# THE AUDITRONICS TRADITION

## C o n t i n u e s

**OUR BRAND NEW 2600 SERIES** is the **PERFECT UPGRADE** for those thousands of stations that have had **AUDITRONICS** consoles over the past thirty years. Designed for the **TIGHTEST** of **BUDGETS**, it is nonetheless the **highest performance** console Auditronics has ever offered!

A **MODULAR DESIGN**, the 2600 features twelve input channels, a monitor module with control room, studio, cue,

headphone and talkback circuits, and an output module with **PROGRAM**, **AUDITION**, both pre and post fader **MONO** outputs, and independent meter selection. Optional line selector and tape remote modules are also offered.

This countertop design fits efficiently in only 25 by 26 inches of space, and like all our consoles is fabricated from steel to withstand the rigors of a broadcast environment.

**ON THE COVER:** The first NAB convention of the new millenium was an adventure in radio's evolution filled with traditional and new technologies. The show review includes our reporter coverage, the Pick Hit Awards and the New Products section. Cover design by Michael J. Knust.

*"You just have to speak  
to the right people."*

Shannon Block, on-air talent at KRQQ FM, at the VADIS DC console.

"After looking at several options, we decided on the VADIS platform and DC consoles from KLOTZ," says John Decker, Chief Engineer, Capstar Communications, Tucson. "Why? First, our install would be much faster since most of the plant wiring could be reduced to a simple Ethernet line and a fiber optic cable connecting each room with our rack room.

"Secondly, all four stations were to be housed in the same facility, and we had to share audio sources all around the plant. This is a function that is part of the KLOTZ system. Our entire plant is now based on a digital audio 'back-bone' that provides an improved audio signal.

"We also purchased five DC consoles. The air talent finds the DC consoles simple to operate. They can put any source in our plant on any fader of the console with a simple LCD button in the meter bridge. Giving the operator the ability to call up any source to a fader is great since each operator prefers a different arrangement of sources on the console."

- Installed in world class facilities
- Integrated platform concept
- Fiber optic networking
- Any audio source, anywhere

## First Professional MP3 Audio Cards

BSI and AudioScience have teamed up to create soundcards that play four MP3 files simultaneously without a software CODEC. The \$2095 ASI4344 and the \$2795 ASI4346 were available on May 1st, exclusively at BSI.

This is the first time a professional audio company has created devices specifically for the MP3 format. The two cards decompress audio files on their own hardware so the processor doesn't have to. With these cards, the skipping and slowness that plague broadcasters with MP3 files have been eliminated.

The concept of decompressing audio on an audio card has been used with other formats, however the Fraunhofer Institute has controlled the CODECs for the MP3 format. Putting the CODEC on the card vastly improves PC performance, so playing multiple MP3 files simultaneously will be no different to your PC than playing multiple linear files.

"Our corporate mission is to respond to customer requests. AudioScience has a record of leadership in the digital audio market. When BSI and AudioScience formed the concept of combining our hardware with MP3 technology it made sense for both of us," says AudioScience President Richard Gross.

"The radio industry has been heading towards an audio card like this one ever since the MP3 format became popular. Broadcasters wanted to use MP3 files, but could not get the consistent sound they needed," says Ron Burley, BSI President. "We were happy to have AudioScience as a partner in this because of their record of creating products users want, rather than finding customers for the cards they decided to make."

BSI will be the exclusive distributor of the new audio cards. And only BSI will distribute the upgrades to two other cards, the ASI4334 and the ASI4336, allowing them to play triple MP3 files. The \$200 upgrades allow you to buy the earlier card with upgrade for the same cost.

### Tip

## Online Tech Data

If the net clock for your station is locked in the PD's office or you can't find the wiring diagram for your audio switcher, you'll probably find the info you need at [www.bsiusa.com/support](http://www.bsiusa.com/support). The BSI web support area has a database that includes wiring instructions for connecting to external devices, whether or not you're using BSI software! It also includes network program & tone clocks. You'll also find complete online manuals for all BSI programs.

## Affordable Digital Automation

Our WaveStation 3.0 has all the features of the too-expensive systems, but is priced reasonably like software, not gold-plated broadcast hardware. We often hear, "It can't be true!" Over 3000 satisfied users prove the contrary.

WaveStation uses linear or compressed audio files. Features include WebCast ability, on-screen voice-track editing, time-shift recording and serial port control. Offers full automation, satellite voice-track and live assist. Works with Windows 2000, 95, 98 or NT.

Get one for only \$1499

[www.bsiusa.com](http://www.bsiusa.com)

### User File

## WJIL - Dan Kolenda

Dan Kolenda visited BSI for WaveStation Weekend in February. "I thoroughly enjoyed it. It's so good to be able to see BSI President Ron Burley demonstrate things. Reading the manual is great, but being able to see him do it, the lights just all come on. He really wants to help us, instead of just trying to sell a product. Ron kept saying that BSI was a user-driven company, and you can really feel that from what he says to you."

Dan has been using WaveStation for a while now. Although he was familiar with the product, there was more to learn. "I've always had a little bit of reluctance to try new things because I might go off the air. WaveStation Weekend really raised my confidence level. I don't mind experimenting more now. And the technology has changed so much that this really brought me up to date. I also think it's good to ask for a roommate," he says, "I planned to go, not for a vacation, but to learn. My roommate and I sat in our room and just bounced ideas off each other."

The thing Dan liked most about the \$1499 WaveStation Weekend was the personal aspect. "I really enjoyed talking to the different technicians. I've talked with them before over the phone, but being able to sit down and pick their brains was worth its weight in gold."

Send us your story.

## Surviving the Internet

By Chriss Scherer, editor

**W**e all know that habits change. Radio listening habits (and naturally radio itself) have undergone some changes from their origin. The most dramatic change was in radio's very early days when usage changed from a messaging medium to an entertainment and information medium. Another significant change was the shift in focus of the radio being the centerpiece of the home, when radio listeners "watched" the radio. This occurred when TV was introduced, and radio slowly moved to a background medium in many cases. Since then, the habit changes have been smaller, introducing only minor differences.

Internet time, a phrase that is often heard today, has real meaning. Changes in habits and technology are occurring much more quickly today. The changes in radio took place over a period of more than 75 years. Now we see technology, and subsequently habits, changing every month or even more often. Changes in online usage as a result of these technological advances are readily recognized.

In May, Scarborough Research released the results of a National Internet Study that examined Internet usage habits and changes in the way Internet consumers embrace online and traditional media. This is Scarborough's first study on the topic, and more are planned.

Some of the general statistics are not surprising to me. It reports that 48% of Americans have used the Internet in the past 30 days, and 42% have consumed some form of streaming media. Further investigation would no doubt reveal that these users are younger as opposed to older people.

The decline in usage of other media as a result of the time spent online shows that the Internet is winning the competition for attention—except in radio. By combining the reported consumption statistics (that is, the percentage of those who consume certain media less and those who consume a certain medium more now that the Internet is available) for various forms of media, the results are: TV viewing down 16%; magazine readership down 12%; newspaper readership down 6%; radio listening up 2%. Some respondents indicated no change in their media habits, and radio again came out ahead with 81% while other media forms showed less favorable responses.

What does this mean for radio? It means that radio is not being affected as much as other media forms. Radio is retaining its audience better than other media forms.

I believe that this can be attributed to radio being an aural medium. You can listen to the radio while performing other tasks: working in the office, working around the house, surfing online. In some cases, listening (online or terrestrial) can be tied directly to the online experience.

Radio, TV, magazines and newspapers all offer additional information online. It's common to see references to additional online stories within an article or during a TV show. It's difficult if not impossible to read something online and also read something in print or watch it on TV. It's not so difficult to listen to the radio and work online.

Listening online may not be the preferred choice because of sound quality or data transmission limitations (other surveys show that at least 60% of the computers on the Internet connect with 56K or slower modems). But regardless of the transmission means, radio and surfing work well together.

Radio is facing its own evolution as terrestrial radio is introduced to IBOC and challenged by satellite radio and Internet radio, but in the end, it's all radio in some form. The same ties can be created and expanded upon. Radio and the Internet work well together. As people stop buying newspapers and reading more information online, the radio will always be turned on in the background.

A handwritten signature in black ink that reads "Chriss Scherer".

# Matrix—

QUITE POSSIBLY THE LAST CODEC YOU'LL EVER BUY.

## THE CODEC FOR THE FUTURE

Your remote equipment toolbox may already include ISDN and POTS codecs plus a slew of other stuff. Now they are talking about high speed digital wireless — GSM and coming soon...3G.

The Matrix's modular approach is designed with this future in mind. The core of the Matrix's flexibility revolves around full access to its powerful coding engine through easily inserted modules and upgradeable flash memory. Whatever may be coming down the communications pipeline, the Matrix is ready.

## THE CODEC FOR TODAY

### WIRELESS

- 15 kHz real-time, full duplex audio on GSM wireless phones
- Up to 10 kHz real-time, full duplex audio on HSCSD GSM
- 15 kHz real-time, full duplex audio on portable Inmarsat terminals (with optional ISDN module)
- 15 kHz nonreal-time, "Store and Forward" feature may be used on many mobile circuits
- Optional battery kit delivers power for up to 7 hours

### ISDN\*

- Layer III for 15 kHz at 64 kb/s
- G.722 for wide compatibility with other codecs
- Turbo-G.722 for 15 kHz with only 6 ms of delay
- Layer III transmit with G.722 return to reduce delay
- 1200 baud ancillary data available
- Fully international terminal adapter works worldwide

\* ISDN module required

### POTS

- 15 kHz full-duplex audio on a standard telephone line
- Available in portable or rackmount versions
- Modular design enables use on future circuits
- Will work at data rates as low as 9600 baud
- "Store and Forward" allows 15 kHz, nonreal-time audio transmission at any data rate

## Make it so!

By Jim Paluzzi

**W**hile you attended the NAB, you kicked the tires and identified the purchases you want to make. What comes next? Cut the purchase order? Pull out the corporate purchasing card? How do you go from capital *decision* to capital *execution*? You must find a way to “make it so!” For many managers, deciding *what* to buy is the easy part of spending your capital budget. The hard part is deciding *how* to buy it.

There are many ways to make a purchase; knowing how to order can make the difference in truly adding value to your radio station. Purchasing errors are more than expensive; mistakes can result in lost productivity that hurts

morale and the bottom line.

Take a look at your purchasing categories, ask yourself (and potential vendors) some questions, and you will likely experience the rewards of money well spent. Let's discuss two types of high-ticket capital investments.

**A convention is a good place to learn about equipment and comparison shop, but save the final decision for neutral territory.**

### Physical plant

Building studios, transmitter buildings and towers is not the core business of most broadcasters. But management can be tempted to assign the task of designing and building technical facilities to the engineering department in an effort to save money. This is usually a mistake.

It may be better to delegate major construction projects to a general contractor or to a series of subcontractors that your engineering team can supervise. There are at least three reasons why it usually makes sense to outsource major capital projects.

*Indirect costs.* While your technical staff is probably more than capable of learning the construction trade, it will take time for your staff to master the learning curve. The costs of learning how to build something for the first time are often buried in the budget, since your staff gets paid anyway. You may never know the real cost of having your staff handle your physical plant projects.

