It is the practice to furnish oak pins and brackets "dipped in red paint," without extra charge; this treatment is of little or no protective value, and we earnestly recommend instead, a dipping in hot Creosote Oil, at a slight additional charge; not only does this make a clean bracket, but gives a preservative value, and a lasting effect.

## No. 13052 Thomas Porcelain Bob Strain Insulators

Wet process porcelain; brown glaze.

The wet flash-over value given is based on the axis of the spool being in a horizontal position. If used with axis in vertical position, value will be slightly reduced due to concentrated flow of rain over the insulated surface.

All metal fittings are hot dip galvanized.

Insulator is shipped completely assembled, ready for use.

Nominal Rating	volts	6600
Dry Flash-Over Voltage		35000
Wet Flash-Over Voltage		23700
Leakage Distance	inches	4 3/8
Wet Arcing Distance	inches	2
Mechanical Strength	pounds	4000
No. in Barrel		90

\*No. 1012 has 1 groove.

## No. 1094 Thomas Porcelain One Part Pin Type Insulators

Brown glaze.

Electrical values given are based on tests conducted in accordance with A.I.E.E. Specification No. 41.

Nominal Rating	volts	5000
Dry Flash-Over Voltage		50000
Wet Flash-Over Voltage		26000
Leakage Distance	inches	6 3/4
Wet Arcing Distance	inches	1 3/4
Mechanical Strength	pounds	5000
Minimum Pin Height Recommended	inches	5 1/4
No. in Barrel		125
Gross Weight per 100	pounds	195

## Thomas Porcelain Assembled Strain Insulators

Wet process porcelain; bronze glaze.  
A high grade type of assembled strain insulator. Used for dead-ending.

The insulator units used in these assemblies are taken from the 510 Series. The connecting links are similar in design to those used in the Thomas Link-Type Hewlett Insulator, and are made of soft copper, a material which readily shapes itself to the exact contour of the cableway under tension. Terminal fittings are steel forgings, hot dip galvanized.

While this type of insulator is most commonly used in single unit assemblies (Type 1) there are occasions when higher potentials or severe service make multi-unit assemblies desirable. Type 2 (2 unit strings) and 3 unit assemblies (Type 3) can also be furnished.

Special assemblies using strain hooks, strain eyes or standard cable-thimble can be made up promptly.

Insulators are shipped completely assembled. The mechanical strength of any assembly is 8000 pounds. All insulators packed in convenient wire-bound wood boxes.

**No. 11069 Thomas Link-Type Hewlett Insulators**

**10-Inch Standard Units**

This assembly includes forged-steel blind adapters (No. 5688) hot dip galvanized at top and bottom terminals. The connecting links (No. 5657) are of soft-drawn copper; the connecting couplers (No. 5656) are cast bronze and are equipped with phosphor bronze spring clips (No. 5613).

Standard brown glazed porcelain units assembled on 5 $\frac{3}{8}$ -inch spacing.

Any desired number of units can be assembled in a string.

Terminal Fittings such as hooks, eyes, clevis, etc., can be found listed elsewhere in this section.

No. of Units in Assembled String	Dimension "A" Inches	FLASH-OVER, K.V.		Gross Weight Pounds

**Thomas Suspension Insulator Fittings and Accessories**  
For Link-Type Hewlett Insulators

**No. 5448 Hooks**

**No. 5449 Eyes**

A drop-forged steel fitting. Ultimate mechanical strength, 15000 pounds. Weight, .875 pounds.

**No. 5686 Clevises**

A drop-forged steel fitting. Ultimate mechanical strength, 15000 pounds. Dimension A, 1 $\frac{1}{8}$  inches; B, 2 $\frac{3}{4}$  inches. Weight, .875 pounds.

A drop-forged steel fitting. Ultimate mechanical strength, 15000 pounds. Weight, .625 pounds.

**No. 5655 Thimbles**

A one-piece dead-ending device having much the same utility as a common wire-rope thimble. Ultimate mechanical strength, 15000 pounds. Weight, 1 $\frac{1}{8}$  pounds.

**No. 5552 Standard Connectors**

A drop-forged steel fitting. Ultimate mechanical strength, 15000 pounds. Weight, .375 pounds.

## Thomas Porcelain Baby Link-Type Hewlett Insulators 6-Inch Units

Brown glazed porcelain; hot dip galvanized terminals.  
Ultimate mechanical strength, 6000 pounds.

Can be furnished in multi-unit strings using bronze couplers for intermediate connections, if desired.

Electrical values given here are based on tests conducted in accordance with A. I. E. E. Specification No. 41.

## Type A Memco Clark Insulator Clamps

Replacing Tie Wires for Clamping Insulators to Conductors

The clamping jaws are bolted together with tie pieces of heavy solid copper with

button heads engaging holes in the clamps. Once the conductor is gripped by the clamping jaws, it serves as a part of the clamp itself.

When ordering, the following information should be supplied:

- 1.—Name and number of insulator, or fill in dimensions on sketch.
- 2.—Solid or stranded wire used.
- 3.—Conductor, bare or insulated.
- 4.—Exact outside diameter of conductor.

These clamps are supplied of either special high tensile strength compositions, or of malleable iron protected by a heavy coating of zinc and with steel bolts and nuts sherardized. Malleable iron clamps cannot be supplied in lots of less than 100.

Prices upon application.

## Type C Memco Clark Insulator Clamps

Especially Adapted for Small Heavy Insulators at Railroad Crossings

There are suitable bushings of soft copper or aluminum provided, depending upon the conductor. It also provides when furnished with lead bushings, to amply protect the insulator, an excellent means of holding insulated conductors in place.

Type C clamp provides rigid construction and is recommended for use on lines strung under considerable tension, such as steel messenger lines, etc.

The clamp is also used with small insulators on the transmission line and also proves serviceable in the power house for attaching bus bars to insulators.

Prices upon application.

**No. 600 Peirce Lineman's Safety Platforms**

Connecting larger transformers, making up cable joints, replacing and washing hi-line insulators, and soldering joints are a few of the many uses to which this platform can be put.

The frame is of high grade steel throughout, forged to shape. Platform is made from a specially cured aeroplane spruce. The chain is 5 feet long, of high grade tested steel.  
Width, 9 3/8 inches; length, 71 inches.  
Shipping weight, 44 pounds each.

Price, No. 600.....each \$50.00

**Peirce Lineman's Safety Straps**

For Use with Lineman's Safety Platform

The length of the leather strap is 6 feet minimum; it can be adjusted to 15 inches. First quality harness leather throughout, sewed with strong linen thread.

A strap made of heavy duty fabric is also furnished; it is not adjustable in length; much heavier and less flexible, but stronger than leather.

Snaps and buckles are steel drop forgings. Straps are reinforced at buckle ends with safety copper clips.  
Price, No. 610, Leather Strap, Wt., 6 1/2 Lbs....each \$21.00  
Price, No. 611, Fabric Strap, Wt. 7 Lbs.....each 30.00

**Hubbard Copperweld Ground Rods**

Briefly, the advantages derived from the use of Copperweld Ground Rods are:

Smaller diameter, less earth displaced, easier to drive—a 4-pound hammer, with light blows, will drive the rod.

Long life, protection from rusting, welded copper.

Little time and field labor are required for installing Copperweld Rods and attaching the grounding wire. This saving will more than offset the difference in storeroom prices.

These ground rods are listed as standard by the Underwriter's Laboratories.

**Hubbard Mechanical Ground Rod Clamps**

For attaching either solid or stranded grounding wires to ground rods, galvanized pipe, or sub-station switching arms.

The clamps are made of high grade, corrosion-resisting, non-ferrous metal.

Five safety screw wrenches are furnished with every 100 clamps.

Cat. No.	Size Rod Inches	Size of Wire	Ship. Wt., Lbs. per 100
9490	3/8	4-17 B&S Solid	25

9496	*1 1/4	4 B&S Solid	120

\*I.D. pipe.

Prices upon application.

**Peirce Ground Rod Moulds**

Peirce Ground Rod Moulds are used for making cast solder connections on ground rods. Both solid and stranded grounding wires can be attached to the ground rod by this method.

The moulds are drawn from sheet brass and are tinned for easy soldering. The collar fits snugly to the ground rod and prevents solder leakage.

Cat. No.	DIAM., INCHES Ground Rod	Top of Mould	Ship. Wt., Lbs. per 100	Cat. No.	DIAM., INCHES Ground Rod	Top of Mould	Ship. Wt., Lbs. per 100

Prices upon application.

**Hubbard Copperweld Staples**

The larger size are used for attaching ground wire moulding to the pole and the smaller sizes for attaching the insulated or bare grounding wires to the pole.

Nos. 7521 and 7522 are designed to be used with standard N.E.L.A. 1-inch moulding.

**Rolled Point Staples**

**Hubbard Drive Caps and Points**

**Hot Galvanized**

Standard unthreaded, pipe or conduit can be easily converted into an effective ground by the use of Hubbard Drive Caps and Points.

Made of malleable iron and galvanized with pure zinc by the hot-dip process.

Hubbard Burger Drive Caps

Point

## Hubbard Ground Pipe

Hot Galvanized

An efficient form of driven ground. It has four times as great an area in contact with the soil as a solid rod of equal weight. Connection with the grounding wire or strand is made by filling the upper end of the pipe with molten solder after driving, and then inserting the grounding wire. Pipe is made of the best grade of steel pipe, forged to a long, sharp point, and then thoroughly hot-dip galvanized, inside and out, after which a plug is inserted to a depth of 6 inches

Cat. No.	Nominal Size Pipe Inches	Actual O.D. Inches	Length Feet	Std. Pkg.	Ship. Wt., Lbs. per 100	Price per 100

9538	1	8	3	2133	314.85

## No. 2400 Peirce Terminals for Grounding Wires

Tinned Copper

The wire used for connecting the overhead ground wire to the earth is soldered to the tinned copper terminal which is slipped under the head or nut of the bolt fastening the lower end of the ground wire bayonet to the pole. This insures a good contact at a low cost of material and labor.

Size, 2x2 inches x 22 gauge. Diameter hole, 1 1/16 inch. Standard package, 100.

Approximate shipping weight, per 100 pieces, 4 pounds. Price, No. 2400 Terminals.....per 100 \$14.20

## No. 9546 Hubbard Ground Plates

With Terminal—Hot Galvanized

Made of galvanized 20-gauge sheet steel, 12 inches square. Can be attached to butt of a pole before erection, or dropped in the hole before earth is filled in. Standard package, 10. Shipping weight per 100, 170 pounds.

Price, No. 9546.....per 100 \$75.00

## Hubbard Guy Wire Protectors

Hot Galvanized

Where guying is done along city streets or highways these protectors should be used as a shield, preventing damage to the guy wire and giving protection to the public.

Made of 14-gauge steel, galvanized after fabrication. Furnished in 2 styles, 2-bolt and 3-bolt.

Cat. No.	Length Ft.	No. of U-Bolts	Ship. Wt. Lbs. per 100	Price per 100
7557	7	2	933	\$310.00
7558	8	2	1033	330.00
7559	8	3	1083	350.00

## Hubbard Guy-Guards

Hot Galvanized

A guy and a protector in one. It saves from 6 to 8 feet of strand, is stronger than the guy rod and more visible than an ordinary guy protector.

It is round and smooth and has no sharp edges. It cannot be bent out of shape and become a menace if hit by a passing auto, because the guy strain immediately pulls it back into alignment.

Furnished in 6-foot lengths for guys that make an angle of 30° or less with the pole, and in 8-foot lengths for guys that make an angle of greater than 30° with the pole.

Cat. No.	Anchor Rod Inches	Size Steel Gauge	Length Feet	Outside Diam. Inches	Std. Pkg.	Ship. Wt. Lbs. per 100	Price per 100

## No. 7546 Hubbard Rock Guy Bolts

Hot Galvanized

Used where solid rock extends to surface or in stone or concrete walls. Of 1" round steel, 18" long, with drop forged eye (1 1/2 x 2" inside). Std. pkg., 25. Ship. wt., 600 lbs. per 100. Price, No. 7546.....per 100 \$95.00

## No. 7547 Hubbard Rock Guy Bolts

With Wedge—Hot Galvanized

Has wedge and split end which spreads bolt as wedge is driven against bottom of hole. Of 1-inch round steel, 18" long. Std. pkg., 25. Ship. wt., 600 pounds per 100. Price, No. 7547.....per 100 \$104.00

## No. 7545 Hubbard Rock Guy Anchors

Hot Galvanized

Consists of 2 drop forged tapered sides 9 1/2 inches long, a wedge and a 3/4 x 2 1/2-inch machine bolt. Standard package, 50. Shipping weight per 100, 496 pounds. Price, No. 7545.....per 100 \$116.00

**Hubbard Hub Guards**

Hot Galvanized

Used on corner poles to protect them from the hubs of vehicles.

Standard package, 1.

Cat. No.	Dimensions Inches	Weight Pounds per 100	Price per 100

**Hubbard Clamp Type Anchor Rods**

Hot Galvanized

Where stiff high strength guy wire is used it is not only a difficult job, but a costly one to make up and clamp the strand to the regular guy rod and wire rope thimble. With the clamp type anchor rod it is now possible to secure a stiff guy wire in less than one quarter of the time. The upper U-bolt is removed and hook of block inserted in bolt hole giving a direct pull on guy wire. Clamp is so designed that the greater the strain, the tighter the grip. Used with 1/2 to 5/8-inch strand.

Cat. No.	Diam. In.	Length Rod, Ft.	Price per 100	Cat. No.	Diam. In.	Length Rod, Ft.	Price per 100
7468	1	8	\$500.00	7472	1	12	\$700.00
7470	1	10	600.00				

**Peirce Pole Struts**

Hot Galvanized

Made of heavy steel channels, with a broad bearing against the pole, from which it extends 11 inches.

Cat. No.	DIMENSIONS, IN		Wt., Lbs. Each	Price per 100
	Strut Channel	Brace Channel		
1500	2x5/8	1x1/2	8 1/2	\$350.00

**Hubbard Steelwing Anchors**

Hot Galvanized

With the Steelwing Anchor, no adjustments must be made under ground. It has a large bearing surface against undisturbed earth so that it will not creep.

This anchor is easily installed. It can be set without a wrench. Goes in more easily and disturbs the earth less.

Nos. 7526 and 7528 have 1 1/2x2-inch eye; Nos. 7530 and 7550, 1 3/4x2 1/4-inch eye.

Cat. No.	Diameter Wing Inches	Overall Length Rod Feet	Std. Pkg.	Wt., Lbs. per 100	Price per 100

7550	10	1 1/4	5	3690	932.50

**Hubbard Gould Clamp Anchor Rods**

Hot Galvanized

Combines an anchor rod, guy clamp and guy thimble all in one. The clamp body and snubbing post are drop forged and will develop the full strength of the rod. The sheave on the snubbing post prevents abrasion of the galvanizing on the strand when the strand is pulled up under strain. A considerable saving in installing time is effected.

Length of anchor rod as shown is from the center of the sheave to the end of the rod.

Cat. No.	Diam. Rod Inches	Length Rod Feet	Length Clamp Inches	Size of Strand Inches	Std. Pkg.	Wt., Lbs. per 100	Price per 100

## Hubbard Guy Shims

Hot Galvanized

Keeps the guy strand from cutting into the pole, which not only injures pole but retains moisture about the strand and accelerates corrosion. Six or more are required per pole.

Cat. No.	Dimensions Inches	Std. Pkg.	Wt., Lbs. per 100	Price per 100
7570	1 1/2 x 7/32 x 8	500	57	\$9.50

## No. 7575 Hubbard Strain Plates

Hot Galvanized

Serves the same purpose as the guy shim but gives better protection and is cheaper to install. From 2 to 4 are required per pole.

Cat. No.	Dimen. In.	Std. Pkg.	Wt., Lbs. per 100	Price per 100
7575	4x8x14-Ga.	250	75	\$17.10

## No. 7576 Hubbard Moulding Strain Plates

Hot Galvanized

Used to prevent strand from cutting or crushing ground wire moulding. Will fit over N. E. L. A. standard 1-inch ground wire moulding.

Cat. No.	Dimen. In.	Ship. Wt., Lbs. per 100	Price per 100
7576	4x8x14-ga.	75	\$18.15

## Hubbard Guy Hooks

Hot Galvanized

The No. 7584 guy hook is the N. E. L. A. and A. T. & T. Company's standard and is in general use, although the 2-bolt type is preferred by some construction men. For lighter work, the 3 1/2-inch hook gives satisfactory results. Made of half oval steel, bent with the flat side to the pole, except No. 7583 1/2 which is formed from flat steel.

Cat. No.	Size Steel Inches	Length Inches	Diameter Holes, In.	Std. Pkg.	Wt., Lbs. per 100	Price per 100
7583 1/2	1 1/4 x 3/8	3 1/4	9/16	450	39	\$8.27

7586	1 1/2 x 3/8	6	9/16	200	88	17.81

## No. 7448 Hubbard 2-Bolt Guy Clamps

Hot Galvanized

This clamp is made from hot rolled open hearth steel plates, 1 1/16-inch wide by 3/8-inch thick.

Dimensions, 1 1/8 x 3/8 x 3 3/8 inches.

Standard package, 175.

Weight, 122 pounds per 100.

Price, No. 7448, 2-Bolt Clamps..... per 100 \$26.37

## Hubbard Rolled Steel Guy Clamps

Hot Galvanized; Light Type

Made from hot rolled steel plates 3/8 inch thick. Furnished with 1/2-inch elliptical shoulder bolts. Used on 5/8 to 1 1/8-inch strand.

Cat. No.	Type	Dimens. Bolt Inches	Wt., Lbs. per 100	Price per 100
7448	2	1 1/16 x 3/8 x 3 3/8	135	\$26.37
7449	3	1 1/16 x 3/8 x 4	155	37.40
7450	3	1 1/16 x 3/8 x 6	226	45.20

## Hubbard 3-Bolt Heavy Type Guy Clamps

Hot Galvanized

Made of plates 1 1/2 inches wide, 3/8 inch thick; equipped with 5/8-inch special heat treated steel bolts. Bolts may be assembled from either side. Standard pack-

age, 75. Shipping weight per 100, 274 pounds. Price, No. 7461, 6 Inches Long..... per 100 \$55.48

## Hubbard Heavy Type 4-Bolt Guy Clamps

Hot Galvanized

This clamp has a combination of a long smooth clamping surface and powerful bolts, giving it great holding power. Heavy bolts eliminate the possibility of twisting off or straining bolt when nuts are tightened. Sides are punched with elliptical holes so that bolts may be assembled from either side.

Made of plates 1 1/2 inch wide by 3/8 inch thick; equipped with 5/8-inch special heat treated steel bolts.

Standard package, 50. Weight per 100, 365 pounds.

Price, No. 7464, 8 Inches Long..... per 100 \$73.79

## No. 7476 Hubbard Wedge Type Guy Clamps

Hot Galvanized

This clamp holds equally well when applied in either direction. The springy sides of the body readily adjust themselves to elongation of the strand when strain is applied.

Can be applied in much less time than a 3-bolt clamp.

Both parts are drop forged from special alloy steel. A brass cotter pin is furnished which holds the wedge in place after it has been properly tightened.

Size of strand, 3/8 inch. Overall length of clamp, 3 1/2 inches; of wedge, 6 3/4 inches. Standard package, 100.

Shipping weight per 100, 210 pounds. Price, No. 7476..... per 100 \$93.00

## Hubbard Wire Rope Clips

Hot Galvanized

Cat. No.	Size Strand Inches	Standard Package	Weight Pounds per 100	Price per 100
7482	3/8	50	37	\$46.75
7484	1/2	50	75	52.60
7485	5/8	50	87	64.28

## Hubbard Pole Markers

Hot Galvanized and Solid Copper

Have 1-inch diameter head. Carried in stock blank and can be stamped with raised letters or numerals as ordered. Overall length, 2 inches. Standard package, 1000.

Cat. No.	Material	Wt., Lbs. per 100	Price per 100
2000	Solid Copper	7	\$13.80
5000	Galv. Steel	6	5.50

**Hubbard Pole Dating Nails**

Hot Galvanized

Used for indicating the year in which poles were set and also the height of poles. Special nails with 2 or 3 numerals, letter or characters, depressed in the head can be furnished. Overall length, 2 1/2 inches.

Standard package, 100. Weight per 100, 4.4 pounds.

**Hubbard Drop Forged Guyeye Nuts**

Hot Galvanized

Used extensively on the threaded end of machine bolts passed vertically through the cross arm for attaching suspension type insulators. Also useful for dead ending lines. By their use an eye may be added to either end of a double arming bolt or a second eye to an eye bolt.

The guyeye nut is designed exclusively for use with guy strand and eliminates the guy thimble. It is well rounded with a generous radius, so that the strand will not be sharply kinked.

**Hubbard Drop-Forged Eye Nuts**

Hot Galvanized

No. 7502

Drop-forged eye nuts were designed for use on the threaded ends of machine bolts passed vertically through cross arms for attaching suspension type insulators. They are also useful for dead ending lines. By their use a second eye may be added to the eye bolts, which permits the attachment of a back guy to the same bolt that supports the insulators to dead ended wire.

**Hubbard Pole Reinforcing Material**

Hot Galvanized

Reinforcement Band

Reinforcement Pipe

The Hubbard Reinforcement Band makes a strong and reliable method for attaching a stub when the butt of a pole is rotted. This arrangement saves the expense of installing a new pole and provides a reinforcement which adds years of life to the pole.

Bolts and lag screws to complete this construction should be ordered separately.

Cat. No.	Description	Size	Std. Wt., Lbs. Price	
			Pkg. per 100	per 100

Lag Screw Type

Back Type

Lag screw type is installed by slipping the plate over the lag and screwing lag in pole until the plate bites into the wood. Step slides down in a groove on each side of head of lag. When the step is removed nothing but the head of the lag extends from pole.

Back type is attached by two 1/2-inch lag screws.

## Peirce Presteel Pole Gains

Hot Galvanized

For attaching cross arms to poles without the need for gaining the pole. The design provides a saddle for the cross arm, a springy saddle for the pole and four points for holding the gain in a fixed position.

Its construction allows for easy installation and ready adjustment for alignment of the cross arm. It spaces the cross arm away from the pole so drainage and ventilation overcome decay.

Cat. No.	Size Arm Inches	Diam. Hole Inches	Size Steel Gauge	Std. Pkg.	Wt., Lbs. per 100	Price per 100
5091	3 1/4 x 4 1/4	1 3/16	9	10	285	\$64.40

5094	4 x 5	1 3/16	9	10	285	64.40

## Peirce Cross Arm Reinforcing Plates

Hot Galvanized

Designed to give greater effectiveness than the standard square washer and provide a means for preventing checking and splitting of the cross arm at the point of attachment to the pole.

Made from flat steel 3 7/8 inches wide. A 1 1/16-inch rib is pressed vertically on the plate to give greater strength.

Cat. No.	Size Arm Inches	Diam. Hole Inches	Size Steel Gauge	Std. Pkg.	Wt., Lbs. per 100	Price per 100

## No. 3830 Peirce Sign Hangers for Span Wires

Hot Galvanized

For attaching small stop signs to trolley span wires. Channel part has 1 3/32-inch hole for bolting to sign. Hinged joint keeps sign in a vertical position. Length over all, 5 1/4 inches. Standard package, 100; weight per 100, 58 pounds.

Price, No. 3830.....per 100 \$30.00

## Hubbard Cross Arm Back Braces

Hot Galvanized

This brace is designed for back bracing cross arms at corners and terminal poles, in many cases eliminating the necessity for double arming. Made of open

hearth steel. Attached to the arm by two 1/2-inch machine bolts at each end and to the pole by a 5/8-inch through bolt.

The lengths given are overall dimensions.

**Hubbard Extension Fixtures**

Hot Galvanized

Showing Diagonal Back and Vertical Brace Assembled

Where it is necessary to clear buildings or trees without the use of high poles, extension fixtures of the A. T. & T. Co. design furnish a very rigid and economical construction. They are designed for supporting either 6 or 10 pin arms, No. 8051 Back Brace being used with 6, and No. 8052 with 10 pin arms.

The Vertical Brace shown is designed for 3 arms spaced 12 inches apart, or 2 arms on 24-inch centers, additional arms being cared for by placing other vertical braces in "series" with the first.

Prices do not include bolts.

Cat. No.	Description	Length Inches	Size of Angle Inches	Std. Wt., Lbs. Pkg. per 100	Price per 100
8050	Diagonal with Step	83	2 x2 x3/16	5 1750	\$208.74

8054	Vertical	30 5/8	1 3/4 x1 3/4 x1/4	5 745	97.04

**Hubbard Pole Balconies**

Hot Galvanized

The frame, braces and guard rails of this balcony are made of open hearth steel, galvanized by the hot-dip process. The wooden platform is made of thoroughly seasoned oak, painted with two coats of standard green pole paint.

Nos. 9035 and 9045 are identical except that the railing on the No. 9035 Balcony fastens to a telephone terminal box and the railing on the No. 9045 Balcony fastens to the pole.

These balconies are used for convenience and comfort in telephone terminal box work and serve as switching platforms with the power companies.

Upright braces are 1 1/2 x1 1/2 x3/16-inch steel, the platform supports 1 3/4 x1 3/4 x3/16-inch angle steel, and the guard rail of 1 1/4-inch flat steel.

The complete balcony includes all bolts for fastening parts together but not bolts for attaching to pole.

Cat. No.	Size Seat Inches	Style of Railing	Ship. Wt., Lbs. Each	Price Each
9035	14 1/4 x29 3/4	Terminal Box	65	\$30.00
9045	14 1/4 x29 3/4	Pole	67	37.50

**Peirce Pole Seats**

Hot Galvanized

The frames and braces of all styles are of 1 1/2-inch channel steel. The wood seats are 1 1/8-inch cypress, boiled in creosote. The bars of the all steel seats are 3/8-inch square steel, let into the frame in such manner as to leave no projecting ends. There is no strain on the riveted joints. The bars are placed with corners up to prevent slipping. They are shipped completely assembled in bundles of five.

## Hubbard Cable Suspension Clamps

Hot Galvanized

These are the standard A. T. & T. Company's Cable suspension clamps, the one-bolt type being used for light cables and on cable arms, and the three-bolt clamp for heavy cables and long spans. The one-bolt clamp is furnished without a bolt, as the 5/8-inch through bolt is used both for attaching the clamp to the pole and tightening the clamp on the stand. The three-bolt clamp is furnished with two 1/2-inch high carbon steel guy clamp bolts.

Cat. No.	Type	Length In.	Size Strand In.	Std. Pkg	Wt., Lbs. per 100	Price per 100

## Hubbard U-Cable Guards and Straps

Hot Galvanized

When telephone or power cables enter the ground at the base of a pole or side of a building they should be protected by U-cable guards.

The U-cable guards are made from No. 14 gauge sheet steel and are formed into a U shape. This shape provides the additional strength necessary against collision and the rounded surface protects the pedestrian.

The straps are made from flat steel and are shaped to fit the U-cable guards.

### U-Cable Guards

## Hubbard Non-Breakable Messenger Hangers

Hot Galvanized

The non-breakable hanger is one of the most economical to install. Placed on standard 5/8-inch through bolt, requiring no extra nuts, and the vertical finger keeps the messenger in place while it is being pulled taut, after which the strand is dropped into the groove and the nut set up. It is made of malleable iron, with back curved to fit the pole, has a long clamping surface, and supports the cable well away from the pole.

Cat. No.	Size Cable Inches	Wt. Lbs. per 100 Pieces	Price per 100
8914	5/16 and 3/8	150	\$67.50
8915	1/16 and 1/2	150	67.50

**Hubbard Crossover Clamps**

Hot Galvanized

Used for joining two cable messengers when they cross each other at right angles. For telephone work where cables turn corners, or where branch cables leave line at points distant from poles.

Weight, 160 pounds per 100. Dimensions, 1½x1½x3¼ in. Price, No. 8930 Clamps . . . . . per 100 \$75.00

**Hubbard Reinforcing Links**

Hot Galvanized

Used on each side of the cable suspension clamp to relieve side strains at angles in the line. Bolted to the pole by ½-inch lag screws.

**Hubbard Pulling-In Irons for Manholes**

Hot Galvanized

Pulling-in irons are set into the concrete or brick walls of street vaults opposite all duct entrances to provide a convenient and strong attachment for the pulling-in blocks for installing or removing cables. They are made of ¾-inch steel in accordance with the A. T. & T. Company's specifications, and are so designed as to straddle the brick.

Cat. No.	Size Steel Inches	Extension from Wall Inches	Std. Pkg.	Wt., Lbs. per 100	Price per 100
9119	¾	9	5	500	\$111.00
9120	¾	12	5	600	128.80

**No. 9145 Hubbard Dowel Pins**

In laying multiple duct clay conduit, these dowel pins are inserted in holes provided in the ends of the lengths and thus keep adjacent lengths in proper alignment and insure the smoothness of the ducts. Made of ¾-inch round steel, 3 inches long.

Cat. No.	Size Inches	Shp. Wt., Lbs. per 100	Price per 100
9145	¾x3	8	\$1.70

**Peirce Presteel Cable Racks**

Hot Galvanized

For manhole and interior cable work.

The rack sections are made in three lengths which can be combined into almost any desired length.

These sections are made from 1½x½x¾-inch open hearth steel channel, with ample strength to support the heaviest cables. They should be fastened to manhole walls with ½x4-inch Peirce Expansion Bolts.

**Rack Sections**

**Peirce Underground Cable Racks, Hooks and Insulators**

For Heavy Cab'e Work  
Hot Galvanized

Rack section is 2¼x2¼x¼-inch steel T section, offset at lower end for overlapping when combining two racks. Any desired length of cable racks can be made in this manner. Racks have 1½-inch mounting hole at top and bottom and are fastened to new manhole walls with No. 2246 anchor bolt which is cemented into the wall. ½x4-inch Peirce expansion bolts are used for attaching to manholes not provided with anchor bolts.

Hooks are one-piece ¾-inch steel pressed to a channel shape, insuring uniform strength throughout. All edges are rounded and there is a smooth flat surface for the cable to rest upon. Hooks can be used with or without an insulator.

Insulators fit snugly on the cable hooks and the weight of the cable holds them in place.

2121	2½	3¼	50	136	\$28.90

## No. 2120 Peirce Cable Rack Insulators

### Standard Type

These insulators, used on Peirce cable rack hooks, provide a smooth, well rounded surface which permits cable creepage without injury to lead sheaths. Also provide insulation between cable and rack. Width, 2 3/4 inches. Std. pkg., 50. Weight per 100, 100 pounds. Price, No. 2120, for 1 1/2-Inch Cable..... per 100 \$26.40

## Hubbard Cable Duct Shields

### Zinc and Hot Galvanized Steel

Used to protect cable sheaths at the entrance of ducts.

No. 9140 fits a 3-inch duct and may be installed, if desired, after the cable is pulled in.

No. 9141 is sheet zinc.

No. 9142 is designed to be attached to the cable. As the cable expands and contracts the wear comes on the shield rather than on the lead sheath.

Cat. No.	Material	SIZE, INCHES Diam.	Length	Std. Pkg.	Ship. Wt., Lbs. per 100	Price per 100
9140	20-Ga. Sheet Steel..	3	6	100	61	\$25.60

9142	12-Ga. Sheet Steel..	2 5/8	9	100	170	39.30

## No. 2100 Peirce Lock Clips

### Hot Galvanized

Locks the hooks to the cable racks and prevents them from being accidentally loosened by workmen. Easily installed. Does not come into contact with the cable in any way that might injure the lead sheath. Made of 18-gauge zinc. Standard package, 100. Shipping weight per 100, 2.5 pounds. Price, No. 2100..... per 100 \$2.90

## Hubbard Standard Transposition Brackets

### Hot Galvanized

Nos. 9250 and 9252 are similar to 9251, illustrated except that the Western Union Standard Bracket No. 9250 does not have the 3/8-inch round holes for lagging the bracket to the arm. No. 9251 is the A. T. & T. Co. standard for one wire, and No. 9252 for two wires on a transposition insulator. The Western Union bracket is clamped on the arm by a 3/8 x 4 1/2-inch carriage bolt. Pins and bolts not included in price.

Cat. No.	Size of Steel Inches	For Cross-arms Size, In.	Wt., Lbs. per 100	Price per 100

9251	1 1/4 x 3/8	3 1/4 x 4 1/4	245	58.83
9252	1 1/2 x 3/8	3 1/4 x 4 1/4	378	80.37

## Hubbard Transposition Brackets

### For Phantom Circuits

### Hot Galvanized

The A. T. & T. Co. standard Transposition Bracket for 4-wire transpositions with large, double potticoated porcelain insulators, such as are used on the transcontinental circuits, is fastened to the cross arm by two 1/2 x 3/4-inch machine bolts, spaced 2 3/8 inches apart, and has holes for 1/2-inch pins. The price includes the two parts shown, the smaller of which projects above the arm, but no bolts or pins.

Cat. No.	DIMENSIONS, INCHES		Wt., Lbs. per 100	Price per 100

9275	1 1/2 x 3/8	3 1/4 x 4 1/4	750	\$383.44

## No. 9280 Hubbard Break Iron Brackets

### Hot Galvanized

No. 9280 Break Iron is furnished complete as illustrated. The standard 5/8-inch wood top pins are spaced on 6 1/2-inch centers. The 1/2 x 6-inch machine bolt is equipped with a clipped pin washer.

Cat. No.	Pin Spacing Inches	Ship. Wt., Lbs. per 100	Price per 100
9280	6 1/2	407	\$122.20

## Peirce Multipoint Transposition Brackets

### Hot Galvanized

No. 237

Made with an angle steel back to which presteel points are riveted. Equipped with spiral spring threads for insulators having standard 1-inch pin hole.

No. 237 is for 2-wire transposition. No. 437 is for transposing 4 wires of 2-toll circuits on which a phantom is connected.

Furnished with No. 1021 3/8-inch U bolts for 3 1/4 x 4 1/4-inch cross arms, unless otherwise specified.

No. 437

Cat. No.	SIZE STEEL, IN. Points	Back	Std. Pkg.	Wt., Lbs. per 100	Price per 100

## Hubbard Transposition Brackets

### Hot Galvanized

Made of 5/8-inch round steel with a standard paraffined wood cob threaded for insulators with a 1-inch pin hole. Diameter tap, 1/2 inch. This bracket is almost always attached to the cross arm by screwing on to the thread of a Western Union pin.

Standard package, 100. Weight per 100, 160 pounds. Price, No. 121..... per 100 \$82.36

## Peirce Transposition Brackets

### Hot Galvanized

No. 111 is for long spans and heavy work; No. 114 is for use with 2-wire transposition insulators.

Made of 1-inch channel steel. Adjustable for cross arms 3 1/4 x 4 1/4 to 4 x 5 inches. Equipped with cross arm U-bolt No. 1021 unless otherwise specified.

No. 111

**Peirce Telephone Knob Screw Insulators**

Hot Galvanized

No. 2920 screw is 3/8 inch in diameter and 1 1/2 inches long.

No. 2927 brown glazed porcelain knob is used with this fixture. No. 2927 wire groove is 1/2 inch wide; hole is 1/2 inch in diameter. Standard package, 500.

Price, No. 2920, Wt., per 100 Pcs., 44 Lbs. . . . per 100 \$18.10  
Price, No. 2927, Wt., per 100 Pcs., 29 Lbs. . . . per 100 11.10

**Peirce Telephone Wireholders**

All-Porcelain Type

Combines a wall bracket, insulator and screw all in one. Used as a corner bracket where the lead from the pole comes to the building at an angle and as a standard house bracket for carrying the pairs on a straight run along the building or for dead-ending.

The double groove on the top makes an ideal arrangement for tying in twisted telephone pairs.

No metal is exposed after installation. The wireholder is not affected by atmospheric conditions and will not make rust stains on the house.

Cat. No.	Equipped with	Wire Hole Inches	Std. Pkg.	Wt., Lbs. per 100	Price per 100
1622	No. 20x2-In. Galv. Screw	5/16 x 3/4	50	60	\$20.00

**No. 8918 Hubbard Span Clamps**

Hot Galvanized

Used when service connections are made at points between poles. Equipped with No. 8901 suspension clamp and bolt. Insulator spacing, 5 3/4 inches.

Standard package, 100. Weight per 100, 138 pounds.

Price, No. 8918 . . . . . per 100 \$77.50

**No. 9214 Peirce Porcelain Knobs for Telephone Racks**

Made of brown glazed dry process porcelain.

The wire groove is divided by a fin which keeps the two wires of the twisted pair separated.

Cat. No.	DIMENSIONS, IN.			Bolt Hole	Ship. Wt., Lbs. per 100	Price per 100

**Peirce Distributing Knob Racks**

Hot Galvanized

For Telephone Wires

These racks furnish a secure but inexpensive means for distributing twisted pair telephone wires from cable poles. Nos. 2900, 2901 and 2902 are made with 1 3/4-inch channel steel back. The holes take a 1/2-inch lag screw.

Cat. No.	No. of Knobs	Wt., Lbs. per 100	Price per 100
2900	4	348	\$111.20
2901	6	460	147.10
2902	8	545	183.30

The above prices are for racks complete with knobs.

**Hubbard Insulated Pole Bands**

Hot Galvanized

No. 7246

Insulated pole bands are in popular use for trolley work. They eliminate one splice on each attachment.

Will be furnished galvanized, complete with standard No. 508 insulators, unless otherwise specified.

## No. 561 Hubbard Insulated Forks

Hot Galvanized

Made of 1¼x½-inch channel. Equipped with insulator No. 355. Oval hole 1½x¾-inch in back permits through bolt to be assembled to clevis without removing insulator. Standard package, 50. Weight per 100, 240 pounds.  
Price, No. 561..... per 100 \$56.10

## Hubbard Insulated Forks

Hot Galvanized

No. 8820

No. 641

By the addition of a standard ⅝-inch through bolt, lag screw or carriage bolt, the insulated forks illustrated may be converted into fork bolts, which simplifies considerably the keeping of stocks.

Fork No. 8820 is made of 1½x¼-inch flat steel, formed so that the head of the through bolt keeps it from turning. It is equipped with insulator No. 357, which is attached by a ¾-inch bolt.

No. 641 is made of 1¼x½-inch channel steel and is provided with a square bolt hole, into which the square shoulders of a carriage bolt fits, preventing the fork from turning around on the bolt. Insulator No. 357 is also furnished with this fork.

## Hubbard Drop Forged Turnbuckles

Hot Galvanized

Eye and Eye

Eye and Hook

All Hubbard Turnbuckles including bodies, hooks, eyes and clevises are drop forged steel, insuring reliability and strength.

The sizes listed below are carried in stock. However, special assemblies can be made.

## Hubbard Dead-Ending Shackles

Hot Galvanized

Used for dead-ending or breaking bare signal wires. Shackle clamps around cross arm, which gives it greater holding power than pin construction. A ⅝-inch lag screw is used to prevent displacement by creeping.

A lead washer and sleeve prevent glass insulator from coming into contact with the steel cotter bolt, eliminating breakage of insulator due to expansion and contraction.

Size, 3/16x1 1/16 inches. Shackle is for 3/4x4 1/4-inch cross arm.

Cat. No.	Description	Std. Pkg.	Wt., Lbs. per 100	Price per 100

9292	Wet Process Porcelain Insulator	50	175	77.70

## Hubbard Standard Western Union Pins

Made in accordance with the specifications of the Western Union Telegraph Co., and the Railway Signal Association. The cobs are of the best grade of air dried oak, turned to a gauge and boiled in paraffine to exclude all moisture. The pins are made of stiff, high carbon steel with clean threads, square nuts and clipped, round washers, and are for use with standard insulators having 1-inch pin holes.

## Hubbard Wood Top Pins

Hot Galvanized

With Steel Bolts

Wood top pins are composed of seasoned locust tops, thoroughly impregnated with paraffine and stiff steel fin bolts. They are made in a variety of heights with short and long shanks for wood, angle or channel steel arms, and for two sizes of insulator pin holes, 1 and 1 3/8 inches in diameter. Furnished with nut and washer.

Packed in barrels and kegs in quantity desired.

