are deemed to be in the general electronics retail and wholesale distributive trades should be certified as referring only to private articles not being resold for merchandising purposes.

Conditions for commercial advertising are as follows: The rate is $22.50 for four lines, plus $2 per line (or part thereof) minimum charge $22.50 pre-payable. Copy is required by the deadline as stated below indexes on page 1.

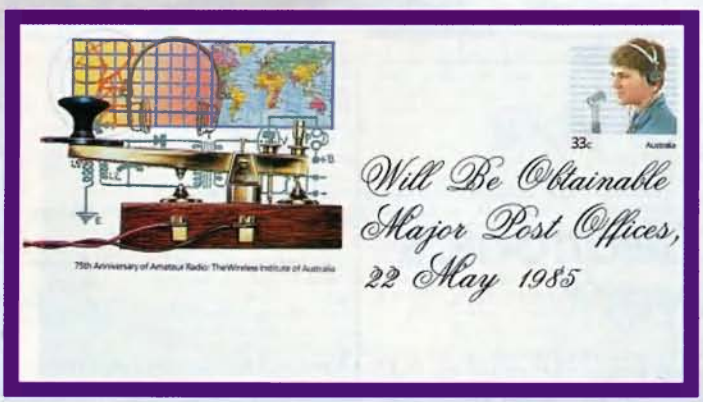
g Key Ring $3.50
h Cloth Badges $2.50

All prices plus postage and packaging.

AMATEUR RADIO

VOL. 53, No. 5, MAY 1985

JOURNAL OF THE WIRELESS INSTITUTE OF AUSTRALIA



BUILD IT YOURSELF & SAVE!

With the exchange rate through the floor and imported goods rising in price, it really makes sense to build your own gear!

You save a fortune because you supply the labour. And you get the satisfaction of home brewing all over again!

(1) 70cm amateur transceiver

Nearly 2000 now built: one of our most popular amateur kits. 40 channels on the 430-440MHz band. Everything supplied, including mic and full step-by-step instructions. Cat K-6300

$199

Upgrade kit for above:

Gives you repeater capability 'S' meter. Cat K-6302 **$24.50**

UHF Antenna Kit:

Suits above transceiver. Magna-base with co-axial mount, whip & cutting chart plus UHF grade co-ax & PL-259. Cat D-4014 **$28.50**

(2) amateur transceiver

The worthy 'brother' to the above set. Similar construction, (same case) with huge savings over the commercial rigs of the same standard. 40 channels & 5kHz offset. Cat K-6308

$199

VHF Antenna Kit

As above but with longer whip to suit 2m band (¼ wave), and standard VHF antenna mount. Cat D-4024 **$28.50**

Matching Power Supply

To suit either UHF or VHF transceiver. 13.8V at 2A regulated.
Cat K-6310 **$49.50**

(3) 'Glass RTTY for the VZ-200/300 $69.50

The low cost way to get into RTTY! Easy to build kit gives you full transceiver control and all 'wanted' RTTY features including WRU buffer, quick brown fox, etc. Works with the new VZ-300 too! Cat K-6318

(4) VK Powermaster (short form) Supply $99

What a supply! Used with M-2000 transformer, you can get a massive 14A continuous or 25A pk from this monster! Build it with the transformer you want for the power you want. Cat K-3448

14A cont. Transformer: Cat M-2010 **$59.50**

6A cont. Transformer: Cat M-2000 **$24.95**

(5) 70cm preamp kit

Get more from your 70cm receiver. Preamp is easy to add, takes up minimal space and can be diode or relay switched.
Cat K-6306 **$19.95**

(6) UHF Power Meter

A brand newey! Build a power meter for the 70cm band (also goes up to the CB band!) tor top performance out of your UHF rigs. Cat K-6312 **$49.50**

Available at all Dick Smith Electronics stores

DICK SMITH ELECTRONICS

Have you got your new 1985 Dick Smith Electronics Catalogue yet?

Now out! The all new 1985 Dick Smith Electronics Supercatalogue. You can't possibly last the rest of the year without one so race into your nearest newsagent for your Dick Smith Catalogue (you'll find it with a bonus issue of EA or ETI!) Whoops. Try buying EA or ETI: you'll get a free Dick Smith Electronics Catalogue.
Or if you miss out, you can send the coupon at left for your very own copy!

NAME _____

ADDRESS _____

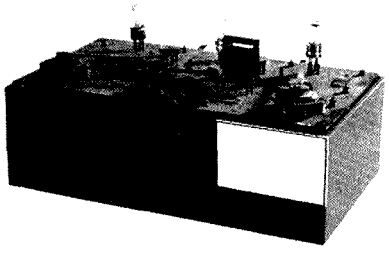
_____

_____ POSTCODE _____

Yes please! I missed out (or someone has already pinched it!) Please send me a copy of the new Dick Smith Electronics Catalogue. I've enclosed a dollar and understand you'll give me the dollar back with a bonus coupon. Send to DSXpress PO Box 321, North Ryde, NSW 2113.

AMATEUR RADIO

Published monthly as the official journal by the Wireless Institute of Australia, founded 1910. ISSN 0002 — 6859. Registered Office: 3/105 Hawthorn Road, Caulfield North, Vic. 3161. Telephone: (03) 528 5962.



Photograph by Ken McLachlan VK3AH

Max Howden's Receiver. The inscription reads — This receiver, handmade except for the valves, was used to win the Trans-Pacific Tests in May 1923 by logging twenty-two stations in the 150-250 metre band. The following year Howden (amateur call sign A3BQ) established two-way contact with the USA. Inset: Australia Post's Stamped Envelope, commemorating the WIA's 75th Anniversary, which will be available from major Post Offices on 22nd May 1985.

Grateful thanks for help and co-operation is extended to Chris Long and Frank Coffa of Melbourne Scientific Museum.

SPECIAL FEATURES

TECHNICAL FEATURES

REGULAR FEATURES

This month the magazine features a reminiscent article by Ian VK2KU, p.13. Ian recalls how he became interested in amateur radio in the late 1910s. Ian and his science master attempted to make wireless telegraphy contact between Tingha and Inverell and by the time they concluded their tests Ian was well and truly hooked on the hobby.

Also of historical interest are two photographs, one is of a class of radio students in 1928-29, p.12 and the other is a Short Wave Tuner which was made in 1918, p.7.

Graham VK5AGR has written an informative article about his trip seeking first-hand information about amateur satellites p.24. Graham visited the US, England and Germany and has gathered a wealth of information of what is happening with current satellites and what can be expected in the future.

For the home-brewer there is a delightful article explaining the construction of an "Afterburner" for 14MHz RTTY p.9. John VK3PL, writing his first technical article, takes the constructor through all the stages to the final product of this inexpensive unit.

Having trouble with the electronic flashers on the car when you are transmitting? Rodney VK3UG may have the answer then, p.17, as he explains how he overcame this problem with a couple of ceramic capacitors.

On the contest scene Ian VK5QX gives a full description of contesting for the newcomer. Ian explains how simple most contests are and emphasizes the hardest part of any contest is to read the rules and follow them to the letter.

On page 5 there is a brief, interim report of the Readership Questionnaires. (B-P)

DEADLINE

All copy for July 1985 AR (including Hamads, columns) must arrive at PO Box 300, Caulfield South, Vic. 3162 at the latest by midday, 23rd May 1985.

Enquiries and material to:
The Editor
PO Box 300, Caulfield South, Vic. 3162

Material should be sent direct to **PO Box 300, Caulfield South, Vic 3162**, by the **25th of the second month preceding publication. Note: Some months are a few days earlier due to the way the days fall. Phone: (03) 528 5962.**

Hamads should be sent direct to same address.

Acknowledgement may not be made unless specially requested. All important items should be sent by certified mail. a word from your EDITOR

COMING TOGETHER

As I write this, in the middle of March, the main item on the Institute's horizon is the Federal Convention at the end of April. So as a change from the editorial history and prophecy of the last few months it seemed that a little Convention history might be worthwhile.

The Convention is an annual event at which the Executive, responsible for managing the WIA from day to day, meets its Board of Directors, the Federal Councillors from all the Divisions.

Although this is the Institute's 75th Anniversary Year, for much of its life it was a small enough organisation to manage with a minimum of Federal-State liaison. The first Federal Convention was in 1924, and was held thereafter in a different capital city each year. In some years no Convention was held, and of course like amateur radio itself the WIA was effectively in suspension during the 1939-1945 war. This will be the 49th Convention in 62 years.

As the Institute grew, the Executive of necessity became larger. In 1972 the Federal body took over the responsibility from the Victorian Division for the publication of AR, which had become too much for one division to handle. This coincided with the appointment of our first salaried full-time business manager, the late Peter Dodd VK3CIF. Since 1975 the Federal Convention has been held in Melbourne, as it is easier and cheaper to bring about fifteen people to Melbourne than it would be to move the same number plus all Executive officers elsewhere. Irrespective of the Convention locale, only the host Division's councillors would not need to travel.

Hopefully, these paragraphs may help to explain, particularly to younger members, how the WIA is organised. The intention is to give all members, irrespective of their location, an equal voice in the Institute's representation of amateur radio to community and Government.

From time to time we hear of amateurs who refrain from joining the WIA, or even resign from it, claiming that their opinions or wishes would be or have been ignored. Perhaps this can happen sometimes. No system is perfect, and amateurs tend to be rather individualistic. Some, believe it or not, might even be a little eccentric! But one thing is certain, the non-member's voice will be ignored almost always; the member's very rarely, and then either by mistake or for good reason. If you are a non-member, reading a borrowed copy of AR, why not join us and let your voice be heard?

Bill Rice VK3ABP
Editor

SOME ANSWERS FROM THE READERSHIP QUESTIONNAIRE

Earl Russell VK3BER.

AR
☐ **Yes** ☐ **No**
☐ **100%** ☐ **80%** ☐ **50%** ☐ **5%**
Call ☐ **Book** ☐

Remember the questionnaire you received with your WIA subs renewal notice? Some preliminary results are now available from the computer analysis. Your opinions of AR magazine will be of greatest interest to the editor and the publications committee so I will give those first.

Generally the magazine is well received but you cannot please all of the people all of the time and still stay within budget; 56 percent say AR is good, 26 percent say it is excellent, 14 percent satisfactory, 3 percent poor and about 1 percent have no opinion to offer. The presentation of the magazine received similar percentages. 88 percent of readers consider the length of articles "about right". The most frequently read regular articles were the Editorial and WIA News, both about 80 percent, whilst the least read were Contests and Awards, both at 25 percent (that still represents a regular readership of over 2000). From these figures it would appear that members are interested in Institute matters but they do not have a great competitive spirit.

The readership of the other regular columns varies between 40 and 60 percent except for Equipment Reviews and Historical Articles which interest 65 percent. 17 percent of members magazines are also read by non-members. Encourage these people to join the WIA so they can receive their own copy of AR and save wear and tear on yours, but more importantly, a significant increase in membership will result in an overall decrease in fees as fixed costs will be spread across a greater number of members.

The Call Book also came under scrutiny; 43 percent have not seen the latest issue yet, but of those who have, 30 percent regard it as excellent, 54 percent good, 14 percent average and the remaining 2 percent consider it poor. Almost half buy each issue of the Call Book.

Hamads have been used by 15 percent to dispose of pre-loved equipment and 21 percent have bought items from Hamads. The commercial advertisements are normally read by 82 percent while 59 percent have purchased equipment as a result of having seen it advertised in AR and 36 percent have made their purchases after reading the Equipment Reviews.

Antenna articles are the most popular (a whopping 90 percent) followed by construction articles (81 percent). It looks as if home brewing is definitely not a thing of the past; well we at least like to read about it. 60 percent claim to build a quarter of their equipment, 21 percent do not build anything and about 1 percent build all their equipment. The remainder build between half to three quarters.

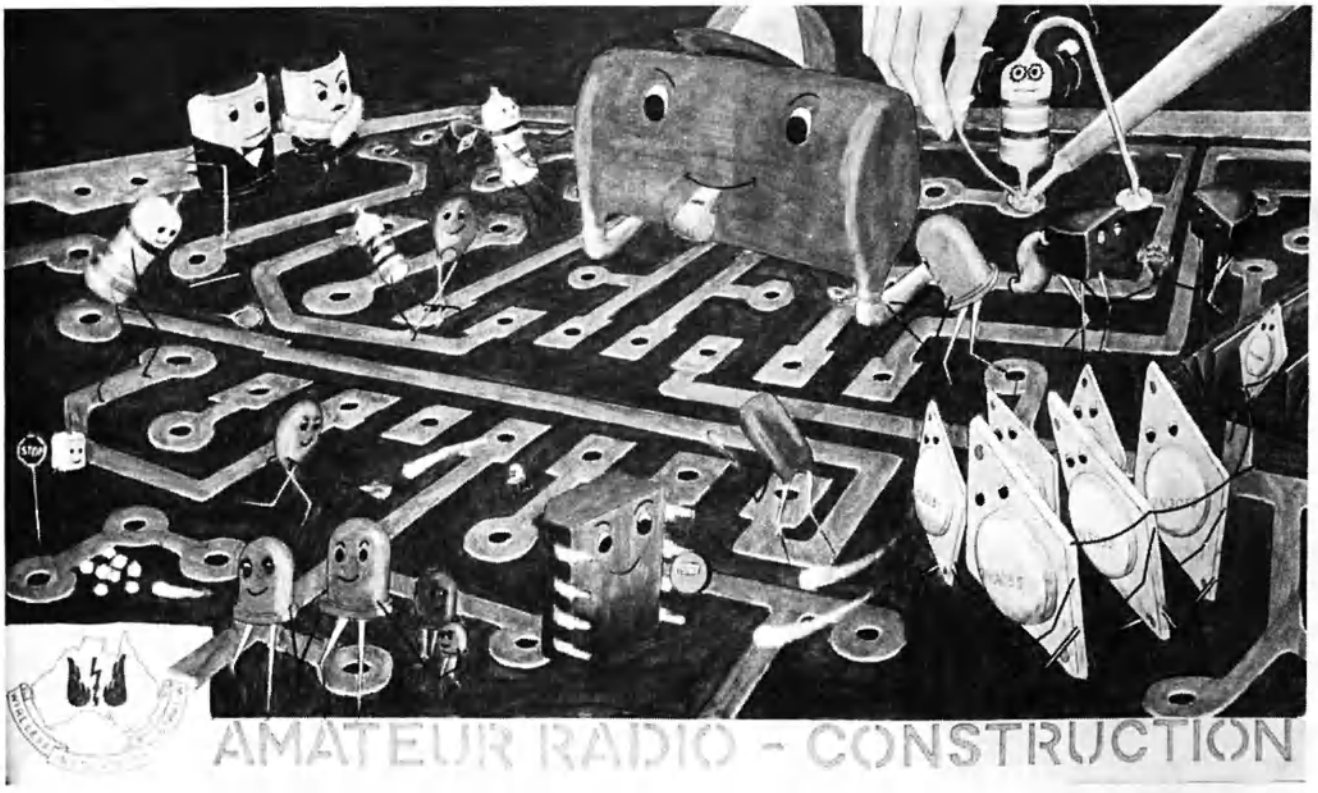
The time and inclination to get on air naturally varies. 45 percent spend 1 to 5 hours a week operating, 20 percent for less than 1 hour and also for 6 to 10 hours. There is a lucky 15 percent who are able to spend more than 10 hours each week communicating with other amateurs. Future analyses will enable us to see which age groups are able to spend the greatest and least times on air.

From the statistics so far only 1 percent of the membership of the WIA is below the age of 20. This the International Year of Youth, let us aim to introduce more young people to the hobby to ensure its perpetuation. The WIA bookpacks are aimed at interesting secondary school children in amateur radio. Another 1 percent declined to indicate to which age group they belonged (our female members?). Only 8 percent of members are in the 21-30 age group, 20 percent are 31-40, 18 percent 41-50, 23 percent 51-60 and 29 percent are over 60 years old.

The on-air operating preferences ranged from 45 percent ragchewing to 3 percent whose main interest was participating in contests while in between were the 31 percent whose main pleasure is chasing DX. Operating modes used are SSB (80%), FM (44%), CW (27%), RTTY (19%), SATELLITES (10%), QRP (9%), AM (6%), ATV (4%), SSTV (3%), PACKET (2%) and EME a small fraction of a per cent. The bands on which these modes are used are HF (55%), VHF (49%), UHF (18%) and MICROWAVE (2%). The mathematicians will already have calculated that the above sets of figures total more than 100 percent, but before dashing off letters to the editor, may I point out that many replies listed more than one band or mode used.

Thank you to all members who returned their questionnaires, the response was far greater than one staff member predicted — he lost his bet — but is vet to provide lunch. When all the replies have been processed we will know the exact percentage return, but it appears to be around 80 percent. The work of inputting the data is still continuing as it is being done on a part time basis between other office duties. The tedium of entering the information is often relieved by the humorous comments written on the questionnaires. These will be the subject of a future short article or fillers in AR. **AR**

WIA Seventy Fifth Anniversary News



Posters on this page were contributed by Vicki Marsden VK2EVM.

POSTER COMPETITION

The entries have now closed for this competition. The Federal office has received some very promising artwork from members. The judging will take place during the next meeting of the Anniversary sub-committee and the results published in a later edition.

PRE-STAMPED ENVELOPE

Members are reminded that Australia Post will be issuing this envelope on 22nd May. If you require envelopes for your friends overseas, you are advised to obtain your supply early.

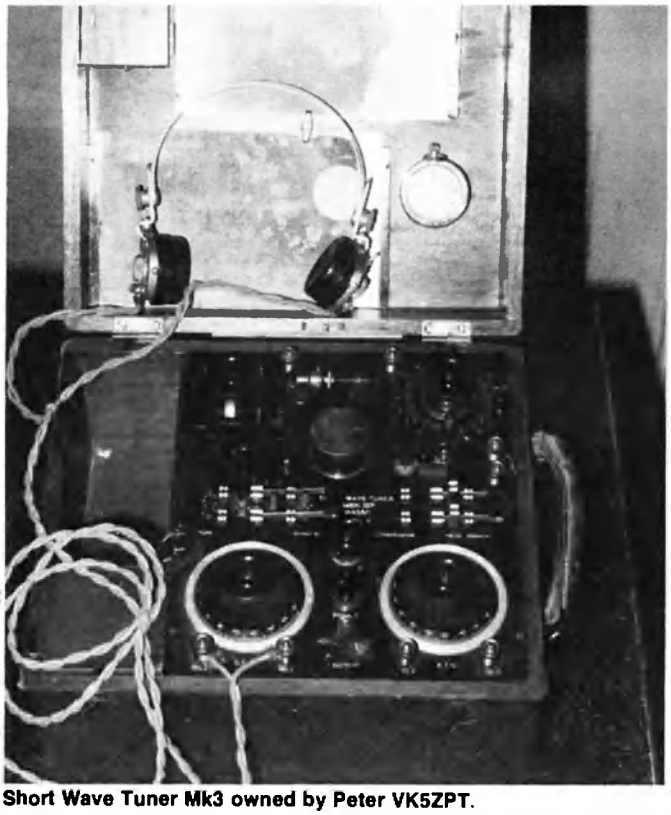
NATIONAL FOXHUNTING CHAMPIONSHIP

The rules for this event will be published shortly, at this time discussions are taking place between the VK1 and VK2 Divisions as to the best venue. This is likely to be the Wagga convention held October. Firm details will be published as soon as possible.

The prizes for this event have been finalised. There will be a large annual trophy with replicas for the winning team. Icom (Aust) have donated a handsome piece of equipment for this 75th Anniversary Year, which will be presented to the winners. This has been followed by a further gift from GFS Electronic Imports of an interesting piece of VHF/UHF equipment, which will help make this event a high note of this special year.

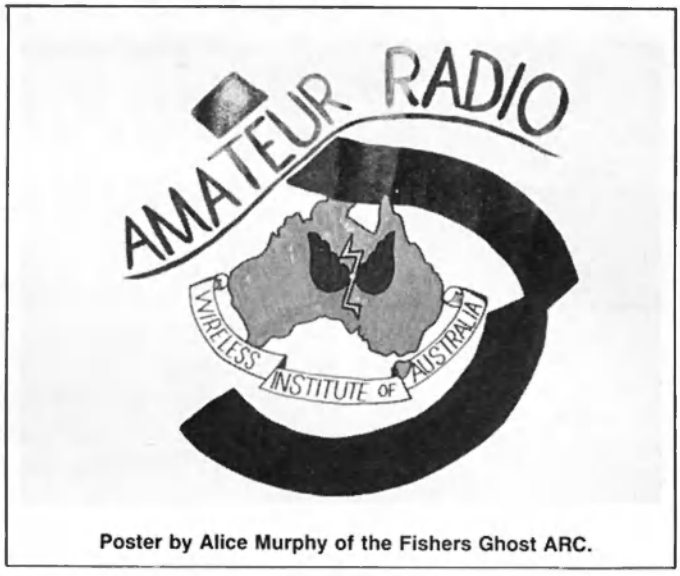
DO YOU OWN A PIECE OF HISTORY?

In reply to this question in January's 75th Anniversary column we have received information about a "Short Wave Tuner Mk 3" owned by Peter Thomas VK5ZPT.



Photograph by David Clegg VK5AMK.

Short Wave Tuner Mk3 owned by Peter VK5ZPT.



Poster by Alice Murphy of the Fishers Ghost ARC.

The unit was made in 1918 by "ATM Co Ltd", England and is in perfect working order. It is essentially a self-contained crystal receiver housed in a mahogany case covered with canvas and measures 12x14x8 inches.

In 1918 the term "short wave" applied to any frequency of more than 500 kHz and the coverage of this unit is approximately 400-2000 kHz.

These units were sold for five guineas in England after WWI and were used by amateurs in the early 1920s when amateurs operated in what is now the broadcast band.

Has any other member any equipment older than this unit?

DELIGHTS OF HOME-BREWING . . . "THE AFTERBURNER"

John Isaac, VK3PL
540 Mount Dandenong Road, Kilsyth, Vic 3137

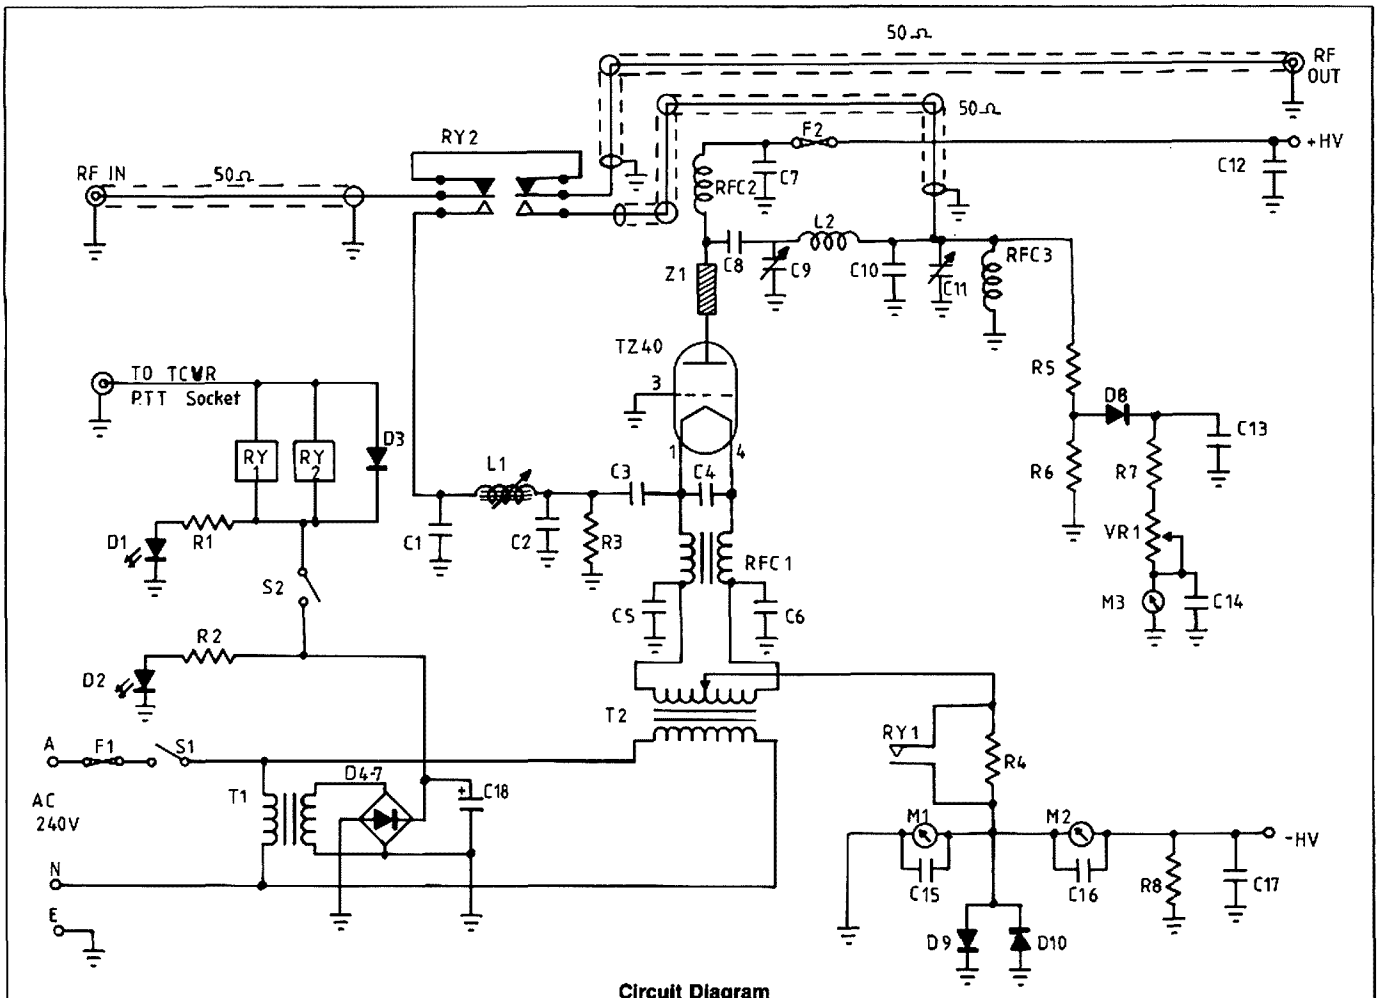
It was after a sixteen year lay-off from radio occasioned by the demands of the salt mine that semi-retirement allowed the writer's re-entry into this "king of hobbies and hobby of kings". A desire to return to the old favourite 14 MHz CW DX scene prompted the purchase of an FT101E transceiver and things looked good. The rehabilitation was proceeding smoothly, discovering what had been happening in the last decade or two . . . even understanding some of it. Then the RTTY bug bit.

The modern transceiver is a fine piece of equipment and the FT101E is no exception. However, their final amplifiers are designed for SSB/CW service and do not take too kindly to the 100 percent duty cycle imposed by RTTY, unless suitably derated. And the main point of interest was now 14 MHz RTTY DX (conditions permitting). The voices were calling *"What you need is a linear, mate"*.

It did not seem a good proposition to buy one, for one mode, one band. *"Better to build one. Let's have a look at the junk box"*.

Most of the parts needed were there . . . or else there was something which could be cannibalised, modified or otherwise fiddled with to suit the job.

It seems unlikely that anyone will duplicate this project exactly, but as a lot of researching was involved it was thought that to present the findings might be helpful to anyone contemplating a similar project. A lot of useful information (with lucid explanations) is available in Bill Orr's "Radio Handbook" (1). The ARRL "Handbook" also has some useful information and examples (2). "Solid State Design" gets thanks for showing how to calculate values for a pi-network (3). VK3XU's "Home Brew



Circuit Diagram

Linear" is an excellent article; this would be a good project tor duplication (4). Also well worth perusing is the article by G3ISD: "A low budget HF linear amplifier" (5), which uses a pair of 813s, triode-connected.

THE CIRCUIT

It was decided to use an old TZ40 zero-bias Class B triode, which happened to be available, in the now popular grounded-grid circuit. Another good tube is the 813, triode-connected. If using a triode the high-mu ones are preferred; for other suitable tubes see (1) 7.23, 21.14, 21.18. There are a few advantages, and some disadvantage, in grounded-grid operation. Simplicity and reliability, self-neutralisation and the absence of bias and screen supplies in many cases make the circuit an attractive proposition.

The main disadvantage is that more drive is needed than for the same tube in a grounded-cathode circuit . . . This is not all lost, however; most of it "*comes out the other end*". (1) 7.16-17, (2) 6.26.

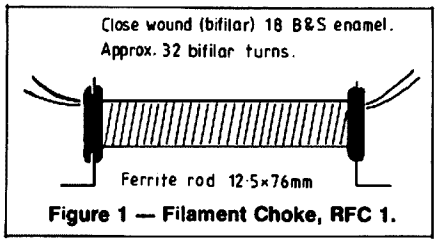


Figure 1 — Filament Choke, RFC 1.

The tube filament is at RF potential and must be isolated from the AC circuit for RF. A neat solution is an RF choke bifilar-wound on a ferrite rod (Figure 1). The plate choke is also home constructed, and has an inductance of about 95 uH, with a series-resonant frequency of around 25 MHz. (4) p 28, (2) 6.47. The tuned input circuit to the filament (cathode) allows the input impedance of the amplifier to be matched to the transceiver output.

RFC3 is a safety measure. In the event of C8 failing short-circuit the fuse in the HV supply line will blow.

Plate meter M2 is held near ground potential by R8, thus avoiding front-panel shock hazards. M1 and M2 are protected by D9 and D10 against gross overload in case of a flash-over or accidental short. The relative-power meter M3 is best adjusted to read about two-thirds scale at rated output. This circuit may be omitted entirely if an external power meter is used, but having the meter on the panel will be found convenient.

Relay RY2 switches around the amplifier during receive periods or when it is desired to use the transceiver "barefoot". RY1 removes the bias developed by R4 on switching to "amplifier in" (S2 closed). With S2 open, the amplifier is in "standby" condition. R4 may require experimentation for different tubes. Use sufficient to cut off plate current on standby.

POWER SUPPLY

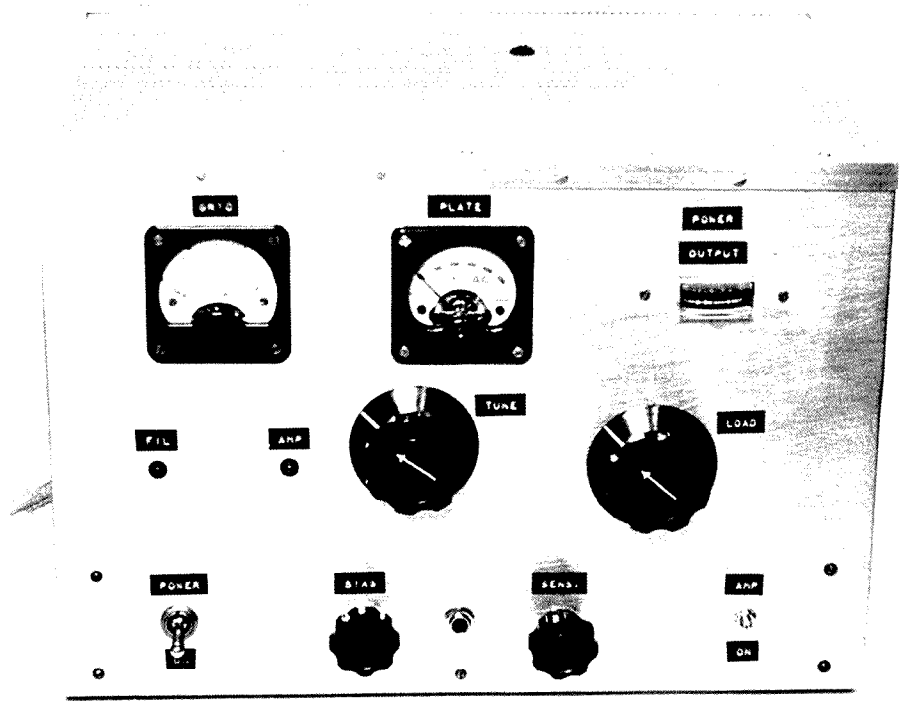
The high voltage power supply is an old home-brew unit using a pair of 866/866A mercury vapour rectifiers. It performs faultlessly and will probably outlast its owner. A modern solid-state unit (1) 23.1 to 23.42, (2) 5.2 to 5.21, 6.45, (4) 31 could be made smaller and lighter. The unit in use delivers 1 kV at 100 to 200 mA and at 100 watts is loafing along.

A 30-second time delay is fitted in the HV primary circuit to allow the rectifier filaments to heat before high voltage can be applied. With the metering circuit employed in the amplifier (meters "cold"), the negative terminal of the HV supply is NOT GROUNDED to chassis in the supply unit and only through safety resister R8 in the amplifier itself.

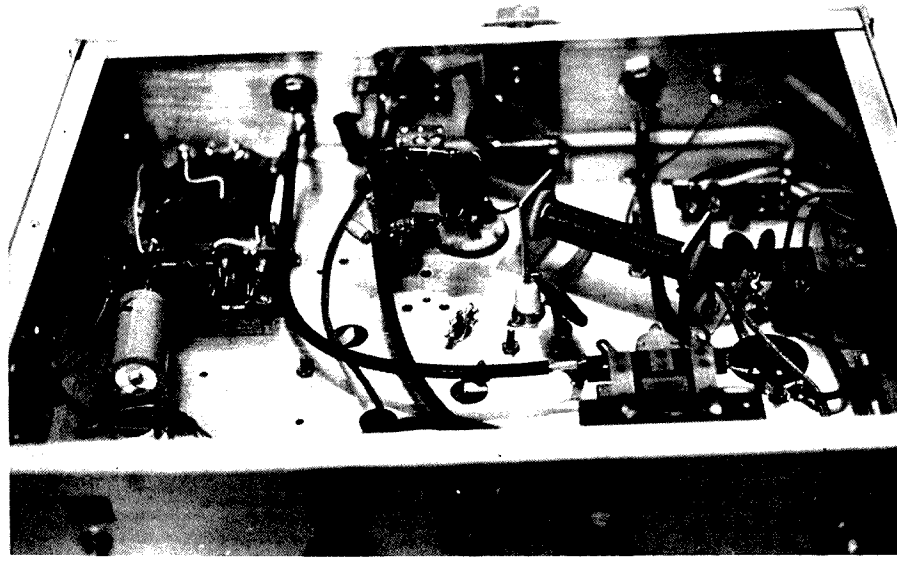
CONSTRUCTION

The amplifier was built on a chassis measuring 250 mm x 330 mm x 63 mm with a panel to suit tube height. Back, sides and top are enclosed by a shield made from perforated aluminium and aluminium angle.

Forced-air cooling has not been found necessary with the tube running at 100 to 120 watts input, but higher input or larger tubes would probably necessitate a fan or blower.



The Completed Unit.



Underside — an Internal View.

It is essential to shield the input circuit from the output. The tube socket is at chassis level, with the input circuit below chassis. The under-chassis section is completely enclosed by a sheet aluminium base.

The relays were junk-box items; provided contact size and spacing are sufficient their ratings are not critical as they are not called on to do any strenuous RF or DC switching.

RFC1, the filament choke, presented a slight problem. If the winding is done on the ferrite it will spring open when released giving a slack fit. Wind the turns on a tube or dowel a little smaller (say 11 mm for 12.5 mm ferrite rod). The coil is easily removed from the dowel and may be eased on to the ferrite by twisting against the direction of the winding so that the coil is opened slightly. Mechanical and electrical insulation between core and coil was provided by a layer of plumbers' PTFE thread sealing tape. A few coats of varnish or coil dope were applied to hold all in place. If loose the windings will hum when AC is applied. One way of supporting the finished article using two large grommets and a pair of brackets is shown in Figure 1.

RFC2, the plate choke, may be finished with a couple of coats of clear Dulux or similar. Winding details are given in Figure 2.

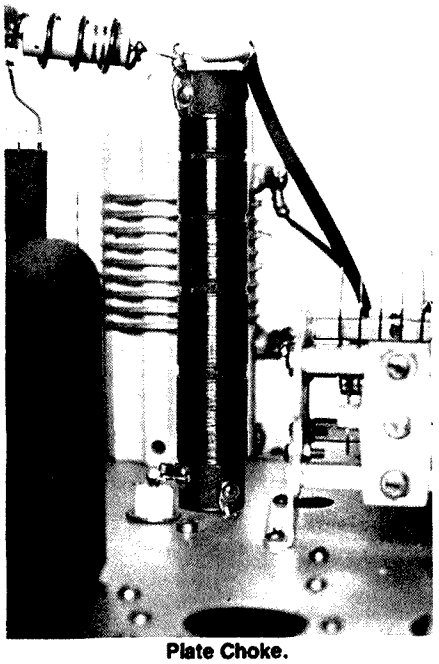


Plate Choke.

The plate cap connector was made from a piece of copper strip 1 cm wide, and is secured by a very small bolt and nut. Brass strip could make the bolt unnecessary. Copper strip was also used for the plate/output tank connections (7 mm wide in this case).

The cathode circuit is best mounted on the rear skirt of the chassis if layout will allow, for ease of access to the slug adjusting screw. If mounted on the chassis surface, a grommet-lined opening in the top of the cover will allow safe adjustment with the cover in place. A suitable tool is easily made (see the XYL for a plastic knitting needle).

ADJUSTMENT AND TUNING

This subject is well documented (1) 21.17, 22.17, 22.23, 22.44 and (2). However, an outline is presented here for guidance.

After a thorough wiring, check the amplifier is connected to the exciter (transceiver) and a suitable dummy load. An SWR meter in the output line is recommended. Input and output circuits may be resonated at the centre of frequency of interest with a dip meter.

With all interconnections in place and the high voltage supply OFF, filament and relay supplies are turned on (S1). High voltage may now be applied after any required warm-up period.

Plate tuning is set for approximate resonance and C11 near full mesh. With the amplifier "in line" (S2) and the transceiver carrier control at minimum, excitation is turned on and the excitation control advanced until a small flow of grid current is indicated.

The plate tuning capacitor (C9) is now rotated for the plate current "dip" indicating resonance. At this point output coupling can be increased by reducing the capacitance of C11 a little, tank resonance then being restored by adjusting C9. Advancing drive in small increments, gradually increasing output coupling (decrease C11) and re-tuning C9 in step, the amplifier is brought up to the desired level of power output, grid current and plate current. On tuning C9 through resonance, maximum grid current, minimum plate current and maximum output should now all occur at the same setting of the capacitor. (1) 21.19.

The input circuit may now be adjusted via the slug of L1, using an SWR meter in the input line to the amplifier, for minimum SWR. It should be possible to achieve 1.5 to 1 or lower.

A check for parasitic oscillations can now be made: with zero excitation and the amplifier fully activated (transceiver in CW mode, key up), C9 is swung steadily from maximum capacity to minimum, watching the plate current. This should show no variation over the full range of C9. Random variations in plate current or any show of grid current indicate parasitics. Changing the inductance of the suppressor Z1 . . . POWER OFF! . . . by springing open or compressing the turns is often all that is needed. If more or less turns are needed, the previous effort will probably show the way to go.

If all is well the SWR meter between exciter and amplifier can be removed after a final tweak at the desired frequency.

The signal may now be monitored in a nearby receiver (well shielded and with the antenna terminals shorted or grounded) with the RF gain backed right off. Keying the exciter with a rapid string of dots while tuning a few MHz either side of the signal should produce no clicks, pops or burps. Any of these may be a sign of residual parasitics; the carrier should be clean with solid make and break but no clicks.

NOTE It is imperative that the input signal to the receiver be adequately attenuated for this test, otherwise misleading results are almost certain. The amplifier is now ready for on-air trials. "Barefoot" operation is simply a matter of throwing S2.

This unit is a delight to use; it has been gratifying to note that stations contacted have been unable to distinguish between signals from the amplifier and from the transceiver when running at the same power level.

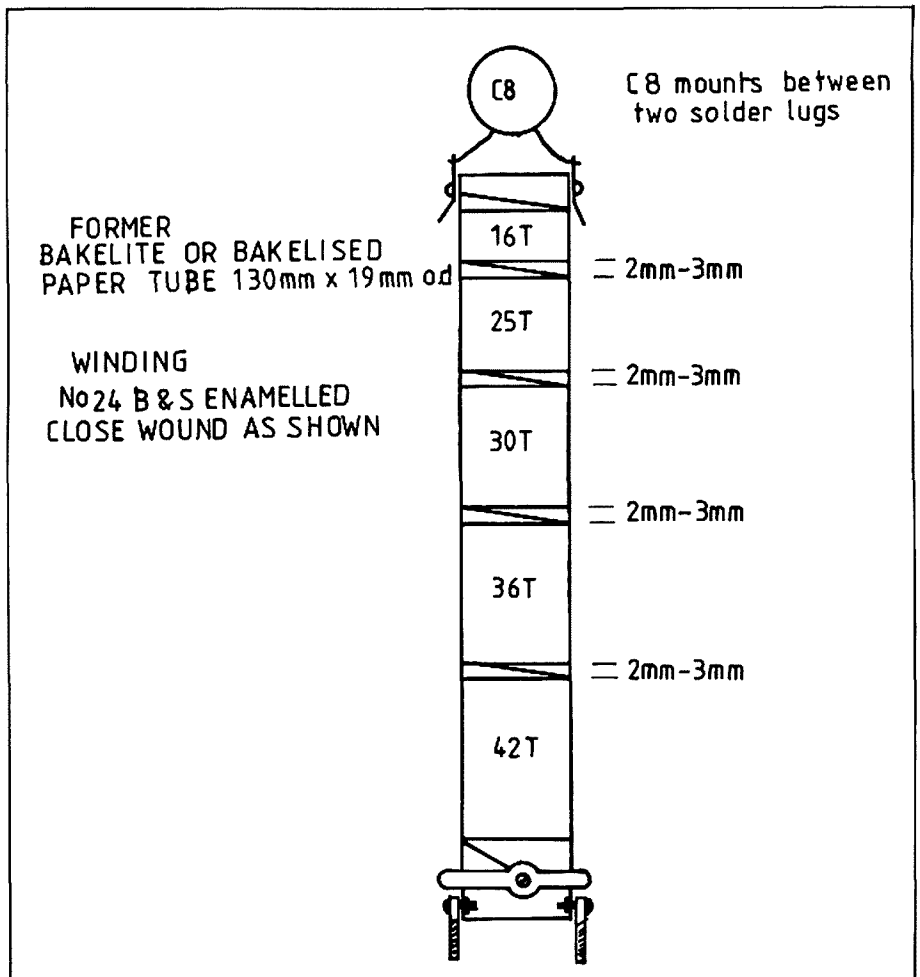

Figure 2 — Plate Choke, RFC 2.

THE FACTS OF LIFE

CONTACT WITH HIGH VOLTAGE CAN CAUSE SUDDEN DEATH, SEVERE BURNS OR SERIOUS INJURY.

AN AMATEUR INEXPERIENCED IN THIS TYPE OF WORK IS SERIOUSLY URGED TO ENLIST THE AID OF A FRIEND WITH THE NECESSARY EXPERTISE IN HIGH-VOLTAGE WORK BEFORE UNDERTAKING A PROJECT OF THIS NATURE.

The writer would like to express thanks to Drew VK3XU for the loan of reference material and the donation of some components, also to Ken VK3AH for the necessary encouragement and helpful suggestions on writing this article. Last, but not least, to a patient XYL.

PARTS LIST

R1, R2	560 ohm ½W
R3	3k 3W
R4	27k 2W
R5	10k 1W
R6	1k 1W
R7	10k ¼W
R8	175 ohm 4W (2 x 350R 2W w/w)
VR1	10k linear pot.
C1	680pF polystyrene 630V
C2	250pF mica (100 + 100 + 50)
C3, C5, C6, C17	0.01uF 630V disc ceramic
C13, C14, C15, C16	0.01uF 100V disc

C7, C12	0.01uF 1.4kV disc
C8	0.0022 6kV disc
C9	19/116pF transmitting type (ex TU10B tuning unit)
C10	400pF 5kV test (ex TU10B)*
C11	2-gang BC capacitor, 400pF per gang *NOTE: C10 may be omitted if a 1200pF gang is available.
C18	2500uF 50V
D1	Red LED ("Amp. in")
D2	Yellow LED ("Power on")
D3	1N4002 etc
D4-D7	4 x 1N4002 or 50V 1A bridge
D8	1N914/4148
D9, D10	1N4007
F1	3AG fuse 1A
F2	3AG fuse 500mA
L1	0.67 uH approx 6½ turns 18 B&S spaced over 10mm. Inside dia 12.5 mm. Aegis "2000" assembly suggested.
L2	9 turns 10 B&S, 50 mm dia, 50 mm long on ceramic former (ex TU10B)
M1	0-40 mA (grid current)
M2	0-500 mA (plate current)
M3	0-500 uA (relative power). Inexpensive VU type suitable here.
RFC1, RFC2	see text
RFC3	2.5 mH pie-wound valve type
RY1	12V SPDT
RY2	12V DPDT antenna change-over (or use 2 SPDT . . . if mounted apart, use 50 ohm co-ax interconnection)
S1	SPDT ("Power on")
S2	SPDT ("Amp in/out")
T1	Pri 240V, sec 5V + 6.3V (old valve receiver type)
T2	Pri 240V, sec 7.5V 5A (home-rewound)
Z1	3½ turns 14 B&S enamelled on 100 ohm 2W resistor. Winding dia 12.5 mm; length 32 mm.

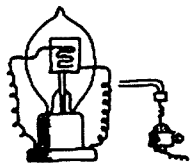
Noel Fredricks
Harold Brown
Arthur Simms
John E. C. Heaver
Gilbert Savill

This photograph is a reproduction of a class of radio students at Mount Gambier High School in 1928-29. The class used the call sign OA5GH on 200 metres. Would this be the first school to conduct such teachings? An enlargement of this photo has been given to the Mount Gambier Radio Club (SERG) by John Heaver VK3VNQ/VK3XEH, one of the students in the class.



From Wireless Telegraphy To Amateur Radio

Ian Archibald VK2KU
15 Elizabeth Drive, Noraville, NSW. 2263

This is a personal history of my long association with the most intriguing of all hobbies. From the first letter of permission and a call sign of OA2EA to my current VK2KU call sign it has given me pleasure, some feeling of achievement, and friendship with other enthusiasts all over the world.

As not a great deal is known of those early days some sixty years ago when experiments were made with spark coils and loose-couplers, I will try to go into some detail as I remember it.

With the wealth of information on electronics available today it is hard to realise the difficulties the pioneer faced in his early experiments with "wireless". Apart from an elementary knowledge of the simpler laws of direct current, alternating current was a closed book. This was a world of horse drawn vehicles and bullock teams. As I rode to school the 26 km from my home near Tingha to High School in Inverell on my "one-lunger" — the type you pushed to start and then leapt on — I would pass waggons loaded with tin oxide, drawn by a team of perhaps thirty draught horses on their way from Tingha to the rail head in Inverell.

As there was no local supplier of the various bits and pieces the experimenter today finds so readily available our inductances had to be tuned by altering the number of turns in a coil. The rotary air spaced variable condenser was probably available to research laboratories but were practically unknown to the experimenter. This led to the design of the loose-coupler, a rather clumsy device but quite effective in a receiver. For tuning the transmitter where very high voltages were generated by a spark coil however it would require much modification. My attempts to make a tuning condenser for this purpose were not very successful!

INTERESTING TO COMMUNICATE BY WIRELESS

In 1919 I was 17 years old and my family lived in the country near Tingha. At that time Tingha was a big producer of tin oxide (cassiterite). Dredges and sluicing plants mined the aluvial flats and creek beds and the deep lead mines had extensive underground workings. My father was a Mining Engineer and managed a number of dredges and open-cut mines. I spent a good deal of my weekends and holidays in the engineering maintenance workshop.

At this time I was a 4th Year student at Inverell High School and rode a motor bike from home to school each day. Our science master, Mr H A Warden was an excellent teacher with many interests. My close association with him during the five year course for the Leaving Certificate gave me a good grounding in inorganic chemistry and it was early in my 4th year he suggested to me that it might be quite interesting if we could communicate by wireless telegraphy between his home in Inverell and mine near Tingha.

Before World War I Warden was teaching at the western town of Narrabri where he had built and operated an experimental wireless station. Now that conditions following the war were gradually returning to normal he was keen to resume experiments in wireless telegraphy. He explained to me that I would have to get permission from the authorities and that it might be difficult to find a source of supply of the various components I would need. He would give me sketches and diagrams and as much of the little known available information that he had. I am sure he could not have guessed that he was starting me on a lifetime enterprise for which I have always felt grateful.

PERMISSION RECEIVED

I sent a letter to the PMG's Department seeking permission to carry out experiments in wireless telegraphy. I was surprised to receive a reply from the Royal Navy stationed on Garden Island giving me authority to carry out these experiments. A short time after this I was notified by the PMG that I had been issued with the call sign of OA2EA.

WE SUPPLY ANYTHING

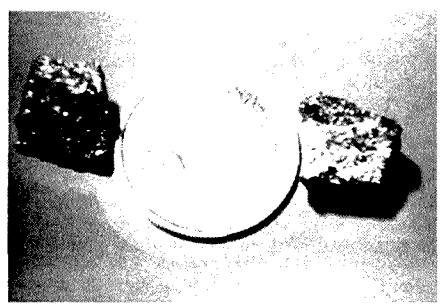
To get started on construction now called for the purchase of equipment and where to buy it at that time presented rather a problem. A study of Anthony Hordern's country catalogue, a large book about 51 mm thick conveyed the message that they could supply anything! An order posted to them for equipment confirmed their claim. When the parcels arrived by post they contained all the items I had ordered.

I now had a Western Electric headset with high resistance phones, a telegraph key, a buzzer with a couple of dry cell batteries, several reels of copper wire of different gauges with green silk insulation to enhance the appearance of the final job, several pounds weight of 34 gauge enamel cotton covered wire for the spark coil secondary and enough 22 gauge soft iron wire to make the core. In addition there were sheets of tin foil and waxed paper, paraffin wax, orange shellac and a good assortment of brass terminals.

SOUND, ATTRACTIVE PIECE OF EQUIPMENT

The loose-coupler was now the first unit to be made. Warden had suggested that I should take the time to make a sound and attractive piece of equipment as it would probably receive critical inspection from interested visitors. With this in mind I prepared a piece of red cedar by sanding and polishing it for the base and coil supports. Cardboard formers were used, the primary about 114 mm diameter by 127 mm long and the shorter secondary former a bit smaller in diameter so that it could slide easily in the primary coil. The primary core was then close wound with 22 DSC wire over about 102 mm and the ends secured and brought out for terminals. Before mounting a narrow track was made by removing the insulation to take a brass slider for tuning.

The secondary core was fitted with wooden end pieces bored to fit over two thin brass rods on which it would slide into the primary. In addition the outer wooden end piece was fitted with a switch arm and three studs so that the winding could be tapped for tuning. This former was now close wound with the DSC 28 gauge wire and connections made to the switch studs. Flying leads were added to make connections to terminals on the base board.



Galena Crystals

To complete the receiver a holder was made for a small crystal of galena to be fitted with a "cat's whisker" and terminals for the phones were screwed to the baseboard. At a later date as a little "know-how" was acquired the galena-cat's whisker was replaced by a detector made by mounting crystals of zincite and bornite, the sulphides of zinc and copper, in small brass cups with Wood's metal. This made a very sensitive and stable detector.

NOW FOR AN ANTENNA

An antenna had now to be put up before the receiver could be tried out. A stringy bark pole about 9 metres long was put up in a corner of the backyard. A small pulley with a light rope was attached to hoist the end of the aerial. A copper wire was then run from the top of the mast to an insulator tied to a verandah post, thence to a butter box (a 304 mm cube) where several turns of the same wire were wound and thence to the loose-coupler primary. We had no information as to the wave lengths the commercial stations would be using but thought it would probably be in the 600 metre range. The idea behind the "butter box" coil was to increase the effective length of the antenna.

MORSE FOUND

An earth wire was run through a hole bored through the floor of the small verandah room. This wire was attached to the buried water pipe running from the tanks to the kitchen. With the aerial and earth wires attached to the receiver I was now ready to search for an incoming signal! After a good deal of time was spent in trying different settings of the loose-coupler and much fiddling with the cat's whisker a faint Morse signal was heard. With further alterations to the tuning of the loose-coupler, the reduction of the number of turns of wire on the "butter box", and some good fortune in finding and holding a sensitive spot on the galena crystal a strong Morse signal was received. My Morse at the time was not very good but I managed to read VIS and later a station with a different note, GBQ the Royal Navy station on Garden Island. This was very gratifying — the receiver was really working.

Before going on to the next project of transmitter and power supply I spent a good deal of time trying to improve my Morse. VIS seemed to transmit chiefly in plain English, GBQ in a five letter code, but both stations proved a wonderful source of good Morse for the beginner.

ON TO BETTER THINGS

The construction of the spark coil was fairly straight forward. Two pieces of board about 152 mm square and 13 mm thick with a 25 mm diameter hole in their centres were used to assemble the core and to give temporary support to the coil during construction. The soft iron wire was stretched to straighten it and cut into pieces about 254 mm long. After assembly with the wooden jig pieces kept flush with the ends the core was insulated with waxed paper and close wound with two layers of the 18 gauge insulated wire. The winding was secured, the wooden end pieces removed temporarily and the unit immersed in the paraffin impregnation pol.

After impregnation and cooling the wooden jig pieces were again fitted and the insulating tube between primary and secondary built up to a wall thickness of over 6 mm. In the first experimental coil made the insulation broke down between primary and secondary,

hence in this second attempt more care was taken to improve the insulation. Strips of brown paper were cut to fit neatly up to the end pieces. The paper was secured with cotton thread, the end jig pieces again removed and the unit immersed in the melted wax bath until no further air bubbles were seen. This method proved eventually to be quite successful.

The secondary of 34 gauge cotton enamel insulated copper wire was pie wound. The inner diameter allowed a smooth fit on the insulating tube, the pies were approximately 13 mm thick with an outside diameter of about 114 mm. The end pieces of the winding jig were slotted so that the pie winding could be secured with thread before removing from the jig for impregnation.

MAKE AND BREAK

The impregnated pies were assembled then on the insulated core with waxed paper interleavers so that the start of each winding could be brought out for ease in soldering. A polished cedar box had been made with the end pieces bored to support the core and to allow one end of the core which had been filed flat to slightly protrude. Before assembling in the box a condenser made from tin foil and cleaned photographic plates was fitted into the bottom of the box and leads brought out to shunt the make and break contacts of the primary winding. The make and break device or trembler used a clock spring armature with a soft iron disc rivetted to one end. The armature was also fitted with a heavy silver contact, and the adjusting screw also had a heavy silver contact.

Terminals were fitted to the top of the box for aerial and earth leads and to hold and allow easy adjustment of the spark gap. Terminals were also fitted to the end close to the vibrator for connecting the key and the battery leads. The spark coil was now ready for test.

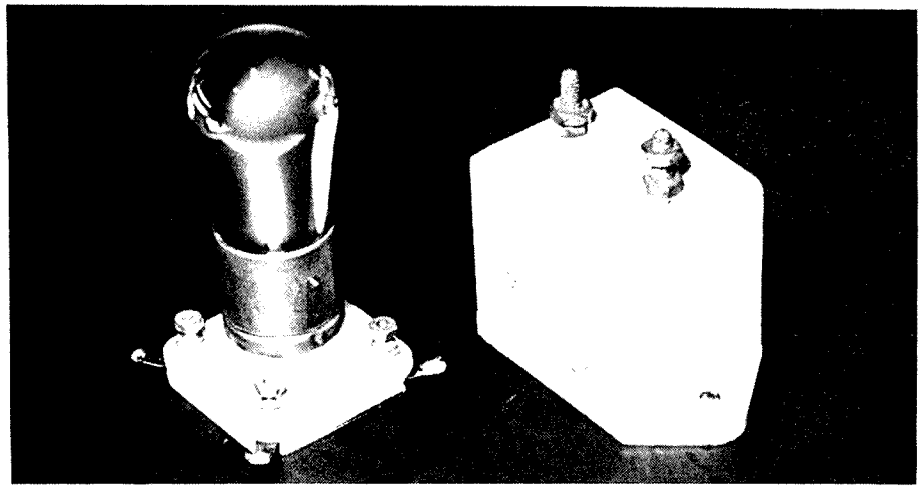
NO ELECTRICITY

Tingha at that time had no electric power service. Our home was lit by kerosene lamps. We used wood fires for cooking and heating. Tingha at nearly 914 metres above sea level could be very cold with occasional snowfalls. Firewood was in plentiful supply in the bush and the big log fires in the winter were very welcome.

Kerosene Lamps.

The primary battery power supply was made up from four wide mouth fruit preserving jars. These were fitted with wooden lids to support the electrodes and the lids were each bored with three holes to take the carbon arc rods and a centre hole for the zinc electrode. The zinc rods were cleaned and amalgamated and a simple lever system fitted to lift the zinc rods out of the electrolyte when not in use. The electrolyte was a saturated solution of sodium dichromate in dilute sulphuric acid. The battery was housed in a stout box with a carrying handle. It was rather messy and had to be handled with care.

The spark coil was now connected to the battery through the key and gave a hefty spark across the gap. Without a suitable meter I could only guess at the power input, as probably about two or three amps at about eight volts. By moving the receiver some distance away and listening to the coil output the burry note could be improved by reducing the spark gap and adjusting the vibrator. The resulting note was not unpleasant.



An early valve and ceramic block capacitor.

SPARK GAP PROBLEM

Tests were now carried out at arranged times to try to contact my friend in Inverell but our joint tests were unsuccessful. Warden believed we would not do much good until we could devise a method of tuning the output circuit of the spark coil transmitter. He had wound coils to separate the spark circuit from the antenna with inductive coupling, but attempts to make tuning condenser failed. The very high voltages generated by the spark coil perhaps of the order of some tens of thousands of volts, depending on the setting of the spark gap presented quite a problem.

I thought it would be interesting if I could determine the range of the transmitter. Mounting the receiver on the luggage carrier of the new motorbike which had replaced the old "one-lunger", and equipped with a coil of wire and an earthing spike, I was ready to try the idea. My brother, recently returned from the war, was not very interested in wireless experiments but offered to key the transmitter for five minutes every half hour until I returned. The results of this expedition were quite informative, though rather disappointing as regards distance covered by the transmitter. It appeared that the trees with their bushy tops absorbed or destroyed the signal. On top of a small hill across an open paddock the results were a little better, but it was found here that tuning the loose-coupler made no noticable difference to the strength of the received signal. This supported Mr Warden's theory about tuning the output circuit of the transmitter.