*The costs of ignorance.* Few things can create as much grief in an organization as a capital project in trouble. It

is safe to assume that mistakes will occur at the construction site; that is why it may be wise to outsource the heavy lifting to someone who does this work for a living. It all boils down to who pays for those mistakes.

*On time, on budget.* A general contractor or a subcontractor should have fewer responsibilities than your engineering staff. Before awarding a contract, see how many concurrent jobs the contractor has scheduled during your construction period. If the contractor is evasive on this issue, find another contractor.

The last thing you need is to pull your engineering team off a construction project to deal with a crisis.

Include penalties in your contract for failing to complete construction by a stated deadline. Penalties are your best insurance that a construction crew is going to stay on the job, even if your contractor has a more lucrative contract in the wings.

There is a middle ground between “doing it yourself” and hiring a general contractor: buying boxes instead of buildings. Increasingly, broadcasters are purchasing prefabricated studios and transmitter buildings, rather than “stick-building” their facilities. This allows broadcasters to take advantage of mass production cost savings—with the promise of greater quality control.

The advantages of prefabrication are magnified at public radio stations at state institutions, where studio facilities are often a neglected part of a much larger, multi-purpose building. The hazards of lowest-cost bidding, combined with the politics and bureaucracy that too often surround public works projects, conspire to ensure that many stick-built facilities will be inferior to their prefabricated counterparts.

### Automation systems

Once considered a necessary evil at neglected sister stations, digital playback systems now deliver the pulse of most radio stations. While the process of selecting an automation system that is right for your station is a lot like buying a car, here are some purchasing tips that will serve you well before you buy:

*Never buy based on a demo.* Arguably, a vendor's product demonstration represents that company's best sales effort. On the other hand, your best predictor of how the system will work at your station will be your observation of how the product works in the field—without the vendor present. Find at least two installations of the proposed system at facilities similar to yours. Travel to those stations and spend a day talking with

Studer On-Air 2000M2: the choice  
for medium to large radio stations

## The New Studer On-Air 2000M2 - now with Input Router

Photo: Kennerly by Regener and Studer

### High flexibility, proven quality

Studer's new On-Air 2000M2 offers the freedom to route any input signal to any fader on the console surface. The modular unit can have up to 64 input signals, regardless of the number of faders installed (6, 12, 18 or 24). The system integrates seamlessly with radio automation systems (CAB) to comply with self-op mode or as part of a complete facility. For existing On-Air 2000 users, Studer offers the additional functionality in a retrofittable upgrade package.

Studer's On-Air 2000 delivers proven quality and reliability. It is the choice for nearly 500 broadcast installations worldwide!

Over the last 50 years, Studer's name has become synonymous with reliability.

Thousands of radio broadcasters all over the world put their trust and their professional reputation in our hands.

Because our technology will not let them down. Because it is by Studer.

Studer On-Air 1000 - High quality for every budget

## Managing Technology

management, engineering and operations.

Ask to have several people demonstrate the system. If you hear frequent references to only one person at the station who "really knows how to make this thing work," run away from the product. If the automation system is user-friendly, everyone should know how it works.

A visit to the factory can be useful in determining the quality of service after a major purchase.

*Visit the factory.* To evaluate the quality of technical support you are going to receive after you purchase your system, head for the factory. Given investment cost of the system, vendors will be hard pressed to turn down your request

for an on-site visit. Forget the multimedia presentations in the boardroom. Instead, head for the repair bench and talk to the technicians. Ask about the most common hardware problems they face.

Visit the help desk and ask the staff to describe the most common problems they encounter. Ask about the help desk tracking system. Any serious help desk operation has software that allows staff to document and track

trouble calls. Finally, look for a help desk that has a high level of *respect* for the products they sell—and the users who buy those products.

*Be careful with factory training programs.* Staff members certainly need training on a new automation system. The question, however, is not whether your staff should be trained, but rather, "Who should train your staff?"

Factory trainers usually understand their equipment and their software, however, not all trainers have a background in station operations. Indeed, few trainers have *any* formal background in training. As a result, system training can be highly frustrating for the staff—and hardly worth the expense.

Instead, find a user who understands how the system works. Offer that person the money you would have spent on factory training. Then, you will have someone training your staff who can focus on the basics of how to get things working, rather than a technically thorough (but otherwise irrelevant) "systems overview."

Capital investments will constitute a larger portion of a radio station's budget in the decade ahead. Stations that establish effective procedures to execute capital purchases will receive an even greater return on their investment.

*Jim Paluzzi, Ph. D., is general manager of Boise State Radio.*

## The licensing process

By John Battison, P.E., technical editor, RF

Whoever said, “the more things change, the more they remain the same,” must have had the FCC in mind. More than 50 years ago, Form 301 was thin and did not demand much in the way of exhibits. Today, Form 301, still thin and demanding little in the way of exhibits, requires many statements of fact that must be backed up by full engineering analysis so that exhibits can be presented on demand. However, today’s Form 301 must be filed electronically.

It is also illuminating to compare the Commission’s present day paperwork requirements with those of 50 years ago. Nowadays, there are more forms to be completed, and the Commission is requesting data in forms that are more examiner-convenient than the original Form 301. I think the latter was designed to get the information displayed in a relatively easy manner for the applicant without much consideration for the examining engineer.

In this article we’re going to run through the engineering process of getting a license for a broadcast station and talk about the new electronic filing forms. It is important to bear in mind that, apart from technical matters, the FCC has sticky fingers and expects its palm to be greased with every application, using Form 159 when sending cash, and 175 in the cases of auctions. However, these forms are best left in the hands of the attorneys.

### Getting a construction permit

In the interest of correctness, I like to emphasize the fact that the first step in building a broadcast station is obtaining a Construction Permit (CP). Too many times we find the expression “getting a license” is used in the press and the daily papers. That’s fine for non-technical people, but “getting a license” is very different from “getting a CP,” and it has a different meaning.

Before starting work on a new broadcast application, it is important to check with the FCC to be sure that the appropriate window will be open. The Commission tends to require windows for almost everything; perhaps in an effort to control workflow to their overloaded engineers.

At the same time, be sure that a current application form is used. Many changes are being made. Sometimes it seems that monthly changes are occurring, and it’s important to check expiration dates. The current OMB approval data appears in the upper right-hand corner. The expiration data appears in the bottom right corner. Also be sure to use the latest rules; these seem to change frequently nowadays.

At the time of writing this, the old AM DA proof of Performance Rules apply. However, there is a Notice of Proposed Rule Making (NPRM) proposing some substantial changes and reduction in required field work. By now, the new Rules may be in force.

The first step towards a CP is finding a frequency, unless it is intended to file on an existing station or an identified frequency. The next step is obtaining and reading a copy of CFR 47, the FCC Rules and Regulations. Although most of the rules governing the completion of Form 301 can be found in Part 73 of the Rules, there are a few paragraphs in other sections of CFR 47 that require reference prior to submitting the application.

Today’s FCC will not accept Form 301 on paper. The filing must be

electronic. This means that the filing is more of a statement of intent than a technical document, as in the old days when voluminous documentation had to be submitted. It seems that with the advent of Docket 80-90, the FCC has become window oriented. It is almost impossible now to file any application unless the appropriate window is open, and it is essential to keep an eye on FCC releases.

In my opinion, the new engineering data portions of Form 301 are important improvements to the Form, although they can be a dangerous trap for a careless filer. Almost every page of the Form calls for the repetition of technical data entered on previous pages. It is easy to make a typographical error from page to page, with disastrous consequences: any inconsistency will result in return of the application.

On the old Forms antenna data was requested once, but on the new forms it seems to be required frequently, and

*Note: Form 301 is used as a generic term in this article, the same things apply for all versions of Form 340 (NCE) as well.*

FCC forms are available at [www.fcc.gov](http://www.fcc.gov) as updateable PDF files.

### Remote System Management (RSM) option

- DSM structure accessible from any phone
- Natural voice communication from transmitter
- Password protected
- System operating functions evaluated and reset remotely
- Alert by phone in the event of system faults.

Crown FMX Series Transmitter models include the FMX 30, FMX 100, FMX 250, and FMX 500. DSM structure and the RSM option can also be retrofitted to current Crown transmitter models.

## RF Engineering

every entry is a possible source of error and rejection. Non-DA and day and night directional operation data are requested on separate pages, for a total of 10. This feature is a great improvement on the old system.

In the case of un-tamable directional antennas, augmentation data are requested and clearly outlined. This format makes the FCC engineer's job a lot easier, but it puts more stress on the applicant engineer because of the earlier mentioned risk of conflicting entries and consequent dismissal. In

lieu of presenting pages of expensive drafting work to demonstrate that the system will work as proposed, many boxes must be checked yes or no, and other boxes show compliance with parts of Part 73.

The page requesting data on operation during critical hours is a good idea. It can be easy to forget that such things as critical hour operation have to be considered when rac-

Form 302 is used for the license application.

ing against time. I missed a critical hours check on a Form 301 about 40 years ago. The critical hours section would have prevented my embarrassment, and I hope it will save engineers in the future. It's very easy to say that a good engineer would think of it; but sometimes in a rush things are overlooked until too late.

### Form 301 FM

Form 301 for FM requires two pages of technical information and the checking of about ten boxes to show compliance with several paragraphs of Part 73 and other parts.

Unlike AM DA applications, FM DA data is not supplied with Form 301FM. Instead, the desired relative fields are listed (after consultation with the antenna supplier to ensure that they produce a DA with the required pattern), and the application is based on that data.

When the CP is issued and equipment ordered, the antenna supplier runs a pattern proof on the actual antenna and/or a scale model. This material is filed with Form 302FM when making application for the station license, in much the same manner as AM DA license application is filed. The main difference is that, in the case of FM DAs, the FCC accepts the promise of the proposed DA pattern, avoiding checking the whole application.

Licensing AM DAs involves making a number of radial measurements to demonstrate that the promised pattern has been achieved and that the antenna is operating as promised. This is known as the Proof of Performance, and it takes weeks to make and analyze the radials runs and produce the exhibits the FCC needs. The AM Proof of Performance is expensive and time consuming. The FM DA testing proof is not as costly as for AM DAs.

Barring conflicting applications, errors, petitions to deny or other problems, the application is accepted. One then begins to wait, and wait, and wait.

# Never Go Off the Air! Get Scott Studios'

# INVINCIBLE

## Fail-Proof Digital Audio System

### Scott Studios Delivers Radio's Only Self-Healing Redundant Digital System

Major stations in major markets choose Scott Studios' *Invincible*. It's a *mirrored* pair of top-of-the-line SS32 digital audio systems, plus Scott's *exclusive* diagnostic watchdog that double-checks everything several times every second by fast USB. At any *hint* of trouble, the backup automatically starts playing where the problem unit left off! *Invincible* switches so fast that most listeners hardly hear a glitch. In fact, one touchscreen controls both systems seamlessly so some announcers don't notice a switch.

