A NATIONAL ELECTRICAL SERVICE

Western Electric

Western Electric

A Service in Distribution that Has Tamed the Geography

Through our chain of Distributing Houses, we have tamed geography for the buyer of quality electrical supplies. Whether the item desired is a fuse or a motor; a product made near by or a thousand miles distant — our nearest office stands ready to

see that the desire is fulfilled—promptly.

But Western Electric Service goes farther than prompt delivery. Careful selection and inspection insures the buyer of Western Electric merchandise of the same standards of quality that he himself would exact if he were able to visit all available markets. Buying electrical supplies from Western Electric is like retaining a staff of consulting purchasing engineers. Before any item gets on our shelves or is listed in the pages of the Year Book you are now reading, our experts must be satisfied that the product is right as to design and quality of workmanship and material.

The benefit of this consulting service of purchasing experts is gained by every purchaser of any Western Electric product. From fuses in cartons to poles in carloads, you can depend on your purchases from the house that has tamed the geography.

When a Woman Buys a Washer

She wants to be sure first of all that it washes clothes clean; she wants it simple to operate and easy to care for; and she thinks five years ahead and wants to be sure that it will do the work then.

The revolving-reversing cylinder principle is a tested and approved one. Clothes washed this way come out clean and whole. The new Models 3 and 3C Western Electric Clothes Washers are operated by two levers and the simplicity of design and construction minimizes the care of the washer. Any washer backed by a company with 57 years electrical experience must have a guarantee satisfactory to both dealer and consumer.

Full details are given elsewhere in this book

Western Electric

A Small Sized Low Priced Ironer

When this 28" Ironer was designed three things were accomplished. It was kept small enough to fit in the average kitchen; the cost was scheduled to come within the means of the average pocket book; and it was made to do all the ironing that can be done on a large Ironer. The open end takes care of that.

As for the Western Electric Iron—that's a staple. The long-lived heating element and the non-kink cord have a special appeal to the dealer as well as the user. Quick heating, even balance, and a comfortable always-cool handle are a few of the other commendable features of this iron.

*Detailed descriptions of both Iron and Ironer
will be found elsewhere in this book*

Western Electric

VIBRATOR TYPE

AUTOMATIC TYPE

TWO SPOOL TYPE

ROTARY TYPE

There's a Type to Meet Every Request

The particular sewing principle chosen is a matter of personal taste. The Western Electric line includes Portable Electric Sewing Machines of every type: Vibrator, Rotary, Automatic and Two-Spool. In addition there are two exceptionally attractive console Cabinet Machines which harmonize with the furnishings of any room. Each machine is equipped with an electric motor foot control and full set of attachments.

Complete details of these machines will be found elsewhere in this book

Western Electric

Equipped with the New Time and Temperature Controls

The new 18-91 and 16-81 Western Electric Crawford Ranges, can be equipped with the full Automatic Time and Temperature Controls. A decided step forward in the progress of Electric Cookery. The accuracy and dependability of these controls match the sturdiness of the range construction.

Another interesting feature is the "Hot Spot" top unit. When the switch is at medium the heat is concentrated in the center. Other Western Electric Models are designed to fit the narrow confines of apartments.

*For detailed descriptions of the complete line of ranges,
see the index in this book*

Western Electric

Western Electric Has Both

"Personal preference" has just about evenly divided the demand for Vacuum Cleaners "with and without" a brush.

If they like them "without" the No. 14 Straight-Air Cleaner is an exceptionally simple and efficient cleaner. It's the nozzle that's different. The extreme simplicity of design brings this cleaner down to a surprisingly low cost for a Quality Product.

If the demand is for the "Brush Type" the No. 12 with its gently-revolving motor-driven brush, that will not injure the finest rugs, will assure a satisfied customer.

Further details of both cleaners will be found elsewhere in this book

Western Electric

The 6025-B Amplifier

The 6025-B Amplifier consists essentially of a single stage amplifier with a self-contained current supply set for both the vacuum tubes used in it. It employs two Western Electric No. 205-D vacuum tubes, one as an amplifier and the other as a rectifier.

No batteries are required for the operation of this amplifier. The only current supply necessary is the ordinary 110-volt 60-cycle A. C. house lighting current. No other form of house lighting supply can be used with this apparatus. The house lighting supply is transformed, rectified and filtered by the self-contained current supply set so as to properly energize the amplifier without the use of batteries. The amplifier consumes about 40 watts, that is it takes about the same power as a medium sized incandescent bulb.

If satisfactory volume is obtained in a head set from the detector tube of a radio receiving set one stage of ordinary audio-frequency amplification plus the 6025-B Amplifier will operate a loud speaking telephone so as to be audible throughout a good sized room.

Comfort, Efficiency and Fine Appearance in This Telephone Head Set

In designing the Western Electric Head Set the dimensions and electrical characteristics of the windings have been fitted to the physical dimensions of the receivers in a manner that the efficiency is practically uniform over the whole audible range of frequencies.

Western Electric

Head Sets are remarkably uniform when compared one with another. Each head set is subjected to an exacting test before it leaves the factory, and any which does not meet this test is rejected. The inductance of each of the coil windings is held within exceedingly close limits by measurements made with a special type of alternating current Wheatstone bridge. The two coils employed in each receiver are each wound with copper wire to a direct current resistance of approximately 550 ohms. This gives a total of approximately 2,200 ohms D. C. resistance when the two receivers are connected in series. The alternating current impedance of the receivers connected in series when at voice frequencies is approximately 20,000 ohms. This impedance permits the head set to be connected in series with the plate circuit of the usual form of vacuum tube detector or amplifier, or with a crystal detector, and makes it possible to obtain the highest efficiency without the use of a transformer.

The Cone Type Loud Speaking Telephone

No. 540-AW Loud Speaking Telephone

The Western Electric Cone Type Loud Speaking Telephone consists of a projector within which the actuating mechanism is contained. The projector is made of two hollow cones (formed of specially selected material) having their bases cemented together. The apex of one is cut away to permit attaching to a bracket, which serves not only as a stand for the projector, but also as a mounting for the actuating mechanism which is of the balanced armature type.

Harmonizing in performance with the best—and in appearance with the finest in home furnishings, the instrument is not alone excellent for making the pleasures of radio available to a room-full of people. The awkward and unsightly curves of the conventional loud speaker are conspicuously absent, and this new loud speaking telephone fits into the home surroundings with the grace of a well chosen portable lamp.

As an adjunct to a radio receiving set, the Cone Type Loud Speaking Telephone may usually be connected direct to the second stage of amplification. When the receiving set is giving good volume and quality in the head phones, it will be found that with two additional stages of audio-frequency amplification the No. 540-AW will give satisfactory reproduction.

Western Electric

Radio Telephone Broadcasting Equipment

Few inventions have attained in so short a time either in national interest or importance the position reached by radio broadcasting. This is due in a large measure to the rapidly improving efficiency of radio apparatus.

Since the first 500-watt Western Electric Radio Telephone Broadcasting Equipment, (with which more than fifty of the best known broadcasting stations in the United States have been equipped), was designed and placed before the public, the engineers and scientists of the Bell Telephone Laboratories of the American Telephone and Telegraph Company and Western Electric Company have been studying the problems of the art with a view of improving the apparatus.

This research work has brought out three classes of equipment, known as the 103-C (50 watt); the 106-A (1000 watt) and the 104-A (5000 watt). Improved speech circuits, the reduction of harmonics, a quieter carrier wave and better facilities for monitoring and control make it capable of even higher quality transmission than that of the former equipment which has built up an enviable reputation for the stations that are now using it in the United States and other countries.

Western Electric

The Public Address System

A Western Electric Public Address System is Used in the Georgia House of Representatives

Public speaking plays an important part in our everyday commercial and social activities. Until the development of the Western Electric Public Address Systems, the number of persons who could be reached by a speaker was limited by the carrying power of his voice and the acoustic properties of the place where the audience was assembled. Western Electric Public Address Systems increase the range of

speakers' voices sufficiently to cover any requirements in regard to the size of the audience. (Audiences of over 200,000 have been enabled to hear clearly.) By permitting the speaker to reach his audience with natural tones these systems prevent voice strain and thus increase greatly the amount of speaking possible without voice fatigue or injury.

Western Electric Public Address Systems reproduce the voice of the speaker in clear, natural

tones. The speaker has a comparatively large amount of freedom. He is not hampered by having to speak in a loud voice nor does he have to direct his words into the mouthpiece of the telephone transmitter.

Large outdoor crowds can be easily handled. Individuals hundreds of feet from the speaker may be addressed and requested to come to the platform. Medical assistance may be summoned in the case of illness and descriptions of children lost or found may be broadcast.

In intervals between speeches music may be transmitted to the audience through the Public Address System.

The apparatus is rugged in construction and once installed requires only a moderate amount of attention from the persons who operate it.

Western Electric Public Address Systems are flexible in their application and can be arranged to serve large gatherings, either indoors or outdoors, or both, or overflow meetings to two or more meetings held simultaneously in different localities.

The Western Electric No. 1-A Public Address System is designed for use with the largest audiences outdoors and indoors. It is adapted for either permanent or temporary installation. The capabilities of this system were demonstrated during the inauguration ceremonies of the late President Harding on March 24, 1921, when by its use an audience of

Public Address System Being Used in Dedication of New Building

Western Electric

*Public Address System in Use at
Hotel Astor, New York*

A Church Application

more than 125,000 people gathered before the National Capitol at Washington, was enabled to hear distinctly the President's Inaugural Address.

The same system was used on March 4, 1925, when President Coolidge was inaugurated. This system not only made it possible for a gathering of many thousand people assembled on the Capitol grounds to hear the address, but in addition, through wire connections, the message was distributed to numerous radio broadcasting stations which broadcast the message over the greater part of the United States.

At both the Republican and Democratic Conventions of 1924, the Western Electric No. 1-A Public Address System served the purpose of transmitting the words of the speakers to the vast audiences present in the convention halls and to widely scattered radio audiences.

In addition to its temporary use on occasions of national importance, the Western Electric No. 1-A Public Address System is installed permanently in many large auditoriums and stadiums.

Though less powerful than the No. 1-A Public Address System, the No. 2-A is capable of taking care of large crowds either outdoors or indoors. The No. 2-A System is at present giving satisfactory service in many auditoriums and hotel banquet halls throughout the country.

A few of the many possible applications of the No. 2-A Public Address System follow.

Where the Western Electric No. 2-A Public Address System Can Be Used

Hotels, for use in Banquet Halls, for reproducing music of an orchestra in as many locations as desired and for paging guests or making announcements in cases of emergency. Theatres and other Auditoriums, Stock Markets and Trade Exchanges, Colleges and Schools for use in large lecture rooms for emergency announcements for directing class drills, Dance Halls, Steamships, Steamship Piers, Department Stores, Prisons, Hospitals, County Fairs, Private Pullman Car or Automobiles so audiences assembled around them may be addressed.

The Western Electric No. 3-A Public Address System is suitable for use in auditoriums, the cubical contents of which do not exceed 85,000 cubic feet. For example, an auditorium approximately 85 feet by 50 feet by 20 feet high. Where it is desired to transmit the sounds into adjoining rooms and corridors, the cubical contents of the combined space should be somewhat less than 85,000 cubic feet. But the total area over which satisfactory loudness and quality of sound can be maintained depends largely on the size and configuration of the separate areas and the amount of outside noise that may enter the rooms.

*Amplifier Equipment for
No. 2-A
Public Address System*

Western Electric

The Audiphone

Numbered among the many developments by the Bell Telephone Laboratories, Inc., the research and development laboratories of the American Telephone and Telegraph Company and the Western Electric Company, are devices such as vacuum tubes and improved forms of transmitters (microphones) and telephone receivers (head receivers) which have made possible the design of the Western Electric Audiphone.

The Audiphone is a special amplifying unit which intercepts sound waves and transmits them to the user's ears. By means of it, those with impaired hearing may perceive sound without noticeable loss of quality or naturalness. This apparatus gives results much superior to those heretofore obtainable.

Types of Audiphones

To meet the more general demands for aids to hearing, the Western Electric Company manufactures different types of audiphones.

32-Type Audiphones

The 32-Type Audiphones are intended for use by those who have sustained a considerable loss of hearing, but are able to perceive sound to some extent in either ear.

The 32-Type Audiphones provide two stages of amplification. All of the apparatus, including the batteries for the plates and filaments of the vacuum tubes, is mounted within a carrying case measuring $7\frac{1}{4}$ inches long by 4 inches deep and 7 inches high and weighing 7 pounds.

Audiometer Measurements

It is obvious that no one form of audiphone will compensate for all degrees of impaired hearing. The Western Electric Company, therefore, recommends that any prospective purchaser of an Audiphone consult an ear specialist competent to make by means of the Audiometer or other efficient method an analysis of the impairment in the hearing of each ear. From such an analysis it will be possible for the specialist to determine quickly which form of Western Electric Audiphone will best suit individual needs.

Western Electric

The Audiometer

An Instrument for Measuring the Acuity and Quality of Hearing

Type No. 2-A

Type No. 3-A

A new precision instrument, capable of measuring the acuity and the quality of hearing has been developed for telephone work by scientists of the Bell Telephone Laboratories of the American Telephone and Telegraph Company and Western Electric Company in connection with their fundamental research in electrical communication.

Realizing the value of this apparatus in determining the condition of hearing, the development work was continued with the thought of making this instrument, the Audiometer, to the highest possible degree, a valuable contribution to the application and the increase of medical knowledge. In order to accomplish this result, each step of the development has been carried on in close contact with the medical profession in an effort to adapt the Audiometer, both in capacity and accuracy, to the technique and requirements of its various users.

Wherever hearing tests are required, one of the types of Audiometer can be used. Its combination of sustained tones automatically produced, and of pitch and intensity adjustable throughout a wide range, will be found of great usefulness, in the delicate functional and diagnostic measurements of otologists. It may also replace to advantage many of the manually operated instruments now in use for conducting the standard hearing tests. In the field of physical examination, the Audiometer should prove extremely valuable in determining, so far as impaired hearing is concerned, the fitness of applicants for insurance policies, automobile licenses, and for enlistment in the Army

and Navy; also in the life protection tests of railroad and steamship companies; and in the health corrective examinations of schools, colleges and gymnasiums.

A Universal Language for Recording Ear Tests

The Audiogram, a form of chart developed for use with this instrument, provides a method of plotting the results of measurements obtained by means of the Audiometer. Such a diagram accurately indicates at a glance the extent and the character of the deficiencies in acuity and quality of a patient's hearing.

Type No. 1-A

This type, which is the largest, was designed to fulfill the requirements for an extensive examination of the acuity and quality of hearing.

Type No. 2-A

The results are essentially the same as Type 1-A, except the maximum intensity is such that it covers only 70 per cent of the hearing range. It is portable.

Type No. 3-A

Adapted to the requirements of industrials, school boards, automobile examining boards and others interested in a single, quick test of acuity for hearing speech.

Type No. 4-A

The No. 4-A or Phonograph Audiometer is a portable instrument for testing quickly and accurately the acuity of hearing of groups of school children.

Type No. 1-A

Western Electric

Power Line Carrier Telephone Systems

*Panel and Protective Equipment
Western Electric Power Line Carrier Telephone
System*

The Western Electric Power Line Carrier Telephone System which uses the power conductors as a transmission medium provides telephone service that is entirely automatic from the standpoint of the user and the quality of the transmission is equal to that afforded by high grade commercial circuits.

The equipment assures positive economical and efficient communication and precludes the necessity of erecting a line for communication purposes.

The development of the apparatus has been founded on many years of experience in the application of carrier current systems to telephone lines. The equipment has been designed primarily from the standpoint of simplicity and reliability as regards both its installation and operation. Selective ringing, or the ringing of all stations simultaneously for general orders, is obtained through the use of equipment now standardized in Western Electric train dispatching telephones throughout the world.

The telephone circuits may be extended through the private switchboards of the Power Company or direct extensions with full control of the carrier apparatus may be provided for load dispatchers located some distance from the equipment.

Provision has been made for the protection of the operator and apparatus from the high voltages.

Coupling between the carrier apparatus and the power line may be effected by means of coupling wires strung parallel to the power line but more efficient coupling may be obtained by high-voltage coupling condensers connected directly to the power conductors.

The equipment may be operated either from a storage battery, rendering its operation independent of any commercial supply, or from a motor-generator connected to the public service A.C. supply. In times of interruptions of the A.C. source, automatic means may be furnished to switch the motor-generator to the station battery until the A.C. is again available.

The carrier apparatus is mounted on vertical frames, permitting accessibility to all parts.

Prices

Prices found in this catalogue are revised to agree with the latest lists at the time of issue. It is understood that they are subject to change without notice and are, therefore, not offered by us as a quotation. It is contemplated that all prices are for shipment from our warehouse unless otherwise specified, except such goods as are shipped regularly direct from factories, in which cases prices are for factory delivery unless otherwise specifically agreed upon.

Orders

When possible, we have placed opposite each article a list number. When ordering material, kindly order by the list number and give a description of the article required.

You are requested to specify the routing over which you prefer shipments to be made. In the absence of specific instructions, we shall use our best judgment in selecting the route, but we are not responsible for extra drayage expenses at destination.

Terms

Our terms are 30 days net from date of invoice.

Payments may be made by check, bank draft, postal or express money order, drawn to the order of or endorsed to the order of the Western Electric Company.

Payments in currency through the mails even if registered are not recommended and are at sender's risk. We are not responsible for loss or miscarriage of the mails.

Receipts are not issued for remittances unless requested. Our endorsement on remittance is acknowledgment of the receipt of the funds.

We solicit new accounts on a credit basis, and in order to give prompt service, request that where you are not rated by the Commercial Agencies, references or other information of a credit character be forwarded with the order. These will be immediately acted upon, and the results held in strict confidence for our sole use and, when reasonably satisfactory, shipment will follow with all possible dispatch.

To avoid the delay incidental to communicating with references, etc., it would be mutually convenient, when immediate shipment is desired, to instruct us to ship C. O. D. by express, or parcel post (insured if so instructed) or by freight subject to sight draft through a local bank against bill of lading.

We shall advise the terms on future orders promptly after communications from references are received.

Returned Goods

To save transportation charges, and to facilitate the handling of goods upon receipt, you are requested not to return goods without having obtained shipping instructions from us.

Shipments

As experienced packers are employed, and as reasonable care is used in packing, we cannot be held responsible for breakage in packages which are delivered in "good order" by the carrier.

Shipments of glassware are made at your risk.

Goods ordered to be shipped by parcel post will be sent only at the purchaser's risk of loss or damage

"It's the little things that tell", is an old saying—and never more true than with a Western Electric Inter-Phone. A convenience that will mean more to you in everyday satisfaction than many a bigger item of equipment.

Weighed in the balance —and found *not* wanting

Western Electric INTER-PHONE SYSTEMS

In the office or factory,
Inter-Phones put you in
direct touch with any de-
partment.

WHEN you build a house, the location and construction materials seem all-important. But after you get living there, isn't it often true that the small conveniences outweigh bigger things?

A Western Electric Inter-Phone is small, but it is mighty important in everyday convenience and time-saving. Install an Inter-Phone system and you can talk in comfort with anyone in any part of your house or garage.

Western Electric carries stocks

of everything electrical—little conveniences and big ones. Convenience outlets for the walls, lighting equipment, and dependable appliances that make housework easy.

For you men in industry too, Western Electric acts as an electrical supply storekeeper, backing you up with prompt and careful attention to your requirements for quality products.

Let us send you information on Western Electric supplies and service. Write now—right now.

INTER-PHONES AND ACCESSORIES

Introductory

Fast and reliable telephonic communication is today such a well recognized essential that Inter-phones are considered a necessity in the modern business and home life. Schools, industries, offices, public institutions and the modern home require them, and they are considered a part of the building equipment by leading Architects in planning and designing new buildings. The user is the only operator required—pushing one button makes the desired connection.

Western Electric Inter-phones can be relied upon to give perfect satisfaction. Our valuable and extensive experience in the telephone field for over half a century enables us to offer equipment which has proved its efficiency and reliability under most severe operating conditions.

Inter-phones described on the following pages are scientifically designed and carefully constructed in various styles and types to meet the service requirements in the home and office. The sets are regularly finished in dull black enamel with nickel trimmings. This finish is pleasing in appearance and will harmonize with any surroundings.

Western Electric Inter-phones
Picture Index of Inter-phone Systems

These diagrams are intended to show the Ringing Service provided for the various Inter-phone systems and should not be confused with the wiring diagrams, which are shown in a separate bulletin, "Installing and Maintaining Western Electric Inter-phones."

System No. 1
Selective Ringing—Selective Talking Service
For 3 up to 24 Stations

1. Any station can ring selectively any other station.
2. More than one conversation can take place simultaneously.
3. Apparatus, operation and appearance, the highest grade obtainable.
(For systems Nos. 7, 8, 9 and 10 see Apartment House Inter-phones.)

System No. 11
Selective Ringing—Common Talking Service
For 3 up to 8 Stations

1. Any station can ring selectively any other station.
2. Only one conversation can be carried on at a time.
3. Apparatus pleasing in appearance and moderate in cost.

System No. 12
Master and Outlying Stations—Common Talking Service
For 3 up to 8 Stations

1. The "master station" can call any one of the "outlying stations," selectively and the outlying stations can call the master station (but not each other).
2. Wall, desk or hand set Inter-phones may be used interchangeably in this system for both the master and outlying stations.
3. Only one conversation can be carried on at a time.

System No. 12A
Master Annunciator and Outlying Stations
Common Talking Service
For 3 up to 20 Stations

1. Adapted for schools where the principal must call the teachers individually and teachers must call the principal but not each other.
2. Same as System No. 12 except master station is equipped with an annunciator for identifying calls from the outlying stations.
3. The master station annunciator is of the Electrical Reset type.
4. Only one conversation can be carried on at a time.

Western Electric Inter-phones
Picture Index of Inter-phone Systems

Continued

These diagrams are intended to show the ringing service provided for the various Inter-phone systems and should not be confused with the wiring diagrams, which are shown in a separate bulletin, "Installing and Maintaining Western Electric Inter-phones."

System No. 12B
Master Annunciator and Outlying Stations
Common Talking Service
For 3 up to 24 Stations

Formerly Known as Systems No. 16 B&C

1. The "outlying stations" can ring the "master annunciator" station but not each other.
2. Master annunciator station may or may not have push buttons for calling any one of the outlying stations.
3. This system is also designed for replacing existing ordinary annunciator and push button systems (where the wiring is suitable).
4. Only one conversation can be carried on at a time.

System No. 15C
Code Ringing—Common Talking Service
For 2 up to 6 Stations

1. A simple private line system (requires only 3 line wires between stations).
2. When a button is pressed at any station the bells of all other stations will ring simultaneously.
3. The various stations are called by signalling each one with a different code.
4. Only one conversation can be carried on at a time.

System No. 18
Master Annunciator with Connecting Cords
For 10 up to 70 Stations

1. From the "master station annunciator" any one of the "outlying stations" can be called selectively, or the master station can be called from the outlying stations.
2. Communication can be established between any two outlying stations by means of connecting cords at the master station annunciator.

System No. 14
Private Line
For 2 Stations Only

1. For connecting two points separated by a mile or less.
2. Only two line wires are required for connecting between the two stations.
3. Either station can ring and converse with the other.

Apartment House Systems

Apartment House Systems

Selective Talking—Non-interfering Service

Selective Talking—Non-interfering Service

Systems Nos. 7 and 8 will furnish selective ringing and talking (or non-interfering) service, making it possible for a number of conversations to take place simultaneously.

Systems Nos. 9 and 10 will furnish selective ringing and talking (non-interfering) service, making it possible for a number of conversations to take place simultaneously.

System No. 7—Non-interfering Service

One vestibule and up to 24 suite Inter-phones.

1. Vestibule can call apartments.
2. Apartments can open door, if desired.

System No. 8—Non-interfering Service

One vestibule, one janitor and up to 24 suite Inter-phones.

1. Vestibule can call apartments and janitor.
2. Apartments can call janitor and open door, if desired.
3. Janitor can call apartments.

System No. 9—Non-interfering Service

One vestibule, one janitor, one tradesmen's and up to 24 suite Inter-phones.

1. Vestibule can call apartments and janitor.
2. Apartments can call janitor and open door, if desired.
3. Janitor and tradesmen can call apartments.

System No. 10—Non-interfering Service

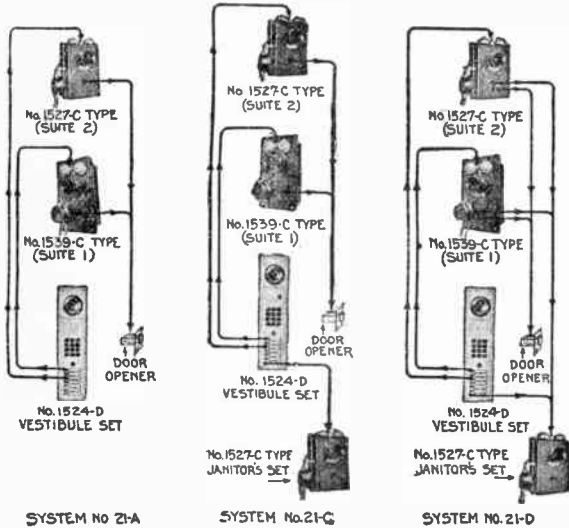

One janitor's switchboard, two or more vestibule and tradesmen's Inter-phones and any number of suite Inter-phones up to 70. A maximum of 24 suite Inter-phones can be connected to each vestibule set.

1. Vestibule can call apartments and janitor.
2. Apartments can open door and call janitor.
3. Janitor can call apartments.

System No. 20-H and 21-H

1. Vestibule can call apartments and janitor.
2. Apartments can open door and call janitor and laundry.
3. Janitor and laundry can call apartments.

Western Electric Inter-phones
Description of System No. 1
Selective Ringing—Selective Talking Service

Inter-phones for the No. 1 System

Represent the highest standards of design, engineering and refined manufacture. Four types of Inter-phones are provided, namely, Surface Wall, Flush Wall, Desk and Hand Sets, and they may be used interchangeably in the same system. These sets all incorporate the same important refinements, as listed hereinafter.

Transmitter and Receiver

The same type and high grade of construction as those used for public telephone exchange service. Due to their character, the transmission is pleasingly uniform and clear throughout the system with a minimum of battery consumption. These transmitters and receivers are familiar to telephone users throughout the world.

Vibrating Bells and Buzzers

Wound to 10 ohms with enameled insulated wire, and have the following advantages (over the low resistance bells which are to be found on the market).

- (a) The current required to ring on long and short lines is more nearly equalized.
- (b) The trouble experienced with armature adjustment is decreased.
- (c) On account of the high resistance less ringing current is used and the life of the battery is lengthened, lowering the maintenance cost.
- (d) The enameled insulation on the windings being moistureproof, assures against current leakage, or short-circuiting due to moisture or poor insulation.
- (e) Avoids use of an excessive number of dry cells to ring the bells of distant stations and prevents harmful sparking at bells near the batteries (as would be the case with two or three ohm bells).

Terminal Block

Located in the base of the set; is made of hard maple which has been boiled in beeswax to make it impervious to moisture. After this treatment, it is given a coat of insulating varnish. On the terminal blocks are mounted terminal connections having a solder terminal and a screw terminal. To the solder terminal is connected the local wiring of the set, while the screw terminal provides an easy method of connecting to the Inter-phone cable, no soldering being required to make a permanent cable connection. All terminals are plainly marked on the terminal block in order to easily identify the local cabling and inter-phone wiring.

Local Wiring

Local wiring from the push button keys, transmitter, bell, retardation coil and switchhook to the terminal block is made by means of a neatly formed cable. Each wire is colored differently in order to easily trace the wiring or identify it in any part of the set. The wires in the local cable form are thoroughly treated to keep out moisture and then laced with linen cord to keep them in shape. The wiring to the apparatus and terminals is soldered to insure a permanent and reliable connection. The cable is so formed and enough slack left in it to allow the face plate to be opened and closed for inspection, without straining, bending or in any way interfering with the wiring. To further support the form and hold it in position, leather straps are fastened to the terminal base and ringing key frame.

Western Electric Inter-phones
Description of System No. 1—Continued
 Selective Ringing—Selective Talking Service

Interior Apparatus

Interior Apparatus such as the transmitter mounting, switchhook, vibrating bell, bell adjusting mounting, and retardation coil are (in the metal sets) also mounted on a treated maple block and fastened to the face plate. This method insulates the apparatus and affords uniform alignment. All terminals are marked in order to easily connect and trace cord and wire connections.

Retardation Coil

A retardation coil of 100 ohms resistance is contained in each Inter-phone. It furnishes talking current from one talking battery for all conversations, provides against "cross-talk" and reduces the drain from the battery to a minimum.

Housing

The housings of the metal wall sets and desk set key boxes are made of heavy sheet steel, formed and pressed into shape. The housing is then treated with a special copper plating process. This method is used to protect the metal from moisture so that rust cannot attack its surface. After the surface is copper plated it is finished with two coats of black japan which is baked on. The japan finish being baked on clings to the metal preventing cracking or peeling as is liable to happen when an air drying finish is applied.

It is standard Western Electric practice to treat the surfaces of all steel parts with either copper plating or an equally effective process, before applying the exterior finish, to protect the steel against rusting.

Push Button Keys

The push button keys and their operating mechanism, are mounted in a rigid metal frame. In designing this key two operations are arranged for (1) for ringing, and (2) for talking.

Each key consists of a hard rubber push button mounted on a metal plunger, which passes through a hole in a movable locking plate ("m"), (which is under the spring tension). When the button is completely depressed ("B") the spring ("o") makes contact with the ringing battery supply at ("e"), causing the ringing current to flow to the station to which this particular key is connected, and ringing the bell at that station. When the pressure is released, the plunger returns to an intermediate position ("C") breaking the ringing contact and placing the Inter-phone on the line of the station called ready for conversation. While the conversation is taking place, the plunger is automatically held in the talking position by the locking plate ("m") and held there until the plate is actuated by depressing another button. The pressing of another button causes the locking plate ("m") to release the key so that it assumes its normal position as shown in "A." Talking current for the Inter-phone is cut off as soon as the receiver is placed back on the switchhook.

Western Electric Inter-phones
Description of System No. 1—Continued
 Selective Ringing—Selective Talking Service

No. 1324 Type Wall Inter-phones
 Surface Mounting

No. 1324 Type

The No. 1324 type Inter-phone is an all metal set having a hinged face plate, movable transmitter and hand receiver. Finished black with nickel trimmings. The face being hinged, makes it possible to easily inspect all connections and apparatus, without disturbing the installation.

This Inter-phone is furnished in 6, 12, 16, 20 and 24 button sizes.

Code No.	No. of Buttons	DIMENSIONS, INCHES		
		Height	Housing Width	Depth

No. 1355 Type Wall Inter-phones
 Flush Mounting

No. 1355 Type

The No. 1355 type Inter-phone is a flush mounting set having a steel face plate on which is mounted all of the talking and signalling apparatus and a sheet steel outlet box arranged for 3/4-inch conduit. The outlet box can be separated from the set and built into the wall during the construction of the building. The face plate is hinged at the bottom, making all terminals easily accessible for installation or inspection. The set is compact but not crowded, and designed to meet the most exacting requirements. Furnished in 16, 20 and 24 button sizes.

Dull black finish with nickel trimmings.

Western Electric Inter-phones

Description of System No. 1—Continued

**Selective Ringing—Selective Talking Service
No. 6016 Type Desk Inter-phones**

Desk Inter-telephone

The No. 6016 type desk Inter-telephone consists of a desk stand and a metal key box which employ the same operating mechanism as described under "Push button keys."

The desk stand is finished in dull black. It is the same type of Western Electric desk stand that is generally used for public telephones, millions of which are in service, its efficiency and dependability being well known.

Construction of Key Box

The key box is finished in dull black with nickel trimmings and is provided with four rubber feet to keep the metal housing from scratching the table or desk. The connecting cord between the key box and the desk stand is six feet long. Cable entrances are provided at the bottom and ends of the box. Furnished in 6, 12, 16, 20 and 24 button sizes.

Code No.	No. of Buttons	Desk Stand	Cord, Ft.	INCLUDES

No. 6016 Type Hand Set Inter-phones

The No. 6016 type hand set Inter-telephone is the same as the No. 6016 desk set type, except that it employs a Western Electric No. 1001 type hand set and hanger instead of a desk stand.

The hand set is nickel plated, of pleasing appearance and extremely sturdy construction. This same type of hand set has been in use for years by telephone linemen and outside repairmen, which attests to its ability to withstand severe service and rough usage.

The hand set hanger is made of cast metal and finished in black. Furnished for supporting the hand set when not in use.

The key box is of the same type described above for use with the No. 6016 desk type Inter-telephone.

Western Electric Inter-telephone Systems

System No. 1

Selective Ringing—Selective Talking

System No. 1—Showing 4 Stations in One System

SERVICE.—For use in business organizations, industries, stores, institutions, large residences, etc., where frequently, more than one conversation will take place at the same time, where instantaneous connections without loss of time are necessary and where the highest grade of transmission is required.

OPERATION.—Each station can (by merely pressing a button) selectively ring and talk with any other station without disturbing the rest of the stations in the system and as many separate conversations can be carried on simultaneously as there are pairs of Inter-telephones. For example, in a system consisting of six Inter-telephones, three separate conversations can be carried on at the same time.

For each station in the system, one push button key is required in each Inter-telephone. For detail description of these keys and method of operation, refer to the general description outlined previously.

CAPACITY.—The Inter-telephones are available in standard sizes of 6, 12, 16, 20 and 24 buttons.

TYPES OF INTER-TELEPHONES.—Wall, desk or hand set Inter-telephones may be used interchangeably in this system. The Inter-telephones listed below are described in detail elsewhere.

No. 1324-C Type Metal Wall Inter-telephone

No. 1355-C Type Metal Wall Inter-telephone

System No. 1—Continued
Selective Ringing—Selective Talking

No. 6016 Type
Desk Inter-telephone

No. 6016 Type
Hand Set Inter-telephone

Accessories
Cable

For connections between the various stations, cable specially designed for Inter-phones can be supplied. A system requires a sufficient amount of cable for connection to each station, the cable being run by the shortest or most convenient route between the various station locations. This cable includes the necessary number of wire conductors (two pairs for battery leads and one pair for each station in the system) and is furnished in three different types to suit various locations and conditions:

Type	6 Stations	12 Stations	16 Stations	20 Stations	24 Stations
Fireproof braid . . .	No.134B	No.141B	No.157B	No.158B	No.136B
Green cotton braid.	No.155B	No.156B
Lead covered	No.134B	No.141B	No.157B	No.158B	No.136B

These cables are listed in detail elsewhere.

Cable Terminals

No. 19B—Cable Terminal with Cable Connections

A cable terminal should be used wherever a junction is to be made between cables. For example: Where an outside lead-covered cable is connected to an interior cable, or wherever a branch is taken off from the main cable. In cases where the cable can be run direct to the Inter-telephone, no cable terminal is necessary. The number of cable terminals required should be determined by the installer.

For 6 and 12 button systems use the No. 19A cable terminals. For 16, 20 and 24 button systems use the No. 19B cable terminals.

Cable terminals are described in more detail elsewhere.

Batteries

Not more than twelve Blue Bell dry cells will be necessary for operating the system. (Five cells for the talking circuit; four to seven cells for the ringing circuit, depending upon length of line.)

The cells can be placed in the basement or any other accessible place.

Detailed information for installing, including wiring diagrams, battery requirements, cable connections, etc., are included in our bulletin, "Installing and Maintaining Western Electric Inter-phones," which will be furnished upon request.

Western Electric Inter-phones

Description of Metal Wall Inter-phones
Nos. 1527C and 1539C Types

Selective Ringing—Common Talking Service

No. 1527C-2 Type

No. 1539C-1 Type

General

The Nos. 1527C and 1539C Inter-phones represent the highest development yet attained toward the standardization of design and construction of Common Talking Type Inter-phones.

This result is due to the exceptional engineering skill employed in producing a universal Inter-telephone that is simple, yet pleasing in design; compact, yet with every part accessible for instant inspection; rugged, yet light in weight and efficient in operation.

Construction and Flexibility

The principal features of these Inter-phones are:

Surface and flush type Inter-phones so wired as to be adaptable for use in any of our "Common Talking" Inter-telephone systems.

An interchangeable push button arrangement provides for readily furnishing Inter-phones from stock in capacities of 1, 2, 3, 4, 6 and 8 buttons as required.

Circuit labels in each Inter-telephone together with an envelope containing strap wires and a diagram of connections give clear, concise instructions for universally connecting the completely equipped sets for any of our Common Talking Systems.

The push button arrangement provides for the future growth of an Inter-telephone system by simply ordering push button units of the required capacities without having to remove or dismantle the sets from the system. (This assumes that cable including spare wires is originally installed.)

Finish of Inter-phones

The metal parts of the Nos. 1527C and 1539C Inter-phones with the exception of the transmitter and bells are treated with the Parker Rustproof Process. This consists of treating the parts in a hot chemical bath, which changes the surface of the metal to a non-rusting basic phosphate.

The protecting surface provided by the Parker Process does not add an additional coating of some other non-oxidizing material, but it is practically a part of the metal itself and prevents rust from spreading if it should start by the exposure of the bare metal at any spot.

Durable black enamel baked on (over the Parkerized surfaces) provides a tough elastic, non-chipping finish, two coats of the enamel being applied on surfaces exposed to view.

Of Interest to Contractors

The universal and flexible feature of these new metal wall Inter-phones is of special importance since it now enables contractors and dealers to carry complete stocks of Inter-phones for adoption to any of our Common Talking Systems with but a small amount of investment.

Western Electric Inter-phones

Description of Metal Wall Inter-phones

Continued

No. 1527C Type Wall Inter-phones

Surface Mounting

No. 1527-4 Type

Interior of Housing

Backboard

The No. 1527C Type Inter-phone has a surface mounting metal housing which contains all of the talking and signalling apparatus, also a metal backboard, which is furnished for mounting the set to the wall.

The housing of the set is of rugged construction, being formed out of sheet steel and is equipped with hinge hooks which match up with slots in the base of the metal backboard. This arrangement permits fastening the backboard in place on the wall and then mounting the housing unit to it.

The hinge arrangement of this set enables the installer to swing down the housing unit from the backboard (see illustration) for making connections to the terminals; also to permit interior inspection of the set at any time after its installation.

The metal backboard is designed to permit the entrance of wires or cabling from either the top, bottom or center of the set; also, a metal guide ring is located near the cable entrance at the base of the backboard so that the connecting wires may be looped through this ring to hold them in place and provide a proper bending point when the housing is swung forward.

The finish is durable dull black enamel with nickel trimmings (see general notes on "Finish of Inter-phones").

No. 1539C-2 Type

Outlet Box

Back of Face Plate

The No. 1539C type Inter-phone has a flush steel face plate on which is mounted all of the talking and signalling apparatus, also a metal outlet box which is furnished for mounting the set in the wall.

The outlet box is of unique design in that metal aligning strips are fastened at the top and bottom front of the box (see illustration), so as to properly align the set after the face plate unit is fastened to the outlet box (in case the outlet box is installed out of plumb). It is equipped with adjustable ears for mounting it in the wall, the same as are furnished on standard sectional outlet boxes. Knockouts are provided at both the top and bottom for the entrance of ½ inch conduit or connecting wires.

The face plate support for installer is an added feature of this set, consisting of a wire hook mounted on a small card with printed instructions for its use. This hook is for temporarily supporting the Inter-phone face plate, of flush type sets, during installation, so that the wires may be readily connected to the terminals by the installer.

The finish is durable dull black enamel with nickel trimmings (see general notes on "Finish of Inter-phones").

Western Electric Inter-phones

Description of Inter-phones
 Selective Ringing—Common Talking Service
No. 6034 Type Desk Set Inter-phones

No. 6034-BE

No. 6034-P

A compact type of desk Inter-phone embodying all of the necessary talking and signalling equipment and retaining in design the same general appearance of the standard type of desk telephone.

The stands are equipped with watch-case receivers and finished in dull black enamel with nickel trimmings, presenting a neat and attractive appearance.

The desk stands of the Nos. 6034AP and BE Inter-phones are each equipped with a push button and buzzer. The push button is mounted in a convenient position in the stem of the stand for signalling purposes and the buzzer is mounted in the base of the stand for receiver calls.

The four and eight button types of Inter-phones have the push buttons mounted in the base of the desk stands (including blank name plates) for signalling the various stations in a system, also a separate bell is furnished for receiving the calls.

Nos. 6042 and 6043 Types Hand Set Inter-phones

The Inter-phone transmitter and receiver are a part of the hand set, which can be held and operated with one hand, leaving the other free. A bar marked "Press to talk" mounted in the hand set handle is held down by the natural position of the hand while talking. When not in use, the hand set can be hung on a hook or laid down in any position. The hand set is finished in dull black.

Western Electric Inter-Phones

Description of Inter-phones—Continued
 Selective Ringing—Common Talking Service
Nos. 6042 and 6043 Types—Hand Set Inter-phones
 Apparatus Unit (or Box). In connection with most "one button" hand sets it is necessary to use Apparatus Units containing terminals and other accessories. Two types can be furnished.

Surface Mounting

No. 383 Type

Surface mounting apparatus Units (No. 383 type) are equipped with an insulated base, black finished round metal cover and nickel hook. Approximate size $3\frac{1}{8}$ inches in diameter by $1\frac{5}{8}$ inches deep.

Flush Mounting

No. 382 Type Apparatus Unit

No. 12007 Face Plate

Type AA Switch Box

Flush mounting apparatus Boxes (No. 382 type) are intended to be set in the wall and are equipped with a brush brass finished face plate. These boxes consist of three parts—a Gem A Union sectional switchbox, an apparatus unit and a face plate. The face plate is $4\frac{1}{2} \times 2\frac{3}{4}$ inches, the wall box $2 \times 3 \times 3$ inches deep.

An important point to be observed is that wall box and face plate are the same as those used in electric light wiring for push button switches. This feature is of special importance to the contractor, since it allows him to draw on his own stock of Union sectional switchboxes and face plates. For this reason we are prepared to furnish sets either complete, including wall box and face plate, or minus these parts.

How Hand Sets Are Connected to Apparatus Units

With the surface apparatus unit the hand set cord is permanently attached to the hand set and apparatus unit.

With the flush apparatus box the hand set cord is permanently attached to the box. Except the Numbers 6042E and K (systems 12A and 12B). These cords are equipped with plugs. The plug can be inserted or removed from the receptacle located in the center of the face plate.

This feature makes it possible to discontinue telephone service at any point by simply removing the plug and the hand set.

Western Electric Inter-phones

Annunciators for Systems Nos. 8, 9, and 12B

Description of Annunciators

No. 36005 Master Station Two-way Service

Selective Ringing—Common Talking Service

The finish of the annunciators used for our various Inter-
phone systems is light golden oak and the cabinets are neat
and attractive in design. Special finishes can be furnished on
order at a slight additional expense.

The drops used in all hand reset annunciators are gravity
type and made of decarbonized steel and brass, constructed
to withstand the most severe service. The drops are shallow
in design to permit neatness and compactness in the annun-
ciator, also they remain locked against all vibration, falling
only when current passes through the magnet.

The drops used in the electrical reset annunciators are the
Semaphore gravity type. Two lock drops are combined in
one unit, self-locking in either position. When energized,
the right-hand magnet throws and locks the shutter to the
left-hand side. The left-hand magnet, when operated by the
reset button of the annunciator, returns the shutter to its
original position.

No. 360011 Master Station One-way Service

Janitor's Annunciator Nos. 361332-361339

Annunciators for System No. 12A

Nos. 401 and 407 Types

No. 401 Type Annunciator

Hand reset type wooden case annunciators with golden oak
finish. Other finishes can be furnished on order at a slight
additional expense.

The Nos. 360000 to 360008 series are for use in System
No. 12B two-way ringing service.

The Nos. 360009 to 360017 series are for use in System
No. 12B one-way ringing service.

The Nos. 361332 to 361339 series are for use in apartment
house Systems Nos. 8 and 9.

An electrical reset type annunciator for use in connection
with our No. 12A system master station and may also be
used for other purposes where a standard type of electrical
reset annunciator is desired.

The drops (as described above) are mounted on the back-
board and are regularly furnished with the reset for the total
number of drops.

The finish of the wood case (No. 401 type) is golden oak.
The finish of the metal case (No. 407 type) is dull black.
Other finishes are "special."

No. of Drops	USED FOR		Systems Nos. 8 and 9 List No.	Drop Arrangement (Horizontal Rows)

24	6	4	13 ³ / ₈	16 ¹ / ₄	2 ¹ / ₂

NOTE.—Intermediate or larger sizes in sets of two drops
can be furnished.

Western Electric Inter-phones

Annunciators for Systems Nos. 10 and 18

Selective Ringing—Common Talking Service

Master Station Annunciator
Nos. 1028 and 1051

A hand reset type wooden case annunciator with golden oak finish, presenting a neat and attractive appearance. Other finishes can be furnished on order at a slight additional expense. The annunciators are equipped with a number of drops and jacks, a push button for ringing, a hand or desk set Inter-phone (which must be ordered separately) and a cord and plug for calling and answering calls.

The drops and jacks will be numbered from one up, unless otherwise specified. The number of vestibule drops for System No. 10 must be specified on order. The combined resistance of bell and drops in series is 10 ohms resulting in lengthening the life of the battery and lowering the maintenance cost.

The Nos. 1028 to 1039 series are for use in System No. 18. For details of operation, see listing of that system.

The Nos. 1040 to 1051 series are for use in System No. 10. For details of operation, see listing of that system.

No. of Drops	System No. 18 List No.	System No. 10 List No.	ARRANGEMENT OF DROPS AND JACKS		OUTSIDE DIMENSIONS, INCHES		
			Across	Down	Height	Width	Depth
10	1028	1040	5	2	23 1/4	12 1/2	5 3/4
12	1029	1041	6	2	23 1/4	14	5 3/4
14	1030	1042	7	2	23 1/4	16	5 3/4

60	1039	1051	12	5	40 3/4	23	5 3/4
70			14	5	40 3/4	23	5 3/4

NOTE—Larger sizes can be furnished on order.

Each of the above List Nos. cover the annunciator only and does not include the Inter-phone, which must be ordered separately as follows:

Desk or Hand Set Inter-phones
For Systems Nos. 10 and 18 Annunciators

- No. 1003K, hand set, black finish, 3 foot cord.
- No. 1320BF, desk stand, black finish, 5 1/2 foot cord.

Hooks

A No. 141A hook can be furnished for hanging the hand set to the side of the annunciator.

Connecting Cords

One or two pairs of connecting cords can be furnished when specified on order. These cords are for use only in System No. 18 as described under listing of System No. 18.

Western Electric Inter-phone Systems

System No. 11
Selective Ringing—Common Talking

System No. 11—Showing 4 Stations in One System

SERVICE.—For use in establishments where conversations can be limited to one at a time.

OPERATION.—Each Inter-phone in the system is equipped with a number of push buttons (one for each other station in the system). By depressing the button marked with the name or number of the station wanted, the bell at that station will ring and there only.

Any station in the system can selectively ring any other station. Only one conversation can be carried on at a time.

CAPACITY.—The wall type Inter-phones can be furnished in capacities of 2, 3, 4, 6 and 8 buttons, accommodating 3, 4, 5, 7 and 9 stations respectively in a system.

The desk and hand set Inter-phones are furnished in capacities of 4 and 8 buttons, accommodating 5 and 9 stations respectively in a system.

TYPES OF INTER-PHONES.—Wall, desk or hand type Inter-phones may be used interchangeably in the same system. The Inter-phones as coded below are described in detail elsewhere.

No. of Buttons	WALL TYPE INTER-PHONES		Desk Set	Hand Set
	Surface	Flush	Inter-phones	Inter-phones
2	1527C-2	*1539C-2
3	1527C-3	*1539C-3
4	1527C-4	*1539C-4	6034M	6034AZ
6	1527C-6	*1539C-6
8	1527C-8	*1539C-8	6034P	6034BB

*NOTE.—For dimensions of outlet boxes, refer to another page.

No. 1527C-1
Surface Type
Inter-phone

No. 1539C-3 Flush
Type Inter-phone

Accessories

Retardation Coils

A No. 51H retardation coil must be ordered separately for installation near the battery of each system.

Cables

For connection between the various stations, cable especially designed for Inter-phones can be furnished. This cable includes 3

No. 51-H

common wires and one individual wire for each station.

Description	Code, Nos.		
	With Fire-proof Braid	With Green Cotton Braid	With Lead Covering
For 3 and 4 Button Systems	161	142	161
" 6 " 8 " "	162	...	162

NOTE.—Cables are described in detail elsewhere.

Connecting Blocks

Where a junction is to be made between cables, or wherever a branch is taken off the main cable, a connecting block should be used. In cases where the cable can be run direct to the Inter-phone, the connecting block is not required.

Batteries

Five Blue Bell dry cells are required for the operation of this system, when the distance between the two stations farthest apart is 750 feet or less, and Inter-phone cable, listed above, is used. On lines of greater length it is recommended that instead of increasing the number of battery cells to more than five, larger wire be used.

Western Electric Inter-phone Systems

System No. 12

Master Station—Common Talking

SERVICE.—Consists of one centrally located "Master Station" Inter-phone to which are connected other "outlying station" Inter-phones. The system provides for communication from a central point to different stations and vice versa.

OPERATION.—The Master Station Inter-phone is equipped with a number of push buttons; one for each outlying station in the system. By depressing the button marked with the name or number of the outlying station wanted, the bell at that station will ring and there only.

The outlying stations are equipped with only one button which will ring the master station when depressed.

Only one conversation can be carried on at a time.

CAPACITY.—One Master Station and from two to eight outlying stations.

TYPES OF INTER-PHONES.—Wall, desk and hand set Inter-phones may be used in this system for either the master or outlying stations. The Inter-phones listed below were described in detail previously.

Master Stations

No. 6034 Hand

No. 6034 Desk

.....	6043E

NOTE.—*For dimensions of outlet boxes refer to separate listing of these Inter-phones.

**No. 6042E is same as No. 6042K, but without face plate and wall box. For details see listing elsewhere.

Accessories Retardation Coils

No. 51-H

A No. 51H retardation coil must be ordered separately with each master station Inter-phone and installed near the battery of the system.

Wiring

For connections between the outlying stations and the master station either cable or insulated wires can be used, depending largely upon the layout of the system. Three common wires are required throughout the system, and in addition, one individual wire from the master to each outlying station. Where there is a long run of a large number of wires, it will be found economical to use cable, and at all distributing and junction points, to install connecting blocks. From these connecting blocks separate wires can be run to the Inter-phones. The sizes of cable and the number of connecting blocks required should be determined in accordance with the installation instructions. Cables and connecting blocks are described elsewhere.

Batteries

Five Blue Bell dry cells are required for the operation of this system when the distance between the master station and most distant outlying station is 750 feet or less and No. 22 B. & S. gauge wire (as in the case of Western Electric cable), is used.

On lines of greater length it is recommended that instead of increasing the number of battery cells to more than five, larger wire be used. This should be determined in accordance with the installation instructions.

The Blue Bell dry cells can be placed in the basement or any other accessible place.

NOTE.—Detailed information covering wiring diagrams, connection of wires and cables, connecting blocks, etc., can be found in our booklet, "Installing and Maintaining Western Electric Inter-phones," which will be furnished upon request.

Western Electric Inter-phone Systems

System No. 12A
Master Annunciator System
Two-way Ringing—Common Talking

SERVICE.—Especially adapted for schools where the principal may call the teachers individually and the teachers can call the principal.

Similar to the No. 12 System except that the master station includes an annunciator for identifying the calls from the outlying stations.

Only one conversation can be carried on at a time.

OPERATION.—The master station Inter-phone includes a push button block having as many buttons as there are outlying stations, also one extra button for electrically resetting the annunciator drops. To call an outlying station, the push button marked with the name or number of the party wanted is depressed. This rings the bell at the station selected and there only.

Each outlying station Inter-phone is equipped with a push button which signals the master station when depressed. This call will also be registered at the master station by the operation of the annunciator drop corresponding to station calling.

CAPACITY.—One master station and 3 up to 20 or more outlying stations.

Types of Inter-phones

Master Stations

To consist of the following:

1. A desk set Inter-phone with a 5½-foot flexible conductor cord.
2. A push button block with or without weighted base and having a flexible conductor cord of any length desired.
3. A connecting block.
4. A surface type annunciator.

Each item must be ordered

separately and in accordance with the following code numbers and capacities; larger capacities can be furnished.

No. of Outlying Stations	No. of Buttons	Push Button Block	Connecting Block	ANNUNCIATOR
		Code No.	Code No.	Type
3	4	104A	7900	1320BF 6G 401
5	6	106A	7900	1320BF 6G 401
7	8	108A	7910	1320BF 6G 401
10	12	7921	1320BF 6B 401
14	16	7930	1320BF 6B 401
17	20	793	1320BF 6F 401

*One button of the push-button block is required for every 8 annunciator drops for electrically resetting drops.

**Connecting cords for push-button blocks may be ordered separately in any length (6 feet of cord being the average length).

Outlying Stations

Wall, Desk or Hand Set Inter-phones may be used. The Inter-phones are the same as specified for the Outlying Stations of System No. 12.

Accessories
Retardation Coils

A No. 51H retardation coil must be ordered separately for installation near the battery of each system.

Wiring

Two common wires are required throughout the system and in addition two individual wires from the master to each outlying station. Cable or insulated wires may be used. Where there is a long run of a large number of wires, it will be found economical to use cable and at all distributing and junction points, to install connecting blocks. From these connecting blocks separate wires can be run to the Inter-phones.

Batteries

The batteries for this system are same as for System No. 12.

No. 51-H

Western Electric Inter-phone Systems

Master Annunciator System No. 12B

One-way or Two-way Ringing—Common Talking
Formerly Known as Inter-phone Systems Nos. 16B and C

SERVICE.—Provides for communication between a master station annunciator and a number of outlying stations.

The master station annunciator (Mechanical Reset Type) is equipped with a hand set Inter-phone, and can be obtained with or without push buttons, depending upon the kind of ringing service required as follows:

Two-way Ringing

Fig. 1

Annunciator equipped with push buttons, one for each outlying station) enabling the outlying stations to ring the master station and the master station to ring the outlying stations individually.

One-way Ringing

Fig. 2

(Annunciator without push buttons) enabling the outlying stations to ring the master station but the master station cannot ring the outlying stations.

Operation

Each outlying station is equipped with a push button which signals the master station when depressed. The call will also be registered at the master station by the operation of the annunciator drop corresponding to the station calling.

Only one conversation can be carried on at a time.

Capacity

One master station and any number of outlying stations up to 24 or more.

No. 1539 C-1
Wall Inter-phone

No. 6043
Hand Set Inter-phone

No. 1527 C-4

Western Electric Inter-Phone Systems
Master Annunciator System No. 12B—Continued
 Two-way or One-way Ringing—Common Talking

No. 360005—Two-way

Master Station

This consists of a black finished hand set with a three-foot cord and an annunciator with hook for holding the hand set.

The annunciator and hand set must be ordered separately.

Finish of annunciator is golden oak. Light or dark oak finish can be furnished without additional charge.

Western Electric Inter-Phone Systems
System No. 14

Two-station Private Line

No 1527-C1 TYPE

No 6034 TYPE

SERVICE.—For use where only two stations are required and where the sets are distantly located from each other.

Only two wires are used for connecting the Inter-phones; dry cells being required at each station.

NOTE.—Refer also to other pages for description of Inter-phones outfits composed of two wall or hand set Inter-phones and the necessary installing material complete.

OPERATION.—Either station can ring the other by simply depressing the push button of the set.

TYPES OF INTER-PHONES.—Wall, desk or hand set Inter-phones may be used interchangeably.

The Inter-phones listed below are described in detail where listed separately.

Annunciators

Two-way		One-way	
List No.	No. of Drops	List No.	No. of Drops
360000	2	360009	2

360005	12	360014	12
360006	15	360015	15
360007	20	360016	20
360008	24	360017	24

NOTE.—For dimensions of annunciators see listing of separate annunciators.

One drop for each outlying station.

Two-way station is also equipped with push buttons corresponding to the number of drops.

Hand Sets

A No. 1003D hand set must be ordered separately with each annunciator. This set is equipped with a three-foot cord, and can be hung on the hook on the side of the annunciator.

Outlying Stations

Wall or hand set Inter-phones may be used. The Inter-phones listed below are described in detail where listed separately.

No. of Buttons	WALL TYPE INTER-PHONE (METAL)		HAND SET INTER-PHONES	
	Surface	Flush	Surface	Flush
1	1527C-1	*1539C-1	6043D	6042M
				*6042D

*No. 6042D is the same as No. 6042M, but without face plate and wall box.

Wiring

For one-way ringing service (annunciator without push buttons) one wire, common to all stations in the system and in addition, one individual wire from the master station to each outlying station.

For two-way ringing service (annunciator equipped with push buttons) one-wire, common to all stations in the system also two individual wires from the master station to each outlying station.

Batteries

Only one battery is required for the operation of the system. This should consist of three or four Blue Bell dry cells, where the distance between the master station and the farthest outlying station is 250 feet or less and No. 22 B. & S. gauge copper wire is used. On lines of greater length it is recommended that instead of increasing the number of dry cells to more than four, larger wires be used as follows:
 250 to 400 ft. use 20 B. & S. gauge copper wire
 400 to 600 ft. use 13 B. & S. gauge copper wire
 600 to 1000 ft. use 16 B. & S. gauge copper wire

No. 6034 Type Desk Set

					*6042AF

*No. 6042AF is same as No. 6042AE but without face plate and wall box.

Wiring and Battery Requirements

A battery of three Blue Bell cells is required at each station to furnish current for talking and ringing if the length of line is less than 750 feet. If the length of the line is increased, additional dry cells are required at each station to insure satisfactory ringing. The following list indicates the additional dry cells required at each station:

Length of Line Between Stations	ADDITIONAL NUMBER OF CELLS FOR EACH STATION —B. & S. GAUGE COPPER WIRE—

4000 " 5000 "	2
5000 " 6000 "	3

Western Electric Inter-phone Systems

System No. 15-C
Code Ringing—Common Talking

Showing 4 Stations in One System

SERVICE.—A simple and inexpensive system for small residences, warehouses, stores or mercantile establishments, where only a few stations are required and the number of calls between the stations are not frequent.

Requires only three line wires throughout the system for two or more stations.

Only one conversation can be carried on at a time.

OPERATION.—Each station is equipped with one push button which, when depressed rings the bells at all the other stations.

The various stations are called by signalling each one with a different code ring; for instance: Two rings for Station No. 2, three rings for Station No. 3, etc.

If more than six stations are in service, signalling code mistakes are likely to occur, due to the possibility of misunderstood signals. System No. 11 is recommended where the initial installation comprises more than four or six stations.

NOTE.—In case only two stations are required (wall or hand set Inter-phones), complete equipment ready for installation can be obtained by referring to Inter-phone outfits.

CAPACITY.—Two to six stations may be operated in this system. More stations can be added but at the expense of ease and certainty in signalling.

TYPES OF INTER-PHONES.—Wall, desk or hand set Inter-phones may be used in the system. The Inter-phones coded below are described in detail elsewhere.

No. 6042 Type No. 1539C-1 No. 6043 Type

No. of Buttons	METAL WALL TYPE INTER-PHONES		Desk Set Inter-phones	HAND SET INTER-PHONES	
	Surface	Flush		Flush	Surface

				**6042AF	

NOTE.—*For dimension of outlet boxes refer to separate listings elsewhere.

**No. 6042AF is same as 6042AE, but without face plate and wall box, see separate listing of Hand Sets.

Accessories
Retardation Coil

A No. 51H retardation coil must be ordered separately and installed near the battery of the system.

Wiring

Three wires are required for connecting the Inter-phones for two or more stations.

Batteries

Five Blue Bell dry cells are required for the operation when the length of the line is 750 feet or less, and not more than four stations are to be used, connected by Nos. 20 or 22 B. & S. gauge copper wire. If more than four Inter-phones are required or if the line is longer than 750 feet, larger wires should be used in accordance with the installation instructions. The Blue Bell dry cells can be placed in the basement or any other accessible place.

Western Electric Inter-phone Systems

Master Annunciator System No. 18
Non-Interfering

Showing Master and 3 Outlying Stations

SERVICE.—For use in hotels, clubs, schools, hospitals, etc., to provide for communication between a central or master station and a larger number of outlying stations, as follows:

1. The Master Station can selectively ring and talk with any of the outlying stations and the outlying stations can call the Master Station.

2. Communication can be arranged between any two outlying stations through the medium of one or two connecting cords at the Master Station.

No connection can be made between this system and a public telephone system.

OPERATION.—The Master Station Annunciator consists of a number of drops and jacks (one for each outlying station in the system), a push button for ringing, a hand set Inter-phone and a cord and plug for calling and answering.

1. To call an outlying station, the Master Station operator inserts the plug into the jack corresponding to the station wanted and depresses the ringing button of the annunciator. The operator converses with the outlying station by pressing the talking lever of the Hand Set Inter-phone.

2. Each outlying station Inter-phone is equipped with a push button for ringing the Master Station and at the same time operating one of the annunciator drops, thereby registering the call. The Master Station operator answers by inserting the answering plug into the jack corresponding to the drop operated and pressing the talking lever of the hand set.

3. If one outlying station wishes to converse with another outlying station, a connection can be established by means of a pair of connecting cords (equipped as part of the annunciator when so specified), each cord terminating in separate plugs. This connection is effected as follows:

The Master Station operator withdraws the answering plug from the jack of the station calling, inserting in its place one of the connecting cord plugs, and proceeds to call the station wanted as explained above, in item 1. Having secured an answer from the station wanted, the operator again withdraws the answering plug and inserts in its place the other plug end of the connecting cord. This completes the connection between the two outlying stations.

No annunciator supervisory features are provided to indicate the termination of a conversation between outlying stations, it being assumed that such connections are required only on special occasions. Where a large number of connections are required between outlying stations, our No. 1801 lamp signal, Private Exchange Switchboard, is recommended.

CAPACITY.—One master station and 10 to 70 or more outlying stations.

Master Station Annunciators

Wood case with standard oak finish. Other special finishes can be furnished. Drops and jacks will be numbered from one up, unless otherwise specified. For further description see annunciator listings elsewhere.

Master Annunciator System No. 18—Continued
Non-Interfering

Hand Set Inter-phone for Annunciator

This consists of a No. 1003K hand set.

Hook

A No. 141A hook can be used for supporting the hand set, the hook to be screwed into the side of the annunciator.

Connecting Cords

If Inter-communication between outlying stations is desired, one or two pairs of connecting cords may be ordered as described under Operation (Item 3).

Outlying Stations

No. 1527C-1

No. 1539C-1

No. 6042 Type Hand Set

Wall or hand set Inter-phones may be used. The Inter-phones as coded below are described in detail elsewhere.

No. of Buttons	METAL WALL INTER-PHONES		HAND SET INTER-PHONES	
	Surface	Flush	Flush	Surface
1	1527C-1	1539C-1	6042L	6043G
..	*6042G

*No. 6042G is same as No. 6042L, but without face plate and wall box.

Wiring

One wire, common to all stations in the system is required, and, in addition, two individual wires between the master and each outlying station. Where there is a long run of a large number of wires, it will be found economical to use cable and install cable terminals or connecting blocks at all distributing and junction points. From there, the installation can be continued by means of separate wires to the various outlying stations. The size of cable and number of connecting blocks should be determined by the installer in accordance with the installation requirements.

Cables, cable terminals and connecting blocks are listed elsewhere in detail.

Batteries

Five or more Blue Bell dry cells are required for operating the system. The cells can be placed in the basement or any other accessible place.

Detailed information for installing, including wiring diagrams, battery requirements, cable connections, etc., are included in our bulletin, Installing and Maintaining Western Electric Inter-phones, which will be furnished upon request.

Western Electric Inter-phones

Description of Apartment House Inter-phones
Selective Talking—Non-Interfering Service
Vestibule Inter-phones for Systems Nos. 7, 8, 9, and 10

The vestibule equipment for Systems Nos. 7, 8, 9 and 10 consists of the No. 1562 type Inter-phone and any number of letter boxes.

No. 1562 Type Vestibule Inter-phones

With Armored Receiver Cord

No. 1562 Type Inter-phone

The No. 1562 type vestibule Inter-phone has a metal case with bronze brass finish, arranged for flush mounting. This Inter-phone is provided with the same type of push button keys as the No. 1 System Selective Ringing—Selective Talking System and permits the Vestibule and Suites as well as the Janitor and Suite Inter-phones to carry on conversations at the same time without interference with each other.

The Inter-phones are furnished in 7, 13, 17, 21 and 25 button keys, each button representing one apartment, except the last or odd button which represents the janitor. The function of each of these keys, when operated is to establish connections between the Vestibule and the called Station. When a push button is pressed all the way down the bell on the corresponding station is rung. When the pressure is released, the key assumes an intermediate position, thereby breaking the ringing contact and connecting the called line for conversation. The key is automatically held in this intermediate position by a locking plate until the operation of another button releases the key and restores it to its normal position. Talking current is cut off when the receiver is replaced on the switchhook. The lower or odd button (for calling the janitor) is non-locking in the operating position. This provides a means for releasing the other buttons in the set should some one maliciously operate all of them at one time. The Vestibule Inter-phone is provided with a watch-case receiver and flush type transmitter. The receiver is equipped with a flexible armored cord for its protection.

Brush Brass Finished Face Plate and Metal Outlet Box

Code No.	No. of Buttons	DIMENSIONS, INCHES	
		Height	Width
1562C-7	7	19 1/2	10
1562C-13	13	19 1/2	10

1562C-21	21	19 1/2	10
1562C-25	25	19 1/2	10

The armored receiver cord complete with receiver is coded as "No. 524W receiver."

Vestibule Mail Boxes

The mail boxes may be obtained in groups of 3 to 12, being assembled complete in units and master-locked for mounting in single or double rows. The boxes are finished in bronze brass, other finishes are special.

The overall dimensions of the individual mail boxes are 5 inches in width and 19 1/2 inches in height.

Write nearest distributing house for bulletin and prices.

Western Electric Inter-phones

 Selective Talking—Non-interfering Service
 Janitors' and Tradesmen's Inter-phones

No. 1350C-25 Type Inter-phone

Janitor's Annunciator Nos. 361332-361339

Janitor's Annunciator

No. 1350 Inter-phones—Surface Type

The No. 1350 type janitor's and tradesmen's wall Inter-phone has a surface mounting metal case with black finish. No bell is provided in this set as it is used with an annunciator (Nos. 361332 to 361339 type) when calls are to be received at this station. These Inter-phones are made in 7, 13 and 25 button sizes, the construction and operation being the same as outlined under Vestibule Inter-phones. The lower or odd button in each Inter-phone is non-locking in operation and provides connection with the vestibule Inter-phone.

No. of Buttons	Code No.	SYSTEM NO.		DIMENSIONS OF HOUSING, INCHES		
		For Janitor	For Tradesmen	Height	Width	Depth

JANITOR'S ANNUNCIATORS.—Annunciators for systems 8, 9 and 10 are described elsewhere.

Coil and Condenser Box

The coil and condenser box is required for each vestibule, janitor's (either wall Inter-phone or annunciator) or tradesmen's station. This apparatus is necessary in order that separate conversations may be carried on simultaneously between the vestibule, janitor and tradesman's Inter-phone and three apartments, without having the conversations interfere with each other. The condenser provides a path for the high frequency talking currents, which cannot pass through the high impedance retardation coil.

Wooden case furnished in golden oak.

Western Electric Inter-phones

Description of Apartment House Inter-phones
 Common Talking Service
 Vestibule Inter-phones for No. 20 Systems

No. 1520U Vestibule Inter-phone with Push-button Plate

Vestibule Equipment

The larger size letter boxes now required for apartment house service will not permit, in most cases, the proper mounting of the vestibule inter-phone on the same wall with the letter boxes, due to the usual limited vestibule wall space available for that purpose. The smaller dimension vestibule inter-phone No. 1520U has been retained and a push-button plate of the same dimensions has been designed to mount with it.

The inter-phone equipment consisting of the No. 1520U set and a push-button plate of the required capacity may be mounted together on the vestibule wall in a convenient position separate from the mail boxes or where mail boxes are not required.

No. 1520U Vestibule Inter-phones with Armored Receiver Cord

The No. 1520U Inter-phone consists of a flush mounting brush brass finish face plate with a push-button for signalling the janitor. The transmitter unit is mounted on the back of the face plate and an embossed metal mouthpiece is provided. The receiver used is of the watch-case type and the cord of the receiver is protected with a flexible armor. The switch-hook is mounted in the center of the face plate, supporting the receiver in the most convenient position. The receiver and armored cord complete is coded as the No. 524W receiver.

Vestibule Push-button Plates

Push-button plates are furnished to mount on either side of the No. 1520U Vestibule Inter-phone.

A card holder is provided opposite each button. The face plate has a brass lacquered finish, other finishes will be considered special.

The over all dimensions of the push-button plate are 5 7/8 inches in width and 12 3/8 inches in height.

Common Talking Service

No. 1524C with Push-button Plate

No. 1524A with Push-button Plate

Selection of Vestibule Equipment

System No. 21

The vestibule equipment for the No. 21 systems consists of the following units, each of which must be ordered separately.

1. A No. 1524 type loud speaking inter-phone (as selected).
2. A push-button plate (except when No. 1524D inter-phone is selected).
3. Mail boxes (as required).

The inter-phone and push-button units are furnished in two distinct sizes depending upon the installation requirements as follows:

1. Installing the inter-phone and push-button plate with the mail boxes, or
2. Installing the inter-phone and push-button plate separate from the mail boxes or where mail boxes are not required.

In the former the inter-phone and push-button plates are of the same dimensions as the new standard size mail boxes. In the latter case, the inter-phone and push-button plates are of smaller dimensions so as to mount together in a convenient position in the vestibule where wall space will not permit mounting the mail boxes on the same wall.

The apparatus to be selected from the following groups.

No. 1524 Type Loud Speaking Vestibule Inter-phone System No. 21

The No. 1524 Inter-phone is designed to eliminate as far as possible, all projecting and removable parts, such as the transmitter, receiver and switch-hook; also to safeguard the theft of the receiver and the cords.

The set consists of a flush mounting face plate. A push button is mounted at the bottom of the plate for talking and listening purposes. The transmitter and receiver units mount on the back, and an embossed metal transmitter mouthpiece is located on the upper section of the face plate. The receiver unit contains a loud speaking horn; the flare end of the horn is attached to the lower part of the face plate which is perforated and covered with a protecting screen. An outlet box is furnished for mounting the set in the wall.

Western Electric Apartment House Inter-phones Systems 7, 8, 9 and 10

Selective Ringing—Selective Talking—Non-interfering Service

No. 1362 Vestibule Inter-Phone
With Letter Boxes

SERVICE.—Apartment house Inter-phones are designed to provide service between the vestibule apartments, janitor and tradesmen. The systems are planned throughout with the utmost care to give the most reliable service.

Systems Nos. 7, 8, 9 and 10 cover the practical service requirements of most apartment houses. One system may be expanded into another at any time by the use of additional apparatus.

These systems are designed for selective ringing and talking or non-interfering service, making it possible for the master station, such as the vestibule, the tradesmen and the janitor to communicate with different apartments simultaneously without interference with each other.

OPERATION.—The vestibule, janitor's and tradesmen's Inter-phones are equipped with push button keys (one for each apartment station). By depressing the button marked with the name or number of the apartment desired, the bell at that station will ring and there only.

The apartment Inter-phones can be provided with one or two push buttons for ringing the janitor's station or operating an electric door opener.

Separate conversation may take place simultaneously between the vestibule, janitor or tradesmen and different apartments.

TYPE OF INTER-PHONES.—Wall type Inter-phones are specified throughout for the various systems.

TYPES OF SYSTEMS.—See descriptions on following pages.

Accessories for Systems Nos. 7, 8, 9 and 10.

Coil and Condenser Box

One retardation coil and one condenser are required for each vestibule, janitor's (either wall Inter-Phone or master annunciator) or tradesmen's station. See for description of coil and condenser boxes elsewhere.

Cable

For connecting the various stations, either cable or insulated wires can be used, depending largely upon the layout of the building. Where there is a long run of a large number of wires (for instance, between the janitor, vestibule, and tradesmen Inter-phones or for the vertical riser from floor to floor) it will be found economical to use cable, and to install cable terminals or connecting blocks at all of the distributing and junction points.

For connecting the Inter-phones of the various apartments to these distributing points, insulated wires (No. 22 B. & S. gauge) can be used. The number of wires is outlined in the description of each system on the following pages. This data should be used when selecting the cable.

Cable Terminals

Cable terminals and connecting blocks are described in detail elsewhere.

Batteries

Not more than 12 Blue Bell dry cells will be necessary for operating any of the above systems (5 cells for the talking circuits and 4 to 7 cells for the ringing circuits, depending upon the length of the line). The cells can be placed in the basement or any other accessible place.

Door Opener

If a door opener is included in the system, additional dry cells will be required. Generally two or three cells have been found sufficient for this purpose.

Any standard type of door opener may be used.

Janitor

1 annunciator switchboard and
*1 or more No. 295 type coil and condenser boxes.

Wiring and Battery Requirements

- *2 wires common to entire system.
- 2 wires for each suite Inter-phone.
- 5 wires for connecting each vestibule to janitor, tradesmen's sets and coil and condenser box.
- Battery to furnish operating current.
- 1 door opener and miscellaneous installing material.
- NOTE.—**One retardation coil and one condenser are required for the janitor's annunciator and each vestibule and tradesmen's Inter-phone.
- *One common wire can be omitted if door opener is not required.

Western Electric Apartment House Inter-phones
System No. 20
 Selective Ringing—Common Talking

No. 1520 Type Vestibule Inter-phone

SERVICE.—The No. 20 Inter-phone Systems are designed to provide an inexpensive and reliable means of communication between vestibule, apartments, janitor's quarters, laundry and tradesmen's entrance. This system differs from Systems Nos. 7, 8, 9 and 10 (as described on the preceding pages) in that only one conversation can be carried on at a time, as all sets are connected to one talking circuit.

There are six combinations of the No. 20 System, differing from each other in the number of locations in the apartments which are to be connected for inter-communicating service. The operation of each of these combinations, however, is the same.

OPERATION.—The vestibule Inter-phone is equipped with a push button for calling the janitor. Each letter box is provided with two or three compartments and below each compartment a push-button is mounted. To call an apartment, the push-button having the name of the apartment wanted is depressed; this rings the bell at the apartment selected and there only.

The apartment Inter-phones can be provided with push-buttons for operating the door opener, calling the janitor, laundry or any other station in accordance with the combination selected.

The janitor's, laundry and tradesmen's Inter-phones can be arranged either for receiving calls from the other stations without being able to signal back, or for receiving calls and for signalling back to any one of the apartments.

Only one conversation can be carried on at a time.

TYPES OF INTER-PHONES.—Wall type Inter-phones are specified throughout for the No. 20 Systems.

TYPES OF SYSTEMS.—(See descriptions on following pages.)

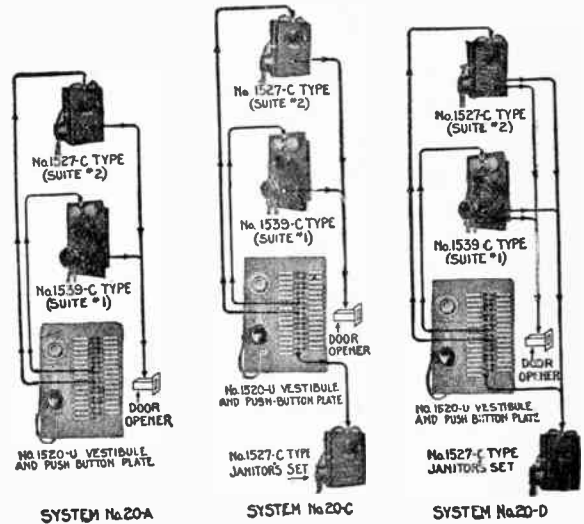

Accessories for No. 20 Systems

The cabling, terminals, door opener (if required) for these systems are the same as outlined for Systems 7, 8, 9 and 10.

Battery Requirements

For the operation of each system a battery of not more than five Blue Bell dry cells is required. These can be placed in the basement or any other accessible place.

Janitor and Laundry

1 Nos. 1527C-2 to 1527C-3 Surface wall Inter-phones (depending upon number of push buttons required).

NOTE.—For more than 8 buttons, add push button block.

Wiring and Batteries

*Five wires common to all Inter-phones. One wire for each apartment Inter-phone, batteries to furnish operating current, one door opener and miscellaneous material.

*One wire may be omitted if door opener is not used.

Western Electric Inter-Phone Outfits

GENERAL.—Where intercommunication is desired between two points in the home or in business, Western Electric Inter-phones can be furnished in "a-pair-in-a-package" outfit; that is, two Inter-phones complete with all the installing materials and instructions necessary to put them up. The outfits do not, however, include batteries, which must be ordered separately. For average conditions four or five dry cells will be sufficient.

SERVICE.—Consists of two wall or hand set type Inter-phones suitable for a private telephone line between house and barn or garage, or for a line that is wholly within a house, also for use in offices or shops between two buildings or in one building.

OPERATION.—Either station can ring and talk to the other.

Outfit No. 17

This outfit consists of 2 No. 1003 type hand sets with all material required to install a simple intercommunicating system between 2 points not over 80 feet apart, and where the wire will be wholly indoors and not exposed to weather conditions or moisture. The material, in addition to the hand sets, consists of 2 connecting blocks with mounting screws, 80 feet of insulated twisted pair copper wire, 60 insulated nails for fastening wire, 2 hooks for holding hand sets, 2 bells, 2 battery connectors and illustrated installing instructions.

Outfit No. 30

No. 1527C-1 Inter-phones

This outfit includes 2 surface wall No. 1527C-1 inter-phones and 1 No. 51H retardation coil in one box but no installing or wiring material.

Western Electric Inter-phone Outfits

Continued

Outfit 31

No. 6043P Inter-phones

This outfit includes 2 hand set type No. 6043P inter-phones and No. 51H retardation coil in one box but no installing or wiring material.

Outfits Nos. 30A and 31A

These outfits are for use where the wiring is to be run entirely under cover and not exposed to moisture or weather.

Outfit No. 30A includes one No. 30 outfit in one box and another box containing installing material (described below).

Outfit No. 31A includes one No. 31 outfit in one box and another box containing installing material (described below).

The wiring material furnished with the No. 30A and No. 31A outfits consists of 75 feet of insulated 3-conductor copper wire, 2 battery connectors, insulated nails for fastening wires and illustrated installing instructions.

Outfits Nos. 30B and 31B

These outfits are for use where the wiring is to be run in the open between or outside of buildings, and exposed to weather and moisture.

Outfit No. 30B includes one No. 30 outfit in one box and another box containing installing material (described below).

Outfit No. 31B includes one No. 31 outfit in one box (described above) and another box containing installing material (described below).

The wiring material furnished with the No. 30B and No. 31B outfits consists of 150 feet of outside 3-conductor copper wire, 2 brackets with screws, hooks and knobs to attach wires to building, 2 porcelain tubes to insulate wires when entering building, 2 battery connectors, 25 insulated nails for fastening wires inside building, and illustrated installing instructions.

This standard package idea for Inter-phones has been devised as a means of assisting purchasers in selecting the proper equipment for their needs without requiring them to make a study of the subject. At the same time it assures them of getting uniformly good materials, and in the proper amounts. The outfits are packed in a box ready to be sold over the counter or mailed by parcel post.

Western Electric Inter-phone Systems

Apartment House Service

System No. 21

Selective Ringing—Common Talking

No. 1524A Inter-phone with Two 3 Nest Letter Boxes

General Information

The No. 21 Inter-phone Systems are designed to provide communication between vestibule, apartments, janitor's quarters, laundry and tradesmen's entrance.

This system has the same service requirements as system No. 20, except that the vestibule equipment consists of a loud-speaking, cordless type Inter-phone which eliminates all projecting parts and provides against theft of receivers and cords. In addition to these features, the telephone set proper has a locking-in arrangement which further protects against theft of the complete unit.

There are six combinations of the No. 21 system, differing from each other in the number of locations in the apartments which are to be connected for inter-communicating service. The operation of each of these combinations, however, is the same.

The vestibule Inter-phone is equipped with a push-button for talking and listening. Each letter box is provided with two or three compartments, and below each compartment a push-button is mounted. One of the letter box compartments and its associated push-button must be used for signalling the janitor.

To call one of the apartments from the vestibule, the letter box push-button (under the name of the party wanted) is depressed, which rings the bell of that apartment. The vestibule party next depresses the button at the bottom of the telephone set, and keeps it depressed while awaiting reply, and while conversing with the apartment party.

The apartment Inter-phones can be provided with push-buttons for operating the door opener, calling the janitor, laundry, or any other station in accordance with the combination selected.

The janitor's, laundry, and tradesmen's Inter-phones can be arranged either for receiving calls from the other stations without being able to signal back, or for receiving calls and for signalling back to any one of the apartments.

Only one conversation can be carried on at a time.

Wall type Inter-phones are specified throughout for the No. 21 systems.

Accessories for No. 21 Systems

The cabling, terminals, and door opener, if required, for these systems are the same as outlined for systems 7, 8, 9 and 10.

Battery Requirements

For the operation of each system three sets of dry batteries are required, each set to consist of three dry cells. The batteries can be placed in the basement, or any other accessible place.

Detailed information covering wiring diagrams, connections of wires and cables, connecting blocks, etc., can be found in our booklet, "Installing and Maintaining Western Electric Inter-phones," which will be furnished upon request.

Western Electric Magneto Non-multiple Switchboards

No. 1800 Sectional Unit Type

Method of Assembling No. 1800 Switchboard to 35 Line Capacity

The unit or sectional type construction for the small switchboard was introduced by the Western Electric Company a number of years ago, and since that time has been supplying the demand of discriminating buyers for a small switchboard that would meet their traffic requirements and eliminate the necessity of buying an "oversize switchboard."