## Peirce Short Shank Forged Steel Pins with 1-Inch Spring Thread

For Steel Cross Arms and Brackets

Hot Galvanized

For electric light, telephone and telegraph lines, on which insulators with 1-inch pin holes are used, this pin possesses all the advantages of the well known Western Union type of pin.

The method of fastening the spring thread to the pin allows for expansion and contraction of the insulator but does not lock the insulator to the pin.

Cat. No.	Diam. In.	LENGTH, INCHES			Std. Pkg.	Wt., Lbs. per 100	Price per 100

1090	Curved	4 1/2	5 1/2	207	84.00

Flat Base Curved Base

## Peirce Presteel Pins

Hot Galvanized

The same pin can be used for either steel or wood arms, on any size wood arm, on arms bored for any size of pin.

The pin is fastened to the arm with a 5/8-inch machine bolt. The nut fits within the body of the pin and is held from turning.

Furnished with spring thread only.

Straight Base

Curved Base

## No. 1650 Peirce Primary Lead Wireholders

All-Porcelain Type

Made from high grade wet process porcelain. Has sufficient leakage distance for primary voltages. No. 22x2-inch brass screw. Wire hole, 7/8 inch. Extension of wire, 3 1/2 inches. Standard package, 25. Weight per 100, 192 pounds.

Price, No. 1650.....per 100 \$88.00

## No. 5462 Peirce Insulated Cross Arm Fuse Block Brackets

Hot Galvanized

This bracket cemented to an insulator provides a clamp for attaching the fuse block or cutout. This gives double insulation to the fuse block. Fuse block or cutout can be quickly removed from cross arm without breaking the porcelain. The bracket being clamped to the cross arm binds the fibres of the wood together and prevents splitting and rotting.

Adjustable for cross arms from 3 1/4x4 1/4 to 4x5 inches; adaptable to most fuse blocks and cutouts. Cross arm straps are not included and should be ordered separately.

Size of fuse block bolts, 3/8x3 1/2 inches, spaced 3 to 3 3/4 inches. Standard package, 15. Weight per 100, 550 pounds. Price, No. 5462.....per 100 \$247.20

**No. 4452 Peirce Side Clamp Pins**

Hot Galvanized

For supporting long primary leads from line wires to fuse blocks. It binds the fibers of the arm together and keeps the arm from splitting and rotting.

Adjustable to any size cross arm from 3/4x4 1/4 to 4x5 inches. Pin extension, 5 3/8 inches. Standard package, 75. Weight per 100, 231 pounds.

Price, No. 4452.....per 100 \$64.40

**No. 5452 Peirce Fuse Block Clamps**

Hot Galvanized

The fuse block or cutout can be quickly removed from the cross arm without breaking the porcelain.

This clamp clamps the fibres of the wood together and prevents splitting.

Adjustable to cross arms from 3/4x4 1/4 to 4x5 inches. Accommodates all standard makes of fuse blocks.

Fuse block bolts, 3/8x4 inches, spaced 3 to 4 inches. Standard package, 100. Weight per 100, 191 pounds.

Price, No. 5452.....per 100 \$75.50

**Peirce Drop Forged Clamp Pins and Corner Plates**

Hot Galvanized

This pin has all the advantages of the Presteel and channel type clamp pins and in addition an assembly for angles and corners in the line. The reinforcing plate for corner construction holds the pin rigid against strains of 1200 pounds in any direction. On straight lines the pin is used without the plate and is prevented from shifting by two 1/4-inch lugs.

Made for flat and roofed top arms from 3/4x4 1/4 to 4x5 inches.

**Peirce Clamp Pins**

For Low Voltage Insulators

Hot Galvanized

The pins listed are equipped with Peirce 1-inch spring threads.

Pin No. 4300 is pressed from a single piece of 12-gauge sheet steel.

No. 4400 is made of 3/4x3/8x1/8-inch channel steel.

All pins are of the same height above the arm, 4 3/4 inches, same as the N.E.L.A. standard wood pin.

**Peirce Clamp Pins**

Hot Galvanized

Designed for angle and corner construction and will withstand strains of 2500 pounds without deflection. Each pin is forged from a single piece of new hot rolled open hearth steel and is so constructed that the greatest amount of metal is at the point where the strain is the hardest. Broad base rests evenly on arm, 4 lugs hold pin from turning on the cross arm.

## Peirce Forged Steel Pins for Wood Arms

The Peirce Pin is a solid forging from a single bar of special treated high carbon steel and has neither welds nor joints. Its strength is uniform in all directions. There are no flanges or webs which must be placed in line with the strain. There are no projections to concentrate electrostatic stresses. The full strength of the pin is carried up to the top of the insulator bore. There is no weakness at the base of the thimble as with malleable pins.

**Peirce Forged Steel Pins for Steel Arms**

**Short Shank  
Hot Galvanized**

**Drawn Separable Thimble Type**

**Lead Thread Type**

**Malleable Thimble Type**

The separable thimble which is a part of the standard pin is drawn from sheet zinc, and the threads are rolled.

The lead thread pin is made the same as the standard, and in addition is notched and so prepared that when the lead thread is cast, it actually becomes a part of the pin.

The malleable thimble pin is also made similar to the standard pin except that the top is threaded with a standard 3/4-inch thread 1 3/8-inch long so that it may be used with any separable malleable thimble. Unless otherwise specified, pin is furnished complete with malleable iron thimbles for cementing into insulators with a 1 3/8-inch hole.

**Peirce Drawn Zinc Separable Thimbles**

**For Peirce Pins**

As these thimbles are included with the pins with which they are listed, it is not necessary to order them separately, except when they are to be cemented into insulators used for replacements.

No. 5051 Thimble, 7/32 inch in diameter, is cemented into insulators with a standard 1-inch pin hole. The 1 1/32-inch Thimble No. 5052 is used with insulators having a 1 3/8-inch pin hole.

Cat. No.	Diam. of Thimble Inches	Size of Insulator Pin Hole Inches	Std. Pkg.	Shipping Weight Pounds per 100	Price per 100
5051	7/32	1	2400	6.5	\$17.80
5052	1 1/32	1 3/8	800	12.5	20.00

Packed in barrel.

**Peirce Lead Thread Separable Thimbles  
Drawn Thimble Type**

While the cementing of thimbles into the insulators is recommended as being the most dependable method, there are cases, for instance, where wood pins are being replaced with forged steel pins, in which the cost and trouble of cementing the thimbles are too great.

For such conditions standard Peirce drawn zinc thimbles are furnished with lead threads cast on them, so that insulators can be screwed on the thimbles mounted on the pins instead of having the thimbles cemented into the insulators and then screwed on the pins. These thimbles may be used on No. 5600 series forged steel pins, high voltage clamp pins, and pole top pins.

Cat. No.	For Insulator Pin Hole, In.	Size of Thimble, In.	Std. Pkg.	Ship. Wt., Lbs. per 100	Price per 100
5020	1	7/32	400	35.5	\$27.80
5025	1 3/8	1 1/32	250	56.5	33.30

**No. 5018 Peirce Lead Thread Thimbles**

**Malleable Thimble Type**

This thimble is made by casting lead threads on the No. 5019 thimble adapter and is used with pins having a standard 3/4-inch center bolt or with Peirce No. 4100 series pin.

The lead thread is made to screw directly into an insulator having a 1 3/8-inch pin hole.

Cat. No.	For Insulator Pin Hole In.	Hole in Thimble In.	Std. Pkg.	Ship. Wt., Lbs. per 100	Price per 100
5018	1 3/8	3/4	150	118	\$43.30

**No. 5019 Peirce Thimble Adapters**

**Hot Galvanized**

Provides a method for using insulators, in which Peirce Drawn Thimbles are cemented, on old lines equipped with cast iron separable thimbles.

Cat. No.	DIMEN., IN.			Ship. Wt., Lbs. per 100	Price per 100
	Outside Thread	Inside Thread	Height		
5019	1 1/2	3/4	3	55	\$27.80

**Peirce Presteel Centering Washers**

**Hot Galvanized**

Used on the lower end of Peirce Forged Steel Pins to center the pin when used on arms bored for wood pins.

## Peirce Solid Steel Pole Top Pins

Hot Galvanized

No. 3120

This type of pole top pin is made of a solid bar of special stiff steel. The two bolt holes at right angles permit the lining up of the wire groove of the insulator.

## Peirce Presteel Pole Top Brackets

Hot Galvanized

Some engineers like to use the same type of pin for both cross arms and pole top work. The Presteel Top Bracket allows them to use Peirce Steel Pins for both these purposes, which simplifies stock keeping.

It is pressed out of a single plate 1/4-inch thick, with no welds or seams. This construction makes it strong enough for use with Peirce Steel Pins, and guarantees that it is free from flaws.

Cat. No.	Pin Hole Inches	Bolt Holes Inches	Std. Pkg.	Wt., Lbs. per 100	Price per 100

**Peirce Fire Alarm Fixtures**

**Hot Galvanized**

3-Wire

6-Wire

These are combination fixtures for carrying signal wires on electric light, telephone or other foreign poles. Any number of wires, from one to six, can be correctly spaced on the various brackets which are bolted to the angle legs. These legs are of 1 3/4x1 3/4x1/8 - inch angle steel and the insulator brackets of 1x1/2x1/8 - inch channel steel.

Prices include all bolts for fastening parts together, but not the 1/2-inch through bolts, for which 5/8-inch holes are provided in the legs.

**Complete Assembly**

**Peirce Ridge Brackets**

**Hot Galvanized**

No. 228

No. 338

Convenient for carrying a few foreign wires such as signal and fire alarm circuits on pole tops.

The No. 228 is made of 1x1/2-inch steel channel and is for use on poles with 6 3/4-inch diameter tops.

The 8-wire bracket, No. 338, is somewhat heavier than the 228, being made of 1 1/2x3/8-inch channel. This bracket is used on poles with 7-inch tops.

The points of these brackets are 4 1/2 inches high and are equipped with Peirce spring threads for 1-inch hole insulators. Each bracket is provided with sufficient holes for secure mounting.

## Hubbard Angle Steel Cross Arms

Hot Galvanized

Steel arms of a given cross section are uniform in strength, and when protected by hot-dip galvanizing, their strength remains uniform throughout the life of the zinc coating, probably thirty years.

Unless otherwise specified, holes will be of the following sizes: for through bolts,  $\frac{1}{16}$  inch; for brace bolts,  $\frac{7}{16}$  inch for flat braces and  $\frac{9}{16}$  inch for angle braces; and for pins,  $\frac{13}{16}$  inch. Quotations on special arms will be given promptly.

## Hubbard Ground Wire Bayonets

Hot Galvanized

Used for supporting the overhead ground wire on wood or steel poles.

All bayonets have two  $\frac{1}{16}$ -inch holes for  $\frac{5}{8}$ -inch through bolts, and their upper ends have two  $\frac{9}{16}$  holes. Bayonets are fastened to the back of the pole by the upper cross arm bolt and a lag screw or a second through bolt.

Corner bayonets are used at all points where double arms are required. They consist of two angles, one bent, the other straight, fastened together by two  $\frac{1}{2}$ -inch machine bolts furnished with the angles. The angle is bent for an 8-inch pole top, but the angles may be spread to fit any size of pole. The through bolt holes in the bent leg of the bayonet are slotted  $\frac{1}{16}$ -inch wide by  $1\frac{1}{2}$  inches long, to allow for any inaccuracy in boring bolt holes in the poles.

Bayonets equipped with Peirce 1-inch Spring Threads will be furnished when specified.

No. 6484 No. 6584 Standard package, 5.

## Hubbard Belcher Ground Wire Clamps

Hot Galvanized

The Type J Belcher Clamp for bayonets provides a secure fastening and one that does not injure the wire. Wire comes in contact only with the rounded surfaces, the link holding it away from sharp corners. The ground wire can be strung through the clamps for several spans at a time and clamps tightened after pulling up. There is only one bolt to adjust.

No. 6450

No. 6451

For clamping overhead ground wires to steel towers, the type U clamp is in general use. Two clamps are used on each wire.

Cat. No.	Type	Spacing Inches Bayonet Hole	Std. Pkg.	Wt., Lbs. per 100	Price per 100
6450	J	1 $\frac{5}{16}$	100	44	\$21.60
6451	U	1 $\frac{1}{2}$	100	70	47.30

**Hubbard Rolled Steel Ground Wire Clamps**

Hot Galvanized

No. 6455

The rolled steel clamps have a long smooth clamping surface with the ends belled to prevent cutting of ground wire. No. 6455 is furnished with a 1/2x2 1/2-inch machine bolt.

The No. 6454 clamp, similar to No. 6455, is not furnished with a bolt, as a 3/8-inch through bolt is used both for attaching the clamp to the pole and tightening the clamp on the wire.

Cat. No.	Size of Wire Inches	Length Inches	Std. Pkg.	Weight Pounds per 100	Price per 100
6454	No. 14 to 6 B&S....	2	500	35	\$18.40
6455	5/8 to 1/2.....	2 1/2	100	120	22.90

**Hubbard Flexible Ground Wire Clamps**

Hot Galvanized

The flexible clamps allow the clamps to swing with the ground wire. The ends are belled out to prevent cutting the strand and for the same reason the clamping surface is perfectly smooth.

The clamp section is 3 1/2 inches long and is equipped with two 1/2x1 5/8-inch clamp bolts. The U bolt is 5/8-inch diameter, and will fit bayonets with hole spacings of 1 7/8-inch.

Cat. No.	Bayonet Hole Spacing Inches	Std. Pkg.	Weight Pounds per 100	Price per 100
6460	1 7/8	50	172	\$167.00

**Hubbard Copperweld Grounding Stakes and Chain**

The grounding chain is used for throwing over bare conductors while power is off to protect line builders from an accidental throwing in of current. The grounding stake is used in conjunction with the chain for ground connections.

Cat. No.	Material	Size	Approx. Ship. Wt. Lbs., per 100 Pcs.	Price per 100

9406	Stake	1/2"x6'	475	.....

**Hubbard Dead End Clamps**

Hot Galvanized

Designed for use with stranded conductors from 5/8 to 1/2-inch in diameter and will develop the full strength of the wire. The loose clamp section is grooved so that as the strain increases this section slides with the conductor and the

movement of the U-bolts with it to an off-center position, the clamping pressure is increased. The ends of the clamp have a large opening. The two lugs on each side of clamp insure a vertical alignment of U-bolts during assembly.

Cat. No.	DIMENSIONS, INCHES		Std. Pkg.	Weight Pounds per 100	Price per 100
	Leth. Arrangement	Length Overall			
6700	7 1/4	13 3/8	15	775	\$383.20

**Belcher Strain Yokes**

Hot Galvanized

For standard suspension many operating companies are ready to protect their high tension lines by double suspension

throughout. The best way to do this is with two strings hanging at an angle with each other, with one Belcher Strain Yoke and standard conductor suspension clamps.

In dead ending long spans of heavy wire in transmission line construction, it is good practice to use two strings of suspension insulators in parallel on each line wire, so as to decrease the mechanical stress on insulator units and thus secure a greater factor of safety, both mechanically and electrically. This is often necessary at crossings and angle turns.

For straight line crossings, as compared with dead ending it has two advantages; the cost of the suspension is half that of dead ending as two strings are used at each tower connection instead of four; also, in case of a broken disc, the line will adjust itself without shock.

Formed of steel plate 1/4 inch thick, hot pressed, to shape and support the two strings of insulators 13 inches apart on centers, which is the standard for 10-inch discs. Each yoke is furnished with the five bolts illustrated, and with a hole for the discharge horn bolt.

Discharge or arching horns for use with these yokes can be furnished to meet specifications.

Their design allows all necessary movement in any direction and their reliability is guaranteed by the fact that every part is forged from open hearth steel and hot dip galvanized.

Cat. No.	Material	Thickness of Steel Inches	Insulator String Spacing Inches	Ship. Wt. Lbs. per 100	Price per 100

## Hubbard Hook Bolts

### For Suspension Insulators

Hot Galvanized

Hook bolts are used for supporting strings of suspension type insulators from cross arms. Hooks are drop-forged and made in 3 lengths above the shoulder, 1 1/2 inches for angle steel arms, 6 inches for wood arms up to 4x5 inches, and 9 inches for the double channel cross arms used on steel towers.

Cat. No.	Shipping Weight, Pounds. per 100	6751 1/2	6756	6759
Price	per 100	\$38.00	86.60	92.40

## Hubbard Corner Construction Brackets

### For Small Angles

Hot Galvanized

Used with suspension type insulators to give the desired clearance to the line wire. A 1/2-inch link is sometimes used in the lower end for attaching insulator string and will be furnished when specified.

Cat. No.	Size In.	Spacing of Eyes, In.	Extension, In.	Ship. Wt., Lbs. per 100	Price per 100

6736	8 3/4	6	160	30.90

## Hubbard Corner Construction Brackets

### For Large Angles

Hot Galvanized

This type of bracket is used with metal cap suspension type insulators at angles or corners in lines using either suspension or pin type insulators on tangents. Two through bolts fasten the bracket to the side of the pole, toward the "pull" and the string of insulators is attached to the 5/8-inch U-bolt shown. The bracket is made of 3/8x2-inch flat steel and extends 8 inches from the pole, with a bolt spacing of 14 1/8 inches.

Cat. No.	Size of Steel In.	Hole Spacing In.	Std. Pkg.	Lbs. per 100	Price per 100
6725	3/8x2	14 1/8	10	700	\$145.00

## Hubbard Strain Insulator Clevises

### Hewlett Suspension Type

Hot Galvanized

This clevis is made from 1/2-inch round steel with drop-forged eyes that accommodate the 3/8-inch curved clevis bolt.

Fits the 6, 7 1/2 and 10-inch Hewlett Insulators. Ultimate strength, 5000 pounds. Should be used only for light strains.

Cat. No.	DIMENSIONS, INCHES				Std. Pkg.	Weight Pounds per 100	Price per 100

**Peirce Strain Insulators**

Standard Type—Dry Process

The Peirce Standard Type Strain Insulators are made in accordance with the specifications of the National Electric Light Association.

They are produced from the highest grade of dry process porcelain and are designed so that all sharp corners and edges have been eliminated.

An exclusive feature of the Peirce Strain Insulator is the radius of the wire groove, which is so designed that it gives a maximum bearing surface on the clevis bolt and may be used equally as well with guy strand or insulated wire.

Peirce Dry Process Insulators are ordinarily used for dead-ending secondary circuits and for guying.

No. 502 is used with clevis No. 805, light type, No. 825, heavy type or No. 845, eye type. No. 504 is used with clevis No. 807, light type, No. 827, heavy type or No. 847, eye type. No. 506 is used with No. 811, light type, No. 831, heavy type or No. 851, eye type.

Cat. No.	DIAMETER, INCHES			Std. Pkg.	Weight Pounds per 100	Price per 100

506	1 1/16	3 3/8	2 3/8	25	276	73.30

**Peirce Strain Insulators**

Multi-Fin Type—Wet Process

For dead-ending primary circuits and guying of high tension lines Peirce Multi-Fin Strain Insulators possess every feature required for dependable, continuous service.

They are made from thoroughly vitrified wet process porcelain and are designed with rugged fins and well rounded edges, which eliminate the possibility of chipping due to rough handling or abuse after installation.

The radius of the wire groove is so designed that it gives a maximum bearing surface on the clevis bolt and may be used equally as well with guy strand or insulated wire.

No. 512 is used with clevis No. 805, light type, No. 825, heavy type or No. 845, eye type. No. 514 is used with clevis No. 807, light type, No. 827, heavy type or No. 847, eye type. No. 516 is used with clevis No. 811, light type, No. 831, heavy type or No. 851 eye type.

**Hubbard Strain Insulator Clevises**

Hot Galvanized

Light Type

No. 803

The light type clevis is drop-forged from 3/16-inch diameter open hearth steel. Has an ultimate strength of 8000 pounds and is equipped with a 3/8-inch bolt. An eye 1/8-inch inside diameter is required to accommodate this clevis.

Cat. No.	DIMEN., IN.		Approx. Ship. Wt., Lbs. per 100	Price per 100	Cat. No.	DIMEN., IN.		Approx. Ship. Wt., Lbs. per 100	Price per 100

Eye Type

No. 843

The eye type clevis is similar to the heavy type, except that it has a drop-forged eye in the crotch of the clevis which is provided with an 1 1/16-inch hole. This hole permits the clevis to be attached to the head end of a through bolt, nut end of a through bolt, double arming bolt, eye bolt, or double arming eye bolt.

## Hubbard Strain Insulator Clevises Barmack Presteel Type (Patented) Hot Galvanized

A strong and adjustable clevis for dead-ending wires. The adjustment of this style clevis is approximately 1-inch. It will fit many sizes and types. Clevis No. 900 is adjustable for all standard Multi-Fin Strain Insulators. No. 902 is also adjustable for 7-inch Multi-Fin type Strain Insulators. The  $\frac{3}{8} \times 1\frac{1}{2}$ -inch curved machine bolt has a  $1\frac{1}{2}$ -inch thread for adjustment. Ultimate strength about 8000 pounds. Has  $\frac{1}{2} \times 1\frac{1}{2}$ -inch machine bolt, pipe spacer, lock washer and  $\frac{3}{8} \times 1\frac{1}{2}$ -inch curved machine bolt.

## Hubbard Strain Insulator Clevises

### Drop-Forged Double Type

Hot Galvanized

With this type of clevis two strain insulators can be assembled in a series.

The light type is made from  $\frac{3}{16}$ -inch round steel and equipped with  $\frac{3}{8}$ -inch curved bolts.

The heavy type is drop-forged from  $\frac{1}{2}$ -inch diameter open hearth steel. It is equipped with  $\frac{1}{2}$ -inch bolt.

### Light Type

Cat. No.	Inside Length Inches	Inside Width Inches	Std. Pkg.	Weight Pounds per 100	Price per 100

655	9	1	8000	100	67	34.40

## Klauber Universal Dead Ending Clevises

Hot Galvanized

No. 555 Clevis

Eye Connection

This clevis is the only one made that will anchor a metal cap strain insulator with any one of the three types of connections—eye, clevis and hook—on the end of a bolt through the side of a cross arm or building. Where a variety of insulators are used, the universal clevis is a necessity. Forged from flat steel  $\frac{3}{16} \times 1\frac{1}{2}$  in., and fits both  $\frac{1}{2}$  and  $\frac{5}{8}$ -inch bolts. Weight, 94 pounds per hundred.

Price, No. 555 Clevises..... per 100 \$33.30

**Peirce Cross Arm Clevises**

Hot Galvanized

For dead ending wires on wood arms.

Cat. No.	Size Arm Inches	Std. Pkg.	Wt., Lbs. per 100	Price per 100
549	3 1/4 x 4 1/4	100	191	\$57.80

551	3 3/4 x 4 3/4	100	224	69.60
552	4 x 5	100	233	72.40

**Peirce Insulated Clevises**

With Wet Process Insulators

Hot Galvanized

No. 1339

No. 1345

For dead-ending primary lines.

The No. 1339 is suitable for use with circuits up to 4000 volts, the No. 1340 up to 6000 volts and the No. 1345 up to 7500 volts.

The yoke of the clevis on No. 1339 and 1340 is made of No. 11 gauge by 1 1/2-inch flat steel and is equipped with a 5/8-inch cotter bolt and brass cotter. The yoke of a 1345 clevis is made of 3/4 x 1 1/2-inch flat steel equipped with a 5/8-inch clevis bolt and brass cotter.

Clevis No. 1339 is furnished with an 1 1/8-inch round mounting hole, Clevis No. 1340 is furnished with an 1/2 x 3/4-inch oval hole while No. 1345 has an 1/2-inch square hole.

Cat. No.	Style of Insulator	Length to Center of Bolt Inches	Std. Pkg.	Weight Pounds per 100	Price per 100
1339	No. 1608	4 3/16	125	125	\$51.30

1345	No. 1610	5 1/2	35	340	154.00

**Peirce Insulated Clevises**

With Dry Process Insulators

Hot Galvanized

For secondary work. Furnished with standard Peirce rack insulators, No. 355 for the large type and No. 1606 for the small type.

The yoke of the clevis is made of No. 11 gauge by 1 1/2-inch flat steel and is equipped with a 5/8-inch cotter bolt and brass cotter pin.

The hole for mounting the No. 1341 is 1/2-inch.

The hole for mounting the No. 1342 is a 3/4-inch oval.

Cat. No.	Style of Insulator	Length to Center of Bolt, In.	Std. Pkg.	Ship. Wt., Lbs. per 100	Price per 100
1341	No. 1606	4 3/16	125	136	\$42.80
1342	No. 355	4 3/8	150	225	56.00

**Peirce Secondary Racks**

Chicago Type

Hot Galvanized

Chicago type racks consist of presteel U-shaped points made of No. 12 gauge steel securely riveted to a 1/2 x 1 1/4-inch flat steel back. The insulators are attached to the rack with a 5/8-inch button head bolt. Pole mounting holes are 1/2 x 1-inch for use with either 5/8-inch through bolts or lag screws. No. 355 insulators are standard equipment. Nos. 356, 455, 456 and 465 insulators can be used.

Cat. No.	No. of Line Wires	DIMEN., IN. Wire Spacing	Over All Length	Std. Pkg.	Ship. Wt., Lbs. per 100	Price per 100
248	2	8	12 1/2	10	562	\$157.60
344	3	4	12 1/2	10	662	168.70
348	3	8	20 1/2	10	887	237.50
448	4	8	28 1/2	5	1212	317.40
544	5	4	20 1/2	5	1110	159.70

**Peirce Universal Secondary Rack Units**

Hot Galvanized

The rack units are made alike and can be assembled to make any combination secondary racks with 4 or 8-inch spacings. They eliminate carrying various spacing racks.

The rack units are made of a single piece of steel and are roofed so that they will not injure the insulation of the line wire when pulled through the rack and also that they will drain readily.

The insulator bolt used is a standard 5/8-inch machine bolt, generally 2 inches longer than the overall length of the rack which can be readily determined as each unit is 4 inches overall in height.

No. 355 insulators are generally used with these racks. The Nos. 356, 455, 456 and 465 insulators can be used and furnished at a slight extra cost.

All three units interchange and interlock in perfect alignment. By adding No. 702 Foot Rack with 5/8 x 1-inch machine bolt these racks can be mounted on buildings.

Cat. No.	Exten- sion	Over All Ht.	Size of Steel	Mounting Holes	Std. Pkg.	Lbs. per 100	Price per 100
702	Rack	Foot		3/16 x 1	10	80	\$26.60
704	4	4	3/16 x 1 1/2	2 1/8 x 7/8	25	90	25.30
708	8	4	3/16 x 1 1/2	2 1/8 x 7/8	10	145	34.50
712	12	4	3/16 x 1 1/2	2 1/8 x 7/8	10	210	44.60

**Peirce Heavy Presteel Secondary Racks**

Hot Galvanized

No. 278

Of sufficient weight and strength for general secondary work; however, for long spans and cable construction Standard Pierce Racks are recommended.

Made of a presteel channel back; presteel channel U-shaped points inserted through and riveted to the back, and a 5/8-inch through rod for attaching No. 355 insulators to points.

The Nos. 278, 374, 378 and 478 are furnished with straps so that they may be used on buildings for making heavy service connections. When used on poles, the straps should be hammered flat against the pole, increasing the bearing surface. The Nos. 1278, 1374, 1378 and 1478 may be used in connection with Peirce Rack Bands for attaching the racks to tubular steel poles.

Cat. No.	No. of Line Wires	DIMENSIONS, INCHES Wire Spacing	Length Over All	Std. Pkg.	Wt., Lbs. per 100	Price per 100
278	2	8, with Straps	16 1/2	10	526	\$157.80
374	3	4, with Straps	16 1/2	10	654	174.40
378	3	8, with Straps	24 1/2	10	879	258.90

1478	4	8, without Straps	32 1/2	10	972	310.20

**Insulators for Peirce Secondary Racks**

Heavy Type

Designed to accommodate wire and cables up to 2,000,000 C.M. in cross sectional area, for use on secondary racks and other applications.

Cat. No.	Color of Glaze	Kind of Porcelain	Wt., Lbs. per 100	Price per 100
465	Brown	Wet Process	165	\$31.00

## Peirce Secondary Racks

Hot Galvanized  
Standard Type

Strong enough for the heaviest work, with an ample factor of safety. Equipped with No. 355 insulators, although Nos. 356, 455 and 456 insulators can be furnished if desired. The insulators are packed in corrugated paper boxes and the racks are wired in bundles of ten.

The width of the back of the rack is 2 3/4 inches with a slot 3/4 inch wide between the two angles, which allows the use of 5/8-inch through or lag bolts for fastening the rack to the pole.

Cat. No.	No. of Line Wires	DIMEN., IN. Wire Spacing	Length Over All	Std. Pkg.	Ship. Wt., Lbs. per 100	Price per 100
250	2	4	9 1/2	10	591	\$126.60

458	4	8	29 1/2	5	1488	394.40
540	5	4	21 1/2	5	1380	311.10
3058	3	8	13 1/2	5	914	215.50

### Extended Back Type

Similar in all respects to the standard rack except that the angles forming the back are extended to accommodate through bolts for attaching the rack. Some construction men like this feature as the insulators can be assembled on the rack in the storeroom and attached to the pole without removing them.

Cat. No.	No. of Line Wires	DIMEN., IN. Wire Spacing	Length Over All	Std. Pkg.	Ship. Wt., Lbs. per 100	Price per 100

## Insulators for Peirce Secondary Racks

### Standard Type

No. 355 brown glazed insulator is the most popular secondary rack insulator and is furnished on all heavy type racks unless otherwise specified. For marking the neutral wire of a secondary circuit, some construction men use the No. 355 white glazed insulator.

Where high mechanical strength is required, such as for dead-ending heavy lines, the No. 455 is used by many companies.

Cat. No.	Color of Glaze	Kind of Porcelain	Ship. Wt., Lbs. per 100	Price per 100
355	Brown or White	Dry Process	132	\$16.70
455	Brown	Wet Process	132	23.10

### Double Groove Type

Has 2 grooves, one for tying in the main circuit and the other for the service wires.

356	Brown	Dry Process	134	\$24.40
456	Brown	Wet Process	134	27.80

### No. 1606 Light Rack Type

Insulators for the light racks are furnished with either brown or white glaze, both of which are made of dry process porcelain. The brown glazed insulator is also used on the No. 1341 clevis, on spreader racks, light racks, and on sister hook and tree fixtures.

1606	Brown	Dry Process	45	\$11.40
1606	White	Dry Process	45	12.60

### No. 1603 House Rack Type

Used with house racks. Also used on the No. 2925 swinging knob fixture.

1603	Brown	Dry Process	45	\$9.80
------	-------	-------------	----	--------

## Peirce Presteel Secondary Racks

Hot Galvanized  
Heavy Service Type

The heavy service type rack has greater strength per pound than any rack heretofore made.

It has no rivets, no pockets to hold moisture and no lapping of material which so frequently starts rusting.

There is not a sharp edge or corner on it.

It has great uniform strength to resist all strains—dead end, side pull and dead load.

The wide back makes it good for either pole or building work.

Equipped with No. 355 insulator.

Cat. No.	No. of Line Wires	Wire Spacing In.	Over-all Length In.	Std. Pkg.	Wt. Lbs. per 100	Price per 100
2844	2	4	12 1/2	10	542	\$126.60

3848	3	8	24 1/2	5	1154	278.90
4844	4	4	20 1/2	5	1156	250.40
4846	4	6	26 1/2	5	1448	381.90
4848	4	8	32 1/2	5	1543	394.40

### Light Service Type

The light service type rack is of exactly the same construction as the heavy service type except that it is smaller and lighter.

Because of its strength and low cost it is especially adapted for running extensions from secondary mains; for lines where future development is limited; and for house service connections.

Equipped with No. 1606 insulators.

The mounting holes on these racks are exactly the same spacing as the heavy service type. This feature permits installing a light service and heavy service rack back to back on a pole using the same through bolt.

2744	2	4	12 1/4	10	322	\$100.00
2746	2	6	14 1/4	10	362	110.90

4748	4	8	32 1/4	10	742	219.00

## Peirce Light Presteel Secondary Racks

Hot Galvanized

These racks were designed for light secondary work. They are especially adaptable, on account of their strength and low cost, for running extensions from secondary mains; for lines where future development is limited; and for house service connections.

The light presteel racks have a presteel channel back 1 1/2 x 1 1/16-inch; No. 12 gauge channel U-shaped points, which are inserted through and riveted to the back, and a 1/2-inch insulator bolt for attaching the No. 1606 insulators to the points.

When 4-inch spacing racks are specified, a shield for attaching over the upper edges of the points, is furnished to prevent injury to the insulation when stringing the wire.

Cat. No.	No. of Line Wires	DIMENSIONS, INCHES—Wire Spacing	Length Over All	Std. Pkg.	Ship. Wt., Lbs. per 100	Price per 100
276	2	6, with Straps	13 1/4	10	350	\$110.90

**Peirce Extension Brackets**  
For Secondary Racks  
Hot Galvanized

No. 3355

Extension brackets are made in two styles, with flat and curved backs, for wall and for pole use, respectively. Both types have one 1/16-inch hole and two 3/16-inch holes for mounting. The brackets are made of No. 9 gauge steel, provide a 6-inch extension, have a 4-inch bearing on pole or wall, and are equipped with a 5/8x2-inch carriage bolt.

Cat. No.	Description	Wt., Lbs. per 100 Pieces	Price per 100 Pairs
3355	Curved Back, for Poles	250	\$65.80
3356	Flat Back, for Walls	250	65.80

**Peirce Pole Bands**  
For Secondary Racks  
Hot Galvanized

No. 7364

No. 7374

Used for attaching all styles of Peirce Secondary Racks to tubular steel poles.

Made of 1/4x1 1/2-inch steel, in two styles, the single type for attaching one rack, and the double type for attaching two racks, to the pole.

Bands are furnished with 5/8x2-inch carriage bolts for attaching the rack and 1/2x1 3/8-inch clamp bolts for clamping.

**Peirce Channel and Presteel Pole Brackets**

Hot Galvanized

No. 144

The No. 144 is a popular bracket for light telephone circuits on transmission poles. It is attached to the pole by two 3/8-inch lag screws. Equipped with Peirce 1-inch spring thread.

The No. 152 is recommended for heavier work such as electric railway feeders and where greater extension from the pole is desired. Mounting holes are 1/16-inch. Extension from pole is 5 inches. Equipped with 1-inch lead thread.

Cat. No.	DIMENSIONS, INCHES		Std. Pkg.	Weight Pounds per 100	Price per 100
	Size of Steel	Extension			
144	1x1 1/2	2 1/2	25	80	\$31.80
152	No. 9 Ga.	5	25	240	55.50

**Peirce Dead-Ending Straps**  
For Secondary Racks

Hot Galvanized

Used to temporarily dead-end a line. Provided with a 3/8-inch hole for 1/2-inch lag screw.

Cat. No.	Type	Pole Mounting Hole, In.	Size of Steel, In.	Ship. Wt., Lbs. per 100	Price per 100
999	Light	9/16	14-ga. x 1 1/4	60	\$18.90
1000	Heavy	9/16	1 1/4 x 1 1/4	100	21.10

**Peirce Dead-End Brackets**  
For Railway Signal Circuits  
Hot Galvanized

Equipped with a 3/8 x 4 1/2-inch carriage bolt with sufficient thread to make it suitable for use on cross arms 3 1/4 x 4 1/4 to 4 x 5 inches.

An important feature of this type bracket is the method of attaching insulator, which places the porcelain in compression, developing its full strength. In the case of a broken insulator it holds the wire in its original position eliminating possibility of a false signal due to a short.

Cat. No.	DIMENSIONS, INCHES		Std. Pkg.	Weight Pounds per 100	Price per 100
	Size of Bolt	Insulator Hole			
195	3/8x4 1/2	1/2x1 1/16	50	102	\$41.30

**Peirce Presteel Cross Arm Brackets**

Hot Galvanized

For heavy work such as running electric railway feeders and signal wires on cross arms.

Furnished with standard lead thread for pin holes having a 1-inch diameter and has an extension of 2 1/2 inches.

The height of bracket above the cross arm gives sufficient clearance for most insulators.

Bracket should be mounted to cross arms by 5/8-inch cross arm straps.

Cat. No.	DIMENSIONS, INCHES			Std. Pkg.	Weight Pounds per 100	Price per 100
	Size of Steel	Extension Above Cross Arm	Height			
172	9 Ga.	2 1/2	6	25	230	\$55.50

**Peirce Cross Arm Terminal Brackets**

Hot Galvanized

Used for dead-ending lines on cross arms.

It is adjustable to cross arms 4x5-inch and smaller. May be used either on top or below the arm.

Equipped with Peirce 1-inch spring thread.

No. 105

Cat. No.	DIMENSIONS, INCHES			Std. Pkg.	Weight Pounds per 100	Price per 100
	Holes	Channel	Extension			
105	1 3/8	1	4 5/8	10	160	\$54.80

**No. 107 Peirce Cross Arm Extra Wire Brackets**

Hot Galvanized

Extension 4 Inches

Will support an extra wire at the end of a filled arm.

Cat. No.	DIMENSIONS, INCHES			Std. Pkg.	Wt., Lbs. per 100	Price per 100
	Length	Holes	Channel			
107	18	7/8	1	25	152	\$68.10

## Peirce Cross Arm Distributing Brackets

Hot Galvanized

No. 1116

No. 131 is for running leads between arms such as are required for transformer pole wiring, attached to the end of cross arm by a  $\frac{3}{8}$ -inch carriage bolt and  $\frac{1}{4}$ -inch lag screw. Provided with a slot so that the same carriage bolt, used to prevent the cross arm from splitting, may, also, be used for attaching bracket to arm.

The No. 1116 is used for transformer pole wiring and attached to cross arm by Peirce Drop-Forged Cross Arm Straps, which are not included in price. Equipped with 1-inch Peirce spring threads.

Cat. No.	DIMENSIONS, INCHES			Std. Pkg.	Weight Pounds per 100	Price per 100

131	$\frac{7}{16}$	1	4	25	79	\$53.30
1116	$\frac{9}{16}$	$1\frac{1}{4}$	$10\frac{1}{2}$	10	140	51.80

## Peirce Heavy Presteel Break Arms

Hot Galvanized

The Cow Horn No. 231 is the type of break arm in general use as a circuit breaker on series lighting circuits. It fits any standard cross-arm, by the arrangement of two bolts with slots and holes in the bracket and in the cross-arm strap.

Cat. No.	Spacing Points In.	Size Steel Gauge	Std. Pkg.	Wt., Lbs. per 100	Price per 100

## Peirce Cross Arm Distributing Brackets

Hot Galvanized

The No. 200 bracket is used for taking off street lamp or service connections. It is adjustable to cross arms 4x5-inch and smaller. Is especially convenient for carrying two wires vertically from arm to arm or for running jumper wires from one end of the cross arm to the other.

Nos. 210 and 300 are used for taking off service connections from ends of cross arms. Adjustable to 4x5-inch and smaller. Presteel points are riveted to angle steel.

No. 210

Cat. No.	DIMENSIONS, INCHES			Std. Pkg.	Weight Pounds per 100	Price per 100
	Size of Steel	Spacing	Channel			
200	1 Channel	16	10	230	\$90.00	
210	$1\frac{1}{4} \times \frac{1}{8}$ Angle	13	10	300	86.60	
300	$1\frac{1}{4} \times \frac{1}{8}$ Angle	$6\frac{1}{2}$	10	340	104.00	

## Peirce Spreader Racks

Wilson Type  
Hot Galvanized

Provides a new and dependable method for taking off secondary services from the ends of cross arms. The neutral wire is usually carried on the insulators under the arm.

Rack No. 328 is furnished complete with No. 1606 insulators. No. 330 heavy type is equipped with No. 355 insulators. Adjustable for cross arms 4x5 inches and smaller.

No. 328

Cat. No.	INSULATOR SPACING, IN.		Std. Pkg.	Wt. Lbs. per 100	Price per 100
	Vertical	Horizontal			
328	$5\frac{1}{2}$	$3\frac{7}{8}$	20	607	\$135.50
330	$5\frac{1}{2}$	$5\frac{1}{4}$	20	890	169.20

## Peirce Cross Arm Extra Wire Brackets

Hot Galvanized

For supporting heavy extra wires on a filled cross arm.