Hands-free redundancy is one of many reasons why major stations in New York, Chicago, Los Angeles, Houston, Dallas, Philadelphia, San Francisco, DC, San Antonio, Phoenix and Toronto installed Scott Studios' SS32 recently. 3,500 stations in the U.S. have Scott systems and those of our sister company, Computer Concepts Corp. More stations use our systems than the second and third largest digital vendors combined! Our customers benefit from the biggest and best service and support staff in radio's digital audio industry, with 105 people at your service.

Scott's *Invincible* SS32 is the most robust digital system of all! SS32 delivers more streams of perfect uncompressed and MPEG audio than any other system. You get industrial rack computers, the fastest CPUs, mega-memory, hot swap redundant power supplies, ultra-fast RAID mirrored hard drives, extra cooling, NT networking, two premium four-output stereo audio cards per system, the best flat panel touchscreens and up to a 5-year exchange warranty! Nothing else gives so much peace of mind as Scott's *Invincible*.

Scott Studios SS32's user-friendly intuitive touchscreen is the simplest for announcers to use and gives all the features that creative major market air talent demands.

For example, SS32 delivers:

- 30 sets of 30 hot keys for instant play of jingles and effects.
- Cart walls that play song requests within 1 to 3 seconds.
- Display of last play and next scheduled play dates/times.
- Ripper puts CD music on hard disk digitally in 18 to 28 seconds!
- Easy voice tracking in context in air or production studios.
- Fast "no-dub" production uploads from Sound Forge.
- Phone recorder with audible scrub and waveform editing.
- SS Enterprise supervises 24 stations over the Internet!

For details about SS32 *Invincible*, go to [ss32.com](http://ss32.com) or call toll-free at 1-888-GET-SCOTT.

Shown above is the top-rated "Big Boy" morning drive personality pointing to the SS32 touchscreen at KPWR, Power 106 FM in Los Angeles. For details, visit [ss32.com](http://ss32.com) or call 1 888 GET SCOTT.

## Remote access—equipment requirements

By Kevin McNamara, CNE

Last month, I discussed three methods to remotely access your server—dial-up, extranet and the virtual private network (VPN). This month, we will look at some of the hardware and software required to implement those solutions.

### Security

Extending the accessibility of your company server can prove to be a valuable resource for your employees that spend time away from the office, or perhaps a means to bring timely information to a remote broadcast; but, at the same time, you provide a

prime opportunity for hackers to gain entry onto the network. Whichever remote access solution you decide upon, the first and

most important detail to be considered is securing the network. You have no doubt heard of, or perhaps even have set up, a firewall.

The firewall is a security mechanism used to control access to your network. Most firewalls are hardware devices; however, several software products are available for small networks and individual workstations. The hardware-based firewall has been around for several years, and is also known as a “proxy server” or “gateway.”

Each layer provides services to the other layers immediately before and/or after it. Firewalls generally operate at either the Network or Application layer.

A proxy server is an example of a firewall operating at the application layer. Essentially, a firewall operating at the application layer eliminates the direct flow of data between the network and an outside user. Firewalls operating at the “network” layer route traffic based on the source and destination addresses, as well as the intended port of each IP packet. The definition and use of ports is a lengthy subject but, simply put, it presents “virtual slots” used to map connections between two hosts at the Transport Control Protocol (TCP) or User Datagram Protocol (UDP) levels. Network firewalls permit traffic into a network based on a set of rules that are programmed by the network administrator. The rules determine what type of traffic is permitted on the network and what will be blocked. The current generation of network routers has sufficient intelligence that allows them to be programmed to act as a simple firewall.

### Dial-up access

By far the simplest method for remote access, dial-up access to your network can be accomplished in a variety of ways, depending on the number and location of users that will need to use the network. The most rudimentary method to implement dial-in access would be to add a basic PC workstation equipped with one or more modems and a network card to your existing network. Outside users would dial the telephone line(s) that have been assigned to the modem(s). The login process may vary depending on the type of network operating system and configuration of the host PC. Most dial-in access uses the standard dialer client program that you probably use to dial-in to your Internet Service Provider. You would create a dial location containing the telephone number and protocols for your dial-in number.

Another means to gain remote access would be to use a program such as PC Anywhere or Co Session that would mimic the operation of the PC located in the office as if you were there. One drawback of this method is that someone could watch what you are doing remotely on the office PC and possibly gain privileged information.

Accommodating a larger user base is slightly more complicated and requires either the use of centrally located modem banks or access provided by the telephone company. Modem banks are typically rack-mounted equipment frames that accept plug-in modem modules.

There are several ways to establish remote network access.

The concept behind it is simple: an outside user would first establish contact with the proxy server, which would require the proper authentication, typically in the form of user name and password. Once the user is verified and authorized, the proxy server will then establish a “session” between the user and server. You will recall that the networking model that is in use today is defined by a document known as the Open Standards Interconnect (OSI) and is comprised of seven layers: physical, data link, network, transport, session, presentation and appli-

and of course,

## New commissioners named

By Harry Martin

The White House announced that President Bush will send to the Senate the names of Kevin J. Martin, Kathleen Q. Abernathy, and Michael J. Copps, three long-time Washington insiders, to fill FCC vacancies. In addition, Andrew Levin, telecommunications counsel to the House Commerce Committee, is likely to be nominated by the White House to replace Commissioner Gloria Tristani, who has indicated she will leave by the year's end.

Martin, a Republican, was legal adviser to outgoing Commissioner Furchtgott-Roth. He is currently the Special Assistant to the President for Economic Policy. He also was Deputy General Counsel for the Bush-for-President Committee. Martin will be nominated for a five-year term expiring in June 2006.

Abernathy, also a Republican, is a lawyer who worked in private practice and at the Commission before taking positions in the wireless industry. Most recently, she was Vice President for Public Policy of BroadBand Office Communications; she was formerly Vice President for Regulatory Affairs for AirTouch Communications. While at the FCC, Abernathy was a legal advisor to Commissioner Sherry Marshall and Chairman Jim Quello. Abernathy's term will expire on June 30, 2005.

Copps, who will fill the open Democratic seat, has spent 15 years in the office of Senator Fritz Hollings in a number of positions, including Chief of Staff. Most recently, he served as Assistant Secretary of Commerce for Trade Development and as Deputy Assistant Secretary of Commerce for Basic Industries.

It is anticipated that Martin, Abernathy and Copps will be confirmed by the end of June.

### Third-adjacent channel LPFM restriction added

At the direction of Congress, the FCC has adopted low-power FM station third-adjacent channel interference protection standards. Although the Commission's original LPFM rules specified co-, first-, and second-adjacent channel spacings between LPFM stations and full-power FM and FM translator stations, and co- and first-adjacent channel spacings between LPFM stations, they did not include standards to protect either full-power or LPFM stations operating on third-adjacent channels. Congress enacted legislation last December requiring the Commission to revise its rules to include such standards.

As a result, 653 otherwise technically acceptable LPFM applications filed during the two LPFM windows last year have become short-spaced to existing full power FM and/or FM translator stations operating on third-adjacent channels. The Commission will allow these stations to file minor

technical amendments to move up to two kilometers to bring their applications into compliance with the new rules. These curative minor amendments were to be filed in May.

The Commission simultaneously opened its last two LP100 filing windows for LPFM applications in the states and territories not included in the earlier LP100 windows. The window closed June 15. Applicants from the earlier windows that have third-adjacent channel short spacings of two or more kilometers, and therefore are ineligible to file curative minor amendments, will be afforded an additional later window within which to file major amendments that specify technical facilities that meet the new spacing requirements.

The revised rules also eliminate the portions of the Commission's rules that permitted LPFM applications from pirate radio station operators that had either (1) voluntarily ceased unlicensed operation of a station no later than February 26, 1999 or (2) ceased operation within 24 hours of being directed by the FCC to terminate unlicensed operation. Under the revised rules, an LPFM license will not be granted to any party who engaged in any manner, either individually or with a group, in the unlicensed operation of any station in violation of the Commission's rules.

### Jailed licensee fined by FCC

The FCC recently determined that the licensee of a broadcast station could no longer be legally in charge of day-to-day operations of the station while incarcerated at the state penitentiary. The FCC levied an \$8,000 fine against the licensee for effectively transferring the station before going to jail. This unauthorized transfer resulted from the licensee entering into a management agreement which delegated virtually all decision-making authority over the station's programming, staff and finances as to a non-owner. Although the licensee claimed he was still operating the station from jail, the FCC stated that imprisonment takes away one's role in station operations. The licensee is serving time for insurance fraud. 

Harry Martin is an attorney with Fletcher, Heald & Hildreth, P.L.C., Arlington, VA. E-mail [martin@fhh-telcomlaw.com](mailto:martin@fhh-telcomlaw.com).

### Dateline

All radio stations in the following states, both commercial and noncommercial, must file their biennial ownership reports on or before August 1: California, Illinois, North Carolina, South Carolina and Wisconsin.

July 10 is the deadline for placing in stations' public files their quarterly lists of community problems and responsive programming broadcast during the period May 1 to July 31.

# I CAN DO IT ALL BY MYSELF.

The Yamaha AW4416 is all the studio you need to single-handedly record, mix and master a multi-platinum CD. This digital audio powerhouse comes fully equipped with every feature, specification and extra you could possibly want, including many crucial items our competition inexplicably left out. And it's all integrated with the signature style, performance and innovation that's put Yamaha digital gear in a class by itself. Once again, Yamaha gives you more for less.

**NO DATA COMPRESSION** – THE AW4416 delivers full-fidelity 24-bit or 16-bit audio all the time on all 16 tracks

**.WAV FILE FORMAT** – Files are stored in standard .wav format for ultimate compatibility and import/export ease

**SONIC FOUNDRY® SOFTWARE SUITE** – Acid®, Sound Forge® and Siren Xpress® are included for comprehensive editing

**02R LEVEL DIGITAL MIXER** – Motorized fader automation accompanies an internal digital patchbay, providing infinite routing options

**STUDIO-GRADE EFFECTS** – Yamaha loaded the AW4416 with dedicated 4-band parametric EQ and dynamics on all channels, plus two patchable multi-effects processors

**INSERT I/O** – Patch your analog gear onto any track to augment the AW4416's capabilities

**EXPANDABILITY** – Dual card slots let you add analog and digital I/O options, Apogee® converters or the new WAVES® multi-effects processor card

**YAMAHA CD BURNER ON-BOARD** – CD mastering and backup are always available and easily accessible

**DEDICATED METER BRIDGE** – It's not a pricey option, it's included

**MAXIMUM PORTABILITY** – The AW4416 is small and light enough to carry on location in our new hardshell case\*

**AFFORDABILITY** – Get all this power for only \$3,299\*\*

## **On-air playback and automation**

The innovative phase of on-air playback systems has reached its peak. This year's presentation was composed of further refinements to mostly existing products.

The biggest splash was in free software. Two companies, Arrakis and Smarts, offered free versions of automation software, following a trend that has been used in other industries that rely on computer software. It is likely that more companies will follow this lead with similar specific-feature versions.

Most companies displayed software with additional facility integration capabilities. The Cart Chunk standard, a means to include file data and a hot topic last year, has been adopted by many manufacturers. Other efforts have been made to include or enhance newsroom and production capabilities.