The capacity of the No. 1800 Unit Type Switchboard is from 10 to 50 lines. While 50 lines has been set as an arbitrary maximum it is safe to assume that with a normally low calling rate as many as 70 or 80 lines can be handled conveniently. While the No. 1800 Unit Type Switchboard is small in size (Floor space required only 2 feet x 2 $\frac{1}{2}$ feet), this does not mean that this board receives less consideration or care in manufacture than a larger switchboard, for the same quality of material, skilled workmanship and rigid inspection are applied to all of the Western Electric products regardless of size. Red oak lumber, which has been kiln-dried, thoroughly seasoned and given a dark rubbed finish, is used in the construction of the units. The inside of the units have been specially treated to preserve wood and prevent warping or cracking.

To meet various requirements, there are different types of base or supporting units, cord units, line units and top units. To assemble a switchboard of 10 lines capacity for example it is only necessary to select units as follows:

- 1 Supporting Unit
- 1 Cord Unit
- 1 Line Unit
- 1 Top Unit

These units are easily assembled into a complete switchboard which presents a neat, compact and serviceable appearance and can be arranged to meet any service condition. Line units can be added at any time.

All of the apparatus and terminals associated with the operator's cord and telephone circuits are mounted in the cord unit.

The circuits used are very simple. A diagram of each circuit is pasted to the inside of the rear doors for convenient reference. The back of each unit is hinged and, when open, all of the wiring and equipment are easily accessible.

This switchboard is specially recommended for small, rapidly growing telephone exchanges where the ultimate capacity cannot be definitely determined.

No. 1012 Western Electric Magneto Wall Switchboards

Ringer Type

This switchboard is intended for use in exchanges having 10 lines or less, and where the number of calls does not warrant having a regular telephone operator in attendance.

It has been installed by numerous rural companies who desire a switching station established in the country in which case it is installed in a farmer's home and the calls are answered by members of the family.

Being equipped with ringers, constant attendance at the switchboard is not necessary as the bells can be heard at some distance from the board.

In addition to this ringer, indicators are supplied with each ringer which gives a visible signal showing which bell has been ringing.

The cabinet is well constructed of thoroughly seasoned, quarter sawed oak, which is given a durable light finish. The front is hinged and the apparatus and wiring is within easy reach for inspection or maintenance.

Equipment

Each line is provided with a jack and a 1000 ohm ringer, although 1600 or 2500 ohm ringers can be furnished if required. Four-cord circuits, with a listening-in jack bridged across the tip and ring, and a listening cord are provided for handling the calls, no supervisory or ring off signals being provided. A powerful five-bar hand generator is furnished for ringing purposes. The operator's telephone set consists of the regular long distance transmitter and receiver.

Operation

Subscribers are called by ringing with the hand generator over the listening cord with which the operator answers calls and listens in for supervisory purposes. Connections are made with the other cords, without the use of keys.

No. 1240-D Western Electric Magneto Switchboards

Non-multiple—Automatically Restored Line Signals

Capacity, 165 Lines 15 Cord Circuits

Front View

as to be within easy reach of the operator, reducing that work to a minimum.

The lumber used in the construction of the cabinet is red oak, thoroughly seasoned and kiln dried to prevent warping or cracking.

The exterior of the cabinet is given a dull golden oak finish which is very serviceable. As an added precaution against warping, cracking or decay the interior surfaces are coated with shellac.

The steel framework which supports the face equipment is copper plated as a protection against corrosion or rust, also insuring a positive ground connection for the apparatus.

An apparatus and terminal board is mounted in the rear of the switchboard on which are mounted the repeating coils, night alarm bell, and large screw terminals where all power wiring such as power ringing, transmitter battery, night alarm battery, monitor taps, etc., are terminated.

The No. 1240-D non-multiple magneto switchboard is furnished with either single or double supervision cord circuits. Single supervision boards may, if desired, be equipped with five cord circuits having toroidal repeating coils and switching keys. Double supervision boards may be equipped with either the condenser type non-hang-up cord circuits, or the condenser repeating coil type non-hang-up, non-ring-through cord circuits. The present switchboard, if arranged for single supervision, may be changed to a double supervision board simply by installing the necessary additional apparatus.

Dimensions

No. 1801 Western Electric Private Exchange Switchboards
Central Battery—Sectional Unit Type

Systems A, B, C or D

The No. 1801 sectional unit type switchboard (like the No. 1800) was originated by the Western Electric Co., and introduced to the telephone trade to supply the demand for a small flexible and economical switchboard. Adaptable to many conditions, this switchboard has been installed by small telephone companies, as private branch exchanges, for hotels, factories, public schools and institutions or any place where telephone service was required and the ultimate capacity could not be definitely determined.

Being of the unit type, with construction somewhat similar to the sectional book case, and so arranged that additional units may be readily added when required, this switchboard is adaptable to many line and traffic conditions which are met on the small exchange. The rear of the units is permanently closed. The front panels of all units are held in place with thumb screw locks and are hinged to permit access to the wiring, terminals and apparatus. All connections are made under screw terminals.

The No. 1801 has lamps for the line and supervisory signals. Birch lumber, with a mahogany finish, or quarter sawed red oak which has been kiln dried and thoroughly seasoned to prevent warping and cracking is used in the construction of the units.

Four systems—"A," "B," "C" and "D" have been devised to handle the various classes of service required in this type of switchboard. Telephones which can be used with the systems are

System A

listed under heading: Central Battery Telephones.

SYSTEM A.—This system provides for communication between the switchboard and stations only. There are no facilities for inter-communication between stations or for connections to a central office.

SYSTEM B.—This system embodies all of the features of System "A" and in addition has facilities or intercommunication between stations.

SYSTEM C.—This system embodies all of the features of system "B" and in addition two plug ended trunks are provided which may be equipped for connections to either magneto or central battery central offices.

NOTE.—Direct current is used for ringing the telephone bells in Systems A, B, and C.

SYSTEM D.—This system has all of the features of system "C" except that it employs the regular two wire line circuit, and alternating current is used for ringing purposes.

The telephone sets used with this system are the regular central battery sets used with central office systems.

Write our nearest house for particulars. State which system is best suited for your requirements.

No. 1962 Western Electric Private Branch Exchange Switchboards
Sanitary Type

Capacity: 200 Central Battery Local Lines,
 8 Trunk Lines, 12 Cord Circuits

This switchboard is designed for use as a private branch exchange connecting with a public telephone system. It is of the central battery type, making use of lamp line signals and lamp supervisory signals. The line signal is associated directly with the corresponding line jack. The lamp supervision is

positive as the signal is closely associated with the corresponding cord. This arrangement provides for rapid and reliable operation.

This type of board is furnished with either plug or jack-ended trunks. The plug-ended trunks provide for reducing the number of connecting cords and are an efficient means of providing inter-connections with a city exchange system. The jack-ended trunks afford high-class connections and are somewhat less expensive than plug-ended trunks. They also require the furnishing of a somewhat greater number of connecting cord circuits. These trunks may be supplied for connection to either a magneto or a central battery office. When plug-ended trunks are furnished, holding jack circuits are also supplied to enable an operator to hold the exchange trunks when all four lines happen to be busy.

DIAGRAM SHOWING DIMENSIONS OF NO. 1962 SWITCHBOARD.

Dimensions

This type of switchboard is furnished only in a single position section, but two sections can be lined up together to appear as one section and a drawer unit can be supplied at either or both ends of a one or two position line-up. The key-shelf is 30½ inches high, which permits the use of an ordinary office chair, also provides for lining up the switchboard with standard office desks.

The standard wood work is birch with mahogany finish, or quarter sawed oak, light finish.

Built along the lines of modern office furniture it will harmonize with the surroundings in any modern office.

The No. 1962 switchboard being universally wired is adaptable to the varied requirements of private branch exchange service. It is designed to handle all practical service conditions which have arisen since the advent of the private branch exchange idea.

In addition to including all of the popular features adapted to private branch exchange service the No. 1962 switchboard is of the "Sanitary Desk Type" of construction which represents the Western Electric Company's most recent development and departure from old manufacturing methods. This switchboard is evidence of the continuous efforts being exerted by the Western Electric engineers toward the development of modern switchboards which will meet the exacting demands of discriminating buyers, and still retain the simplicity of operation, quality of material, skilled workmanship and low maintenance cost, which have been characteristic of Western Electric products in the past.

No. 1948 Western Electric Central Battery Non-multiple Switchboards Sanitary Type

Capacity: 240 Central Battery Lines, 40 Toll or Rural Lines, 20 Transfer Trunks

The No. 1948 Switchboard is designed to provide the small telephone companies who desire central battery service with modern, efficient and reliable equipment. It is built along the lines of the modern office desk, having square lines generally, square legs (metal capped at bottom) and a clearance underneath for cleaning purposes, hence the term "Sanitary Type" and is the Western Electric Company's latest departure from old methods of small switchboard manufacture. Meeting the demands of exacting buyers as it does is evidence of the confidence enjoyed by this company in the development of a much needed small central battery switchboard which is easy to operate, economical to maintain and constructed of the same materials which enter into the construction of the larger boards upon which the Western Electric Company's reputation for quality products is built and maintained.

DIAGRAM SHOWING DIMENSIONS OF NO. 1948 SWITCHBOARD.

Dimensions

Cord circuits are arranged with lamp supervisory signals, giving positive supervision. Any or all cord circuits can be arranged to operate as straight central battery or full universal.

In the universal circuits, toroidal type repeating coils will be furnished if specified. When these are furnished, cutout key may be used so that if two magneto lines are connected, the repeating coil may be either cut in or out of circuit. When a magneto and central battery line are connected, the repeating coil equipment will serve to minimize noise.

Various ringing combinations are available. To provide for any of these, universal wiring is installed.

Suspended type transmitters are usually furnished, but chest type transmitters will be supplied, if ordered.

Write our nearest house for particulars.

No. 550 Type Western Electric Private Branch Exchange Non-multiple Switchboards

80-line No. 550B

The No. 550B switchboard in both the 30 and 80-line capacities makes an ideal installation in any city or town where the present equipment of the main central office is of the manual central battery type.

It has end panels permitting the lining up of two boards.

Red oak lumber with a rich dark finish or birch with mahogany finish is used for all exposed wood-work parts.

If there is a possibility of a change from manual to machine switching telephone equipment the

purchase of the No. 550C switchboard, which has trunks arranged for connection to machine switching offices, including the necessary dialing features, is recommended.

Types and Capacity

	550B(30)	550B(80)	550C(30)	550C(80)
Station lines total.	30	80	30	80
†Station lines.				
wired for relays.	10	20	10	20
Trunk lines.....	10	15	10	15
*Cord circuits.....	10	15	10	15

*The cord circuits in the No. 550B board can be equipped for either single or double supervision while those in the No. 550C board are arranged for double supervision only.

†Certain lines are wired for relays to be used on lines where the telephone is located considerable distance (800ft.) from the switchboard. Relays are not provided unless specified.

The equipment, such as relays, resistances, retard coils, etc., associated with the trunk, line, cord, night alarm, dialing, auxiliary and operator's telephone circuits, is mounted on a swinging relay gate which is constructed of a single piece of cold drawn galvanized steel bent in

Dimensions

the proper shape and mounted on a heavy steel bracket securely fastened to the switchboard.

The line circuits are simple and terminate on screw terminals located on a hinged connecting rack which can be opened for inspection. Jack ended trunk circuits are used in all No. 550 boards. The cord circuits embody all of the features required for the successful operation of the private branch exchange. Connections between stations and from stations to trunks are easily established.

Individual line jacks and associated lamp sockets are used in all boards on trunk and line circuits.

The jacks and lamp sockets are individually mounted as in the line circuits.

The dial may or may not be used as desired it being easily installed when needed. It is connected to the local cable by means of a flexible cord and the dial itself held in place by a spring clip which is screwed to the keyshelf. When the dial is not equipped the hole for the cord is suitably covered with an apparatus blank.

Western Electric Magneto Telephones

No. 1317 Type

General Description

2-Cell, Closed View

The No. 1317 type telephone represents the highest development attained in magneto telephone design and construction. It has been standard with the Western Electric Company for more than a decade, and its high efficiency, reliability and long life have been thoroughly proven by the hundreds of thousands in service.

2 and 3 Cell Types

No. 1317 telephones are made in two styles, namely, the "2 cell" and the "3 cell." The talking circuits of these two types are identical, i.e., they employ the same transmitters, receivers and induction coils. The battery compartment of the "3 cell" type is sufficiently large to take three standard dry cells, whereas only two dry cells can be placed in the "2 cell" type. The larger cabinet of the "3 cell" type also permits the mounting of the No. 43 type (5 bar) generator, while the "2 cell" type employs the No. 50 type (large 3 bar) generator, while intended primarily for use on medium loaded lines, is exceptionally powerful, and is capable of giving satisfactory service on about 90 per cent of the lines now in use. For example this generator will ring thirty 2500 ohms ringers connected to a No. 12BB iron metallic telephone line 15 miles in length (provided, of course, that the line is properly installed and in good condition).

It will operate more tele-
phones on a line than many four or five bar generators.

2-Cell Dimensions

WOODWORK AND FINISH.—The cabinet is made of quarter sawed oak and given three coats of high-grade varnish rubbed down by hand. Unexposed surfaces of the telephone are also given a protective finish so as to prevent warping.

WIRING.—All terminals including those for the transmitter, receiver, cord, line wires, etc., are plainly marked so that

3-Cell Dimensions

there can be no possible mistake when making connections. The various cords, such as those of the transmitter and receiver and the flexible leads running to the condenser are all furnished with cord tips.

A complete and explanatory circuit label is pasted on the inside of the door of each telephone in addition to which a booklet is furnished giving complete instructions for installation and maintenance.

METAL FINISH.—The transmitter bracket, gongs, switch hook, generator, crank and lock escutcheon are given an extremely durable and pleasing black finish.

ADJUSTMENT.—These telephones are carefully adjusted in the factory, and should, therefore, be satisfactory for service as received by the customer unless unusual service conditions should be encountered, in which case only the ringer will require readjustment. The adjustment of the ringer is a very simple matter and instructions furnished in the booklet are so clear that no difficulty will be encountered.

In addition to the above-mentioned apparatus all of these telephones are equipped with the following apparatus:

- No. 13 Induction Coil.
- No. 323-BW Transmitter.
- No. 8A Transmitter Bracket.
- No. 143-AW Receiver.
- No. 143Y Switchhook.

*Equipped with No. 1006A push button. Telephone user can signal central office secretly or not as desired and can signal other parties on same line by code ringing.

Western Electric Magneto Telephones

Nos. 6003 and 6004 Desk Types

Interior View of No. 6004D

The Nos. 6003 and 6004 type desk telephones consist of a No. 1020AL Desk Stand and a No. 300 or 315 type Desk Set Box. These telephones comprise the combinations of desk stands and desk set boxes that are most used, and therefore for convenience in ordering, are covered by a single code number.

Combinations of apparatus differing from those covered by these code numbers listed may be obtained by ordering the separate items that will make up the desk telephone desired. The following items of apparatus are the electrical equivalent of the No. 1020AL Desk Stand and may therefore be used in connection with any of the desk set boxes listed below.

- No. 1020CC Telephone Arm

NOTE.—In the case of the Nos. 300AA, 301AB, 315H, and 315J Desk Set Boxes provision is made for inserting a one microfarad condenser (see No. 21W condenser) in series with the receiver. However, condensers are not furnished unless so ordered.

Western Electric Central Battery Telephones

Nos. 1533 and 6054 Types

Telephones representing the highest and most modern development in central battery telephone design are found in the Nos. 1533 and 6054 types.

In addition to the superior features represented by the individual pieces of apparatus and circuits, these telephones embody a number of features that are particularly worthy of note, namely:

Ringer and gongs are enclosed within the case thereby preventing tampering, reducing maintenance and greatly improving the appearance.

Case is made of heavy sheet steel, copper plated and finished with two coats of extremely durable black enamel (baked on) especially developed for this particular purpose.

The case is constructed so that every part of the interior is easily accessible when the cover is opened.

The base is flanged thereby giving greater rigidity and preventing base from cutting into plastered surfaces.

Unit type of construction and universal terminal block employed. This permits of the telephone being readily converted from one class of service to another. This also permits of a desk set box being converted into a wall telephone or vice versa by a substitution of covers.

All of these telephones are equipped with the No. 7A transmitter bracket, Nos. 547 and 548 six-inch transmitter cords and a 30-inch No. 521 receiver cord.

*NOTE.—The No. 8AG ringers were formerly wound to 1000 ohms instead of 1400 ohms. The 1000 and 1400 ohms ringers have the same impedance and may be used interchangeably in service.

See separate listing for “Central Battery Telephones for Use with No. 1801 Switchboards.”

Western Electric Central Battery Telephones

No. 6054 Desk Type

No. 6054 Desk Telephone—No. 1020AL Desk Stand Partially Dismantled

The No. 6054 desk type telephones consist of a No. 1020 type desk stand and a desk set box. These telephones comprise the combinations of desk stand and desk set boxes that are most used and, therefore, for convenience in ordering are covered by a single code number.

Combinations of apparatus differing from those covered by the No. 6054 series of code numbers may be obtained by ordering a desk stand and a desk set box as separate items, also a telephone arm or a hand set may be used in place of the desk stand if desired.

For example, any of the desk set boxes that will function with the No. 1020AL desk stand will also function with the following:

1020CC ... Telephone arm

1048AA ... Telephone arm

1048AB ... Telephone arm

1048AC ... Telephone arm

Western Electric Central Battery Telephones

For Use with No. 1801 Switchboard

No. 6000AE

No. 1539A

Systems A and B

The telephones for No. 1801 Switchboard Systems A and B are of the series talking circuit type and equipped with 140 ohm vibrating bells which operate on direct current.

Code No.	Case and Finish	Mounting	Receiver
1527A	Metal, Black	Surface Wall	Watch Case Type
1539A	Metal, Black	Flush Wall	Watch Case Type
1533N	Metal, Black	Surface Wall	Hand Receiver
6034AU	No. 1020BJ Stand	Desk	Watch Case Type

NOTE.—Information on hand set type telephones and desk telephones equipped with hand receivers will be furnished on application.

System C

The telephones for No. 1801 Switchboard System C may be of the same types as used for Systems A and B, but in case the system is connected to an outside exchange, telephones equipped with standard central battery induction coil talking circuit should be used in order to obtain satisfactory transmission, as follows:

Code No.	Case and Finish	Mounting
1533M	Metal, Black	Surface Wall
6000AE	No. 1120CN Stand	No. 295AU Box

System D

Any standard central battery telephone with ringers operated by alternating current either induction coil or series types can be used with System D. The No. 1533A wall type and No. 6054A desk type telephones may be selected for this system.

No. 1320 Type Telephones

No. 1320A Outer Door Open

The No. 1320 type is a metal case weatherproof telephone for central battery service. It was designed primarily for the Police Patrol Service but will be found very satisfactory for general central battery service where a weatherproof telephone is required.

The apparatus is mounted on a metal frame which is removable as a unit from the case. An inner door protects the apparatus from the weather when the outer door is open. The overall dimensions are 6 1/8 inches deep by 13 1/2 inches high by 12 3/4 inches wide.

A loud ringing extension bell may be connected in multiple with the ringer of this telephone thereby providing means of signaling a patrolman from a distance (see extension bells).

A tapped hole is provided in each end of the case for receiving conduit. Four holes are drilled in the back of the case for receiving mounting screws or mounting clamps. The lock on the outer door is designed so that the key cannot be removed until the door is closed.

Outer door is not marked. Standard finish, gray paint.

Special No. 1320A telephones may be obtained with outer doors marked (raised characters cast on door) in accordance with customer's requirements; color of finish, as specified.

Western Electric Magneto Mine Telephones

Western Electric Magneto Mine Telephones

General

A reliable telephone system in a mine will enable the superintendent to communicate instantly with all the important parts of the plant. The saving in time and money which it effects by reliably transmitting routine orders or when there is a temporary suspension of power, a shutdown of some part of the plant, an accident or an emergency

affecting both life and property, justifies many times over the investment required.

Mine Laws

That the Legislatures of many of the States have made the installation of mine telephones and signals a requirement for mine operation, is in itself sufficient endorsement of their usefulness. Those farsighted operators who so quickly and wisely responded to these demands are realizing the benefits of the increased operating efficiency that they effect in their mines along with the insurance against loss of life which was the primary object of the legislative acts.

Mine Telephone Systems

In the Superintendent's office, engine house and other dry and protected parts of the Plant, which should have communication with each other and the mine, the use of standard wall and desk type magneto telephones is recommended.

In cases where all the telephones of the system are connected to a single line (party line) the telephone used should be designed for use on heavily loaded lines—for example:

No. 1336J telephones for service below ground and in exposed locations above ground.

No. 1317S telephones (wall type) (5 bar generator) for service above ground in unexposed locations, or

No. 6004B telephones (desk types).

In cases where the size of the plant warrants it, the preferable arrangement is to employ a number of lines and a switchboard instead of a party line. These lines may each have a number of telephones connected to them but the most satisfactory arrangement is to have the most important telephones of the system (for example, the engine room telephone and the Superintendent's telephone) connected to individual lines.

In cases where a switchboard is employed, the telephones used below ground should be of the No. 1336 type but the lines above ground, if lightly loaded, may be equipped with telephones having 3 bar generators. For example:

No. 1317AH Telephones (wall type), or

No. 6003B Telephones (desk type).

No. 1336 Type Telephones

Briefly, these are metal case magneto telephones having all apparatus and parts treated to resist the action of moisture. They are primarily designed for use on heavily loaded lines where code ringing is employed and, while they are intended chiefly for mine service they are also recommended for outdoor use as in railway service, etc.

Moisture-Proofing

Experience has shown that moisture will condense on the inside surfaces of mine telephones regardless of whether or not they are of so called "Air Tight" construction. In view of this, the practice of employing gaskets, stuffing boxes, etc. was abandoned a number of years ago in favor of the design illustrated by the No. 1336 type. In this design small openings are provided which permit air to circulate through the telephone without exposing it to the chance of trouble due to the entrance of foreign material. An opening is also provided so that water may drain off instead of remaining in the telephone.

Protectors

The telephones installed above ground should be equipped with protectors consisting of open space cut outs (for example the No. 60AP protector) to prevent damage to the telephone by lightning. In case there is a chance of contact between the telephone line and a power circuit protectors consisting of open space cut outs and fuses (for example the No. 58AP protector) should be used.

1336E					
1336J					
1336K	A. C.	48C	A. C.	{ Code Ringing Code Ringing	{ Heavily Loaded Medium Loaded

In addition to the apparatus listed above the No. 1336 type telephones are equipped with a No. 143J switchhook and a No. 31 induction coil.

Special No. 1336 type telephones equipped with a heavy brass padlock with two keys are obtainable. The padlock is attached to the chain in place of the latch pin. Orders for these telephones must state that padlocks are desired.

The No. 1336A telephone is not equipped with a ringer as it is intended for use where an extension bell is preferred to the regular telephone ringer, also for service where all the calls will be outgoing.

The No. 1336E differs from the No. 1336A in that it is equipped with a ringer and an iron hood for protecting the gongs.

The No. 1336J differs from the No. 1336E only in that a condenser is provided to permit the ringers of this telephone as well as others on the same line, being rung even though its receiver may have been left off the switchhook.

To add a condenser to a No. 1336 type telephone that was not originally so equipped the following apparatus and parts should be ordered:

No. 21W Condenser. One Condenser Strap P-43065. Two Round Head Machine Screws P-110187.

RINGING.—The No. 1336A telephones are intended for standard bridging service on heavily loaded lines, i.e., the generators and ringers are of such design that forty or more telephones can be operated successfully as far as the ability to ring one another and converse is concerned. It is, however, understood that as many telephones as these on a line would be undesirable.

RINGERS AND EXTENSION BELLS.—The ringers used in these telephones may be readily adjusted if necessary with a screwdriver. The gongs emit a loud distinct ring, which can be heard a long distance, particularly so underground. However it is often desired to provide loud ringing extension bells in connection with mine telephones and for this purpose the No. 392 and No. 342 type extension bells are recommended as they are designed to withstand the severe conditions encountered in mine service.

Western Electric Magneto Mine Telephones

Continued

DRY CELLS.—Two standard size dry cells are required for each telephone to furnish current for talking. Western Electric Blue Bell Dry Cells are specially designed for telephone service and are recommended because they last longer and are more efficient for this class of service than other dry cells.

Two special Blue Bell Dry Cell cartons, impregnated with moisture-proofing compound, are furnished with each No. 1336 type telephone. These are to be substituted for the standard cartons furnished on the dry cells. These cartons resist the action of any moisture that may form on the inside of the case and prevent current leakage and rapid deterioration.

CASE.—The box, outer door, inner door and gong hood are of cast iron heavily coated with a rust resisting finish. When the outer door is closed only the metal transmitter mouthpiece, receiver, receiver cord and the generator handle are exposed. When the outer door is closed these parts are protected from mechanical injury. When using this telephone it is, of course, evident that only the outer door need be opened.

ENTRANCE FOR LINE WIRES.—The line wires may be brought in either at the top or the bottom of the case. A short length of pipe is screwed into the top of the case and is covered with a pipe cap. This cap prevents water running into the set by following the line wires. In case the line wire is to be run to the telephone in pipe (conduit) no difficulty will be encountered in joining the conduit to the telephone as the wire entrance hole at the bottom as well as the top of the case is tapped.

MOUNTING.—Wrought iron mounting bars are secured to the back of the case. The upper end of these have "pear" shaped holes, and with this arrangement the telephone can be readily mounted by one man and without any danger of damaging it. This is accomplished by driving two lag screws into the mounting surface until their heads project about 1/2 inch. The telephone may then be hung upon these mounting screws (the heads of the lag screws will pass through the large end of the "pear" shaped holes) after which the lower mounting screws may be driven into place through the holes in the lower end of the mounting bars. Wrought iron mounting bars are employed as they are less subject to breakage than if lugs were cast on the case.

Typical Western Electric Mine Telephone Systems

Typical Diagram Showing Method of Connecting Telephones to a Switchboard

Gray Telephone Pay Stations

Non-electrical—For Local or Central Battery Service

No. 7 Mounted on a Central Battery Telephone

No. 11 Mounted on a No. 1317 Wall Telephone

No. 14 Mounted with a No. 1020 Desk Stand

The operation of these pay stations is accomplished without the aid of moving parts or electrical connections, the signals being produced by the coins striking gongs or chimes, the sound of which is transmitted to the central office operator through the transmitter of the telephone at which the pay station is located. In view of the simplicity and reliability of these pay stations, their maintenance cost is extremely low.

(These pay stations cannot be used for pre-payment service, as the coin is not under the control of the central office operator, as in the Western Electric No. 7 and No. 50 type Coin Collectors.)

No. 7

This will be drilled to take standard transmitter arms.

No. 20

This pay station will be equipped with fittings to permit of its being attached to a standard type of desk telephone. Fittings are arranged so that the unit thus formed may be fastened to a counter or telephone booth shelf. In ordering, specify the type and make of desk telephone with which it is intended for use.

20	Desk	Nickels, Dimes and Quarters	10¾x4¼x3¼
----	------	-----------------------------	-----------

The above code numbers cover pay station boxes only.

Western Electric Portable Magneto Telephones

No. 1330E Closed

No. 1330E Open

Nos. 1330 and 1331 Types

These are complete magneto telephones mounted in substantial wooden cases. They are primarily for use in railway service and are designed to withstand the jarring and rough handling incident to train service. In addition to railway service these telephones are suitable for any service where a substantial type of portable telephone is required. While these telephones are not waterproof they are designed to withstand ordinary weather conditions.

The Nos. 1330F and 1331F telephones are equipped with a six-foot waterproof cord and No. 146 plug for connecting them to a telephone line through a No. 186 pole jack.

The Nos. 1330E and 1331E telephones are intended primarily for use where connection to the line will be made with a line pole.

No. 1375 Type

The No. 1375B is especially adapted for use in cases where the telephone user must carry the telephone considerable distances. While it is primarily intended for use on moderately loaded lines, the design of the generator is such that it may be satisfactorily operated on heavily loaded lines.

The generator, induction, coil buzzer and terminal block are mounted on an aluminum frame and secured in the case by means of machine screws.

The case is made of high grade leather and is designed to withstand considerable rough handling.

*Batteries are not included in the price of the telephone and are furnished only when specified in the order.

Western Electric Telephone Booths

No. 1 Type Folding Door

The No. 1 type booths are designed for installation in groups being built in units with unfinished sides. They are placed with separators between adjacent units and assembled with panels at either end of the group of compartments. The backs of the units are finished as indicated in

the code listings. The hardwood back can be equipped with an upper panel of glass upon request, at an extra charge.

The folding door construction makes these booths particularly desirable for use in narrow hallways or passages as the door opens and closes in a space only three inches beyond the front surface of the booth. This door will remain as placed in any position. The sides, ceiling and the lower panel of the door on the inside are lined with sheet metal. The floor and front base-board are covered with linoleum and the threshold is protected with a safety tread.

The ceiling of the booth is 4 1/2 inches below the roof and the intervening space may be used as a wiring chamber and to house an electric light relay or door switch equipment when these features are required.

These booths are strong and substantial in construction.

The special folding door design not only economizes space but protects the user.

Standard No. 1 Type Booths Consist of the Following

No. Code	Description
1-A	Light Mahogany Booth Unit with Hardwood Back
1-B	" " " Softwood
1-C	Quartered Oak " " " Hardwood
1-D	" " " Softwood
1-E	Dark Mahogany " " " Hardwood
1-F	" " " Softwood

The above listings of No. 1 type booths do not include end panels, separators, seats, locks, keys and lighting equipment. These items must be ordered separately.

Booth Switches

Code No.	Description
1A	This switch is used for disconnecting a telephone, located in a booth or pole box, from the line when the booth or pole box is locked. It operates when a hasp is placed over the staple and held in place by a padlock. It guards the telephone set against injury from lightning discharges. The approximate dimensions of the switch case are: width, 3 1/2 inches; depth, 1 inch; and length, 4 1/2 inches.

Western Electric Telephone Booths

No. 2 Type Folding Door

Half Closed Booth Over All Height, 88 1/4 Inches

The No. 2 type booth is built as a single unit and presents a neat and pleasing appearance from all points of view. Several of these booths may be placed next to each other to form a group, such booths being ordered without glass panels in the sides, that is, they would have glass panels in the door only.

The following points should be noted in considering the advantages of this form of booth construction.

The movement of the Folding Door takes but three (3) inches of space beyond the front of the booth, making it possible to use this type of booth in narrow passageways.

Design is such that door is open at all times when booth is not in use. This is the only practical plan for booth ventilation. The point where the 2 leaves of the Folding Door meet is of such design as to prevent any chance of injuring the fingers or hand. One of the distinctive advantages of the Folding Door is that it can be both closed and opened by pulling on the handle. This feature is possible only with this type of door.

The Folding Door does not require the use of tracks in the floor, consequently eliminating the main cause of trouble formerly experienced with the booth equipped with sliding doors. The design of the Folding Door is such that it will remain open or closed without the use of latches or catches.

The Folding Door folds within the booth; consequently, there is no interference with adjacent doors.

Standard No. 2 Type Booths Consist of the Following

Code No.	Description
2-A	Plain Oak with 3 Lights (Glass) (2 Left Side and 1 Right Side)
2-B	Birch—Dark Mahogany Finish with 3 Lights (Glass) (2 Left Side and 1 Right)
2-C	Birch—Light Mahogany Finish with 3 Lights (Glass) (2 Left Side and 1 Right)
2-G	Plain Oak has Solid Sides (No Glass in Panels)
2-II	Birch—Dark Mahogany Finish has Solid Sides (No Glass in Panels)
2-J	Birch—Light Mahogany Finish has Solid Sides (No Glass in Panels)

The above listings of No. 2 type booths do not include end panels, separators, seats, locks, keys and lighting equipment. These items must be ordered separately.

Equipment

- INTERIOR.—Sides, back and ceiling lined with sheet metal.
- FLOOR.—Hardwood flooring.
- THRESHOLD.—Protected with safety tread.
- DOOR.—Always hinged on right-hand side (facing booth).
- SHELF.—Furnished with each booth. Shelf is intended only as an elbow rest.
- WIRING.—Space between ceiling and roof (27 1/4 inches wide, 27 1/8 inches deep, 4 1/4 inches high) is provided as a wiring chamber, and as a housing for electric light relay or door switch equipment. A wiring slot is provided back of inside corner moulding. Ceiling of booth is bored for electric light fixture, and to receive a door switch designed to operate an electric light by movement of the door.
- SEAT.—Made of oak or birch.
- LOCK.—Designed especially for Folding Door booths. Furnished only when specified.

Western Electric Telephone Booths
No. 3 Churchill Type Receding Door

Western Electric Telephone Booths
No. 4 Churchill Type Swinging Door

Booth Half Closed

Dimensions
Over All Height, 83 1/2 Inches

Booth Half Closed

Dimensions
Over All Height, 83 1/2 Inches

The Churchill No. 3 type receding (or sliding) door telephone booth is built as a single unit and is especially characteristic in its design. It is made throughout of genuine kiln dried selected plain white oak or birch equipped with a reinforced back panel for mounting a wall telephone or coin collector set. It also has a writing-shelf. This receding door booth construction makes these booths especially desirable for use in narrow hallways or passages as the door only extends a maximum of six inches beyond the front surface of the booth when open. The No. 3 type has no grooves in the floor where dirt can accumulate and interfere with the operation of the door and it is provided with mechanical devices to permit the door being opened and closed in a smooth and easy manner. When the door is in closed position, it is only necessary to push on the right-hand side of the door. This feature from a user's standpoint is important.

Several of these booths may be placed adjoining each other to form a group or battery, such booths being ordered without glass panels in sides.

OUTSIDE DIMENSIONS.—(Booth assembled). 83 1/2 inches high, 28 1/2 inches wide and 29 1/4 inches deep.

INSIDE DIMENSIONS.—80 1/2 inches high, 27 inches wide and 27 1/4 inches deep.

DOOR OPENING.—77 1/2 inches high, 23 inches wide.

DOOR EQUIPMENT.—The door is equipped with patented steel, nickel-plated hardware consisting of:

1 swivel roller guide and track on top of door, 1 sliding guide on bottom of door which operates on outside edge of tread, 2 roller hinges on back edge of door which operate on tracks fastened to side of cabinet, 1 handle for inside of door, 1 lead aluminum tread at front edge of bottom.

FINISH.—The booth is thoroughly finished inside and out in following manner:

The sides and front are stained, filled, then given one coat of shellac and a final coat of flat varnish, producing a smooth satin finish. The back and top are stained, filled and given one coat of varnish. The floor is thoroughly oiled.

SHIPPING.—The booths are shipped "knocked down" in a substantial crate, ready for assembly, upon receipt at destination. Orders for this type of booth should specify the following code and descriptive information (state "Churchill Type").

Code No.	Material	Finish	Description
3A	Plain Oak	Medium Oak	1 Glass Panel in Door, 1 Glass in Right Side.
3B	Birch	Dark Mahogany	1 Glass Panel in Door, 1 Glass in Right Side.
3C	"	Light Mahogany	1 Glass Panel in Door, 1 Glass in Right Side.
3D	Plain Oak	Medium Oak	1 Glass in Door, 1 in Right Side, 1 in Left Side.
3E	Birch	Dark Mahogany	1 Glass in Door, 1 in Right Side, 1 in Left Side.
3F	"	Light Mahogany	1 Glass in Door, 1 in Right Side, 1 in Left Side.
3G	Plain Oak	Medium Oak	1 Glass Panel in Door Only.
3H	Birch	Dark Mahogany	1 " " " " "
3J	"	Light " "	1 " " " " "

BOOTH CONSTRUCTION.—The No. 4 type telephone booth is made throughout of genuine kiln dried plain white oak (with medium oak finish) or birch (with a light or dark mahogany finish). All sides are framed and paneled 3-ply. The door is equipped with a glass upper panel. The right or left sides of the booth are interchangeable and can also be equipped with glass upper panel if desired.

This booth is equipped with a reinforced back for mounting either a wall telephone or coin collector set. A writing-shelf 5 3/4 inches wide is also supplied which affords means for mounting a desk telephone.

OUTSIDE DIMENSIONS.—(Booth assembled). 83 1/2 inches high, 28 1/2 inches wide and 29 1/4 inches deep.

INSIDE DIMENSIONS.—80 1/2 inches high, 27 inches wide and 27 1/4 inches deep.

DOOR OPENING.—77 inches high and 23 inches wide.

DOOR EQUIPMENT.—The door is attached to the door-frame with three substantial hinges, finished in black japan and the mortise lock with knob on each side is finished in japan.

A lead aluminum door tread is supplied on this booth.

FINISH.—The booth is thoroughly finished inside and out in the following manner:

The sides and front are stained, filled, then given one coat of first coat shellac and finished in flat varnish producing a smooth satin finish. The back and top are stained, filled, and given one coat of varnish.

The floor is thoroughly oiled.

SHIPPING.—The booth is shipped "knocked down" in a substantial crate, ready for assembly upon receipt at destination. A card giving full instructions for the assembly of the booth is packed with each unit.

ORDERS for this type of booth should specify the following Code and Descriptive information (state "Churchill Type").

Code No.	Material	Finish	Description
4A	Plain Oak	Medium Oak	1 Glass Panel in Door, 1 Glass in Right Side.
4B	Birch	Dark Mahogany	1 Glass Panel in Door, 1 Glass in Right Side.

4G	Plain Oak	Medium Oak	1 Glass in Door Only.
4H	Birch	Dark Mahogany	1 " " " " "
4J	"	Light Mahogany	1 " " " " "

**Western Electric Street Railway Telephones
Magneto and Battery Types**

No. 1278 type telephones employ weatherproof iron boxes and are provided with "insulated" circuits. They are intended principally for exterior use by street railway companies operating telephone lines on which there is a chance of crosses with low voltage power circuits. This type telephone is arranged so that its circuit is cut off from the line except when its door is opened. When the telephone is in use a repeating coil is interposed between the line and the telephone circuit proper, so as to protect the user, as far as possible, from the chance of injury should the line become crossed with a low voltage circuit. When the door is opened, a line switch is released which connects one winding of the repeating coil across the line and connects two fuses and two open space cut-outs into this circuit. The telephone circuit proper is connected to the second winding of the repeating coil and has no direct contact with the line circuit. The fact that a repeating coil is interposed between the line circuit and the telephone circuit reduces the efficiency of the telephone to some extent and, therefore, the use of these telephones is not recommended on heavily loaded lines, except where the protective feature is essential. See No. 1336 type telephones. In case a car is held up awaiting orders from the dispatcher the door of the telephone is left open so as to permit of the telephone being signalled. (It is impossible for the telephone to be signalled when its door is closed.) As the talking circuit is only closed when the push button in the hand set is depressed, the battery in the telephone is not wasted under the above condition. The apparatus of this telephone is mounted on an iron shelf, which may be removed as a unit from the telephone for inspection. The connection between the apparatus on the shelf and the line and ground terminals is made through the medium of clips which register with contacts mounted on a terminal block secured to the back of the case. The case and door are of cast iron and have a galvanized finish. Both the top and bottom ends of the case are tapped for receiving 1/2 inch conduit.

The F, G and J telephones are equipped with a lock which is arranged so that the key cannot be removed until the door of the telephone is closed. The No. 1278H is equipped with a hasp, staple and pin similar to that used on No. 1336 type telephones, but padlock is not included.

For Magneto Service

Western Electric Unmounted Condensers

Used in on party lines where ringing trouble occurs due to "listening in" or leaving receivers off hook.

Telephones equipped with one of these condensers wired in series with the receiver overcome this difficulty, and it is possible to ring satisfactorily on a line with several receivers off.

Western Electric Desk Stands

No. 1040AL

For regular bridging magneto or common battery service. Insulated transmitter. Includes 1 No. 40AL desk stand, 1 No. 323W transmitter, 1 No. 143AW receiver and cords. Bower-barff finish.

Western Electric A. C. Extension Bells

Intended for auxiliary use in connection with wall, desk or telephone arm telephones. They consist of a ringer on a suitable mounting and two line terminals or binding posts. For magneto bridging non-selective service only.

No. 127 Type

Ringer mounted in an oak box. Approximate dimensions, width 6 1/2 inches; height 4 3/8 inches; depth 4 5/8 inches.

Code No.	Ringer No.	Resistance Ohms
127E	38AG	1020
127F	38BG	2500
127G	38FG	1600

No. 392 Type

Moisture-proofed loud ringing bells having a black finish metal cover and base with galvanized finish gongs.

When the extension bell is to be used on a central battery line a 2 M.F. condenser must be connected in series with the ringer coils.

Base is arranged for mounting a No. 21D condenser. Condenser is not furnished, however, unless so ordered.

The connecting leads to the ringer coils are so arranged that the condenser can be easily connected in series with the ringer without disturbing the line wires when desired.

Code No.	Resistance Ohms	Diameter Gongs, In.
392A	1000	6
392B	2500	6
392E	1600	6
392G	1000	8
392H	2500	8

Biasing attachment for selective ringing can be added.

No. 342 Type

Loud ringing bells for use in mines and other places where a bell protected from weather is desired. Consists of a No. 392 type bell mounted on a No. 149A backboard having a sloping roof which protects the bell.

Code No.	Bell Used	Resistance Ohms	Diam. Gongs, In.	Code No.	Bell Used	Resistance Ohms	Diameter Gongs, In.

**Western Electric Tubular Fuses
Fiber Shell Type**

No. 7T

No. 7A

No. 11C

These fuses are carefully made from especially selected materials. The use of lead fuse wire prevents the possibility of overheating the shell. These fuses will carry their rated currents indefinitely without injury and will act reliably on one and one-half times their rated current values. Fuses of the same code number and rated capacity will give consistent performance as to rated and operating current values.

Code No.	Rated Capacity Amperes	Used with
7A	1 to 8 as Specified	Nos. 61, 77, 1074A and 1078 Protectors
7T	7	B Cable Terminals.
11C	7	Nos. 58AP and 1079AP Protectors

Western Electric Hand Generators

No. 48A

Western Electric hand generators are correct in both mechanical and electrical design and the materials used and manufacturing processes employed are such that their high efficiency is retained indefinitely.

All parts are accurately machined and fitted and the bearings are of such size that no trouble due to the

armature scraping on the pole pieces will be encountered even after years of service. The gears are accurately cut.

All metal parts are given a protective finish and the armature winding is moistureproofed. The magnets are made from steel which was developed especially for this purpose.

No. 22 Type Generators

The No. 22 type generator is used on lightly loaded magneto lines and may be obtained for alternating or pulsating current.

These generators have three magnets except the No. 22E, which has only two.

No. 29 Type Generators

The No. 29 type generators are used where light weight is essential as in linemen's test sets, and portable telephones.

No. 48 Type Generators

The No. 48 is our most powerful hand generator and is used in telephone for heavily loaded line service.

No. 50 Type Generators

The No. 50 type generator was designed for use on moderately loaded lines and while it only has three magnets, it is considerably more powerful than a good many five-bar generators on the market, and will be found satisfactory for use on all but the very heaviest loaded lines. On a line of 12000 ohms, the No. 50 generator will operate six 2500 ohms Western Electric ringers and will operate thirty-five 2500 ohms Western Electric ringers on a line of about 1000 ohms.

No. 50A

The No. 50 generator is approximately 75% as powerful as the No. 48 type.

Western Electric Hand Generator Boxes

A hand generator box consists of a generator mounted in an oak cabinet having a hinged cover.

The leads from the generator are connected to terminals mounted close to the inside edge of the box.

Code No.	Generator	Current	DIMENSIONS OF BOX, INCHES		
			Width	Depth	Length

299G	48B	A. C. and P. C.	8	6	9
303A	22A	A. C.	6 $\frac{5}{8}$	4 $\frac{1}{2}$	8 $\frac{1}{2}$

No. 1001 Type Western Electric Hand Sets

No. 1001A

The No. 1001 type hand sets have been manufactured for over fifteen years. They were originally intended for the use of linemen and are designed to with-

stand the rough handling, incidental to such service. This design proved to be so satisfactory that it is now used extensively for a number of different purposes, as described below.

The handles are made of brass tubing with drawn brass end pieces and the transmitters and receivers are provided with drawn brass cases equipped with screw clamping rings, thereby making an instrument that is extremely rugged.

The No. 1001-C, and H hand sets are provided with a push button switch which is connected so that these hand sets function the same as the No. 1020-AL desk stand. In view of this, they may be used in connection with our regular magneto and central battery desk set boxes in place of a desk stand, in cases where the service conditions are such that a hand set is required. These hand sets have a nickel-plated finish.

No. 1001A

Used by linemen as a test set on central battery lines. The cord is equipped with spring connection clips.

Code No.	Transmitter	Receiver	CORDS		Push Button Spring Combination

No. 1002 Type Western Electric Hand Sets

No. 1002AC

The transmitter and receiver of the No. 1002 type hand sets are mounted on a nickel plated tubular brass frame, equipped with a hard rubber handle. A switch mounted within the frame is actuated by a plunger which terminates in a ring by which the hand set is suspended, when not in use. When the hand set is removed from the hook, the switch is automatically closed. These hand sets function the same as certain desk stands, and, therefore, may be used in place of desk stands, if required. A hook (No. 141A switch-hook) is furnished with each hand set.

No. 1002D

Used in place of desk stands and telephone arms in connection with Interphones. Also for general use.

Code No.	Transmitter	Receiver	Cords		Switch Combination

No. 1003 Type Hand Sets

NOTE.—The No. 1003 type hand sets are listed under Interphones.

Western Electric Hand Set Hangers

No. 1B mounts on a vertical surface for holding a No. 1001 type hand set when not in use. The hand set is suspended by its receiver, which fits into a recess in the hanger. Cast brass; black finish. Overall dimensions, 3¼ inches wide, 2½ inches deep and 3¾ inches high.

No. 1C is the same as the No. 1B, except that it is equipped with rubber studs and a spring, so arranged as to prevent the hand set from swaying. Used principally on steamships.

No. 1B

No. 186 Western Electric Weatherproof Telephone Jacks

Weatherproof jack designed for mounting poles; affords a means of connecting a portable telephone to the line. Contains protective apparatus. Lock will be furnished if specified in order.

Western Electric Telephone Protectors

No. 58AP

Designed for protection against lightning and crosses with electric circuits.

Consists of 2 No. 11C-7 ampere fuses, 2 each Nos. 26 and 27 protectors and Nos. 16, 29 and 43 mountings.

No. 60AP

Designed for protection against lightning. Consists of 2 each Nos. 26 and 27 blocks and mounting No. 49.

NOTE.—The No. 58AP is recommended in all cases except where the entire telephone system is entirely removed from all other electric lines. In these cases the No. 60AP can be used.

No. 27

Provides better telephone service through fewer interruptions of operation. They are used together without a separator (protector mica) and form an open space cutout which will afford the highest grade of protection against high potentials due to lightning.

The No. 26 protector block is a solid piece of hard non-dusting carbon. The face of the block is especially ground to present a smooth surface. The No. 26 protector block is mounted on the ground side of the protector mounting.

The No. 27 protector block consists of a porcelain frame with a countersunk hard carbon plug which is fastened in place with low temperature fusing cement. The surface of the frame which bears against the No. 26 block, when assembled in a mounting, is finished by grinding. The air gap between the carbon insert in the No. 27 block and the face of the No. 26 block is held to close limits by this grinding process and the consistent operation of the cutouts at the proper voltage is thereby insured.

Ordinary lightning discharges will cause an arc across the air gap between the carbon blocks but will not heat them sufficiently to melt the cement used for holding the carbon plug in place. A cross with an electric light or power line, however, will cause a discharge or repeated discharges, of such duration that the heating of the carbon insert of the No. 27 blocks will melt the cement holding it in place and allow the mounting spring to push it into direct contact with the No. 26 block, thus permanently grounding the line.

Code No.	Description	Used with Protectors, Nos.
26	Carbon Block	{ 12AP, 58AP, 60AP, 76AP, 1268A and 1269A
27	{ Porcelain Frame with Carbon Insert	

The new blocks are interchangeable with the old combinations of No. 1 protector block, No. 2 protector blocks and No. 3 protector mica in all subscribers' set protector mountings and are therefore available for improving protective equipment already in service, during the normal replacements. All orders for replacements of Nos. 1 and 2 blocks and No. 3 micas in subscribers' telephone station protectors should specify the Nos. 26 and 27 protector blocks; no separator (protector mica) is needed with the new design of block.

Western Electric Telephone Protector Mountings

No. 82A

No. 83A

No. 82A

This protector mounting consists of a cast iron galvanized case approximately 11 1/2 x 4 3/4 x 4 5/8 inches over all with hinged cover and a wooden backboard. It is used for mounting the No. 58 protector at telephone stations located out of doors.

No. 83A

Designed to protect drop wires between the overhead lines and the subscribers telephone set from lightning. This protector mounting consists of an iron box approximately 8 3/4 x 3 1/2 x 2 1/2 inches deep with a hinged cover having a No. 84A protector mounted within it. Arranged to mount 10 pairs of No. 26 and 30 protector blocks or No. 19 and 20 blocks with No. 11 mica. This protector mounting provides for the protection of 5 pairs of wires. The box mounts directly underneath the crossarms on the poles. Two mounting lugs are provided for this purpose.

Western Electric Hand Receivers

***No. 143AW**

Concealed binding post hand receiver, composition case. Used with telephone sets, desk stands, telephone arms, etc.

***No. 144AW**

With hard rubber case.

*Cord not included; ordered separately.

Western Electric Head Receivers

No. 528BW

Standard bipolar head receiver, hard rubber case with improved wire type headband.

Used with operator's telephone set and all switchboards.

Western Electric Ringers

Have gong posts suitable for either 1/2 or 5/8-inch woodwork; spacers can be furnished to adapt the No. 53 type to 3/8 inch woodwork and the Nos. 38 or 51 types to either 3/8 or 1/2-inch woodwork. Black finish gongs are furnished as standard, but nickel finish gongs can be supplied if desired.

Used with central battery (magneto) telephones.

No. 53 Type

Code No.	Approx. Resistance Ohms	GONGS		Mounts in Woodwork In.
		Code No.	Diam. In.

53FG	1600	29A	2 1/2	5/8

Western Electric Transmitters

No. 323BW

High resistance, insulated transmitter. Provided with mounting lug and clamping bolt. Black case. Designed for use on magneto and central battery desk stands and telephone arms.

No. 353BW

High resistance, insulated, bracket type transmitter. Black case with black finished bracket and arm. Designed for use on magneto and central battery wall telephones, requiring a bracket type transmitter.

Western Electric, Testing Sets

Type 90500

Each set consists of a hand generator and a ringer, wired in series, and inclosed in a wooden case.

No. 90530

Code No.	Will Ring Through Ohms	Consists of
90530	10000	1 No. 22K Generator
		1 " 19B Ringer
90510	35000	1 " 22K Generator
		1 Special No. 19 Ringer
90511	50000	1 No. 22N Generator
		1 " 19A Ringer
90512	100000	1 " 22N Generator
		1 " 19B Ringer

Size of case is 5 3/4 x 6 5/8 x 5 1/4 inches.

It is finished in birch.

No. 1017 Type Western Electric Test Sets

No. 1017B

No. 1017 Type

A wooden box telephone test set equipped with a regular local battery talking circuit consisting of a No. 266W transmitter, No. 13 induction coil, No. 145W receiver and a special three-cell dry battery unit.

NOTE.—The No. 1017C test set differs from the No. 1017B only in that it is equipped with a specially designed high efficiency generator. The No. 1017B will, under ordinary conditions, be found entirely satisfactory, but in case a more powerful set is required to meet unusual conditions, the No. 1017C set has been developed.

No. 1017B. For lightly loaded lines—it will ring 15, 2500 ohm bells over a 15 mile No. 12BB iron metallic line.

Code No.	Wt. Including Battery Pounds	Size of Case, Inches	Finish
1017B	8	4 3/4 x 6 3/8 x 7 3/8	Birch Mahogany
1017C	8	4 3/4 x 6 3/8 x 7 3/8	Birch Mahogany

No. 1017C. For moderately loaded lines—it will ring 33 2500 ohm bells over a 15 mile No. 12BB iron metallic line.

Telephone Brackets

Brackets

This is a substantial and serviceable telephone arm. With this bracket the telephone can be lowered below the base as well as raised above it.

Has nickel-plated finish with black enamel trim. Can be had in all black finish when so desired. Furnished in 24-inch length only.

Bracket is complete with Nos. 83, 84, 85, 85X, 88 or 94 mounting and any style clamp.

Add 50 cents to price when No. 86 mounting is wanted. Price, No. 95.....each \$3.50

**Western Electric Telephone Brackets
S Type**

Equipped with No. 1 Mounting and No. 20 Clamp

Brackets

This bracket is of the "folding gate" type, and is arranged so as to revolve on its base. Furnished in 24 and 36-inch lengths. The desk stand swivels on the front rod. The bracket will be furnished with any of the mountings described below and with either of the clamps listed.

When ordering specify the letter of the clamp and mounting that is wanted in addition to the code number of the telephone bracket.

Complete equipment consists of bracket, one mounting, one receiver hook, one telephone clamp, one set of eyelets for holding cord, but does not include desk stand.

Magneto Motor Generator Ringing Sets

Motor generator ringing sets consist of direct current or single phase 60-cycle alternating current motors direct connected to magneto ringing generators. These sets furnish alternating ringing current only at 80 volts, 19 cycles. An at-

tachment for obtaining positive and negative pulsating current is, however, available.

List No.	Motor	Volts	Output Watts	Type
310087	110	15	{	Motor—S. P. 60 cycles A. C., 1150 R.P.M.

*This higher voltage is advisable on account of the higher frequency produced by the necessary excess speed of the 25-cycle over the 60-cycle. †Twelve bars.

No. 16A Magneto Ringing Generators

A 5-bar, pulsating and alternating current, belt connected power generator. Delivers 106 volts A.C. and 72 volts pulsating at a speed of 1000 R.P.M.

Used to furnish power ringing for central offices.

Mounted on a wood base 7x11 inches. Height, 7 inches. Has a cover for protection against dust and dirt. 2-inch grooved pulley.

Pole Changers

These rotary pole changers are in reality rotating interrupters, consisting of a direct or alternating current motor with a commutator for interrupting the current. They are suitable for use in telephone central offices, serving a maximum of 1500 subscribers.

Code No.	Voltage Required to Operate	Power Consumption Watts	Special Transformer Required	Kind of Current Furnished

*Transformer required if one side of lighting circuit is grounded.

Ringing current for A.C. 110 and A. C.220 must be taken from exchange batteries. Orders should read: No. . . . rotary pole changer to operate from . . . volts . . . cycles, with special transformer for . . . volts D.C.

Western Electric Inter-phone Accessories

Inter-phone Cable

For Interior Use

For Outside Use

The conductors are provided with single silk and single cotton insulation, which is colored in such a way that each pair and each single wire can be identified. The cable is then impregnated with a wax compound and is covered with servings of paper and a heavy braiding, which is given a heavy coat of fireproofing paint.

The impregnation with wax prevents the insulation from fraying when the cables are installed. It also serves to protect the formed ends against moisture.

Three general types of cable are provided. Each type has its particular use, and care should be taken to order the proper cable for any desired purpose. These types are as follows:

1. Interior Cable with outside braiding treated with gray fireproofing paint. Use only in dry places.
2. Interior cable with green glazed cotton outside braiding. Use only in dry places where exposed to view.
3. Outside cable, lead covered. Always use this cable outside, and inside in every case where there is apt to be moisture even in a small degree. In conduit installations lead covered cable should be used.

Lead-covered cables are not listed with separate Code Nos. Any fireproofed type of cable may be ordered with a lead sheath.

All cables are provided with a standard color scheme, so that each pair can be distinguished from any other. The pairs are properly twisted to prevent inductive disturbances. Each cable contains two spare pairs of No. 22 gauge conductors.

No. 19 Type Cable Terminals

The No. 19 type cable terminal is admirably suited for interior distributing work. It was designed after a great deal of study, and is thought to be the best of its kind on the market. Made of hard wood, numbered and shellacked, and equipped with a japanned sheet metal cover.

Code No.	Capacity in Pairs	Length In.	Width In.	Depth In.
19A	14	8	5 7/8	2 1/2
19B	26	14	5 7/8	2 1/2

Western Electric Lead Covered Telephone Cable

The outside plant is a very important part of any telephone system. Unless satisfactory material is used in its construction, it is impossible for a telephone company to furnish satisfactory service even though the central office and substation equipment is of the best. Lead covered cable represents not only a large part of the capital invested in the outside plant, but also a most important part of the construction due to its function of being the transmitting medium for telephone messages.

These are certain characteristics which lead covered cable must possess in order to properly and efficiently function in a telephone system:—

1. It must be so constructed that it will have long life and thereby reduce depreciation to a minimum.
2. It must be designed to transmit telephone messages with a minimum transmission loss.

The Western Electric Company manufactures cable designed to conform to the above requirements and by virtue of the fact that its experience in this field covers the entire period since the first successful installation of lead cable for telephone use, its product is as nearly perfect as present day knowledge of the telephone art permits.

The Western Electric Company occupies an important position in the manufacture of lead covered cable for telephone use by virtue of the following facts:

1. It is the largest manufacturer of this commodity.
2. It has specialized on, and developed this product since its origin.
3. It manufactures for the largest users.
4. It is responsible for practically every important development and improvement.
5. Conscientious careful inspection and testing make sure that specifications are rigidly adhered to.
6. The design and development work is done by the largest force of telephone experts in the world.

Cable for aerial and underground telephone use is composed of copper conductors, insulated with paper, twisted into pairs and enclosed in a lead sheath. In general, cable with single wrapped conductors is recommended, since its electrical and mechanical characteristics are perfectly satisfactory for most conditions, and the cost is less than cable with double wrapped conductors.

Cable for interior construction usually has the conductors insulated with two servings of silk and one of cotton.

The sheath is made of pure lead, lead antimony alloy or lead tin alloy. Experience has shown that while either lead antimony or lead tin is satisfactory for aerial or underground cable, the former alloy, being somewhat cheaper, is more generally used. While pure lead cannot be recommended where the cable is subjected to vibration, it is satisfactory for use within buildings.

Extra Pairs

Extra pairs are placed in all cables containing conductors smaller than No. 16 to take care of any pairs which may become defective in manufacture. In the majority of cables all or part of the extra pairs will often be found good and may be used for additional circuits. All pairs of No. 16 A.W.G. and larger except in submarine cable are guaranteed to meet the specification requirements when the cable leaves our factory.

The coding of all cables is on the basis of the actual number of pairs. Actual and guaranteed number of pairs in the various sizes of standard cables containing conductors smaller than No. 16 A.W.G. are as follows:

Actual Pairs	Guaranteed Pairs
6 to 121	Actual pairs less one
152 " 242	" " " two
253 " 333	" " " three
364 " 444	" " " four
485 " 505	" " " five
606	" " " six
909	" " " nine
1212	" " " twelve

Western Electric Lead Covered Telephone Cable

Continued

Cable Yard at Hawthorne Works

Transmission

The transmitting efficiency of telephone cable, considered as a separate unit, depends principally upon its electrostatic capacity and conductor resistance. When telephone cable forms a portion of a completed telephone connection, the transmitting efficiency of the cable portion is modified somewhat by its relative position in that circuit and also by the type of other construction to which it is connected.

The following data is based upon average standard conditions and may be used for approximate calculations. In the case of circuits involving several different types of construction and considerable investigation, we recommend consulting our engineers.

As a measure of transmission efficiency, standard No. 19 A.W.G. cable, having a loop resistance of 88 ohms and a mutual electrostatic capacity of .054 M.F. per mile is used as a basis.

Thirty miles of this cable is considered the maximum distance over which commercial transmission can be secured. One mile of this cable is approximately equivalent to the following:

- 3.3 miles of No. 12 B.W.G. —B.B. galvanized iron circuit.
- 4.1 " " " 10 " " " " " " " " " "
- 8.0 " " " 14 N.B.S. or 12 A.W.G. hard drawn bare copper circuit.
- 12.7 miles of No. 12 N.B.S. or hard drawn bare copper circuit.

It then follows that 99 miles is the theoretical commercial limit for No. 12 B.W.G.—B.B. galvanized iron wire circuit.

Under each listing is given the respective transmission equivalent in terms of standard No. 19 A.W.G. cable.

Electrostatic Capacity

Consideration of capacity is a measure of that property possessed by a conductor of storing a greater or lesser charge of electricity, important, because it determines to a large extent the length of cable through which it is possible to transmit speech. For subscribers' cables not more than two miles in length it is generally considered economical to use fairly high capacity cable, since the decrease in transmission, due to the capacity, will be only a small percentage of the total loss in the circuit. For long lengths of cable or for those carrying important toll lines, lower capacity is usually specified.

The electrostatic capacity may be specified either as "mutual," that is, the capacity between two wires of a pair, or as "grounded," that is, the capacity between a wire and all the other wires and the sheath. Mutual capacity is a better criterion of the quality of the cable for telephone transmission, since the conductors are used in pairs as a metallic circuit and seldom, if ever, singly as grounded lines. The ratio of mutual to grounded capacity is approximately 1,1.6 but this ratio varies somewhat for different cables.

Western Electric Lead Covered Telephone Cable

Electrostatic Capacity

Continued

Electrostatic capacity may be measured by means of alternating current or direct current. The Western Electric Co. recommends the use of the alternating current method of determining the mutual capacities of telephone cable conductors since by its use true capacities at telephonic frequencies are determined. This is important as the efficiency of the cable for telephone purposes is based on that mutual capacity. For this reason the Alternating Current Method is superior to either the Direct Current Charge Method or the Direct Current Discharge Method. With the Direct Current Discharge Method improper manipulation of the testing equipment can be made to produce untrue capacity values indicating lower capacities than the conductors actually possess.

We strongly advise the specifying of the capacity requirements a given cable shall meet, including the testing method to be employed in making the tests and whether the rating shall apply to single conductors as grounded capacity or to pairs as mutual capacity. Unless otherwise specified in the order, all cables will be tested for mutual capacities by means of alternating current.

The purchaser, when requesting prices, should always mention the type of cable wanted or give a full description.

Special Cables

Special conditions often require cables with different characteristics from those which have been standardized and coded. If your condition necessitates special cable including any of the special types briefly outlined below write our nearest house giving full details and information and price will be furnished.

Submarine Cables

Paper insulated submarine telephone cable may be divided into three general classes, depending upon the use for which they are intended.

1. High dielectric strength, tight core cable, designed for use in comparatively long lengths, where the cost of repairing a break in the cable will be less than the cost of an entirely new cable.
2. High dielectric strength, loose core cable, designed for use in comparatively short lengths, where high transmission efficiency and high dielectric strength are of importance; for example: a short river crossing cable connecting important open wire cables.
3. Single paper insulated loose core cable designed for use in comparatively short lengths where so high a dielectric strength is not necessary; for example: a short river crossing cable connecting land cables.

Either single or double armored cable can be furnished. In many cases, single armor gives sufficient mechanical protection. Double armor is used only in cases of extremely severe mechanical requirements. In still water with a mud bottom, single armor will be sufficient. With a rocky or uneven bottom, or with strong tides or currents, double armor should be considered.

Composite Cables

Composite cable, that is, composed of conductors of two or more gauges can be furnished if desired. The combinations of pairs which will utilize the space within the lead sheath most economically are somewhat limited and our cable engineers will make recommendations along this line upon receipt of detail information as to the conditions to be met.

High Dielectric Strength Cables

Paper insulated cable designed to withstand test potentials up to 1500 volts A.C. is supplied for special circuits such as for telegraph or signal circuits.

Terminating Cables

The general practice of terminating paper insulated cable in the past has been to splice on a short piece of wool insulated cable. It has been found, however, that double silk and single cotton insulation is satisfactory for this purpose and it is less expensive. Double wool insulation can be furnished, if desired.

Prices

Owing to the fluctuations of the market price of raw material, it is impracticable to list prices on cable in a catalogue. Full information and prices will be furnished on request.

Western Electric Lead Covered Telephone Cable

Type ANA Cable

For Aerial or Underground Use

Conductors No. 22 A. W. G., single dry paper tape insulation, with color groups depending upon size. Lead-antimony sheath.

Characteristics per Mile of Cable

Mutual electrostatic capacity not greater than (A. C. Testing) .079 microfarad; approximate equivalent grounded capacity, .130 microfarad; insulation resistance not less than 500 megohms. Dielectric strength. Insulation capable of withstanding a test potential up to 700 volts A. C.

Transmission is equivalent to 1.60 miles of standard No. 19 A. W. G. cable having a mutual electrostatic capacity of .054 microfarad, and 88 ohms resistance per mile.

Premier Handy Ball Bearing Electric Vacuum Cleaner and Blower

The Premier Handy Easily Takes the Dust from the Apparatus in the Switchboard

The Premier Handy Ball Bearing Vacuum Cleaner and Blower will clean switchboards, multiple cable ringing and charging machines and other central office equipment.

The Premier Handy is light in weight, powerful and easy to use. It can be changed from a suction cleaner to a blower in a few seconds. This cleaner has the added advantage of a high speed ball bearing motor, that does not have to be oiled. Price, with Ball Bearing Motor.....each \$40.00

No. 1002C Western Electric Telephone Head Sets

The No. 1002C head set is of the same design as those supplied to the U. S. Army and Navy during the war.

The cases of the individual receivers are of brass nickel-plated.

The inductance of each of the coil windings is held within exceedingly close limits by measurements made with a special type of alternating current Wheatstone bridge. The 2 coils employed in each receiver are each wound with copper wire to a direct-current resistance of approximately 550 ohms. This gives a total of approximately 2200 ohms D. C. resistance when the 2 receivers are connected in series. The alternating current impedance of the receivers connected in series when measured at voice frequencies is approximately 20000 ohms.

The pole pieces of the receiver are made of a special grade of silicon steel which insures the maximum alternating magnetic field with a minimum loss due to eddy currents.

Head band is made to fit comfortably. Head pieces are formed of non-corrosive phosphor bronze spring wire, covered with a heavy textile webbing and are equipped with adjustable yokes, slide rods and thumb screws to clamp the yokes in any desired position. Cord is covered with a black mercerized cotton braid and is equipped with tips which are concealed when attached at the receiver end, and with pin tips on the apparatus end. Cord is arranged to connect the receivers in series.

Replacement Parts

- 509W, Complete Receiver Units
- P-99768, Ear Cap
- P-98387, Diaphragm
- No. 1B, Head Band
- No. 763, Cord

Prices upon application.

No. 543W Western Electric Loud Speaking Telephones

The Western Electric No. 543W Loud Speaking Telephone is a simple form of high impedance instrument.

When used as an adjunct to a radio receiving set and supplied with sufficient energy, at audio frequencies, it will produce a volume of sound distinctly audible in every part of the living room of the average home.

This instrument meets the demand for an inexpensive loud speaking telephone for direct connection to the ordinary forms of vacuum tube receiving sets.

Bottom View of Base Showing Unit

The No. 543W loud speaking telephone may be used satisfactorily to reproduce radio telephone broadcast entertainments, such as music and news, when a radio receiving set of sufficient output energy is available.

Provision for adjusting the unit to the current output of the radio receiver enables the No. 543W loud speaking telephone to operate at maximum efficiency at all times.

Method of Adjustment

The No. 543W loud speaking telephone consists of a telephone unit placed inside a base, with a horn for projecting the sound.

The horn and the base are 23 inches high over all. The opening at the large end of the horn is 10 inches in diameter.

The telephone unit has a direct resistance of 1100 ohms and an impedance of 11000 ohms to alternating currents of average frequency.

It may, therefore, be connected without a transformer in the plate circuit of the ordinary vacuum tube amplifier.

Prices upon application.

No. 540AW Western Electric Loud Speaking Telephones

The No. 540AW loud speaking telephone is a portable sound projecting device mounted on a metal stand suitable for placing on the table of a living room.

The projector consists of 2 cones of specially selected material, having their bases cemented together. The apex of one cone is connected by a driving rod to an electro magnetic unit that responds to current impulses from the radio receiving set and thereby causes the cones to vibrate and reproduce the sound that is being sent out by radio telephony.

The design of the No. 540AW loud speaking telephone is such that the low notes of the 'cello, organ and piano and the brass instruments of the lower register are faithfully reproduced. This gives to the reproduction of instrumental music true depth and richness, thus making it satisfy the most exacting. But while particular stress has been laid on the reproduction of the low notes, because this is the more difficult, it should be borne in mind that the No. 540AW loud speaking telephone reproduces the high notes of the scale with great fidelity.

This telephone may be used in connection with any radio receiving set or audio-frequency amplifier capable of operating an ordinary type of loud speaker. As a rule 2 stages of audio-frequency amplification will be sufficient.

However, to obtain the best volume and quality of reproduction, it is advantageous to use a receiving set or amplifier which contains a power tube in the last stage.

The cones are approximately 18 inches in diameter and the distance between the apex of the front cone and the grating at the back is about 5 inches. The whole assembly stands approximately 21 inches high and weighs 7 pounds. No additional battery is required to operate this loud speaking telephone.

Replacement Parts

P-205745, Paper Cone

P-204895, Thumb Screw

No. 862 cord, 6 feet long unless otherwise specified.

No. 15A Bracket

Consists of the parts required for mounting the No. 540AW loud speaking telephone on a wall. Bracket mounts to the wall by means of 2 round head wood screws or 2 nails fastened in a vertical line approximately 5 1/8 inches apart.

Prices upon application.

**No. 6025B Western Electric Amplifiers
for Loud Speaking Telephones**

A good loud speaking telephone requires more electrical energy for its proper functioning than most audio-frequency amplifiers in common use are able to deliver without overloading the vacuum tube in the last stage.

It is generally possible to secure ample volume with these amplifiers, but at the expense of the quality of reproduction due to the distortion which results from this overloading. The No. 6025B amplifier is intended for use as an adjunct to a loud speaking telephone to furnish sufficient undistorted electrical energy at audio-frequencies so that the loud speaking telephone may function at maximum capability.

It consists essentially of a single stage amplifier with a self-contained current supply set for both the vacuum tubes used in it. It employs 2 Western Electric No. 205D vacuum tubes, one as an amplifier and the other as a rectifier.

Bottom View Showing Connections

No batteries are required for the operation of this amplifier. The only current supply necessary is the ordinary 110-volt, 60-cycle A. C. house lighting current. No other form of house lighting can be used with this apparatus. The house lighting supply is transformed, rectified and filtered by the self-contained current supply set so as to properly energize the amplifier without the use of batteries. The amplifier consumes about 40 watts, that is, it takes about the same power as a medium sized incandescent bulb.

Top View with Cover Removed

When used in conjunction with a radio receiving set this amplifier is not intended to provide all the audio-frequency amplification necessary for proper loud speaking telephone operation, but only that portion of the amplification where there is most likely to be overloading, that is, the last stage. Thus if satisfactory volume is obtained in

a headset from the detector tube of a radio receiving set one stage of ordinary audio-frequency amplification plus the No. 6025B amplifier will provide sufficient energy to operate a loud speaking telephone so as to be audible throughout a good sized room.

The amplifier is equipped with a cord to connect it to a radio receiving set and also a cord with a plug to connect it to the lighting circuit. A switch in the latter cord is furnished to turn the power on or off and is the only control on the amplifier. The apparatus is contained in a metal cabinet.

Replacement Parts

No. 205D vacuum tubes (orders should state "intended for use in No. 6025B amplifier.")

No. 196 cord, 6 feet long.

If a complete cord, switch and plug assembled together for connecting the amplifier to the lighting circuit are required they may be obtained from a dealer or the nearest Western Electric House and should be ordered as follows:

P-168816 cord and plug assembly.

Prices upon application.

**Western Electric No. 224-A Vacuum Tubes
Cathode Ray Oscillograph Tube**

The Western Electric No. 224-A Vacuum Tube is a Cathode Ray Oscillograph Tube which may be used to obtain the performance characteristics of nearly every kind of electrical apparatus. It particularly fills the need for an oscillograph operating at frequencies up to a million or more cycles per second.

The spot of light produced by the cathode ray on a screen within the tube may be moved simultaneously in 2 directions by varying voltages applied to 2 pairs of internal deflector plates, or by current passing through external coils, the resulting trace giving the relation between the 2 currents or voltages. A deflection of one inch is produced by 25 volts on a pair of deflector plates or by 25-ampere turns in suitable coils.

The power equipment required for the tube is a 300-volt B battery and a 6-volt storage battery.

Western Electric Vacuum Thermocouples

The Western Electric Vacuum Thermocouple is a hot wire instrument for use in making accurate measurements of the values of feeble alternating currents.

Vacuum thermocouples are manufactured in 16 standard types. Each of these types may be assembled in any of 3 different types of containers known as the 20, 21 and 22 types. Type 20 container consists of a square mahogany box with binding posts mounted on the cover. Type 21 container consists of a cylindrical metal can with a hard rubber base through which the terminals project and to which leads may be soldered. Type 22 container is similar to type 21 except projecting terminals are designed to make contact with the springs of a standard vacuum tube socket.

By the proper choice of these instruments used in connection with a 12-ohm galvanometer having a scale length of 130 millimeters and a full scale deflection on a current of 200 microamperes, any current from .0005 to 1 ampere may be measured with an accuracy of plus or minus 1 per cent of the minimum deflection.

Below is a table which shows the principal characteristics of each type of vacuum thermocouple. From these values the range of each vacuum thermocouple with the particular type of galvanometer with which it is associated can be determined by the application of Ohm's law.

Type	Heater Resistance Ohms	Couple Resistance Ohms	ELECTROMOTIVE FORCE OF		Type	Heater Resistance Ohms	Couple Resistance Ohms	ELECTROMOTIVE FORCE OF

Western Electric Clothes Washers

No. 2 Western Electric 28-inch ironers

Operates on the revolving cylinder principle. Made in one size only. The washer is 37 inches high and occupies a floor space 24 1/8 x 33 inches. Has a capacity of 6 sheets or the equivalent.

Four straight panels conceal all mechanism. The machine itself is finished in dull gray enamel. The wringer is aluminum.

TANK.—Either of 26-gauge galvanized iron, rust resisting, or of 23-ounce cold rolled copper, tinned on inside to prevent corrosion.

FRAME.—All metal. Angle iron frame with sheet steel panels.

WRINGER.—Aluminum frame, soft rubber rolls, 11 3/4 inches long.

CYLINDER.—Well designed, non-corrosive metal cylinder.

CONTROL.—Separate control levers for cylinder and wringer. Either can be reached from any side of washer.

SWINGING WRINGER.—Has 5 operating positions.

SAFETY WRINGER RELEASE.—A touch of the wringer release bar instantly releases tension of rolls.

CORD.—10 feet water-proof cord and attachment plug.

MOTOR.—1/6-h.p. Western Electric Motor, A.C. or D.C.

Electric Washerpumps

The washerpump is a small, motor driven pump that empties the water from the washing machines into the sink or set tub at the rate of eight gallons per minute.

Used on either stationary or moving tub washers. It is attached to the stationary tub type by merely screwing it on the drain valve. In the

case of the moving tub a small clamp is furnished to mount the washer pump on the washer framework below the drain valve. A short piece of hose is then used to connect the pump intake with the washer drain. This hose is arranged so that it can be easily disconnected from the washer drain before the tub is set in motion, and easily connected again when the tub is to be emptied.

Price.....each \$15.00

An electrically driven gas heated ironer small enough to fit into the majority of kitchens or laundries and yet do the work of a larger ironer—at the small cost of 2 1/2 cents an hour.

SIZE.—This ironer is made in one size only. Length of roll, 28 inches. Occupies a floor space of 37 1/2 x 24 inches.

APPEARANCE.—The frame is finished in dull gray and black enamel. The feed board is natural wood varnished.

REVERSIBLE ROLL.—Made of metal thickly padded and covered with muslin. It is hollow and well ventilated—stronger than wood and cannot warp. It turns at an ironing speed of 9 feet per minute.

The reversible roll is an exclusive feature of Western Electric Ironer. It simplifies operation of the ironer. For instance, if goods going through the ironer—start to wrinkle a snap of the control switch reverses the roll and the goods back out.

OPEN END ROLL.—Makes it possible to iron ruffles, collar bands, etc., and provides for the overhang of goods wider than the roll.

THE SHOE.—Cast iron machined to shape and highly polished. Heated by a gas burner.

PRESSURE SPRING.—Automatically adjusts the pressure of the shoe, thus allowing for varying thicknesses of cloth.

ELECTRIC SWITCH.—Mounted on feed board. Starts and stops motor and causes roll to turn either forward or backward.

HAND CONTROL.—An upright lever convenient and easy to operate, need only be used to bring shoe against roll or to throw shoe back when through ironing.

FOOT CONTROL.—Separates shoe from roll when starting thick goods. Use of foot control leaves hands free for adjusting goods.

FEED BOARD.—Comfortable height for the average woman.

RECEIVING BOARD.—Prevents the ironed clothes from dropping on the floor or in the operator's lap. Built so the operator can comfortably sit at machine or stand close to feed board.

ACCESSIBILITY OF SHOE.—The shoe can be thrown back to a horizontal position that makes the entire surface accessible for cleaning.

ENCLOSED GEARS AND BELT.—Eliminate all danger. The mechanism is practically noiseless and requires no attention.

MOTOR.—A 1/10-h.p. reversible motor controlled by electric switch on feed board. Drives the ironer through a heavy V shaped belt and a silent worm gear. The belt tension is regulated by adjusting bolts. Motors can be furnished for either A.C. or D.C.

Net weight, 187 pounds; shipping weight, 230 pounds.

Western Electric Portable Sewing Machines

The Western Electric Portable Sewing Machine is a high grade Sewing Machine of national repute.

The machine is mounted on a compact wooden base that can be placed on any table. A cover with a handle locks on making it convenient to carry.

PORTABILITY.—The portability of the machine makes it possible to sew wherever there is an electric outlet convenient.

COMPACTNESS.—The machine can be put in a closet out of sight and out of the way.

EASE OF OPERATION.—The most vital thing is the ease of operation. All laborious, and annoying pedaling is done away with by the electric motor.

THE MOTOR.—A $\frac{1}{20}$ h. p. universal motor—runs on either direct or alternating current. It is supported on a swinging bracket. Uses approximately $\frac{1}{8}$ cent worth of electricity an hour.

FOOT CONTROL. A small foot treadle controls the motor. A touch of the foot starts the motor, increases the speed, or lessens it. Removing foot pressure stops it.

Types—

- No. 1 Vibrator—Lock stitch
- No. 2 Rotary—Lock stitch
- No. 3 Automatic—Chain stitch
- No. 4 Two Spool—Lock stitch

ATTACHMENTS.—A full set of attachments comes with every machine, together with a cloth guide, six needles, three bobbins, thread cutter, full oil can, two screw drivers and instruction book.

PROPER NEEDLES FOR SEWING MACHINE—

No. 1 VIBRATOR TYPE.—Western Electric No. 1 or Eldredge F. S. needles sizes 1 to 8 inclusive.

Nos. 2 AND 5 ROTARY TYPE.—Western Electric No. 2 or "B" Eldredge Rotary N.S. sizes 1 to 8 inclusive.

No. 3 AUTOMATIC TYPE.—Eldredge automatic needles, sizes 0 to 4 inclusive.

Nos. 4 and 6 TWO SPOOL TYPE.—Eldredge two spool needles, sizes 00-0-B- $\frac{1}{2}$ and 1 to 4 inclusive.

Western Electric Portable Sewing Machines
No. 1 Vibrator—Lock Stitch

Reciprocating shuttle; $\frac{3}{4}$ size head; automatic tension release; automatic bobbin winder; enclosed needle bar; positive take up; speed of 1-800 stitches per minute; finish—high grade walnut, flat varnish finish.

No. 2 Rotary—Lock Stitch

Rotating bobbin; full size head; increased speed—1-1200 stitches per minute; smoother operation; automatic tension release; improved stitch regulator; simple construction; finish—dark walnut on oak.

No. 3 Automatic—Chain Stitch

Single thread machine; no bobbin; very silent operation; triple strength stitch; stitch very elastic; automatic tension; smaller size and lighter weight.

No. 4 Two Spool—Lock Stitch

Full size head; rotating principle; all improvements of Rotary; no bobbins to wind; sews direct from two spools; finish—dark walnut on oak.

Western Electric Console Type Sewing Machines

The console type machine is for the woman who wants a cabinet type machine rather than a portable machine—and appreciates an attractive piece of furniture.

The Western Electric Console type is in appearance a beautiful table that will harmonize in any room.

By simply raising the lid it is transformed into an Electric Sewing Machine with either improved Rotary or Two Spool head.

It has two pockets on the inner side of door—writing desk style.

A drawer in the cabinet is provided for the

attachments—and a convenient pigeon hole for the foot control.

The cover is hinged and when opened for sewing is supported by a gate leg that swings to one side and is not visible when cabinet is closed. The sewing surface—provided by the table and cover is more than adequate.

It is built of American walnut or mahogany any rubbed satin finish.

The No. 7 Console sewing machine has

smaller oak cabinet in dark walnut finish. Same rotary sewing head and foot control as No. 2 portable.

Full set of sewing attachments, needles, etc. furnished as with other models.

Prices complete with set of attachments.

SE-TO-SO Sewing Lamps

An aid to proper sewing illumination. Small, neat, compact and convenient.

Yellow light, free from glare, eliminating eyestrain.

Attaches to any light socket.

Lamp furnished complete with shade 110 to 120-volt bulb, universal attachment bracket, cord and plug.

Packed, 1 to box, 12 to carton, weighing 15 pounds. Price, Nickel-plated Finish each \$4.50

Construction Features of Crawford Electric Ranges

HEATING UNITS.—Crawford type open coil construction. High grade resistance wire. Interchangeable and easily removed.