Cross arm straps Nos. 1001, 1002, 1003 and 1004 are used for attaching this bracket to the arm but are not included in the price.

The presteel points are made of 9-gauge sheet steel.

Cat. No.	DIMENSIONS, INCHES		Spacing	Extension	Std. Pkg.	Wt. Lbs. per 100	Price per 100
	Holes	Steel					
230	$\frac{9}{16}$	9 Ga. Sheet	10	4	10	300	\$163.30

## Peirce Break Arm Brackets

Hot Galvanized

Break arm brackets are used for breaking series lighting circuits.

Made of No. 9 gauge steel and pressed to shape.

Has a shank which is designed to fit into cross arms bored for  $\frac{1}{2}$  inch insulator pins.

Standard package, 10.

Cat. No.	Spacing	Size of Steel	Shipping Weight Pounds per 100	Price per 100

## Peirce Spreader Brackets

Hot Galvanized

Used where great strength is needed.

These brackets are pressed to shape from No. 9 gauge open hearth steel and are equipped with Peirce 1-inch spring threads which prevent insulator breakage.

Standard package, 10.

No. 217

Cat. No.	Wiring Spacing Inches	Wt., Lbs. per 100	Price per 100
317	$6\frac{1}{2}$	400	196.70

No. 317

## Peirce Wireholders

All-Porcelain Multi-Point Type  
Hot Galvanized

Equipped with No. 1654 All-Porcelain Insulators which have a  $\frac{3}{8}$ -inch bolt and cork washer. Insulators can be installed after back has been mounted to building and can be easily removed or installed to make various spacing wireholders. Base is No. 12 gauge presteel channel  $2\frac{3}{8}$  inches wide with  $\frac{1}{2}$ -inch flanges. Mounting slots are  $\frac{3}{16} \times 1\frac{1}{2}$ -inch with  $\frac{3}{16}$ -inch center punch. Cork washer prevents breakage of insulators when assembling.

3396	3	6	25	401	100.00
1654	Insulator		50	84	25.00

**Peirce Wireholders**  
Standard Type  
Hot Galvanized

The standard type of wireholders have been designed on scientific principles, namely, metal parts in tension and porcelain in compression each developing its greatest strength. The No. 1602 insulator used on these wireholders is designed with well rounded edges almost entirely eliminating chipping or breakage and it is secured to the bracket by a complete band of metal.

This wireholder is not affected by temperature changes or by the difference in the coefficient of expansion of its various parts.

The No. 190 wireholder is in use for making house service connections and when in use the brass cotter pin interlocks the insulator with the metal portion of the wireholder eliminating falling wire hazard should the insulator become broken.

Peirce wireholders are also made in multi-point types. They are provided with ample mounting holes spaced away from the insulator eliminating the possibility of breaking the insulator when driving the screw.

The corner iron No. 501 is used for attaching multi-point wireholders to the corner of a building when occasion demands this type of construction.

Cat. No.	No. of Wires	Wire Spacing Inches	Std. Pkg.	Weight Pounds per 100	Price per 100
190	1	0	50	78	\$28.00

\*Insulator with 1/2x1 1/16-inch wire hole. \*\*With 3/4x1/8-inch hole.

**Peirce Wireholders**  
All-Porcelain Type

The screw type All-Porcelain Wireholder combines a wall bracket, insulator and screw all in one. A jab and a few turns is all that is necessary to install it. This type of wireholder has been designed so that no metal is exposed after installation.

The insulator is small and fits the hand. The wire hole grooves are well rounded so that they will not injure the insulation of the line wire. The insulators have an ample factor of safety for all secondary voltages.

The special wood screw which is a part of this wireholder has a clean cut thread and a point which starts into the wood under very little pressure. The cement used in attaching the screws is non-porous; weather does not affect it.

No. 31 expansion shields are used for mounting the screw type wireholders into brick, stone or concrete buildings.

Nos. 1607, 1614, 1621 and 1625 are equipped with galvanized screw; Nos. 1617, 1624, 1631 and 1635 with brass screw; Nos. 1627, 1634, 1641 and 1645 with toggle bolt; Nos. 1637, 1644, 1651 and 1655 with carriage bolt.

## Peirce Wedge-Grip Service Brackets

Hot Galvanized

No. 3920

No. 3925

No. 3926

Designed for use with multiple conductor service cable. For a long time there has been a demand for this type of cable for use on service drops, but because of the lack of a suitable bracket or support, it has not been used. The wedge grip cable-holder solves the problem.

Jaws of bakelite sliding in a tapered steel shell hold cable in vise-like grip. Steel shell is anchored to pole or house by a copperweld wire bale which can be removed for attaching to eye bolt or secondary rack bolt by swinging through 180 degrees.

Screw eye No. 3925 is used as an anchor in wood while a 1/4-inch eye bolt and a 1/4-inch expansion nut is used as an anchor in brick, stone or concrete. No. 3920 cableholder is furnished with flat face bakelite jaws for 2-conductor cable and No. 3922 with grooved jaws for 3-conductor cable.

No.	Description	Approx. Ship. Wt., Lbs. per 100	Price per 100

3926	1/4-Inch Eye Bolt and 1/4-Inch Expansion Bolt for Anchoring in Masonry.....	15	19.00

## No. 9270 Hubbard Transposition Brace Plates

Hot Galvanized

No. 9270 plate has been developed for the purpose of eliminating to some extent the expensive going over and tightening up of the transposition brackets as practiced by many construction engineers.

The plate, fitting snugly over the roof of the crossarm, is held in position by a lug sunk into the wood and by the machine bolts holding the transposition bracket. Side swing is eliminated by the portion of the plate which bears on the roof of the arm.

The tight fitting channel construction of the plate holds the bracket rigidly in a vertical position even under extreme contractions of the crossarm

due to weathering. A shrinkage of 1/16 inch will not alter the vertical alignment of the brackets.

Besides eliminating losses due to wire crosses and contacts caused by faulty phantom circuits, it greatly improves the line appearance.

Pressed from No. 11 gauge steel which is slotted as shown by the illustration, to provide for a tight fitting adjustment.

Used with transposition bracket No. 9275 on R.S.A. roofed crossarms.

Approximate shipping weight per 100, 52 pounds.

Price, No. 9270.....per 100 \$26.64

## No. 2932 Peirce Swinging Knob Fixtures

Furnished with a redesigned No. 1602 insulator. The insulator hole is 1/2 x 1/2 inch. Standard package, 50. Shipping weight, 100 pieces, 95 lbs.

Price, No. 2932, with Insulator.....per 100 \$37.80

## No. 2945 Peirce Swinging Knob Fixtures with Bolts

Hot Galvanized

The swinging knob fixture is similar to the standard Peirce Fixture No. 2925 except that a 3/8 x 5-inch carriage bolt is secured to the base instead of the standard wood screw.

Some construction men are using this fixture, bolted through the cross arm, for taking off service drops. The fixture is adaptable to light secondaries on twisted wires.

No.	Ins. No.	Wt., Lbs. per 100	Price per 100
2945	1603	111	\$43.10

## Peirce Swinging Knob Fixtures

Hot Galvanized

These fixtures are used for making house service connections. The sister hook arrangement permits the removal of the insulator, for driving the screw, without the use of tools.

The No. 2928 is equipped with a Peirce No. 1606 insulator. The No. 2929 with a Peirce No. 355 insulator.

Price, No. 2928, Wt. 165 Lbs. per 100.....	per 100	\$66.70
Price, No. 2929 Wt. 250 Lbs. per 100.....	per 100	88.80

## Peirce Tree Insulators

Hot Galvanized

- The Peirce Tree Fixture provides:
- 1.—Sufficient insulation.
  - 2.—An easy method of installation without injury to the tree.
  - 3.—An easy method of stringing in the line without cutting.
  - 4.—A roller bearing to prevent chafing the insulation.
  - 5.—Sufficient strength and flexibility for use with various sizes of wire.

The sister hook feature permits the removal of insulators for driving the screw and stringing in the wire without the usual trouble with small nuts and bolts, also eliminates danger of parts working loose.

No.	Type	Standard Package	Wt., Lbs. per 100	Price per 100
2934	Flexible	75	155	\$72.90
2933	Rigid	75	115	39.10

## No. 132 Peirce Screw Brackets

Hot Galvanized

Small diameter of screw, No. 24x2 1/2", prevents splitting of wood. Std. pkg. 100.

**Peirce Insulated Pole Brackets**

For Lamp Leads

Hot Galvanized

No. 174

Used for supporting vertical leads of duplex cable or twisted single wires between cross arm and arc or incandescent lamp. Easy to install. No small bolts or movable parts. Nos. 173 and 174 are equipped with No. 1604 insulators and support the wire 5 inches from the pole. The No. 1660 insulator is not connected to the screw by a band of metal. The line wire is supported 5 1/8 inches from the pole.

## Peirce Insulated Lamp Hanging Attachments

Hot Galvanized

### Suspension Insulator Type

No. 1504 is a metal cap suspension insulator and has a safety hook for an arc lamp. The No. 1514 is similar to No. 1504, except that it has a metal cap tapped for 3/4-inch pipe thread for screwing to the mast arm stud and a pig tail hook for supporting the arc lamp. The No. 1524 is similar to the No. 1514 except that it has a 3/4-inch pipe thread stud instead of a pig tail hook for fastening the arc lamp.

Cat. No.	Overall Length Inches	Working Voltage	Std. Pkg.	Weight Pounds per 100	Price per 100
1504	6 3/4	6600	50	330	\$296.20
1514	7 5/8	6600	50	330	296.20
1524	5 1/16	6600	50	295	296.20

### Suspension Insulator Type with Insulated Spreader Arm

No. 1534 is similar to the No. 1504, except that it has an extended pig tail hook for supporting the arc lamp and an insulated spreader arm for attaching the lamp leads.

No. 1534

Cat. No.	Wire Spacing, Inches	Working Voltage	Std. Pkg.	Weight Pounds per 100	Price per 100
1534	12	6600	25	525	\$349.70

### Insulated Lamp Hanger Type

No. 1591

The No. 1591 consists of a special 6600 volt pin type insulator, a cap for attaching to the mast arm and a stud for attaching the lamp. Both stud and cap are threaded with standard 3/4-inch pipe threads. No. 1592 is similar to No. 1591 except that the pig tail hook is cemented into insulator instead of stud.

1591	6 1/2	6600	50	328	\$107.00
1592	8 3/4	6600	50	290	107.00

## Peirce Presteel Pole Plates

A pole plate of presteel stronger than castings. Eliminates threads on pole end of bracket as it clamps around the pipe.

Permits the wiring of a street hood bracket either internal or external. Has three 1/16-inch mounting holes for 1/2 or 3/4-inch lag screws or bolts. Curved to fit the pole which saves the lineman considerable time in installing. Used for mounting any 3/4 or 1 1/4-inch pipe connections to a wooden pole.

Stock No.	DIMENSIONS, INCHES			Finish	Std. Pkg.	Weight Lbs. per 100	Price per 100
	Size Pipe	Height	Width				
3700	3/4	5	3 3/4	Painted	2	180	\$100.00

3703	1 1/4	6	4	Galvanized	2	254	200.00

## Peirce Pig Tail Arc Lamp Hooks

Hot Galvanized

Made of a 1/2-inch piece of steel, pointed, with a carriage bolt head. Hook is inserted in a malleable pipe cap with standard 3/4-inch pipe thread. Can be attached to mast arm studs.

Overall length is 4 3/4 inches; diameter of hook, 1 3/8 inches. Weight per 100 pieces, 60 pounds.

Price, No. 3340, Std. Pkg., 10. per 100 \$44.10

## Peirce Street Hood Brackets

Straight Arm Type

No. 3381

Made of a straight length of 1 1/4-inch pipe with an ornamental head piece at outer end, equipped with a 1 1/4-inch pipe nipple for attaching reflector hood. Reducing bushing No. 3381 can be furnished. Ornamental scroll has one 9/16-inch mounting hole for pole support and two clamps for fastening to the pipe arm. This bracket takes up less space on the pole. Special lengths can be furnished.

Cat. No.	Length Feet	Size Pipe Inches	Finish	Std. Pkg.	Wt., Lbs. per 100	Price per 100
3704	4	1 1/4	Painted	2	2120	\$710.00
3714	4	1 1/4	Hot Galv.	2	2139	820.00

------	--------	-------	-------	----	----	-------

\*Size of pipe thread, inches. \*\*Reduced to pipe thread, inches.

### Right Angle Type

Similar to Straight Arm Bracket except that it has neither ornamental head piece nor nipple. It

is one piece of 1 1/4-inch pipe with a threaded end to engage the reflector head. Reducing Bushing for 1 1/4-inch pipe thread street hood brackets can be furnished for attaching reflector hoods.

Furnished with Peirce Presteel Pole Plate and ornamental scroll. Special lengths can be furnished on request.

Cat. No.	Length Feet	Size Pipe Inches	Finish	Std. Pkg.	Weight Pounds per 100	Price per 100
3724	4	1 1/4	Painted	2	2140	\$730.00
3734	4	1 1/4	Hot Galv.	2	2158	840.00

### Goose Neck Type

Made of 3/4-inch pipe. This bracket is also furnished with the Peirce Pole Plate.

3725	40	3/4	Painted	2	729	\$230.00
3745	40	3/4	Hot Galv.	2	750	260.00

3764	48	3/4	Hot Galv.	2	830	320.00

## Peirce Presteel Mast Arms

Rigid Type—Hot Galvanized

Used where lamps need not be hung more than 5 feet from pole. Braced against stresses in any direction. Base of arm made of presteel. Can be mounted on garages or similar

buildings. Pole hands furnished extra for mounting arms to any size tubular poles. Adaptable for external or internal wiring. Adjustable spreader bracket can be placed at any point on arm. Flat steel brace and adjustable scroll can be used for supporting the arm from above or below.

Cat. No.	Length Feet	Size of Section Inches	Std. Pkg.	Wt., Lbs. Each	Price per 100
3203	3	1 1/16 x 2 5/16	5	11 1/2	\$568.00

3205	5	1 1/16 x 2 5/16	5	16 1/2	810.00

**Peirce Presteel Trolley Mast Arms**

**Rod Type**

Hot Galvanized

The strong points of the trolley arm are its safety and simplicity. The long swinging loops of wire are eliminated. The lamp is out of the reach of children, and cannot fall to the street. The trimmer has no trouble operating the Arm under any weather conditions, and runs no risk of injury by street traffic.

The lamp trimmer climbs the pole, pulls the lamp in by the rod attached to the lamp hanger, and then pushes it back to place by the same rod. There are no chains or ropes to break or become jammed on pulleys. The sliding mechanism is simple, and is completely protected from sleet and ice.

The Arm is pressed from a single length of 14-gauge sheet steel. It is furnished with a 1/2 inch round eye rod, a channel steel back brace to prevent its swinging around the pole, a channel spreader arm, and an operating rod with a trolley which has a 3/4-inch pipe-threaded connection for lamps. On this lamp connection is another spreader arm. All parts are hot-dip galvanized.

Cat. No.	Length Feet	Size of Section Inches	Std. Pkg.	Weight Pounds Each	Price per 100

**Peirce Presteel Trolley Mast Arms**

**Chain Type**

Hot Galvanized

No. 3610

This type of mast arm is the latest development for street lighting. The carriage is operated by a continuous chain which is completely protected.

All movable parts are equipped with brass bushings which permit a free easy movement. The idler and sprocket are made from a non-rusting alloy. These mast arms are safe and simple. The long swinging loops of wire are eliminated. The lamp trimmer has no trouble operating the arm. He climbs the pole, unlocks the handle and by revolving it pulls the lamp toward him. The handle locking device will not freeze nor hinder quick operation.

Cat. No.	Length Feet	Size of Section Inches	Std. Pkg.	Weight Pounds Each	Price per 100
3606	6	1 1/16 x 2 5/16	2	30	\$1720.00

**Peirce Rigid Mast Arms**

Hot Galvanized

Fig. 1

Fig. 2

Fig. 3

Street lamps supported on standard rigid arms are lowered to the street by rope or chain passing over the two No. 1520 pulleys. The arm is made of steel channels with a 1/2-inch eye rod as a tension member.

Can be furnished in three styles as illustrated above. Figure 1 is the standard rigid type arm which includes two No. 1520 pulleys but no chain.

Figure 2 illustrates the flexible stud fastening for attaching the lamp. With this type arm there are neither chain nor pulleys.

Figure 3 illustrates the No. 1525 Sleet Proof Pulley with clamp knob on the end of the arm. With this type there is included No. 1520 Pole Pulley and No. 1525 Sleet Proof Pulley with clamp knob but no chain.

**Bermico Guy Wire Protectors**

Made from tough cellulose fibres, impregnated with water-proof compound.

Because of the dielectric properties, this protector assures safety against pole wires that have become grounded through leakage and a wet pole.

Supplied in 8-foot lengths; 3-inch inside diameter.

Furnished in aluminum lacquer at no additional charge.

A 3/8-inch slot runs the entire length of the casing.

Prices upon application.

**Peirce Truss Arms**  
Hot Galvanized

This type of arm is lighter than most types and the preference of some construction men because of its low cost. Made of 3/4-inch channel and furnished with 3/4-inch threaded pipe connection for hoods. Attached to pole by 3/8-inch lag screws or through bolts. Can be supported from above or below.

Cat. No.	Size Channel Inches	Length Feet	Std. Pkg.	Wt., Lbs. per 100	Price per 100
370	3/4	4	5	800	\$260.00
371	3/4	6	5	1200	354.00

### Bermico Tree Wire Protectors

Minimizes interruption of service and reduces loss of current from overloads caused by swinging and dead grounds. Made from cellulose fibres, and impregnated with waterproof compound.

In standard lengths of 54 inches; inside diameter, 1 1/2 inches. A 1/2-inch slot runs the entire length of the tube. Prices upon application.

### Bermico Half Round Wire Protectors

Bermico Half Round is standard Bermico Conduit sawed in halves. Gives protective covering to all wires leading down poles into the ground. Made from long cellulose fibres, impregnated with waterproof compound, under pressure.

Will withstand high voltages up to 50000 volts. Furnished with radii as follows: 3/4, 1, 1 1/4, 1 1/2, 1 3/4, 2, 2 1/4, 2 1/2 and 3 inches. All sections are 8 feet in length except the 3/4, 1, and 1 1/4-inch sizes which are approximately 5 feet.

Sections are easily joined because of the socket type joints on each end. Prices upon application.

### Paragon Grounds

Made of one continuous piece of pure No. 22 sheet copper. Five feet of No. 4 copper connecting wire furnished with each ground. The cones are perforated to give ample discharge points and filled with charcoal to give uniform filling and attract and hold moisture in the earth around the cone. The cylinders are not perforated and are furnished either filled with charcoal or open at both ends with no filling.

Cat. No.	Description	Length Filling	Price Each
1	Cylinder.....	1	\$5.00
2	".....	2	6.25
3	Cone.....	1	5.00
4	".....	2	6.25

### Matthews Cable Clamps

For Use on Power Cable Only

These clamps are designed to relieve the strain from cables ranging in size from 000 to 1500000 CM at corners and dead ends, and to do away with the expense of splices at these places and the cost of making up into strain insulators, etc.

Two brass bolts are needed when clamps are used on a.c. cables.

Guaranteed to effect a saving of at least \$5.00 per corner turn in cables from 000 to 1500000 CM inclusive.

Packed in bags of 12, 25 and 50 each. Shipping weight, 410 pounds per 100.

Price, Galvanized Finish..... each \$3.60  
Price, Brass Bolts for Use on A.C. Cable.... per pair 1.00

### Diamond Combination Cable Clamps

With Detachable Bridle Rings

Diamond Galvanized

This combination cable clamp and bridle ring provides a more economical and more quickly applied fastening for attaching lead covered cables and parallel runs of bridle wire to walls built of any material.

The rings are snapped into place by hand and may easily be opened for the addition or removal of bridle wires. Only one size of ring is used interchangeably with all sizes of clamps effecting an economy in the number of parts required in blockwork.

Diameter of eye, 1 inch.

**Diamond Grade Clamps**

**Diamond Galvanized**

For securing lead cable to messenger strands on steel inclines.

Made of refined malleable iron with grooves to conform to the standard diameter of messenger strands and various sizes of lead covered cable.

Supplied with four 1/2-inch high tensile bolts.

Size of Clamp.....inches	27/8	2 1/2	2 1/16	1 3/8
Distance Top to Bottom.....inches	7 3/8	7	6 1/4	5 1/4
Width.....inches	4	4	4	4
Thickness of Each Side.....inches	5/16	5/16	5/16	5/16
Diameter of Cable.....inches	2 5/8	2 1/2	2 1/16	1 3/8
Price.....each	\$4.10	3.66	3.15	2.10

**Trident Guy Clamps**

Made from high grade malleable iron. Bolts have countersunk heads.

Price, 3 Bolts.....each \$ .38  
Price, 2 Bolts.....each .34

**Diamond Heavy Pattern Guy Clamps**

Made from high grade malleable iron with countersunk heads.

Price.....each \$1.50

**Diamond Strand Connectors**

Designed for connecting up dead ends of messenger strands when they occur between poles. With the connector the dead ends of wire strands are looped in opposite directions and held with 3-bolt guy clamps. Width of grooves, 1 inch; diameter of holes, 5/8 inch. Diamond galvanized.

Price.....each \$ .60

**Diamond Insulated Screw Eyes**

The porcelain ring has a diagonal opening which allows the easy insertion of wires and when pulled taut they cannot become released from the ring. Is galvanized. Put up in containers of 100 and 250.

Price.....per 100 \$15.00

**Diamond Bridle Wire Insulators**

For insuring a dry connection between a bare wire and an insulated wire tapped therefrom. Where a dry connection is necessary to prevent leakage over and around the insulation the wire insulator is used. The braid and rubber portion is stripped from the bare wire which is passed through the messenger-proof cup and soldered to prevent messenger following the bare wire into the protected glass petticoat.

It is used on loading coils in telephone construction and for lead-in wires on telegraph strands.

Price.....per 100 \$40.00

**Never-Creep Installing Bars**

The installing bar is a turned maple handle 10 feet long with a galvanized Never-Creep Holder mounted on one end and a malleable tamp head on the other.

Price.....each \$2.35

**Chance New Improved Expanding Anchors**

These anchors are double dipped in asphalt-preserving paint and the rods are hot dip galvanized.

Important features of these anchors are: Has both housing and base for supporting plates; expanding arms hinged to cross

**With Thimbleye Rods**

## Never-Creep Anchors

Twineye

Thimbleye

An ordinary 8-inch auger is all that is required to install all sizes up to and including the 36-inch. The Thimbleye rod is furnished at no extra cost and is so shaped that it holds the cable in a true cylindrical form thus preventing flattening of cable which shifts the greater strain upon a portion of the wires sooner or later resulting in injury. The Twineye, having two thimble shaped orifices is for joint construction or double guying. Prices on Never Creeps with Twineye rods instead of single Thimbleye, add 10 cents to the list prices following.

 " 18 " " " 1-inch Rod..... " 2.35

## Chance Linemen's Socket Wrenches

Made of best tool steel and specially tempered to withstand the severest use.

Made in 2 sizes, 3/4 and 5/8-inch. The 3/4-inch wrench is used principally for steel pole line construction. The 5/8-inch wrench is used for standard wood pole and cross arm, telephone and telegraph and electric light construction.

It takes the place of a hammer, or hand axe in driving lags, pins, bolts, etc. Nuts on 2 or 3-bolt messenger clamps can be tightened without removing wrench from nuts.

Size Inches	Takes Bolts and Smaller Inches	Weight Pounds Each	Price Each
3/4	3/4	3 1/3	\$3.25
5/8	5/8	2 3/4	3.25

## Never-Creep Anchors

### Method of Installing

Locate the spot desired for the anchor rod and measure from that point back from the pole the length of the rod and start the hole at this point. Use an 8-inch auger and bore the hole as nearly at right angles to the line of strain as conditions will allow.

TO DRIVE THE ROD, DROP INSTALLING BAR IN THE HOLE AND DRIVE THE ROD WHILE HOLDING IT IN THE SAME PLANE AS THE BAR. NOTE-ALWAYS USE A NEVER CREEP MAUL, THE WOODEN FACE PREVENTS INJURY TO GALVANIZING.

CATCH THE PLATE BY THE HOLDER, ON THE TAPPING BAR, PASS DOWN INTO THE HOLE AND HANG OVER THE HEAD OF THE ROD.

AFTER HANGING THE PLATE OVER THE HEAD, PUSH THE ROD THROUGH TO BACK OF HOLE.

NOTICE.—After driving the rod take the installing bar and measure the distance the rod is from the bottom of the hole to be sure the plate will have room to swing freely on the rod without touching the bottom.

After hanging plate on the rod attempt to disengage the holder until the rod has been pushed through to the opposite wall of the hole. This not only allows easier disengagement of the holder but permits the plate to drop and swing freely upon the rod.

Always use a Never-Creep wooden faced iron maul to drive the rod. Don't use a hand axe or hammer. They will batter the eye, injure the galvanizing and ruin the rod.

**Chance Pyramid Anchors**

Without Rods

Made of semi-steel, asphaltum dipped. Use the 5/8 or 3/4-inch Thimbleye or Twineye rod for an 8-inch cone anchor and a 3/4 or 1-inch rod for the 12-inch cone anchor. A standard threaded rod may be used. To install, bore a hole not less than 5 feet deep directly in line with top of pole, boring hole as far from pole as possible. Hole must be bored according to size cone.

No.	Anchor In.	Wt. Lbs. per 100	Price Each	No.	Anchor In.	Wt. Lbs. per 100	Price Each
6	6	340	\$ .65	16	16	3740	\$3.15

**Diamond Manhole Cover Hooks**

This is a useful tool for the subway construction force. It is designed to easily raise a heavy manhole cover by prying the wedged point end of the hook under the groove provided in the cover for the purpose.

The hook is made of an excellent quality of electric tool steel suitably hardened at and adjacent to the hook to prevent its bending, and at the same time sufficiently tough to prevent breaking off.

Price.....each \$1.50

**Empire Duct Rods**

Furnished in 2 styles, tapered and straight. Tapered sticks are furnished when not otherwise specified. They measure 1 1/4 inches at the middle of the rod and taper to 1 inch at coupling. Straight sticks are furnished of uniform diameter 1 inch throughout.

Couplings are malleable iron. Ends are interchangeable. Axles are machined from brass rod, solid head and shouldered on coupling. Wheels are machined at hub to fit axle and shaped to conform to curve of duct. The rod is made of best selected straight grain well seasoned hickory, tapering to 1 inch at coupling.

## Manhole Frames and Covers

These frames and covers are cast from an analysis of iron which has proven, by test and experience to be high in tensile strength and wear resistance qualities.

All manholes are machine finished on both frame and cover, which eliminates all rocking covers, makes inter-

change of frames and covers possible, and eliminates necessity of matching.

The illustrations show only a few of a large group of various sizes, shapes, weights and patterns, which can be furnished.

### Earth Boring Equipment International Earth Boring Machines Mounted on FWD Trucks

International Earth Boring Machine Mounted on FWD BT5 Truck

The utility field requires special equipment—"anything" will not do. Particularly does this apply to the selection of means of transportation. The vehicles used for hauling supplies and machinery must be powerful and yet they must have speed. Most of the hauling can be done with trucks, yet not "any" trucks will do, for the work is too varied, too exacting, too specialized. Years ago the FWD Truck appealed to utility engineers as a possible solution to the problem of selecting a truck which would cover the wide range of utility transportation requirements. Several FWD's were put into service. The engineers learned from actual observation that the rear wheels of the truck pushed, the front wheels pulled and the trucks traveled almost everywhere they were directed. They hauled heavy, cumbersome material. Twenty tons of cable were hauled on one FWD and two trailers. They hauled poles to location—long unwieldy poles that did their best to rack the trucks but failed. Other tests were conducted and the FWD's always won out. The trucks were equipped with regular American Telephone and Telegraph line construction body, winch, derrick, and boring machine. This was probably the FWD's most decisive test, for the performance of the equipment mounted on a truck is governed by the performance of the truck itself. The four driving wheels and scientific construction of the FWD, however, enabled it to "walk" right up to the places where the holes were to be dug and the poles set, whether those places were on a steep bank, in a hilly field, or in a ditch. The FWD filled every requirement. From those experimental days until now the FWD's have performed the ordinary work and they have performed the extraordinary

work. They are used with success by utility companies in general hauling and they are easily meeting every requirement made upon them in specialized hauling.

The FWD earth boring truck has been expressly built to meet the extreme conditions it must encounter. Not one ounce of the FWD's power is wasted in pushing dead weight. Power is transmitted to all four wheels and all of the weight of truck and load is used for traction. This means traction on every inch of tire and less tractive effort to propel the truck. The power of the FWD from the motor flows through a multiple disc clutch to a jaw clutch type of transmission. With this transmission the gears are always in mesh and there is no chance of stripping them. At the rear of the transmission and driven by the transmission shaft is a rugged spool or sprocket which drives a 5-inch silent chain. This chain runs over a second and larger sprocket, inside of which is placed a center differential. The propeller shafts lead to front and rear axles from this differential and function through the type of drive pronounced correct by all makes of pleasure cars—pinion and ring gear through bevel gear differentials and full floating axles. By the distribution of the power to all four wheels, strains are divided, a longer life insured for the truck, greater tractive ability provided, economy produced in operation and upkeep costs lessened.

The International Earth Boring Machine is mounted exclusively on the FWD. This boring machine has been on the market longer than other

boring machines and has an enviable reputation for stability and performance and reducing the cost of line construction and line maintenance. The savings which have been effected with this machine are remarkable.

The illustration shows the machine working under ideal conditions; there is, however, practically no place where poles are set that is not accessible to the FWD Earth Boring Machine. The turntable permits the auger to bore at the end of the truck or at either side. The auger can be swung from one extreme position to the other in 15 seconds.

## Earth Boring Equipment

## International Earth Boring Machines Mounted on FWD Trucks

Three men are necessary to operate the FWD Earth Boring Machine—one to drive the truck and control the various gear shifts of the machine, one to operate the earth boring machine and one ground man to assist the machine operator.

By the use of the turn table, the auger may be given a wide sweep and the tower tilted so as to bore a straight hole even though the truck be on very uneven ground. Slanting holes can also be bored for anchor posts. When the truck is in place, tower is given the tilt desired, the auger lowered and the lever thrown to set the auger in motion. In ordinary soil the auger is sunk to a depth of about 2 feet, when it is raised and by centrifugal motion the dirt is removed from the auger almost instantly. This action is repeated until the hole is bored the desired depth.

The derrick may be quickly dismantled by removing one bolt and one yoke pin. This derrick is carried in the brackets provided for alongside the truck. By the removal of six bolts, the complete earth boring equipment may be removed from the truck, thus releasing the truck for other purposes. Steps are mounted on the left-hand side of the tower and a toe guard effectively prevents operator's foot being caught by the tower guide when climbing the tower. All levers are compactly and conveniently arranged on the right-hand side of the truck so that the operator may obtain the maximum of speed and safety in the digging of holes and setting of poles. As a safety factor, truck and boring machine cannot be operated at the same time. It is necessary to disengage the truck when operating the boring machine and the boring machine apparatus must be disconnected before engaging the truck.

Under favorable conditions, the International Earth Boring Machine will bore a 24-inch hole 7 feet deep in 2 minutes. Under ordinary conditions, holes can be bored and poles dropped into them at the rate of 60 per 8-hour day. Records furnished by present users are indicative of a saving of from 3 to 5 dollars on each hole bored and pole set. This machine will dig holes in any kind of soil that can be dug by hand methods without blasting. By using a special auger, supplied by the company, a 24-inch hole 7 feet deep can be dug through the toughest shale in 12 minutes.

The earth boring machine is designed exclusively for FWD trucks and is operated from a power take-off. To operate any part of the borer the operator must first throw in the rotating earth boring clutch. The tower on the earth boring machine can be furnished in various lengths to meet the de-

The 48-inch auger is used for digging holes for abutments for high power lines. The illustration above shows the 4-foot auger working in wet clay.

Because of its sturdy construction and evenly balanced weight, the FWD Earth Boring Machine is not affected by the severest soil conditions met in digging even the larger size holes. The truck has the power to carry the machine to the place desired and the machine is built to stand the gaff of the hard work.

mand of the user. A 6-foot tower allows for boring a hole 6 feet deep; a 9-foot tower is used for boring holes up to 9 feet deep and a 12-foot tower provides for holes up to the 12-foot depth. This tower is of latticed angle iron and is  $8\frac{1}{2}$  inches one way by  $15\frac{1}{2}$  inches the other and it is possible to tilt it to any angle desired by means of a double-acting ratchet wrench. The tower is tilted on a worm made from carbon steel carbonized. This worm has a reduction of 44 to 1. The augers are all made of special cast steel and are of special designs of the spiral type and can be had in various sizes from 15 inches to 48 inches. Cutting blades are furnished with each auger.

The Central Station Type Machines are equipped as standard with one 24-inch and one 30-inch auger and have a 9-foot tower. This machine will bore a hole 10 feet on absolutely level ground, and is rated as a 9-foot size, one foot being allowed for unevenness in ground surface. The boring machine is furnished with a 6-foot turn table which enables the operator to bore holes from either side of the truck as well as from the rear. This turn table gives a range of more than 180 degrees and the auger may be stopped at any point within this range. It requires but 15 seconds to turn the table from one extreme position to the other.

In order to relieve the springs of the truck from all strains and shocks when the boring machine is in operation, a positive lock has been provided on the rear springs. These locks are left in place when moving from one hole to another and disengaged only when the truck is traveling for any unusual distance.

The Telephone Type Earth Boring Machine is the same as the Central Station Type except that it is a 6-foot machine. It will, however, bore holes 7 feet deep on level ground. The auger tower, shaft and chain are, therefore, 3 feet shorter than the Central Station Type. It will set 35-foot poles, instead of 65-foot. Augers furnished are 20-inch and 24-inch instead of 24-inch and 30-inch. Total weight is 14,300 pounds instead of 15,000.

With the above exceptions, both types of machines are identical and the same amount of extras as outlined in the Central Station Type are shipped with the machine.

As the picture above clearly illustrates, boring through shale requires a machine that is built to successfully withstand the unusually hard knocks encountered in this work.

By using a specially designed auger, a 24-inch hole 7 feet deep can be dug through the toughest shale in 12 minutes. These augers are made at the factory and are furnished extra.

## Earth Boring Equipment

## Enclosed Gear Boring Machines Mounted on FWD Trucks

The Enclosed Gear Boring Machine is mounted on the FWD Model HT-7 Line Construction Truck and the FWD BT5. The BT5 is described on the preceding pages. The FWD Model HT-7 Line Construction Truck was especially designed to meet the demand for a small, fast, sturdy 2-ton truck for work in the utility field. It is exceptionally powerful—its four driving wheels carry it through soft fields, over hills, and in and out of ditches. It has a wide range of speeds, 7 forward and 2 in reverse. (It can be equipped with a 4-speed transmission if preferred.) No time is lost in getting to the job or in traveling from one location to the next. Four-wheel brakes insure safety to the mechanism, to the workmen and to pedestrian. Moreover, the FWD is economical. It does not develop more power but it puts more of the power developed to use.

The Enclosed Gear Earth Boring Machine which is mounted on the HT-7 Line Construction Truck brings into the operating department of the public utility field a mechanism which affords not only a tremendous labor saving factor but at the same time leaves the class of the heavy duty machine and ranks as a simple tool. It will bore any pole hole and set the pole in any location where hand digging is possible and where it is at all practicable to place a truck. Occupying but 1½x4 feet in the truck body and weighing a little less than a ton, it can be used on a truck which will also perform any and all of the regular maintenance requirements.

Power is delivered to the boring machine by a special transmission counter shaft which permits full engine torque and the use of any desired speed of the truck transmission for every phase of boring machine operation. The truck counter shaft is extended by means of a propeller shaft which is mounted in self-aligning bearings and which carries the chain sprocket driving up to the clutches of the boring machine proper. The entire operation is controlled by two levers placed at the rear of the truck and just to the left of the boring head in such a position as to permit the operator to clearly see every phase of the hole-boring cycle. One

Enclosed Gear Boring Machine Mounted on FWD Model HT-7 Truck

lever is connected to each clutch, the one controlling the drive and the other the feed. The boring heads are universal in movement, adjustable to 45 degrees in any direction by means of a worm sector on each head and which latter also provide the means of rigidly locking the heads in any desired position. This universal movement means that the auger rack can quickly be brought into a perpendicular digging position, regardless of the inequality of the ground. Levels are provided on each boring head to guide the operator in his leveling operation.

The earth auger with its standard 13-foot rack will dig a 6-foot hole anywhere and on strictly level ground a 7-foot hole. Extra length auger racks are supplied to specifications, permitting of its usage on deeper holes where desired. One 20 and one 24-inch auger are supplied as standard equipment with the 13-foot rack, but 12, 16 and 30-inch augers are also available. For anchor holes a special 3-flight auger of 9-inch diameter can be had.

The boring machine is readily detachable from the truck body, leaving the body clear of every obstruction. It is necessary to loosen only four U-bolts and uncouple chain and control links, then the entire unit can be lifted clear of the body by means of the Graybar winch and derrick which are also a vital part of the entire equipment. The boring machine can be as readily and quickly replaced in the truck body.

Sixty to eighty holes dug and poles set is considered a fair 8-hour day's work. However, 100 holes dug and poles set is not uncommon. When the digging is done under adverse conditions 30 to 50 holes dug and poles set may be considered a good day's work.

Special line construction bodies have been designed for both the HT-7 and BT5 and are included as optional equipment. These bodies are constructed of steel with a heavy steel reinforced oak floor. Racks and compartments are provided on both sides for derricks, pike poles, cant-hooks and other tools. A large box and a water cask are also incorporated in the unit. Derrick anchor hinges and a safety hook are provided on the rear of the body. The 12-ounce duck tarpaulin which covers the body is supported by removable hickory bows.

Side view—auger set for boring anchor holes. (Maximum tilt of auger 45 degrees.)  
Tool lockers on each side, one locker extending entirely across body underneath floor.  
Sliding doors on cab.

## Earth Boring Equipment

## Buda-Hubron Earth Drills Mounted on FWD Trucks

The FWD Model HT-7 Line Construction Truck was especially designed to meet the big demand for a small, fast, sturdy truck for work in the utility field. After years of exhaustive tests in the United States and foreign countries under actual operating conditions varying from good to very poor, the HT-7 has become perfected. It is now complete in every respect, ready to meet the requirements of the most exacting operator.

The HT-7 is an exceptionally powerful truck. Its four driving wheels carry it through soft fields, over hills, and in and out of ditches. Through the rough, swampy places—up to the hubs in sticky mud—it plows right through.

The HT-7 has a wide range of speeds; 7 forward and 2 in reverse. (It can be equipped with a 4-speed transmission if preferred.) It is a speedy truck. No time is lost in getting to the job or traveling from one location to the next. It is safe—four-wheel brakes insure safety to the mechanism, to the workmen, and to pedestrians. With all these qualifications, the FWD is economical. It does not develop more power but it puts more of the power developed to use. Even when the truck is required to do the hardest kind of work it is done economically, for economical trucking is the result of FWD performance.

A special line construction body has been designed for this new model and is included as optional equipment. The body, which is 119 inches long, is constructed of steel with a heavy steel reinforced oak floor. Racks and compartments are provided on both sides of the body for derricks, pike poles, canthooks and other tools. A large box and a water cask are also incorporated in the unit. Derrick anchor hinges are provided on the rear of the body as well as a safety hook. The 12-ounce duck tarpaulin which covers the front half of the body is supported by removable hickory bows. (Full length tarpaulin can be furnished if desired.)

The Buda-Hubron Earth Drill as mounted on the FWD HT-7 is used by telegraph and power companies, railroads and contractors for digging holes on cross-country, high-tension lines, along railroads and highways or wherever pole lines are built.