Ad insertion was also a big buzz because of the RIAA and AFTRA items in the news. Most systems can now support some type of ad insertion within their systems. Still other manufacturers were showing multiple stream capabilities and database functions for program-associated data to be sent with webcasts.

# 40,000 Watts Solid State FM Power.

The Nautel Q20/20 comprises two 20 kW stand-alone FM transmitters fully integrated to operate as a 40 kW active reserve transmitter system. For more than 30 years Nautel has built the best radio transmitters by blending solid state technology and innovative engineering design. The Q20/20 provides reliability and peace of mind through built-in redundancies — in all the world you won't find its equal.

#### **Each Q20 features:**

- redundant Power Amplifiers
- redundant Power Supplies
- dual Digital Exciters
- dual IPA & Power Supply
- dual Low Voltage Power Supplies
- 68% over-all efficiency

*Simply the best engineered transmitters*

# NAB 2001: A RADIO ODYSSEY

## Transmitters, towers and antennas

By John Battison,  
P.E., technical editor, RF

Discussions with FM engineers unearthed concerns about radio's future when considered with reference to streaming, DAB/IBOC, RBDS, satellite

IBOC readiness was a common discussion point among antenna exhibitors.

radio, and new applications of some laws of electronics such as the Crossed-Field Antenna and the EH Antenna.

Dielectric's 20MHz bandwidth FM antenna, designed for tower-top mounting, made its appearance this year.

A rather solid and unobtrusive device received a lot of attention this year from

antenna manufacturers. Combiners, essential to hybrid IBOC operation, were displayed in all shapes and sizes, and varying claims of low insertion loss from companies such as Shively and ERI.

Andrew displayed a new coaxial cable, which uses an improved, corrugated center conductor that avoids center-conductor scoring caused by cable expansion and contraction.

Last year's NAB was full of anticipation regarding the CFA, and we had hopes for a high-power test in the Isle of Mann, but the tests have been delayed.

The AM transmitter field had an entry from Harris in the form of the 3DX50. This transmitter has a completely new design.

Nautel showed a solid-state 60kW AM IBOC transmitter with eight very efficient compact modules in the PA stage.

Broadcast Electronics' contribution this year was the 20kW solid-state transmitter, which includes a combiner and an innovative control system.

## Satellites, STLs and RPU's

By Hal Kneller, CPBE

The hot item of discussion for radio propagation was not terrestrial distribution, but rather the upcoming satellite radio services. Both XM Satellite Radio and Sirius Satellite Radio will begin their services this year.

The satellite news for stations is that SEDAT (*Spectrum Efficient Digital Audio [satellite] Transmission*) has been deemed not-so-efficient and was to be terminated at the end of

# NAB2001: A RADIO ODYSSEY

May, ABC Networks will migrate its remaining full-service satellite formats to Starguide III.

Public Radio Satellite Service (PRSS) unveiled to NPR affiliates a new concept to store and forward programming on an as-needed basis, featuring a user interface and scheduling/programming system to replace the

IBOC digital broadcasting was on the radio agenda. Ibiqity offered a van demonstration on and off the show floor.

OS-2-based SOSS, with the possibility of returning programming via Web FTP. This also holds promise for the many commercial networks distributed by PRSS.

On the STL and RPU side, Moseley has added a TL backup capability to its Starlink SL9003Q 4-Channel linear STL and showed a (non-portable)

450MHz digital RPU system, the Aries 400S (see *Pick Hits*, page 43).

Marti Electronics unveiled an RPU transmitter, the SRPT-40A, which features a new synthesizer, more powerful RF amp and a new front panel, including reflected and forward power metering. Also shown was a new analog composite STL transmitter, the STL-20C/950. The STL-10A features a new 10W amplifier along with a new front panel. Also shown was a new Cellcast for digital systems for use with digital cellular phones and overseas. It includes a POTS port as well.

Energy-Onix bills its new TeleLink as "the world's only reliable STL that utilizes the Internet." TeleLink requires at least a 128kb/s connection and can have one studio unit feeding multiple transmitter sites at great distances.

Bext is the exclusive broadcast representative for Breezecom (wireless equipment) and showed a TL equivalent 2GHz spread-spectrum RF link.

By far, IBOC digital broadcasting was on the radio agenda most frequently, and it was talked about the most at the many coffee klatches and in exhibitor booths. While NPR has an official "no official" position on it, NPR staged a two-day pre-NAB seminar at its Public Radio Engineering Conference almost entirely devoted to IBOC.

## The Perfect Arrangement for Your Audio

Digital doesn't have to mean difficult. With Logitek, your studio wiring and configurations are beautifully simple - and completely flexible. Combine analog and digital sources easily and control them from anywhere. Centrally locate all of your audio sources, share them throughout your facility, network your audio with high speed optical connections and easily manage your audio distribution, routing and mixing.

Find out how at 800.231.5870 or [www.logitekaudio.com](http://www.logitekaudio.com)

# NAB 2001: A RADIO ODYSSEY

spend more time thinking about the quality of your material, instead of worrying about finicky equipment.

HHB showed the Portadisc MDP500 minidisc recorder. It has a professional-grade minidisc transport, and the unit boasts many of the features found in a rack-mount equivalent, such as analog and digital I/O and a parallel remote control.

Marantz offered the PMD-690. It uses ATA-type PC cards or flash memory PC cards with an adaptor. Recordings are saved as .mp2, .bwf or .wav files.

Denon is marketing a portable recorder that uses flash memory. The DN F20R has XLR balanced inputs and RCA unbalanced inputs and outputs.

Sonifex has added features to the Courier. Editing is possible with a jog wheel and LCD screen built in.

The handheld Nagra ARES-P, displayed last year, places all the transport functions at the user's fingertips.

Digigram also had its version of the recorder, the RCX220.

The Orban OpticoDec line includes one model with an audio recorder, in addition to its audio encoding and streaming capabilities.

As is so often the case, broadcasters continue to benefit from new technology brought about by rapid advances in computing and data storage.

## Test & measurement

By Doug Irwin

The explosive use and integration of the AES format in radio broadcast facilities has prompted several manufacturers to get in the game by building test equipment especially for AES signals.

Graham-Patten introduced an addition to its SoundPals line called

the DTG-1. This unit is a small digital waveform generator with AES3/AES3-ID outputs. The audio signals are switch-selectable and include sine waves at six pre-set frequencies.

Dorrough introduced the TG-10A, a waveform generator with digital and analog outputs. With direct digital synthesis, the TG-10A generates accurate, stable and repeatable waveforms.

Prism Sound has introduced the D-Scope III digital/analog measurement system. This system uses a laptop or other PC for the user interface.

NTI, Neutrik Test Instruments, unveiled the Digilyzer DLI, which joins the Minilyzer MLI and Minirator MRI. This handheld device measures and evaluates digital signals.

Audemat has released the FM-MCI, the upgrade from the established line of RF quality measurement tools. Also introduced was the Goldenangle, a multiple FM receiver that automatically monitors the quality and continuity of up to 40 FM signals.

# Flex-Studio

Modulux is the #1 selling furniture system

- One Size fits all modular design
- Assembles quickly & easily in minutes
- Highest quality laminates & wood
- World famous Modulux cabinetry
- In-stock for immediate delivery

The Modulux Flex-Studio is a complete modular studio package that can be configured in dozens of different ways to meet nearly any studio design. It can be assembled left or right handed as well as in all of our standard configurations: Short L, Long L, and Unbalanced U. Far superior to custom cabinetry, Modulux engineered studio systems are precision factory mass manufactured. Quality, strength, durability and appearance are all improved over custom built cabinets.

# LOOKS LIKE WE'VE UPSET THE COMPETITION. AGAIN.

**INTRODUCING  
THE ALL NEW  
32KD DIGITAL  
AUDIO NETWORK  
FROM SAS**

And really, this should come as no surprise.

Consider our fifteen years of industry experience designing and producing intelligent audio products for radio broadcasting.

Consider our long-standing commitment to listening to your needs and ideas—and responding.

Consider the all new 32KD Digital Audio Network.

This modular, digital-core routing system processes more audio, routes more signals, and provides more user control than any other system in its class.

At any given moment, routing, mixing, signal processing, IFB, mix-minus, and more, run simultaneously without conflict. And all this functionality is readily accessible via PC or dedicated control panels—just the way you like it.

For more details about the impressive capabilities of the 32KD, give us a call or visit our web site.

SAS. Doing more for radio. Again.

# NAB 2001: A RADIO ODYSSEY

## Microphones

By Doug Irwin

Radio is discovering the joys of condenser microphones. There has been a proliferation of new models over the last several years, many of which are in the price range that can be justified at a radio station that has already invested

The busy show floor offered a wide array of products to tempt even the most casual observer.

heavily in its facility and air chain.

Neumann displayed the TLM 103 and the TLM-193, both relatively inexpensive condenser mics. The KMS105, originally designed for hand-held use, was also shown for on-air use.

AKG has several condenser microphones in its line that are within most radio budgets, including the the C4000B and C 4500-BC.

Audio Technica has an extensive line of inexpensive condenser mics. The very inexpensive AT 3525 is followed by the AT 4047, the AT 4050 and the AT4060 tube.

If your comfort level lies more in line with the well-known dynamic microphone manufacturers, Shure has the KSM32SL, and Electro-Voice has the RE1000.

Sennheiser has an extensive line of wireless microphones, starting with the 100 Series UHF line up through the top-of-the-line 5000 Series. Additionally Sennheiser offers the 1000 Series, using digital modulation techniques.

LBP unveiled the Silent Mic Boom, which quiets a traditional design.

## FUTURE PROOF

### ANALOG OR DIGITAL?

### ASI4215

- Balanced analog and AES/EBU or S/PDIF I/O
- Four play streams and one record stream
- PCM or MPEG Layer 2 compression
- Independent sample rates and formats
- Windows and Linux drivers

Need analog today but digital tomorrow? The multi-stream ASI4215 sound card from AudioScience has both. It combines the flexibility of independent sample rates and compression formats with a choice of balanced analog and AES/EBU or S/PDIF digital I/O. Combine this with DSP based MPEG compression for minimal CPU loading and maximum responsiveness. With the ASI4215, your station automation system is ready for action, now or in the future.

Sonic Excellence

## Wired audio transport

By Kent Kramer, CBRE

Orban has entered the audio codec market with the Opticodec 7000 and 7400. The 7400 is a 2RU codec that supports a possible six ISDN 'B' channels depending on the configuration.

The Opticodec 7000 is a portable codec that supports many of the same features, but adds a waveform editor with full tape transport controls and tapeless recording via PC flash memory cards.

Harris Intralex showed the Intralink-IP. Shown last year as a concept product, the Intralink-IP will ship later this year. The Intralink-IP provides a bi-directional audio or data path over a 10/100Base-T network.

# NAB 2001: A RADIO ODYSSEY

Comrex is now shipping the GSM module for the Matrix codec.

In addition to its other codecs, AETA Audio demonstrated the Scoop E-Z. The Scoop E-Z has a two-channel mixer and operates on POTS, ISDN, GSM and satellite (Inmarsat).