***CLOSED TYPE ELEMENTS.**—Are furnished optionally for cooking top hot plates at cost of \$7.00 extra per unit. Cast in resistor coils fully concealed. Flat cast iron surface. Unit protected from short circuiting spilled material.

SWITCHES.—Most improved type reciprocating switches; turn either way.

SWITCH PANELS.—Single casting swing out mounting panels, quickly expose backs of switches and wiring connections for inspection and ready repair.

FUSES.—On models fuse equipped. Concealed arrangements under front edge of cooking top. Exposed for inspection or replacement by lifting front nicked rail.

OVEN DOORS.—Drop doors where furnished equipped with patent adjustable tension arrangement for balancing weight of doors. All oven doors equipped with lock tight door handles for keeping heat in oven.

OVEN FLUES.—Crawford system of oven flues used on all models for even heat distribution inside oven. Insures uniform baking results, and efficient use of electricity.

OVEN INSULATION.—High grade insulated wall construction to prevent radiation of oven heat. Adds fuel efficiency and keeps kitchen cool.

OVEN VENTILATORS.—Ventilators with front control dampers for external connected vents furnished on Models 18-91, 16-81 and 18-70.

OVEN HEAT INDICATORS.—Furnished standard on all models.

***APPLIANCE RECEPTACLE.**—Convenient for connection of electric appliances. Standard equipment on all models except Model 16-80.

*Heating units of wattage other than specified furnished when desired. Prices on application.

*NOTE.—Extra and optional equipment.

Model 18-50 Crawford Electric Ranges

Model 18-70 Crawford Electric Ranges

A low oven type of smaller dimensions than the Model 18-60. Two hot plate cooking tops suitable for the small kitchen or kitchenette. Same high quality construction throughout as other Crawford models. Swing out switch panel. Reciprocating 3-heat switches. Swing type oven door. Insulated oven of heat distributing flue construction.

Open coil heating units: cooking top, one of 1500 watts, one of 1000 watts; double unit oven of 1000 watts each. Floor space, 16½x28½ inches. Cooking top height, 32 inches. Size of oven, 18x12x13 inches high

Model 18-60 Crawford Electric Ranges

Models 16-80 and 16-81 Crawford Electric Ranges

A low oven type for use in limited space. Has the quality and high grade features of other Crawford Ranges. Cooking capacity about the same as 18-70 range.

Open coil heating units: cooking top, 2 of 1000 watts, 2 of 1500 watts; oven, 1 of 1500 watts and upper unit of 1000 watts for broiling.

Floor space, 26½x28½ inches. Cooking top height, 32 inches. Size of oven, 18x17x13 inches high.

Shipping weight approximately 300 pounds.

A simplified range of highest quality. Smaller than Model 18-91 but ample in size for a family of 6. Oven construction incorporates principles peculiar to all Crawford ranges with high efficiency heat insulation. Quick and uniform baker. Can be furnished with time and temperature controls described on another page. No fuses furnished at range.

Open coil heating units: cooking top, one of 1000 watts, 2 of 1500 watts; oven and broiler, 2 of 1500 watts.

Oven location, right or left as desired.

Size of oven, 16x17x14 inches high. Floor space, 23x41 inches. Height of cooking top, 32 inches. Adjustable tension drop style oven door. White top and hot closet furnished if specified. Shipping weight, approximately 260 pounds.

Model 18-91 Crawford Electric Ranges

A late model improved range with ample cooking capacity for a household up to 12 persons. Compact and attractive in appearance. Options of equipment and finish in this range provide desirable combinations to meet most home requirements. Furnished with either or both time and temperature controls (see description on another page) making it completely self acting. This range is not fused.

Open coil heating units: cooking top, 2 of 1000 watts, 2 of 1500 watts; oven and broiler, 2 of 1500 watts. Appliance receptacle, standard equipment for 1000 watts. Oven location, right or left as desired. Size of oven, 18x18x15 inches high. Temperature indicator standard equipment. Floor space, 25½x45½ inches. Height to cooking top 32½ inches. Adjustable tension drop style oven doors. Reciprocating switches, no fuses at range. Hot closet furnished at option. Shipping weight approximately 350 pounds.

Automatic Time Control

Furnished in conjunction with temperature control when specified for Models 18-91 and 16-81 ranges only.

Timing mechanism of rugged construction. Invisible clock operates only when control of range is desired. Complete setting accomplished by single knob. The hour when heat is to be turned off is fixed by turning knob to the right. The number of hours for cooking is fixed by turning knob to the left. Marked and calibrated dial aid pointers provide hourly indications required. Key wound timing mechanism. Automatic circuit closing switch and circuit breaker controlled by timer mounted beneath range.

Price, Timer Complete with Temperature Control

Temperature Control

A highly perfected and reliable mechanism for self regulation of oven temperature. Available only for Models 18-91 and 16-81. Will keep oven temperature and even heat as set. Graduated for any temperature from 100 to 600 degrees Fahrenheit. Control functions through self acting circuit control switch mounted beneath range. Entire setting accomplished by convenient knurled knob located at right side of oven.

Price, Completely Installed on Models 18-91 or 16-81

Indicate current to be used.

Crawford Hot Plates

Crawford Hot Plates are companions to the Western Electric Range line in quality and rugged construction, but are designed to furnish portable electric heating units.

Made in single, double, and triple unit models, they may be had in glossy black or white enamel and nickel finish. The heating units are standard range construction built to withstand severe service.

The best grade of reciprocating snap switches are furnished with these hot plates.

No. 75 Western Electric Reflector Heaters

This large bowl type electric heater is very neat and attractive. Its solid copper bowl is illuminated to a deep glowing red when heated and reflects the heat rays in a uniform and highly satisfactory manner.

The nichrome wire wound coil is mounted on a 2-piece ventilated porcelain core supported centrally of the bowl in an Edison screw type socket. The heater will give off all the heat its current rating of 550 watts is capable of developing. The screwed-in element may be readily replaced if broken or when one of a different voltage is required. A welded copper plated wire guard, which is detachable, effectively protects the element and eliminates danger. A heavy cast iron base lends stability and a friction hinge yoke for supporting the bowl permits ready adjustment for your needs.

Old bronze mottled (crackled) finish.

Furnished with a glossy dark brown cord with attachment plug.

Packed in individual cartons and cases of 6.

No. 2 Western Electric Irons

No. 2 Iron

The No. 2 Western Electric Iron is well designed and attractive in appearance.

Full nickel finish.
HEATING ELEMENT.—Perforated mica hand laced with nichrome wire.
CONTACT PINS.—Standard spacing—round—removable without disassembling iron.

PRESSURE PLATE.—Made of cast iron—holds heat a

baffle and heating element tight against bottom of iron.

HEAT BAFFLE.—Novel arrangement of asbestos sheet packing between element and pressure plate to prevent passage of heat upwardly. Directs heat to sole plate and provides greater efficiency and a quicker heating iron.

COMFORTABLE HANDLE.—Dull black finished wood, shaped to fit the hand. Stays cool.

BAIL.—Shaped to prevent discomfort to hand.

SMOOTH IRONING SURFACE.—Machined, ground, nicked and polished.

REVERSIBLE STAND.—Either side may be used—high edges prevent iron from slipping off.

CORD.—High grade brown cotton covered heater cord constructed to give maximum of flexibility and wear.

STANDARD VOLTAGES.—Nominal ratings 95, 110, 125, 220, 250 volts.

SPECIAL VOLTAGES.—All voltages other than above, including 32-volt, are special.

Packed individually in attractive blue and white cartons, 6 cartons in a case.

American Beauty Soldering Irons

Element core and shank of copper tip are heat treated and will not readily

corrode or oxidize. The heating element of nickel chromium ribbon, insulated with pure mica, is kept in intimate contact with core by means of a patented compression winding, preventing overheating of the element. Complete with 6-foot cord and attachment plug. Copper tips are of standard size drawn copper rod, 3/8, 5/8, 7/8 inches respectively in diameter.

Made in the following standard voltage ranges: 95-104, 95-104, 105-120, 121-130, 190-209, 210-240, 241-260.

American Beauty Electric Glue Pots

The outer body of these pots is cast iron, thoroughly galvanized before painting. The heating element is readily removable and is attached to the bottom of the inner cast iron receptacle, thus allowing all heat generated to be efficiently utilized. The inner vessel is of seamless copper, spun in one piece and is equipped with a bail and wiping rod.

Arranged for three heats, with multiple series winding. Full heat maximum wattage, intermediate one half maximum and low heat one quarter maximum. The latter is arranged to give just enough heat to keep the glue contents at a proper working temperature.

Made in the following standard voltages: 95-104, 105-114, 115-125, 190-209, 210-229, 230-250.

Ivory Wavette Curling Irons and Waver Rods

Nichrome element. The ivory wavette is 11½ inches long. Waver rod is ¾ inch in diameter. All metal parts highly nickel-plated, hand buffed and polished. Handle, white Pyralin enamel finish. Cord connector plug in handle. Has brown bakelite, two piece, separable attachment plug. Packed one in box.

Standard package, 12. Weight, standard package, 9 pounds. Price.....each \$3.50

Torrid Electric Marcel Waving Irons

Duplex waving rods in which genuine Nichrome heating elements are incorporated. Detachable Bakelite plug in handle. Ventilated, coil steel cooling rest. Two-piece, separable attachment plug. Extra length connecting cord.

Wood handle, ebonized finish. All metal parts are highly nickeled, buffed and polished.

Packed complete in an attractive box. Standard package 12. Weight, standard package, 12 pounds. Price.....each \$3.50

Hotvent Water Heater

The Reservoir Type Hotvent Heater is attached to any faucet in offices, apartments, stores, soda fountains, residences, lavatories, etc. Shuts off automatically, thus saving electricity.

- Economical, compact and neat in appearance.
- No special wiring required. Capacity, 1200 watts.
- Yields 6 quarts of hot water any time of day or night.
- Will heat over 100 gallons of water in 24 hours.

Takes the place of the tea-kettle on the kitchen range and shuts off automatically with a thermostat or time switch control to prevent waste.

Attach directly to present water and electric systems.

No special rate is required, the regular lighting service is all that is needed.

Prices upon application.

Minneapolis Heat Regulators

The Minneapolis Heat Regulator consists of an attractively designed thermostat (a mechanical automatic thermometer) placed on the wall of living room and connected by a small concealed electric cable to motor in the basement. The motor performs the work of operating drafts, dampers, etc., of the heating plant.

Model 77 Eight-day Duplex Thermostat

No. 77

The operation of Model 77 eight-day Duplex Thermostat is similar in principle to the 1-day thermostat, the only difference being that the clock makes 2 actions, lowering the indicator at night and raising it in the morning. The clock has a jeweled movement with 7 rubies and sapphires, with genuine bi-metallic balance. The finest Breguet hairspring is used. All pivots and pinions are polished, every part is extra heavy, insuring rigidity to the movement, long life and excellent time-keeping qualities. The clock is adjusted to heat and cold and to isochronism. Adjustment of the time set on the thermostat can be made almost instantly and the automatic throw of the indicator is adjustable either backwards or forwards. The Model 77 Thermostat is finished in dull silver.

Model 47 One-day Thermostat

Model 47 One-day Thermostat is equipped with a reliable 24-hour clock, which, when set, will change the indicator at any predetermined hour in the morning to the day temperature desired. For night temperatures the thermostat must be set by hand. The clock is easily removed for winding. Finished in sand blast bronze.

No. 47

Model 55 Thermostat

Model 55 Thermostat is equipped with a dependable non-jewel clock. The thermostat indicator can not only be lowered to any desired degree of temperature, but can also be raised to any degree of temperature. This is possible only with the Minneapolis 8-day thermostat. The Model 55 is finished in sand blast bronze.

Model 40 Thermostat

Model 40 Thermostat is designed for operation where clock attachment is not necessary or desired, as in case of large residences with hot water heat, for churches, etc., where certain fixed temperature is to be maintained at all times. The Model 40 has the same basic construction as all Minneapolis Thermostats, with only one moving bearing, thus eliminating faulty action and lost motion. Model 40 Thermostat is finished in sand blast bronze.

No. 65 Hydrostat

No. 65

No. 65 Hydrostat is used to maintain a uniform temperature in hot water heating and hot water supply systems. Set indicator at desired temperature and when the water starts to go above that temperature, the device automatically checks fires. When the water falls below that temperature, the device advances the fires. The standard model has a range of 100 to 240 degrees Fahrenheit.

No. 70 Pressurestat

No. 70 Pressurestat is used to maintain uniform pressure in steam and vapor heating systems. It is operated by pressure as the No. 65 Hydrostat is operated by water temperature. Standard model has a range of 0 to 10 pounds, but can be furnished up to 160 pounds.

No. 1227 M-B Electric Toasters
Double-action
550 Watts

This toaster has two heating elements so that it toasts both sides of the bread at once.

Sides lift right off the toaster so that crumbs and dust are easily removed.

Has automatic release. A cool button at the end of the toaster automatically pops toast out at the top.

Finished in nickel plate. Furnished complete with cord and attachment plug. Packed one in a box; weight, 4 lbs. 6 oz. Carton contains 6 individually packed; weight, 30 lbs.

Price, No. 1227.....each \$8.50

No. 1615 M-B Waffle Irons

This iron has cast aluminum grids, requiring no grease. Cooks waffles in two or three minutes right on the table. Colonial design, nickel-plated. Consumes 600 watts and operates on 110 volts.

Can be furnished for 220 or 250 volts at 50 cents additional. Detachable switch plug and 6-foot cord. Extreme diameter, 9 1/2 inches. Diameter of waffle, seven inches.

Shipping weight, seven pounds.

Price, No. 1615.....each \$15.00

No. 1616 M-B Waffle Irons

This device makes a thick waffle, seven inches in size, which may be divided into four portions.

The waffle is evenly browned on both sides at once.

Equipped with cast aluminum grids and can be used right at the table without grease or smoke; makes waffles in two minutes.

Furnished complete with cord and switch plug.

An exclusive feature is the trough around the edge of the iron. This catches any over-run of batter and prevents it dripping down on the base.

Consumes 600 watts and operates on 104-115 volts. Can be furnished for 220 or 250 volts at 50 cents additional.

Extreme diameter, 9½ inches. Diameter of waffle, 7 inches.

Shipping weight, 7 pounds.

Price, No. 1616, Nickel-plated.....each \$15.00

M-B Table Stoves

This table stove is a genuine table range. Nickel-plated finish. Single heat, consuming 660 watts.

Designed to operate on 110 volts. Can be furnished for 220 or 250 volts at 50 cents additional.

Equipped with detachable plug and six feet of cord.

No. 1410

The standard equipment of the No. 1410 Table Stove consists of the reflector, toaster drawer, deep fry pan, shallow fry pan, grid and egg poaching cups with holder.

Cat. No.	Description	Shipping Wt., Lbs.	Price Each
1410	With Toaster (6 pieces) No. 1411	8	\$12.50

The No. 1411 is equipped the same as the No. 1410, with the addition of the No. 411 waffle iron attachment.

The waffle iron attachment will not stick in the slides and will make thick or thin waffles. With the toaster drawer bread is toasted on both sides at one time—thick or thin slices.

No. 651 Bryant Appliance Switch Plugs

Schedule H
6 Amp., 125 Volts; 3 Amp., 250 Volts

A composition plug, with coil spring cord protector having composition bushing, for use in place of the ordinary composition plug furnished with most heating appliances. Fits nearly all makes and types of standard heating appliances and permits control of the appliance by means of the simple indicating tumbler switch enclosed in the composition body.

Packed ten in a colored counter display carton which assists in making quick and profitable sales.

Cat. No.	Description	Carton Pkg.	Std. Pkg.	Wt., Lbs.	Std. Pkg.	Price Each
651	Appliance Switch Plug	10	50	22		\$1.00
651C	Spare Jack Contacts for No. 651	*5	*50	1		*.20

No. 100 M-B Tobacco Lighters

Lights a pipe no matter whether full of tobacco or nearly empty. Lights a cigarette or cigar on the first puff.

Operates on a new principle. When the button is pressed the heating coils instantly become red hot. At the first puff air passes over these coils and becomes so hot that the tobacco is lighted at once. Coils never touch tobacco at all. Take off cover, one screw, to plug in new element.

Price, No. 100 each \$5.00

Hamilton Beach Home Motors

This motor can be attached to any sewing machine, old or new. Set the pulley of the motor underneath the handwheel of the machine and slight pressure of the

foot on the speed control starts the motor.

- Price, Motor with Speed Control, Cord and Plug. ea. **\$18.50**
 " Fan Attachment..... " **3.00**
 " Grinder and Polisher Attachment..... " **1.50**
 " Cake Mixer Attachment..... " **5.00**

No. 2 Hamilton Beach Jewelers' Lathe Motors

Universal motor. Speed controlled by foot pedal self-starter. To reverse the direction of the motor, change the position of the carbon brushes.

Price, No. 2 Model, $\frac{1}{2}$ H.P. each **\$20.00**

White Flash Hamilton Beach Drink Mixers

The White Flash Mixer is the latest deluxe model of a one hand mixer. Special features are its extreme simplicity and beauty, and ease of operation.

Hang up the container like a receiver on a telephone and the motor starts. Remove drink and it stops. A single malted milk takes 10 seconds, a double, 20 or less.

Specifications: Motor speed, 14,000 r.p.m.; extra insulation prevents shocks; agitator of everlasting Monel metal, shaft silver plated; all nickel parts triple plated.

Equipped with 2-drink container. Price..... each **\$23.50**

No. 2 Hamilton Beach Hair Dryers

115 Volts, A. C. or D. C.

Designed specially for home use. Made of solid aluminum. Gives hot or cold blast. Fan is fully enclosed. Weight packed, five pounds. Price, No. 2.... each **\$22.50**

No. 3 Hamilton Beach Junior Hair Dryers

115 Volts, A. C. or D. C.

The No. 3 Junior is light, simple and powerful. Can be held in the hand or set in the stand at any desired angle, leaving hands free for scalp massage while hair is drying. Adjustment is instantaneous and automatic. Stays where it is put and stand is quickly detachable. Furnished in nickel finish, or boudoir old ivory.

The fan is fully enclosed, eliminating any chance of catching the hair. Dries the heaviest head of hair in a few minutes.

Gives hot or cold blast by simply turning the switch.

Price, No. 3 Junior Stand-Type..... each **\$18.50**

Type A Hamilton Beach Vibrators

Designed especially for home use. Compact and strong. Consists of one vibrator, with cord and attachment plug for connecting to electric light fixture, and six applicators, all packed in a handsome carrying case of black leatherette lined with satin. A speed regulating switch permits motor to be run fast or slow.

The following applicators are furnished with this machine: Nos. 1 and 4 hard rubber for body; No. 2 soft rubber for face; No. 3 velvet sponge for face; Number 6 soft rubber for head; and No. 7 soft rubber with 12 prongs.

Price, Type A Complete. each **\$19.50**

Type C Hamilton Beach Vibrators

Professional type of vibrator used by physicians, nurses and masseurs. Of heavier construction and has a more powerful motor than the vibrator for home use. For cases requiring energetic treatment. Packed in a black leatherette case, plush lined.

Following applicators are furnished with machine: Nos. 1 and 4 hard rubber for body; No. 2 soft rubber for face; No. 3 velvet sponge for face; Number 6 soft rubber for head; and No. 7 soft rubber with 12 prongs.

Price, Type C Complete..... each **\$28.50**

Type D Hamilton Beach Vibrators

Specially designed to meet the demand for a light, efficient and low-priced vibrator for family use and for the professional hair dresser and masseur who calls on patrons at their homes. Has no speed regulator. Instantly stopped or started by button in handle. A current regulator, which controls the speed of the vibrator by increasing or diminishing the flow of current, can be supplied. Following applicators furnished with machine: Nos. 1 and 4 hard rubber for body; No. 2 soft rubber for face; No. 3 velvet sponge for face; Number 6 soft rubber for head; and No. 7 soft rubber with 12 prongs.

Price, Type D Complete..... each **\$16.50**

Type F Hamilton Beach Vibrators

Similar in design to Type D. Provided with a speed controlling device. Like all H-B Vibrators, the Type F gives both the rubbing and percussion strokes and is guaranteed against electrical and mechanical defects. Packed in black leatherette carrying case, lined with satin.

Following applicators furnished with this machine: Nos. 1 and 4 hard rubber for body; No. 2 soft rubber for face; No. 3 velvet sponge for face; Number 6 soft rubber for head; and No. 7 soft rubber with 12 prongs.

Price, Type F Complete..... each **\$18.50**

Like Sterling on a silver spoon

The nameplate on a Western Electric fan bears the mark of a pledge to you. It is a pledge as faithful in its promise as that of "Sterling" on silver.

For a Western Electric fan is sterling quality all the way through. It is built strong. It will last long. And it's sure to give satisfaction—56 years of Western Electric experience take care of that.

You'll want more than one of these fine fans. And why not? You have more than one lamp; so why stop at one fan, with all the bother of carrying it from room to room?

Let the Western Electric dealer help you pick the right fans. Tell him the size and nature of a room and he'll tell you what fan to get. If he recommends a smaller size than you thought you needed, don't be surprised. The Western Electric dealer knows he profits most when he gives you most—in fans or anything else electrical.

At left, a ceiling fan, ideal for stores and restaurants. Three speed, self-starting, induction type.

At right, a wall bracket fan whose skilfully pitched blades give the wide distribution of air so essential for comfortable cooling.

Western Electric Fans

General Instructions

When ordering fans, use catalogue numbers as given, and only in case the fans required are not listed is it necessary to give specifications in full.

Purchasers are requested to give express or freight routing with their order, in the absence of which we will route shipments with the view of obtaining the best deliveries.

Every part is carefully inspected during the various processes of manufacture; the finished fan is given a long test run with regular blades, and is inspected by a competent specialist, before it is passed to the packing room.

All fans are fully guaranteed to leave the warehouses free from electrical or mechanical defects, and should any such defects develop within one year from date of shipment, we will make good the defect free of charge, either by shipment of a new part to take the place of a part claimed to be defective, or by replacement of the entire fan, at our option; but we cannot be responsible for trouble due to neglect, carelessness, lightning or other cause beyond our control, nor can we assume any responsibility for repairs to our apparatus by outside parties without direct authority.

Fans claimed to be defective, or fans needing repairs, must not be returned until permission to do so has been secured and proper shipping instructions furnished. Application should be made to our nearest branch office for permission.

Claims for shortage or defects must be promptly made, to insure proper attention.

The packing is done by experienced men, who use the utmost care to insure that the fans shall reach their destination in first-class condition, and as we take receipts from the transportation companies for all shipments received in good order, claims for loss or breakage should be made to the transportation company.

The workman installing a fan should read directions, and be sure that he thoroughly understands work before starting.

Every fan should be thoroughly inspected, cleaned and oiled each season by some one who is familiar with the work. Prices for spare parts upon application at our nearest branch.

In corresponding about a fan, give the type and name-plate reading in full, not omitting prefix or suffix letters (if any) to the Catalogue, Style or Serial Number.

All fans except the ceiling and 8-inch are packed each complete in one box.

8-inch fans are packed 10 fans of same catalogue number per case (each fan boxed separately).

The motor, ceiling hook, hanger and canopy of each ceiling fan are packed together in a substantial box. The blades and hanger rod are packed each set in a separate box.

No. 8100 Western Electric 8-inch Non-oscillating Induction Fans

110 Volts, 60 Cycles A. C.

Motor is self-starting single speed induction type. Pressed steel frame and pressed steel one-piece blades.

Has wick oiled front and rear bearings.

Motor body and base are finished in black enamel; blades, black satin finished.

All lead holes are rubber brushed.

Has a hinged joint for desk or wall position. Rigid 6-arm guard welded throughout. Base is felt covered and of a large diameter to prevent tipping.

Furnished with 8-foot new code reinforced cord and separable plug.

Price, No. 8100, 110 Volts 60 Cycles..... each \$10.00

Western Electric 9-inch Non-oscillating Fans

Alternating or Direct Current

Four blades, three speeds, drawn steel frame, series type, 100-120-volt universal motor, hinge joint for desk or bracket position, switch in base, felt pad to allow placing on highly polished surfaces without marring.

110-volt fans will operate on any D.C. circuit 100 to 120 volts, and any A.C. circuit 25 to 60 cycles, 100 to 120 volts.

This is an extra high grade small fan of drawn steel construction. The 9-inch size is ideal for the home or small office and this fan or the 9-inch oscillator should be selected for such service.

Prices include separable plug and 8 feet of black new code reinforced cord attached to base of fan.

Add \$1.00 to price of 110 volts for any voltage between 20 and 110 volts (except 32 volts).

Add \$1.00 to price of 220 volts for 235 or 250 volts. Special voltages between 110 and 220 volts, same price as 220 volts.

The fan as listed for 110 volts will operate on all circuits mentioned without any appreciable variation in speed.

Western Electric 9-inch Oscillating Fans

Alternating or Direct Current

Four blades, 3 speeds, drawn steel frame, series type, 100-120-volt universal motor, standard oscillating mechanism, hinge joint for a desk or bracket mounting, base felt covered.

110-volt fan suitable for any D.C. circuit 100 to 120 volts and any A.C. circuit 25 to 60 cycles, 100 to 120 volts.

This fan is the same as the 9-inch non-oscillating type, except that it has the new standard type oscillating mechanism, readily adjustable for straight breeze or any degree of oscillation without use of tools.

Prices include separable plug and 8 feet black new code reinforced cord attached to base of fan.

Add \$1.00 to price of 110 volts, for any voltage between 20 and 110 volts (except 32 volts).

Add \$1.00 to price of 220 volts, for 235 or 250 volts. Special voltages between 110 and 220 volts, same price as 220 volts.

The fan as listed for 110 volts will operate on all circuits mentioned without any appreciable variation in speed.

Western Electric 12-inch Non-oscillating Fans

Direct Current

Four blades, three speeds, drawn steel frame, series type, trunnion joint for desk or bracket mounting, swivel to turn blades in any horizontal direction, base felt covered and of large diameter to prevent tipping.

Similar to the 12-inch alternating current fans and bearings, oil cups, switch base, blades, guard and other important parts are interchangeable.

Through the use of drawn steel parts, the fan is very light in weight; 15 pounds for 12-inch size and is easily portable, but rugged.

Prices include 8 feet of black new code reinforced cord with separable plug attached to base of fan.

Add \$1.00 to prices of 110 volts for any voltage between 20 and 110 volts (except 32).

Add \$1.00 to prices of 220 volts for 235 or 250 volts.

Special voltages between 110 and 220 volts, same price as 220 volts.

Style B Western Electric 56-inch Ceiling Fans Direct Current

Motor and canopy are finished in two coats of baked black enamel with 2 gilt lines around the motor body.

The blades and shanks are attached directly to the spider. Blade shanks have a baked black enamel finish. The blades are made of selected grade of hard wood with polished mahogany finish.

A 4-point, 3-speed switch, fitted in a casing at the upper end of the motor, serves to start and stop the fan as well as to regulate its running speed.

Prices include ceiling canopy, hook and insulated hanger, and adjustable hanger pipe suitable for 10 to 12-foot ceiling.

Add \$1.00 to the 110-volt prices for any voltage between 32 and 110 volts.

Add \$1.00 to the 220-volt prices for 235 or 250 volts.

Special voltages between 110 and 220 volts, same price as 220 volts.

No. 234 FA Fan Hanger Outlets

Face Plate Installed—Ready for Fan

Primarily designed for fan service, this outlet readily lends itself as a utility outlet for heaters, flood lights for show windows, and various electrical appliances. Adaptable to all classes of modern buildings and approved by the Underwriters' Laboratories for supporting oscillating fans up to and including 16-

inch. Eliminates wall brackets, standards, and all temporary installations.

Made with a pressed steel box, 2 3/4 x 3 1/2 x 2 inches; 4 corners of box fitted with substantial supports tapped for No. 10/32 round head steel screws for supporting the adjustable steel plate inside box, which has 1/2 and 3/4-inch knockouts, and to which the brass cover plate, 3 1/2 x 4 1/4 inches, is fastened. This heavy adjustable steel plate rests on the bottom of the box and is furnished with a flared tapped hole to take the 1/4-inch round head steel bolt for supporting fan; this bolt and the brass screw at top of plate, to take care of variation in thickness of plaster, are long enough for an adjustment outwardly not to exceed 1/2 inch.

Furnished with cover plate finished in brush brass or black and a special outlet box with Hubbell No. 7552 standard universal flush receptacle. Oxidized brass or copper finish furnished at an additional charge of 25 per cent.

Packed in individual carton; standard package of 48 is made up and weighs, 102 pounds.

Price, No. 234, Complete, Brush Brass or Black, each \$4.30

Western Electric 12 and 16-inch Ventilating Fans

Alternating and Direct Current

These ventilating fans are 6-blade and have drawn steel frames. By this construction the weight has been greatly reduced as compared with the cast iron motor and tripod type previously furnished.

They are intended for mounting in walls or partitions and exhausting into open space (free air). They may be mounted in a vertical position, as the bearings are provided with hardened steel end-thrust washers.

The motor and fan blades are mounted in a rigid support. The outfit is complete and ready to fasten to the wall or ceiling wherever the necessary opening can be made.

The motors are fully enclosed, thus making them practically dust and moisture proof, and affording protection against grease, grit, acids, or other substances which might prove injurious to the windings or commutator. The fans remove all the fumes and odors which might be distasteful or injurious to the health, and draw in a constant supply of fresh air.

When working against free air the 12-inch fans will displace approximately 1,000 cubic feet of air per minute; the 16-inch fans from about 1550 cubic feet. When working against back pressure or other obstruction to free air, the displacement will be reduced.

Dimensions: 12-inch size—diameter of fan blades, 12 inches; diameter of ring, inside, 13 3/4 inches; outside, 16 inches. 16-inch size—diameter of fan blades, 16 inches; diameter of ring, inside, 17 3/4 inches; outside, 20 inches.

Finish: the motor and supporting ring are finished in baked black enamel. The fan blades are of brass, polished and lacquered.

Add \$1.00 to prices of 110-volt direct-current fans for any voltage between 20 and 110 volts (except 32).

Add \$1.00 to prices of 220-volt direct-current fans for 235 or 250 volts.

Special voltages between 110 and 220 volts, same price as 220 volts.

The bearings of these Ventilating (Exhaust) Fans are all provided with hardened steel end-thrust washers, thus making the fans suitable for vertical operation, upward or downward discharge.

WALL REGULATOR.—For wall regulator in black enamel finish add \$5.00 to price of 12-inch or 16-inch alternating current fans; or \$4.50 to prices of direct current fans.

Regulator gives two-speed reductions from full speed.

When ordering separately state size of fan and voltage and cycles alternating current, or voltage direct current, for which the regulator is intended.

Regulator is not required to operate the fans unless speed reductions are desired. Any of the fans can be started directly from the line.

*The 25-30-cycle fans are series type.

Sturtevant Ventilating and Exhaust Fans

Design 5

Propeller fans are usually installed to exhaust directly to out-of-doors, and are effective for ventilating kitchens, bakeries, laundries, garages, lodge rooms, engine rooms, toilets, stores, small theatres, and all kinds of industries where ventilation is needed, and for drying many materials, such as photo plates, blue prints, plaster, etc. Sturtevant Design 5 Exhaust Fans will deliver nearly as much air when operating reversed, so they can readily be used for blowing in.

Kind of Room	Number of Minutes in Which Air Should Be Changed	Kind of Room	Number of Minutes in Which Air Should Be Changed
Engine Rooms	5-10	Smoking Room	3- 5
Office	6-10	Garages	5- 7
Toilets	3- 5	Bakeries	3- 5
Kitchen	3- 5	Laundries and Dry Cleaning Plants	5- 7
Lodge Room	7-10	Plating and Galvanizing Rooms	7-10
Theatres	7-10		

Theatres and Auditoriums are usually figured on the basis of 20 to 30 cubic feet per person per minute.

Do not use for installation with duct systems.

*Furnished in 110 and 220 volts, 60 cycles only.

Direct current motor for 115-230 volts only. Sizes No. 5 and larger can be furnished for 550 volts at 10 per cent extra. Direct current motors are furnished with enclosed type starter and regulator for 50 per cent speed reduction.

Single-phase motors are thrown directly on the line. When required, regulator for speed reduction 30 per cent can be furnished for all sizes of single phase, except size No. 3, at an extra price. Polyphase motors are thrown directly on the line. The speed cannot be regulated. All motors enclosed type.

Prices upon application.

Sturtevant Big Midget Portable Blowers

Delivers dry air for removing dust from machinery. Compressed air ordinarily contains moisture; this blower shoots dry air. Does away with air lines and lugging a

hose around, and work is reached from all sides. Has 1/2 horsepower universal motor, 110 or 220 volts; speed, open outlet, 9895 r.p.m., closed outlet, 11100 r.p.m.; volume delivered, 43.2 cubic feet per minute; air velocity, 14820 feet per minute; static pressure, outlet closed, 16.62 ins. water; inside diameter nozzle, 3/4 inch. Furnished with 20 feet cord and plug; switch in handle. Weight, 7 Pounds.

Price each \$44.00

Edwards Annunciators
Special Features and General Information

No. 80

No. 80 Gravity Drops

The drop used in all hand reset annunciators is the No. 80 Gravity Drop. It is made of decarbonized steel and brass. Constructed to withstand severe service. The drop remains locked against all vibrations and falls only when current passes through magnet.

Price, No. 80each \$3.45

No. 400 Semaphore Gravity Drops

The drop used in all electrical reset annunciators is the No. 400 Semaphore Gravity Drop. Two lock drops are combined in one unit thus doing away with the permanent magnet. It is dependable and made to withstand severe service. Self-locking in either position and will stand several times the amount of current necessary for operation. Upon energizing the right

No. 400

hand magnet the shutter is thrown to the left and locked. Upon energizing the left hand magnet it is returned to its original position and locked.

Price, No. 400each \$3.90

No. 11 Closed Circuit Drops

Closed Circuit Drop No. 11 is a satisfactory drop for use where closed circuit operation is wanted. Each drop its own relay.

No. 81 Edwards Dixie House Type Annunciators

For Operation on Battery or Transformer Gravity Drop Schedule E

Hand reset only. A moderate priced instrument with all the desirable features of a higher priced one. The drops used are the No. 80. They are locked in place and cannot be released by shaking or jarring. When current passes through the magnet they drop immediately. A Size 2 Adjustable Lungen Buzzer is mounted in the backboard. The whole mechanism is mounted on a backboard with plainly marked terminals. This arrangement allows the annunciator as a whole (less case)

to be installed, connected and tested with a minimum amount of labor. The case itself, being one piece, may then be slipped on and securely held by fasteners on either side. The backboard is wood, the grain running in two directions to prevent warping. It is recessed for mounting on irregular walls. Each annunciator packed in a separate carton. Standard finish, golden oak; mahogany can be furnished at additional cost. Furnished only as listed. 6 volts D. C., 12 volts A. C., irrespective of line resistance. Other voltages special.

For Operation on Battery or Transformer Gravity Drop Schedule E

Hand reset only. The same mechanism as No. 81 with the exception that the bell is mounted as shown and connected in circuit with flexible cord. The case is iron, the neatness of design and finish making it especially adaptable for offices, kitchens, etc., where cleanliness is an asset. The case is hinged to the backboard. A slotted hole in the case and a countersunk screw form the fastening, it being only necessary to loosen screw to open case.

Each annunciator packed in a separate carton. Finish, white enamel. 6 volts D. C., 12 volts A. C. irrespective of line resistance. Other voltages special.

No. 10 Edwards Return Call Gravity Drop Annunciators

For Operation on Battery or Transformer

6 Volts D.C., 12 Volts A.C.

Schedule T

No. 10 hand reset only. Wood, as shown. Generally used in hotels for the purpose of calling the room and acknowledging from the room that the call has been heard, or the reverse operation. A common battery wire is used for both the call from the annunciator and to calling point. One wire with common return for call from annunciator, the other wire with same common return for call to annunciator. Each button on the annunciator is marked to correspond to a drop. One drop for every station. The No. 80 drop is used. Finish golden oak. Other finishes, special, etc., listed elsewhere. 6 volts D. C., 12 volts A. C. irrespective of line resistance. Other voltages special.

Bryant Hospital Signal Systems

125 Volts

Calling Station Operated by Pulling a Cord

The Bryant system is especially designed for summoning nurses in hospitals and similar institutions. It provides a means for transmitting a signal to one or as many points as desired, and the signals cannot be changed or effaced until the call has been answered at the point of origin.

Supplemental equipment provides for emergency calls and the signalling of doctors.

By use of the elapsed time recorder, positive records may also be obtained as to the time of origin and response to calls made.

Simultaneously with the registration of the call, accomplished by pressure on the button of the bed push, the current is automatically shut off from the extension cord. Cancellation of the call is only accomplished when the nurse presses the control button of the station calling which operation also restores the connection to the extension cord.

Plug receptacles for current-consuming devices such as fan motors, heating pads, reading lamps, etc., may be made a part of the calling system.

Calling Station Operated by Pressing a Button

The Bryant silent call hospital system operates with colored lights instead of bells and buzzers, which are disturbing to other patients. The system is instantaneous, silent and infallible.

The operation of the system is simple. The patient's touch on push button or pull cord lights signal lamps in various parts of the hospital. The nurse knows the origin of the call without hunting, or visiting an annunciator, and can go directly to the patient who requires her services. As the calling point is the only point at which the signal lamps can be

Calling Station with Provision for Calling a Doctor. It is also Intended for Use in Wards

extinguished, she must visit the patient to cancel the call. In this way it is an infallible calling system. The saving in valuable time and energy of doctors and nurses has a direct value in the scientific and economical operation of any hospital and institution.

The Bryant system is made up of units which are assembled to meet the simplest requirements of the smallest hospital or the most comprehensive needs of the largest institutions. It operates on standard lighting voltage without any of the auxiliaries which are essential to signal apparatus using low voltages and for this reason costs less to install and operate properly.

One Type of Signal Light

Two complete catalogues have been prepared describing this system. They are full of information about hospital signal systems and from them can be obtained an exact knowledge of how to lay out, specify and install a complete system for any hospital.

Copies of these catalogues will be sent promptly upon application.

Time Recorder which Makes a Record of Every Call and Time Taken to Answer

DeVeau Hospital Signal Systems

Ward Calling Station

DeVeau Hospital Signal Systems provide a dependable silent call system of the locking-type.

These systems are so designed that audible signals can be added when desired.

Furnished for operation on standard lighting circuits of 110-125 volt, A.C. or D.C., and the advantage of such systems needs no argument; where for some special reason lower voltage systems are desired apparatus will be furnished to operate on 18-24 volt A.C. or D.C. circuits and when specially ordered (be sure to get information on 220 volt circuit apparatus) systems will be furnished to operate on 220-250 volt. A.C. or D.C. circuits.

A DeVeau system has the advantage of any other type of 110 volt system on the market in that the control switch, as well as the signalling lamp, is in a separate unit, there is no mechanism whatever in the wall and if at any time it should be necessary to replace a control switch or signalling lamp the control switch unit with signalling lamp can be taken to the stock room and a new one substituted in a moment. In the DeVeau system to summon the nurse, the patient has

Nurses' Annunciator Station

only to press the button at the end of a flexible conductor. The slightest pressure is sufficient to send a signal and a patient in the most weakened condition can operate the system. Resetting the call can only be made at the station where the call goes in. This prevents the cancellation of the call without the nurse going to the patient. The extension cord is heavily insulated and is extremely flexible. It is a type of cord specially designed for use on the DeVeau system. Each conductor is heavily insulated with rubber and then surrounded by an additional heavy rubber insulation, which can be washed and disinfected, making it much more sanitary than cotton or silk covered cord generally used heretofore.

DeVeau Hospital Signal Systems are so designed that additional equipments providing for emergency calls and signalling of doctors may be readily added to the system already installed. By the use of an elapsed time recorder, permanent record may be obtained as to the origin of the call and the time the nurse took to answer the same.

In a 110 volt De Veau Hospital Signal System the wiring may be installed in the same conduit as the house lighting circuit and every part of the system is designed to provide an economical and entirely satisfactory signalling system for the most up-to-date hospital.

Simultaneously with the registration of the call, accomplished by pressing the button of pear push at bedside, the current is automatically cut off from the extension cord.

Cancellation of the call can only be accomplished when the nurse presses the re-set button of the station calling, which operation also restores connection to extension call.

While primarily designed for hospital signalling, this system, with wall or desk type instead of pear push buttons, is ideal for department stores, etc., where a silent call system, with musical audible signal if desired, will locate the executives away from their desks. Send for illustrated catalogue on DeVeau Hospital Signal Systems.

Prices upon application.

Edwards Fire Alarm Systems

Complete information on each type of system, both closed circuit, electrically supervised, and open circuit, is given in chart form below. The arrangement has been made with as great a degree of accuracy as a subject of such diversity will permit. It presents the different systems at a glance and enables one to see the salient points of each system and the apparatus used.

A complete bulletin showing wiring diagram and giving directions for installation and estimating battery will be sent upon application.

On pages following, the systems and apparatus used are illustrated, described, and all prices given.

*Usually for general alarm purposes. Can be modified by use of an annunciator to indicate where alarm was turned in. General or individual alarm rung by switches or annunciator.

**These systems are so arranged that the alarm, when turned in from any box, rings predetermined bells only in such places as engine room, superintendent's office, etc. If it is necessary, after investigation, the general alarm is turned in from any box by any authorized person holding a key.

Fire Alarms for Towns and Villages

The same as the E. M. B. D., E. M. B., or S. S. systems according to the current available. It is customary to use a motor driven siren for the general alarm signal for which a slow movement type of fire alarm boxes is needed. See price list.

Edwards Fire Alarm Systems**E. M. B. D. Closed Circuit System—Battery Direct**

The Apparatus Used in This System Is Approved by the
National Board of Fire Underwriters

This system is usually operated on primary battery with all bells and boxes connected in series on a single loop.

Boxes are of the code ringing type and when operated cause code to be sounded by a series of single strokes on electro-mechanical bells. These bells are equipped with a powerful spring operated mechanism that is released electrically.

For proper operation it is necessary to maintain a current flow of $\frac{1}{10}$ ampere (100 milliamperes) on the alarm line.

It is customary to add a relay in the system and provide a small vibrating bell of distinctive sound (usually a cow gong) with local battery for operation. This is known as the "Trouble Bell" and should current supply fail or circuit be opened due to breakage of line or any other reason, trouble bell will immediately ring. In this manner notification is given that the system requires immediate attention.

While not necessary it is often desirable to include pen or punch registers which record on paper tape by dashes or holes the boxes operated or tests made. This provides a permanent record for filing. A paper winder is necessary to take up paper tape as issued from register. In conjunction with the registers a time stamp is often used which prints the year, month, day, hour and minute of alarm or test. This is operated by local battery through a relay in the main line and is entirely automatic.

In this, as in all other systems, many modifications are possible to meet special conditions and it is recommended that exact data and requirements be submitted to the manufacturer's engineering department for suggestions and assistance.

E. M. B. Closed Circuit System—Battery with Control Panel

The Apparatus Used in This System Is Approved by the
National Board of Fire Underwriters

This system is operated by primary battery through a control panel which reduces the supervising current value to not more than 25% of that required by the systems without a control panel. This naturally makes the battery last at least four times as long under the same conditions. In addition to this the initial battery investment is greatly reduced.

The system is limited to 14 bells per circuit. Where the division leaves less than 14 bells on one circuit the difference is made up by a resistance unit on the panel. It is arranged so these units may be eliminated if extensions are made to the system. There is no limitation to the boxes.

The bells are in series on one circuit and the boxes in series on a separate circuit. The control board has marked terminals to which each of these circuits are connected.

The boxes are of the code ringing type and when operated cause code to be sounded by a series of single strokes on electro-mechanical bells.

The control panel provides a central point where all connections are made and on which is mounted the necessary meters, instruments, etc.

A trouble bell is furnished with the panel: this is a vibrating bell of distinctive sound (usually a cow gong) with local battery for operation. Should the current supply fail or the circuit be opened due to breakage of line or other reason, the trouble bell will immediately ring. In this manner notification is given that the system requires immediate attention.

While not necessary, it is often desirable to include pen or punch registers which record on paper tape by dashes or holes the boxes operated or tests made. This provides a permanent record for filing. A paper winder is necessary to take up paper tape as issued from register. In conjunction with the registers a time stamp is often used which prints the year, month, day, hour and minute of alarm or test. This apparatus is operated by local battery through a relay in the main line and is entirely automatic.

Edwards Fire Alarm Systems**S. S. Closed Circuit System—110 to 120 volts D. C. with Control Panel**

The Apparatus Used in This System Is Approved by the
National Board of Fire Underwriters

Where dependable 110-volt D. C. service is available this system is recommended as requiring the least attention and maintenance expense of any closed circuit system. It is dependable and satisfactory in every way. Operated from D. C. lighting circuit through a control panel.

If a two-wire lighting circuit is used, the control panel is equipped with dry battery to operate the trouble bell. If the lighting circuit is 3-wire 110-220 volts, the panel is arranged for trouble bell operation on 110 volts. In this case it is customary to operate the system by connecting to neutral and negative while trouble bell is connected to neutral and positive.

The trouble bell is a small vibrating bell of distinctive sound (usually a cow gong). Should the current supply fail or circuit be opened due to breakage of line or any other reason, trouble bell will immediately ring. In this manner notification is given that the system requires immediate attention.

A supervising current of $\frac{1}{2}$ of an ampere is maintained on the line and the approximate operating current is two amperes per circuit.

The system is limited to 14 bells on each circuit. Where this division leaves less than 14 bells on one circuit the difference is made up by a resistance unit on the panel. It is arranged so these units may be eliminated if extensions are made to the system. There is no limitation to the boxes.

The boxes are of the code ringing type and when operated cause code to be sounded on single stroke bells.

While not necessary, it is often desirable to include pen or punch registers which record on paper tape by dashes or holes the boxes operated or tests made. This provides a permanent record for filing. A paper winder is necessary to take up paper tape as issued from register. In conjunction with the registers a time stamp is often used which prints the year, month, day, hour and minute of alarm or test. This apparatus is operated by a modification of one of the control relays on panel and is entirely automatic.

In this, as in all other systems, many modifications are possible to meet special conditions and it is recommended that exact data and requirements be submitted to the manufacturer's engineering department for suggestions and assistance.

S. S. A. Closed Circuit System—110-120 Volts A.C. with Control Panel

The Apparatus Used in This System Is Approved by the
National Board of Fire Underwriters

The same system as the S. S. Closed Circuit System, but for alternating current. The supervising current in this system is $\frac{1}{10}$ of an ampere and the operating current 3 ampere per bell circuit.

Pre-signal Closed Circuit System

Used in Conjunction with E.M.B. or S.S. Systems

The pre-signal system has been designed for conditions where it is desirable to sound a preliminary alarm at a certain place before a general alarm is sounded to clear the building. It is particularly suited for hospitals, hotels, public institutions, etc., where it is desirable to investigate the seriousness of a fire before sounding the general alarm. It involves the use of special boxes having two circuits, and is so constructed that when an alarm is turned in circuit No. 1 operates only, sounding the preliminary signal in some central place or places. The general alarm may be sounded from any box by authorized persons holding keys. The key is inserted and turned and the lever pulled as usual. This operates circuit No. 2 on which is located the alarm bells.

No. 114 Edwards Fire Alarm Gravity Drop Annunciators

For Operation Battery or Transformer
6 Volts D. C., 12 Volts A. C.
Schedule T

No. 114 Manual reset. Wood as shown. The glass of a fire alarm box being broken, the bell on annunciator rings continuously and drop shows bearing number of station. Alarm bells can then be rung individually or collectively by switches on the annunciators. Simple break glass boxes Nos. 2240, 2241 or 77 and Recti Bells or electro-mechanical bells are used with this system. Finish golden oak. Other finishes, special features, etc., listed elsewhere. 6 volts D.C., 12 volts A.C. irrespective of line resistance.

Other voltages special.
No. 114 plain case as illustrated No. 10.

No. 114 Edwards Fire Alarm Annunciators

Open Circuit, Non-supervised, Non-code Ringing

Manual reset, all sizes.
For use in small hotels, institutions, factories, etc.

In case of fire the glass of a fire alarm box is broken, causing tag bearing same number as box to indicate, and annunciator bell to ring continuously. Alarm bells are then rung individually, or all at the same time by means of switches on lower part of annunciator.

Prices upon application.

Edwards Code Boxes

Substantial in construction and with a reliable mechanism.

To sound alarm, open door and pull lever. Pulling and releasing lever winds the mechanism and sets it in motion. Code signal is sounded four times.

When lever is pulled it automatically disengages from the mechanism and subsequent pulling has no effect on the proper operation of the signal.

Door has spring hinge and closes itself.

Silent test made with key supplied for purpose.

Conduit fitting separate from box so conduit work may be completed and wires pulled through before installing boxes.

Finish is red enamel with raised aluminum-tipped letters. Specify open or closed circuit in ordering.

No. 1275

Edwards Registers

Automatic pen register. Indication consists of a number of short dashes. Self starting and stopping.

Resistance 20 ohms, open circuit only.

Can be used with relay for closed circuit.

Price, No. 2197, Single Pen.....each \$168.50
" " 2197, Double " " 180.00

Edwards Fire Alarm Systems

Combined Watchman and Fire Alarm System

Used In Conjunction with E. M. B. or S. S. Systems

In large factories, department stores, building groups, etc., it is often desirable to combine the fire alarm and watchman system. This is possible and practical where there is a central station or office where someone is always in attendance. The best results are obtained by the use of a special adaptation of the dual operation box for the Pre-signal system. The watchman on his rounds uses a key at station which operates circuit No. 1 only, making a record, ringing a bell (or both) at the central station. To turn in an alarm of fire it is necessary to break the glass and pull the lever inside the box. This sounds a general alarm, operating circuit No. 2 on which the alarm bells are located. To accomplish the results described above, special boxes No. 1275-2DW or No. 1276-2DW are used. These are surface and concealed conduit types respectively, the same in outside appearance as Nos. 1275-2 and 1276-2.

Another form of combined watchman and fire alarm system is by the use of a special adaptation of the regular Nos. 1275-2 or 1276-2 boxes. These being one circuit boxes a stop is arranged so that the watchman by use of his key sounds **one round only** of the regular coded signal. To sound an alarm of fire it is necessary to break the glass and pull the lever inside the box; this sounds the regular **four rounds** of coded signals. The boxes mentioned are for surface and concealed conduit respectively.

No. 77 Edwards Break-glass Boxes

This box is surface type, battery only. Break glass to close circuit. Size, 3 3/4-inch diameter.

Finish, brush brass, polished brass or bronze.

Price, No. 77, Open Circuit each \$2.45

Price, No. 77C, Closed Circuit each 3.20

No. 224 Edwards Break-glass Boxes

Nos. 224 and 224A are open circuit, battery only.

Break glass to close circuit.

Size: No. 224, 4 3/8 by 3 7/8 inches; No. 224A, 4 1/8 by 4 3/4 inches.

Fit any standard switchbox.

Finish, dark mat with raised border and lettering of brass, polished, brush or bronze.

Hammer and chain with each box.

Special test key is included with box; signaling without this key or by breaking glass is impossible.

Unless otherwise specified, boxes will be furnished in black ground with lettering, brush brass.

Prices on special finishes upon application.

Price, No. 224, Flush Type each \$8.40
 " " 224A, Surface Type " 9.25

No. 2240 Edwards Break-glass Boxes

For 110 Volts D. C. or A. C.

No. 2240 fits any standard switchbox. Glass in front, window glass replaceable at small cost.

Heavy phosphor-bronze springs with perfect scraping contact mounted on slate.

Separable conduit fitting so that conduit may be installed, wires drawn through and connected, and box then installed by machine screws. Drilled top and bottom for 1/2-inch conduit.

Test key is included with box.

Finish is red enamel.

Hammer and chain included without additional cost.

Price, No. 2240, Concealed Conduit Type each \$15.50

" " 2241, Surface Conduit Type " 15.50

No. 17 Edwards Vibrating Alarm Bells

Open skeleton type of bell for battery operation on battery.

A patented method of breaking the circuit mechanically, gives a very powerful stroke.

Pure hard-drawn silver contacts, new code binding posts, phosphor-bronze springs.

Price, No. 17, 8-inch each \$14.37
 " " 17, 10 " " 21.34
 " " 17, 12 " " 27.50

Nos. 100 and 1001 Edwards Vibrating Alarm Bells

Plunger type movement, patented, and so constructed that armature has no possible way of losing adjustment.

Carbon contacts that cannot stick, rust or corrode. Solid brass hammer, supported at two points, moves in a straight line in and out of case. For this reason, the opening case is only slightly larger than the hammer rod, thus offering the greatest protection from bugs, dust and weather. As a further protection, an oil-treated felt gasket is used under the cover of case, and the magnets are treated with a moisture-repelling compound which is baked dry. The screw secured by lock nut shown at top of the case, is the only adjustment provided or necessary. It controls contact relations. Magnets, keeper and armature support are practically one solid unit, as they are securely riveted together. Phosphor-bronze springs.

No. 5985 Edwards Register Tape Winders

Automatic action.

Spring mechanism carefully adjusted to take tape from register at proper speed and tension.

Self-starting and stopping.

Price, No. 5985 . . . each \$13.50

No. 240 Edwards Carbon Contact Relays

A sturdily constructed relay mounted on a slate base. It is enclosed in a metal box.

Multiple carbon contacts have a capacity of 25 amperes and will handle voltage on the contact side up to 125 volts D. C. or A. C.

Magnets may be wound for operation on 4 dry cells or any voltage up to 250 D. C.

Prices upon application.

Edwards Bank Hold-up Alarm Systems

No. 119 Foot Switch

The standard system for usual installations is as follows:

No. 119 foot switch is placed on the floor at tellers' windows or wherever desired. The two cast-brass arms which support the toe rod are substantially built and strongly pivoted at the back. To one is attached the cast-brass, water and dust-proof box that encloses the contact-making mechanism. The contacts are phosphor-bronze, scraping, self-cleaning type. The box is drilled for 1/2-inch conduit.

A most important feature of the Edwards foot switch is that the foot-rail normally rests on the floor, supported by cast-brass feet. In this position it is habitually used as a foot rest—a natural, human instinct, and particularly desirable as it intuitively fixes its location for the person who might have to use it to give an alarm.

To sound the alarm the rod is raised and not depressed. To do this it is only necessary to slide the foot slightly forward on the floor and the rod will ride up the instep.

False alarms that would result from accidental depression of the foot rail are entirely eliminated.

No. 1190 control station is connected in circuit with all foot switches and consists of a heavy cast box with hinged door equipped with a concealed lock. When the foot switch is operated the mechanism of the control station switches current into alarm bells, which will ring continuously until turned off manually at the control station. To do this the door must be unlocked. As this system is primarily for daylight hold-up protection, it would probably be turned off at night by some person in authority holding the key. When this is done a plunger immediately protrudes through the bottom of the case. In the morning any person may turn the system by merely pushing the plunger.

No. 1190 Control Station

Operating current may be battery, transformer or A.C. or D.C. lighting circuit.

Alarm bells for interior installation are usually 8, 10, or 12-inch size. For exterior alarm they should, of course, be as large as possible.

An annunciator is sometimes used in large installations to indicate which foot has been operated.

No. 119 teller's foot switch is furnished with 12-inch rail for surface conduit.

No. 119C is the same as No. 119, for concealed conduit, complete with separate floor box, drilled on any four sides, as specified. A rubber gasket is furnished with each for insertion between floor box and contact box.

Edwards Single Stroke Alarm Bells

Electro-mechanical. Wound to 20 ohms. Operated by a strong spring mechanism which is released by a small fraction of an ampere. The mechanism is entirely insulated from the case.

The hammer when released, makes a full revolution, passing under the gong and strikes the gong with the great force gathered in this revolution. 400 strokes per winding. Conduit fitting is made for 1/2 or 3/4-inch conduit as specified.

Edwards Single Stroke Alarm Bells

For concealed or surface conduit.

The armature is strongly attracted from a considerable distance giving the hammer a long swing and a powerful blow. The hammer is attached to a hammer rod by a strong, flat spring, causing a quick recoil resulting in clear distinct signals.

The conduit attachment is separable and can be installed with the conduit and wires pulled through, drilled for 1/2 or 3/4-inch. Attachment has 4 inside bosses.

Faraday Industrial Fire Alarm Systems

System A

For Dependable 110-125 Volt D.C. Circuits
Electrically-supervised, Code-ringing
Closed-circuit, Using Straight-
Electric Gongs

Recommended for factories, warehouses, lofts, schools, etc., where there are several floors under one roof rather than several isolated buildings. May also be used for hotels, apartment houses, department stores, hospitals and similar institutions; but for these are recommended the Pre-Signal Faraday Systems C, D and H.

In A Systems either of 2 types of code-ringing fire alarm boxes may be used: plain type or positive non-interfering type.

Where the plain type is used, should more than one box be pulled at the same time, a jumbled signal is likely to result; where the positive non-interfering type is used, such jumbling of the signal is impossible as the boxes are equipped with devices which absolutely prevent interference.

All circuits, instruments and apparatus are constantly under electrical test.

Pull-lever Code-ringing Boxes

Cat. No.	Description	Price Each	Cat. No.	Description	Price Each
2022-A	Surface	\$38.00	2023-A	Semi-flush	\$46.00

Faraday positive non-interfering boxes or break-glass pull-lever fire alarm boxes may also be used with this system. Details upon application.

Always specify whether trouble-bell is to be operated from battery in control cabinet or from 110 volt D.C. circuit.

Faraday Industrial Fire Alarm Systems

System B

For Storage Battery Operation
Electrically-supervised, Code-ringing
Closed-circuit, Using Electro-
mechanical Gongs

Recommended for factories, lofts, schools, railroad yards, docks and all similar installations where large areas are to be covered. May also be used for hotels, apartment houses, department stores, hospitals and similar institutions, but for these Pre-signal Faraday Systems C, D and H. are recommended

In B systems, either of 2 types of code-ringing fire alarm boxes may be used: plain type or positive non-interfering type.

Where the plain type is used, should more than one box be pulled at the same time, a jumbled signal is likely to result: where the positive non-interfering type is used, jumbling of signal is impossible as construction prevents interference.

All circuits, instruments and apparatus are constantly under electrical test.

Faraday Industrial Fire Alarm Systems

System C

Pre-signal or Dual Operated Type

For Dependable 110-125 Volt D.C. Circuits Electrically-supervised, Code-ringing Closed-circuit, Using Straight-Electric Gongs

Recommended for hotels, apartment houses, department stores, hospitals and similar institutions, particularly where there are several floors under one roof rather than isolated buildings.

These systems are especially recommended for installations where it is not desirable to alarm all the occupants of the building immediately upon a fire being discovered, but where it is desired to first notify the members of a trained fire brigade. The operation of the box sounds the code on certain gongs called pilots located where they may be heard by the fire brigade. Should it be necessary to sound a general alarm, this may be done by any member of the fire brigade from any box, by means of a special key, the signal then sounding on the general gongs as well as the pilots.

All circuits, instruments and apparatus are constantly under electrical test.

Always specify whether trouble-bell is to be operated from battery in Control Cabinet or from 110 volt D.C. Circuit.

Faraday Industrial Fire Alarm Systems

System F

For Dependable 100-110 Volt 50-60 Cycle A.C. Circuits (25, 30 and 40 Cycles to Order) Electrically-supervised Code-ringing, Closed-circuit, Using Straight-Electric Gongs

Recommended for factories, warehouses, lofts, schools, etc., where there are several floors under one roof rather than several isolated buildings. May also be used for hotels, apartment houses, hospitals and similar institutions, but for these the Pre-Signal Faraday Systems D and H. are recommended.

Designed for use where an absolutely dependable supply of alternating current is available at all times, but no systems operating direct from the A.C. circuits are considered as good as those employing storage batteries, as gongs operating on A.C. give comparatively weak signals and often cause dissatisfaction. System B which employs Storage Batteries is therefore strongly recommended, batteries being charged from the A.C. circuits by suitable devices.

Main-circuits, box-circuits, and gong-circuits are constantly under electrical test. Trouble is automatically indicated by ringing of trouble-bell.

Faraday Industrial Fire Alarm Systems

System J

For Storage Battery Operation Electrically-supervised, Code-ringing, Closed-circuit, Using Electro-mechanical Gongs

Recommended for schools, colleges and similar institutions where one standard code, 4-4 or similar, indicating fire is desired—the exact location of the box being unnecessary.

When the glass on any Non-code-ringing break-glass box is broken, it trips a pre-set master-code box, which transmits its signal on the gongs, and when finished, rings a trouble-bell which calls attention to the necessity of resetting master-code box.

All circuits, instruments and apparatus are constantly under electrical test.

Faraday Industrial Fire Alarm Systems

Faraday Fire Alarm Gongs

System L

For Patterson Battery Set or Transformer Operation
Non-supervised, Non-code-ringing
Open-circuit, Using Vibrating Gongs

Model 2500
Vibrating Gong

Model 2040
Break-glass
Fire Alarm Box

Recommended for small hotels, small public institutions, lodging houses, small schools and other places where open-circuit, non-supervised fire alarm systems must be installed because of limited funds. The closed-circuit, constantly-electrically-supervised systems are recommended as being safer and more reliable.

This system employs 2 types of gongs, depending on the source of current; if primary battery is to be used, the half-grid-guarded Faraday Battery Gongs must be ordered; if transformer is used, the half-grid-guarded Faraday Transformer Gongs must be ordered.

605-L	200	12	31.90

The above transformers are designed for 110 volts 60 cycles A. C. primary with taps for 12-18-24 volts on secondary terminals. Transformers to operate on 220 volts, or 25, 30 or 40 cycles, furnished to order at slight additional cost.

Single-stroke Gongs for Code-ringing Systems

Model 2120
Single-stroke
Half-guarded Gong

Single-stroke Faraday Fire Alarm Gongs are of 2 general types; viz.: straight-electric, i.e., those in which the blow is delivered direct by the magnetic pull on the armature; and electro-mechanical, that is, those in which the blow is delivered by a heavy ball on the end of a lever, released by the magnet, but operated by a powerful clock spring.

In the straight-electric type, the semi-flexible recoil-type hammer-rod guarantees a clear unmuffled blow on gong with never a double-stroke possible. They are particularly adapted for fire alarm systems because of the simplicity of mechanisms and lack of necessity of winding as is required in the electro-mechanical clock-work type. They are of 2 types, one for operation 14 or less in series on 100-125 volts D.C.; the other for operation 10 or less in series on 110 volts 50-60 cycles A.C. (25, 30 and 40 cycles to order).

Model 2620
Electro-mechanical Gong

Vibrating Gongs for Non-code-ringing Systems

Model 2500
Vibrating Gong

The electro-mechanical type is designed to give a very loud powerful signal with a minimum of current, this being normally about 100 milliamperes, although Faraday Electro-Mechanical Gongs can be specially adjusted to operate on as low as 50 milliamperes. They give over 700 blows with one winding of the mechanism. When so specified, electro-mechanical gongs will, at an additional charge, be supplied with special device indicating when gong needs re-winding.

Vibrating Faraday Fire Alarm Gongs are designed for use on non-supervised, open-circuit systems where it is not desired that a code be sounded. The breaking of the glass in the box causes the gongs to ring until the glass is replaced.

These gongs are of 2 types, one for battery operation and the other for transformer operation. In ordering gongs always specify the type desired, and if battery operated, the resistance.

All Faraday Fire Alarm Gongs are finished in glossy English vermilion, and are supplied with conduit-box-backs for 1/2 or 3/4-inch conduit as specified.

When ordering gongs for operation on 100-110 volts A.C., or A.C. bell-ringing transformers, specify frequency (number of cycles) of circuit. Orders cannot be filled without this information.

Faraday Industrial and Municipal Fire Alarm Systems

Faraday Industrial and Municipal Fire Alarm Systems are designed for every purpose where life and property are to be protected from fire hazard, with full regard to the necessity that a fire alarm system must be absolutely dependable.

Particular attention is called to the cabinet-unit mounting feature of all control apparatus. Instruments and control mechanisms are mounted on slate

and windows are provided in doors of cabinets through which instruments may be read.

Faraday Industrial Fire Alarm Systems may be classified in 2 general types:

- (a) Electrically-supervised closed-circuit code-ringing for local drill alarm purposes.
- (b) Local non-supervised open-circuit non-code-ringing.

Electrically-supervised Systems are guarded by a continuous flow of electric current and employ pull-lever or break-glass pull-lever code-ringing boxes indicating by code signals on gongs or other sounding devices, location of box from which the signal originates; or by simple break-glass boxes and a master code-ringing box sounding one code indicating Fire. All circuits are constantly under electrical test, trouble being instantly indicated by ringing of trouble-bell.

Certain electrically-supervised systems may be of two types or divisions according to the code-ringing Box used:

- (a) Positive non-interfering code-ringing.
- (b) Plain type code-ringing.

Positive non-interfering code-ringing boxes are employed in the best type of electrically-supervised systems and where installed no jumbling of the signal can occur if 2 or more boxes are pulled at about the same time.

Plain type code-ringing boxes may also be employed in closed-circuit systems and where the lever of any box has been pulled down as far as it will go, the box will transmit its code 4 times; no manipulation of the lever can cause confusion of signal. However, should more than one box be pulled at about the same time, there is likely to be confusion or jumbling of signals.

Non-supervised open-circuit systems employ a simple break-glass type of box, and vibrating gongs or other sounding devices. These systems have the disadvantage that should some disarrangement of the circuit occur, any attempt to sound the signal would fail.

Faraday Industrial Fire Alarm Systems are designed to operate from D. C. or A. C. light and power circuits, also from storage batteries and primary batteries. Operation from storage batteries is favored by engineers.

Faraday Municipal Fire Alarm Systems are designed for small cities and towns, industrial centers, etc., and possess all the desirable features of the closed-circuit electrically supervised industrial systems mentioned above. They employ either positive non-interfering or plain type Faraday Boxes as may be desired, also electro-mechanical gongs, single-stroke tappers, punch registers and Faraday Compressed Air Horns and Steam Whistles. They are operated either from primary batteries or storage batteries.

Faraday Municipal Fire Alarm Systems

System M

Recommended for small cities and towns, large industrial plants, etc., where as many as 50 boxes and 10 sounding devices are to be installed and where for convenience in wiring the circuits may be divided into 4 if necessary. They provide the highest type of fire alarm protection. They employ positive non-interfering Faraday Fire Alarm Boxes in weatherproof cases, electro-mechanical gongs and single-stroke tappers, punch registers and Faraday Compressed-Air Horns or Steam Whistles for the automatic sounding or broadcasting of the alarms. Manual transmitters may also be used with these systems—these devices being designed for installation in police headquarters, telephone exchanges, etc., for the purpose of sounding coded signals on the fire alarm circuits without the necessity of transmitting from the fire alarm boxes;—i. e., they permit the sounding of a fire alarm which may have been telephoned to police headquarters or telephone exchange.

System T

Recommended for small towns, small industrial plants, etc., where not more than 25 boxes and 7 sounding devices would be used.

Designed for use in places where the protection afforded by a closed-circuit code-ringing fire alarm system is desired, but where because of limited funds a medium-cost system must be installed. The first cost is slightly more than that of the V System, but the greater reliability of storage batteries, and their lower cost of charging as against the cost of renewals of primary batteries makes this system cheaper in the long run. They also have the advantage over V systems in that, because of the use of storage batteries and their extreme reliability, additional devices for the sounding of alarms may be added from time to time. These systems employ plain type code-ringing fire alarm boxes in weatherproof cases, electro-mechanical gongs and single-stroke tappers for sounding the signal from the boxes, and Faraday Compressed-Air Horns, Steam Whistles or Electric Sirens for the sounding of general alarm. Faraday Compressed-Air Horns and Steam Whistles have the advantage in that they may be coded, and thus the same signal transmitted by a box may be sounded manually, whereas electric sirens because of peculiar construction, are limited to a few blasts and cannot be coded.

System V

Recommended for villages, small industrial plants, etc., where not more than 20 boxes and 5 sounding devices would be used.

They employ plain type pull-lever code-ringing fire alarm boxes in weatherproof cases, electro-mechanical gongs and single-stroke tappers for sounding the signal from the boxes, and Faraday Compressed-Air Horns, Steam Whistles or Electric Sirens for the sounding of the general alarm. Faraday Compressed-Air Horns and Steam Whistles have the advantage in that they may be coded, and thus the same signal transmitted by a box may be sounded manually, whereas electric sirens, on account of their peculiar construction, are limited to a few blasts and cannot be coded.

All circuits, instruments and apparatus are constantly under electrical test.

Faraday Fire Alarm Boxes

Closed Circuit

Plain Pull-lever Code-ringing Type

**Model 2022
Surface Type**

Plain type boxes are designed to give any signal required for standard fire alarm work and automatically transmit the signal 4 times. After lever has once been pulled down and released, the signal cannot be disarranged by again operating the lever.

Plain Type Boxes should only be used where the chances of more than one box being pulled at the same time are comparatively remote. Where many boxes are installed and there is likely to be more than one pulled, the Positive Non-Interfering Type is recommended.

Cat. No.	Description	Price Each
2022	For Surface Mounting with Outlet-Box-Back for Conduit.....	\$38.00
2023	For Semi-Flush Mounting with Outlet-Box-Back for Conduit.....	46.00

In ordering the above boxes, be sure to specify size of opening required for conduit, also, the code desired to be transmitted by box.

Made also in break-glass and weatherproof types.

**Positive Non-interfering Pull-lever
Code-ringing Type**

Faraday Non-interfering Fire Alarm Boxes, while retaining all the superior features of plain pull-lever code-ringing type boxes, have in addition self-restoring and non-interfering mechanisms, and are so designed that should more than one box be pulled at about the same time, no interfering or jumbling of the alarm will result as one box only will transmit its signal and all the others will be automatically locked out.

Particular attention is called to the self-restoring device of these boxes. This device automatically resets the non-interfering mechanism and pull-lever, and places the boxes in condition to send subsequent alarms. In other boxes of this class, it is necessary to manually restore this mechanism, and this has often resulted in a failure to operate where a box has been overlooked.

These boxes are self-winding and therefore do not require the attention necessary in trip-type boxes which must be wound up at certain periods. They will operate perfectly on circuits containing boxes of other manufacture.

**Model 3123
Semi-flush Type**

Cat. No.	Description	Price Each
3122	For Surface Mounting with Outlet-Box-Back for Conduit.....	\$150.00
3123	For Semi-Flush Mounting with Outlet-Box-Back for Conduit.....	175.00

Made also in break-glass and weatherproof types.

Faraday Fire Alarm Boxes

Open Circuit Non-code-ringing Types

Faraday Fire Alarm Boxes, listed below, are open-circuit non-code-ringing type boxes. They are designed for fire alarm systems where it is not desired that the location of the box from which the signal originates be indicated by automatic code ringing of the gong and where failure of operative current or derangement of circuits or apparatus is not required to be automatically indicated.

Non-selective open-circuit Faraday Fire Alarm Boxes are the simplest and least expensive that can be installed with any satisfactory results. They are admittedly, however, not as safe or as desirable as the electrically supervised selective code ringing boxes.

Breaking glass of any box automatically rings all gongs. Gongs usually used are vibrating type and after glass is once broken will continue ringing until glass is replaced in box. These types of boxes, together with the gongs used with them, should be connected in multiple.

**No. 2077 Faraday Fire Alarm Boxes
Surface Type Boxes**

Break-glass fire alarm box, finished in English vermilion, round pattern, for surface work, non-conduit installations. Diameter, 3 3/4 inches.

Furnished with hammer and chain.
Price, No. 2077.....each \$2.45

Nos. 2040-2042 Faraday Fire Alarm Boxes

No. 2040 Surface Type Boxes

Break-glass fire alarm box, finished in English vermilion, for surface work, made for 1/2-inch conduit, projects from wall 3 1/8 inches. Size, 5 1/4 inches high x 3 1/4 inches wide. N. Y. Fire Prevention Bureau Standard.

Furnished with hammer and chain.
Price, No. 2040.....each \$15.50

No. 2042 Flush Type Boxes

Break-glass fire alarm box, finished in English vermilion, for concealed work, made for 1/2-inch conduit projects from wall 1 inch. Size, 5 1/4 inches high x 3 1/4 inches wide. N. Y. Fire Prevention Bureau Standard.

Furnished with hammer and chain.
Price, No. 2042.....each \$15.50

No. 2024 Faraday Fire Alarm Boxes

Flush Type Boxes

Break-glass fire alarm box, finished in English vermilion, with black background, will fit standard outlet box for conduit.

Furnished with special test key and contact device. Tests may be made with key without breaking glass, but without key it is impossible to send test signal.

Size, 4 3/8 inches high x 3 3/8 inches wide.

Furnished with hammer and chain.
Price, No. 2024.....each \$8.40

Faraday Hold-Up Protection Systems

Faraday Hold-Up Protection Systems

Closed Circuit Hold-Up Protection Control Cabinet

Faraday Hold-Up Protection Systems are designed to reduce to a minimum, not only the liability of monetary losses through day hold-ups or night robberies of banks, jewellers, pay-roll departments, cashier's departments, etc., but also prevent, to a large extent, danger of loss of life to officials and employees of such institutions and departments.

Electrically-Supervised, Closed-Circuit, Faraday Hold-Up Protection Systems shown on this page, while slightly higher in cost than some types of Open-Circuit Non-Supervised Systems, are dependable at all times as all parts are under constant electrical test; we strongly urge their use and deprecate the use of Open-Circuit Non-Supervised Systems.

Electrically-Supervised Closed-Circuit types are made in six systems as follows:

DHU for 110 volt D. C. lighting circuits for Day Hold-Up only.

DHUN for 110 volt D. C. lighting circuits for Day Hold-Up and Night Burglary Protection.

AHU for 110 volt A. C. lighting circuits for Day Hold-Up only.

AHUN for 110-volt A. C. lighting circuits for Day Hold-Up and Night Burglary Protection.

WBHU for Primary Battery for Day Hold-Up only.

WBHUN for Primary Battery for Day Hold-Up and Night Burglary Protection.

The Control-cabinets are supplied complete with Master-Switch, Night-Cut-Off-Switch, Relays, Milliammeters, Trouble-Bell, Trouble-Bell Batteries and all necessary fuses, terminals, etc., all being mounted on slate and enclosed in steel cabinet with tamperproof Yale locked doors. These doors are so arranged that any attempt to open them by any means but the proper keys (two being required) will cause the alarm to be sounded.

The Trouble-Bell Batteries are also mounted in the cabinet, which prevents their being tampered with and insures their being in perfect order to ring the Trouble-Bell in case of trouble on the system.

Control-Cabinets can be made for different voltages to suit various conditions as required.

For D. C. and Battery Systems Faraday Full-Grid-Guarded Bank Alarm Vibrating Gongs are employed and these are equipped with triplex platenoid contacts—a three-fold insurance against failure of operation.

For A. C. Systems Faraday Transformer Underdome Bank Alarm Vibrating Gongs are employed. These gongs have no contacts and are fully protected.

Both of the above types require no attention after having once been installed.

Prices on Control-Cabinets and other apparatus for Faraday Hold-Up Protection Systems are shown on other pages.

General To All Systems

Bank Tellers' Foot-rail Contactor

FARADAY HOLD-UP FOOT-RAIL CONTACTORS.—These contacting units for giving instant alarm without knowledge of the robbers have been universally approved; they are sectional in construction and readily provide a semi-continuous foot-rail under all tellers' desks or counters. A slight upward pressure of the foot on any section of the foot-rail to give the alarm. Alarm when once started cannot be stopped except by means of the "Master-Switch" within the Control Cabinet under Yale lock protection.

They are designed for heavy duty service; the contact members are heavy phosphor bronze springs, mounted on slate between which a heavy brass plunger bears, thus insuring perfect connection.

Faraday Foot-rail Contactors

Cat. No.	Description	Price per Set of Two
760-A	Foot-rail Contactors Lift-Up Types for Use with Faraday Closed-Circuit Electrically-Supervised Hold-Up Systems	\$45.00
760-B	Same as Above, But for Use on Closed-Circuit Systems Other than Faraday	45.00
760-C	Same as 760-A Except for Use on Faraday and All Other Open-Circuit Systems	45.00

Faraday Tell-Tale Signal Lamps

In addition to the trouble signal, "Tell-Tale" lamps may be provided for installation in the offices of the President, Cashier or the Telephone Switchboard Operator, the function of which is to notify that the system is disconnected.

Cat. No.	Description	Price Each
772	Faraday Tell-Tale Signal Lamps—Surface Wall Type	\$4.00

Faraday Trouble-bells

Cat. No.	Description	Price Each
777	Faraday Enclosed-Type Trouble-Bell with Outlet Box Back, (One for Each System)	\$16.15

Faraday Push Button Contactors

Faraday Push Button Contactors are for use where it is desired to operate the circuit-closing device by hand.

Contactors are mounted on plate to fit Paiste Taplet Fittings— $\frac{1}{2}$ or $\frac{3}{4}$ inch, as specified.

Where it is desired to operate the circuit closing devices by hand, we supply Faraday Push Button Contactors. Furnished with conduit connections and may be mounted anywhere desired, the simple act of pressing the button causing the alarm to be sounded continuously.

Cat. No.	Description	Price Each
768	Faraday Hold-Up Push Button Contactors	\$3.50

Faraday Hold-up Protection Systems

Faraday Toggle Switch Contactors

Can be used either as hand or foot-actuated devices. Fits standard switchbox, and can be used for both flush or exposed conduit installations. Mounted on standard switchplate.

Cat. No.	Description	Price Each
765	Faraday Hold-Up Toggle Switch Contactors (No Switchbox)	\$3.00

Apparatus Required

DHU System

110 Volts D. C.

Cat. No.	Description	Price Each
DHIU-1	Control Cabinet for Systems using 1 Alarm Gong for 110-volt D. C. Circuit	\$250.00
DHIU-2	Control Cabinet for Systems using 2 Alarm Gongs for 110-volt D. C. Circuit	325.00
766	6-inch Faraday Enclosed Type Full-Grid-Guarded Bank Alarm Gongs (for 110 Volts D. C.)	57.90
766	8-inch Faraday Enclosed Type Full-Grid-Guarded Bank Alarm Gongs (for 110 Volts D. C.)	70.60
766	10-inch Faraday Enclosed Type Full-Grid-Guarded Bank Alarm Gongs (for 110 Volts D. C.)	91.25
766	12-inch Faraday Enclosed Type Full-Grid-Guarded Bank Alarm Gongs (for 110 Volts D. C.)	113.10

The above gongs are furnished with outlet box backs with knockouts to slip either 1/2 or 3/4-inch conduit, as specified.

AHU System

110 Volts A. C. 50-60 Cycle

Cat. No.	Description	Price Each

Standard package for sizes above 12-drop is 1.

Edwards Watchman's Time Detectors

Magneto or Battery Type—With or Without Clock

The Edwards Watchman's Time Detector records accurately and indelibly (by puncture on a paper dial) every visit of the watchman to every station, and the time of the visit.

The magneto type is approved by the National Board of Fire Underwriters and by the Associated Factory Mutual Fire Insurance Companies. No battery type is approved, irrespective of make.

Insurance rates are materially reduced by the installation of a Watchman's Time Detector.

The advantages of the system are:

1.—A record cannot be made unless the

watchman has visited the station.

2.—The record cannot be changed. It is a puncture on paper.

3.—A special device registers the opening and closing of door. The record cannot be tampered with.

4.—The dial cannot be torn as there is a cut-out system preventing prolonged contact of point and paper.

5.—Installation is facilitated by plainly marked connections. Wiring is simplest possible, one common wire from instrument to all stations, and an individual wire from each station to the instrument.

6.—All factory made connections are soldered.

The apparatus consists of heavy brass plate on which are mounted:

1.—An arm indicator (Magnets and armature) at the end of which is a pin for making record. One for each station in plant.

2.—An eight-day clock.

3.—Metal disc with guides for holding paper.

4.—A guide arm with opening for each pin.

5.—Special device which records opening and closing of door.

6.—Binding posts.

Case is simple in design and constructed of heavy oak.

Patterson Electric Tank Indicators

These electric tank indicators, operated either from battery or low-voltage transformer, fill an important want in the industrial field. In connection with a reliable signal gong or annunciator (or both) they give an infallible warning signal when contents of a tank have reached a maximum or minimum level or both. They supplement the use of tank float switches and doubly safeguard the plant against possible failure of tank switches and pumps to function.

Models A-20 and B-21 are furnished regularly, allowing 12 inches between upper and lower balls. Models C-22 and D-23 are furnished regularly with 24-inch iron pipe stem. Models E-24 and F-25 are furnished regularly with 20-inch iron pipe stem. If greater distance between base of flange and ball is required, same will be furnished up to 12 feet for \$1.00 per foot.

Pyrene Fire Extinguishers

Approved and Labeled by the Underwriters' Laboratories

With Bracket

Pyrene Fire Extinguishers are the safest and most efficient for electrical and all fires starting in oil, gasoline, shellac, paint or other highly inflammable substances. Water only spreads oil fires and is dangerous on electrical fires.

Employees need no instruction to use Pyrene.

Pyrene will not injure, stain or destroy anything, but will kill fire from any cause, instantly.

Will not freeze at 50° below zero.

Model H Federal Electric Lanterns

Opened

Will not blow out or blow up and can not go out suddenly. Safe for the handling of gases, oils and all inflammable and explosive materials.

Designed to stand the hardest usage. Has met the severest tests for dependability and unusual conditions. Has fallen from the top of freight cars without damage to any part and without extinguishing the light.

Shines downward and to the sides with bright white flood light as well as a strong beam light from reflector. Equipped with 6-volt, 4-cell battery and 5-volt, 0.15 ampere white or red ruby Mazda bulb.

Lighted and extinguished by means of a switch so placed as to be out of the way of accidental operation or injury. Doubly insulated against shorting and protected from freezing. No exposed metal parts which come in contact with the ground are in contact with either pole of the battery at any time.