The large drills dig in earth, clay, hardpan, etc., and handle without difficulty the small stones encountered in ordinary drilling. Twisted steel drills can be furnished which will sink a hole 1½ inches in diameter to depths up to 15 feet in solid shale for blasting operation. The speed of drilling, of course, depends upon the character of the ground. In tough, heavy clay a 22-inch diameter hole will be sunk 6 feet in from 2 to 3 minutes. The machine will drill under water and handle gravel readily. On blast hole work, in solid shale, the machine will average from 140 to 180 feet a day.

Buda-Hubron Earth Drill  
Mounted on FWD Model  
HT-7 Truck

The Buda-Hubron Earth Drill is simple to operate and as nearly fool-proof as any machine can be. The machine, mounted on springs, moves upward when the drill strikes an obstruction and comes back into place when the obstruction has been dislodged. The cone friction clutch, connecting the engine to the main drive shaft, is so designed that it will slip when the drill strikes too large a boulder to be handled, thus relieving any undue strains on the machine. The drill proper, held in a specially designed chuck mounted on the drill spindle, is lowered or fed by hand and raised by power.

The large size drill, furnished up to 22 inches in diameter, consists of a single cast steel helix, polished on the top and provided with a special check valve, and equipped with removable manganese and carbon steel cutters, bolted to the helix, which when worn can easily be removed for grinding or replacement.

When the drill is lowered, the earth dug by the cutters is forced up through the check valve and slides on the polished top of the helix. The loosened earth does not turn in the hole with the drill, which is an important factor in economical operation and accounts for the remarkable digging ability of the machine. When about 2 feet of earth has collected on top of the drill, the drive clutch is disengaged and the drill raised to the surface by engaging the lifting clutch. The drive clutch is then engaged and the whirling drill throws the dirt around the outside of the hole. The check valve in the drill prevents the return to the hole of any earth already on top of the helix.

Automobile Pole Derricks

Graybar Polesetting Derricks have been developed by the American Telephone and Telegraph Company as a result of the application of modern methods to the erection and maintenance of telephone, telegraph and electric transmission pole lines. They are standard equipment on a majority of Bell System line construction trucks.

The outstanding feature about Graybar Derricks manufactured by the Four Wheel Drive Auto Company is the FWD inspection which is famous for its exacting requirements. Graybar Derricks are made to conform to the specifications of the American Telephone and Telegraph Company. The tubing is of the well-known Shelby manufacture. It has a tensile strength of from 115,000 to 120,000 pounds. The flattened ends of the tubes are strongly reinforced. The cable sheaves are fitted with self-lubricated bronze bushings. When the parts have been built and thoroughly inspected they are painted with a rust-preventing priming coat and then finished with red enamel.

Middle type derricks which are used for general derrick work, center over the middle of the rear of the trucks. Only two men are required to operate this type of derrick; one man operates the winch and the other guides the pole. As many as 10 men are required to do the same work by hand with pike poles; through the use of the derricks, pole setting is done in much shorter time at a reduced cost and yet with less danger to the workmen than hand methods. The middle type derrick is raised and adjusted with the winch. When used as a stiff leg assembly an old pole may be removed from the ground without preliminary digging unless it is firmly embedded or has an abnormal flare. When not in use, the derrick may be disassembled and carried on the side of the truck body, where it is out of the way.

The corner type derrick which works at the right rear corner of the truck body facilitates derrick work in alleys and other restricted places where it is not possible to use the middle type to good advantage. Operating characteristics are practically the same as the middle type.

A complete derrick assembly includes:

- Derrick Proper
  - 1 Right-Hand Side Leg
  - 1 Left-Hand Side Leg
  - 1 Middle Leg, Upper Section
  - 1 Middle Leg, Middle Section
  - 1 Middle Leg, Lower Section
  - 1 Apex, Pin Key, Snap and Chain
  - 1 Floor Pocket Bolt
  - 2 Connecting Pins, Key, Snap and Chain
  - 1 Foot Plate
  - 1 Rear Spindle and Sheave (Length to Suit Truck Body)
  - 1 Tail Bolt Assembly
  - 2 Front Supports for Spindle
  - 1 Floor Pocket
  - 1 Winch Line Hook for End of Winch Line
- } Designated as Metal Parts  
for Attaching to Truck  
Body

LM (Light Middle) and HM (Heavy Middle) Types

The LM Derrick, which has a lift of 20 feet, should handle poles up to approximately 45 feet in length and the HM, which has a lift of 22½ feet, should handle poles up to approximately 55 feet in length. The length in each case depends on the balance point of each pole.

The LM Derrick weighs 385 pounds and the HM 570 pounds, not including the weight of boxing nor body parts such as tail bolt assembly, spindle and sheave.

Price, Type LM.....each .....  
Price, Type HM.....each .....

LC (Light Corner) and HC (Heavy Corner) Types

The LC, which has a lift of 20 feet, is used for handling poles up to 45 feet in length. The HC type, which has a lift of 22½ feet, is used for handling poles up to 55 feet in length. The length in each case depends on the balance point of the pole to be lifted.

The LC Derrick weighs 380 pounds, and the HC 570 pounds, not including the weight of boxing nor body parts such as tail bolt assembly, spindle and sheave.

Price, Type LC.....each .....  
Price, Type HC.....each .....

The 2870 Derrick

The 2870 Derrick, which is an enlarged middle type, has a lift of 28 feet. It should handle average weight poles up to approximately 70 feet long depending on the balance point of the pole. This is a heavy duty derrick intended for service heavier than that supplied by the standard A.T.&T. heavy type derricks. The same thoroughness of construction that characterizes the A. T. & T. corner type and middle type derricks is also typical of the 2870. Every part is thoroughly inspected. Nothing is used that is not up to specifications.

The derrick is designed to be light so as to be easily handled by the construction crew, yet strong enough to carry the poles safely. It weighs 750 pounds exclusive of boxing and the body parts such as tail bolt assembly, spindle and sheave.

Price, 2870 Derrick.....each .....

Adjustable Type

The standard types are provided with a foot piece for lower end of middle leg, which fixes the position of the derrick head and overhang at rear of truck.

Many times a bank on which a pole is placed or to be placed, or a hedge or deep gutter has prevented the truck being so placed as to be of service.

The Adjustable Type Derrick can be changed from one extreme position to the other without the telescoping center leg becoming disengaged. All positions are fixed by the use of pins.

Price, Adjustable Type.....each .....

## Automobile Pole Derricks

LM, HM and 2870 Types

### Adjustable Type

**Winches and Trailers**

In addition to the material shown in this catalogue, for Public Utility Work, we can furnish various types of Winches and Trailers.

Complete information, specifications and prices will be furnished upon application.

**Galvanized Bridle Rings**

Style	Eye	Size, Inches Opening	Shank	Price per 1000
A	1 5/8	1/4	1 1/4	\$70.00
C	1 1/4	1/4	1 1/2	60.00
E	5/8	1/4	7/8	26.00
F	3	1/4	1 3/4	270.00

Prices on enamel furnished upon application.

**Marline and Lacing Twine**  
**Marline**

Furnished in 2 or 3-ply and in 1 and 5-pound balls.  
Price, Marline . . . . . per pound \$ .65

**Waxed Lacing Twine**

Made of pure flax and saturated in beeswax.  
Price, in One-pound Balls . . per lb. \$6.00

**Improved Paper Sleeves**

Made of best grade of manilla paper, carefully selected and put up in cartons of 1000 each, sealed ready for shipment.

Style	Dimen. In.	Price per 1000	Style	Dimen. In.	Price per 1000
2 1/2 A	1/8 x 2 3/4	\$3.00	18 A	1/8 x 18	\$6.00

**National Double Tube Connectors**

These sleeves are manufactured accurately to size from the best grade of pure copper. Each detail of operation has been carefully planned, and a rigid factory inspection weeds out any possible defective material.

When twisted, National Sleeves are drawn so tightly around the conductors as to form practically a welded joint.

Thus the danger of corrosion, due to air and moisture, is entirely eliminated; and instead of building up a high resistance, as is true of the average hand splice, a joint of this type has a ratio of conductivity with the conductor of better than two to one.

263	16	.051	1 1/2	3

Prices upon application.

## Minerallac Hangers

For Cable and Conduit

Hanger without Porcelain Bushing

These hangers are made of the best quality of spring steel and are finished in either japan or galvanized, making them rust-proof. They are intended especially for open wiring, and for running cable and conduit in exposed positions where appearance is an important factor.

By their use an installation may be made much more neatly, and may be more compactly arranged, than with any other form of hanger, since it is possible

to install the cables or conduit with only 1/8-inch clearance. Thus, in installations which present unusual difficulties, due to the surface being wired over or to restricted space, the Minerallac Hanger will easily solve the problem. Another important advantage is the greatly reduced time of installation, since the hanger is properly held in place by means of only one screw or bolt.

Cat. No.	DIAM. OF OPENING INCHES		Size Cond. Inches	Std. Pkg.	Approx. Std. Pkg.	PRICE, PER 100	
	Min.	Max.				Japanned	Galv.

## Minerallac Porcelain Bushings

For voltages below 500 the hanger may be used directly upon the cable or conduit. With higher voltages, it is necessary to insulate them properly from grounds.

The porcelain bushing is designed to furnish the proper insulation for covered cables of any voltage and to resist mechanical shock.

Each size of hanger is fitted with a bushing as shown in the table below, the corresponding numbers of each being used together.

Hanger with Porcelain Bushing

Cat. No.	DIAMETER, INCHES OF OPENING		Size of 250-volt Rubber Covered Cable	Approx. Wt., Lbs. per 100	Price per 100

16	200	45	25.00

No. 6 regalvanized hooks furnished on this grade at a net advance of \$1.50 per 1000.

**Bonita Aerial Cable Rings**

Attach on the strand by hand easily and quickly. May be used either for new work or re-clipping on old cables. May be reused. The ring size is determined by the diameter of the circular opening of the rings when on the strand. May be obtained for any diameter of messenger wire. Specify strand size in each instance. Allow at least ¼-inch greater diameter of ring than outside diameter of cable to be installed.

**No. 1515-1 Klein's Cable Sheath Splitting Knives**

Extra heavy. Knife edge is tempered and ground to a keen edge. Handle is made of leather. Weight per dozen, 12 pounds.

Price, No. 1515-1.....each \$2.75

**Diamond Screw Duct Rods**

Couplings are made of government bronze. The hickory shafts are well seasoned.

Threads are accurately cut to ¼-inch U.S.S., 10 threads per inch. Rivets are countersunk. Hickory shafts are ½ inch in diameter.  
 Price, 3-Foot Length.....each \$1.65  
 Price, 4-Foot Length.....each 1.80

**Goodyear Glove Brand Electric Linemen's Gloves**

Designed specifically to protect linemen's hands from contact with live wires.

To make these gloves seamless and reversible, porcelain forms are dipped repeatedly into a high grade maroon rubber solution. Between dips the gloves are allowed to dry for several hours in an atmosphere where the cleanliness of the air, its temperature and humidity, are closely watched. The windows of the dipping room are closely screened and the air entering the room is washed and admitted through a special ventilation system to keep foreign matter from entering the rubber.

Goodyear Gloves are vulcanized in live steam to assure the required tensile strength, pliability and electrical resistance. Steam curing also adds to the aging quality of the rubber.

Made in 2 types:

**No. 106—Class A**

For use without protectors. These gloves are given a voltage test of 10000 volts for 3 minutes and 16000 volts for 1 minute, with a maximum leakage of 18 milliamperes.

Made in sizes 10 and 11.

**No. 108—Class B**

For use with protectors. These gloves are given 10000 volts for 3 minutes and 14000 volts for 1 minute, with a maximum leakage current of 14 milliamperes.

Made in sizes 10 and 11.

Prices upon application.

**No. 8863 Olympic Linemen's Leather Protector Gloves**

Made of the best grain horse-hide; soft, pliable, durable and comfortable.

All seams are double and lockstitched. Finger seams on the back of glove and nothing to wear away between the fingers.

Thumb is reinforced with leather strap, and gun-cut on palm also protected and reinforced.

No. 8863 is the short style as shown in illustration.

No. 8863B is finished with 2¼-inch band top or short gauntlet.

No. 8863G is finished with 4 or 5 inch gauntlet.  
 Price.....per dozen pairs \$21.00

**Bull Dog Corrugated Rubber Switchboard Matting**

Made with broad flat top corrugations, offering a wearing surface practically indestructible and especially easy to clean. Is invaluable for switchboard use because of high insulation qualities. Provides sure footing, wears long, and always looks well.

Thickness Inches	Bull Dog			Service

## Marshall's Linemen's Shields

Linemen's shield submerged test as follows: Shield placed in water, inside of shield filled with water to within 1½ inches of edge of shield. 1 minute at 20000 volts, ½ minute at 25000 volts and 10 seconds at 30000 volts.

Do not try to repair or patch these shields. If for any reason whatsoever the shields become defective or unserviceable inside of five years from date of shipment, return shield with full details, and an allowance will be made towards the purchase of a new one.

Price ..... each \$35.00  
 " Hard Rubber Rings for Linemen's Shields " .50  
 " Straps for Linemen's Shields " .75

## Marshall's Linemen's Cross Arm Shields

Tested to 20000 Volts

Cross arm protectors dry test. Metal on inside and metal on outside. 1 minute at 10000 volts, ½ minute at 15000 volts, and 10 seconds at 20000 volts.

In ordering cross arm shields, be careful in stating length between pins from center to center and width of cross arm on tip as they have to be made to fit. Made in lengths up to 17 inches from center to center of pins.

Price ..... each \$10.00

## Marshall's Linemen's Shoes

Test: Place the shoe in 2 inches of water, fill the shoe with water to depth of 1¼ inches at center of shoe. 2 minutes at 5000 volts, 1 minute at 10000 volts and 10 seconds at 20000 volts.

A perfectly insulated rubber shoe which gives linemen on the poles, on the ground and in the manholes absolute protection against pressures up to 20000 volts. It is vulcanized into a solid piece and will not peel nor come apart; nor can it be affected by oil, gasoline or grease. No metal used in any part of its construction.

Each pair of shoes includes 1 pair of specially made stockings. Shoes carried in sizes 7, 8, 9, 10 and 11. Unless special size is specified No. 9 will be sent.

Price ..... per pair \$12.00  
 " Linemen's Stockings " 1.25

## No. 325 Simplex Pole Jacks

A combination pushing and pulling jack. Light and sturdy. Furnished with pike pole, steel chains, detachable base and steel lever pole.

 Price, No. 145..... each \$16.00

## No. 310 Simplex Emergency Single Acting Jacks

A single acting, 15-ton jack of extraordinary utility and efficiency. Its pivoting base enables jack to be operated at full capacity, at any angle from horizontal to vertical, as well as vertically.

An all-around jack for use anywhere and everywhere heavy objects are to be pushed or lifted.

The steel detachable shoe and 5-foot special chain attachment permit grappling and engaging loads in awkward or difficult positions, and where the ordinary lifting jack could not operate at all. Heavy calks on base prevent slipping.

Provided with four lifting and pushing points—rotating cap, lower lift, steel adjustable shoe and steel chain, enabling jack to meet every emergency condition.

Capacity ..... tons 15

**Simplex Portable Cable Reel Jacks**

No. 41

No. 81

Jack held on oak base by taper wedged brackets—can be quickly removed and packed in tool box. Made single acting, raising the load on the downward stroke only, and double acting, raising the load on both the downward and upward strokes.

Designed to lift small, but heavy cable reels from 24 inches to 48 inches diameter, and can readily be used for any work, where 1 to 2-ton loads are to be handled.

**Simplex Cable Reel Jacks**

Nos. 320 and 321 are recommended for warehouse purposes.

They will accommodate any height of wire or cable reel.

No. 322 is especially designed for cable reels from 36 to 84 inches in diameter. It is furnished in pairs, one right and one left, so that men operating jacks are working on the same side of the reel and are raising the reel uniformly. The bracing between jack and the oak base has right and left-hand threads so that the jack and base can always be kept taut and in perfect alignment. No. 322 is automatic double acting and

No. 320

recommended for construction work. From start to finish of a cable pulling job, the multiplied manpower of quick-acting Simplex Cable Reel Jacks saves time and money at every step. By fractions of an inch Simplex Jacks level up so the reel pulls evenly.

Blocking is unnecessary with these jacks. The reel once placed, stays put.

**No. 324 Simplex Aerial Cable Jack and Slack Puller**

Designed for pulling both overhead and underground power and telephone cables. Also for taking up slack in guy wires.

Made from the best grade of steels and all parts are heat-treated and hardened. Single acting and automatic operation.

No..... 324  
Capacity.....pounds 4000  
Travel.....inches 20  
Weight, Complete with Handle.....pounds 14  
Price.....each \$30.00

**Simplex Pipe Pushing Jacks**

Designed for pushing pipe through the most unfavorable soil conditions without crushing or distorting it. Can be operated by 2 or 4 men, depending upon soil conditions. When solid cribbing or blocking is difficult to obtain, it is then possible to hold the jack against the back pressure with one lever, while the other lever is being operated.

The duplex levers or sockets can be operated singly, alternately or together, depending on size of pipe, soil conditions and cribbing.

Each size of pipe requires a set of tapered jaws, as perfect gripping is necessary to avoid crushing the pipe.

Furnished complete with one set of tapered jaws, two 1¼x36-inch steel lever bars and two 2-inch steel pipes for extending lever bars (5 feet long for No. 332 and 7 feet long for No. 334). Specify size tapered jaws required.

No.	Handles Pipe Diameter, inches	Weight Pounds	Price Each	Extra Jaws per Set

Price.....each	\$ .75	1.00	1.25	1.75	2.50	3.00

**Matthews Adjustable Reels For Both Pay Out and Take Up**

Wire in coils is hard to handle unless some sort of reel is used. This reel makes the handling of wire on coils easy and wire can be handled on it easier than on wooden reels.

The five arms can be quickly and easily contracted or expanded to fit the inside diameter of any coil of wire within its range. The revolving table is made of sheet steel reinforced by a turned over edge which prevents it from being bent out of shape. This edge also prevents the wire from being caught under the table or cutting itself on the sharp edge.

Supplied with or without a brake. The brake is recommended as it prevents racing when paying out wire.

An exclusive feature in the form of four roller bearings is provided. These roller bearings prevent the reel from catching on the frame or bending due to unequal pressure on the sides of the table. They can be operated either in the vertical or horizontal position.

All reels are furnished with brake, unless otherwise specified.

Shipping weight, without brake, 103 pounds; with brake, 105 pounds.

Price, without Brake.....each \$122.00  
Price, with Brake.....each 130.00

**Oshkosh Folding Take-up Reels**

The reel part collapses and automatically throws off the coil at the same time and in an instant is ready for another coil. The frame, made of heavy hardwood, is strong and heavily reinforced throughout and folds up like a hinge.

It can be taken down in a moment merely pulling the pin out of the shaft, throwing off the coil and folding up the frame.

## No. 913-15 Klein Tree Trimmer Saws

No. 913-15

No. 913-12

No.	Style	Weight Pounds	Price Each
913-15	Curved Blade	1 1/2	\$3.00
913-12	Straight Blade	3/8	3.00

## No. 3628 Klein's Tree Trimmers

The entire head of this tool, comprising hook and socket into which handle fits, is sturdily constructed of pressed steel. The knife, made of tempered tool steel, is round in shape and arranged to rotate slightly with each cut, thus providing the entire circumference of the blade for cutting and giving an edge more than 3 times the length of that on the ordinary blade.

The leverage makes this trimmer cut the heavier branches quite easily. Knife may be readily removed for sharpening or renewal. Two threaded holes are provided for attaching saw.

Size over all, 12 1/2 inches. Weight, 3 1/2 pounds. Price, No. 3628, Trimmer ..... each \$8.50

## No. 3628-K Circular Tool Steel Knife For Klein Tree Trimmer

Weight, 3 ounces. Price, No. 3628-K ..... each \$1.50

## No. 913G Klein Saw Grasps

When a hand saw is required the regular tree trimmer saws can be set in this grasp in a few seconds and held securely with a single thumb screw. Efficient for cutting heavy branches. Weight, 1/2 pound.

Price No. 913G ..... each \$ .75

## Nos. 48 and 49 Electricians' Shears

Forged steel. No. 48 has 3 1/2-inch blade and is 14 inches long. No. 49 has 3-inch blade and is 12 3/4 inches long.

Price, No. 48 ..... each \$2.00  
 " " 49 ..... " 1.75

**B & L Public Utility Tackle Blocks for Manila Rope**

Malleable Iron Shells—Loose Side Hooks and Becketts

Made for public utility work for hard service. Malleable iron plates with specially designed partitions, all held together securely by 4 rivets properly placed, are used to make a strong, durable, rigid shell, of light weight with a bead or flare to protect the rope against chafing. Forging steel of special analysis is used for drop forging the hooks, which are then tested to determine both yield point and ultimate strength.

The sheave pins are made from heat treated nickel alloy steel ground to size. Close tolerance is allowed between pin and bushing. Sheaves are of rugged design to resist wear and to withstand maximum crushing strain. Forging steel straps are accurately drilled for pin bearings to insure perfect alignment of sheaves at all times.

Two types of bushings are recommended, viz.: Patent bronze bushings for hand work, and self-lubricating graphite bronze bushings for heavy duty and power hoisting.

Blocks can be furnished with wood shells if so desired. Keeper or safety link hooks can also be furnished with blocks if so desired.

Order by figure number, stating also size of shell or size of Manila rope to be used, and whether regular loose hooks or hooks with safety links are required.

Length Shell Inches	For Rope Diameter Inches	APPROX. WEIGHT, POUNDS

Price, 7-Inch Sheave.....each .....

**7-Inch Shell Drop Link Wood Snatch Roller Bushed Cast Iron Sheave**

For stringing lighter copper conductors.

Price ..... each \$2.75

No. 2349

## B & L Public Utility Snatch Blocks for Manila Rope

Drop Forged Flatted Stiff Swivel Hooks, Heads and Links—Safety-Locking Link

No. 2355, Wood Shell

All of the connections as well as the hook are drop forged from .25 carbon open hearth forging steel. The flatted drop forged hooks are of special design and tests show unusually high strength. The safety locking feature prevents accidental disengaging; the hook must be deliberately canted over full 90° to one side in order to release.

Sheave pins are made from heat treated nickel alloy steel ground to size with correct tolerance between pin and bushing.

## Improved B & L Star Chain Hoists

The principle of the B & L Hoist operation is extremely simple and the points of contact of the scroll on hand wheel and load gear teeth are machined to an accurate fit.

Improved construction methods eliminate the possibility of spreading the load gear teeth being engaged at exact depth by scroll, even after long wear, and with overload.

It is fully equipped with radial and thrust ball bearings. It has only 2 moving parts. It holds its load securely at any point without a brake. All parts are interchangeable, being built and assembled by precision methods. It is light, safe and portable. It is compact with low head room. The drop-forged steel hooks are proof-tested. It is automatically lubricated and operates with perfect smoothness. Chains are the finest obtainable and fit the wheels correctly.

Hoist is tested to twice its rated capacity before shipment. In efficiency of operation the B & L Improved Star Chain Hoist compares favorably with the most expensive geared hoists.

Capacity Hoist Pounds	Power Required to Lift Full Load Pounds	Regular Lift Feet	Weight Pounds Hoist Complete	Price Each

## No. 102-1 Klein's Splicing Clamps

A handy pocket size tool adapted specially for telephone troublemen.

Arranged with 5 round holes for bare wire.

Copper wire Nos. 8, 10, 12, 14, 16, B. & S.

Iron wire Nos. 10, 12, 14, 16, 18, B. W. G.

Hammer forged from high grade crucible tool steel. Oil tempered, polished head, black handles.

Size, 8 inches.

Weight per dozen, 6 pounds.

Price, No. 102-1 .....each \$2.60

## No. 102-3 Klein's Splicing Clamps

Covers a wide range of wire sizes used in telephone and telegraph line work. Large hole can be used in serving guy wire or messenger strand. The dies fit the wire snugly insuring perfect mechanical and electrical joints.

This clamp is arranged with 5 round holes and one oval hole for bare wire.

Copper wire Nos. 2, 4, 6, 8, 10, 12, B. & S.

Iron wire Nos. 4, 6, 8, 10, 12, 14, B. W. G.

Hammer forged from high grade crucible tool steel. Oil tempered, polished head, black handles.

Size, 10 $\frac{3}{4}$  inches.

Weight per dozen, 15 pounds.

Price, No. 102-3 .....each \$3.35

## No. 105-15 Klein's Splicing Clamps

A convenient pocket size clamp particularly adapted for telephone and telegraph repair work.

This clamp is arranged with openings for twisting double tube sleeves.

Copper sleeves Nos. 8, 10, 12, 14, 17, B. & S.

Iron sleeves Nos. 10, 12, 14, 16, 19, B. W. G.

Hammer forged from high grade crucible tool steel. Oil tempered, polished head and black handle.

Size, 8 inches.

Weight per dozen, 5 pounds.

Price, No. 105-15 .....each \$2.75

## No. 105-17 Klein's Splicing Clamps

The unusually wide range of sizes in this clamp makes it particularly valuable for general telephone and telegraph work.

This clamp has 5 sets of chambers for twisting double tube sleeves.

Copper sleeves Nos. 6, 8, 10, 12, 14, 17, B. & S.

Iron sleeves Nos. 8, 10, 12, 14, 16, 19, B. W. G.

Hammer forged from high grade crucible tool steel. Oil tempered, polished head and black handles.

Size, 10 $\frac{3}{4}$  inches.

Weight, per dozen, 15 pounds.

Price, No. 105-17 .....each \$3.35

## No. 132-12 Klein's Combination Wire and Sleeve Clamps

For telephone and telegraph general line and trouble work.

This clamp has four round holes for twisting bare wire.

Copper wire Nos. 6, 8, 10, 12, B. & S.

Iron wire Nos. 8, 10, 12, 14, B. W. G.

The reverse side has four double chambers for twisting sleeves.

Copper sleeves Nos. 8, 10, 12, 14, 17, B. & S.

Iron sleeves Nos. 10, 12, 14, 16, 19, B. W. G.

Hammer forged from high grade crucible tool steel. Oil tempered, polished head and black handle.

Weight per dozen, 10 pounds.

Price, No. 132-12, Size, 9 inches.....each \$3.50

## No. 132-15 Klein's Combination Wire and Sleeve Clamps

The unusual range of wire and sleeve sizes covered by this clamp makes it practically a universal tool for telegraph, telephone and power line work. Has 5 round holes for twisting bare wire and an oval opening for guy wire or messenger strand. Copper wire Nos. 4, 6, 8, 10, 12, B. & S. Iron wire Nos. 6, 8, 10, 12, 14, B. W. G. Strand opening .437x.624.

Reverse side has 5 chambers for twisting double tube sleeves. Copper sleeves Nos. 6, 8, 10, 12, 14, 17, B. & S. Iron sleeves Nos. 8, 10, 12, 14, 16, 19, B. W. G.

Hammer forged from high grade crucible tool steel. Oil tempered, polished head and black handles.

Weight, per dozen, 16 pounds.

Price No. 132-15 .....each \$4.75

## No. 107 Klein's Di-Stock Sleeve Twisters

This tool has ample leverage for use on heavy wires beyond the capacity of

standard splicing clamps or connectors. The illustration above shows the Di-Stock fitted for making double tube joints.

Forged from high grade crucible steel. Has swing latch provided with thumb nut to fit over reverse jaw to hold both jaws securely in place.

Open to Receive Wire

Special prices on any combination upon application. Specify sizes of sleeve tool is intended for.

Tools are made to order only. Weight, 4 pounds.

Price, No. 107-2, for Sleeves.....each \$13.75

## No. 1802-30 Klein's Self-locking Troublemens' Blocks

Especially for use with Klein's Wire Grips. No. 1802-30 is furnished with 25 feet  $\frac{3}{8}$ -inch Manila rope, 2 $\frac{1}{2}$  pounds. Consists of light steel shell blocks galvanized, fitted with snubbing hook to lock load in any position. To lock load, pull luff rope under hook. To release, simply pull rope. Blocks are arranged with spring guard snap hooks. When pulling up wire to make a splice, it may be used with two grips attached to snaps or with hook to anchor to an insulator-pin or other convenient anchorage.

Cat. No.	Description	Wt. Lbs.	Price per Set
1802-30	Galv., with 25 Ft. $\frac{3}{8}$ -inch Rope.....	2 $\frac{1}{2}$	\$4.00

**No. 1611 Klein's Chicago Grips for Insulated Wire**

Main body piece and lever are forged steel. Drawn parts are wrought steel. Rivets are machine turned.

The upper jaw has a series of transverse shallow grooves into which, on applying strain, the insulation is tightly compressed but not injured.

Cat. No.	Description	Max. Open. In.	Wt. Lbs.	Price Each
1611-20	No. 4 Wire and Smaller.....	1/2	2 5/16	\$3.75
1611-30	No. 00 Wire and Smaller.....	9/16	3 3/4	4.75
1611-40	No. 0000 Wire and Smaller.....	3/4	7 1/4	7.50

**No. 1613 Klein's Chicago Grips for Bare Wire**

Main body piece and lever are forged steel. Draw parts are wrought steel. Gripping jaws are machined smooth. Rivets are machine turned. The harder the pull, the tighter the hold. It pulls straight without leaving kinks in the wire. It is handy to put on and holds itself in place by means of a spring acting on the compressing lever. Arrangement of draw links is so that it does not hang down at right angles and is not in the way of line when grip is put on.

Cat. No.	Description	Max. Open. In.	Wt. Lbs. Each	Price Each
1613-30	For No. 6 Wire and Smaller...	7/32	1 1/2	\$2.00

1613-50	For No. 0000 Wire and Smaller...	1/2	7 1/2	6.75

**No. 1626 Klein's Chicago Grips for Aluminum Cable**

Both gripping jaws are smooth and cannot injure strands of cable. Furnished plain or pulley type. Smaller sizes to order.

Cat. No.	For Cable	Maximum Opening, In.	Weight Pounds	Price Each
1626-39	250000 C.M.	5/8	7 3/4	\$10.00
1626-40	500000 C.M.	1/2	7 3/4	10.00

**No. 1628 Klein's Chicago Grips for Messenger Strand Wire**

These grips can be modified to order to accommodate strand wires of larger diameters.

Cat. No.	Description	Maximum Opening Inches	Weight Pounds	Price Each
1628-6	For 6000-Pound Strand	1 3/8	8 1/2	\$12.45
1628-16	For 16000-Pound Strand	1 1/2	14	24.80

**No. 1625-20 Klein's Improved Haven's Grips**

A heavy grip adapted for handling plain or stranded wire from No. 6 to 3/4 inch in diameter. The particular feature of construction is a swing latch which engages with stud on lower jaw, thus centralizing the pressure on cross bolt which is strongly made of turned machined steel.

Weight per dozen, 69 pounds.

Price, No. 1625-20 ..... each \$7.00

**No. 1604 Klein's Haven's Steel Grips**

For all around work. Forged from crucible steel. The eccentric or dog is hand cut, hardened and tempered. All rivets are steel, machine turned. Handle and eccentric allows instantaneous hold. A shake of rope on tackle disengages or releases grip. Heavy strain makes it grip tighter.

Cat. No.	Size	Weight, Pounds per Dozen	Price Each
1604-10	No. 8 Wire and Finer.....	12	\$2.00
1604-20	1/2-inch " " " .....	30	3.00

**No. 1702-20 Klein's Howes Wire Tools**

The strap is harness leather 1 1/4 inches wide and 7 feet long. At one end a forged steel swivel hook is provided with opening to permit anchoring round insulator pin. The forward end has a locking device to hold the load at any distance and is so arranged that a wire grip can be readily attached.

The metal parts are galvanized.

Weight per set, 2 pounds.

Price, No. 1702-20, Single Purchase.....per set \$6.80

**No. 740 Matthews Strainometers**

For use with No. 730 Matthews Slack Puller.

This dependable device measures the strain to which the wire or guy strand has been pulled by means of graduations on the movable strain bolt. Each graduation denotes 500-pound strain. Maximum strain register is 3000 pounds.

Can be easily attached to either end of slack puller or to block and tackle.

Shipping weight, 15 pounds.

Price, No. 740 ..... each \$24.00

## Matthews Quick Release Slack Pullers

Enables one man to do the work of four when taking the slack out of guy strand, messenger wire or changing strain insulators, or for splicing trolley wire, telephone or power cable under tension; also used for pulling back underground cable. Takes the place of block and tackle. One man can easily pull 3000 pounds with the No. 730, 6000 pounds with the Nos. 731 or 732, and 10000 pounds with the Nos. 7100 or 7110. No slack is lost in dead ending as strain is held to the exact point pulled.

With the new quick release feature, when the entire take-up has been used, the wire is temporarily dead ended and the lock released. This permits the slack puller to be immediately extended to its maximum or any intervening length.

No.	Description	Ship. Wt. Lbs.	Price Each
730	Maximum Take-Up, 19 Inches	17	\$50.00
731	Same as No. 730, Except That Clevis is Substituted for Hook	17	55.00
732	Same as No. 731, Except That it Also Has Quick Take-Up Feature	17	60.00
7100	Maximum Take-Up, 27 Inches	45	100.00
7110	Same as No. 7100, Except That it Also Has Quick Take-Up Feature	45	120.00

The 730 and 731 do not have quick release or quick take up features.

## No. 201 Klein's Diamond Special Side-cutting Pliers

Has handles shaped to the curvature of the hand.

Powerful leverage and keen reinforced cutting knives make this plier adaptable for heavy cutting in telephone, telegraph and power line work. Full clearance back of the knife permits use on insulated wire.

Has polished head and handles temper blued.  
Packed 6 in a box.

**No. 305-6 Klein's Long Flat Nose Pliers**

Has long wide flat nose. Inside of jaws left smooth if desired. Has polished head and handles temper blued.

Weight per dozen, 3½ pounds.  
Price, No. 305-6, Length 6 Inches..... each \$2.20

**No. 206-6 Klein's Long Flat Nose Side Cutting Pliers**

Has long wide flat nose and cutting knives. Smooth jaws if desired. Has polished head

and handles temper blued. Weight per dozen, 3½ pounds.  
Price, No. 206-6, Length 6 Inches..... each \$2.40

**No. 304-6 Klein's Long Duck Bill Pliers**

For general use. Jaws are wider and heavier than those of flat nose pliers.

Has polished head and handles temper blued. Weight per dozen, 3¼ pounds.  
Price, No. 304-6, Length, 6 Inches..... each \$2.20

**No. 205-6 Long Duck Bill Side Cutting Pliers**

General use. Jaws are wider and heavier than those of flat nose plier. Has polished head and handles temper blued.

Weight per dozen, 3 pounds.  
Price, No. 205-6, Length, 6 Inches..... each \$2.40

**No. 301-C Klein's Long Nose Cord Crimping Pliers**

This plier is a long nose type with special opening for crimping switchboard cords to make them fit into the plugs more easily.

Size, 6 inches.  
Price, No. 301-C, Weight per Dozen, 2¾ Pounds... each \$2.40

**No. 316 Klein's Long Nose Pliers**

Particularly adapted for telephone work. Jaws are 2 inches long with ¼-inch point. Handles are 4 inches long, tempered blue. Polished head and jaws.

Size, 6 inches.  
Price, No. 316 Weight per Dozen, 2¾ Pounds.... each \$2.00

**No. 316-S Klein's Long Nose Pliers**

With Sleeve Opening  
Jaws are 2 inches long with ¼-inch point. Has openings for No. 17 B.&S. double

tube copper sleeves. Handles 4 inches long, tempered blue; polished head and jaws.  
Price, No. 316-S, Size 6 Inches..... each \$2.40

**No. 406-6½ Klein's Slip Joint Pliers**

This plier embodies all the advantages offered by a tool of this type. Has a wire cutter and a screwdriver handle. Has polished head and handles temper blued.

Weight per dozen, 7 pounds.  
Price, No. 406-6½, Length, 6½ Inches..... each \$1.00

**No. 302-6 Klein's Long Curved Nose Pliers**

A handy plier for working around switchboards, terminals and telephones, due to the nose being curved. Angle is arranged to give full clearance and prevent skinning of knuckles. Adaptable to a variety of uses. Jaws will not lose their shape or set due to pressure applied, owing to quality of steel used, its hardening and tempering.

Weight per dozen, 2¾ pounds.  
Has polished head and handles temper blued.  
Price, No. 302-6, 6-inch..... each \$2.40

**No. 408-8 Klein's Bent Nose Slip Joint Pliers**

For use in difficult places. An excellent general purpose tool. Has polished head and handles temper blued.

Weight per dozen, 8 pounds.  
Price, No. 408-8, 8-inch..... each \$1.50

**No. 235-6 Klein's Diagonal Cutting Pliers**

This plier has many uses. It has long cutting knives well matched and the head is narrow to permit its use in confined places.

Has polished head and handles temper blued.  
Weight per dozen, 4½ pounds.  
Price, No. 235-6, 6 Inches..... each \$3.00

**No. 242-6 Klein's Oblique Cutting Pliers Heavy Pattern**

Heavy pattern for general work. The knives are perfectly fitted, so that they meet accurately at all points.

Will be found particularly satisfactory where it is not necessary to reach into confined spaces. Has polished head and handles temper blued.

Cat. No.	Size Inches	Weight, Pounds per Dozen	Price Each
242-6	6	4¼	\$2.50

### No. 407-7 Klein's Utility Slip Joint Pliers

Heavy duty type. Adaptable as pipe wrench or wire cutter. Has sure grip jaws for irregular shapes.

Polished head and handles temper blued.

Weight per dozen, 7 1/2 pounds.

Price, No. 407-7, Length, 7 Inches ..... each \$1.25

### Klein's Linemen's Pole Climbers

Also Called Spurs or Hooks

Safety is the first and vital point in considering linemen's pole climbers. The lineman going up a pole depends entirely upon his spurs.

To assure utmost dependability Klein Climbers are forged from special steels and are individually tempered. Shanks and gaffs are tested to insure perfect riveting and temper.

Leg iron or shank is made of spring steel, gaff or spur is forged from tool steel.

The shape of Klein Climbers has been carefully considered. It is the result of many years' experience and much practical suggestion from linemen. Klein Climbers have flexible shanks and yield readily to pressure of leg; they do not chafe. Gaff or spur is correct in shape, set of angle and temper. It is hand riveted to leg iron in secure manner.

### Klein's Eastern Climbers

When ordering specify length of shank desired. Measure from instep to extreme end. Other than stock sizes to order. Tested before leaving factory.

#### No. 1901

Stock sizes, 15, 15 1/2, 16, 16 1/2, 17, 17 1/2 and 18 inches.

Has punched strap loops. Packed 1 pair in a carton.

Price, No. 1901, Wt. 3 5/8 Lbs. .... per pair \$4.10

#### No. 1900

Same and same sizes as No. 1901 but has riveted strap loops. Packed 1 pair in a carton.

Price, No. 1900, Wt. 3 5/8 Lbs. .... per pair \$4.45

#### No. 1903

Light weight pattern with riveted strap loops. Packed 1 pair in a carton.

Price, No. 1903, Wt. 2 7/8 Lbs. .... per pair \$4.45

#### No. 1907

This is the standard tree climber used by forest rangers, top loggers, fire wardens, surveyors, etc. Made in all standard sizes.

Has punched strap loop. Gaffs, or spurs, are 5 1/2 inches long measured on the outside and 3 inches long measured on the underside. They are set high in the leg iron so that points clear the ground.

Packed 1 pair in a carton.

Price, No. 1907 ..... per pair \$5.00

### Nos. 8200-8202 Klein's Soft Pads for Eastern Climbers

Made of select plain leather, and lined with sheepskin or felt, with loops through which to slip climber straps. Size, 4x4 inches. Weight per dozen sets, 3 pounds.

Price, No. 8200 Sheep-Lined ..... per pair \$8.85

Price, No. 8201 Felt-Lined ..... per pair .85

Price, No. 8202 Plain Leather ..... per pair .65

### No. 5301 Klein's Straps for Eastern Climbers

Set consists of 2 upper straps with 4x4 plain leather pads and 2 lower straps.

Made of select high grade harness leather, heavy drop-forged roller buckles, lock stitching with hot waxed harness thread.