NEW TUBES

When I returned to school on Monday, Mr Warden was quite excited about possible new developments. He had received through the post from his friend in Sydney two of the new Expanse A vacuum tubes. He gave one of them to me and told me that he had also received a large amount of technical information on the uses of the new device. Already his vocabulary was changing, and as he spoke of continuous wave generators, of regenerative detectors, of A batteries and B batteries, I began to realise that the wireless experimenters' boundless enthusiasm was hurrying us along at a great rate. I think that at that time my youth and inexperience, like that of many others, could not forsee the enormous commercial possibilities of these new developments.

Warden was now mapping out a new programme for experiment but apart from simple tests of the new Expanse tube my time was limited. Final examinations were now approaching and as I was anxious to matriculate to Sydney University, and as my family would be moving to Sydney in a few months time, further experiments would have to wait for a while.

Although it was now obvious that the day of the loose-coupler, and the spark coil transmitter was finished I did not regret the time spent over the last eighteen months. I had acquired a grounding in wireless and could now transmit and receive Morse at about 15 words a minute. I looked forward to continuing experiments in the new home.

SPECIALIST SUPPLY SHOPS

In January 1922 my family moved to a new home in Sydney. The next three or four years were of tremendous interest to me. The meeting with new friends at University and with the rapidly growing fraternity of enthusiastic amateurs in the suburban area rekindled my own enthusiasm. The first Expanse A triode was soon replaced by a growing range of tubes. Specialist supply shops began to appear with the introduction of broadcasting and components became more readily available. Of particular help to the amateur experimenter was the publication of technical articles directed specifically to him in local and overseas journals. He was now learning something of the activity and rapid development of our hobby in Britain and the USA.

JAM JARS RECTIFY

By 1925 my station after many changes in its construction would have been fairly representative of the average amateur rig for working DX. A Reinartz type receiver and a TPTG transmitter. The transmitter used a single UX210 tube. It was powered from a home-brew transformer with about 400 volts each side of the centre tap, rectified by a string of jam jars with aluminium electrodes in a borax solution, and smoothed by two or three oil immersed 2mF condenser . This was adequate for CW.

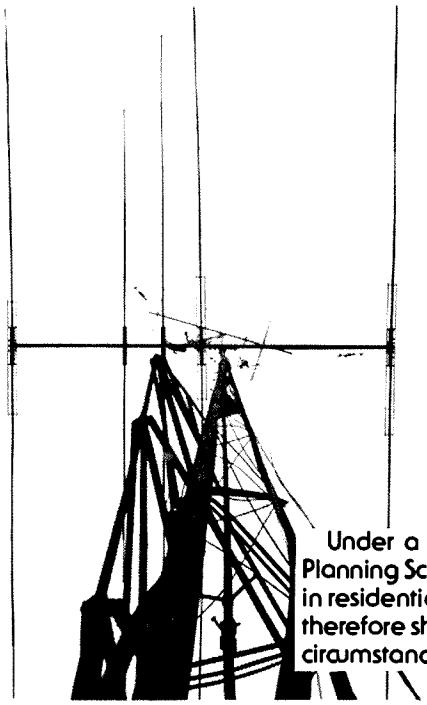
In 1928 I was notified by the Postmaster General's Department that I would have to sit for the AOPC examination. This brought me a very handsome document that I still treasure, numbered 457 and signed by J Malone, Chief Inspector, W T S Crawford, Radio Inspector, dated 8th November 1928 with my name inscribed in copperplate. On the back of the certificate is a photo of myself signed in the presence of W T S Crawford. The secrecy of those communications we might hear had to be observed.

Until the outbreak of WW2 amateur activity expanded with growing worldwide DX aided by the development of directional antennae. During the war the amateur gear had to be sealed in a box and aerials dismantled. After the war the great range of radio equipment offered to the public by the Disposals Departments helped many amateurs to get going again. From then to the present day the wonderful new technical developments in electronics have maintained or accelerated this technical revolution we now experience.

Today I enjoy a rag chew nearly every morning with some old (and some not so old) timers. Starting at 0030 on UHF we switch to the 7 MHz band at 0100 UTC and enjoy the company for an hour! The stalwarts of this session for many years have been my good friends Horrie VK2FA and Gordon VK2AVT. Many other amateurs and myself are always made welcome when we call in.

I am beginning to think that amateur radio must be a long life therapy — I turned 82 at my last birthday.

AR



Radio Masts — a minority of municipal councils, unhappy with losing appeals, wage war on Amateur Radio.

Alan Noble VK3BBM
VK3 FEDERAL COUNCILLOR

Under a recent amendment No 115, Part 3 (Radio Masts) to the Melbourne Metropolitan Planning Scheme (MMPS) a planning permit is now required for the erection of some radio masts in residential areas of the Melbourne Metropolitan Area. This article is about Town Planning and therefore should not be confused with the requirement to obtain a building permit in appropriate circumstances.

Building permits, required under the Victorian Building Regulations, use as their criteria engineering and safety factors.

In 1979 a move was made on behalf of a small number of municipal councils to reserve a situation in which their decisions to refuse building permits for radio masts were being over-ruled by Town Planning Appeals Tribunals.

The Melbourne Metropolitan Board of Works (MMBW) advertised a proposed amendment No 115, Part 3, to the MMPS.

This was designed to bring in the requirement of a planning permit for radio masts in residential areas.

A definition of a radio mast for entry into the MMPS was:

"Radio Mast used in connection with radio transmission or reception within a dwelling, means a mast which together with antenna;

a) Exceeds a height of 14 metres above the ground, or

b) When attached to a building, exceeds a height of 5 metres above the highest part of such building."

Some eleven objections, including eight out of Melbourne's fifty three municipalities, to the proposed definition were lodged, the main thrust being that the dimensions were too generous.

The MMBW accepted the substance of the objections and early in 1981 changed its amendment to read:

a) Exceeds a height of 8 metres above the ground,

b) When attached to a building, exceeds a height of 3 metres above the roof line, or

c) Has any horizontal dimensions in excess of 3 metres.

WIA LEARNS OF PROPOSED AMENDMENTS

The WIA Victorian Division became aware of the situation even though it had not been advised or consulted as an interested party by the MMBW.

The proposal was before the then Planning Minister, Lou Lieberman, for approval.

An immediate protest was made to the Minister by the WIA on behalf of the Amateur Radio Service (ARS).

Following considerable research a thirteen page document, 11 May 1981, was sent to the Minister.

This advised on the purpose, role, and organisation of the ARS, and the technical considerations regarding physical size and height of antennae.

It also summarised cases heard where individuals or businesses had appealed to the Town Planning Appeals Tribunal in the matter of radio masts.

Of the ten cases heard in the period 1971-78 only three concerned ARS installations.

Determination made by the Tribunal in the three cases are summarised:

1) Hobby, Amateur Radio Station. Forms part of normal use of house.

2) Hobby, Amateur Radio Station. Allowed on merits.

3) Allowed on grounds that no permit was required.

The Minister was advised that the MMBW proposals could effectively prevent any future radio amateur installations from using the international frequency allocations in the way envisaged by the International Telecommunications Union and the Department of Communications.

On 16 June 1981, the Institute again wrote to the Minister with two positive alternatives to the MMBW's advanced view.

The first was that the Minister should not refer to "Radio Mast" or "Antenna" in the MMPS as it relates to the residential zoning, and a hobby or domestic use. This was supported by:

a) Town Planning Appeals Tribunals Decisions.

b) The community needs to avail itself of modern technology.

c) The right to receive radio signals broadcast for public consumption including shortwave international broadcasts and television signals in a residence.

d) The right of a citizen to engage in normal activity (hobby or interest) in his own home to the fullest extent.

e) Where a technical subject is involved, Local Government officials or councillors do not have (or rarely have) the expertise to decide what is fair or equitable, necessary or unnecessary, in regard to antennae.

f) Cost to the community would be minimised in an area (ie; radio reception and transmission) which is already governed by federal acts and regulations of a national and international character, and the natural laws of physical science.

g) An Amateur Radio Station is an asset to the local community.

It also put to the Minister the dimension(s) should be such as to exempt the majority of masts used in the ARS and that a height of 20 metres above the ground or 6 metres above the roof line with no horizontal limitation be adopted.

In this context the Institute had in mind these dimensions would include the rotatable antenna mounting pipe above the mast proper.

It was difficult to obtain from any source what exactly the MMBW considered to be mast, and what was not.

As a result of the Institute's submissions to the Minister, WIA representatives attended a meeting on 17 June, chaired by the Chief Planner, Department of Planning, to discuss the proposed amendment.

Others present were representatives of the Department of Communications, CB operators, TV Electronic Technicians Institute, TV Electronics Servicemen's Association, Antenna Manufacturing Industry, and Local Government.

At this meeting it was proposed that *"A self-regulatory approach"* to the siting of radio masts *"may be an acceptable means of ensuring that the sometimes adverse impact of radio masts is reduced."*

On 24 August the Minister wrote to the Institute:

"... to determine whether you would be prepared to take a lead role in developing guidelines which would be available to all those persons seeking to erect antennas on their properties. In view of the large amount of public interest in this issue at Local Government level I have written to the Municipal Association of Victoria (MAV) to determine if that association would be prepared to nominate representatives to work with your organisation in developing non-statutory guidelines. Should the organisation agree to participate it would be my intention to not proceed with the amendment on the assurance that acceptable guidelines are prepared, published and made available to all those wishing to participate in radio operations."

The Minister's invitation was immediately accepted.

In the following weeks the Institute sought talks with the MAV to no avail.

Having no success on a number of occasions to get the MAV to the conference table, the Institute contacted Mr D Daines, Chief Planner of the Department of Planning.

He arranged and chaired a meeting on 5 November 1981 with MAV representatives, the MAV Policy Planning Committee, City of Heidelberg, and the WIA.

The MAV took the view that the WIA should prepare the guidelines and submit them together with substantial argument to enable them to be sold to municipal councils.

It appears that the MAV was not prepared to do any of the development work toward the guidelines and had thrown the ball to the WIA.

Indeed it was to be seen later that the enthusiasm for non-statutory guidelines was hardly brimming over in the halls of the MAV.

The Institute agreed to do what it could but was in a difficult position in regard to resources to do the job. Another problem was that we had no idea of how much was understood of amateur radio by people in the MAV or municipal councils generally. Had they seen the submission to the minister or not?

It was decided that any document to the MAV had to assume no knowledge of amateur radio and it should again start from scratch. Accordingly a document *"A contribution to the development of non-statutory guidelines for the erection of masts in metropolitan residential areas"* was despatched to the MAV in March 1982. Discussion was sought to further develop the concepts presented.

The paper proposed that

— *A height of 20 metres subject to certain conditions of mast design and space availability.*

— *Masts of triangular, square or rectangular cross section having a dimension on any side in excess of 50 centimetres measured at a height of 3 metres above the ground and being of self-supporting or guyed construction could be subject to consideration by the planning authority as to its effects on 'the amenity of the area',*

— *Masts of smaller dimensions than those above should be exempt from planning control.*

The MAV arranged to meet the Institute on 6 May 1982 to discuss the WIA paper. At the meeting the Institute representatives were asked a number of questions relating to its ability to enforce a self-regulating scheme. It was apparent that the MAV was not or did not want to be impressed by the record of self-regulation in the amateur service. Questions on the number of licences issued in Victoria and the number of Institute members were asked. There was no in-depth exchange of views on the proposals put forward by the Institute and no contributions were put by the MAV.

It was the view of the WIA representatives at the time that we had wasted a lot of labour and breath. This seemed to be confirmed when a letter dated 17 June 1982 was received from the MAV in the following terms —

"The planning policy committee finalised its position on the matter and decided to make the following recommendations . . .

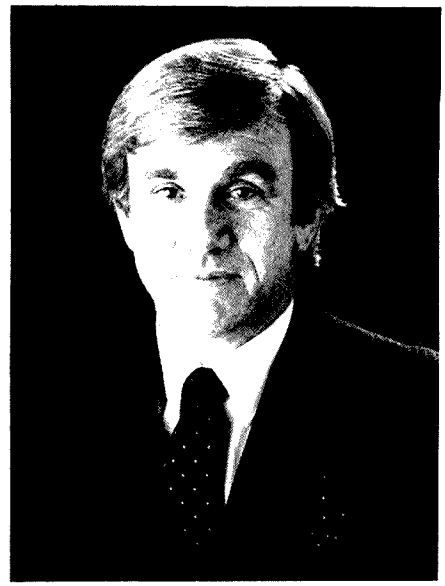
1. That the Association not support the introduction of self-regulation by the WIA, because such an approach would not provide a sufficient and enforceable system for the amenity protection of the community as a whole, particularly as the level of membership of the WIA is not sufficiently high to enable the Institute to effectively enforce the compliance of all residence-based amateur (hobby) radio operators, with self-regulations, it being noted that WIA membership in Victoria constitutes only 48-55 percent of the total number of amateur operators . . .".

It continued with a number of other recommendations which effectively threw the ball to the Department of Planning.

Even though the MAV had used incorrect statistics in coming to its conclusion on the percentage membership of the WIA (the MAV had used members against licences instead of taking members against licencees with allowance for multiple licensed operators). It did raise a significant point in that from an outsiders view even 67 percent membership (about the correct figure at the time) is not over-impressive and most certainly would not have changed their opinion. It is however something to contemplate as to what might have been the attitude had the institute been able to claim 95-100 percent membership.

The Victorian Government changed in April 1982 and a new minister for planning, Mr Evan Walker. The planning department reported to Mr Walker in August 1982 and recommended that the amendment as previously proposed by the MMBW be adopted.

The minister's response was that the issue be referred to the Natural Resources and Environment



Mr Evan Walker

Committee of the State Parliament, for investigation and report.

On the 7 December 1982, the committee was directed by His Excellency the Governor in council:

"To inquire into, consider and report to Parliament by 30 June 1983, whether the environmental impact of larger radio masts throughout the metropolitan area is of a degree of significance sufficient to justify municipal control over the appearance of such masts in residential areas."

The first problem was the answer to the question *'what is a larger radio mast'*? secondly what constitutes *'environmental impact'*? There was no definitive answer available from the inquiry committee, the Department of Planning or the MMBW. *Had we spent the last two years working, talking, and writing submissions to people who could not now say precisely what they were on about?*

So again the Institute was faced with the task of informing a new group of people about amateur radio and some of the simpler aspects of radio propagation and antenna technology.

There were 612 submissions to the inquiry, the majority being pro-forma letters from radio amateurs. a number of detailed submissions were also received from interested amateurs. The Institute's submission ran to 15 pages plus 19 pages of appendices. (That submission is reprinted in full in the report of the committee of inquiry, dated September 1983, and available from the Victorian Division).

The Committee held a public hearing on 20 May 1983 at Parliament House. The Institute was represented by Alan Noble VK3BBM, Jim Linton VK3PC and Jack O'Shannassy VK3SP.

In September 1983 the inquiry presented its report to parliament and recommended that the MMPS be amended to define "radio mast" as *"radio mast used in conjunction with the transmission or receipt of wireless, telegraphy or television means a mast which together with antennae —*

a) has any horizontal distance in excess of 3 metres, or

b) when attached to a building, exceeds a height of 5 metres above the roof line, or

c) when not attached to a building exceeds a height of 14 metres above the ground."

"Antennae are to be defined as rigid elements attached to the radio mast or rotating boom supported by the radio mast. This definition does not include flexible wires or cables."

The committee also suggested each municipality in the Melbourne metropolitan area be requested to establish guidelines for the approval of permits for larger radio masts.

The Institute viewed these proposals with deep concern. It was apparent little of what we had submitted received much attention, although it was evident the committee had recognised that 14 metres and 5 metres were more reasonable than the 8 and 3 metre height dimensions recommended by the MMBW.

The WIA requested a meeting with the minister, Mr Walker to discuss its concerns. A meeting took place in April. Mr Walker who had been due to tell Parliament what he intended to do, sought leave of Parliament to extend his deliberation.

At the end of July 1984, having heard nothing further, the Institute contacted the Department of Planning to find out any developments. The Departments view had not been firmed up at this time.

The Institute was aware of the concern in other places that it had not responded to the report of the Committee of Inquiry now before the Parliament. It was borne in mind that similar submissions had now been made three times to different areas of authority. It appeared as if none of them had been taken very seriously.

At the beginning of October 1984, the Institute received a telephone call indicating that the Department of Planning had reached a position on its advice for the minister and an invitation was received to have discussion.

At a meeting some two days later it was plain that we were not to be informed of the content of that advice, but it was put to us that our main concern was in the area of the horizontal dimension limitation proposed. The Institute's reply indicated concern at a number of proposals out of the inquiry including that mentioned. There was a request made that the Institute state its concerns in writing within a few days.

A letter from the Divisional council was sent on the 11th October. It said that:

The Institute viewed the Report as being ill-conceived, serving neither the cause of intelligent planning in the community nor the interests of those who would be the major target of the proposed controls — the members of the Amateur Radio Service.

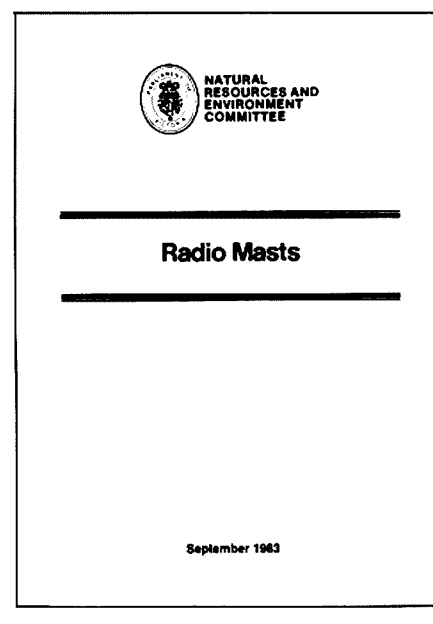
This view was formed from the following observations of the Reports as printed:

There was no conclusive evidence on which to reach a conclusion that planning control over radio masts is justified;

The Report showed clearly those in favour of planning control are in the minority;

The Report also showed the minority of individuals and municipalities in favour of controls has failed to make out a substantial case;

There appeared to have been assumption, that because there had been a public inquiry, planning control was the logical outcome. This Institute disagreed. The alternative of no planning control had



not been seriously considered;
Statistics quoted in this Report had been used with gay abandon. Figures had been used out of context, "imagined" and abused.
The Minister for Planning and Environment submitted his report to the Legislative Assembly on the 24th October 1984.

In regard to his proposed action the Minister said:
PROPOSED ACTION
I have given consideration to the Committee's recommendations and to the various arguments put forward in the statutory processing of the amendment and I now proposed to recommend Governor in Council approval of Amendment No 115, Part 3 to the following general effect:
A Radio mast is a mast which, together with antenna:
(i) exceeds a height of 14m above the ground;
(ii) when attached to a building, exceeds a height of 5m above the roof line;
(iii) has any horizontal distance in excess of 6m; or
(iv) has a structure, not including antennae, exceeding 50cm in width at any point in excess of 3m above ground level.

In coming to my recommendation I have of course noted the reference in the Committee's recommendation to television reception. The concept of planning control over masts for domestic television reception is one that has not been canvassed in the statutory processing of Amendment No 115 and as such should not be considered in the absence of public debate on its planning merits. I propose therefore to raise this aspect of the Committee's recommendation with the Board of Works and to exclude domestic television reception from the operation of the amendment.

The other point to be noted is that I am of the view that a horizontal dimension of up to 6m would be reasonable, in amenity terms, rather than the 3m recommended by the Committee.

By way of technical consideration I am advised that the radio masts of Citizen Band operators do not normally exceed 6m in width.
Radio Mast is to be subject to planning permit, generally in accordance with the Committee's Recommendation, *subject to consequential amendments to zones* not referred to by the Committee.

In addition, I support the general thrust of Committee Recommendation, (3) and will be pursuing this Recommendation with the Board of Works and municipal Councils.

WHAT NOW?

Although we did not win exemption from planning control for the most commonly used mast and antenna configuration, at least some satisfaction can be taken from the fact we are not limited to the much more stringent dimensions as proposed by the MMBW in 1981.

Those municipalities who consider a height of 14 metres to be too generous in 1979 may take action in the future to whittle away the dimensions now decided. If the Minister proceeds with the proposal that each municipality should draw up its own guidelines for radio masts we could have some fifty three different sets of rules in the Melbourne Metropolitan area.

It will be interesting to note the attitudes of municipal councils toward applications for masts, particularly with a view to the involvement of radio amateurs described by the Victorian Bushfire Review Committee as a 'Valuable Community Resource', in Municipal Disaster Plans and Regional Disaster plans now being drawn up to protect the people of Victoria in times of danger to life and property.

ACKNOWLEDGEMENTS

The author of this article wishes to acknowledge the contributions, advice and active assistance so willingly and freely given over the last four years in the protection of the interests of amateur radio. VK3KKA, VK3YIP, VK3DBB, VK3AFQ, VK3GG, VK3BCY, VK3SP, VK3DES, VK3PC, VK3BYA, VK3KI, VK3KP, VK3XV, WIA Federal Councillors in other states who have kindly kept me aware of mast related developments in their states and all amateurs who submitted letters to the inquiry.

The issue of radio masts has the WIA's continued attention.

TURN INDICATORS ON HOLDEN CAMIRA AFFECTED BY RF FROM 2 METRE TRANSMISSIONS

Rodney Champness VK3UG
31 Helms Court, Benalla, Vic. 3672

A friend and I both have Holden Camiras and both of us have trouble with the turn indicators malfunctioning if transmissions are made whilst the indicators are on. To overcome the trouble place 2-0.001uF ceramic capacitors, one on the 12 volt DC line to the Bosch flasher unit and the other on the indicator out line, in both cases the other terminal goes to earth. The indicator flasher unit is dismantled by prising the plastic cover off and the capacitors are soldered directly to the three spade terminals just inside the plastic case. They are a tight fit but, with care, fit quite comfortably.

The flasher unit is located on the fire wall directly behind the instrument binnacle. To get at it, it is necessary to remove the escutcheon around the instrument panel, taking care not to break the rear window demister on/off switch.

It is also necessary to disconnect the other two cables that terminate in dummy sockets on the left side of the instrument panel.

You may need to remove the plastic cover over the steering column, which will involve taking out several screws accessable from below the steering column. Next remove the shroud over the instruments, note that there is one screw at the back of the shroud accessable above the instruments.

Having removed this the instruments themselves have to be removed, and the screws to do this are readily accessable. The instruments may now be pulled forward and reaching behind remove the vacuum line to the economy gauge if fitted and remove the speedometer cable by squeezing the retaining clip to disengage it. Now the instruments can be withdrawn a bit further and the two multi pin sockets and cables can be unplugged and the instruments can be taken out of the way allowing access to the flasher unit.

Removing the instruments is by far the hardest part of the work. It is not difficult to ascertain which of the terminals are which on the flasher. When un-plugged a multimeter will show which terminal is which on the socket, and hence the flasher. As quite a few new cars have the electronic flashers fitted to them, the information above should be of use in suppressing flashers on other vehicles. I know that the Datsun Bluebird flashers are affected by RF and should be amenable to the same suppression techniques. The electronic flashers consist usually of an integrated circuit, a few resistors and capacitors, and a relay.

AR

"DX BEFORE DISHES!"

DX before dishes?
That's OK I suppose.
The dishes are always with us,
The DX comes and goes.

And though the dust is inches thick
That is a matter minor
When you hear, above the QRM
A YL voice from China!
Crumbs upon the carpet?
You can't vacuum the floor!
You might miss, above the cleaner's noise
A chat with Labrador.

What if you haven't made the beds,
Or if the kids are bawling?
These things are unimportant
If you hear San Felix calling!
What if the lawn needs mowing,
All the windows ceased to shine?
Who cares about those boring chores
When Svalbard's five by nine?
The OM's bent the tin-opener?
Well! Who can think of cooking,
When Africa is coming in
And round the bands you're looking.
BUT — If you do the dishes
(with one ear to the set)
Here's a bit of good advice
'Twould pay not to forget!
If you should hear some rare DX
Which everything surpasses;
Don't "drop what you are doing"
If you're washing crystal glasses!

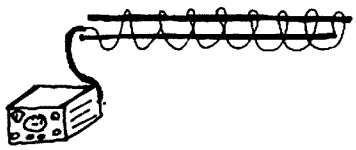
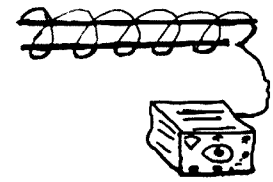
THE EFFECT OF GROUND REFLECTIONS ON CIRCULAR POLARISATION





David Robertson, VK5RN
10 Milan Street, Stirling, S.A. 5152

The effect of a flat earth upon vertically and horizontally polarised waves is dealt with in most antenna handbooks. An excellent treatment is given in the RSGB Radio Communication Handbook (12.15). Here the vertical polar diagrams for vertical and horizontal antennas over a perfectly conducting plane earth are given and the method of images is explained. This article deals with circular polarisation.

To calculate the vertical polar diagram of an antenna a distance H above a plane perfectly conducting earth, one replaces the earth with an image antenna a distance H below the ground. For a vertically polarised antenna, the image is in phase with the real antenna and for a horizontally polarised antenna, the phase of the image is reversed.

With circularly polarised waves the problem is not quite as simple. Electromagnetic waves consist of an Electric (E) field and a Magnetic (H) field, both normal to the direction of propagation and to one another. A vertically polarised wave has its E field vertical and its H field horizontal. A horizontally polarised wave has its E field horizontal and its H field vertical. A circularly polarised wave has its E and H fields perpendicular to one another, as before, but they both rotate once every RF period, the sense of the rotation being either right or left handed.

A circularly polarised wave can be considered as a horizontally polarised wave combined with a vertically polarised wave, the two waves being in phase quadrature. The question is, *what does a perfectly conducting flat earth do to these waves?*

is to refer to circularly polarised waves as circular.

Referring to figure 1 again, it can be seen that the direction of the resultant depends on which way the two counter rotating components were pointing at t = 0. In other words, the direction of the resulting plane polarisation, horizontal, vertical or slant depends upon the phase difference between the two circular components.

After all this, let's return to the problem of a circularly polarised antenna above a perfectly conducting flat earth. *What sort of image antenna should one use?* Well, we know that the phase of a horizontally polarised wave is reversed on reflection and that the phase of a vertically polarised one is not reversed. If one considers a circularly polarised wave as a combination of vertically and horizontally polarised waves, then phase reversal of one component relative to the other will cause the sense of the polarisation to reverse. That is to say, a right hand circularly polarised wave will become a left hand circularly polarised wave and vice versa.

In order to calculate the vertical polar diagram, one must therefore combine the fields of two counter

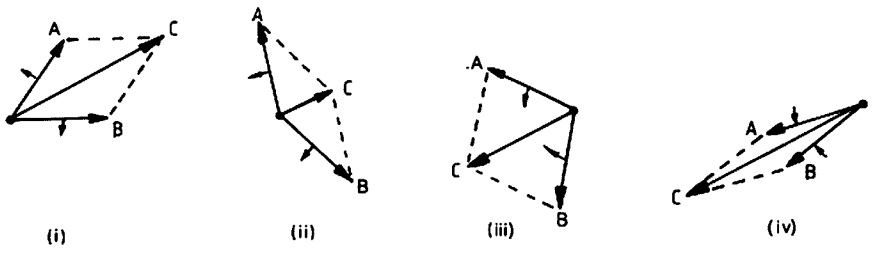


Figure 1 — Two counter rotating vectors, A and B, and their resultant C. Time increases from left to right.

Just as a circularly polarised wave can be regarded as a combination of plane waves, a plane wave can be regarded as a combination of two circularly polarised waves rotating in opposite directions. This is shown in figure 1, where the two E fields are represented as vectors rotating in opposite directions. To get the resultant of these two counter-rotating vectors one simply adds them. As can be seen in figure 1, the resultant vector oscillates back and forth without rotating. It is plane polarised. It should be said that the term plane polarised refers to the plane containing the E vector and the direction of propagation. To be consistent, one should call them linealy polarised if one

rotating circularly polarised antennas, a real one above ground and its Image an equal distance below ground. We have already seen that this combination gives rise to plane polarisation, the direction of polarisation being a function of the phase difference between the two circular components.

The vertical polar diagram of a circularly polarised antenna above earth is therefore uniform. The amplitude of the radiation field is independent of the angle of elevation. The resultant radiation is plane polarised and only the orientation of the plane of polarisation varies with the angle of elevation. *Unlike horizontally or vertically polarised antennas, there are no nulls.*

For angles of elevation that are larger than the vertical half beamwidth of the antenna, it is necessary to tilt the antenna and then the major lobe does not strike the earth. Under these circumstances there is no ground reflection and the antenna will deliver circularly polarised radiation.

All is not lost. At least there are no nulls in the vertical polar diagram. In this respect, a circularly polarised antenna is highly desirable. In fact, this property is probably more useful than the provision of circularly polarised radiation at a satellite. It would be nice to have no nulls and circular polarisation, but you can't have both without using very narrow band widths.

At wavelengths of 2 metres or 70 centimetres, extremely narrow beams are beyond the reach of most of us.

Slant polarisation turns out to be no better than vertical or horizontal polarisation. A mathematical analysis of circularly and slant polarised antennas above a perfectly conducting horizontal earth follows. *(It assumes a zero antenna elevation but the general conclusions apply for elevations of less than the vertical half beamwidth, a common situation. Oscar 10 often requires using elevation angles of 10° or less . . . Ed)*

MATHEMATICAL ANALYSIS

The electric field of a circularly polarised wave can be expressed as $E = Eo \exp(i\omega t)$
where Eo is the amplitude of the field, $\omega = 2\pi \times$ frequency, $i = \sqrt{-1}$, and t = time.

From here on, E_o will be set to the value of 1 and the field will be expressed as $E = \exp(iwt)$. This is a vector rotating anticlockwise once every RF period. (once every 1/f seconds).

Figure 2 shows an antenna with its image below ground. The wavefront from the image has to travel a distance EC more than the wavefront from the real antenna in order to reach a distant point P.

$BC = 2.H. \sin \theta$

Remembering that the image antenna is also circularly polarised, but in the opposite sense to the real one, and that its phase is also reversed, we can write the field at P as:-

$E = - \exp(-i\omega t) \exp(-ik\ (2\ H \sin \theta))$

The first negative sign gives the phase reversal of the horizontal component and the -iwt instead of iwt makes the sense of rotation clockwise instead of anticlockwise. The second exponential gives the extra phase shift of the wave from the image antenna due to the extra distance of travel BC.

$k = 2\pi/\lambda$ where λ = wavelength

The resultant field at P is the sum of the two fields

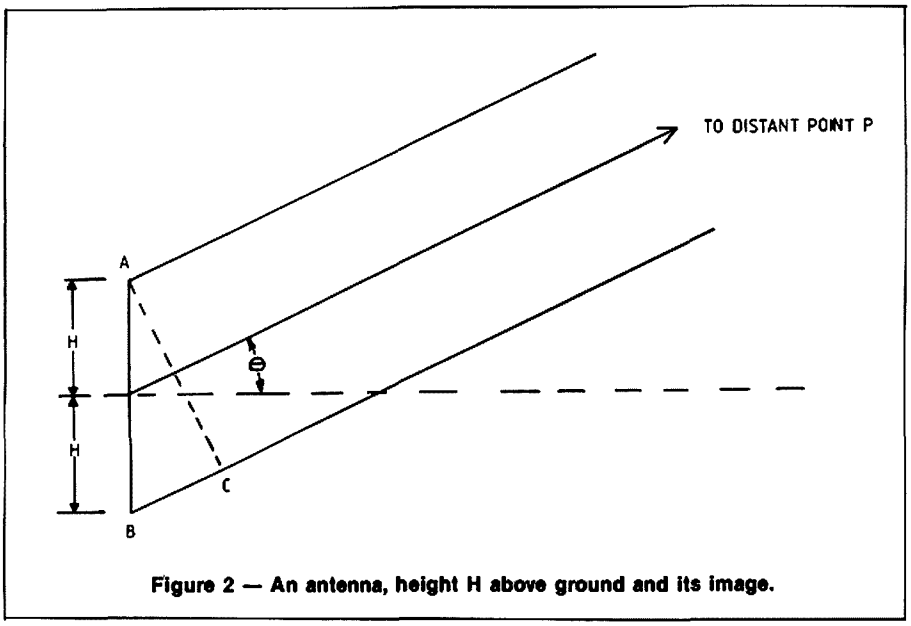

Figure 2 — An antenna, height H above ground and its image.

$E = \exp(i\omega t) - (\exp(-i\omega t))(\exp(-i\alpha))$
where $\alpha = 2.K.H.\sin\Theta$

It is now time to resolve the field at P into its real (horizontal) and imaginary (vertical) parts.

Using the identities

$\exp(i\omega t) = \cos\omega t + i\sin\omega t$
$\exp(-i\omega t) = \cos\omega t - i\sin\omega t$
$\exp(-i\alpha) = \cos\alpha - i\sin\alpha$

and making these substitutions,

$E = \cos\omega t(1 - \cos\alpha) + \sin\omega t.\sin\alpha + i\sin\omega t(1 + \cos\alpha) + i\cos\omega t.\sin\alpha$

Using standard trigonometrical formulae which can be found in trigonometry books and also on page 277 of the Radiotron Designers Handbook fourth edition, this can be reduced to

$E = 2[\sin(\alpha/2) + i\cos(\alpha/2)].\sin(\omega t + (\alpha/2))$

The component of E along the horizontal axis is:-

$2\sin(\alpha/2).\sin(\omega t + (\alpha/2))$

Its component along the vertical axis is:-

$2\cos(\alpha/2).\sin(\omega t + (\alpha/2))$

These two components are in phase with one another because both RF phase angles are the same and equal to $(\omega t + (\alpha/2))$.

The polarisation is therefore plane.

The amplitude is given by:-

$A = 2\sqrt{\sin^2(\alpha/2) + \cos^2(\alpha/2)} = 2$

We therefore have a plane polarised wave arriving at P with a constant amplitude that is independent of antenna height and the elevation angle.

The angle that this plane makes with the horizontal is given by:-

$\phi = \text{Arc Tan (imaginary/real)}$

$\phi = \text{Arc Tan}((\cos(\alpha/2))/(\sin(\alpha/2)) = \pi/2 - (\alpha/2)$ radians

At zero elevation, $\Theta = 0$, and $\alpha = 0$, $\phi = 90°$ and the polarisation is vertical.

When $\alpha/2 = \pi/2$, $\phi = 0$ and the polarisation is horizontal.

SLANT POLARISATION

For simplicity, let the antenna be slanted at an angle of 45°. This gives horizontal and vertical components of the same amplitude. Neglecting the $1/\sqrt{2}$ factor, the field can be written:-

$E = \cos\omega t + i\cos\omega t - \cos(\omega t - \alpha) + i\cos(\omega t - \alpha)$

The first two terms give the field the real antenna and the other two terms give the field from the image antenna.

With slant polarisation, the vertical and horizontal components are in phase with one another so that I have expressed the wt parts as cosine functions. Sine functions could have been used equally well. However, unlike the circular case, there is not a mixture of Sinwt and Coswt terms.

This equation can be expanded to:-

$E = [\cos\omega t(1 - \cos\alpha) - \sin\omega t.\sin\alpha] + i[\cos\omega t(1 + \cos\alpha) + \sin\omega t.\sin\alpha]$

The terms inside the first square bracket give the horizontal component of E and the terms in the second square bracket give the vertical component.

In general, the polarisation is elliptical. For a given value of α . the ellipse can be drawn by varying wt and plotting the real part of E along the horizontal axis and its imaginery part along the vertical axis.

When $\alpha = 0, 360, \ldots$ the polarisation is plane and vertical and when $\alpha = 180, 540, \ldots$ the polarisation is plane and horizontal. When $\alpha = 90, 450, \ldots$ the polarisation is left hand circular and when $\alpha = 270, 630, \ldots$ the polarisation is right hand circular. With other values of α the polarisation is elliptical. With increasing elevation angle, starting from O, the polarisation will vary as follows. Vertical, LH elliptical, LH circular, LH elliptical, horizontal, RH elliptical, RH circular, RH elliptical.

Vertical . . . For a slant angle of -45° change LH into RH and RH into LH.

The amplitude of the horizontal component of E is given by:-

$Ah = \sqrt{(1 - \cos\alpha)^2 + \sin^2\alpha}$

The amplitude of the vertical component is:-

$Av = \sqrt{(1 + \cos\alpha)^2 + \sin^2\alpha}$

The peak power is $Ah^2 + Av^2 = 4$

Power is therefore independent of the angle of elevation. The slant antenna shares this property with the circularly polarised antenna. If, however, the satellite borne antenna is circularly polarised, the slant antenna is a bad choice. This is because there are ranges of elevation angle for which the polarisation from the ground based antenna will be in the wrong sense. The sense alternates between left and right hand and crossed polarisation is equivalent to a null.

CONCLUSION

For satellite communications at low angles of elevation, circularly polarised ground based antennas are better than slant, vertical or horizontally polarised antennas when the satellite uses circular polarisation.

The reason for circularly polarised antennas being best is NOT for the commonly accepted reason that such antennas deliver matching circularly polarised waves to the satellite, but because they deliver constant amplitude plane polarisation at low elevation angles. There are no nulls in the vertical polar diagram.

At high elevation angles, circularly polarised antennas win again because, in the absence of ground reflections, they do deliver circular polarisation to the satellite antennas.

AR

SEARCH FOR ILLEGAL CHIPS

The Mitsubishi Electric Corporation is keen to trace a series of reject M5K4164ANP15 64k dynamic RAM chips illegally released onto the world market by a Japanese toy manufacturer.

The chips, which number around 500,000, failed to meet Mitsubishi Electric's stringent quality control requirements and were sold unbranded to the toy manufacturer, purportedly for a decorative application.

Sensing there was a quick dollar to be made, the company then had them overprinted with the Mitsubishi logo, and part number and resold them to several trading houses.

From that point, the chips have found their way around the world.

However, the problem for the ultimate end-users of the rejects is that they don't carry the usual guarantee because the chips weren't bought direct from Mitsubishi Electric.

According to Mr Jon Spence a spokesman for the Australian arm of the company, none of the rejects have yet been discovered in this country, and a large proportion have since been recovered in the United States and elsewhere.

He said that the chips could appear a little dirty from lengthy storage and carry 841809 and 842105 batch marks.

Anyone finding the chips should contact Jon Spence at Mitsubishi Electric Australia Pty Ltd, 73-75 Epping Road, North Ryde, NSW 2113, telephone (02) 888 5777.

THOUGHT FOR THE MONTH

Are you an active member, the kind who would be missed,
Or are you just content to have your name upon the list?
Do you attend the meetings and mingle with the flock,
Or do you stay at home most times, to criticize and mock?
Do you take an active part to help the work along,
Or are you satisfied to be the kind that just belong?
Do you ever volunteer to help to guide the stick,
Or leave the work to just a few, and talk about the clique?
Come to the meetings often and help with hand and heart,
Don't just be a member, but take an active part.
Think this over member, you know right from wrong,
Are you an active member, or do you just belong.

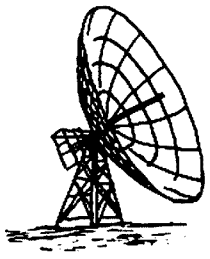
LOCATION OF GEOSTATIONARY SATELLITES

Harold Hepburn VK3AFQ
4 Elizabeth Street, Brighton East, Vic.



Some few years ago the writer had a passing professional interest in determining the "aiming" of antennae for use with geostationary satellites such as the proposed Aussat TV series. At that time computations were done using a pocket calculator — a rather time consuming process.

Recently a Commodore C-64 was acquired, primarily for its word processing capabilities since retirement had meant separation from "free" secretarial services. Somewhere along the line it was realised that a simple C-64 programme for determining the Azimuth, Elevation and Range of geostationary satellites might prove useful, especially if the proposals by AMSAT to put up a series of amateur "geostats" becomes a reality.

A printout of the programme finally developed is given at the end of this article and some comment on it may assist those who wish to alter or expand it.

Line 10 is the usual "name of file" line.
Line 11 clears the screen while Lines 12, 13, and 14 set the background, border and character colours. This particular colour combination happens to suit the writers monochrome monitor but it can easily be altered to suit the individual preferences of users with full colour facilities.
Lines 20-90 provide a heading which is suitably framed and centered for a 40 column display.
When the programme is RUN lines 110 and 115 ask users to enter their latitude with a reminder that southern latitudes must be negative (eg: Melbourne would require an entry of -38).
Lines 135 and 150 ask for the observers longitude with the prompt that the entry should be expressed in degs west.
Line 160 asks entry of the satellite position (also in degs west) while Line 180 asks for entry of the satellite name.
Line 190 establishes a value for Pi, which, together with Lines 200 and 210, convert the entered angles in degrees into angles expressed in radians. This transformation is necessary because the C-64 can only process radians, not degrees.
Lines 300, 310, 320 and 335 do the calculations to determine satellite azimuth and elevation (in radians — they will be transformed back to degrees later in the programme.)
Line 340 calculates the distance (Range) of the satellite in kilometres.
Lines 350 and 370 transform the angles in radians back into degrees.
Lines 400, 410 and 430 put the answers (rounded off to the nearest whole number) on to the screen.
If the answer to the elevation calculation is zero, or a negative quantity, the satellite is either right on the horizon or below it. Under these conditions the satellite is not accessible. Line 375 checks for that situation and, if the calculated elevation is less than a nominal 1 deg, the programme bypasses the normal printout and instead Line 580 puts the message "SATELLITE BELOW HORIZON" on to the screen. The CHR$(18) reverses out this message for further emphasis.

As already indicated, changes to colour combinations can be made to suit individual preferences. More importantly, the minimum elevation angle of 1 deg used in Line 375 needs a bit more consideration. Unless the observer is blessed with a hilltop, or otherwise totally unobstructed, site then anything below an elevation angle of between 5 and 10 degs may represent a more practical minimum. It is left to the user to decide what minimum angle is finally entered into Line 375.

Currently there are two geostationary satellites which can be seen from anywhere in Australia.

ATS1 is situate at 191.78 W and puts out programmes (mostly in English) on 136.46 and 137.35 MHz FM. Hearing this particular satellite should present no difficulty to anyone prepared to "tweak" a 2 metre converter down a bit. The second is a new Japanese weather satellite situate at 220 W. It operates about 2280 MHz. If you have the gear this one will be well within range.

There is a third, named SIRO which is situate at 295.65 W. It transmits weather information on 136.1376 and 136.1381 MHz, but its locations makes it inaccessible from the eastern seaboard. In Adelaide it is only 4 degs above the horizon but in Perth it's a very usable 25 degs up.

Current planning by AMSAT envisages three geostationary amateur satellites. If they are equally spaced at 120 degs round the equator, then at least one will be visible from anywhere in Australia and will always be at least 10 degs above the horizon.

It is hoped that this programme, even if its application is not immediately obvious, will in the future, solve the odd "where do I point my antenna?" problem.

Editor's Note:

For those who would like test data to check the operation of their programme, the following will be useful.

Satellite	*Aussat-3*	*ATS1*
Position	*160 E*	*191.78 W*
Azimuth	*335*	*324*
Elevation	*44*	*40*
Range	*37472*	*37740*

Both readings were made from 37S latitude and 145E longitude.

AR

COMPUTER HELP FOR DEAF CHILDREN

A computer programme that helps deaf children to read from an early age has been devised at Bristol University's School of Education in south-west England.

Known as Catch Up, the system consists of a concept keyboard pad, a BBC computer and VDU, and a print-out unit. Symbols similar to the Egyptian hieroglyphs representing nouns, verbs, etc, are stored in the computer memory. The child places an illustrated sheet on top of the concept keyboard and places a finger on the drawing of the object in which it is interested — for example a car. The symbol for a car then appears on the VDU screen. Later the word "car" is added and by association of symbols with words, the child learns to read.

Progressing from simple symbols, which can be animated to indicate motion — eg a man running to indicate the present tense of the verb to run — the child uses a question and answer sheet to form short sentences. Eventually it can compose short stories, based on symbols chosen from an illustrated sheet, and obtain a print-out. Corrections can also be made by the child.

COMPUTER TRAINING FOR SPINAL INJURIES PATIENTS

When you have lost the use of all your limbs through paralysis, life can seem bleak and hopeless.

But in Britain, a pioneering Government-backed training scheme is bringing optimism, and a sense of purpose, to victims of severe spinal injuries by equipping them for new home-based careers using computers.

In 1982, as part of a long term national 'Information Technology awareness' programme, Britain's Department of Trade and Industry launched its 'Concerned Technology' scheme.

This imaginative initiative — also backed by the UK Government's Manpower Services Commission — provides occupational therapy, and where possible "remote working" (home-centred paid employment), for disabled people.

Coincidentally, earlier the same year, the National Spinal Injuries Centre of the world-renowned Stoke Mandeville Hospital at Aylesbury, south-east England, had bought an Apple Two computer to enable a teenage patient to continue his examination studies. Before long, nine other spinal injury patients were taking part in computer instruction.

"At this point we were approached by the Department of Trade and Industry (DTI), to run a project as part of their 'Concerned Technology' initiative," explains Mr Michael Fountain, training officer at Stoke Mandeville. As a result, with 70,000 pounds funding from DTI, the National Spinal Injuries Centre expanded its workshop. Within two years, it was equipped with 11 personal computers — seven BBC machines (Acorn models used for a television instruction series), two 'Apples', and one each from IBM and 'Apricot'. This finance also enabled special computer-based training software to be developed.

Of the first 100 patients trained at the workshop, 52 were working on computers within one month of discharge from the unit. This included 38 tetraplegics — those paralysed in all four limbs. People with no movement below the neck were taught to operate computers by means of a mouthstick, while paraplegic patients — paralysed from the waist down — who had movements in their arms but not in their fingers, had two short sticks fastened to each arm to enable them to use a computer keyboard.

Among patients released from the Stoke Mandeville unit, 10 now work for pay in their own homes. One man does computer programming for British Petroleum, the company who employed him before his car accident. A former building apprentice runs an estimating service for builders and plumbers in his home locality. Another former patient helps her husband manage a public house, while also working 20 hours a week doing computerised accounting and word processing for neighbouring farmers.

HIGH SPEED PRODUCTION PROGRAMMERS ARE EASY TO OPERATE

A range of high speed production programmers designed to load programmes into EPROM chips with minimal operator skills are now available.

The P-9000 range consists of three models, each with similar programme capabilities but differing features and facilities, and can programme all single rail EPROMs up to 27512 size (64k x 8 Byte). High-speed programming algorithms have been included in the range to reduce the programming time of large EPROM devices by up to over 90 percent over the standard 50 ms pulse method.

The range has many features usually found in more expensive programmers, including menu driven function and device selection, label printing facilities, RS 232 serial interface providing up to 16 formats as standard with user selecting speeds up to 19.2k Baud, powerful editing commands, and fail-safe systems and device tests. UNINTERRUPTIBLE POWER SUPPLIES PROTECT ELECTRONIC EQUIPMENT

A continuous power supply and power protection unit from Britain provides electronic office systems, including computers and word processors, with uninterrupted power during a power cut and also protects sensitive equipment from mains interference or surges.

Installed between the mains and an electronic system, Powermaster solves the power cut problems by providing an uninterrupted supply for up to one and a half hours after power loss. This provides the operator with time to complete the work in progress and transfer the information from the machine's working memory to a disk.

In addition, Powermaster also eliminates supply line disturbances such as voltage spikes, power surges or frequency changes and provides a clean AC supply with regulated and stable voltage and frequency. It therefore provides protection against variations in mains voltage and unpredictable power loss which can cause memory wipe-outs in microcomputers, word processors and telex machines.

A feature of the Powermaster is that it provides a 'no-break' supply, as the current is drawn continuously from the internal batteries and there is no switching over from mains to standby capacity. With other devices there is a switchover and it is this switching action which can cause problems for computers.

Under normal conditions the Powermaster batteries are constantly recharged from the mains. This means, in effect, the connected equipment is totally isolated from the mains.

HAND-HELD MICROCOMPUTER FOR HAZARDOUS AREAS

The world's first truly hand-held microcomputer specially designed and fully certified to be safe for use in hazardous conditions in mines, paint stores, petrochemical installations and on oil-rigs, has been developed by the Scottish mining engineers Anderson Strathclyde of Glasgow.

The hand-held CS21 was designed over the past year to act as an electronic notepad, portable data capture unit, work study terminal, calculator, calendar, stopwatch and electronic tape recorder.

Although designed for the routine monitoring of the condition of underground machinery the number of possible applications is limited only by the imagination of the user. For instance a geological survey company in Australia is using a CS21 in the hot and dusty conditions of the outback.

As versatile as a desk-top computer, the CS21 measures about 200 x 100 mm, weighs less than 1 kg, and is capable of withstanding the rigorous environment of coalface conditions and meeting the safety standards for working in explosion-hazardous areas.

A membrane keyboard with "click effect" keys and two liquid crystal displays are housed in an ABS plastic case which is sealed completely from moisture and dirt. The keyboard has 31 keys providing 61 functions via a full set of alphanumeric keys and additional symbol/function keys.

There are two liquid crystal displays, one with two lines of 24 characters, the other with two lines of 16 characters. The latter normally defines the four "soft-key" functions but can be used for general display. For example, the top panel can display instructions for the operator while the lower panel shows information as it is entered.

The unit can be equipped with a maximum of 128 kilobytes of memory and can be programmed in computer assembly language to suit particular application: it can also be supplied with basic language to allow programmes to be written by the user.

A small auxiliary battery maintains the contents of the memory when the CS21 is switched off or if the main battery pack runs down or is removed.

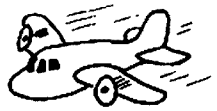
Around-the-World in Thirty Days



Graham Ratcliff VK5AGR
9 Homer Road, Clarence Park, SA 5034

The chain of events that led to on Around-the-World trip by Peter Frith VK7PF and myself began with a meeting in Cheltenham, England on the 15th of July 1984 when a paper, prepared by Jan King W3GEY, entitled 'AMSAT Phase 4 Concept' was first released. Ian Ashley ZL1AOX attended that meeting prior to travelling to Marburg, Germany to be endorsed by Karl Meizner DJ4ZC as a ground control station for AMSAT-Oscar10. On his return to New Zealand Ian passed on a copy of this paper to Irving Spackman ZL1MO the AMSAT Region 3 Scientific and Educational Co-ordinator.

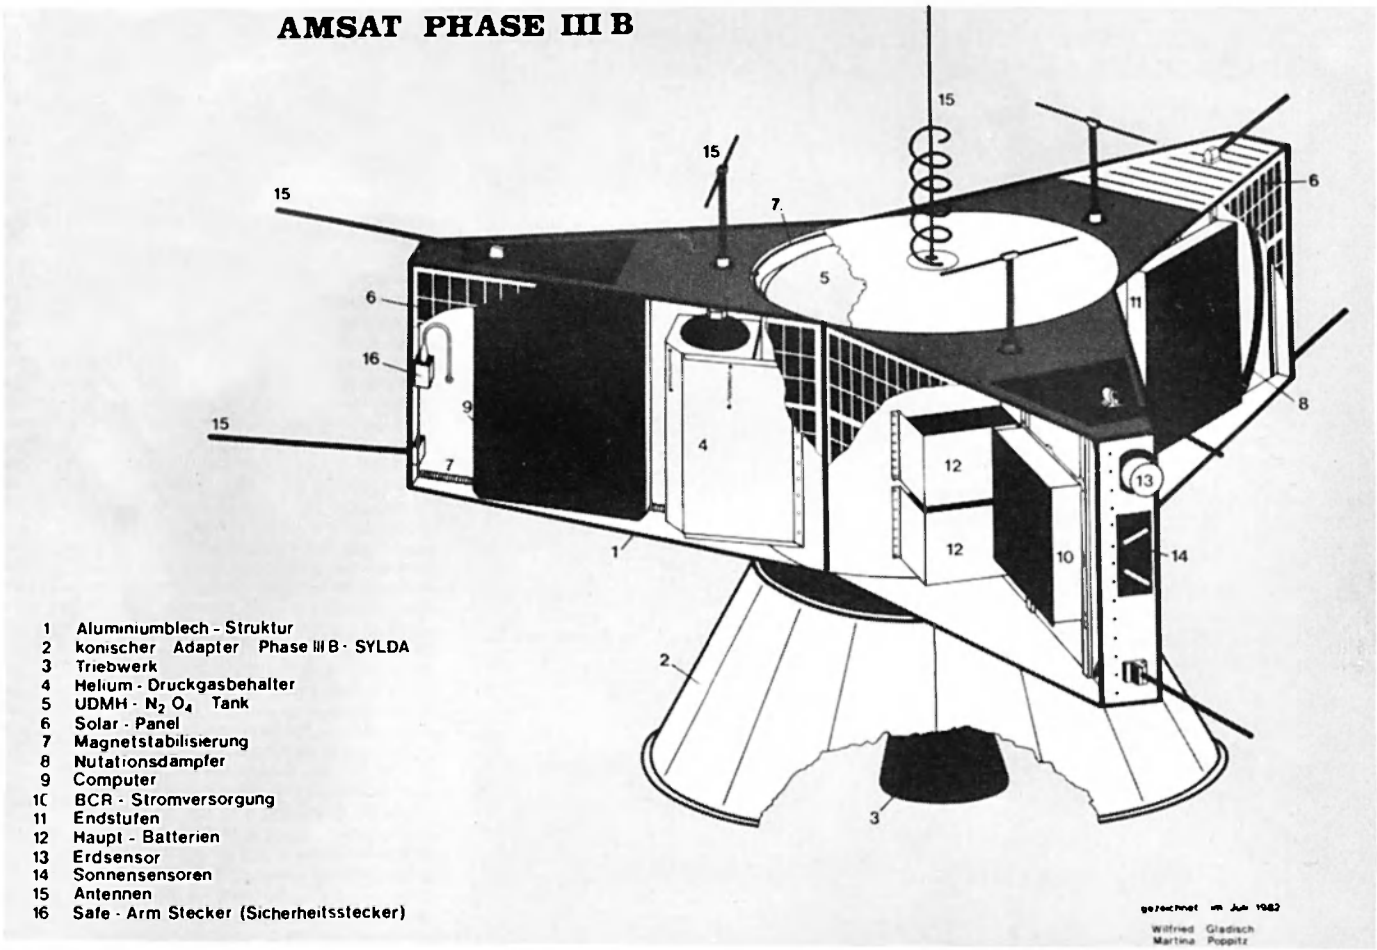
Irving was planning to visit Australia on his holidays in August so with the help of Alan Henessey VK2RX I arranged a meeting of AMSAT-Australia in Sydney and asked Irving if he would agree to be the guest speaker. Irving agreed and the meeting took place on the 15th of August at the Mandarin Club in the Haymarket area of Sydney. Twenty six interested individuals attended, 2 from VK1, 1 from VK5, 1 from VK7 and of course the remainder were from VK2. At the meeting Irving presented a general overview of amateur satellite activities in ZL and then gave an excellent presentation based on Jan King's paper. (A detailed description of the paper was published in the AMSAT-Australia column of the January 1985 issue of 'Amateur Radio'). Basically this proposed 'Phase 4' mission would effectively use the European Space Agencies (ESA) Ariane-4 launch vehicle (or a later launch) volume to place a constellation of a 6 satellites in geostationary orbit. If you take the trouble to read the above-mentioned article you will find that one of the suggested approaches to this project is that spacecraft #4 be co-ordinated by a group consisting of JAMSAT (Japan), AMSAT-NZ (NZART) and AMSAT-Australia (WIA). Another approach involved SA-AMSAT (South Africa), AMSAT-NZ and the WIA in the co-ordination of spacecraft #6. Although everyone at the AMSAT-Australia meeting was extremely excited about the concept, most wondered at what level of involvement Australian amateurs could have in such an ambitious project.

I approached the WIA Federal Executive to join the WIA as a member society of AMSAT, the Amateur Satellite Corporation with its headquarters in Washington in the United States. By the constitution of AMSAT any member society must be invited to nominate up to 2 nominees for the Board of Directors for which members vote just prior to the AGM which is held each year in November. As a result I was nominated for the 1984 elections. As in previous years a Technical Symposium was planned for the 1984 AGM, so I thought what better opportunity to find out what involvement Australia could have in the 'Phase 4' project than to attend the AGM and meet and discuss the project with the experts at the Technical Symposium/AGM.

The venue was the AMFAC Hotel in Los Angeles and on investigation of airfares I discovered that for $280 more than the return airfare to LA I could purchase an Around-the-World ticket. So after contacting Dr Martin Sweeting G3YJO (the leader of the group responsible for building and maintaining Oscars 9 and 11) at the University of Surrey in England and Dr Karl Meizner (the mastermind behind AMSAT-Oscar 10) in Germany I decided to take advantage of the Around-the-World ticket and visit both Martin and Karl. Unfortunately due to work commitments and financial restraints the trip would have to be completed within a 30 day period. The final step in arranging the trip was to see if any other amateur in Australia would be interested and willing to make such a personal financial commitment. Well Peter VK7PF agreed almost immediately to be travelling companion come technical adviser. One unexpected bonus but none-the-less most appreciated was a sponsorship of $750 from the WIA.

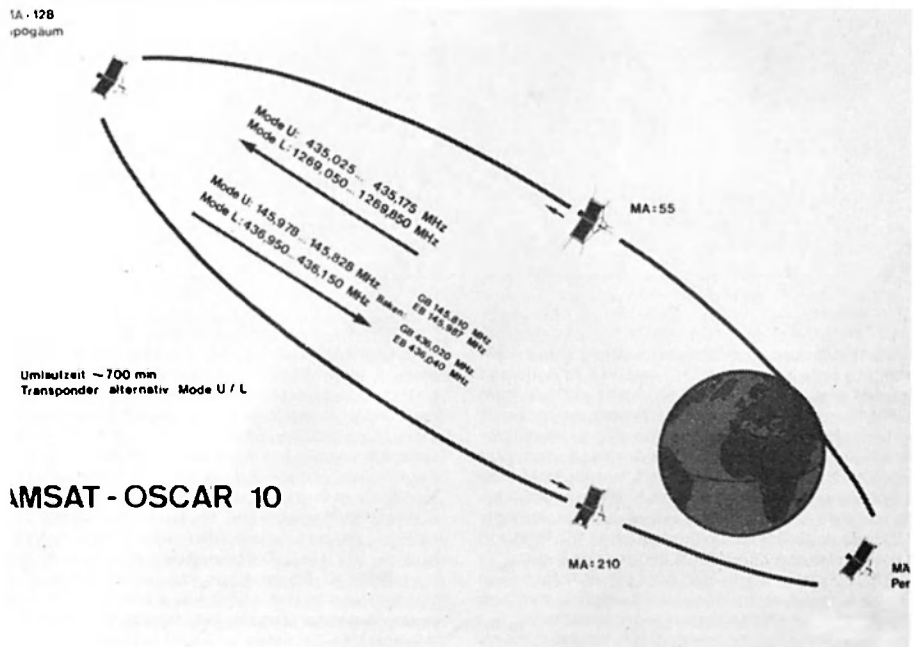
The first question most people will ask is whether or not the trip was worthwhile and the answer is an unqualified YES. Peter and I learnt an incredible amount of background information about amateur satellite activities in the past, present and well into the future. Our first stop was Los Angeles for the AMSAT Technical Symposium and the AGM.