The Federal Battery is recognized for steady strength and long-life illumination. When used with Mazda 5-volt bulb it will give 28 to 35 hours of intermittent service.

Will fit the coat pocket when the three folding legs are clustered. Compact for the autoist's tool box.

Built with high polish aluminum body. Net weight, 2¼ pounds; shipping weight, 3 pounds. Height over all, handle up, 14¾ inches; folded, 9½x7x4 inches.

Price, Model H, Complete	each	\$6.00

No. 6 Columbia Ignitor Batteries

With Screw Top Connections

A special high grade cell designed for all heavy service. It is particularly adapted for motor ignition. A set of ignitors will keep the engine running smoothly until every bit of current is exhausted.

Equally satisfactory for motor boats, gas engines, and in fact, any service where a reliable, long life battery is needed.

These batteries are carefully packed and from fresh stock, guaranteed to reach their destination in perfect condition.

Size..... inches 2 1/2 x 6
Price, No. 6..... each \$.40

No. 6 Columbia Red Label Batteries

Where steady service is demanded over a considerable period of time, Columbia Red Label Batteries prove reliable, efficient and economical. This is particularly true where the current drain is small, such as in telephone, bell, burglar alarm and toy service.

Columbia batteries will, however, stand up under hard service. They are satisfactory ignition batteries.

Equipped with either screw or Fahnestock connections, as desired.

These cells come from fresh stock, are carefully packed and guaranteed to reach their destination in perfect condition.

Size..... inches 2 1/2 x 6
Price, No. 6..... each \$.40

No. 6 Columbia Gray Label Batteries

The No. 6 is designed especially for telephone and light drain service.

Furnished with round jackets or square cartons.

Initial shipping amperage, 19 to 22 amperes.

No extra charge for convenient Fahnestock spring clip binding posts.

This battery is carefully packed from fresh stock.

Guaranteed to reach its destination in perfect condition.

Packed in wire-bound boxes of 50 cells to the box.

	Length	Width	Height		
772	8 3/8	3 1/4	7 1/8	9	\$3.75

No. 770 Eveready Vertical B Batteries

45-Volt Extra Large
For use on multi-tube sets having 4 tubes operating at 90 or more volts without a C battery, and on practically all sets with 5 or more tubes using 90 volts or over, with or without a C battery. With 3 Fahnestock spring clip connectors giving voltages of 22½ and 45.

Cat. No. 770	DIMENSIONS, INCHES			Wt. Lbs. 13¾	Price Each \$4.75
	Length 8¾	Width 4¾	Height 7¾		

No. 486 Eveready Layerbilt Radio B Batteries

Vertical Type, 45 Volts

The Eveready Layerbilt B Battery is made of flat layers of current-producing elements compressed one against another, so that every cubic inch inside the battery case is completely filled with electricity-producing material. Equipped with 3 Fahnestock clips giving voltages of 22½ and 45.

Cat. No. 486	DIMENSIONS, INCHES			Wt. Lbs. Each 14¼	Price Each \$5.50
	Length 8¾	Width 4¾	Height 7¾		

No. 767 Eveready B Batteries

Contains 30 cells, 45 volts. Cells are large size, 2¼x1¼ inches. Equipped with 7 Fahnestock Spring Clip Connectors, giving voltages at 16½, 18, 19½, 21, 22½ and 45 volts.

Cat. No. 767	DIMENS., INCHES			Weight 8 lbs. 11 oz.	Price Each \$3.75
	Length 8	Width 6⅝	Height 3		

No. 764 Eveready Radio B Batteries

The new Eveready vertical type B battery 22½ volts. Occupies practically the same small table space as the small battery designed for portable sets, as No. 763, but as its cells are much larger, it has more than twice the service capacity. It is more economical than the smaller battery and is especially suited for use where table or cabinet space is limited. Contains 15 cells. Equipped with two Fahnestock spring clip connectors. Length, 3¼ inches; width, 2¾ inches; height, 5⅝ inches. Weight, 2½ pounds.

Price, No. 764.....each \$1.75

No. 768 Eveready Radio B Batteries for Radiola Grand and IV

Designed in size and connections for use in the battery cabinet of the Radiola Grand and Radiola IV receivers.

Contains 15 cells giving 22½ volts, equipped with screw binding post.

Length, 4⅛ inches; width, 2⅝ inches; height, 2¾ inches. Weight, 1 pound, 9 ounces.

Price, No. 768.....each \$1.75

No. 763 Eveready B Batteries

Especially suitable for use where light weight or small space is essential, such as in small portable sets.

Contains 15 cells, enclosed in waterproof cardboard box, equipped with two coil wire leads.

Initial voltage of 22½ volts.

Cat. No. 763	DIMENS., INCHES			Weight Ounces 13	Price Each \$1.50
	Length 3⅝	Width 2⅜	Height 2⅝		

No. 771 Eveready Three Radio Batteries

This battery is a 4½-volt unit, containing three cells, provided with three Fahnestock Spring Clip Terminals.

It may be used in either the filament or A circuit, the plate or B circuit or the grid or C circuit.

A 4½-volt C battery is sufficient with most tubes when B battery voltages of not over 80 or 90 volts are used, and the signal is ordinarily loud. For B battery voltages up to 120 volts from 6 to 9 volts of C battery gives better results.

One Eveready Three Battery can thus be used with entire success in the majority of cases and if more voltage is needed, additional batteries may be connected in series.

Price, No. 771.....each \$.60

Storage Radio A Batteries

This battery has thicker plates; more space above the plates, which prevents the acid from bubbling out of vent caps when battery is on charge. Standard battery solution is used same as in automobile batteries. Has exposed cell straps, making it possible to tap batteries at 2 or 4 volts. Handsome mahogany finish, nickel-plated bail handles and soft rubber feet.

Packed individually.

No.	Capacity at 1-amp. Rate	Ship. Wt., Lbs.	Price Each	No.	Capacity at 1-amp. Rate	Ship. Wt., Lbs.	Price Each
6950	127	75	\$23.00	6900	65	52	\$16.75

Patterson Battery Sets

Patterson Battery Sets will always prove dependable and their life (if proper capacity outfit is selected) average two or three years. Patterson Battery Sets have the unique advantage, never possible before with old style battery sets, that once the circuit wires to talking and ringing circuits are connected, no necessity of ever disconnecting them can come up, and the renewal of the battery set is made just as easy as the renewal of a few incandescent lamps.

A Patterson Battery Set will not only maintain a set of batteries at much higher amperage than the old style method of installation, but will in a few years save its entire cost from the greatly increased life each set of cells will give, because of its comprehensive design for cell-protection and economic maintenance; too much stress cannot be laid on the increased life of an installation made in a Patterson Battery Set, due to several facts, chief amongst which are the following:

The absolute full-carrying capacity of the contacts which completely does away with the loss of battery power always present in the old style wired-up battery set.

Housing of the wax-sealed end of cell in practically an airtight cup—away from the effect of temperature change, etc.

Model B, Strip Type

Model B Strip Type is a series outfit of 25-ampere capacity and is designed for ceiling or side wall mounting. It has no enclosing case.

Model B, Strip Type

Model No.	No. Cells Capacity	Price Each without Batteries
B-2	2 in Row	\$5.25
B-3	3 " "	7.85
B-4	4 " "	10.50
B-5	5 " "	13.15

Model No.	Description	Price Each
BM	Middle Section Battery Holder Unit.....	\$2.65
BZ	Zinc Terminal End Section.....	2.65
BC	Carbon Terminal End Section.....	2.65

Model BB, Steel Box Type

Model BB Steel Box Type is a series outfit of 25-ampere capacity for side wall mounting only. It has bronze padlock and 2 keys.

Model No.	Operative Voltage	Price, Each without Batteries	Model No.	Operative Voltage	Price, Each without Batteries
BB-2	2	\$10.50	BB-6	6	\$24.15
BB-3	3	13.65	BB-8	8	31.85
BB-4	4	16.80	BB-10	10	38.15
BB-5	5	20.45	BB-12	12	45.15

No battery cells are included in the above prices. For Patterson-Columbia screw top cells add 2 cents each to prices of ordinary binding post cells. Patterson-Columbia screw top cells are obtainable from all first-class jobbers of electrical supplies.

Patterson Battery Sets

Telephone installations frequently require a split-circuit battery set, usually with 4 or 5 cells for talking, and 5, 6, and 8 or more cells for ringing. While this is a reasonably simple arrangement of circuits, still, in the old way of setting up batteries, a mistake was easily made. In a Patterson Battery Set, the renewal of the entire battery can be done by anybody yet can only be done in one way, and that the right way, all without the slightest technical knowledge, and without tools.

Patterson Battery Sets are also manufactured with 50 watt 6-18 volt heavy duty bell ringing transformer mounted in cabinet to take care of the ringing circuit, and batteries to take care of the talking circuit.

Complete elimination of all leakage due to dampness on bottom of cell or on cartons.

Positive prevention of accidental getting together of zinc terminals, as has always been most troublesome in the old style wire-up battery set.

Multiple Service, Steel Cabinet Type

Model BMC

50-ampere outfits will operate signalling systems four times longer than old-style dry battery installations. 75-ampere outfits will operate eight times longer.

Voltage of sets should be same as old-style battery installations. For example, if 6 cells old-style dry battery gave loud enough signals use P.B.S. with 6 cells in a row. If 8 cells were required on old-style installations use P.B.S. with 8 cells in a row, etc.

Number of rows determines ampere-hour capacity and operative life of battery set as above explained.

Larger size outfits at proportionate prices.

Model BMC

50-ampere Capacity

BMC-38	8	8	121.50
BMC-310	10	10	144.15
BMC-312	12	12

No batteries are included in the above prices. For Patterson-Columbia screw top cells add 2 cents each to prices of ordinary binding post cells. Patterson-Columbia screw top cells are obtainable from all first-class jobbers of electrical supplies.

Patterson Battery Sets

Model BB-5+6

Model Nos. BB and BMC listed below, are furnished with battery units for the "talking" and "ringing" circuits.

Model Nos. BBTW and BMCTW, listed below, are with battery units for the "talking" circuit and a 50-watt Heavy-Duty bell-ringing transformer for the "ringing" circuit.

When using transformer be careful to use 3-ampere fuse-plugs in cut-out on primary side of transformer.

Where Western Electric telephone systems require one set of batteries for both "ringing" and "talking" circuits, use Model Nos. BB and BMC as listed on another page.

Model BB and BBT—Series Steel Box Type

Model BSC—Series Steel Cabinet Type

For Light Service Installations

BB, BSC and BBT outfits are suitable for all Western Electric installations where the current requirements are not so heavy as to make desirable the use of the multiple-service outfits listed below. Stationary terminals for circuit wires are mounted on back-board.

Models BB and BSC—25-ampere Split-circuit Outfits

Using Batteries for Both "Talking" and "Ringing"

Model No.	No. Cells Each Row	OPERATIVE VOLTAGE Talking	OPERATIVE VOLTAGE Ringing	For Western Electric System No.	Price Each

*When ordering Model BMC for operation on System No. 1 add letter W to Model No. selected, for example, BMCW-5+4, BMCW-5+5 or BMCW-5+7; as on these sets carbon terminal of "talking" battery is permanently strapped to terminal of "ringing."

Edison Primary Cells

Edison Primary Cells are furnished in capacities ranging from 200 to 1000-ampere hours. The sizes best adapted for telephone work are the 250, 400 and 500-ampere hour types, for average conditions, and the 1000-ampere hour cells for heavy duty service or when it is desirable to bring the renewal periods far apart.

The characteristics of this battery, which make it particularly well suited for telephone service, are: Uniform voltage under continuous discharge; extremely low and constant internal resistance; freedom from depreciation when the circuit is open; long life, with no attention between renewals; indicator panels in plates, which accurately show the approach of exhaustion in ample time to arrange for renewal and suitability for either open circuit (intermittent discharge) or closed circuit (continuous discharge) work.

The initial open circuit voltage of all Edison Primary Cells is 0.95. The closed circuit voltage averages 0.60 to 0.65 depending on the rate at which the cells are discharged.

Use of Cells

Edison Primary Cells are used extensively for the following purposes: Local battery telephone exchange switchboards; telephone train dispatching (talking circuits); intercommunicating telephone systems; small common battery telephone systems; private branch exchange switchboards; pole changers, supervisory lamps and relays; telegraph work (local sounder and main line circuits); railway signals and crossing bells; railway interlocking plants; gas and gasoline engine ignition; low voltage motors; battery dental engines; fire, police and burglar alarms; auxiliary fire alarm systems (closed circuit); mine signals, bell systems and annunciators; program and self-winding clocks; electroplating; highway beacon lighting; chemical analysis and other school work.

Type S-202 Edison Primary Cells

Capacity, 200-ampere Hours

With rectangular heat-resisting glass jar. Size over all, 3 3/8 x 6 x 1 1/2 inches. Inside dimensions, 2 7/8 x 5 1/4 x 9 inches.

Adapted for intercommunicating telephone systems, railway train dispatching systems, stationary gas or gasoline motors, electric clock systems, small motors, etc.

Use 5 cells for stationary gas or gasoline motors having make and break ignition and 8 cells for jump spark.

Type	Description	Price, Each

Type S-206 Edison Primary Cells

Capacity, 200-ampere Hours

With heat-resisting glass jar. Size over all, 5 3/4 x 9 inches. Inside dimensions, 5 x 7 1/2 inches.

Adapted for motor boats running on salt water. Use 5 cells for single cylinder, and 6 cells for multiple cylinder, high speed make and break engines; 8 cells for jump spark.

Cover is fitted with rubber gasket to prevent splashing. Type S-206 supersedes old Type VP cell.

Type S-208 Edison Primary Cells

Capacity, 200-ampere Hours

With heat-resisting glass jar. Size over all, 5 3/4 x 9 inches. Inside dimensions of jar only, 5 x 7 1/2 inches.

Adapted for stationary gas or gasoline engines, electric motors, burglar alarms, bell systems, program and self-winding clocks, annunciators, electric time stamps, mine signals, intercommunicating telephone systems, etc. Use 5 cells for stationary engines having jump spark ignition.

Type S-208 supersedes old Type Q cell.

Type S-252 Edison Primary Cells

Capacity, 250 Ampere Hours

With rectangular heat resisting glass jar. Size over all, 3 1/2 x 6 x 12 1/2 inches. Inside dimensions of jar only, 2 7/8 x 5 1/4 x 10 inches.

The Type S-252 Cell is the most perfectly balanced of any of the cells of less than 500 ampere hours capacity. The other low capacity cells were designed to meet certain requirements, with definite specifications as to size, etc. In developing this cell, no restrictions were placed on the laboratory and the result is a cell with the zinc, copper-oxide and electrolyte nicely

proportioned and the element suspended high in the solution where its action is not interfered with by the dense solution at the bottom of the cell.

This cell is recommended for railway telephone dispatching transmitters; intercommunicating telephones; self winding and program clocks; fire and burglar alarm systems; radio "A" batteries, etc.

Initial open circuit voltage, 0.95. Average closed circuit voltage, 0.6 to 0.65 per cell. Maximum recommended continuous current 1 ampere. Maximum recommended intermittent current, 1.5 amperes.

Types S-402 and S-404 Edison Primary Cells

Capacity, 400-ampere Hours

These are the popular types in the 400-ampere hour cells. In capacity and operating characteristics they are the same. Therefore, it is only a question of which shape of jar is preferred and while the barrel shaped jar has the greater mechanical strength, the rectangular is particularly well suited for locations where space is limited.

The cells are adapted for telephone transmitter, interrupter and pole-changer operation, private branch exchanges, intercommunicating systems, fire and burglar alarm systems, self-winding and program clock systems, railway signaling, etc.

The maximum recommended continuous current is 2 amperes and the maximum intermittent current is 3 amperes. The initial open circuit voltage is 0.95 and the average closed circuit voltage 0.6 to 0.65 per cell.

Type S-402

With rectangular heat-resisting glass jar. Size over all, 5 1/2 x 6 1/2 x 12 1/4 inches. Inside dimensions of jar only, 5 x 6 x 10 inches.

Type S-403 Edison Primary Cells
Capacity, 400-ampere Hours

With cylindrical heat resisting glass jar. Size over all, 7¼x11 inches. Inside dimensions of jar only, 6⅞x8¾ inches.

The Type S-403 is the successor of the old Edison Lalande Type RR Cell which was used extensively for telephone work, gas engine ignition, etc. The older type was converted into the Type S-403 several years ago, by the use of Type 403 covers, which were furnished with the improved style renewals. The S-403 is still furnished for the benefit of custom-

ers who wish to keep their cells uniform, when making additions to or changes in their battery. However, the S-402 and S-404 are the more efficient cells and should be used when an entire new battery is purchased.

The 400-ampere hour cells are suitable for telephone transmitter, interrupter and pole-changer operation, private branch exchanges, intercommunicating systems, fire and burglar alarm systems, self winding and program clock systems, railway signaling, etc.

The maximum recommended continuous current is 2 amperes and the maximum intermittent current is 3 amperes. The initial open circuit voltage is 0.95 and the average closed circuit voltage 0.6 to 0.65 per cell.

Types S-504 and M-504 Edison Primary Cells
Capacity, 500 Ampere Hours

The 500 ampere hour cells are furnished with either multiple or single plate elements. The letter M before the reference number indicates multiple plates, 2 copper-oxide and 3 zinc plates. The letter S indicates single plate, 1 copper-oxide and 2 zinc plates.

The cells are used for telephone and telegraph service; railway signal, fire and burglar alarm systems, highway beacons and in many other fields where a high capacity cell is desirable. For service in which the load frequently goes to 3 amperes, or where the cells are exposed to low temperature, the multiple plate cells are recommended. For service in which the load does not go over 2½ amperes and the cells are protected from the cold the single plate type will fully meet the requirements.

Initial open circuit voltage, 0.95. Average closed circuit voltage, 0.6 to 0.65 per cell. Maximum recommended continuous current for single plate types, 2 amperes; for multiple plate types, 2.5 amperes. Maximum recommended intermittent current for either types, 3 amperes.

Type S-504
Single Plate Element

With barrel-shaped heat-resisting glass jar. Size over all, 7⅞x12¼ inches. Inside dimensions of jar only, 6x10 inches.

Type	Description	Price, Each

Type M-504

Renewal and element, add 20 cents. Prices of the other parts, are the same.

Types S-502 and M-502 Edison Primary Cells
Capacity, 500-ampere Hours

The 500-ampere hour cells are furnished with either multiple or single plate elements. The letter M before the reference number indicates multiple plate, 2 copper-oxide and 3 zinc plates. The letter S indicates single plate, 1 copper-oxide and 2 zinc plates.

The cells are used for telephone and telegraph service; railway signal, fire and burglar alarm systems, highway beacons, and in many other fields where a high capacity cell is desirable.

For service in which the load frequently goes to 3 amperes, or where the cells are exposed to low temperature, the multiple plate cells are recommended. For service in which the load does not go over 2½ amperes and the cells are protected from the cold, the single plate type will fully meet the requirements. Initial open circuit voltage, 0.95. Average closed circuit voltage 0.6 to 0.65 per cell. Maximum recommended continuous current for single plate types, 2 amperes; for multiple plate types, 2.5 amperes. Maximum recommended intermittent current for either types, 3 amperes.

Type S-502
Single Plate Element

With rectangular heat-resisting glass jar. Size over all, 5½x6½x12¼ inches. Inside dimensions of jar only, 5x6x12 inches.

Type	Description	Price, Each
S-502	Complete Cell.....	\$4.80
S-500	" Renewal.....	2.15

500	Oil.....per bottle	.09

For Type M-502 cell, renewal and element, add 20 cents. Prices of the other parts are the same.

Type M-1002 Edison Primary Cells
Capacity, 1000 Ampere Hours

The 1000 ampere hour cells are furnished with either rectangular or cylindrical jars. Type M-1001 is the specification for the cell with the cylindrical jar and M-1002 for the rectangular. The prices are the same.

This size was developed to meet demand for a battery that would operate efficiently in classes of service where heavy discharges are required for long periods. In railway signaling these cells are used for operating remote controlled switch movements, color light signals and track circuits. In the general trade for any heavy duty work or where it is desirable to bring the renewal periods as far apart as possible.

Initial open circuit voltage, 0.95 per cell; the average closed voltage, 0.6 to 0.65. The cells can be discharged continuously up to 4 amperes and intermittently up to 6 amperes.

Type M-1002

With rectangular heat-resisting glass jar. Size over all, 6½x8½x14 inches. Inside dimensions of jar only, 5x6x12¼ inches.

Type	Description	Price, Each
M-1002	Cell Complete.....	\$8.50
M-1000	" Renewal.....	4.25
Separate Parts		
1002	Jar.....	\$4.80

...	Wing Nuts and Washers.....per set	.20
M-1000	Element.....	3.50
1000	Caustic Soda.....per can	.85
1000	Oil.....per bottle	.09

Type M-1001

With cylindrical heat-resisting jar. Prices same as for Type M-1002.

Tungar Battery Chargers

A Typical Tungar Service Station

The Tungar Battery Charger is a rectifier for changing alternating to direct current. A complete line of Tungars is manufactured for charging starting and lighting batteries in the private garage, public garage, and battery service station. The 2 and 5-ampere sizes are now being used extensively for charging radio batteries in the home. With the addition of an inexpensive compact device, the B battery attachment, it is possible to use these sizes for charging both the A and B storage batteries. Tungars are also being used for charging batteries for electric clocks, bells, telephones, telegraph instruments, railway signals, fire alarms, fire trucks, inspection lamps, small motors and also for direct operation of motors, magnets and in fact for almost any service where a small amount of direct current is needed.

The Heart of the Tungar

The Tungar has been approved by the National Board of Fire Underwriters.

The essential parts of the Tungar are bulb, transformer, reactance, and the enclosing case with equipment. The Tungar bulb is really what makes the apparatus work.

It is a sort of electrical check valve that permits current to flow in but one direction. In appearance it resembles an incandescent lamp and contains a low voltage filament, a graphite anode, and an inert gas-argon. It is a combination of the heated filament and the gas that makes the valve action and allows current to flow only from the anode to the cathode. Thus current can flow through the battery in but one direction and the battery current cannot flow back through the rectifier.

The transformer and reactance are used for adjusting the current and voltage to the values required.

There are many sizes or capacities of Tungars and each size is made for almost any alternating current voltage or frequency that is possible to find in the country.

Tungar Battery Chargers

New Model 2-ampere Tungars

Rear View Showing Terminal Board

The New Model Tungar, recently introduced, will charge a 3-cell radio or auto storage battery at 2 amperes and also 2 or 4-volt A and 24 to 96-volt B radio batteries without an attachment.

Connections for charging the various sizes of batteries are made by changing the position of one wire on the terminal board shown. The charging rate for B batteries is regulated by an ordinary Mazda lamp of the proper size inserted in the socket on the terminal board.

Although 2 amperes is a rather slow rate for a large battery it will charge it just as well as the higher rate. At this charging rate it would be practically impossible to damage a battery by overcharging.

Regular 5-ampere Tungars

Casing Cut Away, Showing Connections

The 5-ampere Tungar has a capacity for charging one 3-cell battery at a 5-ampere rate or a 6-cell at 3 amperes. These are more suitable rates than 6 amperes only, for either a 3 or 6-cell battery for the average car owner.

Exterior View

A 12-volt Dodge or a Maxwell car battery for example should not be charged continuously at much over 3 amperes. This Tungar, therefore, is the one recommended for almost any car owner. It is the ideal battery charger for a private garage, as it can be connected to the battery in a car, connected to a convenient lamp socket, the current turned on and then left practically to take care of itself.

Tungar Battery Chargers

New Model 2-ampere Tungar

The 2 and the 5-ampere, one-battery Tungars are satisfactory for charging radio batteries. Thousands are being sold for this purpose. By means of a simple attachment, the 5-ampere Tungar can be adapted to charge a 48-volt B battery at 0.1 ampere.

4-battery Size, Exterior View

The 4-battery Tungar will charge from one to four 3-cell batteries at 5 amperes or less. It can be used by car dealers forming new batteries, or by the small public garage which does charging as an incidental part of its business.

The 4-battery Tungar has a large field of usefulness and is a neat, compact and inexpensive little battery charger of 150 watts capacity.

4-battery Size, Top View

The 6-ampere, 75-volt Tungar will charge from one to ten 3-cell batteries at 6 amperes or less. It is most useful for the battery service station, the public garage, or for any place where a number of batteries are to be charged at once. There are hundreds of installations of more than one; in many cases as high as ten; and in some cases 35 of these large Tungars are in one place.

This arrangement affords many advantages over the old way.

Tungar Battery Chargers

10-battery Size

The 12-ampere Tungar will charge from one to ten 3-cell batteries at 12 amperes; or one to twenty 3-cell batteries at 6 amperes.

By wiring part of the batteries in series and part in multiple, 10 can be charged at a 6-ampere rate and 5 at a 12-ampere rate at the same time.

It is useful in large battery stations where it is desirable to charge batteries of large capacity at a higher rate than 6 amperes. When operating at 6 amperes

it will do the work of two 10-battery Tungars.

Any of the sizes can be furnished for operation on either 115 or 230 volts alternating current and on 60, 40-50, 25-30, or 125-133 cycles. A part of the list of standard Tungars is given below.

For small auto and radio batteries the 1-battery, 2-ampere Tungar; for the larger auto and radio batteries the 1-battery, 5-ampere Tungar; for the car dealers and garages giving occasional battery service, the 4-battery Tungar; for the service station, the 6-ampere, 75-volt, or double, 12-ampere, 75-volt Tungar.

Fansteel Balkite Battery Chargers

For Charging Radio A Batteries

Fansteel Balkite Battery Charger is a noiseless, fool-proof, efficient and practically indestructible battery charger.

Especially designed for charging Radio A batteries in the home.

This charger cannot deteriorate through use or disuse. It is entirely noiseless in operation. Has no moving or fragile parts to wear out or break. There are no delicate vibrators or bulbs to replace. There is nothing to adjust. Requires no attention except an occasional filling with distilled water.

It can be used while the radio set is in operation without danger of burning out tubes. This charger cannot discharge the battery. It cannot short circuit. Delivers a taper charge which decreases as the battery becomes charged, so that damage by overcharging is impossible. It is unaffected by fluctuations in line voltage or by extreme temperatures. It will charge a completely dead battery.

The Fansteel Balkite Battery Charger will charge the ordinary 6-volt battery from the ordinary 110-120 A. C., 60-cycle current. Special model for 50 cycles. It is economical, consuming about the equivalent of a 60-watt lamp. Furnished complete with all necessary leads, etc., ready for use. This charger may also be used to charge automobile batteries, and, without any added attachments, radio B batteries, of the lead type, in multiples of 6 cells.

Price, Charger Complete.....each **\$19.50**
 " Special Adapter for Charging 2 and 4-volt Batteries.....each **1.50**

**Balkite Trickle Chargers
 For the A Circuit**

This low-rate charger is especially adapted to use with sets of relatively low A current requirements—any dry cell set and storage battery sets having a small number of tubes. Owners of dry cell sets can now make a compact and economical installation with a Balkite Trickle Charger and a low capacity storage battery of the type being offered by leading battery manufacturers.

Charges both 4 and 6-volt radio A batteries at about 0.5 amperes. Usable in 3 ways: (1) As a regular charger with a low capacity storage battery for sets now using dry cells. (2) With storage battery sets of few tubes. Furnishes more current than used by 6 dry cell or 2 storage battery tubes, so that if used during operation it need be used at no other time. (3) As a trickle or continuous charger for storage battery sets of as many as 8 tubes.

Size 5½ inches long, 2¾ inches wide, 5 inches high. Operates from 110-120 A.C. 60-cycle current.

Low capacity batteries especially adapted for use with this charger with sets now using dry cells are being offered by practically all leading battery manufacturers.

Reputable manufacturers are also offering for use with this charger special switches which turn on Balkite B and turn off the charger when set is turned on. This makes the current supply for both A and B circuits automatic in operation.

Priceeach **\$10.00**

Titan Storage Batteries

For Radio Use

The Titan Storage Battery for wireless requirements insures reliable and constant direct current. Necessary for radio apparatus such as vacuum tube detectors, amplifiers, CW transmitting sets, etc.

Modern developments in radio telegraphy and telephony require a dependable source of low voltage, direct current energy at moderate expense, and with a certainty of continuous operation. To supply this need the Titan TWL in 40-ampere hour capacity and Titan TWL-N in sizes over 40-ampere hour capacity, fulfill all requirements.

A Titan Battery is good for from four to six years of service. A single charge of the battery will give service for a long period of time, depending on the current used.

Titan TWL and TWL-N Batteries are made with extra heavy plates, heavy Titan treated separators, sealed in high grade hard rubber jars and contained in a stout case made of hard wood. Will stand up under the most severe conditions on both land and water. Has aluminum nameplate.

No. 155 Fahnestock Battery Connectors

Slip this connector over any type of screw binding post. Broken and loose connections are thus eliminated. Flexible wire is soldered to spring clip.

Will not corrode. Price, No. 155.....each \$0.5

Bethlehem Spark Plugs

1-piece

Mica Insulation 2-piece

No. 07

No. 08

No. 61

No. 07, 7/8-inch-18

Standard for Marmon, Haynes, Durant and many cars taking 7/8-inch hex. SAE equipment on International Trucks and Tractors. Price, No. 07.....each .75

No. 08, 1/2-inch Long

With 7/8-inch hex. For Reo and other cars using plugs this size. Price, No. 08.....each .75

No. 61, 1/2-inch Std.
With 5/8-inch hex. For Henderson Motocycles, 1912 and others using this size, and marine motors. Price, No. 61.....each 1.00

No. 62, 7/8-inch-18

With 7/8-inch hex. Special for Harley-Davidson and Indian Motocycles. Price, No. 62.....each 1.00

No. 63, Metric

With 5/8-inch hex. Special for Excelsior, Reading, Standard and Henderson Motorcycles. Price, No. 63.....each 1.00

No. 101, 7/8-inch-18

Long, with extension below threads, 7/8-inch hex. Special for Holmes and air cooled engines. Price, No. 101.....each 1.00

No. 019

No. 027

No. 019, 7/8-inch Long
With 7/8-inch hex. For Nash, Oldsmobile, Winton and other cars using 7/8-inch long plugs. Price, No. 019.....each .75

No. 027, 7/8-inch-18 With 1 1/8-inch Hex.

Exclusive equipment on Packard. Used on Cadillac, Pierce Arrow, Paige, Peerless, Chalmers and prior models of Hudson. Price, No. 027.....each .75

Tractor Plugs

No. 88

No. 92

No. 88, 1/2-inch Extra Long

For Hart-Parr, Waterloo Boy Tractors, old model Metz and oil field engines. Price, No. 88.....each 1.50

No. 92, 3/4-inch Long

Special DeLuxe type. Exclusive on International Harvester Tractors and some model trucks. Very high grade special built spark plug, different than regular mica construction.

Used also on Hart-Parr, Case and others. Also made in 3/4-inch regular (No. 91), 7/8-inch-18 standard (No. 94), 7/8-inch 18 long (No. 95). Price, No. 92.....each 2.25

No. 029

No. 029, 7/8-inch Special Length

With 1 1/8-inch hex. For Dodge, also latest model Continental motor. Price, No. 029.....each .75

Extra Mica Cores

Specify number and type of plug when ordering extra cores for spark plugs. Prices upon application.

Bethlehem Spark Plugs

Two-piece

No. 8

Extra Core

No. 8, 1/2-inch Extension

New type adopted as standard equipment for all Ford engines in tractor, truck and car. Same as Genuine Ford Part No. 5200.

Price, No. 8.....each .60

Extra Cores For No. 8

Same as Genuine Ford Part No. 5202.

Price.....each .35

Two-piece

No. 27

No. 29

No. 27, 7/8-inch-18

With long body, 1 1/8-inch hex. For Chandler, Hoyt, Moreland, old model White, Titan Trucks, Robinson Fire Trucks.

Price, No. 27.....each .75

No. 29, 7/8-inch-18

With 1 1/8-inch hex. Special for Buick. Fits all models Buick cars and Chevrolet.

Price, No. 29.....each .75

No. 6

No. 10

No. 6, 1/2-inch Std.

With 5/16-inch hex., conical core, for prior model of Studebaker and other cars requiring this size plug.

Price, No. 6.....each .75

No. 10, Metric 1-inch Hex.

Equipment on Packard, White trucks, Indian motorcycles. Used on Hudson, Essex, Pierce Arrow 1915, Peerless 1915. Special for motorcycles and foreign cars.

Price, No. 10.....each .75

No. 2

No. 2, 7/8-inch-18

With 5/16-inch hex. New type adopted by Studebaker. Exclusive equipment on Studebaker Light Six. An exceptionally fine spark plug and on account of the small hex. and particular design will give excellent service on many other standard makes of cars.

Price, No. 2.....each .75

Porcelain Cores

Extra porcelain cores for all type two-piece plugs. Specify when ordering exact type and size of spark plug

Price, for Nos. 1 and 8, ea .35

" All Other Cores " .40

No. 1, 1/2-inch

5/16-inch Hex., petticoat insulator and bent ground wire. Old Ford Special replaced by No. 8.

Edwards Iron Box Bells and Buzzers

Schedule 2

Class C Bell

Fahnestock clips are used on Edwards Bells and insure quick and secure connection of line wires. Striker in underneath gong and protected from injury. Gong is riveted to base to prevent loosening. The base and supports for gong, magnets and armature are formed from one piece of sheet steel, zinc-plated and finished in black enamel. The armature is pivoted at center of balance. Cover is fastened at three points making movement bug and dust-proof. Connections are solderless. Gongs are nickel-plated, base and cover black enameled.

Cadet, Class B—2 Ohms

Cat. No.	Size In.	Std. Pkg.	Price Each	Cat. No.	Size In.	Std. Pkg.	Price Each

720	2 1/2	100	\$.92
725	Buzzer	100	.89

Iron Box Buzzer

No. 730 Edwards Buz-a-bels

Schedule E

A combination bell and buzzer on one frame, under one cover.

One binding post is for the common battery supply, the other two being, one for the buzzer and one for the bell.

The cost is half as much as a single bell or buzzer of quality.

Operates equally well on battery or transformer.

Tested to 40000 operations on 15 volts A. C. which is more than 15 years of actual experience.

Standard package, 100.

Price, No. 730.....each \$1.20

No. 222 Edwards D. C. Buzzers

6 to 110 Volts D. C.

Schedule E

Constructed on the vibrating reed principle to meet the demand for a heavy duty, adjustable D. C. buzzer. Carbon contacts are used which will outwear any metal, are easily renewable and cannot oxidize, stick or corrode.

The springs are best grade phosphor-bronze and there is a double locking adjustment.

Finish is black enamel. Size three inches square.

Cat. No.	Description	Volts	Std. Pkg.	Price Each
222	D. C. Buzzer	6	6	\$7.15
222	" " "	110	6	15.40

Assortment of 6 to make one standard package.

No. 13 Lungen Bells

3 Ohms

Schedule E

Made of brass heavily nickeled; ribbed edges, spring cover. Cast base, screw and locknut adjustment. Price for special finish upon request.

No. 16 Edwards Flush Concealed Buzzers

Schedule T

Consists of the Size 1 Lungen buzzer mounted on back of a switch plate which fits a standard switch box.

When installed, the only part shown to view is the plain plate.

Price does not include switch box.

Standard finish, brush brass or nickel plate.

Price, No. 16 each \$4.00

No. 160 Edwards Loud Signal Buzzers

Schedule T

Consists of the movement of the No. 156 monitor bell mounted on a bracket so that hammer strikes against the solid brass plate. This produces a loud sound distinctly different from a bell or buzzer and is particularly adaptable for alarm systems where a distinctive sound is desired.

It is made to fit a standard switch box.

Price does not include switch box.

Standard finish, brush brass or nickel plate.

Price, No. 160 each \$5.50

No. 136 Edwards Surface Return-call Push and Bell

Schedule T

Return-call push and bell for use with the No. 10 return-call annunciator.

This consists of a return-call push arrangement and a bell mounted in a neat compact iron casing.

Standard finish rubberoid black, no extra charge for oxidized copper.

Price, No. 136 each \$4.50

No. 137 Edwards Flush Return-call Push and Buzzer

Schedule T

This consists of the Size 1 Lungen buzzer and the No. 260RC (return-call) push button mounted on the back of a standard switch plate for use with the No. 10 return-call annunciator.

The whole device fits the standard switch box.

Both push and buzzer are thoroughly insulated from the plate.

Price does not include switch box.

Standard finish, brush brass or nickel plate.

Price, No. 137 each \$4.50

No. 156 Edwards Monitor Bells

3 Ohms

Schedule E

This bell is entirely self-contained. The hammer and rod act in a straight line striking the inside of the gong. There are, therefore, no breaks in the symmetry of the case or gong. This makes a very attractive looking bell in addition to being weather, bug and dustproof.

Springs are the best possible grade phosphor bronze. Contacts are pure, hard-drawn silver. Finish, black base nickel gong.

Cat. No.	Description	Size In.	Std. Pkg.	Price Each
156	Monitor Bell	3	20	\$1.80

No. 750 Bronx Watchcase Buzzers

Schedule Q

A brass case, heavily nickel plated; phosphor-bronze springs, silver-contacts.

Used on main line. When circuits close, lever drops and bell rings. Nickel finish.

Cat. No.	Description	Std. Pkg.	Price Each
26B	For Battery	12	\$2.70
26M	" Magneto	6	3.92
26X	Indicating Buzzer	6	3.92

No. 182 Edwards Street Car Buzzers

3 Ohms

Schedule T

A distinct departure from the usual form of buzzer. Instead of depending on the vibrations of an armature for sound the complete mechanism of the No. 181 bell is used, the hammer rod striking the inside of the protecting case. It produces a character of sound distinctly audible above all usual street car noises. Mounted on a gasket, it is safe from unauthorized adjustment and is waterproof. Finish, black enamel.

Price, No. 182, Size 3 Inches.....each \$3.00

No. 181 Edwards Street Car Bells

3 Ohms

Schedule T

Similar in appearance to No. 156 but designed specially for street car use. The same efficient mechanism is used.

The magnets are impregnated with a special insulating, moisture-repelling compound.

The outside of the base is spotted to indicate where the hammer strikes the gong. By installing with this spot downward, using the rubber gasket supplied, the bell is absolutely waterproof. Maximum operation is also obtained by this method of installation.

Finish, black base, nickel gong.

Price, No. 181, Size 3 Inches.....each \$3.00

No. 241 Edwards Relays

For Direct Current Only

Schedule T

Open or closed circuit.

Multiple carbon contacts with a capacity of up to 15 amperes.

Magnets may be wound for operation on 6 to 250 volts D. C.

Each relay on

slate base mounted in iron box with hinged cover and knock-outs.

Price, No. 241.....each \$35.00

No. 242 Edwards Relays

For Alternating Current Only

Schedule T

Open or closed circuit.

Multiple carbon contacts with a capacity up to 15 amperes.

Magnets have laminated core and may be wound for operation on 6 to 250 volts A. C.

Each relay on slate base mounted in iron box with hinged cover and knockouts.

Price, No. 242.....each \$40.00

No. 17 Edwards Economy Skeleton Bells

Schedule E

Fully insulated, loud ringing bell for all ordinary purposes. The outstanding feature of the Economy is the intensified stroke armature.

No. 21 Edwards Vigilant D. C. Single Stroke Bells

Schedule T

Battery or lighting voltage. A sturdy and reliable bell for fire alarm systems, warehouses, offices, and general signal work. Standard resistance 6 ohms. Made in three types as follows:

No. 21.—As shown and described above. Non-conduit.

No. 21C.—For concealed or surface conduit. A separable conduit attachment which can be installed with the conduit and the bell attachment thereon when the wires are pulled through. The attachment has inside bosses so it is possible to come in from any direction. This makes an ideal through box. Drilled for 1/2 or 3/4 inch conduit as specified. Finish black enamel.

No. 21 F. P.—Similar to No. 21C. For closed circuit fire alarm systems. Prices on application.

No. 21

Size In.	PRICE, EACH			Add for Conduit Fitting
	Up to 30 V.	110 Volts	220 Volts

8	63.10	12	106.75

In ordering state if for concealed or surface conduit.

Add \$10.00 each to list for conduit fitting.

No. 510 Edwards Transformer Bells and Buzzers

Schedule E

Standard Winding, 6 to 24 Volts A. C., 60 Cycles
Can be Furnished to Operate at 25 to 40 Cycles

Bell

Buzzer

Carbon contacts are used, cut from standard 10M. headlight rod.

Two-wire Entrances are provided: one at the top for surface wiring and one at the back for concealed wiring. Both of these are sealed with insulating cement which may be knocked out of those to be used.

These bells, if desired will operate equally well on 6 to 24 volts battery.

The transformer is an inexpensive device and should be of ample capacity to care for the bells and the loss in secondary wiring. A safe rule is to allow 6 to 8 watts per bell for sizes 5 to 12 inches and 3 watts for 3 and 4-inch bells.

Conduit Type bell is so made that the bell attachment may be installed with the conduit and the bell placed thereon after wires are pulled through. The conduit attachment is drilled top and bottom for 1/2 or 3/4-inch conduit as specified. A pipe plug is furnished for use when bell is used on end of line.

Non-conduit Type

For Use on Transformer, 6-24 Volts

*NOTE.—Standard Package may be made up of all types of the same size, or an assortment of 10 of all types, all sizes.

Edwards Recti Vibrating Bells

Constructed for use where exceptionally rugged, clear ringing, weather-proof (or protected bells) are desired.

They are furnished in sizes from three to eighteen inches in various styles of all voltages.

CASE.—Is of iron, heavily japanned, cover is lined with an oil soaked gasket, allowing no moisture to penetrate to mechanism.

MAGNETS.—The scientific proportions of the magnets obtain the maximum strength with the greatest battery economy. Magnets are impregnated with a moisture repelling, insulating compound.

SPRINGS.—Are of the highest grade of phosphor bronze.

CONTACTS.—Carbon contacts made of standard 10M carbon rod are furnished on sizes 5 inches and larger. They will not rust, corrode, fuse or stick together and have a large clean surface insuring a positive contact.

SILVER CONTACTS.—Are furnished on 3 and 4 inch bells. For carbon contacts in these sizes, add to list 50 cents.

HAMMER ROD.—Is of solid brass and direct acting.

OPERATION.—The hammer rod is of the plunger type, works in a direct line—hence the opening in the case, through which the rod passes, is but a trifle larger than the rod, making it positively weather, dust and insect proof.

This design also makes it possible to support the hammer rod at two points so there is no strain on the pivots, which is a deviation from the usual method of having the pivots bear the strain of the hammer, hammer rod and ball.

Nos. 100 and 219 Edwards Recti Vibrating Bells

Schedule 8

No. 100

No. 219

No. 100U

Nos. 100 and 100 A.C. specially adapted for fire alarms, factories, signal systems, mine or marine use. Mechanism entirely insulated from case. This bell can be furnished for automobile use the gong being reversed so as not to hold mud, dirt, etc., and when so constructed is known as 100 A. Price the same as No. 100 and made for automobile voltages.

Nos. 100U and 100U A.C. Approved by the National Board of Fire Underwriters for sprinkler systems and 250 volts or less. Flexible wire leads instead of binding posts.

Nos. 219, 219 A.C., 219U and 219U A.C. underdome type same as No. 100 only gong is mounted over case and hammer strikes inside. 6 to 12 inch sizes.

Edwards Riot Bells

For Operation on Battery and 110 Volts D. C. or A. C.

Schedule T

The motor driven bell is an entirely new principle which has found quick recognition for fire departments, ambulances, burglar alarms and extension systems on street corners to warn of the approach of fire apparatus. A quick responding bell—that is, a loud, continuous volume of sound is available immediately upon pushing the button. The mechanism does not have to gather speed before it rings and there is no detraction from driving the vehicle as is the case with hand operated gongs.

It is absolutely weatherproof and especially constructed for outdoor service.

No. 1238 Dixie Relays

Schedule T

A new relay combining the necessary features of the pony type. The adjustment and length of break is plainly visible.

Price, No. 1238each \$6.00

Edwards Electro-mechanical Gongs

Schedule T

No. 1330

Battery or 110 Volts D.C., Open or Closed Circuit
110 Volts A.C. Open Circuit Only

No. 1331

Edwards Single Stroke Solenoid Bells

No. 23 for D.C., No. 24 for A.C.

Schedule E

This bell is particularly efficient for all types of signalling and fire alarm systems. The only moving part is the plunger which is drawn up through the solenoid coil and strikes a sharp, heavy blow. This plunger is equipped with a specially treated hard metal tip which will resist wear for an extraordinary length of time.

Each bell is equipped with an outlet box for either surface or flush mounting. The bell when installed shows nothing but the gong.

It is adaptable for either multiple or series operation, but this information should be given when ordering.

Furnished in the following types:

TYPE S.—Single stroke. Open or closed circuit D.C. Open circuit only A.C.

TYPE A.—Constant ringing as long as circuit is kept closed.

TYPE B.—Constant ringing as long as circuit is kept open.

TYPE C.—Constant ringing when circuit is closed, even though it be opened again.

TYPE D.—Constant ringing when circuit is opened, even though it be closed again.

The above types are furnished in three styles of bell, as follows:

No. 133.—Non-conduit.

No. 1330.—Surface conduit. Has separable fitting for 1/2 inch conduit (or 3/4 inch if specified.)

No. 1331.—Concealed conduit—otherwise the same as No. 1330.

Operated by a strong spring mechanism which is released by an exceptionally small flow of current. Mechanism is entirely insulated from the case. Binding posts are on the side where they are most accessible.

The hammer, when released, makes a full revolution, passing under the gong to an inclined plane where it is raised and strikes the gong with great force gathered in the revolution. Recoil causes it to drop and become locked in its original position. As the full force of the blow is spent on the gong there is no strain on the mechanism. Operation through an eccentric produces positive action. Weather, bug and dust-proof.

RESISTANCE.—Five ohms; up to 20 ohms will be furnished no additional charge.

VOLTAGE.—Battery to 110 volts D.C. and A.C.

STROKES.—Four hundred guaranteed per winding.

KEYS.—One for each six bells or less. Additional Mfrs. List \$3.00 each.

WEATHERPROOF HOOD.—With wire mesh front. See listing elsewhere.

FINISH.—Red frame, black gong.

No. 1740 Edwards Watertight Bells and Buzzers

6 to 30 Volts D. C.

Schedule T

Bell

Buzzer

Case is made of cast iron, drilled to receive 1/2 or 3/4 inch conduit as specified. The movement embodies the intensified stroke principle so successfully used on other EDWARDS bells. The design is such as to permit the most powerful stroke with greatest current economy. The case and mechanism has been designed and assembled to withstand heavy shocks and vibrations. A gasket located between the case and cover and the operation of the hammer through a stuffing box makes the bell absolutely watertight.

The above-mentioned bell can be made to conform to the specifications of the BUREAU OF STEAM ENGINEERING, NAVY DEPARTMENT. Prices on application.

Faraday Transformer Signal Gongs

Schedule E

Enclosed Type, Vibrating, Weatherproof

For Transformer, A. C. Light and Power Circuits

For use on 12-18-volt A. C. bell ringing transformer or battery, and 100-110-volt and 220-250-volt A. C. light and power circuits, 50-60 cycles standard—25, 30 and 40 cycles to order.

The design and operation of mechanism is different from ordinary signal gongs. The vibration is so rapid that it is as satisfactory for code signaling as a single-stroke gong. Furnished to operate in multiple only—without external resistance. Specify model number, voltage and cycles when ordering.

For Battery and D. C. Light and Power Circuits

Have powerful, long-movement mechanisms. No possibility of a double stroke as semi-flexible, recoil-type hammer-rod is operated by multiple gear between the armature and hammer-rod, guaranteeing a clear, un-muffled single blow on gong. This type of gong is best connected in series, although multiple connection can be made if necessary. Cannot be used on A. C. circuits. All terminals are mounted on Bakelite pads. Have heavy black enameled cast iron bases and rubber-gasketed covers—Bauer-Barff finished gongs, etc.

Specify model No. and voltage, when ordering.

Model AS Non-guarded Gongs

Faraday Single-stroke Transformer Signal Gongs

Schedule T

Enclosed Type

For 12-18 Volt Transformer and 100-125 Volt and 220-250 Volt, 50-60 Cycle A. C. Circuits 25-30 and 40 Cycles to Order

Design of mechanism is in accordance with latest engineering standard—with laminated cores to minimize magnetic losses and light moving parts to insure best results. Gongs listed below are wired for operation in multiple on voltages specified, but special resistance gongs will be furnished, when specified, to operate in series on 100-125 volt and 220-250 volt A. C. circuits. Have heavy black-enameled cast-iron bases, with closely fitted rubber-gasketed covers, guarding against dampness and dust. All terminals are mounted on Bakelite pads—obviating necessity of bushing current-carrying studs where they pass through castings.

Specify model No., voltage and cycles when ordering.

Faraday Enclosed Type Buzzers

Schedule E

Nos. 93, 99 and 101

Extra heavy frame with close fitting gasketed cover; all terminals mounted on Bakelite pads completely insulating same from frame. Breakage of tension spring will not disable mechanism. Side contact adjustment is of patented micrometer lock type; working parts are heavily copper plated for protection against dampness. Magnet coils thoroughly waterproofed; soft rubber gasket between frame and cover guards against outside moisture and dust. Contacts regularly platinum—pure platinum when specially ordered.

Models 93, 99 and 101 are enclosed type with covers.

Absolutely dependable signaling units, frequently more desirable than bells. High-power armatures, rubber-gasketed covers. All terminals mounted on Bakelite pads completely insulating same from frame.

Models 89 and 91 have same mechanism as above buzzers, but are not furnished with covers.

Nos. 89 and 91

Faraday Bells with Fancy Gongs

Schedule E

For 110 and 220 Volts, D. C.

Cow Gong

Dome Gong

Sleigh Gong

Furnished with polished, nickel-plated fancy gongs in place of standard round gongs; desirable where a different sounding or a particularly penetrating sound bell is needed; have high-power armature. Breakage of spring cannot disable gong. All terminals are mounted on Bakelite pads, completely insulating same from frame and enabling gong to be mounted on metal lathing or damp walls without fear of grounding.

Can be furnished, on special orders, at slight additional cost, to operate on 110 and 220-volt D. C. circuits and on transformer and 110 and 220-volt A. C. circuits.

Specify model No. and voltage when ordering.

Faraday Skeleton Bells

Schedule E

Model O Vibrating Type For Battery Circuits Only

Skeleton bells meet the requirement of a good signal gong with exposed mechanism. Faraday Skeleton Bells have high-power patented pivoted-armatures giving twice the volume of sound that ordinary construction affords; full-insulated mechanisms, back-tension adjustments, non-turning contact and binding posts, adjustable locking side-contacts and cylindrical trunnion bearings. Breakage of tension springs cannot disable gong. Contacts regularly platinum, but will be furnished pure platinum, if specially ordered, at additional price. Wound to any special resistance at standard list additions shown elsewhere in this

catalogue; also furnished converted-single-stroke when specially ordered at \$2.50 net additional, but for important single-stroke work multiple-gear single-stroke bells are recommended.

Cat. No.	Size Gong Inches	Frame No.	Resistance Ohms	Std. Pkg.	Price Each

O-18	18	6	8	1	143.25

Ekla Skeleton Bells

Schedule E

Model Z Vibrating Type

For Battery Circuits Only

Ekla Skeleton Bells are slightly lower in price than Faraday and admitted not as desirable for important signal work.

They have reed-type armatures with substantial back-tension adjustments, side-contacts and non-turning binding posts.

Frames finished in dull black enamel, gongs polished nickel.

Pure silver contacts, wound to any special resistance at standard list additions shown else where in the catalogue; will be furnished converted-single-stroke, when specially ordered at \$2.50 net additional; but for important single-stroke work, multiple-gear single-stroke gongs are recommended.

Cat. No.	Size Gong Inches	Resistance Ohms	Std. Pkg.	Price Each

Z-10	10	5	4	21.30
Z-12	12	5	4	27.50

Faraday Hammer-blow Signal Gongs

Schedule E

For Battery and D. C. Circuits

Model AH

Model BH

Model CH

Models AH, BH and CH have mechanisms that give a long slow, hammer-blow movement, very similar to a powerful electro-mechanical gong. Should be operated on battery sets of not less than 50 ampere capacity.

Can be furnished to operate on 110 to 220-volt D. C. circuits at standard list additions. Specify voltage when ordering.

Enclosed Type

Size Gong Std. In. Pkg.	Model AH Non-guarded		Model BH Half-guarded		*Model CH Full-guarded

16 1	AH-16	227.00				
18 1	AH-18	249.10				

*Full-screen-guarded gongs can be furnished 5 inches and up at same prices as model CH. Change Cat. No. to CWH instead. For conduit patterns, add letter P to Cat. No. and regular additions to list. Prices upon application.

Faraday Electro-mechanical Signal Gongs

Schedule T

Enclosed Type, Vibrating or Single Stroke
Open and Closed Circuit Types for Battery,
D.C. and A.C. Circuits

Electro-mechanical gongs are designed to give a very loud, powerful signal, with a minimum of current. The blow itself on the gong is struck by a heavy ball on the end of a lever, released by the electric current, but operated by a powerful clock spring.

Faraday Electro-mechanical gongs give approximately 700 blows with one winding, and at \$5.00 net additional per gong they will be furnished, when specially ordered, with reliable rewind signal contactor to which may be connected a tell-tale bell to give notification whenever a gong needs re-

winding. It will also give warning if, from any cause, the main spring of the mechanism should break.

Regularly furnished with knockouts for 1/2 or 3/4-inch conduit, as specified, in four sides of the box.

STANDARD FINISH.—Dull black enamel with gunmetal gongs. Cases, when specially ordered, will be furnished without additional charge, in English vermilion finish.

Size Gong Inches	Regular Resistance Ohms	Model E, for Regular Installations without Conduit		Model EP, with Conduit Box Back for Exposed Conduit

Faraday Underdome Signal Gongs

Schedule T

Enclosed Type, Vibrating, Weatherproof

For Battery and D. C. Circuits and Transformer
and A. C. Circuits

Regular Pattern

Conduit Pattern

Underdome Faraday Gongs are ideal in design because they do not follow the old-pattern projecting neck type lines. The mechanisms are self-contained—protected by the gong and base-casting and their design harmonizes with high-class building standards to a most satisfactory degree.

Battery and D. C. types have long, powerful, multiple-gear pattern armature, giving a slow, dignified signal of great power and penetration.

Transformer and A. C. circuit types are notable in that they have no contacts of any sort whatever. They vibrate in unison with the line frequencies, and are so rapid in their vibrations as to be practically as satisfactory as single-stroke gongs for code-signaling, while giving many times louder signals.

For Battery and D. C. Circuits

Model U—Non-conduit Pattern

Faraday Double-gong Bells

Schedule T

Enclosed Type, Vibrating, Weather-proof

Double-gong Faraday bells are desirable where an extremely penetrating signal is required; they are made for both battery and D.C., as well as transformer and A.C. circuits. Regularly furnished for operations in multiple, but will be furnished to operate in series on lighting

and power circuits when specially ordered.

For Battery and D. C. Circuits

Faraday Special Resistance Signal Gongs

Schedule R

The following data is applicable to vibrating and single-stroke gongs for operation on battery and D. C. only, light and power circuits.

Regular resistance vibrating bells will operate satisfactorily on battery and D. C. circuits at the voltage shown in tables listing various types of bells, but when gongs are to be operated on higher voltage circuits, or when a number of gongs are to be operated simultaneously in multiple on a circuit, gongs wound to higher resistance must be used.

The following table shows ohms resistance per pair coils required for vibrating gongs for various special battery, motor-generator and D. C. voltages. In actual practice, these resistances may be slightly varied without bad results, but as maximum resistances shown for specified voltages, insure continuous and satisfactory operation of gongs, minimum sparking at contacts, and minimum maintenance expense, maximum resistance gongs are strongly recommended.

Single-stroke gongs may sometimes be used in series. When this is desired, state sizes, number of gongs to be used and voltage of circuit.

Where a vibrating gong is to be operated at the end of a long line, or where over 5 gongs are required to operate simultaneously in multiple on a circuit, special information should be given when order is placed.

Ohms Resistance for Operation of Faraday Vibrating Gongs and Buzzers on Direct Current Voltages without Excessive Sparking at Contacts

D. C. Volts	OHMS RESISTANCE, BUZZERS

Special Features

Faraday skeleton and enclosed type signal gongs and buzzers.

Faraday vibrating gongs converted to single-stroke will be furnished when specially ordered at \$2.50 net per gong extra.

Size Gong and Buzzers	FOR CONTACTS		
	Platinum	Triplex Platinum	Triplex Pure Platinum
Up to 6	\$1.90	\$3.75	\$5.60
8 " 10	2.50	4.40	7.50
12 " 14	2.50	5.00	9.40
16 and longer	2.50	6.25	11.25

Signal Vibrating Bells

A.C. and D.C.

A long time element is secured between strokes which permits the gong to vibrate freely and give a true ring of great penetrating or signaling power.

The contact is not broken or the contact pressure reduced until the plunger has practically reached the end of its stroke when it engages the interrupter and opens the circuit with a quick break.

All gongs regardless of size, mount onto a universal outlet box complete with terminal block and knockouts on all 4 sides.

Can be mounted flush or non-flush. Standard finish, black enamel; fire red if specified.

TYPE		Size Inches	PRICE, EACH

AV12-1	DV12-1	12	28.40	37.20	39.60	39.60

Universal Outlet Boxes

Universal Outlet Box used for mounting (flush or non-flush) all bells regardless of size or type—with the exception of waterproof types. Half inch knockouts on all 4 sides. Installation convenient and simple. Terminal block eliminates splicing and soldering.

Signal Weatherproof Bells

A.C. and D.C.

Cast bell metal gong (polished). Thoroughly protected from rain, snow and ice with cast metal hood.

Cast metal universal housing suitable for wall mounting.

Moulded terminal block with brass inserts.

Drilled top and bottom for 1/2 and 3/4-inch conduit as specified.

Hood, black enamel (baked) finish.

In ordering specify type, size, voltage, and if A. C., the number of cycles.

Furnished in 4, 6, 8, 10 and 12-inch sizes.

Alternating Current

25 or 60 Cycles

Type	Size In.	PRICE, EACH		
		6 to 48 V.	110 V.	220 V.

Signal Single Stroke Bells

A.C. and D.C.
For Multiple or Series Circuits

All bells are of the under-dome type, equipped with special hot pressed alloy steel gongs having a black rust-resisting finish.

Also furnished with cast bell-metal bell shells.

All bells, regardless of type or size, mount onto a universal outlet box equipped with terminal block and knockouts on all 4 sides. Can be mounted for flush or non-flush.

The electrical action (phantom view) and chime signals have the same solenoid principle of design and a sturdy rust-proofed plunger which travels in a condense tube.

The distance of travel is fixed, assuring the same volume of sound for all time without adjustment.

All coils are form wound and moisture proof.

Single stroke bells and chimes have neither springs, contact points nor moving parts other than the plunger.

Reliability, freedom from maintenance expense and unusual tone qualities particularly recommend these bells for use on fire alarm, code calling and time signal systems.

Standard finish for all bells, black enamel; fire red when requested, at the same price.

In ordering, state type, size, voltage, and if A. C., the number of cycles.

Universal Outlet Boxes

Universal Outlet Box used for mounting (flush or non-flush) all bells regardless of size or type—with the exception of waterproof types. Half inch knockouts on all 4 sides. Installation convenient and simple. Terminal block eliminates splicing and soldering.

Signal Call Systems

24, 110 or 220 A.C. or D.C.

Signal call service is primarily an addition to telephone service, providing an efficient means of completing telephone calls by promptly locating all important members of an organization regardless of their whereabouts—calling them to the nearest branch telephone.

Chime Signal

At the same time is provided a code signal system for broadcasting special messages.

The Signal Call is usually placed on the switchboard. Pressing one of the keys starts the mechanism, operating the code number corresponding on signal devices distributed so as to be heard anywhere on the premises.

The operating unit is a magnetic movement (no motor) with jeweled bearings and centralized make and break.

The Signal Call sending station may be furnished with sectional key units giving either 10, 20, 40 or 60 code numbers.

The unit system of design makes possible the changing from 10 to 20 code numbers and additions of units of 20 numbers with the same ease as in adding units to a sectional bookcase. All connections are made automatically.

The designated "call" sounds three times and automatically stops, allowing the maximum number of "calls" in a given time. The red jeweled lamp remains lighted while a call is being sounded.

The case is of solid brass, finished in black enamel.

Special finish upon request.

Soft Tone Bell

Voltages, 24, 110 or 220 A.C. or D.C.

The 10 and 20 call is 7 3/4 inches long, 7 1/8 inches wide and 6 3/8 inches deep; 40 call, 7 1/8 inches high; 60 call, 9 3/8 inches high.

In ordering, state number of code numbers; voltage; and, if A.C., number of cycles.

Write the nearest Western Electric Branch for Bulletin A-50 covering this service in detail.

Musical Tone Bell

Power Signal Relays

Relays are furnished to operate from standard voltages 12 to 250 A. C. and 6 to 250 D. C.

Carrying capacity: maximum rating of power relays, 660 watts, 10 amperes, 250 volts. Maximum rating of heavy duty relays, 1000 watts, 15 amperes, 250 volts.

Relays can be furnished either single circuit or double circuit. A front contact relay closes one or two circuits when energized. A back contact relay closes one or two circuits when de-energized. A front and back contact relay is a combination of the two preceding relays.

"Signal" Relays mean the best in design and construction. Laminated silicon steel magnetic structure. Phosphor bronze contact arms. Self-supporting, form wound, impregnated, moisture-proof coil. Wiping self-cleaning contacts. Moulded insulating base of approved material. All parts secured to base with brass inserts.

The A. C. relays make a contact as dependable as the D. C. relays, free from "humming" or "chattering." No springs or electro-mechanical complications are employed. No adjustments are required.

STANDARD HOUSING.—Stamped steel outlet box. 1/2-inch knockouts on all four sides. Dimensions, 4 3/4 inches square, 3 1/4 inches high.

WEATHERPROOF HOUSING.—(When specified). Cast iron, enamel finished. State whether for open wiring or 1/2-inch conduit, connections top or bottom or both. Dimensions, 8 1/2 x 6 x 4 inches high.

Net weight, 3 1/2 lbs. Shipping weight, 5 lbs.

Heavy duty is Standard Front Contact Relay equipped with main copper to copper contacts and auxiliary copper to carbon contacts. The auxiliary contacts make before and break after the main contact which eliminates arcing or burning of the latter.

Signal A. C. Duplex Horns

The A. C. Duplex Horn operates from 60 cycle current. Furnished for standard voltage—24 to 250. Has one moving element. Two projectors make it equal to two powerful horns with only one operating unit. Its penetrating note will cut through medium noise.

A. C.-1	Duplex Horn, 6 to 48 Volts	\$18.00
A. C.-1	" " 110 " 220 "	20.00

Type A Federal Sirens

This outdoor Type A Siren takes the place of bells, gongs, whistles, etc., wherever electricity is available. There are no gears or vibrating parts. This siren with double horn gives increased efficiency, greater volume, and pleasing tone.

Length over all, 17 inches; diameter of horn, 10 inches; diameter of body, 5 3/4 inches.

Weight, packed in carton, 18 pounds.
Price, Type A, with Universal Motor, 1/3 H.P. A.C. or D.C., 6 to 250 Volts each \$37.50
Price, with Porcelain Enamel Finish " 45.00
" " Brass or Copper " 50.00

Type B Federal Sirens

Single Head

An electrically operated sound signaling device for very small villages and communities. The ideal starting and quitting signal for electrically operated mines, quarries, ranches, plants, factories, etc. The distance penetration is about 3/4 to one mile, depending on wind and surroundings.

Price, 3-H.P. Single-phase, 60-cycle, A.C. 110 or 220 Volts each \$330.00
Price, 3-H.P. 2 or 3-phase, 60-cycle A.C. 110, 220, 440 or 550 Volts each 300.00
Price, 3-H.P. D.C., 110 to 600 Volts " 300.00

Type B Federal Sirens

Double Head

This type siren is designed for use as a general alarm in small towns and cities having volunteer fire department. Has a sound penetration radius of approximately a mile and one-half to two miles under ordinary weather conditions.

Has two 15-inch diameter revolving fans, or cylinders, in the sounding mechanism. Size, 38 inches long, 21 inches high, 19 inches wide. Weight, boxed, 500 to 700 pounds.

Price, 5-H.P. Single-phase, 60-cycle, A.C. 110 or 220 Volts each \$455.00
Price, 5-H.P. 2 or 3-phase, 60-cycle, A.C. 110, 220, 440 or 550 Volts each 400.00
Price, 5-H.P. D.C. 110 to 600 Volts " 400.00

Remote Control Switches

Permits operation of sirens from distant localities. Two push buttons included.

Price, D.C. or A.C., Any Frequency up to 250 Volts, with Steel Case each \$55.00
Price, Extra Buttons " 5.00
" Boxes with Glass Fronts for Buttons each 10.00

Federal Automatic General Alarm Controls

For Operating Electric Sirens

This device automatically performs the on and off function of a knife switch. It is invaluable in places where there is no one to operate the knife switch after an alarm has been received. Can be used in conjunction with remote control device.

Consists of a motor driven rotary switch mounted in a heavy steel, weather-proof case. Complete as shown in illustration.

The use of this device insures the proper tone effect from the siren.

- 1—Weatherproof steel case.
 - 2—Belt drive from motor or direct connected if desired.
 - 3—Worm gear reduction.
 - 4—1-20 H.P. motor, in any class current up to 440 volts.
- Prices upon application.

Klaxon Industrial Motor Driven Horns

Type W

Type WL

Type WS

The Klaxon Industrial Horn is unfailingly effective in sounding time signals, code calls, telephone calls, etc., and can be used with safety as a fire, special hazard alarm or as a warning on cranes.

Can be furnished to operate on electrical current of 6 to 230 volts, direct current; and 12 to 440 volts, alternating current. Weather-proof housings are fitted with brackets for wall mounting and are tapped for conduit. Finished in red enamel. The horns are alike except for their projectors.

Type WS has a short projector, producing a shrill note of great penetrating power. It is especially fitted for indoor use, under severe noise conditions.

Type W is furnished with a ram's horn shaped projector, which directs its deep note downward. It is suitable for overhead or outdoor use.

Type WL has a long projector. Its deep, penetrating note is of great carrying power and is recommended where long distances are to be covered.

Approved by the National Board of Fire Underwriters.

Type	Length Inches	Weight Pounds	Price Each
WS	7 1/8	13	\$30.00
W	12	18	30.00
WL	14 1/4	18	30.00

Wizard Jefferson Bell Ringing Transformers

For 110 V. alternating current only. Designed for the residence or small apartment. Will operate signals and door openers. Secondary, 10 volts.

Capacity, 25 watts; dimensions, 2x2x2 1/4 inches. Weight, 1 pound.

Price, No. 1601, for 60 Cycles...each \$1.50

Jefferson Junior Bell Ringing Transformers

For 110 V. alternating current only. Designed for the average residence or apartment building. Will operate all standard door openers. Generates 12 volts. Capacity, 25 watts; dimensions, 1 3/4 x 2 1/2 x 3 3/4 in. Weight, 1 1/2 lbs.

Price, No. 1602, for 60 Cycles...each \$2.00
 " " 1202, " 25 " " " " 2.50

Jefferson Tri-Volt Bell Ringing Transformers

For 110 V. alternating current only. Generates three secondary voltages: 6, 12, 18 and will take care of longer lines.

Capacity, 25 watts; dimensions, 1 3/4 x 2 1/2 x 3 3/4 inches. Weight, 1 1/2 pounds.

Price, No. 1603, for 60 Cycles...each \$2.50

Jefferson Heavy Duty Bell Ringing Transformers

Standard winding will operate on 100 to 120 volts A. C., 50 to 133 cycles.

Type A

Type A is designed for heavier signal work and installations that require more power than is generated by the Junior or Tri-volt Type. Three secondary voltages: 6, 14 and 20. Dimensions, 3x3 3/4 x 4 inches.

Capacity Watts	Weight Pounds	Cat. No.	Price, Each 60 Cycles	Cat. No.	Price, Each 25 Cycles
50	4	1610	\$5.00	1210	\$6.00

Type B

Type B Heavy Duty is designed primarily to take care of large installations and operate a greater number of bells and other signal devices than the smaller type transformers. Three secondary voltages: 6, 14 and 20.

Capacity Watts	Dimensions Inches	Weight Pounds	Cat. No.	Price, Each 60 Cycles	Cat. No.	Price, Each 25 Cycles
75	3 3/4 x 4 1/8 x 6	7 1/2	1611	\$7.00	1211	\$9.00

Type C

Type C will operate large alternating current bells, 6 to 16 inches in diameter. Suitable for schools, factories, mines, etc. Delivers four voltages: 6, 12, 18 and 24.

Capacity Watts	Dimensions Inches	Weight Pounds	Cat. No.	Price, Each 60 Cycles	Cat. No.	Price, Each 25 Cycles
125	3 3/4 x 4 1/8 x 6	9	1612	\$9.00	1212	\$11.00

Type D

Type D delivers 15, 25 and 40 volts and is designed to take care of large bells, where extra long lines are used, and to operate the old-style direct current bells which require a higher voltage than the transformer bell.

Capacity Watts	Dimensions Inches	Weight Pounds	Cat. No.	Price, Each 60 Cycles	Cat. No.	Price, Each 25 Cycles
125	3 3/4 x 4 1/8 x 6	9	1613	\$10.00	1213	\$12.50

Type E

Type E is designed for unusually large installations. Secondary voltages, 6, 12, 18 and 24. Can be supplied with any desired secondary voltages at slight additional cost.

Capacity Watts	Dimensions Inches	Weight Pounds	Cat. No.	Price, Each 60 Cycles	Cat. No.	Price, Each 25 Cycles
250	5 1/2 x 5 1/4 x 4 1/2	15	1614	\$18.00	1214	\$22.00

Type F

Type F has an output of 500 watts, secondary voltages, 6, 12, 18 and 24. This transformer can also be furnished with any desired secondary voltages at slight additional cost.

Capacity Watts	Dimensions Inches	Weight Pounds	Cat. No.	Price, Each 60 Cycles	Cat. No.	Price, Each 25 Cycles
500	7 1/4 x 6 1/4 x 5	23	1615	\$28.00	1215	\$35.00

No. 1604 Jefferson Porcelain Klad Bell Ringers

This transformer has the combined advantages of all-steel and all-porcelain construction. It is especially adapted to basements and other rooms which are finished and decorated and where a black metal case transformer might be out of harmony.

May be installed using either nails or screws without danger of chipping the case. No projecting lugs to break off.

For 100 or 120 volts. Cycles, 50 or 133. Capacity, 25 watts. Secondary, 10 volts.

Price, No. 1604 each \$2.00

Jefferson Transformers

Jefferson Low Voltage Transformers are designed for service wherever low voltage alternating current is necessary, such as the operation of electrically controlled valves, thermostatic circuits, thermostats, magnetic relays, etc., and equipment for oil burning apparatus.

Capacities range from 35 to 150 watts and are furnished with any secondary voltage desired. For operation on voltages ranging from 100 to 120, 50 to 133-cycle. For 220 volts, 25-cycle transformers, there is additional cost.

Price, No. 95, 35 Watts Capacity each \$4.50
 " " 96, 50 " " " 5.50
 " " 97, 75 " " " 6.50
 " " 98, 100 " " " 7.50

Jefferson Flexible Toy Transformers

For Use on Alternating Current Only

The flexible feature of these transformers consists of a regulating switch and master connection post, by means of which a range of voltages from zero to the maximum limit of the transformer is available, in small steps. Equipped with attachment plug and cord.

The little Jeff Transformer is designed for operating the small types of electric motors, signals, lamps, etc.

The Midget will operate all the smaller types of electric trains and all types of small motors.

The No. 2 will operate anything in the shape of an electric train or electrical toy.

The No. 3 has additional capacity over the No. 2 and will take care of any kind of a large toy outfit or equipment.

The No. 6 has the same secondary voltage as No. 3, but double the capacity.

Standard winding will operate on 100 to 115 volts A. C. 50 to 133 cycles.

Cast Bronze Screw Cap

Round pattern push button, black center only. Finished in brass or bronze.

Diameter is 2 3/8 inches.

Price, No. 25651 each \$1.50

Edwards Bronx Card Holder Push Buttons

The card racks are arranged so that a slot for inserting the card is at each end of the rack, and in this way there is no slot visible when the card is in place. It also allows the push to be mounted any way desired without the card falling out.

The mechanism is entirely insulated and is recessed sufficiently to allow the use of No. 14 wire and still leave plenty of room between the screws and the wall, there being no chance of grounding. The wire is fastened directly to the same screw that holds one side of the contact spring; pushing the button makes a contact on one screw only, thereby assuring a positive contact. The fiber is recessed so the wire cannot slip out of place.

No. 601—Single Card Holder

Cat. No.	Length Inches	Width Inches	Std. Pkg.	Price Each

Drilling through brick, with a reliable electric hammer to do all the work. This handy device connects right to a lamp socket.

30 village blacksmiths in your lamp socket

If you are interested in electric hammers and drills, write for details and prices on the Speedway line.

THE celebrated village blacksmith was right there with the punch, but do you realize that you can go his sinewy arm twenty-nine times better with a sturdy little electric hammer?

Thirty times as fast as a man can work a hand hammer, the electric variety gives a surer blow too—and it never tires. No wonder that industry is turning to these dependable electrical devices and the

many others that Western Electric distributes.

Quality electrical products for wholesale buyers

Whatever your electrical needs, Western Electric can serve you. From the power apparatus that speeds up production to the lighting installation that often means more and better work, Western Electric stocks are widely varied, they are priced right and are quickly available.

Type ULA Speedway Portable Drills

110 Volts

Because of its light weight the ULA is adapted for use in the home, on the farm, in the small repair shops, garages, auto sales room, office buildings, small stores, tinner shops, electrical shops, etc.

The motor is series wound universal and operates from any lighting socket. Equipped with a standard quick make and break switch, and show window impregnated cord. Has a 3-jaw self-tightening chuck.

The switch is automatic type, operating when the handle of the tool is grasped for drilling.

Type	Capacity Steel Inches	Speed R.P.M.	Wt. Lbs.	Price Each
ULA	1/4	1500	5	\$18.75

Add \$1.25 for 220 or 32 volts.

Type ULB Speedway Portable Drills
5/16-inch Capacity—110 Volts

This drill is sturdy, light in weight, and well constructed. Will take care of all drilling in steel and softer materials to rated capacity.

Furnished with 8-foot lead cord, screw plug, side handle, knob handle, self-tightening hand-operated three jawed chuck for straight shank drill bits 0 to 5/8 inch.

Type	Current	Chuck Capacity Inches	Load Speed R. P. M.	Wt. Lbs.	Price Each
ULB	Universal	0-5/16	750-1500	6	\$30.00

Add \$3.00 for 220 or 32 volts.

Type ULD Speedway Portable Drills
1/2-inch Capacity—110 Volts

Strongly constructed and well designed.

In the ULD expensive machined aluminum castings have given way to steel. Bronze in place of balls is used in bearings. Comfortable side handles and breast plate for hand and chest.

Equipped with 8-foot rubber lead cord, screw plug, side and knob handles.

Type	Current	Chuck Capacity Inches	Load Speed R. P. M.	Wt. Lbs.	Price Each
ULD	Universal	0-1/2	400	12	\$48.00

Add \$3.00 for 220 or 32 volts.

Speedway Stands

For Types ULB and ULD Drills

A stand used in conjunction with a drill adds greatly to its value. It allows the drill to be used as a portable tool, or in a moment's time by inserting the drill in the stand, it is converted into a drill press. Either take the work to the tool or the tool to the work.

Type LB Stands

Designed for use with Type ULB drill. Price, Type LB Stand Only. each \$15.00

Type LD Stands

Designed for use with Type ULD drill. Price, Type LD Stand Only

.....each \$20.00

Type ULD In Stand

Speedway Heavy Duty Portable Drills

Operate from Any Lamp Socket

Type UB

80 per cent of rated capacity. The gearing operates in grease on the approved principle of an automobile transmission.

Speedway Drills are built to stand heavy duty and constant service.

Their heavy torque practically eliminates stalling when breaking through a hole. Designed with a nicety of detail, making them rugged, efficient, convenient and light in weight. Liberality of design enables them to safely drill in steel 20 per cent over rated capacity and to ream holes

Motor is universal operating from direct and alternating current. Norma adjustable ball bearings are used on all sizes. Windings are thoroughly insulated and carefully distributed to give perfect electrical and mechanical balance. Large brushes give freedom from commutator trouble. Liberal fan insures cool operation.

Casing of tool is aluminum with properly positioned handles.

Particular attention is called to the manner of placing Brush Holders on brush holder spider in such a way that brushes may be shifted and with the exception of Type UAA, end bell may be removed and the running motor exposed to view and inspection.

Gearing is made of special heat treated alloy steel and runs in grease. Each gear is journaled on both ends thus eliminating trouble experienced with gears running on studs.

Ball thrust bearing and long bronze spindle bearing insure minimum friction and maximum life.

Switch for controlling motor is conveniently located near the handle.

Chuck ordinarily furnished as standard equipment is a high grade three jaw type, but for requirements two jaw or keyless type chucks may be specified; and, on the Type UG, and when so specified on the Type UD, taper sockets are furnished instead of chucks, to hold taper shank drill bits.

Equipment includes 8-foot cord, plug, breast plate or D handle, extra side handle, three jaw chuck and wrench.

Pressure screw or "Old Man" can be furnished at additional price of \$2.50.

Types UAA and UB are furnished with pistol grip.

Cat. No.	Current	Chuck Capacity Inches	Net Wt. Lbs.	Load Speed R. P. M.	Drilling Medium Wood In.	Reaming Mild Steel In.	Price Each
*†UAA	Universal	0 to 3/16	4	8000	3/16	..	\$37.50
UB	"	0 " 1/4	8	750	3/8-1/2	3/16	60.00
UC	"	0 " 3/8	14	600	3/4	5/8	70.00
UD	"	0 " 1/2	13	400	7/8	3/8	85.00
UE	"	1/8 " 5/8	21	350	1	1/2	90.00
UG	"	1/8 " 7/8	40	175	2	3/8	130.00

*Center spindle—direct from motor—no gears.

*†Particularly adapted to wood drilling.

Standard voltage is 115; 32 or 230 volts furnished at \$3.00 extra.

In ordering voltage must be specified.

Types UC, UD, UE

Speedway Stands

For Types UAA, UB, UC, UD, UE Drills

The drill is quickly inserted and securely held in the stand, by means of two clamping collars, held with thumb screws, placed around the stud in end bell and thrust bearing housing. Upper adjustable drilling table is removable.

For Use With Drills Type	Adjustable Drilling Stand Type	Length Inches	Wt. Lbs.	Price Each
UAA, UB	BA	8	18	\$30.00
UC, UD, UE	ED	13	65	35.00

If Type ED stand is used with Type UC drill extra stud will be furnished.

Speedway Slate and Marble Drills
110 Volts

Portable Electric Twist Drills manufactured and adapted to ordinary drilling of metal and wood, are not suited to the drilling of such materials as slate, marble, etc., being geared to such a high

drilling speed that the drill bit will not stand up.

Type USD drill has the correct drilling speed for this type of work. It is of very light weight.

Type	Current	Wt. Lbs.	No Load Speed R.P.M.	Price Each
USD	A. C.-D. C.	8	240	\$85.00

Add \$3.00 for 220 volts.

Prices on diamond point slate and marble bits on application.

Speedway Screw Drivers and Nut Fasteners
110 Volts

Slow speed, ample power, light weight and great torque or pulling power, the prime requisites for such work as driving screws, nuts, bolts, lag screws, etc., are found in this Driver.

The lightness of weight, with pistol grip handle, makes for extreme portability and ease of handling. Aluminum casings throughout. Motor is universal, operating on both A.C. and D.C. of like voltage.

An extremely high gear reduction gives very slow speed together with very great torque. Gears are of chrome nickel steel, especially heat treated. Spindle is equipped with adjustable multiple disc clutch, which acts as a protector to the motor, allowing the spindle to be installed under a predetermined load and the motor continue to run. This eliminates the danger of stalling the motor and a consequent burn out.

Recommended for driving home up to No. 16 wood screws and 5/8-inch cap screws or nuts. A finder or sleeve can be furnished in various sizes to be used for the purpose of placing the tool over the screw, the driving tang automatically finding the slot in the screw head. Socket wrenches may be furnished for standard and special size nuts and bolts.

Driver regularly equipped with one finder, bare driving tang or socket wrench.

Type	Current	Wt. Lbs.	Load Speed R.P.M.	Price Each
U.S.	A. C. & D. C.	8 1/2	105	\$90.00
UBS	A. C. & D. C.	7	750	60.00

Add \$3.00 for 220 volts.

Speedway Bench Grinders

110 Volts

Sharp tools mean speed. This grinder is equipped with a 1/4-horse power motor to operate from any lighting socket. Plenty of power and correct grinding speed.

The machine is furnished complete with two 4 1/2-inch wheels, adjustable grinding rests, solid base, 8-foot lead cord and plug.

Type	Current	H. P.	Speed R.P.M.	Weight Pounds	Price Each
WAG	Alternating	1/4	3600	40	\$42.50
WDG	Direct	1/4	3600	40	47.50

Add \$3.00 for 220 volts.

Specify voltage and current when ordering.

Type IU Speedway Tool Post Grinders

Type IU Grinders give accuracy and efficiency—efficiency through accuracy. Every armature is balanced on a specially designed dynamic balancing machine, thereby eliminating the possibility of chatter marked work. Self-aligning ball bearings are used throughout.