Straps are 22 inches long, 1 1/4 inches wide.

Cat. No.	per Doz. Sets	Description	Price
5301-1	15	With Plain Pads.....	per set \$3.45
5301-2	16	With Sheep Lined Pads.....	per set 3.70
5301-3	16	With Felt Lined Pads.....	per set 3.70
5301-4	6	Straps without Pads.....	per pair 1.45
5301-5	9	Straps with Plain Pads.....	per pair 2.05

### No. 5111 Klein's Hip Pocket Tool Cases

This case is suitable for carrying pliers or other tools in hip pocket.

Prevents cutting of clothes, or possible injury to the person.

Made of black leather.

Weight per dozen, 2 1/2 pounds.

Price, No. 5111, Size, 5x7 Inches .... each \$1.00

### No. 5116 Klein's Detachable Plier Holsters

Made of heavy harness leather with loop to slip over belt.

Carries 7, 8 or 9-inch side cutting pliers.

Mouth of pocket is framed to hold open position permanently.

Length, 10 inches.

Weight per dozen, 6 pounds.

Price, No. 5116 ..... each \$1.50

### Genuine Klein's Tool Belts

Made of select first quality harness leather. Cushion carries D rings. Outer or loop layer is 1 1/2 inches wide formed into tool loops by riveting to cushion. It also passes through D rings and is furnished with a strong drop forged buckle.

D rings are solid steel drop forgings of improved design tested to 1500 pounds. Surfaces taking wear of D rings are protected with copper safety liners riveted through full thickness of belt. All rivets are solid copper set with burrs and sewing is with hot waxed harness thread, lock stitched. D rings and buckle galvanized finish. A belt capable of giving long service.

No. 5202 has 2 1/4-inch cushion. No. 5204 with cushion 3 1/2 inches wide is more comfortable to recline in when using safety strap.

Made in lengths 36, 38, 40, 42, 44, 46 and 48 inches. Specify length required measuring from end of buckle to middle hole at other end of belt.

Cat. No.	Size Inches	Weight Pounds per Dozen	Price Each
5202	2 1/4	30	\$4.75
5204	3 1/2	32	5.10

**No. 5204-D.E. Genuine Klein's Tool Belts**

Particularly suited to the requirements of men working on transmission and distribution lines. Belt is made of first quality harness leather 3½ inches wide and is equipped with leather plier pocket, tape thong and snap for carrying knife. The D rings and buckle are drop forgings tested to 1500 pounds galvanized finish. All rivets solid

copper hand set. Sewing is with hot waxed linen thread lock stitched.

Made in 36, 38, 40, 42, 46 and 48-inch sizes, measured from end of buckle to middle hole at other end of belt.

Width, 3½ inches. Weight per dozen, 35 pounds.  
Price, No. 5204-D.E. .... each \$6.50

**No. 5206-1A Genuine Klein's Belts and Safety Straps Combined**

The tool belt in this outfit is 2¼ inches wide. Strap, 1¾ inches. All snaps, D rings and buckles are solid steel drop forgings tested to 1500 pounds and are galvanized finish. The strap may be adjusted to length by means of buckle or it may be detached entirely from the belt.

Genuine harness leather throughout. Hot waxed harness thread lock stitched.

Belt made 36, 38, 40, 42, 44, 46 and 48 inches long.  
Weight, per dozen, 60 pounds.

Price, No. 5206-1A, with Strap, 1¾ In. x 6 Ft. . each \$9.60

**No. 5211 Genuine Klein's Tool Belts N.E.L.A. Type**

This tool belt is made of select first quality harness leather. The inner or cushion layer, 3 inches wide, is narrowed at ends to carry D rings. Body strap, 2 inches wide, is riveted and stitched to cushion and also passes through D rings. Two tool straps are provided and formed into 2 tool loops at each side.

D rings and buckle are solid steel drop forgings tested to 1500 pounds; galvanized.

Surfaces taking wear of D rings are protected by copper safety liners riveted through full thickness of belt.

Rivets are solid copper, hand set with burrs.

Sewing is with linen thread, hot waxed and lock stitched.

Tool belt is made in 36, 38, 40, 42, 44, 46 and 48-inch lengths.

When ordering tool belts specify length required, measuring from end of buckle to middle hole at other end.

Packed individually.

Weight per dozen, 36 pounds.

Price, No. 5211 ..... each \$6.25

**No. 5205 Genuine Klein's Tool Belts**

Made of select first quality harness leather. The inner or cushion layer, 2¼ inches wide, carries the D rings and is lock stitched and riveted to the outer layer and is furnished with a strong drop forged buckle.

The D rings are solid steel drop forgings tested to 1500 lbs. and are of improved design. Surfaces which take the wear of the D rings are protected with copper safety liners riveted to the belt. D rings and buckle are galvanized finish. Solid copper rivets set with burrs; sewed with hot waxed thread, lock stitched. The loop strap is 1¼ inches wide, formed into 6 loops.

Made in lengths 36, 38, 40, 42, 44, 46 and 48 inches; figured from end of buckle to middle hole at other end of belt.

Weight, per dozen, 32 pounds.  
Price, No. 5205, Width, 2¼ Inches. .... each \$5.60

**No. 5210 Genuine Klein's Tool Belts**

**Bell System Type**

First quality harness leather. Cushion, 3 inches wide, is in one piece to which D rings are secured. Belt straps are in 2 pieces sewed and riveted to cushion at ends. Two plier

keepers are provided; also a tape holder of rawhide. D rings and buckle are solid steel drop forgings tested to 1500 pounds. Galvanized. Rivets are solid copper, hand set with burrs. Sewing is with linen thread, hot waxed and lock stitched. Made in lengths 34, 36, 38, 40, 42, 44, 46, 48 and 50 inches. Specify length required, measuring from end of buckle to middle hole at other end.

Weight per dozen, 38 pounds. Packed individually.

Price, No. 5210 ..... each \$6.70

**No. 5250 Genuine Klein's Safety Straps**

Standard type. Genuine harness leather of first quality. Sewed with hot waxed harness thread, lockstitched. Rivets are solid copper, set with burrs. Snaps have a solid strap loop with roller and buckle, solid drop forgings tested to 1500 pounds. Strap may be lengthened or shortened. Reinforced at ends with copper safety clasp riveted through double thickness of leather. Snaps and buckle galvanized finish.

Weight per dozen, 30 pounds.

Price, No. 5250, 1¾ Inches x 6 Feet. .... each \$4.85

**No. 5253 Genuine Klein's Safety Straps**

This strap is a heavy duty type. Genuine harness leather, first quality. Securely sewed with hot waxed harness thread, lock stitched. Solid copper rivets and burrs. The snaps and buckle are extra heavy steel drop forgings tested to 1500 pounds. The strap may be lengthened or shortened by adjusting buckle. Reinforced at both ends with safety clips of sheet copper riveted. Snaps and buckle are galvanized.

Extra heavy drop-forged roller snaps and buckle. Weight, per dozen, 39 pounds.

Price, No. 5253, 2 Inches x 6 Feet. .... each \$6.20

## No. 5257 Genuine Klein's Safety Straps

### Bell System Type

Has a double tongue buckle. First quality and selection harness leather. Securely sewed with linen thread, hot waxed, lock stitched. Solid copper rivets and burrs set by hand. Snaps and buckle are solid steel drop forgings, tested to 1500 pounds. Galvanized. Adjustable length. One end reinforced with copper safety clip. Weight per dozen, 40 pounds. Packed individually.

Price, No. 5257-S, 2x61½ Inches ..... each \$6.50  
 " " 5257-L, 2x70 " ..... " 6.85

## No. 5258 Genuine Klein's Safety Straps

### N. E. L. A. Type

Heavy duty. First quality and selection harness leather. Sewing is with linen thread, hot waxed, lock stitched. Solid copper rivets with burrs hand set. Snaps and buckle are solid steel drop forgings tested to 1500 pounds. Galvanized. Adjustable length. Reinforced at buckle end with safety copper clip. Weight per dozen, 39 pounds.

Packed individually.

Price, No. 5258 ..... each \$6.70

## No. 5251 Genuine Klein's Safety Straps

Particularly suited to the requirements of work on transmission and distribution lines. Genuine harness leather of first quality. The wear under the buckle is taken by a stout leather pad while the return end at the fixed snap is secured by stitching and riveting. By this means the copper safety clips are eliminated and consequently the strap is unique as having a minimum of metal furnishings.

Strap may be lengthened or shortened. Snaps and buckle galvanized finish.

Width, 1¾ inches.  
 Weight, per dozen, 39 pounds.

Price, No. 5251 ..... each \$4.85

## No. 5215 Klein's Extension Straps

This strap is 1¾ inches wide, made of first quality harness leather and fitted with special forged D ring and buckle. It is worn attached to D ring on main body belt and used when large diameter poles necessitate a longer safety strap than the regular. By engaging snap of the regulation safety strap to the special D ring on the extension strap the lineman can immediately adapt his outfit so that he has no difficulty in working conveniently. No matter how large the pole—can be lengthened or shortened.

Size, 1¾x15 inches.

Weight per dozen, 14 pounds.

Price, No. 5215 ..... each \$2.00

## No. 5209 Klein's Safety Harnesses

Back

Front

Meets requirements of various safety commissions for use where danger from gassing is present. Working in gassy manholes, gas tanks, oil tanks and even boilers, men are frequently overcome and an emergency arises instantly. This harness provides a sure means by which patient can be brought to safety and danger overcome. Design is such that it slings wearer in a perpendicular position so that he can be readily hauled through an ordinary manhole opening. A solid harness leather back plate 2¼x10 inches is stitched and riveted around the 1¼-inch adjustable belt strap. Back plate also carries a tested drop forged D ring to which the ¾-inch manila life line, 25 feet in length is permanently attached. Shoulder straps are ¾ inch and made adjustable and riveted to belt at single ends. These straps hold belt in position around chest so as not to encumber wearer while working. Weight per dozen, 30 pounds.

Price, No. 5209, with Life Line ..... each \$6.70

## Nos. 5107 and 5112 Leather Plier Pockets

Made of good quality leather. Has slits through which belt is inserted. No. 5112 is the same as No. 5107 except that plier does not protrude.

Price, No. 5107, Weight per Dozen, 2½ Pounds. .each \$1.65  
 " " 5112 " " 2½ " " " .70

## No. 5108 Klein's Inspectors' Harness Leather Tool Bags

This bag is made of harness leather and will stand rough usage. It has a shoulder strap combined with a pad and hand strap; also a saw and bit holder. The bottom is three ply and is studded with steel studs. Retaining straps pass clear around the bag.

Seams are sewed with hot waxed linen thread, lockstitched.

Cat. No.	Size In.	Wt. Lbs.	Price Each
5108-18	18x8	4½	\$8.50
5108-20	20x8	5½	8.75

## No. 5102 Klein's Linemen's Canvas Tool Bags

Made of one piece white duck reinforced all around bottom, 3¼ inches up, with heavy bag leather. Bottom is made of heavy leather outside, duck inside. Lock stitched all around. Bottom and sides are joined together with lock-stitched leather welt seams. Has harness leather handles and two retaining straps with buckles.

Cat. No.	Size In.	Wt. Lbs.	Price Each
5102-18	18	3½	\$5.25
5102-20	20	3¾	5.75

**No. 1305-2 Klein's Inspectors' Tool Kits**

Solid black leather folding case strongly stitched, reinforced back. Fitted with one each of the following tools: No. 201-6 side-cutting plier; No. 301-5 long nose plier; No. 1550-2 Xela electricians' knife; 1 pair electricians' tweezers; 1 special file; 1 special screwdriver.

A handy assortment to fit the pocket. Weight, 1½ pounds.

Price, No. 1305-2 ..... each \$7.50

**No. 333 Graybar Lineman's Braces**

This brace is specially constructed of heavy design to stand up to severe requirements of line construction work. Has a 10-inch sweep. Weight per dozen, 41 pounds.

Price, No. 333 ..... each \$4.50

**Millers Falls Ratchet Bit Braces**

Holds bit shanks only. Barber chuck with forged steel alligator jaws. Boxed ratchet. Ball-bearing head, with steel quill. Handle has inserted metal rings. Cocobolo

head and handle. Exposed metal parts are nickel-plated and buffed. This brace will fulfill every boring requirement where bit shanks only are used. Packed 1/6 dozen in a box.

## No. 5 Millers Falls Hand Drills

Capacity, 0 to 1/4-inch round shank drills. Three-jaw chuck, improved protected springs; single speed; ball thrust bearing; cut gears; double steel pinion, including idler to equalize the bearings.

Detachable side handle, cocobolo hollow-end main handle containing eight wood boring points. Black enameled malleable iron frame; red enameled large gear; other parts nickeled.

The wide rim on the large gear can be firmly held between the thumb and finger tips in doing delicate work.

Length, 12 1/2 inches.

Packed one in box. Weight, 1 3/4 pounds.

Price, No. 5, with Drill Points.....each \$3.70

## No. 12 Millers Falls Breast Drills

Capacity 1/8 to 1/2-inch round bit and No. 1 Morse taper shanks. Two-jaw Master chuck; protected springs;

two speeds—gear ratios even and 3 to 1; speed changed by pressing the spring and shifting large gear. Annular ball bearing spindle and ball thrust bearing with take up nut to provide for wear; cut gears; steel pinion; idler roll to equalize bearing. Stained hardwood handles; crank handle extensible, 4 to 6-inch radius. Black enameled malleable iron frame and adjustable breastplate; level attached. Red enameled large gear. Other parts nickeled. Length 17 1/2 inches. Weight 6 1/2 pounds.

Price, No. 12.....each \$5.75

## No. 85 Millers Falls Radio Hand Drills

Capacity, 0 to 1/4-inch round shank drills.

Built especially for radio fans. This drill is sturdy and

takes all drills used in radio work; handsomely finished. Three-jaw chuck; protected springs. Single speed; ball thrust bearing; cut gears; steel pinion. Solid main handle of stained hardwood. Malleable iron frame enameled black. Large gear enameled red. Other parts are nickeled. Length, 12 1/2 inches. Weight each, 1 3/4 pounds.

Packed one in a box.

Price, No. 85, without Drills.....each \$2.30

## No. 97 Millers Falls Breast Drills

Capacity, 0 to 1/2-inch round shank drills, three-jaw chuck, protected springs. Two speeds—gear ratios even and 2 3/4 to 1; ball thrust bearing; cut gears; steel pinions;

double gear drive; stained hardwood handles; black enameled malleable iron frame, red enameled large gear, other parts nickeled. Breast plate has hand-hold for steadying tool. Large auxiliary breast plate. Adjustable crank handle. Take-up nut to overcome ball bearing wear. Fast and slow speeds separated by bushings. Five ratchet actions—neutral, ordinary and continuous right or left hand. Length, 17 1/2 inches. Packed 1 in a box. Weight, 8 1/4 pounds.

Price, No. 97.....each \$11.65

## No. 315 Millers Falls Hand Drills

Capacity, 0 to 1/4-inch round shank drills. Three-jaw chuck; protected springs; single speed; hardened

thrust collar; steel idler gear to equalize bearings.

Ratchet operated by boss on crank handle; cut gears; steel pinion.

Hollow end main handle, stained hardwood.

Solid steel frame, polished and nickeled; large gear enameled red; other exposed metal parts nickeled.

Length, 11 1/2 inches. Weight, 1 pound 3 ounces.

Packed one in a box.

Price, No. 315, without Points.....each \$3.85

## No. 2100 Millers Falls Breast Drills

Capacity, 0 to 1/2-inch round shank drills. Three-jaw chuck, protected springs. Two speeds, gear ratio even, and 3 to 1. Cut gears, steel pinions.

Stained hardwood handles. Black enameled malleable frame. Red enameled large gear, other metal parts polished.

Slightly rotating the knurled ring changes the speed instantly at any point, and without removing drill from work. Length, 17 1/2 inches.

Price, No. 2100.....each \$5.25

## No. 2 Millers Falls Hand Drills

Capacity, 0 to 3/8-inch round shank drills. Three-jaw chuck; protected springs, single-speed; ball thrust bearing; cut gears; steel pinion; adjustable friction roll to equalize bearings.

Detachable side handle, cocobolo hollow-end main handle containing 8 wood boring points. Black enameled malleable iron frame; red enameled large gear; other parts nickeled. Length, 14 1/2 inches.

Price, No. 2, with Drill Points.....each \$4.50

## No. 63 Ratchet Screwdrivers

Ratchet, operates smoothly, noiselessly

and without friction, and is so constructed that the mechanism cannot get bent, broken or out of order. It is a compact, strong tool, well proportioned and handsomely finished.

Ratchet operates by means of cam in rear of shifter sleeve, self-locking on pawls. Operates either to right or left by turning shifter ring. In vertical position can be used as solid screwdriver.

Ratchet pawls are tool steel. Ratchet springs are spring steel. Ratchet frame is cold rolled steel. Highest quality screwdriver steel blade, hardened and tempered. Hardwood, highly polished handle, well shaped.

Length.....inches 3 4 5

Price, No. 63.....each \$ .80 .90 1.00

**No. 55 Millers Falls Radio Ratchet Screwdrivers**

For light work. Thumb and finger ratchet blade by means of collar while handle rests securely in hand with pressure against screw. Screw is tightened by turning handle. Hardwood handle. Right and left ratchet or solid. Six in a box.

Blade Inches	Over All Inches	Diameter Blade, In	Wt., Oz. per Six	Price Each

**No. 3 Millers Falls Hand Vises**

Solid steel castings, well tempered, in black finish with polished jaws. Jaws opened by a heavy spring and closed with thumb nut and screw bolt. Jaws are checked to insure firm grip. Length, 5 inches. Width of jaws, 1 1/2 inches. Jaws open, 1 1/4 inches. Weight each, 1 1/8 pounds.

Price, No. 3 ..... each \$1.75

**No. 59 Millers Falls Ratchet Screwdrivers**

A rugged type tool. Blade of best quality screwdriver steel, hardened and tempered. Hardwood handle highly polished. Exposed metal parts polished and nickel-plated. Length blade, 1 1/2 inches; over all, 6 1/4 inches. Packed six in a box. Price, No. 59 ..... each \$1.00

**No. 5 Millers Falls Tool Holders**

The tools are made from high-grade steel, carefully tempered and finished

and honed to a fine cutting edge.

These tools are contained in the handle which is hollow with screw cap. The jaws hold with a vise-like grip. Socket and screw threads are carefully cut so as to mesh perfectly and prevent shell from working loose and allowing tools to disengage themselves from the jaws. Cocobolo handles, highly polished. No. 5 has tools without blue finish.

Tools for No. 5

Length of handle, 7 1/2 inches. Length of tools, 4 inches. Weight, 14 ounces. Packed one in a box. Price, No. 5, Contains 10 Tools.....per dozen \$39.60

**No. 81 Millers Falls Automatic Drills**

By turning knurled nut on over end of handle, handle is released and slides down on frame, exposing points. Knurled nut locks magazine securely. Metal partitions in magazine keep each point in place. Size of point is marked against each compartment. Handle is of convenient size to fit the hand comfortably.

Has improved ball chuck, knurled handle and spiral nut of Tobin bronze. Shell cannot be completely unscrewed and lost.

Length, 10 1/2 inches.

Weight, 9 ounces.

Packed one in a box.

Price, No. 81 ..... each \$2.70

**Klein's Lineman's Wrenches**

**Bell System Type**

This wrench is forged from selected bar steel and is of the open end type with 2 openings of different size at each end. A hole is also provided for turning in pole steps, etc.

Weight per dozen, 21 pounds.

Price, No. 3146, for 5/8-Inch Hardware..... each \$2.50  
Price, No. 3146-A, for 3/4-Inch Hardware..... each 2.50

## No. 3109-20 Klein's Combination Steel Lag Screw Wrenches

This wrench is forged from select bar steel. The slot is formed in a cross shape and will fit machine bolts, nuts or lag screws from  $\frac{3}{8}$  inch to  $\frac{5}{8}$  inch. The small end of the wrench is arranged for  $\frac{3}{16}$ -inch machine bolts or lag screws. The round hole allows the end of a bolt to come through as the nut is run on.

The jaw is wider at its upper portion and when this wrench is put on a nut or bolt the tendency is to draw the bolthead or nut into the wrench and prevent slipping off. Weight, per dozen, 20 pounds.

Price, Nos. 3109-20, Length, 13 $\frac{1}{2}$  Inches ..... each \$2.50

For attaching multi-point brackets to brick or stone buildings. Size of screw, Nos. 20 and 22; diameter of shield,  $\frac{1}{2}$  inch; length of shield, 2 inches. Standard package, 100. Weight per 100 pieces, 9.5 pounds.

Price, No. 31.....per 100 \$13.10

## Millers Falls Hand Hack Saws Flexible—Tungsten

Flexible blades differ from all hard blades in that the teeth only are hardened. Recommended for use particularly on thin sections of soft materials, both sheet and tubing. Superior to the all hard for use in out of the way places, and when frame must be held in other than a normal position.

Electricians, plumbers and steam fitters will find this type of blade more economical than all hard.

Flexible blades should be strained tighter in frame than all hard. Because they stretch more readily tension should be increased frequently while in use.

When starting a new blade in an old cut, give work a greater turn if possible. This will overcome the binding due to wider set of new blade.

24	$\frac{1}{2}$	100	21.5	13.30

**Nos. 50 and 53 Peirce Hammer Drills**

The Peirce Hammer Drill is a double-ended tool designed for drilling holes easily in brick, stone and concrete. It drills the hole and swages the lead sleeve of the bolt. Holds all sizes of drill points.

The drill cannot become wedged in the hole while drilling as a backward stroke of the hammer instantly releases it.

Injury to the hands of the operator is impossible.

The chuck has a quick release whereby a drill-point may be instantly removed and a sharp one inserted.

Price, No. 50 for Tamping 1/4-Inch Bolts.....each \$14.82  
 Price, No. 53 for Tamping 3/8-Inch Bolts.....each 15.78

**Nos. 56-65 Peirce Drill Points**

For 1/4-inch expansion bolts, 1/2x4 or 6-inch drill points are used; for 3/8-inch bolts, 5/8x6-inch points; for 1/2-inch bolts, 7/8-inch points, the length of drill point depending on the length of bolt used. One and three-fourths inches of drill point is held inside the chuck. All drill points are measured over all except the 12-inch which are 14 inches over all.

Cat. No.	Size Inches	Wt., Lbs. per 100	Price per 100	Cat. No.	Size Inches	Wt., Lbs. per 100	Price per 100

1 1/8	24.00	28.00	32.00						

**Diamond N Drill Holders and Points**

**Drill Holders**

The taper shank on the drill is carefully machined to fit the holder. The transverse hole in the handle is to admit a tapered pin which drives out the point when it is to be removed. The advantage of this drill over the one-piece regular drills is that in the smaller sizes a better grip can be had and a harder blow struck. It is also a great convenience in the reduction in weight of tools to be carried to a job where numerous holes are to be drilled. One holder may be used for many drill points. Worn drill points may be replaced with new drill points and the job continued without interruption.

Holder will take drill points from 1/4 to 3/4 inch.

Price.....per dozen \$24.00

**Drill Points**

The points are provided with tapered shanks to fit the tapered hole in the holder and drift pins are provided to eject the point when replacement is necessary.

Size Inches	Length Inches	Price per Dos.	Size Inches	Length Inches	Price per Dos.
1/4	4 1/2	\$8.50	1/2	5	\$10.00
5/8	4	8.50	5/8	6 1/4	12.00
3/4	4 1/2	8.50	3/4	6	14.00
7/8	4	9.00	..	...	.....

**Sets**

Set made up of one holder, one ejector pin and six points assorted of any of the above sizes, put up in a wooden box, making a convenient drill outfit in compact form for those requiring various sizes of holes for different diameter of expansion bolts.

Price, Complete.....per set \$7.50

**Diamond Drop Forge Twist Drills and Drill Holders**

Style B Holder

Style C Holder

The drill is forged from a solid bar of vanadium tool steel. This process produces a tougher and more durable drill than can be had by the machine process. It is intended to be used with a hand or electric hammer and not as a rotating drill.

Drill holders are made of vanadium steel. Type C drill holder is made with a soft rubber grip with flange to protect the hand of the operator.

Diameter of Drill Inches	Length Over All Inches	Depth of Hole Inches	Weight Pounds per Dozen	Price per Dozen
3/16	25/8	1 1/4	1/2	\$10.80
1/4	3 1/8	1 1/2	3/4	10.80
5/16	3 3/8	2	7/8	12.80

1/2	5 1/2	3 1/2	2	22.80
9/16	5 1/2	3 1/2	2 1/4	26.80

Twist drill kits are put up in sets containing 1 holder and 1 each 3/16, 1/4, 5/16, 3/8, 1/2 and 5/8-inch drill points.

Price, Drill Kit, with Type B Holder.....per set \$7.00

Price, Drill Kit, with Type C Holder.....per set 8.00

Price, Style B Drill Holders.....per dozen 24.00

Price, Style C Drill Holders.....per dozen 48.00

## Diamond Drill Blades and Drill Blade Holders

Diamond Drill Blade is made of vanadium tool steel, accurately tempered for long use in brick, stone or concrete. The blade will not bind in the hole. It is easy to resharpen on a grinding wheel. Put up 6 in a compact container.

Diamond Drill Blade Holder is quick acting. The blade is easily inserted and ejected. Made of high grade carbon tool steel.

Size Drill Blades, inches.	1/4	5/16	3/8	7/16	1/2
Length Blades Over All, in.	3 3/8	3 3/8	3 3/8	3 3/8	3 7/8

Price, Blades, per dozen	\$8.50	8.50	8.50	9.00	10.00
Price, Blade Holders, per dozen	\$24.00				

Price, Set No. 1—6 Assorted Blades, Consisting of 2 Each, 1/4, 5/16 and 3/8 Inch, per set \$4.50

Price, Set No. 2—5 Blades, 1 Each, 1/4, 5/16, 3/8, 7/16 and 1/2 inch, per set 4.50

Price, Set No. 3—Complete Kit Consisting of Holder Ejector and 5 Blades (Set No. 2), per set 6.50

## Diamond Masonry Drill Holders and Points

Diamond Short Masonry Drill Points and Holders are forged and machined of vanadium tool steel. A flat drill in small sizes will cut holes faster than a 4-point drill.

The rubber grip holder protects the operators' hands and gives a comfortable grip making it easy to rotate the drill. Price, Type B Holder, per dozen \$24.00 Price, Type C Holder, Rubber Grip, per dozen 48.00

3/8	2	1 1/16	25.00	3/4	3 3/4	1 1/4	65.00

**Keystone Interlocking Expansion Shields**

Prevents the nut being drawn out of the shield when heavy loads are applied. Guides the mechanic in determining when to stop tightening up the bolt. Prevents the nut being drawn past the point of maximum expansion. Locks the two shields and the nut into a unit of resistance against the load, making it impossible to pull out the nut without extracting the shield, also thus increasing the holding power of the expansion.

Double

Made of malleable iron for durability and strength.

Diam. Screw or Bolt Inches	Length Shield Inches	O. D. and Size Drill to Use Inches	Price Shields Only per 100	Diam. Screw or Bolt Inches	Length Shield Inches	O. D. and Size Drill to Use Inches	Price Shields Only per 100

## No. 2 Atkins Keyhole Saws and Pads

Toothed ten points per inch. Put up one dozen in a box.

Weight, per dozen, 2 1/2 pounds.  
 Price, Keyhole Saws.....per dozen \$3.25  
 " Handle....." 2.65  
 " No. 2, Complete....." 5.90

## Atkins Cable Saws

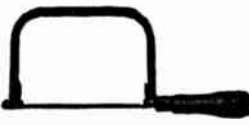

Blade 16 inches long of Atkins high-grade special steel. Beech handle. One edge toothed 10 points to the inch; other edge, 13 points. Packed 1/3 dozen in a box. Weight per dozen, 9 pounds.  
 Price.....per dozen \$15.20

**No. 17 Atkins Forester Pruning Saws**

Length of blade, 26 inches; width at point, 1 1/4 inches; at butt, 3 1/4 inches. Three points to the inch gives large teeth that cut big or small limbs readily. Weight, per dozen, 12 pounds. Packed one-third dozen in a box. Price, No. 17.....per dozen \$24.00

**No. 50 Atkins Coping Saws**

This is a durable and rigid coping saw, as the back is 3/8-inch wide and 3/16-inch thick and made of cold rolled steel, nicked and buffed. Frame, 7 1/4 x 4 3/8 inches deep. Fastened to the handle by malleable iron threaded ferrule.

All parts nicked and buffed. The handle is of hardwood, carved and varnished. Through the use of cap screws into which wires are inserted, the blade may be instantly adjusted to cut sharp or unusual angles with perfect ease and without strain on the blade. Packed two in a box.

Weight, per dozen..... pounds 7  
Price, No. 50 Complete, with Blade.....per dozen \$9.90  
" Blades Only..... " .50

**No. 11 Atkins Cross-cut Saw Handles**

Length, 14 inches. Climax pattern. Reversible. Cast iron face plate and washer. Malleable bolt with lock rivet feature, preventing rivet from becoming detached. Packed 100 pairs in wire-bound box weighing 170 pounds. Price, No. 11.....per pair \$.45

**Atkins Thin-back Tuttle Tooth Cross-cut Saws**

Packed 50 in a case. Prices do not include handles.

## Lufkin Surveyors' Chain Tapes

Etched graduations. Nubian finish; heavy 1/4-inch steel tape.

Hardwood reel with long folding winding handle and large drum. Trimmings nickel-plated.

Wherever graduated, the steel has a bright raised surface, with figures etched in. Steel is tempered and of best quality so that graduations and figures can never be effaced, but will always show clearly and distinctly.

A convenient, strong, durable chain tape for heavy field work.

A pair of rawhide thongs is furnished with each tape, (detachable rings instead if specified).

Tapes in feet are marked feet only every foot, with end feet in 100ths.

**Beaver Square End Pipe Cutters**

This pipe cutter cuts like a lathe tool, each turn removing a thin shaving until the pipe is severed. Leaves no burr to be reamed or filed, or to reduce the capacity of the pipe, and threading dies start easily and with less wear.

Rigid, simple and fool-proof in construction.

The knives give hundreds of cuts on the hardest pipe, and are easily resharpened

No.	Cap. Pipe In.	Price Each Complete	Knives Price per Set
1	1/8 to 1	\$18.00	\$1.20
5	1/2 " 2	20.00	1.50

**Trio Die Stocks for Pipe**

Bushings can be removed to clear couplings for threading close nipples. Regularly furnished with one stock, three Little Giant Pipe Dies and three bushings.

Briggs standard right-hand taper threads furnished unless otherwise specified. British (Whitworth) standard right-hand taper threads furnished at regular prices. Right and left-hand pipe dies are furnished at same list.

No.	Cutting Size, In.	Length Stock, In.	Weight Pounds	Price Each
200A	1/8, 1/4, 3/8	28	4 1/2	\$8.50
200B	1/4, 3/8, 1/2	28	4 1/2	8.50
210A	3/8, 1/2, 3/4	40	10	11.00
210B	1/2, 3/4, 1	40	10	11.00

**Beaver Self-Contained and Adjustable Die Stocks**

**No. 11 Plain and No. 11-A Ratchet 1 to 2-Inch**

No. 11, Plain

These die stocks pay for themselves by saving time and labor. They are fully self-contained, light in weight, easy working and simple in construction.

One set of dies is quickly set to thread 1, 1 1/4, 1 1/2 or 2 inches, saving time in changing dies. Dies cannot become lost; they are always in the tool. They are quickly adjusted to thread under or over

standard, without affecting length of thread.

Dies are high grade alloy steel, specially heat treated.

These tools accurately center the pipe in the tool for straight threads but the tool can be purposely adjusted to cut drip threads when desired. Two knurled screws are quickly set and held firmly to pipe size, leaving only the thumb screw to be tightened after the die stock is placed on the pipe. They eliminate loose parts. Will grip any size coupling for threading short nipples.

No. 11-A, Ratchet

Price, No. 11, Plain Stock Complete.....each \$25.00  
Price, No. 11-A, Ratchet Stock Complete.....each 30.00

Extra dies, \$3.00 per set.

Left-hand tools and dies, add 15 per cent to list prices.

**No. 6 Beaverette Easy Working Die Stocks**

Threads all 4 sizes, 1/4 to 3/4-inch, without changing dies or bushings. A thread may be cut while changing dies in other tools. The 2 sets of dies covering the different thread pitches are held in one plate, instantly adjusted to any size by the single handle.

A universal centering device does away with loose bushings.

The No. 6 is a compact tool, complete without loose parts. Right or left hand, as specified.

Price, No. 6, Complete.....each \$15.00  
Price, Extra Lies, R. or L., 1/8 or 1/4x3/8 or 1/2x3/4 Inches.....per set 3.00

**G T D Spiral Fluted Burring Reamers**

No. 243, Half Round Shank

No. 246, Tee Handle

Nos. 241, 242, 242 1/2, 244 Bit Brace Shank

Made of high grade steel and designed for removing burrs caused by cutting pipe, and also for counter-sinking,

Ground to adapt them for use in a variety of materials. Spiral flute reduces chattering.

No.	Style of Shank	Capacity Pipe In.	Price Each	Price per Doz.

246	T Handle	1/4 to 2	4.00	48.00

**G T D Hinged Pipe Vises**

Made of malleable iron. The holes in the base of this vise are so placed that there is ample room to allow the use of an ordinary pipe wrench when bolting down to bench or post. The base is sufficiently strong to permit the omission of the front apron. Can be fastened back from edge.

Two lugs are cast on base so that frame and hook can be reversed.

The jaws furnished with these vises are made of excellent tool steel.

Jaws are carefully hardened and tempered.

## T & B Lakin Conduit Hickeys

The shank has a bushed hole into which the end of the conduit enters when a short bend is made at its end or a bend is to be worked down.

The bushed opening in the shank fits snugly over the end of the conduit and protects the threads.

This hickey will not slip on the conduit while a bend is being made. It enables a workman to make bends having different curvatures. It will not kink the pipe when making the shortest practical bends.

Made of malleable iron. Japanned finish.

Cat. No.	Size Pipe Inches	Unit Pkg.	Std. Pkg.	Wt., Lbs. per 100	Price Each
335	1/2	1	10	163	\$1.75
336	3/4	1	10	191	2.25
337	1	1	2	520	3.25

## No. 339 T & B Standard Conduit Elbow Formers

For 1/2 and 3/4-Inch Conduit

Forms standard shaped elbows perfectly and accurately, exactly where desired. Saves time and material by eliminating the waste of pipe. Weight, 31 pounds.

Price, No. 339, Complete....each \$45.00

## No. 625 Latrobe Hand Conduit Benders

Showing Socket Clamp

This bender combines 2 tools in 1. By reversing the movable jaw it can be used for bending either 1/2 or 3/4-inch conduit. It will not slip or kink the pipe. A deep socket, threaded internally at bottom, for 1-inch pipe handle eliminates couplings and insures full strength of handle.

The socket clamp is a new feature to insure tight fit on undersize pipe handle and to prevent handle from unscrewing.

Made of certified malleable iron, guaranteed not to break. Galvanized finish.

Packed in full telescoping carton. Standard package, 15 benders in corrugated case. Weight each, 3 3/4 pounds.

Price, No. 625 Bender.....each \$3.00  
Price, No. 626 Reversible Jaw and Pin for 625...each .50

## Fullman Conduit Benders

Made in 2 forms as listed. Furnished complete with riveted handles. The castings are malleable iron.

Cat. No.	Size In.	Form	Wt. Lbs.	Price Each
900	1/2	90°	8	\$3.20
901	1/2	45°	8	3.20
902	3/4	90°	12	4.30
903	3/4	45°	12	4.30

## Henderson Patent Tubenders

This tubender is designed to bend electrical metallic tubing without kinking, flattening or slipping. The side outlet makes it easy to take out the conduit and check the bends at any time. There are deep, snug-fitting bending grooves on both the front extension and the rear. The rear groove is extended so as to give the conduit proper support during the bending operation. The grooves are shaped and the bending elements are spaced so as to keep the conduit circular in cross section while it is being bent.

Handles are not furnished.

Size, Thread for Pipe Handle.. in.	3/8	1/2	3/4	1
Price.....each	\$1.50	1.75	2.25	3.50

## Henderson Patent OK Elbow Formers

For rapid and accurate bending of conduit elbows, offsets or angles in any combination. Will bend a standard radius conduit elbow in a few seconds.

The patented design of the bending groove prevents slipping, flattening and kinking, while the curve of the groove is the same as a standard conduit elbow.

Prices are for elbow former heads only, and do not include pipe braces or handles. Handles should be about 40 inches long.

Size.....inches	1/2	3/4	1
Threaded for Pipe Brace.....inches	1	1 3/4	1 1/2
Price.....each	\$4.50	6.00	7.50

## Henderson Turnbuckle Pipe and Conduit Benches

Style No. 2

STYLE No. 1.—Furnished with two detachable bending blocks for 1/2 and 3/4-inch conduit; capacity of pipe vise, 2 inches. Height, 45 inches. Weight, 45 pounds.

Price, No. 1.....each \$30.00

STYLE No. 2.—Furnished with five detachable bending blocks for 1/2, 3/4, 1, 1 1/4 and 1 1/2-inch conduit; capacity of pipe vise, 3 1/2 inches. Height, 45 inches. Weight, 170 pounds.

Price, No. 2.....each \$120.00

**Henderson EZ Conduit Benders**

Type EZ is a combination hand hickey and stationary bender in the 1/2, 3/4 and 1-inch sizes, and a stationary bender in the 1 1/4, 1 1/2 and 2-inch sizes. Bends elbows or offsets, or any combination of elbows or offsets. The deep close-fitting bending grooves automatically grip the conduit while bending, entirely preventing kinking, flattening or slipping.

Size Inches	Description	Std. Pkg.	Price Each
1/2	Threaded for Pipe Handle	10	\$2.00
3/4	Threaded for Pipe Handle	5	2.50
1	Threaded for Pipe Handle	3	5.00
1 1/4	Threaded for Pipe Brace	1	10.00
1 1/2	Threaded for Pipe Brace	1	15.00
2	Threaded for Pipe Brace	1	20.00

**Henderson Portable K-D Pipe Benches**

For electricians, gas-fitters, millwrights and all mechanics who cut and thread pipe. The K-D bench can be assembled in a few minutes, saving at least half an hour's time in starting a job as no time is wasted in rigging up a place to mount a pipe vise. When not in use the K-D can be taken apart and stored in a small place.

Height, 39 inches. Top, 33x9 1/2x1 1/2 inches, hardwood, finished.

Weight, 55 pounds.

Price.....each \$30.00

**Henderson XL Conduit Benders**

The Henderson XL Conduit Benders are stationary benders. Fasten with lag screws or bolts through the clearance holes in the base, to any suitable support. Simple, powerful and efficient. Designed for hardest service. Heavy base plate. Side outlet. Deep, close fitting bending grooves.

Style No. 1

Style No. 1

Furnished with 3 detachable bending blocks for 1/2, 3/4 and 1-inch conduit, complete with lag screws.

Weight, 18 pounds.

Price, Style No. 1. ea. \$10.00

**Giant Style No. 2**

Furnished with 5 detachable bending blocks for 1/2, 3/4, 1, 1 1/4 and 1 1/2-inch conduit, complete with lag screws.

Weight, 100 pounds.

Price, Giant Style No.

2.....each \$45.00

**Martin Portable Vise Stand and Pipe Bender**

Small Size, with Hinged Pipe Vise

Bending Pipe on Small Stand

Large Size, with Hinged Pipe Vise and Rear Support

This apparatus is designed for use wherever pipe must be cut, threaded or bent. It can be picked up at any time and moved from place to place. There are no bolts, screws or braces to remove. It does not have to be fastened to the floor, walls or ceiling. It will not tilt, upset or skid.

It is convenient for cutting and threading pipe. For these operations, the pipe is fastened in the vise and rests in the bending attachment which keeps it rigid and in line.

**Small Size**

Equipped with a special device which will bend pipe from 1/8 to 3/4-inch diameter easily without kinking. Capacity, with chain vise, 2-inch pipe; with hinged vise, 2 1/2-inch pipe.