The Technical Symposium commenced at 0900 and finished at 1700 with a break of one hour for lunch from 1200 to 1300. The first session was presented by Al Dayton KA4JFO, who described 'Advanced Gateway Concepts' whereby a group of amateur radio clubs and organisations would purchase a geosynchronous satellite, complete with several 'C' band transponders, and give access to the average amateur through numerous gateway stations. The gateways or teleports would serve large communities of amateurs using just a simple 2m FM handheld. Next, AMSAT Director Harry Yoneda JA1ANG presented a fascinating preview of the exciting JAS-1 satellite being built entirely in Japan by JARL and JAMSAT and scheduled for launch by NASDA, Japan's national space agency. The paper, written by JK1VXJ with technical assistance from JR1SWB, was translated and reported by JA1ANG. JAS-1 is due to be launched in February 1986 and will have two transponders, Mode JA anolog 2m up and 70cm down (same as Oscar 8's Mode J) and Mode JD that is a digital store and forward transponder utilising packet radio technology. Launched by the Japanese H-1 launcher (Japan's first experimental launcher), JAS-1 is expected to have a 1500km orbit with an inclination of 50 degrees. ARRL Technical Department Manager Paul Rinaldo W4ARI described progress in Amplitude Compandered SideBand (ACSB) techniques. Paul described initial experiments performed recently at ARRL HQ. He then explained Project Companion, a joint ARRL-AMSAT-Project OSCAR effort designed to encourage the use of the spectrum efficient ACSB technique on the amateur bands. Paul explained that by using special compression techniques, along with some other 'tricks', very substantial improvements in signal-to-noise ratio and intelligibility have been noted by land-mobile users of advanced ACSB radios. Tests performed by the Federal Communications Commission (FCC) both in the laboratory and the field, showed excellent results. Jim Eagleson WB6JNN and Paul Shuch N6TX showed several interesting graphs indicating quantitative improvements realisable with ACSB. Paul then played several taped QSOs dramatically showing the improvements of ACSB over conventional SSB. Jim pointed out that ACSB like FM had a pleasing quieting effect. He also showed some circuits he had developed for effective audio compression. Bob Diersing N5AHD followed with an excellent presentation on 'Computers and the Satellites'. Bob focused on the systems he has developed to track and decode the telemetry from the UoSAT satellites. After lunch a group from the World Space Foundation spoke on the Solar Sail Project. Introduced by AMSAT's John Champa K8OCL, were foundation president Robert Staehle, as well as Mark Bergham and Chauncey Uphoff. Each explained a different aspect of the Solar Sail Project including its history, purpose, initial tests, programme outline and some of the options that would rely on amateur radio for telemetry and communications. One would have the Solar Sail in a nearly geosynchronous orbit or alternatively in a lunar orbit. K8OCL explained the agreement between AMSAT and the World Space Foundation to explore means of co-operation in future projects. The next group presented a review of the latest happenings and progress on the PACSAT project. Speakers included Harold Price NK6K, Wally Lindstruth WA6PJR, Rick Fleeter WA8VGK, and Phil Karn KA9Q. Harold, PACSAT Project Manager, narrated a slide presentation that was (as is customary for NK6K) both entertaining and informative. WA6JPR described some of the experiments that he and others are performing in California. Fleeter discussed some of the propulsion motors being considered for PACSAT. This is an especially important aspect of PACSAT engineering since the anticipated Shuttle launch will be too low for PACSAT, it will need to be boosted up by several hundred kilometres. Phil Karn KA9Q, described progress on advanced modems and solicited help in designing PSK modems that will resist the anticipated radar interference the satellite is expected to encounter when in orbit. Martin Sweeting G3YJO, UoSAT Programme Manager, next summarised the status of both UoSAT-Oscars 9 and 11. He said that both spacecraft were behaving well and that UO-11 had been well stabilised, resulting in better link performance. A brief slide presentation showed the preparations that led to the launch of UO-11 last March. Tom Clark W3IWI, explained some of the economic factors that determine what projects can be built and what expenses AMSAT absorbs in order to keep the organisation running. Tom pointed out especially the cost of publications in terms of its proportion to the overall budget. Tom said that in round numbers AMSAT spends $250,000 annually, for all purposes. Bill Tynan W3XO, gave a progress report on future 'Ham-In-Space' activities. Bill noted that approval of the joint ARRL-AMSAT proposal for W0ORE to fly a suite of amateur radio equipment was thought to be imminent. Among equipment expected to be approved, according to W3XO, was a 2m scanning receiver, 2m to 10m scanning repeater, slow-scan television (SSTV) with a 10m downlink and other features. Bill said it appeared everything was in order for a 1985 flight of W0ORE but the exact date of Shuttle flight was not fixed at that time. Closing the technical programme, Vern "Rip" Riportella WA2LQQ spoke of future advanced satellite projects. Rip claimed that an appraisal of amateur radio indicates that the time maybe right to begin serious consideration of a system of geosynchronous amateur satellites for continuous global coverage. He cited some of the basic Phase 4 conceptual work recently completed by W3GEY (who was unable to attend) as well as the so-called gateway concept, examined earlier by KA4JFO and others. I have only summarised the topics discussed during the Technical Symposium

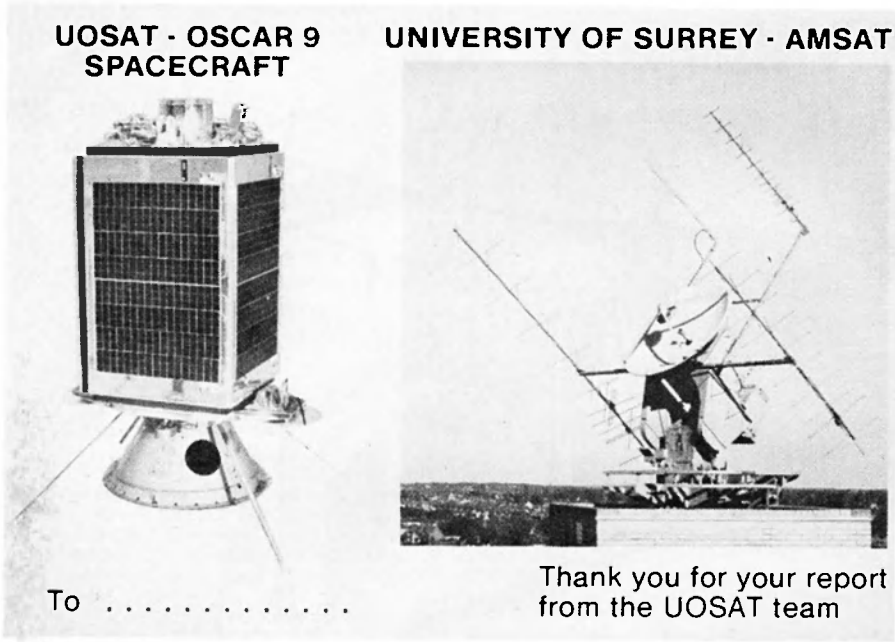


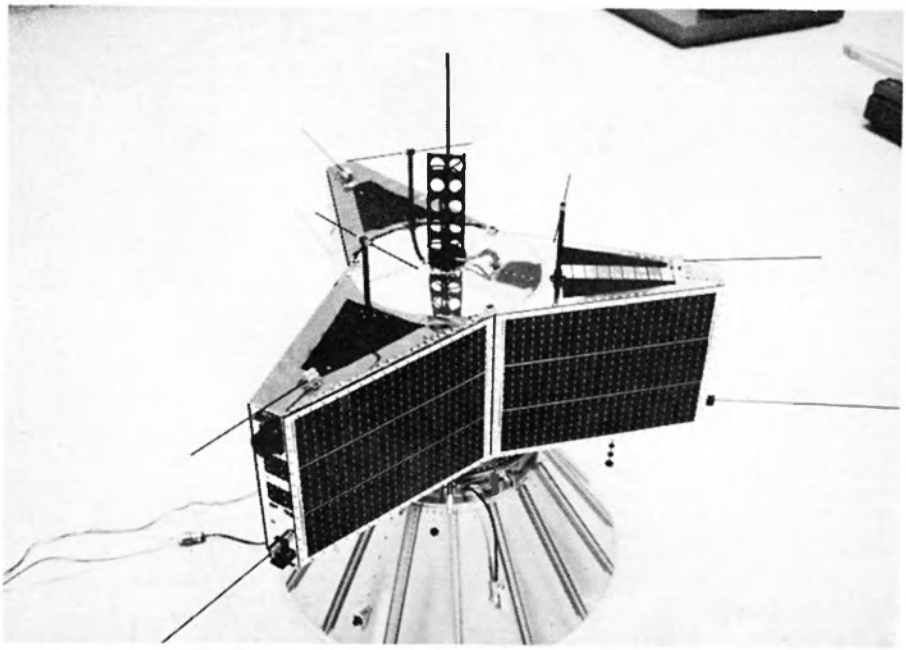
however, if readers would be interested in more information on any of the topics I recorded all seasons using a small handheld cassette recorder, despite its size it gave excellent copy, so if you would like to hear any particular session then send me a blank C90 cassette and sufficient to cover return postage. The whole symposium took six C90 cassettes. At the meeting a number of different handouts were supplied for the following presentations; Advanced Gateway Concepts, JAS-1, circuit diagrams for a Tx/Rx attachment to standard SSB equipment to evaluate the ACSB technique, and a brochure on the Solar Sail project. On one of the trade displays I found information concerning a satellite tracking programme for the Commodore 64 and the VIC-20, the cost of the programme and associated hardware is US$150. The hardware is a small interface card which plugs into the back of the computer and is connected directly to the controls of your Azimuth and Elevation Rotators for completely automatic antenna tracking.

The AGM was held immediately after dinner and went on until late in the evening. Tom Clark, the then President, acted as Chairman and conducted the meeting on a relatively informal basis starting with a description of the major achievements of AMSAT over the last four years. Then Bill Lazzaro N2CF (who was at that time the Manager of the AMSAT HQ office but is now employed at ARRL HQ) gave a status report on AMSAT finances which, to say the least, were a bit gloomy for the current year. With about a US$10,000 deficit for the past year and there had been no major expenditure on amateur satellite projects, only the cost of running the office itself. After a lengthy discussion period amongst those at the meeting it became very obvious that a number of alterations needed to be made in the future to ensure the future of the AMSAT organisation. One such alteration was the suggestion to do away with the glossy AMSAT publication 'ORBIT' and to replace it



with a more regular and informative newsletter at a hopefully much lower cost. Bill reported that there are now 5,500 members, an increase of 36 percent (I believe due to the success of AMSAT-Oscar10) on last year. In my opinion the main problem with the distribution of funds is that in an organisation with only 5,500 members one can not afford to have an office run by salaried staff, it needs to be run by volunteers. Until this procedure is adopted I cannot see how any worthwhile part of members subscription can be channeled into the building of amateur satellites. On the subject of funding future satellites it was





blatantly obvious from discussions held at the AGM that the large sums of money required to build and launch satellites could not be raised entirely from within the amateur ranks. In fact the majority of funds would almost certainly have to come from non-amateur sources such as big industrial concerns or possibly from foundation support. Unfortunately, the days of the 'free' launch and the building of satellites in garages are over. The figure most commonly bandied about for a satellite launch of the Phase III type is in the order of US$300,000 and this is regarded as being rather optimistic in light of information recently received from various launch authorities. Therefore a whole new approach is needed to funding satellites for amateur use and will almost certainly involve the prostitution of amateur radio to large industrial concerns to obtain the necessary funding. In the USA AMSAT is currently trying to raise money for the PACSAT project from foundations willing to support a project for the benefit of thirdworld countries. VITA, Volunteers in Technical Assistance, have already donated a large sum of money to AMSAT for the specific use of developing a system that will allow cheap reliable transfer of messages to and from third world countries using the minimum in equipment, complexity and cost. Similarly without the support of the German government I do not believe we would see the launch of Phase IIIC and in England without the support of British Industry the University of Surrey would have been unable to build and launch Oscars 9 and 11. Therefore without the ability to attract funding of the order of millions from outside the AMSAT organisation a project of the magnitude of Phase 4 has very little chance of a future, however, it was generally agreed by most that it would not be feasible this decade, but maybe a possibility in the 1990s.

After LA Peter and I flew to London and based ourselves at Stevenage about 20 minutes by train north of London at the temporary residence of Charles Mowle VK5ACM who is currently working for British Aerospace. From there we travelled by train to Dover and crossed the Channel by Hovercraft to Calais and then by bus to Brussels. On the next day we travelled by train to Marburg in Germany via Frankfurt. We stayed in Marburg for two days while awaiting the opportunity to meet with Dr Karl Meizner DJ4ZC. Karl spent most of the time with Peter and I discussing the future of the amateur satellite service as he sees it. For instance he has successfully negotiated with the German government to ensure that Phase IIIC is launched on board the Ariane-4 vehicle in 1986. Karl then went on to give us his personal assessment of the future of other proposed satellite projects throughout the world, in particular, PACSAT, Solar Sail Project and the future possibilities at the University of Surrey. We finally discussed the feasibility of the Phase 4 project, and as much as Karl would like this project to happen now but as I mentioned before he believes as do most that because of the level of funding required it will have to wait until the 1990s at least. So, at present, the group at Marburg will devote their energies to building Phase IIIC with its proposed high power (500W) Mode L transponder. The other news from Germany is that another group led by Hanspeter Kuhlen DK1YQ (also an Oscar10 command station) is planning to fly a packet radio experiment on Phase IIIC based on the Tuscon Amateur Radio Terminal Node Controller (TAPR TNC) with its AX.25 protocol. Peter and I had hoped to be able to see Phase IIIC in its early stages of construction but unfortunately it was still neatly packaged in silica gel storage until it is required for the integration of the various modules it will carry aloft in 1986. However, Karl did give me a copy of a booklet on Oscar10 with some excellent photographs as seen in this article. We also received some copies of the original drawings for AFDEM PSK demodulator and Bit Regenerator for decoding the PSK telemetry on Oscar10's beacons. Another gift from Karl was the listing and associated instructions for a satellite tracking programme Karl wrote for the Sharp PC1245 pocket calculator (computer). The programme is extremely concise and Peter VK7PF is currently modifying it to run on the Tandy MC10 colour computer with only 4k of RAM. If you are interested in this or any other information I obtained while overseas please write to: AMSAT-Australia, C/-Box 1234, GPO, Adelaide SA 5001. (Please include sufficient to cover return postage.) The calculator/computer and the programme make a rather unique approach to tracking Oscar10 in that all you have to do is key in the date and time you want to look for the satellite and it will tell you if it is in view and at what azimuth and elevation, at the same time it can tell you whether the satellite is in view at another location providing you know the longitude and latitude.

After leaving Marburg Peter and I did a few days of sightseeing as we wound our way back to London. Once again we travelled by train to Munich via Frankfurt and spent 2 days there. One whole day was spent at the Deutsches Museum which, for the scientific at heart, would have to be an experience of a lifetime. To view all the exhibits you would have to walk a total of 16 kilometres so you can imagine we only saw about half of the exhibits and then it was only a cursory glance. You could literally spend days and still not absorb everything. We did however cover the sections concerning space, aviation, marine, engineering and the telecommunications. Probably the most amazing find was a full scale model of AMSAT-Oscar10 in glorious colour amongst the display of the many famous commercial satellites in the space section. The main aim of the Museum was to familiarise the general public with the exact sciences and with the technology which is based on them. This has been successfully achieved by the design of many of the exhibits so that the general public can actually get hands-on-experience with the current equipment used in today's technology. My final comment is that no one should visit Munich without seeing at least some of the exhibits at the Deutsches Museum. Also while in Munich I attempted to meet up with Hanspeter DK1YQ who, as I mentioned earlier, is a command station for Oscar 10 and the leader of the group building a Packet Radio module which will hopefully fly in Phase IIIC. Unfortunately our contact was restricted to a rather lengthy phone call. However it was most interesting to find that in the Munich area alone there was in excess of 30 amateurs using the TAPR TNC for local Packet Radio. We concluded our

conversation with a promise from Hanspeter to keep me informed on their progress with the Packet Radio module for Phase IIIC.

From Munich it was on to rainy and flooded (hightide) Venice via the famous Brenner Pass through the Austrian Alps which were covered in picturesque snow. Because of the rain in Venice, other than a quick trip around the canals, we headed off for Geneva. We decided to stay in Geneva for a couple of days before the longest day of our trip back to London. One of those days was spent visiting the sights in Charmonix in France, in particular the cable car ride up 3960 metres to view the adjacent peak of Mt Blanc. After lunch we took a ride on a rack and pinion train to view the local glacier in all its glory.

The following day was by the far the longest and most eventful of our entire overseas trip. It began with us getting up at some ungodly hour of the morning to catch the 0700 TGV (famous high speed train) from Geneva to Paris. After arriving in Paris at 1000 we caught the underground to the station from which our train to Calais was due to leave at 2230 that evening to deposit our luggage prior to seeing the sights of Paris. The next 10 hours were spent either walking around Paris or commuting on the unbelievably overcrowded underground. Of course no trip to Paris would be complete without a visit to the top of the Eiffel Tower (274.3 metres). If you would like to use the Eiffel Tower as an antenna sight you would be about 100 antennas too late. As very tired travellers we boarded our train to Calais only to have Peter's suitcase stolen from under our noses (it was no further than 3 metres away from where we were sitting) about 30 minutes prior to the train departing. After a futile attempt to locate a Gendarme to report the theft we left for Calais. No-one in authority on the train was interested in our tale of woe nor on the ferry across the Channel and it was not until 0530 on the next morning when we arrived at the Dover Docks that we found an ever reliable English 'Bobby' who was only too happy to take a report of the theft and document it for insurance purposes. At 0630 the train left Dover arriving in London at 0845 and after a brief stop in London to check with the owners of the Paris train service we headed by train to Stevenage, our base in England, for the next week. We arrived in Stevenage at around 1030 and promptly slept for the next 12 hours. What a day (and a half)??

On Sunday, after a relaxing couple of days of English village life, we decided it was time to start 'work' again namely back to meeting people involved in amateur satellites, so we set off by car to Cambridge to visit James Miller G3RUH who has made himself famous by writing two articles for the magazine 'Wireless World'. The first was a circuit for decoding the UoSAT telemetry and was published in May 1983. The second article published in October 1984 was a PSK Demodulator for the telemetry on Oscar-10. The unique feature of both these designs was their simplicity and excellent performance characteristics. The visit to meet James was primarily to have a look at the performance of the AO10 PSK demodulator and the associated BBC software for displaying the telemetry, the results were outstanding compared to those obtained using the original AFDEM design by AMSAT-DL which had been built here in VK from some rather questionable quality photocopies. Not only was the hardware good but the software was equally impressive. If anyone would be interested in a copy of the article then send an SASE to AMSAT-Australia. James also had a novel design for a helical antenna which was not only functional but rather robust to say the least. An article on this should appear in 'Wireless World' in the not too distant future. Another interesting piece of information that we obtained from James was a copy of his Oscar 10 satellite tracking programme which prints out an extra item of useful data which he calls the 'Squint Angle' which is basically the amount that Oscar 10's antennas are offpointed from the centre of the earth during the orbit. James, from experience, has learnt that for optimum communications ie best signals and minimum 'spin modulation' the 'Squint Angle' should be less than 30 degree. Copies of this BASIC programme are also available from AMSAT-Australia for an SASE. James also had many other interesting tid-

bits of information to offer and if you have the opportunity to visit England he would be well worthwhile adding to your itinerary.

Monday was our only free day left to see the sights of London so back to playing the tourist for a day including voting at Australia House. Once again we took advantage of the Underground to transport us from one tourist spot to the next. The itinerary was, I am sure, all too familiar to anyone who has been to London, namely the Tower of London, London Bridge, Parliament House and Buckingham Palace.

The next 3 days were spent entirely at the University of Surrey with Dr Martin Sweeting and the members of the UoSAT team. Even though the group was not currently building a satellite and therefore not madly rushing about trying to put a satellite together in a record time of 6 months as they did with UoSAT-2 (Oscar 11) they were certainly not idle. Neville Bean G8NOB is almost fully occupied running the UoSAT Control Station for the maintenance Oscar 9 and 11 and of course the operation of the onboard experiments. What little time that Neville has free from the above duties is devoted to programming either the satellite on-board computer or the University's mainframe for handling the management of satellite tracking or data reduction. The UoSAT Control Station has developed over the last few years into quite a sophisticated automatic system for tracking and commanding satellites as well as the collection, storage and handling of masses of satellite telemetry. This automation has been forced on the UoSAT team to enable them to spend the maximum amount of time investigating the success of their satellite production techniques by careful evaluation of the received telemetry. I must admit that I was somewhat disappointed by the level of automation because I had some romantic notion that someone had to be actively involved in the data acquisition procedures, however I can certainly appreciate the need for such a system in their environment. Unfortunately it has set me thinking about setting up such a system in my own shack so that, like the UoSAT Team, I can spend more time finding out the significance of the data rather than collecting it. If anyone would like to experiment with automated tracking and data acquisition I have collected quite a lot of useful information on techniques from UoS (and Bob Diersing N5AHD in Texas) and this is available for the asking. Other activities that were currently in progress at the UoS were the development of an improved automatic satellite tracking system using a BBC microcomputer, development of a 9600 Baud PSK (Phase Shift Keying) modem for

high speed data transfer to and from UoSAT-2 in conjunction with the onboard Digital Communication Experiment (DCE) and the Charged Coupled Device (CCD) camera. Another interesting project that had already been completed before the launch of UoSAT-2 was a 2m repeater consisting of a Kenwood handheld and a Yaseu FT480R located in the Electronics Workshops at UoS to enable most of the members of the team to be in contact wherever they were 24 hours a day. The main purpose of the 2 rigs was that there was a constant need to change the repeater input/output frequencies to avoid outside interested but time-consuming listeners.

For those who have the ability to decode the 1200 Baud ASCII telemetry from UoSAT-1 and receive the weekly news bulletin you may be interested to know the rather lengthy procedure involved in getting that excellent service on Oscar 9 each week. The procedure starts early on Friday morning with either Martin or Neville sitting down at a terminal hooked to the UoS mainframe and putting together about 32K characters of text for uploading later that afternoon. The information is sourced from Telemail (the international electronic mailbox used by the worldwide co-ordinators of AMSAT), letters/news items from users of the Bulletin, news of the week's happenings at the UoS, and many other sundry places such a 'Amateur Satellite Report', AMSAT-DL, AMSAT-UK, etc. Using a word processing package the information is strung together and edited to approximately the required size (there is only a finite size of memory available on UoSAT-1 for the Bulletin). The resulting file is then passed to a programme on the mainframe that formats it so that it is suitable for anyone receiving the Bulletin using a 64 character/line terminal, then the file is passed to another programme which imbeds the text with the appropriate machine code to upload the text and execute it once it has been successfully uploaded to the spacecraft. Unfortunately if the text is only one Byte too long the text has to be culled and the whole process repeated and Martin says it is amazing how many weeks the text is within 1 or 2 Bytes of the available space. The procedure to this stage with the usual inevitable interruptions takes at least a couple of hours. The next step of the procedure is uploading to the spacecraft. Step 1 involves sending up the appropriate command to ready the spacecraft to receive the Bulletin file that is on the UoS mainframe computer. Step 2, assuming that the uplinking command has succeeded, is to ready the UoS mainframe (not always easy on Friday afternoon when staff and students are flat out typing up the wekly reports/assignments before the weekend). Step 3 is to uplink the bulletin file to the spacecraft which is very interesting to watch as it is a full duplex operation in that the ground computer receives a memory map from the onboard spacecraft computer showing those blocks of memory that have received error free data. Having made one pass the procedure is repeated to fill in only those areas not successful during the previous pass. This procedure is repeated until all the file has been successfully received. Bearing in mind that it takes a little longer to uplink this file than it does for you to receive it, so as you can imagine during a single pass this would not be a bad achievement. Another problem is that you must leave sufficient time for Step 4, that is to send a further command to start the beacon transmitting again. Often the 4 steps cannot be achieved in one pass so that it can sometimes happen that the satellite appears with no beacon at all until after the next orbit over UoS.

The remainder of the Friday at the UoS Peter and I spent with Martin discussing the future of the Amateur Satellite Service as seen in his opinion. His views were very similar to those expressed by Karl and reflect the everpresent problem of obtaining funding and launch opportunities. At that time Martin was investigating a number of options which included involvement in building PACSAT, Phase IIIC and a number of purely British Industry type projects. Martin was confident that the UoS would be shortly back in the process of building another satellite with at least some amateur involvement. Finally, Martin agreed to listen to any proposal for Australian involvement in any future projects at the UoS provided that they fitted in with the design criteria. He also promised to keep us in mind for any project that may need outside sources for the appropriate expertise, time and/or funding.

After a restful weekend in Stevenage with a further trip to Cambridge to visit James Miller and a sightseeing trip to the home of William Shakespeare at Stratford-upon-Avon we left London on Monday for home via Bahrain and a one day stopover in Singapore for the inevitable shopping spree before arriving back in Australia on Thursday the 6th of December just 30 days after leaving.

AR

TRANSFORMERLESS POWER SUPPLIES

Bruce Hannaford VK5XI

One of the attractions of voltage multiplying power supplies is that they CAN be used straight off the power supply mains without any transformer. I emphasise the word CAN and I am NOT saying I recommend this practice. Using such supplies will often greatly reduce the weight, size and cost of equipment using valves. The most popular circuits are those having one AC input and one DC output terminal common as this can then be earthed. it is possible of course to design equipment with both DC output terminals above earth but this will complicate construction and is rarely used.

I refer to such supplies as Death Trap Supplies (DTS) and think the name is most appropriate. Those who insist on using such supplies should consider at least the following points. A normal 240V AC supply to a home will consist of a two wire feed, one wire at earth potential and the other 240V above earth, the earthed wire is called the neutral and the above earth wire the active. In some districts, States etc, depending on the supply authority the neutral will be connected to earth at each installation but in other cases it will only be earthed at a few points here and there with no direct connection between earth and neutral wires at each installation.

The first obvious danger of having one side of the mains connected to the metal chassis of your equipment is that you might at some time get the neutral and active feed reversed thus making the whole equipment and anything connected to it 240V above earth! Of course you check first to see it is right-way-round but strange things sometimes happen. You may for example use an extension lead that has active and neutral connections reversed, or some double adapters have one outlet side reversed (for convenience in manufacture). Far less likely you might for a short time get 240V above earth active fed into your normally neutral supply wire! I have been around long enough to know of and experience several cases where this has happened by accident. Let's be kind to Supply Authorities and their staff and just say this can happen if a truck hits a pole and an active wire falls on a broken neutral wire supplying your house.

Some DTS users get cunning and don't connect the neutral to the chassis of their equipment at all but instead rely on the earthing pin of the power supply lead. A two way switch is used as a mains on/off switch for the DTS the common of this switch is connected to the above earth side of DTS and the power lead to the equipment active and neutral are connected to the other contacts of the two way switch. Regardless of which way the active and neutral arrive at the switch one way will be above earth and the other will be earthed. A reversed extension lead etc will just mean the on/off positions will be exchanged. Provided the equipment is properly earthed the supply will switch on and off and operate with no problems.

No more problems with reversed actives and neutrals, yes indeed but even worse problems have been created. The AC power supply to the equipment is now dependent on the earth wire of the three wire power cord and/or any other leads earthing the equipment. Let's say the house installation earth wire is defective, your RF earthing system will take over and carry the AC needed to run your DTS and if you removed or accidentally knocked off this wire with the supply switched on then there will be 240V between the equipment case, and all connected to it, to earth. The whole system is just waiting for someone to touch something connected to it and complete the circuit to earth! With no RF or equipment direct earthing the defective house installation earth wire will also be 240V above earth (in some older installations it is a bare wire) so someone touching a tap or something in contact with the defective earth wire may get a 240V shock. Many installations made years ago depended on the metal water pipe system to act as an earth, however in this plastic age some of the metal pipes may have been replaced by plastic pipes and the earthing may no longer be effective in fact it might well be a hazard.

Quite apart from the lack of safety using an earth return circuit to draw power from the mains this will no doubt incur the wrath of the supply authorities if they find out you are doing it. Additionally if you were unfortunate enough to have a house fire involving your equipment and the insurance people found out your equipment was wired in a dangerous and/or illegal way quite likely they would blame your equipment and not pay up. Yet another factor with DTS is that when in use they sometimes cause hum problems in other equipment being used at the same time, this is especially so with the earth return system.

Those who insist on using such supplies should in my opinion observe at least the following:

Don't use the earth return system. Have two 240V neon lamp indicators wired between both incoming power leads and earth, say a green one for the active and a red one for the neutral, with this if the power is right way round the green will light and if reversed the red will light. A double pole switch should be used breaking both leads alter the neons mentioned earlier, the equipment side of this switch going to two fuses one for the active and one for the neutral. It is normally bad practice to put a fuse in a neutral but in this case it is needed for protection with reversed active and neutral. The neutral fuse should be at least twice the rating of the active so it will not blow first unless active and neutral are reversed. Of course the metal case of the equipment MUST always be connected to an effective earth and this NEVER disconnected while power is being supplied to the equipment.

I hope I have convinced all that very careful consideration is needed before using any such DTS and I repeat I do NOT recommend them.

LIZARD ISLAND BASE FOR CAIRNS AMATEUR RADIO CLUB

Anne Benson VK4FAB
22 Cassia Street, Edge Hill, QLD. 4870

The Cairns Amateur Radio Club took part in the John Moyle Field Day Contest on 23/24 February 1985 from remote Lizard Island. It all began whilst chatting over an NQ Stubby (locally brewed beer) after a normal monthly meeting . . . Roger Kimeklis VK4JB said "Anne, you and I ought to see if we can go to Lizard to operate during the John Moyle Field Day Contest". "Oh yeah," I said, thinking it was a bit of a joke. However, he was serious about it and we thought why not charter an aircraft so a few of the members could set up camp and for the first time, compete as a club in the contest; and so the seed was sown! Roger and I, both working for the air company who operate the service to the island, made the arrangements for an aircraft etc, which was a little easier to undertake, being on the spot.

With all arrangements eventually made, we were ready for our exercise, but alas, firstly cyclone Pierre then Rebecca hard on its heels made it a "stop — go" affair and it was not until the last minute, 7.40 am, at the Cairns airport on Saturday 23 February did we know it was a "goer". The Captain, Alan Hutchinson and First Officer (and Club member) Roger were ready — the Traffic Officers had the Twin Otter loaded, and it was all aboard for Lizard Island.

Lizard Island is situated 250 kms north of Cairns (94 kms north-east of Cooktown) or for those nautical people, 135 nautical miles from Cairns (50 from Cooktown). The flight was along the coastline with wonderful views of the tropical rainforest from Cape Tribulation to Bloomfield, with the Captain pointing out all points of interest during the entire journey. There were great views of the huge silica sand deposits at Cape Flattery north of Cooktown, then on to Lizard Island, surrounded by the most beautifully coloured water imaginable. On landing we were told of the latest weather bulletin which, because of cyclone Rebecca, meant we may have to return to Cairns without making camp, but we were to await the next report. Finally at 12.40 pm came the all clear, so then the trek to the campsite began. During this waiting period we had temporarily erected a radio station beside the airstrip, not wanting to waste time and the first contact was made at 12.16 pm local time. We then dismantled the station, with troops carrying marquee, poles, esky, generators, battery, heavy barbecue plate, personal gear, table, stools, coax, aerial, HF rigs, etc, etc. All this in very strong winds made erecting a camp quite difficult.

Arrival at Lizard Island. The "Twin Otter" is in the foreground with "Cook's Look" towering above.

Awaiting the weather report on LI.

Temporary transmitting site whilst awaiting the all clear with the Wx. From left — Phyl VK4JFA (partly hidden) Roger VK4JB, Colin VK4EX and Anne VK4FAB.

Living conditions were a far cry from those at the luxurious lodge on the island, but members of the Cairns Amateur Radio Club are quite used to roughing it during their operations in conjunction with the State Emergency Service and all is taken in their stride. There were eight licensed operators on a roster system during the contest hours and all were pleased with the number of contacts, taking into consideration the rather poor band conditions.

Operators were Colin Swinburn VK4EX (Club President), Phyl Le Grand VK4JFA, Allen Jacobs VK4BAJ, Ted Gabriel VK4YQ, Ron Petrich VK4ACZ and his XYL Gwen VK4AZC, Roger Kimeklis VK4JB and Anne Benson VK4FAB. There were fifteen in the group including aircrew, one of which, of course, was Club member Roger VK4JB.

Lizard Island had another couple of overnighters some 214 years ago, namely James Cook and Joseph Banks — and here we were on this historic Island sending signals instantly reaching their destination hundreds and thousands of miles away — we wondered how long it took Captain Cook to get a message back to England in those days! The island also became known through the tragedy of Mrs Mary Watson and her baby son Ferrier. The family lived on the Island where Mr Watson was a beche-de-mer fisherman and whilst away fishing in September 1881, hostile aboriginals attacked those left behind and Mrs Watson, baby Ferrier and a Chinese servant fled in a tank they used for a boat. Sadly they died of thirst and exposure and were not found until January 1882 on an island in the Howick group. The remains of their cottage stills stands in what is now known as Mrs Watson's Bay.

The remains of the Watson cottage.

Lizard Island is now known more pleasantly as a stepping off place for the big marlin fishing which lures fishermen from all parts of the world, swimming, snorkelling, coral viewing or just relaxing completely away from it all.

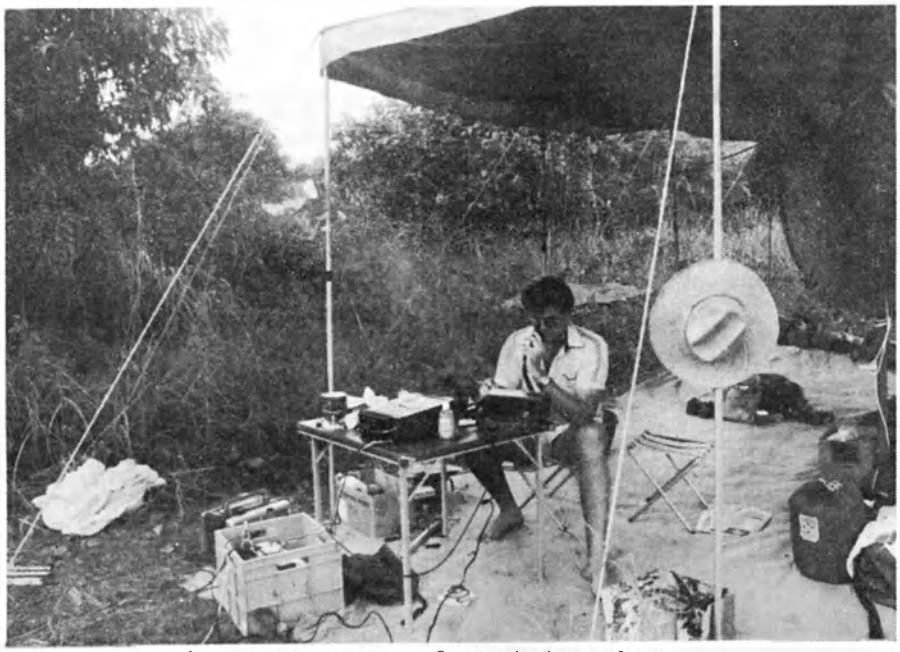
The station, VK4HM operated till about midnight then one by one the ops dropped into bed and had a few hours sleep in spite of the very gusty conditions prevailing but awoke at first light to find the wind had died down, then it was back to work again. When we completed our 24 hours stint it was time for playing and we found the sea very inviting and extremely difficult to remove ourselves from it once we were in. However,

A windmill on the island was handy for an aerial support.

there comes a time for all things to end and time was fast approaching to pack up and head back to Cairns. This time we didn't have our T/Os to load the aircraft but Murphy wasn't around and all was put back in place and we were ready for take-off at 4.45 pm Sunday. The flight back to Cairns was absolutely magnificent (can't find enough superlative adjectives to explain it) and to those, and that was most of us, who had never flown over the Great Barrier Reef or Outer Reef. It was the experience of a lifetime and will live for a long time in our memories.

Ted VK4YG "pounding the brass" whilst others relax before their operating stint.

Going camping in the Far North of Queensland during the wet season is always a bit risky, but we were told that to think of going camping at Lizard Island at this time was madness — well, the layman might say madness, but we are Amateur Radio Operators and we call it dedication and were proud to partake for the first time as a club, in the John Moyle Field Day Contest and it has whetted our appetite to continue to take part in the future and who knows at what exciting destination we will be next year?? It certainly will be hard to beat this one — it was not all hard work, we did find time for swimming, walking, etc and came home tired, a bit grubby, very sunburnt but oh so happy to have enjoyed such an experience.



Colin VK4EX notches up a few contest numbers.

Though we were quite remote (perhaps the most remote location in the Contest?) we were well catered for in the food line, thanks to Sharon, XYL of Colin VK4EX. Sharon took her Novice study material with her, but was too busy catering thus having no time for study, so it's head down and tail up for Sharon for a while. A wonderful exercise, great weekend never to be forgotten, thanks to members, friends and especially the Air Queensland crew.

Technical data: *Transceivers: Kenwood TS130S, Yaesu FT757GX*
Power: 12V battery
Generators: 2 Honda 350W (1 used for battery charging, 1 for lights)
Contacts: 70 (24 hour period) CW and Phone

Aerial: Black CTW — up 25 feet.

Footnote: *I advise anyone contemplating a "radio safari" by aircraft to make arrangements well ahead in order to have enough people to fill the seats. We had several necessarily drop out for various reasons, but we were determined to do this trip, and by golly we did it. Also, charged batteries are not allowed in aircraft, so we had to take an acidless one and were told we could get acid from the Lodge on the Island — however, we found they had none, but we let out a sigh of relief when they said they had a spare we could borrow for the time we were operating — whew — all would have been in vain except for the kindness of the gentleman who tried to find us acid. Also generators must be completely devoid of petrol before being carried on aircraft. No pressure packs — liquid insect repellent or cream is a must.*

AR

BILL AND THE HAMAD

Ted Holmes VK3DEH
20 Edmunds Street, Parkdale, Vic. 3195

Bill sat at his dust-strewn desk, licking the end of his pencil thoughtfully. It had a peculiar taste and he suspiciously inspected the tip. It was the indelible type and purple. So was the end of his tongue. He threw it away and grabbed another pencil. Bill was in the throes of composition.

"For Sale. Set of bowling balls, complete with bag. In very good condition, apart from one ball requiring attention" etc.

He had decided to give the bowling away. The incident at the club a few days earlier had been the last straw. How was he to know that size nine boots were not supposed to be worn on the green during competitions? Anyway, it had been pretty mean of the club to exclude him from the competition, considering the progress he had been making to date. He had learned not to hit the jack more often than he could avoid and it wasn't really his fault the whole thing had to be called off because of the condition of the green. Sometimes things were very unfair.

Now he was selling up his bowling paraphenalia and had decided to get some radio equipment with the proceeds. His old gear was in a terrible state. His tattered wire dipole had fallen into shreds and his 2 metre apology for a Slim Jim was bent at an angle of about 45 degrees. He had quite a bit of work to do in order to get back on the air. Meantime, he was determined to get his shack into some kind of order.

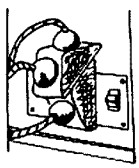
A few days earlier he had responded to a Hamad and had arranged to see the vendor in a few moments time. He was going to buy another rig. The person concerned was calling round with the rig and Bill was getting quite excited about it. There was a ring on the front doorbell.

Bill opened the front door and was confronted by a man carrying an FT 101E. The man stared oddly at Bill's purple stained mouth, but said nothing. Bill ushered him into his shack and again the man said nothing. It was as though he had been struck dumb. He laid the FT 101E on Bill's desk top, after sweeping a few things aside.

Bill looked at the rig, suppressing any excitement he felt. Not a good idea to let on that he was at all interested. He asked the chap to plug the unit in, which he did. This was accomplished with some difficulty, since the power point was festooned with an assortment of two way plugs. Bill screwed a PL 259 plug into the back of the rig. Finally came the moment the rig lit up.

Unthinkingly, Bill pressed the microphone push-to-talk switch. Suddenly, all the lights in the rig died with a quiet sort of spluttering noise. Bill was mystified. Then it dawned on him. He had forgotten about the condition of his dipole and had keyed full power into it!

AR



ELECTRICAL SAFETY IN THE AMATEUR SHACK

Fred McConnell VK3BOU

Safety is of paramount importance and every precaution should be taken to ensure equipment used is perfectly safe, not only for the operator, but other members of the household, or visitors. It should be possible to turn off the power to the entire station by one master isolating switch, located in a very prominent position. All members of the household should know that this switch must be turned off before touching anything.

Ultimate in shack safety would include:-

1 *Power to the shack via a separate connection on the premises main switchboard, via what is known as sub-mains.*

2 *Core balanced earth leakage protection either in the main switchboard or the sub-mains to the shack.*

3 *The shack would have its own sub-switchboard with the following:-*
   (a) Location — prominent and readily accessible.
   (b) Control isolating switch (double pole).
   (c) Core balanced earth leakage protection (if this is not already provided on the main switchboard).
   See Item 2 above.
   (d) Final sub-circuits power (at least 2) to control 240 volt power outlets.
   (e) Final sub-circuit light (one) to control shack lighting.
   (f) All final sub-circuits protected by either fixed setting circuit breakers or high rupturing capacity fuses.
   (g) In addition to a sub-main earthing conductor from the main earthing system of the premises, it is recommended suitable earthing electrode(s) be driven into the ground adjacent to shack and bonded to the earthing system at the sub-switchboard.

4 *Fixed wiring, that is all sub-mains, final sub-circuits, switchboards, outlets and luminaires should only be installed by a registered electrical contractor, who is a licensed electrician.*
If the shack is a detached outbuilding, then the sub-mains would be installed underground with the correct cable, conduit and depth (minimum depth for metered sub-mains being 300 mm cover).

5 *Station layout is a matter of personal choice, but care is required to ensure all 240 volt mains operated equipment is connected via approved plugs and sockets and flexible cords are double insulated type.*
Equipment known as being extra low voltage (ELV) operation (the common 13.8 volt range of gear) should only be connected with approved connectors suitable for extra low voltage. This is to ensure ELV plugs cannot be inadvertently inserted into 240 volt outlets.
Layout should also consider the requirements of separation and segregation of outlets. Keep 240 volt and other high voltage outlets clear of any ELV and antenna coaxial outlets.

6 *Equipment including home brew gear if mains operated should include the following:-*
   (a) Control, via double pole switch.
   (b) Fusing, in both active and neutral of supply lines.
   (c) Transformers should be double wound isolating type, one that gives complete isolation between primary and secondary windings. The screening plate between primary and secondary windings must be effectively earthed.
   The use of auto transformers, one with a common winding but different voltage tappings and no isolation, should be avoided.
   (d) There is always the great danger of making inadvertent contact with live metal parts and connections of equipment. Only training and a constant awareness of the hazard involved in working on live equipment reduces the possibility of electric shock.
   (e) High voltage filter capacitors require care when handling. Even when out of circuit they can still retain the capability of producing lethal discharge currents at their terminals. Capacitors with a voltage rating of 2,000 volts and a storage capacity of less than 10 microfarad can develop lethal capabilities when left in storage without first placing a short circuit across the terminals.
   An important design and construction feature of high voltage power supplies is the use of suitable bleed resistors placed across filter capacitor terminals.
   (f) The Standards Association of Australia wiring rules require that, for 3 core flexible cables, the following colours be used to identify conductors:-
   Active — Brown
   Neutral — Blue
   Earth — Green/yellow stripe

WHAT IS CORE BALANCE EARTH LEAKAGE PROTECTION?

It is a device used with an automatic circuit breaker, that will open a circuit automatically on the detection of a predetermined level of fault current flowing to earth.

They are known as core balance earth leakage circuit breakers and used to safeguard against fatal electric shocks.

The author is uncertain of their origin, but believes they have been in use in this country for 20 years and before in the UK and the mining industry of South Africa. They have gained the popularity they so justly deserve and are manufactured here by an increasing number of companies under different trade names.

Principle of Operation:

When a current greater than 30 milliamps flows through the human body for longer than 1/10 second, the heart is affected and ceases beating. The earth leakage, core balanced circuit breaker is interposed between the supply and the operator, acting as a monitor of minute current variations in the load. If a current flows to earth it bypasses the core and upsets the balance of flux. This out of balance is detected and amplified, then used to trip the supply circuit breaker.

Total time of operation is less than half the normal fatal time, therefore giving the greatest measure of protection. The sensitivity of 20 milliamps is low enough for protection but high enough to eliminate nuisance tripping that may occur from "normal" leakage from a variety of causes.

Current operated earth leakage devices are only able to protect against electric shock caused by a current passing through a person's body to earth.

While this is by far the most common cause of fatal electric shock, it's of course still possible to receive a shock by coming into contact with both active and neutral conductor, or two active conductors on different phases.

These conditions will not trip any earth leakage protection device because the circuit formed is still balanced.

WARNING ABOUT EARTH LEAKAGE DEVICES

Even though a high degree of reliability can be expected, 100 percent effective operation may not always be achieved.

The State Electricity Commission of Victoria (SECV) in its leaflet "Earth Leakage Devices (current operated, core balance relays)" said there had been a small number of cases where these devices had failed to operate.

It advises the devices be periodically tested according to manufacturer's instructions using a simple in-built test facility. The SECV warned that use of the device should never encourage complacency. The usual safety precautions must always be observed.

EARTH LEAKAGE PROTECTED 240 VOLT OUTLET

Available through the electrical trade is a 240 volt double combination flush power outlet that incorporates earth leakage protection. This outlet gives all the required protection and has the added advantage of protecting against earth leakage from other outlets on the same final sub-circuit. This outlet could replace an existing one in the amateur shack and give low cost protection.

ELECTRIC SHOCK

The severity of electric shock depends on:-

1 *The current*

Various researchers throughout the world have established the following figures for 240 volts:
1-3 milliamps — can be felt.
10-15 milliamps — hard to let go.
Above 50 milliamps — heart affected, flutters and does not pump (fibrillation).
About 5 amps — current paralyses nerve centres in the heart.
Heart is clamped and resumes pumping when current removed.

The SECV in its leaflet "First Aid for Electric Shock Victims" says electrical currents may:-
* *Stop the heart.*
* *Cause the ventricles to fibrillate.*
* *Cause contraction of the muscles of the body.*
* *Paralyse breathing due to paralysis of the centre of respiration in the brain.*
* *Cause burns.*

2 *The Time*

Time of contact for fibrillation to occur is related to the heart's cardiac cycle and a ratio of time and current. Listed are figures from graph characteristic curves:-

Current I (Milliamps)	Time T (secs)
25	5.75
30	4
50	1.45
100	0.36
190	0.1

A time of 0.1 seconds is considered the minimum time required.

3 *The Path*

The above figures are for contact from hand to hand, hand to foot or head to foot, where the current path passes the heart and respiratory centres. Contact from foot to foot is less severe.

CURRENT RESISTANCE AND VOLTAGE

It has been found from studies that, for 50 cycles, the resistance figures are constant under the skin, through fat and tissue, at about 600 ohms. The resistance of the skin varies from person to person, and depends on the moisture and condition. It can be as high as 2,000 ohms, and the accepted minimum figure is 500 ohms from hand to hand, or for a body in a conducting fluid about 200 ohms. For a 240 volt to earth system, the current would be 0.48 amp for the minimum condition. The body resistance at low voltages varies to that at high voltages, and the accepted maximum "safe" voltage is about 25 volts.

EQUIPMENT REVIEW

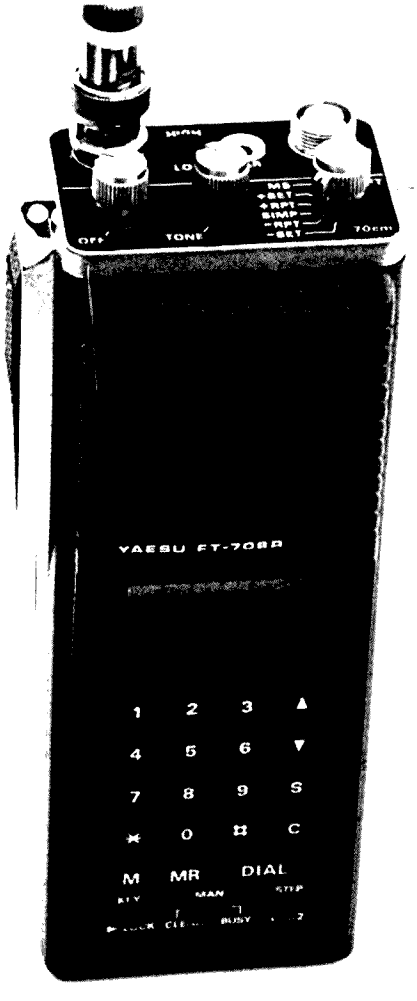
Kevin Phillips VK3AUQ
52 Hereford Road, Mount Evelyn, Vic. 3796

YAESU FT-708R

This is a new 70 cm hand-held transceiver from Yaesu. It features microprocessor control of most functions. This unit is designed as an FM only unit for simplex or repeater use. Power output is 1 watt on high, or about 200 mW on low power. When used with the quarter wave whip antenna supplied, it was more than adequate to operate four repeaters from the Box Hill and Mount Evelyn areas of Melbourne. Other antennas can be used easily.

Frequency coverage is in 25 kHz increments from 430.000 to 439.975 MHz. It has the standard 5 MHz repeater offset available as standard, but if for any reason another shift such as 1.6 MHz is desired, then it can be programmed into it. Up to ten memory channels can be programmed into it, and it has a Lithium cell to keep the memory going for at least five years. All frequencies are entered from the keyboard on the front.

Other features include a variety of scanning modes, such as full band scanning with automatic hold on either busy or clear channels, limited band scanning, memory scan, and it can also exclude a segment on its scan. It can also have a priority channel which it will periodically check.



Top view.

Digital display is provided by an LCD unit displaying the last four digits. This is a practice that irks me personally, as I like to know the full frequency. If I see for instance 7025, or 7.025 as it would be on this unit, I tend to think of 40 metres and 7.025 MHz. The same comment applies to all transceivers that give only a partial display of frequency — many manufacturers do the same thing.

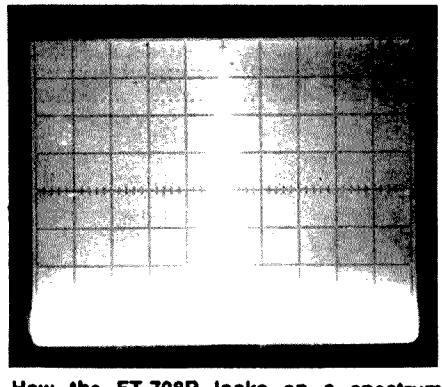
Controls provided are volume, squelch, Tx split switch, High/Low power switch, keyboard for frequencies etc, and a PTT switch. It also has a lamp switch to illuminate the LCD at night and a keyboard lock to prevent accidental change of channel.

Semiconductor line up includes 7 ICs, 5 FETs, 33 transistors and 33 diodes. They are all crammed into a package 166 by 61 by 49 mm, and a fair percentage of that space is taken up by the Nicad battery pack. Weight is approximately 720g.

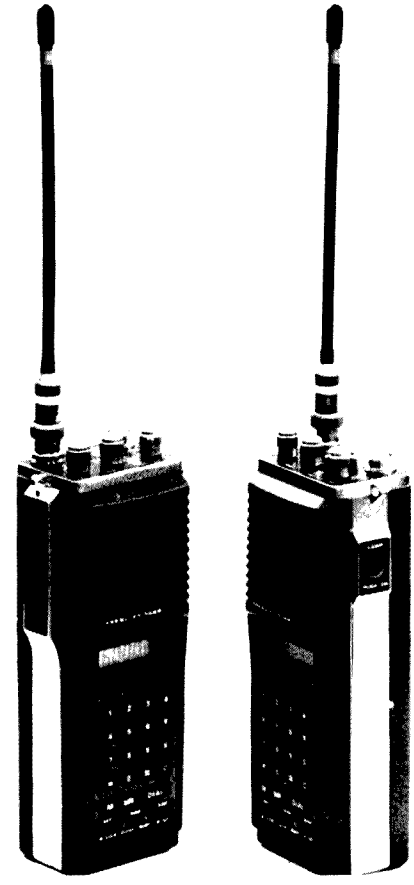
Receiver is a double conversion superheterodyne type with a first IF fairly high at 46.255 MHz, and second IF at 455 kHz. Sensitivity is quoted as being 0.4 μV for 12 dB SINAD. I measured 14 dB at .4 μV, so it was better than the specifications.

Selectivity is claimed as $\pm$ 15 kHz at -60 dB. Audio output is 500 mW maximum, which is more than adequate for most needs.

Transmitter output is switch selectable at 1 watt or 200 mW. I did a check with a radiation hazard checker at distances from the antenna that an operator's head would be, and found it to be at a safe level when on high power. Deviation is set to 5 kHz. Spurious outputs are claimed to be better than -50 dB, and was measured at -60 dB as the worst one. Output is generally quite clean.



How the FT-708R looks on a spectrum analyser.



Side views showing the PTT and lamp switches.

This unit uses Phase Lock Loop technology. It generates a VCO signal at 127.915 — 131.240 MHz, and mixes it with a crystal oscillator at 126.240 MHz. The difference of 1.675 — 5.00 MHz is then fed to a programmable divider with division ratios of 201-600, which produces basic 8.333 kHz steps for the synthesizer. There is also a 5.333 MHz oscillator which is divided down to 8.333 kHz, and the two 8.333 kHz signals are fed to a phase comparitor, and any difference produces an error voltage which is then fed back to the VCO at 127.915 — 131.240 MHz. When the VCO is multiplied by three it comes back to 25 kHz steps.

The VCO output is split two ways. For the receiver it is simply multiplied by three and fed to the first mixer, producing an IF of 46.255 MHz. Signal for the transmitter is first mixed with a 15.4183 MHz frequency modulated crystal oscillator, and then filtered and multiplied by three to the final frequency.

Power requirements are met with a nominal 10.8 volt battery pack. Maximum voltage is 13 volts, so it would be unwise to operate this unit directly from a car battery as most cars can produce voltages above 14 volts. Current consumption is about 20 mA when muted, 150 mA at full audio out and 500 mA on high power transmit.

Plug-Pack Charger.

The review unit was supplied with a plug pack charger, but it was not the Yaesu one. It was one of the Dick Smith units that have polarity reversal and a multi-way plug on it. If it were mine, I would cut off that plug and fit a standard charger plug. Fortunately the transceiver does have polarity protection on the charge input, but not on the external power socket.

The unit can be operated while charging, but as the charge plug enters from underneath, it becomes inconvenient to put it down base first. Side entry would have been better for such use, but as Yaesu also have accessories in the form of table top chargers and power supplies, I guess it doesn't matter.

The handbook supplied was of good standard, providing details of how it works, maintenance data, parts list and circuit diagram. Accessories provided are a rubber whip antenna, Ni-Cd battery pack, carrying case, shoulder strap, and earphone. The review unit also came with the optional external speaker/microphone (YM-24A) which allows the operator to hold the transceiver high under weak signal conditions, and also allows easy base station operation.

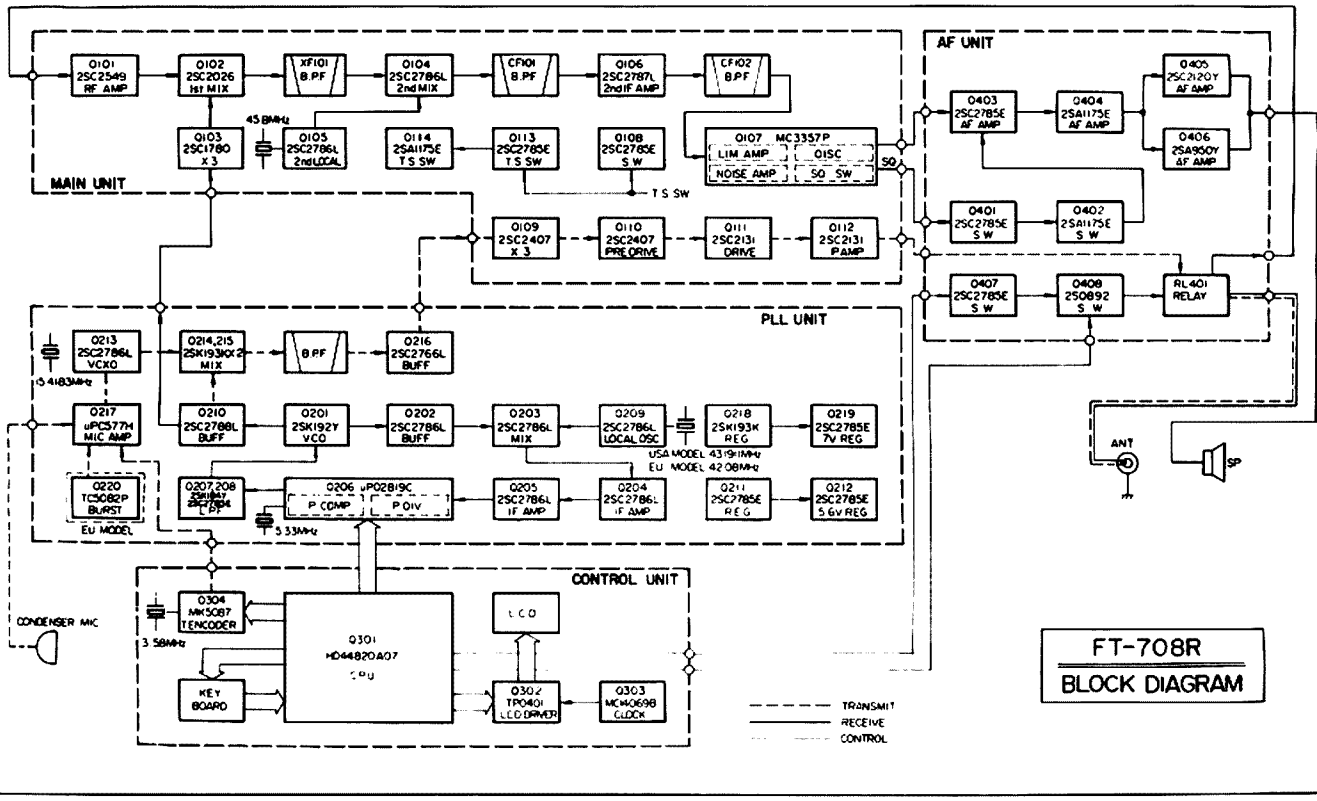
Overall impression of this unit is that it is well built, works well, and has a definite use now that 70 cm repeaters are getting to be numerous. It is worth looking at if you are in the market for a UHF handheld.