The Telos Zephyr Xstream, Xstream MX and Xstream MXP were intro-

A tour of the show floor provided many opportunities for informative discussions.

duced (see *Pick Hits*, page 42). The Xstream includes all of the original Zephyr functions and adds new features: MPEG 2 AAC, IP/Ethernet connectivity for remote connectivity for remote control, software upgrades and audio streaming and DSP audio processing (in the MX and MXP only) based on the Omnia audio processor. The

Xstream is also capable of auto negotiating the algorithm of incoming calls.

Software Authority presented version 5.0 of its Zephyr Remote software. It also supports the Xstream codecs.

JK Audio showed several products aimed at simplifying remote broadcasts. The Remote Mix Sport now features a wireless telephone interface. Wireless phone connections are possible for owners of older Remote Mix products. The newly introduced Daptor One converts the headset jack on a cellular phone to an RJ-11 jack for connection to any of the Remote Mix interfaces (see *Pick Hits*, page 42).

Musicam USA, manufacturers of the CDQPrima codec series, introduced the Voyager, a POTS codec capable of low delay (100ms) with bi-directional 15kHz mono audio at bit rates as low as 24kb/s. Musicam USA is now the exclusive North American distributor of the AudioTX Communicator software codec. Operating on any modern laptop with a sound card, the AudioTX Communicator can communicate with any other codec via ISDN.

Audio Processing Technology showed the full duplex, multi-channel, multi-algorithm audio codec, the WorldNet Rio-X21.

now networkable over a 1GB optical fiber and can be networked with up to 31 additional engines.

Telos Systems was ubiquitous on

Product demonstrations were of great interest to many show attendees.

the radio show floor with the SmartSurface studio controller (see *Pick Hits*, page 40). SmartSurface looks like a 16-channel console, but it's a control panel for audio routing sys-

tems that have mixing and processing built in, such as the SAS 32000 and 64000 series audio routers and the Computer Concepts Epicenter.

Wheatstone, in addition to highlighting its Bridge 2001 Digital Audio Network Router, showed the A2000 linear audio console, a 23-channel modular analog console designed with flexibility and features of larger consoles without a larger price tag.

Wheatstone also highlighted two new consoles from Audiotronics, the 2600, a 12-input, modular analog console that fits tight spaces and tight budgets, and the ALM-12d (amazing little mixer) digital console, a low-priced, 12-channel digital audio console that combines the functions of a small digital audio router and a full-featured audio console.

Harris/Pacific Research & Engineering had the BMX Digital console. Designed for large and major-market installations, it features twice the mix buses as its analog counterpart. The

BMX Digital is available in frame sizes of 22, 30, or 38 inputs and is fully modular.

Arrakis Systems displayed its Revolution audio console, which can operate either as a digital or analog console. It offers all the standard busses, muting and controls in a 12 or 18-channel mainframe.

LPB again showed the Blue 5C console, which is ideal for small broadcast studio installations.

On the analog side, Radio Systems demonstrated the Millennium consoles, and Ward-Beck displayed the Renaissance R2K console

## Digital audio workstations

ins for processing and effects continue to be the competition points. This year, portable hardware was everywhere. The other major feature many manufacturers were touting was Windows 2000 compatibility.

Manufacturers such as Digidesign (Pro-Tools) and Syntrillium (Cool Edit) have provided their base software at reduced cost, or even for free, and are charging a-la-carte for plug-ins and upgrades as necessary.

In the SadiE4 system software, used by the RAD A, SADIe 24-96 and the Artemis systems, Cart Chunk support has been added. This allows the system to interface to BE's Audio-vault, BSI's WaveStation, ENCO's DADpro32, Pristine System's Rapid-Fire and Scott Studio's SS32.

Sadie added support for AES31. Also introduced was the RADia Platinum.

Fairlight has introduced a Plug-In Manager, which allows third party plug-ins to work with their software.

Media Touch unveiled the iMediaEdit, which addresses the need for a low-cost editor that is easy to use. iMediaEdit runs in Win98/NT/2K and uses any Windows-compatible sound card. It features single button record, play, and stop commands using the function keys at the top of the keyboard.

## Interfaces, wire, cable and routing

By Jim Pauzzi, CBT

### Interfaces

Sound Devices showed the USBPre 1.5, which takes an analog audio input and converts it to USB for connection to your laptop (see *Pick Hits*, page 40). It also has S/PDIF outputs in case you'd rather record to DAT. It has multiple inputs, with two balanced mic inputs, two balanced line inputs and two unbalanced tape inputs.

Radio Design Labs (RDL) had numerous new offerings including the FP-MP1 mic pre-amp and the FP-PEQ3 three-band parametric equalizer.

Broadcast Tools debuted several items: the Time Sync and Time Sync II (see *Pick Hits*, page 41), the AVR-8 voice response alarm announcer and the BOR-4 Box O' Relays.

SBS introduced a modular rack-mount system called FlexRack, that includes modules for signal conversion, a silence sensor, and a gain amp. More modules are being developed as well. Also shown was the FlexDA matrix distribution amplifier.

### Wire, cable and routing

Belden has marketed its CAT6 MediaTwist cable as its annuity product capable of carrying any signal a radio station might need to route—now

and in the future. Also shown was DataTwist, CAT6 cable.

Gepco displayed the 5596 extended distance AES3 audio cable, capable of reliable transmission 60% farther than other types of twisted-pair cable.

Neutrik showed the EtherCon ruggedized RJ-45 data connector, ideal for harsh and demanding environments.

Wheatstone displayed the Wiremax studio wiring interface system. Designed to act as a centralized connector interface between Wheatstone

consoles and studio sources, pre-wired interface cables connect the console to the WireMax interface frame, which would most likely be mounted underneath the audio

developing the AirTools audio routing system. This modular system places smaller rack-mount units wherever they are needed.

Sierra Automated Systems (SAS) debuted the 32KD digital audio router (see *Pick Hits*, page 40).

NAB 2001 offered an abundance of information and useful products to all in attendance.

console. Also shown was the Bridge 2001 router (visit the Demo Room for more info).

Symetrix discussed its plans in

## Audio processing

By Chris Scherer, editor

Aphex demonstrated the 2020 Mk II, the successor to the original 2020. It now has a dual-band optical pre-emphasis limiter, overshoot-compensated low-pass filters and a dual-output stereo generator with RDS interface. Also on display was the 1100 tube mic preamp, a two-channel mic preamp.

Eventide announced the BD960 profanity delay replaces the BD941/942 units. It adds the ability to cover objectionable material with a pre-

recorded item, like the old cart-cover systems. Also shown was the Eclipse Harmonizer, which includes a full complement of pitch change, reverb and special effects program presets in 1RU.

Last year, IDT unveiled the DVP-FM. This year, the line has been expanded to include the DVP-AM and DVP-Web, designed for the specific applications. Also new to the IDT line are the Digital Encoder Plus, and FM stereo generator and limiter, the Digital Band Processor, a four-band processor with adjustable cross-overs, and the Virtual Voice Processor, a FET process mic processor.

Inovonics introduced the Omega\_FM is a software-based, four-band digital audio processor. It includes a stereo generator.

Omina displayed the Omnia-6. It now meets the BS 412-9 for European transmission standards. Also shown were the Omnia-3, Omnia.fm and Toolvox mic processor.

Orban has release software version 1.0 for the Optimod 8400, which

# MAGER SYSTEMS, INC.

The Best in Sound Furniture

# NAB2001: PICK HITS TEN SHINING STARS

Reported by Cindy Holst, associate editor

Each year at NAB, 10 Pick Hit winners are selected by a panel of professionals working in the field. All are industry experts. All selections were made independent of the magazine's editorial staff. The quality of the judging ensures each trophy winner meets the criteria of providing an innovative product that addresses a significant issue in radio technology. These 10 products outshone the rest at NAB2001.

For complete rules governing the Pick Hits selection process, see page 68.  
The list of judges can be found on page 43.

Mixing control surface

## Telos Systems

▼ **Smart Surface:** A control system designed to exploit the capabilities of mixing/routing engines and computer-based audio applications. Bearing a slight resemblance to traditional on-air consoles, SmartSurface provides many

familiar controls to operators, while providing new functions. By integrating management of most devices used in the radio studio during on-air or production activities, near-complete control is provided for mixing, routing, playback, recording, editing, phone control, remote (codec) operation and more.

Mic interface for computer audio

## Sound Devices

▲ **USB-Pre 1.5:** A complete, portable audio interface for hard disk recording. Designed for USB-equipped Windows and Mac OS computers, USBPre 1.5 adds S/PDIF input and output to Sound Devices' USBPre Digital Audio Interface. USBPre 1.5 includes all the connections required for 24-bit audio acquisition with notebook or desktop computers. Features include: two active-balanced microphone preamplifiers with 48V phantom power, 24-bit A/D converters, instrument DI, line-level inputs, front panel level metering, with headphone monitoring of both analog source and computer audio. USBPre is completely bus powered, eliminating batteries or external power supplies.

## Master clock systems **Broadcast Tools**

► **Time Sync and Time Sync II:** Featuring an SIG LED and relay, furnished as fail-safe for either loss of satellite or power and invalid time, the Time Sync provides three separate GPS time referenced outputs. The first SPDT relay pulses once every 15 minutes. These times are programmed for 13:00, 28:00, 43:00 and 58:00 after each hour. The second SPDT relay pulses at the top of the hour. The final output is an open collector with a 100 ms pulse every second. The Time Sync II provides four separate GPS time referenced outputs. The first three are identical to the Time Sync; the fourth output is a 4800-baud, RS-232 serial port providing UTC time in HH:MM:SS format. Both units are supplied with a Garmin 12-channel GPS receiver with embedded antenna. The receivers are supplied with a 15-foot cable, longer cable lengths up to 100 feet may be used. Time Sync II is equipped with an optional RS-485 receiver input, allowing up to 1000-foot separation from the receiver.

# NAB2001 PICK HITS

Zephyr Xstream is a rack-mount-style transceiver specially designed for use with a single ISDN line or other low-bitrate transmission paths. Two-channel flexibility over a single ISDN circuit or two synchronous links can be used to transmit and receive 20kHz stereo audio to and from a single location, or two mono channels to and from separate locations.

## ISDN transceiver **Telos Systems**

▼ **Zephyr Xstream:** The newest member of the Zephyr family of ISDN codecs, Zephyr Xstream introduces MPEG4 AAC-LD coding, the newest compression algorithm from MP3 inventor Fraunhofer Labs, for Layer-3 audio quality with transmission times so low. Zephyr Xstream is fully backward-compatible with the original Zephyr. Zephyr Xstream is a rack-

## Wireless telephone adapter **JK Audio**

► **Dapter One:** This little black box converts the 2.5mm headset jack on your cell phone to a modular jack. This RJ-11 jack connects directly to any JK Audio RemoteMix series mixers. You will continue to use your wireless phone to dial or answer the call, but you will use the microphone and headphones

plugged into your RemoteMix during the call. Dapter One does not require any batteries or power supply. It contains a mini hybrid circuit that converts the earpiece and microphone signals into a balanced RJ-11 phone line signal. Mic signals from the RemoteMix are sent into the wireless phone, while the earpiece signals from the wireless phone are sent into the RemoteMix Headphones. The hybrid circuit minimizes crosstalk between transmit and receive.