Weight complete, with hinged vise, 54 pounds; with chain vise, 50 pounds. Rear support not supplied.

Cat. No.	Description	Price Each
1A	Complete with Hinged Vise	\$39.00
1B	Stand with Hinged Vise, Less Legs	35.00
*1C	Stand with Legs, Less Vise	31.00
*1D	Stand Less Legs, Less Vise	27.00

1F	Stand with Chain Vise, Less Legs	35.00
†1G	Stand with Legs, Less Vise	31.00
†1H	Stand Less Legs, Less Vise	27.00

**Large Size**

Capacity with chain vise, 4 inches; with hinged vise, 4 1/2 inches. Bender capacity, one inch. Weight complete, with hinged vise, 175 pounds; with chain vise, 159 pounds.

Cat. No.	Description	Price Each
2A	Complete with Hinged Vise	\$90.00
*2B	Stand with Legs and Rear Support, Less Vise	75.00
2C	Stand with Legs and Hinged Vise, Less Rear Support	71.00
2D	Stand with Hinged Vise, Less Legs and Rear Support	65.00
*2E	Stand with Legs, Less Vise and Rear Support	56.00
*2F	Stand Only, Less Vise Legs and Rear Support	50.00
2G	Complete with Chain Vise	90.00
†2H	Stand with Legs and Rear Support, Less Vise	75.00
2K	Stand with Legs and Chain Vise, Less Rear Support	71.00
2L	Stand with Chain Vise, Less Legs and Rear Support	65.00
†2M	Stand with Legs, Less Vise and Rear Support	56.00
†2N	Stand Only, Less Vise, Legs and Rear Support	50.00

\*Drilled for hinged vise. †Drilled for chain vise.

## Henderson Patent Joist Boring Machines

A portable hand tool, adjustable from 4½ to 12 feet. Will bore a hole straight through an overhead joist.

Ballbearings, with adjustable take-up for wear. Floating chain drive. Universal bit holder, uses standard bits. Positive reverse to back bit out. Weight, 17 pounds. Price, Boring Machine..... each \$25.00

### Boring Machine Parts—Heads Complete

Assembled, mounted in bearing tee, including threaded hollow shaft, sprocket, two cones, two cups, lock washer, jam nut, steel balls, cotter pin, and two-jaw chuck. Price, Head Complete..... each \$12.50

### Head Fittings

Furnished mounted on hollow shaft, including sprocket, two cones, two cups, lock washer, jam nut, steel balls, cotter pin, and two-jaw chuck. Price, Head Fittings..... each \$8.00

## No. 688 Brown & Sharpe American Standard Wire Gauges

Nos. 0 to 36

Adopted by the brass manufacturers, January, 1858.

Gauge numbers are stamped on one side and decimal equivalents on the reverse side.

Small sizes are packed 1 dozen in a box; large sizes are packed 6 in a box.

Price, No. 688, for Gauges 0 to 36..... each \$3.00

Price, No. 688, for Gauges 5 to 36..... each 2.50

## No. 4 Brown & Sharpe Micrometer Calipers

Measures all sizes less than one-half inch by thousandths of an inch.

Packed one in a box.

Price, No. 4, Plain without Ratchet Stop..... each \$7.00  
 " " 4RS, with Ratchet Stop..... " 7.50  
 " Leather Case..... " 1.20

## C & L Double Needle Torches

No. 208, 1-Quart Capacity  
 No. 210, 1-Pint Capacity  
 For Gasoline

The improved double needle burner generates from 200 to 300 degrees more heat. Both needles are blunt, which makes it impossible to ruin the burner by enlarging the orifice. The upper needle has a wire tip that cleans the orifice; lower needle regulates the flame. Ideal for cold and windy weather.

No..... 208 210  
 Capacity..... 1 Qt. 1 Pt.  
 Ship. Wt..... lbs. 5½ 4½  
 Price..... each \$19.00 18.00

## C & L Single Needle Torches

No. 32, 1-Quart Capacity  
 No. 38, 1-Pint Capacity  
 For Gasoline

Burner produces a greater degree of heat and is self-cleaning. Valve seat is away from orifice in jet block, hence it is impossible to enlarge orifice by forcing needle into it, thus ruining the burner. Torch burns the lower grades of fuel perfectly. Not affected by wind or cold.

Tank is heavy gauge drawn brass reinforced both inside and out.  
 No..... 32 38  
 Capacity..... 1 Qt. 1 Pt.  
 Ship. Wt..... lbs. 5 4  
 Price..... each \$18.00 17.00

## C & L Single Needle Torches

No. 130, 1-Quart Capacity  
 For Gasoline

This torch has tapered burner tube with undergenerator. The burner is made of bronze metal and produces a steady blue flame. The needle, which is sharp pointed, is fitted with stuffing box to prevent leakage. Hook is removable. The tank is of seamless drawn brass, fitted with automatic brass pump, having patented double spring check valve. Concave bottom serves as a funnel in filling.

No..... 130  
 Capacity..... 1 Qt.  
 Ship. Wt..... lbs. 4¾  
 Price..... each \$17.00

## C & L Everedy Single Needle Torches

No. 158, 1-Quart Capacity  
 For Gasoline

For use in the workshop and around the home.

Burner is of bronze and produces a clear blue flame of intense heat. It is of the under-generator type, the gas being super-heated as it passes through the burner veins. Any standard grade of motor fuel may be used.

Tank is of heavy gauge drawn brass. C & L double-spring automatic type pump.  
 No..... 158  
 Capacity..... quarts 1  
 Shipping Weight..... pounds 4½  
 Price..... each \$11.12

**C & L Single Needle Flat Tank Torches**

**No. 48S, 1-Pint Capacity**

For Gasoline

This torch is especially adapted for close work in corners where the ordinary torch cannot be used, for carrying in the tool box or kit and for electricians and emergency use. It is oblong, 1 1/4 inches thick, 5 inches long and stands 8 1/2 inches high, complete with burner. The pump, which forms part of the handle, is automatic. Hook is removable.

No. .... 48S  
Capacity..... 1 Pt.  
Ship. Wt..... lbs. 4 1/4  
Price..... each \$22.00

**No. 28 C & L Single Needle Fire Pots**

**1-Gallon Capacity**

For Kerosene

Burner superheats the kerosene gas before it is burned, producing perfect combustion and the maximum degree of heat. Heavy gauge seamless drawn steel tank, fitted with cushion protection band preventing injury to base of tank. Pump, large funnel and filler plug having dust-proof cap.

Has extra large shield and top plate with extended lugs.

Takes an 8-inch metal pot.

Gasoline jet is also supplied.

No. .... 28  
Capacity..... 1 Gallon  
Shipping Weight... pounds 17 1/4  
Price..... each \$38.60

**No. 91 C & L Single Needle Fire Pots**

For Gasoline

The burner has great generating power and burns either high or low test gasoline. A swivel permits turning the burner up or down. The top section is of steel and can be quickly removed by loosening a set screw, and base with burner used as an open fire.

The heavy gauge drawn steel tank is tinned inside and out, which prevents rust. It is strongly reinforced and fitted at base with patented cushion band. Heats a pair of 12-pound soldering coppers and pot of lead at same time.

No. .... 91  
Shipping Weight... pounds 14 1/2  
Price..... each \$33.00

Capacity 1 Gallon

**No. 70 C & L Firepots**

**1-Gallon Capacity—With Tinner's Hood**

For Gasoline

Designed especially for the use of tinner, roofers and cornice workers.

Starts quickly and is ready for use in 90 seconds. Produces a perfect blue flame of intense heat and can be turned up or down at will.

The firepot cannot carbonize even under constant use. It is noiseless in operation and entirely free from smoke or odor.

Will operate at full capacity for 6 hours on a single gallon of fuel.

No. .... 70  
Capacity..... 1 Gallon  
Shipping Weight... pounds 17  
Price..... each \$35.55

**C & L Coil Fire Pots**

**No. 22, Pump Type—No. 12, Bulb Type**  
**1-Gallon Capacity**

For Gasoline

The drawn steel tank is leak-proof and heavily coated with tin inside and out. This prevents rust that works up into the coil and burner, which is a cause of frequent clogging. Pump is extra large and powerful, producing air pressure quickly. Patented three-piece coil cup and shield are of heavy steel. Uprights and fittings are extra heavy.

No. 12 is exactly like No. 22 but fitted with air valve and bulb.

No. .... 22 12  
Capacity..... 1 Gal. 1 Gal.  
Ship. Wt..... lbs. 12 3/4 12 1/2  
Price..... each \$25.00 24.80

No. 22

**No. 3428 Klein's Torches**

**1-Quart Capacity**

For Gasoline

Double length generating channels which quickly vaporize the fuel are a patented feature. Produces an intensely hot flame which can be regulated from minimum to full blast. Will not back generate. Cleaning plugs at all angles. Needle has positive shoulder stop preventing damage to burner by enlarging orifice.

Pump is well made and sturdy.

Tank is heavy gauge copper, capacity, 1 quart.

Weight, 4 1/2 pounds.

Price, No. 3428..... each .....

U.S. PAT. NO. 1676-352

**No. 23 C & L Coil Fire Pots**

For Gasoline

The No. 23 Coil Fire Pot has all of the latest patented features.

It is fitted with tinner's shield which is of sheet steel, and will quickly heat a pair of large size soldering coppers. The shield is removable, thus making the fire pot excellently adapted to melting metals and various other work.

Pump is extra large and powerful, producing air pressure quickly. Drawn steel tank is leak-proof and heavily coated with tin inside and out.

No. .... 23  
Shipping Weight... pounds 13 1/4  
Price..... each \$30.20

**Klein's Furnaces**

**1-Gallon Capacity**

For Gasoline

Sturdy construction made especially for field use.

Quick starting is ensured by multi-coil burner which is economical and vaporizes the fuel thoroughly producing an intensely hot fire. Simple cleaning device to remove carbon deposit without taking burner apart. Filler cap has needle shut-off valve and check combination; 1-gallon capacity tank formed of heavy gauge steel with bottom rolled in. All fittings are brazed. Shipped complete with shield unless otherwise ordered.

Price, No. 3528-G, with Pump Separator, Weight, 12 1/2 Pounds..... each .....

Price, No. 3529-G, Pump in Fount, Weight, 12 Pounds..... each .....

U.S. PATENT NO. 3272-13

## Klein's Furnaces 1-Gallon Capacity For Kerosene

Sturdily made to stand up to the field requirements of Public Utility Companies. Quick starting is ensured by multi-coil burner which is economical and vaporizes the fuel thoroughly producing an intensely hot fire. Filler cap has needle shut-off valve and check combination. The tank is formed of heavy gauge steel with bottom rolled in. A simple cleaning device is used to remove carbon deposit without taking burner apart.

All fittings are brazed. Shipped complete with shield unless otherwise ordered.

**Early's Commutator Cement**

This cement will stand 3200° F. before it will fuse. Its strength is many hundred pounds to the square inch. It resists oil and moisture, and is not affected by gradual expansion and contractions of heat and cold.

Dielectric strength equals that of porcelain.

No special tools or appliances are required. The operation is simple, if directions are followed.

For outside work and damp places give the job a coat of weatherproof insulating paint.

The dryer the cement the better the insulation.

This cement can be used to repair glass, porcelain, metal and all other materials except rubber, vulcanite and black lead.

Price, 1-Pound Package, Size 2½x 5¾ Inches.... each \$2.50  
Price, 7-Pound Package, Size 5 x10½ Inches.... each 10.00

**Allen Commutator Lubricant Sticks**

Prevents sparking and cures it when applied properly. It prevents cutting by lubricating the commutator surfaces.

Description	Price Each
For Copper or Carbon Brushes.....	\$ .30

**Crescent Chatterton Compound**

This is an insulating material used chiefly in submarine cable construction to fill the interstices between the strands of the cable conductors.

No. 1 Domestic..... per lb. \$2.00

**Manson Tape**

Manson Tape is a rubber filled cloth tape for protecting joints against mechanical injury. Easily handled and economical to use.

Color	Width Inches	Weight Pounds per Roll	Price per Pound
Black	¾	½	\$1.10
White	¾	½	1.10

**Okonite Rubber Tape**

A rubber tape of the highest class for making splices or joints which, when properly made, are impervious to moisture.

Color	Width Inches	Lbs. per Roll	Price per Lb.
Black	¾	½	\$1.70

**P & B Waterproof Tape**

A tape especially adapted for hard service. Will not vulcanize with heat, or become defective by exposure or use, will not dry and crack or harden; water, acid and alkali-proof.

Color	Width Inches	Lbs. per Roll	Price per Lb.
Black	¾	½	\$ .75

**Sticka Black Friction Tape**

For all ordinary commercial work. Used to protect the splicing compound on a wire joint from abrasion.

Roll contains ½ pound gross of ¾-inch tape, length 56 feet to a roll.

Price..... per pound \$ .90

**Victor Black Friction Tape**

Protects the splicing compound on wire joints from abrasion. Suitable for ordinary commercial work.

Roll contains ½ pound net of ¾-inch tape, 75 feet to a roll.

Price..... per pound \$1.00

**Amazon Black Friction Tape**

This is a good quality tape and will pass the majority of specifications in use.

Standard rolls contain ½ pound net of ¾-inch tape, which is 84 feet to a roll.

Price..... per pound \$1.25

**Victor Black Rubber Splicing Tape**

A commercial grade, unvulcanized compound. Will fuse into a homogeneous mass at average air temperature under heat of the fingers. Half-pound roll gross, .030 inch thick, 20 feet to a roll. Packed in 50 pound cartons.

Price..... per pound \$1.00

**Amazon Gray Rubber Splicing Tape**

A compound partially vulcanized which increases dielectric and tensile strength. The adjacent layers adhere readily on a joint and after a few minutes become a solid, homogeneous mass. Roll weight ½ pound net, ¾-inch tape, 22½ feet to roll.

Price..... per pound \$1.25

**Grimshaw Tape**

Standard rolls contain ½ pound of ¾-inch tape.

Description	Price per Pound
Black Friction Tape	\$1.00
White "	1.05
Splicing Compound (Rubber Tape)	1.10

**Competition Tape**

This is a good grade of tape furnished in ½-pound rolls in the ¾-inch width.

Description	Price per Pound
Black Friction Tape	\$ .75
White "	.80
Splicing Compound (Rubber Tape)	.85

**Hydr-Proof Tape**

Width of tape is ¾ inch.

Packed in containers of ½-pound rolls.

This tape, as its name indicates, is waterproof and its uses are many.

Price..... per pound \$1.00

**Nos. 1 and 11 India Micanite Plate  
For Molding**

No. 1 India Micanite Plate has a smooth surface which does not show any detrimental amount of loose laminations. It softens sufficiently at 140 degrees C. or 284 degrees F. to be readily molded to ordinary shapes without chipping, cracking or breaking.

It is carefully milled to specified thickness, allowing a variation of .002-inch in isolated spots on the thin sizes below .060-inch, and from .003-inch to .005-inch on sizes .060-inch and up.

Average puncture voltage per .001-inch runs from 900 volts on the thinner sizes to 800 volts on the thicker sizes. It must not be used for insulation between copper bars of commutators.

No. 11 India Micanite Plate is made of the same quality of mica films and cement that are used in our No. 1 Plate, but it is not as exact to thickness, and is not made in as many thicknesses. It varies in thickness from plus or minus .003-inch in the case of the .010-inch thick; .005-inch in the case of the 1/32-inch; to plus or minus .010-inch in the case of the 1/8-inch thick.

It becomes flexible when heated, is readily formed into shapes, and is suitable for all general purposes where a variation in thickness is permissible, except for commutator segments, for which it is not intended.

Average puncture voltage, 800 to 900 volts per .001-inch.

Nos. 1 and 11 Micanite Plate furnished in special thicknesses, sizes and patterns. Prices quoted upon application.

**No. 2 India Micanite Plate  
For Commutator Segment Insulation**

No. 2 Micanite Plate is made of India Mica, as this variety is recognized as standard for electrical insulation where muscovite mica is used.

It is closely milled and the average thickness will not vary more than .0005-inch from specified thickness. Individual plates will not vary more than .001-inch above or .0015-inch below thickness specified in isolated spots. It cannot be molded.

Its average puncture voltage per .001-inch runs from 900 volts on the thinner sizes, to 800 volts on the thicker sizes.

Cat. No.	THICKNESS		Approx. Lbs. per Sheet	Price per Lb.
	Inches	MM.		
1238	.020	0.508	1.2	\$2.65

1248	.060	1.524	3.6	1.90
1249	1/16	1.58	3.8	1.90

No. 2 Micanite Plate can be furnished in special thicknesses, sizes, or patterns. Prices quoted upon application.

**No. 3 Amber Micanite Plate  
For Commutator Segment Insulation**

No. 3 Amber Micanite Plate is made of phlogopite or amber mica, which is softer than the muscovite and presents less liability of failure to wear down evenly with the copper bars.

It is closely milled and the average thickness will not vary more than .0005-inch from the specified thickness. Individual plates will not vary in isolated spots more than .001-inch above or .0015-in. below thickness specified. It cannot be molded.

Its average puncture voltage per .001-inch runs from 850 volts on the thinner sizes to 700 volts on the thicker sizes.

Cat. No.	THICKNESS		Approx. Lbs. per Sheet	Price per Lb.
	Inches	MM.		
1272	.020	0.508	1.2	\$4.75

1282	.060	1.524	3.6	4.00
1283	1/16	1.58	3.8	4.00

No. 3 Micanite Plate can be furnished in special thicknesses, sizes and patterns.

Prices quoted on application.

**No. 4 Micanite Plate  
For Flat Work**

This plate is made for flat work and for purposes where accuracy of thickness is not important. It is not milled or surfaced and therefore has a considerable variation in thickness.

It is suitable for all kinds of bases, round or square washers, and for all kinds of apparatus not subject to high heat.

Its non-liability to fracture under extreme vibration is a valuable feature for marine work. It does not take a screw thread, but can be drilled and turned.

Average puncture voltage, approximately 800 volts per .001-inch.

No. 4 plate is not furnished thinner than 1/16-inch.

Cat. No.	THICKNESS		Approx. Lbs. per Sheet	Price per Lb.
	Inches	MM.		
1296	1/16	1.58	3.25	\$1.25

1301	3/8	9.52	19.5	1.25
1302	1/2	12.69	26.	1.25

Prices on sheets of No. 4 Micanite Plate, of special size and pattern quoted upon application.

**No. 5 Flexible Micanite Plate  
For Cold Forming**

No. 5 Flexible Micanite is made of very thin films of muscovite mica cemented together with a special insulating cement of great flexibility and adhesiveness. This article in many ways presents mica in its most convenient and economical form for electrical insulation. It can be formed or bent to shape without application of heat.

It is an excellent insulator for armature slots, armature, magnet and commutator cores, transformers, field coils, etc.

No. 5 Flexible Micanite Plate cannot be surfaced like No. 1 No. 2, or No. 3 plate. It is therefore subject to some variation in thickness, running from .002-inch to .003-inch on the thinner sizes; from .005-inch to .007-inch on the 1/32-inch thickness, and from .010-inch to .015-inch on the 1/8-inch thickness.

Its average puncture is approximately 600 volts per .001-inch.

Cat. No.	THICKNESS		Approx. Lbs. per Sheet	Price per Lb.
	Inches	MM.		
1303	.005	0.127	.55	\$3.15

2 1½	to 3½	Inches Wide, 4½	to 6	Inches Long 2.50
3 1½	to 3	Inches Wide, 3	to 4	Inches Long 1.80
4 1½	to 2½	Inches Wide, 2½	to 3	Inches Long 1.25
5 1	to 2	Inches Wide, 2	to 2½	Inches Long .65

## Linotape

Linotape is the registered trade mark name under which Empire Oiled Cloth in tape form is sold. Tape is cut in any width from ¾ inch and above, from all grades of yellow Empire, and black Kablak insulating material.

Linotape is an insulating tape of the highest order. Its virtue rests in the multiplication of oxidized oil films on its surfaces. It has come into general use as the insulating medium for cables of all descriptions, and is used extensively in coil winding, cable splicing, bus bars, and all high tension work. Furnished in rolls guaranteed to contain 72 lineal yards, each roll coated on the edges with paraffin to exclude moisture. Linotape is continuous in the roll.

## Empire Oiled Paper

The papers forming the bases all possess the greatest tensile strength consistent with their thickness and have been selected for their uniformity of thickness and freedom from deleterious chemicals. The oil films with which they are coated are of the same nature as the films on Empire Cloth.

The oiled condenser papers, on account of their extreme thinness and high tensile strength, are giving great satisfaction to the manufacturers of induction coils and other delicate work. The thicker papers have been selected for their great tensile strength, density and evenness of texture.

Furnished in rolls 36 inches wide, containing 25 to 50 yards, or in sheets, 36x36 inches.

No.	Thickness Inches	Price per Square Yard	No.	Thickness Inches	Price per Square Yard
101	.0015	\$.22	105	.005	\$.22

135	.0045	.13	...	...	...

## Empire Oiled Canvas and Duck

No. 16 is made on a fabric base that has been specially finished to ensure smooth and even coating of the oil. Nos. 22 and 32 ducks have great resistance to mechanical wear and imperviousness to moisture but do not have the same smooth surface as other cloths.

Cat. No.	Quality of Fabric	FINISHED THICKNESS Inches	THICKNESS MM.	Approx. Thickness Oil Films Inches	Average Lbs. per Yard	Approx. Dielectric Strength	Price per Yard
16	Canvas	.016	0.406	.008	.80	10000	\$ .92

32	"	.032	0.813	.002	1.30	.....	1.40

## Empire Oiled Silk

Empire Oiled Silk has for a base a closely woven fabric of pure silk. It is an excellent insulation where a material possessing very high insulating qualities combined with extreme thinness and great flexibility is demanded.

Cat. No.	Quality of Fabric	FINISHED THICKNESS Inches	THICKNESS MM.	Approx. Thickness Oil Films Inches	Average Lbs. per Yard	Approx. Dielectric Strength per Yard	Price per Yard
44	Silk	.004	0.102	.00175	.22	5000	\$1.33
55	"	.005	0.127	.00275	.27	6000	1.37
66	"	.006	0.153	.00375	.32	7000	1.41

All the above Empire Cloths, etc., are furnished in standard rolls containing 50 yards. Rolls containing 25 to 100 yards furnished when specified.

Any width cut to order provided order amounts to multiples of 72 square yards.

The dielectric strength in above tables was obtained by placing the insulating material between a 12-inch square copper plate, and copper disc electrodes 1½ inches in diameter using 60 cycle A. C. current.

## No. 20 Micanite Cloth

No. 20 Micanite Cloth is made with 1, 2 or 3 layers of high-grade India Mica films, cemented together with overlapping edges into sheet form, the sheet being faced on one side with cotton cloth and the other side with Japanese paper.

It is an excellent composite insulation, the cloth adding mechanical strength, and is often used in conjunction with Empire Cloth and Paper, fish paper, etc., for transformers, field magnets and armature cores. In strip or tape form No. 20 Micanite Cloth is an efficient insulation for wrapping all sorts of conductors, and can be furnished any width from ½ to 36 inches, in rolls approximately 3¾ inches in diameter.

Cat. No.	THICKNESS Inches	THICKNESS MM.	Layers of Mica	Approx. Lbs per Roll	Price per Lb.
1315	.008	0.203	1	3.3	\$3.50
1316	.011	0.279	2	5.2	3.00
1317	.014	0.356	3	7	2.40

## No. 24 Micanite Paper

No. 24 Micanite paper is of the same nature as No. 20 Micanite Cloth except that the material is faced on both sides with Japanese tissue paper instead of cotton cloth, the object being to supply an insulation thinner than Micanite Cloth, but retaining the same thickness of mica film.

Cat. No.	THICKNESS Inches	THICKNESS MM.	Layers of Mica	Approx. Lbs. per Roll	Price per Lb.
1321	.005	0.127	1	2.4	\$3.50
1322	.008	0.203	2	4.2	3.00
1323	.011	0.279	3	6.	2.50

**Minerallac Insulating Compound**

For Use in Cable Joints, Potheads and Terminal Bells

The various compounds listed are intended to cover the exacting requirements of underground and overhead distribution systems.

**No. 2-A Minerallac**

This is a cable joint or pothead compound. One of its most important characteristics is its ability to remain at practically the same volume during extreme changes of temperature.

A semi-solid compound with high dielectric strength. Melting point, 185° Fahrenheit. Averages 900 volts per mil at 86° Fahrenheit.

Standard case contains twelve 1-gallon cans or six 2-gallon cans.

Price, No. 2-A.....per gallon \$2.00

No. 2-A

**No. 78 Minerallac**

No. 78

Price, No. 78.....per gallon \$2.00

**No. 80 Minerallac**

This is a pothead compound. It is a hard compound for use on 11000 volts and over. Melting point 275° Fahrenheit.

Tests 990 volts per mil at 86° Fahrenheit, and 415 volts per mil at 302° Fahrenheit.

Standard case contains twelve 1-gallon cans or six 2-gallon cans.

Price, No. 80.....per gallon \$2.00

No. 80

**No. 104 Minerallac**

No. 104

Price, No. 104.....per gallon \$2.00

**No. 20 Minerallac**

This is a high melting point compound for low-voltage work; 260° Fahrenheit.

For use in telephone work where a close seal against moisture is desired.

Standard case contains twelve 1-gallon cans. Weight per can, 8 pounds. Also furnished in drums approximately 400 pounds.

Price, No. 20.....per pound \$1.10

No. 20

**Ruberoid P & B Rapid Asphalt Paint**

Dries quickly to a hard, glossy coating, exceedingly tough and durable and with high insulating properties.

Adapted for cables, switch boards, battery boxes, shelving, conduit joints and all insulating requirements. Made in medium brushing consistency.

Size Package	Price per Gallon	Size Package	Price per Gallon
50-gallon	\$1.20	1/4-gallon	\$2.00
5 "	1.40	1/8 "	2.25
1 "	1.60	.....	....

**P & B Black Air-drying Varnish**

A quick drying, acid resisting and moisture proof, insulating varnish, indispensable in the repair shop and in general construction work.

For quick repairs to dynamos and motors. For feed wires, cables, switchboards and all overhead and underground connections.

Size Package	Price per Gallon	Size Package	Price per Gallon
50-gallon	\$1.05	1-gallon	\$1.45
5 "	1.25	1/4 "	1.90

**Mico Insulating Compound**

The 3 grades of Mico Varnishes are composed chiefly of asphaltum and refined linseed oil. They are non-corrosive. Durable and elastic; impervious to moisture and will withstand very high temperatures. A perfect film of compound has a puncture voltage of 900 volts per mil. It can be reduced to any desired density or solution with turpentine, benzol or gasoline.

Can be applied by dipping or with a brush. On cloth, paper, etc., it is advisable to apply them by dipping the material in the varnish. If a heavy coating is required, it is well to apply a number of thin coats, allowing each to dry thoroughly.

No. 151 is a glossy, black, baking varnish generally used for armature coils, field and magnet coils, wires and cables, transformers, for covering cloth, paper asbestos, and hard fibre. Bakes hard, but elastic at 300 degrees F. in 6 hours.

No. 370 is a glossy, black, air drying varnish used for armature, field and magnet coils, generators, etc. Dries quickly.

No. 152 is a glossy black, air drying varnish for core plates, transformer plates, and for all outdoor work such as overhead line construction, etc. Dust dry in 5 hours.

Size of Package	1-Gallon	5-Gallon	50-Gallon
Price, No. 151.....each	\$2.75	\$2.60	\$2.20
Price, No. 370.....each	2.10	1.85	1.50
Price, No. 152.....each	1.80	1.65	1.25

**No. 14 Ajax Clear Quick Elastic Baking Varnish**

A suitable clear varnish for general coil work, also oil-coated transformers. Oil, acid and water-proof.

Has maximum binding and cementing properties. Bakes in from 8 to 10 hours at 100°C. Thin with benzine.

Price, No. 14 in 1-Gallon Cans.....	per gallon \$4.30
Price, No. 14 in 5-Gallon Cans.....	per gallon 4.10
Price, No. 14 in Barrels.....	per gallon 3.80

## No. 16 Ajax Clear Elastic Baking Varnish

An extremely elastic and flexible varnish. Is oil, acid and water-proof.

Has maximum dielectric strength, also longest life under heat. Will bake in from ten to twelve hours at 100° C. (212° F.). Thin with benzine.

Intended for use where extreme flexibility and longest life under heat are required, such as on varnished cloth, large coils, wound and insulated before assembly, etc.

Price, No. 16 in 1-gallon Cans	.....	per gallon	\$4.00
" " 16 " 5 "	" " " " " "	"	3.60
" " 16 " Barrels	.....	"	3.25

## No. 18 Ajax Clear Air Drying and Baking Varnish

Oil, acid and water-proof. Has high dielectric strength. Bakes in 5 to 7 hours at 100° C. (212° F.), or will air dry in 8 to 14 hours. Thin with benzine.

Price, No. 18 in 1-gallon Cans	.....	per gallon	\$3.30
Price, No. 18 in 5-gallon Cans	.....	per gallon	3.10
Price, No. 18 in Barrels	.....	per gallon	2.80

## No. 19 Ajax Clear Air Drying Finishing Varnish

A spirit finishing varnish. Has good insulating properties.

Oil and moisture-proof.

Will air dry to handle in about 20 minutes, but requires more time if used on coil. Thin with denatured alcohol.

For use as a finishing coat to prevent absorption of oils and moisture.

Price, No. 19, in 1/2-gallon Bottles	.....	per gallon	\$3.40
" " 19 " 5 " Cans	.....	"	3.20
" " 19 " Barrels	.....	"	2.90

## No. 20 Ajax Black Elastic Baking Varnish

An extremely elastic, flexible varnish. Oil, acid and water-proof. Has maximum dielectric strength, also longest life under heat. Will bake in 10 to 12 hours at 100° C. (212° F.) Thin with benzine. May be used on cloth, all types of coils, on both large and small armatures.

Price, No. 20 in 1-gallon Cans	.....	per gallon	\$4.00
" " 20 " 5 " " "	" " " " " "	"	3.30
" " 20 " Barrels	.....	"	3.00

## No. 21 Ajax Black Plastic Baking Varnish

A soft plastic varnish. Water and acid-proof, but not oil-proof. Has maximum dielectric strength and long life under heat. Will bake in 10 to 12 hours at 100° C. (212° F.) Thin with benzine. Principal use on large form wound armature and stator coils.

Price, No. 21 in 1-gallon Cans	.....	per gallon	\$2.50
" " 21 " 5 " " "	" " " " " "	"	2.30
" " 21 " Barrels	.....	"	2.00

## No. 23 Ajax Black Quick Baking Varnish

A hard, tough, but elastic varnish which is oil, acid and water-proof. Has maximum dielectric strength and long life under heat. Will bake in from 8 to 10 hours at 100° C. (212° F.) Thin with benzine. For use on field and stator coils, large and small armatures.

Price, No. 23 in 1-gallon Cans	.....	per gallon	\$3.50
" " 23 " 5 " " "	" " " " " "	"	3.30
" " 23 " Barrels	.....	"	3.00

## No. 22 Ajax Black Semi-plastic Baking Varnish

A black varnish which dries with a semi-plastic film. Water-proof acid-proof but only fairly resistant to oils. Has maximum dielectric strength and long life under heat. Will bake in from eight to ten hours at 100° C. (212° F.). Thin with benzine.

Suitable for use on field and stator coils and all types of armatures and armature coils, except very high-speed armatures.

Price, No. 22 in 1-gallon Cans	.....	per gallon	\$2.50
" " 22 " 5 " " "	" " " " " "	"	2.30
" " 22 " Barrels	.....	"	2.00

## No. 25 Ajax Black Air Drying Varnish

Dries with a fairly hard film. Is acid-proof and water-proof, but not oil-proof. Will air dry in about one hour, but requires four to eight hours in the interior of a coil. Thin with benzine. Suitable for field and stator coils and all types of armatures except small high-speed.

Price, No. 25 in 1-gallon cans	.....	per gallon	\$2.10
" " 25 " 5 " " "	" " " " " "	"	1.90
" " 25 " Barrels	.....	"	1.60

## No. 60 Ajax Black Extra Quick Baking Varnish

A quick baking semi-plastic type varnish. Similar to No. 22, but not as long life.

Water-proof and acid-proof, but not oil-proof.

Bakes in from 2 to 4 hours at 100° C. (212°F.).

Thin with benzine.

Used principally on stators of small A.C. motors and other applications, except small high speed armatures, where quick baking is necessary.

Price, No. 60, in 1-gallon Cans	.....	per gallon	\$2.10
" " 60 " 5 " " "	" " " " " "	"	1.90
" " 60 " Barrels	.....	"	1.60

## Nos. 111 and 112 Ajax Pothead Compound

### No. 111

A black, asphaltic solid compound, plastic and adhesive. Possesses high dielectric strength and is chemically inert and thoroughly water-proof. It has a low-coefficient of expansion and contraction and will withstand extremes of heat and cold without cracking. The drip point is 83°C (185°F). May be applied by melting and pouring. For use in extremely cold climates and closed type potheads.

Price, No. 111 in 40-lb. Cans	.....	per pound	\$1.18
" " 111 " 10 " " "	" " " " " "	"	.24
" " 111 " 5 " " "	" " " " " "	"	.30

### No. 112

Same as Pothead Compound No. 111, except that the melting point is higher, 105°C (221°F). Intended for use in inverted type potheads and in very hot climates.

Price, No. 112 in 40-lb. Cans	.....	per pound	\$1.19
" " 112 " 10 " " "	" " " " " "	"	.25
" " 112 " 5 " " "	" " " " " "	"	.31

## Davis System of Emergency Equipments

Phone-kits can be furnished which are similar to the B, C and D kits used by the Bell System Companies with the addition of an eye dressing packet and a few more of the minor dressings. Electric-kits can also be furnished which comply with the recommendations of the Accident Prevention Committee of the N.E.L.A., and gas-kits which are approved by the American Gas Association, for use by public utility customers. Prices upon application.

*Western Electric Public Address System, Music Reproducer System  
Radio Distribution System*

**Magnetic Reproducer**

**Microphone**

**Horn Installed in Amusement Park with Artistic Housing**

The Western Electric Public Address System which is distributed by the Graybar Electric Company is essentially a means for reinforcing speech or music so that a large number of people may hear distinctly. It is generally used in large auditoriums, lecture halls, ballrooms and for large outdoor gatherings.

Many sizes of systems are available to meet the most exacting demands. The equipment is made flexible to accommodate any number of microphones and projectors, depending upon the requirements of the specific project. The voice of the speaker reaches the listener with the natural qualities preserved and the audience does not lose the impression of actually hearing the speaker.

The smaller types of systems may be mounted on a truck or carried about in an automobile for setting up for small outdoor gatherings. A radio set may be connected to provide entertainment from broadcast stations. A magnetic pickup will play phonograph records to furnish music at any time.

The Western Electric Music Reproducing System has for its application large outdoor amusement parks, hotel ballrooms, high class restaurants and all places where quality music is essential. The system is so arranged that it can be built up to meet practically any demand for volume or for a multiplicity of projectors to cover large areas. Standard phonograph records are reproduced by a magnetic pickup. Switching arrangements for a microphone and radio set are also provided for making announcements or picking up artists who may be performing, or projecting programs from broadcast stations. The equipment is arranged so that it can be added to from time to time as required. The types of projectors used are of several forms, the usual one being that of the exponential horn with dynamic receivers. The music reproduction system may also be used as a public address system when certain additions are made.

**Amplifier Assembly**

**Exponential Horn with Dynamic Receivers**

**Western Electric Scientific Equipment Instruments****For Testing the Hearing**

The need for a scientifically accurate means for testing the hearing of large numbers of people in physicians' offices, schools and in industry led to the development of the Western Electric Audiometer. Several prominent physicians working with the officers of the American Federation of Leagues for

the Hard of Hearing took their problem to the Bell Telephone Laboratories, an organization well known for its work in the field of sound transmission, amplification and reproduction. The result of this cooperative effort was the Western Electric Audiometer.

**Western Electric 2-A Audiometers**

The 2-A Audiometer is designed primarily for the use of Otologists in testing the hearing of their patients.

By means of the 2-A Audiometer an Audiogram may be prepared for each patient tested and accurate comparison may be made with future tests of the same patient. The 2-A Audiometer measures the faintest sound heard at each pitch, the oscillator having a frequency range extending from 64 to 8192 double vibrations or cycles per second.

**Western Electric 4-A Audiometers**

The 4-A Audiometer is designed primarily for use in schools. It permits the accurate testing of 40 people at one time (an average class).

Investigation has shown that there are nearly 3,000,000 school children in the United States with impaired hearing. The tremendous task of testing all the school children in the country can be greatly simplified by the use of the 4-A Audiometer. Many schools in all parts of the country are already successfully using it.

The Audiometer assures a quick, accurate and scientific test.

**Western Electric 5-A Audiometers**

Designed primarily for industrial use, the 5-A Audiometer has proved itself an ideal means for testing quickly and economically the acuity of hearing of both employees and applicants. Railroads, public utilities and manufacturing concerns have all used the 5-A Audiometer with marked success in reducing accidents and liability claims.

Complete information regarding either the 2-A, 4-A or 5-A Western Electric Audiometers will be gladly sent upon request to the Graybar Electric Company, Graybar Building, New York City, N.Y., or the nearest Graybar House.

*Western Electric* Scientific Equipment Instruments

A Scientific Hearing Aid

A logical development from producing a means for testing the hearing (the Audiometer) was the development of a means for aiding impaired hearing. The same care was given to producing a scientific, accurate instrument (the Audiphone).

Essentially the Audiphone is a miniature telephone set, light in weight, inconspicuous and extremely efficient. It consists of a transmitter, receiver, volume control, switch and a light weight battery box.

*Western Electric* 6033 Audiphones

The 6033 Audiphone has a highly sensitive transmitter, battery box and connection cord, volume control switch and a miniature receiver with a small,

inconspicuous earpiece. Standard flashlight batteries are used.

*Western Electric* 6034 Audiphones

The 6034 Audiphone is similar to the 6033 except that the instrument is assembled in an imitation vanity case.

Both the 6033 and 6034 Audiphones are recommended by physicians and have proved a great help in thousands of cases of impaired hearing; both are light in weight and both are noted by the clearness and natural quality of the tones transmitted.

*Western Electric* 6035 Audiphones

No. 6055-A—Telephone Set

D-87413—Microphone

The 6035 Audiphone is designed particularly for use in churches, club rooms and places where the instruments can be placed in permanent locations.

This apparatus is very powerful, simple in design, reasonable in price and easy to install.

D-87413 Microphone for picking up and transmitting the speakers' voice. The 6055-A telephone set is for use by the listener.

Full particulars may be had upon request to the Graybar Electric Company, Graybar Building, New York City, New York, or nearest Graybar House.

**Western Electric Radio Telephone Broadcasting Equipment**

Broadcasting is now a business and as a business the value of the station is determined by the service given. The service depends upon the extent of the area in which the station provides the clearest and least distorted programs, with sufficient volume to operate satisfactorily an average receiving set.

Covering increased area has obvious advantages provided the more powerful equipment needed to bring the programs to a greater number of listeners does so at a lower relative cost per unit.

Realizing this situation, Western Electric offers a 50-Kilowatt (No. 107-A) Radio Telephone Broadcasting Equipment which not only covers ten times the area covered by a 5-kilowatt set, but does so at approximately one-sixth of the cost per square

mile covered. An analysis of the cost of operating a group of 5-kilowatt stations showed the cost to be approximately \$40.00 per square mile per year. A comparable figure for a 50-kilowatt set would be approximately \$7.00.

This equipment is the result of the research and development carried on by Bell Telephone Laboratories, Inc. The scientific resources of the largest research organization in the world and the experience of fifty years of telephone development were employed in developing a 50-kilowatt radio telephone broadcasting equipment that would operate safely, easily and reliably. All of this culminated in an equipment that has been undergoing service tests for over a year at 3XN, the experimental station of Bell Telephone Laboratories at Whippany, N. J.