This test unit was kindly supplied by Dick Smith Electronics, to whom further enquiries should be directed.

AR

Keyboard Panel.

BLOCK DIAGRAM



NEW ERGONOMIC KEYBOARD SAYS GOODBYE TO "QWERTY"

Complaints by telex operators at the Australian Post Office have led to a British-produced computer keyboard which completely changes this one part of the equipment based on a layout more than 100 years old.

The operators said that using the keyboards all day caused pains in the neck and shoulders, and the resulting investigation by Sydney experts has been used to design the PCD-Maltron ergonomic keyboard.

The keys are divided into two well separated groups, with each key at a different height to allow for the varying lengths of the fingers. This means that the hands can be held straight, instead of close together with the wrists turned outwards, the usual position which leads to tension, and so to pain.

And the inevitable QWERTY arrangement of the keys, inherited from the typewriter, has also been changed. This layout was designed to stop the most used letters jamming together, but as this cannot happen with computers, the letters have been set out so that the most used are all adjacent. The left "home row" now reads ANISF and the right DTHOR, with E, the most used letter in English, being pressed by the normally underworked left thumb.

Ninety percent of the 100 most used words in English are on the home rows — with the addition of E — and the result, say the makers, is an increase in operating speed of between 20 and 40 percent.

The space between the two main sets of keys means that more use can be made of the thumbs. In addition to pressing the E key, the left thumb controls the "left" and "up" arrows, while the right governs the "right" and "down" movements and the return key, which normally has to be reached by stretching the little finger.

Operators are said to have no trouble adapting to the new keyboard, which can be attached to many computers. But for those who cannot learn where the letters are the QWERTY layout can be provided.

IN THE SHACK.

A New Standard Of Comparison
Based on ICOM's proven high-tech designs, the IC-751 is a competitive class HF transceiver. Continuous tuning receiver (100 KHz to 30 MHz) and a full featured multi-mode Amateur Band transmitter ensures a top of the shelf spot in your shack.

ICOM IC-751
With the optional internal AC power supply model IC-PS35, the IC-751 becomes one compact package. Ask for a brochure and compare the features now.

75 Watt 430 MHz – 450 MHz Base
This multi-mode UHF transceiver is packed with all the outstanding features you expect from ICOM. 75 watts RF output and wide dynamic range low noise receiver put the IC-471H in a class of its own.

ICOM IC-471H
As with the IC-751, the IC-471H can also be fitted with an optional IC-PS35 internal power supply. Ask your local ICOM dealer to demonstrate the IC-471H today.

OR IN THE FIELD.

The Legendary Pair:
ICOM's legendary reliability works for you in the IC-02A (VHF) and the UHF portable IC-04A. These feature packed portables include LCD readout, scanning and memories for ease of use, plus a host of optional accessories. Best of all, these radios are built to last. Both are manufactured in a sealed case providing moisture and dust resistance.

IC-02A and IC-04A

REPEATERS — Friend or Foe!

PART 3

Tim Mills VK2ZTM
PO Box 204, Willoughby, NSW. 2068.

Permission for 2 metre repeaters came just over 20 years after the Australian amateur was allowed access to the band. The first permitted use of the band appears to have been 1st May 1948. It replaced an allocation at 166 MHz, which in turn had replaced an allocation at 112 MHz.

In the period after World War I the amateurs were pushed out of the 'useful wavelengths' (round the present AM broadcast bands) down to the "useless 200 metres" (1500 kHz.) and below. Once the benefit of the 'short wave' frequencies were recognised, international planning began. This resulted in bands for the 'experimenters' in harmonically related steps, in larger portions than today's HF allocations, the amateurs received segments at 160, 80, 40, 20 and 10 on HF (15 came after WWII) and on VHF there was 5 (56 MHz) and 2½ (112 MHz). Whether we had 1¼ metres in Australia I do not know, but I expect that the American (Region 2 allocation) 220-225 MHz band may have originated from these harmonic steps. I have seen a reference in old publications to a small portion near 400 MHz. 56 MHz has been lost to Ch 1 TV, 112 is now in the international allocation for Aeronautical Radio Navigation, and 166 is in the high band commercial allocation.

The granting of 2 metres (144-148 MHz) continued the second harmonic related band allocation concept. This thinking appeared to have been that amateurs had harmonics, so give them harmonically related bands and anything they generate will fall in their bands, causing trouble only to themselves. Besides 2 metres, the Australians received 1 metre, 288-296 MHz and ½ metre 576-585 MHz. 1 metre has since been lost (military sub band region) but 50 cm is hanging on in the UHF TV band (Ch 34) under Australian footnote AUS 30 in the ITU Table of Frequency Allocations. (quote) "The band 576-585 MHz is also allocated to the amateur service until such time as the band is required for use by the broadcasting service" — 50 cm is very useful for ATV and is frequently the output frequency for ATV repeaters. (Currently the Institute has a dialogue with the Department of Communications for similar alternative allocations when this frequency is required.)

1 metre was a band that I had little to do with so I invite those who did to write a history about it. There is one story I do remember which goes back many years in VK5 land. It appears that in the late 50s there were about 70 limited licenses issued in VK5. 288 was a very active band — superreg receivers and mod osc transmitters — with over 200 (limited) call signs logged. Word was spread that the authorities were to undertake a 'shack inspection' of all users on 288 and activity suddenly dropped away.

2 metres is an international band but in Region 1 (Europe and Africa) it is 144 to 146 MHz. Region 2 (America's — north and south) and Region 3 Asia, (includes Australia) it is 144 to 148 MHz. Since WARC 79 however, some Asian countries have taken portions away for commercial use. Many countries make use of amateur intended equipment for commercial and military purposes. Next time you see TV news footage of — for example — Middle East events, usually where they show officials in groups, study the handhelds. Amateurs involved in military service in these areas are no doubt able to acquire an adequate range of captured or found amateur transceivers and handhelds. Amateur equipment is reliable and cheap, so a large portion of production may never see the inside of a shack.

We are a lucky country in that there is little crowding of amateur allocations compared to other parts of the world. Region 1 for example, has 2 MHz at 2 metres. There are 10 — 2 metre repeater channels, starting at 145.000, 25 kHz spacing with 600 offset up. The repeater band stops on the lower edge of the international satellite sub band — 145.800 to 146.000 MHz. (In 1972 the old channel "B" 146.000 was dropped from the Australian band plan because of possible interference to this segment.) Region 1 simplex channels are centred round 145.500 MHz. Europe is only a small place. Some years ago West Germany, for example, had 112 x 2 metre repeaters alone sharing those 10 channels, with all their neighbours on the same channels.

Now to return to the Australian scene. After Wodonga in 68, it was not until 1970 that permission began to appear for submissions made in 1968. Based on the two channel concept 1 and 4, VK2 had made to the following allocations. Channel 1, Orange, Gosford and Wollongong. Channel 4, Sydney and Newcastle. It soon became apparent that there was going to be massive interference problems on the shared channels but it was not until late 1974 that VK2 made the change.

Across the Tasman, New Zealand had developed repeaters. Their commercial two way system was AM and used the allocation round 100 MHz. (The FM band). As this equipment became surplus it found its way to 2 metres. They developed AM repeaters. Input was round 144.700 with outputs 1.125 MHz higher at 145.825 MHz. There were 3 channels. When they started into FM repeaters they chose a 700 kHz offset, some apparently preferred a MHz. Their system developed when Australia was in heavy debate on 500 and 600 kHz offset. New Zealand has now chosen the international 600 offset using the same channel positions as Australia, below 7000 in minus offset and plus above. Their channels are those ending in either 00 or 50 for repeater and those ending in 25 or 75 for simplex, centred round 146.5 and 147.5 MHz — there were 15 repeater and 7 simplex channels developed in the early 80s. On 70 cm they have also followed the Australian allocations. They have set aside 6 channels for repeaters and 4 for simplex. The repeater allocations start at 438.500 MHz output with a 5 MHz minus offset to an input at 433.500 MHz. The 6 channels are each 50 kHz to 438.750. The simplex however are at 433.300, 433.350, 433.400 and 433.450 MHz. (Australia has 439.000 ± .250 MHz for its simplex.) The New Zealand channels are 3 figures for repeaters. The Australian 7000 becomes 700 in New Zealand or 438.500 becomes 850. On two metre simplex they use 4 figures, eg 146.475 — their prime calling channel is 6475. On 70 cm however they appear to use 3 figures — 433.300 is 330.

The Australian policy for 70 cm repeaters is to use channels ending in either 25 or 75. VK2 has the extra policy not to allocate any 00 or 50 channels east of the Great Divide so that the ZL channels remain in the clear. The reason for 25 or 75 will be told in a later episode for it was not until 1975 that 70 cm repeaters were introduced. The 2 metre turmoil in the early 70s was yet to be overcome.

Can anyone help with background material or articles on the old bands of 56, 112, 166 and 288 MHz? Please send anything that you might have to the address above. Thanks.

RECEIVING!!

A Dutch engineer has developed a device costing about $50 which apparently can locate, receive and reproduce text typed on a computer terminal within one kilometre.

The device could result in terminals handling confidential information being screened which might include use of a sophisticated faraday cage.

Wim Van Eck, from the Dutch Neher Telecommunications Laboratory, demonstrated his device at the third world congress for the protection and security of information technology and communications in Cannes, France recently.

It was based on the fact each cathode ray tube emits unique rays that are similar in principle to an individual finger (or screen) print.

The device receives these rays and reproduces them on an ordinary television screen or could be recorded using a VCR.

Although the technique was already known to military specialists this was its first public demonstration.

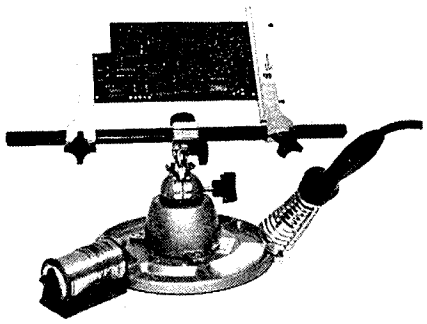
AR SHOWCASE



PORTABLE PCB REPAIR STATION

A new PC board repair station has been released under the Scope-Panavise label.

Features include —

- *an adjustable spring loaded board holder with a 300 mm capacity (larger capacity bars and multiple set of arms available)*
- *180° rotatable swivel and lock base*
- *stable tray base with wiping sponge, non skid feet and parts recesses.*
- *solder reel dispenser*
- *safety stand to accept any iron less than 15 mm barrel diameter.*

Anticipated trade price is $115.00 excluding solder and the Scope Model TC60 temperature controlled iron. This iron has been designed as a portable soldering station to operate direct from 240 V mains with 2 percent accuracy from 20°C-400°C.

For further information ring — (03) 338 1566 and speak to Kay Quinn.

DX 1000 COMMUNICATIONS RECEIVER

There has never been an easier way to hear what the world has to say. The new "Bearcat" DX 1000 allows you direct access to the world.

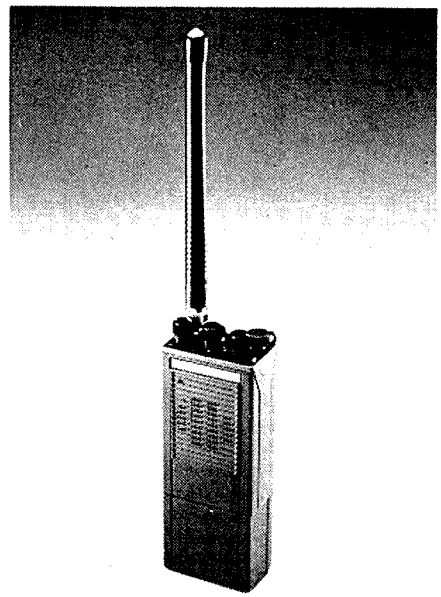
Featuring microprocessor controlled digital technology, DX 1000 covers 10 kHz to 30 MHz continuously, with PLL synthesised accuracy. Yes, that's right! Reception down to 10 kHz. The DX 1000 has ten memory channels to allow for instant recall-or for faster "band-scanning" during key openings. The digital display measures frequencies to 1kHz, or at the touch of a button, doubles as a two time zone, 24 hour digital quartz clock.

The DX 1000 can be programmed to activate peripheral equipment, also, record up to five different broadcasts — any frequency, any mode.

The DX 1000 also includes IF bandwidth selection to help you to separate high powered stations on adjacent frequencies.

The DX 1000 is NOW available at Dick Smith Electronics stores throughout Australia.

AR



D 1404 HAND-HELD VHF MARINE TRANSCEIVER

Just released through all Dick Smith Electronics stores throughout Australia is the D 1404 Hand-held VHF Marine Transceiver.

These units are very compact and provide the diode programming for frequency selection without a need of additional crystals. The D 1404 is high quality for marine craft using from 156 MHz to 162 MHz.

The battery pack slips into the bottom of the radio easily, and various battery packs are available to suit needs for optimum size and longer use.

Features:- 0.5/2.5 W transmitter output power (switchable), High Sensitivity: better than 0.25 uV (12dB SINAD), Capable of all VHF marine channels.

Units come fitted with Channels: 6. 16. 8. 12. 67. 70. 71. 72. 73. 74.

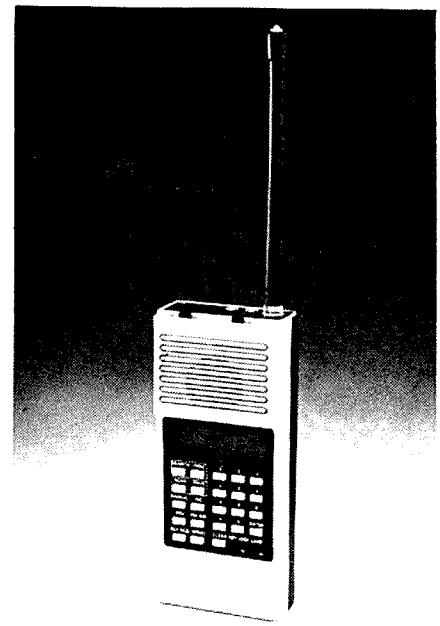
Complete with Nicad battery, No crystals to buy.

For further information contact: Wendy Giles, Public Relations Manager, Dick Smith Electronics Pty Ltd. (02) 888 3200.

AR

HX 2000 HAND HELD SCANNER.

Dick Smith Electronics has available in all stores throughout Australia the new HX 2000 AM/FM Programmable hand held scanning monitor receiver.



Performance is as good or better than from most "fixed" scanners but with the added bonus of being a hand held unit.

Features include:-

20 Channel memories — for full coverage and easy selection

No Crystals Required — Your choice of over 15,000 frequencies just by pushing a button.

7 Bands

Search and Scan — Scan frequencies you have entered or search for exciting new frequencies.

Crystal Liquid Display — Sidelight for night use.

SPECIFICATION:

60	90 MHz (VHF Mid)
118	136 MHz (Air band)
138	174 MHz (VHF Hi)
466	490 MHz (UHF)
490	525 MHz (UHF "T")

Search Frequency increments:

VHF	5kHz, 10 kHz, 12.5 kHz
UHF	12.5 kHz

Sensitivity (12dB Sinad, at tune-up):

Mid VHF	0.5uV
Hi VHF	0.5uV
UHF	0.7uV
Air band	1.0uV (10dB S/D)

For further information contact: Wendy Giles, Public Relations Manager, Dick Smith Electronics Pty Ltd. (02) 888 3200.

AR

NEW COAXIAL SWITCH

Now available from Dick Smith Electronics is the CH 20A Coaxial Switch.

The CH20A is a single pole two output position type coaxial switch.

This unit has been carefully engineered and manufactured under severe quality standards, and will give you satisfactory and dependable operation for many years.

Features: Professionally engineered double cavity layout. Professional RF characteristics.

a negligible insertion loss.
b negligible cross talk.
c super wide frequency range.
d low standing wave ratio.

Mechanically stable switching mechanism and contacts.

For further information contact: Wendy Giles, Public Relations Manager, Dick Smith Electronics Pty Ltd. (02) 888 3200.

NEW MOBILE ANTENNA MOUNT

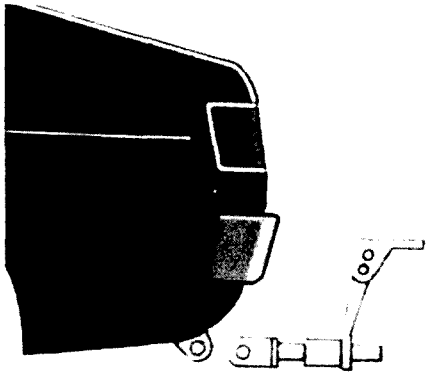
GFS Electronic Imports recently released a new "no holes" mobile antenna mount designed to take the heavy helical and centre loaded whips commonly used in HF operation.

Known as the HS-FB the new mount is designed to take advantage of the towing hook that most modern cars are fitted with today. It bolts directly onto this hook to provide a solid heavy duty mount. Where a towing hook is not available the HS-FB will bolt onto the vehicle's tow bar.

Stainless steel and hot dip galvanising is used throughout the HS-FB's construction guaranteeing a long and useful life. The actual mounting bracket is designed to adjust over an angle of 12 degrees and is drilled to take a ball type antenna base. The ball base is not supplied with the HS-FB.

Cost of the HS-FB is $49 plus $14 p and p. For further details contact the importers: GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic. 3132, or Phone (03) 873 3777.

AR



NEW BOOT LIP MOBILE ANTENNA BASE REQUIRES NO HOLES

The new Hoxin HS-25 mobile antenna is designed so that it secures under the boot lip of a vehicle without the need to drill any holes.

Available through the importers, GFS Electronic Imports, this unique mount offers people who wish to install a two way radio in the car, an attractive alternative to the hole-in-the-roof arrangement that is usually used.

The HS-25 can be fitted in a matter of seconds so that it can easily be transferred from car to car. Its design allows it to take any of the Scalar type antenna bases that are commonly used in commercial two-way, CB and amateur radio circles these days.

Price of the HS-25 is $11 plus $6 p and p. Further information may be attained from GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic. 3132. Phone: (03) 873 3777.

AR

MICROCOMM SX-155 POCKET SCANNER

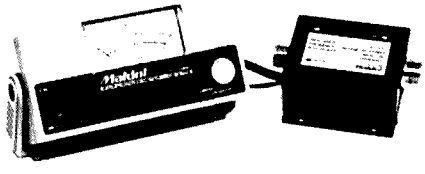
Microcomm recently released their new SX-155 programmable pocket scanning receiver. Manufactured to the same high technical standards as its predecessor, the SX-150, this new scanner offers its potential users a number of advantages.

Enclosed in a sturdy aluminium housing the SX-155 is supplied complete with rechargeable Nicad batteries, battery charger, carrying case and rubber duck antenna. It features an extended battery life of over 4 hours, a better rubber duck for UHF operation as well as lower spurious responses and higher performance. Almost unique amongst scanners, including the larger desk types, is the SX-155's 160 memory channels which are accessed as 4 banks of 40 channels each. Another useful feature is its search and store mode which performs an automatic search and store of active frequencies found while searching between frequency limits. Both its scan and search speeds are set at the rapid rate of 16 channels/second making searches of large portions of a band easy. A priority channel is included as well as user selectable scan and search delays. The antenna uses a low loss BNC Connector.

Other features include an automatic low battery indicator and cut off, a 24 hour digital clock as well as a receive sensitivity of 0.5 uV over its operating range.

Priced at $449 plus $14 P & P, the SX-155 or further information on it may be obtained from GFS Electronic Imports, 17 McKeon Road, (PO Box 97) Mitcham, Vic 3132. Phone (03) 873 3777.

AR



VHF/UHF SWR POWER METER

A new VHF-UHF SWR/ Power meter has recently become available. Known as the HS-370S and manufactured in Japan by Maldol it covers a frequency range of 130 to 450 MHz with extended operation outside this band at reduced accuracy. For convenience of mounting and ease of operation it is designed using two sections, the directional coupler is separated from the main indicator unit.

Power measurement ranges are 0 to 20 watts and 0 to 200 watts while its SWR range indicates 1:1 through to 3:1. Insertion loss of the directional coupler is less than 0.5 dB. For night time operation the meter scale may be illuminated by the connection of a 12 volt power source. The HS-370's directional coupler/indicator cable is 1.6 metres long to allow for wide separation and easy mounting of the two sections. Additionally both are equipped with their own mounting brackets. Size of the indicator is 130 x 62 x 38 mm while the coupler is 70 x 60 x 35 mm.

The HS-370S is priced at $90 plus $6 freight. For further information contact GFS Electronic Imports, 17 McKeon Road, (PO Box 97) Mitcham, Vic 3132. Phone: (03) 873 3777.

AR

HIGH GAIN OMNI DIRECTIONAL ANTENNA FOR 1.2 GHz

GFS Electronic Imports of Mitcham, Vic are marketing a new 1.2 GHz high gain omnidirectional vertical antenna. It is designed for base station operation on the 1296 MHz amateur band where there is now quite a lot of FM activity due to the advent of repeaters.

Known as the GP-1217 it is a 17 section colinear type antenna with an overall height of 1.8 metres. The radiating structure is protected from the weather by an attractive blue fibreglass radome which tapers from 20 mm at its base to 14 mm at the top. The GP-1217's mounting hardware is all stainless steel and chrome plated brass. It is designed to mount on any mast size from 25 mm to 50 mm.

A full operating range of 1260 to 1300 MHz is provided by the GP-1217's flat VSWR and a feed impedance of 50 ohms is presented to its N type connector at the base. Gain is 10.8 dBi.

The current selling price of the GP-1217 is $119 plus $14 freight. For further information contact GFS Electronic Imports, 17 McKeon Road, (PO Box 97) Mitcham, Vic 3132. Phone: (03) 873 3777.

HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

Well my recent remarks about SWLing didn't bring the storm of protests that I thought it might. The only disagreement with my thinking came from Jim VK2BQS, which he describes as a "Zephyr" not a "storm".

Jim does not agree with the requirements I laid down but we are in agreement with one point, that is, the responsibilities of the amateur to reply to SWL reports and Jim on occasions sends the card direct, if there has been an undue delay enroute through the bureau.

Jim is perturbed and thinks that I am a little hard in expecting the details that were laid down in the February issue of AR, particularly with requiring some of the "dialogue" of the QSO. In my possession there are innumerable cards with "dialogue" excerpts noted, also noting the OTH that is given on air which is different to my postal QTH due to the phonetics involved.

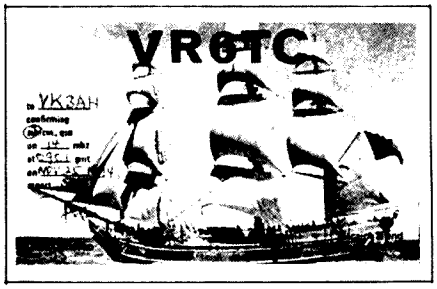
Jim raises a just point but it is felt as do some other amateurs that it has been mentioned to, that the stereo type of SWL is becoming too common. In a contest working at the rate of one or two stations a minute, I have had many cards back listing four or five contacts in order and time. On the other hand I have had many cards noted "Hrd u calling CO" and I have not been on the band at that time or even that day.

Unfortunately it is a problem that is not easy to resolve but I am afraid my line is to expect accurate date time groups and it is felt that some of the dialogue from the station can be copied and noted on the card. Some will term my requirements harsh but I expect more information probably than the average amateur to prove a genuine listening report before a card of my own or on someone's behalf is sent from this QTH and a must is that the log is in my possession before any cards are released.

SWLers take heart, Jim's letter has provoked a lot of thought and has mellowed my initial stand somewhat. Thanks for your constructive remarks Jim.

PITCAIRN ISLAND

New call signs appearing from the smallest British colony are VR6YL and VR6AB. The former belongs to Betty, the XYL of well known amateur and island identity Tom Christian VR6TC. Alastair, a radio technician, is the owner of VR6AB and it has been heard frequently on 40 metres.



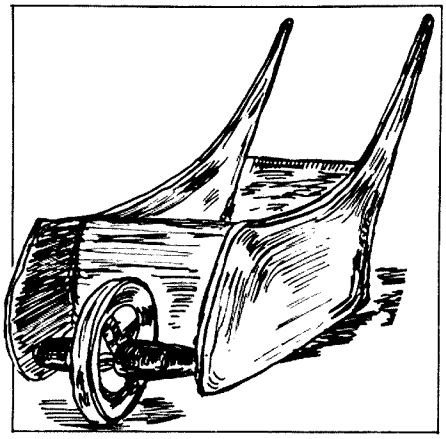
Tom VR6TC's card

Pitcairn is a small rugged volcanic island of about 3.2 km long and 1.6 km wide, with a highest peak of 330 metres named Ship Landing Point, which commands a view of the bay. Pitcairn is located mid-way between Panama and New Zealand and 2500 km ESE of Tahiti. The population has dwindled due to emigration to New Zealand to be around 50 inhabitants that live in the area called Adamstown that is slightly lower than the only small flat area called Flatland.

Public revenue is virtually obtained from the sale of postage stamps that were introduced in 1940 and interest on investments. The small population has approximately 20 children and there are a handful of really elderly people. Every male between the age of 16 and sixty is expected to participate in public work.

Another form of revenue is carving and basket weaving and the arduous journey of 160 km in long boats is necessary to get raw material from Henderson Island for these projects.

Recently the Governor of Pitcairn, Sir Richard Stratton made a visit to the island and presented the inhabitants with a new flag. The new flag approved by Her Majesty Queen Elizabeth II, is blue, with the Union Jack in the top left corner and the Pitcairn Coat of Arms which features a shield with the "Bounty" anchor and the "Bounty" Bible surmounted by the Pitcairn wheelbarrow and bordered by miro leaves and flowers in the colours of yellow, green, pale blue, grey, brown and red, is located in the middle.



An artist's impression of the Pitcairn wheelbarrow

It is believed that this is the only flag in the world to have a Bible portrayed on it and it was raised to the masthead during the singing of the National Anthem at a simple ceremony during Sir Richard's visit. Incidentally Sir Richard is also British High Commissioner to New Zealand and Western Samoa and this was his second visit to the island in four years.

SAUDI ARABIA

HZ1AB is temporarily QRT for the next couple of months due to shifting QTH by all reports and Bob Walsh WA8MOE has resigned from all HZ1AB activities that he undertook!

VE DAY ANNIVERSARY

The special call of GV2HQ has been assigned to RSGB Headquarters to commemorate the 40th Anniversary of VE Day on the 8th May. Other stations will be heard in the week 5th to 12th May with the GV prefix.

RTTY FROM VATICAN CITY

I5FLN and I8AA hope to have RTTY operational on all bands from HV2VO at the end of June or early July. This will probably be a new country to many that use this mode.

SAINT BRANDON

Another one to look for is Taher 3B8DB, who hopes to actuate 3B7 around late June or early July. This is dependent on his obtaining a linear and suitable antennas and of course the necessary documentation.

USSR 160 METRE ALLOCATIONS

The new 160 metre allocations for the USSR appear to be 1.830 to 1.930 MHz on a secondary basis. CW 1.830 to 1.860, CW and SSB 1.860 to 1.900 and all mode 1.900 to 1.930 MHz.

MARION ISLAND

A prediction of the reactivation of ZS2MI turned out to be a "non event" due to the amateur, that was appointed to join the crew for the 14 month stint of isolation, not passing his medical. No operator until next year at least by the looks of things at the moment.

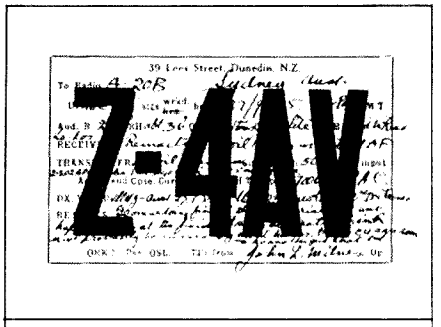
A letter from Wolf Gruellic who was in the 1975/76 32nd Relief Expedition, acting as a Radio/Telex operator, describes it "as a glorious and memorable experience". Any volunteers for next year's team?

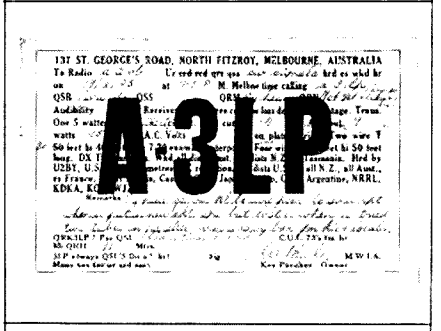
FRANZ JOSEF LAND

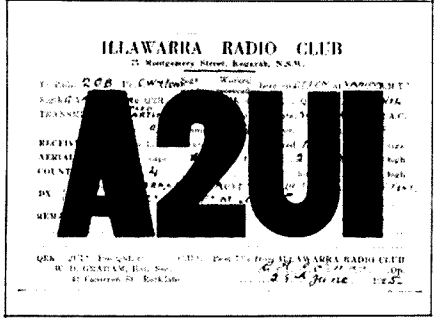
One station QRV from this area is EO1AOK who says he is located on Heiss Island. QSL to UZ1OWA via the Bureau.

CARDS FROM YESTERYEAR

Again are reproduced some cards of yesteryear provided by the courtesy of VK2JM.







THIRD PARTY AGREEMENT

An agreement is being considered by the US Department of State and the Federal Communications Committee for a commital of "Third Party traffic" between the Vienna Centre which houses 4U1VIC and US amateurs. If this occurs it would have to be one of the top priority agenda items, of the new DX Advisory Committee chairman Bob K6SSJ, to have it reconsidered for DXCC status. The DXer always lives in hope!!

Of course there are other areas that could be considered after 4U1VIC such as the Pribilof Islands which has died a natural death.

BOUVET ISLAND

LA4CG was on the island for about one hour on the 28th February. As expected no amateur operation took place. Better luck next year.

LIBYA

Those that may have worked 5A1TK many moons ago and never received a card. There is hope, David is now G3KXI and recently QSLed a 1962 contact. So if you need 5A and have worked David, delve into the old log books and QSL to David Keeler, 14 Honey Close, Hook End, Brentwood, Essex.

SPECIAL CALL YI0AY

The special call YI0AY was allocated to the Arab Scientific Welfare Festival which was held in Baghdad between the middle and end of March with guest operators from A4, HZ, OD and 7X. They had their problems with hostilities prior and during the period.

If you were lucky and really want the card QSL to PO Box 5864, Baghdad and their request is IRCs only. No bureau cards!!

HEARD ISLAND

Heard Island was in the news in March. Lava had been seen flowing from Big Ben by a passing French Fisheries Research vessel heading to the Antarctica from Kerguelen.

Another news item that circulated on most media releases was that the Anaconda II went aground in her home territory, VK5, but was successfully refloated. It can be imagined that the skipper, Captain Grubic, said a few words that couldn't be repeated.

BITS AND PIECES

Andaman and Laccadive Islands activity. Will it be accepted by the ARRL Desk??? ** The PS7ABT/S9 operation will count for ARRL DXCC. A group hope to be QRV on this mode in late June or early July operated by I5FLN and I8AA. ** VK0YL is still work orientated and logs are expected in the mail this month. ** Kimsan XU1SS, has been worked /Mobile. ** Do not waste cards on Mansur EP2KKM who it is believed is a "pirate". ** J4ATC was a special call for a World Air Traffic Controllers Seminar in Athens between the 16th and 22nd of March. ** WA5TKC has the logs for 9F3USA, 9F3USA/P1 and ET3USF. ** ZV9ZZ is located in Brazil. QSL to PY5IW. ** G3EMY ex ZC4RM says that all his operations were within the Sovereign Base Area of Akrotiri. ** VE3KFE/4U is active from the Golan Heights and should be QRV until late August. Another station is OE8AJK/YK who is at the same QTH. ** Number of overseas DX sheets note the activity of VK0GC on 160 metres and other bands. ** A22ME and TE are now QRT. ** By the time you are reading this there is a possibility that Kingman Reef may be a deleted country by the rumours floating around. ** A tip is that Italian stations may be able to increase power later this year! ** Reports to hand indicate that the Indian Government is really making efforts to foster the hobby in that country.

THANKS

Sincere thanks go to the following. The Editors of weekly, bi-weekly and monthly newsletters including the ARRL NEWSLETTER, RSGB DX NEWS, ORZ DX, LONG SKIP, DX FAMILY FOUNDATION NEWSLETTER, WESTLAKES ARC MONTHLY NEWSLETTER, JAN and JAY O'BRIEN'S OSL MANAGER LIST and KH6BZF REPORTS. Magazines including CQ, cqDX, OST, RADCOM, JARL NEWS, KARL NEWS, OZ, 73, BREAK IN and VERON.

Members who have contributed include VKs, 2JM, PS, BOS, EBX, 3YL, G3NBC and L30042. Overseas amateurs include G1EOD, I8SAT and ZL1AMM. Sincere thanks to one and all.

AR

Radio Amateur Old Timers Club

Kevin Duff,
Publicity Officer, RAOTC
10 Stanley Grove, Canterbury, Vic. 3126

The yearly dinner and Annual General Meeting of the Radio Amateurs Old Timers' Club in Victoria was held at the City and Overseas Club on the evening of the 7th of March 1985. There was a good attendance of 56 members including many country amateurs and a number from interstate.

Mac McConnell VK3RV gave a very interesting talk on the first use of electricity for lighting and power in Melbourne including the application of both DC and AC equipment and the advent of the rotary converter, from about 1880 onwards. This was very well received by members.

Max Hull VK3ZS spoke about the production of the OTN Journal and listed some of the events to take place to commemorate the 75th Anniversary of the Wireless Institute of Australia.

Office bearers and Committee for the following year. Murray Clyne VK3HZ, President for the last three years, has tendered his resignation. Nominations for this position were called for and as Max Hull VK3ZS was the only nomination he was duly elected. All other committee members indicated their willingness to serve for the next term and were elected. A vote of thanks was given to Murray for his three years of hard work on behalf of the members. Our long time Secretary-Treasurer, Harry Cliff VK3HC spoke about financial aspects of our Club as did Clem Day VK3GY, the keeper of the membership lists who told us about some of the problems associated with this vital job. John Tutton VK3ZC, in charge of the QSO parties, addressed members about this aspect of our activities. Lay Cranch VK3CF filled us in about successes and problems associated with the monthly first Monday net and also intimated that there is a possibility that people who have held an amateur licence for 50 years or more can take a new call sign. The call could be VM-AAA to VM-AAZ. This has not yet been finalised so listen to the monthly RAOTC broadcast for more news about this. A vote of thanks was given to Lay for all his efforts on behalf of the RAOTC.

Interstate and country members were invited to comment on amateur radio in their areas. These included Bruce Mann VK3BM, from Swan Hill, Frank O'Donnell VK2QC from Ulla Dulla and George Turner VK3GN from Ararat.

David Wardlaw VK3ADW, Federal President of the WIA addressed the meeting about the activities for the 75th Anniversary of the Wireless Institute. This was very well received and a vote of thanks to David was recorded.

The AGM concluded about 10.15 p.m.

AR

RAOTC members will be saddened to hear of the untimely death of long time member and supporter, Dennis Ayre VK3KP. This occurred during the Annual General Meeting and we offer sincere sympathy to his wife and family.

432.440	VK4RBB	Brisbane
1296.171	VK6RBS	Busselton
1296.480	VK6RPR	Nedlands

A few comments about the beacons are in order this month: The first listing is shown for the Nedlands (WA) beacon on 1296.480 MHz, and the Kalgoorlie beacon VK6RTU on 52.350 is being overhauled according to the "WA VHF Group Bulletin". The same bulletin also advises that "VK6RPB is currently under test from VK6WV in Port Hedland. Output is about 5 watts into a vertical. It has an unusual ident sequence: VK6RPB in F1 (ie FSK), then VK6RPB — Port Hedland — PO Box No, then VK6RPB Port Hedland in MCW for FM receivers!

The VK0CK beacon has been removed from the list as David the operator will be returning to Australia soon after these notes are being written. At the moment I am not certain of the future of six metres from Macquarie Island, there has been some talk that Denise VK0YL, the first YL operator from the island, will keep six metres activated, but until something definite comes from David I am reluctant to say what is happening. Next month's notes from me should have something definite on the subject.

David VK0CK certainly did what he could to give amateurs within range a VK0 contact. There were more than 200 six metre contacts made during the two summer Es periods that David was on Macquarie Island, and due partly to the huge dog-piles many operators did miss out on a contact. However, it seems somewhat strange that only about a third of those contacting David have bothered to claim a QSL card from me (his QSL Manager and a stamped addressed envelope with your card is all that is required).

It has been quite an experience for me, a die-hard VHF operator, to go on to 20 metres on Sunday afternoons for the past eighteen months to maintain a sked with David VK0CK. Whilst only sporting an FT101B and a long wire antenna (600 feet long and 40 feet high), contact has been made on almost every occasion, twice we failed due to the "radio blackouts" which are common in the cold southern areas, and one other occasion when there was just too much QRM on the band due to an exceptionally good set of conditions and a contest as well!

Now that David is returning before deciding whether to go south again at a later date, we still have Mark VK0AO (VK5AVQ) at Mawson Base on the Antarctic Continent who is hoping to activate six metres from there. This will certainly provide a test of endurance for the VHF clan, but will more than likely favour VK6 this time, being closer than the eastern seaboard. I am maintaining 20 metre contact with Mark as often as possible, but he has some very difficult problems with interference from the amateur equipment into other equipment on the base, plus return interference to him from the base equipment. Knowing Mark's resourcefulness I am sure he will get everything sorted out before too long and I will be able to advise you of likely operating schedules for the end of the year and six metres.

EME SEQUENCING AND REPORTING

In the world of EME (moonbounce) for many years there have been two main methods of calling and reporting on EME, depending on what band you are operating. At the present it is accepted world wide that on 144 MHz the timing is two minutes receive — two minutes transmit whilst on the higher frequencies of 432, 1296 and 2300 MHz a 2½ minute sequence is used.

Currently there are moves to standardise the sequencing. This is not the first time such a move has been made, but so far universal success has been elusive, with each frequency user thinking the other should change! There is even a suggestion that one minute sequences be used on all bands.

One could argue that with the improvements in technology and better receiving systems that a one minute sequence is all that is needed. This is fine if the signals are well readable, contacts could easily be concluded with one minute sequences. If signals are weak then there are going to be a lot of stations missing out on contacts, the extra time with 2 or 2½ minutes may be all that is required for the identification of a full call sign and/or exchange of signal report. As any DX VHF operator will know, it is not uncommon for signals to change from unreadable to fully readable over a period of one or two minutes during a contact.

A couple of other factors need to be considered as well. The 2½ second propagation delay with the signals travelling to the moon and returning becomes a significant percentage of a one minute sequence. Also, not every antenna system exactly tracks the moon all the time, and there is a need for re-aiming at times! The longer sequence does give some time for this to be done, especially if you are operating on 1296 and above where narrow beamwidths are the order of the day. Some operators on 70 cm rotate their polarisation and it would seem more than one minute would be needed to accomplish this as well as other tasks.

Whilst both sets of bands employ the "TMO5" signal reporting system, some confusion can be caused, particularly to new operators, mainly in the interpretation of the "M" report. "T" is used by both bands to indicate the detection of some signals but with the uncertainty of the exact call sign of the other station. On the other hand, "O" means complete calls are being heard and it is possible to complete a contact, but the level of signals are not sufficient to move up to the next stage which is the usual RST report.

The "M" report on two metres signifies that only one or two letters have been detected and hence it is unlikely a contact can be established both ways. However, on 432 MHz an "M" indicates that enough can be copied to identify a complete call, with difficulty, but still being possible to complete a QSO. Without getting too far out of my depth, one suspects that the "M" system for 432 MHz and above would be nearer the mark than that used on 144 MHz, as surely the "M" on 144 is very close in fact to the interpretation of a "T" report. Those operating EME and using the various systems are the ones who should make up their minds and it is hoped that soon there will be agreement on a suitable system for all bands if only to assist the newcomer. Whatever the reason, I do hope EME operators will give some time and thought to the question, and advise those making the moves of their decision after giving all relevant matters careful consideration.

EME REPORT FROM VK2ALU

From "The Propagator" Lyle VK2ALU reports that EME tests at VK2AMW were carried out on 21/2, 22/2 and 23/2, and consisted of 'fine tuning' the hour angle computer sensing system over the range which was to be used during the programmed 3 hour test period and various other adjustments.

The tests went very well despite the moon not being visible due to heavy cloud cover, echoes were received on the first transmission indicating all systems were working.

Contacts were completed with K2YUH at M/O copy, K4QIF at M/M copy, WB5LUA at M/O copy and VE7BBG at O/O copy. Signal strength at VK2AMW dropped over the last 15 minutes of the 3 hour period and a quick look at the computer readout indicated the dish was 1¼ degrees ahead of the correct position, after resetting the 'tracking' normal echoes returned.

EME REPORT FROM MELBOURNE

Doug VK3UM advises continued success with his 432 MHz EME experiments. On 4/2 at 1030 a sked with VK5MC produced O reports. On 8/2 a random contact with DF3RU was an O report; 24/2: 0935 F1FHI 439/529 random contact; 2/3: 1150 OH2DG random O; 1300 SM5CPD sked O; 1340 DL9KR 539/559 random; 1350 DL9KR SSB 4x4 and 4x4 and exchanged names; 1400 G3SEK sked 439 439; 1416 F1FHN random 439 439.

3/3: 0712 JA9BOH random O; 0735 ZL3AAD random O; 1325 G3LQR random 439 429; 1450 DJ8QL 439 439 but actually peaking 549; 1507 F1FHI random 439 439.

Also on 3/3 2330 to 0000 on 432.1 worked VK1ZIF, VK1BG, VK1BUC, VK1GL, VK1AU and VK2ZAB, with signals varying from 5x3 to 5x6. In addition, Eddie VK1VP can hear VK3UM anytime Doug is on.

SIX METRE STANDINGS

Operators are given advance notice that the next listing is due in the August 1985 issue of "AR". Any changes to your present listing or new listings will need to be on my desk by 15th June for inclusion. Only those people who submit their list in the prescribed manner will be considered! The prescribed manner requires the following information in writing: Your own call sign, date of contact, UTC time of contact, call sign of station worked, country, mode, signal reports sent and received, QSL received yes/no. If contacts were made split frequency 50 to 52 MHz this will help. Please add your signature.

LEARNING TO USE SIX METRES

Although this column is not an advertising medium, there are times when I feel it needs to mention something likely to be of interest to most operators, particularly the newcomers.

The Spring/Summer edition of "6-UP" has two articles which should be required reading for those interested in six metre DX. The first is called "A Tropospheric DX Primer" and the second "Improving Your Chances With Sporadic-E DX" both by Roger Harrison VK2ZTB. Together they give a good insight as

lo what you might expect from the six metre band, in particular, and two metres to a lesser extent.

In addition there is an interesting article on a five over five antenna for six metres by Geoff Moss VK2AHK. The improvement over a single antenna due to the lower radiation angle of the stacked pair can be quite dramatic for long distance signals. I recall around 1976 when signals from Japan on six metres were being received fairly constantly I had a wide spaced 6 element on a 7.6 metre boom on six metres which was capable of outstanding performance particularly on Es signals as they started to fade out. However, I could never ever capture the Japanese stations like David VK5KK could, he was always giving 2 to 3 S points better than I with uncanny consistency. Although David and I were 50 km apart I did not think this was always to David's benefit. In the end I built a similar antenna array to David, being an eight over eight with three quarter wavelength spacing at the same height as the original six element beam.

The improvement was instantaneous! For the first time I could now hear Japanese stations at the same strength as VK5KK, and as we used to spend quite a lot of time talking to one another we were able to compare notes. It was found the stacked pair made little difference on Es signals which was as expected although the signals did seem to hang in for a long time at marginal copy as the Es disappeared. As the peak of the sunspot cycle approached in 1979/80 the system was invaluable for those long distance contacts across the Pacific including no less than four contacts to XE1GE in Mexico. It was not so much the slight increase in gain that I was after as the lowered radiation angle and this has proved invaluable even here in the hills where there are no clear take-offs in any direction. The array is very useful for ZL contacts and I think it would be fairly safe to say I can work ZLs longer than most others in the vicinity. Try a stacked pair!

Should you decide to try a stacked pair on six metres may I suggest you pay very careful attention to the mechanical problems of the installation. Do not underestimate the strength of the wind as it is capable of bending most masts at some time or other. I do not use water pipe because it bends so easily, I use the steel tubing from Hills Industries and at least 50 mm (2 inches) in diameter, and inside this I have another smaller piece of the same material which is a snug fit to add to the structural strength and the two are pop riveted together at frequent intervals. The mast extends below the top of the three legged tower for at least 1.5 metres where it fits into the rotator. At the top of the tower is a piece of good quality jarrah 152.4 mm wide and 304.8 mm long and 63 mm thick mounted on a steel plate the same size but 9.5 mm thick which is welded to the tower. The jarrah is bolted to the steel plate and two bands of galvanised sheet metal about 25.4 mm wide are fixed around the steel plate and the jarrah, two either side of the centre and this acts as a safeguard should the jarrah decide to split through being in the weather. An appropriate size hole in the centre of the jarrah and the steel allows the mast to pass through and provides a fairly wide bearing surface and takes the strain off the rotator when the wind puts side strain on the mast. This method of construction should give a long period of service if you do it properly.

RANDOM JOTTINGS

Conferring with Bob VK5ZRO, that watchdog of the bands, it is confirmed that activity on both six and two metres has been rather quiet this month. There has been the occasional opening to VK2 and VK4 but little else.

Bob VK5ZRO reports the almost nightly contacts with VK5ZRG in Whyalla (220 km) on 1296 MHz are still at very good signal strength. By way of a change however, on the 14th March Bob transmitted 70 cm ATV to VK5ZRG for about 3 hours with similar good results.

On OSCAR 10 on 6/3 Bob VK5ZRO was pleased to have a contact with PJ2MI in the Netherlands Antilles off the coast of Venezuela with the usual 5x5 signals. Bob has now lost count of the number of countries and contacts he has had via OSCAR 10.

A brief contact on 20 metres with Mark VK0AQ at Mawson Base Indicates Mark has had the Mawson beacon on six metres running but some more work is needed to stabilise the frequency and improve the antenna system. He will advise me when the work has been completed. In the meantime Mark is concentrating on getting his equipment in order so as to be able to work through OSCAR 10 which should give him a better chance to gel on the air without the recurring problems of causing QRM to other equipment on the base when he uses 20 metres. During the contact on 17/3 Mark mentioned the temperature was – 10ºC and they were enjoying about 12 hours of daylight from about 0830 to 2030 local time.

As there are no letters this month there seems no point just rambling on, so wishing you good contacts as the winter Es period approaches, and closing with the thought for the month: *"If you have tried to do something and failed, you are vastly better off than if you had tried to do nothing and succeeded!"*

INTRUDER WATCH

Bill Martin, VK2COP

FEDERAL INTRUDER WATCH CO-ORDINATOR

33 Somerville Road, Hornsby Heights, NSW 2077

Good news this month from the DOC. A letter received at this QTH from the DOC in Melbourne goes as follows: *"I refer to your letter concerning intrusion into exclusive amateur band allocations by Russian station 'UMS' . . . Action has been taken to bring this matter to the attention of the Russian Administration and to express our concern at operation of 'UMS' within internationally recognised amateur bands. I am pleased to be able to advise that in this regard, the USSR have recently responded indicating that they have initiated steps to eliminate interference on 14.141 and 21.032 MHz from 'UMS'. The Department is therefore hopeful that the situation will be shortly resolved."*

Good news, indeed! However, we still have to see if in fact the USSR has taken steps, and, as the old joke goes, "I hope they are big ones." Full marks to the DOC on this one.

As I write the column in March 'UMS' is still operating, but I suppose we have to give them time to make the arrangements to QSY. We will be looking at the frequencies in question very hard for the next few weeks.

Some of the more dedicated IW observers will be aware of the rubbish to be found on the 40 metre band in the wee small hours. Recently, I had occasion to be in the shack at about 1730 UTC, and found the following on the band: One AM station; four RTTY stations; three jamming stations, and two amateurs (JA and LZ) trying to fit in somewhere, and not doing too well.

Here is a list of intruders which have been heard between 7.010 and 7.020 MHz, which would have probably interfered with the keen CW operators on the band. This is a short list, and there are many more intruders present on the band: HY8J; LNV; YUX3; XB22' RV3; OBSV; HTCY; VCDB; UMS; as well as Radio Beijing (China). The foregoing, with the exception of Radio Beijing, are all on CW, and are probably trying to masquerade as amateurs, hoping to be lost among the legitimate CW signals. They'll have to do better than that!

A big summary for February last, and many thanks to all who contributed. Let me remind once again, of the IW net. This net is held on or about 3.540 MHz on Wednesday evenings, at 1030 UTC (8.30 p.m. AEST) and 1000 UTC (8 p.m. daylight-saving time). In other words, in summer at 8 p.m. and winter at 8.30 p.m. Everybody is welcome to come in with any enquiries.

Well, I need six more countries for the DXCC, so I suppose I had better go and work them, and get the claim away (HI). See you next month, and good DX.

HAZARDS OF RF RADIATION

The Standards Association of Australia has recently issued AS2772 — Maximum Exposure Levels for Protection Against Radio Frequency Radiation, which reverses and expands previous guidance material for protection against the biological hazards of non-ionising (RF) radiation, issued in 1972.

Medical research during the intervening years, in many countries, indicates that maximum permissible levels of power density much lower than originally recommended are warranted and this attitude has been reflected in the new standard. For the first time, a maximum exposure level has been introduced for the general public, set at one fifth of the occupational level.

Seminars were conducted by the SAA in late March in Sydney and Melbourne covering a wide range of topics including the medical and technical background to the subject, measurement techniques and equipment, reasons for the preparation of the standard and possible further changes envisaged in future editions on the standard. The proposed implementation of the standard in regulations was also discussed. The WIA Federal Standards Co-ordinator, Allan Foxcroft, attended the Melbourne session.

The possible impact of this new standard on amateur operations from both the safety and regulatory viewpoint will be featured in a subsequent issue of Amateur Radio.

Allan Foxcroft VK3AE

FEDERAL STANDARDS CO-ORDINATOR

"An optimist is one who takes the cold water thrown on his ideas, heats it with enthusiasm, generates steam and then forges ahead."

Non-starters are just that . . . NON-STARTERS.

BITS AND PIECES

This month I'd like to catch up on some of the correspondence. I guess I don't have to tell you about holiday confusion (I'm writing this in early January) so you will perhaps forgive me for the delays in answering letters. In fact, I may have neglected to answer a letter or two, and if you haven't received an answer please accept my apologies. I read and take note of all the mail, using a fair bit of it in the column, and I often worry that a particularly interesting letter will get filed in the wrong place, perhaps even used in the column without ever having been answered.

First cab off the rank this time is Quentin Foster, who describes himself as an "ex brass-pounder, VK6QF". Quentin has written periodically over the last few months as he has helped a friend to learn the code for the exams and get established as a brass-pounder. By the sound of things Quentin is one of the best teachers a novice could have, as a sample of his last letter will illustrate:

"After he got his ticket he was very disappointed that he could not get people to talk to him in Morse. He was despondent, but I encouraged him to keep trying. He found that a lot of novices were much faster and he couldn't think what to send. I gave him a format something along the lines that most amateurs are interested initially in RST, name and QTH and then when you have established good contact both ways the field is wide open for casual chat such as rig, antenna, etc.

"He was always concerned that he couldn't copy letter for letter what the operator sent. I explained to him that this was not always possible due to bad sending, QRM/N, etc and after all you weren't in the commercial business of copying telegrams for customers. You could always send WA or AA for repeats, but why waste time asking for repeats on something that was not important and you probably had a good idea anyway of what it was meant to be.

"My reaction to all his qualms and woes was to throw him in the deep end and tell him to start paddling. This he has done and has now emerged as a fairly competent operator . . ."

Quentin's friend is retired, 75 years old, and has had his novice licence for about six months. Quentin's assistance should be an example to all CW operators and his friend should be an example to all prospective ones.

Another old friend, Norman VK4BHJ wrote with several comments on CW operating procedures. One of his criticisms, which I fully endorse, was about the use of R (meaning received and understood) followed by requests for repeats, or used before the callsigns at the beginning of an over. Another concerned the ridiculous "commencing signal", which is insisted on by the DOC examiners but has no significance in amateur CW operations.

Another comment by Norman was:

"If the 60 day rule still is law how is it we continue to call stations in our bands intruders? An intruder is one who enters without permission. The Intruder Watch has stated that UMS is a USSR naval station and therefore has permission to work in our bands, in fact ANY frequency. I am making efforts to try to start a campaign to get this legislation altered. Our service deserves better treatment."

I'm not familiar with all the legislation, and was personally disappointed to find that there is nothing to prevent Japanese or Taiwanese fishing boats from waffling all over the 80m CW allocation — comments from other readers would be appreciated.

By the way, Norman celebrates his Silver Jubilee on 13th June. His original licence was taken out by his father as he was under age at the time. He has some of the original letters from the PMG, inquiring why he asked for 40 metres and why he wanted to work countries outside the UK and what experiments he intended to conduct! Congratulations, Norman, and keep up the good work.

John VK3CVF has had plenty of experience (RAAF, DCA, Bureau of Meteorology) but feels a bit rusty at times and wishes there were some sort of register of experienced operators competent to give procedure checks. I guess we can all recognize a good op when we hear one, and there is nothing to stop us asking for some constructive criticism. One often hears code that sounds like the operator is a hen pecking at the key, but it's difficult to be critical unless asked, so if you have any doubts about your own sending, ASK (or send me a tape). I have just found out how tough it must have been in "olden times", as my kids refer to anything that happened more than about two years ago. I have been fiddling with a homebrew QRP transmitter, and have built a T/R switch box so I can mute the FT102 receiver while sending. Well, for the first time ever I find myself transmitting with no sidetone, nothing to listen to but the clacking of the key. For all I know it sounded like a hen . . .

Ron VK4BRZ filled me in on the number codes used prior to WWII — 1/A 2/U 3/V 4/4 5/E 6/6 7/B 8/D 9/N 10/T — write them out and you'll see how it works. He also suggested that the expression QTHR is a combination QTH and QTR (What is the correct time?).

Tom VK5TL writes that in the early days of his telegraphy career (1918 et seq) PMG message handling required the use of AR to commence a message. Tom says *"the examiners were very much awake and you would find that some of the messages originated from such points as Ardrossan, Arno Bay, and Arncliffe, to name a few"*.

Last comment is on the use of 73s, which came in for some criticism in another part of the magazine a few months ago. Like so many other aspects of CW operation, it's another case of plaguarisation by phone operators. It used to be standard procedure in many telegraphy operations (and still makes sense in a lot of amateur work) to send numbers twice, especially if they occur in the middle of text. Thus you have 73 73 in most CW QSOs, which became "seventy-threes" on phone.

Thanks again to all my correspondents and keep the letters coming!

73 till next month.

AR

ALARA

Australian Ladies Amateur Radio Association

Margaret Loft, VK3DML
28 Lawrence Street, Castlemaine, Vic 3450

As previously mentioned in this column ALARA is 10 years old in July this year. The State Representatives are presently organising a suitable function in their state to celebrate our Birthday.

Bron VK3NTD is arranging a luncheon in Melbourne for the VK3 members, so if you are able to attend please let one of the VK3 members know. Further details as they come to hand.

I wonder if Norma VK3AYL now VK2DJO knew how ALARA would grow in 10 short years, certainly we must thank Norma and her friends for their initiative in setting us on the road we now follow as ALARA members.

NEW MEMBERS

Welcome to new members Valerie VK3CVW; Alma VK3PIP and also welcome back to Josie VK4VAN. We hope you enjoy the friendship that is so much a part of ALARA.

APOLOGY

I must extend an apology to Ian VK2DVJ who won the OM section of our contest last year; unfortunately I put the call sign as VK2DJV or should I blame Murphy. However Ian did get the certificate so all is well.

AGM

This year will be on Monday 26th August. Nominations will be gratefully accepted by Jenny VK5ANW. If you feel you have the time and the ability to offer your services please volunteer. New ideas and new faces are most welcome.

After 5½ years as Publicity Officer and 4 years as Contest Manager I feel it is time to step down. The last few months this column has been harder for me to come up with new topics and I am sure out there is a YL who can give a few hours a month, a new approach will be of benefit to ALARA.

I have gone "back to school" and after many years of thinking about it I am going to try and get a couple of TOP subjects, so will still be pecking away at a typewriter but on assignments instead of articles and secretarial duties. As school work permits I will be joining in on the nets when possible, so will still be keeping in touch.

Until next month 33/73/88 to all.

Margaret VK3DML

AWARDS

Joe Ackerman, VK4AIX
5 Koomooloo Court, Mermaid Waters, Qld 4218

Bill Hempel VK4LC,
FEDERAL AWARDS MANAGER
Southport Avenue, Eagle Heights Qld 4271.

I have finally caught up on all the backlog of work even though I have had to ask some amateurs to kindly help me by providing a list of their countries on a photocopy of the latest DXCC listing from the 1984 Call Book, listing the countries worked in full and in black biro. You may need a photocopy of your records one day if yours is lost. All the DXCC records are kept in lever back folders by states, so you can appreciate whilst computer type listing, while neat, do not fit into the format of the DXCC records. If you are unable to obtain a photocopy please write me with $1 to cover expenses and the pages will be forwarded to you.

My assistant Joe Ackermann VK4AIX is handling all overseas awards and is supplying AR with the relevant details as it is received from overseas.

The WAVKCA award is still the most popular award, 48 have been mailed out in the last two months. I have received many complimentary replies from overseas amateurs who have received their certificate — it is excellent publicity for the WIA.

A proposition has been submitted to Federal Executive that all DXCC credits by certified by two members of DXCC status, or alternatively send the QSLs to the Federal Awards Manager. In the meantime checkers of DXCC QSLs are asked to read the rules of the DXCC and in particular note rule 1.3 "the QSL must show the location or address of the station at the time of the contact".

A second proposition submitted is that FAM be able to call for any QSL. These propositions have been carried over from comments from previous Federal Awards Managers and after my second term as FAM I endorse this submission, we must uphold the status of our most prestigious award.

I have carried over, from the previous awards manager, a new listing for DXCC for RTTY, this award is not endorsable by addition of phone or CW contacts. Three have already been issued. Are there any more?

If anyone has any queries regarding any of the above please contact me direct not over the air, thank you.

AR

Chasing awards is an interesting, lime consuming and at times a very frustrating part of our hobby.

