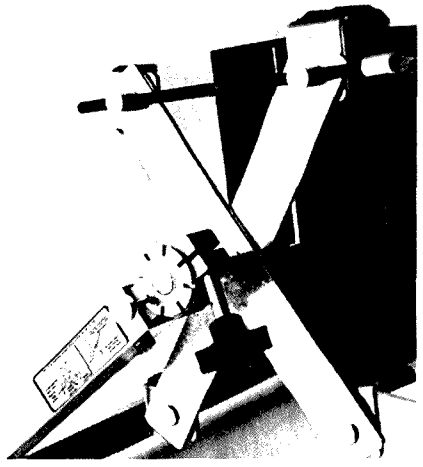
(1) Built-in pin straightening facility — which also provides an effective non slip hand grip.
(2) Slim Wall Stainless Steel clips to cope with high density boards.
(3) Anti Static metal plated surface.

The DS series dispensers are designed for use with the SIT Series inserters and singly or in combination they appear to perform a useful combination of functions.

Distribution is through electronic supply houses in all states.

For further information: Ian Pittman, Scope Laboratories, (03) 338 1566.

AR

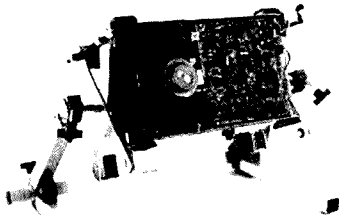


CHASSIS HOLDER ROTATES AND LOCKS

An irregular shaped 40 kg chassis which won't balance in the position you want can be dangerous and frustrating on the work bench.

A New Scope-Panavise work Holder will clamp irregular shaped chassis of up to 50 kg.

Available with either scissor type clamping heads (model 601) or self centering vise heads (model 602) this 'Chassis Mount' rotates about a horizontal axis 225 mm from the bench top.



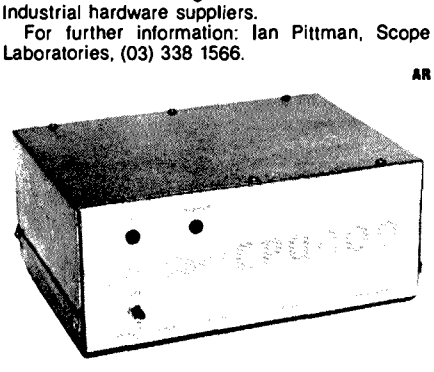
Rotation can be checked using an 8 position positive locking detent or by using twin friction brakes which allow chassis positions to be precisely selected.

Clamp capacity is 225 mm and whilst chassis widths up to 450 mm are accommodated on the standard model, greater widths are feasible with special wider cross bars.

Both units are lightweight (6 kg) and portable. They will be available through electronic electrical and Industrial hardware suppliers.

For further information: Ian Pittman, Scope Laboratories, (03) 338 1566.

AR



INTELLIGENT RAOIO DATA MODEM

GFS Electronic Imports have announced the availability of a new microprocessor controlled radio data modem. Known as the CPU-100 it is designed to provide both Baudot and ASCII data communications over a narrow band HF/VHF/UHF FM or SSB radio path. Being intelligent it relies on internal firmware for control of its operating facilities which may easily be "reconfigured" to suit a users requirements.

A number of versions of the CPU-100 currently exist. All are designed to connect directly to a dumb terminal or TTY KSR printer (ASCII) via the RS-232 port. Baud rate to this IO port is selectable from 50 to 19200 Baud via an internal Dip switch.

The commercial version of the CPU-100 provides a fully transparent Interface between the users remote terminal, narrow band radio bearer and main frame computer. It can do this either as a full duplex system (using a duplex radio link), a half duplex system or simplex depending on the users requirements. Error detection and/or full error correction can be provided. Data speeds used over the bearer may be up to 2400 Baud depending on the radio links quality. Other facilities may be also built in to the CPU-100. For example auto password/call sign transmission and reception could be included. Up to 2 k of internal backed up RAM and 8 k of ROM space is available to store such user requirements.

An amateur radio version of the CPU-100 is also available. It is designed to operate In either Baudot or ASCII modes and provides user variable Baud rates and selective call recognition.

Other facilities available include backed-up memory, user call sign buffer, three large multi-character buffers as well as auto terminal configuration.

For further information on the CPU-100 range contact the distributors: GFS Electronic Imports, 17 McKeon Road, PO Box 97, Mitcham, Vic, 3132, Phone (03) 873 3777.

AR

HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

Having been burning the midnight oil of late has given me the opportunity of listening around the spectrum and listening to a number of signals from Europe particularly on the 20 metre band, short path.

I am still amazed at the number of stations that call CQ for long periods without a pause. One particular station was not having much joy in getting any replies, admittedly his audio was not of "broadcast quality", but he was persistant. After about the fourth CQ call, I timed his CQ call and it was 4 minutes and 22 seconds. Out of pity I called him, gave him R3 to R4 and S9, we exchanged names and QTHs but he either did not understand my remarks about his audio or did not want to. After completion of the contact he repeated the same procedure.

In my book this is a waste of time and energy, a 30 second CQ, then a break to listen and another 30 second CQ call is ample on a quiet band. If no luck, shift frequency, ask if the frequency is clear and if so, proceed again. It is less tiring and generally more productive.

With the band opening up, I was hooked and gave one CQ. Two hours and many enjoyable QSOs later I wanted to go QRT. It was not to be, as many stations were still calling. I firmly stated that three more reports would be my limit, kept my word and went QRT.

It has always been my policy in such a situation to periodically listen for QRP, YL and mobile stations. The QRP stations have as much right to a QSO as the mobile and neither have the advantage of power. The YL ploy doesn't always sort the baritones from the sopranos but if one is persistant the YL will emerge and on one evening I had the pleasure of making one mobile and three YLs happy as being their first VK. All were running around 25 watts into either a whip or dipole.

Try it sometime, it is nice to make someone's day, somewhere!

75TH ANNIVERSARY

The WIA is not the only one celebrating its 75th Anniversary this year. The Canadian Navy are also celebrating and prefixes of CF1-CF8 for VE1-VE8, CY1 for VY1, VC1-VC2 for VO1-VO2 and CF0 for VE0 have been active on the bands. Congratulations to the Royal Canadian Navy on their anniversary.

Another anniversary is the South Africa Amateur League who are celebrating their 60th Anniversary this year. One of the special stations is ZS1SARL which is quite active. Congratulations SARL.

SILENT KEYS

It is sad to report the passing of two well known and respected DXers. The first is of Sebastiao PY1SM, who passed away three days after a heart attack, less than a month before his 100th birthday. Sebastiao was consistently active up until the time of his attack and surely must have been the oldest active amateur in the world.

Another well known DXer and exponent of the hobby Tex TL8TX, became a Silent Key in a Paris hospital earlier this year. Tex sustained serious injuries after being involved in a nasty accident at the timber plantation where he was employed in the Chad Republic.

Tom K0VZR hopes to obtain all the logs for his operations under that call, which are still in Africa otherwise, he will have to return about 250 cards as he will not be able to verify them.

Both amateurs will be sadly missed but not forgotten for their contributions to the hobby.

DETECTIVES WANTED

Peter G3VIE, a member of the Chiltern DX Club, is desperately trying to find the OSL information for Ron AX9RY, who he worked on the 31st August 1970. It is believed this operator became P29RJ, but letters and cards have not been answered. It would be appreciated if anyone who has any clues could pass them on to Peter or to this column.

ACTIVITY FROM 3X

Harry DL7AH/3X has been active from Conarky in the Republic of Guinea. OSL to Harry at the Call Book address, but be patient as he will not process cards until he returns home, probably later this month.

NEW PREFIXES

Portugal presently CT is about to change its prefixes. They will be based on the class of licence and postcode. CO is for a Class A licence, CR for Class B, CS for Class C and CU for Class D. More confusion in the ever changing prefix alterations but a boon for the prefix hunter.

WHO NEEDS POWER

In reading the DX News sheet, Tom GW3AHN, after checking his logs, notes that he has worked 307 current countries in a recent six year period using only 25 watts input. No mention is made of the antenna or the number of confirmations that he has received. If you read this Tom, I am sure that all readers would be interested in your set-up and remarks concerning that period. *How about a few paragraphs for the VK readers, Tom?*

FAROE ISLANDS

News from Martin OY7ML is that OZ5DL and OZ5UR will be operational /OY from the Faroes during June. The operation will begin on 6th June 1985.

ALBANIA

The appearance of "ZA2BB" that was worked by at least three VK4s and amateurs from other countries prompts me to say that the last known legitimate operation from this country was in 1971, under the call ZA2RPS.

Since then quite a number of amateurs have applied for a licence, the answer always being "Sorry, no amateur radio". In 1979 a statement was made by an Albanian Embassy official that, "As from January 1975, amateur radio licences are only granted to nationals". According to an acquaintance from that country it is illegal to have a radio transmitter.

So Albania climbs to be one of the most wanted countries in the world and we wait until the Government has a change of heart. With the complicated political and economical situation in that country, it is personally felt that it will be very low on the list of priorities, unfortunately.

Personal feelings are that Marti OH2BH, may one day be the first to break the barrier and encourage the hobby, as Tom VE7BC did in China, which took over a decade to accomplish.

It is felt that the "ZA2BB" was the figment of a sick minded person who had access to transmitting equipment. Such actions that are perpetrated against a country that is inactive due to its government, are only further placing reactivation in the imminent future in jeopardy.

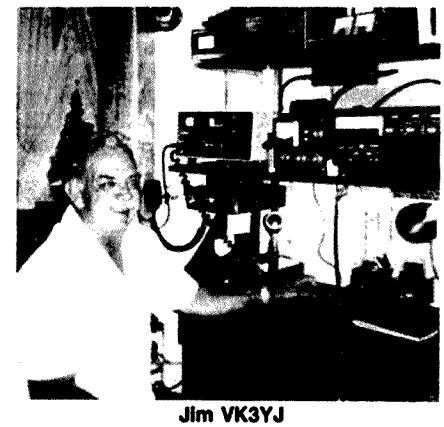
I hope that I am proved wrong and if I am, congratulations to those that made it.

Photograph courtesy World Radio

Unal Akbal TA1A, ex TA1UA, is the first amateur licensed in Turkey (see p39 — April).

CONGRATULATIONS

Any member who has access to the magazine "73 for Radio Amateurs" for April this year should read the excellent article written by Jim VK3YJ, their Australian correspondent.



Jim VK3YJ

Jim, a man of boundless energy, who is ably supported by his XYL Anne, has written articles for AR and regularly subscribes to this column. Jim has written an excellent article on the Institute and its 75 years of history for the overseas magazine. Also Jim has outlined why non-members should become members of their Society and it would be an excellent article to show to that friend who borrows your copy of AR each month but is reluctant to join. It is thought that all Divisions of the Institute would have a copy that could be photostated by supply of an SASE and a stamp to defray copying expenses.

CLIPPERTON

They made it and FO0XX signals into the Pacific were excellent. I worked Clark W8TN, not a member of the planned group, but took Kip W6SZN's place at the last moment due to his business commitments.

Congratulations to all on a first class effort.

FORTY AND EIGHTY METRE ENTHUSIASTS

Apparently JT1AQ is interested in arranging scheds for 40 and 80 metres. If you are interested drop him a line to CH Chadraawal, PO Box 844, Ulan Bator, Mongolia.

CARDS STILL AVAILABLE

F6AJA now FE6AJA still has logs for CC31MD (Oct 1983), FG0BKZ/FS7, FG0HVL, FG0HVL/FS, FG0FGM, FG0FGM/FS, FM0HVL, FM0HVM, FY0HVL, FY0HVM, TR0AB, TR8JD and TR8YL. If you have worked one or more of these stations and still require the paperwork, now is the big chance.

F6AJA's QTH is Jean Duthilleul, 515 Rue de Petit Hem, Ouvignies, F-59870 Marchiennes, France.

Still on cards you might have missed out on Rick NE8Z, (ex WB8ABN) an avid DXer, who OSLs 100 percent. Rick still has logs for the following operations and would be glad to supply cards for the needy.

F0MH-1969, FG0MH-1971, HC1EE-1974, HC1MD-1980 onwards, HC1MM-1972 onwards, HC5EE-1974-1981, HC7EE-1980, HC8EE-1977/79/80, HC8MD-1981, HC8MM-1979 HC9A-1981CQ WPX SSB, HD5EE-1976/1979, HD8CD-1977, HD8EE-1977, HD9EE-1977, HD9X-1979/80, HD0E-Oct 1978, HD0EE-1977, KZ5GC-1979/80, NE8Z/PJ3-Nov 1984, PJ8RD-1971, VP2AAB-1971, VP2EEL-1971, WB8ABN/HC-1971/74/75 and ZF1CW-April 1969.

Rick's new address is Rick Dorsch MD, PO Box 62, Rochester, Michigan 48063 USA.

ZC4 AGAIN

A letter from a member has brought to light a number of points regarding this new DXCC Country.

Apparently for security reasons the exact QTH was not readily given and it was convenient to use the name of a close town as the QTH. The Club station ZC4SS was operational from a location "fairly" close to Famagusta but not within the Sovereign Base of Dhekelia. The member was active from 1963 to June 1966 and was instrumental in getting ZC4SS back on the air.

If a service operator was living in civilian quarters outside any of the bases he used 5B . . . and all licences were issued by the Chief Signals Officers Branch, Dhekelia on production of the relevant authorisation of the applicants country of origin.

Apparently according to the RSGB DX News there is mention that the ARRL have been advised that all operations since 1974 have been within the Sovereign Base.

WHY THERE IS NO DX

The published 1984 figures from the Sunspot Index Data Centre in Brussels didn't paint a very pretty picture for the avid DXer as reported in Lee KH6BZF Reports publication.

The mean figures from January through to December were 57.0, 85.4, 83.5, 69.7, 76.4, 46.1, 37.4, 25.5, 15.7, 12.0, 22.8 and 18.7. The 1984 yearly mean was 45.85 and that is why so many have migrated to the lower bands. The bottom of the cycle is still to come but occasionally there are some good openings. Take heart, tune and listen, you may be pleasantly rewarded.

A CLASSIC AD

On reading January 1985 QST I came across a stray ad which read: *"I would like to get in touch with any amateurs who are professional clowns. James A Payne (Tiny the Musical Clown), W6JCR, 903 Mission Street, Santa Cruz, CA 95060."*

I would like to nominate quite a few, who in my book, are "professionals", particularly after listening to a rare DX station on frequency but I couldn't inflict their mentality on poor James. Sincerely James I do hope you get some genuine replies.

BITS AND PIECES

Bob NA6T was having quite a "Ball" from KH4 over the Easter break. ** Mike VK6HD's call still appearing regularly in DX Bulletins as being heard and worked on 160 metres. ** Visitors to Vienna have no problems in gaining permission to operate 4U1VIC. Basic requirements are a copy of your current licence and a station operator to be in attendance. ** It is believed that 5X5GK now, at last, has written permission to operate. ** Irma OHMA and Miriam OH8YL are believed to be the first OH YLs to operate from Longyerbyen when they handled the multitude in late March and early April. ** Gary VO1OC/S2 operating quite often on 14 MHz. Question: Has he the appropriate paperwork??? This also goes for DL8YR/ST2 who is quite QRV. ** Yet another paperwork problem may be XZ2HN, an amateur operating out of Rangoon from Czechoslovakia. ** Vlad, a Master of Sports in the USSR Amateur Organisation, has been signing J5WAD from Guinea-Bissau on 14 MHz at regular intervals. ** Patsy ZD7XY, an XYL operator from St Helena has been quite active on 14 MHz. ** It appears that more than one call was used from Navassa Island by the Jamaican crew. 6Y5NR/KP1 was the designated call but 6Y5/KP1 has been logged. It is hoped that it was not a pirate operation or someone testing their rig to get 5x9 reports! ** Another call for VR6, it is VR6IM and can be used for Medical Traffic only after approval from the Medical Officer or Island Magistrate. Please stay clear of operating near this stations frequency when in use. You may help to save a life. ** 8J1XPO is the official station of the Tsukuba Science Exhibition and is running 10 watts that remotely control the main transmitters several kilometres away. QSL via JARL.

WORKED ON VARIOUS BANDS FROM THE EAST COAST

(1) According to "The West Australian VHF Group Bulletin" VK6RTU is being overhauled and a 2 metre beacon with a tripler to 70cm is being constructed as an addition to VK6RTU.
(2) From the same source, it is noted VK6RPB at Port Hedland is under test and may be intermittent. It is also audible on FM receivers!

There has been some pruning of the beacon list this month. VK and ZL beacons are listed, plus the Pacific regions and JA beacons. With the present very low spot in the Cycle it would seem a listing of beacons in other areas would be more appropriate at the periods of the equinox, when it seems there is a chance for the longer distance contacts to take place. Therefore for the time being it is proposed to give a complete listing in the issues of September and March.

NEWS FROM THE COLD AREAS

David VK0CK has left Macquarie Island and will be resident in Hobart until the end of 1985. He came back to Adelaide for a brief stay and I was able to meet him and he certainly doesn't look any the worse for the experience! The six metre equipment is still at Macquarie so hopefully there will be some operating from there later this year. David would like to do another tour to the cold areas, so we may yet see him operating six metres again from some other place.

Mark VK0AO (ex VK5AVQ) is safely entrenched at Mawson in Antarctica and enjoying the experience. It is certainly much colder than Macquarie Island. Sunday 14/4 it was −20°C and on some days they have been experiencing blizzards. After making some changes to the positioning of the 20 metre aerial Mark can now operate more satisfactorily on his skeds with me, not now causing the degree of interference as before. There are some problems with enough 240 volt power to run everything satisfactorily from the shack but he hopes to overcome this in due course.

Mark has had the VK0MA beacon running, firstly on 53.1 MHz and later 52.400 but there are some problems getting the gear to fire up on this frequency but he's working on that. The beacon uses a 6AK5 oscillator, 5763 doubler driving an 8165 (4/65) valve in the final for abcut 100 watts output, and the mode is MCW, and has a built in solid state call sign generator.

The immediate concern for Mark is to become operational on the satellite and now that the remainder of his gear has arrived he will be concentrating on achieving that operation. He proposes leaving the main bulk of the work on six metres until later in the year when chances exist for some contacts on that band.

The Mawson weather summary for February 1985 is interesting. The mean monthly temperature was −05.2° (0.8° below average), maximum −02.3°, minimum −08.1°, highest maximum +02.6° (1/2/85), lowest minimum −17.3° (28/2). Maximum wind gust 63 knots/ 117km from SE at 1616 MBT on 13/2, there were 23 days with strong winds with 7 days of gale force winds! The mean daily average of sunshine was 9.7 hours, there were 4 days with falling snow and one day of blizzard. The remarks mention that the −17.3° on 28/2 was the lowest minimum temperature for February, the lowest previously had been −16.0° on 25/2/68! So it does get cold down there and no doubt will get colder than that.

NEWS FROM TASMANIA

A letter has come from David VK7DC accompanying OSL cards for the contacts I had with him in January on 144 and 432 MHz. David says:

"VK7DC and Gary VK3ZHP have been maintaining regular skeds on 70cm for the past 15 months over a path of 385km. Contacts have varied from 5 x 3 to 5 x 9 and can drop to 3 x 1 during rough weather, when there is rapid fading not unlike continuous mobile flutter, and can last for 6 to 8 days. TV1 problems with Ch5A do not allow VK7DC to make full use of two metres.

"Andrew VK7ZAP and I have built up some 1296 MHz gear. Andrew has 1 to 2 watts FM/CW and can receive in all modes, a 15 element Yagi and has a two metre diameter dish under construction. VK7DC has 10/12 watts FM/CW, all mode receive and 1.8 metre dish. Experiments to date with VK3ZHP have produced at worst weak CW copy both ways and recovered audio sounds like you are listening at the other end of a drain pipe! When conditions are more normal, the carrier is usually strong and produces occasional FM quieting, but it will be interesting to see what happens over 12 months. At the same time 70cm has occasionally produced signals better than 2 metres especially during October and November.

"On 28/3/85 VK7ZAP on 70cm SSB worked VK3ZHP, VK3ZBJ, VK3BDL, VK3ZL, VK3ACH and VK3XEX. On 1296 FM: VK3ZEO, VK3ZYN, VK3ZHP

"On 28/3/85 VK7DC worked on 2 metres SSB: VK3ZHP, VK3ZBJ, VK3BDL (all 5 x 9), and VK5NY 5 x 3. On 70cm SSB: VK3ZH, VK3ZBJ, VK3BDL, VK3ZEM, VK3ZL, VK3XEX, VK3ACH (all at 5 x 9), VK3CGH 5 x 7, VK5NY 5 x 5. On 23cm: VK3ZHP 5 x 9 FM, VK3ZBJ 5 x 3 FM; VK3ZL in Ballarat 5 x 1 CW. This was followed on 31/3 with 2 metres to VK5NY by VK7DP and VK7DC, 5 x 2.

"QUERY: On 1/4/85 I (VK7DC) noted VK3RMB on 70cm at 0730 was just audible which was normal. At the same time there were strong lightning crashes and with almost every crash the beacon would rise to S9 for about 1 second. At 1030 the beacon was the same strength, but this time there was no enhancement with the same lightning crashes.

"Was there an increase in ionisation of the air at the moment of strike, or extra ionisation of the 'E' or 'F' layers, or something else? The weather at the time was 'lousy' and I assume the storm centre was between me and the beacon. Perhaps it had moved later. Has anyone any ideas, and have they observed this phenomenon?" . . . Can't really help you David, but lightning plays some funny tricks at times. Someone might write to me about it though . . . 5LP.

Still in Tasmania, a letter has arrived from Joe VK7JG who mentions he was not very active on 6 metres over Christmas but was still holding nightly skeds on 144 and morning skeds on 52 with VK3.

"I still have nightly skeds with David VK3AUU on 144.1 at 2000 local time (1000 UTC) and we have always been able to say 'hello' when both are there. I have also been trying to work the VK1 and VK2 stations on Saturday mornings in conjunction with the VK3s but so far nothing heard except for a few meteor pings. Obviously the antenna needs upgrading!

"There is now a UHF repeater in the Central Highlands with the call VK7RIW, transmitting on 438.5 and receiving 433.5 MHz altitude 4200 feet, antenna 6dB gain and power 15 watts.

"Lionel VK7HL is operational on 1296 MHz and 2.3 GHz and has worked to VK3 on both bands. He lives at Beaconsfield, about 50km north of Launceston.

"My present antenna system is 432: 48 element J Beam, 144: 10 element J Beam, 52: 8 element ATN Yagi. Looking to upgrade 144 to at least 16dB"

MICROWAVES

Des Clift VK5ZO has sent me a copy of the RSGB's Directory of Microwave Operators which rather puts to shame the degree of activity in VK. There are 350 entries in the directory, with call signs, addresses, and bands on which the operator can operate. There are quite a number with gear on 1.3, 2.3, 3.4, 5.7, 10.0 (wide), 10.0 (narrow) and 24 GHz. Twenty six stations can be operated on four or more microwave bands.

Des suggests one possible way of increasing the activity on our microwave bands would be to compile a list of those who can operate 2.3 GHz and above, with updates from time to time. To start off, Des offers the following: Operational FM gear on 3.3 and 10 GHz, and currently rebuilding the FM gear for 2.3 and 5.6 GHz. His current thoughts and actions are to use 100 MHz (Tandy FM tuners) IFs of about 100 kHz deviation for 2.3, 3.3, 5.6 and 10 GHz, the first two being crystal controlled, the other two being Gunn oscillators. For DX contacts on 10 GHz he has a 30 MHz coverage and can work anywhere in the band to suit anyone else.

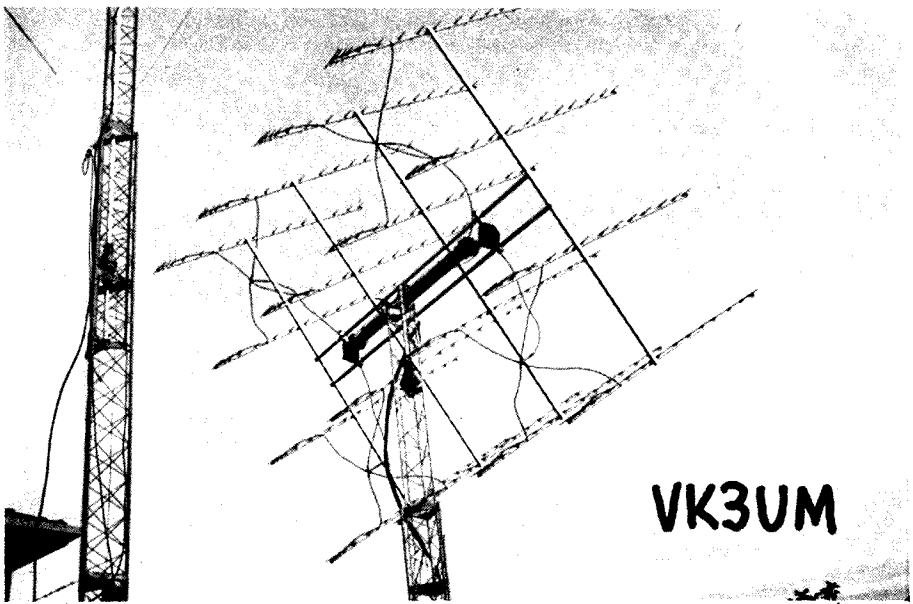
All these sets are /P and any gear possibly made for SSB will not be! He personally feels there is not enough interest in any of the bands in VK to fragment the current position by introducing anything else but FM. To support this Des already has two sets of gear for 3.3 and 10 GHz and will possibly finish up with two sets on the others channels.

If you are interested in outlining your microwave equipment why not contact Des Clift VK5ZO, 6 Netley Road, Mount Barker, SA 5251, and if Des finds there is enough interest to make a listing worthwhile, then I am sure space can be found in these columns to inform you what other people are doing in an area where there seems to be very little activity but where there may be much more than appears on the surface. Over to you!

EME ACTIVITY

Doug VK3UM advises that conditions were rather poor over the weekend of 30/31/3, but he did manage the following contacts: 0530 K2YUH 559 and 559; 0553 ZL3AAD 0/0; 0623 JA2JEJ 0/0; 0725 JA6CZD 0/0 there appeared to be only five stations on, no one from W land. 1125 F9FT 539 539; 1213 I5MSH with his 10.6 metres (35 feet) dish was 0/0 contact, usually is SSB copy; 1252 F1HI 0/0. In all there were 10 contacts for a long time spent. He valiantly spent an hour trying to make it with OZ7UHF but to no avail. Next period for trying was to be 27/28/4.

Doug is still maintaining his 144 and 432 MHz contacts to Sydney, and on the way picking up stations in Canberra. He has found signals are stronger on 432



VK3UM EME Equipment.

but the duration is shorter than on 144. John VK4KAZ is using four DL6WU type antennas and has been able to copy Doug's EME signal.

THE SYDNEY SCENE

I was pleased to hear from Gordon VK2ZAB again, and as usual his letter contains a lot of information. He appeared to be disappointed that no one else had bothered, apart from VK3UM, to send any news of happenings on 144 and 432 from Sydney, or anywhere else for that matter. Gordon has been pretty busy since Christmas, what with getting up a new tower, jobs away etc, but he assures me that he cannot recall any weekend that it has not been possible to have two metre contacts between Melbourne and Sydney; there have been 70cm contacts too, plus 23cm contacts to ZL, all now dated of course, but they have been occurring.

Gordon's letter covers the period 16/2 to 16/3/85 and on two metres unless otherwise stated. On 16/2 2045 VK2EVB and VK2DGT both at Coffs Harbour were 5/2 and 5/5 respectively at his QTH. At 2055 VK2DDG at Byron Bay was 5/4 and VK4LC was heard faintly. At 2130 VK3KEG was 5/5. VK1GL and VK1BG participated and some 70cm activity ensued with VK2OD on that band in Sydney but no Melbourne contacts. During the following week VK2MQ in Moree and VK2AKU in Narrabri were worked from Sydney on three occasions. Signals S1 to S5 at the Sydney end.

On Saturday 22/2 at 2030, Graham VK2MO was 5/4, later VK2DDG also 5/4 and at 2046 Bill VK4LC was 5/1 and Paul VK4AUR and John VK4KJL both in Brisbane were 4/1 briefly VK2DGT was 5/5. At 2130 Ross VK2ZRE in Adaminaby was 5/5 and Trevor VK?KEG was 5/2. Other stations on at the time were Keith VK2BKL in Sydney, Glen VK1GL, Joe VK7JG, Les VK3ZBJ, Jim VK3AZY and Ian VK1BG.

Several Field Day stations were worked on 23/2, the Wagga group again putting in good signals. VK2WG was 5/5 at 0642, VK3KZR was 5/3 at 2148 from a site near Dargo. Earlier VK2DDG was 5/2 in Sydney. The following week was fairly quiet with the exception of the usual 'S meter' wrecking signals from VK2YEZ portable at Foster.

On 1/3 at 2045 VK2DDG was 5/2 with VK2EVB 5/3 at 2047. VK4LC and VK4KJL in evidence, but only just. To the south west things looked brighter, but VK2ZRE at Adaminaby was only 5/2 and hopes faded. Next morning he was 5/5 and Les VK3ZBJ was 5/4 at 2230. Unable to copy Michael VK3BDL but Lionel VK3NM was 5/1.5 at 2246 and Jim VK3AZY 5/5 at 2247. Try 432 was the message from Doug VK3UM via the VK1s. But Gordon didn't have to try very hard as Doug was 5/6 at 2249! VK2ZAB was 5/3 in Melbourne which clinched their fourth Melbourne/Sydney 70cm contact. Gordon heard contacts being made between VK1 and VK3 on 70cm, and heard VK1GL, VK1ZIF, VK1BUC, VK2OD and VK3UM.

The weekend of 8/3 started well with the boys in Coffs Harbour and Byron Bay at good strength on 2 metres and Paul VK4AUR hearing Gordon at S1 in Brisbane at 2150. At 2230 on 8/3 VK3KEG was 5/2 at 2243, VK3ZBJ 5/3 at 2258 and David VK3AUU at Drouin South 4/1 at 2259. He was unable to contact VK3AZY, VK3NM and VK3BDL although he knew they were there.

Gordon got his rewards on 15/3 when at 2132 he worked VK4LC at 5/5, John VK4KJL 5/4 shortly after, Paul VK4AUR 5/3 at 2135, Graham VK4KGS 4/1 at 2150. About this time VK4LC was 5/7 so 70cm was tried and there he was at S2 with QSB. Gordon's 10 watts couldn't quite make it to Brisbane so Bill was unable to make it two-way, but he did hear VK2BE in Sydney, but no two-way contact resulted. Beam around to the south west at 2230 and Doug VK3UM was 5/3 and Lionel VK3NM 5/2. Listen and call on 432.1 but no joy except for VK1BUC off the back of his beam. Peter VK1QS worked Norm VK3DUT on 2 metres.

Beam around to the north again at 2300, Bill VK4LC was still S7 on 2 metres. Try 432.1. Yes, can hear him up to S2 but no contact. Then Dick VK2BDN came on and made what we think is the first Sydney to VK4 contact on 70cm by working Bill at 5/5 both ways. Bill patiently waited until Gordon's 10 watts peaked above the noise and at 2332 they exchanged reports to clinch the contact 5/2 at his end, and 3/1 at Eagle Heights, Brisbane. Well done chaps . . . this would be an all land path of about 750km and over some rather rugged country . . . 5LP.

On 16/3 VK4KJL, VK4AUR and VK4LC were there again on 2 metres at 2130 but only S1. VK2EVB was 5/3 and VK2DGT 5/6. Beam south west at 2230 and Les VK3ZBJ 5/2. Other VK3s heard but not identified. Later, Peter VK1ZQS told Gordon he had worked Darryl VK3AQR at Geelong and Norm VK3DUT at Mill Park. However, John VK2YEZ back home in Griffith was S6 at 2240. Many stations on 2 metres and 70cm in VK1 and VK3 and a few in VK2 at this time. Gordon also had received reports of various VK/ZL contacts on that weekend via repeaters etc on the south coast, and that Ken VK2DGT in Coffs Harbour had an FM contact with ZL. For all that, Gordon says the elusive VK7 still evades him, but he's trying. Well Gordon, VK7 eluded VK5LP for a long time on two metres, and still longer, nearly 25 years in fact, for a 70cm contact, but I did have one to VK7DC in January so with your tenacity you will surely make it in due course. But thanks for writing and filling us in with the continuing happenings on 144 and 432 from Sydney, and wouldn't it be nice to hear from someone else over your way on how they see the scene!

A NOTE FROM BRISBANE

John VK4ZJB sends me a note which will warm the hearts of some six metre operators who have been waiting for a particular QSL card. John says Gary A35GW is now OK for a QSL. Send a SASE to Gary Wilson, Bucknor Drive, Deception Bay, Queensland, 4508 and you should receive your reply.

John also mentions Nev VK4ZNC is definitely going to Lord Howe Island next Christmas and it will be a 6 metre DX-pedition. Bookings are final and more details are to follow! Thanks John, good news all round.

WHAT HAVE WE BEEN DOING

Here in VK5 we have been getting the winter doldrums in the autumn. It certainly has been quiet, even Bob VK5ZRO says so and when he's not working stations it's quiet! Bob still keeps track of things via the satellite and recently worked ZF1GC in Cayman Islands, CN8EO Morocco, PJ2MI Netherland Antilles and the Clipperton Dx-pedition FO0XX. He was also pleased to have words with Bob VK5NZ who was in Florida, USA via the satellite.

Ron VK5ZVA at Whyalla is now on 70cm but presently vertically polarised, but he did work VK5ZRO at 5/7. Roger VK5NY has been noted working to VK3 from his 'gem' location, it doesn't seem to matter what time of the day or night the path is there, particularly on 2 metres.

The VK5LP log book shows only a few local VHF contacts so I have had to be content working VK0AQ at Mawson on 20 metres!!

NEWS FROM OVERSEAS

From April OST and "The World above 50 MHz" I note a listing of the 23cm and 13cm standings and a few points of interest arise. On 23cm the best terrestrial DX in statute miles is that of N6CA with 2472 miles and 10 call areas worked. One assumes that distance is out to Hawaii. The next best distance drops to 847 miles where there are three stations, K4NTD, K5LLL and W5LDV, all with 2 call areas worked. On 13cm WB5LUA has worked 508 miles and 2 call areas, next is W9ZIH at 340 miles and 2 call areas. Apart from the N6CA effort we in VK with our contacts from Adelaide and the south east to Albany in WA are well in excess of these distances. Nevertheless, one must be fair and say there has to be someone at the other end before you can extend any contact distances and I expect the W stations suffer from that the same as we do when we look to other areas than Albany.

While on the subject of standings, I note from "The

Shortwave Magazine" for February 1985, kind courtesy of Steve VK5AIM, that on two metres GW4TTU leads with 92 counties, 37 countries, followed by G1EZF with 83 and 26, then G6ECM with 79 and 28. It is worth noting the wide availability of two metres in Europe when one considers it is possible for someone to work 37 countries and I expect that is not the end of the road, there would still be more to work. No wonder two metre activity is so great there.

The 70cm table shows G8TFI at the top with 63 counties and 18 countries, followed by GW4TTU with 61 and 16, then G6DER with 61 and 14. One would have to say 18 countries on 70cm is a very worthwhile effort. On 23cm G8PNN tops the list with 38 counties and 13 countries, followed by G8TFI with 32 and 12, then GW4TTU with 29 and 8. And 13 countries on 23cm deserves praise for the obvious dedication needed to achieve that total. Even more to the point of dedication is the efforts of GW4TTU who heads the list on two metres, is second on 70cm, and third on 23cm. What an effort? Not only that, GW4TTU also tops the Annual CW Ladder for working 493 different stations on CW during 1984 on 2 metres, 104 on 70cm and 32 on microwaves CW. Total 629 different stations on VHF/UHF CW. G4SFY worked 553 stations and G4ARI 416 stations. This must mean that almost at any time there will be someone on those bands using CW. Quite different from VK where you could go weeks or months before you heard any CW at all.

MOONBOUNCE REPORT

From "The Propagator" Lyle VK2ALU advises that during the 12 months to end of February 1985 VK2AMW participated in a total of six 1296 MHz EME test periods, during which contacts were completed with 15 stations on CW. SSB signals were copied from OE9XXI on one occasion. Several receiving preamplifiers were tried and three methods of noise figure optimisation were used to improve receive system performance.

Dish pointing accuracy was markedly improved by the installation of an hour angle tracking computer designed and built by a University Undergraduate to their specifications. It provides a readout of error in degrees between the actual dish pointing direction and that of the moon, in hour angle and helped to achieve echoes from the moon when it was not visible due to cloud cover etc.

On 2/3 they participated in scheduled EME tests during which SM6FHZ and G3LTF were worked M/O copy. They were pleased with the G3LTF contact as several previous attempts over the past fourteen months had each just failed to achieve the necessary information transfer in the short "windows" available to them.

CLOSURE

That seems about it for this time, but before closing I want to add a further plea for people to respect what the calling frequencies are for. Three main calling frequencies presently exist, 52.050, 144.100 and 432.100 MHZ, and I often receive complaints from operators that local QSOs are being conducted at length on these frequencies mainly under the mistaken impression that because those using the frequency cannot hear anyone else then they assume no one else can either. I have received a further two complaints this month, from Doug VK3UM and Gordon VK2ZAB. In each case they are finding 144.100 and 432.100 being cluttered by long local QSOs so precluding the DX type contacts they are consistently chasing. I assure them it is not only happening in VK3 and VK2 but it is quite evident in VK5 as well.

May I again ask operators to remember what the calling frequencies are for, to call and when answered, particularly signals are strong or from stations near at hand, then to move off at least 20 kHz, conduct the QSO and then come back to the calling frequency if you need to. If the contact is conducted under very weak conditions then it may not be possible to move away in which case other operators should respect the situation. I guess one of the more important aspects of any such operating which is not being observed by most operators is that of leaving at least a 3 second break between transmissions. This does allow someone else to acknowledge they can hear what is going on, and you can allow them in or to complete their own quick QSO with another station. If you don't think any of this matters then consider how you might feel if you can just hear a weak DX station under another two stations much stronger who are just chatting. A general clean up of operating practices would help everyone. Thank you for your co-operation!

Closing with the thought for the month: "By ever taking out and never putting in, one soon reaches the bottom." 73 The Voice in the Hills.

AR

INTRUDER WATCH

Bill Martin, VK2COP
FEDERAL INTRUDER WATCH CO-ORDINATOR
33 Somerville Road, Hornsby Heights, NSW 2077

Congratulations to the Department of Communications for the good work done recently to rid the VHF repeaters of unwelcome pests, which, I must add, is not the province of the Intruder Watch, who is concerned with MILITARY, GOVERNMENTAL and COMMERCIAL intrusions.

All intruders cannot be tempted to leave the amateur bands in spite of the work of the intruder Watch, as the presence of Radio Tirana, Radio Beijing, etc will testify. The DOC has complained on our behalf in the past re these nuisance transmissions, but the offenders continue to ignore repeated requests to QSY. More recently, of course, as reported in this column (AR, May 1985), the USSR Naval intruder 'UMS' was approached via the USSR Administration, and promised to 'take steps' to vacate the amateur bands. At the time of writing, UMS is still being monitored at will, and the DOC tells me that they are going to follow-up their original telex to the USSR. Many thanks to the DOC for sticking with us.

In this column in AR, January 1985, I mentioned the fact that Don Cross, formerly VK2VYI, had up-graded to the combined call of VK2JYI. I am pleased to report that Don's recent intruder reports to this shack were wearing the call sign of VK2EYI, so Don has done it again! Don is "wheel-chair mobile", and I know that he must have put a lot of effort into the upgrade — well done, Don.

Hopefully the conditions on 80 m will have settled down somewhat by now, and the Intruder Watch Net on 3.540 MHz at 1000 UTC will see more interested people joining in.

Looking through the IW Summary for February last, I see a CW station, AQP4/5/6/7 active on 14.011 MHz. This station is listed as Karachi Naval Radio, Pakistan, and I hope he's not moving in on us. Most of the stations signing with a three-letter call beginning with 'V', you will find, are based in Vietnam (eg. VRQ), and they are not above using VK-allocated calls.

Many thanks for recent reports received from VKs 1NET, 2BQS, 2DEJ, 2EYI, 2PWS, 4AKX, 4BG, 4BTW, 5BJF, 5GZ, 5TL, 7LR, 7RH, 8HA, 8XX and SWLs Arthur Bradford and Peter Boskos. Nice to know we can depend on regular help from people such as these and others.

The Wednesday evening 1030 UTC 3.540 MHz IW net has been good lately, with stations on from VK2, 4, 5 and 7. Col VK4AKX reports that UHF3, a nuisance intruder, seems to have effected his seasonal change, and left 40 metres in favour of some non-amateur band, which is good news, but Col hastens to add that he will probably re-appear about August next.

Amazing the number of Intruder stations which have a call sign beginning with the letter 'U' — I have 58 listed here as already-reported intruders on the various amateur bands. We can well do without these. Anyway, we'll just keep sniping away at them, and see what happens.

Please lend a hand by supplying reports of intrusions into the amateur bands, and reinforce the work done by our regular helpers. Any information can be obtained by writing to the address at the top of the column, or ringing me on (02) 477 2717, or get in touch with your Divisional Co-ordinator, whose particulars can be found either in the Call Book, or from your Divisional Council. See you in July, and keep the rig warm.

AR

In reference to Electrical Safety in the Amateur Shack — p31 May. It has been pointed out that fusing in the neutral as indicated in para 6b is contrary to the SAA wiring code throughout Australia and may actually introduce a shock hazard.

EDUCATION NOTES

Brenda Edmonds, VK3KT
FEDERAL EDUCATION OFFICER
56 Baden Powell Drive, Frankston, Vic 3199

Education officers in each division should, by now, have received copies of the revised syllabuses for examinations. These revised versions will appear in the revised Amateur Operators Handbook when it is printed.

I have asked for comments on the changes that have been made, and I would be pleased to receive them. By the time this is published, the revised syllabuses should be available in brochure form, and I will have a supply to send out on request.

The changes in content for the most part have been fairly minor, but there has been a rearrangement of some of the sections to bring the two syllabuses more into line, which should make it easier for those attempting to upgrade.

The context has been left fairly broad, and a note has been included that candidates should be aware of current technological developments. This means that there is still room for the gradual evolution which occurred with the original syllabuses.

This evolution may not have been apparent to those not directly involved with class or exams, and not all readers may be in favour of such a broad scope in the syllabus.

However, when we consider the developments that have taken place since the original definitions of the syllabus — FETs, PLLs, ICs, digital readouts — we see that much of the current 'state of the art' is fairly recent, and it is fair to expect the incoming amateurs to be familiar with the equipment they will probably be using.

It is unreasonable to expect a syllabus to be reviewed more often than about every six-eight years. By leaving it broad, we have the means to ensure that candidates are made familiar with current developments.

Our intention now is for the Institute to develop a Study Guide to go with the syllabus, so that we can define the depth of the topics where they have not been specified and suggest items that should be omitted.

I would be very pleased to receive input on any of this — all or specific topics — or collect names of members who would be prepared to criticise the draft. I apologise to those who feel that changes should have been referred back to members before proceeding to publication, but as with most productions, time was limited and deadlines had to be met.

Those who would have liked to participate are most welcome to participate in the development of the Study Guide.

Of course questions on any topics that have been added or significantly extended will not appear on papers until the revisions have been widely published.

By the time you read this a new printing of the Amateur Operators Handbook should be obtainable. This is just a reprint of the previous one and will contain the original syllabus. It has been reprinted because of demand, to cover the needs of candidates until the revised one is available.

73, Brenda VK3KT

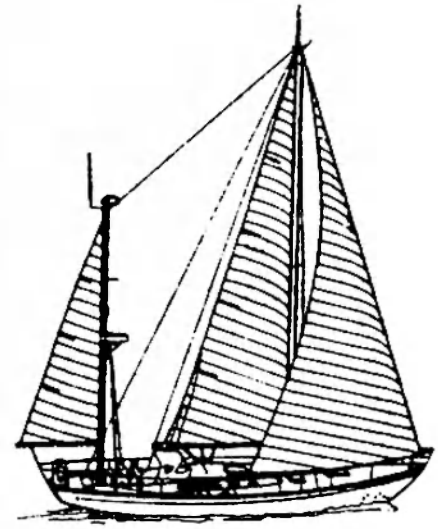
From left — Jim Davis VK7OW, Yuko Sato, Bil's sailing companion since Tahiti, Bil N6APE/VK4FAZ and Ian Ellings VK7QF. Bil is holding the four-legged 'biting' deck-hand George who came aboard in Queensland.

AROUND THE WORLD BY YACHT



Recently, after ten years, Bil Culthurst N6APE/VK4FAZ/MM reached the half-way point of his journey around the world and Bil would not be surprised if it takes him another ten years before he sails into his home port.

Bil docked at Devonport's Mersey Yacht Club marina at 12.45 a.m. on 13th February in his custom yawl 'Concerto' and was greeted by a small group of Coastal amateur radio operators, two of whom have been following his progress with regular scheds for eight months.

Concerto, conservatively estimated to value $300,000, was designed by a successful America's Cup defender, Ted Hood. Bil hopes to be in Perth in 1987 for the America's Cup.

Aboard are four transmitting and six receiving radios ranging from two hand-helds to a highseas SSB unit as well as amateur radio transceivers.

Information supplied by Ian Ellings VK7QF and the Advocate and Examiner Newspapers.

*denotes Multi-operator or Club Station

Many thanks to all participants and to the many who sent a log even with only a few contacts. Much appreciated.

Certificates sent to those with

Numerous logs had incorrect scoring. For 1984 all contacts were TWO points and each OCEANIA call area was a multiplier. This was introduced to make the activity more interesting tor overseas operators.

The 1985 VK/ZL/O DX CONTEST will be held over the first two weekends of October as usual. It is a SPECIAL EVENT as part of the 75th ANNIVERSARY of Australia's WIA. Your active participation to help celebrate this important milestone in amateur radio history is encouraged.

AMSAT AUSTRALIA

Colin Hurst VK5HI
8 Arndell Road, Salisbury Park, SA 5109

NATIONAL CO-ORDINATOR

Graham Ratcliff VK5AGR

INFORMATION NETS

AMSAT AUSTRALIA

Control: VK5AGR
Amateur Checkin: 0945 UTC Sunday
Bulletin Commences: 1000 UTC
Winter: 3.685 MHz Summer: 7.064 MHz

AMSAT PACIFIC

Control: JA1ANG
1100 UTC Sunday
14.305 MHz

AMSAT SW PACIFIC

2200 UTC Saturday
21.280/28.878 MHz

Participating stations and listeners are able to obtain basic orbital data including Keplerian elements from the AMSAT Australia net. This information is also included in some WIA Divisional Broadcasts.

ACKNOWLEDGEMENTS

The sole contribution this month is from recent UoSAT Oscar 9 Bulletins.

AMSAT-AUSTRALIA NEWSLETTER

Graham VK5AGR, the National Co-ordinator of AMSAT-Australia, is now producing a monthly newsletter containing updated satellite news, orbital predictions, kepierian data and operating hints and techniques. The objective of the newsletter is to keep the amateur populous informed on the latest information available and to realise funds for the funding of projects or the purchase of an item (items) of hardware for a future amateur satellite project, eg Phase-3C, Phase 4 or whatever. The cost of the Newsletter is $15 and cheques made payable to WIA (SA Division) should be forwarded to Graham VK5AGR, QTHR.

WHOLE-ORBIT-DATA (WOD) ON UO-11 (UOSAT-2)

The following summary was received on the Oscar 9 Bulletin recently and explains the significance of the WOD telemetry used on both Oscars 9 and 11. Our thanks to the UoS Team.

. . . *"One of the regular features of the UO-11 transmission is WOD surveys carried out using the 1802 On Board Computer (OBC). The OBC has direct access to the telemetry system and can store selected channels away in memory over the course of an orbit, or several orbits, to be read out (dumped) later. This facility enables telemetry data to be collected whilst the spacecraft is out of range of groundstations yielding a more complete picture of the spacecraft's operations and characteristics than can be gathered from just a 12 minute visible 'pass'. Any number of telemetry channels may be monitored by the OBC in this way — the amount of data collected is limited only by the size of memory available to the OBC, normally 14k Bytes but an additional 32k Bytes are available if required. The WOD surveys have been mostly used for navigation and stabilisation analysis using the X, Y and Z magnetometer channels. The motions of the gravity gradient stabilised spacecraft tend to be very slow (hours) and therefore surveys of navigation data spanning at least one complete orbit and frequently several orbits are necessary to observe and measure what is going on. In addition to navigation surveys, battery, downlink, solar array and spacecraft temperature data are gathered somewhat less frequently to provide updates to the overall engineering profile of the spacecraft. As there is a limit to the size of memory available to the OBC for data storage, the surveys can be organised to monitor many channels over a short period or a few channels over a correspondingly longer period. Apart from routine surveys, the WOD facility has been used to support special events such as gravity boom deployment, special downlink configuration tests and will shortly be used to establish baseline current consumption measurements for the DCE memories. The WOD surveys are initiated by the UoS groundstation by sending the OBC an instruction containing the telemetry channels to be monitored — the sampling rate can be further varied by controlling the telemetry rate (300-2400 bps) — the downlink multiplexers are then generally switched to WOD dump automatically by the OBC once the survey has been completed. The time at which the survey was started (UTC), orbit no and channel nos are then included in the following UO-9 Bulletin. Unless otherwise stated, the WOD surveys are carried out at 1200 bps hence each sample of the selected channels takes place every 4.84 sec (telemetry frame period). Generally, the WOD on UO-11 comprises navigation or spacecraft engineering survey data to assess the performance of the on-board systems. The most common surveys include telemetry channels 1, 2, 3 (the navigation magnetometer), 52 (the NiCd battery voltage) and, less frequently, the various spacecraft temperatures (x, y, z facets, battery and module boxes).*

The number of channels can vary up to a usual maximum of six limited by the current on-board computer software and the desired survey period. The WOD format comprises a 'sample (telemetry frame) address' followed by the three-digit value of the chosen telemetry channels in numerical channel order finally followed by a checksum. The sample addresses and their data are transmitted in an 'inter-leaved' format — sub-commutating every eighth address, ie addresses 0-8-16-24-32-40-48 (decimal) on the first run through memory, followed by: 1-9-17-25-33-41-49 etc on the second run through memory, and so on. This technique is employed to minimise the effect of burst errors on the received data — if you watch the data plotted in real-time, you will appreciate the power of this technique. An additional advantage (to the burst error resilience) used by the UoS Control Station is that a rapid appreciation of the trend of a data survey can be gained without the complete data dump thus allowing operators to proceed onto further activities in a minimum of downlink time . . ."

OSCAR-10 APOGEES

An explanation in the use of the apogees supplied in this column is given in the October 1984 Issue of Amateur Radio. The assumptions made in that column are still valid, however now that the bird is slowly drifting into the Southern Hemisphere the higher elevations required may necessitate some "DF-ing" for the strongest signal.

de Colin VK5HI.

CONTESTS

Ian Hunt VK5QX
FEDERAL CONTEST MANAGER

P.O. Box 1234, GPO, Adelaide, SA 5001.

CONTEST CALENDAR

JUNE	
8-10	*VK/ZL 1985 RTTY DX Contest (Rules 'AR' May 1985)*
15-16	*All Asian Phone Contest (Rules this issue)*
22-23	*ARRL Field Day Contest*
28-30	*SMIRK QSO Party*
JULY	
6- 7	*Venezuela Phone Contest*
13-14	*International QRPp Contest*
13-14	*IARU Radiosport Championship*
20-21	*The Sunshine State Jack Files Memorial Contest (Rules this issue)*
20-21	*Venezuela CW Contest*
AUGUST	
10-11	*European CW Contest*
17-18	*REMEMBRANCE DAY CONTEST*
17-18	*SARTG RTTY Contest*
24-25	*All Asian CW Contest (Rules this issue)*

This month the rules for the Sunshine State Jack Files Memorial Contest 1985 are published. I would recommend this contest to you as one very worthwhile supporting. As well as reading the rules you might like to look back at the Thumbnail Sketch provided by Alan VK4SS which featured the late Jack Files VK4JF and appeared on Page 59 of 'Amateur Radio' for April 1985. Together with the copy of the rules I received a very nice note from Val VK4VR. It is a pleasure to hear from officers of a Division of the WIA, and perhaps indicates that there is some divisional interest in contests after all. I would like though to hear more in the way of comment from Divisions as well as receiving letters from individual members.

I recently wrote a letter of apology to Don VK1DH regarding his entry in the 1984 Remembrance Day Contest. For those of Don's friends who may have thought he omitted to send in his log I can say that was not the case. His entry unfortunately appeared as VK1OH due to a typographical error at this OTH.

From time to time I receive letters from various operators querying why their logs have been disqualified from a contest. In each case I provide an answer and in some instances I have received replies thanking me for pointing out where the mistakes lay. In one instance however, having explained in detail to the tune of two pages, as to why a log entry was unsatisfactory as well as answering personal criticism, I received a second letter in which the operator claims that I had been unreasonable by not returning the log with the advice that it was unacceptable in format. Unfortunately it would not be a practical proposition to adopt such an approach as you would undoubtedly realise. I would like to present for your thought a small insight into my attitude regarding the Federal Contest Manager's position and to this end I quote one paragraph of the letter which I wrote to the contestant concerned.

"In the past Federal Contest Managers have included in contest rules a paragraph to the general effect that the Contest Manager's decision is final and no correspondence will be entered into. I have tried to stay clear of this approach as I would not wish to stifle healthy discussion on any worthwhile contest matter. I do however have the right to implement such an approach should I see it as necessary."

I would hope that the situation will remain as is and that during my term as Contest Manager I will be able to help our contest operators here in Australia to improve their performance both in their actual operating as well as finishing the job properly by submitting logs of good quality. It will not always be that I can provide reams of comment and suggestions through this column as sooner or later I will run out of ideas. I am most happy to hear from you re any aspects of contesting you would like to see discussed and would make any contributions for direct publication most welcome as well.

Whilst still on the subject of logs I would like to quote yet another paragraph from the letter referred to above, namely *"In each instance the disqualified logs were examined by myself as well as another amateur assisting me with the compilation of results. The decision to disqualify same was not made lightly, however you surely will understand that there has to be some level arrived at beyond which any unsatisfactory logs may be measured."*

So, once again I would appeal to you to ensure that when you enter a contest you make yourself thoroughly familiar with the rules and go to at least some trouble to see that your log qualifies properly with the requirements laid down. I hope that I do not have to make much more mention of this aspect of contesting, nevertheless I will issue the warning once again that logs received which are considered unsatisfactory WILL BE DISQUALIFIED without further ado.

As I write this I am preparing to process the batch of logs received for this years John Moyle Memorial Field Day Contest.

A quick glance through these logs shows that some most excellent entries have been submitted. It will be most interesting to go through them to come up with the final result. At the recent Clubs Conference here in Adelaide, at which I was invited to speak, I made the comment that I would consider publishing a sample of at least two of the best logs submitted, one a manually produced log and the other a computer produced log. I would, of course, first approach the operators who submitted same to obtain their concurrence before going ahead and providing such copy for public scrutiny.

Also as I write this the Annual Federal Convention is soon to take place. I had the pleasure of meeting Guy VK4ZXZ, who is the Federal Councillor for the Queensland Division, as he passed through Adelaide on his way to the convention and was thus provided with the opportunity of discussing contest matters with him as well as with David VK5AMK, Federal Councillor for VK5. I provided a fairly comprehensive report to the convention and it will be very interesting to see just what comes out of this years convention.

It is certainly a fact that we all learn by our mistakes and that this is what experience means. Harking back to the Field Day Contest I have a feeling that the inclusion of multipliers for VHF operation may have created some interest even to the extent that the VHF section of the contest deliberately omitted this year due to obvious lack of interest in this section might well need to be re-instated. Other recent discussion has revealed a deal of dissatisfaction with the approach to VHF operation in the annual Remembrance Day Contest. I may be able to have the suggestion aired at the Federal Convention to the effect that the contest have completely separate sections for HF and VHF. Such an approach, it has been claimed, would make things somewhat more equal where country and city HF operators are concerned. Needless to say only good can come out of open discussion of such contest matters. It would not do for things to just stagnate with no progress or change taking place.

As part of making the contest scene more interesting to members I would like to see much more in the way of recognition of contest success. Both the VK4 and VK5 Divisions have put up ideas for memorial trophies which have yet to be discussed. Such could certainly be a help, whilst I would like to see such items as more plaques and pennants be awarded for competition. I would propose that the same trophy could not be won by an operator two years in succession and also that trophies, pennants and plaques should only be awarded to members of the Wireless Institute of Australia for contests organised by the Federal Contest Manager. Where operators, other than members, are winners they should receive certificates. If anybody would like to help towards this end by donating such items for presentation I would be very pleased to hear from you. Maybe even some of the electronics companies could consider donating worthwhile prizes to help things along in this way.

Well, that is all I have for you this month. In next months issue there will be the rules for our Remembrance Day Contest. It may well be that there will be a number of changes to these rules so you will be warned to study them carefully. I will also present the rules for the European DX Contests which include the CW Contest as shown in this months Contest Calendar as well as the Phone Section to be held in September and the RTTY Section in November.

Meantime I trust that you will enjoy all the aspects of our really modern and wonderful hobby which you are pursuing.

Just as an afterthought I might add that with the advent of the results of the past VK/ZL Contest being published I will be able to announce the winner of the Contest Champion Trophy for 1984.

THE SUNSHINE STATE JACK FILES MEMORIAL CONTEST 1985

All amateurs throughout the world are invited to participate in this contest, the aims of which are (a) to perpetuate the memory of the late Jack Files and (b) to enable amateurs to work stations for the WORKED ALL QUEENSLAND AWARD and other awards issued by amateur radio clubs in Queensland.

Date and Times: Saturday 20th July 0830-1230 UTC. Saturday/Sunday 20th/21st July 2330-0130 UTC.

Divisions and Sections: (1) Stations within VK4 (a) Tx all bands, (b) Tx HF only, (c) Tx VHF UHF only, (d) Tx QRP only (e) Tx all bands Club Stations. (2) Stations outside VK4 (a) Tx all bands. (3) SWLs (a) receive all bands.

Rules:

1 Except as specified below, rules on cross band, cross mode, repeaters, log keeping and submission will be as per 1985 RD Contest.
2 Stations may be worked repeatedly on all bands and modes provided that one hour has elapsed since the previous contact on that band and mode.
3 For scoring purposes on HF, VK4 is divided into two zones, the dividing line being the Tropic of Capricorn. On all bands a bonus of ten points may be claimed for the first contact to a Qld City or Shire on each band during both, NOT each, sessions. Also a bonus of ten points may be scored for each contact with a Club Station.

(a) Stations in VK4.
HF contacts within same zone, 3 points. Opposite zone 5 points. Outside VK4, 1 point.
UHF/VHF contacts to another City or Shire, 5 points. Same City or Shire, 3 points. Outside VK4, 1 point.

(b) Stations outside VK4.
HF, VHF, UHF contacts to VK4 Stations, 1 point. Bonus points apply. No points for contacts to other call areas.

4 On the various HF bands it is recommended that operation is below: 1.820, 3.575, 7.060, 14.175, 21.175, 28.450 MHz.
5 Logs must be submitted before 16th August 1985 to: The WIAO Contest Manager, 5 Koomooloo Court, Mermaid Waters, Qld. 4218. It would be appreciated if WIA contest log sheets be used.
6 Awards will be given to the highest scorer in each section. However, should a contestant receive an award in one section he/she will not be eligible for an award in any other Section.
7 The Contest Manager's decision will be final and no disputes will be entered into.

AR

THE 26TH ALL ASIAN DX CONTEST

The purpose of this contest is to enhance the activity of radio amateurs in Asia and to establish as many contacts as possible during the contest periods between Asian and Non-Asian Stations.

CONTEST PERIOD:
(1) Phone: 48 hours from 0000 UTC 15 June 1985 to 2400 UTC 16 June 1985
(2) CW: 48 hours from 0000 UTC 24 August 1985 to 2400 UTC 25 August 1985

BANDS:
Amateurs bands under 30 MHz

ENTRY CLASSIFICATIONS:
(1) Single operator, 1.9 MHz band (CW only)
(2) Single operator, 3.5 MHz band
(3) Single operator, 7 MHz band
(4) Single operator, 14 MHz band
(5) Single operator, 21 MHz band
(6) Single operator, 28 MHz band
(7) Single operator, Multi band
(8) Multi operator, Multi band

POWER, TYPE OF EMISSION and FREQUENCIES:
Within the limits of own station license.

CONTEST CALL:
(a) Phone....."CQ Asia"
(b) CW....."CO AA"

EXCHANGES:
(1) For OM stations: RS(T) report plus two ligures denoting operator's age.
(2) For YL stations: RS(T) *report* plus two figures "00 (zero zero)"

RESTRICTIONS ON THE CONTEST:
(1) No contact on cross band.
(2) For participants of single operator's entry: Transmitting two signals or more at the same time including cases of different bands is not permitted.
(3) For participants of multi operator's entry: Transmitting two signals or more at the same time within the same band, except in case of different bands, is not permitted.

POINT AND MULTIPLIER:
(a) Point . . . Perfect contact with Asian stations (excluding US auxiliary military radio stations in the Far East, Japan) will be counted as follows:
1.9 MHz band.....3 points
3.5/3.8 MHz bands.....2 points
Other bands.....1 point
(b) Multiplier . . . The number of different Asian Prefixes worked on each band. According to the WPX Contest rules:

SCORING:
(The sum of the contact points on each band) X (The sum of the multipliers on each band)

THE SUMMARY AND LOG SHEETS
Available from JARL.

AWARDS:
(1) For both phone and CW, certificates will be awarded to those having the highest score in each entry in proportion to the number of participants from each country and also those from each call area in the United States.
(a) The number of participants under 10 . . . Award only to the highest scorer.
(b) From 11 to 20 . . . Award up to the runner-up
(c) From 21 to 30 . . . Award up to the top third
(d) From 31 or more Award up to the top fifth
(2) The highest scorer in each Continent of the single operator multi band entry will receive a medal and certificate from the Minister of Posts and Telecommunications of Japan.
(3) The highest scorer of the multi operator multi band entry in each Continent will receive a medal.

REPORTING:
(1) Submit a summary sheet and logs of only one classification.
(2) Both log and summary sheet must arrive in JARL, PO Box 377, Tokyo central, Japan *on or* before the following dates:
(a) Phone . . . 30 September 1985
(b) CW . . . 30 November 1985

DISQUALIFICATION:
(1) Violation of the contest rules.
(2) False statements in the report.
(3) Taking points from duplicate contact on the same band in excess of 2% by the total.

ANNOUNCEMENT OF THE RESULT:
(1) Phone . . . About February 1986
(2) CW . . . About April 1986

COUNTRIES LIST OF ASIA:
A4, A5, A6, A7, A9, AP, BV, BY, EP, HL/HM, HS, HZ/7Z, JA-JS, JD 1 (Ogasawara Is.), JT, JY, OD, S2, TA, UA/UN/UV/UW, UZ/RA/RN/RV, RW/RZ9-0, UD, UF, UG, UH, UI, UJ, UL, UM, V85, VS9M/8Q, VU, VU (Andaman & Nicobar Is.), VU (Laccadive I.), XU, XV, 3W, XW, XX9, XZ, YA, YI, YK, ZC4/5B4, 1S (Spratly I.), 4S, 4W, 4X/4Z, 7O (S. Yemen), 9K, 9M2 (West Malaysia), 9N, 9V (Singapore), (AbuAil)

WICEN NEWS

Ron Henderson VK1RH,
FEDERAL WICEN CO-ORDINATOR,
171 Kingsford-Smith Drive,
Melba, ACT, 2615

STANDARDISATION OF CONNECTORS

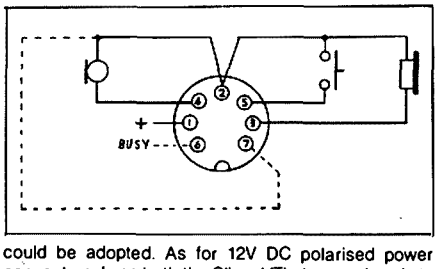
I recently received an interesting letter on this topic from Paul Howarth VK2ZPS and with his permission I am including it below.

I read, with great interest, both articles on standard connectors for amateur equipment which appeared under WICEN News in July 1984 and January 1985.

Although I am not a member of WICEN, my interest comes from my association with a volunteer emergency service organisation and being an amateur I was surprised to learn that a standard does not exist within WICEN as a whole. I am a believer in the use of standards wherever they are practical, and the adoption of a standard wherever they don't.

Both systems have merits, ie: the separate earth for microphone circuits, the busy line for repeater operation, (this feature being omitted where equipment is not modified for this purpose) and a +12 volts line for indication, electret microphones and low current switching. Perhaps a combination such as

1 — +12V supply
2 — Ground
3 — Audio Output
4 — Microphone Input
5 — PTT
6 — Busy (Optional)
7 — Microphone Ground (Optional)



could be adopted. As for 12V DC polarised power connectors, I use both the Clipsal 'T' plugs and sockets as well as 6.5 mm phono plugs and sockets (Metalised type), and believe both have their place. I do understand that the Standards Association of Australia (SAA) has been approached with regard to issuing a standard for the polarity of the 'T' connectors.

I am putting my comments to yourself, WICEN members and amateurs as a whole, hoping to see some active discussion resulting in the adoption of a standard.

This I believe, would further enhance the professional image of WICEN amongst statutory authorities.

Regards,

Paul Howarth VK2ZPS.

The key need is standardisation and interoperability of equipment and accessories within a recognised group of **WICEN** operators, probably on a regional or geographical basis as they will be working together.

AR

MAY'S BEST PHOTOGRAPH

The Judges at Agfa-Gevaert Ltd Australia chose the selection of photographs accompanying the article of Lizard Island in May. Anne VK4FAB will now be eligible for the Agfa prize.

AWARDS

Joe Ackerman, VK4AIX
5 Koomooloo Court, Mermaid Waters, Qld 4218

This month we will be detailing some of the awards which are sponsored by YL groups.

These awards can be gained without much effort as there are a significant number of YLs operating on all bands.

Many countries have special nets operating for YL activities and OMs are welcome to participate, unless stated otherwise.

Some of these nets are shown below:-

ALARA, sixth of each month, hourly and may be found on 7.088, 14.280, 14.288, 21.188, 21.380, 28.050 and 28.588 MHz.

3.525 MHz at 0800 UTC on Mondays. WARO CW net.

3.570 MHz at 0830 UTC on Mondays. ALARA net.

14.160 MHz at 0800 UTC on Mondays and Thursdays. Natter net.

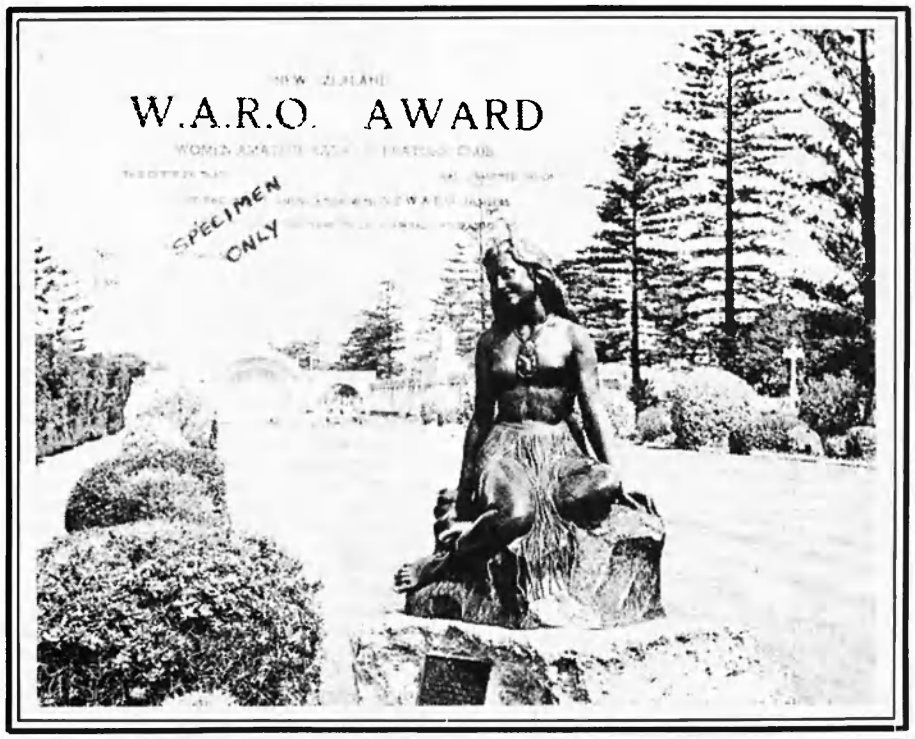
14.160 MHz at 0500 UTC on Mondays and Thursdays. VE/VK/ZL net.

14.220 MHz at 0630 UTC on Mondays DX YL net, OMs welcome on first Monday.

14.333 MHz at 0300 UTC on Saturdays. VK/ZL net.

21.183 MHz at 0400 UTC. VE/VK net.

21.355 MHz at 1430 UTC daily. DX YL net.



ALARA AWARD

This award displays eight hand painted wild flowers native to each of the Australian States. The artist is VK3AZU.

The logo is black and yellow and the whole is printed on dull white paper, 21cm x 30cm. A most attractive addition to any award collection.

Rules for application for ALARA Award

VK/ZL applicants. 10 members to be contacted and to include 5 Australian States. DX applicants. 5 members to be contacted and to include 4 Australian States.

All contacts to have been made with members on or after 30th June 1975. No repeater contacts will be allowed.

Applicants must submit a complete extract of log entries, which is to be certified correct by two other amateurs, whose signatures must be appended. In the event of an applicant in an isolated location being unable to obtain certification, QSL cards should be forwarded in lieu.

Application must include full name, address, signature and call sign of the applicant. All contacts must be made from the same call area. Official ALARA net contacts do not qualify.

Special endorsements available eg Mixed, All CW, All Phone, All 28 MHz, etc. Endorsement stickers available for each ten additional members contacted. For DX applicants, 5 additional.

Fee. Applications should be accompanied by the equivalent of 3 Australian dollars or 7 IRCs. Additional stickers 1 Australian dollar.

Applications should be forwarded to: ALARA Awards Custodian, Mavis Stafford, 16 Byron Street, Box Hill South, Vic. 3128.

WARO — NZ

This award is issued by The New Zealand Women Amateur Radio Operators.

Requirements.

ZL and VK stations must work twelve WARO members resident in New Zealand. DX stations require six contacts. Contacts for amateurs date from 1 June 1969 and for SWLs on and as from 1 January 1979.

VHF Section: Requirements are ten VHF contacts with WARO members and applicants may be home stations, mobile or portable. Endorsements are available for each five additional contacts. Commencing date 1 January 1979.

SWL Section: ZL and VK stations must list twenty contacts heard with WARO members. DX stations need to list ten contacts heard. Heard contacts only from 1 January 1979. Log details with call signs of both stations heard.

General Requirements: Contacts via repeaters, WARO nets or contests are ineligible for the award. Contacts may be any mode or band, with applicants contacts from the same QTH, except as for VHF.

No QSLs are required only GRC list certified by one other amateur and sufficient postage for return of the award to be forwarded with the application

Applications to be forwarded to. Custodian WARO Award-ZL1OC, Vicki Shaw, PO Box 2088, Whakatane, NZ.

BYLARA AWARD

This attractive award is sponsored by the British Young Ladies Amateur Radio Association. It is available

to all amateurs and SWLs.

Requirements

DX outside Europe. Work ten YL members, to include six British YLs, as from 29 April 1979.

All bands, all modes. One contact per member. Open to all YLs, OMs and SWLs. Special endorsements, available on request. eg. "all CW", all "10m SSB", etc.

Applications to be made to: Custodian Bylara Award, G4EZI, 3 Primley Park Crescent, Leeds LS17 7HY, England, UK.

QSLs are not necessary. Log data only required signed by the applicant. Fee is One pound fifty p, 12 IRCs or US$4. List of members may be obtained from the Custodian — please enclose SASE.

THE 88 CERTIFICATE

The Dutch-YL-Club was started on 9 May 1981 and is affiliated with VERON, and they are the sponsors of this Award. Rules are as follows: HF-Eu-DYLC members count 8 points; non members of DYLC, but still Netherlands YLs, count 4 points. DX — All Netherlands YLs plus the members of DYLC, 11 points. Submit proof of having established two-way radio contacts with Dutch YLs or members of DYLC. Each contact is awarded with a number of points and the applicant must earn a minimum of 88 points. (Same rules apply for SWLs.)

Only QSOs from 9th May 1981 are valid. Have list certified by two other amateurs, Club Officer, or Notary Public. Cost is 8 IRCs. Apply to: Awards Manager, M Wolf-Wildeboer, Polotenweg 14-b, 8303 EJ Emmeloord, The Netherlands.

CWRJ "YL" FLOWERS AWARD. (YLAW)

CW only. With the first letter of the suffix of the call sign of stations worked in the 10 metre band (28MHz) spell the names of five flowers (English or Portuguese names). Stations worked must include 5 YL operators. YL stations may be used to substitute letters in the names of flowers (as in poker). YL contacts may be on any band. Contacts may be any country. Endorsements — none. Send log data, certified, calls (listed in order to form names of flowers) YL infor, date.

Fee is 6 IRCs, QSOs valid after 1 January 1982. Manager is PY1DWM, PO Box 24039, 20522 Rio de Janeiro, Brazil.

MINERAL FIELDS AWARD

This Award is to create an interest in the north-east of Queensland, and to bring an awareness of local conditions to interested amateurs.

The Award is on a points attained basis, and point scores are as follows:

Contact with a Mount Isa Station on HF count 1 point
Contact with a Mt Isa Station on VHF count 2 points
Contact with a District Station on HF count 2 points
Contact with a District Station on VHF count 3 points
RTTY and CW counts double points score for that contact.

The District Stations are those stations within the boundary of the area north of Boulia to the Gulf, and west of Cloncurry to the Northern Territory border.

Stations can be claimed once per band, per mode (phone CW RTTY) ie VK4ACE:- 80m phone, 40m CW and phone, 15m CW and phone and VHF =
1 + (1 + 2) + (1 + 2) + 2. Contacts after 1/1/76 may be claimed for the Award.

AWARDS: 1 LEAD/ZINC. 10 points, at least one contact with a station in Mount Isa and one District Station compulsory.
2 COPPER: LEAD/ZINC + 5 points.
3 SILVER: LEAD/ZINC + COPPER + 5 points.

APPLYING FOR THE AWARD: CHC GCR applies. Send certified list of contacts and points claimed to *MIDARG, PO Box 1715, Mount Isa, Old. 4825.*

Please include 4 IRCs to cover P & P and costs.

AR

HIROSHIMA DX CLUB

The Hiroshima Kangaroo DX Club are issuing a HKDXC Award for the third anniversary of its foundation. HKDXC hopes many stations all over the world will participate in hunting this Award. The rules are as follows.

CLASS A: To get more than 500 dissimilar VK stations QSL cards including VK1 to VK8 and also more than 3 HKDXC member's cards.

CLASS B: To get 300 dissimilar VK stations including VK1 to VK8 plus 3 HKDXC member's cards.

CLASS C: To get 100 dissimilar VK stations including VK1 to VK8 plus 3 HKDXC member's cards.

COMMENCEMENT: 1st February 1984. (Effective QSOs only after this date.)

OTHERS: HKDXC member's card must have a membership of HKDXC to be valid for the Award.

The applicant is required to send following objects to the addressee.

1) Each one card of VK1 to VK8 confirmed
2) Three HKDXC member's cards confirmed
3) The summarised log sheets (GCR)
4) Ten IRCs for return postage

THE ADDRESSEE: H Ichikawa JR4WWT 20-20, 5-Chome, Midori, Minami-Ku, Hiroshima 734 JAPAN

WIA 75 AWARD MANAGERS REPORT

The following are quotes from letters included with claims for the award.

Val Rickaby VK4VR *"I had a most enjoyable time collecting the numbers and worked a lot of new stations."*

Ron Millingen VK2PZW *"May I say that as a newcomer to amateur radio and only on air for four months that I found this a most stimulating award."*

John O'Brien VK1NCO *"Thanks for organising the award, it has caused a lot of interest on air."*

Dennis Tidy VK2DET *"I am looking forward to receiving this one off award. It will take prominent position on my shack's wall. I have made many more friends on radio through the amount of interest shown for the award."*

Brian O'Neill VK2AKU *"I would like to thank you for the time and trouble in preparing this award for radio amateurs on this occasion."*

Arthur Harris VK2KFV *"Good luck with the award, and by the sound of the airwaves, particularly 80 metres, you will be sending a few out."*

John Heaver VK3VNQ/XEH *"Having enjoyed the exercise very much and I do wish the Institute all the success it deserves."*

INDEX OF COLUMNS AS AT 16-03-85

No	Pub Date	Subject
1	8/82	Intro, Subjects to be covered.
2	9/82	The CW QSO (I), Establishing Contact.
3	10/82	The CW QSO (II), the QSO
4	11/82	Abbreviations, Query re use of QRL.
5	12/82	Contest Operation.
6	1/83	Keys and Keyers (I), Manual Keys.
7	2/83	Correspondence — VK4RF, VK2BIW, Overlining, Pet Hates
8	3/83	Keys and Keyers (II), Mechanical and Electronic.
9	4/83	Keys and Keyers (III), Paddles, Keyers, AEA.
10	5/83	Signal Reporting, RST.
11	6/83	Signal Report Amplifications.
12	7/83	Retrospective, Zero-beat Operation.
13	8/83	Zero-beating, Applications, Break-in Operation.
14	9/83	Getting Rid of the Garbage.
15	10/83	Learning the Code.
16	11/83	Increasing Speed, request info on Practice Material.
17	12/83	VK5EK Letter, ICW, Circuit for ICW PA.
18	1/84	ORPp Club Fold-up.
19	2/84	Morse Examinations.
20	3/84	ORP Operation.
21	4/84	Readers' letters re ICW and MCW.
22	5/84	ICW and Gentlemen's Agreement.
23	6/84	Spark to CW — 1928 ARRL Handbook.
24	7/84	Net Operation, More 1928 Material.
25	8/84	Birthday, Codemaster.
26	9/84	Establishing Contact.
27	10/84	Poor Sending.
28	11/84	Speed, Letters.
29	12/84	Abbreviations.
30	1/85	Whither CW, RST Reporting.
31	2/85	Signal Report Amplification.
32	3/85	Why Use CW?
33	4/85	Speed Practice for the Novice Operator.
34	5/85	Bits and pieces, correspondence.
35	6/85	Correspondence. Biggest Key.
36	7/85	Getting it right.
37	8/85	Learning the Code.

You may well be wondering about the photos which accompany the column this month — is it a giant key or a midget operator? Is it a normal-size operator who is suffering from elephanitiasis of the key? Read on, and all will eventually be revealed.

But first, I have some more correspondence to deal with. Thanks very much for the letter from Lloyd Collier, who commented on the article "Whither CW?" which appeared in January. Lloyd's comment was that you could engender some interest in CW operation by "reversing" the exam requirements. His suggested exam format would be —

Full call — Regs and CW at 10 WPM.

Novice — Regs and Theory.

Thanks also for an encouraging letter from Ken VK5PKP, who neglected to include a return address. Drop me another line Ken, because the fact that your dad is an N6 indicates we may have more in common than an interest in CW!

Glen Torr VK1FB sent a very interesting letter describing a visit to the Canberra Space Centre at Tidbinbilla. Glen writes:

"Part of the display was a map of Australia showing the locations of previous NASA tracking stations in Australia. There was a short story about each station. They story about the Carnarvon WA station which was used from 1963-1975 for the Gemini Project contained the following, copied word for word —

> *'An interesting event illustrating the initiative of the Outback of Australia was when Carnarvon first began tracking and was just waiting for a spacecraft to be launched, when a bolt of lightning cut all communication out of the town. The time of launch was passed from Geraldton to Carnarvon by* ***Morse code****, using the top wire of fences in places.'*

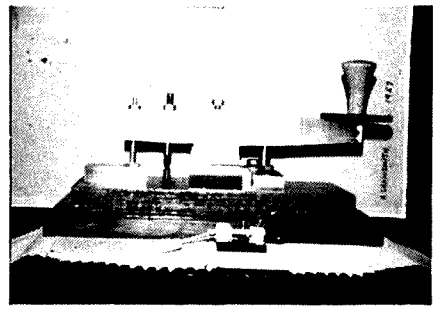
"Even though Morse may be old there will always be need for a code which can convey intelligence by the presence or absence of a medium."

A meeting of the old and new. I well remember as a lad in the USA the fascination of following the early manned space programmes — Mercury and Gemini — little did I suspect I would be reporting a connection between the most modern and the oldest applications of wireless communication.

I was reminded the other night of Glen's letter when I was giving a talk on the history of CW for a local club. As part of my work lately I have had to write formal papers for management, and the best way is to start with an outline which puts the whole thing in perspective. As I was outlining the talk, it suddenly dawned on me that Morse code is essentially a digital mode of communication, having a lot in common with its predecessors smoke signals, signal fires, and heliographs. Meanwhile, there was a side-development, as it were, in analogue modes, which have more or less been perfected in such areas as telephone, television, and FM radio, but the real leading edge in technology is in — you guessed it — digital techniques.

The talk was called "From Key to Computer", and concluded with a rather bald but reasonable assertion on my part that computer reception of Morse code transmissions is a "Cinderella" technology. Where conditions are good enough for computers to read Morse, then they are good enough for more advanced digital codes which are far more efficient. Where conditions are not so good, the human ear will beat the machine every time. I was delighted to prove my point after the talk when two different machines using two different programmes were unable to make any sense out of code which I could read with ease. It was gratifying to see the spectators who had been staring at garbage on the screen slowly drift over toward the receiver, where I was able to tell them what the computer couldn't!

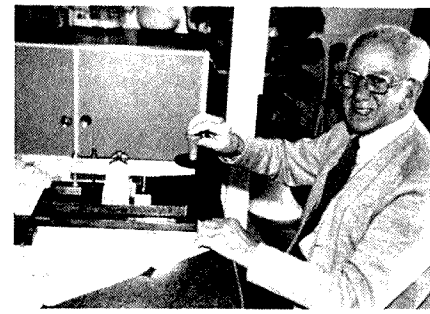
There is a simple elegance about a manual Morse key which has attracted brass pounders through the last century. Most of us use "gadgets" such as paddles and keyers, but I would bet that nearly every one of us has a straight key somewhere in the shack "just in case". Keys have been made from all sorts of materials, with all sorts of decorations and "improvements", and in my learning days I was able to use what must have been one of the smallest — a two inch key bolted onto the top of a portable military transmitter.



The photos show what may well be the largest key in the world. Alan Shawsmith VK4SS kindly provided the photos and some background information.

Alan feels that someone somewhere could produce something larger, but until this happens, he is claiming this straight hand key capable of being used to key any rig as the largest of its type ever made.

It sits on a two tier base and measures overall 19" by 9½" by 9¼" high. The weight is approximately 17 pounds or 7.5 kg; it can be carried in one hand if you have a strong wrist? It would pulp toes if dropped on one's foot, and would make an ideal door stop for a cathedral, yet it is so beautifully balanced that excellent code can be sent with a light touch of two fingers. The



base is of exotic wood and all the machined parts are of first quality inch-thick solid polished brass. The contacts are half an inch in diameter, so it could key a spark transmitter of very high power.

The question, according to Alan, is *"Was it designed for use as a functional instrument, or for static display only?"*

"The Incredible Hulk", as it is now affectionately known, was donated to Alan's key collection by an American collector who prefers to remain anonymous. The collector is desperately keen to expand his collection with some Australian keys (viz the Pendagraph, vertical and broadside models, the Auto Morse 3 paddle, Buzza Bug and others). He is prepared to pay a good price and anyone who can help should contact Alan Shawsmith VK4SS, 35 Whynot Street, West End, Brisbane, Qld. 4101.

A footnote explains that Harry VK3CM paid Alan a visit, and since they couldn't find room in the shack they photographed it on the kitchen table. Much to Alan's surprise, Harry could send 20 WPM on it!

So who knows of a bigger key? Failing that, who wants to go for a place in the record book and build one? I've got an idea or two but I'll say no more until I can see if it will work. Thanks again to all contributors and correspondents, and I hope this column will stimulate some of you to dig into your memories and your files for some more CW ephemera.

AR

SPOTLIGHT ON SWLing

Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

In last month's column, I happened to mention the existence of Single-Letter Beacons and the speculation surrounding their operation. Now William Orr W6SAI, has followed up with an article on so-called "cluster" beacons. (1)

These beacons differ from the high powered stations employing a 500 Hz frequency shift keyer, because they use the standard A1A mode and are generally weaker also. These "clusters" are over a narrow frequency range of 4 kHz and are spaced approximately 500 Hz apart. Reportedly located in different locations within the USSR, they are further inland than the "K" or "U" beacons which are on the coast.

Interestingly enough, these beacons appear in exactly the same position within each frequency span. Therefore, one can subdivide them into eight "channels" with the first one being 500 Hz above the commencement of the Span and the final one at the edge of it. You will readily hear the "F" beacon on "channel 1" and as you tune across the sub-band you will hear other Morse I/Ds including some with Cyrillic letters such as "···.", or "..··" or ".·.·.".

The approximate "Cluster" Beacon Frequency Spans are as follows:—

3.564 to 3.568 MHz	*5.305 to 5.309 MHz*
6.801 to 6.805 MHz	*8.645 to 8.649 MHz*
10.643 to 10.647 MHz	*13.635 to 13.639 MHz*
17.015 to 17.019 MHz	*20.991 to 20.995 MHz*

Of all the "clusters", I have personally found that the 8 and 13 MHz bands is where they can be easily heard from 1000 UTC until they fade out around 1400 UTC. This to me is indicative of an Asian OTH. Orr also states that these beacons will occasionally send different digital information, but I haven't personally noticed this yet. These SLBs are generally weak, being easily lost within the cluttered marine allocations. Their exact purpose is not known, yet appears related to Soviet Defence Communications. For further details, I would refer you to the very interesting article in "Popular Communications".

AN INTRODUCTION

For those just starting out to listen to amateur radio communications for the first time, there is now a very helpful publication entitled "An Introduction To Amateur Radio DXing". It has been written by Rob Wagner VK3BVW, who edits the amateur DX section of the "Australian Radio DX News". It is primarily designed for the SWL and/or DXer as an explanation of the hobby. It has the background to amateur radio together with explanations of the various modes and bands, how to send reception reports to amateurs plus a wealth of information for the SWL/DXer.

I find that the booklet is well prepared and generally free from too many non-technical terms and is ideal for the beginner who has had no experience in amateur radio operation. It could be also a good introduction to the general public at displays, expo's etc, although as it is a little expensive, I would recommend distribution only to those showing interest.

The publication sells for $3.00 within Australia and can be obtained from the publication department of the Club at the following address:— *Australian Radio DX Club, PO Box 77, Glenhuntly, Vic. 3163.*

DX POSITION

Incidentally, the Australian Radio DX Club is holding a "DXposition" on the Queen's Birthday Weekend (8th and 9th June). It will be at Normanby House, Monash University in Melbourne's south-eastern suburbs. It commences at 1 pm and there will be several sessions devoted to various aspects of DXing including antennas, accessories such as ATUs etc. as well as DXing various regions of the World. It will also be an opportune time to meet fellow DXers and enthusiasts. On the Sunday, those attending will inspect the Radio Australia studios at Burwood and the AUSSAT ground receiving station adjacent to the RA studios.

HEAR THIS!!

While tuning across the bands recently, I happened to come on to several programmes for the short-wave listener and/or DXer. We are all familiar with programmes such as "Talkback" over Radio Australia or "Media Network" over Radio Netherlands etc, that I thought it would be a good idea to have a table of DX programmes in this month's column. I have not rated them for quality as that is a matter of individual taste. I include those only that I have heard recently together with the times and days of operation.

JAMMING

You have by now encountered an unusual jamming sound over the past year or so. It can be likened to a klaxon or ambulance siren. I can now confirm that these signals are based in Iraq. As you are aware, there has been a war between Iran and Iraq for over four years now. The Iraqi's have been jamming a variety of stations, both broadcasting and military. The jammer has even been observed on MW, where it caused severe interference to a station in New Zealand, so much that a station in the North Island had to go to a new channel to get away from the pulses. Certainly a long way from the Gulf!

Well, that is all for this time. All the best of 73 and good listening! — Robin VK7RH

CLUB CORNER

THE WIA 75TH ANNIVERSARY HAMFEST

Will be held at the Montrose Yacht Club, Hobart on 8th and 9th June 1985. Amateur radio — yesterday, today and tomorrow will be the theme.

There will be a RTTY display, satellite communications, home brew section, QSL card display and more.

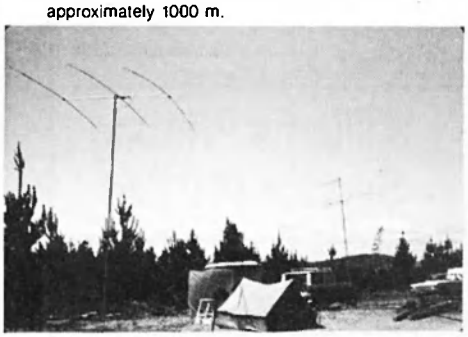
AR

CANBERRA RADIO SOCIETY

During the John Moyle Memorial Field Day, Canberra Radio Society, using the call sign VK1ACA, operated from Kowen Pine Forest for 24 hours.

Fire Tower

The station was located beside the fire look-out tower, 16 km east of Canberra, with an elevation of approximately 1000 m.



A view of the antennas and operating tents.

Eric VK1EP beside the power unit.

Bands 80, 40, 20, 15, 10, 6 and 2 m plus 70 cm were used. Power was supplied by a 5kVA, 240V petrol/electric generator.

Operators were VK1s- TH, AOP, KRS, EP and KCM.

Supplied by M Laybutt VK1ML

AR

WESTERN SUBURBS RADIO CLUB

Recently there was an Open Weekend at Melbourne Airport which saw the biggest public relations exercise ever undertaken by this radio club.

Members of the club participated in providing operators for a WICEN communications exercise as well as promoting amateur radio with operating and demonstrating equipment.

It was estimated that in excess of 80,000 people saw the club in action, complete with amateur television transmissions through the Melbourne ATV repeater.

Over a hundred signatures were gathered from people interested in learning more about amateur radio.

AR

TOWNSVILLE ARC 1985 CONVENTION

Don't forget the dates, 30th, 31st August, 1st September. We are looking forward to any new ideas you might want to have incorporated in the 1985 event. Don't forget also to start getting the home brew display ready. Home Brew sections are also available for XYLs and harmonics. For XYLs your entry may be anything from a potato pie to the latest in embroidery and knitting, just so long as it is made in the home.

Junior displays usually cover some aspect of craft work, but this may not necessarily be so. What we need is a convention with something for everyone.

from Back-Scatter

AR

BALLARAT AMATEUR RADIO GROUP

On the weekend of the 17th and 18th August 1985 members of the BARG will be holding a Field Weekend from the Grampians National Park.

It is hoped this operation will enable amateurs and SWLs to work towards the National Parks Award. (See rules February AR, page 39).

The group also hope to enter the Remembrance Day Contest.

Propagation willing, the bands operational will be 2, 10, 15, 20, 40, 80 and 160 metres.

CENTRAL QUEENSLAND BRANCH

The Central Queensland Branch of the WIA has recently changed its Executive Officers. The new president is Ted Woodford VK4ZEI.

Kay and Clive Sait VK4ACC proudly display the Queensland Recreation Trophy.

Clive Sait VK4ACC, immediate past president, was recently awarded a trophy by the Queensland Recreation Council for his dedication and voluntary services in educating new amateur enthusiasts. Clive and his XYL Kay are extremely proud of the trophy, which was one of ten presented by the Honourable Keith Wright MLA for services in the Central Queensland area.

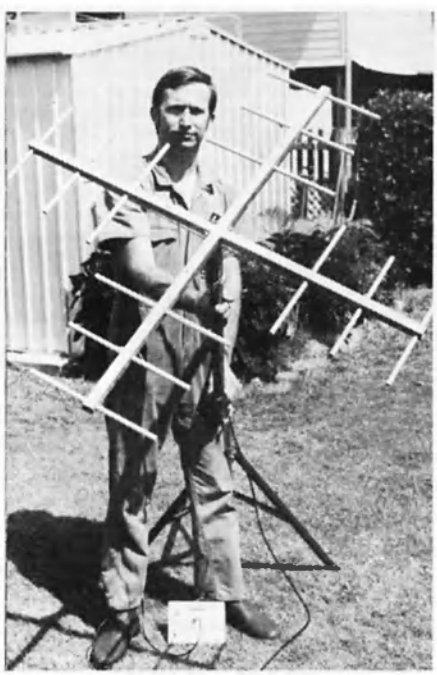
Clive VK4ACC and Frank VK4CAU with the "Ham's Ham"!

Close-up of the ladybirds on the 2 m repeater.

Last years festivities of the Branch culminated with a special dinner catered by Frank VK4CAU. Frank's 'piece de resistance' was a "Ham's Ham" completely emblazoned with the WIA logo.

The 70 cm beacon VK4RAR, sponsored by the Branch, is now operational from Rockhampton.

Recently VK4RAR's 2 metre site played host to a host of ladybirds. The ladybirds, during their annual migration to higher places, caused a few problems, but moved off again as quickly as they came.



Ted VK4ZEI maintaining the 70 cm beacon.

VK4WIR is operated each Monday night at 1030 UTC on 3.570 MHz +/– QRM. Amateurs wishing to attain the "Worked Rockhampton Award" are welcome to join in.

To attain the award amateurs need to contact fifteen member stations of the CQ Branch whilst overseas amateurs need five member stations.

Correspondence to the Branch should be sent to Box 496, Rockhampton, Qld. 4700.

Contributed by Nick Quigley VK4NFL.

AR

BRANCH NEWS FROM THE NORTH WEST COAST

The North West Branch of WIA, Tasmania, VK7NW held its monthly meeting on the 9th April 1985 at the Penguin High School with an attendance of 19. The meeting opened at 8 p.m.

The president is Tony VK7AX, and standing in as secretary for Tony VK7AH who was in Germany was Bruce VK7MB. Tony will be back for the next meeting. The minutes were read from the last meeting and accepted.

WICEN EXERCISE

At the last meeting the Branch were asked if they would provide communications for the National Horse Trials being held at Wynyard, which were held over the Easter long weekend. It was decided that this would be a good WICEN exercise and also a good publicity opportunity for the club. A number of volunteers would be needed and a show of hands resulted in 9 people being accepted. They all attended the horse trials on the Sunday of Easter which turned out to be a very eventful day, as not only did they provide communications for the day, they also became judges for the day, and some were provided with lunch. The people who gave up their time were John VK7ZPT (WICEN Co-ordinator) with VKs-7WJ, 7ZBT, 7WP, 7WL, 7ZNP, 7ZAP, 7AX and Peter Westerhof.

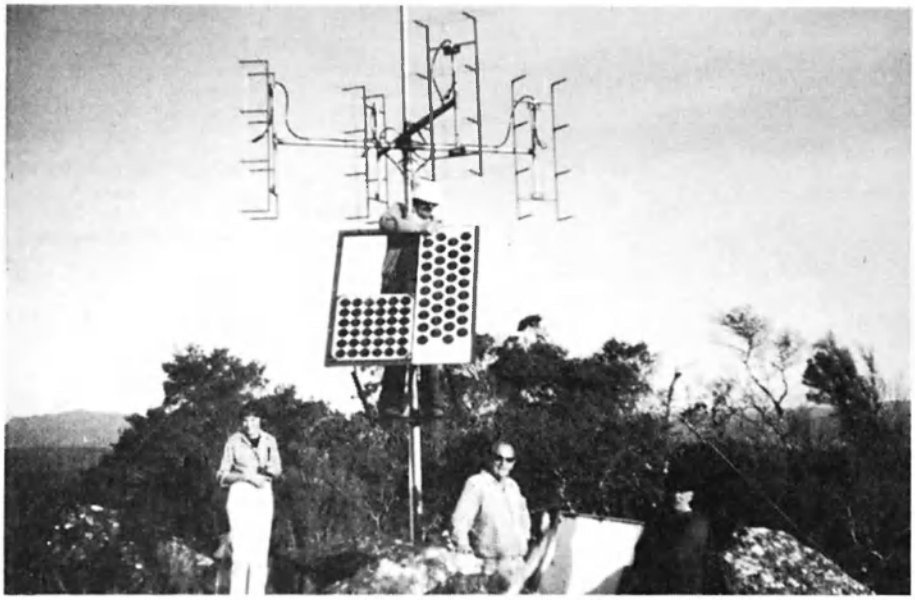
REPEATER 3 VK7NW

The repeater has been giving a little bit of trouble but Andrew VK7ZAP has it in hand, as he is in charge of the NW Branch repeater. For those who happen to visit our State the repeater is situated at Lonah out of Ulverstone, and the theory is if you can hear it you can work it. Andrew does a good job, as he keeps it running well.

ATV Repeater.

ATV REPEATER

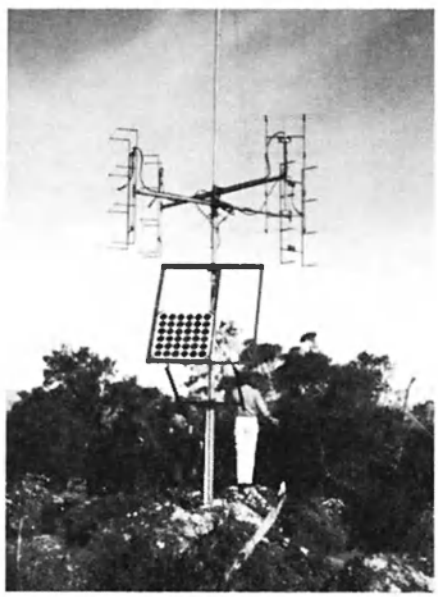
The ATV repeater is located on top of Mount Duncan which is part of the mountain range just behind Penguin, and a picture has been received as far as Devonport to the east, and there has been a report that it was received in Melbourne. The work was hard to get it



Tony VK7AX on the mast and, from left ... Geoff VK7WZ, Jack VK7WJ and Peter Westerof.

Working on the ATV input are VK7AX and VK7WZ.

The output ATV unit.



The input.

where it is, with many man hours carting the equipment to the top of the mountain, but it has been working well, and it seems to be putting out a good picture to most stations who can receive it.

RTTY

Broadcasts are being put out on every second Friday night and as long as the news comes in and interest is shown they will continue. Broadcasts are generally run on activity nights from the branch station VK7NW, so listen for them on the bottom end of 80 metres, and also on 2 metres. Other improvements are on the way and more will be heard on that later or when more information is at hand.

QSL

Not very much in the way of cards coming in at the branch but it is hoped that it will pick up later in the year.

ENTERTAINMENT

VK7ZNP showed a video of the Canberra area and the Communications Tower, also the tracking dishes that are around the capital, and the Mint. These were enjoyed by all. Meeting closed at 10.30 p.m. and coffee and biscuits followed.

Photographs and Article contributed by Max Hardstaff VK7KMF.

SLD ... –·. –·.	Sledite	Follow me (OSY?)
TOV (TOW) – ––– ·–	Tovarishch	Comrade

Academician Vladimir Aleksadrovich Kotel'nikov Vice President, Academy of Sciences of the USSR, Director of the Institute of Radiotechnology and Electronics of the Academy of Sciences of the USSR, Twice Hero of the Soviet Union in an interview replied (in part) to the following question.

Q *"What, in your opinion, is the place of radio amateur creativity in conditions of the new stage of rapid development of radiotechnology?"*

A One of the needs of man is the need to create. Amateur radio opens up broad possibilities in this connection for youth as well as for adults . . . Hundreds are participating in the SNERA (Sportivno-Nauchnyy Eksperiment RadioAvrora — sport — scientific experiment radioaurora) being conducted by a number of establishments of the Academy of Sciences of the USSR, the Ministry of Communication of the USSR, and by "Radio" magazine. Amateur radio has been and remains a wonderful school for mass training of personnel for radio electronics. Many young people entered radio electronics via amateur radio, judging by our experience . . . Of course the problems that occupy radio amateurs change from year to year. In the past, we made condensers, induction coils, tuning systems. Present-day radio amateurs deal with integrated circuits and space communication — for six years now Soviet Radio Amateur Satellites have been flying in space . . . But the main goal of amateur creativity has remained unchanged — to attract youth to active participation in the struggle for technical progress and to teach it inventiveness, innovation, and improvements in technology. This is very important for our country.

VK1 DIVISION

Ken Ray
PO Box 710, Woden, ACT 2606

COMING MEETINGS

Just a reminder that the VK1 Division holds its monthly meetings on the fourth Monday of each month, in Room 1 of the Griffin Centre, Civic, commencing at 8 p.m. Topics to be presented in the next few months are:

24 June — *Computers and Amateur Radio*
22 July — *Winter Sale and Social Night*
26 August — *Test Equipment and its Uses*

Doors open at around 7.45 p.m., with the QSL Bureau and bookstall available before and after the meeting. Visitors and non-members are most welcome, come along and renew old friendships or make new ones.

SIX METRES

With winter now on us, this is the time to stay inside the shack on these cold winter nights and work what DX there is. (Guess whose new house has an indoor shack!). However, the clear sunny Canberra weekends are the time to improve your 6 metre installation prior to the spring sporadic E season. Six metres, once the forgotten band in VK1, has seen a resurgence in the past two years. There are now quite a few VK1 stations capable of operating on this band, at least 15 or 20 stations. In fact, some of the higher rating stations would have well in excess of 10 countries confirmed on six; your humble scribe only has 4 VK1s confirmed. That in itself is an indication of the activity — it is not very long ago when there weren't that many six metre operators in VK1. With the VK1 six metre beacon expected to be operational soon, this will give a better indication to interstate six metre ops when the path is open to Canberra.

BROADCASTS

The 21st of April 1985 saw the 11th anniversary of the VK1 Divisional broadcasts. In that time, many amateurs have contributed to the success of these broadcasts, either by providing news items, or giving their time and stations to send the broadcast to air.

As a reminder, the Divisional broadcast goes to air each Sunday evening at 8 p.m. local Canberra time, on 3.57 MHz LSB and 146.950 MHz FM via the VK1RGI repeater, high on Mount Ginini. Often, relays are made on other bands, such as 10 metres, 70 cm and the UHF CB band. Normally the VK1 Award net operates on 3.57 MHz at the conclusion of the 80 metre callbacks. Join in if you have the time, its a good place to make some contacts for the 75th Anniversary award as well.

AR

VK2 MINI BULLETIN

Tim Mills VK2ZTM
VK2 MINI BULLETIN EDITOR
PO Box 1066, Parramatta, NSW 2150

The 1984/85 AGM and election was held on Saturday the 30th March. A report will be included in a later issue of the Minibulletin. The office bearers for this year are listed below.

Mike Burns VK2AUE: Parramatta Property Officer, Vice President
Roger Henley VK2ZIG: Member Services, JOTA Officer, Vice President
Peter Jeremy VK2PJ: President, New Membership
Tim Mills VK2ZTM: Repeater Committee Chairman, Mini-Bulletin Editor, Alternate Federal Councillor
Jeff Pages VK2BYY: Secretary, Broadcast Officer, Dural Property Officer
Paul Lorentzen VK2ATR: Affiliated Clubs, QSL Bureau Liaison
Max Smith VK2YKF: Assistant Treasurer, Publications Officer
David Thompson VK2BDT: Treasurer
Cec Bardwell VK2IR: Correspondence Course Supervisor
Bill Martin VK2COP: Intruder Watch Co-ordinator
Aub Topp VK2AXT: Librarian
Vince Roberts VK2PRB: Slow Morse Co-ordinator
Ken Hargreaves VK2AKH: Education Service
Jo Harris VK2KAA: Divisional Historian
Stephen Pall VK2PS: Federal Councillor
Wally Watkins VK2DEW: Alternate Federal Councillor
Fred Herron VK2BHE: Honorary Solicitor
Maureen Lavery: Administrative Secretary
David MacKay VK2ZMZ: WICEN Co-ordinator

DINNER DEFERRED

The VK2 75th Anniversary Dinner is being deferred until the warmer weather of Spring. Members who would like to take part in the operation of the next series of the special 75 call sign should write to the Divisional Council to register. The operation is being co-ordinated by Steve Pall VK2PS . . . wet weather reduced the attendance to the fireworks night at Dural on the 13th April. Those who made it saw a very good display . . . In previous notes the wrong date for the South West Zone Convention at Wagga has been quoted. The weekend chosen is 26/27th October. This gets away from a busy holiday time in Wagga. Look for the programme in a later AR . . . The range of QSL cards has been altered to include the 75th logo and are available from the Divisional office in 10 colour combinations . . . Divisional Council notes that while some offenders on two metre repeaters have been located and charged there are still a few to be located. They are concerned however that some amateurs' behaviour leaves a lot to be desired. Perhaps they could take time off to reread the Operators Handbook. They cannot expect the authorities to act if they are not doing the right thing . . .

NEW CALLBOOK

A final reminder for Clubs, Groups and amateurs to check and adjust any entries for the next edition . . . The September issue of AR will feature another Special for VK2. If you have any material for inclusion would you see that it reaches the Divisional office by the end of this month.

EDUCATION WANTED

Brenda VK3KT, Federal Education Co-ordinator, is attempting to correlate a list of all classes teaching amateur radio throughout the length and breadth of Australia. At present she has a list of forty, but surely there must be more.

This list is needed so that when she gets enquiries she may direct the would be amateur to the nearest class or instructor as learning with an instructor is quite often much easier than trying to swat alone.

Brenda also runs an education net on 80 metres each Thursday night, with minimum success. This net is conducted for many reasons but it is particularly a forum for educators to exchange ideas re teaching methods, syllabus interpretation, examination procedures and discuss problems etc. (One instructor may have run into a particular problem which, by discussing it with other instructors, it may not be a problem.)

Do instructors feel a net is worthwhile? Has anyone any ideas at all about educating the would be amateurs? If so please let Brenda know. She is awaiting your letters and calls.

Contact Brenda on the Education Net 3.610-3.625 MHz at 1030 UTC or 3.685 MHz at 1130 UTC or write to Brenda Edmonds via the Federal Office or to 56 Baden Powell Drive, Frankston, Vic 3199.

AR

VK3 WIA NOTES

Jim Linton, VK3PC
DIVISIONAL PRESIDENT
VK3 DIVISION

NEW MEMBERS

The Victorian Division of the WIA wishes to welcome the following new members.

Christopher Bennett, Robert Bradford, Eric Davies VK3PJP, Stephen Dempsey VK3VMD, Tadeusz Dobrostawski VK3NCK, Gordon Ferguson VK3PZF, Robert Gawne VK3NGR, Geelong Technical School Radio Club VK3YTG, David Harrison VK3NDH, Gavin Hatfield, A. Jones.

Hector MacLean VK3ZLM, J. McDonald VK3PJD, Peter McDonald VK3PTE, Chris Milionis, Neville Pietsch VK3PNP, Stanley Pill, John Piovesan VK3KZC, Mark Richardson VK3PMD.

Jeffery Searl VK3KRF, Angus Jones, Bruce Keilar VK3KWK and C Purvis VK3DEN.

VIC DIV COUNCIL

There were eight nominations for the 1985-86 Council, two short of the maximum number.

While this situation meant a costly postal ballot of members was not required, it again leaves Council short of people to carry out the administration of your Division.

Those who nominated were (in alphabetical order) John Adcock VK3ACA, Andy Chan VK3DPJ, Des Clarke VK3DES, Alan Heath VK3KZ, Jim Linton VK3PC, Lindsay Rohrlach VK3KAF, Bill Wilson VK3DXE and Barry Wilton VK3XU.

They were all members of the 1984-85 Council with the exception of John Adcock, a former councillor.

Portfolios will be decided at the first council meeting later this month.

CFM QSO/RPT WITH

VICTORIA 150

The Victoria 150 Award has been highly successful with claims being received from throughout Australia and overseas.

As previously mentioned in AR magazine, the award period has been extended to 31 December.

Another major part of our hobby's involvement in celebrations of the 150th anniversary of European settlement was use of a commemorative callsign VI3WI, and the general use of the VI prefix.

All QSLs received acknowledging contact with VI3WI have now been answered; if you had a QSO with VI3WI please don't forget to QSL.

The callsign was activated by individual WIA members, and WIA member/clubs on a roster basis throughout Victoria in a combined effort resulting in good public relations for amateur radio.

MELBOURNE 150

While Victoria's 150th anniversary started last November, the capital city of Melbourne will have its own 150th bithday later this month.

The WIA has the support of an amateur radio group in Melbourne, Florida, USA, to assist in a special public relations exercise.

The Platinum Coast Amateur Radio Society (PCARS) has contacted their Mayor of Melbourne, Harry Goode, who will be sending, via amateur radio, a goodwill message to the Lord Mayor of Melbourne, Eddie Beachman.

In reply to a letter from WIA public relations officer Jim Linton VK3PC, the PCARS publicity chairman, Robert Wilson KI4LP, said: "At the last meeting of PCARS the membership whole-heartedly endorsed a plan to pursue this public relations exercise. Thank you for the opportunity to participate in this celebration and bolster the good name of amateur radio."

LIBRARY

The reference library available to members through the Wireless Institute Centre is in need of owners and workshop manuals for most types of amateur radio transmitters, receivers, and transceivers.

The plan is to collect the material so it will be available for photocopying by WIA members in years to come.

If you can assist in donating, or loaning for photocopying, manuals for amateur radio equipment, contact Des Clarke VK3DES, who is handling this library project.

Many members are using the reference library, by either dropping into the Wireless Institute Centre, or requesting photocopies of articles via the post.

AR

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

In case you received your "AR" before Saturday 1st June let me remind you that the J150 Launch Celebrations will be going on in Rundle Mall from Sunday 26th May to the 1st of June; so if you still want to help it may not be too late. The dates were put back by a week, in the end, so that they did not clash with the GPO Display Station.

At the time of going to press I am still trying to catch up with the back-log of work (mine and the WIA's!) caused one way and another by the Clubs' Convention in April. Still, I think most of those who attended will agree that it was a most worthwhile exercise. One of the highlights of the weekend was the attendance of our worthy Editor, Bill Rice VK3ABP. Bill was the guest speaker after Dinner on the Saturday evening and the main part of his topic was the processes that an article for AR goes through before you see it in print. Although this was Bill's official function, unofficially he was able to take part in many items of discussion giving us background information from his positions as a member of Federal Executive and his past involvement with FTAC. Also, I believe much was gained by Divisional Council members, and Club Representatives alike being able to discuss things with Bill on an informal basis away from the conference table.

On the Saturday afternoon, Ian Hunt VK5QX, the Federal Contest Manager, spoke on several aspects of Contests and the Contest Manager's job, and answered a number of questions; and after the afternoon tea break, Graham Horlin-Smith VK5AQZ spoke on our involvement to date and in the future with Jubilee 150.

We were disappointed that there were no VK8 representatives present this year. Clubs represented, were: SA ATV Group, Lower Eyre Peninsula ARC, South East Radio Group, South Coast ARC, Elizabeth ARC, Port Adelaide ARC, Whyalla ARC, and the 2nd Adelaide Scout Group.

The consensus of opinion was that this year's Convention was an improvement on last years. Unfortunately, I can't take the credit for that, I can only say thank you to David VK5AMK who "ironed out" all the "bugs" last year and made my job a lot easier this year. This year, for the most part, we all knew what to do and what to expect. Subject to the date of the Federal Convention, our Club's Convention has tentatively been booked at Parnanga for the same weekend (11th-13th April) next year, 1986.

DIARY DATES

DON'T FORGET . . . The S E R G Convention 8th-10th June.

General Meeting . . . Tues 25th (possibly a Forum on Computers)

QSP

VI PREFIX

Australian radio amateurs can use the alternative prefix VI from 1 June to 31 December 1985.

Approval was given by the Department of Communications following a request from the WIA for use of an alternative prefix during the Institute's 75th Anniversary.

It had been WIA policy to seek a special prefix other than AX for the birthday year.

This is the first time all VK radio amateurs will be able to sign VI — although the prefix was available for a limited period during the Victoria 150 celebrations.

HISTORY REVISITED

For newcomers interested in the early days of WIRELESS in Australia "The Best of Australia's Wireless Weekly" will give a fascinating and nostalgic trip back into the past.

This is a magazine size booklet of 130 plus pages containing reprints of pages from Wireless Weekly in 1927. It is interesting to see the ultimate in broadcast receivers and note their prices — comparing the change-over to decimal currency and the devaluation all these years hence, equipment is not too expensive today.

Wireless Weekly was one of the first radio magazines in the world and in 1939 changed to a monthly publication with a name change to Radio and Hobbies. Just prior to televisions inception in Australia it became Radio, TV and Hobbies, then in 1965 the name was changed again to Electronics Australia, a name which it still carries today.

A forward is written by Neville Williams who began working at Wireless Weekly in the early 1940s and retired as Editor-in-Chief of EA in 1983.

AR

WA BULLETIN

Fred Parsonage VK6PF
HONORARY SECRETARY
VK6 DIVISION
Box 10, WEST PERTH, WA, 6005

EARLY APRIL.

In spite of many requests made over the Broadcast and at meetings, there has only been one nomination for the Divisional Council for 1985 outside of the incumbent members. This is Cyril VK6MY.

This means that including the present council there are ten nominations for the nine positions. The present Secretary VK6PF has agreed to stand down to prevent an expensive and unnecessary ballot. Therefore, your Divisional Council for 1985 will be:-

Dave VK6IW	*Membership Secretary.*
Cliff VK6LZ	*Treasurer.*
Cyril VK6MY	*Halleys Comet Sub-Committee.*
Neil VK6NE	*Federal Councillor*
Bruce VK6OO	*President and Alternate Federal Councillor.*
Jill VK6YL	*WA Repeater Group.*
Alyn VK6ZGA	*Vice President and VHF Group.*
Christine VK6ZLZ	*Booksales Officer.*
Douglas VK6ZMG	*Vice President and Broadcast Officer.*

All positions to be ratified at the AGM and first meeting of the new Council.

Postal Addresses for 1985 will remain as follows:-
WA Division, PO Box 10, West Perth 6005.
Booksales, PO Box 425, Cannington 6107.
Broadcast, PO Box 899, Fremantle 6160.
QSL Bureau, PO Box F319, GPO, Perth 6001.

The Secretary for 1985 will be appointed at the first Council meeting and may be appointed outside of the Council as per the constitution.

RADIO RALLY 1985

Due to many requests it has been decided to run another Radio Rally in 1985. The dates will be the 16th and 17th of November at the same location as last year, Advent Park.

Commercial houses have already been approached and have promised support as have various groups within and outside of the Institute. After the first and second Radio Rallies, wash-ups were made, both through the broadcast and at meetings, and the many points from "More for the Ladies" to "Signposts to the toilets" were received. All agreed that the first Rally was good and the second one even better so it now is on us to make this year's Rally better still.

We have no paid employees and everything that is done, is done by volunteers and those volunteers must be you and I. To date, apart from the groups taking part, there has been a shortage of support in spite of frequent requests over the News Broadcast. We don't need you to work every week until the Rally although a few willing helpers would be appreciated, but we do need people who will willingly give just a couple of hours of their time on the Saturday to help set the show up and on the Sunday to help dismantle it. In 1984 there were many willing hands but still no one could be found to do an hour on the entrance, so who did it? Chris Milne the organiser. Who put away the chairs? Chris Milne. In fact the Goldfields Amateur Radio Group have volunteered to man the gate on the 1985 Rally but really, is this necessary? Surely we don't expect a country group to travel 600 km, have their own display and man the gate as well. How about a few of us who enjoy the Rally and enjoy amateur radio putting our names forward to be counted.

The Radio Rally is laid on for two main purposes, one to provide a social function and two, to have a meeting place where city and country amateurs can meet. The site at Advent Park has been chosen as a location adjacent to the city where low cost overnight accommodation is available to city and country members. Support for this overnight facility has increased since the first Rally and the GARG and the PARG have made use of it. The Division is keen on seeing as many country groups as possible come to the Rally in strength and perhaps to participate with their own display as does the Goldfields and Peel Groups. Perhaps now is the time to start some forward planning and advise the Division on what you would like to do and what you would like provided.

This is a story about four people, namely Everybody, Somebody, Anybody and Nobody.

There was an important job to be done and Everybody was asked to do it. Everybody was sure that Somebody would do it, Anybody could have done it, but Nobody did it.

Somebody got angry about that, because it was Everybody's job. Everybody thought Anybody could do it, but Nobody realised that Everybody wouldn't do it. It ended up that Everybody blamed Somebody when actually Nobody asked Anybody.
Sound familiar?

AR

Bill and the TVI . . .

Ted Holmes VK3DEH
20 Edmunds Street, Parkdale, Vic. 3195

Bill was feeling quite happy. He hummed tunelessly to himself as he worked quietly away in the jungle known as his garden. He had managed to pull down the remnants of his ancient dipole and the tattered shreds of wire which were still attached to it and had now erected a brand new one. Almost new, at any rate. He had fortunately been able to purloin some tubular scaffolding poles from a nearby building site, where they had been lying, apparently abandoned, on the ground. Bill had naturally assumed that they were not required and decided that his needs were greater than the owner's.

Apart from a couple of incidents while he was taking them home, involving a car *mirror and a green* plastic dustbin, he had managed to get two lengths home without undue difficulty. Now here they were, rising into the sky, supporting a brand new multi-band dipole.

He had thought of putting a balun in position but had decided against it, after inspecting a balun which he had stored away under his bench. This was not looking the best, and had not, ever since he had trodden on it some years before. In any case, he decided, a balun wasn't really necessary for inverted vees. After tying the ends to convenient tree limbs, he felt satisfied with the result and thought he would go indoors and try the thing out.

Since the unfortunate business with the FT 101E he had been able to get a couple of tubes to replace the ones he had inadvertantly burnt out. Also, after some argument, he had come to a reasonable arrangement with the person who sold it to him. The man hadn't taken too kindly to the idea of reducing the price because of the problem with the valves. On balance, Bill felt that perhaps the chap had been a little unreasonable, since, after all, the rig hadn't actually belonged to Bill at the time the finals became blown.

As he desperately wanted a rig of some kind, Bill decided not to press the matter, although he did not entirely give up his opinion as to the justice of his cause.

He had brought his old ex-Army tuning unit back into service — after cleaning it up a bit — and had connected everything up, using patchcords salvaged from an overflowing junk box. Now for the acid test!

Since it was early evening, he thought he would have a go on 80 metres. Tuning around the band, he found it to be fairly busy but he found a space just on the edge of two QSO's and started to tune. Surprisingly enough, the SWR (with the aid of the tuner) wasn't too bad — only about 3 to 1. Bill felt this to be highly satisfactory and he started to call CQ.

When Bill called CQ he usually went on for quite some time, as there was always the possibility that someone would not hear him. However, it was apparent that someone had heard him, because there was a loud and peremptory ring on his front door bell. Cursing mildly, Bill went to answer it. It was his immediate neighbour and he did not seem pleased.

"*You are mucking up my TV*", said the neighbour.

"*Who, me?*" replied Bill.

"*Yes*", said the neighbour. "*Dirty great bars across the screen and a strange noise like a duck talking. It's got to be you.*"

At this point Bill made his greatest mistake.

"*OK*", he said. "*I'll come in and fix it straight away*".

SOME ADDITIONAL AUSTRALIAN CAPITAL TERRITORY TRIVIA

I would like to add a few words to the various stories written in last April's issue of Amateur Radio on VK1 activities and AJ Ryan.

I joined the Canberra Post Office, as a messenger in May 1927, the first official messenger appointed, and learned Morse code in the Canberra Telegraph Room, where a keen Sydney telegraphist put in a lot of hard work and energy to steer me up to TIT standard (Telegraphist in Training). After passing through various stages — messenger, telephone exchange, postman and postal assistant — I moved to the Taxation Office in 1935.

I obtained the Ticket of Proficiency — No 1425 — on 18th February 1935, with the Postmaster, Bill Piper, acting as Supervisor. I was allocated the call sign VK2ID.

As a boy, I lived in Westlake, a Canberra settlement consisting of over 100 Hudson built houses, which are now demolished, but were located near where the American Embassy Buildings now stand.

My outfit consisted of 182.9 metres (200 yards) of wire feeding a galena crystal and a miniature Brown Horn speaker. I later up-graded to a three 409/415/410 valve type receiver plus associated batteries. These I obtained from Stan Gee, a shop around the corner from AJ Ryan's shop in Kingston.

It was while using this set that I learned a lesson the hard way. Whilst probing around in the set trying to eliminate whistles, I was successful, but it was necessary for me to pick up a new set of valves from Gee's shop costing five shillings per pay over a period. A costly experiment!!!

My family later moved to a semi-double storied house in Manuka located exactly opposite Woolworths. My amateur equipment then consisted of a TPTG 210 carbon plate valve, AC power, a four valve TRF receiver and monitor . . . all home-brew. This fed into a 15.2 metre (50 feet) high Windom antenna, one end being attached to a mast tied to the chimney top on the roof.

I later picked up a 40 metre crystal. The 210 was obtained from a shop in George Street, Sydney.

I experimented with AM using a hand-made mike. The first trial with the mike was made with a clock left in front of it while I dashed across the road to my friends place and checked it out on an AWA all-bander. Yes, it was their alright . . . . . all over the place.

AJ and Gee's shops were regular sources for bits and pieces.

About this time I wrote to the Post Office suggesting that the VK1 prefix be allotted to the ACT.

There was another amateur living in Forrest, who was mainly active on 20 metres.

Upon leaving the Taxation Office for the Commerce Department I spent seven months in a school in Sydney, training for Aeradio. After passing my First Class Certificate of Proficiency I spent some short stints at Rose Bay, Liverpool and Mascot before transferring to Canberra Aeradio.

After only a few weeks of duty at the station, I was in contact with an incoming Military Aircraft one morning when there was a jumble of sound and then silence. (In those days operators used a key). The OIC, who had been up in the DME tower came in, said "He is burning", calmly prepared a message and then sent it to Head Office.

Later the Interior Groundsman gave me a detailed description of the crash. He had only a few pounds of foam on a trailer drawn by a Chev utility for fire fighting which was useless with the heat and fueling of this fire. The description was pretty grim.

About the early 40s, when I was absorbing large amounts of noise from the 325/333 kHz receivers, (there was no carrier operated anit-noise equipment in those days), there was a loud bang. I meandered over to the hanger doors but there didn't appear to be anything amiss. As it happened, A J Ryan had mis-judged a cross wind and landed his light aircraft on the hanger. Fortunately, no-one was injured.

I never heard AJ on air as an amateur, he may have been too busy with his business and 2CA.

Leo Deluil, my OIC at Canberra, and an old experienced Marine Operator, made one good point. He said that the First Class Ticket was only a licence to learn. Probably the same can be said for the amateur ticket???

Yours faithfully,

Jim Brinkman VK2IS,
61 Gundagai Street,
Coffs Harbour, NSW. 2450.

AR

HIGHER POWER AND ACCESS

I am aroused to put pen to paper after reading the letter from RA Davey VK6NND in which he demands the novices of Australia pressure the WIA to accede to the higher power and access to 2m request made by a number of novice and some full call operators. (AR April 1985).

There are a number of points to which I draw Mr Davey's attention:

— High power is not a prerequisite for world-wide communications. Highly efficient, high gain home-brew antennas can be as effective. 30W PEP into a 9dB gain antenna will give an ERP of 240W which is better than a full call running 100W into a dipole or vertical.

— High power causes more problems than not. Next time Mr Davey listens to full calls on 20m on what, to us seems a perfectly clear band, he may be staggered to hear a VK told he is unreadable because of the ORM level within the USA. There are many US amateurs who are advocating a down rating of US power outputs to those generally observed by other countries world-wide. Most Americans will admit that higher power simply means more ORM!!!

I run 400W PEP into a 9 element quad-Yagi array and have actually received 4 x 9 plus reports from the States because of ORM. The solution was to work split frequency to transmit below the US phone band.

At no stage was the US signal unreadable at this end.

Could Mr Davey imagine the ISM band if all Japan was allowed full power? On reflecting, *I am sure he will* comprehend my point.

Be patient Mr Davey, we are at the bottom of the sun spot cycle. Believe me, in a few years you won't need kilowatts to work the world.

The logical solution to this problem apparently faced by so many novices is simple. Remember we have an incentive licencing system which several other countries have copied.

If you want more privileges, study more, sit for the higher exams and keep sitting until you pass.

The attitude displayed seems typical of the 80s . . . everything has to be handed on a silver platter! Don't think this is sour grapes from a grouchy old full call — it isn't. I started as a novice. I hated CW and still do but was prepared to work for the goal of the full call and gained it along with all the privileges.

In 1980 I received the first DXCC issued to a VK with a mobile endorsement — achieved as a novice. The first 42 countries were worked at 10W PEP from a converted CB set and modified Helical whips on 28MHz. The remainder came at 30W on both 10 and 15 metres. This was achieved in 6 months then, with the full call received in late 1980 . . . world first WAZ mobile was achieved to be followed by single band number one on 28MHz and 21MHz and number 2 on 14MHz.

Mr Davey will probably not believe this but I am still the only amateur entitled to print SSB WAZ Mobile on their QSL cards, and all this with a TS-130S at 100W into mobile whips that conformed with NSW traffic regulations, regarding height.

Try taking on the really big DX pile-ups with that set-up and you soon find how hard things can be.

Yet rag-chewing was easy and great fun with generally good signals on a regular basis into the States whilst operating mobile.

The solution to Mr Davey's problem is not one of lifting power but sticking with it and attempting to have the Americans drop theirs.

And don't forget that not very many countries have a novice grade licence.

Just because the US does something is that good enough reason for us to copy them?

Since when does higher power in DX contests encourages more people to enter amateur radio?

Why does everyone seem to want 2m? In a hilly city like Newcastle, except for repeater operation, 28MHz is a vastly superior band.

Work for the goal Mr Davey, do that little extra study and gain the full call and you will have nothing more to gripe about, or can we expect demands for 1kW on the Australian amateur bands?

Yours faithfully,

Philip Greentree VK2IW,
7 Heather Cresent,
Garden Suburb, NSW. 2288.

AR

TEN FM USERS NET

With the decline in sunspot activity the ten metre band of late lacks not only DX signals but any signals at all, which is a pity as it is an excellent noise free band for local contacts. In order to encourage activity on ten metres, and also for something different, I am proposing the running of a ten metre FM users net.

This net will be open to anyone interested in using frequency modulation on ten metres. It will be held on 29.6 MHz, the FM calling frequency, every Thursday evening starting at 1000 UTC. I will use horizontal polarisation and use 145.6 MHz FM for liaison. The net will provide signals for those testing equipment, discuss band conditions, and help keep the band active. I ask Melbourne stations for their support in getting this net going. Hope to hear you on the net.

Yours faithfully,

Ian Sinclair VK3DSI
58 Chute Street,
Mordialloc, Vic. 3195

COMMENTS FROM A NEWCOMER

As a relative newcomer to amateur radio and an aspiring 'Brass Pounder', I would venture a few comments on Pounding Brass, and a Letter to the Editor by B R Schoiz, both in the April magazine.

Having, on more than one occasion, had my humble 10WPM CO answered at a good 20WPM, I can heartily endorse the general principles and sentiments expressed in the first article.

However, whilst the need for word abbreviation and economy in CW is appreciated, it can be rather frustrating for a novice to have to decipher strings of (sometimes home-brewed) abbreviations, all before the next "K".

Similarly, repetition may be boring for an experienced operator, but it can be very reassuring for a new chum, particularly when dealing with strange, foreign names and QTHs, even in a 5 9 9 situation.

I was somewhat saddened to read of B R Scholz's experiences, as my own entry into amateur radio was so different.

After a lifetime in other pursuits, I too (and also encouraged by my wife) studied for and got my 'call' (November 1984). I did it because of my interest in radio, and I did not expect my AOCP to be a key into a fraternity, nor did I expect anyone to go out of their way to help or welcome me. (I did not study through the WIA).

I was therefore pleasantly surprised when it was, and they did anyway.

Nor is my experience confined to one band or location. I started at the DC end, ie HF, and having run the gammit of mistakes and faux pas there, moved higher into the AC part of the spectrum, ie 2 metres, only to find the same help and welcome, despite my tumblings with the repeater(s).

Could it be that Mr Scholz's expectations were a bit too inflexible and disappointment was allowed to come too quickly? And of course, one could, as an absolute last ditch effort for acceptance, actually consider attending the odd meeting of the local amateur radio club or even the WIA!!

Maybe I have been lucky, but all I can say is thanks fellow amateurs. I only hope I can reciprocate adequately in kind when it is my turn to welcome the new chum.

My only regret is that there aren't more available hours in the day for more QSOs.

FB all round.

South Brisbane, Qld. 4101

AR

PLEASE QSL!

I observe some concern expressed by thinking amateurs about the need to QSL, with valid cards, all operations using special call sign prefixes such as AX and VI.

Indeed, at the 1984 Federal Convention, Divisional Federal Councillors agreed on a motion recommending QSLing, with appropriately printed cards, all operations using AX prefixes.

It has just come to me that a solution to this problem exists within the Divisions, namely, a service to members in the form of partially printed QSL cards available free or at a concessional (subsidised?) cost or even at a recovery of printing costs. The cards would need to be pre-printed AX1, VI3 etc with space for the individual amateur to add by means of a rubber stamp his individual suffix. Home addresses could be added by means of self adhesive pre-printed labels.

Divisions should think seriously of providing this service as it would become a tangible indication of local action; besides most divisions have considerable accumulated funds and can well afford to subsidise a print run for members.

Yours faithfully,

R G Henderson VK1RH

Melba, ACT, 2615

AR

CONTESTS AND THE TWENTY FOUR HOUR TIME SYSTEM

In the contests column of AR for February 1985, there are some glaring errors in the starting and finishing times for several of the contests listed.

In the 24 hour clock system of recording time in general, radio communications, signals message systems, marine and aeronautical navigation systems there is no such thing as 0000 hours or 2400 hours.

A moments careful thought will show why. The first minute of a new day is always written as 0001 hours because a change of date is involved, similarly the last minute of that date is always written as 2359 hours because the date is about to change again.

For example . . . 2359 hours 1st March — 0001 hours 2nd March.

There must be this clear distinction to avoid confusion in the dale.

Reasoning thus the 1985 CLARA AC/DC Mystery Contest is really a mystery because according to the times shown it could be a non-event taking place in no-time.

73,

Ted Gabriel VK4YG,
PO Box 245,
Ravenshoe, Qld. 4872

AR

NO METRICS

Amateurs are fairly sensible and practical people on the whole, and among the fraternity, bureaucratic stupidity is rare. When it happens in the pages of "AR", I tend to blow my top — as when I read on Page 48 of the March issue that "these large rail car tanks are highly dangerous at over 304.8 metres". (Presumably 304.7 metres is a safe distance?)

Since metric measurement is meaningless to me, as to most practical people, I reached for my calculator and translated it to feet. The readout was "1,000 feet", and the information immediately made sense. The original estimate of the danger area was obviously a reasonable approximation.

Who was the pedant who translated the original distance to decimetres? Why was it converted at all? Feet are legal Commonwealth units and are internationally used. The Metric Conversion Act does not impose mandatory obligations on anyone to convert to metric, nor to abandon customary measures (feet and inches).

None of us were asked if we wanted metric and most of us don't want it. Now that Canada has abandoned metric conversion, Australia is the only major English-speaking country with a metrication programme. Such items as the one referred to above only emphasise the impracticability of metric units.

Marconi measured his wavelengths in feet, but in the early years we adopted the European practice of measuring electrical wavelengths in metres. Enough is enough! Most amateurs measure their physical dimensions in feet and inches — I certainly do, and have no intention of changing. It is time someone pointed out that the Emperor is nude. So please, Mr Editor, speak to me in English.

Yours faithfully

P D Thomas VK5ZPT,
Thomas Hill Road,
McLaren Flat, SA, 5171

In many technical areas metric measurements are easier to handle. 1000 feet should have been converted to 300 metres. I apologise for 304.8. Both you and I feel happier with feet, but our children prefer metric and our grandchildren will know nothing else. Ed.

AR

LET'S NOT BE APATHETIC

The whole concept of amateur radio has always been one of freedom of choice to do "one's own thing" within the confines of our licence conditions.

In recent years our hobby has not only been largely taken over by the black box industry, but it seems big business is now using its muscle power too, by devious methods, take over our magazines and tell us what they consider is best for us . . . like what makes the fastest buck for them!

A recent example of big business flashing its new found power was in the 1296 MHz band plan issue. Pressure was applied by a leading amateur equipment manufacturer to make our band plan fit their current production-line equipment. Of course, there are many far more subtle examples of the "big business syndrome".

Unlike Europe and America, Australia has only two magazines devoted entirely to amateur radio. To lose either magazine would be extremely detrimental to our hobby; it would leave us even more open to commercial pressure.

No matter what our individual opinions may be about either magazine, both are devoted entirely to amateur radio. It is most important, not only from the commercial pressure view, but for the freedom of speech that both magazines continue to thrive. I am sure all Australians would agree that a one-party government is bad news for any country.

Both "Amateur Radio" and "Amateur Radio Action" provide a great service to members of the Amateur Radio Service with communications in the written form. The WIA (AR) claims around 43% membership; therefore, in rough figures we have around 50% per magazine. Notwithstanding the detailed mathematics, there are sufficient licensed amateurs, SWLs and other interested persons in Australia to support two magazines. So, let us try to ensure these magazines and their organisations are working for us, the amateurs, and not big business laughing all the way to the bank.

"The pen is often mightier than the mic!" Let us not be so apathetic that we lose the right to use both in the way we want to.

Yours Sincerely,

Tony Tregale VK3QQ,
38 Wattle Drive,
Watsonia, Vic. 3087

AR

HAPPY WIA MEMBER

I recently received a packet of "goodies" from the Institute in respect of the Seventy Fifth Anniversary Subscription Renewal Scheme.

In a covering letter received it was hoped I would receive "some pleasure" from the WIA Book and other items. This is quite an understatement, I received a great deal of pleasure. Firstly as being a recipient of the package and secondly from the excellent nature and quality of the items.

The WIA Book is excellent. Congratulations to those who put it together. The pennant, woven badge, decals and the thought behind the whole scheme are all first class.

Again my thanks.

Regards,

C H Judd VK5HQ,
531 Goodwood Road,
Colonel Light Gardens, SA, 5041.

AR

G FOR GEORGE

The following is a letter to the President of the WIA, Victorian Division.

The Association of 460 (RAAF) Squadron have to express their appreciation of the support given by you and your colleagues in the quest for items required to restore the wireless equipment for installation in the Lancaster, "G" George.

The T1154 transmitter and R 1155 receiver performed admirably at the presentation to the Canberra War Memorial. This was in great part due to the work of those who searched for, and those who generously donated, the equipment required for assembly. The thanks of this Association is extended to all who contributed to this work.

On behalf of the President and members of the Victorian Division, 460 Squadron.

Yours sincerely,

B A Niven,
Hon Secretary,
460 Squadron (RAAF) Association,
Victorian Branch,
9 Selbourne Road,
Toorak, Vic. 3142.

AR

CONGRATULATIONS

The excitement of attaining 75 years in the WIA will be a period of reflections and the looking forward to an exciting future.

The WIA has contributed a tremendous amount to amateur radio, since its inaugural meeting in March 1910, and no doubt are well prepared for the future.

As one gets a little older, we tend to look back at the early exciting days of our introduction to this exciting hobby of amateur radio. At the time, it does not appear too significant, but as the years pass by, those who have served in the national organisation, and at local club level can proudly look at the achievements over the 75 years. The recording of events in 'Amateur Radio' and branch newsletters, maintain a comprehensive history of progress made by amateurs in Australia.

May I, on behalf of the New Zealand Association of Radio Transmitters (Inc), its Council, and members, extend to the Wireless Institute of Australia, its warmest congratulations on 75 years of service to amateur radio. I sincerely hope that the Institute will continue to lead the cause of amateur radio in the decades ahead.

Yours faithfully,

D J Mackay ZL3RW,
PRESIDENT NZART,
22 Waipara Street,
Christchurch 2, NZ.

AR

ANOTHER 75TH

I would like to offer my congratulations for the great achievement in reaching the 75th year of the WIA.

As it is coincidental that I will (I hope) reach my 75th birthday in June, I thought it might be interesting to discover, through Amateur Radio, how many WIA members will celebrate their 75th year this year.

73 and good wishes.

Edgar Nicholls VK7RY,
8 Garden Lane,
Midway Point, Tas. 7171.

AR

THANKS

I would like to take this opportunity to thank the Committee for the very lovely clock, book and logos.

I must say, I was overwhelmed at being one of the lucky ones to be picked out of the draw, for these lovely items.

It is the first time I have ever won anything in a draw and this might be a good omen, to try for my NAOCP at the next exam.

Thanks once again, cheers and 73.

Fred Page L60354.

I wish to thank you for the Birthday Gift package and the beautiful Quartz clock. I am not usually a lucky person and I certainly consider myself very fortunate to have received these gifts.

I think the selection process gave all members a chance and the gifts very suitable for the occasion. I have already put the stickers to good use.

I have been working for the 75th Award and encouraging others to do like-wise.

Very best wishes to all and thank you for your efforts. 88.

Poppy Bradshaw VK6YF.

Many thanks for the book and gifts as a result of the 75th Anniversary of the WIA.

The book has been able to answer quite a number of important questions for me. I am very pleased with it.

Sincerely,

G Eves VK4FGE.

SURPLUS

I am writing on behalf of the Karratha Chapter of the North West Amateur Radio Society. We have recently obtained a large quantity of surplus radio equipment from one of the local mining companies and we wish to make it available to amateurs throughout Australia.

The equipment consists mainly of STC 151 VHF 'Hi Band' mobiles most of which are the remote type and have no control heads. The condition of the units externally varies from reasonable to poor, however internally all of the units that have been opened are in good condition with their full compliment of boards. These radios would suit conversion to the two metre band (a number have already been successfully converted), or as parts for the junk box; the units all contain a 25 watt PA. We also have a very limited quantity of Philips 828s and General Electric MVP VHF Hi Band sets, these we believe would make excellent units for conversion to repeater sets.

We are asking that interested clubs can get in touch with us. Because of distance and the resultant high freight charges it is not practical to sell the radios as individual units (except perhaps the repeater ones), so we would envisage clubs getting together to take a bulk amount, say at least ten, and sell them to their members.

If clubs are interested in this equipment they can write to the Society address. We can then give full details of what is actually available and the costs involved. In the case of the 151s the unit cost will be very small — freight will probably constitute the major cost!

ANOTHER WORD ON THE T PLUG

Following the recent publication of a letter in March AR and WICEN notes in April AR, I would like to enlarge on my previous comments, published as part of the Federal WICEN notes, AR, Jan 1985, regarding varying conventions for polarity of Extra-Low-Voltage plugs (Clipsal 495) and sockets with a 'T' pattern of the pins.

To begin, I do not have **ANY** of these fittings in use myself. I therefore have little egotism vested in the arguments I offer, although most amateurs I have tried on this point have been of like mind:

1) *The argument that, when the plug or socket is held or mounted such that the two pins form a 'T', the horizontal pin naturally looks like a '-' sign is, I suggest, banal. While the trade and serial marks on the fittings do suggest this mounting orientation, having the pins side-by-side is just as easy, and would imply the convention as I described it!*

2) *Telecom commonly uses these fittings, but usually on 50V, positive earth systems so, even if someone should inform me which convention they use, I shall suggest it has no bearing on 12V, negative ground usage.*

3) *The import of my previous letter was that, as an easily remembered convention, the 'T' vertical be the* ***EARTH*** *as this is so obviously suggested by the correspondence to the Australian standard 240V mains plug and socket. There are good engineering reasons that this be so,* ***vide infra.*** *It is purely consequential to this that this pin be the negative, as the usual source of 12V supply is of course, a car or van, and positive chassis vehicles (12V) are very much hens' teeth.*

4) *In common with mains fittings, the design of the plug is such that the 'horizontal' pin is significantly farther from the skirt of the plug, affording this pin a greater safety margin against either contact with a finger (not particularly dangerous at 12V, but important for 240V) or a metallic (earthed) object (very common on the floor of a van!). This design feature is* ***not accidental.***

5) *It will be noticed that 240V plugs are made with the earth pin longer than the others. This is to ensure that the earth pin is the first to make and last to break contact. This is significant if partial insertion occurs, such as when the cord is stood upon. Similarly, for the 2-pin plug, although both pins are equal in length, sidewise pulls are more likely to dislodge the 'horizontal' pin first. (It may take a little thought on the shape of the pins and leverages involved to see why this is so.) If the active pin is disconnected, the equipment shuts off outright. If the earth pin comes loose, funny things happen!*

6) *The idea of carrying a test plug with polarity indicator is quite good and saves the mandatory fuse being blown by the mandatory 25A 'crowbar' diode fitted inside the set. Unfortunately a LED in series with a (560ohm) resistor rarely indicates at all once it has been connected to 12V in reverse unless it has a second diode reverse connected across itself, preferably another LED of contrasting colour. (Use a transparent plug!)*

7) *I have referred to the Clipsal series number. Both the 2- (ser 495) and 3-pin (ser 439) plugs of this make appear vastly superior in cord grip, wiring tell-tale and finger grip/skirt design. Transparent covers may also be substituted.*

I agree with VK6RD that 'someone' should define the standard for the use of these fittings in Australian amateur usage. It should be borne in mind, however, that this might be just a little against the amateur nature. It was indeed my reason for submitting the letter to the national WICEN co-ordinator in the first place. The April WICEN column refers to a so-called 'WICEN convention', but the lack of 'official' reply to my original letter convinces me that this really means 'Melbourne WICEN Group convention', just as I quoted the Sydney group signal/control line convention.

My hope is that, on both these matters, a Federal WICEN meeting, or perhaps poll by mail, might result in an overall standard following consideration of both engineering principles and actual numbers of members with a given system in use. Certainly, WICEN is the only 'authority' in a position to do this. Publication in catalogue and callbooks could then follow.

73,

Paul Webster, VK2BZC
59 Gore Street, Port Macquarie NSW 2444

AR

Correspondence has been received from VKs: 2AEV, 2DTH, 4EH and L50567 with reference to the type size in Amateur Radio. We are acutely aware of some readers' problems with the type and are trying to devise some means within our limited budget, of at least reverting partially to a more readable type.

SHOW A NON-MEMBER

The progress of amateur radio from spark transmitters to the modern day transceivers, must rate as one of the greatest achievements of this century. Of course there have been a few little problems along the way, but amateurs being amateurs got together to talk over these diversions, and so an organisation was formed to look after the needs of amateurs. Thus the Wireless Institute of Australia was formed.

Not only is it the worlds oldest radio society, but today it still is a vigorous and dedicated body looking after the needs of all amateurs. Today, I believe the need for an organisation such as the WIA is just as parmount, and I would strongly recommend your membership. The continuing pressure worldwide on frequency allocations alone, needs a united stand. We need a strong society, for undoubtedly the benefits we enjoy are a reflection on the Institutes ability.

Well done and congratulations to the WIA on your 75th anniversary. Long may your service and vision continue.

WALTER GEOFFREY FERRIS VK2PWF

Wal passed away on 18th March following a long period of indifferent health.

Born near Benalla, Vic in 1904, Wal studied at Avondale, NSW, qualifying as a teacher with additional qualification in business administration and as a minister.

He served as a missionary in Fiji for twenty-three years and for shorter periods in Tonga and the Gilbert Islands. During this time he studied for his Masters' Sailing Ticket and had many overseas voyages in both large and small craft between the West Coast of the USA and various Pacific Islands.

In the later years of his missionary service he was stationed on Pitcairn and he designed the Pitcairn flag which was recently accepted by the colonial government. (Refer AR page 38, May).

Following his return to Australia he was appointed to an Aboriginal mission and then back to Lord Howe Island where he had spent much time as a boy.

It was whilst in the remote places he lived that Wal learned the value of amateur radio and he gained his amateur licence at the age of eighty years. He had passed the limited licence and was awaiting the results of his Morse test when he passed away.

This truly remarkable gentleman will be sadly missed by all who knew him.

Westlake ARC-Monthly Newsletter March 1985.

JOHN WALTER GERARD VK2ADN
24.03.1906 — 03.03.1985

John Gerard VK2ADN, radio amateur, movie projectionist, news cameraman and recently author, passed away in Baringa Private Hospital on 3rd March 1985 at the age of 78 years. John had been a radio amateur since 1934.

John and the late Eric Pugh VK2ADK, who later became his brother-in-law, studied for and passed the amateur examinations together and enjoyed many happy hours of amateur operating. They exchanged some thousands of QSL cards with amateurs they met on air and Jack received one from Castros of Cuba.

On one occasion John was speaking with an American who had a visitor in his shack. The visitor identified himself as 'Ike'. He later discovered that it was President Eisenhower.

In 1958 John and his XYL, Marie made a trip to the USA, Canada and Mexico. They attended the Lions' Convention in Chicago and later met and were entertained by many amateurs, some of whom later visited them in Australia. One particular meeting of interest was when John met John W9WCE, as they had had a long friendship over radio for 22 years, and finally met face to face.

John was a member of Coffs Harbour Lions' Club for over 31 years and was one of very few who could recite the Code of Ethics and the Lions' Objects from memory. He participated yearly in the "Hunting Lions in the Air" contest.

He always maintained an interest in moving pictures and was instrumental in forming a company with the late Lawrence Penn (The Picture Show Man).

On 15th March 1937 he opened the Tasma Theatre in Coffs Harbour which provided a high standard of entertainment for the patrons until 30th June 1968. He also acted as a Cinesound newsreel cameraman on the North Coast.

John was the great-grandson of one of Sydney's first surgeons and a nephew of the founder of the retail and shipping firm, Gerard and Co.

During the past five years the writing and publication of his book "From Pastures Green to the Silver Screen" occupied much of his time and was a climax to an eventful and interesting life.

John is survived by his wife, Marie, a son, two daughters, eleven grandchildren and two great-grandchildren to whom deepest sympathy is extended.

From information supplied by Mrs Marie Gerard.

WILLIAM MCINNES MOORE VK2HZ

WILLIAM MCINNES MOORE was born on the 18th February 1911 to ERNEST and LUCY MOORE, of Crows Nest, and was their eldest son. He attended the Suspension Bridge Primary School, Cammeray — then a junior technical school, where he passed his Intermediate Certificate at the age of 15. Although his mother was keen for him to obtain tertiary qualifications, the death of his father when he was only 19, required that he remain in the workforce as it was left to Bill to be the sole support of his mother, sister and brother who is now Sir John Moore. Immediately after obtaining his Junior Technical School Certificate, he joined the Metropolitan Water Sewerage & Drainage Board as an apprentice fitter and turner. He retired 42 years later due to ill health in January 1969 and was then Chief Inspector, Testing and Inspection.

During his early teens, he developed an avid interest in what was at that time the exciting new technology of wireless. On the 29th July 1931, at the age of 20, he was issued an Amateur Operators Efficiency in Radio Telegraphy Certificate No 792. This interest was to have a dramatic effect on his life as it led him to many places which he may otherwise not have seen and certainly created for Bill Moore, a network of friends throughout Australia and the world. As an example of his passion for this new technology, his original logbook shows that he made almost 1500 contacts with other operators in the first two years — an average of 2 every day for that period. The Water Board recognised not only his keen interest in radio, but technical proficiency, and in 1938 he was seconded from his normal duties to carry out experimental work in connection with the Board's use of radio telegraphy.

For 30 years, 1933 to 1963, he was a regular journalist firstly for the Wireless Weekly then Radio and Hobbies, and finally Television Radio and Hobbies. He wrote a monthly column which when I was going to school, I recall was titled "Around the Ham Bands with Bill Moore". I can remember well, my father sitting up night after night copying in his very good handwriting, his notes for despatch to the editor, and the assistance which the receipt of the fee cheques made to our then very tight family budget. Bill Moore joined the Wireless Institute of Australia in 1929 and at the young age of 24, was elected Federal President during a period of some turmoil and interstate rivalry. He held this position for four years until 1938. After the war, he was State President of the NSW branch in 1947 and 1948. Later he was instrumental in forming the Blue Mountains branch of the Wireless Institute in 1958 and was Secretary for its first ten years and President for another four years until 1972. To Bill Moore, his wireless, and his wireless room, was more than an interest; it was an excitement, a stimulation, a sanctuary in times of stress, and a love. He was a life member of the Institute.

In 1934 another and more significant love appeared in the form of Doreen Ashton who he had met by chance at a dance at the Wollongong Golf Club. He was boarding in Wollongong whilst carrying out inspection work at the Australian Iron & Steel works in Port Kembla, and on this night Doreen Ashton had been asked to attend a dance as company for the girlfriend of her brother Harry. Bill and Doreen were introduced by the Club Secretary, and a lifetime attachment was formed. They married fifteen months later on the 13th April 1935 in St Michael's church in Wollongong and would have celebrated their fiftieth wedding anniversary this year. A son, John, was born on the 23rd August 1936.

By 1938 the international scene had deteriorated and war clouds were massing. It was in this year that Bill Moore joined the RAAF Wireless Reserve so that at the outbreak of war, he was called up and commenced duties on the 6th September 1939 as an aircrew wireless operator. He embarked for Singapore on the 10th August 1940 where he was attached to No 8 squadron in Northern Malaya. Early in 1941, he was seconded to the Royal Air Force and attached to their pioneering radar installation and maintenance unit.

He was responsible for the erection of radar stations throughout Northern Malaya. In April of the same year, he was first commissioned as a Pilot Officer and then in the October, was promoted to Flying Officer. As the Japanese advanced, he was responsible for the progressive destruction of the radar stations which he had installed. Still attached to the RAF, he was evacuated from Singapore to Java in February 1942. He was captured in the March and for 3½ years until his release in September 1945, was held in 8 different prisoner of war camps, having been moved 10 times. He returned home on the 30th September 1945 just over 5 years from the date of his departure and was met by his family of two at No 1 platform, Central Railway.

An excerpt from the "Saga of Achievement", written by Group Captain D R Hall, Retired.

"In March 1942 all Airforce personnel remaining in Southern Java were assembled at Tasik Aerodrome prior to being moved as prisoners of war to barracks in Batavia. Flying Officer W M Moore, an RAAF radar officer removed some command receiving equipment from Kittihawk aircraft, a number of which was scattered about the aerodrome either in a new or crashed condition. This receiving equipment was then smuggled into the camp in Batavia where it was modified for operation from *torch batteries.*

"The radio was concealed in a hole in the floor of the barracks formed by moving two tiles and excavating earth and replacing the tiles in position to give the appearance of an undisturbed floor. While operating the set after dark, a tile was removed and an aerial was run up and connected to a wire strung across the room and used to support a mosquito net. Head phones were removed from the hole and Moore received the news bulletins *from All India* Radio *Delhi. Later bulletins were received from the ABC and the BBC. Next morning, the news bulletins were passed to a senior officer, who*

secretly disseminated the news to other prisoners of war.

"When batteries became scarce, small transformers were manufactured and the unit was rebuilt to fit into the bottom of two standard issue water bottles. A false bottom was installed in each water bottle to allow 4 inches of water and a space below for the parts of the radio. This radio was used for 18 months, carried from camp to camp and survived numerous searches by Japanese guards.

"In 1944, all water bottles held by prisoners of war were seized by the Japanese for use by native troops so a new place of concealment had to be found for the radio. The final receiver was built into the heels of a pair of wooden cloggs which were standard footwear tor prisoners of war. It was with this receiver, that news was received of the atomic bomb and the capitulation of the Japanese."

For this gallant and dangerous activity, Bill Moore was awarded a "Mention in Despatches" and received on Oakleaf Emblem.

After the war Bill set about rebuilding a normal life with Doreen. They had two children — Lucille who was born in 1946 but who survived only a few days, and Bill who was born on the 15th April, 1949. Bill senior returned to the Water Board and over the years became involved in many community activities.

He was a keen fisherman, particularly for "niggers", and many a happy hour was spent with him by his friends and family standing beside his special spot, trying to encourage those elusive fish to the greenweed bait — and more often than not, he succeeded. He was a keen photographer and has left a wonderful legacy of photographs.

In 1956 the Springwood RSL sub branch was in the words of their Golden Jubilee Review, "in deep crisis" and "survival threatened". Bill Moore had joined the year before and in 1956 was appointed Treasurer. For the next two years, a period described in the same Golden Jubilee Review as "the great recovery", he was President, and his organisational and leadership abilities were a major factor in the renaissance of the sub branch during that period. Until he was stopped by ill health, he was for many years, the organiser of the Anzac Day marches in Springwood.

Bill was a person that never sought the public stage, nor the limelight and yet both people and organisations turned to him when problems developed and steady, dependable and strong leadership was required. He probably never achieved his real potential due to the circumstances of his education, his early working life, and the intrusion of World War II. However, this to him was never a regret. He viewed his life and his achievements with a quietly modest and unassuming joy of life and people. May he be remembered for those good works which gave him so much satisfaction. Although reserved and quiet, he was a good man, a wonderful father and husband, a person who enjoyed his life to the full in a very personal way. Especially, he is remembered for good humour and in the words of a close friend who wrote to him when he retired in 1968, "Bill, I will miss your cheerful face — I cannot remember it any other way".

John A Moore.

LES SIMONS VK2NLE

On Thursday, 4th April 1985 amateur radio in general and the Royal Signals Amateur Radio Society in particular sadly lost one of its most efficient and courteous operators.

My first contact with Les was in the latter part of 1980. Les, at the time, was conducting a net on behalf of the Royal Sigs ARS and was in contact with the UK chapter of the Society. Being, at that time, newly licensed and eager to possibly make my first DX contact, I called in and will never forget the kind and efficient way in which Les introduced me to his compatriots in the UK.

Les, in addition to being Secretary of the RSARS (VK/ZL Chapter) was also editor of the Society's official journal "Jimmy", which was originally produced in Palestine in 1940. Due to the untiring efforts of Les, the VK/ZL Chapter grew from a handful of operators in the 1970s to the stage that it is now — one of the largest and most respected groups of its kind.

To his immediate family on behalf of his many friends and fellow amateurs we extend our most sincere and deepest sympathy.

Tom Delandre VK2PDT.

MARGARET STAHL VK2AHD

I regret to advise that Margaret Stahl VK2AHD passed away in her sleep, after a short illness on the 26th March 1985.

Margaret served in the WAAAF for a period of five years during World War II, rejoining the WRAAF on it's formation after the war, attaining the rank of Sergeant. Margaret was the first Australian Servicewoman to receive the Long Service and Good Conduct Medal.

At the age of 60, Margaret was persuaded by her OM to study for the Novice examination. Not satisfied, she continued her studies and achieved her Full Call in two years of study, having four call signs in twelve months: VK2VPQ, VK2YYL, VK2KES, and VK2AHD.

Margaret was a member of the WIA, ALARA, WARO, AFARN, YL INTERNATIONAL SSB'ERS, TAREE ARC and WESTLAKES ARC. She was the only regular YL on the call backs on the Sunday Broadcasts.

She will be sadly missed by all who had the pleasure of contacting her.

Deepest sympathy is extended to her OM Les and family, and her sister Gwen Pearce and family.

D Pearson VK2AVO

HAMADS

PLEASE NOTE: *if you are advertising items FOR SALE and WANTED please write each on separate sheets, including ALL details, eg Name, Address, on both. Please write copy for your Hamad as clearly as possible, preferably typed.*

- **Please insert STD code with phone numbers when you advertise.**
- Eight lines free to all WIA members. $9 per 10 words minimum for non-members.
- Copy in typescript please or in block letters double spaced to PO Box 300, Caulfield South 3162.
- Repeats may be charged at full rates.
- *QTHR* means address is correct as set out in the WIA current Call Book.

Ordinary Hamads submitted from members who are deemed to be in the general electronics retail and wholesale distributive trades should be certified as referring only to private articles not being resold for merchandising purposes.

Conditions for commercial advertising are as follows: The rate is $22.50 for four lines, plus $2 per line (or part thereof) minimum charge $22.50 pre-payable. Copy is required by the deadline as stated below indexes on page 1.

☐ TRADE ☐

AMIDON FERROMAGNETIC CORES: Large range for all receiver and transmitter applications. For data and price list send 105 x 220 mm SASE to: RJ & US IMPORTS, Box 157, Mortdale, NSW. 2223. (No enquiries at office . . . 11 Macken Street, Oakley). Agencies at: Geoff Wood Electronics, Rozelle. NSW. Truscott Electronics, Croydon. VIC. Willis Trading Co., Perth. WA.

70 cm power/VSWR meters (see p 23, AR July 1984) 50 W @ $112.80. 23 cm long loop yagis from $64.80. Waveguide modules, tubing & flanges. Gun & mixer diodes at good prices. 0.141" semi-rigid coax @ $2.50/metre. 1/16" DS PTFE board @ 14c/sq cm. 17 pF UHF Porcelain variables @ 10 for $3.50. Send SAE for lists to Microwave Developments, 6 Netley Road, Mount Barker, SA 5251.

☐ WANTED — NSW ☐

COPIES OF BOOKS: Australian Official Radio Service Manual or Gernsbacks Radio Encyclopaedia or old radio text books. Please state price to Brian VK2DLM, 60 Yellow Rock Road, Urunga, NSW. 2455.

DON'T DUMP IT — DONATE IT . . . All that surplus radio gear stored in your garage is now too old to be of any value. Before you dump it please contact me for possible donation to our museum. Particularly seeking ex-military comms equipment that can be refurbished for working exhibition — as described in AR. Colin MacKinnon VK2DYM, Box 21, Pennant Hills, NSW. 2120. Tel: (02) 634 6259 AH.

HANDBOOK FOR IC-502: in English language. Will reimburse for out of pocket expenses. Please contact Carl VK2EEC, QTHR. Tel: (02) 671 6595.

MANUALS . . . Loan required of circuit diagrams or photocopies of PRC10 tcvr. All costs paid. Q Campbell VK2ZQC, Box 403, Drummoyne, NSW. 2047. Tel: (02) 81 2143.

☐ WANTED — VIC ☐

FRONT COVER, TELESCOPIC AERIAL: volume & band change Bowden cables, also full webbing are required for WWII Army HF back-pack rx/tx. VK3AQB. Tel: (03) 337 4902.

ICOM 22S: 2m tcvr. Peter VK3PRB, QTHR. Tel: (051) 44 3398.

☐ WANTED — QLD ☐

VALVE TESTER: In QC and working. Also CCT diagrams/h'books for the following. All costs paid in full. Triplet tester model 1183-SC, Triplet valve tester No 321, Triplet cap Tester 240, AWA BFO R 7077 No 6 & Weston osc 776. Roland VK4EG, QTHR. Tel: (07) 376 4772.

YAESU FRDX-400/FLDX-400: Also Eddystone 680 QC rx. State price & cndx to VK4CB, QTHR. Tel: (07) 202 6566.

YAESU 480R: tcvr. 2m all mode, complete in QC. VK4QM. Tel: (079) 34 2910.

☐ WANTED — SA ☐

SWEEP GENERATOR PLUG-IN: E-1 or E-2 for a Telonic SM-2000 sweeper & any plug-in oscillators for an Alfred 650 sweep osc. Details to Charles VK5MC, QTHR. Tel: (087) 35 9014.

☐ FOR SALE — ACT ☐

TS-520 & EXTERNAL DIGI VFO, FV-101DM: 12 mems, scanning, split freq op. 100+W, all bands. $450 in VQC. FQQ-7 comms rx. $200 VQC. Full manuals with all gear. VK1KCM, QTHR. Tel: (062) 48 8826.

YAESU FT-757GX: tcvr. $875. YAESU FT-757HD (heavy duty power supply) $245. Yaesu FC-700 ATU with inbuilt 100W dummy load. $125. Yaesu MD-1B8 desk mic. $75. A1 cond. Is a complete HF station-package deal for $1200. Theo VK1KV, QTHR. Tel: (062) 61 2097 BH.

☐ FOR SALE — NSW ☐

ICOM R-70 SUPERIOR COM RX: in mint cond. 100% performance. $550. VK2ETF. Tel: (049) 45 4989.

ICOM 750 TCVR: power supply, 3 band Fritzel vert antenna, 3 band Yagi (unused), rotator, mast, guys, cables & access. (All new). $950 ONO. Tel: (043) 32 5163.

KENWOOD TS-520S: Immac cond. First to see will buy. VK2DVJ/VK2KL, QTHR. Tel: (044) 76 7650 AH.

SHACK CLEARANCE: Swan 500 with VOX unit & electret desk mic. $350. 410 outboard Swan VFO unit. $120. $450 as complete unit or will separate. 227R Yaesu 2m tcvr. $200. DX-160 comms rx. $65. Hustler 2m ant twin 5/8 co-linear, nearly new. $35. Home-brew ATU in Dick Smith cabinet. $25. All gear in perfect working order, some spare valves. Brian VK2DLM, QTHR. Tel: (066) 55 1570.

TOWER SECTIONS: 6' long by 8" per side triangular, braced & galvanised. Very strong, ex Army. Can be stacked to 108' using guys. $20 per section. Colin VK2DYM. Tel: (02) 634 6259 AH.

WILSON SYSTEM 2: four el triband Yagi. Very strong design. Max input power 4kW. In VQC. $220. John VK2DFC, QTHR. Tel: (069) 62 5547 AH.

YAESU FL-2100Z LINEAR AMP: As new $600. VK2CE, QTHR. Tel: (02) 871 7758.

☐ FOR SALE — VIC ☐

COLLECTORS ITEMS: Palec valve tester, Palec sig gen, Palec VTVM, 5" CRO, WWII equip. Wave meter type W1117, CRO indicator unit type 6A/APN-4 & more. Old tx, rx, valves & parts including a Ford spark coil. Also old radio text books & WWII equip instr books. All $400. VK3WD, QTHR. Tel: (054) 35 2274.

COMPLETE HF STATION: TS-120V 10-80m tcvr, VFO 120, TL-120 linear, MC-35 mic. All as new with leads, manuals etc. $600 carriage paid. VK3CVA, QTHR. Tel: (051) 49 4123.

ICOM 720A: In mint cond with manual, orig pack, etc. See, hear it working. $850. Ken VK3AJU ex VK3KQX, QTHR. Tel: (03) 654 2533 or (03) 527 9029 AH.

KYOKUTO: tcvr (just serviced by Dick Smith). 12V, 10W FM, 800 freq, 5kHz digi steps 144-148 MHz. Manual incl $150. Standard h'held FM 144-148MHz tcvr. 12V, 2W out. Suited for port or base use. Complete with charger, mic & n'cads, xtal switching. 5 positions, just serviced. 2 sets xtals. $150. VK3AAP. (055) 62 6016.

MFJ-941C ANTENNA TUNING UNIT: 300W ATU incl VSWR & watt meter. Very little use. $80 ONO. Max VK3AMC, QTHR. Tel: (03) 592 9036.

SHACK SELLOUT: Kenwood TS-430S HF $900 with mobile mount. TS-660 with power supply. $450. TW-4000A, 432/144 FM twin. $500. Icom IC-251A $700. All prices ONO. VK3BEL, QTHR. Tel: (053) 34 1397 weekends.

YAESU FT-107DMS: tcvr. 160/10m. Built-in power supply, 12 mems, h'held scan mic, all cables, h'book etc. VQC. WARC bands not fitted but all factory supplied parts, circuits. Instrs for any YWO WARC bands incl. On air demo can be arranged. $850. Yaesu FRG-7 rx. 0.5-30MHz. AC or battery operation. VQC. $220. Allan VK3AMD. Tel: (03) 570 4610.

YAESU FT-7: tcvr with instr manual. $375. Also power supp to suit $150. Chirnside CE-42 duo beam 15-10m. $100. Ken VK3VKS, QTHR. Tel: (03) 547 4082.

YAESU FT-707: with FV-707DM. 16 mems & scan mic in QC. $725. Jim VK3DPO, QTHR. Tel: (03) 857 5342.

YAESU FT-7: HF tcvr. 10-80m plus 11m fitted. Ex cond with manual. $325. Paul VK3AJJ. Tel: (03) 435 3643.

YAESU FTDX-400: tcvr. Excel cond. Must sell. $350. Andy VK3DPJ, QTHR. Tel: (03) 553 3483 AH.

MICROLOO AIR-1 CW & RTTY: Plug-in unit to suit Commodore 64. Computer complete with adapter plugs & manual. No software required all in onboard ROM. $200. Roger VK8IG, QTHR. Tel: (089) 52 4087 AH.

ADVERTISERS' INDEX

Announcing the new IC-735.

You have been waiting a long time for a compact (94mmH * 241mmW * 239mm) HF rig with performance you would expect only from the Icom stable. 100 Watts output, and Icom's direct fed input mixer will provide you with competition winning performance.

It's beyond comparison.

The IC-735 has many features and options to provide you with hours of radio enjoyment. Because the Icom engineers dispensed with the normal power cage at the back, you will be able to fit the IC-735 into ... just about anywhere.

TUNING

Single control triple speed tuning allows frequency resolution to 10Hz. The processor provides 3 scanning modes which includes mode scan, memory scan and program scan. The memory channel (there are 12), operating frequency, VFO, mode and RX/TX are all displayed on the illuminated LCD.

RECEIVING

Icom's direct fed mixer helps to provide outstanding performance in receive, for example Image response of 80dB. Input attenuation, pre-amp and RF gain control combine with notch filtering and pass band tuning to provide the most comprehensive tuning system. Naturally Icom have included the general coverage facility.

TRANSMITTING

100 Watts of clean power (Spurious emission <–50dB) is available on all the amateur bands. The controls not often used, VOX, mic gain and RF power controls are tucked away in the Kangaroo pouch. An optional electronic keyer (EX243) with full break-in facilities are also available if you enjoy CW.

VK3 was the first WIA Division to operate the special commemorative call, VK75A which opened on SSB at 0001 UTC on 15 March from the station of Barry VK3XV and worked continuously for 48 hours. Operation was on 40 and 20 metres with some contacts on 2m FM and SSB. Propagation was very poor on the higher frequencies and 40m proved to be the most reliable. A total of 503 DX stations were worked covering 41 countries. The station was operated by Fred Mackiewicz VK3ZZN, John Ambler VK3DJE, and Barry Wilton VK3XV. Equipment line up included an IC-751 driving a pair of 3 500 Zs in a home brew linear, a FT101ZD driving a FL2100 Z linear, and an IC-271H.

AMATEUR RADIO

Published monthly as the official journal by the Wireless Institute of Australia, founded 1910. ISSN 0002 — 6859. Registered Office: 3/105 Hawthorn Road, Caulfield North, Vic. 3161. Telephone: (03) 528 5962.

Ever read Eric's VHF UHF column and wondered exactly what 'aircraft enhancement', which he refers to frequently, means? Doug VK3UM, one of the pioneers of this mode in Australia, has written an exclusive article for AR, p4, explaining how aeroplanes function in enhancing signals on 144 and 432 MHz, the experiments he and others have conducted on this medium and how others may join in 'to give it a try'.

There is another 'Amateur in Space' launch due around the middle of this month and the WIA wrote to enquire if the amateur, Tony England, would be able to send greetings to the WIA for the 75th Anniversary whilst passing over Australia. Turn to p6 for David K1ZZ's reply.

Interesting comparison! Brenda VK3KT, Federal Education Co-Ordinator, features a trial AOCP exam paper in her column this time and on page 63 there is a Pre-World War II exam paper courtesy of Fred VK4RF. This exam was a written paper with a time allowed of two hours, in which the candidate had to draw diagrams, write answers and also do a little calculating whereas the exams of today, the candidate has to know the answers and tick the appropriate box.

The rules for the 1985 Remembrance Day Contest are printed in this magazine and contestants are requested to peruse the rules thoroughly prior to the contest. There are a few alterations to the rules, but Ian VK5QX has explained them finitely in his lead-up to the rules and has also included diagrams of how the log sheets should be laid out. Also announced in the contest columns is the winner of the Contest Champion for 1985 and the results of the John Moyle Memorial Field Day Contest.

International News, p18, features a special story of how the IARU came into being as it celebrates its 60th Anniversary.

Next month's magazine will feature a review of the Icom IC-735 All Mode HF Transceiver and an informative article of the history of VK6 bridging the communications gap with the eastern states and overseas on VHF and UHF. Also there will be details of a lecture given by Dr Karl Meinzer DJ4ZC in Melbourne on 28th May. Karl visited Sydney, Adelaide and Melbourne en route to the annual amateur convention in Christchurch. He is one of the best-known members of the German AMSAT DL, which was largely responsible for our present operational satellite, OSCAR 10. (a KP)

DEADLINE

All copy for September 1985 AR (including regular copy of Hamads and columns) must arrive at PO Box 300, Caulfield South, Vic 3162 at the latest by midday 22nd July 1985.

Enquiries and material to:
The Editor
PO Box 300, Caulfield South, Vic. 3162

Material should be sent direct to **PO Box 300, Caulfield South, Vic 3162**, by the **25th of the second month preceding publication. Note: Some months are a few days earlier due to the way the days fall. Phone: (03) 528 5962.**

Hamads should be sent direct to same address.

Acknowledgement may not be made unless specially requested. All important items should be sent by certified mail. The editor reserves the right to edit all material, including Letters to the Editor and Hamads, and reserves the right to refuse acceptance of any material, without specifying a reason.

Trade Practices Act: It is impossible for us to ensure the advertisements submitted for publication comply with the Trade Practices Act 1974. Therefore advertisers and advertising agents will appreciate the absolute need for themselves to ensure that the provisions of the Act are complied with strictly.

Victorian Consumer Affairs Act: All advertisers are advised that advertisements containing only a PO Box number as the address cannot be accepted without the addition of the business or residential address of the box-holder or seller of the goods.

EDITOR'S COMMENT

MORE HISTORY

As part of the WIA 75th Anniversary activities, the Publications Committee has, for some months, been searching through old issues of AR to extract items of historical interest. Ultimately this collection will be the framework supporting a full and detailed history of the WIA. We simply do not have enough people with enough spare hours to produce such an ambitious work before the end of 1985. Perhaps our centenary in 2010 could be the target for which our historians should aim.

In the meantime we hope to publish a number of historical reviews during the latter part of this year, each probably limited to just one particular aspect of amateur radio. Thoughts which occur to us are the evolution of VHF, or the techniques and development of SSB, or the growth of amateur television. Amateur radio has such a rich range of individual fields of activity that many full-scale books would be needed to do justice to all.

One such area, of obvious interest to the people who produce it, is the evolution of this magazine. On its own this could be the subject of a book; but let us look at one small aspect, the way in which costs have changed since the first post-war printed issue in October 1945. (The history of AR from its first issue, October 1933, until the war reduced it to a duplicated newsletter, is yet another story.)

The October 1945 issue was of 20 pages and had a cover price of 6 pence (or 5 cents in post-1966 decimals). This, from a value for money angle, is ¼ cent per page. *Seems cheap enough, doesn't it?* In 1949 the price rose to 9 pence, still for 20 pages, although odd issues were of 24 and very rarely as many as 28 pages. So we might say it was still about the same cost per page until 1953, when inflation really hit and the price went to one shilling (10c) for only 16 pages (in January 1953).

How does this compare with today? We do not show a cover price these days, for several good reasons, but each member pays from his/her annual subscription to the Institute about $1 per monthly copy. Each issue now has 64 pages, so the cost per page is less than 2c, about a seven-fold increase over 1945, but only 2½ times as much as that January 1953 issue! And we now have full-colour covers and vastly more information between them!

In 1950 the price of petrol was 3 shillings a gallon (about 7c/litre). It is now nearing 60c/litre in the capital cities. Even as late as 1958 a Melbourne morning paper cost fourpence (3.3 cents) but is now 30 cents. "Amateur Radio" is now even better value than ever. *Can you afford not to belong to the WIA?*

Bill Rice VK3ABP
Editor

Our first tests were very encouraging and although contacts were made the signal levels and reliability was just not as predicted. This however was more due to "what we thought we had" than what we actually were achieving in system performance. Finally when we both got our acts together, presto, signal levels were as predicted!

During our initial tests, we quickly realised that peaks of 30dB or more were evident for periods varying from a few minutes to tens of minutes. It was during one of these "good condition" periods (2130 UTC 1st May 1983 to be exact) that Ralph VK1RK broke on the frequency and almost took the cone out of my speaker! Expecting signals to Ralph to last, Gordon and I continued chatting but when we turned it over to Ralph — *Zilch! No Ralph!* About ten minutes later during another peak in signals to Gordon, Ralph again broke with S9 + signals. This time we did not leave him out on a limb and quickly exchanged reports etc. Without warning signals, which were steady with little or no QSB, started to drop rapidly and Ralph disappeared from the scene leaving Gordon and I communicating via forward scatter with signals about 3dB above the noise!

What caused this strange propagation? The times of the opening seemed to bear a relationship to an aircraft passing between us. A check the next morning positively established that two domestic services from Sydney to Melbourne were mid path at the very times of the enhanced propagation. Actually on hindsight (always a 20/20 vision), Gordon and I had observed this effect on many occasions but the "penny" only dropped when VK1RK appeared on the scene.

The rest of the story is history, but from our hundreds of "scheds" over the last eighteen months our observations may interest others who, under their *own* unique circumstances, may care to observe and utilise this novel form of communication medium.

It is most interesting to consider the path profile and relate the enhancement aspect that aircraft have on the Melbourne-Canberra path. Firstly the mountainous terrain between the two cities prevents direct communication except at rare times of exceptional trophospheric enhancement.

I have worked Canberra on 2 metres via Sporadic E back-scatter but, between normally equipped stations, ground wave propagation is most restricted by the mountains around Canberra. Knife edge bending is predominant on similar paths, however the angle presented at the Canberra end is most acute and to hear signal levels of those encountered and without any appreciable QSB, was somewhat of a surprise.

I have deliberately coined and used the word "enhancement" as aircraft reflection (off the body of the plane) is seemingly not the actual propagation or reflecting medium. Checking the surface area of the aircraft and noting the exposed area to the signal, the height and distance of the aircraft, combined with what would be the reflected signal level, did not tally with the signal levels received. They were simply too strong. Moreover it has been found that they can vary most markedly given certain weather conditions.

Well, what causes the effect? The aircraft are believed to be the cause and not the actual media of the enhanced propagation.

Candidly I am not sure of the mechanism but offer some possibilities that seem to relate to our observations.

1 Under the worst circumstances enhancement of minimal proportions are present on all transient aircraft and although the signal level increase is small it is always present. This effect will only be noticeable by those stations employing high power, high gain arrays and state-of-art (SOA) receiving systems for the signal increase may only be 3-6dB above the scatter path (Melbourne-Sydney). This effect can be related directly to reflections off the body of the aircraft itself and computes closely with the calculated figures.

2 Reflection caused by the condensation trails (con trails) left by aircraft flying above 30,000 feet.

3 Refraction caused by the air turbulence wake left by such aircraft. (Temperature heating effect or vortex turbulence.)

It is notable that although 2 and 3 are offered as explanations, normal aircraft radar returns indicate (other than the aircraft's reflection) the presence of this reflecting medium is seemingly not evident. This could be explained by the fact that such returns would comprise a back scattered signal or possibly insufficient attention has been given to this aspect. Another explanation could be related to the design of such systems which generally display only moving targets. Nevertheless back scatter does occur and will be related later in this article.

Some readers may wish to ponder the actual cause and pursue this aspect to a conclusion and accordingly there are many additional effects which may assist in the derivation of a more scientific answer.

Ignoring point 1, which would be of interest only to high powered or advanced stations, and complies with predictable data, the latter two (or more?) of extended communication range provide the most exciting possibility to stations of more moderate proportions. Signal levels can be very high indeed (over S9 on the Melbourne-Canberra path) and provide reliable and predictable contacts between the two cities. Predicting such enhancement can be as simple as obtaining domestic air time-tables, however as regular air travellers will know, they sometimes only provide a guide! Fortunately there are simpler and more accurate ways.

Aircraft en route report to ground stations remote linked back to the cities via UHF/SHF bearers. Simple sums will show a line of sight path exists from an aircraft midpath between Sydney and Melbourne back to both cities. Naturally you will not hear the ground station but the aircraft provide saturation signal levels.

It is customary for all flights to report their position at designated intervals and in particular the Sydney to Melbourne aircraft use 128.4 MHz, when overflying Canberra. From this report your can ascertain from the call signs and some knowledge of air carrier information, the type of aircraft and more importantly derive just when the enhancement will commence. Experience, plus a little knowledge of aircraft and airspeed dictates that enhancement will commence about 10 minutes from that time on the Melbourne-Sydney path and 12 minutes later on the Melbourne-Canberra path. These figures relate to my location in Chirnside Park (35km east of Melbourne), VK2ZAB (10 minutes) and VK1BG (12 minutes). Significantly all aircraft do not precisely report their position at this point and variations can and do occur. It can be assumed that Air Traffic Control have all aircraft en-route visually on radar and it does not matter too much!!?? *However we can tell!!*

Another method is by observing what is proving to be a most excellent beacon and a prime example of the application of such a device. VK1RCC is located at Mount Majura, near Canberra and transmits FSK CW on 144.490 MHz at about 12-14 watts output to an omnidirectional horizontal polarised antenna. Not much power you may say, but it can be heard in Melbourne during each aircraft enhancement period. Take a listen to Melbourne stations and you will most likely become fascinated by the effect. Signals will appear from nothing, peak rapidly, hold steady, and disappear into the noise about seven minutes later. Signal levels can be anything from just above the noise floor to S9 on

Aircraft Enhancement of VHF/UHF Signals ©

Doug McArthur VK3UM
30 Rollaway Rise, Chirnside Park, Vic. 3116

About two years ago, Gordon VK2ZAB and I commenced forward scatter tests on 144 MHz between Melbourne and Sydney. The path loss indicated a system gain to overcome -245dB was required. This was achievable with our combined stations. The VK2ZAB station consists of four bays of 9 element Yagis (18.5dBd), 400 watts output and a receiver sensitivity of better than 270 degrees K. The VK3UM station consisted of a slightly higher antenna gain (19.5dBd) and the same transmitter and receiver performance. Combining each station's performance with that of the encumbrant path loss, signals should be received at each end of the circuit approaching 3dB above the noise for better than 90 percent of the time. It was this figure that Gordon and I set out to prove. Probably the time and effort required to verify the text books would normally not be warranted. However as we were both "into the two metre scene" such an effort seemed worthy of the time. Besides the Sydney-Melbourne path had never been worked before on two metres!

occasions, but are always present.

Application of this beacon is most useful as it provides an indication that propagation exists (or is just about to become available) to Canberra stations depending upon their location. It does however herald the passing of propagation enhancement to Sydney.

The next interesting facet of this enhancement mode relates to the times signals are received at locations that may only be a few miles apart. Although thought to be strange at first, again one should then relate your own and the other station's location, with that of the aircraft. Naturally times will vary and because of the no signal to signal present aspect it will seemingly appear more dramatic. As an example, stations located in the Melbourne suburb of Frankston hear Sydney some two minutes prior to myself. However because of the flight path signals are present for a longer period at my location. Again one should consider the respective incident angles involved. With respect to the Melbourne-Canberra path Eddy VK1VP appears about one to one and a half minutes earlier than Ian VK1BG at my location. It is of interest to note that Eddy's signal from his SOA station never reaches the signal level of Ian's. This is explained by Eddy's location which at the time of best enhancement (critical angle) is blocked by Black Mountain. (6.5 degrees elevation equals -65dB additional loss on a horizon signal.)

Stations throughout Canberra "come and go" at predictable times commensurate with the angles involved. Thus this aspect may prove a little difficult to initially define for your particular location. However given you know each other's location and the flight path of the aircraft or can hear someone from the distant end, you can from this pretty closely predict when signals will be present at either station. At first you may feel despondent upon hearing a station in your city giving the distant station S9 when you are hearing zilch. Don't give up; assuming your system to be performing well you have either just missed or are about to hear the other guy! If you don't hear them well you have problem(s) to solve.

Back to the signal characteristics. As mentioned earlier I was initially surprised at the level and lack of QSB of Ralph's VK1RK signal. *Where was the characteristic aircraft flutter?* Again the penny dropped! The normal aircraft flutter is caused by the multipath effects of signals between the aircraft, ground, and other relevant reflecting objects. In this case the path is direct, and the received angle on the horizon. Consequently no multipath would be present. That explained that one!

It was not long before it became most apparent that the signal levels were not always strong. In fact levels vary up to 60dB under certain conditions. *Why?* It was this fact that (with continued observations) derived the possible explanations given in 2 and 3.

Ian VK1BG has been a most regular contributor and back-bone to our experiments. His unique location in Canberra provides midpath observations and co-ordination with Sydney. Moreover we can always liaise on 80 or 40 metres. Ian, given favourable weather conditions, can usually observe the aircraft first hand. The viewing of condensation trails provides a possible explanation to our varying signal levels. As a sideline to the saga, if he can actually see the aircraft we can predict to within 10 seconds when enhancement will commence. This you can see is most beneficial on the Melbourne-Sydney path where signals are less strong. Thus given this knowledge you are ready and prepared to go prior to the onset of enhancement.

Ground surface weather conditions naturally play little or no part on the received signal levels. It is what is going on above 30,000 feet that is determining the enhancement. Simply put, it is believed that, given stable conditions "upstairs" (viz winds are minimal and temperatures consistent) signals are higher and remain present for longer periods. Unstable conditions and jet stream effects diminish both these parameters. A simple check of the weather map gives some guidance to what may be expected. Close isobar lines between the cities in question invariably relate to lower enhanced conditions (time and level). It has been found that winter seems to provide better enhancement (on average) than summer, and evenings better than day and mornings. This is a subjective assumption related only to our operations over the past few years which may have to be qualified through a more scientific approach. It does however support the theories although it is a somewhat "chicken and egg" situation. The baseline is however from a practical sense the period of enhancement (for 144 MHz) can vary (for a single aircraft) from 2-7 minutes and is present for better than 95 percent of each aircraft pass.

I mentioned "for a single aircraft" in the previous paragraph and on this aspect we find additional benefits from our "bunched domestic time table" which, although most inconvenient to most travellers is helpful to us as amateurs. As you are aware our domestic airlines on the Sydney-Melbourne route run almost parallel services. In practice this provides two flights separated by about 8-15 minutes. This aspect does provide on many occasions continuous enhancement spanning 15 minutes or so. Throw in an International flight or two in a similar time bracket and you can see we have a propagation medium of practical proportions. Thus aircraft enhancement is not quite the "flash" propagation you may first believe.

The extra flights have a side effect. Now we get QSB! This results from multipath effects between the medium or body of the aircraft in transit. It varies from extremely rapid (making copy difficult) to extremely slow, and seemingly occurs when one aircraft is leaving the mid path area utilised for the enhancement path. It also relates to the speed and direction of the aircraft involved.

The flight path of the aircraft is of prime importance. Coincidentally, my location favours the Sydney-Melbourne route where I have a small incident angle. This is not a limitation to others off route. It has been proven that stations from Geelong to Frankston to Lilydale are all able to use this propagation medium. How far either side of the aircraft track this is possible (given the height of the aircraft and stations separation) has, as yet, to be accurately defined. Activity has not been great but hopefully others reading this article may become sufficiently interested to participate. What is known however, is that David VK3AUU in Drouin South, has worked Gordon VK2ZAB in Sydney. The enhanced period is short, but present at about 80 kms from the aircraft track.

What aircraft routes are useful? Well that's dependent upon the respective locations. In the Melbourne-Canberra-Sydney path, only south bound (out of Sydney) flights are practical. North bound flights (out of Melbourne) fly too far west to provide us with the direct mid path enhancement. Canberra flights are of course too low at the point enhancement.

The Sydney-Melbourne flights fly at altitudes of 31, 33, 35 thousand feet and in addition to height separation may be separated laterally. It is the most easterly path which suits us more. This has become more evident from our 432 MHz experiments to be discussed later in this article.

Obviously many factors come into play but armed with an aircraft route map, time table or VHF aircraft receiver, a hand calculator combined with a couple of suitably equipped stations you could really make a mess of the Ross Hull Contest!!

Aircraft size and type have a bearing on the received signal levels. From our observations and by use of the information given when the aircraft report their positions, we have been able to know just what we are "working off"! Naturally as would be expected the 747s and DC10s provide a higher level of enhancement. 737, 727 and aircraft of this type also provide excellent enhancement. What is somewhat interesting is that the smaller aircraft F28s etc (if flying high enough) provide similar levels. Don't get tricked on the smaller aircraft, they fly slower and naturally your predicted times will be different. Thus pure or turbo prop aircraft provide similar degrees of enhancement.

In November 1984 I dismantled my 144 MHz EME array and decided to put all my effort into 432 MHz. If you read Eric's VHF/UHF notes in this magazine you will be aware of results. Currently I run 16 bays of 16 element ATN yagis which provide just over 26dBd of antenna gain. Under terrestrial working I run 375 watts output (SSB) and the receiving system approaches 45 degrees K. With this background information the aircraft enhancement effects on this band will now be discussed.

Firstly, yes it does exist! Moreover it seems that the peak signal levels may be greater than 144 MHz, although insufficient data to confirm or deny this aspect is, as yet, to be determined.

Currently Gordon VK2ZAB is only running 10 watts to four Yagis and without a low noise preamplifier. Nevertheless we have had many two-way contacts. (The first Melbourne-Sydney 432 MHz.) Signals from me have peaked over S9 and Gordon himself has reached S9.

What we do find difficult between the two bands is the period available for communication and the signal differences between relative sites. In the first case it appears that only one half to two thirds of the enhancement period exists on 432 MHz. Secondly, the transit time of signals appearing (cross town in Canberra) is quite dramatic. Signals can be S9 at one location and inaudible a few miles distant.

I hasten to add that it is early days yet and when stations participating in our experiments improve their systems commensurate to 144 MHz, more definitive conclusions may be resolved.

Naturally as I employ a EME station capability of not too modest standards, allowances must be made in this regard. Advantages of lower sky noise and a greater realised receiver sensitivity offset or actually surpass that of 2 metres, but to discuss this and associated aspects is beyond the intent of this article. In theory my scatter signal in Sydney should surpass (by almost 6dB), that of my previous 2 metre signal, however currently the Sydney guys have as yet to reach this point. (Gordon VK2ZAB is working on it!!) Canberra stations, and in particular Ian VK1BG can copy me on scatter (CW) for greater than 90 percent of the time as evidenced from retransmissions on 80 metres. It is most useful for Ian to be able to copy (on SSB via forward scatter) for 75 percent of the time to be able to wait until signals peak (from enhancement) to S3, before responding.

I strongly believe that aircraft enhancement will support 1296 MHz and wonder just who will be the first to bridge the gap between Sydney and Melbourne on that band. Melbourne-Canberra should be a breeze!

To summarise, what can be expected? Firstly on two metres equipment wise. A well equipped station would, I consider, consist of say a single ATN 13LB type antenna (13.5dBd) fed with half inch heliax or Belden 9913 and 100 transmitter watts output power. Receiver

wise a preamplifier (preferably masthead mounted) with better than 1 dB NF (BF981 or better). Such a station, if located in Melbourne, will work a similar equipped station in Sydney and expect to hear on average signals between S2-S5. On occasions short periods of up to S9 will be achieved.

On the Melbourne-Canberra path signals will "blow your head off" at times and on average be better than S7. Accordingly you may relate this to lower powers and antenna gain. It is quite easy to work this path (Canberra) with 10 watts and a modest antenna.

Don't worry about elevating the array! Signal received angles are right on the horizon due to distances involved, and secondly beam in the direct straight line path.

Some other interesting effects that have come to our notice during our scheds has been the incidence of backscatter signals off the reflection medium. When enhancement is very strong Ian VK1BG receives backscattered signals from Gordon VK2ZAB. Normally Gordon is inaudible when beaming towards me (at VK1BGs QTH) and only on the very strongest of such enhancement (towards me) are signals of this nature heard. Conversely, Gordon can hear VK1BUC, when he is beaming my way.

Multi-propagation modes in association with aircraft enhancement have been noted. Gordon VK2ZAB runs schedules northwards from Sydney on weekends. Many VK4s in Brisbane and Bill VK4LC (Mt Tamborine) are worked. I try to monitor such schedules and relate the meteor "ping" rate from week to week. Generally speaking the VK4s always provide from 5-15 (less than 1 second) pings for each 5 minute period. When meteor showers are present this increases dramatically with some classic pings exceeding 15 seconds. It has come to my notice that on several occasions I have heard Bill VK4LC with a steady signal for periods of up to one and a half minutes. Not sporadic E nor a "beaut" meteor ping! My only explanation would be that of aircraft enhancement plus tropospheric enhancement. (The distance far exceeds that for an aircraft flying at normal heights!! or maybe we have discovered a very high flying aircraft??!!!)

Finally to conclude, mention must be made of operating techniques. This is not the medium to ragchew although those suitably equipped can make a fair fist of it! Thus, it requires short, precise overs if you want to succeed and more importantly for others waiting to participate. Nothing worse than someone hogging the channel and talking through an enhancement period. Treat your operating like working the RD contest. Generally speaking if you are new at the procedure, listen for a couple of weekends and chat afterwards with those involved. Note the times you hear and whom you hear. This can be related to others and especially to your own capability. For example: a Melbourne station hearing Gordon VK2ZAB on two metres and getting him at S2 should realise he is running 400 watts and it is most likely that your 50 watts would not be heard. (This may not be quite true as most "big mouths" have associated "excellent ears" and may make up for your deficiency.) Moreover nothing is worse than stations at both ends of the circuit chatting on the scheduled frequency complaining nothing is happening.

Many has been the time when I have listened to Sydney stations on 432 MHz chatting during the scheduled period, and Gordon reports the same of Melbourne stations on 144 MHz. What is required are very short transmitting sequences and unnecessary chatter. This aspect would be beneficial on the SSB calling frequency of 144.1 and 432.1 MHz!!! For this reason Gordon and I chose 144.2 and 432.2 MHz. At one stage we were forced to work split to avoid the smart "Alecs" but this is the last thing we all would wish.

Currently these are the operating times and frequencies:
144.200 MHz: Gordon VK2ZAB "co-ordinates" the Sydney end beaming Melbourne from 0803-0900 EST (2230-2300 UTC) each Saturday and Sunday morning. He calls for the first 30 seconds of each minute and listens the last 30 seconds when things are quiet.
432.200 MHz: I (VK3UM) "co-ordinate" the Melbourne end beaming Sydney during the same period above. I call and listen alternatively each 10 seconds and monitor 3.690 MHz prior, during and after the scheduled period. If 80 metres is poor, we utilise 7.293 MHz.

Just why did we pick this particular time? Well it was convenient but we know that current flights provide at least two domestic services and generally an International flight during this period. Fog at either airport and resultant closures can cause consternation at times!

I emphasise everybody is most welcome to join and would respectively suggest if the group gets too large (as often it does) to pair off to another frequency.

There *you have it*: "aircraft enhancement" as we have coined the phrase and hopefully this article will inspire others to give it a try and for those scientists out there to come up with a concrete explanation of the "mechanics".

Special acknowledgements include Ian VK1BG, Ralph VK1RK, Eddy VK1VP, Les VK1BUC, Col VK1AU, Glen VK1GL, Peter VK1ZQS, Gordon VK2ZAB, Brian VK2QP, Ron VK2DVZ, Dick VK2BDN, Trevor VK3KEG, Les VK3ZBJ, Lionel VK3NM and David VK3AUU. Apologies to any that have been inadvertently missed.

JUNE'S BEST PHOTOGRAPH

The judges at Agfa-Gevaert selected the photographs on page 21 of the June magazine. Next month the winner of the Agfa prize will be announced.

TRY THIS

Arthur Sibley,
RMB 24, Cooper Road, Wamboin, NSW, 2620.

POWER SUPPLY AMMETER

I had much trouble looking for an ammeter for high current power supplies. This is what I settled on and it works quite well for general measurements.

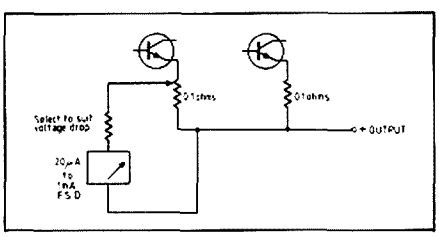

Figure 1: Circuit for the Ammeter. Note that only 2 transistors are shown but any number may be used.

Effectively the arrangement is a voltmeter reading a voltage drop across the transistor equalising resistor of any one of the parallel voltage regulating transistors, any type or make.

I used 2N3055s and have six in parallel. The resistor is 0./ohms and at 6amps the voltmeter has to measure full scale at .6V.

This corresponds to 30,000 ohms for a 20uA meter. As the internal resistance of the meter is 5,000 ohms, a 25,000 ohm resistor will give full scale for 6x6 = 36A.

I selected my resistor so the scale could have 40A full scale. The meter originally came from a tape recorder level meter — nothing sophisticated, but very useful.

VHF COMMUNICATIONS MAGAZINE

Subscribers please note!!

Following the notice in May Amateur Radio, there have been some delays in the 1985 edition due to the lack of a translator.

Please be patient and any further developments will be published in AR.

ERRATUM

The April issue of AR carried a book review of the Confidential Frequency List which stated that the book could be obtained from AR advertisers such as GFS. This was incorrect. The book is available from AR advertiser Dick Smith (Catalogue No B-9602, cost $15.95), or as per Spotlight on SWLing for February 1985, page 37.

Apologies are offered for any inconvenience caused.

WIA 75th Anniversary News

LETTER TO WIA SECRETARY RE SPACE SHUTTLE FROM DAVID SUMNER K1ZZ OF ARRL

Tony England will be carrying two-metre FM and slow-scan TV equipment with him on the 51-F mission that is now slated for mid-July. Unfortunately, he will be limited to using the in-the-window antenna that was used by Owen Garriott, rather than an external antenna in the cargo bay. Also, his operating time will be extremely limited owing to other commitments.

We are passing along your request for a message of greetings to be sent from the Shuttle. The biggest problem is likely to be that Tony will not know, more than one orbit in advance, when he will be able to operate.

At this point I guess the best we can do is to suggest that WIA members equip themselves to receive FM (and preferably SSTV) on 145.55 MHz, and hope that things will fall into place for the mission.

It must be emphasised to members the difficulties with this type of operation — Good Listening.

EQUIPMENT REVIEW

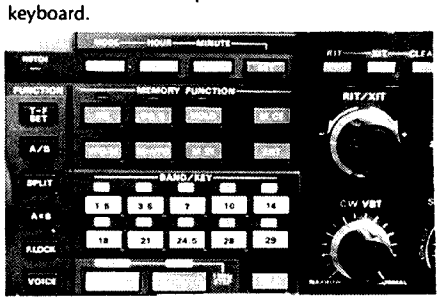
Ron Fisher VK3OM
3 Fairview Avenue, Glen Waverley, Vic. 3150

KENWOOD TS-940S ALL MODE HF TRANSCEIVER

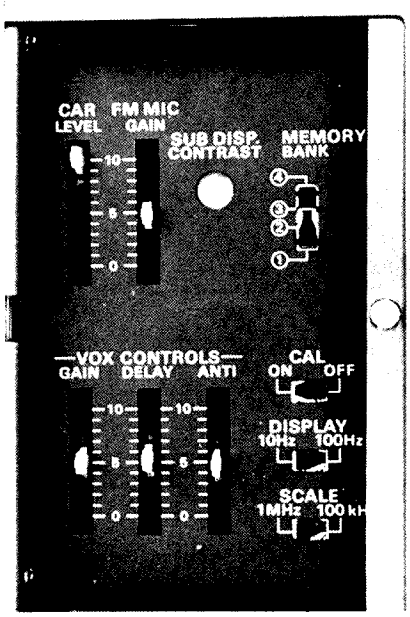
The TS-940S is an updated version of the well known and respected TS-930S. The 930 became available around mid-1982 and quickly became a status symbol among amateurs.

However in many respects, the 930 was surpassed by the TS-430 released just a few months later. Perhaps the greatest draw back of the 930 was the inability of the memory system to store mode information. The 940S overcomes this and at the same time introduces many brand new and unique features.

At first glance, you might suspect that the 940 and the 930 are packaged in the same cabinet. There is certainly no doubt from their appearance that they are closely related. But in fact the 940S is both larger and heavier than the 930. Width is up from 374mm to 401mm, other dimensions remain the same, weight is up from 18.5kg to 20kg. Some of this increase in weight is accounted for in the automatic antenna tuner which now covers 160 metres, and in the improved cooling for the final which allows a longer duty cycle for RTTY. The most striking improvement in the 940 is in the tuning, memory and frequency selection areas. On the 930 this was limited to amateur band selection buttons, 1 MHz up/down selection and the eight position memory switching. All of this has been replaced with a multi function keyboard.



Keyboard.

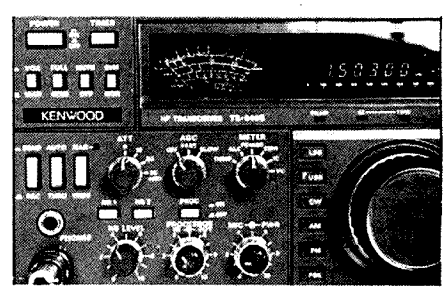


Controls within the Top Hatch.

Let's look at this in some detail. Ten band/key buttons allow instant selection of each amateur band with two buttons for 10 metres at 28 and 30 MHz. When in the memory mode these same ten buttons select memories one through ten in any one of the selected four memory banks. There are now a total of forty memories.

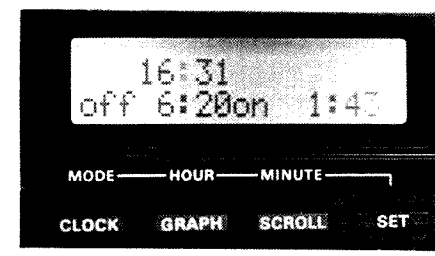
The four memory banks are selected by a switch through the top hatch. Unfortunately the memories are not tunable. They can be shifted up to +/– 9.9 kHz with the RIT, but if a greater range is required, the memorised frequency must be transferred to VFO A or B which you then lose. Memory scanning works well with a 5 second hold on each memory as the scanning proceeds.

Finally, the same ten buttons can be used as a direct entry keyboard to provide direct access to any required frequency. 1 MHz up/down keys are also available.

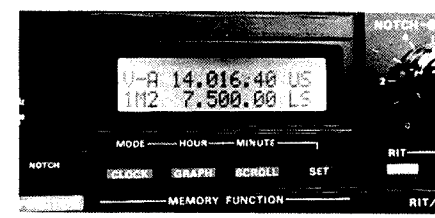


Mode Selection Buttons.

Six mode selection buttons to the left of the tuning control replace the old style rotary switch of the 930. As each mode is selected, a small indicator lights and the mode is signalled in Morse code — 'L' for LSB, 'U' for USB, etc. To the right of the VFO knob are five VFO controls and the voice frequency readout selection button. That is another of the new features of the 940. Along with the Morse code identifier this will make operating much easier for sight impaired amateurs. A voice readout is an optional extra. Eight memory controls are arranged above the keyboard,



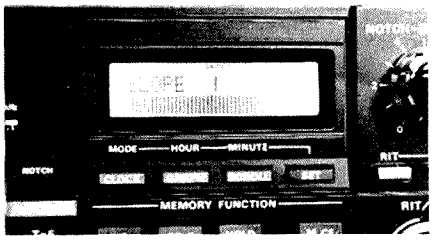
Clock Display.



Frequency Readout.

which allow for memory entry and recall, VFO to memory and memory to VFO transfer as well as memory scan.

Next is the Sub Display, simple name for an LCD display that imparts more information than anything seen before. Let's run through what it displays. A twenty four hour clock, on/off times for unattended switching of the transceiver mains power, frequency in the VFO not being used at the time, ie it displays VFO B if VFO A is in use. It displays, in turn, all the frequencies stored in memory and gives a graphical display of the status of the SSB slope tune and also the CW VBT. It indicates when the auto antenna tuner has been selected, when it is tuning, when it has completed tuning, and whether a match is possible or not. Selection of the various display functions is selected by the four buttons under the display except for the antenna tuner display which appears when the auto tuner is activated.



Slope Status.

SSB and CW tuning rate remains the same as the 930 with one knob revolution for 10 kHz shift but on AM and FM this is changed to one knob revolution for 100 kHz shift. I feel that this is too fast and that perhaps a 50 kHz rate might have been better.

It has been reported in some magazine previews (not AR) of the 940S that transmitter power output is 250 watts. However as we shall later see the output is around 100 watts and the INPUT is claimed to be 250 watts.

Antenna Readout.

Some of the other handy additions to the 940S include switching of the digital display to either 100 or 10 Hz resolution and the analogue slide rule frequency indicator under the digital display to either 1 MHz (where it was on the 930) or to 100 kHz.

Power Output Meter.

The power output meter, which is quite accurately calibrated in watts, now also indicates PEP output on SSB. I found the meter needed a bit more damping when reading PEP but at least this is a start.

Numerous facilities are available on the rear panel, although like the 930, they are a bit hard to get at. The IF output socket is now directly compatible with the SM-220 monitor scope and providing the 220 is fitted with a BS-8 adaptor the band display feature can be used.

On the cosmetic side of things, the S meter colour scheme has been changed. It now has a black background which I rather liked but a 930 owner, who tried the 940, preferred the light coloured meter on his rig.

As 930, the 940 has two cooling fans, one for the power supply and one for the transmitter's final amplifier. The power supply fan tended to operate quite a bit during receive-only operation. The noise produced was quite audible although not all that obtrusive. In fact I noticed more when it had switched off. The final amplifier fan was much quieter and only came on after several minutes of transmission.

The 940 RIT/XIT control deserves a mention. The offset required can be preset to any required amount up to +/-9.9 kHz by rotating the continuously variable control. Push the RIT button and there you are. Push the RIT button again and the receiver is back on the original frequency with the offset frequency still preset and available. Pushing the clear button resets the RIT offset to zero.

Rear panel facilities have been increased and now include two accessory sockets for a computer interface and for the connection of data communications.

CIRCUIT DESCRIPTION

The TS-940 is a triple conversion circuit for transmit and also for the FM receive mode. Other receive modes include one extra conversion down to 100 kHz which includes a most effective notch filter.

The conversion set is: first IF at 45.05 MHz, output from the synthesiser at 45.08 to 75.05 MHz which converts the incoming signal to 30 MHz for the first IF. Second IF is 8830 kHz, and it is at this frequency, common to most Kenwood HF equipment, where the main IF shaping filters are located. Third IF is 455 kHz. The transmitter balanced modulator is at this frequency and a separate 455 kHz IF strip comes off at this point for FM reception.

Output from the synthesiser is in 10 Hz steps for SSB and CW and 100 Hz steps for AM and FM operation. Tuning around on AM there were plenty of clicks when tuning across strong signals as the synthesiser changed frequency. In this respect the 940 is very much inferior to the 930. The variable bandwidth controls operate at the second IF frequency and employ two variable carrier oscillators at 8.83 and 8.375 MHz. The noise blanker also operates at this frequency and uses a four diode switch ahead of the main filters.

It is interesting to note that the specified selectivity of the 940S is rated at 2.4 kHz at -6 dB and 3.6 kHz at -60 dB as against 2.7 and 4.0 kHz for the 930S. In a side by side test there was no detection of any difference in the two transceivers.

The RF output from the solid state transmitter output stage is diode switched to allow the full break in CW operation.

TS-940S ON TEST

The following equipment was used to produce the test figures. A Yaesu YP150 terminating watt meter, Drake R-4 through line watt meter, Kenwood SM 220 monitor scope, AWA F242A noise and distortion meter, Daven terminating audio output meter and Marconi TF995A/5 signal generator.

Frequency Stability

The stability of the 940 is most impressive. It was checked against VNG, WWV and several broadcast stations over long periods and under various ambient temperature conditions. It is really hard to be sure that the 940 drifts at all but if it does, the total would be under 20 Hz. If this type of performance does not satisfy, an optional high stability master oscillator is available which claims a long term stability of +/- x 10-6/year.

Power output

As mentioned earlier, some previews of the 940 have indicated that the power output has been increased to 250 watts. Not so, but the input is claimed to be 250 watts and the output is around 100 watts.

Power was measured under CW conditions with full drive, referenced to the PEP output as indicated on the monitor scope. For good measure a two tone test was carried out.

Band	CW output	PEP output from scope	Two tone output x 2 to give PEP
1.8MHz	127 W	130 W	110 W
3.5 MHz	127 W	130 W	110 W
7.0 MHz	127 W	130 W	110 W
10.1 MHz	126 W	130 W	110 W
14.0 MHz	124 W	135 W	105 W
18.0 MHz	124 W	130 W	105 W
21.0 MHz	124 W	130 W	105 W
24.5 MHz	123 W	125 W	105 W
28.5 MHz	123 W	125 W	100 W

While doing these tests, the power output meter calibration on the 940 was checked. With steady carrier, the 940 meter was 10 percent low compared to reference meters. Under PEP conditions it was hard to arrive at an accurate estimation due to the rather fast ballistics of the meter. Perhaps Kenwood might consider the addition of a hold circuit or even a simple increase of the meter decay time.

The scope pattern indicated a very clean output at all times even with large amounts of speech processing in use.

The power control allows the operator to reduce output in all modes to about 5 watts. This can be easily monitored with the power output setting of the 940 meter.

Subjective tests of the transmitted audio quality was carried out in the three available modes. SSB quality was rated as very good with an actual perceived improvement with the processor in use. Many critical amateurs have noted the distinctive quality of the TS-930. It's pleasing to report the 940 retains the same sound. AM quality was smooth and clean particularly with the optional MC-60A microphone in use. But the big surprise was the superb quality of the FM mode. Over a given path, the FM gave much better quality and signal to noise ratio than either AM or SSB. Why don't more amateurs use this mode on the wide open spaces of the 10 metre band?

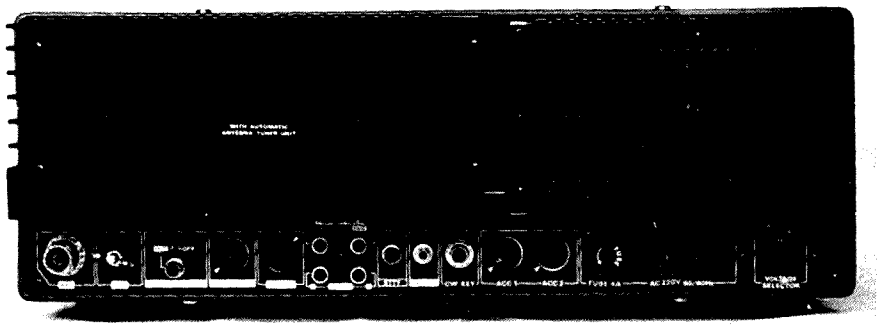
Receiver Tests

The extension speaker output was connected to the terminating audio power meter and the noise and distortion meter. An 8 ohm load was selected. Residual noise with the audio gain at zero was -55 dBm unweighted and -52 dBm weighted. This is a reasonable figure, better than many transceivers but well down on the best (the FT-102). Audio output power and distortion were:

Output Power	Distortion
.5 watts	1.6%
1.5 watts	1.6%
2.0 watts	3.5%
2.5 watts	13%

While these figures are reasonable and representative of modern amateur equipment, I often wonder why a transceiver of this class doesn't have 10 or 15 watts audio output. Surely the cost of producing 10 watts would be very little more than 2 watts but the improvement in recovered audio could be substantial.

Received audio response in LSB was checked by



Rear of the TS-940S.

tuning across the signal produced by the 940 internal crystal calibrator. The results were:

100Hz	200Hz	300Hz	400Hz	1kHz	1.5kHz
-10	-2	-.5	0	0	-1
2kHz	2.2kHz	2.5kHz	2.7kHz	3.0kHz	
-3	-4	-5	-7	-26dB	

While this is very smooth, it shows that the carrier is set a little too close to the filter skirt. A slight adjustment would give a better HF response, although as shown above in the transmitter tests, this is not all that bad.

Frequency response was also checked in the AM reception mode.

100Hz	200Hz	350Hz	700Hz
-10dB	-4dB	0dB	0dB
1kHz	2kHz	3.5kHz	5kHz
0dB	-3dB	-12dB	-22dB

The fall off is surprising at the low frequency end, however feeding a good quality speaker the audio was clean and quite acceptable.

The action of the SSB slope tune controls were checked and should be referred to the overall response figures above.

SSB slopes tune, high. Control at centre (12 o'clock) point.

1kHz	1.5kHz	2.0kHz
0dB	-1dB	-20dB

Control full on (7 o'clock) point.

1kHz	1.25kHz
-13dB	-26dB

SSB slope tune, low. Control at centre (12 o'clock) point.

400Hz
-20dB

Control full on (5 o'clock) point.

1.1kHz
-20dB

The notch filter was checked at four points through the audio range. It was able to produce a -30dB notch at 1kHz, 2kHz and 2.5kHz and a notch of -25dB at 500Hz. The notch was very sharp and its action had very little effect on the received audio quality. There was no overall drop of the received audio level as often happens with these devices. The notch filter can be used with equal effectiveness on all received modes.

The CW VBT (variable bandwidth tuning) operation was measured. No optional CW filter was fitted to the review transceiver and from the results obtained only the most dedicated CW operator would probably require one. Two are offered as options.

With the VBT at normal the band width was 2kHz at the -20dB points, but with it at narrow was reduced to 800Hz at -20dB points with an overall drop of 10dB in the actual audio output.

Receiver signal to noise ratio was next measured. This was checked at two frequencies.

At 14.2 MHz LSB.	1 uV	20dB
	.2 uV	10dB
	.1 uV	5dB
At 28.2 MHz LSB.	1 uV	22dB
	.2 uV	5dB
	.1 uV	2dB

FM quieting was measured at 14.2 MHz and turned in a remarkable 27dB. AGC action was also checked at 14.2 MHz. The signal generator output was slowly increased and the audio level monitored. From 1 to 10 uV there was a 7dB increase in output. From 10 uV to the maximum output of the generator the increase was less than .5dB. AGC decay time from S9 (100 uV) was 10 seconds with slow decay and 2 seconds with fast decay. The AGC was very smooth acting in all modes with no hint of pumping or clicking.

The S meter calibration was checked at 14.2 MHz with the following results:

S 0 — 2dB	S 6 — 4dB	9+20 — 8dB
S 2 — 2dB	S 7 — 4dB	9+30 — 9dB
S 3 — 6dB	S 8 — 3dB	9+40 — not checked
S 4 — 4dB	S 9 — 9dB	9+60 — not checked
S 5 — 5dB	9+10 — 8dB	

It took a signal level of 2 uV to reach S1 and S9 was calibrated at 100 uV. Apart from its reluctance to move off the stop with relatively weak signals, the action of the S meter was very good. You might find quite a few S0 readability 5 signals though.

The increase in the noise floor with an adjacent S9 signal was checked. With 3kHz separation the noise came up 1.5dB with the adjacent signal increased to S9+20dB the noise rose to 14dB. With 5kHz separation these figures decreased to 1 and 8.5dB respectively.

Tuning the receiver from 30 MHz down to 100kHz, a time consuming job, revealed a total of 22 birdies. Of these, only six reached an equivalent input of .2 uV. All of the others would be lost in the noise with an antena connected. Below 500kHz several gurgles were noted possibly eminating from the digital display. Again these were not audible with an antenna connected.

It was noted, during the transmitter tests, the SWR meter was indicating 1.3 : 1 when feeding a 50 ohm dummy load.

No tests were conducted to determine losses, if any, in the auto ATU. Most of the time it was not used during on air tests but a quick evaluation with a trap verticle well off its resonant frequency showed that a 3 : 1 SWR could be easily corrected.

INSTRUCTION BOOK

From an operational point of view, the sixty page instruction manual is well presented. There are three pages devoted to a description of the circuit and three more to basic adjustments and maintenance. The installation of the optional filters, auto antenna tuner and voice synthesiser is also covered.

With a transceiver of the complexity of the 940, operating instructions are of great importance. Each mode of operation is explained with a two page spread showing the operation of each control that is used with that particular mode. Several pages are devoted to memory entry, recall, scanning and direct keyboard entry. Also supplied with the review transceiver was the optional service manual. This consists of 108 pages of technical and service data. I am not sure if a copy of this is supplied with each TS-940. If not, I would recommend that a new owner should invest in one.

SUMMARY

The quickest way to sum up the 940S is to say that it has the lot. Of course if you require a mobile or portable transceiver then one of the smaller, lighter transceivers will perhaps suit better. For home station use it is hard to imagine a more complete rig or how Kenwood are going to improve on this transceiver in the future. Facilities offered are second to none and the overall performance is excellent in all respects.

The TS-940S used for this review was supplied by Trio-Kenwood (Australia) Pty Ltd and all enquiries regarding price and delivery should be addressed to them or one of their authorised local dealers.

EVALUATION AND ON AIR TEST OF THE KENWOOD TS-940S — Serial No 5100619

APPEARANCE
Packaging
*** Strong carton with foam inserts.*
Size
**** Large*
Weight
**** No lightweight (20kg) but everything self contained.*
External finish
***** Superb finish.*
Construction quality
**** Good quality boards and components. Accessibility seems fair.*

FRONT PANEL
Location of Controls
***** With 64 separate controls, layout excellent.*
Size of knobs
**** All frequently used knobs bigger than average.*
Labelling
***** Clear labelling. Mode selection also identified in CW tone.*
Status indicators
**** Most functions well indicated.*

VFO ACTION
Tuning knob
***** Large and smooth action.*
Tuning rate
**** Well chosen for SSB and CW. Too fast for AM and FM.*
Digital readout
***** Would have to be the best available.*
VFO stability
***** Impossible to fault. High stability optional oscillator makes it better.*

RECEIVER OPERATION
Memories
**** 40 available with mode storage, but only 10 at one time. Memories not tunable.*
Slope tune
***** Both high and low end independently variable.*
Notch filter
***** One of the best. Sharp notch with little effect on received audio quality.*
CW VBT
***** Gives excellent CW selectivity without the use of special CW filters.*
CW pitch and tune
***** Selects required CW pitch and changes bandpass tuning to suit.*
Spurious responses
**** Quite a few throughout tuning range but all very low level.*
S Meter
**** Sluggish at low signal level. Otherwise good — see test section.*
AGC performance
***** Excellent response — see test section.*
Signal handling
***** No sign of overload.*
RIT/XIT
***** +/- 9.9kHz on both transmit or receive (selectable) separate offset readout. Main digital display also follows.*
Sensitivity
***** Excellent — see test section.*
RF attenuator
**** 10, 20 and 30dB-handy for checking S meter.*
RF gain
***** Smooth progressive action.*

NOISE BLANKER
Woodpecker
**** Better than most. Very effective when pulses are sharp and clean.*
Ignition noise
***** Cuts it dead.*
General electrical Noise
**** Very good with most types of domestic noise.*

QUALITY OF RECEIVED AUDIO
Internal speaker
** Better than usual quality from upward facing speaker.*
External speaker
NA Matching speaker available as option. Quality very good on my usual station speaker.
Headphone output
**** Stereo phones compatible. Output level ideal.*
Cooling fan noise
** Power supply fan often runs during receive. Quite noticeable but not intrusive.*

TRANSMIT OPERATION
CW and PEP output
**** Output very flat from band to band. See test section.*
Audio response
***** Very smooth quality on all modes.*
ALC action
***** Most effective. No flat topping even when overdriven.*
Compressor
***** Really adds some punch to speech with no audible distortion.*
Metering
***** Compression, ALC, Power in watts, auto SWR, IC and VC (PA stage metering).*

Relay noise
**** None!
VOX operation
**** Very smooth and of course no relay noise.
CW operation
**** QSK (full break in) available. Should suit the most ardent CW operator.
Cooling
*** Two fans, one for power supply, one for final amp. Runs cool at all times.

MANUAL
(Owners handbook)
** Operational information good. Not much else. Workshop manual recommended.

*Rating Code: Poor * Satisfactory ** Very Good *** Excellent ****

AR

Next month the Icom IC-735 All Mode HF Transceiver will be reviewed.

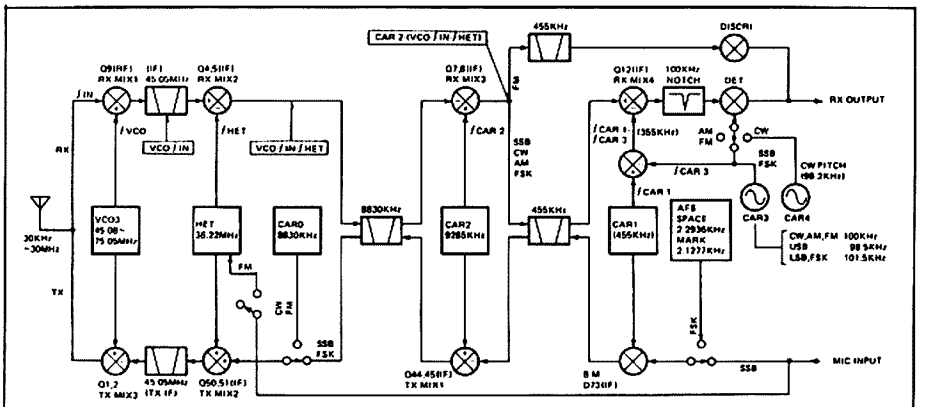


Fig. 1 TS-940S signal channel

75th Nostalgia

THE RIPPLE FROM THE SOUTH

Alf Chandler VK3LC
15 Point Avenue, Beaumaris, Vic. 3193.

The writer first became interested in wireless about 1920, when he was fifteen. He had been listening to Broadcast Station 3UZ on his cousin's wireless set which had been built by George Graham, a celebrity from Brunswick Street, Fitzroy, so the first project was to build a crystal set for myself to listen to the broadcasts. However, living in Beaumaris was a bit far for good reception on a crystal set so the next step was to build a one valve set.

By 1923 the equipment had advanced to a three valve set detector and two audios using 201A valves which I used to receive Madame Melba's opening of 3LO. My father ran a guest house which had a large hall and billiard room and it was in this hall that the wireless set became installed so the neighbours could come and listen to this new fangled set-up. Unfortunately, it was not realised that a hall full of people would dampen the reception and it was necessary to be quite near the set to hear anything.

In 1924, having left Scotch College and working in the guest house I decided it was time to learn more about wireless and perhaps go to sea as a wireless operator; I took a correspondence course in Wireless Telegraphy with the Marconi School of Wireless. A valve set was constructed to listen to VIM and ships in the bay on 600m. This set used three honeycomb coils inductively coupled on hinges, and 201A valves. A gramophone with records of Morse code was also attained which assisted the learning of the code.

After about eight months, a call was received to attend the school in Melbourne and complete the course, and in 1925 their exam was passed for 20WPM Morse, theory and practice.

For the practical exam we had a rotary gap spark transmitter in the basement at Queen Street, power is forgotten but there was a ventilator above into the footpath. (When the key was pressed, passersby would get the fright-of-their-lives!) There was a fault in this transmitter and I was asked to find it. What a fault! A piece of paper had been placed between the contacts of the key.

After the exam, the instructor lined the class up (about six or eight lads) and introduced us to a fellow who said, "I have a job for one of you, whoever steps out first gets the job." I was first out and started employment with Crystal Clear Radio on the corner of Bourke and Swanston Streets. After about nine months an offer was made to join a tramp steamer plying from Darwin to Broome as a Wireless Operator/Purser. Being only 19 at the time and not being too versed in the ways of the world, the offer was declined and I remained with Crystal Clear until their demise in 1927.

An experimental licence was applied for in 1926 with the call sign 3WH being allocated. I then became quite active with CW on the 30 and 80 metre bands. Trevor Evans 3NS initiated me into the "Rag Chewers Club" in 1927.

Upon joining the newly formed Victorian Radio Transmitters League (VRTL) in 1927 as Communications Manager I met with Jack Kling 3BJ, Harry Clift 3HC, Bill Gronow 3WG, Geoff Frew 3PM, Allan Reid 3JR, Chris Rainbow 3CR, Bill Martin 3MJ, Leo Paul 3LP, Bill Seivers 3CB, Charlie Whitelaw 3BH, Ron Jardine 3PR, Col Chirnside 3WQ and many others. This organisation, a branch of the Australian RTL with Mat O'Brien 4MM as President and Leo Feenaughty 4LJ as Secretary, was a break-away group of members who were disillusioned with the WIA at that time.

I joined the WIA in 1928 when, after a meeting between the secretaries of the WIA and ARTL, the two bodies merged with the WIA retaining its identity and the ARTL being totally absorbed. This meeting was ostensibly to present 3WH with a pennant as winner of an 80 metre contest.

After being a member of the WIA Airforce Reserve for some years, resigning in 1937, I enlisted in the RAAF in October 1940.

Training was done at Point Cook and after passing out parade posting was to Ballarat, No 1 WAGS (Wireless Air Gunners School) mustered as Wireless Operator Ground. After many promotions a posting came through to Townsville and then to Cairns in charge of signals at the Radar Zone Filter Station.

In October 1945 I was discharged from the RAAF and it was to be another ten years before amateur radio became an interest again. It was during a reunion of WAGS personnel when Fred Bail, Roth Jones and Peter Lemprierre were talking of what they were doing on 20 metres, that the bug bit again. An application was made for a call sign and VK3LC allotted, a call sign which is still heard quite frequently today.

FOOTNOTE:

From 1963-1970 Alf was a member of the WIA Publications Committee, firstly as Circulation Manager and subsequently as Magazine and Publications Manager.

In 1967 he became Intruder Watch Co-Ordinator for VK3, a position he held until 1970 when he became Federal Intruder Watch Co-Ordinator. In 1975 the IARU were in need of a co-ordinator and Alf filled the bill, a position he retained until 1982.

Awards presented to Alf in recognition for his services to amateur radio are:

1978 — the Ron Wilkinson Achievement Award 'In recognition of outstanding achievement in the field of Intruder Watch activities'.

1983 — a silver medallion 'For meritorious service to the Victorian Division of the WIA'.

1984 — a silver plaque which reads 'Our appreciation to AWH Chandler VK3LC for his long term (1975-1982) contribution to the Association as Regional IW Co-Ordinator. IARU Region 3 Association'.

1985 FEDERAL CONVENTION

The 49th Annual WIA Convention was held in Melbourne from the 26th to 28th April 1985. Federal Councillors and Alternate Federal Councillors from all Divisions attended. Observers were present from VK3 and VK5. All members of the Executive were in attendance, along with several Federal Co-ordinators and members of the Federal Technical Advisory Committee.

The Executive, elected to serve for 1985, is as follows:

President *David Wardlaw VK3ADW*
Alan Foxcroft VK3AE
Earl Russell VK3BER
Peter Wolfenden VK3KAU
Michael Owen VK3KI
Ron Henderson VK1RH
Ross Burstal VK3CRB
Jack O'Shannassy VK3SP
Bill Rice VK3ABP
Gordon Bracewell VK3XX.

The President, David Wardlaw, opened the Convention by welcoming the delegates and asking the Convention to stand for one minutes silence in memory of Peter Dodd VK3CIF, the first full-time Secretary/Manager of the Institute.

The Convention then moved on to the Reports of Federal Officers (some 17), the President's Report is reproduced later in this article. Other reports of note were: the Report of the IARU Officers which dealt with the continuing problems of the IARU Constitution and 10MHz narrow band usage.

The Convention endorsed the Constitutional amendment proposals to be discussed further with the ZL IARU representative at the NZART Conference. The conflicting needs of the 10MHz band plan were discussed, the value of voice modes, in our geographical isolation was acknowledged, but the International recommendations should be observed. The Convention agreed to qualify the Australian band plan in the respect that narrow band usage be adopted for communications beyond the Australian call areas.

The Treasurer's Report gave an overview of operations in conjunction with the Auditors figures and some form of indexing the reserves of the Institute was agreed.

The Editor made the delegates aware that Amateur Radio was being produced within the budget predicted and there was spirited discussion on the subject of the type size. The questionnaire, which members received with this year's subscription renewal, had proved a useful exercise. Members of the Publications Committee were still to study the final Report.

After discussion of the reports, the Convention moved to agenda items:

Minor amendments to the Articles and Memorandum of Association of the Federal body were discussed and agreed unanimously. These changes are before the Corporate Affairs Office (Victoria) for agreement.

The rationalisation of the VK0 and VK9 call areas were discussed and it was agreed that the Executive should approach the Department of Communications at its next Joint Meeting. As examples of the proposal, VK0H . . would refer to Heard Island and VK9X . . would refer to Christmas Island.

The WICEN calling frequencies as published in Amateur Radio were adopted.

A proposal to remove the age limit on licences was discussed and it was agreed that representations to the Administration should be made that licences be issued in respect of ability to pass the required examination.

The position of HF beacons was debated and the IARU representatives given guidance to take the IARU Region 111 Conference in November.

It was agreed to create a Trust Fund for the training and assistance of potential amateurs in the developing islands of Region 111. The funding of this Trust to consist solely of donations/bequests from members.

The mechanism of band planning was discussed and agreed upon, this motion was to ensure that hasty decisions would not be made.

The Convention decided that the Divisional subscription table would no longer be printed in Amateur Radio or any other publication in the future, as the differential in subscriptions shown in the tables as printed, did not clarify the different services offered by each Division.

A motion to frequency restrict contests, as carried out by some other Societies, was discussed at length — the final agreement being that the Federal Contest Manager could restrict the frequencies used in contests at his discretion.

The Convention discussed the policy with regard to Packet Radio. It was agreed that the matter of Protocols should not be included in the policy statement when issued as it was felt that by recommending protocols experimentation could be inhibited. The policy statement should only address itself to Regulatory and Operational requirements. The Federal Technical Advisory Committee was tasked with raising a draft policy for discussion.

This is a very brief outline of some of the items discussed and voted upon, if you require more detail, please contact your Federal Councillor.

PRESIDENT'S REPORT — 1984/85

75TH ANNIVERSARY

The WIA, the world's oldest national amateur radio society, is 75 years old this year. Naturally the Executive has spent a reasonable amount of its time in ensuring that this Anniversary will be adequately celebrated.

A 75th Anniversary Co-ordinating Sub-committee, chaired by Jack O'Shannassy VK3SP, was created at the first meeting of the Executive for the year. Other members of the Committee are Peter Wolfenden VK3KAU, Jim Linton VK3PC, Earl Russell VK3BER, Greg Williams VK3BGW, Max Hull VK3ZS, John Hill VK3WZ and Reg Macey. Thanks must go to this Committee for all the hard work they have put in.

All Divisions are participating in Anniversary activities which have been well publicised in Amateur Radio.

Australia Post will be issuing a pre-stamped envelope in recognition of our 75 years of existence. Max Hull, a past Federal President, and the present Federal Historian, has been a major force in this achievement. I must admit that we had originally hoped for a commemorative stamp, but, as explained by Australia Post, we unfortunately did not meet the criteria for the issue of a special stamp.

In November there will be a special Anniversary Dinner — a very important guest being Dick Butler, the Secretary-General of the ITU.

A special Anniversary Call-sign, VK75A, has been authorised by the Department of Communications. The issue of this call-sign was a special and important gesture by the Department of Communications in recognition of our 75 years of existence.

The CW Contest will already have been held, and there is to be a National "Foxhunting" Contest.

COMPUTER "IN HOUSE"

In accordance with a resolution of the last Federal Convention, the WIA has purchased its own computer at a very competitive price, and like most other users of new computers, has run into the usual teething troubles. However at the time of writing this report it appears that all problems have been resolved. The computer is a Dual Processor 8/16 bit Cromemco System One.

RADIO COMMUNICATIONS ACT

The Radio Communications Act was passed in September 1983, but at the time of writing this Report, still has not been proclaimed. Naturally there will be a new set of regulations under this Act, and I am pleased to report that the WIA was offered every opportunity to comment on various drafts of the Radio Communications Bill and was successful in having most of its comments acted upon.

The value of the ability to be able to input material during the drafting of the Bill is almost impossible to estimate. We, in Australia, are lucky to have such good liaison with our DOC.

The length of time it has taken to proclaim the new Act has led to problems with the Amateur Operator's Handbook. Copies of the old book have run out and more are needed for exam candidates. DOC proposed that an interim update be produced to provide information for exam candidates. Even without the new Act there are a number of changes that arise from concessions gained by the WIA since the last revision of the Handbook in 1978. Also there are a number of changes due to WARC 79, not only in frequency bands but also in the classification of emissions. DOC put pressure on the WIA to produce comment on their draft of this interim handbook. With very little lead time the Divisions rose to the occasion and provided the CASPAR Committee with comment at very short notice.

The CASPAR Committee prepared a comment based on a limited life temporary Handbook. As many of the comments from the Divisions also contained matters that could well be applied to a complete revision of the Handbook, they were, at that stage, put to one side for future use. Time went by and no action on printing by the DOC. In the meantime CASPAR was charged with looking at the existing regulations under the Wireless Telegraphy Act and their relevance to existing practices and privileges of amateurs. Further discussions with DOC made it apparent that a much more detailed revision may take place and that the old book will be reprinted as a stop gap. CASPAR luckily has a deal of material on hand for further negotiations.

DUAL CHANNEL TV SOUND CH0. CH5A

The introduction of dual channel sound for TV broadcasting in Australia is a matter of grave concern to the WIA. This is because the occupied bandwidth will be greater than the 7MHz allocated channel width and TV channels are adjacent to our 2 VHF bands. The WIA has exchanged correspondence with the Minister and we feel his replies are not completely satisfactory, particularly with reference to prior consultation, and also the apparent new method of frequency planning on the 'give and take' principle. However, one item of good news is that there is a sunset on Ch5A albeit somewhere in the future.

The extension of the use of Ch0 by the SBS — although a problem for those 50MHz operators in South Australia and Tasmania, who had hoped for more liberal use of the low edge of the 50MHz band — gives the public more time to learn about UHF, while keeping other new TV stations from

obtaining access to Ch0. The Minister has pointed out the reception problems of Ch0 stations and says it is unsuitable for metropolitan areas. However, it still remains an Australian TV allocation. SBS will cease using Ch0 from December 1985.

The DOC was aware of our concern about the possibility of additional interference to amateur stations by TV stations using dual carrier sound on TV channels adjacent to our band, and requested a meeting to specifically discuss the subject.

It was said that offsets could and probably would be used which would prevent any increase in interference to amateurs from dual carrier sound as used on Ch5A and CH0.

ATV on 576MHz

With the increasing usage of the UHF band for TV the 576MHz temporary allocation to amateurs could be in jeopardy. A submission has been made to the Secretary of the DOC outlining a number of alternatives which would allow ATV continued access to this part of the spectrum. One proposition is that as its use is for ATV, the frequency need not necessarily be uniform throughout Australia. To date we know the submission is receiving attention within DOC.

IMPORT DUTY

The importation of amateur transceivers under by-law entry continues where the technical expert advisers to the Institute certify that the specific equipment will not transmit on other than amateur bands without substantial modification. This requires the certification of individual batches of equipment. In order to cover costs a fee is charged which, as was indicated in the original announcement of the scheme, is not waived. The scheme certainly poses problems for the individual amateur importer, but at the time the scheme was considered to be a compromise that would provide benefit to the greatest numbers.

When the Radio Communications Act is proclaimed it would appear that a new set of conditions would apply which should change the WIA's involvement.

PHONE PATCH

On the matter of phone patch Telecom would not waive the $2.00 per month charge, but there would be no timing charge for calls from amateurs.

EXAMINATIONS

The WIA and the DOC are closely co-operating in the examination area. We have been asked to give assistance in the preparation of material for examinations and are in a position to monitor standards. The DOC has expressed their gratitude as to our assistance, particularly as they wish to make it as easy as possible for candidates to sit for all parts of the examinations and thus require many more different papers to be available. Of course the overall responsibility for the exams in all aspects lies with the DOC.

The DOC has now formalised its arrangements for testing amateurs who so desire at higher Morse code speeds — a fee of $20.00 is to be charged and a formal letter accreditation will be provided.

JOINT MEETINGS

The WIA and DOC continues to hold their regular quarterly joint meetings, at these meetings agreement and clarification has been reached on many subjects. The DOC has agreed that there will be no difficulty in these meetings continuing in Melbourne even after the transfer of the remainder of central office staff to Canberra.

AMATEUR SATELLITES

During the year there will be an ITU World Administrative Conference to deal with planning the Geostationary Satellite Orbit. The Agenda for this conference covers all satellite services including the Amateur Satellite Service.

A CCIR Conference Preparatory Meeting produced a report which makes no suggestion to alter the conditions applying to the Amateur Satellite Service. There is remote possibility that the Amateur Satellite Service could be swept up in some broad Satellite regulations which are not appropriate to the Amateur Satellite Service. The WIA is in contact with members of the Australian delegation, and has indicated our concern as to this possibility. The IARU will be represented at the Conference.

STANDARDS

During the year the WIA became a contributing member of the Standards Association of Australia and is represented on Committee TE3 by Alan Foxcroft VK3AE, who chairs the working group on immunity. Dick Huey VK2AHU and Jim Lloyd VK1JL are also involved in helping the WIA on Standards Association matters in a number of areas, including the Standard involving non-ionising radiation.

PACKET RADIO

During the year the implications of packet radio have been studied by the FTAC with submissions having been received from a number of sources. (The DOC has also shown some interest in this aspect of amateur radio). The matter of protocols seems to have caused some controversy but this is not an important regulatory issue so much as an internal amateur issue. To date the approach is to leave as much self regulation as possible within the understood bases and purposes of the amateur service. No doubt much more will be heard on the subject in the future.

THIRD PARTY TRAFFIC

The Institute has requested that DOC conclude third party agreements with at least the same countries that have agreements with Canada and USA. The replies received so far have not been very helpful.

AMATEUR ADVISORY COMMITTEES

On studying the WIA submission on Amateur Advisory Committees, the DOC replied to us in the following manner:

While the Department recognises the valuable contribution made by AACs to the Amateur Service since their inception, it has been decided that the rigid committee structure should be discounted and replaced with informal meetings. Noting, however, the differing views within the Institute on AACs, the format and timing of these informal meetings will be left open to negotiation between State Managers and the Institute's Divisional representatives. It is considered that this flexible arrangement should cater for individual State requirements and continue to provide a valuable forum for liaison between the amateur fraternity and the Department.

IARU

The matter of an international amateur licence and reciprocal licensing will be the subjects for WIA submissions to the IARU Region 3 Conference in Auckland this year.

At a meeting of the Executive a presentation was made to Alf Chandler VK3LC, on behalf of the IARU Region 3 Association in recognition of his work as Region 3 Intruder Watch Co-ordinator for many years.

The WIA has been invited to attend the NZART Conference in Christchurch this year. This is in accordance with an arrangement made some years ago where one year the NZART would be represented at the WIA Federal Convention and the next year the WIA would attend the NZART Conference and so on. These reciprocal visits have proved to be very fruitful. This year there is the very important issue of amendments to the new IARU Constitution to be discussed. The WIA and the NZART hold similar views on many aspects and a unified approach could vastly help to put these matters across with a great deal more strength.

At the IARU Conference at the end of the year, there are a number of matters, apart from the Constitution, which will be the subject of Agenda items from the WIA. Many of these matters arise out of Federal Council resolutions.

The WIA received a copy of a notice of proposed Rule making by the FCC (USA) which concerned the assignment of a fequency between 7.100 and 7.300MHz for a shortwave broadcasting station on Guam Island, which is administered by USA but is within ITU Region 3 and therefore could have an allocation within this band unlike the rest of the stations administered by the FCC which are in Region 2. In Region 2, 7.100-7.300MHz is an amateur band, not a broadcast band. While understanding the facts of regional allocations the WIA corresponded with the ARRL expressing our worries. A reply from the ARRL has let us know that they have submitted an objection to this Notice of Rule Making. To date the results are unknown.

SPECIAL LEGACY

A legacy of $500 was received from the Estate of the late W Otty. In order that this is not lost in general funds, this legacy will be used to update our promotional material.

DEATH OF PETER DODD

In early March this year Peter Dodd VK3CIF, our first Secretary-Manager, passed away. In his 12 years of tireless service to the WIA Peter was intimately involved in many advances made by the WIA during the period. This year Peter volunteered to assist Max Hull with the preparation of Historic material for the 75th Anniversary. Unfortunately his deteriorating health forced him to relinquish the job.

DUTIES

As Bill Rice VK3ABP is now Editor of Amateur Radio, he felt he could no longer act as Chairman of FTAC, and Peter Gamble VK3YRP has taken over the position.

Gordon Bracewell VK3XX was appointed Chairman of the CASPAR Committee last year. His Committee has been working on the Amateur Operator's Handbook and also the regulations under the Act.

It is with sadness I report the death of our Federal Awards Manager, Hugh Spence VK6FS. Bill Hempel VK4LC has taken over the job.

Thanks to Fred Robertson-Mudie VK1MM for all the work he is doing for the Executive.

This year we have a new Contest Manager, Ian Hunt VK5QX a well-known Contester and past President and Federal Councillor of the VK5 Division, I thank Ian for taking on this difficult job. In his report, Ian is putting a number of matters to the Federal Council. A postal motion on several contest matters was deferred until the Convention as Article 44 of the Constitution was invoked.

For the first time in the history of the WIA a member of the Executive, Ron Henderson VK1RH lives interstate — this was possible because Ron's work brought him to Melbourne regularly. Ron is also the Federal WICEN Co-ordinator, and took on the task of updating the WIA policy book and has produced an updated listing of WIA policies.

Early this year we lost a hard worker when Tony Tregale VK3QQ resigned from the position of EMC Co-ordinator and as a member of the Executive. Tony has extended a great deal of effort in providing the EMC service for the WIA and our sincere thanks go to him for this.

Alan Foxcroft VK3AE Federal Vice-Chairman, represents the WIA at the SAA.

Jack O'Shannassy VK3SP and Peter Wolfenden VK3KAU have been very busy on the 75th Anniversary Committee.

Earl Russell VK3BER is very much involved with the WIA Computer and office liaison.

Ross Burstal VK3CRB our new treasurer, has capably filled this position vacated by Courtney Scott VK3BNG.

Michael Owen VK3KI is joint IARU Liaison Officer and provides valuable help on constitutional, legal and administrative matters. He is also a director of the IARU Region 3 Association.

Our Intruder Watch Co-ordinator, Bill Martin VK2COP has had some success this year.

In other fields:

Greg Williams VK3BGW, Contest Manager.

Neil Penfold VK6NE, Federal QSL Manager.

Fred Robertson-Mudie VK1MM, Federal RTTY Co-ordinator.

Max Hull VK3ZS, Federal Historian.

John Ingham VK5KG, Federal Video-tape Co-ordinator.

Brenda Edmonds VK3KT, Federal Education Co-ordinator.

John Stevens VK4AFS, Federal Asert Co-ordinator.

Graham Ratcliff VK5AGR, Federal AMSAT Co-ordinator.

Bill Roper VK3ARZ and Ron Fisher VK3OM continue to provide that valuable service, the Federal Broadcast Tapes.

I would like to pay tribute to our Secretary-Manager, Reg Macey and his staff:

John Hill VK3WZ, Advertising Manager (part time).

Mrs Ann McCurdy (part time).

Mrs Helen Wageningin (part time).

OFFICE

This has been a hard year in the office with the acquisition of our own computer, which has necessitated considerable re-arrangement of the office and procedures. Those visiting will appreciate the improvement.

Reg has been a tower of strength to me and I hope you all appreciate the hard work he puts into the job. Reg is the only full time officer, the other staff are employed on a part time basis.

The Federal office has continued to provide support to myself and the Executive and through them to the Divisions and membership as a whole. During the year the Secretary has made further changes to the physical layout of the office as well as giving it a much needed coat of paint. This has given the staff a more amenable working atmosphere as well as providing a better environment for Executive and sub-committee meetings. Some changes were necessitated because of the introduction of the new computer and associated hardware. All office equipment likely to produce distracting noise is now grouped at one end of the office.

Despite the re-arrangement within the office it is still overcrowded and lacking storage space. This is becoming a serious problem and one to which the Executive must address itself in the near future.

The general workload on the office is steadily increasing, in part because of the organisation involved with the 75th Anniversary activities. Much of this extra workload has had to be handled by the Secretary himself, partly because of its nature but mainly because the other office staff are fully occupied with their own regular duties. There is far more work than one person should be expected to handle even though the Secretary regularly writes up minutes of meetings in his own time. The Executive has been able to provide some voluntary assistance to the office to alleviate the necessity to employ temporary staff.

It is anticipated that when the computer system is fully operational this situation will be eased.

Betken Productions continued to contribute to the high standard of "Amateur Radio" this year and by diligent negotiations enabled us to hold our costs down in a number of areas.

It is disappointing to note that there was a slight reduction in the number of members last year. I hope that in this our 75th year we will have a significant increase.

In closing this report I would like to thank all those of you who provided me with such great assistance throughout the year.

DAVID WARDLAW VK3ADW,
FEDERAL PRESIDENT

MEMBERSHIP STATISTICS

All statistics are to 31st December 1984 (previous year in brackets). DOC statistics (as supplied to WIA) refer to licences issued, where WIA statistics refer to individual amateurs.

APPENDIX 2

Attendance at executive meetings from 17th May 1984 to 18th April 1985 inclusive.

	Attended	Maximum No. Possible
Mr D Wardlaw	13	13
Mr A Foxcrott	13	13
Mr E Russell	11	13
Mr R Burstal	10	13
Mr W Rice	13	13
Mr T Tregale	6	8
Mr J O'Shannassy	11	13
Mr P Wolfenden	10	13
Mr M Owen	7	13
Mr R Henderson	6	13
ALSO ATTENDED:		
Mr R Macey	13	
Mr G Bracewell	5	
Mr P Gamble	8	
Mr B Bathols	2	
Mr C Scott	1	
Mr K Seddon	1	
Mr I Hunt	1	
Mr R. Hartkopf	1	
Mr J Hill	1	
Mrs B Edmonds	2	

DIRECTORS' REPORT

The Directors of the Wireless Institute of Australia submit their report with respect to the profit of the Institute for the financial year ended 31st December 1984 and the state of the Institute's affairs as at that date.

The Directors of the Institute in office at the date of this report are:

Wardlaw, D.A.	VK3ADW	President
Foxcroft, A.	VK3AE	Vice President
Burstal, R.A.	VK3CRB	Honorary Treasurer
Wolfenden, P.A.	VK3KAU	
Russell, E.R.	VK3BER	
O'Shannassy, J.A.	VK3SP	
Owen, M.J.	VK3KI	
Henderson, R.G.	VK1RH	
Rice, W.M.	VK3ABP	

The principal activities of the Wireless Institute of Australia are to:

(a) Represent generally the views of persons connected with amateur radio in the Commonwealth of Australia, its territories and dependencies.

(b) Promote the co-operation between the Divisions in the encouragement and development of amateur radio.

(c) Safeguard the interest of the Divisions and the members in relation to frequency allocations rights and privileges.

(d) Promote the development progress and advancement of amateur radio in all matters in relation to amateur radio in general.

The profit of the Institute for the year ended 31st December 1984 was $18,078 (1983 profit $13,946). No provision for income tax is required as the Institute is exempt from paying income tax under the provisions of the Income Tax Assessment Act.

No dividends have been paid or declared since the end of the previous financial year.

There were no material transfers to or from reserves or provisions during the financial year, other than those disclosed in the accounts.

In the opinion of the Directors the results of the Institute's operations were not substantially affected by any item, transaction or event of a material nature.

The Directors took reasonable steps before the profit and loss statement and balance sheet were made out to:

(a) Ascertain what action had been taken in relation to the writing off of bad debts, and adequate provision to be made for doubtful debts.

(b) Ascertain whether other current assets would realise, in the ordinary course of the business, their value as shown in the accounting records of the Institute, or to see that the unrealisable portion had been fully provided for if not already written off.

At the date of this report:

(a) The Directors are not aware of any circumstances which would render the amount written off for bad debts or the amount of the provision for doubtful debts inadequate to any substantial extent.

(b) The Directors are not aware of any circumstances which would render the values attributed to current assets in the accounts misleading.

(c) There does not exist any charge on the assets of the Institute which has arisen since the end of the financial year, and secures the liability of any other person.

(d) No contingent liability has arisen since the end of the financial year.

(e) The Directors are not aware of any circumstances not otherwise dealt with in this report or accounts which would render any amount stated in the accounts misleading.

No contingent or other liability has become enforceable, or is likely to become enforceable, within the period of 12 months after the end of the financial year which, in the opinion of the Directors will or may substantially affect the ability of the Institute to meet its obligations when they fall due.

In the interval between the end of the financial year and the date of this report no item, transaction or event of a material and unusual nature has arisen that is likely, in the opinion of the Councillors, to affect substantially the results of the Institute's operations for the next succeeding financial year.

No Director of the Institute has, since the end of the previous financial year, received or become entitled to receive a benefit.

The auditors, Messrs Hebard & Gunning, have informed the Institute that following upon an amalgamation of firms they are now practising in the name of Touche Ross & Co. The Directors have agreed to the continuation of their appointment in that name and accordingly the audit opinion for the current year has been issued in the name of Touche Ross & Co.

Signed: D.A. Wardlaw
R. Burstal

WIRELESS INSTITUTE OF AUSTRALIA DIRECTORS' STATEMENT

In the opinion of the Directors of the Wireless Institute of Australia:

(a) The Profit and Loss Statement is drawn up so as to give a true and fair view of the Profit of the Institute for the financial year ended 31st December 1984.
(b) The Balance Sheet is drawn up so as to give a true and fair view of the state of affairs of the Institute as at the end of the financial year.
(c) At the date of the statement, there are reasonable grounds to believe that the Institute will be able to pay its debts as and when they fall due.

Signed on behalf of the Council

AUDITORS' REPORT TO THE MEMBERS OF WIRELESS INSTITUTE OF AUSTRALIA

We have audited the accounts in accordance with Australian Auditing Standards.

In our opinion:

(a) the accounts are properly drawn up in accordance with the provisions of the Companies (Victoria) Code and so as to give a true and fair view of:
(i) the state of affairs of the company at 31st December, 1964 and of the profit of the company for the year ended on that date;
(ii) the other matters required by Section 269 of that Code to be dealt with in the accounts;
and are in accordance with Australian Accounting Standards.
(b) the accounting records and other records, and the registers required by that Code to be kept by the Company have been properly kept in accordance with the provisions of that code.

INTERNATIONAL NEWS

THE 60TH ANNIVERSARY OF IARU

In every walk of life, achievement results in great part from the ability of leaders to have a vision of the future, from their ability to look beyond today's petty problems and see what might be.

Thus it was that in 1924 Hiram Percy Maxim and the American Radio Relay League (ARRL) realised that amateur radio had become international in scope, and that there ought to be an international organisation, to take advantage of the progress and to tackle the problems that would surely attend such a growth. So in March 1924, Mr Maxim met with a group of talented amateurs in Paris, and made preliminary plans for an international organisation to be known as the International Amateur Radio Union (IARU), with a Congress to be held in April 1925 to effect the permanent organisation. Present at the 1924 meeting were enthusiastic representatives from France, Great Britain, Belgium, Switzerland, Italy, Spain, Luxembourg, Canada and the USA.

During the Easter holidays of April 1925, the amateur radio representatives of 23 countries met again in Paris to officially create the International Amateur Radio Union and to adopt a constitution. The original IARU differed a bit from what we have today, but the goals were much the same — to promote and co-ordinate amateur radio worldwide, to encourage fraternalism and to represent amateur radio at international conferences. In the original organisation, individual amateurs became members of IARU, and Mr Maxim was member number one. While most of the 23 countries represented at the first meeting were from Europe, there were also representatives from North and South America, and from Japan.

On 17 April 1925, the constitution of IARU was unanimously adopted, and on 18 April, at the final plenary session (by which time 25 countries were in attendance), all actions of the organising Congress were approved, and the International Amateur Radio Union was born.

As an aside, it is fascinating to note that two individuals who participated in those 1924/1925 meetings are still alive and are active radio amateurs. One is Dr Giulio Salom I0ACL, operating on the air regularly from his homes in Venice and Rome. He visited the Region 1 IARU conference in Cefalu, Sicily last year, and he is a hale and hearty 82 years of age. Dr Salom is a physical sciences and law graduate, and served for 30 years in the Italian Navy. The other IARU pioneer is Jean Wolff LX1JW, who is a familiar figure at amateur radio meetings throughout Europe and in the USA. He served the US Army with distinction in WW II, and was a member of the Luxembourg telecommunications administration. He, too, is in fine health and is a great source of knowledge about amateur radio throughout the years.

Although IARU started out life with individual memberships, it was later changed to a union of member-societies, and now has 121 national societies as members, with two more applications pending. As a result, IARU represents the international interests of one and a half million radio amateurs.

The history of IARU has been that of gradually increasing effectiveness, and there are clear signs that the effectiveness has increased markedly in the past decade. The Union has grown from one whose emphasis was largely on the issuance of Worked-All-Continents certificates and the reporting of exploits of long-distance communication (DX), to one whose primary emphasis is on the preparation for international telecommunications conferences.

And yet, back in 1925, in the earliest days of international radio regulation of any sort, when international DX was still a rare occurrence, those men of vision who put together the first IARU constitution recognised that preparation for conferences was an important goal for IARU.

It was the continued emphasis on that goal of conference preparation that led to the restructuring of IARU subsequent to 1979, a restructuring that has made IARU more truly international not only in scope but in administration and leadership. Now, the decisions made in the name of IARU are reached by a body — the IARU Administrative Council — which has on it two representatives from each of the three IARU regions.

There are some growing pains when adapting to a new organisational structure, but there is every indication that it is better prepared to handle the next General WARC than it was for WARC-79. IARU has a more truly international leadership, and continue to have the substantial support of ARRL, whose distinguished president, Hiram Percy Maxim, got the ball rolling in the first place 60 years ago.

In the history of mankind, 60 years is but the blink of an eyelid, hardly to be noticed. In the history of amateur radio, 60 years is a long time indeed.

(The above was originally written for the April 1985 issue of QST, the official journal of ARRL, which serves as the International Secretariat of IARU.)

HF BAND PLANS

At its meeting in Paris last July, the Administrative Council of the IARU requested that the Secretaries of the three Regional Secretariats send copies of regionally adopted band plans to the International Secretariat for publication "in a format that will permit comparison".

Here are the band plans for the bands below 30 MHz. The plans that have been adopted for bands above 30 MHz will be presented in the future.

The members of the Administrative Council are to attend the November meeting of the Council prepared to discuss the band plans, with the objective of adopting such internationally recognised band plans as may be appropriate at that time.

The only band plan adopted so far by the Union itself is as below.

21.000-21.150 MHz — Telegraphy only
21.150-21.450 MHz — Telephony (AM and FM) and Telegraphy

This appears, as Rule 8, in the Summary of Miscellaneous Rules (which are still in effect under the new Constitution, pending a review scheduled for the aforementioned Administrative Council meeting).

Region 1

The IARU Region 1 Division has adopted the following band plans:

3.500- 3.800 MHz	*CW*
3.580- 3.620	*RTTY*
3.620- 3.800	*Phone (except 3.730-3.740 MHz)*
3.730- 3.740	*SSTV*
7.000- 7.100 MHz	*CW*
7.035- 7.040	*RTTY and SSTV*
7.040- 7.100	*Phone*
10.100-10.150 MHz	*CW*
10.140-10.150	*RTTY*
14.000-14.350 MHz	*CW*
14.080-14.100	*RTTY*
14.100-14.350	*Phone (except 14.225-14.235 MHz)*
14.225-14.235	*SSTV*
18.068-18.168 MHz	*CW*
18.100-18.110	*RTTY*
18.110-18.168	*Phone*
21.000-21.450 MHz	*CW*
21.080-21.100	*RTTY*
21.150-21.450	*Phone (except 21.335-21.345 MHz)*
21.335-21.345	*SSTV*
24.890-24.990 MHz	*CW*
24.920-24.930	*RTTY*
24.930-24.990	*Phone*
28.000-29.700 MHz	*CW (except 28.200-28.300 and 29.300-29.550 MHz)*
28.050-28.150	*RTTY*
28.200-28.300	*Beacons*
28.300-29.700	*Phone (except 28.675-28.685 and 29.300-29.550 MHz)*
28.675-28.685	*SSTV*
29.300-29.550	*Satellite*

Region 2

So, far, IARU Region 2 has adopted band plans only for the 10, 18 and 24-MHz bands, which are identical with those of Region 1.

Region 3

Below are the band plans adopted by the IARU Region 3 Association. Note that RTTY is permitted in the entire 10-MHz band.

10.100-10.150 MHz	*CW and RTTY*
18.068-18.168 MHz	*CW*
18.100-18.110	*RTTY*
18.110-18.168	*Phone*
24.890-24.990 MHz	*CW*
24.920-24.930	*RTTY*
24.930-24.990	*Phone*

TURKEY AND THAILAND AUTHORISE AMATEUR RADIO

After many years of efforts by Turkiye Radyo Amatorleri Cemiyeti (TRAC), the Turkish government has legalised the amateur service. The first license was issued on 30 January to Dr Unal Akbal, who is General Secretary of TRAC. Unal's official callsign is TA1A.

TA1A is the prefix for Istanbul, while the Asian part of the country is divided into seven call areas: TA2 through TA8. Privileges are all bands (including the WARC bands), all modes, up to 400 watts PEP.

During 1984, the Royal Thai Government authorised the use of two callsigns by the Radio Amateur Society of Thailand (RAST) on five special occasions. HS0A was operated in the Seanet DX, European DX, and CQ Worldwide Phone Contests, and at the RAST 20th anniversary celebration in November. The other authorisation was granted in July for the operation of HS0JUA on behalf of UNICEF. RAST is working towards full recognition and legalisation of amateur radio by the administration.

Congratulations to all those whose persistence made these achievements possible in Turkey and Thailand.

ANNIVERSARIES

1985 is the 60th anniversary year for IARU. In addition, this year marks special anniversaries for many of its member-societies, including the WIA's 75th Anniversary.

Three societies celebrate their 60th anniversary: Reseau des Emetteurs Francais (REF), South African Radio League (SARL), and Foreningen Sveriges Sandareamatorer (SSA).

In conjunction with its annual convention, the French society organised the first Radio Telecom Show in Chateauroux on 25-27 May.

Festivities to mark the 60th anniversary of SARL centred around its annual general meeting over the first weekend of April.

The Swedish society will issue a 60th anniversary version of the popular operating award it sponsors: WASM-60. Only contacts made during 1985 are valid for this special award.

Two societies were founded in 1945, thus celebrating the 40th anniversary this year. They are VERON of the Netherlands, and CREN of Nicaragua.

The Korean Amateur League (KARL) held its 30th anniversary ceremony on 28 April. A special station, signing HL30HQ, was QRV from 25 April to 1 May. In addition, the KARL 30th Anniversary Award will be issued to those who have contacted 30HL stations during the first four months of this year.

Other societies for whom 1985 is a special year are: GARC of Grenada (30th anniversary), ABARS of Antigua and Barbuda, FRA of Faroe Islands (20th anniversary), and SLARS of Sierra Leone (10th anniversary).

Congratulations to all!

TSUKUBA EXPO ON AIR

The Japan Amateur Radio League (JARL) has established a special amateur radio station at the Tsukuba Science Expo '85, which is being held in Tsukuba Science City, Ibaraki, Japan, from 17 March to 16 September, 1985. Signing 8J1XPO, the station is QRV in the 3.5, 7, 14, 21 and 28-MHz bands with a maximum output power of 500 watts. Transmission can be made in CW, SSB, RTTY, FAX and SSTV.

JARL asks amateurs who plan to go to this event to take their amateur radio license; any licensed amateur may operate 8J1XPO without individual authorisation by the Japanese government.

Further information can be obtained from: *Japan Amateur Radio League, 1-14-2 Sugamo, Toshima, Tokyo 170, Japan.*

UN AT 40 AWARD

On 24 October 1985, the United Nations will celebrate the 40th anniversary of the coming into force of the United Nations Charter signed in San Francisco in 1945. To celebrate this event, and in the spirit of developing friendly relations among nations, the United Nations Staff Recreation Amateur Radio Club is sponsoring the UN at 40 Award.

This award is available to any amateur radio station (or SWL) that has contacted two of the three amateur radio stations operating with the United Nations prefix, during the United Nations 40th anniversary celebration year from 1 January to 31 December 1985. Contacts can be made on any band or mode. The three stations are:

4U1UN at the United Nations Headquarters in New York, USA
4U1ITU at the International Telecommunication General Secretariat in Geneva, Switzerland
4U1VIC at the Vienna International Center in Vienna, Austria

Applicants must send a list of the stations worked, including date, time, mode, report and band. This list must contain a signed statement vouching for the bona fides of the application. The cost of the award is US$5.00 or 15 IRCs, of which US$4.00 will be donated to the United Nations Children's Fund (UNICEF).

The application must be sent before 1 February 1986 to: *United Nations Staff Recreation Council, Amateur Radio Club, United Nations, Room DC1-0724, PO Box 20, New York, NY 10017, USA.*

AR

AUSTRALIA'S FIRST ICOM DAY

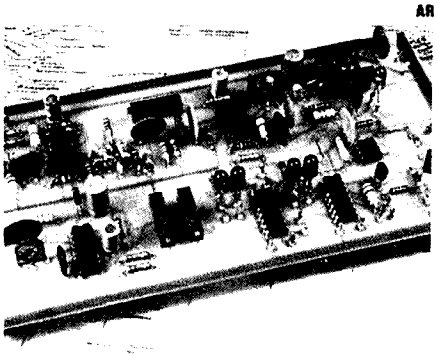
Icom Day, the first of its kind held in Australia, is being hailed as an unqualified success according to spokesmen from parties sponsoring it, Icom Australia and GFS Electronic Imports.

It was held on Sunday 14th April at GFS Electronic Imports' premises. An extremely bad electrical storm held off, fortunately, until the show was over. Both a range of Icom products as well as others handled by GFS were on display including a new range of Japanese antennas from Sagant Antenna Co.

Visitors to Icom Day were also given a live demonstration of Satellite TV which included programmes direct from the USA, Perth and Brisbane. It was also hoped that three new Icom products would make their debut on the day but due to Murphy, as well as some production delays, this didn't eventuate. Icom express their apologies to those who came especially to view these.

The IC-2A door prize, offered by Icom Australia, can be seen in the photo being presented to the winner, Tony Falla VK3XFK by Greg Whiter of GFS.

AR



RTTY/CW MOD-DEMOD

GFS Electronic Imports have available, in kit

AR SHOWCASE

form or fully assembled and tested, a radio teletype and CW modulator-demodulator which is designed to provide its user with satisfactory performance even under noisy HF operating conditions.

Known as the MDK-17 this radio modem uses a receive line-up that consists of an active 40 dB limiter and bandpass filter followed by a phase locked loop detector. Signal tuning is simplified by the inclusion of three LED indicators — Lock, Mark and Space.

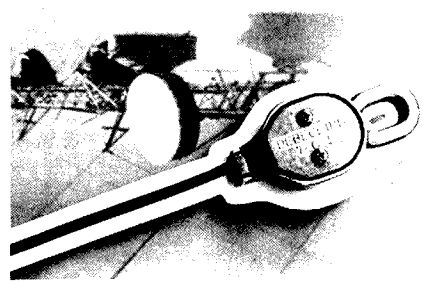
A wide range of shifts, tone frequencies and speeds are accommodated including those used in ASCII, AMTOR, SITOR and ARQ.

The MDK-17 can be interfaced with most of today's popular computers through its TTL level I/O port. Instructions are also included on the addition of RS-232 for those who require it. It additionally provides a direct high voltage current loop I/O for use on mechanical RTTY machines such as the Siemens 100 etc. High isolation between the current loop and the MDK-17s electronics is provided by an opto-coupler.

The MDK-17 kit is priced at $118 while the MDK-17 fully assembled and tested version is $181 plus $14 P&P in both cases.

For more details contact: GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic. 3132. Phone (03) 873 3777.

AR



SIMPLE TERMINATION CLIPS

New guy termination clips are now available from GFS Electronic Imports for their range of Debeglass tower guys. Debeglass is a high tensile strength, low elongation, non-corrosive, non-conductive guy wire substitute. Its extremely high strength, to cross section ratio is brought about by the use of a continuous filament fibreglass core sheathed in UV stabilised PVC. Four Millimetre DB-4 has a tensile strength of 430 kg while 5 mm DB-5 is rated at 560 kg tensile strength.

Up until recently standard termination procedures for Debeglass included the use of thimbles and "D" clamps. The new Debeclips offer an alternative to this which saves the installer quite a deal of time, particularly on a large installation.

Attachment of a Debeglass guy to a Debeclip simply involves knotting the end of the guy, inserting it into the clip then screwing on its cover.

HOME-BREW REGULATED POWER SUPPLY

Des Greenham, VK3CO
16 Clydesdale Court, Mooroopna, Vic. 3629

Some time ago an article on this subject was published by the author resulting in a surprising response by amateurs from all around Australia who were keen to "home brew" a power supply that would operate a 25 watt 2 metre FM unit and at the same time, keep down the cost to an absolute minimum. The unit to be described is basically the same as the previous article except that the overall cost has been further reduced by utilising some less expensive components.

The supply to be described has an output of 13.8V adjustable, with an output capability of 10 amps, more than enough to drive the average 25 watt transceiver.

The actual layout and construction details are left to the constructor as they are not critical. The heart of any power supply is the transformer. A commercial unit, with the necessary capacity, is a costly item to buy. In this case, the transformer to be used is one recovered from an old black and white television, many of which are resting as junk in shacks, sheds and elsewhere.

The transformer is partly dismantled and the old secondary removed and replaced with a new 19 volt winding. This operation is not difficult but takes a little time and patience.

The 19 volt winding is fed into a conventional rectifier bridge of 30 amps capacity, and the DC output is then controlled by a UA78MG regulator and a pair of 2N3055 power transistors which are mounted on a heavy heat sink. This can either be a commercial fin type or a very heavy piece of aluminium or copper U section material. The heat sink is best mounted outside the case to allow better ventilation and heat dissipation.

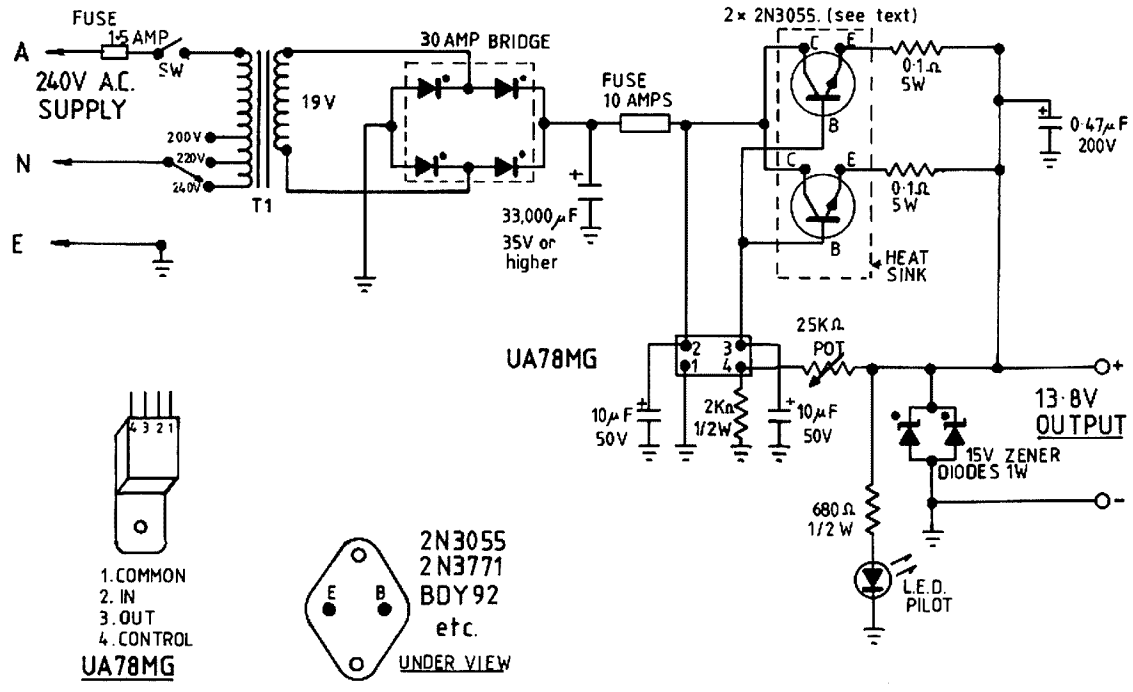
Generally, components these days are most reliable. However should one of the regulating transistors develop an internal short circuit from collector to emitter the output voltage would immediately jump to a dangerous value, around 25 volts, causing instant damage to valuable equipment. Most equipment can operate up to 15 volts before damage occurs. It is desirable therefore to protect the equipment from anything above 15 volts.

Many commercial suppliers have sophisticated and naturally expensive protection systems one being the crowbar. In this type when the output exceeds 15 volts a Zener diode conducts and fires an SCR which in turn short circuits the output and operates a fuse. In this supply to keep costs down we have fitted two Zener diodes (15 volt) across the output. In the event of some internal fault developing causing an increase in output voltage, the Zener diodes conduct and short the output thus protecting the equipment. The current carried by the Zener diodes far exceeds their normal rating and they immediately burn up. When a Zener diode is destroyed it invariably becomes short circuit and consequently operates the fuse, switching off the supply and completely isolating the equipment. The only cost of repair would be the faulty regulating transistor and the replacement of two well-cooked Zener diodes worth only a few cents. However, this is a remote risk and may never happen. It is reassuring however to know there is some form of over voltage protection when using the supply on valuable equipment.

CONSTRUCTION DETAILS

The TV power transformer should be carefully examined for any damage. It should be removed from the chassis noting and marking the 240, 220, 210 volt primary input winding connections. The secondary heater winding is usually 6.3 volts. This winding is obvious because it is wound with heavy gauge wire. After removal, connect the primary to the 240 volt mains supply and check the secondary heater winding with a multi-meter (AC volts) to ascertain if it is 6.3 or 12.6 volts.

After checking carefully tie back the primary connections to avoid breaking the wires. The transformer should now be dismantled by firstly removing the four bolts holding the laminations and frame together. After removal of frame and



Power Supply and 13.8V Regulated Output

clamps the first lamination should be removed. This is the most difficult part of the entire project as these are usually pressed in by machine and difficult to remove. A thin bladed screwdriver driven in between laminations can frequently enable one lamination to be gripped by long nosed pliers and removed. The laminations are usually in a "E" and "I" shape configuration and should be completely removed and stacked.

The heater winding is on the outside of the winding and this should now be carefully unwound making sure to *count the turns as they are removed.* When this winding has been removed and the number of turns noted the remaining secondary winding can be stripped either by unwinding or *careful* use of a hacksaw. This is because the primary winding underneath is to be reused. Some transformers from Astor and AWA sets have a double bobbin winding with *primary on one* side and *secondary on the other.* These are particularly easy to rewind. The more usual type have the primary against the core then the high voltage secondary and finally the heater winding on the outside.

Having now stripped the bobbin down to its basic primary winding we must now calculate the turns ratio of the transformer. The turns per volt figure is found by dividing the turns counted by the heater winding voltage. This is nominally 6.3 or 12.6 volts however most manufacturers wind transformers for 6.5 or 13 volts to allow for a voltage drop. It is common to find that the 12.6 volt winding has thirty nine turns. The turns per volt figure would be $\frac{39}{13} = 3$.

This means we need three turns on the secondary for each volt of secondary output. In our case we need 19 volts, therefore we would need 3 x 19 = 57 turns. This is only an example and you must calculate for your particular transformer to obtain 19 volts output.

To rewind the secondary we need wire that will supply 10 amps without overheating 14 Gauge B & S is adequate and can be purchased from retailers or automotive electricians. A length of 10 metres should be enough for an average transformer. The winding is wound on carefully layer by layer. It can be jumble wound if there is enough space.

The turns must be carefully counted on and when the winding is completed a layer of PVC tape wound around the winding. The ends should be covered with spaghetti (plastic tubing) and extended out in a similar way to the original heater winding. Now the core should be replaced by fitting the laminations back into the bobbin. If the laminations are the E and I type it is easier to fit three E sections at a time alternating the direction. The I pieces can be fitted later.

It is part of Murphys Law that all the laminations removed will never be replaced so do your best. The last few will be difficult to fit and careful use of a *small* hammer will assist. The assembly should be tapped into square shape with the hammer and the four bolts and mounting plates fitted. When finally together, and looking like original, connect 240V AC to the primary and check the secondary voltage. If your calculations have been correct and all care taken your meter will read 19 volts. If your reading is NOT EXACTLY 19 volts you can adjust by changing the primary tapping. By connecting 240volts mains to the 250 volts tapping, the output will be dropped and similarly connecting to the 230 volts tapping will increase the output.

The general assembly of the power supply will be left to the constructor. The transformer should be well mounted and all bolts tightened to prevent buzz. The regulator can be mounted in any position and does not require any heat sink. It can be mounted on a small piece of aluminium formed into a bracket. It is important that the bypass capacitors be mounted directly on the regulator itself and *not* wired away. The output fuse should be rated only marginally higher than the maximum load expected. To operate a set such as an IC22S a fuse rating of 5 amps would be adequate. The main filter capacitor shown as 33,000 mFd is from a disposal computer power supply and is readily available.

Any value larger than 25,000 mFd would be acceptable and this could be made up from several smaller capacitors wired in parallel. An example could be five capacitors, each 5000 mFd, wired in parallel. Be sure the voltage rating is adequate. Any rating higher than 30 volts working is sufficient.

Whilst 2N3055 power transistors are specified, other similar types can be used provided they are NPN construction. Many are available on the disposal market at a very reasonable price. Equivalents that have been tested and found to be suitable are BDY-92 and 2N-3771.

CONSTRUCTION — GENERAL

After completion of wiring and circuit check, remove one side of the Zener diodes before switching on in case the output voltage is high. Connect an accurate DC voltmeter across the output and switch on. If everything is correct, output will be seen. This can be carefully adjusted with the control potentiometer to 13.8 volts — the LED will be glowing. Switch off, and reconnect the protection Zener diodes. Your supply is now ready for use. Connect a transceiver and check with another station for any noise or hum. The supply is clean and hum free and exhibits good regulation. The voltage drop when transmitting is barely discernable.

With the values shown, and a good transformer, a regulated output in excess of 10 amps will be obtained with a minimum dent in the domestic budget.

AR

Technical Editors Note

Constructors of projects such as this should pay particular attention to component ratings. The output load, environment, and duty cycle may well require special consideration. This is of particular concern as the output capabilities increase. Heat sink requirements and power transistor ratings should be carefully considered.

SPURIOUS TRANSMISSION CHECKER

Bruce Hannaford VK5XI
57 Haydown Road, Elizabeth Grove, SA 5112

This checker is so simple and so useful that it is difficult to understand why it is not already in use in most amateurs shacks. I originally developed it for RTTY but it is also useful for SSB and CW. Looking at the circuit of the unit you could be excused for thinking how on earth that simple thing can do any useful checking of any kind whatsoever?

From the circuit of the unit it will be clear if it is coupled to a properly functioning transmitter nothing will be heard unless amplitude modulation is taking place. The coupling to the transmitter is done by a short length of insulated wire from the checker antenna terminal wrapped around or taped to the coaxial feeder near the transceiver. Use enough wire to get good coupling so reasonably loud modulation can be heard when transmitting SSB. Check the coupling is sufficient for all bands you use. Normally the speaker will be used for CW and RTTY and the phones for SSB.

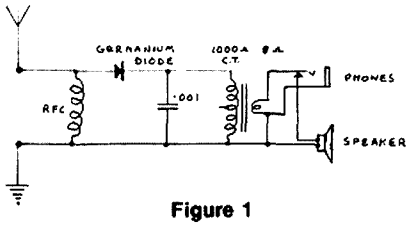


Figure 1

Firstly checking for CW problems, keying will modulate the carrier and the level of key clicks compared to the SSB level of a normal SSB transmission will tell if you have key click problems. Usually the clicks will be quite faint and more of a thump than a click. Also if the carrier is not clean and some hum, etc is present this will be easily heard. If any audio tones or squarking sounds are heard you have big problems and these are probably due to RF feedback oscillations.

For HF bands FSK RTTY a clean carrier (even one changing in frequency) will produce no audio output apart from slight key clicks of about the same level as good CW. However if spurious keying or modulation outputs are present these are then heard as audio tones or "squarks" of some sort. With HF band FSK RTTY generated by audio tones into a SSB transceiver it will normally be found low levels of audio input produce no audio signals from the checker but as the input level is increased a setting will be found where spurious tones or squarks are heard, needless to say you then operate at a somewhat lower setting or find out what is wrong. This checker is very useful indeed for RTTY generated in this manner, as soon as you do the wrong thing or something goes wrong you get an audible warning from the checker speaker.

With SSB, the modulation will be heard in the headphones but be barely understandable, if there are no spurious modulation signals present the modulation will have a "smooth" sound but with spurious signal outputs this will become rough and harsh sounding. Using a dummy antenna, try overdriving the transceiver and note the change of sound that occurs when spurious outputs are being generated.

Fortunately almost all spurious outputs of a modulation distortion or key clicking nature produce beats that will give rise to audio being heard in the checker, once an operator gets used to using the checker and what sounds to expect from it no more bad transmissions of spurious modulation signals should occur.

1296.171	VK6RBS	Busselton
1296.480	VK6RPR	Nedlands
10300.00	VK6RVF	Roleystone

The Roleystone 10.3 GHz beacon is now listed in the "Western Australian VHF Group Bulletin" so it seems sensible to include it in this list.

THE EME SCENE

Doug VK3UM continues to successfully work stations via the moon and his present tally is 15 countries for 30 individual contacts on 70cm from November 1984 to April 1985. His latest successes were realised on 27/4 when the following took place:

0402: K2UYH 559 sent, 549 received, then two way SSB 5x5 and 4x4. 0440: JA6CZD 449/449; 0555; W7GBI 0/0; 0630: JA4BLC 549/549; 0700: ZL2AQE 0/0; 0843: JR4AEP 0/0; 1020: OK1KIR 439/439; 1033: LA1K 439/439; 1100 SM6EUP 0/0; 1120: HB9SV 549/569; 1130: G3LTF 549/539; 1149: F1FHI 549/559.

On 28/4: 0500: K2UYH 559/559; 0537: VE4MA 439/439; 0559: N9AB 549/549; 0950: OZ7UHF 0/0; 1008 SM3AKW 449/449 (he was using 100 watts to a 5m dish); 1112: DF3RU 449/449; 1127: G3LQR 449/449; 1149: G3SEK 439/439; 1207: DL9KR 559/559; 1244 F1FHI 559/559.

On looking back over the list there are some very good signal reports emanating so it looks as though there are a lot of people including Doug who are getting their act right. Additionally, on 13/4 Doug worked VK2DVZ at 0845 at 5/1 and 5/3 and VK7DC was 5x9 off the back of his EME antenna whilst it was at an elevation of 10° on the moon!