## Digital remote data link Moseley Associates

► **Aries 400S:** The high spectral efficiency of Aries 400S allows users to send 64 kbps or 128 kbps data over narrow bandwidth 20 kHz or 30 kHz channels. An industry standard V.35 interface provides a seamless connection to an ISDN codec or data multiplex. A built in 200 to 9600 bps service channel is ready to connect to your remote control. Optional MPEG III audio modules facilitate the transmission of stereo or mono audio over the link. Features include a frequency range of 330MHz to 512MHz, RF occupied bandwidth of 25kHz and 50kHz, user data rates of 64kbps and 128kbps, and modulation type 32QAM, 16QAM, QPSK. Additional features include XLR female and XLR male audio input connectors an MPEG Layer II Option and a dynamic range 90dB static encoder/decoder.

# No wait for Waitt

By Chriss Scherer, editor

*Eleven studios for six stations  
in three months?  
No problem.*

**W**hen the green light was given for the Omaha stations owned by Waitt Radio to relocate to a new facility, there was an abundance of ideas and work, but not time. Maintaining the current facilities, and planning and building the new facilities, is a problem that many facilities face. From the beginning, it was decided that the new facilities would be functional and still be a showcase.

Omaha is Arbitron-ranked 75<sup>th</sup> in market size. While not a large market, this installation shows that large market ideas and methods can be carried out in smaller markets.

There are six stations in the facility KQKQ-FM Sweet 98, KZFX-FM The Fox, KCTY-FM The City, KKAR-AM News/Talk, KAZP-AM ESPN Radio and KOIL-AM Radio Disney. There

are a total of 11 studios, including six air studios, four production studios and one general-purpose studio. Extra space was allowed, including a room for a future studio. The studios are built around a central news-gathering and continuity/production area.

Before the move, the studios occupied several locations around Omaha. This project consolidated the operations. What is truly remarkable about this installation is that the construction project was completed in only three months. This was possible through careful planning and by efficient use of outside services, like those of system integrator RDA Systems

### Project preparation

The new studio building was formerly occupied by a cable company which helped because electrical ser-

The control rooms have similar layouts but are customized for each individual station.

vice was already in place. Satellite dish clearances—both physical and zoning—were already okay. As a bonus, a generator and so a transformer (power balancing) were already installed in the building.

An added benefit of the facility location is that it is on the main road through downtown Omaha. This provides easy visitor access and provides a high-visibility location. The studios occupy a three-story building. The

# Waitt Radio

rack room and generator are on the first floor. Operations and news offices, and the studios are on the second floor. Administration and sales offices are on the third floor.

To speed the construction time, the project was prewired by RDA Systems in St. Louis. The RDA Systems prewiring services, called Pre-Completion, allowed the bulk of the wiring and furniture preparation to be done before it was delivered to the studio site. Construction could begin in Omaha while cables were prepared and terminated in St. Louis. This process has the added benefit that building contractors and broadcast engineers are not in each other's way as the work progresses. It took seven weeks to prewire the racks in St. Louis.

Once the facility walls were completed, the equipment, furniture and prewired systems were delivered, and

**Audioarts R-60 consoles are the center of all the control rooms.**

the process of putting all the pieces together began. Some of the equipment in the facility was purchased new for the move. Some equipment was brought from the former studio locations and re-installed. The installation took five weeks.

## In the rack room

The master control room consists of 10 racks, with a 16-foot long main distribution wall. A six-server, 16-workstation AudioVault automation system is housed in master control. Master control is also equipped with an SAS 64000 routing switcher, most of the air chain equipment, telephone systems, 13 distribution amps, and eight satellite receivers. A separate room, located near the base of the on-site tower, houses two racks

with STL transmitters and RPU receivers. This was done to reduce the length of the coaxial feed because audio wire is cheaper than coaxial cable and is easier to route. Also, audio signals do not suffer the same losses over distance as RF signals.

All Audio Vault, SAS router, distribution amp and satellite wiring was brought out to the main

distribution wall and punched to Krone 6639 termination blocks. The master control room layout did not afford as much space on the main distribution wall as RDA and the stations' engineers wanted, but the Krone have twice the wiring density of a standard 66 block, while occupying the same footprint. The Krone blocks also have an added feature of a built-in patching capability. A special jumper can be inserted to either bridge or break the connection.

Master control has 10 equipment racks. The first five contain station broadcast equipment, with each rack being dedicated to a particular station. KAZP and KOIL share a rack. These racks also contain common equipment such as the SAS router, satellites and DAs. The last five racks house all of the AudioVault equipment.

## Where do You Need to Record Today?

### With Sound Devices USBPre, the World is Your Recording Studio

You've imagined that someday, someone would build a small, simple box that does everything needed for hard disk recording. That day is here.

Introducing USBPre. Very big performance in a very small package. It is unquestionably the easiest and most direct digital audio interface for your computer. Plug the USBPre into your Mac or PC's USB port with

one cable and you're ready. Start recording. Start streaming. Start ripping!

Features include: 24-bit A/D converters, two channels of studio quality mic preamps, 48-volt phantom, high-impedance low-noise instrument DI, line inputs, headphone monitoring, all powered by your computer.

 **SOUND DEVICES**

# Waite Radio

Ten racks face the distribution wall. Most of these racks were prewired by RDA Systems before being shipped to Omaha.

These racks each have a 20-amp service. The AudioVault servers also have redundant power supplies that are fed from their own UPS. This extra precaution makes sense, since the on-air play-

back system is a crucial component of the on-air operations.

Each on-air studio has a 6x1 switcher. The outputs feed the audio processing and STL link for each station. The switcher inputs are the respective studio console program output, studio console audition output, and the three outputs from the AudioVault. One station carries the Disney format, and it

has the three AudioVault outputs summed into one switcher input, since a console is not needed during most of the automated programming schedule.

The 6x1 switcher connections are extended to punch blocks on

the distribution wall. For additional flexibility, the Krone blocks include a patching function, so anything can be routed into a station's airchain.

In addition to the spare inputs on the SAS router, a tieline feed is routed back to each control room (as a console input) from the rack room, so any source can also be patched directly into a console as needed. As installed, the SAS router has a capacity of 128 mono inputs and 128 mono outputs. Additional capacity is available.

The stations' STLs are RF links with equalized phone lines for backup.

## The studios

In all but two small production rooms, new Audioarts R-60 consoles were installed. Other standard studio equipment included CD and mindisc players, cassettes, Cybex KVM extenders for the AudioVault, Symetrix 528 mic processors, and RDA Sys-

## Ad insertion

By Ken Nosé

**A**d insertion systems address the problem of matching advertisers with an audience when broadcasting on the Internet. In the simplest terms, current ad insertion systems take the existing station audio, interrupt it, and replace it with new content for the Internet audience. The people who listen to a radio station on the air hear one set of ads, and listeners on the Internet hear another set of ads. Ad insertion systems are designed to work with your radio station as is for the most part, so you don't have to dedicate any studio resources to programming a separate Internet feed.

stream is one of the biggest technical hurdles that ad insertion systems have to deal with. In some vendors' systems, the ad substitution happens entirely in the audio domain. In this case, the ad insertion system is typically a piece of hardware located at the radio station that takes a feed of the station audio and receives control information from the station automation software. It is basically a smart audio switcher that stores the Internet-only ads locally and has some intelligence of its own in selecting which ads to play. Its output is an audio feed of the station's on-air signal with different ads for the Internet

audience dropped in at the appropriate times. Because it is typically a self-contained piece of hardware, timing of transitions can be exact so that the Internet listener always hears smooth segues between the stored ads and the station audio.

Other systems work entirely in the software domain, like the example in the diagram. The client software used by the listener plays the stream of your station audio normally, and then switches to playing replacement ads from stored files when instructed to do so by the ad insertion system. When the replacement ad files are done playing, the client software reconnects back to the live radio stream. Because the client must switch between sources, and the stored ad files may come from anywhere on the Internet, the issue of lining up the replacement ads on top of the station's audio becomes trickier. Unpredictable network latencies in retrieving ad files, and in reconnecting to the live stream when the ad files are done playing, make it more difficult to maintain smooth transitions.

Most of the big name players don't currently provide a mechanism for switching between sources without some interruption in the audio. Software-based ad insertion systems use different mechanisms on both the server and player sides to address this shortcoming. Some ad insertion systems have the listener download additional software that does local ad caching, or uses mechanisms for pre-buffering ads at the server to minimize delays switching between the files and the live stream.

*Ken Nosé is chief software architect of NeoSonic Industries, Cleveland.*

**Ad insertion systems can take existing station audio, interrupt it, and replace it with new content.**

In operation, an ad insertion system gets cues from station automation software so that it knows when the start and end of an advertisement block takes place. The ad insertion system can then switch over at the start of an advertisement block and substitute ads for the Internet audience in the place of the local on-air ads. The system has the smarts to queue up ads that fit exactly within the time available for the ad block, and to do so in a way that the Internet listener doesn't suffer from rough transitions into and out of the inserted ads.

Managing smooth transitions between the live station audio stream, the stored ad files, and back to the live

## Digital audio console Auditronics

**ALM-12d:** Combines the functions of a router and an on-air audio console into one package. The ALM-12d lets any input source be routed to any fader or monitor pot. Features include twelve faders plus two caller faders, four mic preamps, control room and studio monitoring, and built-in cue speaker and headphone amp w/concealed output jack. A complement of high-end features includes bright LED dot-matrix source displays above faders and monitor pots, and 24-bit A/D and D/A inputs and outputs. Its AES3 inputs have sample-rate converters, enabling them to work with virtually any digital source. Up to eight external source machines can be controlled via channel on/off switches (all opto-isolated). The dual-fader phone channel's caller tools generate automatic mix-minuses, and any of the console's four mix-minuses can be programmed to be pre- or post-fader.

## Transmitter control enhancement

### Armstrong Transmitter

**Transmitter LCD controller:** This multi-purpose tool stores the last minutes of data from all transmitter parameters. Non-volatile storage is continuously updated, giving an accurate record of the last minute of operation. This is designed to minimize trouble-shooting time in the rare event of an alarm or failure. In the event of a main controller failure, the LCD controller takes control of transmitter serving as a back-up to the main transmitter controller. An internal modem allows the LCD controller to dial out to alert of a fault condition. It can also be used for remote control and data acquisition. The LCD display screen allows instant access to all readings and functions. Software provided with the transmitter allows you to dial into the LCD to verify the transmitter's operation, to receive detailed current readings or to review the last moments of operation before an alarm or fault condition.

Audio interface boxes  
 Sonifex

▲ **Redbox Series:** New Redboxes include three stereo matching amplifiers for interfacing domestic or semi-professional unbalanced equipment, such as a CD player, to professional balanced line levels: RB-UL1 single unbalanced to balanced converter, RB-UL2 dual unbalanced to balanced converter, and RB-UL4 quad unbalanced to balanced converter, in 1RU. The RB-MA1 single microphone amplifier consists of a low-noise microphone pre-amplifier for converting mic-level signals to line level, or for driving long lines from microphones to mixing equipment.