There are awards which commemorate a special event or occasion and which may only require one contact to gain the award. Others need the amateur or SWL to work/hear a Club station and a number of Club members, while some require you to work a number of geographical areas within their country.

A club or an association after a lengthy debate decide that they will sponsor an award. This is the easy part. Now an agreement has to be reached as to what form their award will take. A pictorial one or a design which may be simple or one involving considerable art work.

The rules and requirements also require consideration. Will the applicant need to have QSLs, or will GRC suffice and/or only log extracts be sufficient.

The requirements must provide some degree of difficulty which will result in an achievement in gaining the award.

How much shall the award cost to cover the printing, handling and postage, of course we must have an awards manager.

It is disappointing to receive an award you have strived for and for it to be spoiled by the relevant details to be written in by "a thumb nail dipped in tar". A little effort in filling in the details enhances the award.

From time immemorial man has sought alter trophies and the amateur and SWL are no different in this regard.

Most awards require the applicant to have confirmation of the contacts with QSLs and we all know how hard it is at times to obtain those hard to get QSLs, remember a QSL is the final courtesy of a contact, so "pse QSL".

THE KAUAI AMATEUR RADIO CLUB AWARDS

This Club has made available five awards which are available to amateurs world wide. They are:-

A The Worked Kauai Award (WK)
B The Worked Hawaii Award (WH)
C The Worked Hawaiian Islands Award (WHI)
D The Worked All Hawaiian Islands Award (WAHI)
E The Worked All Hawaiian Counties Award (WAHC)

1 All contacts must be dated 1 January 1980 or later and any band and/or mode may be used. Contacts through repeaters are not allowed.
2 GRC rules apply. Submission of QSL cards is not required. The cards must be checked, and the list certified by an officer of any recognised amateur radio society or club.
3 The calls on the certified lists should be in alphabetical order with the times in UTC.
4 Specific award requirements are as follows:-

WK — DX stations need only three contacts with KARC members.
WH — DX stations need only 15 contacts with Hawaiian stations, including one KARC member.
WHI — Contacts with five Hawaiian stations on each of the following islands: Hawaii, Kauai, Maui and Oahu.
WAHI — Contacts with at least one Hawaiian station on each of the following islands: Hawaii, Kahoolawe, Kauai, Lanai, Molokai, Maui, Niihau and Oahu.
WAHC — Contacts with at least one Hawaiian station in each of the following counties: Hawaii, Honolulu, Kalawao, Kauai and Maui.

Applications should state which award is being applied for and if specific band or mode endorsements are desired.

The KARC will furnish a current membership list upon request — include SASE or IRCs.

All correspondence should be addressed to Awards Manager, KARC, PO Box 548, Kalaheo, Hawaii 96741 USA.

J2 AWARD — DJIBOUTI

First Class: 8 QSOs with J2 stations on two or more bands Second Class: 15 QSOs with J2 stations on two or more bands, any mode but must include 5 OSOs on CW.

Requirements: Any contacts since 27 July 1977 are valid. List of QSOs certified or copy of log extracts with copy of QSLs.

Applications to be forwarded to: Awards Manager, ARAD, BP 1076, Djibouti.

Special note, QSL cards if sent will NOT be returned. Information re this Award supplied by J28DN. Cost 12 IRCs or $US6.00.

BOOKLETS

The following information relates to Awards Information Booklets which are available to award hunters;

The Canadian Amateur Radio Federation issues two attractive awards but there are about 65 awards listed for Canada in a booklet issued by Eric S Walden, RR1, Gowanstown, Ontario, Canada N0G 1Y0, cost $5.00.

The International Directory of Awards — cost $8.00 from Vance LePierre, W5IJU, 2618 McGregor, Fernandina Beach, Florida 32034, USA.

The Amateur Awards Directory of the World from Garry V Hammond, VE3GCO, 5 McLaren Avenue, Listowel, Ontario, Canada N4W 3KI, cost $7.00.

Amateur Radio Awards by The Radio Society of Great Britain available from RSGB, 35 Doughty Street, London WC1N 2AE, UK.

DX Awards Guide by Charles J Ellis, PO Box 1136, Welch Station, Ames, Iowa 50010. He has three different volumes available. Write to him for information and cost.

Worldwide Awards Directory Vol. 1 costs $9.95 and Vol. 2 costs $5.95 or both for $12.75. Write to Larry Kebel KB0ZP, 736-39th Street, West Des Moines, Iowa 50265, USA.

The Directory of Certificates and Awards by The International Amateur Radio Society inc. Available from Scott R Douglas Jr KB7SB, PO Box 9990, Glendale, Cal. 91206,.USA. Cost is $12.95 plus $4.50 for postage and packing.

The WIA 1984/1985 call book lists awards issued by clubs as follows:

VK1 Area — 1	VK2 Area — 9
VK3 Area — 20	VK4 Area — 21
VK5 Area — 5	VK6 Area — 3
VK7 Area — 1	VK8 Area — 5

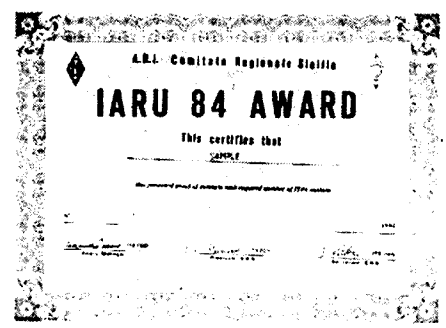
It would be appreciated if awards managers would forward rules and a sample copy of their award for publication in this column.

IARU 84 AWARD RESULTS

The IARU 84 Award was issued by the Regional Committee of Sicily, in order to celebrate the IARU Conference which was held in Cefalu during April 1984.

Over 120,000 QSOs were made by Sicilian amateurs during the month using the special prefix IT84. More than 900 Awards have been sent to 70 countries for amateurs who participated.

Awards were achieved by Australian amateurs, VK4AZA and VK4VC.



WIA 75 AWARD NUMBER 1 CERTIFICATE

A neck injury suffered by Graeme Harris VK3BGH while diving meant he was confined to his home on doctor's orders.

Tuning around the bands he heard WIA members giving out their membership numbers for the WIA 75 Award and decided to give it a go himself.

Graeme said: "This is the first award I have claimed and greatly enjoyed the three days it took during my recent sick leave.

"The WIA is to be congratulated on a well conceived award that must surely promote membership and awareness of our Institute."

He was often heard engaged in friendly but earnest on air rivalry with Kim Wilson VK3CYL, who qualified for the number 2 certificate 24 hours after Graeme, and in a trifecta Gwen Tilson VK3DYL came third.

Graeme VK3BGH is not the only radio amateur or SWL making the award their first "paper chase" because they're getting into the spirit of the WIA 75th Anniversary.

Wireless Institute
of
Australia
THE WORLD'S OLDEST RADIO SOCIETY
75th Anniversary Award

This is to certify ____ has submitted satisfactory evidence of having communicated with the required number of Wireless Institute of Australia members in the 75th year.

On March 11, 1910, wireless experimenters came together at the Hotel Australia, Sydney, in a bond of fraternal friendship and common purpose. They desired to unite for the protection and furtherance of their pursuit. The world's oldest radio society the Wireless Institute of Australia was thus founded.

DATE ____ CERTIFICATE No. ____ PRESIDENT ____

AWARD RULE CHANGE

It has now been made easier for overseas radio amateurs (and shortwave listeners) including those in VK9 and VK0 to qualify for the WIA 75 Awards.

DX stations and overseas listeners can do this in any one of the following ways:

1) Contact the commemorative station VK75A — that QSO automatically qualifies them for the award.

2) Contact (log) any radio amateur who has obtained the award, and log their WIA 75 Award certificate number.

3) Contact 75 WIA members; no more than 30 in any one call sign area, and log their WIA membership number.

SUMMARY OF THE RULES PUBLISHED IN MARCH AR MAGAZINE:

Radio amateurs and SWLs in Australia need to contact 75 WIA members, a maximum limit of 30 in any one call sign area, and obtain their WIA membership number either off their membership certificate or AR address label.

VICTORIA 150 AWARD

The period for this special award to mark the 150th Anniversary of European settlement in Victoria has been extended until 31 December, 1985.

Originally it was only available for contacts up to the 30th of April, but due to demand it will now run an extra 8 months.

To qualify, radio amateurs (and shortwave listeners) need to work (log) a specified number of VK3 stations between 1 November 1984 until the end of the year.

VK3 stations have to work 150 VK3s, other VKs need 15 VK3 contacts, while DX stations including VK9 and VK0 only have to work one VK3.

For this award repeater contacts are permitted, and claims by SWLs are welcome.

A log extract of qualifying contacts must be submitted with each claim for the award.

A QSL card for a single qualifying contact, endorsed with a congratulatory message on Victoria's 150th Anniversary, plus $2 or equivalent, should be sent to:- *Victoria 150 Award, Wireless Institute of Australia, 412 Brunswick Street, Fitzroy 3065.*

HELLO. OLE TIMER

By

D R Sheehan VE2DG

When you lose the thrill of a QSO
With a W-one or two,
When the fact that you're heard in some far distant land
Just don't mean a thing to you.
When sending a card is a burdensome task
And a listeners card is taboo,
It's time you pulled switches and closed up your shack
For there's nothing in this game for you.
When you snub a beginner, when a "chirp" is a crime
And a "QRS" plea you abhor,
You better get out of amateur radio, friend
For there's no fun for you anymore.
I just love to be told, "You're my first, VE2,"
If he only lives over the line;
The pleasure of working a chirpy DC
Is a thrill, boy, to me anytime.
I like to "pipe down", send slow to a kid;
Sure — and tell him his keying is fine,
And when he comes out with that "Pse QSL"
Believe me, the pleasure's all mine.
If you would enjoy this old radio game
Just pause and hark back o'er the years
When if you hooked a "seven", you thought you'd done fine
And to lose him just almost brought tears.
You've got to think back to your lid days again
and remember that this is quite true,
You must do unto others in this Amateur World
As you'd have them do unto you.

— Compliments of W8RHZ
— Spark Gap Times, Jan-Feb 1985

1984 VK/ZL/OCEANIA DX CONTEST

Jock White ZL2GX
NZART CONTEST AND AWARDS MANAGER

FROM THE CONTEST MANAGER

Many thanks to all who submitted logs — especially to those with comparatively few contacts and to whom the prospect of an "award" was very remote.

Once again I stress that logs need not be rewritten and carbon copies are quite acceptable. Only too well do I know the boredom of rewriting a log. Such a task is second only to that of log checking by a contest manager!

Initial planning for the 1984 contest started in 1982 and stopped following a misunderstanding re administration of the '84 contest — and then got under way again in early 1984.

A number of "VK/ZL/O" contest buffs were circularised re the rules to get some consensus of opinion. To get unanimity one would need the wisdom of a Solomon but the effort is always worthwhile.

Scoring is a problem. I cannot accept a system which permits points made on one band to be multiplied by a multiplier made on other bands. Such a system is illogical and mathematically suspect as the score derived bears little true relationship to the value of the contacts made.

Possibly the fairest scoring method was that used in the "old" BERU.

The problem in 1984 was to achieve a fair distribution of points for contacts on different bands — and, I doubt whether those allocated (even after much discussion with experienced contesters) was as fair as it should have been. Further — the value of contacts on different bands must alter as band conditions change from year to year.

I was castigated by one VK who wanted the simple "all in" multiplier system. There are arguments in its favour . . .

i makes checking the scores easier for the contest manager and for the contestant!

ii permits large scores to be developed by utilising multipliers from one band to boost an "all band" score. BUT — the system used in 1984 gives a fairer comparison of multiband operation — IF the points for contacts on different bands are right.

The matter of an "all band" entry is still one for discussion and debate. Just what IS "all band" — or "open" — or, call it what you may! Is it merely "the highest submitted score" — or "a score made up of operation on more than one band?" — on two? — on three? — on four? — on five? The fat is now well and truly in the fire. A perusal of the tabulated results makes the point. On CW, there were only three "all band" scores (the five accepted HF bands) and three on phone. What sort of "bonus" is warranted? Certainly NOT any form of multiplier! I believe this to be the major point to be resolved. I intend giving special certificates to those who submitted "five band" logs.

It is disappointing that some found difficulty with 80 metre contacts. Rule 9c clearly states "contacts between VK and ZL stations" — NOT VK to VK or ZL to ZL which is clearly indicated in 9d when dealing with 160 metre contacts.

This was done specifically to encourage VK to ZL contacts on 80 metres and attention is drawn to some background information . . .

*** *at one time we had a VK/ZL contest for 80 metres only.*

*** *many ZLs are not licensed for HF but can operate on 80.*

Results are tabulated for ease of comparison and set out in "scoring areas" as defined in the rules. I feel that this is not merely a desirable way of presentation but an essential way.

Once again every effort has been made to expedite the promulgation of results. As an old "contester" I'm fully aware of the frustration of waiting —waiting!! It was not pleasant to receive a great deal of "flack" (and some letters with more than mere flack) concerning the late 1983 results for which NZART was not responsible.

I repeat — a growing problem is that of stations operating in an area which is different to that normally considered consistent with the prefix used. It may not be generally known for example that in ZL there could be stations with prefixes of 1, 2, 3, and 4 all operating legally within a "stone's throw" of each other.

Copies of the VK/ZL results and these comments are being posted to all VK and ZL certificate winners.

Copies of overseas results will be sent to all overseas award winners and to major societies.

My thanks to many old contest friends who sent personal greetings with logs. Such fellowship is GREAT!

GOOD LUCK to the WIA with the 1985 contest which is part of the 75th Anniversary Celebrations. You will, as always, receive every co-operation from NZART.

SPOTLIGHT ON SWLing

Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

For many years now I have been hearing stations transmitting on Frequency Shift-Keying (FSK) and the only identification being a single letter sent in Morse. They can be heard in the evenings with the single letter being repeated every three seconds. For example, there is a station on 9.043 MHz with the letter "K" with a 1 kHz shift.

I have been wondering about the purposes behind this signal. It certainly was some kind of direction finding and/or propagational indicator. Recently, I came across an article in an American magazine, written by William I Orr, a respected writer on radio-engineering, on these Single-Letter Beacons (1). This has answered some questions but in turn has raised others.

These beacons use FSK with a 1 kHz shift, which is commonly employed by Soviet and East European nations. There are two beacons operational in different locations, although both are within the Arctic Circle. They also broadcast on a number of frequencies simultaneously. The "K" family of beacons have been pinpointed to the Kamchatka Peninsula near Petropavlotsk and is easily heard here in Australia. Some of the frequencies are 4.005, 7.905, 9.043, 10.570, 11.155 and 18.348 MHz.

The "U" family of beacons are heard here but not as frequently. This perhaps is because of the location near Murmansk. Common frequencies are 7.395, 7.568, 9.056, 10.215 and 12.328 MHz.

Monitors have been giving some time to observe closely the operational patterns for these beacons. To the casual listener, they seem innocous enough, yet a very slight frequency shift of 50 Hz was noted. Orr says that he noted a second beacon, identical to the first, come up 50 Hz higher or lower and the two operated in tandem for about 10 seconds before the first one went off the air. He surmises that these beacons can shift frequency in 50 Hz increments over a band 1 kHz wide to provide 20 possible "channels".

This technique of frequency shift hopping could be indicative of a subcarrier with digital information being superimposed on a normal AM signal. This has been employed over some broadcasting stations in America, where subaudible digital signals (around 80 Hz) are superimposed on the carrier wave, using small-angle synchronous modulation. These subaudible digital signals would not be noticed or interfere with the normal output. Whether this technique is being employed over these beacon signals, one would require a very specialised, sophisticated receiving system to identify the operational sequence.

Occasionally these beacons will burst out into FSK Morse. These are mainly five figure cypher groups, similar to Meteo. However, you may wait several days before you will hear these cypher groups.

Naturally speculation has increased over the purpose behind these beacons. The obvious one, that it is some form of radio direction-finding, can be discounted as such techniques of reliability and accuracy at present do exist such as Loran and OMEGA. Orr says it could be the transmission of tracking and acquisition data on satellites to ships at sea. Probably it is for the transmission of encrypted traffic of a sophisticated scientific military nature and is maritime oriented.

As for stations engaged in clandestine and espionage activities, you can hear stations broadcasting a stream of numbers that does not make sense. This has been going for decades now, and has its origins back in the Cold War. It is usually a female announcer reading five figure cypher groups and is in either German, Spanish or Esperanto. Suspected locations are in East Germany and/or Cuba. The stations do not stick to any one operational frequency or fixed schedule. Some commence with a Martial tune or other music bridge. They often pop up within exclusive allocations and you will hear them rattle off their numbers.

These stations can usually be found near 11.3 MHz around 0530 UTC. They are on DSB or reduced carrier SSB (J3E). They use a five figure pad and it is very difficult, if not impossible to decode. However, in the December issue of "PopComm" (2), Alice Brannigan has written an interesting article on these 5-digit codes. She claims that you could break these codes and decipher the traffic. I personally have not attempted the system, but I would suspect that the traffic would be computer-generated and fairly well advanced that the casual listener would have extreme difficulty in breaking the codes.

And talking of codes, I note in the latest ARRL Handbook (3), the inclusion of the other language Morse codes being used these days. You will hear the Japanese and Russians frequently within the maritime allocations and rarely hear the Arabic alphabet except within the Middle Eastern region. It is good that we don't have to assimilate these other alphabet codes when many of us had difficulty adjusting to the Continental Code for our AOCP examinations!

As from mid-April, the BBC World Service programme "Waveguide" has been re-timed from Mondays at 0915 UTC to Tuesdays at 1115 UTC. This 10 minute feature is primarily designed to help those having difficulty receiving BBC programmes. They also occasionally have mini-reviews of receivers currently available. As well, the listener is kept up to date with any frequency alterations to the BBC External Service schedule. Incidentally, the last BBC relay station to be linked up by satellite-feed, was connected up in mid-March. This was the Ascension Island Relay in the South Atlantic. This ended the direct off-air relay of BBC transmissions from UK sites.

The 39th Edition of the World Radio TV Handbook has now been published. I recently received my copy through one of the DX Clubs. The directory lists all the radio and television broadcasters at present, operating and details of various technical and administrative bodies connected with broadcasting. It is quite light-weight and has all the usual data including a review by Larry Magne on the Icom R71A, the Grundig Satellite 600 and the Uniden DX 100 receivers. Unfortunately, because of the ever-changing nature of the broadcasting and propagation scenes, it is difficult, if not impossible to keep abreast of all developments. The publication of supplementary newsletters will assist this, but I do find the various DX programmes plus the monthly bulletins of the DX clubs, keeps me in touch with what is happening.

The price of the WRTH 1985 should be around $30.00 and should be available from most technical bookshops by now.

Well, that is all for this month. The best of good listening to you and 73. — Robin VK7RH.

QSP

NEW BATTERY

Inventor of the digital watch George Thiess has developed a battery which he says can give an electric powered car a range of about 400kms.

The magnesium and sulphuric acid battery created by Mr Thiess and his partner Jack Hooker is a third lighter than traditional batteries but yields five times as much power.

They estimated the cost of operating an electric car an average of 16,000kms a year would be slightly less than the average for petrol-powered cars at current fuel prices.

Mr Thiess said his electric car: a converted Mercedes 190E, would have a top speed of about 130 kilometres per hour and could accelerate to 97 kilometres an hour in about 15.5 seconds — comparable to typical diesel powered performance.

AR

EVERYBODY — SOMEBODY — ANYBODY — NOBODY

Once upon a time, there were four people named Everybody, Somebody, Anybody and Nobody.

There was an important job to be done and Everybody was sure that Somebody would do it.

Anybody could have done it but Nobody did it.

Somebody got angry about that, because it was Everybody's job.

Everybody thought Anybody could do it, but Nobody realised that Everybody didn't do it.

It ended by Everybody blaming Somebody when actually Nobody could accuse Anybody.

(Telecom News, March 1985)

PACSAT MEETING

A meeting was held at the VITA Headquarters in Washington DC during the 9-10 March involving AMSAT, VITA and UoS. The meeting was followed by a visit to the Goddard Space Flight Centre to view and discuss Get Away Special (GAS) interfaces on the Shuttle.

Presentations were made to the meeting covering most aspects of the proposed PACSAT mission, particularly concentrating on:

- *spacecraft launch opportunities*
- *spacecraft structural design*
- *spacecraft system design*
- *modulation schemes*
- *GAS interfaces and orbit control and propulsion*
- *attitude control and stabilisation*
- *resources and funding*
- *exploitation of the UO-11 DCE as a PACSAT test-bed*

A launch on the Shuttle using the GAS was assumed, although other launch options will be investigated. It was agreed that work with the UO-11 DCE would be accelerated as this experiment, already in orbit, was capable of demonstrating much of the PACSAT concept and could be most effective in raising support for the new mission and in proving technologies and software prior to PACSAT system delinition. It was proposed that, should the appropriate resources/funds be successfully raised, the PACSAT spacecraft would be designed and built as UoS and the Digital Communications Payload by AMSAT/VITA with launch scheduled for 1987. The only restraint on further progress with the PACSAT mission is now the lack of resources and lunds.

SPECIAL EVENT

Congratulations to the Wireless Institute of Australia who are celebrating their 75th Anniversary this year — they were 75 years old on 11th March! Thanks to all members for their support of the UoSAT Programme.

MARCE

The Marshall Amateur Radio Club Experiment (MARCE) is scheduled to fly again on STS 51G slated for May 1986. A procedural error by a Shuttle crew member resulted in the original experiment simply not being turned on. The MARCE Package Is in a Getaway Special but nothing will be deployed from the can. Instead, several active experiments will be performed and telemetry will be sent via the amateur bands from a battery-powered transmitter during specific windows of the flight.

RS SPACECRAFT NEWS

Two RS satellites may be launched from the Soviet Union this year. According to G3IOR who quotes UA3CR, both RS-9 and RS-10 are in Kaluga 200 km SW of Moscow undergoing tests. The frequencies for RS-10 were provided by G3IOR as follows:

Mode A	*145.96 — 146.00 up*
	29.46 — 29.50 down
Beacon	*29.457 or 29.503, 250mW or 1 watt*
Mode K	*21.26 — 21.30 up*
	29.46 — 29.50 down
Robot	*21.140 up 29.457 or 29.503 down*

A third (unnamed mode) transponder may also be included. Its frequencies were specified as follows:

	21.26 — 21.30 up
	145.96 — 146.00 down
Beacon	*145.957*

At present both RS-9 and RS-10 are to be orbited by a single launcher. However, the builders and organisers are thought to be seeking separate launches for each. The desired orbits would be around 2000 km polar circular orbits. UA3CR has built a Mode J transponder for which he is seeking a launch. The current operating schedule for the operational RS's is, according to G3IOR, as follows:

RS-5	Monday and Friday
RS-7	Tuesday and Saturday (Xponder or robot)
RS-8	Thursday and Sunday

DETAILS OF PHASE-3C

The first transponder to be carried aboard Phase 3C will be a Mode B transponder quite similar to AO-10's. With uplink on 70 cm and downlink on 2 metres, It will have about 180 kHz of bandwidth. The frequencies used will be dissimilar to AO-10's to avoid mutual interference. The transponder used could be the actual flight spare which was back-up for the flight unit flown on Phase 3B (AO-10).

The second transponder, if built as planned, is tentatively dubbed Mode JL and would combine uplinks from 2 metres and 24 cm into a downlink on 70 cm. Approximately 50 kHz of the 2 metres band would either overlap or be placed adjacent to the downlink resulting from the 24 cm uplink. Mode J is especially popular in Japan where 2 metre QRM is intense. Mode B, with its 2 metre downlink is not popular in Japan for this reason. Regarding the Mode L portion of the proposed Mode JL transponder, this would have up to 800 kHz of bandwidth and an improved efficiency HELAPS amplifier according to W3GEY.

The third transponder is one proposed by a new group in West Germany and will be a Mode L packet transponder. Details are sketchy but it appears that the packet transponder may use Mode L, require 2400 BPS FSK on the uplink and generate 400 BPS FSK on the downlink.

The fourth transponder proposal is also sketchy but will use 70 cm for an uplink and generate a 13 cm downlink in the vicinity of 2.4 GHz — suitable for a single FM signal approximately 20 kHz wide. The downlink will be at approximately the 2 watt level.

The kick motor to be employed will be identical to that used on Phase 3B. Revisions to the plumbing associated with the MBB 400 Newton motor, however, will be designed to reduce the risk that unexpected low temperatures as experienced with the Phase 3B launch could preclude kick motor retiring. Loss of helium probably due to very cold temperatures is thought to have contributed to the inability to reignite the Perigee kick motor on AO-10.

The Phase 3C bi-propellant system will be similar to the Phase 3B fuel and oxidiser but will improve the specific impulse by 10 somewhat for the anticipated increased total mass of Phase 3C. The Ariane launcher will place P3-C in a geo-synchronous transfer eclipse with zero degrees Inclination. AMSAT then has to raise the Perigee from its perilously low point of a few hundred kilometres to a stable orbit and then accomplish a sizeable plane change from zero to approximately 60 degrees.

The antennas will be reworked but the other key sub-systems will be identical to that flown of AO-10 or quite similar — many sub-systems such as the IHU, BCR and SEU are already built (as flight spares for Phase 3C) and need only be verified and integrated.

AO-10 SPRING SCHEDULE

AMSAT has announced a new operating schedule for AO-10 which will go into effect at 0000 UTC on 1 April '85. The new schedule responds to the changes in sun angle now being experienced and also includes provisions for thermal consideration which will become Increasingly important. The new schedule mean anomaly points for switchover are:

032 — 119 Mode B
120 — 137 Mode L
138 — 200 Mode B
201 — 031 Off

Tnx to UoSAT for all the above items.

OSCAR 10 SCHEDULES

Information to hand indicates that due to the eclipse that will be experienced over the next six months by Oscar 10 there may be revisions to the operating schedule, on a month by month basis. Therefore it is highly recommended that readers listen in to the AMSAT Australia net on Sunday evenings for the most up-to-date schedule.

REQUEST FOR ASSISTANCE

The following request has been received from Ross WB6GFJ/VK4BZZ.

WB6GFJ is requesting help from all those on any of the OSCAR or RS satellites. A collection of 35 mm color slides is being collected to make a programme of those stations on the satellites. This programme will be also reproduced onto VHS and BETA video if enough interest is shown, and the video would be made available through the AMSAT video library.

Here is what stations need to do. Send two or three GOOD, CLEAR, 35 mm color slides. One slide should clearly show most of the person's stations, and if possible include the person operating their equipment. If necessary, send one slide of equipment, and one of the operator at the rig. The last slide should show the OSCAR antennas. If a person has something unique about their station, or may have slides of an OSCAR DXpedition, please include one or two of those also. In other words, please send more than the minimum number of slides requested, if you wish.

Send your slides to: Ross Forbes WB6GFJ, AMSAT Co-ordinator for North Central California, Post Office Box 1, Los Altos, CA 94023.

We would like slides from stations all over the world, and will make video tapes available in PAL and SECAM format if there is interest overseas.

UPS AND DOWNS

From Bob VK3ZBB we have the latest satellite activity. Thanks Bob.

SATELLITE ACTIVITY FOR PERIOD DECEMBER 31 1984 TO JANUARY 31 1985

LAUNCHES

Unfortunately there has been a significant curtailment in the release of orbital elements and mission details for satellites launches since the commencement of 1985.

The only information available is given below:-

1985-001A	Sakigake		Launched by Japan on 8 Jan. An interplanetary probe *with heliocentric orbit and the following parameters:* Inclination 1.448°, perhelion 121.706 million km, aphelion 151.415 million km, period 318.6 days.
1985-002A	Cosmos 1616	USSR	Launched Jan 15.
1985-003A	Cosmos 1617	USSR	Launched Jan 15.
1985-003B	Cosmos 1618	USSR	Launched Jan 15.
1985-003C	Cosmos 1619	USSR	Launched Jan 15.
1985-003D	Cosmos 1620	USSR	Launched Jan 15.
1985-003E	Cosmos 1621	USSR	Launched Jan 15.
1985-003F	Cosmos 1622	USSR	Launched Jan 15.
1985-004A	*Molniya 3-23*	USSR	Launched Jan 16.
1985-005A	Cosmos 1623	USSR	Launched Jan 16.
1985-006A	Cosmos 1624	USSR	Launched Jan 17.
1985-007A	Horizont XI	USSR	Launched Jan 18.
1985-008A	Cosmos 1625	USSR	Launched Jan 23.
1985-009A	Cosmos 1626	USSR	Launched Jan 24.
1985-010A	STS 51-C	USA	Launched Jan 24. On board Discovery were astronauts E Payton, E Onizuka, T Mattingly, L Shriver and J Buchli.

WANTED ARTICLES

Write up your pet project or technical idea so others may share your knowledge through the pages of AR.

CONTESTS

FEDERAL CONTEST MANAGER

P.O. Box 1234, GPO, Adelaide, SA 5001.

CONTEST CALENDAR

MAY	
4- 5	*County Hunters SSB Contest*
4- 5	*G-QRP Club SSB Activity*
4- 5	*Florida QSO Party*
18-19	*ARI International Contest*
25-26	*CQ WW WPX CW Contest (rules April)*
28-29	*CLARA AC/DC "Mystery"*
JUNE	
8-10	*VK/ZL RTTY DX Contest*
15-16	*All Asian Phone (Unconfirmed)*
22	*ARRL Field Day Contest (Unconfirmed)*

Amongst the correspondence received are several letters from operators recently licenced, who state that whilst operation in contests sounds as though it could be an interesting activity they are not too sure how to go about participating in a contest. I will attempt in this column to provide some fairly basic information for both experienced and new contesters.

Contests are run for various reasons, some serious and others not so serious depending on your points of view. An example of a contest run for a specific purpose is the Field Day Contest. Many national societies run such in an endeavour to encourage their members to become skilled in setting up portable stations such as would be needed in an emergency situation. Another type of contest which can be regarded very much as a fun contest is the type of international DX contest where the aim is to try and contact stations in as many different countries as possible or work as many different prefixes as you can. Then again there are the 'specialist' contests such as VHF/UHF only, RTTY, SSTV etc. Many contests are also run specifically to cater for sectional interests such as CW only or Phone only.

The most popular contests are generally those run by the major international societies such as the American Radio Relay League (ARRL) or well known international magazines such as 'CQ' magazine, although many smaller special interest groups and local clubs in many countries organise contests to suit their varied interests. There is hardly a weekend which goes by when there is not some contest being held somewhere in the world.

Here in Australia the major contests run by the WIA are the John Moyle Memorial Field Day, the Remembrance Day, the VK Novice and the VK/ZL Oceania contests. Each of these include HF operation with also VHF operation in the Field Day and Remembrance Day Contests.

The Ross Hull Memorial Contest is another exclusively Australian contest and is of a specialist nature involving only VHF/UHF bands. Information as to when these contests are held appears regularly in this column as well as the various rules which apply.

Most contests include various sections such as Phone, CW and Open. The Open section usually means a mixture of two or more modes being operated by any station. There are sometimes different categories such as single band or multi-band operation as well as single transmitter or simultaneous multi-transmitter operation. For this latter category comes the term 'Multi-multi' which you will hear being used by some of the more knowledgable contesters.

To enter into a contest is in practice a very simple matter. First of all, and MOST IMPORTANTLY, it is necessary to read the rules for the contest in which you intend to operate and ensure that you understand them properly. Generally speaking most rules for contests are fairly straightforward and require the application of just a small amount of commonsense. However, if in doubt it would pay to ask some experienced contest operator for clarification of any item you don't quite understand. The rules will explain just what is required of entrants for the contest from when it is to be held, what bands may be used, the modes allowed, how the log sheet must be laid out and just what the operators must do to be able to claim a contact in the contest. Other items might include details of multipliers to be used for scoring, points to be claimed for particular types of contacts as well as details on where to send your completed log.

So as to prove that a contact has taken place it is usual that stations operating in a contest make an exchange of serial numbers, words or some other cypher and this exchange is recorded in the log of each operator. In this way the contest authorities are enabled to check an individual log against other logs sent in thus authenticating the fact that the claimed contact took place. One quite common form of exchange is known as the RST Serial Number system. With this method the station must send and receive the usual RS(T) report followed by a serial number, usually of three figures, normally commencing with 001 and increasing by 'one' for each successive contact. For example, if the report for the first station worked was Readability 'Five', Strength 'Seven', and Tone 'Nine', you would send the Serial Number 579001. If you were the 'ninth' contact made by the other station and you were RST559 his number to you would be 559009. In some contests this system is not used and instead the exchange might include a number representing your age, ITU Zone or CQ Zone Number or even the input power to your transmitter. The variety of exchanges seems to be limited only by the imaginations of the contest organisers. Again, if in doubt, ask someone else who can explain it all.

One fairly obvious way to gain a further understanding of how operation for a particular contest is carried out is to simply listen for a while to some of the other stations taking part in the contest in question. If there happens to be more than one contest running during a particular weekend, which can happen, this approach might be confusing, however if you enter into a contest and begin sending the wrong type of serial numbers to another station he will probably let you know that you are making a mistake.

The aim in most amateur radio contests is usually to make as many contacts as possible in a given time. One VERY important matter in operation is you should be not only fast but ACCURATE in all your logging. This includes such details as time of contact, station call signs, number exchanges etc. It is also most important that log entries be completely legible.

It is almost inevitable that during the course of a contest the operator or log-keeper will make some mistakes which cause the need for an alteration to the log sheet. Such alterations can mean that a log can become somewhat of a mess in-so-far as its tidiness is concerned. An excellent way to overcome this problem is to spend a little time after the contest tidying the log up. To do this all you need is to make a copy of the original, obtain some of the correcting fluid currently freely available for use by such people as typists and use this to 'while-out' the offending sections of the log. Having done this you can use the information from your copy and re-write the corrections neatly. You can then provide a very neat finish to all of this by making yet another copy of the now corrected version as the 'white-out' material on the page will not show up on the sheet which comes out of the copying machine. It is certainly worthwhile going to this kind of trouble as under most contest rules untidy or illegible logs can be disqualified and should this happen all your effort of operating in the contest will have been in vain.

Most good contest operators are those who have spent some time observing other good operators at work. Make your own assessment of what you consider to be good operating. You may consider it to be making contacts as fast as possible. If this is the case your approach may well be wrong. Listen again. *Is that really fast operator going so fast that he slurs his words and phonetics? Does he use correct phonetics? Can you pick out obvious mistakes that he makes as he goes along, particularly when you hear him read back the numbers given to him by another station which you can also hear and you observe that he has those numbers wrong?* If this happens he is obviously not a good example to follow. The good operator works at a steady pace with clear enunciation, not becoming excited, using correct phonetics and being patient when he is asked to 'say again' his call sign or other information needed. So try and pick an operator who is setting a good example, listen to him for a while and then do your best to emulate his method. Remain calm and alert to what is going on about the frequency and don't be too afraid of making mistakes. If you are methodical you will find it fairly easy to correct any mistakes you make as you go along. If you know that you have made an error and yet have completed that contact containing the error don't panic. Simply place some kind of identifying mark against that contact. The chances are that you will soon hear the station again who should be given the corrected information and in most cases the operator at the other end will be only too glad to receive the correction as without the correction his log also carries an invalid contact which may be disqualified. Should you make the common mistake of duplicating serial numbers simply indicate clearly on your log that such duplication exists. This allows the contest manager checking the logs to sort out any problems which may arise, helps the other operator who otherwise may have contacts deleted from his log by the manager and in most cases the contest manager will appreciate such an indication and will be unlikely to disqualify those contacts with duplicated numbers.

Most contest operation simply needs just a modicum of commonsense. So don't be afraid to give it a try. Start off simply and don't expect to win the very first contest that you enter. Might I humbly suggest that you look back over the columns which I have written for this magazine since last September in which I have tried to provide you with hints on contesting, making up of logs and check sheets and generally training yourself to become a good contest operator. No one else can do this for you, it simply needs you to have a proper approach to the problem and the patience to put ideas into practice over a period of time. It is not the purpose of this article to spell out in great detail all the information which could be written about contest operating but simply to encourage you to try your hand at an aspect of our hobby which can become one of great fun and certainly one of real challenge. You can in fact enjoy the fun of virtually competing against yourself as you improve your own capabilities as an operator.

Once again might I suggest a few important points which should be kept in mind. Firstly, read the rules thoroughly and ensure that you do understand all that is written, then follow all instructions in the rules **to the letter.** This includes layout of logs, type of contacts, exchanges, timekeeping, making out of summary and declaration sheets, marking of entries with the contest names, endorsements on the outside of the mailing envelope as called for, etc. Also, ensure that your log is mailed with the correct address and postage in plenty of time to reach its destination by the due date for entries.

Give contesting a try. I am sure that you will learn from the experience and you may well enjoy it so much that you *will become one of those regular contesters* whose call sign eventually becomes one of those immediately recognised worldwide.

ROSS HULL MEMORIAL VHF CONTEST 1984

This year the participation in the Ross Hull Contest was most disappointing with a total of only seven competition logs and one check log received. The rules had been especially framed to encourage interest and operation, however this contest certainly seems to be a dying event. I have suggested in my report to the 1985 Federal Convention that some thought might be given to the disbanding of this contest. It would seem rather

a pity should this happen, however there may be a better way to pay honour to one of the pioneers of radio acknowledged world wide and one who was also an Australian. Despite the poor level of entries the competition was really keen as can be seen by the scores. The winner for 1984 is that very well known experimenter and VHFer Les Jenkins VK3ZBJ. The result however could not have been closer as Les won the contest by only one point ahead of "The Kid From Coolaroo", VK3ZHP. With such a result it seems almost a pity that both could not have won, and that is not intended as taking away any kudos from the winner. It is interesting to note that VK3ZBJ and VK3ZHP both worked all VK call areas with the exception of VK9 whilst VK3ZHP worked ZL1, 2, 3, 4 and 7 and VK3ZBJ ZL1 and 2. Both logs submitted were very neat with the log from Les actually outstanding in this respect. In fact all the logs submitted were of good standard. The win for Les as outright winner is for his operation in the seven day phone section. You will note that there is a tie for first place in the two day phone section with both VK3ZHP and VK3ZYN featuring in the dead heat. In this contest it is obvious that VK3ZHP had put in a magnificent effort and both he and Peter VK3ZYN are to be well congratulated.

VK2QF entered the two day section for 6 and 2 metres only and came out the winner of that section.

Complete details are as follows:-

Call	7 Day Pts	2 Day Pts	Section
VK2QF	-	620	3
VK3YRP	718	320	3
VK3ZBJ	3780	1128	1
VK3ZHP	3779	1314	1
VK3ZYN	3380	1314	1
VK7DC	496	148	1
VK7ZAP	273	99	1

Check Log VK3ZEM

Together with the logs I received some well reasoned letters from VK3YRP, VK3ZYN and VK3ZBJ providing comment on the contest. If you have any comment on the Ross Hull Contest, particularly if you would like to see it continue, please let me know.

DATES OF CONTESTS

By the time you read this the Annual Federal Convention will have come and gone. Behind the scenes there has been a lot going on particularly with regard to contest dates. I had hoped that by now we would have been able to see our Field Day and VK Novice Contests changed to more suitable times in the year. Discussion at the Federal Convention will see this matter sorted out although it is most unfortunate that it now cannot be before 1986 for such to be resolved even though suggestions to make changes were made over a year ago. The VK Novice Contest will thus still have to be held in September right after the Remembrance Day Contest which will undoubtedly mean very few logs entered in the Novice Contest again this year. *Maybe you could prove me wrong on that point eh???*

CERTIFICATES

By now all outstanding certificates should have been received. Catching up on this has meant a great deal of work, in the order of 138 certificates. This is made up as follows:-

Novice '82 — 8. '83 — 7. '84 — 6.
Remembrance Day '83 — 32. '84 — 63.
Field Day '84 — 18.
Ross Hull '84 — 4.

I must admit to being somewhat concerned about the matter of issuing certificates in such cases where there is only perhaps one entry, and a small scoring one at that, in a section of a contest. I have also mentioned this matter in my annual report and thus hope soon that a firm policy will be decided. Incidentally if you believe that you have been entitled to a certificate and have not received one please let me know.

The months of May and June usually seem to be times of lull as far as major contests are concerned. The CQ WW WPX Contest is on for keen CW operators and in this issue are the rules for one of those specialist contests referred to above, namely the VK/ZL 1985 RTTY DX Contest. I would encourage all RTTY operators who can to support this contest which is run by Australian RTTY enthusiasts for your benefit.

I have not received any details of the rules for the All Asian Phone Contest which I anticipate may be held on the weekend of 15 and 16th June. I do note however that according to the WIA 75th Anniversary Calendar the All Asian CW Contest will probably fall on the same weekend as the Remembrance Day Contest in August.

One final comment. As we are now getting well into our late autumn it may be a wise thing to make those last minute maintenance checks on antenna systems which we may have been putting off, as the winter cold and wet can certainly cause problems if joints etc are not solid and waterproof. One well known saying amongst amateur operators from some years back was *'If the antenna system stayed up all winter it wasn't big enough'.*

Rules for the All Asian Contests arrived too late for inclusion in this issue, however they will appear next month. Dates are . . .
PHONE: 15-16 June 1985.
CW: 24-25 August 1985

VK/ZL 1985 RTTY DX CONTEST

TEST PERIOD: Saturday 8th June 1985 0000 UTC to Monday 10th June 1985 0000 UTC.

- Not more than 30 hours of operating is permitted for single operator stations. Non-operating periods can be taken at any time during the contest.
- Multi-operator stations may operate the entire 48 hour contest period.
- Summary of operating times must be submitted with each score.

BANDS: Use all amateur bands 3.5: 7: 14: 21 and 28 MHz.

CLASSIFICATION: (a) Single Operator (one transmitter), (b) Multi-Operator (one transmitter); (c) SWL Printer.

MESSAGES: To consist of RST, Time, UTC and Zone.

SCORING: As per CARTG Zone Chart, multiplied by the number of countries worked, multiplied by the number of continents worked (maximum six).
After the above calculations, world stations add 100 points for each VK/ZL station worked on 14 MHz, 200 points for each VK/ZL worked on 21 MHz and 300 points for each VK/ZL station worked on 28 MHz. *(Example: 720 points from zone chart x 29 countries worked x 5 continents worked = 104,400 points plus 6VK/ZL stations worked on 14 MHz (that is 600 points) giving a grand total of 105,000 points. A station may be worked only once on each band, but may be worked on another band for further multipliers.*

COUNTRIES: Country count as per ARRL list of countries, except that each

Below . . .
The 1984 WIA Contest Champion, Robert Harris VK3XQ proudly receives from Victorian Divisional Secretary, Des Clarke VK3DES, his trophy. He won the championship by scoring the highest aggregate points based on performance in the WIA's four major contests — JMMFD, RD, VK ZL, and Novice.

	VK, ZL, JA, VE, VO, W/K districts count as separate countries. Contacts with one's own country count as zero points for multipliers.
LOGS:	Logs must show in this order: Date, Time (UTC), Callsign of station worked, Serial number sent, Serial number received, Points claimed.
CLOSING DATE:	Logs must be received by the Contest Committee by 1st September 1985. The address for logs is: W J Storer VK2EG, 55 Prince Charles Road, Frenchs Forest, NSW, 2086.
SUMMARY SHEET:	Summary sheet must show, call sign of station, name of Operator/s, and address of same, bands used (a separate log is required for each band), the points claimed for each band, number of VK//ZL stations worked, total points claimed and signature/s. Multi-operator station logs must contain the signature and call sign of each operator.
AWARDS:	Awards will be issued for 1st, 2nd, and 3rd on a world basis and also on a country basis.

The judges decision regarding the placings in the contest will be final and no correspondence will be entered into regarding same. The logs become the property of the Contest Committee on completion of checking.

This contest is now being organised and conducted by the Australian National Amateur Radio Teleprinter Society, PO Box 860, Crows Nest, NSW.

AR

See previous page for Exchange Table.

RADIO HUNT TO CELEBRATE LIBERATION DAY, 8 MAY, 1985

By the way of international radio waves, this Radio Hunt aims at establishing contact between amateur radio operators and also licensed Scout groups throughout the world in order to commemorate Liberation Day, 8th May, 1945.

Directing and co-ordinating this effort is the **Norwegian Sailors War Veterans International** [Norges Krigsseilerforbund]. This association has appointed a committee to oversee the logs, issue diplomas and to make a final report to the Board of The Norwegian Sailors War International [Norges Krigsseilerforbund].

The Radio Hunt starts on Wednesday, 8th May 1985 at 1200 UTC and continues for 24 hours to 9th May 1200 UTC.

The Radio Hunt is open to all radio amateurs throughout the world as well as Scout groups who can obtain eligibility by using a licence-holding radio amateur.

Two categories are eligible:

a Individual Station.

b Scout groups holding licences [or groups that have obtained user permission].

Bands/Modes: 20 and 80 m SSB and CW.

The call for the hunt for SSB: **"CQ — Sailing for Peace — Radio hunting Norwegian Sailors War Veterans International"** followed by the amateurs call sign. For CW users the call is: **"CQ Sailing for Peace."** [CO SPT]

In the QSO give a control number in the normal contest way. The starting number should be 001.

Scores as follows:

a 1 point for a new station on each band and type of emission. Each new country [ARRL list] counts as one multiplier. To get the test diploma you must have at least 15 multipliers.

b QSO with the stations LA9PA, LA3R and LA2C counts as 3 points on every band/mode and the very first contact counts as 3 multipliers.

Separate log sheets must be used for SSB and CW contacts, but the numbering should be continuous.

Illegal operation or bad amateur behaviour will not be tolerated.

Logs must be sent to:
Norges Krigsseilerforbund, PO Box 144, 0102 Sentrum, OSLO 1, NORWAY, by post before 15 June, 1985.

Norges Krigsseilerforbund will award participants with 15 multipliers or more with an exceptional diploma.

There will also be special prizes for the stations with the highest score on SSB/CW on each band and the same to the Scout stations.

AR

THE INTERNATIONAL SW RADIOCOMMUNICATION CONTEST "PEACE TO THE WORLD"

Object: To strengthen friendly relations among radio amateurs of the world, increase their sportsmanship and provide the corresponding conditions to fulfil the requirements for the diploma offered by the Radio Sport Federation of the USSR and the E T Krenkel Central Radio Club of the USSR.

Promoter: The Radio Sport Federation of the USSR.

Contestants: The contest is open to radio amateurs and listeners from all over the world.

Groups of contestants: A Single operator, single band. B Single operator, all bands. C Multi-operator, all bands, single transmitter. D Listeners.

Contest period: The contest "Peace to the World" is held from 21.00 UTC, Saturday 11 May to 21.00 UTC, Sunday 12 May 1985.

Bands and modes: QSOs may be carried out by CW and Phone with a single sideband modulation on bands 3, 5-7-14-21 and 28 MHz, as well as through radio amateur satellites with retransmission from 144 MHz to that of 28 MHz. QSOs through satellites are judged as those made on separate additional bands with multipliers attributed for them.

No cross mode (phone-CW) is allowed.

Contest call — CQ-M (Peace to all).

During the contest QSOs may be carried out only within the following amateur band allocations:
CW: 3.505-3.600, 7.005-7.040, 14.010-14.100, 21.010-21.150 and 28.010-28.200 MHz.
phone: 3.600-3.650, 7.040-7.100, 14.150-14.350, 21.200-21.450 and 28.400-29.100 MHz.

Check numbers: During QSOs contestants exchange their check numbers composed of RST(or RS) plus QSO numbers (Ex.: 579001 or 57001).

Scoring: a/ Each QSO made within a continent scores 1 point, QSOs between continents scores 3 points. b/ Listeners are judged as follows: one-way QSO receiving scores 1 point; 2-way QSO receiving scores 3 points. c/ Repeated/receiving/contacts with the same radio stations are judged only as those made on different bands irrespective of the mode of operation. d/ A QSO mode within one's home country is judged only to obtain a multiplier with no scores to be awarded.

Multipliers: a/ The number of countries and territories of the world required for a multiplier is determined by the diploma list "R-150-S". b/ For one country/territory/ worked is given one point for a multiplier on each band. c/ Total multiplier is the sum of multipliers obtained on all bands.

Total score: Is the sum of points gained by a contestant on all bands multiplied by a total multiplier.

Winners and awards: a/ Winners are determined separately in each group of contestants: among the contestants of each continent; among all the contestants; among the contestants of each country.

Reporting procedure: The promoter of the contest "Peace to the World" kindly asks you to submit log sheets, irrespective of the number of points obtained, by 1st July 1985 to the following address:
CQ-M Contest Committee, PO Box 88, Moscow, USSR.

CLUB CORNER

THE WIA 75TH ANNIVERSARY HAMFEST

Will be held at the Montrose Yacht Club, Hobart on 8th and 9th June 1985. Amateur radio — yesterday, today and tomorrow will be the theme.

There will be a RTTY display, satellite communications, home brew section, QSL card display and more.

AR

DALBY AND DISTRICT ARC

Last October members of the Dalby and District Amateur Radio Club were invited to provide radio communications for the "Chronicle" sponsored Road Runners Marathon held in Toowoomba. We maintained direct contact with all check points and the roving station kept the organisers and public informed on the runners' progress.

As a result of our proficiency at this marathon Radio 4AK requested our assistance in the King of the Mountain race on 23rd March. This race commenced at Withcott which is at the foot of the Toowoomba Range and proceeded up the range into Toowoomba.

5th May will see us portable again. This time in the Kogan district at a Motor Bike Enduro.

Margaret Schwerin VKLAOE
Publicity Officer

GOSFORD SUCCESSES

The Gosford Field Day was another outstanding success this year. As well as the usual line up of regular trade stalls there were the added attractions of a packet radio demonstration and a satellite link for domestic TV. The latter, designed by Vic Barker VK2BTV of Gosford, is being marketed by Dick Smith Electronics. And for those who wanted to get amongst the second hand gear there was a large "disposals" array. Unrealistic prices expected by some of the vendors made the purchase of new gear at slightly higher figures a viable alternative and one stallholder smiled as he claimed that $22 000 had passed across his table during the day.

Most visitors seemed to go away with an armful of something or other, many getting in on the now popular 70cm equipment for amateur satellite work. Despite the claim by some that "there was less people this year", Dick VK2BBK logged out over 900 cups of tea and said that he had run out of milk, biscuits and cups by the day's end. One wag remarked that there was no possibility that the food stall would run out of steak sandwiches. It had something to do with the meal quality they say.

The OSL Bureau did a roaring trade but it was surprising that so many people, including quite well known names in WIA circles still have no idea how the system works.

On the prizes front, Ross VK2ZRQs son took a big share of the pedestrian events but it was good to see another contender put in a good showing. This was Ian Rodenhuis son of Paul VK2AHB who took away some very good looking prizes as well. He managed it all on his own as his dad was busy trying to interest would be travellers in the excellent range of amateur radio tours to Japan.

Tee shirt sellers got right amongst it and cleared almost all the stocks while Beryl VK2DVL did a magnificent job twisting arms to sell a big bundle of raffle tickets. The reptile park was a good refuge for many.

Nev VK2HT had a broad grin at landing the much sought after mobile scramble.

ATTENTION NEW WIA MEMBERS

During the Wireless Institute's 75th Anniversary Year 1985 a number of special events are happening.

If you have recently joined Australia's and the world's oldest radio society your attention is drawn to the WIA 75 Award.

This is running until 31 December and all WIA members are asked to participate.

The WIA 75 Award rules appear in AR magazine for March or details can be obtained through your division.

AR

EMPLOYMENT!

The Antarctic division of the Department of Science was having difficulty attracting applicants for highly paid trades and technical jobs in Antarctica.

It has had to readvertise 90 job vacancies with salaries ranging from about $35,000 to $45,000 a year.

The division needs cooks and communications officers to spend between 12 and 15 months in Antarctica, beginning in summer.

Building and allied tradespeople are needed for the same period and for summer only.

AR

Bronwyn Jopson, aged 4, loves to imitate Dad, Greg VK2VPP. Greg is hoping the interest will remain and Bronwyn will eventually sit for her amateur licence.

VK2 MINI BULLETIN

Tim Mills VK2ZTM
VK2 MINI BULLETIN EDITOR
PO Box 1066, Parramatta, NSW 2150

CHANGE OF DATES

Would readers note some changes to those shown in the VK2 notes in March AR. The proposed May Seminar has moved to July (tentatively 20th, Sat.) to make way for the launch by Australia Post of the amateur radio envelope. (See item elsewhere.) Wagga ARC advised that since their city is always heavily booked out on long weekends, they will again be following their established practice and host the South West Zone Field Day on the last weekend of 26-27th October.

OXLEY REGION FIELD DAY

A further reminder that this event is being held on the Saturday and Sunday of the Queen's Birthday weekend at Port Macquarie — the 8th and 9th of June. A full range of field events and contests, including one for your CW skills. Bar-be-que lunch etc. Further programme details via the broadcasts or write to the Oxley Region ARC, PO Box 712, Port Macquarie, NSW, 2444.

ORANGE STATE FOXHUNTING CHAMPIONSHIPS

It was set down for 16th March but on the day only one team showed up. A disappointment for the organisers who went to some trouble to set it up. Maybe a sign of the times but there must be some people still interested in mobile events. Both the council and Orange ARC would like to hear from amateurs re this type of event and whether to try again at a more suitable time.

SEPTEMBER AMATEUR RADIO

VK2 will have a further special in this month. Do you have anything to contribute? If so, please submit it before the 25th June. On the same subject, short technical articles would be most welcome to the editor. Make a few notes and sketches and send them off to the AR editor.

1985/86 CALL BOOK

A reminder to repealer groups and clubs to check and correct any of their current entries. Send corrections to the Divisional office, before the end of this month. Amateurs who have any corrections or alterations should also send the request to the Department of Communications with a copy to the Call Book Editor, C/- PO Box 300, Caulfield South, Vic. 3162. The Call Book is compiled from Department records and is only cross checked against membership addresses, so errors to current listings are only known if the amateur advises. The Department input closes about the end of this month. For non-members there is no means of address cross check.

ANNIVERSARY DINNER

Set down for late June. It will be on a Saturday evening. It will include the presentation of awards held over from the Annual General Meeting in March. Venue details in June AR.

AUSTRALIA POST ENVELOPE

Details still coming to hand as these notes were prepared. On 22nd May Australia Post is to release a prestamped 33 cent envelope which will feature amateur radio and the WIA 75th Anniversary. It will remain on sale for about 6 months. It is hoped to mount displays at many Post Offices and both amateurs and clubs are asked to assist. By now approaches will have been made to you for this assistance through your local club and via the broadcasts. If you can assist please do so and follow the requests as made on the broadcasts. It will be an important promotion for the hobby but to be successful needs everyone's support.

TIME CAPSULE

This started with a launching at VK2WI Dural on the afternoon of Sunday the 10th March 1985. Material will continue to be collected during this year and up to March 1986. Read again the details in March AR. Contribute your QSL card, a photo or letter with details about yourself, interests etc. Post it to 'Time Capsule', C/- PO Box 1066, Parramatta, NSW, 2150. Collection will also be made at the Port Macquarie Field Day and at the Dinner in June, the Seminar in July and Wagga at the end of October. Black and white photos will last better than some color prints. This could also be a good club project. Why not arrange a night and send a bulk posting down. By the way, don't forget to include details about the club or group.

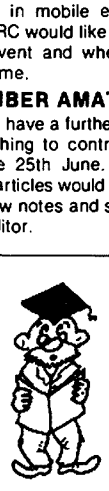
REPEATER NEWS

Notification has been received by the State Repeater Committee for 70 cm systems from Wagga ARC who intend to establish a system within the city area for a local service. Armidale ARC wish to establish a regional service to the north of Armidale to serve them and Glen Innes. Coffs Harbour have indicated their intentions to develop a system for their district. Summerland ARC are investigating the establishment of a two metre system for Byron Bay.

NEW DIVISIONAL YEAR

These notes were prepared in mid March. The June notes will contain a report on the AGM, ballot results and office bearers for the forthcoming year. The annual report and other papers were mailed on the 6th March based on the mailing list for March AR. If you missed out on a copy it is perhaps still in the system awaiting delivery. Copies may be obtained from the Divisional office. Since the report was compiled the annual accounts for the Education service and WICEN groups were completed and a summary will be included in a future AR. It was a disappointment on the folding night for the annual report that only a few members showed up to help. Our thanks to those who did attend, but if the interest is not there on future occasions then maybe it will have to be done commercially which will help increase costs and no doubt the subscription rate.

AR



EDUCATION NOTES

Brenda Edmonds, VK3KT
FEDERAL EDUCATION OFFICER
56 Baden Powell Drive, Frankston, Vic 3199

I am always pleased to receive information about help that is available to the aspiring amateur. Many readers will be unaware of the vast amount of time and patience that go towards helping students get a licence or upgrade to a higher level. Much of this help is unobtrusive, and usually unrewarded except for the satisfaction of knowing that the help is appreciated.

We tend to think that most of the 'Education' is carried out in classes or club discussion sessions, but nearly every week I receive confirmation that there are many amateurs actively participating in the education of a new amateur.

This may be a 'one-off' arrangement for a particular friend — but sometimes it leads the helper into a more structured arrangement for a group next year — and so it goes on.

I have recently been notified about a group who are devoting their energies to improving the CW skills of a group of novices. Operating as the 'Early Bird' net, they are on air every morning except Sundays at 2115 UTC at about 3.545 MHz, to send CW to a group of novices, and give them an opportunity to send in return. Other similar nets are at 0900 UTC for those who want a speed up to 15 WPM — about the same frequency and on 3.595 MHz at 2230 UTC for 11-12 WPM.

There are also some theory discussion groups. One of these runs on about 3.595 MHz at 0500 UTC on Monday, Wednesday and Friday as a self help group to discuss one aspect of the AOCP syllabus at a time.

I have mentioned these nets because in each case the organisers have told me that they would be happy to extend the group a little further. I am sure there are other nets of which I am unaware.

However I still get letters from students who are trying to get through on their own, either because they cannot fit into an existing class programme, or because they are unaware of any assistance that may be available.

So I would be very pleased to collect information about any such systems in existence, so that I can pass it on when necessary. I would also like to have a list of amateurs in various areas who would be prepared to be approached by a student occasionally for discussion or even coaching.

On the other side of helping — I have recently had several more instances of the help that can be given by DOC when the need arises. For the physically handicapped students, special exams have been arranged at a time and place mutually agreed. In other cases, exams have been arranged on request or, for a group in a remote area, by arrangement with the local DI. So, if you are helping someone who has a case for special consideration, make sure that the Department is informed of the situation.

To all those who will be sitting for the May exam, or who are coaching students for it — my good wishes to you all and the usual reminder to candidates to *Read the Questions.*

PRINT HANDICAPPED

The Queensland Tape Service for the Handicapped (Inc) firstly recorded Amateur Radio on tape after a request by a Bundaberg listener.