MORE FROM MELBOURNE

Lionel VK3NM, has been getting in the act by sharing the contacts being made via aircraft enhancement, the theory being that vapour trails from jet engines can lift the signals significantly for many minutes sometimes. This is the work that Gordon VK2ZAB has been so actively engaged in with Doug VK3UM, where 144.200 MHz is used on Saturday and Sunday mornings at 2230 to conduct the experiments. Lionel says no super high power is needed, only a good antenna with a suitable pre-amp being needed as well as some patience!

Plans are in hand at an appropriate time to have stations on at both ends with continuous signals all day and to make notes of the observations.

One method of handling the contacts is outlined by Lionel when VK3NM made two contacts with VK1BG on 70cm. Both stations liaised on 80 metres, monitored aircraft traffic and calculated when contact should be possible. On both occasions both signals were the same strength and duration.

That results have been encouraging is shown by the following contacts either by tropo (T) or aircraft enhancement (AE). *16/2 VK7DC 432 (T); 18/2: VK5ZDR, VK5NY, VK5RO 144 (T); 17/2: VK5NC 144 (T); 2/3: VK1GL, VK2ZAB 144 (AE), VK5NY, VK5RO 144 (T); 3/3: VK7ZAP 432 (T); 8/3: VK1GL 144 (AE);* 9/3; VK1BG, VK1GL 144 (AE); 14/3; VK5NY, VK2YEZ *144 (T), VK2ZAB 144 (AE); 16/3: VK7DC 52,144, 432 (T), VK7KAJ 432 (T); 17/3: VK2YEZ 144 (T); 18/3: VK5DK 144 (T); 21/3: VK7DC 144 (T); 24/3: VK5NY 144 and 432 (T); 29/3: VK2ZAB 144 (AE), VK7JG, VK5NY, VK5RO 144 (T); 30/3: VK2ZAB 144 (AE); 31/3: VK1BG 432 (AE); 7/4: VK5NY 144 (T); 12/4 VK1GL 144 (AE), VK7DC 432 (T).* Lionel certainly seems to have been a busy boy and it is good to see four States sharing in the contacts.

NEWS FROM THE SYDNEY AREA

Gordon VK2ZAB sent another letter during April which was just too late for inclusion last month but is still current for this time. It continues to show what can and is being done on 144 and 432 MHz and from the jottings it is hoped others will be tempted to give it a try and so spread the contacts.

18/3: 144 Graham VK2MQ Moree 5x3, Ralph VK1RK was 5x7; 19/3 and 20/3 to VK1RK and VK1GL again at S7 to 9 on 144; on 21/3 VK2MQ 5x3 on 144. 22/3 the Friday night, worked on 144 VK2MQ 5x5, on 432 VK1VP 5x5, VK1RK 5x2 and John VK1CJ 5x5. The next morning (Saturday) 23/3: 144 VK2MQ 5x4, Paul VK4AUR Brisbane 5x4, Bill VK4LC Eagle Heights 5x4, John VK4KJL Brisbane 5x3, Peter VK2EVB Coffs Harbour 5x2, Ross VK2ZRE Adaminaby 5x7 plus several VK1s. Several 70cm contacts between Doug VK3UM and VK1 stations but Doug not heard in Sydney by any of the several stations listening for him. 23/3: On 144 Tom VK2DDG Byron Bay 5x6, Ross VK2ZRE 5x5, Les VK3ZBJ Frankston 5x4, Doug VK3UM 5x2, no VK4s copied. 24/3 through 28/3: 144 and 432 contacts with Ralph VK1RK most nights, also a rare 144 contact with Tom VK2QT at Mittagong. 29/3 VK4AUR 5x3, VK4AGQ Angus at Brisbane 5x1, VK4LC 5x2, VK4KJL 5x1, Ken VK2DGT at Coffs Harbour 5x3 all on 144. Later VK1 and VK3 were on both 144 and 432, and Gordon worked VK1BUC, VK2ZRE, VK3ZBJ, VK3AZY, and VK3NM all around 5x3. Nothing heard of VK7JG though he was known to be on. 30/3: VK4LC very weak at 2x1 on 144, but south west contacts were reasonable and included Trevor VK3KEG 5x3, VK2ZRE 5x3, Jim VK3AZY 5x2, Lionel VK3NM 5x1 and VK3UM 5x4, the latter on 432 for the fifth time.

4/4 Friday morning: No replies to calls to north, but 144 to south west gave VK1BUC 5x2, VK1ZQS 5x2, VK1VP 5x3 with their beams on Melbourne. Graham VK1ZEI 5x4, David VK3AUU 5x1, VK2ZRE 5x4, VK3KEG 5x3. On 432 Ross VK2DVZ 5x4 from Taree (5x8 on 144), Tom VK2OD heard working VK2DVZ as well as on 432. 5/4: VK2ZMX 5x4 from Cooma, VK3ZBJ 5x3, VK3KEG 4x1, VK2ZRE 5x5 on 144, VK3UM on 432 5x4 heard working VK1. 6/4: 144 VK1BG, VK2ZRE, VK1ZQS, VK1BUC, VK3ZBJ, VK1GL, VK1ZIF. VK3UM was 5x3 on 432 but mistook Gordon's call for VK2DVZ who was 5x5 in Sydney from Taree! Dick VK2BDN also heard VK3UM. 7/4: 144 VK3ZBJ 5x3, Trevor VK3KEG at 0020. 10/4: 0947 VK3UM and VK3ZBJ both 5x2 on 144, but no 432. At 1033 VK3ZBJ 5x3 on 144 and 1043 VK3UM 5x3 also, but still no 432. Conditions were poor on 11/4 and 12/4 to Melbourne, but on 12/4 Graham VK2MQ at Moree was 5x4. Signals to Melbourne still too weak on 144, but heard VK3UM on 432 at 5x3. 13/4: VK2DDG 5x2, VK2ZRE 5x4 on 144. VK4s on both too weak to work. Also the first weekend since Christmas that no 144 MHz contact was made to Melbourne! 14/4 and 15/4: Local and VK1 contacts on both bands. 16/4: VK2MQ in Moree 4x2 on 144.

Gordon VK2ZAB repeats what I have said many times before, and I quote: *"DX contacts on both 144 and 432 MHz are being frustrated to some extent by people conducting local QSOs on the calling frequencies of 144.1 and 432.1. The newcomers are not always to blame either, some old-time VHF operators seem to forget that some others may not be interested in their lengthy conversations with third parties on the calling frequencies. During the weekend of 12/4 one such conversation on 144.1 lasted 43 minutes. Fair go!! I understand the problem is not confined to Sydney either. Melbourne VHF DXers have the same complaint."*

The above paragraph is straight to the point and quite explanatory and will hopefully be heeded by those offending. It certainly happens in VK5 too, so one can assume there are offenders in all States. Something which adds to the overall problem is that many operators do not leave any breaks between overs, thus no one has a chance to break in. It has been said to me before, these stations are operating on the call frequencies so they might attract the attention of others, then they have little chance of "the others" letting them know they are there if no breaks are left between overs. Three seconds would be quite long enough. It only needs a bit of self-discipline and thought for others for this to be done regularly and everyone would feel better about it. Unfortunately, in quite a few cases these and similar comments are not read by the offending parties because they are not WIA members, so it seems they need to be told direct.

But thanks for writing Gordon. Your notes indicate the quite large degree of activity mainly between VK2,1 and 3 on both 144 and 432 MHz and as times progress hopefully more stations will be attracted to give it a try.

NEWS FROM USA

From Bill Tynan W3XO and "The World above 50 MHz" from May 1985 "QST" comes two interesting items which I would like to share with you. The first is called "A Banner Year for Meteors" and I quote the relevant parts as follows:

"This may be an especially good year for the 'ping jockeys'-VHF operators who make meteor scatter, or MS, one of their principal pursuits. As mentioned in last month's column, Michael Owen W9IP, believes this may indeed be a 'year to remember'. He bases his contention on the fact that several comets are approaching our part of the solar system. Since comets are accompanied by clouds of particles, and it is particles travelling through space crashing into the earth's atmosphere that are responsible for the ionisation we know as meteor pings, it stands to reason that there may be some really interesting meteor showers in the months to come.

"Meteor showers are named for the area of the sky, the constellation, from which they appear to come, not for the comets that provide the particles. Thus, the Perseids shower, so familiar to VHFers, appears to emanate from the constellation Perseus. Few of us are aware, however, that it is the Swift-Tuttle comet that furnishes the numerous particles that produce this shower. Probably the best known of the comets is Halley's. Almost everyone has heard by now, it is due to visit the inner portion of the solar system over the next few months, putting on a spectacular visual show as it approaches the sun.

"Last month's column contained W9IP's reminder that the Eta Aquarids Shower is due in early May. Mike pointed out that this shower is caused by particles travelling in the same orbit as Halley's comet but somewhat ahead of it. This is the first of the showers that he believes will be particularly productive for MS operators this year. W9IP further notes that its particles approach the earth almost head-on and thus slams into the atmosphere at higher-than-customary velocity. As a result, they ionise the atmosphere at a greater altitude than is the case with many of the other showers. Thus, the Eta Aquarids should be particularly productive of better-than-average MS DX. That shower is expected to peak about 1300 Saturday, 4 May, with east west paths favoured for us in North America.

"Besides the Eta Aquarids in May and the Perseids in August, there are other meteor showers that W9IP believes bear more than mere watching this year. The 3 October Dracanids, a product of the Giacobini Zinner comet, provides another potentially good opportunity.

This comet will have passed the earth's orbit only 29 days before we arrive at that point in space, so there should be a substantial quantity of particles still around when we get there. That should mean lots of meteors. Mike warns, however, that the peak of this shower will last only an hour or so, and will probably occur about 1600UTC, favouring northwest-southeast paths. Eleven days later, on 20 October, particles accompanying Halley's comet should produce the Orionids shower. W9IP notes that this close proximity of comets provides a similar situation to that which made the 1966 Leonids shower so spectacular, with over 150,000 meteors per hour.

"This may be an MS year we will long remember. It should not only be a great sport for experienced ping jockeys, but also serve as an ideal opportunity for newcomers to get their feet wet in this fascinating and productive propagation mode."

Those of you who intend giving the MS mode a try this year could have an interesting time. Why not share your experiences with others by letting me know in a letter for use in this column.

EME ANNALS

The other item of interest from "QST" is headed "EME ANNALS" and shows for each of the bands being used for EME work the number of different stations (not total QSOs) worked and the number of countries contacted.

6 metres: List headed by K5WVX with two stations and one country, others with the same score include WA5HNK, WB6NMT and VP2EME. 2 metres: K1WHS 552 stations, 61 countries and also WAC. Then VE7BQH 443 54 WAC, WA1JXN/7 344 43 WAC, SM7BAE 306 65 WAC. Incidentally, on 6 metres there are 7 call signs listed, and on 2 metres 120 and the list is not complete. On 220 MHz: K5FF 33 stations, 4 countries, W1JR 26 and 3, W5FF 25 and 3. On 432 MHz: K2UYH 268 stations in 41 countries, and WAC, DL9KR 225 35, I5MSH 200 37 WAC, W1JR 171 31, K3NSS 167 20 WAC. There are 54 call signs listed. 1296 MHz: K2UYH 46 20, OE9XXI 46 — , G3TLF 35 16, with 24 call signs. On 2304 MHz: W4HHK 2 1, WA4HGN 2 2, DF0EME 2 2, W3GKP 1 1 and OE 9XXI 1 1, and those five make up the total list.

EME BEGINNINGS

Also from "QST" this is how the EME scene emerged:

27 January, 1953: first amateur reception of echoes from the moon — W4AO and W3GKP on 144 MHz.

27 July, 1960: first amateur two-way contact via the moon — W1BU and W6HB on 1296 MHz.

11 April, 1964: first 144 MHz moonbounce two-way contact — W6DNG to OH1NL.

20 May, 1964: first 432 MHz two-way moonbounce contact — W1BU and *KP4BPZ (followed shortly by a number of other contacts from KP4BPZ using the 305 metres (1000 feet) dish at Arecibo, Puerto Rico.*

15 March, 1970: first 220 MHz two-way moonbounce contact — WB6NMT and W7CNK followed by a contact next day between WB6NMT and K2CBA.

19 October, 1970: first 2304 MHz two-way moonbounce contact — W3GKP and W4HHK.

30 July, 1972: first 50 MHz two-way moonbounce contact — K5WVX (now K5CM) in conjunction with W5WAX (now K5SW), and WA5HNK in conjunction with W5SXD.

It is always interesting to read about or again remind us who the pioneers were in establishing, what is substantially commonplace today, EME contacts. They still do not come easily, and require a lot of preparatory work and dedication to achieve, so it will never be for the faint-hearted, but obviously the rewards are there for those who make it.

CLOSURE

These notes are being prepared a week in advance of the usual date as I am due to have a period in hospital for an operation on my back for a problem which has been affecting my walking.

Any letters which arrive from now on will have to be included next month unless I am back home within a week in which case I might be able to make the deadline. However, in the meantime, all the best with the winter time DX which you should be experiencing as you read these columns.

Closing with the thought for the month: *"If you don't get everything you want, think of the things you don't get that you don't want."* 73. The Voice in the Hills.

AR

Don't miss the VHF/UHF Story of Firsts from VK6 — August AR.

AMSAT AUSTRALIA

Colin Hurst VK5HI
8 Arndell Road, Salisbury Park, SA 5109

NATIONAL CO-ORDINATOR
Graham Ratcliff VK5AGR

INFORMATION NETS

AMSAT AUSTRALIA
Control: VK5AGR
Amateur Checkin: 0945 UTC Sunday
Bulletin Commences: 1000 UTC
Winter: 3.685 MHz Summer: 7.064 MHz

AMSAT PACIFIC
Control: JA1ANG
1100 UTC Sunday
14.305 MHz

AMSAT SW PACIFIC
2200 UTC Saturday
21.280/28.878 MHz

Participating stations and listeners are able to obtain basic orbital data including Keplerian elements from the AMSAT Australia net. This information is also included in some WIA Divisional Broadcasts.

ACKNOWLEDGEMENTS

Contributions this month are from Bob VK3ZBB and UoSAT Oscar 9 Bulletin 126.

AMSAT-AUSTRALIA NEWSLETTER

Graham VK5AGR the National Co-ordinator of AMSAT-Australia is now producing a monthly newsletter containing updated satellite news, orbital predictions, Keplerian data and operating hints and techniques. The objective of the newsletter is to keep the amateur populace informed on the latest information available and to realise funds for the funding of projects or the purchase of an item/s of hardware for a future amateur satellite project, eg Phase-3C, Phase 4 or whatever. The cost of the Newsletter is $15 and cheques made payable to WIA (SA Division) should be forwarded to Graham VK5AGR QTHR.

The following news items are direct from the UoSAT Bulletin-126 17th May 1985.

ANNIVERSARY

Tuesday 14th May last week saw the anniversary of the successful recovery of the UoSAT-2 spacecraft following the communications problems experienced just after launch on 1st March 1984. UoS dedicated 14th May to the memory of Finn Stollstrup OX3FS, who assisted in the recovery and who was, sadly, killed shortly after.

MILESTONE

UoSAT-OSCAR-9 passed the 20,000 orbit mark on Tuesday 14th May — obviously an auspicious date!

PACSAT

VITA has received some 'start-up' funds from the Hoover Foundation to initiate a major fund-raising activity to support the PACSAT mission. $30,000 has been made available to employ the services of a fund-raising group — TAFT.

JAS-1

The April 1985 (No 4) issue of the Japanese "CO Ham Radio" journal has some details of the user interface for the JAS-1 satellite, including a sample message using the digital communications system on the spacecraft.

UoSAT-OSCAR-11 OPERATIONS

Spacecraft engineering data surveys and 2400/4800/9600 BPS AFSK transmission tests on 435MHz have continued this week — with good result at 4800 BPS.

The spacecraft has been allowed to spin-up to a Z-spin period of 47 seconds and modified magnetorquing algorithms generated by Stephen Hodgart are being assessed which should, hopefully, minimise the introduction of unwanted libration during these manoeuvres. The de-spin manoeuvres have been taking place in range of UoS so that their effect can be monitored closely. However, this generally means that the orientation of the spacecraft to the local geomagnetic field vector is not optimum for such manoeuvres and, as was seen last November, some unwanted component torques are also generated. These undesirable torque components have maximum effect when the spacecraft is spinning at very slow rates and tend to introduce excessive libration — sometimes going so far as to push the spacecraft over and out of lock! The long-term solution is to execute these manoeuvres, using the OBC, when the spacecraft and geomagnetic field vector are optimally aligned — probably out of range of UoS. This will complicate the data collection slightly and requires some further OBC software development but should effect the attitude control manoeuvres with minimal risk of increasing libration and losing gg-lock.

Revised software has been uploaded into the DCE this week by NK6K with a test message sequence. A greater amount of 145MHz downlink time is now scheduled for the DCE.

The telemetry clock on UO-11 has been reset twice since launch and appears occasionally to 'glitch'. We are not sure at present why this occurs, but it is under investigation. We intend to reset the clock once more soon.

INFORMATION FOR 'NEWCOMERS'

In recent weeks I have received a number of letters from newcomers to the amateur satellite ranks enquiring about information and literature pertaining to satellite activity.

As a reference text the following publication is highly recommended, and is priced at about $16 through the WIA.

'The Satellite Experimenter's Handbook'
by Martin Davidoff K2UBC
Published by The American Radio Relay League.
This publication may be available through your WIA Divisional Office. If not contact AMSAT-Australia.

The following organisations also provide literature and information specifically for the amateur satellite communicator. With the value of the Australian dollar depreciating against overseas currencies, subscription rates for the below mentioned groups may not seem as attractive as in recent years. Therefore if your funds are limited I suggest to you the AMSAT-Australia Newsletter mentioned previously in this column as the first priority with membership of AMSAT-UK being the second priority. Membership of AMSAT-UK provides an excellent publication called OSCAR News at least quarterly, with special editions for specific events and launches.

1. AMSAT membership

Those persons wishing to join AMSAT, The Radio Amateur Satellite Corporation based in Washington USA (the parent body of the amateur satellite service) are requested to direct their enquiries to:

AMSAT
PO Box 27
Washington DC 20044

Various categories of membership are available as well as services. These items will be detailed upon receipt of your enquiry.

2. Amateur Satellite Report

This is a bi-weekly newsletter published on behalf of AMSAT. It is mailed first class to all subscribers (AIR MAIL to Overseas). ASR is the update of all satellite activities and events worldwide.

Direct all enquiries to:

Satellite Report
221 Long Swamp Road
Wolcott, CT 06716 USA

3. AMSAT-UK Membership

The English affiliate of AMSAT, AMSAT-UK wishes to advise all intending new members that the correct procedure to join AMSAT-UK is to first write to:

Ron Broadbent G3AAJ
Hon Secretary AMSAT-UK
94 Herongate Road
Wanstead Park
London E12 5EQ

requesting a membership application form and the current subscription rate.

COMPUTER PROGRAMMES

To assist the calculation of the various satellite orbits there are now a number of versions of the Tom Clark W3IWI, ORBIT Programme, available to suit various home computers. If you are personally interested in a suitable programme contact Graham VK5AGR, QTHR supplying a SASE for details.

CURRENT OPERATIONAL SATELLITES

As at the 1st May 1985 the following satellites were still fully operational: Oscar 9, Oscar 10 and Oscar 11.

The following satellites are unfortunately erratic in operation due to their failing batteries: RS5, RS7 and RS8. In respect to the RS Series I will attempt to get a schedule of operational times for inclusion in the next issue.

UPS AND DOWNS

From Bob VK3ZBB we have the latest listings of launches and re-entries.

FROM BOB VK3ZBB

Consideration is being given to the provision of a Transponder operating in the amateur 'S' Band which is 2300 to 2450 MHz. It is suggested that the transponder will be installed in the Phase 3C amateur satellite which should fly in 1986-7.

Obviously potential users of this 'S' Mode will require some experience in the design and development of suitable equipment and it is perhaps fortunate that the USSR is understood to have two satellites operating beacons in this shared frequency band.

Although no details of transmission times etc are yet available the Keplerian Elements for the two satellites have been obtained and, hopefully, will be updated from time to time. These figures will enable amateurs to determine the location of the satellites in the sky and to listen for the beacons on their reported frequency of 2304 MHz.

The Keplerian Elements are:

SATELLITE: Cosmos 1547
Number: 84-033A 14884
Element Set: 559

Epoch	85-103
Epoch Decimal	0.94042977

RETURNS: During the above period 25 objects decayed, including 1985 002-A COSMOS 1616 on 4th March and 1985-019A COSMOS 1632 on 15 March.

GENERAL INTEREST: 1966-100A AT51. On 12 March at 0219 UTC, this satellite was located at 176.540 degrees with an inclination of 11.704 degrees. Transmit on 136.460 and 137.350 MHz.

Dr Karl Meinzer DK4ZC recently gave talks in Melbourne, Adelaide and Sydney. Karl is a member of the German Satellite Organisation, which was largely responsible for the operation of OSCAR 10. During his talks, Karl demonstrated a hand-held computer for calculating satellite positions. There will be a full story of Karl's talk next month.

Special 75th Anniversary

Victorian Division — VK3's

Feature

VICTORIA 150
GROWING TOGETHER 1984-5

Jim Linton VK3PC
4 Ansett Crescent, Forest Hill, Vic. 3131

VICTORIA: PREMIER DIVISION

This 75th anniversary gives us a chance to look back on the achievements of pioneers and reflect on what the future may hold. One thing that must be stated early is that much of our history remains unrecorded.

The date 30 November 1911, is accepted as when a public meeting was convened by P H McElroy to form an "Amateur Wireless Society of Victoria" (Reference "The Argus" newspaper 1.12.1911).

However there's some doubt as to whether a prior organisation existed and the 1911 meeting was to both form an Amateur Wireless Society and amalgamate an exising body of wireless experimenters.

It would be desirable if someone could shine some light on this mystery.

There's no doubt about the role Victoria has played, and continues to play in the affairs of our hobby, and developments in the science of wireless.

In the late 1880s George William Selby of Malvern, Vic was experimenting with radio waves, and progressed to wireless telegraphy.

The turn of the century saw an increase in wireless experimentation.

H W Jenvey at Queenscliff, Vic, in 1901 made wireless telegraphy contact with HMS St George, the escort cruiser for a state visit by the Duke and Duchess of Cornwall.

In 1910, G A Taylor of Vic successfully demonstrated that pictures could be sent by wireless.

Exploring further the use of wireless, in 1911 he conducted the first communications between moving trains in Australia, in 1912 was the first to fly a model airship by remote control, and 1913 saw him being the first to fire a gun by wireless.

The immediate post-World War 1 era was a period of great improvements in the science of wireless.

Playing a key role in reviving the Institute after the war was Victor Nightingall.

Australia retained its leading status in experimentation with history making contact to the United Kingdom and the USA.

Max Howden VK3BQ is forever associated with the startling developments of world-wide communication in the 1920s. His exploits have been well covered in a previous historical article.

Others from Victoria involved in this era include Ross Hull and Howard Kingsley Love. This pair had dominant roles in the Institute, being jointly involved in early publications about wireless (Reference AR August 1970).

The Victorian Division in 1921 began transmitting in telephony news bulletins nightly on 200 metres.

HK Love, President of the Victorian Division, heard transmission from high powered US commercial stations in December 1922.

Being convinced amateur stations on the Pacific coast of the US might be heard he proposed and organised Trans-Pacific tests.

He was appointed head of a special committee to organise the tests (Reference AR October 1983).

Winner of the tests was Max Howden who was congratulated by the whole radio fraternity.

The following period saw broadcasting start, and a growing interest in the medium of wireless.

Moving ahead to 1933, the publications era of the division began as a result of the President, Harry Kinnear, suggesting the printing of a magazine. This key figure in Institute affairs was also the founding editor.

Up until February 1972, the division produced the magazine before handing it over to the Federal Officer due to the financial burden it put on the division.

AR magazine was maintained during World War 2 and sent to radio amateurs serving their country.

The full story about AR magazine can be read in an article entitled "Golden Jubilee" in AR October, 1983.

It is probably timely at this point to mention that the "Premier Division of The Commonwealth" title came to light during interviews with Harry Kinnear and the 1935-41 President, Bill Gronow.

Victoria led the way up until WW2 and forged ahead in the post war years.

The business sense of Kinnear and Gronow was used to benefit the division in the area of war surplus disposals equipment.

This brief history of the division merely attempts to cover the first 50 or so years.

It does not adequately cover the parts played by Victor Nightingall or H K Love.

The formation and activities of the Wireless Reserve is another omission.

There were of course other events and personalities which could have been mentioned — for instance the Exhibitions in Melbourne, 1948, 1949 and 1950.

These public displays of amateur radio will hopefully be written up during the WIA 75th year.

The remaining 25 years of history is well overdue to be recorded in an article.

Those involved in this period are more qualified to accurately put together a record of events and complete the division's history.

By deliberate action good records of events in the years 1983-85 exist within the Victorian Division Council minutes and AR magazine.

AR

FURTHER READING:

An article "A Bit of Victorian History" written by John Adcock VK3ACA, the Victorian Historical Officer, was published in AR magazine in December 1980.

This records the founding of the Amateur Wireless Society of Victoria, which later changed its name to the Wireless Institute of Australia.

It uses a tape recording of a Vic Div General Meeting in December 1979, which was attended by two founding fathers. They were W K Witt and T F O'Shannessy, both who had been at the 1911 foundation meeting.

GEORGE WILLIAM SELBY:

AN EARLY WIRELESS PIONEER

His activities and considerable achievements are clearly remembered by Mr Selby's youngest son, 93-year-old Alexander (Dick) Selby. A remark by him last November at a Bird Observers' Club meeting in Echuca about his father experimenting with wireless at the same time as Marconi was overheard by a WIA shortwave listener. The lead was given to the WIA which tracked him down living with his niece, Jenny Johnson at Gunbower.

Mr Selby has been deaf from an early age, but through letters and other material has supplied all of the information for this story.

G W Selby became interested in electricity when he read an article in "Every Boy's Annual" in 1872, which told how to make a galvanic battery. He was about thirteen at the time, and when sent to England the following year to complete his education, he managed to continue experimenting.

However G W Selby's father had little belief in electricity and sent a letter to the English school master, asking him not to encourage George in electrical matters, as it may be many years before anyone could make a living out of it. But the master presented the letter to George as he graduated from the school.

Mr Selby had returned to Melbourne and was working as a clerk when news was received that Alexander Graham Bell had invented the telephone. He was inspired and soon after built a telephone himself. Mr Selby then established his own business in Queen Street, Melbourne, as an electrical engineer, with accountancy on the side.

His interest in experimental activities gravitated to wireless telegraphy, and to increase his knowledge of this then practically unknown science, taught himself French and German so he could read foreign technical papers. His experiments were developed to the extent of enabling him to transmit radio waves through a solid wall.

This was in the late 1880s and claimed to have been the first controlled radio waves in Australia.

In 1896, he sent a wireless telegraphy message from Brighton to Caulfield (Victoria), and continued these experiments until at least 1900. His assistant in that particular experiment was a Calder Oliver of Brighton, believed to have been involved because of his Morse code knowledge — nothing more is known about him.

Mr Selby had a seven acre block of land on the corner of Alma Road and Khartoum Street, and that was where he transmitted from. He also pioneered the manufacture of X-ray equipment, and owned and operated one of the first X-ray units in Melbourne. The equipment he couldn't buy, he made himself, including the blowing of glass tubes.

In 1896 his equipment was used to locate a bullet in a man's jaw. The medical profession, including the British Medical Association (renamed the Australian Medical Association) was eager to learn about X-rays and turned to Mr Selby for help.

G W Selby also gave his name to the Dandenong Ranges township of Selby, as he was a first councillor for the Shire of Ferntree Gully.

Among his life's achievements include 59 years continuous service as auditor for BHP, with his retirement being in December 1945.

Should any reader have further information on Mr Selby, please pass it on to Jim Linton VK3PC, who's still researching historical details.

APPARATUS DESIGNED BY G W SELBY IN THE ARGUS 29/4/1899

The sending apparatus is a Hertz oscillator, comprising two brass balls or spheres and a powerful battery and induction coil.

While the transmitter theory is easy to understand — radiation from the spark gap directly fed to a wire antenna — receiving needs a little explanation.

G W Selby in The Argus article, later reproduced in The Radio Experimenter, 15 February 1924, said: "The Coherer is an extremely sensitive detector of the kind of electric waves discovered by Hertz.

"This instrument consists of a few metal filings contained in a gap between two pieces of metal, called the pole pieces, which have connected to them longer or shorter collecting wires, and which are respectively joined to the two terminals of a Lechlanche cell or electric-bell battery.

"The sensitiviness of this arrangement to electric waves or jerks, is extraordinary, and the instrument works in this way.

"So long as no waves reach the filings the circuit is practically open and no current passes across the gap, but the instant the waves arrive the filings become a conductor and allow the current from the single cell to flow.

"It is, in fact, a kind of electric-bell push or telegraph key, worked by invisible waves instead of by a human finger."

The early descriptive diagrams

He said many experimenters in different countries worked at improving and suggesting improvements to the apparatus.

Among those to be specially mentioned are Drs Lodge and Jackson, in England, Professor Bose, in Calcutta, Nicola Tesla in America, Popoff in Russia, Righi and Marconi in Italy and England.

"I can lay claim to being a fellow-worker in Melbourne," said Mr Selby.

In the diagram of the receiving apparatus shown in this article, the relay activates another battery with sufficient power to work a Morse sounder or ink-writer.

The code could be copies by ear as a series of taps, or rattles, of longer or shorter duration, or as dashes and dots on the tape of an ink-writer.

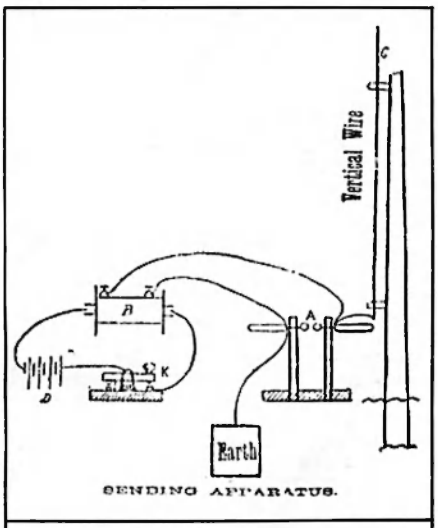
The Knocker shown in the diagram is an ordinary electric bell minus the bell. It is in the same circuit as the Morse sounder or ink-writer.

The purpose of the Knocker is to tap the Coherer to cause the filings to de-cohere and open the circuit.

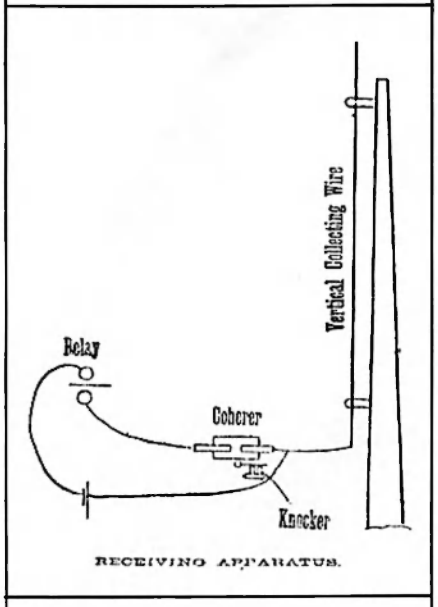
Mr Selby said Dr Lodge had suggested in 1894 the use of an electric bell for this purpose.

In a publication called "Salute to the X-Ray Pioneers of Australia" published by W Watson & Sons Ltd, Australia & New Zealand, an interesting account of Mr Selby is recorded.

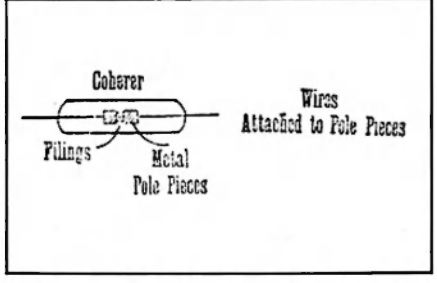
It said: *"Long before Marconi sent the first*



SENDING APPARATUS.



RECEIVING APPARATUS.



signal hurtling across the Atlantic, Selby was engaged in wireless experiments which were the subject of an article published in the 22nd November 1897 issue of the Australasian.

"Two months later he received a letter from Professor Oliver Lodge referring to wireless developments he had communicated to the distinguished English scientist.

"It was Selby who transmitted the first wireless signal in Australia."

His choice of electricity as a hobby arose out of an implement no more significant than a tin tack. It happened in this manner. When a boy at school he was selected to carry out the time-honoured prank of placing a tack in the master's chair. The trick succeeded so well that it is recorded that the learned gentleman suffered pain in a certain part of his anatomy.

Exceedingly wrath, he sought the culprit, and extracted a confession from young Selby, who was reported to the headmistress. That lady punished the youthful offender by withholding from him four prizes that were due to him at the end of the term. Considering this penalty too drastic, the master took the lad aside, forgave him and presented him with a book. It was this book which fired the young scientist to embark upon his electrical experiments. Although his parents greeted his decision in a lukewarm-manner, relatives and friends encouraged him to proceed.

As far back as 1878, G W Selby was experimenting with coils and tubes. In 1880 he exhibited a number of Crookes Radiant Matter Tubes before an interested audience at the Royal Society's Conversazione held at Melbourne.

There is still to be seen a programme printed for the Science and Arts Conversazione held at Melbourne Town Hall on 24th September 1885. In this it is announced that G W Selby would demonstrate:-

Crookes Radiant Matter Tubes.
Vacuum Tubes.
Induction Coil.
Electric Transmission of Power.
Dynamo Electric Machines.

TEN YEARS BEFORE ROENTGEN

Selby was actually operating a Crookes tube 10 years before Roentgen discovered X-rays in 1895 by means of a similar tube.

Had it not been for the fact that G W Selby was ill of scarlet fever when the announcement of the revelation of X-rays reached Australia, it is possible he would have preceded Professor Lyle in the verification of Roentgen's discovery. However, upon recovery early in 1896, Selby set himself to produce X-rays along lines indicated by the great German scientist, losing no time in examining the Crookes tubes still in his possession. Luckily, some were functioning, and he already had the rest of the apparatus required for a test.

While pondering a suitable subject it occurred to him that there might possibly be a rat caught in the trap set in the cellar of his Malvern home. Descending, he found his hopes realised, for there was a rat ensnared in the trap. Here then, was a body for his first successful radiograph. A reproduction of this radiograph was published in the "Australasian" of 16th May 1896.

Reproduction of rat radiograph

From that time onwards, G W Selby carried out in an honorary capacity, X-ray work for several Melbourne doctors and hospitals.

TELEVISION: A PIONEER REMEMBERS

After World War 2 the Australian Government did not want experimenters dabbling in television, but that didn't stop the pioneering spirit of a few in our fraternity. One of them, Len Moncur VK3LN, remembers the saga of trying to get an "Iconoscope" — the then TV camera tube only available from the United States.

He said: *"I was hostile over the government's action at the time in refusing to allow us to buy an Iconoscope.*

"The government didn't want us (experimenters) creating a public demand for television — there were more important things needed like housing and post-war reconstruction."

Len graduated from shortwave listening to take out his licence at the age of 18 in 1928. He said it was a logical progress from radio to TV experiments in his early days.

In fact after reading a few overseas articles on Logie Baird scanning discs Len began TV transmissions in 1932.

"The TV signal at first was literally from one side of the room to the other.

"There were a couple of others experimenting also in New South Wales and South Australia, and I used about 56MHz," said Len.

In 1934 he decided to visit the USA, and meet some of the many DX friends he had made.

He said: *"I bought an A Model Ford coupe, and with QSLs in hand visited 83 amateurs.*

"The QSLs were an open sesame to everything."

While a visiting one shack he was asked by another station on air what route he would be taking. The next day while driving down the highway he heard a car horn sending CQ in Morse and stopped. One amateur had sat on the side of the road sending CQ to every passing car with a Californian numberplate.

The hospitality was running hot for Len and he was invited home. About 10pm the amateur showed me his TV set, and I watched amazed at a commercial TV programme, Len recalled.

"I flippantly said I would like that (TV) in Australia," he said. Immediately, the amateur offered me the TV set, but I politely declined saying it would not fit in my coupe.

To Len's surprise the amateur had the inner workings of the TV set sitting on the back seat ready for his departure next morning.

On arriving back in Sydney, almost penniless, ship's passenger Mr Moncur posed a problem for a customs officer. The words "television set" did not appear in the customs book of words.

Len said the officer asked him which were the most important parts in the TV set, and then fetched a set of tools.

"You hack out the parts you want," said the officer.

Len said: *"Then with great ceremony the remains were dropped into the harbour."*

The most important parts obtained by Len included a state of the art Baird scanning disc, which helped further his TV experiments.

During WW2 Len served his country's war effort like many radio amateurs, with his involvement being in the field of radar installation and the training of others.

After the war he wanted to further his TV experiments by using an Iconoscope.

About 1948 an exhibition was to be held in Melbourne and the WIA was invited to put up a stand. It was suggested by an organiser, a Reverend Elliot, that there be a display of amateur TV. Len said he could oblige — if he had an Iconoscope, but these were not available in Australia. However Rev Elliot arranged for the Mission of Seaman in New York to give two Iconoscopes to the Mission of Seamen in Melbourne. If all went well they were due to arrive about two weeks before the second exhibition in 1949.

Photograph courtesy Herald-Sun Melbourne.

Len and his XYL Phyl working on a 2m rig in 1958.

Len kept track of the important cargo via amateur radio, and great publicity was being made of how TV would be shown at the exhibition.

Alas, the Iconoscopes got lost, and on inquiry customs said they would not be allowed into the country because the Iconoscopes were not unsolicited gifts.

They finally arrived — the Monday morning after the exhibition finished.

At the 1950 exhibition the general public was finally shown the wonder of television — this was six years before commercial TV started in Australia for the Melbourne Olympics.

Len found himself giving a 10 minute lecture on how TV worked.

"I did great magical things like turning the picture upside down, he said. On one night there were three 18-year-old girls among the crowd and two of them described their girlfriend as being most photogenic on TV. The girl asked Len if she could see herself on TV, and Len replied *"only if you can run fast enough."*

The crowd urged her to give it a go. She ran between the camera and TV screen and missed herself every time. Len said that incident made him understand that not one of the crowd which had heard his lecture about TV knew what he was trying to tell them.

When commercial TV began Len lost interest in the mode of transmission which had then ceased to be experimental.

Len's ambition is to travel and this month is in China with his wife Phyl. It's their 97th country, and they hope to notch up 100 countries with a European holiday next year, or as Len puts it: *"Our DXCC of countries."*

Making films is another of Len's activities and he has won several awards, including those from the Melbourne Film Festival. One film was an animation of the opera Madame Butterfly using dolls which required their physical movement (placement) by hand and many thousands of camera shots. The cruel treatment of golf balls by inefficient golfers was the theme of another animation. It used 100 or more golf balls with pipe cleaners for arms and legs, and again using the same technique brought them to life.

Len Moncur has a drive to do something nobody else has done — he gives it a go — which is the mark of a true experimenter and pioneer.

AR

VK3 WIA NOTES

VICTORIA 150

PRESIDENT'S REPORT 1984/85

Delivered at the Wireless Institute, Victorian Division, Annual General Meeting, Wednesday, 8 May 1985

MEMBERSHIP

The number of WIA members continues to increase in Victoria, as it has for the past three years.

The 1985 Membership is on target and by December the Division should have recorded its fourth consecutive year of growth.

A concerted effort has been made by the 1984/85 Council to increase membership — and special thanks go to those individual members throughout the state who have recruited new members.

DOC LIAISON

A good relationship between the WIA and DOC is to the benefit of members.

Representations on interference, examinations and licensing have achieved satisfactory results.

An agreement now exists whereby either DOC or the Institute can call a joint meeting should a significant problem arise.

Normally routine matters are dealt with by letter or phone.

RADIO MASTS

As published in AR magazine, May, planning permits are now required for some radio masts in residential areas.

While the outcome of this matter hasn't been entirely to the Institute's satisfaction, it could have been far worse without the WIA making its views known.

The Minister's decision could be seen purely as a political one in that it appears to be a compromise between what a minority of councils through the MMBW wanted, and the position taken by the WIA.

However, the Institute through Alan Noble VK3BBM and Council continue to monitor the situation.

Although members are facing difficulties in their applications for building permits — no radio amateur has yet sought a planning permit.

In one recent case a member at Ringwood had opposition to his building permit application from a neighbour.

Part of the objectors' case included a valuers report claiming a proposed mast would have an adverse impact on property values.

The WIA obtained its own independant valuers report, which costs $100, stating the property values would not be affected. An appeal against the Council's refusal to grant a permit was upheld.

WICEN

This area of Institute activity has never been stronger or more professional in Victoria.

The post-Ash Wednesday restructure including formation of regions has enabled the workload to be spread and means it can confidently respond to calls for help from government and welfare agencies.

Fires in January this year saw the Department of Agriculture making good use of the Amateur Radio Service, and the Department throughout the state won't hesitate to call on us in the future.

GENERAL MEETINGS

Sadly these have deteriorated in recent months because no-one has been available to arrange speakers and adequately publicise the meetings.

The Frankston and Mornington Peninsula Amateur Radio Club has offered to make its club venue at Carrum Downs available for a WIA general meeting night.

This seems to be a good idea and could be expected to attract members from the south eastern and peninsula areas.

Perhaps other metropolitan clubs might offer their venues for a WIA meeting.

WIRELESS INSTITUTE CENTRE

The purchase of a better and more reliable photocopier has added a new dimension to the production of correspondence and public relations material.

The Administrative Secretary, Maxine Conheady, contributes greatly to the functions of Council, and in recent months her workload has expanded to include assisting the AR Liaison Officer, and mailing of the Victoria 150 Award and WIA 75 Award.

Without Maxine's dedication the active public relations and membership drive campaigns would not have been possible.

Thanks also go to the team of Wireless Institute Centre volunteers who keep the centre open Monday to Friday, and handle out of hours inquiries recorded on the phone answering machine.

PUBLIC RELATIONS

Strong internal and external public relations continued throughout the year with most achievements being recorded in AR magazine.

An awareness of public relations has been translated to most WIA zones, committees, and adopted by some individual members.

Taking advantage of the WIA's 75th Anniversary and the issue of a pre-stamped envelope by Australia Post on 22nd May, the Institute has obtained permission to display leaflets in all 330 official post offices.

Additional material including a take away leaflet will be available at thirty philatelic sales centres.

WIA 75

This has been fully covered in AR magazine. The Victorian Division has played its part by initiating and carrying through the highly successful WIA 75 Award.

Our Division was the first to activate the commemorative callsign VK75A.

Members have got right behind the anniversary celebrations including the CW Contest and World Amateur Radio Day WARC Bands activity.

It was a VK3 member who designed the WIA 75 logo — there were also other good entries from VK3 for both this competition and for the amateur radio posters.

CLASSES

In the past twelve months even more effort has been necessary to keep the theory and Morse classes at viable levels.

There's a serious decline in the number of candidates going to the Novice theory exam — and the WIA in Victoria will try all it can to attract newcomers to amateur radio.

This is where individual members can assist by making it a personal aim to introduce someone to the hobby.

VICTORIA 150

The state's sesquicentenary which started last November has been celebrated through a commemorative callsign, general availability of the alternative prefix VI, and the Victoria 150 Award.

Use on a roster basis throughout the state of VI3WI enabled clubs, zones and individuals to take part in a special event.

At the same time it brought them together in a union of common purpose.

The public relations value of our hobby's participation in Victoria 150 includes the opportunity to get a message to all members of the Victorian Parliament.

They were sent a copy of Amateur Radio magazine — the December edition which featured Parliament House on the front cover and contained a WICEN post-Ash Wednesday article and a feature on emergency communications following Cyclone Tracy.

THE FUTURE

Challenges are ahead for the WIA to further improve its membership, push even harder with public relations initiatives, and strengthen its relationship with member clubs.

With only one percent of WIA members being under the age of twenty, ways must be found to raise the number of youngsters in our hobby.

More attention should be paid in Victoria to our heritage and history before it's too late.

And in this 75th Anniversary Year, serious thought needs to be given to future directions for both amateur radio and the Institute. Jim Linton VK3PC

AR

OSCAR STAMP MAYBE

There are recommendations afoot in the US for the issuance of a commemorative postage stamp to mark the 25th Anniversary of OSCAR 1.

OSCAR 1 was the first non-government satellite placed in orbit and was launched on 12th December 1961, exactly sixty years after Marconi's first trans-Atlantic experiment and exactly forty years after the first amateur trans-Atlantic signals got through.

From The ARRL Letter, Vol 4, No 10.

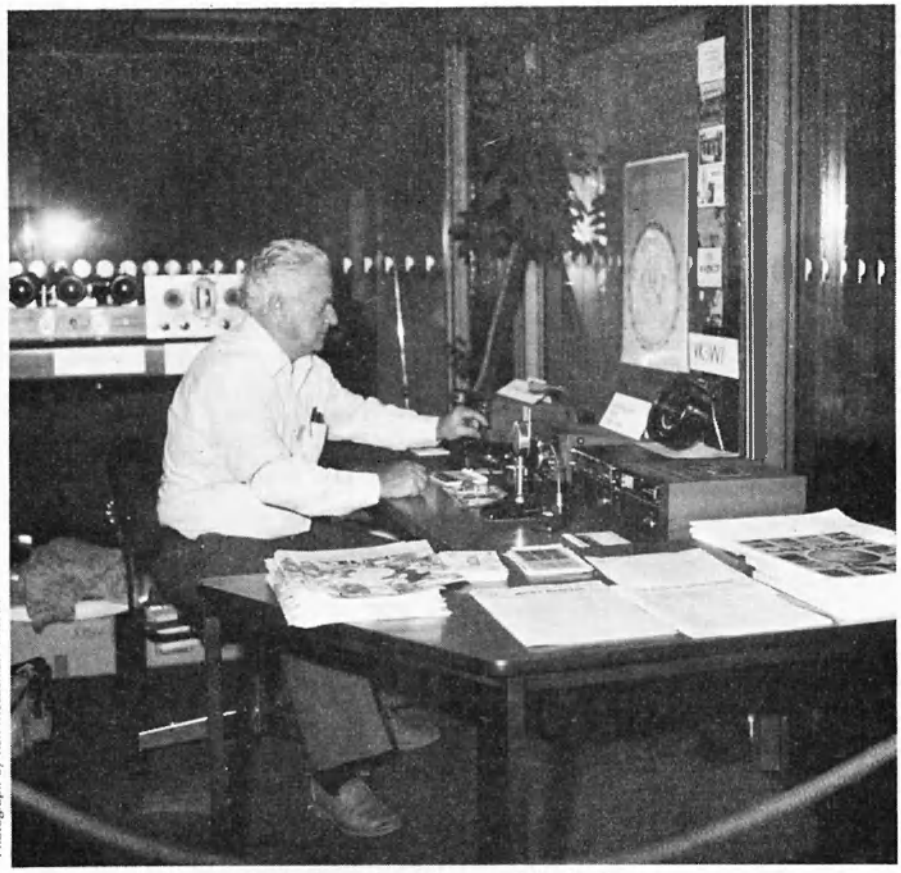
Philately Day — 22nd May 1985



Photograph by Ken McLachlan VK3AH

The display at the Melbourne Philatelic Centre.

Photograph by Ken McLachlan VK3AH

Miss Jill Johnson displaying one of the first envelopes for sale.

Wednesday the 22nd May saw the release of the special Australia Post commemorative 33 cent pre-stamped envelope for amateur radio and the 75th Anniversary of the Institute, as reproduced on the front cover of the May issue.

The Melbourne Philatelic Centre, located in the centre of the city, had static and working displays, including an operative authentic 1936 station loaned by Mac VK3RV. The Manager of the Centre, Mr Ray Bolitho commented on the interest shown by the public to the exhibition and leaflets freely available, to explain more of our hobby.

Other Post Offices in the state had varying displays concerning the launch of the envelope, as space permitted, including the Mooroolbark Office, where a local amateur had loaned modern and equipment of yesteryear, to foster the hobby and promote the sale of the unique envelope.

DUAL BROADCAST

Permission was given by the Department of Communications to a simultaneous broadcast being made from 3RPC Portland and patched to the eighty, forty and twenty metre bands. The programme was opened by a short address from the Minister of Communications, the Honourable Mr Michael Duffy and was followed by a forty minute tape produced by Ken McLachlan VK3AH, interviewing Mr Chris Long, Acting Electronics Curator of the Museum of Victoria. The tape comprised a tour of the museums archives, interspersed with recordings made of Marconi, other notable gentlemen and some of the actual musical broadcasts that used to frequent the broadcast band from home-made transmitting equipment prior to World War II.

Call back stations, which were also patched through the Community Broadcast station, showed extreme interest and commented on the transmissions.

SOME MILESTONES IN COMMUNICATIONS

1832 Samuel Morse develops a system of "Morse" code.

1864 J C Maxwell mathematically proves existence of radio waves.

1887 Heinrich Hertz demonstrates Maxwell's theory.

1888 Prof R Threlfall repeats Hertz's demonstration, Sydney University.

1895 Marconi shows practical use of radio waves for sending/receiving messages.

1896 G W Selby, Malvern, Victoria, experiments with wireless telegraphy transmissions and built Australia's first x-ray machine.

1899 Demonstrations of wireless telegraphy in Melbourne, Sydney, Adelaide, Western Australia, and Tasmania.

1900 A number of wireless experimenters known to be active in Australia.

1901 Marconi's historic trans-Atlantic wireless telegraphy transmission.

1906 Marconi Company opens radio link between Queenscliff Victoria and Devonport Tasmania.

1910 Successful demonstration by GA Taylor in Melbourne that pictures could be sent by wireless.

1914-1918 Amateur Radio ceases during WW1, wireless experimenters serve.

1921 Nightly broadcasts of news by the Victorian Division on 200 metres.

1922 Wireless experimenters given permission to broadcast music and live entertainment on the new AM broadcast band.

1923 2SB (Sydney Broadcasters) now 2BL commences operation on 13th November, the broadcasting era begins.

1924 Experimenters make first wireless telegraphy contact between Australia, UK, and USA.

1925 Plans begin for outback wireless, forerunner of Royal Flying Doctor Service. Experimenter Alf Tragear develops pedal wireless. Experimenters establish Australia-wide wireless telephony communication.

1932 Len Moncur VK3LN Ascot Vale, Victoria, experiments with television.

1939 Black Friday, radio amateurs provide emergency communications.

1939-1945 WW2, radio amateurs play key roles in military communications.

1950 Public demonstration of television, by Len Moncur VK3LN.
Signals bounced off the moon by Victorian radio amateur Ray Naughton, who pioneers this medium with contacts to USA.

1970 WIA Project Australia team of radio amateurs in Melbourne build Australia's first satellite and have it launched in the USA.

1974 Cyclone Tracy, a radio amateur in Darwin and another in Melbourne set up vital emergency communication link.

1983 Ash Wednesday, 200 radio amateurs provide emergency communications.

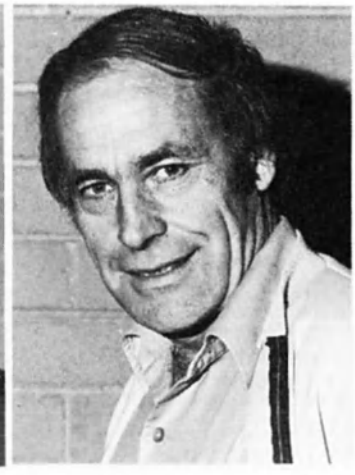
WIRELESS INSTITUTE: TO MANY IT'S A MYSTERY PLACE

Des Clarke — Secretary

Lindsay Rohrlach — Treasurer

Derek McNeil — WICEN Co-Ordinator.



Bill Wilson — Council Chairman

Many members probably haven't given Australia's national radio society much in-depth thought – of course they get the monthly journal or use the various free services provided by the Victorian Division – but actually understanding the WIA is another thing.

Perhaps it's not until one has served on the Council that an insight into the Institute's operations can be fully realised. No matter whether the year is 1925 or 1985, having a position on Council can mean some hard work. You have to make sacrifices, at times this can mean going QRT for weeks and turning your energies on a typewriter, the telephone, or attending meetings.

But all the time a dedicated councillor has in the back of his mind the basic foundations of the Institute set in 1910: "To protect and further the interests of wireless experimenters."

The Council is a barrier to the excesses of bureaucracy, governments and their agencies. It must formulate policies and strategies aimed at getting the best possible (realistic) for the Amateur Radio Service. One on-going task is liaison with DOC and other agencies to help maintain co-operation and understanding. This coupled with the work of managing the affairs and finances of the division can mean a heavy load falling on the shoulders of a few.

And being on Council can often mean you become the subject of criticism by the ill-informed. Admittedly some criticism stems from the "fear of the unknown" – a lack of knowledge about how the Institute works. But it's also generated by those in our fraternity who fail to (or don't bother to) learn the facts of a matter and vent their own personal emotional feelings.

Your national radio society is also harmed by those who hear these people rubbishing the WIA, and then repeat unfounded claims on air – often by prefacing their remarks with phrases like "I've been told that . . .".

The Institute in Victoria is open to scrutinity by its members – should you hear or read anyone voicing anything anti-WIA – remember you can find out the facts through the Divisional Secretary.

As stated earlier – the WIA is a human organisation – and being human means it too can sometimes make mistakes.

But a true supporter of the Institute will seek the full facts before forming an opinion about something the WIA is alleged to have done or not done.

AR

The WIA can be accurately described as a "human organisation" run by volunteers interested in the preservation and furtherance of amateur radio. These volunteers desire to bring out improvements to the Amateur Radio Service and put something back into their hobby.

THE FUTURE: A PROGNOSTIC LOOK AHEAD

Just what will the next 25 years hold for the world's best hobby?

Of course changes in technology will be reflected in amateur radio equipment. Industry sources predict in-built language translation to help radio amateurs (and presumably shortwave listeners) bridge the foreign language gap. Others consider microwave handhelds will be in vogue to link you with your mobile or home rig.

For this (and many other things) to happen, the thorny question of unattended amateur station operation, now prohibited, will have to be resolved.

Will in fact radio amateurs be redundant in the year 2010?

Imagine due to crowded bands and commercial pressures on the spectrum, amateur telephony is banned. It would be possible for our rigs to call CQ, make contacts, exchange signal reports, run a log and print-out QSLs. All of us in 1985 would find that type of development unacceptable.

Packet radio was born in Canada/USA a mere five years ago, and is being hailed by packeteers and others in Australia this year as the emerging trend. A digipeater is operational in Melbourne and packet facilities are to be part of satellites.

No matter how well digital techniques are accepted one feels confident that telephony will remain the major mode of amateur transmission. But only you reading this article in 2010 will know if the confidence held now was valid.

The great potential of packet radio and related keyboard-based techniques is to make our hobby attractive to computer buffs. This issue needs to be addressed with a sense of urgency as part of any WIA strategy to increase growth in radio amateur numbers.

Other obvious challenges include the issue of Morse code being a licensing requirement (no correspondence please – this is not an invitation to open up the code versus no-code debate again), and why not have a geostationary amateur satellite for Australia, New Zealand, Papua New Guinea, and the South Pacific.

This is feasible if an amateur satellite was piggyback launched with a future AUSSAT, the domestic satellite system.

AR

HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

It is on again, having started overseas, and it is something the hobby can do without or for that matter, anyone can do without, in my opinion.

I am specifically referring to the chain letter syndrome, which admittedly has been very quiet over the last three or four years but by all accounts they are around and about again. If any appear at this QTH, I will name the originator and the suggested recipients before casting it into its correct file, the waste paper basket.

There are many ways to ruin a hobby or friendships and this is one of them. In the past, the "letters" have been franked by a business type machine, probably at no cost to the originator, only to his employer who is paying the postal expenses.

CLIPPERTON

The full story is yet to be written, but the operation lasted 6 days 3 hours and 31 minutes, where 11,140 CW and 19,737 SSB contacts were made in temperatures between 35 and 38 degrees Celsius with a relative humidity of 98 percent. Not pleasant.

On landing and departing two boats overturned, luckily no serious injuries were sustained, seas were high and they had to suffer strong winds which brought in the salt spray, if it was not raining. The cost, estimated to be in excess of US$60,000, for less than a week's holiday, to give those number of contacts in round figures equals US$2 per QSO.

Thanks from all DXers, particularly those in the Pacific, to all the operators and donations would be gratefully accepted to help defray the expenses on the members and may be sent to "1985 Clipperton Expendition" c/- Rusty Epps W6OAT, 12866 La Crest Drive, Los Altos Hills, CA94022, where they will surely be appreciated.

All OSLs to YASME, PO Box 2025, Castro Valley, CA 94546 USA.

MT ATHOS

After all the attempts, it appears that I0SNY has received the following letter translated from the Greek language and as printed in QRZ DX.

Sacred Community of Mount Athos
Karie, 21.2.85
To the Civil Authorities of Mount Athos:

Dear Director:
As an answer to your letter (15.1.85) about the request made by the radio amateurs to visit and transmit from Mount Athos, we are sorry to have to tell you that the Sacred Community have decided to forbid forever the making of such transmission from Mount Athos.
Truly yours,
Signed: All the representatives and directors of the twenty Monasteries of Mount Athos.

In my opinion, it is sad that the monks have seen fit to ban a hobby in a rare DXCC country, that means so much to all amateurs, worldwide. My comment is, why?

UGANDA AND OTHERS

Some say there is no paperwork, as the authorities will not issue it because of more important duties and verbal permission is all that is required. This does not suit Don Search at the ARRL DXCC Desk. Others say that written permission has been granted and it is in Don's hands. Apparently Don says that he has documentation of a number of stations but has not processed them as yet.

I go along with the last statement but guess we will just have to wait, see and hope.

On the subject of what is and is not acceptable, the "nots" include C9, 5U7LD, DJ5CQ/SV/A and F6BFN/TT. The good news is, if you are a 40 metre enthusiast, that J5U91 was genuine for the frequency of 7.000 to 7.100 MHz. Outside of this allocation will not be allowed owing to the specifications noted on his documentation.

BAND ENTHUSIASTS

Lee KH6BZF, quite a humourist, predicts very good VHF propagation between the 9th to the 13th of this month, the HF types can expect good activity possibilities from the 1st until the 8th and says there is only 1000 days to go until we reach the bottom of Cycle 21, that is January 1988. This cheerful gentleman asks *"Have you another hobby"*? He closes his Newsletter with the notation *"If we indulge — we bulge..."* Lee a photo please, not head and shoulders either, thank you.

HERIKS DEVALUATION PROBLEM!

Remember Herik FR0LO. Who could forget? Well Herik now sports the call FR5DX and was visited by a couple of European amateurs, demanding an explanation for where were the cards that the dollar notes were sent for. Heriks reply was that it was illegal to send currency in the mail system. I was lucky in getting my card with no hassle and apparently it is not illegal in Herik's code of ethics to receive it.

Herik's many excuses, for not receiving mail at the time, sounded to be genuine but my question is "Did he get in before the devaluation?" and what a killing he must have made either way, as I listened to him a couple of years back, for hours on end, day after day, working the United States at a rate of 30 or 40 contacts per hour. No further comment is necessary except perhaps to note that this has happened in other countries including VK over the years. All countries have their "rare ones"!!!!!

FORUM

George VK3GI has brought to my attention that he worked HI3RST/KP5, last July and has just received the card. The contact was quite difficult and the reports on SSB were 5x1 both ways.

To George's amazement, he received a card with most of the information pre-printed, including the report which was pre-printed at 5x9.

George states *"What utter nonsense this makes of the reality of a contact. I do appreciate the pressure in sending out QSL cards in the thousands after a DXpedition, but is there any value in giving RS reports at all?"*

George likens it to contests, where the monotonous 5x9 reports roll off the tongue hour after hour and in my experience you are requested to, at times, repeat Call and/or report and serial number.

George would like to know how other DXers feel about this matter and I am going to ask you to write to him direct to save overloading my Post Box and trust that he will correlate the replies and pass them on, so they may be printed for the readers' benefit.

George, I don't agree with anyone, but you are an exception with this one and I wonder how the ARRL DX DESK views a pre-printed signal Report. Comments to George please at PO Box 22, Woodend, Vic. 3442.

THE UN AT 40 AWARD

Not trying to steal the Awards Editor's thunder but a special "UN At 40 AWARD" will be issued to any station or SWL working two of the United Nations stations during their 40th Anniversary Celebrations between 1st January and 31st December 1985. The stations are 4U1ITU, 4U1UN and 4U1VIC.

The cost of the award is US$5 of which US$4 goes to the United Nations Children's Fund (UNICEF).

Applications must reach the United Nations Recreation Council Amateur Radio Club, United Nations, Room DC1-0724, PO Box 20, New York, NY 10017 USA before the 1st February 1986.

4U0ITU has been very active on the bands. The operators have been F6EYS and F6HIX.

SALVAGENS ISLAND

The Madeira Club is intending to make an all out effort between the 10th and 20th of next month. No call or QSL information as yet. For those interested the IOA reference is AF-47.

SWEDEN CELEBRATES

Congratulations to the Swedish Amateur Radio Society who celebrate their sixtieth anniversary this year. Selected call signs using the prefix 7S have been heard.

KOREA

An amateur from the German Democratic Republic will be in the People's Republic of Korea and hopes to obtain a licence. Call sign and documentation particularly could be another problem and an interesting "red tape" exercise for the licensing authorities!

BITS AND PIECES

Treat 5A1A as a Pirate**. YV0SE and YV0SEE are thought to be YV40SE and YV40SEE, a special call from EAST Germany. Y40BER has been heard and his QTH is Berlin**. St Brandon didn't eventuate. Amateur operations from 3B7 and 3B8 by foreigners is now forbidden.** Ghis ON5NT, showed how it shoud be done, he made 7210 QSOs from "Bull" 9U5JB's QTH, on all bands 10 through to 80 metres. Only one "G" station appeared in the log. QSL to ON5NT.** Many European stations not happy about the treatment, even though propagation was good, from the Clipperton Expedition. No trouble in the eastern part of VK.** XF4MDX made it, but only for 48 hours, for the many VKs that made it, QSL to XE1MDX. **Crete will be activated by Hal W0PU and his XYL Lynn SV0DW until December. Father John SV0DZ is also presently active. **Three stations, EO1AOK, UW3HY/1 and UA1OT are active from the much sought after Franz Josef Land, ** 3A2CZ and 3A2TO are unissued licences, therefore they are to be treated as "pirates". ** 9U5JW mainly active on CW. ** Twelve JY nationals have passed the examinations and are awaiting the allocation of their licences. ** A wellknown VK3 operator is touring North America, with his XYL operating Motorcycle Mobile and is having a "Ball". ** A positive leap second was put into WWV, WWVB and WWVH on the 30th of June at 23:59:60 UTC. This will retard UTC by one second. Ladies and gentlemen, check your clocks!! ** A well known VK DX operator and QSL Manager has received an invitation to go to the cold south this year. Will he accept??? ** Rumour has it that the residents of Papakura in ZL are jubilant. Dave ZL1AMN, one of the controllers of the Pacific DX Net and Aola ZL1ALE have the tower down for repairs. The neighbours can now see the skyline but I am assured it will not be for long. Will it be a better signal??? ** Still no contact or mailed log to hand on the last boat out from Macquarie Island, from Denise VK0YL, which unfortunately does not allow me to verify the many cards that I have on hand.

PERSISTENCE

Remember in last month's column an appeal for help by Peter G3VIE? Well Peter solved the puzzle of where to find the much wanted cards. A scrutiny of the VK calls one by one, a likely looking similarity, an enquiry to the overseas telephone operator, subsequent phone call and an amazed VK. Peter luckily started at the front of the book and not the VK8 listings as it was found in the first few pages.

Congratulations on your persistence and determination Peter after 15 years of waiting.

DEDICATION

This month, regrettably will be the last segment of "CW SWLing by L30042". Eric has been a constant contributor, except for an overseas trip, since I took over the column.

From all readers and particularly from Bett, my XYL and myself a big thank you Eric, for your contributions that would appear regularly in the mail box on the appropriate day.

Eric feels that it would be impracticable to continue on a regular basis due to the impending change in his lifestyle, which is on the secret list at the moment.

It is hoped to reveal Eric's secret in a future edition of this column but in the meantime our friend, health, happiness and every good wish.

FRANCE

Confusion! The French authorities have decided that first-class licensees may use either the "F" or "FE" prefix at their discretion. For example FE6EYS may also use F6EYS.

WILLIS ISLAND

The new operator Kim VK9ZB, will be active until Christmas. QSLs to VK6YL.

PREFIX CHANGES

VX6 will be used to celebrate the 100th birthday of the City of Lethbridge, Alberta and may be used in lieu of VE6 from the 14th to the 27th of this month.

The X* prefix has been authorised to commemorate the 100th anniversary of Parks in Canada

from the 29th June until the 29th August. Newfoundland XO1, Labrador XO2, Maritimes XJ1, Quebec XJ2, Ontario XJ3, Manitoba XJ4, Saskatchewan XJ5, Alberta XJ6, British Columbia XJ7, NWT XJ8 and the Yukon XK1.

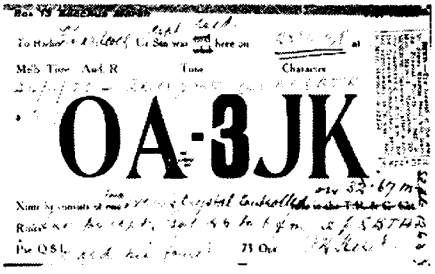
PROPAGATION UPDATE

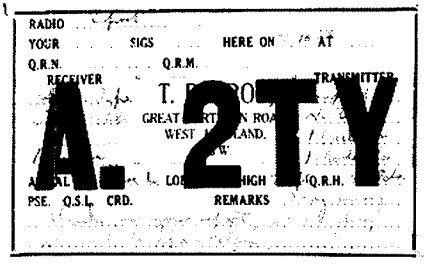
Lee KH6BHF, in KH6BZF REPORTS, estimates that the following dates should be good for long haul twenty metre activity.

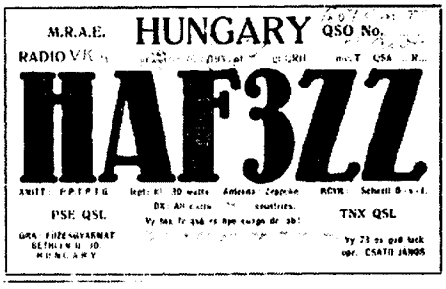
From the 1st to the 3rd, 5th to the 8th, 10th, 15th and 16th, 25th and 26th and the 28th of July. Thanks Lee and we trust that you are correct.

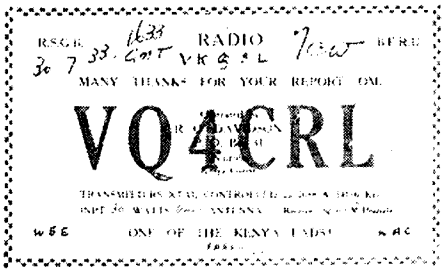
SWL CARDS

Below are reproduced some SWL cards received by Eric L30042. The two Australian cards, OA3JK and









A.2TY were of the 1928 vintage. The overseas cards are 1933. All of course on CW.

ERNST KRENKEL

This old-time DXer, who is now a Silent Key, had the unusual call of RAEM. RAEM was the call of the SS Cheluskin that was smashed in ice in the Arctic Sea in 1934. Ernst was the Chief Radio Operator and was allowed to use the call as late as 1965.

Many references are made to him on some USSR cards and there is an Antarctic and Arctic award in his honour.

TRIVIA

Coaxial cable has been around for over a century. It was patented by Werner Siemens, a German inventor and industrialist, on the 27th March 1884. The first cable of this type was used to carry TV signals between Berlin and Leipzig, for the Olympic Games in 1936.

This type of cable has been used by the majority of amateurs in their time and is still being updated to provide better characteristics.

STATISTICS

The FCC released the following figures regarding Amateur Licences as of the 29th March this year.

The USA has 410,775 individual operators in all Classes and in January 1,097, February 1,454 and March 1,923 amateurs upgraded their licences. In the same period 4,586 people became new licensees.

THANKS

This column would not be possible without the following. The Editors of weekly, bi-weekly and monthly newsletters including the ARRL NEWSLETTER, RSGB DX NEWS, QRZ DX, LONG SKIP, PAPAKURA RADIO CLUB NEWS, DX FAMILY FOUNDATION NEWSLETTER, JAN and JAY O'BRIEN'S QSL MANAGER LIST and KH6BZF REPORTS. Magazines including CQ, cqDX, QST, RADCOM, JARL NEWS, KARL NEWS, OZ, 73 for Radio Amateurs, BARG NEWS, BREAK IN and VERON.

Members who have contributed include VKs 2JM, PS, 3GI, YJ, YL, G3NBC and L30042. Overseas amateurs include G1EOD, G3VIE, I8SAT, ZL1AMM, and ZL1AMN. Special and sincere thanks to one and all.

AR

At the last meeting of the Publications Committee, mutual agreement was that I would continue writing these notes. I sincerely thank the Committee for their confidence, the contributors over the last four years and look forward to more contributions from all readers in the future.

AWARDS

Joe Ackerman, VK4AIX
5 Koomooloo Court, Mermaid Waters, Qld 4218

FROM: Federal Awards Manager

ANNUAL UPDATES

The Federal Awards position now comprises two members, VK4AIX and VK4LC. Joe VK4AIX handles all the overseas awards and submissions to AR, Bill VK4LC handles all WIA awards.

Evidence has been received to confirm that VU7WCY did operate with Indian Government approval from the Laccadives. Their QSL gave no indication where the operation was from (see DXCC rule 1.3). If your card was rejected please resubmit it to FAM.

Cyprus ZC4 was previously mentioned in AR. QSLs for the new country will be credited from 1 June 85. The QSL from ZC4 must indicate that the contact was made from a Sovereign Base Area. If you have doubts please forward the QSL.

Now for details of new DXCC members, DXCC updates and new WIA Awards Certificates issued up to 1 March 85.

Again it is requested that new submissions for DXCC be on a photocopy of the DXCC listing from the 1984-85 Call Book. Thank you for your co-operation.

Enquiries have been made to the Federal Awards Manager for information relating to awards which are issued by the ARRL, CQ Magazine and 73 Magazine.

Full details of these awards will be published in Amateur Radio for the information of amateurs and SWLs.

ARRL AWARDS

The ARRL sponsors the DXCC, 5BDXCC, WAS "Satellite 1000", A1 Operators Club and Code Proficiency Awards.

The DXCC Award is one of the most sought after awards. Its issuance is carefully supervised by three staff members at ARRL Headquarters. Separate DXCC Awards are available for: mixed modes, all phone, all CW, RTTY, 160 metres and satellite.

Applications must be made on the correct forms and endorsements which are available from ARRL Headquarters for an SASE. The forms will be returned, together with a guideline for postage fees if you require the return of your QSL cards.

Further information may be obtained from: ARRL HQ, 225 Main Street, Newington, CT. 06111. USA.

Under the new call system in the USA where a call has been issued for a call area the amateur, on moving to another call area, retains his original call sign. This now makes it possible to work WAS with all W3, W4 etc. I wonder if ARRL will have an endorsement for this achievement?

73 AWARDS

The editors of 73 Magazine provide the following awards: The DX Country Club, Specialty Communications Achievement (two classes), Worked All USA and Century Cities Awards.

These awards do not require you to forward QSL cards, only certification made by either two other amateurs or a local club secretary.

Further information may be obtained from: 73 Awards Manager, Mr Bill Gosney KE7C, 2665 North Busby Road, Oak Harbour, Whidbey Island, WA. 98277. USA.

CQ MAGAZINE AWARDS

Some very interesting awards are sponsored by the Editor of CQ Magazine. WAZ, WPX, WNPX for Novice operators and VPX for SWLs.

Application form CQ 1051A is available from the Awards Editor by sending an SASE. Use sufficient postage if required by return air mail.

Cost of the awards is $US4.00 for subscribers and $US10.00 for non subscribers. Endorsements require application on a special form and cost $US1.00.

Address: CQ DX Awards Editor, Mr Billy Williams N4UF, Box 9673, Jacksonville, Florida, 32208. USA.

ALASKA GOLDPANNER AWARD

Remember the lure of gold and the halycon days of the gold rushes in Australia, California and Alaska?

To commemorate the entry of Alaska as the 49th State of the USA the Alaska DX Association has sponsored an award highlighting, as the centre piece of the award, an OT with his pan sluicing for the elusive metal.

It is produced on white litho paper, the border being green and gold. Inside the border the colour is cream with gold rays leading from the miner's pan to each border edge. Printing is in blue.

The Award is available to all amateurs and SWLs on a heard basis.

Contacts on and after 1 September 1948 are valid.

QSLs are not required. A list certified by an awards manager of a radio club or a representative of the National Society verifying that the QSLs are correct is to be forwarded with the application together with the fee of $US2.00 or IRCs and/or stamps (US) to the value of the fee is acceptable.

Applications to be forwarded to: Alaska DX Association, Awards Manager, Tony P Smaker Jr KL7AF, Box 1614, Kodiak Island, Alaska. 99615. USA.

Requirements: One QSO with each Alaska prefix, AL7, KL7, NL7 and WL7, and nine additional QSOs with any other Alaska station, thus "4-9er".

Awards are issued for mixed, CW only and SSB only. Band endorsements are available on request.

THE WAC AWARD

The ever popular Worked All Continents Award (WAC) can be yours by simply submitting QSLs as proof of contact with each of the six continental areas of the world, Africa, Asia, Europe, North America, Oceania and South America.

Confirmations submitted with all CW, mixed CW and phone will receive the basic award.

Special endorsements include: 1.8 MHz, 3.5 MHz, 144 MHz, RTTY, SSTV, SSB and phone.

A unique version of the award is available for working all six continents on each of five or six bands.

Applications are to be forwarded to the WIA Federal Awards Manager, Bill Hempel VK4LC, QTHR enclosing the six QSLs together with an SASE for the return of your cards.

After certification by the FAM the application will be forwarded to the IARU. Your award will be sent direct to you from the IARU.

The worlds first WAC Award was issued by the ARRL in April 1926 to Brandon (Brandy) Wentworth U6O1. Brandy is still around as K6UJ, living in Maine.

In 1930 the ARRL transferred administration of the popular WAC Award to the International Amateur Radio Union. The first WAC Award issued under the auspices of the IARU went to Sam Cantor W2BOZ, now W6TSQ and active on the low CW ends of the amateur bands.

Who claims the first WAC issued by the ARRL and also the first Award issued by the IARU to VK amateurs?

COPPER COIN AWARD OF FALUN

The CCAF Award is issued by the Falun Radio Club, Sweden and consists of a hand-made, engraved miniature in copper of a l-Daler-piece from the time of Carolus Rex (Charles XII) 1715. Size 57x63x3 mm or 2¼"x2½"x1/8", weight 100 grams (3.5 oz).

The award can be earned by all licensed amateurs in the world, club stations included, who have been in two-way contact with amateurs within the Falun area and thereby gathered at least 10 points according to the table below. Only one contact per station and band after 1st January 1966 will be counted.

3.5 MHz — 5 points, 7 MHz — 3 points, 14 MHz — 2 points, 21 MHz — 2 points and 28 MHz — 2 points.

All contacts have to be made on the same mode, ie CW, AM, SSB, RTTY, etc. A minimum report of 338 on CW and 53 on phone must be recorded in each direction.

Applications with an attached record of the contacts claimed and $US5.00 should be sent to: Falun Radio Club, PO Box 12, Falun 1, Sweden.

Before an application can be approved, all amateur stations in Falun, with whom the claimant has been in contact, must have received the applicants QSL card. The award will be sent by registered mail. The following stations are located within the Falun area: SM4: AJG-AMC-ARY-ATJ-AUU-BJX-BPD-BPU-CGP-CIM-CSF-CUQ-CYR-DAG-DJO-DNX-EAC-ENH-ENK-EPX-FCD-FPR-FTQ-FZQ-GIB-GL-GLX-HFI-HOU-IRX-JCY-JD-JLX-JNC-KRI-KRL-KSM-KVB-MEC-MJH-MVW-MYG-NBG-NDW-NEI-NSQ-OGR-OHH-SX-TO-TU-WQ and SL4BP.

The Daler is a square shaped coin peculiar to Sweden. Coining of big sized copper coins goes back as far as 1644 when the 10-Daler appeared. Coining of square shaped pieces then went on until 1776. The 10-Daler coin from 1644 is the biggest coin in the world and of the 25539 pieces minted only four have been preserved. Falun is located at Lat 60° 36'30"N, Long 15° 38'E.

This is a most unusual type of an award and is surely one which would provide satisfaction to the recipient.

THE WASHINGTON TOTEM AWARD

The Western Washington DX Club, the north-wests largest and most active DX group, takes pleasure in issueing the first W7 major award. This award is issued to any licenced radio amateur who submits proof of two-way radio contact with the State of Washington. The totem pole shown on the colourful award is typical of the totem poles once found in the State of Washington.

Requirements: 1 Applicants must submit proof of QSOs with 100 different Washington stations. Twenty of these must be confirmed contacts with different Western Washington DX Club members. DX stations need only confirm twenty five Washington stations including ten WWDXC members.

2 General certification rules apply. Submissions of QSL cards is not required.

3 All contacts must be dated 1 January 1973 or later.

4 Certified lists submitted should be in alphabetical order with the date and time in UTC.

5 The Washington Totem Award is free to all stations outside the USA.

6 Special endorsement: The Washington Totem Award may be issued for specific bands or modes if all supporting information is included with the application.

7 The WWDXC will furnish a current membership list upon request including an SASE. Address for applications: Awards Chairman, Western Washington DX Club Inc, PO Box 224, Mercer Island, Washington. 98040. USA.

ITALIAN AWARDS

The Torino Section of ARI issues the following awards to amateurs and SWLs who have established QSOs as follows.

DIPLOMA TORINO DT (1953)

Stations of Torino Province
15 for Italian stations
10 for European stations
5 for Extra European stations, all in the same mode and the same band.

DIPLOMA UNITA 'D'ITALIA (1960)

One station of the Province of Torino plus 18 QSOs with 18 stations located in 18 different Italian regions.

It is not necessary to send QSLs confirming the QSOs; all that is required is to send a log extract with the necessary indications countersigned by another amateur to: ARI, PO Box 250, 10100 Torino. Italy.

AWARD "TEATRO GRECO"

This award is instituted by the Syracuse Section of the ARI. To obtain this award it is necessary to send to the ARI Syracuse Section, PO Box 130, a log extract containing all the details of contacts or listenings made, not QSLs.

10 contacts for Italian stations
5 contacts for European stations
4 contacts for Extra European stations

There is no limitation to the band-12 IRCs to cover return postage is required.

The "jolly" stations are valid for 3 points. Member section: IT9: BYJ-DHR-DSL-EJA-FGH-FQF-FTT-GAI-GKY-IDD-KMU-KUG-LHQ-MLT-MNG-NTO-NTQ-PBR-PLT-QDS-QMA-RHK-RIE-RVZ-USV-VEU-VFZ-YRS-YRE-YSI-XNM-ZHB and ZVT.

IT9 stations are very active and this award should not be a difficult one to obtain.

AR

WABAS AWARD (WORKED ACTIVE BRUGES AMATEUR STATIONS)

Class III requires 6 points
Class II requires 12 points
Class I requires 24 points
Endorsement requires 20 points

Points allotted are: phone 2, CW 3, other modes 2 with the Club Station, ON6BR counting one point extra.

Every answered QSL from a Bruges SWL will double the points for that QSO.

The same rules apply for SWLs.

No QSLs are required, just a list signed by two amateurs plus your mailing address. Contacts from the 1st January 1983 are valid for this award.

Cost is 10 IRCs or 200 Belgian francs. Updating is 2 IRCs or 40 Belgian francs plus SAE.

Applications should be sent to the awards manager, ON4AYL, PO Box 24, 9990 Maldegem, Belgium.
Members of WABAS.

ON1: AIL, AIT, AJO, AJZ, ALE, AWI, AWU, AYD, BEW, BFG, BMW, BTU, BUC, BWE, CE, DO, KAN, LV, OK, PW.
ON4: AAJ, ACH, ACK, ADI, ADO, AGD, AJ, AJD, APC, ARL, ASF, ASV, AYL, CJ, DZ, GJ, IA, IK, KE, KF, KZ, LO, ND, NF, OD, OO, PY, RP, UO, WV.
ON5: BG, CV, FU, IA, IG, JR, KG, LO, NO, NT, NY, OE, OJ, SB, TO, VA.
ON6: AA, BK, BR, DX, FF, HO, IU, JA, JI, JN, OH, OU, PX, TL, UM, WU.
ON7: CA, ER, FV, HT, HW, IE, IN, KV, PE, PY, ON, QU, TE, UE, VK, XN, XX.
ON8: RB.

FIELD AWARD

The Swedish Amateur Radio Society will issue the Field Award diploma to licenced radio amateurs and short wave listeners for verified contacts with fields, as defined by the locator system adopted as from 1 January 1985 (Maidenhead locator). Contacts on or later than this date are valid for the diploma.

The field award is issued in four classes:

PLATINUM	*— All 324 fields verified*
GOLD	*— 300 fields verified*
SILVER	*— 200 fields verified*
BRONZE	*— 100 fields verified*

All amateur radio bands and modes are permitted. Endorsements will not be issued.

All contacts shall be made with stations on the earth's surface.

Contacts shall be verified by QSL cards or their equivalent, on which it is clearly stated the field or position, with such accuracy that the field can be determined. The term "position" refers to latitude and longitude or to a place name.

If there is any uncertainty about a field, SSA may demand further information before approving the contact. If the uncertainty remains, then the contact will not be approved.

A random sample of individual QSL cards will be made, which must be sent in for checking.

The application shall be made on a GCR list, containing the information from each QSL card which is required for approval. The GCR list shall be verified by the applicant's national diploma manager or other official in the applicant's national amateur radio society.

The fee is 30 Swedish Crowns, 10 IRCs or 4 USD.

Application address is: *Field Award Manager, SSA, Ostmarksgatan 43, S-123 42 Farsta, Sweden.*

GETTING IT RIGHT

Some months ago I quoted a local newspaper column which gave advice on adapting 240 watts appliances to 110 watts with a three-prong to two-prong converter, or some such. They say a little knowledge is a dangerous thing, but I think you could say a little knowledge goes a long way. The following material forms the gist of some recent reading, and I hope you will find it as amusing as I did.

The scene is the Defence Headquarters conference room, and the President is discussing ways of foiling a blackmail attempt based on a thermo-nuclear device hidden in the Capital. The blackmailer has threatened to trigger it with a radio transmission. Aside from all the speculation, what they don't know is that a "forgotten" OSCAR satellite, which doesn't appear on any listings of orbiting objects (!) is to be used for the detonation signal. But that's getting ahead of the story. Listen in as a Colonel gives all the technical detail to the "Big Chief". . .

". . .'For a transmission over this distance he'd have to use long waves which bounce off the ionosphere and come back down to earth. That means low frequencies.'

" 'How many frequencies would be available to him for something like this?' the "Chief" asked.

" 'A megahertz. One million cycles.'

" 'One million!' the "Chief" rubbed the stub of his chin between his thumb and forefinger. 'Could we jam all one million of those frequencies?'

" 'Sir, if you did that you'd wipe out all our own communications. We'd close down the police, the military, the fire departments, everything we'd need in an emergency.'

" 'Never mind. Suppose I gave the order, could we do it?'

" 'No, sir.' "

Well, the plot thickens, as they say, and there is later reference to very low frequency communications on frequencies of "10 Hertz" or less, and they finally give amateur radio a reasonable plug in describing how the forgotten OSCAR came to be there. For me, however, what could have been a fascinating thriller had become more akin to a comic book. It would have taken so little to get it right — but I suppose the days of critical editing are long gone. Used to be the cardinal sin in writing a thriller was to give your hero an automatic pistol, and then have him point his "revolver" at someone.

What it all boils down to is a matter of **standards**, and therein lies the moral of the story. Effective communication requires adherence to standards or it is meaningless, if not laughable.

Look at the Citizen's Band, where the only enforced standards are a result of peer pressure. They've developed their own standards, so you hear jargon which sounds silly to an outsider (eg "QRZ, ORA, modulate the breaker!") but sounds "cool" to other members of the fraternity.

Things are different in amateur radio, primarily because the hobby itself is serious in purpose, and generally practiced by serious people. Nothing like it used to be, as my old-timer readers are undoubtedly saying, but then **nothing** is like it used to be. Certainly not yours truly.

Am I turning into an old-timer already? I suppose at the ripe old age of 35 one tends to take stock a bit and start to look at things differently — half of the allotted three score years and ten has already been used up. It's too soon to start thinking of yourself as a tribal elder, but it's time to realise that one is no longer a young hot-shot. One is already threatened by or at least feeling a lot of pressure from the next generation of young hot-shots. Things could be a lot worse, of course — pity the young super-star gymnast whose career is over at the age of twenty or less.

So as I grow older, I grow more conservative, and develop an ever increasing nostalgia for the way things used to be done. I use commas where one would pause if reading aloud, despite a ukase from the Australian Government Style Manual that they should be used only where absolutely necessary to the sense of what one is writing.

So where have all the standards gone? Has amateur radio evolved into something so informal that anything goes? I think most of us would hope that some standards can be preserved. I have no doubt that I have led a sheltered, spoiled life in comparison with my parents, and their parents; my own children look pretty sheltered and spoiled to me. In the face of the current "me-first" culture, how can I inculcate in them an understanding that if something is worth having, it is worth working for? Now I think I should get down to what all this philosophising (or whinging) has to do with pounding brass.

As a group within the hobby of amateur radio, we Knights of the Key are a dying breed. We can all sit back comfortably and take pride in the way we operate, in the way we represent tradition, and in the way we could handle an emergency. But I don't think we have a lot to be proud of in terms of preservation of our species. Because of the disciplines imposed by the mode and our pride in our accomplishments we tend to set ourselves apart. We think of ourselves as an elite, and could not care less that other amateurs think we are a bunch of old-fashioned freaks.

Well, if this is freakishness, let's have more of it. We can beat a computer anytime, right? Yes and no. We can demonstrate superiority till the cows come home, but the computer is likely to win in the end because human nature will, like water and electricity, seek the path of least resistance. If people do not understand what we are doing, or think it's too difficult, they will ignore it and in some cases ridicule it.

If CW as a mode of operation is to continue to exist (and we are all agreed that it deserves to continue, I trust) then it follows that we must make some effort to bring newcomers into this hobby within a hobby and encourage their metamorphosis into brass-pounders.

To this end I would like to throw this column open to suggestions as to what incentives and techniques can be used to upgrade the image of CW operation among those who should be worthy candidates for the brotherhood.

Some of the ideas which are worth considering are awards and certificates, contests, a revival of the "Key Section".

I've often thought I should prepare a handbook for CW operation, based on this column, because as a beginner I had a lot of trouble figuring out how things should be done. Please write and let me know if you think such a book would be useful, and if so, what you think should be in it.

On the individual side, why not make it a point to enjoy al least one CW QSO every week with an operator who is much slower?

Well, there's some food for thought. Chew it over, and if you don't get indigestion, drop me a line with a suggestion or two (even rude suggestions will be treated as informative feedback!).

Next month we'll do a reprise on learning the code.

73 till then. AR

THEY'RE GOING TO BURN THE IONOSPHERE

The ionosphere over Tasmania will this month (July) have a 155-mile long hole burnt in it by the space shuttle Challenger.

The hole will be created by firing the shuttle's manoeuvring motors and also spurting water, carbon dioxide and hydrogen.

This will give scientists a chance to analyse the ionosphere, and a glimpse at stars which emit radio waves that normally won't penetrate the ionosphere.

The Australian Science Department's Antarctic Division will use the test to monitor the effect of changes in the ionosphere on satellite transmissions and the earth's magnetic field.

The hole will last until sunrise when solar radiation will recharge and restore the ionosphere.

SEANET ANNUAL CONVENTION

The 15th Annual Seanet Convention will be held in Cebu City, Philippines from 22nd November to 24th November 1985. Convention headquarters will be the Cebu Plaza Hotel.

Further details may be obtained from the Net at 1200UTC on 14.320MHz or from the Cebu ARL Inc, Box 304, Cebu City, Philippines. AR

PACKET RADIO

David Furst VK3YDF
57 Laity Street, Richmond, Vic. 3121

PACKET RADIO IN TURMOIL?

Letters have been received from Jon Bloom KE3Z of the ARRL and Lyle Johnson WA7GXD of Tucson Amateur Packet Radio (TAPR) in response to my November 1984 article. I apologise for not answering these letters sooner and trust that the following will be sufficient answer to this correspondence.

The gist of the arguments raised by both American letters was that the AX.25 protocol is superior to the Vancouver protocols, that anyone using the Vancouver protocols was likely to cut themselves off from the rest of the world and that the hardware standard I proposed in that article was not appropriate.

Following the above correspondence an article has appeared recently in another magazine which requires some clarification. Many of the points it raises re-iterate things said in the American letters.

I take this opportunity to write a combined reply to all the above material.

In particular I feel that the magazine article has misrepresented me and my comments rather unfairly. I will not stoop to such personal attacks and I expect no less of others. To criticise a pioneer in a new field for an article published six months ago and written eight months ago is easy with the benefit of hindsight.

The magazine claims Packet Radio to be stricken by rifts, petty politics and conflicting interest groups. It also contains many errors and inaccuracies.

Many misconceptions about the Vancouver Protocol are put forward — amongst others that it *'unfortunately almost set Packet Radio back enormously.'* Vancouver was where Packet Radio was born. It was invented and implemented by Doug Lockhart VE7APU who can be considered the father of Packet Radio. Doug still inputs all he can both to the AX.25 and Vancouver projects.

One misconception appears to be that those of us who propose the Vancouver Protocol as a standard want to close Australia off from the advantages of overseas communication with AX.25 satellites, gateways, etc. We have had an AX.25 option on our systems from almost the time that AX.25 first surfaced. This is more than can be said of TAPR TNCs. The present TAPR TNC does not implement Vancouver 2. The new TAPR 'Tiny TNC' does not implement either Vancouver protocol.

I was criticised for the suggestion that the TAPR people did not make their AX.25 code available. In reality, after I made that complaint TAPR released the software and THEN stated that my criticism was invalid. At the time I wrote those comments the code was not available and it was not policy to release it. We would very much like to put the latest version of the AX.25 software onto our TNCs. Such a large point is made of how freely 'available' it all is. We've had our order in for the new software since January and it still hasn't arrived.

Much is made of how many AX.25 implementations have been released and how wrong I was about there only being the TAPR machine available. This is a distortion of my comments. There was also the GLB board available at that time. In the Melbourne group we obtained both the TAPR board and also the GLB board for evaluation before making our choices.

The Americans at that time were going in all directions and my major proposal was for a hardware standard which was easy to develop software for and which would stay with us for a long time. I criticised the American effort for their choice of processor for which few people could write code (the 6809).

TAPR developed their TNC and have sold over 2,000 of them. Harold Price, who developed the software which runs on it, (using an HP64000 which few of us have access to) has since become involved in so many organisations that the software development has stopped and is unlikely to re-start. TAPR don't supply these TNCs any more. It is worth noting that Doug Lockhart (of Vancouver) suggested to the ARRL that X.3 and X.28 standards be adopted for talking betwen TNCs and computers, which the ARRL have endorsed. TAPR have said that they'll stick with what they already have.

It was implied that the TAPR unit is cheaper than the Vancouver Unit. When TAPR still supplied it, it cost $240 — American. First add about $100 to account for the weakness of the Australian Dollar. Then add 5 percent duty ($17). Finally add 20 percent sales tax ($71) for a grand total of $428. The Vancouver unit can be built up here in Australia for around $200.

The Americans have followed an interesting path. Their first phase was the TAPR board. Then followed a phase where they developed lots of other boards and systems. Most recently they discovered the Xerox 820 computer and moved things across to that. A word about the Xerox 820. It has a Z80 processor and runs CP/M. They did that because lots of people have plenty of expertise with the 8080/Z80 family of processors and CP/M. Now they have released the TAPR II — their 'Tiny TNC'. It also uses a Z80. My point is that I originally proposed standardising on 8080/Z80 family processors and that the Americans have (belatedly) shown me right by their actions. They are using battery backed up RAM, lots of CMOS components, single voltage supply, lower supply drain and have priced it under $200. I proposed all these things in that article written eight months ago.

TAPR are not sure when this TNC will be available. They won't put you on a waiting list for it either. The Sydney Amateur Digital Communications group have already got a couple of prototypes of a new 'Australian' TNC going and they will be releasing it in August/September. It has all the above (and more). Much more, because it will talk AX.25, Vancouver V1 and V2.

Put bluntly the AX.25 proponents would like it believed that we are trying to kill off AX.25. We are not about to try to take on the might of the USA. We want an orderly development of Australian Packet Radio on hardware that the Americans themselves have endorsed. We do not believe that AX.25 is the 'be all, end all' of protocols — neither do the Americans. The 'Tiny TNC' has AX.25 mark I AND AX.25 mark II. (Yet another protocol). We believe that there is much work to be done in this area and we are doing it. If there are some responsible choices of hardware made, no-one need be left behind as the technology develops. As it is, all those 2,000 owners of TAPR I TNCs appear already to have been dumped by TAPR while the owners of the original Vancouver TNCs still have very usable systems.

The magazine article makes much of the digipeating possibilities of the AX.25 protocol and later admits that most of these abilities contravene our Radio Communications Act. The wording leads to the mistaken impression that the AX.25 system allows you to do what is illegal under the Vancouver system. It does not.

Consider this: *If digipeating is so hot why haven't there been reports of huge networks and long distance multi-digipeat contacts in all the magazines?* The answer is a bit technical, but it boils down to the fact that on a long link you can't get a message and acknowlege packets up and down reliably. When the errors do come along the ACKs and NAKs flying up and down the system bring it to a standstill. The XA.25 system was limitations in this area which the Vancouver protocol does not. The Americans keep talking about level three (in language sounding rather like Vancouver V2) but no code or results have been seen thus far. On the other hand many Vancouver proponents here and overseas have been working on Level 3 networking and we will likely be testing such a system by the time this article appears in print.

The article confuses the V1 and V2 protocols and is accurate about neither. It states that the address field allows only two Bytes of information which will allow only 256 addresses; that we must keep a list of who has which address; that the address field limits the amount of data; that some of us are stuck with V1 and that the Vancouver board is not intelligent.

Anyone will tell you that in two Bytes (16 bits) there are 65,536 possible addresses. V2 allocates these numbers automatically and we don't even need to know what they are. As for the address field limiting the amount of data; what about AX.25 with up to 8 fields of 6 characters? — not that this limits data either. It just slows down the channel with a lot of useless information. None of us is stuck with V1, we can and do upgrade frequently. As for the board not being intelligent it just isn't so.

The magazine editor says *that there is a need for more articles on the subject preferably written by someone with more in-depth knowledge of packet radio than I can claim.'* On the strength of the above, I can only concur.

He further claims that *'there are those who would dearly love to leave this mode shrouded in mystery.'* I am at a loss to know who he's talking about. I for one do many talks to groups, write articles, talk about it on the repeaters and generally spend a lot of time working for nothing when I could be in the arms of a lovely lady!

There should be some mention of the achievements of the two Vancouver oriented packet groups in Australia. The Sydney group has been testing a digital repeater for a couple of years and have been running a bulletin board for almost all that time. The Melbourne group has been running a repeater on test for six months and it is now licensed. They have been running a bulletin board for a year.

The article further states: *'In April 1982, there was not a single soul to be found in Australia who was using the new mode'* (Packet Radio). Elsewhere it says *'Packet radio had its Australian beginnings in Sydney in the early '80s.'* Which is it Sir? The Sydney Amateur Digital Communications group was certainly going at that time.

Further, there are only two groups of Packeteers. Those who want only AX.25 and those of us who want Vancouver, but are willing to put the very latest and best of AX.25 into our TNCs but can't get it. The reference to an 'old guard' who want nothing to do with AX.25 is simply not so.

The suggestion that the Sydney Amateur Digital Communications Group has 'splintered' with some people leaving to form the TAPR Users Group is also not so. The TAPR Users Group is an entirely new group composed of new people. They are not disenchanted ex members of the SADCG.

I was taken to task for Implying that AX.25 software is limited to the 6809 processor — I said nothing of the sort.

It is suggested my complaint that the Americans did not even consider the V2 protocol as a Packet standard is unfounded because V2 was not in widespread use. Of course it wasn't. It was the 'newest kid on the block'. I believe that future developments in level 3 networking will prove it superior to AX.25.

The essential difference between the AX.25 and Vancouver camps is that the Vancouver protocol was developed by Doug Lockhart VE7APU who has been involved with commercial packet communications for many years (with IBM) and can rightly be considered a pioneer in that area.

AX.25 by comparison, was designed by a committee. Lockhart's work displayed an intimate knowledge of the complications and requirements of the higher levels of packet protocols and thus ensured a sound foundation on which to build. It is my opinion that this is less true of the AX.25 protocol. Time will tell.

I am castigated for saying that the American approach was aimed at appliance operators. I have nothing against appliance operators, however when the effort is aimed at them to the point of discouraging experimentation (which it was at that time) I have the gravest objections. It is a matter of much satisfaction that the Americans have started encouraging experimentation by individual amateurs.

Then there are the comments about me criticising the TAPR board for its 6809 processor and the consequent difficulty in software development. TAPR themselves have dumped this processor with the release of their new TNC. The information that AX.25 code will run on Vancouver TNCs is no surprise to those who own them.

Next quote: *'Furst has raised the ire of local and overseas packet users, as evidenced by the amount of mail in response to the comments made in Amateur Radio.'* To my knowledge the only letters received were those two noted above. In fact my phone number was on that article so that people could criticise me easier. Not one phone call was received on the subject — not even from the magazine editor.

Once more: *'Lyle Johnson WA7GXD, President of TAPR, responded to Furst by saying his comments were "erroneous and perhaps misleading". Johnson states that the first Tucson TNCs were developed "for about half the price" of the VADCG TNC and the "Bell 202" modem required to use it.'* The operative expression in the price argument is 'and the Bell 202 modem required to use it'. The modem was the expensive part. They should have done what the group in Sydney did when they developed a cheaper, specialised modem. Lyle Johnson continued: *'But TAPR will continue to make the (TNC) kit available'.* 'Gateway — The ARRL Packet-Radio Newsletter' of 7 May, 1985 states 'The TNC 1 is no longer produced by or available from TAPR'.

Mr Johnson goes on to say that *'there is no harm in multiple TNC designs'* and criticises me for proposing another. My design standard was an old one which was based on the essential parts of the Vancouver design and put forward in the interests of maximum compatibility. I note with interest that his organisation has adopted so many of my recommendations.

Both American writers contend that development of the AX.25 standard was to remedy deficiencies in the Vancouver standard of the time and that the development of new hardware was likewise to address problems with that. Surely it would have made more sense to develop along established lines rather than chart entirely new waters by so radical a departure in both areas? By doing so they immediately created a split in the rather small Packet Radio community of the time. Neither the protocol nor the hardware justified so great a change. Without being ungenerous I can only speculate that these changes came about because someone wanted to 'Americanise' the Packet Radio which someone else had invented.

The article further states: *'What we do advocate is a rational, experimental approach that does not rule out any available option until proven one way or another'.* Surely our approach of a common 'hardware bus' which can run any protocol and will not have to be thrown out if and when a 'perfect protocol' comes along is just that?

The point is made that the TAPR Users Group will have to guard against isolating themselves from the existing V2 systems. We wholeheartedly agree and wish to point out that our repeaters will already repeat AX.25 and will continue tp make such provision. Anyone who wishes to use our installations for AX.25 work is more than welcome to do so.

More: *'Canada and Australia are the only countries experimenting with Vancouver protocol on a large scale and stand to isolate themselves from the rest of the world if they do not adopt a more flexible attitude.'* Given all the above it strains my imagination to see just how we could be more flexible. Would you have us exclude any other technology just because the Americans don't like it?

There is a common thread of misconception throughout the article implying we won't be able to use Oscar 10, JAS-1, PACSAT and other services. *1 We do have and will continue to have AX.25 on our TNCs. 2 It is not envisaged that everyone will talk directly to a satellite, but through a 'gateway' which can translate between protocols — and you won't even notice it happening!*

In conclusion the magazine recognises merit in the Vancouver approach by admitting it *'is more "time efficient" than AX.25'*; that there are many *'Australian Amateurs now competent in writing software for this protocol on popular CP/M computers; that there is a high level of expertise here to develop the hardware; and that the hardware is relatively cheap to acquire and appears to be likely to become cheaper still.'*

A final suggestion is that we *'should use every resource available to ensure that Australia has the best, most flexible packet system in the world'.* A view many of us have dignified by working hard towards it.

I regret that this dissension has arisen. Why, oh why, don't we all go back to where the spirit of Packet Radio was a year ago when we all knew what we were talking about, not bickering, but working towards a common goal?

AR

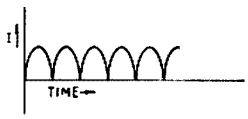
EDUCATION NOTES

Brenda Edmonds, VK3KT
FEDERAL EDUCATION OFFICER
56 Baden Powell Drive, Frankston, Vic 3199

TRIAL AOCP EXAMINATION

Select the correct alternative.

1 This graph shows the output current of a:



a balanced modulator.
b full-wave or bridge rectifier.
c reactance modulator.
d dual voltage power supply.

2 The sidebands of an FM amateur transmission:
a should not be more than 3 kHz wide.
b occur only on one side of the carrier.
c occur at multiples of the modulating frequency.
d add to the power of the carrier.

3 The SWR measured at the output of a 435 MHz transmitter is 1.1 : 1, but at the antenna it is 3 : 1. This may be because:
a the antenna is resonant at 435 MHz.
b of a severe transmitter to feeder impedance mismatch.
c of excessively lossy coaxial cable being used.
d the UHF SWR meter introduces a severe power loss.

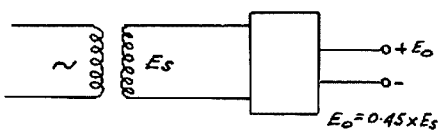
4 The power amplifier in a 144 MHz transmitter is driven by a tripler which is not neutralised because the:
a low power stages do not suffer from positive feedback.
b drive circuit incorporates negative feedback.
c power amplifier provides a passive load for the tripler output.
d tripler input frequency is one third of the output frequency.

5 A bipolar transistor will have a current gain of less than unity:
a in a common base configuration.
b in a common emitter configuration.
c in a common collector configuration.
d when used in an oscillator circuit.

6 A step down transformer has an impedance ratio of 64 : 1. If the input voltage is 120 V AC, the output voltage will be:
a about 2 volts.
b 15 volts.
c 240 volts.
d 960 volts.

7 Typical amateur repeater offset frequencies in Australia for systems operating on 146 MHz and 438 MHz are respectively:
a 600 kHz and 5 MHz.
b 5 kHz and 600 kHz.
c 600 Hz and 5 kHz.
d 500 Hz and 5 MHz.

8 The device in box B is probably a:



a filter.
b voltage doubler.
c bridge rectifier.
d half wave rectifier.

9 A capacitor functions as a result of the:
a storage of energy in an electrostatic field.
b storage of energy in an electromagnetic field.
c dielectric charge.
d accumulation of electrons on the positive plate.

10 In a direct conversion receiver, good selectivity is achieved by:
a the IF stages.
b using a narrow band audio filter.
c low distortion audio amplifier stages.
d a tunable beat frequency oscillator.

11 The reading on a dip meter reduces sharply when it is coupled to a circuit:
a and is tuned to the resonant frequency of that circuit.
b because at resonance it absorbs power from the circuit.
c because the impedance of a parallel tuned circuit is lowest at resonance.
d which is energised.

12 A hot carrier diode may be used:
a as a rectifier in a high current power supply.
b where high heat dissipation is required.
c as a rectifier at microwave frequencies.
d to replace a varicap diode for tuning at VHF.

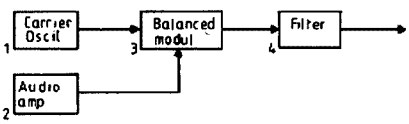
13 To check the linearity of an SSB transmitter to two tone audio test signal is applied. A sample of the transmitter's output is connected to:
a a wave form generator.
b a sweep generator.
c the vertical deflection plates of an oscilloscope.
d an output power meter.

14 Crossmodulation occurs when:
a two signals of precisely equal input strength are received at once.
b the modulation of a strong unwanted signal is transferred to the desired signal.
c two transmitters are operated in close proximity to each other.
d signals are rectified in the receiving antenna.

15 HF multiband transmitting antennas should preferably be used with an antenna tuning unit to reduce the:
a radiation of harmonics.
b angle of radiation.
c height of the antenna.
d generation of intermodulation products.

16 The maximum deviation commonly used in amateur FM transceivers at 144 MHz is:
a 5 MHz.
b 600 kHz.
c 15 kHz.
d 5 kHz.

17 The frequencies which occur at significant levels in the output of block 3 should be:



a AF, RF, sum and difference of AF and RF.
b AF and RF only.
c sum of AF and RF only.
d sum and difference of AF and RF.

18 A receiver's ability to reject unwanted signals is limited by:
a crossmodulation of weak adjacent frequency signals.
b the skirt response of the selectivity circuits.
c generation of harmonics at the transmitting station.
d AF distortion products generated in the detector stages.

19 A 5/8 wavelength vertical antenna is:
a does not require earthing of the radials.
b may use a loading coil to make it an electrical 3/4 wavelength.
c has a higher angle of radiation than a 1/4 wavelength vertical antenna.
d uses its built-in capacitance to reduce it to an electrical 1/2 wavelength.

20 A solid state device having four semiconductor layers but only three terminals could be a:
a NPNP bipolar transistor.
b bridge rectifier.
c silicon controlled rectifier.
d dual gate FET.

21 The 'skip' distance at HF will depend on the:
a radiation angle and virtual height of the ionosphere.
b frequency of local weather changes.
c conductivity of the surface over which the wave travels.
d height of the troposphere.

22 An electret microphone works on the principle that:
a external bias is required.
b its changing capacitance will alter the input frequency.
c a permanent electric charge on the plates provides bias for the amplifier.
d sound waves cause its capacitance to change with consequent output voltage variations.

23 The addition of extra elements to a Yagi antenna will result in increased:
a bandwidth.
b side lobe radiation.
c forward gain.
d SWR.

24 A voltage measuring device incorporates a diode in its probe. It is likely to be used to measure:
a very high pulse voltages only.
b DC voltages.
c RF voltages.
d very low AC voltages only.

25 The rating of a fuse in a transmitter power supply should be approximately:
a 3 to 5 times the expected current.
b twice the power output of the transmitter.
c 1.5 times the current used the output stage.
d 10-20% higher than the expected current.

26 In a transmitter using low level modulation:
a no audio amplifier stage is used.
b all subsequent amplifier stages must be linear.
c the oscillator output must be low.
d the modulation is applied to the buffer stage.

27 To calculate the DC input power to the final stage of a transmitter it is necessary to know the:
a cathode current.
b control grid current and screen grid voltage.
c screen grid current and cathode voltage.
d anode current and anode voltage.

28 A common application for a field-effect transistor is:
a in high voltage, high current power supplies.
b to control the series current in a regulated DC power supply.
c as a high impedance input amplifier.
d as a linear detector for high fidelity reception.

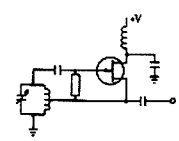
29 The specifications for a device state, in part, '-20 dB quieting with 0.25 uV input signal'. This refers to the:
a image rejection by a superheterodyne receiver.
b sensitivity of an FM receiver.
c carrier suppression in an SSBSC transmitter.
d quality of the noise limiter in a direct conversion receiver.

30 To stabilise the output of a 150 V DC power supply we could use:
a a gaseous regulator tube.
b five 30 V zener diodes in parallel.
c a voltage divider network.
d a choke input filter.

31 An unstable output at VHF from a 3.5 MHz transmitter implies:
a excessive harmonics.
b rectification in the antenna.
c an oscillating power amplifier stage.
d mixing with RF from a nearby television receiver oscillator.

32 One difference between Class AB 1 and Class AB 2 amplifiers is that:
a Class AB 2 amplifiers need less driving power.
b Class AB 2 amplifiers operate without any standing anode current.
c grid current does not flow in Class AB 1.
d two valves in Class AB 1 in push-pull will cancel out odd harmonics.

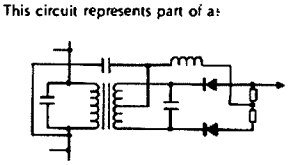
33 The type of oscillator shown is a:



a Hartley.
b Colpitts.
c Armstrong.
d Clapp.

34 To prevent direct radiation of interference from an amateur transmitter it is important to:
a check the SWR at the transmitter output.
b ensure that the transmitter is adequately screened.
c install an antenna tuning unit in the feedline.
d monitor the output on a spectrum analyser.

35 This circuit represents part of a:

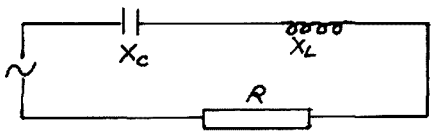


a *frequency doubler.*
b *product detector.*
c *FM discriminator.*
d *full wave power supply.*

36 A multiband dipole can be fed with a single transmission line because:
a *this produces a more omnidirectional radiation pattern.*
b *each dipole presents a high load impedance at other than resonant frequencies.*
c *this produces a uniform vertical radiation pattern on all bands.*
d *a ten metre dipole can act as a matching stub for the longer dipoles.*

37 Ground wave propagation:
a *is not possible across large bodies of salt water.*
b *can be carried out over longer distances on HF than on VHF.*
c *will vary according to the time of day and the sunspot cycle.*
d *can only be used for vertically polarised transmissions.*

38 In this circuit the total impedance (Z) is given by the formula Z= :



a $X_C + X_L + R$

b $R + (X_L - X_C)$

c $\sqrt{R^2 + X_L^2 - X_C^2}$

d $\sqrt{R^2 + (X_L - X_C)^2}$

39 An advantage of the point-contact diode over the junction diode is that:
a *it does not require high purity semiconductor material.*
b *it can be manufactured in a smaller package.*
c *the lower capacitance allows operation at higher frequencies.*
d *temperature sensitivity is higher.*

40 An HF amateur transmitter may produce spurious emissions at VHF. The cause can be identified by using a:
a *sensitive tunable absorption wavemeter.*
b *nearby television receiver.*
c *RF power meter.*
d *RF voltmeter.*

41 Inductances of 20, 30 and 60 Henries are connected in parellel. Ignoring mutual inductance the total will be:
a *110 H.*
b *60 H.*
c *37 H.*
d *10 H.*

42 Marker crystals are often used to:
a *allow simultaneous transmission on several harmonically related frequencies.*
b *calibrate receivers at the band edges.*
c *check for overmodulation.*
d *calibrate the BFO.*

43 A filter has several series and parallel resonant circuit combinations, it is probably a:
a *high pass filter.*
b *low pass filter.*
c *band pass filter.*
d *mechanical filter.*

44 When an alternating voltage is applied to a capacitor, the relationship of the voltage to current is:
a *90° out of phase, current leading.*
b *90° out of phase, voltage leading.*
c *180° out of phase.*
d *in phase at all times.*

45 Hysteresis losses in an iron-cored transformer are due to:
a *the resistance of the wire of the coils.*
b *localised electrical currents in the core.*
c *the extra bulk of the insulation of the coil wires.*
d *the opposition to a change of the magnetic state of the core.*

46 The "D" layer of the ionosphere:
a *is more dense at night than by day.*
b *absorbs MF signals more than HF signals.*
c *is the layer furthest from the earth.*
d *is present only at the peak of the sunspot cycle.*

47 As a safety precaution, before working on a transmitter which has recently been used, it should be disconnected from the mains and:
a *have the microphone removed.*
b *have the fuse removed.*
c *the power supply capacitors should be discharged.*
d *the transmitter earthing strap removed.*

48 The standard colour coding for 240 VAC power leads in Australia is:
a *active red, earth blue.*
b *neutral blue, earth brown.*
c *active brown, neutral blue.*
d *neutral brown, earth green and yellow.*

49 A 'temperature inversion' causes:
a *the air temperature to increase with an increase in altitude.*
b *ionization along a cold front.*
c *improved HF propagation.*
d *VHF signals to be trapped above the inversion layer.*

50 The actual output frequency of a fifth overtone crystal oscillator may be:
a *exactly 5 times the crystal frequency.*
b *one fifth of the crystal frequency.*
c *slightly offset from the fifth harmonic of the fundamental crystal frequency.*
d *adjustable over a 20% range of the fundamental crystal frequency.* **AR**

INTRUDER WATCH

Bill Martin, VK2COP
FEDERAL INTRUDER WATCH CO-ORDINATOR
33 Somerville Road, Hornsby Heights, NSW 2077

It was interesting to note, as I looked through some Intruder Watch figures lately, that, for the last three years, most intruders were reported in September of each year. I can't guess what this means. We can't assume that intruder activity is greatest in that month, as it may be that OBSERVER activity is greatest in September. I favour the latter theory, and suspect that, with the coming of Spring, and the temperatures in the various shacks becoming more conducive to radio activity, more observers are doing more monitoring than in colder months.

THANKS TO OBSERVERS

The time-lag between processing all the reports received and the lead-time for this column means that thanks to contributing observers are very often belated. However, if you keep that in mind, I now take the opportunity to say thank you to those who sent in reports for February last. VK2BQS, VK2DAT, VK2DEJ, VK2PS, VK2PWS, VK2QL, Arthur Bradford (SWL), VK3PIW, VK3XB, VK3XU, VK3YF, VK4AKX, VK4BG, VK4BHJ, VK4VFG, VK5AOZ, VK5BJF, VK5GZ, VK7RH, VK8HA.

With Spring only a few weeks away, when the shacks will start to warm up, wouldn't it be nice if some more amateurs and SWLs sent in some reports of intruders they hear on the amateur bands? There are plenty to choose from, and I'm sure that the above-mentioned workers wouldn't mind at all if others lend a hand.

NEW CO-ORDINATOR

News has come that we have a new IW Co-ordinator in the ACT Division. Ray Roche VK1ZJR, PO Box 81, Campbell, ACT 2601, has taken up the challenge, and we offer a warm welcome Ray to the ranks of intruder watchers. Any reports from the VK1 area can now be sent direct to Ray.

RE-PRINTED HANDBOOK

Recent enquiries reveal that the new edition of the "Amateur Operators' Handbook", was in fact printed, and was available at the Government printing office, but was subsequently withdrawn from sale due to printing errors. However, by the time this column appears, all should be rectified, and the publication should be back on the shelves (a re-printed edition). This handbook is a must for every Amateur Shack, and, of course, the aspiring amateur licensee must have a copy to study the regulations, not only to obtain a pass mark in the regulations examination but to acquaint him/herself thoroughly with the regulations in force at the time so as to save embarrassment on air. That may save them the panic I went through on one occasion, when, as a Novice licensee, a JA asked me to QSY up the band, which I did, and when I realised I had moved up right out of the Novice segment, I was back in about a micro-second!

LEND-A-HAND

A special appeal goes out this month to VK7 amateurs and SWLs to lend a hand with intruder watching. If you have any enquiries in VK7 re the IW, drop a line to Robin VK7RH (QTHR), the Tasmanian Co-ordinator, who will assist you to assist us to assist you (what'?). Robin is waging a lonely war against intruder stations from down south, and could do with some help. Athol VK7LR is helping, but what about some others chipping in. I have the worked 100 Tasmanian Devils Award, so I KNOW there are more active amateurs in Tassie than Robin and Atholl *What about making it a Club project for, say, one month, to see what you can come up with?*

DISTURBING NEWS

Disturbing news to hand that a ship, currently in the Marshall Islands (at the time of writing), is passing commercial traffic in the AMTOR mode on 14.069 MHz, and that two American amateurs are involved. This is disappointing news, and we hope that the FCC will get something done about it. I have been in touch with the Region 2 IW Director in Washington, and hopefully he will be able to get moving on the matter.

Well, that's about all for the month, see you next time, and let's all try to band together and use kinetic energy to get the solar cycle to get moving upwards!

ALARA

Australian Ladies Amateur Radio Association

Margaret Loft, VK3DML
28 Lawrence Street, Castlemaine, Vic 3450

Well this is ALARA's big month when we reach the grand old age of TEN YEARS; what a milestone and certainly one the founder of LARA can be justly proud of.

At our get-together at Mildura last September Norma was presented with a bouquet and I quote her reply *"ALARA started because I was bored; Too many old ladies; There weren't enough old ladies and there weren't enough young ladies either, they were all men. It was a traditional old story, when you visited an amateur where do you go? You go to the shack with the fellas, or into the kitchen with the ladies, so I thought we had better do something about it and try to get the ladies together. The original idea wasn't necessarily that all the ladies get their licence, but somehow or other that got changed. The idea was to all get together and have family outings, the ladies and men together, and have a good time.*

I am very proud to see what it has turned into."

CELEBRATIONS

VK3: Is having a luncheon at the Moorabbin Radio Clubrooms, Turner Road Reserve in Highett from 11.30 am on Saturday 27th July.

Please bring a plate of food to be shared; cutlery and crockery. Tea and coffee will be provided. Please notify Bron VK3NTD for further details.

VK4: Are also having a luncheon at Redcliffes on Saturday 27th July; details from Margaret VK4AOE or Josie VK4VAN.

VK6: Lunch was on 21st June as this suited the YLs better than July.

Welcome to a new member — Lynda Francis from WA, the daughter of Poppy VK6YF.

On a sad note ALARA has lost three members this year; condolences are extended to the families of Margaret VK2AHD; Verle VK2MR and Valerie VK4FKL.

ALARA CONTEST MANAGER

Marlene VK2KFQ has offered to wear the hat of contest manager for the incoming committee. My thanks to you Marlene for your offer and I do hope you enjoy your involvement with the task.

AGM

Most positions for the new committee are filled now, but please, if you feel you can help in any way, write to Jenny VK5ANW and offer, new ideas and new faces are always welcome.

MINI CONTEST

To coincide with our tenth birthday on the 6th July activity day, a mini contest is being held.

Contacts to be on the novice section of 80, 15 and 10 metres.

Phone and/or CW may be used.

YLs to contact YLs only (not necessarily ALARA members).

Each station can be worked ONCE ONLY.

A special mystery prize will be awarded to the YL who has had the greatest number of contacts (if a draw the YL with the most prefixes wins).

Send your log to Contest Manager VK2KFQ, 31 Cadell Street, Wentworth, NSW 2648 by 27th July 1985.

This will be my last report for ALARA in AR. After nearly six years it is a sad day for me, but it is time someone else has a say for you.

My very sincere thanks to all who have helped me with the column. To those who produce AR the best of luck in the future, the magazine is a credit to you all. I am going to sit back and look forward each month to what our next Publicity Officer has contributed instead of looking to see if my column turned out the way it was intended.

All the best to you all
33/73/88

SPOTLIGHT ON SWLing

Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

There has not been too much to get excited about this past month. Band conditions have been very poor and unpredictable with the occasional blackout severely disrupting communications on HF. One highlight though was the unexpected appearance of Radio Greenland in mid-April on 13.797 MHz with reduced carrier USB. It was carrying a news programme in a Nordic language — Danish I would presume, as there were actualities from Tel Aviv. I think that the programme material would have originated in Copenhagen as Greenland's population is not that large, although in the atlas Greenland appears large, it really is because of the distortion of land masses around polar regions on the Mercator Projection. You can see it's true size on a globe.

STATIC LEVELS DOWN

Because of the lack of activity on the higher frequencies, I have been listening down in the tropical allocations between 2 and 6 MHz. The static levels have diminished now and I have been observing some interesting Latin American and Asian signals in our local evening hours. Unfortunately as well, there seems to be a corresponding increase in the amount of utility services utilising these frequencies, because of the lack of HF propagation. This has made reception even more difficult. When you appreciate that the majority of broadcasters down there use low to medium power, you do especially find it difficult to positively identify a station, as there are local languages and dialects spoken plus there are several stations sharing the same channel.

Another complication I have encountered is the presence of several international broadcasting stations, such as Radio Beijing and Radio Moscow in these tropical allocations, which are primarily allocated for local domestic coverage. Both stations have been observed in Japanese and Korean. I have even observed Beijing broadcasting in English around 1200 UTC in the 60 and 75 metre allocations. The frequency was not announced at the microphone nor is it mentioned in the schedules. However the 75 metre allocation (3.900-4.050) is used within Europe and Asia but not in the Americas.

SURPRISE!!

And talking of unlisted outlets, I came across Radio Australia on one of their regular 49 metre channels at 0400 UTC. It was quite strong and unusual because Radio Australia doesn't employ the 49 metre allocation in the local daytime. I think that they could have been using Lyndhurst and not the Carnarvon site which normally is on 6.080 MHz. The VOA was in various European languages underneath from their Wofferton (UK) base. I don't think it was a scheduled transmission as there was no acknowledgement at the microphone of the frequency's use. I guess that they were experimenting to see what propagation was like on 49 metres at that time.

UNIDENTIFIABLE

Around mid-winter, it has been usually possible to hear signals coming in from Europe across the Antarctic regions at midday locally. So far this year, I am hearing several carriers yet the modulation appears well down. There is a characteristic flutter, indicative of a polar path present on the carriers. Perhaps by mid-June, I will be able to identify them.

At present, I am hearing stations broadcasting to North, Central and South America around 0200 UTC which corresponds to our local midday. Signals on the 25 and 31 metre bands have been particularly good. Another unusual propagational occurrence has been the presence of several Pacific Island broadcasters on the 41 metre band during the daytime. Noumea has been heard around 0200 UTC on 7.170 as well as Vanuatu on 7.260, which quickly disappears when the Europeans dominate the channel.

There were several live broadcasts of special events during May. First off, we had a description of the May Day Celebrations in Red Square in English and other languages. Then on the 8th May, better known as VE Day, the BBC World Service carried live the Service of Remembrance from Westminster Abbey. Then the next day, the Soviets had a big Military Parade in Red Square and R Moscow had descriptions over their World Service plus a commentary in German. Apparently the USSR regard 9th May as VE Day.

The BBC World Service has been experimenting with a new audio processing system called OPTIMOD. This new system aims to equalise audio output and is not like the compression system they used previously.

Then you could hear the announcer in between phrases drawing in breath, or the sound effects would drown out the dialogue on a sports description or play. The new system appears much better and easier to listen. Now I would only wish Radio Moscow reduce its compression on its modulation. It sounds lifeless and artificial with no depth. The audio is better on their Domestic Feeders on SSB than it is on the normal DSB (AM) signals, particularly on music programmes.

Well, that is all for this month. I hope to work many of you to obtain my 75th Anniversary Award. Next month, I will have a report on the Australian Radio DX Club's "DXPO" that I attended last month. Until next time, the best of 73 and good listening — Robin. **AR**

QSP

TRANSCRIPT OF JOTA TAPE

JOTA information for broadcast on Sunday, 26th May 1985 from Stan Ellis VK2DDL, JOTA Co-ordinator for 1985 for Central Sydney Area of the Scout Association.

The Scout Association is hoping, this year, to see a much greater response from Scouts, Guides and amateurs to Jamboree-On-The-Air. We feel that, in International Youth Year, amateur radio offers a great opportunity for Scouts and Guides around the world to make contact.

The Scout Association has set up groups of JOTA Co-ordinators at Area and District levels to liaise with the WIA, and, in particular, the Institute's JOTA Co-ordinator, John Bunn VK2NDJ.

We ask any amateur who can spare the time, to participate. Although JOTA is still some months off, we would like to see amateurs and Scout Groups, or Districts, meeting to arrange for the siting of JOTA stations and also for preliminary instruction of Scouts and Guides in operating procedures.

A suggestion is that groups of two or more amateurs visit Scout and Guide meetings and demonstrate procedure, as well as giving some details of the history of amateur radio. It has been found in the past that many of those participating in JOTA, when confronted for the first time with a microphone, become tongue-tied, and contacts degenerate into much giggling and incoherent noises. This does not enhance either the Scouts', Guides' or amateurs' appreciation of the event, and can be avoided if some familiarisation with the art of communicating is provided. A very effective way of providing training in procedure is by the use of intercom units or tape recorders. Intercom units, particularly those FM units which operate over the mains, offer a very easy means of demonstration under conditions which closely approximate push-to-talk operation.

Communication is becoming an increasingly important aspect of Scout training. We hope, in the future, to see more and more amateur stations permanently installed at Scout halls. For many Scouts and Guides the first contact they have with amateur radio is at JOTA. The willingness of amateurs to introduce them to their hobby can often result in the awakening of an interest which will continue for many years.

Any amateur willing to assist with JOTA has only to advise John Bunn on 02-772-3437, giving his or her name, address and call sign. This information will be passed on to the Scout Association who will arrange for a District Co-ordinator to make contact and arrange for a meeting where facilities, a suitable station location and any other necessary arrangements may be discussed. **AR**

CONTESTS

Ian Hunt VK5QX
FEDERAL CONTEST MANAGER

P.O. Box 1234, GPO, Adelaide, SA 5001.

CONTEST CALENDAR

JULY

6-7	*Venezuela Phone Contest*
13-14	*International QRPP Contest*
13-14	*IARU Radiosport Championship*
13-14	*West Coast 180 SSB Contest*
13-14	*Colombian DX Contest*
20-21	*The Sunshine State Jack Files Memorial Contest (Rules 'AR' June 1985)*
20-21	*Venezuela CW Contest*
20-22	*CQ WW VHF Contest*
27-29	*County Hunters CW Contest*

AUGUST

10-11	*European CW Contest (Rules this issue)*
17-18	*REMEMBRANCE DAY CONTEST (Rules this issue)*
17-18	*SARTG RTTY Contest*
24-25	*All Asian CW Contest (Rules June 1985)*
24-25	*SARTG RTTY Contest*

SEPTEMBER

14-15	*VK NOVICE CONTEST*
14-15	*European Phone Contest (Rules this issue)*

OCTOBER

5-6	*VK/ZL OCEANIA PHONE CONTEST (Not yet confirmed)*
12-13	*VK/ZL OCEANIA CW CONTEST (Not yet confirmed)*
26-27	*CQ WW DX Phone Contest*

NOVEMBER

23-24	*CQ WW DX CW Contest*

CERTIFICATES

As I write this, action is still in hand to complete the issuing of all the certificates and overcoming the backlog of same. My plans have gone a little astray regarding this matter and I had sincerely believed that I would have had it all cleared by now. So, please be patient for just a little longer. I can assure you that you have not been forgotten.

REMEMBRANCE DAY CONTEST

This is the biggest of our contests for the year. There are quite a few rule changes, many of which have been previously intimated, and I would suggest that you read the rules carefully. Hopefully there are no ambiguities or mistakes in same.

The weighting factors to be applied for the 1985 Contest with respect to each WIA Division are as follows:–

VK1 — 1.08, VK2 — 7.81, VK3 — 5.96, VK4 — 5.83, VK5/8 — 1.31, VK6 — 1.26, VK7 — 1.27.

I would like to thank Ron Henderson VK1RH for his assistance in calculating the figures from the data available from the 1984 contest and providing same to me. I still have some reservations as to the method used in deriving the formula to determine the winning Division and I mentioned this fact in my Annual Report to the Federal Convention. I trust that there will be some continuing discussion on this subject but would not like to mess with the current system until the matter has been more closely studied. It is a much more complicated matter than may appear at first glance.

CONTEST DATES

Following my Annual Report to the Federal Convention and discussion of same by the Federal Council my recommendations regarding the change of dates for the John Moyle Memorial Field Day and the VK Novice Contests were accepted. It is too late now to be able to do anything about the VK Novice Contest date so we will have to wait until 1986 before that can be sorted out. As you can see by the Contest Calendar published above it will still be held this year in September sandwiched in between the Remembrance Day and VK/ZL/Oceania Contests.

The Convention agreed that the date for the Field Day Contest could be moved to as late as the end of March. It may interest you to know that I am in correspondence with the ZL Contest Manager Jock White ZL2GX on this subject. The New Zealand boys would like our Field Days to continue to coincide as has happened on occasion in the past, so I hope that we can come to some suitable arrangement on this.

There seems to be a large amount of material for the Contest Column this month and it is that season of the year when my work as Contest Manager will be hotting up. I also have a very heavy commitment in other areas as well so the column may be a little sparse in the way of editorial comment and news for several issues. However, do not let this deter you from sending letters of comment and suggestion. They are always welcome, the more comment and discussion the better for all concerned.

REMEMBRANCE DAY CONTEST 1985

This contest is held to commemorate those amateurs who died during the Second World War and is designed to encourage friendly participation between all amateurs and to help in the improvement of operating skills of all participants.

This contest is held annually during the weekend nearest the 15th August, the date on which hostilities ceased in the South-west Pacific area.

The contest is preceded by a short opening address by a notable personality which is transmitted on various WIA frequencies during the 15 minutes immediately prior to the commencement time of the contest. As part of this opening ceremony a Roll Call of names of those amateurs who paid the Supreme Sacrifice is read.

A perpetual trophy is awarded annually for competition between Divisions of the Wireless Institute of Australia. It is inscribed with the names of those Australian amateurs who made the Supreme Sacrifice and so perpetuates their memory throughout amateur radio in Australia.

The name of the winning Division each year is also inscribed on the trophy and in addition the winning Division will receive a suitable certificate.

OBJECTS

Amateurs in each VK call area will endeavour to contact other amateurs:

1 In other VK Call Areas, P2 and ZL on bands 1.8 to 30 MHz, (except the 10 MHz, 18 MHz and 24 MHz bands).

2 In any VK Call Area, including their own, P2 and ZL on bands above 52 MHz, and as indicated in Rule 5.

CONTEST PERIOD

0800 UTC 17th August 1985 to 0759 UTC 18th August 1985. All Australian amateur stations are requested, as a mark of respect, to observe 15 minutes silence prior to the commencement of the contest. It is during this period that the Opening Ceremony Broadcast referred to above will take place.

RULES

1 There will be TWO CONTEST CATEGORIES.
(a) HIGH FREQUENCY (HF) ie for operation on bands below the 52 MHz Band.
(b) VERY HIGH FREQUENCY (VHF) ie for operation on bands from 52 MHz and upwards.

2 In each Category there will be THREE SECTIONS.
(a) Transmitting Phone.
(b) Transmitting CW.
(c) Receiving.

Modes applicable to each section are as follows:–
(a) AM, FM, SSB, TV.
(b) CW, RTTY.
(c) Rx A or B.

3 ALL AUSTRALIAN AMATEURS (VK Call sign) may enter the contest whether their stations are fixed, portable or mobile. Members and non-members of the Wireless Institute of Australia are eligible for awards.

4 CROSS MODE OPERATION is permitted. CROSS BAND operation is NOT permitted excepting via a satellite repeater.

5 SCORING CONTACTS.
(a) ALL CONTACTS SCORE **ONE POINT.**
(b) On all bands a station in another call area may be contacted once on each band using each mode. That is, you may work the same station on each band on Phone, CW, RTTY and TV.
(c) On the bands 52 MHz and above, the same station in any call area may be worked using any of the modes listed at intervals of not less than THREE HOURS since the previous same band/mode contact. However, the same station may be contacted repeatedly via satellite not more than once by each mode on each orbit.
(d) Acceptable logs for all entries must show a minimum of at least 25 valid contacts.

6 MULTI-OPERATOR STATIONS ARE NOT PERMITTED (except as in Rule 7) although log keepers are allowed. Only the licensed operator is allowed to make a contact under his/her own call sign. Should two or more operators wish to operate any particular station each will be considered as a contestant and must submit a log under the individual call sign which applies to that operator.

7 CLUB STATIONS may be operated by more than one operator but only one operator may operate at any time, ie no multi-transmission. All operators at any club station must sign the declaration.

8 CYPHERS. For a contact to be valid serial numbers must be exchanged between stations making the contact. The serial number will comprise THREE FIGURES commencing at **001** for the first contact and incremented by one for each successive contact. Should the serial number 999 be reached the serial number will revert again to 001.

9 TERRESTRIAL REPEATERS. Contacts via terrestrial repeaters are not permitted for scoring purposes. Contacts may be arranged through a repeater and if successful on another frequency will count for scoring purposes. The practice of operating on repeater frequencies in simplex mode is not permitted.

10 PORTABLE OPERATION. Log scores of operators located outside their allocated call district will be credited to that call area in which the operation takes place, eg VK5XY/2. His score will be added to the VK2 Division scores.

11 ENTRIES. A log of all contacts must be submitted. This should be in the format as shown in the example and must be on one side of the paper only.

A FRONT SHEET must also be included showing the following information in this order:
Category (HF or VHF), Section (Phone, CW, or Receiving), Call sign, Name, Address, Total Score, Page Tally.
Declaration: "I hereby certify that I have operated in accordance with the rules and spirit of the contest."
Signed.....Date.....

Logs are to be forwarded to the Federal Contest Manager, PO Box 1234, GPO Adelaide, SA, 5001. Envelopes are to be endorsed "Remembrance Day Contest" on the FRONT outside. Entries must be forwarded in time to reach the Box Number by 27th September 1985. Any entries received later than this date may be used as Check Logs only.

12 DISQUALIFICATION. See general disqualification rules as printed in detail in the August 1984 issue of 'Amateur Radio'.

Any station observed during the contest as constantly departing from the generally accepted codes of operating ethics may also be disqualified.

AWARDS Certificates will be issued generally on the following basis:– To the top scorers for each call sign class in each Section of each Category. The right of the Federal Contest Manager is reserved to issue additional certificates where considered warranted and to NOT issue certificates where, in the opinion of the contest manager, the entry does not warrant same. Certificates will be issued to top P2 and ZL scorers under the same conditions.

DETERMINATION OF WINNING DIVISION

Scores by stations in VK0 are added to VK7 and VK8 to VK5. Scores by VK9 stations are added to the mainland call area which is geographically nearest. Scores claimed by P2 and ZL stations are not included in the scores of any VK call area.

The formula to be applied to determine the winning WIA Division is as follows:– Total Contacts per Division/Total Licences per Division multiplied by Weighting Factor.

The Weighting Factor is calculated such that should each WIA Division perform equally as well in 1985 as in the past nine years (averaged) the result would be a seven way dead heat. Consequently, the most improved Division will win the trophy and also earn a revised and lower weighting factor for the following year.

RECEIVING SECTION RULES

1 This Section is open to all shortwave listeners in Australia, Papua New Guinea and New Zealand. No active transmitting station may enter this section.
2 CONTEST TIMES and logging of stations on each band are as for transmitting.
3 All LOGS should be set out as per the example. It is not permissable to log a station calling "CQ". The detail shown in the example must be recorded.
4 SCORING will be as per Rule 5 for transmitting with other aspects of that same rule also applying.
5 CLUB STATIONS may enter this section. All operators must sign the declaration.

AWARDS FOR SWLs

Certificates will be awarded to the highest scorer in each call area. Further certificates may be issued at the discretion of the Federal Contest Manager.

DUPE SHEETS

Where stations make a reasonable number of contacts it is most helpful that they use some form of checking system to ensure that they do not have invalid duplicate contacts. A form of sheet which provides a convenient method of making such checks for each band was described in "Amateur Radio", December 1984, page 54. I would suggest that you should use such sheets. Whilst it is not mandatory that you do so, it would be of assistance to the contest manager if you forward a copy of same together with your log.

COMMENT ON RULE CHANGES

You will note that there are a number of changes again made to the rules of the Remembrance Day Contest this year. These may be summarised as follows:–

The splitting of the contest into two Categories HF and VHF.
All contacts to score ONE point only.
Repeat contacts on VHF each 3 hours.
Dupe sheets are NOT mandatory.
Operation of more than one call sign is legitimate. Certificates awarded at the contest manager's discretion.

Before you attempt to query these changes I would submit for your consideration some additional information:

There has for some time been some disagreement as to the point that city operators have an advantage over country operators where VHF operation is concerned. Making two Categories and separating such operation should help solve that problem. It is a fact of life that one can obtain a greater number of VHF contacts by either living within an area of high population density or up on a mountain with great line-of-sight paths. I might also add that in some respects country operators have some advantage with less QRM from local stations, lower general noise levels and often more space for antennas, etc.

Under the rules for this contest any operator may enter in both the HF and VHF Categories, however it becomes obvious that he would have to submit two distinctly separate logs. The same would apply to the submission of logs for both Phone and CW operation.

CW and Phone comprise totally separate sections of the contest, however any operator may utilise both modes if he so desires. It seems to be a matter of pride for CW operators to state that they can get through more easily and faster than phone operators when the going is rough. The more important point for this contest is that by providing additional points for one mode over another the whole idea of the special formulas devised to make the competition between WIA Divisions more equal is thrown off balance by such bias.

The change to 6 hours between repeat contacts on VHF last year was excessive and produced a flood of complaints. The choice of the figure of 3 hours is attempted as a compromise. It may be that further change might be made on the basis of more experience with a VHF only category.

As stated above copies of dupe sheets would be helpful, however until more operators properly understand how to use same I am loath to make them mandatory. Some of the examples provided with logs for the contest last year would certainly bear out my point here.

If an operator has more than one call sign legally issued I see no reason why he cannot use them in any manner he wishes as long as he is abiding by the contest rules and licensing regulations. It would not normally provide him with any extra advantage to operate both call signs consecutively and can even add to the fun of the contest. This approach also allows a club call sign to be aired and encourages any such additional operation in the contest.

The matter of issuing certificates can become a problem. Under the previous rules it may surprise you to know that in excess of 96 certificates would be issued against the annual Remembrance Day Contest results. In many cases these certificates were issued to operators who, whilst they did comply with the rules, made in fact very few contacts at all. In some cases, full-call operators, who made hundreds of contacts less than Novice operators in the same call area, became eligible for a certificate just because they made a handful of contacts on phone and maybe one or two on CW and thus became the only entrant for their call area in the 'Open' Section. In another instance some limited-call holders made in the order of 10 contacts on 2 metre FM and then made just one or two RTTY contacts with their friend just down the road. Such an entry qualified for a certificate as the ONLY limited-call holder in the State with an entry in the Open Section.

At the recent Federal Convention I recommended in my annual report that the Contest Manager should accept discretion in the matter of issuing certificates. The Federal Council saw the wisdom of this approach and agreed. The guidelines for the Remembrance Day Contest do however suggest that where possible certificates be issued to holders of each class of call sign. This suggestion would be followed at the same time as consideration under the more general terms of reference for the Federal Contest Manager. The increase of the minimum number of contacts for a valid log from the previous requirement of 10 to the currently required 25 contacts is an effort to assist in overcoming the problem. Let us face the fact that any reasonably competent operator should be able to make at least 25 contacts in not much more than an hours operation and in most cases even less than one hour.

Generally speaking I would wish to pursue a policy which would not provide contestants in any contests with some kind of an advantage due to the fact that they manipulated their entry to fall into some unusual kind of category which brought them the right for an award with very little expenditure of effort as against those other operators who try hard in contests and operate in a fair manner.

In any case, I do hope that you will enjoy the Remembrance Day Contest this year and that you will provide your support for this, our major event for the year, as well as doing the right thing and being in there trying to help your WIA Division to gain the coveted trophy. I will look forward to exchanging a serial number with you.

JOHN MOYLE MEMORIAL FIELD DAY CONTEST 1985 — RESULTS

This appears to have been a success this year particularly taking into account the changes made to the rules to try and provide added interest. Even with the fairly short notice quite a number of stations seemed to come up with sources of 'Natural' power. I think perhaps the one to really 'take the cake' was the operator who set a magneto type generator together with a hand drill on a piece of board and turned the unit by hand to power his IC202 Transceiver. Amateurs seem constantly to show their ingenuity. I operated in the 6 Hour Division of the contest and I asked many stations about their feelings on date changes to same. Almost without exception

Jill VK6YL, on Penguin Island during the John Moyle Memorial Field Day, used Wind Turbine Power.

all those asked indicated that they would favour such a change as was mooted. This matter was discussed at the recent Federal Convention and it was agreed that the contest could be run as late as toward the end of March. As I have been pointing out this would definitely improve the situation as far as bush fire dangers are concerned and also possibly improve matters for the operators in the north of the country by being further away from the middle of the great wet season.

The introduction of the incentive type multipliers for VHF operation seems to have been satisfactory. Rather than very little VHF operation, as in the past, there was quite a lot carried out on a fair number of bands. VK6KZ for example operated on 6 HF bands (1.8, 3.5, 7, 14, 21, 28 MHz) and 7 VHF/UHF bands. (52, 144, 432, 576, 1296, 2304 and 3456 MHz). This was certainly an excellent effort. It might be said that this contest became too VHF orientated however something different had to be tried. As a result of this year's contest it would seem to be a wise move to re-introduce a VHF ONLY Section. I can assure you that even this Contest Manager can learn by his mistakes. Experience is a good teacher.

Some comments from logs:—

'I think your change of rules rather good as it spreads the scoring possibilities, although I will need to revamp my VHF/UHF aerials to be competitive.' — VK3BAF.

'Congratulations on the revamping the rules for the John Moyle . . . the multiplier rule of map reference for VHF could be changed to make it necessary to provide information only on stations worked over 50 kilometres as all contacts are obviously eligible for at least the multiplier of 2.' — VK2YUP/PEP (A valid point — 5QX.)

'I look forward to the next John Moyle Contest as it seems to be the only contest that I have noticed that is friendly and that stations are operated in a gentlemanly manner, unlike the RD Contest where a lot of stations seem to reply to a call then proceed to take over the frequency from low powered stations.' — VK2YUP/PEP.

'Firstly I like the idea of the Section Letter after the serial number. It certainly aided me whilst adding the scores. I question the RS number. It was quite obvious we were not getting dinkum signal and readability numbers . . . We have entered the John Moyle Field Day Contest since 1979 and have a lot of fun . . .' — VK4YX Log Co-ordinator for Southern Downs Ad-Hoc JMFD Contest Group.

'So again, congratulations on an excellent presentation and development of the rules. May your efforts at revising the other National contests be as successful . . . Also I liked the new classification of 'Home Station Emergency Powered'.' — VK2BQS. (Jim enclosed a polaroid photo of his emergency powered station however the photo is not good enough for reproduction — 5QX.)

'It was obvious from the small number of novices contacted by my station that there needs to be some thought put into the rules for novice participants. Maybe an HF ONLY section. We need to encourage the novices to enter as many facets of 'AR' as possible and contesting is one. Especially the John Moyle, as it is meant to familiarise amateurs in 'field' operation . . . look forward to next years event.' — VK1PJ.

'Thanks for another fine contest, unfortunately this year I recently arrived on Christmas Island and events prevented me from activating a portable station . . . Christmas Island has 5 amateurs, two being fairly active . . . We may try and activate the Club Station VK9XI for the RD Contest so keep an ear out for VK9X.' — VK9XZ (VK6CZ). (How about the Club in next year's JMMFD? — 5QX.)

'It was an enjoyable contest and I would like to thank the organisers once again.' — VK5DL.

'You obviously put a great deal of thought into the rules but some thoughts may be of value to you . . . I do not believe there is a place for VHF in the NFD. The Ross Hull Contest caters for the VHF devotees. The present system allows near city operation on VHF to crank up huge scores in a fashion which has no rational significance.' — VK2ARZ. (Max made quite a few rather pertinent comments apart from those quoted here. — 5QX.)

'Next time I see the need for portable HF antennae rather than the mobile whip if one is to be competitive.' — VK6KZ.

'Every Tuesday morning at 10 am at the Moorabbin and District Radio Club venue there is a meeting of the old retired members. About 40 to 50 turn up and of them there is about 10 who used to operate VK3APC during past field days. We have now left it to the young chaps to carry on while we take it easy hi . . . If you study the word Portable in the dictionary you will find the definition does not really suit our situation. When we had VK3APC in the field days we needed a fleet of cars to carry all the gear.' — VK3JI.

'The 6 and 24 hour sections should be retained as it allows people who can't devote all the time to the contest to participate at times to suit them.; — VK5AIM.

'The recent rule changes made the contest more enjoyable to take part in . . . The monster vertical for 160m collapsed when one of the guys broke . . . A hearty slap on the back for an innovative change in the Field Day rules! The introduction of solar power to the contest was a real challenge . . . the generating equipment finally used was only a small portion of that actually experimented with (others included turnstile, exercise bike and chemical batteries using lemons, copper and zinc sheet!) — VK3CGH President North-Eastern Radio Group. VK3CNE. (I believe the NERG will be providing a separate article for Amateur Radio on their Field Day operations. — 5QX.)

'This was my first contest in 6 years of operating. I thoroughly enjoyed it and hope to catch you again next year.' — VK6KHC.

'Ian, I wonder if you are the same Ian Hunt that used to be a member of the VK3 SWL Group many years ago?' — VK3RN. (Yes Ron. And I wrote the SWL column for 'AR' for some time too.)

'Once again it was a good fun weekend . . . Late February was better than early February . . . Probably late March would be better still . . . VHF/UHF Multipliers: We feel the whole contest this year was slanted to operators to use these bands, and the multipliers (plus low HF DX points) gave no incentive to novice operators to go portable.' — Eastern and Mountain District Radio Club.

'The distance multiplier for VHF is a good idea to get stations active but how does someone in a low activity area (ie Mt Newman or some remote area) score highly in VHF or UHF . . . My father's name is John Moyle.' — VK3GK.

'A majority of our operators were novices . . . no stations were heard on 10m . . . This Division runs the station in Weston Park which is located on the shores of Lake Burley Griffin . . . being in the park amongst the public has its advantages as far as publicity for amateur radio.' — VK1KAL VK1 Divisional President for VK1WI/P.

'Next year we go wind power — the points are worth the effort . . . band conditions couldn't be worse . . . It helps to get 50 km from the city . . . we will compete again next year.' — VK6XZ.

Included amongst correspondence about the Field Day Contest was a multi-page letter from David VK4NLV representing the Radio Amateurs' Group. He also supplied copious details regarding past suggestions concerning Field Day rules. All of this material will be considered and discussed where necessary with a view to further 'fine tuning' and improvement of the contest rules in the future.

One final comment to critics of the fact that not much advance notice was given regarding the natural power rule for the contest. Such an innovation had to be brought into the contest sooner or later so always the first introduction of new ideas may seem to be without enough advance notice. As early as the November 1984 issue, this column canvassed the possibility of inclusion of such a rule as well as pointing out that it was already Federal Policy to pursue such an approach, so it should not really have come as too great a surprise.

Congratulations to each of the Section winners in the contest. I will have your certificates on the way to you as soon as possible. I would like to thank all those who entered the contest and for your supporting and encouraging comments.

On a lighter note, it was interesting to see that a number of operators are certainly well aware which state they live in. In the front summary sheet where it was necessary for them to show the 'Division' of the contest they were entered in (namely 6 or 24 hour) quite a few instead showed 'VK2' or 'Victorian Division' etc. (Hi). Perhaps this indicates a mark of really strong state loyalties.

A total of 71 logs, including 3 check logs were received for the Field Day Contest this year.

Check logs were received from VK4APZ, VK4BIL and VK58G. All entrants in this contest must be congratulated for the general high standard of logs submitted. In most respects they were according to the rules and were tidy and well laid out almost without exception. I trust that this standard can be maintained for future contests.

AUSTRALIAN CONTEST CHAMPION 1984 — VK5AGX

With the publication of the results of the VK/ZL Contest I can now provide the results of the Contest Championship Competition for 1984. Congratulations are due to Vic Noble VK5AGX. He has been a consistent entrant in all the Australian contests for the year and his persistence has paid off. A highly honourable mention must go to the runner-up VK5NOD. It can probably be easily seen that if one is to have any chance at gaining the trophy you must enter in all four of the contests concerned as well as take part in both the phone and CW sections. The results below list only the scorers in the four contests who have entered at least two or more.

Observant readers may have noticed that the caption under the photograph depicting the previous Contest Championship winner VK3XQ being presented with the trophy as published in the May issue of Amateur Radio stated that he was the winner for 1984. This was not correct and the caption should have read 1983.

EUROPEAN DX-CONTEST

1. **Contest-periods:** 1985: 10/11 August
   1985: 14/15 September
   1985: 9/10 November
   0000 UTC Saturday to 2400 UTC Sunday
2. **Bands:** 3.5 — 7 — 14 — 21 — 28 MHz.
3. **Classifications:** Single Operator — all band; Multi Operator — Single transmitter; Multi operator/ Single-transmitter-stations are only allowed to change band one time within a period of 15 minutes. A quick band-change and return for working new multipliers is allowed.
4. **Rest period:** Only 36 hours of operation out of the 48 hours are permitted for single-operator-stations. The 12 hours of non operation may be taken in one, but no more than three periods at any time during the contest and have to be marked in the log.
5. **Exchange:** A contest QSO can only be established between a non-European and a European Station. Exchange the usual five or six digit serial number RST/RS report plus a progressive QSO number starting with 001. W/K-stations in addition give their state (e.g. 599011 MA).
6. **Points:** Each QSO counts 1 point. A station may be worked once per band. Each confirmed QTC — given or received — counts 1 point (see below).
7. **Multipliers:** The multiplier for non-European stations is determined by the number of European countries worked on each band. Europeans will use the last ARRL countries list. In addition each call area in the following countries will be considered as a multiplier: JA, PY, VE, VO, VK, ZL, ZS, UA90 (see special regulations for RTTY Fig. 13). Each W/K-state will be considered a multiplier, but not W/K call areas.
   The multiplier on 3.5 MHz may be multiplied by four
   The multiplier on 7 MHz may be multiplied by three
   The multiplier on 14/21/28 MHz may be multiplied by two
8. **Scoring:** The final score is the total QSO points plus QTC points multiplied by the sum total multipliers from all bands.
9. **QTC-Traffic:** Additional point credit can be realised by making use of the QTC traffic feature. A QTC is a report of a confirmed QSO that has taken place earlier in the contest and later send back to a European Station. It can only be sent from a non-European station to a European station. The general idea being that after a number of European stations have been worked, a list of these stations can be reported back during a QSO with another station. An additional 1 point credit can be claimed for each station reported (note special regulation for RTTY see 13).
   a) A QTC contains the time, call and QSO number of the station being reported ie: 1300/DA 1AA/134. This means that at 1300 GMT you worked DA 1AA and received number 134.
   b) A QSO can be reported only once and not back to the originating station.
   c) Only a maximum of 10 QTCs to a station is permitted. You may work the same station several times to complete this quota. Only the original contact, however, has QSO point value.
   d) Keep a uniform list of QTCs sent. QTC 3/7 indicates that this is the 3rd series of QTCs sent and that 7 QSOs are reported.

   Europeans may keep the list of the received QTCs on a separate sheet if they clearly indicate the station who sent the QTCs.
10. **Contest Awards:** Certificates to highest scorer in each classification in each country, reasonable score provided. Continental leaders will be honored. Certificates will also be given to stations with at least half the score of the continental leader.
11. **Disqualification:** Violation of the rules of this contest or unsportsman like conduct, or taking credit for excessive duplicate contacts will be deemed sufficient cause for disqualification. The decisions of the Contest-Commitee are final.
12. **Logs:** It is suggested to use the log sheets of the DARC or equivalent. Send large size S.A.S.E. to get the wanted number of log-and summary-sheets (40 QSOs or QTCs per sheet). Use a separate sheet for each band. All entrants are required to submit cross-check (dupe) sheets for each band on which they worked more than 200 QSOs. For each duplicate contact, that is removed from a log by the checker, a penalty of three additional contacts will be crossed out.
13. **Special regulations for RTTY:** In the RTTY-Section of the EUROPEAN DX-CONTEST also contacts between all continents and also one's own continent are permitted. Multipliers will be counted according to the EUROPEAN- and ARRL-countries list. QSO as well as QTC-traffic with one's own country (district) is not allowed. SWLs apply to the rules accordingly.
14. **Deadline:** CW: 15th September; Phone: 15th October; RTTY: 15th December.

European Country List: C31 — CT1 — CT2 — DL — EA — EA6 — EI — F — FC — G — GD — GI — GJ — GM — GM Shetland — GU — GW — HA — HB — HB0 — HV — I — IS — IT — JW Bear — JW Spitsbergen — JX — LA — LX — LZ — OE — OH — OH0 — OJ0 — OK — ON — OY — OZ — PA — SM — SP — SV — SV5 Rhodes — SV9 Crete — SV Athos — T77/M1 — TA European part — TF — UA1346 — UA2 — UA Franz-Iosefs-Land — UB — UC — UN/UK1N — UO — UP — UQ — UR — Y22-99/DM — YO — YU — ZA— ZB2 — 1A0 — 3A — 4U1 Geneva — 4U1 Vienna — 9H1.

AR

COLOMBIAN INDEPENDENCE CONTEST 1985

CONTEST PERIOD: Saturday 13 July 0000 UTC to Sunday 14 July 2359 UTC.
MODES: CW and phone.
CATEGORIES: A Single operator, single band, CW only, phone only. B Single operator, multi-band, CW only, phone only. C Multioperator, single transmitter, multiband, CW only, phone only. D Multioperator, multitransmitter, multiband, CW only, phone only. *(Note: There is only one single-band category, ie: Single band operators using 14 MHz compete only in this band).*

BANDS: 1.8, 3.5, 7.0, 14.0, 21.0 and 28.0 MHz.

CONTEST CALL: Phone: CQ HK Contest.
CW: CQ HK Test.

EXCHANGE: Phone: Signal report plus three numbers starting with 001. Example: 59001. CW: RST plus three numbers beginning with 001. Example: 599001.

4AIX	8	—	—	—	3	11
2HT	7	—	—	—	3	10

SCORING: Non-HK stations
With HK stations.....10 points
With non-HK stations outside own country 5 points
With stations of one's own country..... 1 point

MULTIPLIERS: The combination of different countries worked on each band plus different HK districts worked on each band.

FINAL SCORE: Total QSO points times multipliers per band.

LOGS SHOULD INCLUDE THE FOLLOWING:
Time in UTC; station worked; report sent; report received; multiplier; QSO points.
Separate sheets should be used for each band.
Multipliers should be indicated only the first time they are worked on each band.
A summary sheet should be included with the submission, indicating point computation, category of participation, name and address of operator, list of operators in case of multi-operator stations, standard contest declaration. Submissions not including summary sheet will be counted as check logs.

PRIZES: Every station which shows a minimum of 50 QSOs, at least 10 of which are HK stations for phone entries, or five for CW entries, will receive a certificate of participation. Overall winners receive plaques or cups.

OTHER CONDITIONS OF ENTRY: Each participant must communiate with at least 10 HK stations on phone, or five HK stations on CW in order to have the entry accepted by the contest committee.
Each entrant must submit proof of a total of 50 QSOs, at least 10 of them with HKs if one phone or five HKs if on CW, in order to be eligible for any prizes.
Only one contact per band with the same station is valid.
Cross-band or cross-mode contacts are not valid.

DISQUALIFICATION: Violation of amateur radio regulations in the country of the participant, or of the contest rules, lack of ethics, phantom QSOs, duplicates in excess of 2% of the total number of contacts, may be sufficient to merit disqualifications. In any such case, the decision of the LCRA Executive Committee on contests will be final and not subject to appeal.

MAILING INSTRUCTIONS: Logs should be mailed no later than 30 August 1985. Logs received after 30 Dec 1985, will not be eligible for consideration, though they may be used as check-logs.

MAIL: All contest logs or other correspondence to:
LCRA
C/o Direction de Concursos y Diplomas
Apartado Aereo 584
Bogota-Colombia
Sur America.

1985 SEANET WORLD-WIDE DX CONTEST

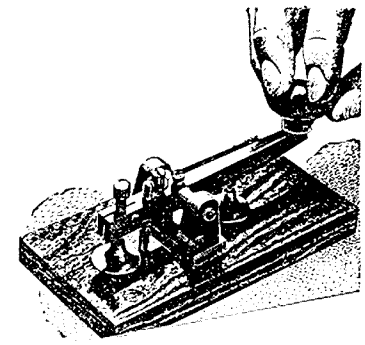
CW Contest: 0000UTC Saturday 20 July to 2359UTC Sunday 21 July 1985.
PHONE Contest: 0000UTC Saturday 17 August to 2359UTC Sunday 18 August 1985.
BANDS 10 thru 160 metres.
ENTRY CLASSIFICATION
Single Band — Single Operator
Multi-Band — Single Operator
Multi-Band — Multi-Operators
POWER OUTPUT As stipulated in the regulations governing the licence of the operator.
CONTEST CALL "CQ SEA" for CW Contest, "CQ SEATEST" for Phone Contest.
REPORTING RS/RST report plus serial numbers starting with 001 and increased by one for each successive contact. See also rule 4d.
LIST OF SEANET AREA PREFIXES A35, A51, AP, BV, BY, C21, DU, FK8, FR, FW8, HL,HS,H44 JA (etc), JD1, KA, KC6, KH2-3-4-5-6-7-8-9-0, KX6, P29 S2, S79, T2, T3's, VK (all), VQ9, V85, VS6, VU2, VU7, XU, XV5, XW8, XX9, XZ2, YB, YJ8, ZK, ZL (all), 3B6-7-8-9, 3D2, 4S7, 5W1, 8Q7, 9M2-6-8, 9N1, 9V1, and 1Z9.
SCORING RULES
1 *For stations OUTSIDE SEANET AREA*
- *a Contacts with stations WITHIN SEANET AREA of the following "bonus" prefixes: DU, HS, YB, 9M2-6-8, 9V1 & V85*
  20 points on 160 metres
  10 points on 40 and 80 metres
  4 points on 10, 15, and 20 metres
- *b Contacts with other stations WITHIN SEANET AREA NOT listed above in 1a:*
  10 points on 160 metres
  5 points on 40 and 80 metres
  2 points on 10, 15, and 20 metres
- *c Contacts between stations OUTSIDE SEANET AREA will not be counted.*
- *d Multipliers will be 3 points for each SEANET country worked.*

2 For stations in the SEANET AREAS
- a *Contacts with stations OUTSIDE SEANET AREAS:*
  10 points on 160 metres
  5 points on 40 and 80 metres
  2 points on 10, 15, 20 metres
- b *Contacts between stations WITHIN SEANET AREAS:*
  6 points on 160 metres
  3 points on 40 and 80 metres
  1 point on 10, 15, 20 metres
- c *Contacts between stations in own country will not be counted.*
- d *Multipliers* —
  Contacts with countries WITHIN SEANET AREA count 2 points for each country worked,
  Contacts with countries OUTSIDE SEANET AREA count 3 points for each country worked.

3 The final score will be the sum of the POINTS multiplied by the SUM of COUNTRY MULTIPLIERS.

4 Restrictions —
- a *Contacts on cross-modes or cross-bands or mixed CW/PHONE logs will be disqualified.*
- b *Operators are not allowed to transmit two or more signals at the same time.*
- c *Only one contact per band with the same station will be counted.*
- d *Contest numbers should begin with 001 on each different band.*

Certificate No.....



THE WIRELESS INSTITUTE OF AUSTRALIA

CW CONTEST

This Annual Contest was inaugurated to celebrate the 75th Anniversary of THE WIRELESS INSTITUTE OF AUSTRALIA — the oldest Radio Society in the world — formed at a meeting at the Hotel Australia in Sydney on March 11th, 1910. It was felt that with the advent of modern equipment and methods that there was a need to further the ability of morse knowledge, practice and skill.

AWARDED TO

.....

FOR OUTSTANDING PARTICIPATION

.../.../...
DATE

.....
PRESIDENT

a *All entries in violation of the contest rules, incorrect statements in the submitted reports, taking points from duplicate contacts, and practices against the brotherhood of amateur radio will be disqualified.*

f *The decision of the SEANET contest committee will be final.*

ENTRIES, LOGS, AND SUMMARY SHEETS All entries must be in the form of logs and summary sheets (list each country worked; number of contacts with that country, per band; and full, clear listing of your mathematical calculations of scoring). ALL TIME must be in UTC. Entries must be received by the Contest Manager not later than 20 October 1985. Results will be announced at the SEANET Convention, with individual winners notified by mail in advance. If you require the results to be sent to you, please include a self-addressed envelope and two IRCs, together with your entry. Please retain a copy of all material sent as these logs will not be returned.

CONTEST PRIZES AND AWARDS The Highest scoring entry, in each classification, three for CW and three for PHONE, will each receive a very unique trophy.

In addition, the **highest single operator entry**, either as single band or multi-band, one for CW and one PHONE, will receive a prize consisting of the following:

Free convention registration (includes two dinners);

Free convention accommodation at Cebu Plaza Hotel (three days, two nights).

If you win but are unable to attend the convention, your trophy and a substitute prize, a copy of the Call book, Foreign Edition, latest copy available, will be mailed to you.

MAILING ADDRESS FOR ENTRIES CEBU Amateur Radio League, PO Box 304, Cebu City, Philippines 6401. Att: Seanet Contest.

CW 75 ANNIVERSARY CW CONTEST RESULTS

The contest was held on the weekend of the 75th Anniversary of the WIA, and it was unfortunate that it clashed with BERU. However NOT to be held on the actual anniversary would have lost the meaning for the contest.

From remarks sent with entries, it would seem that everyone enjoyed the contest and many hope it will continue as an annual event.

Logs were of a high standard with 95 percent being correctly scored. Thank you for participating and for your comments.

Wally Watkins VK2DEW
CW Contest Organiser.

75th Nostalgia

SHORT WAVER

In this 75th Anniversary Year we have had historical stories from or about amateurs in the by-gone era. This article is about a world-wide known, Australian SWL. The article was contributed by Charlie Nelson VK3WC, with original material from The Australian Radio World, Vol 13, No 1, 15th June 1948. The Radio World issued a SW League Badge. Charlie still has his badge numbered RW98DX.

"No listener is better known in this world than BERS195, otherwise Eric Trebilcock of Wynyard, Tasmania. Eric prefers listening to transmitting, ample proof of which liking is the fact that he got his ham licence just prior to September 1939 and hasn't bothered to renew it. Maybe a surfeit of daily operating in Civil Air work is more than enough, but for relaxation BERS195 turns to 28mc/s CW listening.

"For this work he has always preferred a TRF receiver, and the one made for him previously fell into Japanese hands when Eric found it neeessary to leave Rabaul in a hurry. Now a new TRF rx is on the job, using a VR65 RF stage, 954 regen detector and 647G headphone audio stage. Butterfly condensers tune RF and detector stages with coverage of the 50 and 28mc/s bands by miniature plug-in coils. Such a receiver is a joy to handle and Eric says of it — relative to 28mc/s — 'it is the goods. I scored in the recent BERU contest with ZL, VK4, VK5, VK6, VE6, VE7, ZS5, ZS6, ZS1, ZS2, ZE, MI3, VQ4, G, AP and V4. Many of the Gs etc, were RST 599. Last Sunday (25/4/48) I heard G, 1, ON, F, PA and VK2EO as well as many VK6 phones at S9 plus.' There isn't a thing wrong with using a smoothly operating TRF for receiver work.

"If sufficient readers are interested, a description of the receiver in use at BERS195 may be forthcoming."

Eric still retains his BERS number today and also has the VK L30042 number and has been a stalwart of the WIA for many years having been made a Life Member in recognition of his work. Together with his late wife Gene, Eric manned the VK3 QSL Inwards Bureau for many years and has been a regular supporter of How's DX, for the current columnist, with his SWL reports.

Eric is shortly to embark on a new direction in his life which may leave him a little short of time for SWLing, but one may be sure that if there is a spare minute, Eric will be listening.

AR

CLUB CORNER

DEVIL NEWS FROM THE NW BRANCH

The monthly meeting of the NW Branch, with fifteen in attendance, was held at the Penguin High School with Ross VK7WP, being in the chair due to Tony VK7AX, holidaying in Cairns. (just as he was receiving some good SSTV from VK3 on 7.130 MHz). All accepted the comprehensive Treasurer's Report that was given by Jack VK7WJ.

The application by John Vanderlinde to become a member was accepted. Welcome John. Robert VK7NAE, responsible for Youth Affairs, hoped to report more at the next meeting. QSL cards are not moving very fast according to the report given by Greg on behalf of Max who was unable to attend.

REPEATER REPORT

No problems have been reported with two metres and it is with pleasure that it can be reported the NW will soon have a new ATV repeater on the air. The location will be at Kelseys Tiers, behind Devonport, where the tower is installed with 240V AC being available. The Visual and CW ID boards are completed and the antenna design is well on the way. Yet to be completed are a couple of boards and the purchase of the co-axial cable.

Sincere appreciation is tendered to and includes VK7s AX, OL, OM, RN, UD, WJ, WZ and Peter Westerhof for their invaluable assistance so far.

GONG AWARD

It appears the introduction of this award has kept the use of the repeater down under the three minute mark. The name has been changed and if you are heard to make a mistake or other misdemeanour, you are a contender for this award at the next meeting.

Thanks to Greg VK7ZBT for his assistance in gathering the news for me and 73 till next month. Max VK7KMF.

AR

WESTLAKES AMATEUR RADIO CLUB

21st BIRTHDAY CONTEST
***** PRIZEWINNERS *****

1st: ticket no 0063 — Sharp portable colour television VHF/UHF — Mrs J. Webster (XYL VK2BZD), Earlwood.

2nd: ticket no 1733 — Dick Smith UHF transceiver kit — T Soundy VK2ETS, Merimbula.

3rd: ticket no 1380 — Makita cordless drill and flashlight — J Saunders VK2DEJ, Ryde.

4th: ticket no. 0956 — home weather station — Efimov VK2DPY, Elermore Vale.

5th: ticket no 0348 — handyman tools to $100 value — B Laughlin, Mount Hutton.

6th: ticket no 1705 — bathroom decorator style taps, handles and fittings — P Elson, Rockhampton Qld.

Prizes were drawn at the 21st Anniversary Birthday Dinner held at the Lakeside Motel, Warners Bay on 27 April 1985 under the supervision of Aid G Pasterfield, Mayor of Lake Macquarie City.

The organising committee thanks the following for their generous donations:

Watson and Crane (NSW), Wes Hughes Timber and Hardware, M J Cant VK2CMJ and Westlakes Education and all who prepared, distributed, purchased and folded tickets to make this a worthwhile fund-raising venture. All proceeds go to Westlakes Amateur Radio Club.

AR

WAGGA WAGGA '85 — 26-27 OCTOBER

The annual South West Convention will be held in Wagga Wagga this year. This event, one of the largest outside the central coast area, is already attracting exhibitor enquiries.

The National Fox Hunting championships may also be held in conjunction with this event. The expansive undulating landscape and extensive road network is sure to make this event a precedent hard to follow.

The Convention will also include fox hunts and hidden transmitter hunts for both novices and experts.

Wagga Wagga is located just off the Hume Highway. It is on the main Sydney/Melbourne rail link and has airlines serving Melbourne, Canberra and Sydney.

Don't forget to include this important event on the 1985 Event Calendar.

. . . see you there . . .

LISTENING AROUND

Joe Baker VK2BJX
Box 2121, Mildura, Vic 3500

Well! It is the Saturday after Anzac Day, and because of a variety of personal problems, I've missed a few deadlines. Never-the-less, here I am with a new typewriter, a typing table which I have fabricated out of a piece of junk and a nice sunny day so I'm out in the yard under the cheerful beams of "Old Sol."

It's months since I wrote the last column, yet from all over the country I've received on air compliments about past columns which is very encouraging, particularly at times when I've been going through a bad patch.

ANZAC MARCH

As I was in the Mildura march from the post office to Henderson Park (the Cenotaph) on Anzac Day I thought that before I write more about the Northern Territory, a few lines about that march might not be out of place.

I found a place among members of the Second AIF, as there was no special place for Sigs. There were about ten or eleven sections of the march led by the Mildura Pipe Band which kept us well in step. Our section was commanded by a uniformed Sergeant Major, and to hear those orders barked out for the first time after so many years, made me feel almost homesick for army life.

There were great crowds along the route of the march, many of them young people who had not even been born when WW2 was on. Men from the Korean and Vietnam conflicts marched proudly, and there were many from the womens services.

The guest speaker at the Cenotaph was an Aboriginal officer who had seen much service.

Past experience of the marches has taught me that at the end of the march, I would miss out on getting a seat in Henderson Park as the crowd arrives there before the marchers. This time, however, a young scoutmaster guided me to a supply of bucket-type seats, where I rested my weary bones. And who should I find right beside me, looking as chipper as a young colt, but "The Wizard of Oz" — VK3OZ, Bert Shire (ex VK5OZ of Tumby Bay). I don't know who was the more suprised to see the other. Bert is ex-RAAF, and this Anzac Day was his eighty first birthday.

I had brought a pocket camera with me, and needless to say I had it soon aimed at Bert.

BACK TO THE NT

Most serving personnel in the Northern Territory, by virtue of the fact that it was wartime, were not free to wander just anywhere. So, we missed out on many of the prime tourist spots that we hear of these days and were usually confined to restricted areas. However, my brother and I — he was an RAAF Security Guard — managed to keep tag of each other through the various field-telephone links (Don R Telephones and Freddie Phones).

One time I heard that he was up near Darwin on guard duty and when I got there found him standing in the middle of a minefield guarding an RAAF bomber that had failed to make it to base and found itself nose down in the mulga with its tail high in the air. As I approached along the roadway, he screamed out at me to keep back as the whole area was mined. How the RAAF got him into that patch just to keep the mosquitoes away from that bomber, I shall never know, but I took the hint and our conversation was carried out in loud voices across the minefield.

I was in the Territory when Fenton Strip and Adelaide River was bombed and my brother Frank (who died in 1983 at Mildura), said that the Zeros came in so low near Adelaide River that he could hear the bomb doors open.

BOMB ATTACK!

What's it like to be chased by a bombing plane, when you're in the back of a military truck going up a long road? Well, it happened to me and a truckload of others who were hitching a ride to Darwin up a long road from the 67 mile post near Coomalie strip. We were probably somewhere near Manton Dam when the bomber was observed approaching from the south. The pilot had spotted us, and lower and lower over the road he came while we panicked and thumped as hard as we could on the cabin of the truck. He was zooming straight towards us, then when he got so near that we could see him in the cockpit and almost hear him laughing at us, he zoomed straight up and over us. He did three or four dive-bombing attacks at us in this way and when we saw that he was one "of ours" we all shook our fists at him and would have killed him if we had got him on the ground.

SPECIAL RADIOS

In the Territory there was a special radio unit, which it was said, had gear which was so sensitive that it could intercept enemy pilots doing a test-run of their radios before they took off from their island bases. I don't know exactly where the unit was located but we all knew that it existed, and as well as listening to the enemy, their special job was to monitor our own army sigs, lest there should be some unauthorised operating. As far as I know, there never was — our own sigs having to stick to the correct message-form procedure, and on certain links it was customary, to keep up the same average number of messages per day, which of course were all in cypher. Not all of these were "Action" messages, some were dummies, just to make up the average number, for if the enemies began to notice that traffic on such and such a link was a bit busier than usual, they would smell a rat." Stations were also provided with means which any challenging station could identify and know which were ours and any that were not.

There's much, much more that I could say about the Territory. It was an adventure for us rookie soldiers who saw the north under wartime conditions, yet all of us, I am sure, would like to see the Territory again some day, and like the Diggers of Gallipoli, would like to visit again the places where we served.

AR

VK2 MINI BULLETIN

Tim Mills VK2ZTM
VK2 MINI BULLETIN EDITOR
PO Box 1066, Parramatta, NSW 2150

It is approaching mid winter so I hope that your shack is proofed against the elements. These notes cover a few activities over the next few months for you to take part in.

SEMINAR PLANNING

Is in hand to hold the 1985 Seminar at Amateur Radio House, 109 Wigram Street, Parramatta on Saturday the 21st July. The first session will commence at 10 am. Presentations of various awards will be made during the day. The Divisional broadcasts will advise further details.

REMEMBRANCE DAY CONTEST

To be held as usual next month — see rules elsewhere this issue. Last year this Division won the RD for the first time since winning in the first year the event was held in 1948. 36 years has been too long to wait to see it back in VK2. However this is an annual event so each August all States compete to try and win it back. It is hard for the larger Divisions and it requires extra effort to achieve the scoring ratio. Now that the 'Trophy' is back in VK2 how about making sure it stays here for a while. Set aside some time during the RD weekend to take part and help the VK2 score.

Photograph by Ken McLachlan VK3AH.

Left.
Steve VK2PS, the VK2 Federal Councillor accepting the RD trophy on behalf of the VK2 Division from Federal President David VK3ADW at the 1985 Federal Convention.

75TH DINNER

It is planned to hold the VK2 75th Anniversary Dinner on a weekend during September. The Federal Dinner will be held in Melbourne early November.

WICEN

Major coming exercises in the next few months, which will require a lot of operators, include the following. *Sun 'City to Surf' on Sunday 4th Aug. in Sydney. The car rally at Batemans Bay on the weekend 21/22 Sept. The Hawkesbury Outward Bound Canoe Classic on the weekend 26/27 Oct.* All amateurs are invited to assist with these events. Details and calls for operators will be made on the broadcasts nearer the time. As an experiment the weekly WICEN net times have been brought forward to 8 pm on Thursdays, 3.600 MHz and VK2RWS 7150.

SEPTEMBER AR

Is to be another special VK2 issue. If you have anything to contribute please have it reach the Divisional office at Parramatta before 17th July. If you have a small technical article send it direct to AR, there is always a need by the Editor for these.

CONFERENCE OF CLUBS

The next meeting will be hosted by Westlakes ARC at Teralba on 3rd Nov. Agenda items for discussion should be considered now and submitted through your Club to the Divisional office to allow early circulation. Items which may need later national (Federal) consideration should also be submitted to this meeting so that if passed by the C of C there will be sufficient time for other States to consider it before the 1986 Federal Convention, which will be held in Melbourne on the 1986 ANZAC weekend.

MUSEUM STATION

The Museum station VK2BQK has been re-established in the first stage of the new Powerhouse Museum in Ultimo. VK2BQK had been first set up in the original Museum in Harris Street. When this section of the Museum was closed, work started to establish a station for the new building. VK2BQK has been designed so that, on completion of the final stages, it can be relocated in the main section.

The VK2BQK station was officially launched on the evening of 14th May last by Alan Jones from Radio 2UE. A future issue of AR will carry a feature on the station. VK2BQK is operational on weekend afternoons and one day during the week. The operators are members of the Museum Radio Club. To help ease the roster workload additional operators are required. If you would like to help out, please contact Pierce Healy VK2APQ on (02) 705 6125 or leave your name with the Divisional office or the reception counter at the Museum.

Other Museum stations I know of in Australia include the Science Museum in Swanston Street, Melbourne which is used by the VK3 Division for their broadcasts. There is also Wireless Hill at Applecross in Perth. Also some static displays are in other major museums. There are several private displays which often concentrate on a particular subject or aspect of electronics. It would be nice to feature all the Museums and displays in a later issue of AR. If you have or know of a display which could be included in the feature please advise the VK2 Division or Federal offices.

HOME BREW CONTEST

It is again time to start thinking about this annual VK2 activity. Entry forms and details may be obtained from the Divisional office. Call in to the office at 109 Wigram Street, Parramatta 11 am to 2 pm weekdays and Wednesday nights 7 to 9 pm. You can ring during the above times on 02 689 2417. The presentations for the 1984 contest will be made at the July Seminar.

VK75A OPERATION

There is to be another VK2 segment early July. Amateurs who would like to be able to use this call sign in a personal capacity for a 24 hour period should register their interest with the Divisional office. Steve VK2PS is in charge of operations while the call is available to VK2 — 8 to 21st July.

CLUB AFFILIATION

At the May Council meeting the following Clubs were granted affiliation with the VK2 Division. The TARP Users Group and the Chifley Amateur Radio Club. Both groups are located in Sydney. Any club or group seeking affiliation with the Division should apply to the office for application forms.

AR

NEW BAND

On 22nd June 1985 the 24MHz or 12 metre band was released to US amateurs and the 10MHz or 30 metre band became permanent.

Full power of 1500 watts PEP output is allowable from 24.890-24.990MHz with the sub-band 24.890-24.930MHz limited to CW and RTTY only. In the sub-band 24.930-24.990MHz CW, phone, FAX and SSTV are permitted.

On the 10MHz band (10.1-10.15MHz) power is limited to 200 watts PEP on CW and RTTY, the only modes allowed.

From The ARRL Letter, Vol 4, No 10.

AR

NEW THREAT TO SIX??

A German atmospheric radar called SOUSY operates in the region of 50MHz. It is a vertical atmospheric radar or sounding system. Events in the atmosphere and up to 100km altitude are tracked.

A system has been installed for US space shuttle launches from Cape Canaveral. This system checks for severe clear air turbulence and other hazardous phenomena.

A beam peak pulse power of 200kW is used with an antenna array which has a gain of around 30dB. Multiple Yagis are used in phased array.

Resolution to 150 metres is achieved at levels between 500 metres and 30,000 metres. The profile of conditions is dynamic providing a minute to minute read-out.

The SOUSY system was developed by the Max-Planck Institute for Aeronomy. The first trial system was tested in the Harz Mountains in West Germany.

The Cape Canaveral system is leased and operated by Radian Corp of Austin, Texas.

Let us hope that SOUSY is not heard on 6 metre DX. 70cm Syledis on EME is bad enough.

Adapted by Gil Sones VK3AUI from an original report published in Electronics Week, 8th April 1985.

AR

VK4 WIA NOTES

Bud Pounsett VK4QY Box 638, GPO, Brisbane, Qld. 4001.

1

All photographs were taken at the Conference of Queensland Radio Clubs, 13 and 14th April 1985, at Griffith University, Brisbane.

1 Delegates from all parts of Queensland were listening with rapt attention. 2 Mike VK4YOB, speaks on behalf of the South East Queensland Teletype Group. 3 The informal sessions are where a lot of problems are solved. 4 On display. Dept of Communications monitoring equipment including a $100,000 Doppler DF. 5 Doug VK4ADC, representing DOC during his presentation shows a long print out of activity logged on Brisbane 2 metre repeater, VK4RBN. 6 Alan VK4YAF, reports on the radio amateurs group intruder watch programme. 7 Summit meeting of federal representatives. Guy VK4ZXZ (Federal Councillor), Len Keogh, MHR (Federal Member for Bowman) and David VK3ADW (WIA Federal President). 8 Geoff VK4AG, presenting the radio amateurs group report. 9 David VK3ADW, spoke to the Conference. Seated Barry VK4BIK and David VK4NLV, Minutes Secretary and Conference Chairman respectively.

FORWARD BIAS

VK1 DIVISION

Ken Ray
PO Box 710, Woden, ACT 2606

70cm REPEATER

The 70cm repeater is back on the air after repair. It is operating at a temporary site until spring, when we can get access to Mt Ginini to install the repeater in its final location. For those interested, the technical details are:

Callsign	*VK1RGI*
Frequency	*438.525 MHz output*
	433.525 MHz input
	(DSE Explorer ch21)
Output Power	*8.5 watts*
Antenna	*25 element colinnear*
Time Out	*2.5 minutes*

The transmitter is a VHF high band unit, with the 25 watt output strip feeding a varactor tripler, which then feeds through a cavity filter to the 4 cavity diplexer. The receiver is a high band receiver, with a UHF converter. This gives it three IFs — 170 MHz, 10.7 MHz and 455 kHz. Output spurii were undectable on a spectrum analyser, which would put them at least 80 dB down.

Once the winter snows clear, the repeater will be installed on Mt Ginini; with the channel 6950 2m repeater. For those interested, Mt Ginini is one of the highest mountains in the ACT, at 1762 metres high. That makes the VK1RGI repeaters the highest in Australia, at least according to the 1984 Call Book. Mt Ginini is part of the Brindabella range, the rugged mountains which form the western boundary of the ACT, and close to the northern edge of the Kosciusko National Park. For those wanting to know where to point their beams, the site co-ordinates are:

Latitude: 35.5311 deg S
Longitude: 148.7703 deg E
(See Natmap 1:100,000 sheet 8626)
AMG — Zone 55
Easting 660500
Northing 6066600

In summer, a pleasant day's outing can be had from Canberra, driving up into the beautiful alpine country. In winter, it is often cut off by snow for four or five months; and the snow-capped peaks can be seen from Canberra on a clear day.

ITU DAY STATION — AX1ITU

Friday, 17th of May was ITU day, and the VK1 Division set up a display station at Belconnen Mall, one of Canberra's major shopping centres. The station operated from 0200 to 1030 UTC, and 109 contacts were made to the following countries: CT, EA, V2, ZL, W, AL7, C21, JA, XE and of course VK.

Thanks to the following VK1s who gave their equipment and time — KAL, PJ, NEB, CJ, ZZD, KEN, NCO, KCM, ZZT, KRM, UE, OK, NDV, ZL, IC, HZ, and ZXA.

JULY MEETING

Don't forget the July meeting on Monday the 22nd in the Griffen Centre. We will be having our mid-winter sale and coffee night. Doors open at 7.45, see you there.

AR

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

Well, barring any "hiccups" over the next two days, I think I shall be able to say that our display station at the GPO was a great success. At the time of writing I have just spent all day at the GPO display which coincided with the release of the pre-stamped envelope to mark the 75th Anniversary of the WIA.

We were very lucky to be able to use the VK75A call sign for this occasion, and thus ensured no shortage of contacts for the public to hear. The GPO staff were extremely helpful and this along with the free cups of coffee were really appreciated.

My thanks must go to the following:– John Moffat of ICS, and Dick Boxall for the loan of rigs. David Clegg, and David Hogben of the GPO for the "high-wire act" they did in rigging the aerials! Jack Wright for the loan of VHF/UHF aerials, power-supply and coax and all the time he has put into it; and also to Les VK5KLH, Bill VK5AWM, Cyril VK5KEM, Ray VK5RK, Colin VK5FX, Tom VK5TL and Roland VK5OU, for spending varying amounts of time there. And not forgetting the many amateurs who came along in the lunch hour, or dropped in "between jobs" to see how we were getting along.

Lastly, but by no means least a huge "thanks" to Peter Koen for two new panels on the display board, dedicated to the 75th Anniversary, and an improved lighting system; and also my grateful thanks to John and Louise Badcock for their work on the new PR "Flyers" (handouts) and for the media releases which resulted in a photographer from the News being present. If I have inadvertantly forgotten someone, I apologise in advance. It really is great to have so many willing volunteers.

(Don't stop now, we have just heard that the Morphettville News-Electronics Show will be from 18th-20th October this year!)

DIARY DATES

Tuesday 23rd July . . . A Special General Meeting has been called for this date, please refer to your "Journal" for details. We hope that this part will not take long and that there will also be a speaker, but details of this are not known at time of going to press.

AR

WA BULLETIN

Fred Parsonage VK6PF
HONORARY SECRETARY
VK6 DIVISION
Box 10, WEST PERTH, WA, 6005

At the 1985 AGM of the West Australian Division, the following were appointed to the Divisional Council.

VK6IW	*Dave Wallace*	*Membership Secretary*
VK6LZ	*Cliff Bastin*	*Treasurer*
VK6MY	*Cyril Rice*	*Peel ARG and Comet sub-committee*
VK6NE	*Neil Penfold*	*Federal Councillor*
VK600	*Bruce Hedland-Thomas*	*President*
VK6YL	*Jill Weaver*	*WA Repeater Group*
VK6ZGA	*Alyn Maschetti*	*VHF Group*
VK6ZLZ	*Christine Bastin*	*Booksales Officer*
VK6ZMG	*Dougal Gordon*	*(XYL of VK6LZ) Broadcast Officer and Vice President*

There were nine nominations for the nine positions, therefore no ballot was necessary.

In accordance with the Constitution which states that the Secretary may be appointed from outside of the Council Fred Parsonage VK6PF was appointed to the position.

AR

QSP

FM RADIO DX

During March 1984, a low power FM broadcast test transmission was received in Italy. The transmission came from a low power test being carried out near Melbourne.

This transmission, on 106.5MHz, was being made by a local radio broadcasting group called Southern Community Broadcasters. The ERP achieved was only between 6 and 9 watts.

The report from Italy gave a SINPO report of 35333. This is a strong signal.

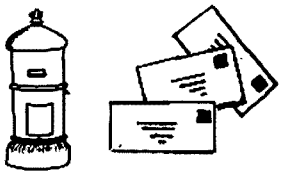
The transmission would have taken place close to the equinox, a good time for such propagation on other occasions.

Previously Channel 0 has been received overseas, also there have been a number of reports of FM radio station reception from Argentina.

This report must be pretty well up in the kilometres per watt stakes. One can only speculate on the possibility of 50 and 144 MHz contacts over such paths.

Contributed by Gil Sones VK3AUI from original source material in IREE Monitor, March 1985.

AR



OVER TO YOU!

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publisher.

AMATEUR COOK BOOK

The Wagga Amateur Radio Club is compiling an Australia Wide VK Cook Book.

Invitations are extended to amateurs and their families for their favourite recipes to be published in the Cook Book.

The book will be printed and for sale at the Annual Wagga Convention to be held on the 26th and 27th October 1985.

Recipes should be forwarded to the Wagga ARC, QTHR.

Thanks and 73,

Dave Longmore VK2ZYE,
Box 126S,
South Wagga, NSW, 2650. AR

Mobile Operation

Regulation 6.18 of the Amateur Operator's Handbook states, inter alia, that " . . . the licensee . . . may operate the station in a mobile capacity . . .". This seems to infer that operation in a moving vehicle is permitted.

It is a fact of life that operation from a moving vehicle is being carried out by a multitude of operators — amateurs, CBers, taxi drivers, fleet drivers and truckies. However, it is also a fact that each such operation breaks the law as interpreted by the police in Victoria.

I believe that the WIA should consider the principles involved, since our hobby at present induces many of us to break the law. I am, of course, not concerned with the law being broken by taxis, truckies — that is their business, not ours.

May I suggest an approach to the authorities concerned with a view to have the relevant regulations modified. I believe that the main objection to operating in a moving vehicle rests in the necessity to drive single-handed while holding a microphone with a receive/transmit switch. If the regulations were to be amended to specifically permit radio operation by the driver of a moving vehicle provided that both hands are used at all times to control the vehicle, it would open the way for legal operation under the following conditions:

Use of either a throat microphone or a headset microphone (lapel microphones are likely to pick up too much noise).

Use of a foot switch, a switch mounted on the steering wheel or, preferably, VOX operation for receive/transmit control.

Use of only one headset ear piece, to allow police or emergency vehicle sirens to be heard, or use of the transceiver speaker.

By using the most convenient combination of the above, operation in a moving vehicle would be no more dangerous than talking to a passenger or listening to the car radio. The use of handhelds would, clearly, be still illegal.

It would be interesting to find out whether action by the WIA in this matter is favoured by other amateurs.

Best 73,

George Cranby VK3GI,
Box 22,
Woodend, Vic. 3442
AR

TECHNICALLY — NO FRILLS CASSETTE LOG PROGRAMME

In the "Cassette Log Programme" article in March 1985 AR, the offer of "a highly abridged version for the unexpanded VIC-20", brought a large number of letters. The programme is "no frills" with the limited VIC memory in mind and like the previous programme, stores 250 callsigns plus the page number in your written log for quick reference.

With 8K expansion RAM-pack on board, the number of calls per cassette may be increased to 500. Further increases are possible at the expense of loading time of the file and for practical use, 500 calls just about takes it out. To increase the number of calls, the following two lines in the programme must be altered to,

```
570 I=I+1:C$(I)="*":IFI> 498THEN940
840 DIMC$(500),P$(500):RETURN
```

The system requires that you have many cassettes so that you split calls by country, prefix etc as described in the March 1985 article. As usual, if you want to avoid Repetitive Strain Injury from the typing, $5 to the author will get you a tape and a summary of the instructions from the March article which don't bear repeating here.

73,

Neil Cornish VK2KCN,
56 Sherwin Avenue,
Castle Hill, NSW 2154

AR

MAN IN MOTION

The Institute has received a request of assistance for the following:

The British Columbia PEP Amateur Radio Service would like to enlist WIA support and assistance in the provision of amateur radio communications for the Man in Motion World Tour, organised by the Canadian Paraplegic Association.

Rick Hansen, a world class wheelchair marathoner, will wheel 25,000 miles around the world in a historic, first ever World Tour to carry a symbolic torch of inspiration to 6 continents, 34 countries, and 60 cities with metropolitan populations totalling over 200 million people.

Rick Hansen is an articulate wheelchair athlete from Canada who has won 19 international marathons in such cities as Montreal, Toronto, Boston, Miami, Honolulu, Sydney, Australia, and Oita, Japan. Rick has won 9 gold medals in athletics at the 1982 Pan-Am Games and is a champion in several other sports. He has also competed in the XXIII Olympiad in Los Angeles in the 1500 metre wheelchair race.

The World Tour began in March 1985 in Vancouver, BC, Canada and will end 17 months later at the gates of the 40 country Vancouver World Exposition, EXPO 86, in August 1986.

The World Tour will roll through the United States and Mexico before going to Europe, North Africa and the Middle East in 1985. In 1986, Rick will wheel through Australasia, Japan and the Far East, departing from China for Central and South America and the home stretch across the breadth of Canada.

The major objectives of this historic undertaking are to provide an awareness of and potential for the disabled person, and to initiate a world wide fund for spinal cord research.

The official caravan will include one specially equipped van or recreation vehicle for Rick and his personal team and one van for an advance party who will be contacting media, making certain the route is still OK, etc.

The amateurs are being asked to provide operators who can ride in or accompany both of these vehicles to provide them with communications to each other, and transmit at least daily situation reports back to Man in Motion headquarters in Vancouver.

In British Columbia, amateur communications will be organised by the Provincial Emergency Programme Amateur Radio Service with a number of paraplegic amateurs at Pearson Hospital in Vancouver, BC operating their HF station as the local end of the communications chain. In the United States, it is being co-ordinated by the Courage Handi-Hams, an organisation of handicapped radio amateurs. It is hoped that in other countries the national amateur radio organisation in each country can be persuaded to assist the project.

I hope that the WIA will consider arranging the amateur activities in your country for us.

Thank you very much for your assistance.

Yours sincerely,

Robert Smits VE7EMD
202-13640 67 Ave.
Surrey BC
Canada
V3W 6X5
604-590-1014

Rick will wheel from Sydney to Townsville during late December 85 to early January 86. Volunteer operators to assist this marathon are required. The Institute fully supports Ricks endeavours and hopes that members, clubs or groups will provide the assistance required.

Contact the VK2/VK4 Divisions for further details.

AR

FURTHER TO QUESTIONNAIRE

I refer to the recent survey of AR readership. I wish to congratulate the Federal Executive for their initiative in conducting this survey and to urge the Divisions to make full use of the results.

This survey, when the results are fully analysed, will provide the Federal Executive and the Divisions with information on the distribution of interests of their members. This information has never been available before in this detail or accuracy. At Federal level, this information provides a data base for decisions on such things as AR content, band and mode planning, funds distribution and in negotiations with licensing authorities. It can be used at Divisional level as the basis for decisions on meeting subjects, funds allocation and activity programmes.

Hopefully, Federal and Divisional committees will make the fullest use of the information gained from this survey. The rate of return of completed questionnaires may reflect the value seen by members in the survey.

Finally, a vote of thanks must be passed to Earl Russell VK3BER, for his valuable assistance in deducting the returns to a usable form. Earl has put many hours into this task and this effort is much more than that normally expected of a volunteer official of the WIA. Well done, Earl!

CODE AN LCD?

Is there anyone who has information as to the coding used to activate the LCD display on small pocket calculators?

I have a number of these — not working — and the LCD display would be ideal for use with home brew projects. But the method of activating the display is **NOT** the normal strobe method used for 7 segment displays. It is a complicated four voltage level arrangement applied to all of the 28 connections regardless of the number of digits which are displayed. Each of the connections seems to go to several digit segments, not always the same corresponding segment. The basis of the coding is a 3 level sequence to each connection and uses all possible combinations of the four available voltage levels.

Anyone who can crack the code is welcome to a few of these displays.

ANOTHER MOTOR VEHICLE INTERFERENCE PROBLEM

Just recently, before the May issue of AR arrived at my home, I was confronted with an unusual problem concerning RF interference to a modern vehicle. After I had "cured" the problem, AR arrived and I read with interest the story by Rod VK3UG, page 17.

Firstly, let me relate my first problem. This concerned a four-wheel-drive vehicle owned by a friend. He brought the vehicle to me complaining that when he pushed the transmit button of his transmitter, the engine stopped!!!

I found this hard to believe but on test it was so. The engine, a powerful V8, stopped dead when the button was pushed, even with the engine "revving" hard. Upon investigation, it was found that the trouble was being caused by a recently connected tachometer. The instrument was fitted on the dash panel and had a lead to the "hot" side of the ignition coil. This is where the trouble originated . . . RF was being picked up by this lead to the tachometer and fed back into the electronic ignition system. Removal of the "tacho" wire cured the problem. But, the owner was keen to retain his tacho, so some RF filtering was called for.

Coaxial cable was tried with the tacho wire being fed through the inner conductor and the outer being earthed. The problem was still there although considerably reduced. The engine would only "miss" but not stop. An RF choke wound on a ferrite ring was placed in the lead to the tacho adjacent to the ignition coil. This was the answer — the problem was completely cured. Bypass capacitors were not used because this would interfere with the electronic ignition system and possibly cause other strange effects. It was just after this event that AR arrived with Rod's story. Not quite the same, but certainly involving the same approach . . .

A few days later I took delivery of a new Australian-made car, appropriately designated as a "VK" model. The old reliable two-metre gear was moved from the old vehicle and installed in the new "one". To my surprise, when turning a corner and transmitting at the same time, the flasher went crazy . . . It not only sped up as Rod described, but broke into continuous "buzzing" depending on the engine revs. In fact, my XYL thought I was using the horn when I was turning the corner and thought I was really going crazy!!! To cure this effect I re-read Rod's article with greater interest . . .

The flasher unit was located, fitted under the dash to the right of the steering column. It proved quite easy to remove being a "plug in" unit with three pins. The unit can be opened revealing a chip and a few components. I decided to install bypass capacitors outside the unit. These were soldered direct to the pins as close to the unit as possible. I used 0.22 MFD capacitors as these were available from the "junk" box. These proved to be quite effective and I am happy to relate that I can now turn corners and transmit at the same time without a loud "buzz" coming from under the dash!!!

With more and more electronics being introduced into the automotive scene, one wonders what other strange effects will appear . . .

Des Greenham VK3CO,
16 Clydesdale Court, Mooroopna, Vic. 3629

Note: Care must be taken when installing RF equipment in modern vehicles as RF has nasty effects on the electronic systems which feature in these vehicles.

AR

WHERE WILL WE BE?

I wonder where amateur radio will be in ten or twenty years time. It is noticeable that we are an ageing fraternity with too few of the younger generation joining our ranks. In a recently published American amateur magazine it was stated that the average age of licence holders there was over fifty. I would like to estimate that Australia would be similar. What can we do? I would like to put forward the view that we are, ourselves, killing the hobby by our own apathy.

Recently I had occasion to call for volunteers, firstly for new blood to come on to Council in VK6, as all members of the Council had served for a number of years and, with the exception of our two YL members, were near or into middle age. There was one nomination from outside the sitting Council, that of Cyril VK6MY who was a regular visitor already. In spite of frequent calls on the news-broadcast and at meetings, no one was prepared to serve. So we have the same members again, plus Cyril.

The second time was for volunteers to come forward to put their names down for work at the November Radio Rally. Many comments had been made previously as to the popularity of the two previous Rallies and how much annual ones would be enjoyed. Total number of volunteers apart from the participating groups? Seven. As a consequence, there will be no Radio Rally in 1985.

Lastly, I had been approached by a mother of a fourteen year old blind boy for help in preparing the boy for the May novice exam. The boy had studied in the UK for the full licence but had failed the exam. I suggested that the novice exam would be well within his capabilities, as his theory was based on the full UK licence and he had no problems with Morse. Consequently appeals were made over several news broadcasts and at the General Meeting for someone in the area to put in one or two hours a week going over regulations and generally assisting. Result NOT A SINGLE RESPONSE.

Fred Parsonage

Obituaries

ROY BAXTER VK4FJ

Yet another old timer has left us, with the passing of Roy Baxter, age 70 years, on the 20th April. Roy held his call, VK4FJ, for 50 years, and, in the past, was one of our top DX men. He was one of the brave souls who first activated Mellish Reef in July 1972, and was a long time member of the First Class CW Operators Club, AMIRE, Amateur Advisory Committee and spent some 48 years in the Salvation Army Temple Band.

Roy also served every day of World War 2 in the Royal Australian Navy, with most of that time at sea. Failing health over the last few years prevented him from pursuing his hobby to the full extent. Roy will be sadly missed by all his mates world-wide.

Fred Lubach VK4RF

MICHAEL (MIKE) F JENNER VK7MJ

Mike was born in England in 1907 and came out to Tasmania in 1912. His early life was spent on Tasman's Peninsula, where, with his father and elder brother, he experimented with the wonderful world of radio.

With a super-regen receiver using a 'Weaco' valve, occasionally they would communiate with VIH Hobart Radio, sending Morse with a damp finger dabbed on the grid.

The seeds of an interest in radio communications were therefore sown at an early age, but did not bear fruit until much later in life.

Mike trained as a motor mechanic in Hobart, and for a time was employed in the trucking garage of Anthony Hordens' in Sydney.

In 1941, he and his wife, Grace, moved back to New Norfolk, in the Derwent Valley, where he lived for the remainder of his life.

During the years his interests included fishing and photography, he was involved in scouting, and was Deputy Fire Chief of the local Fire Brigade.

His interest in radio was re-kindled in the fifties when his eldest son started playing with radios, and the Morse training was put to good use.

Mike was convinced that he was too old to pass an exam but with a little help from his friends, qualified for his amateur licence in 1973. Forced to retire early due to ill health, amateur radio, and later, a computer, made a wonderful and fulfilling hobby for him, Morse being his first love, followed closely by RTTY.

He was a 'man' in the true sense of the word — thoughtful, loving, caring, and a real gentleman.

His family was with him at the end and his caring, understanding and acceptance of the inevitable, helped make his passing, on 16/4/85 at the age of 77, so much easier for his loved ones.

He was my friend, and my father.

Mike Jenner (Jnr) VK7FB

FRED MAZURE — VK6MZ

It is sad to report the passing of Fred Mazure VK6MZ, who died suddenly on 31st March 1985. He was in his late seventies.

Fred rose to the rank of Warrant Officer in the RAAF, and after the war spent all his working life farming in the Busselton district. He never married, and after his retirement he moved into town, where he lived alone until his death. It is to people like Fred that amateur radio is of such inestimable value. In earlier days he was a keen CW operator, and in recent years kept regular daily skeds with friends on 80 metres. Despite his age, Fred kept well abreast of the technical scene. His shack was well equipped for HF and VHF, and he subscribed to several radio magazines, which he always read thoroughly.

Like most of us, Fred may not have made any great mark on the world scene, but he was a good friend and neighbour, and this kindly and gentle man has a place in the hearts of those who knew him.

LIONEL TAMSETT SWAIN VK2CS

The death on Friday 26 April of Lionel Swain VK2CS closed a chapter of amateur radio history in the Newcastle area.

Born in 1902 in Hamilton, a Newcastle suburb, Lionel took an early interest in the newly emerging "wireless" science and by 1922 he was responsible for the founding of the Radio Society of Newcastle of which he was the first president. The call sign 2SO was allocated to this organisation.

It was two years later that Lionel gained his own call sign 2CS and, as was common in those times, he conducted on air tests with a small group of enthusiasts but his music transmissions on the medium wave band reached a far wider audience in the local area.

In 1929, as with all other call signs in Australia, the prefix "VK" was added and Lionel became VK2CS, the call by which he was known until the time of his death.

He was a civil engineer by profession and on retirement held the post of Distribution and Maintenance Engineer, Water Supply, Hunter District Water Board. During World War II he served as a Lt Commander RANR in the Milne Bay area and later was seconded to the Department of Munitions where he worked on radar research in Sydney.

Lionel was a serious experimenter and meticulous with his construction work. Any of his "projects" could have won a constructor's prize. He was an expert on aerials and for this reason alone was much in demand as a lecturer. He had a keen perception of the part radio was playing in the technological developments of Australia and he was often quoted on technical matters in the press. He was a keen WIA supporter from the earliest days and held the post of President WIA Hunter Branch for some years. In 1962 Life Membership of the Institute was bestowed upon him.

The large attendance, including many old timer radio amateurs, at his funeral was an indication of the high esteem in which he was held in the community.

Lionel is survived by his wife Enid and family including several grandchildren and it is to these that our sympathy is directed in the loss of their loved one, a true radio amateur and a gentleman.

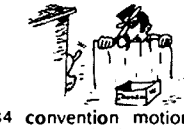
STOLEN EQUIPMENT REGISTER



In accordance with 1984 convention motion 84:17:01, the Federal Office has established a stolen equipment register. Members wishing to take advantage of this register, either to publicise their loss or to check equipment offered to them, may write or telephone the Federal Office their queries.

Update to the list published previously.

MODEL	SER NUMBER	FROM
ICOM IC-25A	03831	VK2DPM
ICOM IC-45A	01876	VK2DPM
ICOM IC-211	6804309	VK3BRV
KYOUTO FM-144/10	5027	VK2KUR
DS EXPLORER 70cm TRANSCEIVER (HAS EXTENSIVE INTERNAL MODS)		
ICOM IC-215	05156	VK2AMX
YAESU FT-209RH	4KO50838	VK3CE (BLUE VYNL CASE)
ICOM IC-2A	04484	VK1MX
YAESU FT-207R	10132725	VK2EMC
KENWOOD TS-120V	0081224600	VK2VWN
ICOM IC-22	12266	VK3BLC
KENWOOD TR-2400	0061926 (Call sign engraved on case)	VK2PJ
YAESU FT-708R	1HO1948 (Call sign engraved on case)	VK2PJ

The first success of this register has been notified to the Federal Office. An Icom 2A has been discovered by an alert member in a batch of equipment offered to a retailer. The equipment is now back with its owner.

If you are offered second hand equipment, please check with the stolen equipment register before purchase.

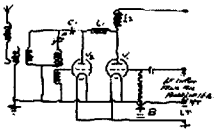
All times in UTC.

75th Nostalgia



EXAMINATION PAPER PRE-WWII

Commonwealth of Australia
PMG Department
Amateur Operators' Certificate of Proficiency
Time allowed 2 hours

THEORY

1. Discuss the relative merits and demerits of Heising and Suppressor grid modulation.
2. Draw a schematic diagram of a 3 stage crystal controlled transmitter suitable for amateur operation.
3. Draw a diagram of a key click suppressor. Also state what method you would adopt to prevent high frequency surges getting back to the mains.
4. Draw a diagram of a B class modulator and briefly discuss its function.
5. Assuming that a screen and plate of an audio frequency amplifier takes 5 and 15 mA respectively, what size bias resistor would be required to give 30 volts negative bias on cathode of indirectly heated valves. State how bias takes place.
6. Describe 3 kinds of microphones used by amateurs and their functionings.
7. Describe, and draw a circuit of a modern frequency checking unit for use in amateur stations.
8. Calculate the capacity of 1, 2 and 4 mF in parallel connected, in series with 3 and 3 mF which are also in parallel.

REGULATIONS

1. Give details of the distress call for telegraphy and telephony.
2. How many times may the CQ call be used? Give an illustration of the use of that call.
3. Which is signalled first in a message, the time or date? What time is indicated by the figures 0420?

Submitted by Fred Lubach VK4RF

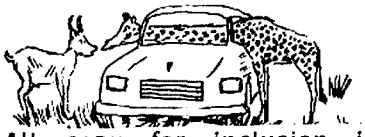
NOTICE



All copy for inclusion in September 1985 Amateur Radio must arrive at Box 300, Caulfield South, 3162 no later than midday 22nd July.

HAMADS

PLEASE NOTE: *If you are advertising items FOR SALE and WANTED please write each on separate sheets, including ALL details, eg Name, Address, on both. Please write copy for your Hamad as clearly as possible, preferably typed.*

- **Please insert STD code with phone numbers when you advertise.**
- Eight lines free to all WIA members. $9 per 10 words minimum for non-members.
- Copy in typescript please or in block letters double spaced to PO Box 300, Caulfield South 3162.
- Repeats may be charged at full rates.
- QTHR means address is correct as set out in the WIA current Call Book.

Ordinary Hamads submitted from members who are deemed to be in the general electronics retail and wholesale distributive trades should be certified as referring only to private articles not being resold for merchandising purposes.

Conditions for commercial advertising are as follows: The rate is $22.50 for four lines, plus $2 per line (or part thereof) minimum charge $22.50 pre-payable. Copy is required by the deadline as stated below indexes on page 1.

☐ TRADE ☐

AMIDON FERROMAGNETIC CORES: Large range for all receiver and transmitter applications. For data and price list send 105 x 220 mm SASE to: RJ & US IMPORTS, Box 157, Mortdale, NSW. 2223. (No enquiries at office . . . 11 Macken Street, Oakley). Agencies at: Geoff Wood Electronics, Rozelle, NSW. Truscott Electronics, Croydon, VIC. Willis Trading Co., Perth, WA.

70 cm power/VSWR meters (see p 23, AR July 1984) 50 W @ $112.80. 23 cm long loop yagis from $64.80. Waveguide modules, tubing & flanges. Gun & mixer diodes at good prices. 0.141" semi-rigid coax @ $2.50/metre. 1/16" DS PTFE board @ 14c/sq cm. 17 pF UHF Porcelain variables @ 10 for $3.50. Send SAE for lists to Microwave Developments, 6 Netley Road, Mount Barker, SA 5251.

ICOM'S IC-3200A Dual Band Radio.

Actual Size

It's the most compact size, most affordable price.

The IC-3200A is surprisingly small, so small we think it's the smallest Dual Band radio in the amateur service, but that doesn't affect performance or PRICE.

POWER. 25 watts of output power is available on both bands. Or if you prefer, low power is adjustable (internally) from 1 to 10 watts. Great if you have an afterburner.

SIMPLE YET FLEXIBLE: You don't want to be fiddling around with a squillion controls in heavy traffic, so ICOM have provided the minimum number of front panel controls to do your job.

MEMORY. 10 tunable memories are available each capable of remembering the receive and transmit frequencies, and each can be tuned up or down when selected. Yet the radio will automatically return to home frequency when reset. These memories are backed up by a lithum battery. Memory lockout is used to scan only the memories required.

SCANNING. Four scanning systems are available. Memory scan, Band scan, Programme scan and Priority scan.

OUTSTANDING FEATURES: A built-in duplexer means only one antenna connection with a minimum of messing around. A Dual Band Antenna will be available shortly. 5KHz and 25KHz steps of tuning are provided. Option UT-23, a voice synthesizer, is backed up with many other accessories for the home or car.

ICOM

Simply the best.

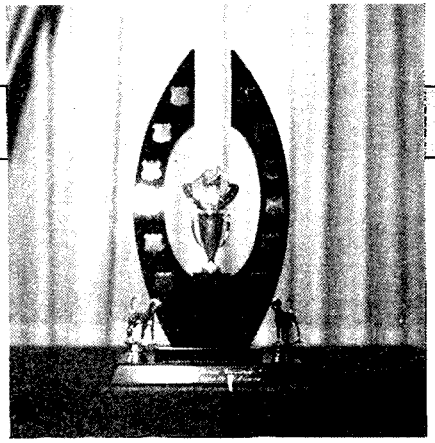
JOURNAL OF THE WIRELESS INSTITUTE OF AUSTRALIA

WIA's 75th Anniversary Fox Hunting Championship — 25th & 26th October 1985

37th Annual Remembrance Day Contest — 17th & 18th August 1985



On 25-26th October 1985, the first National Fox Hunting Championship will be held at the Wagga Convention, in conjunction with the WIA's 75th Anniversary. The winning team will hold the trophy, featured on the cover, for twelve months. Inset: The late William McInnes Moore VK2HZ. Bill, a life member of the Institute, saw service in the RAAF as a wireless operator. See page 29 for a tribute to Bill.

SPECIAL FEATURES

TECHNICAL FEATURES

REGULAR FEATURES

AMATEUR RADIO

Published monthly as the official journal by the Wireless Institute of Australia, founded 1910. ISSN 0002 — 6859. Registered Office: 3/105 Hawthorn Road, Caulfield North, Vic. 3161. Telephone: (03) 528 5962.

As a special feature for this month's RD contest, Max VK3ZS has written an informative article of how this contest began (see centre pages). Max lists the radio amateurs whose memory is perpetuated by this contest.

Another type of contest begins this year — the first National Fox Hunting Championship. This inaugural Hunt is being conducted during the Wagga Convention, 25th and 26th October, and is part of the WIA's Seventy-Fifth Anniversary. The winning team will hold the magnificent trophy featured on the front cover. Full details appear on page 9.

This month the overall winner of the Agfa photographic competition for the past twelve months, is announced, p. 29.

VHF/UHF enthusiasts will be interested in the history of bridging the VK6-VK5 and VK6-VK3 paths on 144MHz and other bands, between 1951 to January this year. Walter VK6KZ has spent many hours studying the logs of the late Rolo Everingham VK6BO, to glean much of this information. (BKP)

DEADLINE

All copy for October 1985 AR (including regular copy of Hamads and columns) must arrive at PO Box 300, Caulfield South, Vic. 3162 at the latest by midday 21st August 1985.

SHOOT YOUR SIGNAL OUT OF THIS WORLD

SCAN THE BANDS WITH OUR NEW SX-155

PROGRAMMABLE POCKET SCANNER

This new unique scanner provides coverage of 26-32, 68-88, 138-176 and 380-514 MHz with a sensitivity of less than 0.5 uV. Four banks of 40 memory channels, total of 160 memories. High scan speed of 16 CH/SEC. Auto search and store mode. Priority channel. 4 hour life on supplied Nicad batteries. 24 Hour clock. Selectable Scan/Search delay of 0.1 or 2 seconds. Includes Nicads, charger, carrying-case & antenna.

ONLY $449

EDITOR'S COMMENT

LOOSE ENDS

From time to time there are occasions when your Editor can actually spare an hour or so for a little listening on the bands, maybe even making a contact or two. It should be compulsory for all of us, on the bridge of the good ship "Amateur Radio", to make this effort to keep in touch. So for this month of August 1985, the occasion of the 38th Remembrance Day Contest, I thought I might mention a few unrelated items heard on the air, or which come to mind.

The first is AR's print size, which we have to admit has been a little on the small side for the last year or so. There is a continuing necessity to put a great deal of material into a limited amount of space. But improvements are already being made by our skilled typesetters. It is possible with computerised equipment to fit larger type into the same space by cutting down on spacings between letters and words etc, and this condensing process is well under way. But if you really want larger type and a bigger magazine there is one certain way to help. Enlist a new member (or two, or more?). Our budget is set by our subscription income, and the more there is the more efficiently we can function. This will become even clearer when our promised article on the production of the magazine appears in print soon.

Finally, if there are some of you in North Queensland or the Top End who would like an opportunity to "earbash" the Editor, your chance is coming. My XYL and I are planning a flying trip up north during the August/September school holidays. We look forward to hearing you on 2m FM, with perhaps the occasional "eyeball".

Bill Rice VK3ABP
Editor
AR

WIA Seventy Fifth Anniversary

Letter of congratulations from overseas societies, presidents, etc. are arriving daily, listed here are those received to date:

NZART
IARU Region 2
IARU Headquarters
Radioklub de Deutshen Demokrtischen Republik
Radio Society of Bermuda
Grenada Amateur Radio Club
Israel Amateur Radio Club

75TH ANNIVERSARY DINNER

Arrangements for this important function are well in hand, a registration form is inserted in this issue to facilitate booking arrangements. It looks as if the 75th Anniversary dinner at the Southern Cross Hotel on 9th November will truly be a night to remember in the long history of our Institute. At this time the official guest list is growing, to date acceptances have been received from:

The Honorable Michael Duffy, Minister of Communcations
Richard Butler, Secretary General of the ITU
Richard Baldwin W1RU, President of the IARU
Carl Smith W0BWJ, Vice President of the IARU Region 2
Pedreo Seiderman YV5BPG, President of the IARU Region 2
David Rankin VK3QV, Chairman of the IARU Region 3
Masayoshi Fujioka JM1UXU, Secretary of IARU Region 3
John Alloway G3FKM, Secretary of IARU Region 1

MEMBERSHIP

In the January issue of Amateur Radio it was announced that each 75th new member during 1985 would receive a quartz multi function clock for their shack. Listed below are the recipients to date of these clocks:

C W Purvis VK3DEN
A R Clark VK3CAC
D H James L20348
D Perno VK4BDP
K J Chipper VK6ZEB
J C Kemp L50129

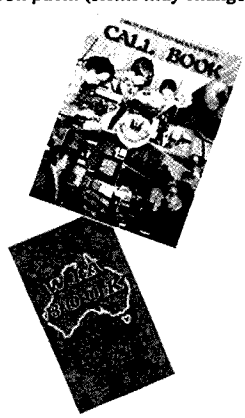
As the year progresses more names will be added to this list, hopefully many more.

Next month we will be listing of proposers of new members, the computer will be selecting a separate listing of proposers of members and gifts will be despatched. Keep up the good work!

BOOK PACKS, THE 75TH ANNIVERSARY and THE YEAR OF YOUTH

The June issue on this item has generated a great deal of interest and mail to the Federal Office. In order to satisfy many of the questions being asked, listed below are the contents of each book pack. (Items may change subject to availability).

$15 pack. P&P Paid.
Into Electronics (NSW Education Service)
Novice Electronics
100 Basic Projects
Guide to Amateur Radio (RSGB)
WIA Book 1
WIA Call Book
Radio Amateurs World Atlas
$30 pack. P&P Paid.
The following plus the $15 pack:
Basic Training Manual (NZART)
Hints and Kinks (ARRL)
Weekend Projects (ARRL)
$50 pack. P&P Paid.
The following plus the $30 pack:
ARRL Handbook (ARRL)
Maidenhead Locator World Atlas



Each pack will contain information on amateur radio in the form of letters, leaflets and posters.

When applying for a book pack please ensure that you enclose, in your request to the Federal Secretary, details of the Club/Group making the presentation and the recipients. It must be stressed that the value of these packs bears no resemblance to retail prices.

POSTER COMPETITION

The 7th Anniversary sub-committee has awarded the prize for the poster competition to V Marsden VK2EVM. Hearty congratulations.

PRE STAMPED ENVELOPE

The success of the envelope released by Australia Post to celebrate the 75th Anniversary was extremely good. The displays put on by Divisions and clubs in Post Offices was not only appreciated by the general public

but by Australia Post also. The envelope has also generated considerable interest overseas, mail from amateur radio collectors has been heavy and news to date is that the envelope will be featured in QST as well as Region 3 news. It has been indicated to the Executive that this envelope has been one of the most popular ever issued!

75TH AWARD

This Federal award, being run by the Victorian Division, is still creating considerable interest both at home and overseas. Our awards manager for this Anniversary event, Jim Linton VK3PC, has advised the Executive that, to date, some 200 of the awards have been issued. To remind you, your membership number is printed each month on the label of your copy of AR. If you have not qualified yet there is still plenty of time as this award runs until the end of the year, the certificate itself is well worth the effort to obtain. The rules for the award appeared in the March issue of AR, page 52.

VK75A

The QSL manager for this special Federal call sign, Des Clark VK3DES, now has supplies of the special QSL card and is busy catching up on the 6000 contacts to date. If you have not been lucky enough yet to have had a QSO, there is still time. During August the VK4 Division will be operating the special call sign, followed in September by the VK1 Division.

WORLD AMATEUR RADIO DAY-18 APRIL 1985

As a result of the Institutes listening stations on the 10, 18 and 24 MHz bands, to increase the use of these bands, the following stations have been selected from the many "heard" during this Special Day:
VK4NL, VK2DVU, VK3AMB, VK1ZU, VK7CH, VK6WT, VK5GZ, VK2AJO, VK3ZM, VK4NR.

These stations will receive, in the very future, 75th Anniversary gift packs.

CW CONTEST RESULT

The results were published in the July issue of AR. The winner of this event P Alexander VK2PA was presented with the Presidents Cup during the Oxley Region Field Day at Port Macquarie over the June long weekend. The presentation of the special 75th Anniversary prize for this inaugural event, the William Willis specially mounted and engraved Morse key, will take place at a later date this year.

All entrants to this special CW event this year have received their certificates.

AR

RADIO AMATEURS WIN MINISTER'S TRIBUTE ON 75th ANNIVERSARY

The Minister for Communications, Mr Michael Duffy, recently paid tribute to the work of the Wireless Institute of Australia which this year celebrates its 75th anniversary.

On 22nd May 1985 Australia Post issued a special stamped envelope marking the occasion.

"Amateur radio is usually looked as a leisure-time hobby," Mr Duffy said, *"but in times of war and emergencies such as bushfires, the operators have proved truly professional in the help they have been able to give."*

The WIA was formed in 1910 and is the first and oldest radio society in the world. Its membership includes operators of all ages, both sexes, the handicapped and the disabled.

Mr Duffy said 1985 was of special significance in the history of Australian communications because of the imminent launch of the AUSSAT communications satellites.

"It is not generally known that fifteen years ago a team of radio amateurs in Melbourne built a satellite and had it launched in the US," Mr Duffy said.

The satellite was named OSCAR 5 (OSCAR is the acronym for Orbiting Satellite Carrying Amateur Radio) and although it operated for only forty-four days it demonstrated that radio amateurs had the expertise and capability to activate a spacecraft radio beacon by transmitting command signals from earth.

"These days ordinary citizens around the world use amateur radio equipment and satellites to communicate with each other," the Minister said.

Mr Duffy said that in its administrative/regulatory roles his Department had a close relationship with the WIA which represents some 16,000 amateur radio operators.

"The two organisations sometimes disagree on matters concerning use of the radio frequency spectrum, but the Department values its links with the WIA and the advice it puts forward."

Press Release No 37/85 — 23rd May 1985 from Minister for Communications.

THANKS

I wish to convey my appreciation and thanks for the prizes which arrived recently in connection with the 75th Anniversary subscription renewals, and congratulate the Institute on the activities undertaken to celebrate the Seventy Fifth Anniversary.

73.

Jim Oliver VK7JO

Re my receipt of the gift package to be followed with my receiving the clock. These moments in amateur radio I shall not forget. Very greatly appreciated and sincere thanks to those concerned.

Best of 73,

Yours faithfully,

H R Hodgson VK5AP

Many thanks for your advice re my membership of the Institute.

I also wish to convey my thanks to the Institute for the presentation clock which came as a complete surprise, and is very much appreciated.

Yours sincerely,

C W Purvis VK3DEN

A note of thanks and appreciation for your letter of the 14th June 1985 and the quartz clock received in the mail.

Just how much appreciation may, perhaps, be judged if I tell you a little about myself: having been "forced" into a somewhat early retirement by the widespread unemployment in the building industry, I took the opportunity, of extra leisure time, to fulfill a lifelong ambition and become an amateur and whilst I have acquired some "necessary" items of equipment the budget certainly does not run to such items as clocks (to date my shack clock consisted of an old resurrected digital watch with a smashed case!).

However, I have received a great deal of enjoyment from my relatively short sojourn in the amateur ranks and as a member of the WIA.

To receive a gift in addition to the pleasure of membership makes me feel very fortunate indeed.

So thanks again, and let me just add that here is a member who is very appreciative of the time and effort expended by the Executive, Officers etc, of the WIA, on members' behalf

Yours sincerely,

Dmitri Perno VK4BDP

AURORA SCATTER — ANTARCTICA

Don Richards VK2BXM
The Ski's Inn, Sackville Road, Ebenezer, NSW. 2756

Between November 1984 and March 1985, the Research Vessel, the Dick Smith Explorer, which is owned by the Oceanic Research Foundation, voyaged from Sydney to Commonwealth Bay, Antarctica, and back again. She spent five weeks moored in the Boat Harbour, Commonwealth Bay, the site of Douglas Mawson's hut which was erected by his party during the 1911-1913 expedition.

Commonwealth Bay is almost directly south of Tasmania and about 2000 nautical miles from Hobart.

During the voyage and whilst moored, the writer carried out experiments on 2m SSB, aimed at using auroral scatter, to make contacts with Australian amateur stations. The call sign which was allocated to the expedition AX0PB (Project Blizzard) was used.

Equipment was a TS9130, all mode 2m transceiver courtesy Trio-Kenwood, a Mirage 160W linear amplifier and pre-amplifier courtesy ATN Antennas, a 2m horizontal dipole made at short notice by Brian VK7BP and a 10 element, 2m Yagi loaned by Ross VK2ZRU as arranged by Dick VK2BDN.

For the voyage south and return the dipole was used and the Yagi was used whilst moored in the Boat Harbour.

Each night, during the voyage, (6.12.84-24.12.84 and 6.2.85-20.2.85) from 2100UTC on 144.100MHz, for about 15 minutes, slow Morse was sent calling CQ with identification AX0PB. The CW was interspersed with voice, sent and listened at about 2 minute intervals.

The same procedure applied whilst moored between 30.12.84 and 5.2.85, only the Yagi was used. The Yagi was pointed at the east coast of Australia for about 15 minutes, then changing direction to the Perth-Albany area.

I was also operating HF daily and would come up immediately on 2m if there was any detection of what sounded like auroral effect on the HF bands. At other odd times through the day and night I would often send and listen.

Arrangements had been hurried before departure but word got through to Pierce VK2APQ, the broadcast, Gordon VK2ZAB and later to Art VK6ART, as to what the programme was.

Good contacts had been made before leaving, with amateurs on sideband in Melbourne and Hobart and it was possible to hold the Hobart repeater for about 120 nautical miles while moving south. For the rest of the time nothing was heard until we were within range of Tasmania again.

So far, a report has been received from Greig VK7KJ, who heard slow Morse on 144.100, at the right time and from the correct direction, on the night of 11.1.85. He was unable to identify the call sign.

Any other reports would certainly be appreciated.

Thanks go to those who helped, including Moonraker, Hobart, with some components and advice and Roger VK2ZTB, who suggested the experiments in the first place.

Next time this vessel goes south it is hoped to take 6m gear and attempt to give more notice of the planned activity.

There was a fair amount of activity on HF, both at sea and from Commonwealth Bay. A report of this activity is being prepared and will appear in AR when completed. **AR**

THE WESTERN AUSTRALIAN — INTERSTATE-OVERSEAS VHF/UHF STORY

75th Nostalgia

Walter J Howse VK6KZ
13 Siddons Way, Booragoon, WA 6154

Recent events on VHF/UHF included the bridging of the Perth Adelaide path (2137 km) on 432 MHz for the first time ever. The author owes his interest and activity on VHF/UHF to the late Rolo Everingham VK6BO who made the first contacts in 1951 and 1952 on 144 MHz to Clem Tilbrook VK5GL and Reg Galle VK5QR. Rolo, as well as the author and others, frequently looked to repeat his feat. This article is an attempt to bring together information on the bridging of the VK6/VK5 and VK6/VK3 paths over the period 1951 to January 1985 as well as other interstate and overseas "firsts" on 144 MHz.

50 MHz — 6 November 1948

The first VK6 to work interstate on the 50/52 MHz band was VK6HM in Kalgoorlie who made his contact at 1035 UTC on 6 November 1948 by working VK5GB (1). He was closely followed by Wally Green VK6WG in Albany who worked VK5GH at 1045 UTC. At 1109 UTC Wally worked Reg Galle VK5QR — the first of many VHF/UHF QSOs between these two amateurs as will emerge later (2). Another Wally — the late Wally Peterson VK6LW chalked up the first interstate QSO on 50 MHz from Perth in December that year (3). By April 1949, the stage had been reached where Don Hawksworth VK6DW at Bruce Rock needed to work a VK6 before he could claim the "Worked All States" award for 50 MHz. Don finished with Certificate No 3 (4). It was not until 1963 that the second such award was made to a VK6 amateur and that was to the author as VK6ZAA (5). The long gap was due primarily to the lack of activity in the Northern Territory.

144 MHz — 30 December 1951

On 144 MHz, the log of Rolo VK6BO shows that on 30 December 1951 the 50 MHz band was opened at 0108 UTC when he worked VK5MK. This was the first of a continuous stream of 50 MHz contacts until at 0705 UTC Clem Tilbrook VK5GL was worked for the fourth time that day on that band. The next entry in Rolo's log was for the 144 MHz band. Rolo gave VK5GL a 5/5-8 report and he received a 5/6-7 on AM with the contact concluding at 0712 UTC. At 0718 Rolo resumed working VK2,3,4,5,7, ZL1,2, and 4 on 50 MHz until 1330 UTC. At that time the log shows "called CQ CW ZS till 12.00 midnight (ie. 1600 UTC)". In all, Rolo had 86 interstate contacts that day on 50 MHz. This contact of 2164 km was just short of the then world record distance of 2253 km.

9 February 1952

On the 9 February 1952, Rolo called CQ at 0245 UTC on 50 MHz and worked VK5GL at 0245 and VK5HD at 0250. The next entry at 0312 UTC was VK5GL on 144 MHz with report sent 4/2-8 and received 5/6. At 0223 UTC Reg Galle VK5QR made his contact with reports of 5/5-8 sent and 5/5-7 received. Rolo called CQ on 144 MHz "on and off till 1145 (ie. 0345 UTC)" and from 0400 onwards worked VK5HD, VK5GL and VK5QR on 50 MHz with the final six metre contact recorded at 0645 UTC (6).

The equipment used at that time gives an idea of the changes now evident in technology. Clem Tilbrook VK5GL used an RL7 tritet oscillator with an 8 MHz crystal, a 6V6GT doubler to 48 MHz, and an RK34 tripler to 144 MHz with an 832 final with 18 watts input. The amplitude modulation resulted from a modulator using a pair of 6V6s in Class A push/pull. The receiver comprised a crystal locked converter with a 6J6 push/pull RF amplifier, 6J6 push/push mixer with a 6C4 cathode follower. The oscillator section used an 1852 tritet, fifth harmonic from 9.4 MHz driving a half 6J6 trebler to 141 MHz. The band tuning from 3-7 MHz was done "on a conventional 12 tube receiver". Clem's antenna comprised a four over four with the bays spaced a full wavelength apart with the top 28 feet (8.5m) high. Folded dipoles were used as radiators fed with 300 ohm open line (7). Clem commented on his QSL card *"look forward to many more contacts with you. Who knows that it won't by 288 MHz soon — here's hoping. Clem".*

Reg Galle VK5QR commented *"Clem and I intend watching each time the weather map indicates a possibility viz cold front from west to east near the coast plus a parallel isobar close to it. Both breakthroughs showed this oddity on weather maps . . . we are very keen to test one metre gear!" (8).*

Rolo's equipment is not so well documented. His colleague Don Graham VK6HK agrees with the author that the antenna on 144 MHz was a five over five array spaced a wavelength apart and the transmitter had an 815 valve in the final.

The input power on AM was 45 watts and his converter used a tunable oscillator. Because of the length of the run between the shack and the tower Rolo constructed his own open wire line.

Near Misses From Perth

In many six metre openings in the period to 1976 when Rolo died, VK6BO could be heard around 144.22 MHz, on the key, seeking to repeat his 144 MHz contacts. The nearest he came to this was probably on 1 January 1967 when Col Moore VK5RO heard Rolo at 0435 UTC (9). The Perth 144 MHz beacon was heard that day at 0305 UTC in Adelaide by VK5ZBR and VK5ZMW (10). Another near miss for Rolo was on 15 February 1970 when he recorded in his log *"At last! 07.15 heard VK5VF on 144.8".* At that time the Mt Barker two metre beacon was 5/9+ off the side of Rolo's beam. Kevin Bicknell VK6ZCB (now VK6AB) also heard VK5VF at that time at 529. These observations immediately followed Rolo's daily early morning checks with Wally Green VK6WG on 144 MHz. Wally was in Norseman at that time. VK6WG's signal was 5/2-5 in Perth at 06.45 WAST (11).

Western Australian VHF Group (Inc) and Beacons

However to revert to the general story of 144 MHz, a significant event had occurred on 30 April 1955 when thirteen amateurs met at the home of Ron Mould VK6FM in Mt Pleasant, Perth and decided to form the Western Australian VHF Group. Following an application for a permit in January 1958, this Group established the first amateur beacon in Australia on 50 MHz. This had the call sign VK6VF and was placed on air in January 1959 in Kalamunda at the QTH of Bob Elms VK6BE (Bob now lives in Albany). On 14 July 1961, the Post Master General's Department approved an application from the VHF Group and the Group established a beacon on 144 MHz in addition to its six metre one. In 1962, the Group built a six metre beacon for operation on Cocos Island which was operated under the care of Lionel Allen VK9LA. The beacons were to facilitate detection of band openings. (12)

Near Miss from Narrogin

On 3 January 1961, Kevin Bicknell VK6ZCB, who was living in Narrogin (165 km south west of Perth), worked Doug McArthur (now VK3UM), then VK5KK, crossband from two to six metres. The six metre band had been wide open with rock crushing signals. Doug had no problem in receiving Kevin's AM signal on 144.18 MHz. However Kevin had chosen that day to rebuild his two metre converter so preventing a two way contact on 144 MHz. The crossband contact continued until 1510 UTC, ie. nearly midnight local time! (13).

Bunbury/Adelaide — 8 January 1965

During a six metre opening to the Eastern States, Andrew Martin VK6ZCN (now VK3KAQ) in Bunbury (150 km south of Perth) worked Colin Hurst VK5ZHJ (now VK5HI) in Adelaide on 144 MHz at 0520 UTC on 8 January 1965. The Adelaide beacon VK5VF on 144.8 MHz was heard at 0612 UTC by Andrew but no other two metre contacts eventuated (14). The commonly accepted theory has been that Rolo and Andrew had achieved their contacts via Sporadic E. However a new phenomenon was about to emerge, to dramatically alter the thinking about east-west VHF/UHF DX.

Weapons Research Establishment Propagation Tests 1966-68

The Weapons Research Establishment of the Australian Defence Scientific Service turned its attention to the anomalous propagation over the path between Albany, Western Australia and Salisbury, 25 km north of Adelaide, South Australia. In December 1966, a VHF transmitter on 135.5 MHz, a power output of 5 kW and Yagi antenna with a gain of 12.2 dB was installed at Albany. A second transmitter on 1769 MHz at 1 kW and parabolic dish antenna with a gain of 35.7 dB was added at Albany in October 1967. Received signals at Salisbury over the 1890 km path indicated frequent openings on both frequencies. Signals on 135 MHz reached as high as 10 dB below free space and 25 dB below free space on 1769 MHz. An early report of that research published in May 1969 showed that from October 1967 to April 1968 there were sixty openings on 135 MHz of at least two hours duration, eighteen openings of 24 hours duration and one which lasted for a fortnight in January 1968. The openings on 1769 MHz were not as frequent (twelve occasions only) nor did the signal reach the same high level as at VHF. Further the VHF signal was always present when a UHF signal was received (15).

Mt Barker 144 MHz Beacon and First Contact 3 January 1969

Spurred on by the success of these tests, the West Australian VHF Group (Inc), (urged on by the then president Don Graham VK6HK) obtained a licence for a two metre beacon which was installed in October 1968 at Mt Barker, 50 km north of Albany under the care of Tom Reed VK6TR. Initially operating as VK6VF/P and later VK6VE, the beacon was heard in Adelaide and the first of many 144 MHz contacts between Albany and the Eastern States was achieved by Wally Green VK6WG and Mick McMahon VK5ZDR on 3 January 1969 (16).

After a power failure in July 1969, the beacon was rebuilt and reinstalled at Mt Barker in December 1969. In May 1970, the beacon was sold to the Southern Electronics Group based in Albany (17) and it was moved to Albany as it was thought that the inland location of Mt Barker was a great disadvantage.

The award for the unluckiest pair of amateurs might go to Rod Graham VK6ZDS (now VK2BQJ) and Charles Kosina VK6LK (now VK3BAR) who, for the three summers of 1964 to 1966, operated just east of Albany with equipment for the six and two metre bands and worked an extensive amount of DX on six metres but none on 144 MHz. Maybe six metre conditions were too good! (18).

Other Near Misses 1969-1970

Back in Perth things were also happening. Kevin Bicknell VK6ZCB was now living in Lesmurdie, a suburb about 20 km east of Perth (and about 300 metres higher!) On 17 January 1969, Kevin copied the VK5VF beacon on 144.8 MHz from 2203 to 2227 UTC (ie. 0603 to 0627 WAST 18 January 1969) at signal strengths peaking 5/9. Wally Green VK6WG in Norseman also copied that beacon at this time. On 15 February 1969, Kevin again heard the VK5VF two metre beacon with strength 3 at 0705 WAST. Reference was made earlier to Rolo Everingham hearing VK5VF on 15 February 1970 and Kevin's confirmation of receiving it. Kevin tells how at 0625 WAST (ie. 2225 UTC on 14 February 1970) he first heard the beacon at 5/9+. Frantic calling for a QSO was unsuccessful. The beacon was still audible when Kevin went out at 0952 WAST and again at 1025 WAST when he returned home. Kevin expressed regret that he did not record in his log when he lost the signal completely. (By the way, the dates 15 February 1969 and 15 February 1970 were double checked to confirm that the events described were one year apart!). On each of these occasions there was no evidence of a six metre opening (19).

First VK6/VK3 Contact on 144 MHz — 1 February 1970

Early in 1970 there was a lengthy opening from 30 January to 4 February when Bernie Gates VK6KJ made sixty six contacts to the Eastern States including the first VK6/VK3 contact on 144 MHz. This occurred on 1 February 1970 at 0050 UTC to Bob Halligan VK3AOT over a 2441 km path for a Western Australian distance record (20).

Inland Contacts

At that time Wally Green VK6WG was in Norseman and during the opening he had difficulty in attracting the attentiion of the Adelaide stations but on 30 January 1970 at 2225 UTC Wally worked Gary Herden VK5ZK for the first Norseman/VK6 contact (21).

On 3 January 1972 at 1206 and 1340 UTC Bob Pine VK6ZFY/P feeding 10 watts AM to a five element Yagi at the north east corner of the Stirling Ranges worked Kerry Adams VK5SU at Ceduna. Bob was one of the earliest, if not the first amateur from an inland location north of Albany to achieve a two-way contact on 144 MHz (22).

The Author's Experiences Along the South Coast of Western Australia

Exploration of the 144 MHz path between West Australia and the Eastern States has been a strong interest of the author, being first encouraged to investigate the VHF/UHF regions by the late Rolo Everingham VK6BO who had had the early successes on 144 MHz. The author missed two important periods described earlier, by being absent from Western Australia in 1968-70 and 1972-74. Beginning in December 1976, he has operated portable during each summer period along the south coast of Western Australia.

In 1976, the equipment used was limited to 144 and 432 MHz and the antenna depended on an adjacent post or tree or, on one occasion, one tall son for support! Contacts were made from Albany to VK5 on both 144 and 432 MHz. Learning from that experience, the author has developed a comprehensive system which enables him to set up a complete portable station for all bands from 1.8 to 3456 MHz at very short notice. This has permitted waiting in Perth until the conditions for DX appear promising before venturing to the south coast.

In 1977-78, heavy QRM in Albany resulted in a shift 20 km west to Torbay Hill. From there, many VK5 and VK3s were worked on 144 and 432 MHz. A contact on 8 January 1978 at 1316 UTC with Mike McDonald VK3ZQV (140 km east of Melbourne) resulted in a new Western Australian distance record of 2614 km for the 144 MHz band.

In 1978-79, Walpole (85 km west of Albany) was selected to see if the two metre path extended further west. Signals were heard and they resulted in contacts on 144 MHz with VK5 and VK3 over paths up to 2571 km.

Also in 1979, two-way 144 MHz contacts were achieved on SSB from inland points. On 28 January 1979 from Mt Burnside, stations as far east as Hatherleigh, near Mt Gambier (VK5MC) were worked on two metres. Mt Burnside, halfway between Walpole and Manjimup, was 35 km from the coast but the direct track to Adelaide had to cover 160 km of land before reaching the Great Australian Bight.

On 4 March 1979, the author, VK6KZ mobile, worked to Peter Smith VK5ZPS whilst returning to Perth from Albany. From roadside locations he was able to work Peter until 1310 UTC when he was 10 km north of Kojonup, ie. 150 km inland from Albany and 225 km from the Bight in the direction of Adelaide.

First VK6/VK4 Contact on 144 MHz

The first contact between VK6 and VK4 occurred on 3 May 1983 at 2150 UTC by John Harlock VK6GU at Wyndham and Steve Hutcheon VK4ZSH portable at Carnooweal using meteor scatter (23). The contact required about one hour to complete.

First VK6 to Indonesia Contact on 144 MHz — 2 October 1982

This was achieved on 2 October 1982 at about 0400 UTC. The Port Hedland repeater (1330 km north of Perth) on 147.0 MHz was opened intermittently with an occasional Indonesian word.

Mark Dunning VK6WV was the first to make contact when he got a call sign and broken English coming back to his call. Harry YD9BC and Gede YD9BR in Denpasar, Bali asked them to QSY off their official Police frequency! Contact was continued direct on 146.5 MHz FM. (24)

First VK6 to Japan Contact on 144 MHz — 23 April 1982

John Harlock VK6GU in Wyndham worked Yuki JH4JPO at 1052 UTC and then JH4XTN at 1103 UTC on 23 April 1982 for the first WA to Japan two metre contacts. The characteristic flutter of transequatorial signals was observed by him. The distances involved were 5509 km and 5501 km respectively. (25)

FM Contacts Through Repeaters

There have been VK6 and VK5 contacts made on FM through the Wagin two metre repeater (146.40/147.00 MHz) from Wagin and Katanning and also from these locations through Adelaide repeaters as well as direct on simplex. On 9 February 1979 some FM contacts were made to VK5ZCT via the Bunbury repeater (146.30/90). Detailed data on these contacts is not available to the author.

144 MHz Distance Record from Cape Leeuwin — 23 January 1980

In the 1979-80 season, VK6KZ operated from Cape Leeuwin, the most south western portion of Western Australia. This was 260 km west of Albany. On 23 January 1980, over forty eight contacts were made on 144 MHz with VK5 and VK3 stations with the longest path being 2785 km to Andrew Martin VK3YLR (formerly VK6ZCN) who was operating portable at Ross Hill, 80 km east of Melbourne. VK6KZ was using 10 watts SSB to a five element Yagi.

Perth/Adelaide on 144 MHz Again After 28 Years — 23 January 1980

However, whilst the author was operating at Cape Leeuwin, the long awaited event was happening. The Perth/Adelaide path on 144 MHz was bridged — this time by four amateurs — Wayne Dowie VK6WD, Jack Borthen VK6ZEL (now VK6KDX), Phil Casper VK6ZKO, and Ron Mould VK6FM who all worked Les Wood VK5ALW in Adelaide. Wayne made the first contact at 0003 UTC on 23 January 1980, following a phone call from Don Graham VK6HK who had heard the VK5VF beacon on 144.8 MHz after a contact with VK6KZ/P at Cape Leeuwin. Poor Don did not receive his report from Les VK5ALW to complete the contact. Other Adelaide stations worked from Perth were Ken Yates VK5RP and Reg Galle VK5QR. Signals to Perth from Adelaide disappeared at about 0110 UTC.

This opening extended to Katanning (250 km south east of Perth). Ken Thompson VK6ZFQ worked into Adelaide over a 1933 km path to Les VK5ALW at 0025 UTC. Ken had two further contacts to Adelaide on SSB during the opening viz at 1255 UTC with Col VK5RO and at 2305 with Eric Jamieson VK5LP. Ken reported hearing VK6KZ/P (237 km away) working Eastern States stations but he was unable to hear the other end of the contacts. (26)

Perth/Adelaide Again on 144 MHz — 28 December 1980

During a six metre opening to VK1, 2, 5 and ZL, on 28 December 1980, the 144 MHz band opened briefly to Adelaide. Don Graham VK6HK at last achieved two-way contacts. He worked Mick MacMahon VK5ZDR and Col Moore VK5RO. Ron Mould VK6FM also worked these two stations. The author (at home this time) heard VK5RO and was heard by him but in frantic efforts between 2245 and 2257 UT was unable to complete a two-way exchange of reports.

Receptions of beacons in Adelaide and Perth were reported on 2 January 1981 when VK5VF on 144.8 MHz was heard by Phil Casper VK6ZKO at 2228 UTC and on 3 January 1981 when T Power VK5ZPE reported hearing VK6VF on 145.00 MHz from 2107 to 2218 UT.

First Perth/Adelaide Contacts on 432 MHz — 10 January 1985

On 10 January 1985 Bob Blinco VK6KRC in Perth was in contact with Max Faulkner VK6FM in Manjimup (250 km south of Perth) on 144.100 MHz and Max asked *"who broke in"*. Bob listened and heard a voice. Thinking it may have been Peter Grumball VK6ZPG (210 km north of Perth), Bob swung his beam only to hear unfamiliar voices to the east. He proceeded to work Brian VK5KBU at 2247 UTC exchanging 5/9 reports. Bob then rang a number of Perth amateurs alerting them to what was going on. At 2302 UTC Bob made the first ever 432 MHz contact between Perth and Adelaide with Brian VK5KBU with reports of 5.9 and 5.3. The author was thrilled to work (from the home QTH in Perth), at 2258 UTC VK5KBU on 144 MHz and then VK5ZRO and VK5ZTS before working VK5ZRO at 2304 UTC and then VK5ZTS on 432 MHz. Other 144 MHz contacts by the author between 2304 and 0014 UTC included VK5ZDR, VK5NY and VK5ZPS. Tests on 1296 MHz between VK5ZRO and the author were unsuccessful.

First VK6/VK5 Contacts on 432 MHz — 11 December 1972

The Perth/Adelaide contacts in 1985 were not the first between Western Australia and the Eastern States. The first VK6/VK5 contact on 432 MHz was made by Wally Green VK6WG on 11 December 1972 with T Bellim VK5ZDY.

Wally later worked Les Jenkins VK3ZBJ, in Frankston near Melbourne, for an unclaimed world record distance of 2440 km. That distance was extended to 2460 km on 8 January 1978 by VK6KZ/P at Torbay Hill working Les VK3ZBJ and this contact was recognised as the world record. Then Aub Keightley VK6XY in Albany worked Mike McDonald VK3ZQV at Carrajung over a 2593 km path to gain the world record. He in turn lost the record when on 18 July 1979 contacts on 432 MHz were established between California and Hawaii. On 23 January 1980, VK6KZ/P at Cape Leeuwin regained the Australian distance record by working Les VK3ZBJ over a distance of 2717 km.

1296 MHz — 25 January 1977

On 1296 MHz it was once again Wally Green who made the first interstate QSO for a world record distance of 1885 km to Reg Galle VK5QR in Adelaide on 25 January 1977. This distance was extended on 29 December 1978 at 1138 UTC when the author VK6KZ, portable at Walpole, worked Chris Skeer VK5MC at Hatherleigh near Mt Gambier, South Australia over a distance of 2107 km. Reports exchanged were 559 to VK5MC and 55 to VK6KZ/P. On 23 January 1980 at 0057 UTC, the 1296 MHz 2146 km path was bridged by two-way SSB between VK6KZ/P at Cape Leeuwin and Reg Galle VK5QR in Adelaide. Later that day at 1202 UTC, Chris Skeer was worked by VK6KZ/P from Cape Leeuwin. This path was 2290 km long.

2304 MHz — 17 February 1978

On 2304 MHz it was again Wally Green VK6WG and Reg Galle VK5QR who made the first VK6/VK5 contact. This occurred at 0650 UTC on 17 February 1978. Signal strengths ranged between S1 and S7. Reg used SSB which was processed in a divide by 6 circuit and mixed to 28 MHz. The 28 MHz signal, with processed SSB, was then transverted to 384 MHz and then tripled and doubled to 2304 MHz. This multiplication by 6 restored the original SSB. Wally used a modified World War II SCR522 which, from a 7 MHz crystal, produced 128 MHz. This was then multiplied to 384 MHz with a BAY96, varactor tripled to 1152 MHz in a modified Microwave Modules MMV1296 and then doubled in a 2C39 which drew 90 mA at 600V. No other amateurs have had a VK6/VK5 QSO.

3456 MHz — Year to Come

Tests have been carried out on this band between Wally Green VK6WG and Reg Galle VK5QR since the 1979-80 summer period but as at 15 January 1985 no contacts had been achieved.

So there is the story of the VK6 interstate and overseas VHF/UHF contacts on AM, CW and SSB in the period 1951-1985 as researched by the author. So far as is known no contacts from VK6 have yet been made with amateurs in VK2, VK7 and VK8. *Will FM operators please write their story or inform the author to complete the picture?* Little comment has been made of the possible modes of propagation but this is another story to be told.

The higher frequency bands have yet to be exploited.

In summary, the first VK6/VK5 contacts were achieved as follows:

50/52 MHz band	*VK6HM/VK5GB*	*6 November 1948*
144	*VK6BO/VK5GL*	*30 December 1950*
432	*VK6WG/VK5ZDY*	*11 December 1972*
1296	*VK6WG/VK5QR*	*23 January 1977*
2304	*VK6WG/VK5QR*	*17 February 1978*
3300 MHz and up	*yet to be achieved*	

The first VK6/overseas contacts on 144 MHz have been

VK6/Japan	*VK6GU/JH4JPO*	*23 April 1982*
VK6/Indonesia	*VK6WV/YD9BC*	*2 October 1982*

WIRELESS INSTITUTE OF AUSTRALIA'S 75TH ANNIVERSARY NATIONAL FOX HUNTING CHAMPIONSHIP

The first Australian Fox Hunting Championships are to be held as part of the WIA's 75th Anniversary. They will be conducted at the Wagga Convention on the weekend of the 26th and 27th October 1985.

Entries are invited from interested teams who should fill out the entry form and send it to:
Australian Fox Hunt Championships,
Box 270,
Greensborough, Vic. 3088.
by the 16th September 1985.

Hunts will be held on the 3.5, 28, 144 and 432 MHz bands and there will be further advice and regulations sent to each participant.

If you wish to register at the Wagga Convention, send a normal convention registration directly to them as well as a Fox Hunt Championship one.

The trophy for this event is shown on the front cover of this months magazine. It will be held by the winning team for twelve months.

RULES

There shall be no more than four members in each team.

All equipment and team members will be in one vehicle.

Passing of information to or from teams is not permitted.

All road laws are to be observed.

The Fox will always be on public property and there will always be public access. This may not be easy to find, however. Hounds should not venture onto private property.

Each team will be issued with a single ID card which is to be handed to the fox controller when the transmitter has been located. A team may have any number of 'sniffers' but the handing over of the ID card is the only way of recording a result in the hunt.

The fox may be hidden anywhere and may not be in a vehicle.

When the fox is mobile it will obey all road laws.

The fox transmitter will not be turned off when a hound approaches unless as part of a predetermining sequence.

The fox may use any authorised mode of transmission, with due respect to appropriate band plans.

SCORING

The first team to find the fox scores zero points. Other teams score one point for each minute (or part thereof) elapsed since the first team.

After ten minutes, the fox will announce 'time up' and hounds should then assemble for the next hunt. The maximum score is ten points.

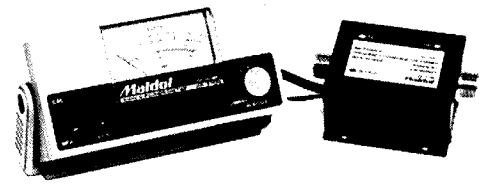
The winner of the championship will be the team with the lowest score.

In the event of a tie, a count-back will be conducted and the team with the most wins on individual hunts will be declared the winner. If a tie still exists, a two metre sniffer hunt will be held to decide the Championship.

SUPPORTED BY ICOM AUSTRALIA PTY LTD

Icom Australia have donated a special 75th Anniversary year prize of a handheld IC-2A to the winning team.
The Wireless Institute of Australia's 75th Anniversary Committee thanks Kioshi Fukushima of Icom.

SUPPORTED BY GFS ELECTRONIC IMPORTS



GFS Electronic Imports have donated a special 75th Anniversary year prize of a VHF/UHF SWR meter for the winning team.
The Wireless Institute of Australia's 75th Anniversary Committee thanks Greg Whiter of GFS for the donation.

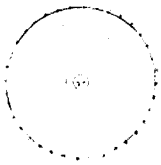
AN EXPERIMENT IN ANTENNA POLARISATION

Bob Slutzkin VK3SK
8 Lynedoch Avenue, East St Kilda, Vic. 3182.



Most operators on the twenty metre band will probably have observed, as I have, that virtually all the big signals from afar eminate from horizontally polarised beams. Even W1DBM's 4 x 4 array of verticals, which put in a big signal over here a few years ago was still surpassed by some of the horizontal beams.

The International broadcasters almost always use horizontally polarised panels. An exception was our Darwin Radio Australia station, which used vertical log periodics until Cyclone Tracy intervened and blew them down. The station has been restored again, but this time with horizontal panel arrays. Another instance of International broadcasters using vertical polarisation was in the 30s or 40s when the BBC had a large Franklin array for their broadcasts to India. An interesting paper (the reference for which I have now lost) described how the Franklin required maintenance, so the stand-by dipole was commissioned during the exercise. Reports came back from Delhi that signals were much better. This triggered off a series of controlled tests over a period of time; and these led to the cautious conclusion which went something like this:

> *Over the path in question, at the frequencies in use, and during the prevailing Ionospheric conditions, it might appear that the horizontal dipole gave a better performance than did the vertical Franklin array.*

All this might suggest to us amateurs that we might be able to do better with horizontal polarisation.

In spite of this, vertical antennas have many advocates. In CQ Magazine, Commander Paul H Lee W3JHR wrote convincingly in favour of verticals for DX, in November 1962. Then, as Captain Paul H Lee W3JM, wrote a magnificent twelve-part series, as good as a handbook, on vertical antennas, in the June 1968 through May 1969 editions of the same magazine. This, plus all the various texts on the subject in the literature should enable any radio amateur to design, erect and adjust an effective vertical antenna to suit his needs; so why is it that we hear so very, very few big signals from verticals in distant lands? Has the ground system anything to do with it, perhaps? An efficient ground system might be a little difficult, expensive or laborious for a lot of us on our suburban lots; but International broadcasters would not be put off by such minor difficulties, and they seem to prefer horizontal panels. Does Ionospheric propagation prefer horizontal polarisation perhaps? The widely accepted theory seems to be that, irrespective of the polarisation of a transmission, once it has encountered the ionosphere, it will continue to the distant point, to reappear with its polarisation randomly mixed; suggesting that the polarisation of a transmission would be of no importance. Perhaps this is an over simplification of a complex subject.

Realising that I will never find all the answers, I nevertheless set about to do some experiments. I used a quad, the polarisation of which I could change from the shack.

The polarisation of a quad element is dependent on the position of the feed point. If the element is fed at the top centre or bottom centre, its polarisation is horizontal. If it is fed at the centre of either side, its polarisation is vertical. My quad was of diamond configuration, and it had a very good bazooka type balun built into one of the support arms. The boom could be revolved like an axle, by a horizontally mounted Stolle rotator; and as the loops turned like wheels, the feed point would change from bottom, to side, to top, to the other side, the polarisation changing in the process. It was a tri-band quad, but I concentrated in optimising its performance at 14.250 MHz, with the idea of conducting the experiments very close to that frequency. This project started early in 1978, at a beach house at Blairgowrie, Victoria, which is on the Mornington Peninsula, about 30 km across Port Phillip Bay from Melbourne.

Harold Tribe VK3AVH provided some valuable help in the early adjustments of the quad. About 750 m from my QTH he had a 4 element Yagi 15 m high, and was good enough to keep many scheds with me across this rather doubtful antenna range. In the end, I could repeatedly measure a front-to-back ratio at the design frequency of better than 25 dB, and a cross polarisation rejection of better than 20 dB. By accident we discovered that Harold's dummy load leaked sufficiently for measurements to be made across our "range"; and fortunately that leakage radiation was vertically polarised, enabling us to do the cross polarisation tests two ways.

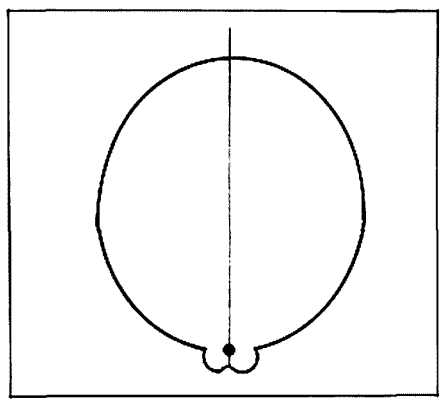


Figure 1 — Azimuth pattern of a quad antenna.

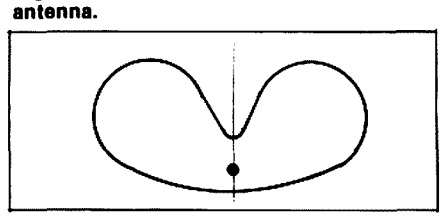

Figure 2 — Cross polarisation azimuth pattern of the quad.

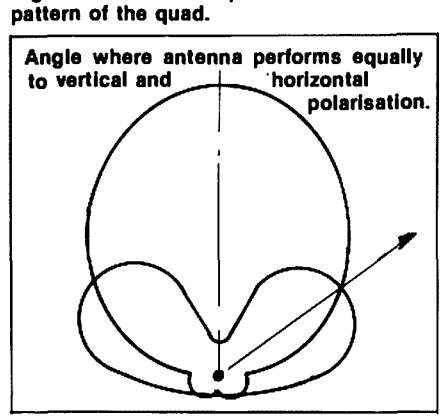

Figure 3 — Figures 1 and 2 superimposed.

During the front-to-back runs, I could see that the quad's azimuth response conformed generally with that shown in the text books (see Figure 1) but I considered that there would be no point in trying to plot it, because of the inadequacies of the "antenna range". The cross polarisation azimuth response was interesting. There were two forward lobes (as depicted in Figure 2), but again there was no attempt made to plot this. More about these later. The tests certainly gave me confidence in the performance of the quad as a beam, and in the effectiveness of the polarisation control. Not only was the front-to-back performance optimised for 14.250 MHz, but also the SWR was minimised for that frequency, at almost 1:1. There was no practical change in the SWR with changes in the quad's polarisation, which would suggest that the balun was effective, and that as the loops were revolved to change polarisation, the radiation efficiency of the quad itself would remain constant. (I believe that any change in radiation efficiency would be accompanied by a change in impedance and SWR). Satisfied that the quad was efficient, it was time to commence the main part of the project, namely to investigate the effects of polarisation on propagation. This part continued intermittently for about two years, at which time the Stolle started to malfunction (possibly because it was not designed to operate on its side). As a temporary measure, to allow the Stolle to be checked over, the quad was fixed for horizontal polarisation; but other projects have become more pressing now, and I cannot see myself continuing the polarisation tests.

During the two years, thousands of observations were made. No statistical analyses were carried out; but a fairly definite trend was apparent, as will be shown.

OBSERVATIONS

Over DX Paths:

The large majority of tests were made over the short and long paths to USA, next came the short paths in the Pacific area, and the long path to Europe. Listening tests showed that on no occasion was the quad better in its vertical polarisation condition; neither was mixed polarisation (half way between the two positions) any better, strengthwise. I did endeavour to test the possibility of mixed polarisation improving fading conditions but was unable to obtain any evidence of this. A minority of tests indicated that the polarisation change made no significant change in signal strength. The majority of tests showed horizontal polarisation to be superior, by at least one S unit and sometimes more than two S units.

On those occasions when I had a QSO with the DX station and obtained reports on my signals as I changed polarisation, these reports showed good agreement with my reciprocal observations.

Local Working:

As would be expected, matching the other party's polarisation was best for close contacts; but strange things happened across Port Phillip Bay to stations 50 or so km away. I had quite a number of QSOs with VK3ADR, VK3IY and the late VK3AHR, all of them using beams.

Most often, signals were better both ways when my quad was vertically polarised, but on some occasions conditions favoured the horizontal setting.

Tests with a Mobile Station:

When Jim Rumble VK6RU motored across to Melbourne from Perth, this gave me a wonderful

opportunity to test the antenna. We kept daily scheds all the way across; and did the polarisation test each time. From Perth (about 2700 km away) to Adelaide (about 600 km from me) signals were significantly better in each direction with the quad horizontally polarised. As Jim left Adelaide climbing the Lofty Range, this was still the case. During the sched on that morning, as he reached the top of Mount Lofty, there was a spectacular increase in his signal to S 9 + 20. At this stage I did the polarisation test, and to my surprise changing to vertical polarisation improved signals by at least 10 dB. I am still puzzled about the mode of propagation over that 550 km path on that day; because, once he reached lower ground we lost contact.

DISCUSSION

Except for local contacts, and over unusual paths, the quad performed better when horizontally polarised most of the time. Had it been at a different height (it was 15 m above the ground) with different foreground conditions, or had an entirely different part of the spectrum been used, the results may not have been the same. However, some comments could be made on the tests that were carried out:

1 We do not know with any certainty that the quad's radiation efficiency remained constant as the polarisation was changed; but it would be reasonable to assume that it did — particularly as I did measure the impedance and SWR as the loops were being revolved and observed virtually no change. Let us assume that the efficiency was constant.

2 We could therefore claim that horizontal polarisation was better for most DX paths — ie from the quad itself, across its foreground, through the ionosphere, to the distant station. Was it the foreground (where a horizontally polarised signal undergoes a phase change at the point of reflection, and the phase of a vertically polarised signal is not changed) which caused this effect? If so; a different location, different antenna height, different ground conductivity or terrain could produce different results. It is my guess that it was the foreground, because otherwise the theory that ionospheric waves are randomly polarised would be under suspicion.

3 An explanation is needed, therefore, for the inconsistency of the results. Why, on some occasions, was no significant change in signal strength observed with the polarisation change? And why was the observed change different on different occasions?

Figure 1 shows the general shape of the quad's polar pattern, ie its azimuth response to a horizontally polarised signal when set for horizontal polarisation. (This is only estimated, because it was not measured and could not be measurable accurately over our doubtful antenna range). Figure 2 shows the cross polarisation polar pattern (also not measured for the same reasons). Figure 3 shows these two patterns superimposed; and it can be seen that there is intersection between the two patterns. Because of the lack of detailed information of the individual curves, we do not know with any certainty where the intersections occur; but what this indicates is that at some angle to the side of the main lobe's centre, revolving the quad loops would make no difference to the polarisation performance; because at that angle the quad's polarisation would be half horizontal and half vertical. If you want to be fussy, the radiation pattern of an antenna cannot be expressed fully as in Figure 1 and 2, but these figures represent the supposed azimuth patterns at one particular vertical angle of radiation. The size and shapes of the lobes would be different at different vertical angles. Therefore that magical azimuth bearing where the antenna performs equally to vertical and horizontal polarisation might be expected to vary over a range of vertical angles of radiation.

As I was not always certain to have had the beam pointing over the optimum path (and many of us must have observed, particularly, over very long paths, that the best signals do not always come in on the great circle bearing) this could be an explanation of why some observations showed a parity between vertical and horizontal polarisation. Had I thought of this at the time I would certainly have checked that I was beaming optimumly before each test.

CONCLUSION

I cannot help but conclude that for the higher frequency bands, at the vast majority of amateur station locations, horizontally polarised antennas are better for DX. I said "higher frequency bands" because these are the bands where an antenna can be mounted high enough above the foreground in terms of wavelength. When a horizontally polarised antenna is strung up an eighth of a wavelength or less above the ground, the ground will act as a reflector and cause most of the signal to be radiated at very high angles. I think you need to have a horizontally polarised DX antenna at least a half wave above ground — the higher the better. Therefore, for the lower frequency bands a vertical might be expected to do better, particularly if a good ground system can be employed.

Before signing off, I must tell you about my friend W2GCX who has a 60 ft x 40 ft all aluminium (or aluminum) mobile home in Florida for winter use. It is a huge complex of similar mobile homes; and no antenna of any kind is permitted. There is no ban on flagpoles, so he has one (complete with traps) mounted at roof level. He flies Old Glory most of the time, but he sometimes flies the Aussie flag that I sent him (when conditions between us are poor). We are amazed at the excellent and consistent contacts we have had over the long path when he is down there, even when conditions aren't the best. His 60 x 40 aluminium ground system, good location, and undoubtedly the Aussie flag make it work well . . . but then, his signal is never as good as those from the boys with horizontal beams.

AFTERTHOUGHT

An interesting thought comes from Figure 3. For reception, a quad may have a disadvantage over a Yagi in locations where directional properties are required to help reject strong QRM from locals — a typical situation in most parts of USA. I do not think that a Yagi would have a cross polarisation response that the quad has, and most Yagis that I have encountered have a very deep null off the side and towards the rear. The null would be drastically reduced by the quad's cross polarisation response, in my opinion. **AR**

SOME COMMENTS ON ANTENNA GAIN

Graham Wiseman VK5EU,
19 Washington Street, Hilton, SA 5033

Whenever a potential user examines published literature and advertisements, describing antennas and evaluating antenna gain, what stands out is the wide variation in actual figures quoted, often on otherwise similar antenna types. Another factor is the use, or more often than not, the lack of use of terms such as gain with reference to an isotropic radiator or dBi, gain with reference to a dipole or dBd, pattern gain, and many others. Here we will briefly look at the difference between these figures and at some other important antenna characteristics.

There are numerous antennas and antenna models that are used as standards for comparison. Some of these are:

THE ISOTROPIC RADIATOR

An antenna model — not practically realisable. Used as a standard of comparison as it has the most basic pattern. Radiates equally well in all directions.

THE HERTZIAN DIPOLE, OR SHORT DIPOLE

Not accurate when used as a reference antenna due to lack of ability to discriminate against error causing reflections. A very short dipole, length much less than a quarter wavelength. Pattern similar to the familiar half wave dipole but flatter "doughnut".

Gain 1.76 dB above that of an isotropic radiator, ie 1.76 dBi.

THE HALF WAVE DIPOLE

Not accurate when used as a reference antenna due to lack of ability to discriminate against error causing reflections. Familiar "doughnut" pattern.

Gain 2.15 dBi or 0 dBd.

EIA STANDARD

Consists of two half wave dipoles fed in phase, mounted in a prescribed manner above a plane reflector.

Gain 9.85 dBi or 7.7 dBd.

ANTENNA GAIN VS SIZE

Assuming the same efficiency, all circular aperture antennas with the same gain will also have the same beam width and aperture or capture area.

From this we can see that in order to increase gain, we must increase aperture and decrease beam width, or alternatively improve efficiency.

A simple way of comparing antennas is to compare their apertures (where similar efficiencies can be assumed).

Rules for evaluating aperture (for comparison purposes).

Parabolic 'Dish' antennas	*aperture equal to surface area*
Corner Reflector antennas	*aperture equal to surface area*
Horn Antennas	*aperture equal to front surface area*
Yagi Antennas (optimum)	*aperture equal to an area included by a circle of diameter equal to the length of the boom of the antenna*
Helical Antennas	*as for Yagi antennas*
Log Periodic Antennas	*difficult to evaluate but is proportional to length of active area at the frequency of interest*
Collinear Antennas	*aperture equal to frontal surface area, plus a strip around the outside equal in width to the 'half aperture' of a dipole.*

COMPARISON BETWEEN MEASUREMENT METHODS

There are two commonly used methods used to evaluate antenna gain, one direct, the other indirect.

REAL OR DIRECT GAIN MEASUREMENT

With a fixed transmitting source, a comparison is made between the voltages measured at the terminals of a standard gain antenna, and that at the terminals of the unknown gain antenna.

PATTERN GAIN OR INDIRECT METHOD

The half power beam width of the antenna to be tested is measured and the formulae relating gain and beam width is used to determine a gain figure.

This method makes no allowance for aperture and coupling efficiencies of less than 100 percent. This consequently gives higher gain figures than direct measurement. It is however much easier to use than direct methods.

ANTENNA BANDWIDTH

Firstly let us oppose one commonly held belief. There is NOT necessarily any correlation between the frequency or range of frequencies at which an antenna exhibits good or best VSWR (voltage standing wave ratio), and that where good or best gain occurs.

One glaring example of this that the author found was a commercial '470 MHz' antenna which exhibited a VSWR of 1.1 : 1 at 465 MHz and almost no gain. Best gain occurred at 560 MHz where the VSWR was 2 : 1.

BANDWIDTHS OF DIFFERENT TYPES

NOTE — considerable variation occurs between different designs; the figures shown are representative only.

Collinear antennas — conventional types are limited to about 4 percent at best or about 17 MHz at 420 MHz.

Extended expanded collinear arrays are limited due to matching constraints, to between 1 and 2 percent or about 8.5 MHz at best at 420 MHz.

Yagi arrays vary considerably depending on driven element type, element size and whether optimum or non optimum. An optimum (maximum gain) conventional long Yagi will probably be well below 1 percent bandwidth, possibly 0.5 percent whereas a near optimum Log Periodic Yagi or Swan Yagi with large elements can achieve better than 10 percent bandwidth with ease.

Helical antennas properly designed can achieve bandwidths in excess of 50 percent.

Reflector type antennas, eg Parabolic and Corner Reflector. Bandwidth is determined principally by the driven or feed element or device. Feeds used include the above antennas, also triangular, biconical, horn and other types. Bandwidths achieved can be multioctave.

TIPS FOR EVALUATING PARASITIC ARRAYS (YAGIS ETC)

Several points worthy of note have been found by the author and others over a period of many years of experimentation.

The elements should not be mounted through the boom unless welded both sides — with time, corrosion between the boom and the element at the points of contact, causes variation in the electrical length of the element with a resultant change in characteristics and loss of gain. Elements isolated from the boom are to be preferred.

Wood booms are subject to similar effects to the above, although not so severe except in extreme contamination. Losses in the wood are also significant, particularly when wet or contaminated.

Element material is relatively unimportant when medium and large element sizes are used (also provided non ferro-magnetic materials are used). Tests made on a dipole antenna at 144 MHz using 3/8 inch (9.5 mm) diameter elements, of aluminium in one case and austenitic stainless steel in the other case, showed less than 0.2 dB difference the two in spite of a 5 : 1 difference in resistivity.

Antenna types with 'gain' driven elements, eg log periodic Yagis and quagis, appear to be less critical in design and construction than conventional types. A change in element length of 1/16 inch or 1.6 mm at 420 MHz reduced the gain of an optimum conventional 13 element Yagi by 8.5 dB. Similar changes made to log periodic Yagis have minimal effect.

FORMULAS RELATING GAIN, BEAMWIDTH AND APERTURE

Antenna gain dBi = 10 log K $\left(\frac{30000}{\Theta_H \Theta_V} \right)$

for small beamwidths

where

Θ_H = horizontal beamwidth 3 dB points in degrees

Θ_V = vertical beamwidth 3 dB points in degrees

K = coupling efficiency

Antenna gain dBi = $10 \log K' \left(\frac{\pi d}{\lambda} \right)^2$

for a circular aperture

where
d = diameter of aperture
λ = wavelength
K' = aperture efficiency

EFFECTIVE APERTURES OF SOME SMALL ANTENNAS

Isotropic radiator

$$\frac{\lambda^2}{4\pi}$$

Very short dipole

$$\frac{1{\cdot}5\lambda^2}{4\pi}$$

Half wave dipole

$$\frac{1{\cdot}64\lambda^2}{4\pi}$$

THE WOODPECKER PROJECT

Bill Martin VK2COP,
33 Somerville Road, Hornsby Heights, NSW. 2077.

Given up on the Woodpecker ? Read on ....

The war against the 'woodpecker' still wages, and, contrary to the beliefs of many amateurs and short-wave-listeners, the various intruder watches and monitoring societies are still gathering information for yet another thrust at this greatest-of-all sources of QRM to the short-wave radio listener.

For those who have just tuned in — The 'Woodpecker' is a colloquiallism for Over-the-Horizon-Radar, which is a defence early-warning system employing high power pulses. The signal is reminiscent of a woodpecker, hence the title. Technically, the signal is a 3 milli-second square-wave pulse with a stable pulse-rate of one tenth of a second. Rates of 17 and 7.4 seconds have been heard, but rarely. The signal is wide-band, with most of the signal concentrated in about 15 kHz, and a weaker 'pulse-scape' filling the adjacent spectrum. The energy concentrations can be clustered together to cover 100 kHz or more. The 'Woodpeckers' change frequency abruptly and often. Their 'dwell-time' varies from a few seconds to a few minutes.

At the 1978 WARC for Aeronautical Services, an anti-Woodpecker statement was signed by eight countries in attendance, and there is some evidence that the Woodpecker QRM in those bands diminished — at least for a while. Similar attempts at ridding the HF bands of the pest have met with little success, and diplomatic overtures have been found to have apparently been in the wrong key. Consequently, "The Woodpecker Project" is under way, and is co-ordinated by the Association of North American Radio Clubs OTH Radar Committee. A major exercise is planned for October 1985, utilising a large number (about 720) volunteer monitoring stations. Each station will be asked to monitor parts of the radio frequency spectrum between 5 and 23 MHz for three-hour periods during the month. If each monitor covers 3 MHz, and at least three geographically-separated monitors are scheduled for each time and band-segment, then at least 144 monitors are needed for a 24-hour coverage. A minimum five days of data is desired. Volunteer monitors will be asked to sweep the assigned band segment for three hours over the 3 MHz segment at will, BUT TO TUNE EVERY FREQUENCY AT LEAST ONCE EVERY 10 MINUTES. This information will be logged graphically. Of course, it is equally important to know when the Woodpecker is NOT transmitting.

The Woodpecker has been observed spending a great deal of time around 10.7 MHz lately. That happens to be the intermediate-stage frequency of a number of popular short-wave receivers. Some of the less expensive models have poor image rejection, so that when the Woodpecker stops at 10.7 MHz, it can be heard across the radio's entire tuning range. It is reported that England and Japan may get OTH radars. America has it, of course, as has the USSR and Australia.

SURFACE-WAVE OTH RADAR

An experimental variant OTH radar is being developed which operates only over the sea. If vertically-polarised radio waves are transmitted close to the sea surface, they induce electrical currents in the water which causes the radio waves to adhere to the sea surface and therefore travel around the curvature of the earth. There is also a good possibility that the reflected energy will couple with the sea surface for the return journey. The proposed frequencies of operation are unknown, but this development could be yet another potential interference threat to communication services.

So you see, the battle is not over. The Association of North American Radio Clubs (ANARC) is to be congratulated on its efforts to do something about the Woodpecker, and concerned amateurs and SWLs will no doubt be interested in the outcome. When next you hear the Woodpecker (and you will), send in a report to the WIA Intruder Watch. Write to your Divisional Intruder Watch Co-ordinator, or to Bill Martin VK2COP, WIA Federal Intruder Watch Co-ordinator, 33 Somerville Road, Hornsby Heights, NSW. 2077.

AR

HOW LONG IS A DOT?

Guy Fletcher, VK2BBF
3/34 Benelong Road, Cremorne, N.S.W. 2090

The last year or two has seen a proliferation of calculator-based and computer-based methods of generating random Morse code characters for practice purposes. In order to produce Morse at a known speed, you need to know the duration of a single dot at that code speed. Surprisingly no two programmes seem to agree about the length of one dot.

Morse code is designed for people rather than for machines. An efficient machine code, such as Baudot, has every character the same length, whereas in Morse code the common letters like E, I and A are shorter than less common letters such as Q and Z. This feature appreciably shortens the time to send a plain-language message of a given number of words and dot duration.

It is commonly agreed that a "standard word" has five letters. A dash is exactly equivalent to three dots. In the case of ITU Morse code, the spacings are one dot between dots and dashes, three dots between characters (letters), and seven dots between words.

It ought to be easy to work out the number of "effective dots" or dot durations in a standard word, but it isn't quite as easy as you might think.

The Length of a Letter

The number of effective dots in a given letter is easily added up. The letter A has one dot, one dash (of length three dots), and one space (of length one dot) between them, making a total length of five dots. Similarly B has a total length of nine dots (three for the dash, one for each of three dots, and one for each of three spaces) and so on through the alphabet.

We need to know the average length of a letter in dots, but it is not correct simply to average all twenty six letters of the alphabet.

The Frequencies of Letters

You can build a device to send random Morse code at exactly ten "words" per minute, in the sense that it will generate exactly ten groups of five letters each minute, with all letters equally probable. This is a great way to learn Morse code, but the characters are NOT really being sent at ten words per minute.

If you take any sentence of ten real words, chosen so that it has exactly fifty letters in it, and then send it with exactly the same length dots and dashes as for the random code above, it will take, on average, about 49 seconds. This is because the sentence contains relatively more of the shorter letters like E, I and A. Obviously the sentence is being sent "too fast". If the speed of Morse code in words per minute is to have any real meaning at all, then in amateur circles at least it HAS to refer to words of plain English language.

The frequency of use of each letter of the alphabet in plain language text can be found by literally counting the number of times each letter appears in a long piece of text. Computers are good at doing this, but it is very laborious manually. The answer depends slightly on the kind of text chosen. It is a little different for, say, a novel than for a technical article. But these differences are slight. Table I shows the average number of times each letter is likely to appear per thousand total letters. These figures are taken from some research a few years ago (1) but are not likely to be greatly in error.

TABLE I
Average occurrence of letters in plain English language

Letter	Times in 1000 letters	Length in dots
A	86	5
B	14	9
C	28	11
D	38	7
E	131	1
F	29	9
G	20	9
H	53	7
I	63	3
J	1.3	13
K	4.2	9
L	34	9
M	25	7
N	71	5
O	80	11
P	20	11
Q	1.2	13
R	68	7
S	61	5
T	105	3
U	25	7
V	9.2	9
W	15	9
X	1.7	11
Y	20	13
Z	0.8	11

Length of an Average Letter

The data in Table I can be used to find the total duration (in dot lengths) of a message containing 1000 letters, broken up into 200 words of average length of five letters each. This average message will contain 86 As each of length five dots, 14 Bs each of length nine dots, and so on. In addition there will be 200 spaces after words, each seven dots, and 800 spaces after letters not at the end of words, each three dots. The grand total is 9818 dot lengths.

The length of an average letter can be found by taking the total for the 1000 letters alone (without the spaces between letters and words). This is 6018 dot lengths, an average of 6.018 dots per letter, and is an average of the lengths of all the letters, weighted by the frequency of each letter. This should be compared with the straight average of 8.231 dots when all letters are weighted equally.

It is worth noting that the letter frequencies used refer to plain English language text. Other languages such as French or German will be somewhat different, and the corresponding length of one dot for a particular "words per minute" will also differ slightly.

The Length of a Dot

We are now ready to write down the correct length D1 of one dot for a given word speed of L words per minute. Our 200 words should take 200/L minutes or 12000/L seconds. Since the whole message contains 9818 dot lengths, each dot should take 12000/(9818 L) seconds, so

$$D1 = 1222/L \text{ milliseconds.} \quad (1)$$

This may be compared with 997/L milliseconds if the letters had been equally weighted.