The RB-SM1 single stereo to mono converter converts a fully buffered and balanced mono line output from a stereo input. The RB-SD1 silence detection unit is used to monitor an unattended stereo studio feed. Remote inputs and outputs can be used to signal alarm conditions and to control the unit. The secondary input signal can either be in the form of a recorded message or a previously recorded program.

NETWORKING SOLUTIONS FOR DIGITAL AUDIO AND REMOTE MANAGEMENT

**Stereo STL**  
**Energy-Onix**

**TeleLink:** The system consists of an enhanced encoder and decoder that permit wideband, reliable transmission over the Internet using a wideband, dedicated connection to and from the Internet. Broadcasters use the free highway to deliver a noise-free stereo program with stereo 22kHz response. The only operating cost of this system is the charge associated with the wideband Internet connections. The decoder of the TeleLink contains smart system, which in the event of an Internet overload or server overload, will reset the equipment in five seconds. If audio is not present within 20 seconds, a local pre-recorded fill from the internal hard drive will serve as the program, and an appropriate pager will be notified. The TeleLink hardware consists of two computers with software designed for the Internet.

**Internet player  
RCS**

► **iSelector:** A fully branded Internet player that harnesses the smarts of Selector with the power of the station's listeners. This software is not just another web-based product to stream music, this is a true extension of the radio station. iSelector lives right on the listener's desktop allowing him to listen while he works.

Selector creates a playlist for each listener based on the radio station's Selector. The listener communicates with iSelector while he listens by hitting iSelect buttons, which let the listener customize and shape the sound of the station. The longer the listener spends with iSelector, the better the station gets. When the station adds new music to its Selector, the new songs appear in iSelector—just like the format. iSelector gives the station ad insertion technology and shows the sponsor's banner synchronized to the audio commercial.

**FastChannel Network**

**adDIRECT:** A service for the distribution and management of print advertising, adDIRECT offers such features as free 24 x 7 technical support; assistance with PDF file creation, setup and output procedures, Internet connection troubleshooting, and emergency ad delivery services; secure and reliable service; and browser-based products, meaning no hardware or software is required to use the system. FastChannel Network members are also entitled to free utilities for automating the process of sending or receiving ads. All users have access to a 45-day archive of ad order data with customizable views and unlimited filtering and sorting capabilities. Data is exportable. AdDIRECT is comprised of adDispatch for ad delivery and adCaster for ad retrieval. FastChannel also offers customers utility applications that interact with adDIRECT to integrate and automate ad delivery.

# FM Simplified

## "David-II" - \$2000

**A SIMPLE, YET REMARKABLY  
COMPETITIVE FM  
PROCESSOR/GENERATOR**

Even 'Goliath' audio processing can't make you Number One in your market. Market share is dictated by attention to demographics and selection of a format and air personalities. Your station's 'signature' is not its 'sound,' it's embedded in its programming.

Each day, the world over, hundreds of "David-II" users prove that a strong, clean, non-fatiguing sound is the best companion to successful programming. With rock-solid PWM processing and digital-synthesis baseband coding, "David-II" more than holds its own against complex and far more expensive FM alternatives. Contact your preferred supplier for a demo at your station.

Active reference monitors

**Hafler Professional**

▼ **TRM8.1 and TRM6.1:** Magnetically shielded and able to be mounted in two different positions by using Omnimount parts, The TRM8.1 is based on Hafler's Diamond Series Transnova amplifier technology. The TRM8.1 is a bi-amped, two-way system offering a free field frequency response of 45Hz to 21kHz. The peak acoustic output per speaker pair us-

ing music as a sound source is 123dB or greater, accommodating the ever-growing dynamic range needs of digital audio playback. Based on the same performance as the TRM8.1, the TRM6.1 two-way bi-amplified active speaker system is magnetically shielded and is based on Hafler's Transnova amplifier technology. The TRM6.1 is a bi-amped, two-way system offering a free field frequency response of 55Hz to 21kHz,  $\pm 2$ dB. The peak acoustic output per speaker pair, using music as a sound source at 1m, is 120dB or greater.

**Broadcast audio processor**  
**Aphex Systems**

◀ **2020 Mk II:** A self-contained FM broadcast and webcasting processor in a single chassis; all functions are

integrated within one interactive, stable and optimized processing framework. Features include a Split-Band Optical Pre-emphasis Limiter, a patent-pending Overshoot-Compensated, Low-Distortion Low Pass Filter and New Processing Algorithms that make the Model 2020 sound even louder and cleaner than its previous generation. The Mk II can be run in dual-mono mode, making it applicable for installations requiring multiple single-channel processing. The Model 2020 is online with an increasing number of webcasters. Because of its new circuits and processing algorithms, the Mk II is suitable for CD and DVD mastering.

**Digital recorder/player**  
**Register Data Systems**

**The Replicator:** The Replicator works with almost any source of equipment, including satellite receivers and telephone autocouplers. With the Replicator it's just as easy to delay Sunday church programs as it is to delay hourly news and commentary. With optional audio switchers, the Replicator can automatically select different program sources for recording. The Replicator can also close relays to select transponders and audio channels on satellite receivers. All systems can record one stereo program or two mono programs while airing another program. Larger systems may record three programs while airing a fourth program. The Replicator can also air a program before recording is complete. Both recording and playback can be pre-programmed with a weekly schedule of events.

## File conversion system Cartworks/dbm Systems

▼ **aptXchange:** Batch mode converts entire libraries between apt-X and WAV effortlessly at speeds of up to 15 times real time. Perfect for studios changing or adding wav format digital audio systems, or popular digital audio editors. The unit supports standard IDAS, DSS, AUD, and other apt-X file types,

as well as uncompressed WAV files and the Cart Chunk standard. Users can exchange audio files between systems from various manufacturers or the Internet. The system runs on standard Windows PCs and uses new SOFT apt-X technology so no ACE100 audio card or other DSP-based hardware is required. Features include negligible coding delay and immunity to multiple encode/decode cycles.

**New Products 2001**

Music scheduling software  
**Micropower Corporation**

◀ **Powergold 2000 v.6.0:** Features include an easier and more powerful Logon window, which automatically stores all data directories you've visited. This is stored per machine. When you click the New button to create a new database, a dialog appears where you can tell Power-

ergold 2000 where to create your new data directory. Internally, Powergold 2000 now uses UNC file paths; you no longer have to map a network drive to a letter for Powergold 2000 to see or use it. Powergold 2000 automatically turns share mode on if you try to log onto a network database. If your Powergold 2000 data resides on a Windows 95/98/ME computer, that data can now be opened by Powergold 2000 from a computer with Windows NT or Windows 2000. Automatic data conversion will upgrade your database to version 6 at startup and/or upon restoring a backup from a previous version.

## Digital audio network router Wheatstone

### Bridge 2001: Features

bi-directional fiber optic or CAT-5 interlocation connectivity, digital-domain AES switching, analog or digital inputs and analog and digital outputs, all in a seven-inch 5RU rackmount digital routing cage. Each cage handles up to 512 simultaneous audio channels on its backplane. The 2001 handles smaller applications, yet offers growth potential via stackable units to upgrade to larger system configurations. Cages can be separated by great distances with many studios connected to a central rack room, providing shared resources yet permitting independently functioning satellite studios. Mixed signal switching is accomplished with a choice of AES digital or analog 24-bit A/D input cards, or 24-bit D/A analog output cards, all of which can be serviced from the front of the cage.

## Switcher tools

Designed by broadcast engineers for broadcasters, our audio and digital audio switchers offer excellent sonic quality, removable I/O connections, contact closures, serial remote control capabilities and flexible mounting accessories.

SS 12-4

Active crosspoint switcher/router with 12 stereo inputs and 4 stereo outputs.

10X1

Passive switcher/router with 10 stereo inputs and one stereo output or vice-versa.

3X2

Active crosspoint switcher with 3 stereo inputs and 2 stereo outputs.

SS 8.2

Active crosspoint switcher with 8 stereo inputs, 2 stereo plus 2 mono outputs.

8x1 DAS

Routes any one of eight AES/EBU digital inputs to 3 common outputs.

SS 3.1

Passive switcher/router with 3 stereo inputs and one stereo output or vice-versa.

ACS 4.1

Active crosspoint switcher with 4 balanced/unbalanced stereo inputs and one stereo output with Visual Audio Level Control.

6X1

Passive switcher/router with 6 stereo inputs and one stereo output, or vice-versa.

SS 2.1/BNC

Passive switcher/router with 2 composite audio, video, or AES/EBU inputs to 2 composite audio, video, or AES/EBU outputs, or vice-versa.

8X2

Active crosspoint switcher with 8 stereo inputs, 2 stereo and 2 mono outputs

SM-6

Stereo mixer with 6 stereo inputs, a stereo output and front panel on/off switches.

SS 2.1/TERM

Passive switcher/router with 2 stereo inputs to one stereo output or vice-versa.

## BROADCAST ENGINEERING CONSULTING SOFTWARE

Longley-Rice over 3-D Terrain

Professional software packages for preparing FCC applications & plotting coverage. For Windows & NT.

- Create "real-world" coverage maps & interference studies with Longley-Rice, TIREM, PTP, FCC & other models using polygon map features.
- Search for AM, FM, TV, DTV, & LPTV channels with graphics oriented programs and FCC databases.
- Plot STL paths in 3-D using 3-Arc second terrain databases...and more!

Would you believe that you can visit a dozen  
markets in an hour without leaving your desk?

If you have the TeleRadio from CircuitWerkes at your stations, you can listen to every radio station in each of your markets.

Old-fashioned air-checks are okay, but they have some real drawbacks. Among them are:

1. You have no control over what is recorded on an air-check. You may be hearing only what someone else wants you to hear.
2. Your own air staffs usually know when they're being recorded and react accordingly.
3. By the time you get an air-check in the mail, it may be too late to respond to the competition.

The TeleRadio beats those problems by letting you listen to both your station **and** the competition in **real-time**. If you have a TeleRadio, you simply dial it up from any phone. As soon as it answers, the internal radio begins playing down the phone line to you. You can control the radio by using the buttons on your phone. It's just like being there! Call us or your favorite dealer for more info.

**BE RADIO** (ISSN 1081-3357) is published monthly and mailed free to qualified recipients by INTERTEC, 9800 Metcalf, Overland Park, KS 66212-2215. Non-qualified persons may subscribe at the following rates: USA and Canada, one year, \$45.00; all other countries, one year, \$60.00 (surface mail), \$100.00 (air mail). Single copy price, \$10.00. Periodicals postage paid at Shawnee Mission, KS, and additional mailing offices. Canada Post International Publications Mail (Canadian Distribution) Sales Agreement No. 0956244. POSTMASTER: Send address changes to *BE Radio*, P.O. Box 12937, Overland Park, KS 66282-2937.

*BE Radio* is edited for corporate management, technical management/engineering and operations and station management at radio stations and recording studios. Qualified persons also include consultants, contract engineers and dealer/distributors of radio broadcast equipment.

Intertec Publishing makes portions of our subscriber lists available to carefully screened companies that offer products and services directly related to the industries we cover. Any subscriber who does not want to receive mailings from third-party companies should contact the Intertec subscriber service department at 800-441-0294 or 913-967-1707.