This organisation is solely concerned with the reading of printed material on to tape, subject to copyright clearances, with distribution through the State Library of Queensland.

Members who know of print handicapped persons who may be interested in this service are advised they should apply to The State Library of Queensland, 132 Grey Street, South Brisbane, Qld. 4101.

Information supplied by Mavis Scott
Honorary Secretary,

FORWARD BIAS

VK1 DIVISION

Ken Ray
PO Box 710, Woden, ACT 2606

1985 COMMITTEE

At the AGM of the Division on the 25th of February, the following people were elected to the various positions on the Division's committee:

President	*Alan Hawes VK1KAL*
Treasurer	*Kevin Olds VK10K*
Secretary	*Richard Jenkins VK1UE*
Vice-Presidents	*Ken Ray VK1KEN*
	George Brzostowski VK1GB
Committeemen	*Reg Towers VK1MP*
	Phil Rayner VK1PJ
	Ray Roche VK1ZJR
Federal Councillor	*Fred Robertson-Mudie VK1MM*
Alternate	*George Brzostowski VK1GB*

The following were appointed to manage the various duties of the Division:

Broadcasts	*Alan Hawes, George Brzostowski*
Meetings	*Ray Roche*
Awards Manager	*Phil Rayner*
Forward Bias	
Editor	*Ken Ray*
Education	*Reg Towers, Ken Ray*
Property Officer	*Alan Hawes*
Book Sales	*Eric Piraner VK1EP*
Intruder Watch	*Vacant*
OSL Bureau	*John Clare VK1CJ (Inwards)*
	Ted Pearce VK1AOP (Outwards)
	Fred Robertson-Mudie (Liaison)
Historian	*Ron Henderson VK1RH*
ATV Liaison	*Kevin Olds*
DOC Liaison	*Fred Robertson-Mudie*
Repeaters	*Alan Hawes*
Wicen Liaison	*Ray Roche*
Field Day Organiser	*Phil Rayner*

JOHN MOYLE FIELD DAY

Again, VK1WI was set up on the shores of Lake Burley Griffen. However, there were fewer contacts and visitors than in previous years. Two visitors of note were members of the local constabulary who wanted to know what we were doing camping here — at 2 or 3 a.m.! Still, for all of those who participated, it was a good weekend.

ITU DAY

Don't forget the ITU Day station at Belconnen Mall on Friday 18th May. Listen out for VK1ITU.

AR

VK3 WIA NOTES

Jim Linton, VK3PC
DIVISIONAL PRESIDENT
VK3 DIVISION

WELCOME TO NEW MEMBERS

Gerardus Burgers, Charles Cassar VK3VZE, George Goodley, Gilbert Griffith VK3CGG, Frank Hanham VK3BJ, David Haysom, Steven Jenkinson VK3YH, Paul Kehoe VK3KPK, Trevor Kelly VK3ZNX, Raymond Kerwin VK3KRK, Edward McMillan, E C Mitson VK3DXJ.

A E Morse, Elizabeth Pennington, Arthur Piner VK3YFZ, Russell Robbins, B A Rossi VK3XCO, Alexander Schmidt, Colin Schultz VK3COL, Art Usher W9KHN, C W Wilson VK3AWW, Paul Dellas VK3PSD, Rajiv Gandhi VU2RG, Peninsula School Radio Group.

Another year comes to an end this month with the Vic Div annual general meeting on Wednesday 8 May starting at 8 p.m.

This meeting is a requirement of Corporate Affairs so an audited financial statement of profit and loss can be presented to members and to confirm election of councillors.

All members were sent an 8 page annual report as an insert in last month's AR magazine.

The AGM is also a major social event with many members making a special effort to attend.

It's an opportunity to find out in detail what your division is doing, and to ask, in person, questions of the office bearers or offer suggestions.

If you're able to make the AGM, I and the other councillors look forward to seeing you.

QSL EUTHANASIA

At least 50,000 unclaimed OSL cards are being held at the Wireless Institute Centre.

These are for QSOs made up to five years ago and keeping them creates a storage problem.

It is unfortunate, but necessary, that the unclaimed cards be destroyed later this month.

Do you have QSLs waiting to be claimed — many limited calls would particularly be surprised to learn they have cards, even DX cards for six metre contacts.

CAMPAIGN 3000

Vic Div was congratulated by representatives from other divisions recently on its high and growing level of membership.

Statistics produced at last month's WIA Federal Convention showed your division once again had the largest number of members.

In the 12 months to December 1984, the Victorian Division lead all other divisions both in the number of full members, and associates.

Most of the overall growth in WIA membership Australia wide occurred in VK3.

This result followed hard work done by several individual members who have taken up the call to recruit others into WIA membership.

It also reflects the appreciation and satisfaction by radio amateurs and shortwave listeners of the wide range of services available through the division, and the work done to protect and further the cause of hobby radio.

More members are always needed and welcomed so if you know any amateurs who are not a member, what about coaxing them to join.

AR

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

My apologies to those of you who are still listening to the Sunday Morning Broadcasts in an effort to discover when in MARCH the Jubilee 150 launch will take place. When I wrote the column for the March issue, we were still going to have our Jubilee 150 launch in March, however due to a hold-up with the sponsors, QSL cards etc, it was decided to postpone the launch until May, to coincide with the school holidays. At the time of going to press definite dates are not known although it will probably be around the middle of the month. However, there has been one problem, in that we had already agreed to "man" a display station in the GPO from 22nd to 24th May to coincide with the launch of the pre-stamped envelope to commemorate the 75th Anniversary of the WIA — and as if that wasn't enough problems, we have heard rumours that the GPO may be being re-decorated at that time, so all I can say is keep your ears to the ground and we'll try to keep you informed!

One thing that will be certain is that we will have the call sign VK75A for use by South Australian stations from the 13th to the 26th May which will include the proposed days at the GPO.

Many of you will know that when we first took over the Burley Griffin Building it was on a ten year lease, but unfortunately, when the lease expired Thebarton Corporation seemed to be unwilling to give us a long term lease, perhaps because they feared some loss of revenue. However, a further request for a long term lease, this year bore fruit (we have asked every time it was due for renewal) and we once again have a ten year lease on the building. So now we can start thinking about painting and other improvements which we were unwilling to even discuss on a short term lease.

DIARY DATES

28th May	*(unconfirmed at time of going to press, but hoped to have Ted Dobrinsky who was unable to give us his talk on Map Reading and Navigation, due to illness, in February.)*
25th June	*(also unconfirmed, may be substituted for or with the above) "Forum on Computers" a panel of experts will answer your questions (we would like the questions submitted before-hand — a week or more — so that the experts can do their "homework"!)*

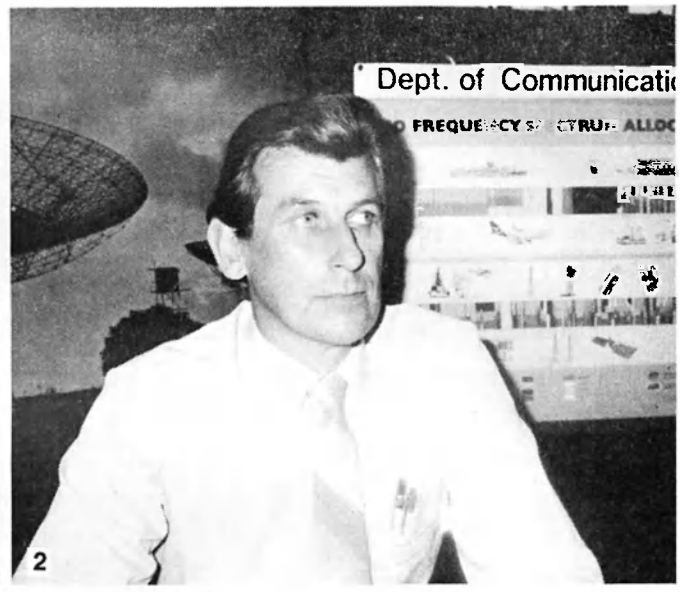
AR

APRIL'S BEST PHOTOGRAPH

The judges at Agfa-Gevaert selected the collection of photographs taken by Sam Voron VK2BV8 on page 13 of April's magazine. Sam will now be eligible for the prize in June.

VK4 WIA NOTES

Bud Pounsett VK4QY
Box 638, GPO, Brisbane, Qld. 4001.



1 At the 1984 Gold Coast Hamfest, Bill VK4YN, proudly displays the award of the Queen Elizabeth Silver Jubilee Trust for Young Australians. The Award included a substantial cash donation to the Gold Coast Amateur Radio Society for educational purposes. 2 Dave Dawson from the Brisbane office of the Department of Communications was ready to answer questions and was kept very busy. 3 Manning one of the many trade stands were Yoshi VK3BZX (Icom Australia), Lance and Brian VK4AHD. 4 The ladies turned out in full force. All full calls — Sandra VK4ACJ, Lesley VK4ZN, Daphne VK4NE, Lynnette VK4CBH and baby Timothy. 5 Greg Rankin VK4AXT was there to guide those visitors not familiar with the Gold Coast, to the venue.

LETTERS TO THE EDITOR

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publisher.

TRACKING WITH A BEE!

I have a computer programme for the Microbee which tracks Oscar 10 and a few other satellites. As the programme is very long I think it would take up magazine space, so I will gladly make tape copies for anyone (amateur) who will send me a blank tape and return postage.

The programme was developed from programmes written by John Branagan and published by AMSAT UK.

I'll include instructions on how to tailor the programme for any OTH knowing the Latitude, Longtitude and Height.

The following is a sample print out.

Thank you,

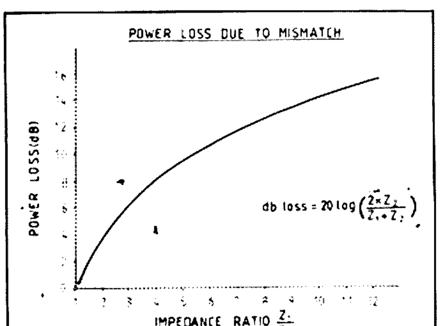
TECHNICAL CORRESPONDENCE

I recently needed to find the loss figure, in dB, due to a mismatch at a joint between a50 and a75 ohm coaxial cable.

After some searching I eventually ferreted out a formula which enabled me to calculate that loss. It then occurred to me that other amateurs could perhaps be interested in the problem. I calculated the mismatch losses over a wide range of impedance ratios and then drew up a simple graph, as shown below.



GRAPH 1

It can be seen that, for example, a 75/50 impedance ratio causes a 1.94dB loss, whereas a 300/50 ohm mismatch causes a loss of 10.8dB.

The calculation may not necessarily be of interest, but is shown for information.

Terms used:
- V1 Input Voltage
- V2 Output Voltage. This is that part of the signal that passes through the join, ie: usable power.
- Vr Reflected Voltage.
- Z1 Higher Impedance.
- Z2 Lower Impedance

From above and knowing that what doesn't pass through is reflected:-

$V2 = V1 - Vr$ and dividing by V1 gives

$$\frac{V2}{V1} = 1 - \frac{Vr}{V1}$$

The formula for equating reflected voltage with impedance is:-

$$\frac{Vr}{V1} = \frac{Z1-Z2}{Z1+Z2}$$

substituting this into the previous equation, along with some rearrangement gives:-

$$\frac{V2}{V1} = \frac{2\,Z2}{Z1+Z2}$$

and as deciBell loss is twenty times the log of the voltage ratio, this gives:-

$$\text{dB (loss)} = 20 \log \frac{2\,Z2}{Z1+Z2}$$ which is the formula

used with the graphs. As Z2 was specified as the lower of the two impedances, the result will be negative; indicating a loss.

Calculated values:

Impedance ratio 1.5/1 2.5/1 4/1 6/1 8/1 12/1

dB loss 1.94 4.87 7.96 10.88 13.06 16.26

Yours sincerely,

George Cranby VK3GI
Box 22,
Woodend, Vic. 3442
AR

CLANDESTINE NAVIGATION

After submitting this article to AR, see page 19 Feb, I realised that in the final transcript, one paragraph from the original rough transcript (and how rough!!) had been omitted inadvertently.

By the time I realised, the magazine was already in the pipeline so I decided to take no action and await the results, if any.

Sure enough, among the various responses to the article, were one each from VK7, VK2 and a VK3 SWL all with the query "Why didn't you magnetise the compass needles across the headphone magnets?"

Hence, here is an abridged reproduction of the missing para.

Some months prior to "operation compass" an unanticipated night entry by German guards into our prison barracks had nearly resulted in them discovering the radio, refer February AR 1984. I therefore had resolved not to simultaneously expose the 'phones and compass components for risk of discovery, which would result in confiscation of both, including the radio. The latter would have been a loss of massive proportions. Also the 'phone magnets were quite weak.

Thanks to those who responded and queried and apologies for my omission.

FURTHER TO WICEN PLUGS

I read with interest the WICEN News article Jan '85 and the letter from VK6RD March '85, regarding clipsal type polarised plugs and sockets. The WICEN group in VK3 HAVE been using these plugs for more than 10 years, to my knowledge.

The problem about which pin is positive and which is negative was raised long ago. Upon investigation it appeared that no standards had been set except by one two-way radio manufacturer who used these plugs extensively. The standard was that the horizontal bar of the 'T' was CHASSIS. Remember the old symbol for chassis.

(Please note that at the time there was both positive and negative earth cars).

Many other mobile radio suppliers adopted the plugs and this standard.

VK3 WICEN adopted the standard of a negative chassis as this was the most common.

The standard is:-
Horizontal Bar — Negative
Vertical Bar — Positive

To remember this remember the negative and positive sign.

If an Australian standard is developed and promulgated I am sure we would comply, in the meantime we will continue to use the above.

Colin Pomroy VK3BLE

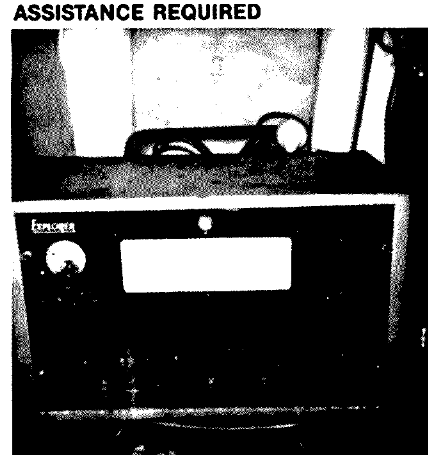
GOOD WISHES

Our thoughts are with you. On behalf of the officers and directors of the Canadian Radio Relay League, our sincere good wishes to the WIA and members as you celebrate seventy-five years of service to Australian amateurs.

Personal 73.

Sincerely,
Harry MacLean VE3GRO
Secretary
The Canadian Relay League, Inc.
AR

ASSISTANCE REQUIRED



The above photograph is of a transceiver I have been given. My intention is to refurbish the rig and on first inspection it appears to be complete.

At present I am acquiring replacement valves but I have not been able to obtain a circuit diagram.

The only information on the unit is the name "Explorer" with a sticker at the top of the front panel saying "Panda Equipment". The bands covered are 80, 40, 20, 15 and 10 metres with modes of CW, FM and AM.

Hoping another member may have a circuit or some further information.

73 and yours faithfully,

Ray Barnes VK4BK,
3 Park Street,
Bayview Heights, Qld. 4870

AR

ANNIVERSARY WISHES TO THE WIA PRESIDENT

Please accept my hearty congratulations on the 75th anniversary of the Wireless Institute of Australia.

After reading "Amateur Radio" for January 1985, the first issue in the WIA's anniversary year, I became further deepened in the impression that your progress and achievements have been remarkable since the foundation in 1910. You may well be proud of being the oldest society in the world. And also it is a gratification for the IARU Region III Association to see such an old member as the WIA among us.

In particular, I, as the secretary of the Association, highly appreciate the contribution made by your society to the founding of our organization in 1968. I fully understand that, by the initiative of the WIA, the inauguration congress was convened in Sydney in 1968 and the interim Constitution was adopted. Since then, I believe your society has been one of the key promoters and has been playing a very important role in international activities in our Region and worldwide.

Meanwhile, I was pleased to receive from the WIA Secretary information on various events of the anniversary and an article on "the history of amateur radio and the WIA".

Congratulations again and I wish you and all of your members further prosperity in the future.

Yours sincerely,

Masayoshi Fujioka, JM1UXU
Secretary
IARU, Region III Association,
Box 73,
Toshima, Tokyo, 170-91, Japan.

Obituaries

PETER BERNARD DODD VK3CIF
14.10.1917 — 03.03.1985

It is my sad duty to report the untimely death of Peter Dodd VK3CIF, after a short illness.

Peter had a long history in amateur radio, travelled extensively in younger days, and was well known by DX operators throughout the world.

Peter's best known activities, as far as Australian amateurs are concerned, was his appointment to the WIA Federal Office in 1971, in the capacity of Secretary/Manager.

Peter was born in England, and moved to East Africa where he was employed by the British Colonial Civil Service. He was the Controller of Customs, and worked mainly in East African countries, Nairobi and Uganda for approximately 40 years.

He arrived in Australia with his family in late 1970 having retired from The Civil Service. He was immediately recognised for his administrative and extensive amateur radio background, and was an excellent candidate for the then newly created position within the Federal Executive.

The WIA Divisions had recognised that a central control and information flow between Divisions and members, together with centralised production of the magazine Amateur Radio, was a necessity, and Peter filled that position with excellence.

For nearly thirteen years, and with the assistance of a part-time typist, he established the solid footing which the Executive office operates under today.

On taking up the position, and in premises and circumstances which could only be described as something out of the Dickensian era, Peter moulded our system within the Institute's economic constraints to an effective force.

My first involvement with Peter was in 1971, when I became involved with the Publications Committee, then later as Editor of Amateur Radio, and finally as Federal President for a short term.

In those exhaustive years, Peter was a pillar of strength to our committee. In almost every issue with the production of Amateur Radio since 1971, Peter played an extensive role.

Little is otherwise publicly known outside of the Publications Committee and Federal Executive, of the important parts he actually did play, and in most cases voluntarily in his spare time.

I would therefore like to place on official record, albeit too late perhaps for any benefit to accrue, of my deepest gratitude to Peter for his direct assistance to me, because without it, the production of Amateur Radio magazine in those times would certainly have crumbled.

Peter was devoted to the WIA, and his mark will always be seen in the WIA portals.

In Peter's colourful amateur career, he held the following call signs, and he was an avid 10 metre DX operator:-

VK3CIF, GD3PBD, VQ4, 5 and 1PBD, G3PBD, 5H3PBD, ZD6PBD, 9J2PBD, OE1ZBW, YA1PBD and ZL1BDC.

Peter retired from the employment of the WIA on his 65th birthday in 1982. The Federal Executive, Publications Committee, Federal Technical Advisory Committee and Divisional Councillors will certainly remember him for his outstanding efforts.

If we can maintain the traditions that he established in his time with us, we will certainly progress.

Peter Dodd was also a member of three Masonic Lodges, Nairobi (Scottish Constitution), Amateur Radio Lodge (London), and England.

He served the Craft well, having being raised to a Master Mason. He held the position of Tyler when he migrated to Australia.

I extend my own personal regret, together with that of the Wireless Institute of Australia, to Peter's wife Barbara and family, in their sad loss.

Vale Peter Bernard Dodd VK3CIF
"SO MOTE IT BE"

JACK GERARD VK2ADN

It is sad to report the passing of Jack Gerard VK2ADN on the 4th March 1985.

Last month Amateur Radio published a Book Review of Jack's recently published book, "From Pastures Green to the Silver Screen", an autobiography of Jack's life with radio and also with the early days of "moving pictures" in Australia.

Jack's local TV station, NRTV channel 11-8, screened a tribute to Jack in their nightly news segment.

Deepest sympathy is extended to Jack's family.

Bruce Fleck VK2FS

DENYS AYRE VK3KP

Soon after 10 pm on Thursday March 7 I threw all switches to off at the station of VK3KP. The station was silent after almost half a century.

Thirty minutes earlier at the Radio Amateurs Old Timers Club (RAOTC) Denys Ayre VK3KP, aged 63, had died suddenly during the dinner.

The 57 old timers were shocked when one of their colleagues, a member of the club since its inception, had become a silent key in front of them.

Denys was typical of VKs in the 30s, resourceful, thorough, eager to talk to the world, hopefully on AM phone, and builders of their own gear. He was one of the first VKs to own the then great National HRO.

His army war service . . . he rose to the rank of Major . . . was ever in his thoughts. He recalled incidents with accuracy more than 40 years after they happened as if they had occurred the previous week. He wore the RSL badge with pride every day.

Fresh from active service, including considerable undercover work against the Japanese, Denys graduated in architecture at the University of Melbourne. He was a fellow of the Institute of Architects until his death.

This pedantic, perhaps even eccentric man of many skills was soon back on the air after graduation and went through the hectic days of the early 50s, when all bands were open, with man made noise minimal and the world could be worked around the clock on many bands.

Professional demands on his time kept him off the air for about ten years, but he returned with the sideband era, full of enthusiasm which was so typical of his make up. SSB and again the DX bug caught up with him . . . then followed VHF and UHF. He was again firing on all bands.

Only a few years ago he decided to erect a tower for a tri-band beam. That's where he hit trouble as the neighbours protested to Malvern Council. He lost. "I lost the battle, but won the war" he told many friends.

He always regretted not having a beam and had to resort to single wire antennas for the DX bands.

His shack was a credit to him, spotlessly clean, professionally laid out with easy access to everything.

Toward the end of his illustrious 48 years in amateur radio he became interested in RTTY, built most of his equipment himself and only a few days before his death made his first DX RTTY contact to JA.

He loved music and his sophisticated hi fi gear had sets of speakers in three rooms, including the shack. His favourite tune typified the man, Sinatra's smash hit . . . 'I did it my way'.

Amateur radio has lost a remarkable man in the passing of Denys Ayre, the man who spoke with authority on most subjects, the almost perfect 'expert', be it the life of Monash the engineer, the latest ARRL handbook or the bachelor on 80 metres he would speak to at 2 am when neither could sleep.

Vale, VK3KP . . . you've left your mark and set a fine example to so many. Sympathy goes to his wife of 43 years, Fay and children John and Judith.

Roth Jones, VK3BG.
AR

VHF COMMUNICATIONS MAGAZINE

It is sad to note the tragic death of Terry D Brittan, editor and publisher of VHF Comms magazine. Terry and two of his colleagues, Franz Xaver Roichl and Klaus Wilk, passed away in tragic circumstances on 17th March 1985.

Members are advised that the staff of the magazine are continuing to produce VHF Comms, but delays may occur.

Deepest sympathy to relatives, friends and workmates.

RCA CR-88 RECEIVER. Also Radio Amateurs Handbooks, early 50s, late 40s. Claude VK2DLC. Tel: (02) 451 2577.

☐ WANTED — VIC ☐

BUTTERNUT MODEL HF-6V. Vertical Antenna. Price to John. Tel: (03) 583 5417.

HANDBOOK OR CIRCUIT for Heathkit SSB adapter, SB-10. Would copy & return or purchase. VK3BAV. Tel: (03) 277 1845.

SWITCHES. 8 bank, 4 or 5 position Yaxley type switch, ceramic insulation & with earthing discs, for home brew rx being built round HRO tuning unit. Willing to pay good price for right unit. W Russell VK3ZUP, RMB 7680, Wangaratta, Vic. 3677. Tel: (057) 21 8109.

☐ WANTED — QLD ☐

HANDBOOK OR CIRCUIT for HP 608E signal generator. Len VK4JZ, 33 Hill Crescent, Carina Heights, Qld, 4152. Tel: (07) 398 2002 after 6pm.

ICOM IC-22S 2m tx/rx in good condx. Barry VK4BCC, QTHR.

VERTICAL ANTENNA either Hustler or Hygain, 10-80m preferred but will settle for 10-40m. John VK4VK. 6 Tosti Street, Sorrento, Qld. 4217. Tel: (075) 38 7152 after 6pm.

☐ FOR SALE — ACT ☐

YAESU FT-107 tcrv + ext VFO & 500Hz filter. Unit in good condx. & includes desk scan mic. Offers around $700. Richard VK1UE, QTHR. Tel: (062) 56 1228.

☐ FOR SALE — NSW ☐

ANTENNA — RAK Trap dipole for 80-40m. $30. Icom IC-720A. Ex condx. with SM-5 desk mic. $800. VK2JN. Tel: (02) 449 4324.

HOME BREW HF LINEAR AMP. 2*813 with spare tubes & P/S. P/S needs repair, $300. VK2AWR. Tel: (02) 865 1062 evenings & weekends.

KENWOOD TL-922 AMPLIFIER. 2/3-500Zs, manuals. New condx. $1550. Icom 290H all mode tcvr. Manual. $450. Keyer Katsumi EK-150, new, $135. Manual, Millen-Craywood dual section capacitors. 16250-255pF, 3kV, new. $100 pair. Rotary inductor, new, ceramic, 28μH. $60 for transmatch ATU. 4/25A — PL 5D-22 tube. New interchange with 3,500Z in GG amplifier. $65. Tel: (02) 918 3835.

KENWOOD TR-2400 with base stand & mic. Prefer part exchange HF tx with cash adjustment or best offer. Bill VK2BDW, QTHR. Tel: (02) 674 1184.

KENWOOD TR-2500 h/held FM tcvr, complete with leather case, hel ant, 240V charger, h'book, $295 ONO. Access also avail. Kenwood TM-201A compact 2m FM 25W mobile tcvr complete with hand mic., MC-55 boom mic. SP-50 mobile spkr, h'book. $315 ONO. Laurie VK2AQW, QTHR. Tel: (02) 969 2160.

KENWOOD TS-520 tcvr fitted with additional 500Hz CW filter type YG-3395C, + Kenwood remote VFO-520. Both one owner & in VGC. Complete with h'books for both units & orig. packing. $550. VK2BFJ, QTHR. Tel: (043) 32 5758 (Central Coast).

KENWOOD TS-520S with VFO-520 remote VFO & mic. Good condx, operating & service manuals. $500 ONO. VK2ATK, QTHR. Tel: (02) 80 4000.

KENWOOD TS-530S. WARC bands. Immaculate condx. $800 ONO. Swan linear amp 1200-Z, 1kW PEP, 600W CW. Ex condx, 2 spare tubes. $450 ONO. Antenna tuning unit, homebrew. Used with 1200-Z, rotary inductor. $75 ONO. Hi Mound hand key $20. Yaesu mic. Imp 50kohms. $10. Vicki VK2EVM, QTHR. Tel: (063) 68 2137.

KENWOOD TR-7600 2m FM tcvr. Complete with mic, mobile bracket & 2x1/4 wave mobile antenna. $175. Icom SM-2 desk mic, unused, $30. Stromberg-Carlson type 5V75 rx. Collectors item. Free. Peter VK2DEH, QTHR. Tel: (02) 452 4302.

TOKYO HY-POWER 45W, 70cm amp. Includes preamp, $190. Icom IC-AG1 70cm masthead, GaAsFET preamp, $60. John VK2DFC, QTHR. Tel: (069) 62 5547.

YAESU FT-101 tcvr with mic & h'book, $395. Stan VK2BKS. Tel: (042) 28 5041.

YAESU FT-107DM tcvr. All WARC bands, mic, phones, service manual. Good condx. $800. George VK2YT. Tel: (02) 724 5276.

YAESU FT-480R 2m all mode tcvr. 25W out in ex condx with instr manual & 5/8 mobile whip & base to suit & mobile bracket. $495 ONO. Tel: (02) 636 9205.

☐ FOR SALE — VIC ☐

ANTENNA TUNING UNIT. MFJ-941C as new. 10-160m rated 300W o/put. $80. VK3AMC, QTHR. Tel: (03) 592 9036.

COIL BOXES. 3 for AMR-100 rx. Made by AWA. $5 each. VK3BAV. Tel: (03) 277 1845.

ICOM IC-02A. 2m h'held synthesised tcvr with AC & DC chargers. Ext spkr, mic. leather case & 12V cig lighter lead. Yaesu FT-7 in good condx. Yaesu FL-110, 100W HF amp. Ex condx. Andy VK3DTO. Tel: (03) 417 5897 BH or (053) 48 3003 AH.

ICOM IC-502 6m SSB/CW tcvr. Good condx with h'book but no mic. $100. David VK3ANP, QTHR. Tel: (057) 27 6218.

ICF-2001 SONY HF digi scan rx. 0-30MHz. As new, comp. with h'book, power supply & straps. $220 ONO. Jonathon VK3PRN. Tel: (03) 20 7520 AH.

KATSUMI EK-26 ELECTRONIC KEYER. $50 with instr book. Omega model TE-701 ant noise bridge $10. Trio VT-108 FET volt/ohm meter cable & instr book. $45. Kyoritsu SWR bridge K-109. $25. Tel: (052) 52 1608.

KENWOOD LINEAR AMP, type TL-120, input 10W, output 100W, match unit for TS-120V. As new condx with operating manual & leads. $175. Ken product RF speech processor, type KP-12, uses xtal filter provides 10dB signal increase. 240V AC operation. Ex condx, complete with leads & instr manual. $40. VK3CCE. Tel: (03) 509 1720.

OSCILLOSCOPE. BWD 5" Model 504. Good condx, complete with leads & h'book, $110 ONO. Alan VK3DRN. Tel: (03) 20 5454 AH.

RTTY EQUIPMENT. Model 15 teletype with cover & all keys intact. 240/115V AC tfrmr, EA mod/demod, circuit & op. instr. Not used for over 12 mths. Good condx, may need a clean & retune. Can demonstrate. Ideal newcomer to learn this mode. $120. HF beam, 10m, 3el, new. Unused, still in box. $50. B Bathols VK3UV, QTHR. Tel: (03) 580 6424.

SHACK CLEAN-OUT. Ham-M rotator with Ham II controller. $75. Ham II rotator with controller, $95. Heathkit model SB-610 monitorscope $60. Rapar model MV-21 VTVM $30. John VK3JF. Tel: (03) 583 5417.

REGENCY M-400 SCANNER. $350. FT-207 h'held tcvr. $300. FT-7 HF tcvr $300. Realistic Patrolman VHF radio, $50. Alinco 2m, 3W in, 30W out. Power amp, SSB & FM, $60. Stan VK3BNJ. Tel: (03) 743 6708.

☐ FOR SALE — QLD ☐

KENWOOD TS-120V In VGC. Fully legal novice power from 10-80m. Includes MC-35S mic. $450 ONO. Tel: (070) 53 2380 AH.

KENWOOD TS-430S with FM module/mike/manual. $1050. TS-520S with mic/manual ctn. $395. Collins KWM-2 with match 30LI. 1kW linear amp $995. Offers considered. VK4VNN. Tel: (071) 98 2282.

KENWOOD TS-520S tcvr, MC-50 mic, DC-DC conv, manual. $475. Yaesu FT-277RB. 10W, 2m tcvr. Scan, 4 mems, manual. $250. 6m, 5el H/B yagi $20. Charlie VK4BMB. Tel: (074) 22 2337.

ARRL

AMATEUR RADIO

Published monthly as the official journal by the Wireless Institute of Australia, founded 1910. ISSN 0002 — 6859. Registered Office: 3/105 Hawthorn Road, Caulfield North, Vic. 3161. Telephone: (03) 528 5962.

Photographs by Ken McLachlan VK3AH

Design by Batken Productions

It was a momentous occasion in April when thirty years of Federal Presidency got together at the Annual Convention Dinner. The feature photograph is Bill Gronow VK3WG. Bill was President in 1939 and from 1947-50 and again in 1954. Lower left — Max Hull VK3ZS, from 1958-61 and 1965-67. Max was also Vice-President from 1955-57 and 1962-1964. Michael Owen VK3KI from 1969-1972 and Vice-President in 1968. David Wardlaw VK3ADW from 1973-79 and 1984 to the present. Peter Wolfenden VK3KAU 1980 to 31st December 1982 and Vice-President 1976-79. Bruce Bathols VK3UV 1st January 1983 to April 1984 and Vice-President 1981-82.

SPECIAL FEATURES

TECHNICAL FEATURES

REGULAR FEATURES

This month's magazine features a great deal of history in many forms. Firstly, on the cover are six gentlemen who have occupied the President's chair for a total of approximately thirty years, with the main photograph being Bill, who served his first Presidential term in 1939 to our present President, David, who is serving his ninth term.

On P28 there is a brief look at the life of Ross Hull, one of the early pioneers of amateur radio, a former Vice-President of the WIA and the man who is remembered yearly with the Ross Hull Contest.

Herbert VK3DHI/K2LVU tells how he met with Nicola Tesla, P20 and on P7 Tim VK2ZTM concludes his journey through the years of repeaters.

Alan VK4SS received an honour for his achievements over the years in amateur radio, P29, Ted VK4YG recalls the devastating effects of Cyclone Tracy, P18, whilst Max VK3ZS searches for more history on P31.

The Technical Side of Early Amateur Radio, P14, gives an interesting side of the early days and gives a circuit of a receiver designed by the abovementioned Ross Hull.

DEADLINE

All copy for August 1985 AR (including regular copy of Hamads and columns) must arrive at PO Box 300, Caulfield South, Vic 3162 at the latest by midday 21st June 1985.

UNINTERRUPTED FREQUENCY COVERAGE
100KHz~1.4GHz with RF CONVERTERS for SX-400 SERIES

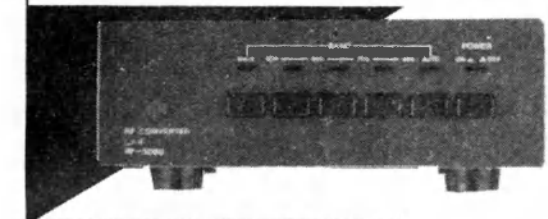
SCANNING MONITOR RECEIVER

FIRE · EMERGENCY · MARINE · AIR · SPACE INFORMATION · BUG DETECTER

RF-8014 DOWN CONVERTER

800MHz ~ 1.4GHz RF converter for SX-400

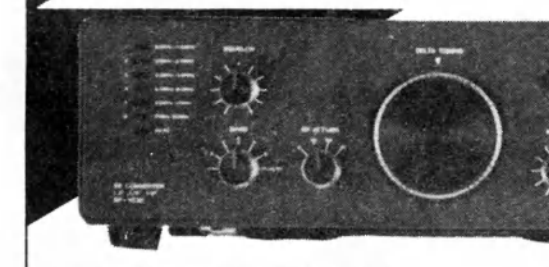
● Bands • MAIN (to cover 26 ~ 520MHz with SX-400) • 800MHz ~ 1.0GHz • 1.0GHz ~ 1.2GHz • 1.2GHz ~ 1.4GHz • AUTO (Automatic control of RF-8014 with an external computer, etc.) ● Frequencies shown in SX-400 display: 500MHz lower between 800MHz ~ 1.0GHz, 700MHz lower between 1 ~ 1.2GHz, 900MHz lower between 1.2 ~ 1.4GHz ● Individual Band Switches and LED Indicaters ● Current Drain: 250mA (approx.) ● Accessories: 1 BNC-M-adapter, 1 Cable with BNC terminals ● Dimensions: W.148 • H.51 • D.225(mm)



RF-5080 DOWN CONVERTER

500 ~ 800MHz RF converter for SX-400

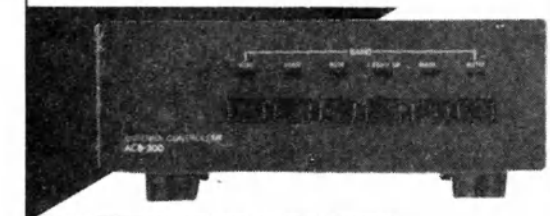
● Bands • MAIN (to cover 26-520MHz with SX-400) • 500 ~ 600MHz • 600 ~ 700MHz • 700 ~ 800MHz • AUTO (Automatic control of RF-5080 with an external computer, etc.) ● Frequencies shown in SX-400 display: 300MHz lower between 500 ~ 600MHz, 400MHz lower between 600 ~ 700MHz, 500MHz lower between 700 ~ 800MHz ● Individual Band Switches and LED Indicaters ● Current Drain: 250mA (approx.) ● Accessories: 1 BNC-M-adapter, 1 Cable with BNC terminals ● Dimensions: W.148 • H.51 • D.225(mm)



RF-1030 UP CONVERTER

100KHz ~ 30MHz RF converter for SX-400

● Bands: (1) 100KHz ~ 1MHz, (2) 1 ~ 2MHz, (3) 2 ~ 4MHz, (4) 4 ~ 8MHz, (5) 8 ~ 17MHz, (6) 17 ~ 30MHz • AUTO (Automatic conrol of 6 bands of RF-1030 with an external computer, etc.) ● Frequencies shown in SX-400 display: 50MHz higher on all bands than the frequencies received ● Individual Mode Switches and LED Indicaters: AM, USB, LSB, CW, AUTO • CW filter (optional) required for CW reception • AUTO — Automatic Control of modes of RF-1030 with an external computer, etc. ● Band Switch and LED Band Indicaters. Sdueln Control, RF Att., AF Gain Control, Delta Tuning, IF ON-OFF Switch, NB (Noise Blanker) Switch ● Current Drain: 1A (approx.) * Power Supply Unit P-1A (optional) required for RF-1030 ● Accessories: 1 BNC-M-adapter, 2 Cable with BNC terminals ● Dimensions: W.300 • H.90 • D.233(mm)



ACB-300 ANTENNA CONTROL BOX

Manual and Automatic antenna control system for SX-400 series RF converters

● Individual Band Switches and LED Indicaters: 1030, 5080, 8014, 1.4GHz UP (for reception of 1.4GHz above), AUTO (Automatic control of antennas for RF-1030, RF-5080, RF-8014 and for MAIN scanner) ● Current Drain: 50mA (approx.) ● Accessories: 1 Cable with BNC terminals ● Dimensions: W.148 x H.51 x D.225(mm)

SX-400

26 ~ 520MHz General Coverage Scanner

● Wider Coverage (100KHz ~ 1.4GHz or above) with RF converters (optional) ● Computer controlled memory channel expansion (unlimited). High-Speed reprogramming. Record of Frequencies and Time, and all functions remote controllable with RC-4000 Interface (optional) ● 20 memory channels. Momentary recall of any memory channel ● Continuous normal and limit search without interruptions by birdies ● Stop Mode Switch for scan or search of modulated signals ● Quick search of the most important frequency with Priority ● Selective FM Narrow/Wide Switch for FM/TV listening ● Variable Delay Control (0 ~ 4 Sec.) ● Current Drain: 1A (approx.) ● Dimensions: W.300 x H.90 x D.233(mm)

RC-4000 DATA INTERFACE **Control of SX-400 series Scanner and RF Converters through Computer.**

● Direct system for NEC 8801A computer ● High-Speed Reprogramming of 20 channels ● Scan of unlimited channels stored in computer ● Record of Frequencies and Time of signals received ● Automatic Control of Bands and Modes of RF converters and ACB-300.

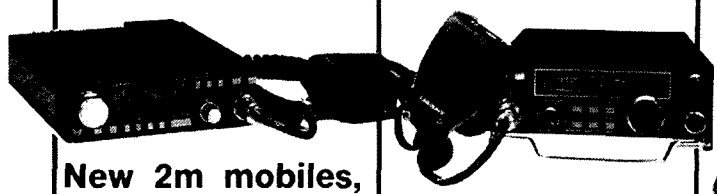
The Latest from Yaesu!

Economy 70cm

Value & reliability - with the latest in features! That's the new FT-703 hand held. Tiny size: but what a performer: even has VOX with optional headset! Cat D-3508

$479



FT-270

New 2m mobiles, Too!

Want economy? Try the new FT207R. Want power? Try the new FT207RH. You get the choice - up to an amazing 45W output (Yasesu's new duct-flow cooling makes it all possible!) Both have 10 memories, dual VFO's plus all the new goodies that make 2 metres fun again!

FT270R (25/3W) Cat D-3515 **$699**

FT270RH (45/5W) Cat D-3517 **$649**

Mobile 70cm

Full 10 watts output on 70: two 4-bit microprocessors make everything so easy!
And it's small enough to go anywhere. Features a brilliant display for extra road safety - and with fast/slow band scanning, it's great, mate!
Cat D-3505

$449

FT-709

Push-Button 70cm

Real performance in a hand-held. Push-button keypad gives you real control; add the battery pack you want for the output you want!
Cat D-3509

10.8V Battery Pack Cat D-3506 **$79**

12V Battery Pack Cat D-3507 **$89**

$499 Battery Not Inc.

FRG-8800: All band all mode

And all singing, all dancing. Amazing performance in Yaesu's new masterpiece, the FRG-8800 receiver. Choice of two models, both featuring the very latest in receiver technology.

- 150kHz-30MHz coverage (FRG-8800)
- Fully CAT compatible (computer aided transceiver)
- Provision for VHF converter inside the receiver!
- 10 memory channels inbuilt (nothing more to buy!)

And much, much more. Ask for a free FRG-8800 brochure at your nearest Dick Smith Electronics store.

FRG-8800 (150kHz-30MHz) Cat D- 2820 **$799**

FRG-8800SW (2MHz-30MHz) Cat D -2821 **$749**

VHF converter to suit (118-174MHz) Cat D-2823 **$149**

FRV-8800 VHF Frequency Conv

Fits right inside case - complete with its own telescopic antenna. Frequency range 118-174MHz
Cat D-2823 **$149**

FRA-7700 Active Antenna

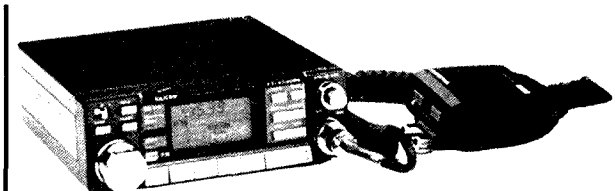
Great for flat dwellers! No need for an outside antenna and preamp will pull in stations you didn't think possible!
Cat D-2845 **$89.50**

FRT-770 Antenna Coupler

Ensures best performance from all types of antennas. A must if your antenna is not low impedance.
Cat D-2843 **$95**

FRG-8800 DC Kit

Allows operation of your FRG-8800 on 12V DC. Great for field operation, monitoring, etc.
Cat D-2822 **$2.50**



2M/70cm FT2700RH

Versatility: both hands in a set so small you wouldn't believe it! Full duplexing, twin VFO's, ten memories ...whatever you want, the 2700 has got!

It features dual independent front ends, dual local synthesisers, dual IF's and transmitter rf stages to make sure you really do get the best of both worlds.

And it even speaks to you: add the optional voice synthesiser and it actually tells you which frequency you're on. Hows that!!!

- 25 watts continous on both bands
- two 4 bit CPU's for complete control
- Amazingly tiny size: just 150 × 168 × 50!!!

Cat D-3515 **$945**

EDITOR'S COMMENT

TWO-WAY COMMUNICATION

It has been said many times that although radio amateurs are specialists in communication we don't communicate well. It is not our ability to produce readable signals which is thus criticised, but rather our failure to make our opinions heard by those who can "change the system" to suit us.

Your Editor heard this complaint again recently, during an enjoyable weekend at the VK5 Clubs' Convention to which he was generously invited. Originating in VK4, but now an annual function in VK2 and 5 also, these Conventions are an excellent means by which the Institute's members can brief their Federal Councillor *on how* he or she should represent their views to the Federal Convention a few weeks later. They are perhaps the best method so far evolved to overcome our communication problem.

There are several avenues for communication between Council or Executive and you, the members, but they are all rather one-way. This magazine, the Divisional journals or newsletters, Club newsletters, the Divisional broadcasts; all are basically "to" the members, not "from" them, even though many individual members may contribute their own special news or opinions. At Club and Federal Conventions the flow of information tends to be the other way, "from" the members "to" their representatives, and the more this happens the more democratic we become.

But once a year is not enough! In the fast-moving worlds of technology and politics the steady-state hardly exists. Today's technology is obsolete almost before it reaches production, and today's political "cock of the roost" is tomorrow's feather-duster!

So, if you have a particular view on how something should be done, don't just complain that "they" never do anything about it. Tell "them", or better still offer to do it yourself. Write a letter to the Editor, or to your Division, or your Federal Councillor. Write an article. If you are not a member the answer is obvious. JOIN! Make your opinions known, so that Councillors have more than their own intuition or guesswork to guide them. Let's communicate more usefully, and make it all two-way.

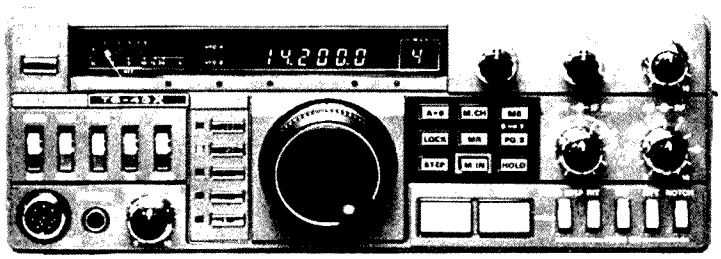
KENWOOD

TOMORROW'S SOPHISTICATION FOR TODAY'S ENTHUSIAST

TS-940S HF TRANSCEIVER

The TS-940S is a competition class HF transceiver having every conceivable feature, and is designed for SSB, CW, AM, FM and FSK modes of operation on all 160 through 10 meter Amateur bands, including the new WARC bands. It incorporates an outstanding 150 kHz to 30 MHz general coverage receiver having a superior dynamic range (102 dB typical on 20 meters, 50 kHz spacing, 500 Hz CW bandwidth).

Engineered with the serious DX'er/contest operator in mind, the TS-940S features a wide range of innovative interference rejection circuits, including SSB IF slope tuning, CW VBT (Variable bandwidth tuning), IF notch filter, AF tune circuit, Narrow/Wide filter selection, CW variable pitch control, dual-mode noise blanker, and RIT plus XIT. The use of a new microprocessor with advanced digital technology controlled operating features, plus two VFO's, 40 memory channels, programmable memory and band scans, a large fluorescent tube digital display with analog-type sub-scale for frequency indication, and a new dot-matrix LCD sub-display for showing graphic characteristics and messages, all serve to provide maximum flexibility and ease of operation. In addition, a CW full break-in circuit, switchable to semi break-in, a built-in automatic antenna tuner, a solid-state final amplifier that is powered from a higher voltage source, a speech processor, all-mode squelch, and a host of other convenience features all add up to even greater versatility of use in fast-paced DX operations. With its power supply and antenna tuner built-in, and with its new whisper-quiet cooling system, the TS-940S is a complete, all-in-one type transceiver that brings tomorrow's sophistication to today's serious enthusiast.



TS-43X HF TRANSCEIVER

The most versatile transceiver of the 80's.

REPEATERS — Friend or Foe!

Tim Mills VK2ZTM
PO Box 204, Willoughby, NSW, 2068.

CONCLUSION

I ended last month by saying that the turmoil of the 70s was yet to be overcome. To many, the introduction of FM and in turn repeaters, was the turning point of amateur radio, hence the heading for this column. During April in Sydney, a person was fined in a Federal Court – the maximum of $100 each on two charges – for offences committed on the two metre band, in particular on Sydneys' repeater 7000. No doubt there will be others yet to face the courts. As one monitors the various repeater allocations, it is disturbing to observe the behaviour of a minority of users like the self appointed 'policeman' who seems to lie in wait for Illegal transmissions so he can bait and abuse them. Sometimes this has to be done to help in the direction finding of the offenders but it becomes apparent that there are those who just do it to be objectionable and get some form of kicks from their action. Two way radios are very public systems and many amateurs like to involve their family in the hobby. It does nothing for the image however when other family members observe the behaviour. If anybody is in doubt on the expected behaviour you can read it up in the recently reprinted DOC Handbook. If you observe someone who's behaviour is not the best, have a quiet word with them if you wish, off air if possible.

There is one group of amateurs who consider the only true 'experimenter' is the person who operates in the 'tuneable' mode on a VHF/UHF band. In the old days the first 100 kHz was deemed to be the DX portion for either CW or those (country) stations outside a metropolitan region. The rest of the band – for a couple of hundred kHz anyway – was the tuneable portion. Today the bands are filling up with a range of new modes. Almost gone as AM and CW. In its place is to be found SSB, FM, RTTY, SSTV, FAX, Packet and other forms of Data. These various modes find suitable 'channels' either by local or national band planning. The determination is a far cry from the planning for a few repeaters at Wodonga in 1968 and Albury in 1972.

Thank you for the comments and letters re the first part of the series. In the near future I will be seeking a few details about various repeater systems for inclusion later in the series.

To hand is a note from John VK2BHO (PO Box 1511, Wollongong, 2500) who is researching the history of the old Illawarra region AM nets in the late 60s on 53.982 MHz. Can you help? Drop him a SAE for one of his questionnaires.

In closing for this month, a reminder to repeater groups. Did you update your details with your State committee for inclusion in the next Call Book? There are now over 150 repeater systems in Australia. **AR**

WIA Seventy Fifth Anniversary News

VK75A

For members information, the QSL manager Des Clark VK3DES, reports that to date some 5000 plus contacts have been logged.

BOOK PACKS, THE 75TH ANNIVERSARY AND THE YEAR OF YOUTH

The book pack scheme to celebrate the 75th Anniversary and International Year of Youth is under way.

Book packs are available on application to the Federal Secretary with a cheque payable to the Wireless Institute of Australia. There are three values available: $15, $30 and $50 post and packing paid.

For members wishing to participate in this scheme it is necessary to notify the Federal Secretary of the school or college etc that you intend your donation to be sent to.

FIRST BOOK PACK PRESENTATION TO REGENCY PARK CENTRE

Jenny VK5ANW explains the finer points of amateur radio to Julie Emmerson, Librarian at Regency Park Centre for the Young Disabled.

On Thursday 18th April 1985, Jenny Warrington VK5ANW and Marlene Austin VK5QO visited Regency Park Centre for the Young Disabled to present a WIA Book-Pack on behalf of ALARA.

The presentation was made in the Centre's Library by Jenny, as Secretary of ALARA, to Julie Emerson the Head Librarian under the watchful eyes of Christine Rowell the Centre's Promotions Manager and Marlene who is the Editor of ALARA's Newsletter.

The centre caters for disabled youngsters from 3 years to 18 years, so it was felt that the books on amateur radio would be eminently suitable for the teenagers there and hopefully give them a lifelong interest in Electronics and Radio.

The Centre is divided into two areas, the residential and the day centre. After the presentation of the Book-Pack and a brief explanation of the running of the Library (which consists of a toy-library and the normal book part — much like a normal school library, for the children; and a medical library for the staff) we were taken on a tour of the day centre, by Christine Rowell. The tour included a brief look at Class-rooms, the Pre-School centre; boot, caliper, etc, workshop; wheelchair maintenance shop; swimming and hydrotherapy pools (with one way glass so that our watching did not distract the lessons) and a prolonged stay in the electronics room, where assessment programmes are worked out with the aid of computers and all sorts of electronic aids. A couple of times the demonstrations (which were still in the development stages) didn't work and Marlene and I hoped against hope, that they wouldn't believe the "build up" that Christine had given us at the start, and ask us to fix it!!

The Centre was delighted to received the books and at the end of the tour we felt that they couldn't have gone to a more deserving place.

FORMAL DINNER

Planning is well in hand for this historic occasion which will take place on 9th November 1985 at the Southern Cross Hotel in Melbourne.

Acceptances to the invitations sent to overseas guests are arriving daily. To date dignitaries such as Mr Dick Butler, Secretary General of the ITU, Mr John Allway of the IARU have accepted, as previously mentioned in earlier editions of the 75th News.

A percentage of seats have been reserved for Institute members so any member who wishes to attend, should notify the Federal Secretary of their intentions. Seats are being allocated on a first come, first serve basis.

AR

Never let is be said that amateurs are satisfied with the ordinary. Here's proof that they are not.

Please QSL — Send Spoon!

MAYER D ZIMMERMAN W3GXK

Being an avid DXer, I not only enjoy working that "new one" in a pile-up, but I also appreciate a good ragchew with a friendly foreign amateur. I really enjoy getting cards directly from diverse and faraway places such as New Zealand, Japan, South Africa, and eastern Europe. No doubt the XYL's uncle enjoys receiving from me the envelopes and stamps which greatly enhance his collection. I always ask for stamps when QSL'ing direct.

And that's where the problem arises. Since I'm basically a very friendly and good person, I like to accommodate all of the unusual requests I receive along with the QSL cards and stamps. You would not believe some of the items foreign amateurs have asked me to send them! (Of course, they always offer to pay for the items and even the postage, which I always refuse, despite the fact that I am not independently wealthy.

Some of the requests are not unusual. A friend in Bulgaria asked for a map of the world with amateur prefixes on it. That was an easy request to honor. The thank-you letter arrived several weeks later and was recompense enough.

One QSO with a new friend in VK-land left me with a request for a used licence plate. He collects them. No problem. Off to my collection of items never discarded (every good amateur has such a collection, no doubt). We found the XYL's expired tags from last year, and off I went to the post office again. The reward? An unsolicited, x-rated QSL card of a special beach in VK-land.

The latest and perhaps most unusual request was the inspiration for this article. A recent enjoyable QSO with a South African YL ended with my frequent suggestion to QSL direct, along with stamps from ZS-land. A couple of weeks later a fat envelope with red and blue stripes arrived stuffed with stamps, some dating back to World War II. Beautiful stamps, gorgeous QSL card, friendly letter with the inevitable request and offer to pay for the requested item and the postage. The request? A request for a spoon with the word "Maryland" on it. Yes, the young lady collects spoons with the names of states on them, and she needed one from Maryland. And you thought WAS stood for Worked All States. No! It's really Worked All Spoons! Perhaps she will eventually hold a QSO with my friend from Australia and send him a licence plate or two in exchange for some miscellaneous silverware. Maybe they'll even get together at a DX convention sometime, somewhere, and compare spoons and licence plates!

So, if you have any spoons with the name of your state on them, or if you have not yet discarded last year's licence plates, please let me know. I can tell you who wants them. Meanwhile, please QSL direct, and send stamps!

Abridged from CQ — October '84.

AMATEUR STATISTICS IN THE USA

The USA FCC operates on a fiscal year, 1st October to 30th September and consequently keeps licensing statistics by fiscal year.

FCC records show that in the 1983 year 20,940 people entered amateur radio in the USA for the first time. In the same period, 16,601 licences were allowed to expire. In the 1984 year there were 18,800 newcomers and 19,644 losses.

From QST, January 1984.

AR

LOCATORS

Harold Hepburn VK3AFQ
4 Elizabeth Street, East Brighton, Vic. 3187

For many years European amateurs, more specifically those interested in VHF communication, have been using a five character code as a convenient shorthand way of stating their location.

**Refer to pages 20-23 last month for the computer programme for this article.

Originally called the "QRA" system, it later became known as a "QTH locator", and a "Locator" statement has long been required by many European VHF contest organisers in logs submitted by contestants.

So long as it was confined to Europe the system served its purpose but any attempt to expand it to the rest of the world led to some funny anomolies — such as a single "Locator" being shared by Iceland and Turkey!

However the system was most useful and, if it could be corrected and expanded into a simple system which could place an amateur station to within a couple of kilometres *anywhere in* the world, it had obvious advantages, not only for VHF enthusiasts, but for the HF buff too.

After several years work, and the evaluation of different propositions put forward by a lot of people, a new system was adopted by all three regions of the International Amateur Radio Union. This new system came into force on the 1st January 1985.

The strong possibility exists that there will be a fairly rapid swing to the use of Locators to replace such contest reports as '59 Timbuctoo' or '59+zone number' familiar to most contest enthusiasts. *(Just why contest reports are always 59 is NOT explored in this article!).*

In brief the new "Locator" system enables a six character combination to define the position of an amateur station anywhere in the world to within a couple of kilometres. To do this using conventional statements of latitude and longitude would take around twenty characters. As an example the writers QTH is, if the survey maps are to be believed, situate at 37 degrees 54 minutes and 34 seconds, latitude and 145 degrees 0 minutes 58 seconds east longitude. Even when the normal abbreviations are used (', ', E, S etc) the full statement requires 20 characters. The corresponding Locator is QF22MC — just six characters. The degree of accuracy is the same!

As shown in the above example, the Locator consists of two letters, two figures and two more letters. They are related to latitude and longitude as follows.

The system first divides the world into 324 "fields" each "field" covering 20 degs of longitude (from west to east) and 10 degs of latitude (from south to north). The first two letters of the Locator define a specific "field".

Each "field" is then divided into 100 "squares", each "square" representing 2 degs of longitude by 1 deg of latitude. The two figures of the Locator define a specific "square".

Each "square" is then divided into 576 "sub-squares", each "sub-square" being 5 minutes of longitude by 2.5 minutes of latitude. the last two letters of the Locator define a specific "sub-square".

A very definitive article by one of the main proponents of the new Locator system — John Morris GW4ANB — appeared in the October 1984 issue of "Radcom" (the journal of the RSGB) and those interested *in* a more detailed explanation of the system, together with a manual method of working out Locators are referred thereto.

The Commodore C-64 programme now presented is based on GW4ANB's manual method and requires a knowledge of one's own station in degrees, minutes and seconds of both latitude and longitude. The actual input to the programme is in degrees and the nearest half minute. This information can be obtained from many sources but the first try might well be your local city or shire engineer or your local library. If this doesn't work then you will have to look for a survey map of your area.

Having written the "lat/long to Locator" programme a second "reverse" programme was written which outputs latitude and longitude when a Locator is put in. It then seemed an obvious step to tack on a third section which accepts latitudes and longitudes of both your own and a distant station (or the lat/long of the nearest identifiable town or city if your contact doesn't know where he is!) and outputs both long and short path bearings and distances — just the thing for VHF log entries in this years NFD where bonus points are awarded for distance.

OPERATION OF THE PROGRAMME

Having 'Loaded' and 'Run' the programme the screen clears and then gives the user four options.

1. To determine a Locator if latitude and longitude are known.
2. To determine latitude and longitude if the Locator is known.
3. To determine long and short path bearings and distances if latitude and longitude (or Locators) is known.
4. To 'End' the running of the programme if access is required to the programme itself.

If the first option is taken (ie to work out a locator) the screen clears and the user is asked to enter, In order:

1 Degrees part of longitude.
2 Minutes part of longitude.
3 Whether longitude is E or W.
4 Degrees part of latitude.
5 Minutes part of latitude.
6 *Whether latitude is N or S.*

The programme does all the necessary conversions, adjustments and calculations and outputs the six character Locator.

The screen then asks whether another Locator is to be determined or whether a return to the menu is required.

The second option asks the user to input the six character Locator and the programme comes up with the corresponding latitude and longitude. It should be noted that this part of the programme calculates the centre point of the Locator square. The effect of this is to show a small difference in the latitude and longitude figures if, say, a Locator is first calculated from a set of 'lats' and 'longs' in option 1 and then this Locator set re-entered into option 2. Unless the original point was exactly in the centre of the square in the first place the two sets of 'lats' and 'longs' will differ slightly. This difference should never exceed 3 minutes of longitude or half that in latitude.