If the figure of 1222/L milliseconds for one dot is used in a computer programme, the speed will be exactly equivalent to a plain language speed of L words per minute. However it must be emphasised that L groups of random letters will actually take 73.5 seconds, and this does not mean that the speed is wrong.

Non-ITU Morse

It is quite common to speed up the dots and dashes to a length somewhat shorter than the correct ITU length discussed above, and to leave correspondingly longer gaps between letters and words. This practice makes the code slightly easier to receive (because of the longer thinking time between characters), and is an important aid in learning Morse code. The individual letters can be sent from the beginning at 8 WPM (as in the novice examination) so as to become used to the correct letter speed, yet the overall word speed may only be 5 WPM or less.

A Morse code programme on a computer should therefore provide for independent setting of the letter speed and word speed. The letter speed L, expressed in words per minute, is equivalent to the words per minute of ITU code of that dot length. The length of each dot is given by equation (1) above.

The word speed W is the actual number of 5-letter plain-language words sent in a minute. Since the spaces between letters

and words are lengthened, clearly W must be less than L.

It is actually more convenient, in a computer programme, to leave the first dot after each letter unstretched (at D1), and to stretch (to D2) only the remaining two dots between letters and six dots between words. This has the effect of slightly changing the ratio of word space to letter space from the ideal 7/3, but the Morse is not ITU code anyway. The practical advantage gained is that it is not necessary to identify the final dot or dash of a letter in order to decide whether to stretch the following space; EVERY dot and dash is followed by a single unstretched space.

Our average message of 200 words now contains

(i) 1000 letters of total duration 6018 dots, each D1,

(ii) 800 spaces after letters, each (D1 + 2*D2),

(iii) 200 spaces after words, each (D1 + 6*D2).

This adds up to a total duration of (7018*D1 + 2800*D2), which must be equated with 200/W minutes, or 12000/W seconds. D1 is already given by equation (1) above, and substitution of this leads to

$$D2 = \frac{4286}{W} - \frac{3064}{L} \text{ milliseconds.} \quad (2)$$

You can see that if W = L (for ITU Morse), equation (1) is recovered.

The pages of AR (and other magazines) have been well decorated with listings of computer programmes in recent months. The detailed code for generating dots and spaces depends on the machine used, so I will refrain from giving my own programme, which uses the formulae derived above. However I will list its features, since any versatile programme for teaching and learning Morse code should have these:

Division of the characters into 6 sub-sets A-G, H-M, N-T, U-Z, the 10 figures, and 4 punctuation marks (full stop, comma, oblique slash and question mark). While punctuation is not examined, these 4 are needed on air.

Character set for practice to be selectable from any combination (or all) of these 6 sub-sets, or from a string entered on the keyboard. This enables concentrated practice on any desired characters.

Choice of group (ie word) length, with option for random length (in the range 3 to 7 characters).

Independent choice of letter speed and word speed (both expressed in words per minute) using equations (1) and (2).

Choice of number of groups in a "block" (ie message).

Use of standard START and STOP signals round each block of groups.

Output of ASC11 characters for subsequent checking if desired.

Simple options for changing speed and number of groups without completely restarting the programme.

An automatic option in which the programme repeats after a pause of, say, 10 seconds. This is useful for generating cassette tapes.

The actual dots and spaces are normally generated from programme loops. The cycle times of these loops depend on the machine used, and the expressions for D1 and D2 above must therefore be multiplied by conversion factors. The easiest way to set these conversion factors accurately is to choose a speed of 0.1 WPM and time the dots and spaces with a stop watch.

To achieve accurate Morse code it is necessary to write very compact programme code in the section which actually generates the audible characters. All possible repetitive calculations should be performed in advance of this. Using only interpretive (non-compiled) BASIC without machine code subroutines, I have been able to generate Morse code on a pocket computer up to 25 WPM before the spacings depart perceptibly from the ideal. Higher speeds are easily achieved using a machine code subroutine for the spaces.

REFERENCE

(1) "On Human Communication" by Colin Cherry. MIT 1965.

Postscript

The word PARIS has sometimes been used to define a typical word for the purpose of calculating Morse speeds. Including four spaces between letters and one space between words, PARIS has a total length of fifty dots.

This corresponds to a dot length D1 = 1200/L milliseconds. Comparison with equation (1) shows only a 2 percent difference from the "correct" value of 1222/L milliseconds.

AR

THUMBNAIL SKETCHES

LYLE PATISON VK2ALU

When only 13 years old and living in Lane Cove, Lyle was introduced to radio by a family friend, Merv Norris, at Greenwich. Merv's home-made TRT fascinated young Patison to such an extent that Merv gave the lad some bits and pieces to keep him occupied. This led to the beginning of Lyle's lifetime hobby with radio. Starting with a crystal set (he still has some of the parts) he graduated through a TRF receiver to a seven valve superhet, on which he heard the declaration of WWII.

After gaining his intermediate certificate at 15, Lyle left school and joined RCS whilst awaiting an electrical apprenticeship with the Sydney City Council. Starting on the production line at RCS, his avid interest in radio soon had him promoted to their laboratory.

An opportunity for a position as an apprentice electrical operator in the Railway Power Stations arose and Lyle found himself on shift at White Bay Power Station in April 1940.

The publishing of Radio and Hobbies in 1939 led Lyle's interest into amateur radio. In between his trades technical courses and shift work, Lyle found time for self-education in radio theory, regulations and Morse and he obtained his AOCP in March 1942 with 12 WPM, however WWII kept him off the air.

Lyle joined the Air Force Reserve in 1942 and started rigorous training in Morse under the watchful tuition of Mrs McKenzie. He graduated to 20 WPM.

In March 1943 he joined the RAAF and departed to the UK via Canada to join an Illawarra Lancaster squadron as a navigator.

It was during this time that radar techniques attracted Lyle's attention — microwave, dishes, wave guides, klystrons, etc.

Lyle returned to civilian life in 1946.

Back to shift work at White Bay and doing an electrical diploma part-time, Lyle somehow found time for amateur radio and was first on air on 166 MHz on 29th June 1946 using CW.

In those days, Prices Radio in Angel Place, Sydney was the Mecca for amateurs and that's where all the 'fancy disposals gear' was appearing. Soon Lyle had some of this gear cranked up on 576 MHz and was building, what was possibly the first crystal controlled rig in Sydney on 144 MHz.

Promotion within his work took Lyle to country power stations in Cowra and Tamworth, with a short stint at Port Kernbla, but he still managed to find time to work on the VHF bands — his major interest.

On his return to Wollongong in 1962 he became a foundation member of the reformed Illawarra ARS. Lyle spent a year as president in 1967/68 and still is actively involved in the club.

The CSIRO had its initial 'large' radio telescope at Dapto but with the advent of time this was closed down and was lying idle. Lyle looked

longingly at the dish but the CSIRO donated it to the Wollongong University. Fortunately, the University knew nothing about radio telescopes but were keen to get it working. Lyle convinced them that the Illawarra club would be an ideal organisation to rejuvenate the dish and the first confirmed EME contact by VK2AMW was made on 10th March 1973, after many months of overhauling the dish and home-brewing gear for 432 MHz.

Vandalism forced the closure of activities for a time but Lyle found a new location and re-established the gear. He also made some new equipment suitable for operation on 1296 MHz.

As a result of his untiring and persistent work, with EME, the club station VK2AMW is well known internationally. Lyle received the Ron Wilkinson Award for his moonbounce activity this year and was also awarded life membership to the Illawarra Club for twenty three years of unstinting duty.

As Lyle retired from the workforce in 1984 he now has ample time to pursue his hobby???

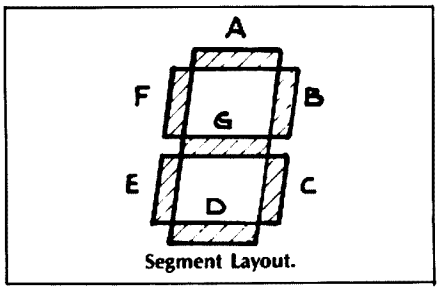
ADD ON MODIFICATIONS FOR THE SIEMENS TELEPRINTER

Peter Fraser VK3ZPF
52 Heathfield Rise, Box Hill North, Vic. 3129

A SHIFT INDICATOR

This is the first in a series of projects you can add to the Siemens Model 100 Mark 1 teleprinter. It will include a counter that shows how far from the left hand margin you are, a figures or letters shift indicator, and a power supply (built into your machine) to run the add ons. To construct these you will need a soldering iron, solder, pieces of matrix board and lots of patience. Now what RTTY'er hasn't got that?

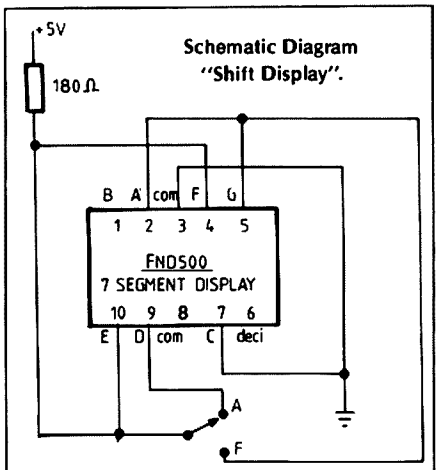
The indicator uses a 7 segment display to show either an 'L' for letters or an 'F' for figures depending upon the shift you are in. The display used by the author was a FND 500, a "common cathode" device. Any "common cathode" display could be used, but I found the FND 500 was large and the easiest to read.



Segment Layout.

CONSTRUCTION

The display is mounted on a piece of matrix board, fastened to a strip of aluminium which can be screwed to the right-hand side of the platen. It should be mounted so you can see it easily through the glass when the cover is down. The 180 ohm resistor is best mounted on the power supply board (to be described later in this series).



1 — Segment 'B'
2 — Segment 'A'
3 — Common
4 — Segment 'F'
5 — Segment 'G'
6 — Decimal Point
7 — Segment 'C'
8 — Common
9 — Segment 'D'
10 — Segment 'E'

HOW IT WORKS

Segments 'E' and 'F' are wired 'on' at all times and through SW-1 segments 'D' is lit to represent an 'L' when in letter shift. In figure shift segments 'A' and 'G' are lit to show an 'F'. The +5V is taken from the power supply. SW-1 is a micro-switch mounted in such a way that, when the carriage goes up and down, the switch also goes on and off. The switch can be mounted on a right angle bracket fashioned from tinplate or aluminium, then screwed, using the existing screws, to the rear frame of the machine. A suitable place for the switch is in the middle of the back frame above the motor. Here, if you look, you will see a lever that pokes in and out as the carriage goes up and down. The switch needs to be bent so that it follows the travel of this lever and switches as the different shifts are selected.

So that's the 'shift indicator' which, when fitted, is very handy if you are distracted halfway through something and don't know if you are up or down.

Next in this series is a power supply to run the indicator and a counter to be described later.

MORE HISTORY

The Institute wishes to thank Clem Scott VK4DW for his generous donation of an article from TECHNICS magazine.

Following is Clem's covering letter.

This Historical Article is from an old TECHNICS magazine published in 1905 which I have had in my possession for some forty years.

On reading the Paper we find that Prof. Fleming first demonstrated and described the vacuum valve later called a diode in an article to the Royal Society in 1889.

The author then goes on telling of the consequences of the fact that incandescent carbon and metals send out vast numbers of electrons. Then with circuits relevant to the occasion explains in a very clear manner the results of same.

If you don't already have this article then I hope it can be of some enjoyment to those who go to your library for a quiet read of some of the history of those experimenters who paved the way for us fellows who are now enjoying amateur radio.

Thank you for a first class magazine in AR.

Vy 73,

Yours sincerely,

Clem Scott VK4DW,
18 Cullen Street,
Bundamba, Qld, 4304.

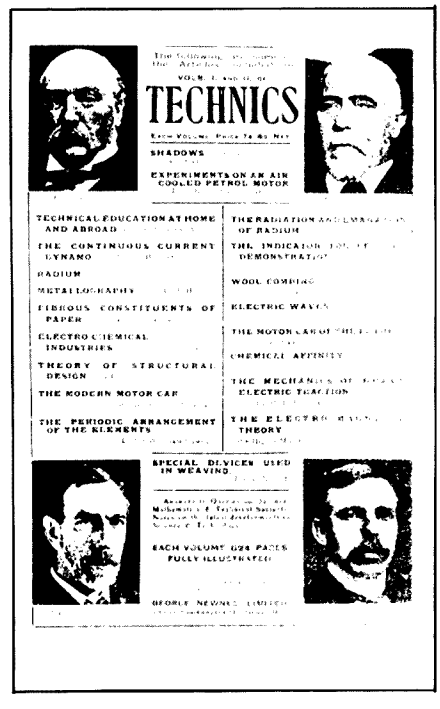
TECHNICS
A MAGAZINE TO AID TECHNICAL PROGRESS.

CONTENTS FOR APRIL, 1905.



THE TCA 1675/1677, A CHEAP LINEAR AMP

Lloyd Butler VK5BR
18 Ottawa Avenue, Panorama, SA 5041.

If you have a spare 1675 or 1677 in the shack, the final stage of the transmitter can easily be utilised as a linear amplifier to boost the power of your low power 2 metre or 6 metre equipment. There are quite a few units about for sale, at low prices, if you wish to acquire one for the job.

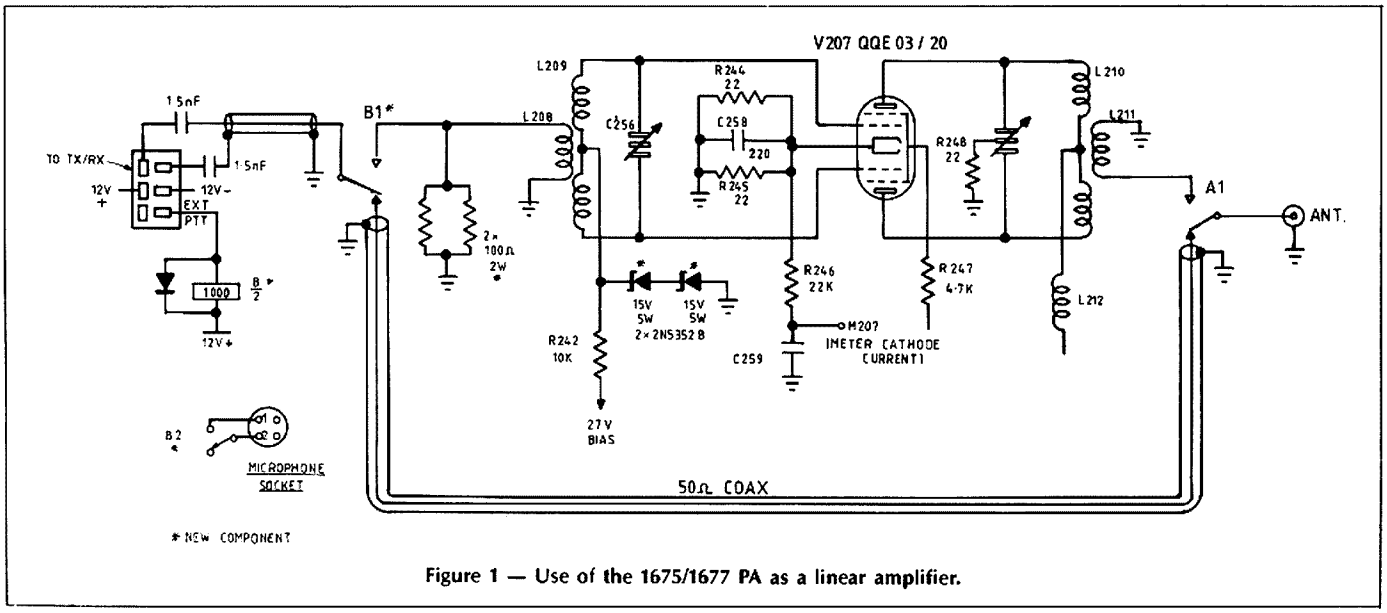


Figure 1 — Use of the 1675/1677 PA as a linear amplifier.

To operate an RF power amplifier valve in a linear mode, the following must be satisfied:

Grid bias must be set, approaching plate current cut-off, so that the stage is operated in class AB2 or class B.

The grid bias supply voltage must be stabilised so that it does not rise when the signal voltage swings positive and causes grid current to flow. Loading of the RF drive source with a low resistance is required to stabilise the grid load and prevent grid current flow from flattening the signal peaks.

In the case of the 1675/1677, the transistor power supply provides high tension of about 250V and 550V and a bias supply of around 26 to 28V. The bias voltage works out nicely to operate the QQE 03/20 amplifier in class AB_2 and this bias is stabilised by series connecting two 15V, 3 watt zener diodes at the grid feed point, centre tap of L209.

Two parallel connected 100 ohm 2 watt composition resistors are connected across the primary of the grid coil L208. This correctly terminates the 50 ohm coax link from the transmitter driving source and loads the grid circuit to prevent clipping during positive signal peaks due to grid current flow.

The modified final amplifier stage is shown in figure 1. The existing relay A provides transmit/receive switching for the amplifier RF output but an additional 12V relay B must be added to also switch the amplifier input. Coil L208 is disconnected from the previous stage and connected to contacts B1 to provide input switching. Normal contacts of A1 and B1 link the antenna circuit for receiving. A further set of contacts, B2, connect to the 1675/77 PTT circuit at the microphone socket to turn on the power supply when switched to transmit.

The frequency multiplier stage valves, 12AT7 and QQE02/5, are withdrawn from their sockets. The 12V supply to the transistor stages in the remainder of the transceiver can be disconnected, if desired, but it doesn't really matter as they consume little current.

If the 1675/1677 has not been previously modified for amateur band use, some changes might have to be made to the tuning range of L209-C256 and L210-C261. If a harmonic filter (L217, L218, C278-280) is fitted, this should be disconnected, (Modifications to the tuned circuits are well described in Amateur Radio, July 1975).

The circuit has worked well on 6 metres using an IC502 as the driving source. With one watt of peak envelope driving power, the amplifier delivers about 20 to 30 watts PEP to the antenna. Equal performance is anticipated on 2 metres.

ETCHING CIRCUIT BOARDS

Bevan Hay VK4ABV,
MS 346, Nanango, Qld. 4315.

Reading Roy Hartkopf's article about circuit board etching I thought it worth mentioning an alternative type of etchant for circuit boards. It seems most people use Ferric Chloride, as have I. This solution suffers from one drawback, namely, you can't see what's going on. There is a solution, if you'll pardon the pun. Use a solution of Hydrogen Peroxide and Hydrochloric Acid, about equal parts of equal concentration.

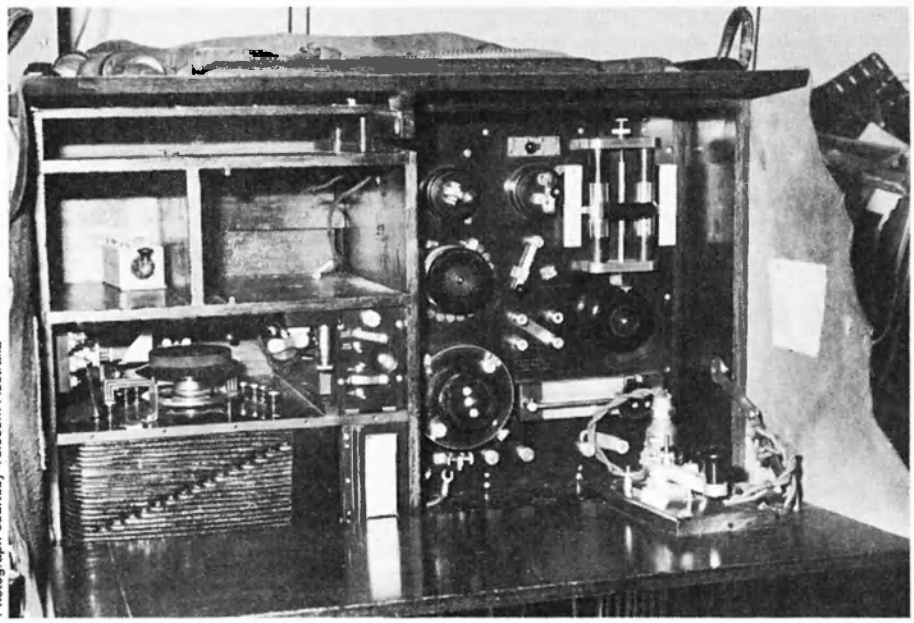
The chemistry is quite simple, the Hydrogen Peroxide reacts with the copper producing Copper Oxide, which is then dissolved by the Hydrochloric Acid producing a pale green solution of Copper Chloride, through which the progress of the etching can easily be seen. I usually do it with a fairly concentrated acid and peroxide for fast results, though this is not necessary and good results can be obtained from dilute solutions.

If you use concentrated Hydrochloric Acid I strongly recommend that the job be done out-of-doors as the fumes from concentrated Hydrochloric Acid are dangerous.

AR

A LITTLE ABOUT WIRELESS IN THE FIRST WORLD WAR

The particular spark transmitter and receiver, photographed and described on this page, was one of six built by Marconi of London in 1915 and sent to Australia for use in the first world war. This unit was used in 1916 by signallers at the Mitcham Army Camp in South Australia before being sent to Melbourne to be packed for despatch overseas.



Photograph courtesy Telecom Australia

The transmitter and receiver ready for operation.

The 'portable wireless sets' were considered marvels of their time, for their compactness and lightness. They weighed about 330 lb (150kg) each. A unit could be set up ready for operation within ten minutes by five or six men and once set up required two men to operate it. It had a guaranteed daylight range of 35 miles (56km) but in daylight it could work two to three times that distance and at night up to 200 or 300 miles (322-483km).

The transmitter was a 0.5kW rotary spark set driven by a Douglas air-cooled petrol engine with a solid flywheel. It was the same engine Douglas used in their motor bikes at that time. It ran at 1800 rpm.

The receiver employed a carborundum crystal detector with bias provided by a couple of dry cells through a potentiometer and was designed to operate from 300-1300 metres by the operation of a band change switch. It was fitted with two galena crystal detectors.

The transmitter unit was located in the bottom section of the equipment case and contained an iron core transformer connected to the alternator by a flexible cable, tubular Leyland jar type condensers. RF chokes and the HF closed circuit. The receiver, operating controls and key were contained in the top section. To quieten the spark in operation, a metal cover was fitted over the rotary gap section.

In December 1915, urgent cables were received in Australia and New Zealand from India, asking for the loan of men to help out the scanty communications of India's Expeditionary Force "D" which was operating in Mesopotamia.

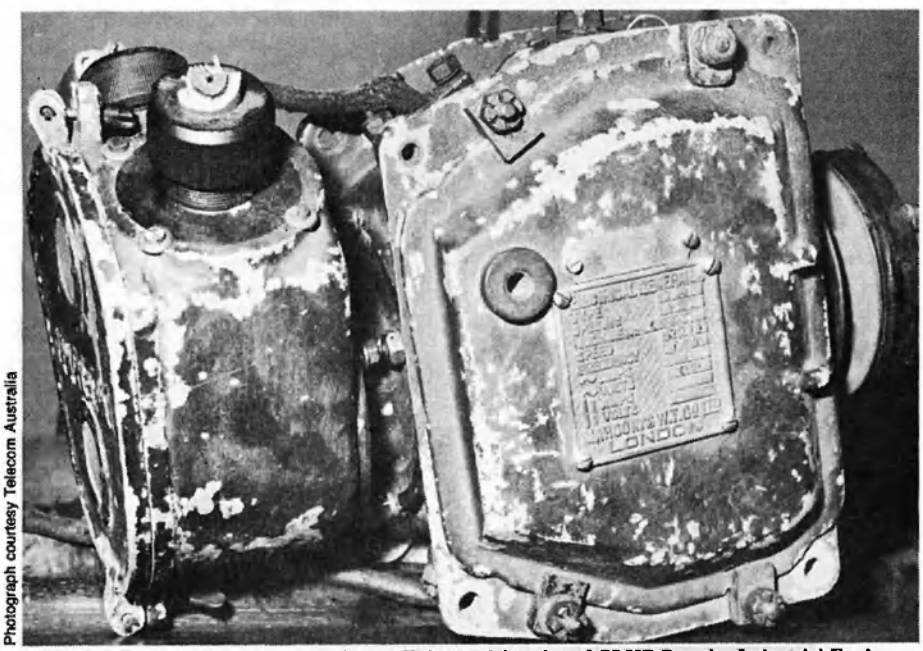
Both countries responded and offered to supply and maintain complete wireless units in the field.

So the 1st Pack Wireless Signal Troop was formed with one officer and 54 other ranks from NSW and Victoria. This Troop arrived in Mesopotamia on 19th March 1916 and on 18th April a New Zealand troop arrived. Both troops were camped at Makina a short distance from Basra. Each troop supplied four pack wireless stations.

On 25th April, the first Australian station went up river and attached itself to the 15th Division at Khamisayah, on the Euphrates.

In March 1916, the Imperial Authorities asked the Commonwealth to increase the wireless establishment at Mesopotamia, which resulted in the 1st Australian Wireless Signal Squadron being formed. It arrived in Mesopotamia on 6th July 1916. The Australian and NZ troops already there were absorbed into this Squadron and they soon became known as "The Anzac Wireless".

As the army moved up the Tigris and the Euphrates, so too did the wireless. The Cavalry



Photograph courtesy Telecom Australia

The AC Generator used to power the set. This was driven by a 2.75 HP Douglas Industrial Engine.

Division had three pack sets and maintained continuous contact with headquarters whilst the cavalry was on the move. This meant that one station at a time halted, erected its two masts, cleared its traffic, dismantled, packed up and galloped with the cavalry rear-guard, who had waited for it, to catch up with the main body of the Division.

So as the army advanced into Baghdad and beyond into Persia, so too did the wireless stations. All messages were in five letter cypher, no plain English and the letter 'V' was used for 'from', not 'DE' as is used today.

As well as the unit described above another unit, a 1.5kW Wagon set was used. This receiver was similar to the one above but the transmitter had a 7 HP water cooled engine, also made by Douglas. The alternator and components were larger, also.

Throughout the service of the wireless operators in Mesopotamia and Persia thousands of messages were transmitted and received, which were of vital importance to the Army operations, without delay or error.

A large portion of the operators were ex Post Office or Railway Telegraph operators but quite a few were "Wireless Hams" or in todays language radio amateurs.

YAESU FT-480R TWO METRE TRANSCEIVER — A simple modification

I was discussing the various pros and cons of the FT-480R on air recently and mentioned my disappointment at the lack of a 'reverse' switch. This switch provides the ability to listen to the repeater input frequency as an alternative to the output. Jack VK6BU mentioned that on all FT-480R units that he was aware of, the careful and SLOW movement of the satellite switch achieves this.

After a lot of jiggling of the switch, I found that my rig was an exception to this rule. So, out came the circuit diagrams and a short time later I was able to make a reasonable guess as to what was happening.

The following diagrams show the modifications that have been made.

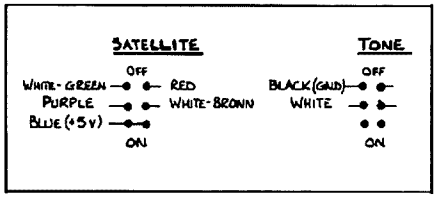

Figure 1: The Original.

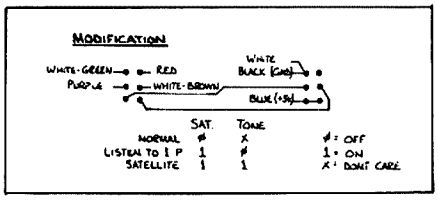

Figure 2: Modification. With this modification transmission is disabled while listening.

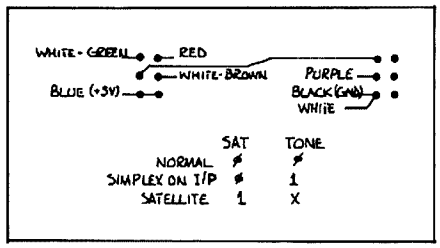

Figure 3: Alternative. (Possibly a better one). With this modification transmission is enabled in simplex on the I/P frequency when the TONE switch is in the ON position.

Underneath the rig is a small panel supporting three switches, labelled Satellite, Scan and Tone. All mods are made directly on two of these switches. The only disadvantage (possibly) is that the tone burst on/off function is lost. In the diagrams it is shown permanently wired to the OFF position. To make it permanently ON just disconnect and tape-up the white lead to the tone switch.

Note: All diagrams are viewed from the solder lug side.

AR

LOW COST SIGNALLING SYSTEM FOR LITTLE USED RAILWAYS

An electronic token signalling system to be installed on British Rail's East Suffolk line between Ipswich and Lowestoft in eastern England could also be ideal for lightly used railway lines throughout the world.

For railways with only a few trains in each direction per day, replacement of old or obsolete signalling may be out of the question, but an electronic token system could be installed to keep these lines open and improve their operating efficiency.

The system is operated from one signal box which is in contact by radio with each train under its area of control. The line is divided into sections with "Stop and exchange token" boards to mark the end of each section. Before a train is authorised to proceed into a particular section it must have received the electronic token for that stretch of line.

Such tokens can only be transferred following a co-operative procedure between signalmen and driver. Each train is fitted with a cab unit which has a unique identity number. The electronic tokens are transmitted by radio in the form of coded data messages and on receipt are displayed by suitable messages on the visual display unit in the train drivers cab.

A computer-controlled solid-state interlocking (SSI) ensures that only one electronic token can be issued to each unique train unit. Before an electronic token is issued the SSI also ensure that the particular token has not already been issued to another train and also that no token for a conflicting movement has been issued to any train.

With passenger safety always of paramount importance, the computer installation is triplicated to guard against malfunctions. At least two out of the three computers must output identical information before an electronic token can be issued.

The equipment to be supplied to British Rail by GEC-General Signal Limited comprises the main signal box equipment (including the SSI cubicle) plus 24 train cab units. It is also planned to equip Chief Civil Engineers' vehicles with electronic token equipment for authorisation of track maintenance possessions.

75th Nostalgia

The following article is from the VK2 Divisional Archives and is contributed by Tim Mills VK2ZTM. Written by the then President of VK2, Charles Maclurcan A2CM, it looks towards the future for wireless and the WIA from the 1920s era, possibly written around 1923. Much of the article still applies today, particularly the reference to amateurs "uniting in the Wireless Institute." It is also interesting to note the Patron at this time.

The Wireless Institute of Australia

(NSW DIVISION)
Charles D Maclurcan (President)

Wireless development needs as its strongest factor every encouragement given to experimenting and in this repect the Australian system covering broadcasting is practically the most liberal in the world, in as much as it gives a free hand to broadcasters, provided of course, they do not encroach upon the regulations under which broadcasting is carried out.

It, however behoves all Australian experimenters to work together, not only in experimental work and so improve the utilisation of wireless, but also in order to see that every encouragement is given to the public to partake of the advantages of wireless as offered them by legitimate broadcasting concerns; hence experimenters, by having such a great trust placed in them by the Government authorities, will return the compliment by doing all in their power to see that the arrangements are given best test.

With the remarkable development of wireless in the last decade we can look for still further developments in the near future, hence the broadcasters must ever be on the alert to peer into future developments and so put on record the advantages won in their experimental work.

There are many problems that they must face, for instance the overcoming of the weakening of wave power by statics, and also solving the problem regarding the one way inefficiency of messages between two certain points, particularly where equatorial districts have to be covered.

By being classed as an experimenter in wireless no mean privilege is given to such, because such are really on the verge of a future which practically lifts humanity into the etherial and is really man's first touch with the infinite given in practice instead of theory.

We, as experimenters in this great science, feel we are specially privileged and we trust that while we enjoy same it shall have something placed on record to merit the honor that has been given us.

The direction of the future developments of wireless will cover such problems as the direction of aerial traffic, the transmission of natural colored photography, and practically the solving of that glorious forecast, the speaking with one voice that can reverberate round the earth.

Experimenters, therefore, have a great responsibility and they can best protect that responsibility by uniting in the Wireless Institute.

It has been said that "There's many a slip 'twist the cup and the lip." How truly applicable is that old quotation to the many vicissitudes which have beset the Institute during the fourteen years of its existence.

Inaugurated in 1910, March of that year to be exact, the then Wireless Institute of New South Wales was the first Technical Radio Association to be formed within the British Empire, and the ambitions of the enthusiastic though small band of original experimenters in this wonderful science have been more than realised by the position of the Institute to-day in the very front rank of Scientific Societies.

If only that small band of originals had been able to lift the veil of the future when they took the initial step of forming this Society, they would have been amazed by the intricate tangles in store for their successors in the years to follow. In this regard it is most gratifying that a round dozen of them are still actively associated with what has now become the New South Wales Division of the Wireless Institute of Australia.

Courage, determination and sincerity are the three outstanding qualifications of the Institute to-day as in the past, and recent events have proved that the faith of the Institute's founders in the righteousness of their cause, has been retained as one of the most precious possessions throughout the Institute's existence.

The principal objects underlying the formation and administration of the Institute may be briefly summed up as follows:—

(a) For the Association interested in the encouragement and scientific development of radio communication in all its branches.

(b) To provide a centre of information, instruction and advice on all matters pertaining to radio communication.

(c) To consider, originate and promote reform and improvements in the law; to consider proposed alterations and oppose or support same; to effect improvement in the administration of the law, and for the said purposes to petition Parliament or take such other proceedings as may be deemed expedient.

In regard to (a) and (b) the results so far achieved speak for themselves. In regard to (c) the Institute has always played its part fairly and has been responsible in very great measure for the development that has taken place in Australia.

Earlier in this year the Institute conducted a series of tests receiving signals transmitted from experimenters in the United States, the power used at the transmitting end being only 100 watts. The great success obtained prompted the Institute to go further, and a series of tests has just been concluded wherein American experimenters again transmitted to Australians, and the local experimenters transmitted back on the same low power, 100 watts. Although the results of this latter test are not yet definite from the point of view of Americans receiving the Australians, still it is gratifying to know that 88 stations in the States have been logged in Sydney and Melbourne.

When broadcasting was first seriously, considered in Australia, the Institute took a prominent part in the compilation of the regulations to suit local conditions, and it is felt that the best possible steps have been taken in Australia to place this wonderful feature of radio on a comprehensive basis to suit local conditions and avoid the many complications which have occurred in other countries.

The severe test came when war broke out in 1914. The shortage of wireless operators for military and transport purposes was acute, and it is a matter of history that seventy-five percent of the then Institute members were immediately absorbed on emergency active service. There were but few of the Institute's members who, on account of age, were not absorbed in war service, and the value of such men in time of national crisis was and ever will be invaluable.

Charles D Maclurcan.

Patriotism is very dear to the Wireless Institute and one of the principal requirements before admission to membership is that candidates must be of British nationality. Other qualifications and conditions of membership, as well as annual subscriptions are compatible with the standard to which the Institute has attained.

There is a distinct division of the Institute in each State of the Commonwealth with headquarters in all the capital cities, and with the incidence of the Australasian Radio Relay League, it is anticipated that the co-operation between Divisions will be greatly enhanced. The keen co-operation between interstate divisions in the past has been of the greatest possible advantage to experimental work and the projected activities of the immediate future will require complete unison and much hard work on the part of all concerned.

Of the Executive of the Institute to-day, of which I have the honour to be president, I cannot say too much in praise of their self-sacrifice in doing all in their power to help the cause of wireless to still better opportunities, and in justice to them, it is only fair that their names be put on record:—

Vice-presidents: F Basil Cooke, FRAS, E B Crocker; Councillors: Major W H Newman, H Rigby Gregory, S V Colville, H A Stowe; Publicity Officer: A H Perrett; Honorary Treasurer: O F Mingay, Honorary Secretary: Phil Renshaw, AMIEA.

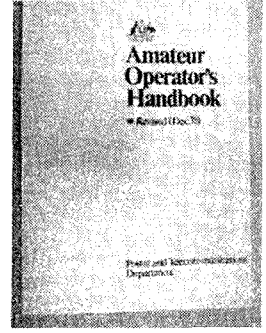
Charles D Maclurcan.

Senatore Marconi, Patron, President.

AR

DE-REGULATION AND SELF-REGULATION: WHAT DOES IT MEAN?

Allan Foxcroft, VK3AE.
FEDERAL COUNCILLOR



Nowadays "de-regulation" has become almost a "catch cry" in Government administration — for example, the de-regulation of the Australian Banking System and proposals for similar action in the Dairy Industry have brought the subject to the public notice. It may come as a surprise to some readers that the WIA has had de-regulation and self-regulation as an endorsed forward planning objective since 1981 when the Federal Convention decided officially to *"aim for de-regulation and self-regulation in negotiations"* (with DOC). Unfortunately, the two terms sometimes tend to be regarded as interchangeable and some misunderstanding can result if one does not clearly differentiate between the two.

EASING OF FORMAL REGULATION

The term de-regulation implies the easing of the formal regulation of amateur radio — the streamlining of regulations and the elimination of all that are unnecessarily restrictive or no longer applicable to present-day conditions. This can be a useful and productive exercise, but to my mind it does not get at the major question *ie how, the service should be regulated after the dead wood has been removed.*

We should be concentrating most attention on the transfer of much of the responsibility for the orderly conduct of our hobby from the licensing authority to the amateur himself, *ie self-regulation more than de-regulation.* Of course a basic framework of regulations must continue to be applied by the DOC — the formal licensing of operators in the service, the allocation of frequency bands and co-ordination with other services are activities which appear more appropriate to the licensing authority. Nevertheless, there are a number of "regulations" dealing with conduct and procedures which could be self-administered, more in the form of guidelines than as conventional regulations.

WE SHOULD BE GETTING TOUGHER

Naturally there are opponents to the easing of formal control of the service, in fact some with rather extreme views would no doubt prefer to see a tightening-up of the regulations. *"We should be getting tougher on offensive behaviour of all kinds". "We should be making the observance of WIA Band Plans obligatory rather than gentlemen's agreements, as at present". "We should increase control on the use of repeaters"* and so on. Yes — by all means let us campaign strongly against undesirable features of amateur conduct, but NOT by the introduction of increasingly formal regulations by the DOC. Instead we should be building up the self-discipline of the Amateur Service by education and by improving, in a friendly, co-operative manner, the operating conditions of our service.

ONLY TAKE PLACE BY GOODWILL

First and foremost, the process of self-regulation can only take place and be sustained by continuing goodwill and mutual confidence between DOC and the amateur body as a whole. It must be engendered by clear demonstration of a highly responsible attitude and a willingness and ability of the amateur fraternity to control its own affairs in a competent and effective manner. We are fortunate that currently this most important ingredient for change is present. There is a tremendous goodwill between the DOC and the WIA — backed by a very genuine and sympathetic desire on the part of the DOC Radio Frequency Management Division to regulate in the best interests of amateur radio.

SHIFT THE BLAME

An example of this attitude can be found in the DOC approach to the solution of Electromagnetic Compatibility and immunity problems. Not so long ago, when interference (other than harmonics and spurious emissions) was "caused" by a licensed amateur station to domestic electronic equipment, the onus for clearance of the problem was almost automatically placed on the amateur station rather than on the recipient of the interference. The present and commendable attitude of the DOC is to shift the "blame" to where it should generally reside — with the electrical equipment manufacturer or the installer who has failed to provide adequate immunity to high RF fields.

The changes which we envisage cannot take place without added responsibility being placed on the amateur bodies — particularly the WIA. They must become even more responsive to the needs of all amateurs — to represent overall amateur views more accurately and to take all views into account when speaking and acting as the amateur representative. An increase in the percentage amateur membership of the WIA is most desirable — but more importantly the organisation and administration of the WIA must be tightened up to meet these needs.

CENTRAL CO-ORDINATOR

I must respond to those who express concern that the WIA does not adequately recognise the rights of non-members to their independent views and should not seek to act on behalf of all amateurs. It is a fact of life that an organisation such as the WIA, able to claim better than fifty percent representation of Australian amateurs and able to speak with one voice will be heeded more than individuals. If the democratic process of consensus is to be pursued, there must always exist some central co-ordinating body. Moreover, if a greater degree of self-regulation is to be applied in the Amateur Service, there will be even greater pressure for that co-ordinating body to possess the strength and ability to represent a majority view of amateurs, of which only the WIA is capable.

The concern of non-members can be eased by a concerted effort to improve the representation and responsiveness of the WIA to overall amateur needs as mentioned previously. This is no mean task when one recognises the great diversity and even conflict of interests to be represented. Amateur radio is, in fact, many hobbies within a hobby and all should be considered and given their appropriate weighting. We should continue to prepare and administer band plans for the amateur frequency allocations, with perhaps greater firmness than heretofore — we should be co-ordinating the use of bands above 30 MHz to ensure that the most effective use is made of all the techniques at present available (here let me stress the word "co-ordinate" in contrast with controlling or directing, which should be resorted to only where absolutely necessary). We should be fostering and again "co-ordinating" the introduction of new techniques — ensuring that flexible procedural guidelines are available where required and that they are directed to the greatest possible benefit for the majority of experiments.

GREATER DISCIPLINE

So, to conclude, let's summarise what self-regulation should mean to the Amateur Service. It is not an easy road to follow. It calls for greater self-discipline by all active amateurs. It calls for a greater awareness of the objectives and values of the amateur service by its members as a whole and a tolerance for "the other fellow" who may wish to pursue a facet of the hobby totally different from one's own inclination.

If the WIA is to spearhead the trend, (as it should), then it must receive greater support by amateurs in terms of membership numbers. Its organisation and lines of communication should be improved to ensure that it is always able to speak with authority for the whole of the amateur population. We must always act in a responsible, tolerant and professional manner in all forums at which the amateur interests are to be represented and by clearly demonstrated competence, foster the wholehearted support of the licensing authority, the amateur and the industry as a whole, *What do you think?*

AR

SKY HIGH PIRATES CONVICTED

A plumbing company has been convicted for illegally using amateur hand held two metre transceivers.

In the Melbourne Magistrate's Court on 13 June J L Williams Pty Ltd pleaded guilty to six identical charges.

The Department of Communications prosecuted the firm under the Wireless Telegraphy Act for using an appliance without authorisation for the purpose of transmitting messages.

The court case followed a visit by DOC officers to the tallest building in the southern hemisphere — the Rialto in Collins Street.

In the raid on 1 February, DOC seized six transceivers which were operating on 144.495 MHz.

They were being used for communication by workers installing air-conditioning.

The company was fined a total of $110 and the units were forfeited.

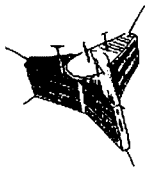
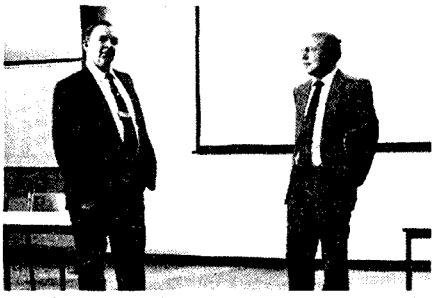
THE STORY OF OSCAR 10



Visit by Dr Karl Meinzer DJ4ZC to Australia

Bill Rice VK3ABP
54 Maidstone Street, Altona, Vic. 3018

The WIA was notified in April 1985 that one of the leading participants in the development of the Phase 3 amateur satellite, which is now operational as OSCAR 10, was to visit Australia during May. Dr Karl Meinzer DJ4ZC had been invited to address the ZL Convention in Christchurch over the weekend of 1-2 June, during a round-the-world trip, and was invited by Graham Ratcliff VK5AGR (our AMSAT Co-ordinator) to add Australia to his itinerary. In a very busy week at the end of May DJ4ZC addressed meetings of amateur satellite enthusiasts in Adelaide, Melbourne and Sydney. The Melbourne meeting was held on 28th May at the Box Hill College of TAFE, the venue being arranged at rather short notice by the Eastern and Mountain Districts Radio Club in conjunction with the VK3 Division and the Federal Office.



David VK3ADW introduced Karl DJ4ZC to the audience.

Karl was introduced to the audience of about 55 people by the Federal President, David Wardlaw VK3ADW, and Jack O'Shannassy VK3SP, representing EMDRC. He then outlined the history of the Phase 3 project from its beginning as a joint concept by himself and Jan King W3GEY in 1973. It was intented to go into a high-level sub-synchronous orbit at an inclination of 57 degrees, with 50 watt transponders enabling good coverage of a large part of the world at any one time, the actual region changing slowly as the earth rotated within the orbit. Transponders were proposed for Mode B (70 cm up, 2 m down), with an onboard computer controlling a built-in propulsion system for optimising the orbit, as well as housekeeping functions (transponder scheduling, solar power budget, engineering telemetry, etc).

GLOOM!

After years of hard work, mostly by the AMSAT-DL organisation, but also involving AMSAT-USA, NASA and ESA, the satellite, plus commercial payloads, lifted off in 1980 from Kourou in French Guiana aboard the second of the Ariane series of rockets. A faulty fuel-valve caused premature first stage shutdown, and many millions of dollars worth of hardware plunged into the South Atlantic!

The West German Government was then persuaded to grant sufficient funds to AMSAT to build a replacement satellite. Karl appears to be not only a technical genius but also a political and financial wizard! The new satellite, improved by the addition of a Mode L transponder (23 cm up, 70 cm down) was launched in June 1983 by a more successful Ariane. However a bump just after separation upset the attitude, bent an antenna, and restricted the supply of fuel for manoeuvring. The inclination eventually achieved was only 26 degrees rather than the wanted 57, and the orbit was more elliptical than desired.

INSURANCE

Learning from the disastrous first attempt, the second satellite was covered by very comprehensive insurance, one clause of which defined the mission as unsuccessful if the inclination was less than 30 degrees. The payout from this has permitted construction of a further Phase 3 satellite to proceed. In the meantime it has been possible to manoeuvre OSCAR 10 into the best possible attitude consistent with its low inclination angle, and communication through it has been readily possible for over a year. However, its sensitivity is about 20 dB down on specification for the Mode L transponder and power will be restricted by frequent long eclipses later this year as the orbit causes the satellite to be in the earth's shadow for up to 3 hours at a time. The attitude needs to be changed twice a year to minimise its effect on solar illumination; and the elliptic orbit involves passage through the earth's radiation belts twice a year, which will shorten the useful life of much of the electronics, particularly the computer memories.

VIDEO

Karl's presentation was supported by a 45 minute video-cassette of the OSCAR 10 story. This was mainly produced by Werner Haas DJ5KQ, and covered all aspects from concept to launch in a most informative style. Several interesting items were gleaned here; OSCAR 10 is spin-stabilised at 35 RPM; its development and testing involved the University of Marburg, the Max Planck Institute, NASA and the ESA Kourou complex; the Ariane take-off thrust is 2445 kilonewtons and its mass 207 tonnes (from which may be deduced an initial acceleration of 1.2 G, less the earth's 1.0 G, so only 0.2 G or 2 metres per second at lift-off); the payload is 2 tonnes and the vehicle takes 14 minutes to reach the altitude where the payloads separate and are left to their own devices. Video coverage of the *Kourou* installation and of the actual lift-off was especially interesting.

FUTURE

An improved version of the present satellite is intended, hopefully with an overall 10 dB improvement in transponder gain, so that the necessary ground ERP will be possible from mobile antennas. There will also be a digital communication experimental system for the packet radio buffs.

The next generation (Phase 4) will involve higher gain antennas, 250 watt transponders, and larger solar cell panels to provide the DC power. One most intriguing suggestion is the use of electrically heated water vapour jets for manoeuvring. Water is of course much cheaper than hydrazine and

Photographs courtesy Gil Sones VK3AUI.

Karl explains the operations of a pocket computer to gain OSCAR 10 information.

other exotic fuels, and can be carried on a manned craft such as the Shuttle. One might envisage a low-level Shuttle launch, the satellite then propelling itself into a much higher orbit, taking weeks if necessary, steaming outwards into space!

QUESTIONS

At the conclusion of Karl's address there were several questions from the floor. These involved the expected life of OSCAR 10, access by mobile stations, commercial support, launch vehicles other than Ariane, possibility of amateur geostationary orbits, ease of access, polarisation, and launch timing for the 10 dB improved version.

In replying, Karl said that at least 3 years was expected of OSCAR 10 (in spite of some experts who said it would not last 2 days, and have already been proved completely wrong!). Access might be possible to later satellites by hand-held SSB sets. Even now many signals into OSCAR 10 are 20 dB stronger than needed, and users must be educated to use the minimum necessary power.

Commercial support is not great, as there is little commonality of aims between the professionals, who require high reliability no matter what it costs, and amateurs, who require a limited capability on a shoestring budget. Ariane remains the most appropriate launch vehicle, but the proposed water vapour propulsion may make a low-level Shuttle launch possible, although expensive. The Amateur Service could perhaps afford one geostationary satellite, but the three or four necessary to cover the whole world would probably be beyond our means.

It was agreed that a satellite system easily accessible even to hand-helds might raise serious problems, although the American philosophy is towards this aim. No change is proposed to the present circular polarisation sense; and the next improved OSCAR may be launched in 1989 or 1990.

In conclusion, VK3ADW thanked DJ4ZC for his notable contributions to the amateur satellite service and his willingness to address us, and presented him with several appropriate momentos of his visit, including an embossed leather binder containing some recent issues of AR.

EXPANSION OF SBS TV INTO UHF

As previously announced the channel 0 transmissions for SBS TV will terminate on 5th January 1986. All future expansion of this service will be on UHF. The use of channel 0 however remains for other TV services.

The UHF SBS channels to be used include:

Ch 28	*Sydney — Canberra and Melbourne and planned for Adelaide and Brisbane July 1985 Perth and Hobart in January 1986 and Darwin late 1986*
Ch 43	*Adelaide foothills*
Ch 44	*North Wollongong in August 1985*
Ch 45	*Newcastle in July 1985*
Ch 58	*Kings Cross — Goulburn — Cooma — Tuggerong in VK1 and Warburton and Marysville in VK3*
Ch 59	*Wollongong in July 1985*
Ch 61	*Gold Coast.*

Contributed by Tim Mills VK2ZTM.

EQUIPMENT REVIEW

Ron Cook VK3AFW
TECHNICAL EDITOR

ICOM IC-735 ALL MODE HF TRANSCEIVER

The IC-735 replaces the well known Icom IC-730. It seems that the days of transceivers that only cover the amateur bands on receive have long gone and the 735 therefore has a general coverage receiver. The 730 appeared on the Australian market in early 1982 and was reviewed in the April 1982 issue of Amateur Radio. It has continued in production ever since and I believe that there has been a steady demand for it. It has been regularly advertised in American magazines but it is quite a while since I have seen a local advertisement for it.

In its basic concept, the 735 fills the same role as the 730 with a compact transceiver for portable or mobile operation, fully solid state no tune up design with amateur band coverage from 160 to 10 metres and operates from a 13.8 V DC source. It is packaged in a cabinet of identical dimensions to the 730, 94mm high, 241mm wide and 239mm deep (less projections) but weighs less, 5.05kg as against 6.4kg for the older model.

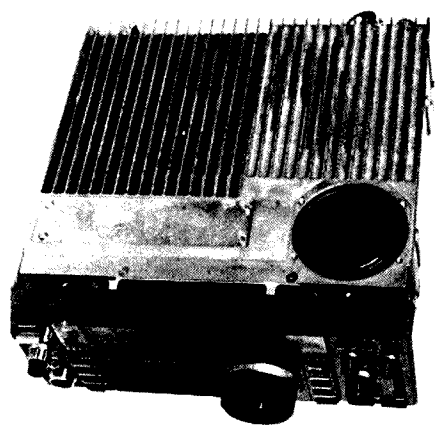
The big difference is what is inside the cabinet. First is the general coverage receiver. This covers from 100kHz to 30 MHz. Tuning is continuous over this range with the choice of stepping in 1 MHz segments or in amateur band segments. Add to this an all mode capability for AM, FM, SSB and CW and you can see we have a very complete package. All controls are on the front panel.

If you refer to the review of the 730, you will see there were a few complaints about the accessibility of controls under the top hatch. This hatch has disappeared and all of the lesser used controls are on the front panel behind a drop down semi-transparent plastic panel. Very neat. Also commented on was the matching AC power supply in fact did not match. Instead of presenting a smooth line up, it looked more like the side elevation of a camel train. But no more, Icom have produced a power supply, the PS-55, which matches the IC-735 in both size and colour. An automatic antenna tuner is also available in matching format.

Frequency, mode, VFO and memory information are presented by means of a large LCD display. To my knowledge, this is a first on an HF transceiver, but several excellent LCD displays have been used on VHF FM transceivers. In more detail, the display shows the following: *frequency display to 100Hz resolution, VFO A or B, mode of operation AM, FM, USB, LSB or FM, transmit or receive status, scan mode, memory channel selected and split frequency operation.* It is illuminated in a soft translucent green. The 'S' meter is also illuminated in a soft green but I found it lacking in contrast. Twelve memory channels are provided. Both mode and frequency information can be stored and each can be individually tuned across the full 30 MHz tuning range. In effect this gives 14 independant VFOs. All VFO and memory information is retained when the power supply is removed by use of an internal lithium battery.

The 735 has an excellent notch filter that can be used with any mode, including AM, and is quite capable of taking out the carrier on a local broadcast station. Other performance information is included in the test section of this review.

As mentioned earlier, the 735 is housed in much the same cabinet as the 730, however removing the top half of the cabinet reveals that the appearance is only skin deep. Underneath is a cast heat sink that takes up the entire depth of the transceiver. A miniature centrifugal fan mounted towards the front of the heat sink draws air in from the rear. The fan operates as soon as the transmitter is keyed and shifts to a higher speed after a few minutes operation. It is fairly quiet but to my ear operates at an annoying pitch.



The IC-735 with the top cover removed to reveal the heatsink and speaker.

Icom have sped up the tuning rate slightly from previous models as the 735 covers 2.5kHz per tuning knob revolution as against 2kHz on the older models. Turning the knob faster than about one revolution per second increases this to 5kHz per turn. One kHz stepping can be switch selected which gives a rate of 100kHz per knob revolution. An input to enable the 735 to be remote controlled by a computer is included called the 'Advanced Remote Control System'.

It is claimed that frequency, mode, VFO A/B selection and memory selection can be controlled by the computer when an appropriate interface is used. There is no information on what this is. It is also stated that the serial port uses a standard 1200 Baud data rate.

Let's look a little closer at the scanning and memory system. The 735 has twelve memories which store both frequency and mode. The memories are fully tunable, it is not necessary to transfer them to one of the VFOs, just select the required memory and tune up or down in the usual way. The memories are selected by first pushing the 'MEMO' button and then selecting the required channel with the memory up/down buttons. Unfortunately memories cannot be changed by using the up/down buttons on the microphone. This only causes the frequency of the memory to change. Pushing the scan button starts the memory scan with a hold time on each of about two seconds. It is possible to scan the complete memories or scan in any selected mode. Memories 11 and 12 can be used to set the limits of a programmed band scan. In general the scanning works quite well and certainly very much better than the scanning in the IC-745.

The CW operator has been given quite a bit of thought by the designers. Provision has been made

Front panel of the unit with the 'hatch' open to display all the controls.

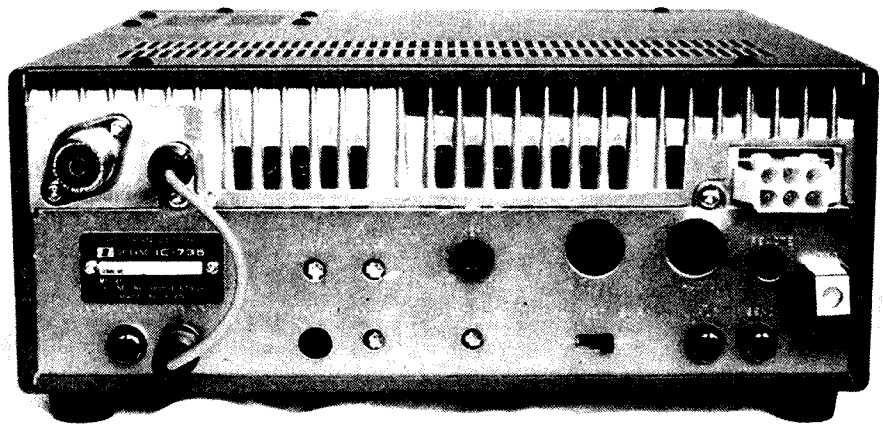
for the optional inclusion of an electronic keyer unit and full break-in keying is built-in. There are no relays, all switching being solid state. This makes full QSK possible and also gives smooth and silent VOX operation on SSB.

A sharp CW filter is a standard fitting with switching to use either this or the normal SSB filter for CW operation. Squelch is useable with all modes although its main purpose is with the FM mode. I feel that one of the few mistakes Icom made was to gang this control with the audio gain. The more logical RF gain is hidden with the lesser used set and forget controls behind the flip down plastic panel. These two should be reversed.

Some of the other handy additional features include: *receiver tone control, adjustment for dial light brilliance, power output switch to give either the normal 100 watts or 50 watts (a handy feature for novice operators), CW side tone volume control, 25kHz marker, scan timer switch and scan speed selector.* All of these controls are not available from the front panel, some like the tone and sidetone adjustments are accessible through holes in the cabinet while others require the top or bottom of the cabinet to be removed.

However I am leaving the best (I think) to last. For the first time since the IC-701, the 735 stays on the same frequency when modes are changed. This is something that I have commented on in each of my Icom reviews over the years. Now if only the R-71 had this same feature.

Well, with all of that, what should the 735 have? Only one thing that I can see; a handle! Here it is, a perfect portable transceiver that just invites you to pick it up and travel, but it takes two hands. The 751 and 745 both have a handle, the 735 should have one as well.



TECHNICAL DETAILS

Unfortunately the only technical information supplied with the review transceiver was a rather hard-to-read photo copy of a block diagram. With the aid of a new pair of bi-focals, the following was discerned. Antenna input to the receiver is via the attenuator and a high pass filter to the eight band pass filters. The high pass filter is by-passed for broadcast and long wave reception. The preamp is now diode switched. The 730 preamp was relay switched and was inclined to trouble with intermittent contacts. Push/pull 2SK125s are used in both the preamp and the first mixer. The conversion set up is 70.45 MHz first IF to 9.01 MHz where the main filters are located. The notch filter is also at this frequency. Third IF is at 455 kHz with an additional limiter and detector for FM reception. Band pass tuning is at 9.01 MHz and uses a VXO to shift this IF frequency in relation to the 455kHz IF.

For transmit, carrier generation is at 9.01 MHz. Two carrier oscillator crystals are employed, one for AM, FM and USB, the other for LSB, CW receive and CW transmit. The actual frequencies being slightly shifted to suit.

The PLL unit supplies all of the conversion heterodyne frequencies and is controlled by the CPU. This is powered by a lithium battery which has an estimated life of five years, therefore all memories and VFO frequencies are retained when all DC has been removed from the transceiver.

Transmitter output is via six relay switched low pass filters.

THE IC-745 ON TEST

The following test equipment was used to produce our figures on the IC-745. Yaesu YP-150 terminating RF watt meter, Drake W-4 through-line watt meter, Kenwood SM-220 monitor scope, AWA F242A noise and distortion meter, Daven terminating audio output meter and a Marconi TF995A/5 RF signal generator.

Frequency Stability

In common with most modern equipment, the IC-745 is very stable. With synthesised VFOs drift that would have passed as acceptable a few years ago is now non-existent. Tested several times over three days, drift did not exceed 50Hz on the several frequencies checked.

Power Output

Power output was measured with the transceiver running from the matching PS-55 power supply. Under full CW output this was able to supply 13.8 volts to the 745. Power was measured under CW conditions, the PEP output was measured on the monitor scope and two tone audio was fed into the microphone socket with the resultant RF out measured on the watt meter and then multiplied by two to give PEP. The results were as follows:

BAND	CW OUTPUT	PEP OUTPUT From Scope	Two tone output by 2 to give PEP
1.8MHz	124 W	130 W	120 W
3.5MHz	124 W	130 W	120 W
7.0MHz	124 W	130 W	120 W
10.0MHz	124 W	130 W	120 W
14.0MHz	123 W	130 W	118 W
18.0MHz	123 W	130 W	118 W
21.0MHz	124 W	130 W	120 W
24.5MHz	124 W	130 W	122 W
28.5MHz	124 W	130 W	122 W

The response from band to band is excellent. The transceiver ran reasonably cool during these tests. Like its predecessor the IC-730, the cooling fan comes on as soon as the transmitter is keyed and stays on for a short time after transmission has stopped.

The scope pattern was clean even with the audio well up. The power control behind the transparent panel allowed the power to be varied from full output down to about six watts. Handy for QRP operation. Subjective tests of the transmitted audio quality was carried out in the three modes. SSB was rated as good. The review transceiver was supplied with an HM-12 hand microphone. An SM6 desk microphone was also tried. Opinion was that the SM6 had a more balanced response but both microphones sounded rather restricted. Transmitted quality in the AM and FM modes was rated as fair. Both had a slightly edgey quality and were not comparable to other equipment tested recently. At this time, there is no way of knowing if this is peculiar to this particular transceiver.

Receiver Tests

The extention speaker output was connected to the terminating audio power meter and the noise and distortion meter. The power meter was set to 8 ohms. Residual noise with the audio gain set at zero was −58.5dBm. This is quite a reasonable figure and somewhat better than previous Icom transceivers tested. Audio power output and distortion were next checked.

Output power	Distortion
.5 watts	1%
1.5 watts	1.1%
2.0 watts	2.5%
3.8 watts	40%

These figures show the combined distortion from the product detector and the audio amplifier is very low up to the overload point. As a point of interest, I did this same test on an old FT-101 and found that the distortion was around 10 percent at less than 1 watt output. There is no doubt that modern transceivers sound very much better than their older relatives.

The received audio response in LSB mode was checked by tuning across the output of a crystal calibrator. The results were as follows:

100	200	300	400	1k	1.5k
−10	−3	−1	0	0	−1
2.0k	2.2k	2.5k	2.7k	3.0k	
−2.5	−3.5	−5	−7	−26dB	

This is very smooth but could be shifted a bit further away from the filter to give a slightly better high frequency.

The AM receive frequency response was checked with the following results:

40	50	75	100	200	400
−9	−6	−4	−3	−1	0
1kHz	1.5	2.0	2.5	3.0	3.5
0	−1	−1	−2	−2.5	−5
4.0					
−8dB					

These are excellent figures for any AM receiver. Feeding a good quality external speaker the results are very pleasing. Add to this the excellent tuning characteristics and relative lack of clicking as the synthesiser changes frequency produces very good AM results. The SSB filter can be selected for AM reception if required by depressing the narrow button.

The CW filter is included as standard in the 735. The response was checked with the following results:

200	300	400	600	800	1k
−20	−15	−10	0	−10	−20dB

The band pass tuning was next measured. With the control central, the SSB response is normal. In the USB mode turning the control to the left reduced the high frequency response while turning right reduces the low frequency response. At 1.5k the selectivity could be adjusted to give −25dB. The same −25dB response could be obtained at 800Hz. It should be noted that you can have either one or the other, not both together. The action of this control is quite useful but not as effective as the Kenwood system that allows independant adjustment of both high and low frequencies.

Receiver sensitivity and 'S' meter calibration were then checked. Signal to noise ratio was tested at 14.2 MHz. At 1uV input the preamp switched out the S/N was 18.5dB. With the preamp in, it was 23dB. At 28.5 MHz 1uV S/N was 11dB preamp out and 16dB preamp in.

'S' meter calibration was measured with the preamp in, and even then it took a signal of 2uV to reach S1. From there up the following results were obtained:

S Meter Reading	Signal input	dB increase
1	2uV	
2	2.5uV	2dB
3	3.1uV	2dB
4	4uV	2dB
5	5uV	2dB
6	8uV	4dB
7	10uV	2dB
8	10.6uV	4dB
9	30uV	6dB
9+10dB	80uV	8dB
9+20dB	300uV	10dB
9+30dB	600uV	10dB

The meter actually reads to S9+60dB but signal input readings were not measured up to this level, but for interest a 10kW broadcast four kilometres away reaches this (preamp out).

With the preamp out, the S meter was very sluggish but the receiver performance was quite acceptable. The preamp has a measured gain of 10dB at 14.2 MHz and the 20dB attenuator was checked at exactly that figure.

The AGC performance was next to be measured. With the preamp in, an increase of signal input from 1uV to 10uV resulted in a 2dB audio output increase and then from there up to the limit of the RF generator, no further increase in audio resulted. With the preamp out, the 1uV to 10uV increase was 14dB, then no further increase in output level from there.

AGC decay time from an S9 signal was 5 seconds with AGC slow and 1 second with AGC fast.

Receiver front end performance was checked for adjacent strong signal handling. A signal was injected into the antenna socket 3kHz off frequency and noise increase measured. With 100uV (equal to about S9+10dB) there was 0dB, with 1mV 1.5dB and with 10mV 15dB. An excellent result.

The antenna input was terminated with a 50 ohm resistive load and the receiver tuned over its entire range. All spurious signals were noted. There were twenty eight but of these only three were of any consequence. These were 23.039 MHz which reached S4, 14.471 MHz, S1 and 9.011 MHz, S1. All others were below an equivalent level of .25uV.

To conclude our tests, the FM receive performance was checked. The tests were conducted on 28.5 MHz. At 1uV input, modulated at 1kHz to give 4kHz deviation, the signal to noise ratio was 6dB. It took a signal input of 4uV to open the squelch. As the specified squelch sensitivity is .3uV something seems to have gone wrong here.

INSTRUCTION MANUAL

Our review transceiver was supplied with a draft copy only. It did appear complete but only time will tell what appears in the manual supplied with equipment sold locally.

CONCLUSIONS

It is interesting to look at the 735 in relation to the older 745. In many ways, it out performs the 745. Broadcast band and long wave reception is vastly better, both from a quality and sensitivity point of view. Memory scan now works in a logical way (see comments on memory scan in the 745 review). There are very few points of criticism with the 735. It is a very versatile little transceiver. If only it had a handle! Perhaps a few comments about the matching PS-55 power supply might be of interest. This worked well throughout the tests with the exception of a slight amount of mechanical hum. But perhaps Icom might consider a few improvements. Firstly, there is no provision to supply DC to anything other than the 735 transceiver. Once you have invested in a good regulated supply it is handy to use it to supply a two metre FM transceiver or some other piece of station equipment. I use a PS-15 which I have modified to give auxiliary DC output and front panel AC switching so that it can be used with all units in the shack. Last point, what about a speaker in the front panel of the PS-55. There is room for one.

Thanks to Icom Australia who kindly supplied this review transceiver.

EVALUATION AND ON AIR TEST OF THE ICOM IC-735 HF TRANSCEIVER — Serial No 0021

APPEARANCE

Packaging
*** Carton with foam inserts, but not up to other Icom equipment.*
Size
*** About as small as they come.*
Weight
*** Slightly less than its predecessor.*
External finish
*** Clean appearance and well finished.*
Construction quality
** Good quality boards and wiring. Reasonable accessibility.*

FRONT PANEL

Location of controls
*** Top marks. Some are hard to get at but excellent layout for front panel size.*
Size of knobs
** Small front panel means small controls, but mostly satisfactory.*
Labelling
*** Very clear.*
Status Indicators
*** New LCD display very comprehensive, but no indicators for many functions.*

VFO ACTION
Tuning Knob
**** Smooth action. Adjustable drag.*
Tuning Rate
*** Better than previous Icoms, but still a bit slow.*
Digital readout
**** New LCD display very good. 100Hz resolution spot on frequency.*
VFO stability
**** Less than 100Hz total drift.*

RECEIVER OPERATION
Memories
**** 12 tunable memories. Very useable memory scan also select ed mode memory scan.*
Band pass tune
*** Quite useful.*
Notch Filter
**** Works well for all modes.*
Spurious responses
**** Quite a few, but mostly very low level (see test section).*
'S' meter
*** OK with preamp in, sluggish with it out.*
AGC performance
**** Good action. No pumping detected.*
Signal handling
***** No cross mod heard except when noise blanker selected with maximum blanking.*
RIT
*** +/- 900Hz. No XIT. No frequency indication. Leaves you in the dark.*
Sensitivity
***** Excellent. See test section.*
Preamp/attenuator
***** Independently controlled. Gives good choice.*
RF gain
** Works well. Difficult to get at.*

NOISE BLANKER
Woodpecker
**** Excellent blanking, but introduces cross modulation.*
Ignition and general electrical noise
*** Works well, but level adjustment critical to avoid cross modulation.*

QUALITY OF RECEIVED AUDIO
Internal speaker
*** Very small speaker but well baffled giving quite fair quality.*
External speaker
NA Appears that no matching speaker available. Very good on my usual station speaker.
AM received quality
***** Special mention, it's excellent.*
Headphone output
**** Stereo phones compatible. Good level.*
Cooling fan noise
***** Does not operate in receive mode except after long transmission.*

TRANSMIT OPERATION
CW and PEP output
***** Excellent — See test section.*
Audio response
*** Good on SSB, fair on AM and FM.*
ALC action
**** Very good, no flat topping.*
Compressor
*** Audio processor only but quite effective if not pushed too hard.*
Metering
*** ALC, relative output and SWR.*
Relay noise
***** None. Solid state switching.*
VOX operation
***** Excellent and no clattering relays. Use it you will like it.*
CW operation
**** Full QSK. CW filter good sidetone.*
Cooling
*** Runs quite cool. Fan operates continuously in transmit mode with audible sound.*

MANUAL
Owners Handbook
NA Only rough copy available at time of review.

Rating Code: Poor * Satisfactory ** Very Good *** Excellent ****

AR

75th Nostalgia

"THE NIGHTINGALE SINGS"

A TRIBUTE TO THE LATE BILL MOORE VK2HZ

Ted Gabriel VK4YG
PO Box 245, Ravenshoe Qld. 4872

I first met Bill Moore in a Japanese Prisoner of War camp in Batavia (Djakarta) in 1942, when thousands of Australians from the three services laid down their arms after fighting a bitter rearguard action to defend their country against the tide of war which had engulfed Malaya, Singapore and the Dutch East Indies.

Bill was a quiet, friendly man who had a cheery smile for everyone who met him.

What has this to do with nightingales you may ask? relax and I will explain.

Bill was an RAAF radar officer serving in Malaya and when Singapore fell he was evacuated to Java.

After the capitulation and while allied servicemen were being rounded up he quietly collected radio components from wrecked aircraft and other equipment and smuggled the parts into the camp in Batavia.

From these components, with typical amateur ingenuity, he constructed a receiver powered by torch batteries which could be easily dismantled for shifting from one camp to another.

It was this receiver that brought the war news to Australian POWs working on the notorious Burma-Thailand Railway of Death, it gave hope in the days of gloomy despair, and lifted the morale of those cut off from their homeland and loved ones.

Without doubt this man's skill and concern for his fellow man gave many the will to survive this terrible ordeal.

"A Nightingale Sang in Berkeley Square" was a wartime tune made popular by Glenn Miller and his orchestra and the phrase; the "Nightingale Sings" was chosen as a code name for the extremely dangerous task of receiving the news from the BBC in India or Radio Australia and passing it on to the troops.

Since the Japanese use the word "newsu" to mean news this word was strictly taboo as were 'radio' or 'wireless'.

Accordingly the code word; "The Nightingale Sings" meant that there would be news before 'lights out' that evening.

The operator, Corporal Arch Caswell, RAAF, who was later awarded the British Empire Medal for his work, would retire under his mosquito net, produce the earphone from its hiding place, switch on the receiver and listen to the news.

While he was doing this there would be several unobtrusive "cockatoos" on watch to see that no guards approached the hut undetected.

Nothing was ever written down, the operator memorised what he heard and then sought out a certain officer who also memorised what he heard and then informed the Australian Senior Officer.

After the evening meal all officers in charge of working parties were called to the CO's quarters to receive orders for the next day and were then told the news.

The officers then went to their groups to prepare work lists for the next day and passed on the "Nightingale's Song" to their men.

Very strict discipline was necessary to protect the lives of those engaged in this dangerous operation, all men were to hear the news and then "forget it," anyone heard discussing it later would be immediately put on a charge and denied access for a long time.

No Australians were caught but an English officer found with a secret radio in one camp was beaten to death — those responsible were later executed after a War Crimes Trial.

Moving from one camp to another meant that the receiver had to be dismantled and the parts distributed amongst several people and concealed in such a way as to evade searches by the Japanese.

Some very ingenious methods were used, parts were concealed in musical instruments, in bags of rice, in hollowed out timber of boxes, in shoes or boots, while the torch batteries were concealed in bamboo carrying poles.

One particularly crafty move was made by concealing parts in the Japanese officer's telephone equipment which was not searched and which was maintained by Australian signals men since neither the officers' staff or the Japanese Military Police, the "Kempei Tai", understood much about this gear.

Considerable discretion had to be exercised when some Japanese, trying to improve their knowledge of English, would discuss items of news published in their propaganda newspaper with the prisoners.

After the midget submarine raid in Sydney Harbour several of us were accosted by a Japanese triumphantly waving his newspaper and saying; *"Nippon submarine torpedo centre pylon of Sydney Harbour Bridge!"*

After several minutes of feigned amazement and careful discussion one of our group produced an old postcard of the famous bridge and showing it to the guard said, *But as you can see there is no centre pylon under the Sydney Harbour Bridge".*

"Ah so", he replied, *"Nippon Submarine captain No 1 shot!"* (you could not win!)

Farewell Bill Moore VK2HZ, the man who made it possible, the Australian Servicemen who heard the "Nightingale's Song" — salute you.

PHOTOGRAPHIC WINNER 1984-85

The winner of the $100 worth of Agfa film and/or video tapes was Sam Voron VK2BV8 for his collection of photographs on page 21, April AR.

NEW LITERATURE

CMOS DAC APPLICATIONS GUIDE—Free—64 Pages, is a guide to explain the use of CMOS D/A converters. The applications guide thoroughly covers theory, operation, and applications in greater detail than manufacturers' data sheets. The guide discusses basic CMOS DAC circuit design and function, as well as many of their specification such as output leakage current, digital-to-analog switching glitches, power supply rejection, and more.

The guide outlines considerations for using the devices in the conventional current-steering mode, in unipolar and bipolar modes, and how the correct voltage reference and precision output amplifier should be selected. Single-supply operation in the voltage-swtiching mode is also discussed. Following a chapter discussing the logic interface, twenty-five applications are described, from the most basic multiplier/divider to microprocessor interfaces with a 12-bit buffered multiplying DAC, and a microcontroller-to-12-bit DAC interface.

BROADBAND DIRECTIONAL VHF-UHF BEAMS

GFS Electronic Imports have on the market a range of high gain broadband VHF/UHF beam antennas designed to suit the requirements of a number of different applications where broadband operation and gain is required.

Known as the LOG-SP and LOG-S respectively, the two antennas in the range cover the needs of most users. The LOG-SP is a 13 element Log Periodic type beam with a gain of 11.5 dBi and a bandwidth of 65 to 520 MHz. Its power holding capability is 200 watts RMS over that bandwidth. Length of the LOG-SP's boom is 3.03 metres.

The smaller LOG-S is designed to cover the frequency range of 100 to 520 MHz and has just 9 elements. It is designed primarily for receive only applications although, with a different balun fitted, it can be made to handle 200 watts RMS on transmit. Gain of the LOG-S is 9.5 dBi and its boom length is 1.02 metres.

One very common application for the LOG-S is its use in conjunction with programmable scanning receivers to provide these units with greater overall performance.

Price of the LOG-SP is $194 plus $14 freight while the LOG-S is $136 plus $14 freight.

For further information on these antennas contact the distributors: GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic, 3132, Phone: (03) 873 3777.

AR

NOW USED BY RESCUE SQUAD

Microcomm's model SX-155 programmable 160 memory HF/VHF/UHF scanner is now in use by one of Southern Victoria's busiest rescue organisations, the Southern Peninsula Rescue Squad, located at Sorrento, 60 kilometres south of Melbourne, on the Mornington Peninsula.

From December through to February the Mornington Peninsula's population is multiplied many times by the influx of summer holiday makers. It offers both the relatively peaceful waters of Port Phillip Bay as well as the somewhat more turbulent surf beaches of Bass Strait.

AR SHOWCASE

During the summer holiday period the squad, operated entirely by volunteers, is kept continuously busy by incidents which range from boating mishaps, car accidents, swimmers caught in trouble to rescueing people trapped on cliffs. The squads 25 members average a total of around 130 rescues each year. Their equipment includes a Bell 206 Helicopter, 2 boats, a four wheel drive vehicle as well as other pieces of ancillary equipment such as the jaws of life.

The squad must liaise with many other services including the Police, SES, Coast guards, Fire Brigade and Surf Lifesaving clubs.

This is particularly the case while they are on the move. Consequently they found themselves with the requirement for a programmable pocket scanning receiver with both a large frequency range and high number of memory channels. The Microcomm SX-155 fitted this area quite well, particularly because of its 160 memories and HF/VHF/UHF frequency coverage. It also offered rechargable batteries, high sensitivity and heavy duty extruded aluminium construction.

Shown in the Squad's Bell 206 Jetranger Helicopter, VH-BLD, are the pilot Bruce Taylor, and communications officer Darrell Williams. Both Bruce and Darrell have been with the squad since it started in 1970 when it operated an old Bell 47J Helicopter.

For further details on the Microcomm SX-155 Pocket scanning receiver contact: GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic, 3132, Phone (03) 873 3777.

EXTRA SERVICE FACILITIES

Am-Comm has expanded its service facilities. Andy Chan VK3DPJ has been appointed Service Manager. His experience spans over 20 years, dealing with all facets of radio communications equipment, including repeaters and marine radars. Andy has held positions extensively in the Pacific region.

The current service facilities at Am-Comm Electronics is fully equipped to cover all Icom, Kenwood and Yaesu customer needs. AR

ITU AND IARU

THE INTERNATIONAL TELECOMMUNICATIONS UNION

The ITU is an international organization, and is a specialised agency of the United Nations. It is, however, far older than the United Nations.

The Convention establishing the ITU defines its purposes as:

- to maintain and extend international co-operation for the improvement and rational use of telecommunication of all kinds;
- to promote the development of technical facilities and their most efficient operation with a view to improving the efficiency of telecommunications services, increasing their usefulness and making them, so far as possible, generally available to the public;
- to harmonise the actions of nations in the attainment of those common ends.

Much of the work of the ITU is undertaken through international conferences and meetings. The members of the Union meet at intervals of normally not less than five years at a Plenipotentiary Conference. This is the supreme authority of the ITU and lays down general policy. The Plenipotentiary Conference reviews the Union's work since the last conference and revises the Convention if this is considered necessary. It elects the members of the Union who are to serve on the Administrative Council, the Secretary-General and the Deputy Secretary-General as well as the members of the International Frequency Registration Board (IFRB).

The detailed regulatory work is carried out by administrative conferences. These may be either world administrative conferences or regional administrative conferences. The conferences review the Administrative Regulations which are the Telegraph Regulations, the Telephone Regulations and the Radio Regulations. These are the regulations which govern the international operation of the three modes of communication.

The Administrative Council is composed of 36 members of the Union (presently including Australia). The Council normally meets for about a month once a year at the ITU Headquarters in Geneva and at these formal sessions the Administrative Council acts for the Plenipotentiary Conference and generally supervises the administrative functions and co-ordinates the activities of the four permanent organs of the ITU and examines and approves the annual budget.

The four permanent organs are the General Secretariat, the IFRB and the two Consultative Committees, the CCIR (the International Radio Consultative Committee) and the CCITT (the International Telegraph and Telephone Consultative Committee). The two CCIs are the technical committees that issue recommendations for the guidance of the Union. The General Secretariat is responsible for the administrative arrangements at all conferences.

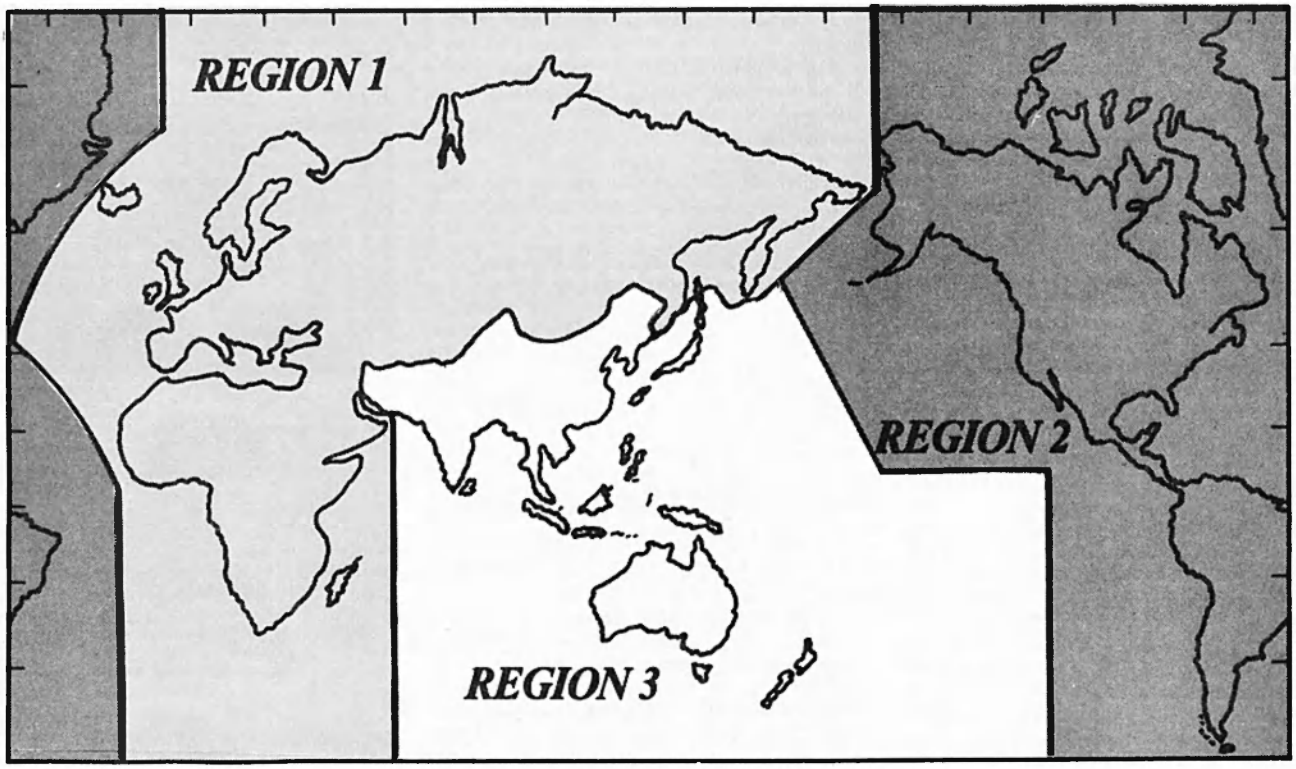
From September to December 1979 a World Administrative Radio Conference was held in Geneva. This conference made a general revision of the Radio Regulations including the International Frequency Table.

This was the first general revision in 20 years, though specialised Administrative Radio Conferences had been held in the intervening period.

INTERNATIONAL AMATEUR RADIO UNION

The amateur service has its own international organization to promote its worldwide growth and to represent its interests at the ITU if this should be necessary. This is the International Amateur Radio Union (IARU) which was founded in 1925. Its headquarters are located in the U.S.A. but it has separate representation in each ITU region (3). Its membership is made up of national societies rather than individuals, just as the members of the ITU are national administrations, not radio services or individuals.

In a similar way to that in which the ITU regulates and co-ordinates frequency allocations as a whole, the IARU regulates and co-ordinates amateur activities within individual amateur bands, albeit on a voluntary basis, so as to cater for the many interests within amateur radio.



EDUCATION

People wishing to enrol in Morse code or theory instruction classes are advised to check with their division of the WIA (see WIA directory in this book for addresses).

Each WIA division should be able to also recommend theory books helpful to those studying either for a Novice licence or the AOCP theory.

The Federal WIA Education Co-ordinator, Brenda Edmonds VK3KT handles national matters relating to the education field. Her role includes education policy matters in connection with DOC examination syllabuses and overall examination problems.

Other services provided include liaison with DOC on matters raised by WIA divisions and members, preparation of Trial Examination papers (Novice and AOCP), and distribution of sample CW examination tapes provided by DOC.

Mrs Edmonds can be reached via the WIA Executive Office, PO Box 300, Caulfield South Vic., 3162, direct via her callbook address, or on the Education Net each Thursday evening, 3.685MHz at 1130 UTC.

She would urgently like to hear from clubs and schools starting theory classes.

These words were written by Robert Laurence Binyon, and would be known to most Australians from the Boar War to the present time. Born in England on the 10th August 1869, he was a poet, art critic and literary contributor to the "New York Times". He was the author of 20 books of poetry. In 1940 he held the position of Byron Professor of the University of Athens. He died on the 10th March 1943, at the age of 72 years.

The Second World War had come to an end in 1945 and the Federal Headquarters of the WIA, located in NSW from 1935 to 1938, had re-commenced operation in Victoria. Its post-war officers were R Marriott VK3SL (President), Alec H Clyne VK3VX (Federal Secretary) Tom D Hogan VK3HX (Treasurer), Charles Quin VK3WQ and A R Williams VK3WE.

The Executive's immediate objectives was to reorganise the Divisions of the Institute in each State, procure the release of all pre-war amateur frequency assignments and organise band-planning for future radio amateur operations in Australia.

The amateurs pre-war equipment had been sealed and lodged in local Post Office Stores (and other Government storage areas) for the duration. Under pressure from the Wireless Institute of Australia frequencies used by amateurs pre-war were slowly relinquished by the defence and maritime services and re-allocated by the Post Master General's Department for use by radio amateurs. The 'imprisoned' equipment was released for return to the owners and feverish activity ensued to 'get back on the air'.

The first post-war Federal Convention was held in Melbourne in 1946. At this Convention the NSW Division proposed that the Executive be authorised to organise a contest to perpetuate the names of those of the amateur ranks who had lost their lives in the service of their country, and that a trophy be provided bearing the names of these amateurs. Needless to say, the proposition gained the full support of all the divisions. The Federal Council approved of the name — Remembrance Day — for the contest as being most suitable.

It was to be two years before the project 'got off the ground' during which time the Federal Council agreed to the contest being a competition between States, the winning State to hold a perpetual trophy for a year, and to receive a special Remembrance Day Certificate. The basic rules were drawn up by the late Major W (Bill) Mitchell VK3UM, with the assistance of the then Federal Contest Manager, E H Jenkins VK3QK. The trophy was designed and constructed by the late George Glover VK3AG, QM, (honorary Life Member of WIA) with some assistance from George Manning VK3XJ. The certificate was designed by the late Mr Frank Manly, a British engraver with the Commonwealth note printing branch.

The weekend nearest to the 15th August (D-Day in the south west Pacific area of World War II) was selected as the most appropriate time to hold the Remembrance Day Contest and the first event was held in August 1948. It was an immediate success and has remained Australia's most popular contest. It has perpetuated the memory of the following radio amateurs —

VK2BQ F W S Easton RAAF VK2JV C D Roberts AMF VK2VJ V J E Jarvis RAAF VK2YK W Abbott RAAF VK2AJB G C Curle RAAF VK3DQ J D Morris AMF VK3GO T Stephens RAAF VK3HN J McCandlish AMF VK3IE J E Mann RAN VK3NG N E Gunter AMM VK3OR M D Orr RAAF VK3PL J F Colthrop RAAF VK3PV R P Veall AMF VK3SF S W Jones AMF VK3UW J A Burrage RAAF VK3VE J E Snadden RAAF VK4DR D A Laws AMF VK4FS F J Starr RAAF VK4PR R Allen RAAF VK5AF C A Ives RAAF VK5BL B James RAAF VK5BW J G Phillips AMF VK6GR A H G Rippin RAN VK6JG J E Goddard RAAF VK6KS K S Anderson AMF VK6PP P P Paterson RAAF.

Being such a popular Contest has not been without its traumas. Many debates over the years have taken place within the WIA Federal Council about the rules. Claims have been made that they favour one division in respect to another, or the larger with respect to the smaller ones. Many variations to the rules have been implemented and additional sections included over the years to encourage participation and interest. The various Contest Committees played an important part in this, and continue to do so.

The Contest's popularity has never really waned although percentage of operation has varied. A summary of the annual winners follows —

Australian Capital Territory (VK1) 1977 — 1978: New South Wales (VK2) 1948: Victoria (VK3) 1967: Queensland (VK4) 1963, 1970, 1971: South Australia (VK5) 1954, 1955, 1964, 1965, 1972, 1974, 1975, 1976, 1979, 1980,

1974

1981, 1982, 1983, 1984: Western Australia (VK6): 1952, 1953, 1956, 1957, 1958, 1961, 1962, 1966: Tasmania (VK7) 1949, 1950, 1951, 1959, 1960, 1968, 1969.

In 1957 the Federal Executive inaugurated the idea of 'going to air' prior to the Contest with an official opening address given by some notable person, firstly to add prestige to the event and secondly as a means of keeping the name of amateur radio in the news. In the early years the address was preceded by the National Athem and the introduction of the speaker by the Federal President or another official of the WIA. The information was given to the press. These arrangements do not appear to have been continued in more recent years. The following distinguished people have willingly given of their time to open the Remembrance Day Contests since 1957 —

1957 — His Excellency the Lieutenant Governor of Victoria, Lieutenant General The Honorable Sir Edmund Herring, KCMG, KBE, DSO, MC, ED.

1958 — The Right Honorable Robert G Menzies, Prime Minister of Australia.

1959 — His Excellency, Colonel Sir Henry Abel Smith, KCBO, DSO, Governor of Queensland.

1960 — The Right Honorable, The Lord Rowallan, KT, KBE, MC, Governor of Tasmania.

1961 — His Excellency, Lieutenant General, the Honorable Sir Eric Woodward, KCMG, Governor of NSW.

1962 — His Excellency, Sir Charles Gairdner, KBE, CBE, KCMG, KCVO, Governor of Western Australia.

1963 — His Excellency, Sir Rohan Delacombe, KBE, CB, DSO, Governor of Victoria.

1964 — Rupert H Arnold, QPM, Chief Commissioner of Police in Victoria.

1965 — Major General Ivan N Dougherty, CBE, DSO & Bar, ED, B. Economics, Director of Civil Defence in New South Wales.

1966 — Brigadier A E Brown, CMG, OBE, Director of the Pacific Region of the Commonwealth War Graves Commission.

1967 — The Honorable Allen Fairhall, MHR, Minister for Defence.

1968 — The Honorable Sir Paul Hasluck, MHR, Minister for External Affairs.

1969 — The Honorable Phillip Lynch, MHR, Minister for the Army.

1970 — Horrace S Young, Controller Radio Branch, Central Administration, Post-Master General's Department.

1971 — Air Vice Marshall Sir Richard Williams, KBE, CB, DSO.

1972 — G Maxwell Hull VK3ZS, Federal President and Honorary Life Member of the Wireless Institute of Australia.

1973 — Myles F E Wright, Chairman, Australian Broadcasting Control Board.

1974 — Senator Reginald Bishop, Postmaster-General of the Commonwealth of Australia.

1975 — The Right Honorable E G Whitlam, Prime Minister.

1976 — The Right Honorable Malcolm Fraser, Prime Minister.

1977 — Horrace S Young, Assistant Secretary, Radio Frequency Management Branch, Department of Posts & Telegraph.

1978 — His Excellency, Air Marshall Sir Wallace Kyle, GCB, KCVO, CBE, DSO, DFC, Governor of Western Australia.

1979 — Richard E Butler, Deputy Secretary General of the International Telecommunications Union (ITU).

1980 — The Honorable Anthony A Staley, MHR, Minister for Posts & Telegraph.

1981 — The Right Honorable Ian Sinclair, MHR, Minister for Communications.

1982 — David Jull, MHR, Member for Bowman, Chairman of the Federal Government Communications Committee.

1983 — Bruce Bathols VK3UV, Federal President, Wireless Institute of Australia.

1984 — The Honorable Michael Duffy, MHR, Minister for Communications.

The opening address for the 1985 Remembrance Day Contest will be presented by Richard L Baldwin W1RU, President of the International Amateur Radio Union (IARU). Mr Baldwin will also be visiting Australia during the WIA's 75th Celebrations this year.

The 75th Anniversary Year of the WIA records the thirty-seventh Remembrance Day Contest. On this occasion the Institute looks forward to a high percentage of participation.

WE WILL REMEMBER THEM

AR

HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

As announced at the bottom of last month's notes, I will be continuing to write this segment of the magazine and look forward to the future and the assistance that has been received from so many.

Entering into the fifth year of gathering, writing and correlating information is not getting easier in lieu of the band conditions which, to the newcomer and old timer alike, are not very lively, but there is DX there and it is going to seem a lifetime before an amateur, who is newly licensed, or someone who has recently been bitten by the DX "bug", will notch up their first 100 countries.

It will seem an eternity before you will receive confirmations, but take heart, as the majority will come. Remember that many countries have only access to their QSL bureau for inward and outward cards and all packaged cards are sent by surface mail.

If you are a real DXer you will acquire lots of patience and suffer many frustrations before you gain your DXCC but don't give up as you will make many life long friendships along the way. Good luck!

DESPERATION

Greg Wilson N4CC, is offering one year's subscription to QRZ DX for the first person to supply him with information leading to a QSL confirmation from Hal VS9PJV, for 1971. Readers dig deep and think hard, as QRZ DX is an excellent weekly publication. Greg would also appreciate to know if anyone was a recipient of a VS9PJV card. His QTH is Route 2, Box 553-A, Yulee, FL 32097 USA.

GOUGH ISLAND

A diary note for October. Art VK3UX, reports that Sam ZS2SI, has indicated that Gough Island 40 10 Sand 9 45 W may be activated sometime in October and the call will be ZD9GI. QSLs to ZS2SI.

MANY CALLS — MANY LOCATIONS

Many VKs have worked Jose Ahumada, however many may not recognise the name but surely LU2ZY from the South Sandwich Islands, will ring a belli

Born in 1926, Jose lived all over Europe with his family in the 1930s. He obtained his law degree in Argentina then entered the Argentina Diplomatic Corps in 1951. He has held a licence for forty years and been the IARU Liaison Officer for thirty years as well as serving as the General Secretary of the Radio Club of Argentina.

Jose has operated as LU2ZY (1955), LU3ZY (1977) and LU5ZI (1981 and 1983) from the South Shetland Islands, LU8DX and LU1ZE from Staten Island and the Antarctic respectively, LU5ZA, LU1ZA (1983) and AZ5ZA in 1984 from the South Orkney Islands. Other calls he has held include LU0CQ/MM, LU2ZA, LU2ZC and LU2ZS. His first call was LU8CW, with which he made DXCC number 252 in 1951. No mean effort!

He is now retired and lives at either his Buenos Aires or Springfield QTH with his XYL Patricia LU3YL, sometimes heard LU3YL/W4. Patricia has beaten Jose to the DXCC Honour Roll with a score of 311; Jose is six behind her but is sure to make it up from the Buenos Aires QTH with equipment such as a TR7, TS930, Alpha Linear and a TH7DXX at a height of fifty-five metres.

Jose has given many a new country and I am sure all DXers wish him a very healthy and happy retirement. Also a few more DXCC countries to bring him on the Honour Roll with Patricia.

The above was adapted from the Carolina DX Association Bulletin and QRZ DX, for the benefit of those that may possess cards from this amateur duo.

DAMAGED CARDS

All cards for NG84O have been mailed to those who supplied envelopes and IRCs. All others are en route to the bureaus. Inadvertently some printer damaged cards got into the mails, these can be replaced by either returning the card or providing log data to K6LAE with an envelope and IRCs. Please do not hassle Dick NG6GO about this matter.

ZC4 AGAIN

Don Search W3AZD, in charge of the ARRL DXCC Desk, has nominated the following ZC4 calls that are definitely valid for DXCC purposes as a Sovereign Area Base.

The calls that will count for a new country include ZC4AB, AK, AKR, AM, ASG, AU, BI, BSG, CB, CI, CN, CS, CT, CW, CZ, DA, DY, EPI, ES, ESB, ESG, FE, GB, GM, HC, HMS, HS, ID, IK, IO, JB, JE, JH, JU, JV, KF, LC, MR, MT, NL, PC, PM, RB, RM, RP, SC, SJ, SS, TEN, TI, TX, UHF, VHF, WD and WW.

Yours truly hasn't had time as yet to seek out the ZC4 cards, or seek out the current active stations.

SATELLITE DXCC

The ARRL have announced that "Contacts made via AMSAT and OSCAR 10 will be now accepted for the Satellite DXCC Award. Credit is retrospective to the date OSCAR 10 first became available for contacts". The report on W1AWs ARRL DX Bulletin remarks that the certificate is a non-endorsable, one time only award and applicants must submit forms CD164 and CD253, which are obtainable from Newington by supplying a 190 x 100mm self addressed envelope and adequate postage.

BEEN THERE, BUT COULDN'T TRANSMIT

All DXers hearts went out to Erik SM0AGD, and crew over the St Brandon effort that was a non event, even though they had received provisional permission from the Mauritius Department of Telecommunications with the promise of a licence on their arrival.

On arrival in Mauritius, a 3B8 licence was issued but they were told that St Brandon and Agalega were "out of bounds" to visitors, hence no licence. Every effort was made through diplomatic channels to "officialdom" but no definite answer was given.

They met the skipper of an Australian boat, the AURA II, who was tripping to and from St Brandon with scuba divers and with the Immigration Officer's approval, they went along with the hope of permission being granted and that if Jacky 3B7CF came along, his call could be used. Jacky, the day prior to departure, was alerted of the fact that he too was not permitted to operate from the area.

Erik and Thor LA7XB, made the 77 hour trip and even went ashore and erected a vertical in case permission was granted. Permission was never granted and the people that pirated 3B7 during the period never went through the trauma and frustration that Erik and Thor endured.

It is a pity that Erik, one of the world's best DX operators and QSLers, who has given so much to the hobby from various parts of the globe, was "conned" into making a fruitless and expensive trip to give someone a new country. Thank you Erik and congratulations on your integrity not to transmit and hope you get accreditation at a later date, as has been done so often, in similar situations in the past.

It is hoped that your faith in the hobby has not been destroyed by "officialdom and red tape" but being aware of your tenacious and determined character I am sure you will be heard from another prime location in the near future.

KE5KK is not the Manager of 3B7CD that was a pirate station.

ENTERPRISING

It was interesting to see an article entitled "Recycling Amateur Radio QTHs" in the May edition of World Radio where Mary N6KLM, has set herself up in the business of becoming a broker for the buying and selling of amateur QTHs.

Mary, who is becoming an avid DXer and is well on the way to acquiring her Extra Class licence, is working on the theory that it is a waste to remove an antenna installation and then go through the trauma of getting new permits etc. So amateurs sell to amateurs and buy from amateurs. It is a brilliant idea but not a first though Mary!

Many years ago, Keith VK3ANI and his XYL Pam, now VK6KN, had difficulties selling their QTH. No better place than Hamads in this news magazine, he thought. A evening city paper columnist, with a prime position in the paper that money couldn't buy, picked it up and reported it. The phone ran hot and the property was quickly sold with no agent's fees!

POLICE/FIRE GAMES

The San Jose (California) State University Amateur Radio Club will be on the air this month under the call W6YL as a special event station for the 1985 World Police/Fire Games. These games have attracted some 10,000 athletic participants from around the world.

Main operation of the station will be from 1900 UTC on the 4th August to 0700 UTC the next day. This pattern will continue until the 7th, then limited operation until the close of the event on the 11th. Frequencies to watch are 7.240 and 14.270 MHz for SSB. CW is catered for on 7.125 and 14.040 MHz.

To gain a commemorative certificate, send your QSL and a large self-addressed envelope with two IRCs to SJSU ARC, c/- Student Programmes and Services, PO Box 2, San Jose State University, San Jose, California, CA 95192 USA.

DILEMMA?

Have you received your CE0AA card yet? Mickey CE3ESS, has a hunch that mail to PO Box 700 is being "lost" and suggests either of these addresses. Radio Club de Chile, PO Box 13630, Santiago, Chile or Mickey Gelderstein, PO Box 9834, Santiago, Chile. This column recommends that it be sent Registered Mail. The expense is high, but San Felix will not be heard again for a long time.

TEN METRES NOT DEAD

Ian ZD8LJ, made 436 contacts in five hours of operating. Not bad operating and just under 10 percent were on 10 metres. He hopes to return later this year and stay for one week. It pays to listen and scan the bands.

RUGGED UP — NOT REALLY

The latest edition of Weather News, the house journal of the Bureau of Meteorology has a photo of the Macquarie Island Bureau's staff. Included are Denise VK0YL and Graham VK0GC, looking very fit in casual dress. The rubber boots really don't suit Denise but I am sure they would keep the feet dry. It is hoped she can appear as soon as duties permit.

MONACO

Valid licences are only issued to residents of Monaco. Due to the operations of some operators of late purporting to be licenced, the Monaco Amateur Radio Society will be making representations to the ARRL. This of course refers to the cards being sent out by EA5AGY for an operation by EA5FDO, who was signing 3A2TO. The endorsement of 103/3A means nothing to the authorities and the latest issues are in the 3A2T-series.

ENTHUSIASTS OF 160 METRES

One for the diary. Manfred DK9CG/TK, will return to activate Corsica next month with the accent being on 160 metres. Write and set up a sched now!

PITCAIRN ISLAND

Jim G3OKQ/VR6JR will be active on the bands as time permits. Jim is on the island, in a voluntary capacity, to assist in repairing the wharf. QSLs to his home call will be attended to when he returns.

GUAM/KH2

A note has been received from Ed KB6DAW/KH2, Secretary of the Mariannas Amateur Radio Club (MARC), which supports the island communications system for many diverse activites.

Some of the active amateurs on the island include WH2ACV, KG6RN, KG6JJH, AH2AN, KS0C and KB6DAW/KH2 on SSB. CW is not forgotten as K0AX, KS0C and AH2G are exponents of that art with W1YRM and KG6DX concentrating on OSCAR.

Ed notes that being in the Pacific directly north of Melbourne has a few advantages, as in the two years he has been an amateur, he has notched up Worked All States (WAS) and some 205 countries.

Confirmations are low, as only 124 (60 percent) have come to light so far.

All of the operations like to have a "rag chew", so if you hear a Guam station, give them a call and have a chat. Of course Ed notes that anyone who has the opportunity of visiting the island would have a lot of fun on the radio as DX is usually open to some part of the globe.

MAIDENHEAD SQUARES

This has taken on and of the 324 "Fields" some SM stations have really got amongst it. SM3CWE has 42 on 1.8, 122 on 3.5, 139 on 7.0, 220 on 14, 158 on 21 and 128 on 28 MHz. Not a bad effort!

So if you hear an SM know your Maidenhead reference to save embarrassment.

BITS AND PIECES

Doug J6LDB was formerly T30DB. ** II2ARI was celebrating the 111th anniversary of the birth of Marconi. ** KG4DX is now QRT. ** Don W6AM, the Gentleman Dxer sadly became a Silent Key in May at the age of 86. ** UA3SYC/1 is another Franz Josef Island Station. ** All NCDXF beacon reports go to W6RQ. ** 4X85WSE was active from Tel Aviv for the World Stamp Exhibition. ** Ross WB6GFJ/VK4BZZ/FO0FB, a WIA member will be visiting VK this month. ** Francis FW8AF, is due to go QRT shortly leaving no activity from Wallis Island. He can be heard daily around 14.275 MHz working F8RV. QSL to PO Box 92, Matautu, Wallis Island, via Noumea, South Pacific. ** More TA and BY stations appearing on the bands. ** 3X0HAB, generally above 14.300 MHz, will be QRV until December, then home to DL before embarking to ZL. ** Listen for AH3AC/TF who hopes to activate Jan Mayen this month. Call unknown. ** Another to listen for over the next few months is G4RWJ/SU. ** XZ2HN is quite active?? ** 9X5WP gives his QSL info as WB6VKD.

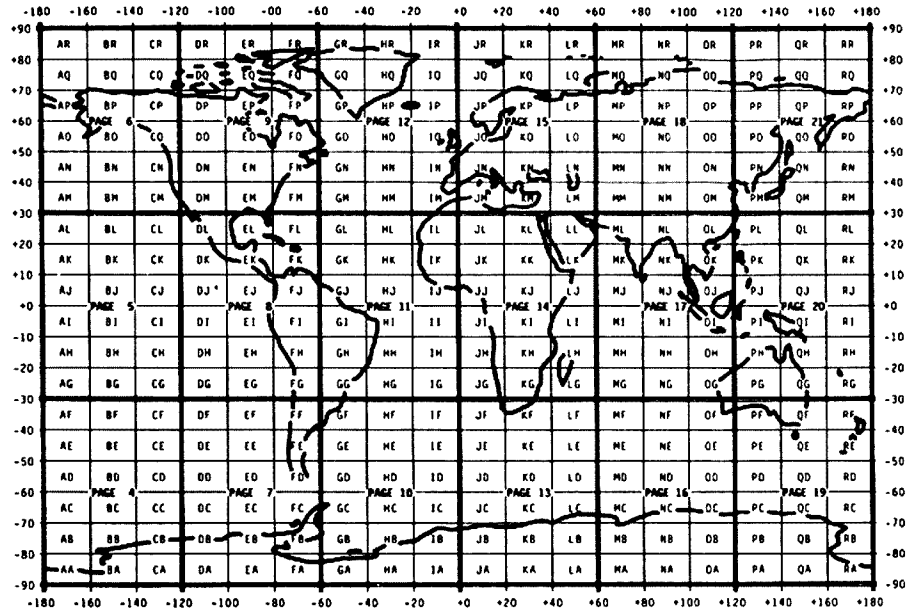
QUIET BANDS

According to Steve VK2PS, WIA Federal Councillor for the VK2 Division, the band conditions have been very poor. Steve busy as he always is with Institute affairs, managed to work a few interesting stations such as GW2SB, HG19HB*, JW6VDA — QSL via LA5NM, KL7JA, NA6T/KH4 (Midway Island) QSL to KD7P, SP6HEK and YO2BEH on twenty metres. Forty metre contacts included CE0ZIG*, CT3DZ, FM5CD* and YV4DJZ. Down on 160 metres 3D2RN* was the only station logged. *(* donotes CW).*

Steve had time to browse through some of the cards he received such as AH8/DL1VU, GB2FAS (Farnborough Air Show Special Station), HA5TL, HL9TA, IT9AUA, LZ1BC, SP40LWP (Commemorating 40 years of the Polish Army) and VK9LH.

Joy VK2EBX, has a few snippets of interest that are worth passing on including the correct address for FG7CBS, QSL Manager for FG4CB/FS which is Adolph Brin, Route de Colombier, F-97133, St Barthelemy, French St Martin. Another QTH of interest Joy has sent is that of OX3KM. QSL to PO Box 103, Godhavn, Greenland 3953.

Our YL poet has been getting some rare ones such as Nanda 4S7YLR, 9M2MM, DJ0CP (YL), HH7PV, PA0QX and Chitra VU2CVP on 20 metres. Forty has yielded A35PP QSL via ZL4QS, CE0AE — WA3HUP, C6ANU, Barbara CP5LE, EA8ANT, HC5EA, VY1CW, XF4MDX — XE1MDX and Peter ZK2IK, whose QSL arrangement is 16 Jessie Street, Petone. NZ.



Maidenhead Field Map — The Radio Amateur's World Atlas containing 32400 Maidenhead Locator Squares is available from WIA Divisional Offices.

The operating console of BY1PK.

SILENT KEY

All DXers will be shocked to learn of the sudden death of Father Dave Reddy CE0AE. Dave suffered a massive heart attack on the 4th June and passed away two days later.

Dave was an avid and meticulous DXer, as well as a thorough gentleman at all times, that experimented on bands from 160 to 6 metres. He gave most VKs and Pacific stations, in the last decade, Easter Island as a new DXCC Country and was willing to make scheds at any hour of the day or night to accommodate a new country for anyone that requested it. This was no mean feat, as the hours of his occupation were very demanding.

His QSLing was ably carried out by his dear friend, Mary Ann WA3HUP, with whom he had regular scheds to transfer his logs, so there would be no holdups in his cards being returned to the recipient.

A sad loss to the fraternity and the populace of Easter Island, Dave's cheery voice will be missed by all amateurs worldwide.

HEARD ISLAND AGAIN

According to reports, the Nella Dan is departing from Hobart on the 16th September, enroute on a Marine Scientific Cruise. Heard Island will be the first port of call, with an expected arrival time of the 29th September, departing next day, after a meteorologist, glacierologist and others in the group have been put ashore, possibly by helicopter, to conduct short scientific studies.

This vessel is scheduled to rendezvous with another Antarctic tripper, the Ice Bird, prior to its return to Heard Island on the 29th October. It is scheduled to leave again on the 5th November, call in at Kerguelen Island next day and return to Hobart on the 22nd of November.

At this juncture, it is unknown if any amateur activity will be involved during the cruise.

VIARC

The Vienna International Amateur Radio Club's first Newsletter and an accompanying letter from the Station Manager, John NK4N/OE3ZOC, who also doubles as the Newsletter's Editor, provides some interesting reading.

John notes that it would help them considerably if members requesting cards from 4U1VIC, send them to the Austrian Bureau and not the operator. If sent direct, please two IRCs, not Austrian stamps, as amateurs and SWLs generally send stamps to the value of seven schillings, which isn't adequate for air mail postage and secondly they cannot be posted at the United Nations Post Office in the Vienna International Centre. With two IRCs, the club will post air mail with UN Vienna stamps.

John mentions that the club appreciates the service provided by the Austrian Radio Club, in assisting, as being the pick-up point for their cards and it really speeds cards up if the operator's name is on the QSL.

Some good news is that they are proposing to erect a three band beam in lieu of the vertical, that has done such a sterling job. This however will take time and it may be some time before it appears and the signal is more easily heard in the Pacific.

THANKS

Sincere thanks are extended to the following that have allowed these notes to be written. The Editors of weekly, bi-weekly and monthly newsletters including the ARRL NEWSLETTER, RSGB DX NEWS, QRZ DX, LONG SKIP, DX FAMILY FOUNDATION NEWSLETTER, JAN and JAY O'BRIEN'S QSL MANAGER LIST and KH6BZF REPORTS. Magazines including WEATHER NEWS, CQ, cqDX, QST, RADCOM, JARL NEWS, JA CQ, 73 for Radio Amateurs, BREAK IN and VERON.

Members who have contributed include VKs 2PS, EBX, 3FR, YJ,YL, WB6GFJ/VK4BZZ/FO0FB and G3NBC. Overseas amateurs include KB6DAW/KH2, G1EOD, ON7WW and ZLIAMM. Sincere thanks to one and all.

1296.171	VK6RBS	Busselton
1296.480	VK6RPR	Nedlands
10300.000	VK6RVF	Roleystone

A note in the "West Australian VHF Group Bulletin" for me drew my attention to the wrong frequency for VK6RPH and this has been corrected in this issue to 52.460. It was also mentioned the 6 and 2 metre beacons VK6RPH are only at Nedlands CAE temporarily, and expected to be back at Bickley in two months, so this could be achieved by September.

SIX METRES

Nev VK2QF, in sending in his corrected six metre standings, wrote a short note to say there had been no current six metre activity. However, the note bears a PS which said the six metre band opened on 9/6 at 0629 when he worked VK3XQ at 5 x 2 , at 0632 VK3YDE 5 x 9, VK3DUT weak, and at 0641 VK3ZYN at Geelong 5 x 9 but with heavy QSB. The VK7RST and VK7RNT beacons had been heard at S1 prior to working the VK3s. Nev's comment "six metres never dies, it just fades away at times!"

From Japan comes a short letter from JA1VOK, which says that XX9UT followed by JA1UT worked about 360 JAs with all areas on 28/4, 1/5, 2/5, and 5/5. The DX-pedition to XX9 (Macao) was the first for the six metre band. JA1VOK worked XX9UT at 1026 on 28/4 at 5 x 9.

JA1VOK on 28/4 also worked VK4JXZ at 0953 and VK8VV at 1155. VK8GB was worked at 0852 on 13/4. Also George DU1GF in Manila who has been active on six metres since Cycle 19, and is 73 years of age, 5 x 9 signals about 4 weeks apart on 2/3, 6/4 and 5/5.

David VK2BA sends his Six Metres Standings List, and mentions on a recent tour of the east coast of Queensland he met many six metre operators, including John VK4TL, Ross VK4RO, Harold VK4ANR, Lloyd VK4FXX, Lyn VK4ALM, Ron VK4FTJ and Dave VK4TUA. He spoke to a number of others after fossicking them out on two metres and then going to six!

During the last few days of April David heard the following on his mobile rig: JA2DDN, JA4MBM, plenty of JA5s, H44HIR and P29BPL beacon, and worked P29PL and P29ZFX. Looks like he had a rather busy trip.

David included a couple of pages from the April 1985 Solar Geophysical Summary from the Ionospheric Prediction Service, which in general comments on Solar Activity states: *"Solar activity was low until 21 April when a region began to grow rapidly producing an M class flare on 22 April and an X class flare on 24 April. The region appeared to be capable of producing further events for much of the remainder of the month but did not do so.*

"An interesting feature during the month was a region of reversed polarity to that normally observed for similar regions during the solar cycle. The polarity of sunspot regions reverse from one solar cycle to the next and so the region observed this month can be regarded as one of the first regions of the next solar cycle." David comments: *"Anyway, it is nice to know that the sun is at least thinking about the new cycle!"*

Under the heading of "Geomagnetic Disturbances" the notes said on 23 to 25 April the magnetic field was at unsettled to active levels, and 26 to 30 April the magnetic field at active to storm levels particularly on 28 April when major storm levels were reached. There was also an intense magnetic disturbance on 20/21 April, the A index for 21 April was 77 which makes this day one of the most disturbed days since 16 November last year.

September and October of course are the equinoxial periods when there is a greater possibility of extended DX including trans-equatorial. It is noted in QST's "World above 50 MHz" that Europeans have been worked from the US east coast every summer for the past four or five years, and Japan was worked from the west coast in June 1977 which was well before the peak of Cycle 21, so it will be the vigilant operators who grab the occasional DX which could appear and usually for very short periods. Suggest you keep the antenna looking out across the Pacific for the next few months at least.

50 — 54 MHZ DX STANDINGS

DXCC Countries based on information received up to 15th June 1985. Crossband totals are those not duplicated by 6 metre two-way contacts. Credit has not been given for contacts made with stations when 50 MHz operation was not authorised.

Column 1: 6 metre two-way confirmed
2: 6 metre two-way worked
3: Crossband (6 to 10) confirmed
4: Crossband (6 to 10) worked
5: Countries heard on 50 MHz
6: Countries heard on 52 MHz

VK6RO	9	9	3	3	2	3

The minimum number of countries confirmed for an operator to commence being listed is five, including VK.

The next list is due to appear in February 1986 and entries will need to be on my desk no later than 15th December 1985. Claimants are reminded full details of all contacts are required, they being the date of the contact, time in UTC, call sign of station worked, country, mode, report sent and received, QSL sent and whether received. Split frequency contacts should be indicated, and please add YOUR call sign and signature, plus the date of your claim.

Most of the submissions sent to me so far have been very neat and precise and are a great help in determining eligibility. Computer printouts and updates are quite acceptable!

The accuracy and eligibility is as correct as I can determine. I have been told some contacts by certain operators were concluded on 28 MHz after 50 or 52 MHz faded out, but in the absence of any proof of these other than what I hear there is really nothing I can do. Obviously I cannot hear everything that goes on the VHF bands! DX standings are obviously at the mercy of the honesty of the claimants and I believe in general they are honest claims.

There are quite a few operators around Australia who have worked a considerable number of countries and who are not included on this list and it would be great to have them included — *what about it chaps?*

EME ACTIVITY

Chris VK5MC has advised me that during November the ARRL EME Contests are to be held on 2nd and 3rd and 23rd and 24th. This is a very interesting period as there will be many EME stations operating on 144 MHz and some of these stations are capable of being heard by ordinary operators with reasonably established 144 MHz stations.

Whilst you may think this could not interest you, however, you many recall I mentioned in these notes last year that as a result of my listening I was able to identify no less than 14 EME stations from all over the globe. My antenna system does help of course, being a stacked pair of 13 elements with a masthead preamplifier, but there are many stations now working through OSCAR who should be capable of hearing some signals, particularly as they have the capability of elevating their antenna system whereas I cannot, being tied to the rising and setting moon only.

Last year Chris VK5MC gave me a computer printout for my location and this included azimuth and elevation bearings plus GHA and declination for the moon. I have a similar printout for this November and Chris has indicated he is willing to provide a printout for any operator who is serious about giving it a try based upon having a system with a reasonable chance of hearing something.

If you would like to give it a go, please contact Chris Skeer VK5MC, Hatherleigh, SA. 5280, giving details of your latitude and longitude, enclosing a large stamped self addressed envelope *(repeat . . . I mean quite a large envelope)* plus three 33c stamps. Contact should be made with Chris as soon as possible as he does not have unlimited spare time, and some effort is needed to make these printouts so be fair and give him as much time as possible. Good luck with your efforts, but you are advised you may need to get out of bed early a couple of times to do it properly!

Further on the EME scene, Doug VK3UM sends

information of his 432 MHz EME activity during May. ON 25/5 contacts were made at random with the following: 0332 K5JL 449 received, 449 sent; 0355 ZL3AAD 449/439; 0410 JA4BLC 559/559 on CW, also worked on SSB at 3 x 3 and 3 x 3; 0511 W7GBI 449/0; 0835 a CQ resulted in YU1AW 549/559 on CW and 5 x 5/5 x 5 on SSB; 0855 I5MSH 549/549; 0915 DK1UV 439/449; 0930 SM1BSA 0/0; 1000 SM6EUP 0/0; 1035 OK1KIR 449/449 and 1055 DF3RU 449/0.

On 26/5 there was bad libration fading which made contacts difficult but the echoes were good. 1005 DK1UV 0/0 and 1027 G4NQC 0/0. These contacts have now given Doug five new stations, one new country for a total tally of 37 initial contacts in 16 countries. This is rather a good effort when one considers most of the contacts have been random. Good to hear from you again Doug.

The Illawarra Radio Group via "The Propagator" and Lyle VK2ALU did not make any contacts since the last report but upgrading of the equipment continues. It was pleasing to note that Lyle VK2ALU has been awarded a Life Membership of the Illawarra Amateur Radio Society. He was a foundation member in 1962 when the club was reformed, and President during 1967/68 and other administrative posts since then.

Eventually the Club acquired the use of the CSIRO radio telescope dish at Dapto and Lyle became involved in its rejuvenation and the first EME contact by VK2AMW, the Club station, was on 10/3/73 on 432 MHz. Vandalism at Dapto eventually caused the dish to be moved to a safer location and further work saw the dish being used on 1296 MHz, much of this work being performed by Lyle. His efforts had not gone unheeded though, as he was presented with the Ron Wilkinson Award by the Federal Executive of the WIA recently.

We congratulate you Lyle on receiving both your Life Membership and the Ron Wilkinson Award, and now that you have retired from the Electricity Commission of NSW hope that you will have even more time to pursue your hobbies and other pursuits, particularly, of course, EME.

CONTACTS FROM SYDNEY

Gordon VK2ZAB has again written in a different vein this time, and believes it would be of interest to others to know what it has been possible to work from his location at Berowra Heights in Sydney on 144 MHz SSB during the period 16th April 1985 to 31st May 1985, listing contacts over 200km only.

STATION	Number of times contacted	Location	Approx distance from VK2ZAB
VK2MQ	11	Moree	474 km
VK1RK	10	Canberra	262
VK2EVB	8	Coffs Harbour	412
VK4LC	3	Eagle Heights	644
VK4AGQ	8	Brisbane	700
VK2DGT	1	Coffs Harbour	412
VK2DDG	2	Byron Bay	596
VK2ZRE	12	Adaminaby	342
VK3UM	4	Melbourne	696
VK2EKT	7	Queenbeyan	260
VK3ZBJ	3	Melbourne	740
VK1BJ	20	Canberra	262
VK4KJL	6	Brisbane	700
VK3TV	1	Strathbogie	620
VK3KEG	10	Melbourne	740
VK1GL	14	Canberra	262
VK3AUG	2	Melbourne	740
VK3NM	1	Melbourne	735
VK1AU	3	Canberra	262
VK2ZJK	16	Tamworth	280
VK4AUR	4	Brisbane	700
VK4BAT	1	Brisbane	700
VK2CTB	1	Tamworth	280
VK2AKU	3	Narrabri	384
VK2DVZ	4	Taree	228
VK2YEZ	2	Griffith	476
VK2EJJ	1	Wagga Wagga	384
VK3AZY	1	Melbourne	735
VK1ZEI	1	Canberra	262
VK1BUC	2	Canberra	262
VK1KRS	1	Canberra	262
VK1ZQS	1	Canberra	262
VK1BX	1	Canberra	262
VK1VP	1	Canberra	262
VK1CJ	2	Canberra	262
TOTAL	**168**		

Contacts over 200 km on 70 cm SSB from VK2ZAB 16th April 1985 to 31st May 1985.

VK1ZQS	1	Canberra	262 km
VK1CJ	1	Canberra	262
VK1GL	1	Canberra	262
VK1VP	2	Canberra	262
VK1BG	2	Canberra	262
VK3UM	3	Melbourne	696
TOTAL	**10**		

The VK2ZAB 144 MHz station runs a TS700A with 400 watt PEP linear and BF981 preamp to four 9 element horizontally polarised Yagis. On 70cm the station runs 10 watts from an IC490A and four 11 element Yagis.

The one thing that continues to upset Gordon is the action of some selfish or uninformed people insisting on conducting local QSOs on the calling frequencies on both bands. One such case occurred as Gordon was compiling the above list, when 144.1 was occupied for two solid hours by local QSOs without a break! Anyone wanting to use the calling frequency or even just monitor it for possible DX had no show whatsoever. *(Fair go chaps, those concerned are hardly playing the game . . . 5LP).*

Gordon concludes his letter by saying *"The only comment I would make is 'Who says there is little activity on 2 metres SSB?'"* It certainly is to be found in the three eastern States by looking at the above lists, perhaps VK5 misses out through lack of interest or through our lack of activity the antennas are not turned this way very often!

IN GENERAL

It's fairly obvious it has been rather quiet during the cold months when many operators migrate to the fire inside the house. There are the occasional contacts across the border to VK3 by the dedicated.

The 21st anniversary of the South East Radio Group Convention went off rather well on the holiday weekend in June. VK3 won the coveted SERG Trophy this year. There was a good attendance despite the rather wintery conditions, but this did not seem to deter the participants in the various fox hunts and hidden transmitter hunts. The usual Grand Tea completed the proceedings on the Sunday.

From "Break-In" — *"Those who think the standard metre is a length of metal enshrined somewhere in France must think again. Things have changed. From being defined in terms of the wavelength of orange light emitted by atoms of krypton the standard metre is now "the length of the path travelled by light in a vacuum during a time of interval of 1/299792458th of a second.' ZL1HV."* Now don't say you didn't know!

From the Antarctic at Mawson Base Mark VK0AQ has been having quite a deal of fun working through OSCAR. It takes a bit of effort however, as the day temperatures at the moment there are around — 26°C and the shack does not boast of too much heating. He has overhauled the VKOMA beacon on six metres and has had it running, but due to a shortage of power it will not be turned on constantly until more towards the warmer months, so we might hear him yet via Es.

Closing with the thought for the month: *"Happiness is having friends who laugh at your stories when they're not so good and sympathise with you in your troubles even when they're not so bad."* 73. The Voice in the Hills.

AR

EDUCATION NOTES

Brenda Edmonds, VK3KT
FEDERAL EDUCATION OFFICER
56 Baden Powell Drive, Frankston, Vic 3199

Work has now began on preparing study guides to complement the revised syllabuses. Discussion with other past and present lecturers tends to confirm my view that we all set our own study limits according to our own ideas and that we are prepared to defend our opinions, sometimes quite fiercely.

The study guides are intended to provide common standards for lecturers, students and DOC. They should be especially helpful to students trying to work on their own. No guide will satisfy everyone, but the required depth of study will be set out and we hope to present statements of our expectations of student capability at the end of each section.

It is not possible to reconcile the different attitudes of various lecturers — from a simple wish to get as many passes as possible to attempts to present a high level course with exam passes of less importance. A good study guide should help the student to cope with the lecturer.

As I have said previously, lecturers fall into two groups — those who see the aim as to help the students pass the exam which gives them a 'licence to start learning' and those who see the theory and truth as the important factor that the new licensee should be fully qualified before he begins to operate.

Most lecturers consciously try to achieve a balance, but it is difficult to completely suppress all bias. Perhaps the emphasis should change as the students progress from Novice to Full Licence.

No amount of discussion will completely eliminate some points of argument about particular questions or exam papers. The February Novice Exam seems to have been the "hardest" for some time, but, strangely, I had very little criticism of it. The results were the worst for which I have records — an overall pass percentage of 22.9 percent compared with figures between 40.5 percent and 54.4 percent from May 1981 to May 1984.

There have been apparently unreasonable variations before — eg. VK2 pass rates have ranged between 23.4 and 61.6 percent in samples of about 200 candidates. There are many possible reasons for this range apart from exam standard, but the February 1984 results were bad in all states except VK6.

I do feel that this exam was more difficult than previous novice theory exams, but surely not enough to have such a marked effect.

Perhaps it is a more realistic paper of a more appropriate standard — many amateurs would be pleased to see the standard raised. But it must have been disappointing for those who have expected a pass rate of about 45 percent.

Statisticians please note that I am not attempting a statistical treatment of data, although I do intend to tackle something in that line soon. It should prove interesting.

To all those sitting for the August exam, please do not let the above discourse cause extra stress and worry. Remember — READ THE QUESTIONS — there is only one question difference between 68 and 70 percent.

Best of luck to all candidates. I'm sure your exam will be the easiest for years.

Comments on education matters are welcomed on the Education Net — Thursday, 1130 UTC 3.680 MHz or thereabouts. The lack of response to my CQs in the Novice band suggests that it is not worthwhile continuing the exercise. 73 Brenda VK3KT

POUNDING BRASS

Marshall Emm, VK5FN
GPO Box 389, Adelaide, SA 5001

LEARNING THE MORSE CODE (REPRISE)

Happy birthday Pounding Brass! It's hard to believe it, but this issue marks the commencement of the fourth year of the column's publication. Since an intention of the column from the very start has been to assist newcomers it is perhaps appropriate to review a subject originally dealt with in the October 1983 issue — how to go about learning the Morse code.

What made me think of it now, of all times, is that I received a letter from Gordon VK3BGB, the Secretary of the Frankston and Mornington Peninsula Amateur Radio Club, back in February (not long before this was written). The letter said that the Club's Vice-President, Graham VK3BL had read my article on CW instruction and the Club had adopted the method for their 1984 Novice Class. Of thirteen students who started the course, three dropped out and ten sat the exam. Of those ten, **nine were successful.**

I hope they won't mind my publicly congratulating the new Novices and more particularly the instructor(s). I appreciate the compliment regarding the method, but a method is only a tool. A good carpenter can do good work with poor tools; a poor carpenter will do a poor job with the best of tools. All the credit for the success of those students belongs to their instructors, but I am delighted to think I may have played a small part by making a useful tool available to them. I doubt very much if it is original to the extent that I could lay claim to the method but it is reprinted here in the hope that it may be of benefit to potential brass pounders. . .

There are no magic recipes which will qualify you as a brass-pounder overnight. There are a number of tips and techniques which can make the job easier, but ultimately it's up to you.

When Mr Samuel Morse invented his code, he had no idea anyone would ever be trying to copy dits and dahs from wireless transmission. In the first place, the code was devised for use on the land-line telegraph. In the second place, the intention was for the signals to be transcribed onto a paper tape by a swinging pen, and then read by sight. Once operators learned the code they quickly found that they could recognise incoming characters by the clicks the pen made, and it wasn't long before they realised that it was actually easier. The pen gave way to the sounder.

The Morse code consists of patterns of short sounds and long sounds, interspersed with spaces. Forget you ever heard of dots and dashes (at least till you've learned the code) and think of the short sounds as "dits" and the long sounds as "dahs". This gives you a useful way to represent the sound of the code any time you want — your own voice.

And here, already, is your first secret technique to help make the job easier — now that you know how to say a Morse code letter by using dits and dahs, forget you ever heard of dits and dahs! What you are really interested in is the **sound of a letter.**

For example, when you hear the sound "di-di-dit" you should recognise the sound as representing the letter S. You should not count the dits. Take a more difficult one now. "di-di-dah-dit". Say it over and over to yourself until you recognise the sound of an F without having to think of it in terms of a bunch of dits with a dah toward the end.

The sound of the dits is written without the T (except for the last one) for a very good reason — they have to be said quickly, and you can't manage that if you say "dit-dit-dah-dit". Try it — "dit-dit-dah-dit . . . di-di-dah-dit".

You should now be ready to learn another secret technique, which is related to speed. You should learn the characters at a speed high enough that they sound like Morse characters, not individual dits and dahs. While you are learning the code, the character speed should be at least eight to ten words per minute (I'm not kidding!) with extra space in between the characters to slow the message speed down to something you can handle. This is called proportional spacing.

An exercise which I use when introducing someone to the code for the first time is to send the letter S at a speed of fifty words per minute. Just once, all by itself. Most people can recognise it without difficulty. This proves that there is no problem in **hearing** code characters and remembering them — the problem is in converting them into letters!

You should by now be ready to start learning the code — you've had all the tools you need since the day you were born; it is simply a matter of applying them (or applying youself) to the task at hand.

Ideally you should listen to pure audio tones, such as those sent over the air or by a good practice oscillator driven by a competent operator. You certainly can learn the code characters by saying them to yourself all day long, without benefit of an instructor or tapes, but there are easier ways.

If you can get someone to send to you, have them send at a character speed of 8-10 WPM, spaced out so they send a character every three or four seconds. This gives you plenty of time to recognise the character, but not enough time to mentally go through the whole alphabet until you locate it.

You need a programme for learning the characters. I often hear of people suggesting that the student should learn the "dit" letters (EISH) followed by the "dah" letters (TMO) followed by the combination letters. That method makes it very easy to start, but very hard to finish. I would suggest the following groups, which give you easy letters mixed with hard ones so you don't get discouraged up by Qs, Js, Xs and Zs coming all at once.

AXSET HBDIJ OPORM ZCGNV UYLKWF 12390 67845

Learn each group thoroughly on its own, then add it to the letters already learned, then make up words using the letters learned. Leave the numbers until you have mastered the letters, and you will find them a lot easier.

DO NOT GO ON TO A NEW GROUP UNTIL YOU HAVE MASTERED ALL OF THE LETTERS LEARNED SO FAR.

You can get a lot of practice in by writing the group you are studying on a piece of paper (writing dits and dahs, of course, not dots and dashes!) and glancing at it while on the bus, or at work, or whenever you have two minutes to yourself.

Once you have learned the first group you can start listening to practice tapes and the Slow Morse Broadcasts (VK2BWI, 0930 UTC, 3.550 MHz and VK5AWI, 1030 UTC, same frequency). Just worry about picking out the letters you recognise, and form a good habit now — if you miss a letter forget it and concentrate on the next one. If you strain too hard to remember a letter, you will miss the next several letters and that's a circumstance which could cost you a pass on the exam.

Once you've learned the code, it's just a matter of getting your speed up to the required level (or the level you desire, which should be higher than the required level). The only way to get your speed up is to practice, whether it's listening to tapes or live code on air, having a friend send to you, or calling out license plates from passing cars. Practice, Practice, Practice, and you will find that your speed comes up very quickly. Then all you have to do is learn the commencing and finishing signals and you are ready for the exam. Learn a bit of procedure and you are ready for the air, and that's where we want you to be.

AR

AMSAT AUSTRALIA

Colin Hurst VK5HI
8 Arndell Road, Salisbury Park, SA 5109

NATIONAL CO-ORDINATOR
Graham Ratcliff VK5AGR

INFORMATION NETS

AMSAT AUSTRALIA
Control: VK5AGR
Amateur Checkin: 0945 UTC Sunday
Bulletin Commences: 1000 UTC
Winter: 3.685 MHz Summer: 7.064 MHz

AMSAT PACIFIC
Control: JA1ANG
1100 UTC Sunday
14.305 MHz

AMSAT SW PACIFIC
2200 UTC Saturday
21.280/28.878 MHz

Participating stations and listeners are able to obtain basic orbital data including Keplerian elements from the AMSAT Australia net. This information is also included in some WIA Divisional Broadcasts.

ACKNOWLEDGEMENTS

Contributions this month are from Bob VK3ZBB and Randy VE1SAT/6 through the AMSAT-OSCAR 10 Telementry.

AMSAT-AUSTRALIA NEWSLETTER

Graham VK5AGR, the National Co-ordinator of AMSAT Australia is now producing a monthly newsletter containing updated satellite news, orbital predictions, keplerian data and operating hints and techniques. The objective of the newsletter is to keep the amateur populous informed on the latest information available and to realise funds for the funding of projects or the purchase of an item (items) of hardware for a future amateur satellie project, eg. Phase-3C, Phase 4 or whatever. The cost of the Newsletter is $15 and cheques made payable to WIA (SA Division) should be forwarded to Graham VK5AGR, QTHR.

DJ4ZC VISIT TO AUSTRALIA

Dr Karl Meinzer DJ4ZC, who is referred to as "the father of Phase 3", recently had the opportunity to stop-over in VK on his way to ZL to lecture at the NZART Annual Conference. Albeit only for three days Karl and his XYL Karin visited Adelaide, Melbourne and Sydney on the 27th, 28th and 29th May respectively, and presented excellent illustrated and informative lectures to well attended and appreciative audiences.

For those who were unable to attend any of the lectures the Adelaide presentation was videotaped by John VK5KG the Federal WIA Videotape Co-ordinator and copies can be obtained from John in the normal manner.

To all those people who assisted with Karl's visit and especially to Graham VK5AGR who orchestrated the visit, the Satellite Community of Australia is extremely grateful.

OSCAR-10 ATTITUDE AND ECLIPSES

The following N block was recently received from the OSCAR-10 PSK Telementry. It highlights the repositioning required for OSCAR-10 due to the eclipses it has had to endure due to the final orbit it achieved as against the designed orbit. However, having read the bulletin you may well ask many questions. Therefore this month I am going to present a tutorial to explain the somewhat confusing terminology.

N BLOCK AS RECEIVED

N de VE1SAT/VE6:1459/50. QST: This is planned s/c positions and transponder ON/OFF times for the coming eclipse. (length = 4 wks) Starting 6/7 July till 1 August s/c will be moved from 190 lon to approx 230 lon with a 15 deg or more Lat movement. This remains constant until the first week in September when s/c is moved to 140/150 lon. Commencing 1 August both xponders OFF from MA 30 to 189. Mode L from MA 190 to 206. Mode B from MA 207 to 29. Logic for above is: *30 to 70 = recharge. 70 to 130 = eclipse. 130 to 189 = recharge. 73 Randy.*

POINTS TO NOTE FROM N BLOCK

Spacecraft Lon and Lat.

The term MA (Mean Anomaly).

The revised schedule as from 1st August, which you may note is a RADICAL departure from past schedules, however the inconvenience to the communicator in the short term must be tempered with the life of the spacecraft in the long term.

SPACECRAFT LON AND LAT

OSCAR-10 is a spin stabilised satellite with the spin axis about the Z-Axis of the Spacecraft. The Z-Axis is parallel to the plane of the solar-cell arrays and passes through the geometric centre of the arrays. Put in a very simplistic manner the Z-Axis is also the "boom" of the antennas onboard OSCAR-10, and to get the strongest signals to and from OSCAR-10 the tip of the Z-Axis must be pointed directly at you.

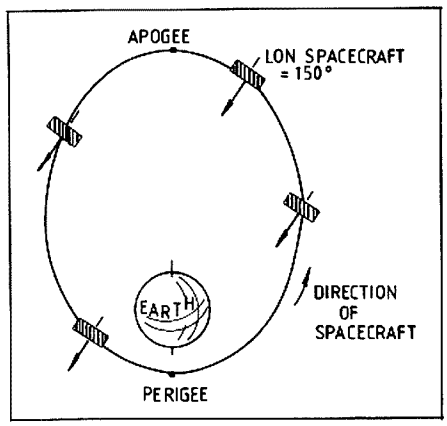

Figure 1 — Attitude of OSCAR-10 through Orbit.

Consequently because OSCAR-10 is spin stabilised at about 25 RPM, its attitude remains fixed in space. Its action is identical to the earth, which is also spin stabilised about the axis through the North and South Poles at one revolution per day. Therefore you must imagine OSCAR-10 at all times in a fixed attitude in space, (refer Figure 1). The complexity comes about when you have to define it to a point on the earth's surface, your QTH. The attitude of OSCAR-10 is expressed in BAHN (Celestial Navigation) Co-ordinates and is best illustrated in Figure 2. When Lon = 180 the Z-Axis of the s/c points at the Centre of Mass of the Earth along the Line of Apsides. Lat refers to inclination of the Z-Axis to the orbital plane of the spacecraft. Positive Lat is upwards from the orbital plane and Negative Lat is downwards from the orbital plane. Introduction of Lat into the attitude of the s/c produces a very complex scenario, as the orbital plane is inclined 26 degrees to the earth's equator. Hence it would be best left at this stage. The terms Lon and Lat referred to in the N-Block are BAHN co-ords and are not to be read as Geographic co-ordinates.

THAT WORD ANOMALY

In order to clear up the problem that many people are having and have had in the past (including myself) in respect to the variant ANOMALY, I have written a small basic programme to produce the data in Figure 3 to allow you to draw Figure 4 to scale using the values of True Anomaly in degrees and range in kilometres. The orbit is symmetrical about the semi-major axis should you wish to draw the whole orbit.

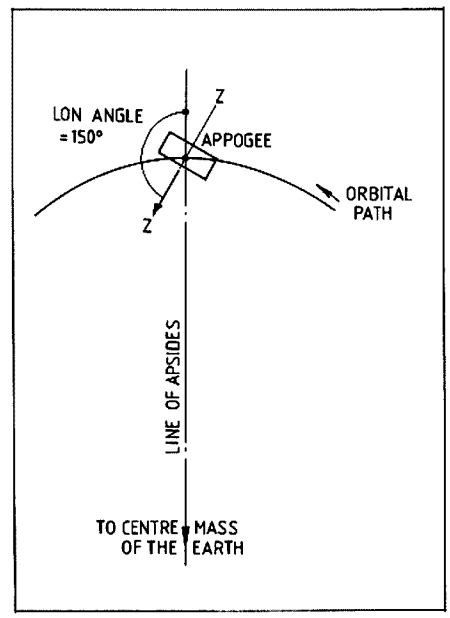

Figure 2 — Bahn Co-ordinates.

With the diagram in view let us now re-define the various terms.

MEAN ANOMALY: *"An angle that increases uniformly with TIME used to indicate where a satellite is along its orbit."*

The thing to remember is the operative UNIFORM TIME.

ECCENTRIC ANOMALY: *"Is an angle that is iteratively derived on a computer to solve Keplers equations for an ellipse".*

On Figure 4 the Eccentric Anomaly is conspicuous by its absence. However, draw a circle to encompass the ellipse, ie. diameter is semi-major axis. Now draw an angle equal to Eccentric Anomaly from the ellipse centre (with perigee being reference 0 Deg), to cut the circle. From that intersection draw a line perpendicular to the semi-major axis. It should pass through the corresponding data point on the ellipse. You can now sigh "thank heaven for computers!".

TRUE ANOMALY: "The polar angle that locates a satellite in the orbital plane drawn between the perigee, geocentre of earth and current satellite position and measured from the perigee in direction of satellite motion."

This should now be self-explanatory having used it to draw your ellipse.

Whereas in a circular orbit these three terms are one and the same, when it comes to an elliptical orbit they take on different values. Practically we continually encounter the term MEAN ANOMALY as this is the term that the ground controllers reference all operations to. This is the term used on telemetry blocks and bulletins. However the MA value disseminated is not an angle referenced in DEGREES, but an angle referenced to a base of 256. This reference is used because of the on board computer and direct linking to groundstations. Consequently the following applies:

Point	*MA (Degrees)*	*MA [256]*
Perigee	*0*	*0*
	90	*64*
Apogee	*180*	*128*
	270	*192*
Perigee	*360*	*256*

Time from Perigee in Mins T	Mean Anomaly Degrees MA°	Mean Anomaly [256] MA [256]	Eccentric Anomaly Degrees E	True Anomaly Degrees θ	Range from Geocentre km r
0.0	0.0	0.0	0.0	0.0	10516
30.0	15.4	11.0	35.1	64.4	13354
60.0	30.9	22.0	60.7	98.8	18480
90.0	46.3	32.9	80.0	118.2	23399
120.0	61.8	43.9	95.8	131.2	27677
150.0	77.2	54.9	109.5	140.9	31294
180.0	92.6	65.9	121.7	148.7	34301
210.0	108.1	76.9	133.1	155.4	36746
240.0	123.5	87.8	143.7	161.3	38672
270.0	139.0	98.8	154.0	166.8	40108
300.0	154.4	109.8	163.9	171.9	41077
330.0	169.8	120.8	173.6	176.8	41593
349.8	180.0	128.0	180.0	180.0	41689

Figure 3

Spacecraft Attitude LON	MA [256] at which antennae Earth Pointing
90	18
100	22
110	27
120	34
130	42
140	53
150	68
160	85
170	106
180	128
190	150
200	171
210	188
220	203
230	214
240	222
250	229
260	234
270	238

Figure 5: S/C LON vs MA [256]

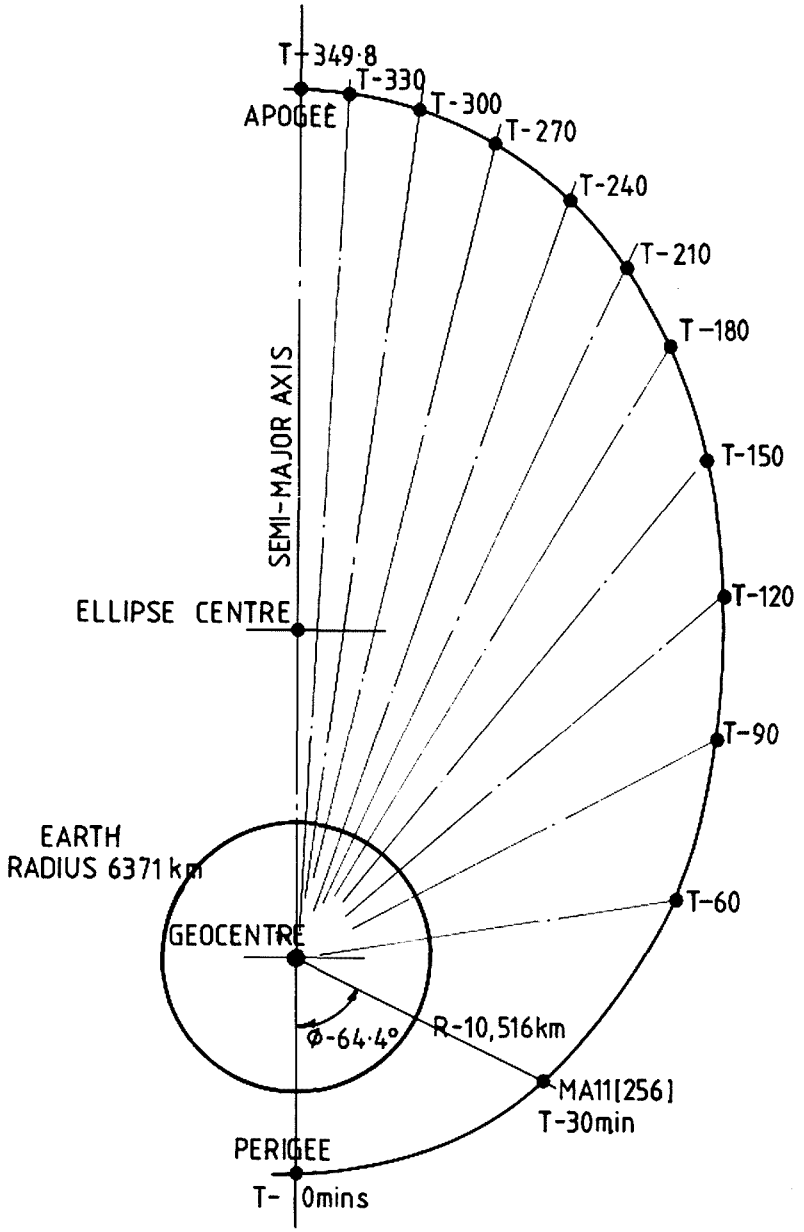

Figure 4 — OSCAR-10 Orbit to Scale.

Because the Mean Anomaly by definition refers to uniform increments of TIME, a useful tool to remember with OSCAR-10 is that 30 minutes equates to approximately 11 counts of MA [256], (actual value is 10.979).

REVISED SCHEDULE

Having digested all the above it is apparent that the ideal situation is to have the s/c at an attitude of 180 Lon. Thus at Apogee the antennae are pointing at the centre of the earth. However we have those eclipses to cope with and thus in the future considerable re-orientation in attitude will take place. Consquently it would be opportune to know when the antennae are earth pointing for the different values of Lon. This is made simpler when it is appreciated that the values of Lon equate to the True Anomaly, consequently the data in Figure 5 derived from another computer programme equates the earth pointing time of the orbit to the Mean Anomaly [256].

From Figure 5 we can see that from the 1st August the best operating times will be based around Mean Anomaly [256] – 214, and then from 1st September this will change to MA [256] – 60. It will certainly pay to listen to the AMSAT Australia nets, monitor the CW or RTTY Bulletins on OSCAR-10 for the latest attitude orientation to optimise your operating schedules. Regular communicators on OSCAR-10 will fully appreciate how signals are degraded when the antennae are off-pointed.

I trust that this tutorial has corrected all the anomalies in your thinking on elliptical orbits, if not drop me a letter with your specific problem.

1985-027A Cosmos 1644	*Apr 17*
1985-028A STS 51D	*Apr 19*

LISTENING AROUND

Joe Baker VK2BJX
Box 2121, Mildura, Vic 3500

I'm writing this in the pre-dawn hours of a late Autumn morning. I've already had a long sleep, and missed the Cocktail Net, and night-owls like Leo VK5GJ, Bronte VK5KV and Gordon VK5HM, all of whom live in what Gordon refers to as the "Perfect State of South Australia" — which never has floods or industrial disputes — where the weather is always perfect and where everyone lives in a state of eternal bliss. Gordon will have gone QRT by this time.

As I listen while typing, the long skip is on and at one end of "80" there are some Asians, the loudest being a hard-working and fast talking JA who keeps saying his call sign like an LP record, or an endless tape over and over again. My puny 18 watts from my standby gear (as the SB102 is out of operation) fails to "break" him so I leave him to it, and confine myself to the typewriter.

So let's have an update on what's been happening recently here. Living in this part of NSW — a long way from anywhere of note — and being an ex-serviceman, I was told of NSW transport concessions which entitled me to reduced fares on most Sydney transport — even the Harbour ferries — and one free annual journey by rail within any two places in NSW — but there was only one snag — I'm about 1046km (650 miles) from Sydney and almost 322km (200 miles) from any NSW railway station.

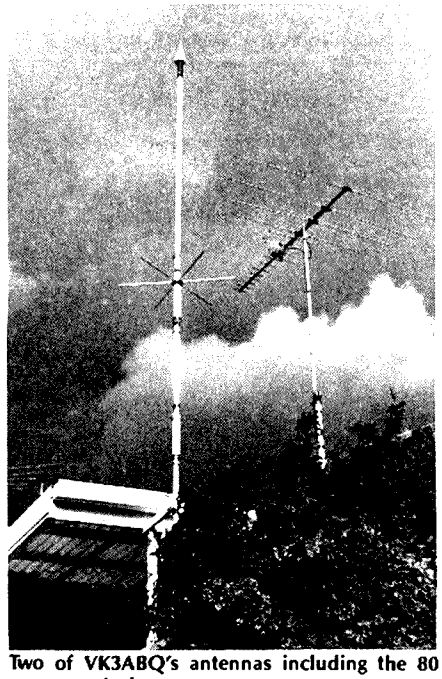
As I live at Buronga, in NSW, just across the river Murray and about 3.2km (two miles) from Mildura in Victoria, I was not too enthusiastic about what the NSW authorities had given me, and thus began a long battle lasting many years in which I badgered all kinds of people to have matters altered. Appeals to local politicians, and even the State Parliament of NSW were fruitless. Even the Victorian transport authorities to whom I also appealed gave me the same answer as their NSW mates — "Sorry, no can do because there's no reciprocal agreements between States" so I was getting nowhere fast. Eventually I got the concessions I was after. Now, I can occasionally get away from Buronga (NSW) by taking an occasional trip down to Melbourne.

That's what I did early in April. Because finances were tight (they always are with me) the plan was to spend two nights only in Melbourne — Monday night and Tuesday night, leaving Melbourne Wednesday night to arrive back to Mildura Thursday morning. The journey from Mildura is long and tiresome. I left by train at 9.25 pm Sunday night, arriving at Spencer Street Station about 6.30 Monday morning — after getting little or no sleep. Of course I had brought my FT208R with me.

Soon after booking into a private motel near the station, I was on the air from my room on the third floor, making good use of the Geelong, Macedon and Mt. Dandenong repeaters.

John VK3ABQ of Surrey Hills and I have had many contacts on my earlier visits to Melbourne, but something always prevented me from seeing John. So, almost as soon as I hit Melbourne this time, I phoned John, who then picked me up took me to his home where I spent a pleasant several hours, sharing a beer with him, inspecting his well-apportioned "shack", and photographing himself and his gear. It was an excellent day — thank you John for your hospitality which more than made up for the earlier times when we were unable to meet.

Another friend I have often wished to meet is Bob, who holds two call signs, VK3CCH ("Chicken, Chips and Hamburgers") and VK3BRW. John decided to drive me to Bob's work QTH. On arrival near the work QTH, John stopped his car in a short side-street off the main road, and decided to walk in one direction to find a street number, while I went in another direction. I got confused with the numbering system and walked about a kilometre in one direction, while John had not far to go before he found the place. I was completely lost, and although I had my FT208R with me, couldn't call John because he didn't have two metres with him. (John meanwhile, having found Bob's workplace, was told that Bob was unavailable because he was out on a job). John then returned to his car, to wait for me.

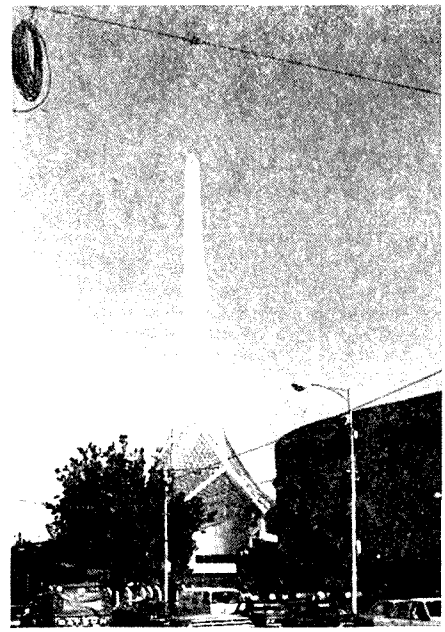


Two of VK3ABQ's antennas including the 80 metre vertical.

I seemed to be walking for an eternity up hill and down dale before calling into a place, where I saw a welder at work, to ask directions. The welder took off his mask and said *"you're going in the wrong direction mate — it's back up that way"* indicating the direction from which I had, so laboriously and with much perspiration, come. So I hi-tailed it back up a hill where I found John waiting for me. *"If Bob wants to see me the next time I am in Melbourne"* I said solemnly to John, *"he had better come and fetch me."* John's good driving got me back to my motel without incident, and after tea, I decided to go back to my room and see who I could catch on two metres. I found myself talking with VK3EW (VK3 "Electric Wireless") on simplex. We had a good old chin-wag, and made arrangements to meet the next day at what I thought was to be 10.30am.

As it so happened, apparently I mistook the time, which should have been dinner time outside the Melbourne Stock Exchange. I arrived about 10.35am and waited till just after 11.15am, and not meeting "Electric Wireless" thought that, being five minutes late, I had missed him and decided to give it away. I went back to my room, had a rest, went for dinner and decided to go and spend a few hours in the Botanical Gardens, by the side of the Yarra.

After taking some good pictures of the "BI-CENTENNIAL ARCH" near the Arts Centre and the lovely vertical tower above the Centre (is that tower just an ornament, or is it somebody's private antenna?) and armed with some cartons of milk, some potato cakes and fish, I decided to park myself and my FT208R on the lovely lawns. I put the FT208R in the



"That Tower" — maybe it is a radio antenna in disguise!! (and who owns the coil of wire in the top left corner?)

scanning mode. Eventually I settled on the Mt Dandenong repeater and spoke with a chap who said that he knew "Electric Wireless" personally and that if I would stay on the repeater, he would contact him as soon as "EW" finished work and let him know that I was listening. I maintained a listening watch and after a while heard "Electric Wireless" call me.

Now here's where I introduce Mr Murphy and his law which says that *"if anything is going to happen, it will"*. Murphy had decided to flatten my battery — so flat indeed that when I tried to respond to "Electric Wireless", the red indicator light on my rig lit about as dim as a candle on Mars as it would appear seen through the Mt Palomar telescope. What maddened me was that I could hear the other chap telling "Electric Wireless" that perhaps I had gone and got lost again.

There was nothing I could do, but to return to the motel (where I still had my luggage, having formally booked out earlier the same day), and ask the booking clerk if I could retrieve my luggage from the baggage room to get my home brew charger — "borrow" an office power point and put some fresh juice into my FT208R. Permission was given, but Murphy was still with me. In the claustrophobia and confusion of that office, I could not remember how to correctly connect up the charger, so it wouldn't work.

Well, having a flat battery, I couldn't even try to disrupt the train communications by operating rail mobile, as I did on a previous occasion. But who can tell what might happen when I again visit Melbourne, perhaps before the winter sets in?

Cheers to all and thanks for all the nice things you've said about "Listening Around" when I've spoken to you on the air.

CONTESTS

Ian Hunt VK5QX
FEDERAL CONTEST MANAGER

P.O. Box 1234, GPO, Adelaide, SA 5001.

CONTEST CALENDAR

AUGUST
10-11 European CW Contest (Rules July AR)
17-18 Remembrance Day Contest (Rules July AR)
17-18 SARTG RTTY Contest
17-18 KCJ CW Contest (Rules this issue)
24-25 All Asian CW Contest (Rules July AR)
24-25 GARTG RTTY Contest

SEPTEMBER
14-15 VK Novice Contest (Rules this issue)
14-15 European Phone Contest (Rules July AR)
28-29 YLRC Italiano 'Elettra Marconi' Contest (Rules this issue)

OCTOBER
5-6 VK/ZL Oceania Phone Contest (Not yet confirmed)
12-13 VK/ZL Oceania CW Contest (Not yet confirmed)
26-27 CQ WW DX Phone Contest

NOVEMBER
23-24 CQ WW DX CW Contest

ALL CONTESTERS PLEASE NOTE THE FOLLOWING . . . .

CONTEST DISQUALIFICATION CRITERIA

A standardised approach is taken to the disqualification of logs entered in all of the contests which come under the direct control of the Federal Contest Manager appointed by the Federal Executive.

A perusal of these criteria will show them to be quite fair and well thought out. They are based on those used by the ARRL in administering their contests. It is suggested that you take note of this particular issue of the magazine for reference to these general rules in the case of all contests for the ensuing year. Details are as follows:

DISQUALIFICATION: An entry in WIA conducted contests may be disqualified if, upon checking of logs, it is necessary that the overall score be reduced by more than two percent. Score reduction does not include correction of arithmetic errors. Reductions may be made of unconfirmed QSOs or multipliers, duplicate QSOs or other scoring discrepancies. An entry will be disqualified if more than two percent duplicate QSOs are detected as being claimed for credit. For each duplicate or miscopied call sign removed from the log by the Contest Manager a penalty of deletion of three additional QSOs of equivalent value to the offending claim may be applied. The penalty will not be considered as part of the two percent disqualification criterion. If a participant is disqualified under these aforementioned provisions that operator will be barred from entering the contest for that particular mode on the ensuing year. eg. Disqualification from the 1985 RD Phone will prohibit an entry for the 1986 RD Phone, however participation in the 1986 RD CW would be allowed.

Logs which are very untidy, illegible or incorrect in layout to a major degree may also be disqualified. The call signs of disqualified participants may be listed in Amateur Radio magazine together with the contest results.

At the time of writing these notes I am visiting the country town of Ceduna in the far west of South Australia. Whilst on the way here I could not help but consider the benefits of being an amateur radio operator living in the country. So much more space is available for the erection of antennas. I had visions of large arrays, tall towers, vee beams and rhombics running in every direction. This surely would be great for both DX and international contest working. I do remember though one year, when I top scored in VK5 in the Remembrance Day Contest, my equipment set up comprised a 40/80 inverted vee and a dipole for 20 metres both supported by the ventilation pipe at the back of the house and fed by a Collins KWM2A and operating without any linear amplifier. It is certainly possible to achieve excellent results with a simple installation and no doubt operating technique must play a very large part in this. Still, large antenna installations and the often nice low local noise level conditions, often found in the country, would be very nice not to mention the lack of high level local QRM with the nearest amateur being well over 322 km (200 miles) away. Coming to the country does not mean that one necessarily leaves behind the benefits of modern life. These notes are being prepared on a computer controlled word processor owned by my daughter and son-in-law. Such modern magic means that I can correct all my typing mistakes before printing out the result, (well that is in theory anyway) and thus the typesetters will not have to put up with all the corrections made using white out and my rather old typewriter can stay in the car where it was stowed just in case I couldn't cope.

As this is my first visit to Ceduna I will be taking the opportunity to have a look at the Overseas Telecommunications Commission Satellite Earth Station. Perhaps this may whet my appetite again to do some amateur satellite operation. Incidentally, such a thought takes me back to somewhere about 1962 when I recorded signals from the first OSCAR satellite using a 16 Yagi steerable array at the NASA Satellite Tracking and Data Acquisition Network Station at Island Lagoon near Woomera. It was most exciting to hear the 'HI' being transmitted by this forerunner of the much more useful amateur satellites and I feel sure that not very many of us foresaw just what great marvels were in store.

The previous comments may seem not connected with the subject of contesting, however my belief is that all our experiences can benefit us in many ways should we but take the opportunity to use them and apply them in the right manner.

As you read this column you will probably be close to preparing your station for the 1985 Remembrance Day Contest. I hope that you will approve of the latest changes to the rules and also that you have studied them carefully. I would also strongly recommend that you look at the matter of preparing your paper work in advance, particularly the 'check' sheets for each band. I suggest that you look back at the Example Contest Check Sheet published in this column in the December 1984 issue of "Amateur Radio".

I have been provided with a copy of rules for the 'Keymen's Club of Japan' (KCJ) Single Operator CW Contest and also the YLRC Italiano 'Elettra Marconi' Contest. You will notice that the KCJ Contest clashes with our Remembrance Day Contest. Perhaps this will mean somewhat more QRM in the CW portions of our bands. Whilst these contests would probably not be considered as being major events on the calendar I have provided the rules for your interest.

Our major Australian event for next month is the VK NOVICE CONTEST as indicated in the calendar on 14th and 15th of September. The rules for this contest are basically unchanged from last year. I would anticipate that, as usual, there will not be very many entries in this contest coming, as it does, right on top of the Remembrance Day Contest. If my intentions come to fruition the 1986 Novice Contest will probably be held in the month of June. It is somewhat unfortunate that it was not possible, despite my efforts to achieve change in this way, to have the date of this contest moved for 1985.

With the Novice Contest comes the end of the major contests organised by me on behalf of the Wireless Institute of Australia for the year. The only other major contest remaining for the year is the VK/ZL Contest which is separately organised. I hope that you have enjoyed the contests provided for your benefit this year and that you will continue to support these contests next year. In the intervening period I will be kept quite busy checking logs, preparing certificates and carrying out the various other tasks required of the Federal Contest Manager as well as preparing the notes for this column. I will certainly be interested in hearing more comment and opinion from you should you feel inclined to write and express your ideas on the contest scene.

VK NOVICE CONTEST, 1985 — RULES

CONTEST PERIOD:- From 0800 UTC 14th September 1985 to 0759 UTC 15th September 1985.

OBJECTS OF THE CONTEST:- To encourage contest operation of amateur radio stations in Australia, New Zealand and Papua-New Guinea with special emphasis on contacts with novice and radio club stations.

STATIONS ELIGIBLE:- Only stations in VK, ZL and P2 call areas may enter. No stations outside these areas are permitted to be worked or entered in a log for the purposes of this contest. Except for radio clubs, no multi-operator working is allowed. Stations in the same call area may contact each other as well as contacting stations in other call areas.

CONTEST BANDS:- All operation must be confined to within the novice frequency sub-band allocations in the 10, 15 and 80 metre bands. No crossband operation is permitted.

MODES OF OPERATION:- Only phone or CW may be used. In the CW mode operation must not exceed a speed of TEN WORDS PER MINUTE. This is to encourage the use of CW by all operators and to allow improvement in this mode by those operators who do not usually practice same.

CONTEST SECTIONS:- (a) Phone — Novice / Full Call. (b) CW — Novice / Full Call. (c) Listeners.

SCORING:- Transmitting Entrants: For contacts with a novice station — five points. For contacts with a club station — ten points. For contacts with a full call station — two points.

Listener Entrants: For novice / novice contact — five points. Novice / full call contacts — two points. Full call / full call contacts — two points. Any contact with a club station — ten points.

CALL PROCEDURE: For phone operation call 'CQ Novice Contest' and for CW operation call 'CQ N'.

CONTACTS: Any station may be contacted only once per mode per band.

NUMBER EXCHANGE:- On phone, stations must exchange a serial number comprising an RS report followed by three figures. These figures must commence with 001 and increase sequentially by 'one' for each contact up to 999. If 999 is reached the serial number is to revert back to 001 and the sequence recommenced. For CW, stations must exchange a serial number comprising an RST report followed by three figures on the same basis as described above for a phone contact serial number. Radio club stations must ADD THE LETTER 'C' following the serial number.

LOG ENTRIES:- Each log sheet should be laid out such as to provide columns in the order given as follows: Date / UTC Time. Band. Mode. Station Contacted. Serial Number Sent. Serial Number Received. Claimed Score. Total Claimed Score should be shown at the bottom of the Claimed Score column for each page. Each log sheet must also be endorsed at the top 'VK NOVICE CONTEST, 1985'.

FRONT SHEET:- A FRONT SHEET must be attached to each log entered and must carry the following information: Name of Operator. Address. Call Sign. Section Entered. Claimed Score.

DECLARATION:- The front sheet must also carry a declaration which states that "I hereby certify that I have operated within the rules and spirit of the Contest". Each entry must carry the signature of the licensed operator of the station and be dated accordingly. In the case of club stations the entry must

be signed by a responsible officer of the club committee or a licensed operator delegated by the committee to do so. In the case of multi-operator stations the call signs of participating operators must also be shown on the front sheet.

REGULATIONS:- All stations participating in the contest must be operated within the terms of the station licence and applicable regulations.

SUBMISSION OF ENTRIES:- Logs are to be forwarded to the Federal Contest Manager, Box 1234, GPO, Adelaide, SA. 5001. Envelopes are to be endorsed 'Novice Contest' on the front outside. Entries must be posted so as to reach the box number no later than 28th October 1985. Any entries received later than this date may be used as Check Logs only.

CERTIFICATES:- Certificates will be awarded to the top scoring entries in each section at the discretion of the Federal Contest Manager and to any other entrant where meritorious operation has been carried out in the opinion of the Contest Manager.

TROPHY:- The "Keith Howard VK2AKX Trophy" will be awarded to the Novice entrant with the highest aggregate score from both the phone and CW sections of the contest. This trophy is a perpetual trophy and will be held by the winner until such time as it is awarded to a winner of a subsequent Novice Contest. Should two or more aggregate scores be equal a decision will be based on a count back as to the greater number of novice stations listed in each log entry. Should such a count also be equal the log containing the greatest number of CW contacts will be preferred. In the event of a further tie under these rules the logs will be placed before a committee which will exercise a vote as to the neatest and most meritorious entry.

DISQUALIFICATION:- The Contest Disqualification Criteria as published in this issue of "Amateur Radio" shall apply. Any station observed during the contest as constantly departing from the generally accepted code of operating ethics may also be disqualified.

KEYMEN'S CLUB OF JAPAN (KCJ) SINGLE OPERATOR CW CONTEST

Object	To work as many amateur stations in as many Japanese prefectures as possible using Japanese CW bands.
Eligibility	Single operator amateur stations worldwide.
Period	Starts 1200 UTC Saturday followed by the third Sunday in August; ends 1200 UTC the Sunday 17-18th August 1985.
Categories	Single operator, CW only: a. All Bands, b. Single Band.
Contest Exchange	JAs — RST plus Prefecture Code. Others — RST plus Continent Code.
Invalid Contact	Contact with a multioperator station, crossmode or not CW, crossband, via repeater or satellite, out of Japanese CW bands (by JAs only).
Scoring	POINTS: One point for the complete contact with a station in Japan on each band. MULTIPLIERS: JAs — Forty-seven Japanese prefectures and six continents on each band. Others — Forty-seven Japanese prefectures on each band. FINAL SCORE: Multiply points by sum of multipliers.
Log Instruction	Log should indicate time in UTC, call sign and exchange. Multipliers should be clearly marked in the log only the first time it is worked on each band. Use a separate sheet for each band. The call sign of the entrant should be indicated in every sheet of the log. Each entry must be accompanied by a Summary Sheet.
Awards	Certificates will be awarded to the top through the third scorer in each entry category and the top scorers in each continent and Japanese prefecture who are ranked in the higher half of the whole entrants in each category. All scores will be published. It is available by 1 IRC (surface mail) or 7 IRCs (air mail) enclosed with the log.
Disqualification	An entry with more than two percent duplicate and/or invalid contacts left on the log will be disqualified. Violation of amateur radio regulations and/or the rules of the contest will cause disqualification. Decisions of The KCJ Contest Committee are official and final.
Deadline	All entries must be postmarked no later than the 31st October 1985 and mailed to: Nagashima Takayoshi JA7GAX 20-6, Kabasawayama, Imozawa, Miyagi-town Miyagi-gun, Miyagi-Pref. 989-32 JAPAN

Suffix of 3 letters originated by Y or Z	(ex JE3YAA, JH4ZBC)

THE ITALIAN YL RC "ELETTRA MARCONI" PROMOTES THE VIIIth INTERNATIONAL CONTEST 1985 TO CELEBRATE THE ETRUSCAN YEAR

AIM: To further activity between Italian YL stations and the rest of the world. QSO must be between Italian YL stations and Italian or Foreign YL or OM stations.

CATEGORIES: Single YL operator, single OM operator, SWL.

BANDS: All bands: 1.8, 3.5, 7, 14, 21 and 28 MHz on the usual YL contest frequencies.

PERIOD: From 1300 UTC Saturday 28th September 1985 to 1300 UTC Sunday 29th September 1985.

CALL: CQ YL/OM CONTEST for PHONE. CQ YL/OM TEST for CW.

REPORTS: RST with progressive numbers (start 001). Italian or Foreign members of RC will add RC to their reports to indicate they are club members.

SCORE: One point for each contact between Italian and ISO stations; Two points for each contact between Italian and European stations; Three points for each contact between Italian stations outside Europe. Each station may be worked only once each band. QSO must be phone/phone or CW/CW. The score is the same for phone and CW.

MULTIPLIERS: a) A multiplier of one for each DXCC country and call area of USA, Canada, Japan, and Australia on each band. b) A multiplier of FIVE each member of YL RC contacted on each single band. This multiplier is not valid for QSO between YLs of RC. For the SWL, one point for each Italian, ISO, or Foreign YL heard on each band.

FINAL SCORE: This is obtained by multiplying the sum of the QSO points by the sum of the multipliers (a) and (b) obtained on all bands.

LOGS: Logs must be sent no later than 31 October 1985, to the YL RC Award Manager I0VOK Olga Scolari, Via Conte Verde No 50, 00185 ROMA, ITALY. Separate logs must be used for phone and CW, and for each band, and a summary sheet must be added. Forwarding of the log means the acceptance of the present rules and the decisions of the Manager which are to be considered final.

PRIZES: There are plaques, medals and diplomas for the first classied in CW and phone in the following categories: YL members of YL RC, Italian and Foreign YL OM and SWL.

?

ARE YOU COMING . . . ?

The Wagga Amateur Radio Club is again hosting the Annual Convention of the Year, in a typical style that only Wagga can do.

Highlights include: Foxhunts with great prizes (possibly the National Foxhunt Championship), Trade displays, Vintage Engine displays, Astronomy displays, Vintage Radio display, Model Aero displays, Auction and Trading table and of course time for rag chewing along with conducted car tours for the sightseers.

The Dinner will be held at the Riverina Australian Rules Football Club with a sit-down three-course meal and entertainment.

We have three motels booked for the occasion plus accommodation at the site for a nominal charge. Caravanners welcome also with on-site power and amenities.

This Premium event is being held on Saturday 26th and Sunday 27th October 1985 at the Curra-jong Scout Camp, approx 9 km S/E of Wagga.

Please watch for the insert in AR August for full details de Jeff VK2KCL.

AWARDS

Joe Ackerman, VK4AIX
5 Koomooloo Court, Mermaid Waters, Qld 4218

The '75' and '150' awards have certainly stirred up some interest in awards amongst amateurs and SWLs.

It is hoped that this interest will continue as many clubs have awards available. Club nets assist greatly in obtaining these awards.

Costs of awards vary greatly and for those interested there are awards for which no fee is required.

Bermuda — WA8 Award
Chile — CE 25-P Award
Finland — OH 500 Award
ARRL — A1-OP Certificate of Merit
White Rose Award
Canada — Vernon Winter Carnival Certificate of Merit
Canada — CW Operators of the British Commonwealth.

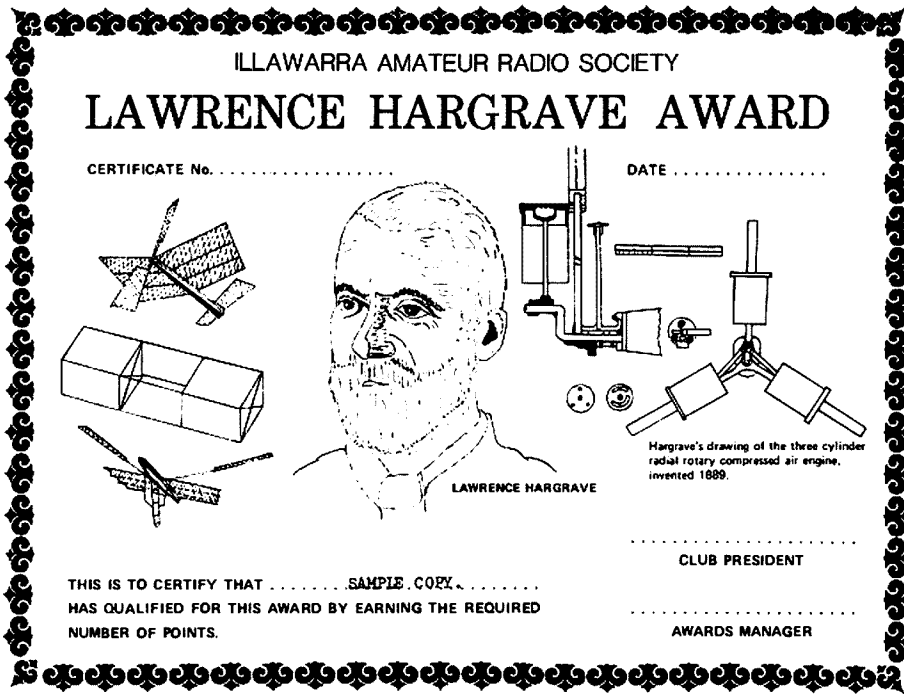
THE LAWRENCE HARGRAVE AWARD

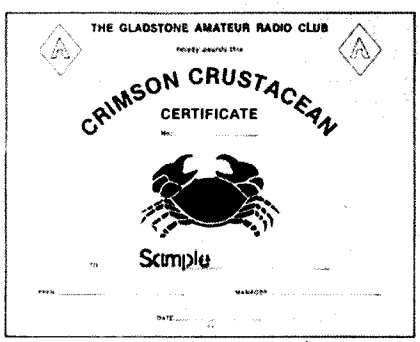
This new award, sponsored by the Illawarra Amateur Radio Society measures 27 x 20cm. The background is light blue with the printing in royal blue. Also depicted are some of the inventions of Lawrence Hargrave, who was one of Australia's earliest pioneers in aviation.

The conditions for obtaining the award are: *VK stations require 10 contacts with IARS members. Overseas stations require 5 contacts with IARS members. Contact with the Club station VK2AMW is sufficient in itself for the award.*

A Club net is held each Sunday night at 1000 UTC on 3.560MHz +/−.

Applications must show: date, time, frequency, station worked and be forwarded to: *The Awards Manager, Illawarra Amateur Radio Society, PO Box 1838, Wollongong, NSW 2500.*





THE CRIMSON CRUSTACEAN CERTIFICATE

This is a new award printed on a yellow background, the centre piece depicting a crustacean in crimson with details also printed in crimson. The design is a joint effort by the members of the Gladstone Amateur Radio Club who must feel satisfaction with their endeavours.

The conditions for the GARC award are:

All contacts after 11/3/85 will count for the award.

1. *All contacts must be on the same band and in the same mode.*
2. *To qualify, a transmitting amateur must show evidence of a contact with:*
   a The Club Station VK4BPA.
   b 5 different member base stations.
   c 1 member station, portable or mobile.
3. *A SWL must show evidence of hearing the Club station as well as 5 members all on the same band and same mode.*
4. *Evidence in the case of clauses 2 and 3 will be certified copy of the log, stating call signs, times, dates, modes and frequencies.*

To assist amateurs and SWLs in obtaining the award a Club net is held each Thursday night on 80 metres at 0900 UTC.

The cost of the award is $2.50 or 4 IRCs.

Applications to be sent to: *The Awards Manager, Gladstone Amateur Radio Club, PO Box 1030, Gladstone, Qld. 4680.*

DIPLOMA JA 35.20

This award is sponsored by the Sakura Amateur Radio Club and requires contacts with amateur radio stations on the 35.20N parallel in Japan.

It is issued in three classes:

Class AA. all 13 prefectures
Class A. 10 prefectures
Class B. 5 prefectures

Prefectures are: Chiba, Kanagawa, Shizuoka, Yamanashi, Nagano, Aichi, Gifu, Shiga, Kyoto, Hyogo, Okayama, Tottori and Shimane.

QSLs are not required only GRC and the fee is 7 IRCs.

Applications to be sent to: *Tuyoshi Chashi, 62, Sakurai, Yoro-Cho, Yoro-gun, Gifu 503-12 Japan.*

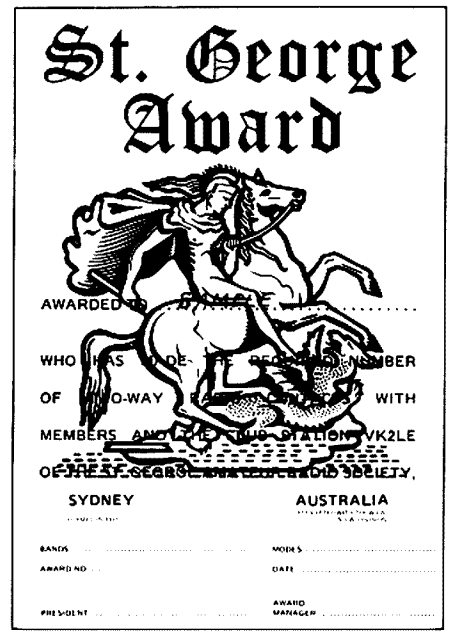
ST GEORGE AWARD

Overseas stations require five points which can be attained by the Club Station VK2LE being worth two points, SGARS member is worth one point on any band or mode.

Australian stations require ten points. Club Station VK2LE is worth two points, excluding via all repeaters. SGARS members worth one point. Any band or mode.

If all contacts are made on CW or RTTY modes, a special silver sticker will be attached to the Award Certificate.

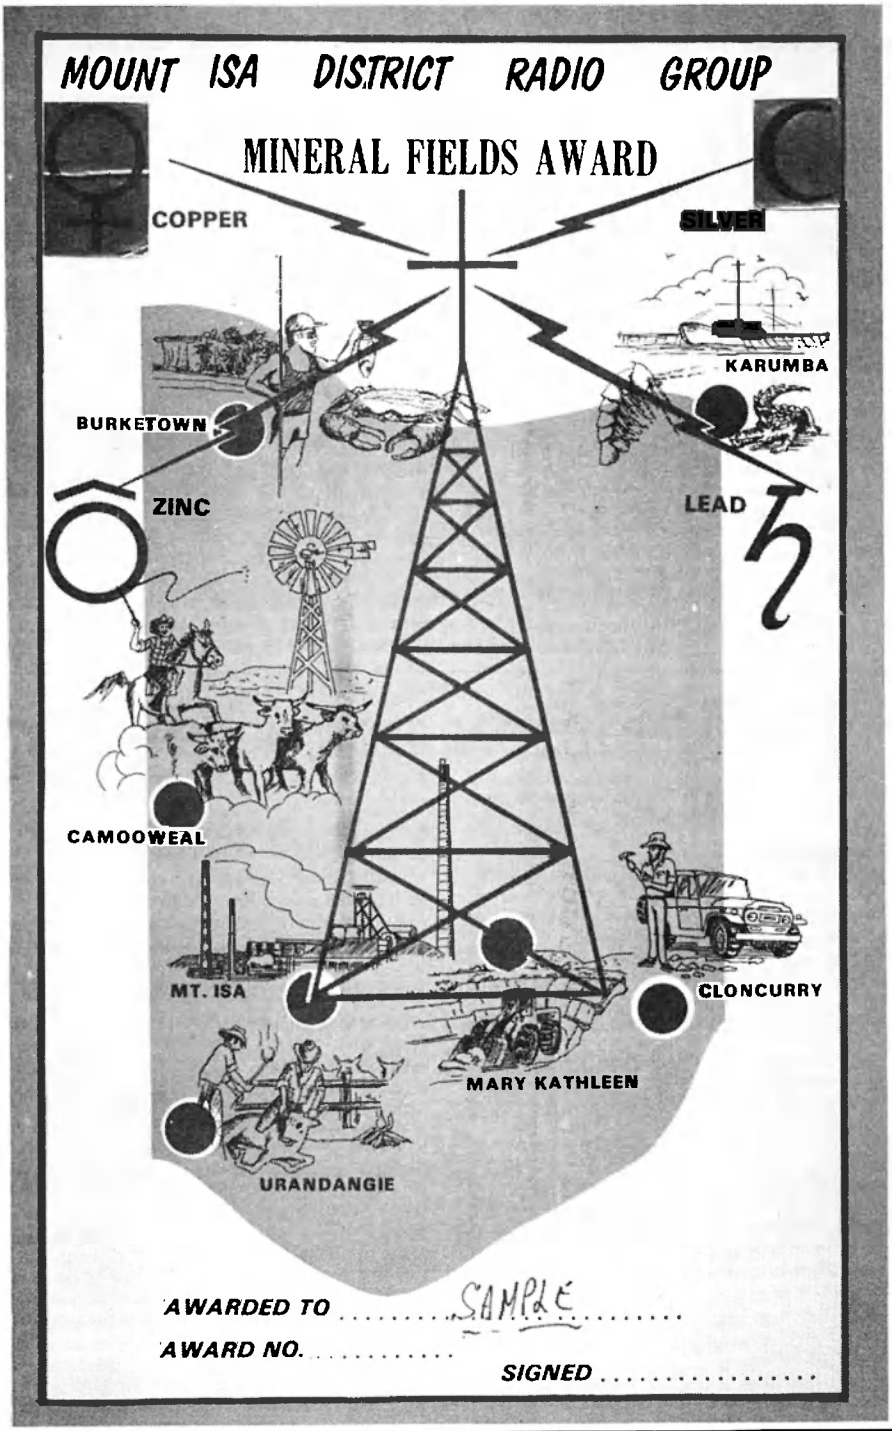
Copies of log entries signed by the applicant and countersigned by an independant fully licenced amateur operator are to be forwarded to: The Awards Manager, St George Amateur Radio Society, PO Box 77, Penshurst, NSW. 2222, together with a remittance of $2 or equivalent made payable to The St Georges Amateur Radio Society.



QSL cards are not needed and the Award is available to all licenced amateurs and SWLs who have made the required contacts, or monitored as in the case of SWLs, on or after 1st January 1985.

LA BALSA AWARD

All the necessary arrangements have now been completed by the committee of the Summerland Radio Club for the La Balsa Award to be available shortly.



See page 49, June AR for details of the Mineral Fields Award.

Australian amateurs and SWLs are required to gain 15 points, DX stations require seven points.

The Club Station VK2AGH counts as five points, member stations count for one point.

A Club net is held each Friday night on 3.605 MHz at 2130 UTC.

Cost is $2.

Complete rules and requirements plus a sample copy of the Award will be published as soon as they are to hand.

AR

QSP

SUBTITLES ON ABC TV

Almost all ABC TV transmitters and translator stations will have supertext subtitles for the hearing-impaired.

Viewers with sets which have text decoders will see a number of programmes such as Minder, Palace of Dreams, Life on Earth, One by One and some children's series subtitled.

The service has been telecast in every capital city for some time and the ABC, after tests, is to extend it to rural areas.

INTRUDER WATCH

Bill Martin, VK2COP
FEDERAL INTRUDER WATCH CO-ORDINATOR
33 Somerville Road, Hornsby Heights, NSW 2077

Opening the column for this month once again with thanks to the following people who have supported the Intruder Watch with reports of intruders heard on the bands during April 1985.
VK2BQS, VK2DEJ, VK2EYI, VK2PS, VK2QL, P Boskos, VK3BPB, VK3XB, VK3XU, VK4ADB, VK4AFO, VK4AHO, VK4AKX, VK4BG, VK4BHJ, VK4KHZ, VK4KZX, VK5BJF, VK5GZ, VK5TL, VK6AR, VK6JQ, VK6XZ, VK7RH. Many thanks for continuing support from these amateurs and SWLs.

SOME FAMILIAR — SOME NEW

April saw a large number of intruders reported, with broadcast stations accounting for 402 intrusions; CW stations accounting for 146 intrusions; RTTY stations accounting for 261 intrusions, and 20 using other modes, eg: R7B, etc. 114 identifications were heard, some familiar call signs, and some new. The harmonic of Radio 5AN, Adelaide, is still being heard on 3.565 MHz at the time of the April reports, and the woodpecker was reported on 7, 10, 14, 18 and 21 MHz. The infamous UMS (USSR origin) has vacated the 15 metre band, but, unfortunately, this is probably only his seasonal change, and if he sticks to past habits, will show-up back on 21.032 MHz at the start of our summer, **UNLESS he has vacated the amateur bands, as the USSR Administration has promised he would.** Very much activity with CW on 20 metres for April, with many call signs being copied.

TRAFFIC CEASED?

Last month I mentioned the commercial traffic being passed in the AMTOR mode on 14.069 MHz from a vessel which was currently in the Marshall Islands. W7JIE, the IARU Region 2 Amateur Interference Reporting System (AIRS) Director, writes that the FCC has monitoring stations on the frequency, and has opened a case against the persons responsible, and at the time of writing this column, I understand that the traffic has ceased.

This unauthorised use of the 20 metre amateur band was first detected by Syd VK2SG, and is a good demonstration of the help which can be given to the Intruder Watch by amateurs who use specialised forms of communication.

If you have facilities for RTTY, AMTOR, etc, and you come across like transmissions, please pass on the information to the Intruder Watch, who can try and do something about it. We need the help of all amateurs in this regard, as we don't all have the specialised facilities. More on this particular case later, when I receive more information from Washington.

LET'S GO TO IT!

Looking forward to the warmer weather, and hope to spend more time in the shack, as no doubt others will. Don't forget to make a note of the intruders you hear, and send it to your Divisional IW Co-Ordinator, who comprise: VK1ZJR, VK2COP, VK3JY, VK4KAL, VK5GZ, VK6XZ (find Bruce under VK6KVV), VK7RH, and VK8HA, all QTHR. See you next month, and I wish you all the best of DX.

AR

ALARA

Australian Ladies Amateur Radio Association

Jennifer Warrington VK5ANW
SECRETARY/VICE-PRESIDENT
AUSTRALIAN LADIES AMATEUR
RADIO ASSOCIATION

As you will have read last month Margaret VK3DML has written her last column for ALARA, at least for the time being. Margaret has done a magnificent job of writing this column over the past few years and I know that the Executive Committee of Alara would want me to say a very big thankyou to her. She will be a hard act to follow, but to soften the blow, before our new Publicity Officer is appointed, it is proposed that we shall have two or three "Guest" writers (after which — with apologies to the others — anyone will look good!)

By the time you read this the AGM will be imminent. The following have been nominated and have accepted (if elected) the positions indicated, so unless we receive two nominations for any of the positions the following will be finalised.

President	*Helene Dowd VK7HD*
Immediate Past President	*Geraldine Plant VK2NQI*
Vice President	*Marilyn Syme VK3DMS*
Vice President	*Jennifer Warrington VK5ANW*
Secretary	*" " "*
Publicity Officer	*Joy Collis VK2EBX*
Contest Manager	*Marlene Perry VK2KFQ*
Treasurer	*Valda Trenberth VK3DVT*
Minute Secretary	*Marilyn Syme VK3DMS*
Awards Custodian and Historian	*Mavis Stafford VK3KS*
Librarian	*Bev Hebiton VK6DE*
Souvenir Custodian	*Joyce Aldridge VK3VBK*
Sponsorship Secretary	*Jessie Buchanan VK3VAN*

State Representatives
VK3 Bron Brown VK3NTD
VK4 Margaret Schwerin VK4AOE
VK6 Poppy Bradshaw VK6YF

At the time of going to press VKs 5/8 and 7 were hopefully filled but unconfirmed. We are still looking for a State Representative for VK2 and would be pleased to hear from anyone who could take on this position. It is not an arduous job.

We were delighted to be the first association to be affiliated, Federally, with the WIA and look forward to a long and happy association. We were also pleased to participate in the Book Pack donation scheme (see June AR) and since then Margaret VK4AOE has presented a second pack to an Agricultural College near Dalby. Marlene and I really felt that we had got off lightly with the Regency Park presentation when we heard that Margaret had to present hers in front of the whole College! One of the questions that Margaret was asked, was, *"are there any amateur operators in the Somali Republic, as a couple of the students at the College come from there and find it hard to get news of home"* If there are any of you reading this who know of any amateurs in the Somali Republic would you please let Margaret or myself know.

Like Australia, many countries have a YL group. We know of groups in Italy, USA, Japan, Germany, Brazil, New Zealand, Great Britain, South Africa Netherlands, Canada and Austria. We have a very popular sponsorship scheme whereby an ALARA member (YL or OM) can pay to sponsor an overseas (usually) YL into ALARA. You specify a preferred country, if you have one, to Jessie VK3VAN and she does her best to match you with somebody on her files. In turn, the overseas YL generally then sponsors you into her local association. It is certainly an excellent way of making friends and learning more about the other girl and her country.

And my final word is actually our "Commercial" for the week. As Father's Day is only a month away, what about buying him one of our new sugar spoons with a fluted bowl and the ALARA emblem of course, so that he can sugar his own cup of coffee/tea while you work the DX! (and as they are only $4.50 you can buy yourself a keyring charm or teaspoon with the money you saved!).

AR

HALLEY'S COMET

It is probably the best known of all the comets and is due to return to visibility in 1986 for the first time in 75 years. Below is a diary of the comet from late 1982 to the end of 1986, as printed in The Propagator, June 1985 issue.

16th October 1982 — The comet detected for the first time since 1911 using the Mt Palomar Telescope at mag 24.2 and beyond the orbit of Saturn.

1984 — Halley moves inside Jupiter's orbit, spending most of the year between stars Orionis and Gemini.

January-March 1985 — Moving through Orion slowly, reaches mag 16 and becomes within photographic reach of large amateur telescopes. Evening object in the low NW sky.

April-August 1985 — Magnitude 15, moving slowly in Taurus, evening object low in the N sky.

September-October 1985 — Brightens to mag 12 in October, moves back into Orion and then Taurus. Remains low in the evening sky, above the northern horizon, heading west.

November 1985 — On 12th November it passes between a close pair of stars. At mag 8 it should be visible in small telescopes and powerful binoculars. On 16/17th it passes 2 degrees south of Pleiades and on 28th passes M74, on 10 mag spiral galaxy. It remains low in the northern sky each evening, reaching an altitude of 35 degrees and mag 7 at the end of the month and should be clearly visible in binoculars. On 27th it passes Earth, 91 million km away.

December 1985 — Moves through Pisces and on 22nd into Aquarius. On 26/27th it passes 1 degree south of Aquarii and should be visible to the naked eye, mag 5, to country viewers. Will not be visible in the city. Moves to NW evening sky and will be highest (50 degrees) above the horizon around 10th December.

January 1986 — Heading towards the sun rapidly, becoming lower in the evening sky. Hard to find after the 20th.

February 1986 — Halley passes the sun 86 million km on the other side of the 9th. Not visible until 15th and is low in the eastern morning sky. Bright with a good tail, reaches 30 degrees altitude on the 28th.

March 1986 — Halley is at its best this month with a bright long tail, visible in the city. Visible in the eastern morning sky, higher each day until nearly overhead at the end of the month. Moonlight will detract from its splendour during the first half of the month.

April 1986 — Moving rapidly, becoming low in the SW morning sky. After 2nd, visible in the low SE sky. Total lunar eclipse on 24th gives the last good viewing opportunity. Rises 50 degrees above the eastern horizon in the evening sky late in the month, fading rapidly.

June-December 1986 — Remains in Sextans, Crater and Hydra. Fades to mag 10-12 in June requiring a telescope to observe it.

AR

SPOTLIGHT ON SWLing

Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

August has come around again and that means that it is time for the annual Remembrance Day Contest. This year it will be held on the 17th and 18th. SWLs are welcome to participate in the receiving section. Some even assist amateurs by acting as logkeepers. For further details and full rules, I would refer you to the July issue of this magazine. I wish you all the best.

XPO REPORT

Over the Queen's Birthday weekend, I was very privileged to attend the "DXPO", sponsored by the Australian Radio DX Club. It was held in Melbourne and provided unique opportunity for fellow DXers to meet and informally share their experiences within the hobby. It was, for me, an occasion where I was able to meet many of those who have been names on pieces of paper or spoken to on the air.

There were some talks on various aspects of the hobby, paying particular emphasis to antennas. There was also a talk on clandestine broadcasts from Central America by Bob Padula. As he said, the number of these stations seems to be variable, depending on the international situation. There was also a test for those keen DXers to identify station interval signals and/or foreign languages. I must state that I was somewhat surprised to be one of the winners of the competition. I would have expected others to fare well. Perhaps DXers are not paying enough attention to the identification of foreign languages.

These days, information is readily available on international stations with the times and frequencies of their foreign language output. By tuning into these regular transmissions, you will acquire the sound and feel of these languages. Then you will be able to identify a language from other broadcasters. As well, SWLs in Sydney, Melbourne, Brisbane, Wollongong and Newcastle have another aid in foreign languages. The Special Broadcasting Services air programmes in forty or so languages over MW. Also most international stations employ an interval signal prior to the commencement of their transmissions, so when you hear that signal or jingle, you will be able to identify the station although you do not know the language.

RADIO AUSTRALIA

As part of the "DXPO", we inspected the Radio Australia complex at Burwood. Located at the corner of Highbury and Springvale Roads, the complex is on an 18 hectare site, where it is proposed to have the domestic radio and TV studios plus an administrative centre for the ABC. Radio Australia was formally located in the central business district of Melbourne in an old biscuit factory. The modern building was finished in late 1982 and is on three levels with a gross floor area of 6800 square metres.

It is air-conditioned and has its own 650 kVA supply to ensure continuity of operations. The studios are on the upper levels with each section having studios conveniently close by. Most studios have an external view out on to Burwood. Visitors can look into the studio through a view window without entering the technical areas. The lower level is for amenities and plant.

It was interesting to observe the programmes going to air live and see many being pre-recorded for later broadcast. It was a personal highlight to meet with Keith Glover as he operated from Studio Nine with the English programming. I well remember hearing him compere the "Mailbag" programme when I first commenced listening on shortwave some 30 years ago. In all, there are 18 studios and control booths plus line switching rooms, cartridge preparation and tape duplicating rooms, all designed to meet the rigid regulations set out for broadcasting equipment.

While I was in Melbourne, there was concern about staff reductions within the ABC, including Radio Australia. Programmes were disrupted on both MW and Radio Australia while stop work meetings were held. Further programme cutbacks can be expected with possible further industrial action in the future.

FOLLOW-UP INFORMATION

A couple of months ago, I happened to mention the existence of a Racal User Group. I note in the March 1985 edition of "Practical Wireless" there is a new address for the group. It is now as follows:

Peter Barker G8BBZ,
15 Epping Green,
Woodhall Farm,
Hemel Hempstead, Herts. HP27JP.

Incidentally there have been some alterations to the DX programme information in the June issue. Swiss Radio International now broadcasts to Australia in English on 9.560, 15.305, 15.570 and 17.830 MHz. It is on at 0830 UTC and repeated at 1000. "The Swiss Shortwave Merry-Go-Round" is now aired weekly with the "Two Bobs" on Saturdays. Judy Cooper has replaced Barry Seeber on Radio Australia's "Talkback".

The Voice of America publishes a bi-monthly magazine called "Voice". It contains articles about life within the USA as well as details of upcoming VOA programmes. "Voice" also lists details of their foreign language broadcasts, which I find very useful. It is free for the asking from the VOA, Washington DC USA 20547.

Incidentally the VOA have two releases for this area. The first one is from 2200 until 0100 UTC on 17.820, 17.740, 15.290 or 15.305 (till 2400) MHz. The evening release is from 1100 to 1500 UTC on a variety of channels, but the best are 6.110 (till 1400), 9.770, 11.715 (till 1330), 15.160 MHz, all from their Phillipines site. You can easily hear their transmissions directed to the Middle East and Africa from 0600 UTC on 7.320 MHz.

While we are on schedules, here are the frequencies and times for several major international stations beaming to Australasia. Radio Sweden Int'l in English is on 15.115 MHz daily. Radio Japan in Tokyo, currently celebrating it's 50th anniversary, has announced it's programme schedules until March 1986. To Australasia it is on from 0845 till 0945 UTC in English. Radio Norway Int'l normally broadcasts in Norwegian, but it has a weekly English and Spanish programme on 17.740 with English at 1000 and Spanish at 1040 UTC. The rest of the week, Oslo broadcasts in Norwegian on that channel at that time. Radio Budapest has re-scheduled their DX programme to Mondays as from April. The times for their English programmes to Australasia are from 0930 till 1000 UTC on 17.710, 15.220 or 9.835 MHz. The Austrian Radio from Vienna beam to Australia at 0700 on 11.840 and at 1000 on 15.270 MHz. English programmes are in a thirty minute block.

IMPROVEMENT??

Conditions of late have been extremely poor to say the least. I have never heard such poor propagation in my life. The maximum usable frequency (MUF) has been as low as 6 MHz in our evening hours. In the daylight hours, it rarely goes above 17 MHz. With spring coming up next month, I expect some slight improvement in the evening hours.

While we are on amateur radio scheds, I am prepared to have chats on-air with those interested in SWLing. I would suggest Wednesdays on or about 3.595 MHz plus or minus QRM after the Intruder Watch Net concludes around 1100 UTC. Please feel free to join in.

Well, that is all for this month. All the best in the "RD". Good listening and the best of 73! Robin.

WICEN NEWS

Ron Henderson VK1RH,
FEDERAL WICEN CO-ORDINATOR,
171 Kingsford-Smith Drive,
Melba, ACT, 2615

WICEN CALLING FREQUENCIES

As a result of a motion passed at the recent Annual Convention the following HF WICEN calling frequencies have been adopted.

3.600 MHz	*18.150 MHz*
7.075 MHz	*21.190 MHz*
10.115 MHz	*24.950 MHz*
14.125 MHz	*28.450 MHz*

It is only necessary to keep these frequencies clear when there is a WICEN net operating on them, at all other times they are available for general amateur usage.

Calling frequencies are frequencies on which communications will originate; once established, nets may change frequency due to local conditions or practice, interference and other factors. Also it is not expected every division will adhere rigidly to these frequencies for training and liaison nets as local conditions may make them unsuitable in some parts of Australia.

WICEN MANAGEMENT

WICEN, by its very title, implies an affiliation with the WIA and in most divisions WICEN is managed by a sub-committee of the divisional council. Matters such as whether all WICEN members must be members of the WIA (perhaps for insurance cover?), the chain of command for WICEN, funding of WICEN and its level of representation and autonomy are all divisional matters. If your WICEN group has not got a clear statement of its status, responsibilities and conditions under which it functions I recommend you obtain this information through the divisional co-ordinator. Some useful guidelines were provided in the AR September 1981 WICEN column. Divisional councils, working through their divisional co-ordinators, must establish clear, sensible, yet not overly constraining conditions under which WICEN can operate. The dichotomy between bureaucratic control by council and a wish to 'get on with the job of communicating' unfettered by unnecessary constraints must be recognised and a healthy working balance struck. Council must realise WICEN operators wish to communicate for their clients, and WICEN personnel must acknowledge that they are involved in only one facet of our extensive hobby.

In summary if you do not have terms of reference, such as divisional rules or by-laws or a written statement of authority negotiate one and work within its conditions.

LAST SUMMER'S ACTIVITIES

Now that the busy season of last summer is behind us what about a few short reports on WICEN activations? By sharing your experiences and perhaps lessons learned with others we can all become better emergency communicators. What about it? Let's hear from you.

AR

PAKENHAM SHIRE WICEN GROUP

Don Jackson VK3DBB
3 Gardenia Street, Pakenham, Vic. 3810

On the 23rd May, the Group assisted the Narre Warren Rotary Club in the running of its annual TWO IN ONE SCENIC STAMPEDE FUN RUN, which followed similar runs in 1981, 1982, 1983 and 1984. So far the Club has raised over $10,000 for the Anti Cancer Council of Victoria by these runs.

The WICEN operators provided mobile communications facilities at nine different points around the 20 km course, with some hand-held units being used around the start finish area. Whilst a great deal of routine traffic was passed, fortunately no emergencies or problems occurred with the runners. The exercise proved very useful and successful, with all stations being able to contact each other clearly. The frequency used was 146.500 simplex, and the Group would like to thank other amateurs for keeping clear of the frequency whilst the exercise was on.

The amateurs who took part in the exercise were: *VK3s: AX, DGS, TX, NNU, ZFT, DBB, BGY, YFC, ZYK, ATQ, KDS, BVA, YPK and BAF.*

Any amateur operator in the area who would like to assist in this valuable community service could contact Don Jackson at the Shire Offices at Pakenham, phone (059) 411 011, and would be made very welcome.

The value of WICEN has been recognised by all disaster combatting authorities, and the Shire of Pakenham is one municipality which has made specific provision in its DISPLAN for WICEN to be called in if and when a disaster occurs. **AR**

MIDLAND ZONE WICEN

Don Hogg VK3XBL
WICEN CO-ORDINATOR MIDLAND ZONE.
Box 155, Kangaroo Flat, Vic 3555.

Unfortunately it is always the lot of the busy people that are supposed to contribute to various activities. My arm is currently being twisted up my back at a great rate of knots to contribute to this column after repeated requests have not produced any results. So here are some of the experiences of the Midland Zone WICEN group.

Our activities started last November with data transmission tests for the CFA continued on to the Great Victorian Bike Ride, revisited Maryborough for the aftermath of the bush fires and found a fowl plague on our back doorstep at the same time we were involved with the Lusty Mallee Rally. So from all this what have we learnt and what can be shared through this medium.

Our first lesson came from an unexpected area (as they all do) but certainly changed our attitude of complacency. The Bendigo repeater has a good coverage and it was anticipated it would be very useful for our two days of the Bike Ride communications. This was fine for day one but we were shocked to find that Maryborough was a dead spot for the control location for the second day. We believe possibly because of the shadow of the tower the repeater aerial is on (not confirmed yet). Naturally we were ready for this situation when, with Ballarat, we revisited Maryborough for the fires and we set up a relay point at a high spot in the town.

Lesson two is a result of the Maryborough fires and the Mallee Rally where in both situations we were operating portable in other vehicles using magnetic base aerials and some handhelds. Unless there is absolute saturation coverage of the area you need at least ten watts output to work effectively as a mobile where the distances are beyond about 15 km radius. Our experience is that handhelds are not always effective to ensure good communications when used as mobile portable sets.

One lesson that follows on from the last is that there is a need to check the power source in any vehicle you may be going portable in. Recently in the fowl plague exercise one of our operators plugged into the cigarette lighter socket for power to his power pack for the handheld. He decided something was wrong when the power pack became very warm and strong odours were also evident. The vehicle was a diesel van with 24 volt supply. Fortunately the regulator in the power pack tolerated the 24 to 9 volt difference long enough for him to unplug and no damage was apparent.

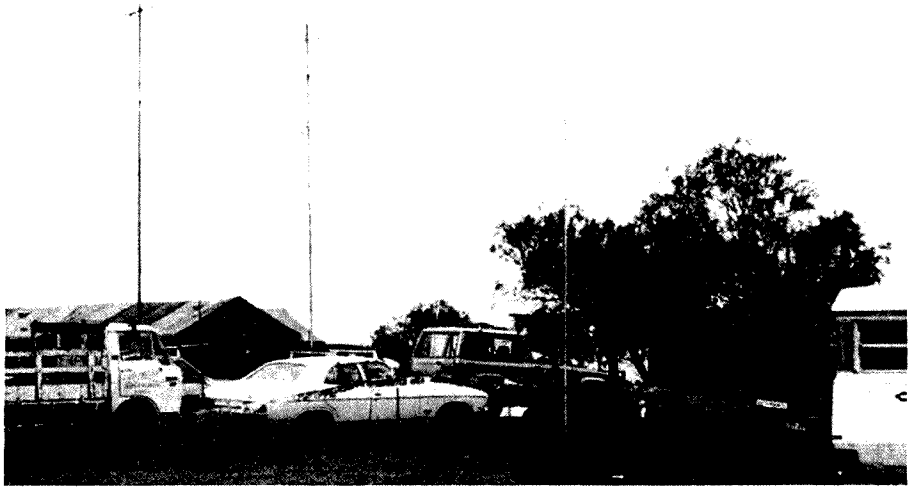
So much for the handy hints the real lessons came when the Midland Zone were landed with simultaneous exercises at the beginning of June. We had a request for assistance from the Department of Agriculture in combatting the outbreak of fowl plague in the Bendigo area which continued over the long weekend in June when we were committed to running the communications for the Mallee Rally. A protracted exercise going more than two or three days needs a lot of preplanning and clear guidelines if effective communications are to be provided and the tolerance of friendships and relationships is not to be taken to breaking point. As Co-ordinator I am certainly the wiser from this bizarre happening and the need for all members of the team to communicate with one another about their feelings and the sharing of the tasks of planning. No one or two persons can effectively run protracted exercises without continual debriefing meetings — unfortunately one of our downfalls on this occasion.

The Mallee Rally was a different experience and one of enjoyment even though there was much fear and trepidation when organising it (albeit with good liaison) from a great distance without having previously been involved or having seen the location. From comments from previous people involved it was evident that there were some dead spots. To overcome this we planned to use our repeater to saturate the general area but this fell through owing to the Department of Agriculture disaster. With 24 hours notice George VK3AGM was set the task of coming up with an alternative. We discussed the principle of a 10 metre link to the dipole we already had installed 42 metres (140 feet) up on a local tower. The result from George was a 6 metre link with the squelch operating a relay to turn the two metre transmitter on for transmission of the audio on to 2 metres.

It worked well with minor difficulties but we believe it would be a better system placed half way into the area of operation. The command centre was some 7 to 10 km from Sea Lake where we had our aerial and the terrain seemed to impede the link without 3 element beams. Our area of operation was in the opposite direction to Sea Lake for some 30 km. This system also gives the opportunity to operate two channels on the same frequency if the link is remote from the base and the other transmitter is located, say at the base station. In fact at times we were operating direct on 2 metres when the link misbehaved for some unknown reason.

The success of the Mallee Rally was due, in part, to the many operators who had been there previously and this made the allocation of duties an easier task than if we had a large number of newcomers. The social gathering around the barbeque each evening was beneficial to the operation and gave the opportunity to discuss problems and share those rare experiences that only happened in front of your check point. We were mystified for quite some time about a dune buggy resting in the lake and the bogged brand new 4WD trying to recover it. We have a sneaking suspicion that both vehicles may belong to a Collins Street farmer type.

As I was on the last sweep vehicle to return at the end of the Rally and did not get the opportunity to say farewell to many of the team I would like to express my sincere thanks to all who were part of the team and to say I enjoyed the new friendships that were made at the Mallee Rally.



This article about all the problems we experienced may give the connotation that the communications were not all that crash hot but the reverse is the case. In all the exercises we have been on in spite of the above problems we have been able to provide good communications and have won some commendation for our services. The problems experienced only served to make us more aware of the problems for the next task and to learn from our mistakes.

The Zone has acquired four computers for mobile use to transmit information in WICEN operations. As some would know we developed a tone board based on the Kansas City Standard for the transmission of data and Ron VK3YHV the designer will use this board in the computers with software control of the facilities. We already have software design of the WICEN message format and have used this in the tests with the CFA. We believe much more effectiveness will be achieved in the future if this medium of message handling is used.

AR

Left: Aerial array at the command centre. Left — 6m beam for the link to the remote 2m transceiver. Centre — 27MHz for listening to the recovery vehicles. Right — Mast with 80m dipole and direct 2m Slim Jim.

REGION 7 EXERCISE . . . OTWAY SURVIVAL

Barry Abley VK3YXK
Exercise Co-ordinator.

Upper Kalimna Falls.

The SES has called for WICEN support, to provide portable (pedestrian) communications at the scene of an accident.

A child has fallen from the Upper Kalimna Falls, in the Lorne Forest Park, in the Otway Ranges.

The child must be diagnosed by a doctor because of possible spinal injuries sustained in the fall. The patient is then to be carried out to a convenient location, to be picked up by helicopter for transportation to hospital.

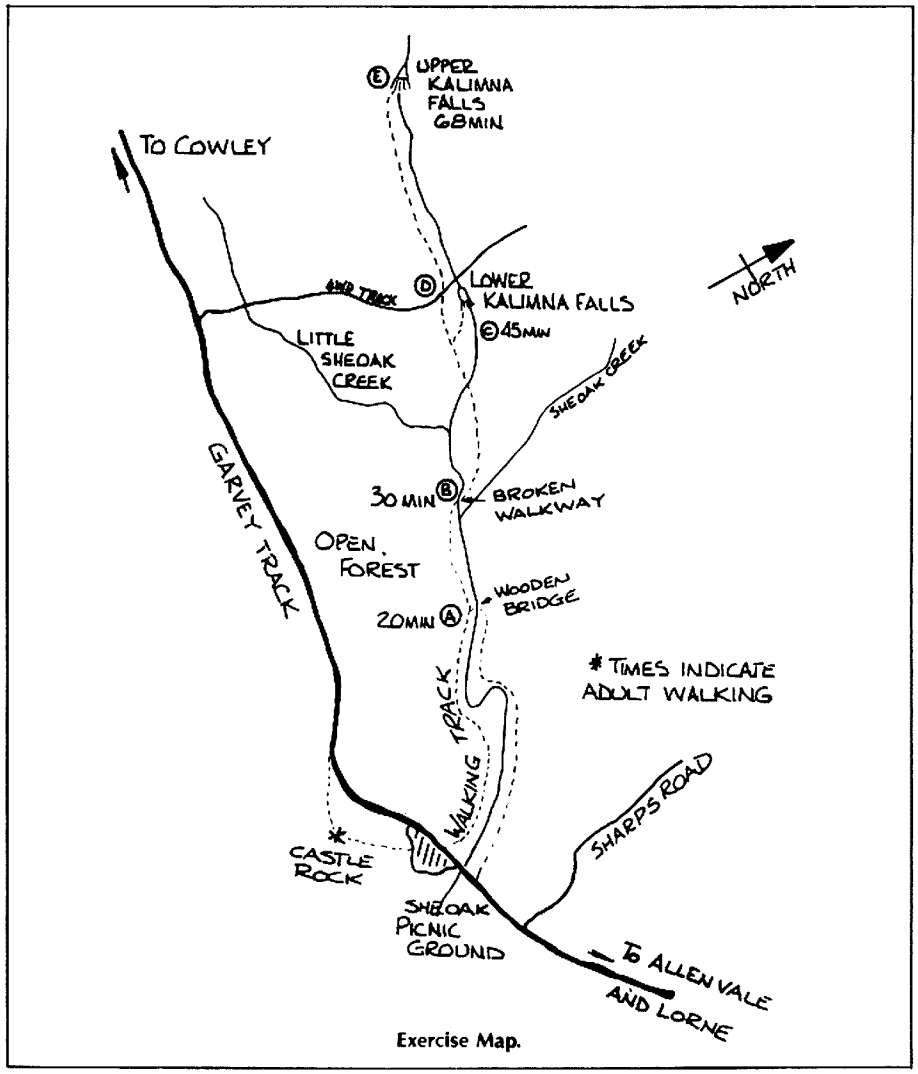
This is the scenario which confronted Zone 7 WICEN operators during exercise "Otway Survival", which took place on Sunday 9th June, in the forest behind Lorne. Twelve operators aged from 16 to 60 were divided into four groups, each with an important task if the victim was to be safely brought out of this rugged location.

The groups were required to undertake a variety of tasks including, moving to the accident site to relay the doctors diagnosis, setting the tapes and fire a smoke flare to assist the helicopter. A helicopter group was required to deliver a Bradford Frame stretcher to the accident site. A net control and support group were also required.

A cool overcast day and the Otway Ranges setting lent authenticity to this most successful exercise. Communications were achieved using hand-held 2m transceivers with each group, an FT480R as net control, and Group 1 carried an IC22S, battery and antenna to the scene of the accident to ensure reliable signal strength.

This exercise has ensured that the operators in Zone 7 are able to confidently work in the Otways, which constitute a large portion of their zone.

AR



Exercise Map.

ORGANISING FIELD EXERCISES

A Discussion paper (WICEN)

Mark J Stephenson VK3PI
VK3 REGIONAL CO-ORDINATOR
46 Fore Street, Whittlesea, Vic. 3757

OBJECTIVES: At the completion of this session, participants should be able to:

Plan, co-ordinate and implement training exercises;

Effectively respond to a request for communications support in a fast, efficient and confident manner, based on proper planning practices.

INTRODUCTION

There are a number of factors to consider in planning field exercises, and in this session I will attempt to present and discuss the more important issues.

The implementation of a field exercise can be broken into three finite stages of planning:

(a) *PRE-EXERCISE — involving liaison with services involved in the exercise, public relations, administrative preparation to determine manpower requirements, equipment requirements etc.*

(b) *EXERCISE — administration and organisation of networks, liaison with all services, rostering etc.*

(c) *DEBRIEFING — analysis of effect of exercise, report on ability of WICEN to handle specific tasks.*

WHAT IS COMMUNICATIONS?

It has been said that there are very few human activities we:

* *value more*
* *understand less*
* *perform worse*

than person to person communication.

Definition:

"WHERE A MESSAGE FROM ONE PERSON TO ANOTHER IS RECEIVED AND UNDERSTOOD BY THE SECOND PERSON EXACTLY AS THE FIRST PERSON INTENDED IT TO BE."

Communications can be divided into three broad categories:

1 *Telephone, telex, radio or any other form of communication relevant to field operations. Also includes communication by members of WICEN with members of the public, or members of other services, administrators and the public;*

2 *Non-emergency communications involving spoken, written or machine communications in support of administration or operations;*

3 *Informal communications between members of WICEN, mostly in spoken form.*

It must be remembered that the most expensive and complex piece of equipment is useless unless users are adept in a technical and communications sense. A member of WICEN who does not communicate adequately fails to gain comparable communication in return, and risks alienating people with whom he is liaising.

RESPONSIBILITIES OF WICEN PERSONNEL

Each member of WICEN, regardless of position within the structure of the system, has responsibilities. All members of WICEN have important roles to play in counter disaster operations, and of particular importance are the roles of Local and Regional Co-ordinators.

Before planning any exercises, one must be aware of the responsibilities as a Co-ordinator, be it Local or Regional.

REGIONAL WICEN CO-ORDINATORS

To promote an awareness of WICEN within their region among amateur radio operators, clubs and counter disaster authorities.

To establish a good liaison with the regional operations officers of the State Emergency Service, and/or relevant regional officers of other authorities. To ensure that each Local WICEN Co-ordinator in the region has good liaison with the local SES controller, local Police Inspector, and/or other counter disaster organisation staff.

To liaise with the Local WICEN Co-ordinators within the region and to ensure that each is active and constructive in their approach to emergency situations.

To maintain records of Local WICEN Co-ordinators and operators within the region, with all relevant details.

To ensure all WICEN operators are trained and exercises in emergency procedures under the guidance of their Local WICEN Co-ordinator.

To maintain amicable relations with counter disaster organisations, and in doing so inform them of the existence and capabilities of the Local WICEN groups.

To monitor WICEN operations in an emergency and assist where necessary.

To be conversant with regulations pertaining to emergency communications as per the DOC handbook.

To ensure that the State Co-ordinator is informed of any changes in regional organisation of the network.

LOCAL WICEN CO-ORDINATORS

To promote an awareness of WICEN within their area amongst amateur radio operators and counter disaster agencies.

To organise, if warranted, a local emergency network to meet any requirements of an area. To organise regular practice exercises using correct WICEN procedures as laid down. To supervise the running of any such network.

To act as liaison officer with the State Emergency Service in an area, and/or any other authorities as necessary.

To maintain a close liaison with the WICEN Regional Co-ordinator and to act on such policies or suggestions issued periodically.

To maintain a list of WICEN operators in an area together with all relevant details. Such information is to be lodged with the Regional Co-ordinator together with a plan for the local network and frequencies used locally.

To be conversant with regulations relating to emergency communications as per the DOC handbook.

ORGANISING A CALLOUT LIST

There are four levels of activity for amateurs:

Member of WICEN
Member of SES
Member of Third Party Traffic Net
Operator

It is important when compiling a list of those anticipating activity in WICEN to bear in mind that many WICEN operators, particularly in small communities, may belong to multiple organisations. This is a good thing provided there is not a conflict of interest.

It may be pointed out that if on a WICEN callout things are going slowly, members should not change allegiance midstream. This only makes it difficult for all.

KEEPING RECORDS — Suggested approach

Each WICEN Co-ordinator should endeavour to maintain an up-to-date list of all volunteers available for callouts or exercises.

The following information may be useful:

IDENTIFICATION — Name, address and call sign
CONTACT DETAILS — Home and work phone numbers
AVAILABILITY — How long can the member afford to be on duty
RESPONSE TIME — How much time does the member need to respond to a callout
VEHICLE — Type — is it able to go cross country
EQUIPMENT — Transceivers, bands, modes
POWER SUPPLIES — Generators, mains supplies, batteries

ACCEPTABILITY OF WICEN — PUBLIC RELATIONS

Liaison must be made with the public, and relevant counter disaster agencies, capabilities established and mutual trust and respect achieved before embarking on practice or operational exercises.

WICEN has suffered in the past with an identity problem in achieving acceptability by counter disaster agencies. Rather than tell authorities what we can do and leave them to fit us into their plan, perhaps we can be progressive and see if we can solve their communication problems. If a disaster plan for the region exists, analyse it. If one does not, carry out a threat analysis (See Appendix One).

Public relations and liaison with all other services is of primary importance and aids your ability to:

Plan your own exercises
Plan co-operative exercises

Be able to be recognised as a viable service when giving or requesting assistance.

Having ascertained the likelihood of any particular disaster in your area, make certain you know and are known by your local co-ordinators. This may include CFA Local Captains and Regional Officers, SES Local and Regional Officers, Telecom Australia District Co-ordinators, and Disaster Welfare Plan Regional Co-ordinators.

When dealing with personnel of other services and/or the public, be extremely conscious of the image you are projecting as an individual, and as a representative of WICEN. Of particular importance is your appearance when meeting people. Poor appearance in the form of untidiness or carelessness, arising from perhaps well meant informality, fails to impress. Adopt an attitude which will reflect the professionalism of the organisation you represent and act accordingly in your manner and dress.

GUIDELINES FOR EXERCISES

INTRODUCTION WICEN exercises should be conducted regularly to train people in message handling, and to test field equipment. One of WICEN's and amateurs strengths is flexibility in the type of equipment we use and the range of frequencies available to us.

In conducting exercises objectives must include matching current communications capabilities moulded around disaster plan needs, and testing/proving new communication techniques such as RTTY, portable repeaters etc. Training in the past has been dominated by practice in voice procedure and message handling. Organisers of exercises must also incorporate testing of frequency and equipment flexibility in their planning.

POINTS TO CONSIDER

Simulated disaster exercises are of limited value unless organised in conjunction with other counter disaster agencies and on a large scale.

For general purpose training and testing, community support exercises are useful. These provide assistance to the community and "real" traffic is passed.

WHO DO WE SELECT TO SUPPORT IN THE COMMUNITY??

(a) *The Community aid exercise should have training value for WICEN operators and involve personnel in tasks similar to emergency situations:*

(b) *It must be within the local groups capabilities and should demonstrate WICEN to local authorities.*

DO WE REPEAT COMMUNITY AID EXERCISES YEAR AFTER YEAR??

All exercises should be debriefed thoroughly to

guage their worth. WICEN may be hooked into a support situation each year and drift away from the general training and exercise aims. Where little exercise traffic is passed and the community event is adequately covered by other services, WICEN should not consider participating. Bear in mind that some exercises may be useful to both parties by strengthening ties and create support for our role.

Larger exercises, including all night and extended period of operation are also good training and may include car rallies, canoe marathons, etc.

EXERCISES AND THE DEPARTMENT OF COMMUNICATIONS

The Department of Communications is the regulatory authority governing amateur radio in Australia, and as such concerns itself with all aspects of the Amateur Radio Service. With regard to WICEN and exercises:

DOC must be convinced that personal safety would be at risk without WICEN involvement, and that WICEN receives valuable exposure.

Permission for exercises must be obtained from DOC. Details of proposed exercises are to be conveyed to the WICEN State Co-ordinator as he is generally in close liaison with officers of the Department.

Regulations regarding exercises are listed in the Handbook for Operators of Amateur Stations. A request in writing must be received at least ten working days before the proposed exercise. The request should contain the following information

- *frequencies to be used*
- *area of operation*
- *organisations operating during exercise*
- *declaration that amateurs receive no gain*
- *details of proposed types of messages (personal safety, accident reports etc)*

All logs must be kept for 12 months.

SUMMARY

Remember the word "PLEDGE" as it will remind you of those points to remember when organising field exercises.

Plan — your involvement and identify what communications you will be expecting or expected to supply

Liaison — good early liaison with those groups you will be working with is a must

Effort — put considerable effort into planning your exercises

Determine — your groups capabilities, strengths and weaknesses

Guide — members participating in exercises or as a support group should be treated no worse than the organisations helpers. This could include free entrance tickets, lunch facilities, car parking, use of clubrooms etc. You are providing a free service which would be quite costly if hired commercially.

Ensure — all WICEN members know their duties and limits of responsibility.

CONDUCTION OF THE EXERCISE

Some tips on Communications

* BE CLEAR	always use words and language the other person will understand
* BE CONCISE	too many words confuse people
* BE COMPREHENSIVE	cover all major and important points
* BE POSITIVE	positivity helps to give confidence and helps to get the message across
* BE COURTEOUS	courtesy is not a sign of weakness but gives the other person the right to be considered as a human being
* REQUEST, DON'T ORDER	where possible use the "we" approach
* BE PATIENT	as this will help those lacking confidence or who may be shy
* LISTEN	thoughtfully to each question giving it careful consideration
* DO NOT	take an aggressive question personally — treat it as evidence of concern and answer it fairly and calmly.

Frequencies

There are no dedicated WICEN frequencies, only band plans. The authorised emergency network operations are accorded a clear frequency by regulation (See Handbook section 6.32). However recommended frequencies for operational use are the following:

***HF** — 3.600 7.050 14.100 21.190 28.450 MHz*
Secondary frequencies are +25kHz for SSB and −25kHz for CW
***VHF** — Simplex Channel 6500 146.500*

Band sharing

The key to good operating is courtesy, tolerance and consideration on both sides. A short identified request along the lines of:

"..... Victorian WICEN is conducting a WICEN exercise in support of the local SES. A clear frequency would be appreciated. This is VK...."

Public relations

Frequently members of the public ask questions which appear on the surface to be shallow or stupid. Try not to assume this as questions may be asked out of ignorance or stoked by a situation or personal anxiety. They may be conversation openers with the real question to follow. Where the person appears under stress, the question in reality may be a form of seeking reassurance as well as guidance. A brusque or contemptuous reaction to the initial question gives no feeling of support or reassurance to comfort the questionner.

Administrative procedures

In the past there has been a fallacy that the most important job one can do during an exercise is operate communications gear. True, it is an important job but one which ranks equal to that of administering an operation. The astute organiser knows that the running of an exercise requires operators, logkeepers, rostering staff etc. Guidelines for procedures and duties to be performed in an exercise are adequately covered in the publication "WICEN OPERATING PROCEDURES LEVEL 1".

Reference should also be made regarding the establishment of a communications network in an operation. Varying factors will determine the size and requirements of a network, perhaps the most important being the area of operation and availability of members with suitable gear.

CONCLUSION

The preceding notes are by no means exhaustive and have been compiled in the hope that they form the basic building blocks for WICEN members to plan and co-ordinate their own exercises.

When planning exercises remember we are all communications orientated, and as such their will be no excuses for not communicating with those directly involved in an exercise, the public, WICEN members, or members of other authorities.

COMMUNICATION means CO-OPERATION, and CO-OPERATION means CONSOLIDATION.

APPENDIX ONE

THREAT ANALYSIS — SUGGESTED GUIDELINES

This involves grouping threats in your local area into probabilities of occurrences and seriousness of disaster. You should aim to satisfy the most likely occurrence in your area.

When planning involvement in countering disasters, and the training leading up to it, you should examine the relevance of the table entries to your local area.

CONSIDER: What are the most likely threats?

What can WICEN do to counter them at various levels of severity?

How does this influence training?

SCALE OF DISASTER

RISK	MAJOR	MODERATE	MINOR
High	Erosion Flood Drought Cyclone Wildfire Storms	Flood (Flash)	
Med.		Plagues	Landslide Temperature extremes
Low	Epidemic .	Tornado Salinisation Tsunami Earthquake	Frost

APPENDIX TWO

HOW DO YOU RATE AS A WICEN OFFICER?

Do most of the local amateurs know you as a WICEN officer?

Have you given a talk at your local radio club on WICEN?

Have you organised a local WICEN net in your area?

Do you know the name of your local SES Group leader?

Do you know the name of the SES Area Controller?

Can you recite the phonetic alphabet?

Are you familiar with WICEN prowords?

Do you know how to give and take a map reference?

Have you emergency power and can get on the air without mains?

Have you a telephone?

Are you emergency minded and a survivalist?

Could you erect an emergency antenna within half an hour?

Have you a fully stocked first aid kit?

Have you a survival kit or emergency rations?

Have you a fire extinguisher in the house or car?

MAN IN MOTION

The British Columbia PEP Amateur Radio Service is seeking support and amateur radio communication help for Rick Hansen — wheelchair marathoner, who will wheel 25,000 miles around the world. Rick will be in Australia during December 1985 and January 1986 and will wheel between Sydney and Townsville.

Are any members prepared to help by providing communications during the trip? If so, please contact the VK2 and VK4 Divisions, who will have more details.

AR

CLUB CORNER

SEQTG & SEQATVG — A WORLD FIRST?

The South East Queensland Teletype Group and the South East Queensland ATV Group are co-operating to transmit the RTTY news from VK4TTY live on the ATV repeater on UHF channel 34.

It is now possible to watch the RTTY broadcast on UHF TV similar to a 'glass' RTTY terminal on the Mt Cotton repeater, 3.630 MHz and UHF TV ch 34 every Monday evening at 1000 UTC.

from QTC June 1985 **AR**

DEVIL NEWS FROM THE NW BRANCH

There was a good gathering at the last Branch Meeting when one considered the poor, wintery weather.

The lease for the ATV repeater site has been renewed so it looks like the repeater will be on top of the mountain for a few more years.

A new antenna has been purchased by the Branch. This will save the beam being pulled down and moved for use at outside broadcasts, such as JOTA. The new antenna is a five band, trapped vertical.

The Branch also hopes to become the proud owners of a new HF set in the near future. Donations have been forthcoming from many members of the Branch, many thanks to them. The Branch has many good hearted people and it is a great feeling to be part of the people who give so much in so many ways.

RTTY is not yet operational as there is still much work to be done on the terminal, however Jack VK7WJ has much of the work in hand, so hopefully it should not be too long before something is happening.

Two metre repeaters 2, 3 and 8 will be set for remote linking by the end of the year.

Florian Biner, the activities officer, has many projects planned for the future including the conversion of the Siemans printer to 45 Baud.

About 250 QSL cards were despatched but not many incoming ones, due to the condition of the bands.

The Clanger Award was received by Tony VK7AX for purchasing raffle ticket books and not taking them to the meeting.

The meeting concluded with an interesting talk on SSTV by Tony VK7AX, which was enjoyed by all in attendance.

Thanks to Greg VK7ZBT for his assistance with these notes.

Contributed by Max Hardstaff VK7KY. **AR**

MOOMBA RADIO CLUB

The Moomba RC have an award called the "Minnet The Mining Net) Award".

WESTERN SUBURBS RADIO CLUB HONOURS MEMBERS

Recently the Western Suburbs Radio Club Committee and members paid tribute to five of their esteemed colleagues, whose efforts in supporting the Club since its inception have been extraordinary.

Preliminary discussions on forming a club were held on the old 2 metre Channel "A" on 19 September 1969. This on-air discussion was convened to determine the possibility of forming a radio club to serve the north and west of Melbourne. Those present in the net included Ian VK3ANZ, Ian VK3ZFH, Ted VK3ZZO, Ted VK3ZKP, John VK3ZWL and Les VK3ZPB.

A meeting was then arranged in the You Yangs on Sunday 21st September 1969. The meeting was arranged to discuss the formation of the club. As a result of discussions, and combined with the comments and thoughts of many XYLs attending, a formation committee meeting was planned. Three meetings took place on 21-11-69, 18-12-69 and 30-1-70.

The inaugural meeting of the club took place on the 20th February 1970, and for many years the Club convened each month at the Melbourne Caravan Park in Elizabeth Street, Coburg. Since 1983 the Club have occupied the Ern Rose Memorial Pavilion, Edwardes Lake, Reservoir, where the recent presentations took place.

Muriel May received a Service Certificate for her excellent efforts in performing duties as Secretary of the Club during 1982 and 1983. Muriel is the XYL of Neil VK3KNM, himself a hard worker for the Club. Muriel is the first ever recipient of a Service Certificate, and deservedly so.

Les Johnson VK3ZPB, the oldest founding member of the Club, was presented with a Life Membership Certificate. Les was the first Secretary of the Club in 1970, and performed this task also in 1971, 1972, 1973 and 1974. Les was Member of the Year in 1975, and magazine Editor for several years.

Ted Howell VK3ZKP was presented with a Life Membership Certificate for his untiring services to the Club. As a foundation member Ted has consistently contributed his services for the benefit of others, and continues to do so.

Below:
Les Johnson VK3ZPB, (left) oldest founding member of the Western Suburbs Radio Club receiving his Life Membership Certificate from Club President, Mark Stephenson VK3PI.

Proud recipients of awards, from left Tom Page VK3AGH, Les Johnson VK3ZPB, Muriel May, David Hunt VK3DMH and Ted Howell VK3ZKP.

Tom Page VK3AGH was presented with a Life Membership Certificate for his unselfish contribution. Tom has held the position of President (1978, 1979, 1980, 1981 and 1982), Vice President (1973, 1976, 1977, 1983), and Secretary (1984) and again this year Tom was Member of the Year in 1980, and remains as one of the more dedicated of our members.

David Hunt VK3DMH is known by many amateurs, and was presented with a Life Membership Certificate prior to his departure to reside in Canberra. David held the position of President in 1973, 1974 and 1975, Vice President in 1979 and 1980, and was Member of the Year in 1972. David used his extensive experience to run radio theory classes for aspiring radio amateurs over many years. David's efforts have been successful in assisting many members of the Club to gain their Certificates of Proficiency. His QSY to VK1 is our loss, their gain.

The Western Suburbs Radio Club continues to grow. Providing the Club attracts people of the calibre of those in the past, the Clubs attractiveness in providing companionship in an intimate small club atmosphere is assured.

Some readers may be interested to know of the whereabouts of the foundation members of the Club? Les VK3ZPB and Ted VK3ZKP are still staunch supporters of the Club. Ted VK3ZZO is also active, although he has had to restrict his club activities due to other commitments. Ian VK3ANZ now resides in VK2, and John VK3ZWL resides in VK4.

AR

HISTORY ON HOBART'S AIRWAVES

The Tasmanian Hamfest, held on 8th and 9th June was a great success. During the weekend a historic re-enactment of the first ship-to-shore wireless signals in Tasmania in 1901, took place.

The Hamfest was a dual celebration, the 60th Anniversary of the incorporation of the Tasmanian Division of the WIA and the 75th Anniversary of the Institute.

The 1901 experiments were conducted by 'Pop' Medhurst, situated at the Blinking Billy Lighthouse to a British warship, the HMS St George, a naval escort vessel. These experiments took place only four years after Marconi made similar experiments in Wales, in 1897.

For the re-enactment, special permission had to be received from DOC to use a WWI spark transmitter. A message was transmitted from the same lighthouse to a vessel, the Marie Francis, then back to a receiver at the Hamfest. It was then transmitted to Cardiff in Wales. DOC's Senior Radio Inspector, Dave VK7MR, was the operator of the spark transmitter.

THE STATELY MORSE OLD TIMERS

(Apologies to Noel Coward.)

Here you see the pick of us,
You may be heartily sick of us,
Still with sense we're all imbued . . .
Although we sometimes keep aloof at amateur conventions
Our good intentions
Musn't be misconstrued . . .
The stately Morse Old Timers how stolidly we stand,
To prove the nineteen twenties have still the upper hand.
Though Grandfather used a microphone.
And Uncle Tom sent a sideband tone.
We are trying to live it down — we don't mention them,
We're making up for their fall
By using no speech at all.
The copper in our spark coil is getting rather green,
We bought it at disposals in nineteen seventeen.
But if circumstances force us to —
And sometimes we fear they might —
We'll move on to Ancient Modulation.

Roy Harlkopf. VK3AOH.

FORWARD BIAS

VK1 DIVISION

Ken Ray
PO Box 710, Woden, ACT 2606

MEETINGS

The VK1 Division's general meeting for this month is on Monday 26th August in the studio room, Griffin Centre, Civic. Doors open around 7.45 p.m., with the QSL Bureau and Bookstall available before and after the meeting. This months' topic is Test Equipment and its uses. Visitors and non-members are most welcome, so come along and meet old friends, or make new ones.

RD CONTEST

While on the subject of diary reminders, don't forget the Rememberance Day contest on the weekend of the 17th and 18th of this month. Let's all try to return the trophy to its rightful place (in VK1 of course). If all VK Is who enter the contest submit their logs, we should have a good chance. By the way, you can hand in your completed log sheets at the August meeting, to save postage. The important thing is, though, to enjoy yourself and have a good time.

UHF BEACONS

Two UHF beacons have been constructed by Dick VK1ZAH, and at the time of writing, were under test at a location on the south side of Canberra. No technical details are available yet, but the frequencies are:

70cm 432.410 MHz
23cm 1295.410 MHz (I think)

A final location has not yet been determined, as there is insufficient room at the Mt Majura site for any more equipment. More details on these when they come to hand.

IOTA

Don't forget that the 19th to 20th of October is JOTA weekend. If you can help, contact Alan VK1KAL. JOTA is an excellent opportunity to show to others the fascinating hobby of amateur radio, so if you can spare some time, let Alan know when you will be available.

If you are not able to help operate one of the VK1 JOTA stations, you may be on the receiving end of a QSO with a Scout or Guide group. If so, have patience, and encourage the young operators. Remember back to you first on — air QSO — they may be as nervous and as "mic shy" as you were — your understanding and encouragement will make it an enjoyable experience for them. **AR**

VK2 MINI BULLETIN

Tim Mills VK2ZTM
VK2 MINI BULLETIN EDITOR
PO Box 1066, Parramatta, NSW 2150

WILL THE RD TROPHY REMAIN IN VK2?

This is an important month for the amateurs in VK2. Last year for the first time since the year the event was introduced (1948), that the amateurs in VK2 were the winners. We won it last in the first year. It has been too long between visits and would be nice if it remained here for a while. For it to do so however requires the annual contest, which is occurring this month — see rules in the Contest section in July AR.

The Remembrance Day Contest — long billed as the frienly contest — is worked on a ratio multiplier of the number of logs received against the number of licences issued in the State. For a State to do well requires first the operation by as many stations as possible and second the return of the logs. *Will you set aside some time during the RD weekend to enter the 'Friendly Contest'?*

WICEN.

WICEN exercises being held during the remainder of this year include — Sun City to Surf 4th August. Car rally at Batemans Bay 21/22 September, contact Peter VK2PJ for details. Outward Bound Hawkesbury Canoe Classic 26/27 October, contact Tim VK2ZTM. Schofields Air Display 9/10 November, contact Syd VK2AHF. WICEN members should advise early which events they are in a position to assist with and any other amateurs may also register their interest. In many cases your assistance would be welcome which would enable you to take part in the training the event provides and obtain an understanding the role that WICEN operation provides.

RECENT HAPPENINGS

While reports are still coming in from the groups who took part in the 'Envelope' release on 22nd May, it appears to have been a most successful day and in some cases a week. Many groups in the country centres were able to have a poster and static display for the whole week.

The Oxley Region conducted a most successful field day over the June holiday weekend at Port Macquarie. Part of the prize presentation included handing over the trophy to Peter Alexander VK2PA, who was the winner of the 75th Anniversary CW Contest held on the 11th March.

A reminder that the South West Zone Convention will be hosted by the Wagga ARC at Wagga over the weekend 26/27 October.

The next Conference of Clubs will be held Sunday 3rd November at Teralba and hosted by Westlakes ARC. Agenda items should be considered now and should reach the Divisional Office by 10th September.

LECTURE BY KARL MEINZER DJ4ZC.

During Karl's visit to Australia it was Sydney's turn to hear his lecture on OSCAR 10 at the VK2 Division Parramatta Headquarters on Wednesday 29th May. Over 80 people attended. Karl's talk in Adelaide on the previous Monday was video taped and a copy is available for borrowing from the VK2 office. One sour note to the evening was that some cars were broken into and equipment stolen from them.

REPEATERS ETC.

A meeting was held in Newcastle on 15th June to discuss a variety of repeater matters. The Central Coast ARC are carrying out site tests west of Newcastle for a wide coverage 2 metre system. They are developing a 23 cm beacon. The Newcastle ATV and UHF group have submitted an application for an ATV repeater. They have also lodged a request to establish a 6 metre repeater. Packet Radio was discussed and it is expected that a repeating system will be developed for the region. Westlakes repeater VK2RTZ 7100 has been overhauled and relocated to a good site in the region of the TV services for Newcastle. The meeting then discussed the proposals from both Westlakes and Hunter-branch for RTTY repeaters. It was decided to accept both proposals. The system proposed by the Hunter-branch Radio Group would be a dual RTTY/Voice system with coverage towards the north and along the Hunter Valley. The proposal from Westlakes would be a RTTY only one from a site towards the south of Newcastle providing coverage over Lake Macquarie and the Central Coast.

There has been a lot of interest recently in new systems for VK2. A report on these proposals will be given next month.

Next month — the start of Spring — will feature another VK2 Division Special within the pages of AR.

A reminder that the Divisional office is open Monday to Friday 11 am to 2 pm., and on Wednesday nights 7 to 9 pm. Phone 02 689 2417 during these times. At other times the 'message only' answering machine will advise you of the office hours.

The office has a full range of the 75th clothing, together with the range of publications from various amateur radio publication sources. **AR**

SIGHTLESS AMATEUR ON PACKET RADIO

25 April 1985 marked an important event for the Rochester packet radio fraternity. 1985 has seen rapid growth of packet in the Rochester area, but the highlight has to be the appearance on packet of Walter Keleher KA2ASL. What's so unusual? Walt is blind.

Operating on voice or CW without sight presents some challenge, but think about operating on packet radio without your sight. Sending is not a big problem, since Walt can touch type, but receiving is another story. Walt has an Apple IIe computer, an Echo voice synthesiser and a specially developed terminal programme. This terminal programme unites the computer/terminal and the text-to-speech functions of the synthesiser or "talker". Whatever appears on the screen of the computer is "read" by the talker, in nearly perfect speech. If pronunciation errors are made, Walt can back up to get a repeat or to have the unit spell out the unknown word or phrase.

On the evening of 25 April, Dave Denz N2DWL, and Mark Winrock both members of the Rochester Packet Group, went to Walt's home and set up his TNC and radio. After a short period of instruction and coaching the big moment arrived. The equipment worked perfectly. Walt worked WB2NBU, K2YNW and W2DUC in rapid succession. While Walt was taking his time learning about packet operation, the rest of the gang was taking turns sending to him. Walt reports that they are perfect copy, but all seem to have a Swedish accent (a common trait of text-to-voice processors).

It was an exciting evening, introducing Walt to packet radio and helping willpower overcome a great barrier.

From W2DUC

From the ARRL Packet-Radio Newletter "Gateway" May 21, 1985.

Contributed by David Pilley VK2AYD. **AR**

HF PACKET RADIO

David VK2AYD is interested in conducting HF tests using 1200BPS with other amateurs interested in Packet Radio. As a tentative start he will be on 14.103 MHz (circa QRM) every Sunday at 0100 UTC. David is also prepared to try any other amateur band at any time outside of working hours. Interested amateurs may contact David on (02) 452 5441.

AR

VK3 WIA NOTES

VICTORIA 150

THE 1985/86 COUNCIL FIRST MEETING

Flection of officebearers has resulted in no change to the major positions.

Re-elected were Jim Linton VK3PC President, Des Clarke VK3DES Secretary, Bill Wilson VK3DXE Vice President and Council Chairman — with Lindsay Rohrlach VK3KAF, the Treasurer, an office filled at the end of each divisional financial year on 31 December.

The President is now in his third term, and the Secretary has held that office for most of the past five years.

Other councillors were John Adcock VK3ACA, Andy Chan VK3DPJ, Alan Heath VK3KZ, and Barry Wilton VK3XV.

Among the first business of the new Council was a review of Vic Div General Meetings. It was resolved to accept the invitation of member clubs to use their venues.

Quarterly meetings were to be arranged at club venues with meetings on other months to become natter nights at the Wireless Institute Centre.

Full details of the new arrangements, including publicity about the location of quarterly meetings and guest speakers, will be published most likely as an insert in AR, and on the Sunday Broadcast.

CLASSES AND REVISION WEEKENDS

The next theory and Morse classes run by the Vic Div begin soon and prior enrolment is advisable.

Novice theory and Morse classes begin Tuesday, 27 August, AOCP theory starts Monday 26 August, with AOCP Morse on Tuesday 27 August.

Anyone can also take the theory and Morse classes separately.

Theory revision weekends will be held very soon for those intending to sit the next DOC exams.

The Novice weekend is on 3/4 August and AOCP theory being covered on 10/11 August — book yourself in now to avoid disappointment.

To secure a place in either the regular theory and Morse classes, or the special theory revision weekends, write to the Education Officer, Wireless Institute, 412 Bruswick Street, Fitzroy Vic. 3065, or telephone (03) 417 3535.

Two members proudly show their LETTER OF APPRECIATION issued by the President for service to the division.

This new form of recognition was launched at the 1985 AGM.

The first ever "LETTER" went to Norm Dench VK3DNE in appreciation of the role he played in ensuring WICEN and our hobby were prominent at the Melbourne Airport open weekend last February.

WICEN provided ground communications and a comprehensive display station situated in a hangar was provided by members of the Western Suburbs Radio Club.

Retiring Disposals Officer, Fred McConnell VK3BOU (pictured right) has made a truly commendable contribution to Vic Div in the past two years.

Hard dedicated work by Fred resulted in $8,000 income from the sale of disposals equipment.

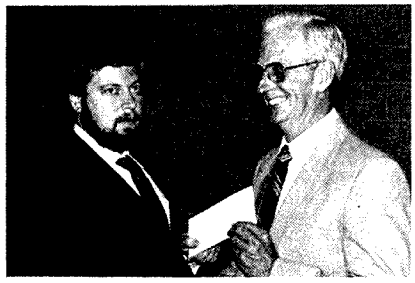
Not only did the division benefit from the income, but members (including some in other divisions) had access to cheap equipment.

A third "LETTER" was presented to the RTTY Fixers Group which turned incomplete and damaged Siemens teleprinters into clean, working and reliable machines.

The group even provides a back-up self-help service for anyone who strikes a difficulty with their teleprinters.

The many manhours volunteered by group members greatly contributed to the disposals service and the RTTY scene generally in Victoria.

Arthur Fraser VK3BII accepted the "LETTER" on behalf of his fellow RTTY fixers.



First prize winner in the annual Kinnear Trophy for contributions by Vic Div members to AR magazine, was Ken McLachlan VK3AH. The President caught him by surprise when he announced the prizes at the 1985 Annual General Meeting. Ken was chosen first by the judges for his sustained effort as DX notes editor and photographic contributions. Second prize went to Lindsay Lawless VK3ANJ and third placegetter was Des Grenham VK3CO — both had a series of articles published during 1984.

REMEMBRANCE DAY CONTEST — 17 & 18 AUGUST 1985

Victoria has won this, the major WIA contest, only once, and that was many years ago.

Last year it was encouraging to have an increased number of VK3s submit logs.

This year, with just a little more effort, the RD Trophy will be Victoria's.

It would be appreciated if all WIA zones and member clubs help encourage participation by their respective members.

The message is simple:—

* *Maximum participation is needed — a minimum valid log needs 25 contacts.*
* *As many Victorian call signs as possible should be put on air — dual call sign holders and zone/club call signs included.*
* *A free RD Contest Kit is available. Send a self-addressed A4 size envelope, plus 3 x 33 cent stamps to:- RD Contest Kit, PO Box 270, Greensborough, Vic. 3088.*

As further encouragement, each Victorian radio amateur, zone or club submitting a log with more than 100 contracts will get an RD contest participation certificate.

There will be endorsement for each hundred, from 200 upwards.

A zone and club competition will be held again this year based on maximum percentage participation. For registration in this competition, a list of zone/club members must be with the VK3 RD Contest Co-ordinator before 17th August.

AR

NEW MEMBERS

A warm welcome is extended to the following:

Mark Anderson, John Antonello VK3ZAF, Reg Bagwell VK3VRB, William Bibby VK3KWB, Michael Boord, Sergio Bughi VK3XAR, Allan Clark VK3CAC, Kazimierz Gretschel VK3CKG, Evan Matthews, Ronald Raworth VK3CRR, Ian Rochester VK3VIR.

Leon Reichelt VK3NLR, T R Smith VK3NTS, J H Struckeh VK3PSJ and John Svendsen VK3NJS.

Judith Atkins VK3NYL, Ronald Atkins VK3NYM, A Baker VK3YWR, R Berger, Ashley Bolton VK3NAB, Paul Casbolt VK3ZAD, Peter Crawford, Frederick Dierck VK3KTC, Mark Fairbairn VK3XVC, Ian Fitzpatrick VK3BV, Robert Habel VK3KCH, Christopher Kayler-Thomson VK3CKT.

William Land, Robertson Milne VK3KEL, Peter Wajngarten VK3NAD, Russell Walker VK6CV and I Westerland.

AR

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

Which VK5 old-Timer holds the record for having held a licence the longest? — and is he still on air? (I say he because I know that there are no ladies eligible!) I don't know the answer to these questions, but perhaps YOU do, if so I should be very interested to hear from you. I do know of a couple who must be near the top of the list. I heard this week that John Bulling VK5KX "chalks up" 50 years in August, so congratulations John; but one better than that is Keith Ring VK5KH who notched-up his 50 more than 2 years ago, a great achievement indeed.

There must be many things about those early days which would make very interesting reading or listening. The only trouble is, how to get it. One suggestion being "tossed around" at present is that we could get some of the old timers to put their early recollections and anecdotes about amateur radio on to audio tapes. These could possibly be used as a regular Historical Segment for the Sunday Morning Broadcast. Peter Barlow VK5NPC, our distinguished Broadcast Producer, is quite enthusiastic about the idea, so if you would like to be involved, please contact Peter direct. We would also like to hear from anyone who made copies of the Historical Segments that Les Diener VK5NJ made several years ago. Unfortunately, the originals were not kept, so we should be delighted to hear of any copies. Needless to say, we shall try to ensure that the same fate does not befall anything which is taped in the future which might have some historical significance. It is good that our 75th Anniversary has made us aware of our early beginnings — but let us make sure that nothing which we have now, be it a person's memories, a tape, photographs, or anything else, gets lost. Think how much more important it will have become by our 100th Anniversary!

At the first Federal Convention that I attended I was told that if I didn't bring back the RD Trophy I wouldn't be allowed back into the State. So for four years (with your help!) I continued to bring back the trophy — and what happens — the first year that I'm not there to keep an eye on things they let the VK2s take it home! Joking aside, this is RD month once again, and as they say *"you have to be in it, to win it"* so come-on VK5 LET'S BRING THAT TROPHY BACK WHERE IT BELONGS!

Diary Dates

17 AUGUST — 18th Remembrance Day Contest.
27th AUGUST — General Meeting.

WA BULLETIN

Bruce Hedland-Thomas VK6OO
VK6 PRESIDENT
Box 10, West Perth, WA. 6005

COUNCIL REPORT FOR THE YEAR APRIL 1984 TO MARCH 1985

One of the few things not to suffer from inflation is these council reports. I have noticed that they have become steadily shorter since 1981 and I hope this year continues the trend.

MEMBERSHIP

We normally compare membership figures from one January to the next. We are not able to do this due to problems with the Federal Office computer, which have resulted in our not having received any EDP sheets since last November. However, on 17th November 1984 we had 744 members, exactly the same number as at the same time the previous year. This is the first year since the CB boom that we have not experienced a nett growth.

These are difficult times financially and when the figures come through with the unfinancials deleted, we expect to find we have lost a good many members. We lost 70 last year, we believe mainly attributable to subscription increases. For this reason, although the Federal portion of the subscription has had to be increased, we have held the divisional portion constant and even subsidised the Federal portion by 50c in the case of pensioners.

It is implicit in the two previous paragraphs that we must have elected 70 new members in the course of the year, some being new licencees and some previous members re-joining. We are glad to welcome them.

MEETINGS

We have enjoyed at least three excellent lecture/presentations at general meetings during the year. But these have all been arranged by one or other of the councillors, its having been impossible, either by threats or entreaty, to obtain a volunteer for Programmes Organiser.

Don Lorimer, assisted by Mark Bastin has continued to cater well for the needs of the 'inner man' (do we have to say 'inner person') at meetings.

The Christmas meeting was arguably the best of recent years and they have all been very good since we decided to move out of Science House on the third Tuesday of December. It was organised almost unaided by the redoubtable Bastin family — Cliff VK6LZ, Christine VK6ZLZ and Mark — at the Westrail Centre. The DOC manager remarked that it was the most enjoyable he had attended.

DEPARTMENT OF COMMUNICATIONS

We have continued to have excellent relations and receive cheerful co-operation from the Department.

WICEN

This group, which is still ably led by Don VK6DY and Syd Jenkins, will no doubt, report separately but they appear to have had a quieter year than usual. Perhaps a time for consolidation of their growth. It is a pity that their work and dedication is insufficiently recognised by the authorities. Council voted $400 to assist them with the construction of their own repeater.

SLOW MORSE

This most useful service has been maintained but with the minimum number of volunteer operators.

QSL BUREAU

From being in the red a couple of years ago, the bureau has traded itself back to a positive balance and still runs efficiently under the management of Jim VK6RU. It is interesting to note that the cost to users has been constant since September 1976 during which time postage must have increased by at least 50 percent.

BOOK SALES

In the book shop Christine VK6ZLZ has shown herself a worthy successor to Chris VK6DV with a few special touches of her own. Book sales are almost our only source of income outside subscriptions. At Radio Rally she sold $680 worth of books.

JOTA

This year JOTA was a mixture of inflation and deflation. There was an increase in the number of operators but fewer scouts and guides participated. As usual, the bands went dead but JOTA always has a special meaning, perhaps because it bridges the generation gap.

INTRUDER WATCH

Bruce VK6XZ is handsomely filling Dave VK6WT's shoes. There was an extra flurry of activity (and telexes) protesting about the use of amateur frequencies by contestants in the Hong Kong to Manila Yacht Race. We did not get much feed-back but no-one could have been in any doubt about our feelings. Subsequently, one of the offenders had his equipment confiscated when he put into a NW port.

NEWS BROADCAST

Under Douglas VK6ZMG, assisted by Alyn VK6ZGA, Chris VK6FC and Phil VK6AO, the broadcast is still very much our shop window to Australian amateurs, and a well dressed one too. We added an 80m evening relay to our list of times and frequencies.

A thoughtful and thought provoking submission on broadcast matters was received from the Southern Electronics Group, supported by other country clubs. We appreciate their interest and goodwill.

RADIO RALLY

This event was the highest of the year and even more successful than last year. Reading the description of the long established and respected Gosford Field Day in AR, Radio Rally seems to compare very favourably. If it could be said to suffer any faults, they would be due to too few people trying to do too much.

As a result of their dedication in masterminding and bringing the rally to fruition, Chris VK6AUX and his long-suffering XYL Robyn were made Co-Amateurs of the Year.

REMARKS

As we all know, committees do not design very good horses (the usual result being a camel) and councils do not write good reports. It therefore falls to the President to do the actual writing. Because of this I feel free to say that the councils members have been loyal, hardworking and shown quite exemplary co-operation and dedication. The division has been indeed fortunate to have such councillors.

There are undoubtedly other members who deserve to be singled out for thanks and I ask them not to feel slighted, but to give themselves the pat on the back they know they deserve.

If I had to sum up the year in a few words I would say it was very much "the mixture as before", but we still managed to go forward in some areas. The phenomenon which I feel is evident throughout this report is the marked reluctance of amateurs to offer themselves for the many jobs which need to be done if our hobby is to survive and prosper. When there is some special project, usually the bare minimum of people come forward at the last minute but it is

Signed C A Bastin VK6LZ Hon Treasurer
14.4.85

We certify that we have examined the books and vouchers of the WIA (WA Division) and have found them to be kept in a business like manner and to record the true financial position of the Division at the close of the period. We have received every assistance in the Auditing of the Accounts, and compliment Mr Bastin on the informative manner in which the Books have been kept and the final accounts presented.

Signed F E Taylor VK6JK — *A H Van Den Avoort VK6HA*

Honorary Auditors 30th May 1985

impossible to get anyone to commit himself in advance to a pre-arranged task or roster. I can understand people having to drop their membership in times of financial stringency, but not people spending tens of hours per week operating and exercising the ever-increasing privileges which are gained for them by the dedicated few without being prepared to put anything back into the hobby which gives them so much pleasure and interest. We on the council don't want just an audience. We want co-workers. If many people were prepared to spend just one hour a month helping the Institute we could have an organisation which would be the envy of all others.

Think about it. Please!

THREE MAJOR EXHIBITS DEBUT AT EXPO 86 CENTRE

2 May, 1985 was a crucial date for watchers of Vancouver's 1986 World Exposition. It marked the opening of the Expo Centre, a unique prelude to EXPO 86. For the first time in the history of World Expositions, the public will experience a major pavilion a year before the official launch of the main event.

Within the Expo Centre's 17 storey geodesic dome three major exhibits present the future. The most prominent exhibit is the 500 seat Omnimax Theatre with its 27 metre wide domed screen, a screen which surrounds its audience with images nine times larger than a conventional movie screen.

Called the world's most breathtaking medium, the Omnimax Theatre will feature the film **A Freedom to Move.** By turns philosophical, humorous, informative — and, above all, exciting — this movie puts the audience inside a speeding train, a hang glider and other fascinating means of travel.

Another exhibit inside the Expo Centre is the 323 seat Futures Theatre, where members of the audience have the final word on the future. Visitors are first introduced to a show of dazzling computer graphics and laser illusions dealing with topics ranging from extraterrestial intelligence to brain implants. Fifteen screens, a 16 millimetre projector and 12 speakers heighten the drama of the presentation.

The audience is then introduced to a series of future possibilities and asked to choose from these options. They vote through computer buttons set in the arm of each seat. The vote is then computed and the consequence of the majority vote is revealed through a second audio-visual show.

The third exhibit is **Design 2000,** an exhibition of future technology. On display will be high-tech holography and space gear, a strap-on jet plane and "alternative technology" creations such as human-powered aircraft and a three-wheeled cycle that will do more than 80 kph on the freeway.

Restaurants, shops and a gallery of windows with a stunning view of the city and the EXPO 86 site are also a part of the Expo Centre.

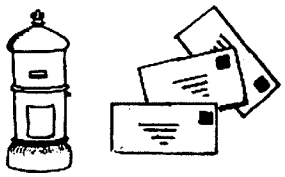
WIA VIDEO TAPE LIBRARY

John Ingham VK5KG, Federal Video Tape Co-Ordinator, now has some new equipment which will enable him to provide a much improved quality service, so all are urged to make use of this excellent facility.

Remember BETA format is available as well as VHS.



OVER TO YOU!

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publisher.

WE USE THEM

Without wishing to take sides in the current debate regarding polarity standards for Clipsal 495 plugs and sockets, I would like to advise that these fittings are used by the West Australian State Emergency Service for the connection of transceivers in their vehicles. The standard used by this Authority is POSITIVE on the vertical pin of the 'T'.

FUSING ERROR

I am referring to the generally excellent article "Electrical Safety in the Amateur Shack" by Fred McConnell VK3BOU, published in the May issue of "Amateur Radio".

Unfortunately there is a potentially quite dangerous error in the reference to fusing, Par 6(b).

The SAA Wiring Rules explicitly prohibit fusing of the neutral. The wording of Rule 2.16.2, in my 1976 edition of AS 3000, reads: "No fuse or unlinked switch shall be inserted in the neutral conductor."

The reason for this provision is clear. If a neutral fuse should happen to blow before the active fuse the equipment concerned will remain active to earth while probably not working and appearing safe.

The only way in which the neutral may be opened by a protective device is the use of a linked switch or thermal device which opens both the neutral and active connection simultaneously.

Obviously, any circuit installed by a licensed electrician will never have a fused neutral.

With best 73

George Cranby VK3GI,
PO Box 22,
Woodend, Vic. 3442
AR

FURTHER TO METRICS

Further to the footnote to P D Thomas' letter 'No Metrics', June AR, page 60, prompts me to write about the touchy subject.

To say that 'our grandchildren will know nothing else' is a bit wrong as I am sure any grandchildren involved in aviation engineering and any engineering units originating from the USA will be very much involved in Imperial measurements.

I doubt very much whether Imperial measurements will ever be displaced in manufacturing. Machinery lasts a long, long time, particularly in smaller workshops.

Many letters were written to the magazine 'Model Engineer', 15 March 1985 issue, also on this matter.

Yours faithfully,

R M Foreman VK2DKG,
42 Cambridge Avenue,
Vaucluse, NSW. 2030.
AR

METRICS-YES!

I totally disagree with VK5ZPT (AR June 1985 page 60) where he complains about the use of metric units in amateur radio measurements. The real issue is resistance to change, but I will first comment on his reference to The Metric Conversion Act.

I have not seen that Act, but I have a copy of the Australian Government Style Manual (whose authors must have knowledge of that Act), and I quote it in part at page 73:

All references to physical quantities and measurements in Commonwealth government publications should be in terms of the metric system as defined above. Only in special circumstances (for example, direct quotations from historical documents) should other units be used.

Non-government publications need not follow the above guidelines, and individuals should do what they must.

I was born in VU2, which adopted metrics and decimal coinage in 1957. I was only 5 then, so my education to university level in 1973 was based on metrics and decimal currency. For many years to this day, my elders expressed coinage in Annas, weight in pounds, and distance in miles. Our automobile was calibrated in miles, so I found it easier to estimate miles than kilometres, but felt comfortable with metrics for scholastic exercises. In 1973 I migrated to ZL, where I had a brief encounter with pre-metric days and had to learn all about pints, stones, pebbles, rocks etc. Then ZL and VK went metric, and the old timers have not yet stopped whingeing. Resistance to change is visible in the form of emotive letters to editors, absurd metric abbreviation eg MTRS, KPH, KLMS per LTR etc.

I get emotional when I see a British Dominion and supposedly English-speaking country (Australia) where North American influence (imitation) is stronger than is admitted. I cringe when I hear words like "dance", "chance" etc pronounced the American way. I have not discovered why some Australian publications use American spellings some of the time eg "Labor" and "Color" but not "Tire" (car tyre) or "Aluminum". The Americans do not use metrics, but we seem to like their pronunciation of "kilometre"! I am fussy about correct spelling (the British way), and my blood pressure goes up when editors and proof-readers cannot spell, and when newsreaders disregard grammar. People tell me that language is dynamic, and cannot be bound by rigid rules, whereas I prefer consistency. I too like to believe that I am "sensible and practical". Why do people complain that many to today's youth and even some teachers often cannot spell?

So dear Mr Thomas, many non-English-speaking nations have survived quite nicely without the advantage of Imperial units. Why not imitate them for a change? The Americans are slowly making compulsory the wearing of seat belts and motorcycle helmets, and one day they may change to metrics. The editor has already explained to you that metrics are easy to manipulate. Don't confuse our kids further, and perhaps direct your energies towards an Australian language that does not change with the tide. Then when you are on the air on six and a half feet, I'll come up on two metres, and we can have a good blue.

73,

Ash Nallawalla ZL4LM/VK3CIT

Werribee, Vic. 3030
AR

THANKS . . .

I would sincerely like to thank fellow amateurs who eventually managed, via the Australian Traffic and Travellers Nets, to contact me on a recent camping trip in VK2 and VK4, with urgent family information.

I am particularly indebted to Kevin Gill and VK3BBM for initiating the message, to VK3YH for drawing my attention to it being on the ATN, VK3VUZ for making vital telephone calls and to VK7RH and VK6BO for efficient handling of the matter on the nets.

Many thanks,

Hartmut Budde VK3DYD,
22 Clonmult Avenue,
Highett, Vic. 3190
AR

SATISFY AN EGO!

I am sick and tired of reading and listening to people who can't get assistance for their own projects ie public exhibitions, rallys, exercises etc etc.

Surely these people usually put on a show to satisfy their own ego or their own group's ego. So why complain when nobody else wants to help!

The real secret is to find out how it will be accepted by the people they are going to ask to assist. If the response is zero, and they still want to go ahead, then cut it down to an event that they or their group can handle. This seems to me to be fairly logical. I know most of the replies will be *"If we don't put these shows on, who will know about amateur radio?"* My reply would be, *"If a person really wants to know about amateur radio he will find out, come hell or high water"*. When it comes to the recruitment of new amateurs the legalisation of CB was probably the biggest and best boost amateur radio has ever had and will ever get.

Yours sincerely,

John C Eastaugh VK5GY,
77 Grenfell Road,
Modbury Heights, SA 5092
AR

MAKE MORE USE OF AR

I wish to thank the Victorian Division for the second prize award in the annual Kinnear trophy prizes and I congratulate the other prizewinners.

My thanks also to the editor of AR for his encouragement and acceptance of my contributions for publication.

The two main subjects I chose for my papers — amateur satellites and helical aerials, were new to me and I wanted to learn about them. I believe the best way to learn and understand a subject is to discuss it with others, experiment and then write about it.

The AR magazine is an excellent vehicle for papers from amateur radio experimenters and we should make more use of it for that purpose. Contributing a paper improves our own understanding of the art and helps others.

My thanks also to Rex VK3YN for triggering the interest in helicals and to Maurie VK5ZU for useful information about plotting satellite orbits and great circle tracks.

Yours sincerely

Lindsay Lawless VK3ANJ
Box 112,
Lakes Entrance, Vic. 3909
AR

HISTORY!

Congratulations to the WIA on completing 75 years of valuable service to amateur radio in Australia.

Although I have only been a member since retiring from a working lifetime in telecommunications, I have had an interest in amateur radio since the mid 1920s and, like Edgar VK7RY (AR June), reached 75 years this year on 5 July.

Since becoming involved in telecommunications in 1928 I have been privileged to see, and be involved in, many of the advances and changing techniques in the art and it has been evident that amateurs have been in the forefront of change, bringing about many improvements — the use of HF, early DX working with the UK and USA, the use of VHF etc, etc, all encouraged by the WIA.

Many thanks WIA, for your co-ordination of amateur radio affairs, through the enthusiasm and hard work of members, and for the camaraderie of amateurs which the WIA has fostered so successfully.

73 and long life to the WIA.

John Weir, VK4KJW,
100 Wrigley Street,
Maroochydore, Qld. 4558
AR

"ATV SHOP WINDOW"

Congratulations to the Western Suburbs Radio Club (Vic) for making such excellent use of one of amateur radio's best public relations and technical training machines . . . the 50cm ATV Repeater.

The recent televising of a lecture on Packet Radio,

and the announcement of further programming, indicates this is one club which is really looking to the future.

Melbourne's excellent 50cm ATV repeater, which is accessible on any commercial UHF television receiver (Ch 34), is without doubt one of our best shop windows. Unlike in-band ATV, one needs no special gear, everyone can view this full and comprehensive system on a regular lounge TV or VCR.

Technological change is fast, the Amateur Service must keep up. We must make full and efficient use of such excellent educational facilities as 50cm ATV . . . We have the technology — programme production and promotion is all that is required — *"Go to it Western Suburbs!"*

Best Wishes.

Tony Tregale VK3QQ,
38 Wattle Drive,
Watsonia Vic 3087

AR

THANKS FOR AMATEUR RADIO DISPLAY

Thanks to the fine effort of Des VK3DES for the display in the Philatelic Sales Room of the Elizabeth Street Post Office during the sales of the First Day Cover celebrating the 75th Anniversary of amateur radio.

We are grateful also to Mr Ray Bolitho, manager of that section, for his kind assistance.

Yours faithfully,

C J Pope, VK3DPO,
23 Ayr Street,
Doncaster, Vic.

AR

TECHNICAL CORRESPONDENCE

In the April issue of 'Amateur Radio' there was an article written by me dealing with Over-The-Horizon HF Radar. This article was written and published with the approval of the Director, Electronics Research Laboratory, Defence Research Centre, Salisbury, South Australia.

Since the publication of that article another magazine has attempted to provide information on the Jindalee OTHR system as well as present some associated theory.

I am concerned that a number of incorrect statements have been made in this later article and that these may be misleading to some readers. My comment on these mistakes are as follows:

1 Sections from the paper 'HF Skywave Radar — Current Progress' by Soden and Anderson have been used liberally throughout the article. Unfortunately in trying to rearrange this paper to suit the article the meanings of portions of the paper seem to have become either lost, distorted or stated incorrectly. eg the description of the effects of galactic noise.

2 The Doppler Resolution as shown in Table 1 of the article is incorrect by the loss of a decimal place. This is probably just a typesetter's error.

3 The photograph of the Hart's Range transmitting antennas is JUST THAT and NOT 'a small section of them' as suggested in the caption.

4 The 'Cable Connection Room' photo caption says 'Note earth straps'. What is pictured are not earth straps but rather multi-conductor plaited 'ribbon type' cables. I would hate to think that anybody would suggest that the engineers concerned would be so inept as to attempt to run earth braiding in the manner depicted.

One reason for the publication of my original article was to try and allay unnecessary fear which may exist within the Amateur Service that interference of a 'Woodpecker' type could be suffered as a result of operation of the Jindalee system.

The author of the article in the other magazine appears to be making an attempt to stir up concern when he intimates that after the radar leaves DSTO control and comes under RAAF control things may change as far as interference potential is concerned.

I would maintain that such statements smack of irresponsible journalism and that such an approach by the author should be soundly condemned. There is no reason at all to suppose that what he suggests is likely to occur. Both DSTO and the RAAF are parts of the Department of Defence.

Furthermore, the Department as a whole could be expected to consistently implement the policies laid down by the Federal Government. I can see no reason why this situation should change. To suggest otherwise would be considered to be alarmist and constitutes what I believe to be a most dishonest attempt to create sensationalism.

Naturally one would expect the situation to be totally different in the event of an outbreak of war of a general nature which included our country and we could expect that our amateur stations would be closed down as has happened in the past.

Finally, I would like to make it quite clear that this letter is written by me as both an amateur radio operator and an individual and private citizen and should not in any way be construed as an offical comment from an officer of the Commonwealth.

Ian J Hunt VK5QX
8 Dexter Drive,
Salisbury East, SA. 5109

AR

ELECTRICAL SAFETY

I read, with interest, the article in AR, May 85, page 31 "Electrical Safety in the Amateur Shack" and believe that an important factor has been omitted from the article.

Firstly let me state that I am no expert in these matters, just a simple hobbyist, however this is what I understand.

The core balance earth leakage protection is OK when in the main switchboard or the sub-mains to the shack, providing the appliance being used is transformerless, eg electric irons, toasters, etc. but when the appliance has a transformer (as suggested in 6(c)) the CBEL provides protection only on the primary side of the system and NO PROTECTION AT ALL on the secondary side of the transformer — and it is in this area that many radio amateurs will be probing.

If the above very brief explanation is sufficient to outline the point I am trying to make and which I

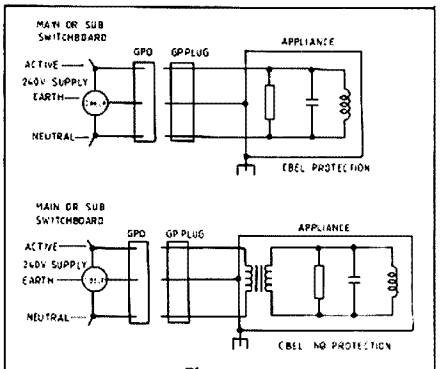

Figure 1

believe is important in the context of safety, then a clear warning to this effect should be included in any discription of CBEL.

73,

Colin Heath, VK5FX,
33 Braund Road,
Prospect, SA 5082

AR

QSL BUREAU

Please note that I am handing over control of the VK5 QSL Bureau to John Gough VK5QD with effect from 1st June 1985.

The Bureau will continue to operate as it has done in the past and provide the usual service for WIA members at the monthly meetings.

The new address of the Bureau will be: *VK5 QSL Bureau, John Gough VK5QD, Post Office, Williamstown, S.A. 5351.*

I wish to thank my fellow amateurs for their help and co-operation during the last five years and assure them that, family matters permitting, I will still be available to ensure the smooth change over to the new QSL manager.

Ray Dobson VK5DI,
16 Howden Road,
Fulham, S.A. 5024

AR

CORRECTION

The caption to the photograph at the foot of page 30 — July AR was incorrect.

The operator on duty at the Melbourne All Models Exhibition in 1955 was Graham Sutherland VK3ZAA. He was in contact with David Rankin VK3ZAQ (now VK3QV), when I took the photo.

73,

Alan Elliott VK3AL (ex VK3ZBE),
334 Dorcas Street,
South Melbourne, Vic. 3205.

The Southern Ontario Repeater Team, Inc. presents The Radio Society of Ontario/Canadian Radio Relay League Joint Annual Convention 27-29 September, 1985 Holiday Inn — City Centre.

The following programme outline gives a taste for what to expect at RSO/CRRL '85 in London, Ontario this September.

Giant Product Show, "Early Bird Eyeball" Wine & Cheese Party, Top Flight Speakers on every subject imaginable, Contests & Prizes, Partners' Progamme, Gala RSO/CRRL '85 Banquet, Entertainment, and Induction Ceremony into the Royal Order of the Wouff Hong.

Further information write to: Box 73, Hyde Park, Ont, N0M1Z0.

LOW-COST SYSTEM LETS MICROCOMPUTERS SEE

Image analysis is now available for use with any microcomputer which has high resolution graphics and an 8 bit parallel port at no more than the cost of the microcomputer itself, thanks to a vision system developed by a British manufacturer.

The basic system, called Microsight 1, uses a standard closed circuit television camera to capture images, passing them through a special interface and transferring the data as 8 bit digitised video signals. The microcomputer's RAM stores the captured image in monochrome and the software can be used for simple mapping and object recognition.

With addition of Microsight II, it is possible to input pictures of television quality and store them on disk. The further addition of Microscale software allows enhancement of picture detail measurement of defined areas of the picture, thus providing CAD type facilities.

The software is available for BBC, Apple, Commodore, Sirius and other popular microcomputers.

Obituaries

ALFRED JOSEPH BARNES VK2CE

Alf, formerly of Eastern Suburbs, for the last 30 years in Telopea, passed away at "Lottie Stewart Hospital" on Tuesday 4th June 1985.

Alf who was in his 77th year first became interested in amateur radio at the early age of 16. After getting his amateur licence he experimented on many projects, and one project that had many people thinking was one called "The Barnes Mystery Circuit".

Over the years Alf has aided and assisted a great number of people that are interested in amateur radio, both in getting their licence, and building projects. He was always there when someone wanted assistance. The hand of friendship was always extended to assist his fellow man.

Alf VK2CE, "Charlie Echo" — That call will be missed by a great number of people throughout the world, especially by his close mates and friends.

Alf is survived by his loving wife Kath and family, to whom we offer condolences.

Ron Jones VK2VND.
AR

PETER COHN VK1KPC

Monday the 6th of May marked a sad day for many amateurs, friends and associates of Peter Cohn VK1KPC, who passed away suddenly.

Peter will be missed by those who knew him at the Honeysuckle Creek Tracking Station, the computer section of the Government Printer's Office, the ANU School Computer Unit of the Research School of Physical Sciences, and by those who knew him as a hobbyist on the VHF bands, with WICEN, or in foxhunts on 2 metres.

But Peter was more than that. His friends and interests spanned the technical, the bushwalking groups, the mountaineers, and the performing arts.

A service in his memory in Canberra brought together a truly large gathering of those people whose ambassador Peter was. We knew of the diversity of his life, although few of us had any inkling of those that were his confreres in other fields. He promoted each of his dedications. He always spoke well of his fellows, and he joined us all with his sense of humour and his warm and gregarious nature.

What we did not realise, is that there was one more diversity to his life. It was a sadness which he did not share, for he held no brief in such matters.

Farewell young and dear friend.

George Brzostowski (VK1GB) and Dick Elliott (VK1ZAH) for the VK1 Division.

GEOFFREY SAINT COOMBE VK5ML
5 April 1985

Radio was Geoffrey's hobby, and had been so, since his early teens.

Of his school friends with the same inclinations, he was the first to obtain his operators licence, his call sign was VK5ML.

During his time, he contacted most countries of the world, both on phone and Morse code, the Morse being a great love, and one in which he was particularly proficient.

He was not only an operator, but also a practical constructor, and one of his early home made transmitters is a heritage item preserved in the museum of the Wireless Institute of Australia.

Over the years, there developed a group with which he regularly spoke, but of late, could only listen.

Geoffrey will be sadly missed by his many friends.

In amateur radio language, Geoffrey is QRT, which simply means, he has closed his station down.

Basil Rogers VK3ABJ

MILES UPTON VK3AMU

It is sad to report the passing of Miles, in Box Hill Hospital on 26th May 1985.

Miles moved to Queensland approximately seven years ago and held the call sign VK4AMU, but he returned to Melbourne three months prior to his death.

Miles is survived by his wife Jo, to whom we extend our deepest sympathy.

SILENT KEYS: LEUKAEMIA MORTALITY IN AMATEUR RADIO OPERATORS

Sir — In 1982 I reported increased mortality due to leukaemia in men whose death-certificate occupation suggested exposure to electrical and/or magnetic fields.[1] Similar findings have been reported by others.[2-4] An amateur radio operator (Andrew R Sabol W2EVE) wrote to me suggesting that I study mortality in members of the American Radio Relay League, a group of amateur radio operators exposed during their hobby to electromagnetic fields.

Recent deaths of members, with City and State, are reported in the "silent keys" section of QST, the league's monthly magazine. For 1971-83, there were 296 male deaths listed for Washington State and 1642 listed for California. Death certificates were obtained for 280 (95%) of the Washington State deaths and age, date, and cause of death information was obtained for 1411 (86%) of the California deaths. A proportionate mortality ratio (PMR) programme[5] was used to analyse the 1691 male deaths in the two States.

The table shows an increased PMR for the leukaemias, limited to myeloid (8th ICD 205) and unspecified (ICD 207) leukaemia. Lymphatic (ICD 204) and monocytic (ICD 206) leukaemias show no excess. This difference by cell type may have happened by chance, but it is unlikely to have resulted from any bias inherent in proportionate mortality analysis. Studies in the USA[2] and UK[3,4] also revealed a tendency toward a relative increase in the acute myelogenous type of leukaemia in electrical workers.

There is a strong association between employment in occupations with exposure to electromagnetic fields and membership in the American Radio Relay League. 97 of the 280 (35%) Washington State "silent key" death records listed occupations such as electronics technician, electrician and radio operator, while these occupations account for only 3% of male deaths in the Washington State death file.[6] The PMR due to leukaemia (ICD 204-207) in Washington State amateur radio operators was 264 (2 deaths observed, 0.76 expected) in those who worked in electrical-exposure occupations and 210 (3 deaths observed, 1.4 expected) in those who worked in all other occupations. Occupational exposure alone, therefore, probably does not explain the leukaemia excess in these men.

These findings offer some further support for the hypothesis that electromagnetic fields are carcinogenic.

ANALYSIS OF LEUKAEMIA DEATHS IN MALE MEMBERS OF THE AMERICAN RADIO RELAY LEAGUE RESIDENT IN WASHINGTON AND CALIFORNIA, 1971-83

Cause of death (ICD 8)	*Deaths*		
	Observed	*Expected**	*PMR*
All causes	1691	1691	100
All leukaemias (204-07)	24	12.6	191 ($p<0.01$)
Lymphatic (204)	3	3.9	77
Chronic (204.1)	3	2.1	143
Myeloid (205)	16	5.7	281 ($p<0.01$)
Acute (205.0)	11	3.8	289 ($p<0.01$)
Chronic (205.1)	4	1.5	267 ($p<0.05$)
Unspecified (205.9)	1	0.4	250
Monocytic (206)	0	0.4	0
Unspecified (207)	5	2.7	185

*Expected deaths for leukaemias generated using 1976 US age-specific white male death frequencies by detailed ICD number and a simple proportional model.

GET ON THE BANDWAGON?