## PHOTOCOPY RIGHTS

Authorization to photocopy items for internal or personal use, or the internal or personal use of specific clients, is granted by INTERTEC provided that the base fee of U.S. \$2.25 per copy, plus U.S. \$00.00 per page is paid to Copyright Clearance Center, 222 Rosewood Drive, Danvers, MA 01923. The fee code for users of the Transactional Reporting Service is ISSN 1081-3357/2000\$2.25+\$00.00.

For those organizations that have been granted a photocopy license by CCC, a separate system of payment has been arranged. Prior to photocopying items for educational classroom use, contact CCC at 978-750-8400.

Organizations or individuals with large quantity photocopy or reprint requirements should contact Reprint Management Services, 717-399-1900. Microfilm copies of *BE Radio* are available by calling/writing Bell & Howell Info & Learning, 300 N. Zeeb Rd, P.O. Box 1346, Ann Arbor, MI 48106-1346. Phone: 313-761-4700 or 800-521-0600.

## BE Radio Pick Hits Rules

1. Products must be new and not shown at a previous NAB Spring Convention. In some cases, distinguishing a new product from a modified older one is difficult. For "Pick Hits" purposes, a new product is one with a new model number or designation.

2. Products must have some positive impact on the intended user's everyday work. Judges search for equipment intended for use on a regular basis. Products should provide new solutions to common problems.

3. Products must offer substantial improvement over previous technology. Unique circuit architecture need not be included, but some new approach or application must be involved in the product's design.

4. The price of the product must be within reach of its intended users. The judges seek products appropriate to a wide range of facilities.

5. The products must be available for purchase within calendar 2001. Equipment must be on display on the show floor, currently (or imminently) in production, and some type of product literature must be available. Judges take the exhibitor's word on availability dates. Products demonstrated in private showings do not qualify.

6. The Pick Hits Judges operate independently from one another and remain anonymous to everyone including other judges until the selection meeting. This ensures that the products chosen are truly representative of the industry, that the judges were not persuaded in any way, and that the entire selection process is as fair as possible.

7. The editorial staff of *BE Radio* magazine serves only as a moderator during the final selection process and has no influence or decision in determining the winners.

## Leave the driving to us?

By Skip Pizzi, contributing editor

**N**AB 2001 provided the opportunity to see and hear the latest on IBOC digital radio. iBiquity presented demonstrations of off-air IBOC audio reception and a mock-up of what might become a video sidecar to the IBOC receiver. The latter was actually the work of Impulse Radio, which is developing a system that could use the relatively small amount of auxiliary data (including opportunistic bandwidth) in the iBiquity format to feed text and images to a Web browser-like display in IBOC receivers or IBOC-equipped vehicles.

In addition, prototype IBOC-FM receivers

at NAB 2001 presented the digital signal as an *enhancement* feature. Users tune to a station's analog FM signal, and after a few seconds, if an adequately robust IBOC signal is available on the channel, the receiver automatically and seamlessly switches to the digital audio. An indicator illuminates when this occurs, similar to the stereo pilot light, and if multipath distortion or noise is present in the analog signal, these artifacts disappear when the IBOC light comes on. Other-

wise, the audio quality stays about the same.

The user experience is like viewing a thumbnail or a progressive JPEG image on the web – it comes in small or rough at first, then resolution improves after a few seconds. In the channel-surfing world of car-radio listening, this can be considered an efficient use of the digital signal: no need to bother with long channel-acquisition time required for IBOC signal while tuning around, but once a listener decides to stay with a channel, the higher quality kicks in.

### Quantity vs. quality

Downplaying the qualitative improvement of IBOC and stressing the quantitative addition of a visual component could be the right approach to sell IBOC to broadcasters, advertisers, electronics manufacturers and consumers. Broadcasters would have a potential return on conversion investments because a premium upcharge could be levied (or at least a value-add offered) for the visual display of IBOC advertising. The screen gives equipment vendors something to catch consumers' eyes and entice them to purchase.

The Impulse Radio display approach seems right, as it uses an optimized XML subset, and envisions a flexible and adaptive server method that can accommodate synchro-

nous national and local elements in a narrowband environment. But important questions remain: 1) Will this display format be set as a standardized optional element of the IBOC specification, so authoring tools and a wide array of common content can be quickly developed? 2) Will there

be enough bandwidth available to allow the system to work? To help with the latter, pre-caching of content in the receiver would be possible (or more likely,

required), but the frequent channel-changing behavior of most listeners will limit the applicability of this technique.

**There is something fundamentally troubling about a format designed by a unilateral, proprietary group and not driven by an open standards process.**

### The regulatory challenge

The iBiquity model virtually guarantees there will be no growth in the number of audio services provided by IBOC, which some discussion at the NAB 2001 Broadcast Engineering Conference suggested might be a stumbling block for regulatory approval of the format. Even if iBiquity is an appropriate system design, there is something fundamentally troubling about a digital broadcasting format designed by a unilateral, proprietary group and not driven by an open standards process.

Such an approach will favor the interests of the group producing the design; in this case, the constraint of no new audio services is an example. This serves most broadcasters' current needs. (Having gone to great expense to reduce competition via consolidation, why open the band up to more channels?) It's also the driver for most broadcast investments and recent interest in iBiquity, i.e., its defensive value in certifying that new technology will not threaten the less competitive environment that broadcasters have recently crafted. Given this mandate, iBiquity engineers seem to have accomplished their objectives (at least for FM, so far), producing a VHF-optimized, narrowband COFDM-based system that relies on an analog backup channel.

iBiquity may represent the best technology for the job, but without an open standards process that sets requirements and defines an open specification to meet them, we will never know for sure. If the FCC rubber-stamps a format proposed by private interests, it will be neglecting due diligence and abdicating its ultimate responsibility as steward of the public interest. So while the latest IBOC-FM format is looking more marketable, it may be worth waiting a little longer for a proper, and subsequently unassailable, approval process to be set before we starting baking the silicon. 🍌

# Save a Bundle on *this* Bundle

We've broken the price barrier for a high-end DAW! The **Diga ProPack** offers you the functionality and reliability found in large stations. **ProPack** gives you everything you need to compose, produce and manage your audio whether it's last-minute stringer reports, jingles or full-blown multitrack productions.

Here's what the **Diga ProPack** comes with:

- **DigaStudio** rackmounted A/D converter and desktop control console made by **STUDER**
- Intel PIII 800MHz, 256MB RAM, 30GB HD, CD-ROM, 6 PCI slots in a rugged 4U (19") rackmount
- Windows 2000 Professional
- **DigaSystem** software bundle: DataBase Manager Personal Edition and EZ Track 3-track editor
- 15" TFT flatscreen display
- **Digigram** PCX 924 professional I/O card
- Keyboard and mouse

Software application features:

- ✓ Easy to use database application with drag-n-drop
- ✓ Automatic file format recognition & conversion- MPEG, WAV, AIFF and BWF
- ✓ Auto-save and 99-step undo
- ✓ Time correction matches the audio clip length to available time
- ✓ Multiformat clipboard capable of storing both audio and RTF text clips
- ✓ DirectX plugin support, crossfade mixing, looping, auto-duck, scrubbing and available with upgrade to Multitrack Editor

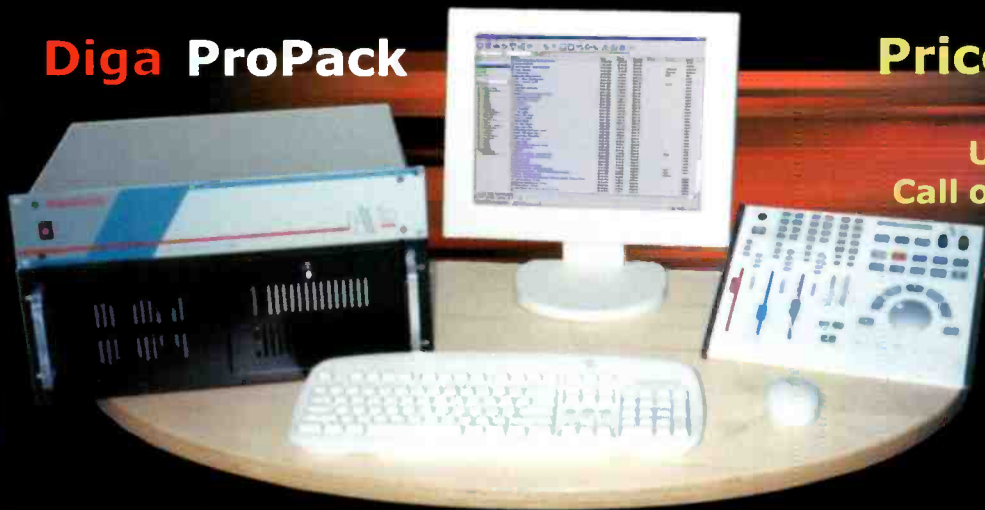

The **DigaStudio** is a combination A/D audio converter and desktop controller console. Designed by D.A.V.I.D. in cooperation with **STUDER**, it features balanced inputs, phantom power and onboard DSP. The desktop controller includes a 3-channel mixer, smooth jog wheel and illuminated function keys.

**Diga ProPack**

**Price \$9995**

## DIGITAL AUDIO NETWORK ROUTER

- *BI-DIRECTIONAL FIBEROPTIC OR CAT-5 INTERLOCATION CONNECTIVITY*
- *ALL DIGITAL DOMAIN AES SWITCHING*
- *ANALOG OR DIGITAL (AES SAMPLE RATE) INPUTS*
- *BOTH ANALOG AND AES DIGITAL OUTPUTS*
- *SERIAL CONTROL AND DISPLAY WITH WHEATSTONE CONSOLES*

THE 2001 MAKES AUDIO NETWORKING PRACTICAL. It's simple to install, easy to learn, and certain to reduce system costs. Compact enough for small applications, yet stackable for tremendous growth potential, it's design consists of 7" rackmount digital routing cages, each capable of handling 512 simultaneous audio channels on its backplane.

Units can be stacked to suit particular card complements (analog or digital input and output cards or optical network cards) but more significantly cages can be separated by great distances and network their audio through either bidirectional fiberoptic links or a single CAT-5 wire. **ONE INTERCONNECT DOES IT ALL:** 64 channels of simultaneous bidirectional digital audio, interstage communication, X-Y controller commands plus auxiliary RS-232 data streams. This single interconnect between your studio and central rackroom can save you tens if not hundreds of thousands of feet of wire in a typical installation.

The 2001's graphic based setup software is intuitive and easy to use, with all the authorization and security levels you could want. And of course we have a full

complement of control panels and PC applications to choose from—all designed for straightforward operation and a rapid learning curve.

With 25 years of experience, Wheatstone has the infrastructure in place to help you build your OWN infrastructure. Contact us for answers.

**MIXED SIGNAL SWITCHING** is easily accomplished with a choice of AES digital or ANALOG 24-bit A>D input cards, and of course 24-bit digital or 24-bit D>A ANALOG output cards, all of which can be serviced from the front of the cage. All signals are routed entirely in the digital domain.