The third option asks the user to enter the co-ordinates for his own station (called the source station) and the distant station (called the destination station). The screen then shows —

1 The long and short path distances in kilometres and
2 The long and short path bearings in degrees.

Fairly obviously, by transposing the source and destination data the reverse bearings (ie him to you) can be calculated. Unless something cataclysmic has happened the distances should be the same!

If anyone wants a disk copy of the programme they can contact me on (03)5962414. Can't currently help with tape copies since I don't possess a *recorder*.

Finally I must thank Alf Chandler VK3LC for getting me thinking about the subject, John GM4ANB for providing most of the information and Ken Seddon VK3ACS for helping sort out the complexities of the spherical geometry involved.

THUMBNAIL SKETCHES

Alan Shawsmith, VK4SS
35 Whynot Street, West End, Qld 4101

JOE ELLIS VK4AGL

Joe Ellis was born at Ventnor, Isle of Wight but went to school at Lismore, NSW. With the help of the Richmond River Listeners League he obtained his amateur licence at the age of sixteen and was active on ten and twenty metres using rotatable monoband Yagi antennas.

He trained at the Marconi School of Wireless to commercial standard and was a ships radio operator during World War II.

Post-war he was an aircraft radio technician at various airports in Australia and subsequently joined Qantas Empire Airways as a flight radio operator. During the change-over to pilot-operated radiotelephone he was based overseas to monitor radio standards and train aircraft engineers in basic radio servicing. During this period he obtained a commercial pilots licence. He spent the last sixteen years prior to retirement as a flight navigator.

Joe is a member of the Sunshine Coast Amateur Radio Club and is a liaison officer for the Radio Amateurs Old Timers Club of Australia. Antennas in use include a rhombic directed at the United States and rotatable Yagis for HF, VHF and UHF. He operates 160 metres through to 70 cm on CW, SSB and FM. The station motto is "Tune for Maximum Smoke".

AR

THE GREATEST SHOW ON EARTH

Colin MacKinnon VK2DYM
PO Box 21, Pennant Hills, NSW, 2120

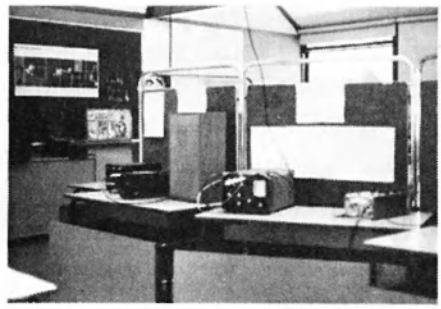
As part of World Communications Year activities, the Castle Hill RSL Amateur Radio Club mounted an exhibition of amateur and military radio equipment at the Glenorie Public School. Glenorie is a bushy, outer Northern Sydney suburb and the exhibition was timed to coincide with the school's gala day.

The school pupils held competitions and made up posters with a WCY theme. A wide variety of communications gear was set up in a classroom and was open to the public for an entrance fee of $0.20, with the money going to the school funds. As over $100 was raised this means more than 500 people viewed the exhibit.

Special WCY "Show Bags" containing items donated by various communications organisations, electronics companies and Government Departments sold well. Assistance from the Tandy organisation and the Army and RAAF public relations offices was most appreciated.

From left — No 19 set and AMR101.

The radio gear on display included:- *No 19 transceiver, No 22 transceiver, AMR 101 communications receiver, ARB receiver, BC433G compass receiver, PRC 10 VHF Backpack transceiver, ER-68-A transceiver (from a RAAF Mirage fighter), B-47 VHF transceiver, C-11 HF transmitter, C-42 VHF transceiver to 60 MHz, C-45 VHF transceiver to 35 MHz (the last four items — army circa 1950s), R210 communications receiver, AR-88 communications receiver, B-40 Navy communications receiver, a very wide band RF amplifier and several versions of the BC-454 (command sets).*



From left — BC454, R210 and wide band RF amplifier.

The equipment is owned by individual club members with an interest in collecting and restoring this type of gear.

An interesting aspect was that all the sets were functional and could be demonstrated in action. It probably is true to claim it was the biggest show of operational equipment of its type in Australia. (With genemotors whining, relays clacking, and loud speakers blaring, the noise was equally impressive!)

In an adjacent room the Radio Club's station, VK2DXS, demonstrated state-of-the-art HF and VHF operation. Publications on amateur radio and the WIA were distributed to interested parties. The children made up special QSL cards for the occasion, helped with money collection and explanations to the public, and generally had a good time.

The exhibition was so popular that the Headmaster of the Castle Hill Public School, who is also the Shire President, asked if the Club could repeat it at his school a couple of weeks later. Again it was a roaring (and noisy) success.

The driving force for the exhibitions was Ian VK2ZIO, who, apart from owning some of the vintage equipment, happens to be the Deputy Headmaster at Glenorie school.

Plans are in hand to improve the exhibition and to bring it to other schools and shows in the district. It is hoped to expand the range of equipment and show it in chronological order, a sort of "Amateur and Military Communications Through the Ages" exhibit.

In order to do this, members of the club are seeking donations of any amateur and military communications gear that would fit in with this theme. If readers have any gear that they would like to donate or perhaps sell for a reasonable sum, please contact the writer at the above address.

ANOTHER CRYSTAL CONTROLLED AFSK GENERATOR FOR RTTY

Maurie Hooper VK5EA
11 Richland Road, Newton, SA, 5074

There was an excellent response by amateurs to the RTTY generator described in the August 1984 issue of AR. This article describes an improved design, incorporating all of the advantages of the previous one (eg frequency accuracy and stability, and lack of switching spurii when changing from one frequency to the other) and reducing the number of ICs used from seven to five — reducing the cost and complexity.

The divider circuit is "user programmable", and virtually any available crystal in the range 1 to 10 MHz may be used, giving a frequency error of a few hertz at worst for the normal RTTY frequencies (2125 and 2295 Hz for mark and space). With slight modification the circuit could be used for any application requiring an accurate and stable clock (eg a UART) or, with suitable filtering, a sine wave frequency reference.

The constructor has the choice of using 74192 divide-by-10 or 74193 divide-by-16 presettable up/down counters. The circuit described uses the 74193 chip, but an example is given using the 74192 since the two IC types are pin-compatible. The counters are used in the pre-loaded down-counting mode ie they are loaded with a predetermined number (the divisor) and then count down to zero, as described in the following paragraphs.

CIRCUIT DESCRIPTION (See Figure 1)

IC1A and 1B together with the crystal, resistors and capacitor are configured as a square wave oscillator or "clock", the output being fed to a sequential binary divider chain comprising three 74193 presettable down counters (IC2, 3, 4). When the count reaches zero a "borrow" pulse is output from pin 13 of IC4, which when input to pin 11 of IC2, 3, and 4 causes them to be loaded with the data present at their "data input" pins 15, 1, 10, 9 (A, B, C and D inputs respectively). The down count then recommences. IC5 is a dual edge-triggered D flip-flop (of which only one flip-flop is used) wired as a toggle or divide-by-2 device. The borrow pulse from IC4 is used to clock the D flip-flop, producing a 50 percent duty cycle square wave output of half the frequency of the divider chain output. IC1C uses the "TTL input" to select the divisor for either mark (2125 Hz) or space (2295 Hz) as required. In Figure 1 a 0 V (logic 0) TTL input selects the "mark" frequency.

The circuit as shown uses a 3.579545 MHz TV "colour burst" crystal, readily available and quite inexpensive. This crystal produces calculated output frequencies of 2125.6 Hz (mark) and 2294.6 Hz (space) ie within 1 Hz of the nominal values.

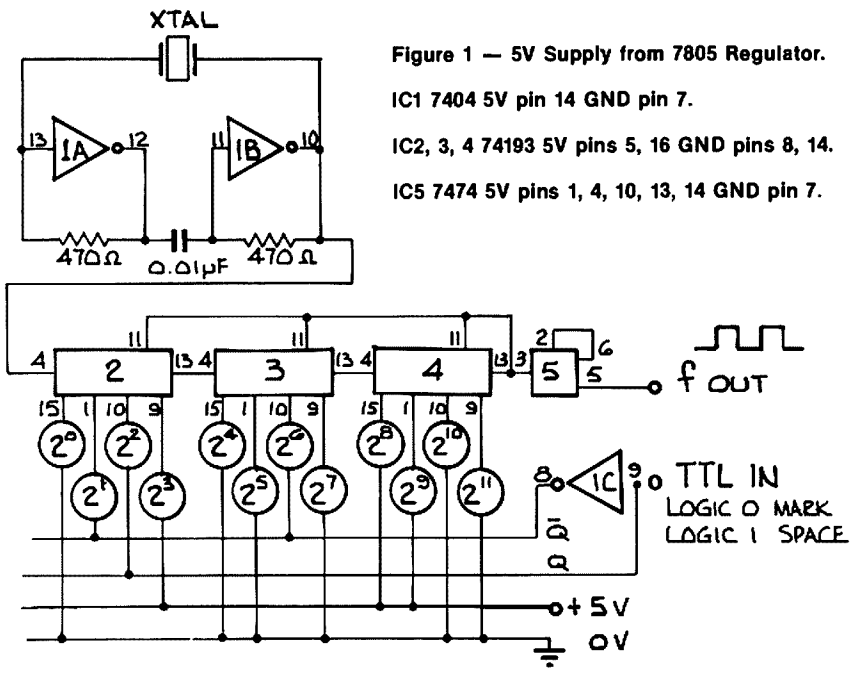

Figure 1 — 5V Supply from 7805 Regulator.

IC1 7404 5V pin 14 GND pin 7.

IC2, 3, 4 74193 5V pins 5, 16 GND pins 8, 14.

IC5 7474 5V pins 1, 4, 10, 13, 14 GND pin 7.

For those who wish to use a "junk box" crystal, a relatively straightforward method is described to determine the wiring necessary to decode the divider chain to produce the correct output frequencies.

DECODING THE DIVIDER NETWORK

Since IC5 divides the output of the dividers by two, the divider chain (IC2, 3, 4) must produce outputs, at pin 13 of IC4, of twice the mark and space frequencies ie 4250 Hz (mark) and 4590 Hz (space).

Let F be the crystal frequency in hertz, and Dm and Ds the divisors required for mark and space respectively. Calculate Dm = F/4250 and Ds = F/4590 and round to the nearest whole number. As an illustration, the circuit of Figure 1 (F = 3579545 Hz nominal) is calculated, giving Dm = 842.2 and Ds = 779.9 which, when rounded, gives the divisors Dm = 842 and Ds = 780. (The frequencies corresponding to the rounded divisors may be checked using f = F/(2xD).

The next step is to convert these two divisors to their binary equivalents, which is simply that combination of powers of two that when added together give the corresponding decimal number. The easiest method is to successively subtract the largest possible power of two from the divisor until the remainder is zero. This procedure is illustrated in Table 1.

TABLE 1 Example of conversion to binary

Power of 2	Decimal	Mark	Space
		842	780
2v10	1024	−512 (2v9)	−512 (2v9)
2v9	512		
2v8	256	330	268
2v7	128	−256 (2v8)	−256 (2v8)
2v6	64		
2v5	32	74	12
2v4	16	−64 (2 6)	−8 (2v3)
2v3	8		
2v2	4	10	4
2v1	2	− 8 (2v3)	− 4 (2v2)
2v0	1		
		2	0
		− 2 (2v1)	
		0	

giving 2v1+2v3+2v6+2v8+2v9 (for Mark)

giving 2v2+2v3+2v8+2v9 (for Space).

Note: 2v5 represents 2 to the power 5 = 2x2x2x2x2, etc.

Reverting back to Figure 1, the "TTL in" signal is inverted by IC1C so for an input of logic 0 (0 V), rail Q is logic 0 and Qbar is logic 1. Similarly, for an input of logic 1 (5 V), rail Q is logic 1 and Qbar is logic 0. To load the required divisor into the divider ICs, the powers of 2 obtained in Table 1 must be applied to their data

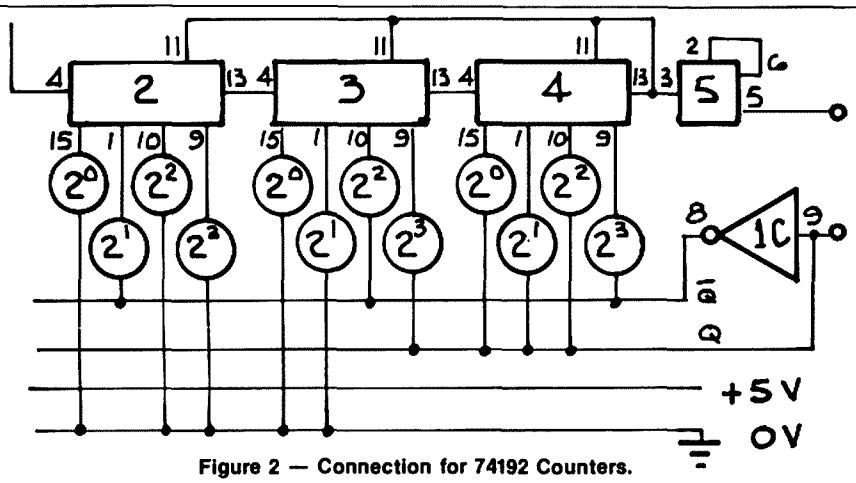

Figure 2 — Connection for 74192 Counters.

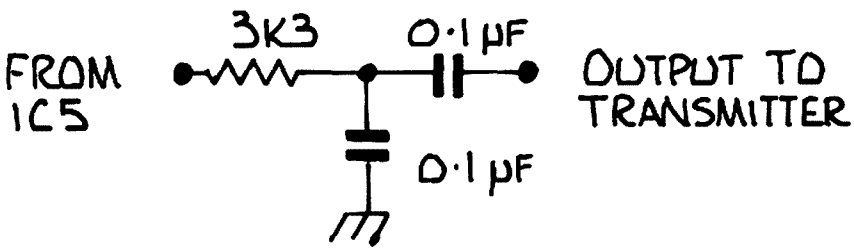

Figure 3 — Output Filter.

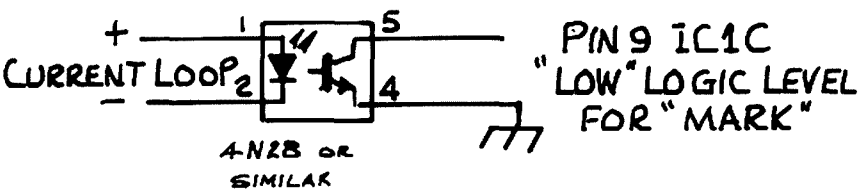

Figure 4 — Current Loop Interface.

inputs at a logic 1 level (5 V), with unused powers of 2 held at logic 0 level (0 V). It is important that the powers of 2 common to both divisors (both used and unused!) be permanently connected to the appropriate logic level, hence the use ot +5 V and 0 V (GND) rails. In the above case (Table 1) 2v3, 2v8 and 2v9 are common and are connected directly to the +5 V rail. Similarly 2v0, 2v4, 2v5, 2v7, 2v10 and 2v11 are not used in either divisor and are therefore all connected to the 0 V rail. The remaining powers of 2 are connected to Qbar for "mark" (2v1 and 2v6) and Q for "space" (2v2).

USE OF THE 74192 COUNTER

If the constructor wishes to use the 74192 divide-by-10 counter a slightly different approach is required. Each IC in this case is coded with a binary number corresponding to one of the decimal digits of the divisors, with IC2 the lowest significant digit and IC4 the highest. For the crystal used in Figure 1, the appropriate calculations are given in Table 2 and the method of connection shown in Figure 2.

TABLE 2 Calculations for 74192 counters

From table 1: 2 = 2v1, 4 = 2v2, 7 = 2v0 + 2v1 + 2v2 and 8 = 2v3
The appropriate wiring codes are therefore.

	IC4		IC3		IC2
"mark" = 842 =	(2v3)	+	(2v2)	+	(2v1)
"space" = 780 =	(2v0+2v1+2v2)	+	(2v3)	+	(−)

FILTERING

The output is a square wave and some filtering is desirable to reduce the harmonic content. An active low-pass filter could be used, many circuits of which are readily available. However, for most situations a simple RC filter (Figure 3) will suffice.

CURRENT LOOP INTERFACE

For those who still rely on a 20 or 60 mA current loop, a simple interface is given in Figure 4.

CONSTRUCTION

The circuit wiring layout is not critical, and the use of veroboard or similar makes a neat job. It is good practice to use sockets for the ICs.

Depending on the wiring layout, it may be necessary to add decoupling capacitors to reduce noise pick-up on the supply rails to the ICs. A few 0.02 uF ceramics at strategic places will do the trick.

AR

THE ULTIMATE AMATEUR BAND ANTENNA

Unfortunately this isn't an article that will tell you how to construct or even where to buy such an antenna. It's the story of a group of Dutch amateurs who, for a short period, were able to go on the air with perhaps the biggest antenna array ever used to produce strictly amateur signals.

The occasion was the opening of Radio Nederlands new transmitter site at Flavoland in northern Holland. For thirty six hours over the weekend of the 16/17 of February two amateur stations were set up in the transmitter hall and connected to the antennas of the new complex. They then proceeded to work the world on 80, 40 and 20 metres using the special call of PA6FLD.

The highlight of the operation however was when the proceedings were broadcast live over the Media Network programme of Radio Nederlands. This is compered by Jonathon Marks and devoted to short wave listening and related subjects.

In Melbourne, Radio Australia's Talkback programme propagation expert Mike Bird and myself were waiting for the band to open to contact them. At 0830 UTC with half the world calling we got through on 7.068 MHz with S9 signals both ways.

While in contact we had a receiver running on the 9 MHz transmission of Radio Nederlands and so were able to hear ourselves coming back. Quite an experience. The entire proceedings were recorded and excerpts later used in the Talkback programme on Radio Australia.

Gear in use at Flavo was two FT-102, FL2100Z combinations feeding the big broadcast arrays with something like 20 dB gain plus optimum radiation angle.

Special QSL cards are available to those who worked PA6FLD and also to short wave listeners who heard their transmissions.

THE TECHNICAL SIDE OF EARLY AMATEUR RADIO

John Gazard VK5JG.
2 Corbin Road, Medindie Gardens, SA, 5081.

To generate a radio signal it is necessary to make a high frequency alternating current flow in an aerial wire. The early wireless experimenters had no knowledge of electronics, but found three ways to do this. They were:

1 *The high frequency alternator which was a large, complicated and expensive machine suitable only for the lowest frequencies but capable of high power output.*
2 *The Poulsen arc which depended on high frequency variations in an electric arc current between copper and carbon electrodes. This was a cheaper machine than the alternator but was still complicated, and it was necessary to water cool the copper electrode.*
3 *The spark system in which a spark discharge shocked an aerial circuit into oscillation. This was a very simple and cheap method and could be easily constructed by an amateur, and consequently it was the method used by the first radio amateurs.*

In its simplest form, the spark transmitter consisted of a spark coil with its spark gap in series with the aerial and earth, and the receiver had a crystal detector and headphones in series with the aerial and earth. This simple form depended on the length of the aerial to fix its frequency, but its signals covered a very wide band and had a range measured in yards rather than miles.

The Model T Ford car used four trembler type spark coils in its ignition system, and many amateurs started out with one of these which were generally available at a low price.

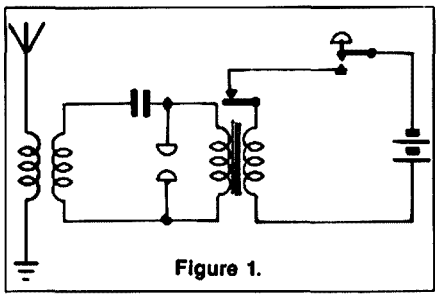

Figure 1.

An improved form of transmitter, the circuit of which is shown in Figure 1 was used by most amateurs. It operated as follows. When the primary of the spark coil was interrupted a current flowed in the secondary and the capacitor C was charged up until the voltage was sufficient to cause a discharge across the spark gap. This spark discharge caused a spurt of current which set oscillating currents flowing at the resonant frequency of the circuit. These currents died away (were damped) until the next spark arrived when they recommenced. The resulting wave form was as shown in Figure 2 and was known as a damped wave.

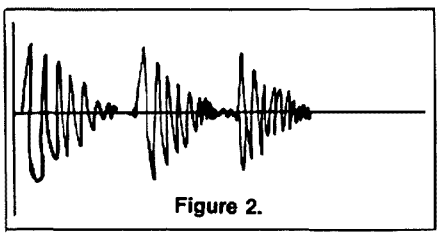

Figure 2.

The receiving circuit used was as shown in Figure 3. This also was simple and easy to construct.

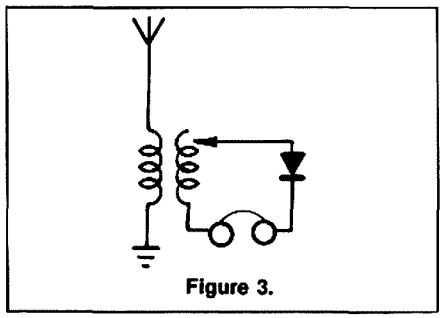

Figure 3.

The spark transmitter was not efficient as regards output compared with input and its signals spread over a wide band. The crystal receiver was not sensitive and its selectivity was poor. For example, in the early twenties the ship to shore spark stations on 500 kHz could be heard all over the broadcast band on the crystal receivers used at that time.

There were minor improvements in spark transmission as time went on. Larger spark coils and then high voltage AC transformers were used for power input. A quenched spark was one improvement. With this the spark was cut off sharply by cooling the gap with a mass of copper. The same result was achieved by using rotary machines to open and close the gap.

Although the presence of the Heaviside layer had been known for some years, it was not until the twenties that its effect on radio signals was recognised, and consequently before then it was thought that the ground wave was the only useful signal emitted. As with the ground wave, higher frequencies are more rapidly attenuated by ground absorption frequencies above 1500 kHz were considered less than useful for commercial longer distance working, and amateurs were relegated to these frequencies.

About 1920 valves became available to amateurs. They were used in receivers. A typical receiver consisted of a regenerative detector transformer coupled to a triode amplifier as shown in Figure 4. This receiver had much greater sensitivity and selectivity than a crystal set. In transmitters valves were used as oscillators, either of the Hartley, Colpitts or tuned plate, tuned grid type, and produced a continuous wave (CW) as compared with the damped wave of spark. A single keyed oscillator was loaded directly into the aerial. A commonly used circuit is shown in Figure 5.

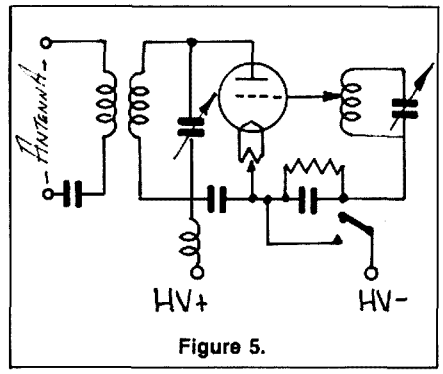

Figure 5.

A transmitter of this type would obviously be not very stable and would suffer from chirps, frequently drift and a poor note. However it was preferable to spark which it gradually replaced in amateur use.

Frequency measurement was made with a wave meter which was a calibrated tuned circuit which, when brought near the transmitter tank coil, indicated resonance by a dip in the plate current or the lighting of a torch globe in the tuned circuit. However when the wave meter was brought near the tank coil it changed the oscillator frequency so that this was a doubtful method of measuring frequency.

Valve operation permitted amateurs to use higher frequencies, and it was soon discovered by them that these higher frequencies were suitable for long distance communication, and it was not long before the effect of the Heaviside layer in reflecting or refracting

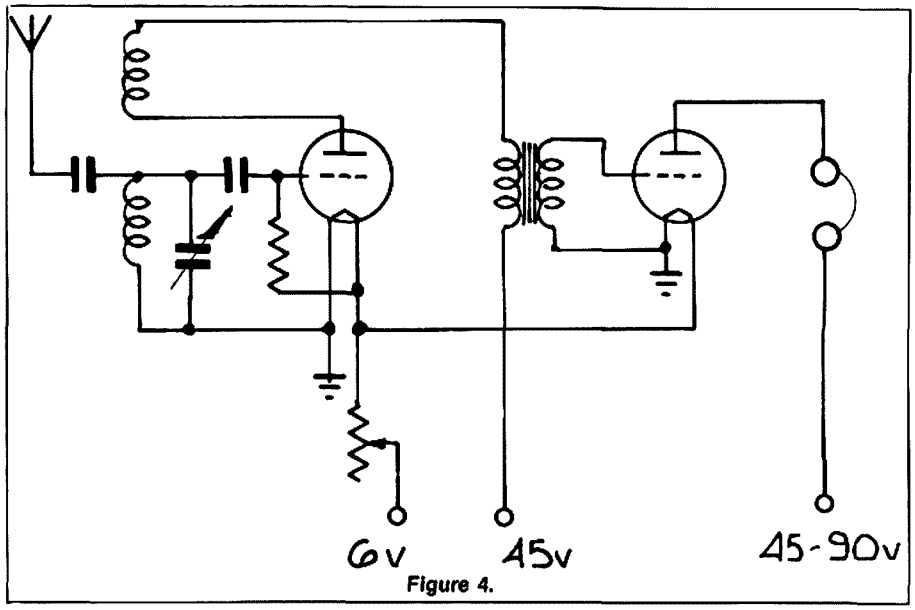

Figure 4.

radio signals was understood and the once despised high frequencies became much in demand by government and commercial interests for long distance work.

With the advent of these new users of the high frequency bands, amateurs were restricted to allocated bands by some countries, and in 1924 in the USA which had the largest number of radio amateurs, these bands were 1.75-2.0, 3.5-4.0, 7.0-8.0, 14-16 and 55-60 MHz.

Valve operation (CW) continued in the 1920s with very little change in techniques. The science of electronics was only just developing, and most newcomers to amateur radio had no knowledge of electronics and it was "learning as you go" for most of them, and most of them built their own transmitters and receivers. Probably more effort was put into making long distance records as with the advent of high frequency working there were exciting new opportunities to make contact with all the countries of the world where amateurs operated.

In 1927 an International Radio Telegraph Conference was held in Washington. This was the first International Conference since the value of the higher frequencies had been discovered, and the increasing demand for the use of these frequencies put great pressure on amateurs to retain their frequencies. In the end the amateur frequencies were fixed at 1.715-2.0, 3.5-4.0, 7.0-7.3, 14-14.4, 28.0-30.0, 55-60 MHz, but some countries reserved the right to reduce these allocations in their own country. These new bands and some new regulations were to come into force in 1929.

The amateur bands were thus considerably narrowed, and there would be penalties for out of band operation and poor signal quality. The directors of the American Radio Relay League realised that the amateur operation would have to be improved to meet the new conditions and inaugurated a Technical Development Programme to cope with the situation. This programme was placed under the control of Ross Hull, a prominent Australian amateur who was visiting USA. He was assisted by a small staff, and his findings and recommendations appeared in QST from August to November 1928, and provide a clear picture of the technical side of amateur radio at that time. Hull was very critical of the quality of amateur transmitted signals. He said in August 1928 QST *"if the world's crystal controlled and oscillator-amplifier transmitters could be taken off the air tomorrow there would be about five truly constant frequency and unmodulated signals left"*. His tendency was to scrap self excited transmitters and break into new methods, probably crystal control, but as this would mean scrapping 90 percent of amateur transmitters he decided to investigate methods of improving existing equipment.

In his investigations and experiments Hull found that the frequency of self excited oscillators changed considerably with variation of the plate voltage, and as plate supplies were often unfiltered in those days, the frequency varied with ripple voltage creating a wide band mushy signal. Obviously improvements in power supply were necessary, but Hull found that frequency change from voltage variation was much reduced if the coupling to the aerial circuit was loosened, and also if the ratio of capacity to inductance in the tank circuit of the oscillator was increased (high C), and he recommended a 500 pF tuning capacitor in the tank circuit. The high C increased RF current in the tank coil and therefore ¼ inch diameter copper tubing was required for the coils which were to be directly bolted to the capacitor frame terminals. With loose coupling, high C solid construction and careful adjustment of the feedback, Hull showed that a self excited oscillator coupled to an aerial circuit could produce a DC note. Hull did not propose any change in transmitter circuits which were Hartley, Colpitts or TPTG type. The TPTG type circuit remained as shown in Figure 5.

As for the frequency measurement, Hull found that the wave meter was not an accurate instrument, and apart from shifting the frequency of the oscillator when brought near it, its peak reading was not precise. He therefore proposed the use of a separate calibrated oscillator, the frequency of which would be compared with the frequency of the transmitter. This developed into the heterodyne frequency meter-monitor which was in use until digital meters evolved.

Amateur operation in 1928 was almost wholly CW and the simple oscillating detector with one or two audio amplifiers was the popular receiver. Screen grid valves had just been introduced, but amateurs were using the triodes in all stages. Hull described three improved receivers. The first used a screen grid untuned RF stage ahead of a triode regenerative detector which was followed by a screen grid first audio amplifier with a tuned plate circuit resonant at 1000 cycles. The SG valve was used because its high impedance matched the impedance of the resonant plate circuit which used the secondary of a Ford spark coil with the core and primary removed, and was tuned by a selected fixed capacitor. The second audio stage was a triode. The circuit is shown in Figure 6.

The RF stage was untuned because an extra control and shielding would have been necessary if tuned, but it gave some gain and its main purpose was to isolate the oscillating detector from the aerial and thus prevent radiation and make regeneration control smoother. The tuned audio stage provided audio selectivity and enabled CW signals 200 Hz apart to be separated. This receiver was suitable for CW only.

The second receiver was similar to the first except that the RF stage was omitted and the third was a simple two valve receiver with a detector and one audio stage. These receivers had plug in coils for band changing, and were specially designed to have full dial band spread on each band. Like all receivers and transmitters at that time, they were built on wooden bases (bread boards).

In the late 1920s broadcast receiving valves designed for working from AC power were introduced and high power audio output valves became available. These valves were also suitable as RF output valves in amateur transmitters, and as they were produced in large quantities they were considerably cheaper than valves previously available. The power transformers, rectifiers and filters also used in these new AC operated broadcast receivers could be used for making amateur transmitters, and were likewise cheaply available for building amateur gear.

About 1926 quartz crystals for oscillators were first introduced in USA. They were expensive, being priced at the equivalent to 200-300 dollars at today's values, and were originally only cut for the lowest frequency amateur band. At first they were not much used by amateurs because they were too expensive and were considered too complicated as they required double stages. However in course of time they became cheaper and better electronic knowledge reduced the supposed complication, and amateurs began to use them. By 1935 they had mainly replaced self excited oscillators. The 1935 ARRL Handbook gave construction details for crystal controlled transmitters only.

With crystal controlled oscillators good quality phone transmission was possible. In the early thirties class B audio amplification was introduced, and shortly after receiving valve beam power amplifiers became available. Before then, with only class A amplification and triode valves even low power modulators were expensive, but with class B and AB beam power amplifiers a relatively cheap modulator with up to 100 watts output was available and increasing numbers of amateurs built and operated phone transmitters in the thirties.

The regenerative 2 or 3 valve receiver continued to be used for many years. It was simple, cheap and easy to construct, and when used on CW it was possible to achieve remarkable results. One was described in the 1958 ARRL Handbook. It was usual for the newcomer intending to enter amateur radio to first build his simple regenerative receiver and use it to learn the code, and has his first receiver after being licensed. About 1930 receivers were built with a screen grid tuned radio frequency stage in front of the regenerative detector. These were known as TRF receivers. The RF stage added to the sensitivity for phone reception and isolated the detector from the aerial, but provided little improved selectivity.

Elementary super heterodyne receivers had been described in QST in 1928 and were further developed into the thirties but their construction, generally involving metalwork, and their adjustment were beyond the capability of most amateurs and very few were home-built at first. Later several manufacturers began making bandswitching superhet receivers of high performance and these became popular with amateurs who could afford them but others continued to use regenerative 2 valve and TRF receivers. The 1935 Handbook described 2 two valve receivers, 2 TRF and 3 superhet receivers. One superhet receiver had plug in coils and the other two used bandswitcher coil assemblies supplied as manufacturer's kits.

The thirties was a period of great development in amateur radio. In those years the amateur ranks were filled with young men learning the new science of electronics. In most countries radio component parts were readily available and amateurs developed and built their own equipment and were generally technically up with the state of the art. The thirties are often considered to have been the Golden Age of amateur radio.

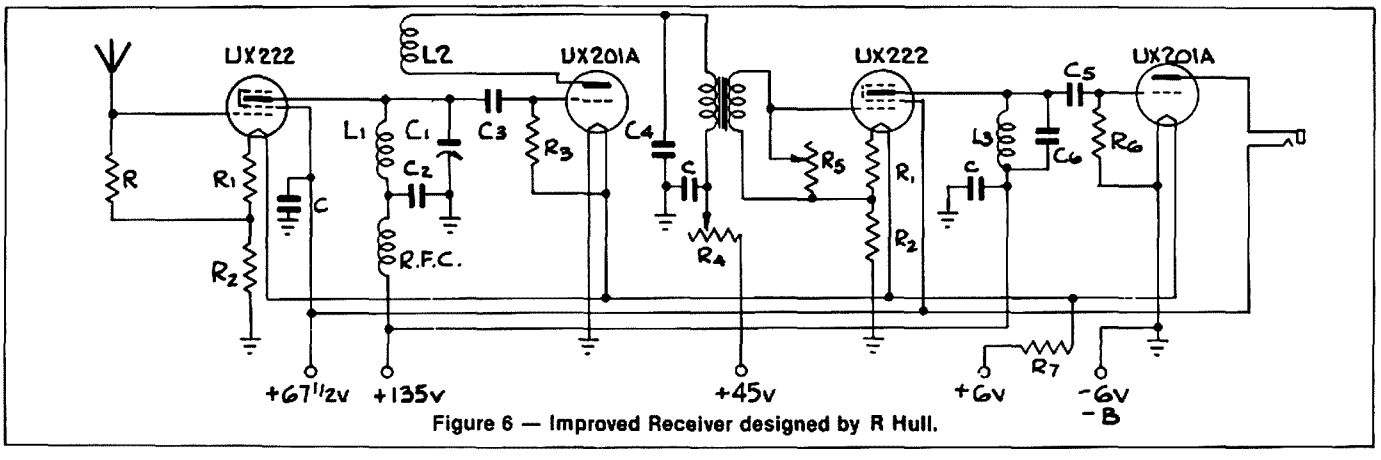

Figure 6 — Improved Receiver designed by R Hull.

A FORTY METRE ROTATABLE DIPOLE — ALMOST AS GOOD AS A BEAM

Bob Slutzkin VK3SK,
8 Lynedoch Avenue, East St Kilda, Vic. 3182

In his book, "HF Antennas for all Locations", Les Moxon G6XN writes quite a bit about compact antennas. On page 171, he points out that a 20 metre dipole may be shortened to 24 feet and end loaded by T pieces 6 to 7 feet in length "without any significant effect on any aspect of performance". He claims that a 17 feet dipole properly end loaded might have a reduced bandwidth but only about 1 dB less gain than a full dipole. He does not recommend anything shorter than that, but if shortening to 17 feet (which is a quarter wavelength) has such a small detrimental effect, I think a little more shortening might be acceptable if the circumstances demanded it.

Now, the boom of a 204BA (20 metre beam) is 26 feet long, which is about 1/5 wavelength at forty metres; and at each end of the boom there is a 20 metre element which would act as quite a large T piece to end load the boom. I figured out that if I could feed the boom of my 204BA on 40 metres it might work reasonably well. It is up 60 feet in the air, and I would be able to rotate it to obtain the advantage of any directional properties that it might have.

Stan VK3TE also liked that idea, so he helped me in some experiments in trying to shunt feed the boom on 40 metres. We made up a number of bits and pieces for a gamma and omega match, a T match and a Y match, and spent quite a lot of time in unsuccessful attempts to feed 40 metres into that frustrating boom trying all four methods. I do not know exactly where we went wrong; but later on I shall tell how W8BEB finished up. He must have been doing his thing at about the same time as we were planning our exercise; and he wrote it up in August 83-QST.

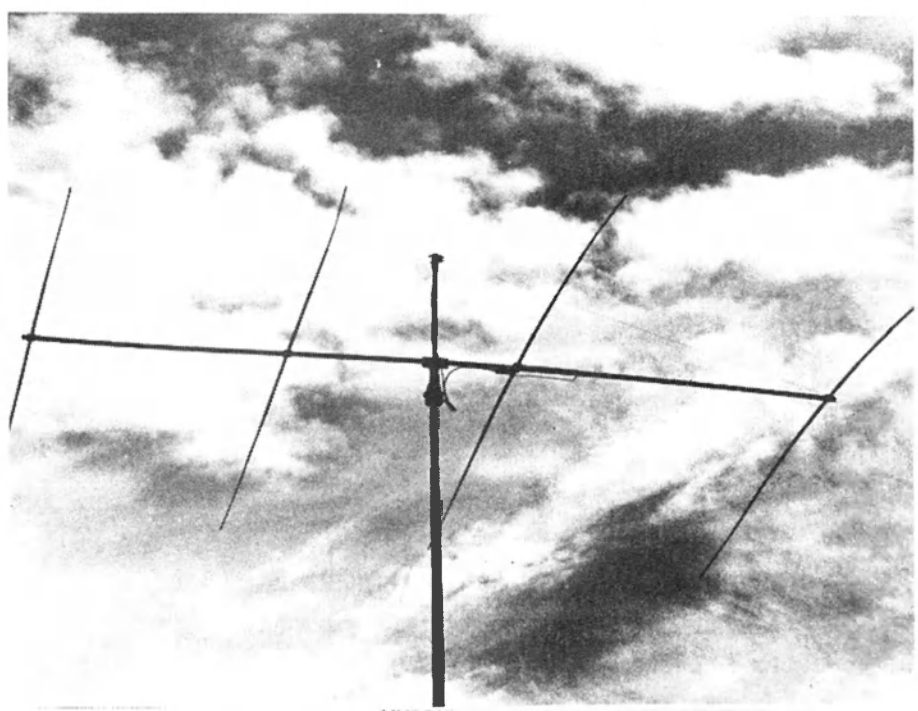
If shunt feeding would not work (so we thought at the time) perhaps we might have more success with series feeding. Now it would be almost impossible to insulate the boom in its centre, so I decided to run a wire dipole from the top of the mounting pole which holds and rotates the beam. This pole protrudes about 4 feet above the centre of the beam; so I attached a BN86 balun at the top of this pole and ran wires down from the balun to the two ends of the boom. I used short lengths of strong fibreglass pipe to insulate the end elements from the boom; and the wires were connected to their centres and so I had a wire dipole which was end-loaded by huge T pieces. I had hoped that the proximity of the boom and the other two elements of the beam would not have any detrimental effect on the 40 metre antenna. I connected the 50 ohm coax from the balun to the rig via an antenna tuner and tried it out. Instant success! It worked well on 40, had an unexpectedly good front-to-side response (as was demonstrated when I rotated it).

It could work Ws and Gs, and even locals. There was only one problem. The SWR was a bit too high, and I would have preferred not to have to use an antenna tuner. Leaving out all the trial and error experiments, I established that the antenna resonated somewhere around 6 MHz; but best of all, a single condenser of the correct value placed in series with one of the dipole wires at the balun would not only resonate it in the centre of the 40 metre band but also keep the SWR below 2:1 over all the band except below 7.030 MHz (a part of the band I am a little ashamed to admit that I never use). Of course it could be tuned to cover the CW end to the detriment of the other end — the bandwidth was just a little too small.

Does anyone want a 40 Metre ATU cheap?

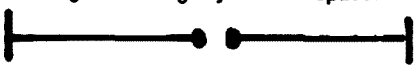
That series condenser that I mentioned had to be the correct value. I determined the right value using a variable one, then substituted a huge encapsulated mica condenser of WW2 vintage. Then everything was tightened up and waterproofed, and the job was finished. (Stan used a variable condenser mounted inside a refrigerator box).

Well, what about W8BEB? He used an 11'6" long gamma rod of 3/4" diameter, spaced 4" centre to centre from the boom. It was attached 6" from the director end and fed 12" from the boom centre through a 400pF variable condenser. The secret might be the off-centre feeding, or perhaps Stan and I were not going about it the right way. Anyhow, when I read the QST article I had to try it out. I removed my wire dipole, and short circuited across the insulators at the end of the boom. Then I reproduced his gamma system in a rather temporary fashion. By this time I had acquired a pair of selsyn motors[1] which enabled me to tune the gamma capacitor from the shack. It took me all of thirty seconds to adjust for a perfect match at 7.150MHz; and I found that the W8BEB shunt-fed boom worked similarly to my wire dipole. I reverted to the original arrangement for two reasons: *1) It was my own idea, and I am a little vain, and 2) all the bits and pieces were there to restore it to a mechanically sound and*

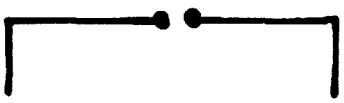


VK3SK's antenna.

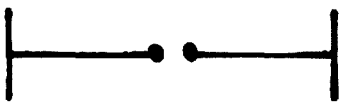
a) Bending the ends slightly to fit a half wavelength in a slightly smaller space.



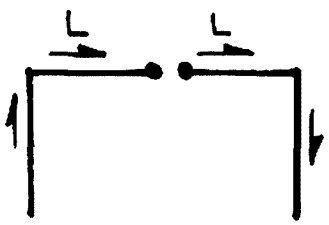
b) An alternative to a. The piece at the end is a T or T piece of about the same length as the L piece in a.



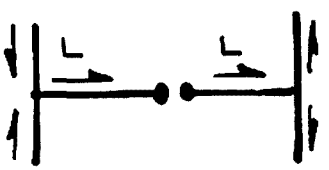
c) An extension to a.



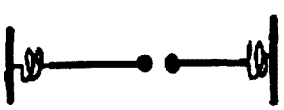
d) An extension to b.



e) a further extension to a. The current in the L pieces which are now of more significant length are likely to cause some vertically polarised radiation off the ends of the dipole.



f) a further extension to b. The two currents in the tee piece halves would be half that in the L, and would tend to cancel radiation from the ends.



g) G6XN's method of using a loading coil before the tee pieces. This allows a shorter tee to be used and would further reduce end radiation.

Figure 1 — End loaded Dipoles.

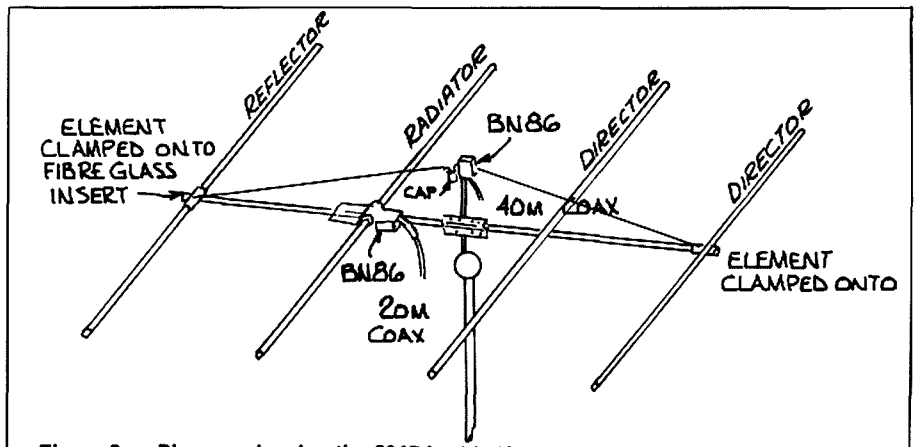


Figure 2 — Diagram showing the 204BA with 40 metre dipole attached VK3SK style.

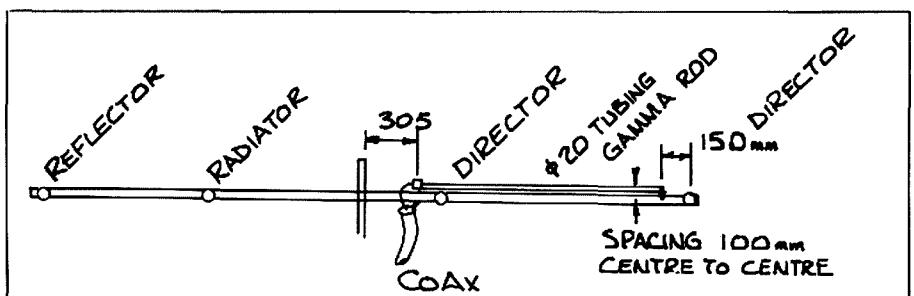

Figure 3 — W8BEB's method of shunt feeding the boom.

weatherproof job, and I did not see the need to make up more hardware for a permanent gamma match.

If you want to adapt your large 20 metre beam, I would recommend W8BEB's method.

I have now been using the wire dipole for a few years, but mainly for local contacts. I don't enjoy the DX round tables on 40, but if ever I happen to join in during the openings to G or W, I find my antenna is nearly as good as a beam.

FOOTNOTE 1

For those who are not familiar with selsyns, they are a type of electric motor, with 5 terminals — 1, 2, 3, A and B. You need a pair of them and you connect all the corresponding terminals together (ie 1 to 1, 2 to 2 etc.) and the correct AC voltage across A and B. (My selsyns required 110 volts AC). The motors can be separated by as long a 5-core cable as you like. Then, when you turn the shaft of one of them, the shaft of the other follows. If you couple a variable condenser to the shaft of one, and a knob to the other, you can tune the condenser remotely. This is precisely what I did to tune the gamma condenser. The selsyns are now tucked away somewhere in my junk room complete with a motley cable and 110V tranny. They are available for loan to Moorabbin Radio Club members (or others) for a nominal fee to the club.

APPENDIX

End Loading a Dipole

The simplest method of end loading a dipole is simply to bend the ends over, which is quite a common practice where there is not quite enough space for a half wave dipole. When you do this you will usually find that you have shifted the resonant frequency a little. The bent pieces radiate a little off the end, but very little if the bent or "L" piece is small. But you could shorten the dipole by quite a lot and use a large L piece at each end, (eg a quarter wave flat top with two L pieces about 1/8 wave long, like half a quad element). There would be quite a bit of radiation off the ends from such an arrangement, and if the L pieces are vertical, the end radiation would be vertically polarised. If instead of L pieces they were T pieces, approximately the same length of wire would be needed, but the behaviour of the device would be a little different. There is a current entering the T piece and it divides into two equal currents which would flow away from each other and so be out of phase with each other. The radiation from each half of the T would be reduced by 6 dB (because

of the reduction of current), but the radiations would tend to be self cancelling.

Therefore we should expect a T loaded shortened dipole to be better than the L loaded device. Les Moxom likes a loading coil in between the dipole end and the T, and of course the T would then be shorter. I believe that long T pieces are OK when the circumstances permit. Figure 1 shows the development of end loaded dipoles.

In Northern Australia tropical cyclones form in the summer months over the Coral and Arafura Seas and these revolving wind storms can affect the coastline from Brisbane around the 'top end' and down to Geraldton.

Cyclone 'Tracy' began as a weak tropical low some 700 km north-east of Darwin on the 20th December, the Bureau of Meteorology received satellite photographs and issued the first cyclone alert on the 21st December.

Three weeks previously cyclone 'Selma' had also approached out of the Arafura Sea but after passing over Bathurst Island veered away to the north.

In the city of Darwin on Christmas Eve 1974, the residents, with an air of complacency, were preparing for the season's festivities and parties were in full swing in spite of the oppressive humidity which is usual at this time of the year.

During the evening cyclone warnings were being issued on radio and TV. As the cyclone approached Point Charles, 24 kms to the west, it hovered momentarily and then headed for the city, the wind speed increased and around midnight the destruction of the city began.

At 3 am on Christmas Day the anemometer at the airport registered a wind gust of 217 km/Hr and was then damaged, some gusts were estimated to have reached 250 km/Hr.

The eye of the cyclone passed over at 4 am, there was a short lull, then the fury recommenced from the opposite direction further completing the destruction.

Torrential rain added to the hardships of the survivors as they huddled in the wreckage of their homes or in motor vehicles waiting for the shrieking wind to abate.

At dawn the 45,000 residents looked out at a ruined city, a city without power, communications, water or sanitation, a city in which in just a few furious hours some 50 people died and hundreds were injured.

This was Darwin's Christmas of '74.

WICEN in North Queensland has always been aware of the severity of tropical cyclones and had formed its operational plans accordingly, the most important part of which is to follow cyclone track plotting and prepare emergency networks before the event.

So, that while shocked by the news early the next morning, Cairns WICEN operators commenced a listening watch on 14MHz for any signals from the stricken city.

At 242300Z — the writer started monitoring the WICEN calling frequency of 14.100 MHz while John Roberts VK4TL, agreed to search the band. Meanwhile other Cairns WICEN operators were alerted on the VHF networks.

Eventually at about 250005Z, John's attention was drawn to a 'dogpile' which had developed on 14.175 MHz, the cause of this being the first amateur signals from the ruins of Darwin.

Bob Hooper VK8RR, Manager of the Overseas Telecommunications Commission's transmitter site, which included VID, Darwin Shipping Radio, was confronted at first light with a tangled mess of bent masts and antennae and with ships at sea in the cyclone area.

Photograph by Owen Marshall VK8OM

Darwin Community College after Tracy. Slim VK8JT operated from the building on the left.

Bob extracted his car from under the wreckage of his house, screwed in an aerial whip, and went on air in order to get the information to OTC headquarters in Sydney. However, the moment he was heard, he was besieged, quite understandably, by amateurs who were anxious for news of relatives and friends in Darwin.

Bob patiently explained that there were no telephones working, he could not drive around enquiring because of blocked roads and his main request was for urgent contact with OTC.

Some amateurs phoned local OTC stations but no definite instructions were forthcoming until Cairns WICEN managed to penetrate the QRM and make contact with him.

John VK4TL, phoned the Cairns OTC Manager, Keith Parker VK4VI and asked him to come up on the frequency, however, when he did the interference was building up with persistent breakers interjecting and blocking the contact.

At 250115Z, the writer, as WICEN co-ordinator for North Queensland, activated a WICEN emergency channel on 14.175 MHz for the purpose of urgent traffic between Darwin, Cairns and Sydney for the OTC.

This was the start of the WICEN National Net for Darwin which was to last for seven days and would involve hundreds of amateurs in cities and towns throughout the country, hundreds of messages were handled from urgent relief traffic to whereabouts and welfare messages concerning evacuees, 25,000 of whom were airlifted south in the largest operation ever undertaken in Australia.

Once the net control was established and order restored the contact between VK8RR and VK4VI continued and shortly instructions were received from Sydney for Bob to take over the radio installation in the MV 'NYANDA' in Darwin harbour and set it up as VID2.

Bob then closed down to carry out his duties and the WICEN group continued a listening watch until 250201Z when Owen Marshall VK8OM, mine manager at Koongarra came on to report weather and site status and also that his single engined aircraft was serviceable.

Photograph by the Sydney Morning Herald.

An injured mother and child await evacuation.

At 250430Z 'Slim' Jones VK8JT was heard with a weak signal from Darwin.

'Slim' and his wife had been sheltering under their high set house and escaped injury, however when he found his radio gear among the wreckage it was useless because of water damage.

'Slim' then went to the Community College at Casaurina to seek shelter and there met Garry VK2BNN/8 and XYL Wendy VK2BYL/8. Their Hallicrafters transceiver was dried out with the aid of a hair dryer and after putting up an aerial they managed to put out a signal. The college had 240V AC from a gen-set.

'Slim' checked into the net and then sent a message to the Darwin Police Station, that communications via WICEN were available and shortly the National Net commenced handling primary traffic.

Later in the afternoon as more official messages were being directed to Canberra and Melbourne WICEN COMCEN was set up at Police Headquarters, D24 in Melbourne and net control was handed over to Ken VK3AH by Ted VK4YG.

Conditions on 14MHz were variable and Cairns WICEN had to relay traffic between Darwin and Melbourne as well as assuming local area control for outlying settlements in the Northern Territory and North Western Australia.

As the network expanded, information and relay stations were set up in various centres, Basil VK6NA at remote Kolumburu Mission, Craig VK8CW and VK8IG in Alice Springs, Terry VK2BTS/4 (now VK4AAT) and Owen VK4OV at Mt Isa plus scores of others, all did excellent work in traffic handling in a fine example of amateur radio teamwork.

Late in the evening official traffic ceased and 'Slim' closed down for a well earned rest and WICEN went to listening watch.

Day two commenced early with official message handling and relay between Darwin, Cairns and Melbourne.

Contact was made with Keith VK8KG at Gove which had no communications since its radio base at East Point had been destroyed. Owen VK8OM at Koongarra also checked in and traffic for these centres was handled by Cairns WICEN.

During the day Cairns WICEN controller, VK4YG was authorised to accept official traffic from NDOC Canberra via VK2ADA for onward transmission to VK8JT and NDOC Darwin headquarters.

Major General Alan Stretton, the newly appointed head of the National Disasters Organisation, who had been flown to Darwin by the RAAF to assume supreme command of relief operations, stated in his book, 'FURIOUS DAYS' that the first major problem encountered was the almost total lack of communications, not only within the disaster area but to centres outside.

This was the situation for several days and explains why WICEN had to handle so much official traffic since other available channels were overloaded or unreliable.

Some 60 percent of houses were destroyed or severely damaged and for this reason there was very little amateur equipment in a serviceable condition, furthermore as Ray Williams VK2ARW, Inspector In charge of the NSW Police contingent reported later, most residents were in a state of shock after their terrifying ordeal.

On the 26th December, Owen VK8OM at Koongarra, 120 nautical miles east of Darwin, was becoming anxious about the welfare of his company staff in that city.

He drove to the airstrip and tried to obtain flight clearance from Darwin Air Traffic Control by HF radio from his aircraft. Darwin did not reply but Katherine ATC eventually informed him that clearance was not available.

The next day (27th) through the net Owen heard that Slim VK8JT, was having trouble with his transceiver, so he offered to fly in an FT75 rig.

Flight clearance was arranged by NDO and after packing the rig plus spares aboard his single engined Comanche 250, Owen took off for Darwin at 0147Z. When he arrived he had to orbit the city while a huge US Starlifter freighter landed so while he was flying over the northern suburbs he was able to see the tremendous damage from the air. After landing he delivered the FT75 to the Darwin Community College where he found Slim to be operating under difficult conditions as heavy rain was still falling and due to roof damage everything was wet in the building.

Owen then saw to the welfare of his staff and flew back to Koongarra where he reported the conditions in Darwin to WICEN COMCEN in Melbourne.

On the 28th, Owen heard that Slim was having trouble with the portable generator at the college. A 1.5 kVA unit was offered from Koongarra, and accepted, however flight clearance was not available due to heavy traffic in and out of Darwin so this unit was delivered by a 4WD vehicle driven by Chris Pedersen, the senior geologist at the mine, who got through safely in spite of flooded creeks and boggy roads.

Photograph by the Sydney Morning Herald.

Darwin — a city in ruins.

Little known incidents like these and the other qualifications of many amateurs all contributed to keeping the vital Darwin WICEN network operating successfully.

Another rig was received by Slim VK8JT from Arie Bles VK2AVA. When he learnt that Slim was having trouble with the transceiver he was using, Arie rushed a new rig to RAAF Richmond whence it was flown to Darwin in order to keep the vital link open; two amateurs in Adelaide were standing by with a complete portable station including a gen set but permission was not granted for them to go to Darwin.

On day three an officer of the Victorian Radio Branch ordered the closure of the WICEN net, apparently unaware of the communication situation and of directives issued by NDOC. Amateurs operating the net sent a telegram to the Prime Minister and the Postmaster General and the close down order was then revoked.

Permission was given for WICEN to handle public telegram traffic concerning the whereabouts and welfare of evacuees, this added to the constant flow of official traffic so that more amateurs in all states were called in to assist. Propagation conditions were variable due to a sunspot minima period and a considerable amount of message relaying was necessary.

The message logs for Days three, four and five listed the following traffic:

NDOC traffic and replies.

Police messages.

Aircraft movements, RAAF and Civil-Flight planning, route weather forecasts, load details.

Salvation Army — re food airlifts.

Department of Social Security.

Whereabouts and welfare of evacuees — Telegrams and queries.

Weather reports and synoptics.

During this period enquiries were received from Pom YB0NQ/9 and Gene YB9ABT at Tembagapura in West Irian concerning the Fokker F27 aircraft (medical evacuation) belonging to Freeport Indonesia which was on the ground at Darwin airport during the cyclone. Since their radio base at Darwin had also been destroyed traffic was taken over on an official basis by Ray VK4HE, the Radio Inspector at Townsville.

The efficient manner in which this type of traffic was handled clearly demonstrated the ability of WICEN to integrate with other emergency services having a similar communications system.

During Day five, 29/12/74, the WICEN COMCEN in Melbourne was closed down on instructions from the Victorian Radio Branch.

The WIA received a congratulatory message from the National Disasters Organisation, praising in particular the devotion to duty of 'Slim' Jones VK8JT, and all net controllers and operators.

North Queensland WICEN, on instructions from NDOC Canberra continued in a combined WICEN/NDOSES operation for Darwin, Gove and Koongarra until all communication circuits were finally restored on the 31st December 1974.

The WICEN National net for Darwin closed down at 310825Z, the North Queensland group had been operating for a period of seven days with an on air time exceeding 85 hours.

So ended the largest emergency communications operation ever undertaken by the Wireless Institute of Australia in a major disaster situation, however there was another important facet to this operation:

Major General Stretton stated in reply to a controversial instruction from Canberra:

"The only commodity we deal in here is human beings . . ."

People — that was what the National Net for Darwin was all about. People in distress — people in need of communication with their loved ones.

The Wireless Institute's Civil Emergency Network was able to provide that communication.

MORE ABOUT TESLA

Herbert Schwartz VK3DHI/K2LVU
505 West Broadway, New York, NY, 10012.

Mr Mowat's article, "Forgotten Genius" in Amateur Radio for March 1985 reminded the author of his own personal experience with Nicola Tesla, recounted here with nostalgic delight.

It took place during the Stateside 1932-1933 academic year when I was in my final year at high school. I had won a prize (of $10, which I squandered on an official school sweater and a pair of "saddle" shoes) in the last previous American Institute School Science Fair, and I was intent upon a project that I hoped would earn me even greater distinction in the next one.