When Jakarta police swooped on a group of smugglers off-loading a plane from Singapore in the wee small hours recently, they received quite a shock. Instead of finding quantities of electronic goods, probably videos, they found a large number of walkie-talkies and amateur radios to feed the city's latest whim.

As most are unlicensed, it is difficult to tell how many operators there are in Indonesia but it is believed to be around one million. It is a status symbol to be able to operate with a proper call sign in Jakarta but many are too busy to sit for the ITU exams so they PAY for their licenses instead, whilst others just go without completely.

Amateur radio was granted by Government Regulations in 1967, however a boom started in 1981 with many using smuggled base stations and hand-helds. At first many were happy to use the CB channels, however these soon became overcrowded and any clear wavelengths are now used including amateur frequencies and sea and air navigation bands.

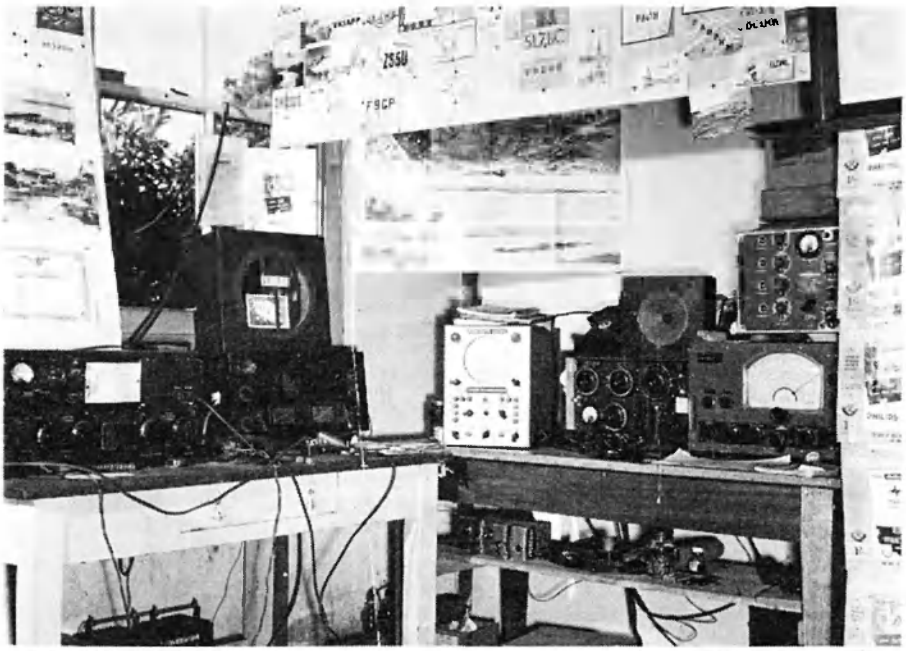
75th Nostalgia:



This equipment was set up as part of the Port Macquarie 'Carnival of Pines' in 1954. On the left is the station of Ted VK2AVG (now VK4YG). The transmitter is an ART13 with an American National HRO receiver. Under the bench are large power supplies needed to drive the equipment. To the right is the equipment of Peter VK2PA (the winner of the WIA's 75th CW Contest). This equipment consists of a Homecraft test kit CRO, an A2RTB and an STC AMR-300 communications receiver. Above the AMR-300 is a converted Bendix transmitter. Amateur Radios line the extreme right-hand side of the photo.

Photograph published in 'Oxtales', May 1985. Courtesy Peter Alexander VK2PA and R O'Connell VK2BFP.

NOTICE

ALL copy for inclusion in October 1985 Amateur Radio must arrive at Box 300, Caulfield South, Vic. 3162 no later than midday 21st August.

HAMADS

PLEASE NOTE: *If you are advertising items FOR SALE and WANTED please write each on separate sheets, including ALL details, eg Name, Address, on both. Please write copy for your Hamad as clearly as possible, preferably typed.*

- **Please insert STD code with phone numbers when you advertise.**
- Eight lines free to all WIA members. $9 per 10 words minimum for non-members.
- Copy in typescript please or in block letters double spaced to PO Box 300, Caulfield South 3162.
- Repeats may be charged at full rates.
- QTHR means address is correct as set out in the WIA current Call Book.

Ordinary Hamads submitted from members who are deemed to be in the general electronics retail and wholesale distributive trades should be certified as referring only to private articles not being resold for merchandising purposes.

Conditions for commercial advertising are as follows: The rate is $22.50 for four lines, plus $2 per line (or part thereof) minimum charge $22.50 pre-payable. Copy is required by the deadline as stated below indexes on page 1.

"FROM PASTURES GREEN TO THE SILVER SCREEN" by the late John W Gerard VK2ADN, is a 20th century autobiography comprising 156 episodes and 273 illustrations. The author's memories of remarkable events, exciting experiences and achievements were transferred to paper during a period of five years and make interesting reading for people of all ages. The price is $14.95 plus $2.50 postage and packing. Available from Mrs Marie Gerard, East Bonville Road, Bonville, NSW. 2441.

AMIDON FERROMAGNETIC CORES: Large range for all receiver and transmitter applications. For data and price list send 105 x 220 mm SASE to: RJ & US IMPORTS, Box 157, Mortdale, NSW. 2223. (No enquiries at office . . . 11 Macken Street, Oakley). Agencies at: Geoff Wood Electronics, Rozelle. NSW. Truscott Electronics, Croydon. VIC. Willis Trading Co., Perth. WA.

☐ WANTED – NSW ☐

AMATEURS WANTED . . . VK2AYD is interested in conducting HF tests using 1200 BPS with other amateurs interested in Packet Radio. As a tentative start he will be on 14.103 (circa QRM) every Sunday at 0100 UTC. He is also prepared to try any other amateur band at any time, after working hours. VK2AYD, QTHR. Tel: (02) 452 5441.

BEAM . . . Small triband Mosley, TA33-Jnr or similar. Turning radius around 10-12'. In good order. Bert VK2OW, QTHR. Tel: (02) 76 5730.

CHEAP VIC-20. Not necessarily working. VK2ZQD. Tel: (046) 25 7746 AH.

PARABOLIC MICROWAVE DISHES. Any size up to 2m diameter. Buy, long or short term loan. Peter VK2JJJ. Tel: (02) 57 1426 AH.

YAESU FL-110. 100W amp for Yaesu FT-7 tcvr. Cress VK2AYB, QTHR. Tel: (02) 631 3186.

☐ WANTED – VIC ☐

HY-QUAD HY-GAIN HQ-2. Graeme VK3BGH. Tel: (03) 735 7300 BH or (03) 870 4371 AH.

ROTATOR HAM M in working order or alternatively a defective unit with good upper casing. Required to replace unit with fractured upper casing. H G Tribe VK3AVH. Tel: (059) 88 8797.

WORKSHOP MANUAL for Comtronix FM-80 or any info relating to known faults in tx section. All costs re-imbursed. Any info welcome. Murray VK3CGC. Tel: (03) 306 5430.

☐ WANTED – QLD ☐

CRYSTAL for 435 kHz. Any size or shape. Fred VK4RF, QTHR. Tel: (07) 200 7916.

EARLY MORSE KEYS for private collection. Please contact Fred L 40855, QTHR. Tel: (07) 396 3521.

SWAN EXTERNAL VFO. Model 508 in GC. Jim VK4AJG, QTHR. Tel: (075) 38 0270.

☐ WANTED – WA ☐

MOBILE ANTENNA for 20 & 80m. VK6LT, QTHR. Tel: (09) 457 1080.

☐ WANTED – TAS ☐

ASSEMBLY MANUAL for Chirnside 4 el HF Yagi. All costs reimbursed. Tom VK7NBE. Tel: (004) 24 5122 or 27 8318 AH.

☐ FOR SALE – ACT ☐

DC-200 . . . 12V power supply for FT-200, as new. $80. Ten Tec 'Power Mite' tcvr. 12V 5W tx VFO, synchro rx. 40/20m, CW. Wt 1.5kg, + AC5 ATU & phones. $100. VK1BE, QTHR. Tel: (062) 81 3301.

FT-7 TCVR. 28.1-28.6 MHz xtal fitted. EC. Ideal novice rig. $350. FRG-7 rx. As new. $250. Richard VK1UE. Tel: (062) 58 1228 AH.

KENWOOD TS-820 with CW filter, mic, hbk. $500 ONO. Realistic PRO-2020 scanner $250 ONO. Consider exchange for Dual trace CRO or VHF multimode rig. Andrew VK1DA, QTHR: Tel: (062) 81 4209 AH or (062) 84 4620 BH.

YAESU FP-707 POWER SUPPLY. $120. Frank VK1ZL, QTHR. Tel: (062) 81 3956.

☐ FOR SALE – NSW ☐

DECEASED ESTATE of VK2BHI. Yaesu FT-107 DMS, with scan mic. In immac cond. $850. Hidaka VS-80KR vert aerial with radial kit. $140. This unit is 4 yrs old but had little use. Jack Flynn VK2AY, QTHR.

DECEASED ESTATE of VK8NE. Kenwood TS-930S $1650. Kenwood RD-300 dummy load $80. Yaesu FC-707 ant coupler $160. Yaesu FV-707 DM digi VFO $195. Datong speech processor MDL ASP $175. Daiwa speech processor MDL RF-550 $90. Shure 444D mic $85. Kenwood MC-35S mic $20. Scalar mobile ant set MDL SC-00-R $100. ONO on above prices. VK2VVO, QTHR. Tel: (02) 630 2437.

FDK MULTI-QUARTZ 16 2m FM tcvr with mic & manual, xtals fitted for repeaters 1-8, + 40 & 50, 1/10W output. VGC. $170. Bob VK2ENU, QTHR. Tel: (046) 26 4776 AH or (02) 925 8109 BH.

FT-227R 2m FM 10W mobile tcvr $150. FT-620 6m SSB/AM/CW base tcvr $150. FT-7 HF SSB mobile tcvr + FL-110 100W amp. $400 the two. 25W FM 6m tcvr $40. All in GC. Tel: (069) 31 1490.

ICOM HP-1 HEADPHONES, new $30. Icom SM-6 desk mic. New $45. Icom AG-1 70cm masthead GaAsFET pre-amp. New $60. Texas Instr TI-55 professional advanced calc $40. VK2AS, QTHR. Tel: (02) 467 1784.

KENWOOD TR-2400 2m h/h complete with all manuals, spare nicad batt, fast & slow chargers & speaker mic. $260. Packet Radio software approach for TRS-80, complete with all manuals & built-up interface. $80. VK2HL. Tel: (02) 981 4762.

KENWOOD TR-7625 2m FM tcvr $300. **TR-3200** 70cm tcvr $100. AT-200 ant tuner $100. Yaesu FTDX-400 HF tcvr $200. KR-400 ant rotator $120. TET HB-34D 4el tri-band beam $300. Prices negotiable. All in VGC. Peter VK2EPJ. Tel: (02) 524 7387.

KENWOOD TS-120S, mic MC-10, new 20A power supply, ant tuner AT-120, mobile bracket, mobile ant mnt & 10 + 80 whips. $795 ONO. Cartons & handbooks. Yaesu 101ZD (WARC bands) with fan, 2 mics, ext VFO FV101DM, top gear, ctns & handbooks. $695 ONO. Tom VK2PDT, QTHR. Tel: (02) 807 3974.

KENWOOD TS-820S tcvr with 520S VFO. $650. PC. Kenwood TS-130S tcvr with 240V power supply & ext spkr $500. PC. Yaesu FRG-7700 rx with memory. $500. PC. VK2MW. Tel: 449 2439.

KENWOOD TS-830S in EC, very little use. Incl 12V inverter, orig manual & packing. Also workshop manual. $850. John VK2DFC, QTHR. Tel: (069) 62 5547 AH.

MARCONI SIG GEN TF-801D/1. 10-470 MHz. 1uV to 600mV. $150. VK2ZHM. Tel: (02) 663 0197 BH or (02) 406 5338 AH.

OSCAR 10 ORBITAL DATA – SASE for sample printout. FT-243 xtals, 3.720-5.995 MHz. SASE for list. Quantity of ex-military equipment components. Meters (55mm round mount) 180uA, 200uA & 1mA FSD. $5 ea. 100kHz xtals – octal $6.50, 7 pin $8.50. Polar variable caps 100pF, 50pF, 20pF – shaft length 8mm, dia 5mm $2 ea or 6 for $10. Stepped attenuators (10k) 0-40dB in 20 steps $4 ea. P&P $1. Ian VK2ZIO, QTHR. Tel: (02) 680 2112.

TOWER (CRANK-UP) 43' Purchaser to remove. $250. Bruce VK2YU, QTHR. Tel: (02) 869 1125 AH.

YAESU FL-2100B HF linear amp. Mechanically A1 cond but not operational. Offers invited from tech-minded amateurs who would like the challenge. Full details, Laurie VK2AQW, QTHR. Tel: (02) 969 2160.

YAESU FT-101 tcvr. 160/10m, WWV, the complete HF station. On air demonstration if required. $300, worth much more. VK2ALV, QTHR. Tel: (042) 29 6858 AH.

☐ FOR SALE – VIC ☐

CH1BA CB 40 ch, audio test equipment, expertly assembled. All valves, CRO, oscillator output meter, dist volt meter. Decade box, ohm meter, no paper work. Will swap for 2m h/h or UHF Tiger. VK3DIO, QTHR.

ICOM 251A. 2m tcvr. 12 or 240V, built-in SWR meter, in top cond. $500. David VK3XPO, QTHR. Tel: (03) 848 6819.

ICOM STATION. IC-701 HF tcvr, IC-701PS power supply, IC-SM2 desk mic, IC-RM3 remote controller, IC-EX2 marker/ext terminal. All in PC. Plus spare SS finals, instr manual, orig cartons. $800 the lot. Rob VK3BVW. Tel: (03) 876 1665.

KENWOOD TS-520S tcvr in EC. New 6146 finals fitted, mic & op manual supplied. Good reliable radio for 160/10m. $400. Bert VK3ZZX. Tel: (052) 26 5033 BH or (052) 78 2374 AH.

KENWOOD TS-820S tcvr. Digi readout, CW filter, noise canc mic. As new cond. $500 ONO. Stan VK3AGT. Tel: (058) 58 2426.

TONO 7000 with cables, instr book & circuit. $325 ONO. John. Tel: (055) 23 1025.

SHACK CLEARANCE – Swiss Quad for 10 & 15m & inverted V for 80m, coax cable incl. 4 yrs old. Asking $225 ONO. VK3NAJ. Tel: (051) 74 6559.

TRAP VERTICAL, 5 band, Chirnside CE-5SS, 4.7m high, self-supporting. As new in orig carton with instr. $80. Kevin VK2ASM. Tel: (03) 874 2046.

VINTAGE MANTLE RADIOS, wooden cases, (need servicing). Tubes OK. AWA radiolette 1932 BC rx & STC C1938 BC-SW. $40 ea. VK3CD, QTHR. Tel: (03) 842 1374.

WERNER WULF 10/15 beam. Daiwa DR-7500X rotator with preset controller. 21ft plumbers pipe, welded guy rings, coax $230 or exchange good Eddystone comm rx. VK3VXY. Tel: (059) 74 2053.

YAESU FRG-7700 comm rx with FRT-7700 tuner and FRV-7700 VHF converter. All VGC $550. Yaesu FT-620 6m SSB/AM tcvr. 50-54 MHz. $260. Standard T-1200 2m H/H, new nicads & accs $190. Peter VK3PM. Tel: (050) 24 5814 or PO Box 30, Mildura, Vic. 3500.

☐ FOR SALE – QLD ☐

HEATHKIT 'Q MULTIPLYER' with handbook. Was used in KWM 2 tcvr. $30. Fred VK4RF, QTHR. Tel: (07) 200 7916.

KENWOOD TS-120V 80-10m tcvr. PC, little use, no mods. $450. Scalar 5 band trap vert ant. 80-10m. PC, little use. $60. Steve. Tel: (07) 284 1127 after 6.00 p.m.

TOWER . . . 48' free standing. All steel, bolt together. $300. Fred L 40855, QTHR. Tel: (07) 396 3521.

YAESU FT-101E HF TCVR, AC-DC 100W output. Top cond. Fitted with 30m, new finals. $400. Joe VK4AGL, QTHR. Tel: (071) 41 2315.

YAESU FT-902D HF TCVR. WARC bands, hand mic, all modes, instr manual. Reasonable cond, $670 or best offer. Yaesu FV-101DM ext VFO. Instr manual, without patch leads, 1 yr old. $45. Steve Hyland. Tel: (077) 79 5388 from 8.00 to 9.00 a.m., Mon-Thurs.

☐ FOR SALE – SA ☐

YAESU FT-707, FV-707, MMB-2 (mobile mount brack for FT-707 & FV-707), FT707 service man, spare IF & AF boards (complete), ATU-120. $750 ONO. Prefer not to separate. Siemens model 100 teleprinter, $80 ONO. PRC-10, $10. Trevor VK5ATB, QTHR. Tel: (085) 62 2886 AH.

☐ FOR SALE – WA ☐

ICOM IC-740. VGC. 1.8-30MHz & manual $750 ONO. Icom IC-730 with SSB filter, from Heard Island Expedition 1983 incl mic, manual $700 ONO. 8el ATN log periodic ant. 13-30 MHz $400 ONO. 2 section Hill's winch-up mast 12m complete. Make an offer. Contact Emanuel VK6NEB for inspection. Tel: (09) 276 2207.

R-2000 COMM RX, 10kHz-30MHz. Near new cond. No faults. Complete with orig carton, manuals & necessary patch connectors for remote control of tape recorder. Will send anywhere in Australia at buyers cost by post. $450. VK6HT, 4 Quandong Place, North Pinjarra, WA. 6208.

☐ FOR SALE – TAS ☐

YAESU FT-200 HF TCVR. Orig cartons with power supply $170. Paddle keyer with mem $90. Yaesu desk mic $25. Will trade. Tbm VK7NBE. Tel: (004) 24 5122 BH or (044) 27 8318 AH.

AR85

Announcing the new IC-735.

You have been waiting a long time for a compact (94mmH * 241mmW * 239mm) HF rig with performance you would expect only from the Icom stable. 100 Watts output, and Icom's direct fed input mixer will provide you with competition winning performance.

It's beyond comparison.

The IC-735 has many features and options to provide you with hours of radio enjoyment. Because the Icom engineers dispensed with the normal power cage at the back, you will be able to fit the IC-735 into ... just about anywhere.

TUNING

Single control triple speed tuning allows frequency resolution to 10 Hz. The processor provides 3 scanning modes which includes mode scan, memory scan and program scan. The memory channel (there are 12), operating frequency, VFO, mode and RX/TX are all displayed on the illuminated LCD.

RECEIVING

Icom's direct fed mixer helps to provide outstanding performance in receive, for example Image response of 80dB. Input attenuation, pre-amp and RF gain control combine with notch filtering and pass band tuning to provide the most comprehensive tuning system. Naturally Icom have included the general coverage facility.

TRANSMITTING

100 Watts of clean power (Spurious emission <–50dB) is available on all the amateur bands. The controls not often used, VOX, mic gain and RF power controls are tucked away in the Kangaroo pouch. An optional electronic keyer (EX243) with full break-in facilities are also available if you enjoy CW.

TECHNICAL FEATURES

REGULAR FEATURES

In this year's Queen's Birthday Honours, another amateur was honoured with the Order of Australia. This was none other than our stalwart columnist, Eric VK5LP. Eric has been an amateur and member of the WIA for twenty-three years and 'ye olde faithful' VHF UHF editor for over fourteen years. Listed on page 43 are some of Eric's achievements in over forty-six years of community service.

This month Tim VK2ZTM, has been busy co-ordinating another VK2 Special in honour of the 75th Anniversary. This special feature begins on page 29 with a special story of the VK2 Museum amateur station written by Pierce VK2APQ.

We all know there is usually plenty of 'hot air' around amateurs and their shacks, but Gil VK3AUI has taken to this air in another way. On page 15 Gil tells of his experiences with Hot Air Ballooning and 2 metres.

Beginning this month, for the guidance of the new amateur, is a series 'Know Your Second Hand Equipment', p.13. Ron VK3OM has delved into his archives to find some general information of some of the early 'black boxes' which are still available today through the 'used and loved' channels. Ron hopes to continue this series for some time, as he has plenty of information hoarded away, if there is enough interest from members. Drop him a line so he may know what you think and what equipment you would like to see written up.

For VHF enthusiasts, don't miss some more thoughts on the phenomena of 'Aircraft Enhancement', to be published next month.

Also, VK5 will be presenting a special section for the 75th Anniversary, and from the copy, which is already received, this will be a must for those interested in the early days of radio in South Australia.

DEADLINE

All copy for inclusion in the November 1985 issue of AR, including regular copy of columns and Hamads, must arrive at PO Box 300, Caulfield South, Vic. 3162 at the latest by midday 23rd September 1985.

WARNING!

Worldradio
Year 14, Issue 10 April 1986 • 95c

Beware of bogus Yaesu 757 GX radios

Yaesu 757 GX radios, considerably different than those being advertised nationally, are showing up in the Midwest. A serial number check with Yaesu Headquarters in Paramount, California confirmed these radios are illegal. They are not made for export. Apparently, someone has imported the sets illegally and is passing them off on unsuspecting amateurs. Radios can be purchased cheaper in Japan, and stripped down models even cheaper.

The radios are identical in appearance externally but do not have the CW filter, won't work on the WARC bands, have no warranty and *will not* be serviced by Yaesu repair centers in the USA. The manuals are also different than those with the "Made for sale in USA models". The shipping containers indicate the radios must be returned to Japan for servicing; however, this marking could be easily removed or covered.

The Yaesu Headquarters people estimated it would cost about $150 to bring the illegal radios up to specifications. It is unknown how many of these radios have been brought into the country, but three showed up in the Dayton area during January. These were not purchased from legitimate Yaesu dealers.

So, know your dealer and beware of guys who may have a "real deal" for you.
— *Robert McKay, N8ADA*

You can get caught here too!

It doesn't just happen in the USA . . . you can get caught here right here in Australia.

Like the USA, some unscrupulous traders are passing off Japanese domestic models as the same as export models intended for Australia.

Don't fall for it: you can easily spot the frauds by checking the box: Japanese domestic models have this sticker on them:

国内向仕様品
WARRANTY POLICY IS
VALID IN JAPAN ONLY

If they have such a sticker (or if there is evidence of removal or cover up) don't be conned. The set is not covered by Yaesu warranty in Australia and may also be quite different internally. You probably won't even get a proper instruction manual — often a photostat copy of a few pages!

Buy your Yaesu with confidence from the Yaesu factory authorised importers. You'll receive a genuine Australian model, genuine Australian warranty, genuine Australian back-up, genuine English language manual. . . and a genuine deal.

There are 55 Dick Smith Electronics stores across Australia. . . there's one near you.

RADIO EXPERIMENTER'S HANDBOOK

This first volume is 132 pages chock-full of circuits, projects to build, antennas to erect, hints and tips. It covers the field from DX listening to building radio-teletype gear, from 'twilight zone' DX to VHF power amplifiers, from building a radio FAX picture decoder to designing loaded and trap dipoles. This book carries a wealth of practical, down-to-earth information useful to anyone interested in the art and science of radio. Your copy is available by mail order for $7.95 plus $1 to cover postage and handling (add $5 to these charges for air mail postage outside Australia) from:

Federal Marketing
P.O. Box 227
Waterloo, N.S.W. 2017

Travelaw's Electronics Tours

TRAVELAW

Following the highly successful Electronics Tours of Japan in October 1984 and May 1985, Paul Rodenhuis VK2AHB announces the new **EUROPEAN ELECTRONICS TOUR!**

Departing 21 June 1986 for a four-week tour of France, Italy, Switzerland, Germany, Holland, and UK with the following highlights:—

1. Visit the DARC Ham Fair in Friedrichshafen.
2. Factory visits to Siemens, Blaupunkt, Marconi Plessy and BBC.
3. Touring in air-conditioned coach, staying in First Class, centrally located hotels.
4. All breakfasts and some dinners included.

The cost of this fantastic, specially planned tour is a very reasonable $4995 per person.

For more information write NOW to:—

Paul Rodenhuis VK2AHB,
Travelaw,
7th Fl, 130 Phillip St, Sydney 2000.
Phone (02) 233 8442, 231 2214.
TARB B1154.

EDITOR'S COMMENT

WHAT IS OUR FUTURE?

In a recent VK3 Division Sunday morning broadcast these questions were asked;

"Have you a personal view on the future direction of amateur radio? Do you believe the hobby is being adequately promoted to all age groups? What role will computer technology play in amateur radio in years to come? Has amateur radio in fact got a future? If you would like to comment on these matters write to the WIA Public Relations Officer, Jim Linton VK3PC".

We feel that these questions are of such importance to amateur radio, not only in VK3, but in Australia as a whole, and throughout the world, that they need to be placed before us all for our deepest consideration in this, our 75th Anniversary Year.

There is much in amateur radio in Australia at present which should cause us all to think very seriously about the future of our hobby. I think myself that "hobby" is inadequate. "Part-time way of life" might describe better for many of us how we feel about our activities.

One of the first disturbing facts is that we are becoming an older segment of society. A recent ARRL poll revealed that the largest ten year age group among radio amateurs is that from 51 to 60 years old. Our own recent questionnaire tallies almost exactly with the US distribution. There are amateurs under 20, but far fewer in number than corresponds to their share of the population. Certainly, few people can be expected to become amateurs at less than about 15, but the 21 to 30 group is not much better in its representation. How can we make known to all the potential young amateurs the existence of this magificent arena for their talents?

Computer technology, with the introduction of packet radio, is bringing in younger people, some returning after a period devoted entirely to computers. This is an important trend but the numbers are still small. We have gained many younger amateurs from those who began with CB, but after an initial meteoric boom CB is now contracting as it matures. Where is the next infusion of new people to come from?

And what of the Institute? Is out time-honoured programme of club and Divisional meetings, conventions and field days, contests and DX the only way to continue? Why are so many amateurs not WIA members? What must be done to convince them that we, the Institute, need them, and they need us?

If you have any answers, please let's hear them. Write to VK3PC, or to your own Division, or to us here at the Federal Office. If you can, introduce newcomers to amateur radio, and introduce new amateurs to the WIA. We all need each other.

Bill Rice VK3ABP
Editor.

AR

WIA Seventy Fifth Anniversary

75th AWARD

Members are advised that they have only three months left in which to satisfy the requirements of this award.

Remember that in the years to come, the certificates for this award will be a collectors item.

75th ANNIVERSARY DINNER

If you have not sent in your registration form by the due date, ie 30th August and you now wish to attend, contact the Federal Office to enquire as to whether there are any vacancies or cancellations. A "reserve" list will be maintained in the event of cancellations.

PROPOSERS OF NEW MEMBERS

As promised in the August issue of AR, below are listed the proposers of new members that the Federal Office are aware of. These and all those that we have not been notified of, are to be congratulated. Small gifts will be despatched during the next weeks to the following:

VK3BER(3), VK3WZ, VK9ND, VK2YE, VK2BQS, VK2JGK, VK2PTL, VK3XR, VK2DAF, VK2EMC, VK2KFV, VK2EDQ, VK2EJW, VK2AKX, VK2AIT, VK2DYW, VK2KGO, VK3VU, VK2AKY, VK4NUU, VK2BXT, VK2BTD, VK5AMI, VK4VRS, VK4FOX, VK4AAE(2), VK4UG, VK5MC, VK2CRR, VK2AYB, VK2ETS, VK2VA, VK2AZS, and VK2EZZ.

Membership is the life blood of your Institute. It is not only a matter of statistics, but it affects all aspects. Our budget is set by the subscription income. The more members there are, the cheaper becomes the unit cost. New members this year receive a special, 75th Anniversary membership certificate, along with the opportunity to be the "75th Member Scheme" for a quartz multi function clock and there are the small gifts available for those members who propose new members.

TAPE RECORDINGS OF OLD AMATEUR RADIO SOUNDS.

The 75th Anniversary Sub Committee are proceeding with this project — we again appeal to any member who has in their possession any recordings of a historical nature, to loan them to the subcommittee for transcription. You can rest assured that any item loaned will be treated with the utmost care — please despatch by certified mail, well packaged to the Federal Office.

Recently, at an Eastern and Mountain District Radio Club meeting, held at the Nunawading Civic Centre, a demonstration of the sub-committees work in this area, was given by Peter Wolfenden VK3KAU, and all who heard the segments were impressed. It was of special interest to hear the voice of one of the founders of Long Distance Radio Communications, Gugliemo Marconi amongst those that Peter demonstrated.

We appeal to any amateur who has access to historical recordings of any kind to come forward.

BOOK PACKS, THE 75th ANNIVERSARY AND THE YEAR OF YOUTH

The June issue on this item has generated a great deal of interest and mail to the Federal Office. In order to satisfy many of the questions being asked, listed below are the contents of each book pack. (Items may change subject to availability).

$15 pack. P&P Paid.

Into Electronics (NSW Education Service)
Novice Electronics
100 Basic Projects
Guide to Amateur Radio (RSGB)
WIA Book 1
WIA Call Book
Radio Amateurs World Atlas

$30 pack. P&P Paid.
The following plus the $15 pack:
Basic Training Manual (NZART)
Hints and Kinks (ARRL)
Weekend Project (ARRL)
$50 pack. P&P Paid.
The following plus $30 pack:
ARRL Handbook (ARRL)
Maidenhead Locator World Atlas
Each pack will contain information on amateur radio in the form of letters, leaflets and posters.

When applying for a book pack please ensure that you enclose, in your request to the Federal Secretary, details of the Club/Group making the presentation and the recipients. It must be stressed that the value of these packs bears no resemblance to retail prices.

WIA NEWS

IMPORT DUTY

As members are aware, in 1983 a by-law was implemented to allow the import of amateur transceivers at the 2 percent levy, subject to these transceivers being certified by the Federal body of the Institute "as not capable of transmitting outside of the amateur allocated frequencies".

This by-law has recently been consolidated and is now a permanent by-law of the Customs Department and will remain effective until the Radio Communications Act and its subsequent regulations are enforced. This by-law, does allow the purchase of amateur transceivers at retail outlets at a much lower cost than otherwise would be the case.

Amateurs travelling overseas and wishing to bring accompanied equipment back to Australia with them, should not experience any difficulties. You are advised to consult with the Customs Department in your home State and certainly to obtain a copy of the Australian Customs Information leaflet for tourist — this is available from the Australian Government Printers and is form No R83/160.

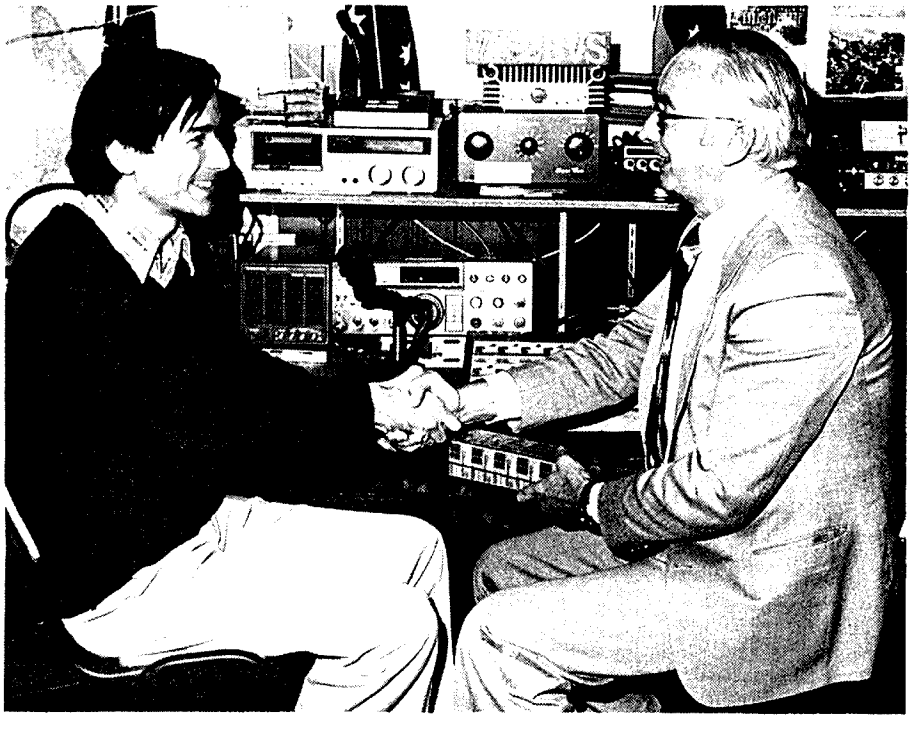
PHOTO WINNER 1985

Agfa-Gevaert's Sydney Manager, Mr John Schrauwen, presents Sam Voron VK2BVS with his prize for the 1984-85 Photographic competition. No doubt Sam, a great exponent of amateur radio, attempted to get John interested in the hobby. Congratulations Sam and thank you Agfa for your continued support of our magazine.



1985 NZART CONFERENCE

David Wardlaw VK3ADW, and Michael Owen VK3KI, attended the NZART Conference in Christchurch as representatives of the WIA.

During the Conference a resolution of congratulations to the WIA on their 75th Anniversary was carried with acclamation. As you know, the WIA has considerable reservations about certain sections of the new IARU Constitution. We now know that these same reservations are held by the NZART. As a consequence, working with the NZART overseas Liaison Officers, David and Michael, both WIA IARU Liaison Officers, started preparing a joint paper on suggested amendments to the IARU Constitution. This paper is to be presented at the Region 3 Conference at Auckland in November this year.

The proposed new New Zealand goods and services tax is causing considerable concern as it will be applied to subscriptions. As the level has not been announced, it makes budgeting for the next financial year difficult.

Many of the matters raised by the branches at the Conference are very similar to those raised in Australia, for example, an asterisk beside call signs in the Call book to indicate membership of the NZART, and the matter of introducing cyclic billing.

With the continuation of these exchange visits to each other's Conferences the relationship between the two societies has grown very close. Which must be to the advantage of amateur radio in both countries.

75th Nostalgia

A MODEL T POWER SUPPLY

Has there been another?

Herb Unger VK2UJ
"The Ranch", Alectown, via Parkes, NSW. 2870.

It was in 1924, that I listened to the first wireless set, about the time I left school. I was in my home-town, Alectown, and I listened to a weak station in Sydney, some 200 miles (322km) away.

There were loud crashes of static, interspersed with faint notes of music. From this first experience of radio, I became fascinated with it.

The receiver had four valves, with a rheostat for each valve and honeycomb coils, mounted on the front panel. To be able to hear the sound of music and voices through the air, over such a long distance, through the air without wire, seemed like magic.

How could it happen? How could a wireless set work? How did a transmitter work? Information on this subject in outback areas, in those early days, was not readily available.

It took years to fathom it out and eventually I heard about AMATEUR RADIO. Now that was something and I dreamed, that in years to come, I may be able to become an amateur, and have my own transmitter and communicate with others all over the world.

There were no amateurs or potential amateurs in my area, so it required an abundance of enthusiasm to pass the Morse code exam at 12 WPM, with no assistance, was a major stumbling block. I decided to thoroughly learn one letter a day, as I sat on a five furrow plough pulled by eight horses, and each succeeding day repeat all the letters learned the days previously.

In a little over a month, the alphabet was memorised and the next hurdle was to learn to copy and gain speed. The only Morse available was on 600 metres on the family broadcast set. It consisted mostly of a series of Vs followed by a three or four letter call sign, depending on whether it was a land or ship station. Progress was slow, but after several years of patience and determination I could copy most of the messages I heard.

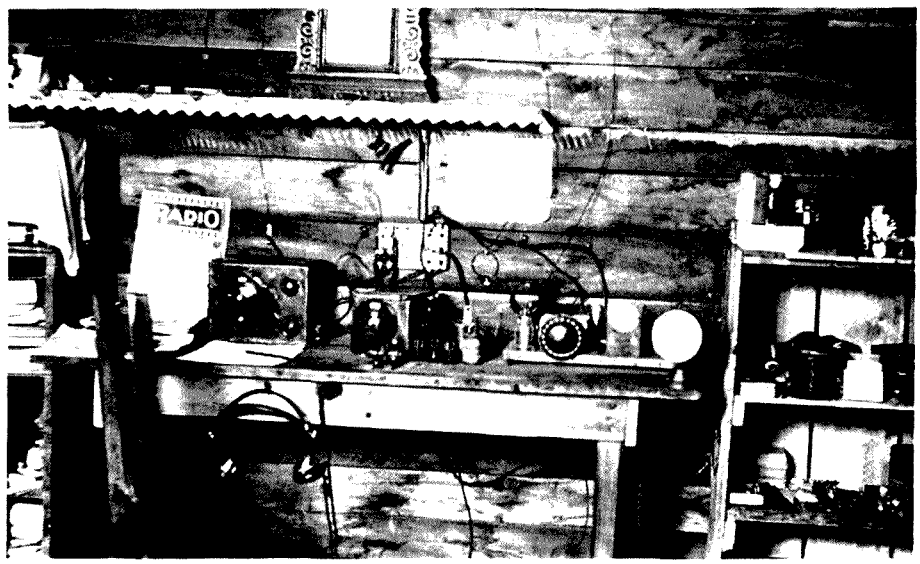
One night I had a great thrill-an SOS! I was able to copy most of the message. A ship, I copied the name of it and its position, was in trouble with a broken screw, off the Queensland coast. Next morning the news broadcast gave a full account of what I had heard the previous night.

In 1933, with much trepidation, I sat for and passed the AOCP exam. My dreams had at last come true.

The first thing I did was to print my call sign on a large piece of cardboard and hang it on the wall of what was to become my shack.

Now to build a transmitter and receiver. There were many problems as this was the Depression and finance was not plentiful, there was no mains power so all gear had to be battery operated. A small soldering iron had to be heated on a few coals in the wood-fire stove and only one joint could be soldered at one time as the heat would only be retained for a few seconds.

A two valve SW receiver was eventually constructed, for use with headphones. The transmitter was a TPTG using a single UX199 valve. A 4 volt accumulator was used with a rheostat to reduce the voltage for the filament. HT supply was provided by two 45V (B) batteries, which had been discarded from the BC receiver and had only 70 volts left in them.



Herb's equipment in February 1934.

The transmitter drew 10mA, so the input was .7 of a watt.

What a thrill the first QSO was on CW with a VK4, early one morning before breakfast. All VKs and ZLs were worked with 1 watt or less. Supplying HT voltage was the greatest problem. What a boon transistors would have been in those days of low voltages.

In an endeavour to improve the HT supply, I experimented with a modified Ford vibrator coil, which gave out a few more watts and made it possible to use phone with a grid modulator and a PMG microphone but the trembler points were not very reliable and would occasionally need a kick to keep them going.

Something more efficent was urgently needed and, after many sleepless nights, I was suddenly struck with a brainwave. I wondered if it would be possible to use a Model T Ford magneto as a power supply as it had 16 V shaped, permanent magnets bolted on the circumference of the flywheel and 16 coils of narrow copper strips, arranged on a stationary ring, with a spacing of about 1/32 – (.9mm).

The output was about 25V AC and by means of a transformer, could be stepped up to whatever voltage is required. No one was able to tell me if this would be practicable, so the only thing to do was to try it. I mounted the magneto assembly on a wooden frame and drove it at about 2000RPM with a 2.5HP engine. The 16 magnetos and 16 coils would cause a reversal of current 16 times every revolution, which meant 32,000 cycles per minute or a little over 500 cycles per second. A special transformer, with turns per volt to match was built up. Very little inductance and capacity were needed to smooth the current at such a high frequency. The tranny was wound for 350V and the current was about 100mA or 35W - not very efficient considering the 2.5HP engine was fully loaded, driving the magneto.

A two valve MOPA transmitter was built up and used quite successfully for many years with the above power supply and with grid modulation, the input power was about 25W.

I have made many enquiries, both locally and overseas, regarding the use of a Model T magneto, as a power supply for an amateur transmitter and as far as I know I am the only one to achieve this.

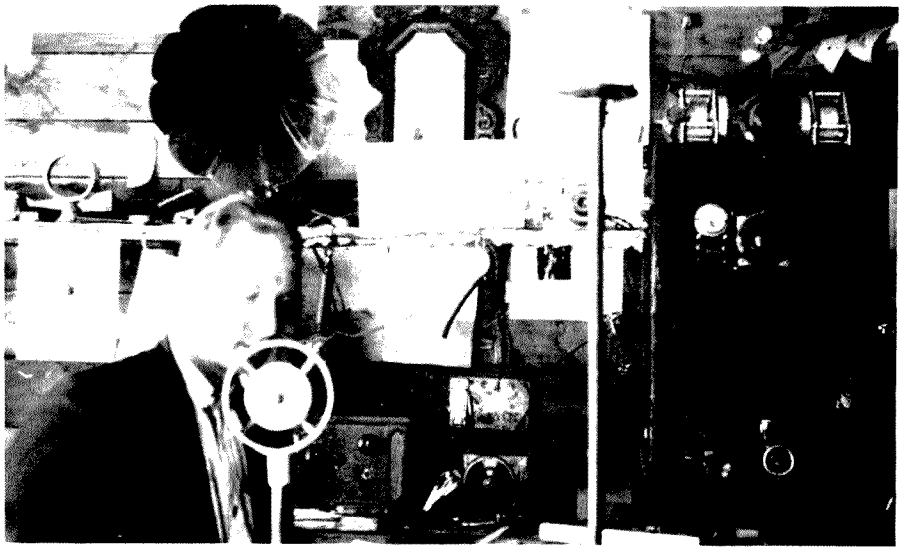
Just prior to WWII, I acquired a Carter Gennymotor. It was 350V at 100mA, driven from a 6V car battery. For me, this was the ultimate of the time.

I delayed returning to the air after the war until 1955, when 240V AC mains reached the shack. After all the pre-war years, with limitations and unreliability of battery power supplies, it was thoroughly appreciated to be able to build high power transmitters and just plug them in.

The availability of cheap disposals equipment as a source of components, was also a big help.

After a few years on AM, the SSB transceivers came along with much higher efficiency and convenience.

What great changes we have seen during the last 50 years or so. In the early days we used to make many of our components. Fixed capacitors



Herb VK2UJ — 1937.

were made by overlapping .5 square inch (about 1 sqcm) of tinfoil separated by a piece of waxed paper from a breakfast food packet and bolted between two pieces of bakelite. That gave a capacity of approximately .0001mF or 100pF. To increase the capacity you increased the number of square inches of overlap or layers. Grid leaks were made with Indian ink.

Highly efficient insulators were made from small tomato sauce bottles or anchovy jars, sometimes a hole would be drilled in one end by means of a three-cornered file with turpentine as a lubricant.

Spacers for open wire feeders were made by oven baking strips of wood in bees wax. now there is an abundance of good quality insulation material for this purpose such as plastics, etc.

Homebrewing, ingenuity and resourcefulness of the pre-war amateurs was a necessity and they got a great deal of enjoyment and satisfaction from it, but how things have changed!

The manager of a well-known electronics retailer told me recently, some of his clients order a dipole antenna, cut to size with insulators and guys attached, ready to string up. **AR**

75th Nostalgia

From The Listener In - 8th August 1925. Contributed by Roy Hankopf VK3AOH

A photograph of the annual dinner of the Victorian Branch of the WIA, which was held in mid-1925.

NOSTALGIA

In 1925, C A Cullinan 3XW of Diggers Rest, operated a unique, but efficient experimental station. He used a Amplion 'dragon-fly' speaker as a microphone and one of the first 5 metre outfits in Australia. A special receiver operated between 5 and 25,000 metres, with batteries. A gramophone was used as a loud speaker, using the reproducer of the dragon-fly.

The station, using 1.1 and 2 watts, was heard in the USA. The antenna was a three wire cage, 10 feet (3m) long by 30 feet (9m) high.

WIA 75 AWARD GUARANTEE

The Wireless Institute of Australia is happy to be celebrating its 75th anniversary, and wants everyone to feel the same way.

Recently a couple of WIA 75 Award recipients have written to say they were not completely happy with their award.

In two cases a wrong call sign was written on the certificate, due to an error in reading the call sign on their handwritten award claim.

Another person found the award certificate arrived in the letterbox damaged and not suitable for display.

In these cases a new certificate is issued free of charge — satisfaction with this award is guaranteed.

WIA 75 Award Manager Jim Linton VK3PC **AR**

Another VZ200 RTTY System

Lloyd Butler VK5BR
18 Ottawa Avenue, Panorama, S.A. 5041.

Generation of RTTY tones and BAUD rate clock can be controlled from the keyboard using a programmable interval timer. Experimental hardware and associated computer programme have been developed incorporating such a system for RTTY on the VZ200.

Armed with no previous expeience in RTTY, the writer set out to adapt a VZ200 computer for the purpose. Had the ETI-Dick Smith kit been available at the time, the project might never have been started and purchase of a kit might have been the way to go. Notwithstanding this, the project was proceeded with, to an operational state, using a number of different ideas which could well be of interest to others experimenting with the VZ200.

THE HAREWARE

The circuit of additional hardware, plugged into the VZ200 memory expansion socket, is shown in figure 1. Serial encoding and decoding of the teletype signal is carried out by a communications interface (8251 USART). The teletype programme is stored in a 2732 4 K Byte EPROM.

An important difference, to that of the ETI system, is the inclusion of an 8253 interval timer which contains three independant programmable 16 bit counters. Two of these counters are used to generate the two teletype tones divided down from the computer clock. The third counter is used to feed the USART and determine the BAUD rate. The advantage of this system is that there are no oscillators to adjust for correct frequency and tones and BAUD rate are set to an accuracy, determined by crystal control in the computer. Furthermore, the tones and the BAUD rate are under the control of software and can be changed for the computer keyboard.

The USART BAUD rate control clock is fed at sixteen times the BAUD rate. (Note: Although one times the BAUD rate can be used, errors result in decoding if the BAUD rate is not exactly synchronous to that used on the signal being received.)

Output tones are square wave and these are shaped to reduce harmonics by an RC filter network.

THE PROGRAMME

The programme developed by the writer provides selection of the following modes of operation from the keyboard —

1 ASCII or BAUDOT codes

2 BAUD rates — 45.45, 50, 56.92, 74.2, 100, 110, 150, 300, and 600 Hz.

3 Tone pairs —

Mark-Hz	SPACE-Hz
1275	1445
1275	1700
1275	2125
2125	2295
2125	2550
2125	2975

4 Two buffer stores, 1000 Bytes each.

5 Message resident in programme.

CQ de VK5BR
RYRYRY.....etc
The quick brown fox.....etc 1234567890
de VK5BR Lloyd

6 Selection of split screen or normal screen. (Split screen is used to load the buffer at the same time as receiving. Normal screen allows full use of the screen for receive only).

7 Clear screen control.

8 Reverse receive BAUDOT letters/figures. (This is useful if a letter/figure switch character is lost or one is interpreted when it shouldn't be. Sometimes a whole line can be lost when this happens unless reverse is operated).

Included in the programme is automatic insertion of carriage return and line feed at the first space after each and every 50 characters. This is a good feature to prevent printers running over the end stop and over-riding the necessity to put in CRLF when required. Sending BAUDOT, letter/figure control is also initiated on the character after each space, independant of any control put in because of a letter/figure change. This reduces the error to one word in the event of a wrong change in decoding at the receive end.

The programme resides in an EPROM at memory locations COO3H to CDOAH. RAM space utilised in 8000H to 8900H. The RTTY programme is initiated from the basic monitor with two POKE statements and an X= USR (x). Return to basic monitor can be carried out at any time with simple commands from the keyboard.

The programme is written in instructions suitable for 8080/8085 or Z80 processors, but is dedicated to the VZ200 in that it calls in the resident VZ200 keyboard, character print and beep routines.

DECODING

From the point of view of reducing component parts, a phase locked loop system (such as the XR 2211 circuit) is the simplest way to go. On the other hand, all the experts say, that in the presence of noise, better performance is achieved with a filter type system and essential for reception on the HF bands.

Many circuits have been published for both types of decoders and since the decoder design has no bearing on the computer hardware and software design, further comment will be avoided on design. At this point it must be pointed out that it would be a fairly complex decoder which could cope with all the BAUD rates and tone combinations available for transmission from this computer system. These were selected from standards recommended in Amateur Radio last year, and were all included just in case they were required. It is unlikely that other than 45 or 50 BAUDS and 2kHz tones will get used on the experimental unit assembled and at present it is being operated with a 2kHz type filter system which will accept up to 100 BAUDS.

ASSEMBLY

The VZ200 attachment was made up using a general purpose printed circuit card, suitable socket fitted and hard wired. For the present, the attachment is unshielded and causes some interference to radio receivers. Fitting of a metal enclosure is a job still to be tackled. What is really needed is some industrious person to layout the printed circuit card and design an appropriate housing.

SUMMARY

A RTTY system for the VZ200 computer has been developed as an experimental exercise. Transmission tones and BAUD rate clock are generated from the computer clock. The programme is operational but no action has been taken to lay out an easily assembled printed circuit card and shielded enclosure.

The programme has not been included as it is 3338 Bytes of machine language. Those who contemplate construction many consult the writer about copying the programme. **AR**

I LIKE AMATEUR RADIO

I like amateur radio;
I really think it's fine
That I'll still be a "YL"
If I live to ninety-nine.

I like amateur radio,
And getting on the air,
Making friends around the world
And contacts everywhere.

You can talk to Lapps in Lapland,
Nepalese in Katmandu,
Malays in Kuala Lumpar,
Or Peruvians in Peru.

You can talk to dukes and dustmen,
Or communicate in Morse,
Experiment with A T V,
And RTTY of course.

Put together bits and pieces,
(Though at first the prospect balks;)
A diode here, condenser there,
And — listen to that — it talks;

Experiment with aerials,
It looks real good on paper;
But getting that lot in the air
Is quite another caper;

You can enter in a contest,
Gather points for an award,
Join a DX net, or "ragchew",
One thing's sure, you're never bored.

Yes, I like amateur radio,
And all the friendly sounds,
Removed from all the trouble and strife
With which this world abounds.

It's a satisfying hobby,
It will certainly do me;
Til they write beside my name the words
"Became a silent key." **JOY COLLIS.VK2EBX**

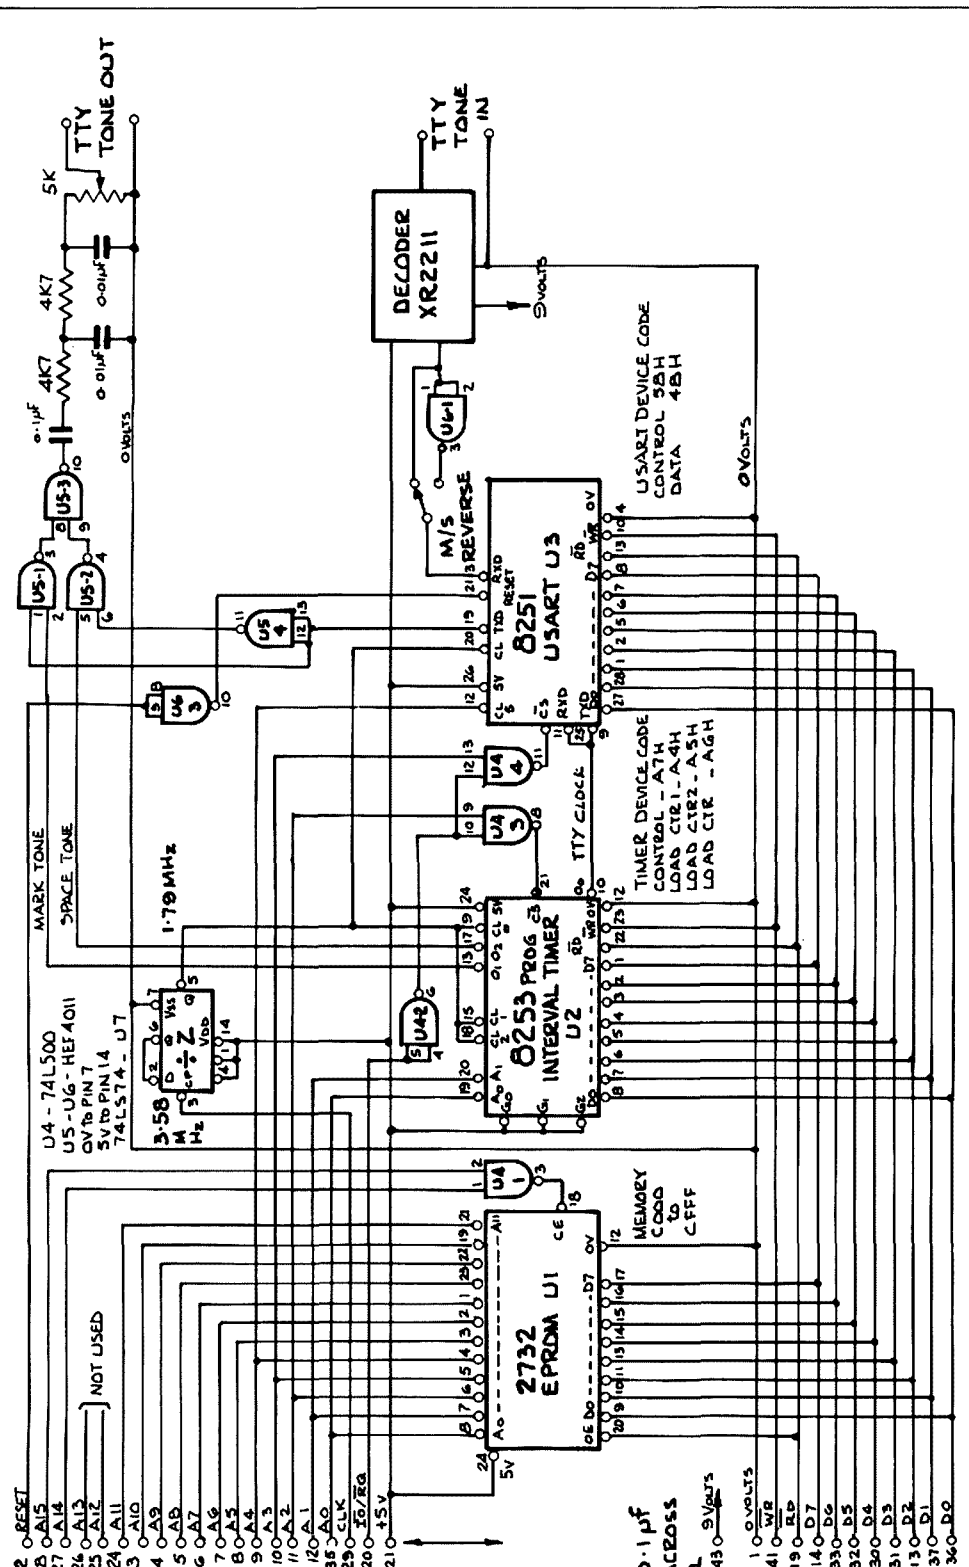

Figure 1 — VZ200 RTTY Attachment.

ADD ON MODIFICATIONS FOR THE SIEMENS TELEPRINTER

This is the second in a series of projects.
It's a power supply (5 volts) to power the other projects in this series.

Peter Fraser VK3ZPF
52 Heathfield Rise, Box Hill North, Vic. 3129

AN INBUILT POWER SUPPLY

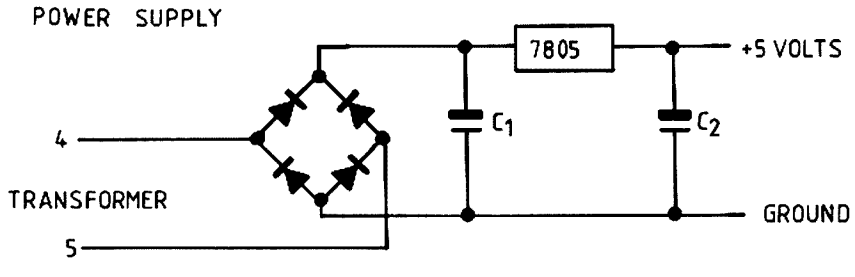

Figure 1 — Power Supply Circuit.

DESCRIPTION

The power supply delivers 5 volts DC at a maximum of around 500 milliamps: this can be constructed small enough to fit in the same case as the teleprinter's transformer.

PARTS LIST

C1, C2 — 100 UF 25 volt electrolytic capacitors.
7805 — 5 volt three terminal voltage regulator.
Bridge rectifier — type 'MB 1' or 4 1N4002 diodes.

CONSTRUCTION

The power supply can be built on to a small piece of matrix board small enough to be screwed inside the transformer case. *"Where is the transformer?"* you ask. Well, looking from the front of the machine, it's on the right hand side, towards the back. It has a red 'spark' on the cover. **Unplug your machine before removing the cover.** The AC side of the bridge rectifier is connected to the winding marked '4' and '5'. These are the top two connections on the left hand side of the transformer.

HOW IT WORKS

The AC from the transformer is rectified (made into pulsating DC) by the bridge rectifier. This pulsating DC is filtered by C1 to give a smooth DC voltage. The 7805 regulator reduces the DC voltage to 5 volts while C2 acts as a final filter capacitor. The 5 volts output is used to run the 'shift indicator' and a 'counter' to be described later.

AR

KNOW YOUR SECOND HAND EQUIPMENT

A Series to Help You Identify Amateur Equipment

Ron Fisher VK3OM
3 Fairview Avenue, Glen Waverley, Vic. 3150

Over the years, I have collected much information on a lot of amateur gear. It seems that perhaps the time is right to share it with you, the readers. It will, I am sure, be of use to buyers and sellers of second hand equipment and hopefully a source of information to newcomers to the hobby, who must be very confused with the various equipment types they hear quoted.

It is expected that this series will continue over many months and will be , more or less, random in the selection of gear to be covered. It will, in general, date from around 1960, but in some cases, may cover gear produced prior to this. I will also concentrate on gear that was sold here in Australia through normal retail outlets.

If any members have any thoughts on equipment they would like to see featured, please write to the above address.

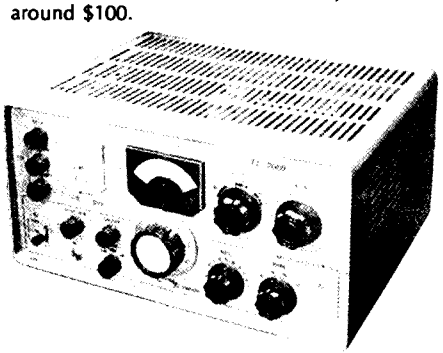
Due to space limitations, descriptions will only cover the major aspects of any particular piece of gear. In many cases, I may be able to provide more detail upon request.

What better place to start this series, than with the early Yaesu transmitters and receivers. Second hand values should be taken as a general guide only and can be subject to wide variation, especially with older units. Prices quoted assume the gear to be clean, working well and unmodified.

YAESU FL-100B TRANSMITTER

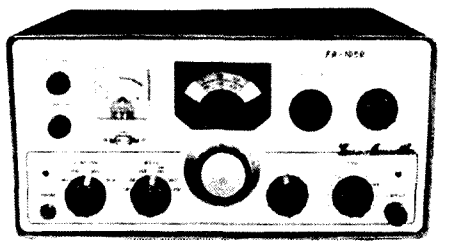
The first piece of Yaesu gear to be imported by Bail Radio and TV Service, was initially advertised in the March 1964 issue of Amateur Radio. It was a self-contained SSB/CW transmitter covering the 80 to 10 metre amateur bands. It used an all tube line up, with a single 6DQ5 in the final with around 60 watts PEP output.

The SSB signal was generated by means of a 455kHz mechanical filter. Both transmitter and power supply were contained in the one cabinet measuring 15x7x11.75 inches and weighed 35 pounds. The original price was $454 and estimated second hand value today would be around $100.



YAESU FL-200B TRANSMITTER

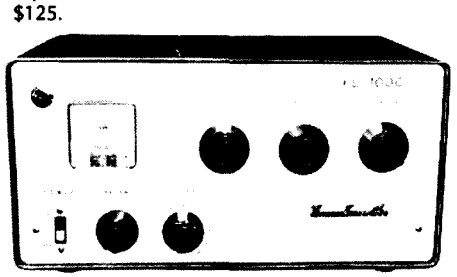
First announced in January 1966. The appearance is the same as the FL-100B but power output was increased to about 120 watts PEP, with the use of two 6JS6 tubes in the final. Second hand value is around $120.



YAESU FR-100B RECEIVER

Announced at the same time as the FL-200B, the FR-100B receiver covered the 80 to 10 metres amateur bands only.

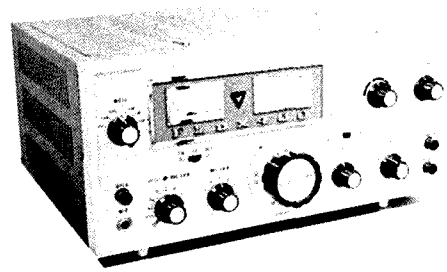
It was an all tube design and, like the transmitter, used a 455kHz mechanical filter. A single crystal filter was used in conjunction with the mechanical filter for sharpér CW reception. Seventeen tubes and several diodes were used in a double conversion setup with the first IF being tunable and the front end crystal controlled. Crystals were supplied for all bands but coverage on 10 metres was limited to 28 to 29.200MHz. Coverage was in 600kHz segments. Performance was quite good, with excellent stability after a warm-up period. Provision was made to feed the VFO to the FL-200B transmitter for transceiving, but this didn't always work out very well due to variations in the heterodyning and BFO/carrier crystals in each set. Second hand value is around $125.



YAESU FL-1000 LINEAR AMPLIFIER

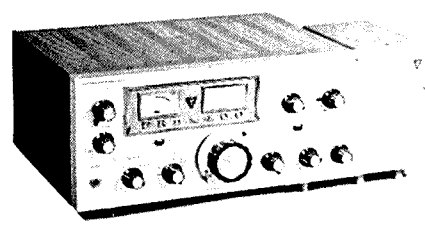
Again announced at the same time as the FL-200B transmitter. Housed in a matching cabinet and of similar size to the other units, the amplifier used four 6JS6 tubes in parallel, in a grounded grid circuit. With a plate voltage of 850 volts, the PEP input was claimed as 950 watts. Output would possibly reach 400 watts. As the cathode input was untuned, it would not be recommended to use it with a modern solid state output transceiver. Metering included plate and grid current, plate voltage and relative power output but no SWR meter was included.

A cooling fan was built in. Second hand value is around $150.



YAESU FLDX-400 TRANSMITTER

The new DX series equipment was introduced in early 1968. The styling was modernised to include a smarter cabinet with a rectangular brushed aluminium front panel surround and an illuminated meter. In general, the circuit was the same as the older FL-200, but improvements were made in the transceive ability with the matching receiver. The transmitter was self contained with in-built power supply, etc. 6JS6 tubes were again used in the final with around 120 watts output.



YAESU FRDX-400 AMATEUR BAND RECEIVER

Similar in appearance to the FLDX-400 and similar in design to the older FR-100, but up-dated in several aspects. Band coverage now included 160 metres. 6 and 2 metres could be included with optional converters installed in the cabinet. Another option was an FM detector.

By now a few transistors had crept into the circuit. Two were used in the tunable VFO, no doubt to improve stability. The two optional converters were also solid state and even ran to a FET in the RF stages. Provision was also made to crystal lock the receiver on a fixed channel. Quite a good receiver, with very reasonable performance. Stability was good after warm up, but not much better than the older model.

Second hand value, around $135.

Watch for the FLDX-2000 Linear Amplifier and others next month.

KENWOOD

TS-940S

HF TRANSCEIVER

The TS-940S is a competition class HF transceiver having every conceivable feature, and is designed for SSB, CW, AM, FM and FSK modes of operation on all 160 through 10 meter Amateur bands, including the new WARC bands. It incorporates an outstanding 150 kHz to 30 MHz general coverage receiver having a superior dynamic range (102 dB typical on 20 meters, 50 kHz spacing, 500 Hz CW bandwidth).

Engineered with the serious DX'er/contest operator in mind, the TS-940S features a wide range of innovative interference rejection circuits, including SSB IF slope tuning, CW VBT (Variable bandwidth tuning), IF notch filter, AF tune circuit, Narrow/Wide filter selection, CW variable pitch control, dual-mode noise blanker, and RIT plus XIT. The use of a new microprocessor with advanced digital technology controlled operating features, plus two VFO's, 40 memory channels, programmable memory and band scans, a large fluorescent tube digital display with analog-type sub-scale for frequency indication, and a new dot-matrix LCD sub-display for showing graphic characteristics and messages, all serve to provide maximum flexibility and ease of operation. In addition, a CW full break-in circuit, switchable to semi break-in, a built-in automatic antenna tuner, a solid-state final amplifier that is powered from a higher voltage source, a speech processor, all-mode squelch, and a host of other convenience features all add up to even greater versatility of use in fast-paced DX operations. With its power supply and antenna tuner built-in, and with its new whisper-quiet cooling system, the TS-940S is a complete, all-in-one type transceiver that brings tomorrow's sophistication to today's serious enthusiast.

UP UP AND AWAY!!

Gil Sones VK3AUI
30 Moore Street, Box Hill South, Vic. 3128

Hot Air Ballooning is becoming an increasingly popular sporting interest. A number of balloon operators offer 'ballooning weekends'. One such operator is Balloon Rise, operated by Tony and Annette Norton in Stawell, Vic. Tony has been ballooning for many years and presently flies a balloon made by Kavanagh Balloons in Sydney.

Balloon flying starts early in the day. This is to take advantage of the cold morning air and the generally still conditions first thing in the morning. Cool conditions are needed to get the best lift from the balloon.

Inflating the Balloon in preparation for 'take-off'.

Soaring aloft.

During the Queen's Birthday Weekend the writer was at Balloon Rise for some flying and discovered another amateur, Ian VK3KCM, was there with the same intent. On this weekend Tony had enlisted the help of Chris Tuttle with his balloon and crew, due to the large numbers interested in flying.

As it happened, Ian and I both had two metre equipment with us and several contacts were made. These were both on simplex and through the Mt William and Mt Macedon repeaters.

The link between balloon and ground proved useful on occasions as the balloons go where the wind carries them. The recovery crew must chase them to refuel, recover and change passengers at intermediate landings. Radio contact was useful on these occasions.

Gil VK3AUI and two metres. Note the gloves, beanie and coat, necessary equipment for the chill frosty early morning flight.

Ballooning is a great experience, soaring aloft with only the occasional roar of the burner breaking the tranquility. You drift with the wind. At times the balloon skims the tree-tops whilst at other times considerable heights are reached.

The balloons are approximately 25 metres high and 16 metres in diameter or about the size of an eight storey building. The take-off and flight are very smooth but a few bumps can occur on landing. They make a pretty good sail if a breeze springs up.

For mobile operation they offer freedom from ignition noise and an excellent antenna sight, however burner operation can be a problem – the noise from the burner blots everything out.

If any members would like to try ballooning there are several operators around Australia. Tony Norton of Balloon Rise, 19 Seaby Street, Stawell, Vic. 3380 can be phoned on (053) 58 3086. I am sure he would be delighted to send details to you.

The roar of the burner blots out two metre operation.

THE AR STORY

Ken McLachlan VK3AH,
PO Box 39,
Mooroolbark Vic 3138

Many members are curious how a monthly magazine containing up to 80,000 words, such as Amateur Radio, is brought together from contributions of technical articles, general interest stories, photographs and the regular column sub editors.

Photographs courtesy York Press Pty Ltd, Graeme Hattwell VK3NGH & Ken McLachlan VK3AH

It is hoped to give you an insight in what transpires from when an article to an advertisement is received in the Federal Office, until the issue is placed in your letter box, by your trusty postal officer.

A full schedule for the year, after consultation with the companies involved is made up. This schedule comprises all deadlines, from the latest acceptable time copy can be received, which is noted in each AR near the index, to delivery is made to the typesetters, received back, proof read, pasted up continuing through until it is delivered to Australia Post.

All contributions received are pre-read, where spelling and grammatical errors are corrected. If photographs are included these are marked and filed. Technical articles are handed to the Technical Editors at a Publication Committee meeting, held each month to be technically edited and corrected if necessary, and returned to the Production Company, if not before, for processing at the next meeting. Each technical article is acknowledged and drawings if necessary are sent to the drafting crew.

It is necessary to retype some articles in double spaced type, if they are presented in difficult to read, close spaced handwriting. As an example, most "HAMADS" are sorted into alphabetical order and typed, due to the variance of presentation by the advertiser. (A minority of members send their "HAMAD" in on the back of a bus ticket written with a "thumbnail dipped in tar"). This is necessary so that scraps of paper are not lost or mislaid and copy is easy to read for the typesetter. The article is re-read and "marked up" to recognised Australian Standards, which is the means of instructing as to the type to be used, Size, width and justification. Each article is the numbered and entered in a master log book. When an adequate amount of work has accumulated it is delivered to one of the companies for typesetting.It must be remembered that typesetters work at high speed and must be able to read copy at a glance. AR language is foreign to them and whilst amateurs can read between the lines and guess a word, they can't. The ideal copy is double spaced upper and lower case copy with a 35mm margin on the left hand side, but budding authors who have not got the facilities of a typewriter, don't be deterred. Neat double spaced handwriting or printing with a 35mm left hand margin is acceptable. The space allows for clarification of a word and the insertion of instructions.

TYPESETTING

Every newspaper and magazine, before printing, has to be typeset. In 400 years, between the invention of the printing press and until recently, type was produced as indentations in metal. This was a primitive, arduous and time consuming operation in comparison with modern computerised typesetting methods employed in the industry today.

Our main typesetters, chosen by tender, are York Press Pty. Ltd, a business that was first

A Hot Metal Typesetter.

established in 1933 as a weekly newspaper and now have a staff of 100 employees. In addition to modern typesetting equipment, York Press operates Art and Film Departments, servicing a range of printing presses suitable for both multi-colour and newspaper work. A large Bindery department is also included in the factory equipment, which allows the company to produce a variety of promotional material and magazines similar to Amateur Radio.

They were one of the first companies in Australia to see the advantages of modern technology and make the change over from metal composition to computerised typesetting. The computer, a Compugraphic MCS8400 typesetter with six terminal keyboards can output any number or character, except mathematical symbols, in a variety of sizes and styles. These styles are referred to as fonts and separate fonts may be *light type, *bold type, *italic type, *bold italics, *condensed types etc as designated by the producers. Serif typefaces have little edges on the letters which make for easier readability.

Computer Typesetter.

THE TYPE

The above sub heading, as an illustration, is in a Sans Serif heading set in 10 Point Bold. The balance of the article is set in 8 Point Oracle. Printers have their own measure based on a Point and there are 12 points to an em and 6 ems to one inch. The Typesetting Department is able to produce from 6 point to 72 point characters with a choice from sixty four different fonts. These columns are set at 14 ems wide.

A trained operator starts with the copy to be typeset. It is essential that this copy is legible, preferably double spaced typed in upper and lower case and on one side of the paper with a margin of 35mm on the left hand side. This margin space allows the producers to correct spelling or grammatical errors, prepare a design and designate instructions to the operator. The data is then keyed in with the necessary commands from a conventional keyboard with extra keys for entering commands. The input is viewed on a Visual Display Unit (VDU). Some operators can type up to and in excess of 60 words per minute (WPM), when reading from first class, marked up, copy.

The computer contains an in-built programme for hyphenation, spacing and justification. When the end of one line is reached, the computer ensures it aligns with the other lines (justification). If a word break is necessary, the computer knows to place the hyphen in the correct spot. This information is stored on disc and fed to the electronic photographic typesetter which operates as a high speed, high resolution computer printer.

The printed output is on galleys, with left and right margins aligned, on special paper (Bromides). These are then photostated and proof read for errors against the original copy, alterations are marked and sent back to the typesetter for corrections. After correction another bromide is produced and read. If correct, it is again photocopied and two copies are sent to the producers for any missed errors or literal corrections. The producers "proof read" all type setting against the original copy. If any errors are found, they are marked and returned to the typesetters for correction. The corrections are made, checked and a bromide is then produced with photocopies, which becomes the basis of the magazine article.

Whilst copy is being set, the colour cover is being separated as outlined in the article on p20 of September 1984 Amateur Radio.

Two other typesetting companies, with different equipment but working on similiar lines also do work on the magazine, generally to a much lesser degree. The basic reason for this is that in the case of equipment breakdowns, which are very infrequent, staff sicknesses and when peak loading occurs, the producers have the option of delegating the work to a supplier for the quickest turnover, to keep within the scheduled printing dates.

A "Dummy" of how the magazine is to be laid down by the printers is produced, to the last detail, which includes the positioning and sizing of photographs, diagrams, cartoons, captions, logos, rules and borders etc.

The "Dummy" is checked as to continuity as it is laid down. Not in the sequence of the pages that you read (ie page 1, 2, 3, etc) but 1 and 64, 2 and 63 etc. The reason for this is the way that they are made up and laid on the printing plates.

Making-up a 'Dummy'.

The next process is to index the magazine, which is done by a home computer, and note all captions for photographs, fillers etc which are used. This again is rechecked and sent to be typeset. The producers place all artwork into numbered envelopes for each appropriate page. The photographs, artwork and advertising are noted as Photo 1, Cartoon 1, Circuit 1, 2, 3, etc as required to correspond to the "DUMMY" and page of the magazine. Separately, all the typesetting bromides are numbered to the page that they appear on. It is then delivered to the printers for make up with the proof read index and captions, which have been collected from the typesetter in a separate part of the premises.

The Index is Generated on a Home Computer.

THE PRINTING PROCESS

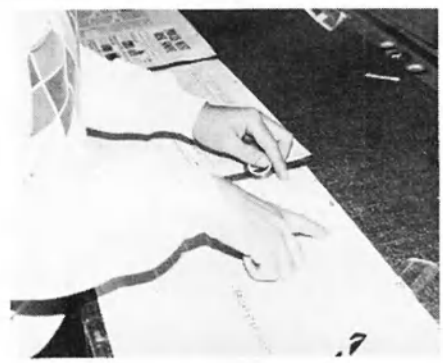
The magazine is printed by the Waverley Offset Publishing Group on a yearly contract, won on tender, for the last five years. This company has grown from a small business established in 1964, to a company with multi-associations in the printing industry, and prints magazines such as this, newspapers and advertising material. They employ a staff of thirty two, with expertise in various printing techniques to cater for their needs.

The producers layout (the "dummy"), is delivered to the printers by a scheduled date arranged for the whole tender period, in page numbered form, as described above, with the accompanying envelopes of artwork.

The "dummy" pages are sequentially pegged up at the back of a work bench on which is laid the correct number of blank "make up" sheets (pages) with printed guidelines in faint blue, termed "dropout blue" which the camera does not reproduce. The compositor, positions any advertising material first by passing it through a waxing machine, causing it to be pressure sensitive and by the use of a small roller allows it to adhere to the make up sheets, as per the "dummy" and then proceeds to lay in the editorial material in the same manner.

Photographs to be used are then screened by a computer controlled camera that segregates the picture or transparency into thousands of tiny dots so that it does not print as a solid black, onto bromide paper at the appropriate enlargement or reduction required to suit the pre-determined space that has been allowed on the page and any line illustrations or circuit diagrams are also bromided to the correct size prior to waxing.

The Compositor making-up the Page Artwork.



Border Tape being applied to the Artwork.

The Camera Operator applies the grey screen to the Bromide Negative.

When all copy is in position, any borders, boxes or rules are made according to the producers instructions, with a large variety of adhesive border tapes that are available to complete the art work.

After completion, final proofs are thoroughly checked by the producers, last minute corrections made if necessary, the page is evaluated for aesthetics, initialled as approved and sent to camera, to have negatives made prior to plate making. Occasionally, human error or Mr Murphy intervenes and mistakes are missed.

The negative and Receiver Papers are prepared to reveal the finished Screen Bromide.

Page Negatives being prepared for Plate Making.

Setting up the Process Camera to make a Screened Bromide.

AR Cover Negatives in the final stages of preparation for Plate Making.

The Offset Printing Plate being applied to the Plate Cylinder prior to printing.

Text Sections being printed on the Web Offset.

Feeding the Exposed Plate into the Automatic Plate Processor.

Checking the Web Section of the Text.

Colour Covers are printed two-up.

The Developed Plate emerges from the Processing Machine.

The film after development, is opaqued to remove any unwanted spots, shadows and cut lines and then imposed into eight page flats in printing sequence prior to plate making. These are then laid in position on a light sensitive anodised aluminium plate which is 0.3 millimetres thick. These are placed on a burning down frame which creates a partial vacuum, to ensure good contact, between the film and plate and exposed to a 8kW pulsed Zenon lamp for approximately one and a quarter minutes. The plate is removed, then automatically processed to remove the unexposed areas, leaving an ink receptive image on its printing surface.

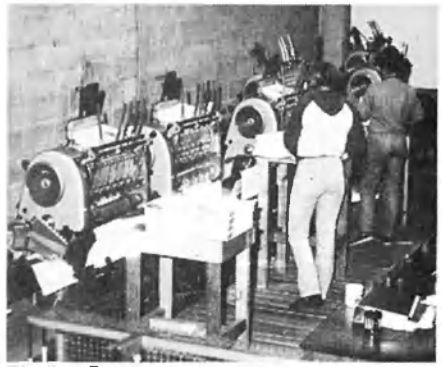
THE PRINTING PRESS

The finished plates, containing the page contents, are printed on a Web-offset press which prints the magazine in 64 page sections and folds them to 16 page segments, in one operation, from large reels of Australian made paper, each weighing approximately half a tonne.

The ink content and quality control is continuously monitored and the processed product is placed on pallets ready for the next operation.

The covers, which are printed in a similar manner are done on smaller two colour sheet-fed presses, from pre-cut sheets, in full colour by two passes through the machine, on gloss art paper. These are printed two up and guillotined prior to binding.

Printed and Folded Sections being delivered from the Press Folder.



Binding Process.

Finished magazines are packaged for Despatch to the Mail Service.

BINDING

When all the magazines and covers have been printed and dried, they are transported within the factory, to the bindery to be collated, stapled inserts placed in position (if any), stapled and trimmed to size.

This operation is performed by a high speed automatic collator/stitcher/trimmer from which the finished magazines emerge to be placed in cartons ready to be despatched to the mailing company.

THE MAILING PROCESS

Mailing of the magazine is done through Automail Pty. Ltd., a direct mailing company that has processed Amateur Radio for over a decade. This company has grown with the demands of their clientele, investing in modern mail processing equipment as their business expanded.

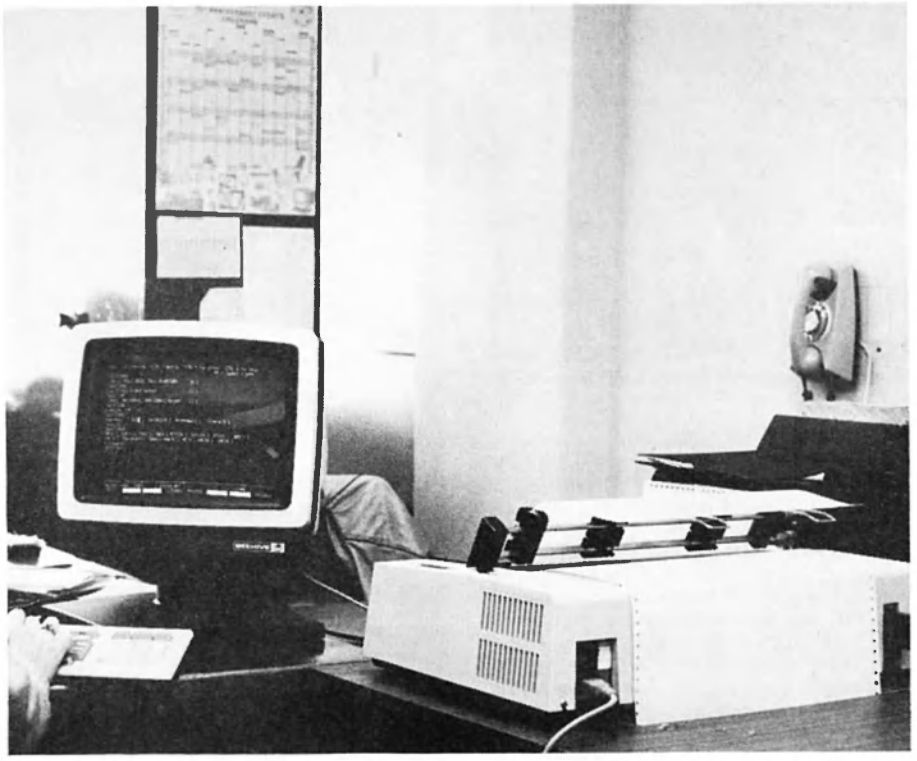
Each monthly magazine is scheduled up to twelve months ahead, to arrive at their premises at a particular time on a certain day, from the printing and binding process, as are the labels and any inserts that may be required to be enclosed in the magazine. This is important, as the company does handle anything from 100 to 150 thousand units to be mailed per day and tight scheduling is vital to ensure that the magazine arrives in the recipients mail box on time.

Amateur Radio up until August, before mailing, went through several processes. The first, involved the listing containing the names and addresses which were generated from the members list, by the computer in the Federal Office. This list, when received two days prior to the magazine, was fed through a Cheshire machine which automatically cut the multi printed addresses to label size and adhered them to the envelopes. These were then held in stock until the magazine arrived. The automatic Cheshire machine has a capacity of 8000 units per hour when running at full speed.

Manual Sorting Area at Automail.

At the completion of this process the envelopes were progressed to the Sorting Area, where they were manually sorted into their postcode groups, to obtain concessional Registered Publication mailing rates, prior to the insertion of the magazine.

The magazines, on their arrival were channelled either to the manual area, if inserts were to be collated into the magazine, or direct to the mechanical insertion machine where the magazine was automatically inserted into the envelope and sealed at speeds of up to 2500 units per hour. Magazines with inserts were then handled in the same manner.



WIA Computer generates the Address Labels.

Inserts being Automatically Folded.

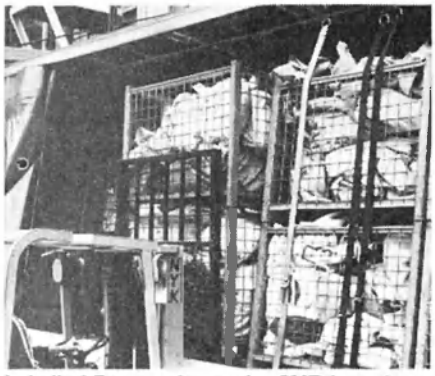
Inserts being Collated into Magazines.

The new method, quite modern in mail processing, is plastic wrapping, as you have received this issue of Amateur Radio. This machine can adhere address labels from the Cheshire machine that have been generated on the WIA's computer, collate up to six pieces inside each issue, heat seal, and operate up to 7,000 units an hour. This form of processing, includes a significant saving in cost and time.

The finished product is segregated into Australia Post preferred post code listings, placed in mail bags, appropriately labelled and are then ready for despatch to Australia Post.

The management of the Company stress the importance of co-ordination of the mail processing, as it is the vital factor in the scheduling of all material, arriving prior to or at the appointed time to obtain a fast, efficient and cost-effective result to you, the member receiving your magazine on time.

Bagged Magazines despatched from Automail.



Labelled Bags arrive at the CME from Automail.

AUSTRALIA POST

The bagged magazines are picked up from Automail with other publications for posting and taken to the unloading bays at the State Mail Centre (SMC) formerly known as the Central Mail Exchange (CME), located at the corner of Bourke and Spencer Streets in the city of Melbourne. This building has quite a history, having been built in 1916/1917 and became the Melbourne General Post Office (GPO) in the latter years. The cost of construction is reported to have been $250,000.

The building was also occupied in June 1917 by the Deputy Postmaster General (later Director General), and most other administrative staff. In the 1960s it lost its status as the Melbourne GPO and became known as the CME, being the clearing house for 90 percent of Victoria's mail until 1975 when the regional mail centres commenced to operate.

Sorting into Mail Areas.

The labelled bags, not exceeding 16 kilogrammes in weight, designated by Post Codes on attached labels and contained in large metal baskets, are off loaded with a fork lift, stacked and sorted into different mail areas according to their designation, interstate, intrastate and overseas. The interstate are forwarded direct to their respective SMEs. The intrastate are forwarded to the appropriate City Delivery Centre, seven metropolitan and five country Mail Centres.

The magazines at the respective Mail Centres are again segregated into preferred Post Code areas and sorted to be forwarded to their destination Post Office, with other mail.

On arrival at the destination Post Office, they are again sorted to respective postal delivery rounds by the Postmen and women, responsible for that particular area.

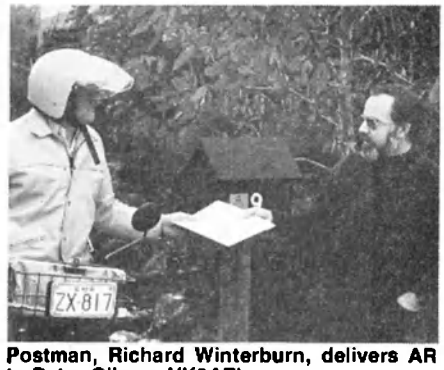
From the arrival in each state the delay to the recipient is minimal, considering the handling involved, and happy WIA members have considerable reading ahead of them, until looking forward to the next issue.

Sorting at the CME.

Sorting Mail Bags.

Despatch to Mail Centres throughout Australia and Overseas from the CME.

Sorting at the Destination Post offices.



Postman, Richard Winterburn, delivers AR to Peter Gibson VK3AZL.

After reading this, it is hoped you will have a better understanding of the production of your Society's monthly magazine and may be enthused into writing a technical or general interest article for publication and introducing one new member at least to the oldest Radio Society in the world.

ACKNOWLEDGEMENTS

This is a programme for calculating beam headings and great circle distances. It is intended for the AMSTRAD CPC 464, but can be easily modified for any of the System 80 or Commodore variety computers.

To modify the programme for individual locations, it is only necessary to change lines 90 and 100, eg in the copy Canberra is listed as (line 90) — 35.3, and (line 100) as — 149.133.

Southern latitudes for the DX station should be entered as negative values, and eastern longitudes should also be entered as negative values. The programme will give both short path and long path bearings and the distances in nautical miles, statute miles and kilometres.

It is a fairly simple programme. Given it ease of modification to the more common computers, it could be useful.

AR

TRY THIS

240 VOLTS 50Hz METER

Stan Widgery VK3SE
8 York Street, Ballarat, Vic. 3350

Portable AC generating units can have wide variations in the frequency of their outputs due to load condintions affecting the alternator speed. The frequency meter shown in this article can be used to indicate 50Hz operation.

The zeners can be any voltage between 6V and 12V. The 25k ohm resistors may have to be adjusted to suit the zeners.

The meter is calibrated for 50Hz by using mains power as a reference.

A variable voltage AC supply can be used to ensure the zeners are working, as there should be no variation in the meter reading with different voltages.

Other frequencies can be calibrated with a good quality audio oscillator.

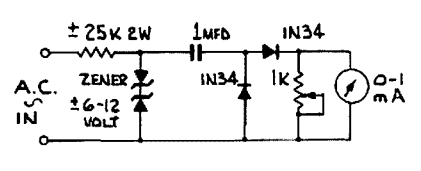

Figure 1

1985 VK/ZL/OCEANIA Contest

Announcing the 1985 VK/ZL/O Contest to be held on the first two weekends in October.

SSB for 24 hours from 1000Z 5th October 1985
CW for 24 hours from 1000Z 12th October 1985

This is a special contest for it commemorates the 75th anniversary of the Wireless Institute of Australia and is the 50th VK/ZL contest.

There will be awards for the top scorer on each continent, these will take the form of leather bound log books, and medallions will be awarded to top scorers in countries that have more than 10 logs submitted. Further certificate awards will be made at the discretion of the contest manager.

For the top scorer in VK, AMCOM of Melbourne have donated a prize valued at $350. TRICITY HOUSE in New Zealand have donated a triband beam to the top scorer in that country. So the contest is well worth entering this year. These prizes will be awarded to the top scorer in each country including both phone and CW, get that key out NOW and start practising.

RULES — Overseas Entrants

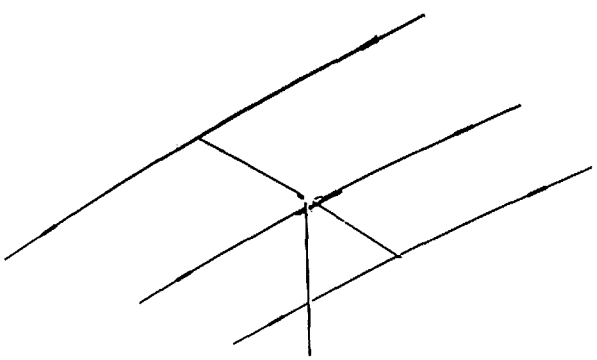
1. There are the following sections in the contest
   (a) Transmitting Phone
   (b) Transmitting CW
   (c) Receiving Phone and CW combined
2. Only one contact per mode per band is permitted. All bands are permitted except WARC bands.
3. Scoring
   For stations operating outside OCEANIA score two points for each contact with a VK/ZL or OCEANIA station. OCEANIA stations score two points for all contacts.
4. Final Score
   Multiply total QSO points by the sum of all VK/ZL/O prefixes on ALL bands. (The same VK/ZL/O prefix worked on a different band counts as a separate unit).
5. Exchange
   Five or six digit numbers composed of the RS(T) report plus a three digit sequence number beginning at 001 and increase by 1 for each QSO on that band.
6. Logs
   A separate log is required for each band and mode (Different people will be checking different bands). It must show — Date, Time (Z), Callsign of station. Exchange sent and received. Underline or highlight each new VK/ZL/O prefix.
   Summary sheet to show CALLSIGN, NAME AND ADDRESS Equipment Details, QSO points for that band, Total VK/ZL/O prefixes worked on that band.
   Signed declaration that all rules and regulations were observed.
   Send logs to:—
   W.I.A. VK/ZL/O Contest Manager
   1 Noorabil Court
   Greensborough
   Vic 3088
   Australia
   Logs to arrive by 31 January 1986
7. SWL Section
   A VK/ZL/O station must be heard in a contest QSO, log the following *information. Date,* Time (Z), Callsign of VK/ZL/O station, Callsign of the other station and the Exchange, scoring and summary sheets as detailed above.
   Phone and CW scores will be combined for SWL section.

NOTE: OCEANIA stations are those which qualify as Oceania for WAC.

RULES for VK/ZL STATIONS

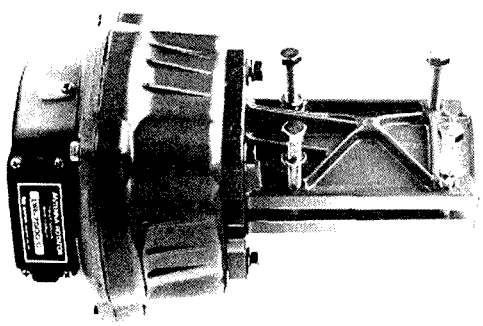
1. There will be five sections for VK/ZL these are:-
   (a) Transmitting Phone — 24 Hours
   (b) Transmitting CW — 24 Hours
   (c) Transmitting Phone — 8 Hours
   (d) Transmitting CW — 8 Hours
   (e) Receiving CW + Phone Combined
   2. Only one contact per mode per band is permitted. All bands are permitted except WARC bands.
3. VK/ZL Stations are permitted to contact each other only on 160 and 80 metres. VK/VK, ZL/ZL, and ZL/VK contacts are all permitted.
4. SCORING
   Different points are allocated for contacts on different bands these are 160m — 20, 80m — 10, 40m — 5, 20m — 1, 15m — 2, 10m — 3. Total score will be total QSO points multiplied by total number of prefixes worked. The same prefix on a different band is counted. Note K1, W1, WA1, AA1, N1 are all different prefixes, W1AAA/6 would count as W6 not W1.
5. Exchange
   Five or six digit numbers composed of the RS(T) report plus a three digit sequence number beginning at 001 and increase by 1 for each QSO on that band.
6. Logs
   A separate log is required for each band and mode (Different people will be checking different bands). It must show — Date, Time (Z), Callsign of station, Exchange sent and received. Underline or highlight each new prefix.
   Summary sheet to show CALLSIGN, NAME AND ADDRESS Equipment Details, QSO points for that band, Total prefixes worked on that band.
   Signed declaration that all rules and regulations were observed.
   Send logs to:—
   W.I.A VK/ZL/O Contest Manager
   1 Noorabil Court
   Greensborough
   Vic 3088
   Australia
   Logs to arive by 30 November 1986
7. SWL Section
   A VK/ZL/O station must be heard in a contest QSO, log the following information. Date, Time (Z), Callsign of VK/ZL/O station, Callsign of the other station and the Exchange, scoring and summary sheets as detailed above.
   Phone and CW scores will be combined for SWL section.
8. Awards
   Awards will be made to the top scorer in each section from each country. Awards for top scorers in each call area or on a single band may be given at the contest manager's discretion (determined by the number of entrants). The prizes which have been donated will be awarded to the top scorer in each country determined by adding the Phone and CW scores.

SUPPORTED BY TRICITY HOUSE



The WIA 75th Anniversary Committee thanks Don McKay and Tricity House for their support of the VK/ZL/O Contest in this, the WIA's Anniversary Year.

SUPPORTED BY AM-COMM ELECTRONICS



The WIA 75th Anniversary Committee thanks Fred Mackiewicz and Am-Comm Electronics for their support of the VK/ZL/O Contest in this, the WIA's Anniversary Year.

THE ROLL-UP

A portable antenna for 2m.

Chris Carter VK6FC
37 Ashfield Parade, Ashfield, WA 6054

Users of handheld transceivers will know how often the "rubber ducky" antenna is just not good enough. With this antenna you will gain three or four S-points over your usual signal. You can roll it up, take it with you and have it ready in seconds whenever you want to operate portable handheld. It's so cheap and easy to make, you can leave several around the place ready for immediate use. All you need is a few metres of RG-58 or equivalent coax, a plug, a few odds and ends and an SWR meter for tuning. To use, simply unroll, hang it from a convenient twig or nail and start talking.

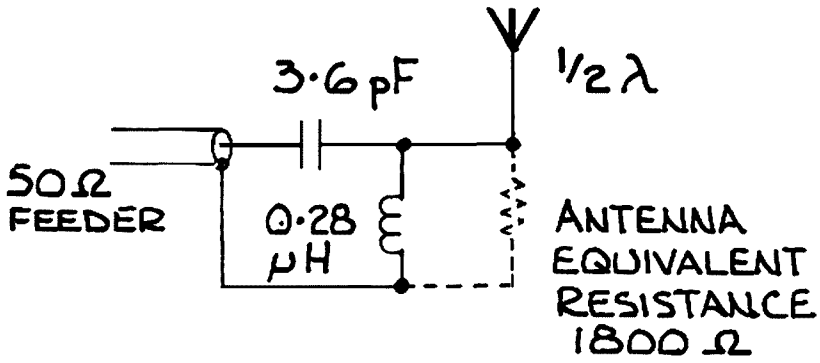


Figure 1 — The Roll-up Equivalent Circuit.

DESIGN

The antenna is an end fed half wave radiator made from RG-58 coax. Its feed point impedance of about 1800 ohms is matched to 50 ohms by an L-network. See figure 1.

The capacitor and inductor are stubs, also made from RG-58 coax. If you use coax with characteristics significantly different from RG-58 then you will have to adjust the dimensions.

CONSTRUCTION:

Make the radiator and inductive stub first. See Figure 2. Make the capacitive stub by removing exactly 10mm of jacket and braid from the feedline, about 50mm from the end. Connect the braids and stubs as shown.

Hang the assembly in the clear and carefully trim the open stub while checking the SWR across the band. Keep the inner 1 or 2 mm longer than the braid to prevent accidental short circuits. When the SWR begins to fall proceed very carefully because 2mm changes the resonance by about 500 kHz.

Finish by attaching a nylon loop and covering the join with tape or heatshrink tubing. If you fill the gap with silicone it will lower the resonance by a few hundred kHz so allow it to cure before tuning. The gap and top are high impedance points so keep them clear of conductors during use.

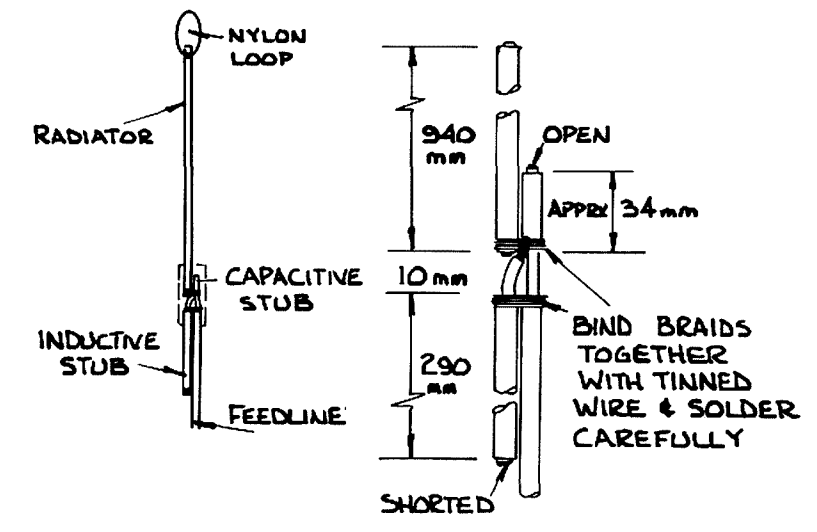

Figure 2 — Construction Details.

PERFORMANCE:

I have consistently obtained between 15 and 25 dB gain over a "rubber ducky" in simplex QSOs. The SWR is better than 1.1 : 1 from 146 to 147 MHz, and 1.5 : 1 at 145 and 148 MHz.

Note: Chris is editor of the WA VHF Group Bulletin. This article first appeared in the Bulletin in September 1982 and was recently revised and re-published by popular request in March 1985.

AR

WHAT IS THE INTRUDER WATCH?

The purpose of the Intruder Watch is to monitor the amateur bands for unauthorised transmissions and work towards the removal of the offending stations. It should be established that the intruding station is appearing on a more or less regular basis. It is pointless to report a signal, eg a carrier, heard once only, as it may never be heard again.

If you hear a station you suspect to be an intruder, make a note of the details and listen again the next day, or on the same day the next week. It may be a regular sched he is keeping or he may have scheds at appointed times at several times each day.

If you are satisfied that he is a regular, and IS, IN FACT AN INTRUDER, then go ahead and send in a report. The Intruder Watch is only concerned with intrusions into the amateur bands of frequencies, by governmental, military and commercial stations. Pirate operators and the like should be reported to the DOC.

You should look for the date, time (UTC), mode, signal strength, frequency of operation, and his identifying call sign, if heard.

Many intruders do give call signs, but this does not mean that it is then any easy task to have them removed from the amateur bands. But it is a starting point, and simplifies things somewhat. You will find that a great many intruder stations do come up on a regular basis, and they can be monitored at will.

Special intruder log sheets, or further information, may be obtained from the Divisional Intruder Watch Co-ordinators or from the Federal Intruder Watch Co-ordinator, Bill Martin VK2COP, ex VK2EBM QTHR. Send your report this month and share the load....

from BARG News, July 1985

160 METRES IN THE USSR

Summary translation by Dex Anderson W4KM
From Radio #1 of 1985.

Effective from the 1st January 1985 the 160 metre band in the USSR is as follows:

1.830 to 1.860 MHz	*— CW.*
1.860+ to 1.900 MHz	*— CW, & SSB (LSB)*
1.900+ to 1.930 MHz	*— CW, & LSB & AM*

As before the band is allocated to the Amateur Service on a secondary basis.

Contributed by David Rankin 9V1RH/VK3QV

SHOOT YOUR SIGNAL OUT OF THIS WORLD

SCAN THE BANDS WITH OUR NEW SX-155

PROGRAMMABLE POCKET SCANNER

This new unique scanner provides coverage of 26-32, 68-88, 138-176 and 380-514 MHz with a sensitivity of less than 0.5 uV. Four banks of 40 memory channels, total of 160 memories. High scan speed of 16 CH/SEC. Auto search and store mode. Priority channel. 4 hour life on supplied Nicad batteries. 24 Hour clock. Selectable Scan/Search delay of 0.1 or 2 seconds. Includes Nicads, charger, carrying-case & antenna.

ONLY $449

WHAT IS IT AND WHAT DOES IT DO?

If you have ever contemplated operating from a primary power source, such as a windmill, you will have encountered the problem of achieving a stable 12 volt (nominal) supply. A similar problem will confront you if you operate a truck with a 24 volt system and you want to run a radio transceiver or tow a trailer with 12 volt lights. *What do you do?* Well, you could use a series dropping resistor but this would only be satisfactory for a fixed lamp load. Putting on the brakes would dim all the trailer lights! And if you tried to use your transceiver rig your signal would probably be unintelligible because of the poor regulation. To solve such problems you would buy an electronic voltage reducer. Most readers will be more familiar with the term voltage regulator an electronic voltage reducer is really a regulator designed for voltage reduction first and regulation second.

The VOLTEX 3.6 O.V.P. is an electronic voltage reducer designed for use with any **DC** supply in the range 20-30V. It is rated at 3 amps (continuous) at 13.8 volts output. It has a peak output rating of 6 amps. It is one of a family of reducers manufactured by Atron Products in Ballarat. Ballarat has a reputation for excellence in engineering (stationary engines, mining machinery, etc) and has produced many fine electronic engineers; are we seeing the beginning of a new centre of excellence?

As can be seen from the photograph, the reducer is built on a 12.5cm long heatsink. It is provided with an inlet lead, an outlet lead and a common (-Ve) lead. The input lead is fitted with a 5 amp in-line fuse.

The manufacturer provides an installation sheet with easy-to-follow instructions. A ventilated position protected from wet weather is recommended.

ON TEST

The reducer was connected to a regulated 10 amp supply and a bank of lamps used for the load. The 5 amp fuse was left in line.

The input voltage was varied over the rated range with the rated load. The results are given in Table 1. It can be seen that the output remains constant at 14.00 volts to better than 10 mV when the input drops to 20 volts or rises up to 30 volts. To get a 0.1 volt drop in output, the input had to be reduced to 17.55 volts. This is a performance in excess of what would be required in its intended service.

The input voltage was set to 24 volts and the load varied. The unit managed to achieve 6 amps out in spite of the 5 amp rating of the fuse, although the output voltage had fallen considerably.

The reducer was then run at 3 amps for one hour at the conclusion of which the output voltage had risen to 14.18 volts.

An attempt was then made to obtain 6 amps output but only 5 amps could be obtained on short circuit. The manufacturer states that this is normal as the unit is designed to be safe against thermal run-away, thus as the unit becomes hot the maximum output current is reduced. In normal commercial use a transceiver would be limited to one minute transmissions and hence the test performed was very severe. If higher currents are required at higher duty cycles, then one of the other model Voltex reducers should be used. Models up to 20 amps continuous rating are available.

The heat sink becomes quite hot after 15 minutes or so of continuous operation so the unit should be mounted in a well ventilated area if it is intended to use the unit at full rating.

INSIDE THE VOLTEX

The cover was rivetted on so no attempt was made to remove it. No manual was supplied so it is not possible to give an accurate circuit description. It appears that the reducer is a series pass regulator employing two 3055 type transistors as the series element. This would give an adequate capability and the limiting factors would be the main regulator and the heatsink as the transistors would each be capable of carrying the load current.

The Installation Instructions also include a specification statement. This states that the output is factory set to 13.6 volts and that the units will current limit in the event of overload. Voltage spike and surge protection is incorporated as is an over voltage protection. If the output voltage rises to 16 volts, the unit will shut down by blowing the fuse fitted in the input line.

CONCLUSIONS

The Voltex 3.6 O.V.P. would enable operation of 25 watts and lower power level transceivers from 24 volt vehicles or from any DC source between 20 and 30 volts. It should provide a considerable degree of isolation from ripple and alternator whine, providing proper earthing is employed. Indeed lamps and any 12 volt appliance could be safely run from 24 volt sources providing the 3 amp average rating is not exceeded.

If you own a vehicle with a 24 volt system or use a 'home lighting plant' with a windmill charging system, then you need a Voltex.

Thanks to WECAM for supplying our review unit. All enquiries should be direct to them at 11 Malmesbury Street, Wendouree, Vic. 3355.

EQUIPMENT REVIEW

Ron Fisher VK3OM
3 Fairview Avenue, Glen Waverley, Vic. 3150

BEARCAT DX-1000 DIRECT ACCESS COMMUNICATIONS RECEIVER

Until the introduction of the DX-1000 receiver, the Bearcat brand had been associated with VHF-UHF scanning receivers. Bearcat equipment is manufactured in Japan for the Electra Company, a division of Masco Corporation of Indiana USA.

The DX-1000 is imported into Australia and distributed by Dick Smith Electronics, who kindly supplied our review receiver.

This unit is a full featured, desk top, communication receiver. It measures 370W x 130H x 240D mm and weighs 6.5kg. The receiver requires a power source of 12 volts DC, either from an external power supply or from internal batteries. With the batteries installed, the total weight increases to 8kg.

Coverage is from 10kHz to 30MHz, with either continuous tuning or key board entry. The receiver has ten frequency and mode memories and two 24 hour clocks. It is supplied with a telescopic antenna, so that with the internal batteries installed it becomes a completely portable receiver. Frequency and time readout is by a five digit, red LED display plus an imposing array of 15 LED status indicators. All mode reception includes AM, USB, LSB, CW and FM, for which three selectivity positions of 2.7, 6 and 12kHz are provided.

A dual speed noise blanker, which is claimed to be effective against the Woodpecker, fast and slow AGC selection and two speed tuning round out the impressive list of features.

With all of that, you might well ask what DOESN'T the DX-1000 have. Incredible as it might seem, the DX-1000 does not have an AC power supply. At a price of $699, the power supply is an optional extra. It seems that when the receiver is sold in the USA, a wall type power pack is included as a standard feature, but the Australian purchaser is not quite so lucky.

DX-1000 IN OPERATION

The first requirement is to find a suitable AC power supply. The rated current drain is 450mA peaking to 700mA at full audio output. At this rate, the 8 internal D cells would not last too long. I happened to have a home-built, 1A, 12V regulated supply, which did the job very well. In addition three AA cells are required for memory retention when the external power supply is removed. With a total of 39 push buttons and six rotary controls, the DX-1000 takes a bit of getting used to. Many of the controls interact in some strange and unexpected ways. On initial switch-on, the receiver starts on 10kHz in the (KEY) mode. This means that you can now enter any required frequency via the key pad to the nearest 1kHz. At the same time, these can be entered into memory if required at this time.

To manually tune the receiver it is necessary to push the 'MANUAL' button, the 'DIAL' LED will light and the tuning knob becomes operative. Two tuning rates are selectable, 100Hz which gives a rate of 2.5kHz per tuning revolution or 1kHz, which gives 25kHz per knob revolution. It is at this point that some of the unexpected funnies become evident. Tuning across a SSB signal, for instance, steps in 100Hz increments, but every so often, the tuning goes backwards for an instant. However, let us say you now have your SSB signal tuned and you decide to check the time. Push the 'CLOCK' button and, low and behold, the SSB signal disappears off frequency. To retrieve the lost signal it is necessary to step through the two clock modes, back to the frequency readout, hit the 'MANUAL' button and retune. The problem appears to be that, on selection of the clock mode, the tuning system returns to the 'KEY' mode and so resets the tuning to the nearest 1kHz point. A strange idea, to say the least.

The two tuning rates are well chosen, however the synthesiser is rather clicky in operation and the digital display does not have a 100Hz digit. The tuning knob is a good size, but it does not spin. The knob seems to be made from a light grade of plastic, so perhaps the old trick of filling it with a mixture of shot and glue may help.

In addition to the keyboard frequency entry and the normal tuning, the DX-1000 also has a stepping facility. Steps of from 1kHz to 100kHz can be programmed so that it would, for instance, be possible to tune across a short wave broadcast band in 5kHz steps. However, you must keep your finger on the 'UP' or 'DOWN' button, there is no automatic scanning.

One interesting feature is the ability of the clock to switch the receiver on, a tape recorder on and select a memorised frequency on five separate occasions. Very handy to check the twenty metre beacon frequency at three in the morning.

The DX-1000 has provision for different antennas. A 1.2 metre long telescopic whip is supplied and can be attached to the rear, via the HI-Z terminal. A low Z (50 ohm) antenna can be connected via an SO-239 connector or a screw terminal. A rear switch selects either the HI or LO impedance connections. Results with the telescopic antenna were not good. Compared with a small, all wave receiver I keep for travelling, the DX-1000 was well behind.

A squelch control is provided for use with all modes. I have yet to find a satisfactory squelch system for a HF receiver and this one is no better or worse than the others. You might find it useful. Construction of the DX-1000 is fairly basic. Most of the components are mounted on one large circuit board with a separate assembly for the receiver front end. The cabinet is of steel with a black crackle paint finish, while the plastic front panel is backed with a metal shielding panel.

The large carry handle, which is very reminiscent of the one used on the Kenwood R-1000 receiver, allows the set to be tilted up at any re-

quired angle, a very useful feature.

In general, the DX-1000 is a fairly pleasant receiver to operate and once the complexities of the control panel have been mastered, it is capable of turning in good results.

THE DC-1000 ON TEST

The following equipment was used to produce the test figures: a Marconi TF995/5 signal generator, AWA F242A noise and distortion meter, Daven terminating audio power meter and a Heath AV-3 audio VTVM.

The extension speaker output was connected to the audio power meter and noise and distortion meter. An 8 ohm load was selected. The residual noise output with the audio gain at zero was measured. This was -71dBm unweighted and -59dBm weighted. These are excellent figures and certainly indicate, at least that my home made power supply is clean.

Audio power output and distortion was:

OUTPUT POWER	DISTORTION
.5 watt	1.4%
1.0 watt	2.2%
1.5 watts	13.0%
2.0 watts	32.0%

Clearly, something is wrong here, so the load impedance was changed to 4 ohms with the following results.

OUTPUT POWER	DISTORTION
.5 watt	1.6%
1.0 watt	1.7%
1.5 watts	1.8%
2.0 watts	8.0%

This now meets the specification but at 4 ohms load, not at the specified 8 ohms.

Received audio response was checked in the LSB mode, 2.7kHz selectivity, by tuning the receiver across an external crystal calibrator.

100Hz	200Hz	300Hz	1kHz	3kHz	3.3kHz
-8	-4	-3	0	-6	-10dB

Next, the response was checked in the AM mode with 6kHz selectivity.

80Hz	100Hz	200Hz	300Hz	1kHz	2kHz
-15	-12	-5	-4	0	-1
3kHz	4kHz				
-4	-8				

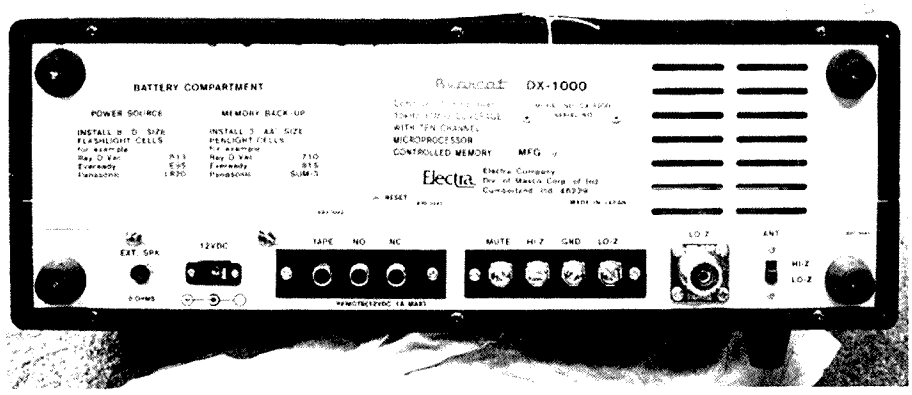
The above figures were taken with the tone control set to the centre position. The action of the tone control is such that, at one extreme it produces a top cut and at the other, a bass cut. It was noted that the 1kHz responce varied by 5dB from one end to the other and the 100Hz response by 25dB and the 2.5kHz response by 15dB. Sensitivity was checked at 14.100MHz USB with 2.700kHz selectivity. At 14.100MHz AM with 6kHz selectivity, the 1uV S½N ratio was 12dB which is a little better than the specified 10dB.

The S meter calibration was measured and found to be very miserly. It took 25uV to move the meter up to S2. The full calibration results are as follows:

S2'25uV, S4'50uV, S6'100uV, S8'125uV, S9'160uV, 9+10'250uV, 9+20'500uV, 9+30uV'2.5mV and 9+40'10mV.

With the way 20 metres is these days, you will not see much action from the S meter.

The AGC action was also checked at 14.100MHz. The audio output level was monitored as the signal generator level was slowly increased. From .1uV to 1uV, the increase was 12dB. From 1uV to 10uV-15dB, from 10uV to 100uV-2dB and then no change from there upwards.



The overall frequency stability of the DX-1000 is very good over a one hour period. The total drift in the SSB mode did not exceed 100Hz. This meets the specification.

Strong signal handling was checked subjectively and found to be quite fair from 2MHz to 30MHz. Below 2MHz it was poor. Using a long wire antenna for broadcast and long wave reception produced severe cross modulation. The use of the 20dB RF attenuator was needed most of the time and the 40dB position for the rest of the time.

Sensitivity of the low bands was not checked but appeared to be reasonable down to 150kHz, but poor from 150 to 10kHz. No signals were heard in this region, at all.

The receiver current drain was measured. No signal drain was 420mA. At 1 watt audio output: 600mA. Power switched off, but clock still indicating: 100mA. Power switched off, clock display off: 20mA.

It appears from this that the battery back up for the memory and clock is for short term backup only. In other words, the main DC power supply must be left switched on all the time and the batteries are for short term power failures only.

Lastly, the accuracy of the digital display was checked. On AM it was accurate to within the 1kHz resolution and on SSB to within +-/1.5kHz. The BFO offset is not taken into account with the display reading.

INSTRUCTION MANUAL

The 18 page instruction manual covers: Introduction, Technical Specifications, Preparation for Use, General Operating Instructions, Some Basic Information on Antennas, UTC and a World Time Chart the Morse Code and the Frequencies of some International Broadcast Stations.

The operating instructions are reasonably well written, but the new owner will need quite a bit of time to get used to the rather complicated operation. Technical information is very sparse. Apart from the specifications, there is no other information, nor even a circuit diagram.

The manual is also written on the assumption that an AC power supply is included, which of course it is not. Perhaps it is not asking too much for the local distributor to add some supplementary notes to help the Australian purchaser in this regard.

THE BEARCAT DX-1000 SUMMARY

Unfortunately, the DX-1000 falls short in many aspects of its design. Perhaps the designers have tried to provide too many facilities and have lost sight of good basic receiver performance.

Having said that, the DX-1000 does perform reasonably well for many applications, although it is up against many better receivers at an only slight increase in price. If you are considering the purchase of one, could I suggest that you try it and determine if it meets your requirements. But then, of course, this applies to any purchase. I look forward to seeing the DX-1001.

Our thanks to Dick Smith Electronics for the loan of our review receiver and all enquiries should be directed to them.

EVALUATION AND ON-AIR TEST OF THE BEARCAT DX-1000 RECEIVER.....Serial No 003746

APPEARANCE

Packaging
*** Colourful, strong carton with foam inserts.
Size
** *Rather large, considering no inbuilt P/S.*
Weight
** *Reasonable at 6.5kg.*
External Finish
** *Very basic finish.*
Constructional Quality
** *Reasonable quality circuit boards and construction.*

FRONT PANEL

Location of Controls
** *Generally well laid out.*
Size of Controls
** *Knobs OK, but mode selection buttons poor.*
Labelling
** *Generally OK but mode selection buttons confusing.*
S Meter
** *Not easy to read.*

RECEIVER OPERATION

VFO Knob Action
** Rather stiff - should spin.
Digital Readout
* To 1kHz only. Red LED display rather outmoded.
Receiver Stability
*** Quite OK for general use.
Memories
** Ten with required mode but, awkward to use.
S Meter
* Very sluggish.
AGC Performance
* See test section.
Sensitivity
** Quite OK for general use. See test section.
Signal Handling
** OK on short wave. Poor on medium and long wave.
Selectivity
** A bit broad.
RF Attenuator
** 20 and 40dB. Might be better with 10, 20 and 40dB.
Noise Blanker
** Not over effective.

QUALITY OF RECEIVED AUDIO

Internal Speaker
** *Front mounted speaker. Reasonable quality.*
Headphone Output
* *Not compatible with stereo phones.*
Tone Control
** *Gives a wide choice.*
Audio Output
** *Plenty for most applications.*
Instruction Manual
** *Operational instructions fairly good, but no technical information.*
Over-all-Rating
** *At the price, it should be much better.*

RATING CODE...* Poor ** Satisfactory ***Very good **** Excellent

AR

Remembrance Day, 1985

Remembrance Day, and the Remembrance Day contest, are always special occasions in Australia, but this year they are even more special than usual, because 1985 marks the 75th anniversary of the Wireless Institute of Australia!

What a wonderful and noteworthy event! The WIA is the oldest amateur radio society in the world, and it has a marvellous record of leadership throughout the years. Your longevity and your 75-year record of achievement set a standard by which other amateur radio societies can measure themselves.

In 1979 amateur radio was especially successful at the World Administrative Radio Conference in Geneva. We were successful at that conference because of our excellent preparation for and our participation in the work of the conference. In those efforts, Australia was a leader and a significant factor in our success. Australian amateur radio leaders played a dominant role in the preparation, which extended over a period of several years. Australian Radio amateurs played a leading role in the deliberations of the conference itself, and were influential in many of the important decisions of the conference.

We look to continued leadership by Australia especially in amateur radio affairs but also in the overall conduct of telecommunications in its many facets.

The International Amateur Radio Union has recently been restructured in order that it can better meet the challenges of the future, and the Wireless Institute of Australia played an important part in the restructuring process. Those of us most intimately involved in the work of the IARU are indeed grateful for the support of and the participation by the WIA.

Amateur radio has demonstrated that it is a radio service which deserves the support of administrations at and between international telecommunications conferences. We of IARU intend to concentrate on making sure that all administrations recognise the value of the amateur radio service and that at the next General World Administrative Radio Conference we are once again successful.

With your help, my Australian friends, we shall succeed.

Richard L. Baldwin W1RU
President, IARU

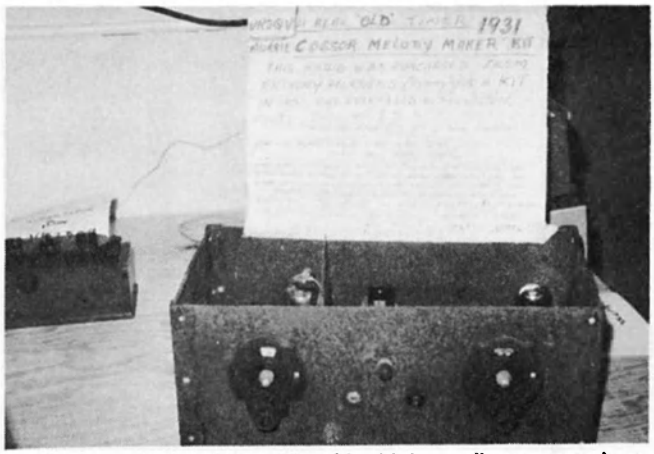
75th Nostalgia



Morrie Cossor Melody Maker Kit...This old time radio was recently on display at the 1985 Oxley Radio Club Field Day. Part of the sign with the unit states 'This radio was purchased from Anthony Hordens (Sydney) as a kit in 1931 and assembled by Dan Willett. Cost - Radio Kit three pounds five shillings. Stations heard: Night time 4BC, 2BL,2FC, and in Day time 2NR Grafton
This was the second radio at (downtown Brierfield), the first radio on the river (South arm of the Bellinger) was an AWA Radiola 5 valve owned by the Spillett family, about 1930. People would crowd around the speaker to hear the cricket by Alan McGilvray from England, via Sydney'.

Photos by Pete Alexander VK2PA

Photo right:
This transmitter was also on display at the Oxley Field Day. Jack Hill VK2ADT, who constructed the transmitter, is still very active on the bands. It used a valve type 42 oscillator and a type 46 amplifier with an output of 10 watts on CW.

Special 75th Anniversary

AMATEUR RADIO — PUBLIC DEMONSTRATIONS

VK2BQK was first established in 1979 on the first floor of the old Museum of Applied Arts and Sciences, at Harris and Mary Ann Street, Ultimo in Sydney. A modest station housed behind sliding glass panels, it shared a display alcove with a reconstructed 1924 amateur station and feature panels on the past to present communication themes. VK2BQK provided many museum visitors with their first insight of working amateur radio, and was a very popular display. When the decision to develop the new Power House Museum and close the original building was made, the popularity of the amateur radio exhibit placed it high on the priority for the new displays. The station has been constructed so that it can be transferred from State one to the stage of the Power House Museum, where it is planned to be a major exhibit, together with a tower and beam system outside, which will become a land mark.

Tim Mills VK2ZTM

The Power House Museum Amateur Radio Station VK2BQK was officially opened on 14th May 1985 by Mr Alan Jones well known Sydney broadcaster and sportsman. The function was attended by representatives of the Department of Communications, Electronic media, Radio equipment distributors, Museum staff and associates, and a number of Sydney amateurs and friends. The station was also featured in a live morning telecast and a recorded interview news feature on channel TEN television. Publicity was also given in Sydney and suburban newspapers.

The completely rebuilt station has been established as a major communications exhibit for the Power House Museum Stage Two due to be opened in 1988 to where it will be re-located. At present it is located in Stage One, Mary Ann Street, Ultimo, just off Broadway, Railway Square, Sydney.

The geometrical styled externally mirror clad shell enclosing a panelled console was designed and built by the Museum staff. All the equipment is panel mounted giving a functional, attractive and colourful appearance.

The operating position at the console is surmounted by a large backlit coloured world map flanked by a large screen monitor and a great circle map which, in conjunction with the beam rotator controller, indicates the part of the world to which the beam is pointing. Also above are clocks showing time in Sydney, Bombay, London and Vancouver, plus two speakers for higher levels of audio output.

Set in the mid section are five speakers, operators time clocks, the audio and unit switching panel and antenna switching panel. The audio and unit switch panel allows speakers to be switched to each of the high frequency transceivers, an all band receiver and the cassette recorder. Also reception of radioteletype and Morse code signals from an all band receiver, high frequency, very high and ultra high frequency transceivers may be switched for decoding through the 7000E communication computer. Likewise, FSK and AFSK or Morse code output from the Tono may be switched to the HF, VHF and UHF transceivers.

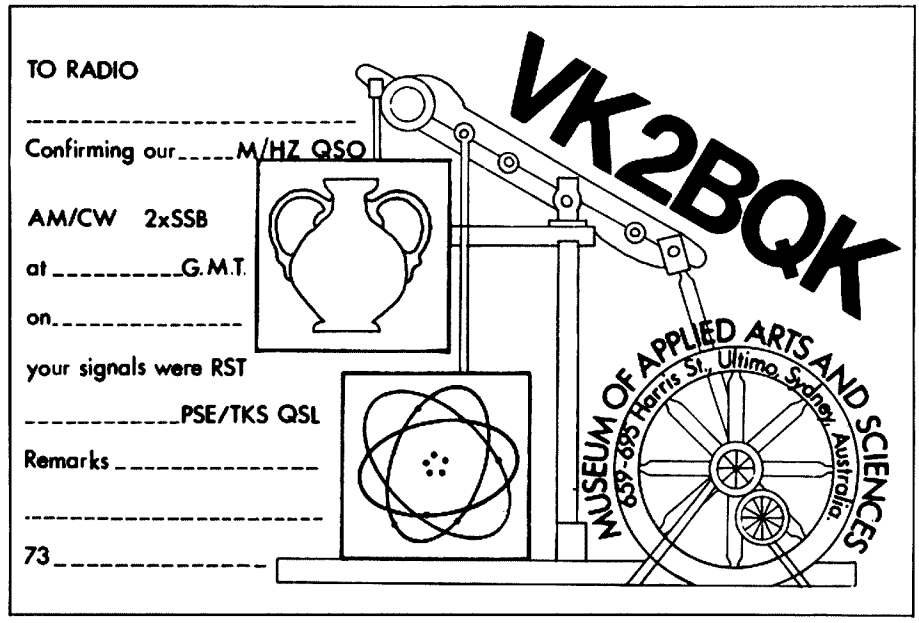
The antenna switch panel is the distribution point for the antenna system located in the forecourt area of the Museum and allows switching of HF antennas to HF receivers and transceivers, also vertical and horizontal antennas to VHF and UHF transceivers. It also allows the 3.5MHz dipole to be available for the all band receivers except when required for the HF transceivers, or, isolating the HF transceivers if the other HF antennas are required for the all band receivers.

The 7000E communication computer set into the desk top is linked to the video monitors and the Alpha 80 dot matrix printer mounted on a mobile pedestal which houses the paper bale.

Provision is provided for the use of a Morse key or the keyboard for CW operation.

Storage drawers and cupboard are located under the desk top as is the master keyed power switch.

The lower backward sloping panels house the all band receivers, cassette tape recorder, V-212 CRO, operators video monitor, SWR/Power meter, antenna tuning unit, beam rotator controller, TS 93X, FT 101E and FT 7 HF transceivers, TR 9500 UHF and TR 9130 VHF transceivers, Function Generator and EA Large Screen Storage CRO. Separate microphones are provided for each transceiver.



Modulation patterns from the CRO and wave form patterns from the function generator can be displayed on the video monitors through the Large Screen Storage CRO.

Two comfortable adjustable swivel chairs are provided for the operators.

A five sectioned transparent panelled surround protects the console from direct access by visitors to the station. Adequate security surveillance is maintained at all times.

The antenna system located in the forecourt of the Museum is a 15 metre high, two section triangular telescopic tower with a special section on top to house the rotator and shaft support. The guy wires are anchored to 3.5 metre high steel pillars. On the rotating shaft are mounted a HB34D four element tri-band beam for 14, 21 and 28MHz. A LOG-SP thirteen element log periodic horizontally polarised for VHF and UHF, with a 2 metre cross arm at the top carrying vertical co-linear ground planes for 144MHz and 432MHz.

In addition to the work of the several specialist trades staff of the Museum, amateurs interested in the project carried out various aspects of the work involved. The station custodian is Pierce Healy VK2APQ, who collaborating with Museum administrative officers, their staff and amateurs, co-ordinated the installation of equipment and brought the station into operation. All work by amateurs has been carried out on a volunteer basis.

For the 3.5 and 7MHz bands insulators have been inserted in the guy wires which are used as inverted "V" antennas. Baluns are used at apex feed point.

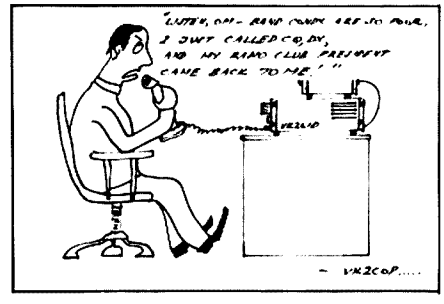
An operators guide has been compiled detailing switching procedures, extracts from manuals for each piece of equipment and other appropiate information.

In addition to equipment purchased by the Museum the following organisations have generously made equipment available: Dick Smith Electronics; Trio Kenwood Australia; GEC Electronics: Electronics Australia; Emtronics.

Future plans are to incorporate — Colour ATV, Slow Scan TV, Facsimile, and Amateur Satellite Communication.

Prior to the official opening the station had limited public exposure. There were several demonstrations to High School and College groups, participation by Scouts in the 1984 Jamboree-on-the-Air and later over the Easter 1985 holiday period.

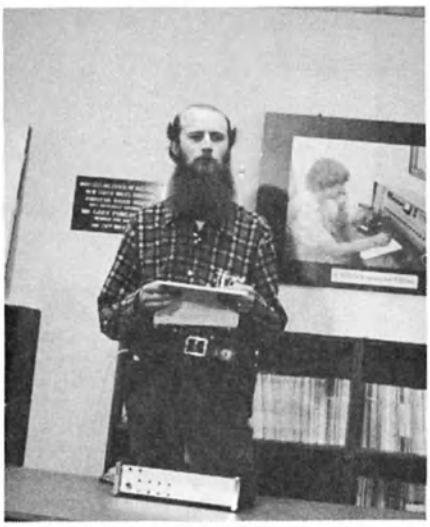
The station is now manned each weekend by volunteer amateur operators and is proving to be a very popular attraction to visitors. Demonstrations are also given to groups during week days when requested. **AR**



1985 VK2 SEMINAR.

Peter VK2PJ, VK2 President welcomes all to the 1985 VK2 Seminar.

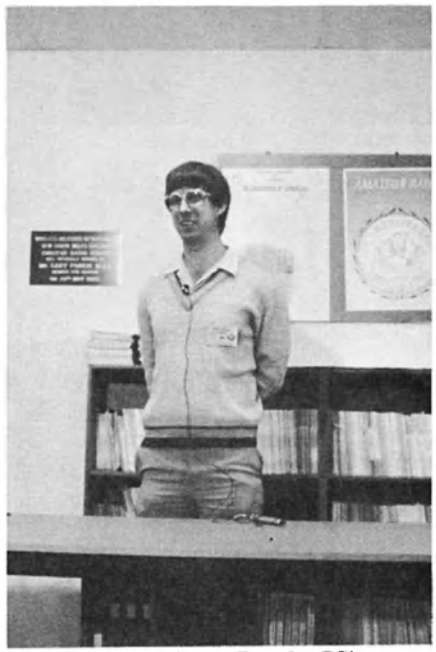
The seminar was held on Saturday the 20th July at Amateur Radio House. It was during a period of influenza in Sydney, which resulted in a smaller attendance than last year. Those who were able to attend had an enjoyable and informative day. Illness and personal reasons also prevented two of the lecturer's from attending and they will be held over to the next Seminar planned for early 1986.



Les VK2KYJ (above) and Barry VK2AAB (below), presented talks on Packet Radio.

Photographs courtesy of Henry Lundell VK2ZHE

The first lecture was a report on the developments in Packet Radio since the last seminar, when Jim VK2BVD presented his talk. The updated report was presented by Les Grant VK2KYJ from the Sydney Amateur Digital Communications Group and Barry White VK2AAB from the TARP Users Group.



Jeff VK2BYY spoke on Doppler DFing.

The next lecture was given by Jeff Pages VK2BYY on Doppler DF'ing. This talk was illustrated with diagrams and a working model.

David VK3ADW, Federal President, discussed the history of radio and the WIA with the gathering.

Following the lunch break Federal President, David Wardlaw VK3ADW, discussed the history and development of amateur radio and the Wireless Institute of Australia.

A presentation was made to Peter Stuart VK2BEU who was the winner of the VK2 Divisions 1984 Home Brew Contest.

The final speaker was John Milton, State Manager of the Department of Communications, who discussed the operation of the Radio Frequency Management Division, with particular reference to the amateur service.

A lively question and answer session followed each talk. The proceedings were recorded on video tape and are available through the Division's video tape library. Copies will also be available from the Federal video library.

wice each Sunday, at least two amateurs make a journey VK2WI to read and engineer the Divisional weekly broadt. The first session is in the morning at 11am and the gramme is repeated in the evening at 7.30pm.

K2WI transmits on 160, 80, 40 and 10 metres in the HF specn and on 6, 2 and 70cm in the VHF/UHF spectrum. It proes a direct relay to 2 metre repeaters in Newcastle, Central ast Western Blue Mountains and Wollongong.

ch month, on the first Sunday, a barbeque is held at Dural er the broadcast and an invitation is extended to all to at. Last June, several of the announcers and engineers attendand were persuaded to appear before the camera. It is hoped capture the remaining team and present their likeness in a ure issue.

ny members who would like to assist in either an announc or engineering capacity is invited to notify Jeff BK2BYY or tact the Divisional Office.

URTHER READING: A full story of Dural appeared in Amateur Radio, page 28, 1982.

EIGHTY METRE OUTLET ADDED TO VK2RCW

Tim Mills VK2ZTM
STATE REPEATER CO-ORDINATOR
PO Box 1066, Parramatta, NSW. 2150

Photograph courtesy VK2KCP

Barry VK2AAB, the developer of the VK2RCW Morse machine.

VK2RCW is the Sydney based, continuous Morse transmission on the two metre band. Often wrongly assumed to be a beacon, because of its call sign, that is not its prime purpose.

It consists of a transmitter fed from a memory store with about an hour of text. The text is changed at intervals, by typing the new text into a personal computer, transferring it to tape, taking the tape to the VK2RCW site and loading it into the memory. A wide selection of text is used and can include foreign languages. Sometimes, the text is sent backwards or similar, to prevent the listener from journalising.

VK2RCW has three transmission speeds. There are about 5, 8 and 12WPM. It transmits for approximately five minutes and looks for a full stop in the text. When one is found, it stops the programme and sends station identification at 20WPM. After four periods of identification, it increases its sending speed to the next range. After a further four periods, it goes to the highest speed and at the end of that block, it reverts back to its slow speed.

As the cycle period and the store capacity have different time intervals, the whole text ends up over a period of a few days, being sent at all speed ranges. With its 24 hour operation, it has enabled listeners in Sydney, access to Morse practice whenever they like.

VK2RCW has been operational from late 1976 on 147.400MHz using (mostly) a MR3 carphone, 5 watts, into a five-eighth whip on the top of the tin roof of its host building, on the upper North Shore in Sydney. It has a good view of the city and southern and south western suburbs. It is now in the process of a frequency change to 144.950MHz, (one of the band plan frequencies for such systems), and a power increase to about 25 watts. The antenna has been replaced, affording some further gain.

The old channel 147.400 (7400) will then become available for use with the proposed Newcastle, Sydney and Canberra ATV repeaters.

For some time it was felt that the service should be expanded to enable more listeners (future amateurs) access to its facilities. It was considered that an outlet on HF would provide this, but where? The higher frequencies, eg 10 metres, have limited groundwave local coverage and then skips into the DX world. This narrowed the choice to either 160 or 80 metres. It was felt that less newcomers to the hobby of amateur radio would have 160 metre access, so the choice became 80 metres. Since 80 is a popular and crowded band, the choice of frequency became important. It appeared that the top end of the Australian allocation offered the best choice and the frequency of 3.699 MHz was suggested.

About two years ago the application was submitted. Since then, there has been considerable debate and investigation about an 80 metre outlet for VK2RCW. It has been decided that it should operate for a trial period and the Department of Communications has granted a permit for it to operate for six months, until early 1986 when it will be reviewed. The VK2RCW system is intended only to supplement the various existing sources of Morse practice sessions.

VK2RCW went to air on Thursday 18th July, on 3.699MHz, using a crystal locked FT7 with 15 watts into a simple long wire antenna. While indicated earlier, it is not intended to be a beacon, its continuous CW operation on 80 metres will show some of the propagation characteristics of this band, with Australian, New Zealand and Pacific coverage.

It is planned later to change the antenna and the transmitter.

During this trial period, listener reaction is sought as to whether it is providing them with any benefit. VK2RCW is sponsored by the Hornsby and District Amateur Radio Club, PO Box 362, Hornsby, NSW. 2077. It is under the development, care and control of Barry White VK2AAB. You are all invited to have a listen to the transmissions and sometime, would you then put your thoughts in writing and send them to HADARC.

It is not known if similar systems exist elsewhere in the world, but since VK2RCW is almost ten years old, I am sure it could have been a world first.

It is hoped that a technical article on VK2RCW will follow in the near future.

AR

JOTA 1985

John Bunn VK2NDJ
VK2 JOTA CO-ORDINATOR
PO Box 1066, Parramalta, NSW. 2150

To the date of writing, being the new JOTA Co-ordinator has enabled me to meet various people interested in this project. I wish to thank them and hope to continue in this theme.

As we all know by now, the plans for a JOTA station should be well beyond the planning stage. Namely, a positive venue, a positive contact or two in the scout/guide area, plus our own technical plans.

Mind you, I am quite sure that many good stations in the past have set-up and operated, after a very late kick-off.

As always, there are the lucky ones who have a regular amateur and scouts station each year.

Recently the OZ for Africa telethon was doing its inspired and wonderful fund raising effort. The Universal bond was an intangible thing . . Music . . beamed to all people by satellite. A similar bond of CW or words is easily accepted as normal by amateur operators. These words, sometimes only a few beating the QRM, are understood by our unseen friends.

Once yearly, with special co-operation with the scout/guide organisations, we again have a good opportunity to extend our contacts. The JOTA experience to one group is really a multi-contact as it goes to all young people interested and listening.

By helping them, we are eventually helping ourselves and the WIA, for future amateurs are made, not born.

Most communication will again, probably be regional, owing to present conditions. However, this is generally only a worry to the operator. Except for a possible extrovert in a group, the intelligibility of a contact is the most important factor. QRM is not easily accepted unless one is used to it.

The NSW scout/guide movement are very interested in improving the efficiency of their network and will, where possible, personally telephone or contact the operators. I am led to believe, they hope for many more radio stations than last year, when they could not get enough volunteer amateurs.

Should they ask you..try it..even if you haven't before.

If you have been waiting to be asked, don't waste anymore time. Phone your local scout/guide leader and ask if you are needed in that area. Second choice, although time is running short, phone me on (02) 772 3437, and I will check via the system and notify the NSW Scout Liaison Officer.

Wishing all old timers, full call, limited and novice operators good DX for JOTA '85.

AR

LAUNCHING OF THE VK2 TIME CAPSULE

As advised in the March issue of Amateur Radio, VK2 has opened a (Time Capsule), which will be closed in March, next year.

A small group of stalwart amateurs and their families attended the launch in March this year.

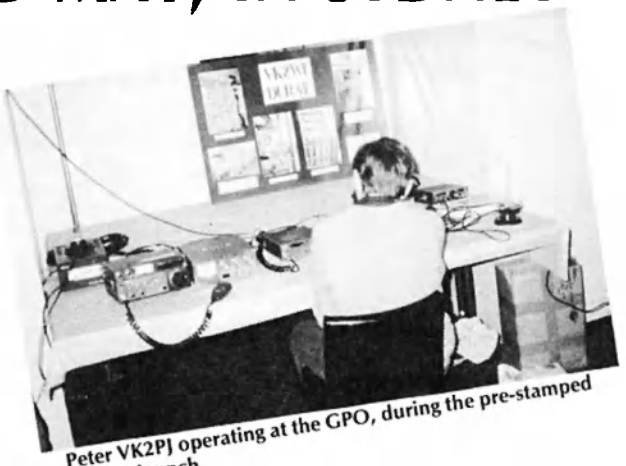
Launching the VK2 Division's Time Capsule at VK2WI on the 10th March 1985 are Jeff VK2BYY, Divisional Secretary and Tim VK2ZTM, Divisional President. Tim is behind the 75th Anniversary cake.

Jeff VK2BYY cutting the anniversary cake.

STAMP LAUNCH, 22ND MAY, IN SYDNEY

Photograph courtesy Australia Post

Everyone into the action . . . L to R: Peter VK2PJ, Tim VK2ZTM and Steve VK2PS.



Peter VK2PJ operating at the GPO, during the pre-stamped envelope launch.

Peter operating, carefully watched by (from left), Tom VK2PDT, Tim VK2ZTM and VK2EW.

The VK2 Division provided a small display at the GPO, in Martin Place for the launching of the WIA 75th Anniversary pre-stamped envelope, on 22nd May 1985.

Several clubs provided displays at their local post offices. It is hoped we may be able to include a report on their activities, when they submit copy to the Divisional Offices.

HISTORY & DEVELOPMENT OF OSCAR 10

Pictorial look at the lecture given by Karl Meinzer DJ4ZC in Sydney in late May 1985. See also page 22, August AR.

VK2 MINI BULLETIN

Tim Mills VK2ZTM
VK2 MINI BULLETIN EDITOR
PO Box 1066, Parramatta, NSW 2150

It had been planned that this issue would be another special for the VK2 Division but the deadline came up too fast. Instead it will be a smaller input with further material in a later issue.

YOUR RD LOGS

I am sure that most VK2s would have a few entries during the weekend, but have you posted your log? The RD Trophy is in VK2 at the moment but we need your log to help keep it here. If you still have to post your log, please do so today.

HOME BREW CONTEST

Peter VK2BEU was the winner of the 1984 contest. Now is the time to be looking over your project collection and seeing if there is anything that you have under construction which you can enter. Application forms are available from the Divisional office during the normal hours of 11am to 2pm each weekday or 7 to 9pm each Wednesday night.

WICEN EXERCISES

Coming up in the near future is the Car Rally at Batemans Bay this month. The outward Bound Hawkesbury Canoe Classic is at the end of October and the Schofields Air Show in November. Further details will be on the weekly nets on VK2RWS 7.150 or 3.600 MHz. Note that there has been a time change to 8.30pm Thursday for this net.

CONFERENCE OF CLUBS

This will be hosted by Westlakes ARC on the first Sunday in November at Teralba. A reminder to clubs that agenda items close at the Divisional office early this month. If you have an item which, if passed, needs to be passed on to the 1986 Federal Convention, submit it now for consideration at the November C of C so that it has time for interstate circulation.

VK2 ANNIVERSARY DINNER

The date has been set for Saturday the 12th October. Planning has been difficult, as no indication of possible attendance can be gauged. As these notes were being prepared, the final details were still to be worked out, so most information will be given via the broadcasts. Bookings are to be made by contacting the Divisional office, before the 27th September.

TECHNICAL ARTICLES

Do you have a short article suitable for inclusion in Amateur Radio? If so, send it direct to the Editor.

DOC MEETING

In July, a meeting took place between representatives of the WIA and the Department of Communications in Sydney. Representing the WIA were Jeff Pages, Divisional Secretary, and Tim Mills, Repeater Co-ordinator. The Divisional President, Peter Jeremy, was unable to attend due to work commitments and tendered his apology. Also present was Bob VK2YRX.

The repeater abuse problem was discussed at length, and the Department advised that further investigations were underway. For obvious reasons, no further details can be given at this stage. Again the Department stressed that amateurs should not respond to, or acknowledge, the presence of offenders. The Department requested that anyone having information which may be of use in locating the offenders should forward it in writing via the Divisional Office rather than directly to the Department. Jeff Pages reported on the transmitter location system being developed at Sydney University as a long-term aid in dealing with this problem.

A suggestion that equipment seized by the Department be cross-checked against the WIA stolen equipment register was discussed, and both the Department and the Divisional Council are to look at ways of overcoming some of the administrative problems involved in implementing such a scheme.

The Department accepted an invitation from the Divisional Council to address the WIA seminar held on the 20th July.

A question arising out of the last Conference of Clubs, relating to interference to amateurs from commercial services was discussed. The Department advised that the term "protected service" applied to services operating from a fixed and accurately known location and related to efforts made to ensure freedom from intermodulation and harmonic interference from other nearby services. Because of the frequency agility and portability of an amateur station this type, of protection is impractical, however if the interfering service does not meet specifications then action will be taken regardless of whether the station being interfered with is protected or not. Before lodging a complaint, amateurs should ensure that the interference is, in fact a transmitted spurious and not a receiver deficiency.

It was agreed that the next meeting would take place in October on a date to be determined. Members who wish matters to be raised at this meeting should place the item in writing and foward it to the Divisional office before the end of September.

REPEATERS

Mention has been made elsewhere in this issue about the changes to the VK2RCW Morse machine. It should be remembered, it is only for a trial period and comment is required from all amateurs so that its future operation can be determined. The interest for new Repeater systems continues and this generates a constant workload, together with matters pertaining to existing repeaters. Many repeaters operating in the top MHz are finding that the expansion of the paging network on frequencies between 148 and 150 Mhz is increasing the inter and cross modulation problems.

Packet Radio is continuing to grow and, with it the interest in repeating or range extending systems. During July applications were being processed for systems at Newcastle, Hornsby, Terry Hills and Dural. The frequency requirements for these systems in the two metre band have still to be addressed at a national level.

Interest is also being expressed to develop an ATV repeater for the Sydney region, together with the possible addition of a 70cm repeater for the Sydney city region. A Sydney club has expressed interest in a 6 metre repeater but this presents a problem as this State has already assigned its two allocations, one to cover Newcastle in the north and the other for the Sydney region. Southern coverage, if required, will be provided by one of the VK1 allocations, perhaps from Mt Ginini — It looks like the Ch 0 SBS service may be around a little longer. Ads in local newspapers, when the service extended its coverage to Newcastle and Wollongong in July, carried a statement in small print that it would be operational on 0 until the end of June 86. This is being checked since the previous close date had been set as 5 January 86.

A two metre repeater has been developed for Goulburn. It is on channel 7325 with the call VK2RGN. It has been established at a test site near the city and it is planned to later relocate it to the local RF hill above the city. This frequency may present a problem should a future 148 MHz pager be installed on the same hill, which already has one just below 150 MHz.

The ATV repeater planned for the Sydney region, is expected to have its input on ATV 1, (426/431) and its output at 50cm. It is likely to include the ATV liaison 2 metre voice repeater of ch 7300 and the simplex channel of 7400. Location is likely to be in the Blue Mountains. An application for a similar ATV repeater in Newcastle is currently in the processing stages.

Not everyone agrees with repeaters and, in the limited spectrum space at 70 and 50 cm, consideration has to be given for those who wish to carry out simplex operation. The Sydney region, with its terrain, will be difficult to cover from any single site.

THE 'BITS AND PIECES' OF PACKET RADIO

The average Packet Radio station consists of three major parts which must be interconnected. These are the two metre rig, the TNC (Packet Controller) and the computer. Many questions have been asked about these parts and their interconnections in conversations on Melbourne (and other) repeaters.

The two metre rig most often used is the IC22, though many other rigs are just as suitable. The main requirement of the rig is that it should have solid state transmit/receive switching to enable it to keep up with the fast turn around times involved in alternately sending and receiving packets. It is also an advantage if the rig can be permanently set to one channel so that if the power should go down it will power up on the same frequency again.

There are several connections between the rig and the TNC. Audio from the TNC to the rig is usually fed into the mic circuit. The audio from the rig to the TNC is normally tapped off at the discriminator to avoid the distortion of the audio amp. These two connections allow the TNC to send and receive information from the rig. Of course the TNC has to be able to 'drop the button' so a connection is made to the 'press to talk' line. The last connection made is to the squelch line in the rig so that the TNC can know when the channel is being used and not interfere with any other transmission.

Packet Radio is a simplex mode, even when using a Packet Repeater (Digipeater). As such, all activity is on one frequency and there are no repeater offsets, etc. Packet is not generally sent over voice repeaters as these have phase distortion and long turn around times which upsets packet rigs — quite apart from the upset it would cause other users of the voice repeater.

The TNC (or packet controller) has two basic parts. The one connected to the rig is a modem. This converts the 'ones and zeros' of digital communications into upper and lower tones which are more suited to transmission. It also contains the converse function of turning the received tones back into ones and zeros to feed into the other part of the TNC which is a dedicated microcomputer. The modem is integral to the TNC and is not suitable for use on the phone system as it does not have line matching and isolation circuits, is not full duplex and does not operate on audio frequencies which are commonly used on the phone network.

The dedicated micro in the TNC accepts commands from the computer, responds to them and assembles and disassembles packets. Packet is a 'high tech' mode and requires a certain degree of intelligence in the controller — hence the dedicated micro.

The commands used to command this controller are not overly complicated. To establish a connection with another station (which is like beginning a contact) the instruction 'ESC CO VK3XYZ' will do the trick. The escape character is to say that this is the beginning of the instruction, the 'CO' is a connect instruction and the call sign of the station to connect to. To finish a connection one simply types 'ESC DI'. It is not necessary to tell the TNC who to disconnect from as it already knows. There are many other commands of varying complexity but fortunately the more complex the command, the less likely they are to be needed. For those who wish to get into the 'nitty grittys' the complete command summaries, protocol specifications, circuits and programmes, which run the TNC, are all readily available.

There has been far too much hooey said and written about which TNC and system to go with. The American TNC will not handle any protocol other than AX.25. The present Canadian TNC and the new Australian designed TNC (which will be available in a few months) will handle the Canadian V2 protocol and the American AX.25 protocol. It will also cost about half. (Roughly $200 for a kit.)

There is no specific computer required to connect to a TNC. In fact a 'dumb terminal' is quite sufficient. The normal computer has a keyboard and screen. A small programme is needed to take the output from the keyboard and send it out the serial port to the TNC. This programme must also be able to take the output from the TNC which arrives at the serial port and feed it to the screen. No great intelligence is required of the computer as the TNC does most of the work. This is done by programmes built into the TNC. They are stored in EPROMS and may be upgraded easily.

One of the great advantages of Packet Radio is that advances in the technology won't require you to buy new gear, merely upgrade the programmes stored in the EPROMS.

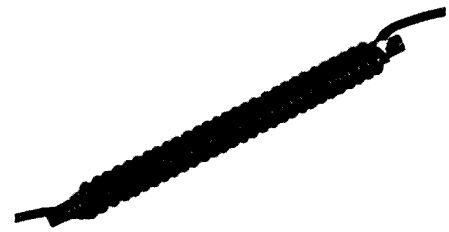
The TNC has auto sensing, which allows almost any baud rate to be used between the computer and the TNC although it is recommended that a baud rate of at least 1200 be used. By typing a series of commas and full stops the TNC will decide for itself what baud rate, parity, number of stop bits and number of data bits are being used and it will automatically adjust itself to suit. The normal connection between the TNC and the computer is simply joining wires 2, 3 and 7 of the DB25 connectors together.

Should you have any enquiries please feel free to contact the Sydney Amateur Digital Communications Group at P.O. Box 231, French's Forest N.S.W. 2086 or the Melbourne Packet Radio Group at 57 Laity Street, Richmond, Vic. 3121.

TRY THIS

Geoff Griffiths VK6YR
9 Hicks Street, Leeming, WA. 6155

T.V.I.?



If TVI or RFI is still a problem at your station perhaps the use of ferrite RF chokes will provide a suitable solution.

This method serves to isolate the offending unit from RF energy entering via the mains power cable and TV antenna coax outer braid.

Construction is straightforward, as may be observed in the photograph and consists of winding as many turns as possible of both the mains power cable and TV 75 ohm cable around separate 194 mm ferrite rods. The windings are secured using nylon wire ties and a layer of insulation tape.

Both chokes should be installed as close as possible to the TV set.

An additional high pass filter may also be required as in my case to eliminate the last trace of interference.

Audio systems with a breakthrough problem could also benefit from a power line choke and separate speaker line chokes made in a similar way.

QSP

COMPUTERISED COMMUNICATION

A new type of computerised communication, termed Teladex, that provides a less expensive way of sending telex messages to any part of the world,will be introduced to Australia by a mission led by Mr Norman Frampton, Chairman of Framptons UK, this month.

The system is claimed to be more modern and cheaper than telex, even though it involves higher technology equipment and a reasonable degree of computer skills. Teladex transmits commercial messages by computer using national packet switched networks, which are themselves connected through a teladex host computer located at the company's headquarters in England, which acts as a sorting "office".

It is stated, that Australian users could save up to half their cost of telexes to Europe, if their usage is at least eight minutes per day.

DAIWA'S NEW MULTI TORQUE ROTATOR Model MR-750E

$360 incl. motor

Check These Features:

1. The rotator frame can house up to 4 motors to increase the torque and load capacity of your antenna system.
2. Each motor is equipped with a Super Wedge and Clutch brake system which works independently from the main frame gear train.
3. Maximum brake power is 18,300 lbs/in when 4 motors are installed. The main frame and reduction gear train have been designed to withstand maximum wind loading.
4. The motor unit can be dismantled easily for maintenance if required.
5. A 1½" to 2½" diameter can be installed and aligned easily with the rotator center.
6. Low voltage (24VAC) motors are used to ensure safety during installation work on the antenna tower.
7. Low cost 6-wire control cable can be used for the low voltage motors.
8. The control panel can be removed easily for calibrating the direction indicator.
9. Balanced type control knobs have quick lock mechanisms on both sides.
10. The advanced Super Wedge and Clutch brake system (Slip clutch type) provides exceptional holding power and protects the rotator mechanism from excessive torque.
11. Lower mast bracket MS-1 is available (optional).

		MR-750E PE
Rotation time	50 Hz	70 seconds (50 Hz input)
Output torque		700 kg·cm (608 lbs·inch)
Brake power	1 motor	6,000 kg·cm (5,215 lbs·inch)
	2 motors	11,400 kg·cm (11,217 lbs·inch)
	3 motors	13,000 kg·cm (13,906 lbs·inch)
	4 motors	21,000 kg·cm (18,251 lbs·inch)
Rotation angle		375 degrees
Permissible mast size		38 mm – 63 mm (3-diameter)
Control cable		6 wire cable 0.5sq 1.25sq (AWG16,18,20 etc.)
Continuous rotating		5 minutes Max. permissible
Unit weight		7.5 kg (with 1 motor unit fitted)

HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

While the bands are a "little" on the dead side, of what we are used to, and whilst tuning around for the elusive DX, which is *around if you are in* the right place at the right time, have a listen for some of the intruders that are taking advantage of our non-activity, to "move in". Remember that these intruders, once in, will want to stay and when the bands improve as propagation increases one will find that they will have to contend with QRM emanating from outside the amateur service, whilst trying to renew old acquaintances as well as make new friendships. Your Divisional Intruder Watch Co-ordinator or the Federal Co-ordinator, Bill VK2COP, will welcome your contributions and you will be assisting the hobby, not only on a national basis but for amateurs worldwide.

Another very worthwhile activity, whilst the sunspot minama is present, is to join a WICEN group. I would be prepared to say that all WICEN groups need volunteers and again this is one way of keeping your operating skills honed to the sharpness you will need when that DX does return. Of course, you will be assisting in exposing the hobby to the public, whilst preparing for disasters if they should unfortunately occur.

WICEN operations have provided very necessary communications, particularly in the last decade and no one knows when your skills, gained through a hobby interest, may be needed in an emergency, no matter where you reside. Contact your WICEN co-ordinator now and register your interest, it is a facet of our hobby that will assist the community at large as well as you becoming the member of a very efficient organisation under the banner of the Wireless Institute of Australia.

ZM PREFIX

All ZL operators have the optional choice of using the ZM prefix from the 1st of October to the 31st December. This prefix has been allowed by the authorities to celebrate the Sixth Conference of the IARU Region 3 Association, to be held at the Rose Park Hotel in Auckland between the 13th and 17th of November, 1985.

PITCAIRN ISLAND

DXing from this exotic island may be easier in the near future. It is believed that there are plans afoot to build a five unit motel and there is now a yacht running out of Tahiti that services the island at intervals. So DXers, there is something of a difference, if not to do, then dream about!

WANTED COUNTRIES SURVEY

Gerben PA0GAM, DX Editor of Electron, is compiling a list of the 100 most wanted DXCC countries in the world. He feels that this will be a guide to DXpeditioners of the future. Readers are requested to nominate the 100 most wanted countries that they require, preferably in the following form, as it is easier to transfer into the computer.

No	PREFIX	SSB	CW	BAND IN METRES					
				160	80	40	20	15	10
001	ZA	✓			✓	✓	✓	✓	✓
002	VK9L		✓				✓	✓	

The two examples are given as a guide. It is important to designate the prefix that indicates a country. Most do, except Chile is one exception that comes to mind. Gerben would like to print this survey and receipt of your wanted list marked "Survey" and posted to PO Box 39, Mooroolbark, Victoria, 3138 by the 27th September, would be appreciated. It will then be computerised and printed in this column. A copy will be forwarded to Gerben, who will correlate this survey with other magazines' reports. This, it is hoped, will give a world wide picture and these too will be reprinted in this column.

All amateurs and SWLs are urged to assist in this project, as Dxpeditions are becoming more costly and it will give the adventurous an indication where to proceed to for maximum satisfaction of the dedicated DXer.

To carry the project a little further, an indication of the WIA member's interest in the WARC bands, Maidenhead System, IOTA and Oblast hunting by a simple yes or no would be appreciated. It is not mandatory to indicate a call sign or identification on any submission. Your assistance will be greatly appreciated.

BURMA SOON????

Mike JH1KRC, Editor of The DX Family Newsletter, is of the opinion that a legitimate Burmese station under Governmental control may appear in the not so distant future. Let us hope that he is correct, as apart from being a much wanted country there are many of the OTs, who I am sure would like to get back on the airwaves and rekindle friendships of many years ago.

8J9IYY

This station will be active this month to commemorate "International Youth Year 1985". QSL to the JARL Bureau. Other stations that have been active throughout the year for the same commemoration, such as 8J6IYY and 8J8IYY are also to be QSLed via JARL.

COMPLAINTS

VKs are not the only ones to be awaiting cards from Roly ZL8BQD/ZL0AJW. Two "G" stations have at last received their cards from ZL1BQD. The "mail gone astray" ploy was again used but numerous letters, including one to NZART brought results. The question now is what about the FK0RR cards? Incidentally the FO0XX cards should have been mailed by now.

The whole scenario is reminiscent of the plight of Chris ZL4OY/A, before Bill VK3DWJ, stepped in and promptly put things straight.

SAILING AROUND THE WORLD

Max PA3DBB, and his XYL Yvonne, have commenced a trip that will take three years in a 13.5 metre yacht named the "En Passant". Max will be QRV on all amateur bands using an IC720A. The rough itinerary is for visits to Portugal, Gibraltar, Caribbean Islands, Panama Canal Zone, Galapagos, French Polynesia, Tonga, New Zealand, Bali, Mauritius, South Africa, Brazil, Venezuela, Bermuda and the Azores before returning to Europe. A nice trip Max and Yvonne but why is VK not included? You would be made very welcome, I can assure you!

CARDS AVAILABLE

Ron ZL1AMO, well known for his expeditions, still has logs for the following which you may need.

5W1CW — August/September 1980. A35EA — August/September 1980 and March/April 1985. FW0BX — October 1984, H44RW — April/May 1981. VK4ANS/LH — July 1981. VR6HI — March/April 1979. YJ8RW — November/December 1981. ZK1CO — August 1979/April 1982. ZK1MB — August 1979. ZK2EA — August/September 1980. ZK9RW — October 1983. ZL1AMO/C — November 1980 and March/April 1983. ZL7AMO — May/June 1984 and ZL8AMO for October 1983.

Another source for cards you may have missed is Dieter OE2DYL. Dieter has logs for the following operations.

5W1DE/DO February 1981, A22EL — September/October 1982, A35EL/A35XX — February 1981, C21NI — September 1981, CR9EL — February/March 1981, OE1ETA/KH6/KH8 — September 1981, OE2VEL/KH6/KH8 — September 1981, OE2VEL/ZS3/3D6 — September/October 1982, OE2VEL/ZS6 — September 1982, T2VEL/T2ETA — October 1981, T30BG/T30BF — September 1981 and ZK2EL/ZK2TA — September 1981.

Well known DXer Saty NH6J/NH8, with the "rig" on his last expedition.

A self addressed envelope and 2 IRCs, plus your cards sent to Ron or Dieter's QTH should result in a prompt return of QSLs via Air Mail.

HELP WANTED

For the past fourteen years, George Hicken W4GH and Tom Carten K1PZU have been recording each monthly edition of Worldradio, a publication that is brimming with interest with all facets of the hobby.

They have been sending out about 300 tapes monthly, to the less fortunate amateurs and SWLs who are blind. This excellent service is open to all and they are asking for donations so that they may be able to purchase a high speed copier. It is known, but not publicised, that the costs so far have been borne out of their own pockets. If you know of someone who would like to receive this excellent magazine on tape or you feel that you may be able to financially assist, please contact them, by writing to George Hicken W4GH, PO Box 7497, Macon, GA 31209 USA.

ISOLATED

Dan 5H3FG and Doreen 5H3DG (who also hold the calls VE7AHV/EP2QM and VE7CYY respectively) are operating from the vicinity of a small paper mill about 640km from Dar es Salaam. QSL to Mr and Mrs D Giles, C/- Stohert Group, PO Box 6306, Dar es Salaam, Tanzania.

SOUTH PACIFIC MAP

The State of Hawaii has published a map of the South Pacific. It is believed to be free by a request to the Hawaii Information Office, PO Box 2359, Honolulu. It is felt a couple of IRCs or one "green stamp" would defray postage charges.

MAPS AGAIN

It appears that Geoff Watts, well known in DX circles, has come across a National Geographic Map of the USSR showing all the Oblasts (Map No 02396) and may be obtained from National Geographic Services, PO Box 19, Gullford, England for approximately six pounds which includes packing and postage. A bit pricey, but good value for Oblast hunters.

SUNSPOTS

Lee KH6BZF, reports in a recent issue of his Newsletter that the Sunspot Index Data Centre in Brussels has given the following Definitive Sunspot Numbers for the first quarter of the year. If you feel like being despondent, then read on.

The Mean Numbers for January, February and March were 16.5, 15.9 and 17.2 respectively. The day by day figures show many zeros but 59 was recorded on the 21st of January. What will the next report indicate? It really is a lottery at the moment.

Lee, quite a humourist, ends each Newsletter with a quote. The latest printable quote says "Science is truth . . . don't be misled by the facts"!

UGANDA AND SAO TOME

It appears that the ARRL DXCC Desk will accept cards for OSOs held after the 28th August 1984, for stations signing 5X5XB and 5X5WR. Don Search, the administrator of the ARRL DXCC, says that he must see documentation to validate Luis S92LB's operation, before any credits can be given. By the time the VKs and Pacific area get a chance, let's hope the documentation has been received. It could be a long time before many VKs make a contact, compounded by propagation, low power and the great demand for Luis in Europe. The frequency band to watch is 14.180 to 14.190 MHz for SSB and 14.005 MHz for CW if it is genuinely Luis???

MT ATHOS AGAIN

Apparently DL7FT was heard signing DL7FT/SV/A recently and expounding the fact that he had no written permission but to deluge the DX-CC Desk with the cards. It is hoped this is myth rather than truth, as I am astounded that a well known DXer would try this approach to get "accreditation" from the ARRL, through intimidation, with its impeccable record and secondly further jeopardise any glimmer of hope of getting the authorities at Mt Athos to reverse their stand, as regards the hobby.

BITS AND PIECES

Masao JY9MG is quite active from Jordan. Another active station is JY9RL. QSL to WA6POZ ** ZV2ADV was a Brazilian station using the call for the annual Fire Prevention Week. ** The Pribilof Islands may yet become a new country, hold onto those cards. ** Tom K0VZR, was not successful in receiving the logs of the late TL8TX and is returning the cards. ** All XF4MDX cards have been mailed, have you received yours? ** 5A1AB has been heard and quotes G4UZO as the QSL route. If you have the chance work him and wait for further advice. It may save some IRCs and postage! ** George VE3FXT is operational in Europe with an itinerary of operating as G3WNE, GD3WNE, GW3WNE, EI9TVF, 9H1CR, ZB2HF, 4U1ITU, GU and GJ. ** The Egyptian authorities may be reticent to license visitors working or having extended holidays in that country, ** Y40TOR was QRV from Torgau, situated on the River Elbe, where the US and Soviet Armies met. Y40BUC was QRV from the site of the former Concentration Camp at Buchenwald. Both stations were active during VE Day Week. ** IS0CPU/IM0 was operational from Serpentara Island by IS0AEQ, IS0CPU and IS0XDB. ** A browse through overseas Newssheets shows that quite a number of well known overseas DXers, from many call areas, are being heard on the WARC bands. ** ZC4 operations in the future can only be from personnel located there for a period in excess of six months. Apparently it is because a European operator offended someone and had his licence rescinded! ** The T4 prefix appears to be coming out of Cubal ** The prefix VX6 was to celebrate the 100th anniversary of the City of Lethbridge, Canada ** Vlad J5WAD, has returned his transceiver to UA4RO, for repairs to the final "chips" and is restricted to the original transmitter on 14.158 MHz. Another additional hassle is a limited fuel supply for the generator. ** UA1OT is operating out of Franz Josef Land. BY0AA and BT0MMN are reported to be in CQ Zone 23.

THE SECRET OF L30042

A couple of issue ago, I intimated that Eric L30042 had an impending change of lifestyle. Well the accompanying picture tells all. Eric received another "ticket" in the form of a marriage certificate at St Matthew's Church, Marryatville, SA on the 25th May. Congratulations and much happiness to you both for a long and happy future.

Aline and Eric signing the register.

KERMADEC

As predicted in this column, many issues ago, the much wanted DXCC Country Kermadec, will be activated for a one year period. Chris ex-ZL7OY has been selected to join the meteorological party on Raoul Island commencing next month.

From October until the 31st December he will sign ZM8OY, to commemorate the Sixth IARU Region 3 Conference being held in New Zealand. From the 1st January until he leaves the island he will revert to the call of ZL8OY. Chris intends to operate all bands on CW and SSB as off-time duties from his work permit.

QSL arrangements are with his XYL, Mrs C Hannigan, The Terrace, Warrington, Otago, New Zealand who will receive the logs from amateurs in contact with Chris. Good luck with the pile-ups Chris.

SPECIAL CALL SIGN

ZL is in the news again, this time with a special event call sign ZM6ARU, that will be operational on the HF bands, around the clock from the 9th to the 18th of November.

This call sign will be used on a roster system by the ZLs to commemorate the Region 3 Conference. In addition an Oscar 10 station is to operate from the site of the Conference, the Auckland Rose Park Hotel, from the 13th to the 17th of November.

To further commemorate the event, the NZART have made available to amateurs and SWLs, a special award called the IARU Region 3 Conference Award which may be obtained by contacting ZM6ARU and two other ZM stations or alternatively five other ZM stations in lieu of missing ZM6ARU. (Seven ZM stations in all.)

Send log details (no QSLs) with 3 IRCs or A$1.00 for surface mail, 6 IRCs or A$2.00 for air mail return to the NZART Awards Manager ZL2GX, 152 Lytton Road, Gisborne, New Zealand.

RADIO CLUB de CHILE

This society transmits an international Bulletin in English and Spanish on 7.085 MHz each Saturday at 1000 UTC, directed towards the Pacific area. News of forthcoming events are welcomed and may be sent to RCCH International Bulletin, PO Box 13630, Santiago, Chile.

160 METRE ENTHUSIASTS

According to a translation by Dex W4KM, from Radio No 1 of 1985, a USSR publication and kindly forwarded by David 9V1RH/VK3QV, the 160 metre band in the USSR, as from the 1st January 1985, is as follows.

As previously, the following frequencies are allocated to the Amateur Service on a secondary basis.

1.830 to 1.860 MHz CW.
1.860+ to 1.900 MHz CW and LSB-SSB
1.900+ to 1.930 MHz CW, LSB-SSB and AM.

HEARD ON THE EAST COAST

14 MHz: 3D6BD, 3B8CA, 3B8LA, 4X4YM, 5X5GK, 5Z4EG, 7Q7LW, 7P8AF, 7S7SSA, 8Q7AB, 9J2BO, 9M2EE, A22DP, AH9AC, AL7FG, BT4RUU, BV2B, CT3BM, CT2FN, EA6BH, EA8AKH, EA8AUS, FH4AA, FH8CB, FO8IW, FR4DN, FT8XA, FT8XB, GJ2LU, GW4BLE, HL9AA, JW1FM, JW5NM, KC6HA, KL7KU, LA7HJ*, OH8DX, ON5IG*, OZ1JLX*, OZ5DL/OY, T30AT, T31AT, T32AF, TI2ANL (YL), TF5TP, UA1OT, UZ0SWW/JT, VE5ADA, VE6PW, VE7CYW, VK0GC, VK9ZB, VR6JR, XE1ALT, XX9UT, Y32OC, YZ1FW and ZS1OU.

According to the "West Australian VHF Group Bulletin" for July, the Kalgoorlie Beacon is still off the air, so this has been removed from the listing for the time being. Also from the same bulletin came a report that the Perth beacons were off the air during June due to spurious emissions 900kHz either side of the carrier, being traced to a leaking electrolytic capacitor in the power supply, causing instability. The permanent location of the beacons on the Channel 7 TV tower is not expected to be available for a couple of months, so the beacons are to be re-installed at Nedlands.

ON SIX METRES

Although somewhat quiet from the VK5 viewpoint, nevertheless, there have been a number of six metre openings to the eastern states possibly the best being on 9/6 with contacts to VK2, 3 and 4 over the period 0400 to 0700. Roger VK2XJ seems to have been particularly active. He was also noted again on 22/6 and 23/6 along with others. Locals involved included VK5s ZDR, ZBU, ZTJ and RO. VK4RO was heard on 13/6 working into VK3 but faded out before I could catch him.

A letter from Jim VK2IS, at Coffs Harbour says he and Bruce VK2DDU had a QSO with Tony ZL1BHX on 52.050 at 0142 on 23/6. Signals were 3x5 to Jim and 5x5 to Bruce. ZL1BHX continued to call CQ until 0200 without success. Thanks Jim.

According to Graham VK6RO, the 6 metre operators in Japan have been finding conditions rather quiet. At the time of writing in June, according to "CQ ham radio" from Japan, the last notable contacts were in March with contacts to VK4s FXX, JH, JXZ, ALM, AJL, DV and DU1GF. Even beacon reports are missing.

I received a report that Kim VK9ZB, is now on six metres from Willis Island and would like contacts with VK stations.

TWO METRES REPORT

Received a nice letter from Bruce VK4KIT, from Mount Isa, a place we occasionally hear on six metres but not on two metres. Bruce says two metre repeater operation on VK4RMI channel 6700 predominates due to their somewhat isolated location. The repeater is 200 metres above the surrounding country side and gives reliable coverage up to 60km in all directions with contact points up to 120km being available to well equipped mobiles. About nine stations are operational on the repeater including VK4ZDQ, recently operational from Cloncurry. Little monitoring is available to passing mobiles during working hours, as nearly all operators are wage earners, giving the appearance of a deserted band.

Two metre simplex activity except for cross town contacts is generally intermittent, due to lack of stations at the distances required to enable contacts to be made. However, the following are some interesting contacts: VK4BMW Hughenden to VK4YLG/FNQ at Mattaburra, a distance of 204km, a total of 269 contacts between 21/9/83 and 6/4/85 with signals Q2 to 5x9+, of these 220 contacts have been on FM and 49 on SSB or CW.

VK4BMW to VK4KIT/P at Cloncurry 340km 5x1 on SSB but with FM poor. Time 2015. Contact made on first and only attempt! VK4BMW to VK4KIT/P at Boulia 460km 5x1 SSB at 2005, again contact made on first and only attempt.

Two metre SSB signals from VK4ZDQ have been heard in Mt Isa over the extremely obstructed path from Cloncurry 100km distant.

TWO METRES UNDERGROUND MOBILE

The heading is correct. Steve VK4KHQ has written to say that recent experiments between VK4s KHQ, KIT and ARZ have led to what could be a record for amateur two metre communications.

On 4/6/85 contact was made from 1050 metres underground to Bruce VK4KIT and Roger VK4ARZ who were both more than five kilometres from the main shaft at the Mount Isa mine. The local repeater, over 10km away, was just accessible from 20 level, which is 1022 metres down. Future attempts will be made to extend this distance to the bottom of the mine at 1197 metres! Equipment used was an IC2A handheld feeding a quarter wave vertical whip.

Congratulations to all concerned. The mind boggles at the possibilities of these experiments if more power could be used to a small beam antenna. I would have thought the attenuation through so much earth would have made such contacts impossible, but it seems you never know until you try. Thanks for writing Steve and please keep me informed of your future experiments.

THE SYDNEY PATH

Doug VK3UM, reports briefly on the continuing experiments via aircraft enhancement on the path between Melbourne and Sydney. On the way of course is Canberra and the operators there have been getting in on the act.

On 1/6: VK1s VP, BG and BUC. 8/6 VK1s BG, GL, AU, VP, BUC and VK2DZV heard. 9/6: VK1s BG, AU, BUC, VP, GL and VK2s BE and BDN heard. 15/6: VK1s BG, VP, AU, GL, with VK2s BDN and DVZ heard. 16/6: VK1s BG, AU, GL, BUC. On 22/6 and 23/6 the same stations were worked. During this time Gordon VK2ZAB was absent on leave.

EME ACTIVITY

Doug VK3UM, found conditions on 22/6 and 23/6 reasonable and some quite good contacts emanated. 22/6: 0148 K1FO 439/M; 0756 DF3RU 449/449; 0900 SM0PYP 0/0 to 439. On 23/6: 0225 KU4F 449/339; 0830 JA4BLC 449/449; 0923 SM3AKW 449/449; 0940 G3SEK 439/439 (he was using a six bay antenna system); 1024 DF3RU 449/549 peaking to S6. Doug tried SSB but the DF3 was called by other stations. 1050 G3LTF 4x3 and 4x2 SSB. Thanks Doug for your continued support of the column and congratulations on your efforts largely from random calls.

There has been nothing to report from Lyle VK2ALU, lately as he has been on a seven weeks holiday overseas, meeting up with EME operators there, but eventually there should be something to report on his findings.

AIRCRAFT ENHANCEMENT OF SIGNALS

The article in July 1985 – Amateur Radio – entitled "Aircraft Enhancement of VHF/UHF Signals" by Doug McArthur VK3UM is already causing a few ripples amongst the knowledgable VHF fraternity, and as I have been mentioning this phenomena from time to time in my notes when relating to contacts between VK3UM and Gordon VK2ZAB in Sydney, the article is very timely.

Some comment is already to hand and there may be more before long. I have decided to leave the comments until next month because I will be away on holiday in August when the usual time for preparation of the October notes occurs; as there will be only a fortnight between the preparation of these notes and those for October, I will probably be scratching for something to fill the columns, so the enhancement comments will be held over together with another report I have on interference problems occuring on 432MHz in Western Australia.

FORECASTING SPORADIC E

I received an interesting letter from Roger Harrison VK2ZTB, plus a copy of a short article written by him and published in the August 1985 edition of "Australian Electronics Monthly" entitled "Forecasting for Sporadic-E propagation" and is the result of him having talked with Mr Roy Piggott, an ionospheric physics pioneer from the UK, recently. A somewhat longer report is to appear in the next issue of "6 UP".

"Spectacular propagation over distances of 1000-2500km at VHF frequencies, arising from clouds of intense ionisation that form from time to time in the E layer of the ionosphere — for TV broadcasters, a nuisance, for radio amateurs, a boon, this has long eluded efforts aimed at prediction or forecasting.

"Recent work by UK ionospherics physics pioneer, W R Piggott, shows promise that forecasting 'Sporadic-E, as it is called, may well be within reach.

"I was privileged to attend several talks Piggott gave at the Ionospheric Prediction Service while in Sydney during last April, and to talk with him afterwards.

"Previous work on 'Sporadic E (Es), amongst other characteristics, examined the Es maximum frequency. Piggott however, employed a means of measuring the excess ionisation, which provided a more useful parameter. (Actually, two parameters were used).

"Using this measure, Piggott was able to classify Es into three types: weak, strong and intense. From a communications, or propagation, viewpoint, the strong and intense types are the ones of interest.

"Piggott's study found that there are a number of observation techniques for Es activity which show promise for predicting or forecasting the behaviour of strong Es. It seems that, beyond a predetermined threshold of the excess ionisation, the chance of finding exceptionally intense Es increases significantly.

"Also, days of strong Es activity tend to be preceded by no Es activity, strong Es occurring over a 'cluster' of two or three days. Likewise, with no Es, Piggott

found that the peaks of strong Es activity get later in the day the more intense the Es gets.

"Strong and intense Es is predominantly an evening phenomenon showing up after 1800 local mean time (LMT), while weak Es is a daytime phenomena occurring between 0600 and 1400 (LMT), while weak Es is a daytime phenomena occurring between 0600 and 1400 LMT. Weak Es has a negative correlaton with strong Es.

Sporadic-E is largely a summertime phenomena, with lower activity during the winter. Summer Es is predominantly a night time phenomena, while winter Es is a daytime phenomena, Piggott found.

"He also found that there is considerable geomagnetic control over the occurrence of Es, which decreases as much as five to ten times the closer you approach the auroral zone.

"There is some 'tidal' control of Es height, which has distinct peaks and troughs at roughly 12 hourly intervals. Piggott also examined solar cycle control of Es. He found little solar cycle variation of Es heights, but from plotting 144MHz amateur band activity, Piggott found a distinct positive correlation with the solar cycle, the incidence of 144MHz propagation in Western Europe increasing markedly during solar maximum years.

"The study was done over 1983-84 for the UK Departmental Users Radio Propagation Programme. A report has been published, titled 'Problems Associated with the Forecasting of Sporadic E over Western Europe' by W R Piggott OBE, D.Sc, F.Inst.P., RAL project No N2A 3R 1477.

"Piggott concludes that Sporadic-E is much more regular in its behaviour than expected from the literature and is probably worth at least, limited study".

For those of us who have shown an interest in Es propagation over many years, we will certainly be looking forward to any other results which may come from further studies . . . . .VK5LP.

THE PROBLEMS WITH REPEATERS

From "The Propagator", the monthly newsletter of the Illawarra Amateur Radio Society, comes a report of damage incurred to the repeater installations at Sublime Point and Hill 60, when a storm hit Wollongong on the night of 6/6/85.

At Hill 60, a piece of roofing iron came adrift from the coastguard building and cut through the transmit antenna of UHF channel 8225. The innards of the coaxial collinear remained intact and the outer fibreglass sheath broke, causing the antenna to lay horizontally with its edge wedged firmly in the gutter of the building. The broken antenna has been removed for repairs and temporarily replaced with a two stack five-eighths wave vertical, on loan from Ian VK2EXN.

At Sublime Point, the mast was bent over by the wind, and is at present leaning at 45 degrees to the north west. Both 2 metre and 70 cm repeaters are functioning, but their range is reduced because of the attitude of the antennas. One of the commercial base stations at the same site was damaged by lightning also, so the Illawarra Group came out of it fairly well. However, it may be sometime before the mast is repaired as a crane will have to be used to lower the tilt-over section and the ground will have to dry out properly to enable safe access for a crane.

Those of you who have not suffered this type of damage from the wind should count yourselves very lucky. Repeaters and beacons are usually on the tops of hills, so are more likely to be affected, and the damage can be considerable.

Some years ago, I had the mast holding my eight over eight, 6 metre assembly bent to an angle of 30 degrees, as the result of one gust of wind, estimated at more than 120kmh. The bending occurred despite the mast being 50mm in diameter, with another close fitting tube inside. When the mast was brought down for straightening, it took an enormous amount of effort to straighten it, despite the fact that more than 5 metres of purchase was available and you can put a lot of pressure on a length like that!

CLOSURE

Before closing I would like to mention a paragraph from the Geelong Amateur Radio Club newsletter for June 1985, which mentioned the Club visited the Moorabool Terminal Power Station of the SEC on 23/6. The station is only two years old and has state of the art electronic control and protection equipment. That station receives power at 500kV and transforms to 220kV, to supply western Victoria. The station is also controlling the largest capacitor in Victoria, which also operates at 500kV and is 75 metres high, costing one million dollars to construct! . . . some capacitor.

Don't forget September and October are periods for possible long distance DX particularly on 6 metres, to places out in the Pacific area, in particular. I have already mentioned VK9ZB on Willis Island and there are plenty of others. These could include FK8, YJ8 etc.

Closing with the thought for the month: "The trouble with doing nothing is that it's too difficult to tell when you're finished".

73 The Voice in the Hills.

BIRTHDAY HONOUR

It is pleasing to announce that your VHF UHF editor was awarded the Order of Australia in the Queen's Birthday Honours list, last June.

Eric VK5LP has been writing the Amateur Radio column for over 14 years, a very time consuming job when one presents their notes in such a professional manner, as Eric does every month, without fail.

Eric's award was for community service spread over more than 46 years. A fitting tribute for a hard working, civic minded gentleman.

A short resume of the life and times of one Eric Jamieson follows. This information was used by the Forreston Community Centre Incorporated, who sought the award for Eric.

A member for 39 years of the RSL, including 23 years as President of the Gumeracha Sub-Branch. Providing an amplifier service for a multitude of functions in the district, for 39 years. This includes street music at Christmas.

Assistant Returning Officer for State and Federal Electoral Departments over a 34 year period.
34 years a member of the Gumeracha Agricultural Bureau and now a Life Member.
Secretary of the Forreston Community Centre Inc for 31 years.
Member of the Gumeracha Bushfires advisory Committee for 27 years.
22 years as a member of the Gumeracha Hospital Board including six years as Deputy Chairman.
A member of the Gumeracha Camera Club for 29 years, including 17 years as Secretary.
Member of the South Australian Division of the WIA for 23 years.
A licenced amateur radio operator for 23 years.
Secretary of the former Gumeracha A H & F Society for 19 years.
Justice of the Peace for 20 years.
17 years as Secretary of the former Forreston Tennis Club.
Editor of the VHF UHF column in Amateur Radio for 14 years.
Editor of 'Community Capers', a local monthly news bulletin, for 12 years.
12 years member of the Parish Council of the Uniting Church, with six years as Treasurer of the Gumeracha Parish.
Vice-President and electrician for ten years to the former Gumeracha Social Club.
Five years as Chairman of the Torrens Valley Historical Society.
Gumeracha Country Fair Inc Secretary for four years.
Wireless Maintenance Mechanic in the RAAF from 1942-1946.
Secretary of the local SA150 Jubilee Committee for eighteen months.
Member of the Gumeracha District Local History Centre for three years.
Editor of the Forreston History Book in 1951.
Editor of 'Forreston - Its Pioneers and People' 1960.
Assistant Editor of 'History of Gumeracha Hospital' in 1982.
Winner of two Australia-wide awards for electrical articles in 'Australasian Radio World' in 1941 and 1942.
In 1938, at the age of 14, Eric was running dances for the Red Cross using records and his own home-built amplifier. At the same time he wrote a weekly column in Adelaide's newspaper, 'The Advertiser' for short wave listeners and also for the 'Listener In' in Melbourne.
In 1984, Eric received the 'Citizen of the Year' award from the Australia Day Council.

Congratulations Eric, from all your friends within the amateur radio fraternity.

CONTESTS

Ian Hunt VK5QX
FEDERAL CONTEST MANAGER

P.O. Box 1234, GPO, Adelaide, SA 5001.

CONTEST CALENDAR

SEPTEMBER
14-15 VK Novice Contest (Rules August AR)
14-15 European Phone Contest (Rules July AR)
28-29 YLRC Italiano 'Elettra Marconi' Contest (Rules August AR)

OCTOBER
05-06 VK/ZL Oceania Phone Contest (Rules this issue)
12-13 VK/ZL Oceania CW Contest (Rules this issue)
13 RSGB 21/28MHz SSB Contest (Rules this issue)
20 RSGB 21MHz CW Contest (Rules this issue)
26-27 CQ WW DX Phone Contest

NOVEMBER
9-10 European DX Contest - RTTY Section (Rules July AR)
23-24 CQ WW DX CW Contest

It is a little too early to list in the calendar the series of World Championship SSB contests run by CQ magazine, to be held in January 1986. The following extract from the rules may however be of use to intending participants.

CONTEST RULES AND FORMS: Contestants are encouraged to use official contest forms. To obtain your own copy of the rules and each contest form, send a SASE to: Contest Rules and Forms, Billy Maddox KA6JJK/3, 1162 Bayview Vista Drive, Annapolis, MD 21401, USA'.

You might note that there are five separate contests to take place on the 40, 75, 160, 15 and 20 metre bands. Full details of the rules will appear in the December issue of Amateur Radio.

CONTEST CHAMPION TROPHY

The July issue of Amateur Radio carried the details of the Contest Championship Trophy points for 1984. I would like to apologise for the omission of figures for VK3DNC, who finished with a total tally of 26 points in this competition and was thus placed fifth in the listing.

Whilst on the subject of this competition, some comment is certainly in order. I have had a certain amount of discussion in connection with the rules for the Championship and also some quite interesting correspondence, including a very comprehensive letter from Jim VK2BQS. Up until now the rules seem to have been very simple and have left a great deal to be desired, as well as open to all kinds of interpretation. The rules have been:

The entrants must operate in at least three out of the four selected contests. The contests for the competition will be John Moyle Memorial Field Day, Novice, Remembrance Day and the VK/ZL. Points will be allocated on the basis of 10 points for first, nine points for second, etc, down to one point for tenth place in each contest. The trophy winner must be a member of the WIA.

It has become obvious to me that the rules for this event need to be spelled out to a far greater degree. I would be very interested in your comments and to this end I will make a few preliminary comments myself. Firstly, the VK/ZL comprises, in fact, two separate contests, namely phone and CW with each held on different weekends. There is no way in the world that one could score the results of the VK/ZL contest on a band by band basis for quite a number of reasons. Should this approach be taken it could be feasible for an operator to win the trophy merely by entering this contest, making a handful of contacts, say 10, on each of six bands and with this meagre effort, win the trophy by simply submitting a minimum log for two of the other contests and perhaps even picking additional points for these last two, as well. If you don't believe me, just think about it just a little more, I am sure that you can work this out for yourself. Should such an operation confer 'Contest Champion' recognition?

This year, for the Remembrance Day Contest, I scored on the basis of the highest points in each call area, regardless of modes used. Should this really be the approach used? Would it be fair to allocate points along the following lines scoring for each section on a separate basis, eg VK1QQQ scored 800 points. (800 phone QSOs). VK1PPP scored 250 oints. (250 CW QSOs). VK1LLL scored 160 points (170 phone QSOs and 10 CW QSOs). With each of these operators being the top scorer in their individual sections should they deserve ten Championship Trophy points for their efforts? If VK9GGG enters the only log for his call area with a total of ten contacts in the same contest, should he also receive ten Championship points? Should there be two separate Championship competitions for phone and CW? Where an operator can enter either the phone and CW sections or both in a contest, such as the VK Novice Contest, should he be allocated points for each mode even if he may gain perhaps nine points for being second in his call area with five CW contacts? Should points be allocated on a call district basis or should they be worked out on a national basis only? Would the latter approach always favour particular call areas, thus making it pretty well impossible for operators in some areas to have a proper chance of winning? *(I believe that it would...FCM).*

So, perhaps you can see that the present rules are definitely very much lacking and also that it is not necessarily a simple matter to come up with a satisfactory set of rules. I hope that having addressed this problem, which has been apparent for some time, I might be able, with your help, to come up with a worthwhile method of determining who should receive the trophy.

CONTEST CALENDAR

The sharp sighted and contest aware persons may have noticed the misprint in the July Contest Calendar where it appeared that the SARTG RTTY Contest was on two different weekends. I hope that the error will have been corrected in the August issue, where you should see that the GARTG RTTY Contest is on the 24-25th August.

CERTIFICATES

The backlog of certificates is slowly still being overcome, with the help of a lovely lady named Florence, who is most adept with the pen. Florence is very neatly hand lettering all the certificates, rather than have me use the more mechanical method I had intended to employ. The hand lettered approach does however, take a great deal more time when the task is fitted in between other work, which has priority. I have received letters from VK2PMX and P29ZL on the subject of certificates, so this comment should suffice to show that you are not being ignored. The letter from P29 certainly went the rounds due, for some reason, to the postman not looking closely at the name, and other indications as to the correct destination for the original letter.

ROSS HULL CONTEST

My report to the 1985 Federal Convention asked the question as to whether or not this contest should be continued in view of the constant lack of support over the years. My question seemed not to have been addressed by the convention and I am at a loss as to just what the true opinion of our fraternity is on this subject with very little feedback available from members. No more than a couple of operators present at the Federal Convention seem to have ever operated in this contest. Peter VK3YRP has provided me with some interesting statistics. These show that over a period of seven years only 21 VK operators have entered the contest on more than one occasion and over the last three years, only 12 of these have been in the contest more than once, with only seven entries in the latest effort. Now, come on chaps. Surely you don't expect me to believe that there really is any interest in this contest with results like that or that the Federal Convention can make a proper decision, with such a lack of support evident!! Over to all the real VHF types out there.

*SECRETARY'S NOTE....*At the 1985 Federal Convention, the future of the Ross Hull contest was discussed and the majority of delegates were in favour of keeping this contest 'alive and kicking' by improving the publicity given it. All VHF enthusiasts should enter the Ross Hull Contest and send in their logs to the FCM and in so doing, give this contest a boost.

FIELD DAY CONTEST

Some recent research came up with the following: 'In this contest VK4 made the second highest contribution to contest logs with 15 logs submitted, as against 17 for VK3, 10-VK2, 9-VK5, 6-VK6 5-VK1, 3-VK7 and 1-VK9.

What is just a little disappointing though is to see, as I went through the logs checking several aspects, that in fact there were at least 46 VK4 stations alone, giving out numbers in the contest, so what happened to the other 31 logs, which could have been sent in from that state? Even more to the point is the question, as to just how many more logs could have been sent in by all the other states to show support in this contest? I would perhaps hope, that the change of date for the Field Day Contest next year might spark a little more interest in what I believe to be a very good and most enjoyable event.

In late June, the ARRL held their Field Day Contest and I very much enjoyed a contact with an operator assisting in setting up one of the stations in that event. It was a contact with Carl WB6TDE/6, who is a member of the TRW Radio Club, who were entering the contest using their club call sign, W6TRW. The station, when set up would comprise seven separate operating units. For the sake of brevity, here follows a direct extract from my notes for the contact. *"Location... 1200 feet (365m) ASL, near LA Harbour. 40-15 metre bands inclusive, 2 metres, OSCAR, Packet Radio, for 24 hours. About 30 to 40 club members to operate over the period in eight hour shifts. Nine on SSB. XYLs cooking dinner, but OMs to make their own lunch. Located in a public County park. Generators for power. Natural power...solar panel for mainly VHF. Antennas - 20m monobander, three quads, 15m CW and phone, long wire for 80 and 75 m, special long antenna called Ollies Folly for 40m and a vertical for 6m. 30 feet (9m) crank-up towers for supports. Novice station, the XYL works at TRW, hence the association with the club, got the amateur ticket through the club, first field day was 13 years ago and he has missed only one since. Doesn't chase DX in FD but will work anything. A dipole for 40m CW. Last year 1055 contacts were made on 20m. Operate from travel trailer, tents, motor home and trucks. Uses TS-830S with TR4 on standby. 150 watts downwards gives extra points. Stations within a 300 metre diameter circle. Some beer and a LOT of coffee. No linears!!! 1kW generator for 20m SSB. 5.5kW generator for several of the stations'.*

I wonder if any of the above sounds slightly familiar to our local club operators here. I would think it most likely that many of us, familiar with field day operations, could appear at W6TRW/P and feel very much at home. Amateur radio certainly is the same in my experience, all over the world.

Whilst still on the subject of field days, I make mention of further communications with Jock ZL2GX, who is the Contest Manager for the NZART. The boys over the pond, are most keen to have their field day coincide with ours, thus it means that I have to make an almost immediate decision as to the date for same. I am also aware that there is a need for all the dates for the 1986 contests to be determined within the next few weeks. It would be my intention to try and choose dates which will not cause a clash with major overseas events, however, it will not always be

possible to do this, or to spread our contests as much as I would like, as well as steer clear of successive weekends with popular contests, both local and overseas. It would certainly appear that there are just too many contests.

My annual report to the Federal Convention recommended that the CW 75th Anniversary Contest should be a 'one-off' effort.

A look at this year's calendar would indicate the following CW contests are available. The French CW, ARRL DX CW, RSGB 40m CW Field Day, CQ WW 160m CW, Polish CW, CQ WW WPX CW, Venezuela CW, Europe CW, All Asian CW, Remembrance Day, VK Novice, WA 80m CW, VK/ZL CW, County Hunters CW, CQ WW DX CW, CQ-M CW, YL ISSB CW, DX YL CW, QCWA CW QSO Party, Commonwealth Contest and CLARA AC/DC.

That is at least 22 contests which the CW operator may enter and you will find that this list is not exhaustive, as there are many other events which occur throughout the year. So, who says the art of CW is dead? I hasten to add that these comments are not intended as a slap at CW operation. I indeed enjoy CW contest operation, although I would hardly ever touch a key at other times and I always use a straight hand key. Much the same kind of list and comments could be made with respect to phone contests.

My point is that contests should not be inaugurated without there being a close and proper look at what it is all about, and these comments came from one who is keen on contest operation.

I quote from a letter from ZL2GX, NZART Contest Manager, dated 21st March 1985.

"You might be interested to know that I am sick and tired of moaning and groaning from all and sundry about all the contests on the bands. I've suggested that this should be investigated. I do think there are too many....and some that are added from time to time are a lot of nonsense"

I also quote from the VK4 Division notes from Amateur Radio for March 1985...*"For some time now radio amateurs throughout the world have been requesting some contest-free operating spectrum space"* ...

So, just what is your opinion? I will be only too pleased to hear from you as the only way there is to judge just what is wanted by you, the amateur operator in general, is for us to have your comments in writing and on record.

Well. I feel I have posed more than enough questions for this month. By the time you read this I will no doubt be all geared up to deal with the inrush of logs from the Remembrance Day Contest and will have little time available for cogitation on such subjects, as aired in this issue of the contest column. Meantime, I wish all readers great success in their amateur radio activities, whatever aspects happen to be encompassed by same.

RSGB 21/28MHz SSB CONTEST RULES FOR 1985

TRANSMITTING SECTION

Eligible entrants...Overseas...All licensed amateurs.

Period...0700 to 1900UTC, Sunday 13th October 1985.

Sections...i British Isles single operator, ii British Isles multi-operator, multi-band, iii Overseas single operator, iiii Overseas multi-operator.

Frequencies and mode...21 and 28MHz, telephony only. Entrants are requested not to operate in the bands 21.400-21.450MHz, 28.200-28.400MHz and 29.100-29.700MHz.

Exchange...RS report and serial number starting at 001.

Scoring...Overseas: Three points for each completed contact with a station in the British Isles. Multipliers are G2, G3, G4, G5, G6, G8, G0, GD2, GD3, GD4, GD5, GD6, GD8, GD0, GI2, GI3, GI4, GI5, GI6, GI8, GI0, GJ2, GJ3, GJ4, GJ5, GJ6, GJ8, GJ0, GM2, GM3, GM4, GM5, GM6, GM8, GM0, GU2, GU3, GU4, GU5, GU6, GU8, GU0, GW2, GW3, GW4, GW5, GW6, GW8 and GW0. Contacts with GB stations will not count for points. For all entrants the total score will be the number of points on each band added together, times the number of multipliers on each band added together. Unmarked duplicate contacts will be penalised at the rate of ten times the claimed points. Entries with more than five unmarked duplicates will be disqualified.

Logs...Log sheets are to be headed date, time UTC, station worked, RS and serial number sent, RS and serial number received, multiplier, points claimed.

Declaration...With each entry there must be a declaration, signed and dated, that the station was operated within the rules and the decision of the council of the RSGB shall be final.

Address...Overseas entrants should send their entries to PO Box 73, Lichfield, Staffs, WS13 6UJ, England. These entries must be received by 9th December 1985.

Awards...Overseas. Certificates will be awarded to the leading station in each country and to the leading station in the multi-operator section.

RECEIVING SECTION

Rules as for the transmitting section except as varied below.

Eligible entrants...Overseas. All SWLs. Note that holders of transmitting licences for frequencies above 30MHz may enter the receiving section.

Scoring...Overseas SWLs should only log British Isles stations in contact with overseas stations taking part in the contest. Scoring and multipliers as the transmitting section.

Logs...Logs to be headed date, time UTC, call sign of station heard, RS and serial number sent by station heard, call sign of station being worked, multiplier, points claimed. A summary sheet showing multipliers heard on each band must be included. Note: In the column headed station being worked, the same call sign may only appear once in every three contacts logged except when the logged station is a new multiplier for the receiving station. Also the station heard may only be logged once on each band for the purposes of scoring.

Declaration...Each log must be accompanied by the following declaration: 'I declare that this station was operated within the rules of the contest and I do not hold a transmitting licence for the frequencies below 30MHz'.

Awards...Certificates of merit will be awarded to the leading entrant in each overseas country.

21MHz CW CONTEST RULES FOR 1985

TRANSMITTING SECTION

Eligible entrants...Overseas (including Eire) All licenced amateurs.

Period...0700 to 1900UTC, Sunday 20th October 1985.

Sections...i British Isles section, ii QRP British Isles section. British Isles station using less than 10W input, iii Overseas section (including Eire), iiii QRP Overseas section. Overseas stations using less than 10W input.

Frequency and mode...21MHz only. CW only. Entrants are requested not to operate in the band 21.075-21.125MHz.

Exchange...RST report and serial number starting at 001.

Scoring...Overseas stations: Three points for each completed contact with a station in the British Isles. The final score is the number of British Isle prefixes multiplied by the total number of points. British Isle prefixes are the same as for the 21/28MHz SSB Contest, listed above.

Duplicate contacts, Logs, and Declaration as per the rules for the 21/28MHz Contest.

Logs to be received at PO Box 73, Lichfield, Staffs, WS13 6UJ, England by 31st December 1985.

Awards...Certificates of merit will be awarded to the leading station in each overseas country.

RECEIVING SECTION...Rules as per the 21/28MHz SSB Contest.

THE 9TH WEST AUSTRALIAN ANNUAL 3.5MHz CW & SSB CONTESTS TRANSMITTING & RECEIVING

1 — DURATION: SSB Saturday 31st August and Sunday 1st September CW Saturday 28th and Sunday 29th September. On both days between the hours of 1100 and 1330 UTC. i.e. 5 operating hours in all for each contest.

2 — FREQUENCIES: All contacts to be made in the 3.5/3.7MHz band using frequency allocation applicable to your licence conditions.

3 — CALLING: Stations will call CQ WAA using the three times three technique, infringement of this rule by the use of long CQ calls may entail disqualification as will pre-arranging of a QSO.

4 — SCORING: Points for contacts are as follows:—

Within Western Australia	*5 points per contact.*
WA to all Mainland Eastern States.	*2 points per contact.*
WA to VK7	*4 points per contact.*
WA to VK0 & Overseas	*8 points per contact.*

Stations other than WA 3 points per contact with WA Stations only.

5 — MULTIPLIERS: A multiplier of 2 per WA Shire worked will apply to the final score. For WA Stations north of the 26th Parallel a multiplier of 1.4 per contact confirmed.

6 — CONTACTS: Stations may be worked twice on each night ie once between 1100 and 1300 UTC and again between 1300 to 1330 UTC these contacts will count for points. Each time the contact for WA stations will take the form of an exchange of 5 characters comprising RST/RS and Shire letters. eg a station in NORTHAM sends 579NM or if in HARVEY 579HY, this helps towards the Worked All Shires Award. Eastern States and Overseas stations will send RST/RS plus a running number starting at 001.

7 — LOGS: Contest logs to be set out on one side of a quarto or foolscap sheet with columns headed as below.

DATE:		CALL:		OPERATOR:
TIME UTC	CALL WKD		RST OUT	RST IN
	SHIRE LETTERS	SHIRE MULTIPLIER		POINTS CLAIMED

Column 7 to be totalled at the foot of each page and the running totals brought forward. The last page to contain the following summary: Total number of points scored, Input power, Equipment and antennas used, along with comments on the contest in general. SWL participants score as above using the outgoing Tx score.

All logs to be addressed to WAA Contest Committee, PO Box 6250, Hay Street East, Perth, WA. 6000 and posted so as to reach us not later than 14th October for both contests. The results for all contests will be published in the December issue of AR.

75th Nostalgia

MORE FORGOTTEN PIONEERS OF RADIO

Norm Melford VK3ZTN
Old Coonara Road, Olinda, Vic. 3788

Following recent articles [1,2] about Nicola Tesla, it is fitting to remember others who were engaged in similar pioneering work at much the same time but in different places.

In 1871, Elihu Thompson, apprentice teacher at what became the Benjamin Franklin High School in Philadelphia USA, with Professor Edwin Houston, noticed an interesting phenomenon. They could draw sparks from various metal objects up to 30 feet (10 metres) from a Ruhmkorff (spark) coil to which they had connected a gas pipe and a wire resting on the bench.

Four years later, possibly prompted by reports of similar experiments by Edison, Thompson and Houston extended their work and used a "lead" pencil to draw sparks from door knobs throughout the building — perhaps up to 100 feet (30 metres) from the "transmitter". [3]

This work seemingly was not developed further at that stage, but preceded by over a decade the famous experiments of Hertz, and later still, of Marconi.

Thompson, then 22 years old, was a very active inventor. He later went on to hold over 700 patents and to found the Thompson-Houston Electric Company which, in 1892, merged with Edison's company to become General Electric.

In 1895, the famous Bengali, Jagadis Chandra Bose, transmitted radio waves from a lecture hall in the Calcutta Town Hall for a distance of some 80 feet (25 metres). At the "receiver", the signal tripped a relay, fired a pistol, and blew up a small mine.[4]

This was in the year before the issue of Marconi's patent, and three years before Tesla's radio powered and controlled model boat demonstration.[1]

While Marconi, Thompson and Edison tended to concentrate on inorganic science, Tesla, and even more, Bose, seemed drawn to the study of the earth itself and of living things. This, indeed, became one of Bose's biggest difficulties. British academia, as tightly compartmentalised as Indian castes; was ill disposed to tolerate anyone brash enough to straddle the boundaries between physics, physiology, and botany (with perhaps an undercurrent of Indian mysticism lurking in the background).

A further problem was that British-ruled India was unable to accept readily a native Indian pre-eminent in science.

As his work with electromagnetic waves began, despite these obstacles, to win him recognition, Bose was becoming less and less certain about the traditional distinctions between living and inorganic matter. Moving into physiology, he noted striking similarities between metals and living tissue in their responses to various stimuli. He found 'fatigue" effects in his metal coherer radio detector which he had invented. Its sensitivity, depressed after heavy use, returned to normal after a rest period! He studied the stimulating effects of Hertzian waves on living tissue (which perhaps we are only now re-discovering in our concern about human exposure to strong RF fields). In botany, he pioneered study of the effects of sound on plants and his instruments revealed many other hitherto unknown aspects of plant life, reaffirming his conviction of the basic unity of all things.

It is interesting to reflect that all of their radio-pioneering work was going on along substantially similar lines in widely separated parts of the world, at much the same time. This, without the experimenters keeping in touch via the computer based library services, telecommunications and mail services which we take for granted today.

Amateurs of today interested in carrying on our pioneering tradition may do well to investigate the work of Bose and other, more recent work on biological (wireless) communication. Reference 4 gives an overview of these fields which, if further developed, might eclipse even radio in their importance to mankind. Way out? Of course. But so was radio at the time of Tesla, Thompson, and Bose. Now, as I check my audio, I wonder what a little more clipping might do to the plants around my antenna . . . . . .

LIONS CLUB CERTIFICATE

A certificate of appreciation has been received by the Westlakes Amateur Radio Club from the Lions Club of Newcastle for a *'very worthwhile exhibit'* which was prepared by the Club for a recent Toys and Hobbies exhibition. The certificate will be displayed in the Club's library.

From Westlakes ARC Monthly Newsletter

PACKET RADIO

David Furst VK3YDF.
Chairman, MPRG.

REINTRODUCTION

In Amateur Radio of May 1984 an introductory article to Packet Radio was published. Since that time, many people have asked questions about Packet Radio which were covered in that article. We take this opportunity to re-print parts of it.

Packet Radio is a method of transmitting data, without errors, from one amateur station to another across a radio network.

This new technology will be a very natural marriage of two related disciplines and groups of people, amateurs and computer hackers. It should be noted at this point that no great knowledge of computers is required to run a Packet Radio station. The packet controller may be used as a black box by those who do not wish to get too deeply involved in its inner workings.

It's all done by packaging the information into 'packets' (a packet is usually one ASCII line of text). A Packet consists of three primary parts. The first part is an address. In this case usually the call sign of the station the information is being sent to or a station identification number. The next part is the actual data to be sent. The final part is error checking information.

All the above is done by a smart box called a Terminal Node Controller (TNC) hooked up between your computer and your two way radio.

The actual workings happen a little like this: You decide to talk to station VK3XYZ and ask your TNC to arrange this. Your TNC waits until no one else is using the frequency for a couple of microseconds then sends out a packet to the effect (VK3XYZ, are you free?). If the other party is indeed free his TNC sends back another packet replying that he is free. Both TNCs then consider themselves connected to one another and will ignore any other packets floating down the ether but will send addressed packets to each other and respond only to packets from the other.

Just to be certain there are no misunderstandings, each TNC will always acknowledge that it did, in fact, hear what the other said. From this you will see that each station only needs the radio channel for the few milliseconds it takes to send a line of ASCII text, and that the channel can be used by many stations effectively simultaneously. Naturally all the TNCs are well mannered enough to understand the social niceties of getting along together and should clashes occur, they will settle their differences amicably.

As there is error checking information built into each packet it is easy for the receiving station to check if an error has occurred and request the other station to re-send the packet.

So that's it the machines consider themselves to be connected and act like they're connected even though they aren't. This is referred to as a virtual connection. A 'Claytons' connection?

Apart from all this whiz-bang stuff, what's so great about packet radio? Well, it gives you data integrity, virtual connections, can route messages, act as a gateway to other systems and get heaps of information from lots of people across just one radio channel. Pretty neat,huh?

It can be used for 'chatting', interchange of programmes, dissemination of information, a gateway onto amateur radio satellites and other packet systems (amateur and professional), playing games such as Space Empires, access to computers that people may choose to put 'on line' and bulletin boards.

The whole area is so new that we really don't have much idea of what the full possibilities of the system are.

Cost? Well the packet controller '(TNC) costs about $200 to build up and hopefully you already have a two metre rig and a computer with a serial port.

The chosen frequencies are 147.600 MHz, for the main channel and 147.575 for a sort of 'chat' channel. Others are under consideration.

The protocol most Australian Packeteers have settled for is the V2 protocol. We have standardised on this same protocol as the Canadians who invented Packet Radio. It should be pointed out that protocols are NOT based on the circuitry, but on the programmes which run it, so if protocols should ever need to be changed, this is a blessedly simple thing to do. The radios most used are IC22s because of the fast turnaround time from transmit to receive. The baud rate will be 1200 initially.

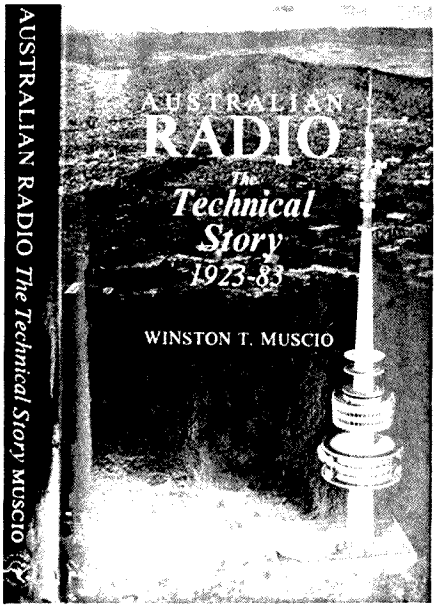
BOOK REVIEW

Jim Linton VK3PC
4 Ansett Cresent, Forest Hill, Vic. 3121

AUSTRALIAN RADIO — THE TECHNICAL STORY 1923-83



As its title suggests, this publication sets out to be the first to give a detailed account of the fascinating technical developments which have occurred in Australia over the past 60 years.

The book describes in detail, the development of broadcasting transmitters and receivers, then goes on to cover other interesting technical advances in many other branches of radio.

Some areas covered include the Beam Wireless Telegraph Service through to modern high speed data transmissions, and mobile radio, starting with the earliest Victorian Police Wireless Patrol to the microprocessor-controlled Telecom services.

Some other aspects documented are the evolution of telephone systems, sound record playing equipment from electric pickup to digitally-recorded compact discs, the development of audio frequency amplifiers and loudspeakers, and the chequered history of FM broadcasting.

This excellent publication was written by Winston Thomas Muscio, a chartered engineer, who retired in 1980 after a lifetime in radio engineering starting with STC in the design and manufacture of radio receivers for domestic, commercial and military use.

AR

CLEAR ACROSS AUSTRALIA

The book covers Australian telecommunications from when the first telegraph line was erected between Melbourne and Williamstown in 1854.

It is written in an entertaining style and is excellently illustrated.

Most stages of telecommunications appear to have been covered, from the post, to telegraph, telephone, wireless telegraphy, picturegrams, radio, telex, co-axial cable, satellites and optic fibre cables.

The human contribution to telecommunication development in Australia is well covered and research from archival material is obvious in the early sections of the book.

The author, Ann Moyal, where possible had interviews with many of the former administrators and staff in the PMG and Telecom, and several Ministers who held the portfolio.

Control: VK5AGR
Amateur Checkin: 0945 UTC Sunday
Bulletin Commences: 1000 UTC
Winter: 3.685 MHz Summer: 7.064 MHz

AMSAT PACIFIC
Control: JA1ANG
1100 UTC Sunday
14.305 MHz

AMSAT SW PACIFIC
2200 UTC Saturday
21.280/28.878 MHz

Participating stations and listeners are able to obtain basic orbital data including Keplerian elements from the AMSAT Australia net. This information is also included in some WIA Divisional Broadcasts.

ACKNOWLEDGEMENTS

Contributions this month are from Bob VK3ZBB and UoSAT Bulletin Number 135.

AMSAT-AUSTRALIA NEWSLETTER

Graham VK5AGR the National Co-Ordinator of AMSAT-Australia is now producing a monthly newsletter containing updated satellite news, orbital predictions, keplerian data and operating hints and techniques. The objective of the newsletter is to keep the amateur populous informed on the latest information available and to realise funds for the funding of projects or the purchase of an item (items) of hardware for a future amateur satellite project, eg. Phase-3C, Phase 4 or whatever. The cost of the Newsletter is $15 and cheques made payable to WIA (SA Division) should be forwarded to Graham VK5AGR QTHR.

COMPUTER SOFTWARE

As mentioned previously in this column there are a dearth of satellite programmes available for the mumerous home computing systems currently in use by satellite communicators. Those newcomers not aware of what is available should drop a line to Graham VK5AGR (QTHR) the AMSAT-Australia National Co-ordinator, enclosing a stamped self-addressed envelope requesting details of what is available and from whom it is available.

Past practice has been that, provided the requestor supplied the media (tape or disk) and return pack and postage, the copies of the relevant software has been provided WITHOUT charge. The majority of persons availing themselves of this service have been most appreciative, however it is disturbing to hear that some individuals have had the audacity to write back and complain bitterly that the software was not up to their expectations. To that inconsiderate minority may I address the following comments . . . . The AMSAT-Australia software service is being provided by a group of fellow amateurs to assist YOU as a fellow satellite communicator. Next time think twice about knocking a gratis service.

UoSAT-OSCAR-9 Bulletin-135 19 July 1985 (Excerpts)

PHASE-3C

The Phase IIIC spacecraft is now scheduled for launch less than 11 months hence — Mid-June 86 is ESA's schedule on the Ariane 4 launcher. Four transponders will be aboard: B, JL, L Rudak (digital) and S.

AMSAT is about to sign a contract with the Solar Energy Research Institute, SERI, in Golden Colorado for a facility in which to integrate Phase IIIC. A strong team is now functioning in the Boulder area under W3GEY. The Phase IIIC spaceframe recently arrived in Boulder having been shipped from W4PUJ in Washington.

JAS-1 SPACECRAFT

The JAS-1 launch has slipped 6 months until August 86.

RS SOVIET SPACECRAFT

After the recent scare, RS-8 seems to have returned to normal operation. It may have recovered or it may be a last gasp. Better watch this spacecraft closely for signs.

Rumors in Europe say the birth of ISKRA-3 is near. Prior ISKRAs, built by the Moscow Aviation Institute, were manually launched by ejection out the hatch of a Salyut space station. Sources indicate a 15 to 10 metre narrowband transponder is likely. RS-9 and RS-10 are due for launch late this year or early next year.

AMSAT-OSCAR-10 SPACECRAFT

The 2 metre omni antenna is on from MA 35 to MA 80 for a trial period. Comments on reception would be appreciated. An attitude manoeuvre is taking place at the moment. The target attitude is LON 230, LAT -10 degrees. This will require 6 to 7 days at least of magnetorquing. The change is taking place now as it will be difficult to check the S/C attitude when the sun gets too close to the orbital plane. (ZL1AOX)

AO-10 spacecraft controllers have determined an operating schedule for the critical eclipse period which begins in August, as follows:

Off 030 — 189
L 190 — 206
B 207 — 029

UoSAT-OSCAR-11 OPERATIONS

UO-11 dropped out of gravity lock last week during some attitude experiments but was recaptured by OBC auto-magnetorquing routines on Wednesday. Work has been under way on up-grading the P/Wave and CCD experiment OBC software and was used for the first time on Wednesday and Thursday P/Wave surveys — the results are being analysed.

A news release

The Sixth Conference of the IARU Region 3 Association is being held in Auckland, New Zealand, from 13 to 17 November 1985 with the New Zealand Association of Radio Transmitters (NZART) as host society.

To mark the occasion, New Zealand radio amateurs have approval to use the prefix ZM from 1 October to 31 December inclusive.

A special station ZM6ARU will operate from the conference venue in the period 9 to 18 November.

Special approval has been given for IARU representatives and delegates to the conference to receive call signs from the special series ZL0ZAA for hand-held transceiver use during their visit to New Zealand.

IARU REGION 3 CONFERENCE AWARD

To publicise the IARU Region 3 Association Conference in Auckland, New Zealand, 13-17 November 1985 and is available world-wide to licensed amateurs for contacts made during November 1985 with ZM6ARU (Conference station) and other ZM stations.

Any band or mode may be used.

For overseas stations: Contact ZM6ARU and two other ZM stations. Note: Five other ZM stations may be substituted for ZM6ARU.

The Award is available to SWLs.

Send log details (no QSLs) and $1 (3 IRCS) for surface mail or $2 airmail to : NZART Awards Manager ZL2GX, 152 Lytton Road, Gisborne, New Zealand.

AR

RADIO CLUB DE CHILE INTERNATIONAL BULLETIN

The RCCH International Bulletin transmits every Saturday, in English and Spanish, on 40 metres, 7.085 MHz at 1000 UTC. This transmission is directed to the Pacific area.

Other transmissions to Europe are on 21.300 MHz at 1700UTC and to America on 14.200 MHz at 2300 UTC.

The call sign used is CE3AA in Santiago, Chile.

AR

SPOTLIGHT ON SWLing

Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

Well, Spring has hopefully arrived by now. About this time of the year, the major international broadcasting stations make their alterations to their frequencies to take account of the seasonal fluctuations in propagations. The S-85 period commences on 1st September from 0100UTC.

As well, most of Continental Europe goes off daylight saving on Sunday 29th September. This is significant because many programmes targeted for European audiences are slotted in local time in Europe and not in UTC, as is the case for other target areas. So there are going to be some changes noted on 29th September. While we are on Standard Times, I have noted that Soviet external services run on the Standard Time in Moscow, and you will note that programming will be one hour later, as from 1st October.

MONITORING THE WOODPECKER

Next month I shall be participating in a sustained monitoring effort on the 'Woodpecker'. This pulse signal has been well known to amateurs and SWLs for many years by causing severe disruption to telecommunication users. Now the American SWL Group - the Association of North American Radio Clubs (ANARC), has decided to co-ordinate the collection and analysis of data on the effects of this PON mode activity which is, unfortunately increasing.

The results of these studies will be presented to the telecommunications departments and/or ministries throughout the world, in order that a protocol statement can be drafted at the next WARC, in 1987, condemning this interference.

The monitors in Canada and the USA will monitor parts of the spectrum between 5 and 23MHz, with each monitor being assigned a 3MHz wide spectrum to scan over a 3 hour period, allocated by ANARC. The majority of the pulse rates are 10 per second, although rates of 7.5 and 17 per second have also been noted. The rate can be determined by measuring the width of the pulse signal. Eg 40kHz or 75kHz. As the 'Woodpecker' pulses seemingly gravitate in 100kHz steps, it can be easily mapped out on graphics and displayed.

CO-ORDINATORS CO-ORDINATING

Also, the committee has asked monitors to note instances where international broadcasters have been interfered with by PON pulses. Here in Australia, our Intruder Watch Co-ordinators will be co-ordinating the work of various monitors within the spectrum assigned to them by the ANARC OTHR Committee. This is not surprising as IW has noted the effects of the OTHR pulses within the exclusive amateur allocations, ever since they appeared.

CONSIDERABLE DEBATE

It is interesting to note further, that the US Air Force expects to commence operations from OTHR radar in Maine, very shortly. It is licenced to operate within the Fixed Allocations, but excludes amateur, maritime and broadcasting allocations. There has been considerable debate within American defence circles over the effectiveness of OTH radar systems. Some maintain that the Strategic Defence Initiative, commonly referred to as 'Star Wars', would be more effective, from economic and efficiency standpoints. As the SDI proposal will be probably very costly and expensive, there could be pressures to implement further OTHR sites. Already there have been suggestions that further sites, located on the American West Coast, Alaska and the Midwest could be constructed. However, the US congress is not all that keen on further costly expenditure on defence systems, wishing to trim the ever increasing US budget deficit.

OTHERS INTO OTHR

Also according to the ANARC OTHR committee, it appears as if the UK will also be experimenting with OTHR from Cricklade, near Swindon. This is also, in co-operation with the US defence scientists. Another site at Ordfordness, which has has past involvement with OTHR research in the early 70s, could be considered and would reportedly cover shipping and air movements in the Baltic and Arctic, north of the UK.

Japan is also reportedly interested in joining the OTHR club. Time will alone tell if more countries will use PON, yet it is quite clear that they will have to rapidly devise ways of minimising severe disruption to other telecommunications users/consumers.

IMPROVED SIGNALS!!

Radio HCJB in Quito, Ecuador recently completed the erection of their 49 metre antenna array, to improve their signals to Europe and the South Pacific, coupled with their 500kW transmitter. This has certainly improved the stations' audibility and signal strength on the South Pacific service on 6.130MHz from 0700UTC. Unfortunately, their transmissions on 9.745 and 11.925MHz remain useless because they are frequently drowned out by SE Asian stations, such as R Pyongyang or jammers.

LACK OF SHORT-HAUL

Recently I have been unable to maintain scheds with local stations on 80 metres because of the lack of short-haul propagation. This certainly is very unusual, as well as being very frustrating to all concerned. Now we know the reason why - the Polar Absorbtion Effect. Apparently, protons bombard the ionosphere around the Polar regions, causing the disappearance of the D layer for several hours. It is also often in tandem with a solar flare, as was the case on 9th July. Interestingly enough, it allows signals to come in on channels that are usually dominated by local stations. The RA senders were inaudible on 49 metres, allowing Asian stations to be rarely heard.

Well, that's all for September. Until next time, the very best of DXing and 73....Robin VK7RH.

AR

MEGAWATTS IN THE WIND

Electricity produced from the wind could be contributing significantly to power requirements in Victoria during the early 1990s.

This is the view of Bruce Tregaskis, an engineer in the State Electricity Commission, System Planning Department.

Fifty sites along the Victorian coast has been assessed — and ten of these were selected for the installation of wind monitoring equipment.

The recording of wind speed, direction and duration began in February and will continue for two years.

Mr Tregaskis said after the data had been analysed the SEC would be in good position to know the potential of wind generation.

Preliminary indications are that wind energy could be expected to contribute about two to three megawatts to the Victorian grid by the early 1990s.

This could need 20 or 30 generators with a capacity of about 100 kilowatts. Mr Tregaskis said in the long term wind generation was unlikely to contribute more than five to ten percent of the state's power requirement.

A 55 kilowatt aerogenerator was installed two years ago by the Mars confectionary company at Ballarat.

The SEC planned to install a 75 kilowatt version this year near Geelong.

(Source: SEC News, June 1985) AR

INTRUDER WATCH

Bill Martin, VK2COP
FEDERAL INTRUDER WATCH CO-ORDINATOR
33 Somerville Road, Hornsby Heights, NSW 2077

A good supply of intruder reports were received for the month of May from:

VK2BQS, VK2DEJ, VK2DUO, VK2EYI, VK2PS, VK2QL, G H A Bradford, VK3BGH, VK4AFO, VK4AHO, VK4AKX, VK4BG, VK4BHJ, VK4NUN, VK5BJF, VK5TL and VK7RH.

Many thanks to these people for their continued support of the Intruder Watch.

HARMONIC STILL HEARD

The fourth harmonic of Radio 5AN, Adelaide continues to be heard on 3.564MHz. I would be interested to hear from more VK5 amateurs on this one.

VRQ from Vietnam continues to trangress on 14.080MHz on CW. UMS is still being heard on 14.141MHz, but seems to have changed his habits somewhat, as he is using more FSK Morse than formerly. RJS has also been heard on this frequency, so call signs must be listened for, as they are necessary for identification purposes.

In the August *Intruder* Watch column, I mentioned that there was AMTOR traffic emanating from a large vessel, at the time located in the Marshall Islands, the point being that the traffic was of a commercial nature. Recently, someone blew the ship up, and she sank at her moorings. I want to make it quite clear that the Intruder Watch had nothing to do with it.

STATISTICS

Statistics for May are as follows: 350 Broadcast intruders reported, 82 CW intruders, 76 RTTY intruders, 57 other modes and 67 stations identified.

Col VK4AKX sends the following notes. Radio Tirana (Albania) continues to be the number one pest on 7MHz during our afternoons, from 0400 to 0700UTC. 99.9 percent of intruders are located in the Northern Hemisphere. Col makes a valid point, in that he says that the intruders Radio Tirana, Indonesia, Radio Peking, Voice of the Straits (China), etc are so strong, that even if they are NOT heard in some states, the result is that those states could NOT work on or near the frequencies in question because, no doubt the offenders are being heard in other parts of the globe, and as radio communication is a two-way affair, the stations at the other end would be QRMed out of the game. So it works both ways...

Even if we, in VK, can't hear an intruder station, it is an equally effective intrusion if it is heard elsewhere, because one end of the communication path is interfered with. So it is important that radio amateurs world-wide take part in the Intruder Watch programme, in order that we can take steps to censure the offending stations from both ends. Please report any intruders heard to your divisional Intruder Watch Co-ordinator.

73 for now, and see you next month.

INTRUDERS

In the May issue of this column I referred to a comment regarding the "60 day rule" by Norman VK4BHJ. Several operators have written in the meantime and the subject bears re-opening. We all have a lot at stake here (not just us brass pounders), and we would do well to remember the motto of the CIA — "Eternal Vigilance is the Price of Freedom."

First of all, my thanks to Bill Martin VK2COP, Federal Intruder Watch (IWS) Co-ordinator, who wrote to explain the 60 day rule —

AN ADMINISTRATION CAN ASSIGN ANY OF ITS STATIONS TO OPERATE ON ANY FREQUENCY AND, IF NO-ONE OBJECTS WITHIN 60 DAYS, THE STATION CAN OPERATE LEGITIMATELY ON THAT FREQUENCY.

Bill goes on to say, "This is one of the reasons why the Intruder Watch is constantly calling for reports of intruders, so that the objections may be lodged as quickly as possible. In the case of the USSR intruder "UMS" this does not apply, as objections have been lodged for years against this intruder. The Intruder Watch has recently mounted an intensive campaign against this intruder, with the result that the USSR HAS ACKNOWLEDGED that it is one of their stations, and has stated in writing to the Department of Communications that 'they will take steps to have the stations removed from the amateur allocations of 15 and 20 metres.' "

The moral of the story, obviously, is that the Intruder Watch Service is effective — but only so long as it has the support of the amateurs it is designed to protect. They need accurate, timely and **reliable** reports of harmful interference; without the reports they can do nothing. Addresses of state co-ordinators are listed frequently in "Amateur Radio." Drop yours a line and he will supply you with intruder logging sheets and some good advice.

On the subject of Japanese and Taiwanese fishing boats, their operation on 80 metres is legal so long as they are in international waters. If they are in Australian territorial waters they are intruders, and action can be taken.

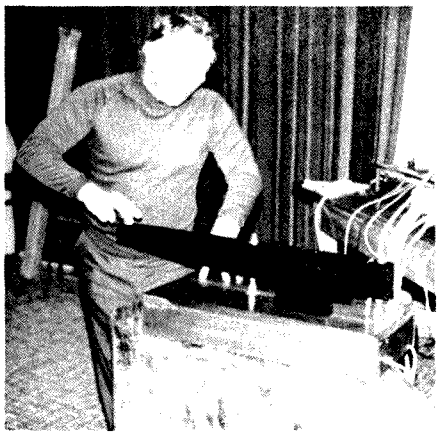
If you have reason to believe that such an intruder is in fact within Australian territorial waters, you should log the interference and report it to the Intruder Watch. David Brownsey VK4AFA, the Brisbane Secretary of the IWS has been very persistent in documenting such intrusions and has written to the Japanese Consulate-General, and the Department of Communications. He advises that the Australian Coastal Surveillance Centre can be telephoned in Canberra on (062) 47 6666, which is a free STD call (they will accept reverse-charge trunk calls).

David mentions another instance on 80 metres, fascimile transmissions on about 3.625MHz, emanating from the USSR. Unfortunately these are legal, because their orgin is in a different region. However, **any** broadcast stations, harmonics from Australian commercial broadcast stations, and transmissions from cordless telephones are intruders and should be reported to the IWS.

Norman VK4BHJ has also foreshadowed another form of intruder problem looming on (or over) the horizon — frequency-hopping stations. These stations use the latest in digital communications technology to break up transmissions into segments which are transmitted on different frequencies. A station can "hop" all over the HF spectrum, spending only milliseconds on a particular frequency. The effect is only apparent as a rise in the overall background noise, which is bound to get worse as commercial and service transmitters are seeking and using any relatively clear HF channels regardless of other users. This situation does not appear to be covered by current international regulations.

Finally, a word of caution — it is extremely unwise to deliberately "QRM" an intruder. In the first place, you are violating regulations if you transmit anything which is not a legitimate amateur pursuit. Secondly, you are only adding to the pollution of the airways. Bear in mind that you are not the judge and jury. For all you know those fishing boats are in international waters, in which case deliberate QRM is harmful interference to a legitimate (unfortunate though it be) user. Futhermore, the level of their signal in your location is no indication of your ability to cause QRM at theirs. You might be making 10-20 kHz unusable in your own neighborhood while the "intruder" can't even hear you. The best practice is to log the details and report them to the IWS, and otherwise **ignore** them.

On a lighter subject, we have another entrant for the un-offical, un-sponsored and no-prize-but-self-esteem competition to find the world's biggest key. Craig ZL3TLB, editor of "Break-in" the offical journal



of the NZART, has sent the accompanying photo of a key which was built for the 1983 VHF convention by Tony ZL3DQ. Morse operators at the convention were invited to try it out, but they were unaware that the oscillator was controlled by a remote VHF system. The 1kHz tone could be changed to a harsh "raspberry" and the tones could be delayed by half a second, which threw even the best brass pounders. The photo shows David ZL2SX "having a go."

In thinking about the "rules" for this "competition," I have had to decide that there are no rules. It's difficult enough to determine what constitutes a key, without worrying about terms like "biggest."

Any other takers??

73 till next month.

AR

MURPHY MARCHES

Mr Murphy, at a late hour, got amongst Ron VK3OM's typewriter keys — and magically got the IC-735 and 745 mixed up in last month's Equipment Review. Still marching, he attributed the review to Ron VK3AFW, who, upon reading the magazine, found that it was the best, easiest and quickest review he had ever written.

WICEN NEWS

VICTORIA'S DISPLAN OFFICER RETIRES

Many changes have occurred in the area of counter-disaster planning in Victoria since the Ash Wednesday tragedy in 1983.

One man who has played a key role was Bruce Bingham, who recently retired from the position of Displan Officer after four years.

His retirement was the result of him being promoted to rank of Chief Inspector, meaning he had to move to the next phase of his police career.

He said it had been very difficult to get others interested in disaster planning before Ash Wednesday, and there was general apathy within the police department, government and the public itself.

"When Ash Wednesday occurred people realised there was something in counter disaster planning.

"My job became very satisfying after that, and although no longer Displan Officer I still maintain an interest in that particular field," said Mr Bingham.

Commenting on WICEN, he said he knew of its potential from the time of its involvement in the Cyclone Tracy disaster, 1974.

By not being used in emergency situations interest in WICEN had dwindled over the years, said Mr Bingham.

"But since Ash Wednesday it's a very viable and important communication resource.

"That has been indicated by the number of times WICEN has been used since Ash Wednesday.

"The WICEN organisation is going to play a valuable role in Victoria in the future," he said.

With any type of disaster situation the normal emergency services "can't cope with everything and need help particularly from an organisation like WICEN that has "this communication expertise."

WICEN coordinator, Derek McNiel VK3BYA said he was very thankful for Mr Bingham who had helped bring WICEN on from where it was at Ash Wednesday.

"He helped WICEN win recognition within the police department and other emergency services.

"For example he instructed the police regional Displan coordinators to make contact with the WICEN regional coordinators and involve them in local disaster planning," said Derek.

WICEN wishes Chief Inspector Bingham all the best for the future, and looks forward to a continued close relationship with his successor, Inspector John Park.

WESTERN ZONE WICEN ACTIVITIES
Regions 4,5 & 17

After organising a training school in Hamilton earlier this year, in which Derek McNiel was the instructor, the WICEN group were keen to put their newly acquired knowledge into practice. They did not have long to wait to do so.

An off-chance comment to a member of the Hamilton Light Car Club saw an invitation forthcoming for the WICEN group to provide communications for their Yulunga all-night-car-trial during the evening of 13th April to the small hours of the 14th.

The invitation was duly accepted and the afternoon of the 13th saw Ken VK3KAV, co-ordinator, Lyle VK3DWL, controller and their group setting up stations in the Annya State Forrest and the immediate hinterland.

The trial officials were, at first, a little slow to make use of the communications facilities, however, as the event continued, the messages continued to increase, speeding up the search for lost cars, directing the recovery teams and passing safety messages and scores.

The event concluded with an early morning barbeque breakfast, where the competitors, officials and WICEN group got to know more of one another.

A weary WICEN group got to bed at a time when normal people were getting up but all agreed they would be willing to participate again next time.

Thanks go to Lyle, for his ability to supply maps, etc for the event and for his efforts as control station.

At this time, Region 17 WICEN do not have any active members. If you live in this region and would like to participate, call Ken VK3KAV, QTHR and he would be pleased to answer any queries.

ALARA

Australian Ladies Amateur Radio Association

Poppy Bradshaw VK6YF
203 The Strand, Bedford, WA. 6052

I have been asked to be guest writer for the ALARA column this month, an honour I assure you as my journalistic abilities are very limited. Firstly I would like to thank Margaret VK3DML for her excellent efforts as Publicity Officer and Contest Manager and for her on air friendship and assistance.

Here in VK6 it is not practicable for our members to take a position on the executive committee because of distance, time difference and of course on-air conditions. We are always grateful to those members who fill these positions each year and for relays and QSPs passed on by other members in regard to ALARA and its members.

Locally our members are very active in WIA and local club committees. Diane VK6KYL has been re-elected secretary of the Goldfields Radio Club.

Bev VK6DE, who some of you may have met in her travels over east, is very active in the Geraldton Radio Group. Bev also does their segment for the VK6 WIA News. Gill VK6YL is secretary of the WARG and with Christine VK6ZLZ is a VK6 WIA Councillor. Christine is the WIA Book saleswoman and like Sue VK6NSU is a very active repeater group member. Trish VK6QL although fairly new to AR encourages and tutors others to join the amateur radio ranks.

Our first VK6 ALARA function was to celebrate ALARA's tenth birthday. Nine members went to lunch at the Westrail restaurant and Christine VK6ZLZ baked a delicious cake for the occasion. A week later our Radio Ladies Luncheon group held their sixth birthday at the Sheraton Hotel with 13 in attendance. These luncheons are held on the last Thursday of each month and any lady interested in radio, YL, XYL, mother or daughter of an amateur, etc is welcome. Visiting ALARA members from VK2, Canada, USA and visitors from NZ and UK have attended luncheons. I would like to take this opportunity to extend an invitation to any visitor to our beautiful state to join us.

Thank you to the new ALARA executive committee for carrying on the tradition of ALARA. Thank you for giving me this opportunity to take part in our tenth anniversary celebrations.

EDUCATION NOTES

Brenda Edmonds, VK3KT
FEDERAL EDUCATION OFFICER
56 Baden Powell Drive, Frankston, Vic 3199

Statistics for the May exams have been received and are available from me or the Executive Office on request.

As usual, CW sending results are better than receiving, and the pass rate for the Regulations exam overall was 80 percent.

The main interest, however, lies in the results of the Theory exams at both levels as hereunder.

State	AOCP		Novice	
	Pass rate %	Cand#	Pass rate%	Cand#
VK1	12.5	8	20	5
VK2	38.4	99	45.2	62
VK3	46.2	156	47.8	90
VK4	25.3	91	21.5	65
VK5/8	29.8	47	43.9	41
VK6	16.7	54	27.3	33
VK7	57.1	14	44.4	9
Total	**VK 35.2**	**469**	**38.4**	**305**

Of course, the figures for the states with smaller numbers of entrants cannot be used for any statistical analysis, but overall the results are better than those for the February exams, although they are not as good as in May 1984.

I have not received information about which papers were used in each centre, but expect so fairly soon.

I have also been promised information on distribution of past exams, to complete some analyses over a longer period. Now that we have had a year of four exams at each level, it may be possible to work out if the change in exam availability has affected the pass rates. The change has been appreciated by many candidates and has made things easier for those organising classes.

The number sitting for the May exams was significantly down on that for May last year, but was up on the February figures. What I do not know is how many of those sitting were attempting both levels on the one day. I would be interested to know if class instructors are encouraging students to attempt both levels at once, or if any candidates have been debarred from attempting both by the examiners arrangements.

It will be interesting to see the effect of the proposed new scale of fees on the number of entrants, and particularly on the large group of students who enter but do not turn up for the exam.

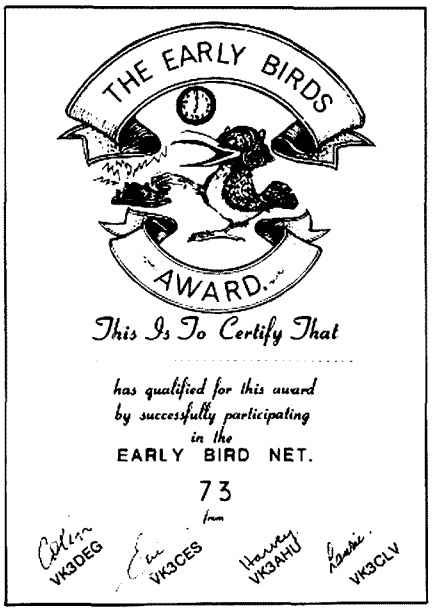
A small group of volunteers is working on producing a Study Guide to accompany the revised syllabus when it is published. Drafts of sections are being circulated as they become available, so that we can collect opinions from members who are actively involved in any classes. Any reader who is interested in assisting with this work is welcome to contact me (QTHR Call Book or any Melbourne Phone book)____I will assume that a request for a copy of the draft means that the requestor is prepared to give it serious thought and provide written comments back to the group. I would be most pleased to receive notes from members on any non-standard reference material which they have found useful, as we would like to include references with each section.

Several instructors have sent me copies of notes on sections, sets of questions, or ideas for demonstrations. These are much appreciated. I hope eventually to be able to establish a system of circulating ideas. This was what I had in mind for the Education Net (Thursdays 1130 UTC about 3.680 MHz), but the net does not draw much response. Why not drop in some evening?

73 Brenda VK3KT AR

AWARDS

Joe Ackerman, VK4AIX
5 Koomooloo Court, Mermaid Waters, Qld 4218



THE EARLY BIRD AWARD

This award has been organised by a group of four amateurs who at present are conducting a CW practise net each morning, Sundays excepted, at 2100 UTC on 3.547 MHz.

The purpose of the net is to provide encouragement and CW instruction at 10 WPM to assist Novices and Limited Call holders in their sending and receiving and to prepare them for the DOC examination.

It was considered that an award would be appropriate for those interested enough to take part in the net on a regular basis. To qualify the amateur must have participated in the net on 20 occasions and must also have reached an acceptable standard of sending and receiving. A short test passage will be transmitted at regular intervals.

Applications for the Award together with submission of the un-corrected test passage, a claim log and $1 should be sent to VK3DEG, QTHR.

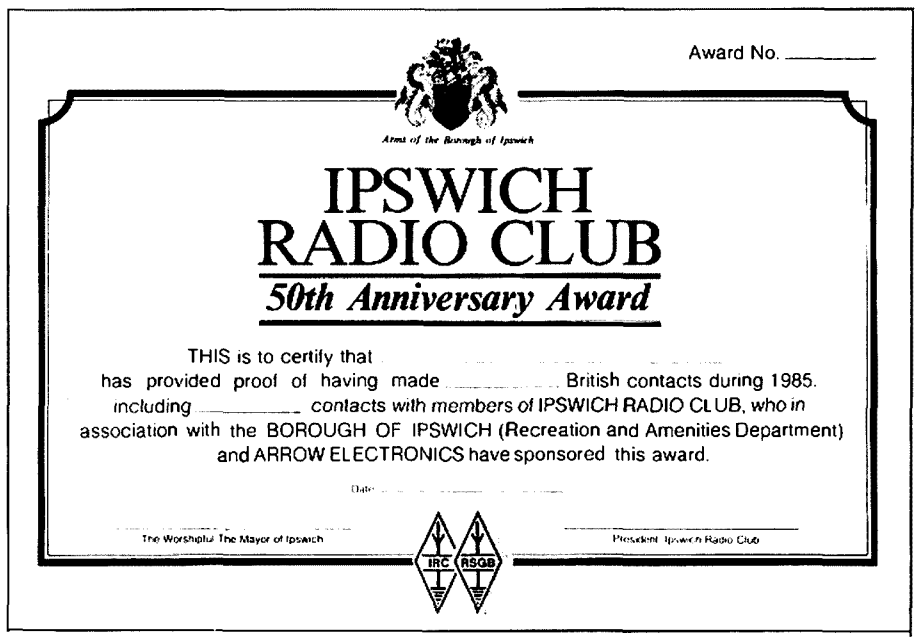
AR



IPSWICH RADIO CLUB GOLDEN JUBILEE AWARD

To celebrate its Golden Jubilee in 1985, the Ipswich Radio Club, in the UK in association with the Ipswich Borough Council and Arrow Electronics, will present a special Award Certificate signed by the President of the Club and the Mayor of Ipswich for contacts made during 1985 with Ipswich Club Members and Stations in the County of Suffolk. The rules are:—

Only contacts made during 1985 will count for the Award. The Award will be presented for 50 points, 25 of which must be for Suffolk and Ipswich Radio Club contacts. Contact with a G station will count 1 point, with a Suffolk station 2 points and with an Ipswich Radio Club Member 3 points. Each contact with the Club Station (G4IRC, G1IRC, or GB2IRC) will count as 5 points. Several special event stations using these call signs will be on the air during 1985.

Contact may be on any amateur band by any mode of transmission. The same station may count for contacts on more than one band, but only once on each band irrespective of mode. Terrestrial repeater contacts will not count for the award. If applicants so wish, Certificates will be endorsed for a single band and/or a single mode.

Contacts on bands above 1296MHz will count as double.

Applications for the Award, enclosing a list of contacts confirmed by a Club Chairman or Secretary or by a representative of a National Society (QSL cards are not required and should not be sent with the application) should be forwarded with six IRCs (or 1 pound or $2) to Alan Owen G4HMF, 102 Constable Road, Ipswich, IP4 2XA, before the 31st March 1986.

SWLs may also apply for the Award by supplying a similar list of QSOs heard between the appropriate G stations and others in their own country.

Contributed by Alan Owen G4HMF Chairman, Ipswich Radio Club.

Trivial Questions . . . ?

Q: Name the radio amateur who went mobile marine on Lake Eyre in 1975,76,77 — you see his name each month.

A: Bill Rice VK3ABP, used a trailer-sailer on the normally dry Lake Eyre during its rare but periodic filling of water.

Q: Who immortalised "The Radio Ham" by his TV portrayal and comedy record.

A: The late Tony Hancock on his comedy show "Hancock's Half Hour". The comedy sketch is also known for its phrase "It is are not raining here in Tokyo".

Q: In relation to amateur radio, what is special about Vietnam and Kampuchea.

A: The governments of these countries do not permit amateur radio.

Q: If you had an Australian callsign with /T after the suffix what did it mean.

A: The /T used to signify your station had a permit to transmit television.

Q: What did the letters ARTL stand for.

A: ARTL stood for the Australian Radio Transmitters League which was formed after the WIA and later amalgamated with the Institute.

Q: Name the four types of signals used by radio amateurs to transmit pictures.

A: Pictures are transmitted by ATV, SSTV, FAX and RTTY.

Q: Who was the man who announced the general availability of Third Party Traffic privileges for Australian radio amateurs.

A: In his opening address to the RD Contest, August 1980, the then Minister, A A Staley, announced TPT privileges would be available.

Q: Which amateur bands did the 122 set transceive on.

A: This WW2 disposals set had a frequency range of about 2 to 8 MHz and was used on 80 and 40

Q: What is a "BCL".

A: The letters BCL stood for Broadcast Listener.

Q: If you had a "split stator" it would be-

A: A split stator is a type of variable tuning capacitor arrangement with two capacitors on the one shaft.

Q: What or who are Leonids, Lyrids and Perseids.

A: Meteor showers, which occur in November, April and August respectively.

Nostalgia

STATION WITH A FUTURE!!!

Simplicity and efficiency were the slogan of the amateur transmitting station of the Federal Secretary of the WIA, B J Masters 3LM, in 1925.

Mr Masters discarded all panels and had his set laid out on a board and secured to the wall. It used a Philips Z3 in a modified Colpitt's circuit. High tension was supplied from a home-made transformer capable of delivering 3000 volts, with filaments supplied from another home-made transformer.

The receiver was a (Schnell) using a Marconi V24 as detector with 26 volts on the plate.

From The Listener In-14th November 1925

CLUB CORNER

DEVIL NEWS FROM THE NW BRANCH

At the last meeting Noel Davies VK7EG was welcomed back from South Africa and Ray MacNamara was a welcome guest.

The club now has a new rig, which is working well, so it is hoped many more stations will be worked on activities nights now.

One correction to previous notes is that the club has applied for an all mode repeater on 70cm, not that it is "an all mode repeater".

During a recent activity night much work was done on the RTTY terminal and with the help of Andrew VK7ZAP's VZ200 and portable TV, we were able to put it to air and had a very enjoyable contact with a VK3 station. It is hoped to have the RTTY broadcast operating at 1000UTC shortly, using the call sign VK7NW. It is also hoped to have a special club QSL card soon.

Thanks are extended to Rob VK7KAB and the family of the late Max Upston VK7NMU for the donation of many radio magazines to the club, from Max's estate.

It was good to see so many volunteer to man VK7NW during the RD Contest and make this a successful club exercise.

Club member Jack VK7WJ has been away for six weeks on the mainland. We all hope he has a good holiday.

Contributed by Max Hardstaff VK7KY.

LOWER EYRE PENINSULA ARC

The Lower Eyre Peninsula ARC was formed in late 1978 and over the past years has doubled in membership. Early meetings were held in members homes but with the formation of the local SES we were able to use a room in their building. We helped them erect towers for joint use and obtained our first equipment with the help of the local Lion's club.

Within a few years the SES operation became much bigger than expected and we were asked to find alternative accommodation. The local Council offered the use of land adjacent to the SES Compound and offered a loan of $1,000 to help establish our facility. We were fortunate in obtaining a Caboose for the Radio Shack and two dis-used Guards Vans for a Workshop and Storeroom.

We also "acquired" a shed — provided that we shift it from its site! In March '85 the concrete slab for the floor was laid and Easter Monday found all hands on deck to erect the "New" building. This structure has now been lined and the ceiling has been installed together with an overwhelming number of power points. This room was unofficially opened at the June meeting.

During late 1984 it was decided that, as a club, we should consider a special project for 1985, the joint celebrations of the WIA and International Youth Year. After discussion with some interested students, their schools were asked if they would like to have amateur radio as an Elective choice for 1985. Naturally we were almost killed in the rush but decided to limit the groups to 10 per class. The end result was two groups of Year 10 students at Port Lincoln High and one group of Year 9 students at St Joseph's Convent.

Term 1 was pretty solid with Video Tapes, Lectures and on air sessions during the 11 week course. Term 2 has seen workshop sessions and recognising testing and sorting components. They have also started on a construction project in two parts.

Part 1. A Two Valve Reaction Radio Receiver. Suitable for listening to Broadcast and SW Bands up to 30MHz.

Part 2. Novice Valve Transmitter. CW and AM. To be assembled as a supplement of Part 1.

A prototype to receive 80 and 40 m bands has been constructed and, although lacking in AGC, was able to resolve all signals heard on a FRG7 receiver for those bands. Students will also take part in the forthcoming contests as second ops.

Term 3 will be more Theory and after the exams in November the high spot of the year — a DXPEDITION to a nearby off-shore island. Equipment to be used will include the Rig built by the students and an early model rig built by Alf Treager. Other equipment will also be used to fill out band coverage and thus ensure plenty of contacts. The venue and dates still have to be confirmed as we are experiencing quite a number of problems. These are not new to anyone who has tried to organise a similar venture.

We have the support of the South Australian Division of the WIA and have applied to the Department of Communication for a special call sign. In between all this radio activity the students are trying to come up with a suitable QSL card and T-shirt design.

So listen out over the next few months — you may hear some of our prospective amateurs calling CQ CQ CQ VK5ALE VK5ALE VK5ALE.

Warrnambool Amateur Radio Club

The extent to which some amateurs will go to further their experience of their hobby is ridiculous; and none more so than some of the members of the Warrnambool Amateur Radio Club, in particular Russell VK3ZQB. The Club was asked by the Port Fairy hospital whether we could supply support communications for a project they were planning. Apparently they had found another individual fanatical about his chosen hobby, in this case cycling. As a fund raising event for the hospital this cyclist, Graham Woodrup, was going to attempt the seven day distance record for a solo cyclist, a record of some 46 years standing. He planned to ride back and forth between Port Fairy and Melbourne a total of five times over the seven days and break the present record of 2680 kms.

"That shouldn't be too hard" we said to ourselves. Russell, who by the way is a lot more cautious about what he lets himself in for now, said that since he lived in Port Fairy he would be able to man the base station and provide the link to the ride co-ordinators. Terrific, now all we needed were five operators who could each make one trip to Melbourne and back. Well that wasn't as easy as it first sounded since most of the event was occurring during the working week, and each trip took 30 to 35 hours. The ride was starting at 1400 on Sunday June 9th and finishing at 1400 on Sunday June 16th. One week prior to the ride we had three of the trips covered with mobile operators. By the Wednesday before the event we had four operators and negotiations were continuing to provide an operator for the vacant spot, trip number four.

On the Friday and Saturday (7th and 8th) our man in Port Fairy, Russell, installed our 2mt and 80mt equipment into one of the support vehicles, which happened to be a van owned by the local Member of Parliament that he had converted into a mobile office. So our mobile station was very well appointed with table, chair and a great heap of spare bike frames and wheels to stretch out on when we needed a kip. Russell also installed a PA system on this vehicle and UHF CBs in all four support vehicles. Very happy to help out are these Port Fairy people.

Well the clock chimed 1400 on Sunday and we were away; well at least Harry VK3XI was. This young fellow Harry (82 years young) was to be our guinea pig. The link between mobile operator and base was to be established on the Warrnambool repeater, and when out of its range we would use 80mts. After passing through Warrnambool on this first trip Harry and Russell thought they should try the 80mt system to make sure all was in order. Enter one Mr. Murphy. The mobile 80mt rig which functioned perfectly prior to the event now produced considerable audio distortion on transmit. Luckily Harry had a spare HF rig; but it was of course in his car back in Warrnambool. So Ray VK3BOH chased up the convoy, obtained car keys from Harry and headed back to Harry's car to extract the rig. Then back on the road again to catch the rider by this time at Terang.

After all this it turned out that only the microphone was at fault, so it was swapped. The Warrnambool repearter is not up on Mt. Warrnambool yet, so it only covered to just the other side of Terang. So back onto HF again. Problem number 2; noise from the SEC power lines along much of the highway between Terang and Geelong made HF impossible for the mobile operators. Formal messages were only being exchanged every two hours, so communications vehicle would have to leave the convoy and head off the highway a kilometre or so before contact could be successfully established. Andrew VK3VDE helped Russell with the HF contacts, and when he was unavailable other local full calls provided relays.

Despite the fact that the rider, and therefore the team as well, only had about three hours sleep each night, Harry was in high spirits so during spare time and breaks in power line noise he made many contacts on HF to other VK's and ZL's. The rider was due back at Port Fairy about 1900 Monday evening. Monday afternoon we received a message that our second operator, Bill VK3XE who was to take over that night, had flown to Port Pirie for the weekend and had been weathered in and wouldn't be back that day. In fact he didn't make it back until Wednesday. None of the other operators were able to do this next shift, and remember that negotiations were still in progress for an operator for trip four. Small panic! After some desperate talking the negotiatee of the fourth trip agreed to take over this now vacant second trip, in the hope that Bill would do the fourth trip if he ever returned from VK5. So Fred VK3KFL joined the team just out of Warrnambool at about 2200 on Monday night. Another major crisis averted.

This second trip was to be the worst as far as the rider was concerned. Strong head winds, bitter cold and driving rain cut his schedule to ribbons. This caused problems for Fred also as he had to be back home Tuesday night for a sleep in order to drive back to Melbourne early Wednesday morning for a meeting. The rider was most definitely not going to be home that night. Another small panic. Remember that young 82 year old Harry, well he jumped in and said he'd finish the shift for Fred. So Ray (VK3BOH) again played taxi and ferried Harry down to Winchelsea Tuesday night and brought Fred home. Harry and the team made it back to Warrnambool about lunch time Wednesday. Harry felt he knew that little stretch of road between Warrnambool and Melbourne, having travelled most of it three times at 25 K.P.H.

The rider turned again at Port Fairy to start the third trip mid afternoon on Wednesday and our operator for this trip was Digger VK3BFF. I'm not sure whether it was his calming influence but things went unusually well on this trip. By this stage it had been found that the recently modified Ballarat repeater was usable along the highway from Terang (edge of Warrnambool repeater range) right through into Melbourne. With the help of an 80 watt amplifier Russell was able to access Ballarat almost all the time. This relieved the reliance on HF. The users of the Ballarat repeater were very courteous and were many times heard to QSY to leave the repeater free for the bike ride.

By the time Digger and the team arrived home again, at 1630 Thursday evening, Bill (VK3XE) had got the wind out of his feathers sufficiently to take on the fourth trip. Again this trip went remarkably smoothly. Because the rider was several hours behind schedule due to weather encountered on trip two, this fourth trip was shortened by turning for home at Geelong instead of Melbourne. This of course shortened his proposed distance but would still allow him to just break the record if he got back to Port Fairy for the fifth time by 1400 Sunday.

Yours truly, Colin VK3DRF, was booked for the fifth and final trip, initially timed to start at 2300 on Friday night. But even with the short fourth trip the rider was behind this time. In fact he was not yet home when I went to bed at about 2200 Friday night, and it was planned that the rider would rest at Port Fairy before commencing the last trip. I set the alarm clock for 3 a.m. Now I know what you're thinking, but it did in fact wake me as programmed. I reached out from under the blankets and grabbed the 2mt hand-held; a quiet call to Russell so as not to wake the XYL, and there he was as he had been all week, the microphone almost permanently grafted to the palm of his hand by this stage. The news was that they planned to leave Port Fairy at 0500, being in Warrnambool at 0600. So I programmed the clock for 5am and went back to sleep. A quick call to Russell when I got up at 0500 confirmed that the rider was about to leave. Radio operators were picked up in Warrnambool each time; UHF provided communications between Russell and the vehicles while on route from Port Fairy to Warrnambool. So I manned the mobile station for the final, desperate trip at 0615 Saturday morning.

For the whole of this trip the rider, Graham, was battling against time in order to be back home by 1400 the next day. He would also have to ride right to Melbourne in order to cover the required distance. As luck would have it he had a reasonable tail wind all day and made good time with no major problems. Communications were also good, with the occasional relay by other amateurs when Russell couldn't quite access the Ballarat repeater. By the time Graham turned for home at Melbourne, the wind had moderated a little and he was only facing a light breeze. It was 1900 Saturday evening and a long night ahead. Long indeed, we did not take a major stop until reaching Camperdown at 0500 Sunday morning. We slept, and I mean slept, until 0730 when we had a quick cuppa and hit the trail again. Calculating ahead it appeared that if we could keep Murphy (hallowed be his name) at bay we should make Port Fairy a little before 1400. When we reached there Graham would have exceeded the record by a margin of 4km. Tight schedule!

The closer we got to Port Fairy the more people we passed on the side of the road who were there to cheer Graham on. This public support lifted his spirits, and even though he could hardly sit on the saddle, his posterior being somewhat tender, he lifted his speed considerably. We passed through Warrnambool at 1210 and made the Port Fairy post office at 1300. He had broken the record but still had to ride for the last hour to complete the seven days. So he completed two circuits along back roads around Port Fairy to notch up a further 30 kms before his triumphant finish at 1400. The record attempt had been successful and had also raised a large amount of money for a new wing at the Port Fairy hospital.

The club had also made a significant achievement. We had provided experienced operators and radio equipment, including the repeater systems, free of charge at very short notice. Despite the difficulties we had faced with the length of the event, the schedule changes and our personnel being held hostage in VK5, we had provided an invaluable communications link for the organisers and travelling team. For the entire week we left the team without communications for a total of only thirty minutes. Much of this achievement was due to the efforts of Russell VK3ZQB who was contactable nearly 24 hours a day for the entire week. He was later honoured by the Port Fairy hospital board by being presented with a life governership of the new wing. This honour is also shared by the Warrnambool club and indeed by amateur radio at large.

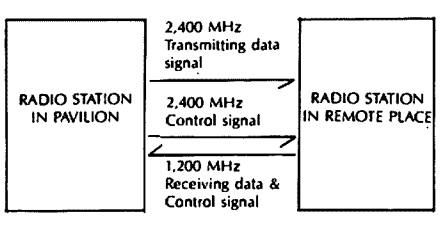
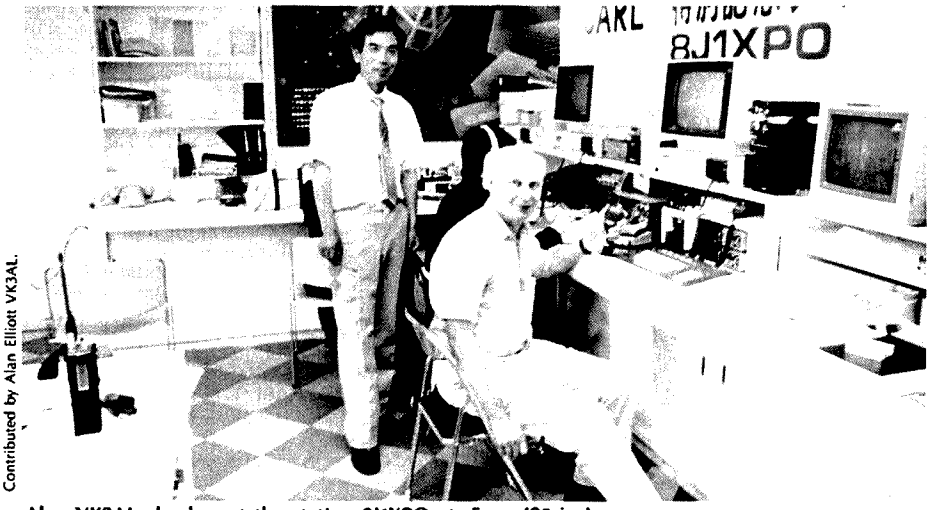
TSUKUBA EXPO '85

OUTLINE OF COMMEMORATIVE AMATEUR RADIO STATION 8J1XPO

For the first time in amateur radio communication, this system was designed to control an HF transceiver TS-940 from a remote place equipped also with TS-940. The Control Station transmits an analog signal for transmitting data and a control signal, both on the 2,400 MHz band. The Main Station transmits a 1,200 MHz analog signal for receiving data and a control signal whenever needed.





Contributed by Alan Elliott VK3AL.

Alan VK3AL checks out the station 8J1XPO at Expo '85 in June.

FORWARD BIAS

VK1 DIVISION

Ken Ray
PO Box 710, Woden, ACT 2606

NEXT MEETINGS

The remaining meetings for 1985 are:
23rd September Power Supplies
28th October Packet Radio (to be confirmed)
25th November End of Year Social
Meetings are in the Griffin Centre, Civic, and doors open around 7.30 to 7.45, with the meeting starting at 8.00 pm. The bookstall and QSL bureau are available at the meeting.

VK1 AWARD

An update on the VK1 Award from the Award manager, Phil VK1PJ, listing those who have gained the award this year (to July 1985):

Call	Cerificate Number	
JA1EF	*147*	
VK2PZC	*148*	
VK1GB	*149*	*+ Gold upgrade*
VK4VAT	*150*	*+ Bronze upgrade*
VK3PXC	*151*	*+ Bronze upgrade*
VK2ERJ	*152*	*+ Gold upgrade*
VK2JBM	*153*	
VK2PKT	*154*	
VK3DYL	*155*	
VK2PZW	*156*	
VK7DS	*157*	
VK3YH	*158*	*+ Bronze upgrage*
VK1NDK		*Gold upgrade*
VK3KJI		*Silver upgrade*

For those looking for VK1 stations, the VK1 award net is run each Sunday evening on 3.570 (+/- QRM) MHz, after the VK1 Divisional broadcast, around 1030 UTC. Phil would particularly welcome those VK1 stations that rarely (or never) join the net to come up.

UHF REPEATER

The VK1 UHF repeater has been moved to a new site, on Isaacs Ridge, on the south side of Canberra. Further testing is taking place prior to its final installation on Mount Ginini.

MEMBERSHIP REPORT

As at the end of May, membership stands at 219. This is comprised of 184 full members, 9 country, 12 associate, 3 pensioner, 5 student, 3 family and 3 life members. During the 6 months January to June 1985, the Division welcomed 14 new members:-

JL Vardanega, JE Chapman, WD Fallow, RW Walker, ES Chan, DA Card, CJ Wylkes, T Van Andel, H Daniell, NGC Sutton, C Young, A Craig, HPA Van Roy, CR Bollard.

Additionally, a small number of new members have come into the ACT and have transferred to the VK1 Division. Unfortunately, the new computer system does not show up these transfers as they arrive.

That note was from Richard Jenkins VK1UE, the VK1 Divisional Secretary.

VK3 WIA NOTES

VICTORIA 150

VIC DIV COUNCIL

Portfolios decided upon at the May, 85 Council Meeting were Alt. Fed. Councillor Des Clarke VK3DES. VT.A.C. Co-ordinator Peter Mill VK3ZPP. Public Relations Officer Jim Linton VK3PC. A.R. Liason Bill Wilson VK3DXE. Inwards QSL Bureau Barbara Grey VK3BYK. Outwards QSL Bureau Des Clarke VK3DES. Library & Historical John Adcock VK3ACA. Classes Organiser John Adcock VK3ACA. Intruder Watch Steve Philips VK3JY. Book Officer Barry Wilton VK3XV. Office Secretary Maxine Conheady. Education Officer Fred Swainston VK3DAC. Minute Secretary Margaret Wilson.

REPEATERS

The new site for VK3RGL at Mt. Anakie has taken more than 2 years of negotiation with various Government authorities and is now being finalised. This is a combined effort by Vic. Div. and The Geelong Amateur Radio Club and will mean a new permanent site and a rebuild of VK3RGL. Vic. Div. Council and V.T.A.C. have been engaged in a programme of upgrading existing repeaters, and the construction and installation of a number of new ones.

R.T.T.Y. FIXER'S GROUP

This group under the direction of Fred Mc CONNEL VK3BOU has been engaged in rebuilding Seimens M100 teleprinters for use by interested amateurs for some considerable time, and offer instruction on rebuilding and or repair of these units. If you are interested in joining this group then contact the divisional rooms for further details.

A warm welcome is extended to these new members of the Victorian Division.

J C Beverin VK3KAM, Rohan Bushell, Gary Carroll VK3NCG, Michael Davies, Kenton Dean NK6F, James Ferrier VK3MC, Arthur Forecast VK3AM, Mario Gallucci VK3PBB, Biron Hardinge.

J E Hunt VK3DSC, Martin Luby, Ian McDonald VK3AXH, Robert Marshall VK3DSS, W F Massey, Raymond Meany VK3HA, Frederick Messemaker, Bill Nicholls VK3WX, Hendrik Pillekers VK3CAQ.

VK4 WIA NOTES

Bud Pounsett VK4QY
Box 638, GPO, Brisbane, Qld. 4001.

A WORLD FIRST FOR QUEENSLAND

For some several years, the South East Queensland Teletype Group have been running a weekly news broadcast. This has been on the group's 2 metre repeater, VK4RBT, each Monday evening at 1000UTC. When possible the broadcast has been made on HF, first on 40 metres and then on 80 metres. Until recently, the HF broadcast was heard at irregular intervals.

Early this year, Rob Green VK4KUG took over as the groups news co-ordinator and station manager. Rob has brought a fresh approach to the RTTY broadcast. He has changed the format considerably. The news now covers international, national and local items and runs usually for some 40-45 minutes. The number of stations calling back after the news has reached an unprecedented high, proving the popularity of this weekly bulletin. Through the Queensland Division's news editor, Rob is able to select suitable items from the WIA news sources, as well as from other avenues. Often the VK4WIA Sunday Morning Broadcast contains items from VK4TTY news sources, so there is a two way flow of information.

Several members of the very progressive South East Queensland ATV Group were copying the RTTY news and their president, Arnold Youngberg VK4SU, approached Rob with a brilliant suggestion. – What about printing up the RTTY news on the ATV Groups' Vision Repeater, VK4RTV on UHF, channel 34? – Rob quickly gave his consent and so each Monday evening at 8pm, up comes the bulletin on channel 34.

The result was quite spectacular, not only were local amateurs watching it, but many others also. So much so that the ATV Group were inundated with requests for details of antennas and pre-amplifiers for better pictures. Tom Ivins VK4ABA, the groups' secretary, even had to re-write the antenna construction details in layman's language for the non-amateurs including girls from one of Brisbane's private schools.

Here in Queensland, we are claiming a world first in amateur radio, RTTY news printed up on UHF amateur television regularly, each week. VK4TTY news is now on VK4RBT, 3.630kHz and UHF channel 34, Monday, 1000UTC.

SBS, ATV AND ALL THAT

SBS television has come to Queensland, at least to Brisbane. It is transmitted from Mt Coot-tha from the ABQ2 site. Its arrival was not without drama and some gnashing of teeth amongst the ATV fraternity. The SEQ ATV Groups' repeater, VK4RTV, was operating in beacon mode to assist amateurs who had built the groups' down converters at the same time as SBS had a test transmission going on channel 28. The problem was that antenna installers were aligning UHF TV antennas on VK4RTV instead of the SBS signal.

Whilst VK4RTV had vision identification, there was none on the SBS transmission. SBS were using a test card and caption scanner from the ABC at the channel 2 site.

The crunch, for the ATV Group, came on 25th June, when a message from DOC, Canberra, ordered VK4RTV off the air. In relaying the instruction from Canberra, the Brisbane DOC office was most courteous and sympathetic and, for their part, the ATV Group complied without hesitation.

After SBS were established and programming began, the repeater was allowed back on the air. It has shown the tenuous hold that we have on the temporary allocation of 576-585MHz. The footnote in the Australian Table of Frequency Allocations (AUS30) states, "The band 576-585MHz is also allocated to the amateur service until such time as the band is required for use by the broadcasting service".

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

One of the biggest costs in our annual budget is the Journal but, whenever members complain of rising costs in the form of membership fees and it is suggested that one way to cut these costs would be to do without our bi-monthly Journal, a great wail of protest goes up. South Australia has had its own Journal for so long that most of us couldn't envisage the Division without it. But we give you fair warning here and now — you may have to!!

This year has not been an easy one for Bill Wardrop VK5AWM as Journal Editor. First our printer went out of business and there was the problem of finding another one. Recently Bill has had to give up personal study commitments in order to spend more time on the Journal and has advised Council that he will have to give up the position as Journal Editor at the end of 1985. So, we are now looking for a replacement for Bill, as Journal Editor, preferably one with a computer, but it's not mandatory! Please let us (Council) know if you are interested.

However, our Journal problems do not end with the Editor! Some months back it was decided, because of a lack of volunteer help, to have the Journal collated by the Printer, this once again comes out of your pockets! At the last Journal "collation" night (the journals still have to be put into envelopes along with ESC/Publications order forms, and address labels stuck on) only FOUR volunteers turned up! Along with myself and Bill, were Joy VK5YJ and John VK5NX. Now I don't doubt that there were some people who had legitimate excuses, but what happened to the rest of you? I have heard people say that they don't go because it goes on so late — of course it runs late if you only get four volunteers! I realise that there are many country members who can't help in this respect but I'm sure that Bill or John Butler, our technical Editor would be delighted to receive articles from you. We can all do something — with apologies to John F Kennedy — Ask not what your Division can do for you, ask what you can do for YOUR DIVISION.

Finally, a happy and a sad note for two VK5s who do work hard for all of us. To Steve VK5AIM our deepest sympathies on the death of his wife Chris, and to Eric VK5LP our congratulations on being awarded the Medal of the Order of Australia, for Services to the Community.

DIARY DATES

Tuesday 24th September — Display of members equipment, with both the ICS AWARD, and the MILLAR AWARD being donated, for the best overall piece of equipment and the most improved/best newcomer, respectively. Several ESC Vouchers will also be awarded, so bring along that homebrew gear and make it an interesting evening for all.

AR

QSP

FLINDERS ISLAND DXPEDITION

The Lower Eyre Peninsula Amateur Radio Club (LEPARC), noted for its very impressive Matthew Flinders Award, is proposing to make a substantial DXpedition to Flinders Island. This is NOT the large island at the eastern end of Bass Strait, but a sizeable island about 30 km off-shore from Elliston on the west coast of Eyre Peninsula.

The operation will involve up to 60 people, mainly students of the Club's very successful Novice certificate course which has been run in conjunction with the Port Lincoln secondary schools. They will be ferried to and from the island in three or four groups over the period 22 November to 1 December 1985, so that all may enjoy for a few days a unique "Wild Australia" experience very appropriate to International Youth Year.

Supervision of the whole expedition, including the amateur operating, will be the responsibility of LEPARC, which has been planning the activity since early this year. It is expected that the special call sign VI5IYY will be used, marking both International Youth Year and the WIA 75th Anniversary.

VK3ABP. Information from VK5PWA.

READ MACHINE

The State Library of New South Wales has become Australia's first library to own a reading machine for used by the visually handicapped.

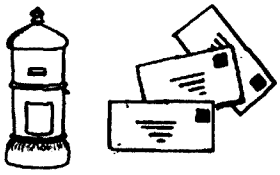
The Kurzweil machine, which cost $51,000, was said to be the most advanced system in the world which automatically read print materials aloud in a synthesised voice.

Contributed by Jim Linton VK3PC.

AR

THE ONLY EXERCISE SOME PEOPLE GET IS:

- Jumping to conclusions
- Side-stepping responsibility
- Running down friends, and
- Hopping on the bandwagon



OVER TO YOU!

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publisher.

GREAT QUALITY!

The 75th Anniversary Calendar (for the whole year) is really great.

What about putting such a calendar into Amateur Radio every year? What do other members think?

Also AR is excellent. Keep up the great quality.

Best wishes

Norm Melford VK3ZTN,
Old Coonara Road,
Olinda, Vic. 3788 AR

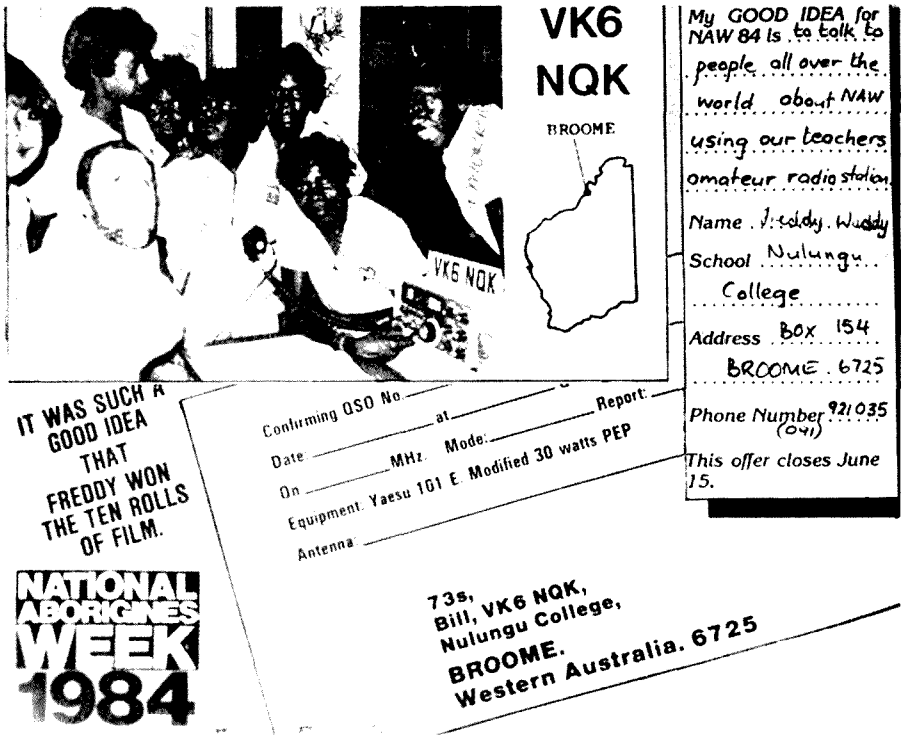
NATIONAL ABORIGINES WEEK

For the past three years our students have celebrated National Aborigines Week by helping me run my station for that week. Many contacts were made and the resulting exchange of names and other information promoted a great feeling of camaraderie.

Many thanks to all amateurs who took part and who have spoken to our students on other occasions.

Sad to say, when NAW is celebrated in September, I will be in Rome so there will be no amateur radio exercise as part of our activities — unless the Holy Father lets me loose with Vatican Radio!

Yours sincerely,
Br Bill Marchant VK6NQK,
Nulungu College,
Box 154,
Broome, WA. 6725



From Diawal-Idi Magazine - September 1984.

HAPPY 75ER!!

It is with much pleasure, I acknowledge receiving your presentation clock.

It has taken pride of place in the "shack".

Once again I thank you for your generosity. It has added a bit more enthusiasm to learning that confounded CW!

Yours gratefully,
I C Kemp L50129,
Box 578,
Millicent, SA. 5280

COME ALONG!!!

During the weekend of 26th and 27th October, the Wagga Amateur Radio Club are to hold an Amateur Radio Convention and Hamfest. This will be a continuance of the long tradition of conventions and hamfests reaching back to the origins of amateur radio in the Riverina area.

A new *dimension to* this years convention will be the inclusion of the inaugural Australian National Fox Hunting Championships. The purpose of the championship is to find the Australian champion fox and hidden transmitter hunter.

In addition to the National Championships, the convention will also conduct hunts for the beginner and more professional hunters in the local hunts. Parts of both the national and the local hunts shall be televised back to the convention site by the local ATV repeater. The local surrounds of Wagga provide a magnificent backdrop to the running of both events.

Many trade displayers will be descending on Wagga Wagga for the weekend. This will provide an excellent venue for the perusal of the most recent technological releases into the amateur radio field. Of course, all displayers will be looking to lighten the load on the return trip so bargains are sure to be the order of the day. And of course, there will be the trading tables, where someone's 'junk' is anothers goldmine.

There are many displays to be featured including a vintage steam engine display, remote controlled aircraft display, vintage radio display and many other exciting activities.

Accommodation in Wagga Wagga is first class. There will also be accommodation available at the actual convention site. To ensure your reservation, contact the Wagga ARC, Post Office Box 294, Wagga Wagga, NSW. 2650. Phone: (069) 26 1532.

Yours faithfully,
Peter Clee VK2KZZ,
Publicity Officer,
Wagga ARC,
Box 294,
Wagga Wagga, NSW. 2650.

FURTHER TO....

Consequent to my interest in statistics, the article 'Editor's Comment' page 3, AR July 1985, absorbed my attention for some time. As an experiment, I extended on Bill's figures, with a conversion to (real terms), reproduced below. Figures are approximate and are rounded off.

COMPARATIVE WORK EFFORT REQUIRED TO PURCHASE AR MAGAZINE

YEAR	APPROX TIME WORKED FOR ONE ISSUE IN MINUTES	APPROX TIME WORKED FOR ONE PAGE
1945	11.5	35 sec
1949	15.5	47 sec
1953	16.5	54 sec
1985	8.0	9 sec

Thus we see that AR *magazine has never* been better value than today. Pundits of socio-econo maths will produce variations to my figures, but they will still be comparative, with minimal influence on the results.

Bill suggests the present price of AR is about $1.00 per issue, from members subscriptions — even at $2.00, it would be the best value ever.

So Bill, your comment is valid — "Can you afford not to belong to the WIA?"

De
Reg Glanville VK2ELG,
63 Buffalo Cresent,
Thurgoona, Vic. 2640.

AMATEUR SPIRIT ALIVE AND WELL

Service to the community is part of the Amateur Code of Conduct, especially during natural disasters and emergencies. Recently I noticed an example of co-operation with the public, which should not go unnoticed by our readers.

Apparently, communication between Australia and Antarctica is difficult for VK0 operators due to the local circumstances and the many other duties they have to attend to. Also, there is a very heavy demand on the official telephone link with the main land.

I gathered that much from a very interesting QSO between VK0AJ and Stan VK3DSW, who had two members of a previous antarctic expedition with him in the shack, who were busy exchanging scientific data with VK0AJ.

The radio link was professionally conducted and maintained by Stan VK3DSW, for almost three hours, during which conditions changed, QRM had to be kept to a minimum, and equipment monitored.

Perhaps this is not a rare occurrence, except that Stan is handicapped and TPI from war service in New Guinea.

Ted Struys VK3DGC,
10 Dolphin Street,
Mt Eliza, Vic. 3930

SPIRIT OF AMATEUR RADIO

I wish to draw attention to an action by VK3CJT recently, which I consider worthy of approval and appreciation as being in the real spirit of amateur radio. We hear often with dismay about deliberate interference, bad language, unwarranted criticism on the amateur bands and it is pleasing to observe the other side of the coin!

The Early Birds Net offers Morse code practice each day and each evening at 10 and 15 WPM VK3s DEG, AHU and CLV are those I have heard in this service and I feel that the format of this net is excellent for Novices wishing to upgrade and Full Calls wishing to improve above the DOC level.

On the occasion under discussion the participants were delighted to hear that VK3VJT had passed the 10 WPM DOC test and congratulations flew thick and fast. Then VK3CJT came on and offered to relinquish his call sign so that 3VJT could apply for it now that he had upgraded. I consider this to be a very generous gesture and a complete contrast to other activities which occur from time to time. Long may this type of co-operation and kindness continue in the amateur radio fraternity. Sincere commendations to VK3CJT. May you have a long career on our bands. I know that with a kindly attitude like that you will surely make MANY friends.