Type IU Grinder

The motors on these grinders are 1/8-h. p. and are Universal, operating on either direct or alternating current. The equipments A, B, C, D and E are interchangeable so that each of them may be set on the same center grinder.

Grinder With C Arm

Grinder with Equipment A is for general tool room use, and may be set up in a moment on any lathe, shaper or milling machine. It is the ideal tool for grinding dies, reamers, gauges, etc. The main motor spindle makes 10000 r. p. m. and the internal attachment 30000 r.p.m. The internal attachment has a reach of three inches.

The price includes five wheels for internal work 3/8, 1/2, 5/8, 3/4 and 7/8 in. and two wheels for external work, 2 1/2 and 4-inch. Also one cutter rest, cross feed lever, cord and plug.

Grinder with equipment C is for button die grinding and will grind at the rate of twenty per hour. The high speed spindle operates at 30000 r. p. m. When external work is to be done, the high speed spindle may be removed and either the 2 1/2 or 4-inch elastic wheel used.

The price includes a specially balanced chuck holding a 3/8-inch round emery pencil, 2 1/2 and 4-inch elastic wheels, one cutter rest, cross feed lever, cord and plug.

Equipments B, D and E for the 1U Grinders are for 5, 10 and 15-inch internal work.

Description	Price Each
Type 1U, Plain Machine, Universal 1/8-H. P.	\$50.00
A—Arm High Speed, 40000 R.P.M.	20.00

C— " Chuck for Dies	15.00
For Dies:	
D—Arm 5-inch, Internal	20.00
E— " 15 " "	35.00

Standard voltages are 110 and 220 volts. Always specify voltage when ordering. Add \$3.00 for 220 volts.

Type 2UA Speedway Angle Plate Grinders

This 1/4-h. p. Universal Grinder is a strictly high grade tool for requirements of the tool room. All grinding is done from a special spindle, driven by belt. A great variety of speeds may be obtained by the use of various sized pulleys.

Internal quills for special requirements are also furnished. Full information, specifications on request.

Type	Motor	H. P.	Wt. Lbs.	Speed R. P. M.	Price Each

		20—21—Drill Bits	

22—Pressed Steel Case
23—SpeedWay Power Unit

Price, Complete	each \$75.00
-----------------	--------------

Speedway Portable Hammers

110 Volts

Types D-3 and U-2

Speedway Hammers are primarily built for drilling into concrete, stone, brick, etc. Light chipping, channeling, scaling and one hundred and one other uses where a great number of blows is required.

These hammers operate at about 15 per cent of the power cost of operating air tools and without the expenses and inconvenience of compressor, air piping hose, etc. Over handwork, the economy is from 80 to 90 per cent, and it is by no means

uncommon for a tool to save its cost in a week. Every tool is controlled by a switch mounted in the handle and equipped with flexible cord and plug. They may be attached to any lamp socket.

A man drilling by hand strikes from forty to sixty-five blows per minute. These hammers from 1000 to 3000. Power cost is negligible, about \$.15 a day for ordinary work. The hammer, when it strikes the blow, is absolutely free from the motor and the strength of the blow is constant. Cannot overload the machine, no burning out of armatures.

Types D-4 and U-6

Types U-2 and D-3 Light Series

Type	Current	Diagn. Drill In. In.	Speed per Min.	Power Consum. Wats	Blows per Min.	Net Wt. Lbs.	Price Each
U-2	A. C. - D. C.	1/2	2	150	3000	16	\$150.00
D-3	D. C.	1/2	2	150	3000	15	125.00

Types U-6 and D-4 Medium Series

U-6	A. C. - D. C.	1	2	240	1800	26	\$185.00

There's a clear waste of horsepower in the factory which depends on belts and shafting to turn the machines. Read how Western Electric individual motor drive means using a truck-horse only on a truck-horse's job

Stop using a truck-horse to pull a wheelbarrow

A BIG HORSE doing a little horse's work, or even a man's work—that's exactly what happens when you use your horsepower to drive shafting.

Ask any Western Electric motor dealer to figure how much power and money you can save when you install Western Electric individual motor drive.

Power when and where you want it—

Western Electric motors and control can cut your operating costs and give you more satisfactory results in the bargain. Western Electric service too is an economy. Our prompt delivery from complete stocks saves time on an installation. Full particulars—both the service and a motor layout—whenever you say.

**—and everything
that goes with it**

The Western Electric line goes all the way from the conduit to the motor—complete supplies for a quality job. Put it up to a Western Electric motor dealer and you can be sure everything will be right, down to the last detail.

Foreword Western Electric Motor Information

The best electrical talent of the times is responsible for the selection and test of the materials which go into Western Electric Motors. Designed to give lasting service and to stand up under the demands of day in and day out service, these motors naturally live up to their reputation for quality and dependability.

Sturdy and time-tested construction results in motors that bring real economy to the user by their freedom from trouble and the continuity of the service they render. Economical, too, is the distribution service back of these motors, for with its offices in more than half a hundred cities, Western Electric can supply motor and control equipment promptly to any of the manufacturing centers of the country.

Many Industrial plants and Electrical contracting firms are using Western Electric service to advantage on motor and control equipment. By dealing with nearest Western Electric distributing house, these customers avoid tying up capital in large stocks of motors and control equipment. The plan of ordering as needed saves storage space, too.

Buyers of electric motor equipment are invited to visit their nearest Western Electric distributing house at the first opportunity and inspect the stock and shipping facilities maintained there. Detailed information on any specific type of motor or control is available, either through personal call or by mail. In addition to motors and control equipment a full line of conduit, fittings and wire is maintained, ready for prompt shipment.

Western Electric Motors and Control Equipment are handled by representative dealers in cities and towns throughout the country. You will find them willing and capable to advise and help you on all your electrical power apparatus problems.

All 1725 r.p.m. motors rated for continuous duty, 40 deg. C. temperature rise; all 1140 r.p.m. motors for continuous duty, 50 deg. C. temperature rise. Cat. Nos. do not include pulleys.

Western Electric Type SA A.C. Small Power Motors

**Protected Type—Constant Speed
60, 50, 40 and 25 Cycles, Single-phase**

Revolving primary Type SA motors should be selected as closely as possible for the frequency and voltage on which they are intended to operate, but successful operation may be expected on circuits where the variation of either the frequency or voltage from normal does not exceed 5 per cent. Where both the frequency and voltage vary, the sum of the variations must

not exceed 10 per cent. The starting torque and maximum torque will vary as the square of the voltage, the speed varying directly as the frequency.

Standard direction of rotation is counter-clockwise. Specify direction of rotation when ordering.

*All frames have waste-packed bearings. Feet are cast integral with end shields. †Model No. does not include pulley or connecting cord with plug. ‡Ratings are for intermittent duty and are not satisfactory for continuous duty. If continuous duty motors are required refer to the company.

The waste-packed bearing protected type motors are mechanically interchangeable with the wick-oiled bearing open type motors of the corresponding frames for either A. C. or D. C. types. Footless motors in all frames listed can be furnished in the same ratings at same prices as with feet.

Prices upon application.

Western Electric Type RSA Fractional Horsepower Motors

Constant Speed, Single Phase, Repulsion Start

Standard direction of rotation is counter-clockwise facing the end opposite pulley. Has waste-packing bearings.

Type RSA is a constant speed high starting torque motor. Motor starts as a repulsion motor and at a predetermined speed, a centrifugal device short circuits the commutator and motor then runs as and with induction motor characteristics. Brushes are fixed, that is, they are not lifted from commutator but carry current only when the motor is starting.

Enclosed motors furnished when desired. Refer to nearest distributing house.

Starting torque, 300 to 400 per cent of full load torque with full line voltage.

Maximum running torque, 200 per cent of full load torque.

The starting current is approximately three times the full load normal running current.

These motors will operate successfully when the combined variation of the voltage and frequency does not exceed 10 per cent above or below that given by the name plate stamping. Standard motors may be operated on circuits corresponding to either of their two listed voltages by suitably grouping the external connections of the four leads brought out from the motor frame.

Listed 40-cycle, 118/236-volt motors will operate successfully on circuits varying from 110/220 to 127/254 volts inclusive, but not necessarily in accordance with the standards established for operation on 118/236 volts.

Standard 60-cycle Type RSA motors should not be operated upon 50-cycle circuits.

Western Electric Type BSR Single-phase Varying Speed Motors
60 Cycles, 110 or 220 Volts

Foot controllers are available for all sizes of brush shifting varying speed Type BSR motors. With these controllers a speed range, when the motor is operated against full load torque, of 2.5:1 is obtained through a large number of intermediary steps. Speed range 2000/800 r.p.m. on motors having synchronous speed of 1800 r.p.m. and 1350/550 r.p.m. on motors having synchronous speed of 1200 r.p.m.

Western Electric Type SCR Single-phase Repulsion Induction Motors

Constant Speed
60 Cycles, 110 or 220 Volts

Designed for constant speed, with moderate or heavy starting torque. In starting direct from the line Type SCR motors take current approximately in proportion to torque. If desired to reduce current values during acceleration, Type CR1026 rheostats may be ordered at an extra charge.

Type KT and KQ Western Electric Standard Polyphase Induction Motors

Types KT or KQ
Riveted Frame Induction Motor

The following is a partial list of Western Electric Constant Speed, Belt Drive, Standard and Semi-standard Induction Motors for use on two and three-phase circuits of the voltages and frequencies given. Further data and prices may be obtained upon application; other ratings and speeds are also available.

Types KT and KQ have squirrel cage rotors and are designed for constant speed service.

Western Electric Back Geared Motors

Type KT, 3-phase Motor on Reduction Gear Base

Direct or alternating current motors for use with back geared features, employing steel or fabroil pinions, should be selected so that the horse power rating at any speed does not exceed the limits indicated below.

H.P.	Speed R.P.M.	H.P.	Speed R.P.M.	H.P.	Speed R.P.M.
10	1800	30	1000	60	750
15	1500	40	900	50	720
30	1200	60	800	40	600

If side wall or ceiling installation is desired, platform suspension with standard horizontal equipment is recommended.

Cradle Type

Including Pinion, Gear and Gear Case for Types KT and KQ Motors

The cradle type back-gear attachment is a device which is designed for use with standard motors, with or without standard base. When standard base is used, the back-gear attachment is fitted between the motor and base and dowelled to the motor to ensure alignment being maintained. Ring oiling bearings are used. Gear cases are oil tight, except at the joints and around the shaft.

For addition to the net retail price of standard motor. Sliding base not included, but if wanted, use standard sliding base and price.

Gear case not furnished unless called for on the requisition.

Prices upon application.

Western Electric Types BD (2-pole) and CD (4-pole) Direct Current Motors

Constant Speed, Commutating Poles

Iron sliding bases and starting rheostats are included with standard belted motors. Semi-enclosing covers will be furnished on special order. The use of solid enclosing covers increases the temperature rise of motors to which they are applied and therefore modifies the open ratings. Belt tightener attachments, consisting of cast iron ring adjustable idler on pulley end, may be furnished on order.

Motors will operate successfully at normal rated load at any voltage not more than 10 per cent above or below normal, but not necessarily in accordance with the standards of performance established for operation at normal rated voltage.

All standard Types BD and CD shunt wound motors may have speeds increased by field adjustments 25 per cent above normal, maintained rated output.

Motors will be furnished with keys, nuts and lock washers for shaft extension on each end, except three bearing motors which will have key for pinion and key, nut and lock washer for solenoid brake, and in addition, a thimble will be furnished for the solenoid brake end of the motor. The thimble will be omitted when a solenoid brake is ordered on the requisition with the motor, or when the requisition specifies that a solenoid brake will be used with the motor.

High-voltage (2200 volts) hoist propositions should be referred to the manufacturer giving complete information including duty cycle, as drum type controllers are not recommended except in special cases.

Prices upon application.

**Western Electric Types TAB or QAB
A.C. Belt Driven Generators**

Form ML

120, 240, 480, or 600 Volts

**Type TAB or QAB Form ML Belt Driven Alternators,
Self-exciting Revolving Armature Type**

The self-excited revolving armature Form ML alternator is especially adapted for installation in isolated plants and small power plants.

The alternators are built in three sizes, 7½, 15 and 25 kw., 120, 240, 480 and 600 volts, 60-cycle two-phase or three-phase. They may be operated as single-phase alternators. Their single-phase rating is 70 per cent of their three-phase rating.

1.0 P-F.	0.8 P-F.	Speed R.P.M.	Approx. Ship. Wt. Lbs.	Poles	NET WT., LBS.			
					Rotor	Stator	Sub-base	Total
9	7.2	1800	860	4	120	500	95	715
18	14.4	1800	1300	4	165	810	95	1070
30	24.0	1800	2050	4	235	1160	140	1535

The generators are equipped with an auxiliary direct current armature winding and commutator from which the field excitation is obtained. The alternating current winding can be two or three-phase at the same price.

Single-phase capacity is 70 per cent of the above capacity.

Prices upon application.

Heating Specifications

Full load continuously at rated voltage and power-factor 50 deg. C. rise. No overload.

If it is desired to obtain a rating on which 25 per cent overload for two hours may be guaranteed, this rating will be 83½ per cent of the corresponding one given above. For this rating, heating guarantees will be full load continuously 40 deg. C. rise. 125 per cent load two hours, 55 deg. C. rise.

**Western Electric Types ATB or AGB
Continuous Rated A.C. Belt-driven
Generators**

60 Cycles, Polyphase

240, 480, 600, 1150 or 2300 Volts

**Type ATB Form PB Belt Driven Alternators
with Direct Connected Exciters**

The Form PB belt driven alternator is especially adapted for installation in small plants.

These alternators are so designed that they operate at high efficiencies at all loads on power factors of from 80 to 100 per cent. They range in capacity of from 30 kw. to 200 kw., 60 cycles, two or three-phase, and voltages of 240, 480, 600, 1150 or 2300 volts.

They may be operated as single phase alternators by using two of the phases, and may then be rated at 65 per cent of the polyphase rating. They may be furnished with or without direct connected exciter.

The Form PB alternators may be used as synchronous motors, synchronous condensers, and for this duty they are equipped with squirrel cage winding in the pole faces, which does not interfere with their use as generators.

Western Electric A.C. Horizontal Water Wheel Driven Generators

3-phase, 60-cycle, Separately Excited

Type ATB and TRC Water Wheel Driven Alternator with Pedestal Bearing Mounted on Sub-base

These water driven alternators combine the highest electrical operating characteristics with a most rugged mechanical construction presenting effective guarantee of uninterrupted service and perfect safety at relatively high speeds. They have proven exceptionally satisfactory during their many years of actual service, and embody in their design and construction the most improved features, resulting in a low cost of operation and a minimum cost of maintenance.

Prices upon application.

**Western Electric Type ML Form 1 D.C.
Belt-driven Generators and Exciters**

Type ML Generator, 125 or 250 Volts

The line of small, belted, direct-current exciters described are known as Type ML. They are standardized in the smaller sizes, from 1 to 35 kw., both compound and shunt wound.

These machines are standard for 125 and 250 volts, two-wired, and, in the sizes above and including 7 kw., for 250 volts, three-wire.

When used as exciters they are flat compound wound at 125 volts; otherwise they are compounded from 115 volts no load to 125 volts full load unless a shunt wound machine is wanted.

The sizes up to and including 9 kw. are also standard, shunt wound for 35 volts, for low-voltage storage battery service.

Western Electric Engine-driven Generators

Type LD—Direct Current
Commutating Poles

Type LD D.C. Generator—2-wire

The Type LD and LDS engine type generators represent the highest development in generators designed primarily for central station and isolated plant equipment. All generators of this design are equipped with commutating poles which insure practically sparkless commutation over the entire range of operation. The general construction embodies simplicity and mechanical strength together with high efficiency and low operating temperatures.

	†200	125	12000	3100	1600	
			250	11800	3100	800

*DS-2 parts include base, shaft, two pedestals with bearings. Coupling is extra. Half coupling is not recommended.

Base supports generator magnet frame and both bearings only. It is not a common base for engine and generator. Base is not designed to be self-supporting. Foundations must be so constructed as to prevent deflection.

†These machines are designated as slow speed.

Generators driven by gas engines should be recommended on D.D.-0 basis, i.e., without base, shaft or bearings.

Prices upon application.

Electric Hoists

Single Drum Hoist on Wheels

The hoist equipment may be either single friction drum, double friction drum or three friction drum, and with boom swinging gear mounted in front; or a separate electric swinger may be used. The drums are provided with powerful foot-operated band brakes and in addition an automatic mechanical brake or an electrically operated Solonoid brake can be furnished.

The shafts and bearings are unusually large while the electrical parts are designed to carry heavy overloads with safety. The motor controller and resistance are all mounted on the hoist frame, making the hoist entirely self-contained and readily moved from place to place.

Built in hoisting capacities ranging from 500 to 44000 pounds on a single line with rope speeds varying from 50 to 1200 feet per minute. The motors are rated from 3 to 350 H.P.

Price and data upon application.

POWER SWITCHBOARDS

125 and 250-volt Two-wire, Direct Current Standard Unit
Central Station Switchboard

Whenever you are interested in the purchase of any type of switchboard, either for light or power, or both, let us submit figures on our product.

We feel that this catalogue will be in the hands of persons familiar with the electrical line generally and therefore that you are competent to make up a layout of practically any board you may wish a figure on.

With this in mind, we are soliciting your inquiries, asking that you give us detailed information when you submit your drawing, showing sizes of switches, etc.

*The intermittent rating in amperes is the current the battery will give discharging 4 hours resting 16 hours, discharging 8 hours resting 16 hours, discharging 8 hours resting 16 hours, and discharging 4 hours to 1.7 volts per cell. This ampere rate multiplied by 24 gives the intermittent ampere hours.

†Negative plates are 5/32-inch thick inside and 5/16-inch thick outside, except 70 and 125 ampere hour sizes which are 5/16-inch throughout.

Negative group has one more plate than positive.

8DC Power and Light Outfits

32-volt, Direct Connected Type

Typical Installation 8DC Outfit

This outfit consists of a direct connected generator and engine, together with a glass cell battery. It has many of the features listed under the larger 15-DC outfit. The battery rack does not form a part of the outfit as regularly supplied, but can be furnished if desired.

The 8-DC outfit is conservatively rated 750 watts, but actually develops more on battery charging run.

Specifications Engine

PRINCIPLE.—Single cylinder, vertical, 4 cycle type.

HORSEPOWER.—1 1/2 H. P.

FUEL.—Kerosene or gasoline.

GOVERNOR.—Special design. Centrifugal governor holds uniform speed under all loads.

IGNITION.—Jump spark ignition.

COOLING.—Air cooled. A special protected fan of high efficiency mounted on crankshaft between the engine and generator draws air over the cylinder of engine, keeping temperature of set within proper limits.

BORE AND STROKE.—2 3/4 by 4 inches.

SPEED.—Approximately 1250 R. P. M.

OILING.—A positive splash feed oiling system supplies the lubrication.

Generator

VOLTS AND WATTS, AMPERES.—Volts, 36. Watts, 750. Amperes, 21.

DESIGN.—Shunt wound with series winding for starting.

MOUNTING.—Built into the engine, armature mounted on crankshaft of engine.

Control Panel

STARTING.—Set starts electrically by pressing button.

STOPPING.—Set automatically stops when batteries are charged. Button provided to stop set manually when desired.

9DC Wall Switchboard

This switchboard contains an ammeter, line switch and fuses. It is an additional feature which will prove useful in installations where it is considered advisable to know the exact amount of current generated by the set or consumed by the line load. It is to be mounted near the set. When this switchboard is included in the equipment the set is known as the 9-DC outfit.

Batteries

NUMBER.—16 glass jar cells fully charged.

CAPACITY.—Intermittent rating, 125 ampere hours.

Approximate Dimensions

Overall width, 18 inches. Overall length, 28 inches. Overall height, including base, 29 inches.

Type and Size	Intermittent Battery Rating	Watt Hours	Approximate Shipping Weight Pounds
8DC-125	3750	Watt Hours	900
9DC-125	3750	" "	900

Prices upon application.

15DC Power and Light Outfits

15DC Power and Light Outfits

32-volt, Direct Connected Type

Typical Installation 15DC Outfit

These Power and Light Outfits are time and labor savers. They make it practical for anyone, no matter how remote from central service, to use electricity on farm or country estate or in villages and towns.

The 15DC outfit is one where the gas engine and electrical generator are built on the same shaft. That means steady electric power and electric light three hundred and sixty-five days of the year.

By simply pressing a button you can have electric power and electric light any time and anywhere you want it—electric power to run all the machines you now turn by hand, separator, churn, feed grinder, grindstone, etc. Electric power to do housework too, such as sweeping, washing, ironing, sewing and dishwashing. It will automatically pump the water to the house, barn, dairy, garage and garden. Running water where and when you want it saves countless steps and makes the conveniences of a modern bathroom possible. Electric light makes night work easy; enables you to use all your daylight hours for outdoor work. Eliminates the disagreeable task of filling and trimming kerosene lamps and lanterns. Electric lights are safe.

Electric light in hen houses increases egg production. Tests made by agricultural stations have proved this.

Power and Light takes the drudgery out of farm and country life, adds to their attractiveness and substitutes comfort for discomfort.

The 15DC outfit is economical. It runs on kerosene—very often less than was used to keep oil lamps burning. The kerosene is poured into a tank on the base of the outfit. The capacity of this tank is such that it does not need to be filled during charging period. Easy to operate. A slight pressure on the lever starts it; it stops itself when the battery is charged. It gives the tapering charge which makes the battery last longer.

Has a circulating splash system of lubrication. Simply pour oil into the crank case and the engine does the rest. Oil is sprayed up on the cylinder walls and conveyed by pipe to the main bearing. Runs in a steady stream over the crank pin bearing and keeps every moving part in a bath of oil.

32-volt, Direct Connected Type

Continued

Every part of the outfit is easy to get at. By taking off four nuts the crank case cover is easily removed, making easy access to every part.

The engine cannot get out of time as the timing gears come off with the crank case plate, and when that is put back, the question of timing is taken care of automatically.

The engine is air cooled and equipped with a throttle governor so that, irrespective of load carried, the speed is always the same.

The outfit is ruggedly built, durable and dependable. With it the user is always sure of plenty of power and plenty of light.

The outfit as supplied under this code number consists of a direct-connected generator and engine, together with a glass cell battery. The battery rack does not form a part of the outfit as regularly supplied, but can be furnished if desired.

Specifications
Engine

PRINCIPLE.—4 cycles.

FUEL.—Kerosene or gasoline.

FUEL CONSUMPTION APPROX.—1.6 gallons to charge WE G-125; 2 gallons to charge WE G-250.

GOVERNOR.—Special design of throttling governor insuring a uniform speed at all loads.

IGNITION.—Jump spark ignition.

COOLING.—Air-cooled. A fan mounted on flywheel draws air over the cylinder of engine, keeping temperature of set within proper limits.

BORE AND STROKE.—Cylinder bore 3½ inches; stroke 4½ inches.

SPEED.—Speed Engine and Generator, approximately 1000 r.p.m.

OILING.—A splash feed oiling system supplies the lubrication.

PULLEY.—A pulley 4 inches in diameter and 3 inches face is provided on the main shaft to drive auxiliary line shafting or other machinery.

Generator

VOLTS AND AMPERES.—Volts 35-42. Amperes maximum 40.

DESIGN.—Special design of generator to give batteries a "tapering charge."

MOUNTING.—Built up on crank shaft of engine.

Control Panel

STARTING.—Set starts on its own power by pressing starting switch.

STOPPING.—Special regulator provided for automatically stopping set when batteries are fully charged.

OVERCHARGE SWITCH.—Provision is made for occasional overcharging of batteries.

POWER SWITCH.—Provision is made for opening electrical circuits when set is operated for engine power only.

PROTECTION.—Fuses and line switch are provided.

Batteries

NUMBER.—16 glass jar cells fully charged.

CAPACITY.—Intermittent ratings: 125, 185, 250 ampere hours.

Power and Light Outfits

32-volt 15-DC Magneto Type Outfit

The 15-DC Magneto type outfit is designed and built to generate 32-volt current for a wide variety of applications, notable examples being schools, churches, road building work, dredges, traveling shows, service stations, pumping stations, pavilions, summer camps, signal battery charging stations, depots and for use in any place where utility, limited space and dependability are the real factors.

The special features of this outfit are: Unit construction, easily started and stopped, magneto equipped, runs on kerosene, special fueling system, exclusive oiling system, accessibility, air cooled, equipped with power pulley, constant speed, occupies small space and is easily transported.

Specifications
Engine

PRINCIPLE.—4 cycles.

FUEL.—Kerosene or gasoline.

FUEL CONSUMPTION.—The following quantity of kerosene will be required to charge the batteries when completely discharged:

Approximately 1.6 gallons for WE G-125

Approximately 2 gallons for WE G-250

GOVERNOR.—Special design of throttling governor insuring a uniform speed at all loads.

IGNITION.—Jump spark ignition.

COOLING.—Air cooled. A fan mounted on flywheel draws air over the cylinder of engine, keeping temperature of set within proper limits.

BORE AND STROKE.—Cylinder bore, 3½ inches.
Stroke, 4½ inches.

SPEED.—Speed engine and generator, approximately 1000 R. P. M.

OILING.—A splash feed oiling system supplies the lubrication.

PULLEY.—A pulley 4-inch diameter and 3-inch face is provided on the main shaft to drive auxiliary line shafting or other machinery.

Generator

VOLTS AND AMPERES.—Volts 35-42. Amperes, maximum 40.

DESIGN.—Special design to give batteries a "tapering charge."

MOUNTING.—Built into engine, armature mounted on main shaft of engine.

Magneto

The magneto is a Dixie High Tension.

Type	Approximate Shipping Weight Pounds	Price Each
15-DC Magneto	700

Edison Electric Portable Lighting Outfits

The Edison Electric Portable Lighting Outfit is especially adapted for underground work. This set is neatly and compactly installed in a small steel black enameled box. The equipment includes an Edison Storage Battery, consisting of 5 cells, Type B-2, completely assembled in a tray, fully charged, ready for immediate service, together with two properly guarded 12 C. P. lamps with reflectors and with 11 foot leads. One of these lamps can be used for twenty hours on one complete charge of the battery, constantly burning. Both of them will burn for 10 hours. Edison Storage Battery is universally used for manhole lighting service, because it can be allowed to stand idle indefinitely in any condition of charge or discharge without injury or without care or attention.

Height	Width	Length		
10⅜	7⅝	17⅝	40	\$100.00

Power and Light Hydrometers

To install the hydrometer select the cell which is most convenient and where the light is best. Remove the hard rubber vent plug from the cell and install the hydrometer. The soft rubber plug in the bottom of the glass barrel rests on the top of the wood separators. The soft rubber bushing on the outside of the glass barrel should fit loosely into the hole in the cover, in order to provide vent for the cell.

To operate the hydrometer place one finger over the small hole in the top of the soft rubber bulb. Then squeeze the bulb and, while still holding a finger over the hole in the bulb, gradually release the pressure on the bulb and as it expands the solution will be drawn up into the glass barrel.

With the hydrometer floating freely note the position of the solution on the stem. This indicates whether the battery is full, half empty or empty. Make this test each morning. Before the battery is entirely empty fill the fuel tank and give the battery a full charge.

Price, Hydrometers.....each \$1.25

Rockwood Paper Pulleys

A paper pulley overcomes in a large degree the annoyance and loss caused by a slipping belt. The lighter tension on the belt permits lighter shafting, hangers, etc., reduces consumption of oil and loss from hot bearings. Tighteners are not necessary.

Rockwood Pulleys are used extensively on dynamos, motors, etc. Prices on larger sizes furnished upon request.

Paul Self-priming Suction Pumps

A pump capable of drawing water through a suction pipe from a level below same without having any working parts extended into the water is called a suction pump. The height or vertical distance from the water level to the pump is the suction lift against which it works. The lift is theoretically limited by laws of nature and practically by resistance to the flow of water in the pump itself and in the piping, also by priming considerations. Suction pumps are not used under normal conditions on lifts over 20 to 24 feet, according to size, with moderate lengths of suction pipes installed air-tight.

On high lifts small pumps of conventional design cause much trouble by becoming unprimed due to air leaks and by being unable to reprime themselves even on moderate lifts. The Paul Pumps are self-priming and when started up dry they will also reprime themselves under ordinary conditions. For the same reason they will positively charge air into their air chamber and into pneumatic tanks if admitted into the suction side. These valuable features together with extreme simplicity and strength of design, automatic lubrication, absence of wear, accessibility and unusually high efficiency insure dependable service with the least amount of attention.

Paul Pumps are built in two types, according to size, each type in several capacities. All have the same characteristic general features. They are driven by pulleys. The pumps with motors are mounted on rigid cast iron bed plates supported on brackets and form complete, self-contained units.

Pumps driven by electric motors must always be wired through a properly fused hand-switch near the pump. This switch is used for starting and stopping the pump when hand control is desired.

In case of pneumatic tank systems automatic service is obtained by means of a pressure controller connected to the discharge side of the pump or to the tank. The controller automatically closes the circuit and starts the pump at the low pressure and stops the pump by opening the circuit at the high pressure for which it is set.

Type K Paul Self-priming Suction Pumps

Motor Driven

Capacities: 100-210 Gallons per Hour

SPECIFICATION.—Each complete unit listed below consists of a standard Paul Self-priming Suction Pump, Type K, mounted on a cast iron bed plate with electric motor, belt, idler, automatic controller wired to motor and connected to discharge pressure, air chambers, air charger, strainer and floor or wall-brackets, as ordered.

Water-direct-from-wall attachments, water relief valves, float switches, extra air chambers, unions and other accessories are described and listed on another page.

Paul Complete Water Systems

With Paul Type K Self-priming Suction Pumps

Capacities: 100-210 Gallons per Hour

SPECIFICATION.—Each complete Unit System listed below consists of a standard Paul Type K Self-priming Suction Pump mounted on a cast iron bed plate with electric motor, belt, idler, automatic pressure controller wired to motor and piped to discharge pressure, air chambers, air charger, strainer and floor brackets, bolted to a cast-iron sub-base, a pneumatic tank with water gauge and pressure gauge, mounted on the sub-base, piping between pump and tank with stop valve and water relief valve.

With Assembled Systems a complete set of fittings is furnished but no piping between pump and tank.

Water-direct-from-well attachments and other accessories are described and listed on another page. Any of these which can be applied

may be added or omitted in the specification to order.

Type US Paul Water Systems

Capacities 100 to 360 Gallons per Hour For Shallow Wells

The system may be placed directly upon a level cement floor or it may be raised above the floor upon a cement pier or other convenient sub-structure capable of supporting its weight and eliminating vibration. All that is needed in the way of installation is to connect the suction pipe to the pump and the discharge opening in the tank to the service pipe of the house.

There is one condition that requires a little additional attention of installation, and that is when the water level in the cistern or at the supply stands higher than the pump. The pump is then without a natural suction lift and has a negative suction head, which makes it impossible to charge air and sometimes causes knocking due to lack of air in the air chambers. To avoid such conditions, when installing, place a riser with a stop valve in the suction pipe, formed by a piece of piping, having an air cock at the highest point. By throttling the suction until the pump draws air when running the riser and the air chambers can be charged with air which will make the operation of the pump smooth and quiet for a considerable length of time. The stop valve is left in the throttled position and need not be touched when additional air is required, and the riser should extend to a point above the highest water level to prevent flooding in case the air cock is left open.

The Paul Type US Systems consist of a standard Paul Type K suction pump, a special heavy duty pump motor (all A.C. motors are of the repulsion induction type), extra heavy galvanized tank (galvanized inside and out), and a standard Paul Type F pressure controller.

Assembled complete with pressure gauge, water gauge, relief valve and all fittings between pump and tank.

Each system shipped completely assembled in one crate.

**Paul Complete Water Systems
With Paul Type J Deep Well Pumps**

Capacities: 120-160 Gallons per Hour

SPECIFICATION.—Each complete system listed below consists of a standard Paul Type J Cushion Stroke Deep Well Pump mounted on a cast iron bed plate with electric motors belt idler, automatic pressure controller wired to motor and connected to discharge chamber, air compressor piped to discharge chamber, floor brackets and a pneumatic tank with water gauge and pressure gauge, tapped for discharge pipe from pump and service pipe.

Well cylinders, pump rods, drop pipe, frost-proof attachments, water-direct-from-well attachments, "shifter carriage" mountings, float switches and other accessories are described and listed on another page. Any of these which can be applied may be added or omitted in the specification to order.

CR1003 Enclosed Heavy Duty Starting Rheostats

Under-voltage Protection—For Direct Current
For Series, Shunt or Compound-wound Motors

CR1003 rheostats are suitable for use with series, shunt or compound-wound direct current motors that do not require more than 150 per cent full load torque to start or longer than 30 seconds to attain full speed. They comply with E. P. C. Resistor Classification Nos. 34 and 35.

When ordering state Cat. No. of rheostat and horse power and voltage of motor.

CR1026 A.C. Enclosed Starting Rheostats

For Type SCR Repulsion Induction Motors

40, 50 and 60 Cycles, Single-phase

These starters may be used with motors that do not require more than 150 per cent torque to start or longer than 30 seconds to attain full speed. They comply with E.P.C. Resistor Classification No. 35. They are primarily for use with the single-phase repulsion-induction motors (Type SCR) where the inrush of current resulting from throwing the motor directly upon the line is objectionable. When these motors are started by being thrown directly upon the line they require from 250 to 300 per cent full-load current. While in many cases this starting current may not be objectionable, it is recommended that a starter be installed in every case with the 7 1/2 and 10 h.p. motors and with the smaller motors when it is desired to reduce the starting current.

Starters for use with motors up to and including 5 h.p. 110 volts and 7 1/2 h.p. 220 volts are provided with button contacts. Larger sizes have renewable segments.

The switch, base, and resistor comprise a self-contained unit which may be removed bodily from the enclosing case.

The retaining magnet coil is connected across the line.

Off, Start and Run markings on the cover correspond to the respective switch position.

Starters are operated by an external handle.

Conduit knockouts are provided in the top and bottom of the enclosing case near the back, permitting a straight run of conduit.

ORDERING DIRECTIONS.—State CR No. and Cat. No. of rheostat and horsepower, voltage and frequency of motor.

CR1028 A.C. Enclosed Starting Rheostats

For Slip-ring Induction Motors

Size No. 2

These rheostats are totally-enclosed in a case provided with convenient conduit knockouts, and are operated by a lever outside the case, thus conforming to safety regulations.

The starting arm is spring-retracted and is held in the running position by a latch, which can be tripped from outside.

The secondary circuit is not opened on the dial switch which, to avoid overheating the resistor must be operated to bring the motor up to speed as soon as the primary switch is closed.

Order by catalogue number when the complete motor rating including horse power, revolutions per minute and frame number with which the rheostat is to be used, corresponds to the motor rating listed opposite the catalogue number of the rheostat.

Orders or requests for quotations on rheostats differing from those listed above, should give the full name plate rating of the motor and the amperes secondary current per phase at full load, or the secondary volts per phase at standstill. The secondary volts per phase should be measured with full voltage on the primary, and with all secondary phases open-circuited.

These rheostats control the secondary circuit of the motor only. A primary switch is required in addition for the primary circuit. Push button stations are not required.

CR1034 A.C. Hand-starting Compensators

For 40-degree C. Squirrel Cage Induction Motors
With Undervoltage and Overload Protection

Form K1

Cover Removed Showing CR2824-TC-121 Relay Mounted

With Ammeter Attachment

The CR1034-K1 Compensator consists of an auto-transformer winding with taps, a switching device, an undervoltage protective device, and a 2-coil hand-reset temperature overload relay, all self-contained within a sheet metal case. A handle, on the outside of the case, is provided for operating the switch. All compensators are designed for wall mounting.

Multiple Rated Auto-transformer Coils

Used in the Size No. 1 Compensator only, making it possible to use one compensator for more than one size of motor for a given voltage. Therefore, in the Size No. 1, the temperature overload relay must be selected for the h.p., speed and voltage of the motor.

Switching Mechanism

Oil-immersed and has 3 definite positions: an off position, a starting position, and a running position. No. 6 oil is furnished for ordinary applications, but if the temperature is below 32 deg. F. (0 deg. C.) No. 21 oil is recommended.

Undervoltage Protection

Provided by a retaining magnet which holds the switch in the running-position. Upon failure of voltage, it releases the switch, which automatically returns to the off-position. The magnet is energized from full line potential for circuits of 600 volts or less.

Overload Protection

Provided by means of a temperature relay (CR2824-TC-121 for size No. 1 Compensators and CR2824-TC-221 for Sizes Nos. 2 and 3 Compensators), which upon an overload opens the undervoltage circuit.

Stop-reset Button

Each compensator has a double acting push-button in the front cover.

The stop feature—when the button is pressed, it opens the undervoltage release circuit, tripping the switch if it is in the running-position. The double acting mechanism of the push button also opens the contact and insures that the switch, if in the running-position, will be tripped upon starting to remove the front cover of the compensator.

Reset feature—designed so that in case the overload relay trips due to overload on the motor, by pressing the button the overload relay will be reset.

Ammeter Attachment

Consists of a dead-beat indicating ammeter mounted on a pressed steel box. Knockouts for conduit wiring are provided in the top, bottom and sides of the box, and in addition there are four 1/4-inch knockouts in the bottom of the box at the corners for bolting the attachment to the conduit wiring box of the compensator and 4 in the top at the corners that can be used for attaching a similar box containing other accessories such as a disconnecting switch.

Primary ammeters operating directly from the line are furnished for compensators of 600 volts and less.

Ordering Directions for Size No. 1 Compensator

1. Order CR1034-K1 compensator by Cat. No.
2. Order a CR2824-TC-121-A temperature overload relay by Cat. No. for horsepower, speed and voltage of motor.
3. Order ammeter attachment by Cat. No.
4. Order CR1923 disconnecting switch by Cat. No.
5. Order CR1019 or CR1924 motor circuit switch by Cat. No.
6. Order pipe supports by Cat. No.

CR1035 Type FP-110 Oil Circuit Breakers

Alternating Current

These switches are especially adapted for the protection of small induction motors which can be thrown directly on the line or can be used in connection with compensators, drum type switches or similar devices employed in starting alternating-current motors.

All live parts are enclosed. Frames, oil tanks and calibrating parts are practically dustproof. The frame is provided with a lug to take a padlock by which the switch may be locked in the open position.

Automatic switches trip free from the handle and cannot be held closed on overload or short circuit or left in an intermediate position. The handle follows the operation of contacts and the position of the contacts is indicated by On and Off stamped on the frame.

The frame is arranged for mounting on any flat surface or bracket and is held rigidly by 2 bolts.

The contact parts are insulated from ground and between phases by porcelain insulation, giving a high factor of safety, and are constructed as a unit so that they may be easily removed from or replaced in the frame. The contacts are double-break, opening by gravity, with speed augmented by springs. Contact fingers are so constructed that the burning occurs on a surface other than that used for contacting when the switch is in the closed position.

The mechanism is simple in construction and all parts are held by lock washers. Practically all of the parts are made from dies so that they are accurate and interchangeable.

The switch frame is arranged to take either open or conduit wiring at right-hand end.

All automatic switches equipped with inverse time relays have the time setting controlled by a needle valve. The time setting is easily adjusted to give the proper delay for motor starting without removing the dashpots from the calibrating tubes on which they are mounted.

The current setting recommended is 25 per cent above the normal (full-load) current of the motor for motors with 25 per cent overload guarantee and about 10 per cent above the normal (full-load) current of the motor for continuous rated motors. At this setting the time should be adjusted so that the switch will just fail to trip under starting conditions or in approximately 10 to 15 seconds under starting load. This will give a considerably longer time under ordinary overload conditions, but if the current-setting is correct, this time will allow the switch to trip out with the motor running single-phase before the motor will be injured by such operation.

Switches with under-voltage trip have mechanisms similar to the other automatic switches and trip free from the handle.

The under-voltage trip operates at approximately one-half rated voltage. Combinations are listed for 25, 40, 50 and 60 cycles at 110, 220, 440 and 550 volts.

The auto-transformers, where required, are mounted inside the switch, all wiring connections being enclosed.

All switches are triple or 4-pole, single-throw only. For single-phase use the triple-pole switch, leaving middle pole disconnected, using only one or both series trip coils as desired.

Quick break switches have knob handle.

Quick make and break switches have handle for shipper-rod connection. These are not adapted for operation by hand. Knob handles may, however, be substituted for shipper rod handles where required.

Table with 3 columns: *Cap. A up. of Series Coils, Cat. No., Price Each. Rows include 2602731G1 through 2602731G13.

Table with 3 columns: *Cap. A up. of Series Coils, Cat. No., Price Each. Rows include 2602732G1 through 2602732G13.

Table with 3 columns: *Cap. A up. of Series Coils, Cat. No., Price Each. Rows include 2602733G1 through 2602733G13.

*Series coils will carry 25 per cent overload for 2 hours at 45 degrees Centigrade rise or less. The calibration of series coils is from normal (as listed) to twice normal, i. e., 2 to 4, 3 to 6, 25 to 50, 50 to 100, etc.

†The automatic quick make and break switches have shipper-rud handles which are not adapted for hand operation. Knob handles will be furnished at the same price if specified on the order.

‡The under-voltage trip and transformer where required are mounted within the switch frame and when properly adjusted, the switch cannot be held closed unless there is full voltage on the circuit.

The under-voltage coil is reset by the action of the operating handle. The under-voltage coil should be connected across one phase of the load side (if possible) with proper transformer tap (where transformer is used) in circuit. No resistance is required.

*Cat. No. covers switch complete with receptacles for 2 thermal cutouts but does not include the cutouts which must be ordered as a separate item by Cat. No. from following table. †Price covers switch complete with 2 thermal cutouts.

‡Includes auto-transformer with taps tagged to indicate proper connection.

Thermal Cutouts

The thermal cutouts do not protect the branch circuit from short circuit and cannot be considered as taking the place of branch circuit fuses, which must be installed as specified in the Underwriters' Code.

Type CR1038 A. C. Starting Switches

For Small A. C. Motors

No. 256911 Switch

CR1038-A1-A2 or B2 Motor Starting Switches consist of a triple or 4-pole, single-throw, quick-make and break switch and two thermal cutouts mounted on a base, totally enclosed in a sheet steel case with operating handle projecting through the front of the case. Cat. No. 256911 and Cat. No. 258206 switches are for use with three-phase or two-phase three-wire motors, while Cat. No. 258205 switch is for use with two-phase four-wire motors. Overload protection is furnished by two inverse-time thermal cutouts. The cutouts are mounted by two metal strip

terminals, each slotted for a holding-down screw. By reason of the time lag in the heating coil, the momentary inrush starting current will not cause the thermal cutouts to open the circuit. The thermal cutouts protect the motor from such overloads as are ordinarily met with the service. Standard fuses must be used in series with the thermal cutouts.

Cast iron pedestals have been designed for use with the CR1038-A2 and -B2 switches where the thermal cutouts are mounted above the switch.

This design of the CR1038 switch is particularly applicable for pedestal mounting and where it is desired to have the service lines come in at the bottom of the switch.

Each switch is provided with a locking device.

Ordering Directions

Order CR1038 switch by Cat. No.; thermal cutouts by Cat. No.; and pedestal by Cat. No.

CR1042-A3 A.C. Enclosed Resistor Starters
For Squirrel Cage Induction Motors
 Under-voltage and Overload Protection
3-phase—60, 50, 40 and 25 Cycles

Designed to keep the inrush currents within the limits allowed by the N. E. L. A. rules. The voltage at the motor terminals at starting averages 82%, giving a starting torque of approximately 65% of that developed when thrown on the line. The resistor capacity is such as to carry 3 times normal full-load current for 15 seconds once every 4 minutes for an hour, without exceeding Electric Power Club temperature limits.

Have a single-step resistor, equal parts of which are connected in each phase. The switching elements are of the contactor finger type—strong and readily renewable.

Operated by throwing handle to starting position and holding it there until motor is under way. Releasing handle will cause the starter to automatically throw over to running side without disconnecting motor from line.

Safety type, completely enclosed in a ventilated case, externally operated.

*Price is for the starting rheostat complete with a CR2824-TC-121-A temperature overload relay. The relay may be omitted at \$7.00.

†The starter is furnished with punched terminals which are rated 30 amperes maximum by the Underwriters. Where the normal current of the motor exceeds 30 amperes, a set of punched tube terminals, Cat. No. 1774499, should be ordered at no increase in price.

The following table gives catalogue number and symbol of the temperature relays and range of the full-load currents of 40-degree motors with which each may be used:

Cat. No.	Relay Symbol	Normal Rating in Amperes	Full-load Current of Motor in Amperes
1746862G11	TC-121-A11	6.5	4.7-5.8
1746862G12	TC-121-A12	8.0	5.9-7.2
1746862G13	TC-121-A13	10.0	7.3-9.2

1746862G22	TC-121-A22	80.0	58.1-80.0

Ordering Directions

The price of the starter given above includes the relay but the Cat. No. covers the starter only.

1. Order a CR1042-A3 starter by Cat. No.
2. Order a CR2824-TC-121-A temperature overload relay by Cat. No.
3. Order a set of terminals Cat. No. 1774499 if normal motor current exceeds 30 amperes.

CR1263 and CR1264 A. C. Enclosed Speed Regulating Rheostats
For Types MT or MQ Slip-ring Induction Motors
 For Secondary Control Only, 60 Cycles, 3 or 2-phase
 110, 220, 440 and 550 Volts

CR1263 and CR1264 Enclosed Rheostats are for use in the secondary circuit of Types MT and MQ slip-ring induction motors to reduce the speed 50 per cent. As they are not connected with the primary circuit of the motor, it is necessary to also install an oil circuit breaker, magnetic switch or similar device to control the primary circuit. They are enclosed in a case provided with convenient knockouts, and are operated by a lever outside the case.

CR1263 Rheostats are intended for use with motors where the torque requirements are practically constant throughout the speed range. The rheostats for motors up to 3 h.p. inclusive provide 50 per cent speed reduction at approximately 50 per cent torque, but have capacity for full load torque. The rheostats listed for motors above 3 h.p. provide 50 per cent speed reduction at approximately full load torque. The resistors comply with E.P.C. Resistor Classification No. 95.

CR1264 Rheostats are intended for use with motors that drive fans or other machines where the amount of torque required decreases as the speed is reduced. They have sufficient resistance to provide for speed reductions up to 50 per cent at 33⅓ per cent full-load torque. The resistors comply with E.P.C. Resistor Classification No. 93.

Both types of rheostats can be used where the torque requirements are somewhat less than the values given above but the speed reduction will be correspondingly less. For example, at 50 per cent full-load torque, the maximum speed reduction that can be obtained with a CR1263 Rheostat is 25 per cent instead of 50 per cent.

A 3 or 4-pole knife switch must be installed to open and close the primary circuit.

For 60-cycle Motors

CR1920-A2 and B1 Inverse-time Protective Cutouts

For A. C. Motors

DR1920-A2

The enclosing cases, containing thermal cutouts, are suitable for use with motor-starting devices where it is desired to obtain inverse-time overload protection, for example, with CR3900 drum type switches.

The CR1920-B1 case has one 3/4-inch knockout in each end. The CR1920-A2 case has three 3/4-inch knockouts in each side and 2 in each end.

CR1920-A2

Fusible link, Cat. No. 167539 is the same for all cutouts.

CR2904-A1 Open-phase and Phase-reversal Relays

25 to 60 Cycles, 600 Volts or Less

For use with any motor-starting device that provides under-voltage release or under-voltage protection for a motor of 3 H.P. or larger.

A CR2904-A1 panel consists of an open-phase and phase-reversal relay mounted on an insulating base and enclosed in a sheet metal case with knockout holes on top, bottom, and sides, and with hasp and staple for locking the cover closed. Used in connection with the control of a polyphase motor to prevent the motor from starting when a phase of the power circuit is open or reversed, and to cause the motor to be disconnected from the line when a phase of the circuit opens when the motor is running. The relay does not open the motor circuit itself but opens the control circuit to the contactor or circuit breaker which handles the main motor circuit. This makes this panel suitable for use with any hand or automatic control device that provides under-voltage release or under-voltage protection.

CR2990 Thermostats

For A.C. or D.C. Circuits

Thermostat can be accurately adjusted for a wide variation in temperature.

Adjustment will not change from wear or vibration.

Wiping contacts are self-cleaning and do not affect adjustment.

The thermostat is ideal for installations where excessive vibration occurs, such as in railway service, etc. The small size (5 inches square) makes it inconspicuous and easily mounted.

Mechanism is of the quick-break type, supported on frictionless, long-wearing edges.

Will operate satisfactorily in damp places. Particularly suitable for refrigerator work.

All parts accessible and substantial.

Type CR2922-A1 Pressure Governors
For A. C. or D. C. Circuits

Type CR2922-A1 Pressure Governor

These governors are recommended for the automatic control of motor-driven pumps, air compressors, etc., and must always be used in connection with a suitable type of automatic starter. The relay is designed to handle the control circuit of any standard automatic starter and only 3 control wires are necessary for connecting the pressure governor to the starter. These governors can be used on any liquid or gas system that will not corrode the Bourdon tube.

To prevent fluctuations of pressure in the discharge pipe from affecting operation, the governor should be connected to the tank by an independent pipe and should not be connected to the discharge pipe from the pump. If this is not feasible, a small air tank of about 10-gallon capacity may be placed between the pressure governor and the discharge pipe. A needle valve may also be found necessary to further prevent fluctuations which affect the operation of the governor.

Shipping weight, 35 pounds.

*The stop post indicators on the governor may be brought close enough together to give this range between high and low pressures.

†The pound is the full pressure scale rating of the governor. Each governor has a maximum pressure adjustment as indicated in the table.

Ordering Directions

Order by CR number and by catalogue number.

Prices for governors for pressures above or below those listed and for other voltages and frequencies will be furnished on application.

Type CR2927 Pressure and Vacuum Switches

For A.C. or D.C. Circuit—Double-pole, Double-break

2 H.P., 110 or 220 Volts, D.C.; 3 H.P., 110 or 220 Volts, Single-phase, A.C.; 5 H.P., 110 or 220 Volts, 3 phase, A.C.; and 1 H.P., 550 Volts, A.C. or D.C.

Type CR2927 Pressure Switch

The Type CR2927 switches are suitable for use in the pilot circuit of any standard automatic starter A. C. or D. C., or directly in the motor circuit for throwing small motors across the line.

Switches having rubber diaphragms are designed for use on air compressors and water pumps. Those having metal diaphragms of phosphor bronze are for oil or steam, but can be used on air.

The switches consist essentially of a cast iron case, a phosphor bronze or rubber pressure diaphragm, an adjusting spring, and a switch mechanism.

The base of the case is a bowl-shaped casting which is covered by the pressure diaphragm and which forms the compression chamber. The 1/8-inch pipe tap in this chamber provides means for easy connection to a pressure line by means of a standard pipe or small hydraulic copper tubing. The casting can be rotated with the pipe tap through 180 degrees to make it more convenient for certain installations. The base is provided with feet, drilled for holding down screws. The pressure in the compression chamber is transmitted by the pressure diaphragm to a pressure plate against the adjusting spring and an adjusting screw. The movement of the pressure plate is transmitted to the switch mechanism by means of a switch arm, a tension spring, and a locking arm. The tension spring and locking arm provide quick make and quick break of the contacts.

Moving contacts for each pole of switch consist of 2 silver buttons fastened at opposite ends of a heavy copper bar. The 2 copper bars are fastened to opposite ends of an insulating cross bar. Loose rivets and coiled springs insure equal pressure on each of the 4 contact buttons.

The Form B switches have an unloader. The unloader is designed to reduce the pressure in the cylinder of the air compressor to atmosphere as soon as the pressure switch has opened the circuit of the driving motor. By doing this, the unloader reduces the starting torque required of the motor when the pressure switch again closes the circuit.

Forms D and K switches are equipped with a conduit box. The difference between the opening and closing values of a pressure switch is a fixed value and cannot be changed. The difference between the opening and closing values of a vacuum switch is adjustable through a wide range. The vacuum switch may be set to close at any value between 0 and 25 inches and can be set to open from 3 to 20 inches above the closing value provided that the opening value thus obtained is not above 28 inches.

CR2930 Open Type Float Switches

For A.C. or D.C. Circuits

CR2930 Open Type Float Switches together with the usual accessories, namely, float, chain, pulleys, and counterweight, are suitable for automatically starting and stopping motors where it is desired to maintain a predetermined water level on an open tank or reservoir system. They may also be used as sump switches by reversing the positions of the float and counterweight. The switch contacts are designed for handling pilot circuits for automatic starters or for controlling the main line circuits of small motors.

While these switches are suitable for many installations, the CR2931 switch is recommended for general use because it is entirely enclosed in a weatherproof case. The case is provided with an opening which can be drilled for conduit wiring.

CR2930 float switches may be used to throw motors up to the following capacities directly on the line. For larger motors use a magnetic switch or automatic starter in addition.

Circuit	H.P. of Motor	Volts	No. of Poles of Switch
A.C.	2	110-220	1 or 2

Accessories

Cat. No.	Description	Price Each
58973	1 Copper Cylindrical Float	\$11.00
	2 Pulleys	
	15 Feet Bronze Chain	
	1 Counterweight	

If more than 15 feet of chain are required add \$.15 for each additional foot.

Float switches are not recommended for use where the freezing of the water in the tank will interfere with their operation. In such cases a CR2922 Pressure Governor or a CR2927 Pressure Switch should be installed.

CR2931 Enclosed Float Switches

For A. C. or D. C. Motors
Forms A, B, C and D

Form D

These float switches have a continuous capacity of 30 amperes, either alternating or direct current up to 550 volts. They may be used for throwing motors up to the following capacities directly on the line.

Circuit	H. P. of Motor	Volts	No. of Poles of Switch
A. C.	2	110-220	2
Single-phase			
A. C.	3	440-550	2
A. C.			
2 or 3-phase	5	220-440-550	2 " 4
D. C.			
	1	115-230-550	2

These switches are weatherproof and are suitable for either tank or sump operation. Shipment is made with the parts assembled for tank operation. If sump operation is desired, the operating parts can be easily reassembled. All electrical parts are enclosed by a heavy cast-iron weatherproof enclosing case drilled and tapped at the top for 1 1/4-in. conduit. The lower half of the case is removable to facilitate inspection of the contacts and make connections. The moving contacts are operated by a weighted arm falling over center which gives them a quick motion when opening and closing and insures a minimum amount of arcing and burning.

Form A is for clamping to the inside top edge of a tank and is operated by a rod and float. Range, 10 inches to 2 feet.

Form B is for bolting to a tank cover and requires a guide in the cover for the operating rod. Range, 10 inches to 3 1/2 feet.

Form C is for bolting to a tank cover. Range, 10 inches to 3 1/2 feet.

Form D is for bolting to a tank cover and is operated by a chain and float, thus being suitable for any depth of tank or any variation in water level not less than 10 inches

Cat. No.	Form	No. of Poles	Ship. Wt., Lbs.	Price Each
141637	A	D-p.	70	\$28.00
141639	A	4-p.	75	32.00
141641	B	D-p.	75	32.00
141643	B	4-p.	85	36.00
141645	C	D-p.	75	34.00
141647	C	4-p.	85	38.00
*141649	D	D-p.	70	36.00
*141651	D	4-p.	75	40.00

Forms L and M

These switches are of lighter construction than the A, B, C and D forms. Used on control circuits and for throwing small motors up to the following capacities directly in the line.

Circuit	H. P. of Motor	Volts	No. of Poles of Switch
A. C.	1	110	2
Single-phase			
A. C.	1 1/2	220-440-550	2
2 or 3-phase			
A. C.	3	110	2
2 or 3-phase			
D. C.	1	115	2
D. C.			
	2	230-550	2

All electrical parts are enclosed in a weatherproof enclosing case which is drilled and tapped at the bottom for a 3/4-inch conduit. The moving contacts are actuated by a snap action mechanism which assures a quick break. A double break is provided for each pole. Switches may be used for either sump or tank operation by interchanging the positions of the float and weight.

Form L is operated by a chain and float. Suitable for any variation in water level not less than 2 inches.

Form M is rod-operated. Range 2 in. to 4 ft. 6 in.

Cat. No.	Form	No. of Poles	Ship. Wt., Lbs.	Price Each
*2666739	L	D-p.	25	\$20.00
2666740	M	D-p.	25	20.00

*Prices for Form D and Form L switches include 15 feet of bronze chain. Add 15 cents for each additional foot.

Ordering Directions

Order by CR Cat. No. and give the form letter and number of poles of the switch. Specify number of feet of chain required for Forms D and L switches.

CR2940 Push Button Stations

CR2940 Push Button Stations

The CR2940 Push-button Stations are primarily intended for use in the control circuits of automatic starters. They are designed to withstand the frequent operation and ordinary rough usage met with in the operation of machine tools and similar motor-driven machinery.

All stations except the CR2940-BS-79 and BS-207 are enclosed in a cast iron box drilled for conduit connection at the bottom. This box is furnished complete with a fitting that accommodates either 1/2 or 3/4-inch conduit. If it is desired to run conduit in at the top instead of at the bottom, the box may be installed with the conduit hole at the top instead of at the bottom. In such a case the name plates that indicate the functions of the buttons should be interchanged.

The CR-2940-BS-79 and BS-207 stations are enclosed in a pressed steel box with a pressed steel cover. This box is furnished with a fitting that accommodates either 1/2 or 3/4-inch conduit and is shipped for conduit connection at the top. If it is desired to make the connection at the bottom the push-button mechanism should be reversed in the box. In case of the CR-2940-BS-207 the cover should also be reversed to keep the locking bar with the stop-button. Each button is marked to indicate the functions it is to perform.

When ordering specify the type and form of station required as CR2940-BS-207J or give the type of the station as CR2940-BS-211 and specify how each button is to be marked. For the CR2940-BS-11N station give voltage of circuit if it is to be used for under-voltage protection or the amperes field current if it is to be used for field protection.

*The CR2940-BS-79 or BS-207 station can be used as a pendant switch when furnished with a pendant fitting, Cat. No. 197484, which can be obtained for \$2.00. The Cat. No. and price include a 15-foot 3-cord conductor. In ordering, mention the catalogue number in addition to the push button desired.

†Diameter.

CR3100 D.C. Drum Switches

For Series, Shunt or Compound-wound Motors Reversing or Non-reversing Armature Points Only, Resistors Not Included

R-122-A Drum Switch-cover Removed

CR3100 Switches provide full reverse rheostatic control for series, shunt, or compound-wound motors. When for use with shunt-wound motors, order should so state in order that proper wiring diagrams may be furnished. Some switches require a slight change in connections when for use with shunt-wound motors.

Switches when shipped are arranged for use with reversible motors. When desired for use with non-reversible motors, notation should be made on order. For starting duty use with CR3130 resistors. For speed regulating duty use with CR3131 resistors. For crane and hoist

duty use with CR3132 resistors.

Type R-307-A

Hole in bottom for leads. No leads furnished. Only for starting duty. Not recommended for crane, hoist, or regulating duty. Not suitable for use on 550-volt circuits.

HORSE POWER RATING						Points Approx.		Price Each
*CONTINUOUS			†INTERMITTENT			Forward	Ship.	
115 Volts	230 Volts	550 Volts	115 Volts	230 Volts	550 Volts	Reverse	Lbs.	
3	5	3	40	\$28.00

Type R-122-A

Hole in bottom for leads. No leads furnished. Does not open shunt field in off position. Should not be used with motors with intermittent shunt fields. With these motors use R-28 controller. Should not be used on circuits where the voltage exceeds 600 volts.

5	12	20	6	12	20	5	75	\$58.00
---	----	----	---	----	----	---	----	---------

Type R-28-V

Holes through side for leads. Use R-128-E for continuous duty.

...	15	30	60	5	125	\$90.00
-----	-----	-----	----	----	----	---	-----	---------

Type R-128-E

Holes through side for leads. Use R-28-V or R-164-A for intermittent duty.

15	25	50	5	135	\$105.00
----	----	----	-----	-----	-----	---	-----	----------

Type R-156-A

Holes through back for leads.

...	65	8	150	250
-----	-----	-----	-----	----	---	-----	-----	-------

Type R-164-A

Holes through back for leads.

20	35	75	25	50	100	8	250	\$160.00
----	----	----	----	----	-----	---	-----	----------

Type R-115-L

Holes through back for leads.

35	75	150	50	100	200	10	300	\$275.00
----	----	-----	----	-----	-----	----	-----	----------

*Continuous rating should be used in all cases when any point on drum switch will be used for any period exceeding 5 minutes. †Intermittent rating should be used for crane, hoist, or other applications when running time is not over 50 per cent of total and maximum continuous running time is not over 5 minutes. ‡Number of resistance steps is one less than number of drum switch points.

Drum Switches for Use with CR3137 Dynamic Braking Resistors or CR3170 Protective Panels

MAXIMUM H.P. CAPACITY	Points Forward and Reverse			Type	Approx. Ship. Wt. Lbs.	Price Each
	115 Volts	230 Volts	550 Volts			
3	5	R-307-A	40	\$28.00
5	10	15	4	R-187-A	75	90.00
5	10	15	4	R-122-P	75	68.00
15	25	35	4	R-128-T	135	120.00
20	35	65	7	R-164-J	200	195.00
35	75	..	10	R-115-M	300	360.00

Types R-307-A and R-122-P are for use with only CR3170 Protective Panels. Type R-187-A is for use with CR3137 dynamic braking resistors. Type R-115-M is not suitable for use on 550-volt circuits. §Number of resistance steps is one less than number of drum switch points.

CR3102 Type R-307 D.C. Drum Controllers

For Small Machine-tool and Similar Drives

The CR3102 equipment consists of an R-307 Drum Switch with starting resistor mounted on the back, the latter being protected by a separate enclosing cover.

This equipment is well suited for use with small machine tools and similar drives that require a small, compact and substantially made enclosed starting device.

Resistor

The resistor for the 5 h.p. 230-volt equipment is designed for 10-seconds starting duty; all other resistors are for 1-minute starting duty.

Connections

All connections between the resistor and drum switch are made before shipment. In installing the equipment all that is necessary is to pull the line and motor leads in through a hole in the bottom end of the frame and to connect them to terminals provided for the purpose.

Overload and Under-voltage Protection

When overload and under-voltage protection is desired, a CR3171 protective panel should be used.

Reversing—Includes Starting Resistor

*Cat. No.	H.P. of Motor	Points Forward and Reverse	Approx. Shipping Wt. Lbs.	Price Each	
115 Volts	230 Volts				
258344	258347	1	3	50	\$40.00

2042220	2042223	3	15	14.00
.....	†2042224	5	15	14.00

*Catalogue number and price include complete equipment consisting of R-307 controller with starting resistor on back.

†Resistor has capacity for 10-second starting duty only. For heavier duty use R-307 drum switch with CR3130 starting resistor.

‡Not suitable for 5 h.p., 115-volt motor. Use CR3100 drum switch and CR3130 resistor.

Type CR3105 D.C. Drum Switches

For Use with Adjustable Speed Motors for Machine Tools, etc.

Reversing or Non-reversing Armature and Field Points

CR3105 Drum Switch Complete with Armature and Field Resistors

CR3105 Drum Switches are provided with armature points for starting duty and field points for continuous duty and are particularly adapted for use with adjustable speed motors for machine tools, etc. The field resistor is controlled by fingers in the same manner as the armature resistor and not by a dial switch in the base of the drum switch.

Dynamic Braking

The standard CR3105 Drum Switches, with the exception of the R-301-B, can be used with CR3137 resistors for providing dynamic braking at the off position. The R-301-B can be used with 115 and 230-volt motors for dynamic braking but with 550-volt motors it is necessary to use a contactor with the dynamic braking resistor. This requires a slight change in the drum switch. The changed drum switch is known as the R-301-A, having the same price as the R-301-B, and is suitable for use with motors up to and including 15 h. p. on 550 volts.

Resistor

With motors up to and including 2 h. p. with the R-302 and 3 h. p. with the R-301 drum switches, both the armature and field resistors are mounted directly on the back of the drum switch while in the larger sizes the field resistor only is attached to the drum switch and the armature resistor is furnished as a separate unit.

Reversible Drum Switches

All CR3105 Drum Switches can be used with reversible or non-reversible motors as each is provided with a nickel-plated stop in the cap plate to prevent reversing. The stop should be removed when used with reversible motors. A name plate on the front explains this feature.

Under-voltage and Overload Protection

Any of the CR3105 Drum Switches can be used with the CR3170 panel to provide under-voltage and overload protection. When ordering these drum switches for use with the protective panel a statement should be made to this effect upon the requisition so that the correct wiring diagram can be supplied.

Connection Diagram

A diagram showing the connections of the drum switch and resistor will be found on the inside of the sheet iron enclosing cover.

Type	MAX. 115 Volts	H.P. 230 Volts	CAPACITY 550 Volts	*POINTS FORWARD AND REVERSE Armatures	Field	Approx. Ship. Wt. Lbs.	Price Each
†R-302-B	3	3	...	2	10	75	\$60.00
R-301-B	5	10	15	3	18	85	78.00
R-182-A	12	20	40	4	18	140	125.00
R-98-B	20	35	70	4	22	200	165.00
†R-166-A	35	65	100	4	22	400	250.00

*Number of resistance steps is one less than the number of drum switch points.

†No magnetic blowout; not for use on 550-volt circuits.

‡Special form of drum switch required for 550 volt circuit. Do not specify R-166-A, but order R-166 Drum Switch for use on 550 volt circuits.

**CR3130 D.C. Starting Duty Resistors
For Machine Tool Service**

These resistors are for use with direct-current constant or adjustable-speed motors. Those listed for constant speed motors should be used with the CR3100 and those for the adjustable speed motors should be used with the CR3105 drum type switches. Designed primarily for starting duty, but, while they cannot be used for regulating duty continuously, it is possible to use them in this manner for short periods. This will be found convenient, particularly in connection with machine tools

during the "setting up" period.

Resistor Units

For constant speed motors up to and including 2 h.p., 110 volts, 5 h. p. 220 volts and 10 h. p. 550 volts, wire-wound resistor units are used, while cast grid units are used with the other motors.

The resistors for adjustable-speed motors up to and including 2 h.p. with the R-302 drum switch and 3 h.p. with the R-301 drum switch consist of a ribbon unit assembled between sheets of mica attached to a cast iron plate, and are mounted on the back of the drum switch with the field resistor. The resistors for the 3 h.p., 115 and 230-volt motors with the R-302 drum switch, and the 5 h.p. 230-volt and 5, 7½ and 10 h.p. 550-volt motors with the R-301 drum switch are composed of wire-wound units, while the resistors for the remaining motors consist of cast grid units.

The wire-wound and cast grid units are rigidly supported by tie rods from cast-iron end frames. Perforated sheet iron covers enclose the front and back. All terminals are within the enclosing cover which is suitable for conduit wiring.

CR3131 D.C. Motor Regulating Duty Resistors

These resistors are for use with direct-current constant-speed motors in connection with drum switches CR3100 and are designed for continuous duty, giving 50 per cent speed reduction at ¾ full load and 65 per cent speed reduction at full load. Resistors for motors of 2 h. p. and less, 110 volts; 5 h.p. and less, 220 volts; and 10 h.p. and less, 550 volts, consist of Form R wire-wound units. Cast grid units are used for the larger resistors. The units are rigidly supported by tie rods attached to cast iron end frames. Sheet iron covers are placed over the back and front, the latter being perforated in order to insure good ventilation. All terminals are placed within the enclosing cover which is adapted for conduit wiring.

**CR3132 D.C. Intermittent Duty Resistors
For Crane and Hoist Service**

These resistors are for use with direct-current motors in connection with CR3100 Drum Type Switches.

These resistors for small motors consist of Form R wire-wound units assembled in a well ventilated box, while for the larger motors, Type SG cast grid units are used.

The cast grid units are assembled in one or more boxes and when more than one box is required, they may be bolted together to form the equivalent of a single unit. All boxes containing cast grid units have the same dimensions and all units have three supporting lugs equally spaced so that any unit will fit all boxes. Tie rods supporting cast grid units are insulated both from the units and from the end frames.

In order to secure proper ventilation, resistors using cast grid units should be mounted horizontally, that is, with the units on edge. When two or more boxes are bolted together the heating will be materially reduced if 6-inch spacers are used between the boxes. In no case should resistor sections be stacked more than six high, and at least 12 inches should be allowed between the stacks.

Prices upon application.

CR3202 A. C. Drum Switches

For Slip-ring Induction Motors

Reversing or Non-reversing, Primary and Secondary Control
3-phase

Types T-10-J and T-10-N

These drum switches are for use with slip-ring induction motors and, owing to the wide range of secondary currents for motors of the same horse power rating, it has been found advisable to list them by current capacity rather than by horse power capacity. Standard motors are listed with the proper drum switch, which has been selected after consideration has been given not only to the capacity of the drum switch, but also to the service. In no case should a drum switch of less capacity or fewer points be recommended, even if it appears permissible to do so from the secondary current and voltage of the motor with which the equipment will be used.

For starting duty use with CR3221 resistors.

For speed-regulating duty use with CR3223 resistors.

For crane and hoist duty use with CR3244 resistors.

The following drum switches open two legs of the circuit in the off-position, the third leg running direct to the motor. An additional switch should be installed which will entirely disconnect the motor from the line.

If it is desired to have the drum switch open all three legs of the motor at the off-position, a 2-phase drum switch should be used.

***Type T-133-R**

Has an auxiliary contact for use with a CR7006 primary switch or with a primary oil circuit breaker having a magnetic lock.

*Starts motor with single-phase secondary. Not recommended for motors above 75 h.p.

**Starts motor with 3-phase secondary.

†Price is for drum switch only.

CR3202 A.C. Drum Switches

For Slip-ring Induction Motors

Reversing or Non-reversing, Primary and Secondary Control
2-phase

Types T-79-D, T-79-H, and T-79-K

These drum switches are for use with slip-ring induction motors and, owing to the wide range of secondary currents for motors of the same horsepower rating, it has been found advisable to list them by current capacity rather than by horse power capacity.

Standard motors are listed with the proper drum switch, which has been selected after consideration has been given not only to the capacity of the drum switch but also to the service. In no case should a drum switch of less capacity or fewer points be recommended, even if it appears permissible to do so from the secondary current and voltage of the motor with which the equipment will be used.

For starting duty use with CR3221 resistors.

For speed-regulating duty use with CR3223 resistors.

For crane and hoist duty use with CR3244 resistors.

The following drum switches when used on a 2-phase, 4-wire circuit will open three legs of the circuit at the off-position, the fourth running direct to the motor, in which case an additional line switch is required to entirely disconnect the motor from the line. When used on a 3-phase or a 2-phase 3-wire circuit, they will open all three legs at the off-position.

***Type T-157-G**

Has an auxiliary contact for use with a CR7006 primary switch or with a primary oil circuit breaker having a magnetic lock.

*Starts motor with single-phase secondary. Not recommended for motors above 75 h. p.

**Starts motor with 3-phase secondary.

†Price is for drum switch only.

CR3204 A.C. Drum Switches

For Slip-ring Induction Motors Having 3-phase
Secondaries

Non-reversing, Secondary Control

Type No. 1501-A

The CR3204 drum switches are for use with slip-ring motors having 3-phase secondaries and provide secondary control only. The resistors used with them are connected to prevent the opening of the rotor circuit, and a separate primary switch must be used to stop and disconnect the motor from the circuit. They are provided with auxiliary contacts which permit of connections to either a CR7006 magnetic primary switch or an oil-immersed circuit breaker in the motor primary circuit to afford under-voltage protection on all but the first point of the switch, and overload protection.

When the drum switch is used with a CR7006 magnetic primary switch without a separate push-button station, the handle of the drum switch must always be turned to the first position to close the CR7006 primary switch. The handle of the drum switch must be turned to the off-position to open the primary switch and stop the motor.

When the drum switch is used with a CR7006 magnetic primary switch and a separate push-button station, the handle of the drum switch must be turned to the off-position so that the start-button of the push-button station may be operated to close the CR7006 primary switch.

CONDUIT BOX.—The CR3204-1500-A drum switch is suitable for wall mounting. In making the installation the conduit box should first be secured to the wall or support. The CR3204-1501-A and CR3204-1503-A drum switches are adapted for floor mounting.

SWITCHBOARD MOUNTING.—The CR3204 drum switches for switchboard use are arranged for mounting vertically with the switchboard and are furnished with a bevel-gear mechanism for operating from the front of the panel.

A primary switch is required with CR3204 drum switches as they provide secondary control only and have no open-circuit point.

For starting duty use with CR3221 resistors.

For machine service regulating duty use with CR3223 resistors.

For fan service regulating duty use with CR3224 resistors.

Order CR3204 drum switch by Type No.

Type No.	CURRENT PER PHASE		Max. Secondary Voltage	Points	Approx. Ship. Wt. Lbs.	Price Each
	*Starting Duty	†Starting or Regulating Duty				
1500-A	250	150	550	11	140	\$65.00
1501-A	600	300	550	13	200	110.00
1503-A	1000	500	1000	11	400	260.00

For Vertical Switchboard Mounting

1500-B	250	150	550	11	170	\$110.00
1501-B	600	300	550	13	250	180.00
1503-B	1000	500	1000	11	450	360.00

*Starting duty, if separate short-circuiting switch is used. This rating should be used only when the drum switch will be in circuit not longer than 5 minutes and then short circuited by a separate device, such as a CR7002 magnetic switch or its equivalent. The CR3204 drum switches are furnished with an additional auxiliary contact on the last point which will provide an interlocking means between the drum switch and a magnetically operated short-circuiting switch.

†Starting or regulating duty, when no separate short-circuiting switch is used. This rating should be used in all cases where any point on the controller will be used as a running point.

‡Price includes conduit box which may be omitted at \$3.00.

A.C. Heavy Duty Starting Resistors

Types CR3221, CR3223 and CR3224

For Slip-ring Induction Motors

Constant Torque, 60 Cycles, 2 or 3-phase

These resistors consist of Type IG grid units assembled in one or more boxes, and are for use with standard slip-ring induction motors having 3-phase rotors.

CR3221 Resistors are designed for starting duty only, and should not be used on applications where the drum switch may be left on an intermediate point. They comply with the E. P. C. Resistor Classification Nos. 34 and 35.

CR3223 Resistors are designed for speed-regulating machine service, i.e., where the torque is practically constant throughout the speed range. They will provide a speed variation of approximately 50 per cent, under torque conditions corresponding to the horse power guarantees at 50 per cent normal speed of the motors with which they are listed. They comply with the E. P. C. Resistor Classification No. 94.

CR3224 Resistors are similar to CR3223; but are designed for fan service, i.e., where the torque increases with the speed of the motor. They provide approximately 50 per cent speed reduction at 40 per cent torque, and should be used with ventilating fans, centrifugal pumps, ice cream freezers, and similar machines. They comply with the E. P. C. Resistor Classification No. 93.

CR3244 A.C. Intermittent Duty Resistors

For MTC or MQC Motors for Crane Service

60, 50 and 25 Cycles, 3 and 2-phase

These resistors are for use with Types MTC or MQC slip-ring motors for crane duty and comply with E. P. C. Resistor Classification No. 52. They are not recommended for use with motors where the service differs greatly from that usually experienced in crane work.

Prices on similar resistors for use with motors of other manufacture will be furnished upon application. All requests for prices should include the secondary data of the motors.

These resistors have a permanent block of resistance which gives better regulation during acceleration and prevents the motor from stalling as it enables the motor to exert its maximum starting-torque regardless of how rapidly the operator throws the controller handle to the full running position.

All resistors consist of Type SG cast grid resistor units assembled in one or more boxes. In case the resistor consists of more than one box, the boxes can be bolted together, if desired, to form a single unit. All resistor grids have three supporting lugs equally spaced, requiring the use of only one size of end frame. The tie-rods supporting the units are insulated both from the units and from the end frames. All boxes have the same over all dimensions.

Prices upon application.

CR3900 Drum Type Switches

For Small A.C. and D.C. Motors

Reversing or Non-reversing—Not for Elevator Service

Switch with Standard T Handle

These switches are recommended for throwing small direct and alternating current motors directly across the line.

The RD-80 switches have cast iron boxes with dust tight covers and the holes in the side of the frame through which the leads pass are fitted with rubber bushings.

The RD-417, RD-418, RD-419, RD-420, RD-421 and RD-422 switches have a cast iron frame with sheet metal cap-plate and cover. Two holes are provided in the bottom of the frame for the leads.

*These switches have a continuous capacity of 30 amperes but can not be used with motors where the starting current exceeds 45 amperes. When used for throwing small two or three-phase induction motors directly on the line, their use should be limited to the following sizes: 1½ h.p., 110 volts; 3 h.p., 220 volts; 5 h.p., 440 volts, and 7½ h.p., 550 volts.

†This switch is equipped with a spring return attachment which automatically brings the handle to the off-position when it is released.

The pawl and pawl spring are omitted and the switches should be used only where the shipper rod is provided with a spring or other centering device for insuring the handle being thrown to the full running or to the off-position. The handle for shipper-rod operation of the RD-419 may be assembled in the dotted position for counter-clockwise rotation of the cylinder.

In ordering, specify type and form of switch desired.

CR4002 D. C. Magnetic Switches

The CR4002 magnetic switches consist of a contactor or contactors mounted on a slate base, with feet for wall mounting, with or without a sheet metal enclosing case. Used extensively with accessory switches, such as float switches, pressure governors, push buttons, etc., to control small motors which can be thrown directly on the line. Also used where it is desired to control, from a distance, circuits carrying large currents and where it would be too expensive to run the main leads to the remote points. The control wires need be only large enough to furnish the requisite mechanical strength and maintain not less than 80 per cent normal voltage at the contactor coils.

The Form A2 requires two control wires between the contactor and the remote control point. A single-pole knife switch, or similar switch, may be used to close the contactor circuit, and the contactor will remain closed until the knife switch is opened, or until voltage fails or becomes low. If voltage fails the contactor will open and remain open until normal voltage is restored, when the contactor will close. This gives under-voltage release.

The Form B2 is similar to the Form A2, with the exception that an interlock is added to the contactor. Three control wires are required between the remote control point and the contactor. A two-button push-button station of the momentary contact type, instead of the knife switch, is used to control the contactor; one button to open and one to close the contactor. In case the voltage becomes low or fails, the contactor will drop out and upon return of normal voltage will not close until the closing push-button is pressed. This gives under-voltage protection.

Forms C2 and D2 are Forms A2 and B2, respectively, enclosed in sheet metal cases which have hinged doors and hasps for padlocking. The connections are made to terminals on the fronts of the panels. The enclosing cases are arranged for conduit connections.

Ordering Directions

State ampere capacity and voltage.

Order by Cat. No. when the voltage to be supplied at the terminals of the operating coil will never be lower than 20 per cent below or higher than 10 per cent above the voltage corresponding to the catalogue number. A 115-volt switch will operate on any voltage from 92 to 126.5; a 230-volt switch on any voltage from 174 to 253; and a 550-volt switch on any voltage from 440 to 605.

When the voltage to be supplied will not fall within any of the above limits order a switch similar to the nearest catalogue number and specify the operating voltage. The operating voltage mentioned must be such that any actual voltage supplied will never be lower than 20 per cent below it or higher than 10 per cent above it.

One of the following accessories or its equivalent should be ordered in addition to the switch:

FOR CR4002 FORMS A2 OR C2: HAND CONTROL.—Single-pole knife or snap switch.

AUTOMATIC CONTROL.—CR2930 or CR2931 float switch for open tank system. CR2922 pressure governor for pressure system. CR2925 or CR2927 pressure switch for pressure system.

FOR CR4002 FORMS B2 OR D2: HAND CONTROL.—CR 2940-B5-207 or CR2940-B5-212A momentary contact "Start" and "Stop" push-button station.

CR4002 D.C. Magnetic Switches

With and Without Enclosing Case

For Remote Control by Knife Switch, Float Switch, Pressure Governor, Thermostat, Etc.

†Price does not include an accessory. See ordering directions.

**CR4031-A5 and CR4031-A6 D.C. Series
Contactor Type Automatic Starters**

Speed D. C. Motors
Under-voltage Release

CR4031-A5

CR4031-A6

These starters may be used with series, shunt, or compound wound motors which when fully loaded do not require more than 150 per cent full load torque to start or longer than 30 seconds to attain full speed. The resistors comply with E. P. C. Resistor Classification No. 16.

CR4031-A5 Automatic Starters

CR4031-A5 automatic starters are of the enclosed type. They are suitable for applications where automatic acceleration is desired after the closing of a line at some remote point.

CR4031-A6 Automatic Starters

CR4031-A6 starters are immersed in oil. For use in mines and similar places. Oil tank can be easily removed. A sufficient quantity of oil is furnished with each starter.

Ordering Directions

Order by Cat. No.; if not given, state type of panel wanted and complete rating of motor with which it is to be used.

CR7002 A.C. Magnetic Switches

Contactor

Open Type Switch

Enclosed Type Switch

The CR7002 Magnetic Switches consist of a contactor mounted on a slate base, with feet for wall mounting, with or without sheet metal enclosing case. (The CR2810-1265 contactor, which is self-contained, is also furnished unmounted and without enclosing case.) The switches are used extensively where it is desired to control from a distance, circuits carrying large currents and where it would be too expensive to run the main leads to the remote points. The control wires need be only large enough to furnish the requisite mechanical strength and maintain not less than 80 per cent normal voltage at the contactor panel.

They are also suitable for controlling small A. C. motors that may be thrown directly across the line, provided over-load protection is not required.

The Form A2 switch requires two control wires between it and the remote control point. A single-pole knife switch or similar switch, may be used to close the contactor circuit, and the contactor will remain closed until the knife switch is opened, or until voltage fails or becomes low. If voltage fails, the contactor will then open and remain open until normal voltage is restored, when the contactor will close. This gives under-voltage release.