I was building a "million-volt" electrical oscillation transformer, a Tesla Coil, in the school's Physics Department workshop, using begged, borrowed and scrounged materials; and sturdily constructed device into which I poured much effort, time and the resources of my long-suffering friends. When, at last it was finished to the point at which I could put it to the test I did so, and although my rotary spark-gap snarled merrily as it arced and produced lots of ozone, nothing else resulted; no lightning bolts, no corona, not even a glow on the copper toilet-tank ball-float that was serving as a business-end terminal of my secondary. *Utter failure.*

I went over the system bit by bit for days and couldn't pin down the fault. I checked and rechecked every component and rebuilt what I could, to no avail. In desperation, I finally decided to consult Mr Tesla himself. Important people were much more readily accessible then, and this very popular and highly respected New Yorker was no exception; it was well known that he fed the pigeons every morning on the steps in front of the main Public Library. Since it was also generally known that he did not suffer fools gladly, especially when they interrupted his pigeon-feeding, I decided to seek him out "at home" and went about doing so the very next available Saturday morning. It was quite an adventure.

Nicola Tesla was living in the Hotel Governor Clinton (after having been put out of the St Regis for keeping pigeons in his rooms) at that time, and when I got there I had no difficulty at the front desk because Mr Tesla preferred to send and receive things by messenger, and boys with burdens were always turning up asking for him. I was quickly given the location of his room and the fact that he was in it, and made my way to it. I knocked on his door persistently until it was snatched open by a very much irritated, elongated (he was at least six feet tall (1.8 metres)) scarecrow-like man who gave me to understand (in a surprisingly high-pitched voice) exactly how he felt about being torn away from an important task by a rude creature who was "barely out of knee-pants" (boys in New York wore pants that buckled just below the knee until they were wage-earners or high school seniors, in those days). When he had to pause to catch his breath I blurted out my reason for having done so, pointed out that since it was his invention it was also his responsibility to do something about my failure with it. I shall never know whether it was because of the audacity of my stand, or my naivete in pursuing it, or because he was at heart a very generously sympathetic person, but he invited me in.

He very carefully, examined the portfolio-full of notes, drawings and snapshots that I'd brought with me, questioned me closely about what I had done in constructing and testing the device, concluded that my troubles lay in the condenser (as even he called it then), and sent me away with precise instructions as to how to go about correcting the fault and as to how I was to report the results to him ("By telephone . . . not in person!"). I did as he asked, and my Tesla Coil came to life. And when I told him so, his reply was simply "Of course!!"

However, I never won a prize with that Tesla Coil. In fact, I never got to enter it in that year's School Science Fair. Fine-tuning had produced such splendid results that I was able to work up a spectacular show (with an enormous and fiery "Jacob's Ladder"; illuminating light-globes held in the hand; a "hair-raising experience;" lightning bolts punching holes through bottles; and the like) presented in several successive school-assembly programmes to great (and heady) acclaim.

DAILY NEWS
PRESENTS
47TH SCHOOL SCIENCE FAIR
YOU ARE INVITED TO SEE 46 OF THE BEST HIGH SCHOOL SCIENCE PROJECTS ON DISPLAY
MARCH 19-22
AT IBM GALLERY
OF SCIENCE AND ART

A newspaper clipping from the New York Daily News — 20th March 1985 — referring to the 1985 School Science Fair. This is the same Fair, different year, that Herbert had hoped to enter his Tesla Coil.

But, I was unwittingly also interfering with radio reception for miles around, as I found out to my very great dismay from the field-agents of the then newly instituted Federal Communications Commission when they came to the school to find and dismember my wonderful machine. And I firmly believe to this day that I can claim the dubious distinction of having been among the very first persons who were ever singled out in this way by the FCC;-- thanks to Nicola Tesla!

Footnote: By coincidence, my K2LVU address is situated 75 metres (250 feet) south of the place where the Tesla Electrical Company's first laboratories were located until just ninety years ago (the six-storeyed labs burned to the ground one night in March of 1895).

Editor's Note: We thank Allan Doble VK3AMD for bringing the Previous article to the notice of K2LVU, and suggesting he write the above account as a sequel.

AR

HOME BANKING MOVES TO AUSTRALIA

Homelink, the electronic banking service developed in the United Kingdom and operated by British Telecom Prestel, the Bank of Scotland and the Nottingham Building Society, and now widely used throughout the country has been sold to the Commonwealth Bank of Australia and is now in use in several European countries.

The Commonwealth Bank, which has 1200 branches throughout the country and over eight million account customers, plans to establish home banking in Australia early in 1985.

In the UK transactions are carried out by customers in their homes using adaptors. Using these adaptors banking transactions can be carried out 24 hours a day throughout the year from home or office or anywhere there is a suitable terminal. They include checking current account, paying certain bills, transferring funds between accounts at any bank, and sending and receiving messages to and from the bank and the building society.

The system is accessed through Prestel, the viewdata system developed by British Telecom which allows subscribers using a domestic television set and an ordinary telephone line to access many thousands of pages of information including stock exchange quotations, commodity prices and company information as well as a wide range of other information such as travel and traffic news, news and sports results, weather reports and shopping guides. A mailbox system allows subscribers to communicate with each other instantly.

PROPAGATION STUDIES

John Mahagan WB4JHS would like to get in touch with DX stations who are willing to participate in a propagation study during the low portion of the sunspot cycle by listening for a CW beacon on 10, 21 and 28 MHz.

Amateurs interested in this project or requiring further information should write to John at PO Box 3282, Thomasville, GA. 31799.

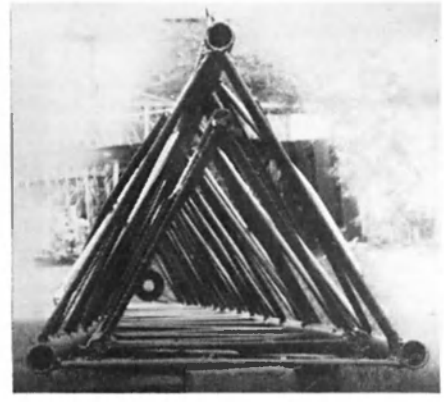
from World Radio, March 1985.

AR

MURPHY AND THE TOWER

Mal Le Maistre VK3KSA
2 Thornton Court, Mooroolbark, Vic. 3138

Everyone that has a radio mast or tower, commercial or otherwise, thinks it will never happen to them, so they overlook certain precautions. Things like guying the top section when one is employed. It is the same old story . . . "If the winds are around and blowing, I don't wind up my tower" . . . If this sounds familiar, fellow amateur, read on . . .



Looking down the centre of the tower in a horizontal position.

NIGHTMARE OF REALITY

One fine summers day last year
Around Christmas and all that cheer
A tower in Lilydale was in the clear,
Til a gust of wind at full flight
Took the tower at full height.
Now in dismay, an assorted heap of metal in view
For to insurance claim pursue.

Fortunately the insurance did come to the rescue and aid the expenses a little. After sorting out what could be salvaged, apart from all the antennae that were either flattened, bent or twisted out of shape, it soon became apparent there were three choices:

Break the bank and in the process annoy the XYL by using the money for THAT DREADED amateur radio hobby!

Build a new tower.

Go without . . . NO WAY . . . this could not be classed an option?

I then proceeded to price a new wind-up, tilt-over tower. The three towers priced were over $1000 installed, too dear, another alternative would have to be found!

Well! What about constructing one myself? Popular towers were studied, criticised and good and bad points noted. I then located a set of computations and altered the design to rectify and comply with the said notes. With such alterations it was felt prudent to ask an engineer to re-write the specifications. This was done at a very moderate cost.

Material was then priced and amazingly everything would be well under $500, so it was full steam ahead!!!

Three lengths of 33.7 mm OD black pipe, four lengths of 25.4 and one length of 19.1 mm along with nine plates 75 x 5 x 285 mm and another nine of 75 x 5 x 372 mm, all precision cut and delivered and I had the basic frame of both sections and change from $100.

Then Murphy almost stepped in. For the lattice work, a quote was received for 58 cents per metre, pre-bent and delivered. Length, span and width were immediately worked out and a cheque and order despatched.

After a couple of days . . . a phone call was received . . . the office department had made a mistake. Thoughts flashed of Murphy standing complete with pitch fork in hand and a cheese-like grin. However as they had received a certified bank cheque for the goods they decided to stand by their quote. It was possible to breathe again. (The correct price should have been $2.20 per metre).

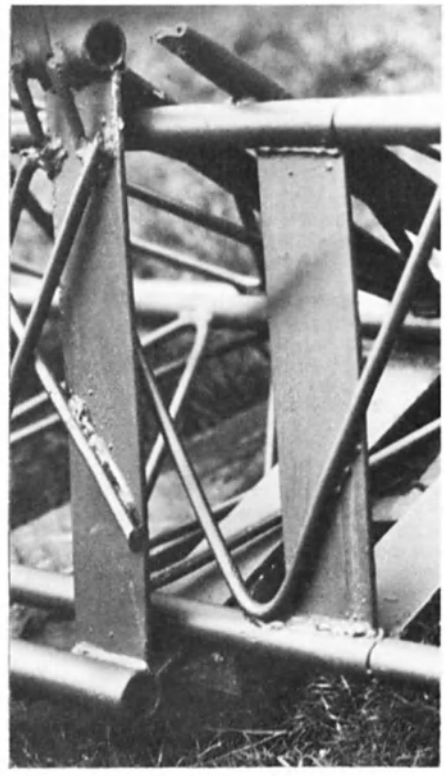
Now the real work of welding the tower began in earnest using various homemade jigs and braces to maintain straightness. The end result . . . two sections, one slightly longer than the other, but they looked great complete with their two coats of kill rust-red oxide.

The end result, when time permits, will be a 14 metres (45 feet) wind-up, tilt-over tower, housing a rotator inside the top section with a thrust bearing at the top. The tilt-over will be at 3.5 metres (12 feet) and the basic or down position height will be 8 metres (26 feet).

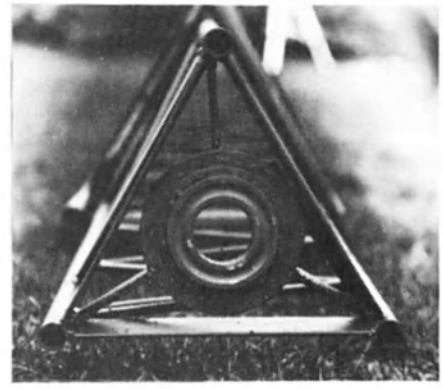
The clearance between both sections is about 6 mm (.25 inch). The ultimate of course would be one set of nylon bushes for runners to guide the tower down. The thrust bearing, which is actually a tractor differential bearing mounts on a 140 mm (5.5 inch) pipe flange mounted inside the top section at the end, carefully centred to the mast.

It is hoped to employ two 10:1 winches and various other anchors and pulleys.

AR



The Sliding Joint.



The Bearing Mounting.

DIGITAL TELEVISION

Digital TV sets are expected to be readily available this year in the United States, Europe and Japan.

It was created by the ITT group's West German semiconductor maker Intermetall which developed a group of seven semiconductor chips to replace up to 500 components in a traditional analogue TV set.

ITT started marketing the world's first digital set in West Germany in 1983 and it was recently introduced in Britain.

The ITT is also selling its chip set to most of the world's TV makers including General Electric and Sony.

Some manufacturers promise enhancements by adding their own specialised chips to ITT's original set.

Viewers can expect various models giving the ability to freeze frames, zoom in for close-ups and watch two channels at the same time by splitting the screen. The most visible difference between analogue and digital sets is picture quality.

Digital sets convert (digitise) the received signal, each signal fragment is analysed and interference components removed giving an on-screen picture more closely resembling the original image.

AR

CAN YOU HELP WITH JOTA?

The following guidelines have been produced by Tom DeLandre VK2PDT, and while written with VK2 in mind, the information applies anywhere in Australia. If YOU can help with JOTA, please do so . . . .

Ideally the initial preparations for JOTA should be commenced as early as May by the participating amateurs and scout/guide groups. Listed below are some thoughts on the necessary preparations on the part of the scout/guide groups, and the amateurs concerned.

BY JUNE — The scout/guide group should

— Have a poster on the notice board publicising the activation of JOTA in their area.

— Have advised the Group Council of the intended activity.

— Have advised the Group Committee *(can they help?).*

— Have programmed the Unit Council *(what help do they need?).*

BY JULY — The participating amateur should have been invited to attend a meeting to explain to the youngsters the following —

— Basic radio communication.

— The amateur service — it's history in the technical development of modern communication systems — it's roll in the time of emergency — activation of the necessary authorities by individual amateurs in reply to distress call — WICEN — as an aid to Civil Authorities in times of emergency.

— Propagation — youngsters are interested *in* how and why, so give them a simple but factual explanation.

— Use of the microphone — make use of a tape recorder (preferably with a hand held mike) to have a mock transmission. On the replay the participants can assess their efforts and improve their technique, and at the same time overcome any "mike shyness".

— The "Q" code — it's use primarily as a form of abbreviation for use with CW, and the "Phonetic Alphabet" the sensible use of this as a means of clarification when and as needed — not something to make an unnecessary adjunct which slows down communication.

— Station Log (yes, it is necessary that you keep a log when operating as a "JOTA" station) — the Group Log (the group are required to return a log and report to their JOTA Co-ordinator) so your advice in this regard would be appreciated, however this is the responsibility of the group. "QSL" cards — they may wish to design their own. Obtain some from their Scout shop or if need be obtain some from VK2 Division of WIA — these cards would best be handled through the Scouting Organisation so it is essential that they indicate clearly the various units concerned — ie "1st Beecroft Scout Group".

For 1985, during the 75th Anniversary of the WIA, special QSL cards have been provided to the Scouting Organisation, by the WIA, for this years "Jamboree on the Air".

— Amateur "Slanguage" — explain but do not overdo this as you no doubt have seen the ridiculous results of this when overdone.

— Call signs — How the prefix indicates the various areas and countries.

— Frequencies — How the various frequencies allow contact to be made at various times. The changes with time of day and the seasons — the effect of the solar flares, etc.

— "UTC" time has replaced "GMT" — how it works. Why it is used, particularly in International communication.

NOTE To help with the above why not have another look through the latest Call Book. There you will find an ideal source of information to pass on to the enquiring minds of these "amateurs" of the future. You don't need to be a lecturer — simply read to them some of the relevant details.

BY AUGUST — The site of the activation should be settled — group hall, camp-site — amateur "shack". Remember, if portable the pre-planning of portable antennas, power supply, equipment protection from the weather, and the security of the equipment.

Remind the participants to *research* the subjects which they intend to cover with their contact.

BY SEPTEMBER — A roster should have been organised as to the times of operation and the number of participants — insist on only a small group being in the station area at any one time, and that those not actually "on air" maintain a quiet harmonious atmosphere.

If a portable location is planned, detail to the group what assistance you will need in the way of erection of antennas.

Can you handle all the participants on your own? If not seek assistance NOW — IMMEDIATELY. Don't expect your fellow amateur to drop everything at the last moment. Ask for help NOW.

Plan now to ensure that your equipment is not operated without your supervision. As well as the risk of damage to your equipment, the illegal operation of your equipment could bring discredit to you personally and to the "amateur" fraternity as a whole.

OCTOBER — JOTA commences 0001 hrs local time on 19th October, 1985, and continues until 2359 hrs local time on 20th October 1985.

Double check all your preparations just prior to the event and we feel sure you will be rewarded with a most enjoyable weekend.

Should you wish to participate with your group on a regular basis through the year joining in the Scout nets, let us know and we will pass on the relevant information. These nets operate throughout the year and there are also the activation of scout stations at the various jamborees and camps both here and overseas.

PLEASE NOTE: The 14th Australian Jamboree will be held at Cataract Scout Park near Appin from 30th December 1985, until 9th January 1986. Please assist in activating your local scout stations.

CW COMMUNICATIONS ANNOUNCES hotCider

CW Communications has announced the forthcoming publication of hotCider, a collection of the best programmes ever submitted to **inCider,** the firm's monthly magazine for users of the Apple family of microcomputer systems. The programmes, which will be available on disk, will include applications for business, home management, education, graphics, and games.

The first volume of hotCider, available in May 1985, will consist of nine selected programmes that have never been published. An easy-to-read documentation booklet will accompany the software.

A second volume of hotCider will be available in October 1985. Retail prices for both Volume I and Volume II of hotCider have been set at US$21.47, which includes postage and handling.

AR

73 MAGAZINE CELEBRATES 25th ANNIVERSARY

CW Communications/Peterborough, Inc, has announced three changes in its amateur-radio journal, **73,** as part of the publication's 25th anniversary celebration. Previously known as **73: Amateur Radio's Technical Journal,** the magazine's new title will be **73 For Radio Amateurs.**

In addition to its new title, which began with the March 1985, issue **73** will sport a new cover format which will feature full cover photography.

According to Jack Burnett, publisher of **73,** a third alteration will be a slight refocusing of the magazine's content. *"As this change commences," said Burnett, "**73's** editorial content will be geared more toward the average amateur radio operator than the highly technical, engineering type of reader."*

AR

POWER CHECKS

Many amateur stations in the USA have recently been inspected by FCC personnel and concern is that the FCC might be preparing to change its amateur radio power limits.

The Field Operations Bureau had taken measurements at 172 amateur stations by 25th February. Objectives were to discover whether amateurs can reduce power, what levels most amateurs use, what effects a 50 percent reduction in power has on a QSO in progress and whether there was a general awareness and compliance with a US amateur rule which mandates use of the minimum power necessary for the communication in progress.

It is not known what the data will be used for but they may use it to persuade individual amateurs to temporarily use less power where there is a reported case of amateur interference to neighbours.

Many are anxiously awaiting the results.

SCRAMBLING WITH TWO METRES

Lionel Curling VK3NM
18 Lexington Street, Vermont, Vic. 3133

Every fourteen days, madness bursts forth on 2 metres around Melbourne for about half-an-hour. This madness is known as the fortnightly 2 metre SSB Scramble. (Nothing to do with eggs).

A number of 2 m SSB stations meet every second Sunday night on 144.250 MHz to engage in a fierce competition which makes any HF contest really tame in comparison. The scramble band is 144.200-144.300 MHz with stations divided into country and city.

A city station is located within a 100 km radius from the Melbourne GPO.

HOW THE SCRAMBLE WORKS

Like any other contest the aim is to work as many stations as possible in a very limited time, usually only a few minutes each Scramble.

There are four Scrambles each time. Before the start of the first, all participants check in to the controller on 144.250 MHz. He then starts the first session and all stations participating work each other, exchanging 59001, 59002, etc. After the four Scrambles are finished the controller then asks for total points from each station.

Point scores are as follows . . . city to city is worth one point, city to country is worth two and country to city three points. The latter is to encourage country stations to take part.

Each station is allocated points towards a prize/trophy at the end of the year. The winner receives four points, second receives three, third two points and all other stations receive one point. The winner also controls the next Scramble and then receives three points towards the trophy.

Similar to the VK3 Fox Hunts, prizes are donated by a trade house. In the past, sponsors have been AR advertisers, Bail Electronic Services and Vicom, with the present sponsor being Eastern Electronic Services. Presentation of the trophy is at the December meeting of the WIA, Victorian Division.

The Two Metre Scramble is not a new activity, it has been around for many years, although the rules have been altered. The old 2 m AM Scrambles used to be of half an hours duration for one Scramble only. As most stations were crystal controlled it was necessary to call "CO Scramble . . . tuning band edge to point 5". (144.0-144.5). It was hard work to win.

During the 70s, SSB stations started to appear on the scene and Scrambles faded from the picture for a short time but they eventually began again in their present form.

Two metre Scrambles are good practice for HF contests, conventions, etc. They also mean that the tunable part of 2 metres is activated at least once every fourteen days.

After the Scrambles conclusion many stations QSY for a chat.

Why not pop up on 144.250 MHz and see for yourself how much fun Scrambling is? Call in on 144.250 around 08.15 p.m. every second Sunday. Starting time is usually between 08.15 and 08.30 p.m.

Regulars taking part in the Scrambles are Rob VK3XQ, Laurie VK3YDE, Max VK3AUA and Lionel VK3NM.

HAPPY SCRAMBLING.

AR

ETCHING CIRCUIT BOARDS

Roy Hartkopf VK3AOH
34 Toolangi Road, Alphington, Vic 3078

Amateurs are supposed to be innovative and practical people but no reasonable person would expect them to home brew the equivalent of the fancy commercial equipment available today. On the other hand it is most disheartening to see the same old complicated, primitive, expensive and inefficient so called practical ideas being trotted out year after year in various magazines. One can sympathise with an isolated enthusiastic beginner who thinks he has invented the wheel, but for the technical staff of leading magazines to publish this kind of thing is another matter.

One example is the etching at home of printed circuit boards. How many beginners have been frightened off by heat lamps, motor driven eccentric cams, thermometers (see the hardy perennial in the ARRL handbooks from way back), converted goldfish tank equipment, oscillating solenoids and, as late as November 1984, a fancy "bubble etcher" in QST. It is rather ironic that the same issue contains some devastating comments on a "state of the art" automatic antenna matcher. What was that remark about motes and beams?

Anyway how does one etch circuit boards efficiently at home?

The illustration shows the complete equipment required. It costs all of three or four dollars at the local supermarket and in between times the basin can be used for washing socks and bathing the baby.

Dilute a concentrated solution of ferric chloride with about 50 percent water. Pour enough into the bucket TO BARELY COVER THE BOTTOM 1/16 to 1/8 inch is quite enough. Add about 5 ml (a tablespoonful) of hydrochloric acid if you wish. It seems to make the etchant a little more efficient but is not essential. Then half fill the basin with near boiling water. Put the circuit board, copper side up, in the bucket and float the bucket on the hot water at the same time giving the etchant a swirling motion, like one does with a gold panning dish, so that it washes

The illustration shows the highly sophisticated technical equipment needed to etch any circuit board in 3 to 5 minutes. The task of half filling the basin with hot water should be within the abilities of any technically minded amateur. If in doubt consult the XYL.

continuously over the board. In about three minutes the board will be completely etched without any sign of undercutting. If it takes more than about five minutes it is time to replace the etchant. If you get any splashes from the etchant when you swirl it round you have put too much in the bucket. Tip some out and continue. When the board is etched wash it under an outside tap and drop it into the hot water for a couple of minutes. Dry it and rub it lightly with steel wool and coat it with a resin flux. It will solder perfectly and last indefinitely. Boards I etched ten years ago are still in perfect condition.

So if you have been deterred by all the complicated gadgetry which is supposed to be needed, buy a plastic basin and bucket and have a go. If you have very large boards, then fill a trough with the hot water and use the basin for the etchant. This requires a little more care but is equally effective. Double sided boards etch equally well provided they are not drowned in too much etchant. When you have finished put the lid on the bucket or cover it with a board and put it in a safe place and it will be immediately ready whenever needed.

AR

ONLY YOU CAN TAKE HIS PLACE

We were saddened to learn of the death this week of one of our most valued members — Someone Else.

Someone's passing creates a vacancy that will be difficult to fill. Else has been with the WIA since its beginning, (1910). He did far more than a normal person's share of the work. Whenever there was a job to do, a function to attend, orders to be filled or a meeting to cover, one name was on everyone's lips, "Let Someone Else do it". It was common knowledge that Someone Else was among the largest contributors of his time to the WIA whenever there was a need for volunteers, everyone just assumed Someone Else would volunteer. Someone Else was a wonderful person — sometimes appearing superhuman but a person can only do so much. Were the truth known, everybody expected too much of Someone Else.

Now Someone Else is gone! We wonder what we are going to do. Someone Else left a wonderful example to follow, but who is going to do the things Someone Else did? When you are asked to help, remember — **WE CAN'T DEPEND ON SOMEONE ELSE ANYMORE.**

INDIAN AMATEURS IN EMERGENCY

Grace Dasan VU2AIG,
5B Versova Cross Road,
Off 4 Bungalow Road,
Andheri, Bombay, 400058.

BHOPAL, the world now knows this city which until 3rd December 1984, was known to **very few people outside** India. But thousands died to bring this city to world attention by **the accidental leak of** MIC gas from the multinational Union Carbide's fertiliser plant. The **company began operation** in India 50 years ago in a small way at first with battery **cells and later diversified** to become a major chemical company. The accident took place **on the night of 2nd-3rd** December 1984 and within a few hours the world came to know **of this ghastly accident, in** which over 3000 people died, many thousands were blinded, **and many more, some say** over 200,000, will continue to suffer the after effects of exposure to **this deadly gas. To be** sure, the early reports on the radio and television did not convey the **magnitude of the disaster**. It was only after a few days had elapsed, that the world **realised the enormousness** of the situation.

This was because Bhopal became a virtual ghost city in the first few hours of the tragedy as almost half of its population of 800,000 fled into the countryside to escape the lethal effects of the gas. As vital services and communication links were stretched to breaking point due to acute manpower shortage, amateurs stepped in to fill the breach.

On the 5th December, the third day of the tragedy, VU2RX, VU2AID and the writer conceived the idea and were responsible for the formation of the team that departed for Bhopal in the early hours of the 6th. It was finalised that the group should leave by car after ruling out transport by train due to the large consignment of equipment that they had with them.

Having very short notice VU2AID formed a small team of VU2EMJ and VU2NAX. This group was not aware of the conditions or situation they would face in Bhopal. With lack of rest or sleep but with true amateur spirit and determination to assist wherever they could help they drove all day and night to arrive in Bhopal on the morning of the 7th December, covering a distance of approximately 950 km over rough and dusty roads. Being unfamiliar with the town, they traced the QTH of VU2NB with great difficulty. At 12.30 pm on the 7th the team was welcomed by VU2NB and VU2SKN his XYL who were by then expecting their arrival due to prior information by VU2NYR when VU2NB had, the previous day reported on the air for the first time. VU2NB then invited them to stay in his house.

After a brief rest, the team learnt the magnitude of the tragedy and arranged for a meeting with the chief executive of Bhopal, to work out a plan to meet the civil administration's communication requirements. The commissioner of Bhopal welcomed the group and detailed his needs. The communication link needed were of the following nature, inter hospital, central control police Hq, factory site, supply centre, missing persons' Bureau and the Commissioner's Office. To meet these requirements both HF and VHF equipment was deployed. The group from Bombay was assisted by five other amateurs of Bhopal, VU2PRO, VU2RUZ, VU2HEL, VU2ARK, VU2SKN and VU2NB. The demand for more stations was met by the provision of Mohan Dy Spt of Police and also by the arrival of four more amateurs with additional equipment from Bombay by train on the 10th December. The amateurs were VU2JAC, VU2HPR, VU2VSK and VU2MRX, all young college students. All had to work long hours but they completed the assignment to the satisfaction and admiration of the Civil Authorities.

After the gas leak the production at the factory was stopped and the factory shut down, leaving 40 tons of the lethal gas in the storage tanks. In order to make the city safe, the authorities thought it best to use up the stored gas by manufacturing pesticide. This operation was codenamed "OPERATION FAITH". When news got out of this operation, the residents started another exodus, despite the assurance of the Government that there was no danger involved. People left the city by every mode of transport, including by foot, for safer places. They travelled on the rooftops of trains and goods wagons, scooters, cars, bullockcarts, cycles in a never ending caravan, carrying with them their prized possessions, leaving the city once again reeling under the shortage of manpower. However the amateurs remained to maintain the much needed communication links.

After five days, Operation Faith was a success, and the amateurs got ready to wind up operations to return home, but the civil authorities requested they stay to assist in the distribution of food and civil supplies in the disorganised city. Later, the commissioner himself requested the amateurs stay and assist in monitoring the communications for the distribution programme, a request which the overworked and tired crew readily accepted.

The requirements of this communication was between the godowns, control centre, commissioner's office, ration shops, fairpriced shops and also mobile communication units to direct the transport to such points where supplies were needed. The work the Civil Authorities had planned for ten days was completed in four days due the assistance provided by the everwilling amateurs. Bhopal Operation came to an end on the evening of the 23rd December. Finally VU2AID and VU2JAC were on the road driving night and day to be with their families for Christmas. The members of the Bombay team had made their way home by train a few days earlier to catch-up with their studies, tests and examinations.

While the amateurs in Bhopal were busy handling the communications required by the Civil Authorities and also extending communication requirements to the other relief organisations, they were also helping to trace persons whose welfare was a cause of anxiety in other parts of India and in other countries. Airnet India maintained a continuous watch day and night. When propogation conditions were poor, stations relayed and handled the various traffic regarding the welfare of various persons, the residents of Bhopal. These enquiries were coming from all over India and overseas. This work was done by VU2RX, VU2XYL, VU2NYR, VU2CK, VU2TP, VU2PDN, a few AP stations, 8Q7AV and also by a few A4X stations with the writer controlling Airnet India for this purpose. Another golden chapter has been written by amateurs and it is now well established that amateurs will always come where and when they are needed.

Article by Grace Dasan VU2AIG who conceived the operation and assisted the Bhopal team by continuous watch on the AIRNET INDIA from BOMBAY. 1984. **AR**

A NOSTALGIC LOOK AT THE LIFE OF ROSS A HULL ex OA3JU 1902-1938

Ross Hull was one of Australia's most notable amateurs. Born in 1902 in Melbourne, Ross studied to become an architect. By 1922 Ross was deeply immersed into the amateur radio fraternity and was the first VK station to hear American signals. Each year the WIA holds a VHF contest in remembrance of his achievements. The following is a resume, taken from an editorial in QST, November 1938, of the life of Ross Hull.

Ross Hull.

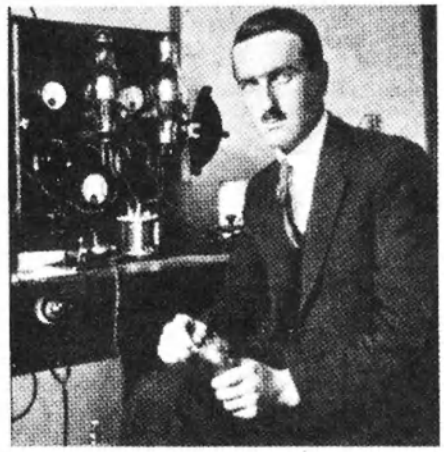
The brilliant career of Ross A Hull, editor of QST and The Radio Amateur's Handbook, came to an untimely end on the evening of 13th September 1938, when he was accidently electrocuted in his home in Vernon, Connecticut, whilst engaged in experiments on a television receiver.

Ross was a brilliant, ingenious and indefatigable amateur, possessed of a restless, inquiring mind, with a determination to outdo all others in everything he attempted. He was never satisfied with his accomplishments and always strived to better anything he had already achieved.

He was interested in many technical fields and although amateur radio was his greatest love, he was proficient in a variety of other interests. He was a brilliant pianist, with a great love of music, and played for many hours everyday. He was an artist of considerable ability in oils, water colours and crayon. He was an expert amateur photographer and his photographs graced many a QST cover. He was interested in astronomy and had built several reflecting telescopes. And model aircraft was a passion he carried on from early childhood.

During his latter years, together with another amateur, he built model planes large enough to carry radio apparatus for control in flight.

Ross, with so many interests, still found time for much reading and also to ski in winter and play golf in the summer. He was unmarried.



OA3JU at his station in Melbourne about 1924.

In 1926, as OA3JU and secretary of the WIA, Ross set off to visit ARRL headquarters on a study of American radio activity, particularly amateur radio. Upon arrival he encountered a vacancy in the junior position in QST's editorial department, technical information service. This was an admirable vantage point from which to see American amateur radio so he asked for and got the position.

He extended his stay and soon was promoted to an assistant technical editor's position.

In 1928, when a special technical development programme to devise new apparatus at headquarters required a director, Ross was the logical man to head the programme. Much new gear of his devising was introduced and his studies over the period revolutionised amateur radio techniques. He popularised "band spread" for amateur receivers and was responsible for the first serious use of the superheterodyne in amateur circles as the logical receiver for phone stations.

He produced the first practical apparatus employing the high-C circuit for self-excited oscillators, made the first presentations in amateur radio of 100 percent modulation and the use of linear RF amplifiers and first introduced the signal monitor.

Ross popularised the practice of putting valves upside down or at unusual angles to shorten leads and was largely responsible for the abandonment of bread-board construction in favour of a bent metal chassis. The apparatus he built was always beautifully constructed, mechanically rigid, with losses minimised to work at the greatest efficiency, whatever its purpose.

Ross and Galbraith Hull.

He returned to Australia in 1929 and became the technical editor of Wireless Weekly but he had been bitten by the radio bug in the USA and within eighteen months was back on the QST staff as associate editor. (He was succeeded as technical editor for Wireless Weekly by his brother Galbraith Hull).

Ross possessed an immense interest in UHF and pioneered simple apparatus for this field. He also encouraged the use of 56 MHz. By means of high-gain antennas he regularly communicated over distances in excess of 160 km on 5 metres. Over a period of several years he made recordings of distant UHF signals and correlated and analysed the vast quantities of data he acquired.

He became editor of The Radio Amateurs Handbook and jointly re-wrote the fourth issue.

Ross Hull and his model plane.

Ross was also greatly interested in television, particularly in the ultimate opportunities for its use in amateur radio and had an elaborate experimental set-up at his home. With his remarkable ability to scoop-up UHF signals, he was succeeding to receive NBC experimental transmissions from New York (a distance of approx 160 km) shortly before his death. He had also built an experimental TV transmitter.

It was the power supply for his TV receiver which caused his death. The receiver required a 6,000V plate supply for its large Kinescope. While only a few mA were required, small transformers had caused trouble through surface leakage and he had replaced them by a large 1.5kW, 4,400V pole transformer. The power supply was on a shelf under a table and the mains outlet was on a wall behind and immediately above the equipment. While wearing headphones connected to the converter and receiver and grounded on one side, he reached over the power supply to plug into the 120. As he withdrew his hand he came in contact with the HT lead to the rectifier plate, pulled it off, and fell so that the 4,400 V lead was contacting his body, with the phones providing the ground.

As it happened he had a dinner guest that evening, a doctor who was familiar with high voltages. Sensing trouble from the next room within thirty seconds after Ross had plugged in the power supply, the doctor ran to his aid, dragged him clear and administered artificial respiration. Two other doctors arrived in a short time and every effort was made by experts to revive him but to no avail — death was instantaneous.

There is an awful lesson in this for ALL radio amateurs everywhere. If a small transformer had been in use instead of the large one with the powerhouse behind it . . . if the power supply had been covered . . . if the plug had been somewhere else . . . if the line had been lightly fused . . . if he had not been wearing headphones . . . he was, himself the author of the warning against high voltages which appeared in the ARRL Handbook.

An enthusiastic skier.

In his passing, amateur radio lost one of its most valuable minds.

Compiled from information contained in QST, November 1938, by Bett McLachlan.

AR

HONOUR FOR OLD TIMER

On his recent visit to Queensland, the Federal President, David Wardlaw VK3ADW, together with Queensland Divisional President, John Aarsse VK4QA, had great pleasure in presenting the Annual VK4 Merit Badge to Alan Shawsmith VK4SS. David read the following citation to Alan honouring his achievements for the good of amateur radio over the years.

Alan's first interest in WIRELESS began in 1925 when Queensland's Broadcasting Station 4QG was built and put on air and he began building crystal sets. A neighbour Len Greenhill VK4LE encouraged his interest in the hobby, allowing him to use his equipment. Alan sat for and passed the AOCP in August 1935 at the age of 17. He was allotted the callsign VK4SA and became an avid DXer, largely using A1 mode, until the outbreak of WW2 in 1939 when all licenses were cancelled and rigs had to be dismantled. Post-war he was granted the call VK4SS. Some 50,000 QSOs later, with 320+ countries tally, countless awards and many contest placings to his credit, he is still pounding brass.

Despite these personal achievements Alan feels his greatest contribution to the hobby has been through his journalism. He has written and had published many feature articles of merit on a wide range of subjects and quite a few humorous stories and sketches, both locally and in overseas countries ('73', 'QST', 'CQ' magazines to name a few). For a twelve year continuous period (late 1960 through 1970) he wrote the monthly DX Column for AR magazine and for a shorter period contributed to 'QTC'. His greatest interest has always been in the historical side of AR — he has built up a considerable collection of early Morse keys and pre-war rigs (mostly self-constructed). Some of these have been loaned for Divisional and Club displays.

At present Alan VK4SS, on behalf of the Queensland Division of the Institute, is gathering material on VK4 OOTers of the thirties, many of whom are now SK. This information is being recorded in AR magazine. It is hoped that a booklet on the early history of the WIA in Queensland, with reference to these OOTers and the state of the art generally, will soon be published, and that it will be as well received by the amateur fraternity as his other articles on the early days of wireless.

Alan's greatest asset, apart from his many children, is his wife Lovice. Lovice has always been a tower of strength to him, by being his willing secretary and researcher. At present both Alan and Lovice are not always enjoying the best of health, but their keenness and energy is undiminished.

AR

From left — Alan, David and John.

DOCTOR DX

How do you play radio when you are not really playing radio? With Doctor DX.

Doctor DX is a memory cartridge module which, with a Commodore-C64, simulates the CQ Worldwide DX Contest. The cartridge plugs into the memory expansion port at the back of the microcomputer. The only other equipment required, as Doctor DX is a Morse code only simulator, is a Morse key. The key plugs into the RCA connector on the cartridge. That is all the hardware required.

The heart of the system is stored in the two 2764 EPROMs; the software. Doctor DX's programme simulates the rest of world during the CQ Worldwide DX Contest. It pretends to be the other station in an exchange which requires confirmation of RST and zone numbers. The other variables such as QSB, QRN and QRM are all combined in varying amounts to make the Doctor DX simulator so incredibly believable.

I tried a CQ TEST. Back came a ZS6 with 569.1 gave him a 599, and, as soon as I confirmed, up came a score on the screen. The programme had also found my call sign and this too had been displayed. Calling CQ again netted a W6 and XE3, then a HM3 called me, something that had not happened for a long time. I was beginning to like this machine.

After clearing with two more stations that called me, I decided to tune around and pick out the DX. The frequency (call sign used) is based on the populations of amateur stations with a guarantee that there are 304 countries represented. Just tuning around I was able to work SM, ZL, G, SP, LZ, PR, LA, VU and the occasional American. It was totally absorbing: the adrenalin was going just as in a real contest.

To give an idea of the level of sophistication in the programme a contact with a OY3 is a good example. I was continually beaten by Europeans and decided to QSY. Moving down the band and then returning, all the stations were on the same frequency that I had previously heard them. The OY3 was eventually worked but only by increasing the output power and using a technique I call tail ending; dropping one's call in on the change over. I like the way one station seemed to be working another, especially when you knew that it was only the computer talking to itself.

The other bands were tried and both 15 and 10 metres worked well. Just listening to Doctor DX on 10 metres is enough to restore faith in the band. However on 160, 80 and 40 metres nothing was heard. Calling had the same effect. Further reading of the instruction manual was needed to find the answer. Doctor DX also takes diurnal variations of the ionosphere into account. Using the latitude and time it works out if the band should normally be open at that time of day.

By changing the time to local night time the lower bands opened and the top bands closed. Just another variable that the programme uses to make Doctor DX very realistic.

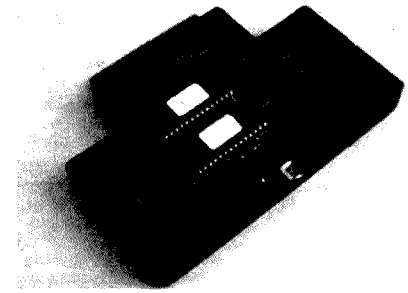
SETTING UP

After plugging the system together with the monitor screen shows a picture of a transceiver with the controls in use as well as the score broken up by band, country and zone.

Before starting, the programme needs to know your latitude, longitude, time (UTC) and the duration time; for those who really want to make a contest. Other variables such as output power, band, volume, filter, bandwidth and frequency can all be varied during a contest run. They are changed by pressing the keyboard button displayed on the screen. The exception being frequency which uses the function keys to the right of the keyboard. This allows for fast or slow change in frequency.

ON AIR

For me the best place to start in any DX work is 20 metres. Doctor DX conforms to the usual practice of the faster stations operating lower down the band so I moved up the band and started at 14.12MHz and heard nothing. Using the F3 and F5 keys to move around this spot showed that the band was active so



CONCLUSION

I was able to use Doctor DX twice and after each attempt I was able to work out how to improve my score. By deleting, all but the essential, high scores are possible, with high QSO rates. Doctor DX is certainly aimed at the keen contester and this breed of amateur will enjoy this simulator. I have read of some American amateurs being fooled completely by this simulator when it was in a prototype form: it looked like a transceiver then and certainly sounded like one.

For me, it is a great device. I found that my code speed and proficiency made marked improvement. I just wanted to go faster and faster. No doubt this would happen for others. By turning the monitor and lights off there is no obvious way of knowing whether you are working the simulator or a transceiver. The only way I found to pick the difference was the sound of computer generated noise. There was a difference if you concentrated on it.

Doctor DX could be called "Claytons" radio, but with current band conditions, for contestors, it is more fun.

The Doctor DX simulator was supplied by Hy-Tech Distributors of Archerfield Airport, Queensland.

The Club Conference — How It All Started

1985 'celebrates' the tenth anniversary of the Wireless Institute of Australia, Queensland Division Annual Radio Club Conference, originally known as the "Radio Club Workshop". This Conference is now an accepted way of life in this Division, so it may be of some interest to learn something of the development and history.

Way back in the 70s, 1973 in fact, the idea was mooted by John VK4QA as a Council member that Council should meet with representatives of all affiliated radio clubs in Queensland to:

a: *find out what the clubs and their members really wanted*
b: *combat the age-old differentiation between CITY and COUNTRY, between US and the QUEEN STREET COWBOYS*
c: *create a continuing above the board relationship between Council, the affiliated clubs and WIAQ members.*

It took quite some time of deliberations at Council level to finally suggest that such a meeting would have some benefits. The major supporters of this idea were John VK4QA, Roger Davis VK4AAR and David Laurie VK4DT.

Finally, towards the end of 1975, Roger VK4AAR, could not stand it any longer and, before anybody knew it, he called a mini workshop for South East Queensland, held in Ipswich. Only a few SEQld clubs participated, but the outcome of it all was that Council suddenly woke up and a plan was formulated whereby a workshop was to be held at times to be determined and not be limited to Brisbane.

Council determined that the first workshop was going to be held at BUNDABERG in March 1976. Only one delegate from Brisbane made it to Maryborough, only to be stopped in his tracks by 4 metres of water over the road just north of Maryborough. No workshop in Bundaberg.

Council then reviewed the policy and decided that such workshops could better be held in Brisbane every so often and delegates from northern clubs reimbursed their airfares. Further, by being held in Brisbane, money would be saved as otherwise the whole Council or at least a majority, would have to be transported by air or road, the costs to be borne by the WIAQ members. This was just not on and the suggested venue of Brisbane was more acceptable.

The first workshop along these lines was finally held in September 1976. Roger VK4AAR, was able to secure the YMCA Hall in Windsor and there the delegates from most of the affiliated clubs met for the first time. It would be optimistic to say that right from the beginning a cordial relationship existed between the delegates and council.

However, the delegates became more talkative AND critical on the second day of the workshop, once they discovered that Council was genuine in their attempts to create better communication between "them" and "us".

When, towards the final hours of the workshop, Council announced that the following workshop was scheduled to be held in 1978, the meeting quickly moved that the workshop should be an annual affair, even if it meant extra expenses to both the WIAQ and the clubs.

Before the second workshop was called, Council decided that it would be an excellent idea to hear from the clubs what they thought about certain Federal Conference Motions, so that the VK4 delegates would be better informed. Thus, the conferences (or workshops) were destined to be held one or two weeks before the date of the Federal Conference.

The workshops in 1976 and 1977 were held in Windsor, the Brisbane North Amateur Radio Club hosted the workshop in 1978, 1979 and 1980, followed by the Redcliffe Radio Club in 1981.

At this point in time, the then Council realised that a lot of time was wasted in the transportation of delegates from private billets to wherever the workshop was held. Guy and Anne Minter VK4ZXZ and VK4KZX, had heard of the possibility to use certain sections of the Griffith University when the Uni was in recess. Fortunately this usually happened just when the workshop should be held, so it became possible to meet at the University in the 'live-in-format". 1982 saw this idea implemented for the first time and it has now become a standard feature.

1982 also saw a new idea being applied to the workshop, thanks to the then VK4 Councillor, Dave Laurie VK4DT, the formulation of specific WIA policies. Although the task was rather unexpectedly thrown upon the shoulders of the delegates, all 'committees' acquitted themselves very well and their results became, after some dressing up, the OFFICIAL WIA POLICIES. This idea has continued until this day and the 1985 delegates are prepared for another round of policy making sessions.

In 1983 a great debate took place on the 'name' of the workshop. Finally, with the barest of majority, the Radio Club Workshop was no more and became the Queensland Radio Club CONFERENCE. Another innovation was the "appointment" of a permanent chairman and since 1982 David Jones VK4NLV, has done a tremendous job.

So, with having read all this, what is there in it for the "ordinary" club and WIAQ member?

There is ONE and only ONE answer, you as a member has now the destiny of your own future in your very own little hands.

Clubs who take the conference seriously will discuss the presented motions and instruct their delegates accordingly. That is part of the input of the club to the conference. In turn, the delegate will have endless yarns with other delegates and will come back with someone else's ideas which could be of benefit to his own club. Thus, much more is achieved than only discussing motions, clubs get to know each others problems and possible solutions.

The original originators of the workshop idea should be more than pleased with the way their brainchild has developed. Lets hope it will continue to grow and improve. A hard road is ahead of future conferences, because they will now have the "competition" of other Divisions who finally have discovered that the Queensland Radio Club Conference is not such a bad idea after all.

Historically Speaking

Below is an early QSL card designed and used by the WIA Federal Historian, Max Hull VK3ZS.

Max designed the card to depict his signal from Melbourne reaching the four corners of the world. Max was first licensed in 1937.

Max would now like some help from YOU. As Federal Historian he would like to learn YOUR story so that our past will not be lost. Max is seeking stories of firsts, historical or human interest, etc. You may think the story insignificant, amateurs of tomorrow may be fascinated.

Now is the time to write it down and post it to Max at Box 33, Canterbury, Vic. 3136.

NOVICE NOTES

Diode Switches and TVI

Ron Cook, VK3AFW
Technical Editor

It has been brought to my notice by Bill VK3ARZ and Ken VK3ACS, that most current model video recorders use diode switches to switch the TV signals through to the recorder or to the TV receiver. Unfortunately they considerably increase the likelihood of TVI.

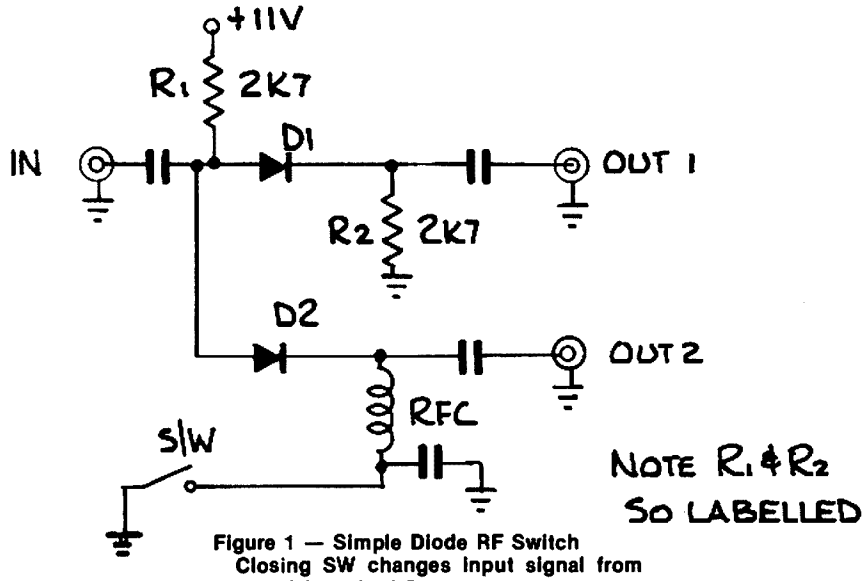

Figure 1 — Simple Diode RF Switch
Closing SW changes input signal from output 1 to output 2.

Figure 1 shows a possible configuration for a change-over switch which can be operated by a single on-off switch. The latter need not be designed for RF nor need it be near the RF circuit where the switching takes place. For best results D1 and D2 should be PIN diodes which are specifically designed to switch RF. Unfortunately it seems that the manufacturers have opted for cheap 1N914 type diodes. These will rectify strong RF signals quite readily.

When the switch SW is open a current flows through R1, D1 and R2. D1 is forward biassed and will allow small signals of a few millivolts maximum to pass without distortion or rectification. If SW is now closed D2 will conduct and D1 will stop conducting. The current will prefer to take the path, D2, RFC, as it has a lower resistance than the D1, R2 path. Thus the input signal may be directed to either output 1 or output 2. The signal will flow through D1 or D2 when they are forward biassed or conducting because the resistance of the diode is only a few ohms under this condition. When no current is flowing through the diode it has a high resistance. Provided the applied voltage is less than about 0.6 volts (for a silicon diode) there will be negligible current flow, but above this voltage the diode conducts. Hence a strong amateur signal might cause D1 to turn on (on each positive going RF cycle of the amateur signal). Even when the diode is on due to the applied DC the amateur signal may still be rectified.

Unfortunately one of the effects of rectification, apart from switching the TV signal on and off at a frequency determined by the amateur transmitter, is to produce harmonics. Thus there exists a rich source of TVI. One of the interesting effects is that the interference is worse on the TV set than on a recording made at the same time of the same channel. If you have a report of TVI concerning a VCR ask the owner to help you do a test with the antenna connected directly to the TV set rather than through the VCR. If this clears the TVI then you have a case of diode induced TVI.

Usually a simple cure can be effected. A low-pass filter can be inserted in the coax at the input to the VCR. If you are making up a unit stick to proven designs. Calculation of the inductances from first principles will result in too low a cut-off frequency because the standard inductance formula does not take into account self capacitance effects. Ken VK3ACS, has found errors of 20 percent or more at 30 MHz for small inductors.

A simple solution is the use of a "Braid Breaker". Figure 2 shows a simple design supplied by Ken. The reactances were measured using a Wayne Kerr RF Admittance Bridge. Two short lengths of 28 B&S enamelled copper wire are twisted together at one turn per cm to form a transmission line of about 72 ohms impedance. This line is wound on a standard 100 mm long ferrite antenna rod. Ken used 42 turns spread over 92 mm.

Ken also had a toroidal core of about 40 mm diameter on which he wound 20 turns of RG179B/U coax as in Figure 3. This coax is thin and teflon insulated. Dick Smith stores are one source of this. It has a similar impedance compared to the other design and gives a better result on 14 MHz. (This is of no consequence to the novice.)

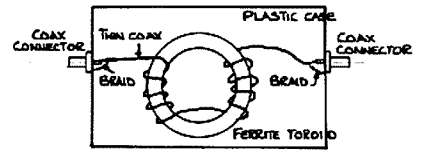

Figure 3 — Braid Breaker No 2
See text for further details. Note that the braid of the coax connects to the outer of the connectors.

Measured Impedance is:—

FREQUENCY MHz	IMPEDANCE Ohms
3.5	4,500
7	33,000
14	37,000
21	3,000
28	2,300

The properties of the ferrite are not of great importance in practice so almost any ferrite rod or toroid is worth a try.

The braid breaker works by placing a high impedance in series with the TV coax braid thus choking off any RF which is present on the outside of the braid. In most cases of interference to VCRs the amateur signal will appear on the outside of the coax (which acts as an excellent HF aerial) and then finds its way to critical parts of the set from there. A braid breaker will cure this problem but usually a low pass filter cannot; sometimes both are needed together. Braid breakers are easy to make and can be an inexpensive and practical answer to that TVI problem. Thanks Ken for the information.

73 de Ron.

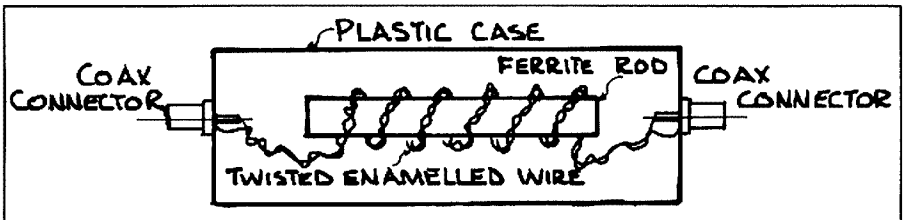

Figure 2 — Braid Breaker No 1
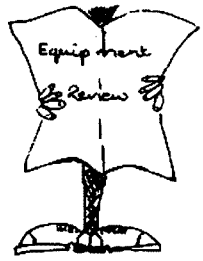
See text for details. Note that same wire connects to centre pins of connectors for DC continuity.

Measured Impedance is:—

FREQUENCY MHz	IMPEDANCE Ohms
3.5	1,700
14	11,000
28	5,700



EQUIPMENT REVIEW

THE ICOM IC-3200

Ron Cook VK3AFW
TECHNICAL EDITOR

INTRODUCTION

Anyone who has a car less than 5 years old will know the difficulties of fitting one, let alone two rigs into the car in a convenient position. For the multi-band VHF/UHF operator this poses something of a problem. Well worry no more, Icom have produced the answer — the IC-3200.

The IC-3200 is a small dual band FM transceiver that packs a punch. It measures only 140 mm wide, 50 mm high and 207 mm long and weighs just 1.9 kg. Power output is a minimum of 25 watts on 146 and 440 MHz. It comes fully equipped with all the features you would expect of a modern microprocessor-controlled rig.

In fact the set is so small that antenna and power sockets could not be fitted on the back panel. Instead a short length of coaxial cable exits through a grommet and is terminated in a cable-mounting female SO239 connector. The DC power cable similarly exits through the back and is terminated in a click on connector.

SOME GENERAL DETAILS

The unit supplied was serial number 11 This must be a first for Australia. Because this was a pre-release unit only a Japanese manual was available. (Perhaps there is sometimes merit in reading the handbook only when all else fails but this was not one of those occasions). When this model is released in June it will come with an English handbook, a mobile mount, microphone and power cable.

The case has a very ordinary plastic appearance. The front panel has a neat functional appearance and features a large LCD display which is backlit with a green light. The display incorporates a signal level bar indicator, and displays the operating frequency. It also indicates which of the two VFOs are in use, the selection of memory channel, duplex or simplex operation, priority channel, tone burst, and indicates transmitter RF output level. When programming the set other functions, such as the duplex offset frequency, are displayed. Any offset may be programmed although the transmitter will not transmit out of band.

There are 8 function buttons, 5 of which have a second function selected by a control button. Two other buttons control large frequency steps, up or down. Smaller frequency steps can be achieved by turning the main tuning control or by buttons on the microphone. The volume control and squelch are conventional potentiometers with the latter also being used to switch from 5 to 25 watts output. Call tone facilities are available although they are not of use in this country yet.

In spite of the number of controls, which is modest by some standards due to using dual functions, there is no need to worry about hitting two buttons at once because of the size of your fingers. I found the control size quite acceptable and adequately spaced.

The operating frequency may be locked to prevent accidental QSY, a priority channel may be scanned every 5 seconds for 1 second, memory channels may be scanned (or skipped without being erased).

The size of the frequency steps may be selected to be 5, 10, or 25 kHz.

ON TEST

According to the manual the power level is normally set to 26 watts on both bands. The receiver sensitivity seemed very good on both bands.

The set was given a "test drive" and found to give a very good account of itself. The extra power improved the signal received at the other end in some of the notorious "holes". Using a quarterwave antenna on both 146 and 440 MHz gave very good mobile reports at ranges of 120 km from several repeaters. It was generally not possible to pick any signal strength difference between the 2 m or 70 cm signals when co-sited repeaters were used. The audio reports received were very good. The receiver audio level was sufficient to overcome all noises induced by travelling at the speed limit and was of good quality especially considering the size of the speaker.

A dual-band antenna was constructed and although it was not as effective on 440 MHz as it should have been, several hours of mobile operation were achieved using both bands. The ability to change channels and bands by pressing a button on the microphone was a new experience for me, and one which I enjoyed as it is a much safer means of changing frequency when mobile.

FOR THE TECHNICALLY INCLINED

Now for some comments about the circuitry. When the case is opened a neat but not overcrowded pair of printed circuit boards is exposed. Servicing would not be as much of a problem as for some of the handheld sets.

The 2 m and 70 cm RF sections are separate. Both receiver front ends use 3SK121 FETs with bandpass filters. The 70 cm section has a 2SK125 as a second RF amplifier. The IF section is common and has a 30.875 MHz first IF feeding an IC amplifier, detector and noise amplifier operating on 455 kHz. An active filter is used in the AF chain to improve the received audio readability.

Separate VCOs are used for the transmitter and receiver oscillators. The output power sections are modular units rated at 25 watts out. Diodes are used to provide antenna switching between transmitter and receiver. A lowpass filter connects to the antenna socket for 2 m and a highpass filter followed by a lowpass filter connects the common antenna line to the 70 cm change-over switch. An additional lowpass filter is used on the output of the UHF module.

All of the functions are controlled by a microprocessor chip which monitors the rotary dial and switches for operation. A digital to analogue converter is used with a comparator to measure the signal and RF levels. Digital data lines from the microprocessor drive the LCD display, VOO dividers, key scan lines, and diode switches. A memory back-up battery is used to retain all those channels you stored even when the rig is removed from its power source. Incidentally, the block diagram has an interesting spelling of "battery", namely "buttely".

FINAL COMMENTS

In conclusion I found this rig to be a most useful innovation even if it is not the first dual band VHF/UHF FM transceiver to reach these shores. It is up to the usual high standard of Icom for VHF equipment. The price is likely to be around $700 which is less than the cost of two rigs. Perhaps if you can afford a car large enough for two rigs the extra cost would not be significant. More details can be obtained from the Icom advertisers in this issue.

ANTI STATIC DESOLDER NOZZLE

A new conductive nozzle model SNAS has been released by Scope Laboratories for their model SR desoldering tool.

It will help technicians eliminate one more source of damage to voltage sensitive MOS devices.

Air passing rapidly through a high surface resistance Teflon nozzle is a major generator of static electricity. Scope have approached this problem by *rendering* the Teflon sufficiently conductive to dissipate static voltage at its source.

Distribution of this new nozzle is through electronic trade and hobby supply houses.

For further information contact:— Scope Laboratories, PO Box 63, Niddrie, Vic. 3042. Telephone: (03) 338 1566.

NEW IC TOOLS

Tools that accomplish more than one basic task will always justify their existence in workshop or production facility.

These new IC dispensers and IC inserters show clear signs of thoughtful design. They are distributed nationally by Scope Laboratories.

The DS1440 series of IC dispensers embody these features.

(1) Built-in pin alignment fitted to every channel.
(2) Accept diverse shipping tube shapes by using a spring loaded clamp.
(3) Control IC feed velocity by varying tube slope.
(4) DIP length adjustment uses spring loaded stops.
(5) Anti Static metal plated surface for adequate earthing.

Standard configurations and 2, 5 and 10 channel in combinations of 0.3 and 0.6 pitch DIPs.

The SIT Series Inserters and Straighteners covers 8 pin to 64 pin DIPs in 9 tools. Their design features include.