Yours faithfully, Rex C Black VK2YA
562 Kooringal Road,
Wagga Wagga, NSW, 2650

TRUE SPIRIT OF AMATEUR RADIO

I would like to compliment Doug McArthur VK3UM and his group for their VHF achievements described in July Amateur Radio. I have followed VHF activities, somewhat inactively at times, since 1950 and have attended VHF group meetings from that time up until their demise a few years ago. I learned that, of all the inter capital paths, the Melbourne to Sydney path was probably the most difficult, being too mountainous for tropospheric enhancment modes and too short for sporadic E.

Tropospheric scatter was always a possibility. Not only was this mode used but a new mode of propogation has been pioneered. This type of activity is in the true spirit of the amateur radio experimenter and is therefore worthy of all encouragement. Even the effort involved in constructing the equipment is considerable and is the type of effort that results in worthwhile discoveries.

There are two questions that spring to mind from this exercise. When and by whom was tropospheric scatter first utilised between Melbourne and Sydney and, not wishing to detract from the achievement of the group, has Aircraft Enhancment of VHF/UHF signals been described previously for propogation over considerable distances? If it has not been previously described then the achievement of the group is remarkable.

Yours faithfully, J A Adcock VK3ACA,
12 Albert Street,
Oak Park, Vic. 3046

CORRESPONDENT WANTED

Recently I received a letter from Arnold Feldman WB3DAO, holder of a General Class Licence, and resident of Maryland, USA.

Arnold is keen to correspond with any Australian amateurs, SWLs or prospective amateurs, to learn more about our way of life and establish new friendships.

He is interested in stamp collecting and would be happy to exchange photos, post cards and bumper stickers.

His address is PO Box 700, Jessup, MD, 20794, USA.

Best 73,
Kevin Moore VK3ASM,
17 Haddon Court,
Mitcham, Vic. 3132.

LOCATION OF GEOSTATIONARY SATELLITES

The May 1985 issue of AR carried an excellent article on the location of geostationary satellites using a Commodore 64 home computer. Due to Murphy's Law, the accompanying "programme" had to be reproduced in the June 1985 issue. I have not tested the programme as I have a Microbee computer and have no reason to question its accuracy. I base the following comments on the assumption that the satellite position maps published each month in the US magazine Satellite World (formerly Satellite Orbit International) are accurate. I have also assumed that Degrees West greater than 180W can be expressed as Degrees East by subtracting from 360.

My first query is about the present status of ATS-1. I have an Experimenters' Guide issued by NASA in 1980. It mentions its location as being 149 degrees West Longitude, and that the preferred channel is #3 (Uplink 149.22 MHz; Downlink 135.6 MHz). This frequency pair is still allocated to several Australian educational institutions in the current public-release edited version of AMFAR (Australian Master Frequency Allocation Register). I have not heard ATS-1 in Melbourne recently, admittedly using only a vertical antenna, and I have heard that NASA handed over control to the University of Hawaii. This may explain a change of the downlink frequencies to 136.46 MHz and 137.35 MHz, as stated in the May issue. (Only the latter frequency is shown in AMFAR.) I cannot see why ATS-1 would have moved to "191.78W". There is a good article on ATS-1 in the October 1980 issue of 73 Magazine.

My second query is about the (proposed) location of AUSSAT-3 at 160E. Most published sources show the locations of AUSSATs 1, 2 and 3 as 156E, 160E and 164E respectively.

The "new Japanese weather satellite situated at 220W" (140E) would have to be touching the Russian Gorizont 6 which also shares that spot. 2280 MHz is not allocated to spacecraft in AMFAR, but the nearest locations are 2275 MHz and 2287.5 MHz.

Geostationary satellites tend to be spaced at least 1 degree apart (although I have seen nothing to suggested that they cannot be closer), so I am puzzled by the satellite named SIRO at "295.65W" (64.35E). It would be very close to the Italian SIRIO at 65E and Intelsat V F5 at 64E. The frequencies of 136.1376 MHz and 136.1381 MHz are not listed in AMFAR, but that proves nothing.

The Editor's Note left me puzzled. Even if ATS-1 is at 191.78W (168.22E), computed Azimuth of 324 degrees from 37S, 145E would be impossible. A satellite at 168.22E would be east of true north (=145E), and the azimuth would be around 35 degrees. Your calculation for AUSSAT-3 is similarly incorrect.

I have a programme adapted from one published in 73 Magazine, January 1982, page 62. I used it to locate Intelsat IVA F3 (179E or 181W) from 37:51:49S, 144:44:45E, and computed azimuth as 47.971 degrees: elevation as 33.4987 degrees. This has been confirmed by actually receiving TV signals from that bird at one of AR's advertisers' premises (GFS Electronic Imports). Their programme produced the same co-ordinates. Co-ordinates for most TV satellites visible from VK state capitals and Auckland have been published with my article on Satellite Television in Amateur Radio Action, Vol 8 No 1.

Ash Nallawalla ZL4LM/VK3CIT
PO Box 539
Werribee, Vic. 3030

TECHNICAL EDITORS COMMENT

The mistake in the test data is mine. I transposed some headings and data. The correct data, that I had intended to include is —

	AUSSAT 1	AUSSAT 2	AUSSAT 3
Location (°E)	156	164	160
Range (K)	37382	37589	37472
Elevation (°)	45	42	44
Azimuth (°)	17	29	24

Any distress that this caused is regretted.

The position of the various AUSSAT satellites was provided by AUSSAT who confirmed, after receipt of this letter. The number of the satellite gives the chronological order, based on launch dates.

Finally the position of the Applied Technology Satellite (ATS-1), according to my information, agrees with the letter writer. However, as this satellite was launched decades ago, it most probably is "dead" to general users. **AR**

HOW ABOUT SOME TRIVIA?

On the ABC broadcast station 2BL, a question was asked 'Where did SOS and Mayday originate from?'

Perhaps we could start a Trivia column! If it's not too 'heavy', I'll even volunteer to edit it.

Kind regards, sincerely,

David A. Pilley VK2AYD,
15 Forest Glen Crescent,
Belrose, NSW. 2085.

What do readers think? If enough suitable contributions are forthcoming, we may accept David's offer. Ed.

Obituaries

JIM POWELL VK2CK

Jim, who was generally known as 'Captain Kangaroo', was taken ill whilst on holiday with his wife and two young children, in India. He flew to Houston, Texas, where he passed away in hospital on 8th July 1985.

Jim was an American, but had lived in Australia for the past ten years and was very active on the DX circuit. He will be sadly missed by all his amateur friends.

Deepest sympathy is extended to his wife and children.

Paul Christoforidis VK2DOU

CLAUDE D'EVELYNES VK2CD

It is sad to report the passing of Claude at 2AM on 16th June 1985.

Owing to ill health, Claude has not operated his station very much in recent years, although he was still a keen radio enthusiast.

Claude was a co-founder of the Christian Radio Missionary Fellowship and his contribution to this work of radio communications in Papua-New Guinea was his principal employment until ill health forced him to retire.

To his wife Betty we extend condolences.

P J Evans VK2KEV

FRED SIZEMORE VK2ARU

It is sad to report the passing of Fred Sizemore VK2ARU on the 29th May 1985, in his 83rd year.

Fred was a real "old timer" in amateur radio and will be remembered by those active in pre-war years. He resumed activities after WW2 and a few months back changed to SSB.

He had not been enjoying good health and had a sudden fatal heart attack on the morning of 29th May.

Deepest sympathy is extended to his wife and family.

Bill Bullivant VK2BC

MANFRED (TED) DOUGLAS HUDSON VK4MH

Ted Hudson VK4MH, first became interested in radio at school in Brisbane when 4QG was the only station operating and crystal sets were all the rage.

He built his first one valve crystal set in 1926 and later experimented with musical broadcasting at Mt Isa in 1934.

During WWII he worked as a crane driver on the Cairns wharves loading vital war supplies for the Pacific campaigns.

In 1949 he became a fully licenced amateur with the call sign VK4MH and in 1967 was a foundation member of the Cairns Amateur Radio Club, he actively participated in club events and was later awarded life membership.

In March 1956, Cyclone Agnes struck Cairns and official communications were disrupted. Ted, along with other amateurs, handled all the telegram traffic between Cairns and Brisbane, until services were restored.

Ted also stood radio watches with North Queensland WICEN during Cyclone Tracy in 1974 and later during Cyclone Allen in 1976. He also participated in WICEN-SES exercises in the Cairns area.

Ted, known as 'Ted One', was a regular on the Coral Coast Net, along with his cat 'Blue', who had a good microphone voice. Ted was also a member of the RAOTC and will be missed by all in North Queensland.

All of Ted's fellow amateurs were indeed saddened by his passing and their deepest sympathy is extended to his son Doug, daughter Gloria and their families.

Ted Gabriel VK4YG (Ted Two)

RONALD NEWTON RIDE VK2BQF

Ron was born in England in 1919 of Australian parents. He passed away after a short illness on 30th June 1985 at the Woden Hospital in Canberra.

Ron's early years were spent in Tasmania. His parents were keen musicians and kindled his love of music. An uncle who had an aptitude for things mechanical and electrical stirred his interest in these fields. When the family moved to Melbourne, Ron studied at the RMIT and gained his Diploma on Chemistry and Physics. At the same time he also learned singing and developed a fine bass voice which he used on many occasions for charitable and humanitarian purposes. In 1939 he joined the Munitions Supply Laboratories and was transferred, in 1942, to the MSL Branch Laboratories at Penfield, SA.

During his stay in Adelaide he married and also studied the pipe organ. It was during this time that his interest in amateur radio crystallised and Ron began studying for the AOCP.

On returning to MSL in Melbourne after the war, he began research on corrosion. In 1946 he passed the exam for AOCP and became licenced as VK3NH.

When Ron retired from the work-force he moved to Merimbula, NSW where he became actively involved in community affairs including the local radio club.

Over the years, as a result of his outgoing personality and intense interest in many fields, he made many lasting friendships, both in the social field and that of amateur radio. For some years a member of the South East Asia Net (SEAnet) and in recent years in contact with personal friends, he led a full life, always ready to help those in need.

Ron's passing is a sad loss to the community and to amateur radio.

He is survived by his wife, Doris, sons John and Bruce and daughter Joanna, to all of whom we extend our deepest sympathy.

James Blackwood VK3ABL

SELWOOD CHARLES (JIM) AUSTIN VK6SA

Jim passed away on 18th June 1985. His death brought to a close a long career in amateur radio. He was a member of the FCO CW Club and a MIRE.

Born in 1902, Jim completed his formal education at Perth Modern School and soon became interested in radio. His introduction was via a home brew receiver, the antenna being the top strand of the home wire fence. He learned Morse code and increased his speed by copying VIP, the local coast station, and any readable ship station.

Jim's amateur activities covered many years from the 1920s until shortly before his death, the only gap being during the wartime shutdown.

Finally a change to a QTH in a block of units for the aged and risk of TVI proved too big a problem.

Early in his amateur life he was active in the old Subiaco Wireless Society and later in the WIA. Interest in VHF on the old 5 metre band resulted in many debased valves and various antenna arrays. I believe he shared an early distance record on this band.

However his main activities centred on the HF bands, where he made many thousands of contacts. VK6SA was a very familiar call sign in all parts of the world, especially the USA.

In 1921 Jim sat for and obtained a first class commercial certificate and went to sea in the old MV 'Kangaroo', an early motor ship of rather strange appearance. She had four masts but no funnel.

Various appointments followed and when I first met Jim, he was installing radio gear in an ocean going tug at Fremantle prior to a towing voyage, in the late 1920s.

Our next encounter was upon the foundation of the WA Police Radio Branch. The then Commissioner of Police, inspired by the famous Scotland Yard 'Flying Squad', decided to institute a similar patrol system in Perth. Formed in 1930, it used two Speed Six Bentleys and wireless telegraphy.

The PMG's Wireless Branch insisted upon certificated operators being employed, so four ex marine WOs were recruited. For five years rented transmitters and receivers were used, but in 1936 the system was taken over by the WA Police and Jim was appointed OIC

From then on Jim's and the WA Police's radio history ran on parallel courses.

Opposition and prejudice from senior officers in the traditional force had to be overcome and some situations were complicated by Jim, who was not renowned for his diplomacy and tact when aroused.

However his technical ability and skills in improvising resulted in much of the radio gear being built at VKI, especially during the war years, when commercial firms were too busy with war orders. Over the years the system grew until it was statewide and handling traffic from Police HQ in all states.

Many memories come to mind which demonstrate his true amateur qualities. One time, in 1932 during a police expedition to the Warburton Ranges to investigate reports of murders, Jim was taken along as communications officer. Jim's equipment was a homebrew transmitter and receiver and a camel. Not being on good terms with the camel, he

chose to walk most of the long distance. Jim kept schedules most evenings using a hand cranked HT generator and passed traffic through VIP Perth or VIO Broome radio stations. The generator he used is now preserved in the museum at Wireless Hill, WA.

After his retirement in 1962 Jim undertook some installation and relieving work for the Royal Flying Doctor Service, in the north west of WA. Typical of Jim, he undertook a solo visit to the USA at the age of 82 years to fulfil an old ambition.

Vale Jim.

W S Watson VK6WW.

HARRY SIMMONS VK6KX

One of the early pioneers, Harry was like the equipment he constructed, built to last a long time. Sadly, all good things have to end sometime and Harry died early in July aged over 80 years.

As a young man, Harry went to sea as a merchant ship radio officer at short notice. We are told that his first job on entering the radio room was to reconstruct the equipment. Harry came ashore in 1929, and joined Musgroves, Perth, in the service department, working on the new wireless receivers. One year later, in 1930, Musgroves Limited obtained the first commercial station license in Western Australia, from the PMG. This was radio 6ML.

Harry Simmons was the obvious choice to supervise the building of the transmitter and he became the station's chief engineer. (This transmitter is now in the Wireless Hill Museum in Perth).

Three years later, WA Newspapers formed radio 6IX in Perth and in 1936, 6WB Katannine and in 1941, 6MD in Merriden. Harry was, of course, the network's chief engineer.

An early member of the legendary Subiaco Radio Society, Harry helped many members with this new hobby of wireless. The walls of his shack were covered with rare QSL cards, from all over the world.

A true pioneer of Australian radio, he was a Fellow of the IREE Australia and an early member of the WIA. He is survived by his wife Elizabeth (Peta) and his daughter Helen and son Robert.

Douglas Gordon
Vice-President, VK6 WIA Division

FRANCIS MICHAEL NOLAN VK4FN

Francis Michael Nolan VK4FN was born at Coraki NSW on 5 October 1910, the son of a publican. Frank left school at the age of 14 and was apprenticed as a motor mechanic at Lismore. Whilst an apprentice Frank became interested in radio and became an early member of the thriving Queensland Radio Transmitter's League. Frank obtained an experimenter's permit and was allowed to transmit over a distance not exceeding 2 miles (3km).

Frank continued his studies by moving to Sydney where he obtained his diploma in radio engineering at the Australian School of Radio Engineers situated at the STC Laboratories, Waterloo, Sydney. Here he became a member of the Australian Radio Transmitter's League.

Always liking a warmer climate Frank returned to Brisbane as a qualified radio technician, gained the call sign VK4FN, and, after a brief period with Ben's Radio Service, became self employed.

Naturally his interest in amateur radio was strong and he became a member of the WIA on 5 March 1833.

During the Great Depression business was poor so Frank secured a permanent job with the PMG Department, initially as a telephone technician but after topping Queensland in their trade exams, as a radio technician.

In 1939 Frank started his long association with Rockhampton and was placed as OIC of the local broadcasting stating 4RK. Being in a reserved occupation Frank was unable to enlist but in 1945 spent a year in Port Moresby establishing 9PA.

Frank then returned to Brisbane in 1946 and once again VK4FN was heard on air. Frank was very active in WIA affairs when the Institute was re-established after the war and was Federal Councillor in 1947, 1948. Frank then started his long association with the Amateur Advisory Committee in which area he has assisted countless amateurs. Frank was also an enthusiastic supporter of WICEN activities.

In 1951 VK9FN was heard when Frank was promoted by the PMG Department to be in charge of broadcasting in the Territory of Pupua and New Guinea. In 1952 Frank led moves to establish the VK9 branch of the Institute and was its first President until he was retired from work early, on health grounds, in 1958.

After a spell in Brisbane, Frank returned to Rockhampton where in 1960 the WIA CQ Branch was formed with Frank as its inaugural president and the late Hal Hobler VK4DO its inaugural secretary.

After 5 years as President of the WIA CQ Branch Frank then stood down and in 1969 returned to Brisbane. Frank since then was a tower of strength at the monthly general meetings of the Institute and in his own inimitable way broadcast the weekly news broadcast on 80 metres for over 10 years.

The Institute in Queensland has honoured Frank VK4FN by awarding him Merit Badge No 3 and more recently in awarding him the Institute's highest honour — Life Membership of the Wireless Institute of Australia.

Frank became a silent key on Friday 31st May 1985 and to his XYL Helen and seven children, all members offer their condolences.

WIA QLD DIVISION.

VALERIE NORTON VK4FKL

Valerie passed away prematurely of cancer at Mackay Base Hospital on 19th May 1985.

Many will remember Val as VK4VKT, a regular on the 15 metre band and a popular contact, especially with the JA stations. It was often amusing to hear her as she helped yet another JA operator with the subtleties of the Australian language. It was wonderful that, in June 1984, Val was able to visit Japan and personally meet the many friends she made through her hobby.

As a member of the Mackay Amateur Radio Club, she was a prime mover in the operation of a slow Morse net, designed to help locals through the 10 WPM barrier. At meetings she was always vocal in promoting a responsible approach to the use of the privileges and responsibilities of amateur radio.

She was also well-known as a member of ALARA and encouraged local OMs to participate in their contests and activities.

She had a cheery, helpful voice on the air and will be missed by all who had the pleasure of a QSO with her.

Deepest sympathy is extended to her OM, Terry and their family.

Charles Ivin VK4BPI
Secretary,
Mackay ARC

APOLOGIES . . .

Are extended to the families of the late Messrs Bail and Semmens, as the photograph in the centre pages of July AR was actually Fred Bail, with the caption of Bert Semmens.

1-4 April Magnetic field unsettled to active A20,16,19,16.

9 April Magnetic field at storm levels until 1700 UTC, then quiet to unsettled A=28

19-21 April Magnetic field became active towards the end of 19 April. The field was at minor to major storm levels on 20 April and again on 21 April until 1800 UTC on 21st. The field then subsided to unsettled levels A15,44,77.

22 April 1 M class flare. Possible fadeout 1637-1651 UTC A14.

23 April Magnetic field unsettled to active A15.

24 April 1 X class flare. Possible fadeout 0845-1002 UTC. Field unsettled A15.

25 April Magnetic field unsettled to active A22.

26-30 April Magnetic field at active to storm levels particularly on 28 April when major storm levels were reach A26,28,40,15,24.

SOLAR ACTIVITY

Solar Activity was low until 21 April when a region began to grow rapidly producing an M class flare on 22 April and an X class flare on 24 April. Flux figures were 20=72 21=77 22=86 23=92 24=90 25=94. The region appeared to be capable of producing further events for much of the remainder of the month but did not do so.

An interesting feature during the month was a region of reversed magnetic polarity to that normally observed for similar regions during the solar cycle. The polarity of sunspot regions reverse from one cycle to the next and so the region observed this month can be regarded as one of the first regions of the next solar cycle.

GEOMAGNETIC ACTIVITY

The most noteable feature of the month was the intense magnetic disturbance on 20-21 April. The A index for 21 April was 77 which makes the day the most disturbed day since 16 November 1984. The period 19th to 30th April was generally disturbed with the most disturbed days being 20 April A=44, 21 April A=77 and 28th A=40.

1-2 May A magnetic disturbance began gradually around 2300 UTC on 1 May and the field was at storm levels until app. 1530 UTC on 2 May. At 0741 a M class flare occurred with effects lasting until 0753 UTC. A13,28.

13 May 1 M class flare at 0904 UTC with possible fadeout until 0948 UTC. A11.

15 May The magnetic field was at active levels from 0100-0700 UTC and from 1430-1600 UTC otherwise the field was unsettled. A16

SOLAR ACTIVITY

Solar activity was low during May with the exception of energetic flares on 2 and 13 May. The region which produced the large flare in April rotated off the visible disc of the sun on 2 May producing an M class flare when close to the western limb of the sun. Another region appeared on the eastern edge of the sun on 6 May and it was this second region which was responsible for the elevalid 10.7 cm flux in the middle of the month 8=80 9=88 10=90 11=88 12=90 13=90 14=90 15=91 16=93 17=90 18=91 19=88. This region rotated off the disc of the sun on 19 May having produced one energetic event only, the flare of 13 May. The return of the first active region on 16 May helped maintain the 10.7 cm flux at higher values. However, this region did not appear at any stage to be capable of producing energetic flares.

The monthly average 10.7 cm flux was the highest monthly value since August 1984.

GEOMAGNETIC ACTIVITY

May was a very quiet month in that there were only two days on which the field was disturbed. The most disturbed day was 2 May with an A of 28 and the field was at minor storm levels. The most notable feature of the month was the absence of activity during the period 26th to 28th May. This represented the end of a sequence of "recurrent" (ie spaced at intervals of 27 days) disturbances. This sequence began a year ago making it an unusually long sequence of disturbances.

These summaries have been extracted from the Solar-Geophysical Summary prepared by the Ionospheric Prediction Service each month which arrives during the second week of the following month. They are dated but will serve as a useful summary of events gone by. Of course the daily information is available as a recorded telephone service on (02) 269 8614 or in other forms on WWV Boulda Colorada USA on 5,10,15 MHz at 18 minutes past each hour. It is proposed to present them each month from this month onwards.

The January 85 notes made a comparison between the sunspot number and the 10.7 cm flux. Seems that the gremlins got to it no end. It should have read like this.

SSN SMOOTHED MEAN 0 7 21 34 47 71 93 115 136 157 176 195
10.7 CM FLUX SMOOTHED MEAN 60 70 80 90 100 120 140 160 180 200 220 240

There is no direct correlation between these two indices. The SSN is derived from counts of sunspots and sunspot groups made at optical observatories. The derivation of the sunspot number is difficult and is often replaced by the 10.7 cm solar radio flux which can be measured with relative ease and consistency.

THE IONOSPHERE

How come?

The sun emits electromagnetic radiation at all wavelengths, but only the optical and the shorter radio wavelengths reach the earths surface. The remaining solar radiation heats the atmosphere and also, especially the UV and EUV part of the spectrum produces some ionisation in the form of free electrons and charged ions. The ionosphere is the region of the upper atmosphere where ionisation is appreciable.

Until artificial satellites came into existence, long distance radio communication was possible only because of the presence of the ionosphere which is able to reflect certain high frequency radio waves.

The nature of the atmospheric gases varies with height, and each component is ionised by a different part of the solar radiation. Therefore, the ionosphere tends to be stratified into layers of ionisation at different heights.

In the daylight situation

The three main daytime layers, called the **E**, F1 and F2 layers are at heights of approximately 110 kms, 220 kms, and 250 to 350 kms, respectively.

In addition there is a region below the E layer which is responsible for much of the daytime absorption of HF radio waves. This is called the D region and lies at heights between 50 and 90 kms.

After dark

Following sunset, the ionisation process stops and the lower layers rapidly decay with time. The D region ionisation is absent at night. The E layer is heavily depleted. The F1 and F2 layers merge into a single night time F layer. This layer does not completely disappear because the decay process is much slower and also because very strong ionospheric winds at F layer heights blow ionisation in from the sunlit parts of the earth.

The F layer is the most important layer of HF communications because it is always present.

SOLAR GEOPHYSICAL SUMMARY — JUNE

SOLAR ACTIVITY:

The return of the active region on June 3 produced an increase in the 10cm Flux, 3=73 4=75 5=82 6=85 7=86 8=06 9=87 10=89 11=89 12=87 13=86 14=83 15=81. On its last transit this region produced one energetic flare (M flare on 13/5) but on this transit never appeared likely to produce energetic flares. The region rotated off the disc on 16th. It returned again on 30th and produced higher 10cm flux levels for the first two weeks of July. This should produce higher ionospheric critical frequencies during that period.

GEOMAGNETIC ACTIVITY

June 1 The field was active to minor storm levels to 1800ut then quiet A=16

June 6-10 Field was at active to storm levels on 6th and 7th. The field was generally active on 8th, on 9th was at minor storm levels prior to 1500ut on 10th A=26, 33, 18, 18, 22

June 26-29 The geometric field was active on 26th, 27th with periods of storm conditions on 28th A=18, 16, 21, 15

June 30 The field became disturbed after 2030ut and reached storm levels early on July 01. A=11

MUFS were typically 10-20% higher than anticipated particularly the period 5th-15th associated with the higher 10cm flux over this period. Ionospheric conditions during local night hours inhibited HF propagation at times.

10cm FLUX MONTHLY AVERAGE 76.2
SUNSPOT MONTHLY AVERAGE 24.2
A INDEX MONTHLY AVERAGE 11.9

FLEA MARKETS

Next time you attend one of these, ask yourself the question, "How did a flea market get its name?"

Quite naturally, you might conclude it is because it deals in many small bits and pieces of little value, or that it is a trading place of minisize. Not So!

The original Flea Market was a half mile long conglomeration of stalls and selling venues, on the outskirts of Paris, whose polyglot proprietors offered everything from a needle to an anchor. It earned the description because of the vermin-ridden clothing, rags, floor mats, etc that it offered for sale.

In those days, reasonable hygiene was unattainable and the flea plague was persistent.

Fleas don't inhabit metal goods, so our Radio Flea Markets are a bit of a misnomer.

NOTICE

NOTICE

ALL copy for inclusion in the November issue of AR must arrive at the Federal Office by midday on the 23rd September 1985.

HAMADS

PLEASE NOTE: *If you are advertising items FOR SALE and WANTED please write each on separate sheets, including ALL details, eg Name, Address, on both. Please write copy for your Hamad as clearly as possible, preferably typed.*

- **Please insert STD code with phone numbers when you advertise.**
- Eight lines free to all WIA members. $9 per 10 words minimum for non-members.
- Copy in typescript please or in block letters double spaced to PO Box 300, Caulfield South 3162.
- Repeats may be charged at full rates.
- QTHR means address is correct as set out in the WIA current Call Book.

Ordinary Hamads submitted from members who are deemed to be in the general electronics retail and wholesale distributive trades should be certified as referring only to private articles not being resold for merchandising purposes.

Conditions for commercial advertising are as follows: The rate is $22.50 for four lines, plus $2 per line (or part thereof) minimum charge $22.50 pre-payable. Copy is required by the deadline as stated below indexes on page 1.

AMIDON FERROMAGNETIC CORES: Large range for all receiver & transmitting applications. For data & price list send 105x220mm SASE to: RJ & US IMPORTS, Box 157, Mortdale, NSW. 2223. (No enquiries at office . . . 11 Macken Street, Oakley). Agencies at: Geoff Wood Electronics, Rozelle, NSW. Truscott Electronics, Croydon, Vic. Willis Trading Co, Perth, WA. Electronic Components, Fyshwick Plaza, ACT.

ANTENNAS FOR CONFINED SPACE: Transmitting antennas for amateurs without space to erect full size HF antennas. Write for details to: FRANK HUNTER, 37 Darwin Street, Campbelltown, NSW. 2560.

PACKET RADIO THE SOFTWARE APPROACH by Robert Richardson W4UCH/2. Use your Z80 computer as a TNC. Get on Packet for well under $100. Full Z80 source code listing. Vol 1 (Vancouver Protocol) $24. Vol 2 (AX25 Protocol) $34. Disks available for TRS80 Model 1 & Model 3. $30 each. Modem & I/O circuits included. Prices include P&P Aust & NZ. A A O'BRIEN VK2BOA, Box 333, Charlestown, NSW. 2290. Tel:(049) 43 8981.

"RADIO MAN PACK". VZ200/300 or VIC 20. (Log book plus Morse code plus beam heading & typing tutor). All four programmes on one cassette for only $12. Specify computer. J HIRST, RSD 170, PO, Exeter, Tas. 7251.

WANTED — ACT

TAPR TNC KIT complete or assembled, working or not, with documentation. Keen to get started in digi comms. Bryan VK1ZBS, QTHR. Tel:(062) 86 4327.

WANTED — NSW

CHEAP VIC-20 OR COMMODORE 64, not necessarily working. VK2ZQD, QTHR. Tel:(046) 25 7746 AH.

CIRCUIT DIAGRAM FOR 18 CH CB TCVR. National Panasonic Model RJ-3100B18. All costs paid. A K McPhail VK2YSC. Tel:(02) 692 3591 BH, (02) 868 2561 AH.

SOCKET FOR 4CX1000A OR 4CX1000B. Cash or trade 3-500Z or 4CX1000A Eimac tubes. Tel:(02) 918 3835.

WANTED - VIC

ARMY TYPE 109 TX-RX. Any cond. Also type 3B tx-rx built by AWA. SCR 536 Walky-Talky, ATR-4B, pwr supplies for -11 set. Wanted for collection. Mike VK3PID, Olinda Road, The Basin, Vic. 3154. Tel:(03) 762 8492.

COLLINS 30L-1 LINEAR AMP. Any cond, even incomplete. Collins S line access. 312B4 spkr, 312B3 console, 136B2 blanker, SM3 desk mic. Any other Collins accs, valves, spares or literature. Eimac 3/400 or 3/500 Z tubes. Prices to Garry Marcon VK3AJX, 2 Lowan Court, Frankston, Vic. 3199. Tel:(03) 789 4363.

COPIES OF OR INSTRUCTION BOOK for NSC1400 calculator. VK3AH, QTHR.

IC-225A in good condition. VK3QQ, QTHR. Tel:(03) 337 8094.

VIDEO TAPES: .75 inch U-matic tapes, blank or reusable. Any quantities, any lengths. Also low band U-matic recorder, any cond. Also Sony DXC 1200 P camera. Price & details to Paul, 81 Murray Street, Rutherglen. Tel:(060) 32 9217.

YAESU FT-225R. In good cond. Details to Bert VK3BH, QTHR. Tel:(03) 857 9438.

WANTED - QLD

METER SCALE MODEL 400 for Taylor 'Windsor' model 75A multimeter or complete unit. Hi voltage probe 20 & RF probe 22 for University MVA6 valve voltmeter. Circuits & data for Realistic AM 27MHz TRC200, 5W tcvr, Ace tone electronic organ, mod A1025. Data etc on Paton VCT2 valve tester. JR colour TV circuit publications. VK4DY. Tel:(071) 96 1186.

SWAN 700CX, SS16B SCHEMETIC DIAGRAM. Also for power supply. Information on stabilising tx frequency FT-620. Will pay postage etc. Ken VK4TPE, Rockhampton, QTHR. Tel:(079) 27 1966.

WANTED - WA

MANUAL/CIRCUIT DIAGRAMS or photo copies for AWA CR6B type 2C60600 receiver. All costs gratefully paid. Peter VK5ZM QTHR or Tel (08)384 5569.

CRYSTALS...tx & rx styled (HC6U) for conversion Hybrid set type PM1677 A/25, serial 8109 to 6m. Albert VK6ARD. Tel:(09) 384 3298 anytime.

WANTED - TAS

YAESU SP101 OR SP101P EXT SPKR to suit FT-101E & FV-101 ext VFO. Cash paid. Must be clean or near mint cond. VK7AN, QTHR. Tel:(003) 31 7914.

FOR SALE - NSW

COLLINS KWM-380 'PROMARK' TCVR. 0.5-30MHz, 10Hz resolution, 5Hz stability. Incl HF-380 (commercial model) access. For more information write giving call sign & address or phone no to: Collins KWM-380, Box 3, Hazelbrook, NSW. 2779.

DRAKE L7 power amp, MN2700 ant tuner, Telereader CWR 685E terminal. Please leave a message on (042)28 7455 ext 606 BH or write to VK2OE, PO Box 1914, Woolongong, 2500.

KENWOOD HC-10 CLOCK $90. Eimac 3-500Z new tube $185. Pelita 5D22/4.250A. New. $65. Sockets for above $30. 4CX1000A Eimac. 13uH ceramic roller inductor, 10 gauge silver plated wire $60. Tel:(02) 918 3835.

KENWOOD TR-2400 2M H'HELD. Complete with all manuals, spare nicad batt, fast & slow chargers & spkr/mic. $260. Packet Radio software approach for TRS80, complete with all manuals & built-up interface. $80. 2m power amps, 50W $60 & 80W $100. ETI modem, 300 BAUD & 1200 BAUD, modified for Packet Radio use. $100. Dentron Super Tuner, 1kW, 160-10m with in-built hi power balun. $150. VK2HL. Tel:(02) 981 4762.

KENWOOD TS-120S with mic & mobile mount. Good cond. $410 ONO. Bill VK2TS. Tel:(043) 74 1207.

MUIRHEAD PICTUREGRAM EQUIPMENT. 1930s vintage, tx & rx, many spares, CCTs. $500. John VK2ZHM. Tel:(02) 663 0197 BH or (02) 406 5338 AH.

SONY ICF 6500W. Excellent comm rx. Covers .530-30MHz plus FM with BFO. Covers most amateur bands. Top cond. $150 ONO. Bernard VK2NUU. Tel:(02) 30 7829.

TOWER...HILLS. 50' complete with base, guy wires, & turnbuckles. $500. Glen VK2AGM, QTHR. Tel:(02) 269 6997 BH or (02) 77 8407 AH.

YAESU FT-901DM. Complete with separate ext VFO with synthesised scanning & 40 mems, FM board, auto CW generation, separate match spkr, stand-off card for board servicing. Desk & Hand mics, separate 12V & 240V leads. Just taken out of service. Orig packing. $700. VK2DBH, QTHR. Tel:(065) 54 2105.

FOR SALE — VIC

ANTENNA... Vertical HF Chirnside 5 band in good order. $60. Yaesu FL-2000 HF linear, dismantled, $80. Yaesu antenna, mobile gutter grip. 2m & 15m. $30. Heathkit CRO, 5MHz. $30. Icom IC-290H 2m, all mode tcvr. $400. Barrie VK3KBY. Tel:(03) 347 3619 AH.

ANTENNA...TH3JR with rotator, plus 9m tower. $200. AR journals, Dec 1979 to present. 70 issues. ARA, Vol 10 to present. 77 issues. All EC. Graham VK3AOT. Tel:(051) 67 1434.

BEAMS...20m W/Wulf monobander. Heavy duty boom. As new. $110. Log Periodic, 11el, 144MHz ATN with balun. As new $50. VK3XV, QTHR. Tel:(03) 527 4029 from 0430-0800pm.

CLEARANCE SALE... Offers for IC-201 2m, FM, AM, SSB. Has fault. 6m tcvr valve type teleprinter, Creed 75 with tape punch, tape reader, teletype tester. VK3BOB, QTHR. Tel:(03) 578 7441.

FTDX-401 TCVR. Yaesu's finest valve tcvr, no need for linear, rated at 560 W PEP input, 500Hz CW filter, 160, 80, 40, 30, 20, 15, 11 and 10m. As new, one owner. Suit OM with preference for valves and ease of service. $350 VK3AFW, QTHR. Tel (03)579 5600 1830-2130 Mon-Thu.

FLUKE 8060A MULTIMETER. This top of the range meter cost $600. Sell for $350. With case, leads, manual or exchange for rx or scanner. Tokyo HL-45 uc linear, CW, SSB, FM. 2/15W in, 10/45W out, 432MHz. Rick, 'Idaville', Lewis Road, Montrose, Vic. 3765. Tel:(03) 728 2706.

FV-107 REMOTE VFO FOR FT-107. Unused in carton, with instr book. $50. John VK3AJI, QTHR. Tel:(03) 758 5859.

ICOM IC25A, 25W 2m FM tcvr (late model with green readout) $340.Printer, dot matrix-FAX 80,80 col,80 CPS, Centronics parallel interface, spare ribbon, little use $300. Hewlett Packard 310A wave analyser. 1kHz-1.5MHz. Complete with handbook and calibrator option. EC $300. Peter VK3AWY Tel (03) 697 6161 BH or (052) 82 2751 AH.

KENWOOD 120S, 100W. In ex cond with AT-120 tuner unit. $550. VK3SS, QTHR. Tel:(051) 47 2265.

KENWOOD TS-830S, 240V AC BASE STATION. 2/6146Bs final, all bands. 160-10m inc all WARC bands. CW filter, calib. mic spare tubes, mech & elec as new. Occasional stand-by use only. $675 ONO. Andy VK3UJ. Tel:(03) 726 8911.

RECORDER, REEL TO REEL. Portable English 'Studio'. Mech excellent. Ideal for transistor conversion. Inc 8 full size recorded tapes of music. (Beatles & Dance), Morse, Churchill's war speeches & BBC 'Take It From Here' series. Also BASF splicing kit. $50 the lot ONO. Errol VK3GG, Tel:(03) 337 8094.

TOWER... Tilt over, 30' free standing. $350. Ian VK3DSM, QTHR. Tel:(03) 798 8070.

UNIDEN 2020... In good cond, but with intermittent fault. Complete with mic, manual, AC & DC leads. $150. VK3WM, QTHR. Tel:(03) 288 2180.

YAESU FT-230R 2M FM TCVR. Fully micro-processor controlled, 144MHz to 148MHz in 5kHz steps. 10 mem ch, LCD readout, 25W output. All packing cartons, circuits & access. In ex cond. $330. VK3BEW. Tel:(057) 21 2363.

YAESU H'HELD FT-208R. 800ch, adaptor BNC-UHF plug, YM-24A spk/mic. PA3 DC-DC chgr. 13.8-10.8V. Nicad batt. Chgr 10.8V. Spare nicad 10.8V pack. Q craft 2m SWR meter. Manual. $350.50 the lot. Norman VK3FT, QTHR. Tel:(03) 82 4853.

FOR SALE — QLD

MICROWAVE MODULES...70cm transverter MMT432/28S. Brand new, perfect cond. $300. 70cm linear amp MML432/50. Brand new, perfect cond. $200. IC-2A in PC. $200. FT-7B in EC. $350. Multi-7 in fair cond but works well. $50. Beven VK4ABV, QTHR. Tel:(071) 63 1477.

SOCKETS . . . Variety of early octal, 7 and 9 pin peanut tubes. Write for list or state type wanted. Include SAE: VK4SS 35 Whynot Street, West End, Qld. 4101.

FOR SALE - WA

ICOM IC-730 WITH mic, h'book & power cable. In ex cond. $750. Rod VK6AOK, QTHR. Tel:(09) 386 1998.

ADVERTISERS' INDEX

Andrews Communications Systems

YAESU FT-726 (R)

VHF/UHF all mode transceiver. 10 watts output, AC/DC, 0.15uV sensitivity on SSB. LSB, USB, CW, FM. Repeater reverse. IF shift & width controls. RF speech processor. 10ch memory store mode, frequency & searches. Full cross band, cross mode duplex possible with satellite unit. Supplied with 2m module & mic.

$1199 Save around $300

AR85

Announcing the new IC-735.

You have been waiting a long time for a compact (94mmH * 241mmW * 239mm) HF rig with performance you would expect only from the Icom stable. 100 Watts output, and Icom's direct fed input mixer will provide you with competition winning performance.

It's beyond comparison.

The IC-735 has many features and options to provide you with hours of radio enjoyment. Because the Icom engineers dispensed with the normal power cage at the back, you will be able to fit the IC-735 into ... just about anywhere.

TUNING

Single control triple speed tuning allows frequency resolution to 10Hz. The processor provides 3 scanning modes which includes mode scan, memory scan and program scan. The memory channel (there are 12), operating frequency, VFO, mode and RX/TX are all displayed on the illuminated LCD.

RECEIVING

Icom's direct fed mixer helps to provide outstanding performance in receive, for example Image response of 80dB. Input attenuation, pre-amp and RF gain control combine with notch filtering and pass band tuning to provide the most comprehensive tuning system. Naturally Icom have included the general coverage facility.

TRANSMITTING

100 Watts of clean power (Spurious emission <–50dB) is available on all the amateur bands. The controls not often used, VOX, mic gain and RF power controls are tucked away in the Kangaroo pouch. An optional electronic keyer (EX243) with full break-in facilities are also available if you enjoy CW.

AMATEUR RADIO

Published monthly as the official journal by the Wireless Institute of Australia, founded 1910. ISSN 0002 — 6859. Registered Office: 3/105 Hawthorn Road, Caulfield North, Vic. 3161. Telephone: (03) 528 5962.

October's Amateur Radio includes the VK5 Division's special contribution for the WIA's 75th Anniversary. A special story, by Marlene VK5QQ, tells of the life of the Division from its inception in November 1919, through the days of experimentation with spark transmitters, the invention of pedal radio to black boxes and repeaters, to its sixtieth year in 1980 and another milestone for the Division, the election of the first female to the VK5 Council — certainly a historic step when one considers that around 1948 ladies were not invited to attend the Christmas Social. John Flynn, the Flying Doctor, was well known for his work in outback Australia but, a fact not so well known about this man was his membership of the WIA in 1925. A historic article of the Flying Doctor, Pedal Radio and Alf Traeger is included in the VK5 contribution, page 31.

Gordon VK2ZAB expounds some other theories, and expands upon the article in July by Doug VK3UM, about Aircraft Enhancement. See page 8.

The final article of this particular series, add-ons for the Siemens Teleprinter, appears in this issue, page 10. Peter VK3ZPF, describes the use of two seven segment LED displays to show how far the typing basket has travelled.

The new Rad Comms Act has now replaced the old Wireless Telegraphy Act. A general outline of information about the new Act appears on page 5.

At the end of August, Australia moved into the Space-age of terrestrial based communication, when her own satellite was launched into space by the American spaceshuttle 'Discovery', see page 12. The inset photograph on the front cover is an artist's impression showing AUSSAT 1's coverage, depicting national and spot beam footprints over the continent. Thanks to AUSSAT Pty Ltd for supplying the picture.

This month sees the staging of the 28th JOTA. Max VK3ZS has documented, page 17, how JOTA came into being and a general history of the contribution made by the WIA.

DEADLINE

All copy for inclusion in the December 1985 issue of Amateur Radio, including regular copy of columns and Hamads, must arrive at PO Box 300, Caulfield South, Vic. 3162, at the latest, by midday 23rd October.

EDITOR'S COMMENT

ANNIVERSARIES

October is notable each year for the annual Jamboree on the Air, in which the amateur radio movement makes possible on a world-wide basis, a weekend of personal contact between Scouts, Guides, Cubs and Brownies: not to mention their leaders! But 1985 is a notable year in itself, being both the 75th Anniversary of the WIA and also the 75th Anniversary of the Girl Guide movement. Indeed, 1910 was a year of very significant innovation. So when you welcome your special visitors to your Jamboree station on the 19th and 20th of this month, the girls will have something more to talk about than in other years.

There are other more personal anniversaries which we propose to begin noting from early in 1986. The VK2 Division suggested recently that we should publish a list of all those who have reached the milestone of WIA membership for 50 years. This is not quite as easy as it might seem, involving a search of the records of each Division (which may be incomplete), and cross-checking against current membership in all Divisions. There is a high risk of errors and omissions in this procedure, so we suggest that those most interested in such a list, the 50 year members themselves, should notify their Divisional Secretary, or the Federal Office directly, of the details. The list is planned to include:

Present Call sign, Previous Call signs (if any), Name and locality, Date of joining the WIA.

We hope to publish an initial listing in February and then add to it every three months. How about it, Old Timers? Divisional Secretaries, too.

Another milestone which has been in the news recently, is that 1985 is the 40th anniversary of the nuclear bombing of Hiroshima and Nagasaki, and the end of World War 2. The fact that nuclear weapons have never been used since, even though there have been many smaller wars, is a hopeful sign that the human race is not unavoidably motivated towards global suicide. Many of us have contacted amateurs living in those two Japanese cities, and the fact that we can do so in peace and friendship in spite of the hatred and destruction of the war years should give us some hope for the future. May the international bonds of amateur radio and also Scouts and Guides help towards a world in which, not only nuclear weapons but wars themselves become outmoded relics of our barbaric past!

Bill Rice VK3ABP
Editor.

RADIOCOMMUNICATIONS ACT NOW IN FORCE

The long-awaited Radiocommunications Act has now replaced the 80 year old Wireless Telegraphy Act. Its broad range covers, particularly those areas in which the WT Act was ineffective.

Working on replacing the old Act began about 15 years ago, when its inadequacy to deal with modern and developing communication technologies had become apparent. When the WT Act was introduced, wireless telegraphy was in its infancy. Today, the many uses of the radio spectrum affect everyone.

The Department of Communications (DOC) sees the Act, which came into force on 20th August 1985, as vitally important for the efficient management of the radio-frequency spectrum. It gives DOC the necessary powers to cope with the vast range of uses now being made of the spectrum, and recognises the modern electronic environment and the issue of electromagnetic compatibility (EMC).

The formulation of the Act, and the Regulations, has involved the slow process of extensive consultation with the users of the spectrum, manufacturers, importers and others affected by the new laws.

The Wireless Institute of Australia, with its CASPAR Committee, has been involved in the consulation process for many years. This will continue as regulations and standards are evolved.

DOC will have new powers to deal with all forms of radio frequency interference (RFI), from ali sources, not just from radio equipment. Common interference sources to radio receivers include electric motors, welders, thermostats and power lines.

Users of electronic home entertainment equipment will also benefit. TV sets, VCRs, stereo units, electronic organs and intercoms sold in Australia will be required to comply with standards of immunity to RFI. In time, less and less equipment with inadequate immunity against RFI will be used by the community. DOC intends to make standards for all radio communications and other equipment likely to be affected by RFI.

It will be an offence to supply, possess or use equipment which does not meet a standard or to modify it in such a way that it ceases to comply with the standard. Equipment made before the introduction of a standard will not be affected.

The Act creates a number of new offences, in addition to the obvious offence of unlicenced operators of a transmitter. These include using a transmitter causing interference to safety communications, using a transmitter to harass another person, or to transmit hoax calls.

Overall, the new Act will achieve two major improvements in the regulation of the spectrum. The first is the establishment of a regime that will, in time, control the causes of interference, and the susceptibility of equipment to interference. The second is the creation of offences, coupled with powers to achieve compliance, that will hopefully facilitate the role of the law enforcement agencies.

Copies of the Act can be bought from the Australian Government Publishing Service Bookshops, in all capital cities.

AR

WIA NEWS

UHF ATV — 50cm

Members of the Federal Executive have again met with the Department of Communications, Broadcasting Division, to discuss the progress of the Departments UHF ATV planning and the amateurs place in that plan.

These discussions are the result of a discussion paper on the future of 50cm ATV in the UHF band, put to the Department of Communications by the Institute at the beginning of this year.

The Department advised that progress was being made on a Channel Equalisation Plan for Commercial TV channel coverage. Policy on equalisation and the associated detailed planning still remain to be developed but, an announcement on the options will be made shortly by the Minister of Communications, Mr Duffy.

As a direct result of the meeting, the following points were advised by the Department of Communications:

a) the DOC Broadcasting Services Division accepted the principle of

continuing future co-existance of commercial and amateur TV in the 50cm band.

b) the present amateur allocation of 576-585MHz can remain for approximately another three years.

c) as detailed planning of the UHF translator services takes place, alignment of the amateur allocation with the UHF channelling plans may be required, at least in the Melbourne and Sydney areas. The present amateur allocation straddles channels 35 and 36.

d) if pressure for additional translator channels, beyond those presently envisaged, becomes apparent, WIA/DOC will examine the band plans to accommodate, if practicable, alternate 50cm amateur allocation/s in specific geographical areas.

AGE LIMITS FOR AMATEUR RADIO LICENCES TO BE REMOVED

Since 1982, il has been Wireless Institute of Australia policy to seek a reduction of the age limit, required for limited and full call amateur licences. At the Federal Convention in 1985, the Federal Executive of the Institute was asked to negotiate with the Department of Communications, for the complete removal of any age restriction for amateur licences.

The Executive, recognising that this is the International Year of Youth, made strong representations to the Department of Communications, that all age restrictions be removed. This was proposed at the WIA/DOC meeting of May 1985.

The Department of Communications, after consideration of this matter, have advised the Institute by letter, in August 1985, that the inconsistencies in the application of age restrictions in the various categories of amateur certificates and licences had arisen over the past years, due to 'patchwork' amendments to the regulations. In the new Radio Communications Act and its Regulations, there will be no reference to age limits for amateur licences/certificates. Therefore, from the proclamation date of the new Act, the only requirement to hold any grade of amateur licence, will be a pass in an amateur radio examination.

FEE INCREASES

The Radiocommunications Act 1983, came into effect in two stages . . . the Act as of midnight on 19th August 1985 and, then certain provisions in the ACT pertaining to 'offences' followed on 27th August 1985. During the period between these dates, offences will be dealt with under the old Wireless and Telegraphy provisions.

As a result of the Radio Communications Act being proclaimed on the 20th August, certain fees were increased.

EXAMINATION	FEE
Amateur Operator

CERTIFICATES OF PROFICIENCY — all successful candidates will be charged $5.00 for each certificate.

The Department have advised the Institute that, the new charges relate to the costs of providing the examinations for candidates. Naturally, the Institute's officers have registered with the Department, their strong dissatisfaction at the lack of prior adequate discussion on the subject of licence and examination fees.

PHONE PATCH

On the question of phone patch, a WIA delegation from the Federal Office and the Victorian Division, met with Telecom Headquarters recently. The WIA pressed for improved conditions for amateur phone patch but, Telecom continued to take a firm stand against any improvement in conditions of phone patch for the amateur service. The WIA stressed the major differences between the amateur service and commercial users, particularly stressing the non-profit nature of our activities.

Telecom refused to accept this argument as a reason for any further improvement, in what they consider, to be generous conditions compared with those applying to commercial users. The WIA gave notice that they were not prepared to accept these views as final, and would wish to continue to discuss them. Telecom representatives agreed to meet with the Institute at any time it wished, in the future.

Telecom, however, did agree to discuss with the Institute, the design of a simplified interface unit for the amateur service, which could lead to a significant price reduction, compared to existing commercial units.

HAZARDS OF RF RADIATION: NEW STANDARD

Allan Foxcroft VK3AE
Federal Standards Co-ordinator

Early this year, the Standards Association of Australia (SAA) issued Australian Standard 2772 — *"Maximum Exposure Levels — Radio Frequency Radiation — 300 kHz to 300 GHz"*. This represented over five years of work by the SAA's Committee TE/7 on Hazards of Non-ionising Radiation assisted by many others, with expertise in medicine, physics, engineering, commerce and trade union matters. The Wireless Institute of Australia was represented on the Committee by Rear Admiral Jim Lloyd VK1JL.

During the 1960s and 70s there was growing recognition, world-wide, that our knowledge and understanding of the biological effects of human exposure to electromagnetic fields was inadequate to meet the growing use of EM energy in industry, science, medicine, telecommunications, domestic and other applications. Research and study in this field was accelerated and the present Standard has been based on consideration of the mass of world literature and reports issued mainly in the period 1960-1985.

BIOLOGICAL EFFECTS

The foremost thing to remember about the new Standard is that it deals primarily with the safety of people — those who operate RF equipment as part of their occupation and those who may be exposed to RF by chance. Any regulatory or technical recommendations stemming from it are based on present biological/medical knowledge.

RF energy can have deleterious effects on the human body. RF burns and shocks are clear and immediate examples of this. However, sustained exposure to high level RF fields can also result in the formation of cataracts of the eyes and can affect the nervous system in a number of ways. The neural effects are not clearly demonstrated and usually relate to such vague features as fatigue, irritability, depression, loss of appetite and lowered physical and mental performance.

EXPOSURE LEVELS

The new Australian Standard specifies maximum exposure levels in terms of the acceptable power flux density (milliwatts per square centimetre or watts per square metre) which, for far-field conditions may be readily expressed in electric field strength or magnetic field strength. Two categories of maximum exposure levels are laid down: namely non-occupational levels applying to (a) the general public and (b) occupational, where a person is required to work in higher electromagnetic fields. Persons in the latter group are defined as radiation workers. It is recommended that the general public be protected to a level of one fifth that of radiation workers and typical acceptable maximum levels for continuous radiation are 2 mW/sq cm at 3MHz, dropping to 0.2mW/sq cm at 30 MHz and above. Compared with levels generally specified during the 1970s these represent a considerable tightening-up of the protection required by 5 to 50 times and reflect the greater current awareness of the possible hazards of non-ionising radiation.

EXCLUSIONS AND CONDITIONS

One of the most significant exclusions from this Standard, from the amateur point of view, is the hand-held portable transceiver running power output of not greater than 7W at frequencies lower than 1GHz. It has been accepted that these may produce localised fields in excess of the values prescribed for the general public. However, it is unlikely that the total amount of energy coupled into the whole of the human body would be significant.

There are a number of special "relaxation" clauses, some of which are confusing in their applicability, which relate to industrial exposure periods of less than 30 minutes. These are included to accommodate special maintenance situations or abnormal, one-off exposures of relatively short duration in which the actual period may be monitored and readily determined. There are no equivalent provisions for non-occupational exposure. Anyone wishing to make assessments of the acceptability of specific conditions should refer to the Standard itself.

PRACTICAL IMPLICATIONS

Probably the greatest impact will be found in the area of industrial radio frequency heating and welding where often many kilowatts of power are used and where workers are in close proximity to the source for significant periods. Surveys conducted within Australia and overseas of typical industrial RF heaters show that a substantial proportion of them could be regarded as unacceptable under the Australian Standard.

Insofar as communications services as a whole are concerned, excessive field strengths, if any, are likely to be confined to the immediate vicinity of antennas associated with high-powered equipments and certainly where normal current practices and precautions apply, the general public is not likely to be subjected to unacceptable RF levels.

AMATEUR ASPECTS

Looking particularly to the personal safety of amateurs as a group, only a few situations are likely to require special care and attention, provided occupational RF levels and short term exposures are assumed. These will be confined to near-field situations (for example within half a wavelength of a half-wave dipole). Within such volumes, practical measurements at any point must include values of electric and magnetic fields — requiring sophisticated equipment and measurement techniques. Furthermore, the space impedance cannot be assumed constant and therefore simple mathematical conversion from power density to equivalent electric field strength to equivalent magnetic field strength are not valid. However when at least semi-quantitative allowances are applied it can be shown that only a few amateur situations require special attention.

Despite the fact that the typical hand-held equipments have been excluded from this standard, commonsense precautions should always be taken to minimise irradiation of the head and particularly the eyes. Care should be taken with mobile equipment antennas, which should not be approached or handled when radiating. Where there is no alternative to the adjustment of live antennas of any type, use the absolute minimum power input to them. Do not drape wire antennas along dividing fences even if it is only to guard against RF burns to the unwary.

LIFE OF THE STANDARD

It should be reiterated that medical knowledge of the effects of RF radiation on the human body is still incomplete. Even though this Standard is based on the very best information at present available, it is intended that it should have a limited life and will be reviewed within three years *"on the basis of evidence gained during its application and from research on the subject which is now world-wide"*.

THE "ALARA" PRINCIPLE

There is of course no guarantee that the levels set at present are **absolutely** safe in all situations. As a consequence the ALARA, principle, (As Low As Reasonably Achievable) should always apply in exposure to RF fields. Discussing this situation at the recent SAA Symposium on RF Hazards, Dr D Hollway, Honorary Research Fellow of CSIRO quoted a most appropriate analogy used by a US expert working in this area. When criticising the present ANSI (US) standard on RF Safety Levels, Professor N H Steneck, stated: *"The assumption is made that when one is walking along the edge of a potentially dangerous cliff, the best way to keep from falling is to know exactly where the edge is. Theoretically, if all the twists and turns were properly plotted one would not fall. (It is difficult not to point out in this regard that one could also avoid falling by not walking so close to the edge)"*.

AR

MAKE THIS JOTA SPECIAL!!!

1985 has been declared International Youth Year by the United Nations. Scouts and Guides have been involved in many special activities related to the Year's theme of "Participation, Development, Peace". Yet every year is a youth year for Scouting and Guiding. There are more than 25 million Scouts and Guides in over 150 countries.

JOTA is the largest gathering of Scouts and Guides and also amateur radio. Each year some 300,000 participate in more than 100 countries.

Let us make 1985 extra special and involve age (the WIA's 75th Anniversary) with youth (the International Youth Year) to make this year's JOTA bigger and better than ever. Participation is the answer on 19-20th October 1985.

This year the Institute is providing the QSL cards for JOTA and the 75th Sub-Committee have settled on a design that incorporates the Boomerang gate at Clifford Park, Wonga Park, Victoria.

The reason for this choice was, in 1955 the Institute's Official Station, VK3WIA operated 24 hours a day for the duration of the Pan-Pacific Jamboree - the forerunner of JOTA in Australia and perhaps the world.

From information from the Official World Scout Bureau and the Federal Office of the WIA.

AR

ENHANCED VHF/UHF SIGNAL LEVELS DUE TO AIRCRAFT

Gordon McDonald VK2ZAB,
59 Wideview Road, Berowra Heights, NSW. 2082

The anomalous propagation frequently observed on 2 metres and 70 centimetres during Sydney to Melbourne and Canberra to Melbourne contacts was comprehensively described by Doug VK3UM in his article "Aircraft Enhancement of VHF/UHF Signals" in July AR. The fact that enhancement does occur and that it is caused by aircraft is beyond dispute. This article is concerned with how the aircraft does it.

SPECULATION

When strange phenomena are first observed, logical observers will seek to determine whether or not their observations can be adequately explained by known facts.

In the case of Aircraft Enhancement this process was started but received an early setback coincident with an on-air remark (by me I think) to the effect that the levels of signals received could not be accounted for by known radar echoes from the aircraft involved. This either triggered or at least marked the start of a period of speculation about what might cause the signals to be so strong if it wasn't reflections from the aircraft itself.

Hypotheses concerned with possible refraction or scattering from gases ionised by the jet's exhaust or from turbulence in the aircraft's wake or from mini temperature inversions caused by the heat of the exhaust have all been heard. Some of these speculations have been accepted as facts by some amateurs.

The possibility that some truth might lie in some of these ideas cannot be discounted but nevertheless this article shows that the fundamental mechanism of aircraft enhancement lies in reflections from the aircraft itself.

THE AIRCRAFT AS A REFLECTOR

Radar echo calculations are based on an isotropic reflecting sphere of that size which gives the same signal at the radar receiver as the target being considered. An isotropic reflecting sphere scatters an oncoming beam uniformly in all directions and therefore calculations based on this model will result in the erroneous conclusion that the signal level at a distant receiver is the same as that of the back-scattered signal at the radar receiver.

An aircraft is not an isotropic sphere. The large, substantially flat surfaces under the wings and tailplane reflect radio signals in a beam. The reflection efficiency is virtually 100 percent because of the low losses in the aluminium skin of the aircraft and the beam width is inversely proportional to the ratio of the flat area to the wavelength of the incident signal.

When the aircraft is in flight the flat undersides are parallel to the ground and so are in the right position to reflect our signals and thus provide enhanced levels at the receiver by reducing the path loss.

However, Figure 1 illustrates that the whole of the flat area cannot be seen from transmitting or receiving sites in general because of the angle of incidence, which will change as the aircraft's position changes relative to the sites. Furthermore, the undersides of the wings and tailplane are not entirely flat so a more accurate model will be realised if we delete the contribution of the tailplane and any other flat area. The effective area of our reflector will be given by:—

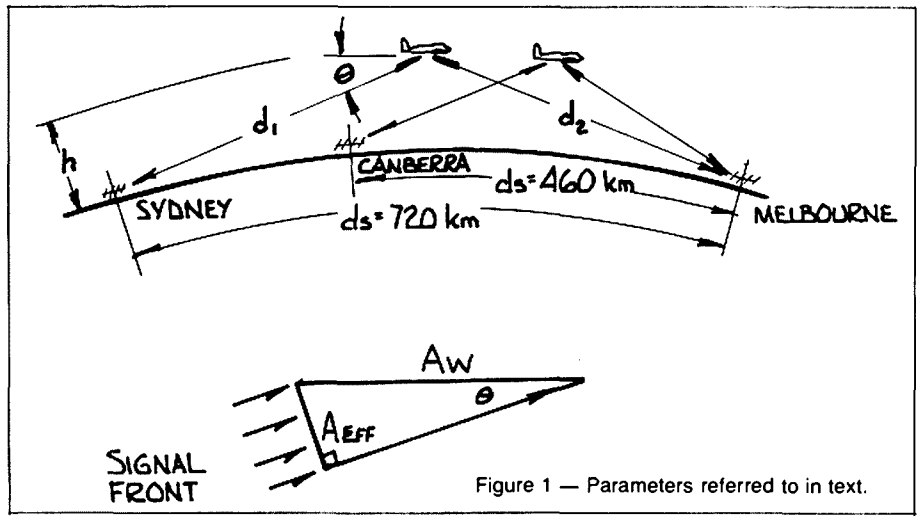

Figure 1 — Parameters referred to in text.

$$Aeff = Aw \sin \theta \quad (1)$$

Where:
Aw = *Area of Wings in square metres*
θ = *Angle of incidence*

The effective area has been calculated for various aircraft operating between Sydney and Melbourne assuming that the aircraft is stationary at its nominal operating altitude half way between Sydney and Melbourne and again half way between Canberra and Melbourne. In this case the angle of incidence is given by:—

$$\theta = 90\text{-}Tan^{-1}\left[\frac{r \times \sin(4.5ds \times 10^{-3})}{h}\right] \quad (2)$$

Where:
r = *Radius of Earth in km*
ds = *Distance between sites in km*
h = *Operating Altitude in km*

The distance from Melbourne to Sydney is taken as 720 km and from Melbourne to Canberra as 460 km for these calculations. Note that the angle of incidence is small, being less than 2° for all Sydney to Melbourne paths considered and from 2.5° to just over 3° for all Canberra to Melbourne paths.

The results are given in Table 1:

GAIN OF AIRCRAFT AS A REFLECTOR

As a reflector the aircraft behaves in the same way as two identical, back to back, antennas. Its gain, as an antenna, can be defined in the same way as the gain of any other antenna:—

$$G = \frac{4\pi A}{\lambda^2} \quad (3)$$

Where:
A = *The effective area*
λ = *Wavelengths in the same units*

Converting λ to frequency and expressing G in decibels we get:—

$$G_a = 20 \log f + 10 \log A - 38.55 \quad (4)$$

Where:
f = *Frequency in MHz*
A = *Effective Area in square metres*

This gain is realised when the reflecting aircraft receives the incident signal and when it retransmits it so that the total reflector gain is twice that given in equation 4. ie:—

$$Gr = 40 \log f + 20 \log A - 77.1 \quad (5)$$

Using this formula and the effective area from Table 1 the reflector gain on 432.2MHz of a 747 at 37,000 ft. half way between Canberra and Melbourne is 56.58dBi!

SPACE LOSS WITH AIRCRAFT AS REFLECTOR

Free space loss between isotropic antennas is:

$$Ls = \left[\frac{4\pi d}{\lambda}\right]^2 \quad (6)$$

Aircraft Type	Altitude (ft)	Wing Area (m^2)	Aeff (m^2) Syd/Melb	Aeff (m^2) Can/Melb
Airbus A310.200	33,000	219	6.116	9.565
Boeing 727.200	35,000	144.92	4.292	6.712
Boeing 747.200B	37,000	528.15	16.54	25.86
Mcd/D DC10	35,000	364.3	10.79	16.87
Boeing 767.200	40,000	283.3	9.59	14.99

TABLE 1 — See Text.

Aircraft Type	Lar (dB) Syd/Melb	Lar (dB) Can/Melb	SR (dBm) Syd/Melb 2 Metres	SR (dBm) Can/Melb 70 cm
Airbus A310.200	228.5	216.8	– 132.5 (S2)	– 113.1 (S5)
Boeing 727.200	231.6	219.9	– 135.6 (S1)	– 116.2 (S5)
Boeing 747.200B	219.9	208.2	– 123.9 (S3)	– 104.5 (S7)
Mcd/D DC10	223.6	211.9	– 127.6 (S3)	– 108.2 (S6)
Boeing 767.200	224.6	212.9	– 128.6 (S3)	– 109.2 (S6)

TABLE 2 — See Text.
NOTE: "S" Units are taken to the next lower place.

Converting λ *to frequency and expressing Ls in decibels we get:*

$Ls = 32.44 + 20 \log f + 20 \log d$ (7)

Where:
f = *Frequency in MHz*
d = *Distance in km*

There are two "spaces" to be considered where we have a reflector in the middle of the path so taking the loss for each space from equation (7) and combining these with the reflector gain (5) we will get a formula for the space loss between isotropic antennas with an aircraft reflector in between. i.e.:

$Lar = 141.98 + 20 \log d_1 + 20 \log d_2 - 20 \log A$ (8)

Where:
d_1 = *Distance from site 1 to aircraft*
d_2 = *Distance from site 2 to aircraft*
A = *Aeff (Table 1)*

Note that the frequency factor has cancelled out because the increasing space loss with increasing frequency is exactly matched by the increasing gain of the reflector with frequency.

Lar's for the various aircraft considered are listed in Table 2.

SIGNAL LEVELS VIA AIRCRAFT REFLECTIONS

The signal power at the receiver in dBm is:

$S_R = P_T + G_T - L_T + G_R - L_R - Lar$ (9)

Where:
P_T = *Transmitter power output in dBm*
G_T = *Gain of transmitting aerial in dBi*
L_T = *Transmitter feeder loss in dB*
G_R = *Gain of Receiver serial in dBi*
L_R = *Receiver feeder loss in dB*
Lar = *Space loss via aircraft reflector in dB*

Examples:

1 I run 400 W PEP on 2 metres, my antenna gain is 20.65dBi, feeder loss 0.65dB and there is a clear path from me to a Boeing 747 at 37,000 ft just east of Tumbarumba. I call CQ VK3 and Melbourne stations located in an area centred roughly on Dandenong and who have similar antenna gains and feeder losses along with a clear path to the same 747 must receive my signal at a peak level of:

$S_R = 10 \log 400 \times 10^3 + 20.65 - 0.65 + 20.65 - 0.65 - 219.9$
$= -123.9$ *dBm*

which, assuming the "S" meters are calibrated according to the IARU standard for VHF/UHF is one dB short of S4.

2 Doug VK3UM runs 375 W PEP and about 28 dBi of antenna gain after deducting feeder losses on 432.2 MHz. The same 747 as in example 1 has now arrived over Mitta Mitta still at 37,000 ft. A Canberra station equipped with 20 dBi of antenna gain after feeder losses and who has a clear path to the 747, as Doug has, will receive Doug's signal at:

$S_R = 10 \log 375 \times 10^3 + 28 + 20 - 208.2$
$= -104.5$ *dBm*

which, on an IARU calibrated meter, is better than S7 peak.

3 If I had been listening on 432.2 MHz when the 747 was over Tumbarumba I would have heard Doug at – 115 dBm which is better than S5 and he would have heard my 10 Watts PEP at almost S3.

The stations used in examples 1 and 2 are used for all examples listed in Table 2.

VARIATIONS FROM EXPECTED LEVELS

Variations can and do occur for a variety of reasons, some of which could be categorised as "normal" variations. eg:

(a) The aircraft can be "seen" by the transmitting and receiving sites for periods up to several minutes either side of the time the aircraft reaches the centre of the path. However the signal level will vary over this period simply because the power density in the beam from the transmitter varies spatially, as it also does in the beam reflected by the aircraft.
This means that the length of time that the signals are enhanced will be decreased as the frequency increases even if the beam widths of the ground sites remained constant because the beam width of the reflected signal will get narrower as the ratio Aeff to λ increases.
Aircraft off to one side of the direct site to site path may expose a greater area of reflecting surface to both sites during banking turns. The signal levels will increase accordingly.

(b) Anomalous propagation other than aircraft enhancement occurs at some time almost every day. Ducting and subrefraction can trap or divert the beam from the transmitter or aircraft so that it is not intercepted by the aircraft or receiving site as "normally" expected. In Sydney, it has been observed that signals due to aircraft enhancement are either weak or not present at all during periods when signal levels are high over direct paths from Sydney to Canberra and Adaminaby indicating the presence of superrefraction.

(c) Perhaps the most obvious reason for variations lies in power outputs, antenna gains and particularly "S" meter calibrations not being what they are thought to be. It is not possible to come to any sensible assessment of path losses unless you know exactly what the fellow at the other end means when he says you are S4 or whatever.
The IARU has set a logical, absolute standard for "S" meters. It is that S9 is 5 microvolts input to the receiver at VHF/UHF. 5 microvolts equals – 93 dBm for 50 ohms input and the "S" units are 6 dB apart. S4 then is –123 dBm input to your receive system — preamp in circuit or not.

MISCELLANEOUS THOUGHTS ON REFLECTIONS

There is no doubt that this mode of propagation will be evident at 1296 MHz and above, however the length of time that the signal will be available at a given receiving site will be quite short because the beam will be very narrow.

In the unlikely event that a signal is reflected from one aircraft to another before being intercepted by the ground station the path loss will be quite different. It will also decrease with increasing frequency.

Someone might like to derive a formula for the maximum distance which can be covered by aircraft reflections from say a 747 at 40,000 ft to give an S2 signal from a 400 W PEP transmitter with 20 dBi antennas at both ends.

CONCLUSIONS

The signals received during Melbourne/Sydney and Melbourne/Canberra contacts on 2 metres and 70 cm can be accounted for by reference to the known effects of passive reflectors. The aircraft itself is a passive reflector.

Observations made by myself on 2 metre signals in Sydney correlate closely with the levels predicted in this article. My 70 cm observations did not correlate well with these predictions until the "S" meter was properly calibrated. Correlation is now close. In the case of observations made in Canberra and Melbourne any lack of correlation with the levels predicted in this article will have to be explained by the observers but I strongly recommend that they carefully consider the possibilities listed under the paragraph "Variations from Expected Levels" in this article.

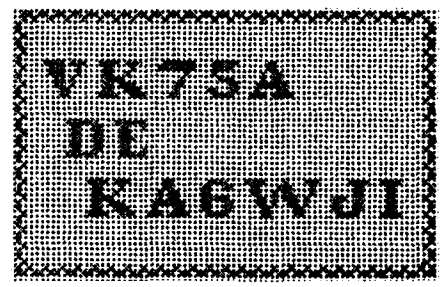
AR

VK75A

Among the many cards received for contacts with VK75A was this one from Nancy Dietrich KA6WJI of Santa Barbara, California. The front of the QSL is stitched very decoratively with embroidery.



ADD ON MODIFICATIONS FOR THE SIEMENS TELEPRINTER

This is the third in a series. The last two were a 'shift indicator' and a 5 volt power supply. This article is about a simple counter circuit to show how far you are from the left hand margin: it's so much easier than counting in your head.

Peter Fraser VK3ZPF
52 Heathfield Rise, Box Hill North, Vic. 3129

A SPACE COUNTER

DESCRIPTION

The counter uses two seven segment LED displays to show numerically how far the typing basket has travelled. The circuit is a conventional counter which is clocked by a flip-flop de-bounce circuit. The counter is reset to zero when the carriage return is pressed or a 'CR' is received.

PARTS LIST

SW-A, SW-B	*(2) Miniature micro-switches.*
FND 500	*(2) 7 segment displays (common cathode).*
74C48	*(2)BCD decoder/driver IC.*
74C90	*(2) BCD counter IC.*
4011	*(1) Quad 2 1/P nand gate IC.*
470 ohms	*(14) Resistors (1/2 watt).*
12K ohms	*(3) Resistors (1/2 watt).*

You will also need two pieces of matrix board (one for the counter and the other for the displays), some ribbon cable and hook-up wire.

CONSTRUCTION

The parts should be put together in such a way as to take up the least amount of space. Just a word of explanation about the circuit diagram: the display shown on the left of the diagram is, in fact, the units display, while the display on the right is the tens display. The board is best mounted down on the right hand side (looking from the rear) of the machine base, under the motor. The screw hole near this location is tapped to accept 4BA screws. The board with the LED displays can be mounted on the left hand side of the platen on a strip of aluminium.

I suggest the use of IC sockets as the chips are all CMOS and don't like too much handling. When all sockets are wired together the board looks like a bird's nest, but if your nest is well kept it should work first time.

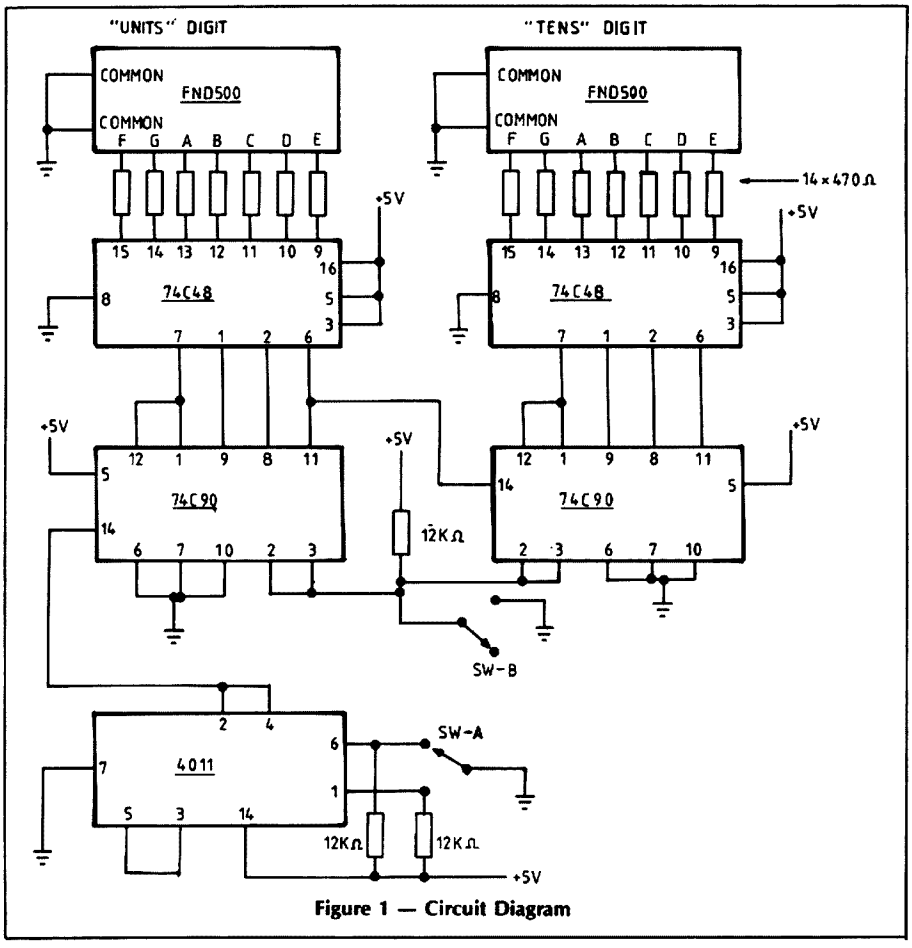


Figure 1 — Circuit Diagram

The 'count' switch (SW-A) is mounted on a right angled bracket screwed on so the switch is activated by the decagonal 'cog'. This is on the right hand side, in the middle of your machine (looking from the front), just behind the code bars. It's on the same shaft as the 'screw' which moves the typing basket along. The micro-switch is positioned so each time the carriage moves along one space, the switch closes, then re-opens ready for the next space.

Care should be taken so neither the bracket nor the switch foul the typing basket, as it means instant destruction of the switch. The two holes located near the 'cog' are tapped to 6BA and only 6BA screws should be used.

The 'reset' switch (SW-B) is located on the left hand side of the machine directly under the return spring. It's held on a 'L' shaped bracket arranged so, when a 'CR' is received, the switch opens then closes again. The hole provided is again tapped 6BA.

HOW IT WORKS

As the carriage moves along, the 'count' switch (SW-A) is switched from one state to the other. As the switch contacts come together they 'bounce'. To remove this bounce the 4011 is wired as a flip-flop. As the name implies, it 'flips' to one state (high) then 'flops' back to the other state (low). This 'pulse' is then used to 'clock' the 74C90 (units) counter. It's output is in the form of 'binary coded decimal' (BCD) and this is converted by the 74C48 to drive the seven segment displays. Each display has 7 dropping resistors (one for each segment). These resistors limit the current available to the light emitting diodes in the display.

When an '8' or '9' is displayed in the units column, pin 11 (74C90) goes high. When the 74C90 (units) is clocked over to '0', pin 11 of the 74C90 (units) goes low. This 'down going pulse' is connected to pin 14 of the second 74C90. This 'pulse' causes the 'tens' column to count 'one'.

When a 'CR' is received, pins 2 and 3 (74C90) are taken high then low again. This 'up going pulse' resets both counters to '00'. *Note: When installed 'SW-B' (reset) is held in its depressed position until a 'CR' is received; hence pins 2 and 3 (74C90) are normally low and go high on reset only.*

So that's the counter project and, although it seems complex, it is quite simple and any RTTY'er should have no trouble at all. This brings us to the end of the current series of projects, but don't put the soldering iron away yet, as the new year

may see some more interesting projects for you to have a go at.

EDITOR'S NOTE

The transformer winding mentioned is used to provide power for a two colour option. Teleprinters with this option (very scarce) already have a bridge rectifier so will only require the voltage regulation. Small capacitors (0.1/UF) between ground and the regulator terminals, soldered to the regulator are advisable, to prevent oscillation.

NB: Other windings on the transformer are not suitable for this power supply. **AR**

POSTAL SERVICE

Did you know that the first recorded Postal Service was in operation in the Chou Dynasty, China in 1100BC.

The Romans in BC and AD had a highly developed Postal Service (presumably by speed chariot). This was made possible by their penchant for building excellent metallised roads and having plenty of military manpower to deliver the mail and parcel bags.

Greece, Egypt and Persia also had planned mail services.

However, during the reign of King Richard II, the English developed the most highly efficient system of all, using couriers and messengers. In 1839, a competition was held to design an embossed envelope with an adhesive flap.

VK3WK AERONAUTICAL MOBILE FIGHTS OFF SHARK

Jim Linton VK3PC
VK3 DIVISIONAL PRESIDENT

A regular aircraft ferrying flight for Bill Bell VK3WK, nearly ended in tragedy when he struck fuel problems, forcing him to ditch a single engine plane, 300 nautical miles from Hawaii.

The 50 year old pilot made front page news when plucked from the ocean, by helicopter, 11 hours and 40 minutes after the plane went down on 16th August.

Bill said he became separated from the aircraft's liferaft and distress radio beacon and was left floating in a lifejacket

A shark about 2.5 metres long encircled him for at least three hours.

"I saw the shadow of the shark circling and the thing made a run at me.

"It was getting fairly excited about me and leapt out of the water. I kicked and slashed like crazy and it went away for a time," Bill said.

He had to keep alert and splashing, so the shark didn't get too close. Bill said after describing the shark's colouring and the way it jumped, a shark expert confirmed the species to be Blue Fin.

A distress radio call was made by Bill before ditching the plane but, it was not picked up. The rescue authorities received a report of an emergency distress beacon and assuming it came from Bill's overdue plane, started a search.

An aircraft located the downed plane and two helicopters with para-jumpers arrived, thinking the pilot was trapped dead in the cockpit. Bill said the Coast Guard decided he was still alive and five aircraft started searching but, in the wrong area because the distress beacon had drifted.

He said searchers later tried a different grid and spotted him waving.

A 'Jolly Green Giant' helicopter plucked him from the ocean and Bill was back on land three hours later.

Bill, who makes regular trips across the Pacific for his company, said he would continue the trips, because it was like being thrown from a horse, you have to get back on.

Lost with the plane was an IC-720 HF transceiver, home brew power supply, antenna coupler and an IC2A, two metre hand held.

Bill can be heard signing VK3WK/aeronautical mobile on 20 and 40 metres during his trans-Pacific treks. **AR**

RICE COULD BE FUTURE SILICON SOURCE

Researchers in the US and Norway think rice husks may be a good material from which to make pure silicon, for chips and solar cells.

Rice husks are a by-product of rice refining ...the average cost is about $US20 per tonne.

Dr James Amick of Exxon in the USA says that although the process has not yet been perfected, it looks promising.

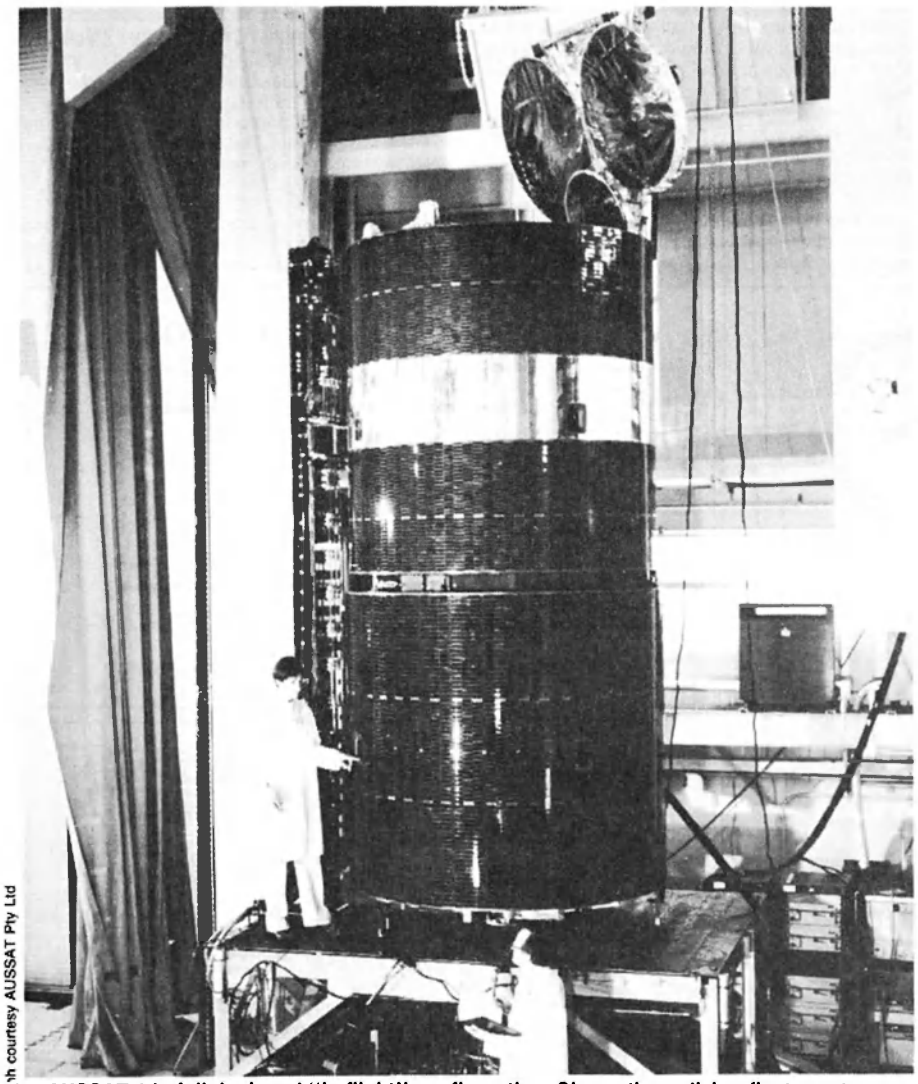
The husks contain carbon and silica and when heated in the correct proportions, they react to give silicon and carbon dioxide. **AR**

AUSSAT: An event in Australia's History

Ken McLachlan VK3AH
Box 39, Mooroolbark, Vic. 3138

More than a quarter of a century after the first satellite, Sputnik 1, was propelled into orbit by the USSR, followed by endless others including space missions, Australia now has its own telecommunications satellite.

Australia, a country with a land area of 7,830,000 square kilometres and a transcontintental distance approaching 4,000 kilometres, with a population exceeding 15.6 million, has successfully launched the AUSSAT satellite, K1. Due to be launched on 24th August, the launch was aborted due to a thunderstorm in the vicinity of the Cape Canaveral launch site, when the countdown was within five, tantilising minutes of lift-off. This caused much nail-biting to the management and staff of the mission, including the General Manager of AUSSAT Pty Ltd, Mr Graham Gosewinckel, who imperturbably stated on a direct television report of the launch, 'that it was a milestone in Australia's history and a delay of 24 hours for a successful launch was infinitesimal to the period of, in excess of the seven years it would be in orbit and the service to the community it would bring'. Graham, and his staff, were overwhelmed by the number of telegrams bestowing good wishes, that had been received, including one from the former Minister of Communications, Mr Tony Staley, in whose government it had been inaugurated, to those from the Prime Minister of Australia, Mr Bob Hawke, Mr Michael Duffy, present Minister for Communications, and the general public.



Photograph courtesy AUSSAT Pty Ltd

AUSSAT 1 in full deployed "in flight" configuration. Shows three dish reflector antenna systems. It measures 6.6 metres in height and 2.2 metres in diameter. in orbit mass is 650kg.

Unfortunately, the second attempt, on 25th, was not without tribulation, as again, this time at nine minutes before scheduled lift-off, in a very 'narrow window' of time, a back-up flight computer fault developed and it was impracticable to repair or reprogramme another back-up computer. This history making event, for Australia, had to await yet another day.

On 26th August, weather conditions again were to haunt a successful launch and with the 'window' narrowing, tomorrow was to be another day. AUSSAT was now programmed for lift-off at 1055UTC on the 27th, with weather forecasts being less than optimistic.

K1 was sent into space, five minutes late, after a near copybook countdown, from Cape Canaveral, 50 km north of Melbourne, Florida. At last, AIRBORNE!

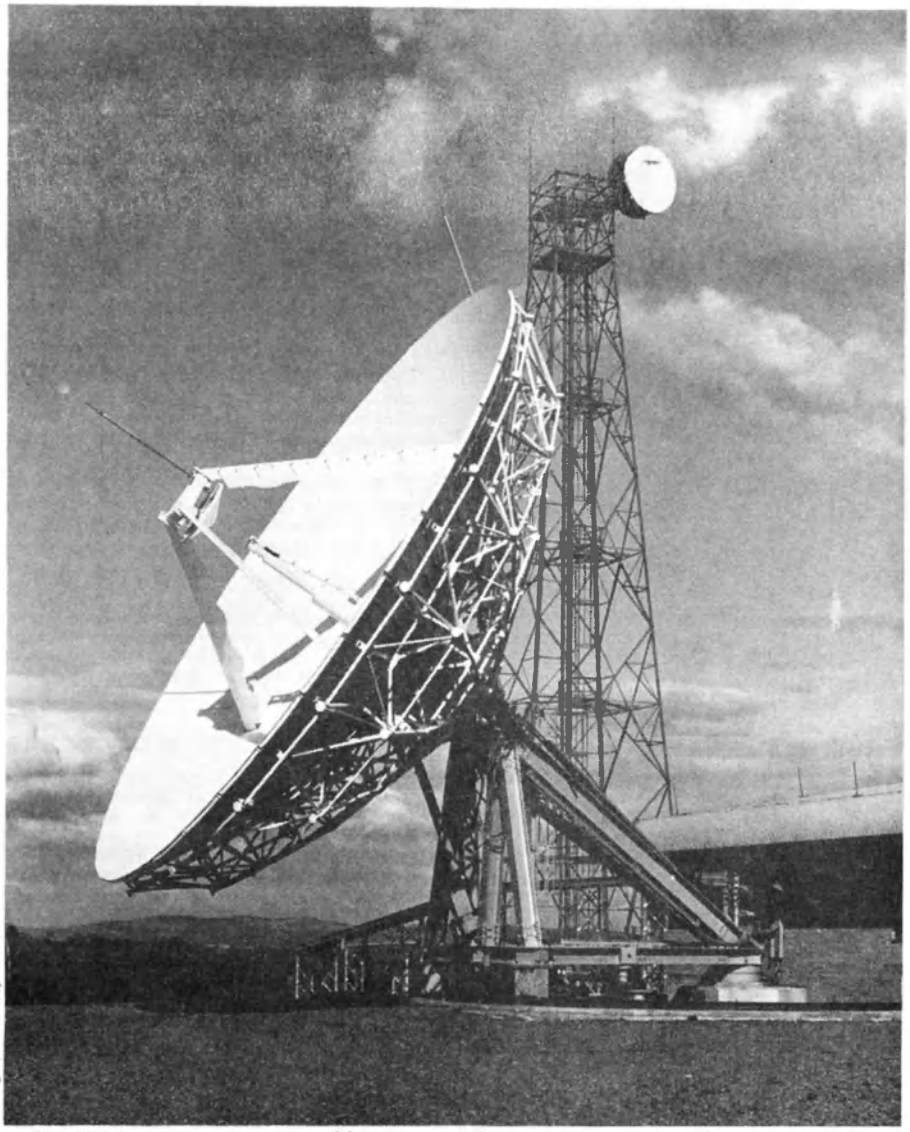
After discharge, with two other satellites from 'Discovery', that had to be propelled into space enroute, and a specific trajectory, due to its main purpose of making a rendezvous with the disabled satellite 'Syncon', worth, in excess of, one hundred and twenty million dollars and the duty of reclaiming it from space due to its unusual orbit, hence the 'narrow window'. Within hours of lift-off, K1 was ejected into space.

Deploying K1 into its 'resting place' above the Equator was in the hands of the control station, in Sydney, for manoeuvreing it into position. No mean task, but the small close knit group of some 268 AUSSAT employees, comprising scientists, engineers and administration staff, scattered across Australia, had the know-how and back-up assistance from previous launches, in other countries, and their experiences, to put it in the correct location.

AUSSAT K1, next month will be joined by a companion, K2, and a third in June or July, next year, which will be launched by the European Space Agency launcher, Ariane. K1, 6 6 metres long and 2.2 metres in diameter, with an all up weight of 655 kilograms, was 'piggy-backed' via the American spaceshuttle,'Discovery' and manoeuvred to hover 36,000km above the Equator by commands from the Sydney control centre. By the time you read this article, AUSSAT K1 will be operational.

Australia, since the middle of the 19th century, has kept abreast of technological advancement. Alexander Graham Bell invented the telephone in 1876 and two years later it was introduced in this country.

Presently, Australia can boast of the most modern terrestrial based communication system in the world, particularly, in the urban areas and this satellite network will bring Australia into line



Photograph courtesy Ken McLachlan VK3AH

Mitsubishi 13 metre antenna, with 32 metre microwave tower for customer links in the background.

with space age technology, also increasing our communication effectiveness, through diversity.

Purported by many to have cost in excess of four hundred million dollars which has been funded by the Australian Government, Telecom and loans from private enterprise, this satellite has created a tremendous potential in communication, to cover our vast land mass.

The purposes that the satellite can be used for are endless and it is not restricted to providing a direct broadcasting and television service coverage to all states, the Northern Territory and the surrounding peripheral surrounding coastline, including such islands as Norfolk and Lord Howe.

It will provide greater access for such organisations as the 'School of the Air', presently being mainly dependant on the Royal Flying Doctor Service frequencies, provide telephone links to very remote areas that it was previously impossible to service due to economics and in the case of a failure of present terrestrial links in the unfortunate case of a natural disaster, mobile transceivers will be available to use the celestial communication link to various land stations scattered across the continent.

Provision has been made for numerous channels, which will be used by the Australian Broadcasting Corporation, commercial radio and media outlets, Telecom for updating and backing-up the present network, police and military for transfer of important data and the business community at large, such as banks, large retail stores and mining interests. A further enhancement to our already outstanding air traffic control effectiveness will be made, with the installation of 200 satellite ground stations for use in the control of flights above 3000 metres. The untapped potential of this celestial wonder, with an expected life of seven years is, as yet, to be realised.

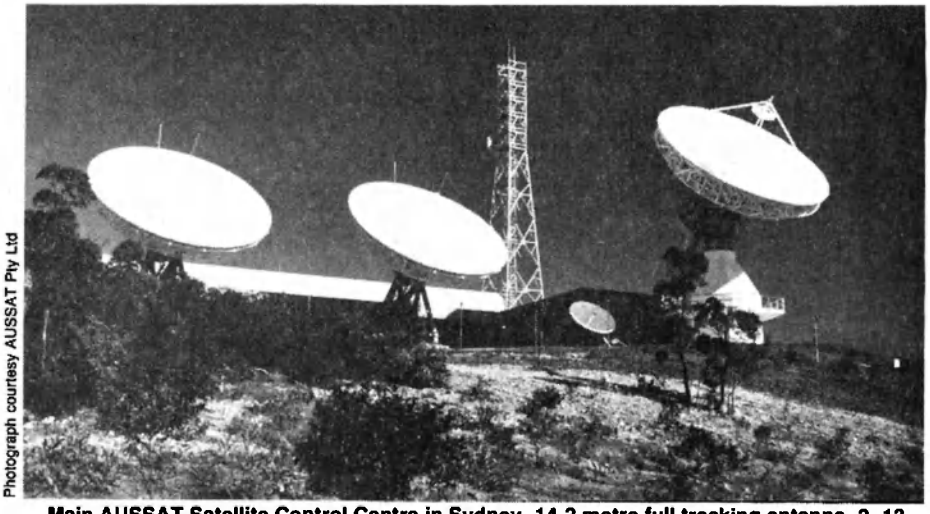
It is interesting to note that the communication licence for K1 is $62,000 and K2 and 3 will attract similar revenue to the Department of Communications. The AUSSAT account for the earth stations is expected to be in the vicinity of $125.000. Quite a licence fee per annum, when compared with the amateurs fee!

TECHNICAL DATA

Initially, the two communication satellites will be in a geostationary orbit of 156 and 164 degrees east. The third satellite, when launched next year, will be located into an orbital position of 160 degrees. The primary satellite control, monitoring and communications centre is located in Sydney, with a back-up, with similar facilities in Perth. Major earth stations are located in all state capital cities, including Canberra, Darwin and numerous smaller user-owned earth stations dotted around the continent, to cater for a wide range of communication services.

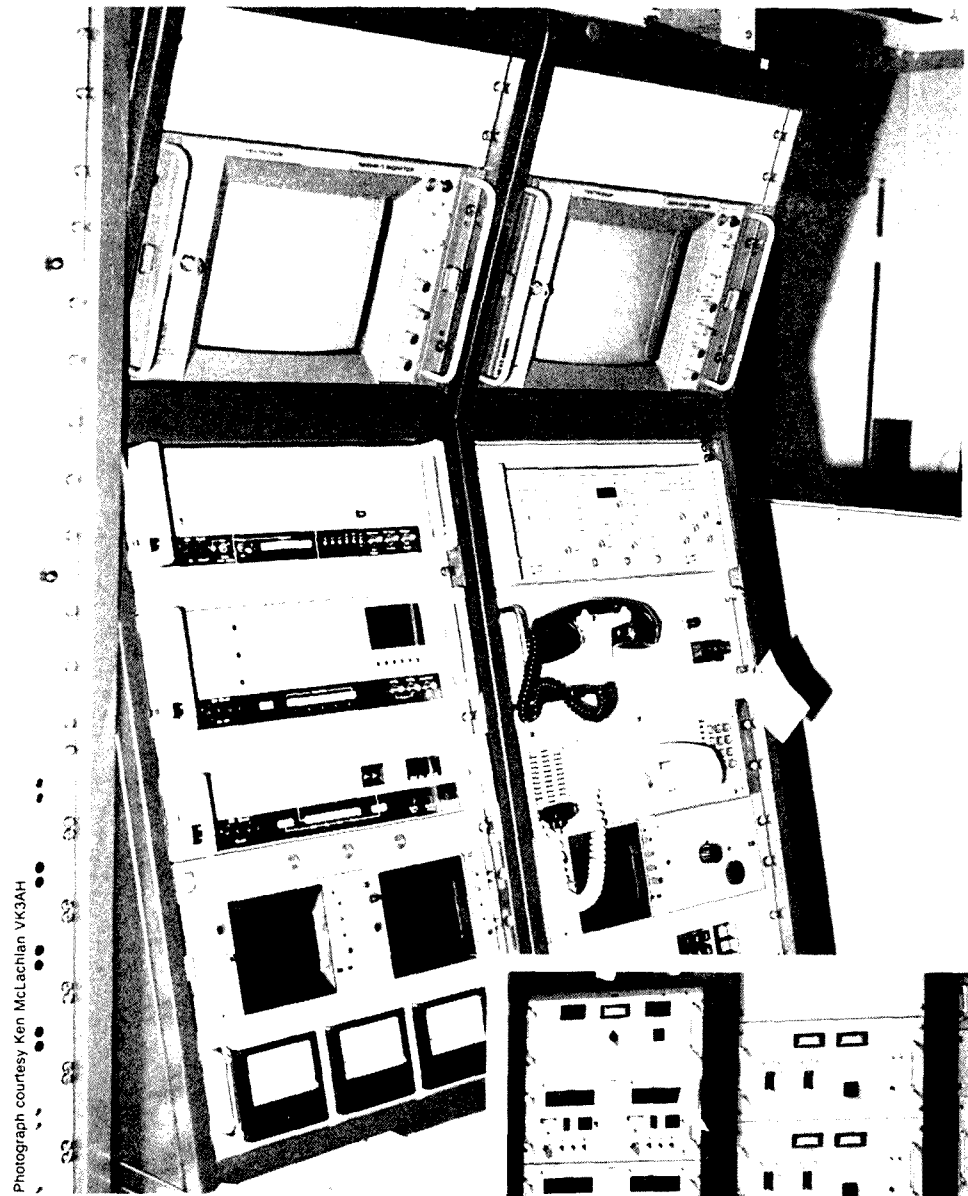
The uplink and downlink frequencies are 14 to 14.5 and 12.25 to 12.75GHz respectively with channel capacities of 11 by 12W and 4 by 30W transmitters, with a bandwidth of 45MHz. Many configurations can be used with the satellite antennas and the DCrwin and Brisbane dishes are 18 metres in diameter to the other major cities installations of 13 metre diameter antennas. The B-MAC (Multi-Plexed Analogue Component, Type B) system has been chosen because of several significant advantages, which include h-ff-gh quality television reception, six digital sound channels, a data channel and more reliable reception under adverse weather conditions.

It is interesting to note from a comprehensive table that has been published by AUSSAT Pty



Photograph courtesy AUSSAT Pty Ltd

Main AUSSAT Satellite Control Centre in Sydney. 14.2 metre full tracking antenna, 2, 13 metre communication antennas with 40 metre microwave link tower. This will provide mission control and full satellite tracking, monitoring and control facilities.



Photograph courtesy Ken McLachlan VK3AH

win, with Brisbane second, win the dB attenuation stakes with as, at times as much as 13dB, Hobart gaining the 'wooden spoon' with a mere maximum of 2dB. For being in the winning stakes, they have received a larger antenna.

It has been stated that it will be an easy handyman project to orientate a small homestead type dish of about one and a half metres in diameter, to receive the satellite transmissions, by the use of a magnetic compass and a data sheet which will include an azimuth chart that will be supplied, when the equipment is purchased. It only remains for fine tuning of the antenna for the best reception.

DETECTION

Under full computer control from Sydney and data collected by other stations, traffic usage will be determined and controlled. This data will be a valuable tool for determining the type of traffic

Photograph courtesy Ken McLachlan VK3AH

Ltd, of the attenuation caused by rain in the various cities at various times of the year. Dar- and effectiveness and will be used as a guide in determining the parameters of the system, when the necessity of updating occurs, on which planning has already begun. Also, it will instantly detect unauthorised use and unwanted interference and pin point its source.

To radio amateurs, satellite communication is not new, as within four years of the Sputnik launch, they built and had launched a system that has been continually updated which has allowed followers of the facet of the hobby to contact amateurs in other countries across the world. From these contacts, information has been gained that has assisted the state-of-the-art technology we are enjoying today.

Philatelic collectors will be delighted, as Australia Post are planning to release a special commemorative stamp early next year with a design based around the satellite. A must for all enthusiasts!

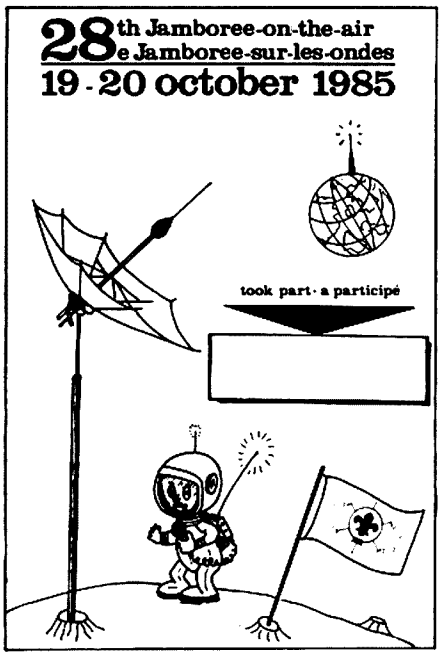
It is felt fitting that AUSSAT K1, has been launched during the 75th Anniversary of the first radio society in the world, the Wireless Institute of Australia, of which I am proud to be a member.

ACKNOWLEDGEMENTS

Sincere thanks are extended to the staff of AUSSAT Pty Ltd, particularly to Mr Robert Loane, Marketing Manager, Mrs Helen McLennan, Ms Jenny Lin, Messrs Kerry Carney and Roger Donnelly, for their co-operation. Also to the staff of the Australian Bureau of Statistics (Melbourne), in their assistance with the preparation of this article.

AR

At the time of going to press, the talented crew in Bellvue said that the deployment of the antennas and solar panels was the smoothest operation of its kind ever accomplished.
Amateurs are invited to listen to the beacon and telemetry signals on the frequencies of 12.74875 and 12.74975GHz.
Congratulations to all concerned.



WIA, 75th ANNIVERSARY AND 28th JOTA — LET'S MAKE THE BANDS ALIVE IN 1985

Peter Hughes VK6HU
NATIONAL CO-ORDINATOR FOR JOTA
58 Preston Street, Como, WA. 6152

The Wireless Institute of Ausralia will, this year, promote their seventy fifth anniversary, through QSL cards supplied for use by stations participating in Jamboree on the Air. Where-as, there has been enormous support from the Institute in 28 years of encouragement to Scouts and Guides and their Leaders and Organisers to participate and in promotion to radio amateurs to make it all possible, in this special year for the Institute, the Scout and Guide Movements are proud to assist in this promotion.

Amateurs who have not been previously involved may be interested in the following information. Even the 'old hands' may appreciate a refresher.

JOTA is not a contest but is a lot of fun, being one weekend in the year when radio amateurs world wide invite Scouts and Guides to participate with them to talk to others around the world, across the continent or just 'over the back fence'.

The third full weekend in October is fixed for JOTA by international agreement between the IARU and Scout World Bureau in Geneva. This avoids any conflict for the airways, between the eager young voices and a possible contest.

In 1985 JOTA starts at 0001 hours LOCAL TIME (EVERYWHERE) on Saturday, 19th October and continues to 2400 hours on Sunday, 20th October, with the amateur fitting in whatever time is possible and convenient.

The youngsters can be fascinated by your explanation of how JOTA starts at midnight on the dateline in places like ZL and 3D2, progressing west through VK1/2/3/4/7 to VK5/8 and VK6, then onwards through ZS, etc.

They can also be educated on Great Circle (shortest distance and Delta navigation) Beam Headings and the difference between various maps — particularly Mercator versus a Globe (try beam heading to South America).

There are no rules. Amateurs can operate within any condition of their licences — any band, any mode. Be ready for the situation wherein, unlike Australia, Scouts and Guides are not allowed to speak on the microphone in some countries. A special type of 'relayed' contact is needed for these people.

To facilitate contacts, World Scout calling frequencies are recommended, with the expectation that stations QSY after contact is established. As we know, this system can lead to disappointment through a contact being 'lost' on changing frequency so, perhaps it would be more effective to listen or call "CQ Jamboree" at the edge of the contacts near these frequencies.

Please note, VK participation is traditionally highest or second in the world and for many years we have been asked to 'leave a gap' between overs for DX stations as they tell us they can often hear us but are unable to break in. It has been agreed that, except by special arrangement, metropolitan repeaters are not used for JOTA, as they were installed for mobile communication. Two metres simplex is generally very popular because of clarity, in spite of the lack of DX.

BAND Metres	CW Frequency/MHz	SSB Frequency/MHz
80	3.530	3.590 (in VK)
40	7.030	7.090
20	14.090	14.290 (DX) 14.190 (VK)
15	21.140	21.360 (DX) 21.190 (VK)
10	28.190	28.990

Frequency Table

The Official Opening Ceremony will be broadcast, as in recent years, from Government House, Yarralumla, over VK1BP which will be operated by members of the RNARS, with VK6HU as Master of Ceremonies.

Their Excellencies, the Chief Scout and Chief Guide of Australia, will be supported by the Chief Commissioners for Scout and Guides.

This Broadcast commences at 0400UTC (or as near as possible), on 21.190, 14.190 and 7.090MHz simultaneously and will be followed by a call back, to enable the dignatories to talk with some of the participating stations.

It would be appreciated if stations could keep these frequencies clear from 0345UTC, to enable propagation checks to be made, mainly with the assistance of Branch Official Stations. If you are looking for them during JOTA, they are generally VK.SAA and VK.GGA, but VK5BP and VK6SH are still current and the Northern Territory uses VK8SBP.

Some Branches also have their own Official Broadcast:

VK5 by courtesy of the WIA in the Sunday Broadcast at 2330UTC.

VK6SAA at 1200UTC, Saturday 19th October on 3.590MHz.

VK6WV at 1130UTC, Saturday 19th October on 3.590MHz (for NW stations).

VK6SAA at 0800UTC, Saturday 19th October . . . rebroadcast of speeches from Canberra on two metres Channel 8, 7.090 and 21.190MHz.

Logs and Reports are the responsibility of the Scout and/or Guide Leaders but, help or verification of the contacts could be appreciated. These sheets are in no way intended to replace any station log.

VK5BP will be on air on the four Sundays prior to JOTA from 0130 to 0600UTC for enquiries and demonstrations and would no doubt appreciate some contacts.

VK2SAA will be active from late December to mid January 1986, from the site of the 14th Australian Jamboree at Cataract Park, near Wollongong, south of Sydney. Contacts during this time will be very important to demonstrate amateur radio in association with workshops, an AM broadcast band station and displays.

Opportunity is being taken to hold the Third National Conference of Scout JOTA Organisers and Guider Liaisons during the Jamboree.

On behalf of all Scouts and Guides, I take this opportunity to sincerely thank the WIA and all amateurs who make this exciting international event possible.

AR

QSL CARDS TO AND FROM THE USSR

It is common knowledge that cards from Russian amateurs take, very often, a long time to come through. This is not the fault of the WIA Inwards Bureaus.

The main reason is that most Russians do QSL and almost 100 percent of those cards come through the outwards bureau in Moscow.

Of late, the cards appear to be coming through reasonably quickly, only taking six months to a year or so. A few years ago, the time would have been two, three or even four years.

Has Box 88 become more efficient? No! Because of the present poor conditions due to the state of the ionosphere, there are not so many opportunities for the Russian stations to work DX, hence less QSL cards. Less cards means that the bureau people have been able to catch up on the back-log.

No doubt things have improved in the other direction too. Sorting cards sent to Box 88 would not be the mammoth task that it was when conditions were good.

Do you respond to listener reports from the USSR or do you throw them in the WPB?

Russian SWL cards probably outnumber all SWL cards received from other countries. There is a reason. Before an aspiring amateur can make application for a licence, he or she must become a SWL and collect the prescribed number of foreign QSL cards.

So, next time you receive a Russian SWL card, give a thought to Vlad or Serge or Alex, spending hours over the receiver, listening to you talking to your heart's content and wishing that he could join you. Your card may be just the one he needs.

From QTC, Aug 1985

HISTORY OF JAMBOREE ON THE AIR

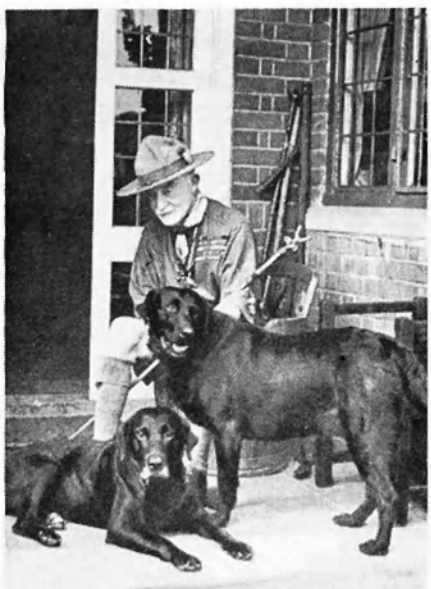
Maxwell Hull VK3ZS
FEDERAL HISTORIAN
PO Box 300, Caulfield South, Vic. 3162

Photograph courtesy 'The Story of 25 Eventful Years in Pictures'.

At the Scout Jamboree, Arrowe Park in 1929.

Lord Robert Stephenson Smyth Baden-Powell was a British General, born in 1857. He took part in the operations in Zululand in 1888, and in 1895, was sent on special service to Ashanti. In the expedition against King Prempeh, conducted by Sir Francis Scott, he was given command of the native levies, whom he turned into splendid fighting material. During 1896-7, he was Chief Staff-Officer in South Africa, and took part in the campaign against the Matabili. On the outbreak of the Boer War in 1899, he was given the command of the small force in Mafeking. Although surrounded by a greatly superior body of Boers in the very early stages of the war, 14th October 1899, he, in spite of a close investment of determined assaults, and of starvation rations, kept the flag flying until the siege was raised by Mahon and Plumer on 17th-18th May 1900. Baden-Powell then organised the South African constabulary, and from 1900-3, was Inspector of the Transvaal police.

In 1903, he became Inspector of Cavalry. He founded the organisation of Boy Scouts in 1908, to promote good citizenship in the rising generation, and to educate boys by means which really appealed to them — namely, scouting and back-woodmanship. In order to devote his time to this work, he retired from the army in 1910. In 1909, he received a knighthood. He was the author of Reconnaisance and Scouting, 1890, Cavalry Instruction, 1895, The downfall of Prempeh, 1896, The Matabele Campaign, 1896, Aids to Scouting, 1899, Sport in War, 1900, Scouting for Boys, 1908, and Sketches in Mafeking and East Africa, 1907. In 1929, he was given peerage and took the title, Lord Baden-Powell of Gilwell.



Photograph courtesy 'The Story of 25 Eventful Years in Pictures'

Lord Baden Powell, taken at his home in 1929, after he received a barony on 2nd August, for the work he had done for the youth of Great Britain and the whole world.

AMATEUR RADIO, SCOUTING AND GUIDING

Amateur radio, scouting and guiding have a similar philosophy — of spreading international friendship and goodwill throughout the world — of crossing borders of language and creed and of doing these things in a manner different to most other pursuits of mankind. It is a common link which exists between the amateur radio and scouting organisations of the world.

World scouting commenced at an experimental camp, organised by Lord Baden-Powell, on Brownsea Island, England, in August 1907. The principles of scouting, as identified by its founder were, 'that man should serve God, act in consideration of the needs of others, and to develop and use his abilities to the betterment of himself, his family and the community in which he lives'.

The 75th Anniversary of the movement was celebrated in 1982-3. This was also the 125th Anniversary of the birth of Lord Baden-Powell, fondly referred to as BP.

The word JAMBOREE means 'noisy revel, carousal or spree, especially a large gathering of Boy Scouts'. In Australia, the word CORROBOREE is often used, particularly when referring to an interstate gathering of Boy Scouts. Corroboree is an Australian aboriginal word which, by definition means 'an aboriginal assembly of sacred, festive, or warlike characters, any large or noisy gathering, a disturbance, an uproar'. From the inception of scouting, gatherings of Boy Scouts were identified by these terms.

The first world Jamboree was held at Olympia, London, in 1920. It was at this event that BP was acclaimed Chief Scout of the World. In the same year, the first International Scout Conference was held in London, from which the International Bureau, now World Bureau, was formed.

The first Australian Corroboree was held in Sydney in 1922. In the same year an International Committee was established. The largest Jamboree was held at Arrowe Park, near Birkenhead, England, on the 2nd July 1929, when 50,000 scouts from all over the world were in camp. On 1st August of the same year, Robert Baden-Powell was given a barony in recognition of 'the great work done for the youth of England and the whole world'.

The story is told how in 1910, a group of girls attended a rally at the Crystal Palace in England, dressed as Boy Scouts, demanding to be included in the activities of scouting. It seems Robert Baden-Powell was not over-impressed with this representation in those days but, nevertheless, could not see any reason why girls should not be involved in scouting. And so it was, at his instigation, that his sister, Agnes Baden-Powell, formed the Girl Guide Movement in England, which officially commenced on the 1st May 1910. In Australia, the existing Red Cross Girls Aids and Girl Aids of Australia, were willingly absorbed into the Movement.

When scouts and guides meet together nationally and internationally, the gathering is referred to as a JAMBORELLA. The first Australian Jamborella was held at Gilwell Park, Victoria, during December/January 1978-9. The first international Jamborella was an Asia-Pacific event, held at Rossmoyne Park, Dandenong, Victoria, during December/January 1984-5.

Scouting activities have always included 'signalling' but, until the postwar years of 1955-6, little interest appears to have been shown in 'wireless signalling'. The first known association of scouting and wireless was as early as 1912, when boys of the First Arundel Troop, in Sussex, England, registered the call sign XBS and, after purchasing component parts at the A W Gamage Department Store in London, constructed and operated a Spark Transmitter. It was described as a 50 watt transmitter, powered by storage batteries and operating on the 200 metre band with a sending range of five miles (8km). The station was also licenced to use portable apparatus to operate within a five mile (8km) radius of its base transmitter. The troop's receiving apparatus was said to have a range of 800 miles (1287km).

There seems to be no further evidence of the Boy Scout Movement utilising wireless in its

general activities, other than the individual operation of licensed stations, whose owners were also in scouting, until the Pan Pacific Jamboree held at Clifford Park, Wonga Park, Victoria, during December 1955 and January 1956. This was such a massive undertaking for its time and it deserves detailing for the sake of history.

VK3WIA AT WONGA PARK

In November 1955, the Federal organisation of the WIA received a request from Mr Levi Molineux, Leader of the Fraternity Group of the Pan-Pacific Scout Jamboree Camp Committee, seeking the co-operation of the amateur radio movement to provide, as an additional amenity at the Jamboree, a complete amateur radio station in full operation, to enable scouts to see it working and hear signals from all parts of the world.

The then Federal Secretary, Doug Bowie VK3DU, with the approval of the Executive, offered the use of the WIA Federal Station, VK3WIA, which was readily accepted. There was not a lot of time in which to organise such a project.

At that time, VK3WIA was operated from the home station of Major Bill Mitchell VK3UM, who was Federal President and Manager of the Federal Traffic Net. His station, like many of the postwar rigs, was substantially 'home brew' from disposals equipment. It was not exactly transportable. A decision was therefore made to seek the assistance of the defence services and the radio industry, in setting up a station. The result was beyond expectation!

First, a request was made for VK3WIA to operate at the Clifford Park camp site at Wonga Park using a power of 500 watts, and this was granted by the Wireless Branch of the Postmaster General's Department. The installation was inspected by Mr Joe Dobbyn, Superintendent of Wireless (Victoria) and Mr Alf Avard from the same office.

To operate with this power, two Type AT20 transmitters, with 50 kVA petrol driven motor alternators supplying 240 VAC, were obtained from the RAAF. The location of the station was on Headquarters Hill, the name given to a raised knob of terrain, just to the right, inside the main entrance, overlooking the Sound Shell and main amenities area. The entrance was composed of four huge boomerangs forming an arch and was featured in the design of the special QSL card, to be sent to all those operators who contacted VK3WIA.

Photograph courtesy W.L. Hull

Erected many weeks before the commencement of the campsite installations, this impressive formation of four boomerangs formed the entrance to the Clifford Park Jamboree site. VK3WIA operated from the site for the 10 days of the Jamboree.

The Jamboree Committee provided a large marquee, complete with wooden floor, in which to house the transmitters and operations area. A decent 'blow' during the early days of setting up the campsite brought the marquee to the ground. During its re-erection, the opportunity was taken to re-lay the flooring at more convenient levels. A timber and sisalkraft shelter, erected by a troop of Sea Scouts, housed the 240 VAC motor generators. Sleeping quarters were normal scouting tents, provided by the Jamboree Committee.

The two transmitters were connected for switching to any one of six directional (four wave lengths per leg) V beams, suspended from a central 75 feet (23m) metal pole. This was supplied and erected on Headquarters Hill by personnel from the Royal Army Signals Corps, at Balcombe, Victoria. Six 30 feet (9m) collapsible masts, loaned by the RAAF, were set up on the perimeter of Headquarters Hill by WIA personnel, who also completed the audio, feedline, antenna switching and power wiring, for the entire installation. The transmitters were operated on 80, 40 and 20 metres.

900 yards (823m) of 7/20 bare copper wire used in the installation, was donated by the British General Electric Company Pty Ltd, Glorad Engineering Services Pty Ltd, Johnson & Phillips Pty Ltd and O H O'Brien Pty Ltd. Several hundred insulators, of various kinds, were donated by Nilsen Porcelain Pty Ltd, Australian Electrical Industries (AEI) Pty Ltd and R H Cunningham Pty Ltd. 400 yards (366m) of steel guy wire was provided by ARC Engineering Co Pty Ltd and 150 yards (136m) of rope halyard from Glorad Engineering Services Pty Ltd, the latter company also supplied control equipment, 80 feeder spreaders, power distribution boards, relay power supply and test equipment. Antenna change over relays were supplied by Ham Supplies.

Fuel and oil, for the motor driven alternators, were delivered, on site, by the Vacuum Oil Company, paid for by donations from Ampol (Alba) Petroleum Pty Ltd, Caltex Oil (Australia) Pty Ltd, Commonwealth Oil Refineries Ltd and the Vacuum Oil Company Pty Ltd. The surplus was sold to the Jamboree Committee.

A four channel audio mixer, on loan from the Australian Broadcasting Commission, provided means by which, important addresses from the main sound shell could be mixed with local announcers' voices for transmission at appropriate times.

Despite the short notice, inclement weather part of the time and many frustrating technical problems associated with installing the equipment in difficult circumstances, the project was a success, from which many lessons were learned. VK3WIA operated for almost 24 hours per day over the 10 days of the Jamboree, logging more than 480 contacts in 38 countries.

Scouts from all over the world flocked around the operations area, many of them being able to talk on the air to local, interstate and overseas amateurs. The scouting movement in Australia and overseas had been notified of the operation of the station and were looking for signals from the Australian Jamboree on the Air. From the WIA's point of view, the Clifford Park Jamboree was the first Jamboree on the Air ever held and sparked off the enthusiasm for encouraging amateur radio operators around the world to open their shack doors to the scouting fraternity.

The entire operation was carried out by a small team, namely: M Cameron VK3AC, George Glover VK3AG, R Jones VK3BG, Doug Bowie VK3DU, Jack Elton VK3ID, Reg Jepson VK3JI, Ray Jones VK3RJ, Bill Mitchell VK3UM, Ivor Stafford VK3XB, Fred Bail VK3YS, Lance Frith VK3ZA, Max Hull VK3ZS, Ken Seddon VK3ACS, Hans Albrecht VK3AHH, R Bailey VK3ZAQ, John McKenrick and Bob Darlington.

From left: James Yapp, Karam Singh, Ashkar Hasbollah and Max Hull VK3ZS, making contact with stations in North Borneo during Clifford Park Jamboree.

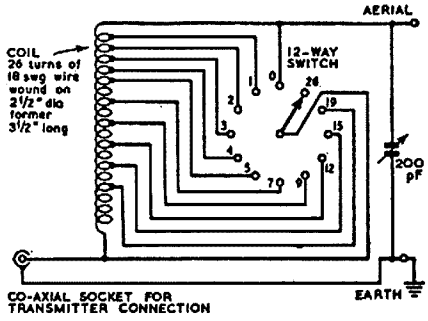


Figure 1 - Circuit Diagram of a the end fed Aerial Matching Unit.

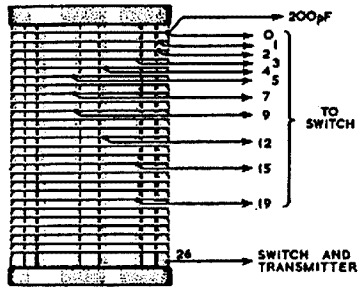

Figure 2 - Details of Coil and Tappings. The Coil is wound on an Eddystone Frequentite Former.

In August 1957, the year following the successful Australian venture, the Boy Scouts Association in England celebrated its Jubilee Jamboree. The event was the 'BP Centenary 1857-1957 Jamboree' at Sutton Park, Sutton Coldfield, celebrating 100 years since the birth of Robert Baden-Powell.

The British Postmaster General granted special facilities for the operation of an amateur radio station, using the call sign GB3SP. It was permitted to operate simultaneously on more than one band, between 3.5 and 30MHz, and to transmit a News Service as well as conducting the normal activities associated with amateur station operation. The News Bulletins were transmitted 'on the hour' for approximately five minutes, from 1000 to 2200 GMT (UTC), with special radiations beamed to suit conditions and local times around the world, where possible.

The Federal Executive received notice of this event and recirculated the information to VKs through the pages of Amateur Radio and WIA Divisional Broadcasts. It was from this event the idea was born for all scouts operating on the amateur bands to nominate one day a year on which they would get together for a Jamboree on the Air, JOTA. Les Mitchell G3BHK, who had been running scout radio camps in England since 1946, was given the job of organising JOTA. For its success, it was seen as being necessary to invite amateurs throughout the world to take part, rather than confining the event to local licensed scout stations.

In November 1957, the idea was put to the test, using a 40 watt AM transmitter, set up at a meeting held at Fielden, UK, at which local scouts attended. It was an outstanding success, with 63 contacts in some 30 countries being made in 24 hours. The rules were then drawn up for the first official JOTA in 1958 and it was officially listed as an annual scouting event. From 1959, JOTA became the responsibility of the Boy Scout World Bureau and this organisation annually circulated International Commissioners, Jamboree on the Air Organisers and Amateur Radio Organisations, with details of dates and times. The co-operation of amateur organisations was vital to ensure the continued success of JOTA.

The WIA played an important part in encouraging Australian amateurs to open their shacks for scouts to see amateur radio in operation. There was some apparent lack of interest in the early days, which has largely been overcome.

In 1963, the Australian Boy Scouts Association contacted the Federal Executive of the WIA, seeking the assistance of the Institute to again install and operate an amateur station at the forthcoming Seventh Australian Jamboree, to be held on the site of the Old Police Paddocks at Rowville, near Dandenong, Victoria, from 29th December 1964 to 11th January 1965. In making the request, the Association cited the success of the 1955-6 Jamboree and expressed the hope 'that the WIA could do it again'.

Jay Lancaster VK3JL, had taken over the office of Federal Secretary.

Almost a decade had passed since the Wonga Park operation and Jay knew little of what had gone into that event. With his typical efficiency however, he organised a committee composed of Bill Mitchell VK3UM, Max Hull VK3ZS, George Glover VK3AG and David Rankin VK3QV and advised the Scout Association that VK3WIA would operate at the Jamboree. This time the installation was a very much smaller and amateur like setup. Compact commercial rigs were appearing in the market place and the Executive had acquired a Geloso G222-TR Amplitude Modulated transmitter covering 3.5 to 30MHz in six bands, for use on its Federal Traffic Net, and this was pressed into service at the Rowville camp site. The simple antenna tuning unit, illustrated in Figure 1 and 2, coupled the transmitter to a random length end fed antenna.

A brief study was made of the sun spot cycle conditions which appeared favourable. VHF home brew equipment was therefore also installed, thus providing the scouts with a broad example of what amateur radio was all about.

Hundreds of contacts were made on all bands during the 10 days of the Jamboree, which this time enjoyed excellent weather. Due to circumstances, the bulk of the operating of the station fell in the lap of Bill Mitchell VK3UM and David Rankin VK3QV, who kept the station on air for many hours a day.

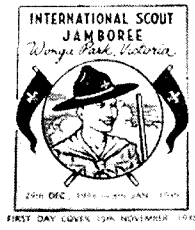
This was the last known activity of VK3WIA at Scout Jamborees. The WIA has, however, fostered the activity of JOTA and over the years, from the middle 60s until the present time, has seen a great deal of publicity and co-operation given to this event. Amateur Radio magazine has carried a number of front cover feature pictures of amateurs and scouts participating in JOTA. It has become one of the most important world wide events on the calendars of the scouting and amateur radio organisations.

Many scouts today are licensed amateurs, who first gained interest in amateur radio through participating in JOTA.

Lord Baden-Powell of Gilwell, passed away on 8th January 1941. From the humble beginnings of scouting in 1907, he saw world membership reach 1,019,205 in a 1922 census. Today the organisation of World Scouting boasts over 17 million scouts, around the world. BP visited Australia in 1912, 1931 and 1934.

Lady Olave Baden-Powell passed away on 26th June 1977, after a life of fulfilment, dedicated to her husband's cause and that of the Girl Guide Movement. She visited Australia on the occasion of the Diamond Jubilee Year of Scouting 1907-1967. A thanksgiving service was held on 30th April 1967, in Festival Hall, Melbourne, at which a gathering of more than 6000 scouts and guides were addressed by Lady Baden-Powell. This address was recorded for posterity by the writer.

This year, 1985, celebrates the 75th Anniversary of Guiding in Australia. The Girl Guide Movement has a present membership of 100,000. Australia Post issued a 33 cent Pre-Stamped Envelope celebrating the event.



Pre-Stamped Envelopes and Commemorative Postage Stamps have been issued on several occasions, celebrating scouting events, in Australia. A red 2 1/2d (3 cent) stamp depicting a scout was issued, together with a First Day Cover, to celebrate the 1948-9 Pan Pacific 'Yarra Brae' Jamboree. A similar 3 1/2d (4 cents) stamp and First Day Cover were issued for the 1952-3 Pan Pacific Jamboree at Graystanes. The scout depicted on these two issues was the son of the then, Commonwealth Note Printing Branch Engraver, Mr Frank Manly. In 1979, a 20 cent, First Day Cover was issued to celebrate the Fourth Asia Pacific (12th Australian) Scout Jamboree, in Perth. This Jamboree had a special importance, being the final event in an exciting year of sesquicentennial celebrations for Western Australia.

During the WIA's 75th Anniversary, it is again the Institute's pleasure to be associated with scouting and guiding, for the October Jamboree on the Air. It looks forward to many more years of JOTA activity, in harmony with people who have such an affiliation with it.

All VKs are cordially invited to participate in the 1985, 28th Jamboree on the Air.
JOTA is part of our history. AR

Radio Amateur Old Timers Club

QUEENSLAND'S SECOND ANNUAL LUNCHEON A SUCCESS

Bill Bentson VK4QF/W7QFY, advised that the Annual Luncheon of the Queensland RAOTC, held at the Coorparoo RSL Club on 28th April, was, again, a success, with 33 members present. Bill says they plan to have one every year, on the Sunday following ANZAC Day.

The VK4 boys donated $20 towards the cost of printing the RAOTC 'OTN Journal'. The Committee extends its thanks and appreciation. With the cheque was a photograph of the members at the luncheon.

Back row standing-Art Walz VK4AW, Malcolm Gray VK4ASU, Alan Taylor VK4BE, Keith Schleicher VK4KS, Roy Hildred VK4RE, Bill Stevens VK4YN, Bob Linsket VK4ALI, Stan West VK4RL, James Halyday VK4HZ, Stewart Smith VK4LA, John Atkinson VK4RZ, Ron Guttormsen VK4WY, Neville Jones VK4NJ, Ken Smith VK4KA, Ian Morrison VK4MO, Ernie Burnage VK4OG, Sam Weller VK4CZ, Herb Sprenger VK4ES.

Centre Row seated-Ernest Ginn VK4GE, Charlie O'Brien VK4NC, Ron Glassop VK4BG, Merv Wratten VK4MW, Norm Hart VK4KO, Al Carter VK4LT, Fred Lubach VK4RF, Eddy White VK4OW, Joe Ellis VK4AGL.

Front row-Bill Bentson VK4QF, John Pardon VK4PU, Ken Ayers VK4KD, Cress Everdell VK4ZAO, Ced Marley VK4CJ and Claud Singleton VK4UX.

Ron VK4BG, John VK4RZ, Norm VK4KO and Art VK4AW have been licensed for over 50 years. Congratulations, OMs.

HOW TO JOIN THE RAOTC

Eligibility for membership is available to amateurs who have held, or been qualified to hold an amateur licence for a period of 25 years, or more.

Its objects are to maintain interest and fellowship among the older licensed amateurs. It is affiliated with the Wireless Institute of Australia.

The joining fee is $15 ($20 overseas applicants), which should be submitted to the Secretary, Harry Cliff VK3HC, PO Box 50, Point Lonsdale, Vic. 3225, together with the date of your original licence, operator's certificate number, original call sign or qualification held and present call sign, if original not now held.

An application form is available from the Secretary at the above address. It is required to be signed by a proposer and seconder, who are already members of RAOTC.

Membership is only paid once! It entitles members to participate in all RAOTC on air nets, social functions and a copy of the Club's journal 'OTN'. Members also receive a Club badge, as part of the once only fee. Donations may be called for occasionally, to cover operating costs.

SIXTY YEARS AGO LAST MONTH

Most old timers will recall the name, Hugo Gernsback, author of many text books on radio and editor of the magazine RADIO NEWS.

Sixty years ago, in the August 1925 issue of this magazine, was a picture of a microphone, which was said to be one of the greatest advances of the year in radio.

It was called a 'Marble Block' microphone and was invented in Berlin by a German experimenter named Eugen Reiss. Marble was used, because it was said to eliminate undesirable oscillations, which were common in other microphones. Instead of the carbon powder usually used in microphones of the day, Reiss used a finely powdered crystal substance, the formula of which was a secret!

Many old timers constructed copies of the Reiss microphone, using a marble block, gold plated rods as electrodes and polished carbon granules. What then, was the secret formula, said to be used by Reiss in his original microphone? It seems the wiley German might have 'put one over', still using carbon but, is a crystal granule form. Does anyone know of any other 'secret crystal substance'?

This and many other interesting early subjects on wireless will be coming to you in future issues of the OTN journal, and the Old Timers' page in Amateur Radio.

HISTORICAL RECORDING

Our President and Editor, Max Hull VK3ZS, with Co-Editor Kevin Duff VK3CV, Peter Wolfenden VK3KAU, a member of the WIA 75th Anniversary Committee and Chris Long, Assistant Electronics Curator of the Melbourne Museum, are working on the production of a historical cassette, to be made available for sale during the WIA's 75th Anniversary Year.

There are some remarkable recordings coming to light, giving an insight into amateur radio, some decades ago. There must be some old timers who have recordings of amateurs, either on acetate disc or magnetic tape, who would like to lend them to the Institute for editing. Or perhaps you might have some Edison cylinders with amateur recordings engraved in those fine grooves!

Chris Long is an expert on retrieving this precious material from every known audio source and every care is taken to avoid any damage. Do you have anything to offer? If so, mail it to the WIA Federal Office, PO Box 300, Caulfield South, Vic. 3162 or to Max Hull, PO Box 33, Canterbury, Vic. 3126.

The completion of this recording involves a lot of work, so any material old timers can offer must be rushed to the above, if it is to be used in this First Historical Recording.

1985 VK/ZL QSO PARTY RESULTS

Logs were received from 23 of the 48 VK members, who appeared to take part in the 14MHz Party. 13 ZLs and two W6s were also active. Conditions made contacts between adjoining states rather difficult, but everyone seemed to enjoy themselves. Congratulations to VK7RF, whose 1600 points were the highest yet recorded in these parties.

CALL	MODE	QSO	MULT	TOTAL
VK7RF	SSB	32	10	1600
VK5SI	SSB	31	9	1390
VK75A*	CW/SSB	27	10	1350
VK6PM	CW/SSB	28	9	1260
VK2PU	SSB	26	9	1170
VI3LC	CW/SSB	26	9	1170
VK3ML	CW/SSB	26	9	1170
VK4AGL	SSB	21	10	1050
VK3VF	CW/SSB	24	8	960
VK3JI	CW/SSB	27	7	945
VK7BI	SSB	18	8	720
VK7AL	SSB	12	8	680
VI3XB	CW	20	6	600
VI3KS	CW	19	6	570
VK4OX	SSB	15	7	525
VK4AEM	SSB	14	7	490
VK5RK	SSB	15	6	450
VK4CI	CW	18	5	450
VK3XF	CW/SSB	14	6	420
VK2AWA	CW/SSB	12	4	240
VK7GB	CW	8	5	200
VK5KV	SSB	7	5	175
VK3ZC	CW	8	4	160

*VK75A was operated by VK3JA

The lateness in publishing these results is due to the late returns of logs. Participants are requested to please forward logs within 14 days of the conclusion of the QSO Party. It takes time to carry out the checking of logs and when received late, precludes the probability of meeting magazine copy dates, which are always (and have to be) well in advance of the publication date.

WIA ACCEPTS RAOTC AFFILIATION

After several months delay, whilst the Federal Council of the WIA considered our application under Article 103 of its constitution, the RAOTC has been advised, that affiliation with the Institute has been approved.

This means that the RAOTC, as a body, is an affiliate of the WIA and derives the benefit of all the facilities and activities the Institute offers.

Article 103 (Regulation 1) defines our affiliation -

The Federal Council may accept any duly constituted group, club or organisation (hereinafter referred to as an affiliate) which in the judgement of the Council has objects such that:

a) it allows membership not restricted to persons living in any part of Australia, and

b) it has objects not inconsistent with the objects of the Institute, and

c) it confers no voting rights or any other rights whatsoever apart from those listed herein;

d) not less than 75 percent of members shall at all times be licensed radio amateurs, and

e) that not less than 55 percent of its members at any time shall be financial members of a Division of the Institute and resident within Australia.

Under the present operation of the WIA, the membership fee is $24, being what is known as the Federal element. This has been paid by Secretary, Harry Cliff. Your Committee is now entitled to address any suggestions or complaints to the Institute through the proper channels.

Submitted by Max Hull VK3ZS.

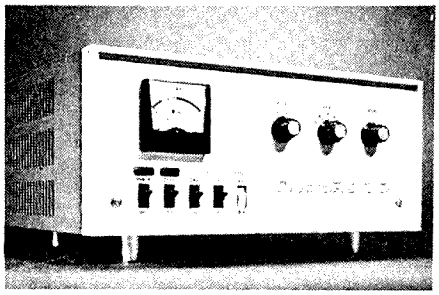
KNOW YOUR SECOND HAND EQUIPMENT

A Series to Help You Identify Amateur Equipment

Ron Fisher VK3OM
3 Fairview Avenue, Glen Waverley, Vic. 3150



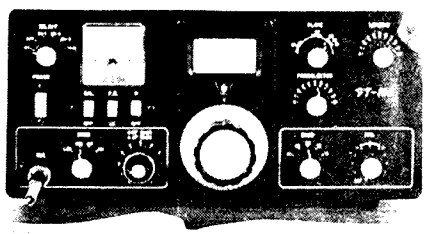
YAESU FLDX-2000 LINEAR AMPLIFIER

Styling matches the FL/FRDX-400 while the circuit is similar to the FL-1000, but much improved in many areas. 6KD6 tubes were now used, which gave a greater output of about 500 watts PEP. High voltage was now up to 1000 volts. An SWR meter was included but the input circuit was still untuned, so it is not really suitable for use with modern solid state gear.

Tune-up had to be quick or they had a nasty habit of blowing up the final tubes, often with spectacular results. Second hand value is around $175.

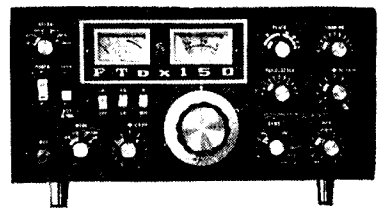
EARLY YAESU TRANSCEIVERS

By the time Yaesu released their first transceiver in late 1966, there were many other HF transceivers available. Swan, Galaxy, Hallicrafters and National were all well established. For those with plenty of money, the Collins S Line had been around since 1959. A few lesser known American brands, such as SBE, were also available. If you think gear is expensive today, a Swan or Galaxy transceiver would have cost around $600 in 1966. All of this equipment will be looked at in due course. The first Yaesu set new ground with its solid state design, which was to follow into the future.



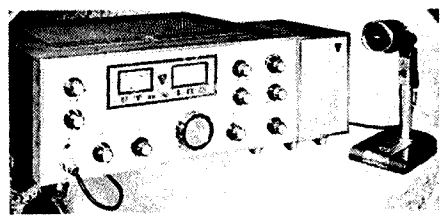
YAESU FT-100 TRANSCEIVER

The FT-100 appeared here during late 1966. By the standards of the time, it was very compact and, with its all black colour scheme, was perhaps the original 'black box'. Its advanced circuitry was almost all solid state. Three tubes were used in the transmitter final, a 12BY7 driver with two 6JM6s in the output. Power output on the 80 through 10 metre bands was about 60 watts. An inbuilt power supply provided for operation from either normal AC mains or from a 12 volt DC source. Current drain on receive was about 500mA and on transmit 10A average. The FT-100 was the direct predecessor of the famous FT-101 series. Original price of the FT-100 was $600 and second hand value today is about $200.



YAESU FTDX-100

Electrically, much the same as the FT-100, but styling has been changed to bring it into line with the other FTDX series of equipment. This model was released in late 1968. Original price was $650 and second hand value today is about $225.



YAESU FTDX-400 TRANSCEIVER

The FTDX-400 was the first of the big high power Yaesu transceivers. It arrived around April 1968. It measured in pre-metric units..15.75 x 6.25 x 13.25 inches. Weight was a hefty 40 pounds. The 400 was a tube design, with a few transistors for such things as the VFO and calibrator oscillator. The power supply was built in for AC only operation. Two 6KD6 tubes were used in the final with 800 volts on the plates. Power output in excess of 200 watts was available, however many 6KD6s 'bit the dust' when the tune-up procedure was extended a bit too long.

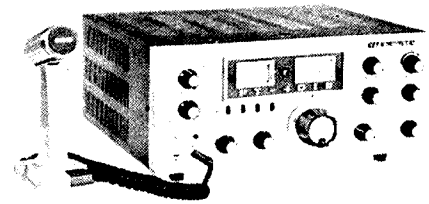
Everything was built in to the 400. VOX, calibrator, CW side tone and that wonderful gadget, the receive clarifier. General performance was very good in its day, but if you are looking at a second hand unit today, check the following points. VFO Drift — I have noted that many 400 VFOs now drift to an excessive degree and this can be hard to fix. Also check power output on each band, which should be at least 150 watts on 10 metres and increasing to about 200 watts on 80 metres. While not covering 160 metres, they can easily be modified to do so. Original price in 1968 was $690 and second hand value today is about $225.

YAESU FTDX-560

Very similar to the FTDX-400, but up-dated in some respects. Tuning rate was improved to give about 20kHz per knob revolution. A row of four slider switches under the meter replace concentric rotary switches on the FTDX-400. General performance is the same as the 400 and the same precautions should be taken if purchase is considered. Released about mid 1971 and priced down to $595. Second hand value today is around $250.

YAESU FTDX-570 TRANSCEIVER

Very similar to the FTDX-560 above, but now has a cooling fan for the final amplifier installed as standard equipment. This improved the overall reliability, somewhat. The 570 also incorporated a noise blanker in place of the audio noise limiter of the earlier model. Second hand value about $260.



YAESU FTDX-401 AND 401B TRANSCEIVERS

These were the last of the line. Similar in appearance to the 560/570 transceivers, the 401 was released in late 1971 and the 401B in early 1974. Both had a CW filter installed as standard and the 'B' model also had an AM facility. They also included an excellent noise blanker. New price was about $600 and second hand value would be about $275.

FLAT VIDEO TUBE DEVELOPMENT

Television sets and video displays are expected to become more compact following a technology breakthrough in flat screen production.

Japanese electronics giant Matsushita Electric has developed a new color screen which reproduces a distortion-free image.

It uses a matrix drive and deflection system; with a panel consisting of 3,000 picture cells arranged in a matrix — 200 horizontally and 15 vertically.

Each cell is scanned by one electron beam which excites phosphor stripes.

Matsushita believes the new flat screen technology has immediate application in office automation technology such as teletex and videotex.

AR

NOVICE NOTES

Ron Cook VK3AFW
TECHNICAL EDITOR

ARE YOU ZERO BEAT?

Zero beat is the term used to describe the condition when two single sinusoidal signals are set to the same frequency. There is no resultant beat note. If the signals are 1kHz apart then a 1kHz beat will be produced which can be heard if appropriate circuitry is used. For example, a signal at 1000kHz and another at 1001kHz will produce a 1kHz audio beat, which may be heard in a crystal set. Amateur radio operation usually requires that participants in a contact be zero beat.

Newcomers often have difficulty in achieving zero beat, so this article is intended to help them.

WHY ZERO BEAT?

In any contact, it is most desirable that all stations involved operate on the one frequency. This minimises the amount of the band space used and reduces the need to use the receiver offset tuning control (clarifier or RIT). The use of VOX, which should be used more often, is inhibited if all stations on a particular frequency are not zero beat. Further, when CW is used, because of the increasing use of narrow CW filters, incorrect zero beating (or netting as it used to be called), can mean not making the contact because you have not been heard. If you are 1kHz off frequency, you will probably be outside the pass band of the other station's receiver.

The most common error is to leave the clarifier/RIT on while tuning. Any offset in the clarifier will show up as an offset in transmitter frequency. Most clarifier controls have poor scales which are unsuitable for setting to better than 100-200Hz off centre frequency at best.

Regrettably some transceivers actually shift frequency slightly when switching from receive to transmit. This can come about because of inadequate power supply regulation, although this would normally also give FM on SSB and chirp on CW. It should not occur in a well maintained rig. Some transceivers suffer from inadequate carrier oscillator buffering so when the oscillator is switched from the product detector to the balanced modulator, a slight frequency shift occurs due to loading effects. The cure for this, when one exists, is different for each rig and not the sort of exercise I would recommend for the average novice. If you have this problem consult the local agents for your rig.

For SSB there is another common source of non zero beat transmissions. This is the different perceptions that operators have of the correct pitch of received audio. The best check of this is performed by joining in a net with a female operator. Female voices need more precise tuning than male voices to sound natural, so if all operators leave their clarifiers off and tune to the female operator's transmission then everyone should be on the same frequency. It is likely that you will prefer some transmissions when slightly mistuned. Perhaps these transmissions have their carrier crystals slightly offset or perhaps it involves the combined response of the microphone and SSB filter. Or perhaps it is all in the ear of the receiving operator.

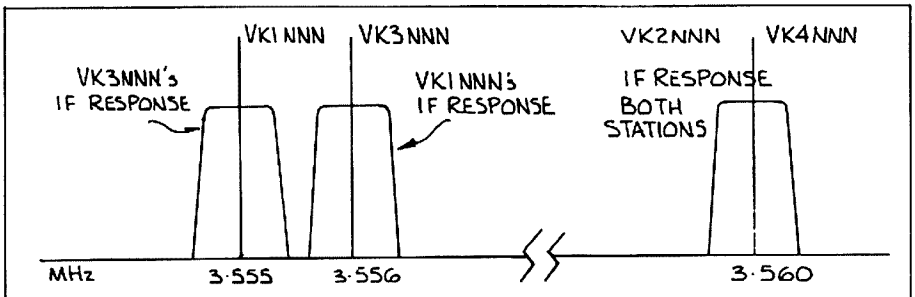


Figure 1 — Illustration of incorrect and correct zero beat operation. See text for details.

Figure 1 shows two hypothetical CW QSOs in progress on the 80 metre band. VK1NNN called CQ and VK3NNN responded. Unfortunately he offset his transmitter 1kHz high. By using their clarifiers, both stations are able to receive one another's signal at a comfortable pitch. It would be difficult for another station to join in as an inspection of the receiver bandpasses will make obvious.

By comparison, before VK4NNN called VK2NNN, she carefully set her transmitter to zero beat with VK2NNN. Both are on frequency and are using the minimum of band space. Anyone else calling on the same frequency will be easily heard, propagation permitting.

HOW OFFSETS OCCUR

In the old days, separate transmitters and receivers were the usual equipment. There was little difficulty in ensuring zero beat as both the incoming signal and the operator's own transmitter could be monitored in the station receiver. Today transceivers are the usual equipment and the operator merely tunes in the desired station and responds, the transceiver being automatically on frequency. Well, that is the theory, but a random selection of QSOs reveals that this is not so.

For CW most transceivers offset the transmit frequency by 800Hz when CW is selected so that when the incoming signal is tuned into the centre of the filter transmission takes place on the same frequency as is being received. This relies on the operator being able to match the received tone to 800Hz. Any error in setting to 800Hz will appear as a difference between operating frequencies. Figure 2 shows the shift of carrier on CW transmit and the high attenuation suffered by signals which are incorrectly set.

The sidetone is usually generated by an audio oscillator which has been factory set to 800Hz (in most rigs) so initial tuning should endeavour to match the received note to that of the sidetone. If any doubt exists, the sidetone frequency should be checked with a frequency counter.

If you do not have access to a frequency counter, then it is possible to use the inbuilt crystal calibrator to generate an 800Hz tone. Set the calibration on and tune to zero beat. The dummy load must be connected for this test. Set the dial skirt to an exact alignment with a 100kHz mark or note the reading of the digital dial. Tune 800Hz away from zero beat using the dial and note the audio pitch. Press the key and note the pitch of the sidetone. If all is well they will be almost the same. If not tune the receiver until the tones match and read the receiver frequency. The difference between this and the initial zero beat setting gives the frequency of the sidetone. There is a possible inaccuracy of 100Hz or so due to the limited resolution of the dial, so measured values in the vicinity of 650 to 950Hz are probably acceptable.

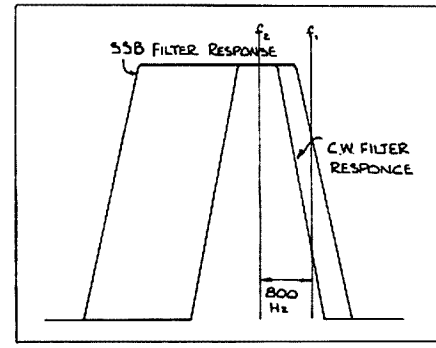

Figure 2 — Illustration of CW Transmission Offset. f1 is the BFO frequency for the product detector for reception of SSB (LSB) and CW; f2 is the frequency of a correctly tuned incoming CW signal. It is also the frequency of the CW carrier oscillator for transmission. Note that this is 800Hz lower than the analog dial indication. (Some transceivers with digital readouts adjust the indicated frequency to be correct for CW transmission). Beware of getting beyond the band edge!

THE CLARIFIER

As misuse of the clarifier is the main culprit for off frequency operation I thought it useful to review the operation of a typical circuit. Figure 3 shows a simplified circuit of the clarifier used in an FT-7. The transceiver is tuned by an L-C VFO. A varicap diode is connected across the oscillator tuned circuit. A varicap is a diode especially constructed to give a variation of capacitance with varying reverse voltage. It is a voltage controlled capacitor, having a range of a few tens of pF in most cases. When the clarifier is off the applied voltage is set by VR1 and VR2. VR1 sets the VFO to correct alignment with the dial by trimming the output from the regulated supply and hence the voltage applied to the varicap. VR2 sets the transmit and receive frequency to the same frequency as obtained with the clarifier on and the clarifier control centred. When the clarifier is off, VR2 determines the varicap voltage and hence the operating frequency.

When the clarifier is on, the voltage applied to the varicap is determined by VR2 on transmit, as before, but on receive the clarifier control VR3 determines the voltage and hence the received frequency.

The 800Hz offset on CW transmit is achieved by switching capacitance across the carrier oscillator or by using a different carrier oscillator. The FT-7 uses the latter method.

CONCLUSIONS

The basic rules for avoiding off frequency transmissions are:

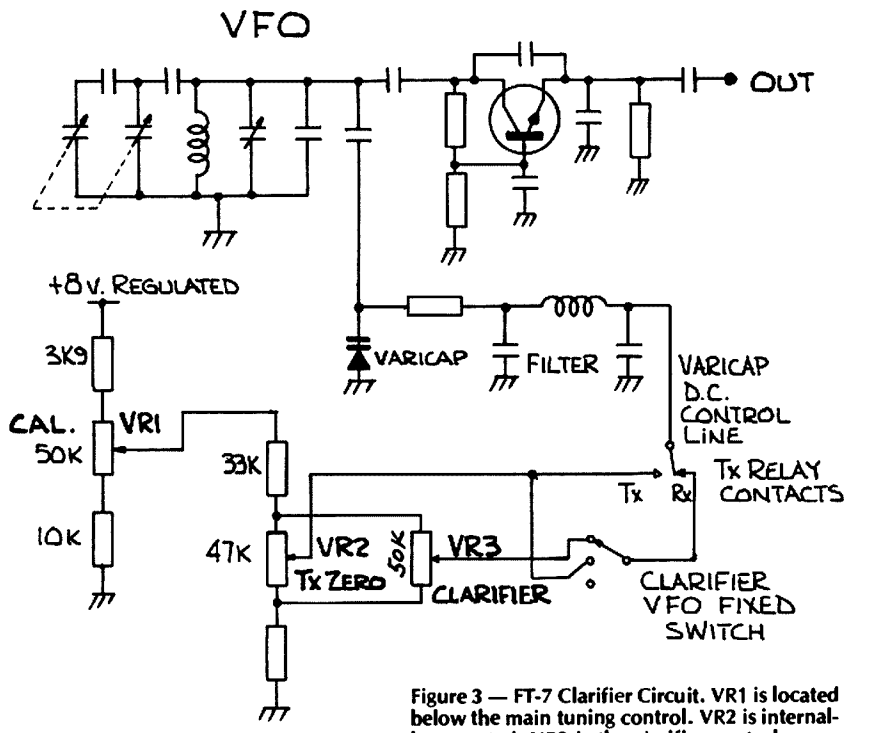

Figure 3 — FT-7 Clarifier Circuit. VR1 is located below the main tuning control. VR2 is internally mounted. VR3 is the clarifier control.

On SSB tune initially with the clarifier off.
On CW tune initially for an 800Hz tone.
To obtain audio that suits you use the clarifier - after obtaining zero beat.

73 de VK3AFW

As this is my last contribution to this column, I want to take the opportunity to thank all those who have assisted me in various ways over the past few years. It has been fun, thank you for your company.

TELEMEMO

Telecom Australia has awarded contracts totalling $1.3 million for the supply of a computer based message system to be marketed as "Telememo".

GTE Australia and Tandem NonStop have been selected as the suppliers of the system software and operating hardware, respectively.

"Telememo" will enable users with access to a personal computer or visual display terminal and modem to enter messages for other users. Users will be able to access "Telememo" from anywhere in Australia, at any time and scan, read and file their messages.

Announcing this, the General Manager of Commercial Services, Mr Ian Campbell, said that Telecom's "Telememo" service is to be installed during July and will be available for public service by the end of 1985.

From "Telememo" press release, 9th July 1985.
Submitted by Peter Gamble VK3YRP.

VANUATU

Jack Hannaford YJ8JH ex 9V1ND, advises that there are still problems with unauthorised use of YJ calls.

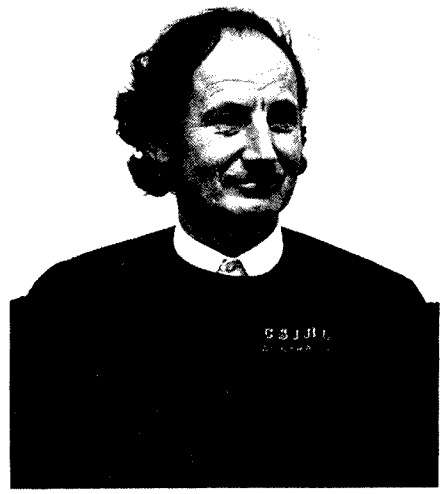
The current situation is as follows:

*YJ8** (two letter calls) are only allocated to residents — both citizens and long term expatriate workers.*

*YJ0A** (three letter calls beginning with 'A) are allocated to visitors who satisfy the authorities about their technical amateur radio qualifications.*

YJ3, YJ4, YJ6, etc are not legally allocated calls.

Submitted by David Rankin VK3QV/9V1RH



THANKS!!

Regrettably Ron Cook VK3AFW, has resigned from the Publications Committee due to pressure of business commitments.

Ron, over a thirteen year period as a committee member, has held the positions of Assistant Editor and Technical Editor and has been renowned for his segment 'Novice Notes' over the years.

Ron, a qualified Electrical Engineer employed as an Experimental Scientist with the Commonwealth Scientific and Industrial Research Organisation, will be greatly missed for his contribution to the magazine. On behalf of all readers, sincere thanks Ron and best wishes to you and your XYL Ruth, for the future.

Bill Rice VK3ABP

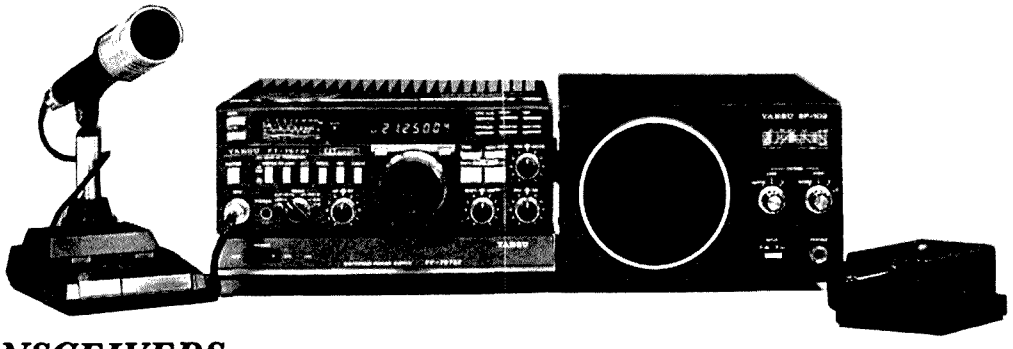
BAIL ELECTRONICS

asks you to look at our range of

AMATEUR GEAR



HF TRANSCEIVERS

FT980-all mode; 12 memories; general coverage receiver

FT757GX-all mode; 8 memories; all normal options installed; general coverage receiver

FT757GX.....SPECIAL PRICE FOR OCTOBER..... $1295.00

VHF & UHF TRANSCEIVERS

FT726R-all mode; 10 memories; 10 watts output; two VFOs; can hold three modules (2m, 6m, 70cm, 21/28m modules) plus satellite IF unit; AC/DC operation

FT203R-handheld 2 metres; 2.5 watts, thumbwheel; optional headset/microphone & VOX operation
FT209-RH-handheld 2 metres; 5 watts; keypad entry; optional headset/microphone & VOX
FT290R-all mode portable 2 metres; 2.5 watts
FT270R-mobile 2 metre FM; 25 watts; 10 memories; optional voice synthesiser
FT2700R-mobile 2 metre & 70cm; 25 watts both bands; 10 memories; full duplex 2m/70cm
FT690R-all mode portable 6 metres
FT703R-70cm handheld; thumbwheel 2.5 watts
FT709R-handheld 70cm; keypad entry; 45 watts
FT730R-mobile 70cm; 10 watts; 10 memories

LINEAR AMPLIFIERS

FL2100Z-160 — 10 metres; 1200 watts maximum input
FL2010-2 metres; 10 watts out; suits FT208, FT290, etc.
FL7010-70cm; 10 watts out; suits FT708, FT790, etc.
FL110-suits FT7, etc.

ANTENNA TUNING UNITS

FC700-suits FT707/77; inbuilt 150 watts dummy load
FC757AT-automatic; suits FT757/FT980; inbuilt 150 watts dummy load
FAS-1-4R antenna selector (four-way)

EXTERNAL VFO

FV700DM-suits FT77/707; 12 memories
FV102DM-for FT102

TRANSVERTER

FTV707-suits FT707/77, takes one module
-6m, 2m, 70cm modules for FTV901, FTV107 & FTV700

POWER SUPPLIES

FP700-suits FT77, FT757; 20 amp inbuilt speaker
FP575GX-switch mode; 20 amps
FP757HD-heavy duty; inbuilt speaker fan
FP7-3 amps
FNB-2, FNB3, FNB4-NiCad packs for handhelds

CHARGERS AND DC/DC ADAPTERS

NC-8; NC-3A; PA-2; PA-3; etc

EXTERNAL SPEAKERS

SP102-suits FT102, FT726, FT757GX; has filters
SP980-suits FT980; has filters
SP55-general purpose

TRANSCEIVER ACCESSORIES

AM/FM units; keyer units; WARC bands mod kit for FT101Z, FT107, FT901; FIF-232C (RS232 interface); extender boards; mobile brackets; etc

MICROPHONES

MD-1B8-deluxe desk type with scanning
MH-1B8-hand mic with scanning
MH-12A2B-speaker/mic for FT203, 209, 703, 709
MF-A3B-boom mic for mobile or base use
YM-34-desk mic; dual impedance
YE-7A-hand mic; 4 pin; 600 ohm

We also have a range of YAESU COMMERCIAL HANDHELDS and MOBILES approved by DOC. Low and High band VHF, VHF Marine handhelds, UHF handhelds and mobiles.

TELEPHONE, TELEX OR WRITE TO BAIL ELECTRONICS FOR HELPFUL ADVICE. MAIL ORDERS ARE WELCOME.

YD846-hand mic; 50 kohm
YM36-hand mic; noise cancelling
YM-40-for FT480, 680, 780
YM47-for FT290, 690, 790, 230, 730
YM49-speaker/mic for FT290, 690, 790
YM24A-speaker/mic for handhelds
-4 pin, 6 pin, 7 & 8 pin plus and sockets for above
YH-1-headset/boom mic for handhelds and mobiles
YH-2-headset/boom mic for FT203, 209, 703, 709
-SB-1, SB-2, SB-3, SB-10 switches

HEADPHONES

YH55-with earmuffs
YH77-lightweight

RECEIVERS

FRG8800-HF communications receiver, all mode
FRV8800-VHF converter (118-174MHz) for FRG8800
FRG9600-VHF/UHF receiver; all mode; 60-905MHz; 100 memories
FRT7700-antenna tuner for FRG7700/8800
FRA7700-active antenna for FRG7700/8800
FRV7700-VHF converters for FRG7700
Memory unit option for FRG7700

HAM CLOCK

Yaesu QTR24D — quartz, shows time zones

FILTERS

CW, CW (narrow), AM, SSB (narrow) for transceivers.

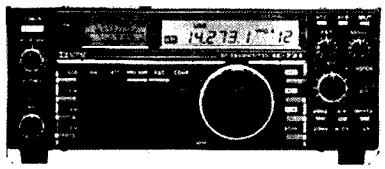
YAESU FT-726 (R)

~~$1499~~

VHF/UHF all mode transceiver. 10 watts output, AC/DC, 0.15uV sensitivity on SSB, LSB, USB, CW, FM. Repeater reverse. IF shift & width controls. RF speech processor. 10 channels memory store mode, frequency & searches. Full cross band, cross mode duplex possible with satellite unit. Supplied with 2m module & mic.

Full 12 months warranty!

70cm.....~~$475~~
6m.....~~$375~~
Satellite.....~~$105~~



ICOM IC-731

HF SSB, CW, AM, FM transceiver with 100 watts RF o/p. 160-10m transmitter, 100kHz-30MHz receiver. 12 tunable memory channels with memory scan & programme scan functions. PBT & notch tuning. NB, etc. Inc mic. Sensitivity 0.15uV SSB. Compare to the FT-757GX and save. (Available soon will be the IC-731S 10 watts for only $975 inc mic).

$1095 Save around $200
Full 12 months warranty.

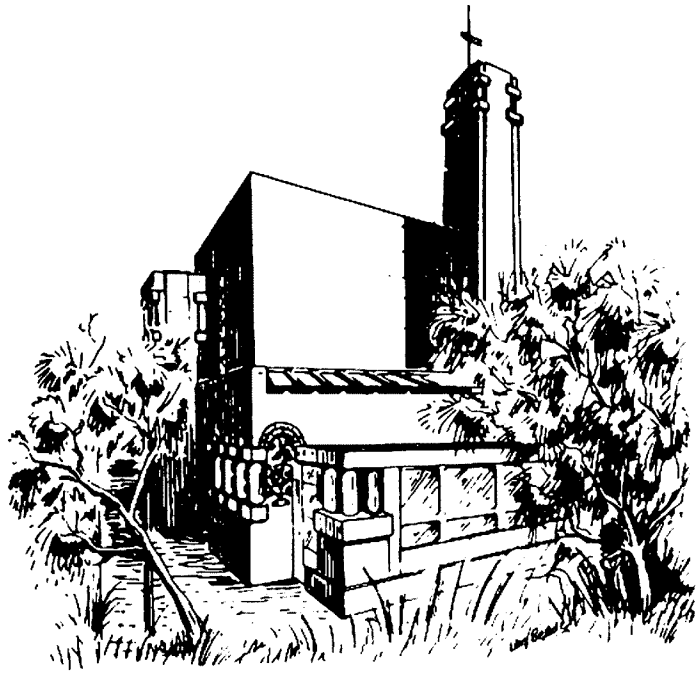
VK5 FIVE-EIGHTH WAVE *Edition*



BURLEY GRIFFIN BUILDING

Marlene Austin VK5QO
BOX 7A, Crafers, SA. 5152

The First Sixty Years — 1919-1980

1919 was quite a momentous year — not only was everyone settling back into normal life after the 1914-1918 "war to end all wars", but in South Australia a group amateur experimenters gathered to form a branch of the Wireless Institute of Australia. The minimum age was set at 16, and the annual subscription was 10/6d ($1.05) payable in half yearly instalments of 5/3d (.53c) at a time when the average weekly wage was 3.9.9d pounds ($6.99). However, the penalty for erecting an aerial without permission was 100 pounds ($2 00) and a 6 months imprisonment!

A provisional committee was established under Adam Mather, and eight weeks later on 5.11.1919 at the first Annual General Meeting, office bearers were elected.

President	*J W Hambly Clark XVX (later 5AA)*
Vice Presidents	*R S Lee*
	J M Heagney
Hon Secretary	*C E Ames XVG (later 5AV)*
Hon Treasurer	*R O C Matthews*
Councillors	*V R P Cook*
	D G Malpas
	D H Smith
	W Harrison
	H C Coles
	R M Dunstone

In 1919 an enquiry was received from a lady aspirant as to admittance of lady members to the Institute. Other States were consulted as to the advisability of this, and Miss Rogers was advised "This Institute at present is unable to admit lady members". No lady obtained her licence until Betty Geisel VK5YL in 1936.

Prior to WW1 the PMG had issued "X" licences (eg "XVX") in South Australia between 1911 and 1914, but during the war they were all withdrawn. During 1919 the Institute did the examining and the Navy issued "S" permits (eg "S.26") for reception only, and in 1920 the PMG took over both the examining and issuing of licences, such as J W Hambly-Clark's "5AA" licence for transmitting and receiving. By the end of 1923 the prefix was changed to "A" (A5AA), by 1926 "OA" (OA5AA), and in 1929 "VK" (VK5AA) to distinguish the various countries of the world.

Most licences were for spark receivers and transmitters, and gradually people were given permission to use valves after passing 12 wpm Morse code. However, there were many "pirates" who operated without a licence, and the penalty for this was 500 pounds ($1000) (set before the war).

During 1920 arrangements were made for the starting of a Valve Club by which members could obtain a valve or any other apparatus up to a certain value, by the payment of 1/- (10 cents) per week, ballots for the drawing of gear arranged at intervals according to the number of members.

A library was established, and a small charge made for membership. Also, a "Sale and Exchange

Department" for members with apparatus they wished to dispose of was a popular innovation, as was the weekly buzzer practice class, lectures and demonstrations.

During May 1921 several members indicated they would be pleased to arrange a test to listen to a Victorian Division news bulletin at 8 pm, transmitted on a 200 metre wavelength .5 kW spark set.

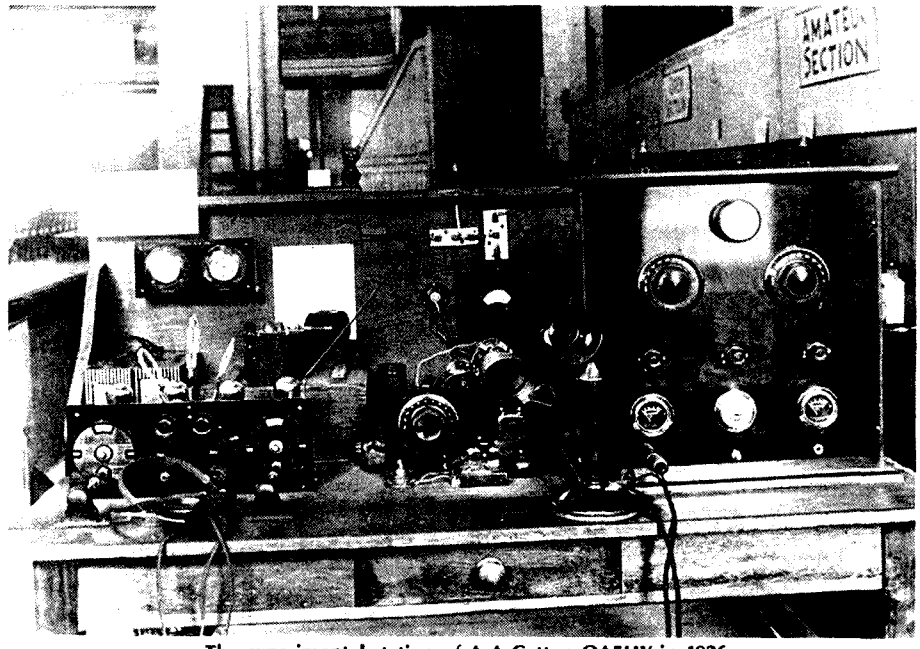
Members were requested to voluntarily fly pennants approved of by their Council from their aerials so that members of the Wireless Institute, on seeing an aerial, could tell at a glance whether the owner was a member of the Institute, and so that members from other States visiting would know where they would find a welcome from a fellow member of the Institute. This scheme had already been adopted in NSW. One dozen flags were ordered, at a cost of 5/6d each.

Membership continued to grow, with over 50 members. One applicant for membership, F G Miller, had travelled all the way from Murray Bridge to Adelaide, a distance of over 60 miles (96.5 km), and in view of his enthusiasm in coming such a long distance to join the Institute, the usual proceedings in passing on his application to the Council were waived in his case, and he was declared a member forthwith! (Frank had been a signaller in the first World War, and while in the trenches worked on the development of the teletype machine, and was credited with its invention by the Royal Signal Corps.)

The meeting place of the Institute was altered from Currie Street, Adelaide, to the YMCA, and shortly afterwards to the University.

Also in 1921, the Division was registered under the Companies Act, and on 6th September 5WI was granted for the official station (it became 5AV for 7 months three years later, before reverting back to 5WI).

It was suggested radio apparatus should be exhibited at the September Show to bring radio before the public and make the Institute more widely known.



The experimental station of A A Cotton OA5HY in 1926.

During this period many lectures were given, such as ones on a tuned buzzer and sparking buzzer; the theory of atoms and electrons; honeycomb, duo-lateral, pancake and spiderweb coils. A single stage amplifier was demonstrated, using a V24 valve and built into a cigarbox by Hal Austin 5BN (later 5AW) "which reflected great credit on that gentleman's handiwork, he having constructed his own intervalve transformer and all other fittings".

In 1922 speech and music were successfully broadcast by Fred Williamson 5AH. Adelaide was astonished and delighted with a social and radio dance on 28.6.1923 in the first publicly announced application in this State of broadcasting to practical use, when music for the dancing was played by Harry Kauper 5BG and Lance Jones 5BQ at the Royal Institute for the Blind Hall in North Adelaide, and transmitted by radio from records at the home station of Hal Austin, two miles (3.2 km) away.

By the end of 1924 the Institute demonstrated the reception of programmes on nine receivers set up on a specially chartered night train to Halletts Cove. Nearly 500 booked seats, and it was an outstanding success.

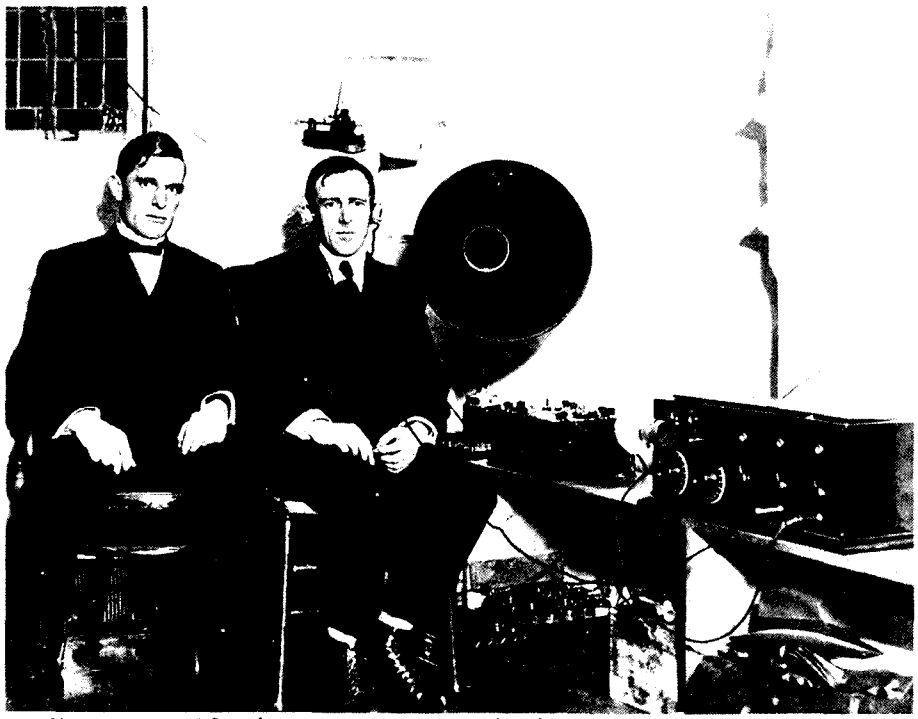
Experimenters were so frequent now (at least 30 or 40) that people with licences to listen to commercial broadcast stations were complaining of interference from the spark transmitters of the amateur experimenters.

Twenty or more clubs were established throughout the metropolitan and country areas of South Australia in this period of intense activity, no doubt fuelled by excellent constructional articles on crystal sets etc. in such papers as "Boys' Own Paper" and the "SA Wireless (Monthly) and Radio Magazine" (the official organ of the Institute from 1924) and "Radio Broadcast" (from September 1925).

In 1924 the NSW Division asked for co-operation in endeavouring to keep in touch with an exploring expedition in Western Australia that was equipped with wireless. The expedition was being led by Dr Clapp, and they were using a Marconi .25kW quenched spark transmitter and valve receiver on 600 metres.

1925 saw new bands issued to experimenters (the 8-10, 21-23, 32-37 and 85-95 metre bands) and the first contacts between SA and California USA on Morse code. It was not long before other countries were contacted.

In 1927 there were 400 amateur transmitters licensed in Australia (45 in SA, and half of those in the Institute), and the Institute suggested to a Wireless Royal Commission that control be by one body, allowable power be 500W, traffic of a non-revenue earning nature be transmitted (to equip



Harry Kauper 5BG and Lance Jones 5BQ operating the receiver at the first Radio Dance in SA in 1925.

Reg Anthony OA5CM transmitting at Unley Park in 1927.

operators to handle any emergency), and permission be granted for experiments on commercial broadcast bands when they were not in use, to determine propagation.

At this time, during a severe storm, a submarine cable to Kangaroo Island broke, and several amateurs maintained contact until repairs were effected.

Also in 1927 the fourth Federal Convention was held in Adelaide, comprising representatives of the WIA from all over Australia.

In 1928 the membership was 66 (31 licensed to operate transmitters), and this was the time that meant the end of loneliness to thousands in the outback — Alf Traeger (5AX and 8XT) developed the first pedal radio (typewriter keyboard and a pedal generator) for the Flying Doctor Service, with Harry Kauper 5BG (who had invented a method of firing a machine gun through the moving propellor of a plane during WW1).

Photograph courtesy The Advertiser

Alf Traeger seated at an early model pedal radio set.

Council appointed Bob Bruce VK5BJ as QSL Officer, and this position was shortly taken over by George Luxon VK5RX who undertook it for nigh on 50 years, assisted at times by Frank Bourne VK5BU.

1929 to 1933 were the main depression years, and in spite of reducing the annual subscription from 25/- ($2.50) to 21/- ($2.10), membership numbers dropped by about 50 (from 220 to 170), but one of the brighter efforts to lighten the gloom was the broadcast on commercial radio of the wedding of George Luxon VK5RX and Thelma Job in 1931.

Excitement was at fever pitch during the six day Sydney to Perth air race, which started on 28.9.1929. Dougal Whitburn VK5BY was in charge of message handling in SA, and this was the first public performance of the newly formed RAAF Radio Reserve (picked from the Australian radio amateurs) to prove to the Government and Air Force that Australian *radio* amateurs *could* become an extremely important cog in the machinery of national defence. Planes in the race were single engined, open cockpit, and all communication was by Morse code. They were also supplied with strips of cloth and a code card to signal to planes if out of touch and forced to land between stopping places.

One of the early "Field Days" organised by the Institute over the years was held at Long Gully, Belair National Park, on 17.11.1929, when portable gear was operated and contests held, and a good time was had by all (transport for some being a Model T Ford).

Television apparatus which "gave visitors an idea of the possibilities of this branch of science when it is fully developed" was demonstrated by its builders R B Caldwell and P A Kennedy, two local radio pioneers, at the Radio Exhibition organised by the WIA in co-operation with radio dealers, held in Adelaide in July 1931.

On opening the Institute's new clubrooms at 176 Rundle Street, Adelaide, the Institute was congratulated on its initiative and enterprise in arranging and so successfully conducting the recent Radio Exhibition, which was a great financial success too. Three sections of the Institute met in the new clubrooms:

Technical Development	*(research)*
Brass Pounders	*(active transmitting)*
Receiving	*(development of shortwave phone reception).*

With hindsight it is amusing to see how knowledge has changed over the years, but in 1933 Professor Kerr Grant gave a lecture on the heaviside layer in which he said he was of the opinion that penetrating radiation was caused by shooting stars, which when travelling through the air and turning to dust by friction, caused the generation of electricity. It was intended at a later date to send up a balloon loaded with material similar to that which we find in a comet or shooting star, and blow the lot to pieces with explosives, ignited by a time fuse, and record on laboratory instruments any electrical impulses which would most likely be generated.

In Australia, Federal Executive was originally administered by each State in turn, and in March 1933 Dougal Whitburn was offered the Federal Presidency but resigned in favour of R B Caldwell VK5BP. In 1934-35 the Federal President was Pete Bowman VK5FM.

On 1.10.1933 the WIA published its own official organ "Amateur Radio" with a copy sent every month to every member in Australia, and apart from one issue missed during the war years, this excellent monthly magazine has provided official information, technical articles, photos, advertisements, and club and Divisional news ever since.

VK5WI started transmitting telephony broadcasts on the 80 meter band late 1934, and SA can now boast one of the best weekly news bulletins in Australia, relayed on most bands throughout the State and to the Northern Territory.

Back in 1936, however, licensees were informed of restrictions, in that no music was allowed between 5 pm and 8 am on the 7 and 14 MHz bands, all other telephony was to be for genuine experiments only, and each session was to last no more than ½ hour. Also, they had to have a stable signal 25W input maximum. The biggest blow to new licensees was they were not allowed to use telephony at all for a probationary period of 6 months, and this restriction stayed in force for 12 years.

On 1.8.1936 the first auction was held of gear of a deceased amateur.

The Institute was the hub of social activities about this time — there were social nights every Friday in the clubrooms for card parties and table tennis matches, general business nights, separate lecture nights, and of course the annual sit-down Christmas supper, smoke socials, dances, picnics, field days and other get-togethers.

When bushfires were rampant in SA and Victoria in February 1939, communication was maintained on Fleurieu Peninsula in SA for 30 hours by a number of amateurs using mainly Morse code, and the hope was expressed more emergency gear would be built and kept in readiness for such times of need.

However, in September 1939, on the outbreak of World War II, all transmitting gear was confiscated by the PMG's Department in the interests of National Security, and by the time the gear was released to amateurs six years later, it was so obsolete because of the fortuitous speedy advance in technology by the Armed Services, it was hardly worth bringing home!

During the war, when threat of invasion brought fears of disruption to normal communications, the Institute (with official approval and assistance to obtain replacement parts) set up a network on 1775 and 3605 kHz using telephony and duplex operation, and regular weekly exercises were held by at least eight amateurs, with the blessing of Civil *Defence and Navy* authorities.

Institute fees had been dropped to 12/6d ($1.25), in an effort to keep members, and encourage others to join, as it was realised their only chance of getting back on air again was to have a strong and united society of amateurs.

After the war, a meeting was held on 18.7.1945 by 43 enthusiasts with the aim of reforming the Institute (Joe Kilgariff in the chair). Within a month a general meeting elected

President	*Ivor Thomas*	*VK5IT*
VP	*Joe Kilgariff*	*VK5JT*
Secretary	*"Doc" Barbier*	*VK5MD*
Asst. Secretary	*Ted McGrath*	*VK5MO*
Treasurer	*Ces Baseby*	*VK5BZ*
Membership organiser	*Joe McAllister*	
Publicity Officer	*Pete Bowman*	*VK5FM*
QSL Officer)		
Programme Officer)	*George Luxon*	*VK5RX*
Public Officer	*Warwick Parsons*	*VK5PS*
Instrument Custodian	*Frank Wreford*	*VK5DW*

Full membership was 21/- ($2.10), associate 10/6 ($1.05), country 7/6d (75 cents), the nominating fee 2/6d 25 cents, and meetings were held at 17 Waymouth Street, Adelaide. AOCP licence requirements were altered to two classes, and within two years reverted to one class of licence, CW increased to 14 WPM, maximum 100 watt output, no music or entertainment to the transmitted at all, and the 6 months CW probationary period to remain.

In 1945 the first post-war AOCP class was held on 5th November, and was attended by 16 students, the lecturers were Roy Buckerfield VK5DA and Harry Robert VK5MY.

Enthusiasm was increasing, and at successive meetings over 30 members were welcomed as full members. Not surprisingly, a larger meeting room

Back row — 2nd from right John Bulling VK5KX, right Gordon Bowen VK5XU. Front with bat — Warwick (Pansy) Parsons VK5PS, 2nd from right Clem Tilbrook VK5GL. Date and other unknown — can any member help?

was needed and this was hired (still at 17 Waymouth Street).

Identity badges were needed at meetings (a healthy sign!) and an attendance book was implemented to record signatures and call signs of members and visitors attending general meetings. A buy, sell or exchange board was also provided at meetings, and amateurs proposing to carry out tests on any particular frequency were requested to place a notice on the board showing times and frequencies.

A Technical Information Service was formed under Ted McGrath VK5MO, and the Vigilance Committee was reformed and known as the Experimental Advisory Committee, to act as a buffer between any amateurs infringing the regulations, and the PMG's Department.

Test equipment was available to members, and advantage taken of the disposal of surplus Service gear.

One aid to amateurs which was eagerly awaited were the Ionospheric predictions of John Allan VK5UL.

A Programme Organiser was appointed, and one very popular item on the year's agenda was always the Christmas Social, held in a cafe on North Terrace, Adelaide.

A War Service Record was undertaken by Council, and a new Constitution was adopted.

By May 1946 it was deemed safe enough to take no further action regarding the amateurs' part in the Air Raid Precaution (ARP) network.

It was normal to build your own gear, and in those busy constructional days of "home brew" gear, electrical traders in Adelaide gave a discount to licensed amateurs who were members of the Institute, but later on as the "black box" (manufactured gear) became available, discounts (and home brewers) became less common.

In those days the transmitter was crystal locked onto one frequency, and you had a separate tunable receiver. You would call "CQ" on your own crystal frequency, and tune around until you heard someone calling you (on their crystal locked frequency), so you always worked split frequency. When VFOs came into use, it was normal to get on the same frequency as the person calling you (which is what we do now, although with a transceiver you are automatically on the same frequency (hopefully!)

A discussion was held on the extension of hours for amateurs outside restricted periods, because amateurs were allowed to broadcast music and any other entertainment on what is now known as the commercial broadcast bands, during certain hours when the normal broadcast services were not operating, eg Sunday mornings and after 10 at night. Eventually the amateurs were unable to do this, because the broadcast stations got on earlier and earlier, and now many operate 24 hours a day.

Amateurs had the use of bands 28-29, 50-54, 166-170, 1345-1425, 7.150-7.200, 14.100-14.300 MHz, and by September 1946 the 3.500-3.800 MHz band was released. Within two years the 144 MHz band was released in lieu of 166 MHz.

At the end of 1946 members were circularised regarding sending food parcels to their opposite number in G-land: for instance Dougal Whitburn VK5BY sent a parcel to G5BY (much to the recipient's surprise and delight!)

Total membership by now was 267, and growing steadily. Fees were one guinea still ($2.10).

Early in 1947 the half hour limit placed on each QSO was abolished, and QSL cards were provided free by the SA Tourist Bureau to amateurs in SA as a novel travel promotion and good publicity.

Les Pearn VK5PN suggested the WIA should again broadcast notes to country and city members, and Reg Harris VK5RR commenced the VK5WI broadcasts under his own call sign in January 1947, the call sign and licence for VK5WI being re-issued on 13.5.1947.

A Sports and Field Day was held at Hawthorndene Oval in January 1948, and proved a great success, and others have since been held at Clare, Fort Largs/Outer Harbour.

The AOCP classes were also so popular by 1948 that there were 31 students and others had to be turned away.

An Associates' Representative (Jim Paris) was appointed to Council also a VHF Representative, nominations were called for a Country Representative on Council, and three Trustees (Ces Baseby VK5BZ, Len Sawford VK5YF, and Dougal Whitburn VK5BY) were appointed under the terms of the Constitution to safeguard excess monies.

15.8.1948 saw the first Remembrance Day contest to perpetuate the memory of amateurs who lost their lives in the war. VK amateurs only participated until 1971, when New Zealand amateurs joined in. In the 32 years 1948-79 inclusive, the trophy has been won by VK5 ten times.

Fees rose to 25/- ($2.50) full member, 17/6d ($1.75) associate city, 15/- ($1.50) country.

The Christmas Social was catered for at the Burnside Town Hall at a charge of 4/- (40 cents) per member. A vote was taken on whether it should be "wet" or "dry", and the "drys" won 57 to 55 with 1 informal vote. Costs were becoming prohibitive, and the following year the Social was an informal gathering in our own meeting rooms with members bringing along a basket supper. It was some years before ladies were invited to attend.

Gear was purchased at this time for the use of members confined to hospital (type III, Mk 2), and a Visiting Committee discussed to visit sick amateurs.

The May 1950 meeting proved to be quite a success (after a cautious start) as a "buy and sell" was held and a considerable quantity of equipment changed hands. Enthusiasm for this type of entertainment has not diminished over the years.

Amateurs in Darwin proposed to form a branch of the WIA there in 1951, and it was not for another 9 years that VK8 was allocated to the Territory.

The Woomera Radio Club sought affiliation with the WIA, and had their own special difficulties operating from a security area.

The Institute has arranged working displays at many Exhibitions, and only those who have assisted would appreciate the improvisation neccessary to get gear and aerial systems functioning satisfactorily under makeshift and often awkward working conditions. The Institute was awarded the bronze medal for its display of VK5WI at the Royal Adelaide Exhibition in 1952. While the Governor of SA watched, the amateur operators worked America, to everyone's delight. When the medal was received, the President asked Reg Harris VK5RR to be custodian, as it was due to his efforts that VK5WI was the success it turned out to be.

In this year that King George VI died, a dozen Greybeard Certificates were issued by the Institute to those members of more than 20 years' standing who were still active on the air, and these were proudly displayed in their shacks.

1954 saw the first of the picnics for XYLs and children, at the George picnic ground, and it has been a regular highlight ever since, latterly being held at the Bridgewater oval in the Adelaide Hills.

VK5 agreed to provide the Federal Contest Committee for four years from 1954, and many "volunteers" were coerced to help the Committee of Gordon Bowen VK5XU, Reg Harris VK5RR, Jim Vivian VK5FO, Jack Coulter VK5JD, Reg Galle VK5QR and Warwick Parsons VK5PS.

1954 also saw the Limited AOCP exam granted by the PMG's Department, and these successful applicants with "Z" calls were admitted to full

Award issued to the VK5 Division in 1952.

membership of the VK5 Division. The age limit for the AOCP had been set at 17 years, and this was reduced to 16 years and later to 15 years.

In 1955 Jim Sullivan VK5JK suggested the forming of an emergency network, after difficulties experienced in maintaining communications in recent disastrous Hills bushfires, and in view of floods in NSW. Mention had been made in his submission to the Minister of Agriculture of the radio communication service provided during the war from the metropolitan area to Civil Defence HQ in the event of landline disruption, and also that the WIA had some 3,000 members (350 in SA of whom some 200 had transmitting and receiving equipment in operation, 50 of them located in country towns and 150 in the metropolitan area). The Government accepted this proposal. Within 12 months Fred Martens VK5MA proved the value of the emergency network system during floods at Renmark.

SA Divisional Council 1953, Back from left — Jack Coulter VK5JD, C Sappiatzer, Joe McAllister VK5JO, J Parish, D Hosking, John Bulling VK5KX and Hal Austin VK5BN/5AW. Front from left — Reg Harris VK5RR, 'Doc' Barbier VK5MD, 'Pansy' Parsons VK5PS, Gordon Bowen VK5XU and H Vivian. (Hal Austin became SK in August 1954 and 'Doc' Barbier in March 1962).

Joe McAllister VK5JO showed considerable foresight in 1955 when he organised the Brompton Boys' Club, the first of the Youth Radio Schemes in Australia, which aimed to develop the capabilities of boys and girls of generally High School age, towards radio and electronics as either a hobby or career. Bob Guthberlet VK5OD was the State Co-ordinator of the YRS in SA.

Meeting nights were extremely popular, on an average 90 to 100 attending. A display of members' gear was a popular innovation, and an inspection of the Electricity Trust's power house at Osbourne was a great attraction. Such was the enjoyment of the meeting nights that repeated visitors had to be given a tactful suggestion as to their joining the Institute!

The changeover to 50-54 MHz from 56-60 MHz came into effect, much to the concern of most amateurs, because the band was not harmonically related. We used to have bands 14, 28 and 56 MHz, and you would have a 7 MHz "rock", double for 14, quadruple for 28, then double again for 56, using the same piece of gear and doublers etc. When the 50 MHz band came into use, it was necessary to buy a new crystal, say on 8.3, triple it to 25, then double to 50.

Another cause for concern to amateurs was the proposed allocation of the 144 MHz band to TV channel 5. South Australia has been fortunate to avoid this.

The TVI Committee was formed under Ray Tuck VK5BT, and the SWL Group had regular meetings with Jim Paris as their representative on Council.

During October 1957 the Institute's Moonwatch Committee played a significant role in tracking early satellites launched by Russia and America, and the data obtained was sent to those countries. Observers were

Gordon Bowen	VK5XU
Graeme Bowen (son)	VK5XV
Colin Luke	VK5XY
Brian Austin	VK5CA

often on a clear, frosty night on the flat roof of a University building. The Astronomical Society provided the dozen or so telescopes, and Gordon built a receiver on 108 MHz to give warning of the approach of the Sputniks etc over the horizon.

July 1958 saw the power output increased to 150W, and this remained the limit until 10 years later when the wording was altered to a maximum of 400W PEP for SSB operation.

South Australian amateurs enthusiastically took part in the first Jamboree on the Air in 1958, when scouts and guides visited amateur radio stations to talk to others around the world.

In December 1959 the first issue of the SA wireless Institute Journal was written and sent to the Division's 400 members, by Gordon VK5XU. Funds were cautiously provided, as it was not expected to continue, yet in 1985 the Journal celebrates its 26th anniversary. This is the only State to have such a direct link with its members (other than through "AR").

1960 also was the year the meetings were held in St Paul's Church Hall, Pulteney Street, Adelaide. Within 2½ years another move was made to the Master Builders' Assn at 47 South Terrace, Adelaide.

Fees were raised in February 1960 (for the first time in eight years) by 10/- ($1) for all but junior associates.

A beacon was commissioned and operated on 50.5 MHz at Mt Lofty, with a VHF beacon under consideration, and a beacon on 430 MHz proposed.

A Public Relations Officer, and a Publications Officer were appointed at this time.

Amateur TV experiments were proving successful, with the first two-way TV contact in SA in 1963 claimed between VK5AO/T and VK5ZEY/T over a distance of 5 miles (8 km).

The 1964 Federal Convention was held in Adelaide (the third time we had hosted this), and one of the items discussed was the formation of the Federal Company of the WIA.

The Institute in SA had conducted classes for the AOCP from the very early days (and for the last 12 years John Allan VK5UL had taken the theory classes). These were organised and financed by the Adult Education Section of the Education Department in 1964.

The Minister for Education also approved the Youth Radio Scheme for SA. Requirements were that we must find interested schools and arranged speakers, we must have active amateurs to assist with club activities, training and testing for certificates, and we must provide equipment parts. Training must be guided and integrated into school curricula. There were 12 YRS clubs affiliated with the Division within 12 months, although latterly the novice licence has captured the enthusiasm of youngsters (and those not so young) alike.

Around the time of the introduction of decimal currency, kilocycles (Kc) became Kilohertz (kHz).

There was a sigh of relief from those sitting for the AOCP when the CW speed was reduced from 14 WPM to 10 WPM at the end of 1967.

In September 1968 membership figures had risen to 270 city full, 120 city associate, 135 country associate – 525 in all. Fees were $5 city full, $4 city associate, $3.50 country full & associate.

The VHF Group was very active, with the 576 MHz distance accomplishment and the 432 MHz converter project. Members were also constructing a translater for installation in the Adelaide Hills. Repeater VK5RAD was commissioned in 1970.

VK5 was making plans to host the 1970 Convention and this time VHF allocations were high on the agenda for discussion.

1970 saw the start of objections by Councils to the erection of towers by amateurs, and the Courts in the eastern States ruled that a Council was not competent to rule on aesthetic grounds. Negotiations continued, including an appeal to the Planning Appeal Board, with the Institute endeavouring to educate local governmental bodies on a more accurate interpretation of the Building Act in regard to processing amateur radio tower installations. (The Supreme Court upheld our appeal in 1981 that amateur radio is a normal home activity.)

VK5 promised support for the Australis OSCAR 6 satellite ("Orbiting Satellite Carrying Amateur Radio") and appointed Edwin Schoell VK5NZ as the Australis Co-ordinator. Satellites have proved a very popular aspect of amateur radio activity.

The amateur licence fee was increased to $6 in 1970, instead of $2 (not changed since 1924).

The Equipment Supplies Committee came into being under Barry Cleworth VK5BQ and Roger Pullem VK5ZKK, and an Intruder Watch Co-ordinator appointed.

In 1971 the Division had nearly 650 members, and a Building Committee was appointed to investigate obtaining our own headquarters. The Thebarton Destructor Building (an incinerator designed by Walter Burley Griffin from Chicago, USA, who also designed Canberra, ACT) was deemed suitable (with a lot of work) and the first Council meeting held in the renovated building on 15.11.1974. The official opening was on 3.4.1977, forty years after its original opening.

Clive Pearson VK5PE, secretary of SA Division 1977-79 at the controls of the Institute's transmitter.

The Federal Awards Manager's position was undertaken in 1973 by Brian Austin VK5CA, and then by Bill Verrall VK5WV in 1979. Duties included issuing certificates for the Worked All VK Call Areas, Worked All States, VHF Century Club, Worked All Continents, DX Century Club.

In 1974 it was decided novice licensees would be granted full membership in SA, as had the limited licensees 20 years before. The Institute undertook two novice courses and appointed John Mitchell VK5ZJB as Education Co-ordinator. The first novice exam was held in 1976.

VK5 was glad to be able to help with communications after Cyclone Tracy hit Darwin on 24.12.1974, with WICEN and others assisting.

The beginning of the end! The first female elected to VK5 Council in 1980. Back row from left: Maurie VK5ZU, Ross VK5AG, Ian VK5QX, John VK5NX, Bill VK5AWM and Gerry VK5PI. Front — Trevor VK5ATW, Jenny VK5ANW and Colin VK5HI.

Fees in 1976 were set at $20.50 full city, $19 full country, associate city or country, $9 student or pensioner, $2 family.

1976 was a busy year for repeaters, with 5RMN (mid north) handed over, 5RHO (Ch 5 at Houghton near Adelaide) operational, 5RMG (Ch 6) at Mt Gambier almost ready, and application for a TV repeater being processed. Later, a repeater was proposed for Cowell, also a 70 cm repeater.

New groups were being formed — Microprocessor Group, RTTY, and John Ingham VK5KG was appointed by Federal HQ as Custodian of the Video Library. A Membership Secretary, Historian, and Commissioner for Scout Radio were also appointed.

Membership was now over 900, and the first one-day Planning Conference for the Division was held at a Christies Beach venue, with 10 Council members and 2 invited members attending, and the discussion covered the meeting format, State repeater policy, station facilities at HQ, broadcast facilities, WICEN, education, relations with P & T, public relations, financial planning report etc.

Over the years the Institute has been fortunate in having many willing workers, but ten members have given exceptional service to the Institute, and have been granted Honorary Life Membership, Up to 1980 these were —

Professor Emeritus	*Sir Kerr Grant*
Joe McAllister	*VK5JO*
"Doc" Barbier	*VK5MD*
Gordon Bowen	*VK5XU*
Warwick Parsons	*VK5PS*
George Luxon	*VK5RX*
Brian Austin	*VK5CA*
Geoff Taylor	*VK5TY*
Roy Cook	*VK5AC*
Bob Murphy	*VK5MM*

In the 60 years of its existence in SA the Wireless Institute has increased to over 1,000 members, and although not as widely known as some would like, it is respected in the community. It is one of only two hobbies in which members have to pass a stiff exam and be licensed (the other being flying).

It is hard to imagine the next 60 years could see the same progress, excitement and rewards of the last 60 years, but with the advent of computers, new horizons will surely emerge to test the initiative and ingenuity of members of the Wireless Institute.

(It should be noted the above is necessarily incomplete, as 25 years of minutes are missing.)

An approximate decimal amount is included beside the pounds to allow younger members to compare. **AR**

WIA (SA DIVISION) GENERAL INFORMATION

The Headquarters Building is at the rear of the Thebarton Council Depot, West Thebarton Road, Thebarton, Phone 352 3428. General Meetings are held on the fourth Tuesday of each month at 7.30 p.m.

The Divisional Broadcast is transmitted each Sunday at 9.00 a.m. local time on 1.820 MHz with relays on 3.550, 7.095, 14.175, 28.470, 53.100, and 147.000 MHz. The Broadcast is also relayed via the Adelaide Amateur TV repeater VK5RTV with an output frequency of 579.000 MHz. This repeater may be tuned on channel 34 of any television receiver. Some relay frequencies may vary slightly to avoid interference. Except for a four week break over Christmas, Morse Practice Transmissions designed specifically for learners, are provided each evening at 1030 UTC, on 3.550 MHz +/− QRM.

A WICEN Call Back net operates each Wednesday evening at 8 p.m. local time on repeater channel 7000 and at 8.30 p.m. on a frequency of 3.600 MHz. Call sign for the WICEN Control Station is VK5WIE.

The Divisional Journal is published bi-monthly by the SA Division of the WIA. The closing date for receipt of contributions or copy is the 15th of each odd month.

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

Firstly, I would like to thank all those people who have been in some way involved with making this issue of AR a very special issue for VK5. Hopefully, they will all get their due credit in various other places in the magazine, if I mentioned them all here it would take up most of the column.

This year is the tenth birthday of ALARA (no, you haven't started reading the wrong column), so to celebrate the event, each state was asked if some sort of celebration could be arranged within the state. Here in VK5 there are about 25 to 30 licenced YLs, so it was decided that we should contact as many as possible, and those that we couldn't contact personally, were invited via the WIA Broadcast.

On Saturday, 27th July, a group of 15 licenced and two licenced YLs met for lunch at the Olde London Tavern in Adelaide. Those present were, Marlene VK2KFQ (an honourary VK5, as she lived in Adelaide a couple of years back), Joy VK5YJ, Marlene VK5QO, Meg VK5AOV, Denise VK5YL, Myrna VK5YW, Loraine VK5LM, Janet VK5NEI, Vicky VK5FK, Carol VK5PWA, Elaine VK5KEB, Linda VK5QP, Judy VK5BYL, Pauline Koen, Liz VK5NES, Diane Smit and myself. Carol VK5PWA flew from Port Lincoln for the weekend and stayed with us at the Warrington QTH.

Judy travelled up from Victor Harbour on the day, and Janet and Loraine had also travelled from Wasleys and Mallala, respectively. Marlene VK2KFQ had planned a holiday in Adelaide for that week!

One person that we would have liked to have had present but, unfortunately we were unable to get in contact with her, was Mrs Elizabeth Wallace, the former Betty Geisel, who was the first VK5 YL and the first VK5YLI Both Linda and Myrna were founder members of ALARA, so their presence also had an historical significance. At the other end of the scale, we were delighted to have Liz VK5NES and Liz's mother, Diane. Liz is our newest VK5 YL, and she is 12 years old. Her father is Hans VK5YX and both he and Diane are justifiably proud of Liz. We hope to hear a lot more of you on the bands Liz, when homework permits.

The get-together was considered such a success, it looks like being an annual event. Any YL who would like to join us next year, please let me know.

Thankyou also to Peter Koen, who took photographs of the historical, or should it have been hysterical, event.

DIARY DATES

22nd October . . . General Meeting. Speaker will be John Moffat VK5MG, showing us the latest in radio gear.

29th October . . . Buy and Sell night.

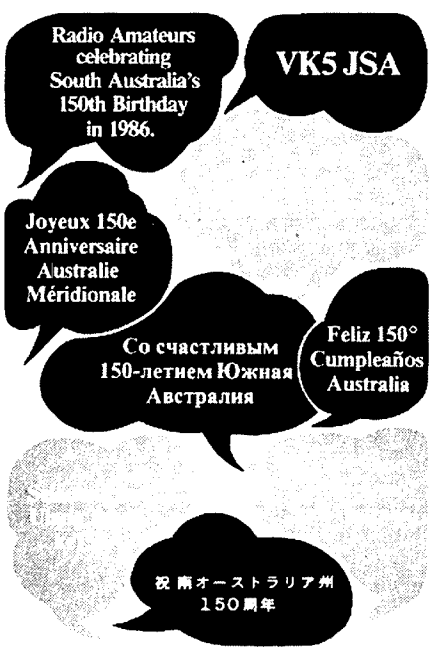
17th November . . . WIA Picnic.

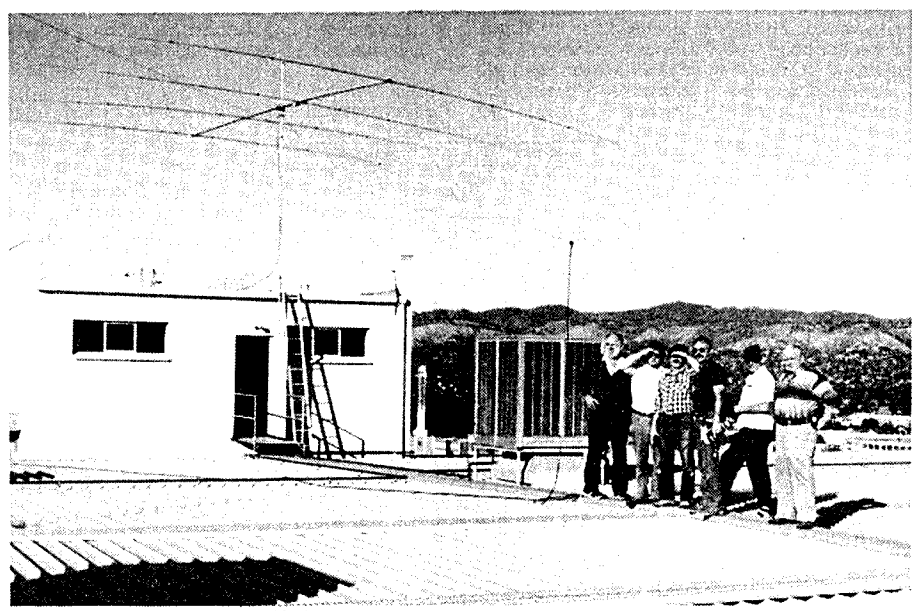
26th November . . . General Meeting. Speaker will be Trevor Conlon from CFS Headquarters. **AR**

"AMATEUR CROWEATERS ACTIVATE FROM VK5-LAND"

Graham Horlin-Smith VK5AQZ
Co-ordinator J150-WIA (SA)
2 Athol Avenue, Plympton, SA. 5038

Eighteen months planning to link amateur radio with SA's 150th birthday in 1986 reached fruition on Monday 27th May 1985 when VK5JSA, the special events call sign, was activated from the centre of the city of Adelaide. The location was the Renaissance Centre which overlooked the Rundle Mall in Adelaide.





Don VK5ADD, Roland VK5OU, Bob VK5BJA, Peter VK5PRM, John VK5LV and Peter VK5NPC, pause while checking the antennas on the Renaissance Centre Roof.

Three operating points were established. At street level a group of HF operators worked two rigs from an OB radio van, a 93X and an FT757GX out of a 204 BA, 4 element monobander and a 40-80 metre trapped dipole respectively located on the roof of the seven storey building about 61 metres (200') above ground level. The second operation for CW and RTTY was located in Radio Rentals (Adelaide) ground floor shopwindow (5 band trapped vertical also at the same height) and the third consisted of UHF/VHF, ATV and a satellite display on the 6th floor of the restaurant which had a commanding view of Adelaide and Repeaters 5 and 8 in the Adelaide Hills. Computers by ICL demonstrating the link with amateur radio and substantial visual displays by the WIA (SA Division), International Communication Services, Dick Smith's (Adelaide), the Department of Tourism and the Jubilee 150 Committee complemented all operating points. With outside scenic lifts opening into the restaurant an average

Bill VK5AWM, WIA, SA Division Immediate Past President, welcomes guests at the Renaissance Centre Restaurant. From left — Rob VK5RG, Bill Fitzgerald, Jubilee 150 media. of 2,000 daily visitors had a direct eyeball with amateur radio during the weeks operation.

The activity launched the commencement of a programme of several activities which intend to continue during 1985 and throughout 1986. As a result of this and other planned activities VK5 amateurs expect to propogate 100,000 special Jubilee Sourvenir QSL cards worldwide and 2,000 awards during 1986. The special issue welcomes amateur participation in SA's 2,000 plus planned Jubilee programme and extends "Happy Birthday" greetings to SA in eight different languages, a very novel almost "unique" welcome to the first Grand Prix held in Australia which coincides with the commencement of a "whole" year of birthday parties. 28th December is SA's Proclamation Day, and 1986 it's 150th birthday or sesqui centenary year. Come on over and "enjoy" SA!

SA has chosen to share and twin its 150th year celebrations with Texas, Adelaide and Austin, Texas, being linked as twin cities. In excess of 170 towns and districts and 300 schools have been distinctively linked and exchanges have already commenced. SA amateurs see a role in providing the communication link to assist, where possible, with towns, schools, activity groups, community and service organisations — a daunting task, but look upon as a real challenge and a spirit of adventure which hopefully will be rewarding in so far as the hobby of amateur radio is concerned. Promotional type activities and working with Jubilee activities, it is hoped, will provide a positive exposure of the hobby as well as an awareness and a better understanding of amateur activities in the long term.

"Amateur Radio Week, Promoting SA", fired the first shot and the launch of the programme. The official launch was by Dr Ian McPhail, the Chairman of the Bi-State Centenary Committee with guests from government, the Jubilee 150 Committee and representatives from sponsorship groups, 50 guests in all. The Launch took place in the VIP area of the Renaissance Centre Restaurant on the 6th Floor. Escorted tours of the operating locations, press releases, media

John VK5LV conducts a footpath Press Conference during AR Week.

involvement and amplified amateur radio links with Texas via San Francisco into an amplified Mall focused the public's attention on amateur radio which continued throughout the week. Special appearances later in the week by Mr Gavin Keneally, the Hon Minister of Tourism and Local Government and a special amateur link between the citie's respective Mayors, Adelaide's Lord Mayor, Mr Jim Jarvis, and Austin's Mayor Frank Cooksie, exchanged greetings and invitations and gave further impetus to amateur communications in support of Jubilee 150 and SA promotional activities.

The WIA (SA Division) Sub-committee of Jenny Warrington VK5ANW, Rowland Bruce VK5OU together with Graham Horlin-Smith VK5AQZ, co-ordinator, acknowledge the financial sponsorship of the Department of Tourism (SA Government), Estrow (Civil Engineers and Supervisory Consultants), the Jubilee 150 Committee and the WIA (SA Division) with the willing backup support in equipment and displays by Radio Rentals (SA) International Communication Services, Dick Smith's (Adelaide), The Electric Bug, Captain Flash Advertising, Norman's Estates Winery, ICL, the South Coast ARC, the Renaissance Centre Management (Emanual Group), Sound Out Services and the Renaissance Tower Restaurant management. In such an undertaking these people gave the group the opportunity to mount a successful promotion of amateur radio and achieve the purpose of the programme. There were many amateurs themselves who contributed time and effort to get the show into the ionosphere for which sincere gratitude has been acknowledged.

The week's operation netted 1063 logged contacts of which there were 297 DX contacts from 20 countries, a reasonable expectation when priority was given foremost to promoting SA and the 1986 Jubilee celebrations. Timeouts were opportune to introduce the hobby to the many visitors and answering enquiries from interested "budding" amateurs in the making. USA, ZL and VK headed the list of contacts with one major sortie into Europe when the 204 BA, 4 element 20m monobander was armstronged into the long path. To linger at the centre and under a major pile-up was a fantastic experience.

Almost 800 contacts were made with Australian stations, 200 of which were made by UHF and VHF. The 40 and 80m trapped dipole favoured Australian contacts generally. Promotion rather than contesting was preferred particularly as the location point of contact was at the very heart of the City of Adelaide's shoppers and school holiday visitors. The organisers were pleased to welcome to the official promotion Dr Karl Meizner and his charming wife, Wendy, during their short visit to Adelaide and to share some of the host state vintages.

THE STICKY-TAPE AND STRING SECTION

The problems of erecting temporary HF antennas on the roof of a city building are many. The most important consideration was to ensure safety for both the crew erecting the antennas and

Bob VK5BJA making contacts on 20 metres from the outside Broadcast Van.

the general public below. The antenna crew were no real worry, because one look over the side of an eight storey building is all it takes for individual self-preservation to take over, and any thoughts of "daring deeds" vanish instantly.

The safety of the public is another matter. We had to erect an efficient antenna system that would stay put for the duration of the project, not fall off the building and cause injury below, not to mention, re-arrange the VSWR and element spacing of the antenna.

The antennas decided on were a 204 BA, 4 element, 20 metre mon-band Yagi, a half-wave dipole on 80 metres with traps for 40 metres, a couple of trapped verticals and a VHF "Slim Jim".

The installation of all these antennas went smoothly and with the enthusiastic and dedicated crew, took one and a half days working at a moderate pace and although the roof now resembled an elaborate "bird-trap", antenna performance was interesting, if not predictable.

The 204 BA when checked, exhibited a VSWR of 1.1:1 right across the band. I suspect that the 300 metres of RG-8 might have been responsible for making it look slightly better than it was. The dipole, which was also fed with 300 metres of RG-8, underwent apparent VSWR changes, as originally it was tuned using a short feeder. However the result was still reasonable and well within the scope of the automatic AT units used.

These antennas enabled the station to transmit strong signals and we generally received very good reports.

Due to a high noise level, reception was not as good as we had hoped. The noise problem was the result of a trade-off between going for the efficiency of elevation, and the local noise generated in the elevator control rooms which were, of course on the roof with our antennas. The trapped verticals, needless to say, were particularly susceptible to the noise and as a result, weren't very successful.

Surprisingly, the "Slim Jim" on 2 metres performed well inspite of the fact that it also was fed with 300 metres of RG-8.

The moral of the story is, given a little

The OB Van used for HF contacts.

forethought, commonsense, a good crew and a few handheld radios, a complex project can be achieved with safety and efficiency.

Immediate responses to the programme have been most gratifying to those involved, the support groups and, in particular, the WIA (SA Division) and Council which superintended the operation and gave the green light of approval to the proposal, purpose and eventual achievement of the project. The co-ordinators, the operators, the technical advisors and the antenna group ensured the practical success of this first up, unique operation which had its few uncertainties, doubts and difficulties to say the least. Fortunately the project, in its outcome, was almost problem free and therefore projected the hobby and image of amateur radio favourably in the eyes of the community and the general public. Of valued importance has been the impact of sharing the hobby from the awareness viewpoint with people from higher echelons of government and administration — another positive step forward to promote the rewarding expectations of amateur radio on the home front and welcome visitors to SA.

"Amateur Radio Week, Promoting SA", successfully negotiated by a willing group of amateur entrepreneurs, has provided the spark for future programmes as SA prepares itself for its Jubilee celebrations . . . in 1986.

THE FLYING DOCTOR, PEDAL RADIO AND ALF TRAEGER

Ken McLachlan VK3AH,
PO Box 39, Mooroolbark, Vic 3138.

The Royal Flying Doctor Service, the first service of its kind in the world, came into being in Queensland in May 1928. The Service was to provide medical aid in emergencies, comprehensive health care and community service to the people of inland Australia.

The Service was the 'brain-child' of the Reverend John Flynn — Flynn of the Inland — who was involved in missionary work for the Presbyterian Church's Inland Mission. When he began his missionary work in 1912, there were only two doctors to service large areas of Western Australia and the Northern Territory. Flynn realised that aircraft and radio would be a way of breaking the isolation of the Inland and also provide medical care for its people.

Photograph courtesy RFDSA

John Flynn.

It is felt fitting that some of the history of the perceptive gentleman who was the founder of the Aerial Medical Service, later to be known as the Royal Flying Doctor Service of Australia, The Very Reverend Dr John Flynn, OBE be documented with this article. He was born at Moliagul, near Bendigo, Victoria and at the age of 18, joined the Victorian Education Department for five years. This was not his calling in life, as he then served two years with a mission appointment for the Church, prior to enrolling to become a Minister. He was ordained to work in South Australia in 1911. In 1925, he was made a member of the Wireless Institute of Australia, 1933 saw him awarded the Order of the British Empire and in 1939 he was appointed Moderator-General of the Presbyterian Chuch of Australia, the peak of his career. He passed away on the 5th May, 1951.

When the Service first began on 15th May, 1928, there were no radio links, but it was realised a cheap, but reliable two-way radio was necessary. The unit would need to be easy to operate, need a range of around 500 km and be light enough in weight to make it portable.

This was a very large order in the days of the infancy of radio. Flynn spoke to many technically qualified men, but always received the same answer — it couldn't be done. However there was a young, inventive genious in Adelaide that was making generators and motors for a living, who was willing to accept the challenge. This was Alf Traeger.

Alfred Hermann Traeger was born at Glenlee, near Nhill, Victoria on the 2nd August 1895 and spent most of his boyhood on the family farm at Balaclava in South Australia. At the age of twelve he developed communications between the machinery shed and the house, using a home made telephone utilising pitch fork prongs, wire, tobacco tins and charcoal. This young innovator, was later educated at the Adelaide School of Mines, where he graduated as a Mechanical Engineer with distinction.

John Flynn had faith, so much faith in fact that he employed Alf on a salary well in excess of his own and within twelve months the first set was on the air. The initial set that Alf designed required the operator to crank a handle to provide a power source, which was to overcome troublesome batteries. As it was necessary to use Morse Code to combat poor radio conditions, this unit proved difficult to use for one person, by the time they cranked the handle with one hand and sent their message, on the key, with the other.

Photograph courtesy The Advertiser

Alf Traeger with a 1928 transmitter of the second type made.

The first successful on-air experiment was conducted from a nursing home in Alice Springs to another set at the Hermannsburg Mission, about 150 km west of the "Alice" and a third set (which didn't work) was positioned at the police station in Arltunga, about 250km to the east. Incidentally the Mission was among the first to receive a transceiver. Problems existed with the cranking method but Alf overcame this problem by equipping the set with pedals to provide power — hence the pedal wireless was born. These pedal sets were installed in remote outstations, and provided vital links with flying doctor bases.

The story goes that the Rev John and Alf drove into the Queensland town of Cloncurry, in early November 1928, which happened to be Melbourne Cup Day, to publicise a better model of their innovation. The ideal place to set up the demonstration was in front of the local hotel and as a local horse was running, a crowd soon gathered to see if the results could be quickly obtained. A transmission of over 4000 km was heard, the local horse won, the crowd that had gathered adjourned to celebrate, and two men were left with the set, knowing that they had succeeded in their venture.

Not to be forgotten in the pioneering days of what has become a service that has helped so many, is Maurie Anderson ex 5AM. Maurie, an ex-ship's radio officer, was employed in 1929, as the Radio Officer at Cloncurry, on the princely sum of six pounds per week ($12), where he served for ten years, before being transferred to open the base at Alice Springs. It is believed that Maurie was in everything and had a hand in transmitting weather reports to KLM Airlines when they were surveying the Europe to Australia air route. This man of boundless energy, prior to leaving Cloncurry, made an inspection and repair tour of many installations, which involved travelling in excess of five thousand kilometres.

The next improvement to the sets was the development of a keyboard transmitter that was first used in 1931, a typewriter which sent the correct Morse signals when the required keys were pressed. Tnis eliminated the need to learn Morse code.

The demand for this form of communication grew and the quiet, unassuming amateur radio buff was to go on to open his own factory, Traeger's Transceivers, in Marryatville, S.A. and produced many other innovations during his long career, including a solar device that produced fresh water from salt water and at the age of 77, Alf designed a vehicle that was powered by a gas-turbine that generated power for electric motors connected to the rear wheels.

Around 1937, technology had developed to a stage whereby voice operation could be employed instead of Morse and more reliable batteries, with the use of vibrators, could replace the pedal generator. Alf's original transmitter at the base station in Cloncurry remained in service until the 1940s.

At the outbreak of WWII, his radios were extensively used for Military purposes and highly praised by the Commander in the Pacific, the late General Douglas McArthur. Alf, later in his career, was awarded the prestigious Order of the British Empire (OBE).

An AT14 war surplus transmitter was employed at the main base at Cloncurry in 1945, due to its higher output and in 1947 a new base at Charleville opened, using Alf's original Cloncurry transmitter, however

Photograph courtesy RFDSA

Reverend John Flynn and Padre Skipper Partridge talking from the outback to distant Cloncurry.

eventually modified disposals equipment was installed to improve the service.

Until the mid 1950s, all equipment was either AM or DSB but improved technology was beginning to show that the use of SSB would be more economical and practical. From January 1978, all communications have been converted to SSB.

It is interesting to note that the flying doctor works like any other medico. Each homestead is equipped with a medicine chest containing about 100 different medications which are all numbered and regularily checked. The diagnosis is made by radio and the patient is instructed what number and quantity to administer. Of course certain drugs must never be taken without the doctor's authorisation. An instant service with no waiting rooms, a boon to patients, particularly those in isolated areas.

It is interesting to note that it is now an around the clock, all days of the year service with a medico always on call. When the receivers are unattended and a signal is detected, an alarm is actuated that can only be silenced by the transmitter being operated.

Probably some statistics would be in order. The RFDS in 1984, flew 1177 people to hospitals and 34,877 patients were treated by the doctors belonging to the service. One can only imagine the number of lives that have been saved and the assistance that has been given since its inception.

If it were not for the radio section of the RFDS, many people would live in complete isolation. With the closest shop 200-300km away and the nearest neighbour possibly 100km down the track, no telephone, radio is the only form of communication. When the channels are not occupied for official traffic, such as sending telegrams, a certain time each day is set aside for a "galah" session. This is like an old fashioned chat over-the-back-fence in suburbia.

A gentleman who belonged to the fraternity of amateur radio enthusiasts, Alfred Hermann Traeger OBE, ex VK5AX/VK8XT, passed away on the eve of his 85th birthday, the 31st July 1980 in Adelaide. He will not be forgotten for his ingenuity, that brought immediate medical assistance within the scope of innumerable homesteads, sparsley spread across the arid inland of our vast country and was the forerunner of School of the Air and other communication necessities. It was estimated that 30 stations were existent in 1934, today it would be in the thousands.

Again it can be seen that amateurs have made a substantial contribution to the development of meaningful communications in this country.

HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

At the expense of receiving a mail box full of letters with differing opinions, I am going to make the statement that all DXpeditions to be recognised, should get accreditation by submitting visas, operating permits and relevant information to the ARRL or another accredited body acceptable to the ARRL's impeccable standards, for endorsement that their efforts will be recognised, prior to proceeding on a costly jaunt to themselves and numerous QSL cards that are sought by amateurs and SWLs and if received by reasonable expense to the recipient, are proven to be valueless.

I am sure that this would deter quite a number of "pirates", allow adequate publicity in time for deadlines of all DX orientated magazines and allow a far better return of QSO's to the expedition, which would assist them in donations of equipment and expenses.

It is appreciated that in some cases it is hard, but not impossible, to get documentation in advance at the beginning of the planning stage. This would be easier and less costly to all concerned and even it would probably benefit the DX net controllers in preparing their lists; in some cases those on the list would know the station that they were in the running for!

Think about it, the serious DXer has many cards that are quite attractive but completely valueless and they have cost a lot of time, frustration and money to acquire. Would tentative accreditation from a country's licensing authority, validated by documentation that the operator or operators did actually transmit from that much valued location, benefit the hobby and the pockets of all concerned? I think it would — what do you think?

HOLIDAY JAUNT

Ernie VK3DET, ex 3D2TN, 5W1DW, A35TN and ZK2BB, and his charming XYL Kim, are taking a holiday jaunt around the Pacific. Their itinerary includes operating as ZL0ACP from the 19th to the 22nd of November and as A35TN from the Kingdom of Tonga, Kim's home country where they were married in 1982, from the 25th of November until the 3rd January next year. It is not an expedition but a holiday and Ernie hopes to get on all bands as much as possible. QSL in 1986 when they return to Ernie Turner VK3DET, 1006A Armstrong Street Nth Ballarat 3350 Victoria. Happy holidaying Ernie and Kim.

INDIA

If you think you have hassles, read this, as they may seem infinitesimal to those of a couple of VU amateurs. One amateur had a gift external VFO and microphone sent to him in July 1984. He has sent registered letters to the appropriate authorities in September and October last year and in January and March this year. So far no reply and of course, he has not sighted his equipment.

The other amateur apparently revalidated his licence in 1963 and despite several reminders, has not as yet received the paperwork.

A RECORD?

Apparently veteran CW operator Jack VK2KQ, when a telegraph operator at the Tamworth Post Office, was told to stand by at about 9.30 am in the morning as a message was coming through from Burren Junction concerning a murder case.

Jack sat at the sounder until 7.15 pm that evening, until there was a change of operators, taking the traffic at 25 WPM. Apparently the message was in excess of 15,000 words. Some effort! How many operators could stand the pace in the '80s? Being honest, I know I couldn't even in speech let alone CW.

Can anyone beat Jack's "record" — either commercially or on an amateur basis? And I wonder if Jack, at that time, wished that Samuel Morse had stayed a painter, instead of becoming an inventor.

Adapted from WESTLAKES Amateur Radio Club Newsletter, July 1985.

SAO TOME

Where is it, many amateurs are asking. The easy answer is 0 degrees 10 minutes North and 7 degrees East and West of Libreville in the Gabon. The area of 960 square kilometres consists of the main island, Sao Tome with its capital being the same name, the second island Principe and four other small islands. From the middle of the 15th century, except for one hundred years rule by the Netherlands, the area has been colonised by Portugal, until a transitional Government was installed on the 21st December 1974. The Principe of Sao Tome gained its independence on the 12th July 1975.

The population was estimated to be about 115,000 inhabitants in 1980 and its main export for the last 150 years has been cacao, which was forced on them by the Portuguese rule, with 90 per cent of the area being under cultivation. The seeds were exported and items such as wheat, rice and other necessities were imported.

Since independence, the islands have become economically unstable, as the former landholders "tore" up the ownership documentation for the cacao plantations, leaving the farmers with a decreasing market, no technology or chemicals to assist the already old plantation trees. Financially ruined, parts for equipment and automobiles that still do exist are unobtainable. Their exports tumbled dramatically and are still dropping according to the latest figures available, which are quoted in sterling, was 494,000 pounds in 1982 which dramatically dropped to 218,000 pounds in 1983. Their imports also reflected the dropping export revenue, as in 1982 the value was 1,510,000 pounds with a drastic drop to 218,000 pounds in 1983.

In spite of the financial problems being encountered, the islands are abundant with many kinds of fruits including bananas, pawpaws and mangoes. The area is rich in sea foods, but as the President, Dr Manual Pinto de Costa, has said "Everything can be harvested; but we have no equipment to cultivate and fish." Education is a high priority on the government's agenda, and school attendance is deemed to be 100 per cent at the elementary level and all graduates of high schools receive their certificate plus a scholarship to continue studies abroad.

Luis or Luiz as perhaps it should be, S92LB, who has been licensed for some twenty years, and his XYL Berta are thought to be partners in the business of the Luiz and Jonseca Company, which apparently is a trading company from all reports. His former transmitter was apparently confiscated and now he uses a TS 520 and dipoles.

By reports from overseas newsletters, he is rather prompt in returning cards. Good luck Luiz and Berta, and may you be worked by all those that need you for a new country, particularly in the Pacific, and not the chosen few who trade on "mate rates".

CLUED UP "PIRATES"?

It is felt that 5A1AB, not an April Fools prank in bad taste, does exist, even if it is only a figment of the operator's "brain". But this brain evidently has some "grey matter" even if it is *channelled in* the wrong direction. He gives his QSL information as G4UZO. G4UZO is not listed in the 1985 International Call Book and the RSGB Call Book's notation alongside the call is "Particulars withheld at licensee's request". In other words, someone has done their homework!!

Another similar case is that of 702PP, heard in Europe quoting "WB0IDO" as his QSL route. "WB0IDO" does not appear in the current International Call Book either!!!

PETER THE FIRST ISLAND

Well this island has a high chance of being operated for a period of 24 hours in late December or early January. (What a Christmas present!)

Apparently a Japanese fishing vessel will be going near the island and is willing to take Jin JF1IST, along. Jin will have to remain with the vessel for four months and will have to go ashore alone in a rubber boat, if the schedule comes off. The fishing vessel will wait only 24 hours in the vicinity and, as mentioned before in this column, the landing conditions are very hazardous on this island. If Jin makes it, there will be no elaborate antennae (which has to be dismantled and removed before he leaves either by transporting it back to the "mother" ship or casting it into the sea), as the Norwegian authorities have decreed that nothing must remain on the island.

Jin, if it comes to fruition, every good wish for your welfare and if you make one QSO, congratulations, as in my book you are a very brave and determined amateur and the thoughts of all DXers go with you. If the plan goes as scheduled, the QSLs will be handled by Suzuki JR1HHL, who is not noted in the 1985 International Call Book.

MOUNT ATHOS AGAIN

Does any DXer remember Don Read WB1GDQ, who created the impression that he was on San Felix as KF1O/CE0X. (Refer AR September 1982, p30.) Well, Don also has the calls SV0BV and G4VGO attached to his name.

Don has been heard on air signing SV0BV/A expounding the fact that the monks were providing wine and cheese one afternoon. He was challenged by another SV amateur that it was a "commercial venture" but Bob, always with a reply, said all IRCs were being donated to the Holy Community. Many other operators would not work him and he packed his base and went home from wherever he was.

Is this another "Mission Impossible" for Don Search at the Newington Headquarters? My advice is to let us see if this was a genuine operation, before we commit any IRCs to charity or otherwise!! For the record QSL to G5VS.

My impression of Bob, with apologies to Luis CE3IW.

THAILAND AND BANGLADESH ACTIVITY

Apparently Jonas HS1SD, is the only active station from this country at the moment and it is believed that he is a high-ranking Police Officer. Apparently there is no ban as such on amateur activities, as the Minister of Communications lifted it in January this year. Meanwhile another school of thought is that amateur examinations are due to

be held soon and the Thai authorities will allow the Radio Society to issue the new call signs and all will become active at the same time. We hope so, as the hobby in this country has been in a "grey" area for some considerable time now.

No genuine operations out of S2, except that Saifud, President of the Bangladesh Amateur Radio League who has done so much to promote the hobby in his homeland, recently passed the British examinations. He hopes to be active from his Middlesex home shortly. Congratulations Saifud.

NEW COUNTRY????

Many JA operators believed that BT0NMN, being in the Tibet Autonomous Region, could be a new DXCC Country. It is thought that this station and BY0AA are located in an area that is administered by a local government, which is quite separate from the Beijin administration and the People's Republic of China. Incidentally BY0AA is in the much sought after Zone 23.

Meanwhile, many more BY stations are becoming active!

UNUSUAL NETT

Rainer DL1BEI advises of a net that may be of interest to some of our readers. The net is run at 0500UTC each Wednesday on 14.300 MHz +/- 10 kHz using the "Piatt" dialect. It appears that this dialect is a mixture of the Dutch, German and Belgium languages.

GU DXPEDITION

The Guernsey Amateur Radio Society with the support of the RSGB Committee is sponsoring an under 18 DXpedition from the 19th to 27th of this month, to allow participation in International Youth Year. They hope to become involved in the CQ WW DX Phone Contest. If they are heard, it would be worth a call, to make the organisers' hopes of promoting these young members of our fraternity with familiarity of better operating skills and widening their horizons with the use of the hobby they have chosen.

GUERNSEY

The DAGOE (Dutch Amateurs going on Expedition) will activate this DXCC Country under the call PA0FAS/GU0 from the 23rd to the 30th of this month. The operators PA0FAS, PA0TUK, PA3AWW, PA3CJF and PE1FNB will activate 160 through to 10 metres, on both CW and SSB including the WARC bands. Equipment that will be pressed into service includes a TS820, TS930, L4B, L75B into a beam for the high bands and dipoles for the lower end of the amateur allocations.

They hope to participate in the CQ-WW Contest and all QSLs are via DAGOE, PO Box 356, 3300 AJ Dordrecht or via the PA Bureau.

NEWS FROM GUAM

Ed KB6DAW/KH2, from his prime position in the Pacific has been getting his share of some good DX. Ed has worked SU, 7X and HV on the Rare DX Net with Zedan JY3ZH. This net is at 2100 UTC on the frequency of 14.224 MHz. Other stations heard have been 7X5CYK, A92EM, KX6DS, TA1A and TA1E.

Kimsan XU1SS is being heard, but when she reappears consistently, YB0BZZ and Ed are organised to assist in running some traffic for her. Another station that has been inactive is RF0FWW with his Net on Wednesdays at 14.195 MHz. His problems have been of an equipment nature.

Unfortunately Ed's trip to Johnson Island has been cancelled but the trip to Wake Island has been approved for the 22nd of this month until the 4th of November. That period covers the CQ World Wide DX CW Contest. Call signs to look for are KB6DAW/KH9 for CW, NY6M/AH9 for SSB and KB6DAW/NH9 for the contest only. All QSLs for the expedition are via KB6DAW/KH2, Edward Campbell, 300A Rendova, APO SF 96334, USA.

Ed has been asked to activate some VK and ZL stations to look over towards the South America's around 2200UTC on 14.338 MHz where the "Confusion Net" is run.

Good luck with Wake Island, Ed, and we hope to work you.

DXCC AND ALL THAT!!!

The ARRL DX Advisory Committee has voted 15-1 to amend the Country Criteria Rule 5b to read as follows:

"The following will NOT be eligible for consideration as a separate entity from the host country: Embassies, consulates and extra-territorial legal entities of all nature, including but not limited to monuments, offices of UN agencies and related organisations, nor other intergovernmental organisations, diplomatic missions, etc."

Well not being a "Legal Eagle", I feel that this will be the curtain call for 4U1VIC and maybe others if it is adopted by the ARRL desk. More aspirin or maybe something stronger for Don Search, who holds the responsibility for the DXCC administration!

HELLO — GOODBYE

The last Willis Island changeover went smoothly and at departure time both crews were full of smiles as this picture shows. Note the dish that many amateurs would like in their back yard!

L to R John Goonan—OIC*, Neil McArthur—O+, Brian McGurgon—OIC+, Kim Briggs—VK9ZB; RTO+, Chris Frisby—O*, Gaye Wooley—O*, Owen Anderson—O+, Peter McLennan—VK9ZR, RTO*.
KEY: OIC denotes Officer in Charge, O = Weather Observer, RTO = Radio Technical Officer, * = Outgoing crew and + = Incoming crew.

Photo supplied by Peter Barclay VK3FR.

BITS AND PIECES

The prefix OJ0 is no longer issued for Market Reef, so if you want this country, watch for any call signing . ./OJ0. ** UA8T is active from Oblast 174. ** Who was "YA7FPB" and "3Y3W"? Perhaps some psychologist may be able to elaborate! ** Lothar 5T5SL, will be QRV until the end of this month as will VR6JR. ** It is sad to relate that the XYL of 1Z9A was killed by a sniper in the Karen State. ** Kim VK9ZB, quite active from Willis Island and is also on 6 metres, particularly looking for VK contacts. ** Irma OH8MA, a well-known YL DX operator including being a member of the recent JW5E operation, was active from the Maldives as 8Q7MA. QSL via OH2BH. ** 4J0F was an operation from the USSR-owned Kuril Islands that lie between Kamchatka and Japan. ** Steve VK2PS, received 18 USSR cards in the last batch from the Bureau. Someone still listens on the bands! ** It is believed that OK2BKH is at the QTH of XZ2HN, but it is impossible to obtain the correct authorisation to operate amateur radio. ** Feng, ex XW8BP apparently has been allocated the call BV2EA. ** Apparently why WB0IDO is not in the International Call Book is that the call isn't issued. ** According to HB9TK, who is employed with the Swiss Embassy in Accra, the hobby is absolutely forbidden. ** YIs will soon have their own personal call signs but will be limited to operation from the club station. ** 70 might be active in the near future. ** Watch for JY50 stations in November and there could be an award. The special call is to celebrate the birthday of JY1, His Majesty King Hussein. ** XF4MDX had only 5386 QSOs during their jaunt, the propagation was so bad due to a solar storm prior to arrival that only nine stations were worked from Europe 2 and 7 on forty and twenty metres respectively.

THANKS

Sincere thanks go to the following: the editors of weekly, bi-weekly and monthly newsletters including the ARRL NEWSLETTER, CQ-QSO, DX FAMILY FOUNDATION NEWSLETTER, JAN and JAY O'BRIEN'S QSL MANAGERS LIST, KH6BZF REPORTS, LONG ISLAND DX BULLETIN, LONG SKIP, NEWSLETTER of the NATIONAL INSTITUTE OF AMATEUR RADIO HYDERABAD, OLD MAN, QRZ DX, RADIO AMATOORI, RSGB DX NEWS and WESTLAKES AMATEUR RADIO CLUB NEWSLETTER. Magazines including: 73 for Radio Amateurs, BREAK IN, cqDX, JA CO, JARL NEWS, KARL NEWS, OST, RADCOM and VERON.

Members who have contributed include VKs 2PS, EBX, 3FR, YJ, YL, and G3NBC. Overseas amateurs include DL1BEI, G1EOD, PA0GAM and ZL1AMM. Sincere thanks to one and all, happy DXing and Intruder Watching. **AR**

WE'RE A WEIRD MOB

The WIA Victorian Division financial accounts underwent their annual audit, but an item called "Security" had the office-bearers puzzled.

Was it an overlooked expenditure for the Wireless Institute Centre (Vic Div HQ) — doorlocks or something?

No, it turned out to be postage and other expenses for the Intruder Watch Co-ordinator.

The Auditor not knowing about Intruder Watch, thought it would be more appropriate to list the item as Security.

I suppose he's right — for without IW our exclusive amateur bands would not be secure.

ALARA

Australian Ladies Amateur Radio Association

Margaret Schwerin VK4AOE
114 Bunya Street, Dalby, Qld. 4405

I am privileged to be given the opportunity to write this month's column.

The 27th July was the day chosen by YLs in four states to meet in celebration of the 10th anniversary of our Association.

In VK5, 15 ladies met for a luncheon in Adelaide, 10 of whom were members and included Marlene VK2KFQ. Such an enjoyable time was had by all that it was generally agreed to give consideration to making the luncheon an annual event.

And, I won't reveal the identity of the YL who, arriving late, hurriedly placed her car in a car park and when she returned found the gate to the park securely locked until the evening!

Fifteen ladies and six men, plus several members of the Redcliffe Radio Club who called in to say hello, joined in the VK4 celebrations, which were held at Redcliffe. Josie VK4VAN did all the organising and the result was a highly successful, first ever ALARA function in Queensland. The Redcliffe Radio Club very kindly provided afternoon tea, which Josie prepared with the help of Beryl, wife of VK4UG, Elsie, wife of VK4NBL and Josie's daughter Roxanne (John VK4QA would never forgive me if I used the term XYL). We were happy to welcome Darleen WD5FQX, Bev VK6DE and Brian VK6AI, also John VK4QA, President of the Queensland Division of the WIA.

Bev and Brian, who were touring the eastern states, 'just happened' to be in the vicinity of Redcliffe. Good planning Bev! Darleen, with daughter Diane, spent a few days with Wendy VK4BSQ and family, on their boat. She is the International Membership Chairman of YLRL and is looking for Australian YLs who would like to be sponsored into YLRL. Any ladies interested, please contact Jessie VK3VAN, who will pass the information onto Darleen.

The VK4 festivities were wound up with 15 staying on for tea at Antony's. More news on the functions in other states next month.

During July, I was interviewed on the Television Channel 10-4-5A 'Here Tonight' programme. The topic was ladies in amateur radio. The on-air showing was very brief but, judging by the many comments I have heard, it was very well received.

The results of our birthday contest have been received from Marlene VK2KFQ. The winner was Kim VK3CYL, who was awarded the mystery prize — a crochet centre designed to commemorate ALARA's 10th Anniversary. The very close runner-up was Gwen VK3DYL, who received a consolation prize. Thank you to all who participated.

Apologies to our hard working editor, Marlene VK5QO, who was omitted from the list of office bearers published in August's AR. Marlene is responsible for publishing our quarterly newsletter and does a fantastic job. Additions to the committee are:

VK2 State Representative — Bobby Ohare VK2PXS
VK5/8 State Representative — Meg Box VK5AOV
VK7 State Representative — Laura Tucker VK7NYL

Welcome to new members, Jan VK3NCA, Judith VK3NYL, Betty KG6C and Joanne N6LFZ and a welcome back to Siegi VK4VSF, Helen GM4KNQ and Doris N5CFP. Last, but certainly not least, is congratulations to Dorothy, who has changed her call sign from VK2NVQ to VK2DDB.

VK75A was activated by Connie VK4ATK on 12th August. Val VK4VR plans to air this special call sign on 11th November, so do look out for her.

33 73 88, Margaret VK4AOE.

AR

HISTORICAL STRAYS — AT HOME AND ABROAD

Alan Shawsmith VK4SS
35 Whynot Street, West End, Qld, 4101.

The Canadians, who were part of the USA progressive scene, possessed a certain advantage over their Down Under cousins in early days; information on the state of the art reached them more quickly than it did us — nevertheless, VKs were never far behind, and in some cases ahead.

The AOCP license came into being in Canada in 1919 and in VK in 1925.

The first VE Broadcast MW voice transmission also occurred in 1919. Two amateurs with the call signs 3GX and 3IG (the VE prefix was not then in existence) combined to transmit the human voice (no mention was made of music) from a homebrewed station they called KDKA. The antenna used was a long trolley wire 'obtained' from a nearby railway yard and strung between two high structures.

In Australia, one of the first amateurs to set up a MW sound Broadcasting Station was Tom Elliott using the call 4CM. This took place from the top of the Queensland Insurance Building, cnr, Adelaide and Edward Streets, Brisbane in 1920.

Amateurs on both sides of the Pacific threw up makeshift antennas using all sorts of wire — but the sky hook erected by Canadian Graham Peacock 3SI deserves a mention. It was a roll of phosphor bronze wire which was so thick, tenacious and non-pliable that he had to borrow his Dad's team of Clydesdales in order to unroll and straighten it out. It was used for MW experiments. One wonders how he managed to get it up into the air.

The ubiquitous 210 tube used in thousands of transmitters around the world originally cost $13.50 in VE land in the 1920s — this was more than the average man's weekly wage.

In the quest for a triple ton, ie 300 countries worked, most avid DXers would eventually QSO St. Paul Island, off the Canadian east coast. Contacting this rare spot is really nothing new as it was first activated by Syd Young (VE)1EO in 1926. The power used was 100V at 10mA (or 1 watt input). Much DX was accomplished.

In the early thirties, when living on the shores of Moreton Bay to the south of Brisbane, Roy Jonasson VK4NG pulled off some remarkable QRP DX feats to NZ and USA. Also locally he worked into VK2 on phone, on more than one occasion, using 15 volts and less on the transmitter plate. His antenna was an end fed Zepp some 60-70 feet (18-21 metres) up.

In the late thirties, Harry VE3IT, operating from Toronto, worked several VE west coast stations (about 3000 miles 500km) using 5 watts with the antenna lying on the floor.

W Wright of Winnipeg, Canada (call sign not known) homebrewed his 700V power supply in 1925. The transformer made so much noise, it had to be suspended by rope under the operating table. When placed on the floor it made the whole room vibrate. In spite of this, it worked successfully.

Can any Aussie beat this? Motoring through lonely country out of Buffalo, Canada, in a model T Ford in the year 1922, amateur 8AII (name not known) became lost. *What to do next?* Ingeniously he found a length of wire, weighted it at one end, threw it over the nearest tall tree and connected the other end to a spark plug on the model T motor. (It is not known if the wire was 'borrowed' from a nearby fence or carried in the car). He then cranked up the motor, set it running at a good rev and keyed the sky hook at the spark plug connection. Another experimenter some miles distant heard and replied to his call for navigational help. It is reported that the QRI transmitted by the model T was something shocking, nevertheless it served the purpose. The type of receiver used is also not known but it would have been necessary to stop and then recrank the motor each time in order to transmit, a laborious, exhaustive business — but then desperate situations require desperate measures!

Acknowledgment for part of the above Canadian information is from the book titled "From Spark to Space" published by Saskatoon Amateur Radio Club VE5AA 1968. **AR**

SIX METRES

Whilst we have had to be content with the occasional opening between the various states during the winter months, some activity during the northern summer Es season is reported in 'CQ ham radio' from Japan, per courtesy of Graham VK6RO. Japanese stations have been working FK8EB, DU1GF, HL1SB, as well as quite a few VKs 4, 6 and 8 stations, mostly around the end of April. It is interesting to note their reception of XX9UT on 50.110, which is listed as a beacon. My lists do not state the location with that prefix, although I note Kampuchea is XU. My Japanese is not good enough to decipher further details, but it was heard on 28/4 at 1130 by IA2GHT and again at 1928 by JR2HCB.

SIX METRE STANDINGS

I was very pleased to receive a superbly prepared list of stations and countries worked on 6 metres from Graham VK8GB. The list arrived too late for inclusion in the August issue, but will be included in the February 1986 listing. I will tell you this much too, that it will be the top number with 39 countries confirmed! I will leave further details until later as I want to make a feature of this entry, but suffice to say that it includes a photocopy of the front and back of each appropriate QSL card, the list is meticulously prepared and typewritten, and the whole bound into book form. Thanks for all your trouble Graham, I had been hoping you would eventually send me your list. I now hope we can hear from others, particularly in VKs 2, 4 and 6, who must have some impressive totals too. I am sure Bill Tynan W3XO, of 'The World above 50MHz' in QST, will be very interested in this submission.

EME ACTIVITY

Doug VK3UM still keeps bringing them in on 70cm EME, although the last EME weekend on 20/7 produced some very good signals, there did not seem to be a lot of stations on. At 0138, VK3UM worked K5JL exchanging 0/0 reports, 0155 VE4MA 449/449 and 4x3/4x3 SSB, 0700 DF3RU 449/449 and 4x3/5x4, 0744 DL9KR 459/559 and peaking to 569, and 5x5/5x5. Doug said this station was the strongest signal he had ever heard, equally as good as some of the Canberra stations he has been working on aircraft enhancement! They chatted for half an hour and Doug said it was as good as a telephone and cheaper! At 0810 G3LQR 449/449, 0830 DL2CJ 4x3/4x3.

On 21/7: 0000 VE3CRU (sched) 439/339, 0300 WB0TEM 449/449 (sched), 0042 N4GJV 4x3/4x4, 0100 N7ART 0/0 (sched), 0155 VE4MA 449/549, 0722 JA4BLC 449/439, 0815 DF3RU 449/0, 0845 F1FHI 449/449, 0942 to 1022 OE5EFM 0/0 — this one was a real battle, due to Faraday rotation, but with perseverance the contact was made.

There was a lot of very good signal reports in the above list, so it indicates a good set of conditions. Incidentally, the first signal report is that sent by Doug and the second is what he received. All contacts not marked with (sched) are random QSOs, either by being called or tuning around!

And while we are on the subject of EME, you are reminded that the ARRL EME Contests will be held on the 23rd and 24th of November and if you have a reasonable 144MHz setup, particularly if using a masthead preamp, you should have a chance to hear some stations, particularly those with good OSCAR systems with the ability to elevate the antenna.

If you would like a computer printout of azimuth and elevation for your location so you may see what you can hear, then I repeat the offer made by Chris VK5MC of Hatherleigh, SA. 5280, who is prepared to send you such a printout if you will send him your latitude and longitude, and enclose a LARGE stamped, self addressed envelope. But don't leave it until the last minute, Chris does have to do work around the farm to enable him to eat, so be fair and get moving straight away, if you have not already done so.

THE ROSS HULL CONTEST

As VHF/UHF operators know this is an annual contest in memory of the late Ross Hull, a keen exponent of the art, and will start again this year in December and end in January. Please keep your eyes on the Contest pages of AR for the opening and closing dates.

The Federal Contest Manager, after each year's contest, receives some logs and quite a few complaints about the conduct of the contest, particularly in relation to the points score. The Victorians argue that the Western Australians have it too easy and the Western Australians say they are too isolated when compared with the ease and luxury of close distance contacts from Melbourne to other parts of Victoria and to Tasmania and therefore deserve some special considerations.

It has been long known, that for a country as large as Australia, it will never be possible to make a VHF/UHF contest which is fair to everyone, something which is not too hard to obtain in HF contests. That the rules of the Ross Hull Contest change so frequently is evidence of the pressure placed on consecutive contest managers by various groups and an honest attempt to appease those who are often quite vocal and to be fair to the greatest majority. No one denies the large amount of effort it requires to build and finally operate equipment on a multitude of bands and there have been very commendable efforts to do this in both WA and Victoria. At the same time, those who operate only on, say, 6 and 2 metres, often do not submit logs because they realise they have no hope against the multi-band stations, yet they form the backbone of the total number who do operate during the contest, and it must be agreed there is quite a high level of overall activity during the Ross Hull, particularly on 6 metres and to a reasonable extent on 2 metres, but this would not be reflected in the number of logs submitted.

Without going too far into the politics of which camp is the right one to promote (multi-band against two/three bands), a subject which could be the source of a separate article for AR, which I may consider initiating later, for the time being, the important thing is to keep the contest going while we once more look at the problems in depth. I would like to advocate therefore, that as many as possible submit a log to the contest manager for the next contest, in December, and when submitting your log, give your thoughts on the subject in as much detail as you can, with the aim of such material eventually being looked at by both the contest manager and myself in the first instance, with the aim of getting details of any forthcoming proposals or changes into AR for comment early in the year, rather than it should start being aired as the time for the next contest arrives. One would see the ultimate aim of any such deliberations eventually involving representatives from WA and Victoria in particular, so through these columns I am prepared to keep the matter open and before readers on a continuing basis while sorting out what can be done for the best interests of all participants and for the memory of Ross Hull.

For a start, I am prepared to raise my level of participation to the highest possible and will submit a log. I hope there will be many more of you doing the same thing. I repeat, it is important to keep the contest going for the present, while we again see what can be done to help it, and support needs to come on a continuing basis from the multi-band operators as well as the less well endowed stations. In other words, let us maintain the status quo for this year and make a concerted effort to arrive at some worthwhile decisions. I am prepared to foster the idea in conjunction with the contest manager, who at the moment has been threatening to close up the contest, due to lack of log support, but I would see this as a great pity, so it will be up to all of us to be rational and fairminded in our approach to a problem which will not be easy to solve with the best of intentions. I seek the support from all of you, particularly during the next twelve months.

A WOODPECKER ON 427MHz

The July 1985 issue of 'The West Australian VHF Group Bulletin' contains an article headed like that, and the article, together with the additional article by Don Graham VK6HK on the subject should be prescribed reading for those who have an interest in our hobby and the 432MHz band, in particular.

"SYLEDIS is the French acronym for (Lightweight Range Measurement System). It is designed for use over water at ranges up to 150km. A transponder is mounted on the vessel and a network of responding beacons is erected at accurately determined places onshore. When interrogated, a beacon emits a long pulse (5300 microseconds) of UHF which is digitally encoded as two megabits/sec. This is correlated and digitally filtered by the transponder to give a continuous readout of distance from each beacon, and hence location.

"The absolute accuracy of SYLEDIS in measuring range is three metres up to 80km, deteriorating to about 12 metres near maximum range. The band chosen by SYLEDIS was 420-450MHz (primary allocation radio location, secondary amateur) because 'It offered a very good compromise between the relative spectral occupation of the transmissions and the quality of long distance propagation'. However, there have been problems in extending the range of SYLEDIS, the main one being 'super-refraction', better known to other occupants of the band as 'ducting'.

"Efforts were made to reduce the spectrum occupation and spurious emissions by using a high quality interdigital filter. This resulted in a bandwidth of 2.5MHz at 20dB. Without the filter, the bandwidth would be 70MHz . . . . 'which would be considered intolerable for radio authorities of many countries'. (!!)

"The following article by Don Graham VK6HK shows how a total lack of consultation has enabled SYLEDIS to blow a hole in the primary amateur TV location like an Exocet (another product of French ingenuity) encountering a 'large naval object' in the Gulf War".

SYLEDIS INTERFERENCE TO 425-432MHz TV

"ATV operators in the Perth suburbs of Victoria Park, Balga, Wembley Downs and Melville have reported severe interference to Amateur Service Television transmissions over the past month (approximately), when using the WIA recommended primary television channel. (Vision carrier 426.25MHz, Sound 431.75MHz).

"The interference has been traced to the installation of a chain of at least five pulsed beacons along the coastline, north and south of Perth and Fremantle, all operating on the same nominal carrier frequency of 427.3MHz approximately. The bandwidth allocated is 2.5MHz, fast rise time pulses being transmitted, at a PRF of 25Hz.

"Enquiries with the Radio Frequency Management Division of DOC (Mr B R Field) have confirmed the presence of the system and established:

"(a) The system, known as SYLEDIS, has been installed as part of elaborate navigational preparations for the 'America's Cup' series and will operate 24 hours a day until 1987. The State Government have also expressed interest in retaining the system indefinitely thereafter.

"(b) The present frequency was allocated, in principle, to SYLEDIS several years ago, but no consultations were known to have taken place with the Amateur Service as the Secondary Service.

"(c) The existence of WIA Band Plans as an indicator of likely interest by the secondary user, or as an indicator of the impact of frequency allocation decisions, was not known or taken into account by the DOC Head Office, who tended to be of the view that the WIA should not recommend band plans in shared allocations, without consulting the Department. The DOC Central Administration is of the opinion that the SYLEDIS frequency allocations have been made known to the Federal Representatives of the WIA.

"(d) The system was switched off on 19th June pending clarification of its status with DOC, but is now restored.

"(e) The options for any improvement appear very limited. A compromise involving effective 'surrender' of the SECONDARY ATV channel 443-450MHz to SYLEDIS was considered as the best solution. However, while the beacons can apparently be retuned (synthesiser/filters), the associated receivers come as a high or low band version and it could be that some visiting users may not have the right equipment if the upper band is chosen.

"A second compromise option is to position the SYLEDIS between 420425MHz. This would require careful control of the lower sideband products of ATV transmissions to avoid interference to SYLEDIS, although the system seems to be fairly immune to outside influences. The problem of high/low band receivers remains.

"A third option is considered even more unpalatable than the present situation. SYLEDIS might be moved to a frequency around 434MHz. This would probably see the end of the present weak signal work between 432 and 436MHz, which includes activities associated with beacons, SSB, repeater inputs, and international allocations for EME and the amateur satellite service. Licencees are active in Perth in all pursuits. This course is to be avoided at all costs!

"The fourth option is 'to grin and bear it'. This will probably mean that ATV activity will have to transfer to the secondary channel (443-450MHz). The penalties are that the existing prevailing psuedo DSB transmitters will have to be replaced by new VSB IF modulated designs at significant inconvenience and expense. Existing RF amplifiers may have to be redesigned and achieve the same performance as at present. Receivers and antennas will have to be returned or rebuilt. It will present the sort of modest challenge with which the Amateur Service is all too familiar.

"All options are impractical from the DOC viewpoint except the fourth. The Amateur Service has apparently little or no standing as the Secondary Service. Frequency changes in this band must be preapproved by other departments and this involves months of unacceptable delays in commencement of service by the business interests involved, with no guarantee of success. After strenuous efforts, Mr Field has now advised that nothing can be done to change the allocation and that ATV operators in the Perth area should transfer operations to the alternative 443-450MHz channel.

"RECOMMENDATIONS"

"It has been recommended that:

"(i) The WIA take up as a matter of urgency, clarification of the future possibility of extensions of SYLEDIS in Australia.

"(ii) The WIA discuss urgently with DOC, band plans for the shared UHF bands and endeavour to have them recognised as points for consultation when fixed allocations are made to Primary Services. The DOC are currently preparing Policy Guidelines associated with the Australian Frequency Allocation Table and input to these guidelines may be possible. (The formal title is 'Australian Frequency Assignment Policy and Technical Criteria').

"(iii) The WIA attempt to correct by any means the approach taken in the present instance which has treated the Secondary Service as if it did not even exist. At least a warning to avoid interference to the Primary Service in a capital city would have practical value!

"(iiii) Wide publicity be given to the Perth case to reduce the possibility that licencees may be incurring further expenditure on 426.25MHz ATV equipment, which will be rendered useless by SYLEDIS interference.

"QUESTION: Has the SYLEDIS plan, nominating 8 or 9 spot centre frequencies between 426.59 and 427.50MHz been made known formally to the Amateur Service?

"LESSON: This is what being the Secondary Service really means . . . How many of our bands carry this tag?

"Obviously there is a message to be learnt and understood in what has transpired in Perth, and as has already been done similarly overseas with this radio location system. We could well see in the future the existence of such systems around each capital city, so what price for future contacts between Melbourne and Hobart in the 70cm band? Or between Adelaide and Albany?

DXPEDITION?

Roger Harrison VK2ZTB, has responded to a suggestion from Don Richards VK2BXM, that the Dick Smith Explorer may be available late January/early February 1986 for a DXpedition.

Roger suggested one possible trip could be to the Kermadecs of the North Island of New Zealand. It is about 2400km from many points along the eastern seaboard of Australia and the path has possibilities for both Es and tropo propagation modes on the VHF/UHF bands. Sponsorship for food and fuel is the major requirement, of about $3000 per week.

The suggestion has already been put to Don, who is looking at it, but Roger would like some feedback from others who could be interested, as the Kermadecs allows for exploring an interesting propagation path, opens the opportunity to probably the widest range of operators and creates interest because of the call sign (authorities permitting) being a rare one. Propagation to the New Zealand islands could also be explored, further broadening the appeal of the expedition. Weather data could be recorded, perhaps using balloon profile flights and a portable ionospheric sounder.

Roger notes the above are only suggestions and is open to thoughts from others, but fairly soon looms the need for a proposal and willing sponsors. It would certainly provide some healthy VHF/UHF activity, as well as giving an adventure to a few lucky people. If you have any thoughts and could help I am sure Roger would be pleased to hear from you at PO Box 289, Wahroonga, NSW. 2076, phone (02) 487 2700.

By the time you read this I will have returned from a trip to the Pacific on the 'Oriana', so these notes are prepared a fortnight earlier than usual, hence the lack of news. So, closing with the thought for the month: "The only people who brag about having been poor are the rich!". 73. The Voice of the Hills.

AR

AMATEUR HONOURED

A get-together will be held on the 6th October 1985 to commemorate the 50th Anniversary of the first TV transmission in Queensland, which was conducted by the late Tom Elliott VK4CM, one of the Sunshine State's outstanding amateurs.

Those wishing to participate in this official event are requested to assemble at the convict built Observatory Tower on Wickham Terrace, Brisbane at 10.00 am on the above date. This was the site and building from which Tom transmitted his first pictures.

It is not mandatory, but to add atmosphere to the happy gathering, you are invited to appear in period costume — 1930-35 or earlier.

After an official nostalgic speech, those in attendance will then be transported by a colourful fleet of 20 vintage cars, supplied by the Brisbane Vintage Car Club, to the Royal Historical Society in William Street, Brisbane. Here HD Television and other items of the art will be displayed and memories of bygone days joyfully aired.

Come along and pay tribute to a great experimenter and amateur.

For further details contact, Tom Ivins VK4ABA, 11 Bunya Park Road, Eatons Hill, Qld. 4035. Telephone: 264 1278.

SOUTH POLE HAS SHIFTED

Since measurements began at Mawson Base 30 years ago, the South Magnetic Pole has moved approximately 300km. Latest measurements show the pole has shifted north west of its 1955 position in the eastern sector of the Australian Antarctic Territory.

Its present location is 150km offshore from the French station, Dumont D'Urville. An accurate measurement of the pole's position is important for navigation, particularly in higher latitudes.

The reason for the pole's movement is unknown, but scientists believe that it is caused by changes in the electric current in the earth's outer molten core.

Contributed by Jim Linton VK3PC from LINK, a publication of the Victorian Department of Industry, Technology and Resources.

COMPUTER CARE

A British manufacturer of a wide variety of cleansing and maintenance products is seeking an Australian agent for its range of computer care products.

The range includes a tape and disk drive cleaner, anti-static foam and screen cleaners, pressurised air duster, printer cleaner and much more.

A range of accessories including cleaning brushes and floppy disks are also available.

The company is seeking a national distributor in the first instance, with the possibility of exporting in bulk for re-packaging and perhaps later formulating the fluids in Australia.

Enquiries should be directed to the nearest office of the British Consulate-General, and quote AL15/IT/BITN.

CONTESTS

Ian Hunt VK5QX
FEDERAL CONTEST MANAGER

P.O. Box 1234, GPO, Adelaide, SA 5001.

CONTEST CALENDAR

OCTOBER

5 — 6 VK/ZL Oceania Phone Contest (Rules September AR)

12 — 13 VK/ZL Oceania CW Contest (Rules September AR)

13 RSGB 21/28MHz SSB Contest (Rules September AR)

20 RSGB 21MHz CW Contest (Rules September AR)

26 — 27 CQ WW DX Phone Contest

NOVEMBER

9 — 10 European DX Contest, RTTY Section (Rules July AR)

23 — 24 CQ WW DX CW Contest

DECEMBER

14 Ross Hull Memorial VHF Contest . . . . begins (Rules this issue)

JANUARY

6 Ross Hull Memorial VHF Contest . . . . concludes

December should also see the ARRL 160 and 10 metre Contests however, I do not have any dates for these at the time of writing.

To allow a calendar to be set up for 1986, I have had to allocate dates for those contests conducted by me. In doing this, I have tried to avoid clashes with major overseas contests, based on dates which have operated over the past three or four years. It may still work out that there will be some clashes, although there is very little else that I can do about the situation.

One of the worst months for contests is March, with the ARRL DX Phone, BARTG RTTY and CQ WW WPX SSB contests, all being staged in that month. I have, for several years, campaigned to have our Field Day Contest changed to fall within this month for safety reasons and I feel very strongly that it must receive precedence, as a result. Coupled with this, is the current requirement for an additional contest, namely the CW Contest. Following my notes last month, in which I addressed the matter of too many contests, I was asked by the Federal Office for my comments on this contest. My reply addressed the matter at length and it has been circulated to all Divisions. I have presented a very strong and reasoned case as to why this contest should be deleted from our calendar and have proposed that a postal motion, should be raised. In the meantime, I have no recourse but to schedule the CW and Field Day Contests for consecutive weekends in March. Thus contests under my control for 1986, will be programmed as follows, with the CW Contest scheduled only on a tentative basis, pending a decision yet to be arrived at.

14th December 1985 to 6th January 1986, Ross Hull VHF Contest. 8th and 9th March, CW Contest. (Tentative). 15th and 16th March, John Moyle Memorial Field Day Contest. 21st and 22nd June, VK Novice Contest. 16th and 17th August, Remembrance Day Contest.

Harking back to my comments of last month about the rules for the Contest Championship Trophy, I would also toss the following question in for good measure. Should championship points be accredited to home stations when they are operated in the Field Day Contest? I personally believe that they should not, even when they are operated on emergency power, as I do not believe that they can be classed as being in any direct competition with field stations in this particular contest. Discussing this matter with quite a number of operators from various states, seems to elicit one main comment to the effect, 'it is a real can of worms'. I am still anxiously looking forward to receiving some bright and outstanding suggestions to solve the problems presented. Maybe I will have to put the matter up to a Federal Convention?? In all seriousness, if you have an opinion or some interest in this matter, see that it is brought to notice within your Division for proper discussion and debate within the membership. Meanwhile, I will attempt to have discussion raised by working from the other direction, through the Federal Executive and back down to you through the Federal Councillors, who should also bring such matters to the Divisions for discussion amongst the membership.

Remember, this column is being written in August and I feel that our organisation should be capable of making decisions in a rational manner, but without there having to be excessive time delays.

I would also take the opportunity to repeat here what was written by me previously and published in the August 1984 issue of AR. "Please take note that such matters discussed in these notes should be brought to the attention of Divisional Secretaries and Councils". I wonder whether repeating this plea for some interest to be shown, may now fall on other than Deaf Ears

ROSS HULL MEMORIAL VHF CONTEST 1985

Following discussion with quite a number of VHF orientated operators and with particular help from Eric VK5LP, who is well known to you as the correspondent of the VHF column in this magazine, I present, in this issue, the rules of the Ross Hull Memorial VHF Contest for 1985. The rules are being published earlier this year to allow plenty of time for studying them. Quite a number of changes have been made, which we feel (or at least hope) might cause a modicum of increased interest in this contest, following the abysmal showing last year, with only seven entrants logs received. I have received various letters dealing with this contest, some of which make certain claims as to just how great the interest really is. Also, at the Federal Convention, statements were made that interest does exist.

Now, please let us just face facts. The only way I, or anyone else for that matter, have of determining how much interest is shown in any particular contest is by the number of entries submitted to the contest manager. I queried as to whether it was worthwhile continuing this contest in my annual report and to date, no one has really answered my question in any satisfactory way. I would suggest that if there is a poor response again this time, my next annual report may well contain a very strong recommendation that this contest be disbanded. So, come on all you VHFers, if you want a specialist contest for VHF/UHF minded operators, make it known in the obvious manner by supporting it.

One particularly interesting letter I have received, describes a portable operation utilising VHF equipment and a number of operators, who are enthusiasts, obviously trying to do their best to provide an interesting number of contacts during the period of the Ross Hull Contest. The letter did however, pose a query as to the nature of the operation, particularly as it involved multiple operators. My view point, is that under the rules, such a station cannot enter the contest on a competitive basis although, it would seem perfectly acceptable that the station could make contacts on VHF and such contacts may be utilised by other stations competing in the contest. If any stations do adopt such forms of operation as proposed in this instance, and give out serial numbers for the contest, I would appreciate receiving a check log, which will help me when checking contacts and results.

Another view point proposed was, the contest is a battle between just a few elite members of the VHF fraternity. Now, this is certainly one approach which I would like to discourage. I feel, the rules are being framed in such a way to make it possible for many more operators to participate, otherwise why go to so much trouble for just a few? Last year was an attempt to encourage more entrants and this year, whilst there are changes made, with the same idea in mind, none of the changes could be considered radical or outside the general guidelines for this contest. Over the years there have been many experiments made with the rules of this contest and I would like to feel that, if we keep going, we could find a formula which will make it much more enjoyable and of interest to a greater number, as well as providing a stable set of rules which can remain unchanged for quite some time.

Following the listing of the rules, are quite a number of comments and examples of how things should work and explanation of the philosophy adopted in trying to achieve the desired ends. Again I would like to express my thanks to Eric for his invaluable help in providing these comments.

Before closing, I would like to bring one other aspect of the Ross Hull to your attention — the matter of unethical methods of operating. Various instances of such happenings have been brought to my notice and I have set about investigating such complaints.

Whilst it is not possible for me to monitor all that goes on, it is a fairly simple matter to obtain information about such practices occurring. I would also like to point out that the practices complained about actually do infringe the regulations applying to the operation of our stations and as such, they are likely to be monitored by official Departmental monitors and action taken where necessary.

Further, I would suggest to you, we are engaged in a hobby which should bring us much pleasure and surely we would not gain pleasure and true gratification by spoiling things for other operators by operating in a selfish manner. I do realise, at times there are technical difficulties which we encounter, such as crowded bands and cross modulation which present problems but generally there is a way around such difficulties if we apply ourselves.

The previous comments could of course apply to operation in all contests and, to any of our operations at any other time, as well. I would simply wish that you all find your contesting and whatever other facets of the hobby you deign to pursue of benefit and pleasure, at all times.

OBJECTS — Australian amateurs will endeavour to contact as many other amateurs as possible.

PERIOD — From 0001UTC 14th December 1985 to 2400UTC 6th January 1986.

EXCHANGE — RS(T) plus three figure serial number starting at 001 and increasing by one for each contact. When 999 is reached, a start is made again from 001.

BANDS — All amateur bands above 30MHz. Six metre contacts valid only between 52 and 54MHz. Cross band contacts are not permitted. Contacts via active repeaters and translators cannot score.

OPERATOR — Single operator only. One transmission only at one time.

CONTACTS — One contact per UTC day per band with each station.

DURATION — a) For the period of the whole contest. b) 7 UTC days — not necessarily consecutive. c) 2 UTC days — consecutive.

SECTIONS — i Phone (AM, SSB, ATV, SSTV). ii CW, RTTY. iii 52 and 144MHz only. All modes. iv Receiving. Any mode.

LOG SHEETS — It is desirable that logs covering the complete period of the contest be submitted for cross checking purposes. Photocopies are acceptable. The following details must be shown. Date and Time in UTC. Band, Emission, Station Worked, RST and Number Sent, RST and Number Received, Points, Bonus. Each page must be numbered and totalled at the bottom.

FRONT SHEET — A front sheet must be attached to the log entries showing the following information, in this order. Section, Call Sign, Total of Daily points with Bonus points added to provide an overall contest total, List of the best seven UTC days,

with a daily score and bonus points added to provide a seven day total, List of the best two UTC days with daily score, bonus points and two day total. List the bands on which operation has taken place.

DECLARATION — I certify that I have operated in accordance with the rules and spirit of the contest. Name, address, signature and date.

SCORING TABLE FOR AUSTRALIAN STATIONS — 52MHz — 1 point, 144MHz — 1 point, 432MHz — 2 points, 576MHz — 5 points, 1296MHz — 5 points, 2304MHz — 10 points, 3300MHz — 20 points, 5650MHz — 30 points, 10000MHz — 40 points.

The above points apply irrespective of distance.

BONUS — a) For each new call area in Australia, including own call area, 10 points once only per band per UTC day.

b) For each prefix worked outside Australia, 10 points once only per band per UTC day.

c) For each band used, 576MHz and higher add 10 points once only per UTC day.

SCORING FOR OVERSEAS STATIONS — Stations outside the Australian mainland and Tasmania call areas will endeavour to contact as many Australian stations as possible. Scoring for such contacts will be: 52MHz — 20 points, 144MHz — 50 points, 432MHz — 100 points. Should any contact by overseas entrants take place on bands higher than 432MHz, scores will be: 1296MHz — 200 points, 2304MHz — 300 points, etc.

AWARDS — A perpetual trophy is awarded annually for competition between members of the Wireless Institute of Australia. The winners name is inscribed on the trophy and he/she also receives a suitable certificate. The entrant with the highest overall score for the contest will be the winner and their Division will hold the trophy for one year.

Certificates will be awarded to the highest scorer in each of the seven day and two day divisions. No entrant may receive more than one certificate. Overseas entrants will be awarded certificates on the same basis, one for each call area.

STATE SCORES — Certificates will be awarded for the highest overall score in each State, and for the highest seven day score in each State.

52 and 144MHz — Certificates will be awarded to the entrants with the highest overall score and the runner up for operation on 52 and 144MHz only (combined).

SUBMISSION OF LOGS — Entries are to be forwarded to the Federal Contest Manager, WIA, GPO Box 1234, Adelaide, SA. 5001. Entries must be received no later than Friday, 7th February 1986. Please endorse the outside of the envelope 'Ross Hull Memorial Contest'.

RECEIVING SECTION — Logs for the receiving section must show the same information as for a transmitting log, except for the second number exchange. If both stations participating in the contact are heard, both may be claimed but must be listed as separate entries on the log. Scoring will be as for a transmitting log. Any scoring contacts may be logged with no limit to the number of times that one station can be logged.

DISQUALIFICATION — The Contest Manager may disqualify logs which are illegible or improperly set out or do not conform to the rules laid down. See the General Disqualification Criteria as published in Amateur Radio for August 1984. Any station observed during the contest as constantly departing from the generally accepted codes of operating ethics may also be disqualified.

COMMENTS ON A FEW CHANGES TO THE RULES FOR THE ROSS HULL MEMORIAL CONTEST

As a result of submissions from entrants in the 1984 contest, it seemed the ten hour operating rule for another contact with a station was undesirable and this has been removed to allow only one contact per band per UTC day with each station. This should allow some entrants to catch up on wanted sleep.

There seemed also to be quite a call for scoring over the whole period of the contest as it was a number of years ago. This has been included, but with the seven and two day sections retained. Let us see how it works out before you criticise! The bonus points for VK6 have been withdrawn. It was a very sore point with a lot of people. Some doubt still exists in my mind that some form of loading may still be desirable, but at what level is open to comment. Let us try this year without. A two day section has been added to the 52 and 144MHz part, it was missed last year.

Now to the scoring table. This has always been the greatest source of contention and various combinations of scores and distances have been tried ever since the contest started. None have been really satisfactory and I doubt if there is any one formula which can suit everyone in a VHF/UHF contest spread over a country as big as Australia and with a limited VHF population, when compared with some overseas countries. At best, one can only strive to provide reasonable competition for the majority, there will always be someone disadvantaged in any or all states.

There have been suggestions to have the upper limit over 3000km, instead of last years 2500km, some have doubts about the accuracy of the 400km limit, others would like to see the minimum distance for all bands set at 100km and so it goes on. One of the major continuing problems has been the demand by those operating many bands, that due recognition should be given to the fact, and in general over the years this has been done, either by massive scores per contact, band multipliers and the like. But, what seems to be overlooked, is the question of relativity of scores. Even one point per contact, irrespective of band or distance can be very worthwhile providing, it receives a bonus for the effort involved, which in turn ensures the multiband operator keeps a step ahead of the one or two band operator.

However, one must realise that, were it not for the many people who operate on 52 and 144MHz only and make contacts available to all and sundry, the VHF bands would be a rather drab place. Without the push required to match scores being run up by these two bands people, the multiband operators would also find the other bands also becoming drab. It is the mixing of contacts across the spectrum and with all kinds of operators that makes it a contest worth having, and the removal of the second contact after ten hours will make life easier for most.

The scoring table this year is the same as the top line of last years table with the addition of points for the next three highest bands after 2300MHz and all distance scales have been removed. Some will be shocked at this move, but before getting too worried, study the tables below and see how it really does affect you.

On average there is no way operation only on 52 and 144MHz can take the overall trophy, although these bands could feature in the issue of certificates. The present formula for scoring will make log preparation so much easier and more accurate and there will be no distance dispute. In one stroke it has removed the disgruntlement that Es on 52MHz is more favourable to some than to others, and will be some consolation to those in Ch 0 and 5A areas, to know other areas are not drawing away from them in leaps and bounds with high scoring contacts. Examples . . .

BAND	52	144	432	576	1296	2304	3300	5650	10000
CONTACTS PER BAND-1	1	1	2	5	5	10	20	30	40
CALL AREA BONUS-1 area	10	10	10	10	10	10	10	10	10
576 & ABOVE BONUS	-	-	-	10	10	10	10	10	10
TOTAL FOR 1 CONTRACT	11	11	12	25	25	30	40	50	60

If you operated on 52 and 144MHz, that one contact gave you 22 points, up to 2304 you got 114 points, and to 10GHz — 264 points.

If the opposition got into it and worked 50 stations in four call areas on 52MHz, and ten stations on 144 in two call areas, his score would be 120 points. If the multiband operator did the same, he would score 212 up to 2304MHz and 362 up to 10GHz. But, if the multiband station in the same time only worked five stations in two call areas on both 52 and 144MHz, plus one on each of the high bands, then his score would be 142 up to 2304 and 292 to 10GHz.

If each contact, irrespective of band, was one point then, 52 and 144MHz only would be 22 points, up to 2304 would be 96 and up to 10GHz 159 points, with the added bonus score, and all this for only one contact on each band!

Surely it cannot be said there is no incentive to operate multibands when, in all reasonable approaches to a daily set of operating contacts, the multiband station wins easily. The 6 metre operator would need to make massive daily scores to have any chance of matching the results of a multiband station of six bands, and then his score is negated to some extent because the multiband operator also takes his share of 6 metre contacts! If the multiband operator sees scores of 100 to 200 points per contact as required to warrant his operating on some of the highest bands when he already has many advantages with lesser figures, then his stance is somewhat unrealistic.

What price banning 52 and 144MHz contacts under say, 200km, with pro rata, similar distance bands for all other bands?

Incidentally, some operators thought five weeks for the contest was too long. It has been shortened to three weeks and two days covering most of the prime Es periods. The XYL should be more amiable now!!

UBA SWL COMPETITION 1986 — FOURTH EDITION

This SWL competition is open to anyone in the world that are members of an organisation recognised by the IARU.

The intention of this contest is to log as many DXCC countries as possible on five bands during a one year period, from 0000UTC 1st January 1986 to 2400UTC 31st December 1986.

The countries are according to the ARRL DXCC list and operating bands are, 28, 21, 14, 7 and 3.5MHz.

Each country heard counts as one point, and each new country counts as a multiplier.

The final score is the total of countries heard on all bands added together and multiplied by the number of different countries heard.

There are four categories. It is possible to participate in more than one category at the same time.

The categories are: Phone - single operator, CW - single operator, RTTY - single operator and all mode, club stations or multi-operator.

It is necessary to use special logs, these logs are available from the contest manager for four IRCs.

Stations logged must have made a QSO and the call sign must be shown in full. Dubious calls will be refused.

To enter the contest, an interim result, no log, must be sent to the contest manager twice during the year, postmarked no later than 1st April and 1st September. The log must be post marked no later than 20th January 1987.

Prizes and certificates will be awarded by the SWL Committee of the UBA and its decision will be final.

All participants will receive at least the commemorative QSL via their organisation. Participants who wish to receive the interim and final results direct, are asked to enclose one IRC with their interim results or log.

Comments are always appreciated.

Logs, interim results and all correspondence regarding this competition should be addressed to The UBA SWL Contest Manager, Marc Domen ONL 6945, Gebr Blommestraat 14, B-2200, Antwerpen (Borgerhput), Belgium.

PRIZES - The winner in the categories 1, 2 and 3 will receive a trophy. The top five in all categories will receive a certificate. In all categories, the top scorers from each DXCC country, the first YL and the first /MM stations will receive a certificate if a reasonable score is reached.

All other participants will receive a special QSL. All operators in category 4 will receive a QSL if their names are mentioned in the log.

AWARDS

Joe Ackerman, VK4AIX
5 Koomooloo Court, Mermaid Waters, Qld 4218

Further to the information relating to the WAC Awards, published in the July issue of Amateur Radio, please note the following, which brings the information up-to-date.

FAX endorsed certificates are available. Satellite endorsed certificates are available. 50 and 430MHz endorsement stickers are also available.

QRP stickers are available, effective 1st January 1985.

There are no CW certificates. Basic certificates are issued instead.

AM phone certificates are now discontinued.

I also asked the question, 'Who claimed the first WAC issued by the ARRL and also the first award issued by the IARU, to VK amateurs'.

Alfred Short 2SH, was the first awardee of the WAC certificate by the ARRL to an Australian amateur. It was in 1926 and he was number 34, worldwide.

A S Matber VK2IZ, was the awardee of the first WAC certificate issued by the IARU to an Australian amateur. It was in 1930, and he was number five worldwide.

The announcement of the issuance of these certificates was made in the IARU News column of the March 1930 and March 1931 issues of QST magazine.

AWARD NET ASSISTANCE

To assist amateurs and SWLs gain Australian awards, the following information relating to nets operated by some clubs is shown.

* FISHERS GHOST AWARD, Fishers Ghost ARC, Box 249, Camden, NSW. 2570. Net Fridays 1000UTC on 3.580MHz. Call VK2FFG.

* BLUE MOUNTAINS AWARD, Blue Mountains ARC, Box 54, Springwood, NSW. Net Tuesdays 1030UTC on 3.540MHz. Call VK2AUX.

* LAWRENCE HARGRAVE AWARD, Illawarra ARS, Box 1838, Wollongong, NSW. Net Sundays 1000UTC on 3.562MHz. Call VK2AMW.

* SOUTHERN CROSS AWARD, EMDRC, Box 87, Mitcham, Vic. 3132. Net Thursdays 1000UTC on 3.567MHz. Call VK3ER.

* QUEENSLAND CITIES, TOWNS AND SHIRES AWARD, Box 323, Warwick, Qld. 4370. Net Thursdays 0930UTC on 3.605MHz. Call VK4QA or VK4BMW.

CQ WPX AWARD

The CQ WPX Award recognises the accomplishments of confirmed QSOs with the many prefixes used by amateurs throughout the world. Separate distinctively marked certificates are available for two-way SSB, CW and mixed modes.

APPLICATIONS: All applications and endorsements for WPX certificates must be submitted on the official applications form - CQ 1051A. This form can be obtained by sending a SASE to the WPX Award Manager, Norman Koch K6ZDL, PO Box 1351, Torrance, CA. 90505. It is highly desirable to use a business size envelope for this purpose.

All QSOs must be made from the same country.

All call letters must be in strict alphabetical order and the entire call sign must be shown.

All entries must be clearly legible.

Certificates are issued for the following modes and numbers of prefixes. Cross mode QSOs are not valid for the CW or SSB certificates. Mixed (any mode) — 400 prefixes confirmed. CW — 300 prefixes confirmed. SSB — 300 prefixes confirmed. Separate applications are required for each mode.

Cards need not be sent, but must be in the possession of the applicant. Any/all cards may be requested by the WPX Award Manager or by the CQ DX Committee.

The application fee for each certificate is $4.00 for subscribers and $10.00 for non-subscribers, or the equivalent in IRCs.