The Form B2 switch is similar to the Form A2, with the exception that an interlock is added to the contactor. Three control wires are required between the remote control point and the contactor type instead of the knife is used to control the contactor, one button to open and one to close the contactor. In case the voltage becomes low or fails, the contactor will open and upon return of normal voltage will not close until the closing push-button is pressed. This gives under-voltage protection.

The connections of both Forms A2 and B2 are made to the back of the panel as there is ample room between the panel and the wall for making them.

Forms C2 and D2 are Forms A2 and B2 respectively, enclosed in sheet metal cases with hinged doors and hasp for padlocking. The connections are made to terminals on the fronts of the panels. The enclosing cases are arranged for conduit connections.

The CR2810-1265 contactor is single-pole only, with double break in series. Where a double-pole switch is needed, two of these contactors are used with the coils connected in multiple. The contactor is furnished either mounted or unmounted for it is self-contained and can be mounted on an insulated or non-insulated base by means of bolts. This device is suitable for applications requiring a small compact contactor or relay for handling small currents.

Furnished to operate directly across the line without the use of any other series resistance for the coils. Designed so that all parts are open for inspection, and those parts subject to wear can be easily, cheaply and quickly renewed.

Directions for Ordering

FOR 60-CYCLE CIRCUITS OF STANDARD VOLTAGES.—Order by Cat. No. and, as a check, specify the complete CR number, ampere capacity, voltage, frequency and number of poles. If an accessory is required, order it as separate item.

FOR OTHER FREQUENCIES AND SPECIAL VOLTAGES.—Omit the Cat. No.

CR7005-A4 A. C. Enclosed Magnetic Switches

CR7005-A4 A. C. Enclosed Magnetic Switches

For 3 or 2-phase Motors up to 3 H. P., 110 Volts; 5 H. P., 220, 440, 550 and 600 Volts

Under-voltage Protection or Under-voltage Release
Inverse-time Overload Protection

Prices include CR2940-BS79J push button station, two thermal cutouts, 12 extra links. Approximate shipping weight, 30 pounds.

Closed

Open

The CR7005-A4 Enclosed Magnetic Switches are suitable for throwing small A. C. motors up to 3 h. p., 110 volts; and 5 h. p., 220, 440, 550 and 600 volts, directly on the line. They consist of a 3-pole contactor or magnetically operated switch and a thermal cutout receptacle for 2 thermal cutouts mounted in a sheet steel enclosing case. Incoming leads are easily connected to the stationary contacts which are thoroughly insulated by means of moulded material of which the base is composed. Outgoing leads are connected directly to the porcelain base of the thermal cutouts.

Enclosing Case

The enclosing case is furnished with a hinged cover which may be locked shut if desired. The enclosing case is provided with ten 3/4-inch knockout holes; 3 at the top, 3 at the bottom, and 2 at each side. Knockout holes are also provided in the top for mounting adapter, Cat. No. 2040400, which is required with the CR1923-A1 disconnecting switch.

Thermal Cutouts

Particular care should be used to select thermal cutouts of the correct size.

In case of an overload, the links of the cutouts will open the motor circuit, but the line contactor will not open automatically. The door of the enclosing case cannot be opened until the contactor is opened, because of an interlock between them. A conspicuous name plate on the cover calls attention to the fact that the cover cannot be lifted until the magnetic switch is de-energized by pressing the stop-button. This insures the cutouts and their receptacles being dead before the operator can replace blown fuse links.

Under-voltage Protection or Under-voltage Release

The switch is ordinarily operated by means of a CR2940-BS79J "Start" and "Stop" push-button station. This station is of the momentary contact type and an extra pole is provided on the magnetic contactor to provide an electrical interlock for the holding circuit. If such a push-button station is used and the voltage fails, the contactor will open and will not close automatically on return of voltage, but the Start button must be pressed to restart the motor. This scheme of connections provides Under-voltage Protection. If desired, the switch may be controlled from a number of places simply by installing a suitable number of CR2940-BS79J Push-button Stations.

The switch may also be operated by any master switch of the single-pole single-throw type, as for example, a CR2940-BS30A Push-button Station, a CR2922 Pressure Governor, or a CR2930 or CR2931 Float Switch. In wiring up such switches the connections to the interlock on the contactor should be omitted. The equipment will then provide Under-voltage Release for, when voltage returns, if the master switch is closed, the contactor will close and start the motor automatically. Before deciding to use this scheme care should be taken to be sure that Under-voltage Release, not Under-voltage protection is required.

Ordering Directions

The Cat. No. of the switch does not include the push-button station or the two thermal cutouts. They must be ordered as separate items.

Order a switch by Cat. No.

Order a push-button or master switch by complete rating.

Order two thermal cutouts for each switch by Cat. No.

CR7006 Enclosed Magnetic Switches

For Alternating Current Motors

CR7006-D4

The CR7006 Enclosed Magnetic Switch consists of a three- or four-pole contactor and a two-coil hand-reset temperature overload relay enclosed in a sheet metal case.

With the exception of the contactor, parts of the CR7006-D4, D5 and D7 are similar. The contactor for the CR7006-D4 switch is provided with barriers between the poles. The contactor for the CR7006-D5 is provided with magnetic blowouts. The CR7006-D7 is identical with the CR7006-D5 except that the enclosing case is larger and ventilated to provide more heat radiation and thus give it a higher rating.

The three-pole forms are recommended for three-phase and two-phase three-wire motors and open all lines to the motor. The three-pole switch may be used with two-phase four-wire

motors provided it is permissible to leave one line of the circuit permanently connected to the motor. The four-pole switch should be used for two-phase four-wire motors when all lines must be opened. The CR7006-D5 or -D7 switch cannot be furnished four-pole.

Overload Protection

Overload protection is provided by means of a temperature relay, which upon an overload opens the contactor. This relay has two heating elements, one connected in each of two phases, so that it provides full overload protection for single, two, or three-phase motors.

After the relay trips, the contacts must be reset by hand and a resetting device operated from the outside of the case is provided for the purpose. Provision is made for attaching a cord to the resetting device for convenience in resetting the relay when the switch is mounted above the reach of the operator.

Under-voltage Protection or Under-voltage Release

The switch is ordinarily operated by means of a CR2940-BS79J "start" and "stop" push-button station. This station is of the momentary contact type and an extra pole is provided on the magnetic contactor to provide an electrical interlock for the holding circuit. If such a push-button station is used and the voltage fails, the contactor will open and will not close automatically on return of voltage, but the "start" button must be pressed to restart the motor. This scheme of connections provides "under-voltage protection." If desired, the switch may be controlled from a number of places simply by installing a suitable number of CR2940-BS79J push-button stations.

The CR7006 switch may also be operated by means of any master switch of the single-pole single-throw type, as for example, by means of a CR2940-BS30A push-button station, a CR2922 pressure governor, a CR2925 or CR2927 pressure switch, a CR2930 or CR2931 float switch, etc. In wiring up switches of this type the connections to the interlock on the contactor should be omitted. The equipment will provide "under-voltage release."

Enclosing Case

The enclosing case is provided with a hinged cover which may be locked shut if desired. It is provided with ten 3/4-inch knockout holes; three at the top, three at the bottom, and two at each side.

Ordering Directions

The price of the switch includes switch, overload relay, and push-button station; but the Cat. No. refers to switch. Order a switch by Cat. No.
 Order a temperature overload relay by Cat. No.
 Order a push-button or equivalent accessory.
 Order a cover interlock Cat. No. 1773107, if desired.
 Order a set of terminals Cat. No. 1774499, if the normal motor current is over 30 amperes.

CR7006-D9 Enclosed Magnetic Switches

For Alternating Current Motors

The CR7006-D9 magnetic switch consists of a 3-pole contactor and a 2-coil hand-reset temperature overload relay. It may be used for throwing squirrel-cage motors directly on the line if permitted by the power company. The switch has a more general application as a primary switch in connection with a slip-ring motor, the secondary of which is handled by a drum switch.

primary switch in connection with a slip-ring motor, the secondary of which is handled by a drum switch.

Overload Protection

Overload protection is provided by a CR2824-TC221 temperature overload relay which is made up of 2 units, one connected in each of 2 phases, so that full protection is provided for 2 or 3-phase motors. Each unit consists of a heating coil surrounded by a brass frame, a V-shaped strip of thermostatic metal rigidly fastened at one end to the brass frame and a contact mechanism normally held closed mechanically by the thermostatic strip but opened when the strip is heated above a certain temperature. The heating coil and the thermostatic strip, the latter bridged by a shunt, are connected in series in a line of the motor circuit.

Heating in the thermostatic strip occurs because of the current flowing through it and also because of the heat which is conducted through the brass frame from the heating coil. For small overloads, the heating coil raises the temperature of the thermostatic strip slowly due to the large volume of the brass frame which absorbs the heat.

With normal current in the thermostatic strip, the heat produced is not sufficient to raise its temperature greatly, but since the heating is proportional to the square of the current flowing through it, the heat produced with 3 or more times normal current is sufficient to cause the relay to trip quickly. Thus the metal frame around the heating coil may represent the iron of the motor and the thermostatic strip may represent the copper of the motor.

For small overloads of long duration the metal frame provides the correct thermal capacity and delays the tripping of the relay, while for large overloads, the heating of the thermostatic strip is accomplished immediately and the relay quickly trips.

The relay is provided with means for adjusting the tripping value over a range of from 80 to 120 per cent of its normal rating. The relay must be reset by hand from inside the switch enclosing case. After the relay has tripped it cannot be reset for about 30 seconds, or until the relay and motor have had an opportunity to cool.

Under-voltage Protection or Under-voltage Release

The switch is ordinarily operated by means of a CR2940-BS212A start-and-stop push-button station. This station is of the momentary contact type and an extra pole is provided on the magnetic contactor to provide an electrical interlock for the holding circuit. If such a push-button station is used and the voltage fails, the contactor will open and will not close automatically on return of voltage, but the start button must be pressed to restart the motor. This scheme of connections provides under-voltage-protection. If desired, the switch may be controlled from a number of places simply by installing a suitable number of CR2940-BS212A push-button stations.

When this switch is used to handle the primary circuit of a slip-ring motor in connection with any of the listed CR3204 secondary drum switches a start-and-stop push button is not required, as provision is made in the switch for closing the contactor coil circuit as the switch handle is turned to the first point, and to open it in returning the handle to the off-position. This combination of CR7006 magnetic switch and secondary drum switch provides under-voltage protection.

CR7006-D9 Enclosed Magnetic Switches

For Alternating Current Motors

Continued

The CR7006 switch may also be operated by means of any master switch of the single-pole single-throw type, as for example, by means of a knife switch, a CR2922 pressure governor, a CR2927 pressure switch, a CR2930 or CR2931 float switch, etc. In wiring up switches of this type connections to the interlock on contactor should be omitted. Equipment will provide under-voltage release.

Enclosing Case

The enclosing case is provided with a hinged cover which may be locked shut if desired. Two 2-inch and one 3/4-inch knockouts, for conduit connections, are provided in both the top and bottom of the enclosing case.

Ordering Directions

The price of the switch given above includes the switch, temperature overload relay, and push-button station; but the catalogue number refers to the switch only.

1. Order a CR7006-D9 switch by catalogue number.
2. Order a CR2824-TC221 temperature overload relay by catalogue number.
3. Order a CR2940-BS212A start-and-stop push-button station or equivalent accessory if desired.

CR7009 A. C. Enclosed Magnetic Reversing Switches

Overload Protection by Hand-reset Temperature Overload Relays

Under-voltage Protection or Under-voltage Release Depending Upon Accessory Used

CR7009-B5

For Reversing Single-phase, Two-phase or Three-phase Motors When Thrown Directly on the Line or When Used with Non-reversing Automatic Starters

The CR7009 switch consists of two three-pole mechanically interlocked contactors mounted back to back on a compound base, enclosed in a sheet metal case. The contact details of the contactors of the CR7009-B5 switch are the same as those of the CR7006-D4 magnetic switch and those of the CR7009-B6, the same as those of the CR7006-D5 magnetic switch.

The CR7009-B5 switch is suitable, as furnished, for use with single-phase, two-phase, three-wire, or three-phase motors. When used with a two-phase four-wire motor, the reversing connections must be changed by the customer to agree with the diagram furnished. This change can very easily be accomplished.

Since this is a three-pole switch, one of the lines must run directly to the motor. It may also be used to control small direct-current motors (14-ft.-lb. torque or less) where the period of operation does not exceed 30 seconds and where the motor is not operated more than once in the same direction every five minutes.

The CR7009-B6 switch is made up in two forms, one for three-phase or two-phase three-wire, the other for two-phase four-wire. This switch is also suitable for controlling direct current motors on intermittent duty within the time limitations as given above for CR7009-B5. The contactors, being equipped with blowouts, can be used with motors having a full load current of 75 amperes or less.

Overload Protection

These switches provide overload protection by means of a CR2824-TC121A temperature overload relay which has two heating elements, one connected in each of two phases, so that it provides full overload protection for single-phase, two-phase or three-phase motors. The relay is provided with calibrating arms for adjusting the tripping value over a range from 80 to 120 per cent of its normal rating. A resetting device operated from the outside of the case is provided for the purpose of resetting the contacts.

Under-voltage Protection or Under-voltage Release

The CR7009 switch is ordinarily operated from one or more CR2940-BS13 push-button stations, the combination providing under-voltage protection. It may also be operated by means of a single-pole, double-throw master switch, in which case the connections to the interlock are omitted and under-voltage release is provided.

The top of the enclosing case is provided with small knockout holes for fastening the adapter (Cat. No. 1775956) which is necessary when a CR1923-A1 disconnecting switch is used. The CR1923-A1 switch provides a convenient means for disconnecting the CR7009 switch and motor from the line for purposes of inspection and repairs.

Enclosing Case

The enclosing case is fitted with feet for wall-mounting, so arranged that the base, on which the contactors are mounted is perpendicular to the wall. Knockout holes for conduit fittings are provided at the top of the case close to the edge nearest the wall. Hinged door over each contactor.

Ordering Directions

The price of the switch includes switch complete with a CR2824-TC121A overload relay. Cat. No. refers to switch.

Order a CR7009 switch by Cat. No.

Order a CR2824-TC121A relay by Cat. No.

Order a CR2940-BS13 push-button station, or equivalent master switch.

Order, if desired, a CR1923-A1 disconnecting switch by Cat. No. with an adapter, Cat. No. 1775956.

*Price includes switch complete with a CR2824-TC121A overload relay; Cat. No. covers the switch only. A suitable relay should also be ordered by Cat. No. from the table under Accessories.

**May be used for throwing small direct-current motors on the line on applications where either contactor coil will not be energized more than once every five minutes, no longer than 30 seconds at a time.

Accessories

TEMPERATURE RELAY.—May be omitted at \$7.00.

PUSH-BUTTON STATION.—A CR2940-BS13 three-button station should be included at a net price of \$7.00.

MASTER SWITCH.—A single point, forward and reverse, master switch may be used in preference to a push-button station.

DISCONNECTING SWITCHES.—A Cat. No. 2040256 switch, at a price of \$14.00, is recommended for use with these reversing switches. If used, an adapter, Cat. No. 1775956, at 50 cents, is necessary for mounting the disconnecting switch on the enclosing case of CR7009.

CR7051 Automatic Starting Compensators
For Squirrel-cage Induction Motors
 Definite-time Acceleration—Overload Protection
 220, 440 and 550 Volts

No. CR7051-J1
(Side View)

No. CR7051-J1
Cover Removed

The CR7051 Automatic Starting Compensators are suitable for starting squirrel-cage induction motors that do not require longer than 15 seconds to attain full speed, once every 4 minutes for an hour.

Consists chiefly of an auto-transformer for supplying reduced voltage to the motor for acceleration, a contactor for connecting the auto-transformer to its low-voltage taps during acceleration, a contactor for connecting the motor to the line, a temperature overload relay and a definite-time relay which causes the accelerating contactor to open and the line contactor to close at a pre-determined time.

The auto-transformer has 2 coils for 2-phase motors and 3 coils for 3-phase motors, which gives balanced starting currents and the maximum starting torque per ampere line current. For motors up to 18 h.p., 3 sets of starting taps are provided which furnish 50, 65 or 80 per cent line voltage with respective line currents of 25, 42 or 65 per cent of the current which would be required if no compensator were used. For motors above 18 h.p., 4 sets of starting taps are provided which furnish 40, 58, 70 or 85 per cent line voltage with respective line currents of 16, 34, 49 or 72 per cent of the current that would be required if no compensator were used.

Compensators are shipped with connections made to the set of taps that furnishes 58 or 65 per cent line voltage. Provision is made for conveniently changing them to any other set which may be found more desirable when installing.

An electrical interlock is provided on the starting contactor which prevents the running-contactor from closing until the starting-contactor has opened. As a further safeguard, there is also a mechanical interlock between the 2 contactors.

CR7051-J1 Compensators, Size No. 1

The CR7051-J1 Compensators are furnished for wall mounting but can be supplied for floor mounting by the addition of pipe supports, Cat. No. 1769917, at an additional price. The accelerating and running contactors are mounted back to back with the auto-transformer and relays mounted below. This reduces the wiring and results in a compact arrangement of all mechanical and electrical parts, completely enclosed in metal case. The enclosing case may be locked to conform with all safety requirements.

CR7051-K1 Compensators, Sizes No. 2 and 3

The CR7051-K1 Compensators sizes No. 2 and 3 are furnished for floor mounting. They are supported by angle iron frame work and are enclosed in a sheet metal enclosing case which extends to the floor. The hinged front door is provided with means for locking to conform with safety requirements. The cover for the back of the panel is easily removable for making line and motor connections.

CR7051-L1 Compensators, 2200 Volts

The CR7051-L1 Compensators for 2200 volts are electrically similar to the CR7051-J1 and K-1 compensators for 220 to 550 volts but are of a different mechanical construction. The contacts are oil-immersed, each pole being in an individual compartment. The definite-time accelerating relay, temperature over-relay and electrical interlocks are mounted on a slate base which is enclosed in a sheer metal case. Low-voltage for the control circuit is provided by means of a voltage transformer. The transformer is included in the price of the compensator but must be ordered as a separate item and mounted by the purchaser.

*Cat. No. 2040256 switch with Cat. No. 2040400 adapter; approximate shipping weight, 30 pounds; price, \$11.50.

**Includes ammeter.

Price is for compensator complete with temperature overload relay.

For changing wall-mounted to floor-mounted compensators, add pipe supports, Cat. No. 1769917, at an additional price of \$16.00.

CR9158 Cage Type Resistors with Enameled Resistor Units

Arranged for wall mounting. The perforated enclosing case protects the units and at the same time affords ample ventilation. The units can be connected on series or in parallel as desired and are in most general use on switchboards and in railway signal work.

In ordering specify CR9158 and give the number of resistor unit desired. The desired resistance of each unit should also be given. The resistance and current values as given for the 80-watt enclosed rated units apply to the form OE units used in these resistors.

*Price includes temperature overload relay which is included in Cat. No. of CR7051-L1 compensator. Price also includes potential transformer but this must be ordered as a separate item.

**Accessories
For Hand Control**

A CR2940-BS-79-J Start and Stop push-button station, which provides under-voltage protection, may be used with CR7051-J1 compensators and CR2940-BS-212-A Start and Stop push-button station with all other forms of CR7051 compensators.

A single-pole knife or snap switch, which provides under-voltage release, can be used in the pilot circuit to start and stop the motor.

For Automatic Control (Under-voltage Release)

To maintain a water level in an open tank between definite limits, use a CR2930 or CR2931 float switch.

To maintain a definite pressure in a closed tank, use a CR2922 pressure governor or a CR2925 or CR2927 pressure switch.

Ordering Directions

For CR7051-J1 Compensators

1. Order the compensator by CR number and Cat. No. and specify the complete name plate rating of the motor.
2. Order a CR2824-TC-121-A temperature overload relay by Cat. No. 1746862 and group number from table for horsepower, speed and voltage of motor.
3. Order a push-button station or other accessory by its complete description.
4. Order an ammeter attachment by Cat. No.
5. Order pipe supports by Cat. No.

For CR7051-K1 Compensators

1. Order CR7051-K1 compensator by Cat. No.
2. Order a TC-221 temperature overload relay by Cat. No.
3. Order a push-button station or other desired accessory by its complete description.

For CR7051-L1 Compensators

1. Order CR7051-L1 compensator by Cat. No.
2. Order one Type H, 1½-kv-a., control circuit transformer.
3. Order a push-button station or other desired accessory by its complete description.

*Price is for rheostat with black polished handwheel.

CR9000 Resistor Units

CR9000 resistor units consist of resistance wire wound on asbestos tubes. The wire used has a low temperature coefficient so that the resistance remains constant as the temperature increases. After being wound, the tube is treated with either a special blue compound or with a moistureproof varnish depending upon the form of tube. This compound or varnish forms a coating on the inside and outside of the unit, which reinforces the tube and makes a strong, solid construction. A porcelain or metal bushing (depending upon the form of unit) is then cemented into each end of the tube, after which the entire unit is thoroughly baked.

Form P and PM units are treated with the special blue compound. The form P unit is fitted with a porcelain bushing at each end for purpose of mounting so that the resistance wire may be insulated from the support. The Form PM unit is fitted with a metal bushing at each end to which the resistance wire is connected, each bushing forming a terminal for the winding. Units having a resistance of 500 ohms or more require use of fine resistance wire for which it is necessary to afford special protection. Form P or Form PM units can only be furnished with resistances of less than 500 ohms. When units for a resistance of 500 ohms or more are required, Type CR9006 Resistor units should be ordered.

Ratings

Form P units are made in six standard sizes, and Form PM is made in three standard sizes as listed. The continuous capacities given are correct for units assembled in frames that afford good ventilation. As resistor units are used for many different purposes, it is difficult to assign definite watt ratings to them, and the ratings listed should be used only when two or more units are assembled in a frame that affords free ventilation.

Taps

All listed forms of CR9000 resistor units can be furnished with taps so that several different resistance steps can be obtained from a single tube.

Ordering Directions

Form PM units are made in the A, B and C sizes of the Form P units, and have the same ratings. The General Electric Company is not prepared to furnish PM units in the D, E and F sizes of Form P units.

The fuse clips, screws, nuts and washers necessary for supporting the PM units are covered by Cat. No. 58728, for the A, B and C sizes only. Therefore, in ordering, it is necessary to give only the rating of the unit and the Cat. No. For example: 25-A, CR9000, Form PM unit and two Cat. No. 58728 holders.

Orders for units with extra taps should specify the additional taps required, for example, CR9000-25C-1/2 indicates a 25-ohm C size unit with one extra tap located in the center of the unit, and CR-9000-25C-3/4 indicates a 25-ohm C size unit with 5 extra taps located so as to provide 6 equal divisions of resistance.

CR9006 Enameled Resistor Units

Form QL

The QL unit has stranded copper leads for making external connections.

Form QD

Has stranded copper leads and porcelain bushings to facilitate mounting.

Form QC

Designed for fuse clip mounting. Leads are connected to the metal ferrules.

Form QS

Provided with a screw base for mounting in lamp sockets. The 3/4-inch size has a candleabra base and the 1 1/8-inch size has a standard Edison base.

Form QF

Form QF is provided with metal feet to which the leads are connected and through which the external connections are made.

Description

CR9006 enameled resistor units employ a strong, high-heat resisting silicate compound body developed to withstand sudden and extreme temperature changes without weakening or in any way being injured.

The resistance wire has a low temperature coefficient so that the resistance remains nearly constant as the temperature increases.

The wire, after being wound on the body, is embedded in a blue vitreous enamel which is fused at a high temperature to a uniform, glassy structure.

The enamel is moistureproof, extremely durable, and forms a mechanically strong and airtight casing for the resistor windings.

Ordering Directions

When ordering give the symbol, including form and size, and ohms resistance of the unit.

In case fuse clips are desired for mounting the 1 3/4 units, the catalogue number or punching number of the clip should also be given. For example:

Ten CR9006 QCK1924014 125-ohm enameled resistor units, each complete with 2 Cat. No. 58728 fuse clips.

Standard resistance values should be specified when possible. However, intermediate values can be furnished at the same price. Units with resistance values lower or higher than those shown in the table of prices can be furnished; prices will be quoted on application.

Model 1 Weston Portable Millivoltmeters

For Direct Current

With Shunts for Ampere Measurements

This millivoltmeter in connection with Weston Patent Alloy Shunts, reads directly in amperes. Shunts of different sizes can be adjusted to the same instrument, and it can, therefore, be used to measure a current of 2000 amperes with the same degree of accuracy as a current of one ampere. The combination of millivoltmeter and shunt is practically compensated for temperature and is correct within 1/4 of 1 per cent. If, at any time, the user of this combination desires to employ additional ranges to those for which the instrument is already adjusted, it is simply necessary to purchase additional shunts of the ranges required, thus saving the expense of an additional instrument. The scales of the instrument can be divided into 100, 120 or 150 divisions. In selecting shunts of different range for use in connection with one instrument, it should be considered that the higher ranges must be even multiples of the lower one in order to suit the same scale on the instrument.

These shunts can be supplied in two or more ranges combined in one case, as indicated in price list below. Price, Model 1 Standard Portable Millivoltmeter, each \$62.50

Shunts for Millivoltmeters

With Single Range

Volts	Amps.	Div.			Volts	Amps.	Div.		
150	1.5	150		\$93.75	150	3	150	\$93.75	

Model 1 Type 2 Weston Portable Direct Reading Ohmmeters

May be operated on ordinary dry cells, thereby dispensing with the necessity of using a troublesome or expensive storage battery as a constant source of e.m.f.

No auxiliary rheostat, voltmeter, or other apparatus is required and as only six dry cells are essential for the highest range instrument (fewer cells being required for the low range instruments) the complete apparatus may be readily carried from place to place as a unit.

If the instrument is connected by its proper binding posts to the battery it then merely becomes necessary to connect the unknown resistance to the two binding posts provided for the purpose; press the contact key and read directly in ohms.

Instruments are made with double and triple ranges, a plug switch serving to make the change from one range to the other.

The instrument is guaranteed to be accurate within 1/4 of one per cent of full scale at any temperature from 10° C (50° F) to 30° C (86° F).

When not indicating, the pointer stands in a free zero position, there being no initial tension on the movable coil springs. Any inaccuracy at zero can therefore be instantly determined and corrected by means of the zero corrector.

Range Ohms	Volts Necessary to Operate	Price Each
0-2.5, 0-25, 25-50	*1.5	\$106.25
0-10, 0-50, 50-100	*1.5	106.25
0-200, 0-1000, 1000-2000	6	112.50
0-300, 0-1500, 1500-3000	9	112.50
0-1000, 0-5000, 5000-10000	24	120.00

*When used for long periods on the low range it is recommended that 2 cells be used in multiple.

Model 280 Weston Garage Testing Instruments

This instrument is compact (pocket size) and has a uniform and legible scale, is accurate and serviceable, damped, quick in action, shielded from the disturbing influence of external magnetic fields, permanent and durable. It is adjusted for ranges of 30 and 3 volts and 100 milli-volts (all self-contained), and is provided with external shunts of 3, 30 and

300 ampere rating for use in making current measurements.
Price, Model 280, Testing Instrument.....each \$41.25
" Carrying Case....." 5.00
" Multiplier for 150-volt Range....." 4.75
" Cadmium Cables.....per pair 5.00

Model 45 Weston Battery Testing Voltmeters

This instrument has been developed for the battery service station which is called upon to repair, charge and test batteries on a large scale. It is substantially constructed to withstand hard usage, the vital parts being contained in a cast-iron case about which is a wooden carrying box.

The range is 0.2-0-3 volts, which is particularly adapted for making voltage and cadmium tests on the individual cells of the battery.

Price, Model 45.....each \$41.25
" Cadmium Test Cables.....per pair 5.00

**Model 45 Weston Portable Voltmeters
For Direct Current**

The movement is completely enclosed in an iron case, securely fastened in a wooden carrying box, which protects it from stray magnetic fields. Has zero correcting device.

Double and triple range voltmeters will be furnished when desired in the combinations listed under Model 1 voltmeter. To determine the price of such instruments add \$7.50 for each additional range to the price listed for the highest range.

Box is provided with a hinged cover, which protects the scale and binding posts.

*This instrument is particularly adapted for railway signal testing.

Model 341 Weston Portable Voltmeters For Alternating and Direct Current

These instruments are electro-dynamometer meters and may be used with equal accuracy on either alternating current or direct current circuits. They are contained in highly polished mahogany boxes, provided with carrying handles, locks and covers equipped with slip hinges. The weight is approximately 11 pounds, and the dimensions are 8x10 1/4 x 5 3/4 inches over all.

The entire movable and field coil system is mounted in a double closed iron shield, which effectually protects it from external magnetic field and electrostatic influences.

Weston Y-Boxes for Models 310 and 432 Wattmeters

These multipliers are resistors having a definite multiplying constant, the resistance material of which is highly insulated and arranged for proper heat dissipation.

They are so adjusted that the readings of the instrument may be multiplied by a specific constant.

Normal Voltage of Instrument	Y-Box Constant	Normal Line Voltage With Y-Box	MAXIMUM VOLTAGE With Y-Box Model 310	Model 432	PRICE, EACH	
					Model 310	Model 432

150	5	500	700	550	30.00	18.00
150	6	600	750	650	45.00	18.00

The multipliers listed are those most commonly required, but intermediate ranges or sub-divisions will be provided when so ordered.

Model 311 Weston Potential Transformers

Designed for use on circuits of any frequency from 25 to 133 cycles per second.

They have an accuracy better than one-half of one per cent for loads not exceeding 15 volt amperes at any power factor.

The variation in ratio of transformation for various applied voltages within the range of the connected instrument is small.

Range Volts	Price Each
2200-1100 to 110	\$74.25
1100-550 " 110	70.75
440-220 " 110	66.75

Model 370 Weston Portable Instruments
For Alternating and Direct Current

These instruments are electro-dynamometer ammeters, and may be used with equal accuracy on either direct current circuits or on alternating current circuits of any frequency up to 133 cycles per second and of any wave form. They are contained in polished mahogany boxes, provided with carrying handles, locks and covers equipped

with slip hinges. The weight is approximately 11 lbs., and the dimensions are 8x10¼x5¼ inches over all.

Model 310 Weston Portable Wattmeters
For Alternating and Direct Current

These instruments represent the latest development in electro-dynamometer wattmeters and embody many characteristics hitherto considered unattainable in instruments of this class.

They are contained in highly polished mahogany boxes, provided with carrying handles, locks and covers equipped with slip hinges. The weight is approximately 11 lbs., and the dimensions are 8x10¼x5¼ inches over all.

Scales

Scales are 5¼ inches long, are uniform throughout their entire length, and are provided with mirrors to prevent parallax mirrors.

The pointers are of the Weston triangular truss type with knife edges, and are equipped with simple zero setting devices controlled from the outside of the case.

Ranges

Double ranges for both the current and voltage circuits are provided. The double current, range feature is obtained by connecting the two field coil sections either in series or in multiple by means of links and binding screws, conveniently located on the top of the instrument. These links are provided with handles to facilitate their manipulation, and are slotted, making it unnecessary to remove them entirely each time the range is changed. The double voltage ranges are controlled by means of independent binding posts.

As each instrument has a number of ranges, a scale cannot be made which is readable with equal facility for all ranges. In each case however, a scale is provided which gives 1, 2 or 5 units per division for the range marked, and simple multiplying factors for the other ranges.

Special Model for Very Low Power Factors

Model 329 Weston Portable Polyphase Wattmeters

These instruments are contained in highly polished mahogany boxes, provided with carrying handles, locks and covers equipped with slip hinges.

This form of instrument really consists of two single phase wattmeters, electrically independent, but having their movable coils mounted on a common shaft, so that they rotate together. Each coil, however, moves in its own system of field coils.

Scales are uniform throughout their entire length, and are 5 1/4 inches long.

The pointers are equipped with simple zero setting devices, and are of the Weston triangular truss type with knife edges. To prevent parallax errors mirrors are provided.

Approximate weight, 17 1/2 pounds.
Dimensions overall, 9 1/2 x 10 1/2 x 8 1/8 inches.

Normal 100/50, Maximum 150/75 Volts

Model 312 Weston Current Transformers

They have an accuracy better than one-half of one per cent for loads not exceeding 15 volt amperes at any power factor.

The variation in ratio of transformation for various applied voltages within the range of the connected instrument is very small, and for all ordinary measurements no correction is necessary.

Secondary, 5 amperes.

Capacity, 25 volt amperes.

Test, 10,000 volts for 1 minute.

Frequency, 25 to 133 cycles.

Range Amperes	Price Each
10- 20- 40 to 5	\$81.75
25- 50-100 " 5	81.75
50-100-200 " 5	81.75

Model 313 Weston Current Transformers

The ranges listed correspond to the primary current for a conductor passing through the opening once. Range can be changed by passing the primary conductor through the opening more than once. Transformer has a short-circuiting switch in the secondary. Designed for use on potentials as high as 2500 volts. Secondary, 5 amperes. Capacity, 25 volt amperes. Test 10,000 volts for 1 minute. Frequency, 25 to 133 cycles.

Range Amperes	Opening Inches	Price Each
1200 to 5	2x3 1/2	\$63.25
1800 " 5	2x4 1/2	66.75
2400 " 5	2x4 1/2	70.75

Model 461 Weston Portable Multi-range Current Transformers

There is a wide variety of testing that can only be conveniently and successfully conducted by means of a portable current transformer that is comprehensive as to range of values; accurate within the order of accuracy of any precision portable instrument with which it may be used; compact in size; light in weight and reasonable in cost. Weston Model 461 Portable Current Transformer meets these qualifications.

It has three self-contained primary ranges of 10, 20 and 40 amperes to which connections are made by binding posts. The secondary has a range of 5 amperes and is provided with a special short circuiting switch. The core of the transformer has an opening through which one turn of primary will give a range of 800 amperes, two turns 400 amperes, four turns 200 amperes, eight turns 100 amperes, etc. Hence the primary ranges extend from 10 to 800 amperes.

Has a ratio accuracy within the guaranteed precision of any standard Weston portable A. C. ammeter or wattmeter when used on circuits of 60 cycle frequency. The maximum error on circuits of 25 cycle frequency is .3 of 1 per cent of full load value at 1/2 secondary current. May be used on frequencies from 25 cycles up to 133 cycles and on line voltages up to and including 2500 volts.

It is compact, its dimensions being 6 1/4 x 7 3/4 x 3 inches (158.8x196.9x76.2 m.m.) It is light, weighing only 6 1/4 pounds (2.84 kilograms).

Price, Model 461 Multi-range Current Transformer
.....each \$55.00

**Model 155 Weston Portable Voltmeters
For Alternating Current**

This instrument may be used on circuits of any frequency from 15 to 140 cycles per second without appreciable errors resulting.

Voltmeters are all self-contained. Voltmeters having ranges of 125 volts or higher require 75 milliamperes to produce a full scale deflection. Equipped with zero correcting device.

Dimensions, small size, 7x7 1/8 x 3 1/4 inches; large size, 7 3/4 x 8 3/4 x 4 inches.

**Model 155 Weston Portable Ammeters
For Alternating Current**

The ammeters listed may be used on circuits having a difference in potential of 2300 volts.

The current transformers must be used for the measurement of all the alternating currents greater than 500 amperes.

Instrument provided with zero-correcting device.

Dimensions, small size, 7x7 1/8 x 3 1/4 inches; large size, 7 3/4 x 8 3/4 x 4 inches.

**Model 433 Weston Portable Voltmeters
For Alternating Current**

Model 433 Voltmeter is of the electromagnetic or movable iron type depending for its operation upon the mutual repulsion of two properly shaped pieces made from a special iron alloy, one fixed and the other movable, which are polarized by a current passing through a field coil in which they are mounted. The movable piece is fastened to the pointer through a staff so that its motion is communicated to the pointer.

Made as single range or double range instrument. In the case of the double range instruments three binding posts are provided, one of these being common to both ranges.

All the voltmeters listed are self-contained. Ranges higher than those listed can be obtained by means of an external multiplier or by using a potential transformer in conjunction with an instrument having a 150-volt range. For ranges above 750 volts transformers must be used.

Effectively shielded from the effects of external magnetic and electrostatic influences, the movable system being contained within a drawn steel shielding cup.

Motion of the movable system is controlled to a proper degree by means of an efficient air damper of special design and construction. The damping is of such a quality that the movable system instantly follows circuit fluctuations without undue oscillation.

The pointer is of the trussed type of construction, assuring maximum strength and eliminating vibration at all commercial frequencies. It has a knife-edge tip, which is of valuable aid in obtaining accurate readings.

Model 433 Voltmeter scales necessarily are not uniformly divided throughout their length. By means of special design and construction it has been possible to make the scale divisions nearly uniform over the upper two-thirds of the scale.

Over All Width	5 5/16 Inches	147.6 Millimeters

30			300		
15	150	37.50	150	150	39.00
60			150		
30	60	37.50

Resistor Multipliers can be furnished for voltage ranges in excess of 300 volts and up to and including 750 volts. Prices will be quoted upon application.

For ranges above 750 volts a Weston Portable Potential Transformer is recommended.

Model 433 Weston Portable Ammeters and Milliammeters

For Alternating Current

Model 433 Ammeters and Milliammeters depend for their operation on the electromagnetic or movable-iron principle.

This principle consists of the mutual repulsion of two properly shaped pieces made from a special iron alloy, one fixed and the other movable, which are polarized by a current passing through a field coil in which they are mounted. The movable piece is fastened to the pointer through a staff so that its motion is communicated to the pointer.

Made in single ranges only. They are all self-contained up to and including 50 amperes.

Ranges above 50 amperes can be obtained by using a current transformer with a 5-ampere instrument. Weston Model 312, 313 and 461 Portable Current Transformers are recommended for this purpose.

For proper protection from the action of external magnetic and electrostatic influences, the movable systems of these instruments are placed in a shielding cup of drawn steel.

By means of a very efficient air damper of special Weston design, motion of the movable system is effectually controlled so that no undesirable oscillation occurs. The pointer follows the circuit fluctuations with rapidity, making it possible to obtain accurate instantaneous readings.

The pointers are of the trussed construction assuring rigidity and absence of vibration. The pointer is provided with a knife-edge tip.

Model 433 ammeter and milliammeter scales have characteristics similar to those of the voltmeter scales. These scales are easily read over their working range. A mirror is provided which, with the knife-edge pointer, facilitates the taking of accurate readings through the elimination of parallax errors.

May be used on any frequency as high as 500 cycles per second without appreciable error. Errors in indication due to changes in temperature are negligible. These instruments may be left in circuit continuously without overheating or causing error in the instrument indication.

Model 432 Weston Portable Wattmeters

For D.C. and Single-phase A.C.

The Model 432 Wattmeter is an electro-dynamometer instrument having electrically independent potential and current circuits. All of these instruments are made with a single current range and double voltage ranges. Standard normal current ranges are available from 1 ampere up to and including 50 amperes. The voltage range combinations are 75-150 and 150-300 volts. All of the listed ranges are self-contained. Current ranges can be extended beyond 50 amperes by using a 5-ampere instrument in

conjunction with a current transformer. Width overall, 6 1/8 inches. Depth overall, 5 1/4 inches. Height overall, 3 1/2 inches. Scale length, 3.8 inches. Approximate weight, 3 1/4 pounds.

Resistor multipliers can be furnished for voltage ranges in excess of 300 volts and up to and including 750 volts. Prices upon application. For ranges above 750 volts a Weston Portable Potential Transformer is recommended.

Model 457 Weston Portable Potential Transformers

Designed to supply the need for a compact light weight transformer which the user can easily and conveniently carry in addition to the measuring instruments with which it is to be used. Consequently, this transformer has been made as small and as light in weight as possible yet maintaining a high degree of accuracy in performance.

The transformer is contained in a neat polished wooden case having a removable cover. It is also provided with a strong carrying strap.

Model 457 potential transformers have two primary ranges, the higher range being four times the value of the lower range. A primary range changing switch is provided which enables either primary range to be brought into use instantly.

The range changing switch is mounted on the bakelite top of the transformer. The knob is of bakelite and bears an index mark so as to show which range is in use. On this top are also mounted the primary and secondary binding posts. Markings on the transformer top clearly indicate which are the primary and which the secondary binding posts. By means of the marking the primary and secondary binding posts of like instantaneous polarity are designated.

Normal	RATIO, VOLTS		Frequency Cycles	Price Each

Model 57 Weston Round Pattern Switchboard Instruments

For Direct Current

These instruments are made in three patterns: Regular, for front of board connection. Back connection, in which the binding-posts are carried through to the rear of the switchboard. Flush type, in which a flange is provided for the front, allowing the entire body of the instrument to pass through for connection in the rear of the switchboard.

The cases of these instruments are regularly supplied in No. 11 dull black japan finish.

Diameter, 9.5 inches. Shipping weight, 22 pounds.

Ammeters

25	50	39.00	150	75	44.25	750	75	54.25

Voltmeters may be made with an additional lower range at an increase in price. These prices are for No. 11 finish dull black japan. No extra charge will be made for above instruments with back connection or flush-type cases. Always specify the style desired when ordering.

Model 24 Weston Round Pattern Switchboard Instruments

For Direct Current

The cases are supplied in three types: regular, to be attached directly to and connected from the front of the switchboard; back connected regular, but with binding-posts projecting through to the back of the board; and flush type instrument, intended to be countersunk so that the front of the case is practically flush with the face of the board, causing the body of the instrument and the binding-posts to project through to the back of the board.

Finished in dull black japan. Specify style desired, when ordering. Diameter, 7 1/4 inches. Shipping weight, 15 pounds.

Weston Fan-shaped Switchboard Instruments

For Direct Current

Compact in size and have remarkably long, open and legible scales. Each instrument is provided with a zero shifting device.

The standard finish of case is a heavy, rich, dull black japan that has the appearance of hard rubber, and exceptionally durable.

All instruments are of the back connected type and are secured to the switchboard by means of studs projecting from the rear of the case.

**Models 159 and 160 Weston Eclipse Switchboard Instruments
For Direct Current**

These instruments belong to the soft-iron or electro-magnetic type, and yet have none of the many disadvantages and errors commonly associated with instruments of this class. They possess a degree of accuracy and general electrical excellence. Made in two models, namely: Models 160 and 159, the only difference being in the dimensions.

These models do not indicate polarity. Cannot be made as zero center instruments.

Dimensions

Model	Diameter Inches	Depth Inches	Length Scale Inches	Shipping Wt., Lbs
159	7.25	3.15	5.25	15
160	9.56	3.15	6.5	20

**Model 301 Weston Switchboard Instruments
For Direct Current**

Recommended for small panels and switchboards. Recommended for radio in controlling the filament and plate voltage.

Each instrument has zero-adjuster. Furnished in nickel finish.

Voltmeters

Ranges above 50 volts have external resistor. Ranges above 150 volts will be furnished with Bakelite case.

Range in Volts	Number of Scale Div.	Price Each	Range in Volts	Number of Scale Div.	Price Each
1	20	\$8.00	15	30	\$8.00
1.5	30	8.00	20	20	8.00

Model 151 Weston Round Pattern Switchboard Voltmeters For Alternating Current

Model 151 Voltmeter is contained in a cast-iron case and is self-contained for ranges as high as and including 300 volts. For use on higher voltages a current transformer must be used. Provided with normal index pointers and zero correcting device.

Case of voltmeter made of cast-iron. Diameter of case, 9.56 inches; depth, 3.15 inches; length scale, 6.5 inches.

Range in Volts	Price Each	Range in Volts	Price Each
75	\$30.50	300	\$37.25
125	30.50	500	38.50
150	31.00	600	39.00
250	37.25	750	41.00

Model 151 Weston Round Pattern Switchboard Ammeters For Alternating Current

The case is provided with a ground terminal which must be connected to earth when the potential difference of circuits exceeds 200 volts. Case is made of cast iron. Diameter, 9.56 inches; depth, 3.15 inches. Length of scale, 6.5 inches. Self cont. up to 500A.

Range in Amps.	Price Each	Range in Amps.	Price Each
1	\$29.50	50	\$29.00
2	29.00	75	29.00

40	29.00

Model 156 Weston Round Pattern Switchboard Voltmeters For Alternating Current

Made for direct connection to circuits up to and including 750 volts up to and including the 300 volt range the resistors are self-contained. Above 300 and up to and including 750 volts an external resistor is provided. Voltages above 750 necessitate the use of potential transformers. Fitted with zero-correcting device.

Voltmeter is contained in cast iron case. Diameter of case, 7.25 inches; depth, 3.15 inches; length of scale, 5.25 inches.

Range in Volts	Price Each	Range in Volts	Price Each
75	\$24.00	500	\$32.25

40	22.75

Models 167 and 343 Weston Switchboard Wattmeters For D.C. and Single-phase A.C.

For current ranges in excess of 100 amperes it is necessary to use current transformers.

For voltages above 750 volts for any current range both current and potential transformers must be employed. All current circuits have an overload capacity of double normal value permitting full-scale readings to be made at 50 per cent power factor. Dull black japan finish.

Model 167

Diameter, 9 5/8 inches. Depth, 3 7/8 inches. Length of scale, 6 5/8 inches.

Self-contained

Models 216 and 368 Weston Switchboard Wattmeters

For Polyphase Alternating Current

Semi-flush Type

Furnished in semi-flush or full front case, dull black finish.

For current ranges above 100 amperes current transformers must be used.

For voltages above 750 volts for any current range and potential transformers are necessary. Current circuits can be used continuously on double normal current enabling full-scale readings to be made at 50 per cent power factor.

Model 216

Full-front: Diameter, 9¹¹/₁₆ inches. Depth, 6⁷/₁₆ inches.
Semi-flush: Diameter, 10 inches. Depth, 4 inches. Scale, 6⁵/₈ inches.

Models 215 and 356 Weston Power-factor Meters

For Alternating Current

By virtue of a novel mode of construction, the Weston power-factor meter has been rendered practically perfect in its operation. From ³/₁₀ load to full load it indicates the true phase angle to within 1 per cent independent of any variable conditions found on ordinary commercial circuits. Polyphase power-factor meters may be used on any commercial frequency. Single phase meters require a phase-splitting device and, therefore, must be calibrated for the frequency at which they are to operate. The following ranges are regularly carried in stock: 25, 40, 50, 60, 125 and 133 cycles per second. Polyphase power-factor meters are arranged for the following systems: two-phase three-wire, and three-phase three-wire for balanced loads. Meters above 150-volt range are equipped with external resistance box. All meters have the same kind of scale, reading from 0.50 lag to 0.50 lead. Special scales for power-factors as low as 0.30 may be had at slight extra cost. This instrument may also be arranged as a sine or cosine meter. For two-phase four-wire circuits, two-phase three-wire instruments in conjunction with two potential transformers. Polyphase instruments are made for balanced load only.

Model 215

Diameter, 9⁵/₈ inches. Depth, 4 inches. Scale, 6¹/₂ inches.
Polyphase

External resistor furnished on ranges above 150 volts.

Single-phase

Single-phase meters require an auxiliary device for splitting the phase, which is mounted in an external box. The price of Single-phase Power-factor Meters, including auxiliary device, is \$13.75 more than the price of corresponding range polyphase meters. They are made for direct connection only up to 300 volts.

When ordering, always specify the frequency.

Model 356

Diameter, 7¹/₂ inches. Depth, 4¹/₂ inches. Scale, 5¹/₂ inches. Prices given below are for polyphase only.

Single-phase meters including external phase splitting reactors carry list prices \$14.75 more than the corresponding range polyphase meters. Single-phase meters are made for direct connection to circuits of 300 volts maximum. All resistors for all ranges are self-contained. Always specify frequency when ordering.

Model 214 Weston Frequency Meters
For Alternating Current

Indications are independent of changes of temperature, voltage and wave form, such as may be encountered in the commercial circuits of to-day. Standard meters are made for one voltage, 100 to 125 volts. Every frequency meter is provided with an external box which contains reactors and resistors.

Diameter, 9 5/8 inches.
Depth, 4 inches.

100-125 or 125-150 Volts

Cycles	Price Each	Cycles	Price Each
25	\$82.50	60	\$82.50
40	82.50	125	82.50
50	82.50	133	82.50

For 200-250 or 250-300 volts, add \$7.00 list to above prices.

Model 355 Weston Frequency Meters
For Alternating Current

Indications are practically independent of changes of temperature, voltage and wave form, such as may be encountered in the commercial circuits of to-day. Standard meters are made for one voltage, 100 to 125 volts. Every frequency meter is provided with an external box which contains reactors and resistors.

Diameter, 7 3/4 inches. Depth, 4 1/2 inches.

100-125 or 125-150 Volts

Cycles	Price Each	Cycles	Price Each
25	\$78.00	60	\$78.00
40	78.00	125	78.00
50	78.00	133	78.00

For 200-250 or 250-300 volts, add \$7.50 list to above prices.

Model 226 Weston Synchrosopes
For Alternating Current

Consists of a phase angle indicator mounted with its pointer behind a ground glass scale and illuminated by a small synchronizing lamp. A difference in frequency between machines causes the pointer to swing back and forth. Perfect synchronism is indicated by the pointer remaining at rest in the middle of the scale with the lamp lighted.

Made for 100-125 volts and any commercial frequency up to 60 cycles.

Price, Model 226.....each \$86.00
Specify voltage and frequency when ordering.

Model 375 Weston Students' Galvanometers

The instrument is mounted on a base, so that the face, or scale is inclined at an angle of 45 degrees. The scale is 2.35 inches in length, is uniformly divided, and is calibrated 30-0-30. Each instrument is provided with a zero-adjusting device. The resistance is approximately 25 ohms. The current required for a millimeter (1 scale division) deflection is 22 micro-amperes.

With one volt, a deflection of 1 millimeter (1 scale division) will be obtained through 45,500 ohms, but as a deflection of 0.2 of a scale division can be readily detected, the galvanometer is, in reality, serviceable through 227,500 ohms.

Price, Model 375.....each \$13.50

Models 260 and 261 Weston Round Pattern Switchboard Instruments

For Alternating Current

Voltmeters with a range above 300 volts are provided with external resistance.

Every ammeter is tested before shipment for insulation with 4,600 volts for one minute.

The case of each ammeter is provided with a ground terminal, which must be connected to earth when the potential difference of circuits exceeds 200 volts.

Transformers must be used on all circuits carrying over 500 amperes, and a value of 5 amperes for the secondary is recommended. Models 260 and 261 have drawn steel cases.

Models 251 and 252 Weston Round Pattern Switchboard Instruments

For Direct Current

Same instruments as the Models Nos. 57 and 24, except being mounted in drawn steel cases so as to correspond with the alternating current instruments.

Voltmeters are furnished with self-contained resistors for circuits up to and including 300 volts. For higher potentials external resistors are provided arranged for mounting on the back of switchboard.

...	750	35.50

Voltmeters above 300 volts have external resistors. Ammeters, all ranges, have external shunts.

All ammeters are furnished as millivoltmeters adjusted for use with external shunts only. Prices for lower or higher ranges will be quoted upon request.

Model 429 Weston Round Pattern Switchboard Instruments

For Alternating Current

Model 429 voltmeters, ammeters, and milliammeters operate on the electro magnetic or movable iron principle in which is utilized the repulsion action between a fixed and a movable piece of iron placed within a field coil.

All scales are calibrated by hand in reference to standard instruments. The angle of deflection is approximately 86° and the scale

length 2.7 inches (68.6 m.m.). These scales have the same general characteristics as those of the larger Weston A. C. Instruments, being slightly congested at the lower end but remarkably uniform over the working range, which comprises approximately the upper four-fifths of the scale.

Voltmeters are made self-contained in the listed ranges up to and including 150 volts. Ranges above this value are provided with an external resistor box. For use with potential transformers, the 150-volt instrument can be supplied having the scale calibrated to indicate the primary voltage, if this is desired. Voltmeters are accurate within 1 per cent of full scale value, over the working range of the scale, under normal working conditions on any frequency between 25 and 133 cycles per second. Changes in temperature have no effect on the accuracy of indications, neither are instruments affected by length of time they are left in circuit. Low range voltmeters of this type necessarily require a larger current for operation than the high range instruments. At times, this larger current may become an important factor in altering the normal circuit conditions; therefore, the resistance of each range has been stated in the price list in order that the purchaser may be better enabled to select the proper instrument for his purpose.

Ammeters and milliammeters are self-contained in the ranges listed. Ranges above 50 amperes can be obtained by using a 5-ampere instrument with a current transformer of proper range. When desired, the ammeter will be calibrated to indicate the primary amperes. In cases where an overload capacity is required, a 6 1/4-ampere instrument can be provided with scale calibrated to indicate primary amperes.

Prices will be quoted upon application.

Model 427 Weston Switchboard Wattmeters

For D. C. and Single-phase A. C.

Model 427 Wattmeters operate on the electro-dynamometer principle; consequently they can be used on both direct and alternating current.

Flush and semi-flush types of cases are provided for this model. In order that the semi-flush case should harmonize with the surface type instruments of the other models, its projection from the switch-board has been made the same as for the other surface type instruments.

These instruments are accurate within 1 per cent of full scale value at any part of the scale, under normal working conditions on direct current or on alternating current of any frequency between 25 and 133 cycles per second and of any wave form met with in commercial practice. Temperature errors are negligible.

The current circuits of these wattmeters are capable of withstanding an overload current of 50 per cent of the normal current without overheating. This feature is of value when the power factor of the circuit is low.

Model 427 Wattmeters are regularly made with self-contained voltage ranges up to and including 250 volts.

Above this value and up to and including 750 volts, an external resistor is provided. Voltage ranges may also be extended by using a potential transformer of suitable range in connection with a 150-volt instrument.

Current ranges are self-contained up to and including 20 amperes normal (30 amperes maximum). For high current ranges, it is necessary to use a current transformer in connection with a 5-ampere instrument.

Model 496 Weston Rectangular Switchboard Instruments For Alternating Current

These instruments are of the electro-magnetic or movable-iron type.

Each instrument is mounted in a dust-proof iron case which serves to protect the movement from the influence of external magnetic fields.

Case is 5 3/4 inches wide, 6 inches high and projects 4 1/4 inches from front of the switchboard. Designed for back connection and surface mounting

only. Finish, dull black japan.

Scale is 5 1/8 inches in length, hand calibrated.

Voltmeters

External resistors required for all ranges.

Ranges above 750 volts require the use of potential transformers.

Volts	Number of Scale Divisions	Approximate Resistance Ohms	Price Each
100	50	1300	\$28.00

10	50	.013	26.50

Model 497 Weston Rectangular Switchboard Power Factor Meters For Alternating Current Single-phase, 2-phase 3-wire and 3-phase

The Power Factor Meter is constructed on the electro-dynamometer principle.

Each instrument is mounted in a dust-proof iron case which serves to protect the movement from the influence of external magnetic fields. Case is 5 3/4 inches wide, 6 inches high, and projects 4 1/4 inches from front of the switchboard. Designed for back connection and surface mounting only. Finish, dull black japan.

Scale is 5 1/8 inches in length, hand calibrated.

External resistors required for all ranges. Current ranges above 5 amperes require the use of current transformers. State actual voltage when ordering.

Single-phase Meters

Made for direct connection to circuits of 300 volts maximum. Always specify frequency when ordering.

Single-phase meters including external phase splitting reactors carry prices \$14.75 more than the corresponding range polyphase meters as given below.

2-phase 3-wire and 3-phase

Made for direct connection to circuits of 750 volts maximum. For 2-phase 4-wire circuits use 2 phase 3-wire instrument with 2 potential transformers. All details in regard to ratio and connections of transformers to be used on 3-phase circuits should be given.

Model 500 Weston Rectangular Switchboard Frequency Meters

For Alternating Current

This instrument is of the electro-magnetic or movable-iron type.

Each instrument is mounted in a dust-proof iron case which serves to protect the movement from the influence of external magnetic fields.

Case is 5 3/4 inches wide, 6 inches high, and projects 4 1/4 inches from front of switchboard.

Designed for back connection and surface mounting only.

Finish is dull black japan.

External reactance required for all ranges.

Higher ranges require the use of a potential transformer.

State actual voltage when ordering.

For 220-volt service, add \$7.50 to prices given below.

Volts	Cycles	Price Each	Volts	Cycles	Price Each
100 to 125	25	\$78.00	100 to 125	60	\$78.00
or	40	78.00	or	125	78.00
125 to 150	50	78.00	125 to 150	133	78.00

Model 501 Weston Rectangular Switchboard Triplex Ammeters

For Alternating Current

The Triplex Ammeter consists of three separate and distinct ammeter movements mounted one above the other and contained all in one case. Designed for back connection and surface mounting only.

The dust-proof iron case serves to protect the movements from the influence of external magnetic fields.

Case is 5 3/4 inches wide, 15 1/2 inches high, and projects 4 1/4 inches from front of switchboard.

Finish, dull black japan.

Scales are 5 1/8 inches in length, hand calibrated.

Ranges above 10 amperes and 750 volts require the use of current transformers.

Amperes	Number of Scale Divisions	Approximate Resistance Ohms	Price Each

Model 502 Weston Rectangular Switchboard Instruments

For Direct Current

These Rectangular D.C. Instruments are of the permanent magnet, movable coil type, similar to the round pattern Model 24 Instruments.

Each instrument is mounted in a dust-proof iron case which serves to protect the movement from the influence of external magnetic fields. Case is 5 3/4 inches wide, 6 inches high, and projects 4 1/4 inches from front of switchboard.

Designed for back connection and surface mounting only. Finish is dull black japan. Scales are 5 1/8 inches in length, hand calibrated.

Voltmeters

Resistance self-contained up to 800 volts.

The resistance of these instruments is 100 ohms per volt.

Volts	Number of Scale Division	Price Each	Volts	Number of Scale Division	Price Each
120	60	\$27.25	300	30	\$33.75
150	30	28.00	600	30	38.00

Model 443 Weston Battery Testing Voltmeters

This instrument meets every requirement for a means of testing the individual cells of a storage battery.

The acid-proof case is of Bakelite.

In addition to its normal scale of 0 to 3 volts, this instrument is calibrated so that a portion of its scale is specially divided and figured for making the Cadmium Test. This special test which goes as added equipment has terminal consisting of a spike and a protected Cadmium stick, whereas the cable regularly supplied with the instrument has only the spike terminal.

Price, Model 443 Voltmeter, each \$14.00
 " Cadmium Test Cable. " 2.75

Model 453 Weston Heavy Discharge Battery Testers

To obtain the actual working condition of an automotive storage battery the voltage of each cell of battery should be tested while a relatively heavy current is flowing.

The Model 453 consists of a prod upon which is mounted a direct-current voltmeter having a range of 3-0-3 volts.

Price, Model 453, Complete.....each \$14.00
 " Prod Only....." 5.50

Model 425 Weston Radio Frequency Instruments

Consists of a heating element and Weston direct-current permanent magnet movable coil instrument mounted in the same case. They are regularly made as ammeters, milliammeters and galvanometers or current squared meters. All are back connected. These instruments are furnished in dull black finish with either flush or surface type cases. All instruments have a zero adjusting device. The indications

are not affected by changes in temperature and are equally accurate on any audio or radio frequencies. The galvanometers and milliammeters cannot be used on direct currents. The power required to operate these instruments is small. They have a safe overload capacity of 50 per cent.

Model 400 Weston Thermo Ammeters

Weston Model 400 Radio Frequency ammeters or thermo ammeters consist of a heating element and a direct current permanent magnet indicator calibrated to indicate directly the current passing through the heating element.

These instruments are made self-contained with either front or back connection studs for currents up to and including 100 amperes. Above 100 amperes external heating elements must be used. Ranges of 100 amperes or below are also supplied with external heating elements when desired although for the lower ranges it is preferable to use the self-contained instrument.

Instruments for use with external elements are always made back connected.

Indications are not affected by changes in room temperature. Each instrument has a zero correcting device for rectifying any slight accidental changes in the zero position of the pointer. The standard finish is dull black japan.

Model 441 Weston Fault-finders

The Fault-finder consists of an ammeter and a voltmeter mounted in a strong, compact carrying box with carrying strap. The ammeter and voltmeter being electrically independent of each other, simultaneous readings of current and voltage can be made.

The voltmeter has ranges of 2-0-30 and 0.2-0-3 volts. The latter range is particularly adapted to making cadmium tests.

Each Fault-finder is provided with a pair of flexible rubber-covered cables.

Price. Model 441..... each \$31.00
" Cadmium Test Cables..... per pair 2.75

Model 354 Weston Dashboard Ammeters

For Direct Current

Furnished in two styles—(A) Flush style, with a wide flange, so that the instrument can be fastened directly to the dashboard; and (B) Surface style, projecting out from the dashboard; and held in place by the back connection studs, which also serve for making the electrical connections.

Finished in dull black or full nickel, with silver grey or black scales.

Finished in the following ranges: 10-0-10, 15-0-15, 20-0-20, and 30-0-30.

Price..... each \$3.50

When ordering, specify the style, range, finish of scale desired.

Ford Adaptor Flange, 25 cents extra.

Sterling Pocket Meters

Sterling Pocket Ammeters, Voltmeters and Voltammeters are always reliable and accurate. They not only indicate the strength or condition of batteries but are invaluable in locating ignition and starting trouble. They are especially valuable for this purpose because they show polarity and thus indicate the direction of the current. The best permanent magnets obtainable are employed in connection with an electro magnet.

The ammeter is for testing dry cells; the voltmeter for storage batteries. The voltammeter, a combination of both ammeter and voltmeter, is invaluable to those who work with both dry and storage batteries. Types 34C, 35, 37, 38 and 39 voltmeters are designed especially for testing "B" batteries. Type 36 has two scales, one 0-10 volts for "A" batteries, and one 0-50 volts for "B" batteries. Type 45 voltammeter is particularly useful in radio work in measuring the amperage of dry cells used for operating tubes and the voltage of "B" batteries.

Models E, EA and ER

Model E

Models E and EA meters are of the series type and are made for capacities as shown in the price list. The Model E meters are also made with astatic field coils and armature in sizes including 25 amperes and larger and when this feature is wanted, please specify Model EA.

Model ER is of the shunted type and is provided with a shunt that is connected in series in the main feeder or line and having flexible cables that connect it with the field coils of the meter. This arrangement allows only a portion of the main current to pass through the field coils of the Model ER and for this reason it adapts itself most admirably for heavy currents and we are prepared to furnish it for any capacity up to and including 30,000 amperes at either 110, 220 or 500 volts. The armature in the Model ER is slightly different from the armature employed in the other series type models. Its form resembles that of a squirrel cage instead of the coils being wound around the armature, the same as is practiced in the building of a form wound armature for dynamos, and for this reason repairs to the armature are easily taken care of and made at small expense.

Duncan Direct Current Watthour Meters
Models FR and R

Model R

Model FR meters are of the shunted type and include sizes from 100 to 30,000 amperes. They have their internal metal parts finished in frosted nickel and are provided with a sheet metal cover having an all glass window in front only. The outside of the case and back support are enameled in plain black which is neat and durable.

All Model R watthour meters are of the shunted type. They are provided with a neat cover of plate glass and extruded metal, the front of the back support are finished in black enamel; the field coils and magnets are finished in hard rubber black and the rest of the mechanism will be finished in polished copper, polished nickel or hard rubber black and nickel combination. The latter finish will be furnished unless otherwise advised.

Both the Model FR and R meters are provided with 5-foot cables as a standard length; for additional lengths see prices below.

Shunt Cables For Models FR and R Meters (In excess of 5 feet)					
Length Feet	Price Extra	Length Feet	Price Extra	Length Feet	Price Extra
6	\$2.80	10	\$15.55	16	\$50.00
8	8.45	12	26.50	20	68.70

The Model ER Watthour Meter is of the shunted type. The prices listed include, for each meter, one set of 5-foot shunt cables, one shunt for the 2-wire, and two shunts for the 3-wire meter.

When cables in excess of five feet are required and specified, the following extra list prices will be charged.

Total Length—Shunt to Meter					
Length Feet	Price Each	Length Feet	Price Each	Length Feet	Price Each
6	\$2.65	10	\$14.75	16	\$47.40
8	8.00	12	25.00	20	65.00

†Specify normal voltage of circuit when ordering.

Type I-14 Watthour Meters

Front Connected—Metal or Glass Covers

Single-phase, Alternating Current

This watthour meter is self-contained, that is, requires no instrument transformer, except when the current exceeds 300 amperes, 2-wire, and 150 amperes, 3-wire, a current transformer is necessary, or when the voltage is more than 600 volts, both current and potential transformers are required.

Shipping weights per box: 5 to 25 amperes, 6 in a box with metal covers, 60 pounds; with glass covers, 65 pounds. 50 to 75 amperes, 4 in a box with metal covers, 55 pounds; with glass covers, 79 pounds. 100 to 300 amperes, 1 in a box with metal cover, 25 pounds; with glass cover, 27 pounds.

When ordering, state frequency and nature of circuit.

Type I-14—Self-contained—Require No Instrument Transformers

---	--------	--------	--------	--------	--------	--------	---------

*For 3-wire transformer rated circuits, 800 amperes and below, the 2-wire meters, as listed are to be used with a double-primary and single-secondary 5-ampere winding Form WM current transformer. For circuits above 800 amperes the 3-wire meters, as listed are to be used with 2 single-primary transformers.

Ordering Directions

Meters listed as self-contained require no instrument transformers. When the currents to be metered exceed the listed ratings, current transformers are required, or when the voltage of the circuit is more than 600 volts, both current and potential transformers are required. In such cases, meters for use on the secondary of transformers should be ordered, designating such meters by catalogue numbers and ratings as given above. Catalogue numbers of meters listed for use with transformers do not include transformers.

Unless otherwise specified, meters when ordered with transformers or for use with transformers in customer's possession, will be calibrated and furnished with suitable register to read directly the primary energy.

These meters may be used on circuits the voltage of which is not more than 10 per cent above or below the rated voltage of the meter. When ordering meters for voltages outside of these limits, the normal operating voltage must be specified.

Type D-7 Watthour Meters
Front Connected—Metal or Glass Covers
Polyphase, Alternating Current

The operation of this meter is based on the 2-wattmeter principle in metering the energy in a polyphase system. It utilizes 2 single-phase elements acting on a common moving element and recording on a single register. It is suitable for metering 3-wire, 2-phase and 4-wire, 2-phase balanced or unbalanced systems. Meters for 4-wire, 3-phase differ very slightly in their design.

Approximate shipping weight, all voltages: 5 to 25 amperes, one in a box, metal cover 34 pounds, glass cover 36 pounds; 2 in a box, metal cover 60 pounds, glass cover 64 pounds.

50 and 75 amperes, one in a box, metal cover 45 pounds, glass cover 47 pounds; 2 in a box, metal cover 85 pounds, glass cover 89 pounds. 100 and 150 amperes, one in a box, metal cover 49 pounds, glass cover 51 pounds; 2 in a box, metal cover 90 pounds, glass cover 94 pounds.

When ordering, state frequency and nature of circuit.

Type D-7—Self-contained—Require No Instrument Transformers

These meters listed are self-contained, that is, require no instrument transformers. When the currents to be metered exceed 150 amperes, current transformers are necessary; or when the voltage of the circuit is more than 600 volts, both current and potential transformers are required. In such cases, meters for use on the secondary of transformers should be ordered, designating the meters by catalogue numbers and ratings.

These meters may be used on circuits the voltage of which is not more than 10 per cent above or below the rated voltage of the meter. When ordering meters for voltages outside of these limits, the normal operating voltage must be specified.

110-volt—3-wire, 2 or 3-phase

Table listing meter specifications for 110-volt, 3-wire, 2 or 3-phase circuits. Columns include Amp., Metal Cover, Glass Cover, and Price Each. Rows are categorized by 25, 50, and 60 Cycles.

Type D-7 Watthour Meters

Front Connected—Metal or Glass Covers
Polyphase, Alternating Current

Type D-7—Self-contained—Require No Instrument Transformers

220-volt—4-wire, 2-phase

Table listing meter specifications for 220-volt, 4-wire, 2-phase circuits. Columns include Amp., Metal Cover, Glass Cover, and Price Each. Rows are categorized by 25, 50, and 60 Cycles.

440-volt—4-wire, 2-phase

Table listing meter specifications for 440-volt, 4-wire, 2-phase circuits. Columns include Amp., Metal Cover, Glass Cover, and Price Each. Rows are categorized by 25, 50, and 60 Cycles.

550-volt—4-wire, 2-phase

Table listing meter specifications for 550-volt, 4-wire, 2-phase circuits. Columns include Amp., Metal Cover, Glass Cover, and Price Each. Rows are categorized by 25, 50, and 60 Cycles.

Type D-7—Self-contained—Require No Instrument Transformers

These meters are self contained, that is, require no instrument transformers. When the currents to be metered exceed 75 amperes, 3 current transformers are necessary; or when the voltage of the circuit is more than 500 volts, 3 current and 2 potential transformers are required. In such cases meters for use on the secondary of transformers should be ordered, designating the meters by catalogue numbers and ratings as shown under Meters for Use with Instrument Transformers.

These meters may be used on circuits the voltage of which is not more than 10 per cent above or below the rated voltage of the meter. When ordering meters for voltages outside of these limits the normal operating voltage must be specified.

220Δ and 127Y Volts—4-wire, 3-phase

Table listing meter specifications for 220Δ and 127Y Volts, 4-wire, 3-phase circuits. Columns include Amp., Metal Cover, Glass Cover, and Price Each. Rows are categorized by 25, 50, and 75 Cycles.

440Δ and 254Y Volts—4-wire, 3-phase

Table listing meter specifications for 440Δ and 254Y Volts, 4-wire, 3-phase circuits. Columns include Amp., Metal Cover, Glass Cover, and Price Each. Rows are categorized by 25, 50, and 75 Cycles.

Type D-7 Watthour Meters

Front Connected—Metal or Glass Covers
Polyphase, Alternating Current
3-element Meters—Self-contained

The self-contained 3-element meters listed require no instrument transformers. When the currents to be metered exceed the listed self-contained capacities 3 current transformers are necessary or when the Δ voltage of the circuit is more than 600 volts, 3 current and 3 potential transformers are required. In such cases 3-element meters for use on the secondary of transformers should be ordered, designating the meters by catalogue numbers and ratings as shown under Meters for Use with Instrument Transformers.

Shipping weight, 4-wire, 3-phase, 3-element, 5 to 25-ampere meters, 1 in a box, 50 pounds.

Ordering Directions for Meters for Use with Transformers

Always state frequency and nature of circuit. If 4-wire, 3-phase, state both the Delta and Y voltages.

These catalogue numbers cover the meter only and do not include transformers. If transformers are to be furnished, they should be ordered by catalogue number and rating. For 3-phase 4-wire transformer rated circuits, 3 current transformers are necessary. For description and prices, refer to current and potential transformers. If meters are to be used with instrument transformers in customer's possession, the ratio of these transformers must be given on the order.

Unless otherwise specified, meters when ordered with transformers (or for use with transformers in customer's possession) will be calibrated and furnished with suitable register to read directly the primary energy.

These meters may be used on circuits the voltage of which is not more than 10 per cent above or below the rated voltage of the meter. When ordering meters for voltages outside of these limits, the normal operating voltages must be specified.

Type IP-5 Watthour Meters

Single-phase, Prepayment

Where the service to certain classes of consumers must be rendered under somewhat unfavorable conditions from the viewpoint of the usual method of metering, such for instance as transient or shifting populations involving frequent "cutting in" or "out" of service, reading, billing, collecting, etc., such cases may be metered more efficiently and conveniently through the use of the prepayment type of meter.

The Type IP-5 prepayment meter is made for this class of service and is arranged so that after the prepayment of one or more coins (25-cent piece) in the usual manner the consumer may receive energy up to the full amount for which payment has been made. The coin device permits prepayment of from one to twenty coins at a time. When the energy paid for has been used the meter automatically opens the line switch.

The mechanism is entirely mechanical in its operation. The element of the single-phase Type 1-14 meter is employed. Front connected, metal cover, dull black finish.

These meters may be used on circuits the voltage of which is not more than 10 per cent above or below the rated voltage of the meter.

When ordering meters for voltages outside of these limits the normal operating voltage must be specified.

Approximate shipping weight, one in a box, 31 pounds; two in a box, 57 pounds.

Types IS-4 and IS-5 Watthour Meters

Single-phase, for Switchboard Service

The Types IS-4 and IS-5 meters, made expressly for switchboard service, are of strong and simple construction.

They possess the fundamental features of the Type I-14 worked into an attractive switchboard housing. Their electrical characteristics are, therefore, the same. They are back-connected, but in order to facilitate testing are equipped with a very convenient form of testing terminal so designed that access to the back of the panel is unnecessary in order to introduce testing instruments, or to cut the meter out of service. They are equipped with micrometer adjustments for full and light loads.

Type IS-4

Type IS-5
 the metal parts being finished in dull black and nickel.

The Type IS-4 is furnished with a cast metal case finished in dull black with the raised parts of polished nickel.

The Type IS-5 is furnished with a glass cover as shown in the illustration

Types DS-6 and DS-7 Watthour Meters

For Switchboard Service

Polyphase, Alternating Current

Type DS-6

The Type DS-6 and DS-7 meters are designed expressly for switchboard service. In principle they are like the Type D-7 but are provided with housing as shown adapting them for mounting on panels. They possess the same electrical characteristics as the Type D-7. They are provided with special testing terminals so that access to the back of the panel is unnecessary in order to introduce testing instruments or to cut the meter out of service. Micrometer adjustments are provided for full and light load and

for the balance of elements. A suitable power-factor adjustment is also available.

The Type DS-6 is furnished in an attractive cast metal case finished in dull black with raised portions of polished nickel very similar to the single-phase Type IS-4.

The Type DS-7 is furnished with a glass cover, the metal parts being finished in dull black and nickel.

199303	50	40	40	159.00
199304	75	60	60	170.00

Meters listed above are self-contained, that is, require no instrument transformers. When the currents to be metered exceed 75 amperes, current transformers are necessary, or when the Δ voltage of the circuit is more than 600 volts, both current and potential transformers are required. In such cases meters for use on the secondary of transformers should be ordered designating the meters by catalogue numbers and ratings as given below.

Meters for Use with Current and Potential Transformers

Cat. No.	Amp.	Volts	Price Each
199307	5	190Δ110Y	\$117.00

Meters for Use with Current Transformers Only

199305	5	220Δ127Y	\$117.00
199306	5	440Δ254Y	127.00

The catalogue numbers cover the meter and do not include transformers which should be ordered in addition giving complete rating. Unless otherwise specified, meters when ordered with transformers will be calibrated and furnished with suitable register to read directly the primary energy.

Approximate net weight each, 34 pounds. Approximate shipping weight, one in a box, 85 pounds; two in a box, 160 pounds.

Always specify the nature and frequency of the circuit on which the meter is to be used.

When ordering three-phase, four-wire meters listed, always state both the Δ and Y voltage of the circuit.

All meters listed may be used on circuits the voltage of which is not more than 10 per cent above or below the rated voltage of the meter. When ordering meters for voltages outside of these limits the normal operating voltage must be specified.

All meters listed under "Self-Contained" require no transformers.

When the current to be metered exceeds the maximum listed above current transformers are necessary, or when the voltage of the circuit is more than 600 both current and potential transformers are necessary. In such cases meters for use on the secondary of transformers should be ordered by catalogue number and rating as listed under "Meters for Use with Transformers."

These catalogue numbers cover the meter only and do not include transformers.

Transformers should be ordered separately by catalogue number and rating.

Type C-6 Watthour Meters
Thomson—Side Connected Metal Cover
Direct Current

This meter is made for direct current circuits. It has unusually high torque, light weight moving element, small commutator gravity control brushes and adjustable shunt field coil. It can be furnished for back connections. Prices on application.

Approximate shipping weight, all voltages, 5 to 50 amperes, inclusive, one in a box, 26 lbs., two in a box, 50 lbs.; 75 amperes, one in a box, 35 lbs., two in a box, 69 lbs.; 100 to 600 amperes, one in a box, 48 lbs.

State normal operating voltage of circuit when ordering.

100-120 Volts, Direct Current, Two-wire

Type CS-3 Watthour Meters
Astatic—Side Connected—Metal Covers
Direct Current

Type CS-3 is an astatic watthour meter for direct current service and is especially designed by an astatic arrangement of the armature and field coils for operation with accuracy in the presence of stray fields.

This meter can be furnished in back connected form, known as Type CS-4. Prices on application.

Approximate shipping weight, all capacities and voltages, 60 pounds.

Always state normal operating voltage of circuit when ordering.

Type CS Watthour Meters
For Switchboard Service
Direct Current Astatic

This meter embodies the double or astatic arrangement of field coil and armature as in the CS-3 meter. The magnets are astatically arranged and magnetically shielded by a laminated iron box which totally surrounds them. The resistance for the potential circuit is mounted within the case so that all parts are at the same relative temperature, minimizing errors arising from this source. It is furnished with glass cover, the finish of the meter being dull black and nickel.

When ordering, state normal operating voltage of circuit.

Type C-15 D.C. Watthour Meters

Type C-15 2-wire

The Type C-15 direct-current watt-hour meter is identical in principle with the Type C-6 meter and retains those essential features of the latter which insure successful operation. It differs, however, in many of its mechanical details, such as in the use of the Type 1-14 meter register and magnets, the D-7 meter cover and a material reduction in over-all dimensions and weight.

The back is an aluminum alloy casting following out as far as possible the idea introduced in the I-14 meter, i. e., one central casting to which all parts are attached. The terminal chamber is at the bottom with a separately concealed cover identical with the I-14.

This meter is built only in the smaller ratings of 5 to 15 amperes, 110 and 220 volts, 2 and 3-wire.

Watthour Loose Leaf Meter Books

Meter Book Complete

The Hall Loose Leaf Meter Book is made in two sizes Nos. 100 and 200. No. 100 is designed to hold 100 meter sheets.

No. 200 will accommodate 200 sheets. No. 100C consists of a No. 100 cover and 100 sheets.

No. 200C comprises a No. 200 cover and 200 sheets.

Size of leaf is 5x8 1/2 inches.

Type L Matthews Woodpecker Telefaults

For use on telephone, telegraph, or signal cable. A self-contained instrument that will exactly locate water in cables, shorts of all kinds in cables, crosses, grounds, split pairs, in fact, everything except "opens." It only uses one dry cell battery, maximum voltage under 5 volts. The tone is like a woodpecker on a pole and does not "noise" up other working pairs, because of the inductive field created.

Can also be used as a tone test set, as a howler to make subscribers hang up receivers.

The Type L Matthews Woodpecker Telefault is held in a neat, strong case, and furnished with a carrying strap. The vibrator, battery, head phone and exploring coil are all contained in this box.

No batteries are furnished.

Shipping weights, Type L Telefaults complete, 8 pounds; extra exploring coils, 2 pounds; extra receivers, 1 pound.

Price, Type L Telefault Complete.....each \$132.00
" Extra Exploring Coils....." 30.00
" " Receivers....." 8.00

Foot-candle Meters

The foot-candle meter is a small, self-contained instrument which measures illumination intensities in foot-candles. This unit is rapidly becoming recognized as the popular as well as the scientific measure of intensity in illumination, which makes the application practical. Technical knowledge is not required in the use of the meter because the ad-

justment is simple and determinations are readily made. The foot-candle meter shows where increased intensities must be installed to get the desired results. It should be returned at least once every four months for recalibration.

8x6x1 1/2	3	4	7	\$25.00	\$1.50

Type H Distribution Transformers

Single-phase, 60 Cycles, Self-cooled

The Single-phase Distribution Transformers are built on the distributed core, which has been found best adapted both electrically and mechanically to this type of transformer.

Various coil constructions have been developed to meet the particular requirements of designs depending upon unit size and voltage rating. In the larger sizes, circular coils of either disk or cylindrical form are used on account of their greatly superior mechanical qualities, and the facilities they give for rigid mechanical support.

The windings of the Distribution Transformers are carefully dried under vacuum, and filled under pressure with an insulating compound. This process not only removes all moisture from the insulation and seals the windings against the entrance of moisture, but also makes the winding a solid mass, thus giving it greater mechanical strength and heat conductivity. In the core-wound transformers this treatment is applied to the complete unit, consisting of core and coils. In the form-wound transformers the complete winding is treated as a unit before assembly on the core.

For Operation on 2200-2300-2400-volt Circuits

APPLICATION.—By connections of the low voltage leads outside the tank, transformers are arranged for series, multiple or three-wire service, with the exception of sizes 150 and 200 kv-a. which are suitable for series and three-wire service only.

SERVICE.—All sizes are suitable for outdoor or indoor installation.

FUSIBLE PRIMARY CUTOUTS.—Two cutouts, Cat. No. 104227 are furnished with sizes up to 50 kv-a., inclusive. When cutouts are desired for sizes 75 to 200 kv-a., inclusive, two Cat. No. 260773 should be ordered separately.

SUSPENSION HOOKS.—Suspension hooks are provided with all sizes up to 100 kv-a. inclusive.

Transformer weights include suspension hooks up to 100 kv-a. inclusive.

Type H Distribution Transformers

Single-phase, 60 Cycles, Self-cooled

For Operation on 440-460-480 and 550-575-600-volt Circuits

APPLICATION.—By connection of the low voltage leads outside the tank, transformers are arranged for series, multiple or three-wire service.

SERVICE.—All sizes are suitable for outdoor or indoor installation.

FUSIBLE PRIMARY CUTOUTS.—Two cutouts Cat. No. 104227 are furnished with sizes up to 10 kv-a., inclusive, in the 440-volt class and with sizes up to 15 kv-a., inclusive, in the 550-volt class. When cutouts are desired for sizes 15 and 25 kv-a., in the 440-volt class or for sizes 25 and 37.5 kv-a., in the 550-volt class, two Cat. No. 260773 should be ordered separately.

SUSPENSION HOOKS.—Suspension hooks are provided with all sizes up to 100 kv-a. inclusive.

Transformer weights include suspension hooks up to 100 kv-a. inclusive.