**No. 7-A Radio Transmitter at Station 3XN**

**Western Electric No. 224-A Vacuum Tubes  
Cathode Ray Oscillograph Tube**

The Western Electric No. 224-A Vacuum Tube is a Cathode Ray Oscillograph Tube which may be used to obtain the performance characteristics of nearly every kind of electrical apparatus. It particularly fills the need for an oscillograph operating at frequencies up to a million or more cycles per second.

The spot of light produced by the cathode ray on a screen within the tube may be moved simultaneously in 2 directions by varying voltages applied to 2 pairs of internal deflector plates, or by current passing through external coils, the resulting trace giving the relation between the 2 currents or voltages. A deflection of one inch is produced by 25 volts on a pair of deflector plates or by 25-ampere turns in suitable coils.

The power equipment required for the tube is a 300-volt B battery and a 6-volt storage battery.

**Western Electric Vacuum Thermocouples**

The Western Electric Vacuum Thermocouple is a hot wire instrument for use in making accurate measurements of the values of feeble alternating currents.

Made in 16 standard types. Each of these types may be assembled in any of 3 different types of containers known as the 20, 21 or 22 types or furnished unmounted in the 23 type. Type 20 container consists of a square mahogany box with binding posts mounted on cover. Type 21 container consists of a cylindrical metal can with hard rubber base through which terminals project and to which leads may be soldered. Type 22 is similar to type 21 except projecting terminals are designed to make contact with springs of a standard vacuum tube socket. Type 23 is unmounted.

By the proper choice of these instruments used in connection with a 12-ohm galvanometer having a scale length of 130 millimeters and a full scale deflection on a current of 200 microamperes, any current from .0005 to 1 ampere may be measured with an accuracy of plus or minus 1 per cent of the minimum deflection.

Below is a table which shows the principal characteristics of each type of vacuum thermocouple. From these values the range of each vacuum thermocouple with the particular type of galvanometer with which it is associated can be determined by the application of Ohm's law.

Type	Heater Resistance		ELECTROMOTIVE FORCE OF		Type	Heater Resistance		ELECTROMOTIVE FORCE OF	
	Ohms	Ohms	.005 V. Amp.	.015 V. Amp.		Ohms	Ohms	.005 V. Amp.	.015 V. Amp.

**Western Electric Magneto Non-Multiple  
Switchboards**

**No. 1800 Sectional Unit Type**

Method of Assembling No. 1800 Switchboard to 35 Line Capacity

The unit or sectional type construction for the small switchboard was introduced by the Western Electric Company a number of years ago, and since that time has been supplying the demand of discriminating buyers for a small switchboard that would meet their traffic requirements and eliminate the necessity of buying an "oversize switchboard."

The capacity of the No. 1800 Unit Type Switchboard is from 10 to 50 lines. While 50 lines has been set as an arbitrary maximum it is safe to assume that with a normally low calling rate as many as 70 or 80 lines can be handled conveniently. While the No. 1800 Unit Type Switchboard is small in size (floor space required only 2 feet x 2½ feet), this does not mean that this board receives less consideration or care in manufacture than a larger switchboard, for the same quality of material, skilled workmanship and rigid inspection are applied to all of the Western Electric products regardless of size. Red oak lumber, which has been kiln-dried, thoroughly seasoned and given a dark rubbed finish, is used in the construction of the units. The inside of the units have been specially treated to preserve wood and prevent warping or cracking.

To meet various requirements, there are different types of base or supporting units, cord units, line units and top units. To assemble a switchboard of 10 lines capacity for example it is only necessary to select units as follows:

- 1 Supporting Unit
- 1 Cord Unit
- 1 Line Unit
- 1 Top Unit

These units are easily assembled into a complete switchboard which presents a neat, compact and serviceable appearance and can be arranged to meet any service condition. Line units can be added at any time.

All of the apparatus and terminals associated with the operator's cord and telephone circuits are mounted in the cord unit.

The circuits used are very simple. A diagram of each circuit is pasted to the inside of the rear doors for convenient reference. The back of each unit is hinged and, when open, all of the wiring and equipment are easily accessible.

This switchboard is specially recommended for small, rapidly growing telephone exchanges where the ultimate capacity cannot be definitely determined.

## No. 1012 *Western Electric* Magneto Wall Switchboards

### Ringer Type

This switchboard is intended for use in exchanges having 10 lines or less, and where the number of calls does not warrant having a regular telephone operator in attendance.

It has been installed by numerous rural companies who desire a switching station established in the country in which case it is installed in a farmer's home and the calls are answered by members of the family.

Being equipped with ringers, constant attendance at the switchboard is not necessary as the bells can be heard at some distance from the board.

In addition to this ringer, indicators are supplied with each ringer which gives a visible signal showing which bell has been ringing.

The cabinet is well constructed of thoroughly seasoned, quarter sawed oak, which is given a durable light finish. The front is hinged and the apparatus and wiring is within easy reach for inspection or maintenance.

### Equipment

Each line is provided with a jack and a 1000 ohm ringer, although 1600 or 2500 ohm ringers can be furnished if required. Four-cord circuits, with a listening-in jack bridged across the tip and ring, and a listening cord are provided for handling the calls, no supervisory or ring off signals being provided. A powerful five-bar hand generator is furnished for ringing purposes. The operator's telephone set consists of the regular long distance transmitter and receiver.

### Operation

Subscribers are called by ringing with the hand generator over the listening cord with which the operator answers calls and listens in for supervisory purposes. Connections are made with the other cords, without the use of keys.

## No. 1240-D *Western Electric* Magneto Switchboards

### Non-multiple—Automatically Restored Line Signals

Capacity, 165 Lines 15 Cord Circuits

Front View

as to be within easy reach of the operator, reducing that work to a minimum.

The lumber used in the construction of the cabinet is red oak, thoroughly seasoned and kiln dried to prevent warping or cracking.

The exterior of the cabinet is given a dull golden oak finish which is very serviceable. As an added precaution against warping, cracking or decay the interior surfaces are coated with shellac.

The steel framework which supports the face equipment is copper plated as a protection against corrosion or rust, also insuring a positive ground connection for the apparatus.

An apparatus and terminal board is mounted in the rear of the switchboard on which are mounted the repeating coils, night alarm bell, and large screw terminals where all power wiring such as power ringing, transmitter battery, night alarm battery, monitor taps, etc., are terminated.

The No. 1240-D non-multiple magneto switchboard is furnished with either single or double supervision cord circuits. Single supervision boards may, if desired, be equipped with five cord circuits having toroidal repeating coils and switching keys. Double supervision boards may be equipped with either the condenser type non-hang-up cord circuits, or the condenser repeating coil type non-hang-up, non-ring-through cord circuits. The present switchboard, if arranged for single supervision, may be changed to a double supervision board simply by installing the necessary additional apparatus.

Dimensions

**No. 1801 Western Electric Private Exchange Switchboards**  
 Central Battery—Sectional Unit Type

Systems B, C or D

The No. 1801 sectional unit type switchboard (like the No. 1800) was originated by the Western Electric Co., and introduced to the telephone trade to supply the demand for a small flexible and economical switchboard. Adaptable to many conditions, this switchboard has been installed by small telephone companies, as private branch exchanges, for hotels, factories, public schools and institutions or any place where telephone service was required and the ultimate capacity could not be definitely determined.

Being of the unit type, with construction somewhat similar to the sectional book case, and so arranged that additional units may be readily added when required, this switchboard is adaptable to many line and traffic conditions which are met on the small exchange. The rear of the units is permanently closed. The front panels of all units are held in place with thumb screw locks and are hinged to permit access to the wiring, terminals and apparatus. All connections are made under screw terminals.

System A

used with the systems are listed under heading: Central Battery Telephones.

**SYSTEM A.**—This system provides for communication between the switchboard and stations only. There are no facilities for inter-communication between stations or for connections to a central office.

**SYSTEM B.**—This system embodies all of the features of System "A" and in addition has facilities or intercommunication between stations.

**SYSTEM C.**—This system embodies all of the features of System "B" and in addition two plug ended trunks are provided which may be equipped for connections to either magneto or central battery central offices.

**NOTE.**—Direct current is used for ringing the telephone bells in Systems A, B and C.

**SYSTEM D.**—This system has all of the features of system "C" except that it employs the regular two wire line circuit, and alternating current is used for ringing purposes.

The telephone sets used with this system are the regular central battery sets used with central office systems.

Write our nearest house for particulars. State which system is best suited for your requirements.

**No. 1962 Western Electric Private Branch Exchange Switchboards**  
 Sanitary Type

Capacity: 200 Central Battery Local Lines  
 8 Trunk Lines, 12 Cord Circuits

This switchboard is designed for use as a private branch exchange connecting with a public telephone system. It is of the central battery type, making use of lamp line signals and lamp supervisory signals. The line signal is associated directly with the corresponding line jack. The lamp supervision is

positive as the signal is closely associated with the corresponding cord. This arrangement provides for rapid and reliable operation.

This type of board is furnished with either plug or jack-ended trunks. The plug-ended trunks provide for reducing the number of connecting cords and are an efficient means of providing inter-connections with a city exchange system. The jack-ended trunks afford high-class connections and are somewhat less expensive than plug-ended trunks. They also require the furnishing of a somewhat greater number of connecting cord circuits. These trunks may be supplied for connection to either a magneto or a central battery office. When plug-ended trunks are furnished, holding jack circuits are also supplied to enable an operator to hold the exchange trunks when all four lines happen to be busy.

This type of switchboard is furnished only in a single position section, but two sections can be lined up together to appear as one section and a drawer unit can be supplied at either or both ends of a one or two position line-up. The key-shelf is 30½ inches high, which permits the use of an ordinary office chair, also provides for lining up the switchboard with standard office desks.

The standard wood work is birch with mahogany finish, or quarter sawed oak, light finish.

Built along the lines of modern office furniture it will harmonize with the surroundings in any modern office.

The No. 1962 switchboard being universally wired is adaptable to the varied requirements of private branch exchange service. It is designed to handle all practical service conditions which have arisen since the advent of the private exchange idea.

In addition to including all of the popular features adapted to private branch exchange service the No. 1962 switchboard is of the "Sanitary Desk Type" of construction which represents the Western Electric Company's most recent development and departure from old manufacturing methods. This switchboard is evidence of the continuous efforts being exerted by the Western Electric engineers toward the development of modern switchboards which will meet the exacting demands of discriminating buyers and still retain the simplicity of operation, quality of material, skilled workmanship and low maintenance cost, which have been characteristic of Western Electric products in the past.

DIAGRAM SHOWING DIMENSIONS OF NO. 1962 SWITCHBOARD.

**Dimensions**

## No. 1948 *Western Electric* Central Battery Non-multiple Switchboards Sanitary Type

Capacity: 240 Central Battery Lines, 40 Toll  
or Rural Lines, 20 Transfer Trunks

The No. 1948 Switchboard is designed to provide the small telephone companies who desire central battery service with modern, efficient and reliable equipment. It is built along the lines of the modern office desk, having square lines generally, square legs (metal capped at bottom) and a clearance underneath for cleaning purposes, hence the term "Sanitary Type" and is the Western Electric Company's latest departure from old methods of small switchboard manufacture. Meeting the demands of exacting buyers as it does is evidence of the confidence enjoyed by this company in the development of a much needed small central battery switchboard which is easy to operate, economical to maintain and constructed of the same materials which enter into the construction of the larger boards upon which the Western Electric Company's reputation for quality products is built and maintained.

DIAGRAM SHOWING DIMENSIONS OF NO. 1948 SWITCHBOARD.

### Dimensions

Cord circuits are arranged with lamp supervisory signals, giving positive supervision. Any or all cord circuits can be arranged to operate as straight central battery or full universal.

In the universal circuits, toroidal type repeating coils will be furnished if specified. When these are furnished, cutout key may be used so that if two magneto lines are connected, the repeating coil may be either cut in or out of circuit. When a magneto and central battery line are connected, the repeating coil equipment will serve to minimize noise.

Various ringing combinations are available. To provide for any of these, universal wiring is installed.

Suspended type transmitters are usually furnished, but chest type transmitters will be supplied, if ordered.

Write our nearest house for particulars.

## No. 551 Type *Western Electric* Private Branch Exchange Switchboards

This switchboard has the distinction of being a pioneer in the private branch exchange field since the adoption of the modern flat type relays, it being the first private branch exchange switchboard in which the new relays were used. The No. 551B switchboard in both the 30 and 80-line capacities makes an ideal installation in any city or town where the present equipment of the main central office is of the manual central battery type.

The compact cabinet presents a neat appearance and compares favorably with the furniture in any modern office.

If there is a possibility of a change from manual to machine switching telephone equipment the purchase of the No. 551C switchboard, which has trunks arranged for connection to machine switching offices, including the necessary dialing features, is recommended.

### Types and Capacity

Type	551A (40)	551B (80)	551B (320)
Station Lines Total	40	80	320
*Station Lines Wired for			
Relays	10	20	20
Trunk Lines	10	15	15
Cord Circuits	10	15	15

\*Certain lines are wired for relays to be used on lines where the telephone is located considerable distance (800 feet) from the switchboard. Relays are not provided unless specified.

Red oak lumber with a dark finish or birch with a mahogany finish is used for all exposed woodwork parts. The lumber is kiln dried and thoroughly seasoned to prevent warping and cracking. Iron reinforcing brackets are placed on the inside of the cabinet at the corners giving added strength. The keyshelves and fronts of the 551-P.B.X.'s have been faced with phenol fibre rubbed a dull black which not only results in a pleasing rich appearance but provides a hard and durable surface.

The stile strips which hold the line jacks and lamp sockets in place as well as the key mounting strips in the keyshelf consist of cold drawn galvanized steel. This insures alignment of the face and keyboard equipment also prevents damage from moisture.

All apparatus inside the section, except hand generator and ringing resistance lamp, is mounted upon a relay gate which makes equipment immediately available for adjustment while gate is closed and leaves wiring fully exposed when gate is open. Cord-weight protection panel is mounted on the relay gate rather than being fixed in the section so that when gate is open and work is being done on cords or hand generator the gate wiring is still protected from damage.

Gate is equipped with mounting clips and screws. The mounting clips hold the relay mounting plates on the relay gate and permit the use of the one-piece relay gate.

The cabinet is compact and all parts are easily accessible. Switchboards in the 80 line capacity are equipped with removable end panels. This permits lining up of 2 boards and makes an ideal installation where several positions are required.

The line circuits are simple and terminate on terminal strips which are easily accessible.

**No. 551 Type Western Electric Private Branch Exchange Switchboards**

Continued

Certain lines are arranged for use with relays and intended to be used for the stations located considerable distance (800 feet) from the switchboard. The latest standard flat type relays are used throughout which permits placing the maximum amount of equipment in a small place.

Strip line jacks and associated lamp sockets are used in all boards on the line circuits. The number of jacks and lamps required are equipped and the remaining jack and lamp positions plugged with apparatus blanks. The blanks can be removed and jacks and lamps installed at any time. The panels upon which the individual jack and lamp sockets are mounted consist of one piece of dull finished black faced fibre which does not reflect the light. A designation strip is provided above each row of jacks for convenience in numbering. The black faced fibre panel presents a neat appearance and insures perfect alignment of the face equipment.

Jack ended trunks are used on all No. 551 type boards. The jacks and lamp sockets are individually mounted.

The cord circuits embody all of the features required for the successful operation of the private branch exchange. Connections between stations and from stations to trunks are easily established. Each cord circuit is arranged for dialing by the operator from the board and through dialing from any station on the private branch exchange to the machine switching exchange. This through dialing is accomplished by the operator throwing the night key and through dialing key in the proper position after putting up the night connections. The function of the night key is to cut out all the equipment from the circuit which is not required for night service.

The dial may or may not be used as desired it being easily installed when needed. It is connected to the local cable by means of a flexible cord and the dial itself held in place by a spring clip which is screwed to the keyboard. When the dial is not equipped the hole for the cord is suitably covered with an apparatus blank.

**No. 2062 P. B. X. Switchboards**

Designed to meet the demand for a private branch exchange switchboard of 80 lines capacity, incorporating the circuits used in the 1962 switchboard. Sixty of the lines may be equipped with relays and trunk circuits may be equipped for service to common battery, magneto and machine switching central offices. The circuits are of the same simple character as those used in the 1962 switchboard, which is famous for its low maintenance.

The framework is of the same size as the

550-80 line switchboard and the boards are carried in stock equipped with 40 lines less relays, 6 trunks to common battery central office and 10 cord circuits. Boards are made of oak and arranged for the following circuits:

Local Line Circuits.....	80
Relays for Local Line Circuits.....	60
Cord Circuits.....	12
Jack Ended Trunk Circuits to Machine Switching Office.....	6
Jack Ended Trunk Circuits to Common Battery or Magneto Office.....	9
Operator's Telephone Circuit.....	1
Ringing Circuit.....	1
Night Alarm Circuit.....	1

**Western Electric Magneto Telephones**

No. 1317 Type

General Description

2-Cell, Closed View

The No. 1317 type telephone represents the highest development attained in magneto telephone design and construction. It has been standard with the Western Electric Company for more than a decade, and its high efficiency, reliability and long life has been thoroughly proven by the hundreds of thousands in service.

**2 and 3-Cell Types**

No. 1317 telephones are made in two styles, namely, the "2-cell" and the "3-cell." The talking circuits of these two types are identical, i.e., they employ the same transmitters, receivers and induction coils. The battery compartment of the "3-cell" type is suf-

ficiently large to take three standard dry cells, whereas only two dry cells can be placed in the "2-cell" type. The larger cabinet of the "3-cell" type also permits the mounting of the No. 48 type (5-bar) generator, while the "2-cell" type employs the No. 50 type (large 3-bar) generator.

The 3-cell set is the more powerful and the better set from a transmission standpoint but where a smaller set is desired the 2-cell sets can be used. The 50 type generator is exceptionally powerful for a 3-bar generator. This generator will ring thirty 2500 ohms ringers connected to a No. 12BB iron metallic telephone line 15 miles in length (provided, of course, that the line is properly installed and in good condition).

2-Cell Dimensions

3-Cell Dimensions

It will operate more telephones on a line than many 4 or 5-bar generators.

**WOODWORK AND FINISH.—**

The cabinet is made of quarter sawed oak and given three coats of high-grade varnish rubbed down by hand. Unexposed surfaces of the telephone are also given a protective finish so as to prevent warping.

**WIRING.—**All terminals including those for the transmitter, receiver, cord, line wires, etc., are plainly marked so that

there can be no possible mistake when making connections. The various cords, such as those of the transmitter and receiver and the flexible leads running to the condenser are all furnished with cord tips.

A complete and explanatory circuit label is pasted on the inside of the door of each telephone, in addition to which a booklet is furnished giving complete instructions for installation and maintenance.

**METAL FINISH.—**The transmitter bracket, gongs, switch hook, generator, crank and lock escutcheon are given an extremely durable and pleasing black finish.

**ADJUSTMENT.—**These telephones are carefully adjusted in the factory, and should, therefore, be satisfactory for service as received by the customer unless unusual service conditions should be encountered, in which case only the ringer will require readjustment. The adjustment of the ringer is a very simple matter and instructions furnished in the booklet are so clear that no difficulty will be encountered.

## Western Electric Magneto Telephones

### No. 1317 Type—Continued

No. 1317, 2-Cell, Open View

### No. 1317 3-Cell Type

The 3-cell set is the more powerful and the better set from a transmission standpoint but where a smaller set is desired, the 2-cell sets can be used. The 50 type generator is exceptionally powerful for a 3 bar generator.

- No. 323-BW Transmitter.
- No. 8A Transmitter Bracket.
- No. 143-AW Receiver.
- No. 143Y Switchhook.

\*Equipped with No. 1006A push button, Telephone user can signal central office secretly or not as desired and can signal other parties on same line by code ringing.

## Western Electric Magneto Telephones

### Nos. 6003 and 6004 Desk Types

Interior View of No. 6004D

The Nos. 6003 and 6004 type desk telephones consist of a No. 1040 AL Desk Stand and a No. 300 or 315 type Desk Set Box. These telephones comprise the combinations of desk stands and desk set boxes that are most used, and therefore for convenience in ordering, are covered by a single code number.

Combinations of apparatus differing from those covered by these code numbers listed may be obtained by ordering the separate items that will make up the desk telephone desired. The following items of apparatus are the electrical equivalent of the No. 1040 AL Desk Stand and may therefore be used in connection with any of the desk set boxes listed below.

- No. 1048AA Telephone Arm
- No. 1048AC Telephone Arm
- No. 1048AB Telephone Arm

NOTE.—In the case of the Nos. 300AA, 301AB, 315H, and 315J Desk Set Boxes provision is made for inserting a one microfarad condenser (see No. 21W condenser) in series with the receiver. However, condensers are not furnished unless so ordered.

**Western Electric Central Battery Telephones**

**Nos. 1533 and 6054 Types**

Telephones representing the highest and most modern development in central battery telephone design are found in the Nos. 1533 and 6054 types.

In addition to the superior features represented by the individual pieces of apparatus and circuits, these telephones embody a number of features that are particularly worthy of note, namely:

Ringer and gongs are enclosed within the case thereby preventing tampering, reducing maintenance and greatly improving the appearance.

Case is made of heavy sheet steel, copper plated and finished with two coats of extremely durable black enamel (baked on) especially developed for this particular purpose.

The case is constructed so that every part of the interior is easily accessible when the cover is opened.

The base is flanged thereby giving greater rigidity and preventing base from cutting into plastered surfaces.

Unit type of construction and universal terminal block employed. This permits of the telephone being readily converted from one class of service to another. This also permits of a desk set box being converted into a wall telephone or vice versa by a substitution of covers.

**No. 1533 Type Telephones**

1533G					
1533H				Selective	

All of these telephones are equipped with the No. 7A transmitter bracket, two T1-A cords, 6-inch transmitter cords and a 30-inch No. 521 receiver cord.

NOTE.—The No. 8AG ringers were formerly wound to 1000 ohms instead of 1400 ohms. The 1000 and 1400 ohms ringers have the same impedance and may be used interchangeably in service.

See separate listing for "Central Battery Telephones for Use with No. 1801 Switchboards," and for protectors.

The No. 323BW transmitters have a black finish.

**Western Electric Central Battery Telephones**

**No. 6054 Desk Type**

**No. 6054 Desk Telephone—No. 1040AL Desk Stand Partially Dismantled**

The No. 6054 desk type telephones consist of a No. 1040 type desk stand and a desk set box. These telephones comprise the combinations of desk stand and desk set boxes that are most used and, therefore, for convenience in ordering are covered by a single code number.

Combinations of apparatus differing from those covered by the No. 6054 series of code numbers may be obtained by ordering a desk stand and a desk set box as separate items, also a telephone arm or a hand set may be used in place of the desk stand if desired.

For example, any of the desk set boxes that will function with the No. 1040AL desk stand will also function with the following:

- No. 1048AA Telephone Arm
- No. 1048AB Telephone Arm
- No. 1048AC Telephone Arm
- No. 1001C and H Hand Sets (See Hand Set Hangers)
- No. 1002AC Hand Set

6054K	...	None	Series Central Battery	{ Single party and 2 party selective... }	A.C.

NOTE.—See listings of No. 534 type desk set boxes, No. 1040 desk stands and protectors.

\*The No. 8AG ringers were formerly wound up to 1000 ohms instead of 1400 ohms. The 1000 ohm and 1400 ohm ringers have the same impedance and may be used interchangeably in service.

## Western Electric Central Battery Telephones

For Use with No. 1801 Switchboard

No. 6000AE

No. 1539A

### Systems A and B

The telephones for No. 1801 Switchboard Systems A and B are of the series talking circuit type and equipped with 140 ohm vibrating bells which operate on direct current.

Code No.	Case and Finish	Mounting	Receiver
1527A	Metal, Black	Surface Wall	Watch Case Type
1539A	Metal, Black	Flush Wall	Watch Case Type
1533N	Metal, Black	Surface Wall	Hand Receiver
6034AU	No. 1020BJ	Stand Desk	Watch Case Type

NOTE.—Information on hand set type telephones and desk telephones equipped with hand receivers will be furnished on application.

### System C

The telephones for No. 1801 Switchboard System C may be of the same types as used for Systems A and B, but in case the system is connected to an outside exchange, telephones equipped with standard central battery induction coil talking circuit should be used in order to obtain satisfactory transmission, as follows:

Code No.	Case and Finish	Mounting
1533M	Metal, Black	Surface Wall
6000AE	No. 1120CN	Stand No. 295AU

### System D

Any standard central battery telephone with ringers operated by alternating current either induction coil or series types can be used with System D. The No. 1533A wall type and No. 6054A desk type telephones may be selected for this system.

### No. 1320 Type Telephones for Police Service

No. 1320A Outer Door Open

The No. 1320 type is a metal case weatherproof telephone for central battery service. It was designed primarily for the Police Patrol Service but will be found very satisfactory for general central battery service where a weatherproof telephone is required.

The apparatus is mounted on a metal frame which is removable as a unit from the case. An inner door protects the apparatus from the weather when the outer door is open. The overall dimensions are 6 $\frac{1}{8}$  inches deep by 13 $\frac{1}{8}$  inches high by 12 $\frac{3}{4}$  inches wide.

A loud ringing extension bell may be connected in multiple with the ringer of this telephone thereby providing means of signaling a patrolman from a distance (see extension bells).

A tapped hole is provided in each end of the case for receiving conduit. Four holes are drilled in the back of the case for receiving mounting screws or mounting clamps. The lock on the outer door is designed so that the key cannot be removed until the door is closed.

Outer door is not marked. Standard finish, gray paint.

Special No. 1320A telephones may be obtained with outer doors marked (raised characters cast on door) in accordance with customer's requirements; color of finish, as specified.

## Western Electric Magneto Mine Telephones

A reliable telephone system in a mine permits instant communication throughout the plant. Routine business can be easily handled with such a system. In cases of power suspension, shut downs, or emergencies involving possible loss of life or of property the telephone is of inestimable value.

GENERAL—There are three classes of location must be considered for mine telephones. 1. Dry locations above ground or in protected parts of the workings such as the Superintendent's office and the engine room. In such locations the standard wall or desk magneto telephones are recommended. 2. Exposed locations above ground or in mines in which methane or other explosive gases or coal dust are not likely to be present in dangerous proportions. In such locations No. 1336 type telephones are recommended. 3. Mines or other locations in which methane or other explosive gases or coal dust are likely to be present in dangerous proportions. The No. 1536 type telephone is recommended for such locations.

### No. 1336 Type Telephones

Briefly these are metal case magneto telephones in which the apparatus has been especially treated to provide resistance to moisture, acid fumes, and non-inflammable gas. All parts are enclosed in a cast iron case which provides protection against damage from water and falling objects. The top of the case is rounded so that water will readily drain off and any objects falling on the top will slide off to the ground. An outer door totally encloses all parts including the transmitter receiver and generator crank.

**Western Electric Magneto Mine Telephones**

Continued

**No. 1336 Type Telephones**

The sets are primarily designed for use on lines to which a large number of telephones are connected and where code ringing is used. Although intended chiefly for mine service they are also recommended for out-of-door use as in railway service, police alarm, etc.

Equipped with a No. 143J switchhook and a No. 31 induction coil.

Special No. 1336 type telephones equipped with a heavy brass padlock with 2 keys are obtainable. The padlock is attached to chain in place of latch pin. Orders for these telephones must state that padlocks are desired.

No. 1336A telephone is not equipped with a ringer. Intended for use where an extension bell is preferred to the regular telephone ringer, also for service where all the calls will be outgoing.

No. 1336E differs from the No. 1336A in that it is equipped with a ringer and an iron hood for protecting the gongs.

No. 1336J differs from the No. 1336E only in that a condenser is provided to permit the ringers of this telephone as well as others on the same line, being rung even though its receiver may have been left off the switchhook.

To add a condenser to a No. 1336 type telephone that was not originally so equipped the following apparatus and parts should be ordered: No. 21W condenser, one condenser strap P-43065, and two round head machine screws P-110187.

**Dry Cells**

Two standard size dry cells are required for each telephone to furnish current for talking. Western Electric Blue Bell Dry Cells are specially designed for telephone service and are recommended because they last longer and are more efficient for this class of service than other dry cells.

Two special Blue Bell Dry Cell cartons, impregnated with moisture-proofing compound, are furnished with each No. 1336 type telephone. These are to be substituted for the standard cartons furnished on the dry cells. These cartons resist the action of any moisture that may form on the inside of the case and prevent current leakage and rapid deterioration.

**Case**

The box, outer door, inner door and gong hood are of cast iron heavily coated with a rust-resisting finish. When the outer door is closed only the metal transmitter mouthpiece, receiver, receiver cord and the generator handle are exposed. When the outer door is closed these parts are protected from mechanical injury. When using this telephone it is, of course, evident that only the outer door need be opened.

**Entrance for Line Wires**

The line wires may be brought in either at the top or the bottom of the case. A short length of pipe is screwed into the top of the case and is covered with a pipe cap. This cap prevents water running into the set by following the line wires. In case the line wire is to be run to the telephone in pipe (conduit) no difficulty will be encountered in joining the conduit to the telephone as the wire entrance hole at bottom as well as the top of the case is tapped.

**Mounting**

Wrought iron mounting bars are secured to the back of the case. The upper end of these have pear shaped holes, and with this arrangement the telephone can be readily mounted by one man and without any danger of damaging it. This is accomplished by driving two lag screws into the mounting surface until their heads project about  $\frac{1}{2}$  inch. The telephone may then be hung upon these mounting screws (the heads of the lag screws will pass through the large end of the pear shaped holes) after which the lower mounting screws may be driven into place through the holes in the lower end of the mounting bars. Wrought iron mounting bars are employed as they are less subject to breakage than if lugs were cast on the case.

**Western Electric Magneto Mine Telephones**

Continued

**No. 1536 Type Telephones**

Designed especially for use in mines and other locations subject to the hazard of explosive gases or coal dust and have been declared by the United States Bureau of Mines permissible for use in mines or other locations where methane or other explosive gases or coal dust are likely to be present in dangerous proportions.

No. 1536E telephone is the same as the 1336E except that protective features are incorporated in the electrical contacts of the switchhook, generator, ringer.

No. 1536E has a 149A switchhook, a 31 induction coil and is furnished without condenser unless the condenser is called for in the order. The outer door is omitted. Projecting hood over the door protects the transmitter, receiver and generator crank. Line wires are brought in either top or bottom, when from the top an angle fixture is provided so moisture cannot enter. Holes in the bottom of the set drain off any accumulation of moisture. Special cordage adapter is provided at the receiver connection of the cord. Unusually hard usage and hoisting will not fray the insulation. Internal mechanism, batteries, line connection, etc. in the housing are inaccessible without unlocking the door and removing the cap screws around the side of the door. Switch hook, generator and ringer are separately removable so they can be carried away for repairs.

Two Blue Bell dry cells with screw terminals are furnished as part of the set. Cartons P-201339 are furnished with sets, but new cells can be ordered without cartons as one carton has a longer life than the cell. Wrought iron bars are secured to the back of the set for mounting. Two lag screws are needed (but not furnished) to mount set. Set as furnished is permissible, any change automatically voids the approval of the Bureau of Mines.

**Systems**

For a system in which all the telephones are connected to a party line, the set should be of such a design that all the stations can be clearly signaled, for example: No. 1336J telephone set for service below ground or exposed locations above ground and the 1536E for gaseous locations. No. 1317S wall telephone set for service above ground in unexposed locations or No. 6004-B desk type telephone set.

It is preferable, in cases where the size of the system warrants, to use a number of lines connected to a switchboard rather than to depend on one party line. Any of the lines may be a party line but it is much better to have the important stations such as engine room and superintendent's office connected to the switchboard by individual lines. With a switchboard and individual lines the 1336E or the 1536E telephones should be used below ground and in exposed locations. For the lightly loaded lines above ground and not exposed the 1317AH wall telephone set or the 6003B desk telephone set can be used.

**Ringers and Extension Bells**

The ringers used in these telephones may be readily adjusted if necessary with a screwdriver. The gongs emit a loud distinct ring, which can be heard a long distance, particularly so underground. However it is often desired to provide loud ringing extension bells in connection with mine telephones and for this purpose the No. 392 and No. 342 type extension bells are recommended as they are designed to withstand the severe conditions encountered in mine service.

**Protectors**

The telephone installed above ground should be equipped with protectors consisting of open space cut outs (for example the No. 60AP protector) to prevent damage to the telephone by lightning. In case there is a chance of contact between the telephone line and a power circuit protectors consisting of open space cut outs and fuses (for example the No. 58AP protector) should be used.

## Western Electric Street Railway Telephones

### Magneto and Battery Types

No. 1278 type telephones employ weatherproof iron boxes and are provided with insulated circuits. They are intended principally for exterior use by street railway companies operating telephone lines on which there is a chance of crosses with low voltage power circuits. This type telephone is arranged so that its circuit is cut off from the line except when its door is opened. When the telephone is in use a repeating coil is interposed between the line and telephone circuit proper, so as to protect the user, as far

as possible, from the chance of injury should the line become crossed with a low voltage circuit. When the door is opened, a line switch is released which connects one winding of the repeating coil across the line and connects two fuses and two open space cut-outs into this circuit. The telephone circuit proper is connected to the second winding of the repeating coil and has no direct contact with the line circuit. The fact that a repeating coil is interposed between the line circuit and the telephone circuit reduces the efficiency of the telephone to some extent and, therefore, the use of these telephones is not recommended on heavily loaded lines, except where the protective feature is essential. See No. 1336 type telephones. In case a car is held up awaiting orders from the dispatcher the door of the telephone is left open so as to permit of the telephone being signalled. (It is impossible for the telephone to be signalled when its door is closed.) As the talking circuit is only closed when the push button in the hand set is depressed, the battery in the telephone is not wasted under the above condition. The apparatus of this telephone is mounted on an iron shelf, which may be removed as a unit from the telephone for inspection. The connection between the apparatus on the shelf and the line and ground terminals is made through the medium of clips which register with contacts mounted on a terminal block secured to the back of the case. The case and door are of cast iron and have a galvanized finish. Both the top and bottom ends of the case are tapped for receiving 1/2 inch conduit.

The F, G and J telephones are equipped with a lock which is arranged so that the key cannot be removed until the door of the telephone is closed. The No. 1278H is equipped with a hasp, staple and pin similar to that used on No. 1336 type telephones, but padlock is not included.

### For Magneto Service

Code No.	Hand Set	RINGER Resistance No. (Ohms)	Generator	Ind. C. Coil	Repeating Coil	Lock	Class of Service	For Line Load

1278J	1001H	51AG 1000	None	13	25E	5B	†Code	Medium
-------	-------	-----------	------	----	-----	----	-------	--------

Designed for medium line load.

In addition to the apparatus listed above these telephones are each equipped with: A special door switch. A special protector.

- 2 D. & W. No. 5001 Type C fuses—500 volt 1 ampere.
  - 2 No. 2 protector blocks.
  - 2 No. 1 protector blocks.
  - 2 No. 3 protector micas.
- Dry cells must be ordered as a separate item.

\*Equipped with hasp, staple and pin the same as No. 1336 type telephones. Ringer is disconnected from the line when door of telephone is closed.

†Generators have special mounting brackets.

## Western Electric Portable Magneto Telephones

No. 1330E Closed

No. 1330E Open

### Nos. 1330 and 1331 Types

These are complete magneto telephones mounted in substantial wooden cases. They are primarily for use in railway service and are designed to withstand the jarring and rough handling incident to train service. In addition to railway service these telephones are suitable for any service where a substantial type of portable telephone is required. While these telephones are not waterproof they are designed to withstand ordinary weather conditions.

The Nos. 1330F and 1331F telephones are equipped with a six-foot waterproof cord and No. 146 plug for connecting them to a telephone line through a No. 186 pole jack.

The Nos. 1330E and 1331E telephones are intended primarily for use where connection to the line will be made with a line pole.

### No. 1375 Type

The No. 1375B is especially adapted for use in cases where the telephone user must carry the telephone considerable distances. While it is primarily intended for use on moderately loaded lines, the design of the generator is such that it may be satisfactorily operated on heavily loaded lines.

The generator, induction, coil buzzer and terminal block are mounted on an aluminum frame and secured in the case by means of machine screws.

The case is made of high grade leather and is designed to withstand considerable rough handling.

**Gray Telephone Pay Stations**

**Non-Electrical—For Local or Central Battery Service**

**No. 7 Mounted on a Central Battery Telephone**

**No. 11 Mounted on a No. 1317 Wall Telephone**

**No. 14 Mounted with a No. 1020 Desk Stand**

The operation of these pay stations is accomplished without the aid of moving parts or electrical connections, the signals being produced by the coins striking gongs or chimes, the sound of which is transmitted to the central office operator through the transmitter of the telephone at which the pay station is located. In view of the simplicity and reliability of these pay stations, their maintenance cost is extremely low.

(These pay stations cannot be used for pre-payment service, as the coin is not under the control of the central office operator, as in the Western Electric No. 7 and No. 50 type Coin Collectors.)

**No. 7**

This will be drilled to take standard transmitter arms.

Gray Code No.	Type of Telephone Used On	Coins Arranged For	Approx. Size In.
7	Wall	Nickels, Dimes and Quarters	9x4½x3

This pay station will not be provided with a mounting bracket unless specifically so ordered.

8A	Wall	Nickels	7x3¾x3½
----	------	---------	---------

Bracket for No. 8A Pay Station. In ordering this bracket, specify the make and code number of the telephone on which the pay station is to be used in order that the proper form of bracket may be furnished.

**No. 11**

A mounting plate is included with this pay station for mounting it at the side of a telephone, as shown in cut.

11	Wall	Nickels, Dimes and Quarters	9x4½x3
----	------	-----------------------------	--------

**No. 13A**

This equipped with two clamps of such size as to fit the stem of a standard desk telephone. In ordering, specify type and make of desk telephone with which it is intended for use.

13A	Desk	Nickels	9½x3½x3¼
-----	------	---------	----------

**No. 14**

Fittings will be furnished with this pay-station to permit of attachment to standard types of desk telephones. In ordering, specify the type and make of desk telephone with which it is intended for use.

14	Desk	Nickels, Dimes and Quarters	11x4½x3½
----	------	-----------------------------	----------

**No. 20**

This pay station will be equipped with fittings to permit of its being attached to a standard type of desk telephone. Fittings are arranged so that the unit thus formed may be fastened to a counter or telephone booth shelf. In ordering, specify the type and make of desk telephone with which it is intended for use.

20	Desk	Nickels, Dimes and Quarters	10¾x4¼x3¼
----	------	-----------------------------	-----------

The above code numbers cover pay station boxes only.

**Telephone Booths**

**No. 1 Type Folding Door**

Designed for installation in groups being built in units with unfinished sides. They are placed with separators between adjacent units and assembled with panels at either end of the group of compartments. The backs of the units are finished as indicated in the code listings.

The folding door construction makes these booths particularly desirable for use in narrow hallways or passages as the door opens and closes in a space only three inches beyond the front surface of the booth. This door will remain as placed in any position. The sides, ceiling and the lower panel of the door on the inside are lined with sheet metal. The floor and front base-board are covered with linoleum and the threshold is protected with a safety tread.

The ceiling of the booth is 4½ inches below the roof and the intervening space may be used as a wiring chamber and to house an electric light relay or door switch equipment when these features are required.

These booths are strong and substantial in construction.

The special folding door design not only economizes space but protects the user.

**Standard No. 1 Type Booths**

1	Birch Booth Unit with Hardwood Back
1	Birch Booth Unit with Softwood Back

The above listings of No. 1 type booths do not include end panels, separators, seats, locks, keys and lighting equipment. These items must be ordered separately.

Telephone Booths

No. 2 Type Folding Door

Booth Half Closed

Over All Height, 88 1/4 Inches

The No. 2 type booth is built as a single unit and presents a neat and pleasing appearance from all points of view. Several of these booths may be placed next to each other to form a group, such booths being ordered without glass panels in the sides, that is, they would have glass panels in the doors only.

The following points should be noted in considering the advantages of this form of booth construction.

The movement of the Folding Door takes but 3 inches of space beyond the front of the booth, making it possible to use this type of booth in narrow passageways.