All applications and endorsements should be sent to the WPX Awards Manager.

ENDORSEMENTS: Prefix endorsements are issued for each 50 additional prefixes submitted.

Band endorsements are available for working the following number of prefixes on the various bands:- 1.8MHz-50, 3.5MHz-175, 7MHz-250, 14MHz-300, 21MHz-300, 28MHz-300.

Continental endorsements are given for working the following number of prefixes in the respective continents:- North America — 160, South America — 95, Europe — 160, Africa — 90, Asia — 75, Oceania — 60.

Endorsement applications must be submitted on CQ Form 1051A. Use a separate application form for each mode and be sure to specify the mode of your endorsement application.

For prefix endorsements, list only additional call signs confirmed since the last endorsement application.

A self addressed envelope and $1.00 or five IRCs is required for endorsement stickers.

PREFIXES - The two or three letter/numeral combinations, which form the first part of any amateur call sign will be considered the prefix.

Any difference in the numbering, lettering or order of same shall constitute a separate prefix. The following would be considered different: W2, WB2, WA2, WN2, K2 and KN2.

Any prefix will be considered legitimate if its use was licensed or permitted by the governing authority in that country, since 15th November 1945.

A suffix would designate portable operation in another country or call area and would count only if it is the normal prefix used in that area. For example, K4IIF/KP4 would count as KP4. However, KP4XX/7 would not count as KP7 since this is not a normal prefix. Suffixes such as /M, /MM, /AM, /A and /P are not counted as prefixes. An exception to this rule is granted for portable operation within the issued call area. Thus contacts with a special prefix, such as WS2JRA/2 counts for WS2, however, WS2JRA/3 would count for W3.

All calls without numbers will be assigned an arbitrary 0, plus the first two letters to constitute a prefix. For example RAEM counts as RA0, AIR as AI0, UPOL as UP0. All portable suffixes that contain no numerals will be assigned an arbitrary 0. For example, WA4BPD/LX counts as LX0 and WA6QGW/PX counts as PX0.

VPX AWARD

The VPX or Verified Prefixes Award can be earned by short wave listeners (SWLs), who possess QSL cards confirming reception of at least 300 different amateur prefixes. No mode endorsements are available. Applications are submitted to the WPX Award Manager, in accordance with the WPX rules.

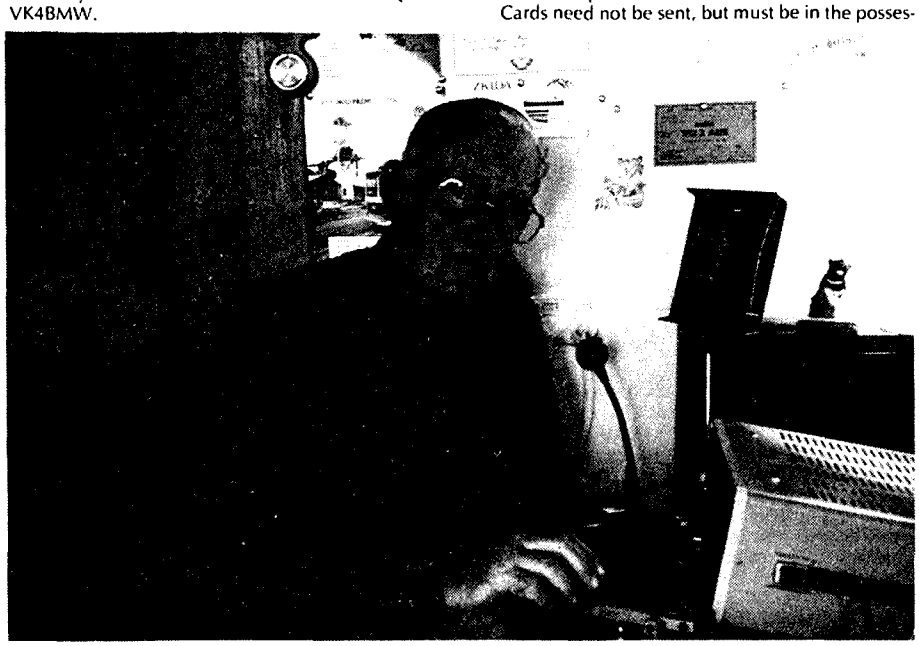
For those amateurs and SWLs who do not wish to send their QSL cards to the CQ DX Awards Manager, they may send them to either of the check points in Australia. ie VK3NDY and/or VK6JS.

PELICAN AWARD

This award is made available by the Sunshine Coast Amateur Radio Club for all licensed amateur radio stations and SWLs.

Stations must obtain 10 points by working Sunshine Coast Club members. Overseas stations need only obtain five points for qualification. SWLs must indicate the call signs of both stations heard in a QSO.

Stations can be worked on any band, using any mode.



Photograph courtesy VK7AN

Bob Jackson VK7NBF, Tasmanian Devil Awards Co-ordinator and Net Controller. The Tasmanian Devil Net is on 3.590MHz every Tuesday at 1000UTC.

A contact with the club station VK4WIS counts as two points.

QSL cards are not required. Applicants must send a log extract giving details of the contact.

The cost of the award is $2.00 or 10 IRCs.

Address all applications to The Awards Manager, Sunshine Coast Amateur Radio Club, PO Box 80, Nambour, Qld. 4560.

The award is printed in two colours on good quality white matt paper. The title is in blue and black, the bird in black whilst the surround is blue. The award measures 305 x 230 mm.

A club net is held each Thursday night on 3.595MHz at 0900UTC and on 28.400MHz at 0945UTC.

SINGLE MODE — FIVE BAND — ALL CONTINENTS AWARD

This award is sponsored by the Northern Kanagawa DX Association. Rules are, as follows.

Applicants must submit proof of QSOs with stations in six continents on a single mode and five bands.

This award is issued to any licenced radio amateur and SWL who submits proof of two-way radio contacts with the above stations.

The mode and amateur bands used, and the date of contacts are not limited.

The serial number of the award is separately given to each mode.

This award may be issued for six or more bands with the special endorsement if all supporting information is included in the application.

QSL cards of the same station for different bands and different modes may be used in the one application.

Cross-band and cross-mode QSOs cannot be counted.

This award is given in the form of a trophy with a medal.

Log extracts must be certified by two other licenced amateurs.

Applications to be forwarded to The Awards Chairman, Northern Kanagawa DX Association, JE1TTI, Michinori Jimbo, 2653 Suarashi, Sagamiko-Machi, Tsukui-Gun, Kanagawa-Ken, 199-01, Japan.

Cost of the award is 35 IRCs and the award is returned by air mail.

A FAR NET AWARD CERTIFICATE

The Armoured Force Amateur Radio Net offers it's 'A Far Net Award' certificate to amateur radio operators of any nation. The 216 by 279mm certificate is printed on white heavy stock, in four colours and is intended for framing.

Endorsements are available for making additional contacts also for contacts in one mode or on one band. Applications may be made for any award, level, mode or band operation, at any time.

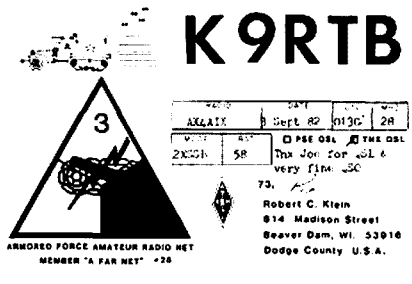
To qualify for the basic award, non-member stations must establish two-way contact with a minimum of 15 different Net members.

To qualify for endorsements, non-member stations must make contact with 10 or 35 member stations on any band, in any mode.

Confirmation of the required contacts must be through a copy of the non-members log which has been certified by two other amateur radio operators.

Applicants for the basic award certificate must submit a minimum of 50 cents, along with their application to cover postage, envelopes, etc.

All applications should be sent to The A Far Net Certificate Manager, Alfred G Beutler K2DWI, 36 Manchester Road, East Aurora, New York, 14052.



A Far Net members have a very distinctive QSL card which shows the badge and the members number.

NEW ZEALAND LIGHTHOUSE AWARD

This award is sponsored by the Certificate Hunters' Club, NZ Chapter #3 and commenced on the 1st February 1985.

The main purpose of the award is to make two-way contact with, and collect points from amateur radio stations within a radius of 30km of the 26 recognised Marine Department lighthouses around the New Zealand coastline.

Only those lighthouses on the check list are acceptable. Lights under the control of the Harbour Boards are not acceptable.

Points are allocated according to the degree of difficulty in road access to within the 30km radius. This distance has been selected as it represents the average distance that these lights can be seen, even though they may not be visible on land.

A total of 10 points are required for ZLs, all others require five points. An extra point is given if the station worked is within one km of actual light.

Two extra points are given if the station worked is aviation mobile or marine mobile within the 30km radius.

Triple points are given if the station worked is a paid member of the lighthouse service of the Marine Division, Ministry of Transport and is operating within one km of a recognised light.

Applicants to also work any five members of CHC nominating this award for the contact. The members CHC number to be recorded.

All applications to be on the official check sheet, which also has a list of the lighthouses which are acceptable. They are available from the Awards Custodian.

Cost is $1.00 and applications should be sent to The CHC Awards Custodian, Evan P Tombs ZL2IG, Ihakara, RD. 1, Levin.

JUBILEE 150 AWARD

The Colony of South Australia was founded on the 28th December 1836, and to celebrate the 150th Anniversary of this event, the Wireless Institute of Australia, South Australian Division Inc has pleasure in announcing the Jubilee 150 Award.

Through the generous support of the South Australian Tourist Bureau (major sponsor), ESTROW and Qantas, the award is issued free of charge to radio amateurs and short wave listeners who satisfy the conditions set out below. There is a $2 handling fee, one pound sterling or 4 IRCs.

1 a: Amateur operators must work stations in the Australian fifth call area, ie AX5, VI5 and VK5, to accumulate 150 points, all contacts to be made within the conditions of the operator's licence. Contacts to fall within the UTC year 1st January to 31st December 1986.

2 b: SWLs must log stations in the Australian fifth call area, as above, to accumulate 150 points. Each log entry must show not only the Australian call sign, but also that of the station being worked. No CQ calls to be included. Logged stations to fall in the UTC year 1st January to 31st December 1986.

2 The points per contact are calculated from the location of the station claiming the award as below:

QTH/BAND	*1.8*	*3.5*	*7*	*14*	*21*	*28*	*50/ABOVE*
VK5	*1*	*1*	*1*	*1*	*1*	*11*	
VK1-4 & VK6-8	*3*	*1*	*1*	*1*	*1*	*2*	*5*
OTHER OCEANIA	*5*	*3*	*2*	*1*	*2*	*3*	*10*
REST OF WORLD	*6*	*5*	*3*	*2*	*3*	*4*	*10*

Exceptions are satellite and EME contacts, 5 points. WARC Bands, 5 points regardless of location. WIA affiliated club stations count double (VK5s — WI, WIA, ALE, ALM, ARN, APC, ARC, BAR, BPA, BWR, LZ, RCN, SR). Jubilee station VK5JSA counts 15 points (alternative prefixes allowed). Stations other than VK5 are allowed repeater contacts on VHF/UHF. Each station may be worked once only on each band.

3 Contacts may be made by any mode, on any authorised band, and awards will be endorsed appropriately if requested. Contest contacts are acceptable, and DX stations should note that the primary DX contest is the VK/ZL/Oceania Contest held on 3/4 October (phone) and 18/19 October (CW).

It is not necessary to submit QSL cards. Log extracts submitted may be checked for authenticity.

4 The log should show the call sign/s, name and QTH of the applicant as well as the following information, set out in chronological order.

*Date, UTC, Station Worked/Heard, *RS(T) Received, RS(T) Sent, Band, Mode, Points Claimed.*

** SWLs should indicate here the station being worked by the South Australian stations.*

5 Further information, and application for the award should be made to Rowland Bruce VK5OU, GPO, Box 1234, Adelaide, SA. 5001.

MALTESE AMATEUR RADIO INTERNATIONAL SOCIETY OF AUSTRALIA

The MARIS was formed in January 1981, and has experienced a healthy growth, with the object of promoting amateur radio to the Maltese community, Australia wide.

The society's activities include field outings, two regular nets on the air and conducts regular lectures in electronics for those interested in achieving an amateur radio licence. One net is held every Wednesday at 1000 UTC on 3.585MHz +/- QRM, the other being each Sunday at 2300UTC on 28.585MHz +/-.

An award is available for amateurs and SWLs who can fulfil the following conditions.

Only contacts with members of MARIS of Australian are valid for this award.

DX stations require three points.

Stations within Australia require five points.

Claims submitted for the award should show an extract of the log, including the MARIS members number per station worked.

MARIS members count as one point, MARIS club station counts as two points.

Applications together with A$3.00 or equivalent should be sent to: The Award Manager, 842 Old Northern Road, Glenorie, NSW, 2157 or PO Box 690, Parramatta, NSW, 2150.

Submitted by Ali Portelli VK2PPA, PR Officer, MARIS of Au

WIA AWARDS

The Federal Awards Manager is on leave for three months. During this time, all awards material will be handled by Joe VK4AIX, QTHR.

SPOTLIGHT ON SWLing

Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

October has arrived, which means that it is time, once again, for the annual VK/ZL Contest, Jamboree on the Air, as well as the CQ Worldwide DX Contest. It can be quite a hectic month, if one were to engage themselves in all of these activities.

I will mainly be concentrating on JOTA '85 and will be operational again with the 18th Launceston Scout Troop. I am sure there will be many other amateurs operating portable with the scouts, or having scouts in their shack over the weekend of the 19th and 20th October.

HIGH SECURITY PROFILE

This month I will be involved in monitoring various services, with regard to the amount of deliberate interference they suffer from OTHR systems or from 'jammers'. Sadly, the amount of interference is increasing, which does restrict available band space for HF communications. There have been developments with specialised communication systems, such as some with time division and frequency division multiplex modes, to get around jamming. But these modes are designed, primarily for data applications, where there is a need for security and speed and not by amateurs or broadcasting services. Both TDM/FDM modes are utilised by the military services or by other users with a high volume of traffic requiring a high security profile.

UNMISTAKABLE WHITE NOISE

While I am talking of jamming, I did notice that the BBC Russian Service continued to be suffering interference, during the recent strike by BBC External staff, even though there were no programmes, only announcements stating that normal programming would be resumed the next day. One source claims that the jammers were removed from the BBC's Russian and other language groups of the USSR, but this may have been on later time slots. Yet the unmistakable white noise was clearly audible at 0345UTC, during the first release of Russian.

This white noise is a real nuisance, for it spills over on adjacent channels, causing real difficulties to listeners. It would be ideal if there were no jammers to clutter the air waves. Yet, we have to be realistic and face the fact that jamming will continue. Protests have some effect, but the results seem to be temporary. With propagation being markedly poor because of the low sunspot count, it is quite annoying to have jammers splatter over the allocations, when one is trying to listen to signals.

NEW RECEIVER

Recently I acquired a Sony ICF 7600D portable communications receiver. I must say that I am pleasantly surprised by its performance although, admittedly it is not in the same league as my R-70. The sensitivity is quite good but, its selectivity is wide, which is to be expected. The size is a lot smaller than the original ICF-2001 and is only 640 grams. Its dimensions are 184.5mm wide by 118.5mm high and only 32mm deep. This means that it slips very easily into a carry bag. It runs on 6 volts DC from four 'AA' cells and has an AC adaptor, which weighs as much as the set itself.

The set tunes from 153kHz to 29.995MHz, continuously. It also has a BFO for SSB or CW. It also covers the FM broadcasting band from 76.000MHz to 108.000MHz. There are ten pre-set memories for you to enter your favourite channels. There are four ways of tuning the set by manual or automatic tuning. However, you do go to the nearest five kilohertz above 160kHz, eg: Radio Pyongyang on 9.997kHz will appear as 9975 on the display, but one can net exactly with the fine tuning control.

NOT PREVIOUSLY HEARD

On medium wave, the set scans in 9kHz steps, yet inside there is a switch to scan in 10kHz steps within North America. Unfortunately, my location is pretty close to a 5kW sender on 1.008MHz, which blocks all MW signals. This is overcome by using an ATU or wavetrap.

Away from the city, I have no overload problems. Yet here in Launceston I have heard Radio Beijing on 1.296MHz broadcasting in Vietnamese quite well from 1130UTC, when both 4BK in Brisbane and 1ZH in Hamilton, New Zealand, fade out. The transmitter is believed to be located at Kunming and is rated at over 500kW. I must confess that I haven't previously heard this signal on my R-70.

The set performs reasonably well on the tropical bands, although its wide selectivity causes problems. I have heard Radio Reloj, in Costa Rica, on both 4.832 and 6.006MHz, although there was plenty of noise and whistles from adjacent stations. That is why I prefer the R-70 on tropical bands, as I can notch out adjacent channels and use the noise limiter.

MAJOR PLUS IS PORTABILITY

I would say that the set's major plus is its portability, as it fits quite readily into my lap or travel bag, only taking 90 seconds to pack whilst the R-70 takes at least 20 minutes. I can carry the ICF-7600D anywhere.

BROADCASTING IN TURKISH

Interestingly enough, I recently came across Riyadh, in Saudi Arabia, broadcasting within our 20 metre amateur band. The station was broadcasting in Turkish on 14.060MHz and was operating on 11.685MHz in parallel. Now, as you are aware, that frequency is allocated exclusively to amateurs and not broadcasters, so you may wonder why it was on that channel with 350kW of RF. Well, it appears as if human error is the simple explanation, for the sender normally is scheduled to operate on 15.060MHz, at that time. The station has returned to normal operations on 15.060MHz now, after causing havoc on the CW section for a few days before they realised their error.

Well, that is all for this month. Until next time, the very best of DX and 73 — Robin VK7RH.

AR

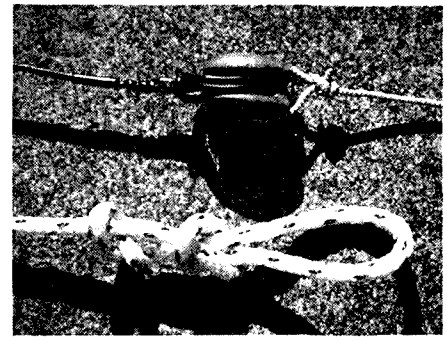
RADIO LICENCES INCREASE

The Wireless Department of the Commonwealth Government was working long hours in 1925, after a revision to licencing regulations. A total of 58,876 broadcast listener's licences were granted in Australia. 32,889 in NSW, 18,517 in Vic, 3290 — WA, 2702 — SA, 1004 — Qld and 474 in Tasmania.

To supply this large radio public with programmes there were six 'A' class stations and 13 'B' class stations. In addition there were 1118 experimental receiving licences and 276 transmitting/receiving licences.

Adapted from The Listener In, 4th July 1925.

TRY THIS



THE 'GEE' KNOT

Errol Chick VK3GG
15 Vida Street, Essendon, Vic. 3040

This simple loop knot has been used over the ages by the Eskimos but, for some unaccountable reason, its existence and virtues have been ignored.

Compared to the usually recommended bowline, the Gee knot is easier to tie, main line tension is easily maximised, adjusted and maintained and the end is clear of the loop.

It is simply formed by feeding the end of an overhand knot back through that knot, repeating the overhand twist the same way around the main line, then locking the end against the knot — see photograph.

It all started when my wife wanted a tight nylon line in the laundry to air clothes. The problem was to maintain tension when tightening the knot — coming back through the overhand knot was ideal: push against the knot and pull the end tight, hold, lock and finally tighten.

My first *reaction* was 'Gee - What an ideal knot!' Hence the name and surely someone had thought of it before. As expected, knots research revealed the Eskimos as the origin.

This knot can also be safely used on fishing line, thin enough to apply good tension but, for Halyards, I prefer to use 2.5mm monofilament nylon shark line as the most durable and weatherproof, with minimum wind resistance and maximum strength. It is then desirable to use extra locking by a second overhand knot, instead of the self-locking twist.

Neither the bowline nor the Gee knot give maximum line strength, so the Blood Bight Loop knot should be used for fishing. AR

GALLIUM ARSENIDE

Gallium Arsenide has arrived! This year it will begin to replace silicon as THE material for semiconductors. Not a few UHF GaAsFETs but for up to five times faster computer chips. A simple device has been developed with a few transistors in which electrons travelled from input to output in 11 trillionths of a second. The other big advantage is temperature. Silicon deteriorates with heat. Gallium Arsenide works happily at 200 degrees Centigrade.

21.280/28.878 MHz

Participating stations and listeners are able to obtain basic orbital data including Keplerian elements from the AMSAT Australia net. This information is also included in some WIA Divisional Broadcasts.

ACKNOWLEDGEMENTS

Contributions this month are from Bob VK3ZBB, Graham VK5AGR and various UOSAT Bulletins.

AMSAT AUSTRALIA NEWSLETTER

Graham VK5AGR, the National Co-ordinator of AMSAT Australia, is now producing a monthly newsletter containing updated satellite news, orbital predictions, keplerian data and operating hints and techniques. The objective of the newsletter is to keep the amateur populous informed on the latest information available and to realise funds for the funding of projects or the purchase of an item/s of hardware for a future amateur satellite project, eg: Phase 3C, Phase 4 or whatever. The cost of the newsletter is $15 and cheques made payable to the WIA (SA Division) should be forwarded to Graham VK5AGR, QTHR.

At the time of writing these notes, there were 111 paid subscribers to the newsletter.

PLAN 10 COMPUTER SOFTWARE

An excellent OSCAR 10 software package, called PLAN 10, has been written by Jim Miller G3RUH. This package takes into account the actual attitude of the spacecraft (lat and long in BAHN co-ordinates), and outputs a term titled SQUINT angle, in addition to the standard Az and El data. The SQUINT angle is the angle subtended by the spacecrafts antennae and the groundstation, a direct reading of the off-pointing magnitude. Due to the massive eclipse season that OSCAR 10 is currently experiencing, thus the resultant re-orientations that are taking place, makes the use of PLAN 10 a must for the most ardent of communicators.

At this stage, the programme is available from AMSAT Australia (VK5AGR QTHR) for the Tandy Model 1 and 3, and the Commodore 64 computers. Jim G3RUH requests that a donation be made to the satellite programme for each copy made, and in Australia, cheques made payable to the SA Division, WIA, will assist the smooth transfer of funds to the satellite programme.

MANNED MISSIONS

The latest shuttle liftoff was from Cape Canaveral, at 2100UTC on 29th July. The launch had to be postponed from 12th July because of a faulty computer. It was due to launch at 1923 on 29th July but, further minor problems forced the delay until 2100. When the first 2 metre SSTV signals were heard on orbit 47, the word was spread quickly, that the operation was under way. W0ORE began keeping QSO scheds with club stations and youth groups. Video was exchanged with the JPL Club in Pasadena, WA6VIA, the Johnson Space Centre Club in Houston, and the Goddard Space Flight Centre in Greenbelt, WA3NAN. Later open field QSOs were sought by the astronaut and thousands responded with a deluge of RF.

NOTES.

* denotes the date that the satellite was separated from the main platform.

1985-048E Spartan 1 was launched from the STS Shuttle Discovery on June 20, 1985. Spartan 1 is the first of a series of low-cost free flyers designed to extend the capabilities of sounding rocket class experiments.

These satellites are designed by NASA to be deployed and retrieved by the orbiting STS Shuttle, using the Canadian-built Remote Manipulator System (RMS). Once deployed, the Spartan satellite will perform scientific observations for up to 40 hours. All control commands are stored onboard in a microcomputer, and all data is recorded on a 10E10-bit tape recorder. When the Spartan has completed its observing sequence, it secures all systems and places itself in a stable attitude to permit retrieval by the shuttle and return to Earth for data analysis and preparation for a new mission.

The Spartan 1 experiment, which is a medium-resolution X-ray scanner over the energy range 0.5 to 15 keV, will make observations of the Perseus Cluster, Galactic Center, and Scorpeus X-2. The instrument was provided by the U.S. Naval Research Laboratory.

2. RETURNS.

During the period forty-five objects decayed or returned including the following satellites:-

1973-097A	Molniya 1-26	Jun 9
1984-125E	VEGA 1 Lander	Jun 10
1984-125F	VEGA 1 Balloon	Jun 10
1984-128E	VEGA 2 Lander	Jun 14
1984-128F	VEGA 2 Balloon	Jun 14
1985-031A	Cosmos 1647	Jun 11
1985-044A	Cosmos 1657	Jun 21
1985-048A	STS-51G	Jun 24
1985-048E	Spartan 1	Jun 24

Continued over page . . .

ticipation in the STS41-F Shuttle Mission was rather sketchy. However, it has been reported that Peter VK2BXQ did manage a voice contact with Tony England W0ORE on 5th August at around 1130UTC. On the subject of the SSTV transmissions, I understand that many fine pictures were received by many amateurs in VK2 and VK3. To this end, Barry VK2AHE, in Newcastle, is undertaking the task of co-ordinating all the SSTV receptions and plans to make a video tape of all the Shuttle pictures, for the benefit of those unable to view SSTV transmissions. It is hoped that Barry's efforts will find their way into the Federal Video Tape Library.

UP-COMING FLIGHTS

Two German radio amateurs may be carrying an amateur radio station aboard Shuttle Flight 61A, this October. It is reported that Dr Ernst Medderschmid, DG2KM and Dr Reinhard Furrer DD6CF, will be on board Shuttle Columbia, for the Spacelab D1 operation and hope to engage in cross band, OSCAR transponder type operation. The equipment was reportedly built by the European electronics concern, Robert Bosch Company, and is said to be capable of four, 2 metre and eight 70cm channels. In addition to two-way FM QSOs whenever the astronauts are available, automatic logging equipment is planned for recording all received calls when they are busy with other Spacelab duties. The package will also have a 1 watt, 70cm beacon for determining when the shuttle is within your communications range. The equipment appears to be designed for cross band, rather than in band operation. A typical Mode B or Mode J station would appear required to permit QSOs. (Mode B is 70cm up, 2m down; Mode J is 2m up and 70cm down).

AMSAT OSCAR 10 OPERATIONS

As anticipated, the new restricted use operating schedule was put into effect by command station ZL1AOX, earlier this month. The exact cutover date was slipped from 1st August to 5th August, to allow a few extra days for repositioning the satellite. The new schedule is:

OFF	040-189
MODE L	190-206
MODE B	207-039

The ten extra counts of Mode B time (as compared to the previously announced cutoff of 29), is an experiment according to ZL1AOX. It will be carried at this extended level for as long as battery condition allows.

Also changing with the new schedule, is the use of the 2 metre omni-antenna — its use now extends from MA45 to 184. This increase reflects the results of experiments last month to evaluate the effectiveness of the omni, compared to the high gain array, during portions of the orbit when the latter is severely off-pointed.

This schedule and antenna protocol is likely to remain in effect until early September.

SOVIET SPACECRAFT

The RS satellites have been off because of eclipses, according to G3IOR, who also stated that ISKRA 4 will not be launched this year, but rather January 1986. There will be no transponder aboard according to this report, but a beacon is possible, however no frequency has yet been specified. The ISKRA satellites are constructed by a group of international students studying at the Moscow Aviation Institute and are intended more as educational exercises in practical engineering, rather than communications experiments, but they have none-the-less provided considerable propagation information.

de Colin VK5HI.

AWARDS

Bill Hempel VK4LC is on holidays. Please direct all award claims, etc, to Joe Ackerman VK4AIX, at 5 Koomooloo Court, Mermaid Waters, Qld. 4218.

Bill Martin, VK2COP
FEDERAL INTRUDER WATCH CO-ORDINATOR
33 Somerville Road, Hornsby Heights, NSW 2077

Intruders reported for the month of June 1985 are a little up on the figures for the same month, last year. Let us hope the rest of the current year shows a downward trend.

BEING HEARD

The nuisance beacon-like signal sending 'V' in CW on or about 7.003MHz is still in evidence, and is being heard by many observers.

INTRUDERS ON LATE

The usual 40 metre broadcasts continue to plague us, and late at night, the intrusions into the 40 metre band have to be heard to be believed.

BROADCASTING!

For those who are hearing and/or reporting the broadcast station 14.060MHz, the information is that this is BSKSA, in Riyadh, Saudi Arabia. Its usual frequency is 15.060MHz, and it broadcasts in Turkish between 0400 and 0600 UTC. It is also heard on 11.685MHz. Radiated power is 350kW . . . try competing with that!!

Thanks to Robin VK7RH for that piece of investigative work.

IS YOUR CALL HERE?

Other interested amateurs and SWLs who have helped out with reports for the month comprise: VKs 2BQS, 2DEJ, 2DUO, 2QL, 4ADB, 4AKX, 4BG, 4BHJ, 5GZ, 5TL, 7RH and Mr G H A Bradford. I do not know what we would do without these stalwarts of the Intruder Watch. What about giving them a hand?

Perhaps a look at the number of intrusions reported for June may motivate someone to send in a report . . . 311 intruders were logged using the broadcast mode; 74 using CW; 89 using RTTY and 48 were using other modes of emission. 48 intruders gave identifying call signs . . . very civil of them — pity they didn't have such high standards in other spheres.

NEW SHACK

As I write the column this month, I am about two hours away from the RD Contest, and am even now mentally preparing myself. Should do well this year, as I have just built and only a few days ago, moved into a new shack. There is nothing like a new shack — the signal reports are improving already!!

While I am talking personally, I would like to report that I have just qualified for, and have received, the WIA DXCC Certificate. A lot of work went into the obtaining of this desirable award, and I am very proud to be a recipient.

I would like to take the opportunity to say what a fine job Bill VK4LC is doing as Federal Awards Manager. He processed my application in quick time, and deserves many thanks for doing a fine job. (One which I wouldn't like to have, incidentally). Better finish up now, as the RD Contest will be starting soon, and I want to get in early, although if conditions are no better this year than they were last year, it will be tough going.

See you all later, and think of the Intruder Watch next time you hear a station that should not be there. 73 and good DX.

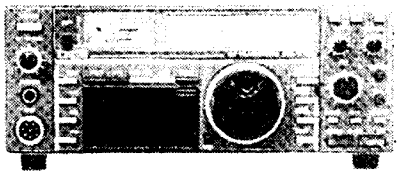
MAGPUBS

Please note that the UHF Communications magazine (English version) is being produced for 1985, and the first issues were sent at the end of July 1985.

ICOM

MOST COMPACT HF TRANSCEIVER

IC-735



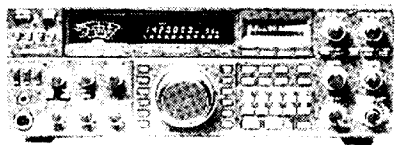
WE HOLD LARGE ICOM STOCK!

- HF Transceivers & Receivers
- VHF TRANSCEIVERS
- UHF Transceivers
- Accessories

KENWOOD

TRANSCEIVERS
For Reliability & Performance

TS-940



We also stock:

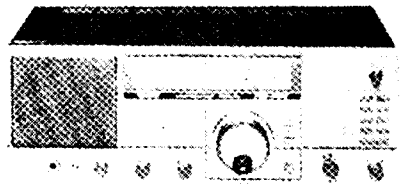
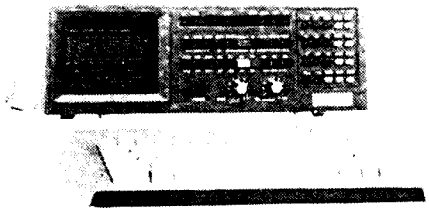
NEW HF COMMUNICATION RECEIVER

FRG-8800



We also stock the new FRG-9600 All Mode Scanning Receiver. Contact us for other YAESU Products.

TONO THETA 500E



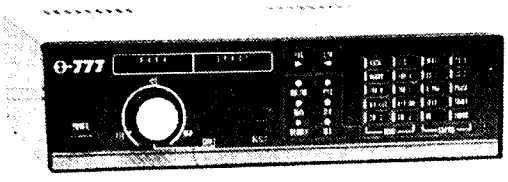
The top of the line communication terminal for amateur and professional applications, it opens the world of CW, RTTY and new dual Amtor.

THETA 5000E is the new state of the art micro computer controlled communication machine. Write for specs.

$1290

TONO THETA-777

The most advanced computer interface ever designed for commercial and amateur use.



Everything Built In – Including Software – Nothing Else To Buy!
RTTY, BIT INVERSION (RTTY), ASCII, AMTOR (MODE A (ARQ), MODE B (FEC AND SEL FEC), MODE CW, ANY SPEED ANY SHIFT (ASCII AND BAUDOT)*

$560

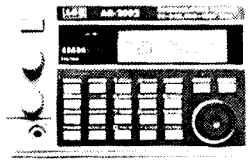
- AUTO DECODING: Automatically decodes signal and display mode, speed and polarity of the CRT.
- Use with any computer that has RS232 or TTLI/O.
- The awesome power of the Theta-777 is limited only by the imagination of the user and the terminal program of the computer.

NEW 1.3GHz

SCANNER
COMMUNICATIONS RECEIVER

AR-2002

Features: ● 25-550 MHz, 800-1300 MHz (UHF TV Ch 550-800 MHz excluded) ● NBFM-WBFM-AM ● 20Ch Memory ● S-meter ● Clock ● Priority Ch ● Fine tuning etc.



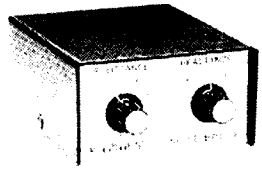
EMTRON EAT-300

ANTENNA TUNER

Best 300W Pep Antenna tuner on the market. 1.8 30 MHz continuous SWR meter 4:1 balun, air & toroid inductors.

$199

EMTRON-ENB-1 NOISE BRIDGE

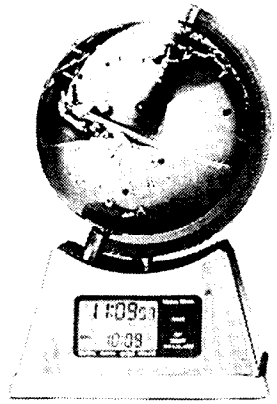


Professionally made noise bridge for all kinds of RF measurements, antenna work etc.

$99

NEW GLOBAL CLOCK

In non stain antique copper finish instant world time anywhere in the world!



Write for full specs.

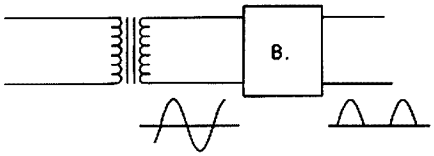
NAOCP TRIAL EXAMINATION PAPER

This time we again test members with a Novice Trial Exam. This is a chance for listeners to check to see if they are ready to sit for an operating licence and for licence holders, who sat for their licence a few years ago, to see if they would still get their ticket today! Select the correct or most appropriate alternative and indicate that alternative.

1 An EMF is induced in a conductor when:
a it is in a strong magnetic field.
b the magnetic field around it changes.
c a current flows through it.
d it is wound into a coil.

2 The device in B could be a:



a bridge rectifier.
b low pass filter.
c diode.
d Class B amplifier.

3 The characteristic impedance of open wire twin feed transmission line is usually:
a 50 ohms or 72 ohms.
b 150 ohms.
c 300 ohms or 600 ohms.
d 1000 ohms.

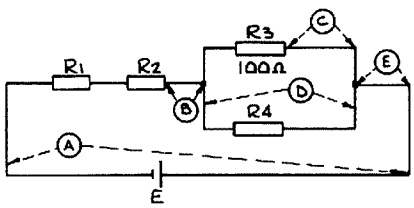
4 A resistor is colour coded red, violet, yellow, gold. Its measured resistance should be between:
a 283 kohms and 256 kohms.
b 342 kohms and 418 ohms.
c 28350 ohms and 25650 ohms.
d 297 kohms and 243 kohms.

5 A novice transmitter has a DC input to the final stage of 30 watts. The power supply transformer should be capable of supplying:
a 30 amps.
b 30 watts.
c 35 watts.
d 75 watts.

6 When low level modulation is used in an AM transmitter:
a the received signal will appear undermodulated.
b no audio amplifier stage can be used.
c the modulation must be applied at the final power amplifier stage.
d all subsequent RF amplifier stages must be linear.

7 The point of peak voltage in a quarter wave length vertical antenna is:
a at the tip.
b at the feed point.
c one quarter wavelength below the tip.
d alternately at the tip and the feedpoint.

8 The current through R3 could be calculated from the voltage measured at:



a A.
b B and E.
c C.
d D.

9 A germanium diode will conduct when:
a the junction voltage exceeds 0.3 volts.
b a positive voltage is applied to the N type material.
c there is an excess of electrons in the P type material.
d the depletion layer is saturated with current carriers.

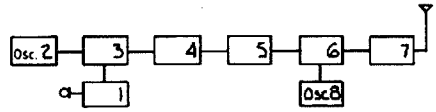
10 The screen grid in a pentode electron tube is usually:
a at higher potential than the anode.
b at cathode potential.
c at potential between that of the cathode and the anode.
d internally connected to the anode.

11 The third harmonic of a 7MHz signal would appear at:
a 2.33MHz.
b 21MHz.
c 28MHz.
d 56MHz.

12 In a bridge rectifier circuit, the PIV ratings of the diodes should be at least:
a twice the peak AC output of the secondary.
b the peak AC output of the secondary.
c twice the AC RMS voltage.
d equal to the AC RMS voltage.

13 An RF power amplifier stage may be neutralised:
a to prevent the radiation of harmonic oscillations.
b by providing positive feedback to the input.
c when the output frequency is exactly twice the input frequency.
d by providing negative feedback.

14 In this SSB transmitter the function of block 4 is to:



a suppress the carrier.
b filter out one sideband.
c multiply the frequency.
d filter out the modulation.

15 A keyed CW signal when transmitted comprises:
a a continuous single frequency intermittently modulated by a 1kHz tone.
b short and long segments of a single frequency modulated by a 1kHz tone.
c a single unmodulated frequency switched on and off.
d a 3kHz band of frequencies broken up by keying.

16 The wave propagated from a horizontal dipole antenna will be:
a vertically polarised.
b horizontally polarised.
c omnidirectionally polarised.
d unpolarised.

17 To receive CW on a receiver designed for AM only, it is necessary to add:
a a product detector.
b a BFO.
c another IF.
d an RF pre-amplifier stage.

18 If a moving coil meter is used to measure alternating current:
a there will need to be a diode in the circuit.
b the figure measured will be the peak AC value.
c a series capacitor will be needed.
d a large value shunt resistor will be needed.

19 A neighbour's broadcast receiver suffers overload when a novice station transmits. This problem:
a could not be reduced by reducing the novice station power output.
b may be due to harmonics in the amateur signal.
c may be due to insufficient selectivity in the broadcast receiver.
d is usually caused by random parasitic oscillations.

20 In a 28MHz, three element Yagi antenna, the driven element should be:
a approximately 10 metres long.
b impedance matched to the feedline.
c the longest element.
d electricity coupled to the other two elements.

21 The mixer stage of a single conversion superheterodyne receiver mixes:
a two radio frequencies to provide the IF.
b audio and radio frequencies to provide modulated RF.
c two radio frequencies to balance out the carrier.
d the received signal and the first IF to produce the second IF.

22 If a novice transmitter causes 'splatter', the operator should:
a fit a high pass filter at the transmitter output.
b neutralise the transmitter power amplifier.
c reduce the transmitter power output.
d reduce the modulation level.

23 For an AM transmitter to be 100 percent modulated the power in the modulating signal must be:
a twice the power in the carrier.
b one third the power in the carrier.
c half the power in the carrier.
d half of the total power output.

24 The ionosphere:
a is a magnetic field around the atmosphere.
b includes the layers of charged particles in the upper atmosphere.
c is present only during daylight hours.
d refracts the very high frequencies better than the high frequencies.

25 A transformer has a primary:secondary impedance ratio of 64:1. Its turns ratio will be:
a 64:1.
b 8:1.
c 1:4.
d 1:8.

26 For a transistor in the common emitter mode, the 'current gain' is the ratio of:
a emitter current to collector current.
b grid current to anode current.
c collector current to base current.
d base current to emitter current.

27 To protect a television receiver from the effects of a strong unwanted signal on a particular frequency, the antenna input should have a:
a parallel tuned trap.
b series resonant circuit tuned to the unwanted frequency.
c tuned diode detector.
d series RF choke.

28 The specifications for the receiver section of an amateur transceiver state, in part, '2.5kHz at 6dB down, 4.1kHz at 60dB down'. The characteristic referred to is:
a sensitivity.
b carrier suppression.
c audio frequency response.
d selectivity.

29 The reliability of a particular long distance (DX) communication path may vary during the daytime due to changes in:
a sunspot numbers.
b the amount of cloud cover along the path.
c the degree of ionisation of the ionosphere.
d the angle of the moon's inclination to the earth.

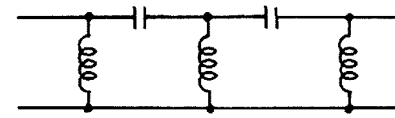
30 A primary cell:
a has an output voltage of 1 volt.
b provides the power for the first stage of the transmitter.
c cannot be recharged.
d cannot be used in series or parallel combinations.

31 An unsuitable type of material for use as the dielectric in a capacitor is:
a mica.
b ceramic.
c air.
d aluminium.

32 Class A amplifier stages operate at an efficiency of about:
a 30 percent.
b 45 percent.
c 60 percent.
d 75 percent.

33 A zener diode used as a voltage regulator must be:
a forward biased.
b bypassed by a bleeder resistor.
c followed by an electrolytic capacitor.
d reverse biased.

34 This device may be used:

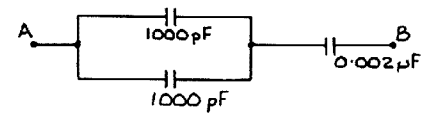


a at the output of a novice transmitter to prevent radiation of harmonics.
b at the input to a television receiver to reject a strong novice station signal.
c as a smoothing filter in a DC power supply.
d as a trap in a multiband antenna.

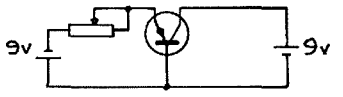
35 The presence of standing waves on a transmission line indicates:
a loss of power in, and radiation from, the feedline.
b overdriving of the final stages of the transmitter.
c a mismatch between the transmitter and the feedline.
d that unbalanced feedline is being used.

36 Parasitic oscillations may be:
a prevented by reducing the power output.
b harmonically related to the transmitter output frequency.
c caused by random inductances and capacitances.
d detected by monitoring the audio output.

37 Total capacitance between A and B will be:



a 2000pF.
b 0.0022uF.
c 1000pF.
d 0.004uF.
38 In this transistor the:



a base is N type material.
b emitter — base junction is not biased.
c gate is N type material.
d collector current is greater than the emitter current.
39 The relationship between frequency (f), wavelength (*) and velocity (V) of a radio wave is given by the formula:
a V = f/ .*
*b V x f = *.*
*c V = 1/f x *.*
*d V = f x *.*
40 A novice SSB transmitter operating on 3.5MHz with its carrier oscillator on 5.5MHz is likely to have a heterodyne oscillator on:
a 2.5MHz.
b 7.0MHz.
c 9.0MHz.
d 11.0MHz.
41 The three basic filter types often used in TVI and RFI prevention are:
a low pass, high pass and broad band.
b low pass, band pass and choke input.
c high pass, band pass and capacitor input.
d high pass, low pass and band pass.
42 In a very simple AM receiver, the detector circuit might use a:
a point contact diode.
b silicon power diode.
c FET product detector.
d three terminal regulator.
43 The dc input power to a transistor power amplifier is calculated by:
a using 70 percent of the output power as a reference.
b multiplying the collector voltage by the collector current.
c measuring the power drawn from the power supply.
d measuring the voltage drop across the output capacitor.
44 The crystal in a high stability oscillator:
a is usually in the anode circuit.
b usually operates at its fundamental frequency.
c cannot have its frequency changed.
d is not dependent on the piezo-electric effect.
45 A television receiver shows interference in the form of two parallel bands of spots across the screen. This is due to:
a 'splatter' from a novice transmitter.
b harmonics from a high powered amateur station.
c parasitics radiated by an amateur station.
d a power leak from an AC power line.
46 The inductive reactance of a coil:
a is measured in henries.
b depends on the composition of the wire used.
c depends on its inductance and the frequency used.
d is highest at its resonant frequency.
47 Semiconductor devices are most vulnerable to:
a moisture.
b cold.
c overheating.
d light.
48 A single conversion superheterodyne receiver tuned to 3.6MHz with an IF of 455kHz could also respond to an image signal on:
a 3.145MHz.
b 8150kHz.
c 4.510MHz.
d 910kHz.
49 'Key clicks' produced by a CW transmitter:
a can be cured by use of an appropriate filter.
b are due to an excessive gap at the key.
c occur only when the oscillator stage is keyed.
d are the result of incorrect transmitter tuning.
50 The effectiveness of an HF mobile installation depends mainly on the:
a battery voltage.
b efficiency of the antenna.
c speed of the vehicle.
d artificial earth connection.

AR

ANTARCTIC NOT SO FAR AWAY!

A new satellite telephone system, expected to be operational within two years, will link Australia with its Antarctic Bases.

The project, expected to cost about one million dollars, will give a 24 hour telephone and data link system to Davis, Mawson and Casey Bases.

POUNDING BRASS

CONTESTS

This is being written during the week after the 1985 Remembrance Day Contest. Like most of those who participated, I suspect, I have had my fill of operating for a while and so, better late than never, have dedicated this column to what seems to be an appropriate subject. Not terribly timely, I guess, but maybe some of you will file it for next year, or have a crack at the John Moyle or a international contest.

The change in rules this year seems to have caused some confusion, and mixed feelings. Personally I am glad that VHF was separated from HF phone, but disappointed that CW was separated from phone in the HF section. I managed to complete logs in both phone and CW and, assist in the Adelaide Hills club operation, VK5BAR, but I can't help wondering whether CW participation was reduced by the need to make 25 contacts for an eligible log. I know our co-ordinator, Ian VK5QX, is amenable to suggestions, so drop him a line if you have any thoughts on the matter.

While I'm on that subject, I heard several operators complaining about the need to wait three hours between contacts on VHF, and there was a campaign going to get people to make comments to that effect on their VHF log sheets. I have to sympathise with the Z calls who have never managed 5WPM CW and therefore are restricted to VHF and up during the RD. It's just the logic which puzzles me slightly. Why not allow multiple contacts on HF after, say, 12 hours a'la John Moyle? And obviously the VHF crowd would be delighted if you allowed a repeat contact after only one hour. For that matter, why not after ten minutes? Hey! Why have a time limit? Why not just see how many times they can 'work' the same station in 24 hours?

That may sound a bit silly, but I am afraid I will have to admit that contesting in general seems a bit silly to me if one is in it to 'win'. If that is your only motivation you will always be wiped out by somebody in a better part of the world, or who has better gear, or a higher tower, or is willing to cheat. There are good reasons for participating, but you've missed the point of amateur contests generally if you are so concerned about personal, or divisional, glory that the *rules* themselves become a battleground.

So enough preaching, let us talk about how to operate in a CW contest.

The following paragraphs will form a general introduction to the subject, and I hope, encourage some otherwise timid souls to get their feet wet in what should be a valuable educational and practical exercise.

There are so many different aspects of CW contest operation that it is difficult to decide where to begin. There are CW Only contests, contests with separate sections for CW operation, and mixed mode (open) contests. One can enter as a serious contestant, use CW to supplement a phone score, or participate on a casual basis with no intention of submitting a log. There are some fringe benefits to participation in a CW contest which make it attractive to the 'non-contesters' among us...you can experience a wide variety of sending styles and speeds in a very short time, and significantly improve your 'ear' or copying ability while you are at it. As with any contest, the basic point of it all is to make as many contacts as possible, as fast as possible. Therefore contest exchanges are cut down to the bare bones. A typical contest exchange requires call sign, signal report (RST), and a contest number (serial number, zone, or age, etc) and would look something like this:

STATION 1	*CQ test de VK9ABC K*
STATION 2	*De VK2DXP K*
STATION 3	*De VK5FN*
STATION 1	*VK2DXP NR 5 N N TT8 BK*
Station 2	*QSL UR NR 5NN 132 BK*
Station 1	*R GL E E CQ test . . .*

There isn't much to it, is there? And when you consider that most of these exchanges take place at 20-30WPM or faster, the contact rate can be very high indeed.

Looking at the sample exchange piece by piece. the first element is the CQ *contest* call. *Quite often* this is specified in the contest rules, but if not, common sense and efficiency should prevail. The Remembrance Day Contest call is CQ RD; the John Moyle Field Day call is CQ JM or CQ FD; when in doubt CQ TEST is just fine. The call should consist of the CQ, your call sign, and K sent only once, allowing three or four seconds for a response before repeating.

The answer to a call should be simply DE followed by your call sign. This presumes that if you answer on the same frequency, you must be answering the CQ.

The station calling CQ should send the responding station's call sign once, because there may be several stations answering, and will then give the signal report and contest number. Repeats are usually not given unless requested. Signal reports are usually given as 5/9/9 regardless of the facts of the matter, and I shall refrain from making any further comment on that subject aside from noting that reports were not even required in the '85 RD. Nines and zeros are coded because they are so common (N = 9, T = 0), so an exchange of 5/9/9 008 would be sent as 5NN TT8. BK, or break, is then sent to invite the other station to transmit. Often it is sent as B (space) K, and sometimes K is used by itself. Sometimes the break is preceded by 'QSL?'

As is the case in phone contests, it is up to the station which called CQ to send any pleasantes (such as GL E E) and he may or may not listen for an acknowledgement (E E) before calling CQ again. Unlike most CW activities, successful participation in a contest does not depend to any great extent on your copying speed for 'normal' CW. You can generally work a station calling CQ at twice to three times your normal copying speed. Firstly, the format is so standardised that all you have to pick out is a call sign and a number. You can listen to two or three calls before answering in order to be sure of the call sign; you can listen to the next contact the guy makes in order to verify the number. Secondly, asking for a repeat is as simple as sending a question mark. For example, if you missed the number, you send 'NR? K.' Finally, although you may start out listening to CQ calls three or four times, it doesn't take long before you can pick them up first time. It is generally recognised that any 5WPM novice can recognise a single character at speeds up to 50WPM; a string of three or four characters at 25WPM is not difficult.

As far as sending speed is concerned, you should send as fast as you can and still be readable at the other end. But as I've said before, it is only reasonable to send the minimum to get the job done. If the other station wants a contact, (why else would he be in the contest?) he'll be patient.

That pretty well covers the aspects of contest operation which are unique to CW; questions of whether to call CQ or 'search and pounce', when to change frequency or band, when to have supper or try to pacify the XYL...all these are matters for judgement based on experience and CW is no different from phone, in that regard.

By all means, dust off that key the next time a contest is on and hand out a few numbers . . . you will probably be hooked. 73 FER NW.

AR

CLUB CORNER

BALLARAT AMATEUR RADIO GROUP

The Ballarat ARG will again hold 'HAMVENTION 85' during the weekend of 2nd and 3rd November 1985. This years hamvention will follow the lines of previous, very successful hamventions.

A dinner will be held on Saturday and on Sunday, a giant trade display, along with the usual amateur radio activity events will be held.

A barbeque lunch and afternoon tea will be provided on Sunday, along with special entertainment for members of the family not involved with amateur radio.

Attending amateurs are asked to bring their own QSL card to put on the display board. It could win a prize for the most interesting QSL card.

Further details may be obtained from Kevin Hughes VK3WN on (053) 35 5011.

The venue will be the Marty Busch Recreation Reserve, seven kilometres south of the Ballarat City Hall on the Ballarat to Colac Road.

See you at 'Hamvention 85'.

Contributed by Kevin Hughes VK3WN. **AR**

WESTERN ZONE OF THE VIC DIV

At 01:30pm, on 21st September the Western Zone will hold a members General Meeting at the Lake Bolac Hotel. Come along.

Join the Western Zone 'Hook-up' each Monday evening at 1000UTC. The 'Hook-up' is cross band, dual mode on Ch 7 and 3.585MHz, with the call sign VK3BWZ.

Office Bearers for 1985-86 are:
PRESIDENT Geoff Smith VK3ADB
VICE-PRES Ken Taylor VK3KAV
JUNIOR VICE-PRES David Timms VK3YLV
SEC/TREASURER Jim Wright VK3CFB
COMMITTEE VK3KAV, VK3YLV, VK3CAI, VK3XFC, L31266, VK3DLO, VK3ANH
TECH OFFICERS VK3KAJ, VK3AGD
INTRUDER WATCH Ken Taylor VK3KAV
REPEATER COMM VK3AGD, VK3YLV,VK3AEX, VK3BFF, VK3KJH
STATION OFFICER Oliver Gellert VK3AEU
WICEN OFFICERS VK3KAV, VK3AEU, VK3DWL
AWARDS MANAGER Maurie Batt VK3XEX

Contributed by Geoff Smith VK3ADB
AR

DEVIL NEWS FORM THE NW BRANCH

Attendance at the recent meeting was good, with 25 present. Apologies were received from VK7s: WJ, SF, AH and BV. Jack VK7WJ was on holiday on the main island. Syd VK7SF is also on holiday, but he has travelled a litte further afield — he is in England and plans to visit Cardiff.

CLUB CARD: It was decided, at the meeting, to have a special club QSL card printed so the club may reply, as a club, to QSLs received.

MEMBERSHIP: A new member from America, K6KTO was welcomed to the club.

REPEATER NEWS: As more money becomes available, it is hoped to make some improvements to repeater VK7RNW. At present the repeater is performing adequately.

ACTIVITIES: The first broadcast on RTTY by the club was very good with five replies to the broadcast. This was very encouraging and there is now a regular broadcast each Friday night on 3.630MHz. All who receive the broadcast are welcome to join in.

YOUTH AFFAIRS: VK7NAE has been doing some PR at his school and has been explaining the benefits of the WIA. He is hoping to encourage visitors to club meetings.

CLANGER AWARD: Was presented to Ivan VK7XL for miscellaneous activities leading up to and about trying to stop a cow from choking by jumping up and down on its stomach. The general belief was that he was using it for a trampoline.

REMEMBRANCE DAY: Volunteers operated the club station VK7NW for the RD Contest. Stations who participated were: VK7s: WP, WN, ZAP, KY, ZBT, EQ, WZ, WL and AX.

QSL BUREAU: The QSL section of the club is operating quite well, although there are not many outgoing cards due to the conditions with propagation.

AUCTION: An auction followed the meeting with Ron VK7RN acting as auctioneer. He performed so well we think he could 'sell honey to the bees!' The largest item sold was a Siemens Teleprinter. A good time was had by all.

It was anticipated to hold a video night after the auction but, unfortunately the auction took up too much time so the video was held-over for a future time. However, the auction was such a success it is hoped there will be another one, before too long.

The club extends sympathy to Terry VK7BV, on the death of his father.

Cheers until next time.

MANLY WARRINGAH RADIO SOCIETY

The MWRS has been testing a 70cm voice repeater over the last few months on 438.175MHz and is presently awaiting final approval. Increased use of the 70cm band in the local area, encouraged the group to develop a new repeater co-sited with the existing 2 metre repeater, VK2RMB 146.875MHz, providing mobile coverage through the northern beaches of Sydney. The group has recently started developing a 2 metre Packet Repeater, to be licensed and co-sited with the voice repeaters at Terrey Hills.

Meetings are held every Wednesday night, with business meetings on the second Wednesday of each month, at 7.30pm. All are welcome to attend, including out-of-town visitors. Location is at the MWRS club rooms, in the Warringah Volunteer Services Centre, Aumuna Road, Terrey Hills.

SYDNEY AMATEUR DIGITAL COMMUNICATIONS GROUP

The SADCG is a non-profit organisation, set up to provide help and information to amateur radio operators wishing to experiment with amateur packet radio. We have encouraged the formation of similar groups in other states.

Since the formation of the SADCG, there has been diversification into hardware and software development of both packet equipment and packet protocols, primarily based on Canadian and US activities.

Marketing of packet equipment was a task previously done by the SADCG, but has now been passed on to a professional marketing company.

Further information of this group activities and news may be obtained from Box 231, French's Forest, NSW. 2086.

Submitted by Steven Blanche VK2KFJ
Secretary, SADCG **AR**

Your best friend could be the next WIA member. Persuade them to join today . . .

AR SHOWCASE

NEW MOBILE RADIOS

The first of the Victorian Police's new mobile radios have gone into action with excellent results.

The 1885 UHF radios, valued at $3.2 million, have been supplied by Motorola Australia's Mulgrave factory in Melbourne and are the latest in state-of-the-art communications equipment.

The radios have been enhanced to meet the operational requirements of police in Victoria. They prevent general interference on allocated police frequencies, have the facility to be used as a repeater from a small hand-held portable, and scan several police frequencies as desired by the operator.

In addition, all 1885 radios can be quickly adapted to prevent eavesdropping or scanning of confidential police broadcasts, if desired. Several have already been tested by Special Task Force and Surveillance groups. They are proving ideal for the job.

Assistant Commissioner (Services) Mr Newnham said, "The new equipment gives police a flexibility and capacity not possible previously. The number of channels has been expanded from a previous 10 to 144 and the capacity to have voice confidentiality if desired, in the one radio is most cost effective".

"The new radios are installed in police cars, motor cycles, Water Police and Air Wing units", he added.

For further information contact, Martin Cahill, Motorola Australia. Telephone: (03) 561 3555.

AR

Constable Lisa Hardeman of Russell Street, demonstrates the new Motorola equipment.

QSP

ENCODING

A method of encoding computer data, claimed to be many thousands of times more secure and half the price of the American DES encryptor industry standard, has been announced by a Western Australian telecommunications group.

Perth based Ran Data Corporation Ltd launched its (EKES Encryptor) in London recently. Encryption is increasingly being used in electronic funds transfer, message transmission, and will play an important part in the new era of home banking.

The DES system employs a 56 Bit (key), but questions had been raised as to its adequacy. Ran Data uses a 32,000 Bit (key) system which was accepted as statistically unbreakable using present technology.

VK2 MINI BULLETIN

Tim Mills VK2ZTM
VK2 MINI BULLETIN EDITOR
PO Box 1066, Parramatta NSW 2150

The VK2 Division is continuing the 75th Anniversary Year through until March 1986, when the 'Time Capsule' will be closed off. To mark the end of the year, the 1986 VK2 Seminar will be held, together with the judging of the 'Homebrew Contest'. In addition, March 1986 Amateur Radio is planned as another VK2 special feature edition.

During this month, October 1985, there are several VK2 activities. One is the 75th Dinner, which will be held on Saturday, the 12th. Bookings have closed, but there may still be room if you contact the Divisional Office, without delay.

Then there is the JOTA weekend. At the end of the month, the South West Convention will be held at Wagga, which includes the 'National Foxhunting Championships' over the weekend of the 26th and 27th. During the same weekend, WICEN will be involved in the 24 hour communications exercise on the Hawkesbury River for the 'Outward Bound Canoe Classic'.

HOME BREW CONTEST

Entries are invited for the 1985 'Home Brew Contest'. The closing date will be 1st March 1986 and entry forms and other details are available from the Divisional Office.

DIVISIONAL LIBRARY

Aub Topp VK2AXT, has upgraded the cross indexes at Parramatta. If you can attend the library, you will be able to find the material we have under its specific heading. If you are unable to attend, then a written or phone request will enable a photocopy of the reference page to be sent to you. From this you will be able to select the particular item/s, and a loan of the magazine arranged. It should be noted that postage costs on books and magazines can be high. Where permitted, copying of the item could be a cheaper alternative.

Work is currently underway to increase the storage capacity of the library area. From time to time, donations of books and magazines are received for which we are very grateful. In many cases, particularly the Australian publications like EA and ETI, adequate copies already exist and we either have to decline or pass them on to groups and clubs. Sometimes the odd copy helps make up a set. However, we are interested in many of the overseas publications and in particular, the older technical books, which were often limited print editions. So, if you are faced with a clear out of publications because you no longer have the room, or you have to dispose of a deceased estate, would you first contact the Divisional Office. It is likely that we would be interested.

TAPE LIBRARY

Now to a library of a different kind. The Divisional Office maintains a copy — in VHS — of the majority of the material in the Federal Video Tape Library. New material is added at intervals and a SAE to the office will obtain a list and borrowing conditions, either for your club/group or individual members.

ANOTHER ANNIVERSARY

While the WIA celebrates its 75th, not far behind in the age stakes, is the Waverley Amateur Radio Club, who first received their licence on 18th August 1920. Duane VK2VE, is preparing a history on WARC — VK2BV to appear in Amateur Radio at a future date.

ANNUAL GENERAL MEETING

The 1986 AGM will be held on Saturday, 5th April 1986. A reminder that the Divisional year for reports and financial matters ends on 31st December 1985. Further reminders closer to the time.

RADIO FOR THE PRINT HANDICAPPED

2RPH on 1.629MHz, Radio for the Print Handicapped needs volunteers with technical experience and qualifications for occasional assistance in maintaining their on-air equipment. Further details from the station at North Sydney on (02) 92 8056, during business hours.

BROADCAST ROSTERS

Another period in the roster has commenced from October to December. To help maintain the numbers and the spacing between each day of duty, as far as possible, additional announcers and engineers are always welcome. Contact the Divisional Office or Jeff VK2BYY, OIC, Dural, for further details.

JOTA

There is still time to help with this years JOTA. Many groups have the venue, they just need the amateurs. Contact the VK2 JOTA Co-ordinator, John VK2NDJ on (02) 772 3437, as soon as possible.

CONFERENCE OF CLUBS

The next C of C will be held at Westlakes ARC, Teralba on Sunday 3rd November. The agenda has closed, but your club needs to be represented on the day. Check and find out who will be your delegate and let him know your views on any matter to be discussed.

SATELLITES

Do you own a Commodore 64? Are you interested in satellites? For a $15 donation to AMSAT funds, you can obtain a copy of the excellent VR85 satellite mapping and tracking programme, with full instructions for the cost of a disk. Contact Bruce VK2DFH on (02) 84 5886 for details.

STUDY CLASSES

Will your club or group be conducting any licence study classes in early 1986? If so, would you let the Divisional Office have the details to be filed for the enquiries we are always receiving. One course already advised is a Novice course to commence on 30th January. It is being conducted by Gladeville ARC. For details, contact either VK2JX on (02) 428 2462 or VK2LT on (02) 516 1271. A further reminder, that the Correspondence course, conducted by the VK2 Division, is always available, should you be unable to attend a personal class.

VK2WI — DURAL

Following the lightning strike in February, an inspection of the towers at VK2WI was carried out. No damage from the strike was found but, it was noted that it was reaching the time that general maintenance was required to them.

Accordingly, Divisional Council has authorised a commercial firm to undertake the tightening and replacement, where required, of the nuts and bolts on the main tower.It was decided that both towers should be painted, as some of the original finish is strarting to deteriorate. A rub back, undercoat primer and a final 'harbour bridge grey' paint has been carried out on the beacon tower. By now, much of the work on the main tower will be completed.

A couple of months ago, something of doubtful parentage paid a visit and cut some of the coaxial cables to the HF antennas.

The construction of the 23cm beacon is well underway. When installed, it will be on the frequency of 1296.420MHz. After some tests into Packet Radio at VK2WI, Council has started the paperwork to apply for a Packet licence. Equipment and frequency is yet to be determined.

TWO METRE INTERFERENCE OF THE RF KIND

The increasing development of paging networks increases the problems to the 2 metre band. The majority of the paging systems use frequencies in the 148 to 150MHz sub-band. This is remote in frequency terms from the high-band commercial channels, but is adjacent, with no guard band, to the amateur band. The top megahertz repeater inputs are from 147.625 to 147.975MHz. The first pager channel is 148.0125MHz. In Sydney, where the majority of the top megahertz repeaters have been developed, there is also a large number of pagers, both for the public telephone access as well as private paging companies. It appears recently, that VK2RLD 7375 has had a pager installed in near proximity to its site. It has been taken off air while a solution is found.

VK2ROT 7075, near the city, is suffering from pagers a couple of kilometres either side of its site. VK2RWS 7150, on the North Shore, gets its share of problems, too.

This problem has occurred in other areas, also. Currently, discussions are underway between the SRC and FTAC for possible solutions.

PACKET RADIO

This new mode is starting to gain converts in VK2. With interest, comes the need to talk (type?) further and with VK2's terrain and distances comes the desire for repeaters. It appears, at this stage, that interest for inter area connections starts in Sydney and goes north along the coast. So far, repeater applications have come from Hornsby and District ARC, Manly Warringah RS, Westlakes ARC, the Division and WICEN. Part of the experimental work at VK2WI was to test a frequency of 144.800 MHz, which got away from the nearby pagers. While much of the Packet work can be carried out around 147.575 and 147.600MHz, these frequencies may present a problem with sharing a site where either a top megahertz repeater exists or a pager.

Packet uses a single frequency to transceive on and the voice repeater, its two channels. To place both on the same site may cause both to desence each other, the packet receiver from the voice transmitter and the voice receiver from the packet transmitter. A solution here is a frequency towards the lower end of 2 metres, unless one lives in a channel 5A area. This is another area for discussion and solution for the SRC and FTAC.

The State Repeater Committee would be interested in hearing opinions on Packet frequencies for 2 metres.

In a recent Federal tape, there was a call for groups with an interest in Packet to register this interest with the Federal Office, at PO Box 300, Caulfield South, Vic. 3162, so that you can participate in the guidelines for this emerging mode.

WICEN

Mentioned elsewhere is the exercise to be held on 26th and 27th October on the Hawkesbury. In November, there is an exercise with the Schofields Air Show on the weekend of the 9th and 10th and the annual SET on 24th November.

AWARDS

Many clubs and groups in VK2 have an award. A request is being made to those who issue awards, to make a sample copy available for display, along with the rules, at the Divisional Office.

SLOW MORSE ON 80 METRES

Since the early sixties, a nightly session has been transmitted by a host of volunteer stations on 3.550MHz. The early part of the evening from VK2BWI and then followed by VK5. The frequency seems most popular for everything else and there are times when copy is difficult for our future amateurs. Some of the problem comes from Japanese fishing boats operating in international waters. While the segment 3.500-3.700MHz is primary amateur within Australia, it is an equal share in Region 3 between amateur — fixed and mobile. On the lower side of 3.550, there is RTTY operation and all round there is the crowding of phone stations, all trying to find a clear space.

The frequency choice comes from the time when the CW/Phone point was, I understand at 3.550MHz.

In the crowded 80 metre band, it would most likely suffer, no matter where it was so, perhaps it would be best if we all could give 3.550 a little breathing space so that the future users of the 80 metre band may learn a little sooner. Up the top end of the 80 metre band, on 3.699MHz is VK2RCW, as reported last month, so there is further practice there after you finish with the evening sessions on 3.550.

REPEATERS

UHF repeater, VK2RRS 8475, was taken out of service in the Parramatta region during August, for a major overhaul. VK2REE 8325, to the north/west of Taree, went into service during the winter, on its final site. The channel 7300, band planned for ATV liaison, will be used by the future Sydney region ATV repeater. The TV side will have an input at ATV1 in 70cm and the output at 50cm on channel 34. An application for this service is currently in the course of development. Parkes and District ARC advise that their system VK2RWM 7100 is now fully operational from their site near Grenfell. Good coverage has been reported. It fills the region which was previously on the outer service areas of VK2RGF 6850, VK2RWG 6750, VK2RAO 6700 and VK2RRT 6900 in the central west of the state.

As has been reported previously in these notes, repeaters have generated their bad side with anti-social behaviour. Sydney has been through another wave of such behaviour on VK2RWI 7000. Many amateurs think it just a matter of a complaint to the Department and DOC will come out, locate and prosecute the offenders. When this does not happen overnight, they complain, come on air and some even act in such a way that it is hard to tell who is who.

For a successful prosecution to be made, evidence must be obtained which will stand up in court. Much of the anti-social acts thrive because some amateurs appear to crack under the strain. Others appear to like to indirectly communicate with an offender, either by abuse at him or talking about him. Still others make on-air comments as to who they think it is or the bearings or signal strengths of the transmission. All these actions help encourage this behaviour. to be constructive, one should observe and report findings, desirably through the Division.

At intervals, there are some offenders apprehended and for a time the frequency returns to a degree of normality. It is then that all amateurs should read up on the handbook and operate correctly, with decorum. We should respect the privilege that we have with access to the radio spectrum. Now-a-days, many services in the radio spectrum have the added privilege of 'self regulation', we should rarely have to resort to calling in others to do it for us.

BREAK-IN AT THE DIVISIONAL OFFICE

During Sunday evening, 11th August, a robbery occurred at the Divisional Office in Parramatta. The forced entry was through the ground floor office, which gave the intruders access to the stairs. The object of their visit was the office safe. They brought with them, some oxy equipment and a range of engineering tools. The safe is used by the Division as a fire proof second storage. It must have been a disappointing nights work for them, as they netted less than $150 in petty cash from both offices.

They left the police a range of fingerprints, other identification and the full set of oxy and tools.

Little damage occurred to the records but it left us with a mess and repairs to the property. Some interest was shown in the key register. The Divisions key system has been re-keyed.

The break-in left one with the impression that, they were rather amateurish at their 'trade'. The investigations are being conducted by the Parramatta police, to whom any information should be given. **AR**

VK3 WIA NOTES

NEW MEMBERS MADE WELCOME

The Victorian Division of the WIA would like to welcome the following members who joined in the month of July.

P R Adams VK3XNI, Stephen Bell VK3XSG, John Brennan VK3KKN, David Burden VK3VFO, H R Campigli VK3BIA, R C Carter VK3CAZ, George Christie VK3XEC, Robert Crowle, Gordon Esam VK3AGE, Eric Ferguson VK3KF.

David Grinblat, Ronald Harding VK3KKQ, Barry Hipgrave, Graeme Ireland, Eric Kelly, J R Kemp VK3CAY, William Leeming VK3ALW, Stewart McLean VK3AIA.

David Paulin, Daryl Quirk, Andrew Richards VK3YML, Jack Spark VK3AJK and Neil Ross VK3CUF.

WICEN NEWS

WESTERN ZONE WICEN ACTIVITIES

Regions 4,5 & 17

After organising a training school in Hamilton earlier this year, in which Derek McNiel was the instructor, the WICEN group were keen to put their newly acquired knowledge into practice. They did not have long to wait to do so.

An off-chance comment to a member of the Hamilton Light Car Club saw an invitation forthcoming for the WICEN group to provide communications for their Yulunga all-night-car-trial during the evening of 13th April to the small hours of the 14th.

The invitation was duly accepted and the afternoon of the 13th saw Ken VK3KAV, co-ordinator, Lyle VK3DWL, controller and their group setting up stations in the Annya State Forrest and the immediate hinterland.

The trial officials were, at first, a little slow to make use of the communications facilities, however, as the event continued, the messages continued to increase, speeding up the search for lost cars, directing the recovery teams and passing safety messages and scores.

The event concluded with an early morning barbeque breakfast, where the competitors, officials and WICEN group got to know more of one another.

A weary WICEN group got to bed at a time when normal people were getting up but all agreed they would be willing to participate again next time.

Thanks go to Lyle, for his ability to supply maps, etc for the event and for his efforts as control station.

At this time, Region 17 WICEN do not have any active members. If you live in this region and would like to participate, call Ken VK3KAV, QTHR and he would be pleased to answer any queries.

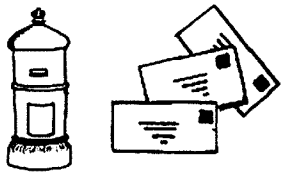
PARTICIPATE IN THE NATIONAL FOXHUNT — 26th & 27th October



OVER TO YOU!

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publisher.

CONFUSION!

Unfortunately, I did not peruse the rules of the RD Contest until the evening it commenced. Try as I would, I failed to unravel the complicated set of rules. I consulted a friend on air and he was not sure either.

After 27 years continuous participation,it seems a pity that I couldn't see the light. Consequently, I regret that my log or logs will be missing this year. I abandoned the whole business.

I look back to the days when the rules were sensible, simple and precise: we scored points commensurate with the effort we made. Now it is a headache to get past the rules, let alone work the contest.

Is it possible that drastic changes were motivated by bad losers somewhere along the line? Today the will to win has a queer effect on our standards. To participate in a memorial contest should be sufficient reward.

This year, I pay silent tribute to those silent keys!

Maybe I am a lone ranger but, contest participation may tend to prove otherwise.

73,

Max **Ives VK7MX,**

EXPEDITIONS!!!

Many amateurs know of the Oceanic Research Foundation and the various expeditions undertaken by them.

The Executive Board of the Foundation is now looking at the feasibility of an expedition during 1986 to the Kermadec Islands in their vessel, the Dick Smith Explorer.

The Kermadecs, NE of New Zealand, are interesting from many viewpoints and it is anticipated to carry, scientists in several disciplines, on board.

There would, no doubt, be many amateurs who would like to make contact with this country on HF and there is scope for interesting work on VHF and possibly UHF.

To make such a trip successful, we would want some help, particularly by way of defining a radio programme and raising money.

If anyone thinks they can assist in either or both of these functions, I would appreciate hearing from them.

The Oceanic Research Foundation is a non-profit research organisation funded by sponsors and public subscriptions.

Yours sincerely,

Oceanic Research Foundation Ltd,
D F Richards VK2BXM,
The Ski Inn,
Sackville Road,
Ebenezer, NSW. 2756.

AMF AMATEUR RADIO SOCIETY

To all members and ex-members of the Australian Military Forces, I feel very disappointed when I hear other service and ex-service men and women joining their particular nets - RNARS, RAFARS and RSARS. All ex-sailors and airmen are entitled to join their respective society, but unfortunately no soldier is entitled to join the RSARS unless he served in the Royal Signals RAS.

We can go one step forward, and make our society open to all ex-soldiers, no matter which army he served in, we are all friends, whether we come from England, Germany, Greece, Italy, etc. There will be no discrimination as we are all Australians. We all have something in common so we all have something to talk about, and who knows, we may find some of our lost friends.

I personally have served in many countries, with many different countrymen and many armed forces during my 37 years in the Army.

We may be able to design an emblem. So let's hear some suggestions.

I enjoy reading Amateur Radio and hope that this year will attract many new members, especially with the 75 Award, as many amateurs feel very small when you ask them for their WIA number and they reply 'I am sorry, I am not a member yet'.

73 and keep up the good work,

Yours sincerely,

Sam Galea VK2AKP/9H1GS, ex RAA, RA, RAA.
Hadidu,
57 Fairview Road,
Canley Vale, NSW. 2166.

FURTHER TO P H MCELROY!

Re the query concerning Mr P H McElroy, who was the founding treasurer of the WIA.

A gentleman of that name operated a business known as Homecrafts (P H McElroy) at 211 Swanston Street, Melbourne in the 1920/1930 era. The business catered for hobbyists, particularly those interested in model engineering electrics and woodwork.

He also published the 'Homecraft Magazine', which carried articles covering the construction of various electrical appliances, model locomotives and railway supplies, in addition to radiocomponents. He later sold the business, which was later transferred to larger premises, but still traded under the Homecrafts name, but only in radio and electrical goods.

I purchased my first radio components from Mr McElroy, in the late 1920s.

Unfortunately, I have no idea when he first established the business.

73,

J Kelly VK3AFD,
28 Tottenham Street,
Carnegie, Vic. 3163.

AR

HALLEY'S COMET

After twelve months of research and endeavour, in co-operation with other amateur enthusiasts and astronomical groups, it would appear that the apparition of Halley's comet will have no effect on the HF bands, as the Comet itself has no radio emissions. There is the co-incidence that the comet's arrival parallels with every seventh sun spot minima.

The VHF bands however, whilst not being subject to any known interference, does offer an opportunity for meteor scatter enhancement as the result of the new meteor trail, associated with the comet's 1985/6 apparition. To this purpose, it will be very necessary to evaluate the density of the trail and compare it with the present trail associated with the 1910 Halley comet apparition manifested in the eta Aquarid and Orionid meteor showers in May and October of each year. To date these observations have been visual as there is, as yet, no amateur radio group set up to make recorded radio observations.

Just recently, during the last eta Aquarid meteor showers, visual observations over Australia recorded meteorite entry into our atmosphere at over 100 per hour. (Remember, that this is from a trail that has been shedding meteorites into our atmosphere every May and October for the last 75 years). The astronomical societies predict that radio observations could be three times greater than visual, and that there is a much needed development in this field. I believe that there has been some work done in this field but, it seems to have lacked in continuity and I have not been able to contact anyone who is involved or has any equipment for such projects.

Current investigative work is being conducted between VK5ALH and VK2AFX on 2 metres. Previous 6 metre contacts have been accomplished and it is necessary to continue this work, as well as look at the possibility of a new project to be initiated on 10 metres.

It is worth noting that the duration of meteor scatter propagation is proportional to the frequency. ie: the higher the frequency, the shorter the duration and, it appears that 175MHz is about the top cut-off point and to date 21MHz appears to be the bottom cut-off point. (There are other factors involved, such as the size of the meteorite, its speed and angle of entry, etc).

Further details regarding these projects can be obtained from VK2KA, VK3AJU, VK4UQ, VK5ALH and VK6MY, all QTHR. Mostyn VK5ALH, in particular, is very interested in amateurs in South Australia, who are prepared to set up a study group and arrange development programmes. Mos is also the chairperson of the Halley Comet Net, held each Tuesday and Thursday, 0430UTC on 14.160 +/- QRM or alternatively 7.070MHz. If enough interest is shown, it is planned to have a net, same time and frequencies on a Sunday for those who cannot make the mid-week scheds.

Much has yet to be discovered from the study of meteors and this study will not cease when Halley disappears from our skies, it is only the beginning and in co-operation with the various astronomical societies, can be a vast and exciting experience. It is known that governmental instrumentalities are very interested in this field also and are probably more advanced than we are led to believe. The fact that the eta Aquarid and Orionid meteor showers are usually mentioned in press articles, and probably the best known, they are non the less, part of many (in fact there can be several showers a month), that can be used for meteor scatter. There are, in reality, about a dozen meteor showers per year that afford reasonable contact results.

Continual monitoring of research may provide some changes in our present findings. If any changes do come to hand, every endeavour will be made to rush it into the presses and broadcast it over the WIA Federal News and WIA Divisional News Broadcasts.

Yours fraternally,

C D Rice VK6MY,
Chairperson,
Comet Sub-Committee,
PO Box 10,
West Perth, WA. 6005

AR

IN REPLY TO . . .

The following letter has been published in THE LANCET, 29th June 1985, in reply to the letter published in Amateur Radio, August, page 62. The letter is in reference to Leukaemia Risk in amateurs.

In his letter, Dr Milham uses the 'silent key' (recent deaths) information from two US states published in the ARRL's magazine QST to claim an increased incidence of certain leukaemias in a group of amateur radio operators as compared with a 'normal' population. While some previous studies have suggested a link between leukaemia and occupational exposure to mains frequency electromagnetic fields (Ref 1,3), other studies have not found a correlation (4). The question needs further careful study but we disagree with Milham's conclusion that there is a casual link with amateur radio operations, and we also disagree with the selection of a group of radio amateurs to test his hypothesis.

The operating habits of amateurs are highly varia-

ble and ofter not very extensive. A 1980 survey of 8895 amateurs in the USA and Canada showed that typical amateurs spend 6.1 hours per week on amateur radio (5). Much of this time is itself highly variable, for most of it is spent listening, with any transmissions made intermittently, with highly modulated (fluctuating) wave-forms, giving low average radiated power. Milham also states that 35 percent of the Washington amateurs were employed in electrically related occupations. Were the additional cases of leukaemia related to this occupational exposure or to the lesser time spent on amateur radio? Furthermore, silent keys are not representative of the amateur radio community as a whole, deaths being listed in QST only when reported by a family member. Therefore silent keys tend to be those particularly prominent in amateur radio just before their deaths. Amateurs are also more well-to-do than the general population (5), which may be an added selection bias. The whole question is further complicated by the possibility that toxic chemicals were commonly present in electrical/electronic equipment in days past (1).

There are pitfalls associated with the use of ratios when the population exposed to a risk (and the exposure) is not adequately defined (6,7). The numerators of the ratios are known but not the denominators. MacMahon and Pugh (8) explain that 'numbers of cases of a disease are sometimes expressed relative to the total number of cases of all diseases, rather than to the population. For example, the number of deaths ascribed to a particular disease may be expressed as a proportion of all deaths. This value is known as the proportional mortality rate (PMR).

Such proportional rates do not, of course, express the risk of members of the population contracting or dying from the disease. Even Monson (9), originator of PMR and cited by Milham, offers similar caveats, which Milham seems to ignore.

For these reasons, and because of the other defects of Milham's study in regard to sample sizes, we believe that his hypothesis that electromagnetic fields are carcinogenic remains purely specualtive. On the basis of the data we have seen, it cannot be assumed that participation in amateur radio activities increases the risk of leukaemia.

Milham's study has methodo logical weaknesses similar to those admitted by Wertheimer (10) in respect of her studies associating mains frequency fields with cancer incidence (promotion) in children and adults (11). Milham is less modest: he goes all the way and offers a carcinogenic hypothesis.

FUSING CONFUSION

In reply to the letter from Mr George Cranby VK3GI published in the open column 'Over to You!' in the August issue of Amateur Radio, that appeared under the heading 'Fusing Error', referring to my article 'Electrical Safety in the Amateur Shack', published in May issue.

The writer expressed concern regarding Par 6(b). In the article, Par 6 referred to equipment and requirements, if mains operated, and connected to supply via flexible cord.

6 (b) reads "Fusing, in both active and neutral of supply lines".

Mr Cranby is correct in his concern regarding a blown fuse in the neutral conductor at the equipment. He is, however, incorrect in applying SAA Wiring Rules to that portion of the article.

I would suggest that SAA 3000 Wiring Rules applies to 'fixed wiring', and not to equipment that is connected to supply via flexible cords.

A more suitable specification for research may be AS 3100 (1981) 'Approval and Test Specification for Definitions and General Requirements for Electrical Materials and Equipment'.

From my own experiences with a large variety of radio and electrical equipment (connected to mains supply via flexible cords), it has been a common practice to fuse both of the supply lines at the equipment.

The reason for this is the uncertainty of just which is the 'active' when flexible cords and possibly extension leads are involved.

It is a nice feeling to know that, if your mains transformer breaks down to earth on the primary side (in your power supply or whatever), that you have both ends of the winding protected by a fuse.

I would concede, that I now recall that 'more modern' equipment of the 'better quality' does have built into it, protection on the supply side in the form of a double pole miniature fixed setting, over current, circuit breaker.

I see this as the answer to the problem.

The article was produced by me as a discussion aid, in a lecture to the Radio Enthusiasts Club of the Blind and delivered under the same heading.

A copy of the article was submitted to the Chief Electrical Inspector, Victoria, for his comments. (A copy of his reply follows this letter). He showed concern regarding item 3(b) and the explanation of the principle of operation of core balance earth leakage circuit breaker protection.

It is interesting to note that, in the reply from Mr L J Francis, the Chief Inspector does not show any concern for item 6(b).

In the same column, August AR, Mr Colin Heath VK5FX, expressed concern regarding the lack of a clear and suitable warning that the earth leakage protection will only give protection on the primary side of a mains transformer.

The concern expressed is justified and he is totally correct in his understanding of core balanced earth leakage protection, and its limitations.

Mention was made in the article, of the possibility of electric shock in conditions where, the circuit formed, was balanced and the core would not detect it. No mention was made to contact with any live parts on the secondary side of the transformers other than Par 6(d).

I thank both readers for their interest and contribution.

Yours sincerely,
Fred McConnell VK3BOU,
89 Latrobe Street,
Bulleen, Vic. 3105.

With reference to your letter and a copy of the article 'Electrical Safety in the Amateur Shack', the article of which would be of assistance in promoting electrical safety has been perused and comments follow.

The reproduction of the information in Braille would be of great benefit to blind persons and the comments made are not offered as criticism, but rather to contribute to the value of the document.

Item 3(b) generally would not be correct for a subswitchboard supplied by the multiple earthed neutral system which is used almost universally in Australia. This system relies on the continuity of the neutral conductor of the mains or sub-mains and, therefore, the neutral is not switched unless special conditions prevail, such as changeover to a stand-by generator.

In relation to the explanation of the principle of the core balance earth leakage circuit breaker form of protection, the explanation could read as follows:

"The core balance earth leakage circuit breaker is interposed between the supply and the operator in such a way as to interrupt the passage of current if minute values of leakage current flow to earth. The sensing core for the circuit monitors the normal load current between the active and neutral conductors but if the earth leakage current exceeds (say 30mA), the detected current is amplified, then used to trip the circuit breaker".

Apart from the suggested amendments as set out above, the article would have been of interest and help to radio enthusiasts.

Yours faithfully,
L J Francis,
Chief Electrical Inspector, Victoria
State Electricity Commission of Victoria,
Box 2765Y, GPO,
Melbourne, Vic. 3001.

HELP!!!!!

I live on Rodriguez Island and hold the amateur radio licence 3B9FR, issued by the Director of Telecommunications at Mauritius this year.

I am the first licencee on the island and my licence has the privileges of Region 1, including the WARC bands.

I taught myself radio theory and Morse to attain my licence.

Up until now I have not operated, due to the economical condition on the island, and I am seeking help to find some old radio equipment suitable for an amateur station.

Thanks in anticipation.

Yours faithfully,
Robert Gerard Felicite 3B9FR,
Victoria Street,
Port Mathurin,
Rodriguez Island
Indian Ocean

AR

TOWER ASSISTANCE

I wish to express my appreciation to the WIA for the assistance given to me regarding my negotiations with the Portland Town Council for a permit for a 60 feet (18.3 metre) antenna tower.

Special thanks to Mr A Noble VK3BBM for his personal involvement in assisting me in formulating and lodging an appeal, and to his XYL for her overnight hospitality on the day of the appeal hearing.

I now have the necessary permit to erect the tower, so I suppose the hard work now begins.

Yours fraternally,
K Simpson VK3XFC,
58 Wade Street,
Portland, Vic. 3305

AR

LEUKAEMIA AND RF

I read, with interest, the letter detailing leukaemia deaths of operators in Washington State.

For some considerable time I have felt that we treat too casually electromagnetic fields, particularly the very high frequencies and above. The long term effects of such radiation is still a matter of conjecture but evidence is accumulating, as is pointed out by Milham, that such fields are very likely carcinogenic.

However, before locking the shack and throwing away the key, it would be interesting to know if the operators who died of leukaemia were:
operating at the high power levels which are fairly common in the USA,
or, if they were subject to excessive stray radiation in the shack,
or, did the location of the antenna place the shack

or residence directly 'in line of fire' of the antenna.

If the latter applies, were health checks done on family members or other occupants of the dwelling.

I feel however, that if one adopts a common-sense attitude and operates at or below the modest levels of power, at which we are permitted to radiate, if a check is kept for stray radiation in the shack and if the antenna is located a reasonable distance from the shack, one can, I feel, be reasonably certain the electromagnetic field generated and radiated will be innocuous, particularly if the shack has a corrugated iron roof. This presupposes that an operator has adequate or for the separation of the antenna from people, something that may not be possible for a lot of operators — so be on the safe side, keep radiated power low.

AR

ETCHING CIRCUIT BOARDS

With reference to my article on Circuit Board Etching, Try This — August AR, using a mixture of Hydrochloric Acid and Hydrogen Peroxide.

I have received advice that this mixture is potentially dangerous.

I apologise for any inconvenience.

Thank you.

Bevan Hay VK4ABV,
MS 346,
Nanango, Qld. 4315. AR

Without commenting in depth on the use of Hydrogen Peroxide and Hydrochloric Acid (which seems to have dangerous possibilities) I fear that Bevan Hay VK4ABV, has entirely missed the point of my article in etching circuit boards in the June issue of AR.

He states that with Ferric Chloride one can't see what is going on. True, if one drowns the board in etch, but I went to the trouble to stress that the etch SHOULD BARELY COVER THE BOTTOM OF THE BUCKET in which case it will merely WASH OVER the board. And if the etch does not continuously cover the board it can hardly prevent one from seeing the board.

In practice, the board is continuously visible, one can see exactly what is happening and the Ferric Chloride can be used and stored without dangerous fumes being generated.

Roy Hartkopf VK3AOH,
34 Toolangi Road,
Alphington, Vic. 3078. AR

CORRECTION

I was alarmed to see (page 17, August Amateur Radio), that I had drawn the two zener diodes the wrong polarity. Connected this way, the bias line is short circuited to earth. The consequences are excessive plate current and a severely embarrassed QQEO3/20.

In reference to the article, September AR entitled Another VZ200 RTTY System, I have now added Morse code to the programme and hardware. The hardware modifications are simple.

This modification should be an attractive addition, but I am unsure if the system will work on the VZ300.

73,

Lloyd Butler VK5BR,
18 Ottawa Avenue,
Panorama, SA. 5041.

We look forward to receiving and printing your follow-up article, Lloyd . . . . ED

AR

EGO IS A DIRTY WORD?

I reluctantly reply to John Eastaugh VK5GY, whose letter 'Satisfy an Ego' appeared in Amateur Radio, August.

Will readers please closely examine what John has said, to quote: "If a person really wants to know about amateur radio, he will find out, come hell or high water".

He appears to be naive about publicity and public relations. Fact is that people will only find out about our hobby from the direct actions of radio amateurs. It pays to advertise, and one of the main ways to do this is by public displays.

John, and sadly others, fail to understand the purpose of public relations and publicity. The hobby has, for too long, been starved of the oxygen of publicity. My personal experience is, that publicity and displays result in people taking up amateur radio, who would not have otherwise done so.

Comments from members of the public include: "I did not know such an interesting hobby existed" or "Have fiddled with radios many years ago, how do I get a licence?"

John has shown a lack of understanding about the role of public relations, which is different from publicity. Basically, public relations aim to raise the public awareness and understanding of amateur radio. We need to be understood by our neighbours, the general public, municipal councils and state and federal members of parliament. If we are not understood, the hobby will suffer through poor relations with neighbours, and at the hands of ill-informed legislators.

The Amateur Radio Service is relatively small compared with other community groups. For this reason, more PR aware radio amateurs are needed, either acting on their own in their local community or workplace, or in a club, group or WIA branch.

It is an insult for John to say that those who put on amateur radio displays, and that would include participation in JOTA, do so to 'Satisfy Their Own Egos". On the contrary, they are making a positive contribution to the well being of the hobby. Hopefully they will not be discouraged by statements like John's, and will get the support they need.

Jim Linton VK3PC,
4 Ansett Cresent,
Forest Hill, Vic. 3131.

EXTRA CB CHANNEL FOR EMERGENCIES

A second channel for emergency messages, Channel 35, is to be reserved for exclusive emergency use from among the forty UHF channels available to users of CB radios.

The change was to take place from the proclamation of the Radio Communications Act in August 1985.

AMATEUR YOUTH FEATURE

STUDENTS TRACK SATELLITES

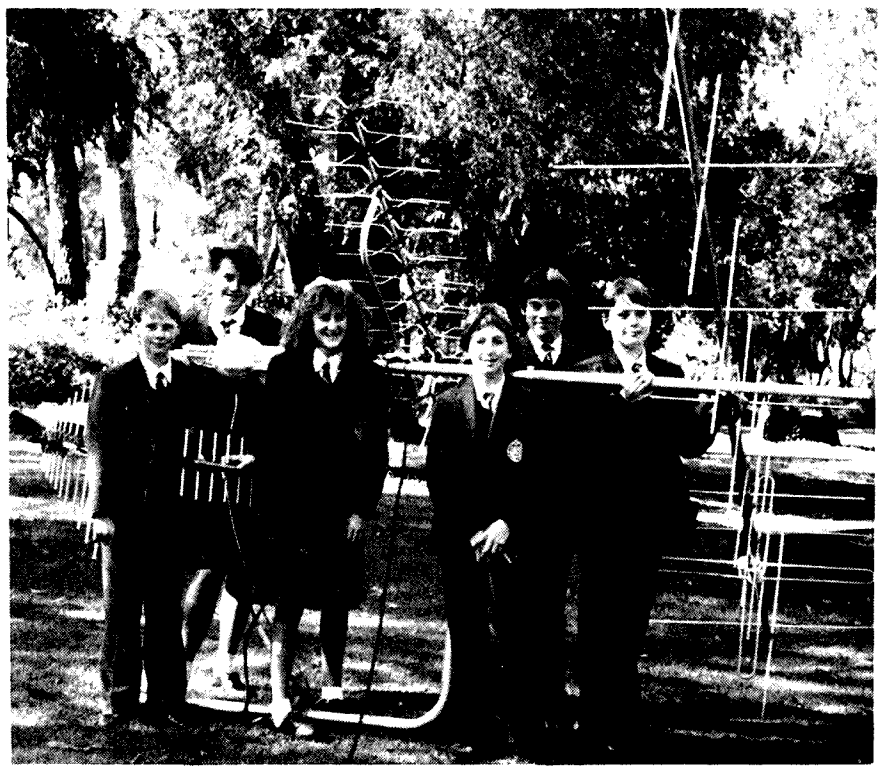
Radio option students in year 9 at Bunbury Cathedral Grammar School have been actively engaged in tracking satellites.

The students have built their own equipment and are now communicating with other radio amateurs via OSCAR 10.

The project is a joint exercise between the mathematics and science departments of the school. The school's senior science master, Keith Peterson VK6PT, has been conducting amateur radio classes since 1975, and the school received a Federal Government Grant in 1978 to establish an earth station.

The students operate with the call sign VK6OT. The students have been working OSCAR 10 since the beginning of the school year and have had over 30 contacts with overseas countries.

Compiled from information supplied by Keith Peterson VK6PT and the South Western Times, 25th July 1985.



The photograph depicts six of the year 9 students with their home-brew antenna system for OSCAR 10. It consists essentially of a vertical square of aluminium piping, with a rotator and bearing in the top section. A fibre glass pole forms the extension on which is mounted the crossed nine element Yagi for 145MHz. The uplink antenna is a 48 element skeleton slot beam on 435MHz, mounted at the top centre of the square parallel to the 2 metre antenna. The whole antenna fits into a second rotator on top of a 30m tower. This set-up gives a full 360 degrees azimuth rotation and 0 to 90 degrees elevation control.

Silent Keys

It is with deep regret we record the passing of —

MR E F WILLIS	VK2PGT

Obituaries

C N (CLIFF) PICKERING VK3ATP

Cliff became a silent key on the 27th July 1985, at the age of 66 years.

Educated at Scotch College and later graduating in Electrical and Mechanical Engineering at the Swinburne Institute of Technology. Cliff was employed by the companies of ICI, GMH and later Telecom, from which he retired in 1977.

His interest in amateur radio dated back to his early years, when he obtained an Experimental Licence, later updating to the AOCP in August 1947.

Cliff's association with the WIA extended over 40 years and, one of the highlights of this period, was his dedication to introducing new members to the hobby and the running of meticulous study courses, that gained many amateurs a licence to operate on the bands. For his untiring efforts, Cliff was honoured by being bestowed a Life Membership of the Institute.

Apart from his tutoring activities, he was an active 'home brewer' and later in his hobby career, his station became quite sophisticated, including state of the art, computerised RTTY equipment and the preparation of establishing the mode of ATV.

Other activities of this gentleman were the sports of bowling, boating and fishing and the love of his Lodge, being honoured by becoming a Master in 1982.

Cliff, a member of the RAOTC and the Moorabbin District Radio Club, will not be forgotten for the help he has given to so many, through his quiet, unassuming manner which, endeared him to all that had the pleasure of knowing him.

Sincere condolences are extended to his XYL Margret, daughters Natalie, Jennie and their families.

Ike Tarbit VK3OW

AR

WALTER HARRY PLANT VK4FO

All, who in their lifetime, were fortunate enough to cross the path of 'Wally', as he was affectionately known, will be saddened by the news of his sudden death from a heart attack on Wednesday, 1st August 1985.

Wally was born in Birmingham, England, in 1925 and during World War II saw service as a Wireless Operator, mainly as a crew member of the Lancaster . . . 'Lonesome Lola'. He migrated to Australia after the war via East Africa arriving here in January 1962. As a UK amateur he held the call sign G3BQC before moving to East Africa, where his call sign changed to VQ4FO. This changed to VK4FO on his arrival in Australia. He was an active member of the Queensland Division of the WIA and, whenever his health permitted, strongly supported WICEN.

Maybe, as a rub-off from his visit to the Sutton-Coldfield Jamboree in Birmingham in 1958 (where Jamboree on the Air saw its origins) and because of his commitment to his three sons, he joined the Scout movement, becoming a Group Leader of his local Group, and in 1970, Assistant Branch Organiser of Jamboree on the Air in the Queensland Branch.

Wally was a quiet and gentle person, highly regarded by all his friends and, when one achieved that status, one came to know his many other talents, not least of which was his expertise in leatherwork. He was a wonderful husband to Monica, a devoted father to his three sons and one daughter, and a fine father-in-law and grandfather to the rest of his family.

He will be sadly missed by them all, as well as his many other friends in amateur radio, scouting and other fields in which he became involved.

Vale Wally.

Noel Lynch VK4BNL

THE GREAT REPEATER RUMPUS

Lindsay Lawless VK3ANJ
Box 112, Lakes Entrance, Vic. 3909

Our new president said we needed a repeater; one which we could call our own and which would make us independent.

Nobby woke up, looked around sleepily and said. *"We've got a repeater, me and Jim built it and got it going three years ago. I haven't heard much traffic on it since old Bob died but I thought everyone knew about it".* Our startled president looked disappointed, he saw his chance of impressing us disappearing at this his maiden debut as chairman.

"Yeah," said George *"it works alright between my place and Jim's — we usually have a talk on our hand helds bringin' in the cows".* Our curious president asked *"does anyone else use it?"* and *"is it any good?"* Some of those present had heard of it but didn't know which channel it was on; the rest hadn't heard of it. It appeared that Nobby, Jim, Bob (deceased) and George had enjoyed an exclusive channel for some time. *"I think we had better appoint a repeater committee to investigate this"* said our efficient president. *"would you be leader Nobby?"* Nobby declined and pointed out that he couldn't be very active until all the cows had dried out but he would provide the circuit diagram and show the way to the four wheel drive track to the site.

Several meetings later the repeater committee reported as follows — they made their way to the repeater site without incident and found everything in good working order; the batteries were fully charged, electrolyte level was correct and tests to and from the site confirmed transmitter output and receiver sensitivity satisfactory. The general opinion was that Nobby was doing a good job. *"I haven't been near the place for about eighteen months"* interjected Nobby. Our confused president fearing complications requested further investigation and another report.

At the next meeting the repeater committee reported that their representative had talked with the owners of the site and their new technician. The technician said he knew the equipment referred to and had kept it in good order and condition. Our representative thanked him profusely to which he replied *"If I'd known it was amateur gear I would have thrown it over the side".* Which he did on his next visit.

The repeater committee is now charged with the task of salvaging the Nobby repeater from a fern gully at the foot of the mount and repairing this for installation at a new site to be determined.

Our retiring president has discovered the joys of HF DX. Nobby sleeps through all meetings waking only for supper.

AR

Up until a few months ago it had been unlawful for extra phone points to be put in unless the work was done by Telecom.

However a Telecom spokesman said this had changed and products were now available to help anyone do it themselves.

Two new products being sold by Telecom were the telephone extension cord and telephone double adaptor.

A leaflet entitled "Handy, Do-It-Yourself ways to adapt your phone to your needs" explains the products.

The extension cord is 10 metres long and comes complete with a plug one end and a socket on the other.

Suggested uses for the double adaptor include extra telephones, answering machines, Viatel terminal, data modems or other telecommunications equipment.

"Make your telephones extra handy — use the double adaptor and extension cord together to connect an extension phone in your home or office," said Telecom.

For further information contact your nearest Telecom Business Office.

SOLAR GEOPHYSICAL SUMMARY-July 1985

Solar activity was low in July. On second and ninth, there were M class solar flares. The 10cm flux was elevated during the period from the first to 14th, corresponding to the transit across the visible disc of an active region which has produced energetic flares on previous rotations. The 10 cm flux again increased after the 25th when the active region returned, once more, to the visible disc.

The 10cm flux peaked at 101 on the ninth, which was the highest value since the same day, last year.

Daily 10cm readings were 1 = 74, 2 = 82, 3 = 79, 4 = 78, 5 = 81, 6 = 85, 7 = 95, 8 = 95, 9 = 101, 10 = 99, 11 = 94, 12 = 90, 13 = 83, 14 = 74, 15 = 71, 16 = 70, 17 = 70, 18 = 70, 19, 20, 21, 22, 23, 24 = 69, 25 = 73, 26 = 75, 27 = 77, 28 = 79, 29 = 81, 30 = 81, 31 = 80. The average was 79.1 with a Sunspot average of 30.8.

GEOMAGNETIC-JULY 1985

1st July . . . Geomagnetic field at storm level A = 15.

4th-8th July . . . Disturbed, with intervals of minor storm level A = 24, 16, 22, 20, 16.

11th-14th July . . . Generally active, on the 12th there were storm conditions A = 15, 35, 15, 15.

17th July . . . Disturbed, particularly 1100 to 1700UTC A = 19.

23rd and 24th . . . The field was at storm level from 0000 to 0600UTC. Active on 24th A = 11 ,15.

26th and 27th July . . . Active A = 16, 17.

31st July . . . At storm level after 0600UTC A = 38.

The most disturbed days were the 12th and 31st A = 35, 38. The month was a disturbed one, but most were relatively weak.

Bill the Philosopher

Ted Holmes VK3DEH
20 Edmunds Street, Parkdale, Vic. 3195

Bill Blitheringtwit was sitting in his garden thinking about life in general. He had come to the conclusion that life is like a battery. It had a plus and a minus. Sometimes he had got the distinct impression that there was an over-abundance of minuses but, on reflection, he had to admit that every now and again appeared a plus.

For example, there was that business with his neighbour's TV set the other day. Bill wasn't to know that the turret tuner would come away in his hand the way it did. It had cost Bill a few dollars to get the unit fixed, but he guessed (correctly) that it would be a very long time indeed before the neighbour would mention TVI again.

Then there was the XYL. Getting into the bowling club hadn't been a resounding success for Bill, but the XYL had got very interested and, in fact, was still an active member. This meant that she was absent from the house, leaving Bill to do his own thing for long periods. This was much appreciated. After all, wasn't amateur radio all about doing your own thing?

So things had worked out pretty well, on the whole. Bill sighed luxuriously and turned the pages of the magazine he had been glancing at. There was a very interesting article he had been reading about RTTY. He'd never been involved in that field of activity and was keen to get into it.

He had acquired an old Model 100 and had been boning up on the modem required to get on the air. It didn't look too difficult and, in any case, Bill prided himself on his ability to overcome problems.

All he needed were a few bits and pieces and, before you knew it, he would be on the air making those odd bird-like chirpings he had heard so often, particularly on his favourite band, 40 metres. He decided to have a rummage around his garage for some bits.

The bench was covered in a layer of assorted junk and Bill found himself an ice-cream carton to hold anything useful he might find. Several minute's diligent searching didn't turn up anything other than useless rubbish. However, he did come across a small electric drill which he thought might be handy to make the holes in the circuit board. He hadn't used the thing for many years and couldn't think why he had left it simply lying around on top of the bench, instead of putting it away somewhere. He thought he would try it out.

The power cord looked a bit frayed, but at least it was continuous. He plugged it in and turned on the power. Almost immediately he dropped the drill, as a shock almost paralysed him. Now he remembered why he hadn't put the thing away. It was live. At this stage the drill began to emit smoke, finally bursting into flames. Bill ran over to the garden tap, turned on the water, and directed the hose on to the bench top. There was a loud bang from the house fuse box.

It occurred to him that perhaps today was one of those minus days after all.

HAMADS

PLEASE NOTE: *If you are advertising items FOR SALE and WANTED please write each on separate sheets, including ALL details, eg Name, Address, on both. Please write copy for your Hamad as clearly as possible, preferably typed.*

- **Please insert STD code with phone numbers when you advertise.**
- **Eight lines free to all WIA members. $9 per 10 words minimum for non-members.**
- **Copy in typescript please or in block letters double spaced to PO Box 300, Caulfield South 3162.**
- **Repeats may be charged at full rates.**
- **QTHR means address is correct as set out in the WIA current Call Book.**

Ordinary Hamads submitted from members who are deemed to be in the general electronics retail and wholesale distributive trades should be certified as referring only to private articles not being resold for merchandising purposes.

Conditions for commercial advertising are as follows: The rate is $22.50 for four lines, plus $2 per line (or part thereof) minimum charge $22.50 pre-payable. Copy is required by the deadline as stated below indexes on page 1.

☐ TRADE ADS ☐

AMIDON FERROMAGNETIC CORES: Large range for all receiver & transmitting applications. For data & price list send 105x220mm SASE to: RJ & US IMPORTS, Box 157, Mortdale, NSW. 2223. (No enquiries at office . . . 11 Macken Street, Oakley). Agencies at: Geoff Wood Electronics, Rozelle, NSW. Truscott Electronics, Croydon, Vic. Willis Trading Co, Perth, WA. Electronic Components, Fyshwick, Plaza, ACT.

☐ WANTED — NSW ☐

TRANSMITTING VALVES: 4-250A or 4-400A. VK2KCZ, QTHR. Tel:(046) 25 1519.

☐ WANTED — VIC ☐

AUDIO WATT METER: Heathkit AW-1 or similar resistive load watt meter. VK3OM, QTHR. Tel:(03) 560 9215.

☐ WANTED — QLD ☐

EIMAC VALVE SOCKET: Type SK800B, air chimney type SK806. Also require 8874 valve & 5-6kVW filter capacitors. David VK4BGB. Tel:(07) 844 1749.

VIDEO HEADS: Can anyone supply & fit new video heads to Shibaden SV700E. VK4KD, QTHR. Tel:(075) 58 2293.

☐ WANTED — SA ☐

DRAKE R4C COMM RX: Pref with filters. No mods. Must be in good cond. Pay good price for right set. Interstate answers welcome. Bob. Tel:(087) 25 1511.

HELRAY PEAK POWER METER: Ranging from 150-500W. Will pay good price. Graham VK5YM, QTHR. Tel:(087) 25 9752 after 6.00pm.

☐ FOR SALE — ACT ☐

ICOM IC451A: As new $635. Yaesu FV707DM digi VFO, new $145. KLM 140W, 2m linear, $170. HP606A and HP608D sig gen, $325 each. VK1VP, QTHR. Tel:(062) 49 6348 AH

☐ FOR SALE-NSW ☐

AR7 RX: With complete set of coils. Modified to a self contained, single unit with int power supplies. 1st RF stage mod 6SK7. Audio stage mod for ext spkr use only. RF gain cut off mod. ACC & BFO on sep switches. Recond & aligned. Works very well. $200. Unit must be collected. VK2EES, QTHR. Tel:(067) 36 2383 AH.

FOOD RECIPE COOK-BOOK: VK2AXZ limited edition, collector's item, worthy cause. $2 posted. VK2ATZ, Westlakes RC, Box 1, Teralba, NSW 2284.

KENWOOD TL922 LIN AMP: 2 3-500Z tubes, new cond with orig instr manual, orig pack. $1600. Manfred VK2RV, QTHR. Tel:(02] 371 8854.

KENWOOD TR2400: 2m h/held complete with all manuals, spare nicad batt, fast & slow chargers & spkr mic. $200. Kenwood TS930S with built in tuner, extra filters, very good cond. $1750. 2m power amps, 50W, $60 & 80W, $100. ETI Modem, 300 & 1200 BAUD, modified for Packet Radio use. $100. Dentron Super Tuner, 1kW 160-10m with in built high power balun. $150. VK2HL. Tel:(02) 981 4762.

KENWOOD TS830S TCVR: $850. Swan TB2A beam ant, $155. CDE HAM II ant rotator with control, $150. Antenna mast with cables, $150. Adigawa PM2H power/SWR meter, $65. Zephyr 21ZA mic in grey handpiece, $15. Tel: 871 7758.

KENWOOD TS700A: 10W, all mode tcvr, 144-148MHz, 240VAC & 12VDC operation. $300. Yaesu FT227R, 10W, 2m FM mobile tcvr. $150. Athol VK2BAD. Tel:(02) 605 7731.

SWAP IC700R: amateur bands rx in 1st class cond, cannot fault, very selective & sensitive rx, for general coverage rx. Tel: Bribbaree 61.

YAESU FT107DMS: 160/10m inc WARC bands. 240VAC/13.5VDC. 12mem chs. CW & AM filters fitted. H'held scan mic. Orig cond, top perform, little use. Oper & w'shop manuals. Extender boards $850. VHF & UHF lin amp. Mirage B108 (2m) 80W out. Tokyo Hi Power mod HL45 (70cm) 45W out. Both have pre amps & suitable SSB, FM, CW modes. As new. $150 each .VK2DJH. Tel:(043) 24 7630.

YAESU VHF H/HELD 208R: Ex con, new batt pack & charger, spkr/mic. $260 ONO. FDK 2m Allmode 750GX. Ex cond. $420 ONO. Station monitor, Kenwood SM220 used only once. Has BS5 pan adaptor for TS520. $350. Tel:709 2826 AH.

☐ FOR SALE-VIC ☐

CB BASE UNIT: converted to 10m band. Freq 28.300-28.600MHz, SSB/CW. Built in PS & SWR meter. VGC $100 ONO. Mark VK3PUC. Tel:(053) 32 1333.

GENUINE SHACK CLEARANCE OF PRELOVED AMATEUR GEAR: 2 Swan design 9 el Yagis. Sell separately or $50 pair. CE55DX, 5 el tribander, 8m boom. $225 ONO. TS520 Kenwood tcvr. VGC & MC35S mic. $450 ONO. SP520 match spkr incl with above. Icom IC202 tcvr & mic. VGC. $100 ONO. Icom IC502 tcvr & mic. EC. $110 ONO. All original pack & manuals for above. Home brew linear (RSGB 640 design) & PS, 144MHz. $50 ONO. B40 rx. 640kHz-30.5MHz. Ex HMAS Melbourne. GC. Collectors item. $70 ONO. RTTY Terminal. ETI Design. See working. (730/731) Throw in Model 15 tape perf/sender. 3 spare motors. $100 ONO. Rolls of paper for all machines, fuses, etc. ATU 'Z' match RSGB. $30. ONO. Also various meters. $5 each. Geoff VK3ADB, QTHR. Tel: (053) 32 1037.

KENWOOD TR2400: H/held 2m tcvr & ST1 pulse charger with ext mic & aerial connections for base station operation. MC30S 500ohm mic to suit the lot. $250. Incl carry case. Frank. Tel:(03) 529 1686.

KENWOOD TS530SP: In VGC. $850. Eddystone 840C, gen cov rx. Very seldom used. $240. Jim. Tel:(03) 367 6920.

NATIONAL RJX601 PORT TCVR: 6m, VFO controlled, FM/AM. $180. Realistic AX190 comms rx. 11 bands inc CB & VFO input. $180. VK3CKD. Tel:(03) 561 5119.

PERFECT DX QTH: Large 2 storey home on 1.25 acres, for sale. Near summit of Dandenongs, good views of city, access nearly every VK3 repeater, 4 bedrooms, radio room, sauna, formal lounge & dining, billiards & games room, with built-in bar, large aviary & more. Lance VK3DIM or Laurie XYL. Tel:(03) 755 1758 or 755 1900

ROBOT 400: Little use & in EC, with full documentation. Includes partly built key board, with all parts and circuits. Tel:(03] 725 9285.

ROTATOR: Able CT1000 computerised rotating system. 6 mths old. $500 ONO. 4 ATN 16 lb, 432MHz Yagis, power divider & 'H' frame. $250. Andrew VK3BEL, QTHR. Tel:(053) 34 1397, weekends.

SHACK CLEARANCE: Antique coils, tuning gangs, dials, sockets, silk wire, misc components, etc. Early projector globes. Meters, transformers, genemotors, valves, 100s, many in orig early boxes. Large spaced tuning gangs, tx inductors. Powerful transformer, 100V multi tapped, 20A. Pye TRP1 port tcvr in case, with whips, 2-7MHz. GC. Hi band carphone. Command tx, 7-9MHz, GC. Much more, list available. Peter VK3APN, QTHR. Tel:(03) 211 8979.

YAESU FT-230R, 2m FM tcvr. 144-148MHz in 5kHz steps. Fully microprocessor controlled. 10 mem chan, 25W o/p. $320. VK3BEW. Tel:(057) 21 2363.

YAESU YM38 SCAN MIC: Suit all current Yaesu rigs. Sell for $35 or swap for MC50 mic. Yaesu HY55 h/phones. $10. Yaesu hand mic, 4 pin connector. Suit older gear. $10. Icom SM6 desk mic. Brand new in box. $45. VK3OM, QTHR. Tel:(03) 560 9215.

☐ FOR SALE-QLD ☐

DX100 REALISTIC GEN COV COMM RX: 520kHz-30MHz. As new in orig box & pack. Instr manual. Cost $159. Sell $95. Tel:(071) 94 1271.

FT75B WITH FP75B & DC75B POWER SUPPLIES: Orig cartons. Also FV50C VFO & spare finals. On air trial if reqd. Goes well. 100W PEP $275. Bill VK4BN, QTHR. Tel:(071) 93 1178.

YAESU FL2100B LIN AMP: Unmarked, as new. $400. VK4AGL, QTHR. Tel:(071) 41 2315.

TR2400 TCVR: H/h 2m FM synthesised 800 ch, 10 mems, scan ext/mic, mains charger, manuals. Good cond. $180 (less batt). DC200 batt power supply for FT200 tcvr. $50. VK4AKU, QTHR. Tel:(071) 45 1714.

TRS 80 MODEL 1 LEVEL II 16k COMPUTER: Macrotronics M80 CW interface, B/W TV monitor, cassette recorder & assorted software. Best offer. John VK4KOQ. Tel: (079) 58 9485.

VALVES: Tx valves, QB3-300 (4/125) $20, pair used 572Bs $70, 8008 mercury rectifiers (new) $10. Plate transformer 4kV CT, 500mA continuous $50. David VK4BGB. Tel:(07) 844 1749.

VALVES: 2 6LQ6, new. $10 each. 8 6KD6, new matched pairs. $28 pair. 4 6LF6 matched pairs. $30 pair. 6GK6, 6BE6, 6EW6, 12BA6, 12BZ6, 12BE6, 12AX7, 6BY7, 6BQ5, 6BW6, 6BA6, 6AV6, 6DX8, 6N8, 6BM8, 6AL5, 6DA6, 6DC8. $4 each. All new. Keith VK4KS, QTHR. Tel:(07) 353 1968.

☐ FOR SALE-WA ☐

EIMAC 4CX-250 TX TUBES: In absolutely mint cond, in orig sealed poly packs. 4 only at $50 each. Also STC MTR151-25A, 25W solid state, 70-85MHz tcvr, 12VDC opn. $15 each. Plus P&P. Also new RF pwr transistors, 2N5589. $8 each. 2N5590, $9 each. 2N5591, $10 each. Ray VK6PW, QTHR. Tel:(09) 339 1359.

ADVERTISERS' INDEX

Just when you thought you'd seen it all . . . .

Latest Generation Receivers from Yaesu!

FRG9600 Scanner

Never Before! A scanning receiver that has so many features, offers so much. And it's absolutely ideal for the amateur, too! It offers **continuous coverage** between 60 and 905MHz, in all modes (SSB up to 460MHz), with FM and AM in both wide and narrow bandwidth. But that's not all:

You get 100 keypad-programmable memory channels, full rotary dial tuning as well as push-button tuning, fully programmable scanning in various modes . . . and much, much more.

PLUS it's a CAT unit: with the optional interface you can control its operation from most micros! Virtually unlimited customised control functions in software are possible!

Impressed? Not half as impressed as you will be with one in your shack!

Specifications:

Range: 60 — 905MHz (SSB 60 — 460MHz)
Modes (3dB bandwidth)

FM (N): 15kHz 0.5uV Sens (12dB SINAD)
FM (W): 180kHz 1.0uV Sens (12dB SINAD)
AM (N): 2.4kHz 1.0uV Sens (10dB S+N/N)
AM (W): 6kHz 1.5uV Sens (10dB S+N/N)
SSB : 2.4kHz 1.0uV Sens (10dB S+N/N)

Conversion:	Triple for FM (N) AM & SSB, Double for FM(W)
IFs:	45.75MHz, 10.7MHz and 455kHz
Image rejection:	60-460MHz — 50dB typical
	460-905MHz — 40dB typical
Memory Channels:	100
Power Supply:	12-15V DC 550mA (lithium cell back-up)

LIMITED STOCK!

(Includes power supply) **$799**

Cat D-2825

Orders taken now at your nearest DSE store

DICK SMITH ELECTRONICS PTY LTD

B-052

FRG8800 Receiver

What about HF, you ask?

No worries. Yaesu design engineers have excelled themselves yet again!

- General coverage from 150kHz to 30MHz
- All mode, including AM wide and narrow and FM narrow
- 12 internal memories (push-button) with scanning functions
- Selectable AGC rates, noise blanking widths & tuning rates
- Dual digital clocks (great for different time zones)

And so much more!

PLUS, it's also a CAT system: add a microcomputer and the optional interface and you can transfer function to your micro!

And even more: with the optional VHF coverter (fits completely inside) you also get 118 - 174MHz.

It also uses the '7700' series of accessories: active antenna, and antenna tuner.

Specifications:

Modes:	AM, SSB & CW in both wide and narrow; FM (N)
Sensitivity:	AM, SSB & CW: 10dB or better (S+N/N)
	FM (N): 20dB or better (S+N/N)
Selectivity:	AM (W) 6kHz (−6dB), 15kHz (−50dB)
	AM (N), SSB, CW 2.7kHz (−6dB), 8kHz (-50dB)
	FM (N) 12.5kHz (−6dB), 30kHz (−40dB)
Antenna Imp:	50 ohms and 500 ohms (VHF conv 50 ohms)
Power:	240V AC

Cat D-2820

$899

Alternative: FRG-8800 SW — 2MHz to 30 MHz range, otherwise identical $829.00
Cat D-2821

LIMITED STOCK!

Optional VHF Converter

Yes! 118-174MHz from your FRG-8800. And it fits completely inside the set — operation is completely automatic. Full dial or pushbutton selection, same features as standard set.

Incredible versatility - and full CAT operation too.

Cat D-2823 **$189**

Your entire spectrum? Covered!

Icom's latest dual band IC-3200A delivers a powerful 25W punch at VHF & UHF. Big performance. Small size. *Lowest price dual bander on the market.

HF, VHF, UHF: Icom's spectrum of technology.

An ultra compact 100W HF transceiver small enough to go mobile. The IC-735 combines size, superior performance, & FM, CW, LSB, USB, AM to become a new HF standard: yet the simplified front panel makes the IC-735 easy to use, even when mobile.

Powerful, clean performance in the bands you use most. Icom's team perform for you at your local authorized dealer.

Like a brochure? Send us your name & address.

Simply the best.

AMATEUR RADIO

VOL 53, No 11, NOVEMBER 1985

JOURNAL OF THE WIRELESS INSTITUTE OF AUSTRALIA

75th ANNIVERSARY 1910 1985

JAMBOREE ON-THE-AIR

Special Queensland 75th Anniversary Issue

WELCOME

The Wireless Institute of Australia welcomes overseas dignatories and visitors to our 75th Anniversary Celebrations. We particularly welcome:

The (Right) Honourable Michael Duffy MP
Minister for Communications

Mr Richard Butler
Secretary General of the International Telecommunications Union, Switzerland

Mr Richard Baldwin W1RU
President of the International Amateur Radio Union

Mr Carl Smith W0BWJ
Vice-President of the International Amateur Radio Union

Mr David Sumner K1ZZ
Secretary of the International Amateur Radio Union

Mr L Van Der Nort PA0LOU
Chairman of the International Amateur Radio Union, Region 1

Mr John Allaway G3FKM
Secretary of the International Amateur Radio Union, Region 1

Mr Pedro Seidemann YV5BPG
President of the International Amateur Radio Union, Region 2

Mr Alberto Shaio HK3DEU
Secretary of the International Amateur Radio Union, Region 2

Mr David Rankin 9V1RH/VK3QV
Chairman of the International Amateur Radio Union, Region 3

Mr Keigo Komura JA1KAB
Director of the International Amateur Radio Union, Region 3

Mr Masayoshi Fujioka
Secretary of the International Amateur Radio Union, Region 3

Ms Tsuyako Miyagi
Assistant Secretary of the International Amateur Radio Union, Region 3

Mr Larry Price W4RA
President of the American Radio Relay League

Mr William Stevens W6ZM
Pacific Director of the American Radio Relay League

Mr Wang Xun
Chinese Radio Sports Association

Mr Huang Yongliang
Chinese Radio Sports Association

Mr Pentti Lareva OH3TY
Finland Amateur Radio Society

Mr Shozo Hara JA1AN
President of the Japan Amateur Radio League

Mr Yoshi Arisaka JA1HQG
Director of the Japan Amateur Radio League

Mr Yutaka Kasahara JA1CLN
Manager, External Affairs, Japan Amateur Radio League

Mrs Junko Tanaka JR1ANP
Japan Amateur Radio League

Also travelling is a large delegation of JARL members

Mr Seung Bang Park HL1AFR
Vice President of the Korea Amateur Radio League

Mr Terry Carrell ZL3QL
President of New Zealand Amateur Radio Transmitters

Mr Erlanega Suryadarma YB0BZZ
Organisasi Amatir Radio Indonesia — Council

Mr Ben Samsu YC0EBS
Organisasi Amatir Radio Indonesia — Council

Dr Sukarto YB0MS
Secretary General of the Organisasi Amatir Radio Indonesia

Mr S Anwar Mahmood Shah AP2AM
Pakistan Amateur Radio Society

Mr David Evans G3OUF
General Manager of the Radio Society of Great Britian

Mr Nick (A H) Percival 9Y4NP
President of the Trinidad & Tobago Amateur Radio Society

On behalf of the members of the Wireless Institute of Australia — the World's Oldest Amateur Radio Society — I bid you welcome and hope that you all have a memorable stop-over on your journey to New Zealand.

D.A. Wardlaw

David Wardlaw VK3ADW
Federal President
Wireless Institute of Australia

AMATEUR RADIO

Published monthly as the Official Journal by the Wireless Institute of Australia, founded 1910. ISSN 0002 – 6859. Registered Office: 3/105 Hawthorn Road, Caulfield North, Vic. 3161. Telephone: (03) 528 5962.

SPECIAL FEATURES

TECHNICAL FEATURES

REGULAR FEATURES

November's issue of Amateur Radio is a special "Jumbo" size edition and features much news, views and history.

VK4, this month, have a special segment containing a history of radio in that State, year by year, until WWII intervened, plus a look into many other historical events in Queensland.

Roger VK2ZTB, probes the intrigues of Aircraft Enhancement further. Roger examines the previous results, together with other information available about this phenomenon, and suggests a preliminary "model" of the propagation mechanism.

Is membership to your radio club flagging? Are you concerned at the lack of new, young amateurs coming up through the ranks? A letter from Jim VK2BQS, page 76, and an editorial from CQ magazine gives an insight into some of the reasons why the youngsters may not be interested in radio and suggests that everyone must attempt to prove to them what a good hobby radio really is.

What happens to old amateurs when they move into Retirement Villages? It is a time for retirement and enjoyment of their hobby, but many are restricted as they are not allowed to erect antennas and henceforth, in many cases, no amateur radio. Harry VK6WZ, after a chance encounter with an old-timer, has given this problem much thought, and suggests that special "Villages Veekay" be erected so the OTs may enjoy their hobby in peace, with no restriction. *See page 8.*

DEADLINE

All copy for inclusion in the January 1986 issue of Amateur Radio, including regular columns and Hamads, must arrive at PO Box 300, Caulfield South, Vic. 3162, at the latest, by midday, 11th November 1985.

RADIO EXPERIMENTER'S HANDBOOK

This first volume is 132 pages chock-full of circuits, projects to build, antennas to erect, hints and tips. It covers the field from DX listening to building radio-teletype gear, from 'twilight zone' DX to VHF power amplifiers, from building a radio FAX picture decoder to designing loaded and trap dipoles. This book carries a wealth of practical, down-to-earth information useful to anyone interested in the art and science of radio. Your copy is available by mail order for $7.95 plus $1 to cover postage and handling (add $5 to these charges for air mail postage outside Australia) from:

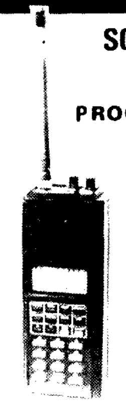
AIMING HIGH WITH COMMUNICATIONS ACCESSORIES FROM GFS



SCAN THE BANDS WITH OUR NEW SX-155

PROGRAMMABLE POCKET SCANNER

This new unique scanner provides coverage of 26-32, 68-88, 138-176 and 380-514 MHz with a sensitivity of less than 0.5 uV. Four banks of 40 memory channels, total of 160 memories. High scan speed of 16 CH/SEC. Auto search and store mode. Priority channel. 4 hour life on supplied Nicad batteries 24 Hour clock. Selectable Scan/Search delay of 0.1 or 2 seconds. Includes Nicads, charger, carrying-case & antenna.

SPRING SPECIAL

$399 + $14 P & P

EDITOR'S COMMENT

MORE ANNIVERSARIES

It is in the nature of us all to endow with some significance the passing of one or more whole years since some notable event. Birthdays and wedding anniversaries are always an occasion for celebration. We become even more impressed when the number of years is a multiple of five or ten. There is little doubt that our decimal counting system was originally based on our quota of fingers, so, as with the Chinese abacus, the special significance of five and ten is easily understood.

However, this year of 1985 seems to have been endowed with more than the usual number of anniversaries, significant to us as radio amateurs. All this year we have, of course been celebrating the 75th Anniversary of the WIA, and those of us in VK3 are also enjoying the 150th Anniversary of the State of Victoria. Last month, we mentioned the Girl Guides organisation, which shares, with the WIA, a 75th Anniversary, noted the 40th Anniversary of Hiroshima and Nagasaki, and the end of World War 2. We also proposed a listing of all those who have belonged to the WIA for 50 years.

But, that's not all! An organisation very closely connected with the WIA in its early days was the RAAF School of Radio, which began as the Signals School at Laverton, in 1935, and after various changes of name and location, (to Point Cook and Ballarat) came back to Laverton in 1961 under its present name, and forms now, a large and impressive part of that Air Force Base.

All those who have qualified for the WIA 50 year Honour Roll will remember the pre-war RAAF Wireless Reserve, whereby the WIA and the RAAF were jointly involved in building up a nucleus of competent amateurs, familiar with Air Force practice, many of whom went on to serve in the war. We remember some of the unlucky ones, every year, in the RD Contest (which will have its 40th Anniversary in 1988, Australia's Bicentenary year! These special years keep on coming!).

Perhaps, not totally unrelated, another 50th Anniversary also occurs this year. It was in 1935, that experiments in England proved the feasibility of detecting distant ships and aircraft, by their reflection of radio waves. In the atmosphere of increasing international tension until the war erupted in 1939, this discovery was of obvious strategic value, and a high pressure top-secret development programme led to Britian having a viable radio-location system when war broke out. With the British-invented magnetron and American mass production, radar (radio detection and ranging) became a vital factor in the eventual Allied victory. Some of our older members were involved in this developmental saga.

Now radar not only guides our missiles and spacecraft, but maps the planets, brings airline passengers routinely home through all kinds of weather, and even detects us exceeding the speed limit! Today the magnetron also cooks some of our meals; truly a ploughshare, as well as a sword!

Bill Rice VK3ABP

AR

WIA Seventy Fifth Anniversary

In celebration of the 75th Anniversary of the Wireless Institute of Australia — the world's oldest amateur radio society — Mr Murray Hull of Parameters Pty Ltd, has donated one of his company's new range of Digital Multimeters to the Institute for use in a membership recruitment competition, during this Anniversary Year.

The rules are simple: any member who sponsors a new member during NOVEMBER 1985, will be entered into a draw to be held after receipt of lists from Divisional Offices, by the Federal Office. If you sponsor more than one new member, you increase your entries in the draw.

As usual, there are exceptions and Officers and Employees of the Institute, and their families are not eligible.

The 75th Anniversary Sub-Committee extends its thanks to Mr Hull of Parameters Pty Ltd, for his generous gesture.

IARU ADMINISTRATIVE COUNCIL MEETING

The IARU Administrative Council will be holding a business meeting in Melbourne on the 8th and 9th November 1985. All members of Council from around the world will be attending. This meeting is being held by the IARU's Administrative Council, to honour the 75th Anniversary of the Institute.

BOOK PACKS, THE 75TH ANNIVERSARY AND THE YEAR OF YOUTH

The June issue on this item has generated a great deal of interest and mail to the Federal Office. In order to satisfy many of the questions being asked, listed below are the contents of each book pack. (Items may change subject to availability).

$15 pack. P&P Paid.
Into Electronics (NSW Education Service), Novice Electronics, 100 Basic Projects, Guide to Amateur radio (RSGB), WIA Book 1, WIA Call Book, and Radio Amateurs World Atlas.

$30 pack. P&P Paid.
The following plus the $15 pack:
Basic Training Manual (NZART), Hints and Kinks (ARRL), and Weekend Projects (ARRL).

$50 pack. P&P Paid.
The following plus the $30 pack:
ARRL Handbook (ARRL), and Maidenhead Locator World Atlas.

Each pack will contain information on amateur radio in the form of letters, leaflets, and posters.

When applying for a book pack, please ensure that you enclose, in your request to the Federal Secretary, details of the Club/Group making the presentation and the recipients. It must be stressed that the value of these packs bears no resemblance to retail prices.

AR

WIA NEWS

(WARC-ORB (1)) completes its work.

After nearly 40 days of work, the First Session of the World Administrative Radio Conference on the Use of the Geostationary-Satellite Orbit (GSO) and the planning of the Space Services Utilising It (WARC-ORB (1)), organised by the International Telecommunication Union completed its work on Sunday, 15th September 1985. It was opened on Thursday, 8th August at the International Conference Centre in Geneva and attended by over 900 delegates and observers from 111 countries and 14 international organisations.

BACKGROUND AND PURPOSE

This Conference was the first of its kind in history and had before it, as its principal task, to decide which space services and frequency bands should be planned and establish the technical criteria and the planning method(s) to be used. The Conference was also requested to adopt Final Acts to enable the incorporation of the decisions of the 1983 Regional Administrative Radio Conference for the Planning of the Broadcasting-Satellite Service in Region 22.

Tremendous progress in the field of space radio-communications and satellite telecommunications has taken place since the

Members of the Union first took specific steps at the Ordinary Administrative Radio Conference of 1959, to adopt new international legislation to govern the radio frequency spectrum for space activities.

These developments, together with the ever-increasing realisation of new service applications, linked with ever-decreasing unit costs, led to a series of administrative radio conferences for space radio-communications, the first of which was held in 1963.

The principle of the use, by all countries, with equal rights, of the GSO and the frequency bands allocated to the space radiocommunication services was established by the Space Conference in 1971 and endorsed (Resolution No 2) by the World Administrative Radio Conference, Geneva, 1979. Furthermore, the WARC-79, in its Resolution No 3, relating to the Use of the Geostationary Satellite Orbit and to the Planning of Space Services Utilising It, resolved that a world administrative radio conference, to be held in two sessions, was to be convened to guarantee in practice, for all countries, equitable access to the GSO and the frequency bands allocated to space services using it. (For the agenda of the Conference, refer to Press Release ITU/85-12(Corr) of 7th August 1985).

During the five weeks of meetings, the Conference endeavoured to find a balanced solution that would not only permit any Member of the Union to start a satellite service on a basis of equality and consolidate continuing equal access to satellite services, but also avoid hampering the development on a sound basis of satellite technology aimed at improving spectrum use and economic viability — especially in view of the present rapid rate of technological advance in all fields of telecommunications.

The WIA, whilst not directly participating in this Conference, did give a thorough briefing to the Australian delegation on amateur involvement prior to its departure. The delegation will report to the Federal Executive any decisions taken that could effect amateur radio in space.

LICENCE FEES

The Department of Communications has notified the Institute that as from September 1985, the fee for an amateur licence will be $23.00 per annum, an increase of $2.00.

1985 IARU REGION III CONFERENCE

David Wardlaw VK3ADW, the Federal President and the Institute's IARU Liaison Officer, will lead a WIA Delegation to the Conference in Auckland, New Zealand, this month. Accompanying David will be Ron Henderson VK1RH, Guy Minter VK4ZXZ, and an observer, Wally Watkins VK2DEW.

Michael Owen VK3KI, as a Director of Region III, is also travelling to New Zealand.

Host for this Conference is our Sister Society, the NZART, who will be supplying the back-up facilities.

IARU REGION III CONFERENCE 1988

As part of the proposed Bi-centenary celebrations in 1988, the Institute has proposed to the Administrative Council of the IARU, that the 1988 IARU Region III Conference be held in Australia. A decision on the venue will be made during the IARU Region III Conference 1985, being held in Auckland, this month. There will be other contenders for the Conference in 1988. At the time of writing, we know that Korea has also applied (in conjunction with the 1988 Olympic Games).

GOVERNMENT ISSUES DISCUSSION PAPER ON RADIO COMMUNICATIONS PRIVACY

Currently the Institute's officers are studying a discussion paper on the above subject, issued by the Minister for Communications, Mr M Duffy. The paper covers the Intent, Concerns, the Issues and Implications of possible new legislation to ensure privacy, by controlling unauthorised reception of radio communication signals.

The Minister, commenting on the paper, has said that some privacy control was possible under the Telecommunications (Interception) Act 1979, but this was restricted to controlling the interception of communications over the Telecom network. The Minister continued that, over the past 25 years there has been an explosive growth in the number of radio communication services in Australia. In many cases, interception of the messages is of no concern, but in others, for security or commercial reasons, confidentiality is vital to the user.

The Government is not considering legislation to prevent interception by unsophisticated devices such as scanners used by casual listeners and hobbyists. What is being considered and discussed is legislation which would support users who go to the trouble and expense of encoding their messages.

MEXICAN EARTHQUAKE DISASTER

At the time of preparing this news segment, we know that a number of first-hand reports of this disaster have been made by amateurs through the media. Australian amateurs are assisting in passing personal messages into Mexico.

AR

VILLAGE VEEKAY

It was a million to one chance — but it had happened. Two strangers, side by side, in a bus, suburbs bound from the city, and they discovered they shared a common interest — amateur radio.

Harry Atkinson VK6WZ

294 Middleton Road, Centennial Park, Albany, WA. 6330

He'd lived in the city all his life, I was a recent arrival from the country. We had worked once or twice, as it happened, but had never met until that moment.

"What do you think of that?" He held up a small plastic bag with an electronics firm's logo on the side. "Few ounces — grams they call it now — of 30 gauge enamelled. Cost $7!" I made sympathetic noises.

His tone of disgust turned to one of triumph. "But, I'll beat 'em with this. See if I don't!"

"Who — the people in the shop?" "No!" Disgust again, this time directed at me. "Listen," he went on, "ever seen those articles in AR and QST — you know, about invisible antennas and the like?" I nodded. "Well, that's what this is for — my own invisible antenna. I'll trick them and be back on 40 and 80 again, talking to the boys. You can't keep a good amateur down!"

It happened that he was a widower and had recently sold his house and invested the proceeds in a unit at a retirement village. That was where some things got better ... and others worse.

The unit was ideal in every way. No steps to climb. No maintenance, except by paid professionals. On-site health care if needed. Everything one could ask for — well, nearly everything.

No radio masts. No beam antennas. No amateur radio. Comfortable rooms. Nice furniture. Friendly neighbours and staff. But no radio! !

"What makes me so mad," he continued, "is this. All the experts say we oldies must have hobbies and/or pets, for a full and happy life. At the units there are people playing bowls, golf, mini-golf, even tennis. They are encouraged to take part in indoor and outdoor pastimes, they can even have pets. There are so many activities, but no radio!"

The bus rumbled on. I felt sorry for him. In an age when life was blooming, he was one of society's neglected men. His voice broke in on my thoughts. "Nice meeting you; keep an ear open for me on 80 one of these nights!" He waved his little bag, rose and got off.

As the bus moved on again I went back to my thoughts. Why should amateur radio be taboo in a retirement village? Retirement is the very time when OMs and YLs look forward to pursuing their hobby with even greater enjoyment than before. They have more time for every facet of the hobby.

There must be many who have had to sell their gear and give up their hobby because of the hard-and-fast, uncaring rules and regulations in institutions and retirement villages. All over Australia, numerous bodies are devoted to the improvement of conditions for the elderly, but amateur radio remains the one area which, far from being simply neglected, is actually being discouraged.

"We can't have visual pollution. I mean, aerials and all that wire hanging about the place. And of course there is all that interference with television. But, how about joining the aerobics class? Or even tiddleywinks?"

No thanks. I'm headed for Village Veekay. The first of many, I hope. A village for amateur radio operators. Singles or couples. All 'mod cons' as in an ordinary retirement village, but with one important extra. AMATEUR RADIO! I

Can you visualise it? A village where amateurs co-operate on a loosely-framed roster basis. Where all the proper procedures will be followed so that television, computers and flectronic musical instruments, can live happily, side by side ..... with radio. A place where scheds can be kept without hassles.

A pipe dream, you say. Don't be negative. Radio itself was a pipe dream, once-upon-a-time.

So, who is going to build the first Village Veekay? Who is going to take the plunge? Cost? No worry, all that is needed is a sponsor for the idea. Retirement villages are largely financed by the occupants themselves — directly or indirectly. What is needed is a live, but small steering committee to make contacts with State and Federal Departments involved in community funding, to get the facts and to discuss the scheme with developers. Friendly societies, churches and lodges, those already involved in villages, would be an invaluable source of information.

How about marking the WIA 75th Anniversary by laying the foundations of this scheme? Remember ladies and gentlemen under 50 — your turn will come, one day. Won't it be nice to have a Veekay Village to turn to? **AR**

AIRCRAFT ENHANCEMENT OF VHF/UHF SIGNALS

— towards a propagation model

Roger Harrison VK2ZTB
PO Box 289, Wahroonga, NSW. 2076

In the July 1985,issue of Amateur Radio[1], Doug McArthur VK3UM, detailed results of observations, carried out over some two years, of unusual signal level 'enhancements' of VHF and UHF troposcatter signals over the Melbourne-Sydney and Melbourne-Canberra paths. This paper examines the results reported, along with other information gleaned about the phenomenon from the many other amateurs exploiting the propagation, and sets forth a preliminary 'model' of the propagation mechanism. Suggestions for further experimental investigations and measurements are advanced.

Being a long-time VHF/UHF enthusiast, with a keen interest in propagation, my curiosity was naturally aroused by Doug McArthur's article in the July 1985 issue of AR[1]. In some detail, Doug describes how, during attempts at making contact via tropospheric scatter on 144MHz between his station, in Melbourne, and Gordon McDonald VK2ZAB, in Sydney, a path some 700km long, massive 'lifts' in the signal level lasting some minutes were evident at times. The same effect was observed, fortuitously, on the Melbourne-Canberra path. This led to the effect being correlated with the passage of domestic passenger aircraft more or less passing through the path mid-point between the stations.

Subsequent to the early observations, many other stations exploited the 'newly-discovered' propagation mode and a series of co-ordinated contacts threw up a great deal of data about the phenomenon. In addition, the same paths initially exploited on 144MHz were successfully attempted on 432MHz, with similar results.

In summary, here are the observations reported:

a. Predominantly, the phenomenon has been exploited with south-bound aircraft.

b. Enhancement periods on the Melbourne-Sydney path, for 144MHz, are about 2-7 minutes. On 432MHz the period decreases to about half or two-thirds.

c. Signal level 'lift' observed is estimated to be 30-60dB. Subjectively, signal lift on 432MHz appears greater than on 144MHz.

d. No 'flutter' fading of signals is observed.

e. Signal level lift and period of enhancement are dependent on upper-air wind conditions. Period and signal strength are best when upper-air conditions are 'quiet', worst when 'turbulent'. Diurnal (daily) and seasonal effects are noted (though subjective); winter providing better enhancements on average than summer, and evenings being better than daytime or morning.

f. Stations in Frankston (Melb) hear stations in Sydney some two to three minutes earlier than VK3UM, who is located about 40km closer to Sydney.

g. Best enhancement periods are observed when stations lie close to the line of the aircraft track.

h. Stations located up to 60km distant (possibly more), orthogonal to the aircraft track, have exploited the phenomenon.

i. 'Backscatter' propagation is noted between Canberra and Sydney stations while exploiting propagation on south-bound aircraft. This phenomenon is only noted during exceptional 'lift' conditions.

j. Lengthened enhancement periods are observed when two (or more) aircraft pass at 8-15 minute intervals.

k. The size and type of aircraft seemingly has little bearing on the enhancement characteristics, although jet or turbo-prop aircraft are known to be always involved.

That gives a fairly complete picture of the aircraft enhancement propagation phenomena.

MECHANISMS PROPOSED

Three possible mechanisms were proposed by McArthur:

i. Direct reflection from the body of the aircraft.

ii. Reflection from the condensation trails left by the aircraft flying above 30 000 feet (about 9km).

iii. Refraction caused by the air turbulence wake left by such aircraft. (Temperature heating effect or vortex turbulence).

From personal discussions with Gordon McDonald VK2ZAB, he favours i. as the explanation.

The model of the propagation mechanism I propose to explain the characteristics of the phenomena is based on iii. First, however, let me explain why I dismiss i. and ii.

I do not think reflection from the aircraft is the mechanism involved, nor does it contribute to the observed signal levels. I have argued this in another article, published in 6UP recently[2], but let me re-cap here. There are two reasons why I believe direct aircraft reflection is not a consideration:

I. Consider Figure 1. If the aircraft is acting as a mirror, the reflection of the signal will have a 'foot-print' on the ground that travels at twice the speed of the aircraft and in the **same direction.** *The observation in f. above directly contradicts this and an aircraft reflection model does not explain this important observation of which I have first-hand experience[2].*

II. There are widely differing opinions, even in the engineering texts, as to how to calculate the signal levels after reflection from the aircraft. Picquenard[3] gives a relatively simple 'mirror' reflection method for calculating the signal strength. Consider Figure 2. Picquenard indicates the total path loss, from A to the 'mirror' to B, is the sum of the individual path losses. This model takes the 'mirror' to be simply a re-radiator of the energy illuminating it.

Take the VK3UM-VK2ZAB case. I calculate the distance between the stations to be about 708km. For the 'mirror' at path midpoint (0.5d), the distance between A and the 'mirror' is 354km. From [3], the free-space path loss for this distance is calculated from:

Loss = 32.4 + 20log(d) + 20log(f)
where — d is distance in km
f is frequency in MHz

On 432MHz, we get:

Loss = 32.4 + 20log(354) + 20log(432)
= 32.4 + 20(2.55) + 20(2.64)
= 32.4 + 51 + 52.8
= 136dB (within 1dB)

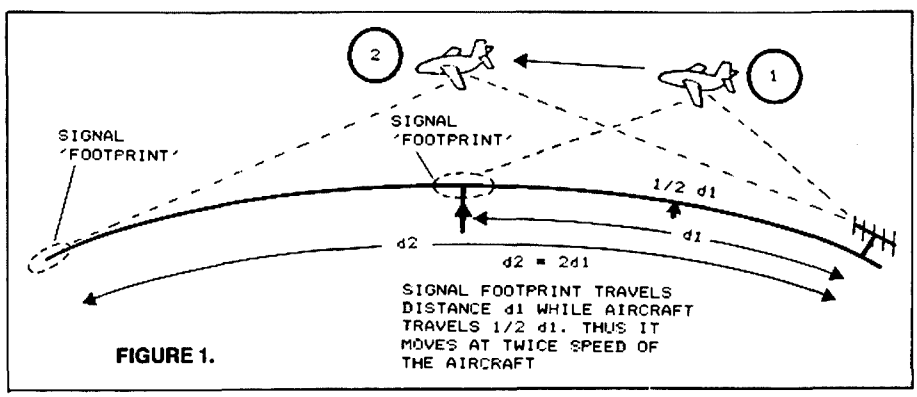

FIGURE 1.

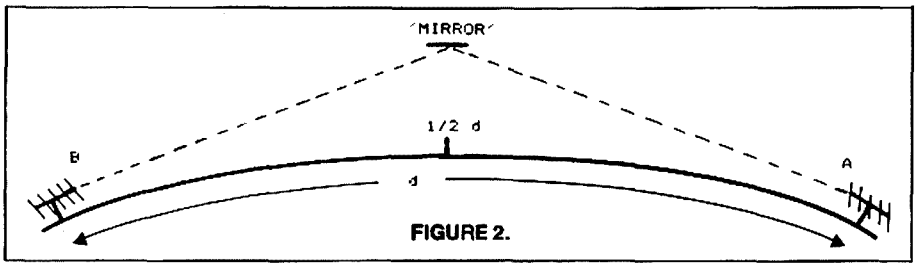

FIGURE 2.

Thus, total path loss is twice that, or 272dB. Note that the EME path loss is 262dB on 432MHz[4], which makes the 'mirror' model 10dB worse off under these circumstances providing Picquenard's methodology applies.

Even if the 'mirror' were able to focus the signal, thus providing an improvement in signal strength by concentration of the beam reflected, this model of the mechanism cannot apply as so little power falls on the 'mirror'.

In addition, stations off-track would reflect a foot-print off-track on the opposite side of the aircraft track and the observations do not show this.

As for ii., aircraft vapour trails comprise atmospheric water vapour. Radio waves travel slower in such a medium and thus a terrestrial VHF or UHF radio wave impinging on the vapour trail would be refracted upwards, away from the ground. In addition, vapour trails are not always present where signal enhancement is experienced.

For those who might consider some form of reflection from a possible ionised trail left behind by the aircraft exhaust, let me point out that the recombination time of atmospheric ions at the aircraft altitudes involved would be extremely short. Remember, the aircraft fly well below the minimum height of the ionospheric D layer.

Now, let me set down the geometry of a variety of the paths exploited by different stations as this is important to my hypothesis and gives a more 'visual' picture of what is going on.

GEOMETRY OF PATHS

An overview of the Melbourne-Canberra-Sydney path is shown in Figure 3. The Sydney-Melbourne (south-bound) aircraft track has a bearing of about 50-51 degrees (from Melbourne), which is pretty well along the Great Circle path joining Melbourne and Sydney. Canberra lies just to the east of the track. The aircraft will take an actual flight path that may be a few kilometres east or west of this track at times, but that only contributes a minor, if at all noticeable, variation, as we shall see later.

The Melbourne-Sydney aircraft track takes a bearing slightly northward of the southbound track, flying some 50km or so to the west of Canberra before turning east again on the approach to Sydney. The aircraft fly at heights between 30 000 feet and about 45 000 feet, or roughly 9km to 13.5km altitude.

From a mass of data about reported contacts between stations[5], I have sorted out some particular contacts that provide a picture about the details of the path geometry. The paths chosen are listed in Table 1, in which I have listed the point-to- point distances involved. Note the large path distance variation observed, from 360km to 750km. I would point out that these are not necessarily the maximum or minimum limits.

Using a set of ICAO World Aeronautical Charts covering the Melbourne-Canberra-Sydney path[6] I plotted the general track of the Sydney-Melbourne flights involved and then measured the orthogonal distance of four off-track locations of Victorian stations who had exploited the enhancement phenomena to get an idea of the size of the 'foot-print' of signals from Sydney and Canberra. The geometry of the idea is shown in Figure 4, and the orthogonal distances listed in Table 2.

It is apparent from observations and chart plotting that VK3UM, at Chirnside Park, in Melbourne, is located very close to the line of the general aircraft track. How fortuitous! It seems, also, that some Sydney stations are similarly positioned, *(Note, though, that aircraft descending for a landing at Melbourne airport, Tullamarine, turn off-track well to the north of VK3UM).*

The vertical geometry of the situation is illustrated in Figure 5. Essentially, this is an optical model of the situation. The station at A will 'lose sight' of the aircraft when it passes point M. Likewise, the station at B will lose sight of the aircraft when it passes point L.

Using this diagram, you can fairly well estimate the time taken for an aircraft to traverse M-L and the 'seeing angles' (a and b) for given path lengths, knowing the typical aircraft cruising speeds and altitudes for the paths involved as reported in [1]. The various aircraft that fly the Sydney-Melbourne route cruise at speeds that range from around 800km/hr to 910km/hr (from data supplied by the various carriers).

From [7], I worked out typical tangential distances station-to-aircraft and was able to make good estimates of the time two stations could 'see' an aircraft, as well as the other parameters. As you would expect, the parameters vary with path length, aircraft cruising speed and altitude and the altitude of the stations.

Typically, on the Sydney-Melbourne path, stations are able to 'see' the aircraft for periods of around five to seven minutes. On the Canberra-Melbourne path, stations are able to 'see' the aircraft for some 18-23 minutes (ignoring the obscuration of Black Mountain for some VK1s). We'll see how this fits into the reported enhancement periods shortly.

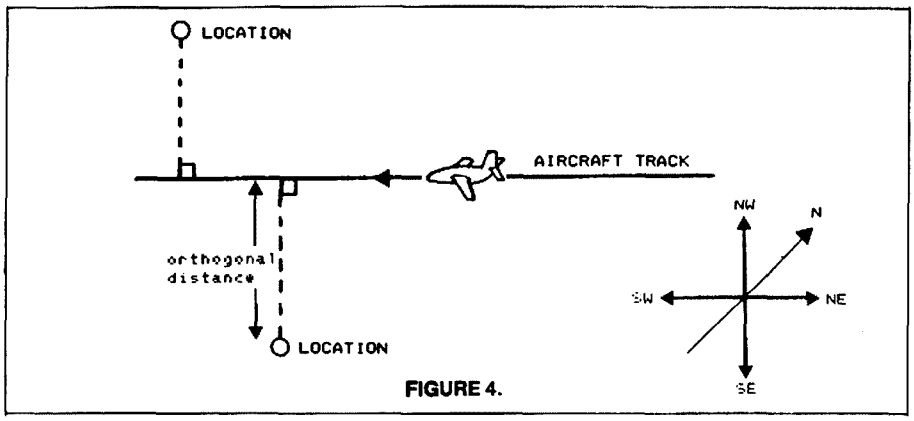

FIGURE 4.

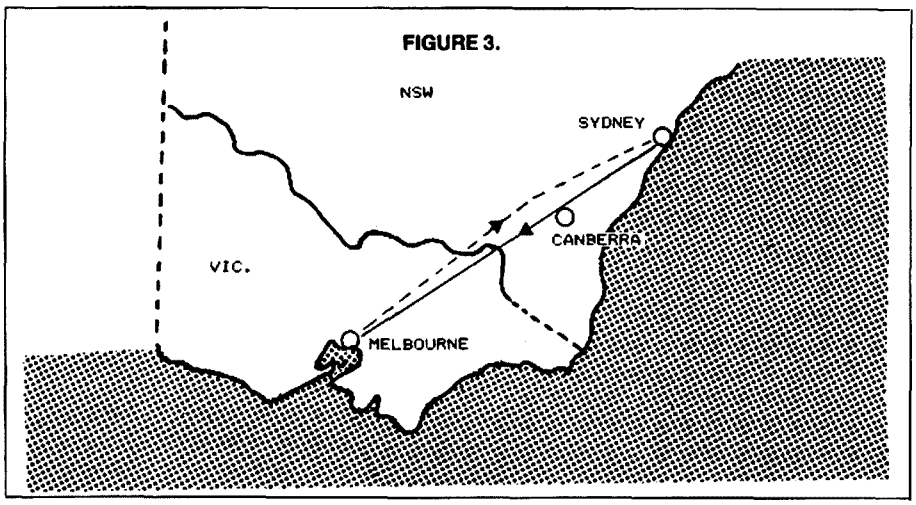

FIGURE 3.

THE SIGNAL 'FOOT-PRINT'

By timing the first appearance of a signal at two separated stations located at one path terminal[2 5], it is apparent the signal foot-print travels toward the aircraft at about the same speed as the aircraft is flying. By timing the period of the enhancement — from acquisition of the signal to loss of signal — one gets an idea of the longitudinal width of the foot-print at a particular station location. By taking into account the orthogonal distances listed in Table 2, one gets an idea of the lateral extent of the foot-print.

From putting together more or less simultaneous observations by Melbourne stations located on-track and off-track[5], it seems the lateral and longitudinal width varies with upper-air wind conditions. The foot-print apparently shrinks when upper-air conditions are turbulent.

Well, just how big is that foot-print and what might its shape be?

For the Sydney-Melbourne path I would judge the foot-print to be roughly elliptical, or

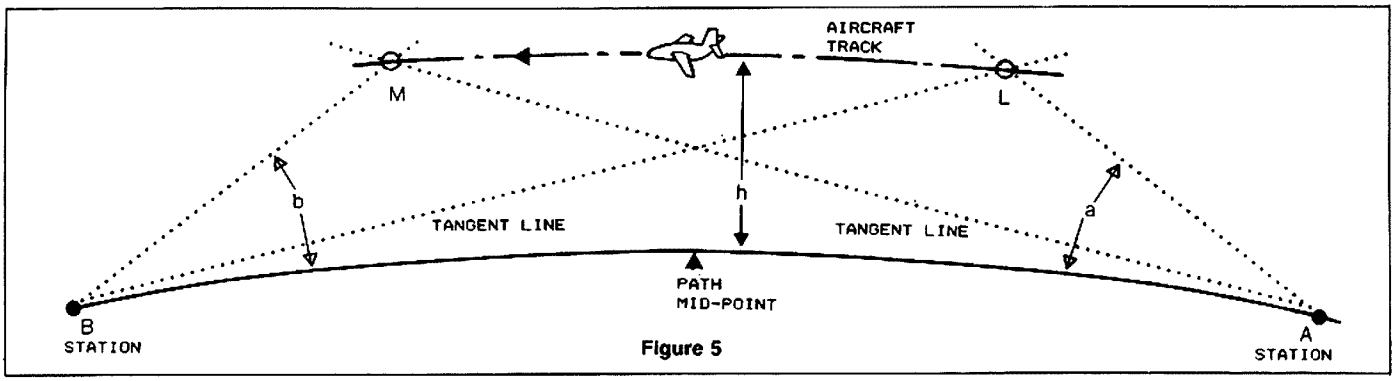

Figure 5

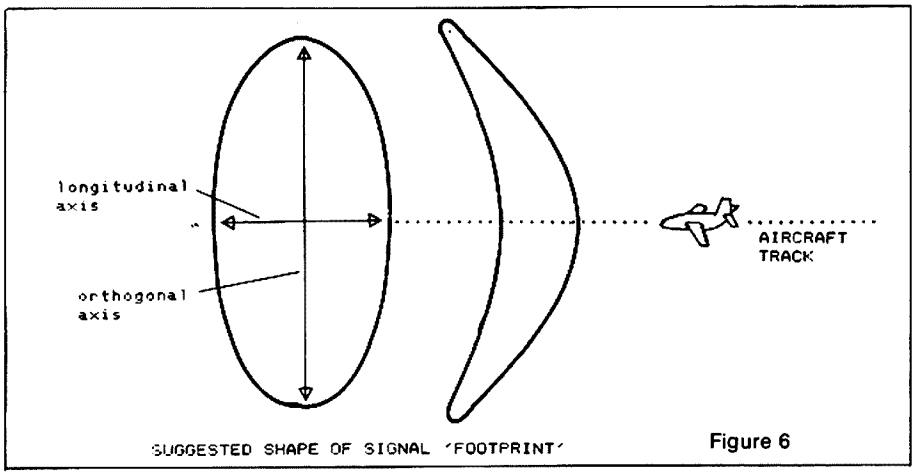

Figure 6

perhaps an ellipse 'bent' into a crescent shape (not unlike a boomerang!), see Figure 6. Under conditions of best enhancement, its longitudinal axis seems to be around 60-70km, and its orthogonal axis somewhat greater than 120km. When conditions are 'bad', it seems to shrink so that its longitudinal axis is only about 6km and its orthogonal axis about 25-30km. See Figure 7.

observations of David Tanner VK3AUU[5]. Under bad conditions, the minimum foot-print seems to be much the same as for the Sydney-Melbourne case. This isn't to say that, if a Melbourne station first works a Sydney station, followed by a Canberra station, the successive foot-prints in Melbourne will be of comparable sizes resulting in similar enhancement periods.

With such a foot-print model, stations located

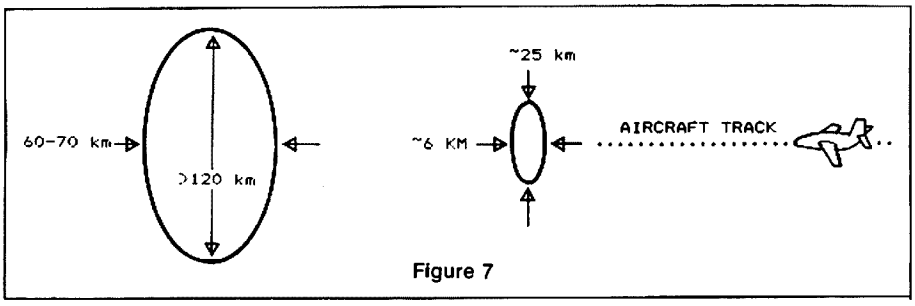

Figure 7

For the Canberra-Melbourne path, the longitudinal axis under best conditions appears to be around 150-200km, although the orthogonal axis seems to be about the same (ie a circular foot-print), judging from the more or less on-track with the aircraft flight path will always observe longer enhancement periods, while those off-track will experience shorter enhancement periods. For stations well off-track (eg VK3AUU), conditions have to be

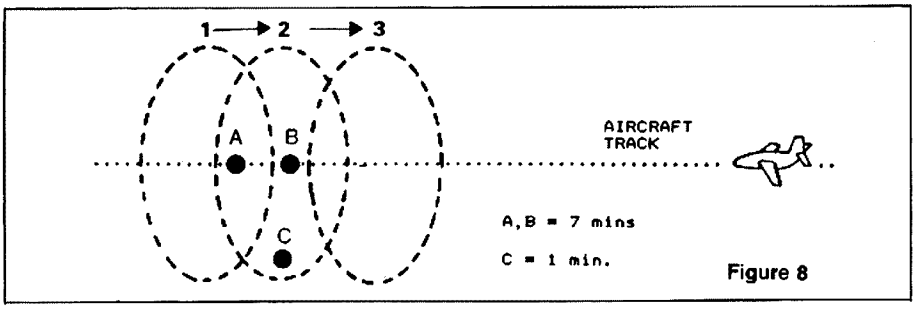

Figure 8

good if they are to make it at all. Figure 8 illustrates the typical enhancement periods reported under good conditions as the foot-print passes over stations on-track and off-track.

A PROPAGATION MODEL

If the aircraft is not itself reflecting sufficient signal to account for the observed phenomena, *what mechanism returns the signal to earth in the manner observed?*

I think the aircraft engine exhaust — largely superheated air — is responsible. It seems very little is known about what these aircraft leave behind as they traverse their paths through the sky. From data obtained by Don Bradbury VK3YV[8], the exhaust temperature of the jet engines fitted to the variety of aircraft flying the route is around 650 degrees Celsius or so, but this decreases rapidly to about 200 degrees C as it passes the aircraft tail (for wing-mounted engines, eg on 747s, 737s, A300s, etc) at the altitudes involved. *But what happens to all that hot air?*

The aircraft develops a turbulent wake; this is well known. What seems not to be well known are the parameters of the aircraft wake at altitudes of 9km and above. A recent issue of the Aviation Safety Digest[9] gives a few clues, but is not all that helpful. The particular article detailed measurements of the 'vortex tube' created by jet aircraft, measured at quite low altitudes. Apparently, the vortex tube descends behind the aircraft at a rate of around 500 feet/minute to a distance of around 900 feet below the aircraft. This seems to relate more to what the aircraft does to the air than what the engine exhaust contributes. Draw a blank there.

What I think happens is this: although the jet engine exhaust cools rapidly a first, the cooling rate will slow down rapidly; the hot exhaust air left behind will then expand, creating a 'bubble' of air at a temperature well above that of the surrounding air (which will be typically at -30 to -40 degrees Celsius). A radio wave impinging on this hot air bubble from below will travel faster in the hot air than in the cold air and thus be refracted toward the ground. The amount of refraction depends on the rate of change of temperature from outside the bubble to inside the bubble. From Collier[10], a rate of change of temperature with height of three degrees Celsius per 100 metres will cause a refraction at 144MHz of perhaps three to five degrees in angle, possibly more.

Now, the temperature inside the bubble need not be too much greater than the outside air temperature to provide the necessary refraction. Until we can obtain some direct data on the parameters,exactly what is happening there will remain a mystery.

Accepting that the signal is refracted by the hot bubble being dragged along behind the aircraft, *why does the signal foot- print travel towards the aircraft?*

Consider Figure 9. As the aircraft drags its bubble through position 1 (equivalent to L in

Figure 5), it will refract the signal as shown, and station C will commence to hear A. When the aircraft has progressed to position 2 (equivalent to M in Figure 5), station B hears A. Communications will last so long as the station at one end of the path can 'see' the bubble and also that the angle between the ground and the bubble is not so great that the bubble cannot refract the signal sufficiently to return it to earth.

On the Sydney-Melbourne path, the 'seeing angle' to the bubble (a in Figure 5), when the aircraft passes through position 1 (Figure 9) is typically around 1.25 to 1.5 degrees and the bubble can be seen for around 5-7 minutes, depending on the aircraft's altitude. This accords well with the observations.

On the Canberra-Melbourne path, while the bubble can be seen from both ends for around 20 minutes, the elevation angle for one end of the path eventually becomes too great for the bubble to refract the signal to ground. Typically, I estimate the elevation angle at loss of signal to be five or six degrees.

BUBBLE DIMENSIONS

How long is the bubble and what diameter is it? The bubble trailing behind the aircraft will eventually dissipate its energy through convection and radiation. Under turbulent upper-air conditions, it will be literally blown away.

The 'length' of the bubble, as 'seen' by the radio wave, depends on the bubble having sufficient refractivity to return the signal to ground. A rough estimate obtained by correlating subsequent Canberra-Melbourne contacts with Sydney-Melbourne contacts for VK3UM, puts the bubble length under best enhancement conditions at around 60km to perhaps 80km. The diameter is much harder to estimate.

One could possibly get an estimate of bubble diameter from the width of condensation trails. It seems entirely reasonable that the condensed water vapour would mark the lateral boundaries of the base of the bubble, but not necessarily the longitudinal extent. Water vapour, once condensed in the upper atmosphere under the right conditions, is quite stable, whereas heated air will dissipate by radiation and convection.

By estimating the angle subtended by aircraft con trails at altitudes around 10km or so, I would put the diameter of the bubble to be around a half kilometre to perhaps two kilometres within about 20km behind the aircraft. I will admit this is a bit of a fudge, but we need some starting point.

Diurnal and seasonal variation of upper-air conditions are reasonably well known and would affect the bubble accordingly. Lower air temperatures in winter would mean a greater temperature differential in the bubble, and quite possibly generally larger bubbles. This would account for the reported better conditions in winter compared to summer. A similar explanation applies to diurnal variations, in broad terms.

SIGNAL STRENGTHS

To get a reasonable numerical model to explain signal strengths is a difficult problem indeed. One of the fundamental problems here is lack of accurate measurement of the signal level 'lift' observed. The majority of reports are the usual amateur 'S-meter' (rhymes with 'guess-meter') reports. All we can really deduce is that S9 is 'quite strong' and S3 is 'quite weak'. McArthur[1] provides an estimate of the signal level variation, being some 60dB, which gives some clues. If, enhancement levels can vary this much, then the 'lift' provided should be at least that or greater, providing the reported estimate is within at least 10dB. From[5] I'm fairly confident of that.

If the troposcatter path loss for Sydney-Melbourne is around 235dB on 144MHz[11], then the aircraft is dragging a 'window' through the path, reducing the path loss to around 175dB. As suggested[1], stations of quite modest performance will have sufficient system gain to overcome that and achieve communications. *But what about the reported back-scatter on the Sydney-Canberra path?* I would say the signal travels twice through the bubble, being scattered from the ground at the far end of the path. As observed, it requires a 'good' enhancement and well-equipped stations.

From experience, ground back-scatter loss at the frequencies concerned is on th order of 30-40dB. This would subtract from the lift provided by the enhancement, but well-equipped stations can readily overcome the extra loss, as has been reported[1].

I hope o tackle a numerical 'guesstimate' of how the observed signal strengths are obtained in a subsequent article.

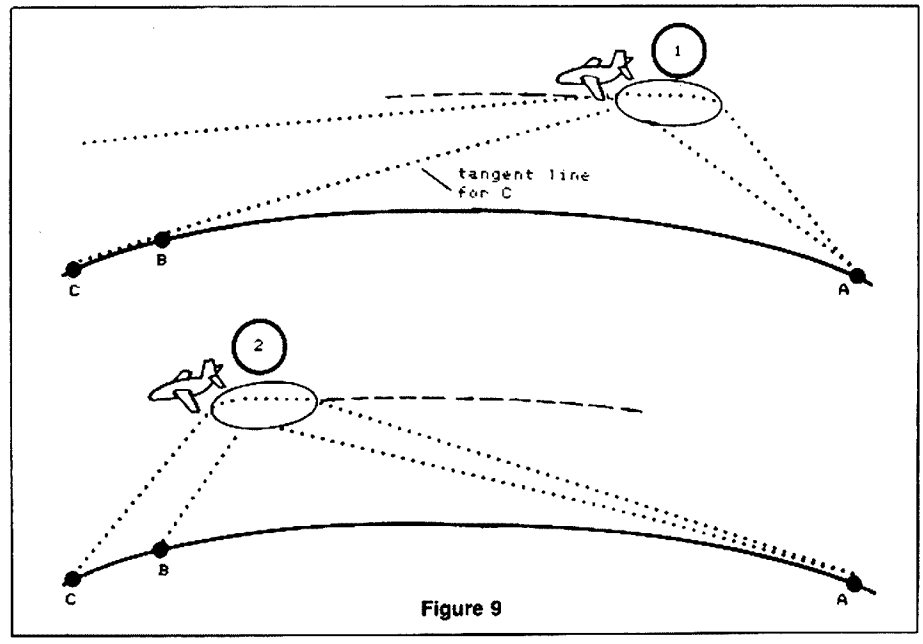

Figure 9

MAXIMUM PATH LENGTHS

From Figure 5, reference[7] and knowing the sort of altitudes the aircraft fly at, it is possible to predict maximum path lengths, For an aircraft flying at 40 000 feet (12km) or above, maximum path length is on the order of 900km for an enhancement (under 'good' conditions) of a minute or less for stations on-track at each end. If you could 'chain' flight paths and arrange the aircraft to fly through their respective path midpoints at around the same time, you could get a two-aircraft enhancement and extend the path to around 1800km.

McArthur[1 5] reports observations of VK4LC which suggest just such a possibility for Brisbane-Sydney/Sydney-Melbourne flights.

SUGGESTIONS FOR EXPERIMENTS

I would suggest it is now important to obtain two sets of measurements: calibrated signal strengths and co-ordinated time observations of the foot-print parameters. In addition, the paths should be attempted on other bands, such as 50MHz and 1296MHz.

A calibrated step attenuator at the receiver front end, or in some convenient portion of the receiver chain, could be used to measure peak 'lift' values quite simply. Upon observing the maximum signal lift, simply add enough attenuation to reduce the signal to scatter levels or below the noise.

Chart recorder observations of beacons or a continuously transmitting station would be invaluable. Simultaneous chart recordings from stations at one end of a path, separated both longitudinally and orthogonally with respect to the aircraft track would also tell us much about the signal foot-print.

Co-ordinated simultaneous tape recordings of one station by an array of stations at the opposite end of a path would be relatively easy to attempt using readily available equipment. Each listener would need a stereo tape recorder and an HF receiver in addition to his VHF/UHF receiver. The station at the other end of the path would be recorded on one channel of the tape, while VNG or other time standard station is recorded on the other channel. By co-ordinating on another band or channel, all recorders would be started before acquisition of signal by the furtherest away station, and stopped after loss of signal by all receiving stations.

Such experiments would tell us a great deal and likely contribute much toward working out a numerical model for the propagation mechanism.

To paraphrase a common expression — the foot-print is in your court, gentleman!

TABLE 1 — Path Distance Parameters.

LOCATIONS	APPROX DISTANCE
VK2ZAB/Berowra to Frankston (eg VK3ZBJ et al)	750km
VK2ZAB/Berowa to Drouin (VK3AUU)	720km
VK2ZAB/Berowa to Chimside Park (VK3UM)	708km
VK3UM/Chimside Park to Sydney (eg VK2BE et al)	678km
VK3UM/Chimside Park to Canberra (eg VK1BG et al)	466km
VK3UM/Chimside Park to Adaminaby (VK2ZRE)	360km

TABLE 2 — Off-Track Parameters.

LOCATION	ORTHOGONAL DISTANCE/DIRECTION
Drouin (VK3AUU)	62km/SE
Adaminaby (VK2ZRE)	45km/SE
Geelong	25km/NW
Frankston	22km/SE

ACKNOWLEDGEMENTS

I would like to acknowledge the willing assistance of Doug McArthur VK3UM, Gordon McDonald VK2ZAB, Ian Cowan VK1BG, Don Bradbury VK3YV, Peter Ford VK3YTB and my youngest son, Corey, who obtained all the relevant physical data on the aircraft. I would also like to acknowledgement the encouragement and forebearance of my wife, Val, who acquiesced to lengthy late-night STD 'phone calls and my long hours buried in texts and behind a word processor.

AR

INTERNATIONAL TRAVEL HOST EXCHANGE

The ARRL are maintaining a listing of amateurs throughout the world, who are prepared to entertain, and in some cases, accommodate travellers.

The list of countries are as follows: *Australia, Austria, Canada, France, Germany, Ireland, Italy, Jamaica, Japan, Kenya, Lesotho, Liberia, Netherlands, Sierra Leone, Sweden, Switzerland, Syria, United Kingdom and USA.*

Any members travelling overseas can, by writing to the address below, obtain a copy of the current listing. Also any other member who wishes to have their details included on the listing, can do so by advising the address below.

ITHE,
Federal Secretary,
Wireless Institute of Australia,
PO Box 300,
South Caulfield, Vic. 3162.

AMATEUR RADIO IN SPACELAB D1 MISSION

Last month, the Federal Republic of Germany had their first scientific manned space mission, the D1 mission. German science astronauts, Ernst Messerschmid and Reinhard Furrer hoped to carry out experiments on board the SPACELAB, transported by NASA's Space Shuttle COLUMBIA. Both men are licensed radio amateurs and members of the Deutscher Amateur Radio Club, (DARC).

From left — Dr Messerschmid DG2KM, Professor Furrer DD6CF, the astronauts and Dr Ellgering DL9MH, the co-ordinator of the mission.

During the seven day mission, the science astronauts operated an amateur radio station, located in the Spacelab on board Columbia. The call sign was DP0SL.

Activity was focused on Europe, but attempts were made to contact other parts of the world.

Calls of responding ground stations were recorded on tape and will, eventually, be evaluated and confirmed by a special QSL card by the DARC.

The VHF/UHF transceiver used is a special development, designed and constructed by BOSCH/Germany, according to the D1 mission specifications and uses components out of the normal mobile transceiver programme of BOSCH.

RF power output of the transceiver is 10 watts, which is reduced to one watt for automatic (beacon) operation. Frequency range of the transmitter is 144 to 146MHz, modulation is FM.

The receiver is a double super-heterodyne receiver, with a receiver frequency range of 430-440MHz. Sensitivity for S+N/N is 12dB 0.45 microvolts.

Selection of operating frequencies is provided by a ROM, programmed for four VHF transmitting frequencies and six UHF receiving frequencies within a 25kHz channel spacing. The transceiver has a built in micro-cassette recorder.

THE WAY IT WAS

The original Westlakes Novice Contest was the inspiration of Paul Linsley, then VK2NDL and now P29PL.

The contest arrived on the scene shortly after the introduction of the Novice licence to Australia. The purpose of the contest was to encourage newcomers to amateur radio towards contest activities, at an easy, friendly level.

The first contest was held over the weekend 10-11th December 1977. It was a moderate success. With much publicity, another attempt was arranged during 1978, but no sooner had the Westlakes Novice Contest gone to air than the problems arrived.

The major problem was that half of the two man organising team was transferred to P29. During the 1979 Gosford Field Day, the Federal Contest Manager was informed of the success of the contest and the new problem. It was stressed that although the contest was a great idea, the mere fact that an organisation, apart from the WIA, was conducting it might be construed as 'dividing the camp'.

Letters were exchanged during 1979 with WIA Federal Executive and the Westlakes Club. In the interim, Westlakes would supply the remainder of the handsome certificates for overprinting and also the contest trophy. At Westlakes request, the original trophy was deleted. It was agreed that another trophy, called the Keith Howard, VK2AKX Trophy be accepted. By way of explanation, Keith, a WIA Life Member, also played a major role in getting the Novice licence started. As well, he had a record of educational achievements, most notably, the compilation and printing of the Manual of Questions and Answers, for the Novice licence.

The new conditions were accepted, with the contest to be known as the Australian Novice Contest.

At present this contest is held in September and is known as the VK Novice Contest. Due to a variety of reasons, the original concept of the contest appears to have changed.

Much of the success of this contest depends upon the participation by the amateur fraternity at large. Next year, see if we can have a record participation.

Five Element Cage Dipole

'BIG EARS', A HALF-WAVE BROADBAND ANTENNA

Malcolm K Johnson VK6LC
9 Abinger Road, Lynwood, WA. 6155

For 75 and 80 metres in restricted space

The author lacks the space necessary to construct a full half-wave dipole, but required a broadband antenna which could be fed directly by a solid-state transceiver without needing an antenna tuner. The resulting cage design, aptly known as 'Big Ears', performs extremely well over the whole band.

This antenna was constructed last January because the original dipole just did not have the receiving capabilities to sched with RSARS members in the Eastern States and overseas. As expected from the SWR curve it runs very smoothly with the solid-state rig (IC730) over the full 300 kHz bandwidth without the use of an ATU.

The broadband characteristics result from the use of a 400 mm diameter cage rather than a single wire. The antenna is only 0.38 wavelength at mid-frequency (31.1 metres or 102 feet), so exhibits capacitive reactance at its centre. This is *transformed* by the parallel line feed section to become slightly inductive. An alternative way of looking at this is that the centre 300 ohm feed section of approximately 0.08 wavelength extends the antenna to just beyond half-wave resonance. Shunt capacitors then parallel-resonate with the inductive reactance. Due to their opposing reactance-frequency behaviour, this combination of parallel resonance with the inherent series resonance of the dipole further aids in bandwidth extension.

BALUN

The antenna will work quite well without the 1:1 balun, but receiving performance suffers due to local noise pickup which otherwise cancels out when the balance is better. Also the radiation pattern may become slightly asymmetrical without the balun. The toroidal balun core is one of the "Amidon" range, and the wire gauge is chosen so that the trifilar winding can be comfortably wound on to it. 18 or 20 gauge wire is suitable.

The shunt capacitors are very generously over-rated. In all probability a single 470 or 510 pF unit of 1 kV rating or better would suffice, but the two 6 kV items were on hand and ensure that failure here is virtually impossible.

The coaxial feedline is shown as a quarter wavelength. This also is not essential, but the accuracy of the SWR curve cannot be guaranteed for other lengths.

PERFORMANCE

Tests have proven reception to be 100 percent better from the present location, after testing it out with stations such as A71AD, YC4FPE, ZL1ON, JI1QPU, ON5YA, EI8H, DJ4AX, WA6SLO, 9M2CO, SP9MRO, 18SAT, HA5XW, Z21EV, OK3EY, YU4EBL, G3FPQ, H44IA and GI3OQR using FT102 and IC730 rigs on SSB. These stations were not all worked on 75 metres, but at the top end of 80 metres. Many incoming reports were 5x8 or 5x9.

Incidentally, if a different centre frequency (within 100 kHz or so) is required, it can be lowered by adding 125 mm to the 300 ohm feedline for each 20 kHz change, or conversely raised by similar shortening.

One practical point is that the cage section, both top and bottom, requires support from two points using heavy duty nylon fishing line to prevent the cage from turning in strong winds.

In the installation tested, the central tower is 10 metres high, with a 1 metre outrigger at the top, to the tip of which the halyard pulley block is attached. The two cage halves then slope down to a height at their ends of 3 metres.

AR

ANTENNA TUNERS WITH PARALLEL TUNED CIRCUITS

Leo Weller VK3YX
46 Pepperell Avenue, Syndal, Vic. 3150

It is an accepted fact that some antennas are easier to match to the transmitter than others. The number of hard-to-match ones are, too often, demonstrated on the amateur bands by a strong carrier going up and down in level for some 30 seconds before talking commences. In the course of experimenting with three antennas for the 15 metre band, three tuners were built to facilitate quick change over. There is no apparent reason why any of the three tuners could not be made to work equally well with any antenna. But problems arise when they are least expected (Murphy's Law again!).

Having established problems with some antenna tuner-circuit combinations, a number of different tuners have been built and their characteristics noted. This article describes five different tuners using a parallel tuned circuit.

INPUT CIRCUIT

In the following circuits an input capacitor will be found. This gives the tuner a high impedance until it is tuned. Many circuits use a capacitor in the output circuit, however it will perform its task equally as well on the input side. In particular, when the CW mode is used for tuning purposes, the author believes that the output transistors are safer.

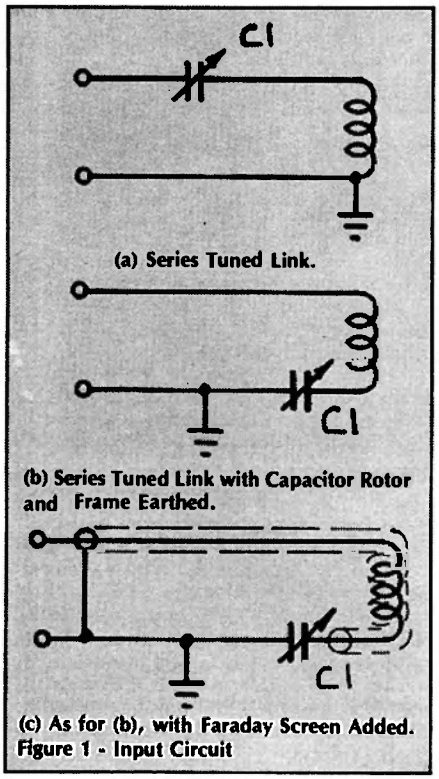

Figure 1 - Input Circuit

In some situations, it may be easier to earth the frame of this tuning capacitor. Figures 1 (a), 1 (b) indicate two circuits which are electrically the same. It was found that the capacitance between the coil and coupling link played an adverse role. This was eliminated by introducing an electrostatic (Faraday) shield. Coaxial cable was used to wind the link. The screen was earthed at one end only, usually at the input socket, and is cut back 1cm on the other end. This link is always located on the earthed side of the main coil, to reduce the probability of flash-over.

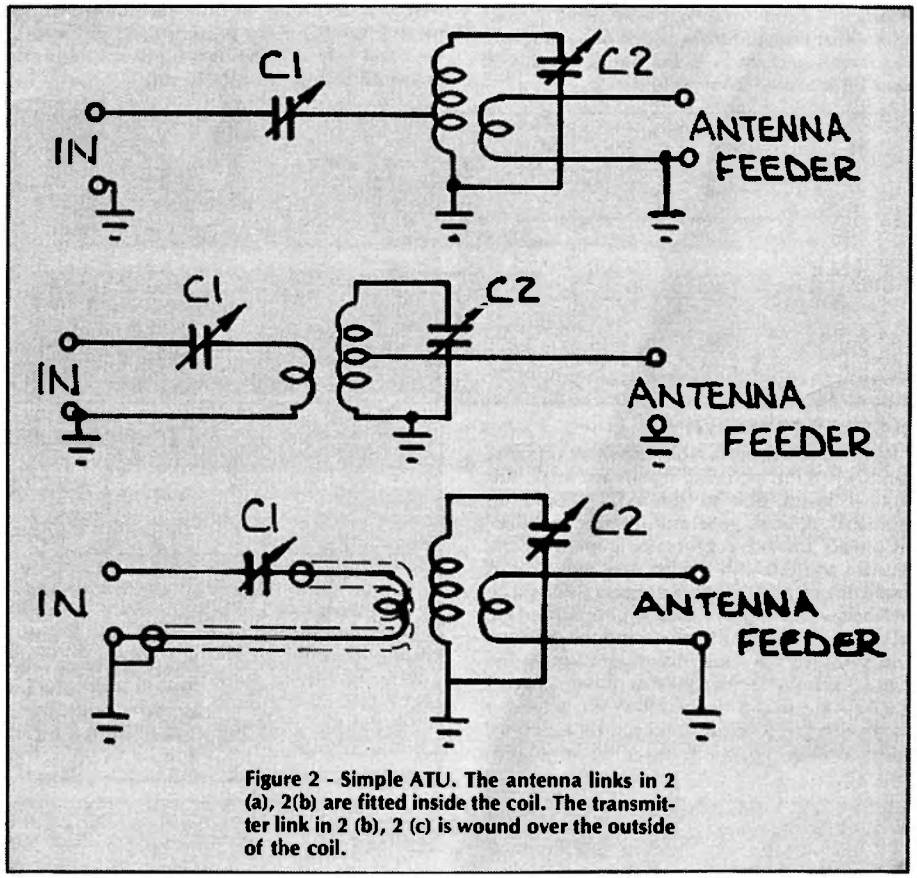

Figure 2 - Simple ATU. The antenna links in 2 (a), 2(b) are fitted inside the coil. The transmitter link in 2 (b), 2 (c) is wound over the outside of the coil.

SIMPLE ATU CIRCUIT

The circuit in Figure 2 (a) is so simple that one cannot escape testing it first and that of Figure 2 (b) next. Both circuits exhibited some interaction between the two tuning capacitors which was eliminated by using the circuit of Figure 2 (c). This also gave a remarkable reduction in received noise from local devices such as vacuum cleaners and washing machines.

TESTING FOR COUPLING FACTOR

A watt meter, if available, is the correct instrument to use however, an SWR meter will also do the job. The purpose of this test is to establish that the turns ratio or tapping positions are correct. Adjust the ATU to provide a 1.0:1 SWR with the antenna connected. Connect the transmitter to a dummy load via the SWR meter. The VSWR

should be 1.0:1. Set the transmitter output power to a low level and adjust the SWR meter for full scale deflection in the 'forward' mode. Now connect the tuner instead of the dummy load. If all is well the SWR meter will read the same. If it reads low, the coupling must be increased. The SWR meter does not always tell the whole story. (Or the whole truth. Tech Ed). Although the SWR meter might indicate that the correct match has been achieved the forward indication is a very sensitive comparator. The CW collector current is also a sensitive indicator of incorrect adjustment. If the coupling is too light, the tuning of C2 will be very sharp and if the coupling is too heavy, the tuning will not be effective. Incorrect coupling can also result in very high RF currents in the tuner, which will lead to increased power loss in the tuner.

AUTOTRANS ATU

The name originates from the autotransformer, due to the similarities of operation. Figure 3 illustrates a circuit suitable for use with plug-in coils and receiver type tuning capacitors. The wires and the taps must go at right angles from the coil for at least half a coil diameter, before being bent to ensure that no half turn is added or subtracted. The frames and rotors of the tuning capacitors must be insulated from ground.

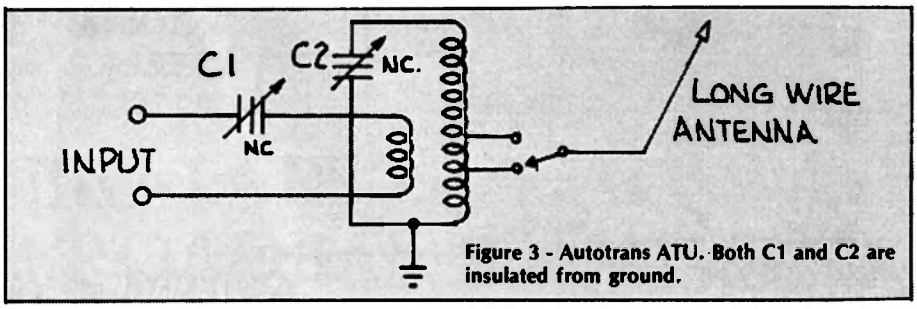

Figure 3 - Autotrans ATU. Both C1 and C2 are insulated from ground.

RECEIVER SENSITIVITY

Receiver sensitivity is most important on quiet bands when the incoming signals are weak. Additional losses due to the ATU should be evaluated. A noise generator is recommended.

Connect the noise generator directly to the receiver and establish a noise level sufficient to distinctly override the receiver noise. This will be well below an S1 meter indication. Next insert the ATU between the noise source and the receiver. The ATU must previously have been adjusted to give a 1.0:1 SWR with a 50ohm dummy load. If the ATU has negligible loss, then the generator noise will still override the receiver's internal noise. (A loss of up to 1dB should be acceptable. Tech Ed.)

ALL BAND TUNER

This is another simple circuit using old broadcast receiver tuning capacitors. The capacitor frames and rotors must be insulated. Two coils are used, a switch short circuits the one not being used. See Figure 4.

The links are made of coaxial cable with both the inner and outer being shorted to ground at one end. The link is of two turns on the high band coil and three turns on the low band coil. Shorting the unused coil effectively shorts the associated link.

INTERACTION TEST

Load the tuner with a dummy load and adjust for a 1.0:1 SWR in band centre. Now check to see if a 1.0:1 SWR can be maintained across the band by adjusting the main tuning capacitor, only.

Repeat this test with the antenna connected but start at the resonant frequency of the antenna instead of band centre, if these differ.

Ideally C1 is only adjusted when the band is changed and can be fitted with a clicker plate to make tuning quicker. See Figure 5.

In practice, with an antenna connected, a perfect match will not be achieved right across the band but, with the right tuner, the residual mismatch will be acceptably small.

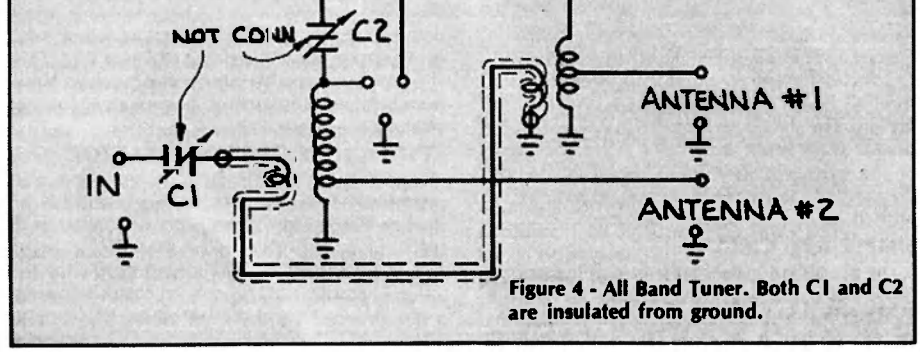

Figure 4 - All Band Tuner. Both C1 and C2 are insulated from ground.

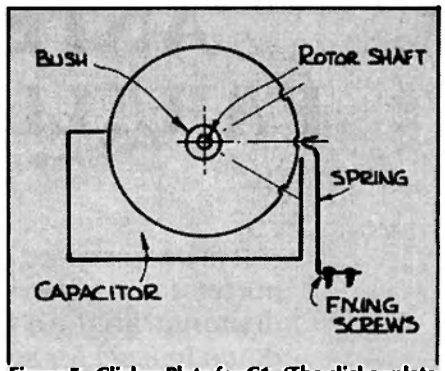

Figure 5 - Clicker Plate for C1. (The clicker plate could be made from brass sheet and soldered onto a bush fitted with a grub screw to facilitate fitting on the rotor shaft...Tech Ed.)

LONG WIRE MATCHER

This circuit, shown in Figure 6, was found in various World War 2 transmitters, intended for use with random lengths of wires. With broadcast tuning capacitors, it will tune two bands without a coil change, but a switch is needed to select the correct tappings, which can be found by experiment.

A good earthing system is required for this antenna system.

IMPROVEMENTS TO THE ALL BAND TUNER

It must be realised, that with a tuner covering the 10, 15 and 20 metre bands in one sweep, the width of the 20 metre band is only 15 degrees out of the 180 degrees sweep.

For ease of tuning a slow motion mechanism is recommended. The disc and spindle drive from an old radio receiver is perfect. A disc of 5cm diameter is sufficient.

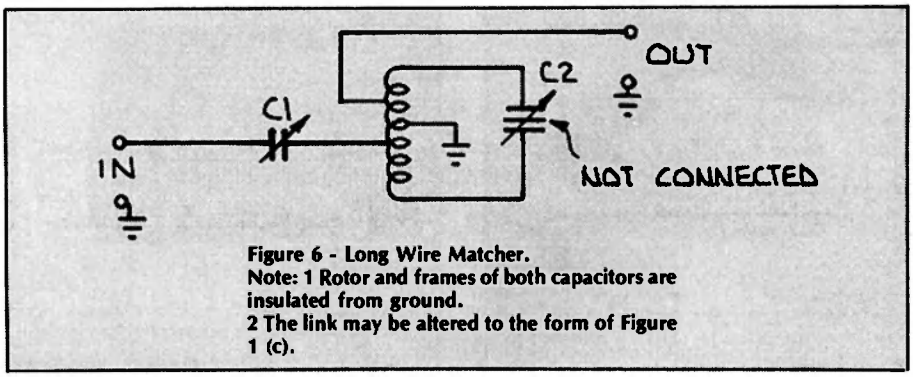

Figure 6 - Long Wire Matcher.
Note: 1 Rotor and frames of both capacitors are insulated from ground.
2 The link may be altered to the form of Figure 1 (c).

TRANSMATCH ATU

The transmatch, (from ZS1CK back in 1947), feeds the transmitter from the rotor of the split stator capacitor, while the output is from point A. See Figure 7. Tuning requires care as there is some interaction between C1 and C2.

I found that by tapping the output down to two turns from the cold end that C1 was no longer critical of adjustment and could be replaced by switched fixed capacitors to suit the bands and antenna in use. For a 100 watt transmitter the necessary capacitor plate spacing is 1mm.

CONCLUSION

In the preface, it was pointed out that easy tuning depends on the correct tuner-antenna combination. The circuits described will pass all tests mentioned in this article, but not necessarily on

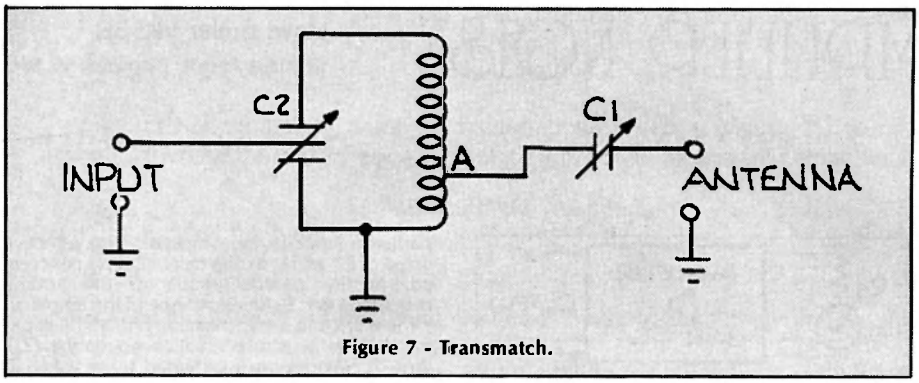

Figure 7 - Transmatch.

every antenna. The most convenient solution to the problem of rapid frequency shifting may be one tuner for the low band and one for the beam.

The author calls these tuners 'up-tuners' as the received signal increases on the correct setting. Only a 5 watt signal is required for tuning to a 1.0:1 SWR which is accomplished in 2 to 3 seconds. Details of the number of turns in the coils have been omitted because the author used many components that were on hand and these may not be available to many readers. Should any readers wish for further details, they are welcome to write to the author. (Include an SAE please. Tech Ed.)

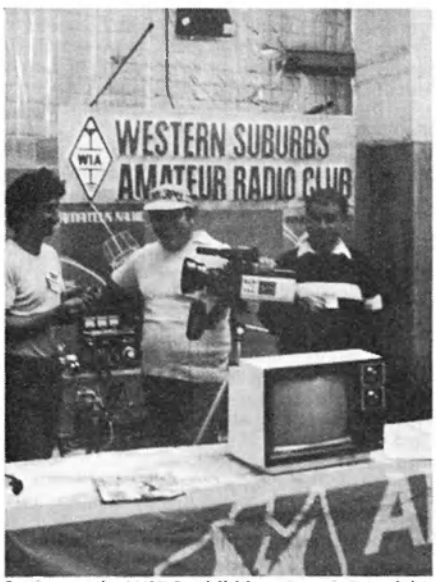
"FLYING HIGH WITH AMATEUR RADIO"

Mark J Stephenson VK3PI
PO Box 163, Whittlesea, Vic. 3757

Earlier this year WICEN and the Western Suburbs Radio Club promoted amateur radio in many ways before over 150,000 people.

The occasion was the Melbourne Airport Open Weekend organised by the Keilor Rotary Club, with participating organisations including the Department of Aviation, Ansett Airlines of Australia, Trans Australia Airlines, Qantas, Royal Australian Air Force, Victoria Police, Australian Army, State Emergency Service, Wireless Institute Civil Emergency Network and others. Static displays of aircraft and associated equipment were presented, along with vintage, military and civil aircraft. Enthralled crowds were also treated to aerobatic displays and fixed wing aircraft and helicopter manoeuvres.



Setting up the WSRC exhibition, from left to right, John VK3NJS, Fred VK3PU, and Terry VK3KBD.

The Western Suburbs Radio Club presented an amateur radio display within the Ansett Airlines of Australia hangar. Antennae were erected atop of the hangar, and live ATV pictures transmitted via VK3RTV, the 50cm ATV repeater situated on Mount Dandenong, east of Melbourne Airport. Scores of visitors to the display were fascinated

Left to right Mark VK3PI, Rob VK3VOE and Gordon VK3YOD perusing safety equipment within the Ansett hangar, and next to the Club exhibition.

by their own images displayed on a monitor. Members of the club explained many aspects of amateur radio to the public, whilst operating equipment and demonstrating operating practices. A promotional videotape, on loan from the Victorian Division of the Wireless Institute of Australia, ran continuously for the duration of the event, and assisted in outlining fields of amateur radio not able to be demonstrated in practice, such as SSTV, RTTY, Satellite work and emergency communications.

Twenty five Region 14 and two Region 8/26 Wireless Institute Civil Emergency Network members provided communications between services such as the Department of Aviation, Victoria Police Force, Country Fire Authority, State Emergency Service, and others. An amateur television link was also provided on simplex, between the State Emergency Service location, and the Command Centre. This link displayed logistics information relating to traffic control, and was of benefit to the Department of Aviation, State Emergency Service, and Victoria Police.

It was interesting to note that when a fire broke out in one of the public car parks, WICEN passed the message directly to the Country Fire Authority, and as the CFA were co-located with WICEN in the Police Caravan, action was prompt. The incident proved to be an effective demonstration of WICEN being utilised to provide communications between services with non-compatible communications systems.

Overall communications was conducted on VHF and UHF simplex, and the exercise proved to be of training value, and a worthwhile public relations effort. This was particularly true in proving to other members of the Region 14 Disaster Committee that WICEN Region 14 are capable in providing reliable ancillary communications, in a responsible manner.

To list those amateurs involved in both facets of the Open Weekend would be a considerable task, however, let it be said that both the Western Suburbs Radio Club and WICEN Region 14-8/26 members are to be congratulated on their enthusiasm in promoting our hobby in such a professional manner. A special thanks to Norm Dench VK3DNE for his enormous personal contributions in assuring the success of both efforts. To all concerned well done!!!

AMPLIFIER NOISE

Lloyd Butler VK5BR
18 Ottawa Avenue, Panorama, SA, 5041

Amplification of low level audio or RF signals is always accompanied by noise generated in the amplifier itself. The following discusses the generation of this noise and some of the methods of assessing noise performance.

One of the factors which governs the performance of any amplifier system is the noise in the system. Noise might be defined as signals in the system which are unwanted and which degrade the desired signal content in the system.

As far as the amplifier system is concerned, noise can be divided into noise it receives at its input and noise it generates itself. A good system is one in which the noise generated by the amplifier itself is small compared to noise from the incoming source. In a HF receiver, for example, atmospheric noise is high and it is not difficult to achieve this requirement. At VHF and UHF, atmospheric noise is low and performance is limited by the noise generated in the first stages of the radio receiver.

Noise is generated in all stages in amplifiers and radio receivers but it is the first stages, operating at the lowest signal levels, which are of main concern, particularly where low signals from aerials, microphones, etc, are to be amplified.

THERMAL NOISE

There is no such device as a perfect amplifier, but assuming such a device could be built, there is still a limit to how low a signal level can be detected. Figure 1 shows an amplifier fed from a signal source which has a resistance R_s. Thermal noise in the resistance generates a noise voltage (E_t) as follows:

$$E_t = 2\sqrt{KTBR_s}$$

where

K = Boltzmann's constant
T = Absolute temperature
B = Bandwidth in Hertz

At normal temperatures (say 17°C), this simplifies to:—

$$E_t = \sqrt{1.6 \times 10^{-20} \times B\, R_s}$$

Short of fitting the source in a cryogenic chamber, this is the lowest noise which can be achieved at the amplifier input and the practical equivalent noise at the input as always higher than this.

EQUIVALENT NOISE VOLTAGE

Whilst noise generated by an amplifier system is generated within the system, the level of noise is evaluated by referring it to the amplifier input, that is, it is considered as equivalent noise at the input as though it were being generated at that point. The equivalent noise voltage (E_n) is calculated by dividing the noise measured at the amplifier output (E_{no}) by the gain of the amplifier (A_v).

$$\text{ie } E_n = \frac{E_{no}}{A_v}$$

BANDWIDTH

Noise in any system is dependent on bandwidth of the system and this must be specified when defining noise performance. It is common practice to define noise for a 1 Hz bandwidth, for example, noise voltage might be specified in nanovolts per square root of Hertz (nV/√Hz).

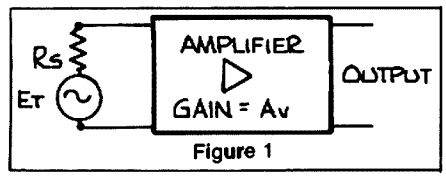

Figure 1

Over a limited bandwidth, noise power can be considered to be proportional to bandwidth and noise voltage proportional to the square root of bandwidth. If noise voltage is defined for a 1 Hz bandwidth system noise can be determined by multiplying by the square root of the system bandwidth.

The level of noise generated by an amplifier system generally varies over a wide spectrum, and for a wide bandwidth the noise performance must be defined by plotting noise (say in nV/√Hz) against frequency.

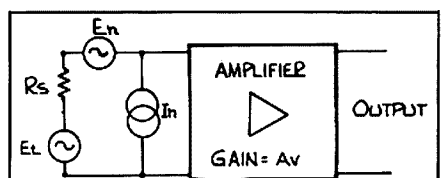

Figure 2

EQUIVALENT NOISE VOLTAGE AND CURRENT GENERATOR

In considering solid state amplifiers, noise is often resolved into two components at the amplifier input, an equivalent noise voltage generator (V_n) and an equivalent noise current generator (I_n) (refer figure 2). The first component (V_n) is independent of the value of source resistance (R_s). The second component (I_n) develops a noise voltage across R_s equal to $I_n R_s$, that is, the noise voltage it develops is directly proportional to the value of R_s. V_n can be separated from the voltage developed by I_n and also the thermal noise (E_t) by short circuiting the input terminals. The voltage developed by E_t and I_n is then zero and what is left is the noise voltage generator V_n.

NOISE FIGURE

One method of defining the noise performance of an amplifier is the noise figure (F). This can be defined as the ratio of equivalent noise power developed at the input to that generated by thermal noise in the source resistance (R_s). Noise figure is often expressed in decibel form. A perfect amplifier, if such a device were possible, has a noise figure of 0 dB.

To establish noise figure, the voltage gain (A_v) of the amplifier is measured and the noise voltage output (E_{no}) is measured at a known bandwidth (B). For the second measurement, the amplifier input must be terminated in a resistance (R_s) equal to the normal source resistance. Noise figure is calculated as follows:

$$F = 20 \log A_v \frac{E_{no}}{\sqrt{1.6 \times 10^{-20} B\, R_s}}\ dB$$

Figure 2 and the formula assumes a high impedance input to the amplifier. The effective value of R_s, as far as the calculation is concerned, is the parallel result of the source resistance and input resistance of the amplifier. If the source is a transmission line and it is terminated in its characteristic impedance (Z_o), then R_s should be substituted by a value Z_o divided by 2.

TRANSISTOR NOISE

The value (V_n) of the equivalent noise voltage generator in a bi-polar transistor can be calculated from the following formula:—

$$V_n = \frac{0.0147\ nV/\sqrt{Hz}}{\sqrt{I_e}}$$

where I_e = Emitter current in amps.

Note that the noise voltage is entirely dependent on emitter current and decreases as the emitter current is increased.

Derivation of the value of the equivalent noise current generator is more complicated. Its value is dependent on various constants which vary with transistor type and which also vary between selected samples of the same type. For lowest noise, it is therefore necessary to select samples on a test basis. The noise current is also dependent on emitter current and frequency. Figure 3 illustrates a typical change in noise current with frequency for a bi-polar transistor, giving a rise in noise current below 1000 Hz. Above 1000 Hz, noise current is constant.

In contrast to the value of the noise voltage generator, the noise current value increases as emitter current is increased. The noise voltage developed from the noise current is further dependent on the value of source resistance (R_s) through which it flows. (Refer previous paragraphs).

In consequence, for a given transistor, at a given frequency, there is an optimum emitter current for each value of source resistance (R_s) used, the point at which the curve showing the noise voltage generator (negative slope) intersects with that of the appropriate curve showing noise voltage derived from noise current generator (positive slope), refer figure 4.

At low values of source resistance (say 50 ohms), the equivalent noise voltage generator is the predominant factor and lowest noise is achieved at emitter currents in the order of several milliamps. At higher impedances, (0.1 to 1 megohms), noise voltage developed from the noise current is predominant and emitter currents in the micro-amp region must be used to reduce the noise. (It is also of note that if common emitter configuration is used, these low emitter currents are necessary to achieve the high input resistance required).

For a low source resistance, a low noise bi-polar transistor works well and provides high gain. A typical noise current is 0.1 pA/√Hz and of little consequence developed across the low source resistance. For a high source resistance, a low noise field effect transistor is more suitable. Noise current at the input of a field effect transistor is a fraction of that for a bi-polar transistor and even at high impedances, the equivalent noise voltage generator is the predominant factor. For low noise, drain

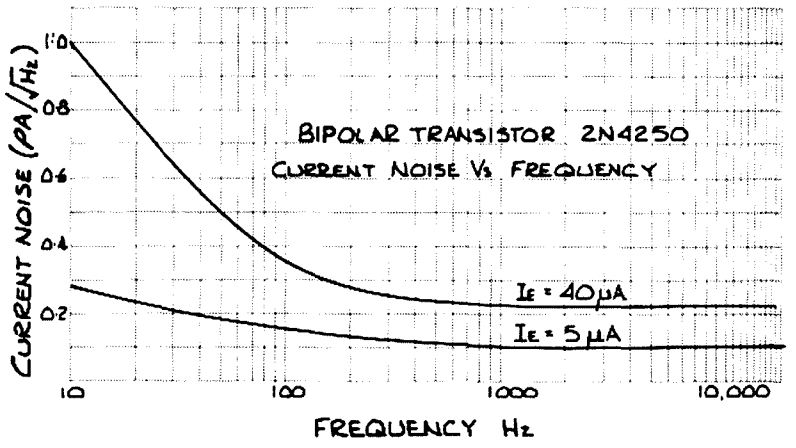

Figure 3 — Bi-polar Transistor 2N4250 Current Noise Vs Frequency

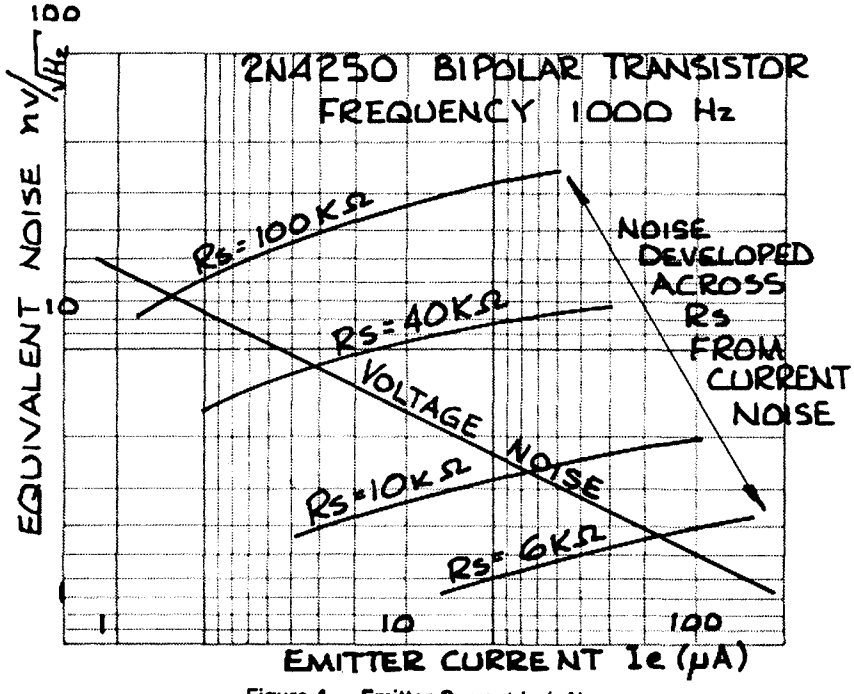

Figure 4 — Emitter Current Ie (μA)

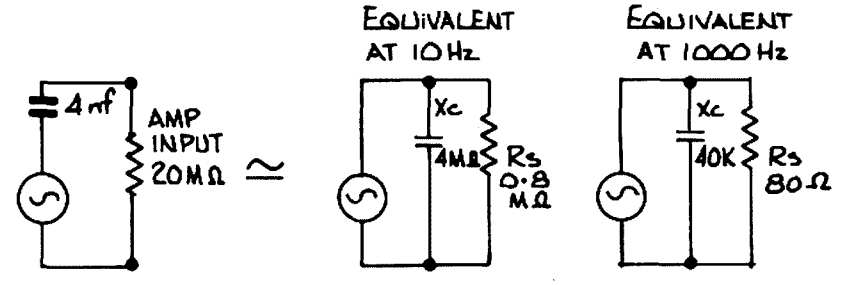

Figure 5 — Plezo Electric Device Equivalent Parallel Resistance.

current in the order of 2 to 10 mA is used.

Field effect transistors have found quite universal use as low noise front end amplifiers in VHF and UHF receivers where their gate is connected across the high impedance input of a tuned circuit.

A TYPICAL NOISE PROBLEM

One typical noise problem occurs when a piezo electric device (such as a microphone) is used at audio frequencies and connected to the input of an amplifier. At audio frequencies the device can be considered as a generator in series with a small capacitance (refer figure 5). Supposing the series capacitance were 4 nF and frequency response down to 10 Hz were required; the device must then be terminated in not less than 20 megohms to achieve response at the low frequencies. Referring again to figure 5, it can be shown that such an example places a resistive component across the amplifier input of 0.8 megohms at 10 Hz compared with 80 ohms at 1000 Hz. The high equivalent source resistance at the low frequencies is a problem where amplifier current noise develops a noise voltage across that resistance. Quite apart from amplifier noise, the high value of R_s puts a limit on the lowest noise voltage achievable due to factor KTBR.

Bearing in mind the problem discussed in the previous paragraph, the writer tested a number of different operational amplifiers and discrete transistor circuits to compare noise at the input using the 4 nF and 20 megohms example. Table 1 shows the results obtained.

Table 1. Measurements of Equivalent Noise at Input for Various Devices in Nanovolts/√Hertz

Device	R_s = 0.8 megohms f = 10 Hz	R_s = 80 ohms f = 1000 Hz
OP AMP OP7	773	18.
OP AMP OP5	2711	18.5
OP AMP NE5534A	7553	18
OP AMP AD510	782	29
OP AMP LM11	330	256
OP AMP LA3140	262	45
OP AMP AD504	3374	19
OP AMP BB3510	1919	21
OP AMP LM308	256	32
OP AMP μA776	1211	38
Balanced bi-polar transistors (I_c = 2 x 9μA)	450	8
Balanced bi-polar transistors 2N4250 (I_c = 2 x 3μA)	207	15
Balanced FET transistors 2N5523 (I_d = 2 x 1μA)	130	6
Thermal Noise limit ($2\sqrt{KTBR_s}$)	126	1.3

Discrete bi-polar transistors running at very low collector currents demonstrated a lower noise voltage than the operational amplifiers tested. At low frequencies, where the value of R_s is high, the FET gave the best performance. At higher frequencies, where the value of R_s is low, the bi-polar and FET transistors are comparable. Had the bi-polar transistors been run at milliamps of collector current instead of microamps, they would have out-performed the FET transistors at the higher frequencies but been unsatisfactory at the low frequencies where R_s is high.

One interesting device, not yet tested, is the Burr-Brown OPA111 FET operational amplifier. According to the curves published for this device, it would produce noise figures comparable with the discrete FET transistors tested. (At 10 Hz with an R_s = 1 megohm, noise voltage would be 120 nV/√Hz. At 1000 Hz with an R_s = 100 ohms, noise voltage would be 7 nV/√Hz).

MEASUREMENT OF NOISE

To measure equivalent noise voltage at an amplifier input or to measure noise figure the following is required:—

A means to measure RMS noise voltage over a controlled bandwidth.
A means to measure the voltage gain of the amplifier.

Voltage gain can be measured using a signal generator and calibrated CRO suitable for the frequency spectrum of interest. A spectrum

analyser is very useful to measure noise voltage as it usually has a defined bandwidth or means to adjust bandwidth over which the measurement is made.

Equivalent noise (E_n) in nanovolts/√Hertz is calculated from the measurements as follows:

$$E_n = \frac{E_{no}.10^9}{\sqrt{B.Av}} \text{ nV}/\sqrt{\text{Hz}}$$

where E_{no} = Measured noise output voltage

A_v = Amplifier voltage gain

B = Bandwidth of measurement in Hertz

THE NOISE DIODE

One means used to measure noise figure in the VHF and lower UHF region is to use the thermionic noise diode (refer figure 7). Plate current is fed through resistance R_s which becomes the source resistance of the noise generator formed. The plate current is controlled by varying the filament voltage of the diode. It turns out that for a temperature limited diode, the noise component of the plate current is precisely related to the DC plate current as follows:—

If the plate current is adjusted so that the noise power in the receiver being tested is double that for zero plate current, then noise figure is:—

$$F = 0.02\ I\ R_s$$

where I = the plate current in milliamps.

For a source (R_s) = 50 Ω, the formula is F = I, hence the noise figure can be read directly from the plate current value.

Equivalent input noise power for the receiver is KTBI and the equivalent input noise voltage (E_n) is:—

$$E_n = \sqrt{1.6 \times 10^{-20}\ I\ R_s}\ \text{V}/\sqrt{\text{Hz}}$$

Many years have passed since solid state electronics phased out most uses of the vacuum tube and hence suitable tungsten filament diodes are not easy to obtain. An alternative noise generator can be made using a semiconductor diode (refer figure 8). In this case, the relationship between noise voltage and diode current will depend on the characteristics of the diode and for the device to be of any use in testing receiver performance, it must be calibrated against a known noise source.

Noise power change is best measured at the output of the IF amplifier in the receiver. In an AM receiver (but not an FM receiver), audio noise power can be measured. The method is to gradually increase the diode current until the power indication is double, or if an AC voltmeter is used, until the voltage increases by a factor of 1.4 (Refer also to figure 9).

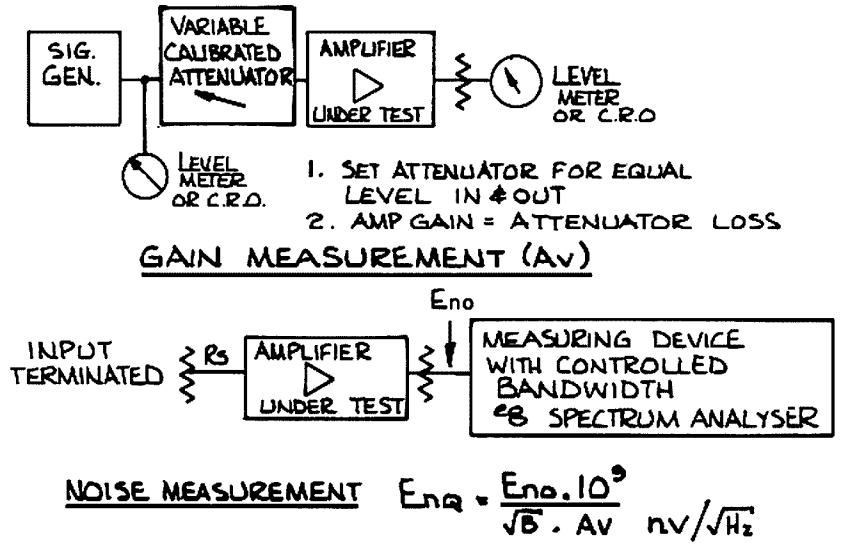

Figure 6 — Measurement of Noise

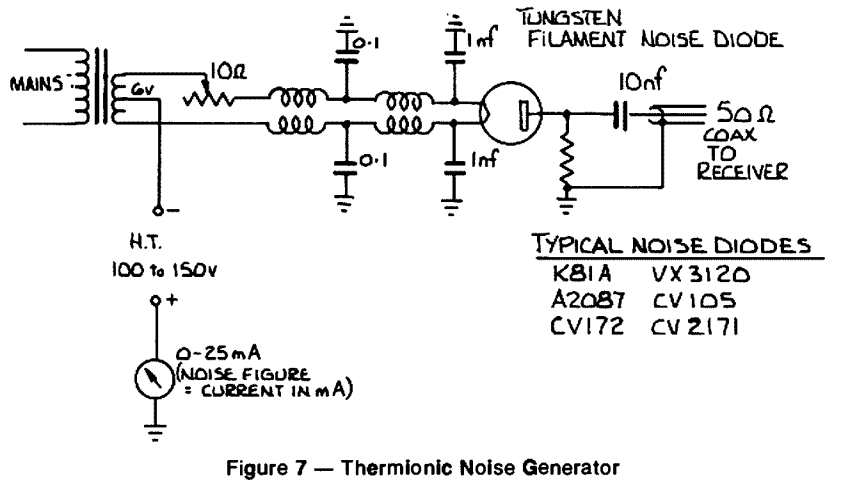

Figure 7 — Thermionic Noise Generator

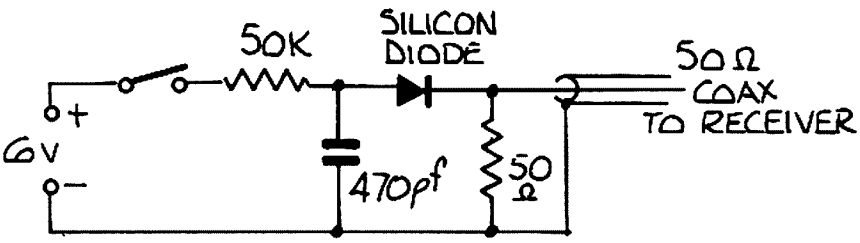

Figure 8 — Noise Generator using Semi-Conductor Diode

RADIO RECEIVER PERFORMANCE

A discussion on noise would not be complete without reference to specifications for receiver performance since such specifications are tied to amount of noise generated in the first stages of the receiver.

Amplitude modulation (AM) receivers are often said to have a given signal to noise ratio for a given input level in microvolts eg 15 dB S/N ratio for 1 μV of signal. What is assumed (if not quoted) is that noise power at the audio output is 15 dB below a 400 Hz or 1000 Hz signal demodulated from a 30 percent modulated, 1 μV signal at the receiver input. To get some idea of noise performance, the receiver bandwidth must also be considered. A 15 dB S/N ratio for a 3 kHz bandwidth receiver is not as good a noise performance as one with a 15 dB S/N ratio with 6 kHz bandwidth.

A single sideband receiver might be quoted as 12 dB S/N ratio for 1 μV of sideband. This implies noise 12 dB below 1 μV, i.e. 250 nV. If the receiver has a bandwidth of 3 kHz and its input resistance is 50 ohms, thermal noise is calculated as 49 nV and noise figure is 20 log (250/49) = 14 dB.

The noise performance of a frequency modulation (FM) receiver is more difficult to define. Noise, as has been considered, is caused by random amplitude variation which the FM demodulator is designed to reject. The noise takes predominance when the FM signal level falls to a critical level and it has been a practice to quote decibels of quieting for a given input signal level eg 20 dB of quieting for 0.5 μV. Whilst this gives an indication of the noise performance of the front end of the receiver it does not give assessment of the noise performance as an FM detector and an additional specification giving decibels of S/N ratio for an input signal deviated by a fixed amount is also required eg 20 dB S/N ratio for 0.3 μV signal deviated 5 kHz by 1000 Hz tone.

A more recent specification is SINAD performance. For this, a minimum signal input level

in microvolts is given which satisfies a given level (12 dB) of noise and distortion below a modulating tone. (1000 Hz deviating 3 kHz in a 5 kHz maximum deviation system). To test a receiver, an FM signal generator, modulated by a 1000 Hz tone to a deviation of 3 kHz, is fed to the aerial input and the audio output is monitored with a distortion meter (refer figure 11). The input level is decreased until distortion read is 25 percent (ie 12 dB of noise and distortion below the tone level).

The difference between SINAD measurement and previous methods of measurement is that the tone is tuned out at the output of the receiver instead of switching off at the input signal source. With tone removed, noise components remain and in the SINAD case, include distortion components generated in the receiver by the tone itself.

A conventional method of measuring signal to noise ratio in an AM receiver is illustrated in figure 10. Performances testing of an FM receiver using the SINAD method is illustrated in figure 11.

SUMMARY

Low equivalent noise at the input is better achieved using discrete transistors with controlled collector (or drain) current rather than IC packages. Bi-polar transistors are good for a low source resistance but field effect transistors perform better for high source resistance.

Noise can be measured by a number of methods described. At VHF the noise diode is useful. Assessment of performance of FM receivers requires different test procedures to those for AM receivers.

PROFILE OF TWO NEW MEMBERS OF THE WIA PUBLICATIONS COMMITTEE

The WIA Publications Committee is pleased to welcome two new members to its ranks, namely, Doug McArthur VK3UM and Peter Gibson VK3AZL. Peter and Doug will add some new ideas to the Committee and will also be laden with technical editing.

Doug was first licenced in 1958, as VK5KK and later operated from Alice Springs and Darwin, as VK8KK.

He has been a member of the WIA since 1957.

Doug's main interest is VHF, UHF and specialist communication techniques with his 'pet project' currently, operation on 70cm EME.

Previously employed in High Power, TV, Microwave and Data Communications with the PMG, Doug is presently employed with the DOC.

Peter joined the WIA in 1963. In 1964, he became licensed as VK3AZL, at the age of 16, and has been actively involved on HF since that time.

Peter's main interest in the hobby is home brewing and has a wide variety of projects ranging from Test Equipment to a Synthesised Two Metre Transceiver.

He graduated as a Communications Engineer and was employed for 12 years with the Department of Transport and Aviation, working on Navigational Aids and then the development of Microwave Landing Systems. He is currently employed at Channel 7, Melbourne, as a Video Tape and Project Engineer.

Welcome Gentlemen — Ed.

DOUG MCARTHUR VK3UM

PETER GIBSON VK3AZL

THE FEEDER TUNED ANTENNA

Bruce Hannaford VK5XI
57 Haydown Road, Elizabeth Grove, SA. 5112

If you want to work all HF bands including the WARC bands, with one antenna, without exhausting your patience or wearing out your finger tips by constantly retuning an ATU for each QSY, here is the system for you.

It is possible with three switch selectable feeder lengths, to do away with the need for an ATU, if the Antenna Matching Unit (AMU), also described, is used.

The switching can be done with a double pole, three position switch having good insulation, good sized and well spaced contacts, or alternatively by two DPDT switches or relays of similar construction.

This antenna design relies on broadly tuned antenna and feeder line lengths rather than sharply tuned lumped L and C, as in an ATU. The antenna arrangement is similar to the G5RV and the J pole, both of which can be fed with coaxial cable at the base of a tuned length of open conductor feeder. With the G5RV, only one compromise length of feeder is used and this really only suits the 20metre band. On other bands the SWR is often above 10:1. With three lengths of tuned feeder obviously three bands can be exactly tuned, or with a slight compromising of the 80 and 40 metre lengths, all the other HF bands can be covered with quite low SWR. More than three feeder lengths could be used, with additional switch positions, if so desired.

In the physical construction, a centre pole must be used to support the feeder selecting switch mounted on the pole and to hold the three feeder systems, extending from it, towards the shack. It is preferable that the outer poles be of equal height, but this is not essential. Shorter outer poles or inverted V construction can be used. Where space is a problem, the outer ends of the antenna radiator may be bent down, or sideways, for about 3m at each end, with very little loss of performance.

The three position switch can be a rotary type with the shaft pointing downwards and extended to near ground level by a long insulated shaft, such as a 4m length or more of orange coloured plastic conduit, as used in electrical work. It will probably be best to remove the switch clicker plate for easy turning and fit a pointer on the shaft at the bottom. Alternatively the switch can be extended mechanically to the operating position or motored in much the same way as an antenna rotator.

Open wire feeders have been shown for the tuned feeder sections in all cases, but these could be replaced by slightly shorter lengths of window type 300 ohm ribbon, if preferred. Multiply the open wire lengths given by the velocity factor, usually .82, to determine the length required. The coaxial cable can be either 50 or 75 ohms and the use of baluns at the antenna ends of these cables normally seems quite unnecessary. The open wire feeder lengths are only approximate calculated lengths, in practice these are only a guide, slightly longer lengths should be cut and then pruned to get the best results.

The electrical design is based on the principle that it is possible to do all necessary tuning by

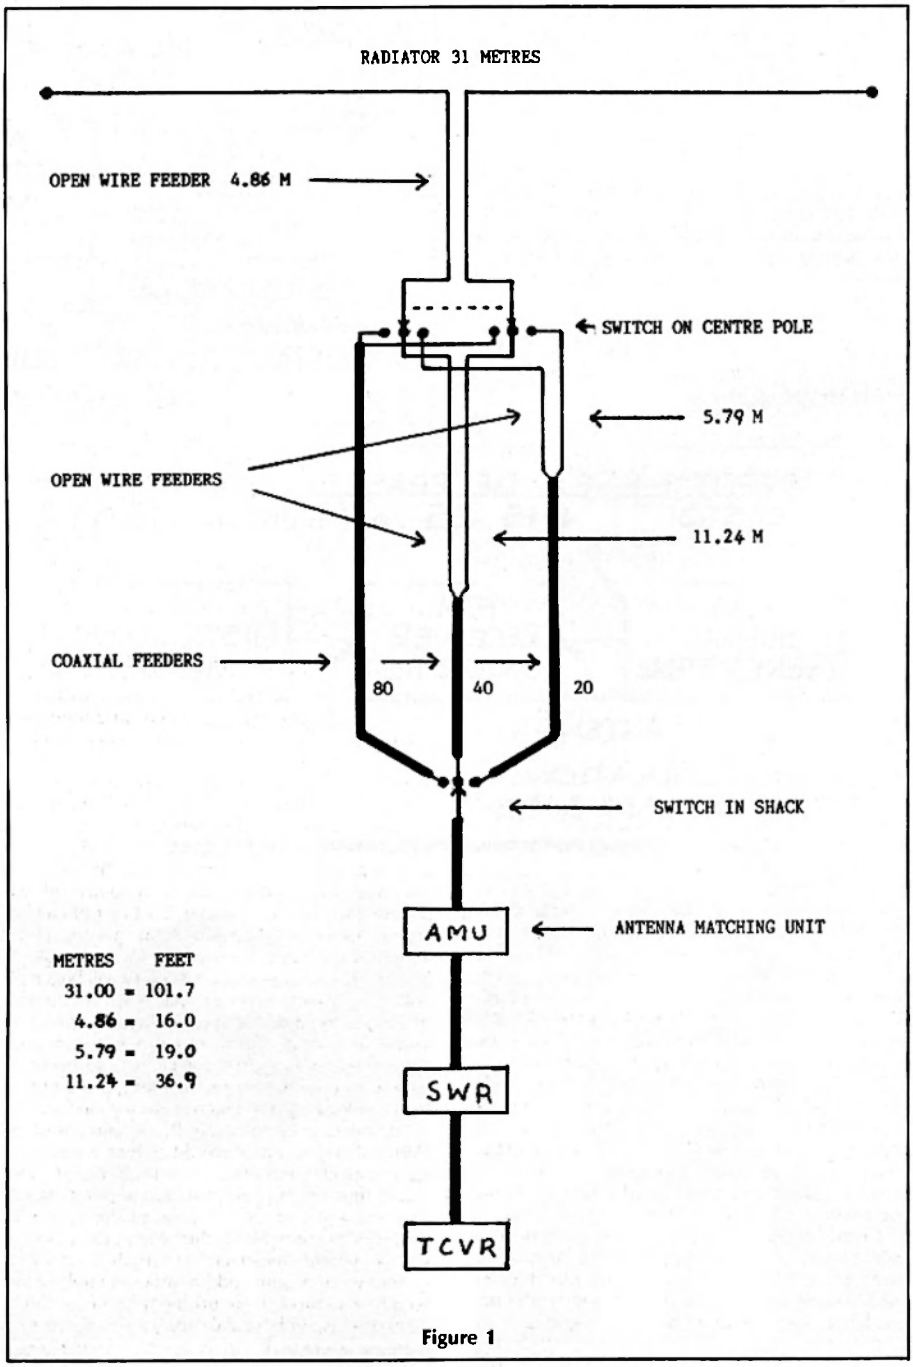

Figure 1

pruning the lengths of the radiator and the feeders used and any slight SWR remaining can be dealt with by the AMU described.

It is best to think of the radiator and open wire feeders as a continuous antenna length, a portion of which is folded up in the form of an open wire feeder at the antenna centre. Thought of in this way, the 80 metre system is a half wave with a slightly folded up centre portion. The 40 metre system is three half waves with a little over one half wave folded at the centre. The 20 metre system is five half waves with two of these folded at the centre. As we are considering resonant lengths and harmonic frequencies for long wire type operation, I first submit the following useful table of figures.

HALF WAVES	METRES FORMULA	HARMONIC MULTIPLIER
1	142.5	
3	442.5	3.11
5	442.5	5.21
7	1043	7.32
9	1343	9.42
11	1643	11.50
13	1943	13.60

NOTE: Half waves refers to the number of electrical half waves in the radiator and open wire feeders combined. Metres formula is the figure that must be divided by the frequency in MHz to obtain the metres length required. (Feet = Metres x 3.2808).

Harmonic multiplier is a figure used as a multiplier to the fundamental frequency to obtain harmonic frequencies. Eg: The third harmonic of the fundamental frequency is not exactly three times — it is 3.11.

Considering the above table and making calculations using it, we see the total length the 80 metre coaxial cable needs to 'see' for 3.5MHz is 40.71m. This is the sum of the radiator 31m plus both sides of the 4.86m feeder. To obtain the harmonic frequencies we use the multiplier table, 3 = 10.9, 5 = 18.2, 7 = 25.6, 9 = 33. So we see the harmonic frequencies suit the WARC bands if the 80 metre fundamental frequency is 3.5MHz or a little lower.

On 40 metres, the coaxial cable 'sees' three electrical half waves. Using figures from the table and calculating for three half waves, 7.0MHz is 63.2m. Using the multipliers, we find the fundamental frequency is 7.0 divided by 3.11 as 7.0 is the third harmonic frequency. So we get, 1 = 2.251, 3 = 7.0, 5 = 11.73, 7 = 16.48, 9 = 21.20, 11 = 25.89, 13 = 30.61. The 15 metre band is well covered by the ninth harmonic (a better ratio than first to third) and the 10 metre band is not far from the thirteenth harmonic.

On 20 metres, the coaxial cable 'sees' five electrical half waves, so the length needed for 14.2MHz is calculated as 52.3m. The fundamental frequency will be 14.2 divided by 5.21, as we are using the fifth harmonic. Resonate frequencies will be, 1 = 2.726, 3 = 8.48, 5 = 14.20, 7 = 19.95, 9 = 25.68, 11 = 31.35. Only the 20 metre band is 'spot on', but 10 metres may be reasonably close to the eleventh harmonic.

In all the above, more decimal places than necessary have been used so figures will check out reasonably well, in actual fact no such accuracy is possible. The slight velocity factor in the open wire feeders and the antenna thickness ratio have both been neglected, but the errors will only be small.

Considering the high order harmonics sometimes used, some may think the impedance seen by the coaxial cable would be very high indeed however, the folded portions reduce this impedance, so the overall results are good.

Before tuning-up the system, let us consider the height of the pole mounted feeder switch. The distance down from the top is shown on the diagram, but other heights are possible. If higher positions are used, the radiator will become longer and you may not have enough room. If lower positions are used, too much of the 80 metre half wave will be folded up in the feeder and poor results will be obtained on this band. The position shown is good, as it gives three half waves on the radiator for the 20 metre band, thus giving a very good radiation pattern. With typical pole heights of about 10m, the switch can be easily reached from a small home extension ladder, a very useful point. In the following, we assume the switch has been fixed at the height shown on the diagram and that the radiator, 40 and 20 metre feeder lengths have been cut a bit long to allow for exact pruning.

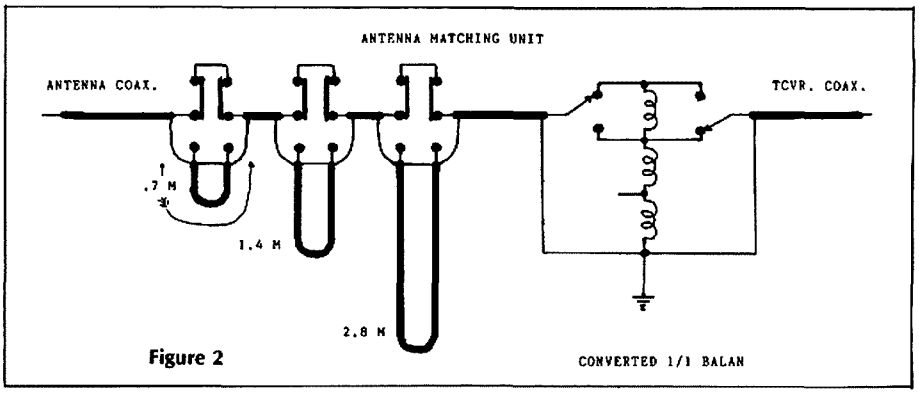

Figure 2

To tune-up the system, the feeder pole switch is set to the desired position then GDO readings are taken at each coaxial cable connection point before the cable is connected. Check at both the fundamental and any useful harmonic frequencies, pruning to get the best average results. On 80 metres, the antenna ends are pruned and for 40 and 20 metres, the open wire feeder lengths are pruned. Of course, 80 metres must be attended to first as the radiator length decided on will also be used for 40 and 20 metres. As all three feeder lengths give harmonics close to the 10 metre band, most likely all three will be suitable for 10 metres use, but at least one will be without any special tuning. Having attended to this pruning, the coaxial cables can then be connected, but leave them a bit long as they also may need to be pruned slightly.

As the coaxial cables will usually not be perfectly matched, the resulting SWR will mean the voltage, current and impedance along each cable will not be uniform throughout its length. At current maximum points, there will be low impedance and at voltage maximum points high impedance will be experienced. Starting from a high current low impedance point looking along a long length of coaxial cable with considerable SWR, an electrical quarter of a wave away will be a high voltage, high impedance point. A further quarter of a wave and it will be back to high current, low impedance once again and this will continue along the entire length of the cable. The electrical length is equal to the physical length multiplied by the velocity factor which is usually .66 for most solid type coaxial cables. In this system, as some SWR will be present, it would be nice if we could stick to electrical half waves or multiples of a half wave, thus having low impedance points at the antenna and transceiver ends of the cable. In cables with some SWR, the worst possible case will be where the electrical length is an exact quarter wave or some odd number multiple of this length. The most likely problem band for this is 80 metres as, with typical cable, this is about 13m of physical length. If 13m happens to be the length needed to reach your transceiver, even a few extra metres might well be worthwhile to reduce the problem.

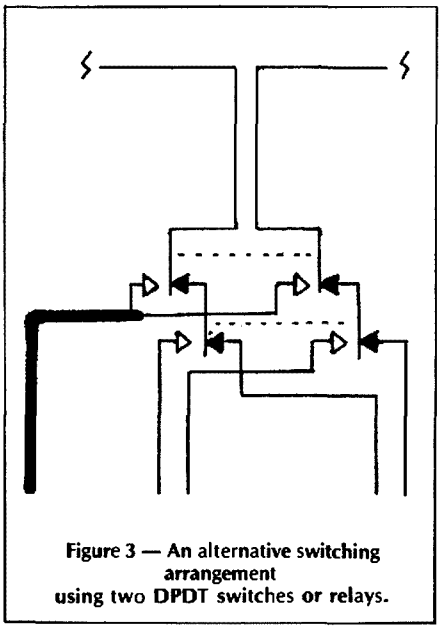

Figure 3 — An alternative switching arrangement using two DPDT switches or relays.

Looking at the Antenna Matching Unit (AMU), it will be noticed that provision is made for switching in additional lengths of coaxial cable and a RF matching transformer is also included. With the coaxial cable additional lengths available, the problems of difficult coaxial cable lengths can usually be overcome, but if difficulties still persist slightly different antenna coaxial cable lengths can be used. With the matching transformer a considerable range of impedances can be matched. The advantage of using this no lumped inductance or capacitance system is that no exact tuning is needed and the switch settings usually hold across an entire band.

Looking at the AMU diagram and the coaxial switching used it will be noticed that starting from the shortest length, the next is double the length and the longest is double this again, making it four times the shortest length. This arrangement, by the different switch combinations available gives seven possible additional lengths, so starting from zero a total of eight lengths are available. The lengths I have chosen will normally be satisfactory but other lengths may, at times, be better, but stick to the same 1, 2 and 4 ratios, so the switch adding will give a choice of seven additional lengths. It will be noticed that the braid of the coaxial cable is bonded in a way that could be considered as a short circuiting of its length but this does not cause any problems.

The matching transformer is basically a con-

verted 1:1 balun or you can buy a balun kit from a well known radio supply house and wind your own. In the diagram, I have shown the windings end to end for simplicity when actually they are interwound. It will be seen either a slight step up or step down can be achieved by changing the switch positions. Also, if both are set either up or down a 1:1 ratio is obtained. So three impedance matchings are possible, in practice giving reasonably close transceiver matching to antenna coaxial feeder impedances of about 15 to 150 ohms. The unused tap on the transformer could be switched in instead of the presently earthed end to give an even greater range of impedance matching if desired, but I have found this unnecessary in my case.

To operate the system watch the SWR meter and using a minimum of RF power run through all eight switch length positions in order starting from zero to the seventh added position, and do this for each of the three impedance matching conditions. If you write number 1 next to the switch adding the shortest length, 2 next to the medium length and 4 next to the longest length, it then becomes a matter of simple addition to get the number you require.

Unless your memory is much better than mine, you will need to record the best operating switch positions for each band. One way of doing this, is as follows, designate the three impedance positions as A, B and C and the length positions as 0 to 7 then all switch positions can then be recorded by a single letter and figure, so you can return to any desired setting, with ease. The average SWR for this system across all HF bands (including WARC) is 1.2, proving it is possible to avoid using an ATU.

AR

A Solar-powered House and Amateur Station

We live in the village of Sarmai Atas, on the side of a hill about 80 km west of Jayapura, in the Indonesian province of Irian Jaya. we are surrounded by lush green forest, interspersed with gardens of taro, sweet corn, bananas, sugar cane, and coconuts. This is one of 25 villages where the Nimboran people live, whose language we have been studying for six years. The climate is hot and humid all the year round. As we are a long way from sources of electric power, our power needs are met by solar panels. These provide electricity for lighting, radio, and some other household items.

Kevin May YB9ARZ/VK5IV.
Box 54, Jayapura, Irian Jaya, Indonesia.

The basic system comprises a 12 volt battery, two ARCO solar panels of 30 watt output each, a voltage regulator, and distribution wiring to lights and outlets throughout the house.

The battery

Any automotive 12 volt battery can be used, and at first we had a standard 40 ampere-hour car battery. This had the usual disadvantage of needing maintenance and topping up, but it performed satisfactorily while it lasted. However, it is a better proposition in remote areas to have sealed gel-type batteries which need no maintenance, and can be carried in easily. We now have one of 38 Ah capacity which meets our needs well.

A battery that can't spill can be very important. One of our friends had her radio battery taken to town to be charged, before she had solar power installed. On the way back to her village, a 2½ hours walk, it was accidentally carried upside down, and when it arrived there was no acid left in it at all! Sealed batteries can also be carried safely and easily in light aircraft, such as serve some of the more remote villages.

The Solar Panels

The two panels are mounted side by side on the roof of the house. Here they are clear of shadows from nearby trees all day. They lie along the slope of the roof, an incline of one in four, so that rain will drain off quickly, taking any dirt or fallen leaves with it. They face slightly to the east, so as to make best use of the morning sunshine. Often the afternoons are cloudy, so a tilt toward the east is beneficial.

Output of the panels working in parallel in good direct sunshine is normally around 2.5 A. This is surprising at first, seeing that each panel can deliver just over 2.0 A on its own. The explanation can be seen from Figure 1.

Figure 1a shows a single-panel charging circuit. The source resistance is Rp, the internal resistance of the panel. The load resistance Rl is the *sum of* resistances in the wiring (Rw), the regulator (Rr), and the battery (Rb). The net EMF is the difference between that of the panel (Es) and the battery (Eb). Thus the output current for one panel is:

$$I_1 = \frac{Es - Eb}{Rp + Rl}$$

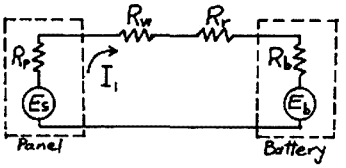

Figure 1a — Charging circuit with one panel.

If a second panel is connected in parallel, then the source EMF is the same, but the source resistance is *now* ½Rp (Figure 1b). The *output* current for two panels is:

$$I_2 = \frac{Es - Eb}{½Rp + Rl}$$

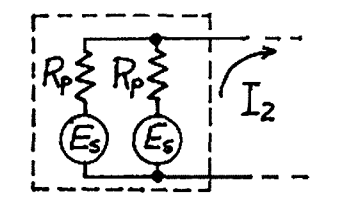

Figure 1b — With two panels.

Because Rl is not negligible, I_2 is always rather less than $2 \times I_1$. The real benefit of a second panel comes in cloudy conditions, when due to the lower illumination of the panel, Rp is greater. A smaller current flows, and the regulator, responding to a lower circuit voltage, reduces its own resistance Rr. Thus Rl becomes much smaller than Rp, and I_2 is *much closer* to $2 \times I_1$, and a worthwhile improvement in the rate of charge is obtained.

The regulator

The regulator controls the rate of charge, using a voltage sensing circuit to control a pass transistor. As the battery voltage rises to the fully-charged condition, the transistor reduces the flow of charging current to maintain a trickle charge. During the night, reverse current is blocked by the regulator to prevent battery discharge through the panels. It also has a meter to monitor the charge rate and battery voltage. Using this system, the house can be left unoccupied when necessary without danger of discharge or overcharge of the battery.

The load

Household lighting consists of a 10 watt fluorescent lamp in each room, each with a simple transistor inverter built in. A 304.8 mm (12 inch) square of aluminium foil behind the lamp makes a fine reflector, and the resulting light level is adequate. Apart from the radios, other equipment supplied from the battery includes an automotive-type stereo player, tape recorders, portable computer, and an organ. We also use a 12 volt soldering iron, a small power drill, and a food mixer converted from rechargeable batteries (when they failed) to run directly on 12 volts. However, the stove and refrigerator run on kerosene, because of their much higher power needs.

Outlets around the house are of the car cigarette-lighter type. A number of 12 volt appliances and adaptors are available nowadays with that style of plug already fitted, so they are convenient. They are safe as well, since you can't reverse the polarity by accident, as you can with some 2-pin plugs.

Radio Equipment

The main amateur transceiver is a TS-130S, working into either a TH3JR tribander, or a G5RV dipole. This unit is quite economical on battery power, which is very important to us as the amount of recharging each day is limited. I also have a 2-metre FM rig, which works into a homebrew 4-element quad. With reasonable

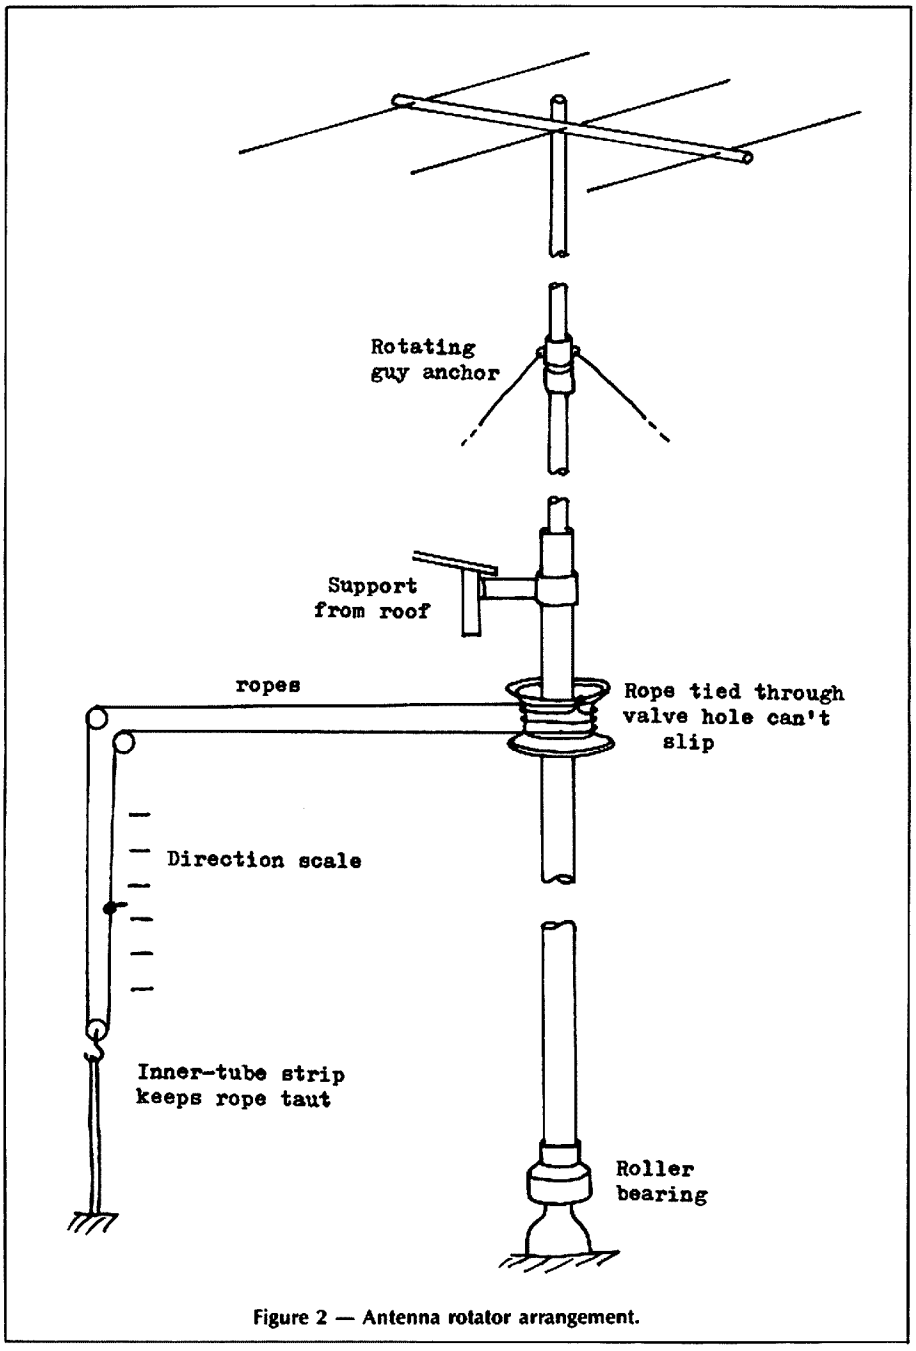

Figure 2 — Antenna rotator arrangement.

Kevin YB9ARZ/VK5IV operating with Solar Power.

restraint on the length of time each week spent on the air, we have no problem with over-discharging the battery. Obviously, daily prolonged sessions are not possible, but then we have other work to do too!

The beam antenna is rotated by the "armstrong" method, so that no power is needed for that. The antenna is mounted on top of two 6-metre lengths of water pipe telescoped together. The bottom of the pipe is supported on a car wheel-bearing, and a rotating guy-wire anchor allows the whole to turn freely. Near the house roof another support surrounds the pipe, close to a wheel from a Vespa scooter which is clamped to the pipe. A rope attached to the wheel is brought in over pulleys to the operating position, where a knot lies close to a scale on the wall to show antenna direction. Pulling one side or the other of the rope provides rotation of 1½ turns. The arrangement is sketched in Figure 2.

The G5RV antenna was built and erected over Easter this year. It is supported on two masts made of water pipes of three sizes telescoped end to end, and standing 14 metres high. It is mostly used on 80 metres, but will, of course, work on the other HF bands also. The antenna which I first used is a 20/15 metre duo band portable dipole, but this is now held in reserve for use when I am away from home for longer periods.

I first began amateur operating in Australia as VK5IV in 1982. In Indonesia I have had the call signs YB0ARK, then YB9ARK, and now YB9ARZ. I have also operated from Papua New Guinea as P29KM. The YB9 prefix is fairly uncommon, so that there is seldom a shortage of people to talk to. I mostly prefer chatting rather than DX-chasing, with its pile-ups and tensions, yet I have recorded a total of 67 countries contacted so far. It goes to show that one can get considerable satisfaction from the hobby of amateur radio with modest power output and simple equipment.

AR

NEWS FROM THE ARRL

A reciprocal licence agreement has been signed by the USA and Japan, effective the 7th September 1985. THe WIA awaits details of the agreement, prior to asking the Australian Administration to conclude a similar agreement.

The ARRL have obtained use of the 902-928MHz band for Technician Class Licences and above on a secondary, non-interference basis.

Amateur operators in the northern parts of the USA have had the 420-430MHz band removed from their allocation. At this stage, little is known as to the reasons, but we believe this action has been taken to protect Canadian Fixed and Mobile operations.

RADIO PRIVACY LEGISLATION

Legislation to protect the privacy of radio communications is suggested in a Department of Communications discussion paper, dated 1st September 1985.

Communications Minister, Mr Michael Duffy, said he was not considering legislation to prevent interception by unsophisticated devices, such as scanners and shortwave receivers.

Mr Duffy said however, that there was an increasing public desire to prevent the interception of messages which were commercially sensitive or vital to security.

An option in the discussion paper is to have legislation which will support users who go to the trouble and expense of encoding their messages.

Besides making it an offence to intercept certain radio messages, legislation could also control the supply of decoding devices which, enable people to intercept these messages.

In many cases, interception of messages is of no consequence, but in others, security or commercial reasons make confidentiality essential.

FOURTEENTH AUSTRALIAN JAMBOREE

The 14th Australian Jamboree will be held from 29th December 1985 until 9th January 1986, near Wollongong, at Cataract Scout Park, about 6km from Appin. An amateur station, using the call sign VK2SAJ, will be set up on the highest part of the site for the duration of the Jamboree and will hopefully be manned 24 hours a day.

The antennas, an 80 metre dipole, two 40 metre dipoles, two 4 band beams with rotators, beams for 6 metres, 2 metres and 70 cm, and various ground plane antennas for 2 metres and 70cm will be mounted on three wooden poles about 20m above ground level. They will be arranged in a triangle. The shack will be a portable building, about 8m square.

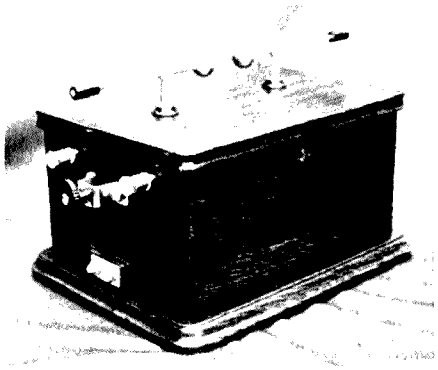
COLLECTORS CORNER — Featuring Bob Pallett VK3BEA

Alan Shawsmith VK4SS
35 Whynot Street, West End, Qld, 4101.

One of the great attractions of amateur radio is that it allows a broad range of interests under its title. There is scope for endless diversity even among those whose hobby is homebrewing. For some, construction projects involving the silicon chip are the attraction; others like Bob Pallet VK3BEA turn their skills to recreating equipment used at the very beginning of WIRELESS — and now almost impossible to obtain.

The accompanying photos show the high degree of Bob's skill and craftsmanship.

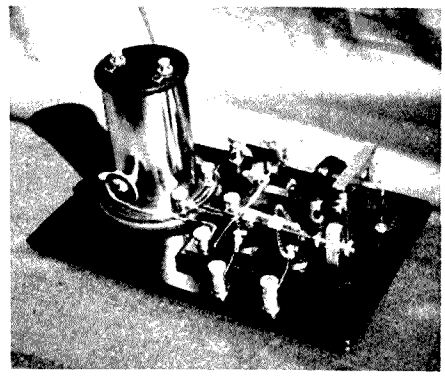
The MAGNETIC DETECTOR (used by Marconi and others) not only looks as good as anything turned out commercially — it also works well. In Bob's words . . . *"not quite as sensitive as the galena detector but picks up the local broadcast stations with good quality."*



This shows an INDUCTION COIL housed in a box of exotic wood, with a spark gap mounted on top. The coil is simply one taken from an automobile. A 1 inch (25 mm) spark is possible.

VK3BEA's further artisan skills encompass making exact replicas of various component parts; eg vintage horn speaker drive units, gramophone pick-up heads, rare and odd shaped knobs, etc. In most cases they are so well done it's impossible to pick the imitation from the real thing. And no, he does not have an elaborate workshop. His tools are simple but effective — the main item being nothing more than a handy man's electric drill. Figure 1 is a sketch of the many ingenious ways Bob sets up and uses his homebrewed tools.

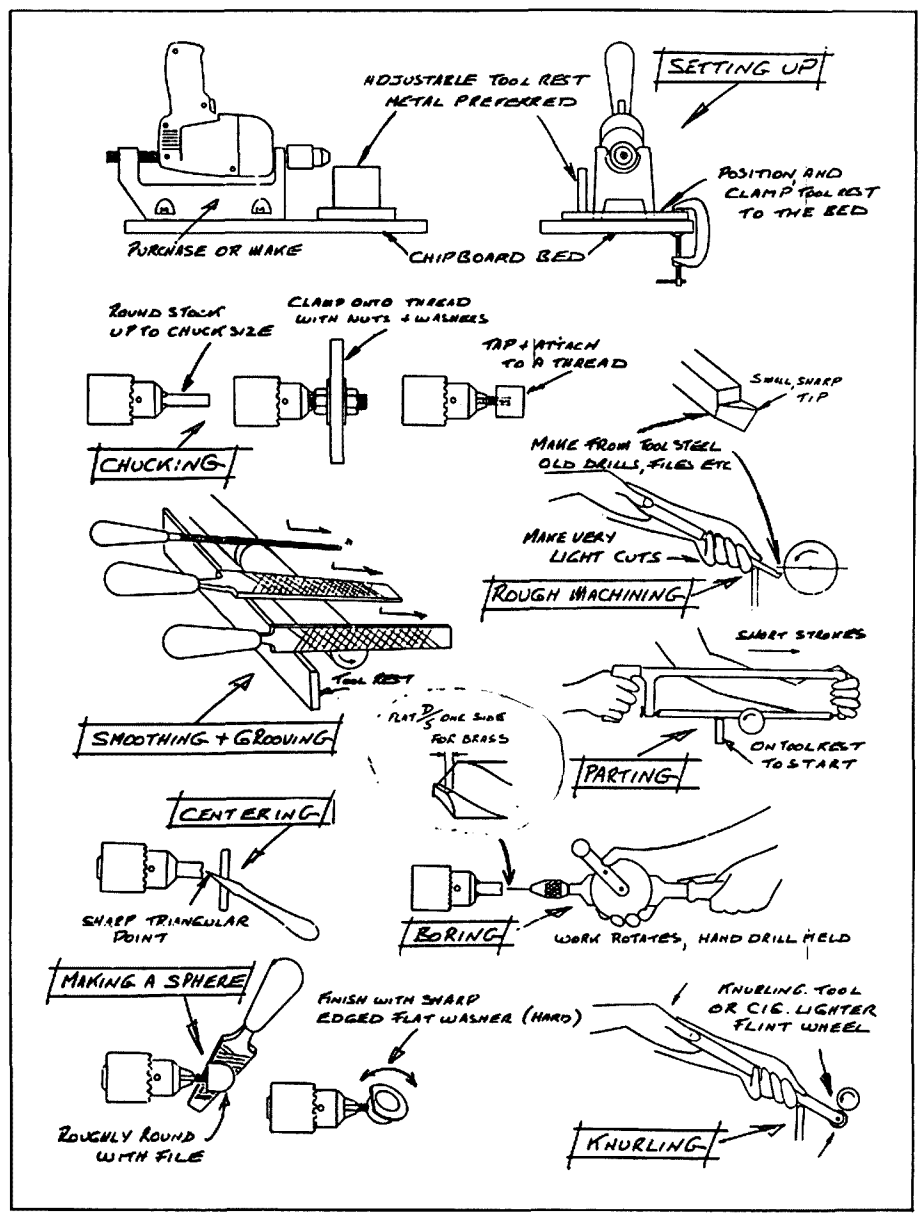
He is also a member of HRSA (Historical Radio Society of Australia) — group dedicated to the restoration and preservation of early wireless.



A COHERER DETECTOR in use at the turn of the century. This particular one, built by VK3EA, is not only a masterpiece of homebrewing, it works magnificently. Coupled into a G5RV antenna it will register lightning strikes thirty miles (48 km) distant. Bob reports that the COHERER is very sensitive and has a very good on/off ohmic ratio.

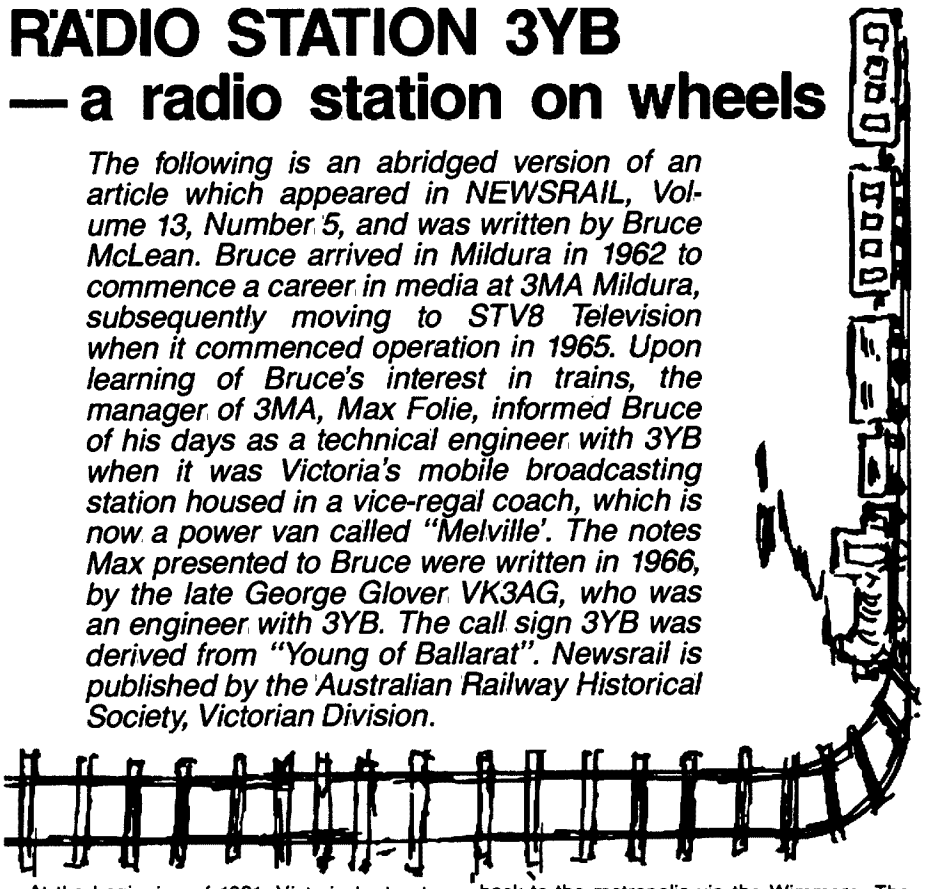
Amateurs like VK3BEA are now very thin on the ground and they will be greatly missed when they QRT. No matter how well history is written, it is only by eyeballing and actually using the equipment of our pioneers that a real appreciation of their achievements is understood.

Other homebrewers working on similar equipment can write to Bob and swap information or ideas at 4 Ailsa Street, Dandenong Nth, Vic. 3175



RADIO STATION 3YB — a radio station on wheels

The following is an abridged version of an article which appeared in NEWSRAIL, Volume 13, Number 5, and was written by Bruce McLean. Bruce arrived in Mildura in 1962 to commence a career in media at 3MA Mildura, subsequently moving to STV8 Television when it commenced operation in 1965. Upon learning of Bruce's interest in trains, the manager of 3MA, Max Folie, informed Bruce of his days as a technical engineer with 3YB when it was Victoria's mobile broadcasting station housed in a vice-regal coach, which is now a power van called "Melville'. The notes Max presented to Bruce were written in 1966, by the late George Glover VK3AG, who was an engineer with 3YB. The call sign 3YB was derived from "Young of Ballarat". Newsrail is published by the Australian Railway Historical Society, Victorian Division.



At the beginning of 1931, Victoria had only four country radio stations, and the receiving sets then available, lacked the selectivity and range of the equipment of today. Further, most stations were operating with limited power so, unless in close proximity to a station, reception was very poor.

The Chief Wireless Inspector, Jim Malone and his Deputy Jack Martin, were anxious to give country listeners a better service and were naturally in favour of mobility when the idea was put to them by Mr J A Young, an employee of radio station, 3BA Ballarat.

They were however, somewhat dubious, so agreed to a permit for three months trial.

Support was obtained by Mr Young from several Melbourne business men and Mobile Broadcasting Services Pty Ltd was registered.

Two large motor caravans and one trailer housed the complete equipment which was constructed by Mr Bert Aldridge and thus 3YB was born. It left Melbourne on 11th October 1931 for its initial tour with the first broadcast from Clunes, near Ballarat, on 12th October. The crew comprised Messrs Vic Dinneny, manager and announcer, Bert Aldridge, engineer and operator and Bert Rennie, business manager and copywriter. These were their official titles but unofficially they were known as housemaid and cook, motor driver and mechanic, and circus hand and general labourer, respectively.

ERECTING THE AERIAL

The aerial was supported by two 40 feet (12m) steel masts placed 120 feet (36m) apart. When the aerial was erected, the caravans were manoeuvred immediately below. The whole system was then coupled by flexible cables. As far as it is known, 3YB was the first complete broadcasting station on wheels in the world. The first tour covered the Lower and Upper Mallee, as far north as Mildura and then back to the metropolis via the Wimmera. The tour occupied a period of three months. At the end of the first six months, Max Folie took over from Bert Aldridge and Bert Rennie retired to the metropolis.

Adventure, humour and real human interest were encountered by this small band of pioneers as they heralded a new era in the broadcasting field.

The nature of the aerial system demanded open space, the type only found in paddocks, which meant that bogging in wet weather endangered the maintenance of the itinerary. After one winter, camping under appalling conditions, it became obvious that a more congenial means of carrying a broadcasting service to the country was a must.

During this period, Jack Young was busy dreaming of a broadcasting station on rails, and after many interviews with officers of the Railways Department, and overcoming many obstacles, a coach which had been built 30 years previously for use throughout Victoria of King George V and his Queen, when they visited Australia as the Duke and Duchess of York, was swung into service for the radio station.

The coach was admirably suited for its new duties. The parlour became the studio, comfortably furnished with a long settee which converted to two beds, a table, chairs, a convertible easy chair and the operating desk with double electric turntables, and a microphone pendant from above. A corridor led to the far end of the coach where a room, the dining section, housed the transmitter, cupboards and lockers contained spare tools. Between the two rooms, a kitchen was equipped with running water and all necessary cooking and storage facilities. The rear platform of the coach was equipped with a canvas weather blind covering the power plant which was used on locations where mains power supply was not available. The aerial consisted of two 20 feet (6m9 masts arranged one at each end and on opposite sides of the roof. A counterpoise system on the roof completed the system. For stability, an earth pin was driven in beside the rails when the coach was on location.

On 17th October 1932, 3YB, now a station on rails, definitely the first of its kind in the world, set out for a tour of the Goulburn Valley.

Upon arrival at its destination, the coach was backed into a siding, where it remained until called for, on schedule, in accordance with a carefully prepared itinerary covering a wide area of Victoria. In spite of the low power used by 3YB, 25 watts, the coverage was excellent.

By arrangement with the metropolitan stations, relayed items of particular interest were featured, fed over the landline from Melbourne, and coupled into the station by temporary lines provided by the ever courteous members of the Postmaster General's Department. Where power supply was available in the town, arrangements were made whereby temporary service was given, otherwise the station's own plant was used.

In 1933, Mr James Joyce, well-known in the theatrical world at that time, took over as manager/announcer and Jim Givens as engineer and operator. Jim was later relieved by George Glover VK3AG, who remained with the station until it changed over from rails to a fixed location. The story of the life of this unusual station which paved the way for a chain of fixed stations which replaced it, ended in 1935 when the mobile licence was surrendered for two fixed licences, namely Warrnambool where 3YB still carries on in the old tradition, and Warragul where 3UL profits from the pioneering spirit that brought it into being.

Some of the equipment from the mobile unit which was withdrawn from service when the fixed 3YB at Warrnambool received a higher power licence, was still operating in the amateur station of Harry Fuller VK3HF in May 1966. Harry, an engineer, succeeded George Glover at Warrnambool in 1938.

Thanks to Mr Richard Watts, Articles Editor of Newsrail, for his permission to publish this article. Further information for members interested in trains and who may be interested in receiving Newsrail, may be obtained from the ARHS Membership Officer, Box 5177AA, GPO, Melbourne, Vic. 3001. Abridged and adapted from Newsrail by Bett McLachlan.

AR

COUNCIL OF EUROPE — TP2I

A new radio station has been created at the Headquarters of the Council of Europe, in Strasbourg, France.

The call sign is TP2I, this prefix serial was deleted from the French international call sign series, and officially attributed by the ITU to the Council of Europe.

The Council is an International organisation bringing together 21 democratic countries of Western Europe. It co-ordinates European activity in the political, cultural and juridical fields, it also deals with human rights problems.

The Headquarters enjoy Extraterritorial Status and are now applying for a New Country on the DXCC list, at the ARRL.

The station's director and QSL manager is F6FQK, assisted by F6EYS. Station operators are F8RU, F6EQG and F6HIX. Operations begin in December 1985.

Contributed by Francis Kremer F6FQK

IS THE CB LICENSED DAD? ... GEE NO DAVE!

An upsurge in illegal UHF CB operation in rural areas was coming in for attention from the Department of Communications.

A DOC spokesman said a nationwide appeal had been made for farmers to pay the $12 licence fee or face prosecution and equipment confiscation, under the Radio Communications Act.

UHF CB is popular in rural districts, but apparently many users are neglecting to obtain a licence.

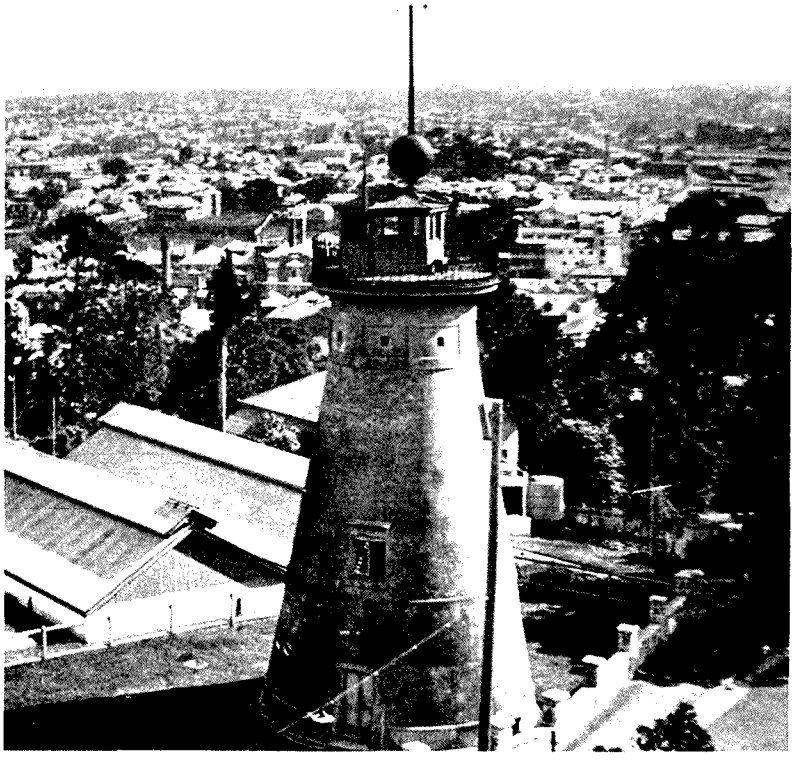
VK4 WIA NOTES

Alan Shawsmith VK4SS
35 Whynot Street, West End, Qld. 4101



Photograph by F Stevens in 1928.

The convict built Windmill and Observatory Tower. One of Brisbane's oldest landmarks and the QTH and shack of Tom Elliott 4CM. It was from here he directed Sir Charles Kingsford Smith to the Australian coast and later carried out his famous television experiments. The Tower now attracts thousands of curious visitors each year.

PRE-WORLD WAR TWO VK4 HISTORY *(abridged)*

*Marconi has gone down in history as the WORLD'S FIRST AMATEUR — a title he loved to hear, particularly in his latter years. Although this is something of a misnomer, no one would begrudge it to him. Many of his wireless experiments were commercially backed and the word AMATEUR as applied to WIRELESS at the turn of the century was seldom used — the official term was EXPERIMENTER; nor was he the **first** person to achieve WIRELESS communication.*

Queensland, the Sunshine State of Australia, had a few 'eccentrics' who experimented with wireless, as distinct from electricity, in 1900 — or even before this date. They must have been very few and far between, because at the outbreak of WWI, in 1914, only 10 names appeared on official lists. By the year 1930, this number had grown to 95 (give or take a few). During the next nine and a half years, to September 1939, the ranks had swelled to 275, with the ratio of city to country being approximately 50:50. WWII then intervened and when peace was restored, six years later, the number to re-register was 169 — a drastic depletion. Not all paid the supreme sacrifice, many simply had given amateur radio away for other interests. The immediate pre-war figure of 275 was not reached again until the year 1948. This meant that the war set amateur radio back, population wise, by almost 10 years.

Early in 1912, the Wireless Institute of Queensland (WIQ), was formed by S V Colville XQF This gave the Bananalanders the distinction of being the third Australian state to form such a group.

The first VK Call Book was published by the WIV in July 1914 (AR August 1970, page 10, features a reprint) and, out of a total of 401 experimenters listed, VK4 could only manage 10, as mentioned above. However, the equipment used by at least one of these very early pioneers, viz Marcus Brimms ZQA, of Mareeba, N Qld, is still intact. The spark type station was dismantled and stored. There is no reason why it cannot be re-assembled and made to function. It appears to be the earliest station still complete in VK4 and must be one of the oldest in Australia. Shortly after the Call Book was published, experimental stations were ordered to QRT due to the outbreak of WWI and all gear was impounded by the PMG's Department.

The electronic spin off available at the cessation of hostilities gave the home-brewing experimenter many unexpected advantages. One of these was the improved quality and efficiency of the vacuum tube, which quickly led to the development of SOUND TRANSMISSIONS, ie voice and music. The first Queenslander to ably demonstrate this was Tom Elliott, who built station A4CM. His broadcasts, in 1920, were transmitted from the third floor of Preston House, later named the Queensland Insurance Building, in Queen Street, Brisbane. To commemorate this achievement, a plaque describing the event was installed in the vestibule. From this location, he very successfully organised the first Outside Broadcast (OB), a stage play being performed at His Majesty's Theatre — no mean feat in those days. OBs then became a regular feature of his transmissions.

Back in 1915, for security reasons, the Royal Australian Navy (RAN) took over the control of Australia's communications from the PMG, until 1920 — two years after conflict ceased. Anecdotal stories that have surfaced from around this time indicate that both the Navy and PMG were somewhat reticent to issue 'experimental' permits to private individuals. Part of a letter written by Old Old Timer, Frank Carey VK2AMI, shortly before he became a Silent Key, will shed light on the official attitude:

. . . the VK call letters were not in use then and no 'experimental wireless' was permitted. When WWI ended, the Post Office stubbornly refused to allow any form of 'wireless' by private owners. However, I managed, on my war record, to get Prime Minister Billy Hughes on my side, (allegedly by personal interview). The Post Office's objection, which was given as lack of secrecy in communications, was over ruled. I got the call 4FC but, the Navy refused to allow me to use it away from home on account of possible 'homing' on a sea-going ship leaving our ports."

If ex-Queenslander, Frank 4FC, A4FC and finally VK2AMI, found it necessary to enlist the PM's aid in obtaining a licence to experiment, then it can be assumed that lesser souls had little or no hope. This official attitude surely must have retarded the progress of wireless in VK — fortunately it did not last. VK2AMI was a skilled electrical and mechanical engineer — decorated by the USA for his WWI service. His name and call sign appear on the Honour Roll in the Toowoomba City Hall; his home brewed spark transmitter (circa 1917) is permanently displayed in the Brisbane Museum. This set must also be amongst the oldest functional equipment in Australia.

At this point it may be propitious to clarify the progression of call signs used in Australia since wireless began. Pre 1914, the experimenters call sign was a three letter affair with the prefix 'X', eg XCM. After WWI this was replaced by a number assigned to each State, eg 4CM — Queensland. Then the letter 'A' (for Australia) was added, eg A4CM. As DX began to reach into other continents, Down Under was further clarified, in 1926, by the addition of the letter 'O' (for Oceania), eg OA4CM. Late in 1929, amateurs were allocated the 'VK' prefix which has remained to this present day.

In 1925, the PMG first introduced the Amateur Operators Proficiency Certificate (AOPC), later changed to AOCP — and about this time the term EXPERIMENTER began to be superseded by the less descriptive word AMATEUR.

GOLDEN DECADE

'National' MW Broadcasting, namely 4QC Brisbane and Commercial Station 4GR Toowoomba came to the Sunshine State in 1925. These events appear to have inspired the experimenting fraternity to follow suit in a big way. Research reveals a surprising number of amateur disc jockeys who 'had a ball' between the years 1925-35. The PMG then began to impose restrictions on MW transmissions and finally closed them down pre WWII. One of the best known amateurs, during this period, was Cec Morris VK4LW, who had a large listening audience. V H Wooster VK4VH of Townsville was another. His signal was heard far and wide, even to the islands north of Australia. Most clubs had a weekly broadcast service and many, using only QRP, were heard at incredible distances. It is hoped to provide much more information on this 'Golden Decade' of amateur radio DJs, in VK4, at a later date.

VHF ARRIVES

The firsts forays into VHF began in 1925 in Queensland. As a matter of passing academic interest, Hertz and others, investigated VHF in the 1880s — but decided the spectrum had little potential and naturally turned his genius to more profitable research. What this great man may not have fully realised was, that the shortcomings lay more in the apparatus than in the medium.

Early experimenters in VK4 faced the same dilemma; the state of the technical art was hardly up to efficient communication at VHF In 1926, Leighton Gibson OA4AN constructed, what must have been one of the first successful five metre transmitters in Queensland, the adjective 'successful' being relative. From a look at the photograph of this rig it appears to have been the well-known, one tube Hartley oscillator. At 56MHz it must have been very unstable and subject to hand capacity when tuned. How well, or how badly, it keyed will never be known. It was displayed at a radio and electrical exhibition at Brisbane in the above year. One prophetic comment written at the time bears mention, *"five metres appears useless for DX but has potential for interplanetary communication."* Obviously the science fiction writers were among us way back in 1926.

In 1928, Arthur Walz OA4AW, prominent in all pre WWII activity in VK4, produced a receiver which performed creditably on VHF It was stable enough to allow signals to be tuned with minimum difficulty. In the early 30s, with one or two reported exceptions, five metre DX was mostly restricted to a range of a few miles.

It was not until Edwin "Feedback" Armstrong's super regenerative circuit was adopted, that things began to move. This super sensitive, simple, easy-to-construct set, nicknamed the 'rush box' — because it operated with a no signal, low level, high pitched hiss — revolutionised VHF operation. For the first time ever, mobile duplex phone became a "piece of cake'. Magazines from 1930 onwards began to feature regular articles on the 'RUSH BOX' transceiver — QST (USA) in July 1931, devoted 11 pages to, what was now, a most popular activity.

As the 30s advanced, so did the VHF DX frontiers. One of the best five metre QSOs was made by Arthur Walz, VK4AW at Nundah, with Roy Harston VK4RY. and Bill Wishart VK4WT at Mount Gravatt, early in 1934. Although this cross-town contact covered only 22km, the signals both ways were steady, strong and clear — a triumph for "rush box' equipment. Shortly after this, technical instruction on super regeneration became part of the WIA (Q) tuition class curriculum.

Over-the-horizon ship-to-base contact had already been made by a WIA (Q) crew using Nim Love VK4JL's ship, the SWEETHEART en route to Stradbroke Island — thus disproving the, then current theory, that VHF waves were strictly line of sight.

Early in 1935, several members of the WIA, viz VKs: 4AW, 4HR, 4RY, 4AL and others achieved a long sought aim, by breaking three Australian VHF records. They were: mobile to mobile, mobile to base and base to aeroplane. Maximum distance was 112km. This DX was very quickly surpassed with QSOs from places well north of Brisbane to beyond Toowoomba, on the Darling Downs, and to Springbrook near the NSW border. Again Arthur VK4AW was prominent in all of these activities. These final successes on VHF were a just reward for a dedicated group of VK4s who, initially had many failures, but stubbornly persisted investigating this part of the electromagnetic spectrum.

BUMPY ROAD TO TRAVERSE

Most post WWII amateurs would know very little about the early days of the WIA and might conclude that, since its inception in 1910, the body has progressed smoothly and steadily. Not so! As with all long surviving societies, the Institute has had its 'ups and downs' and at least one era, when it had to contend with a vigorous and fast expanding group, the Australian Radio Transmitters League (ARTL).