Type H Distribution Transformers

Single-phase, 60 Cycles, Self-cooled
For Operation on 2300-volt Circuits

APPLICATION.—By connection of the low-voltage leads outside the tank, transformers having low-voltage rating of 115/230 are arranged for series, multiple or three-wire service, with the exception of sizes 150 and 200 kv-a. which are suitable for series and three-wire service only. Transformers having low-voltage rating of 230/360 are suitable for series and multiple service only.

SERVICE.—All sizes are suitable for outdoor or indoor installation.

FUSIBLE PRIMARY CUTOUTS.—Two cutouts Cat. No. 104227 are furnished with sizes up to 50 kv-a., inclusive.

When cutouts are desired for sizes 75 to 200 kv-a., inclusive, two Cat. No. 260773 should be ordered separately.

SUSPENSION HOOKS.—Suspension hooks are provided with all sizes up to 100 kv-a., inclusive.

Transformer weights include suspension hooks up to 100 kv-a., inclusive.

Type A Distribution Transformers

Single-phase, 60 Cycles, Self-cooled
For Operation on 1100 or 2200-volt Circuits

Type A transformers are standard for nominal 1100-volt service and are also suitable for nominal 2200-volt service.

APPLICATION.—The high voltage windings of sizes 1 to 50 kv-a., inclusive, may be connected for either 1150, 2300 or 4000Y volts. The high voltage windings of sizes 75 and 160 kv-a. may be connected for 2300 or 4000Y volts only. By connections of the low voltage leads outside the tanks, transformers are arranged for series, multiple or three-wire service.

SERVICE.—Suitable for outdoor or indoor installation.

FUSIBLE PRIMARY CUTOUTS.—Two cutouts Cat. No. 104227 are furnished with sizes up to 50 kv-a., inclusive. When cutouts are desired for sizes 75 and 100 kv-a., for 2300 or 4000Y volt operation, or for sizes 37.5 and 50 kv-a., for 1150-volt operation, two Cat. No. 260773 should be ordered separately.

SUSPENSION HOOKS.—Suspension hooks are provided with all sizes up to 50 kv-a., inclusive.

Transformer weights include suspension hooks up to 50 kv-a., inclusive.

Type H Distribution Transformers

Single-phase, 60 Cycles, Self-cooled

For Operation on 4000-volt Circuits

These transformers are to provide service where it is more economical or desirable to connect transformers across phases than between line and neutral on 2300-4000 volt Y circuits. The use of these transformers gives the same service voltages as 10:1 ratio transformers connected between line and neutral.

APPLICATION.—By connection of the low-voltage leads outside the tank, transformers are arranged for series, multiple or three-wire service, with the exception of 150 and 200 kv-a. which are suitable for series and three-wire service only.

SERVICE.—All sizes are suitable for outdoor or indoor installation.

FUSIBLE PRIMARY CUTOUTS.—Cutouts are not furnished with these transformers. When cutouts are desired two Cat. No. 260773 should be ordered separately.

SUSPENSION HOOKS.—Suspension hooks are supplied with all sizes up to 100 kv-a., inclusive.

Transformer weights include suspension hooks up to 100 kv-a., inclusive.

Type H Distribution Transformers

Single-phase, 60 Cycles, Self-cooled
For Operation on 6600-volt Circuits

APPLICATION.—For operation on 6600-volt circuits and for supplying 2300 or 4000-volt distribution and motors.

Transformers having voltage rating of 6600/11430Y to 2300 are, when operated in bank, suitable for transforming from 6600 to 2300; from 6600 to 4000Y or from 11430Y to 2300. They should not be used connected in Y on both high- and low-voltage sides simultaneously to transform from 11430Y to 4000Y as this connection may result in the presence of excessive stresses in the windings due to harmonic voltages.

SERVICE.—All sizes are suitable for outdoor or indoor installation.

FUSIBLE PRIMARY CUTOUTS.—Cutouts are not included with these transformers.

SUSPENSION HOOKS.—Suspension hooks are provided with all sizes up to 50 kv-a., inclusive.

Transformer weights include suspension hooks up to 50 kv-a., inclusive.

Type H Distribution Transformers

Single-phase, 60 Cycles, Self-cooled
For Operation on 11000-volt Circuits

APPLICATION.—For 11000-volt circuits and for supplying service voltages 600 and below. Transformers of these name plate ratings are also designed for operation as follows:

High Voltage Rating **Line No. 1** **Line No. 2** **Line No. 3**
 11000, 10450/9900 to 110/220 220/440 550

By connection of the low-voltage leads outside the tank, transformers having low-voltage rating of 115/230 are arranged for series, multiple or three-wire service with the exception of sizes 150 and 200, which are suitable for series and three-wire service only. Transformers having low voltage rating of 230/460 are suitable for series and multiple service only.

SERVICE.—All sizes are suitable for outdoor or indoor installation.

FUSIBLE PRIMARY CUTOUTS.—Cutouts are not furnished with these transformers.

SUSPENSION HOOKS.—Provided with and included in weights of all sizes up to 50 kv-a., inclusive.

192511	192525	192605	200	240	6230

Type H Subway Transformers

Single-phase, 60 Cycles, Self-cooled
For Operation on 2200, 2300 and 2400-volt Circuits

Transformers for subway service must meet all the conditions imposed upon them by underground installation; they must be watertight since subways are not dry and transformers are often subjected to actual contact with water. Their dimensions must be as small as consistent to adapt them to the limited space available in manholes; they must have high efficiency and low losses because they are usually connected to the line continuously. The design must provide for low temperature rise as the radiation is slow, due to the poor circulation of the air in the manhole.

APPLICATION.—By connection of the low-voltage leads at the terminal board, transformers are arranged for series, multiple or three-wire service, with the exception of 75, 100, 150 and 200 kv-a. which are suitable for series, and for three-wire service only.

FUSIBLE PRIMARY CUTOUTS.—Cutouts are not furnished with these transformers.

It is recommended that subway transformers be protected with D & W oil fuse cutouts as follows: Sizes up to 50 kv-a. inclusive, No. 246103 (50 amp. capacity) or No. 246104 (100 amp. capacity). For sizes 75 and 100 kv-a. No. 246104 (100 amp. capacity standard service), No. 246107 (100 amp. capacity heavy service) or No. 246105 (200 amp. capacity). For sizes 150 and 200 kv-a., No. 246105 (200 amp. capacity standard service) or No. 246108 (200 amp. capacity heavy service).

APPLICATION.—Terminal board is provided on the low-voltage side for either series or multiple connection.

SERVICE.—All sizes are suitable for outdoor or indoor installation.

FUSIBLE PRIMARY CUTOUTS.—Three cutouts Cat. No. 104227 are furnished with sizes up to 50 kv-a., inclusive, in the 2300-volt class.

SUSPENSION HOOKS.—Suspension hooks are provided with all sizes up to 50 kv-a., inclusive, below.

BRACKETS.—Brackets for supporting the high-voltage leads are regularly furnished with all sizes up to 50 kv-a., inclusive.

For Operation on 2200, 2300, 2400 or 4000-volt Circuits

APPLICATION. — Terminal board is provided on the low-voltage side for either series or multiple connection.

SERVICE. — All sizes are suitable for outdoor or indoor installation.

FUSIBLE PRIMARY CUTOUTS.—Cutouts are not furnished with these transformers.

SUSPENSION HOOKS. — Suspension hooks are provided with all sizes up to 50 kv-a. inclusive, for voltage ratings 13800 and below.

BRACKETS. — Brackets for supporting the high-voltage leads are regularly furnished with all sizes up to 50 kv-a. inclusive, for voltages 13800 and below.

D & W Oil Fuse Cutouts

Pole Type 50-200 Amperes

When ordering specify catalogue number and in addition, the type, rated ampere capacity and voltage.

Subway Type 50-200 Amperes

For example, if ordering two (2) Cat. No. 230014 Cutouts, the requisition should read: Cat. No. 230014—Type D-1C—50-ampere—2500-volt Standard Pole Type—D & W Oil Fuse Cutouts. Sufficient oil (No. 21) is shipped with the cutouts in all cases and it should not be specified as a separate item on the requisition.

Particular attention is directed to the fact that fuse links are not included with cutouts and must be ordered as a separate item. Ordinary fuse wire or fuse links for other kinds of cutouts will not operate satisfactorily and the special links designed for these cutouts should be used.

In ordering fuse links specify the catalogue number and in addition the ampere rating, type, and mention the ampere rating of the cutout for which they are intended, and line voltage on which the cutout is to be used. If possible, also mention the catalogue number of the cutout.

Supply parts should be positively identified on the requisition by description and the form letter of the cutout as well as the Cat. No. of the cutout.

*Cat. No. 235587 is now obsolete. The links listed are for the boxes which are already in service.

**Cat. No. 230008 when used on 5000-volt circuits will require special reactive type links. Full data on request.

†The standard links for 150 amperes and below listed for these cutouts will operate satisfactorily on 5000 volts.

‡When Cat. Nos. 230007 and 230013 are used on 5000-volt circuits where reactive type fuse links are required, use links Cat. Nos. 235636 to 235656. Links Cat. Nos. 230704 to 230730 are only good for 2500-volt circuits.

§Not suitable for use in Cat. No. 230010.

Type OK Matthews Fuswitches and Disconnecting Switches

Designed to Give the Maximum of Protection for Transformers and for Sectionalizing of Lines, etc.

Matthews Fuswitch and Disconnecting Switch are exactly the same with the exception that the first has the patented double barreled vacuum cartridge, and the second has the metal switch blade. Either can be quickly and easily converted to the other by substituting the blade for the cartridge or vice versa.

They are both rated 7500 volts or less; the Type OK Fuswitch 100 amperes or less; the Type OK Disconnecting Switch 150 amperes or less.

The box is made of Tidewater Cypress soaked in linseed oil and protected inside and out with high voltage weather resisting paint. Roof is covered with sheet copper.

Four holes are provided for right or left-hand entrance. Fuse cartridge or blade is handled entirely by the Matthews Safety Fuse Puller. One of these furnished with each 2 switches. Can be inspected without disturbing service.

Type	Description	Ship. Wt., Lbs.	Price Each
OK	Fuswitch	18	\$19.50
OK	Disconnecting Switch	18	18.00
OK	Extra Cartridges	3	9.00
OK	" Blades	3	6.50
OK	" Bushings	1	1.20

Extra fuses can be furnished in 3 to 100 amperes inclusive. All fuses 25 amperes or less will be furnished made of round lead with flat copper terminals. All fuses over 25 amperes will be furnished of flat zinc. Prices for extra fuses 40 cents each. One fuse will be sent with each fuse switch as specified and without extra charge.

Type CG Matthews Fuswitches

For 4400 Volts or Less, 60 Amperes or Less

Closed View

Open View

When wires become short-circuited, a Matthews Fuswitch protecting the wire is designed to open the circuit in trouble by the fuse melting from overload, killing the section short-circuited. Matthews Fuswitches combine in one device the fuse block and the primary line disconnecting switch.

Type CG has a composition top, which makes it absolutely impervious to weather conditions.

Type	Shipping Wt., Lbs.	PRICE		
		Less than 12	12 to 24	25 or More
CG	25	\$36.00	\$34.00	\$32.00

Extra fuse blades for the Type CG cost \$13.00 each.

The above prices include fuse cartridge, hangers, insulators and fuse wire for one charge. Specify amperes of fuse desired. Extra fuses for Type CG-3 to 60 amperes, 40 cents each. Lead fuses furnished for 25 amperes or less.

Type HQ Matthews Fuswitches and Disconnecting Switches

Designed to Give the Maximum of Protection for Transformers and for Sectionalizing of Lines, etc.

Matthews Fuswitch and Disconnecting Switch are exactly the same with the exception that the first has the patented double barreled vacuum cartridge, and the second has the metal switch blade. Either can be quickly and easily converted to the other by substituting the blade for the cartridge or vice versa.

They are both rated 7500 volts or less; the Type HQ Fuswitch 200 amperes or less; the Type

HQ Disconnecting Switch 250 amperes or less. The box is made of Tidewater Cypress soaked in linseed oil and protected inside and out with high voltage weather resisting paint. Roof is covered with sheet copper.

Four holes are provided for right or left-hand entrance. Fuse cartridge or blade is handled entirely by the Matthews Safety Fuse Puller. One of these furnished with each 2 switches. Can be inspected without disturbing service.

Type	Description	Ship. Wt., Lbs.	Price Each
HQ	Fuswitch	25	\$36.00
HQ	Disconnecting Switch	24	29.00
HQ	Extra Cartridges	3	13.50
HQ	" Blades	2	6.50
HQ	" Bushings	1	1.20

Extra fuses can be furnished in 3 to 200 amperes inclusive. All fuses 25 amperes or less will be furnished made of round lead with flat terminals. All fuses over 25 amperes will be furnished of flat zinc. Price for extra fuses 40 cents each. One fuse will be sent with each fuswitch as specified and without extra charge.

Open Type Matthews Fuswitches

Rating 15000 Volts or Less—100 Amperes or Less

Furnished with either 17500 or 25000-volt as specified. Frame certified galvanized malleable iron. Can be strapped or bolted to cross arm. Fuse cartridge 14 inches between contacts.

The inner tube is made out of horn fibre covered with an exterior of weatherproof tube.

The upper contact clip is covered with a rib that prevents the cartridge from falling out in case of a severe jar.

Description	Ship. Wt. Lbs.	Price Each
Fuswitch with 17000-volt Insulator	20	\$20.00
" " 25000 " "	24	25.00
Extra Cartridges	3	11.70
" Insulator Assemblies, Upper or Lower, 17500-volt	7	6.50
Extra Insulator Assemblies, Upper or Lower, 25000-volt	8	9.00
Extra Cross Arm Strapping, 4 1/4 or 4x5 as Specified	..	3.25
Matthews Safety Fuse Puller Tongs, 5 Feet Long	6	18.00

Extra fuses can be furnished in 3 to 100 amperes inclusive. All fuses 25 amperes or less will be furnished made of round lead with flat copper terminals. All fuses over 25 amperes will be furnished of flat zinc. Price for extra fuses 40 cents each. One fuse will be sent with each fuswitch as specified and without extra charge.

Transformer Specialties

Transformers for Special Purposes

In addition to the standard Type M transformers, there also has been developed a uniform line of special parts for manufacturing any miniature air-cooled transformers ranging from 15 to 5000 watts inclusive, 60 cycles, and from 5 to 3000 watts inclusive, 25 cycles, at voltages of 550 and below. No oil is used for either cooling or insulating purposes.

Type M transformers present a good appearance wherever installed. The construction may be for indoor or outdoor service as desired. By substituting this transformer for batteries or magneto generators, no maintenance or replacement charges due to wear are incurred, less space is required and cleanliness and reliability are assured.

The following are a few representative applications: Electric welding, speed variation of motors, operating of small, low-voltage motors from higher voltage circuits, railway signal lighting two to three-phase transformation.

Sign Lighting Transformers

Primary—110-220 Volts; Secondary—11-22 Volts

These transformers are used in connection with the lighting of large or small advertising, municipal, civic, or other display signs. They are also used quite extensively for experimental purposes where a standard transformer is needed for producing heavy currents at low voltages.

Primary windings are arranged for series-multiple connection to operate either from 110 or 220-volt circuits. Secondary windings are similarly arranged to give full output at 11 or 22 volts and to permit of three-wire operation. Coils are enclosed in a strong, metal case which is provided with lugs for fastening to the wall, or to the back of the sign.

Insulating Transformers

**Primary—110-220 Volts; Secondary—110-220 Volts
50 to 140 Cycles**

Insulating Transformers are arranged for 1:1 or 2:1 ratio and are manufactured chiefly for uses such as insulating lighting from power circuits; single wire lighting systems in mines; insulating telephone circuits (before rectification) from lighting circuits, etc., and for other transformations to which the rating is adapted. They are used as well for balancing three-wire, 110-220 volt circuits where auto transformers cannot be used. Weights include oil for the Type H sizes. Suitable for indoor or outdoor installation.

Auto Transformers, Single-phase

**Primary—220 Volts
Secondary—110 Volts, 2-wire
or 110-220 Volts, 3-wire**

The auto transformer is an economical substitute for the ordinary transformer, particularly when both voltages are low and a comparatively small change in voltage is desired.

The design is for single phase, two phase or open delta transformation. It is not suitable to transform power three to two phase from 220 volts to 110 volts. Type M, air-cooled; Type H, oil-cooled.

Auto Transformers

For Conduit Wiring Installations

Primary—220 Volts
Secondary—110 Volts, 2-wire or 110-220 Volts 3-wire

When a comparatively small change in voltage is desired, or where both voltages are low, an auto transformer can be used as successfully as a transformer and its reduced capacity will mean a considerable saving.

The use of auto transformers for supplying lighting circuits from power circuits having potentials above 250 volts is not, however, considered good practice.

All sizes are suitable for outdoor installations.

Type M transformers are air-cooled.

*Kva output at 110 volts, 2-wire or allowable unbalancing at 110-220 volts, 3-wire.

Type MTQ Auto Transformers

MTQ Auto Transformers are designed to transform power efficiently and inexpensively from three to two-phase, 4-wire, or the reverse, with outputs of 1 to 25 Kva.

The principal application of the MTQ Auto Transformer is to adapt polyphase motors to existing circuits. They are not suitable, however, for 3-wire, 2-phase service, or to operate motors with interconnected phases.

Suitable for indoor or outdoor installation.

In ordering MTQ Auto Transformers specify whether the two-phase circuit is 3 or 4-wire.

Primary—220 Volts, 2-phase
Secondary—220 Volts, 2-phase, 4-wire

All-Nite-Lite

The All-Nite-Lite has been introduced to satisfy the demand for an electric illuminant to operate all night at a sufficiently low cost to be well within the means of all who use electricity.

It operates on any alternating current supply circuit within the voltage and frequency limits specified. Installation is made by simply screwing the All-Nite-Lite into a standard lamp socket.

The complete All-Nite-Lite consists of a miniature transformer contained within an attractive brass shell, and a miniature Mazda lamp. The transformer is constructed with the primary and secondary coils liberally insulated and with a core built of the highest grade of transformer steel.

One of the principal applications for the All-Nite-Lite is illumination of the porch and house number. The porch of the average householder is usually in darkness and the house in obscurity. The All-Nite-Lite may be operated all night for less than \$1.50 a year or kept in the circuit continuously for \$3.00 a year.

If wired so that it cannot be turned off the householder is always assured of illumination on his porch without the necessity of turning switches.

**Pyrotip Electric Burners
For Lead Burning**

The Pyrotip Electric Burner, while designed especially for lead burning in the repair of starting and ignition batteries, may also be used for the repair of vehicle, truck and locomotive batteries and has various other uses about the garage. The equipment is portable, and complete weighs approximately 25 pounds.

May be connected to any alternating current lamp socket by means of the attaching cord, which is 10 ft. long. A plug connector is arranged for connecting and disconnecting the attaching cord when it is not convenient to use the socket switch. The secondary leads are flexible and made from heavy rubber-covered cables.

ELECTRODES.—Specify Cat. No. 219930—Carbon Electrode. Standard packages contain 100.

NOTE.—Equipment cannot be used on Direct Current Service. Prices furnished upon application.

**Pyrotip Electric Burners
For Heavy Service**

The large size Pyrotip is designed to take care of heavy work which, due to the large amount of energy required, cannot be accomplished by the smaller set. Other than being of greater capacity and necessarily larger throughout, it has the same operating characteristics as the set described in the preceding paragraphs.

Particularly adapted for cutting thin sheet steel, and repairing very heavy storage batteries. Portable, weighing approximately 45 lbs. and under normal operating conditions, draws about 800 watts. This depends somewhat on the depth that the carbon is inserted in the material being worked.

This size Pyrotip is too large to be connected to the ordinary 110-volt lighting socket, but it is equipped with a connecting cord and a separable plug which permits ready attachment to an outlet receptacle or an Edison base flush or surface type receptacle.

The secondary leads are of extra heavy construction and are detachable. Handle and carbon holder are of heavy design.

Type OF Oxide Film Lightning Arresters

The oxide film arrester consists essentially of a number of cells with a gap in series between line and ground. The cells are held together under slight pressure and are arranged in sections or stacks according to the voltage and kind of circuit. Each cell is made of 2 circular brass plates crimped firmly to the edges of an annular piece of porcelain. A powder, lead peroxide, which has low resistance, compactly fills the space between the plates. The inside of the metal plates is covered with a varnish film which is an insulator. The number of cells used in an arrester is such that the voltage per cell is approximately 300 volts.

When a lightning voltage sparks over the gaps it is impressed on the cells and breaks down the insulating coating on the metal plates. The breakdown occurs in the form of a minute puncture of the film coating. The metal plates are not punctured. As soon as the film gives way, a discharge current flows through the cells to ground, thus relieving the lightning pressure. The flow of current through the cells immediately causes a chemical change by heat, in the lead peroxide at the point of puncture. The lead peroxide is reduced to red lead and litharge which have a high resistance. Thus, following the lightning discharge, a high resistance amounting practically to insulation is automatically cut into the discharge path. This cuts off the flow of generator current that would otherwise follow the lightning discharge and the arcs in the gaps die out. If the potential should still, or again, be sufficiently high to break down the gaps, the operation is repeated at some other point on the surface of the varnished plates.

Single-phase—Indoor Service

Not for use on single-phase circuits from quarter-phase 3-wire circuits. Use 2 on quarter-phase, 4-wire circuits.

Cat. No.	**VOLTAGE RATING OF ARRESTER		Ship. Wt., Lbs.	*Price Each
	Min.	Max.		
1576223	1000	3000	190	\$130.00
1576224	3000	5000	270	180.00
1576225	5000	7500	360	240.00

*Prices do not include disconnecting switches. Some kind of disconnecting device must be installed with these arresters. †Single-pole, for 2300-volt delta or 4100-volt grounded Y circuits.

**Select arrester so that the line voltage will never exceed the maximum rating of the arrester under any normal operating condition. Arresters are suitable for altitudes up to 4000 feet.

Horn Lightning Arresters

For Series Lighting Circuits

Horn Arrester for Indoor Service

Consist essentially of a horn gap in series with a resistance. The horn gaps and resistances of the indoor arresters are mounted on insulating supports, which, for the higher voltages, have asbestos barriers and backs.

The indoor arresters are double-pole.

The outdoor horn arresters consist of a horn gap, and resistance units enclosed in porcelain. Designed to be mounted on the tops of the poles and above the wires.

They are supplied in single-pole units only.

Double-pole Horn Gaps

To prevent the full line potential being thrown on the telephone protective equipment in the case of a cross with the telephone line.

Price, No. 201112, for Outdoor Use, Wt., 70 Lbs. each \$28.00

Form A Compression Chamber Multigap Arresters

For Outdoor Service Only on A.C. Constant Potential Circuits

Up to 3000 Volts
Single Pole

Designed mainly for the protection of distribution transformers. Consists of a column of gaps and a series resistor mounted in a porcelain tube. The porcelain tube is sealed in a porcelain base and a cap is sealed on the tube.

No. 270281 Line Connectors

Line Connector Attached to Pole

Line connector. Cat. No. 270281, has a current carrying capacity of 200 amperes.

The connector can be clamped on any wire from $\frac{3}{16}$ to $\frac{5}{8}$ inch in diameter.

A hole $\frac{3}{16}$ inch in diameter is provided for soldering a lead to the connector.

This connector is suitable only where occasional disconnecting is required and where particularly quick disconnecting is not necessary.

Especially useful for making temporary connections in construction work.

The clamp is made of brass throughout with the exception of the spring, which is of phosphor bronze and the two set-screws, which are of zinc plated steel.

There is required to operate this device only a standard disconnecting switch hook.

Insulated Choke Coils

Choke coils are recommended for use with all high-voltage lightning arresters when used on overhead lines. They should not be installed with lightning arresters when used to protect cables over half a mile long, without careful consideration.

Type LG-116 Disconnecting Switches

Single-pole, Single and Double Throw

Indoor Type—Unmounted

2500 or 3500 Volts

Type LG-116 switches are for disconnecting purposes only. They should not be opened under load.

All switches are given an insulations test at least equal to that prescribed in the Standardization Rules of the A. I. E. E. (2¼ rated x voltage + 2000 volts).

2500 or 3500-volt switches are for mounting directly on marble bases or on 1½ or 2-inch marble panels. Slate should not be used. Special LG-116 switches on marble bases for 3500 volts can be furnished. These switches parallel the 2500-volt line on bases except that special larger marble bases and special spacing are required.

Back connected switches, 1200 amperes and below, include 2 nuts and 1 terminal per stud.

Front connected switches, 1200 amperes, inclusive, are equipped with a complete set of terminals.

All switches 1600 amperes and above are laminated for bar connections. No terminals are included.

Do not fail to order one or more switch hooks with each equipment, unless previously ordered.

Combination Safety Catches and Opening Devices

For Type LG-116 Disconnecting Switches

These combination safety catches and opening devices are for use on single-throw switches only. Prices on combinations for double-throw switches will be furnished upon application.

They must be used together in combination form and neither can be used separately.

Prices on combinations for double-throw switches may be had on application.

These devices permit of the release of the catch and the opening

of the switch with one operation of the switch hook.

65850	25000	8	15	7.00

90 Degree Blade Stops

For Type LG-116 Disconnecting Switches

It is often desirable to provide stops for switches in order to prevent them from accidentally coming in contact with other apparatus, or to prevent the closing of a double-throw switch in the wrong throw.

For use on all voltages, 2500 to 15000.

Cat. No.	Cap. Amps.	Shipping Wt., Lbs.	Price Each
1960395G1	300	1	\$4.00
1960395G2	600	1	4.00
1960395G3	800	1	4.00
1960395G4	1200	2	4.00
1960395G5	*1600	2	6.00
1960395G6	*2000	2	6.00
1960395G7	*3000	2	7.00

*Require 2 stops per switch.

Type LG-17B Disconnecting Switches
Indoor Type, Single-pole, Single and Double-throw
With Moderate Duty Insulators and Safety Catches Mounted on Oval Metal Bases for Flat Surface or 1 1/4-inch Pipe Mounting
15000 Volts

Back connected 1200-amp. and below, have round studs. 1200-amp. back connected, have 2 nuts per stud but no terminals. Adapter plate with 2 terminals and necessary bolts and nuts No. 2609820G1 must be ordered separately if desired. 800-amp. and below, back connected, have 2 nuts and one terminal per stud. Front connected 1200-amp. are complete with 4 hex. head bolts and nuts per clip block but no terminals. Adapter plate with 2 terminals and necessary bolts and nuts No. 262275G1 must be ordered separately if desired. 800-amp. and below, front connected are complete with set of terminals with bolts and nuts. 800-amp. have 4 bolts and nuts per terminal. 200, 400 and 600-amp. have one bolt and nut per terminal complete with a doweled

locking washer. Clip blocks in addition to hole for bolt have 4 small holes in which 2 dowels on locking fit. These projections go through 2 holes in terminal itself and then into 2 of the holes in clip block and prevent terminal from turning or twisting. Terminal can be mounted straight out or swung to either right or left.

When it is desired to mount Type LG-17B switches listed below on 1 1/4-inch pipe (not included), add for each switch two 1/2-inch half yokes with nut for clamping base to pipe.

EEE Form C Insulating Supports
Outdoor Service—Flat or Pipe Mounting

Type FP

Type FF

All Form C supports are made in the interchangeable part construction. They can therefore be made upright or underslung by interchanging position of bus clamp and mounting base.

Supports for other sizes of conductors, other arrangements of conductors, higher voltages, or other styles of mounting can be supplied.

EEE Indoor Style Cable End Bells
Alternating or Direct Current

Cat. No. 105

This device which is sometimes called a pot head, is essential for the protection of lead covered power cables.

A completed end bell not only provides a perfect grounding device for the lead sheath of the cable, thereby removing static accumulation, but also seals the cable against moisture.

Specify, when ordering, voltage of circuit, number of conductors, gauge of cable, exact over all diameter of cable over lead sheath, type of joint (all bells are made to either screw on pipe or clamp, or wipe on cable) and if pipe joint, the size of pipe must be specified also.

Cat. No.	Type	No. of Conductors	Voltage	MAXIMUM OUT-SIDE DIAMETER CABLE, INCHES		Amt. Compound Required	Shipping Wt. Lbs.	PRICE, EACH

*Direct current only; all other bells may be used on either direct or alternating current.

Type CG Air Circuit Breakers

Type CG air circuit breakers are efficient and reliable and may be recommended for general industrial use except in steel mills or like installations where heavier breakers (Type CP) should be used. They should not be recommended for high grade switch-board service but are used effectively on small motor panels, mercury arc rectifier outfits, small battery charging panels and the like.

Type CG breakers are made in capacities from 3 to 300 amperes at 550 volts direct current, 600 volts alternating current, front and back connected.

The following forms are available:

Overload direct and alternating current.

Plain shunt trip, direct and alternating current.

Underload, direct current.

Plain under-voltage, direct and alternating current.

Reverse current (including under-voltage), direct current.

Attachments, under-voltage shunt trip and auxiliary switches.

By the use of the under-voltage attachment, circuit breakers may be arranged to operate on a drop in or failure of voltage; two or more circuit breakers may be electrically interlocked and by the use of a switch to short circuit the under-voltage device, circuit breakers may be tripped from one or more remote points. This device is also made use of when it is desired to open the breaker by the operation of a speed limit device or various types of relays.

The shunt trip is to provide for conditions under which the under-voltage device cannot be successfully applied. It trips the breaker when energized and should be allowed to remain in circuit only momentarily.

FRONT CONNECTED BREAKERS are mounted on 1 1/4-in. dull black marine finish slafe (D.B.M.F.) bases.

TRIPLE-POLE BREAKERS have "trip free" mechanism. They may be furnished for use on direct current. Order should read "Similar to Cat. No. (give Cat. No. of corresponding alternating current breaker) but calibrated for use on direct current." Prices are the same as listed for alternating current breakers.

All current-carrying parts are satin finished and all other metal parts have black marine finish.

Terminals

Front Connected Breakers

All front connected Type CG air circuit breakers are furnished with a complete set of nuts and terminals.

Back Connected Breakers

All back connected Type CG air circuit breakers are furnished with a complete set of nuts but will have only one stud of each pole equipped with a terminal.

Additional terminals if required should be ordered extra.

Features

- 1.—Recommended for general industrial applications, small panels for motor control, rectifier outfits, etc.
- 2.—Thoroughly reliable—will stand hard usage.
- 3.—Ample current-carrying capacity.
- 4.—Main contact brushes protected by carbon secondaries.
- 5.—End-on contact of brush laminations insures good contact.
- 6.—Small overall dimensions.
- 7.—Each breaker calibrated individually. Wide range of calibration clearly marked.
- 8.—Series coils made detachable. On 25 amperes and above, copper bar-wound coils replaces old wire-wound coils.
- 9.—Tested and approved by Fire Underwriters.
- 10.—Close easily; do not jar open.
- 11.—Double-pole breakers, each pole separate handle; triple-pole breakers, one handle for all poles and "trip free" feature.
- 12.—Superior finish, neat appearance.
- 13.—Large number of capacities and combinations covering practically every requirement.

110572	110584	100	25	15	\$42.00
110576	110588	200	48	32	64.00
110580	110592	300	48	32	70.00

Capacities below 100 amperes, same price.

No overload coils on these breakers.

*Shunt trip coils are intended for momentary operation only and must not be left in circuit continuously after being energized. Connections should be so arranged that the opening of the circuit breaker will disconnect the shunt trip circuit. If for any reason, however, the shunt trip has to be connected to the line side a circuit opening auxiliary switch should be mounted on the breaker to open the trip circuit.

†Double-pole plain shunt breakers trip both poles, same as overload breakers.

Type CG Air Circuit Breakers

Direct Current, Underload

Underload breakers are calibrated at the factory to trip on 20 per cent of the carrying capacity. They can be set to trip at any point as low as 10 per cent if so specified on the requisition.

Undervoltage Attachments
For Type CG Circuit Breakers

By the use of under voltage release attachment, circuit breakers may be arranged to operate on a drop in or cessation of voltage, two or more circuit breakers may be electrically interlocked and by use of a switch to short-circuit under voltage release, circuit breakers may be tripped from one or more remote points.

For Direct Current

Shunt Trip Attachments
For Type CG Circuit Breakers

The shunt trip has been designed to provide for conditions under which the undervoltage attachment can not be successfully applied. It trips the breaker when energized, and should be allowed to remain in circuit only momentarily.

Type CP Air Circuit Breakers
Alternating Current—Over Current (Overload)
Back Connected

Single-pole

Triple-pole

These breakers may be relied upon to open circuits under severe abnormal conditions. Either the breakers may have self-contained features which provide the particular protection desired, or various attachments or auxiliary devices may be added to give that protection.

They are recommended for use on railway, lighting and power switchboards, or for general industrial service. When used for industrial service, each breaker is usually on a base for separate mounting.

These breakers are simple in design and each part is properly proportioned for the work it has to perform, and at the same time all combine to form a symmetrical and attractive device.

†Mounted on 1 1/2-inch base only.

Nuts and Terminals

All Type CP Air Circuit Breakers are furnished with a complete set of nuts (2 nuts per stud), but will have only one stud of each pole equipped with a terminal. Additional terminals, if required, should be ordered extra.

Type CP Air Circuit Breakers

Alternating Current—Plain Shunt Trip Back Connected

Shunt trip coils are intended for momentary operation only and must not be left in circuit continuously after being energized. Connections should be so arranged that the opening of the circuit breaker will disconnect the shunt trip circuit. If, however, the shunt trip has to be connected to the line side, a circuit-opening auxiliary switch should be mounted on the circuit breaker to open the trip circuit.

*For use on alternating current only at 480 volts. Attachments with 650-volt, 480-volt rating adjusted to release at approximately 240 volts.

†Cat. No. of attachment and price include series resistance for under-voltage coil.

Type CP Air Circuit Breakers

Recommended for general switch-board work.

Close easily. Do not jar open. Main contact brushes protected by carbon and metal secondaries.

End on contact of brush laminations insures good contact—each lamination under equal pressure. Contact pressure adjustable.

Double-pole breakers, each pole separate handle; triple-pole breakers, one handle for all poles and trip free features.

All standard Type CP circuit breakers are made back-connected only for panel mounting. Where front-connected Type CP breakers are wanted it is recommended that standard back-connected breakers mounted on slate base to be installed on cleats or brackets to hold the base away from the wall far enough to clear the studs and connections. This method of mounting is decidedly superior to front-connected breakers especially for the larger capacities. A more substantial and secure connection can be made by clamping the terminals between nuts on a large stud than with bolted front-connected terminals. All cables are out of the way, both of the operating mechanism and of the arc from secondary carbons. This makes a neater appearance and a better installation.

The connections may be made to the breaker in the same way as would obtain if the breaker itself were front connected, and where cables are heavy the connections can be more easily made.

Type CP Air Circuit Breakers

Underload breakers differ from corresponding overload breakers only in the construction of the tripping details.

Pulling down the knob at bottom of calibrating tube sets the plunger against the action of a spring and allows the breaker to be closed.

Type CP Air Circuit Breakers

In general construction the reverse current breaker follows closely the design of the underload breaker, but with the addition of a small potential coil which is momentarily in circuit during the closing of the breaker; this coil energizes the trip magnet and holds the plunger against the action of a spring.

Direct Current—Under Current (Underload) Back Connected

Single-pole—650 Volts or Less

Table with 6 columns: CATALOGUE NUMBERS (On 1 1/2-inch Base / For 1 1/2 or 2-in. Panel), Cap. Amp., SHIP. WT., LBS. (On Base / For Panel), Price Each.

*Over Current (Overload) and Reverse Current—Back Connected

Breakers have one overload coil and one (separate) reverse current coil, either of which actuate the tripping mechanism.

Single-pole—650 Volts or Less

Table with 7 columns: CATALOGUE NUMBER (On 1 1/2-inch Base / For 1 1/2 or 2-in. Panel), Cap. Amp., CALIBRATION (Min. / Max.), SHIP. WT., LBS. (On Base / For Panel), Price Each.

Double-pole—250 Volts or Less

Table with 7 columns: CATALOGUE NUMBER (On 1 1/2-inch Base / For 1 1/2 or 2-in. Panel), Cap. Amp., CALIBRATION (Min. / Max.), SHIP. WT., LBS. (On Base / For Panel), Price Each.

*The standard calibration of reverse current trip is 10 to 20 per cent of rated ampere capacity on reversal. If any other range of calibration is desired it must be so specified on the requisition.

†The magnetizing coil used with the reverse current breakers listed above is for 125 volts direct current only, and cannot be used on any other voltage. Therefore the line voltage must be definitely specified in each case.

‡Mounted on 1 1/2-inch base.

All Type CP air circuit breakers are furnished with a complete set of nuts (2 nuts per stud) but will have only one stud of each pole equipped with a terminal. Additional terminals extra.

Type CP Air Circuit Breakers

Type CK Air Circuit Breakers

Direct Current—Plain Shunt Trip—Back Connected

With Laminated Studs

Shunt trip coils are intended for momentary operation only and must not be left in circuit continuously after being energized. Connections should be arranged so that the opening of the circuit breaker will disconnect the shunt trip circuit. If, however, the shunt trip has to be connected to the line side, a circuit opening auxiliary switch should be mounted on the circuit breaker to open the trip circuit.

The Type CK 250-volt circuit breakers are recommended for service where large capacity breakers are required for lighting or power installations.

Terminals are not included with the circuit breaker as in many cases busbar connections are used.

Can be furnished from stock in wide range of capacities.

Are designed with ample conducting parts. Complete line of attachments. Require small amount of space on panel. Close easily. Very heavy and substantial secondaries. End on contact construction of main brush. Heavy brush pressure, high efficiency contact and means of adjusting pressure.

Wiping contact, both main brush and secondaries. Trip easily but cannot jar open. Handle and tripping button well insulated from live part of breaker.

Each breaker calibrated individually. Wide range of calibration.

Prices on solenoid, motor and pneumatically-operated circuit breakers on request.

Prices on double-pole, overload shunt trip and under-voltage breakers on request.

***Single-pole—650 Volts or Less**

Shunt Trip Attachments

For Type CP Circuit Breakers

The shunt trip attachment causes the breaker to open when energized. The coil should be allowed to remain only momentarily in circuit; hence it should be so connected that the opening of the circuit breaker disconnects it from the circuit.

Type CK-2 Air Circuit Breakers

With Laminated Studs

The Type CK-2 650-volt circuit breakers are recommended for any service, however severe, and are especially adapted to large railway installations of any character.

Terminals are not included with the circuit breaker as in many cases busbar connections are used. Where terminals are required, the size and quantity of cable connections vary so widely, depending on the length of run, the line drop allowed and other conditions, that it seems preferable to list them separately so that proper selection may be made to suit each case.

Range of calibration from at least 50 per cent below to 100 per cent above normal rating.

Large handles with guards afford protection to the operator. The frames as well as current carrying parts are alive. Spade handles are standard but straight handles can be furnished.

Especially heavy mechanism and a powerful toggle held by hardened steel catches secure the breakers in closed position and the breakers operate with minimum effort without auxiliary closing mechanism.

Under-voltage Attachments

For Types CK and CK2 Circuit Breakers

In general, D. C. under-voltage devices cause the opening of the air circuit breakers when the line voltage drops to approximately 25 per cent of the normal voltage. The coil is always in circuit and operates with the releasing of its armature.

Releases at approximately one-half rated voltage.

Cat. No. and price includes series resistance for under-voltage coil.

Only one attachment may be used with a single-pole or double-pole breaker. With a single-pole breaker the attachment is mounted on the right-hand side facing the panel; with a double-pole breaker it is mounted symmetrically between poles, and trips the left-hand breaker.

Type FP7 Pole Line Oil Circuit Breakers

Pole line oil circuit breakers are usually less adequately protected by lightning arresters than station breakers, and the question of high-voltage strains must be more carefully considered. This is especially true on circuits of voltages of 15,000 volts and below where the line insulators will frequently stand high-voltage test of many times the normal voltage.

In no case should a breaker be selected for any given service having a lower test voltage than the actual arc over voltage (dry test) of the insulators used on the lines.

The Type FP-7 oil circuit breaker is adapted for use on alternating current series arc systems, for sectionalizing feeder systems, cutting out transformers, and all classes of service requiring a reliable outdoor switch to be operated under load. In many cases the use of one of these breakers in connection with pole type transformers will obviate the necessity for bringing high tension lines into a building.

All Type FP-7 oil circuit breakers are given a dielectric test considerably above that prescribed in standardization rules of the A.I.E.E. For the purpose of comparison with arc-over voltage on line insulators, minimum arc-over voltage for the Type FP-7 breakers is given below:

4500 Volt.....	18000 Volts Test
7500 ".....	25000 " "
15000 ".....	45000 " "

The breaker is enclosed in a substantial weatherproof case consisting of a cast iron frame, with a removable cover which is grooved on the under side to fit closely the edge of the frame and a readily detachable oil tank which fits around a flange on the bottom of the frame. The oil tank has an insulating lining and wooden barriers are provided between poles.

Lugs are provided on the frame for bolting the breaker directly to a flat surface, or supporting it by means of strap-iron hooks, for mounting on transmission pole cross arms in a manner similar to that usually employed for pole type transformers.

Porcelain bushings are provided for incoming and outgoing leads. They are protected from the elements by the overhanging switch frame.

Bushings will take cable up to 3/4 in. diameter for 100-amp. switches and up to 1 in. diameter for 200-amp. switches.

These circuit breakers are equipped with porcelain shields covering terminals and leads in top of breakers, thus greatly increasing the arc-over test.

Type FK20 Circuit Breakers

The Type FK-20 Oil Circuit Breakers are used especially for the protection of induction motors in industrial applications.

They are made single-throw only and are for mounting on wall, post or other flat surface. They may be mounted directly on machines by the use of brackets or suitable supports.

All breakers both automatic and non-automatic have toggle in mechanism so that overload or under-voltage features may be added as desired.

All Type FK-20 oil circuit breakers are provided with entrance holes in sides, back and underneath breaker frame for open or conduit connections. The breakers are shipped out with a set of porcelain entrance bushings for open wiring and in the automatic type the leads from the series trip coils are extended through two of the porcelain bushings. If conduit connections are used the porcelain bushings are discarded and the conduit brought directly to any of the entrance holes desired, the coil leads are pushed back into the breaker and connections made inside the frame. An approved form of making connections to this breaker is by means of conduit boxes.

NOTE.—FK-20 oil circuit breakers are not recommended for use out of doors, or indoors when directly connected to incoming lines where they will be subjected to surges or other voltage disturbances unless protected by lightning arresters or other surge protective devices.

While the FK-20 oil circuit breaker is totally enclosed for the purpose of rendering it dustproof it is not waterproof and should not be used out of doors unless protected.

The dashpots may be adjusted for a time delay from one (1) second to about one (1) minute. The standard setting recommended is for a time delay of ten (10) seconds at double the normal full load current of the motor. This gives a time delay of about one-half (1/2) minute at 25 per cent overload, and correspondingly less at greater overloads, which affords ample protection against overload, yet prevents the breakers from opening on starting currents.

Magnetic Lock

Breakers may be equipped with a magnetic locking device to lock the oil circuit breaker in the open position. The magnetic lock consists of a magnet with a hinged armature which is attached to the under-voltage trip. The armature is designed so as to interfere with an extension on the under-voltage tripping lever and prevents the under-voltage from being set as long as the coil on the magnetic lock is de-energized.

When the locking coil is energized, its armature moves out of interference and the under-voltage trip may be set. In other words, the breaker is locked out with magnetic coil de-energized; unlocked with coil energized.

The magnetic lock coil should be connected on the line side of the breaker or to some separate source.

The under-voltage coil should be connected on the motor side of the breaker, so that it will become de-energized when the breaker is opened. The under-voltage in the open position permits the armature of the magnetic lock to spring out, thereby again preventing the under-voltage being set, unless the magnetic lock is first energized.

Type FK-20 Oil Circuit Breakers

Non-automatic, without
Overload Release
2500 Volts or Less

The non-automatic breakers listed have the tripping toggle so that undervoltage or automatic features can be added at any time.

*Load which the breaker will carry continuously at 30 degrees C. rise or less.

†Series coils will carry 25 per cent overload for 2 hours at 45 degrees C. rise or less.

The calibration of series coils is from normal, as listed, to two times, i.e., 2 to 4, 3 to 6, 60 to 120, etc.

Type FK-20 Oil Circuit Breakers

2500 Volts or Less

Undervoltage Attachments*

All undervoltage attachments listed below include coil W. S. F. 92660 and are common for all breakers listed. The undervoltage mechanism and transformer, where required, is mounted within the breaker frame, and when properly adjusted the oil breaker cannot be closed until undervoltage plunger is lifted by hand to its upper position, when it will hold in if full potential is upon the line.

The undervoltage attachment should be connected across one phase on the load side, if possible, with proper transformer and tap in circuit. No resistances required.

Cat. No.	CIRCUIT Volts	Cycles	Includes Transformer Mfrs. No.	Approx. Net Wt., Lbs. Extra†	Price Each
167421	110	60	None	3	\$10.00

167424	2200	25-40	191394	9	21.00

*Release at approximately one-half rated voltage.

†Add 5 pounds for boxing if shipped separate from breaker.

‡Auto-transformer with taps tagged to indicate proper connections for various voltages and cycles.

Gaskets

Order breakers Same as Cat. No. (give Cat. No. of standard breaker), except that it is to be equipped with felt gaskets.

Breakers ordered with gaskets will be furnished with gaskets between cover and frame and between frame and oil vessel.

Standard Type FK-20 oil circuit breakers, as regularly furnished, are sufficiently dustproof for use in cotton mills and for like service. When, however, these breakers are to be installed in cement or flour mills where the dust is very fine the standard breakers are not tight enough to exclude the dust from the top of the breaker or the oil vessel. In these cases breakers provided with felt gaskets should always be recommended.

Price, for 60-200 Ampere Breaker, 2 and 3-pole... each \$4.75
 " " 300 " " 2 " 3 " " " 4.75
 " " 60-200 " " 4-pole..... " 4.75

Oil Circuit Breaker Covers
For Mounting Ammeters

These covers replace the covers ordinarily furnished with the FK-20 breakers and provide a suitable mounting for a Type R-6 ammeter. The rear half of the cover completely houses the ammeter studs and all connections and is removable to permit of easy access to breaker and connections. The front part of cover which supports the ammeter is provided with bushings to take any standard R-6 ammeter within the range of capacities required.

*Cat. No.	Amperes	For Breaker Poles	Mounts R-6 Ammeter Amps.	Approx. Ship. Wt. Lbs. Extra	Price Each
167425	60-200	2 and 3	4-300	50	\$18.00
167426	300	2 " 3	4-400	60	20.00
167427	60-200	4	4-300	60	20.00

*Ammeters and current transformers, where required, are not included. Order separately.

NOTE.—Series ammeters, R-6, used with Type FK-20 breakers are recommended only for use on circuits 650 volts or less. For voltages above 650 volts, secondary ammeters, 5 amperes with suitable current transformers, should be used. The current transformers are mounted separately, outside of breaker. Secondary ammeters will be calibrated in primary current, if so ordered, without extra charge. Ratio of current transformer with which it is to be used must be specified.

SELECTION OF AMMETERS.—Ammeters for use with induction motors having standard A guarantee (25 per cent overload for 2 hours) should be selected to have full scale deflection equal to or greater than 150 per cent of the normal full load running current.

ORDERING.—In ordering Type FK-20 breakers with cover for ammeter mounting five Cat. No. of breaker (non-automatic or automatic); Cat. No. of undervoltage if required; Cat. No. of special cover as above; also Cat. No. of ammeter and of current transformer if required. The omission of the standard cover will be taken care of without special notice.

Type FK13 Oil Circuit Breakers

With Operating Lever For Mounting on 1½ or 2-inch Panels

The Type FK-13 oil circuit breakers are of the single tank type, all poles in one oil tank with insulating barriers between phases.

CONTACTS.—The Type FK-13 breakers have wedge contact blades and flared contact fingers. Any arcing, when the breaker is opened, takes place between the flared ends of the contact fingers and the upper edge of the contact blade, thus insuring a long life to the contact surfaces.

MANUAL OPERATION.—Type FK-13 oil circuit breakers are listed single or double throw for manual operation as follows:

For mounting directly on back of panel.

For mounting on panel frame 5 inches back of panel.

For mounting on pipe framework remote from panel.

As these breakers are furnished with 45-degree operating levers

they are listed non-automatic and automatic with one, two or three-trip coils.

SERIES TRIP.—For circuits above 750 volts the use of transformer trip coil circuit breakers is recommended.

The manufacturer does not recommend the installation of apparatus on the panel or switchboard when that apparatus is subjected to a pressure in excess of 2500 volts. For such installation, remote control apparatus is recommended.

Non-automatic—Without Overload Release

*Operating lever equipped with 4-amp. trip coil WSF 321496. With or without circuit-opening relay.

†Operating lever equipped with 125-volt direct current trip coil WSF 90094. For use only with circuit-closing overload relay or similar device. With or without circuit-opening relay.

Under-voltage Attachments

For Type FK13 Oil Circuit Breakers

A complete line of hinged armature under-voltage attachments for pressures up to and including 550 volts. Above 550 volts, use 110-volt attachment in connection with suitable voltage transformer.

Where no overload features are required, the under-voltage attachment may be used with a special, plain, under-voltage operating lever provided with a tripping toggle for the under-voltage attachment, but, otherwise similar to the non-automatic lever.

Double-throw circuit breakers are usually automatic and would use standard under-voltage attachments as listed. Plain under-voltage, double-throw circuit breakers will require special consideration. Prices on request.

Plain Under-voltage Operating Levers

Addition to Prices of Single-throw Breakers

For Circuit Breaker Mounted on Panel	For Circuit Breaker Mounted on Panel Pipes	For Circuit Breaker Mounted on Remote Control
\$9.00	\$9.00	\$9.00

Hinged Armature Under-voltage Attachments

Under-voltage release operates at approximately one-half normal voltage.

Plain Under-voltage Operating Lever

Single Throw

Plain under-voltage operating lever not made for double-throw. Use automatic breaker with under-voltage attachment.

Auxiliary Switches

For Type FK13 Oil Circuit Breakers

For Use With Type FK13 Oil Circuit Breakers Mounted on Back of 1 or 2-inch Panel or on Panel Pipes 5 Inches Back of Panel

Cat. No.	Function	Approx. Shipping Wt. Lbs.	Price Each
134598	Circuit-Opening	5	\$12.00
134599	" Closing	5	12.00
134600	" Opening and Closing	8	23.00

For Use With Remote Control Type FK13 Circuit Breakers Mounted on Flat Surface or Pipe Framework

134601	Circuit-Opening	\$12.00
134602	" Closing	12.00
134603	" Opening and Closing	23.00

Drilling for attaching the auxiliary switch must be done by the customer except when the auxiliary switch is ordered with the oil circuit breaker and mounted at the factory.

Bell Alarm Switches

For Type FK13 Oil Circuit Breakers

Operates Only When the Oil Circuit Breaker Opens Automatically

Price, No. 139335, Wt. 1 Lb. each \$3.00

For Circuit Breakers Mounted on Panel Pipes or Remote Control

Price, No. 139336, Wt. 1 Lb. each \$3.00

Tank Lifters

Simple and practical tank lifting devices can be furnished for Type FK13 oil circuit breakers to facilitate handling the heavier oil tanks used on double-throw breakers. For single-throw breakers the weight of the oil tank is hardly sufficient to warrant the use of a tank lifter.

Description of breakers must be given.

Circuit Breaker Rating

Cat. No.	Amperes	Volts	Shipping Wt. Lbs.	Price Each
169569	200	3300	40	\$54.00

Natural Black Slate Panels

For Type FK13 Oil Circuit Breakers

These small panels for mounting individual Type FK13 oil circuit breakers are made of natural black slate, 1½ inches thick and mounted on 48-inch pipe supports with floor braces. Panels will be drilled only for oil circuit breakers, lever mechanism and under-voltage attachment if the latter is required.

Oil circuit breakers will not be assembled on the panel at the factory and the equipment will be shipped knocked down, panel and breaker in separate cases.

In ordering, specify catalogue number of panel and also catalogue number of oil circuit breaker and under-voltage attachment (if latter is desired) for which the panel is to be drilled.

For Single-throw Circuit Breakers

Cat. No.	Description	No. of Trip Coils	Approx. Shipping Wt. Lbs.	DIMENSIONS, INCHES			*Price Each
				Height	Width	Thickness	
1842931G1	Non-Automatic	0	100	16	20	1½	\$34.00
1842932G1	Automatic	1	100	16	20	1½	34.00

For Double-throw Circuit Breakers

1842934G1	Non-Automatic	0	130	16	24	1½	\$38.00
1842935G1	Automatic	1	130	16	24	1½	38.00
1842936G1	" (two Coil Transformer trip)	2	130	16	24	1½	38.00
1842937G1	Automatic (two coil Series Trip)	2	130	16	24	1½	38.00

*Add \$2.00 if panel is to be drilled for under-voltage attachment.

Type FK5 Oil Circuit Breakers

For Switchboard Service

600, 4500 and 7500 Volts

Manually-operated Non-automatic

The Type FK-5 Oil Circuit Breaker is in extensive use for circuits up to 7500 volts, where a reliable breaker of moderate capacity is required. It is constructed from the best materials and the workmanship is of the highest character, in short, essentials for long service are found in this breaker.

The operating lever now being used adds its advantages to those already possessed by the breaker. Uniformity in the application and appearance of these operating levers; sensitiveness of the tripping toggle; and the improvement in manual operation—these are a few of the advantages obtained.

RATINGS.—The ratings of the breakers are based on the maximum current the breakers will carry continuously without overheating. Therefore, equipment should be selected that has a capacity at least equal to the maximum rating or to the one- or two-hour overload rating of the circuit.

Single, triple and four-pole single-throw breakers can be obtained in all capacities.

The breakers are made in the following capacities:

Volts	Amps.	Poles	Throws
600	300	2, 3 or 4-pole	Single- or Double-throw
600	500	2, 3 or 4-pole	" " " "
600	800	2, 3 or 4-pole	Single-throw Only
4500	200	2, 3 or 4-pole	Single or Double-throw
7500	300	2, 3 or 4-pole	" " " "
7500	300	1-pole	Single-throw Only
7500	500	2, 3 or 4-pole	Single or Double-throw
7500	500	1-pole	Single-throw Only

OPERATING MECHANISMS.—The following are obtainable: MANUALLY-OPERATED LEVERS.—Non-automatic levers for all breakers.

Automatic levers with one, two, or three-coil secondary overload trip.

TRIP COILS.—For tripping automatically, alternating current trip coils connected directly or by means of relays to the secondaries of current transformers may be used, or coils separately energized from a reliable source of under-voltage alternating or direct current. When separately energized coils are used, circuit-closing relays consisting of one, two or three units are energized from the secondaries or current transformers with their contacts controlling the tripping circuit.

SECONDARY TRIP COILS.—Five ampere coils, for use with current transformers. Coils calibrated at 5, 7 and 9 amperes.

Four ampere coils, calibrated at 4 amperes, for use with current transformers and circuit-opening relays.

Potential coils from 12 to 250 volts, direct current and from 110 to 440 volts, alternating current, for use with circuit-closing relays or other contact-making devices.

SOLENOID MECHANISM.—Solenoid operation can be furnished for 4500 and 7500-volt breakers. (Two breakers may be electrically interlocked to effect double-throw.) Standard solenoid coils are wound for 125, 250 and 600-volt direct current only.

Overload protection for solenoid-operated breakers is obtained by the use of separate current transformers and circuit-closing overload relays.

When breakers are solenoid-operated the same number of current transformers are used as for manually-operated breakers, but one, two or three single-unit circuit-closing alternating current relays are used to connect the low-voltage tripping current to the trip coil of the direct current solenoid.

†Current transformers not included. Class PP.

Under-voltage Attachments

For Use with Manually Operated Type FK5 Oil Circuit Breakers

Hinged armature under-voltage attachments are listed for pressures up to and including 550 volts. Above 550 volts, use 110-volt attachment in connection with suitable voltage transformer.

The under-voltage attachment is mounted at the left (right-hand not furnished for use with Type HA2 lever) of a single-throw lever mechanism or between the levers of a double-throw mechanism. In the latter case, it acts on the tripping toggle of the right-hand lever, the action being transmitted to the left-hand lever by the cross trip.

Operates at Approximately One-half Normal Pressure

For use with manually operated oil circuit breakers of 800 amperes or less, 25 to 60 cycles.

Auxiliary Switches

Auxiliary switches for signaling, electrical interlock or control of auxiliary apparatus are frequently required.

For manually-operated Type FK5 oil circuit breaker mounted directly on back of panel or on panel frame 5 inches back, finger-type auxiliary switches are used.

For manually-operated Type FK5 oil circuit breakers mounted remote from panel, rotary type auxiliary switches are used and mounted on the horizontal hanger which is drilled for such accessories at the factory.

Type FK35 and FK35Y Oil Circuit Breakers

For Switchboard Service

600 and 7500 Volts

Manually Operated—Non-automatic

Types FK35 and FK35Y oil circuit breakers are recommended for use up to 7500 volts on systems where thoroughly reliable breakers of moderate capacity are required.

These breakers are of standard unit construction, each unit consisting of oil tank, cover, insulator studs and contacts, blade and rod. Thus, a single, double, triple or four-pole breaker is made up respectively of one, two, three or four standard units plus frame, breaker mechanism and either manual or solenoid operating mechanism.

Each standard unit is suspended from the frame of the oil circuit breaker by attaching the oil tank cover to the under surface of the frame. Each oil tank is held in position by hook bolts.

The FK35Y oil circuit breakers are similar to the Type FK35 breakers, except that they have removable arcing tips and the operating rods and the blades are slightly different. The interrupting capacities are the same.

DISTINCTIVE FEATURES.—Breakers adapted to either vertical or horizontal operation by making one member of breaker mechanism a bell crank.

Interchangeability of breaker units of like rating.

Each phase in separate tank.

Bell alarm auxiliary switch included with all operating levers.

The manufacturer does not recommend the installation of apparatus on the panel or switchboard when that apparatus is subjected to a pressure in excess of 2500 volts.

For Mounting Directly on Back of Panel

Double-throw Attachments

Mechanical interlocks are available as attachments to combine for double-throw non-automatic operation.

1.—Any two panel or panel frame mounting, or remote control Types FK35 or FK35Y breakers.

2.—Any Type FK35 or FK35Y breaker with any Type FK32A or FK32B breaker.

For panel or panel frame mounting the interlock is attached to the breaker frame, proper holes for same being provided on the breakers.

For remote control mounting the interlock is attached to the hangers on back of panel, proper holes for same being provided on the hangers.

In ordering specify breakers to be interlocked, form of mounting and distance between centers of operating levers 8, 9, 11, 12, 13 or 16 inches.

Price, Mechanical Interlock.....each \$6.00

Cross Trip—Automatic Operation

Where operating levers for breakers interlocked for double-throw are equipped with automatic trip attachment in one operating lever only, a cross trip is required between the two levers to trip on both throws.

Where two sets of current transformers are used with automatic trip attachments in both operating levers, or where one set of current transformers is used with automatic trip attachments in both operating levers with trip coils in series in each phase, the cross trip is not required.

In ordering specify distance between centers of operating levers, 8, 9, 11, 12, 13 or 16 inches.

Price, Cross Trip.....each \$1.00

Type Y-298A Tripping Current Transformers

For Oil Circuit Breakers

25-125 Cycles, 15000 Volts or Less

400 Amperes and Below

These transformers are for tripping oil circuit breakers. They may be used with any of the standard 4- and 5-ampere trip coils. They are listed in capacities from 5 to 800 amperes at 15000 volts or less.

In general their use is limited to tripping duty only, either directly or in connection with relays, but where high accuracy is not essential a secondary ammeter may be used.

As these transformers are small and inexpensive they may be used very conveniently in installations where series trip has heretofore been recommended.

500 to 800 Amperes

The smaller capacities from 5 to 400 amperes inclusive are equipped with cast metal bases with two-bolt holes, allowing them to be bolted to flat surfaces or pipe supports.

The larger capacities from 500 to 800 amperes inclusive are of the bus type and are supported by the buses or the stud of the oil circuit breaker, no bases being required due to the light weight of these transformers.

Cat. No.	Primary Capacity In Amperes	Ratio	Shipping Weight Pounds	Price Each

246266	600	120-1	44	62.00
246267	800	160-1	44	63.00

All transformers are provided with an additional turn on secondary for ammeters only.

These transformers are tested at 5000 volts between primary and all other parts, and at 2500 volts between secondary and ground.

Type Y-285-D Tripping Current Transformers

For Oil Circuit Breakers

25-125 Cycles, 4500 Volts or Less

5 to 300-ampere Transformer

These transformers are for tripping oil circuit breakers. They may be used with any of the standard 4 and 5 ampere trip coils. They are listed in capacities from 5 to 800 amperes at 4500 volts or less.

In general, their use is limited to tripping duty only, either directly or in connection with relays, but where high accuracy is not essential a secondary ammeter may also be used.

As these transformers are small and inexpensive they may be used very conveniently in installations where series trip has heretofore been recommended.

They are equipped with feet, allowing them to be bolted to flat surfaces or pipe supports.

They have fixed secondary terminals, subtractive polarity and a uniform distance of 12 inches between centers of primary terminals for all capacities.

These transformers are tested at 15000 volts between primary and all other parts, and at 2500 volts between secondary and ground.

Types PQ, PQ2 and PQ3 Overload Relays

For Use with Current Transformers Having
5-ampere Secondaries

For Mounting on 1/2 or 2-inch Panels

Alternating Current—Single Pole—40-60 Cycles

Fig. 1
**PQ Instantaneous
Circuit-closing**

Fig. 2
**PQ Inverse Time-
limit
Circuit-closing**

Fig. 3
**PQ3 Inverse Time-
limit
Circuit-opening**

The relays are for use only on 5-ampere secondaries of current transformers. The standard winding has a continuous rating of 5 amperes and is calibrated to operate at 5, 8, 12 and 15 amperes. The volt-ampere burden, 22.5 volt amperes, is sufficiently low to permit using these relays on the same current transformers with meters and other instruments without affecting the accuracy of the instruments.

All time Type PQ relays are regularly equipped with needle valve only. The quick return valve and the quick exhaust valve are not regularly furnished but can be furnished as a separate item. The bellows support has a tapped hole for receiving these valves. This hole is closed by a removable plug which is regularly furnished with the relay.

The standard unit Types PQ, PQ2 and PQ3 overcurrent relays are all of the same general construction, the only difference being in the respective contact elements. All parts are interchangeable, thereby permitting changing any relay to secure the desired contact characteristics by simply adding the necessary parts and omitting those not required. This rule does not apply to the Type PQ2, two-circuit, 3-contact, circuit-closing relay. The Type PQ2 relay is provided with instantaneous closing contacts only.

The 3-spring-finger type of contact cannot always be relied upon to retain their proper alignment with the result that when the plunger operates slowly, as in the case when employing the air bellows, all 3 contacts may be engaged simultaneously. This condition would cause arcing and the subsequent destruction of the contact tips. The relays are dust-proof both with respect to the contact parts and the calibrating parts. A dustproof cover encloses the contacts, and a shutter encloses the calibrating parts after adjustments have been made. The coil can be replaced without disturbing the upper part of the relay.

These relays can be provided with alternating current or direct current potential coils.

Type HG-101 D-C Auxiliary Relays

Single-pole—2 Coils Operating in Series
24-600 Volts Direct Current

For Mounting on Front or Back of 1/2 or 2-inch Panel
or on 1/4-inch Vertical Panel Pipes

Cover Removed

Removable Cover

The Type HG-101 Auxiliary relay, is made in single-pole units with one-circuit, circuit-closing contacts only. It is provided with 2 coils connected in series, both of which act on the armature. This arrangement results in a more positive operation of the armature, also a positive alignment of contact surfaces and their maintenance in this position while the coils are energized.

Application

The Type HG-101 relay is for use in a general way where it is desired that some means be provided to relieve a protective relay from breaking too large a current on its contacts. By this method the coil of the auxiliary relay and the contacts of the protective relay are connected in series.

The application of the Type HG-101 relay is not confined to individual operating. The relays may be operated in series, thereby providing simultaneous control of more than one circuit. Series operation can be obtained down to a minimum of 32 volts, direct current, although the maximum number of relays which will satisfactorily operate in series is governed by the applied voltage. This number varies from a maximum of 2 relays on 32 volts direct current, to a maximum of 4 on 125, 250 and 600 volts direct current.

No resistor is required for relays operating for a period of 15 seconds on voltages up to and including 125 volts direct current, or operating continuously alone on 24 volts direct current, 2 in series on 32 volts direct current, 2 or 3 in series on 48 volts direct current. All other permissible methods of application will require an external series resistor.

Service is fixed by number of relays operating in series, and resistor used.

Contacts

The contacts of the Type HG-101 relay are silver against silver, and will carry 12 amperes continuously or 30 amperes for a period of one minute.

Contacts will control either alternating or direct current.

Type HG-2 A.C. Auxiliary Relays

Single-pole, One-circuit, Circuit-closing Contacts
25 to 60 Cycles Alternating Current
For Mounting on Front or Back of 1/2 or 2-inch Panel

Without Cover

With Cover

Has only one operating coil.

If used with potential transformer the 110-volt relay with its resistor will impose a burden of 22-volt amperes.

(On account of the high impedance of the operating coil

these relays should not be connected to operate with their coils in series. Multiple connection is recommended in all instances. Can be used generally on alternating current circuits of from 110 to 550 volts where the contacts of a protective relay are not of sufficient carrying or interrupting capacity, or when its service is to be supplemented to control more than one circuit. The contacts will carry 5 amperes continuously and 15 amperes for a period of one minute. They will interrupt current at the various voltages indicated. Contacts control either alternating or direct current.

Service, 15 seconds or continuous.

Cat. No. (Resistor Included)	*Voltage A.C.	Maximum Continuous Cap. of Coil, Amp.	APPROX. SHIP. WT., LBS.		Price Each Class PP
			Relay	Resistor	
2841462G1	110	0.2	2	2	\$21.00
2841462G2	220	0.2	2	2	21.00
2841462G3	440	0.2	2	3	23.00
2841462G4	550	0.2	2	3	23.00

*Refer to general office all inquiries concerning relays for use on voltages below 110; state also frequency (cycles).

Type HG-7 A.C. Auxiliary Relays

Single-pole, One-circuit, Circuit-closing Contacts
25 and 60 Cycles Alternating Currents
For Mounting on Front of 1/2 or 2-inch Panel

Intended to perform proportionally heavier duty.

When used with potential transformers the 110-volt relay imposes a burden of 21 volt-amperes at 25 cycles, 30 volt-amperes at 60 cycles.

Without Cover

With Cover

This relay is of the hinged armature type and its action in opening is supplemented by a compression spring after the coil is de-energized. The front cover is provided with a glass window. The winding of this relay will ordinarily withstand low voltage alternating currents continuously applied without any external resistance. There are rare instances where a resistor is used when it is necessary at times that the relay be short circuited but the resistor in this instance will stand full voltage for only one minute.

Particularly adaptable where generous contact capacity and quick action are desired. Contacts will carry 15 amperes continuously and 50 amperes for a period of one minute. Will interrupt current at the various voltages. Contacts control either alternating or direct current.

Service, 15 seconds or continuous. External series resistance is not required.

Types PB-53 and PB-54 Solenoid Control Relays

With Blowout Coil
Totally Enclosed, Single-pole, One-circuit
Circuit-closing Contacts
48 to 600 Volts, Direct Current

For Mounting on 3/4 or 1 1/4-inch Vertical or Horizontal Pipe

Types PB-53 and PB-54 Relay with Cover

Type PB-53 Relay Cover Removed

Type PB-54 Relay Cover Removed

The types PB-53 and PB-54 solenoid control relays are made in single-pole units only. They are provided with a blowout coil and a metal cover. The blowout coil reduces the arc and the burning of contact tips. The metal cover encloses all live parts thereby providing full safety features.

Contacts

Contacts are of copper against copper and will make and break the current given in the following table:

Voltage of Circuit	CONTACTS WILL CARRY AMPERES	
	Continuous	5 Seconds
125	50	200
250	50	100
600	20	40

Type PB-53 (Instantaneous)

In the Type PB-53 relay the plunger is normally down and the contacts in the open position. When energized the plunger closes the contacts through a bell crank arrangement.

Type PB-54 (Hesitating)

In general the Type PB-54 relay operates the same as the PB-53 except that the contacts are closed through a toggle mechanism actuated by the plunger.

The hesitating feature is obtained by the inductive effect of a heavy copper short-circuited winding located in the spool which delays the drop of the plunger approximately one second after the coil is de-energized.

Mounting

The relays are provided with supports for mounting on 3/4-inch or 1 1/4-inch vertical or horizontal pipe. When it is desired to mount the relay on front or back of panel the pipe fitting can be removed and the relay secured by 2 screws through holes provided for this purpose in back of frame.

Type PB-53 (Instantaneous)

Twin Pull Button Control Switches

For Controlling Motor and Solenoid Operated Switches, Circuit Breakers, etc.

Single-pole—Double Throw
125 to 600 Volts

Mechanical indicator shows which throw was last operated; Mazda lamps, with red and green lenses for indicating, show whether switch or breaker is closed or open.

These switches are equipped with sliding contacts which will handle 10 amperes at 125 volts, 3 1/2 amperes at 250 volts and 1/2 an ampere at 600 volts.

Lamp Receptacle and Lens

S-P. D-T. Twin Pull Button Control Switch with Indicating Lamps and Receptacles

*1959119G4	With	195-4179†	600	10	26.00

*Switch only, no provision for lamps, no lamps, receptacles or lenses included.

†Each Cat. No. includes one control switch; two receptacles, Cat. No. 40431 each complete with a Cat. No. 36099 glass tube fuse; one ruby lens and holder, Cat. No. 36795; one green lens and holder, Cat. No. 36796; and two Type E Mazda (T7 Bulb) candelabra lamps and screws for fastening receptacles and switch in position. The 250 and 600-volt, Cat. Nos. 1959119G3 and 1959119G4, also include for lamp circuits, one resistance in two divisions electrically separate, Cat. Nos. 1954175 and 1954179 respectively. No base or connection included.

‡For 2-inch panel mounting, the spacer shipped with the switch is not used. These switches can not be mounted on thicker panels.

†Resistances, Cat. Nos. 1954175 and 1954179, are for use only with Mazda candelabra lamps.

Indicating Lamps and Lenses for Control Switches

Cat. Nos. 234284, 234285, 234286 and 234484 are complete with porcelain receptacle No. 40431, with expansion bolts, terminals, glass tube fuse No. 36099, Type E Mazda Candelabra lamp and lens with holder.

Potential and Synchronizing Plug Switches

The standard synchronizing receptacle and plug are shown in the accompanying illustrations.

Potential Plug Switches

Potential plug switches are used to connect a voltmeter to any one of a number of generator, battery or feeder circuits, or to any phase of a polyphase circuit.

Synchronizing Plug Switches

Synchronizing plug switches are used for connecting a synchronism indicator or synchronizing lamps to the generator being synchronized.

Plug switches intended to perform different functions or for use upon different voltages are so designed as to prevent the closing of the circuits by any but the appropriate plugs. This desirable feature is secured by varying the distance between centers of poles.

Two plugs are used for the synchronizing connections shown. One is inserted in the receptacle of the machine which is running and the other in the receptacle of the machine which is starting.

These plugs are marked in such a way as to insure their proper insertion into the receptacles, so as to give the correct indication.

Connections between the points of the plug are laid in grooves so that they will not become disarranged or damaged. The plug is provided with a shield which prevents the operator from accidentally touching the live parts of the switch. On the outside of this shield are white enameled lines indicating the internal connections.

The plug has a polished black finish; live parts are of brass.

Plug Holders

Plug holders can be furnished to provide means for holding the plug switches when not in use and to prevent them from becoming lost.

Prompt delivery is worth dollars and cents to you when you're anxious to get an electrical installation completed. You get prompt delivery from Western Electric.

Electrical supplies *Quick!*

STEP on the gas. Zip and away! That's the habit at Western Electric.

When an electrical contractor or a purchasing agent wants a coil of wire or a motor and wants it right away — he can get it right away if we're in on the order.

Ample stocks of all electrical supplies and ample facilities for moving those stocks fast make such service possible.

Quality service plus quality supplies

But just as important as speed is the quality of the goods delivered.

In electrical supplies, as in all other manufactured products, the quality of the finished article rests on two things. Quality of raw materials used and honesty of workmanship.

To buy Western Electric supplies is to buy the kinds that will prove themselves on these points by lasting years of service.

That's the real test. And you can bank on it.

The full tool kit ranks next to the full dinner pail in its importance to the electrical contractor. Western Electric fills kits with quality tools and supplies.

Bryant Wiring Devices with Extra Long Keys

The medium base key sockets and similar size socket devices have keys 1 inch long, but can have longer keys on special order, which must specify the distance desired between the outside of the shell and the end of the key. Otherwise, if extra long keys are ordered 1 1/2-inch keys will be supplied. The lengths which can be supplied are 1 1/4, 1 1/2, 2 and 2 1/2 inches.

For sockets and other devices with keys longer than 1 inch, add to the price of standard device 5 cents.

Standard package quantity, 100 of one length. No assortment permitted.

The keys of the candelabra and miniature base devices are 3/8 inch long and this is the only length that can be furnished.

Bryant Wiring Devices with Removable Push-buttons

Nos. 34, 77, 81 and 4181 socket bodies can be supplied, on special order, with removable buttons 2 1/4 inches long over all; the standard length is 1 3/4 inches.

For devices with removable buttons add 7 cents to price of standard device.

Standard package quantity, 100. No assortment permitted.

Devices with Wooden Push-buttons

Nos. 34, *77 and 81 can be supplied with enameled wood buttons, which resist heat, at an addition to price of \$10.00 per 1000 sockets. Minimum quantity, 1000 sockets, one catalogue number, one shipment.

*No. 77 is not National Electrical Code Standard.

Bryant Wiring Devices with Metal Keys

Any Bryant key socket listed in this catalogue can be supplied with a metal key as shown in the adjoining illustration. The key can be detached for finishing. Unless otherwise specified it will be finished the same as the socket. The standard length measures 1 inch from the shell to the end of the key. Other lengths which can be furnished are 1 1/4, 1 1/2, 2 and 2 1/2 inches.

For sockets with 1-inch metal keys, add 10 cents to price of standard socket. For sockets with keys longer than 1 inch, add 15 cents to price of standard socket. Standard package quantity, 100 of one length. No assortment permitted

Bryant Wiring Devices for Special Metal Keys

Any Bryant key socket listed in this catalogue can be supplied with insulated threaded mandrel to receive a special key furnished by the fixture manufacturer. The unthreaded portion is 1/4 inch in diameter. The threaded portion will take a key tapped for No. 6 screw, 32 threads per inch. Add 7 cents to price of standard socket.

Standard package quantity, 100. No assortment permitted.

**Bryant Wiring Devices with Art Keys
Brush Brass Color**

Key socket bodies and their combinations will, when specified, be furnished with brush brass colored composition keys. The color is permanent because it is moulded into the composition. When Art Keys are desired, specify Art Key, after the catalogue number. The price, schedule, standard package quantity and carton are the same as for sockets with regular keys. Key socket bodies of the same Cat. No. with Art Keys and regular keys may be assorted in unbroken cartons to make up a standard package quantity.

Bryant Pull Devices with Extension Chain Guides

Pull devices installed in husks or socket covers require extension chain guides to carry the chain through the cover. These chain guides are not in any way part of the device shell but are attached to the device mechanism. The extension piece, which is 3/2 inch in diameter, can be unscrewed for installation through the hole in the husk and for refinishing. The male threaded portion of the chain guide, which is attached to the device, extends less than 1/8 inch outside of the device shell, making it possible to insert the device in any husk, even though it follows the outline of the device shell closely. This male threaded portion of the chain guide is not interchangeable on New Wrinkle and Wrinklet sockets, but the extension pieces are interchangeable and can be used on any Bryant New Wrinkle and Wrinklet socket which is properly equipped with its own male threaded portion of the chain guide.

Extension chain guides are made only in the following regular lengths: 3/8, 1/2, 5/8, 3/4, 1, 1 1/4, 1 1/2, 1 3/4 and 2 inches. Add 10 cents to price of standard device.

Standard package quantity, 50 of one length or 100 of assorted lengths. No assortment with devices having regular chain guides permissible.

Bryant Pull Devices with Chain of Special Length

The regular length of chain on all pull devices, except as otherwise noted, is 3 inches. Devices with chains shorter than regular will be sold at the same price as regular.

For devices with chains longer than regular, add 10 cents per foot of extra chain per device.

For special, except silver and gold, finishes on chains longer than 1 foot, add 2 cents per foot of extra chain per device.

For silver finish, add 10 cents. Price of gold finish on application.

The standard quantity package will be the same as for standard length. Devices of the same catalogue number with standard and special length chains may be assorted in unbroken cartons to make up the standard package quantity.

Bryant Pull Devices with Linen Cord

Some pull devices are regularly fitted with a short chain, 10 ft. of linen cord, small size, and a small composition ball. Sockets and other devices which are regularly fitted with 8 inches of chain and a brass ball will, on special order, be furnished with a short chain, 3 feet of linen cord and composition ball at the regular price.

For cords longer than 3 feet, add 1 cent per foot to price.

The standard package quantity will be the same as the regular article. Devices with linen cords may be assorted in unbroken cartons with similar devices with chains of various lengths to make up the standard package quantity.

Connection between chain and cord is made by means of a No. 810 splicing link.

Bryant Sockets and Receptacles for Gas-filled Lamps

All mogul base sockets are regularly waxed with a compound which will not soften under heat. When medium base sockets are to be used with gas-filled lamps, they should be similarly treated. For medium base devices, add 3 cents to price. Standard package quantity will be the same as the regular article. Regular and specially waxed sockets of same catalogue number may be assorted to make up the standard package quantity.

Bryant Sockets and Receptacles with Lamp Grips

Most mogul base devices and most medium base devices listed in this catalogue can be equipped with a lamp grip, as illustrated, which effectually prevents the lamp from unscrewing.

For devices with lamp grips add 5 cents per outlet to the price.

The standard package quantity will be the same as the regular article.

Devices of the same catalogue number without and with lamp grip may be assorted in unbroken cartons to make up the standard package quantity.

Bryant Sockets and Receptacles with Left-hand Screw Shell Medium Base Only

For special conditions many of medium base sockets or cut-out bases listed in this catalogue can be fitted with left-hand screw shells, designed to receive lamps similarly equipped.

For medium base devices with left-hand screw shells, add 3 cents to the price for each left-hand screw shell.

The standard package quantity will be the same as the regular article.

Devices of the same catalogue number with left-hand and right-hand screw shells may be assorted in unbroken cartons to make up the standard package quantity.

Bryant Socket Caps with Side Entrance Bushings Medium Base Size Only

The caps of most medium base brass shell sockets can be furnished with an insulated bushing as illustrated. The purpose of this construction is to provide a passage for the conductors when the support for the socket is a rod instead of a pipe or tube; or when for any other reason it is impossible or undesirable to pass the conductors through the regular bushing of the socket cap.

No. CX cap is such a cap, being an AA cap with side entrance bushing.

For socket caps fitted with insulated side bushing, add 2 cents to price.

The standard package quantity will be the same as the regular article. Caps of the same catalogue number with and without the insulated side bushing may be assorted in unbroken cartons to make up the standard package quantity.

Bryant Unassembled Sockets

Cap

Cap Lining

Shell

Interior and Lining

Sockets, when so specified, will be shipped unassembled. By this is meant that the caps will be packed in one set of cartons, the shells in another set, the cap linings in another set. This should not be confused with sockets shipped knocked-down, which describes the shell, lining and interior complete as one unit, and the cap with its lining complete as another unit. It is advantageous to purchase sockets unassembled only when the purchaser does his own refinishing, in which case orders should specify, polished but not lacquered.

Bryant Brylock Lock Attachments

No. AA-15 with Brylock Attachment Showing Construction

In public places where the theft of lamps presents a problem, the use of Bryant sockets equipped with the Brylock attachment will stop further loss.

The Brylock attachment consists of a pointed and hardened steel screw supported by a threaded sleeve. The sleeve is fastened into the socket in such a position that when the pointed screw is turned by the special Brylock key it is forced to pierce the metal of the lamp base and effectually prevents the lamp from being turned.

Thus the lamp cannot be removed without the use of the special Brylock key.

Brylock keys are not supplied with Brylock equipped sockets but must be ordered separately.

The cost of a Bryant socket or receptacle with Brylock attachment is 27 cents per attachment more than the cost of the same device without the locking feature. Devices of the same catalogue number with and without the Brylock attachment may be assorted in unbroken cartons to make a standard package, which will be the same as for the standard device. A standard package of Brylock devices is 100 identical Brylock devices, carton 25; except when the standard package of a regular device is less than 100, under which condition the regular standard package and carton quantities apply to the device when equipped with the Brylock attachment.

Bryant Assembled Sockets

The following sockets are carried in stock assembled, i.e., the socket body is partially inserted in the cap, but the latching operation is not completed, so that the sockets are easily taken apart for wiring. Each complete socket is separately wrapped in tissue paper. This method of packing sockets is especially advantageous to fixture manufacturers who have frequent use for other than $\frac{1}{8}$ -inch caps. For the average socket user, requiring a considerable variety of bodies, caps and bases, the "knocked-down" method of shipping sockets is decidedly more convenient.

Other combinations of sockets than those listed below will be shipped assembled, when so specified, without extra charge, but such orders will be subject to the delays which are usual in connection with goods that are not carried in stock.

New Wrinkle Sockets

No. AA-10 Key Socket

Cat. No.	Description	Sched-ule	Car-ton	Std. Pkg.	Wt., Lbs. Std. Pkg.	Price Each

No. WA-85 Pull Socket

No. AV-17 Bryant Dubl-Duty Sockets

250 Volts, 250 Watts

each. Small Undark luminous pendant, 25 cents. Lamp grip, 5 cents per outlet.