In March 1919, at Brisbane, an inaugural meeting was held to form the Queensland Wireless Institute, known hereafter as the QWI. Like its predecessor the WIQ, which became largely inactive during WWI, membership must have been only a handful of enthusiasts, at most. Some six years later, dissatisfaction with the Institute began to surface; the younger and more active experimenters viewed it as an ineffectual body. Frank Carey A4FC had this to say, *". . . the development of wireless is not due to the skills and knowledge of the academic 'big shots' . . . but due to progressive ideas from just ordinary fellows from all walks of life."*

Research by this author at the Oxley Library, Brisbane, has, so far, failed to reveal any high level activity by the QWI during the period leading up to the mid-20s. There are records of experimenters on the 200 metre band and some tuition in wireless — but this did not satisfy a growing number of vigorous younger experimenters, who viewed progress in the State of Queensland as being in a State of Stagnation.

This led to a well-attended meeting held in April 1927 at Tom Elliott's Radio Shop, Adelaide Street, Brisbane, where those assembled, formed a separate organisation. It was given the name of the Queensland Radio Transmitters League (QRTL). Office Bearers elected were:

President — Matt O'Brien OA4MM
Secretary — Leo Feenaghty OA4LJ
Treasurer — Cliff Gold OA4CG
Working Committee — A Walz 4AW, R J Browne 4RB, C Gold 4CG and Tom Elliott (of T.V. fame)

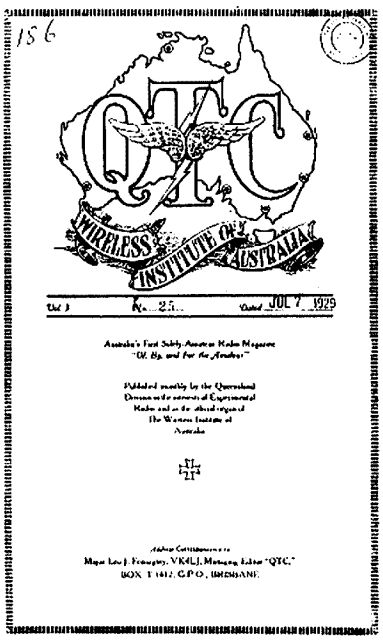
These office bearers became some of the most talented experimenters, administrators

Leo Feenaghty as he is today, retired on the Gold Coast. He was the Secretary of QRTL and AR's first Editor.

and journalists that the VK4 Division has ever had.

Three months later, on 29th July 1927, the QRTL published its first newsletter 'QTC', under the editorship of L J Feenaghty OA4LJ — a foolscap sized, 12-15 page production, issued monthly, for a subscription of six shillings (60c) post free. It met with an enthusiastic reception and had to be reprinted twice, subsequently being expanded and read in several foreign countries. 'QTC', the first solely amateur wireless magazine in Australia — and the second in the British Empire — went on to become the official organ of the ARTL and eventually the WIA.

The influence of the QRTL spread rapidly and in less than 12 months there were interested groups in all States. This led to the suggestion that a National Organisation be formed under the title of the Australian Radio



QTC 1929.

Transmitters League and each State identify itself by appending its Division, eg ARTL Queensland Division. The decision as to which State would act as Federal Headquarters went by majority vote to Queensland — this came into effect in July 1928.

ARTL membership was growing rapidly all over Australia and in Queensland alone it was several times that of the QWI (reportedly 10:1). Official recognition by the PMG would put the seal of authority on the ARTL, so to this end direct representation was made. The Departmental reply was pragmatic — neither Yes or No. It preferred, if possible, to negotiate with ONE body only — but didn't specify which one.

By this time, the ARTL was in a position of strength to enable it to alter the course of Australian amateur radio history, consequent on any decisions it decided to make. On its side, the WIA had many years of official recognition behind it — but the ARTL had undisputed popularity, positive, progressive policies and an energetic group of persuasive administrators, bursting with new ideas.

QTC Magazine, Volume 2, Number 17, November 1928, ran the following editorial (extract only):

". . . . in Australia at the present time there are two great bodies representing the amateurs. There is the WIA, the senior body in point of date of formation, having its strongholds in Tasmania and Victoria. In the early days of its formation, the Institute rendered yeoman service to the amateur cause and not a few of the privileges we now enjoy are the result of its activities. For certain reasons, there arose, in this country, some 18 months ago, the Radio Transmitters League movement which, on account of the need for some body composed entirely of transmitters, had a phenomenally successful reception and which very soon firmly established itself in Queensland, New South Wales, Victoria and Western Australia. The stage has now been reached when it behooves the two bodies to take stock and examine the position of the amateur very carefully, with a view to joining forces for the ultimate good of the CAUSE which both sides are striving their utmost to foster . . . ."

NO WIA?

After much discussion, the FHQ decided to seek a possible merger with the WIA, which had formed itself into a National body with headquarters in Victoria. Had the ARTL chosen the alternative course, at this point of time, and single mindedly pressed the PMG for recognition as THE National body representing the amateur, there might well be no WIA today. No one can really say — it can only remain as one of those polemic moments in our history.

During the following month, December 1928, Major L J Feenaghty VK4LJ, the ARTL Secretary, journeyed to Melbourne to discuss amalgamation with the WIA Executive, represented by the President Howard Love VK3BM, Vice-President Stanley Gadsen VK3SW and the Secretary Bruce Hardie VK3YX. The intense week long conference produced a rough draft of a new Australian amateur radio society. It included an amended constitution, the name Wireless Institute of Australia was to stand unchanged and QTC magazine was to become the official magazine of the Institute.

It is gratifying to report that the above negotiations were conducted in a spirit of cordiality and goodwill. However, it is unfortunate to report that VK4LJ was indisposed during this period, a fact that may have had some influence on the final draft.

All that now remained was an indication of acceptance by the Divisions in order that the merger could be declared a 'fait accompli'. The QWI proved to be a stumbling block; it rejected the decisions taken at the December Conference. This led to a sudden surprise move by the WIA Federal Executive in Melbourne. It simply recognised the ARTL Qld District as the official Qld Division of the WIA. Queensland Secretary, VK4LJ, in his editorial in April 1929 issue of QTC mentioned jubilation among the VK4 ARTL followers. In his turn, the WIA Federal Secretary, Bruce VK3YX said, *". . . Thus gentlemen, we have achieved our object — we are the WIA. A great and bloodless victory has been ours and I am able to say that no trouble is likely to be experienced from QWI and that we will experience no opposition from them in connection with the Federal Headquarters action."*

In April 1929 — two years almost to the day when the QRTL was first formed — the last obstacle to an ARTL/WIA amalgamation had finally been overcome. The merger was a 'fait accompli'. The stage was now set for a united WIA to play a positive role in the Halcyon Days of the coming decade, ie 1929-39.

During this halcyon period, the private clubs that had at first flourished in VK4, began to diminish in influence, but the WIA (Q) went from strength to strength. This was primarily due to energetic and capable executive officers who established the Institute as a body of influence and respect.

Among the fraternity, the state of the art began to expand rapidly. Single tube Hartley transmitters gave way to multi-stage crystal oscillator or variable frequency oscillator controlled rigs; the superheterodyne receiver was homebrewed or bought over the counter and primitive beam antennas put in an appearance. As solar activity improved, DX and award hunting increased dramatically. Contests were staged and well supported. For the first time ever, communication wise, the world had become a global village. (See Chronology).

AND SO TO WAR

Amateur radio was never looking so good when, on 3rd September 1939, the then Prime Minister, Mr R G Menzies, informed the people that we were at war. Once again all amateur radio ceased and rigs were dismantled. Sadly, due to circumstances beyond control, many never returned to the hobby.

It is gratifying to record that Major L J Feenaghty, ex 4LJ, who played a dominant role in forming the QRTL, ARTL and negotiating the ARTL/WIA merger, is still alive and receives Amateur Radio magazine. He also produced the first VK all amateur journal, which became the first official WIA journal, viz "QTC" and he must be happy to know that it is still the official WIA (Q) newsletter.

The above material, is but an extract of VK4 history being compiled, not a complete account. Hopefully, many more events of a personal nature and general relevance will be added. Readers are invited to submit any information they have, either new or contradictory. But please include your source of information. The author is eager to hear from any Old, Old Timers who held any WIA (Q) Division Office or Council Executive position pre WWII. He is also hoping to compile an Honour Roll of all VK4s who died as a result of service in any combat zone, up to and including WWII. Please write to the author at the above address.

ACKNOWLEDGMENTS: Much of the above mentioned information was obtained from periodicals and magazines held at the Oxley Library, Brisbane. Many thanks must go to the staff for their courtesy and assistance.

AR

CHRONOLOGY

Queensland's Amateur Radio History Prior to World War Two

Alan Shawsmith VK4SS
35 Whynot Street, West End, Qld. 4101

1905 — The 'X' prefix allotted to all experimenters — terminated at the beginning of WWI, August 1914.

1911 — David James Garland active. Now regarded as Queensland's first experimenter. His SPARK transmissions achieved a DX of 50km.

1912 - The Wireless Institute of Queensland formed (WIQ).

1914 — Ten Queensland experimenters on official lists. In the USA, 3800.

1914 — Marcus Brimms XQA, completely homebrewed a SPARK station. Dismantled, but still intact. Possibly the oldest functional, complete station in Queensland.

1917 — SPARK transmitter built by Frank Carey ex XFC, later VK2AMI. Transmitter now in the Queensland Museum.

1919 — The Queensland Wireless Institute formed (QWI).

1920 — Numeral prefixes allotted to each State. replacing the prefix 'X', eg 4CM — Qld.

1920 — Tom Elliott built Station 4CM and transmitted the first MW sound broadcast from Preston House, later the Queensland Insurance Building. A brass plaque placed in the foyer to record the event.

1921 — Bill Bright 4WB, a railway telegraphist conducted the first wireless tests between Toowoomba, Qld and Melbourne, Vic. Frequency — MW, Mode — Spark.

1921 — Tom Elliott, using station 4CM, organised the first outside broadcast from His Majesty's Theatre, in Brisbane — a three hour stage play. No mean technical feat, in those days.

1923 — The letter 'A' added to the prefix. 'A' stood for Australia, as DX was becoming international, eg A4CM — Qld.

1923 — Norm Odgers licenced as A4BO, now VK4CH. He is believed to be the longest licenced amateur in Queensland — 62 years to 1985 and still active.

1924 — Harold Hobler A4DO, in Rockhampton, received Broadcast Station KGO (USA), in daylight hours, on one valve. During this year, A4DO was placed second in Australia during the Wireless Weekly Tests.

1925 — National and commercial broadcasting began in Queensland, with stations 4QG in Brisbane and 4GR in Toowoomba. Amateurs began to follow suit.

1925 — Tom Elliott developed the ELLIOTT 3 HF receiver. Acknowledged as a superb performer.

1925 — First experimental forays into VHF

1926 — Letter 'O'added to the prefix 'A' to further distinguish area. 'O' for Oceania, eg OA4CM — Qld.

1926 — Successful five metre transmitter built by Leighton Gibson OA4AN. Displayed at the Electrical and Radio Exhibition in Brisbane.

1926 — Radio journals and magazines began to appear commercially in Queensland. During the following decade, more than a dozen different publications were in circulation in Australia and New Zealand, at one time or another. Only a few were still functioning at the outbreak of WWII.

1026 — Hal Hobler OA4DO, worked the USA on one watt, QRP and was made a member of the Australian Rag Chewers Club. Queensland was the winner of the Trans Pacific Tests. Queensland winner of the Jewels Miles per Watt Contest.

1927 — SPARK type transmissions made illegal.

1927 — Amateur radio clubs began to be created in Queensland. During the 30s, some 24 clubs, with an estimated total membership of 1000, were active at one period or another. Only a few were still functioning at the outbreak of WWII.

1927 — Queensland Radio Transmitters League formed (QRTL).

1927 — First publication of 'QTC', the newsletter of QRTL. Editor was Leo Feenaghty OA4LJ. This was the first publication devoted entirely to the experimenter.

1927 — QRTL staged the first Radio Convention in the Commonwealth, in Brisbane.

1927 — QRTL obtained permission to handle urgent radio traffic.

1927 — QRTL gave evidence before the Royal Commission on wireless.

1927 — QRTL influenced a group in NSW to form the NSW RTL.

1927 — QRTL expanded activities and had an active representative in all States (Districts), eg Qld — Fourth District.

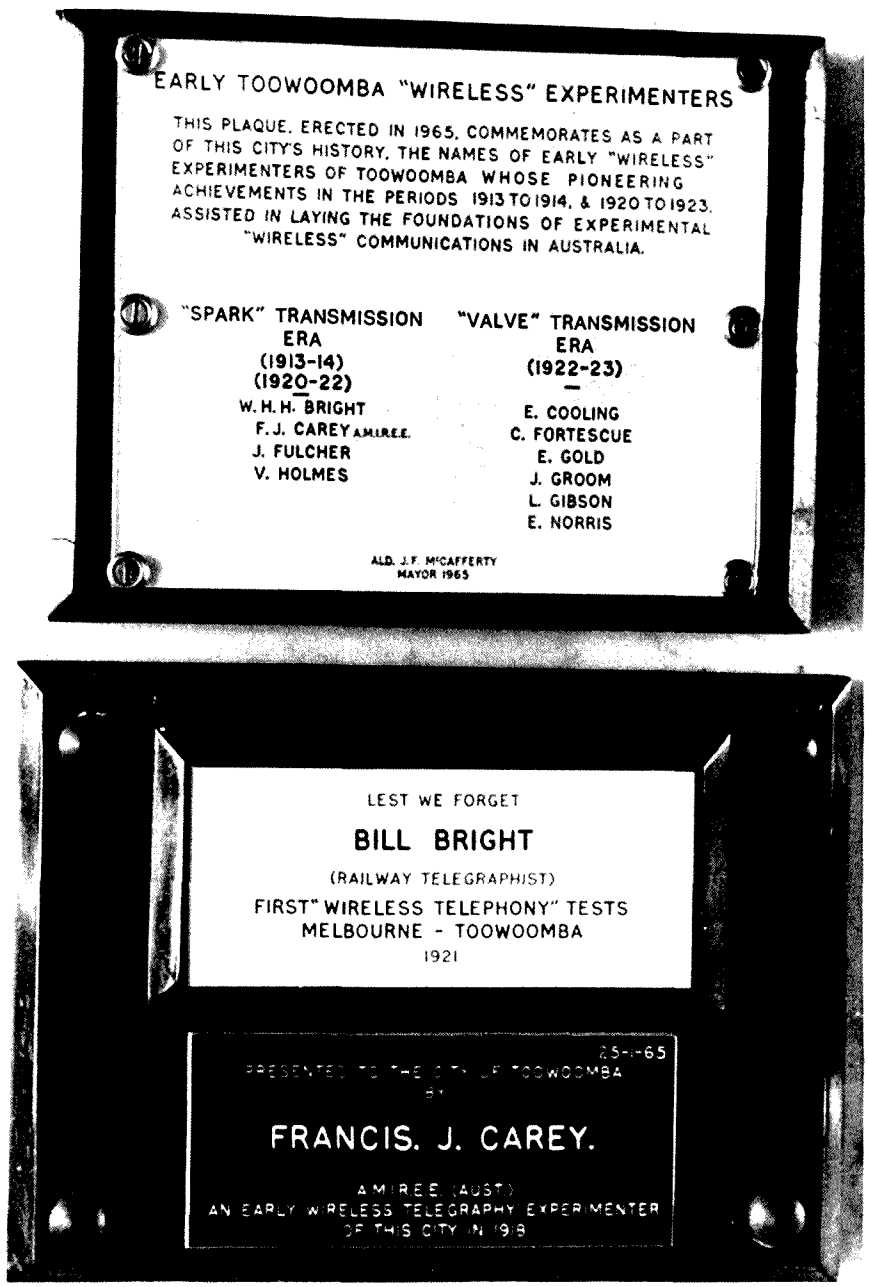
1927 — QRTL opened QSL services for any 'OA' operator.

1927 — Leighton Gibson OA4AN and Andy Couper OA4BW, in North Queensland, handled urgent cyclone traffic. Both praised by Mr A J Christie, Department Director of Posts and Telegraph.

1927 — V F Kenna OA4FK, 'Marconi' to his mates, passed the AOCP exam at 18 years. He then began a career as a trainee mechanic in the PMG, later rising to be Senior Engineer in the Radio Section of PMG Headquarters in Victoria, the highest position one could attain in this field. An *outstanding* Queenslander.

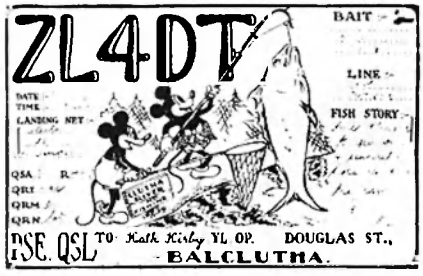
1928 — Australian Radio Transmitters League (ARTL) formed with a Division in all States. Queensland was voted Australian Headquarters.

1928 — ARTL, Qld Div membership was several times more than that of QWI membership.



Photograph courtesy The Toowoomba Chronicle

1928 — ARTL seeks official recognition from the PMG.
1928 — Five metre receiver was constructed by Arthur Walz OA4AW and performed efficiently. He was heard in freak conditions in Tasmania.
1928 — Tom Elliott, using OA4CM, provided an HF navigational fix for 'Smithy', making it possible for the completion of his record breaking trans Pacific flight. After leaving Fiji, the 'Southern Cross' ran into extremely bad weather and urgently required directional assistance.
1929 — 'VK' prefix replaced the 'OA' prefix and has remained **unchanged** to the present time, eg VK4CM.
1929 — ARTL and Federal WIA propose to amalgamate — official title to be WIA. 'QTC', under the editorship of Leo Feenaghty VK4LJ, became **Australia's first solely amateur radio magazine,** with approximately 15 foolscap pages. It was published by the Qld Division as the official organ of the WIA.
1930 — QWI objects to ARTL/WIA amalgamation. QWI's total assets 20 pounds ($40).
1930 — Federal Executive of the WIA in Melbourne ceased to recognise QWI and accepted ARTL, Qld Div, as the official Qld Division of the WIA.
1930 — Reverend R J Delbridge VK4RJ, wins the Hutchison Cup for HF activity work.
1930 — Bill Hagarty VK4WH, using eight volts to a Model T Ford coil into a CX310, worked OA4J in Peru, South America, on QRPp.
1930 — Miss Dorothy Harriss VK4DH, was the first YL operator licensed in Queensland.
1930 — Frank Nolan VK4JU, in contact with USA on 80 metres, 10 watts CW.
1931 — 'QTC' magazine ceases to exist by directive from Federal WIA, Melbourne.
1931 — G (Mac) Mackenzie VK4GK, first to receive news of Napier, NZ, earthquake from a ZL amateur. There were 500 deaths. He relayed the information to the Courier Mail in Brisbane.



1931 — J McDermont VK4JM, contacted Western Australia on 40 metres, QRPp (less than one watt to a 201A receiving tube).

1932 — Roy Jonasson VK4NG, contacted ZL4DT in Balclutha on the South Island of NZ, on 40 metres 'loop' phone. Power in the aerial was .2 watt. Report was 3 x 5. During the same year VK4NG worked VK2KZ in Curri Curri, NSW on 'loop' phone. No measurable antenna current on the meter. 10 volts HT to the tube. Report 3 x 4.
1932 — Vince Jeffs VK4VJ, began experimenting with single sideband.
1932 — 'Five Point Relay' organised by the Association of Amateurs, NSW, was won by Reg Vickary VK4RV. The third place went to Arthur Walz VK4AW.
1933 — Len Grey VK4LN, was the first Queensland amateur to fly the overseas service with QANTAS as a pilot and wireless operator. He had to repair and self-service the gear when needed.
1933 — R Vickary VK4RV, of Cunnamulla, using 12 watts input was heard in Rockhampton on the broadcast band in daylight.
1933 — Jack Wooster VK4VH, of Townsville regularly put 204.7 metres broadcast signals into New Guinea on QRP, (50 watts), in daylight hours on Sunday mornings.
1933 — F Scott VK4BO, was QRV from Thursday Island. Was he the first VK to operate from this location? ?
1933 — P Whelan VK4KR, believed to be the first amateur active from Willis Island.
1933 — P (Pop) Hardgrave VK4PH, was almost an octogenarian when he obtained his amateur licence. He was then the oldest amateur in the British Empire.
1933 — Bill Chitham VK4UU, licensed. Created the famous 'U'gang.
1934 — Arthur Walz VK4AW, W Harston VK4RY and W Wishart VK4WT successfully conducted a 14 mile (22km) cross-town (Brisbane) five metre QSO with strong, steady signals both ways. Best VHF results to this date.
1934 — Sunshine State conducted its first Radio Cup Contest. Winner unknown.
1934 — Queensland Division wins the Fisk National QRP Contest.

The 12 year old prodigy of the 1930s, Madeline MacKenzie VK4YL, now Mrs Pligh, photographed in 1981. Shown here proudly displaying her trophies and parts of her old vintage gear. Her decision to leave amateur radio post WWII was a big loss to the fraternity.

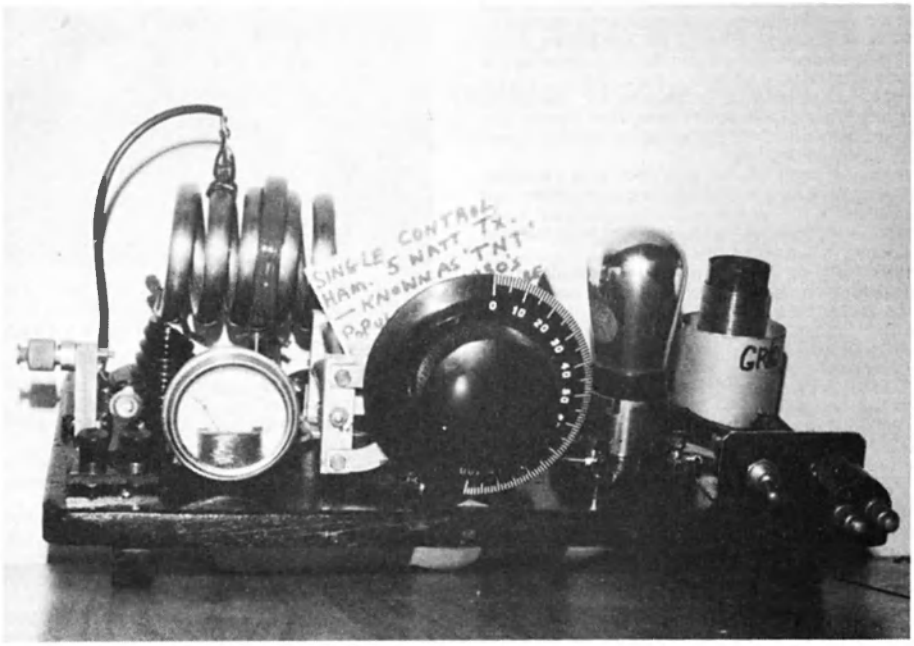
1935 — Madeline MacKenzie VK4YL, the youngest licenced YL operator in the British Empire. Her age — 12. Quickly, she became a competent CW contest operator with many high placings in BERU contests. WBE on 20 metres soon after she was licenced.
1935 — M O'Brien VK4MM, W Wishart VK4WT and Nim Love VK4JL, successfully conducted over-horizon, ship-to-shore, five metre contacts, thus disproving the then held theory, that VHF was line of sight communication, only.
1935 — Australian five metre DX record was broken several times. Participants were Arthur Walz VK4AW, H Scholz VK4HR, B Munro VK4AL and Pat Kelly VK4KB. All were WIA members. The distance covered was approximately 174km.
1935 — Roy Belstead VK4EI, was the first Bananalander to contact Europe on 10 metres. He worked ON4AU, F8VF and D4JMK, with 20 watts input.
1935 — Alf Guilford VK4AP, won two WIA, Qld Trophies — for outstanding DX achievement and the most efficient active station. He was issued with a special QRO permit by the PMG.
1935 — E R Ashlin VK4EA, QRV on 229 metres with six watts input, was heard by two short wave listeners in New Zealand. Reports from both contained enough logged information to make them acceptable.

Two great QRP DX men. VK4RF left, and VK4EL right, making FS measurements to a vertical antenna in an effort to coax the last milliwatt of RF into space.

1935 — Harry Angel VK4HA, obtained his AOCP Harry is still on air almost daily, held a century later at the age of 93 years. Is he Australia's oldest active amateur?
1935 — Eric Lake VK4EL, sells the rights of his 'One Valve HF Lake Special' (unofficial). A super performer.
1935 — Queensland Division wins '5 plus 5' CW Fisk Contest. Mr E T Fisk, in the broadcast station 2CH Sydney, presented the Fisk Trophy to Arthur Walz VK4AW, Queensland Divisional President, in the broadcast station 4BC Brisbane.
— Tom Elliott VK4CM, broadcast television signals on 136 metres from Observatory Tower, Brisbane. The picture transmitted was of film star, Janet Gaynor. Subsequent transmissions were received on the Darling Downs, 90 miles (144km) away.

A recent photograph of Arthur Walz VK4AW holding the Fisk Trophy, which was won by the Queensland Division in 1935.

1936 — Queensland Division again won the Fisk Contest and was declared the outright winner of the Trophy. The Fisk Trophy Contest was a forerunner of the REMEMBRANCE DAY CONTEST.
1936 — Vi Nolan VK4LO, the YF of Frank VK4JU, is said to have completely homebrewed her own rig, down to the component parts, including winding power transformers. Quite an ex-YL. Also claimed contacts with 20 000 USA stations up to the period of WWII.
1936 — Eric Lake VK4EL, made WAC on 20 metres CW with less than half a watt, into a vertical antenna and claimed overseas as a QRPp world record at that time. VK4EL, was the official WIA and private Morse code instructor to all and



The famous Work-the-World TNT Circuit, one tube, five watt transmitter, circa 1930. The usual form of modulation was LOOP — a single loop around the tank coil, connected to a PMG carbon microphone. Some operators used a glove to prevent RF burns and avoided lip contact.

sundry. In his latter capacity, the fee was six pence (5 cents) per hour, or free if beyond the ability to pay.

1936 — Harold Hobler VK4DO, created WAC in a world record time of 50 minutes, on QRP.

1936 — G MacKenzie VK4GK, worked the first WAC on 10 metres AM phone.

1935 — Fred Lubach VK4RF, makes WAS (USA) in 100 days on 20 metres CW. VK4RF also worked DXCC in less than 12 months on QRP during this year.

1937 — G MacKenzie VK4GK, awarded 10 metre CW WBE by BERU.

1938 — Chas Miller VK4CM, now VK4QM, achieved first place in the VK/ZL CW Contest. Bob Beatson VK4BB, of Maryborough, was placed first in the Junior A1 section.

1939 — Frank Nolan VK4JU, participates in the, now famous, all continent round table 20 metre AM phone event. Other participants were VK3KU, VK3DH, VU2CQ, G6ML, W4DLH and stations in Egypt and South America, whose call signs are unknown. Reported in the USA and Europe and recorded by VK3DH.

1939 — Frank Shannon VK4SN, won the WIA Queensland Divisional Pennant for DX achievement on QRP.

1939 — VK4SA, now VK4SS, handles an emergency from cyclone devastated, Solomon Islands. In the same year, VK4SA contacted G8KP, a prefix 'first' for both. After 40 years, they 'eyeballed' for the first time and swapped the first QSL cards sent to each other, pre WWII. **AR**

Alan Shawsmith VK4SS.

FINE ACHIEVEMENT IN AMATEUR RADIO

10 Metre Communication Between Queensland and Europe

For seven years it has been the ambition of Australian amateur wireless men to establish two-way radio contact with European amateurs on the 10 metre band, and to a Queenslander has fallen the honour of having done so. The successful amateur is Mr. Roy Belstead, of Townsville, who last Sunday night worked with ON4AU (Belgium), F8VF (France), D4KPJ (Germany) and D4JMK (Germany).

On previous occasions OH7NC (Belgium) has reported having heard VK4EI (Mr. Belstead's station), and 4EI has heard European amateurs, but last Sunday night was the first time he was able to establish two-way contact.

In amateur circles this is regarded as a noteworthy achievement and VK4's are particularly pleased that it was a Queenslander who has made fresh history on the 10 metre band. The successful contact has stimulated interest in the efforts to link up with European amateurs, and reports from abroad state that the Europeans are keeping a look-out every night for VK stations.

Another interesting report is that, for the second time in the history of 10 metre experimental transmissions, an Australian has established two-way communication with a South African

An excerpt from the Brisbane Telegraph — 8th October 1935.

PROFILE OF THOMAS M B ELLIOTT

Thomas M B Elliott, early wireless and television pioneer, is credited with the following 'firsts'. He was the first radio voice in broadcasting in 1919, built the first sound broadcasting station, 4CM in Queensland in 1920, was the only amateur to contact and assist aviator, Sir Charles Kingsford Smith in 1928 and was the first to regularly transmit television pictures in 1935.

Alan Shawsmith VK4SS
35 Whynot Street, West End, Qld, 4101

It would seem, fate is largely indifferent to the struggles of man, and bestows her whims as she deems fit. There was nothing in the early years of Tom Elliott's life to indicate that he was a man destined to become a legend in his own lifetime.

Born in Queensland in 1899, Tom was one of a fairly large, but not affluent family. Nevertheless, his parents provided him with a good basic education. In 1916, at the age of 17, he secured a position as a Wireless Operator (Sparks) with the ORIENT Line. How he obtained the technical knowledge for this position is not known, however he would have been quick to acquire the skills.

Tom left the sea in 1919 and participated in building the broadcast station that was the forerunner of 2BL. Anecdotal information says that from there he made the **first voice broadcast.** A recording of this is said to be in the National Museum, Canberra.

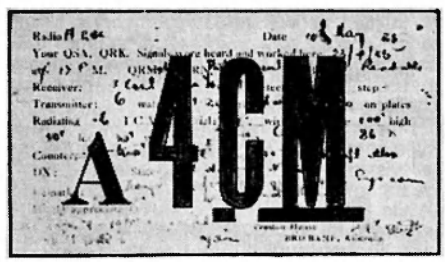
In 1920, he returned to Queensland and, during this year, constructed and put on air, broadcast station 4CM. This was a full **five** years before National and Commercial Broadcasting began in the Sunshine State. The listening public was restricted to reception by the ubiquitous crystal set. Very few had valve receivers. Unofficial reports of 4CM's transmission indicate it was heard at a distance of 2000km. A large plaque in the vestibule of the Queensland Credit Union Centre building, then Preston House, in Queen Street, Brisbane, testifies to this achievement. The wording is thus:

"Sound Broadcasting Originated in Queensland from this Building. Transmission Commenced in 1920 and continued to 1923 under the Auspices of Dr V MacDowall. The Installation was Designed and Operated by Thomas M B Elliott".

Tom's next venture was a very successful outside broadcast (OB) of 'Aladdin's Pantomime' from His Majestys Theatre, Brisbane. No mean feat in those days when, music and other effects had to be picked up acoustically. Again, this broadcast was the **first** of its kind in Queensland — and in Australia — conducted by a purely experimental station. These OBs became regular features, many being relayed from the Exhibition Hall. A well received speech, by the then Premier of Queensland, Mr E G Theodore, broadcast in 1924, finally created an awareness in political minds of the potential of broadcasting, and acted as a catalyst to the creation of station 4QG, Brisbane, which came on air in 1925.

The station A4CM at Preston House was dismantled and, for a period in the mid 20s, Tom ventured into radio retailing, setting up a 'Wireless Centre' in Adelaide Street, Brisbane. At these premises, in April 1927, the inaugural meeting of the QRTL, forerunner of the powerful ARTL, was held. Tom was elected to an executive position.

By 1928, the experimental station OA4CM had been rebuilt in the Old Windmill Tower, on Wickham Terrace. Not only was this place ideal for radio and TV experiments, it also had a great historical background. From here, on the morning of 9th June 1928, Tom Elliott wrote himself into the pages of both wireless and aviation history books. Through the QRN on approximately 35 metres, he heard the call KHAB from the transmitter aboard the aeroplane SOUTHERN CROSS, in which Sir Charles Kingsford Smith (Smithy), who was attempting to fly the Pacific. Contact was made and a message received by Tom, asking for navigational directions and the provision of a 'fix' so that landfall may be reached as quickly as possible, before the fuel supply was depleted.



A photocopy of a card confirming a QSO with A2BC from Preston House in 1925. Power was six watts into an antenna 100 feet (30m) high.

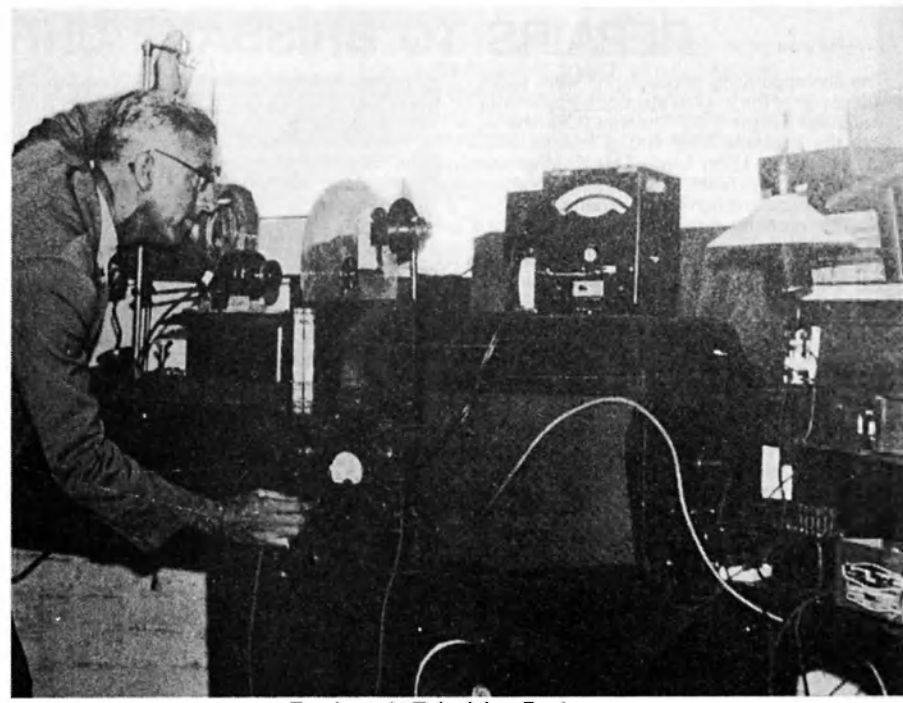
The 'off course' predicament that 'Smithy' was best described in this extract, taken from Australia's Heritage, Volume 5, page 1895, published by Hamlyn.

". . . on the afternoon of Friday 8th June, the Southern Cross left Suva on what was to prove the worst part of the trip. Four hours later, the plane ran into storms, which Ulm described as the worst he had ever encountered.

"Three times now, great sheets of lightening have flashed across our path and each time it had been accompanied by terrific roars of thunder'.

"For the next three hours, the plane was thrown all over the sky and at times it took the combined strength of Smith and Ulm on the controls to drag the Southern Cross back on to an even keel. Throughout the night the storms raged and Smith was forced to fly blind for hours on end, relying solely on his instruments, rather than his instinct, to tell him whether the aircraft was level, turning or climbing. At 7.30am on Saturday, 9th June, Warner received the first radio message from Australia and Smithy turned the aircraft to the west. Two hours later, they crossed the Australian coastline, to discover they were, in fact, about 100 miles south of their proposed Brisbane landing field . . . . . "

The station referred to was OA4CM and Smithy's Wireless Operator Warner asked Tom to keep the key of his transmitter closed, so that a navigational 'fix', on which to fly, could be established. In attempting to comply, Tom also ran into difficulties whicn are best told in



Tom's early Television Equipment.

his own words — "*. . . it was necessary to use full power to maintain contact, As the rig wasn't built to operate key down at this input, the PA tube plate was soon cherry red, in spite of a fan blowing cold winter air on it. I knew that if the valve blew, all might be lost,* (apparently Tom had no spare) *so I had to regularly break the transmission. For over an hour my gaze was glued to the tube — would it last the distance? Fortunately it did, until contact was lost due to short skip; but Smithy was now near the coast and crossed it about 90 miles south of Brisbane. Not bad, considering he was flying in the wrong direction when contact was first made . . . .*"

Tom 4CM (right) and friend Jim Munro taking the air from the verandah of the Grand Hotel, Southport (now demolished).

One of the crew of the Southern Cross (The Old Bus), speaking publicly shortly afterwards, made a brief, but pertinent comment on the flight from Fiji. He said, "*. . . no one will ever know if we would have made it without the timely assistance of Tom Elliott operating station OA4CM . . .*"

Perhaps Warner has a better idea than most. Thirty years later, when visiting Australia, he paid Tom a congratulatory visit and signed his log book.

In 1935, VK4CM achieved yet another first. Television pictures were transmitted from the Windmill Tower on approximately 130 metres and received clearly in Ipswich, 40km away, and later on the Darling Downs, 140km distant. An extract from a plaque erected on the tower reads,

"*An experimental television station was established in the Windmill in 1935 by Dr Val MacDowall and Thomas M B Elliott. The first actual television transmission in Queensland was broadcast from this Tower.*"

These first transmissions were made by means of a mechanical drum. At the outbreak of WWII, his transmissions were an all electronic affair on approximately 200MHz and 180 lines. Tom Elliott was a superb homebrewer,

Tom relaxing with a friend on the waters of Moreton Bay in 1946.

able to construct almost anything to meet his individual needs, including large vacuum tubes specially suited to his television experiments. By instinct, he was a true experimenter, willing to 'cut and try' any project a dozen times until satisfied — then his inquiring mind instantly moved ahead to meet the next immediate challenge.

Readers may be curious to know just what type of man Tom Elliott was, outside radio and television — a man who had spent so many years in research burning the midnight oil. While living in the Tower, pre WWII, he was regarded by some as a recluse — in truth, he was so preoccupied by the tasks in hand, he came to resent being disturbed by curious visitors. At the same time, he was in business, retailing Xray equipment from a nearby office in Ballow Chambers. To eyeball him was a pleasant surprise, his early education was evident in both his manner and speech. No trace of dull or distant academia touched him — in fact he rather exuded the playboy image. Tom enjoyed nothing better than a session with the boys, where his talents as a very witty raconteur had full scope and many a convivial glass was raised in the process. His friends were legion and from all walks of life.

Personal material possessions seemed to have little attraction for him. When, in deference to his advancing years, he was asked to write his memoirs, he replied,

"*There are two large plaques erected in my honour — one at the Tower, the other in Queen Street — they will tell anyone interested in Mr T Elliott all they need to know*"

Such was the simple, but great nature of the man. Thousands of passerbys and tourists now view these plaques each year.

In 1965, Tom was made an Honorary Fellow of the University of Queensland and soon after this, the Royal Historical Society of Queensland bestowed its Fellowship upon him.

There is no record that he ever obtained his AOCP. The call signs used, viz 4CM, A4CM, OA4CM, VK4CM belonged to the late Dr Val MacDowall, who became Tom's mentor, early in his career. They worked together for a time in the profession of radiography. After the doctor's death, the call VK4CM was allotted to another great DXer, Charlie Miller ex VK4US, ex VK2ADE. In the mid 60s, at the suggestion of the PMG, Charlie gladly returned the call to Tom as a mark of respect for the man's achievements. It appears also, Tom was never a member of the WIA.

Tom Elliott died at Redcliffe, Queensland, on 31st July 1971, aged 72 years.

To honour the memory of this true pioneer, the SEQATV Group held a commemorative reunion (50 years since the first transmissions), at the site of his famous experiments, the Old Windmill Tower, Wickham Terrace, Brisbane, on 6th October 1985.

AUTHOR'S NOTE: No attempt has been made to describe and explain the technical experiments conducted in the Tower. These were long, involved and difficult, and a story for another time. I am indebted to a lifelong friend of Tom's, viz Jim Munro of Clontarf, for much of the above information.

AR

REPAIRS TO BRISBANE UHF REPEATER

The accompanying photographs were taken on the tower of the largest six metre transmitter in Australia! This is TVQ Channel 0, Brisbane, where the Brisbane VHF Group has its UHF repeater, at the 137m level. The base of the tower is roughly 300m above sea level on Mount Coot-tha, overlooking Brisbane. For four years, the repeater has operated from an old metal car fridge (Esky). But recently it has been a little erratic. On a repeater day recently, Paul Mead VK4ZEM, Nev Potts VK4KNP and Don Marshall VK4AMA climbed to the level to find the problem — the box had collapsed through corrosion, corrosion caused by weather on tne 240V plug (rain and mist blow upwards at that level), plus a little electronics.

The equipment was carried down the tower in haversacks and it is now being revamped. The unit will possibly be changed to micro control and after testing in the city, will be installed in a new box at the same place on the tower, provided a solution can be found as to how to get the box up the tower.

The tower is a maze of a variety of aerials up to SHF dishes, but the Group were able to report their progress, via a UHF handheld, to other Group members on terra-firma below, despite RFI. On a good, clear day visibility is around the 80-100km range.

Contribution and photographs courtesy Don Marshall VK4AMA

KENWOOD

SUMMER SALE!

TM-211A

The TM-211A 2-m FM mobile transceivers has been designed to be the ultimate in compact size and lightweight, and feature a front panel that can be tilted in relation to the main body of the radio, allowing maximum flexibility in automotive installations. The use of the latest in technology is exemplified in the incorporation of KENWOOD's new DCS (Digital Code Squelch) circuit that provides the operator with a capability to program his radio to respond only to transmissions from stations whose radios transmit a preselected digital code. Additional convenient operating features include a powerful 25 watts of RF output, dual digital VFO's built-in, priority watch, memory scan and programmable band scan, audible "beeper" to confirm operations, microphone test function, repeater offset switch, reverse switch, and high performance receive/transmit specifications.

DCS

TR-7950

KENWOOD, in its new TR-7950 2 meter FM mobile transceiver, introduces a completely new concept of versatility and performance in 2 meter operations. Among the more important convenience features providing enhanced ease of operation is a new, large, easy-to-read (direct sunlight or dark) LCD siaplay, 21 new multi-function memory channels that store such information as frequency, offset, and sub-tone channel data (sub-tone unit optional) with a hefty 45 watt output power in the TR-7950, and the use of microprocessor technology throughout. Other important features include auto-offset, programmable priority, memory, and band scans, automatic center-stop tuning in scan modes with center tuning indicator, built-in lithium battery memory back-up, and a built-in 16 key autopatch. Both models are identical, except for power output.

TR-9130

The TR-9130 is a powerful, yet compact, 25 watt FM/USB/LSB/CW transceiver. Available with a 16-key autopatch UP/DOWN microphone (MC-46), or a basic UP/DOWN microphone.

FEATURES

• 25 watt RF output power on FM/SSB/CW • FM/USB/LSB/CW all mode operation • Six memories • Internal battery memory back-up (battery not supplied) • Memory SCAN • Automatic band scan (1 MHz segments) • Hand microphone with UP/DOWN switch • Squelch circuit on all modes (FM/SSB/CW) • Repeater reverse switch • Tone switch • Tuning transmit frequency for OSCAR operations • Built-in CW semi break-in with side tone • Digital display with green LED's • Dual digital VFO's • High performance receive-transmit characteristics • Compact design and light weight • Transmit OFFSET switch • High performance noise blanker • RF gain control • RIT circuit • AGC time constant automatically selected • HIGH/LOW power switch • Accessory terminal (rear panel) • Piezoelectric beeper • Visual indicators • Quick release mounting bracket • Extended frequency coverage 143.900-148.999 MHz (Region 2/3 version)

DIGITAL CODE SQUELCH

TRIO-KENWOOD's new DCS "Digital Code Squelch" is a revolutionary signalling concept for Amateur Radio that utilizes current state-of-the-art technology. This new technology is a major feature of the new TR-2600A, TR-3600A "2-m and 70-cm FM Handheld Transceivers", the TM-211A, TM-411A "2-m and 70-cm FM Mobile Transceivers", and the TS-711A, TS-811A "2-m and 70-cm All-mode Transceivers". The DCS should not be confused with conventional CTCSS (Continuous Tone Coded Squelch System). DCS uses a 5 digit, digitally coded data string, to open squelch on a receiver that has been programmed to accept this same specific code group. By utilizing a 5 digit code group the operator may choose from 100,000 possible combinations, thus providing increased security. In addition to the 5 digit "access code" the DCS also transmits the operators call sign, in decimal ASCII code. Call signs of a maximum of 6 digits may be entered. By using the optional CD-10 Call Sign Display, the operator may store incoming call signs, for later review or logging.

100,000 different 5 digit code groups. Convenient keyboard entry of the "access code" is possible with all models equipped with the DCS.

Capable of monitoring multiple access codes. The DCS codes, and call sign data, are stored in separate memory locations within the host unit. This allows the operator to monitor several access code groups at one time. Clubs and nets will find this function useful, as will operators who wish to listen for more than one group at a time.

CD-10

The CD-10 store the call sign of calling station in its memory and displays it on an LCD display. Call signs of up to 20 of the most recently calling stations are stored, allowing the operator to quickly check for and return any call.

DCS Decoding. Decodes the digital ASCII call sign data that is a portion of the DCS data string.

Automatic Call Sign Transmission. A 6 digit Amateur "Call Sign" is entered into the DCS memory using decimal ASCII coding, by use of the frong panel keyboard. This call sign is then transmitted in conjunction with the DCS data string each time the PTT switch is depressed or released. By using the optional CD-10 Call Sign Display the operator can automatically store up to 20 different call signs. This feature is useful for unattended monitoring of the radio. Upon return to the station the operator can review the CD-10 memory to determine who tried to contact him during his absence. This function is also usefule for logging purposes.

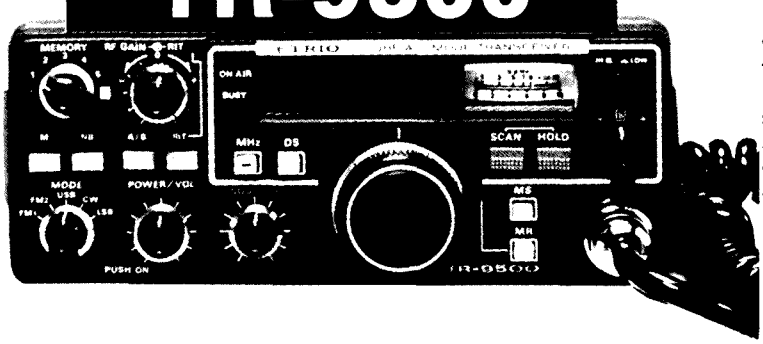
SUMMER SALE!

TM-411A

The TM-411A 70-cm FM mobile transceivers has been designed to be the ultimate in compact size and lightweight, and feature a front panel that can be tilted in relation to the main body of the radio, allowing maximum flexibility in automotive installations. The use of the latest in technology is exemplified in the incorporation of KENWOOD's new DCS (Digital Code Squelch) circuit that provides the operator with a capability to program his radio to respond only to transmissions from stations whose radios transmit a preselected digital code. Additional convenient operating features include a powerful 25 watts of RF output, dual digital VFO's built-in, priority watch, memory scan and programmable band scan, audible "beeper" to confirm operations, microphone test function, repeater offset switch, reverse switch, and high performance receive/transmit specifications.

TR-9500



The TR-9500 is a compact 70-cm USB/LSB/CW/FM transceiver providing increased versatility of operation on the UHF bands. It features dual digital VFO's six memory channels, memory scan, automatic band scan, SSB/CW search, high performance receive and transmit, and a host of other features. It should be especially appealing to the OSCAR or 70-cm SSB/CW operator.

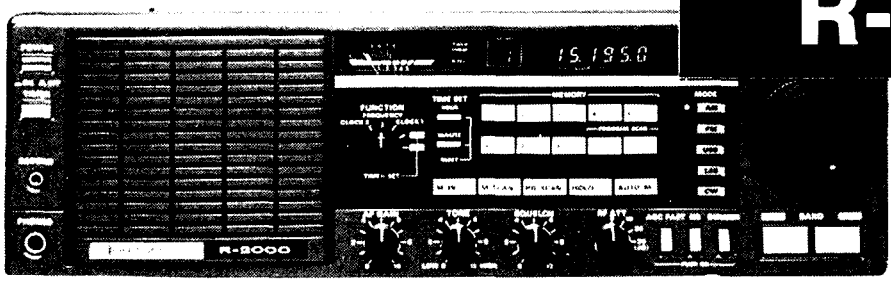
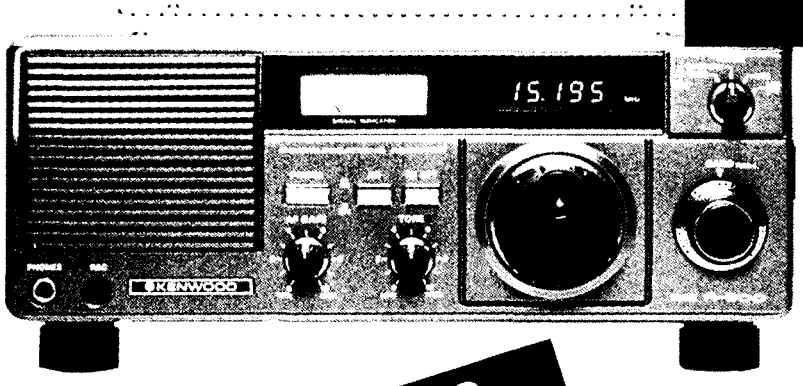
R-2000



R-2000 COMMUNICATIONS RECEIVER — World's leading all mode receiver. Receives 150 kHz to 30 MHz.

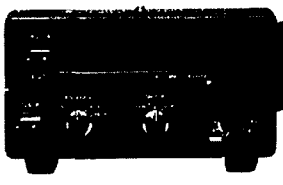
The R-2000 is an innovative all-mode SSB, CW, AM, FM receiver that covers 150 kHz — 30 MHz. New microprocessor controlled operating features and an "UP" conversion PLL circuit assure maximum flexibility and ease of operation. Key features include digital VFO's, ten memories that store frequency, band and mode information, memory scan, programmable band scan, digital display and 24 hour dual clock with timer, plus a host of other features to enhance the excitement of listening to stations around the world.

R-600



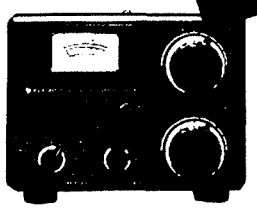
The R-600 is a high performance general coverage communications receiver covering 150 kHz to 30 MHz in 30 bands. Use of PLL synthesized circuitry provides highly accurate frequency control with maximum ease of operation. Use of the latest technology assures the ultimate in short wave listening enjoyment on all covered frequencies, whether using AM, SSB or CW modes of operation. The compact size of the R-600 allows the user the maximum flexibility in placement of the radio, and the front mounted speakers permits the radio to be located between shelves without degradation of audio quality.

AT-250



AUTOMATIC ANTENNA TUNER
The AT-250 is an automatic antenna tuner designed to match the TS-430S in size, colour and appearance. It may also be used with other HF transceivers such as the TS-130 series, the TS-530S, TS-830S and the TS-930S.

AT-230



ANTENNA TUNER
The AT-230 antenna tuner includes the new three bands and functional features such as a through-line wattmeter, SWR meter and antenna selector switch. The AT-230 adds greatly to the effectiveness of your station.

AT-130

ANTENNA TUNER
The AT-130 is a compact and lightweight antenna tuner designed for base or mobile use. (Includes the new three bands). It consists of an antenna coupler, an SWR meter and an antenna switch.

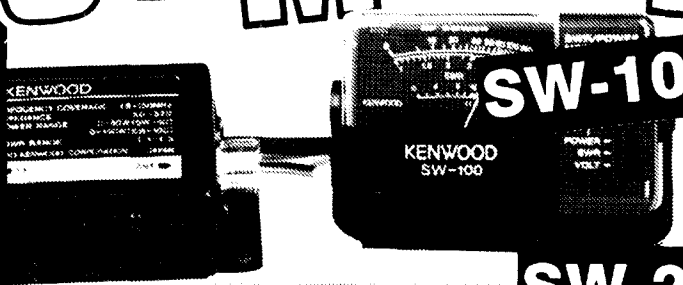
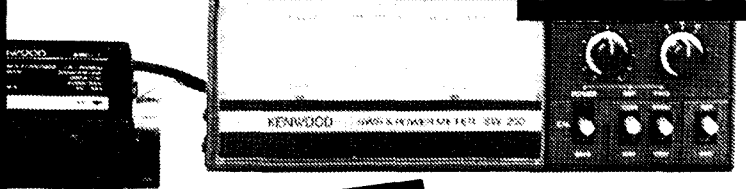
SUMMER SALE!

SW-100 A/B



SWR/POWER METER
Compact and lightweight SWR/POWER/VOLT meters cover 1.8 — 150 MHz (SW-100A), 140 — 450 MHz (SW-100B) in range of 150 W full scale for mobile use.

SW-200 A/B SW-2000

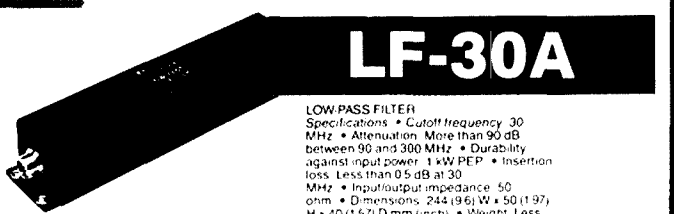


SWR/POWER METER (Supplied With A Coupler)
SW-200A supplied with SWC-1, SW-200B supplied with SWC-2, SW-2000 supplied with SWC-3. Selectable peak-reading/RMS. SWR/POWER meters cover 1.8 — 150 MHz (SW-200A), 140 — 450 MHz (SW-200B), 1.8 — 54 MHz (SW-2000) in range of 0 — 20/200 W (SW-200A/B), 0 — 200/2000 W (SW-2000) full scale for base station use.

AL-1/2

LIGHTNING & STATIC PROTECTOR
AL-1: Handles 100 W output at 50 ohm with SO-239 Connector.
AL-2: Handles 1 kW output at 50 ohm with SO-239 Connector.

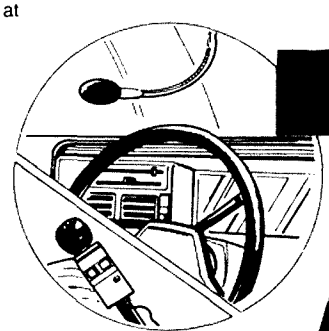
LF-30A



LOW-PASS FILTER
Specifications • Cutoff frequency 30 MHz • Attenuation More than 90 dB between 90 and 300 MHz • Durability against input power 1 kW PEP • Insertion loss Less than 0.5 dB at 30 MHz • Input/output impedance 50 ohm • Dimensions 244 (9.6) W x 50 (1.97) H x 40 (1.57) D mm (inch) • Weight Less than 560 g (1.2 lbs.)

MC-60A

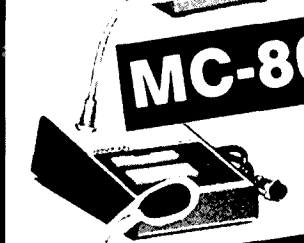
MC-60A (8 Pin)
Deluxe Desk-Top Microphone With Built-In Pre-Amplifier
The zinc die-cast base provides high stability, and the MC-60A is completed with PTT and LOCK switches, UP/DOWN switches, an impedance selector switch and a built-in pre-amplifier



MC-55

MOBILE MICROPHONE (6 Pin or 8 Pin)
The MC-55 provides UP/DOWN switch, LED display for switching transmit or receive, adjustable microphone gain, automatic receive returning circuit (approx. 5 minutes) and many functions.

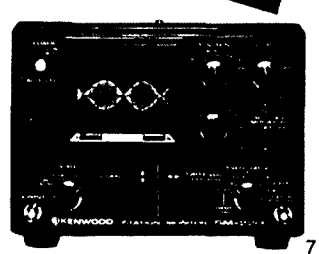
MC-80



MC-80 (8 Pin)
Desk-Top UP/DOWN Microphone With Built-In Pre-Amplifier
The MC-80 is an omnidirectional electret condenser microphone provided with UP/DOWN switch, volume adjustment for output level, PTT and LOCK switch, and built-in pre-amplifier

SM-220

STATION MONITOR
Suitable for use with the TS-530SP, TS-830S and the TS-940S. Direct connections. Based on a wide-frequency-range oscilloscope (up to 10 MHz), the Model SM-220 station monitor features, in combination with a built-in two-tone generator, a wide variety of waveform-observing capabilities.



MC-85

MC-85 (8 Pin)
Multi-Function Desk-Top UP/DOWN Microphone With Built-In Audio Level Compensation
The MC-85 is an unidirectional high-class electret condenser microphone provided with the output selective switch, audio level compensation circuit, low cut filter, level meter, PTT and LOCK switch

The past and future of amateur radio, as I see it!

Dennis Breitkreutz
14 Birmingham Street, Alderley, Qld. 4051

My experience with amateur radio goes back to around 1952, when I started as a shortwave listener in the days of audio modulation, using ex-WWII vintage receivers purchased from disposals stores. To name but a few, there were AR88s, AR8s, R1155s, Kingsley AR7s and HROs.

The task was to convert these receivers for amateur use. First, it was necessary to make a power supply, so they could be operated from the 240V mains power. Next, the selectivity and sensitivity had to be improved. Information about these changes was published in Amateur Radio and Army conversion manuals. Amateurs of the day were a fussy lot, you know!

I knew some licenced amateurs at that time and we became close friends. These amateurs were very knowledgeable men when it came to amateur radio, but to ask them what a SWR meter was, they would say they had never seen one, never used one and that was that. I have watched them check their transmission lines, etc by holding a fluorescent tube in their hands and moving it along the open line feeder. As far as I was concerned, I didn't worry about these fancy goods, I used a long wire antenna and was satisfied with it.

At that time it was not necessary to have a SWL licence, but it was necessary to have a broadcast receiver licence, which was issued by the PMG's Department.

A very reasonably price unit some years ago, was the Geloso VFO. This sold for around 17 pounds ($34) and with a key and power supply, plus licence you could be operational on the amateur CW bands. For phone, a driver p/o stage, public address amplifier and microphone was needed. But don't forget the aerial!

In those days, amateurs had to construct their own gear, frequently with the help of other amateurs, who had been there and done that. I constructed a VFO using a 5Y3 rectifier, 6J7 oscillator driving a 6V6. When I switched it on I jammed the local amateurs for miles around.

Not far from my QTH there was an electronic enthusiast, who was known as the 'Colonel'. When he fired up his transmitter, with two 'lighthouse tubes' in the final stage, which shot two kilowatts into the aerial. He was so strong, I was able to read him strength 9 with our electric 'stove'.

Another amateur friend was very cunning. In those days, it was necessary to have a Class C Wave Meter in the shack, by law, to check the transmit frequency. But amateurs were checking their transmitting frequency with a calibrated receiver or crystal calibrator instead. This amateur didn't have a wave meter but he had a box with dials and knobs which looked like one.

One particular day, he had a call from a radio inspector who was doing 'spot checks'. He looked around the shack and did some voltage checks on the terminals at the back of the transmitter. All checked okay. He then pointed to the 'wave meter imitation' and asked if it worked. The amateur said, "Like a beauty". The RI then left and my friend took the covers off his meter to show me the naked interior.

I did a lot of constructing, got it operational and then would sell it. I made things on breadboards, changing components until it worked. There were no such things as transistors, so these things were built around HT power supplies. There was a lot of trial and error involved, and I never knew what the finished product would look like.

We all took pride in our equipment, too. When I sold my AR7 receiver, the buyer asked if it was selective? I said that, with 455kHz crystal phasing, it would change a duet into a solo. I made the sale.

Around the late 1950s, amateur radio received a shot in the arm with the introduction of SSB and transistors. It was then, head down, tail up to learn how these new-fangled things worked. With this new mode it was necessary to improve selectivity by making Q multipliers. BFOs were no problem as most ex Army equipment had them built in, for CW reception. Working with transistors was a breeze — no high voltage to worry about, a big reduction in size, and above all, much cheaper. There were no PCBs so all wiring was point to point, as had been with the valve equipment.

Using this method, it was difficult to build two pieces of equipment the same, however, with PCBs this was a thing of the past.

Amateur radio moved rapidly in the mid-60s with the arrival of ICs and amateur transceivers.

Over the years, I've been a railwayman by day and an electronics engineer by night, and I think this is what amateur radio is all about.

Now how did I get interested, in the first place? I can remember going to Radio Equipment Junk Sales in the early 50s and buying some funny looking pieces, cheaply. I would then take it to the local radio shop to attempt to find out what it was. They wouldn't know and would send me off to the local 'ham'. He lived close to me, we became friends and I was hooked.

Radio clubs of today could learn a little from the past, to bring new people to this worthwhile hobby. It is not so important to run club displays and write pamphlets but more to get people involved. Start with the youngsters. Encourage schools to have hobby classes as part of their programme.

What hampered me from taking out an amateur licence in those days, was the 14WPM Morse code. I could have taken out a limited call but this was of no interest to me. I didn't know of any AOCP classes and as far as I knew, the only book on amateur radio was the ARRL Handbook. It was basically necessary to listen to CW on air, at about 20WPM. Many amateurs overcame the problems with Morse, but I just didn't like it.

I finally sat the Novice exam, and received the call VK4NMK, in May 1978 and 12 months later the limited call VK4ZEW. By this time, when I went to air, I didn't have to make or convert anything. I just went out and bought the latest transceiver, put up an aerial and was off and running. In fact I got on the air without even using a soldering iron. Impossible in the early 50s!!

However, the old cunning was still there when the Novice licence was received. I was rearing to go but had to wait over a weekend to be allocated a call sign . But, it was necessary to see if the aerial was working, wasn't it? If it was no good it may not be worthwhile getting the call sign! I found a group of operators on 10 metres and tuned up on top of them. When they started complaining, I knew I was transmitting all right.

Some people say "in the good old days". The only thing good about them was that we were younger. The amateurs of today have it made, with computers, micro-controlled transceivers and the like. With buying our equipment, it gives us more time to play with it and our new modes. Just think, with Packet Radio, Satellites, ATV, RTTY, etc, we don't get the time to build our equipment, anyway.

And what of the future of amateur radio? Well, I think it will be high speed data transmissions, with SSB and FM finishing up like the AM mode of the past. But the amateur spirit will never change.

If someone ever invents a TELEPORT system, as seen in the Star Trek TV series, you may bet London to a brick, that there will be an amateur radio operator in there somewhere.

AR

MORE HISTORY

The WIA is pleased to acknowledge the receipt of some more extracts of a 1920s publication, Amateur Wireless Handbook, safely kept for the past 50 years by Clem Scott VK4DW.

Clem includes the following information: *Superhets were being developed and taking over from the TRFs, which were a bit touchy to manipulate. Of interest is the dressage of the wiring of these old timers and is it is any wonder that hand capacity caused the operators a few headaches.*

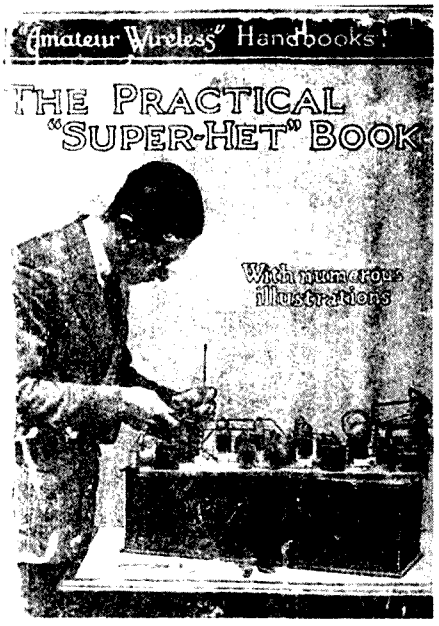
Filament control — Four rheostats were used (excluding the master rheostat on the panel), to control the filaments of the seven valves. These were adjusted to give best results, after which the brilliance of the filaments are controlled by the single-master rheostat on the panel. No 18 gauge square-section wire is used for connecting all the components and 16 gauge for the filament run.

After switch on and when signals were received the filaments rheostats and positive HT tappings were adjusted for best results. Also adjusted for the best result was the screw, with knob control, on the bottom of the horn type speaker.

I can remember listening to the wrestling, matches every Saturday night from Melbourne, in the late 20s, early 30s, on one of these old sets.

Time marches on!

Many thanks, Clem for your most interesting contribution. ED



ELECTRONICS IN THE 'OLDEN TIMES'

Alex Ellison VK4RU
5 Colthorpe Street, Boondall, Qld. 4034

My father began constructing radio receivers in the early 1920s. He was the local school teacher, and in a country community, in those days, was looked upon as a source of knowledge, first aid man, bush lawyer, etc. But he knew nothing of radio, either theory or practical. I was six or seven years old at the time, and have many recollections of the era, as seen through the eyes of a mere child.

I have no idea where he got his inspiration, but later on, of course, Wireless Weekly was very useful.

The first radios attempted were crystal sets, I was told, but I have no particular recollection of them. There were no suitable signals available on what is now the Sunshine Coast, except from Sydney, so there were no results. A valve set was then built, in partnership with a neighbour, who was a beekeeper/farmer/tinsmith, etc.

I remember this particular unit. A breadboard was channeled to take the wiring and the channels filled with Bees Wax! Wire used was ordinary hard copper, telephone wire and soldering was achieved by the use of an ordinary plumber's iron, heated in a kerosene tin; flux was killed spirits. They later found the convenience of 'Fluxite', but never used rosin, as far as I can recall.

BRIGHT LIGHTS

The set did not work, and after a couple more attempts an entirely new circuit was used, which was a regenerative detector type. I well remember being fascinated by the bright bulbs used. It could not be made to work either, so my father made a trip to Brisbane, 63 miles (102km) by rail, to visit a Mr Price of Radio House. This gentleman confirmed the construction, but pointed out that the valve, though it lit brightly, had its filament (cathode) touching the grid. So Dad bought another valve and Mr Price assured him he could 'listen to Sydney tomorrow night'.

There was no joy immediately, with the set, but eventually Dad heard his first words on radio. The call 'Beaumaris, Victoria' was repeated several times, and part of a Sydney programme was heard.

A check of the valve revealed the filament was again touching the grid. Several different types of valves were used and I can remember some but, not all the type numbers. There was a Marconi 'R' and a V24. Another valve I later used as a bedroom light, using four reconstructed telephone cells in home made beer bottle jars, with sal ammoniac electrolyte and sheet zinc cathode. Later I used beer bottle jars as Leyden jars in static electricity experiments.

Radio batteries proved a problem. The 'A' battery was the car battery but, as the car, a 1923 Studebaker, was infrequently used, it was a problem to keep the battery charged, and the car was hand started. 'B' batteries were expensive but a round-up of the school children produced several dozen Marmite and fish paste jars. Dad was able to strip the old cells and make a new recycled battery.

I loved to help, but Dad's temper fluctuated from benevolent to very irritated, when I got in his way. I learned a lot, anyway, and I could wind coils, both honeycomb and 'fan' type, with the best of them. I also learned to solder.

A GOOD AERIAL!

Attaining a good aerial was a hassle, and I am sure the idea used by my Dad was original for him, though it has possibly been used elsewhere, since.

We lived in a government house, on a hill, with a road around three sides. At the acute corner, on the road, was a huge gum tree, with a large fork some distance from the ground. To the western side was a pineapple farm and to the east, a sugar cane field. Dad decided to fly a kite through the fork of the tree, hauling a line attached to some aerial wire. He constructed a kite, complete with tail and when the south east wind blew, he tried to fly it through the tree. It was really hilarious.

It took no time for the kids to gather, also the neighbouring farmers. Most knew nothing about kites and even less about wireless. Dad was the expert, but every time he got the kite near the fork, the tail would get caught. This necessitated going through fences into either our yard or the cane field, to disentangle it. In the process some of the young cane was trampled. The neighbour's dog, a black and white 'bitzer' called Toby, a good friend of mine, had a field day. He enjoyed the game of picking up the ball of string, attached to the kite, and kept running off with it.

Eventually the kite flew where it was supposed to, but another problem arose, how to get it down from the tree. It was a good strong kite and it was anticipated that if left there, it would chafe the line through. Eventually dad gave it a mighty jerk and the tail came off.

A SOURCE OF WONDER

That aerial was a source of wonder to all. Tomato sauce bottles, with holes laboriously bored through the bottom, were used at each end as insulators. The holes were made with a hand brace, a metal rod and some grinding paste. They gleamed in the sunlight and were visible for some distance. The wire used was telephone wire.

This high antenna resulted in exceptional reception until it came to a sticky end when the road was built and graded and the tree was duly felled. We then had to use a 'normal' aerial from a pole in our yard.

ELECTRO-CULTURE

About the 1930s, there was a lot of interest in 'Electro-Culture'. Possibly many old timers would remember it and I think the subject has been resurrected in various guises up to the present time.

Basically the theory was that an antenna was erected, with leads to wires placed above the crop that was to be grown. It was thought that electric force drawn from the sky encouraged growth, and apparently many people wrote of fantastic results.

A very amusing story (fiction) was published about this time, and I think it was in Wireless Weekly. It seems that a farmer (Dave) decided it was too costly to put on electro-culture, as a major project and decided to first experiment with a pilot scheme on a banana plant.

Uncle Bill was sceptical, but the children were very interested, especially Harry, the ring leader.

A mast was erected to support a vertical wire, with points pointing to the sky. The lower part of the wire was anchored to a post and grounded, via a circle of wire over which the banana sucker was to be planted.

The great day of the banana planting ceremony arrived. It was a Sunday and Uncle Bill, the local farmers and sky-larking children were an apprehensive audience. Tea was provided, with corned beef and mustard sandwiches and Uncle Bill had something special hidden away in the nearby cowshed. Careful measurement of the banana plant indicated it was 27 inches (686mm) high.

CRASH, BANG AND GROWTH

Dave measured it every morning and carefully recorded the height in a note book. There was no change for several days then, one morning it had grown three inches (76mm). Amazing! ! This new idea seemed to be working. Actually, there had been a 'bit of a storm last night', and the lightning must have stimulated it.

Nothing more was noticed for a few days, then again there was another growth of three inches. Everyone was intrigued and again a summer storm was given credit for the growth.

There was not another storm for about a week, but on the Saturday there was a 'real beauty'. Smith's lost their roof, lightening struck a tree and brought it down across a fence, killing a cow in its path. By this time, the story of electro- culture had spread far and wide, and next morning there was quite a gathering as Dave went through his measuring process.

Lo and behold, now 48 inches, a good 12 inches or more gain, overnight! Uncle Bill strolled over and examined the plant carefully, then strode toward the cowshed, returning with a bottle and tin mug, which he presented to Dave.

Dave was elated but Uncle Bill was still wary. "I say Dave, didn't you plant a Cavendish sucker?" "Yes", replied Dave. Bill, "Well yonders a Lady Finger and if your fancy idea can change a Cavendish into a Lady Finger overnight, it is really worth celebrating". Dave looked thoughtfully around the throng of children, then roared: "Where's young Harry?" But Harry was long gone!

RIDICULOUS, BUT TRUE

Earlier, when our neighbour was in partnership with Dad in the first radio project, they got in touch with an ex Royal Navy radio operator.

Both my father and the neighbour were of generous natures, anyway, they needed help with their pet project. They used to drive seven miles (11km) to Nambour to collect the Navy op and he would then stay overnight at one of our houses.

I now realise he may have been a good operator on spark transmitters, but he knew nothing about voice reception. He would pore over the circuit trying different things and spend most of the evening enjoying the hospitality. There was a vario-coupler in use and he would twiddle the knob with his right hand whilst pressing the left fingers to his forehead.

Our neighbour was the first to realise our Navy man was a bit of an empty vessel, but not before he had unsuccessfully tried, for several night to operate the radio, using all the arrangements he could think of.

Ridiculous? Maybe, but true!

AR

Something to ponder on:

Returning from a computer display trade fair, my teenage son was asked, "How did it go?" His reply: "It was much easier to communicate with the computers than it was with the attendants!"
—VK4SS—

IPSWICH AND DISTRICT RADIO CLUB

At a gathering of radio enthusiasts at a local Scout Hall, on the 28th August 1962, the Ipswich and District Radio Club was formed. From the large group present, a committee of six was selected to formulate the aims and policies of the Club. The membership fees were set at five shillings (50c) for seniors and two shillings and six pence (25c) for juniors.

On 12th February 1963, affiliation with the WIA was effected and the Club continued to prosper. Monthly meetings were conducted at the Scout Hall, but on 7th July 1964 the winds of change struck. As members felt that the Club now had more to offer, the fees were raised to one pound ($2) for seniors and three shillings (30c) for juniors. Mr W Hayden, Member for Oxley, was elected Patron and the Mayor of Ipswich was elected as an Honorary VP, a position each succeeding incumbent has accepted. Due to pressure of office, Mr Hayden relinquished his Patronage in 1978 and that position was accepted, and is still retained, by Dr Sir Llew Edwards.

In August 1964, an application was submitted for a Club call sign and a station manager, VK4LI was appointed. The Club Station, VK4IO, was officially opened by Mr Hayden on 24th January 1965, using the VK4LI equipment at his home. Member enthusiasm was increasing and after a Club Award Certificate was produced in March 65, proposals for acquisition of a Club House began to emerge. Inquiries to the City Council resulted in the grant of some land, currently occupied by the Club House, the plans of which were approved in January 66. After many trials and tribulations, the efforts were justly rewarded when, on 26th July 66, the first meeting was held in the encumbrance free Club House, possibly a first for any VK4 club.

The members, now happy with a permanent home, were desirous of furthering the cause for amateur radio. The facilities for lectures and classes had vastly improved and training aids were constructed. A repeater licence was obtained and VK4RAI, channel 6900, was activated, firstly at the Club House, then at the current location at Mount Crosby. More recently, a UHF licence established VK4RWM, channel 8375, to operate from the Club House.

In common with other clubs, even those not electronics orientated, the technology explosion has affected membership. The advent of computers and video recorders has provided another avenue for recreation with a resultant decrease in active club membership. This Club welcomed, as associate members, a group of TRS-80 computer enthusiasts, some of whom are also licenced amateur members of the Club. This is not the only computer type of interest to members, others being used in CW, RTTY and Satellite modes. Use of a VCR for theory classes was discounted, due to the impersonal nature presented by that format.

Meetings are held at 7.30pm,on the second and fourth Fridays of the month at the Club House. Theory classes are conducted each Thursday at 7.00pm, subjects being regulated to the requirements of the students. The club station, now VK4WIP, conducts a weekly net on Thursdays at 7.30pm, operating on 3.590MHz +/- QRM, from the first Thursday in April to the last Thursday in September. It then goes to 28.500MHz for the summer months.

The computer group meets on the last Sunday of each month at 1.00pm — a popular event.

All visitors are cordially welcomed, both on air and personally at Club meetings. Details of the Club Award are available from members and VK4WIP.

Contributed by Bob Linskel VK4ALI, President and Life Member of the Club.
AR

THE CORAL COAST GROUP

Les Bell VK4LZ
Box 40, Airlie Beach Post Office, Qld. 4741

Prior to September 1967, for radio amateurs living north of Mackay, the Kookaburra Net was most popular, but owing to QRM from Asian stations, and the fact that most operators had to sign out by 2130UTC to go to work, it did have some difficulties.

A clear frequency was found on 7.068MHz, where northern stations could have a clear reception, and on 28th September 1967, Charlie VK4BQ Townsville, Les VK4LZ Airlie Beach, Bill VK4XZ, at the time living at Charters Towers, Basil VK4ZW Cairns and Newton VK4QW of Brisbane, met at 2100UTC and decided to form a group to serve, mainly Northern Queensland. It was called the Coral Coast Group.

Evelyn VK4EQ of Townsville, was the next to join, followed by Vince VK4VJ, Vic VK2ARY and Bob VK3GR. Vic was residing at Coffs Harbour and was a friend of Newton's. He had also known Les in New Guinea.

The Group remained on 7.068 until 3rd September 1969, when QRM caused them to move to 7.060MHz, where it is still operating today.

As time was limited for most, it was decided to keep overs short, attempt to give each operator at least two overs, give signal and weather reports, state of health and short items of interest, and to leave long discussions until after 2130UTC. The net was also to encourage mobile and others in as many areas as possible, and those who were interested in propagation, state of the roads and other conditions.

The net is open for any station wishing to join in and today there are regular members from Cairns and Weipa in the north to Traralgon, Victoria, in the south. For breakers, there is always someone who will hear them, ask them to stand by and advise the Net Controller, who will call them in.

The net has been most helpful to many people in distress on the roads and at sea. At one time, a Canadian family aboard a yacht near Port Macquarie, en route from New Guinea to California, via Sydney and New Zealand, had a small sick child on board and were seeking medical advice. The net controller relayed the request to Frank Carey VK2AMI (now a silent key), who contacted a doctor friend in Sydney. Details were given and advice for a cure was relayed back. As a result, when they arrived at Port Stephens two days later, after battling heavy seas, the child was in good condition and made a speedy recovery. Later a letter of appreciation was received by the group, from the child's parents.

Usually, the net controller calls the most northerly stations in at 2100UTC, then the most southerly. Then each station passes it to the next, working along the coast from south to north. If there is no reply, the net controller calls the next area and this continues until the farthest north station is reached again. After this, the controller calls for late-comers or DX.

The Net virtually controls itself and if the usual controller is absent, any of the usual members can take over and proceed as usual.

At times, due to skip and eastern QRM, the going can be rather difficult but, due to the great distance covered, there is always someone able to relay to another within hearing distance.

Much valuable information on propagation and working conditions has been gathered over the years and it has shown how different conditions are in the north from that in Victoria.

Many DX stations have called in and recently ZS6DN from Pretoria contacted all on the Net. This is the fourth occasion he has been able to call into the Net at 2100UTC and it is most noticeable that propagation to the far north is always stronger than in the southern regions. For instance, he was S 5-6 at Traralgon, S 7 in Sydney, S 8-9 in Brisbane and up to S 9+ at Airlie Beach, Townsville and Cairns.

Many marine mobiles, overseas DX stations, all states of Australia, North and South Islands of New Zealand with several ZL stations almost regulars.

To 30th June 1985, over 49,474 contacts have been made on the Net, with 772 different call signs. Following is a list of the first 25 stations to call into the Net. Those marked with an asterix still call in. VKs: 4LZ*, 4BQ*, 4QW, 4XZ, 4ZW, 4EQ*, 4VJ, 2ARY, 3GR, 4AB, 4XX, 4UN, 8XI, 5ZX, 2NS, 4JW, 4DO, 4SA, 4HB, 4OL/MM, 2ANZ, 4KM, 3QZ*, 2PA and 4RZ*. Prefixes who have joined in are: VKs: 1-9, ZLs 1-4, FK8, P29, N6, ZS6, YJ8, YC1 & 9, YB0, VR2, WA6, ZK, EL, VE, KC, G3 and YJ0.

Aeronautical mobiles to have used the Net are: ZL1AKI, VK4YT and VK4MAL and marine mobiles: VKs: 4OL, 4JJ, 4JM, 4JI(New Guinea), 4ALN, 3BAG, 2AUA, 2BK, 4CM, 4EP, 6NM, 9AR(New Guinea), EL8EP, VE0NER, ZL1DQ, ZK1DQ, VK3AUO, KS6ES, KS6EV, WA6GOU, VK4ATZ, VK4PHO, EL2EU, VK2APQ, VK4EP, VK4BVS, N6SPN, YJ0AXZ and VK4APM.

Unfortunately, the Net also has its Honour Roll of Silent Keys. Newton VK4QW, Basil VK4ZW, Vince VK4VJ, Ramsay VK4AB, Herb VK4JW, Stan VK4SA, Wal VK2SA, Ernie VK4CEB, Bob VK4NG, Vern VK4LK, Trevor VK2NS, Cedric VK3ARX, Freddie VK3BAL, Fred VK3YS, Stan VK3UE, George VK5CV, Graham VK9DJ, Eddie VK2BB, Sid VK4VT, Bill VK2ABZ, John VK2QJ, Ted VK4MH, Bill VK2WF, Casey ZL4CA, Colin ZL1BJL, Claude VK4ZY, Gerry VK4YB, Basil VK2HI, Frank VK2AMI, Frank VK4FN, Bob VK3AHF, Frank VK2IZ, Len VK4GD, Harold VK4DO, Geof VK6NM and Harry VK4HK.

AR

HALLEY'S COMET INFORMATION LINE

The CSIRO and Telecom are providing a news service about Halley's Comet. Recorded messages can be heard on telephone number 11622 in Brisbane and Sydney, and 11613 in Melbourne.

The telephone message includes information about Halley's approach, details of Space Missions, particularly the European Space Agency's Giotto mission and general information about comets and meteor showers.

The Giotto spacecraft will fly through the head of the comet during its closest approach to Earth next April and will send data and pictures back to Earth via the CSIRO's radio telescope at Parkes, NSW. Halley's Comet has returned every 76 years since, at least, the first documented sighting in 240BC.

BEACON ADDITIONS

The following are some additions to the beacon list, published in September AR, page 63, contributed by Bert VK5AUS.

28.200MHz .... KF4MS, 28.201MHz .... LU8ED, 28.210MHz .... K4KMZ, 28.2175MHz .... WB9VMY, 28.253MHz .... WB4JHS/KF4UZ/B and VK2RSY, which was incorrectly listed, amended to 28.262MHz

John Wb4JHS/KF4UZ/B, requests amateurs look for his seven watt, continuous beacon on 28.253MHz and QSL any reception.

NO BLACK BOX?

or how to get going in the 1980s the 'hard way'

Aub McKibben VK4AFO
5Concord Drive, Loganholme, Qld. 4129

Maybe it was the outworking of the effects of electromagnetic radiation (EMR) at a young age, but by 1980, the 'bug' was biting worse than ever and I just had to do something about getting 'that ticket'.

Actually my fascination with radio goes back to the 1950s when, I was being brought up 'just down the road' from a 100kW BBC broadcast station in Northern Ireland. The large tower and flashing navigation lights, at night, were enough to start any four year old's imagination running with wonder! All my father knew, was — 'its for the wireless'. But for me the bug had bitten.

Symptoms came fast when, a few years later, the family moved to another location where I could overlook a small mountain with a 1000 feet (305m) television tower, dwarfing the mountain. However, it was not until later years that I became interested in 'tuning around' on the family shortwave radiogram.

I scored a windfall in 1968 when, at the age of 14, my father decided that it was time to retire our 1950 model radiogram and buy a stereo unit. It wasn't long before the broadcast/shortwave radio was whipped out of the large cabinet and promptly placed in my bedroom where a piece of wire — as long and as high as I could get it — was attached. My shortwave listening days had begun!

After a short while I realised I could pick up some private citizens (they called them radio 'hams'), down at one end of the dial (160m), and would occasionally tune down there when nothing else was on. I gradually became more interested in what they had to discuss (it was mostly technical talk in those days), but occasionally one station would come on frequency with 'duck talk', which confused me a little. This was SSB.

I was fortunate to get-to-know a friendly amateur who explained the need for a BFO to resolve SSB and I then proceeded to add one to the receiver. He also allowed me to visit his station and, when I was handed the microphone to talk to someone in California, USA, at 2.30pm one afternoon, I was rather dumbfounded. Realising he was operating at about 14MHz on SSB, I searched this frequency and was amazed to hear the USA and other amateurs quite well. Thus followed a number of years of SWLing on the amateur bands. It is really amazing what you can do with a receiver that has an IF strip as wide as a barn door! !

It was not until I had done some of the more important things in life, like a job, marriage and starting a family, that I had a little spare time to finally try for a licence. A quick phone call to DOC got all the papers underway and, before too long, I sat for, and passed, the Novice AOCP.

Having gone to the trouble of getting up to a good seven WPM Morse speed, I thought I had better keep the inertia going and practice hard for the next 'full call' CW exam. I sat and passed the CW and theory, now, *what about getting on the air?*

Well, that was the problem! I didn't have any equipment and our finances were being put to better use paying for a house, rather than a black box. Being the holder of a NAOCP and AOCP licence and never having been on air, it was time to do something.

The receiver side of my problem was obvious. My old friend, the 1950 domestic shortwave receiver would have to do. It was reasonably frequency stable on 80 metres, as long as the table was not bumped, and sensitivity was good also. But what to use for a transmitter?

I built a two transistor (oscillator and RF amplifier) unit; my version having about half a watt output. It was crystal locked, so I figured that would please DOC, anyway, with that much power I wouldn't get out of my own backyard, would I?

Fortunately, and also unfortunately, I figured that 50kHz within the band edge would be 'safe'. This got me out of the CW QRM with the old receiver — but put me right in the middle of the slow Morse WIA broadcasts on 3.550MHz. What is more, they beat me to the frequency nearly every night! !

A multiband, inverted vee, fed with open wire feeder was the antenna decided upon, with icy pole sticks as spacers. A 'link coupled' antenna tuner was built and also a SWR meter. The results were, at first, confusing and disappointing.

The transmitter would key for the first dit or dah — thereafter, it would not oscillate and the SWR meter made no sense, at all. The solutions were simple enough once realised — which was the hard part.

I had carelessly left the base bias resistor off the oscillator transistor of the transmitter and SWR meters need approximately five watts of RF to start to operate. I was only putting in about half a watt. Not to be outdone, I used it as a field strength meter, instead.

Soon, I was tuned up and ready to work the guys down the street. I sent out CQs at about 12WPM, not believing I would get any replies, except for very local amateurs. When I heard my call sign coming back the first time I nearly fell off the chair and I didn't copy a word of the QSO unfortunately, as I was so excited. However, I slowed the CQs down and worked at a slower speed until I understood what FB TNX BCNU, etc really meant. It was great fun.

Before long, I realised that my miserable half watt was covering the east coast of Australia, and putting about a 5x5 signal into New Zealand, as well. I quickly learned a great respect for QRPp!

I battled with the old receiver for a while. Selectivity was poor and often three or four stations were on top of one another. But it is amazing how the human brain can be used as an IF strip in cases of necessity. Retuning was necessary every few minutes due to drift and there was no beat note from the receiver in the transmitter, just a growl, because the strong local RF seemed to pull it off frequency. It was a challenge, to say the least, buy great fun, just the same.

Not everyone gets started with a black box, have the guidance of a radio club or amateur friends to help, but it was really worth the effort, as I have found a challenging and rewarding hobby, with many very special QSOs, both on key and phone, over the past years. I look, with interest, to what the future holds for the amateur.

AR

THE LONG WAY ROUND

Moira Millgate VK8NW
45 Giles Street, Alice Springs, NT. 5750

Some Saturday mornings, when I was a little girl, my father used to take me with him to his workshop/office at the back of the post office. We passed the telegraph office on the way and I could see the operating room and hear the clatter of the Morse key. It fascinated me and I promised myself I was going to learn that language and find out what they said to each other.

Luck was with me when, in 1936, I found the Morse alphabet in a Wireless Weekly and included with it, an article on "How to Learn the Morse Code". I have been carrying this article around with me ever since and it is well torn and tattered now.

In those days, it all seemed far away and beyond my reach but in May 1942, I read an article in a Sydney newspaper, which said something like this: "If you would like to become a wireless telegraphist in the WRANS, apply at No 2 Clarence Street for training in Morse code". I went there the next day, and about six months later, with the help of Mrs Florence McKenzie and members of her Signalling Corps, I passed the 22WPM entrance examination, required for the WRANS.

I stayed with Mrs Mac, as a member of her Signalling Corps, until I left Sydney in 1943 for HMAS HARMAN and a life in the Navy for the next three years.

For different reasons, that should have been the end of the story, except some 35 years or so later, two amateur radio operators from Queensland, crossed my path. In different ways, they convinced me that I ought to study electronic theory and become a radio amateur. One of these amateurs was Bob VK4ADZ of Bundaberg, my husband's brother; the other, Arthur, now VK4KOB, of Gin Gin, Bob's friend.

On a visit to Alice Springs, Bob brought me helpful study books, and 'spied' out the land for a suitable future antenna site.

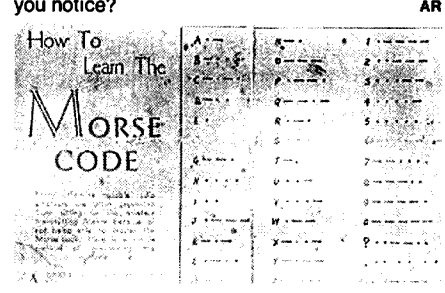
Arthur, some months later, when passing through, used a shanghai to "shoot' a long wire into our Jacaranda tree. We then talked to Bundaberg from our back lawn.

Arthur also left an eight WPM Morse tape with me while he and his family travelled to Ayers Rock and back. It was very encouraging to find I could read this tape after so many years. I then sent to Brisbane for an 18WPM tape, to see what would happen to my morale.

Exactly two years after Arthur catapulted his aerial into our tree top, I became a full call amateur radio operator. The electronics had been a problem, but different amateurs in Alice Springs were kind enough and helped me out.

Somewhere along the way, however, I missed out on being able to read those old post office chatterbox sounders . . . but the buzzer does have a happy dancing swing to it, or didn't you notice?

AR



FIELD DAY 1939

The photograph at right depicts a group of WIA (Q) members at the completion of a very successful field day, on location at Eildon Hill, Brisbane, on 20th August 1939, just prior to WWII.

The suburbs of Brisbane were divided into mapped grid zones. The 'ENEMY" vehicle was followed on DF, on 80 metres with the 'CHASER' vehicles receiving instructions, via two-way, on five metres.

At the far back are two Rover Scouts. Back row from left: John Thorley VK4RT (d), Pat Kelly VK4KB (d), Howard MacGregor VK4ZU (nl), Dr Margan Gabriel (d), Bill Harston VK4RY (d), Keith Price VK4KF (d), Albert Carter VK4LT (la), Visitor VK2??, Leo McMahon VK4LM, now VK2AC (la), Geo Hughes VK4HU (nl), Jack Files VK4JF (d).

Front from left: George Gray VK4JP (la), Vince Jeff VK4VJ (d), Arthur Walz VK4AW (la), Alf Guildford VK4AP (d), Bill Chitham VK4UU (la), Jack Heine VK4JX, now VK3JF (la).

Present Status: (d) Deceased. (nl) Not now licenced, but still living. (la) Licenced and active.

Left

Bruce Hughes, Queensland President, tests the WICEN communicator, which had been brought to the Convention from VK3, by Pierce Healy.

VHF GROUP 1958

At left is an early photograph of some members of the Brisbane VHF Group. The photograph was taken in August 1958, at the home of the first President, Jack Ross VK4JO.

The Group was formed at a meeting held on June 1958, during the 1958 WIA (Q) Convention, at Palm Beach, Qld.

Bruce Hughes VK4ZBD, later VK4BZ, was the Queensland Divisional President at this time. He was the first limited licensee to become president of the Division.

The VHF Group resolved to support the fledgling WICEN concept and undertook to build several WICEN communicators — a six metre, battery operated, valve transceiver, developed in VK3.

TELEPHONE AIDS FOR THE HANDICAPPED

British Telecom has recently produced a catalogue of some 70 products and services for customers who have difficulty in using a telephone. The catalogue covers devices for those with impaired hearing, speech difficulties, blind and visually handicapped and those with restricted mobility.

The 36 page book is being circulated to many of the world's telecommunications authorities.

One of the most recent innovations is the Claudius Converse, a portable speech synthesiser. It consists of a keypad connected to the telephone and can 'speak' up to 64 phrases at the touch of a button, including emergency messages such as 'I want the police!'

Other devices include amplifying handsets, Vistel, a portable deaf communicating terminal, and the Jumbo Button Terminal, which has large raised figures and letters for people with limited sight or dexterity.

THUMBNAIL SKETCHES

Alan Shawsmith VK4SS
35 Whynot Street, West End, Qld. 4101

NORM TYAS VK4TY (SK)

Norm was one of the real OOTers, having obtained his licence at Brisbane in 1932.

As principal of various Queensland State Primary Schools for over 30 years, in both country and city areas, his QTHs read a bit like the Lucky Starr song, "I've been everywhere man". It's a wonder his arms didn't become tired taking down and putting up his antennas. Norm wasn't the sort of chap to be satisfied with a dipole just strung up anywhere — rather he strove constantly for better, bigger and often higher skyhooks.

VK4TY at work. His equipment and desk were homebrewed to suit his needs.

How many OOT operators have their FIRST log book, compiled over fifty years ago? Here is a page extract from Norm VK4TY's first log. OOTers will recognise many familiar calls with pleasant memories, no doubt. As this is a photocopy from the log it has some shadows from the next page showing through, unfortunately.

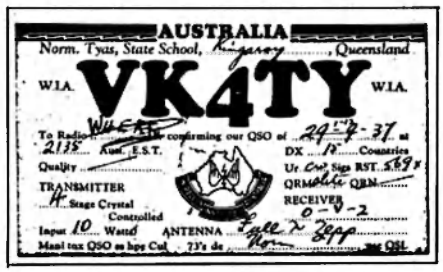
An ardent homebrewer, he applied the same principle to his gear — always seeking improvement. His second hobby, carpentry, was a most valuable asset which enabled him to construct his own operating desk to suit his particular needs.

Norm was always ready for a rag chew, nevertheless, he spent most of his time chasing DX — the end result being many contest placings and a long list of awards. His Australian DXCC, number 35, was a good effort, dated 26th August 1950. He was a long term member of the WIA and was invited to join several overseas clubs, viz CHC No310, QRP No713, QCWA No2553, ISSBers, etc.

During WWII he served in the RAAF as a Wireless Operator, being stationed in Port Moresby, Papua, Darwin and Townsville. As may be expected, Norm's CW 'fist' and operating technique were very professional, indeed.

VK4TY finally settled at Manly in Queensland. His signal from this seaside QTH was outstanding and it is a great pity he did not have more years to enjoy amateur radio. Rightly, he could be called 'the complete and fair dinkum amateur', in that he built much of his gear to suit his need and participated in most of amateur radios activities.

AR



ROY L BELSTEAD VK4EI (SK)

Roy was the first amateur in Oceania to contact Europe on 10 metres phone. The contact took place on the 5th October 1935.

Roy Belstead VK4EI at the age of 23.

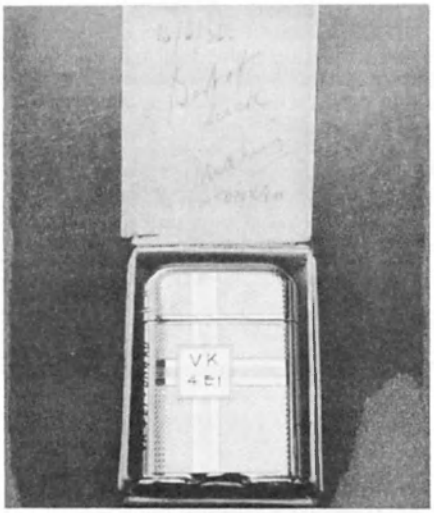
This achievement in wireless could be likened to breaking the four minute mile in track athletics. Most believe it would be done eventually, but by whom and when! The Oceania amateur radio honour fell to a Queenslander and a TARC member, VK4EI from Townsville. No exact time has been recorded for the contact but, in view of the season, it is safe to say, the two way contact was made around 11pm EAST.

A feature of this 'first' VK/Europe QSO was that it occurred during a period of low solar activity. In 1933, the average Zurich sunspot number, expressed as Rz, was approximately five; this was the minimum between Cycles 16 and 17. For 1935, as the cycle began to strengthen, the Rz was given as 35. By October of this same year, when the QSO was made, it was probably around 60-65 — still not enough to expect a QSO with Europe on 28MHz, with QRP and no beam antenna. Consequently, it is reasonable to ask, "Did Roy VK4EI strike it lucky? Was there a magnetic disturbance of the ionosphere — even a minor one?" Only a check of past records can say if this was so.

Pennants awarded to VK4EI for DX Achievements.

Special Award presented to VK4EI.

The A B Shepherd Trophy presented to VK4EI in 1936.



A Cigarette Lighter sent to VK4EI, from ON4AU, for the first anniversary to commemorate a 10 metres QSO.

Like the first sub-four minute miler, Roger Bannister, who gave credit for his success to the optimum conditions, so Roy Belstead was the man on the spot at the right time and place.

The Brisbane Telegraph and Rockhampton Morning Bulletin (16.10.1935) both reported the event, as did overseas magazines. The WIA Queensland Division presented Roy with three large pennants and a handsome silver cup, the latter being inscribed thus — *"Special Award to VK4EI 1st VK/Europe 28mc Contact"*. He also received the 'A G Shepherd Trophy", another very fine cup. The identity of this donor is now obscure, however it is thought he was a non-amateur member of TARC and/or a local identity keen on amateur radio.

ON4AU in Belgium was so delighted to be at the European end of such an historic event, as a first anniversary memento, he sent Roy a cigarette lighter engraved with the words *"Remembrance of First 28mc QSO. Oceania/Europe. VK4EI-ON4AU October 5th 1935."* All these prestigious trophies are now held in perpetuity by the Townsville Amateur Radio Club.

Roy Belstead VK4EI obtained his AOCP in Townsville in 1934. He was then 23 years of age and a member of the TARC. As his early log books show, he wasted no time getting among the DX on all bands.

His first occupation was that of a clerk in the Queensland Railways. Later he journeyed interstate and completed a BOCP course at the Marconi School of Wireless, Sydney. Next he was employed as a technician at the Broadcast Station 2KY, for some years. Eventually, after several positions, he returned to Winton in central Queensland in 1971. Here he set up the business 'Belstead Electronic Repairs' and operated under a new call sign, VK4RU. Ill health forced him to retire in 1978 and he became a silent key in April 1981. However, in the minds of most Northern Queenslanders, he will remain forever as VK4EI — the rather quiet, unassuming man, who broke the 10 metre barrier to Europe.

The author is indebted to TARC Historian, Evelyn Bahr VK4EQ, for much of the above information and photographs.

WING COMMANDER KEITH McCARTHY, DFC.AFM.AE (RTD) — VK4DU

A 'peek' into the activities of Keith VK4DU (Macca to his mates) shows him cleary as a man's man, one who instinctively spiced his life with challenge and adventure. His best and most distinguished years — over thiry of them — were spent with the RAAF as both W/O and Navigator. This meant that AR had to take second place, out of necessity — even so, he held and used a dozen different call signs from places in Australia, New Guinea, the south west Pacific and the UK.

Keith's first interest in wireless was stimulated in a rather unusual way; it was not the construction of the ubiquitous crystal set followed by the purchase of a pair of headphones to test it out — rather the reverse. In Macca's case, an uncle who was a ship's W/O gave him a heavy GERMAN navy headset, way back in the 1920s — that started it, Keith had to build a set to accommodate them.

In 1930 he qualified as a telegraphist in the Victorian Railways; no doubt this job moulded his 'fist' into that clear-cut, well-spaced, relaxed style of sending that was to signify his QSOs in later life.

Gaining the AOCP two years later (1932), he went straight to air with the call VK3FX. During 1934 Macca was QRV in Sydney NSW as VK2IM; however the PMG relieved him of this call and assigned it to the Harbour Police Launch in 1935 and in exchange he was allotted VK2VM. 1936 saw him back in Victoria using his original VK3FX and it was in this same year that Keith joined the RAAF.

During the war years (1939-45) Keith was engaged in active service on BEAUFIGHTER and LANCASTER aircraft in New Guinea and SW Pacific areas.

A short list of Macca's post-war call signs are as follows:

1946 — VK2VM again, at Richmond RAAF Station.
1948 — VK4FX Port Moresby (PNG at that time was part of VK4), as Chief Sigs Officer Northern Command RAAF.
1949 — G1AA, on staff of Empire Radio College RAF, Dabden UK.
1952, VK3FX again, Chief Instructor at RAAF School of Radio.
1964 — VK4DU, Wing Radio Officer at No 82 Wing RAAF Amberley.
1971 — VK9AR, now a civilian aboard his ketch "Pandemonium", Port Moresby.
1978 — VK4PY
1981 — VK4DU
1983 — VM4AAA

Also the ship civil call signs: VM2039, VMPM, PZPM

After his RAAF discharge Keith and his YF sailed their auxiliary ketch "Pandemonium" to various parts of Micronesia, New Guinea and Malaysia. Using the call VK9AR regular contacts and scheds were kept with the VK mainland. An around-the-world cruise had been planned but this was cut short by unavoidable circumstances.

In 1965, a navigator and 'back up' W/O if needed, he was a member of the distinguished WWII veteran air crew which flew a 'worn out' Lancaster (fit only for the wreckers yard) from Australia to the UK, against all odds. Already almost a legend among his mates, this was quite possibly Wg Cmdr K McCarthy's finest hour. The whole hair-raising adventure is graphically described by author P Kilvington in the book "THE LAST LANC". — a **must** for all those who had anything to do with flying during WWII, it will grip you to the last chapter.

Stories of crazy capers in the Officers Mess in the Armed Services are legend. It is alleged that a case of spirits, which carried an exotic and unknown brand name was delivered to the Officers Mess. Macca's boys broached it with caution — and sampled it with greater caution. The common consensus was, "Send it over to the Sergeant's Mess."

Next day Keith enquired from an NCO how he enjoyed the gift (with compliments) from the Officers Mess. "Well, it was like this, Sir," said the Sergeant reflectively stroking his chin and running a tongue across his dry lips, "If if had been any worse we couldn't have drunk it — and if it was any better we wouldn't have got it!"

Rich in the satisfaction of many jobs well done, many places and faces seen and various call signs used to good effect, Keith now lives in retirement in a well-chosen spot near Beenleigh half-way between the Gold Coast and the City of Brisbane.

He can be heard on/air on 'Charlie Whisky' when the spirit moves him, with the rightfully-earned distinctive call sign of VM4AAA. The VM4 prefix is issued only to those Queensland OOTers who have held an amateur license for a half-century or more. May no injustice ever deprive him of it.

AR

ERIC LAKE, VK4EL (SK).

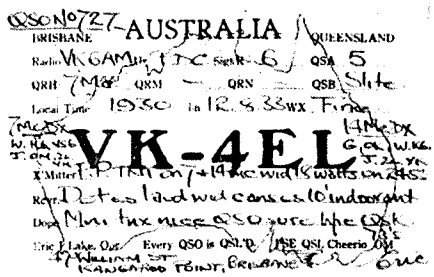
Eric, gifted with a plethora of talents topped off by wit and humour, was one of the nicest OOTers ever to find his way into AR. Born in Shrewsbury UK, he eventually emigrated to Sunny Queensland and sat for his AOCP in 1933.

His first transmission was alleged to have taken place from Kangaroo Point, Brisbane, where he erected a 90 feet (27m) pole and started out as a DJ on the 200 metre band. This was short-lived as the skyhook crashed down in one of Brisbane's thunder storm blows (one wonders how the neighbours reacted). However, he soon turned his attention to HF, particularly 20 metres CW, where his ability as a top class operator became apparent.

It is often said that a good code man can copy Morse when it is no stronger than the background QRN; Eric VK4EL could do better. He could extract call signs and turn them into QSOs when only noise was apparent in his receiver; visitors to his shack will attest to this. He was even referred

to with admiration as the 'bloke with super ears', able to decipher sounds beyond the range of the average listener. From his Camp Hill QTH, which was close to a main road and his reception permanently marred by low level car QRN, he nevertheless managed to work more 'G' stations with A1 mode QRP on the long path than anyone else in VK4 during the same period 1935-1939.

Shortly after the war he joined the PMG and served for many years on the technical staff at Broadcasting Station 4QN Townsville. He lived at the nearby suburb of Belgian Gardens, from



whence he continued to chase DX. His achievements in this regard were impressive. However, fate was to intervene. In the prime of life he fell ill and bacame an SK before reaching 50 years of age.

Eric made several contributions to AR, the most important being his ability to impart his knowledge to beginners. He supervised the WIA AOCP classes and he had private students as well. There was hardly a period in his amateur career when he was not engaged in a teaching task, either theory or code. His worth to AR in this regard will never be fully known or recognised. Teachers who are engaged in WIA AOCP youth student schemes are like SWLs — the forgotten section of our hobby.

He received international recognition when he attained WAC on CW on QRP, viz. ½watt in ½wave vertical. This was reported in overseas magazines and hailed as a record for its time.

In the 1930s he constructed a one valve regeneration receiver which became know as the One Valve VK4EL Special. There was nothing radical or innovative in its design but Eric experimented with the value of every component in it to obtain maximum sensitivity. Rumour has it that he sold the circuit to a Sydney manufacturer for mass production.

In his youth Eric had the honour of representing Queensland in a game of soccer against a Chinese team. The Bananalanders were beaten by 20 goals to one, VK4EL scoring the only goal for the home side. He naturally wanted to tell others of this accomplishment, but when he did, their reply was usually, "That's not a score mate, that's a race track starting price!" Consequently, Eric kept it a secret.

Author's Note:

Eric VK4EL did not earn the reputation of a worker of 'Gs' purely by chance. For him, a QSO with his motherland was a dedicated daily two hour ritual — part of his territorial imperative.

Around 4:30 pm local time the gear in his spartan downstairs shack would be tested; a 3 valve TRF receiver and a 3 stage transmitter with a modest 245 in the final; power usually around 20 watts. His operating position was a straight-backed kitchen chair — no soft comforts for Eric. Although capable of sartorial elegance when the occasion demanded, his shack attire even on cold days was also spartan — a 'jackie howe' and shorts seemed to be all his bulky frame needed. With a mind so pre-occupied winter didn't exist.

As the receiver settled down to a steady crackle, a rather fat cigarette was rolled and lit. Listening intently, the band was very slowly tuned (no on frequency operation then — an object lesson on DXing for any Novice). Intently, he poured all his aural senses into the band noise, listening listening; the 'fag' drooping from his mouth was forgotten — and out — a useless, spittle-soaked appendage. At the end of two hours his immaculately kept log usually showed more than one 'G' QSO, even in bad conditions. His sending 'fist' was a pleasure to copy — even at 30 WPM plus.

AR

past achievements present objectives future aspirations of R R C

The Redcliffe Radio Club was formed in 1971 with the banding together of a few licensed operators on the Redcliffe Peninsula. It was quickly discovered there were many would be amateurs within a 30 mile (48km) radius of the Redcliffe City, who desired to acquire the skills and knowledge in theory, regulations and Morse code, to enable them to pass the, then, half yearly examinations set by the Department of Communications.

Volunteer instructors were willing to teach theory and the code and students began to qualify at the examinations. Membership of the Club was strengthened accordingly. This trend has continued to the present day and the Club now boasts a membership of 100 and is thriving.

Early in its inception, the Club instigated the Redcliffe City Award, with the financial assistance of the Redcliffe City Council. The promotion of the Award appealed to many active Club members and special award nets were instituted on a weekly basis, on Saturday afternoons and Wednesday evenings. In excess of 500 awards have now been distributed on a world wide basis and has played its part in the tourist promotion of the Redcliffe area. This, naturally, is a source of satisfaction to the Redcliffe City Council.

At appropriate times, Club members have organised 'on air' displays at the annual Redcliffe Show and the Redcliffe Library. These efforts have assisted to create interest and the publicity has been responsible for an increase in Club membership.

As time inexorably passes, so to have some of the foundation members. One, VK4IZ, was granted Life Membership, and his memory is further kept alive by his donation of a HF transceiver, which is available for use by Club members. In addition, the Club has inherited a fine collection of amateur radio books from the late VK4YB, and these are available for use, by members. A reference library of technical books are available on loan, also.

Meetings are held weekly on Mondays, at the Redcliffe Education Centre, from 7.30pm. The first and third Mondays are devoted to class instruction and discussion nights, the second is a General Meeting, with a Guest Speaker, if there is one available. The fourth Monday is a general workshop evening, with something of interest to all.

Members of the Club have actively supported JOTA each October, with 1985 having been no exception. This year the JOTA station demonstrated two metres, 70cm, RTTY and amateur television.

Latest Generation Receivers from Yaesu!

FRG9600 Scanner

Never Before! A scanning receiver that has so many features, offers so much. And it's absolutely ideal for the amateur, too! It offers continuous coverage between 60 and 905MHz, in all modes (SSB up to 460MHz), with FM and AM in both wide and narrow bandwidth. But that's not all:

You get 100 keypad-programmable memory channels, full rotary dial tuning as well as push-button tuning, fully programmable scanning in various modes . . . and much, much more.

PLUS it's a CAT unit: with the optional interface you can control its operation from most micros! Virtually unlimited customised control functions in software are possible!

Impressed? Not half as impressed as you will be with one in your shack!

Specifications:

Range: 60 — 905MHz (SSB 60 — 460MHz)
Modes (3dB bandwidth)

FM (N): 15kHz 0.5uV Sens (12dB SINAD)
FM (W): 180kHz 1.0uV Sens (12dB SINAD)
AM (N): 2.4kHz 1.0uV Sens (10dB S+N/N)
AM (W): 6kHz 1.5uV Sens (10dB S+N/N)
SSB : 2.4kHz 1.0uV Sens (10dB S+N/N)

Conversion:	Triple for FM (N) AM & SSB, Double for FM(W)
IFs:	45.75MHz, 10.7MHz and 455kHz
Image rejection:	60-460MHz — 50dB typical 460-905MHz — 40dB typical
Memory Channels:	100
Power Supply:	12-15V DC 550mA (lithium cell back-up)

LIMITED STOCK! (Includes power supply) **$799**
Cat D-2825

Orders taken now at your nearest DSE store

DICK SMITH ELECTRONICS PTY LTD

B-052

FRG8800 Receiver

What about HF, you ask?
No worries. Yaesu design engineers have excelled themselves yet again!

- General coverage from 150kHz to 30MHz
- All mode, including AM wide and narrow and FM narrow
- 12 internal memories (push-button) with scanning functions
- Selectable AGC rates, noise blanking widths & tuning rates
- Dual digital clocks (great for different time zones)

And so much more!

PLUS, it's also a CAT system: add a microcomputer and the optional interface and you can transfer function to your micro!

And even more: with the optional VHF coverter (fits completely inside) you also get 118 - 174MHz.

It also uses the '7700' series of accessories: active antenna, and antenna tuner.

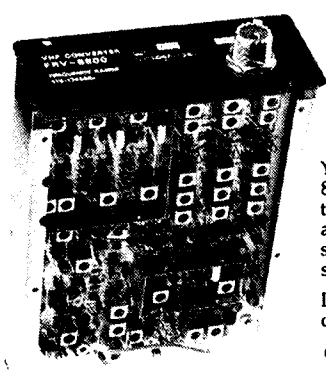
Specifications:

Modes:	AM, SSB & CW in both wide and narrow; FM (N)
Sensitivity:	AM, SSB & CW: 10dB or better (S+N/N) FM (N): 20dB or better (S+N/N)
Selectivity:	AM (W) 6kHz (−6dB), 15kHz (−50dB) AM (N), SSB, CW 2.7kHz (−6dB), 8kHz (−50dB) FM (N) 12.5kHz (−6dB), 30kHz (−40dB)
Antenna Imp:	50 ohms and 500 ohms (VHF conv 50 ohms)
Power:	240V AC

Cat D-2820

Alternative: FRG-8800 SW — 2MHz to 30 MHz range, otherwise identical $829.00
Cat D-2821

$899
LIMITED STOCK!



Optional VHF Converter

Yes! 118-174MHz from your FRG-8800. And it fits completely inside the set — operation is completely automatic. Full dial or pushbutton selection, same features as standard set.

Incredible versatility - and full CAT operation too.

Cat D-2823 **$189**

(1) A short note has come from Lee KH6BZF, asking that the KH6EQI Beacon be re-listed, but in the note he says the beacon is operating on 50.600MHz! Now I am pretty sure that frequency is incorrect. It operated for a long time on 50.060MHz and I listed it as such, to have it operating on 50.600, right out of the DX band, seems strange, so see it as a written error. For the time being, it has been included again, but on 50.060MHz; if incorrect, please advise me. Lee.
(2) A message from Mark VK0AQ, at Mawson, Antarctica, indicates he has the beacon running there 24 hours-a-day and will keep it that way unless special problems of interference arise. So far there are no problems. The antenna is on Australia and the beacon runs about 90W output, with FSK ident, although you may have to listen closely to make the identification. At the moment, Mark has problems himself, operating on six metres, and has no way of knowing when the band may be open as he has no TV stations to alert him, as David VK0CK had at Macquarie Island, so the possibility exists that you could hear the beacon and not have anyone to work. Mark expects to be at Mawson until February 1986, so he will have a full Es season to play with for contacts.
(3) A letter from Peter VK4ZDO, the Acting Secretary of the Brisbane VHF Group, asks for their two metre beacon, VK4RTT at Mount Mowbullan, to be added to the list. (I am not sure why it was removed, but it has been added again . . . 5LP). Peter goes on the say that, except for maintenance, the beacon has served the amateur community for 20 years, and believes it to be the oldest two metre beacon in Australia. It is owned and maintained by the Brisbane VHF Group, who also operate a two metre repeater, VK4RBN, a 70cm beacon, VK4RBB, and a 70cm repeater, VK4RBC.

NATIONAL CALLING FREQUENCY ON HF

A letter has arrived from Charlie Gnaccarini VK3BRZ, airing a matter which has received attention in the past, without a great deal of success. He says: *"Recently, I had my enthusiasm for VHF DX operation rekindled after many years of almost exclusive HF operation. The recent article in AR, on Aircraft Enhancement, was particularly responsible for this, and I am currently putting together a serious two metre SSB station.*

"It has occurred to me many times, that VHF DX operation is very much a hit and miss affair, (mostly miss), since a number of random events need to coincide, (propagation conditions, operators being on the air, beams pointing in the right direction, etc). What is required is a national calling frequency on HF, where communications can take place throughout Australia, with some reliability, so that scheds can be arranged, tests co-ordinated, and so on.

"Some attempt was made years ago by keen six metre operators to use 10 metres for liaison, but 10 metres is not what it used to be! My proposal is to agree on a frequency on 40 metres and one on 80 metres, so that day and night can be covered. By being able to liaise with other operators, we may be able to improve the chances of working openings which we would otherwise not be aware of, instead of optimistically calling CQ with beams pointed every which-way. Perhaps we could even have a weekly 'VHF DX Net' on 80 metres. This would go a long way towards encouraging VHF SSB operation.

"Limited call holders would still gain some benefit from the HF nets by simply listening to what is happening. If the 80 metre net is held inside the Novice segment, than combined Novice/Limited call holders could make use of it too (the only problem is finding a clear frequency!).

"Perhaps someone in the past has thought of this before and I am merely re-inventing the wheel. I would certainly be prepared to give the scheme a try, if not just to find out what others are doing on the VHF scene, and to keep up with the latest gossip".

What you are asking, Charlie, has certainly been attempted in the past, in fact several times, I believe, but with only limited success. Maybe we did not have the right frequencies, but more likely we lacked the dedicated operators, with the requisite time required to maintain the net, and lacking the right kind of person to be net controller. It was used with quite a degree of success during the high years of Cycle 21, on 28.885MHz, and a lot of useful information was sent to other people on that frequency, at the time. Its usefulness tended to run out when propagation conditions changed and the frequency, itself, became unreliable. It also suffered from the accusations that some unscrupulous operators were using 10 metres to complete 50 and 52MHz contacts, which had only partially been completed on the six metre band, when it too faded out during the opening. These accusations are very hard to prove, of course, but I believe there is a measure of truth in the statement. Such a situation may not so readily arise here if the main purpose is to bolster two metre and above operation, but in the prime six metre days, when there was a mad scramble to work as many countries as you could, the opportunity was there to finish the contact by any means, and still claim a valid contacts!

However, despite what has happened in the past, there seems no reason why the matter should not be aired again. Anyone interested should write to me and state their views, and indicate what frequencies (Specifically), and the times of operation (bearing in mind we have a two hour time difference across Australia), and on what day/days the net should be held, and who should control it. I am prepared to be a clearing house for any opinions, so aired!

ROSS HULL MEMORIAL CONTEST

You are once again reminded of this VHF/UHF contest coming up for a start in December. There are some more rule changes this year, which it is hoped, will be acceptable to the majority. They will not, and cannot satisfy everyone on a country as large as ours, so some compromise will be required. Importantly though, please send in your log to the Contest Manager, at least keep the Contest alive while we try and sort out how best to run it; without logs, the Contest will surely disappear off the calendar.

USE OF VI PREFIX

The Department of Communications has approved the use, by all amateurs, of the 'VI prefix' instead of 'VK' for the period, 1st October to 31st December 1985, in celebration of the WIA's 75th Anniversary. VHF and UHF operators should note this also applies to them and is not restricted to the HF bands. It would be appropriate to use the new prefix during the Ross Hull Contest, this year.

SIX METRE STANDINGS UPDATE

Following my plea in August AR for more operators to add their scores to the present list of Six Metre Standings, it is pleasing to note some entries are coming in. Lindsay VK4ALM, has given an update to his listing, Graham VK8GB sent in that very comprehensive list I mentioned before, and Bert VK3ZZY has sent in his list for the first time. I still make a plea for others to do the same, there must still be some excellent scores around the country, unlisted. Once you have you listing with me, it is very easy to keep it up-to-date, as QSLs come in. At least, from our listings, the rest of the world can see that Australia, which is one of the most difficult VHF DX locations to work from many other countries, has had quite a share of exciting contacts.

I have received several requests from VHF operators, for me to list what countries the higher scoring stations on the list, have worked. I can see no reason why this should not be done, as the results are not secret, and it would be, as Bert VK3ZZY says: *"interesting to see what the potential list is and which ones of those I might have worked, had I been near a six metre rig, at the time."*

David VK2BA, heads the list at the moment, with 28 countries confirmed and these are: *6.1.78 ZL3QK New Zealand; 8.1.78 VK9NI Norfolk Is; 28.11.78 VK2HZ Aust; 19.12.78 JA4MBY Japan; 23.12.78 FK8AX New Caledonia; 7.1.79 P29BH Papua/New Guinea; 7.1.79 YJ8ZV New Hebrides; 12.3.79 KG6DX Guam; 13.3.79 WA4TNV/KL7 Alaska; 10.3.79 W6XJ USA; 2.4.79 HL9TG Korea; 5.3.80 KH6IAA Hawaii; 9.4.80 XE1GE Mexico*; 13.4.80 KX6QC Marshall Is*; 13.9.80 C21NI Nauru; 6.10.80 VK2YHA Lord Howe Is; 24.10.80 VK9ZG Willis Is; 2.4.81 ZF2DN Cayman Is*; 11.4.81 KH3AB Johnston Atoll; 12.4.81 FO8DR Tahiti; 20.4.81 AH8A American Samoa; 25.4.81 VS5DX Brunei; 4.2.82 H44PT Solomon Is; 3.4.82 3D2JT Fiji; 11.4.82 A35JT Tonga; 18.12.82 VK0AP Macquarie Is; 29.12.82 ZK2RS Niue Is; 19.6.83 ZL4OY/C Chatham.* * means split frequency QSO, with VK2BA operating above 52MHz and the other station on 50MHz. All other QSOs were two-way, above 52MHz. A very commendable effort and one which many will find hard to better.

The letter from Lindsay VK4ALM, with his standings update says, that at long last he had received a QSL from A35GW. It took a long time and several letters, but eventually the treasured card arrived. Lindsay believes there are still quite a few disappointed stations waiting for their card.

Lindsay also worked A35RS (Bob), on 24th November 1984, on 52.055MHz, and sent the usual IRC, etc, direct to his New Zealand address, but nothing heard. As he says, you win some, you lose some!

On the six metre scene, in the Rockhampton area, Lindsay said it has been very quite this year. The mid-year Es were of short duration, with a few openings in June to VK2 and VK3, with the last recorded opening to VK3s: XQ, AZY and AMK, on

15th July. No ZLs heard. Russian TV showed up on 14, 15 and 16 September 1985, usually between 0730 and 1000UTC and reaching S9 on the 15th, at 0900. No sign of any JAs on 50 or 52MHz, and no beacons. Last contact was with JA4MBM on 28th April 1985. Also, a report that Graham VK8GB has worked JA4MBM on the 7th September, the same day the band opened on 10 metres to the USA's 4 and 5 areas from Rockhampton. Lindsay also spoke to FK8EB and FK1SB on 10 metres on 14th September and both reported no six metres for quite some time, and no VK TV either, in Noumea. Thanks for writing Lindsay, we all hope for something better this summer.

USING MOUNT ANAKIE

The Geelong Amateur Radio Club Bulletin reports, that after two years of time-consuming, and often frustrating negotiations, the GARC and WIA has secured exclusive use of a site on Mount Anakie to house their repeaters and beacon, VK3s: RGL, RBU and RGG. Drawings of the tower and hut are being prepared and, when formalities are completed, construction can commence as soon a the weather improves. The Club is looking for a free standing tower, 14 to 20m high for use on the site. *Can you help?*

Approval has also been given for the installation of repeater, VK3RGC, on Montpellier, using a Philips FM828 with 18W output. Antenna; transmitting, a folded dipole at 14m, and receiving, a folded dipole at 7m, with an Intel 8748 Microprocessor controller. Time out, three minutes. Ident, seven minutes.

OVERSEAS

The Northern Hemisphere have recently passed through their summer Es period with the big news being the 2nd July Es opening across the Atlantic to the UK. Bill Tynon W3XO, and 'The World Above 50MHz' in QST for September 1985, says there have been other such openings in the past two years, but this one was the most widespread, and longest lasting, of any trans-Atlantic Es propagation yet experienced.

"Scattered reports have arrived of several stations, as far south as Washington, DC, working one or more stations across the pond. W3ZZ had a QSO with EI0RTS at 2358UTC. W3WFM hooked up with G4DGU at 2345. WA1OUB, in New Hampshire, was alerted to the possibilities of interesting conditions at 2115, by very short skip to the north east, on 10 metres. He began calling on six metres and was rewarded at 2145 by a call on 28.885MHz from G4GLT. It would be 2230 before the select group of 100 Gs, who have special permits for 50MHz operation, would be allowed to begin transmitting on the band. The two stations hooked up again at 2230 for a two-way, six metre QSO, with 5x9 signals, both ways. WA1OUB went on to work G4BPY at 2232, EI0RTS at 2232, G6NB at 2234, GW3LDH at 2242, G3OSS at 2244, G3COJ at 2255, G3WBN at 2302, and G4DGU at 2305. At 2356, EI0RTS was worked again and the last contact was at 0027, 3rd July with GJ3YHU. Except for G4GLT and EI0RTS, signals were weak, between 4x3 and 5x5. Bob reported that the Gs said they had heard W4 and W5 earlier in the day."

Good to see our US friends sharing in trans-Atlantic contacts. I did hear only this week (mid-September), that amateurs in the UK were all to have an opportunity of working 50MHz outside TV hours, instead of only 100; hope they get it. It should be possible to work across the Atlantic with reasonable consistency, the distance is about half that from VK to the West Coast of the US, which means about the same distance for us on the Eastern Seaboard to, say Tahiti (FO8). Even VK5LP has worked that far, but not often! With a large six metre population in the US and the thrills of early times on six metres for the G operators, means vigilance on the bands will certainly produce contacts, so we can expect to hear this being repeated from time to time before long, as more and more Gs obtain six metre equipment. The opening of 2nd July will be a shot-in-the-arm for six metres, both ways.

EME NEWS

Nothing heard from Doug VK3UM this month, but there is some news from Lyle VK2ALU, in 'The Propagator' for August and September 1985.

Lyle reported having discussions with G3WDG, in the UK, and VE7BBG in Canada, while on his holidays, on the subject of EME. Also by phone, with G3LTF and PA0SSB, all of whom have been worked by VK2AMW on either 432 or 1296MHz.

G3WDG has had several EME contacts with OE9XXI, etc, on the 2300MHz band. VE7BBG indicated that it should be possible to obtain echoes from the moon on the 10GHz band with 35W output, into a 10 feet (3m) dish. The receiving system would require to have a 2dB noise figure, with 500Hz passband. The interesting point is that all the above transmitter and receiver requirements have been individually achieved by amateurs, but not used for EME operation. It would be interesting to have to keep the moon within the 0.6 degree beam-width of the antenna, Lyle said.

A critical look at results obtained by VK2AMW, indicated that it may be possible to improve reception of signals by readjustment of the feed-horn of the dish. This work will keep the EME station off the air until further notice.

In the September issue of 'The Propagator', Lyle VK2ALU, reported the EME site building had been broken into again, just two weeks previously. The intruders were well equipped with cutting equipment, as they were able to destroy a heavy steel shroud plate, fitted over the padlock on the door, after the previous break-in. The hardened steel lock had been cut with large bolt-cutters. Fortunately, most of the equipment had been removed for checking, while the dish feed-horn was taken down for re-building, so nothing was stolen.

One wonders at the mentality of people who set about such destruction. I recall, years ago, the damage that was done, at the former site of the dish, by vandals and thieves, and the need, then, to shift the dish for greater security. Seems as though nothing is safe today!

OTHER NEWS

There is very little. Six metres has been almost dead. Channel 0 from Brisbane is often heard, particularly during mid-morning, and I did hear a VK4 working a VK2 around 0225 recently, but they faded out before I could make a call when they looked like finishing their contact.

Congratulations to David VK3AUU, who worked VK4AUR and VK4GC, on the 17th August, around 2130, via meteor scatter. Signals were understood to be quite strong and did not last long. That would be a normal comment, as MS on two metres doesn't usually last long, there is no time for niceties!

While the pros and cons of having Morse code examinations continues from time to time, it may be well to ponder the feats of those best at the game, as they appear under amateur radio in the Guiness Book of Records, per favour of 'Tiara News' and 'Break-In' August 1985: *"The world record for copying Morse code is held by Ted R McElroy. He is credited with copying 17 characters a second. Yes, that's right — per second. That works out to 75.2WPM. McElroy set that record on 2nd July 1939, so if has stood for 46 years! The sending record, using a straight key, is held by Harry A Turner W9YZE. He sent at 35WPM, back on 9th November 1942. Last, but by no means least, Richard C Spencerley KV4AAA, holds the record for the most QSOs in a single year — 48 100. That works out to an average of 132 QSOs per day."*

At 132 QSOs per day of, say, 12 hours per day, every day for a year, that is 11 per hour or just over five minutes per QSO, right throughout the year. Phew!

Also from 'Break-In', ZL1HV *"Revealed at the Paris Air Show by British Aerospace, were plans for a Mach 9 aircraft, which will be able to carry 69 passengers from London to Sydney in 45 minutes. So early next century, it will be possible to have a QSO before breakfast in London and deliver the QSL card to VK2 the day before it was made! But I doubt if even that would be good enough for some DX hounds."*

Closing with the thought for the month: *'By ever taking out and never putting in, one soon reaches the bottom.'* **And don't forget to enter a log for the Ross Hull Memorial Contest starting next month.** Full rules and details appeared on page 44, in last month's AR. 73. The Voice in the Hills.

AR

CONTESTS

Ian Hunt VK5QX
FEDERAL CONTEST MANAGER

P.O. Box 1234, GPO, Adelaide, SA 5001.

CONTEST CALENDAR

NOVEMBER

9 . . Australian Ladies' Amateur Radio Association Contest (Rules this issue)
9-10 . . European DX Contest — RTTY Section (Rules — July AR)
23-24 . . CQ WW DX CW Contest

DECEMBER

7-9 . . ARRL 160 metre Contest
14-15 . . ARRL 10 metre Contest
14 . . Ross Hull VHF Memorial VHF Contest Begins (Rules October AR)

JANUARY

6 . . Ross Hull Memorial VHF Contest Concludes
11 . . 40 metre World SSB Championship Contest
12 . . 75 metre World SSB Championship Contest
18-19 . . 160 metre World SSB Championship Contest
25 . . 15 metre World SSB Championship Contest
26 . . 20 metre World SSB Championship Contest

Note that the World Championship Contests are sponsored by '73' magazine, not 'CQ' magazine as stated in October AR. The rules for these five contests will appear in December's issue of AR, as previously indicated.

As I write the notes for this month, the very large quantity of logs from the Remembrance Day Contest are flooding in. Opening and sorting of same has been *proceeding and*, naturally, I have been quite interested in scanning through the comments, which were forwarded with the logs.

I would make two observations which come to mind — it is surprising just how many people cannot spell the word 'REMEMBRANCE' and it is also surprising, just how many operators fail to endorse the envelope, containing their log, with the name of the contest, despite the fact that a requirement for it appears in the rules.

Perhaps we can improve on this item in future. It may seem just a little thing, however, when there are many envelopes to be opened, it allows me to differentiate between contest logs and other correspondence, some of which may require instant attention.

It has been most pleasing to note that the vast majority of logs for this years contest have been of a much improved standard, as have the 'Dupe Sheets', when provided. Congratulations chaps and ladies, let's keep up the standard, in this regard.

Generally speaking, the Remembrance Day Contest seemed to run fairly smoothly. I have already received many requests from all over the country for the time for repeat contacts on VHF to be reduced even further and, judging by my observations, this may well be warranted. Unfortunately, I was only able to spare time to operate mainly on the Saturday and my own personal score is lower than usual, although, even under these circumstances, the going seemed somewhat slow. I will have more comment to make when the results of the contest are ready for publication.

VK NOVICE CONTEST — Activity in this contest seemed only fair and as usual, the going was very slow. I certainly hope to see quite a big improvement in support of this contest in 1986, although those who were participating seemed to be really enjoying themselves.

Rules for the 1985 ALARA Contest were only provided to me in time for this issue, however, I do hope that you will support our lovely ladies in this event. I thank Joy VK2EBX, for providing me with the details and I wish ALARA well in all their activities.

Pressure of a number of activities means that the notes for this issue will be much shorter than usual. There are still many things to be discussed and points to be brought forward. I already have received some comments on the subjects of the Contest Championship Trophy and the need to reduce the number of contests. On this latter point, I would offer my opinion, that while our VK Contest Calendar may not appear to be excessive, one must be prepared to accept the fact that contesters do not form the majority of operators, and spectrum space must be available for all to operate with as much freedom of action as possible. No doubt, much more is yet to be said on these and other related subjects.

Please keep your ideas and opinions rolling in. Whilst I may not reply personally to every letter, you may rest assured that I value your contributions and they allow me to formulate suggestions and recommendations, based on a reasonably widespread body of opinion.

Any contest station needs to have equipment, which is well set-up and is top line as far as performance is concerned. Not the least of the necessary items is a good rotator for the directional antennas employed. I have recently taken steps to replace *my* rotator, which was a 'Ham M', which I have had in use for about 26 years. My research into the subject of rotators led me to select one of the new Multi-Torque units, which uses up to four separate motors. I must admit that I was more than pleasantly surprised by the very fine design, construction and engineering, which has gone into this unit. The approach has obviously been well thought out, even to such refinements as the neatly machined drain channels beneath the underside of the unit.

My next issue of notes will be the last for 1985. The time does certainly fly past and we must continue to make the most of what opportunities are offered to us as we expand our experience.

I trust that for the rest of this year, all your activities will be successful, and you are able to enjoy your hobby to the utmost.

So, until next month, I pass along my best wishes to you.

ALARA CONTEST

ELIGIBILITY — All licenced operators throughout the world are invited to participate. It is also open to SWLs.

OBJECT — The object of the contest is **participation!** YL works everyone, OM works YLs only. One contest (combined phone and CW) run over 24 hours.

PERIOD — 0001UTC Saturday, 9th November 1985 to 2359UTC Saturday, 9th November 1985.

SUGGESTED FREQUENCIES — bands to be used are: 3.5, 7, 14 21 and 28MHz only. The following are suggested frequencies for easier location of contacts.

PHONE	CW
28.480-28.520	28.100-28.200
21.180-21.200	21.100-21.200
21.350-21.370	14.050-14.060
14.180-14.200	7.010- 7.020
14.280-14.300	3.525- 3.535
7.100- 7.120	
3.570- 3.590	

OPERATION — Phone and CW operation. Each station may be counted twice on each band for credit: once on phone and once on CW. All contacts must be made in accordance with operator and station licence regulations. No net or list operation, no cross-mode.

PROCEDURE — Phone: Call "CQ ALARA CONTEST". CW: Call "CQ TEST ALARA"

EXCHANGES — ALARA member: RS or RST, serial number, starting at 001, ALARA member, name. YL non-member or OM: RS or RST, serial number starting at 001, name.

SCORING — Phone: Five points for each ALARA member contacted. Four points for a YL non-member contacted. Three points for OM contacted.

CW: Double all points for CW contacts.

SWL: Five points for ALARA members logged. Four points for YL non-members logged.

LOGS — Single log entry (but Australian YL Novices entering for the Mrs Florence McKenzie CW Trophy should indicate their CW score separately, also). Logs must show date/time UTC, band, mode, call sign worked, report and serial number sent, report and serial number received, name of operator of station worked, and points claimed.

LOGS MUST BE SIGNED — Logs to also show full name, call sign and address of operator, and show final score (points claimed). Logs must be legible. No carbon copies. No logs will be returned. Decision of the COntest Manager will be final. Logs must be received by the ALARA Contest Manager on or before 31st December 1985.

CONTEST MANAGER — ALARA, VK2KFQ, 31 Cadell Street, Wentworth, NSW. 2648.

A TROPHY — Will be awarded for the highest aggregate score over five years (commencing 1983) of a licenced YL operator (not necessarily Australian.

MRS FLORENCE MCKENZIE G W TROPHY — This will be awarded to the Australian YL Novice operator with the highest CW score (not necessarily an ALARA member). Minimum score 50 points. The actual trophy, because of the size and weight, will not be forwarded to the winner, but a certificate bearing a photo depicting the trophy, will be sent to the winner each year.

CERTIFICATES — Will be awarded for the following:

Top overall score
Top score Australian YL Novice (Mrs Florence McKenzie Certificate)
Top ALARA member score in each country and VK call area
Top YL non-member score in each Continent
Top OM score in each Continent
Top SWL score in each Continent
Top VK Novice score
Top Overseas YL Novice score — CW

Mrs Florence Violet McKenzie, 1892-1982, was the first lady in Australia to take out a transmitting licence, in 1921. She passed the AOCP in 1925, and obtained the call sign 2GA, later VK2FV. Mrs Mac taught Morse code to thousands of people, particularly service personnel, during the 1939-45 war years. In 1984, the Townsville Amateur Radio Club kindly donated a trophy in her memory.

VK VERSUS THE WORLD CW QRP CONTEST

DATES: Saturday, 16th November and Sunday, 17th November 1985.

DURATION: A total of 48 hours from 0000UTC 16th to 2400UTC 17th November.

MODE: CW only.

CALL: CQ QRP.

BANDS: 160 to 10 metres, no WARC operation.

SECTIONS: QRP. Single operator. QRP. Multi-operator. QRO. Single operator. All multi-band or single band.

PERIOD: Full period — 48 hours or half period — any 24 consecutive hours within the 48 hours period.

EXCHANGE: All stations use six digits comprising RST and serial number, starting with 001 up to 999, then starting again with 001.

SCORING: QRP stations indicated power output must not exceed FIVE WATTS. QRO stations power exceeding five watts. Each contact shall score points based on the following.

Up to one watt — six points, between one and two watts — five points, between two and three watts — four points, between three and four watts — three points, between four and five watts — two points, over five watts — one point. QRO stations over five watts **QRO/QRP only allowed.**

SAMPLE LOG:	Date/Time UTC	Band MHz	Mode	Callsign	RS(T) & serial No sent	RS(T) & serial No rec'd	Name	Points
	9/11 0135	28	SSB	VK3DML	59001	58028	Margaret	5
	0141	21	CW	VK2SU	599002	599045	Freda	10

MULTIPLIERS: Every contact in a different ITU zone counts as a multiplier, on each band.

BONUS SCORE: Field stations using battery/solar/wind/hand generated power, excluding motor generators, multiply the grand total score by 1.5. Field stations to be erected on the same day a the contest.

CONDITIONS: One contact in each band in each 24 hour period. A separate log sheet must be used for each band. Each logged QSO to show: DATE, TIME (UTC), STATION WORKED, RST EXCHANGE, MULTIPLIER, POWER OUTPUT, POINTS CLAIMED and GRAND TOTAL SCORE. The grand total score is derived from the total points from all bands by the total multipliers from all bands by the bonus score.

ENTRIES: All entries must have a summary sheet showing, the calculation of the grand total *score* plus, name address, call sign and signature, with a declaration stating ... *"I certify that all entries in my contest log sheets are true and honest."* Entrants are requested to include a brief description of their station's equipment and any comments/suggestions.

CERTIFICATES: To the QRP single operator and multi-operator, in each country, with the highest score, in each section. To the QRO operator with the highest score in each section. To the highest scoring CW OPERATORS QRP CLUB member in each section.

CLOSING DATE: Entries to be addressed to: *The Contest Manager, J Elliott, 8 Queens Street, Rosedale, Vic. 3847* no later than 14th December 1985.

Contributed by Rai Taylor VK7VV.

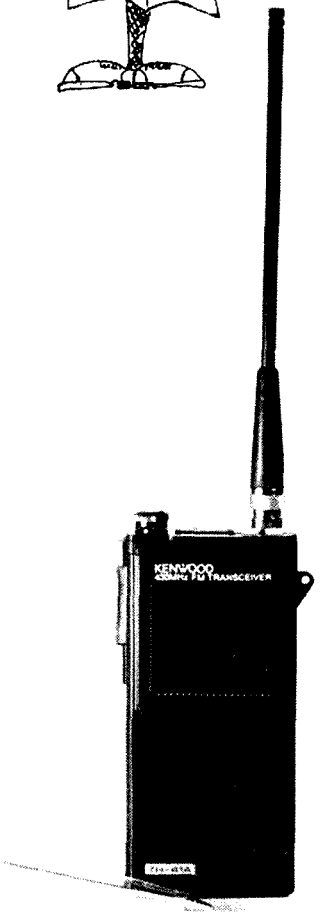
EQUIPMENT REVIEW

Are black boxes getting smaller, or am I putting on weight?

Written and reviewed by David Furst VK3YDF



Kenwood have released a new hand-held, two metre transceiver, the TH21A. Of itself, the release of the unit probably warrants little attention, however, the TH21A marks a new direction in our hobby.

The era of hand-helds began in this country with beasts such as the Ken transceiver. Hand-held it was, but only if one had a very large hand. From these inauspicious beginnings began the revolution (well, bloodless 'coup d'etat'). New designs followed, making the rigs smaller, adding frequency synthesisers and then built-in computer power. I personally didn't like this. A unit (in my humble opinion) should be simple beast, a joy to use and not overly complicated. The advent of something I could carry around and talk into was nice. Loading it with enough computer power to calculate pi to a zillion decimal places just meant that I had to study away my leisure hours, working out how to drive the thing! To add insult to injury, by the time I had halfway mastered the evil device it had been superseded a couple of times.

The IC2A was a good sturdy unit, simple enough to drive without a diploma, light enough to carry around and it performed very adequately indeed. Here was a rig I could walk hand-in-hand with, into the sunset.

The IC2A (and its clones) were a boon. They suffered only one fatal flaw. Have you ever tried to carry one in *your* pocket? It was probably very practical. If you happen to have pockets that large, okay — but don't go to the Supermarket, because they will probably think you are a shoplifter and spirit your freedom away before you can say "Hand-held".

The TH21A solved this (and coincidently I can now frequent supermarkets unmolested). Kenwood realise you don't hold a hand-held rig all the time. Sometimes it would be nice to just tuck it into a pocket and attend to other matters — or just daydream. Yes, a truly pocket-sized rig.

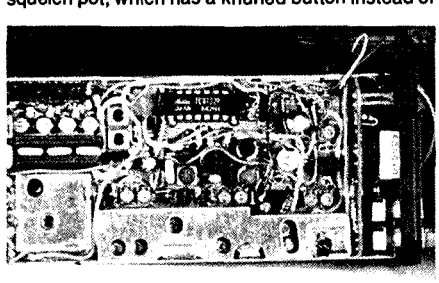
The specifications state that (including projections) the rig *is* 65.5mm (2.5inches) wide, 127.5mm (5inches) high and 32mm (1.25inches) deep. It is about the same size as a packet of cigarettes.

How does it perform? Really well, no less. Compared to the IC2A it comes in well. This is most appropriate as this rig has similar controls and facilities as the 2A, the only difference being that the TH21A doesn't have a separate on/off switch — it is incorporated into the volume control.

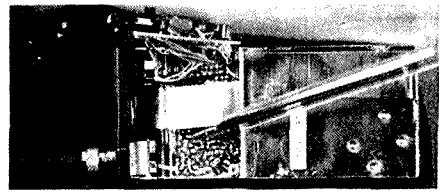
Both cover 144 to 148MHz in 5kHz increments. Both receivers are double conversion superhets with adequate sensitivity, though the TH21A is better with 28dB quieting for an input of .5 microvolts, as opposed to the IC2A with its 20dB quieting for the same input.

The Kenwood pushes out one watt on high power and uses 600mA. The IC2A has 1.5 watts for an input of 550mA. This is where the only significant difference in performance shows. The IC2A will transmit for a reasonable time before the batteries die, the TH21A has smaller batteries which don't last as long. This is a good reason to buy a spare battery pack, as you will always have fresh power at hand.

Living with one of these units is a pleasure. It is not only small, it qualifies for a 'Tiny Award'. It is light in the pocket and very comfortable in the hand. The transmit button is sensibly placed and doesn't tire the button finger. Controls are well placed, and are most usable. I particularly like the squelch pot, which has a knurled button instead of a knob and the squelch is a good reliable 'set and forget' type. The battery pack slides onto the back of the rig and the spare pack is slim in the pocket.



Internal View.



Internal View compared to a "throw-away" Biro Pen.

A slightly radical departure from normality is the antenna connector. This resembles a RCA connector with a thread on the outside so you may screw something onto it securely. The antenna mounting is good and tight, but if you use their BNC connector it will twist the inside of the connector five or ten degrees each time you connect or take something off the rig. On my unit, this broke the internal connection going to this connector. This is the only problem I have encountered with the unit — the physical design is excellent.

I was silly enough to repair the above problem myself. Probably boyish curiosity, just wanting to see the insides of the new toy. If you are a microsurgeon by all means open the unit. The rest of us should leave well enough alone (it has the tiniest, tightest packed internals I have ever seen).

The unit arrives with a circuit diagram, which is immensely larger than the unit itself. This must be a new record for a rig to circuit diagram ratio.

The earphone is excellent and naturally, tiny. My unit came with a vinyl case and belt clip. I personally don't like vinyl cases, on principal, and belt clips seem irrelevant for a rig which fits so neatly into a pocket. I have a bet on with the AR advertiser who sold it to me. If I find no use for the belt clip in twelve months, he is giving me one of my dollars back! You may find a use for this clip — but for me, I intend to get that dollar!

The TH21A does cost more than an IC2A, but then it really is a portable rig. I am extremely pleased with mine. If you get one, I'm sure you will be tool

The TH21A also has a 70cm brother, the TH41, which is physically identical and is photographed on this page. The unit for photographing was supplied by the courtesy of Am-Comm Electronics.
AR

HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

With most of the major overseas contests tucked away for another year by the end of this month, Spring over, and Summer in the offing, now is the time to check the antennas and associated coaxial or open wire feed lines, before one starts their Christmas shopping list. Perish the thought, another year has slipped by without significantly adding to the DXCC list.

Whatever power one runs, efficiency in the antenna system will give you an edge on hearing that elusive country that you have been seeking and one must hear the station before they can call it.

I have found it important to check all connections on the beam, tighten bolts, check waterproofing, and renew if thought to be doubtful, examine the tape that the birds have cheerfully played with, also the coaxial cable if they have fancied that as a delicacy too. Check rotator couplings and wiring, also all earths, not forgetting the SWR on all bands across the frequency range, jotting them down in the back of the log book for future reference.

You are now prepared for another season of good listening and whilst in the mood, check all the connections in the shack, vacuum around the inside of the equipment, with a plastic nozzle attached to the XYL's vacuum cleaner and of course don't forget to have the equipment turned off. Then it is the time to put the feet up and tune across the bands, knowing that your equipment is 'top notch'.

USSR

Many USSR stations, using the prefix of EN0 and 9, have been active. No reason can be offered for the use of the unusual prefix. Work them and wait, they will QSL, with the SWL cards coming in as well.

QSO NUMBER 500

Nothing unusual about the heading, which is a little misleading but herein lies quite an interesting story.

Mike VK4BFO, on the 18th August this year, made his 500th QSO with John G4KJF, located at Diss on the Norfolk/Suffolk border of England. Mike's QTH is in Mt Isa. Their first QSO was Christmas Day 1980, on 10 metres. When this band closed, 15 was used, generally on the short path around 0800 UTC. These gentlemen have always had two overs each, even though the signals may be 4x1 each way. Amazingly they have only had two QSOs on 20 metres, due to Mike's location in proximity to a hill.

So far this year, the duo have had 35 QSOs at the time of writing these notes and Mike has been absent from the QTH for three months. The equipment on the VK end consists of a FT107M/DMS driving a FL2100Z into a TH6.

A fine effort gentlemen and this proves that the signals are there, if one cares to perservere. More listening and calling girls and boys, will produce more QSOs!

GUAM

Ed KB6OAW/KH2, a subscriber to this column, has kindly written an insight to the island where he lives during his tour of duty.

Guam is a small island, 48 kilometres long by 19 kilometres wide, maintaining a population of 175 000, with 20 percent living on the mainland. Of this population there are approximately 20 000 people that are transient service personnel.

Guam is known as the "hub" of the Pacific, as it is a major link for NASA satellite communications, being less than 10 000 km from Los Angeles, 5 800 km from Honolulu, 5 600 km to Singapore, 4 800km to Manilla and a mere 2 500km from Tokyo.

This island has two types of seasons, wet and dry, *no in between*. The wet season is from July to December when the surrounds are lush and green. The temperature ranges from 30 degrees to 24 degrees Celsius with an annual rainfall of 2 160mm. Quite a lot of rain!

The highest point of the island is Mount Lamlam, with a height of 400 metres. The lowest point is to the north where there is a plateau located, dotted with several undisturbed jungles and is the habitat for about 75 percent of the population and where the Andersen Air Force Base is located. The population density is about 685 people per 25 square kilometres.

Located at the southern end of the island is Apra Harbour where the main Naval Station may be found. Nearby there is a small island known as Cocos Island, which is about 7 square kilometres in area and is quite a tourist attraction because of its sandy beaches, hotel and a zoo, which is home to many tropical birds and other wildlife.

The proud population of this island in the Pacific are made up of a mixture of Chinese, Japanese, Koreans, Filipinos, Micronesians and some of Spanish descent without including the itinerant workers for the services from the United States. The Guamanian men are known as Chammorros and the ladies as Chamorritas.

Guam has quite a history. After many years of rule by the Spanish, it became a Territory after the Spanish American War and the Treaty of Paris in the year 1898. Over half a century later in 1950, the Chomoro people were given their citizenship by Congress. In 1971, Guam elected its first Governor, after many years of one having been appointed by Congress. The following year they elected their first delegate to the United States Congress.

I feel that Ed should be the Public Relations Officer for the island, as he states that the island is a DXers dream, with about half of the 100 amateurs being active with very little QRM. Also duty free shopping exists, with some of the prices being about 50 percent of the same item in the United States.

With good weather and lots of water sports, to me it sounds marvellous and a lot better than 'punching' the keys on this word processor, to write my notes.

Thankyou Ed, for giving us an insight into the land, its people and attractions from where you operate.

SAO TOME

Apparently the Carolina DX Association Bulletin recently reported that INDEXA has been assisting two Brazilian amateurs with plans for a DXpedition to Sao Tome. The planned operation of 10 to 14 days duration, possibly this month, apparently has the sanction of the President, Dr Manuel Pinto de Costa.

It appears the main purpose of the proposed operation, anticipated to take place later this month, is to take the 'heat' off Luiz and allow a more orderly segregation of the DXers clamouring for this country.

Let us as DXers, firstly hope that it comes to fruition, secondly that propagation will allow all VKs to hear, before calling, this much wanted country and thirdly, let all behave and show the true spirit of the hobby with impeccable operating habits. Many, from VK and other countries may have to practice, before-hand, by using their dummy load, if they possess one!

Incidentally, the cards of Luiz S92LB, are being accepted by the ARRL DXCC Desk.

LATE NEWS

Unfortunately, an International Telegram from Dieter DK9KD, arrived too late for inclusion in the last issue. Deiter, advises of a concentrated onslaught of removing this much wanted country further down the DXCC ladders "wanted list".

It is hoped that all VKs that wanted it for a new country, made the grade. QSL to DK9KD, unless advised to the contrary, by the operator. Good luck, one and all.

PREFIX HUNTERS BONANZA

A group of amateurs, under the banner of the Uruguay DX Group, have decided to reactivate the CV prefix, which has been sitting unused on the "shelf" for more than a decade.

Eleven operators intend to actuate "Isla de Flores", a small island with an area of six square kilometres located just over 10km from the coast. The island has quite a history, having been discovered by Juan de Solis in 1516, during his search for a route from the Atlantic to Pacific Ocean.

The first "Lighthouse" was the stern lantern of the unfortunate Spanish frigate "Loreto", which was wrecked on the island in mid-1792. The lantern was placed at the highest point on the island, remaining there until the present lighthouse was built in 1798.

The operators are being transported to the island by the Uruguayan Coast Guard and hope to be operational by 2100UTC on the 6th of December, for three days.

Further information, regarding bands, modes and a handsome award, that is available, may be obtained from the QSL Manager, *Ricardo CX2CS, PO Box 2063, Montevideo, Uruguay.* A SAE and 2 IRCs should suffice.

TIME CHANGE

I had the pleasure of catching up with Dave ZL1AMN and his XYL, Aola ZL1ALE, who by the time you read this, will have returned from a jaunt to South East Asia.

Dave as a NZART Councillor has taken on the onerous task of co-ordinating, and being the custodian of, the special prefix of ZM6ARU, which will be aired on different dates to those previously published. Operation of ZM6ARU, a special call to commemorate the IARU Conference, will commence at 0001UTC on 1st November, and end at 2359UTC on the 18th November, at 2359UTC.

To further create chaos in the household, Aola has taken over the chores of being the QSL Manager, and all cards are preferred to be received via the Bureau. Aola's mail QTH is *PO Box 397, Papakura, New Zealand*, for those that prefer this method.

AFRICA JAUNT

The "Globetrotting Colvins" are on the move again under the YASME banner. Their hopes are to operate from, whilst visiting, the prefixes of ZS3, A2, 7P, 3D6, S8, ZE, 7Q, 9J and possibly CR8, before returning home to the United States in April, next year.

Iris and Lloyd are dedicated first class DXers, whom many have tried to emulate, but without success. I personally feel it is time that the YASME Foundation seriously considered instigating the *"Colvin Award"*, maybe for stations that have worked them in 25 different locations on one mode, as a commencing point.

The QSL information for YASME is *PO Box 2025, Castro Valley, CA94546, USA.*

For those that might agree with my sentiments, re an award, please drop a line to the Secretary of YASME, Bob Vallio W6RGG, expressing your views! I

RECIPROCAL AGREEMENT

A reciprocal agreement has been signed between the USA and Japan allowing amateurs, whilst visiting, to operate without further testing. The call sign allocation in JA, is from the block 8N1AAA-8N1XZZ. It seems the FCC will use their present arrangement for visitors.

Apparently, the USA are the first to implement reciprocal rights, of a number of countries, contemplating an agreement.

MOUNT ATHOS

Unfortunately, the Mount Athos discussion is still being continued and the mail to overseas Newsletters and the ARRL, shows that quite a lot of the exponents of DXing are concerned with the "fiasco" that has been caused by a few unscrupulous operators.

Bob Read who was signing SV0BV/A, and has a number of other calls attributed to his name, has

now been heard signing JY9BV. It is a wonder that this very "slick" operator didn't succeed in getting a lower prefix numeral allocated.

The QSL arrangements are with Alec G5VS, who is going to QSL the Mount Athos cards, even though they are valueless. Bob is still maintaining to the Jordanians, that he will get a letter from the monks. In my opinion he will get a letter, but it will never be forwarded to the ARRL.

SABLE ISLAND

This country will be activated in late October or November by a group, for one week. It is intended that LF propagation will be the order of the day, but equipment for all bands from 160 through to 6 metres and OSCAR will be operational.

OSL to VE1ASJ, who incidentally is associated with the Bedford Institute of Oceanography which is located in Dartmouth, Nova Scotia.

NEW COUNTRY? ? ?

The Headquarters of the Council of Europe, located in Strasbourg, have been allocated the call TP2I. By all reports, the Manager for SSB operations is F6FQK and the Assistant Director is F6EYS, who will handle all the QSLing duties.

They have applied for DXCC accreditation, but with previous remarks made in this column, their success could be doubtful. The adage of work them first and worry later starts when they fire up in December. Good luck.

QSL CARDS OF VALUE

Do not discard QSL cards, they are of value. My XYL Bett, browsing through the local library, whilst researching some other material, came across a book entitled "Collecting Australian Postcards" by Nick Vukovic. This excellently illustrated book of nostalgia, has a reproduction of a card from VK3KE to VK5JS for a 14MHz contact on the 17/11/1948 and is valued at $2.

It is imagined for those interested, it would be obtainable at most libraries and in Victoria it is coded 769.509.94 VUK.

NOT ACCEPTED

The Pribiloff Islands will not become a new DXCC Country. This has been decreed by the ARRL, against the recommendations of the Advisory Committee. It is felt that the criteria, when correctly interpreted, will make it exceedingly difficult for new countries to appear on the list in the foreseeable future.

GREECE

The special prefix SW3 will be used by some SV operators through to the end of the year to celebrate the founding of Thessilonika, 2 300 years ago.

BITS AND PIECES

Since 1972, Erik SM0AGD, a quiet gentleman with excellent operating techniques, has operated from CE0, SM0AGD/3B8, HK0, 3C1, TA2, A2, 7P8, S2, CR3, 9N1, XW8, CR9, J5, 9X5, 3D6, A22, ZK1, 3D2, C21, T30, T2, FW0, KH8, ZM7, T31, KH1, T32, 5W1, and 3B8. A true DXer! * * YA1KBL and YA1KBZ. Very doubtful, I am afraid. * * Nice to hear more BY stations populating the bands, also an increase of activity from Indonesia. * * HC8 was well represented before, during and after the CQ WW DX Contest. * * More stations from TA appearing weekly. * * 5B stations using 5B25, to celebrate 25 years of independence. * * No official amateur operations allowed from D2, therefore no recognition from the ARRL and other societies for accreditation. * * Don't become optimistic about 7O becoming operational, if you hear one, work and wait! * * ZL9AA was active from Auckland Island. * * It is anticipated that Willis Island, VK9Z will be active after Kim VK9ZB, finishes his tour of duty in December. * * Another special Canadian prefix graced the ether. It was CG9, to commemorate the Canadian Summer Games at Saint John, New Brunswick. QSL to VE1 and the suffix used. eg:CG9AU to VE1AU. * * 8Q7ITU will be operational until the end of December. * * Martii OH2BH, still awaits some confirmation from the Albanian authorities. Patience is a virtue, Martiil * * 8A0PPI was located at a Fair in Indonesia. * * Gerben PA0GAM, has taken over the QSL duties for 9Q5MA. * * VE8RCS is located at Alert, 450 nautical miles from the North Pole. * * YJ8IND/1 was Ron YJ8RG, with a special call used to celebrate independence. * * Cyprus stations have been using 5B25 prefixes to celebrate 25 years of independence. * * Alain 5R8AL, has returned from his holidays in France and is beginning another one year stint. * * Jim N6TJ, hopes to operate from D44BC's QTH on Cape Verde, to coincide with the CQ World Wide DX Contest. * * TZ6FE is operational, early birds watch 14.227 MHz around 2000-2200 UTC and good luck. * * The suffix PNG added to the P29 prefix was to celebrate 10 years of independence. * * I am pleased to relate that I have the logs of VK0YL, courtesy of Gwen VK3DYL. All cards received have been processed and mailed. * * 9U5JB active again after leave. QSL to ON5NT. * * Nice to know that XU1SS is active again. * * ZA2EW? ? reported to be worked from Europe. QRV at a special exhibition and could only be operational for a few hours! ! ! * * May be some operation from Tokelaus before the end of the year! * * During the CQ WW DX Contest and a few days after, Pedro CE3BFZ and Jorge EA4LH/CE3 were hopeful of being active as XQ0ZFZ and EA4LH/XQ0. The location: Robinson Crusoe Island in the Juan Fernandez Island group. * * TA2TAT, is one station that you do not waste your IRCs on! * * Joe W3HNK, is NOT a QSL Manger for any Soviet station. On occasions he can assist if other avenues have failed.

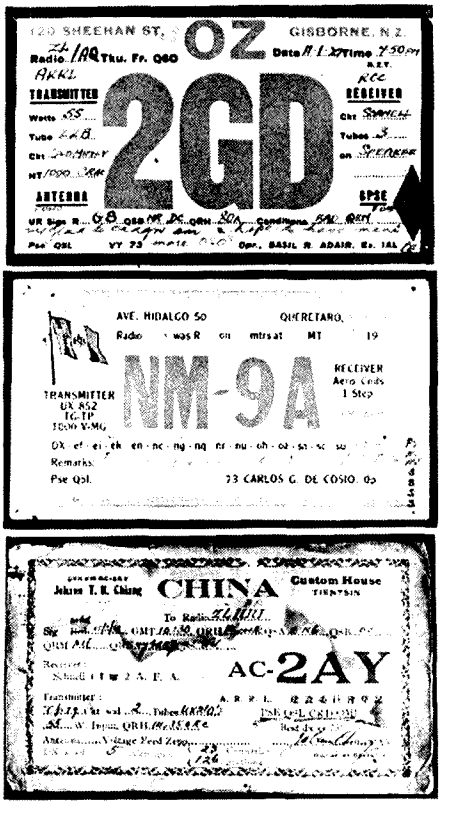
UTC

Although it is not mandatory to keep a log under the new licensing laws, except under certain conditions, for a DXer this would be foolish in my book. It is important for checking QSL and SWL cards, as well as maintaining information on conditions. But please, for the benefit of all, use correct UTC time and date on your QSL, it is easier for all.

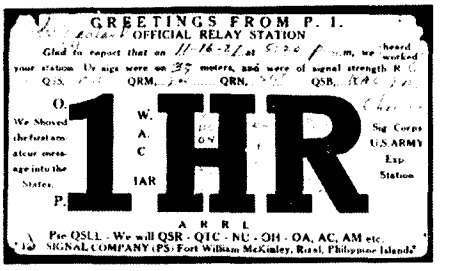
LOGS AVAILABLE

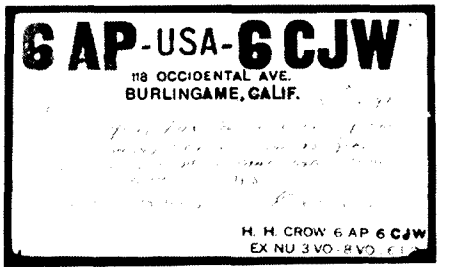
The logs for 4W1ED, A6EF, MP4TEE, P29LS and P29MF are available from G4CHR No cards are available for 4W1ED or A6EE I feel that a signed letter from the Manager, stating that it appeared in the log would be adequate for DXCC purposes.

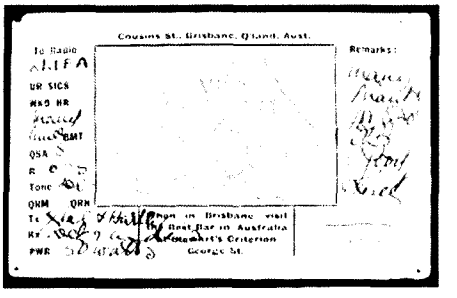
NOSTALGIA QSL CARDS



These QSL cards from yesteryear are reproduced, courtesy of Peter Wolfenden VK3KAU.







Peter has a large collection of old QSL cards, and it is anticipated, as space permits, to present some more. Many thanks, Peter.

WORKED ON THE EAST COAST

15 METRES: HL0I*.

20 METRES: 3D2DW, 4X4FR, 5B4MF, 5B25MF, 5Z4JM, 8J3UNV, 8J3UNV*, 9V1VS*, A35SA, AP2ZA, BY1SK, BY1SK*, BY4AA, BY5RA*, DU9RG, FK8XB, FT8XB, G4STZ, HL9AA, JY3ZH, JY5HH, KL7KN*, KL7NT, KX6AZ, OE6HGB/YK, OK2BXW*, OH0JN, OH1TW*, OH9RJ, PA0ALO, RF0FWW, SL5BO, SM5BCO, SV1DO/SV9, UD6DZ, UL8ULA, UO5GO, UP2BR, UO1GXZ, UY5PC, V85BA, P29PNG, VI0AH, VK0DJ, VK0YL, VK9ZB, VR6JR, VS6BB, VS6JH*, XE1ANU*, Y63TI, YO9BCM, YJ8RG, ZS1AV, ZS2OM and ZS6J.

** denotes CW operation.*

INTERESTING CARDS RECEIVED

Steve VK2PS, reports that he received 16 JA cards for contest QSOs, 17 USSR cards for QSOs including RJ8WCY (1983) and 42 USSR SWL cards, mostly of the picture variety with good quality printing. Others received of interest included A4XKH, F5OF, HK1ANP, HL2SF, ON4KU, ON5IU, ON7BM, ON7JK, YO2CMI, YO2BEH, YO8OK and 5 USA cards for the VI prefix. Steve notes that he OSLs, all cards received.

Joy VK2EBX, the 'radio poetess from the north' has received a batch of cards, those of interest being from the late CE0AE via WA3HUP, CE0FQU, CE0ZIJ, FW8AF, VK0YL and VK2BCH/LH.

THANKS

Sincere thanks are extended to the following: *The Editors of weekly, bi- weekly and monthly newsletters including the ARRL NEWSLETTER, CO-QSO, DX FAMILY FOUNDATION NEWSLETTER, JAN and JAY O'BRIEN'S QSL MANAGER LIST, KH6BZF REPORTS, LONG ISLAND DX BULLETIN, NEWSLETTER of the NATIONAL INSTITUTE OF HYDERABAD, OLD MAN, QRZ DX, RSGB DX NEWS and THE WESTLAKES AMATEUR RADIO CLUB NEWSLETTER. Magazines including, BREAK IN, cqDX, JA CQ, JARL NEWS, KARL NEWS, OST, RADCOM and VERON.*

Members who have contributed include VKs 1KEN, 2HD, PS, EBX, 3FR, YJ, YL, 4BFO and G3NBC. Overseas amateurs include G1EOD, KB6OAW/KH2, WB6GFJ and ZL1AMM. Good DXing and early Christmas shopping.

AMSAT AUSTRALIA

Colin Hurst VK5HI
8 Arndell Road, Salisbury Park, SA 5109

SATELLITE ACTIVITY FOR PERIOD 30 JUNE TO 29 JULY 1985.

1. LAUNCHES.

The following Launching Announcements have been received:-

1985-055A	Intelsat-VA-11	Jun 30	ITSO
1985-056A	Giotto	Jul 2	ESA
1985-057A	Cosmos 1665	Jul 3	USSR
1985-058A	Cosmos 1666	Jul 8	USSR
1985-059A	Cosmos 1667	Jul 10	USSR
1985-060A	Cosmos 1668	Jul 15	USSR
1985-061A	Molniya 3-25	Jul 17	USSR
1985-062A	Cosmos 1669	Jul 19	USSR
1985-063A	STS 51F	Jul 29	USA
1985-063B	Plasma Diog. Package	Jul 29	USA

STS 51F with a Plasma Diognostics Package was launched using the Challenger spacecraft from Kennedy Space Centre on July 29.

Orbit elements were period 90.9 min, inclination 49.5°, apogee 321 km, perigee 312 km.

On board were C.G.Fullerton, R.D.Bridges, F.S.Musgrave, A.W.England, K.G.Heinze, L.W.Acton, and J.D.Bartoe.

The spacecraft carried Spacelab-2 and a free flying Plasma Diognostics Package which is deployed and retrieved using the remote manipulator system.

Amateur Radio including SSTV, was operated by Tony England WOORE and John-David Bartoe W4NYZ.

2. RETURNS.

During the period fiftysix objects decayed including the following satellites:-

1985-051A	Progress 24	Jul 15
1985-052A	Cosmos 1663	Jul 5
1985-054A	Cosmos 1664	Jul 5
1985-057A	Cosmos 1665	Jul 17
1985-059A	Cosmos 1667	Jul 17
1985-060A	Cosmos 1668	Jul 29

3. GENERAL.

1966-100A ATS 1 . As at July 7, 1985 1637 UTC, ATS 1 was located at 146.130°East. Inclination 11.767°.

Participating stations and listeners are able to obtain basic orbital data including Keplerian elements from the AMSAT Australia net. This information is also included in some WIA Divisional Broadcasts.

ACKNOWLEDGEMENTS

Contributions this month are from Bob VK3ZBB and Graham VK5AGR.

AMSAT-AUSTRALIA NEWSLETTER

Graham VK5AGR, the National Co-ordinator of AMSAT-Australia, is now producing a monthly newsletter containing updated satellite news, orbital predictions, keplerian data and operating hints and techniques. The objectives of the newsletter are to keep the amateur populous informed on the latest information available, and to realise funds for the funding of projects or the purchase of an item/items of hardware for a future amateur satellite project, eg: Phase-3C, Phase 4 or whatever. The cost of the newsletter is $15 and cheques should be made payable to the WIA (SA Division) and forwarded to Graham VK5AGR, QTHR.

To date, the newsletter has been a resounding success within Australia and now comments from overseas amateurs, who have received copies from friends in Australia, indicate that they would also like something similar in their own countries. The newsletter is basically an eight-page compendium of the nitty-gritties that are relevant in the short-term, items that are basically out-of-date when printed in this column, due to the six week lead-time of AR.

To date it has included some small computer programmes specifically for satellite determination, the latest telemetry blocks from OSCAR 10 and OSCARs 9 and 11. If you are at all interested in satellite communication, this newsletter is a must!

HAND-HELD COMPUTER OFFER

Perhaps one of the drawbacks of satellite communication is the ability of knowing where the satellite is and whether it is available to you. In the past, computers conjured up dollar signs in front of our eyes to the tune of some thousands of dollars. However, today the price of hand-held computers is well within the reach of us all. Although these hand- held computers are restricted in memory capacity, thus preventing the more traditional expectations of a computer, they can be of significant use if you have a specific problem to solve. Karl Meinzer DJ4ZC, the father of the Phase 3 programme, whilst in Australia, demonstrated a small hand-held computer (see August AR, page 22), utilising an excellent orbit derivation programme, based around the computer software he produced for the actual spacecraft.

This programme, utilising the Sharp PC-1246 Pocket Computer, is now available through AMSAT-Australia for $70, including packaging and postage, as a special service to the amateur community. Bargain hunters will readily note this price is well below the listed retail price, and it also includes the software.

When forwarding you cheque, made payable to the WIA (SA Division) Inc, please include your

stations latitude and longitude so that these values can be inserted in the programme for you, by AMSAT-AUSTRALIA, and thus saving you the hassle. A complete set of operating instructions comes with the computer, plus a printout of the actual computer programme.

All that is required is to turn the computer on, insert the day and time you wish to operate from and the computer will display the time, beam headings, and mean anomaly. Then with the stroke of a single button, you can increment the display at 30 minute increments. The satellite communicators, who have purchased these units, adamantly declare that it has included a new dimension to their activities. Frank VK2ZI, an ardent satellite communicator, despite his blindness, had his unit adapted to a talking computer, and he unashamedly boasts that to him *"... it is the best thing since sliced bread"*.

In the short term that this unit has been available from AMSAT-Australia, those amateurs who are gifted with software expertise have already included additional operating improvements to suit their respective tastes, within the limits of the memory capacity of the units.

It is interesting to note that amateurs who have full-blown computer systems prefer to use this small hand-held unit because of its more practicable operation.

Just turn it on, insert the data, and that's it!

OSCAR-10 OPERATING SCHEDULE

As mentioned in previous columns, it pays to listen to the Sunday evening session of AMSAT-Australia, to keep track of the operating schedule of OSCAR-10. The latest schedule however, is as follows:

MEAN ANOMALY	MODE
40 to 119	B
120 to 136	L
137 to 220	B
221 to 39	Off

With the passing of the latest spate of extreme eclipses for OSCAR-10, it is anticipated that this schedule may remain in force for some months to come.

AUSTRALIAN COMMAND STATION

Whilst on his recent visit to Australia, Karl DJ4ZC invited Graham VK5AGR, to act as a command station for Phase 3C, due for launch in 1986. Ian Ashley ZL1AOX, is currently the sole command station in the Southern Hemisphere for the Phase 3 programme, and as such, is heavily committed towards OSCAR-10. Command stations are one of those commodities that everyone takes for granted, however, it is perhaps one of the most demanding, and extremely responsible tasks that an amateur can impose upon himself/herself.

The commitment Ian ZL1AOX, has made to OSCAR-10 could really be re-termed sacrifice, in lieu of commitment, because, in recent months, the Northern Hemisphere command stations have seen very little of OSCAR-10 and, as such, the majority of commanding has befallen Ian, and this situation will continue for some time to come.

Consequently, the request for Graham to act as an additional command station in the Southern Hemisphere will eventually ease the burden that Ian is currently handling. It is anticipated that Graham will be attending a Command Seminar in either Marburg, West Germany or Colarado, USA later this year, to come to grips with the task that he is about to undertake, on behalf of the satellite programme. Commensurate with Graham taking up this challenge will be a dearth of technical information that has not been readily available to us in the past.

OSCAR-10 ATTITUDE PROGRAMMES

For those enthusiasts who have the means by which to receive and demodulate the PSK telemetry from OSCAR-10, and are interested in determining the attitude of OSCAR-10, Graham VK5AGR (QTHR), has a number of programmes developed by Jim Miller G3RUH, for that purpose. If at all interested, drop Graham an SASE for details.

QSP

JUMPER LEADS DANGEROUS

The makers of most jumper leads tested recently by the Australain Automobile Association (AAA) were failures when it came to the practical use of ohms law.

Only four of 44 cables subjected to tests were considered acceptable in terms of their electrical capacity needed to start a six cylinder engine.

The AAA recommended that only cables with a 100A or greater capacity should be used to start a car with a flat battery. The testing included passing 100A through the cables for four six-minute periods, with cooling in between, and a mechanical strength test of 25kg.

These tests are in the Australian Standard AS 2697 of 1984 . . . which was drafted as a result of reports of injury and damage caused by inadequate cables. During AAA testing of electrical capacity, the plastic insulation on many of the cables melted because they could not carry 100A. Thick insulation on the cables, in some cases, gave the appearance of them being heavy duty.

The mechanical test revealed bad wire-to-clamp connection which also led to overheating and failure to the cable.

The AAA said none of the 44 cables tested claimed to meet the AS 2697 standard, and one of the four which passed its test was slightly shorter than the standard's recommended minimum 2.7 metres length.

WAVERLEY AMATEUR RADIO CLUB

The Waverley ARC celebrated the 65th Anniversary of the granting of an Experimental Licence by the then Department of the Navy on 18th August 1920, the Waverley Club having been formed in March 1919.

With the granting of Licence Number 249, the club was allowed to transmit and receive Morse code on 200 metres with 250 watts, spark transmission. The annual licence fee was two pounds, later reduced to one pound in 1923.

In June 1921 permission was given to transmit radio telephony on 1,000 to 1,500 metres, as it was considered that radio telephony on 200 metres was impractical. The reception of voice and music, in a public hall in Coogee, NSW, from the club radio station, took place on 22nd September 1922. During 1923, the call of 2BV was issued, instead of using the number of the licence issued to the club, namely N249.

In that same year, broadcasts of concerts at St Lukes Church, Clovelly, NSW, were permitted. The club was allowed to transmit on the 90 metre band in 1925, and in 1926 additional bands were authorised, namely 85 to 95 metres, 32 to 37 metres, 21 to 23 metres and 8 to 10 metres. In 1928, the club was allowed to transmit telephony between 125 and 250 metres with a power of ten watts.

1926 saw the club's call change to A2BV, then in 1930 the present prefix was allocated which resulted in VK2BV with a licence fee of 30 shillings. The club's members were very active when approval was given to conduct television experiments in the 56-60MHz band with the proviso that no commercialisation on the transmissions would be allowed. THIS WAS IN 1935!!!

The club's call sign was re-activated after WWII on 21st August 1946 and has been active ever since. The club also activated the repeater VK2RBV between December 1975 and June 1978.

The Waverley Amateur Radio Club is the oldest radio club in Australia and has had the continuity of licence for 65 years.

COMMONWEALTH CONTEST 1985

John Tutton VK3ZC
11 Cooloongatta Road, Camberwell, Vic 3124

As most participants will remember, conditions on HF in March this year were pretty poor, not much worse than they have been over the last few months, so it was quite a surprise to find that 58 VKs had submitted logs, comparing well with the 66 in 1984 when the bands were in much better shape.

Congratulations again to RUSS COLESTON VK4XA, who led the Australian contingent for the sixth year in succession and the seventh time in the last eight. He was placed eighth overall, and was the only VK in the top ten — there were four last year. It is pleasing to see P29PR well up in the results, but again disappointing that only four ZLs sent in logs. The absence of ZLs generally has a detrimental effect on VK scores as for some hours during the day, ZL is the best DX we can work! Picking the overall winner was a bit harder than usual because of the lower serial numbers encountered, but VE7CC would have been the favourite (as he well might, with TS820/L4B, 80 metre delta loop, 80 metre inverted vee, both at 100 feet (30m), 40 metre, 2 element Yagi (same height), 20 metre, 5 element Yagi at 105 feet (32m), and a 4 element Yagi at 90 feet (27m) on 15)!

In the receiving section, ERIC TREBILCOCK completed a treble, 83-84-85.

AUSTRALIAN AWARDS

The Gold Medallion for the leading VK entrant was won by RUSS COLESTON VK4XA.

The Silver Medallions for the leading State Team were awarded to D PILLEY VK2AYD, KAREL NAD VK2BQQ, E CARRUTHERS VK2AQF and LYELL WOOLNOUGH VK2GW.

The Bronze Medallion for the middle placed VK entrant — S BOURKE VK2EL.

HOW THE LEADERS MADE THEIR SCORES

QSO/BONUSES per band 80-10 (claimed)
VE7CC, 58/36, 91/45, 127/49, 19/18, —
6Y5HN, 57/17, 121/39, 221/39, 12/9, —
5Z4MX, 43/12, 121/35, 143/41, 97/14, 2/2
G4BWP, 67/33, 62/42, 79/52, 12/12, —
P29PR, 35/22, 59/34, 127/41, 33/23, —
VK4XA, 49/25, 81/35, 124/40, 7/7, —
VK2AYD, 48/26, 106/39, 49/32, 4/4, —
VK7BC, 25/19, 63/38, 55/38, 6/6, —

RSGB COMMENTS

It appears that the VE stations still prove a threat to those who challenge for the honours in this contest, and this year sees a return of a Canadian winner in the form of Lee Sawkins VE7CC, who wins the Senior Rose Bowl with an impressive total of 4265 points, narrowly beating last years winner Nigel Hoyow 6Y5HN, who receives the Junior Rose Bowl, with 4062 points. Third place goes to first-time entrant Rolf Salme (SM5MX), who operated from the Swedish Embassy in Nairobi as 5Z4MX. 6Y5HN and 5Z4MX were separated by a mere five points on claimed scores, and thorough checking was called for to establish the correct positions.

Al Slater G3FXB, laid down the 'gauntlet' last year, challenging the G4s and his challenge was well met by F Handscombe G4BWP, who managed to oust G3FXB from top UK spot, the first time Al has been beaten in this contest for 12 years, with a total of 3793 points to Al's 3514. Well done! However, I am sure Al will not let this rest and a good battle should take place next year. Eric Trebilcock BCRS 195, entering his 45th BERU (is that a record?), just beat Brad Bradbury BRS 1066 with 1840 points to 1805, to take the Receive Rose Bowl.

Conditions for the 48th Commonwealth Contest were the worst that many had experienced for a long time, perhaps shown best by the lack of activity on 28MHz, with just four OSOs in total being logged on this band! Even 14MHz, which can usually be relied upon to provide plenty of communication, succumbed to the dismal conditions with no long path openings from the UK to VK/ZL, whilst 21MHz was generally poor. This resulted in lower scores and bonus points for all concerned, although some of the leaders managed to pick up many areas which others missed through well timed operation and good ears.

Unfortunately, the WIA decided that the 10th March would be a good day to celebrate their 75th Anniversary, with a 24 hour CW contest! This caused some confusion with many VK stations being called in the Commonwealth and the WIA contest. A special station, VK75A, operating from VK3, was worked by many, and claimed as VK7. The adjudicator decided to bend to this overwhelming support for VK7 and adjusted logs accordingly. The added complication of ZL call areas did not seem to manifest itself, and unfortunately, the error of omitting ZL2 from the call areas list did not deter entrants from claiming for ZL2. Thank-you.

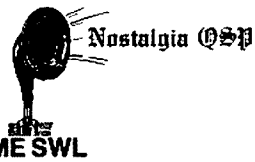
Once again, 14MHz carried most traffic with 45 percent of the total QSOs being made on this band, followed by 32 percent on 7MHz and 22 percent on 3.5MHz. 21MHz had little support except from 9J2BO and Z23JO.

Just under half of the Commonwealth Call Areas, 51, were active and worked. It is interesting to note that 3B8 and 3B9 were worked once only, and from the UK! Of course, this contest relies upon good support from the Commonwealth Call Areas and it would be far more interesting if more areas could be activated. *How about it? Does anyone have any contacts with those rare areas for next years contest?*

Once again almost 300 UK stations appear in the logs, but not in the list of entrants! The HFCC are anxious to improve UK participation, particularly amongst the more newly licenced amateurs. This contest is not like the 'hammer and tongs' of AFS or NFD, it requires a great deal of skill, knowledge of band conditions and patience, so how about it G4s. You never know, you may pick up some useful prefixes too ! Thanks to John Tutton VK3ZC and Eric Trebilcock BCRS 195, for their publicity, down under. See you next March. G4DJX.

BERU 1986 WILL BE HELD NEXT MARCH, 1986. Rules in February Amateur Radio.

AR



OLD TIME SWL

Keith Wood of Surrey Downs, SA, started short wave listening as a young man in 1925, on his parents' farm, about 16km from Ardrossan, on Yorke Peninsula, where his parents took up land in the early 1900s.

Keith lived there for almost 70 years and his listening log books, in immaculate hand-writing, are something to see. His busy life on the farm did not give him time to study for a transmitting licence.

Now retired, in Surrey Downs, for the past 12 years with his wife, Keith has 60 years of SWLing behind him. Quite a good effort for one who was 81 years young on 31st August 1985. Many more good years of listening, Keith.

From The South Australian Wireless Institute Journal, August 1985. Written by Wally Mann VK5DF

SPOTLIGHT ON SWLing

Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

I recently recalled the numerous occasions when I came across low-powered signals on the bottom edge of 40 metres. These were broadcasting in Indo-Chinese languages. What sparked off the reminiscences was the television tribute to fellow Tasmanian Cine-cameraman, Neil Davis, who was tragically killed in fighting in an abortive Thai Coup. These weak signals were usually around 7.006MHz, but it was extremely difficult identifying them as they were under-modulated and there was considerable frequency instability, also. These were the stations of the Viet Cong or National Liberation Front.

I do recall one night in September 1974, hearing a station in Vietnamese on 7.021MHz, around 1300UTC. I obtained complete identification with plenty of martial music. This was after foreign assistance had withdrawn, leaving South Vietnamese to do the bulk of the fighting.

HOME SERVICE LOUDER

As well, the Voice of Vietnam, from Hanoi, was often heard in English at 1000 and 1100UTC, very close to WWV's frequency. It broadcast the names of US POWs and had occasional interviews, in English, which were heavily edited. Today, the Voice of Vietnam can still be heard on 9.840MHz, at 1000 and 1100UTC, in English. However, their Home Service outlet on 10.059MHz, in Vietnamese, is much louder that the Foreign Service outlets. There is also a very strong MW outlet on 680kHz, which I hear daily. This isn't very surprising, as they reputedly utilise a 500kW sender. Listen around 1200UTC and you will have no difficulty copying it. It is the same programme as on 10.059MHz.

There are a number of low-powered provincial stations wandering about 6.600MHz, in mostly minority languages. They are particularly noted for their abrupt frequency hopping. This is presumably because they are using ex-military senders, captured from the Americans, which employed rapid frequency alteration techniques.

PRESENCE HAS DIMINISHED

In the late-60s, early-70s, it was quite common to hear US Military traffic to and from Guam, Clark AFB (near Manilla), and South Vietnam. They were heard around 8.900-9.050MHz almost continuously, and also around 6.700MHz. Today the amount of US Military air traffic is only a fraction of what it was at the peak of the Vietnamese war, as the American presence within the region has diminished. Most of the communication is now, probably, routed via satellites and cable from VHF/UHF channels.

Somehow, I was never able to hear the South Vietnamese radio from Saigon, as they were lost within the crowded allocations, underneath more powerful competitors. Today, Saigon has been renamed Ho Chi Minh City, and I have, surprisingly, observed it on 610kHz, after the Brisbane ABC station, on 612kHz, closes down at 1402UTC.

AUDIBLE IN VK

While there is an absence of any clandestine broadcasting in Vietnamese, the same cannot be said for nearby Kampuchea, especially since it was invaded and the Pol Pot was overthrown. The Chinese have provided the Khymer Rouge with a sender, which is easily audible here, in Australia. The two frequencies to try, at 0930UTC, are 15.135MHz or 1.680MHz. Broadcasts are exclusively in the Khymer language. There were other Khymer clandestine stations of other resistance groups, which were tiny, but these have virtually disappeared since the Vietnamese launched an offensive in Easter of this year and drove them to find sanctuary, in Thailand.

The same Chinese site used for the Khymer Rouge programmes was also utilised by Malayan communist guerrillas in there clandestine broadcasts. The base was located at Kunming and was on the non-standard channel of 15.880MHz, which made it easily heard during the evening hours. Programmes were in English, Chinese, and Bahasa Malay. But, since the Chinese began cultivating relationships with Malaysia and Singapore, the guerrillas have lost their facilities and been forced to commence broadcasting from their bases, located near the Thai-Malaysian border. The Intruder Watch noticed the appearance of a low powered signal around 7.075MHz up until last year. There have been reportedly joint operations by Thai and Malaysian security forces in the border jungles, which have virtually nullified the guerrillas and the senders have not been heard since.

VUNC

Another *unusual* station, I also *recall* observing, was the Voice of the United Nations' Command (VUNC), based in South Korea. This was a hangover from the Korean War in the 50s, and had programming in Korean. They were also on an unusual frequency of 14.870MHz, which made it audible in the evening hours. The station was deactivated in the late-60s or early- 70s.

Looking back in my log book of 10 years *or more* ago, I came across a logging on 3.668MHz, around 1200UTC. The station was in a language similar to Spanish and had pop music, plus commercials. Audio was on the upper side of the carrier. The station was, in fact, located in Dili, Portuguese Timor, which meant that the language was Portuguese, of course. I first came across it in September 1974, and it was some *time before I* was able to find out where it was operating from. In November 1975, Indonesia invaded the Portuguese colony and the original transmitters were destroyed. Dili today is heard down at the bottom edge of the 90 metre tropical allocation, as part of the Radio Republik Indonesia (RRI) network.

INTRUDERS A DECADE LATER

While glancing at the log book of a decade ago, I noticed, to my chagrin, that several intruders noticed then, are still operating today on the same channels, or very close to them, For example, the Chinese domestic network on 7.095MHz is still coming in very loudly, as it did in 1973, although it has switched networks. The semi-clandestine Fujian Front Station is still on 7.025MHz, In various Chinese dialects, beamed to Taiwan, although the station's call is Haixia or Voice of the Straits. It also has been heard on 3.640 and 3.535MHz, In the Northern Winters. And, of course, Radio Tirana is still on 7.065 and 7.090MHz in various European languages, as they were then. So, nothing appears to have significantly altered.

Upon reflection, I can safely state that the bands have become more congested today, compared to 10-15 years ago. More nations have acquired 100, 250 or 500kW transmitters. The amount of deliberate interference or jamming has also increased as well, with adjacent channels suffering from the resulting degradation. If you look at the frequency occupancy charts today and compare them to 15 years previously, one can readily appreciate how congested the international broadcasting allocations have become. A decade or more ago, there were only a handful of stations broadcasting outside the recognised allocations. Today however, the various broadcasters have begun to crawl out alarmingly from the standard allocations, to attempt to get a clear channel. The channelling of much telecommunications traffic onto satellite and cable has assisted in this, although a significant number of developing nations still utilise HF, as it is more economical.

With the trough of the cycle at present, it is easy to speculate it we will return to the exceptional conditions we experienced in 1979-80. Is propagation more unreliable today than it was 10 or 15 years ago? Today the science of propagation has been advanced considerably, by extensive space exploration. I think that despite the *inconvenience* and disruption caused by blackouts, we can more safely predict when disturbances are likely to occur, than we could a decade or more ago.

MASIRAH ISLAND

I do note on the BBC schedule for October, that they will be experimenting with the Masirah Island Relay Base to broadcast to Australasia. This has been tried out because of the strong signals coming into the region from UAE Radio in Dubaii. So they will be using 21.550MHz from 0600 until 0800UTC, with the World Service. As well, 7.150MHz will be on from 0700 until 0915UTC. 15.070MHz is on from 0600 until 0800UTC and again through the local evening hours.

Well, that is all for this month. Until next time, the very best of 73 and good listening — Robin VK7RH. AR

ANDREWS CORRECTION

The following prices were incorrect in the Andrews Communication Systems advertisements, page 26, October AR.
Tokyo Hy-Power HL-85V — $249
Tokyo Hy-Power HL-62V — $219
Tokyo Hy-Power HL-35V — $149

75th Nostalgia!

THE MORSE CODE AND ITS USE

or How to learn Morse 1898 style!

SIGNALLING is accomplished by sending long or short groups of wave-trains in certain recognised sequences, the arrangement being different for each letter of the alphabet.

A momentary depression of the signalling key constitutes a dot, and this consists of short groups of sparks, each which sends out a train of waves to the distant receiver; If the key is held down for longer, a dash or long group of wave-trains Is produced.

Each letter or other sign is made up of dots and dashes and the letters are distinguished from each other by longer periods of rest than those given between signals which make up the letter.

The beginner is advised to transmit various letters in continuous repetition for three or four minutes each, until the person at the receiving end is thoroughly used to reading them.

V is a clear and useful letter to send while adjustments are being made at the receiving station.

Until the operators are thoroughly familiar with the different signals, it is well for all messages to be written on a piece of paper in the Morse code and transmitted while the sender reads from this paper.

Similarly, the receiving operator should write down, in properly spaced dots and dashes, all that he receives, interpreting it at his leisure, when the signals have ceased.

Any hesitation while the signals for letters are hunted for in a book will lead to hopeless confusion and spontaneous messages sent as they come to mind, should not be attempted until thorough proficiency has been attained.

Dots should be sharp and crisp, and dashes should be long enough to give them clear distinction.

Uniformity of dots, dashes, and spacings should be aimed at: but signals should be sent slowly at first, the speed being increased as the code becomes familiar.

Is it not marvellous, that Morse code is still a major reliable means of communication in 1985.

The above was contributed by Peter Alexander VK2PA, an excellent exponent of the Morse art, and the winner of the WIA 75th Anniversary CW Contest. The extract is from **WIRELESS TELEGRAPHY FOR AMATEURS** by R P Howgrave-Graham (Associate member of the Institution of Electrical Engineers). Published in London in 1898.

AWARDS

Joe Ackerman, VK4AIX
5 Koomooloo Court, Mermaid Waters, Qld 4218

FRASER VALLEY DX CLUB AWARD — VE7DXC

DX stations are required to work five members of the club to qualify for this award. Cost is US$1.00 or 5 IRCs.

Send log information only showing Date, Time, Call Sign, Name and Frequency to: *The Awards Manager, Box 3112, Langley, BC, Canada, V3A 4R3.*

FVDXC members are: VE1LD, VE7s — AB, ADC, AFY, AIO, AKH, AKR, AUF, AVA, AVC, AZA, AZQ, BFO, BGY, BIP, BSM, BTV, CA, CBH, CC, CEW, CFC, CGM, CIK, CIO, CJG, CJK, CMF, CMY, CMZ, CPT, CVM, CXC, CXN, CZS, DLM, EXE, HV, IN, SZ, TT, WJ, XQ, YD, YJ, YQ, VE8DX. Note that VE7BIP is now VE7YL.
KC7GX, N7RO, W7s — EKM, ISX, MBY, SFF, WA7s — YCZ, ZWG, WB7s — CAO, CLU, VXR, WQE and YV5HLK.

KDXA BUFFALO AWARD

The KDXA logo is the American buffalo, the official State animal of Kansas. In the early days, the American buffalo numbered millions and roamed free in large herds on the Kansas prairies. The logo outline represents the Kansas State Boundary.

This beautiful award is offered to DX stations outside the Continental USA.

RULES:

DX stations shall work 20 Kansas stations plus five KDXA members.

Contacts on or after 1st September 1980, qualify for the award.

Use of any amateur band or mode.

Applicants shall submit normal log information. QSL cards are not required.

SWLs shall submit log information of stations heard.

Applications shall be sent, together with 4IRCs or US$2.00, to KDXA, Box 454, Salina, Kansas, 67401, USA.

KDXA will supply a current membership list upon receipt of an SAE and 1 IRC.

INDONESIAN AWARDS

ORARI, representing the Republic of Indonesia, and CRSA representing the People's Republic of Chine were admitted to the membership of the IARU, Region 3, in September 1984.

The ORARI has a membership of 40 000, only one percent of these being DXers. However, an upgrading programme hopes to increase this number to 10 or 20 percent.

YB0BZZ, previously the Secretary of the Society, is now in charge of the QSL/Awards Bureau. A letter written by him to K6UD states:

"For your information, by law, all amateurs have to become a member of ORARI (Organisasi Amatir Radio Indonesia), there are no individual amateurs. Everyone should be under the district and regional sections of ORARI, but we do have problems also, due to our geographical situation, which consists mostly of islands. It is as wide as from the west to east coasts of the USA, therefore a get-together between the Regional Committees is only once every three years. We in Jakarta, the capital city, which is the 0 call area, together with the National Committee, will always be the barometer throughout the country."

Acknowledgment to the NCDXF Newsletter.

The ORARI awards programme is shown below, with rules only, as there are no sample copies of the awards.

The **"Jakarta Award" (JA/SWL-JA)** is for confirmed contacts with, or having heard from, 20 licensed amateurs, including at least one club station, in Jakarta, (0 call area only), the capital of the Republic of Indonesia. Apply to M S Lumban Gaol, YB0WR, Box 96, Jakarta, 10002, Indonesian. Club stations are: YB0s — ZAA, ZAB, ZAD, ZAE, ZAF, ZBA, ZBB, ZCA, ZCB, ZCD, ZCE, ZDB, ZDC, ZDD, ZDE, ZDG, ZEA, ZEE and ZZ.

The "Worked all Indonesian Award" (WAIA/ SWL-WAIA) for two confirmed contacts in each call area with, or having heard from, licensed amateurs in each of the Indonesian call areas, total 20 contacts. The Awards Manager is, Mr M Maruto YB0TK, Box 96, Jakarta, 10002, Indonesia.

The "Worked the Equator Award" (WEA/ SWL-WEA) for confirmed contacts with, or having heard from, licensed amateurs in countries along the equator. The countries are: C2, HC, HC8, HK, KH1, KB6, PP-PY, PY0 (St Peter), S9 (Sao Tome), T30, T31, T32, TN, TR, YB5, YB7, YB8, 5X, 5Z, 6O, 8Q and 9Q. The WEA will be issued in three classes, ie

Class 1 — For confirmed contacts with 15 countries

Class 2 — For confirmed contacts with 12 countries

Class 3 — For confirmed contacts with eight countries

All classes must contact YB5, YB7 and YB8.

The Awards Manager is Ben S Samsu YC0EBS, *Box* 96, Jakarta, 10002, Indonesia

GENERAL RULES:

ORARI Awards will be issued to licensed amateurs for two-way SSB, CW, RTTY, mixed or single mode, mixed or single band in the 80, 40, 20, 15, and 10 metre bands, only. SWL Awards in the same category will also be available.

The applicant may request endorsements for such distinctions accordingly.

All contacts on or after 9th July 1968, will be valid for these awards.

Claims must be accompanied by a QSL card list (GCR) furnished with the call sign of the stations worked, dates, bands and modes of contacts, meeting the requirements of the award concerned.

Rules and requirements will be specified, when required, *in* each of the awards *programmes.*

QSL card list must be accompanied by a statement from the applicants National Society, Club Station, or from any two amateurs, other than the applicant, that the QSL cards of the contacts listed are in the possession of the applicant, and that the items of the cards are correctly listed.

A fee of US$8.00 or 16 IRCs should accompany the Award application to the respective award manager.

Only contacts with land stations within the same country will be accepted.

IDX — ISLAND DX AWARD

This award is sponsored by the Whidbey Island DX Club, and is available to all licensed amateurs and SWLs on a heard basis.

Awards are issued for two-way SSB, CW, RTTY, SSTV, as well as mixed and single band accomplishments.

The basic award requires 50 IDX Islands. Endorsements are given in increments of 50 Islands, up to and including the maximum number of Islands possible.

All DXCC Countries which are bonafide "islands" are the only qualifying contacts.

To be valid, all contacts must be made AFTER 1st October 1977.

To apply, prepare a list of contacts in prefix order. PLEASE NUMBER YOUR CONTACTS 1 through 50 etc. Include the call sign of the station worked, IDX Island's name, band, mode, date and UTC.

DO NOT SEND QSL CARDS! ! ! Have your list verified by two amateurs or local radio club officials. Confirmation of each contact must be in the applicants possession and confirmed by verifying signatures.

Send verified list with US$4.00 or 12 IRCs and a 101 x 229mm business size, SASE to the following address: *Whidbey Island DX Club, 2665 North Busby Road, Oak Harbour, Washington, 98277, USA.*

Rules governing this award are reviewed annually. Please enclose an SASE with any inquiries regarding this award.

NWIRA — TEN METRES FM AWARDS

This award is sponsored by the North Whidbey Island Repeater Association.

All contacts, to be valid, must be made on/after 1st January 1981.

Cross mode contacts do not count. Contacts must be two-way 10 metre FM.

Special endorsements include All Mobile, All Simplex, Single Frequency accomplishments and contacts made within a Single Day, Week, Month or Year.

DO NOT SEND QSL cards. Forward your list of contacts showing date, time and frequency, of each contact and provide a brief station description.

Send the list of contacts, together with US$4.00 for each award to: *The 10 Metres Awards Programme, 2665 North Busby Road, Oak Harbour, Washington, 98277, USA.*

WORKED ALL DISTRICTS AWARD: Applicants must work one 10 metre station in each of the US Call Districts.

WORKED ALL STATES AWARDS: Applicants must work a MINIMUM of 50 US States on 10 metres FM.

CENTURION AWARD: This Award requires the applicant to work a MINIMUM of 100 stations on 10 metres FM.

DX **DECADE AWARD:** Applicants must work a MINIMUM of 10 DX stations outside the 50 US States and Canada on 10 metres FM.

NORTH AMERICAN AWARD: TO qualify, applicants must work all 10 US Call Districts, a MINIMUM of six Canadian Provinces and/or Territories and at least four DX Countries within the North American continent (other than the US and Canada) *on* 10 *metres* FM.

Members of the NWIRA monitor 29.600MHz and also the area repeater on 29.640MHz (an 1800Hz tone or whistle is required to access it).

NZ CHAPTER NO 3 AWARDS PROGRAMME

The are many fine awards available from the

LA BALSA AWARD

The La Balsa Expedition, consisting of 3 rafts constructed entirely of balsa logs fastened with wooden pegs and sisal ropes, under the command of Vital Alsar and 11 other men of different nationalities and languages departed from Guayaquit on 27/5/73 and drifted 13,760 kms in 178 days to reach Ballina on 21/11/73. Radio communication was maintained by amateur radio with several operators including the late VK2PF a prominent Summerland Amateur.

PRESENTED BY THE SUMMERLAND AMATEUR RADIO CLUB

AWARD No..... DATE.....

....

AWARDS' MANAGER PRESIDENT

ENDORSEMENTS.....

SUPPORT THE AUSTRALIAN VOLUNTEER COAST GUARD

New Zealand Chapter of the Certificate Hunters' Club, for a reasonable fee. There are too many to list in these columns but an SASE to Evan P Tombs ZL2IG, Ihakara. RD1, Levin, NZ, will provide all the information necessary for those interested.

PAPAKURA JUBILEE AWARD

This award is sponsored by the Papakura Branch of the NZART and is available to amateurs and SWLs until the end of November 1985.

REQUIREMENTS:

Six contacts to be made with Branch members, one contact with the Club station ZL1VK, or with one YL Branch member, is obligatory.

Contacts may be made on any amateur band and/or any mode. Nets are held on the frequencies from 3.580-3.590MHz.

Application to be forwarded to: *Awards Custodian, P O Box 397, Papakura, New Zealand.*

Fee for the award is $2.00 and the log extract must be certified by another amateur.

LA BALSA AWARD

This award is presented by the Summerland Amateur Radio Club to commemorate the crossing of the Pacific by three balsa rafts.

The Award is printed on a deep blue background, with a red border and printing is in black. The Award measures 25.5 x 19cm, with one of the rafts and four crew members depicted on the bottom half of the Award.

This Award will be limited to 500 copies.

Three rafts constructed entirely of balsa logs, fastened with wooden pegs and sisal ropes, under the command of Vital Alsar and 11 others, from different nationalities and languages, departed from Guayaquil on the 27th May 1973 and drifted 13 760km in 178 days, reaching Ballina on the 21st November 1973.

Communication was maintained throughout the voyage by means of amateur radio and several Australian amateurs were deeply involved. These included Fred Carruthers VK2PF, now a silent key, who at the time was a prominent member of the Summerland Radio Club.

FT-101s were used on the rafts. One is in the Marine Museum at Ballina, whilst another one was given by VK2SG to the Westlakes Amateur Radio Club.

RULES:

Australian amateurs and SWLs are required to gain 15 points, DX stations and SWLs require seven points.

The Club Station, VK2AGH, counts as five points, members count one point.

A Club Net is held each Friday night at 0930UTC on 3.605MHz.

Applications, together with log extract and fee of $2.00, to be forwarded to: *The Awards Manager, P O Box 524, Lismore, NSW. 2480.*

AR

MOROKULIEN AWARD

Morokulien, a Swedish Norwegian border district, is a monument for peace between Sweden and Norway and was founded in 1914 in memory of 100 years of peace between the two countries. It has been proclaimed a free state and has its own flag.

Morokulien has its own permanent broadcasting station for radio amateurs. It was opened in 1968 and has the call signs, LG5LG in Norway and SJ9WL in Sweden.

The station has an award which is available to licensed amateurs and SWLs.

Contacts after July 1968 are valid for this award.

It is not necessary to send QSL cards. A list showing full details is sufficient.

The award is issued for all modes of transmission which are permissible in Morokulien.

The fee for the award is 15 N.kr, $3 or 10 IRCs.

To qualify for the award the call signs LG5LG and SJ9WL/SK9WL must be contacted on one band but on different days.

All applications to be sent to: *Ulf A Strandberg LA2ZN, Konglevegen 3, N-2200 Kongsvinger, Norway.*

For philatelists, the Swedish-Norwegian Post Office has its own post mark and it is possible to mix the stamps from two countries on one letter.

ALARA

Australian Ladies Amateur Radio Association

Joy Collis VK2EBX
PUBLICITY OFFICER FOR ALARA
PO Box 22, Yeoval, Vic. 2868

VK5 YLs enjoying their Birthday Get-Together. Standing from left — Marlene VK5QO, Linda VK5QP, Lorraine VK5LM and Vicki VK5FK.
Seated from left — Elaine VK5KEB, Judy VK5BYL, Pauline Cohen, Marlene VK2KFQ and Janet VK5NEI.

Rear from left — Carol VK5PWA, Jenny VK5ANW and Meg VK5AOV.
Front from left — Liz VK5NES, Liz's mother, Denise VK5YL, Joy VK5YJ and Myrna VK5YW.

L-R: Wendy VK4BSQ, Bev VK6DE, Wendy VK4NWT, Val VK4VR, Cecily VK4QW, Eleanor VK4BEM, Chris VK4ABM, Margaret VK4AOE, Darleen WD5FQX, Dorothy VK4NAM, Josie VK4VAN and Jill VK4ASK.

Redcliffe, 27th July 1985. John VK4QA congratulates Margaret VK4AOE on the Tenth Birthday of ALARA.

The first thing I would like to do, on taking over the reins as Publicity Officer from Margaret VK3DML, is to thank my predecessor, who has worked so conscientiously for the past six years, and to wish her well with her studies.

We are grateful to you, Margaret, for all your willing work.

You've done the job so competently, and not been one to shirk.

There is no doubt your 'track record' will be quite hard to beat,

And I hope, as I step in your shoes, that I won't get COLD FEET!

Thanks also to Jenny VK5ANW, Poppy VK6YF and Margaret VK4AOE for holding the fort as "Guest" writers over the past three months. Your efforts were most appreciated, and, I'm sure, were enjoyed by all

Thanks are also due to Marlene VK5QO, who designed the special cover of our Birthday Newsletter; Valda VK3DVT for the ALARA Award Birthday Stickers, and Margaret VK4AOE for the beautifully embroidered table centre. Truly, we have some very talented ladies in ALARA!

While we are sorry to lose Joyce VK2DIX, Suzanne VK2PSC and Joy VK5YJ from the committee, we appreciate all their efforts on our behalf during their terms of office.

1985 is ALARA's tenth birthday year, and there have been get-togethers to celebrate the occasion in VK2, VK3, VK4, VK5 and VK6. Nineteen members attended the VK3 festivities, including Helene VK7HD and Pat, also five OMs. They all enjoyed themselves so much, they plan to repeat the performance annually.

A birthday mini-contest was held on YL activity day, 6th July, operating on the Novice frequencies. Unfortunately, conditions on 10 and 15 metres ranged from poor to non-existent, so most of the action was on 80 metres. The result was so close it had to be decided on the basis of time, with Kym VK3CYL winning by only one minute from Gwen VK3DYL.

Congratulations to Kym, who received the lovely table centre, and Gwen, whose prize was an

ALARA sugar spoon.

Our appreciation to all who submitted logs, and to Marlene VK2KFQ, our new Contest Manager, for getting it all together.

To the OMs who were kind enough to call, offering a contact — thanks fellas! We had to decline, as it was a YL only contest, but we will appreciate hearing from you during the ALARA contest on 9th November 1985 (UTC).

While on the subject of the ALARA Contest, let us see if we can make this tenth birthday contest the best ever! Try and get on the air, even if you can only spare a little time. It really is a lot of fun, and a very friendly contest.

Welcome to new member, Marie-Jean ON4AYL, sponsored by Marilyn VK3DMS.

Heartiest congratulations to Betty VK2AMU, ex2KYL, Margaret VK3CWA, ex3KCP, Jill VK4ASK, ex4VSK, and Eleanor VK4BEM, ex4VNS. Great to hear the new call signs.

Well, that's it for now, until next month, best wishes to all.

33/73 Joy VK2EBX

EDUCATION NOTES

Brenda Edmonds, VK3KT
FEDERAL EDUCATION OFFICER
56 Baden Powell Drive, Frankston, Vic 3199

I have mentioned previously that, for some time now, there has been a small committee working towards producing a Study Guide to accompany the revised Novice Syllabus. Copies of the draft have been circulated for comment to DOC and to some members, who I know, have been involved in Novice classes in recent years. By the time you read this, I hope I have the comments collated and a second draft on the way.

We have tried to produce a document which defines the depth of each topic on the syllabus, so that it can be of use to both the class instructors and the students, especially those who are unable to attend classes.

One part which still has room for further input is the list of recommended texts. I am sure there are many publications of which I am unaware, so if any readers have a favorite reference book, leaflet, article, etc, for some part of the course, I would be very pleased to hear of it. Of course, it would need to be fairly easily available if we are to recommend it in a Federal publication.

The revised syllabus is now available in leaflet form from me or from DOC State Offices, but I have not, as yet, heard when it will take effect — not that there are really many changes in content.

The next step will be to prepare a similar guide for the Full Call Syllabus. Now is the chance for those who feel they have been left out of the discussion on the Novice Guide, to have their say. A soon as leaflets of the Full and Limited Syllabus are available, I will be happy to send them out for members to work on. Education Officers in each Division already have a copy.

Perhaps each club or zone could spend one meeting night on one section of the syllabus, and let me have their ideas on how far each topic should be developed, and, perhaps more importantly, the degree of detail or knowledge that would not be acceptable for an exam question. We hope these guides will be a prescription for the examinees as much as for the examinees.

When a point of mutual agreement between DOC and the WIA is reached, the guides will be printed and made available. As soon as they are ready, I will make it known. I would expect that the Novice one should be ready for use for courses starting early in 1986, but considering the time it has taken and the greater content of the Full course, the next one is probably at least six months away — although lots of input from Interested parties would probably speed it up a bit.

Again, references for the various sections would be most valuable, as the Full call course is even less well provided for than the Novice.

With the advent of Daylight Saving in some States, local time for the Education Net will vary — ie the Net will remain at 1130UTC Thursdays, despite everything — 3.680MHz +/- in case you're looking for it.

The Net in the Novice Band of 60 metres has been cancelled because of lack of interest. I would be pleased to have the Net used for discussion of points arising from the syllabus and the Study Guide draft. It seems to me it would be much easier to discuss ideas in a group than for you each to write me a letter — I am sure I would get more out of it too. But perhaps the easiest course of all is just not to write or talk at all.

Best wished and good luck to all those sitting for the November exam. May you all get new call signs for Christmas.

73 Brenda VK3KT

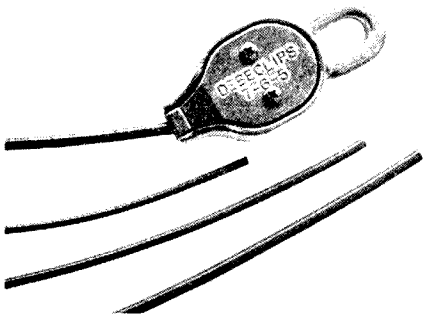
TELEVISION FOR FIJI

The Pacific island nation of Fiji has decided to have a television service and it is expected to begin in 1987.

Fijian Prime Minister, Ratu Sir Kamisese said a licence had been granted to Kerry Packer's Publicity and Broadcasting Ltd (PBL), which had proposed to develop a national network in three stages.

The ultimate aim was to bring the TV service within reach of as many Fijians as possible, in every part of the country. To enable this, the government planned to speed up the availability of electricity supplies to rural areas and outlying islands.

AR SHOWCASE



GUY WIRE SUBSTITUTE

GFS Electronic Imports have announced the introduction of 6mm Debeglass antenna tower guy wire substitutes, as a stock line. The addition of DB-6 to the range means customers now have a choice of 4, 5 and 6mm sizes.

For those not familiar with Debeglass, it is a non-conducting, non-corrosive, low elongation, high tensile wire substitute which has a number of applications in the area of radio tower guying. It also has applications in many other areas including the fishing and marine industries, mining, off shore exploration and drilling, as well as building.

The new DB-6 has a tensile strength of 970kg, with a weight of only 44 grams per metre. DB-5 and DB-4 offer 560 and 430kg tensile strength respectively for weights of 31.5 and 19.5 grams per metre.

Termination of the three Debeglass sizes is done simply by using a thimble and standard 'D' clamp, or with a Debeclip, shown in the photograph.

Full specifications and a brochure may be obtained from GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic. 3132. Telephone: (03) 873 3777.

AR

NEW RF POWER METER HAS FREQUENCY COUNTER

Vicom Australia Pty Ltd has announced the release of the new Fujisoku range of termination power meters which include a built-in frequency counter.

The frequency counter has been designed for low power consumption and operates from internally mounted batteries. The counter uses a seven digit LCD.

The instruments are ideal for servicing applications due to the wide frequency range, the compact rugged construction and light weight.

Three models are available to cover the frequency ranges 0-150MHz, 30-500MHz and 330-960MHz. Additionally, three power ranges of 1.5, 7 and 15 watts are available. Other models for higher RF power are available.

Further inquiries should be directed to Vicom's offices at Melbourne, Sydney, Brisbane and Wellington or direct to Michael Bonacci, National Sales Manager, VICOM Australia Pty Ltd, Box 366, South Melbourne, Vic. 3205. Telephone (03) 62 6931.

AR

PACKET RADIO MODEM

In their continuing endeavour to promote and foster Packet Radio, the Sydney Amateur Digital Communications Group have commenced development of a complete Australian designed Amateur Packet Radio System.

Rather than enter into conflict with various groups that have purchased semi-commercial equipment, the SADCG have set their design objectives around a system that will satisfy most groups. The TNC has improved software handling both Vancouver V.2 and ARRL AX25 version 2, allowing multiple digipeating. This TNC will be available in late 1985.

Currently the SADCG have just completed the design of a high performance AFSK Radio Modem board, based on the AMD 7910 World Modem chip. This modem provides both CCITT and BELL modem frequencies. It is tailored for use on UHF, VHF and HF voice grade channels and incorporates a PTT Watch Dog Timer. The AMD 7910 was selected because of its ability to handle noisy conditions as found on HF and satellite operations.

This modem will interface via RS-232/V.24 to a TNC or computer. It can be easily interfaced to amateur transceivers. The circuit has the option to generate a DCD signal from either the external squelch signal from the radio or internally generated DCD from the 7910, or both. Various connections are available for LED monitoring of circuit conditions, such as CTS, TXD, etc.

The Radio Modem PCB, together with construction information, is available for $22 post free from the SADCG, PO Box 231, Frenchs Forest, NSW. 2086.

AR

NEW MEASURING INSTRUMENTS

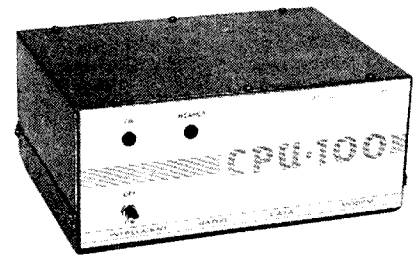
VICOM Australia Pty Ltd announce the release of a new range of RF test instruments from Fujisoku, Japan.

The range of high quality devices includes termination power meters, wideband and narrowband power meters, through-line power meters and RF power peripherals, including coaxial switches and dummy loads.

Fujisoku has been a leading manufacturer of precision instruments for more than three decades.

Further details including specifications and pricing can be obtained from VICOM offices in Melbourne, Sydney, Brisbane and Wellington or by contacting Michael Bonacci, National Sales Manager, Vicom Australia Pty Ltd, Box 366, South Melbourne, Vic. 3205. Telephone: (03) 62 6931.

AR

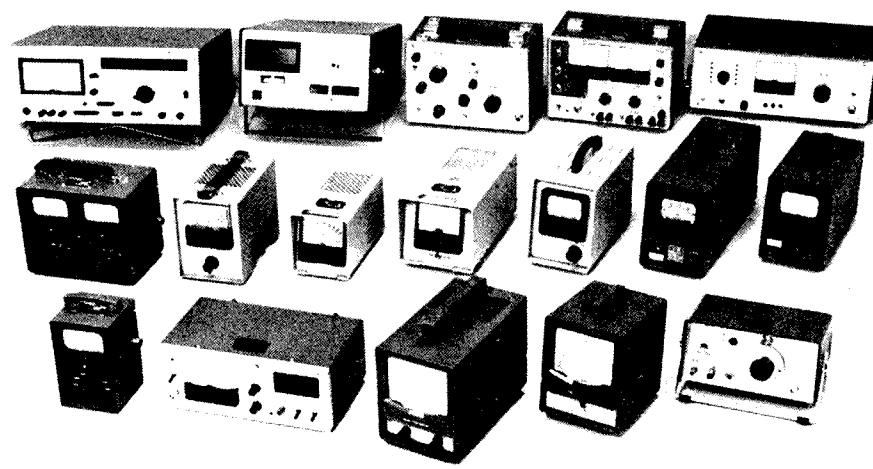


ERROR FREE RADIO DATA MODEM

A new version of an intelligent radio data modem is now available from GFS Electronic Imports. Known as the SDX-PKT 1.2, it is designed to provide error free data communications over a standard voice bandwidth simplex radio link on HF VHF UHF or two wire land line.

The CPU-100 simply connects between a terminal, computer or remote sensing device via their RS-232 port, and the radio transceiver. Its full error correction means that, even under loss of signal conditions, absolutely no data is lost or corrupted, the system is simply held up until the signal is recovered.

Data rate on the link is nominally 1200 BAUD, depending on the radio link quality. Exchange of data between the two communicating CPU-100's is in blocks and takes the form of an asynchronous Byte-oriented protocol. Automatic block resends are initiated for all detected errors. The radio equipment automatically switches from transmit to receive as each block of data is sent. For every received block, each Byte is checked for correct parity and framing or over-run errors. A further check sequence then calculates block validation data on the received block which must agree with the received check data contained in



that block. Only when all checks verify, is the data accepted and output to the DTE.

In its standard form, this version provides equal data transmission priority to each end of the link, ie 50 percent of link time is allocated to each DTE in turn. A higher priority to one end may be provided if it is felt necessary for a particular system, thus giving an overall increase in speed.

The flow of data from the DTE to the CPU-100 can be controlled by either XON/XOFF characters or the RS-232 hardware signal RTS. A buffer is provided in the CPU-100 to cater for any overflow data from the DTE that may occur after the unit has issued an XOFF or deactivated the RTS line to the DTE.

All data Bytes transmitted in each block are eight Bits, plus parity. This allows data over the full ASCII and Binary format range, for the transmission of target code programmes, etc, as well as normal text and control characters. A broadcast mode is also optionally available as the SDX-PKY 1.2 version of the CPU-100.

Other versions are also available. These include a full error correcting version, designed to operate over a dual channel duplex radio link, a high parity, non-error correcting type for a duplex link, as well as a one way, high parity version for a simplex radio link.

Further information can be obtained from the Australian Manufacturer, GFS Electronic Imports, Box 97, Mitcham. Vic. 3132. Telephone: (03) 873 3777.

AR

MURPHY STRIKES

The VK2 28MHz Beacon, listed on page 63 of September's AR, was incorrectly listed.

VK2WI and VK2RSY are one and the same and the frequency is 28.262MHz.

Also, on page 12, same issue, the teleprinter 7805 regulator doesn't have a ground in the circuit diagram.

Bill Martin, VK2COP
FEDERAL INTRUDER
WATCH CO-ORDINATOR
33 Somerville Road, Hornsby Heights, NSW 2077

Well, the warmer weather is now with us and, hopefully the solar cycle has finished it's fiddling about, and is heading up to where it should be! Of course, this will mean an increase in intruder activity, no doubt, and we hope that more listeners will send in their intruder reports.

REQUIRED READING

Col VK4AKX, one of the stalwarts of the IW, has drawn my attention to some interesting reading, about intruders, in a long article in "Practical Wireless" for April 1985. This makes almost required reading for any serious intruder observer, and, although the article is orientated towards the UK, there are many points germane to the VK observer.

Thanks once again to the following observers, who have helped out during July 1985: *Mr G H A Bradford and VKs — 2DEJ, 2EYI, 2PWS, 2PS, 2QL, 3AMD, 3XB, 3XU, 4AFA, 4AKX, 4BHJ, 4BG, 4BTW, 4KHZ, 5BJF, 5GZ and 7RH.*

AIRS DIRECTOR

This month sees the arrival in Sydney of Gib W7JIE, the IARU Region 2 Director of 'AIRS' (Amateur Interference Reporting System), which the Intruder Watch is known as in the USA, now-a-days. Gib is en route to New Zealand for a radio conference, and I hope to have an 'eyeball' QSO with him, whilst he is passing through Sydney.

I don't often get the chance to meet intruder watchers from overseas, or from inter-state, for that matter.

NEW MERIT CERTIFICATE

I would now like to take the opportunity to mention the striking of an Intruder Watch "Merit Certificate", which has been approved by the WIA Federal Executive. This certificate will come into effect shortly.

It is not really an award, in the amateur radio sense, but is a certificate conceived to give some tangible recognition, albeit small, to those who have taken the time and trouble to support the Intruder Watch, and by so doing, have given assistance to their fellows of the hobby, by helping to keep tabs on the radio pests of the world, who bully their way all around the frequency bands. The certificate will be issued on a "one per call" basis, and will not be easily gained. Provision is made for the **ANNUAL** issue of the certificate to that person, amateur or SWL, who has best supported the ideals of the Intruder Watch for the previous 12 months, **IN EACH WIA DIVISION.**

Each certificate will be consecutively numbered, and signed by the WIA Federal President, and counter-signed by the Federal Intruder Watch Co-ordinator, who holds office at the time. The certificate will not be issued as a matter of course, and **ANY** certificate for **ANY** Division will not necessarily be awarded in any particular year. The achievement will be recognised by the publication of the recipients details in this column, at the time of the award.

I think that those who take the time and trouble to monitor the amateur bands for the benefit of others should have, at least, this small token of appreciation.

STATISTICS

The IW statistics for July 1985 are: *327 Broadcast Intruders, 85 CW Intruders, 53 RTTY Intruders, 44 other modes of emissions and 56 intruders obliged by giving identifying call signs.*

How does it work? SOLAR ELECTRICITY

A silicon solar cell works because of its non-silicon ingredients. First, a tiny amount of boron impurity is put into the melt during crystal growth. The boron atoms are dispersed throughout the crystal structure of the silicon. However, the boron — doped silicon has one less electron in the outer shell, so it has a "hole" that will accept stray electron. Thus boron-doped silicon is called "Ptype".

After the crystal is sliced, a thin layer of phosphorus is diffused across the top surface of each wafer to form the "N" (negative) layer. The phosphorus atoms displace silicon atoms in the crystal structure, but each has one extra electron in the outer shell so it can become an electron donor when the right external stimulus is applied.

Light energy is such an external stimulus. When the light energy strikes the cell, positive and negative charge carriers are freed to migrate within the silicon wafer. There is a net migration of positive charge carriers to the "P" side and of negative charge carriers to the "N" side.

Attach leads to front and back of the cell and the charge carriers can flow through an external load to do usable work. The electrical current starts, stops and varies in intensity as a direct function of the light energy. When the sun shines the cell will work.

Each cell, regardless of size, has a potential of about half a volt. Connecting them in series will raise the voltage to more useful levels.

Most solar panels have cells connected in series and produce power at 16 VDC for use with 12 volt systems.

Cell area determine current output with 100mm cells having a current output between 2 and 2.5 A in bright sunlight (dependent on the manufacturer). By multiplying voltage by current one may determine the peak power capability of any given panel.

There is nothing complicated about Solar remote power systems. They are just sun-powered battery chargers. You can assemble them with common hand tools and maintain them with just a dust rag. You will never need to change the oil, spark plugs or filter, because there aren't any!

Solar cell modules make the system work, and storage batteries permit it to work at night since the modules only generate electricity during daylight hours. The batteries store the electricity for use at night or in periods of bad weather. A typical photovoltaic system includes sufficient storage for several days of normal operation.

The first step in choosing a photovoltaic system is to determine your power requirements. Make a list of items to be powered and compute the daily hours of operation for each. Multiply the power of each item by the hours of operation to get watt-hours per day of total consumption.

To figure how many solar panels you will need, however, you need to compute the ampere-hours per day of each piece of equipment. To get Ah/day divide watt-h/day by your system voltage.

For a simple DC system divide by 12 volts. For example, you might have four fluorescent lights, a 12 V communication station and a DC powered television set. The lights draw 1.7 A each, or 6.8 A total. The two-way radio station may draw 1 A on receive and 5 A on transmit the TV 2 A. Your typical usage might look like this:-

Item	Current Drain A	x Time (h)	= daily usage (Ah)
Lights (4 x 1.7)	6.8	x 4	= 27.2
Radio Receive	1	x 4	= 4
Radio Transmit	5	x 0.5	= 2.5
TV	2	x 4	= 8
			41.7

Next compute the number of solar panels required to supply this power. A 40 watt panel can produce 2.5 A peak, lets say 2.3 A average per hour. The average useful number of hours in central South Africa is 6 thus 6 x 2.3 = 13.8 Ah. So 41.7 Ah ÷ 13.8 Ah = 3.02 panels.

A four panel system would comfortably satisfy the above requirement.

With a photovoltaic system, you can only take out as much power as you put in. This may require establishing some new habits about electricity consumption. Plan to conserve electricity from the start. If your system allows three hours of television viewing per day, you cannot expect to watch for six hours, unless some other item, say one or two lights less are used.

You are the decision maker.

Bear in mind that in the above example the correct Ah rating is not 41.7 Ah but twice that or 83.4 Ah + 3 x 41.7 = 208.5 Ah thus giving you three days of usage during bad overcast weather.

FORWARD BIAS

VK1 DIVISION

Ken Ray
PO Box 710, Woden, ACT 2606

NEXT MEETING

The last meeting for 1985 will be our end of year social event, on 25th November. Bring your spouse or friend, and share a drink, meet old and new friends, and have a good time. The meeting is in the Griffin Centre, Civic, and doors open around 7.30-7.45pm. The bookstall and QSL bureau are available at the meeting.

VK1 AWARD

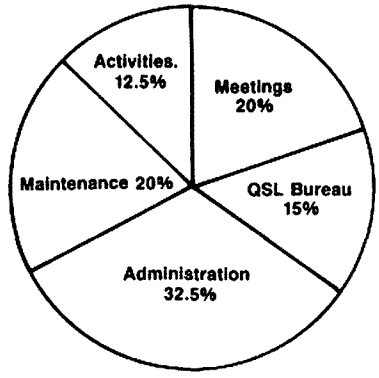
An update on the VK1 Award from the Awards Manager, Phil VK1PJ, lists those who have recently gained the Award.

ZL2 259 . . . First ZL SWL, VK2DJJ, VK2NAN, VK7NEC, VK1ZXA, VK4MAX, VK3DVF, VK1NYA, and VK2VFL.

For those looking for VK1 stations, the VK1 Award Net is run each Sunday evening on 3.570MHz ±QRM, after the VK1 Divisional Broadcast, around 1030UTC (8.30pm EAST). Phil would particularly welcome those VK1 stations that rarely (or never) join the net to come up.

1986 MEMBERSHIP FEES

At the September Committee Meeting, the committee recommended that the VK1 component of members fees remain at $9.50, so if the Federal component remains unchanged at $24.50, VK1 members will pay $34 in 1986. This makes VK1 one of the lowest priced Divisions to belong to.



1986 Planned Expenditure — VK1 Division

For 1986, we are budgeting on an income of around $2 000. Of this, one third will go on administration and secretarial costs. Other major items are, meeting room hire and equipment maintenance and depreciation. The pie chart shows the approximate breakup of expenditure.

AR

VK3 WIA NOTES

NEW MEMBERS

The Victorian Division of the WIA extends a warm welcome to the following members who joined in the month of August.

Simon Anderson VK3KRL, George Antippas, Kim Briggs VK9ZB, Arthur Brighton VK3ACB, John Carwardine VK3BMC, A Fisher VK3KTF, Douglas Flynn, Annette Inness, John King VK3XLN, Ronald La Franchi (SWL), Nick Lycopoulos.

William Pearce (SWL), Glenn Potter, Michael Scott VK3XMS, Luke Thistlethwaite VK3PHU, Robert Toseland VK3XRT, Max Tulloch VK3AKT, Laurens Van De Paveart VK3CLV, Roderick Wall VK3BKO, Peter Westley VK3DXD, Alan Woolley VK3AMT, Frederick Wright, John Day VK3ZKF and Barry Petersen VK3XIR.

BEECHAM AND LINTON

Several months ago, the Lord Mayor of Melbourne, Councillor Eddie Beecham, was pleased to receive greeting letters from the City of Melbourne, Florida, USA. The occasion was to mark Melbourne Victoria's 150th Anniversary and had been arranged through the international spirit of amateur radio.

Greetings were received from Harry C Goode, Melbourne Mayor, and the Platinum Coast Amateur Radio Society, based in Melbourne. PCARS mentioned, in its letter, how an early settler in its city was a former Melbourne, Australia, resident Cornthwaite John Hector. His colorful stories of Melbourne prompted fellow settlers to name their area Melbourne, also.

Vic WIA President, Jim Linton VK3PC, presented Councillor Beecham with the letters at the Melbourne Town Hall. Not missing an opportunity to push the cause of amateur radio, Jim asked the Lord Mayor if he knew much about the hobby. To his surprise, Jim was told about the role Councillor Beecham played in a part ot Australia's amateur radio history.

As a school teacher in the small Victorian town of Birchip, he was asked by Ray Naughton VK3ATN, in 1966, to check the mathematical calculations Ray had done for his first Moon Bounce contact with the United States.

PRINTERS GREMLINS HAVE A SHUFFLE WITH AUSSAT

Two typesetting errors — DCwin (Darwin) and h-ff-gh (high), beyond the control of the Producers and Printers were compounded by the lines "of Ltd, of the attenuation caused by rain in the various times of the year" appearing at the head of column 3, page 14, October AR — instead of commencing underneath the captions for the pictures.

The Management of Waverley Offset Publishing Group apologise for any inconvenience or embarrassment this has caused to AUSSAT Pty Ltd, the writer and the readers of the magazine.

Please amend your copy now.

VK2 MINI BULLETIN

Tim Mills VK2ZTM
VK2 MINI BULLETIN EDITOR
PO Box 1066, Parramatta, NSW 2150

HOMEBREW CONTEST

Are you building or about to start a project? Why not enter it in this years event. The closing date is 1st March 1986. Entry forms are available from the Divisional Office, at 109 Wigram Street, between 11am and 2pm, Monday to Friday, or 7 to 9pm on Wednesday night. Or you may phone (02) 689 2417 or write to PO Box 1066, Parramatta, NSW. 2150. Check with your local club as some may also have details and/or forms for entries.

NOVEMBER EVENTS

On Sunday, 3rd November, the Conference of Clubs will be hosted by the Westlakes ARC at Teralba.

On the weekend of the 9-10th September, there will be a WICEN exercise at Schofields Air Show.

The Batemans Bay Car Rally, postponed in September due to rain, may be held towards the end of the month.

VK2BQK

The Museum has been closed for the remainder of this year while a new exhibit, for the display area, is set up.

DECEMBER BARBECUE

The Dural Committee and Divisional Council invite you to attend VK2WI on the first Sunday, 1st December. Further details will be announced on the Divisional Broadcasts during this month.

HISTORICAL ARTICLES

The next VK2 Special Edition of AR is scheduled for March 1986. Material is required for this feature. If you have anything, please contact or send to the Divisional Office.

AR

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

Several months ago, I asked which old timer had been licenced the longest? Well, I still don't know the answer, but Keith Ring VK5KH, rang me from Kapunda, with a list of OTs that he thought were eminently more deserving of mention, than he. Those mentioned include, Reg Anthony VK5CM, Cliff Moule VK5CX, Elmore 'Shep' Shepherd VK5DC, George Andersen VK5GA, Vic Chennell VK5JH, Darcey Hancock VK5RJ, George Luxon VK5RX, and Arch Hewitt VK5XK. All the above were licenced in, or before, mid-1930.

I shall look forward to meeting the above gentlemen, and many others, at the 1985 Old Timers Luncheon, to be held at the Woodville Football Club, on Thursday 14th November. Not that I qualify as an old timer, but for the past couple of years a group of wives of the OTs and other interested ladies have met for lunch at the same time and venue, and I hope to join them again this year.

If you are interested, listen to the Broadcast for more details.

TAKE YOUR OWN LUNCH

That will be a busy week, because three days later, the WIA Picnic will be held at the Bridgewater Oval. The proceedings start about 11.00am and after a settling-in period, races of all sorts, foxhunts (usually of the sneaky sort), and similar entertainment will be the order of the day.

This year may see many new innovations, as Gary VK5OR and his XYL, Valmai, will be taking over much of the organising. The picnic is open to all WIA members and their families. You take your own lunch, but soft drinks, ice creams, and lollies for the children, are provided by the WIA. (Soft drinks and ice creams are for everyone). It is a very pleasant venue, and I hope to see you all there.

SOME PEOPLE HAVE ALL THE FUN

Some people get all the tough jobs! Recently, Graham VK5AQZ, in his role as Jubilee 150 Co-ordinator, organised an Amateur Radio STATION Carriage, which was attached to a train, that just happened to be going to Perth. With Alan VK5ZN and Peter Koen (who spent the previous three days silkscreening posters!), Graham spent the best part of four days on the train, and two in Perth, telling people about J150, and for those on the train, about amateur radio.

Apparently, a good time was had by all, except Bob VK5BJA, who having put up aerials, etc, had to stay behind because of work commitments.

I was invited, but before I could accept, it was pointed out to me that my presence would complicate the sleeping arrangements.

DIARY DATES

14th November — Old Timers Luncheon, Woodville Football Club and YL Luncheon.
17th November — WIA Picnic, Bridgewater Oval.
23/24th November — Display at the SA Hobby Fair.
26th November — General Meeting and Trevor Conlon, guesting from CFS Headquarters. 10th December — WIA Christmas Social. Speaker Geoff Taylor VK5TY, on the first Burra to Broken Hill Wheelbarrow Race. (At the time of writing, the venue is uncertain, so check the Broadcasts for details.)

AR

Bill Prepares for RTTY!

Ted Holmes VK3DEH
20 Edmunds Street, Parkdale, Vic. 3195

From Bill Blitheringtwit's garage emerged the muffled sound of somebody uttering curses, interspersed with slight yells of pain. Bill had been searching for about an hour, but so far his efforts had been entirely in vain. He was looking for a card table. He knew that there was one around somewhere, since he could distinctly remember buying the wretched thing. It seemed only yesterday but in fact it was some time in 1938 that he had found the little folding table in a junk shop. He could also remember putting the thing away at some time, but the problem was where.

He also couldn't remember the reason why he had folded the thing up and stowed it in the rafters. The rafters! That's where he found it, covered with dust but still apparently intact. He stood on his Holden's roof and tugged away. A piece of steel piping fell on to the car bonnet with a clang and tumbled to the ground. It left behind a long dent and a trail of scratched paint where it had slithered downwards.

This did not deter Bill. Once he had made up his mind to do something, nothing was allowed to get in his way. Finally he got the table down and carried it into the shack. The reason behind all his efforts stood before him on the carpet — his recently acquired Model 100.

Ever since he bought the heavy machine he had been trying to work out where he was going to install it. Then, in the middle of the night, a flash of inspiration lit up his brain. Of course! The card table! He was for going out to the garage right away and fetching it but his wife had (justifiably) stamped on the idea. It was 2.30 in the morning.

Bill unfolded the spindly legs of the little table, now warped with age, and stood it upright. It didn't look right somehow. It had a decided wobble. Then he remembered why he had originally put the thing away. His wife had complained that it made things fall over. Bill had to agree with her about that. He had lost quite a lot of beer because of the table's nasty habits. Anyway, the weight of the Model 100 should make it sit properly. It was a heavy machine and if that wouldn't steady the table down, nothing would.

He set the table where he wanted it and then bent down to pick up the RTTY machine. He struggled it over to the table and placed it firmly on the top. The long-suffering table gave a quiet groan. Then the thin legs gradually splayed outwards. Bill watched as something very surprising happened. All four legs suddenly collapsed with dramatic effect and the table top bowed downwards at the same time. The end result was that the Model 100 landed with a thump on the floor. Fortunately, the impact was deadened slightly by the presence of Bill's feet.

Bill sat on the floor, nursing his feet, and looked at the debris. It was as though a house had collapsed on a matchbox. Splintered pieces of wood lay all around and the Model 100 was sitting triumphantly on top.

It looked as if Bill would have to think of something else to support the dratted machine. Meantime, the bits of wood might come in handy for starting the barbecue.

AR

GOLD COAST AMATEUR RADIO SOCIETY

The Eighth Annual Gold Coast HAMFEST will be held on Saturday, 9th November 1985, from 10am to 5pm at the Albert Waterways Community Centre; opposite Pacific Fair, Broadbeach.

Displays and demonstrations will include: all facets of amateur radio equipment, computers, lasers, videos, a WIA bookshop, jewellery and copper art. There will also be a ladies fitness class demonstration.

There will also be a variety of contests for the young and old, alike.

Further information may be obtained from Bill Stevens VK4YN, President of the GCARS, Box 588, Southport, Old. 4215, telephone (075) 35 7415.

ALL WELCOME!

AR

DEVIL NEWS — NW Branch News

It was pleasing to have a gathering of 25 at the last Club meeting. Two guests, Daniel VK4YDC and Roy Rothwell, were welcomed as was Darren Dell VK7ZDD from Hobart, an ex Devonport High School student, since moved south. It was pleasing to see Tony VK7AH back in the Secretary's chair and also for the Club to gain two new members.

Devonport High has a class in electronics and quite a number of the boys from the school now have call signs, a pleasing result to the school curriculum. The school call sign, VK7DHS, is operational most lunch hours and after school, so if they are heard, please give them a call.

The Club has had a pleasing month in the QSL department with 154 cards incoming and 84 outwards. Several W stations have been heard, so maybe the bands are picking up. Let's hope so!

Permission has been received for the Club to begin work on a 70cm repeater, so now it will be all stops out to get it operational!

The regular RTTY Broadcasts have had a few problems with 'Murphy' but not even he will keep the 'stout-hearted' down, so perseverance is the order of the day.

John Duncombe, the Club WICEN Co-ordinator has been studying the requirements needed for an exercise and checking areas of Map Reading so that the Club may be prepared for an exercise, when and if called upon.

Ron VK7RN related his experiences of the difficulties in erecting a tower in the township. It is not easy to get the requirements for amateur towers, anymore.

Bob VK7KAB has been placed in charge of fund raising activities, and it is hoped to have some good ideas operational by the next meeting.

The meeting concluded with a talk about the Club Repeater, and workings of same, from Andrew VK7ZAP

Contributed from Max Hardstaff VK7KY.

OVER TO YOU!

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publisher.

RADIO IS FUN

From time to time we find, in Amateur Radio and other magazines, which cater for the amateur radio enthusiast, articles or letters bemoaning the fact that the hobby is not what it should be. The complaints centre around many aspects of our activities buy always seem to present the problems without even a hint of the answers.

We are told that there are no young amateurs coming on to fill the gaps left by the silent keys, that appliance operating is the order of the day and that the days of experimentation are over. The standard of examinations are criticised for everything from being too difficult to being childishly simple, and the use of CW is considered everything from a discipline to an absolute waste of time and effort.

With a little thought, we can see that, In fact, all things are true to all men, the youngsters are not entering the hobby at the maximum possible rate, there are appliance operators, many of whom also happen to be highly skilled at their chosen task, the examinations are simple to the technically minded but very difficult to a hobbyist who has not entered the field before and CW can be a waste of time to one who is not interested In the mode, but it is a fine discipline and, as such, has great value. One of the biggest problems is that the radio field has progressed so rapidly, that it requires a technocrat to even start to understand some facets, but this is no reason to deny the hobbyist entry to the fold, therefore examinations must always be aimed at preliminary standards, otherwise the newcomer makes it no further than the first page.

I think the world of the amateur has forgotten the most important value that the hobby has, and really it is the *raison etre* of the entire scene. The simple word is *fun* — we can use many, many expressions to convey why we started and continued in the hobby, but they can be reduced to the one concept of *fun.* Of course, to sell this idea, something else is needed and to further this, I now turn to the 'Editorial' which started me typing this letter. Alan K2EEK, has captured much in his leader, which he assures me is the start of a series to try to convince the amateur world that they have a problem which they themselves must solve. Alan is the Editor of 'CQ Magazine' and has a large reading public, I only hope that those VKs who are unable to otherwise see his writings are given the opportunity to read of the Unicorn.

73,

Jim Swan VK2BQS,
PO Box 93,
Toongabbie, NSW. 2146.

The following is the editorial referred to in Jim's letter.

AMATEUR RADIO NEEDS A UNICORN

I am still at the awkward age — not old enough to be sage and wizened and not young enough to have all the answers. When I first got involved in amateur radio, people my present age were in charge of radio clubs and they did have all the answers, at least as far as kids my age were concerned. People my present age were the role models, the teachers, and the ones who gave us the terrible jobs on Field Day. They were the ones who quieted us down at meetings and told us they were sorry but we couldn't attend a club social because beer was going to be served and we were minors. They collected our dues, though, and gave us our first history lesson — an understanding of "taxation without representation."

In spite of the above, we persisted in amateur radio, because at the time there were no real alternatives. There really was no TV, a Sperry UNIVAC was unaffordable and would take up the whole block, sex was not to be invented for a few years, drugs came from a pharmacy when you were sick, and drinking was something "old folks" did to keep you from their parties.

But we knew how to make things better with the world, and we especially knew what the club and amateur radio really needed. We also knew that if we waited, someday we too would be that old and we would be running things *our way.* Well, those old folks just got older and more set in their ways. We got involved in other things and drifted away to school and to starting jobs and families, putting amateur radio on the back burner for a while. Oh, it was still there, but other things were a bit more important at the time. It just wasn't time for *our* time.

About the time when it became our time and we then could give out the terrible jobs at Field Day to the kids (kids and lids) and enjoy the parties without the kids (although they helped pay for the parties) and have meetings at which we could tell them to shut up, it became apparent that there were no kids. They were into CB. The ungrateful wretches wouldn't co-operate with the Master Plan.

The kids of the mid 1960s and early 70s couldn't see the value in taking abuse and in being one license grade behind, these being the rites of passage. It wasn't worthwhile to wait and endure so that you could do it to someone else later on. They were crass enough to want something immediately. CB was "dumb" enough to offer Instant acceptance to everyone on an equal level. Everyone could indulge in the same fantasy right at the same time. Everyone could talk "southern," pretend to be a truck driver, wear funny T-shirts, and display CB decals and belt buckles. CBers could form national groups, have large social gatherings for the whole family, and in general laugh a lot and have a good time. For shame, they didn't know.

We did offer to show them the error of their ways. We used all the old (there's that word again) winning ways: derision, contempt, and hostility. We honestly told them that they were not really enjoying themselves, and that we, and only we, had the answer. Some did opt for "conversion" and some kept both irons in the fire, but the majority of the 25 million went on somewhere else. They're all out there somewhere doing whatever now, but it's my guess that they're still looking for fun.

The computer craze caught the next generation or two of kids for many of the same reasons. Amateurs *are* also involved with computers, doing wonderful and interesting things, but even if every licensed amateur (and bootlegger) was involved with computers, the numbers wouldn't come anywhere near the number of civilians who are. By now, however, the panic is starting to set in as the realisation hits home. Where are the kids? Well, whatever the next electronic wizardry Is that comes down the pike, they will be there.

The one big, glaring fault with our amateur radio tradition is *NOT* the amateur radio part. We all agree that whatever it is, it is great. Why it doesn't attract kids may have more to do with the tradition part than the amateur radio part. To a lot of us it still is exciting, pleasurable, and immensely worthwhile. The problem is, how do you convey that? How do you share a world with someone perhaps less than half your age and treat that person as an equal and not a child being scolded? How do you explain the fun in working a "rare" one, in building a project, or in restoring a classic? How do you describe a hamfest to talk about friendships that transcend international and political boundaries? Amateur radio is an immense universe that is constantly changing. Those who limit the change in the name of "tradition", especially *their* tradition, have restricted the growth of amateur radio and have begun to choke its very life.

If we presume for a moment that we do have something of value to offer a youngster, namely amateur radio, then we have to examine it on its own and not as a character-building rite of passage. Since everyone involved in amateur radio feels very strongly about and extremely protective of his own definition of it, then there has to be a very worthwhile core to it that is universal. It is this essence that is the product, the commodity that must be sold. This essence, and I know that it's hard for some to believe, is FUN — FUN on its own terms and not part of any process.

Some of us have to loosen up and stop taking ourselves so very seriously. It's hard to sell a pastime that is so serious with portents of a lifelong career in engineering, physics, and Industrial management to a 12 year old. There is nothing wrong with those ambitions, but they have nothing to do with amateur radio here and now. Many careers, including mine, have come from amateur radio, but that was not the reason or motivation for getting Involved in the hobby. Initially, I thought that I would enjoy it and have a good time, period. It looked like fun.

Amateur radio has a lot to offer a youngster. We should know best. as it was offered to us. Today there is tremendous competition for a youngster's time and abilities. We need and can use that talent. It is we "older" folks who will benefit in the long run. It's up to us to come up with a way of vying for that time. The traditional cod liver oil approach of "take It" (*I took it)* even though it tastes bad and "some day *(maybe)* you'll understand when you're big and strong" just hasn't worked.

So it's up to *us* to find the way to sell the product. *Us* Is everyone, every organisation, and every group who has a stake in amateur radio. We as individuals or in groups have to compete for attention and interest. It's not easy. We have to think beyond ourselves. The product is proven and good. We have to bring it to market and sell it using modern techniques, just like an IBM. We have to develop catchy ways of drawing attention to amateur radio and creating an interest in what we do.

Recently the circus came to New York. For several days murder and mayhem, world crisis, and political unrest left the front pages in favour of the speculation on whether or not a certain animal featured in the circus was indeed a unicorn.

Prior to this the argument was academic, as the only unicorns available were those depicted in artwork and famous tapestries. However, from the numerous depictions of unicorns one would have to say that the general consensus of those who had seen these renderings would lead us to believe that a unicorn was more or less shaped like a horse. The circus unicorn was shaped like a goat, looked like a goat and made goat sounds, and in the dark with a hat on could be honestly mistaken for a goat. That it was a goat was finally and officially determined by the US government after much deliberation and careful inspection.

The circus I'm sure revelled in the publicity, and I don't think that too many people were disappointed in discovering that the one-horned goat was not really a fabled unicorn. A lot of folks, though, heard about the circus being in town and went to see for themselves to "decide" on the authenticity first hand. After all, a real unicorn is a serious thing, and we shouldn't be swayed by all of the extra tickets the circus sold.

Well, the unicorn idea was just used, and it's too soon to try to pass off a squirrel as a miniature dinosaur. The rock video option is still open, and it's still possible to get amateur radio on the charts via a hit single. Publicity is where you can find it these days. Most of our publicity has come about via extremes, natural disasters, accidents, wars, and space flights. They are hard to generate on demand, hard to control, and usually involve some measure of tragedy. It's not really an "up" sales tool.

We've got to come up with something that we can use during peacetime, sunshine, and happiness and that's exciting, novel, and captures the imagination. I know we can do it. We've waited for our time, and our time is now.

Editorial from CQ June 1985, written by, and printed with the kind permission of Alan Dorhofer K2EEK, Editor, CQ The Radio Amateur's Journal.

AR

EVERYTHING IN READINESS

LEPARC have received a call sign for the International Youth Year DXpedition to Boston Island from 8th to 14th December 1985.

As mentioned in an earlier magazine, the students are busy constructing a rig, which will be used for some contacts on 80 and 40 metres, and there will be a variety of other equipment, to ensure adequate band coverage.

The allocated call sign is VK5IYY, but the Club has decided to use the option given by DOC, the VI prefix.

Whilst operational on Boston Island, the Club will be using portable power. The Commonwealth Bank are sponsoring QSL cards and there is a local competition to design the card. Things are looking good!

73,

Carol McKenzie VK5PWA,
President, LEPARC.
97 Dublin Street,
Port Lincoln, SA. 5606.

WE'RE ON A WINNER? ? ?

Congratulations on allowing me to read the latest edition of Amateur Radio as soon as I received it. Previously our delightful representative at the Postal Service would carefully fold the issue and meticulously insert it through the letterbox aperture in such a way that the rain would completely permeate it.

Now I find that all the unwanted bills are saturated with the local rain and my edition of AR is now completely dry and able to be read, immediately.

Admittedly, I do miss the opportunity to sit and carefully hold the AR carefully in front of the heater to dry it without the pages sticking together. I also find I now have a complete magazine whereas, before, often many pieces tore off with my handling of the paper.

Keep up the good work.

Peter Ford VK3YTB,
7 Sherman Street,
Forest Hill, Vic. 3131.
AR

A BIG OPPORTUNITY FOR YOUNG PEOPLE!

Do you know a young person between the ages of 12 and 17, who wants to get into amateur radio? A number of amateurs from Sydney are planning a 10 or 12 day live-in Novice Amateur Radio Course during the 1986 May school holidays.

The camp will involve five or six amateurs as lecturers and supervisors. There will be places for about 24 students. The camp will be held near Sydney and will include both theory and practical electronics, regulations and Morse code. Other activities may include swimming, bushwalking and sports.

They also anticipate that a full amateur station will be set up, including AMTOR, Packet Radio and Satellites. This will give the students some on air experience.

Interested students and amateurs should contact the undersigned, enclosing a SAE.

Yours faithfully,

Peter O'Conneli VK2JJJ
3A Algernon Street,
Oatley, NSW. 2223.
AR

WIA 75th AWARDS

I am in receipt of the September Amateur Radio, and on page 6 there is a list of the WIA 75th Award recipients.

Against No 147 on the list, appears my name, B L Mills, but no call sign is indicated. This is the only entry shown thus.

Why was this printed this way? It is obvious that there must be a call sign involved, and that this is known to the awards manager. I have had this call for 39 years, and been a member of the WIA for 34 years, so why was the call sign not printed? If you are to use a person's name, then why not do it correctly, and not incorrectly.

I have no objection to my name being published, with call sign, but I certainly do object to it in the form in which it was used, which means nothing to anybody.

Yours faithfully,

B L Mills VK2AJE,
Box 10,
Cronulia, NSW. 2230.

Unfortunately, your call sign was inadvertently omitted from the list when it was typed for Amateur Radio and the Producers of the magazine thought it was meant to have just the name published. I am deeply sorry for the upset it has caused you, OM. — Jim Linton VK3PC, WIA 75th Awards Manager.

AR

REPLY TO AN EDITORIAL

The answers to the questions, asked in the September AR Editorial, probably need airing in Amateur Radio before our PRO uses them in a publicity campaign, or whatever he plans. I am sure Jim could proceed with more confidence, knowing that the issues have been debated among our widely scattered members.

I believe that the second question is the most important; the answer to that one will provide the clues to answers for the others.

Is the hobby (?) being promoted adequately? My answer is — yes, but in the wrong way. The cover picture of the September AR is a good example. Is that an amateur radio station? My estimate of the cost is $15 000 and that doesn't include the aerial farm. Inside the September Issue, for those people contemplating making a start, the advertisers provide the following information.

Morse Key — $50
World Clock — $75
HF Transceiver — $1099
Power Supply — $280
Antenna Tuner — $400
SWR/PWR Meter — $95
Broadband Dipole (?) — $150
Total — $2149

Most parents would not spend that amount to get young Jenny or Johnny started in the hobby of their choice.

Of course, we say it is not necessary to spend even half that amount to get started. Why not 'promote' that fact? The WIA Book, Volume 1, is a good example of what can be done by the members; I suggest something similar devoted entirely to showing young people how to become involved in a branch of modern science and technology at very little cost and of great benefit to themselves. Such a book could be distributed free to all public and school libraries. It would have more chance of acceptance if prepared by members younger than 25 years. Count me out, I had my 65th birthday in September!

Lindsay Lawless VK3ANJ,
Box 112,
Lakes Entrance, Vic. 3909.

I WUZ GUNNA

Over the last few years, I read in Amateur Radio, a number of stories about amateurs of quite a number of years standing, and was always interested in their stories of the early days. I knew such an old timer, I told myself, I must get around to taping his story one of these days and write it up for AR.

I had heard him talk of a lot of interesting things, anecdotes, old equipment, broadcasting music in New Guinea before the war, but I did not take notes at the time, thinking that I could come back later and tape it all.

His obituary appears in this issue and if it appears a little thin on detail radiowise, that is because I did not get around to getting his story before he passed on. So another gold mine of amateur radio history is lost to us.

So as the title suggests, *"I wuz gunna"*, but didn't. The moral of this story is *'don't let this happen to you'*. If you know an old timer, get your tape recorder out **NOW** and get the raw information on tape, before it is too late.

Brian Mennis VK4XS,
11 Jethro Street,
Aspley, Old. 4034.

FURTHER TO SATELLITE ATS 1

I refer to the correspondence in Amateur Radio, August 1985, on the location of satellite ATS 1 (66/110A).

It is surprising that both Ash VK3CIT and the Technical Editor assume that a Geostationary Satellite will remain in one location over a period of five years.

Although ATS 1 was at circa 150 degrees west longitude in the 1970s, it was reported at 176.5 degrees west in June 1982. Shortly after this date, the satellite was moved to circa 164 degrees east and remained in that position until late 1984, when it began moving eastwards, reaching 179.08 degrees east on the 12th February 1985.

It has since travelled westward to its latest reported position of 155.14 degrees east, on 15th June 1985. This and other data on ATS 1, has been regularly included in the AMSAT Australia column in Amateur Radio.

SIRIO (presumably 77/080A), also referred to, has remained reasonably stable during the past five years, at 64.5 degrees east, +/- two degrees.

My data source is the NASA Spacewarn Bulletins.

Obituaries

RALPH L WILLIAMSON VK3BRF

It is with deepest regret that we report the passing of Ralph Williamson, on 3rd August 1985, while on holidays, with his wife in Queensland.

Even though confined to a wheelchair, Ralph was an ardent CW enthusiast who's 'bug-sent' Morse was always a pleasure to rceceive.

With the aid of his trusty 'Simplex Auto' he became famous for the expression, "G'day" when initiating a contact, and "Happy daze" when signing. His jokes, stories and humour on the key were unparalleled. Ralph's humour made CW a real joy for all who listened.

Ralph was a regular on the Friday night North West CW Net, (on 3,510MHz at 1130UTC) and it was here that we learned of his many exploits; everything form camping with his 'bride', operating whilst mobile (both car and wheelchair), to rolling his chair into a bramble bush. It was with wit that Ralph had the fortitude to look on the bright side of things. Hence he usually brightened the day of everyone he came in contact with.

While on radio, his outlook always reflected sincerity and mateship. All of Ralph's fellow amateurs were deeply saddened by his passing. Thankfully memories linger.

Deepest sympathy is extended to his wife Jolean and family. In Ralph's own words; "I can't stay long tonight chaps, as the batteries in my chair are flat. So I'd better hit the perch early so my bride can put them on the charger. Happy daze. 73"

Ralph will be greatly missed.

HARRY SELMAN VK3CM

May my YF and I pay our respects to a very lovely OOTer who never failed to visit us each time he came to Sunny Queensland — yearly, if he could manage it. Like so many pioneer Australians of that era, he kept us amused with an endless variety of humourous stories — his recall of past events was excellent. Since he obtained his licence in 1925, his interest in amateur radio never waned.

Harry's death, on 18th September 1985, came as a shock, as he had paid us a visit only recently and appeared chipper and quite active. He had driven on his own from VK3 and was about to return to Geelong.

Liking Harry VK3CM, was very easy. His natural goodwill and gentlemanly manner are qualities amateur radio can ill afford to lose. The fraternity is very much the poorer for his passing.

Deepest sympathy is extended to his two sons and families in Melbourne and Brisbane.

Alan Shawamith VK4SS

GILBERT POLLOCK VK2FU

Gilbert was born in Cumberland, UK, in 1911, but was taken over the border when he was two years of age, and really remained a Scot for the rest of his life. He migrated to Sydney in 1922 to live in Belmore. After school days at Canterbury Boys High School, he joined his family's firm, Pollock Electrical Co. Later in 1930 he became Chief Engineer at Radio 2KA, Katoomba.

He was an active member of the Lakemba Radio Club and became VK2XU in 1931. Over the next few years Gilbert made hundreds of contacts.

In 1937, Gilbert returned to London, obtained the call sign G2OY, and had relinquished VK2XU and his mobile call, VK2YQ.

During the war years he was an engineer at the Scottish Regional Transmitter at Westerglen and later ran as electrical and radio retail and repair service in Falkirk.

In 1951, he returned to Sydney and took out VK2FU, a call sign he retained to his death.

A move to Blaxland, in the Blue Mountains, during 1962, saw Gilbert and his sons, Jim VK2WX and Adrian VK2FZ, erecting a 100 feet (30m) mast to accommodate beams for 20, 15 and 10 metres. These came into operation in 1965, with phenomenal signals to Europe and the world.

In 1973, he moved to Wentworth Falls but as this was a high wind area, Gilbert used wire antennas for HF operation and verticals for VHF He was active on all bands, 80 to two metres and was always particularly happy to speak with G and GM, where he had many amateur friends.

Gilbert was on a sentimental visit to G'land when he became ill. He passed away in Edinburgh on 31st July 1985 and was interred in a country church yard in the quiet Scottish town of Selkirk.

Deepest sympathy to his widow Nancy, daughter Helen and sons Adrian and Jim.

John Warren VK2QX
AR

BILL HOLLAND VK4WT

Vale Bill Holland VK4WT, who passed away at his home at Strathpine, near Brisbane, on 30th July 1985.

Bill obtained his AOCP in Melbourne during the late 1920s, his certificate being number 114. Unfortunately, his originally allocated call sign is unknown. He had been playing with radio for sometime before obtaining his licence, and according to his wife, Jess, he never stopped.

After attending a state school in Melbourne, followed by 18 months doing a fitting and turning course, Bill took on a variety of jobs, including gold prospecting, rabbit shooting and ironing. He also tried to establish a small radio repair business, but, with the run up to the Depression, there was not much money around for such luxuries as radios, and this venture did not prosper.

At this time, gold was big news in New Guinea, and as jobs were very difficult to get in Melbourne, Bill set off for Wau, the gold centre at that time. Working in the Wau/Bulolo area, Bill had a variety of positions, including barman, mechanic, miner and eventually an electrician with Bulolo Gold Dredging. It was during this time that Bill first obtained the call sign VK9BW, and was active for most of his stay in Wau. During this time, he also met his future wife, Jess, who was staying with her brother, the local publican.

Following the Japanese landing during WWII, Bill and Jess were evacuated to Australia, where Bill was placed into radio in Melbourne under the manpower regulations. He was eventually able to join the Army in 1944 and was posted to Port Moresby, where he was involved with maintenance of the Unit's radio equipment.

After the war, Bill tried to settle down at Mackay, in Queensland, with the call sign VK4BQ, but New Guinea called and he returned, this time being located at Rabaul, again with the call sign VK9BW. Continuing in radio, he worked as a serviceman, eventually have his own business. However, the advent of transistorised equipment, children at boarding school, and his health all forced him to leave and settle in Strathpine. As his previous VK4 call had been reallocated, he was issued with VK4WT. Always a HF operator, he remained active, both operating and constructing, until his passing at the age of 74.

Bill will be missed by his many friends, and particularly those he met on the amateur bands over more than 50 years.

He is survived by his widow Jess and four children.

Brian Mennis VK4XS.

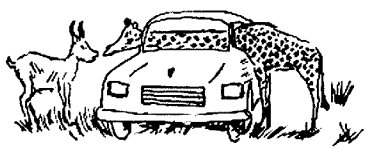
NOTICE



DEADLINE

All copy for inclusion in the January 1986 issue of Amateur Radio, including regular columns and Hamads, must arrive at PO Box 300, Caulfield South, Vic. 3162, at the latest, by midday, 11th November 1985.

HAMADS

PLEASE NOTE: *If you are advertising items FOR SALE and WANTED please write each on separate sheets, including ALL details, eg Name, Address, on both. Please write copy for your Hamad as clearly as possible, preferably typed.*

- **Please insert STD code with phone numbers when you advertise.**
- Eight lines free to all WIA members. $9 per 10 words minimum for non-members.
- Copy in typescript please or in block letters double spaced to PO Box 300, Caulfield South 3162.
- Repeats may be charged at full rates.
- QTHR means address is correct as set out in the WIA current Call Book.

Ordinary Hamads submitted from members who are deemed to be in the general electronics retail and wholesale distributive trades should be certified as referring only to private articles not being resold for merchandising purposes.

Conditions for commercial advertising are as follows: The rate is $22.50 for four lines, plus $2 per line (or part thereof) minimum charge $22.50 pre-payable. Copy is required by the deadline as stated below indexes on page 1.

YAESU FT-980: Computer aided, full coverage tcvr with mic & access. Still in box. $1800. Also Yaesu YP-150Z dummy load, still in box. $100. Also HC-500 Universal ant coupler, as new. $100. Must sell, going overseas. Ph: (051) 99 2393 or (051) 74 1381(BH).

FOR SALE — QLD

COMPLETE STATION: Including Kenwood TS-820S, 30' tower, ex Army, 5 band vertical, power mod SWR meter. Kenwood mic MC-60. Rotator, sweep & mark gen, as is. Reflected pwr meter. 3 home-brew ATVs, ext spkr, 2 VHF tcvrs, 12V less crystals. Numerous books, 15m Yagi, spares. C Parsons, 38 Valerie Street, Clontarf, Qld. 4019.

ICOM 730: New condition, scarcely used. Complete with all access, manual, orig pack. $750. VK4YF, QTHR. Ph: (071) 82 1183.

MAGAZINES: 300, including Elect Aust, Amateur Radio, CQ, 73. Full set of Amateur Radio Action, plus others. Will swap for old radio mags/books or sell for best offers. Details to VK4NGW, QTHR. Ph: (07) 341 5039.

144MHz VALVE CAVITY AMP: 4CX250B, silver plated cavity, tuneable, no power supply, $100. KR-400 rotator, used one month, in EC. $100. Noel VK4BTX. Ph: (074) 22 9266, 8am-4pm. (free number).

ADVERTISERS' INDEX

KENWOOD

TS-940S

HF TRANSCEIVER

The TS-940S is a competition class HF transceiver having every conceivable feature, and is designed for SSB, CW, AM, FM and FSK modes of operation on all 160 through 10 meter Amateur bands, including the new WARC bands. It incorporates an outstanding 150 kHz to 30 MHz general coverage receiver having a superior dynamic range (102 dB typical on 20 meters, 50 kHz spacing, 500 Hz CW bandwidth).

Engineered with the serious DX'er/contest operator in mind, the TS-940S features a wide range of innovative interference rejection circuits, including SSB IF slope tuning, CW VBT (Variable bandwidth tuning), IF notch filter, AF tune circuit, Narrow/Wide filter selection, CW variable pitch control, dual-mode noise blanker, and RIT plus XIT. The use of a new microprocessor with advanced digital technology controlled operating features, plus two VFO's, 40 memory channels, programmable memory and band scans, a large fluorescent tube digital display with analog-type sub-scale for frequency indication, and a new dot-matrix LCD sub-display for showing graphic characteristics and messages, all serve to provide maximum flexibility and ease of operation. In addition, a CW full break-in circuit, switchable to semi break-in, a built-in automatic antenna tuner, a solid-state final amplifier that is powered from a higher voltage source, a speech processor, all-mode squelch, and a host of other convenience features all add up to even greater versatility of use in fast-paced DX operations. With its power supply and antenna tuner built-in, and with its new whisper-quiet cooling system, the TS-940S is a complete, all-in-one type transceiver that brings tomorrow's sophistication to today's serious enthusiast.

Your entire spectrum? Covered!

Icom's latest dual band IC-3200A delivers a powerful 25W punch at VHF & UHF. Big performance. Small size. *Lowest price dual bander on the market.

HF, VHF, UHF: Icom's spectrum of technology.

An ultra compact 100W HF transceiver small enough to go mobile. The IC-735 combines size, superior performance, & FM, CW, LSB, USB, AM to become a new HF standard: yet the simplified front panel makes the IC-735 easy to use, even when mobile.

Powerful, clean performance in the bands you use most. Icom's team perform for you at your local authorized dealer.

SPECIAL FEATURES

TECHNICAL FEATURES

REGULAR FEATURES

Here we are at the close of another year. During 1985, the WIA's 75th Anniversary Year, Amateur Radio has presented many historical stories, including some special contributions from the Divisions. All in all, it has been an interesting year, and it has certainly been interesting for the Old Timers to reminisce, and it has given the younger members an insight into some of the difficulties that were faced by the pioneers of amateur radio.

Locator Systems have come to the fore during 1985, and this month's magazine has another computer programme to locate your Locator using the VIC-20 series of computers, see page 10.

Reg VK2ELG, a favourite writer with many readers for his series of Clandestine articles has put pen-to-paper again. This time Reg describes how he constructed a drink heater element for use of his fellow POWs in Germany, see page 14.

A recent happening on the amateur radio scene has been the invaluable assistance it has given to many during the tragic earthquakes in Mexico City Jim VK3PC, gives a brief discription of the services provided by the Australian Traffic Net, page 19.

Chris Long, former Acting Curator of Electronics at the Museum of Victoria, a 'doyen' of the history of electronics, has compiled a history of some of the first magazines available to the radio experimenter, page 21. Chris has spent many hours perusing the magazines at the State Library of Victorian, and has managed to obtain some photocopies of the covers of some of some of the more interesting ones.

December is the time for the publication of the entire index for the year, so turn to page 26 and see if you have missed reading an article of interest. Next month will also feature the Technical Index for the past five years.

Season Greetings to all readers!

B·P

DEADLINE

All copy for inclusion in the February 1986 issue of Amateur Radio, including regular columns and Hamads, must arrive at PO Box 300, Caulfield South, Vic. 3162, at the latest, by midday, 2nd January 1986.

EDITOR'S COMMENT

1985 IN RETROSPECT

As our 75th Anniversary year draws to its close we may recollect several highlights, the most recent being the Anniversary Dinner in November, at Melbourne's Southern Cross Hotel. Very rarely, perhaps never before, have leaders representing so large a proportion of the world's radio amateurs come together under one roof. The combination of our Dinner and the IARU Region 3 Conference immediately following it in Auckland, proved to be a powerful attraction to this part of the world for the leading executives of amateur societies from 15 overseas countries, and all three ITU/IARU Regions. We were honoured to have as official guests, the Secretary General of the ITU, Mr Richard Butler, and our Australian Minister for Communications, Mr Michael Duffy.

During the year we received letters of congratulation on our 75th Anniversary from our sister societies in almost 40 countries, and we can be sure that the WIA, and its standing as the oldest amateur society in the world, are better known everywhere as a result of our anniversary activities.

Throughout the year we have published many items of historical interest under the general title of "75th Nostalgia", and these have been received with interest, particularly by the older members. Unfortunately, this has reduced the space available for technical articles, but from now on the proportion of technical material will be much greater.

The WIA 75 Award seems to have been very successful, judging by the lists so far published of those who have qualified for it. Hopefully even your busy Editor may find time before the end of December to make the remaining contacts needed to total 75!

Altogether, the work that has been done throughout the year by the enthusiastic volunteers on the 75th Anniversary Committee and their helpers in all Divisions has been a great boost to the WIA and to amateur radio in Australia.

To round off this most auspicious year, it is now my privilege once again, on behalf of the Publications Committee, and all those involved in producing this magazine, to wish you all a very Merry Christmas and may 1986 prove to be the happiest of New Years.

Bill Rice VK3ABP

WIA NEWS

CISPR

The WIA, as a member of the Standards Association of Australia, is concerned with the activities of a number of international standards bodies, including the Special International Committee on Radio Interference (CISPR). Sydney was the recent venue of a major meeting of CISPR Sub-Committees, at which the WIA was represented, both in an official and social capacity.

Firstly, some background on CISPR. This is an international committee directly associated with the International Electrotechnical Commission (IEC). It is responsible for the standardisation of Electromagnetic Interference Measurement, and for the recommendation of appropriate standards for the protection of radio services. A number of sub-committees covers such subjects as; Methods of Measurement of Interference, Industrial Scientific and Medical Equipment, Interference from Overhead Power Lines, High Voltage Equipment and Electric Traction Systems, as well as other well-known sources of RFI problems.

All sub-committees of CISPR are of some interest to the amateur service, but probably the most important is Sub-Committee E, which deals with the interference characteristics of radio receivers (and associated equipment). The immunity of television receivers, broadcast receivers, audio frequency amplifiers, etc is covered by this sub-committee, and a special working group.

The Australian Standards Association is the accredited point of contact with CISPR, and its Committee TE/3 is the responsible national group for electromagnetic interference. The WIA, through its representation on the TE/3 Committee, is able to monitor international activity in this area, and contribute to the work of SAA, CISPR, and the IEC on a continuing basis.

Since CISPR has its headquarters in Geneva, most of its meetings are held in European countries. It was, therefore, a very special occasion to have a full scale meeting of all sub-committees of CISPR in Sydney during August/September 1985.

Allan Foxcroft VK3AE, WIA Representative on the SAA Committee TE/3, was a member of the Australian delegation to the CISPR meeting, and attended sessions of Sub-Committee E. The delegation was able to contribute to the proceedings, particularly in respect to methods of measurement of immunity. It was also of significance that quite independent Australian work on the setting of immunity levels was, in many areas, closely in line with those proposed within the CISPR working group. This will finally lead to much-needed Australian standards on the immunity performance of commercial television receivers, AF amplifiers, etc.

The Federal Executive also took action to contribute financially to a function held at the end of the Conference to farewell international delegates. The function, held in the Board Room of Philips Industries, North Sydney, was jointly sponsored by the Institution of Radio and Electronics Engineers, (WIAs sister organisation), the Institution of Engineers, and the Wireless Institute of Australia.

Four members of the WIA attended officially — Allan Foxcroft, from Federal Executive, and Peter Jeremy, Tim Mills and Stephen Pall from the New South Wales Division.

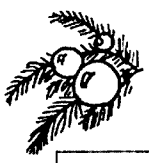
The Institute's involvement in the function proved most effective in bringing our organisation, and hobby to the attention of international delegates to CISPR. The WIA's 75th Anniversary celebrations were referred to by a number of speakers, and this led to reminiscences of amateur activities in the welcoming address by the immediate past-President of the IREE, Dr Wing. 75th Anniversary posters, which were on display, were quickly 'souvenired' — and the pity was that we did not have more to distribute.

The fact that the WIA 'was probably the senior partner emerging from the IREE/WIA common origins' was conceded by Mr Ian Shearman, in a jocular fashion, during his address to delegates on behalf of the Electrotechnical Committee of the SAA.

The contacts made, and the publicity gained, for the amateur service, and the WIA in particular, are considered to be of great value, and will undoubtedly facilitate negotiation of the amateur case in the future.

Allan Foxcroft VK3AE
AR

SEASONS GREETINGS



QSP

Our 75th Anniversary Year is now drawing to a close and, on behalf of the Executive, I would like to convey to you all the best of Season's Greetings.

This year, a milestone in amateur radio, has resulted in a close examination being made of the past history of the WIA, which, of course, is intimately connected with the development of amateur radio, in Australia.

In the early days, amateurs took up the challenge of the unknown. They were certainly to the fore-front in advancing technology, such as the use of shortwaves, during the early 20s.

Since those days, there has been a technological explosion, the rate of change being almost exponential.

The sophistication, and complexity, of modern frontier research makes it very expensive, and as a consequence, puts it largely out of the range of an individual, and into that of an institution.

However, this does not mean that the individual, who had a place in the past, has lost it. But, by necessity, his, or her contribution perhaps cannot be as great as that made by the individual in the pioneering days.

Because of the diverse nature of radio communications, there will always be a challenge for the individual to advance.

The Amateur Radio Service is a Radio Communications Service, recognised by the International Telecommunications Union, and defined by it as follows:

"Amateur Service: a radio communications service for the purpose of self-training, intercommunication and technical investigations carried out by amateurs. That is – by duly authorised persons interested in radio technique solely with a personal aim, and without pecuniary interest".

This definition is as pertinent now as it has ever been.

It acknowledges that there are individuals to whom there is a desire to become involved in radio communications, just for the love of it.

It is obviously necessary to regulate the use of the radio frequency spectrum internationally, to avoid chaos. In this regulated spectrum a space has been provided for the Amateur Service.

Because of the diverse nature of the many aspects of developing radio communications, recognition has been made of possible future needs.

The Amateur Service, because of its unique status as a radio communications service that is not dedicated to any specific purpose has, in the past, provided communications in many emergency situations, and will continue to do so in the future. It does this at minimal cost to the community.

The Amateur Service, because radio waves do not stop at national borders, is a great ambassador of international goodwill.

In conclusion, amateur radio to the individual amateur, is what he or she wishes to make it.

There is a place for all, no matter what their special interests may be.

Remember, we are all amateurs because we want to be, not because we have to be.

David Wardlaw VK3ADW
FEDERAL PRESIDENT

WIA CW CONTEST PRESENTATION

The President's Cup and a Morse key, donated by William Willis, were presented to the winner of the 1985 WIA CW Contest at the Oxley Region Amateur Radio Club's Annual Field Day, 1985. The winner was Oxley Club Member Peter Alexander VK2PA.

The Club was honoured by the presence of Peter Jeremy VK2PJ, Jeff Pages VK2BYY, and Tim Mills VK2ZTM, members of the NSW WIA Executive, who journeyed to Port Macquarie for the presentation and Field Day.

Peter VK2PJ, congratulated Peter VK2PA, on his great performance, after giving those in attendance a brief history of the President's Cup. Peter also expressed the appreciation of the WIA NSW Division for VK2PA bringing the Cup to New South Wales.

The were approximately 150 visitors and club members present at the presentation, and the applause was deafening when Peter responded. He said it was quite an emotional win for him as he considered it to be a most prestigous event to capture. More so, because of the history attached to the Cup, added to 1985 being the 75th Anniversary Year. Offers came from members to help him keep the Cup 'polished'. Peter threw down the challenge that he will hold the Cup for 1986, against all-comers!

KEY TROPHY

At a special Club Dinner Night, members of the Club gathered to once again congratulate Peter VK2PA, as he received a specially mounted Morse key, very kindly provided by William Willis and Company Pty Ltd.

Club President, Keith VK2KDL spoke highly of Peter's dedication to amateur radio spanning some 45 years. In particular, Keith referred to Peter's long years of recognition in the CW field of amateur radio.

Peter responded by thanking the thoughtfulness of the management of William Willis for donating such a fine trophy, as a back- up to the President's

Cup for 1985. He said it will go into 'operation' and will hold pride of place in his home.

Peter had 722 contacts in the recent 24 hour VK-ZL Oceania Contest - an average of around 30 contacts per hour. All contacts were fully signed and took place on the 80, 40, 20, and 15 metre bands. Approximately 400 contacts were on 40 metres, and included 195 prefixes. A truly commendable effort again, Peter

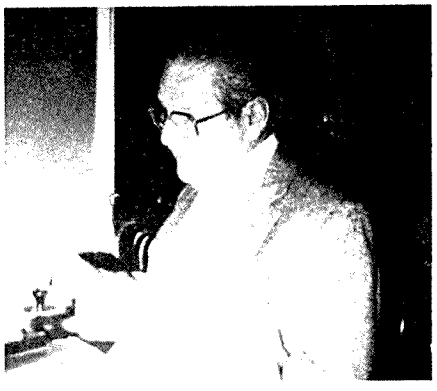
Oxley Region ARC President, Keith VK2KDL, presents the President's Cup to Peter VK2PA, winner of the WIA CW Contest 1985.

Peter VK2PA proudly displays the President's CW Cup which was presented to him at the Annual Field Day of the Oxley Region ARC, 1985.



"The Touch of a Master's Hand". Peter VK2PA tests the key presented to him for his winning entry in the WIA CW Contest.

The Morse Key Trophy presented on behalf of William Willis to the winner of the WIA CW Contest.

SCHOOL BEGINS

The Australian Film and Television School began a 35-week training programme for SBS radio co-ordinators and broadcasters in Melbourne (21st October), and Sydney (29th October).

The project is aimed at enhancing the growth of quality ethnic broadcasting in Australia, and will run until August 1986.

For more information contact the Course Co-ordinator Joan Sharry (02) 887 1666, or the Assistant Co-ordinator Georgina Guilfoyle (03) 328 2517.

Contributed by Sandy George, Publicity/Information Officer

SAFE TUNE-UP WITH THE FT-7

Bruce Doyle VK6ABD,
PO Box 85, Tuart Hill, WA. 6060

A discussion with a fellow amateur, Ross VK6DA, on the problems encountered when using transceivers with solid state finals in conjunction with an ATU, resulted in an article being resurrected from Ross's collection of Rad Com Journals, on an ATU pre match unit that always presents approximately 50 ohms to the transceiver, while adjustments are made to the ATU.

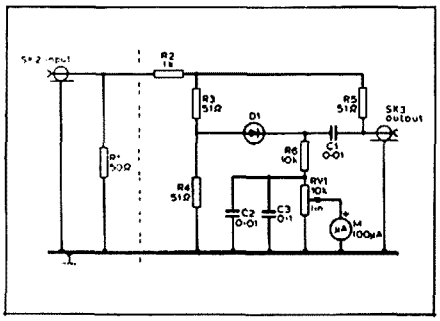
The article may be of interest to operators of solid state and valve transceivers alike, as the unit described also allows tuning of a transceiver into the antenna without any unwelcome carriers being transmitted into our already crowded bands.

The original unit design had the operator physically unplugging the unit from the transmission line to be able to conduct a QSO, but by incorporating a three pole/four way rotary switch (wired as in Figure 3), the unit may be built either as a separate unit or into the ATU and left in line.

I have tested the unit using both a TS-830S and TS-430S and have been able to tune a portable 80 metr helical dipole without the stations that I have wished to work, knowing that I had tuned up on the frequency that they were operating on.

The following is the article, written by Les May G4HHS, which appeared in Radio Communication, August 1981, page 715.

When the author's HW100 was replaced by an FT-7, no particular antenna matching problem was envisaged, as the half-size G5RV could be matched on 3.5 to 21MHz with the E-Zee Match in use. However, conversations with other operators indicated that the longevity of the transistors in modern solid-state power amplifiers was a matter of some concern; whether they were used operating valve power amplifiers is a poorly matched condition was not clear. What was well known was that the FT-7 and TS-120V transceivers must be operated with an output VSWR of less than 1.5:1.

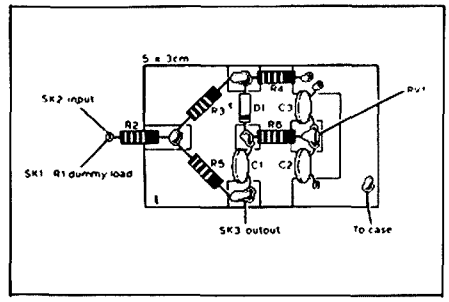


Provided a suitably tuned matching device is used, this does not present any problem. The procedure normally adopted with the FT-7 is to tune-up into a dummy load, and then to replace the dummy load with the E-Zee Match pretuned to the positions previously determined and logged when the HW-100 was in use. By pretuning the matching unit the instantaneous VSWR is always low enough for safety, and the possibility of a serious mismatch (which can occur during tune-up) is avoided. The requirements to pretune the antenna or ATU is stressed in the FT-7 manual. A major attraction of a compact lightweight rig is the opportunity it affords for mobile and portable operation, yet the pretuning requirements may act as something of a deterrent.

When a demonstration station was set up using a newly made G5RV antenna at the author's school, it was not possible to pretune the matching unit, and it was quickly realised that the instantaneous VSWR during the tune-up process was unacceptably high. Adjusting for maximum noise on receive was simply not good enough. What was required was a device which allowed the FT-7 always to 'see' 50 ohms while the antenna or ATU was being adjusted, however serious the instantaneous mismatch. A little reading and some thought produced the device shown in Figure 1, which was suggested by W Hayward and D DeMaw in their book 'Solid-state design for the radio amateur'.

The mode of operation may be understood by dividing the diagram at the dotted line. To the left R1 is a dummy load able to dissipate the output-power of the transceiver. It is shunted by everything to the right, made up of R2 and the effective resistance of R3, R4 and R5 together with the unmatched reactance of the antenna or ATU. It will be seen that whatever the condition at the output the shunting resistance will always exceed 1,000 ohms. A parallel combination of 50 ohms and 1,000 ohms resus in the load 'seen' by the transceiver being about 48 ohms, which is near enough to 50 ohms to be of no consequence.

The matching process itself is monitored by the RF bridge formed by R3, R4 and R5 and the output to the ATU. Because the three resistors are all 51 ohms the bridge is balanced when the ATU presents a pure resistance of 51 ohms. D1, C1, and the meter form an RF detector to sense the balance point; when the meter reads zero the bridge is balanced. Loading by the meter is reduced by R6 and RF is bypassed by C2 and C3. A sensitivity control was fitted but found to be unnecessary with the FT-7, as explained later. Some rough calculations suggested that R2 might need to be reduced to 500 ohms and that a diode with low turn-on voltage would be required. Because only a null reading, not a measurement, is desired, the meter does not have to be very special; a meter of the type to be found in portable cassette recorders will do provided it is no less sensitive than 100uA.



The layout of the bridge should be as symmetrical as possible, and a PCB layout is given in Figure 2. Because the board is symmetrical the input and output sides can be interchanged to suit the particular operator's convenience. Part of the board must be connected to the case by a thick wire, and a short length of desoldering braid is convenient. The 'works' fit comfortably into a 15 by 8 by 5cm diecast box. This is heavy enough to ensure the unit sits still on the bench, leaving both hands free for tuning up. The board is self-supporting on the input and output wires to the bridge. After wiring up and checking for shorts, the unit can be tested.

With a dummy load fitted to SK1, the input to SK2, SK3 not connected (to ensure maximum mismatch), and RV1 at minimum, power can be applied to the unit via an in-line VSWR bridge.

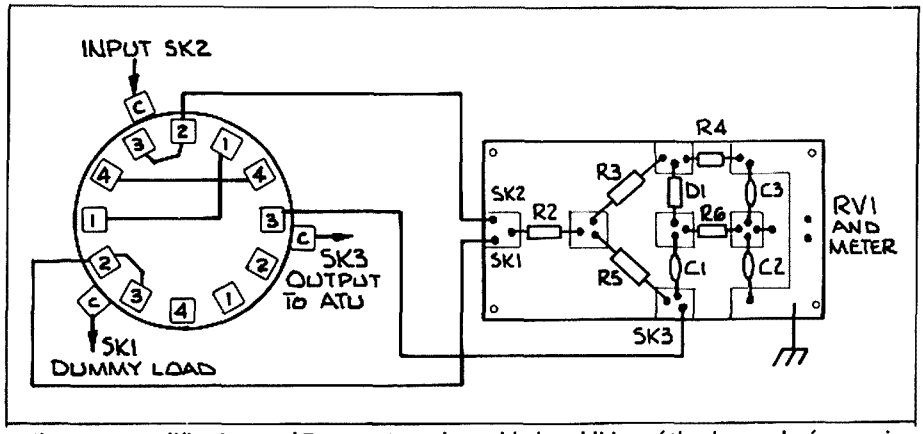


Figure 3 — Modifications and Tune up Procedure with the addition of the three pole, four position switch.

1 Function Switch . . . Dummy Load; Tune Transceiver if applicable.

2 Function Switch . . . Meter Set; Key down Transceiver, set meter for full scale deflection with a 10 kohm linear pot.

3 Function Switch . . . ATU preset; Key down transceiver, adjust ATU until preset null meter reads zero.

4 Function Switch . . . Antenna Only; Check inline SWR meter. If necessary touchup ATU.

If all is well in-line reflected power will be zero. The sensitivity control should be rotated until the meter reads full scale. If FSD cannot be obtained, R2 can be reduced but should not be less than 500 ohms. In practice, it does not matter if the meter reads a little less than full scale, and RV1 can be preset or left out entirely in this case. When the ATU is connected, the meter reading should fall a little. By adjustment, the match can be improved until the reading is zero, and no movement should be perceptible when the transmitter is keyed on and off. Some care is needed to ensure that the reading obtained is zero, as this indicates that the antenna is very well matched. When the antenna or ATU is connected to the output of the in-line bridge, the match will be found to be very close to the best obtainable with the ATU and antenna in use.

The unit described eliminates the possibility of an unintentional bad mismatch during antenna adjustment and, as a bonus, reduces the annoyance to other band users caused by continuous carrier being radiated during adjustment of the ATU. Very little RF reaches the antenna.

MODIFICATION BY VK6ABD

The addition of a three pole, four position rotary switch, will allow the unit to remain in line during normal operating conditions.

AR

ROBBERY

Recently, Greg Whiter, of GFS Electronic Imports, was confronted by armed bandits, who escaped with $22 000 worth of electrical equipment, plus an amount of cash.

Next month, we hope to publish a comprehensive list of the serial numbers of the equipment stolen, in the hope of recovering the same.

I had thought of writing this article after reading the articles by Harold Hepburn VK3AFQ, in the May and June issues of Amateur Radio, thinking that the programme could be converted for use on a VIC-20, and improved.

This programme will run on a standard VIC-20, VIC-20 with memory expansion, or the C-64.

To run the programme on a standard VIC-20 it must be slightly shortened. This can be done by removing input validation, though this requires that care must be taken to input only valid values, and in the correct order.

The lines to be deleted are: *1020; 1030; 1050; 1060; 2010; 2030; 3020; 3030; 3050; 3060; 3090; 3100; 3120; 3130; and 3230.*

To run the programme on a C-64, it is necessary to delete POKE 36879,8 from line 20, and insert a new line — 15 POKE 53280,4 = POKE 53281,0.

The screen layout of a C-64 is different to that of a VIC-20, having 40 rather than 22 characters across the screen. This means that the displays could do with a tidy up for use on a C-64.

The programme starts by clearing the screen and setting it to black, with white characters. A title block appears and is followed by a menu from which the desired function is chosen.

If any character, other than one of those listed is chosen the menu will reappear.

SELECTION 1

The programme goes to step 1000, and displays 'MAP REFERENCE TO IARU LOCATOR'. The Latitude and Longitude are asked for, then checked for validity when given.

If a value is not valid, the Latitude and Longitude is asked for again.

```
3220 IF(1-X*X)=(0THEN3000
3230 I=FNA(X):SP=INT((I*180/¿)*111.19):LP=INT((2*¿*6367.45)-SP)
3240 IFSIN(I)*COS(S5)=0THEN3000
3250 X=(SIN(D5)-(SIN(S5)*COS(I)))/(SIN(I)*COS(S5)):IF(1-X*X)=(0THEN3000
3260 H=FNA(X)
3270 IFSIN(D6-S6))=0THENH=2*¿-H
3280 BSP=INT(H*180/¿)
3290 IFH(¿THENBLP=BSP+180
3300 IFH)=¿THENBLP=BSP-180
3310 PRINTCHR$(147);"SOURCE STATION"TAB(44)S1;S2;SNS$,S3;S4;SEW$
3320 PRINT:PRINT"DESTINATION STATION"TAB(44)D1;D2;DNS$,D3;D4;DEW$
3330 PRINT:PRINT"SHORT PATH:"TAB(44)SP;"KM",BSP;"DEG"
3340 PRINT:PRINT"LONG PATH :"TAB(44)LP;"KM",BLP;"DEG"
3350 PRINT:PRINT"PRESS RETURN TO SELECT":A$="":INPUTA$:GOTO160
4000 PRINTCHR$(147)"END":END
READY.
```

The Locator is then calculated and values assigned, using string handling to cut down on typing. Output restates the Map Reference for verification, and the IARU Locator is given.

To return to the menu, press 'RETURN', or, if the desired function is known, then input the relevant number and press 'RETURN'.

SELECTION 2

The programme goes to step 2000 and displays 'IARU LOCATOR TO MAP REFERENCE'. The Locator is asked for, then checked for validity when given.

If the Locator given is not valid it is asked for again.

The Map Reference is then calculated. Output restates the Locator for verification, and the Map Reference is given.

To return to the menu press 'RETURN', or if the desired function is known, then input the relevant number, and press 'RETURN'.

SELECTION 3

The programme goes to step 3000 and displays 'DISTANCE AND HEADING'. The Latitude and Longitude of the source station and then the Latitude and Longitude of the destination station are asked for.

The values given are checked for validity, and if any value is not valid, it is asked for again.

The Distance and Heading for both Short Path and Long Path are calculated using the Great Circle formulae.

The screen is cleared for output, then the Map References are restated for verification, and the Short Path Distance and Heading, then the Long Path Distance and Heading are displayed.

To return to the menu press 'RETURN', or if the desired function is known, then input the relevant number and press 'RETURN'.

SELECTION 4

The programme goes to step 4000, clears the screen, and ends the programme.

AR

LOADING UP ON 1.8 MEGAHERTZ

Lloyd Butler VK5BR

18 Ottawa Avenue, Panorama, SA, 5041

How does your transmitter load on 1.8MHz? Here are a few ideas on how to match into that odd length of wire on our lowest frequency band.

INTRODUCTION

As amateurs, most of us are restricted to an antenna system which must fit into a standard house block. If we venture down to the medium frequency band on 1.8MHz, we are usually restricted to operating with whatever length of wire we can manage, connected with an earth or counterpoise system. Such a system, particularly if the wire is less than an electrical quarter wavelength, leads to a number of problems in coupling to the transmitter.

ANTENNA EFFICIENCY

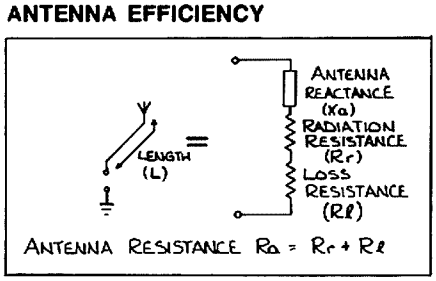

Figure 1 — Equivalent Antenna Electrical Circuit

The first problem is one of antenna efficiency. Referring to Figure 1, the antenna resistance (Ra) is the sum of radiation resistance (Rr) and the loss resistance (Rl) in the antenna system. Loss resistance is the result of a number of factors including leakage loss across insulators, the AC resistance of the antenna conductors and, most significant of all, the earth resistance. Also, not to be overlooked is the additional loss resistance of any loading inductance used in matching to the transmitter.

Antenna efficiency is calculated as follows:

$$\text{EFFICIENCY} = \frac{100\ Rr}{Rl + Rr}\ \%$$

Referring to the curve, Figure 2, radiation resistance falls rapidly as the antenna length is reduced, also reducing efficiency because a greater proportion of power is being absorbed in the loss resistance.

If antenna efficiency is to be optimised, the antenna should be as long as possible and earth resistance kept low, particularly if the antenna is shorter than a quarter wavelength. Wired radials, counterpoise or earth mat, are of value in reducing earth resistance.

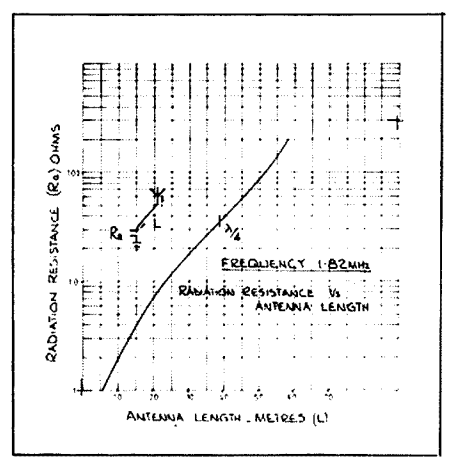

Figure 2 — Radiation Resistance Vs Antenna Length

Loss resistance can be checked by first measuring the antenna constants Ra (antenna resistance) and Xa (antenna reactance) with an impedance bridge. The measurements can be carried out quite well with the familiar noise bridge, used by many amateurs. If the bridge is calibrated directly in reactance at one frequency, do not overlook correction for 1.8MHz.

Now refer to Figure 2 to obtain the nominal radiation resistance (Rr) for the length of antenna in use. Subtract this value from Ra and the result is loss resistance (Rl). Antenna efficiency can be now calculated from the previous formula. If antenna efficiency is low, consideration might be given to improving the earth or increasing the antenna length. The constant Xa obtained will be considered later in the text.

ANTENNA MATCHING

The second problem concerns the correct matching between the transmitter and antenna. Most modern transceivers are designed to operate into a 50 ohm resistance load and do not tolerate much divergence from that impedance. The antenna, however, has resistive and reactive components which vary with length. The resistance component has already been discussed. A typical example of the reactive component (Xa) varying as a function of length is shown in Figure 3.

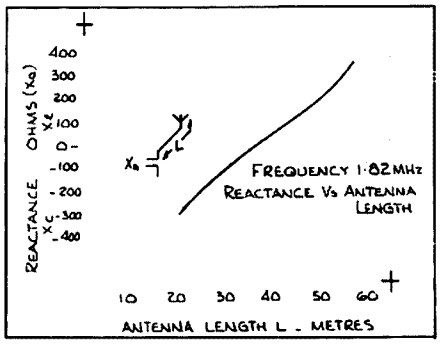

Figure 3 — Antenna Reactance Vs Antenna Length

Attempts to match the antenna to the transmitter using the typical antenna tuning unit (ATU) might not prove successful because of insufficient range in the ATU tuning capacitors. At 1.8MHz, loading capacitance needed could well be in the nano-farad regions, 1nF = 1000pF.

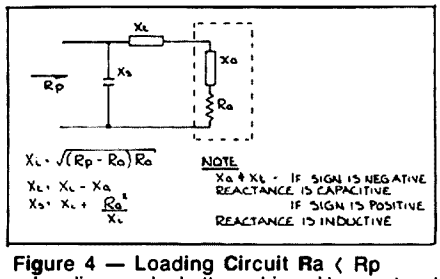

Figure 4 — Loading Circuit Ra ⟨ Rp

Loading can be better achieved by a network of fixed reactive components selected to form a correct match. To design a network, the antenna resistance (Ra) and the antenna reactance (Xa) must be first measured with the impedance bridge as discussed previously. Now proceed as follows:

If Ra is less than the desired load resistance (Rp) at the transmitter, use the circuit of Figure 4 and calculate thus . . .

i. Reactance Xi = $\sqrt{(Rp - Ra)\,Ra}$

ii. Calculate the series reactance

Xt = Xi - Xa

Note that if Xa is capacitive, its sign is negative and therefore its value is added to Xi.

If the resultant Xt is positive, Xt is inductive.
If the resultant Xt is negative, Xt is capacitive.

iii. Calculate the shunt capacitance (Xs)

$$Xs = Xi + \frac{Ra^2}{Xi}$$

If Ra is greater than the desired load resistance (Rp), use the circuit of Figure 5 and calculate thus:

i. Series reactance Xi = -Xa

That is — if Xa is inductive, Xi is made an equal value of capacitive reactance.

— if Xa is capacitive, Xi is made an equal value of inductive reactance.

ii. Calculate shunt capacitive reactance (Xs)

$$Xs = -\frac{Rp\,Ra^2}{\sqrt{Ra - Rp}}$$

iii. Calculate series inductance (Xt)

$$Xt = \frac{Xs\,Ra^2}{Ra^2 + Xs^2}$$

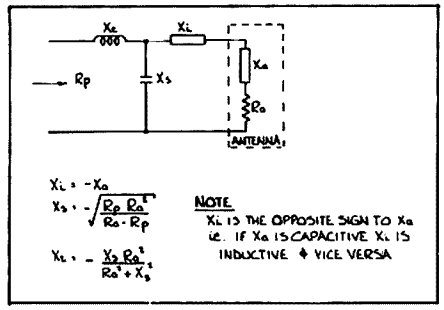

Figure 5 — Loading Circuit Ra > Rp

Fixed capacitance and inductance values are now calculated from the standard formulae:

$$C = \frac{1}{2\pi f Xc}$$

$$L = \frac{Xl}{2\pi f}$$

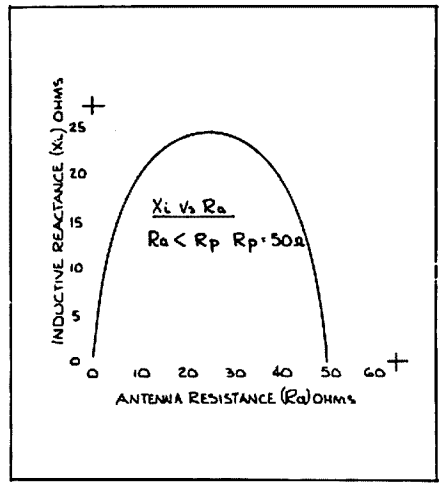

Figure 6 — Xi Vs Ra (Ra ⟨ Rp)

Taking the calculation further, specifically for 1.8MHz, we have worked out curves of network components assuming a transmitter load of 50 ohms. These curves can be used as follows:

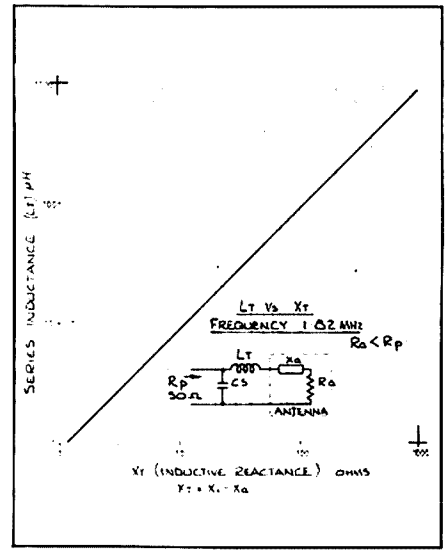

Figure 7a — Lt Vs Xt (Ra ⟨ Rp)

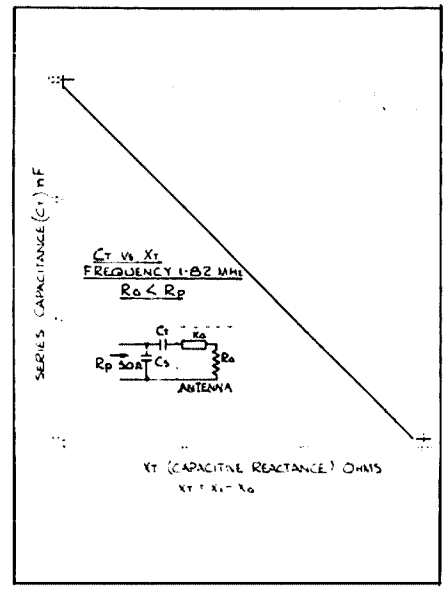

Figure 7b — Ct Vs Xt (Ra ⟨ Rp)

if Ra is less than 50 ohms, use the following procedure:

i. Refer to Figure 6 to obtain the value of Xi

ii. If Xa is capacitive, add its value to Xi to obtain Xt, an inductive reactance

iii. If Xa is inductive, subtract its value from Xi

If the result (Xt) is positive, Xt is inductive

If the result (Xt) is negative, Xt is capacitive

iv. Now find the value of series inductance (Lt) or series capacitance (Ct) from Xt in Figures 7a or 7b respectively

v. Finally, refer to Figure 8 to obtain the value of shunt capacitance (Cs)

If Ra is greater than 50 ohms, use the following procedure:

i. Refer to Figure 9 to obtain the value of series inductance (Lt) and shunt capacitance (Cs)

ii. If Xa is inductive, a series capacitor (Ci) is required and its value is selected from Figure 10a

iii. If Xa is capacitive, a series inductance (4) is required and its value is selected from Figure 10b

NETWORK COMPONENTS

The network capacitors should have suffi-

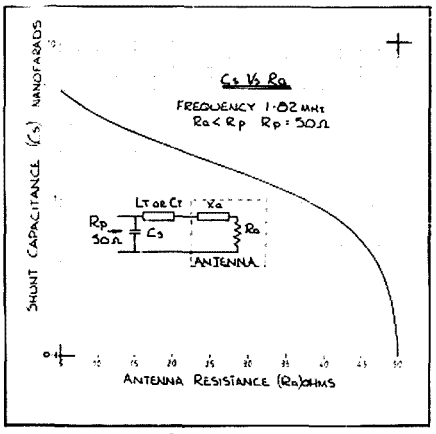

Figure 8 — Ra < Rp. Shunt Capacitance Vs Antenna Resistance (Ra)

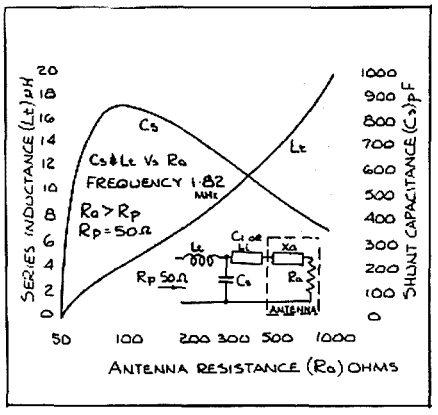

Figure 9 — Lt and Cs Vs Ra (Ra > Rp)

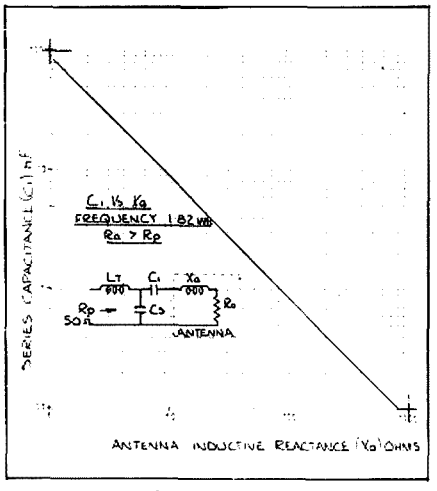

Figure 10a — Ci Vs Xa (Ra > Rp)

cient voltage and current rating. A power of 400W PEP across 50 ohms develops a peak voltage of 200 at a current of 200 V divided by its reactance. A good quality mica capacitor or a large air dielectric tuning capacitor could be suitable.

The series inductor should be made to have a high Q. Its loss resistance causes further power loss and if sufficient in value, compared to the antenna resistance (Ra), its value should be added to all calculations involving Ra. Network calculated values should then be reassessed. To check the inductance and loss resistance, the noise bridge can again be utilised.

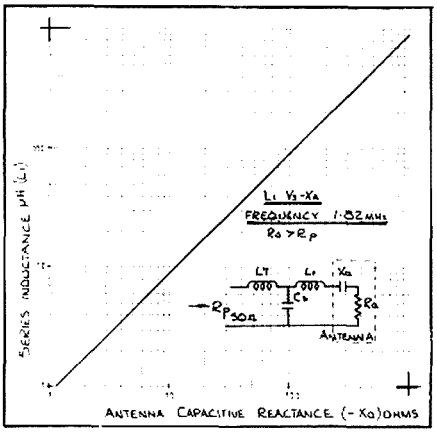

Figure 10b — Li Vs -Xa (Ra > Rp)

TESTS

If everything has worked out right, the input of the network should look like a resistance equal to Rp (50 ohms) with negligible reactive component. This can be checked by the further use of our valuable noise bridge. If Rp value is correct, our transmitter can be connected and we are ready to transmit.

At this point, with the aid of an RF ammeter and the measured values of Ra and Rp, we can check our matching efficiency. Connect the RF ammeter in series with the transmitter output and, with the transmitter on tune, record the current (It). Reconnect the RF ammeter in series with the antenna and for the same transmitter setting, record antenna current (Ia).

Transmitter power output is equal to It Rp and radiated power is equal to Ia Rr.

Efficiency of the matching network is calculated as:

$$\frac{100\ Ia^2\ Ra}{It^2\ Rp}\ \%$$

Efficiency of the whole aerial system is calculated as:

$$\frac{100\ Ia^2\ Rr}{It^2\ Rp}\ \%$$

A possible inaccuracy is the value of Rr, taken from Figure 2 and based on antenna length. Its value for a given length could vary with other physical features of the antenna.

TRANSMISSION LINE

Previous discussion has assumed that the transmitter is connected directly to the antenna tuning network within the radio shack. A disadvantage in doing this is that high RF current flows in the antenna and earth conductors within the shack, causing a high local RF field. Apart from its nuisance value, considerable radiated power could be wasted in absorption in the building structure.

To eliminate this problem, one might choose to place the tuning network external to the shack, directly between the antenna wire and earth or counterpoise and feed via a transmission line, such as a 50 ohm coaxial cable (refer Figure 11).

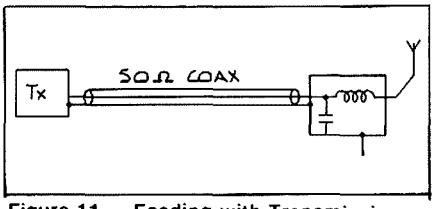

Figure 11 — Feeding with Transmission Line

A point worth noting is that you should not get too concerned at poor standing wave ratio (SWR) on the line at this frequency (1.8MHz). The loss in coaxial cable at 1.8MHz is quite low and even for an SWR of as high as 3:1, the net loss is a fraction of a dB per 100 feet. If the transmitter loading is satisfactory, precise SWR can be ignored.

In conclusion, it can be said that power radiated might not mean power in the direction you would like it to go and that is another subject. However, it is hoped that the information here will be of some help with those loading problems.

APPENDIX 1

Expansion of Figure 4
Put Xi = Xt + Xa

$$\frac{i}{Ra + jXi} = \frac{Ra - jXi}{(Ra + jXi)(Ra - jXi)}$$

$$= \frac{Ra - jXi}{Ra^2 + Xi^2}$$

$$= \frac{Ra}{Ra^2 + Xi} - \frac{j\ Xi}{Ra^2 + Xi^2}$$

Hence R + jXi is equivalent to a parallel network:

Resistance component Rp =

$$\frac{Ra^2 + Xi^2}{Ra} \quad ....(1)$$

Inductive component

$$X2 + \frac{Ra^2 + Xi^2}{Xi} \quad ....(2)$$

From (1)

$$Xi^2 = \frac{RpRa - Ra}{}$$

$$\& \ Xi = \sqrt{(Rp - Ra)Ra} \quad ....(3)$$

Xs is made resonant with Xi and Xs = -X2 ....(4)

From (2) and (3)

$$Xs = \frac{-(Ra^2 + Xi^2)}{Xi}$$

$$Xs = \frac{Xi + Ra^2}{Xi}$$

(capacitive) ....(5)

APPENDIX 2

Expansion of Figure 5
Xa is cancelled by making Xi = Xa leaving Xs in parallel with Ra

Admittance

$$\frac{1}{-jXs} + \frac{1}{Ra} = \frac{Ra - jXs}{-jXsRa}$$

Thus the parallel result of Xs and Ra is impedance:

$$\frac{-jXsRa}{Ra - jXs} = \frac{-jXsRa\ (Ra + jXs)}{Ra^2 + Xs^2}$$

$$= \frac{RaXs^2 - jXsRa^2}{Ra^2 + Xs^2} \quad ....(1)$$

The resistance component $Rp = \frac{RaXs}{Ra + Xs^2}$

hence

$RaXs^2 = RpRa^2 + RpXs^2$

$RaXs^2 - RpXs^2 = RpRa^2$

$Xs^2 =$

$$\frac{RpRa^2}{Ra-Rp}$$

and $Xs =$

$$\frac{\sqrt{RpRa^2}}{\sqrt{Ra-Rp}} \quad ....(2)$$

From (1), the reactive component $X2 =$

$$\frac{-jXsRa^2}{Ra^2 + Xs^2}$$

Xt is made resonant with X2, i.e. $Xt = -X2$
hence $Xt =$

$$\frac{jXsRa^2}{Ra^2 + Xs^2}$$

AR

TRY THIS

EMERGENCY SOLDERING TIPS

The following technique can be used for soldering two wires together without using a soldering iron that can be used, for example, when repairing outside antennas.

The requirements are: a *short piece of aluminium foil, and a box of matches or a cigarette lighter.* The procedure as shown in figure 1 is: *(a) clean the wire ends, twist them together, and then wrap a short length of cored solder round them; (b) cover the whole with several layers of foil, close up the ends, and place a lighted match or lighter flame under the wrapped joint and move it slowly backwards and forwards; (c) allow a few seconds for the joint to cool, remove the foil and* "surprise yourself with a perfectly soldered joint". The real secret to success in this procedure lies in wrapping the foil on as tightly as possible with no air holes. The foil conducts heat to the joint as well as preventing oxidisation and the formation of soot on the joint, It also stops the molten solder from running away.

CLANDESTINE HOT WATER

Reg Glanville VK2ELG

63 Buffalo Cresent, Thurgoona, NSW. 2640

Since the publication of the two "Clandestine" articles, in March 1985 and February 1985 Amateur Radios, there have been suggestions that another article could be written, based on the circumstances which spawned the previous two, which were the result of activities in the prisoner of war camps at a sugar factory in south east Germany. Hence, Clandestine Mark Three.

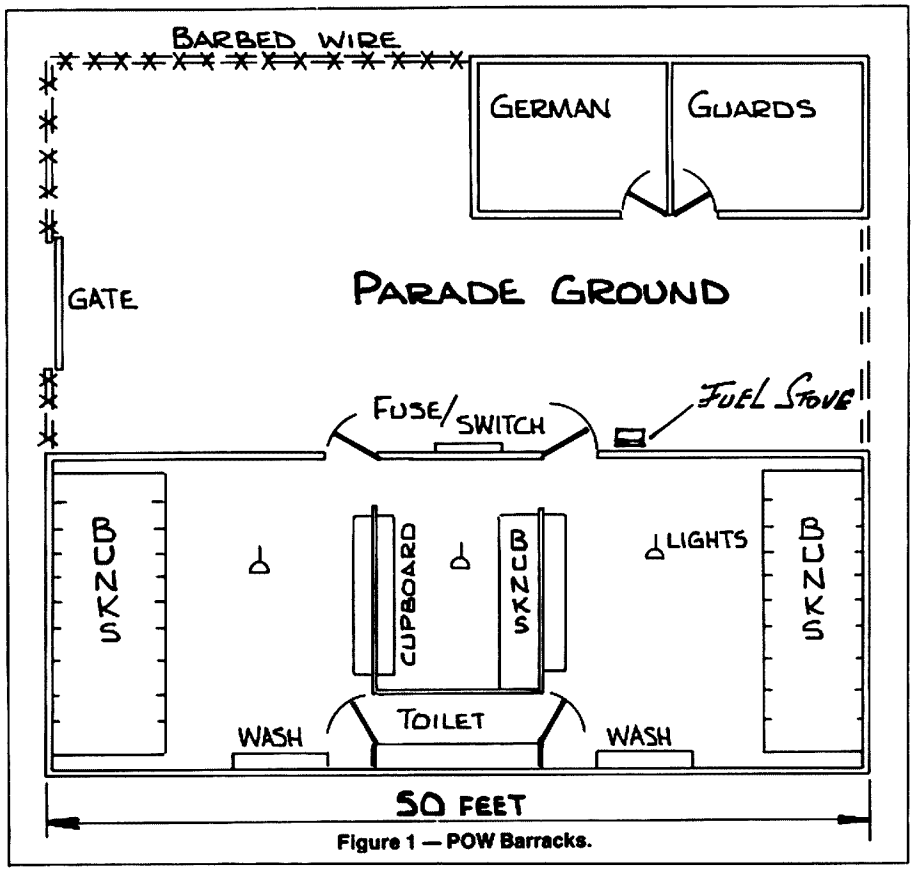

Figure 1 — POW Barracks.

These barracks were built circa 1939, as open fronted garages to house the pending arrival of the Volkswagon, the Peoples Car, for German workers who had ordered them. Delivery was to be made, when the cars were paid for. Payment was made by weekly deductions from the workers pay packets.

The onset of hostilities curtailed this ambitious scheme, but the vehicles subsequently proved a military boon, as the garages were simple to convert to POW barracks. The roof of the barracks was constructed of pine planks which were covered with heavy bituminous paper, single brick walls and a thin concrete floor. They were cold in winter and stifling in summer. The barbed-wire compound was locked at all times but the barracks' doors were open until 8 pm, for exercise, but NONE of us needed that!

Prisoners work was either out-of-doors, shovelling snow, sugar beet or coal or in a factory, which was humid with steam and heat. The work roster for most of the year was, 12 hours per day, 84 hours per seven day week. Consequently, the inmates were a somewhat dishevelled and languid lot by the end of the shift each day.

Outside the barracks, exposed to all weathers, was a coal fuelled hot plate, approximately 610 x 305m is size, which was the only means of heating food or drink. Despite rosters, the congestion around this stove between seven and eight in the evenings defies description, particularly when it was cold and wet. Consequently, many prisoners invariably retired after a cold supper, with cold feet.

Red Cross parcels, containing small quantities of tea, coffee, cocoa and powdered milk, arrived on a semi-regular basis. However, the limited stove access was an obstruction to the intended benefits of the drinks.

Shortly after the fabrication of the Shortwave Receiver, (AR, March 1984) prisoners were each issued with an enamelled metal can with a tapered top, lid and carry handle. Capacity was about one and a half pints (about three-quarters of a litre), with the primary function being for the daily factory ration of "ERSATZ" coffee. A friend suggested, "Sparks, (this was my nick-name in the camp), now that we have these cans, could you devise a hot water heater for use after our eight o'clock curfew?"

Much had been learned from 'Operation Receiver', and I was now aware of the possibilities, and pitfalls, of extra-curricular activities so decided to investigate the probabilities of electrically heating water. NO PROBLEMS? ?

CONSERVATION OF ENERGY

Briefly the factors were, vigilance of the order necessary during the construction of the radio, and later, the compass, could be somewhat relaxed as contravention of German internal propaganda security and escape would not be involved. The guards would not be unduly interested as maintenance of the party, intact and working, was their role. The factory para-political management hierarchy would be the stumbling block as the conservation of energy, particularly electrical, was almost of fetish proportions. Power outlets were rare — none at all in our barracks and light points were limited and of low wattage. I hence decided to build an immersion heater, designed to drop into our cans, powered from one of the Edison screw base (ESB) light sockets.

Friends were sent to surreptitiously check factory salvage bins for light sockets, light globes, flex, stiff wire to support an element and, most importantly, heater element wire with a profiled ceramic former.

The latter proved a problem. A fortnight elapsed before a broken element was located. Alas, how much was missing? What was the remaining resistance? Without tools or instruments the formula would again be trial and error.

Lighting was controlled by the guards at an external switch box which held the sole fuse, no internal switches. Lights out was 10pm except for a single toilet light, which remained on all night. The barracks were locked and barred at 8pm, so clandestine activities had to be carried out in these two hours.

Each area of the barracks was serviced by only one light, which we could not afford to lose, so the first need was an ESB double adapter, one outlet for the globe and the other for the heater. As could be anticipated, all manner of guile failed to produce one of these, so it was into the junk box. Two ESB female sockets were wired in parallel to a globe male thread, taking care that the exposed external threads were isolated from the neutral.

I worked in the factory's electrical workshop charging batteries, painting switch boxes, etc. Soldering jobs were only possible when the two German electricians, friendly types, were absent.

WORRYING TIME

All testing of the element had to be done immersed. Easy you say! Try it sometime. The power could not be switched off and it was difficult to screw in the connection whilst standing on a flimsy table. As the wires to the element were exposed, this caused current leakage through the water and enamel defects and partially charged the enamel can. Also, not blowing the sole fuse was a top priority.

The 240VAC supply (there was also 110VAC and 210VDC in parts of Germany) to our barracks was via a heavy gauge copper wire, which continued on to the guards quarters. The internal wiring in the barracks was only light gauge aluminium. Therefore, the 'operation heater' voltage drop effect should be less noticeable on the guards lights than in the barracks. This was a bonus, as the variation in light intensity was the only indication we would have of the heaters current consumption. Theoretically, the 20 amp fuse should cope with 4000 watts, but the aluminium wiring would not.

Testing heater Mk1 produced a dramatic drop in the lights in our barracks, so obviously the broken junk element was too short. (Next day one of the guards mentioned the drop in the lights and I suggested it was possibly a momentary drop in RPM of the steam turbine driven alternator, that supplemented the factories power.

A week later another short section of element was found, but over several nights of painstaking work, the old brittle wires refused to be joined. By now, optimistic members of our party could 'taste their hot cuppa' and subtle pressure on 'Sparks' to complete the project increased. However, another month of searching still failed to locate a suitable element.

I then vaguely remembered the use of two metal plates, either as a water heater or variable resistance, that I had seen in Australia. This led me to a completely different approach.

I had no idea of the optimum area or spacing between the plates necessary for our needs, other than the dimension limitations imposed by the coffee pot neck. Because of the limitations of usable current, I decided to commence with small plates, approximately 1x.75 inches (25x19mm) and spaced 1.5 inches (38mm) apart.

Once again the scrap bins arose to the allied cause and yielded more battered copper sheet, which was duly flattened, shaped and soldered to the stiff wires used previously in the Mk 1 version. My New Zealand friend, a worker in the carpenter's shop, cut a spacer from pine wood. See Figure 2.

When tested, this version proved inefficient — after 30 minutes only a slight water temperature increase was discernible and, there was no visible lighting drop. A wattage increase was necessary so, back to the drawing board. Slightly larger plates were cut and fitted.

Of course, practicality dictated that we should have commenced with large plates and progressively reduced their area to save the necessity to return to the workshop to cut and solder larger plates. However, I was not prepared to risk using excessive current initially because of the predictable repercussions.

Two further increases in plate size and a decrease in spacing spanned many days because of lack of convenient periods in the workshop. Finally, Eurekal After about 25 minutes the water was hot, about 80 degrees, accompanied by only a minor drop in lights. Great! We were there, now only the trifling last step to boiling point.

ALMOST THERE!

Just prior to boiling, the water turbulence in the container rose and the lights dimmed — what now? Several repeat tests verified this behavior so, obviously, under these specific conditions, the water resistance to AC was a converse situation. Increase in temperature caused a resistance decrease but with an increase in current flow.

It was now relatively easy to reduce the plate area by folding back a 3/16th inch (5mm) strip down one edge of each plate with the two folds

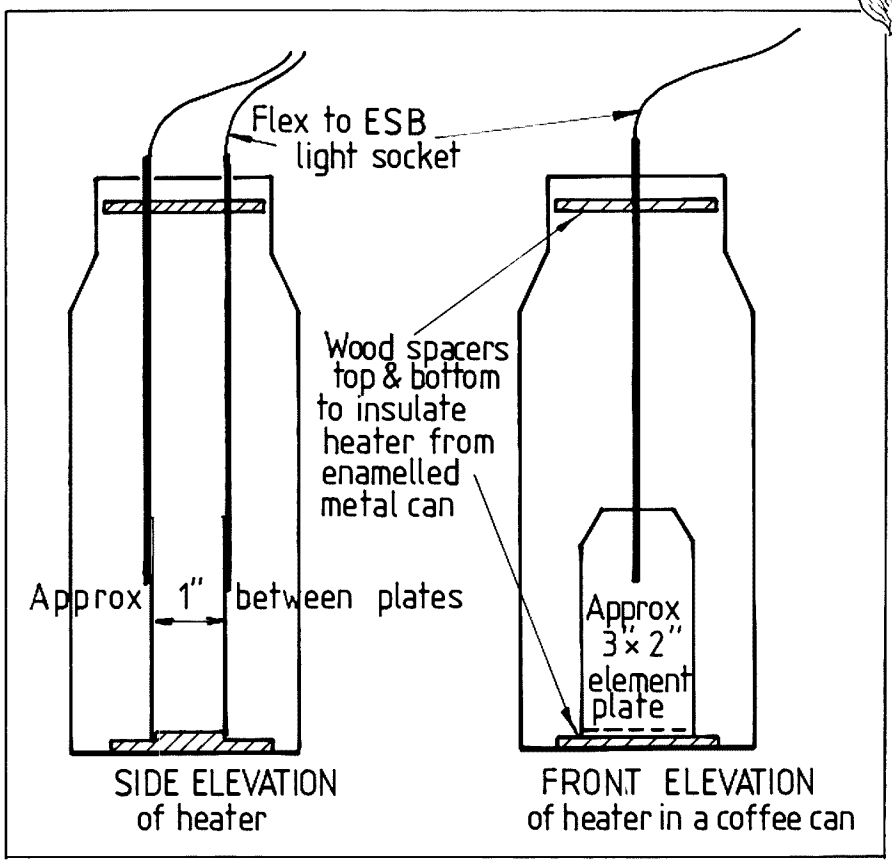

Figure 2 — Side Elevation.

Figure 3 — Front Elevation of the Heater positioned in the Coffee Can.

made outwards to avoid any reduction in plate spacing.

This version appeared to be the best compromise — a slight increase in the time required to reach boiling point and a decrease in the lighting intensity drop; although the latter still caused some concern at the point of boiling. This was eventually overcome by slowly lifting the heater clear of the water at the first sign of the lights dropping.

SUCCESS

During the following few nights, an operational procedure for water boiling evolved. Immediately our doors were locked at 8pm, our makeshift double adaptor was screwed into the light socket, which was not visible outside from the two small windows. The globe was replaced in one outlet, the heater in the other, exposed and alive. The heater was held by the flex and gently lowered into the filled can, taking particular care not to allow the element wire to short against the can. The guards were not noted for their alacrity in replacing the fuse if it blew. When positioned in the can, the upper wood spacer prevented a short circuit.

The damp concrete floor was a permanent earth and during the heating process, the can was partially charged — the operator adopting a permanent state of qui vive. A small price to pay for a hot drink? ?

The entire operation was quite hazardous and normally would not have been perservered with but, the relative psychological and physical well-being values of a regular hot drink, procured under clandestine conditions, amply compensated the risk. Personal safety was not highly rated.

The coffee cans were five cup capacity, so the party rostered themselves into groups of five and each group rotated in sequence nightly. The groups were always ready and waiting.

During the two hours available between lock-up and lights out five cans could be brought close to boiling, hence 25 cups for 30 guests.

The electrical characteristics of the heater were now relatively stable and predictable, with only an occasional deviation stemming from an operators error. After some weeks of basking in our new found, up-market living standard, an abrupt change in heater characteristics occurred. An increase in water turbulence was visible and current drain increased, noticeable by a drop in the light. Either the voltage or spacing between plates had altered and there was no change in the wooden table that isolated the can from the concrete floor. Where do we go from here?

Then an enlightening remark from one of the inmates that "It must be the water Sparks, the tea tastes lousy!" His nationality had been tea connoisseurs for over 300 years.

That winter, the nightly temperatures had dropped to about -10 degrees Celsius and the water reticulation to the barracks had fractured. We had to carry water from a well, attained by an Armstrong powered pump. Could the status quo have been altered by this water change?

That evening after work, a can of the usual water was brought from the factory and magically the heater reverted to its former behaviour. Therefore the well water must have been mineralised to the extent that its resistance was lowered and its heating design characteristics were disturbed.

FINALE

The heater was in use for 18 months, which made possible, over 7000 cups of tea, coffee and cocoa. This generated a morale boost beyond all proportion to the simplicity of the device. The arrival of the Russians on the German eastern border terminated, after four years, this rather debilitating and neurosis prone existence.

Electricity is presumed, and expected, to be ever available to serve man's needs, irrespective of location or circumstance. Pre-war radio and electrical experience, once again made it possible to harness this energy to, at least, slightly alleviate the depressed conditions for 30 people.

To obviate a possibility of the 'Clandestine' theme becoming hackneyed, this is a definite FINAL! To minimise connotations of egotism, endeavours were made over the three articles to use second or third person grammatical form, but it seemed to cause a loss of realism.

It is not recommended that 'home brewers' see this device as a low cost water heater — it is the absolute antithesis of safety.

AR

TEMP RISE	PLATE SIZE 1.5"x1.25"	3.25'x2'
10-20 deg C	18mins	9mins
20-30 deg C	14mins	8mins
30-40 deg C	8mins	6mins
40-50 deg C	4mins	3mins
50-60 deg C	3mins	1min
60-70 deg C	2.5mins	.5min
70-80 deg C	2mins	.25min
80-90 deg C	1.5mins	12secs
90-99 deg C	1min	8secs
TOTAL	54mins	28mins

Water Temperature Rise related to approximate Elapsed Time with the Plates one inch apart.

The approximate resistance between the plates with water at 10 degrees Celsius was 1150 ohms and at 95 degrees Celsius, 200 ohms.

Prior to producing this article, a quirk of curiosity prompted the writer to carry out a re-enactment in his workshop, to substantiate the heaters characteristics, which were dependant on a nebulous memory. Taken for granted, workshop facilities, ie: thermometer, multimeter, clock with a second hand, etc, were a dramatic contrast to the vicissitudes of 1943!

The table above summarises the findings — note the rapid and simultaneous temperature increase and time span decrease above 70 degrees — the problem phenomenon in the barracks.

One experiment was made with the plate spacing reduced to .75 inch but this had to be curtailed above 80 degrees because of the massive water turbulence, apparently caused by steam pockets between the plates. Once aluminium plates were used which formed an insulating film,obviously an electro-chemical reaction.

LET'S LOOK BACK

Now that the Bi-centennial year is fast approaching, and thoughts are being given to ways and means by which the amateurs of Australia may celebrate this important occasion, it is fitting perhaps, to just look back to the 150th year.

On that occasion, the IRE of Australia donated a most impressive trophy to the WIA, to go to the person *"for the best work done in making known internationally the World Radio Convention and Anniversary Celebrations"*.

A DX contest was organised for Australian amateurs and at the 14th Annual Convention of the WIA, Sir Ernest Fisk announced that Mr D H Fisher of York Street, Launceston was the winner.

The plaque is of bronze, mounted on polished wood — a very impressive trophy, indeed.

The equipment used by the late Doug Fisher VK7AB, was naturally home-brew. The transmitter was AM with a 35T in the final. The receiver was also home-brew — a well built superhet, the 'Cernutt' nine valve, designed by W6BAY. A photograph of the receiver is in 'Jones Handbook' of 1937/38. The antenna was a 138 feet (41m) flat top and a 'loop' on 10 metres. Doug's widow Val says it was the 10 metre operation that won the day for Doug.

The trophy was presented at the Annual Dinner, Hobart in 1938 by Sir Ernest Fisk.

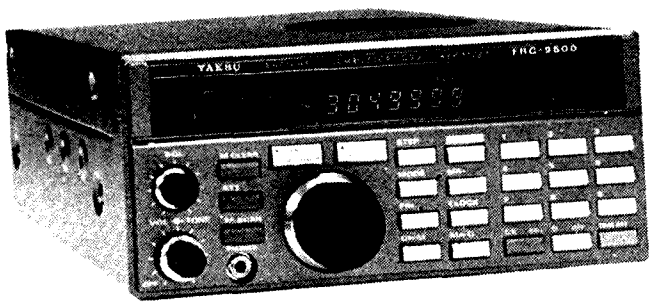
Latest Generation Receivers from Yaesu!



FRG9600 Scanner

Never Before! A scanning receiver that has so many features, offers so much. And it's absolutely ideal for the amateur, too! It offers continuous coverage between 60 and 905MHz, in all modes (SSB up to 460MHz), with FM and AM in both wide and narrow bandwidth. But that's not all:

You get 100 keypad-programmable memory channels, full rotary dial tuning as well as push-button tuning, fully programmable scanning in various modes . . . and much, much more.

PLUS it's a CAT unit: with the optional interface you can control its operation from most micros! Virtually unlimited customised control functions in software are possible!

Impressed? Not half as impressed as you will be with one in your shack!

Specifications:

Range: 60 — 905MHz (SSB 60 — 460MHz)
Modes (3dB bandwidth)

	FM (N): 15kHz 0.5uV Sens (12dB SINAD)
	FM (W): 180kHz 1.0uV Sens (12dB SINAD)
	AM (N): 2.4kHz 1.0uV Sens (10dB S+N/N)
	AM (W): 6kHz 1.5uV Sens (10dB S+N/N)
	SSB : 2.4kHz 1.0uV Sens (10dB S+N/N)
Conversion:	Triple for FM (N) AM & SSB, Double for FM(W)
IFs:	45.75MHz, 10.7MHz and 455kHz
Image rejection:	60-460MHz — 50dB typical
	460-905MHz — 40dB typical
Memory Channels:	100
Power Supply:	12-15V DC 550mA (lithium cell back-up)

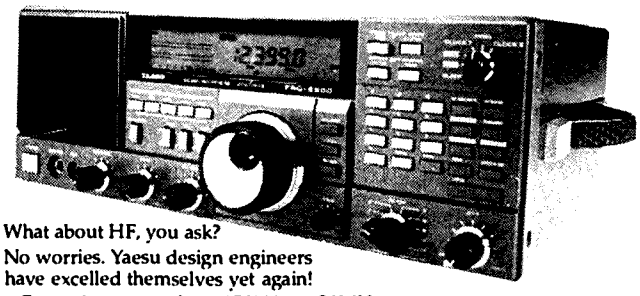
LIMITED STOCK! (Includes power supply) **$799**
Cat D-2825

Orders taken now at your nearest DSE store

DICK SMITH ELECTRONICS
PTY LTD

B-052

FRG8800 Receiver



What about HF, you ask?
No worries. Yaesu design engineers have excelled themselves yet again!

- General coverage from 150kHz to 30MHz
- All mode, including AM wide and narrow and FM narrow
- 12 internal memories (push-button) with scanning functions
- Selectable AGC rates, noise blanking widths & tuning rates
- Dual digital clocks (great for different time zones)

And so much more!

PLUS, it's also a CAT system: add a microcomputer and the optional interface and you can transfer function to your micro!

And even more: with the optional VHF coverter (fits completely inside) you also get 118 - 174MHz.

It also uses the '7700' series of accessories: active antenna, and antenna tuner.

Specifications:

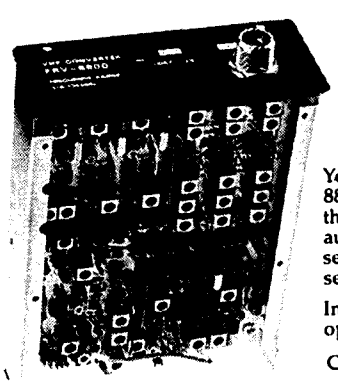
Modes:	AM, SSB & CW in both wide and narrow; FM (N)
Sensitivity:	AM, SSB & CW: 10dB or better (S+N/N)
	FM (N): 20dB or better (S+N/N)
Selectivity:	AM (W) 6kHz (−6dB), 15kHz (−50dB)
	AM (N), SSB, CW 2.7kHz (−6dB), 8kHz (−50dB)
	FM (N) 12.5kHz (−6dB), 30kHz (−40dB)
Antenna Imp:	50 ohms and 500 ohms (VHF conv 50 ohms)
Power:	240V AC

Cat D-2820

Alternative: FRG-8800 SW — 2MHz to 30 MHz range, otherwise identical $829.00
Cat D-2821

$899

LIMITED STOCK!



Optional VHF Converter

Yes! 118-174MHz from your FRG-8800. And it fits completely inside the set — operation is completely automatic. Full dial or pushbutton selection, same features as standard set.

Incredible versatility - and full CAT operation too.

Cat D-2823 **$189**

MEXICO QUAKE DISASTER AND AMATEUR RADIO

Jim Linton VK3PC
4 Ansett Crescent, Forest Hill, Vic. 3131

An earthquake measuring 8.1 on the Ritcher Scale sent shock waves through the City of Mexico causing death, injury and damage, on the 19th September 1985. The actual death toll may never be known, but estimates ranged from 5 000 upwards, with 40 000 injured.

The heavily populated city was isolated because major communications centres were knocked out. Mexican amateurs were the first to give details of the quake, via the United States.

While horrifying accounts of the earthquake became known, Sam Voron VI2BVS, was operating portable in Sydney suburban Willoughby Park, as a public relations exercise for amateur radio. Sam, with a radio display station as part of the Willoughby Fair, Carnival 85 and IYY celebration, planned just to do as he had on numerous other occasions, *expose the general public to the hobby of amateur radio.*

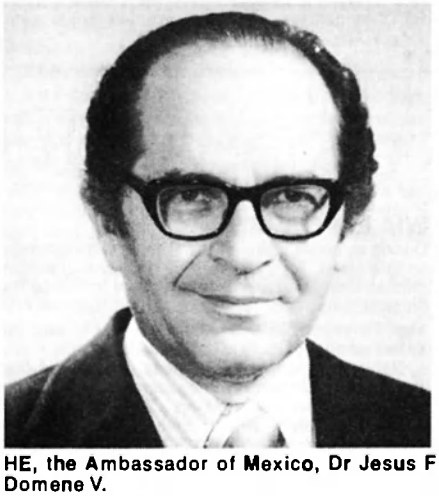
The Australian Traffic Net (ATN) Co-ordinator was told by someone visiting the Fair about news reports of US radio amateurs being the only link Mexico had with the outside world after the quake. Sam, with a group of helpers, found himself ideally situated for public access should there be a demand for third party traffic.

After the news media was told, on Saturday, 21st September, about radio amateurs being able to send welfare messages to Mexico, many distraught Mexicans began arriving at Willoughby Park. By 9pm, Sydney's radio and television stations had carried news of what amateur radio was doing.

A Mexican, Jose de la Vega travelled from Wollongong to Willoughby Park to see if he could help, and Sam explained that a third party agreement with Mexico could be useful.

Mexico was one of a number of countries the WIA had sought, through DOC, to have formal TPT agreements with Australia, but it had not responded to the request. Traffic for Mexico could however be routed via the USA or Canada, both of whom had TPT agreements with Australia and Mexico.

Jose, together with Martin VK2PJW, went to the Mexican Consulate to discuss the matter, and the Mexican Ambassador contacted a senior DOC official, who granted TPT approval for the disaster.



HE, the Ambassador of Mexico, Dr Jesus F Domene V.

Photograph courtesy North Shore Advocate

Sam VK2BVS, sends a welfare message to Mexico for Julia McLaren, during the Earthquake Disaster

On learning ot the TPI approval, Sam sent a priority message from Mr Jesus Domene, Mexican Ambassador, to television channel 13, in Mexico City — the only station on the air. The message read: *"All Mexicans that have relatives in Australia can send messages through amateur radio operators. Permission granted 21st September 1985, at 1300UTC for Third Party Traffic between Mexican and Australian amateur radio stations"*.

Next day, word came back that television was being used as a notice board and the Ambassador's message was being periodically flashed on the screen.

News of the VK/XE TPT agreement was phoned to WIA Sunday morning broadcasts from the WIA ACT Division following a request from DOC. By this time the ATN was in full operation with stations in, at least, VKs 1, 2, 3, 6, and 7. Some of the stations included VKs 2BBT, 2ATZ (Westlakes Radio Club), 3HP, 3CUG, 3CKK, 6MQ, 6AGG, and 7RH (apologies to other who participated, or offered help, but whose call signs are omitted).

Telephone numbers of participating stations, along with a story of their community service involvement, was given to the news media in Melbourne. The media, in turn, were clamouring for more details about amateur radio's involvement — it gave radio, television, and newspapers a local angle on an overseas disaster.

Radio news bulletins throughout Australia carried the story, and in Melbourne, at least three TV stations had it in the evening news services.

Meanwhile, Sam had a queue of people consoling each other, as they waited to fill in Amateur Radiogram forms for messages to their loved ones, in Mexico. The Mexican Consulate was directing people, wanting to get a message to Mexico, to Willoughby Park.

Telephones were ringing hot throughout Australia in the shacks of participating radio amateurs. One difficulty they faced was in trying to understand the callers, both due to their emotion-filled voices and Spanish accents.

Ken Richards VK3CKK, at the microphone during his marathon effort to help Australians contact relatives and friends in devastated Mexico City.
Photograph courtesy Knox-Sherbrooke News

With the considerable number of messages tor Mexico being put in at the Australian Traffic Net, poor propagation to the USA, and a growing backlog of Amateur Radiograms, the WIA Victorian President, Jim Linton became concerned.

On the Monday he contacted Telecom to see if three co-ordinating radio amateurs could have free International Subscriber Dialing (ISD) from their phones, so they could pass messages direct to US radio amateurs. Help of the Australian Red Cross was also enlisted, to approach the Overseas Telecommunications Commission (OTC), to obtain free ISD access.

Both Telecom and OTC responded favourably, and the first to use the free overseas calls was Ken VK3CKK, on Tuesday, 24th September. Between 1400 and 1700UTC (midnight and 3am local time) he passed 90 messages to Dick Hoppe N5T, in New Mexico, USA. Ken had help from a group called the Knox Community Volunteers, who manned his phone, and the two additional phones installed by Telecom.

Members of the Eastern and Mountain District Radio Club, including John VK3DP, Gwen VK3DYL, and David VK3UR, assisted Ken and put up a better 80 metre dipole for use on the ATN's 80 metre frequency.

Ken originated about 150 messages to Mexico received from throughout Australia.

A second radio amateur to be given free ISD access was Fred VK2DZL, who collected 120 messages from Sam, and passed them, via the telephone, to Bill Smith W7GHT, in Idaho.

The third was Alan VK3CUG, at Barkers Creek, central Victoria, who passed some 60 messages to Troy Grimshore K7OVK, in Oregon. Alan also managed, on air, to pass about 20 pieces of traffic to KH6SP, at Pearl Harbour, who then relayed them to the US West Coast National Traffic System Net.

Alan had been involved in the operation from the Saturday evening, when the first messages for Mexico were received on the ATN. His telephone rang hot with calls from people throughout Australia, all wanting to get a message to Mexico, and also the news media seeking information on his activity.

Later, due to continuing poor propagation, messages from Mexico City were received from the USA using the ISD telephone facility provided to the three participating radio amateurs.

During the telephone calls it was learned that just one US radio amateur had reported handling 4 000 welfare messages for Mexico. Another snippet of information was that the US State Department had airlifted five fully equipped radio amateurs into Mexico City to help with emergency communications.

Overall, an estimated 600 messages for Mexico were passed, via the ATN. The community service it provided received unprecedented media publicity, and left a good and lasting impression about the hobby with the authorities, and the general public.

On 24th September, the Mexican Ambassador, Dr J F Domene V., sent a letter of appreciation to the President of the WIA, on behalf of all Mexicans. The letter stated:

In the name of the Embassy of Mexico, and all the Mexicans in Australia, I wish to express to you, and by your kind mediation, to all the amateur radio operators in Australia, our most grateful thanks for the time and effort they so generously gave in aid of the relatives and friends of the people of Mexico City, who were left without means of communication following the tragic earthquake of 20th September. Your kindness and solidarity will not be forgotten.

AR

LETTERS OF APPRECIATION

The following letters were received by Sam Voron VK2BVS.

Council at its meeting on 23rd September 1985, received a Mayoral Minute on the tireless efforts of the Willoughby Amateur Radio Group in assisting families and friends make contact with Mexico City in the wake of the recent tragic earthquakes.

Council subsequently resolved to convey its congratulations and thanks to you and the members of the Willoughby Amateur Radio Group for your dedication to the services of others during this emergency.

It gives me great pleasure to convey Council's decision to you and to also add my personal thanks for the compassion you have shown in assisting numerous Mexican families during their time of great emotional stress.

Yours faithfully,

A J Payne,
TOWN CLERK,
The Council of the Municipality of Willoughby.

Once we have been able to obtain information about almost the total number of personas who have consulted this Consulate-General (Mexicans and Australians), I wish to express to you our recognition for your valuable assistance which came just in time, specially during the first most tragic days.

Thank you very much.

Yours sincerely,

Hugo DiazThome,
Consul-General of Mexico.

AR

We sincerely thank Sam Voron and his friends for the wonderful support and hard work following the Mexico City Earthquakes.

It was an anxious time for the Mexican Community in Australia, and we appreciate all the time spent making contact with Mexico.

Yours sincerely,

Alfonso and Louise Cardenas,
27 Greenhill Crescent,
Saint Ives, NSW. 2075.

BILL HAS A GO AT RTTY

Ted Holmes VK3DEH
20 Edmunds Street, Parkdale, Vic. 3195

Building a RTTY modem proved to be a little beyond Bill Blitheringtwit, mainly because it was not possible for him to utilise anything suitable from his vast store of junk. He figured that if he had to go and buy all sorts of parts he might just as well buy a ready made modem. Better be safe than sorry — an attitude unique to him.

Now the modem was connected in position to his dipole and into the Model 100, which was still sitting on the floor. From somewhere or other he had managed to scrounge a reel of teleprinter paper. An earlier experiment with some of his wife's kitchen paper towels had proved to be a dismal failure. It had provided some temporary entertainment when it had come apart in the machine and required picking out, fragment by fragment, with tweezers. However, it now really looked as though Bill was at last in business.

He turned the machine on and it gave out a satisfying humming sound. Then he turned on his FT 101E and tuned around on 40 metres. He was in luck, somebody was warbling away and Bill fiddled about until little lights on the modem began to blink. It gave him quite a start when the Model 100 suddenly started chattering away.

Bill was delighted. At last he had got something to work! He realised what Columbus must have felt like when he discovered America. The printer reached the end of its line and stayed at one spot, busily hammering away at the edge of the paper, making a sort of black blob.

What was this? Bill was mystified. There had to be something wrong with the machine. He kicked it but the thing still hammered away in one spot. Then, just as suddenly as it had started, the warbling sound ceased and was replaced by a similar sound, somewhat lower in pitch. Bill felt triumphant. He knew what that was! He adjusted the frequency on the FT 101E and once more the Model 100 began to tap happily away. However, when it reached the end of the line it made the same sort of blob again.

There had to be something wrong with the dratted thing. The message up to the blob seemed to have been typed by somebody using his feet, but, apart from that, it had a slight resemblance to english. But the blob business puzzled Bill. He grabbed a screwdriver and started poking, ending up dropping the tool into the machine's bowels. That finished his first attempt at RTTY, as, by now he was slightly bored by the whole business. Leaving the screwdriver still in the machine, he ripped open a beer can and drank thoughtfully.

Nobody had told him about the lack of carriage returns sometimes experienced with people who sent RTTY by computer and received their messages on TV screens.

AR

WIA EXPOSURE

During a recent "Sale of the Century" programme on television, Tony Barber, the host and questionmaster, displayed a WIA badge, sent to him by the Federal Secretary. Tony commented that the WIA was 75 years old this year, and that it was the oldest society of its kind in the world.

Delvene Delaney, his hostess, mentioned that the film star Marlon Brando was an amateur. This fact was also reported in '73' magazine of September 1985, which gave a call listing as follows: *Martin Brancheaux FO0GJ.*

The "Sale of the Century" programme was good exposure for the WIA and amateur radio.

AUSTRALIAN RADIO JOURNALS BEFORE 1939 — A SURVEY

Chris Long,

6 Torring Road, East Hawthorn, Vic. 3123

Historical matters have come to the fore during the WIA's current 75th Anniversary celebrations. The July issue of Amateur Radio contained a good deal of historical writing, though no references were given to the sources of the material. Such facts and dates are unsubstantiated. Anecdotal material passed on through the spoken word is valuable for fleshing out the dry bones of history, but definitive facts and dates can only be positively ascertained with reference to written or printed records.

In July's issue of Amateur Radio Jim Linton gave us an outline of G W Selby's work, but I question the source of some of the dates he provides. Selby himself did not claim to be working with wireless telegraphy earlier than 1897, according to the RADIO EXPERIMENTER article published in February 1924. An alleged reference to an article on Selby's wireless experiments in THE AUSTRALASIAN of 22nd November 1897 is plainly wrong, as that newspaper was not published on that date. A search of the newspaper for the whole of November and December of 1897 failed to find any reference to Selby. Does any evidence exist to confirm Jim's suggestion that.

"In 1896 he sent a wireless telegraphy message from Brighton to Caulfield?"

Further research is certainly necessary on this matter. It would be nice to say that Selby, a Victorian experimenter, was the first Australian radio amateur, but proof of such a claim is necessary first.

During my recent appointment as the Acting Curator of Electronics at the Museum of Victoria, I had access to the closed storage stacks of the State Library of Victoria. I took advantage of this excellent opportunity to compile a rough list of local radio literature in the pre-war years, up to 1939. During the 1920s and 30s, a surprising number of local radio magazines were published and preserved in the State Library. Most of these journals have been forgotten. A layer of dust confirms that few have been used for research in recent times. I hope that this article will rectify the situation.

Before the First World War, most of the literature on wireless telegraphy was only available in books which were difficult to obtain. There were few specialist journals on the subject, and none locally published. References to local experiments were scattered through newspapers, or reported in the transactions of engineering societies. G W Selby's work can be found in print in the Melbourne ARGUS of 29th April 1899.

By 1900, H W Jenvey of the Victorian Post Office, as chief telegraphist, began a series of experiments into wireless telegraphy, particularly with a view to its practical application. He had been the author of an exhaustive two-volume book on local telegraph systems in the early 1890s, which was the standard Australian text of its time. Assisted by M H Fitzgerald and F W Chambers, he initially set up stations at the Melbourne Observatory and the Melbourne GPO. A circuit

Pat Wilson, the Empire's champion baby, listens to bedtime stories in 1925.

diagram of one of these stations, dated September 1900, is held by the manuscripts section of the La Trobe Library. The Museum of Victoria also holds a telegram sent from Chambers in Doncaster to Jenvey in the city, confirming reception of wireless telegraph messages during the latter part of 1900.

In May 1901, Jenvey set up a temporary station at Elwood to communicate with the Duke of York's escort ship, St George, during the Royal Visit for the opening of Australia's first Federal Parliament in Melbourne. Lieutenant Trousdale controlled the Marconi equipment aboard the escort. The complete Morse tape record of the Jenvey/Trousdale communication of 18th May 1901 is held in the La Trobe Library's manuscripts section in Melbourne. About six weeks later in Hobart, Trousdale conducted a similar experiment with the pioneer Tasmanian amateur F W 'Pop' Medhurst. These were the first confirmed ship-to-shore wireless communications in Australia, though there are rumours of earlier tests conducted by G W Selby to the HMVS Cerberus which have not been confirmed.

Jenvey's wireless telegraph experiments were cut short by a new Director of Posts and Telegraphs in about 1902. The new director saw wireless telegraphy as 'unproven', and directed Jenvey to activities which seemed more likely to produce immediate revenue. A complete account of Jenvey's experiments was not published until the LISTENER IN revealed the sad details on 19th June 1926. Jenvey's coherer detector is in the collection of the Museum of Victoria.

The next local wireless event which was sufficiently important to gain press coverage was the opening of the Queenscliff-Devenport link across Bass Strait on 1906. The Marconi Company sent its engineer, Captain L Walker, to set up the apparatus. Massive masts were erected at Queenscliff, near the football ground, and a special excursion train from Geelong loaded with dignitaries was chartered. Jenvey is believed to have been involved with the Victorian side of the installation. The GEELONG ADVERTISER, 13th July 1906 (p4) and the Melbourne AGE, 13th July 1906 (p3), published lengthy accounts of the opening ceremonies. The receiver, a 'magnetic detector', together with the three-circuit aerial tuner used on that occasion, are both held by the Museum of Victoria.

In 1908, a Postal Electrical Society of Victoria was formed with H W Jenvey as its first president. Technical papers were read at each of their monthly meetings, and wireless telegraphy must have been the subject of some of these. I cannot locate any transactions or proceedings for the Society in its early years, though some sort of journal may have been privately circulated. The story of the founding of the Society is told in the TELECOMMUNICATION JOURNAL OF AUSTRALIA, June 1938, (pps2-4).

Experimental licences were first granted under the Wireless Telegraphy Act in 1905. Prominent among the radio amateurs of the pre-First War period was Victor Nightingall of Glenhuntly, an inveterate experimenter in all things electrical. He was deeply involved with professional X-ray work, and held many patents in fields as diverse as slow combustion stoves and sound recording machines. A scrapbook of his experiments is held by his son in Warrandyte, Vic. The Museum of Victoria holds some of his X-ray gear, but no radio equipment.

The minutes of the Wireless Society of Victoria have miraculously survived. These document the activities of the local amateurs from 1910 to 1914. A few weeks before the declaration of war they published the first Australian radio call book. A copy is held by the State Library of Victoria. Photostat copies of the early minutes are held by the Federal WIA Historian, Max Hull VK3ZS.

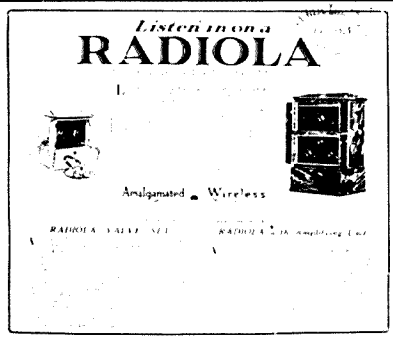
All amateur radio activities were suspended during the First World War, though many former amateurs extended their radio knowledge in the services, particularly in respect of the provision of communication with the troop transports on ships. Amateur communication, as a pastime, went into recess until the early 1920s.

Cover 20th May 1923. 'The smile of a deaf man who hears for the first time through radio receivers'.

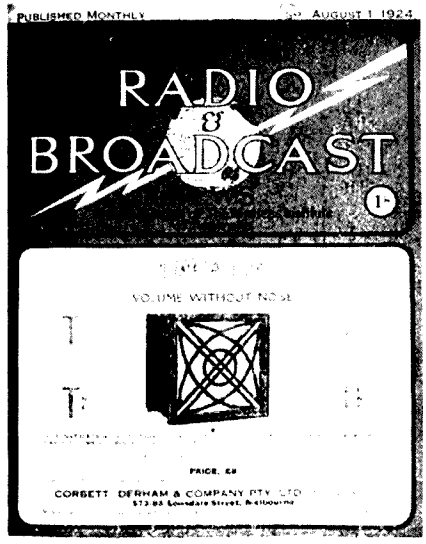
In 1922, the first issue of a Sydney wireless journal, SEA LAND AND AIR, was put on the market. A few years later this became the 'Official Journal' of the NSW Division of the WIA, but the official journal of the Federal Convention and the Victorian Division has always been published in Melbourne, as we shall see. By 4th April 1923, SEA LAND AND AIR was absorbed into a fortnightly periodical, RADIO IN AUSTRALIA AND NEW ZEALAND, which was first published on that date. This continued as a fortnightly journal until 13th April 1927 when it became a monthly, still published in Sydney. The last copy of RADIO IN AUSTRALIA AND NEW ZEALAND (sometimes known more simply as RADIO) held by the State Library of Victoria is dated 15th December 1928. WIRELESS WEEKLY, the Sydney journal which had been running parallel with RADIO since the mid-20s then absorbed its rival, and the first WIRELESS WEEKLY incorporating RADIO was published on 28th December 1928. WIRELESS WEEKLY ran through to the early months of 1939, and then seems to have been re-organised as the monthly RADIO AND HOBBIES IN AUSTRALIA, first published in April 1939. It continues today as ELECTRONICS AUSTRALIA.

The Wireless Institute's own 'official journal' was initially the RADIO EXPERIMENTER, a Melbourne-based monthly, first issued in December 1923. The Wireless Institute ceased to be involved with this journal after June 1924, though it continued under private ownership as the RADIO EXPERIMENTER AND BROADCASTER until July 1925.

After the split from the RADIO EXPERIMENTER, the Wireless Institute's official journal became EXPERIMENTAL RADIO AND BROADCAST NEWS, which appeared in August 1924 and ran monthly until February 1925. From the March 1925 issue it was renamed RADIO



Radio sets available in 1923.



A Speaker of Excellence in 1924.

BROADCAST. This was an expensive-looking magazine, printed on glossy art paper with a cover

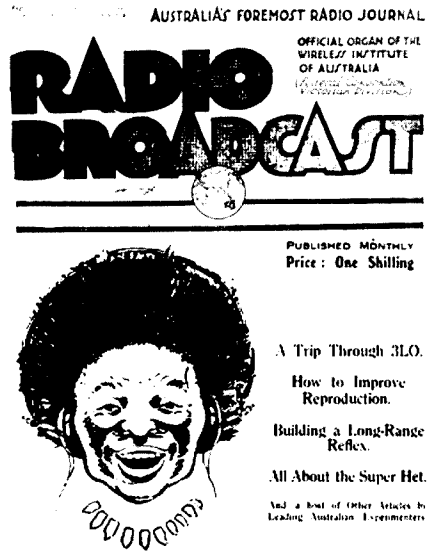
of dyed and textured cartridge paper. It was lavishly illustrated throughout, usually in inks of several different colours. It provides a wealth of written and pictorial documentation for the radio historian. The Melbourne-based RADIO BROADCAST continued in monthly editions as the WIA's official journal until January 1927, and then went into a swift decline. There was no February 1927 issue. March and April were published in a reduced size. Then a 'new series' of RADIO BROADCAST was issued weekly, with no cover — virtually an eight page pamphlet. The State Library of Victoria has only one issue of this pamphlet format for 10th June 1927.

From the 10th June 1927 to the first issue of AMATEUR RADIO in October 1933, there is a mysterious gap in the printed record of WIA activities. There must have been some sort of 'official' WIA publication during this time, but I am not sure that any publication that I have sighted could be the one in question. The front page of a printed 'WIA BULLETIN' for February 1932, 'Vol 3, No 8', is reproduced in the WIA BOOK. This 'Bulletin' seems to have been printed in Western Australia, and with the issue numbers given it could have filled the gap quite nicely. But is this merely a state bulletin? As the State Library of Victoria holds no examples, I am unable to comment on its content.

Another possible 'official publication' of the WIA is RADIO MONTHLY (Sydney) of which I've seen only a few isolated issues in private collections. This was a voluminous production published by 'Amateur Radio and Broadcast Monthly Pty Ltd'. The two copies sighted were for September 1932 and December 1933. The latter is held by Peter Wolfenden VK3KAU, and is numbered 'Vol 2, No 10'. Assuming one volume per year, it was probably established at the start of 1931. It continued well into the 1930s.

From October 1933, amateur radio events have been reported in the WIA's own monthly AMATEUR RADIO magazine, and a complete set is held by the Victorian Division. The State Library's set is incomplete, having only a few odd issues before 1946. The story of Amateur Radio, the magazine, was told in the Golden Jubilee issue, October 1983.

But it would be wrong to assume that amateur radio activities were ignored by magazines not possessing the WIA's official sanction. Some of



1st July 1925.

the most fascinating and detailed descriptions of early amateur activities are to be found in seemingly unpretentious hobbyist magazines. During the 1920s and early 1930s, the Melbourne firm of Homecrafts (P H McElroy) either published or was associated with a series of hobby journals which encouraged sales of their radio components. They published articles of a very high journalistic and technical standard and helped the hobby along extremely well in its early years. The uninspiring titles of these magazines discourages many researchers from using them as references, but they should not be underestimated.

The earliest of these journals, of which I am aware, was the HOME CRAFTSMAN, a monthly journal published between September 1923 and June 1924. The advertising for Homecrafts is certainly included, but the articles are not overtly commercial and are written by various amateurs who obviously 'know their stuff'. There are fascinating advertisements for early radio components, lists of stations and reports of amateur activities. The magazine is of about A4 size and is lavishly illustrated with photographs and diagrams. From June 1924 to June 1925 there is a gap, as either the magazine folded or a volume may have gone missing from the State Library shelves.

In June 1925, Homecrafts published the first monthly edition of THE HOMECRAFT MAGAZINE. This had radio as its principal thrust, with occasional additional articles on model making. Stan Hosken 3MP, was the Technical Editor of this excellent tabloid, which was slightly smaller, but thicker in format than the earlier HOME CRAFTSMAN. The HOMECRAFT magazine published lists of stations heard in Melbourne which provide an interesting insight into the number of broadcasters who briefly occupied the bands in these early experimental days. Its content is otherwise reminiscent of RADIO TELEVISION AND HOBBIES in the John Moyle era. The HOMECRAFT magazine ran until October 1926. A magazine of much larger format, POPULAR HOBBIES, then took its place. This was one of the best Australian electronics monthlies of its era, running until the economic depression knocked it out in 1932. POPULAR HOBBIES published the first local constructional article on the design of a working closed circuit television system, in 1928!. It described the operation of such

1st February 1927.

new inventions as radio facsimile, and even had in-depth descriptions of broadcast studio design by 3AR's chief engineer, Donald Macdonald. A truly creditable effort, and a very good read. What a pity it is that Homecrafts no longer serves the radio component trade.

Many commercial radio journals of the late 1920s and 30s carried amateur radio news. The Melbourne weekly LISTENER IN, first published on 10th January 1925, the southern equivalent of Sydney's WIRELESS WEEKLY, had regular amateur notes by Max Howden 3BQ. His column of intelligent comment and dry wit was constantly accompanied by technical articles and constructional information. The paper slowly changed into a radio entertainment guide during the 1930s. A particularly humourous touch is added to some of the editions from 1928, which include programme notes for broadcast band music transmissions by 3BY, 3EF and others. This 200 metre activity of the early amateurs kept our hobby in the public eye, and its value in maintaining public relations must have been great. Anyway, it must have been fun to play 'deejay' each Sunday on your own transmitting gear. LISTENER IN continues today as the TV SCENE.

The LISTENER IN had healthy competition during the 20s from the Melbourne-based POPULAR RADIO WEEKLY, a tabloid of smaller format than its competitor, but printed on better glossy paper. POPULAR RADIO WEEKLY began on 25th February 1925, six weeks after the LISTENER IN, and continued until 20th June 1928, when competition forced it to change its format. On the latter date, it became POPULAR RADIO MONTHLY, with more discursive, lengthier articles. Then on 1st November 1928, it changed its name to POPULAR RADIO AND AVIATION, with a mish-mash of material from both spheres of interest. The last issue of the magazine held by the State Library is for 1st May 1929, and I assume that it folded.

Continued next month . . .

SCHOOLGIRLS TARGETS BY SCIENTISTS

Women CSIRO scientists, and technical staff are to tour Australian high schools to encourage more girls into scientific careers.

Science Minister Barry Jones, and Education Minister Senator Susan Ryan said the scientists would encourage girls to study science. Only about four percent of Australia's tertiary students in engineering and technology were female and girls were under-represented in "hard science" subjects in secondary schools.

OSCILLOSCOPE SET FOR WORLD MARKETS

An Australian firm is hoping for big export orders after developing a new form of oscilloscope.

Melbourne-based BWD Industries is confident of tripling international sales in the next 12 months with its 8811 Powerscope 11. This model is a high performance oscilloscope which provides accurate measurements of voltage, current, power, phase, and time.

Unlike conventional oscilloscopes, this one can simultaneously display multiple in-circuit power control measurements up to 1000 volts. Additional features allow it to operate as a conventional oscilloscope for measurements up to 50MHz.

BWD describe it as the most versatile and universal test tool available.

On Saturday, 9th November, a Special 75th Anniversary Dinner was held at the Southern Cross Hotel, Melbourne.

Guests met for cocktails and a get-together, prior to enjoying a sumptuous meal in the Alpha Ballroom, ably presided over by Master of Ceremonies, Max Hull VK3ZS.

During the evening, at Max's suggestion, menus were circulated around the room so that all guests could sign them as a memento of the auspicious occasion.

Messages of congratulations were received from The (Right) Honourable R J L Hawke, Prime Minister of Australia, Mr Ronald Reagan, President of the United States, and Senator Barry Goldwater. (See page 3).

At the conclusion of the meal, the WIA Federal President, David VK3ADW, was the recipient of many gifts from the overseas guests, presented on behalf of their organisations to mark the Institute's Anniversary.

ANNUAL INDEX for AR — 1985 ..... Vol 53

ARMADILLOS

Armadillos will run again in 1986.

In 1983, the members of the Texas DX Society decided to try their hand at county hunting, by activating all 254 Texas counties during a County Hunters CW contest. Fewer than 60 amateurs covered 262 000 square miles in less than 48 hours to accomplish the feat.

In 1984, the club expanded the "Armadillo Run", as it became known, to include the states of Arkansas, Louisiana, and Mississippi.

For 1986, the group has even bigger plans — a national Armadillo Run! They will attempt to activate *every county in the United States* during the County Hunters phone and CW contests in May and July.

From 73 for Radio Amateurs — August 1985.

POLYCHLORINATED BIPHENYLS

The serious health hazard represented by contact with polychlorinated biphenyls (PCB) has been mentioned several times in this magazine. This man-made chemical was widely used, from the 30s to the 70s, for such common applications as oil filled capacitors and transformers; these ranged from very large industrial transformers to fluorescent lamps capacitors. It was only as a result of a series of human disasters that led to the recognition (in some countries) of this very real hazard; PCB compounds can be absorbed through the skin or ingested (since it does not break down in food chains), and it has been linked with liver cancer, deformed babies and skin diseases. It was not until 1977 that manufacture of these chemicals was abandoned by British firms. Such compounds provided excellent insulation and coolants and reduced fire hazards; and were much cheaper than the silicones now commonly used to replace this dangerous material.

PCB compounds are still likely to be found in large high voltage transmitting capacitors and transformers.

Precautions should be taken when dealing with (or disposing of leaky oil filled transformers and capacitors unless it is known, for sure, that they do not contain this chemical. British amateur, Brian Castle G4DYF commented: "Recently I came across a leaking transformer and wondered whether it was necessary to dispose of this with great care. An industrial chemist suggested the following test to detect the presence of PCB compounds: 'Take a piece of plain copper wire. Put in a gas flame and burn off all dirt until the flame becomes clear. Allow the wire to cool. Dip it in the oil. Return the wire to the gas flame. If it burns *yellow* it is ordinary oil. If it burns *bright green*, then these compounds are *probably* present. It is not a 100 percent positive test, but if the flame burns bright green it will be wise to assume that the oil contains the compounds — deal accordingly, as it is better to be safe than sorry'."

Contributed by Ron Cook VK3AFW, from Rad Comm July 1982.

NOVICE NOTES

BASIC METALWORKING - "CHASSIS BASHING"

Drew Diamond VK3XU
Lot 2, Gatters Road, Wonga Park, Vic. 3115

Have you ever wanted to have a go at an electronics project, but have been discouraged by the metal- working prospects? Nowadays, there are plenty of handsome factory-made cases available, but their cost can sometimes be a bit prohibitive, especially for the poor student. With a few tools, and a little skill, it is possible to make some very presentable boxes to house your projects. Firms such as Alcan and Comalco sell sheet aluminium by weight, so the amateur can buy a selection of off-cuts at reasonable cost.

An investment in good tools is never wasted money, for they will hold their value, and prove their worth, time and again. It is the intention of this article to describe the use of some basic tools, and illustrate the fabrication of a simple box for a QRP transmitter project.

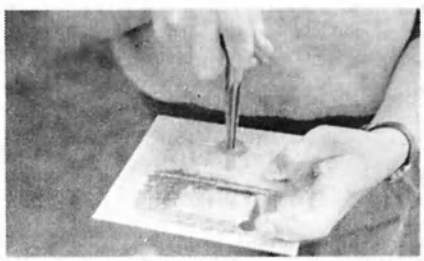
FILING

Of the hundreds of different files available to the amateur, we only require about three or four types at first to carry out basic operations. These would include a 'flat' second-cut file for finishing straight edges, and removing burrs, a round or 'rat-tail' file for enlarging holes (but see later), and a half round, for finishing meter holes and the like. Never use a file without a handle, as there is always the danger of "spearing" oneself with the pointed tang.

DRILLING

Some kind of drill is essential. For radio and electronic work, a manual 'egg-beater' type is fine, and allows firm control over the drilling operation. A set of twist drills, ranging from 1.6mm (1/16") to about 6.4mm (¼") will be found satisfactory for most work. Avoid cheap drills, as they blunt and bend easily, and are therefore not economical in the long term.

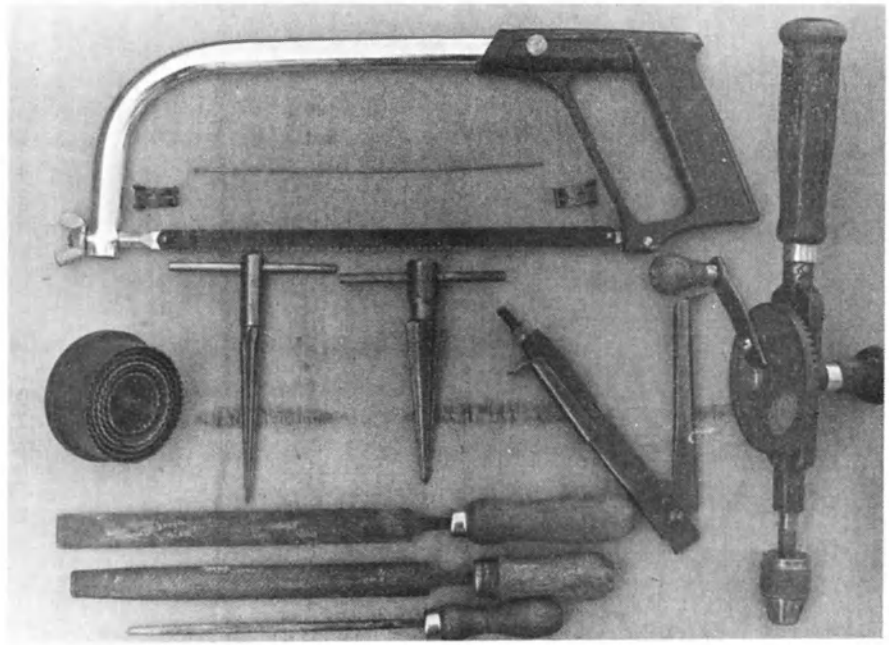
Before a hole is drilled, the spot should be marked with a centre punch to prevent the drill from drifting, and when drilling holes of more than about 3mm in sheet metal, a small pilot hole, of about 1.6mm should be made first to prevent drift. When a hole is completed, the burrs should be removed with a counter-sinking bit, or a drill of larger diameter than the hole. To prevent damage to the workbench, a scrap of wood should be placed under the work during all drilling operations.

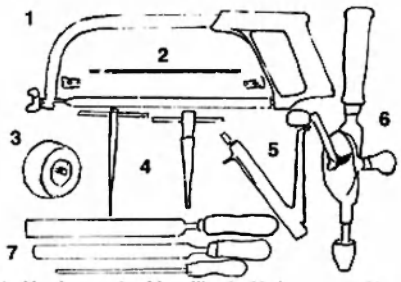


Handy sheet metal worker — the tapered hand reamer.

One of the handiest tools for the sheet metal worker is a tapered hand reamer. For holes of greater than about 6mm, a hole of that diameter is drilled first, then carefully enlarged to the required diameter with the reamer. It produces a rounder and smoother hole than can normally be obtained with a drill and/or round file.

For making larger holes in sheet aluminium, a set of hole-saws is ideal. They are rather expensive however, and must be used in a drill press with the work firmly clamped, and goggles worn by the operator. This operation is not recommended to the beginner, but is mentioned here for future use as skill and confidence increases.





1. Hacksaw 2. Abrafile 3. Holesaw 4. Hand Reamers 5. Nibbler 6. "Egg Beater" Drill 7. Files — note the handles.

CUTTING

The hacksaw is useful for cutting small areas of sheet metal. A blade with at least 24, and preferably 32, teeth per inch should be used. A not so well-known device is the Abrafile, which fits into a hacksaw frame. Being a toothed rod of small diameter, it is more manoeuvrable than an ordinary hacksaw blade, and so is useful for making odd shaped holes in sheet material.

The 'nibbler' has become very popular. It is a sort of miniature guillotine, and is useful for cutting round and square holes in sheet metal up to about 16 gauge.

The Nibbler.

BENDING

There are one or two amateur type benders available, but probably not worth the investment if only small projects are planned. With a selection of L-section angle iron of different sizes, a vice, hammer, and some scraps of wood, it will be possible to make boxes of reasonable quality.

MAKING A BOX

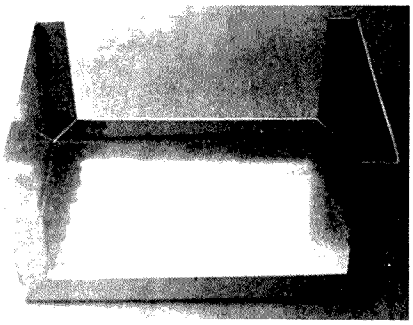
1 Cut out sheet to the required size. Felt-tipped pen stain will provide a background for scribing the marking out lines.

2 Drill a 2mm hole at the apex of the cut-outs, as shown. This allows the bends to be done without crushing at the meeting edges. Nibble or hacksaw the 90 degree cut-outs. Smooth the edges and remove burrs with a flat file.

3 Sandwich the narrow edge of the job in a vice between two lengths of angle iron. G-clamp the ends together if the job is significantly longer than can be accommodated by the vice. Apply a block of wood to the edge to be bent, and with a hammer, carefully dress the metal to a right angle. Do the same with the other side.

Dress the metal with a hammer to form a right angle.

4 Select, or cut, a piece of angle iron to fit into the bends which will form the front and back panels of the finished box. The metal is dressed to form a right angle for these two bends as for step



The bent body of the chassis.

5 Carefully measure the width and height of the front and back panels now formed. We can now cut to size, mark out, and make a lid to suit. The height of the lid will have to be about 3mm greater than was actually measured, and this should be allowed for in the marking out. Test the lid on the box after making the first bend. This will allow you to make the second bend in precisely the right place irrespective of the marking out line, so allowing for any inaccuracies that have crept in.

6 With the lid complete, mark out where the securing screws are to be placed so that self-tappers may be inserted into the folded up edges formed in step 3. Drill the holes in the lid. It will now be possible to put the lid in place and mark the spots where holes must be drilled to take the screws. These should have a diameter equal to about ⅔ that of the screws.

THE RADIO PHONETIC ALPHABET

Maxwell Hull VK3ZS, WIA Federal Historian

Phonetics is the doctrine of sounds, the science which treats of the sounds of the human voice and the art of representing them by writing. It pertains to the representation of sounds and it is this aspect which interested early 'wireless operators' in making clear to the receiving parties those words (or figures) in the transmission which were difficult to understand because of weak signals, fading, atmospherics, electrical interference, interference from an adjacent transmission (even sometimes from a harmonically related band!), poor audio response in the modulation equipment or a poor quality microphone, or just plain inability of the operator to articulate clearly for one reason or another.

One could probably trace the necessity for the use of phonetics back to when man first commenced to communicate by the spoken word (or grunt!). It certainly would have been used occasionally by public speakers in bad acoustic conditions before amplification of the voice became possible.

In the early days of 'wireless' operators used whatever word seemed suitable to make clear the meaning of that part of the context of their transmission needing clarification. Hence, around the amateur world in particular, a somewhat of a 'hotch-potch' of words came into use not all of which were necessarily good.

The problem didn't escape the world Governments responsible for the developing communications in their respective countries. In 1947 at the Atlantic City conference of the International Telecommunications Union a phonetic alphabet was incorporated which proved to leave much to be desired. Thus by the 1956 Geneva Conference of the ITU it became necessary to use up a lot of hours deliberating on the problem. The result was the adoption of the phonetic alphabet which had been used by NATO Forces and civil airlines prior to this Conference.

When the Geneva Regulations came into force in May of 1957 the following approved phonetics came into general use.

A	***Alfa***	*Able*	*Amsterdam*
B	*Bravo*	*Baker*	*Baltimore*
C	***Charlie***	*Charlie*	*Casablanca*
D	***Delta***	*Dog*	*Danemark*
E	***Echo***	*Easy*	*Edison*
F	***Foxtrot***	*Fox*	*Florida*
G	*Golf*	*George*	*Gallipoli*
H	***Hotel***	*How*	*Havana*
I	***India***	*Item*	*Italia*
J	***Juliet***	*Jig*	*Jerusalem*
K	***Kilo***	*King*	*Kilogram*
L	***Lima***	*Love*	*Liverpool*
M	*Mike*	*Mike*	*Madagascar*
N	*November*	*Nan*	*New York*
O	***Oscar***	*Oboe*	*Oslo*
P	*Papa*	*Peter*	*Paris*
Q	***Quebec***	*Queen*	*Quebec*
R	*Romeo*	*Roger*	*Roma*
S	***Sierra***	*Sugar*	*Santiago*
T	***Tango***	*Tare*	*Tripoli*
U	***Uniform***	*Uncle*	*Upsala*
V	***Victor***	*Victor*	*Valencia*
W	***Whisky***	*William*	*Washington*
X	*X-Ray*	*X-Ray*	*Xantippe*
Y	***Yankee***	*Yoke*	*Yokohama*
Z	***Zulu***	*Zebra*	*Zurich*

The Geneva Regulations still permitted individual countries to use any other phonetic alphabet recognised by their own administration for communication between themselves.

The first column is the NATO/ICAO phonetics adopted at Geneva with the syllables emphasised in heavy type, then the well-known Able-Baker-Charlie list which is still used between British ships and British coast stations, and finally the third column lists the cumbrous words which had been approved at Atlantic City and which were used until the Geneva Regulations were introduced. Amateurs have tended to use some phonetics from all three systems.

The method of identifying numerals 1 to 0 respectively utilises the first ten words of the Geneva list, (Alfa, Bravo, Charlie, Delta, Echo, Foxtrot, Golf, Hotel, India, Juliet); and that of 'comma', 'fraction bar', 'break sign' and 'full-stop' the next four letters (Kilo, Lima, Mike, November). When transmitting figures they are preceded and followed by the words "as a number" spoken twice. As an example the figures 1985 would read "as a number as a number, Alpha India Hotel Echo, as a number as a number". The method of identifying numerals in this way is not used by operators in British ships and coast stations. The GPO "Handbook for Wireless Operators" gives the following rules for the pronunciation of numerals —

*O — **zero**; 1 — **wun**; 2 — **too**; 3 — **thuh-ree**; 4 — **fo-wer**; 5 — **fi-yuv**; 6 — **six**; 7 — **seven**; 8 — **ate**; 9 — **niner**.*

Each transmission of figures is preceded and followed by the words — "as a number" spoken twice. Amateurs usually don't follow that part of the procedure. There is no adamant compulsion for amateurs to specifically use the Geneva endorsed phonetic alphabet but it assists to be uniform.

*This is **Victor Kilo** Thuh-ree **Zulu Sierra** signing off. This is a number this is a number, **Sierra Charlie**, this is a number this is a number". **Ditdahditdahdit.***

Participating stations and listeners are able to obtain basic orbital data including Keplerian elements from the AMSAT Australia net. This information is also included in some WIA Divisional Broadcasts.

ACKNOWLEDGEMENTS
Contributions this month have been from Bob VK3ZBB, and the ever reliable UoSAT Bulletins.

UOSAT BULLETINS
In recent weeks Bulletins have commenced publication on the UoSAT-2 (OSCAR 11) in addition to OSCAR 9. Albeit of slightly different format they are an excellent addition to the service provided by the University of Surrey.

G3RUH COMPUTER PROGRAMMES.
Jim Miller G3RUH, known world-wide for his excellent series of articles in Wireless World, has also written some excellent computer software related to spacecraft orientation, eclipse calculations, etc for OSCAR 10. Although written for the BBC computer, in BBCBASIC, they are easily converted to other systems. Conversions to TRS Models 1 and 3, and CP/M3 have already been made.

For those interested in the complexities of spacecraft attitude determination, an SASE to Graham VK5AGR will provide a listing of those programmes available for general release.

FUTURE SATELLITES FOR THE 90s
The following item was posted on a recent UoSAT Bulletin and discusses future proposals for the Amateur Satellite Service. The article originated from Amateur Satellite Report (ASR).

GEO-SYNCHRONOUS SATELLITE SYSTEM
Progress is being made on several fronts towards a geo-synchronous amateur radio satellite capability, according to AMSAT. The geo-synchronous satellites, often called Phase 4 satellites, have been the subject of keen interest recently as a result of several unrelated developments. These developments were said to be three-fold.

First was the recent National Aeronautics and Space Administration (NASA) announcement of its Advanced Communications Technology Satellite (ACTS) Programme, and the suggestion that it could conceivably include amateur radio interfaces.

Second, it was recently learned, by W3GEY, that there is a possibility of AMSAT flying its own transponder/s aboard the ACTS spacecraft.

Thirdly, Arianespace has told AMSAT it is currently developing a so-called "piggy-back" pricing policy for small payloads on its Ariane 4 launcher.

Thus, according to these officials, there are three avenues to a Phase 4 system currently under active study.

An ad hoc AMSAT ACTS study group suggested ACTS was in fact out of reach of AMSAT. The group thought the 30/20GHz uplink/downlink combination and the very high speed digital switching involved would tax our technical resources beyond the projects worth. While no one was willing to say 'impossible', several pointed to

other projects and noted that all available resources would have to be devoted to ACTS at the expense of most other development activities. The cost in these terms, the group seemed to say, would be too high. On the other hand, a number of the AMSAT ad hoc ACATS study group suggested that ACTS offered an excellent possibility for gateway access to a geo-synchronous spacecraft. AMSAT is seeking individuals to work on a proposal to this effect and has dubbed this access to the geo-synchronous capability the P4A1 option (Phase 4A, option 1).

The launch is currently slated for fourth quarter, 1988, according to W3GEY.

W3GEY reported that he received cautious encouragement from NASA and RCA. A preliminary concept would place a Mode L and a Mode S transponder aboard the ACTS payload. AMSAT's transponder would advantage itself of conditioned power, station keeping, and thermal control provided by the host.

AMSAT would provide transponders, control, and its own antennas. The antennas on ACTS appear unsuitable for any antennas AMSAT might use.

The key incentive for including AMSAT aboard ACTS, barring any fundamental technical constraints, was for NASA to perceive a positive technical innovation and a public service aspect to any such proposition. Thus, AMSAT is now soliciting concrete suggestions as to how amateurs might benefit society either directly through communications services or indirectly through technological innovation in connection with ACTS — we should be mindful of the nature of ACTS, that is, it is a communications technology experiment. An ACTS proposal team is to collect ideas and codify them in the form of a formal proposal to NASA.

According to preliminary concepts discussed by W3GEY and WA2LQQ, three types of service might be provided by the Mode L and S transponders. First would be a Mode L linear transponder, similar to that on AO-10 and Phase 3C. Second would be a packet radio repeater, or perhaps even packet switch. Finally, a third service might include a capability to both link selected terrestrial repeaters and group address repeaters for bulletins, training, educational materials, and, of course, emergency communications on a hemispheric basis. Given the opportunity, AMSAT might also propose a more ambitious amateur C-Band transponder, as well.

The suggestions by W6KAG were made, based on his examination of the NASA ACTS documents, and on his independent contacts in the space industry. It was W6KAG who established that there might be payload accommodation sufficient for AMSAT's interests. The idea of placing an amateur radio transponder aboard a commercial, or scientific geo-synchronous spacecraft has been discussed by AMSAT for nearly a decade, and builds on the SYNCART (Synchronous Amateur Radio Transponder) concept of AMSAT Canada and Project OSCAR. More recently, a proposal was made by Cablesat General of Florida, and its President, WA4OHK, to place a C-band amateur radio transponder aboard a proposed commercial spacecraft. The FCC recently eliminated Cablesat from competition for the orbital slot in which Cablesat was to place its satellite.

AMSAT will be working this possible Phase 4 option as its P4A2 option. Concepts for use may be sent to AMSAT President, WA2LQQ, PO Box 177, Warwick, NY. 10990. Similarly, individuals interested in writing portions of AMSAT's proposal to NASA, or in participating in a proposal team should contact WA2LQQ by mail at the same address.

A third avenue to a geo-synchronous system could be a two satellite system launched by an Ariane 4. Arianespace is known to be working on a low-cost, "piggy-back" system which seems ideally suited to carry an AMSAT payload to a geo-synchronous transfer ellipse. A two-satellite system with one placed over the Equator at 47 degrees west, and another over 148 degrees west, would provide coverage for virtually all of North America to Western Europe, and most of Africa on the eastern satellite (AMSTAR East), and most of North America to the Pacific Basin, including New

SATELLITE ACTIVITY FOR PERIOD 1 AUGUST TO 29 AUGUST 1985.

1. LAUNCHES.

The following Launching Announcements have been received:-

1985-064A	Cosmos 1670	Aug 1	USSR
1985-065A	Cosmos 1671	Aug 2	USSR
1985-066A	Oscar 24	Aug 3	USA
1985-066B	Oscar 30	Aug 3	USA
1985-067A	Cosmos 1672	Aug 7	USSR
1985-068A	Cosmos 1673	Aug 8	USSR
1985-069A	Cosmos 1674	Aug 8	USSR
1985-070A	Raduga 16	Aug 8	USSR
1985-071A	Cosmos 1675	Aug 12	USSR
1985-072A	Cosmos 1676	Aug 16	USSR
1985-073A	Planet A	Aug 18	Japan
1985-074A	Molniya 1-64	Aug 22	USSR
1985-075A	Cosmos 1677	Aug 23	USSR
1985-076A	STS-51I	Aug 27	USA
1985-076B	Aussat 1	Aug 27	Australia
1985-076C	ASC 1	Aug 27	USA
1985-076D	Syncom IV-4	Aug 29	USA
1985-077A	Cosmos 1678	Aug 29	USSR
1985-078A	Cosmos 1679	Aug 29	USSR

Notes on these satellites:-

Planet A was launched by the Institute of Space and Astro-nautical Science (ISAS) from the Kagoshima Space Center, Japan. The spacecraft is cylindrical with a 1.4 meter diameter and 0.7 meter height and weighs 139.7 kg. On board is an ultraviolet imaging camera to observe the hydrogen corona around the coma of the comet Halley and an energy analyser of ions and electrons to measure solar wind and probably cometry charged particles. The spacecraft transmits on 2293.89 MHz with 0.07/5 Watts with coherent/non-coherent modes for ranging/telemetry.
The orbit parameters are epoch 04h 10m 32s August 22, 1985(UTC), incl'n 0.888°, perihelion 100.480 million km, aphelion 151.467 million km, period 282.2 days. The closest encounter with comet Halley will be 1256Z March 8, 1986, distance 211,000km.
The spacecraft is now renamed "Suisei" (the Japanese for comet).

STS-51I orbit elements were period 92.0 min, incl'n 28.5°, apogee 385 km, perigee 355 km.
On board were J.H.Engle, R.O.Covey, J.D. van Hoften, W.F.Fisher, and J.M.lounge. Payload included Aussat 1, ASC 1 and Syncom IV-4. This Discovery mission also included the repair of a fuel laden Leasat satellite.

2. RETURNS.

During the period fortythree objects returned or decayed including the following satellites:-

1982-111A	OPS 9627	Aug 13
1983-102A	Cosmos 1502	Aug 29
1985-039A	Cosmos 1654	Aug 7
1985-062A	Cosmos 1669	Aug 30
1985-063A	STS-51F	Aug 6
1985-065A	Cosmos 1671	Aug 16
1985-067A	Cosmos 1672	Aug 21

3. GENERAL.

1966-100A ATS 1 was located at 133.120°West at 1305 UT on Aug. 15, 1985. Inclination 11.872°.
1984-033A Cosmos 1547 and 1984-107A Cosmos 1604 are reported to have beacons operating on 2304 MHz. Both satellites are in range of Australia and the South Pacific for several hours each day. Updated Keplerian Elements are available for a SASE sent to VK3ZBB, QTHR.

Zealand. Eastern Australia and Japan would be on the western satellite (AMSTAR West). Further trade-offs could be made in coverage and a terrestrial relay might be invoked to allow double-hop communications such that Australia, for instance, could work England. AMSAT is working this option as P4A3. W3GEY and WA2LQQ were planning to discuss these options at the Space Symposium and Annual General Meeting on 9th November, in Vail, Colorado, and the following day with AMSAT's Directors. Comments and suggestions are solicited.

However, neither AMSAT's officers nor its directors are precisely certain what is in the greater interest of its members, and the amateur radio community, for future projects.

The view from AMSAT DL is that a follow-on to Phase 3C next summer should naturally be phase 3D, a 1.2 scale version of Phase 3C with a super power Mode L transponder aboard (in the 200 to 300 watt class). Meanwhile, JAS-1 will be launched next summer, as well. AMSAT UK and SA AMSAT are both interested in satellite projects with the latter now supporting the Mode S transponder project of Phase 3C.

AMSAT-OSCAR-10 OPERATIONS (ZL1AOX)

A new Mode B transponder schedule was put in place on the 17th October. A review of this schedule was to be considered about the 12th November 1985. The new schedule is:

MA 055 to 119 ..... Mode B
MA 120 to 136 ..... Mode L
MA 137 to 203 ..... Mode B
MA 204 to 239 ..... OFF
MA 240 to 019 ..... Mode B
MA 020 to 054 ..... OFF

The main reason for this schedule is to reduce the continuous Mode B time during poor sun angles, which will occur again when the attitude in moved to LON 185, LAT -2. This started on 20th October. It will also give the Northern Hemisphere stations the opportunity to work during perigee passes. I request that during perigee operation, and also when AO-10 is oriented at 185, -2 that stations **please reduce their power** so that they are not more than one S point above the General Beacon.

The present attitude is approximately LON 165, LAT -26 degrees, which means that when standing behind the S/C at apogee looking towards the Earth, the S/C antennas are pointing to the right 15 degrees, and upwards towards the Northern Hemisphere 26 degrees. All systems seem normal in the S/C at present.

Operators should monitor the bulletins on the General Beacon of Mode B, 145.810MHz, for the latest developments.

The following item is presented after the event so to speak, however, from an historical point of view, it is extremely well worth presenting.

MANNED MISSIONS

During the seven-day Spacelab Mission D1, in October 1985, the science astronauts R Furrer DD6CF, E Messerschmid DG2KM, and Dr Wubbo Ockels PE1LFO operated an amateur radio station, located in the Spacelab on board the Space Shuttle COLUMBIA — the call sign being DP0SL. The amateur activity started on day three and continued until 12 hours before landing. Therefore, five days operation, with the astronauts active as radio amateurs in there (free) time.

TECHNICAL INFORMATION

The station on board the Spacelab consisted of the following items: *VHF/UHF Transceiver, Antenna, DC/DC Converter, Various Cables, Headset Container with 10 micro-cassettes.*

The VHF/UHF transceiver is a special development, designed and constructed by Bosch/Germany according to the D1-mission specifications, and using components out of the normal mobile transceiver programme of Bosch. RF power output of this transceiver is 10 watts, which is reduced to one watt for automatic (beacon) operation. Frequency range of the transmitter is 144 to 146MHz with F3e (FM) modulation.

The receiver is a double-superheterodyne receiver, frequency ranged from 430 to 440MHz. Sensitivity for S+N/N=12dB is 0.45 microvolts.

Selection of operating frequencies is provided by a ROM, programmed for four VHF transmitting frequencies and six UHF receiving frequencies, within a 25kHz channel spacing. The transceiver is provided with a built-in micro-cassette recorder.

The antenna was designed and constructed by a group of radio amateurs at the antenna laboratories of the University of Bremen. This special antenna, which was mounted outside the Spacelab, is an aluminium whip, approximately 50cm in length. It shows quarter-wave resonance for VHF, and 5/8 lambda resonance for UHF

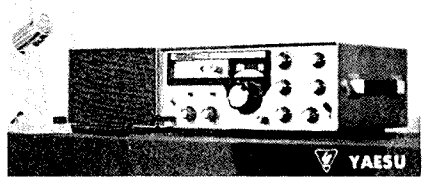
Electrical power (28V DC) was applied to the transceiver from the Spacelab utility power lines, via a DC/DC converter, to provide line isolation from ground, for the Spacelab power lines.

SEASONS GREETINGS

Perhaps it is a sign that I am getting older at a faster rate, because it only appears that last Christmas was just last week. Nonetheless, may I offer Seasons Greetings to all the readers of this column and trust that the year to come will provide you with all the pleasures that you missed out on in 1985.

de Colin VK5HI
AR

KNOW YOUR SECONDHAND EQUIPMENT



YAESU FT-200 TRANSCEIVER

Perhaps one of the more famous of the Yaesu transceivers. First arrived in Australia in mid-1969. The 200 covered amateur bands from 80 to 10 metres in 500kHz segments, but only 28.5 to 29MHz was provided as standard for the 10 metre band. The circuit was a single conversion set-up with a 9MHz IF and tubes were used for most functions. However, like the FTDX-400, transistors were used in the VFO and other ancillary circuits. Unlike the FTDX-400, the 200 did not have a built-in power supply. AC and 12 volt DC power supplies were available as optional extras. Most were sold with the AC supply but many amateurs built their own. There are three models of the FT-200. The original can be identified by the dummy switch between the meter and tuning dial. The knob is there but no switch behind the panel. The second model had the internal/external VFO selector switch in this same position and the third model was in an all black colour scheme. The earlier models had a silver front panel and a grey cabinet. Many modifications were published in AR over the years and I would have to say that most were quite unnecessary.

If you are looking for a second hand FT-200 beware of one that has had lots of mods. The new price of the FT-200s varied between $400 and $450 with AC power supply. Second hand price tends to be variable. Late models with matching AC supply $300 down to about $175, for an early model, perhaps with a home built power supply. Some home built power supplies are more of a liability than an asset. A good FT-200 can perform very well indeed. Most of the tubes used are still easy to obtain and the FT-200 can be recommended as an excellent rig for the beginner.

8- 9	*CW Contest (Tentative)*
15-18	*John Moyle Memorial Field Day Contest*

** Denotes World SSB Championship Contests sponsored by 73 magazine. Rules for these contests appear in this issue.*

It would seem like a very busy start to the New Year with all the contests listed. I would hardly imagine that even the most dedicated contester would be able to enter all the contests listed. It certainly allows the 'faithful' to keep themselves well occupied, and at the same time, provides a wide variety of operations.

REMEMBRANCE DAY CONTEST

As I write these notes in October, all the logs have been collated and sorted into batches for checking. It is certainly the most popular contest in VK, and entails me in a fairly heavy workload. I had hoped to have the results completed for publication in this issue, however, the pressure of other matters has not allowed as much time as I would have wished. I can certainly promise that, completely unforeseen circumstances barred, the results will appear in January's magazine.

As stated in my notes last month, the standard of log entries has certainly improved, however, there are still a number which leave something to be desired. Whilst it is not a perfect world, and I do not expect to see that situation ever occur, I cannot understand why some operators are just too downright lazy to read the rules properly, and go to at least reasonable lengths to try to comply with them.

It certainly was obvious, to the majority, that there were two categories, namely HF and VHF, in this years Remembrance Day Contest, and as this was the case, two totally separate logs together with separate front sheets should be provided.

In an endeavour to try and indicate just where problems exist I am considering taking the liberty of listing such problems and indicating against particular entries where some shortcomings apply. This would be done not in an attempt to embarrass anyone, but merely to try to assist and encourage those prepared to submit entries to improve their standard of entry.

Incidentally, it may interest some members, that two logs submitted showed the post-marked date of 3rd October. The latest due date was 27th September!!! Unfortunately, both logs were from club stations, so it is anticipated members of the clubs concerned will express some dissatisfaction in the right areas about their logs not being submitted in time. In such instances I cannot, in all conscience, accept such entries as being valid.

I would not wish to finish my notes for this year on anything which sounds like a sour note. To that end, I wish to express my thanks to all who supported my efforts throughout the year, by entering the contests conducted by me, on behalf of the WIA, and I wish, in particular, to thank those who took the time and trouble to write and express your opinions on contest matters, as well as make suggestions as to where things can be improved. I have said previously in this column, I cannot undertake to answer all the letters I receive, but I can assure you, even though you may not receive a personal reply, your thoughts and comments are properly considered. There are times where I would find it most difficult, if not impossible, to implement completely the suggestions made.

In the position of FCM, I find there are not always simple answers available, so I believe I must try and function in a manner which is fairest to the majority, and keep in mind the interests of amateur radio as a whole, not just look at things in isolation. I most particularly appreciate the instances when members bring up matters concerning contests at Divisional meetings, or at their club. This promotes a wider discussion, than would otherwise be the case. I would encourage an increase in this approach.

As far as I can see, 1985 has been a fairly successful year on the contest scene. I would like to think, with even more experience under my belt, I will be able to play my part to help make the coming year even more successful.

With the Christmas season coming, and another New Year in sight, it is traditional that we look back over the past 12 months and review just what has occurred. It seems, for some reason, to be easier to adopt a spirit of goodwill to others, as well as a happier outlook, at this time. I would, as I have done for some years now wonder why we cannot maintain such a healthy attitude right throughout the year. Perhaps I can say a word, through these pages, to encourage you to try and adopt such an approach, and, at the same time, remind myself to heed my own words and instincts.

I feel that we can learn quite an important lesson if we stop and look back over, not just over this past year, but rather to consider what has occurred during this last century. Without doubt, it has been a century of incredible advances in technology. Our current day capabilities in modern sciences, physics, and technology of all kinds are nothing short of amazing, and who can say just how much further we can progress. I may ask though, whether we have really come from out of the dark ages. Just think about it briefly.

We have devised more scientific ways of devastating the world, and all creatures that share this planet with us. Many of our new-found capabilities could be put to better use, to benefit all.

The point of my philosophising in this manner is that if we are to see a change for the better, it is up to us all, as individuals, to do something about it. Just the way we live our daily lives can play a big part in making this a better world to live in. Need I point out, that we as amateur radio operators, with world-wide communications capability at our fingertips, have an amazing potential to influence things for the good and betterment of mankind.

I make no apology for writing in this vein, as I strongly believe every opportunity should be taken to try to better things, and that if every person tries to do some good, we must all benefit, as a result.

May I suggest that you all fall into the habit of wishing each person you come into contact with to *'have a nice day'* (and maybe give them a smile). You will be amazed at the responses you receive. Also let us carry this approach into our contacts on the air, with fellow amateurs,

I would like to take this opportunity to say; "Have a nice day", and wish you, on behalf of my wife and myself, a very happy and blessed Christmas. May we look forward to a New Year of much happiness and peace in the world.

I would also wish that those away on holidays will have a pleasant and safe time. Drive carefully on the roads, as accidents hurt many more than those directly involved.

Best wishes, and 73 — Ian VK5QX

WORLD SSB CHAMPIONSHIP CONTESTS

These five separate contests are sponsored by 73 magazine for radio amateurs.

Fifth annual 40 metre test will be held from 0000-2400 UTC, 11th January 1986.

Fifth annual 75 metre test — 0000-2400 UTC, 12th January 1986.

Seventh annual 160 metre test — 0000 UTC 18th January to 2400 UTC 19th January 1986.

Second annual 15 metre SSB test — 0000-2400 UTC, 25th January 1986.

Second annual 20 metre SSB test — 0000-2400 UTC, 26th January 1986.

BASIC RULES — Stations may be worked only once per event. All contacts must be two-way SSB. All stations may operate for the entire contest period.

CLASSIFICATION — a Single operator, Single transmitter, SSB only. b Multi operator, Single transmitter, SSB only.

EXCHANGE — Stations within the continental 48 US States, and 13 Canadian Provinces or Territories transmit RS report, and State, Province, or Territory. All others, including Alaska and Hawaii, transmit RS report and ARRL DXCC Country.

POINTS — Five QSO points for contacts within your own continent, 10 QSO points for contacts outside your own continent.

MULTIPLIERS — One multiplier point is earned for each continental US State (48 maximum), Canadian Province or Territory (13 maximum), or ARRL DXCC Country (excluding the US or Canada).

SUGGESTED FREQUENCIES — 21.250-21.350; 14.175-14.250; 7.050-7.080 (DX); 7.175-7.250 (W/VE); 3.760-3.790; 3.805-3.875; 1.830- 1.850, and 1.855-1.900MHz. (Australian amateurs note that some of these frequencies are outside our allocations).

FINAL SCOCOm RE — Total QSO points X Multiplier points = the Claimed Score.

ENTRIES — Must include Contest Log, Dupesheet for 100 or more contacts, List of Multipliers, and Summary Sheet as outlined below. Be sure to include your SOAPBOX COMMENTS, and a black and white photograph for possible publication.

SUMMARY SHEET — Must contain Contest Call Sign, ARRL DXCC Country, Station Owners Name and mailing address, List of Station Equipment and Antenna/s, Operator's Class, Total QSOs, Total QSO Points earned, Total US States Worked, Total Canadian Provinces/Territories Worked, Total DXCC Countries Worked, Total Multiplier Points, and your Claimed Contest Score.

DEADLINE — Entries should be mailed to the appropriate Contest Chairman, and postmarked no later than 20th February 1986. Late entries will be registered as check logs.

DISQUALIFICATION — Usual disqualification criteria applies. Stations disqualified this time will be barred from these events for one year

thereatter.
PENALTIES — A penalty of 100 QSO points will be assessed for each duplicate contact counted in a contestants claimed score.
AWARDS - A minimum of 100 QSOs must be worked in an event to be eligible for a contest award. Plaques will be issued to the World Championship Stations. Awards will be issued in each operator class, in each DXCC Country represented.
CONTEST RULES AND FORMS — Your own set of rules, and official contest forms, may be obtained from Billy Maddox KA6JJK/3, 1162 Bayview Vista Drive, Annapolis, MD. 21401.
CONTEST CHAIRMEN —
15 *metres* ... Gary Vest WA3KCY, Star Route, Box 34, Holliday, TX. 76366.
20 metres ... Chuck Ingram WA6R, 44720 N 11th Street East, Lancaster, CA. 93535.
40 metres ... Dennis Younker NE6I, 43261 6th Street East, Lancaster, CA. 93535.
75 metres ... Ron Johnson KC7PA, 68 South 300 West, Brigham City, UT. 84302.
160 metres ... Harry Arsenault K1PLR/4, 704 Curtiss Drive, Garner, NC. 27529.

WHITE ROSE AMATEUR RADIO SOCIETY — SIXTH SWL LOWER FREQUENCY BANDS CONTEST

From 1200 UTC 18th January to 1200 UTC 19th January 1986. Up to 18 hours logging may be done during the period.

The contest is open to anyone in the World, and there will be two sections — Phone and CW. No mixed modes allowed. Transmitting amateurs holding a VHF only licence (LAOCP) can participate.

The 1.8, 3.5 and 7MHz bands are to be used.

The practice of logging a series of contacts made by one station is deprecated. Log entries must not include the same call sign in the 'Station Worked' column more than 10 times on each band. A station appearing in the 'Station Worked' column can only be claimed once for scoring. Duplicate entries will incur penalties if not shown as such.

The object of the contest is to log as many stations, in as many countries as possible. Scores should be compiled as follows:
one point for each station heard on each band from one's own continent, and five points for each station heard on each band outside *one's continent. Total points on each band to be multiplied by the total number of countries heard. The final score is the total of the three bands. A list of countries heard* must *be furnished and a separate log must be submitted for each band.*
The call areas of the USA, Canada, Australia, and New Zealand will count as a separate country; ie VK1, VK2, VK7, ZL1, ZL2, W1, etc — separate countries. All other countries will be determined by the ARRL Countries List.

No CQ, QRZ, or similar calls will be allowed to count for points. /AM or /MM stations are not to be included in the entries.

Log sheets to show the following information: Date; Time UTC; Band; Station Heard, Station being Worked; Report at SWL's QTH. Points may only be claimed for stations actually heard, and the call sign must be shown in full. If points are claimed for both stations, the call sign must appear in the Station Heard column.

Entries should be sent to the Contest Manager, John Hart G3ZGA, White Rose Amateur Radio Society, 146 Street Lane, Leeds, LS8 2AD, to arrive not later than 24th February 1986.

Certificates of Merit will be awarded at the discretion of the White Rose ARS. and its decision will be final. **AR**

RESULTS 1984 CQ WW DX CONTEST

Following are the call signs and scores of Australian stations that competed in the Single Operator section of the 1984 CQ WW DX Contest.

VK1RJ 108 452; VK1WB 54 390; VK1LF 2 992; VK2DVJ 125 496; VK2WU 594 000; VK2OE 2 856; VK3DVT 22 815; VK3CJW 64 932; VK3SM 20 331; VK3FY 100 056; VK4OX 7 380; VK4NX 1 026; VK5BJA 244 387; VK5QX 199 485; VK6DU 417 261; VK6MD 323 635; VK6IR 208 748; and VK6HD 1 007.

VK6DU was zone winner for Zone 29, and VK2WU was winner for Zone 30. A check log was received from VK3XB.
From CQ, September 1985.

INTRUDER WATCH

Bill Martin, VK2COP
FEDERAL INTRUDER WATCH CO-ORDINATOR
33 Somerville Road, Hornsby Heights, NSW 2077

Most columns at this time of the year conclude with Christmas greetings ... but I will start the column by wishing all readers a very Merry Christmas, and a Happy and Prosperous New Year, and once again, many thanks to those who supported the Intruder Watch during 1985.

Particular thanks to those who sent in reports for August last: *VKs 2BQS, 2DEJ, 2PS, 2QL, 4AKX, 4BG, 4BHG, 4BTW, 4KHZ, 5GZ, 5BJF, 7RH and Mr G Bradford.*

STILL AROUND

The end of the year brings to a close the WIA 75th Anniversary celebrations, and, no doubt, it will seem no time at all until the Institute is making plans for the celebration of their Centenary. I hope I will be around to see it!

On the bad news side, the USSR Naval Intruder, "UMS", has once again returned to his summer spot on 21,032MHz, **DESPITE assurances from the USSR Administration** that the offending stations would be removed from the 21 and 14MHz bands.

WILL WORK THIS WAY!

An interesting letter was received recently from Bob ZL1BAD, the IARU Region 3 Intruder Watch Co-ordinator. Bob was recently in Geneva for a 'Study Group' on Intruder Watches, which was held at the ITU building. Amongst other things, Bob reports that, in future, the IW system will work this way:

The National Amateur Radio Society (in our case, the WIA) will continue as usual with monthly summarisation of reports, with copies going to local Administration (DOC) and the Regional IW Co-ordinator (Region 3 for Australia). The Regional Co-ordinator will then forward information to the International Co-ordinator (new appointment), who will forward the information to the International Frequency Registration Board (IFRB) through the IARU Executive Committee.

The IFRB has indicated that it is in favour of the change to the system, and should be good news for all intruder watchers. Formerly, the IW had no direct access to the IFRB.

Bob also mentioned that, while he was in the USA, he visited the Ferndale FCC monitoring station. This station is able to get a bearing on a signal in 90 seconds, which is computer-linked to other remote stations for the cross-bearing. **They can pin- point a transmitter to within one square kilometre in five minutes.**

STATISTICS

Statistics for August are — 346 Broadcast Intruders, 130 CW, 51 RTTY, and 20 other modes. Intruders identified were 48.

INTRUDER NOTES

The 'V' Beacon-like signal is still being heard on 7.003.5MHz; SSB stations operating from the South American continent are still causing a problem on the lower end of 40 metres, and are thought to be **NON-AMATEUR**; The North American Armed Forces Net, which operates just under the 40 metre amateur allocation has been spilling over into the amateur allocation of late; VK8s, in Darwin, are plagued by Indonesian CB operators on the 28MHz band, and, when the solar cycle comes good, we will be looking at a new problem, because the taxi-cab operators, in Hong Kong are using the 28MHz band, with apparently little concern shown by their administration. Actually, it appears that a lot of the intruder problems on the amateur bands are a direct result of the apathy (ignorance?) displayed by the Administrations of various countries, which is a sad state of affairs.

Thanks to Col VK4AKX, and Henry VK8HA for the above notes.

Anyway, let us try to put these problems aside for this month, and HAVE A VERY MERRY CHRISTMAS! See you next month.... **AR**

"Yes Kris, OM — and a linear, and a new rotator, and ....." — VK5COP

VHF UHF - an expanding world

1 The Mount Gambier two metre beacon is now back on the air, and has been heard both in Melbourne, and at VK5LP It appears not to be as strong as previously being at the threshold of noise more consistently John VK5DJ, wrote to me and advised of the reopening of the beacon, following more than a year of being out of service due to water entering the vents in the enclosure, which damaged the identifier and caused instability in the exciter strip. Peter VK5BKF repaired the identifier and made up a waterproof cover, while John VK5DJ, repaired the exciter and amplifier stages. The final result is a very stable beacon, with further pulse shaping to produce a cleaner signal, but currently running 12 watts output rather than the former 20 watts. In due course, full power will be available.

John and his group are not sure whether to increase the height of the antenna from the present chimney position where it is largely not arousing much interest by vandals, but may well do so if raised. Personally, I believe reliability is the most important parameter, and the relatively weak signal being transmitted means any improvement in propagation conditions produces a more readable signal. I believe it should be left as is, I can still read it all the time, even if I do have to now wait for a minute or two for the signal to come out of a fade whereas, before it was always audible, despite QSB.

2 I understand there is a possibility of a frequency change for VK2RCW to 144.950MHz. October 1985 Break-In has a note from Tim VK2ZTM, advising of this and the possibility of an 80 metre outlet on 3.699MHz for a trial period of six months, until early 1986, using a crystal locked FT-7 with 15 watts into a long wire antenna. The beacons are sponsored by the Hornsby and District Amateur Radio Club, PO Box 362, Hornsby, NSW. 2077, and reports are sought.

VK2RCW is a Sydney based, continuous Morse transmission station, and is transmitter fed from a memory store with about an hour of text, which is changed at intervals. A wide selection of text is used, including foreign languages, and can be sent backwards to prevent the listener from journalising. Transmission speeds are 5, 8, and 12WPM, and operation is continuous.

VK2RCW started transmissions in 1976, on 147.400MHz using (mostly) a VK3 carphone, with five watts into a ⅝ whip on top of the tin roof of its host building, on the Upper North Shore in Sydney, where it has a good view of the city, and the southern and south western suburbs. (Also, see page 34, Amateur Radio for further details).

Whilst on the subject of beacons, I note also in the October issue of Break-In in "The VHF Scene" columns, on 23rd May VK2s copied the VK9ZR beacon on six metres, from Willis Island. I was not aware such a beacon existed but, it may have been an attended keyer used when the operator was in the shack. If anyone has more details they would be appreciated, but in any case it indicates a very distinct possibility of six metre operation from there this Es season.

SIX METRES

This band is being reported as being very quiet in all areas of the Southern Hemisphere. ZL3ADT said the winter Es were very poor indeed, Jim VK3AZY says much the same thing, and I am doing likewise. There appears to have been some contacts between VK2 and ZL, around June and July, but little has come through of later contacts. From my viewpoint, the present equinox has been very quiet.

SIX METRES OVERSEAS

From "CO ham radio", Japan, the Northern Hemisphere summer Es produced plenty of contacts, but not covering any great distances, it seems. In the lists provided are contacts from Japan to HL1ASS, HL1QW, HL5BAS, HL2DCE, VS6ZMT, JD1BCD, VS6EL, VS6XNF, HL2GS, HL1ADN, HL2ICB, HL1ICM, HL5BMA, HL2ASH, HL2AFG, JD1BBE, HL1AJY, HL2PQ, HL1EJ, HL5BFM, HL5BAS, plus another 10 or more HL stations, DU1GF, VS6XPZ, BT1HHL, BY4AA, VS6TE, BT4RJU, HL3ARA, BY5RA, K7RWT, BY1PK, and with the VS6SIX beacon on 50.075MHz being heard almost on a daily basis, but this being the only beacon to be heard there! Contacts have been made on SSB, CW, FM, and AM, with the latter mode being as high as 50.610MHz.

Television sound signals have been heard in Japan from Russia on 49.750, 9M — TV on 53.740, BY — TV on 51.250, 9M — TV on 48.240 and 48.250MHz. The stations which have been worked on FM all appear to be above 51.000 and no SSB operation appears to be taking place below 50.100MHz. CW signals also keep above that frequency, judging by the lists. It seems reasonable to assume that generally the beacons operate below, or around 50.100, and for the present time at any rate, all other operation above 50.100, with most up to 50.200, but some beyond.

SIX METRES — USA TO EUROPE

The opening up of new areas to six metres for the first time must be quite an event if you are an avid six metre operator, and within range of those new areas. The increasing availability of stations in the UK, and with good Es band conditions, allowed many stations in the US their first trans-Atlantic contacts. Bill Tynan W3XO, in October 1985 QST 'World above 50MHz' says it all . . .

"The 30th July Es opening between the East Coast (USA) and the British Isles certainly ranked as one of the greatest thrills in this conductor's 37 years on six metres. Prior to this, in my wildest dreams, I had hopes that maybe, about 1990, F2 and longer operating hours for the G stations, might team up to let some of us North American Six Metre Enthusiasts add a few UK countries to our 50MHz DX rosters. I even harboured a faint glimmer of hope that some of us in the mid-Atlantic States might be able to work one or two G stations on a fleeting Es opening. As reported last month (See November AR), one such Es opening took place on 2nd July. But, who would have thought that a much bigger one would occur again so soon, and so late in the season? On top of that, it was a long opening, lasting upwards of two hours, and very wide-spread, stretching from New England to northern Florida.

"Those in the mid-Atlantic States fared best, W4CKD in Virginia, a suburb of Washington, made his first six to 10 metre cross- band contact at 2152, and went to work four G stations prior to 2230, when those with special six metre permits are allowed to begin transmitting on 50MHz. After that he worked another 14 UK stations. W3XO, after being alerted by a phone call from WA3DMF, worked eight Gs plus GJ3YHU and GW4BCD. Further south, W2CUK worked VP9GE (Bermuda) at 2302 and then eight Gs, the last at 2327. At 0130, W2CUK, N0EAO, and KA0NNO in Denver, and at 0138 W6RXQ. Quite an evening — working from Europe to California via six metre Es in the space of a few hours!

"From the other end of the contacts, G3COJ reports nine W QSOs between 2230 and 0005, to W4CKD Virginia, K2MUB New York, K3ACR and W3JO Pennsylvania, KB3QM Delaware, W2HFI New Jersey, W2CUK/4 South Carolina, W3XO Maryland, and KA4DVH Florida, which is quite a wide coverage.

"On 6th August, about 2245, six stations in the W1 and W2 areas worked EA4CGN in Spain, six to 10 metres, during a very intense Es opening."

I suppose there are reasons for it, but one would have thought that with the opening on 30th July being so strong, that more actual contacts would have been made across the Atlantic. Possibly, one of the reasons more contacts are not made is that there are not a lot of operators at the moment in the UK, and the time differential has to be taken into account; there are probably thousands of W stations capable of putting a signal into Europe under good conditions, so I would imagine it to be something akin to a good JA opening to Australia, when so many stations are calling from one end that the rate of contacts becomes slow due to massive QRM levels. If there are other reasons, then I expect Bill W3XO will tell me in due course!

"The Shortwave Magazine" for August 1985, carries the following under the heading of 'Six Metres'.

"28th June 1985 was an historic day for UK VHF operators. In the House of Commons, Mr Geoffrey Pattie, Minister of State for Industry and Information Technology, made a statement concerning the future planning of Bands 1 and 3. Part of this statement was : '. . . I am conscious that the interim Merriman Report recommended that the radio amateur service should be given an allocation in the band — ie Band 1 — and I am therefore proposing to fulfill that recommendation by allocating the band 50 to 50.500MHz to radio amateurs'."

I am sure we are all very happy for the UK amateurs, who, for some time, have had a restricted usage of the 50MHz band, and we all hope that this will lead to a much greater six metre population in that country, with more possibilities for all to work someone there, even from VK. But, more importantly, isn't it great to be able to read of a positive statement being made by the appropriate Minister, and that is something not too often heard in todays political arena.

Norman Fitch G3FPK, who writes the 'VHF Bands' columns for 'The Shortwave Magazine', has this to say: *"Behind that simple statement lies years of hard work by the RSGB, which has*

resulted in the UK becoming the first country in Europe to grant its radio amateurs a 50MHz band . . . It seems likely a Gazette announcement could appear by the end of September.

"It is to be hoped that the Society will keep the band plan simple with these out-moded calling frequencies largely omitted. SSB and CW calling frequencies are unheard of on the HF bands, so why bother with them on six metres? Perhaps we should consider not using FM mode on this band, since it is a spectrum wasting system, better suited to UHF/SHF.

"Of great significance was the reception at 0200, on 23rd June, of GB3NHQ by K7KV, in Auburn, Washington, on the West Coast, a distance not far short of 8 000km. What kind of propagation was that at this low point in the sunspot cycle? Quite obviously, there is much to be researched about 50MHz propagation".

About the only additional comments I wish to make about the above couple of paragraphs is that, despite the abuse of calling frequencies by some operators, leading to the frustrations of others, there is ample evidence that the use of calling frequencies has, in the past, resulted in contacts being made that might otherwise not have eventuated. One needs only to look at a possible situation where an operator could be in the shack building some equipment, and monitoring say 52.050, and being on hand to answer a call from a station in a distant area. If you have 50 operators doing nothing else but monitoring, there exists the chance for some contacts being made. And what of 28.885MHz during Cycle 21? World-wide usage of that frequency certainly alerted a lot of people as to band conditions and many useful contacts resulted. I think the people of Europe will eventually see the wisdom of some nominated frequency to monitor, and this wisdom will come with their now given ability to make greater use of the band with all its strange happenings.

On the question of the 8 000km hearing, it could be very similar to that which prevails here when JA signals come down as far as North Queensland and they are given further help down to, say VK5, over an additional 2 000km due to Es existing between here and Queensland. 8 000km is a long way I know, but most things have an explanation when Es is around. Let us now hope the G operators can share in some of these strange, but interesting, happenings, and so add to the knowledge being built up all over the globe as a result of six metre operating.

CALIFORNIA TO HAWAII ON TWO METRES

They have done it again! A tremendous duct formed between the Californian Coast and Hawaii, from 12 to 14th July, and stretched from the Mexican border to well north of San Francisco, and also up to 100 miles or so (200km) inland, when previously the ducts stopped near the shoreline.

Both KH6IAA and KH6HME were 8 000 feet up on the side of Mauna Loa, about half a mile (.8km) apart, which restricted their operating to some extent as they had to take turns operating on the band. Bill KH6IAA, had 40 QSOs using an IC-211 to a 100 watt amplifier, and an eight element Quagi about 12 feet (4m) above the lava flow. One of the highlights of the operation was the contact between KH6HME and N6CA on 23cm, SSB. Paul had worked Chip last year for a new world record on the band, but on CW only.

K6QXY, near Santa Rosa, 50 miles (80km) north of San Francisco, and 2 000 feet (610m) above sea level, says both KH6IAA and KH6HME had strong signals for 36 hours with the latter especially strong on 70cm. W6YKM is 100 miles (161km) inland from the coast and had contacts on two metres, obviously helped by his location 3 000 feet (914m) above-sea-level. The most inland station was K6PVS, and it is thought he may now hold the DX record for the W6 to KH6 path with a distance of approximately 2550 miles.

The whole thing repeated on 28th July, but did not last so long, however, signals again penetrated quite a distance inland. KH6IAA again worked some 40 stations, and added that the polarisation of the signals was preserved, when the Quagi was turned vertical the SSB stations were weaker. The band opened again on 14th August, but confined to northern California, the southern stations hearing nothing. Once again, KH6HME's two metre signals were heard first, then the 70cm beacon. WA6LHD, at Fairfield was able to make a two metre contact with KH6HME, despite having three mountain ranges in the pathway!

The above information was again extracted from 'The World above 50MHz' October 1985, and it looks as though the W6s are consolidating their hold on the two metre, and 70cm records by extending the contact distances further than just their coastline. This makes it all the harder for VK to snare the record again, but Albany to New Zealand might just do it, so you never know!

THE AUSTRALIAN SCENE

John VK4ZJB, has written with details of the DXpedition to Lord Howe Island by Nev VK4ZNC, to operate on six metres. He will arrive on 20/12 and leave on 30/12. He will operate with the call sign VK9LC, with 70 watts PEP into a three element Yagi. QSL information as per the current Call Book — QTHR. Nev is requesting a nominal donation of $5 for a QSL in an effort to help with some of the costs of mounting the DXpedition to give many operators a new country. The primary frequency will be 50.050, and suggests *". . . lots of listening and CQ VK9L, not QSQs on the frequency to clutter it up!"*

John also confirms that Chris ZL7OY has been chosen to be with the meteorological team going to Raoul Island for one year, commencing October 1985. Raoul is part of the Kermadecs, and Chris has been allocated ZM8OY to 31st December, then from 1st January 1986 until the end of his stay he will be ZL8OY. QSL via Chris' XYL, Mrs C Hannigan, The Terrace, Warrington, Otago, NZ. Chris proposes operating 'all bands CW and SSB', and John is hoping this includes six metres. In the light of previous contacts from the Kermadecs, it seems very likely some six metre operation would be scheduled.

As I write this information, *another note has* come from John confirming Chris was definitely taking six metres with him and will operate on all ZL and VK common frequencies, and the departure date from ZL was 3rd October 1985.Thanks for the letters John, they contained good news for the six metre gang.

Eddy VK4KAA ex VK4ZEZ, has now returned to Townsville after spending some time in Melbourne, Ipswich, and Mount Isa after leaving Townsville previously. At the moment, he is trying to get his station in order again, and so far is monitoring OSCAR 10, and also six metres, but no signals on the latter band so far.

Eddy reports that recently a larger inversion over the Coral Sea produced a good two metre path to Port Moresby, and it was possible to have contacts through their repeater, using a hand-held transceiver. On two metres he also uses the VK5 pre-amp, and has had successful AMTOR RTTY contacts to Cairns on two metres. So it looks as though we will have another station from Townsville, this summer.

432MHz EME

Doug VK3UM, continues to have considerable success with his mostly random EME contacts. The following is a resume of recent QSOs with the first report being that sent from Doug, and the second being the report he received.

7/9: This was a sched weekend; 2145 DL9KR 559 559; 1709 VE4MA 439 339 with bad libration fading; 2325 DJ6MB 449 439; 2357 JA4BLC 339 349.

4/10: 2000 DL9KR 559 559; 2023 YU1AW 559 559; 2040 G3LQR 439 439; 2112 LX1DB 439 439, this contact with Luxembourg was a new country for Doug.

5/10: 1452 N4GJV 439 449, again bad libration; 2022 DJ6MB 449 339; 2115 G3SEK 339 339; 2140 DF3RU 449 439.

Scattered amongst the libration fading there are some very good signal reports listed above, good enough for SSB, one would think.

In addition to the above, Doug has maintained contacts on the path to Sydney, with Canberra on the way. Sunday 1/9 on 432 produced contacts with VKs 1ZT, 1BUC, 1ZQS, 2BE, 2QP, 2DVZ, and 2ZAB. Don VK3YV also worked into Sydney, while Lionel VK3NM heard VK2ZAB. On Saturday, 5/10: VKs 1BG, 1VP, 1AU, 1BUC, 1ZZT, 2ZAB, and 2ZRU. These type of contacts always seem to be possible when the various parties are home and available. On Sunday 6/10 Ross VK2ZRU was worked by VK3UM four times using aircraft enhancement!

Doug also indicates he will be signing VK75A for contacts via the moon during the prescribed time the call sign can be used. Thanks for the info Doug.

ROSS HULL CONTEST

This memorial VHF contest is scheduled to commence at 0001 UTC on Saturday, 14th December, and conclude at 2400 UTC on Monday, 6th January 1986. Again there have been some rule changes which is bound to bring some flak, but one would have to feel sorry for the succession of contest managers who have tried to arrange the rules of this contest to be fair to as many people as possible. One important change has been the shortening of the period to about three weeks, and another, the one contact per station per band per UTC day. Such changes have resulted from the pressures applied to the Contest Manager by correspondence from contestants. Before knocking these two changes too much, why not try it for this year and see what the results are. Incidentally, it would not have taken much more correspondence to have all Ross Hull contacts not less than 200km for all bands! Such a rule might have caused some interesting situations, especially at the higher frequencies. Perhaps contestants might like to comment to the FCM on that when submitting their logs.

Looking at the revised scoring I am sure there will be some grumbles, but if you are fair-minded you would have top concede there is no hope of a scale of points which will suit everyone, and there must be some give and take. After all, even VK5LP has to operate under the same rules, and I would give a lot, at times, to live in some of the great VHF locations that some operators enjoy, when compared with my poor location, but I have not used that as a reason for not operating. To live in the metropolitan area of a city, with its inevitable large VHF/UHF population, is not all detrimental when you go up in frequency — try doing some UHF operating from out in the sticks, particularly if the sticks are not located between two capital cities.

All the above paragraph simply means is *". . . let's give it a try this year, see how the changes shape up, but send any helpful comments to the FCM with your logs"*. Also, if you care to go to a little more trouble, why not send me a copy of your log front sheet, and your comments so they could be aired throughout the year, rather than they be held by the FCM until it is time for another contest. I am prepared to extract anything from your comments, which is reasonable and generally constructive, and give it some mileage through this column. See you in the Ross Hull.

OTHER NEWS

A new Region 1 23cm record was established on 29th June 1985, between David G6LEU, and EA8XS, between 1940 and 2012 UTC, with reception apparently in 10 to 15 second bursts. The distance has been calculated as 2620km. The world record for this band is held by KH6HME and N6CA, on 24th June 1984, with a distance of 3997km. This note is recorded in 'The Shortwave Magazine', August 1985.

From the same source is the news that a new world record for 144MHz EME was established on 26th May 1985, between G3POI and ZL2BGJ, with a distance of 18 821km, which is only 1 184km short of the maximum possible distance which could be achieved with someone in Spain. G3POI used a 160 element collinear array and ZL2BGJ, an array of four Yagis and a Henry 2002 amplifier. Congratulations to both operators.

The Annual VHF/UHF Table of 'The Shortwave Magazine' shows the top scorer being GW4TTU, with 19 countries confirmed on two metres, eight on 70cm, and five on 23cm. The second top station, G4TIF, incidentally has 12 countries on

70cm. I suppose that is one advantage of having so many countries within the range of your station in the UK. One wonders what some of the scores must be for European mainland operators, right in the centre of Europe, where distances between countries are even shorter? Perhaps mutual QRM is a limiting factor under these circumstances. I also note that G4TWD had 350 QSOs on CW for the year, on 144MHz!

Mark VK0AQ, at Mawson, continues to pile up contacts via OSCAR 10, judging by the exotic QSL cards arriving here, from time to time. Mark suffers quite a deal from local QRM at his base, which can make 20 metre contacts difficult at times, hence the OSCAR operating. The VK0MA beacon appears to be still running on six metres.

Gil VK3AUI, recently returned from an extended round-the-world trip, has provided this photograph of Johannes LA6HL. Johannes was operating portable in Iceland and is pictured at his location in a Reykjavik camping ground. Johannes has visited Iceland a number of times, and works 144 and 432MHz meteor scatter. He also has 50MHz equipment. A two metre beacon is being installed in Iceland by Johannes, with the help of a group he is associated with. Thanks Gil, for the photo and information.

Johannes LA6HL.

Johannes' Meteor Scatter Antenna.

Local news on VHF is scarce this month, maybe the Es will start to come along soon and help the situation. With this issue I commence my 16th year of compiling these notes. Thanks once again to those people who write to me and send information, and to the Clubs who send their bulletins and journals.

As it is December, I wish everyone the compliments of the season, and plenty of useful DX in 1986 — the year of South Australia's 150 Jubilee.

Closing with the thought for the month — *"PUSH may get you anywhere in this world — except through a door marked PULL."* 73 The Voice in the Hills.

AR

HIGHLIGHTS OF AMATEUR WIRELESS HISTORY IN AUSTRALIA

APRIL 1935: Mr Kenna (ex VK4FK) and Mr Billin of the PMG Research Department demonstrated 56 MHz equipment in the Queen Street rooms of the Victorian Division of the Wireless Institute of Australia. Two-way 'phone communication was established with a portable-mobile transceiver below the rooms in Queen Street and by means of a loudspeaker in the meeting room progress of the mobile station was followed as it moved along Queen Street. At this time there were not many VHF enthusiasts so this demonstration inspired great interest and brought into being the WIA 56 MHz Group. The late John Moyle VK2JU, was an early 56 MHz experimenter.

1934-1935: Amateur Radio magazine carried an — "Operating & Experimenting Section — covering 28 MHz, 56 MHz, 112 MHz and 224 MHz. The Gadsden Trophy was awarded to the Group for outstanding work on these bands over the period from June 1935 to June 1936. It was the first Experimenters Trophy for annual presentation. The Queensland group notched up the Australian distance record of 70 miles (113 km) in the 56-112 MHz region in 1935 and in May of that year were setting up for tests over a 150 mile (241 km) path. The Queensland Group also achieved duplex contacts between two flying aeroplanes and two moving cars; one plane directed one of the cars around the suburbs in which the tests were conducted.

SEPTEMBER 1935: First organised 56 MHz Field Day arranged in Victoria following the success of VK2 and VK4 tests from aeroplanes and motor cars. Twelve sites selected were at Mt Dandenong, Mt Macedon and Arthur's Seat. Geelong amateurs were alerted in case Port Phillip Bay was spanned! Distances of 45, 70 and 80 miles (72, 113 and 129 km) were achieved.

OCTOBER 1935: First 28 MHz contact between New South Wales and Europe made between VK2LZ and F8VS. First 28 MHz contact between Queensland and Europe was between VK4EI and ON4AU in the same month.

1935: The first transmitter for the WIA Victorian Division using the call sign VK3WI was constructed by Bill Gronow VK3WG, for the Institute's activities at the Essendon Aerodrome. It was later rebuilt by VK3WG and Bob Cunningham VK3ML and operated from Law Court Chambers at 191 Queen Street, Melbourne, In the post war years after WW2 it was again reconstructed for use at the same site by the late George Glover VK3AG.

1935: The Lakemba Radio Club in New South Wales published a successful official Club paper — The Lakemba Review.

1935: The Tasmanian Division of the Wireless Institution of Australia staged its first State Field Day in March of 1935, held at Campbell Town 80 miles (129 km) from Hobart at which the northern amateurs met the southern amateurs.

OCTOBER 1934: The Victorian Division of the WIA staged Australia's first DX Contest on the occasion of Victoria's Centennial Celebrations. The Contest Manager was Bob Cunningham VK3ML. Prizes were presented by the Chief Inspector of Wireless, Mr J Malone, in the studios of the commercial station 3DB Melbourne. The Centenary DX Contest was the forerunner of the first VK-ZL Contest held in October of the following year.

SEPTEMBER 1934: The Amateur Radio Association (NSW) set up an amateur station at the "Gentlemen's Hobbies Exhibition" held in aid of the Industrial Blind Institute. It was organised by VKs 2UX, 2FQ and 2HZ.

OCTOBER 1933: The Melbourne amateurs gave a dinner to the country amateurs.

1935: The Wireless Institute of Australia celebrated its Silver Jubilee as the oldest amateur organisation in the world having been founded in New South Wales in 1910 by a group of wireless experimenters.

OCTOBER 1934: First contest organised by the WIA titled — The Five Point Contest. The second contest was the — The Fisk Trophy Contest in 1935 run on a six monthly basis for interstate contacts with cypher interchange with each QSO. The trophy was presented by Mr Ernest Fisk (later Sir Ernest Fisk) of AWA Ltd. The suggested call in the contest was — CQ Fisk. Sir Ernest Fisk was also an early President of the WIA in NSW and also of the Australian Radio Amateur Transmitters League (ARATL).

1928: 'Phone Section of the WIA in charge of frequency allocation of crystals for the 200 metre 'Amateur Broadcasters'. Stations had to meet a technical standard before crystals were allocated. The quality of some transmissions were frequently superior to the commercial transmissions of the day. In October 1934 a 'Phone Contest was held in which the quality of recordings and speech were judged. Some authorised stations utilised YL announcers.

OCTOBER 1933: The first issue of the WIA's own magazine — Amateur Radio — was published in octavo format by the Victorian Division of the WIA. The Federal Council of the Institute endorsed it as the Official Organ of the Institute. During World War II the printed publication ceased due to costs and the temporary cessation of amateur radio on the air. It was replaced with a 'roneoed version' until 1945 when reprinting commenced in a quarto format.

1933: The licensee of the famous station A3BY, OA3BY, VK3BY, (Mr Holst) tells the story of how, in 1912, he used a spark transmitter to work out school lessons with his pals!

AR

HOW'S DX

Ken McLachlan, VK3AH
Box 39, Mooroolbark, Vic 3138

The writing of the last column for 1985 has come around again, seemingly very quickly and the year has flown past.

Unfortunately, the solar cycle on its downward trend has not been conducive to enthusing the newcomer to seek DX, however the DX is still there, if you are in the right place at the right time. When one tunes across the band, it appears 'dead' but, what one does not know is, there are also possibly others tuning and not calling at the same time. As New Year resolutions are coming up, why not make it a practice every time you switch the transceiver on, to give at least three calls.

Next months column will present another amateurs view point of DXing, as she has known it for in excess of half a century, which has allowed her to join the ARRL DXCC Honour Roll, to the best of my knowledge the only VK YL to achieve this honour. Incidently, this amateur has been a member of the WIA for 56 years.

To all readers, I would like to extend Seasons Greetings for 1985, and I hope that 1986 bestowes health, happiness and of course lots of good DX, even if the conditions are not what they could be.

QSLING

A chore, to us all at times but a necessity, as in my opinion a card compliments a contact that you have made with a new station, a friend you have just made and may never have the pleasure of meeting, yet will meet from time to time in the ensuing years.

Jan and Jay O'Brien, KH6HHD and W6GO respectively, in their invaluable publication the W6GO/K6HHD QSL Managers List, issue number 67, have written an excellent article termed 'Successful QSLing'. I have decided to reproduce this article in an adapted form to suit conditions applicable in Australia which I am sure will be of interest to all who QSL, either directly or through the bureaus.

Jan and Jay state *"Gelting OSLs is important to you. Otherwise, if it wasn't you would have little interest in this publication. Our goal is to help you get those important OSL cards. We have been gathering information from many sources and have presented several columns for you with hints on QSLing."*

Here is a recap of the most important points.

THE BASICS

At all times use 24 hour UTC time and UTC date, this will then agree with the DX stations log and save the operator, or if he is lucky enough to have a manager, the precious commodity of time. Many operators and managers place the cards that do not agree with the log into a separate file to be attended to when they get around to it, which may be a week, month or never in some cases. It is easy to see the importance of the use of a universal time. Even in Australia with the advent of daylight saving time, there can be a huge variance, particulary if a station is working 60 stations per hour, a conservative figure for a good operator.

COMPUTER GENERATED CARDS

If one uses a computer, as I do, it is convenient to place the year, month, day, and time in that sequence when keying the log in for sorting purposes. Some countries place the month first, followed by the date and year, eg: The 1st of April 1985 on my card becomes 1985/04/01 and on an American card it could be written as 04/01/1985. Imagine yourself in the recipients shoes. *When did this station work me? Or did he or she work me?* So into the too hard file, therefore on those special cards, write or print the month in or programme the 'wonder box' to do it for you. The same applies with time. A five minute incorrect time could mean five contacts difference, not much to look for but it may be over a page, which becomes time consuming. So precise time in the log is essential.

THE CARD

Cards should not exceed the dimensions of 140mm x 90mm and be on a card not heavier than 250 grams per square metre, if one intends to use the bureau. The reason — economics!

It is essential, when filling in a card, that the information is clear and accurate and that there are no alterations. If you unfortunately make a mistake, destroy the card and start again. An altered card will not be accepted for DXCC accreditation or most awards and therefore becomes pasteboard, nice to behold but heavy on the wallet, particulary if you are sending it direct instead of using the bureau facilities.

SENDING DIRECT

If it is a rare station in a country that you have not received accreditation for, my advice is to QSL direct, if you can afford it. As your chances of receiving a card fairly promptly are quite high. It is essential that one sends a self addressed envelope (SAE), accompanied by adequate International Reply Coupons (IRCs) or a 'green stamp'(one American dollar), the latter is valueless in many countries and in some cases cause the recipient many problems.

SENDING BY THE BUREAU

Each VK bureau has its standards, and it is advisable to check — but, to make it easier for all, the following ground rules will assist.

Remember, volunteers run the bureaus, and time is precious, so pre-sort the cards alphabetically, and numerically, after having placed the recipients call sign in 12mm high, legible lettering at the top right corner of the card. This can be on either side, whilst viewing it in a horizontal position.

If there is a manager involved, it can be placed underneath in smaller lettering.

Your attention to the above will be greatly appreciated by all bureau personnel throughout the world — and, of course, expediate your card to the recipient.

MAIL CENSORSHIP

According to media reports, Pakistan AP2, has begun censorship of all incoming mail, except those of a diplomatic nature. Currency is strictly taboo, so please don't embarrass the recipient.

It is believed there is evidence of mail being inspected also in the Peoples Republic of China, particularly if photographs are included and it has been proved that material of an offending nature is confiscated and destroyed. Again please beware of embarrassment to your fellow amateur, and the image of our country.

PROFILE OF A MANAGING EDITOR

I read, amongst many other magazines, World Radio, and quote a lot of their material. This excellently presented monthly, that is entirely devoted to amateur radio, is edited under the management of Christine KA6TAL, who gained her Technician Licence three years ago at the age of 27. This lady, apart from being a housewife for five years, does freelance journalism, and is involved in a little public relations work for a nature centre.

Christine, a person with boundless energy, is heavily committed with church work and has other hobbies including reading, playing the guitar, hiking, photography, and her duties at the local nature centre. Christine, keep the excellent standard up. It is known that all your readers appreciate your untiring efforts, as do the folk at this QTH.

Chris at work.

NEW TAIWAN AMATEURS

BV2DA Feng, ex XW8BP, BV2FA Shane Tang, an ex HS operator, BV2GA Randy Wan, ex KA6LGA, BV5HA G T Chang, BV6IA W L Chen, BV7JA C L Soo, BV7KA S L Teng, BV7LA C M Tsai. Congratulations and welcome to the above newcomers who will take the 'heat' off Tim BV2A/BV2B, who has given so many a new country for their DXCC over so many years. Incidentally Taiwan is divided into nine different call areas with the 0 being reserved for visitors.

Further examinations are expected to be held in the near future.

SMOM

It is reported that Mario will be active with 1A0KM in February. If you have not worked it place a note on next years diary as Mario I0MGM, would like to keep it on the 'much' wanted list! I Hence, very few operations per year can be expected.

CONGRATULATIONS

Isao JH1RNZ, also known as 3D2RN and other calls pertinent to the Pacific area, has a smile from ear to ear, since he had a QSO with the US Space Shuttle CHALLENGER, on both two metres FM and colour SSTV on the 4th and 5th of August. Congratulations Isao on being the first and probably only JA operator to succeed.

BEREAVEMENT

It is sad to relate that confirmation has been received of the deaths of JI3USA, JF3NAK, and also JO1PSU, with her two children. These amateurs were killed in the tragic Japan Air Jumbo Jet air crash in the mountains of Gunma on the 12th of August. From all amateurs, condolences to the families, not only of the amateurs, but to the other passengers involved in this unfortunate disaster.

Also, it would be remiss of me not to mention the disaster in Mexico City, where amateurs, played a magnificent role in assisting in rescue operations and the transmission of emergency traffic. Again condolences to all who lost loved ones and friends in this horrific natural disaster.

KNOW YOUR COUNTRY

Bob Winn W5KNE, has written an excellent article on the much sought after Galapagos Islands, which is reproduced for the interest of all readers.

The Galapagos Islands, or Archipelago de Colon as they are officially known, are astraddle the Equator, 960 km west of South America and 1250km southwest of Panama. The islands were named by early visitors for the large tortoises that inhabitated the islands. The Spanish word for tortoise, is Galapago.

The Galapagos, which includes 13 main islands and many smaller islets and rocks, has an area of 7800 square kilometres. The largest island, 130km long Isabela has five major volcanic peaks, the highest having an elevation of 5600 feet (1700m).

The islands are the tops of large volcanoes. Some volcanic activity (fumaroloes) is still evident on the islands of Isabela, Fernandina, Pinto and Marchena. The last volcanic eruptions occurred in 1963 (Isabela) and 1968 (Fernandina).

Even though the Galapagos are somewhat isolated they have a long and rich history. The first known visit to the islands was by Fray Tomas de Berlanga, Bishop of Panama, in 1535. However, the islands were relatively unknown for another 200 years.

By the late 1700s, whalers and fur seal traders visited the islands for food and water. The hunters slaughtered the fur seals, iguanas and giant tortoises were often taken alive on board for food

and sport as they could survive for long periods without food or water.

Before being claimed by Ecuador in 1832, the islands were often the base for pirates and generally ships from many nations. During the war of 1812, the US frigate ESSEX used the islands as a base. It wasn't till after Ecuador claimed the islands, that they became permanently inhabited.

Probably the most famous visitor to the Galapagos was Charles Darwin, the father of evolution. Darwin visited the islands in 1835 with the HMS BEAGLE. Many of his ideas concerning 'evolution' originated from studies made while visiting the islands.

In 1959, the government of Ecuador proclaimed all uninhabited areas of the island group as a National Park and enacted laws to protect the native wildlife.

I know Bob, and his XYL Bonnie, put considerable research into this article and it is trusted that you will have something to chat about with your next QSO to that part of the world.

DISAPPOINTMENT

It was a disappointment as to the number of replies that I received for the survey of wanted countries, as requested to readers in a previous issue. The Post Box wasn't crowded to say the least.

Out of the number I received, the following countries predominated: 3Y0 (St Peter 1 Island), 3Y0 (Bouvet Island), 7O, ZA, S9, CE0 (San Felix Island), PY0 (Trindade), SV (Mt Athos) and 1A0KM (Knights of Malta).

This is not by any means a true evaluation of the needed countries required by VK amateurs and SWLs, as it does not include any SWLs or Novice operators figures. The reason is that none were submitted.

No one included their interest in the WARC bands, even though they don't count for awards or DXCC, so no figures are available. This column was not the only one to suffer a lethargic response. The same happened from European operators, with only 30 submitting their 'wanteds' to the 'DX Bulletin', out of a total of 582 returns. The overall figure was 768 last year. My question to all readers — is DX what it used to be? Has it become a 'black box' operation, or is it a lack of interest due to the propagation conditions which are nearly at the bottom of the Solar Cycle.

A LADY OF NOTE

Many VK CW operators have worked Liz W3CDQ, over the last half century, and they have the card to prove it. However, very few of these operators realise that Liz still uses a 1922 hand key and will celebrate her 87th birthday on the 11th of this month. Quite an achievement for Liz as she has been on the air 62 years.

Liz remembers, and talks quite often about, the time in 1917, when, as a young girl, she took a radio course with the hope of becoming a ships operator, after her completion and passing of the course. Her hopes were dashed due to World conditions at that time, but before long, with her new commercial licence, she was teaching code to hospitalised veterans wishing to update to new positions in the forces.

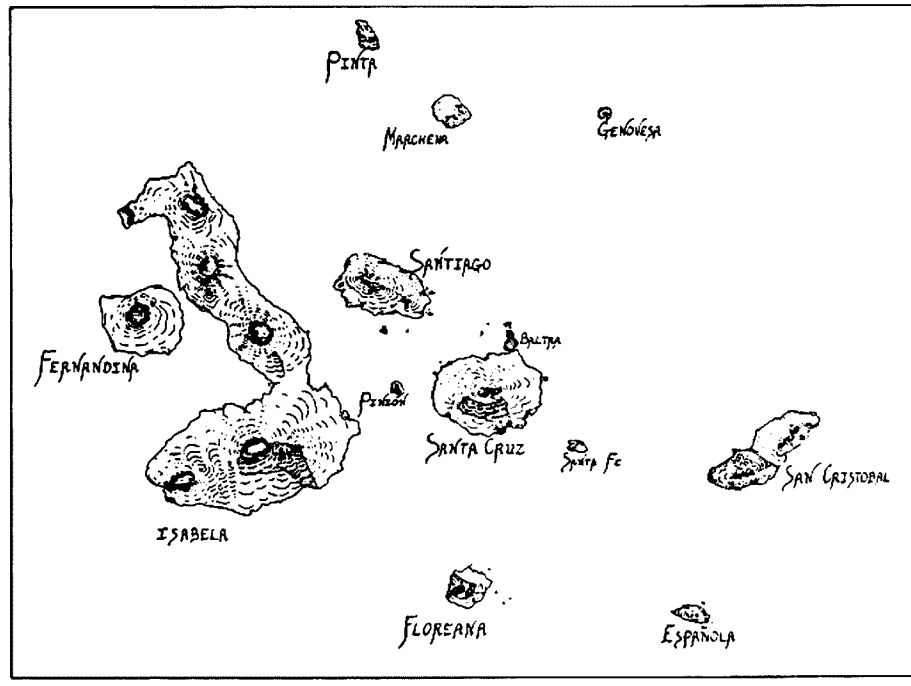
In 1921, Liz obtained a position with the Bureau of Standards, as the only lady in its staff of 21 radio personnel. Her duties were varied to the extent of taking measurements, the winding of coils, making receivers, translating items from foreign magazines, to assisting in the publication of a book titled 'How To Build A Crystal Set From An Oatmeal Box', of which 20 000 copies were sold.

This lady built a five watt, one valve transmitter, and also a one valve receiver, after gaining her amateur licence in 1922. Since then she has made innumeral friends throughout the world and is continuing, since her retirement from the Bureau of Standards, with a rig running 100 watts to an indoor multi-band dipole antenna that is located between the roof and ceiling.

Liz, has been a member of her national society, the ARRL, for 55 years, and belongs to many clubs and the Society of International Radio Engineers. In a letter to a VK friend, she remarks that she recently attended a YL convention, where some 200 attended, and had the privilege of meeting some of the friends she made on air in the very early stages of her amateur career. This lady always maintains that the hobby we enjoy, has meant friendship to her.

Happy birthday and many more healthy and happy birthdays in the future Liz Zandonini, from all your friends in Australia and the amateur fraternity in general.

Adapted from World Radio, September 1985, with assistance from her many friends in VK.



ODDS AND ENDS

The WARC 10 MHz band is now available to Italian operators. I3BLF has achieved 27 countries on all continents. ** Rudi DJ5CQ, is quite active from Lord Howe Island. QSL to his home QTH. ** 4U1UN quite active on 20 metres. ** Watch for XT2AU who hopes to be active from 5U7 this month. ** SEA Net starting to be heard again in the eastern states. Time 1200UTC Frequency 14.320 MHz. Don't miss an excellent net where everyone is made welcome. ** Zone hunters watch for UZ9OWB/0, located on Shitokan Island, which is in Zone 19. ** Gary VO1OC/S2 does not hold acceptable credentials for DXCC. ** Bernt A24BJ, quite active. QSL Private Bag 7, Francistown, Botswana. ** Listen for Chris VK0CC, ex VK2BCC who is on Heard Island. It is unlikely that he will be very active due to the workload. Listen between 14.210 and 14.150 MHz. ** John S79JW quite active, with strong signals. QSL to PO Box 487, Victoria, Seychelles.

CARDS ROLL IN! I

Stephen VK2PS, reports that he is still flying with the 'VI' prefix and running his 'commercial' regarding the WIA's 75th Anniversary. It apparently brings a lot of DX out of the 'woodwork' that would not normally appear.

Stephen has had another batch of cards from the Bureau, including 25 SWL cards from the USSR and pasteboard from BV0AC, BY1SK, HB0NL, PP8JJ, PT2VE, TI2ANL, TI8CBT, YO3CD, YOP8WCY and ZS1OU.

The way Stephen is working the DX, I recommend to him that he buys up on pens, to fill in the onslaught of cards he is going to receive.

Karen KA0CDN, has found a way of quick returns to get a J5WAD card. Karen used the three envelope trick. In her own words she says *"I put our cards in one envelope along with 2 IRCs and a SAE and wrote the QSL Managers call on the envelope. Do not seal the envelope. Send along with other cards to Box 88. Cards were returned in our SAE with Soviet postage stamps and rubber stamped from U QSL Bureau, Moscow, Box 88".*

QSL MANAGERS YOU MAY NEED

ODDS 'N' ENDS

This month, I'd like to catch up with some of the correspondence, and I'll start with a subject that is dear to my heart — the unofficial, unsponsored, and no-prizes-but-self-esteem competition to find the World's Biggest Key. We have two more entrants! I hope they will stimulate competitive activity out there, but it's necessary to remind you once again of the rules of the competition. . .

". . . there are no rules. It is difficult enough to determine what constitutes a key, without worrying about terms like 'biggest' ".

First entrant is our friend Bill Martin VK2COP, the Federal Intruder Watch Co-Ordinator, who wrote to comment on my column about intruders. Bill says, *"Rarely have I ever undertaken an endeavour which has proved to be so frustrating, and lacking in finalisations. But the rain finally wears down the stone, and, even if we have the occasional success, then the effort has been worthwhile."* I am sure all of you are grateful for Bill's efforts on our behalf, and will continue to give him your support.

Bill says he is not a contender for 'keeper' of the World's Biggest Key, *"but let me tell you this. . . Sometimes, when I am tired, and the conditions are bad, my key SEEMS to be the largest key in the world, HI"*.

A flattering and welcome letter from Douglas VK4VLJ/MM, aboard the JAVELIN enclosed the artwork for a proposed QSL card. I am not too sure of the degree of accuracy with which the drawing represents the actual communications facilities on the JAVELIN, but, as Doug quite rightly points out — *". . . as you have taken a 'no rules' position (most wise, et diplomatic (thanks, Doug)) I believe that a theoretical key is as valid as a physical one"*. That's true, I think, or at any rate appears to be within the spirit of the competition, but what we lack here is a scale. Without the measurements of the theoretical key, or at least of the actual JAVELIN, it is difficult to assess a ranking. I mean, how do we know this nautical scene isn't inside a theoretical bottle?

Well, much as I would hate to take the grand prize away from Doug on a technicality, you must remember that I am by birthright a genuine American, and we learned a thing or two about technicalities in the process of losing a certain nautical mug. I am fore-shadowing a grand effort by the Adelaide Hills Amateur Radio Society, and ask you to bear in mind that, as the author of the rules, I am in a very good position to exploit them to our own advantage.

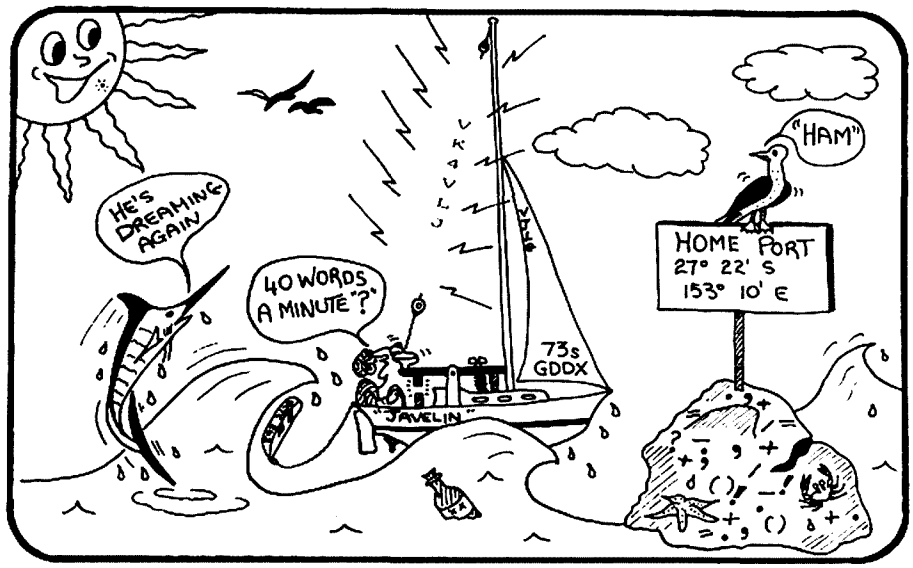
Any other takers?

Changing the subject, the balance of opinion as to whether Novices could or should be granted CW-only privileges on other bands, judging by my correspondence, is just that — balanced. Some very strong points of view were expressed on both sides of the issue, but I think overall there was a sufficient level of interest to justify a look at it by Federal WIA. To this end, I will write to them at my earliest convenience (as we say in the business), and ask them to consider the matter.

Opinion was not divided on the subject of a handbook for CW operators. The response was unanimously in favour, and those of you who wrote will, I trust, be pleased to learn that the negotiations are under-way.

My article on standards drew a lot of correspondence, and I was pleased that there are others who feel strongly about the future of CW. On that note, I would like to quote a large portion of the letter from Ken VK5PKP. . .

"Obviously, you are one who perceives CW as an integral part of amateur radio. I would suggest that the majority of license holders today see it merely as a nuisance to obtaining a particular level of license, especially from Novice to Full Call. On the other hand, it can be seen as both a status symbol, ie; 'I can work 20WPM,' or by the amateur association as a covert way of keeping amateur radio 'pure'. The latter I suspect. There is no real reason for needing CW qualifications, nor for that matter is there reason for more than the barest theoretical knowledge in order to become licensed.



"In fact, I would say that todays advanced technology caters to the amateur in such a way as to require only a basic understanding in order to operate. Latest equipment requires knowledge equal to that of a microwave oven or video recorder. It is easy then to understand the amateur service's paranoia about CW and exams. As for regulations, they are legislated to prevent interference with other radio services, and with an exam, are an obvious way in which a government can regulate the amateur service. CW today is an adjunct to that regulation. My apologies for these old arguments.

"In any case, CW is not the popular force it should be, and to some, is only an interest in, perhaps, the same manner as ORP. So what is to be done to convince newcomers to our hobby that CW is equally as important and fulfilling as any other aspect of amateur radio? One thing, keep the mystique, but get rid of the mystery. The mystique of Morse code, enabling the world to establish communications early this century, is worth promoting; the fear that it is highly skilled and difficult to master should be denied.

"Perhaps we could look at CW more in terms of the international scene rather than just locally. That is, code skills are a common requirement to most amateur services and because of different frequency allocations, could be the only way to communicate with select licensees abroad. I would support the idea of individual awards or certificates, but to me this might be 'preaching to the converted.'

"What I personally would like to see is wider privileges for CW. I see no good reason why any licensed amateur should be restricted to any band here in Australia, but at the same time, appreciate both the DOC and WIA views on this. What about allowing, for example, those with Novice licenses wider access to bands, CW only? It would be more rewarding to the Novice, and possibly stimulate them to further study. It may be the means by which limited calls might also become more involved. On the other hand, if I could work 20 and 40 metres CW I might never consider upgrading to full call. Oh well. . ."

A thought provoking letter. Especially since we brass pounders must be concerned, not merely with getting amateurs interested in CW, but in getting non-amateurs interested in radio in the first place. The CB boom is over, and we will have to get our act together if we want to preserve the hobby. Get someone interested today!

One last light touch — the smiling chap's arch-rival sent me a brochure recently containing this high-tech description of a 'field-strength/SWR meter'. 'Reads SWR, both forward and reflected, to 1kW'. (!) CU next month.

WE SERVICE WHAT WE SELL —

In our fully equipped service department we cater for micro computers, amateur radio equipment, CBs (HF and UHF). Service contracts to trade also.

Car sound components, hand tools, altronic distributors, extensive range of second-hand radios, computers and test equipment.

ARAS

SPOTLIGHT ON SWLing

Robin Harwood, VK7RH
5 Helen Street, Launceston, Tas 7250

Well, it is that time of the year again as Christmas has come around once more. On reflecting over the spectrum during the past 12 months, I can state that it has been extremely frustrating, due to the poor propagation on the higher frequencies. The maximum usable frequency has been often very low, sometimes as low as 13MHz. The usually crowded 20 metre amateur allocation has been, at times, completely devoid of any signals, which is a little unusual.

On the other hand, the lower frequencies have been very good, especially the 49 and 60 metre broadcasting allocations. Although there were fewer Latins observed this winter, there were some interesting signals heard, nevertheless. The propagation paths appear to be north-south as plenty of signals coming from Asia are being easily heard. In fact, I have been surprised to hear Asians on 11 and 15MHz at fair to reasonable strengths during local daytime hours. This seems to emphasise the fact that propagation does indeed favour this path.

NEW STATIONS

During this year, several new stations came on the air, such as Radio Marti. This station is within the VOA, although separate from it and broadcasts in Spanish to Cuba. It mainly uses a powerful MW sender in Marathon, Florida, but also the VOA transmitters at Greenville, North Carolina on HF are utilised. R Marti is easily heard here on 6.075MHz at 0930UTC. Then another station was launched later in the year called 'R Free Afghanistan'. It is primarily in the Dari language and uses the RFE/RL studios and facilities in Europe, with a 15 minute programme daily.

We saw some stations remove some of their long-running services. For instance, Radio Australia discontinued their special Antarctica programming on Fridays during October. Radio KGEI, in San Francisco, discontinued their Japanese programming from their schedule.

We also witnessed the unusual event of the BBC External Services going on strike in July for 24 hours, the first time in history. This was due to the banning of a television documentary on political extremism, which resulted in all radio and television networks being blacked out in protest. Our own Radio Australia also had some programme disruption caused by industrial disputes within the ABC.

Also on the 17th October, a radio station was put off the air as a result of terrorist action. The religious station 'Voice of Hope', which is precariously situated in 'no-man's land' on the Israeli-Lebanese border, was put off the air by a suicide mission. The 'Voice of Hope' broadcasts on MW and SW, and has been heard in Australia, but on the unusual frequency of 6.550MHz, in Arabic.

EXPERIMENTAL TRANSMISSIONS

Over the next few month, several new stations are scheduled to commence broadcasting on shortwave. These are mainly within the continental United States of America, and are either commercial or religious in content. Radio KCBI in Dallas, Texas, has commenced an experimental transmission between 1700 and 2100UTC in the 25 metre band. Radio Earth International has been using their facilities for a three hour slot, on a weekly basis.

Radio NDXE, in Birmingham, Alabama, should be commencing soon. It will be commercial and reportedly transmit in AM stereo. I regard this information with a pinch of salt as AM stereo is questionable, both from the commercial and technical stand-points. There are no HF receivers with AM stereo capabilities, so presumably they haven't a large audience to make it feasible. Also the fickle nature of QSB on a normal AM (DSB) signal on HF would presumably render AM stereo useless. *And, what stereo format are they going to use?* There are three different systems, and the Khan system would be the most feasible, as the programme information is channelled into the lower and upper sidebands. Another hassle would be the congested bands and the amount of splatter from adjacent channels plus the "Woodpecker" pulses to contend with.

OVER-THE-HORIZON

And while I am on about the Woodpecker, during October I did participate in a survey of the behaviour on-air of the Over-the-Horizon Radar (OTHR) pulses. I was allocated a frequency range of 17 to 20MHz, from 0900 to 1200UTC on a particular date. Unfortunately, I didn't hear one signal during my sweeps because the MUF was down around 13MHz during that time frame. So it was very frustrating to only tune around and continuously hear a hiss. 'Woody Woodpecker' was about though, but on the lower frequencies that were not on my brief. OTHR pulses were observed causing severe QRM to several broadcasters, including the BBC World Service, and these were also reported.

EXPANDED OUTPUT

Some international broadcasters have recently expanded their output. For example, the VOA recently launched 'VOA- Europe' with a continuous English service. However, you will not find it on MW or SW, for it is a satellite feed for various European cable broadcasters. Also, Radio Finland commenced an experimental service in German, as well as Radio Moscow commenced in Scandinavian languages.

Reception of the BBC World Service has been difficult lately here, especially since Radio Moscow started to use their frequencies at the same time. For example, the frequency of 9.640MHz usually provides good signals from 0545 UTC to Australasia, but now a Soviet station is on that channel till 0600 UTC, drowning out London completely. Because of the indifferent propagation from the UK site, I have often relied on the BBC Mediterranean Relay from Cyprus on 9.580MHz. This is on about 0500 UTC, but is virtually unusable because Moscow is now co-channel with their 'World' service, and Scandinavian programming.

The Caribbean Relay on 9.510MHz is fair until 0645 when Algiers come up on 9.509MHz in French, leaving a nasty heterodyne on the channel. COupled with that, I am having difficulty hearing the BBC Far Eastern Relay from Singapore from 0900 UTC, on 11.750MHz, because Radio Beijing is 5kHz higher, broadcasting to Australia until 1025 UTC. Fortunately 15.070MHz is becoming reliable again, but at variable levels.

The experimental transmission from the BBC Eastern Relay, to this area at 0600 UTC on 21.550MHz, has not been observed very often. This is because of poor propagation from Masirah Island. Also, the usually powerful Irkutsk sender, carrying Radio Moscow's World Service, on 21.530MHz, is well down. I rarely have heard many JAs either on the 15 metre amateur band. It is interesting to note that no broadcasters are now using the 11 metre allocation. I guess that they are waiting for the minima to pass before they operate there once more.

YULETIDE MESSAGES

Around the Christmas period, many stations schedule special programming in keeping the Yuletide spirit. As I am writing this in mid-October, I have not received any advance information, so I am unable to give any details. I can say that the BBC World Service is likely to have the annual "Festival of Nine Lessons" from King's College, Cambridge, at approximately 0935 UTC, after The Queen's Christmas Message. It will be on the usual World Service frequencies.

The Vatican Radio will broadcast Midnight Mass on Christmas Eve at 2230 UTC, from Saint Peter's Basilica. No frequency details are at hand, but my recommendation is the 25 metre band, where it will probably be heard *in* Australia.

Well, it only leaves me to wish you, and your families, all the best for Christmas, and hope that 1966 will be happier than this year has been. All the best of listening, and best 73 — Robin VK7RH. AR

TECHNICAL REVIEW
Amateur Packet Radio

An article entitled "Packet Radio in the Amateur Service", has appeared in the journal of the Institute of Electrical and Electronics Engineers. The IEEE is an American society with membership drawn from the ranks of people involved in the various electrical, electronic, communications, and computing professions. Its members reside not only in America, but around the world, wherever there is serious interest in things 'electrical'.

It is a tribute to the authors, Philip Karn KA9Q, Harold Price NK6K, and Robert Diersing N5AHD, that such an article on 'amateur' activities has been accepted for publication in such a 'professional' journal.

The article briefly describes the hardware used — both the VADCG and TAPR Terminal Node Controllers — and then goes on to discuss the development of appropriate software for the amateur radio environment. This is followed by some comments on modems and modulation methods.

Following brief comments on various experiments and examples, there is a section on the use of satellites for packet radio. This section includes comments on OSCARs 9, 10, and 11, PACSAT, and JAS-1, and finally a brief comment on Phase 3-C.

The article is illustrated by a series of well prepared diagrams and appeared in the May 1985 copy of the IEEE Journal on Selected Areas in Communications, VOl SAC-3, No 3, pp 431-439. Many libraries carry the IEEE Journals and copies should be obtained through any library.

This article was brought to our attention by Peter O'Connor VK4KIP, who is a member of the IEEE.

VERSATILE NINE-IN-ONE HF ANTENNA KIT

An easily portable multi purpose antenna kit from Britian contains all the components that are necessary to permit any of nine different antennas, covering HF bands, to be erected by one man in as little as ten minutes.

The multi-purpose tactical antenna kit covers the frequency range, 1.6-30MHz, and is said to be far more versatile than other antenna kits of similar design. Components can be selected to provide omni-directional or directional characteristics for short, medium or long range communications and everything is contained in a small canvas bag.

By using trees or available buildings, dipole, delta, base-fed vee, inverted 'L' or sloping vee configurations can be rigged and the dipole arrangement can be made directional by using one element as a reflector.

Transmitter power of up to 500W can be used.

From Information Technology from Britian, 19th August 1985.

NEW LOOK! !

A5 ATV Magazine has changed both its format and its name. The new SPEC-COM JOURNAL features a larger page size, and an expanded focus on all forms of specialised amateur communications.

Complete details of this new magazine may be attained by writing to *Spec-Com Specialized Communications Journal, PO Box H, Lowden, IA. 52255.*

From 73 for Radio Amateurs — August 1985. AR

LISTENING AROUND

Joe Baker VK2BJX
Box 2121, Mildura, Vic 3500

It's me again, and of course I have missed several deadlines. I will start my column this time with a riddle.

He's at a location, which has 14km of sea-front on about 4000 hectares of land near Victor Harbour and Cape Jervis, overlooking Kangaroo Island. I was speaking to him on 80 metres in mid-September and he spoke of hordes of tourists from Adelaide, anxious to get away from "The Big Smoke", who do not realise the folly of dropping a used cigarette butt in the tinder-dry bushland. *Who is he?* Non other than Pat VK5PAT. Pat had taken time off from milking 250 cows, and building a fowl pen to speak with me.

MAN-MADE BEACH

I told Pat that I was an ex-Sydneyite, and I haven't seen a wide stretch of ocean for more than a quarter of a century. Pat replied that he could not stand to live too far away from the ocean, and the wide-open spaces. (For those who may not know, Buronga, where I live, is very much inland, and the next best thing to a beach around here is a man-made strip of sand by the Murray River). So, I envy Pat his nearness to the sea, especially on the blistering hot summer days when the temperature can hover around 44 degrees Celsius.

BUSHFIRE SEASON

Much of our talk concerned the lush undergrowth, which is now so evident, both here and at Pat's QTH, and of the coming bushfire season.

Buronga is not really prone to bushfires, the last fires being about a decade ago when almost the whole of the far western region of New South Wales was on fire. The fires at that time were so bad, fire engines from Sydney and suburbs were sent to this area to assist the local brigades, a distance of the best part of 700 miles (1126km). Many of the fires were thought to be deliberately lit, and at one point of time, there were as many as 17 fires raging on both sides of the Murray. Spotter aircraft and Army helicopters were also used in the battle.

Some valuable lessons were learned at the time. It was found that radio equipment aboard some of the vehicles could not operate on common frequencies. (I was not an amateur at the time, so could offer no assistance of worth, and only observe). It was the most devastating sight to behold to see kilometre upon kilometre of burnt country-side when the fires were finally extinguished. Many fires are caused by the careless, thoughtless act of dropping a cigarette butt on a day when the undergrowth is tinder-dry, and the winds and temperature are just right for a major conflagration.

LISTENING AROUND

Recently, on 80 metres, someone remarked that this column was one of the first things they read in AR, and asked why it wasn't in September's magazine. I had to explain that I had missed the deadline, and that it was about time I got in from of my typewriter again. Gordon VK5HM, who is fond of correcting me, informed me that I should have said *"when I get the typewriter in front of me"* not *"when I get in front of the typewriter"*. Pardon me Gordon, but you must be right, as usual. Gordon is always jibing me about my New South Welsh accent, and pronounciation.

Over the past few weeks, nightly conditions on 80 metres have been atrocious, to say the least. There have been times when I could hear Des VK3BSB in Gippsland, whilst Alan VK3BRG in Shepparton could not *hear* him or vice-versa. Also, communication between VKs 5HM, KV, GJ and myself, normally regarded as a short distance haul, was impossible. Yet, Paul VK2VJR, in Armidale NSW, could hear all three. Another time, a Hobart station that I could copy very well *informed me* that whilst he *could speak* with me, he could not communicate with any other VK7 stations. Odd conditions, indeed.

Matters have not been improved at all by CW interference of plague proportions, however, we will leave that matter to another place, and time! I

NO PHONES (Tele-type)

Gordon VK5HM, is a person who does not like telephones — he say he has never had one, and never will. Therefore, in the early hours of the morning, when Tom VK6TR was mobile on a highway between Mount Barker and Albany, and called for assistance, Gordon could not help. It was then left to me to ring Tom's wife in Albany and ask her to venture out to pick Tom up as his vehicle had broken down. Within 45 minutes she was at his side, and they were both very grateful. The sequel to the story was, Tom had only installed the radio in the car a few hours prior to departure and had not tested it on-air. Tom is an engineer at a television station at Mount Barker and was on his way home after working his shift.

AND AMATEUR RADIO DOES IT AGAIN!

Several weeks ago, I just happened to switch on when I heard Walter, in Parkes, NSW, calling me. It was pure chance that we happened across each other at that time, but we have spoken many times before and he knows my usual haunts on 80 metres.

Walter wanted me to try to catch up with a mini-bus, which had just passed through Mildura but, as they were not equipped with amateur radio, I could not see how I could help. It appeared that a person on the bus needed to be contacted by relatives in Hoxton Park, near Sydney, about a death in the family.

However, Walter thought I may be able to pass a message into South Australia, where the bus was destined for, in the hope that someone may spot it. I felt the chances of this happening were very remote, so I would instead ring the Mildura police. Upon ringing them I was told that the bus had been located in Berri and the message had been passed on via police channels. I was then able to call Walter back and he passed the message back to Hoxton Park that the relative was now informed. Meanwhile, an amateur in Adelaide who had intercepted the initial call from Walter and had duly notified the Adelaide police. Oh well! It doesn't matter if we double up on these things, just as long as the message gets through.

The telephone is often an invaluable asset in conjunction with amateur radio. On Friday 13th September, about 1710 UTC, I made a casual contact with Neville VK5NNH. Neville and his XYL Norma, were operating portable from between Cobar and Wilcannia, en route from Queensland to South Australia.

Neville told me that during their trip they had maintained regular scheds with another amateur, 74 years old Eddie, at Gonns Crossing on the Murray River. As it was some time since they had heard from him they were concerned of his welfare. After Neville locating Eddie's telephone number, I was able to ring Eddie and had him come up on air to talk to Neville. How pleased they both were, and I was pleased that I had the facilities to help. Eddie had been working on a 1906 chaff-cutter that his son had brought around for him to fix, and not only did Eddie manage to fix it, he also found a 1906 engine to power it!

A person I often speak with is Ken VK3DSK, of Geelong. Ken is troubled with atmospherics and arthritis, neither of them are very welcome.

One morning, I was talking my head *off*, when right in mid-sentence, the lights flared very brightly, dimmed, flared again and then they were gone completely. I was in complete darkness, and, of course, off-the-air.

Pandemonium! No torch, and where was the candle which was last used about six months ago? I did find a box of matches, but where was the phone book so I could ring the electricity authority at 2am on a very wet, and wintry morning. I couldn't find the phone book, even after finding a glimmer of light with a stump of candle. I knew I should have written a number like that on the wall near the phone for emergencies.

I sat and listened to a portable, battery radio for about two hours in the hope of the lights returning, but it wasn't to be and about I retired after turning on the mains operated radio so that it would wake me as soon as the power was back on. This it duly did at 5am. I never did find out why Mildura still had power and Buronga was in darkness, as we get our power from VK3.

In the morning, I received a phone call from Ken in Geelong. It seems that Gordon VK5HM was concerned about my sudden departure from the air, and was worried I may have had a 'bad turn', or worse. Thanks Ken, for ringing and caring. We radio amateurs certainly take care of each other, don't we?

As I have just made the deadline for the December issue of Amateur Radio, I would like to wish all my readers and friends a very Happy Christmas, and may 1986 be a very happy, and productful year.

Cheers for now, and 73 until next time . . . Joe VK2BJX.

AR

Due to the fluctuating A$, an incorrect price was included in the GFS Electronic Imports advertisement in November magazine.

Radio Amateur Old Timers Club

Can any Old Timer identify the missing name and call signs in the accompanying photograph? The photograph was supplied by Ray Carter VK2HC. As far as can be ascertained they are, from left — Matt O'Brien VK4MM, — Norville, Trevor Evans VK2NS, Howard Love VK3BM, Ray Carter VK2HC, Alderman J Jackson Lord Mayor of Sydney, Phil Renshaw VK2DE, Ernest Fisk, Leo Feenaghty, Arthur Walz VK4AW, D G Lindsay VK2DY, Bruce Hardie Federal Secretary of the WIA, and Oswald Mingay.

The photograph was taken by a Sydney Morning Herald photographer, on the balcony above the entrance to the Sydney Town Hall, circa 1931. The occasion was the WIA Federal Convention, held in New South Wales.

LETTER FROM FATHER CHRISTMAS TO HIS BANKER

I'm sending this letter to tell you
That credit restrictions today,
Have robbed me of all my equipment
My workshops, my reindeer, my sleigh.

I'm making my rounds on a donkey,
He's old, and decrepit and slow,
So you'll know, if I miss you this Christmas
I'll be out on my mule in the snow.

REPLY FROM HIS BANKER TO FATHER CHRISTMAS

Your message has caused us much sorrow,
A sorrow we can't drown in beer,
But wait till we really get going
On credit restrictions next year.

You're lucky to still have a donkey,
On which to proceed on your round.
If things don't improve by next Christmas,
Your mule will be flat to the ground!

DO YOU REMEMBER?

Latest Dance Hit! Roll up the Rugs! Sway to the pulsating lilt of your favourite Metropolitan Orchestra.

Dance in unison with ten thousand other gliding couples. Tap the limitless ether for the rhythmic harmony that awaits your 'tuning in'.

Cunningham Radio Tubes give that bell-like clearness, that perfect re-creation of tone which you must have for the utmost in radio enjoyment.

Since 1915 — Standard for all sets. Types C301A, C300, C11, C12 in the Orange and Blue Cartons.

This, and similar advertisements, told the reader of Hugo Gernsback's magazine, RADIO NEWS in 1925, how magnificent was the sound reproduction of wireless. We even thought so ourselves, 60 years ago!

LOSS OF ASSISTANT SECRETARY

It is with sadness we record the passing, on 6th October, of the RAOTC Assistant Secretary, Clem Day VK3GY.

Clem was a lovable character who carried out a tremendous amount of work for the Club behind the scene in conjunction with the Secretary, Harry VK3HC. Never wanting the limelight, but getting on with the job was his philosophy, and this he did in fine style up to the end, despite having lost his very beloved wife a few months ago, and himself under treatment for a serious illness which was to claim him.

Heartfelt sympathies are extended to his family and friends. His work experience will be difficult to replace. His amiable nature will always be remembered.

SILENT KEYS

We regret the passing of the following RAOTC Members since March 1985.

Bill Bullivant VK2BC; Ronald Ride VK2BQF; Jim Blackwood VK3ABL; Norman Chapman VK3ANC; Cliff Pickering VK3ATP; Arthur Wilson VK3DGA; George Turner VK3GN; Clem Day VK3GY; Denys Ayre VK3KP; Frank Nolan VK4FN; Ted Hudson VK4MH; J P Rosewarne VK5MN; and Harry Simmons VK6KX.

If readers are aware of the passing of a member who is not included in these notes, please notify the Secretary, Harry Clift VK3HC, in order that condolences can be sent, and records kept up to date.

VICTORIAN ANNUAL RAOTC LUNCHEON

The Annual Luncheon of the RAOTC in Victoria was held at the City and Overseas Club, on the 25th September. It was a most enjoyable function with 60 members present, gossiping about the early days. Many apologies, for non-attendance, were received.

When members sat down to lunch, they found a *Who am I?* sheet in front of them describing part of the life of one of our Club members and inviting them to read the document and name the person concerned. When collected and vetted, 17 members had judged correctly, so a winner was 'drawn from a hat'. Bob Cunningham VK3ML, was the mystery man and Ed Manifold VK3EM, was the lucky winner who received the President's prize of an air-wound inductor.

Amongst the answers were — *'It might have been me'; 'Fred Nerk'; 'Is it, I don't know'; and 'Search Me'* — which added some merriment to the occasion.

The highlight of the luncheon was an audio-visual display, presented by Chris Long, a former Acting Curator of Electronics at the Melbourne Museum, and well-known researcher into early wireless, sound recording, and amateur radio.

The display of sounds and stills intrigued everyone, commencing with the story of George Selby's very early experiments in the 1890s with Morse code spark transmissions, and paper tape recordings of these signals carried out between South Yarra and Brighton, in Victoria. The clockwork paper tape printers and coherer detectors were viewed and described. Crystal detectors and the use of headphones early in the 20th century led to recording fast Morse on wax cylinders.

A broadcast by King George V was recorded and transmitted on the BBC's first station in England In 1924, and a copy of this was included in tne presentation.

The luncheon programme by Chris Long also included pieces from the early days of radio broadcasting and recording in Australia, the advent of 'electric recording', talking pictures, amateur transmitters on the broadcast band, and much more.

A hearty vote of thanks was extended to Chris for his valuable and highly interesting presentation. A lengthy discussion and question time finally concluded another very successful Old Timers Luncheon.

AR

AMATEURS SPAN THE ATLANTIC ON 10 METRES

Plunging ahead with an increasing amount of enthusiasm in the exploration of the unknown radio territory in the vicinity of 10 metres, amateur radio operators have already accomplished trans-Atlantic communication on this wave-length.

With the opening of this territory, dozens of amateurs hastened to construct transmitters and receivers to operate at this extremely low wave, with encouraging results.

The first actual trans-Atlantic two-way communication on 10 metres was affected between C K Atwater NU2JN, in New Jersey, USA, and Pierre Auschitzky EF8CT, France. These stations engaged in conversation for nearly half-an-hour with good signal reports, both ways. Neither station was using high power.

The above report has been condensed from Ham Notes, Radio, 16th July 1928, and was contributed by Peter Alexander VK2PA.

OLD TIMER IN 1928

Mr Crocker 2BB is one of the oldest transmitters in Australia. He first got a licence in 1911, when experimental listening-in tickets were issued, but were cancelled when war broke out. When peace was signed he took out an amateur experimental transmitting licence. At that time there were only a handful of others operating, amongst them 2CM, 2JR, 3BQ, who were the most enterprising.

In the old 240-metre days, when there was not any broadcasting stations on air, 2BB, with 2CM, transmitted some great Sunday night concerts, and 2BB claimed to be the first amateur to put phone signals across to New Zealand.

Condensed from Ham Notes, Radio 16th July 1928, and contributed by Peter Alexander VK2PA

ALARA

Australian Ladies Amateur Radio Association

Joy Collis VK2EBX
PUBLICITY OFFICER FOR ALARA
PO Box 22, Yeoval, Vic. 2868

Kay GM6KAY.

Akiyo JH1GMZ and Fumio JA1BAR.

Well, our birthday year has been a memorable one, with more YL activity than ever, and get-togethers, parties, and luncheons to celebrate. It has been a good opportunity for ALARA members, OMs, and families to get to know each other personally, and put a face to the voice!

One thing that distinguishes those involved with amateur radio is that they have no difficulty finding a topic of conversation. None of those 'awkward' pauses on meeting for the first time. After all, we already know each other, don't we!

It is good to see so many really keen YLs. One (who shall remain nameless), having shifted to another location, was so anxious to get back on-air that, with the OMs help, the 80 metre aerial was strung from the highest available point — in this case the mast of a boat moored on the back of a trailer in the driveway. It did the trick until something more permanent could be arranged.

Mary KB6CLL.

ALARA CONTEST

Our thanks to all who were active in the ALARA contest, especially the OMs who joined in. Without participation, of course, there is no contest, and the ALARA Contest is noted for its friendliness.

Logs should be sent to Marlene VK2KFQ, 31 Cadell Street, Wentworth, NSW. 2648, prior to the ***31st December 1985.*** Novice YLs — please mark in ***RED or otherwise indicate*** your CW score for the Mrs McKenzie CW Trophy Award.

WEEKLY NET

Don't forget the official Monday night net, which is held at 1000UTC during daylight saving. The frequency is 3.580MHz +/- QRM.

There will be no monthly general meeting in December. So many other activities claim our attention at this time of the year that it was unanimously decided it should be cancelled.

ALARA AWARD

A slight alteration has been made to the ALARA Award Rules. They should now read:

VK/ZL — 10 members to be contacted and to include five Australian call areas

DX — Five members to be contacted and to include four Australian call areas

SUBSCRIPTIONS DUE

It is that time of the year again, and subs are now due. This year it is $6 for VK members; $6 for DX sponsorships with the newsletter going airmail and $4 for it to go surface mail.

Whilst on the subject of sponsorships — sponsoring an overseas YL is a wonderful way to make new friends. If you don't know anyone yourself, please write to the Sponsorship Secretary, Jessie Buchanan VK3VAN, 4 Milford Crescent, Karingal, Vic. 3199. Jessie will be able to assist you. Frequently sponsorships are reciprocal.

NEW MEMBERS

Welcome to new members — Betty VK4BET, who joined on 24th September, and Muriel VE7LQH, who joined on 10th October. Muriel was sponsored by Helene VK7HD.

From lusty infancy in 1975, ALARA has grown to be quite a big girl by her tenth birthday. May 1986 see even better things.

A very Happy Christmas to one, and all.

33/73, Joy VK2EBX

QSP

WARNING ON ELECTRICAL SAFETY

An average of 80 Australians die each year in electrical accidents — many of them occurring in the home.

The Australian Consumers' Association (ACA) said the growing use of hair dryers, do-it-yourself power tools and power boards containing extra electrical sockets, was creating new hazards.

In a special guide on living safely with electricity, in its journal 'CHOICE', the ACA said extension leads and other lead accessories were the biggest killer group, accounting for nearly one third of the deaths.

A number of people, most of them young, had been killed when hair dryers fell into baths.

RESTRAINTS REMOVED ON 24 HOUR BROADCASTING

Television and radio stations can now broadcast 24 hours a day without the need to seek specific permission from the Australian Broadcasting Tribunal.

Under amendments to the ABT policy statement on "Hours of Service" a licensee may transmit programmes at any time. However, if there was a reduction of more than 25 percent in its average weekly hours of service, the licensee is required to explain the reduction.

AWARDS

Joe Ackerman, VK4AIX
5 Koomooloo Court, Mermaid Waters, Qld 4218

Here we are at the close of 1985, and we can now look forward to 1986, hopefully a very good year for everyone.

I would like to extend, to all amateurs and SWLs, the very best for the Festive Season, and a special thank you to those clubs, and individual amateurs who have provided me with copies of their awards throughout the year. Good hunting in 1986.

Are Australian awards easy, or hard to obtain? There has been a lot of on air discussions about poor propagation, etc, but Ivan ZL1AQO, has collected 77 Australian Awards, all on 80 metres. Congratulations Ivan.

P S CUMBEROONA AWARD

At the turn of the century, there were over 300 paddle steamers, and steam boats operating on the Murray, and Darling River systems. Presently, only a few are operating, and provide an opportunity for tourists to travel the River Murray.

A new paddle steamer has been designed, and is being built at Albury by Warwick Hood. This will be the first designed and built since the decline at the beginning of the century.

To commemorate the launching of this vessel, the Twin Cities Radio and Electronic Club are sponsoring an award, to be called the P S CUMBEROONA Award.

Award requirements are: *All HF bands, except 160 metres, for a 24 hour period only. One contact to be made with VK2EWC — SWLs to log the information of the station working VK2EWC.*

Log extract to be forwarded, together with $2 to: *The Awards Manager, PO Box 396, Albury NSW 2640.*

Unfortunately, the format and printing of the award, nor the date have yet been finalised, however it is anticipated to be sometime in later this month.

Arrangements will be made by the Club to inform amateurs and SWLs of the date, per medium of WIA Sunday Morning Broadcasts.

INTRUDER WATCH CERTIFICATE

Over the years, many dedicated amateurs, and SWLs, have devoted many hours logging intruders in our bands. Now their efforts may be rewarded with the issuance of an award, in the form of a MERIT CERTIFICATE, as some recognition of the work they have performed on your behalf. I hope that this may encourage many others to take part in intruder watching.

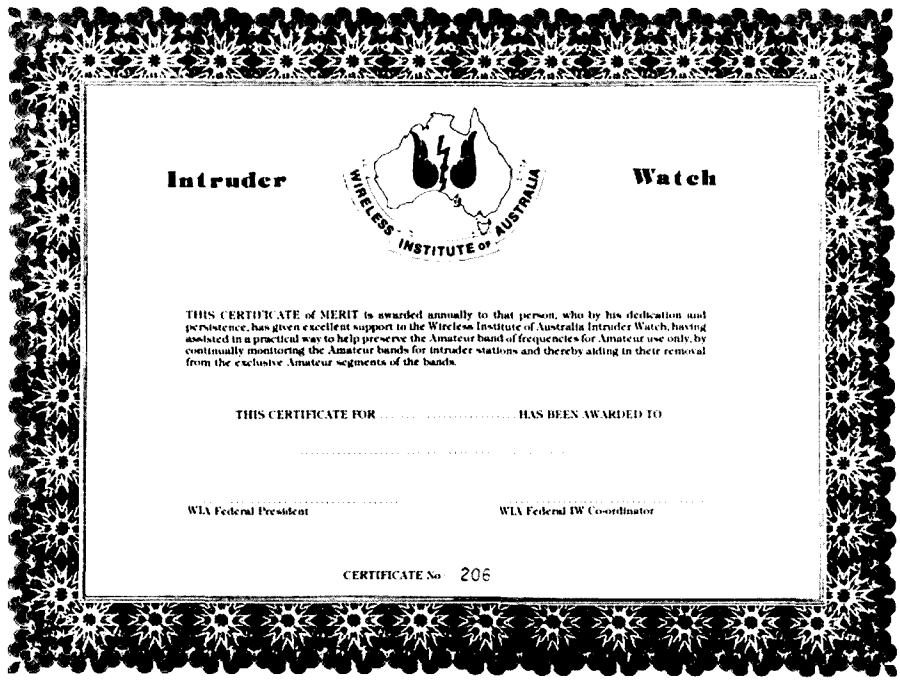
The Certificate measures 335 x 255mm, with the WIA logo in red and blue, a blue border and black printing, on good quality white paper.

The Certificate marks the acknowledgement of the WIA on a Federal level, to the good work done by individual amateurs, and SWLs, to further the cause of the Intruder Watch, ie *to endeavour to monitor, and cause removal, of offending Government, Military, and Commercial radio stations who continue to offend by transmitting their signals on radio frequencies where the amateur service has been allocated primary, or exclusive rights.*

The Certificate is allocated on a once only basis, and any individual amateur, or SWL can only qualify once. It will be awarded annually to the individual amateur or SWL in each Division, who has demonstrated outstanding support to the Intruder Watch, with consistency being more of a criterion, than quality.

It will be signed by the Federal President of the WIA, and co-signed by the Federal Intruder Watch Co-Ordinator of the time. Certificates will be consecutively numbered.

Help preserve your bands by submitting reports to your Divisional Intruder Watch officers, or to the Federal Co-Ordinator. Listen around the bands, and as there is mainly poor propagation, there seems to be many more intruders. If they are not removed, imagine the effect when we once again have good conditions.



Intruder Watch

WIRELESS INSTITUTE OF AUSTRALIA

THIS CERTIFICATE of MERIT is awarded annually to that person, who by his dedication and persistence, has given excellent support to the Wireless Institute of Australia Intruder Watch, having assisted in a practical way to help preserve the Amateur band of frequencies for Amateur use only, by continually monitoring the Amateur bands for intruder stations and thereby aiding in their removal from the exclusive Amateur segments of the bands.

THIS CERTIFICATE FOR ..... HAS BEEN AWARDED TO

.....

WIA Federal President ..... WIA Federal IW Co-ordinator

CERTIFICATE No 206

ALARA AWARD (revised)

Rules for the ALARA Award have been revised. Following are the new rules.

The Award is available to all amateurs and SWLs (YLs and OM).

Australian and New Zealand amateurs are required to contact 10 ALARA members, and to include five Australian call areas.

Overseas amateurs require contact with five members, and include four Australian call areas.

All contacts must be made with members on or after 30th June 1975, and no repeater contacts will be accepted.

Applicants must submit a complete extract of log entries, which is to be verified and signed by two other amateurs. In the event of an applicant in an isolated location being unable to obtain verification, OSL cards should be forwarded in lieu.

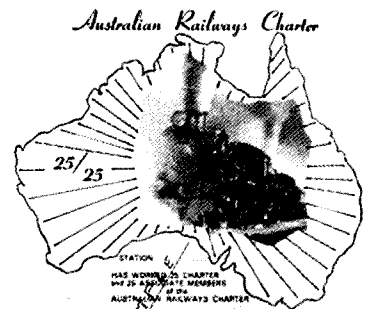
The log should show Date/Time UTC; Band; Mode; Call Sign of ALARA Member Contacted; Report Sent; Report Received; Name, and must include applicants Full Name, Address, Signature, and Call Sign.

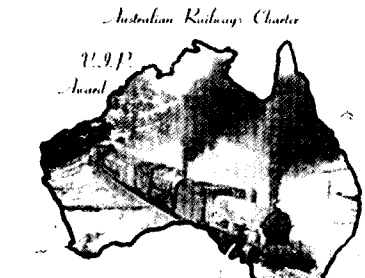
All contacts must be made from the same call area.

Official ALARA Net contacts do not qualify.

Special endorsements are available for Mixed, All CW, All Phone, All 28MHz, etc. Endorsement stickers are available for each 10 additional members contacted for VK and ZL stations. DX stations require five additional member contacts.

Applications should be forwarded to: *ALARA Awards Custodian, Mavis Stafford VK3KS, 16 Byron Street, Box Hill South, Vic. 3128, and accompanied by A$3, 7 IRCs, or equivalent for initial award, and A$1 for additional stickers. (No fee for stickers awarded with the original issue of the Certificate, only additional stickers applied for later).*





AUSTRALIAN RAILWAYS CHARTER

The Australian Railways Charter offer amateurs, and SWLs, a number of very attractive awards. So far, 63 Charter Certificates, and 142 Associate Certificates have been issued. Surplus moneys from the issue of these certificates have enabled the Charter to donate $300 to the National Heart Foundation.

A group of railway employees, all radio amateurs, of the railways of Australia, and retired employees, joined together to form the Australian Railways Charter on 9th March 1980. There are four certificates available which any amateur or SWL may apply for. These can be obtained by working Charter members, or award holders, on any band or mode. These contacts may be hard to

AUSTRALIAN RAILWAYS CHARTER

WHISTLE STOP AWARD

obtain due to the varying shifts worked by railway employees.

For membership of the Charter, members must be present or retired railway employees, and need only to apply to the Awards Manager, giving details of employment. Honorary membership is extended to retired, or serving members of overseas railways. Membership is the issue of the BASIC AWARD from which the Charter number is obtained.

Associate members are non railway employees who qualify, and apply for the certificates.

BASIC AWARD
Six contacts comprising three Charters in three different states, plus three other award holders. DX stations require three contacts, comprising one Charter, plus two other contacts.

WHISTLE STOP AWARD
Basic Certificate must be held, plus 50 points.

VIP AWARD
Requires 200 points.

25/25 AWARD
Work 25 Charters and 25 Associate Certificate holders.

GOLDEN SPIKE AWARD
To obtain this award the operator must hold the VIP Certificate, and must contact 10 members on one band or mode; ie 10 metres or 15 metres, or CW, etc, or make contact with five overseas members on one mode. These stickers may be placed on the VIP Certificate. There is no charge for these Spikes, but a SASE is a must.

Golden Spike is available for Net attendance. These are for every 25 nets attended.

Logs must show Certificate number, points, station, name, location, date, and frequency.

Fees - All Certificates $3 (DX add 2 IRCs), except 25/25 which is $2 (DX add 2 IRCs).

Points value — Charter . . . five points (or one contact towards Basic). Associate . . . two points. Whistle Stop . . . two points. VIP . . . to points. 25/25 . . . one point.

The Australian Railways Charter holds a weekly net every Sunday at 1030UTC, on 3.608MHz +/- QRM.

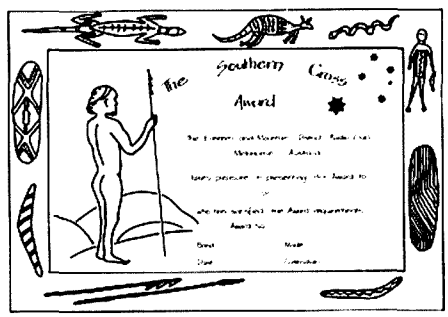
Inquiries and award applications to: *Harry Frundt VK5NHF, Box 87, Tailem Bend, SA. 5260.*

SOUTHERN CROSS AWARD

The new version of this Award, issued by the Eastern and Mountain District Radio Club, is available to licensed amateurs, and SWLs, who obtain the required number of points. Applicants must hear or work Club members. Contacts on or after 1st September 1985 are valid.

VK stations require a total of 10 points.

DX stations, including VK9 and 0, require five points.



Each Club member is worth one point, and one only of the Club call signs is worth two points, with the other Club call signs worth one point each, if included in the same application.

A member can only be claimed once per application regardless of upgrading their call sign. The only exception is the person operating the Club call sign, who can be claimed under that call, as well as under their own personal call sign.

Cross mode and cross band operation can be claimed, but not repeater contacts.

A list of current members call signs will be forwarded to anyone requesting same, upon receipt of a SASE (foolscap size) for VK stations or 2 IRCs from DX stations for airmail return.

QSL cards are not required, but an applicant must submit log extracts, certified correct and signed by two licensed amateurs. Full name, address, call sign, and signature of the applicant are required, together with the necessary fee, which is A$2 (or equivalent), or 5 IRCs. DX stations to add 2 extra IRCs if return by airmail is desired.

All correspondence to: *The Awards Manager, EMDRC, PO Box 87, Mitcham, Vic. 3132.*

Club Nets are held Wednesdays on 3.572MHz +/-, at 1000 UTC, and Sundays on 28.475MHz +/- at 1130 UTC.

LABRE AWARDS

The Liga de Amadores Brasileiros de Radio Emissao — LABRE, to encourage interest in the Brazilian, American, and Atlantic Ocean areas, and DX on the lower bands, sponsors the following awards for radio amateurs. *WAB (Worked All Brazil), WAA (Worked All America), WAO (Worked All Oceans), and the DBDX (Diploma Brasileiro de DX — Brazilian DX Award).*

THE WAB AWARD is available to amateurs that confirm contacts with Brazilian stations in all 23 States, and the City Capital — Brasilia (PT2). A special ribbon (TBT) will be attached to the award to confirm contacts with the two Brazilian Federal Territories (Amapa and Roraima).

THE WAO AWARD is available to amateurs that confirm contacts with all nine Brazilian Geographic Regions (First Region — PY1-PP1; Second Region — PY2-PP2-PT2; Third region — PY3; Fourth Region — PY4; Fifth Region — PY5-PP5; Sixth Region — PY6-PP6; Seventh Region — PY7, PP7, PR7, PS7, PT7; Eighth Region — PY8, PP8, PR8, PS8, PT8, PU8, PV8, PW8; Ninth Region — PY0, PT9, PY9), and 21 countries of the Atlantic Ocean.

THE WAA AWARD is available for confirmation of contacts with 45 countries in the American Geographic Area. One of them must be with Brazil.

THE DBDX AWARD is available for confirmed contacts with a minimum of 20 different countries, as shown in the official DXCC list. One of the countries must be Brazil. Special stickers are available for additional countries in groups of 10, to be attached to the Award. All contacts must be in the 160, 80 and 40 metre bands only. There are three different kinds of Certificates for this award. One for Phone/CW, one for Phone Only and one for CW only. All awards issued will be kept on an Honour Roll and are numbered sequentinally.

All applicants must be licensed amateurs, operating in authorised amateur bands.

All contacts must be from the same location except when a station moves from one call area to another, then all contacts must be made from within a radius of 150 miles (241km) from the initial location.

All contacts must be with land-based stations. Contacts with ships, anchored or otherwise, and aircraft are not allowed.

Contacts over a period of years are valid providing they have been made under the provisions of the current rules and with the same station license.

All confirmations must be submitted exactly as have been received from the worked station. The log must be verified by the Awards Manager of the applicant's country. Where there are no managers available, the log may be checked and signed by two licenced amateurs.

Compliance with international conventions, national laws, and the rules in force, fair play and good sportsmanship in operating are required by all operators applying for these Awards.

All applications must be sent to LABRE Headquarters, Awards Manager, PO Box 07-0004, 70000 — Brasilia, DF, Brazil, enclosing 10 IRCs for handling cost.

The decision of the Awards Division of LABRE shall be final.

FEDERACHI AWARDS

The "Federacion de Clubes de Radioaficionados de Chile" has three awards available for amateurs.

Send a GCR list showing Station, Date, Time, Band, and Mode certified by any official radio club in the applicants country. Similar rules apply for SWLs on a heard basis.

Cost is 10 IRCs for postage.

All correspondence to *The Awards Manager, FEDERACHI, PO Box 2545, Concepcion, Chile.*

ABCE AWARD (All Band CE Award) — Proved communications with at least one CE station in each of the 80, 40, 20, 15, and 10 metre bands.

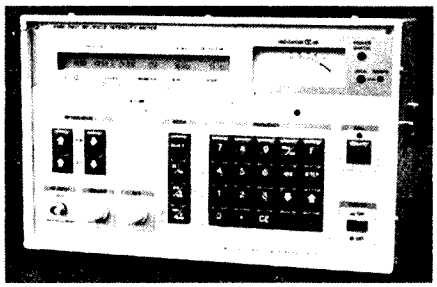
CE AWARD — Confirmed communications with 100 CE stations in the same mode.

The third award is for six metre operation which is not applicable for Australia. **AR**

SPECIAL EVENT

On 1st December 1985, the Ninth Annual Pasadena Parade will be operational. They will be operational from 2000 to 2200UTC on the lower 15kHz of the 20 metre band. QSL to WA6MUK, 932 N Lake Avenue, Pasadena, California, USA. SWLs are also welcome to send a listening card.

AR SHOWCASE



INTENSITY EQUIPMENT

The Vicom Group has announced it now represents Kyoritsu of Japan with their range of specialised EMI and Field Intensity equipment.

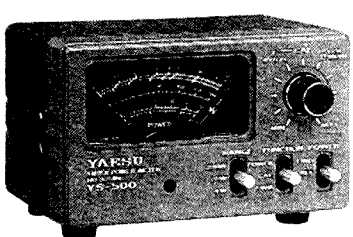
Kyoritsu was established in 1948, and is a respected leader in the industry with products including RFI Field Intensity meters to 1.5GHz, EMI meters to 1GHz, Disturbance Analysers, plus a range of broadband and tuned dipole antennas.

They also have considerable expertise in shielded room design and manufacture a number of sizes.

Full details of the Kyoritsu range of products may be obtained from the Vicom Group Offices in Melbourne, Sydney, Brisbane, and Wellington, or telephone (03) 62 6931.

AR

YS-60



YS-500

IN-LINE SWR/POWER METERS

The new Yaesu YS-60 and YS-500 are handsome, compact, multi-function instruments for monitoring both average and peak transmitter power output and reflected power, and voltage standing wave ratio (VSWR) of antenna systems in two-way radio stations from 1.6 to 60MHz (YS-60), or 140 to 525MHz (YS-500).

The small size and colour co-ordinated cabinets make these units ideal additions to any Yaesu transceiver. Three functions provide monitoring of either forward or reflected average transmitter output power for CW, AM, FM, and FSK modes, or peak envelope power (PEP) for SSB modes, and VSWR for testing and monitoring the performance of transmitting antenna systems.

The efficient, linear circuit design assures accurate measurements with minimum insertion loss over the entire specified frequency range, even at low power levels.

For more information contact Bail Electronic Services, 38 Faithful Street, Wangaratta, Vic. 3677.

AR

STEREO SYNTHESISER

A stereo synthesiser, the MFJ-1501, designed to provide high quality synthesised stereo from a television or video recorder, is now available in Australia.

The unit simply connects between the audio output of a VCR or across a television speaker and the AUX input of a stereo system. The technique used to derive the stereo is similar to that used by most TV stations when operating from a mono source. It is also the same as record manufacturers use when they produce a stereo record from an old mono recording.

The effectiveness is so good that a sense of spaciousness is conveyed, which puts the viewer right into the middle of the movie scene without having to outlay the many hundreds of dollars required for a new stereo television or video.

The MFJ-1501 is equipped with two mono inputs which are switchable, and allow for other sources to be used, such as a portable electronic organ or AM radio. Operation is from 240V AC or 12V DC for portable/mobile operation.

The unit is finished in egg shell white with walnut grain sides, and measures 126 x 50 x 152mm. Price at $305 including postage within Australia, the MFJ-1501 is available from GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic. 3132. Phone: (03) 873 3777.

AR

LARGE THEATRE SOUND AT HOME

GFS Electronic Imports have announced the availability of a unique 'add-on' device which provides the illusion of large theatre sound to a video recorder, television, or Hi-Fi system in the home.

The MFJ-1500 provides this sound by electronically processing the source signal, including the introduction of variable time delay and reverberation, the characteristics of a large listening environment.

The unit accepts a mono or stereo input and produces single processed, as well as unprocessed outputs, both of which can be fed into the two channels of a stereo amplifier.

For users who do not have a stereo system the MFJ-1500 has its own built-in two watt amplifier. A single speaker is connected to the MFJ-1500 speaker terminals, and placed behind the viewing position. This speaker, in conjunction with the TV's speaker then provides viewers with the illusionment of big theatre sound.

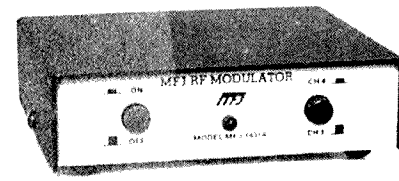
A special price of $250 plus $14 p&p is applicable if this article is mentioned.

Contact GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic. 3132. Phone: (03) 873 3777.

AR

RF VIDEO MODULATOR

A new RF Video Modulator, the MFJ-1431A, converts video and audio signals to Australian VHF Channels 1 or 3. These video/audio signals (from units which do not have a built-in RF modulator, such as computers, video cameras, VCRs, image enhancers, or distribution



amplifiers, etc) can then be monitored on a standard PAL colour television set.

The MFJ-1431 is set to accept standard level video and audio signals, although internal level controls are provided to cater for the situation where non-standard levels are presented to the modulator. Input and output impedances are 75 ohms, via RCA sockets, or 300 ohms may be achieved by using a balun/switch, which is supplied. All the necessary cabling is provided with the unit. Operation is from 12V DC, or from an optional 12V, 300mA AC adaptor.

The price of the MFJ-1431 is $215 plus $7 p&p and is available from GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic. 3132. Phone: (03) 873 3777.

DIFFERENT NOISE BRIDGE

Most antenna noise bridges on the market today provide only a limited reactance measurement range up to 300 or 400 ohms. Some others don't even give their user individual inductive and capacitive reactance readings, only a combined total reactance.

The MFJ Enterprises Model MFJ-202B provides the ability to measure both measurements up into the thousands of ohms range. It can also measure resistance over a similar range.

These wide performance parameters have been achieved by incorporating a switchable range expander in the MFJ-202B. With the range expander switched in, measurements of resistance up to 3 800 ohms, and both inductive or capacitive reactance up to 1 900 ohms may be made. Frequency range extends from 1 to 100MHz.

Each MFJ-202B noise bridge is individually calibrated and provided with a calibration chart prior to leaving the factory. A comprehensive manual, which is also supplied, covers such subjects as 'Finding Antenna Resonant Frequency', 'To Cut a Half Wave Dipole to Resonance', 'Tuned Circuit Adjustment', 'Measurement of RF Amplifier Impedances', 'RF Transformers and Baluns', as well as 'Capacitance and Inductance Measurements'.

The MFJ-202B simply connects in series with the receiver, or transceiver antenna line, and the circuit under measurement. Power source for the bridge is an internal nine volt battery.

Priced at $193, plus $7 p&p, the MFJ-202B is available from GFS Electronic Imports, 17 McKeon Road, Mitcham, Vic. 3132. Phone: (03) 873 3777.

AR

PART TIME!

A man with all the earmarks of a laborer was smoking thoughtfully and watching a large building In the process of construction. A foreman approached and asked:

"Hey, want a job?"

"Yes," was the reply, "but I can only work mornings."

"Why can't you work all day?"

"Every afternoon I gotta carry a banner in the unemployment parade."

From The Victorian Railways Magazine, September 1927, Vol 4 — No9.

FOR THE RTTY OPERATOR

MDK-17 (KIT) MOD-DEMOD

A high performance RTTY CW modem kit for use on a computer or teletype. Offers high noise immunity on receive. **$142 + $6 p&p (Kit) or $219 plus $8 p&p (assembled).**

MFJ-1224

Versatile RTTY CW modem. Interfaces with a computer and is supplied with software for VIC-20 or Commodore-64 **$345 + $14 p&p**

Great Circle Map

Now point your beam in the correct direction using this Great circle Map! Centred on Melbourne **$2** + $3 P&P

What is stronger than wire of equivalent cross section, non corrosive, non conductive, and has virtually no elongation?

NEW DEBEGLASS WIRE

Now, guy your tower without having to break the wires with dozens of egg insulators or worrying about them corroding away due to a salty atmosphere. Our Debeglass wire alternative is made using continuous filament fibreglass yarn, jacketed in UV stabilized vinyl chloride. Compare the figures below.

	DB-4 (4mm)			DB-5 (5mm)		
	Core diam (mm)	Wt of 200mm (gm)	Tensile Str (kg)	Core diam (mm)	Wt of 200mm (gm)	Tensile Str (kg)
Debeglass	2.5	3.9	430	3.0	5.4	580
Steel wire	2.5	9.6	370	4.15	9.1	700

DB-4 (4mm) $0.55m. DB-5 (5mm) $0.78m. DB-6 (6mm) $1.29m. Debclip Termination Clip to suit DB-4, DB-5, DB-6, $4.50 each.

CLUB CORNER

DEVIL NEWS FROM THE NW BRANCH

Hello once again to all, and to all the people on the North West Coast that read this column each month, it is hoped that it fills you in on some of the activities of the Branch, especially those unable to attend meetings.

At the last meeting, 25 people attended, plus some students from the Devonport High School, including one YL. The visit was part of their Activities Week, and they were made very welcome.

Much discussion was held, continuing from last month, regarding the problems involved in the erection of towers in the town area.

There were 85 QSL cards inwards and 110 outwards this month. Any member unable to attend a meeting to collect their cards may send a SASE to Max, QTHR as VK7KMF, and he will post the cards to you.

A request has been received to again provide communications for a horse trial. This is a worthwhile exercise and will be a combined WICEN exercise.

Unfortunately, the 70cm ATV aerial has to under-go a re-build, as it has had an altercation with the wind.

VK7NW RTTY Broadcasts have been heard in Hobart, with a good report received from VK7HV.

The Group's WICEN Officer gave a brief lesson on map reading, which proved very popular, and it is anticipated to have another one shortly.

Bob VK7KAB and Kirby VK7KC operated from Guilford during JOTA, whilst Ron VK7RN, with a group of Guides and Brownies, operated from Devonport.

There are several members of the Group showing an interest in Packet Radio. VK7s AX, KDR, ZAP, WP, WN and WZ are starting to get this medium on the air, so if there are any other members interested, please contact Tony VK7AX.

Welcome to new member — John Clayton.

A picnic was planned at Bells Parade, Latrobe for the fourth weekend in November. Hopefully it was a success (as these notes are being compiled in mid-October), and another picnic trip on the Pieman River Ferry is being planned for later this month/early next year.

The Clanger Award for the month was presented to Bill, an SWL, for lending a rig to monitor a news broadcast, without a power lead. It was then necessary to explain the Clanger Award to the visiting students.

Tony VK7AH, a teacher at the High School, as well as attending the Branch meeting, took his electronics class to the East Devonport Ferry Terminal where they were conducted on a tour of the Able Tasman Radio Room. The students have their own call sign, VK7DHS. Members of the Branch have attended the school to speak to them about amateur radio.

VK7SF recently returned from a trip to England, spoke of his visit to the location where the first Spark Transmissions took place. Following this talk, a video was shown of Hamfest 85 and the Spark Transmission re-enactment by DOC at Hobart earlier this year.

ANNIVERSARY CELEBRATIONS

The VK4 Disabled Persons Radio Club, VK4BTB, celebrated its Second Anniversary in September, with on-air activities from the QTH of Roley VK4AOR.

Amateurs were in attendance from Toowoomba, and the Darling Downs, as well as Mount Tamborine. Margaret VK4QK, a White-Stick operator from Brisbane, helped to make the day a great success.

Disabled members of the Help Handicapped Enter Life Project (HHELP), the parent body of the Club, also joined in the celebrations.

Contacts were made with amateurs in New Zealand, Suva, Japan, Europe, all Australian states, and some of the smaller Pacific islands. Margaret was also able to speak with man counterparts in New Zealand and Australia.

From left — Des Orr, Margaret VK4QK, and Graeme VK4NYE.

The Club worked on all HF bands, making in excess of 50 QSOs. Ray VK4ACU made a few CW contacts, and Ron VK4AGS had a computerised RTTY system operating when conditions permitted.

Following the death of Tony Burge VK4BAC, a young man suffering from Muscular Dystrophy who derived great enjoyment from amateur radio, his family donated his equipment to HHELP The Radio Club was then formed.

Since its opening on 24th August 1983, the Club, with the main aim is to introduce and involve disabled persons in the hobby, has had a steady membership growth. Today there are over 100 members, approximately 40 of whom are disabled.

Regular weekly contacts on the Friday evening Net (3.590MHz +/- QRM) are kept with disabled operators from all states of Australia, as well as New Zealand.

Types of disabilities encountered include Blindness, Multiple Sclerosis, Quadriplegia, Cerebral Palsy, Polio, and even severe speech impediments. When speech become difficult to understand, or embarrassing, CW can be used to great effect.

The Club is considering the possibilities of asking all disabled individuals, clubs, and other interested operators to participate annually in 'on-air' activities on a suitable date close to the Club's anniversary. It is also pondering the feasibility of circulating a questionnaire, with the idea of compiling lists of amateurs prepared to help disabled people with their study, as well as general assistance for disabled persons. By centralising such information, it is felt more people could become involved thereby not only achieving more operators on air, but a greater awareness of disability, which can only lead to more people participating equally.

Any comments from amateurs Australia-wide would be appreciated. Write to the Club at Box 3126, Town Hall, Toowoomba, or phone Roley VK4AOR on (076) 96 7587, or Graeme VK4NYE (076) 30 8323.

AR

WESTERN SUBURBS RADIO CLUB

On 7th September 1985, the Western Suburbs Radio CLub and the North East Radio Group combined to present the "Lakeside Hamfest".

The Hamfest was held at the Western Suburbs RC meeting rooms, at picturesque Edwardes Park Lake, Reservoir.

With perfect weather, and a wide variety of activities, it was the ideal setting for many amateurs and their families to meet others in a relaxed social atmosphere. Attendees had a chance to view a wide selection of equipment provided by a comprehensive trade display.

Hamfest traders and buyers were kept busy trading in pre-loved equipment, with many buyers clutching prized acquisitions, whisking them off to the safety of their motor vehicles, then returning for more goodies.

Photograph courtesy Fred Taylor VK3KLL

Bargains were plentiful at the Pre-Loved Display.

One special guest was Her Worship, the Mayor of Preston, Councillor Helen Davis. Councillor Davis, together with her husband Chic, strolled casually around the displays, asking questions, and mingling with the many other visitors. Councillor Davis expressed keen interest in the work of both radio clubs, and the hobby of amateur radio. Although not initially aware of the value of amateur radio in its many guises, and the popularity of the hobby, Councillor Davis gained invaluable knowledge through visiting the Hamfest, and has pledged practical support for any future ventures the clubs may undertake.

Icom Australia, Am-Comm Electronics and Werner Wulf kindly donated some equipment to the clubs for use as prizes, with Ted VK3ZKP and Geoff VK3XUK being the eventual winners.

John VK3KJW was active in 'calling-in' visitors on 2 and 80 metres, using the WSRC call sign, VK3AWS.

Photograph courtesy Mick Van Geyzul VK3KMV

Mark VK3PI, explains antenna systems to the Mayor of Preston and her husband.

Undoubtedly, the highlight of the day was the 'Radio Throwing Contest'. Ten ladies entered this prestigous event, and the judges, Richard VK3CRH and Mark VK3PI were forced to modify the rules as the event proceeded. The results were:

Longest Distance . . . Gayle Stephenson, XYL of VK3PI.
Largest Divot . . . Pamela Gill.
Smallest Divot . . . Val Henderson.
First to Break the Radio . . . Marg Baxter, XYL of VK3DBQ.
First to Make a Piece Fall off the Radio . . . Betty Page, XYL of VK3AGH.

Throwing styles were unorthodox, to say the least, but all participants, and amused spectators, enjoyed the event. Winners were presented with WSRC/NERG Certificates.

The Hamfest was a great success, and plans are already being made for another one next year. Thank you to all for making the day such a success.

AR

BOOK REVIEW

MICRO AND TELEVISION PROJECTS

John Ingham VK5KG
FEDERAL VIDEO TAPE CO-ORDINATOR

Is there an amateur television enthusiast in Australia who has not yet heard of the British Amateur Television Club and their magnificent publications? Well, if YOU are such a person, read on!

For more than 32 years, the BATC have published their quarterly magazine 'CQ-TV', and over the years it has become the 'ATVers Bible'. While there have been other magazines available, which feature ATV, CQ-TV has consistently provided more construction articles than any other.

In 1981-2, the BATC produced volumes one and two of the 'Amateur Television Handbook', each having almost 100 pages crammed full of completely new projects designed by a team of engineers headed by Trevor Brown G8CJS. Every aspect of ATV was addressed and while the two volumes were universally recognised as the definitive works on the subject, they were recently updated by 'The Revised Amateur Television Handbook'.

And yet, in 'Micro and Television Projects', Trevor has again produced, what is, except in name, Volume 4 of the series. This time, reflecting the current ATV trends, he has expanded the scope of work to include circuits which allow micro-computers to become integrated into the ATV shack.

Following is a list of the topics examined within the booklet:

***CHAPTER 1:** A Simple ATV Station*
*Test Pattern and Sync Generator**
*Electronic Caption Writer**
*Simple Vision Switcher**

***CHAPTER 2:** The Best of the Handbook*
*Electronic Testcard**
*PAL Encoder**

***CHAPTER 3:** SECAM Encoder*

***CHAPTER 4:** The Home Computer*
A technical description of the Sinclair 'Spectrum'
*Spectrum User Port**
Computer Controlling Character Generators
*Spectrum EPROM Programmer**
RS-232 EPROM Programmer
Spectrum Picture Freezer
*Teletron Hamshack Micro-Controller**
Teletron VDU.
Ham Text — an Amateur Teletext-like System

Printed Circuit Boards (PCBs) are available for the projects marked *

As compared to the very wide range of topics covered in the handbooks, (Aerials, Feed-lines, Tuners, Receivers, Transmitters, Modulators, Processing Amplifiers, RF Probes, Character and Test Signal Generators, Cameras, Aperture Correction, Video Switchers, Colour, Slow Scan TV, Teletype, and Microwave), the scope of this new work is more specialised. Certainly, beginners in ATV would be well advised to first start with the 'Amateur Television Handbook'.

But, if you are looking for a new challenge in ATV, 'MICRO AND TELEVISION PROJECTS' could well be the stimulus you are looking for! Certainly there is a place for this publication on the book-shelf of every ATVer.

The booklet contains 86 pages in total, 44 pages of text, eight block diagrams, 27 circuits, 10 PCB 'top view' overlay diagrams, five illustrations and nine software listings, and is laid out in the competent manner in A5 size pages familiar to readers of CQ-TV.

MICRO AND TELEVISION PROJECTS is written by Trevor Brown G8CJS and published by the British Amateur Television Club. It will shortly be available from Divisional Bookshops.

AR

USER TRAINING MANUAL

Len Poynter VK3BYE
14 Esther Court, Fawkner, Vic. 3060

This manual is designed to accompany a basic three-lecture User Training Course presented by IPS personnel. Introducing the Ionosphere; Formation of the Ionosphere; Production, Loss, and Redistribution of Electrons; Deflection and Absorption of HF Radio Waves; Ionospheric Variations; Solar Cycle Variations; Oblique Propagations; Predictions; Sun-Earth Environment; Solar Activity; Effects of Solar Activity; IPS Services are some of the topics covered in this book.

There are 125 pages with plenty of diagrams, Glossary, etc.

This book is highly recommended to those who wish to know more about propagation, and is available for $12 posted from IPS, PO Box 702, Darlinghurst, NSW. 2010.

AR

ERITH ISLAND

Ken Gott VK3AJU, plans to operate again from Erith Island, located in the Kent Group in Bass Strait, from around 22nd December, for one month. Dates are approximate as sailing conditions may delay the arrival on Erith, which is uninhabited. Equipment will be an IC745 and G5RV, at 30 feet (9m).

Ken operated from Erith, as VK3KGX/7, during the Christmas period of 1982-83, and again in 1983-84, as VK3AJU/7. Operation then was mainly on 3.5MHz at night, with occasional visits to 7 and 14MHz.

The group that ventures to Erith each year has some 20 years continuity, and most members have been aquaintances even longer, The island is not known for its *great* DX location, but the island allows plenty of time for operating, and, with its ample growth of ti-tree and scrub, some opportunity for experimentation with wire antennas.

DEFINITIONS

AUTOMATIC LEVEL CONTROL . . . a magazine used to prop up the front of the rig so you can read the dial more readily.
ANTI-TRIP DEVICE . . . a really short microphone cord.
RESTING CURRENT . . . what you get when you touch the HT terminal on your linear.
MODULATION ENVELOPE . . . the one your telephone bill comes in.
ENVELOPE DETECTOR . . . a letter box.
PRODUCT DETECTOR . . . the name plate on the rig.
PTT . . . noise of a fuse blowing.

From BARG News, August 1985.

It had been some years since a dinner had been held by the Division. The 70 people who attended the dinner all agreed it was an excellent night. Perhaps dinners of this type can again become a regular feature of the Divisions activities.

ANNUAL GENERAL MEETING

Members are reminded that the Division's administrative year ends on 31st December. This is the date to close off the books, submit reports, etc for the AGM, which will be held on the Saturday after Easter.

HOME-BREW CONTEST

Have you something to enter in the Home-Brew Contest? Entry forms are available from the Divisional Office, which is open between 11am and 2pm weekdays, and Wednesday evenings from 7 to 9pm. Ring (02) 689 2417 or write to the post box address shown at the top of this column. Entries will close at the end of February 1986.

HOLIDAYS

The VK2 Divisional Broadcasts will cease over the Christmas holiday period, and will resume in mid-January. The last broadcast will be on 22nd December.

PLEASE WRITE!

Have you been using the 80 metre transmissions of VK2RCW, on 3.669MHz? If so, would you please write your comments and send them to HADARC, PO Box 362, Hornsby, NSW. 2077. The six month trial period on HF is nearing the review time — see report in September's AR.

PAGERS

Previous mention has been made in these notes that the two metre band, and the repeaters in the top megahertz have been having a problem with the adjacent pager band. An extensive discussion paper has been prepared and was ready for distribution in October, when there were delays in the postal service.

It is hoped that all repeater groups within this State, as well as all other Divisions will have received their copy by now, and your replies to the enclosed questionnaires are starting to be returned. We would like to have these at hand before the end of the year. A few copies of the paper are available if any member would like to contact the Divisional Office. An article on the problems is being prepared for inclusion in AR next year.

REPEATERS

While on repeater matters — interest has developed in the Sydney region during this year to establish ATV repeaters. The terrain of the region makes its difficult to provide a single site coverage. This means that more than one system is likely to develop. To date, the Sydney ATV Group have submitted an application to establish an outlet in the lower Blue Mountains. Gladesville ARC, who have been conducting simplex transmissions on Wednesday evenings, have relocated their site to the upper North Shore.

They have advised that they wish to develop the facility into a repeater. There are also those who wish to use the allocation in a simplex capacity. So that all requirements can be looked at, would any other group, or person, with an interest to develop a repeater, or conduct simplex operation, using the 50cm-channel 34 segment, please advise the Divisional Office, in writing.

A system will have to be devised of time-sharing, or similar, for all interests to share the allocation. The Newcastle region has an ATV repeater to the operational stage, but their operation is unlikely to be affected by the requirements of the Sydney region.

PACKET RADIO

Packet Radio has continued to develop. Interest has been to develop repeating facilities, which provide range extending. The Oxley Region ARC have advised that they will be adding packet, as well as UHF voice repeaters to their existing VK2RPM system.

ERRATA FOR CONFERENCE OF CLUBS

The Conference of Clubs was not held last month, as announced in November AR. It will, instead, be held on 8th December 1985, same location . . . Westlakes ARC.

THE END!

It is almost to the end of the Institute's celebrations of its 75th year. The VK2 Division will not conclude its period until March 1986. Material is still being collected for the 'Time Capsule' — see March 1985 AR.

On behalf of the Council, and all its Office Bearers, may I wish one and all the Season's Greetings, and the very best for 1986.

de Tim VK2ZTM
AR

FORWARD BIAS

VK1 DIVISION

Ken Ray
PO Box 710, Woden, ACT 2606

MEETINGS FOR 1986

There will be no VK1 Divisional meeting in December, due to the Christmas holidays. The next meeting will be on the 20th January 1986, at the Griffin Centre, Civic. Doors will open around 7.45pm, for the bookstall and QSL bureau, with the meeting commencing at 8pm. At the time of writing, the topic had not yet been confirmed, but will most probably be a video-tape evening.

The Annual General Meeting for 1986, will be held on Monday, 24th February, at the Griffin Centre, starting at 8pm. One of the functions of the AGM is to elect office bearers for the 1986 year. All members of the VK1 Division are eligible to strand for election to any committee position, and it appears that a number of long serving members may not stand for re-election. Any member interested in standing for a committee position should contact the Public Officer, Alan Hawes VK1KAL, for nomination forms and further details. Serving on the committee can be very satisfying, and need not be an onerous task if all pull their weight. This could be your chance to put something back into our hobby of amateur radio, and can be a very enjoyable, and rewarding experience.

JOTA 1986

The VK1 Division operated three stations on the JOTA weekend, from all reports with great success. While propagation could have been better, all stations reported reasonable interest from the Scout and Guide Movements. Thanks must go to Alan VK1KAL, Karl VK1KCM, and Adrian VK1NYA, who co-ordinated activities at the three stations, and to the many other amateurs who provided their time and equipment for the weekend.

One of the stations, VK1BP, operated from Camp Cottermouth, where almost 400 Scouts participated. Most Australian States, and New Zealand were contacted, and all those on the camp had a great time. A more detailed report on the VK1 activities in JOTA should be forthcoming shortly.

That is all from me for this year. Thanks to all those who provided information to me for inclusion in the column, and for those taking holidays over the next few months, have a good time, take care, and we will see you next year. I take pleasure in wishing all members, a very Merry Christmas, and a prosperous New Year, on behalf of the VK1 Division.

AR

FIVE-EIGHTH WAVE

Jennifer Warrington, VK5ANW
59 Albert Street, Clarence Gardens, SA 5039

Have you ever had one of those days when you felt you should go back to bed, and start again tomorrow? Well, I've had a whole month like that!

Last month, in this column, I gave the Picnic a big "plug". I then received a telephone call to say that we would not be able to hold it at Bridgewater Oval in November, as the Oval is being dug up for drainage and sprinkler systems installation. Of course, by this time, everything else had been booked out. It has now been decided to postpone the Picnic until the first or second week in March 1986.

And, if that wasn't enough. I was informed that the RSL Hall, in which we hold our Christmas Social, was having some urgent repair work done, and may not be finished in time to hold the December meeting. I am expecting news on this one at any minute (or hoping, at least!).

The third major outside venue is the Parnanga Camp-site for our Clubs' Convention — *what could go wrong with that?* Well, they had us double-booked with another group for the week-end of the 11-13th April 1986, and we are still trying to sort out who will go where.

OUTSIDE BROADCAST

There were some brighter spots in the month, though. Bob VK5ADR, restored my faith in human nature when he volunteered to set up a station at Hectorville Primary School, for their Communications Day. Bob volunteered within half an hour of my request on the Broadcast. We shared the day with 5EBI, the Commercial Radio Station, who had their Outside Broadcast van set up in the playground.

LIBRARY SHACK

When I arrived at midday, I found the school library looking more like an amateur's shack. Peter Koen had done his usual excellent job with various displays around the walls. Bill Gill VK5NVM, whose son was on the cover of October's AR, had lent his display of old valves, etc. Lindsay VK5GZ, was fascinating the children with his CW contacts, and Bob VK5ADR was kept very busy typing the children's names into a teletype machine, which in turn, relayed the information to a second machine, which produced a punched tape. Each child got his or her name, and relevant piece of punched tape to take home.

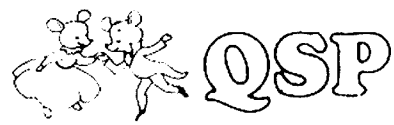
During the lunch break, we managed to keep a pre-arranged sched between one of the teachers at the school and her brother, Kevin P29KM. The teacher was delighted to be able to speak with him, and is now considering sitting for a licence herself, in due course. Colin Ralph VK5KCR, was officially with 5EBI, but came in to have a chat with us, and then took me back to have a look at their gear and meet the crew.

Thanks must go to Bob VK5ADR, and the others for a most successful day.

DIARY DATES (what optimism!)

Tuesday, 10th December — Christmas Social with speaker Geoff Taylor VK5TY. Geoff will speak on the First Burra to Broken Hill Wheelbarrow Race. Bring your YL/XYL/OM and a plate of supper.

AR



PLANNING FOR AUSSAT

AUSSAT's space and communications manager, Dr Wayne Nowland has stated that, due to rapid technological development designing the next generation of satellites, it is necessary to estimate communication needs of the 1990s.

Plans are to be completed by 1987, and the new AUSSATs launched in 1992. To be taken into account, was the expected increased demands for personal communications, using small earth stations.

Satellite technology will be the catalyst for inventiveness and entrepreneurial activity to develop the necessary new person- to-person services.

VK3 WIA NOTES

WHERE WE STAND

By now most members will have received their annual WIA membership renewal notice.

The fees have been frozen at last years level, with the exception of the Student Grade, which has been reduced to $15.

Increased membership in the Division has been a factor enabling the fees to be kept to a minimum.

Another year of membership growth has been experienced in VK3 with about 70 percent of active radio amateurs in Victoria being WIA members.

A brief explanation, may be pertinent, about the 40 percent decrease in the Student Grade. This step has been taken, as part of a Youth Development Programme, to encourage more youngsters into the hobby.

Your Division has three main sources of income — the Divisional portion of subscriptions, sale of disposals equipment, and book sales.

Following is a brief resume of the last four years operation.

The Division had a very difficult period from the late 1970s to 1982. Many serious problems had to be faced by Council, which had to make tough decisions to overcome the difficulties.

That crisis period is now behind us, but it is worth looking at the Council's achievements. In 1982, it paid off the Victorian Divisional Headquarters mortgage of $12 727 (current market value of the building is $120 000), which gave financial stability and enabled Council to embark on other projects.

During the four years, 1982-85, the VHF/UHF repeaters have been substantially upgraded, and many new ones installed. The small group of radio amateurs who install, and service the repeaters deserve the credit for the standard of repeaters now available for general use, and in times of emergency.

However, many radio amateurs, particularly non-members, take repeaters for granted, do not contribute to them, and are among the first to complain if a repeater is off the air.

In the past four years, the VK3 Council has used $28 000 of members funds for repeater Installations and repairs. There is site costs, insurance, power, and licence fees to be paid each year on repeaters.

The all-up capital worth of repeaters in Victoria would be in excess of $33 000 — this asset belongs to you, the WIA member.

Other major expenses incurred during the past four years by the Division include:

Office Postage	*$4 000*
Rates	*$3 628*
Insurances	*$7 732*
QSL Bureau	*$9 342*
Office Typist	*$15 600*

Without the efforts of a small group of members responsible for the revenue through disposals equipment, and book sales, the Division would not have had $15 000 to spend. There efforts are making cheap services available to members, and at the same time, contribute to the Division's financial well-being.

The VK3 Divisional Council looks forward, with confidence, that the number of members will continue to grow. After all, this Division is recognised as having the best range of membership services, including a free QSL Bureau for members. At 75 cents per week (even less for pensioners, students, and family members), WIA membership is value for money in terms of service provided, and as an insurance policy for your hobby.

AR

VK4 WIA NOTES

Bud Pounsett VK4QY Box 638, GPO, Brisbane, Qld. 4001

Nearly every Sunday, the Divisional President, John Aarsse VK4QA, speaks to members on the weekly broadcast from VK4WIA. Here is one such script from September.

Communications is the key to our hobby, so it is said by many But do we communicate effectively? Looking around, one would say, communication skills are the worst in any communication organisation, be it in the hobby field or professionally.

Too often, many details are taken for granted. Council, when it has made an announcement, assumes that members will remember it forever. . .members assume that a mere mention of a problem will automatically be followed up by a solution.

Unfortunately, this is not the case and, while attending the Townsville Amateur Radio Club Convention, this was brought home to me in no uncertain way And I am thankful that it was brought to my attention, and that is part of our communication exercise.

So, here is a summary of a reasonable communications solution, applicable to our Division. If you have serious problems, say with non-receipt of AR, or cannot find out how to form a local radio club, or your club wants to put up a repeater, contact, in writing, the WIA Q Secretary. He/she will direct it to the right person, who will then answer you direct. In this manner, you have a written record and you are able to study your question, and the answer you receive, at your leisure. But, as all of our Council Members are volunteers, and thus have certain family commitments, you will not always receive an answer by return mail. If you wish to have such a service, even within the WIA Q, the expression "the user pays" applies. In other words, the fees will have to rise to allow your Division to employ staff. This other method will cost you the price of a postage stamp.

Another method is to use the telephone. This is not always recommended, as the person may not be at home and, if one lives outside the particular call-area, it may become an expensive exercise.

The last method is more in line with our hobby . . . use the airways. It may not be a private line, but there may be others who always wanted to ask the same question, but were afraid to do so.

As far as this Division is concerned, the following ON-AIR possibilities are as follows:

Tuesday evenings, from 0930UTC on approximately 3.605MHz, VK4AWI and the Queensland Radio Club Net. It is primarily intended as a contact line between Council and representatives of the VK4 Radio Clubs. If time permits, individuals can check in, but for them there is another net, believe it or not. By the way, VK4AWI is presently operated by Council Member, Bill VK4UB.

Thursday evenings, from 0930UTC on approximately 3.605MHz, the Queensland Net. Unfortunately, a lot of operators think that this net is there solely to amass Cities, Towns, and Shires for the Queensland Award. This is not so. Its primary aim is to be a contact point between Council and members and non-members alike, on a regular basis. In the past, many problems have been solved, either on the spot, or after one week. Only one or two tricky questions required a longer waiting time as it involved checking with, either DOC or Federal Executive.

After some time of operations, there were no questions forthcoming, and it became a meeting point for those wishing to contact the many Shires, Cities, and Towns, in Queensland. But please remember, the purpose of the Queensland Net is still primarily a contact net, and those with questions to ask will have priority. Often, if an important item is available, this will often be announced at the start and repeated later in the net. After all, the Queensland Net was the first to officially announce the extension of the 80 metre segment for Novice operators, some years ago.

Further, since this is a regular net, any portable, mobile, or fixed station should know it is possible to squeeze a possible emergency call through at this point in time.

The net controllers are John VK4QA, Max VK4BMW, or Val VK4VR. Of the three, John and Val are Council Members. If Max has control, a Council Member is usually on the side listening. If there are no questions, the Queensland Net will happily chase all those elusive Shires, etcetera. By the way, 3.605MHz is the WICEN frequency in Queensland for state use.

The final method of getting a message through, with some reservations, is during the Call-Back after the News Broadcasts.

This is not recommended, as it could be time consuming, and many would like to get on with their Sunday chores. Also, it could put extra pressure on the Call-Back controllers if they are not Council Members. They may forget the message, or cannot get in contact with a Council Member in time for the next Call-Back.

So, unless you know that the Call-Back-Controller is a member of Council, do not use the Call-Back to ask questions or put forward suggestions. It will not always reach Council, the very people who you want to consider your proposals.

So, in conclusion, a recap of methods of communication between members and council:

Do it in writing to GPO Box 638, Brisbane, Qld. 4001. If you know to what section it should be directed, put that on the envelope, you may save valuable time.

Use the airwaves, as a Club Representative each Tuesday at 0930 UTC, on around 3.605MHz, with VK4AWI as controller.

As a member, or non-member, use the Queensland Net, each Thursday, at 0930UTC, on or around 3.605MHz, with either VK4QA, VK4VR or VK4BMW as net controllers.

During call backs, after the news, but this method is not guaranteed to give immediate results, unless a Councillor on the Net is willing to offer some of his/her Sunday time.

I hope this has given you some insight on a possible effective communications system within our hobby in VK4. This information may be repeated from time to time to alert new licensees of the recommended types of communications with their Division.

AR

On the eve of the Queensland Radio Club Conference, 1985, at the North Brisbane Radio Club, three presidents were together, representing the WIA structure. From left: Bill Donovan VK4AKV, North Brisbane Radio Club President, David Wardlaw VK3ADW, Federal WIA President, and John Aarsse VK4QA, Queensland Divisional President.

SEASONS GREETINGS from VK4

OVER TO YOU!

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the publisher.

THE ROSS HULL CONTEST

It is not so distant past when this was a marvellous contest when every VHFer,'worth his salt', was out there changing reports.

Since then, the so called 'Big Guns' (many of which I would consider friends), have cramped the style of the smaller operators. It seems we now may need modification to the contest layout. Where-as, before if you worked three or more bands, your points score from multipliers soon soared pretty high.

Consideration needs to be given to a possible 'single band' section of the contest, where an amateur can select a favourite band, (in my case six metres), or the band on which the operator is best equipped to compete.

I have discussed this with many fellow VHFers throughout Australia and feel that this may give the Ross Hull a new breath of ionosphere. I realise this may complicate a once simple, but dying contest. So maybe someone will win the 10GHz section with a single contact, but at least someone was active, which is the whole essence of the contest.

What do others think?

See you on six metres during the contest.

Best wishes,

Peter Sumner VK8ZLX,
Alice Springs, NT. 5570.
AR

PHONE PATCH

Telecom Australia would appear most unsympathetic to Australia's most diplomatic, law-abiding, and best international ambassadors .... a group which has neither the political power nor the finance with which to protect itself or its interests, ... I refer to the Amateur Radio Service.

Telecom's answer to a request, from the Amateur Service, for phone patch privileges is contained in their document, "Interconnection of Mobile, Amateur, and Citizen Band Radio Communications" with the Public Switched Telephone Network, Policy, and Conditions, Issue 2, June 1985. This document is so restrictive that it makes the use of the telephone system, by the Amateur Radio Service, unbelievably difficult. Also, Telecom want us to pay a surcharge (in addition to the regular telephone charges) for no more facilities than normal use of the telephone. The Department of Communications makes no extra charge for third party privileges!

The Amateur Service cannot, by DOC regulation, make any form of profit whatsoever, and cannot recover any costs — not even the standard telephone charges.

Please help us to encourage Telecom to modify their unnecessary rules and regulations, and remove their demands for unwarranted surcharges on the Amateur Radio Service.

Yours sincerely.

Tony Tregale VK3QQ
38 Wattle Drive,
Watsonia, Vic. 3087.
AR

WHERE ARE THE YOUNG ONES?

With the assistance of Amateur Radio, I would like to call the attention of the younger members of the fraternity.

As part of a small group of young, radio orientated people, I would like to hear from any others in the same position. My primary aim is to come up on air in a net to chat on our own wavelength (so to speak!).

I am aware of the presence of other young amateurs, but unfortunately cannot seem to catch up with them. I also realise that there are some school groups around.

So, how about a national, or perhaps international 'under 18s/21s' net. If things work here in Australia, I will send similar letters to overseas magazines.

If you are interested, or know of anyone who may be interested in the idea, please contact me.

Yours sincerely,

Nick Morgan-Hobbs VK6EU,
7 Eltham Place,
Kingsley, WA. 6026.
AR

75th ANNIVERSARY

Greetings and congratulations on the 75th Anniversary of the Institute. May there be many more with the passing years.

The kind thought of the Anniversary Gift is much appreciated, and rest assured much more activity will be heard on the WARC bands in the future.

Best regards,

Noel Lawton VK4NL,
50 High Street,
North Mackay, Qld. 4740.
AR

WARC BANDS

Many thanks for the WIA gift pack, presented as a result of me being heard on the WARC bands — 18 and 24MHz. I feel that a resume of these bands may enlighten all on the happenings on these two bands.

I commenced operation in these bands on 2nd January 1983, and on 24MHz have worked GW, G, Germany, and VKs 2, 3, 4, 5, 6, and 7. I am also active on 10.1MHz.

On 18MHz, I have worked 20 countries including; G, GW, GM, I, C21, F, VU, A35, LA3, HB9, FR7, VP9, YU, OZ, OE, T30, ZL, many stations in Germany, ZS, and LU1/MM in the Indian Ocean. All VK States have been worked except 1, 8, 9, and 0.

For about the past 2 years, I have had the advantage of a home brew programmable CW CQ Caller (used on eight HF bands), on 18MHz. The Caller keys my transceiver as a 100W manned beacon, while I am busy writing out OSL cards, filing QSOs into a filing card system, or building up another CQ Caller.

It is sad to say, but 18MHz has also gone down, with DX contacts being very rare. But, as some say, this band will be a really good one, when propagation improves.

73,

Lindsay Collins VK5GZ,
VK5 Intruder Watch Co-ordinator,
12 Park Avenue,
Rosslyn Park, SA. 5072.

Lindsay, you may care to write-up the construction of your Caller for publication in AR — Ed. **AR**

NOW IN TOUCH

Congratulations on an excellent magazine, and I especially like the Pounding Brass column. The magazine is my only contact with the WIA, so I really appreciate it a lot.

Would any readers be interested in an interface to drive the rig with CW taped on a recorder? I am building my third prototype now.

73,

Gil Brownrigg VK3CGG,
7 Church Street,
Bright, Vic. 3741.

Are there any members interested? If so, drop Gil a line and encourage him along the author's path. — Ed **AR**

OBITUARY TO THE VHF/UHF/SHF AMATEUR BANDS

I read (with a feeling of sorrow at having lost a good friend) the paragraph in the October 1985 issue of AR, entitled 'A Woodpecker on 427MHz' (VHF UHF — an expanding world). What has been forecast by myself, and others that watch the amateur scene overseas, has come to pass. The commercials have commenced to take over amateur frequencies that offer great potential for the future.

I can now throw away the equipment I have spent so much time and money building, and improving. Nobody in their right mind would want it now.

Warnings that *at all costs* exclusive segments must be secured in all UHF and SHF amateur bands have fallen on deaf ears, and now it is too late. The head in the sand attitude of 'it won't happen in Australia', aided by a lack of support by some groups has lost us our VHF, UHF and SHF bands.

Some of us will mourn their loss.

G Wiseman VK5EU,
19 Washington Street,
Hilton, SA. 5033.
AR

SCOUTING

This photograph was taken in 1922, a year before I came to Australia. I am now 81 years of age, so I would have been about 18 at the time.

I was in the Sixth West Hampstead Troop, and met Sir Baden-Powell many times, also King George IV and King Edward VIII, as they used to visit our camps.

This was the time also, when I first became interested in radio, as I learned Semaphore and Morse signals.

I can still remember the first crystal and valve sets that I built with Mullard valves and honeycomb coils.

Yours sincerely,

Albert Shire VK3OZ,
173a Eighth Street,
Mildura, Vic. 3500.
AR

Help Save Amateur Radio Language

The Macquarie Dictionary defines the word ***LANGUAGE*** as *"Communication by voice in the distinctively human manner, using arbitrary auditory symbols in conventional ways with conventional meanings".*

Amateur radio has a long established language of its own which adds to the hobby's character and uniqueness. But the language has, unfortunately, been overlooked by some newcomers, particularly in the last decade.

A few old hands are also to blame for not using the language correctly, or failing to encourage others to speak it as it should be spoken.

The vocabulary of some radio amateurs includes phrases like 'come-back'. Everytime this is used on a repeater I, and others mumble to ourselves *'come-back from where'.*

Another phrase gaining popularity is *'I've got to*

Silent Keys

It is with deep regret we record the passing of —

MR WILLIAM N BULLIVANT VK2BC
10th September 1985

Obituaries

BILL BULLIVANT VK2BC

It is with deep regret I advise the passing of Bill Bullivant VK2BC, on 10th September 1985, following a short illness.

Bill, who was in his 77th year, became interested in amateur radio during his early teens, at Albury, and obtained his licence in 1925 under the call sign VK2WB.

Upon taking up residence in Sydney, Bill obtained his First Class Certificate and, at one stage, was stationed at Rose Bay as a base station operator in connection with the Flying Boat Service. At the demise of the Aeradio Service he was transferred to the Sydney GPO, as a telegraphist, and soon gained promotion to the position of Traffic Officer.

Prior to Bill's retirement from the work-force he held the position of Senior Traffic Officer (OIC) Telegraphs.

When Bill renewed his licence, he was allocated VK2BC, and became a keen DX fan, having contacted some 300 countries. Besides his innate skills in radio and electronics generally, he had other great hobbies including clocks, tape recorders, and photography. Furthermore, he was a talented musician, not only on the saxophone, but also other various instruments. One of my happy memories of Bill was his rendition of the 'Happy Birthday' tune, played on his saxophone.

Over the past nine years Bill conducted a net on 40 metres telephony which included some fifteen amateurs.

Being such a personality, Bill will be greatly missed by his friends and fellow amateurs, especially for his jovial and generous nature. We were the richer for knowing him.

To his wife Joan, and family, deepest sympathy.

Laurie Sinclair VK2MH

HAROLD GEORGE SELMAN VK3CM/ex 3GN

It is a sad task to report the sudden death of Harold VK3CM on 18th September 1985.

Born in 1907, Harold could have been classed as an 'old-timer' in amateur radio, however his enthusiasm and active nature gave no impression of his senior years. He was a Life Member of the Geelong Amateur Radio Club, and served as treasurer for a number of recent years in succession. His kindly nature, and sense of humour, were respected, and enjoyed by all club members, young and old alike.

Over the years, Harold developed a special rapport with the younger generation of radio enthusiasts by encouraging, and assisting them, to construct their equipment. His generosity benefited many with those 'hard to get' components, of which he seemed to have a ready supply from his 'junk collection'.

Harold was well known on the HF bands, in particular in the CW segments. His true love was for the 160 metre band, on which he had confirmed contacts with approximately 30 countries. With modest transmitting equipment, and a highly efficient long wire antenna system, he achieved remarkable results; his name often appearing prominently in contest result listings. These results were achieved with a minimum of fuss, but with quiet dedication and enthusiasm.

Harold had an involvement with radio communications from its very beginnings. He operated under the VK3GN call sign prior to World War Two, served in New Guinea during the War as an instructor and technician, and then continued his interest in amateur radio, post war, under the call sign VK3CM.

Harold was well-known for his enthusiasm and active participation outside of amateur radio circles, also. He had an intense interest in motor bike racing and participated in Sporting Motor Bike Club scramble and road racing events, right up to the age of 64 years.

Harold was known to all by his gentle nature, his sense of humour, and his unfailing goodwill. He will be sadly missed by all and deepest sympathy is extended to his immediate family, Graeme, Rita, Max, Mervin, Stanley, and Marlene, and to his grand, and great-grand children.

Alan Bradley VK3LW

Over to you continued

get out of here' when in fact what is meant is *'I want to go clear'*. I'm sure if you think about it you will have heard other examples of non-amateur radio phrases on air. Perhaps like *'What is your handle, OM?'* which has been replaced by some people who say 'What's the name that way?'

The Q-code is also being abused. For example *'I'm going QRT for a second'* when in fact the radio amateur plans to go QRX. *'What is your QTH'*, never *'what's your 10-20 there'*. But listen long enough and you will hear the 10-code on the amateur bands.

It is enough to make any *'old man'* or *'YL'* take the top off a *'gaseous 807'*.

73, never 73s, de VK3PC.

Jim Linton VK3PC,
4 Ansett Crescent,
Forest Hill, Vic. 3131.
AR

FAMOUS NAMES

Many well-known people enjoy the hobby of amateur radio, and it is true to say that you never know who you may talk to. Following is a short list of some, can any members add to this list?

King Hussein of Jordan JY1 and EP1JY; Arthur Godfrey K4LIB (SK), American entertainer; Howard Hughes 9CY (SK), had this call sign in the 1920s; Owen Garriott W5LFL, first amateur-in-space; son of the late Shah of Iran EP1MP; Anastacio Somoza YN1AS (SK), former Nicaraguan dictator; Barry Goldwater K7UGA, US Senator; Sir Alan Fairhall VK2KB, former Australian Minister for Defence; Percy Sara VK2QV (SK), father of the famous "Sara Quads" who were born in the 1950s; Stu Gilliam WD6FBU, US actor and comedian; Donny Osmond KA7EVD, singer of the Osmond family; Jean Shepherd K2ORS, US author and humourist; Marlon Brando FO0GJ, US actor; Rajiv Gandhi VU2RG, Prime Minister of India, and his XYL Sonia VU2SON, Bernie Abramson W6PJX, a director of photography in Hollywood. (Bernie worked on some of the late John Wayne's films, so there is no doubt he extolled the virtues of amateur radio to Mr Wayne, off camera.

THE BENJAMIN FRANKLIN METHOD

Lindsay Lawless VK3ANJ
Box 112, Lakes Entrance, Vic. 3909

Nobby was a natural born experimenter, nothing deterred him from trying new ideas; if his theoretical knowledge discounted the chances of success he would proceed regardless. *"The theory is probably right"* he would say *"but it will do no harm to prove it."* The latest fixation was implanted by someone on air saying that the secret of good aerial construction was to get as much wire into the air as possible. Nobby's aerial farm therefore encompassed an area bounded by the palm tree near the wash-house (laundry to city folk), the old gum tree at the dairy, another at the creek and returning to the wash-house palm via the defunct windmill near the stables. In all, the length of wire was about two wavelengths at 80 metres. Results were somewhat patchy and according to the experts on the zone net a vertical would produce better results. Nobby admitted that it would be beyond even his considerable skills to get the same amount of wire into a vertical but it would be worth trying to see how much he could raise with a balloon or a kite or several of these.

A kite would be an interesting experiment. After all many top scientific people and other experimenters had contributed beneficial developments to engineering as a result of messing about with kites. *"It would amuse the kids too"* said the XYL *"and you have always been interested in aviation."*

Many designs have been tried, kilometres of baling twine expended, all the magpies have moved to other territories free of terrifying tethered hawks and the kids have retrieved their BMX bikes from the temporary storage in the barn. Not a metre of wire has been lifted vertically. *"I think balloons will be the shot"* says Nobby.

Balloons are easy to get but they must be filled with Hydrogen or hot air to get them off the ground and keep them there. Hot air is out because it has to be kept hot. Hydrogen has to be the answer. With the problem thought this far Nobby gave it a rest awaiting inspiration or technical advice from the experts on the net. He didn't know of a source of supply of Hydrogen which would cost little or nothing.

The final solution was almost a final for Nobby and a severe shock to other members of the Nobby household. The blue heeler bitch refuses to come out of her kennel except for meals, the bay mare bolts to the far end of the horse paddock on hearing any unusual sound and the XYL is considering a long holiday at "mums". Hydrogen you see is a by-product of battery charging; a suitable arrangement of inverted plastic funnels and plastic tubing will direct this by-product into an inverted jerry can.

To test this apparatus a 24 hour charging of the tractor battery was arranged and the result taken to the middle of the cowyard and a lighted match applied to the mouth of the jerry can. The bay mare in spite of being harnessed to the Furphy leapt the fence into the pig yard leaving the Furphy behind. The heeler which had been sniffing around the jerry can fled yelping, cleared the creek in one bound and disappeared into the scrub. Nobby escaped unhurt and except for a sort of chirpy CW affecting his hearing, is almost ready for the next experiment. He optimistically predicts a deep fade of the chirpy CW in only a few days. The jerry can will remain at the top of the dead gum in the pig yard until the tree is needed for fuel for the kitchen stove.

There is a sequel to every notable event. The XYL did take that holiday and returned with a gift for Nobby from "mum"; one Cimbidium orchid in a pot and a book entitled "How to Raise Orchids for Pleasure and Profit". Nobby thinks this is a great idea but "I will need a Commodore 64 or similar to record my orchid growing experiments" "Yes" said the XYL to herself "and for AMTOR experiments I suppose".

AR

Unfortunately, due to an industrial dispute, there are no IONOSPHERIC PREDICTIONS this month.

SOLAR GEOPHYSICAL SUMMARY: AUGUST 1985

SOLAR

Solar activity was very low during August, with no energetic flares being observed. The active region which raised the 10cm flux levels in recent months has now decayed. The remnants of this region produced the slight rise in the flux levels early in the month.

Even with this rise, the monthly averaged flux value was the lowest since the last solar minimum period.

10cm daily readings were 1,2=78, 3,4=77, 5,6=76, 7=77, 8=76, 9= 73, 10=71, 11=67, 12=68, 13=67, 14=68, 15=67, 16=67, 17=66, 18=67, 19=68, 20,21=69, 22-26=71, 27-29=72, 30,31=73. Average 71.6 and the Sunspot monthly average was 10,4. Sunspot yearly average 1/85=20 2/85=19.1.

GEOMAGNETIC

August was a disturbed month, in general. There was an extended period of mildly disturbed conditions from the 18th through to the 30th. The most disturbed days were the 13th A=41 and the 31st A=32.

1st August . . . Field unsettled to active A=17
12-15th August . . . Field became disturbed after 1800 UTC on 12th and was at major storm levels until around 1200 UTC on 13th. It was disturbed again between 0500 and 1000 UTC on 14th, and between 0600 and 1400 UTC on 15th. A=20,41,22,16
18-19th August . . . Field was at active levels between 2200 UTC on 18th and 0600 UTC on 19th. A=14,16
22nd-23rd August . . . Field was at active levels with periods of minor storm levels. A-18,18
25-26th August . . . Field was at unsettled levels with periods of active conditions. A=19,17
29th August . . . Field at active levels between 0600-1900 UTC. A=16
31st August . . . Field at storm levels between 0900 and 1900 UTC. A=32
Quiet days . . . 5 A=4; 6=3; 7=4; 11=4

From data supplied by Department of Science, IPS Radio and Space Services.

DEADLINE

All copy for inclusion in the February 1986 issue of Amateur Radio, including regular columns and Hamads, must arrive at PO Box 300, Caulfield South, Vic. 3162, at the latest, by midday, 2nd January 1986.

HAMADS

PLEASE NOTE: *If you are advertising items FOR SALE and WANTED please write each on separate sheets, including ALL details, eg Name, Address, on both. Please write copy for your Hamad as clearly as possible, preferably typed.*

- Please insert STD code with phone numbers when you advertise.
- Eight lines free to all WIA members. $9 per 10 words minimum for non-members.
- Copy in typescript please or in block letters double spaced to PO Box 300, Caulfield South 3162.
- Repeats may be charged at full rates.
- QTHR means address is correct as set out in the WIA current Call Book.

Ordinary Hamads submitted from members who are deemed to be in the general electronics retail and wholesale distributive trades should be certified as referring only to private articles not being resold for merchandising purposes.

Conditions for commercial advertising are as follows: The rate is $22.50 for four lines, plus $2 per line (or part thereof) minimum charge $22.50 pre-payable. Copy is required by the deadline as stated below indexes on page 1.

YAESU 901DM HF TX: with FM, ext VFO, auto scan, 40 mems, auto CW chip, 240/12V ext spkr, desk & hand mics, manuals, extender board, orig pkg. $650 ONO. Ron VK2DBH. Ph:(065) 54 2105.

#FOR SALE — VIC#

FT-230R 2M TCVR: 10/25W output, 10 mems, 2 VFOs 5/10 steps, priority chan, auto scan mic. Complete with mic & manual. $335. Little use, as new. VK3ALT. Ph:(059) 41 1248.

ICOM IC-502 H/HELD 6M SSB TCVR: Covers 52-54MHz. Ex cond. $150. Also 6m, 4el beam. $50. Bob VK3ZBB, QTHR. Ph:(03) 379 4242.

KENWOOD TS930S: in VGC with auto tuner, WARC bands, & h/held mic. $1650. Rotator SAY-103, near new. $210. Jim VK3NR. Ph:(03) 367 6920.

MARCONI TF-867 STANDARD SIG GEN: 15kHz to 32MHz in 11 bands. GC. $150. VHF Sig gen type AN/USM-44. 10-420MHz in 5 bands. GC. $250. Both above instruments are professional grade, with h/books. Hepburn. Ph:(03) 596 2414.

REALISTIC DX-300 COMMS RX: Digi read-out, in GC. $230. Ross VK3CBL. Ph:(03) 836 0073.

SHACK CLEARANCE: Yaesu FT-101E tcvr. GC. $420. Yaesu FV-10B ext VFO. $80. Yaesu FL2100B lin amp. $400. Please contact Paul VK3AJJ. Ph:(03) 435 3643 AH or (03) 267 3399 BH.

SIEMENS 100 MK2 TELEPRINTER C/W READER: Tape punch, paper, tapes, inbuilt power supply. ETI modem in instrument case C/W tuning LEDs and meter. Active switched filter, relay PTT switching. Excellent HF operation, worked RTTY DXCC, all in perfect cond. $175 ONO. Ken VK3MW, QTHR. Ph:(03) 560 5278.

YAESU HF EQUIPMENT: Yaesu FT7 mobile tcvr, fitted with 10A & 10B preamp & processor. $370. Yaesu FT-110 lin amp to match FT-7, or similar hi-power finals. 15W drive, delivers 150W. $210. Yaesu FT-107V ext VFO, grey external, 150mV @ 50 ohms/5-5.5MHz. $40. Reel-reel tapes. 4x7" & 4x3". $10. Spider Hub, Bandit Spider quad hub (new). $40. VOM Heathkit IM-16. 0- 1500 AC/DC & 0-1000Mohms. Line or bat pwr. Very good test unit. $40. Valves — Mullard 2 x CV788 (RF). $12. Mullard 1 x 803 & pore base (RF). $30. VK3KSA, QTHR. Ph: (03) 726 8752.

YAESU EQUIPMENT: FRG-7. $250 ONO. FT-620B in VGC. $275. FT-200. $200 ONO. FT-75B with AC/DC power packs. $300 ONO. FT-7 in VGC. $350 ONO. FL110 linear, new. $250. Ph:(055) 69 2320.

YAESU FRG-7 COMMS RX: In exc cond. $185. Also modified Marconi R-1155 aircraft rx. $30. Both for $200. VK3AMT, QTHR. Ph:(059) 86 2601.

YAESU FLDX-2000 LINEAR AMP: All new 6KD6 tubes in exc cond. Circuit & instructions. $100. VK3CLM. Ph:(03) 542 3487 BH or (03) 794 8432 AH.

#FOR SALE — QLD#

YAESU FT-290R 2M MULTIMODE: NiCADs, charger, ¼ wave stub, ½ wave whip, 11 el beam. All in VGC. $550 the lot. George VK4BGR, QTHR. Ph:(071) 95 4057, evenings 7-9pm only.

#FOR SALE — NT#

GOING OVERSEAS — MUST SELL: Shure 444D desk mic, Hi/Lo impedance in EC. $95. RTTY/ASCII terminal: Xitek SCT-100, Keytronics keyboard, case, complete documentation, extras. $125. Tokyo HL-30V, 30W, 2m linear amp. $69. Dick Smith M-9517 small NiCAD charger. $8. Larsen LM-MM mag mnt VHF antenna, new. $69. RAK balun, 20-15m parallel dipole, insulators. $25. Nick VK8DE, QTHR. Ph:(089) 52 3692.

ADVERTISERS' INDEX

KENWOOD

TS-940S

HF TRANSCEIVER

The TS-940S is a competition class HF transceiver having every conceivable feature, and is designed for SSB, CW, AM, FM and FSK modes of operation on all 160 through 10 meter Amateur bands, including the new WARC bands. It incorporates an outstanding 150 kHz to 30 MHz general coverage receiver having a superior dynamic range (102 dB typical on 20 meters, 50 kHz spacing, 500 Hz CW bandwidth).

Engineered with the serious DX'er/contest operator in mind, the TS-940S features a wide range of innovative interference rejection circuits, including SSB IF slope tuning, CW VBT (Variable bandwidth tuning), IF notch filter, AF tune circuit, Narrow/Wide filter selection, CW variable pitch control, dual-mode noise blanker, and RIT plus XIT. The use of a new microprocessor with advanced digital technology controlled operating features, plus two VFO's, 40 memory channels, programmable memory and band scans, a large fluorescent tube digital display with analog-type sub-scale for frequency indication, and a new dot-matrix LCD sub-display for showing graphic characteristics and messages, all serve to provide maximum flexibility and ease of operation. In addition, a CW full break-in circuit, switchable to semi break-in, a built-in automatic antenna tuner, a solid-state final amplifier that is powered from a higher voltage source, a speech processor, all-mode squelch, and a host of other convenience features all add up to even greater versatility of use in fast-paced DX operations. With its power supply and antenna tuner built-in, and with its new whisper-quiet cooling system, the TS-940S is a complete, all-in-one type transceiver that brings tomorrow's sophistication to today's serious enthusiast.

The Australian Electronics Monthly

Australia's only independent popular magazine for the electronics enthusiast

WOULD YOU LIKE TO RECEIVE RADIOTELETYPE AND RADIO FACSIMILE TRANSMISSIONS USING YOUR RECEIVER AND COMMODORE 64?

The December issue of AEM shows you how!

Using our simple, inexpensive "Listening Post" project and software published in the magazine, you can use your receiver with your Commodore 64 to decode RTTY transmissions or radio FAX picture transmissions.

With your Commodore you can display weather maps on your screen and print them out on your printer — fascinating stuff!

Since we published details of how to build the Listening Post project and use it with a Microbee in our July issue, we've been inundated with requests for details on using it with the popular Commodore 64. If you're interested —

DON'T MISS THE DECEMBER ISSUE!

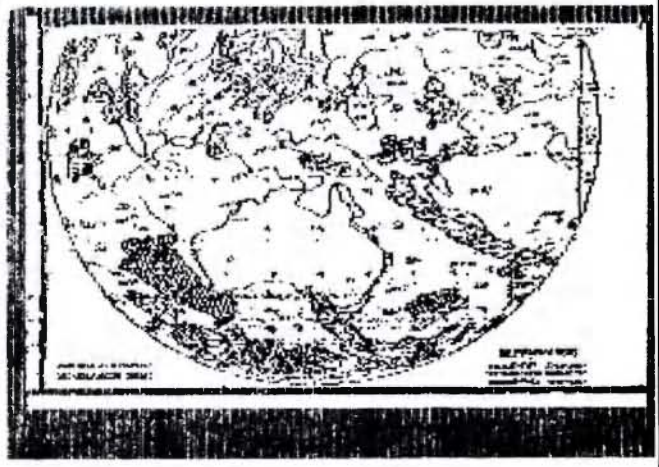
Yet more goodies!

A VARIABLE SPEED CW MEMORY

Here's a great little weekend project that finds that elusive DX for you. You can generate and store a brief Morse message and send it at a speed which may be varied over a wide range. VK3AMK gives away his 'secret' for successful DX hunting!

BUILD A 'DUAL-SPEED' MODEM

Here's a great project for computer enthusiasts. This modem provides both 300/300 Baud and 1200/75 Baud operation and can be built for less than $150.



'Nephanalysis' (cloud) weather chart printout from AXM Canberra on 13 920 kHz, 1-10-85.

WIN A FRG-9600 SCANNER FROM DICK SMITH ELECTRONICS IN OUR SUPER CONTEST!

— worth over $700.

AND COMING UP . . .

APPLE II AND THE LISTENING POST

Neil Duncan VK3AVK shows how to interface the Listening Post to your Apple II, and provides software for decoding Morse, RTTY and FAX.

RADIO COMMUNICATORS GUIDE TO THE IONOSPHERE

Our popular series continues in January, covering "Variations of the Ionosphere". Written by internationally-known scientist Le McNamara and well-known technical author Roger Harrison VK2ZTB, this important series gives detailed, practical information in plain language, with copious illustrations.