This socket provides two Edison screw base outlets where formerly there was but one. Bottom outlet is controlled by pull chain; side outlet is always on; side outlet is above shade; when bottom outlet is used for a lamp, the lamp maintains its original position.

Any standard shade holder can be used, including Uno.

Standard finish brush brass. Standard chain furnished, 8 inches of No. 6. Brylock attachment, add 27 cents.

No. 4004 Bryant Candle Sockets

Porcelain, Keyless, with Paper Jacket

660 Watts, 250 Volts

The bushing of this socket is threaded for $\frac{1}{8}$ -inch iron pipe, .405-inch outside diameter, 27 threads per inch.

The outside diameter of the paper jacket is $1\frac{3}{16}$ inches. Length of socket, $1\frac{7}{8}$ inches. Length over all, $2\frac{3}{16}$ inches.

No. 4004 Old Style

No. 4004 is easy to install. The fixture wires are passed up through the center of the socket while the socket is being screwed onto the fixture pipe. When the socket is adjusted, the wires are pulled out and are then fastened under the binding screws.

No. 4004 Old Style is similar to No. 4004, except that it has a short bushing without hickey, and there is no hole in the center of the socket through which the wires can be passed when installing the socket. It must be used in connection with threaded $\frac{1}{8}$ -inch pipe (.405-inch outside diameter, 27 threads per inch) which has openings cut in it through which to pull the fixture wires.

The outside diameter of the paper jacket is $1\frac{3}{16}$ inches. Length of socket, $1\frac{7}{8}$ inches. Length over all, $2\frac{3}{16}$ inches.

When this socket is desired, No. 4004 Old Style should be specified. Price, Schedule, Standard Package Quantity, Carton Quantity and Rating are the same as No. 4004.

Bryant Sockets for Flat Pans

Schedule B
660 Watts, 250 Volts

These sockets are made by soldering 8-inch leads of stranded rubber-covered wire to the terminals of regular No. 95 Wrinklet sockets and covering the tops with wax to hold the bodies in the shells. Used in ceiling pan fixtures by making round holes $1\frac{1}{4}$ inches in diameter in the pans and soldering around the holes on the upper side of the pans Bryant No. 549 Uro fixture rings, after which the wires are connected.

Wrinklet caps cannot be used on these sockets. Standard finish, brass polished but not lacquered. Longer leads can be supplied at an advance in price of $4\frac{1}{2}$ cents per foot each conductor. Wire lengths cannot be assorted to make up a standard package.

718	H	10	100	30	\$.23

No. 4235 Bryant Medium Base Reflector

Sockets
Schedule B
660 Watts, 250 Volts

No. 4235 Front View

No. 4235 Back View

A single piece of ruggedly designed porcelain. The conductors pass through separate holes in the porcelain to the binding screw terminals which are located in shallow recesses at the lamp end of the socket. This construction greatly simplifies both the installation of the socket in the reflector and the connecting of the conductors. The terminal binding screws are extra heavy and long and are staked to prevent being backed out too far.

There are four mounting surfaces or levels accomplished by steps of 1/4 inch each, so that it is possible to hold the lamp at four different positions or focuses with reference to the particular style of reflector used.

This socket can be installed with ease in any type of metal reflector regardless of whether the reflector and its holder are made in one piece or separate pieces; it is suitable for use with metal caps tapped to fit either 3/8-inch or 1/2-inch pipe.

No caps are furnished with these sockets. Reflector manufacturers will supply whatever kind of support is best suited to their particular style of reflectors or holders.

The supporting means of the socket may be so arranged in the reflector that the holding screws, as well as the binding screws, are accessible from the lamp end of the socket.

Socket is 2 3/4 inches in diameter by 1 9/16 inches deep. Holes for supporting screws are 3/16 inch in diameter and are spaced 1 3/4 inches on centers.

Lamp grip, 5 cents extra.

Hubbell Pull Sockets with Insulated Chain

Schedule B

Hubbell pull sockets may be furnished with insulated chain. This arrangement is effected by inserting a piece of fibre rod 1/2-inch long in the chain. For sockets so equipped, add 8 cents to the list price.

Standard package quantity is the same as for the standard socket with which the insulated chain is ordered

May be furnished on any style of pull socket.

The illustration shows a pull socket with insulating link and detachable acorn assembled.

Hubbell Extension Eyelets for Pull Sockets

Schedule B

For Standard and Electrolier Sockets

When sockets are furnished with extension eyelets, add 10 cents to the list price of corresponding socket with regular eyelet.

Standard eyelet sold separately from socket, 5 cents each. Standard package, 250. Unless otherwise specified, sockets with 1-inch extension eyelet will be furnished. If assorted, 100 extension eyelets constitute a standard package.

For special finished eyelets not attached to socket, add 2 cents to price. Standard finish is brushed brass.

Special finished sockets with extension eyelets take same advance as regular sockets, plus extra, as above, for the extension eyelet.

Hubbell Sockets with Extra Long Keys

All Hubbell key sockets are equipped with 1-inch keys, but can be fitted with longer keys on special order, which must specify distance desired between outside of shell and end of keys.

The following can be furnished: Length, 1 1/4, 1 1/2, 1 3/4, 2, 2 1/4 and 2 1/2 inches. Add to list price of standard socket, 5 cents.

Standard package, 100 of one length.

On orders for sockets with extra long keys, where the length is not given, 1 1/2 inch will be supplied.

(a) Standard finish on all brass shell devices is Brush Brass which will be furnished on all orders where no finish is specified.

Any electroplated finish on pull chain parts furnished at an addition of 2 cents list. This addition is subject to quantity reduction applying to socket finishes.

(b) Pull Devices in white finish but with chain eyelet, chain and acorn in any electroplated finish except Brush Brass add 2 cents list advance over price shown for Key, Keyless and Push Sockets.

Pull Devices in Brush Brass finish but chain, acorn and eyelet in any other finish add to list difference between columns 1 and 2 for the finish desired.

(c) All finishes not listed above, including Gold, prices on application. Sample should be submitted with inquiry.

Standard and special finishes of one catalog number may be assorted to make up standard package.

The above prices for special finishes apply to small lots. When ordering in quantity lots of one finish, one shipment, one catalog number, they are reduced.

Sockets are also furnished unassembled, the interiors, linings, etc., being packed separately. Sockets furnished in this manner carry the same list price as assembled sockets.

Special finishes, on chain and parts other than gold and silver, add to list prices as follows:

Chain Eyelets, standard or extension, 2 cents.

Chains, not longer than 1 foot, with or without cords and insulators, 2 cents.

Brass Acorn, 2 cents.

Chain Splicing Link, 2 cents.

Chain Insulator, 2 cents.

For any chain, not longer than 1 foot, with any combination of Chain Eyelet, Connector, Insulator Link, and Brass Acorn in one finish, per set, 2 cents.

Chains, longer than 1 foot, per extra foot or fraction, 2 cents.

Chain in bulk, per foot, 2 cents.

Prices for gold and silver will be quoted on application.

Hubbell Socket Parts

Medium, Mogul and Candelabra Base

Brush brass is standard finish on all metal parts listed below and will be furnished unless otherwise specified.

Carton quantity will be considered one-fifth standard package.

Hubbell Brass Shell Keyless Mogul Sockets

1500 Watts, 600 Volts

Without Shade Holder

With Shade Holder

These Mogul base sockets are fitted with special, high heat-resisting linings capable of withstanding the intense heat generated by type C gas-filled lamps.

These linings are largely composed of asbestos fiber with special binder, and in process of manufacture, are treated at a temperature of approximately 650° F. and are practically non-combustible.

Laboratory tests show these linings chemically neutral; of good dielectric strength, and moisture-proof to about the same degrees as ordinary fiber linings.

Shell and cap are fastened together by means of a screw thread and held in place by a steel set screw.

Without Shadeholder

6000	25	100	20	.18

H & H Adjustable Pull Candle Sockets

To meet all requirements of 4, 5 or 6-inch candles and holders, 4 separate yokes have been designed which may be attached to pull body, Part No. 90.

The most commonly used is Yoke BY, 2 inches long.

When fastened to socket body Part (BY-90), it may be used with 4-inch candles, and holders flat to 1/16 inch deep.

There are 2 set screw holes on each yoke, the top being used practically entirely.

When special conditions arise, however, such as an extra shallow holder, the yoke is easily cut off 5/32 inch above the center of the bottom hole and then a new range of adjustment is available.

A special set screw easily accessible after socket is screwed down in holder, keeps pull chain in alignment with hole in bobèche.

Socket cannot work loose.

P & S Shurlok Sockets

The prime object of Shurlok Sockets and Receptacles is to prevent the theft of the lamp. The value of Shurlok in addition to the prevention of theft is suggested by the few examples shown below:

HOTELS.—Prevents the breakage of lamps by careless removal and handling. Prevents guests from installing high wattage lamps, heating appliances, etc., which tends to overload the circuits and cause trouble.

Prevents guests using electric flat irons without the knowledge and permission of the proprietors.

APARTMENTS.—Insures the permanent location of lamps over fire exits and dark stairways. Insures that lamps which illuminate danger signals will not be removed.

FACTORIES.—Guards the illumination necessary for employees to work efficiently. Prevents the exchange of broken lamps during the absence of the employees.

COMPENSATION DAMAGE SUITS.—Reduces the number of damage suits and compensation litigation because accidents are prevented.

VIBRATION.—Prevents the loosening and falling of lamps due to excessive vibration in moving vehicles, etc.

MINES.—Prevents the theft of lamps that are within easy reach as the majority of lamps are taken because it is easy.

All Shurlok and regular brass sockets are supplied with a threaded bead to which any Uno shade holder may be attached instantly. This feature is valuable as the Shurlok also prevents the removal of the glassware; the glassware will not slip over the body of the lamp.

The illustrations show how the Shurlok Sockets and Receptacles keep the lamp on the job. A rugged set-screw with a triangular head and pointed end is forced into the brass lamp-base and thus the lamp is firmly gripped to prevent the turning of the lamp in the socket. The Shurlok key is of special design and is properly insulated to protect the user while locking or unlocking the Shurlok. When lamps are properly locked in these sockets they cannot be removed without the aid of the Shurlok Key No. 1299. The head of the set-screw, when the lock is in operation is recessed a considerable distance in the bushing or boss so it cannot be reached or operated with tools other than Shurlok key.

The No. 1299 Shurlok keys are designed for use in all types of Shurlok sockets and receptacles. These keys are not given away under any circumstances. The price of the No. 1299 Shurlok key is 35 cents each, net, regardless of quantity. Strict watch is kept to see that no keys are obtained by those unauthorized to possess them.

UNO SHADE HOLDERS.—Brass Shurlok sockets and receptacles are designed to accommodate the Uno shade holders in all patterns.

Shurlok Sockets and Receptacles are manufactured both in the brass and the porcelain types and porcelain Shurlok sockets and receptacles are recommended for use in exposed positions where the brass sockets and receptacles might be easily disintegrated by acid-fumes and gases.

P & S Interchangeable Porcelain Sockets

The key movement is of the double break, single pole type. The caps and bases are secured to the bodies by means of a rugged center-screw, which permits the bodies to be removed from the cap or base while the current is on.

The porcelain Shurlok devices are designed to prevent the unauthorized removal of the lamp and furthermore when the lamp is locked in place the body cannot be removed from the cap or base.

**No. 1410 P & S Brass Sub-base Adapters
For Outlet Boxes**

The sub-base adapter is a new departure and is designed for use with 4-inch box base receptacles and rosettes where the outlet boxes are not flush with the surface of the wall or where the outlet boxes are tilted. The sub-base adapter carries the receptacle or rosette base 1 inch from the wall and permits unusual variations in the position of the outlet boxes. It is held in place by a circular lip which surrounds the devices.

Standard finish is Brush Brass.

No. 91 Benjamin Plug Socket Extensions

660 Watts, 250 Volts

This extension is particularly suited for use where it is desired to get a wide diffusion of light with a small amount of lamp wattage. For example, a fixture designed for 100-watt lamps can be used successfully with 75s by adding a No. 91 Socket Extension.

The extension lowers the filament of the lamp one inch, placing it in the proper position with tee fixture for maximum light diffusion.

The bead offers a convenient method of attaching glassware to flush receptacles, outlet boxes, etc.

Cat. No.	Description	Std. Pkg.	Wt., Lbs. Std. Pkg.	Price Each
91	With Bright Brass Casing Having Shade Holder Bead	10 1		\$3.30

No. 1261 Benjamin Strain Relief Cord Grips

Serves as a strain relief and a cord bushing. Fits any socket tapped 1/2-inch and accommodates any cord from 3/8 to 1 1/2-inch diameter, inclusive.

Easy to attach. Slip cord fitting over end of terminal wires, then wire socket in ordinary way and screw cord grip into position. By means of 2 screws, tighten the steel straps so they will firmly grip cord.

Consists of an iron galvanized malleable bushing with 1/2-inch iron pipe thread, to which 2 straps are attached by machine screws.

Standard package, 10.

Price, No. 1261.....each \$1.10

No. 98 Benjamin Mogul Socket Reducers

660 Watts, 250 Volts

For adapting mogul screw base sockets for use with medium screw base lamps. Both threaded shells are made of copper. Standard package, 10.

Weight, standard package, 1 1/2 pounds.

No. 23 Dim-A-Lite Attachments

For dimming or turning down a single incandescent lamp.

Can be used with either carbon or Mazda lamps up to 50 watts. Suitable for any current, either direct or alternating. Operated by a simple pull of chain which gives five changes of light, full, low, dim, nitelite and out.

Portable, interchangeable type. Brush brass finish. Fits any fixture or chandelier socket and takes any ordinary lamp.

Approved by Underwriters. Standard package, 48.

Price, No. 23.....each \$1.25

110 volts furnished unless otherwise ordered. Add 10 cents for 220 volts. Add 10 cents for 32 volts.

For special finishes, add 25 cents.

No. 24 Dim-A-Lite Attachments

For dimming incandescent lamps.

Portable shade holder type, brush brass finish. Operated, either by turning shade or pulling cord.

Slight turn of shade gives any degree of light desired. Equipped with 2 1/4-inch shade holder. Preferred when the light is within easy reach.

A simple pull of cord gives five changes of light, full, low, dim, nitelite and out.

Can be used with either carbon or Mazda lamps up to 50 watts. Suitable for any current, either direct or alternating. Approved by Underwriters. Standard package, 60.

Price, No. 24.....each \$1.25

110 volts furnished unless otherwise ordered. Add 10 cents for 220 volts. Add 10 cents for 32 volts.

For special finishes, add 25 cents.

No. 34 Dim-A-Lite Attachments

For dimming incandescent lamps. Portable shade holder type, brush brass finish. Perforated shade holder takes standard size shade.

A simple pull of cord gives five changes of light, full, low, dim, nitelite and out.

Can be used with either carbon or Mazda lamps up to 50 watts. Suitable for any current, either direct or alternating. Approved by Underwriters. Standard package, 60.

Price, No. 34.....each \$1.40

110 volts furnished unless otherwise ordered. Add 10 cents for 220 volts. Add 10 cents for 32 volts.

For special finishes, add 25 cents.

No. 33 Dim-a-lite Pull-Chain Sockets

Dim-a-lite pull-chain socket is permanently wired to any electric light fixture or lamp, just the same as an ordinary pull-chain socket. It replaces and improves upon standard pull-chain sockets.

Giving maximum comfort and convenience at minimum cost, Dim-a-lite socket gives five changes of light and saves 30% to 80% current at the meter.

For dimming or turning down a single incandescent lamp. Can be used with either carbon or Mazda lamps up to 50 watts. Suitable for any current, either direct or alternating. Standard package, 100.

Price, No. 33.....each \$1.25

110 volts furnished unless otherwise ordered. Add 10 cents for 220 volts. Add 10 cents for 32 volts.

For special finishes, add 25 cents.

Bryant Ventilated Uno Shade-holders

No. 501

Designed to be attached to the threaded bead of brass shell medium base socket or receptacle.

No. 504—Style H

Bryant Emergency Shade-holders

No. 443

Designed specially for use in connection with medium screw base porcelain sockets and receptacles on not over 250 volts. The method of attachment is by means of a screw shell, thoroughly insulated from the holder itself, which threads onto the outside of the screw shell of the lamp socket without in any way interfering with the use of the lamp. May also be used with most porcelain sockets and receptacles of other manufacture. Emergency shade-holders are made with spring grip only.

Standard finish, brush brass.

The Bryant Spartan Line of Attachment Plugs and Receptacles

The Bryant Spartan Line is composed of a variety of attachment plug caps, bodies and receptacles which incorporate the two main features of Interchangeability and Standardization. They are the standard in general use.

The Spartan design has become accepted as standard throughout the United States and Canada, and is being used extensively in the making of plug devices for both surface and flush installations.

The original Spartan design for both parallel ⊖ and tandem ⊕ slots was the "Quad" slot arrangement, thus: ⊖. For purposes of standardization, this design is now being replaced by the "T" slot arrangement, thus: ⊕.

Spartan receptacles are designed to receive plugs with prongs or blades which are either parallel ⊖ or tandem ⊕. Thus the trade-name Spartan is derived from the two words which are descriptive of the design of these interchangeable devices.

Spartan Plugs are made in two separable pieces. One is the cap with parallel blades. The other is the screw base body with parallel slots into which the blades of the cap are inserted. The combined cap and body form the complete plug.

All Spartan caps fit all Spartan bodies and receptacles. And all Spartan devices are interchangeable with all other makes of standard parallel-blade attachment plug devices.

The Spartan Polarity Feature

WIDE SLOT
Quad Slots

WIDE BLADE
Polarity Cap

WIDE SLOT
T Slots

When it is desired that an attachment plug cap fit into a receptacle in only one way, not reversible, thus providing a polarized connection, Spartan polarity caps should be ordered by substituting for the first letter K of any Spartan cap, the letter M to indicate polarity cap. Thus: A KA cap with polarity feature is known as an MA cap and an MK cap is a polarity cap, in all other respects exactly like a KK cap.

Polarity (M) caps differ from standard Spartan (K) caps only in the greater width of one prong. This wide prong will not fit the narrow slot of the two parallel slots of either the quad slot or T slot receptacles. It will fit the wide slot: This feature is shown in the illustration above. Because of this wide prong, a polarity cap can be inserted into a standard slot receptacle in only one way.

Polarity (M) caps cost the same, their schedule, discount, standard package and carton quantities and their weights are the same as similar standard Spartan (K) caps.

Bryant High Capacity D. D. Receptacles and Plugs

Schedule II

25 Amperes, All Voltages Up To 250 Volts Maximum

This receptacle has been developed in response to the demand for a device having a carrying capacity suitable for atmospheric heaters, moving picture machines, and other portable current-consuming apparatus requiring a large amount of current. The hole in the plug is 3/8 inches in diameter, and is designed for No. 10 portable cable which should be used when the receptacle is to be loaded to its full capacity.

No. 2568 high capacity flush switch may be used for controlling the current to this receptacle, and these two devices may be mounted together on a Y-Z combination flush plate in which case a four-gang switch box is required for mounting.

Receptacle cup; 2 1/8 inches long; 3 1/2 inches wide; 2 1/2 inches deep. Requires a two-gang box. Supporting screw spacings (four holes) 3 3/8 inches vertically and 1 1/8 inches horizontally.

Suitable machine screws for mounting on box are furnished.

When ordering combination plates, specify Z sections to accommodate No. 446 receptacle.

Standard finish for plugs is brush brass. Perma finish for plugs when ordered alone is same as for brush brass. Plugs ordered with special finish plates are given same finish free of extra charge.

Cat. No.	Description	Car-ton	Std. Pkg.	Wt., Lbs. Std. Pkg.	Price Each

Bryant Porcelain Surface Heater Control Combinations

Schedule II

10 Amperes, 250 Volts

Non-fusible

No. 466 may be used for cleat, concealed or molding work. A combination of a 10-amp., 250-volt D. P. indicating switch with No. 2781 porcelain handle, a Spartan receptacle, and, in parallel with it, an Edison receptacle for a pilot lamp.

Base, 4x5 inches. Four holes for supporting screws spaced 1 1/2 x 3 3/8 inches for attachment to standard two-gang switch or outlet boxes, which should preferably be mounted in a vertical position.

Switch cover is reversible so that it will show indications correctly, whether feed wires enter from above or below.

Machine screws for mounting are furnished. On special order an expulsion type switch mechanism especially designed for inductive loads will be substituted for the regular switch mechanism at an advance in price of 30 cents each.

Bryant Bull's Eye Plates

A Section

The B section consists of an F plate into which has been fastened a No. 736 bull's eye jewel.

The A sections should be used only in large combinations so that any lamp can be replaced without removing the whole plate.

When A and B plates are desired with ventilated jewels No. 737, they should be ordered by catalogue No. followed by the words, with No. 737 jewel.

The cost of any plate with No. 737 jewels instead of the standard No. 736 jewels is 50 cents additional for each No. 737 jewel specified. Unless otherwise specified ruby jewels will be furnished. Green, clear, amber, opalescent or blue jewels can be furnished on special order without extra charge.

Standard finish, brush brass.

Bryant Brass Plates with No. 736 Ruby Jewel

For One No. 427 or No. 627 Receptacle
Schedule II

Standard package, 30. Carton, 10.

Assortment of plates is permitted.

When combination plates longer than three gangs are ordered it is advisable to specify A sections instead of B sections.

The price of B plates, solid only, in gangs, when dimensions and spacings are standard, is \$1.00 per gang.

Brass mounting screws are furnished.
Standard finish, brush brass.

Bryant Brass Plates with No. 736 Ruby Jewel

For Two No. 427 Receptacles
Schedule II

Lamps with candelabra bases are commercially limited to a maximum voltage of 125 volts. When bull's eyes are desired for circuits above 125 volts it is necessary to connect two No. 427 receptacles in series in a two-gang box and cover them with a No. OX12 plate. Voltage of two No. 427 receptacles wired in series is 250 volts maximum.

Standard package, 10 plates all of the same one style. Carton, 2 plates of the same style. Plates of the same style may be assorted in various finishes and thicknesses to make up a standard package or carton. No other assortment.

Bryant Bull's Eye Combinations

One Switch and One Bull's Eye

With .040-inch Plate, Not Ready-wired, Two-gang

Schedule II

10 Amperes, 125 Volts

These combinations are made up of assorted parts which must be ordered separately and wired. A No. 427 receptacle with either a No. 2202 push-button switch with a No. OPB42 plate or a No. 2952 tumbler switch with a No. OSB42 plate makes up a combination when wired.

Porcelain cup of receptacle is 2 9/16 x 1 1/8 x 1 5/8 inches. Supporting screw spacings. Outside, 3 5/8 inches; inside, 2 9/16. Receptacle is furnished with a No. 618 lamp, regularly, but will take a Form II lamp. Plates of the same one style may be assorted in various finishes and thicknesses to make up a standard package or a carton. No other assortment permitted.

Standard finish of plates is brush brass. For Perma finish deduct 4 cents per gang from the price. For other finishes consult special list on another page.

Brass mounting screws are packed in the carton with each plate and suitable machine screws are furnished for mounting switch device on the box.

Switches can be furnished with either luminous handle or button for 25 cents extra. Identical devices, regular and luminous, may be assorted.

Bryant Pilot Combinations

One Switch and One Lamp with Brass Guard

Ready-wired, One-gang

Schedule II
10 Amperes, 125 Volts

No. 465

Each combination consists of a one-piece porcelain cup, 2 9/16 x 1 1/2 x 1 5/8 inches, with supporting screw holes spaced 3 3/4 and 2 1/2 inches on centers vertically for installation in a standard one-gang outlet box. This cup incorporates a switch and a candelabra base receptacle ready-wired in multiple, and has two terminals with binding screws on each end.

A No. 618 lamp is fitted in the receptacle and the whole is covered by an M .060-inch plate. This lamp cannot be removed without removing the plate.

The lamp is in circuit when the switch is closed, so this device can be used for remote control of cellar lights, garage and attic lights, and in many other places where a tell-tale is desired.

One No. 2126 key is furnished with each No. 469 switch.

Standard finish is brush brass. For Perma finish, deduct 4 cents per gang. Special finish, see another page.

Suitable machine screws for mounting this device are furnished and brass mounting screws are packed in the carton with each plate.

Price of No. OM61 plate is \$1.30, schedule II, standard package, 10, carton 1.

The price of any combination without No. OM61 plate is \$1.30 less than the price given below.

When ordering combination plates, specify M sections to accommodate the combinations listed.

†To complete installations of old style deep receptacles and plugs 2 inches deep are carried in stock at all times. Add one-half additional list as shown for special finish on receptacle plugs.

H & H Baseboard Receptacles

The contacts are deep sleeves of bronze that closely engage the plug fingers over a large conducting area. Although they grip the fingers tightly, a slight pull will disengage the plug.

These devices have great overload capacity because the contacts are separated by a wall of porcelain so that the current cannot jump across and because the plug fingers

reach the contacts through narrow tubes or porcelain that choke the arc and prevent its reaching the plate when the plug is withdrawn.

Dirt-proof Receptacles—10 Amperes, 250 Volts

The openings of these receptacles are automatically closed with shutters when the plug is withdrawn. The insertion of the plug automatically opens the shutters.

Standard switch plates can be used with these receptacles.

Cat. No.	Description	Std. Pkg.	Wt., Lbs. Std. Pkg.	Price Each
3087	Receptacle Complete	30	31	\$1.23
2850	" Base	30	15	.80

Benjamin Swivel-separable Attachment Plugs

With Standard Cap

Most of cord failure is due to twisting cord when plug is screwed in, something which cannot happen when Swivel-separable is used. Many prefer to screw a separable swivel attachment plug into the socket in one piece, rather than separate cap from base.

No. 900

Base is molded bakelite and is polarized. Cap has large binder screws and parallel blades. Standard package of 10. Weight per standard package, No. 900, 1 1/4 pounds; No. 901, 1 pound.

Price, No. 900, Plug Complete (Base and Cap).....each \$.35
 " " 901, Polarized Base Only..... " .25

Benjamin Attachment Plugs With Parallel Blades

660 Watts, 250 Volts

No. 1001 is the standard type of separable plug in common use. It consists of a standard parallel blade cap No. 938 and polarized base No. 940. No. 938 is of strong high heat molded insulating material with gripping-bead to facilitate removal. It has large binder screws and standard parallel blades. No. 939 is same but has polarized blades. No. 940 base is same material and is polarized. It will fit any medium screw base socket.

No. 205 Hemco Tee-Lite Plugs

660 Watts, 250 Volts

To fit all standard prong type receptacles. Fits closely to baseboard, at the same time permitting the connection of all types of attachment plug.

Cat. No.	Car-ton	Std. Pkg.	Wt., Lbs. Std. Pkg.	Price Each
205	5	100	20	\$.75

Elexits

Elexits are new standardized wiring devices which make portable, removable and interchangeable lighting fixtures a reality. All lighting outlets in properly wired installations will now be finished with elexits.

An elexit outlet is a combination of a mechanical support for the fixture and a receptacle for its lighting circuit. Each part functions independently. No splicing or connecting of wires is required to put an elexit fixture in service and no cutting of wires is necessary to remove it.

Each outlet is complete and covered with a flush brass plate.

An elexit plug is fitted into the base of every elexit fixture whether for wall or ceiling suspension. Separate prongs are provided in this plug for mechanical support and for connections to the electrical circuit.

Elexit plugs can be attached to practically any style of electric lighting fixture.

Elexit Wall Receptacles

10 Amperes, 250 Volts

No. LX101, with Standard Steel Supporting Plate

Receptacle LX101 can be installed in various ways: first, by means of the screw holes spaced $3\frac{3}{2}$ inches on centers in the two elexit covers listed for LX 111; second, by means of the screw holes spaced $2\frac{3}{4}$ inches on centers direct to $3\frac{1}{2}$ inches round and octagonal boxes, also to 4-inch square, round and octagonal boxes, if they have covers with ears drilled and tapped $2\frac{3}{4}$ inches on centers for No. 8-32 screws; third, by means of stirrup LX 151 or LX 153 attached to fixture stud or gas pipe; if gas pipe is alive, use gas cap to support stirrup.

Extreme care must be used to have receptacles exactly flush with wall surface.

Mounting screws, $\frac{5}{8}$ inch, No. 8-32, are included.

Cat. No.	Schedule	Plate Required	Car-ton	Std. Pkg.	Price Each
LX101	LX	LX301	10	50	\$.80

No. LX111, with Narrow Steel Supporting Plate

Supported by screws $3\frac{3}{2}$ inches on centers vertically.

Designed for attachment to special outlet box covers 52C63 and 54C63.

This receptacle can be used only with these two covers.

If wall outlet boxes are tapped for two No. 8-32 screws, spaced $3\frac{3}{2}$ inches apart, and arranged vertically, elexit receptacle may be installed by using these screw holes. If the openings in such box covers are sufficiently narrow, the elexit receptacle may be finished with a narrow oval plate.

Mounting screws, $\frac{5}{8}$ inch, No. 8-32 are included.

Cat. No.	Schedule	Plate Required	Car-ton	Std. Pkg.	Price Each
LX111	LX	LX111	10	50	\$.75

Elexit Steel Supporting Stirrups

No. LX151 short stirrup, is designed to support LX101 from $\frac{3}{8}$ -inch fixture stud, when end of stud is $\frac{5}{8}$ inch to $1\frac{1}{4}$ inches back of wall surface.

No. LX153 long stirrup, is designed to support LX101 from $\frac{3}{8}$ -inch fixture stud, when end of stud is $1\frac{1}{4}$ inches or more back of wall surface.

Cat. No.	Schedule	Car-ton	Std. Pkg.	Price Each

Perkins Shallow Cup Switches

Schedule II

Extremely shallow switches for use in thin partitions, two-button, flush, push types.

Porcelain cups are 2 3/8 inches long, 1 1/2 inches deep. No. 5501 is 1 7/16 inches wide; Nos. 5502, 5503, 5504 and 5505, are 1 1/8 inches. Supporting screw spacings: outside, 3 1/2 inches, inside, 2 3/8 inches.

When ordering combination plates, specify P sections to accommodate two-button flush push switches.

Machine screws for mounting are furnished.

Prices of switches with metal or fibre buttons longer than regular will be quoted upon application. The standard moulded composition buttons in other than regular lengths cannot be furnished.

For switches with metal buttons, regular length, add 10 cents. For switches waxed with a compound that will not melt add, 20 cents which includes metal buttons regular length. Metal buttons are necessary where switches are subjected to heat. For switches with both buttons ivory add \$1.00. Luminous button, 25 cents extra.

Perkins Flush Push Self-Restoring Momentary Contact Switches

Schedule H

10 Amperes, 125 Volts; 5 Amperes, 250 Volts

In these switches the circuit is closed or opened as the case may be, only while the button is held in. As soon as pressure is released, the switch automatically restores itself to its normal position with a quick action.

Length of porcelain cup, $2\frac{1}{8}$ inches. Width, $1\frac{3}{8}$ inches. Depth, $1\frac{1}{2}$ inches.

Supporting screw spacings: Outside, $3\frac{3}{4}$ inches; inside, $2\frac{1}{2}$ inches.

When ordering combination plates specify P sections to accommodate two-button flush push switches.

Machine screws for mounting these devices on boxes are furnished.

Push-button and push lock switches of the same description may be assorted to make up a standard package quantity, and no other assortment is permissible.

Push-button Type

Regularly made with one pearl and one black button.

Prices of switches with metal or fibre buttons longer than regular will be quoted upon application. Regular lengths only of standard moulded buttons. Metal buttons are necessary where switches are subjected to heat, add 5 cents for each regular length button. For switches waxed with a compound that will not melt add 20 cents to price of switch which includes metal buttons regular length. For switches with assembling screws soldered, add 10 cents. For switches with buttons of white ivory add 50 cents per button. Luminous buttons, 25 cents each extra.

Bryant Glo-Guide Switches

No. 2951-BH Switch with No. OS41 Plate

One of the most recent developments in luminous locators is the Bryant built-in locator for flush tumbler switches.

The luminous handles of these switches are made of clear transparent Bakelite, each of which contains a glass rod covered with radium paint. Only genuine Undark radium paint is used because this brand is made to certain exact luminous standards and will maintain its original luminous brilliance indefinitely. Unlike substitutes it can be used in a permanently dark place. The locator is a permanent non-detachable part of the switch.

Any Bryant tumbler switch with handle can be equipped with this luminous handle at an addition to cost price of 65 cents each. In ordering, specify Cat. No., followed by a hyphen and capital initials, BH.

Bryant Brass Plates for One Tumbler Switch and One Flush Receptacle Two-gang, .040-inch Stamped

Brass mounting screw packed in carton with each plate.

Standard package consists of 10 plates, all of the same style. Carton consists of 2 plates. Plates of the same style may be assorted, in various thicknesses, finishes and gangs.

Reversible plate can be turned end for end without affecting the proper operation of devices which it covers.

The price of brush brass solid S plates in one vertical row (tandem) above four gangs, when dimensions and spacings are standard, is 40 cents per gang.

Bryant Bakelite Flush Plates

Schedule II

Made of genuine Bakelite and can be furnished only in styles and sizes given below. No combinations can be supplied.

A standard package of F, P or S plates consists of enough plates all of the same style to accommodate 100 similar flush devices. A standard package of V plates consists of 50 plates all of the same style.

Standard finish of Bakelite plates is reddish brown but black plates can be supplied on special order when so specified, without extra charge.

With each F, P and S plate are supplied 2 plate holding screws and 2 ornamental Bakelite rosettes to cover them.

With each V plate are supplied 2 black or brown finished oval head screws to support plate in position and 4 washers of different thicknesses to place under plate, in the center, for support and prevention of cracking.

Bryant Blank Brass Flush Plates

Schedule II

One Horizontal Row

Standard finish, brush brass which will be furnished when no other finish is specified.

Brass mounting screws are packed in the carton with each plate.

A standard package of K plates consists of a sufficient number to cover 100 gangs. A carton is one-fifth of a standard package. K plates may be assorted in various finishes, thicknesses and gangs to make up carton and standard package quantities. No other assortment permitted.

Solid blank plates, brush brass finish, one horizontal row only, when spacings

and dimensions are standard, can be furnished at 44 cents per gang, and under the same conditions struck-up blank plates can be furnished at 30 cents per gang when .060 inch thick and at 26 cents per gang when .040 inch thick. For tandem plates, solid only, add 20 per cent.

Unless otherwise specified supporting screws are spaced 3 3/8 inches on centers vertically and 1 1/8 inches on centers horizontally, so that the plate will be attached directly to the ears of the box. When mounting yokes are wanted with the plates, add to the prices shown, 5 cents per gang. When yokes are furnished the plate supporting screws are spaced 2 3/8 inches on centers vertically.

Bryant Special Finishes

Special Finishes for Brass Shell Sockets, Socket Type Devices and Parts, Canopy Switches Shade-Holders, Fixture Specialties, Attachment Plug Caps and Flush Plates

GENERAL.—The standard finish of all brass shell devices and brass flush plates, unless otherwise noted, is brush brass, which will be supplied when the finish is not specified. Standard and special finishes on all devices of one catalogue number may be assorted to make up the standard package quantity, which will be the same as though all were standard finish.

Assortment of catalog numbers may be made only as indicated in the catalog pages where the devices are listed. Prices on all special finishes other than those listed, including gold, will be quoted on application. Sample of finish desired should always be submitted to avoid mistakes and delays.

DEVICES EXCEPT FLUSH PLATES.—Devices will be supplied unfinished or polished but not lacquered at the same prices as brush brass. When any of the devices mentioned in columns 1, 2, 3, 4, 5 or 6 in special finishes are ordered in quantities the list prices for finishes only will be reduced as follows: lots of 500-999, one catalogue number, one shipment, one finish, 20%; lots over 1000, one catalogue number, one shipment, one finish, 50%.

When any of the devices mentioned in columns 7 and 8 in special finishes are ordered in quantities, the list prices for finishes only will be reduced as follows: lots of 100-499, one finish, 10%; lots of 500-999, one catalogue number, one shipment, one finish, 20%; lots of 1,000 or more, one catalogue number, one shipment, one finish, 30%.

CHAINS AND METAL CHAIN PARTS.—Chain guides, chains not longer than one foot, and chain parts, singly or in combination, can be supplied in any special finish, except silver and gold, at an addition to list price of 2 cents per unit. For silver finishes add 10 cents list per unit. Gold finish prices on application. For pull devices in one finish and chain parts in another finish add 2 cents (10 cents for silver) to the list prices given in columns 1, 3 and 6 below.

FLUSH PLATES.—The charges given below in column 9 cover all one gang plates. For multiple gang plates these charges cover the first gang only; for the second or any additional gangs of a multiple gang plate the charge is 10 cents list per gang for all special finishes except gold. The prices of gold finishes will be quoted on application.

"Perma" Finish is a durable colored lacquer or varnish that resembles brush brass. Any brass flush plate can be supplied in "Perma" finish (the symbol for which is "-P" following the catalogue number) for 4 cents list per gang less than the price of the same plate in brush brass finish. When flush plates in special finishes are ordered in quantities the list prices for finishes only will be reduced as follows: lots of 100-499 gangs, one finish, one shipment, 10%; lots of 500-999 gangs, one finish, one shipment, 20%; lots of 1,000 or more gangs, one finish, one shipment, 30%. Unfinished plates, polished and buffed will be supplied at the same prices as brush brass. Unfinished plates, not polished or buffed will be supplied at the same price as "Perma" finish.

†When ordering brass shell devices in colored lacquers send a sample of the finish desired, otherwise it is not possible to definitely state whether one, two or three coats are necessary.

Bryant Flush Devices

EXPLANATION OF GANG.—All flush plates and flush devices of standard design are made to fit into switch or outlet boxes. When flush devices are arranged side by side they are said to be arranged in gangs and the number of such gangs so arranged is specified.

In this catalogue standard flush plates, one horizontal row only, are designated by the number of such gangs as they are designed to cover. Thus a one-gang plate will cover a one-gang box and the one-gang flush device contained by it; likewise a five-gang plate will cover a five-gang box.

When flush devices are arranged end to end they are said to be "in tandem" and flush plates designed to cover them are called tandem plates, the length of the plates being expressed in gangs to show the number of boxes arranged end to end which they are designed to cover.

Tandem plates are not designated by descriptive catalogue numbers.

Standard Spacings and Dimensions

One-gang Flush Device

- A—Plate screw spacings usually $2\frac{3}{8}$ in.
- B—Supporting screw spacings, outside $3\frac{3}{8}$ in.
- C—Supporting screw spacings, inside $2\frac{3}{16}$ in.
- L—Length of body or cup, not over $2\frac{13}{16}$ in.
- W—Width of body or cup, not over $1\frac{11}{16}$ in.
- D—Depth of body or cup.

One-gang Flush Plate

- A—Plate screw spacings, usually $2\frac{3}{8}$ in. On G, H, K, T, T2 and T3 plates it is $3\frac{3}{8}$ in.
- L—Length of plate, $4\frac{1}{2}$ in.
- W—Width of plate, $2\frac{3}{4}$ in.
- T—Thickness of plate, solid, 0.100 in.; .060 stamped, 0.060 in.; .040 stamped, 0.040 in.

Five-gang Flush Plate

One Horizontal Row

- A—Plate screw spacings, usually $2\frac{3}{8}$ in.
 - S—Spacings between centers of adjacent gangs always $1\frac{9}{16}$ in.
 - L—Length of plate, $4\frac{1}{2}$ in.
 - W—Width of plate varies for different number of gangs as follows:
- | | | | |
|-------------|--------------------|-------------|---------------------|
| 1 Gang..... | $2\frac{3}{4}$ in. | 5 Gang..... | 10 in. |
| 2 "..... | $4\frac{9}{16}$ " | 6 "..... | $11\frac{13}{16}$ " |
| 3 "..... | $6\frac{3}{8}$ " | 7 "..... | $13\frac{5}{8}$ " |
| 4 "..... | $8\frac{3}{16}$ " | 8 "..... | $15\frac{7}{16}$ " |

**Bryant Flush Devices
Standard Spacings and Dimensions**

Continued

**Three-gang
Tandem Flush Plate
One Vertical Row**

- A—Plate screw spacings usually $2\frac{3}{8}$ inches.
 - V—Spacings between centers of adjacent tandem devices always $3\frac{3}{8}$ inches.
 - W—Width of plate varies according to number of vertical rows.
 - L—Length of plate varies according to number of devices in tandem as follows:
- 2—tandem $8\frac{1}{2}$ inches.
 - 3—tandem $11\frac{3}{4}$ inches.
 - 4—tandem $15\frac{3}{8}$ inches.
 - 5—tandem 19 inches.
 - 6—tandem $22\frac{5}{8}$ inches.
 - 7—tandem $26\frac{1}{4}$ inches.

**Information Regarding Flush Plates
Plates of Special Dimensions
and Spacings, Solid Only**

Plates of special dimensions or spacings will be billed at 7 cents per square inch in addition to the price of the corresponding standard solid plate. The standard package quantity will be ten plates of one style and size. Schedule II. On quantity orders for identical plates the following list price per square inch reductions will be allowed: 100-499 plates, 10%; 500-999 plates, 20%; 1000 and over, 30%. When plates are other than rectangular in shape the area by which the price is determined will be the size of the smallest rectangular piece from which the specified plate can be cut.

Hammered Plates, Solid Only

Plates with hammered finish can be supplied at an advance in list price of 20 cents per gang over the cost of the plate plus any special finish desired.

**Plates to Fit Condulets
Solid Only**

Flush plates to properly fit FD and FS Condulets should be solid, with round corners and beveled edges and of the following dimensions:

Description	Length Inches	Width Inches
Single.....	4	$2\frac{1}{2}$
Two-gang.....	4	$4\frac{5}{16}$
Three-gang.....	4	$6\frac{1}{8}$
Four-gang.....	4	$7\frac{15}{16}$

When plates are specified, Condulet dimensions, the only extra charge will be 15 cents per plate for the round corners and beveled edges when dimensions and spacings are standard.

The standard package quantity and schedule will be the same as the standard plate. Single and gang plates to fit the same devices may be assorted to make up the standard package quantity. No other assortment is permitted.

Plates of Special Metals, Solid Only

Plates of genuine rolled bronze, will be furnished at an addition of 10 cents list per gang to the list prices of the corresponding solid brass plates and the standard finish will be brush bronze. Plates of Benedict metal will be furnished at 25 cents list per gang to the list prices of the corresponding solid brass plates and the standard finish will be polished, which has the appearance of polished nickel. Prices for plates of other metals will be quoted on application. Plates of special metal may not be assorted with standard plates to make up a standard package quantity. The standard package quantity and schedule will be the same as for the corresponding standard solid brass plate.

Bryant Flush Plates

Explanation of Catalogue Numbers for Flush Plates

When specifying flush plates there are three things that must be known: The style of plate; the thickness of the metal, and the number of gangs.

Except for tandem plates (plates arranged vertically) and combination plates, each listed Bryant flush plate has a catalogue number which describes the kind of plate it is.

OP12 is the catalogue number for a two-button push switch plate, solid, two-gang (Old No. 3640).

OV61 is the catalogue number for a duplex flush receptacle plate, .060 in. stamped, one-gang (Old No. 550).

OPF42 is the catalogue number for a plate for one two-button push switch and one single flush receptacle, .040 in. stamped, two-gang (Old No. 3650).

OV211 is the catalogue number for a plate with doors for a duplex flush receptacle, solid, one-gang (Old No. 579).

In each case the left-hand number O indicates a flush plate. See examples.

1. The symbol letter or letters immediately following describe the style of plate.

2. The figure next to the right-hand figure indicates the thickness of the plate.

- 1. Indicates .100 in. thick (Solid).
- 6. Indicates .060 in. thick, stamped.
- 4. Indicates .040 in. thick, stamped.

3. The right-hand figure indicates the number of horizontal gangs wide.

When the simple elements of this number system are learned it will be found very easy to specify Bryant plates by catalogue number.

Examples

Engraving

No. OS12 (Old No. 3692) Engraved with 3/16 In. Wide Block Letters

Flush plates will be engraved with words or numbers at an addition to the list price of 10 cents per character, standard package quantity 100 characters. Wide and narrow block letters and figures, 3/16, .053, 1/16, 5/64, 3/32, 7/64, 1/8, 5/32, 3/16, 1/4, 5/16, 3/8, 1/2, 5/8, 3/4 and 1 in. high, as selected, filled with black, can be made. Schedule will be the same as the plate engraved. Engraved plates may be assorted with standard plates to make up the standard package quantity.

Bryant Flush Plates

Plates with Round Corners and Round Edges Solid Only

No. OS11 (Old No. 3691)

Plates with round corners and round edges, when dimensions and spacings are standard, will be furnished at an addition to the list of solid plates of 15 cents for single plates and 5 cents for each additional section in gang plates.

The standard package quantity and schedule will be the same as the standard plate. Single and gang plates with round corners and round edges to fit the same device may be assorted to make up the standard package quantity. No other assortment permitted.

Plates with Round Corners and Beveled Edges, Solid Only

Plates with round corners and beveled edges, when dimensions and spacings are standard, will be furnished at an addition to the list price of solid plates of 15 cents per plate.

The standard package quantity and schedule will be the same as the standard plate. Single and gang plates with round corners and beveled edges to fit the same device may be assorted to make up the standard package quantity. No other assortment permitted.

No. OS11 (Old No. 3691)

Plates with Raised Edges Solid Only

Front No. OS11 Back (Old No. 3691) Side Edge

When ordering plates with raised edges, always give dimension indicated between arrows.

Plates with raised edges are sometimes required when the outlet box projects beyond the surrounding surface. For plates with raised edges not more than 1/2 inch high, add to the price of each plate \$1.00 net for one gang and 50 cents net for each additional gang. Upon application, prices will be quoted for plates with edges raised more than 1/2 inch.

Plates with Square Edges, Solid Only

Plates with square corners and square edges, when dimensions and spacings are standard, will be furnished at the same price as regular solid plates and may be assorted with regular plates to make up the standard package quantity. The standard package quantity and schedule will be the same as the standard plate. For plates with round corners and square edges, the additional charge will be the same as given above for plates with round corners and beveled edges.

No. OS11 (Old No. 3691)

Flush Plate Mounting Screws

The requisite flush plate mounting screws are included with each flush plate. When bought separately they will be billed at 75 cents per 100, standard package quantity 100, Schedule H.

Wood screws are sometimes wanted for use in connection with flush plates. 3/4-inch No. 6 oval head brass wood screws can be furnished at \$3.00 per 100, standard package quantity 100, Schedule H.

The standard finish for these screws is brush brass; however, special finishes, when specified, will be furnished without extra charge.

Bryant Solid Flush Plate Sections

Schedule H

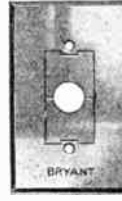

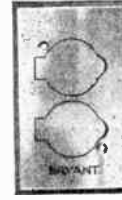

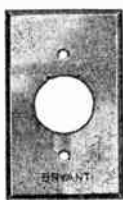

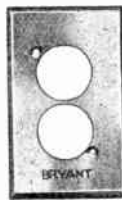

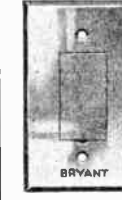

Below are illustrated the standard plate sections which can be furnished, together with a description of each plate and a list of the devices with which it may be used. The symbol letters are those used in the catalogue numbers of plates regularly listed in this catalogue.

Combination plates should be described by using the letters shown on cuts of the respective plates, giving the letters in order from left to right, or from top to bottom, as the devices are to be mounted. The list price, in brush brass finish when dimensions and spacings are standard and the devices are arranged in one horizontal row, will be the sum of the lists as shown. For plates with devices mounted tandem or in more

than one horizontal row, add 20 per cent to the sum of the list prices. The standard package quantity is ten plates of one description (not ten gangs). The carton quantity is two plates.

A combination plate cannot be so considered unless it is described by at least two different letters, but letters may be used to describe any desired arrangement of plate sections. Standard spacings and dimensions for combination plates are listed here. For plates of special dimensions and spacings see another page.

The standard finish of plates is brush brass which will be supplied if no finish is specified. For special finishes see another page.

*Supporting screw spacings on this plate are $3\frac{9}{32}$ inches on centers.

Bryant Tumbler Type Surface Switches
Indicating, with Black Composition Handle
Porcelain Base and Metal Cover
Schedule II

No. 2933

Diameter of base, 2 inches.
 Height over cover, 1 1/8 inches.
 Height over handle, 1 5/8 inches.
 Supporting screw spacings, 1 3/8 inches.

The standard finish on metal covers is polished nickel which will be furnished when the finish is not specified.

For covers in any other finish, except gold, add 10 cents each.

Indications are stamped on the covers. Polished nickel brass handle can be furnished on special order instead of black composition handle at no increase in cost. Identical switches with composition and metal handles may be assorted.

Perkins Large Size Surface Switches
Single-pole
10 Amperes, 125 Volts; 5 Amperes, 250 Volts

Outside diameter of base, 2 1/8 inches. Nos. 2221 and 2036 can be supplied, on special order, on a base measuring 2 1/4 inches in diameter, which is likewise diameter of cover.

Height over cover, 1 1/8 inches. Height over handle, 2 1/4 inches.

Screw holes spaced 1 1/4 inches on centers.

**Perkins Expulsion Type Surface Switches
For Inductive Loads and Electric Railway Circuits
With Porcelain Base and Handle, Metal Cover**

Schedule II

No. 2171
with Cover Off

No. 2060, Indicating
with Cover Off

Expulsion type switches are designed with barriers between parts of opposite polarity which are effective in limiting the arc formed when the circuit is broken. For this reason, they should be used to control inductive loads such as motors.

Because of the difference in operating characteristics of inductive apparatus it is not possible to guarantee expulsion type switches on all inductive loads but they will give better results on inductive loads than the regular type of rotary switches.

While only the 600-volt rating of these switches is National Electric Code standard, the suggested rating at 250 volts is also given for each switch.

It is not advisable, though possible, to convert 600-volt switches into lock switches by the use of No. 2384 rotary switch lock attachment.

The standard finish on all metal covers of surface switches unless otherwise noted is polished nickel which will be supplied when the finish is not specified. For covers in any other finish, except gold, add to price 10 cents each.

Perkins Triple-pole Expulsion Type Surface Switches

For Inductive Loads and Railway Circuits
Schedule II

20 Amperes, 250 Volts, 2 H. P. 250 and 600 Volts, 3-phase

For controlling three-phase A. C. motors up to and including 2 H. P. Only the 600-volt rating is N.E.C.

No. 2597 is designed to be attached to conduit fittings made by The Crouse-Hinds Co., The Appleton Electric Co., The Columbia Metal Box Co., and The V. V. Fittings Co. Dust-tight, indicating cast iron cover, is regularly furnished in black. On special order, sherardized cover is furnished, 15 cents extra.

No. 2887 has a stamped brass cover, non-indicating, polished nickel finish, with insulating lining. Any special finish except gold, furnished 10 cents extra.

The switch mechanism has a composition handle which is fastened to the center post with a screw and which serves as an indicator of the position of the switch.

Perkins Rotary Switch Handles

Schedule II

All Perkins rotary switch handles, except the handle of No. 2597, lock attachments and switch center posts, except Nos. 2635 and 2636 and range switches, are threaded alike, regardless of the size of the switch. Handles differ in external shape and size for purposes of leverage appropriate to the size of the switch. In an emergency, any available handle can be attached to any switch.

Refer to switch listings for definite information regarding handles. Any switch regularly equipped with one of these handles can, on special order, be furnished with any other of these handles without extra charge.

When switches are ordered without handles, deduct 2 cents.

No. 2785 Perkins Metal Rotary Switch Handles

Schedule II

This metal handle may be substituted for any composition or porcelain switch handle on any size switch.

For switches fitted with this handle add 6 cents extra.

Cat. No.	Description	Std. Pkg.	Price Each
2785	Flat, Nickel-plated Brass	100	\$.12

Perkins Security Ratchet-lock Handles

Schedule II

These handles may be substituted for standard round or flat handles on any of the rotary switches listed in this catalogue except Nos. 2597, 2635, 2636 and range switches.

They are attached in the usual manner, but can be removed only with screw driver.

The ratchet principle is employed so that turning the handle backward does no damage either to handle or switch.

For switches fitted with these handles, add 5 cents extra.

No. 2621

Bryant Range Switch Fusible Sub-bases

These sub-bases are designed to be mounted in a row and have provisions for bus-wires, heater-wire connections and means for supporting the switch.

The housings for the switches are supplied by the range manufacturer and include supports for the sub-bases, a cover plate bearing the proper dial indications and through which the center posts of the switch mechanisms project, and an easily removed cover for ready access to the fuses. The porcelain indicating handles plainly show the connections to the various heaters.

The main-line connections, or bus-wires, are supported in parallel grooves on the backs of the sub-bases. The wires from the switches to the heating units are connected to the terminal plates on the sub-bases and are carried through holes in the porcelain to suitable terminals on the heater units. To determine the height of any switch mounted on any sub-base add the dimensions "Height to mounting surface," and "Height under handle," or "Height over handle".

Bryant Range Switch Fusible Porcelain Sub-bases

Schedule II
30 Amperes, 125 Volts

With Fuse Receptacles Parallel to Switch Center Post

This sub-base may be installed in the range with the fuses either above or below the switch. The bus-wire connections are so devised that the load of the range may be balanced between the neutral wire and each of the two pressure wires. This is accomplished by shifting the contact plate from one pressure wire groove to the other making the proper connections.

No. 3806

Bryant Double-pole Range Switches
Separable Mechanism, Porcelain Bases and Indicating Handles, Bakelite Insulation

The switch mechanism is a separate unit and is fastened to a sub-base by means of screws which also form the electrical connection between the switch mechanism and the sub-base. The wires which connect the switch to the line and to the heater are fastened to suitable terminal plates on the sub-base. The switch mechanism unit can be removed from the sub-base without disturbing any of the wiring connections by loosening the contact screws which secure the mechanism unit to the sub-base. The advantage of this construction is the ease and convenience with which switch replacements can be made without possibility of connecting the switch in the wrong way.

In the following listings, switches described as reversible, are arranged so the handles may be returned backward or forward. This permits a switch to be operated from Off to either High or Low or from High or Low to Off or Medium without going through any other position.

**Perkins Push Panel Switches
Double-pole Fusing**

Each branch is fitted with a double pole switch, which is mounted on a separate base and may be removed without disturbing either main or branch connections.

These switches may be installed in any standard cabinet having a minimum depth of 3 inches. Gutter cabinets may be specified to the exact size of the switch bases as there is 1/2-inch of insulation outside of all current carrying parts.

The covers of these switches are steel, lined with insulating material. Each cover has an overhanging edge which engages with the cover of the adjoining switch, thereby effectively preventing accidental contact with any live parts.

Orders will be filled with switches having glossy black covers.

White enamel covers will be supplied when specified without extra charge. All other finishes on covers, add 50 cents to list.

Can be furnished with luminous button at an addition to list price of 25 cents for each switch button so fitted. Identical switches, regular and luminous, may be assorted.

**With Connections for Two-plug Fuses in Each Branch

Perkins Rotary Panel Switches

Single-pole Fusing

Each branch is fitted with a double-pole switch, which is mounted on a separate base and may be removed without disturbing either main or branch connections. On special order, switches will be fitted with expulsion type mechanisms for inductive loads at an additional list price of 30 cents per branch.

These switches may be installed in any standard cabinet having a minimum depth of 3 inches. Gutter cabinets may be specified to the exact size of the switch bases, as there is 1/2 inch of insulation outside of all current carrying parts as required.

One plug fuse receptacle or clips for one cartridge fuse are omitted from one side of the line in each branch. This unfused side should always be the grounded side of the line.

The catalogue numbers of panel switches with fuse omitted from one side of the line in each branch, are the same as similar panel

switches with two fuses in each branch, except that the numeral 0 is added between the second and third figures.

Can be converted into lock switches by removing the handles and substituting Cat. No. 2384 universal rotary switch lock attachment.

Hubbell Flush Plates

Flush Plates with Round Corners and Round Edges

Plates with round corners and round edges will be furnished at the price of solid plates plus 15 cents list for single plates and 5 cents for each additional gang.

Plates with Round Corners and Beveled Edges

Plates with round corners and beveled edges will be furnished at the price of solid plates plus 15 cents list for each plate.

Plates with Extension Edges

Plates with extension edges to cover a device not flush with the wall can be furnished in solid metal at a net price of \$1.00 for a single plate and 50 cents net for each additional gang in addition to the price of the standard plate. For extension edges deeper than 1/2 inch, special prices will apply.

Plates with Square Corners and Square Edges (Not Beveled)

Plates with square corners and square edges (not beveled) will be sold at list price of 10 cents per square inch, except when spacings and dimensions are standard, in which case solid plates will be furnished and there will be no extra charge.

Special Size Plates—Solid Brass

Plates of special size or spacings in standard finishes will be furnished at a list price of 7 cents per square inch in addition to the list price of corresponding solid plate. Standard package consists of 10 plates of a size or kind. This list on plates smaller than a single standard will be computed at the same rate using as a basis the area of a single standard plate. For special size combinations having double hinge cover, add 75 cents list extra for each lift cover.

Orders for special size plates should always be accompanied by a plainly marked sketch giving the dimensions; and for special finish plates, should be accompanied by a sample of the desired finish.

When special size plates are not rectangular in shape, the charge will be for a plate the size of the smallest rectangular piece from which the specified plate can be cut. In no case shall a special plate sell at a price less than the corresponding standard plate.

Receptacle Plate Screws

Receptacle plate screws, size 3/8 inch, when bought separately, 75 cents list per 100 in brush brass or Lacco finishes. Standard package, 100. Schedule H. Special length plate screws, \$1.00 per 100.

Engraving

Flush plates will be stamped with words or numbers at a list price of 10 cents per letter or numeral; standard package, 100.

Plate Dimensions

No. of Gangs	INCHES		No. of Gangs	INCHES	
	Vertical	Horizontal		Vertical	Horizontal
1	4 1/2	2 3/4	7	4 1/2	13 5/8

(a) Standard finish is Brush Brass which will be furnished on all orders where no finish is specified.

(c) All finishes not listed above, including Gold, prices on application. Sample should be submitted with inquiry.

(d) These prices should be added to Brush Brass prices and not "Lacco."

(e) List prices applying to finishes on Plates are based on single plates. When ordering in gangs, add 10 cents for each gang beyond the first, regardless of finish except gold.

The above prices for special finishes apply to small lots. When ordering in quantity lots of one finish, one shipment, one catalogue number, they are reduced as follows:

- 100 to 499 gangs or caps, list price reduced 10%.
- 500 to 999 gangs or caps, list price reduced 20%.
- 1000 gangs or caps and over, list price reduced 50%.

These deductions should be made from the list prices of finishes before trade discounts are figured.

Unfinished devices (except flush plates) or devices polished but not lacquered will be supplied at same list price as devices in standard finish.

Unfinished flush plates, that are polished and buffed, will be supplied at same list price as brush brass plates.

Unfinished flush plates, not polished or buffed, (in rough state) will be furnished at same list price as "Lacco" finish plates.

"Lacco" finish is a durable sprayed-on lacquer coating resembling Brush Brass.

Diamond H Single-pole Surface Switches

These switches may be converted into lock switches by removing the handle and using lock attachments.

Diamond H Momentary Contact Switches

This is a special push button switch for use in connection with remote control switches. The mechanism is similar to that of the regular diamond H push button switch and is so arranged that a snap contact is made by pressing either of the buttons and a quick break is obtained when the button is released. Both buttons cannot be pressed at the same time. This switch fits all standard conduit boxes and uses a regular Diamond H push button plate. It can be fitted with a lock attachment, if desired.

Can be furnished with luminous buttons. Add to list price of any switch 25c per switch list. For switches with buttons longer than regular add to list price 40c per switch. White or red ivory switch buttons 50c per button list extra.

Diamond H 20-ampere Rotary Flush Switches

No. 1322 Switch

The 20-ampere Flush Switches have the same mechanism as the 20-ampere surface type which is enclosed in a heavy porcelain base which is practically unbreakable. They are made in both single and double pole types, either with or without indicating dial, as may be desired.

Single pole, 20 amperes, 125 volts.
Double pole, 20 amperes, 250 volts.
Base 3 inches x 2½ inches deep.
Supporting screw holes 3½ inches center to center.

Diamond H Automatic Door Switches

Made in two types, No. 601 light on with door open and No. 602 light off with door open. Strike plates for door switches are made of hard brass ⅜ inch thick. The conduit box for door switches is made of cold rolled steel .085 of an inch thick, galvanized or black enamel finish. It is furnished with a clamping device suitable for use with all kinds of flexible conduit. A liberal number of knock-outs is provided. Regular plate dimensions are 1¼x4½ inches. Special size plates can be furnished to order.

Diamond H Remote Control Switches

A Remote Control or magnetically operated switch is used where it is desired to control a certain load from a remote point, so remote that it would be inexpedient and expensive to run the heavy mains from the load to the point of control and return. This would mean an unnecessary loss of voltage and a heavy expenditure for copper and conduit.

A Remote Control Switch is installed as near the load as practicable and three small wires, for moderate distances No. 14, are run from this switch to the manual momentary contact switch located at the desired point of control.

By extending these control wires and connecting in momentary contact switches, the points of control may be increased to any desired number.

The momentary contact switch is normally in an open position and connects the common control wire alternately with the other two which are in series with the opening and closing coils respectively of a Remote Control Switch.

The principal use of the Remote Control Switch is for the control of large groups of lights in public buildings, theatres, train sheds, isolated sections of plants or docks, individual buildings, etc.

Type F Single Throw

For Potential Not Exceeding 250 D. C. Volts or 440 Volts A. C.

Type F Remote Control Switches consist of the required number of contacts mounted on a slate base. Switches of this type are used extensively with auxiliary switches, tank switches, pressure gauges, thermostats, momentary contact switches, etc., to control small motors which can be thrown directly on the line.

Cat. No. 610

Type F Remote Control Switches will operate directly across the line without the use of any other series resistance for the coils. Three control wires are required between the remote control point and the Type F switch.

A 2-button push button switch of the momentary contact type is used as control; one button to open, and one button to close the Remote Control Switch.

Diamond H Remote Control Switches

Type A Single Throw, No Voltage, Release

For Potential Not Exceeding 250 Volts D. C. or 440 Volts A. C.

Cat. No. 630

In the Type A switch, the closing coil is of comparatively low resistance and requires current only while the switch is closing, being automatically cut out the instant the switch locks in the closed position. The high resistance coil takes but a small fraction of an ampere and is in circuit while the switch remains closed. An interruption of this circuit either from failure of current supply, or by the opening of the control switch, allows the armature, which this high resistance coil holds suspended, to drop, releasing the ball-locking device of the main armature and allowing the switch to open by gravity. The manual control is effected by a single-pole switch, or when more than one point of control is desired, by 3 and 4-way switches. Switches are furnished for either alternating or direct current, but with different windings. It is necessary, therefore, to specify the type of service on which the switch is to be used. This switch is particularly desirable where the service is subject to interruption. Upon the failure of the service, the switch automatically opens and prevents injury to the device controlled by the switch in case of sudden resumption of service. In many cases, however, it is desired and can be furnished if specified, that the switch will close upon resumption of service.

The Type A switch is suitable for intermittent service, such as vacuum cleaners. One pair of wires and single-pole switches of any type at each point of control can be used, instead of three wires and the more expensive momentary contact switches. When so wired, the switch closes on completion of the circuit by any of the single-pole switches. The switch may be also controlled by the use of 3 and 4-way switches, in which case it can be thrown on at any point of control or off at any other point of control.

H & H Tri-Use Surface Switches
For Pipe Taplets, Wood and Metal Molding
Schedule S

Designed for use on 1/2, 3/4, and 1 1/4-inch standard oblong type of pipe taplets.

May also be mounted on V. V. Fittings, with rectangular openings, by the use of V. V. Cover No. 43SS.

For wood molding, the switch is wired and mounted on the molding. The molding capping is then cut off square and butted up against the ends of the switch.

For National Metal Molding, Paiste Adapter No. 4075 is required.

Single Pole—5 Amperes, 125 Volts; 3 Amperes, 250 Volts
Screw holes spaced 2 5/16 inches. Height, 2 inches.

H & H Two-circuit 600-volt Barrier Switches

Schedule S

For Electric Railway Use

These two-circuit barrier switches are frequently used to control combination arc and incandescent headlights, giving the connections: "Arc," "Off," "Incandescent," "Off."

They are also used to alternately throw the headlights and tail lights into circuit, and for similar combinations of lights.

H & H Unremovable or Clutch Handles

A handle called a clutch handle can be supplied on 5 and 10-ampere, 125-250-volt switches, except on switches with porcelain covers. It can also be supplied on 3 and 5-ampere, 600-volt switches. The clutch handle is turned in the regular way to operate the switch, but can be turned backward without dropping off and cannot be removed until a small screw is taken out. Clutch handles can be attached to switches only at the factory at an extra charge of 5 cents and must be plainly specified on orders.

H & H Momentary Contact Switches

Schedule H

6 Amperes, 250 Volts

Pressure on the button of these switches closes the circuit as long as the button is held in. Releasing the button opens the circuit with a quick snap. The two-circuit type has two separate, single-pole switches, each controlling a separate circuit. Both buttons cannot be operated at the same time. This

switch is often connected as follows: Pressure on one button closes and pressure on the other button opens the remote-control switch. The single-circuit type is often used on bell circuits. These switches are $2\frac{3}{16}$ inches deep and can be installed in regular deep-wall case No. 3031. The two-circuit type takes regular push-button flush plate. For single-circuit type use plate No. 3515.

Depth of switch, without plate, is $2\frac{3}{16}$ inches. Outside supporting screw holes spaced $3\frac{3}{32}$ inches on centers. Inside supporting screw holes $2\frac{3}{16}$ inches on centers.

Deep Type—Circuit Normally Open

Cat. No.	Description	Car-ton	Std. Pkg.	Wt., Lbs. Std. Pkg.	Price Each

3661-L	" " Lock	10	10	11	2.35

Shallow Type—Circuit Normally Closed—No Rating

No. 2063 is a smaller switch that does not have the same quickness of snap or length of break as the No. 2061. On battery circuits of low potential, the No. 2063 can be used in the same manner as the No. 2061.

It can also be used on lighting circuits, provided that the remote-control switch itself opens the solenoid-energizing circuit when it operates. Standard switch plates are used.

Depth of switch No. 2063 is $1\frac{1}{2}$ inches. Outside supporting screw holes spaced $3\frac{3}{32}$ inches on centers. Inside supporting screw holes $2\frac{3}{16}$ inches on centers.

H & H Automatic Door Switches

Schedule S

For automatically operating a light upon the opening and closing of a door. All H & H door switches have a roller-tip plunger, which rolls across the edge of the door as it closes, and prevents friction and strain on the switch mechanism.

Each door switch is enclosed in a rolled steel base, which eliminates the trouble resulting from broken and chipped bases, as frequently occurs when door switches with porcelain bases are used.

With every switch is furnished a small round plate with screw, for placing on the edge of door, where plunger strikes it. The shell of the switch is of sheet steel .081 inch in thickness. Dimensions of plate, $3\frac{3}{4} \times 1\frac{1}{4}$ inches. Opening required, $2\frac{5}{8} \times 1\frac{1}{16}$ inches. Depth, $1\frac{3}{4}$ inches.

Single Pole—6 Ampere, 125 Volts; 3 Ampere, 250 Volts

*100 single plates, or the equivalent in gangs is a standard package.

H & H Struck-up Brass Push Switch Plates

Edges are swedged to a greater thickness than face, thereby strengthening plate. Screw holes are deeply counter-sunk so as to allow edge of screw hole to rest on crossbar of switch. Will not dip under pressure of the screws.

The standard finish on all plates except where noted, is old or brush brass which will be supplied unless otherwise specified. Finish is attractive.

Standard package, 100 gangs. All plates for push switches may be assorted.

†100 single telephone plates or the equivalent in gangs.

Plates for H & H Flush Switches
Solid Plates with Round Corners and Round Edges

Will be furnished at 15 cents list extra for a single plate, and 5 cents list extra for each additional switch or receptacle in gang plates.

Solid Plates with Round Corners and Beveled Edges

Will be furnished at 15 cents list extra per plate.

Special Sized Plates

Bear a list price of 7 cents per square inch plus the list price of nearest regular plate, in lots of less than 100 and 8 cents per square inch in lots of 100 or more separate plates of one size and type. When plates are not rectangular in shape, the charge will be for a plate the size of the smallest rectangular piece from which the specified plate can be cut. In no case shall any special plate sell at a price less than that of the corresponding standard plate.

Always send a clear sketch giving all dimensions and detailed specifications.

Small Sized Plates

Both rotary flush plates and push button plates are made in two sizes, standard size and small size (except in tandem gangs).

Blank Plates

These are plates used to cover an unused outlet. Unless otherwise specified, they will be furnished with two screw holes, spaced 3 1/4 inches between centers, to fit standard outlet boxes.

Engraving

The lettering is deeply etched in block design and can be made to any desired height. For engraving on plates, the charge is 10 cents list, per letter.

Finishes

Flush plates for rotary, push button switches and receptacles are furnished in old or brush brass. All other finishes are special. For special finishes, except gold and silver, add to the list price per switch, 10 cents.

Regular and special finishes of one manufacturer's number may be assorted to make up quantity.

H & H Brass 2-gang Combination Plates

For Square Handle Tumbler Switch and Single Receptacle

Schedule S

Prices given are for standard old brass finish, which is furnished unless otherwise specified.

No. 1181 H & H Horizontal Lid Plates

Schedule K

.040-inch Struck-up Brass

For narrow baseboards and wiring convenience, the No. 1181 Horizontal Lid Plate is especially desirable.

Size, 2 3/4 inches high, and 4 1/2 inches long.

The hinge is accurately adjusted for tension so that the lid will stay in any position. Only

one hand is needed to open lid and insert the plug. Sharp bevel edges and countersunk screw holes. Edges reinforced to resist buckling.

H & H 3-gang Combination Plates

Schedule S

.060-inch Brass

No. PEE-60

Size, 4½ inches high and 6¾ inches long.

Standard finish is old or brush brass and will be shipped unless Duroplate or some other finish is specified.

The order in which symbol letters appear from left to right in catalogue numbers is the order of the gangs or units of the plate as explained below.

Explanation of Symbol Letters

- P—For Push Switch
- T—For Tumbler Switch
- D—For Duplex Receptacle
- F—For Single Receptacle
- E—Lid Receptacle Plate

For 2 Push Switches and Duplex Receptacle

For polished finish, 30 to 200 amperes, add 30%; over 200 amperes, 20%. For double break switches, add 50%. For fuse at handle end, add 25%.
NOTE.—Double-throw switches will be furnished with fuse connections at both ends.

FA Quick Break Attachments

For Any FA Type A and B 250 or 600-volt Knife Switches

Auxiliary break or the equivalent are recommended for switches designed for over 300 volts and less than 100 amperes, and will be required on switches designed for use in breaking current greater than 100 amperes at a pressure of more than 300 volts.

FA Type B Knife Switches

Unfusible

Back Connection—Satin Finish—Unmounted
[250 Volts D. C. or 500 Volts A. C.]

For switches mounted on slate or wood templates, add 50% up to 200 amperes, and 25% for everything over.

For polished finish, add 10% only.

Unless otherwise specified, all switches will be furnished for 1 1/2-inch panel mounting.

FA Type B Knife Switches

Fusible at Bottom

Back Connection—Satin Finish—Unmounted

Single-pole

250 Volts D. C. or A. C.

For switches on slate or wood templates, add 50%. For polished finish, add 10%. For double break switches add 50%. Unless otherwise specified, all switches furnished for 1 1/2-inch panel mounting.

FA Service Knife Switches

With Steel Gutter Box, Slate Barrier and Steel Front

For 250 Volts

The combination of code thickness steel box, slate base knife switch with slate barriers and all steel front.

The top and bottom of box fitted with adapter plate punched for 1/2, 3/4, 1 or 1 1/4-inch conduit, larger holes will be punched if specified on order.

Prices up to and including 200 amperes, include Type F switch; 400 amperes and over, Type A.

FA Service Knife Switches

With Steel Box and Flanged Door

For 250 Volts

The combination of code thickness steel box with flanged hinged door and slate base knife switch plain finish.

The top and bottom of box fitted with FA adapter plate punched for 1/2, 3/4, 1 or 1 1/4-inch conduit, larger holes will be punched if specified on order.

Prices up to and including 200 amperes include Type F switch; 400 amperes and over, Type A.

Square D Safety Switches

Positive Quick Make and Break

Equipped with a Square D cover control, which makes it impossible to open the box cover while the switch is on and prevents operation of the switch when the cover is open. By means of a key, the box cover may be opened when the switch is on and the switch operated when the cover is open. The key will lock the cover permanently shut. One key fits all cover control switches. Keys are not furnished with each switch

as their distribution should be limited to authorized persons. Switch boxes are with solid ends. No end plates are required. Price, No. 70000 Cover Control Key.....each \$.50

*Has no cover control.

Square D Safety Switches

Mounted in a heavy steel box with a hinged cover. Switch parts are mounted on individual bases of moulded insulating material. Quickly removed or replaced.

A lever which operates the switch extends outside the box so that the switch may be operated with absolute safety.

The box is electrically welded throughout and is of rigid construction. Square D boxes are made with solid ends. No end plates are required.

Square D Safety Switches
Single-throw, Unfused, Quick Break

Unfused switches are used where overload protection other than fuses is provided. This is the case with compensators equipped with overload relays. An unfused switch is used to disconnect the compensator so that repairs, etc., may be made.

Boxes are made with solid ends.

Square D Safety Switches
Double-throw, Unfused

Designed to throw either of two services into a circuit or one source of current supply to either of two loads. These are also used as reversing switches. The switch is provided with a means of latching and if desired, locking the handle in the neutral position. Switch boxes are made with solid ends. No end plates are required.

No. 46000 Type Square D Safety Switches
3-pole, Single Throw, Fused, Quick Break

These switches are intended for use as entrance switches, disconnects or for any installation demanding infrequent operation.

Switches have Square D finish. Designed and built under careful standards and are subjected to rigid inspection. Infrequent operation does not require the same unusual strength found in the 80000 and the 90000 series making

it possible to produce the 46000 series at a lower cost.

Square D Motor Starting Switches
Quick Make and Quick Break Straight Connected Single Throw

Mechanism is designed so that the action is very rapid, and once started is entirely automatic. This is accomplished by the use of heavy springs, and a cam and toggle action.

The Square D Cover Control makes it impossible for the box cover to be opened while the motor is running. Prevents operation of switch with the box cover open. Switch boxes are supplied with solid ends. No end plates are required.

Square D Meter Test Switches
Single Throw, Fused Bottom, 125 Volts

No. 78211

By means of this type switch, meters can be tested without interrupting the current supply.

Cat. No.	Amperes	No. of Poles	Weight Pounds	Price Each
78211	30	2	4½	\$3.30
78311	30	3	5	4.50

Square D Compensator and Meter Test Switches

The compensator provides 2 taps, one for a direct line circuit for starting, the other for a local fused circuit for running. The switch may be arranged to have the fuses on the line side of the switch or by removing links, on the compensator side, depending on the design of the compensator. The switch has a quick-break mechanism.

By removing the links the 78,000 line switch becomes a meter testing switch which consists of a cut-out and switch mounted on the same base. The line current is brought through the cut-out fuses to the meter, and thence to the switch and the load.

250 Volts—For N.E.C.S. Fuses

No. 18318 Square D Cabinet Connectors

Twin box connector No. 18318 is used to connect house service switches and branch cut-outs, also to connect 2 or more industrial switches where it is desired to run the feed wires through switches, arranged vertically.

Carton, 5; weight, 1½ pounds.
Price, No. 18318each \$.24

Square D Meter Switches

The adoption of a standardized system of service installation devices has extended into practically every section of the country. The Square D standardized line is built in sufficient sizes and types to meet every requirement of every standardized system. Such a system comprises an enclosed and externally operated safety switch, a device to completely enclose all connections between the switch and the meter, an enclosed cutout for branch circuits, and connecting troughs to enclose bus wires in banked installations.

Square D standardized switches and fittings are so designed that all meter connections and all fittings are interchangeable with those of the other manufacturers of standardized material.

Square D standardized switches provide complete enclosure and safety.

They permit meter testing without current interruption and with convenience, speed and safety.

Ample wiring space makes them easy to install. Provision is made for sealing or locking the cover shut, and, when desired, the current off.

Convenient means for grounding are provided.

Knockouts and U-shaped twistouts, placed in standard locations, make complete the interchangeability and ease of wiring standardized systems.

What had for some time retarded the movement toward defined service installations had been the great variety of switch types and fittings that were being marketed and the consequent need for the central station to carry and maintain a separate stock of meter protective devices for each different type of switch manufactured.

The standardized service system eliminates all these difficulties and simplifies the service installation situation for everyone concerned.

The standardized entrance switch is so designed that the meter end walls and all other accessories are interchangeable with like devices built by other manufacturers of standardized devices.

During the earlier stages of the development of the system it was necessary for the central station to stock a supply of meter end walls to fit the several different widths of standardized cabinets of 60 and 100-ampere capacities.

Through the development of the standard opening, the central station, instead of removing a whole end wall and substituting one of the several widths of meter end walls, merely removes a small blank shutter and inserts a meter shutter conforming to the configuration of the meter terminal chamber.

The opening is of standard dimensions, regardless of the width of the switch box. Since the adoption of the standard opening the central station is required to carry but one shutter for each meter, which can thus be set with any size switch.

Previous to the design of the standard opening and shutter idea, it was often difficult for the central station to insert the meter end walls into the cabinet ends. The installation of the conduit often distorted the side walls of the cabinet and made the top end opening either too small or too large for the meter end wall. With the shutter design, the end frame is secured to the cabinet with screws so that distortion is prevented and the shutter can be removed or inserted easily and with a perfect fit.

Square D Standardized Switches and Fittings

No. 53211

These switches and fittings are so designed that all meter connections and all fittings are interchangeable with those of the other manufacturers of standardized material.

These switches provide complete enclosure and safety. They permit meter testing without current interruption and with convenience, speed and safety.

Ample wiring space makes them easy to install. Provision is made for sealing or locking the cover shut and, when desired, the current off.

Convenient means for grounding are provided. Knockouts and U-shaped twistouts, placed in standard locations, make complete the interchangeability and ease of wiring standardized systems.

What had for some time retarded the movement toward defined service installations had been the great variety of switch types and fittings that were being marketed and the consequent need for the central station to carry and maintain a separate stock of meter protective devices for each different type of switch manufactured.

The Standardized Service System eliminates these difficulties and simplifies the service installation situation for everyone concerned.

No. 5000 Wigginton Voltage Testers

This voltage tester requires no lamps, and consequently is less expensive to use than a pigtail socket and an ordinary lamp. Enclosed in fiber and withstands rough usage.

Indicates voltage on any line up to 550 volts and whether current is A.C. or D.C.

Used to locate open circuits, blown fuses and motors running single phase. May be used in phasing out transformers.

Price, No. 5000..... each \$10.20

Square D Cabinet Supported Fuse Blocks

The cabinet supported fuse block is a double-pole cutout for Edison plug fuses. It provides accessible branch fuses and fits into the U-shaped twistout openings in the side of the standardized cabinet. Each switch may be fitted with one or two fuse blocks. The cover of the block is kept closed by means of a spring.

Fuse blocks may be fitted not only to 30-ampere cabinets, but by using locking plate Cat. No. 20531 will fit both 60 and 100-ampere Square D cabinets.

Cat. No.	Amp.	Poles	Volts	Price Each
1021	30	2	125	\$1.40

Square D Connecting Troughs

Connecting troughs are used to connect standardized switches in gang installations. The trough fits into the U-shaped opening in the side of the cabinet and affords an easy and convenient method of enclosing the bus wires.

The use of troughs eliminates the need for conduit, lock washers and bushings.

Price.....	each \$.60	.70	.24

**Square D Standardized Meter Service Switches
Universal Type**

Universal Type Switch for Services Requiring Four Branch Fuses

This new standardized switch combines in one device the service entrance unit (switch and cutout) and an enclosed dead front cutout for branch circuit distribution. The Universal Type Standardized Switch is built in the same dimensions as the other types of standardized switches and consequently takes all the standard end walls and fittings.

Made only in the 30-ampere size and for plug fuses. There are several arrangements providing for different main service and branch circuit connections, including two or three wire services with two or three wire branch circuits. The devices provide for two branch circuits, single fused or double fused, and for four branch circuits single fused.

The porcelain switch base is supported on brackets in the side walls of the cabinet. The main switch is on the rear face of this base. The main fuses are on the upper edge of the base. The branch fuses are on the front face of the base. The branch fuses fit tightly into an opening in the closed cabinet cover, making them accessible without permitting access to the inside of the cabinet. Another hinged cover encloses the accessible branch fuses.

Cabinet is of 30-ampere standardized dimensions and takes 30-ampere end walls and accessories. Provided with twist-outs to permit the use of troughs in ganged installations.

The Square D Universal Type Standardized Switch affords economy in time and labor installation. The main service and the branch circuits are enclosed in one device, eliminating the need for separate installation of each device and the requirements for connecting and wiring them.

The arrangement of terminals simplifies wiring. The lower edge of the base has all the service-side connections, while the upper edge of base has all the meter connections.

The base is sufficiently small to provide ample cabinet room for making all connections and running bussing wires through the cabinet in gang installations.

*These switches are designed for any of the installations described under their respective catalogue Nos. Descriptive wiring diagrams covering the various types of installations will be furnished with each switch.

Square D Switch End Walls

Conduit End Wall

End walls are used to close the opening in the top of the standardized cabinet before the meter is set, or

Combination End Wall

when no meter is to be installed with the cabinet.

The end wall most commonly used, when a meter is to be installed, is the combination end wall—so called, because it consists of a frame, having an opening of standard dimensions, designed to be closed by a removable blank shutter.