Door is open at all times when booth is not in use. This is the only practical plan for booth ventilation. The point where the 2 leaves of the Folding Door meet is of such design as to prevent any chance of injuring the fingers or hand. Can be both closed and opened by pulling on the handle.

The Folding Door does not require the use of tracks in the floor. The design of the Folding Door is such that it will remain open or closed without the use of latches or catches.

The Folding Door folds within the booth.

Standard No. 2 Type Booths

Code No.	Material	Finish	Description
2A	Oak	Plain Medium	2 Glasses in Door, 2 in Left Side, 1 in Right Side.

2	Gumwood	Gumwood Finish	2 Glasses in Door, 2 in Left Side, 1 in Right Side.
2G	Oak	Plain Medium	2 Glasses in Door Only.
2H	Birch	Dark Mahogany	2 Glasses in Door Only.
2J	Birch	Light Mahogany	2 Glasses in Door Only.
2	Walnut	Walnut Finish	2 Glasses in Door Only.
2	Gumwood	Gumwood	2 Glasses in Door Only.

Equipment

INTERIOR.—Sides, back and ceiling lined with sheet metal.

FLOOR.—Hardwood flooring.

THRESHOLD.—Protected with safety tread.

DOOR.—Always hinged on right-hand side (facing booth).

SHLELF.—Furnished with each booth. Shelf is intended only as an elbow rest.

WIRING.—Space between ceiling and roof (27 1/4 inches wide, 27 1/4 inches deep, 4 1/2 inches high) is provided as a wiring chamber, and as a housing for electric light relay or door switch equipment. A wiring slot is provided back of inside corner moulding. Ceiling of booth is bored for electric light fixture, and to receive a door switch designed to operate an electric light by movement of the door.

SEAT.—Made of oak or birch.

Telephone Booths

No. 3 Receding Door

Booth Half Closed

Dimensions Over All Height, 83 1/2 Inches

The No. 3 type receding (or sliding) door telephone booth is built as a single unit and is especially characteristic in its design. It is made throughout of genuine kiln dried selected plain white oak or birch equipped with a reinforced back panel for mounting a wall telephone or coin collector set. It also has a writing-shelf. This receding door booth construction makes these booths especially desirable for use in narrow hallways or passages as the door only extends a maximum of six inches beyond the front surface of the booth when open. The No. 3 type has no grooves in the floor where dirt can accumulate and interfere with the operation of the door and it is provided with mechanical devices to permit the door being opened and closed in a smooth and easy manner. When the door is in closed position, it is only necessary to push on the right-hand side of the door. This feature from a user's standpoint is important.

Several of these booths may be placed adjoining each other to form a group or battery, such booths being ordered without glass panels in sides.

OUTSIDE DIMENSIONS.—(Booth assembled). 83 1/2 inches high, 28 1/2 inches wide and 29 1/4 inches deep.

INSIDE DIMENSIONS.—80 1/2 inches high, 27 inches wide and 27 1/4 inches deep.

DOOR OPENING.—77 1/4 inches high, 23 inches wide.

DOOR EQUIPMENT.—The door is equipped with patented steel, nickel-plated hardware consisting of:

1 swivel roller guide and track on top of door, 1 sliding guide on bottom of door which operates on outside edge of tread, 2 roller hinges on back edge of door which operate on tracks fastened to side of cabinet, 1 handle for inside of door, 1 lead aluminum tread at front edge of bottom.

FINISH.—The booth is thoroughly finished inside and out in following manner:

The sides and front are stained, filled, then given one coat of shellac and a final coat of flat varnish, producing a smooth satin finish. The back and top are stained, filled and given one coat of varnish. The floor is thoroughly oiled.

SHIPPING.—The booths are shipped "knocked down" in a substantial crate, ready for assembly, upon receipt at destination. Orders for this type of booth should specify the following code and descriptive information.

Code No.	Material	Finish	Description
3A	Plain Oak	Medium Oak	1 Glass Panel in Door, 1 Glass in Right Side.
3B	Birch	Dark Mahogany	1 Glass Panel in Door, 1 Glass in Right Side.
3C	Birch	Light Mahogany	1 Glass Panel in Door, 1 Glass in Right Side.
3D	Plain Oak	Medium Oak	1 Glass in Door, 1 in Right Side, 1 in Left Side.
3E	Birch	Dark Mahogany	1 Glass in Door, 1 in Right Side, 1 in Left Side.
3F	Birch	Light Mahogany	1 Glass in Door, 1 in Right Side, 1 in Left Side.
3G	Plain Oak	Medium Oak	1 Glass Panel in Door Only.
3H	Birch	Dark Mahogany	1 Glass Panel in Door Only.
3J	Birch	Light Mahogany	1 Glass Panel in Door Only.

**Telephone Booths  
No. 4 Swinging Door**

Booth Half Closed

Dimensions Overall Height, 83 1/2 Inches

**BOOTH CONSTRUCTION.**—The No. 4 type telephone booth is made throughout of genuine kiln dried plain white oak (with medium oak finish) or birch (with a light or dark mahogany finish). All sides are framed and paneled 3-ply. The door is equipped with a glass upper panel. The right or left sides of the booth are interchangeable and can also be equipped with glass upper panel if desired.

This booth is equipped with a reinforced back for mounting either a wall telephone or coin collector set. A writing-shelf 5 3/4 inches wide is also supplied which affords means for mounting a desk telephone.

**OUTSIDE DIMENSIONS.**—(Booth assembled). 83 1/2 inches high, 28 1/2 inches wide and 29 1/4 inches deep.

**INSIDE DIMENSIONS.**—80 1/2 inches high, 27 inches wide and 27 1/4 inches deep.

**DOOR OPENING.**—77 inches high and 23 inches wide.

**DOOR EQUIPMENT.**—The door is attached to the door-frame with three substantial hinges, finished in black japan and the mortise lock with knob on each side is finished in japan.

A lead alunalun door tread is supplied on this booth.

**FINISH.**—The booth is thoroughly finished inside and out in the following manner:

The sides and front are stained, filled, then given one coat of first coat shellac and finished in flat varnish producing a smooth satin finish. The back and top are stained, filled, and given one coat of varnish.

The floor is thoroughly oiled.

**SHIPPING.**—The booth is shipped "knocked down" in a substantial crate, ready for assembly upon receipt at destination. A card giving full instructions for the assembly of the booth is packed with each unit.

**ORDERS** for this type of booth should specify the following code and descriptive information:

Code No.	Material	Finish	Description
4A	Plain Oak	Medium Oak	1 Glass Panel in Door, 1 Glass in Right Side.
4B	Birch	Dark Mahogany	1 Glass Panel in Door, 1 Glass in Right Side.

**Type C Western Electric Cable Terminals**

A No. 22 B.&S. gauge cable stub 6 1/2 feet long will be furnished on Nos. C-10 and C-16 unless otherwise specified. A 7-foot, No. 22 B.&S. gauge cable stub will be furnished with No. C-26 unless otherwise specified.

Code No.	No. of Pairs	Height Inches	Replaces
C-10	10	12 3/4	8A
C-16	16	14 5/8	8B & 8D
C-26	26	17 3/4	8C & 8E

**No. 14 Type Western Electric Cable Terminals**

**Without Protectors**

This is for open wire distribution from lead-covered aerial cable, and is intended to be mounted on poles or buildings. No arrangement is made for protective devices. A six-foot No. 22 B.&S. gauge cable stub is standard.

Code No.	Capacity Pairs	Length Including Nipples	Width of Cover In.
14B	11	10 3/32	7 1/16
14C	16	12 21/32	7 1/16
14D	26	17 23/32	7 1/16

**No. 18 Type Western Electric Cable Terminals**

**With Protectors**

This is a protected terminal for open wire distribution from lead-covered aerial and underground cable. Inclosed in a black finished galvanized iron cover approximately 8 1/16 inches in diameter, provided with a safety chain fastened to the mounting base.

Arranged for mounting on poles. Equipped with: No. 7A fuses (7 ampere unless otherwise specified). No. 1 protector blocks. No. 2 protector blocks. No. 3 protector micas.

A six-foot No. 22 B.&S. gauge cable stub is standard.

Code No.	Capacity Pairs	Length Inches	Code No.	Capacity Pairs	Length Inches

18C	25	28 23/32	18F	60	53 21/32

**Western Electric Unmounted Condensers**

Used in on party lines where ringing trouble occurs due to "listening in" or leaving receivers off hook.

Telephones equipped with one of these condensers wired in series with the receiver overcome this difficulty, and it is possible to ring satisfactorily on a line with several receivers off.

Code No.	Capacity Micro Farads	Tested on Voltage	Use

21R	0.1	500 D.C.	General
21U	0.05	1200 A.C.	Railway Sets

**NOTE.**—In addition to the 21W condenser, a condenser strap P-43065 and two 8x1 1/2-inch round head wood screws should be ordered separately in case it is desired to mount this condenser in a wooden telephone set box.

**Western Electric Hand Generators**

No. 48A

Western Electric hand generators are correct in both mechanical and electrical design and the materials used and manufacturing processes employed are such that their high efficiency is retained indefinitely.

All parts are accurately machined and fitted and the bearings are of such size that no trouble due to the armature scraping on the pole pieces will be encountered even after years of service. The gears are accurately cut.

All metal parts are given a protective finish and the armature winding is moistureproofed. The magnets are made from steel which was developed especially for this purpose.

**No. 22 Type Generators**

The No. 22 type generator is used on lightly loaded magneto lines and may be obtained for alternating or pulsating current.

These generators have three magnets except the No. 22E, which has only two.

**No. 29 Type Generators**

The No. 29 type generators are used where light weight is essential as in linemen's test sets, and portable telephones.

**No. 48 Type Generators**

The No. 48 is our most powerful hand generator and is used in telephone for heavily loaded line service.

**No. 50 Type Generators**

The No. 50 type generator was designed for use on moderately loaded lines and while it only has three magnets, it is considerably more powerful than a good many five-bar generators on the market, and will be found satisfactory for use on all but the very heaviest loaded lines. On a line of 12000 ohms, the No. 50 generator will operate six 2500 ohms Western Electric ringers and will operate thirty-five 2500 ohms Western Electric ringers on a line of about 1000 ohms.

No. 50A

The No. 50 generator is approximately 75% as powerful as the No. 48 type.

**Western Electric Hand Generator Boxes**

A hand generator box consists of a generator mounted in an oak cabinet having a hinged cover.

The leads from the generator are connected to terminals mounted close to the inside edge of the box.

Code No.	Generator	Current	DIMENSIONS OF BOX, INCHES		
			Width	Depth	Length
299F	48A	A. C.	8	6	9
299G	48B	A. C. and P. C.	8	6	9
303G	50A	A. C.	7 <sup>29</sup> / <sub>32</sub>	4 <sup>13</sup> / <sub>32</sub>	8 <sup>1</sup> / <sub>8</sub>

**No. 1001 Type Western Electric Hand Sets**

No. 1001A

The No. 1001 type hand sets have been manufactured for over fifteen years. They were originally intended for the use of linemen and are designed to withstand the rough handling, incidental to such service.

This design proved to be so satisfactory that it is now used extensively for a number of different purposes, as described below.

The handles are made of brass tubing with drawn brass end pieces and the transmitters and receivers are provided with drawn brass cases equipped with screw clamping rings, thereby making an instrument that is extremely rugged.

The No. 1001-C, and H hand sets are provided with a push button switch which is connected so that these hand sets function the same as the No. 1020-AL desk stand. In view of this, they may be used in connection with our regular magneto and central battery desk set boxes in place of a desk stand, in cases where the service conditions are such that a hand set is required. These hand sets have a nickel-plated finish.

**No. 1001A**

Used by linemen as a test set on central battery lines. The cord is equipped with spring connection clips.

Code No.	Transmitter	Receiver	CORDS		Push Button Spring Combination
			Code No.	Length	
1001A	244W	131W	243	8 in.	None
			2-574	3 ft.	
			(Waterproof)		

**Nos. 1001C and 1001H**

No. 1001C is used with Nos. 1330 and 1331 portable magneto telephones.

No. 1001H is used with No. 1375B portable magneto telephone.

Code No.	Transmitter	Receiver	CORDS		Push Button Spring Combination
			Code No.	Length	
1001C	285W	131W	366	6 ft.	2 Make
1001H	244W	131W	422	5 ft. 2 in.	2 Make
			(Waterproof)		

**No. 1001E**

Used with desk type Inter-phones where 5-conductor cord is required.

Code No.	Transmitter	Receiver	CORDS		Push Button Spring Combination
			Code No.	Length	
1001E	244W	131W	398	6 ft.	1 Make and 1 Break

**No. 1001J**

No. 1001J is used with desk type Inter-phones.

Code No.	Transmitter	Receiver	CORDS		Push Button Spring Combination
			Code No.	Length	
1001J	144W	244W	502	6 ft.	1 Make and 1 Break

## No. 1002 Type Western Electric Hand Sets

No. 1002AC

The transmitter and receiver of the No. 1002 type hand sets are mounted on a nickel plated tubular brass frame, equipped with a hard rubber handle. A switch mounted within the frame is actuated by a plunger which terminates in a ring by which the hand set is suspended, when not in use. When the hand set is removed from the hook, the switch is automatically closed. These hand sets function the same as certain desk stands, and, therefore, may be used in place of desk stands, if required. A hook (No. 141A switch-hook) is furnished with each hand set.

No. 1002D

Used in place of desk stands and telephone arms in connection with Interphones. Also for general use.

Code No.	Transmitter	Receiver	Cords		Switch Combination
			Code No.	Length	
1002D	267W	141W	336	14 ins.	1 make and 1 break (4 conductors)
			402	8½ ins.	
			429	4 ft. 6 ins.	

No. 1002E

Used in connection with a janitor's switchboard in apartment house equipment. Also for general use.

1002E	267W	141W	402	8½ ins.	1 make contact
			336	14 ins.	
			430	4 ft. 6 ins.	

No. 1002AC

Used in place of local battery bridging or central battery desk stands. Functions same as No. 1040AL desk stand. Also No. 1801 swbd.

1002AC	267W	141W	318	4 ft.	2 make
			414	4¼ ins.	
			415	9½ ins.	

## No. 1003 Type Hand Sets

NOTE.—The No. 1003 type hand sets are listed under Interphones.

## Western Electric Hand Set Hangers

No. 1B mounts on a vertical surface for holding a No. 1001 type hand set when not in use. The hand set is suspended by its receiver, which fits into a recess in the hanger. Cast brass; black finish. Overall dimensions, 3¼ inches wide, 2½ inches deep and 3¾ inches high.

No. 1C is the same as the No. 1B, except that it is equipped with rubber studs and a spring, so arranged as to prevent the hand set from swaying. Used principally on steamships.

No. 1B

## No. 186 Western Electric Weatherproof Telephone Jacks

Weatherproof jack designed for mounting poles; affords a means of connecting a portable telephone to the line. Contains protective apparatus.

Lock will be furnished if specified in order.

## Western Electric Telephone Protectors

No. 58AP

Designed for protection against lightning and crosses with electric circuits.

Consists of 2 No. 11C-7 ampere fuses, 2 each Nos. 26 and 27 protectors and Nos. 16, 29 and 48 mountings.

No. 60AP

Designed for protection against lightning. Consists of 2 each Nos. 26 and 27 blocks and mounting No. 49.

NOTE.—The No. 58AP is recommended in all cases except where the entire telephone system is entirely removed from all other electric lines. In these cases the No. 60AP can be used.

## Western Electric Telephone Protector Blocks

Nos. 1 and 2

No. 1

No. 2

Code No.	Description	USED WITH		Protectors, Nos.
		Protector Blocks, No.	Protector Micas, No.	
1	Plain Carbon Block with Fuse Metal	2	3	12A, 58A, 60A,
2	Grooved Carbon Block without Fuse Metal	1	3	12A, 58A, and 60AP.

**Western Electric Telephone Protector Blocks**

		Protector Blocks, No.	Protector Micas, No.	Protectors, Nos.
19	Plain Copper Block with Two Pins Grooved Copper Block with Two Bushings	20	10	58B, 60B
20		19	10	58B, 60B

Nos. 26 and 27

No. 26

No. 27

Provides better telephone service through fewer interruptions of operation. They are used together without a separator (protector mica) and form an open space cutout which will afford the highest grade of protection against high potentials due to lightning.

The No. 26 protector block is a solid piece of hard non-dusting carbon. The face of the block is especially ground to present a smooth surface. The No. 26 protector block is mounted on the ground side of the protector mounting.

The No. 27 protector block consists of a porcelain frame with a countersunk hard carbon plug which is fastened in place with low temperature fusing cement. The surface of the frame which bears against the No. 26 block, when assembled in a mounting, is finished by grinding. The air gap between the carbon insert in the No. 27 block and the face of the No. 26 block is held to close limits by this grinding process and the consistent operation of the cutouts at the proper voltage is thereby insured.

Ordinary lightning discharges will cause an arc across the air gap between the carbon blocks but will not heat them sufficiently to melt the cement used for holding the carbon plug in place. A cross with an electric light or power line, however, will cause a discharge or repeated discharges, of such duration that the heating of the carbon insert of the No. 27 protector will melt the cement holding it in place and allow the mounting spring to push it into direct contact with the No. 26 block, thus permanently grounding the line.

Code No.	Description	Used with Protectors, Nos.
26	Carbon Block	12AP, 58AP, 60AP, 76AP, 1268A and 1269A
27	Porcelain Frame with Carbon Insert	

The new blocks are interchangeable with the old combinations of No. 1 protector block, No. 2 protector blocks and No. 3 protector mica in all subscribers' set protector mountings and are therefore available for improving protective equipment already in service, during the normal replacements. All orders for replacements of Nos. 1 and 2 blocks and No. 3 micas in subscribers' telephone station protectors should specify the Nos. 26 and 27 protector blocks; no separator (protector mica) is needed with the new design of block.

**Western Electric Telephone Protector Mountings**

No. 83A

No. 83A is designed to protect drop wires between the overhead lines and the subscribers telephone set from lightning. This protector mounting consists of an iron box approximately 8 1/16 x 5 x 2 3/4 inches deep with a cover and having a No. 84A protector mounted within it. Arranged to mount 10 pairs of No. 26 and 30 protector blocks. This

protector mounting provides for the protection of 5 pairs of wires. The box mounts directly underneath the crossarms on the poles. Two mounting lugs are provided for this purpose.

No. 86A is for housing the 58 type protector where outside installation is desired. Consists of a galvanized iron metal box having a sliding cover with locking screws. Three screws are furnished for mounting the protector in the box. Size, 10 inches long, 5 1/2 inches wide, 3 1/4 inches deep.

No. 86A

**Western Electric Hand Receivers**

\*No. 143AW

Concealed binding post hand receiver, composition case. Used with telephone sets, desk stands, telephone arms, etc.

\*No. 144AW

With hard rubber case. \*Cord not included; ordered separately.

**Western Electric Head**

**Receivers**

No. 528BW

Standard bipolar head receiver, brass case with improved wire type headband.

Used with operator's telephone set and all switchboards.

**Western Electric Ringers**

Have gong posts suitable for 5/8-inch woodwork; spacers can be furnished to adapt the No. 53 type to 3/8-inch woodwork and the No. 38 to either 3/8 or 1/2-inch woodwork. Black finish gongs are furnished as standard, but nickel finish gongs can be supplied.

Used with central battery (magneto) telephones.

No. 53 Type

Code No.	Approx. Resistance Ohms	Gongs		Mounts In Woodwork Inches

53FG	1620	29A	2 1/2	5/8

## Western Electric Transmitters

No. 323BW

High resistance, insulated transmitter. Provided with mounting lug and clamping bolt. Black finish.  
Designed for use on magneto and central battery desk stands and telephone arms

No. 353BW

High resistance, insulated, bracket type transmitter. Black finished all over.  
Designed for use on magneto and central battery wall telephones, requiring a bracket type transmitter.

## Western Electric Testing Sets

Type 90500

Each set consists of a hand generator and a ringer, wired in series, and inclosed in a wooden case.

No. 90530

Code No.	Will Ring Through Ohms	Consists of
90530	10000	1 No. 22K Generator 1 No. 19B Ringer
90510	35000	1 No. 22K Generator 1 Special No. 19 Ringer
90511	50000	1 No. 22N Generator 1 No. 19A Ringer
90512	100000	1 No. 22N Generator 1 No. 19B Ringer

Size of case is  $5\frac{3}{4} \times 6\frac{5}{8} \times 5\frac{1}{4}$  inches.  
It is finished in birch.

## No. 1017 Type Western Electric Test Sets

No. 1017 Type

No. 1017B

A wooden box telephone test set equipped with a regular local battery talking circuit consisting of a No. 266BW transmitter, No. 13 induction coil, No. 189W receiver and a special three-cell dry battery unit.

NOTE.—The No. 1017C test set differs from the No. 1017B only in that it is equipped with a specially designed high efficiency generator. The No. 1017B will, under ordinary conditions, be found entirely satisfactory, but in case a more powerful set is required to meet unusual conditions, the No. 1017C set has been developed.

No. 1017B. For lightly loaded lines—it will ring 15, 2500 ohm bells over a 15 mile No. 12BB iron metallic line.

Code No.	Weight Including Battery Pounds	Size of Case Inches	Finish
1017B	8	$4\frac{27}{32} \times 6\frac{3}{32} \times 7\frac{27}{32}$	{ Birch { Mahogany
1017C	8	$4\frac{27}{32} \times 6\frac{3}{32} \times 7\frac{27}{32}$	{ Birch { Mahogany

No. 1017C. For moderately loaded lines—it will ring 33 2500 ohm bells over a 15 mile No. 12BB iron metallic line.

## E. Z. Type Telephone Brackets

Brackets

This is a substantial and serviceable telephone arm. With this bracket the telephone can be lowered below the base as well as raised above it.

Has nickel-plated finish with black enamel trim. Can be had in all black finish when so desired. Furnished in 24-inch length only.

Bracket is complete with Nos. 83, 84, 85, 85X, 88 or 94 mounting and any style clamp.

Add 50 cents to price when No. 86 mounting is wanted. Price, No. 95.....each \$3.50

## Mountings and Clamps

Auxiliary receiver hook furnished with telephone arms free. Price, if Furnished Separate.....each \$1.00

**Telephone Brackets  
S Type**

Equipped with No. 1 Mounting and No. 20 Clamp Brackets

This bracket is of the "folding gate" type, and is arranged so as to revolve on its base. Furnished in 24 and 36-inch lengths. The desk stand swivels on the front rod. The bracket will be furnished with any of the mountings described below and with either of the clamps listed.

When ordering specify the letter of the clamp and mounting that is wanted in addition to the code number of the telephone bracket.

Complete equipment consists of bracket, one mounting, one receiver hook, one telephone clamp, one set of eyelets for holding cord, but does not include desk stand.

Code No.	Length of Bracket Extended, Inches	Approximate Shpg. Wt., Lbs.

**Magneto Motor Generator Ringing Sets**

Motor generator ringing sets consist of d.c. or single-phase 60-cycle a.c. motors direct connected to magneto ringing generators. These sets furnish alternating ringing current only at 80 volts, 19 cycles.

An attachment for obtaining positive and negative pulsating current is, however, available.

List No.	Volts Motor	Output Watts	Type
310087	110	15	Motor—S. P. 60 Cycles A. C., 1150 R.P.M.
310088	220	15	Generator—80 Volts, 19 Cycles, S. P.

310094	220	15	*Generator—110 Volts, 23 Cycles, S.P.
310081	115	15	Motor—D. C., 1150 R.P.M.
310082	230	15	Generator—80 Volts, 19 Cycles, S. P.
310110	†12	15	Magneto Generator—80 Volts, 19 Cycles S. P., 1150 R.P.M. Belt Tightening Sub-base and 2½x1½ Inches Play Pulley.

\*This higher voltage is advisable on account of the higher frequency produced by the necessary excess speed of the 25-cycle over the 60-cycle. †Twelve bars.

**No. 21-RA Ringing Machines**

No. 21-RA Ringing Machine uses 115-volt, 60-cycle a.c. and furnishes 20-cycle ringing current.

Used with two 12-volt automobile storage batteries (furnished by customer) which operate machine and insure continued operation for some time, even though outside power fails.

**No. 7-A Frequency Converters**

No. 7-A Frequency Converter uses 115-volt, 60-cycle a.c. and furnishes 20-cycle ringing current.

**No. 27 Harmonic Ringing Machines**

No. 27 Harmonic Ringing Machine uses 115-volt, 60-cycle a.c. and furnishes 16⅔, 33⅓, 50 and 66⅔ cycle ringing current.

Used with two 12-volt automobile storage batteries (furnished by customer) which operate machine and insure continued operation for some time, even though outside power fails.

**No. 121-R Ringing Machines**

No. 121-R Ringing Machine uses 115-volt, 60-cycle a.c. and furnishes 20-cycle ringing current. Used with two 12-volt automobile storage batteries (furnished by customer) which operate machine and insure continued operation for some time, even though outside power fails.

Mounted in steel cabinet, complying with Underwriters' requirements.

## Western Electric Inter-phone Cable

For Interior Use

For Outside Use

The conductors are provided with single silk and single cotton insulation, which is colored in such a way that each pair and each single wire can be identified. The cable is then impregnated with a wax compound and is covered with servings of paper and a heavy braiding, which is given a heavy coat of fireproofing paint.

The impregnation with wax prevents the insulation from fraying when the cables are installed. It also serves to protect the formed ends against moisture.

Three general types of cable are provided. Each type has its particular use, and care should be taken to order the proper cable for any desired purpose. These types are as follows:

1. Interior Cable with outside braiding treated with gray fireproofing paint. Use only in dry places.
2. Interior cable with green glazed cotton outside braiding. Use only in dry places where exposed to view.
3. Outside cable, lead covered. Always use this cable outside, and inside in every case where there is apt to be moisture even in a small degree. In conduit installations lead covered cable should be used.

Lead-covered cables are not listed with separate Code Nos. Any fireproofed type of cable may be ordered with a lead sheath.

All cables are provided with a standard color scheme, so that each pair can be distinguished from any other. The pairs are properly twisted to prevent inductive disturbances.

## Western Electric Lead Covered Telephone Cable

The outside plant is a very important part of any telephone system. Unless satisfactory material is used in its construction, it is impossible for a telephone company to furnish satisfactory service even though the central office and sub-station equipment is of the best. Lead covered cable represents not only a large part of the capital invested in the outside plant, but also a most important part of the construction due to its function of being the transmitting medium for telephone messages.

These are certain characteristics which lead covered cable must possess in order to properly and efficiently function in a telephone system:—

1. It must be so constructed that it will have long life and thereby reduce depreciation to a minimum.
2. It must be designed to transmit telephone messages with a minimum transmission loss.

The Western Electric Company manufactures cable designed to conform to the above requirements and by virtue of the fact that its experience in this field covers the entire period since the first successful installation of lead cable for telephone use, its product is as nearly perfect as present day knowledge of the telephone art permits.

The Western Electric Company occupies an important position in the manufacture of lead covered cable for telephone use by virtue of the following facts:

1. It is the largest manufacturer of this commodity.
2. It has specialized on, and developed this product since its origin.
3. It manufactures for the largest users.
4. It is responsible for practically every important development and improvement.
5. Conscientious careful inspection and testing make sure that specifications are rigidly adhered to.
6. The design and development work is done by the largest force of telephone experts in the world.

Cable for aerial and underground telephone use is composed of copper conductors, insulated with paper, twisted into pairs and enclosed in a lead sheath. In general, cable with single wrapped conductors is recommended, since its electrical and mechanical characteristics are perfectly satisfactory for most conditions, and the cost is less than cable with double wrapped conductors.

Cable for interior construction usually has the conductors insulated with two servings of silk and one of cotton.

The sheath is made of pure lead, lead antimony alloy or lead tin alloy. Experience has shown that while either lead antimony or lead tin is satisfactory for aerial or underground cable, the former alloy, being somewhat cheaper, is more generally used. While pure lead cannot be recommended where the cable is subjected to vibration, it is satisfactory for use within buildings.

### Extra Pairs

Extra pairs are placed in all cables containing conductors smaller than No. 16 to take care of any pairs which may become defective in manufacture. In the majority of cables all or part of the extra pairs will often be found good and may be used for additional circuits. All pairs of No. 16 A.W.G. and larger except in submarine cable are guaranteed to meet the specification requirements when the cable leaves our factory.

The coding of all cables is on the basis of the actual number of pairs. Actual and guaranteed number of pairs in the various sizes of standard cables containing conductors smaller than No. 16 A.W.G. are as follows:

Code No.	CONDUCTORS, B. & S. GAUGE		Covering	Approx. Outside Diam., In.
	No. 22	No. 18		
185B	4 singles	.....	Fireproofed braid	1/4
161B	8 "	.....	"	5/16
161B (Lead)	8 "	.....	Lead sheath	5/16
142B	8 "	.....	Green cotton braid	5/16
162B	12 "	.....	Fireproofed braid	3/8
162B (Lead)	12 "	.....	Lead sheath	3/8
164B	6 "	2 pair	Fireproofed braid	1/2
164B (Lead)	6 "	2 "	Lead sheath	1/2
134B	6 pair	2 "	Fireproofed braid	1/2
134B (Lead)	6 "	2 "	Lead sheath	1/2
155B	6 "	2 "	Green cotton braid	1/2
141B	12 "	2 "	Fireproofed braid	7/16
141B (Lead)	12 "	2 "	Lead sheath	1/2
156B	12 "	2 "	Green cotton braid	7/16
157B	16 "	2 "	Fireproofed braid	17/32
157B (Lead)	16 "	2 "	Lead sheath	9/16
158B	20 "	2 "	Fireproofed braid	9/16
158B (Lead)	20 "	2 "	Lead sheath	13/32
136B	24 "	2 "	Fireproofed braid	11/16
136B (Lead)	24 "	2 "	Lead sheath	5/8
140B	31 "	2 "	Fireproofed braid	5/8
140B (Lead)	31 "	2 "	Lead sheath	11/8

### No. 19 Type Cable Terminals

The No. 19 type cable terminal is admirably suited for interior distributing work. It was designed after a great deal of study, and is thought to be the best of its kind on the market. Made of hard wood, numbered and shellacked, and equipped with a japanned sheet metal cover.

Code No.	Capacity in Pairs	Length in.	Width in.	Depth in.
19A	14	8	5 1/8	2 1/2
19B	26	14	5 1/8	2 1/2

Actual Pairs	Guaranteed Pairs
6 to 121	Actual pairs less one
152 " 242	" " " two
253 " 333	" " " three
364 " 444	" " " four
485 " 505	" " " five
606	" " " six
909	" " " nine
1212	" " " twelve

## Western Electric Lead Covered Telephone Cable Type BSA Cable

For Aerial or Underground Use

**SHEATH.**—Lead antimony.

**CONDUCTORS.**—No. 22 A.W.G., single dry paper insulation, with color groups depending upon size.

**MUTUAL CAPACITANCE.**—A.C. resting, .090 microfarad per mile of cable.

**CONDUCTOR RESISTANCE.**—Not exceeding 92 ohms per mile of cable at 68 degrees Fahrenheit.

**INSULATION RESISTANCE.**—Not less than 500 megohm miles.

**DIELECTRIC STRENGTH.**—Insulation of each conductor capable of withstanding an a.c. test potential whose maximum instantaneous value is 500 volts.

**ATTENUATION.**—1.8 transmission units per mile at 1000 cycles.

Code No. and No. of Pairs	No. of Pairs Guaranteed	Thickness Sheath Inches	Mean Outside Diameter Inches	Approx. Weight Pounds per Foot	Convenient No. of Feet on Reel
BSA- 11	10	.070	.44	.45	3500
BSA- 16	15	.070	.48	.52	3500
BSA- 26	25	.070	.58	.67	3500

### Type CNB Cable

For Aerial or Underground Use

**SHEATH.**—Lead antimony.

**CONDUCTORS.**—No. 19 A.W.G. single dry paper tape insulation, with color groups depending upon size.

**MUTUAL CAPACITANCE.**—A.C. testing, .090 microfarad per mile of cable.

**CONDUCTOR RESISTANCE.**—Not exceeding 46 ohms per mile of cable, at 68 degrees Fahrenheit.

**INSULATION RESISTANCE.**—Not less than 500 megohm miles.

**DIELECTRIC STRENGTH.**—Insulation of each conductor capable of withstanding an a.c. test potential whose maximum instantaneous value is 700 volts.

**ATTENUATION.**—1.3 transmission units per mile at 1000 cycles.

40. Isolated Plants 10-50 Volts.
50. Circuits and Equipment Operating at More than 600 Volts between Conductors.
60. Signal Systems.

For car wiring and equipment of cars and car houses, see separate editions of Rules and Regulations of the National Board of Fire Underwriters as recommended by the National Fire Protection Association.

## ARTICLE 1. DEFINITIONS.

**Accessible:** (As applied to wiring methods) Not permanently closed in by the structure or finish of the building; capable of being removed without disturbing the building structure or finish. (As applied to equipment) Admitting close approach because not guarded by locked doors, elevation or other effective means. (See also "Readily Accessible.")

**Adjustable-Speed Motor:** One in which the speed can be varied gradually over a considerable range, but when once adjusted remains practically unaffected by the load, such as shunt motors designed for a variation of field strength.

**Approved:** Acceptable to the authority enforcing this Code. In order to avoid the necessity for repetition of examinations by different examiners, frequently with inadequate facilities for such work, and to avoid the confusion which would result from conflicting reports as to the suitability of devices and materials examined for a given purpose, it is necessary that such examinations should be made under standard conditions, and the record made generally available through promulgation by organizations properly equipped and qualified for experimental testing, inspections of the run of goods at factories, and service-value determinations through field inspections.

**Automatic Door:** One which closes automatically by means of a device operated by heat.

**Branch Circuit:** That portion of a wiring system extending beyond the final automatic overload protective device of the circuit.

**Lighting Branch Circuits** are circuits supplying energy to lighting outlets only.

**Appliance Branch Circuits** are circuits supplying energy either to permanently wired appliances or to attachment plug receptacles, that is, appliance or convenience outlets, or to a combination of permanently wired appliances and additional attachment plug outlets on the same circuit; such circuits to have no permanently connected lighting fixtures. (For Medium-Duty and Heavy-Duty Appliance, Branch Circuits see Section 1602 of Article 16.)

**Combination Lighting and Appliance Branch Circuits** are circuits supplying energy to both lighting outlets and appliance outlets.

**Building:** A structure which stands alone or which is cut out from adjoining structures by unpierced fire walls.

**Cabinet:** An enclosure designed either for surface or flush mounting, and provided with a frame, matt or trim in which swinging doors are hung. (See cutout box.)

**Cable:** A stranded conductor (single-conductor cable) or a combination of conductors insulated from one another (multiple-conductor cable).

**Circuit-Breaker:** A device designed to open under abnormal conditions a current-carrying circuit without injury to itself. The term as used in this Code applies only to the automatic type designed to trip on a predetermined overload of current.

**Concealed:** Rendered inaccessible by the structure or finish of the building. Wires in concealed raceways are considered concealed, even though they may become accessible by withdrawing them.

**Conductor:** A wire or cable or other form of metal suitable for carrying current.

**Controller:** A device, or group of devices, which serve to govern, in some predetermined manner, electric power delivered to the device governed.

**Cutout Box:** An enclosure designed for surface mounting and having swinging doors or covers secured directly to and telescoping with the walls of the box proper. (See cabinet.)

**D. C. Neutral Grid:** A well grounded network of neutral conductors formed by connecting together within a given area all of the neutral conductors of a low-voltage direct-current supply system.

**Demand Factor:** The demand factor of any system or part of a system, is the ratio of the maximum demand of the system, or part of a system, to the total connected load of the system, or of the part of the system under consideration.

**Disconnecting Switch—Disconnecter:** A switch which is intended to be operated only when the circuit has been opened by some other means.

**Diversity Factor:** The diversity factor of any system, or part of a system, is the ratio of the sum of the maximum power demands of the subdivisions of the system, or part of a system, to the maximum demand of the whole system, or part of the system under consideration, measured at the point of supply.

**Dustproof:** So constructed or protected that an accumulation of dust will not interfere with its successful operation.

**Dust-tight:** So constructed that dust will not enter the enclosing case.

**Enclosed:** Surrounded by a case which will prevent accidental contact of a person with live parts.

**Exposed:** Accessible; not concealed.

**Factory Yard:** A plot containing an assemblage of buildings served by an isolated plant, or by a substation, or by a master service, and permitting access from building to building within the yard.

**Guarded:** Covered, shielded, fenced, enclosed or otherwise protected, by means of suitable covers or casings, barriers, walls or screens, mats or platforms, to remove the liability of dangerous contact or approach by persons or objects to a point of danger.

**Hazardous Location:** Premises, locations, rooms or portions thereof in which (1) highly flammable gases, flammable volatile liquids, mixtures or other highly flammable substances are manufactured or used or are stored in other than original containers; or (2) where combustible dust or flyings are likely to be present in quantities sufficient to produce an explosive or combustible mixture; or (3) where it is impracticable to prevent dust from collecting in such quantities on or in motors, lamps or other electrical devices that they are likely to become overheated because normal radiation is prevented; or (4) where easily ignitable fibres or materials producing combustible flyings are handled, manufactured, stored or used.

**Hoistway:** A hoistway is any shaftway, hatchway, well-hole, or other vertical opening or space in which an elevator or dumbwaiter is designed to operate.

**Isolated:** Not readily accessible to persons unless special means for access are used.

**Isolated Plant:** A private electrical installation deriving energy from its own generator driven by a prime mover.

**Master Service:** The service conductors supplying a group of buildings under one management.

**Motion-Picture Studio:** Any building or portion of a building in which motion-picture films are manufactured, developed, printed, re-wound, repaired, stored or otherwise exposed.

**Motor-Circuit Switch:** A switch used to stop a motor when at full running current, but not intended to open the motor circuit with stalled-rotor current flowing. The switch may also serve to disconnect the motor and its controller when necessary for repairs, etc.

**Outlet:** A point on the wiring system at which current is taken to supply fixtures, lamps, heaters, motors and current-consuming devices generally.

**Panelboard:** A single panel, or a group of panel units designed for assembly in the form of a single panel; including buses and with or without switches and or automatic overload protective devices for the control of light, heat, or power circuits of small individual as well as

aggregate capacity designed to be placed in a cabinet or cutout box placed in or against a wall, or partition and accessible only from the front. (See switchboard.)

**Portable Appliance:** An appliance capable of being readily moved where established practice or the conditions of use make it necessary or convenient for it to be detached from its source of current by means of flexible cord and attachment plug.

**Qualified Person:** One familiar with the construction and operation of the apparatus and the hazards involved.

**Readily Accessible:** Capable of being reached quickly, for operation, renewal, or inspection, without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, chairs, etc.

**Secondary Neutral Grid:** A well grounded network of neutral conductors formed by connecting together within a given area all the neutral conductors of individual transformer secondaries of the supply system.

**Service:** That portion of the supply conductors which extends from the street main or duct or transformers to the service switch, switches, or switchboard of the building supply.

**Special Permission:** The written consent of the authorities enforcing this Code.

**Switchboard:** A large single panel, frame, or assembly of panels, on which are mounted, on the face or back or both, switches, overload and other protective devices, buses, and usually instruments. Switchboards are generally accessible from the rear as well as from the front and are not intended to be installed in cabinets. (See Panelboard.)

**System Ground Conductor:** An auxiliary, well grounded conductor used for connecting together the individual grounding conductors throughout a given area, but which is not a part of a circuit wire.

**Totally Enclosed Motor:** A motor which is so completely enclosed by integral or auxiliary covers as to practically prevent the circulation of air through the interior. Such a motor is not necessarily air-tight.

**Vaportight:** So enclosed that vapor will not enter the enclosure.

**Ventilated:** Provided with a means to permit circulation of the air sufficiently to remove an excess of heat, fumes or vapors.

**Voltage to Ground:** The voltage between the given conductor and that conductor of the circuit which is grounded; in ungrounded circuits, the greatest voltage between the given conductor and any other conductor of the circuit.

**Waterproof:** So constructed or protected that moisture will not interfere with its successful operation.

**Watertight:** So constructed that moisture will not enter the enclosing case.

## ARTICLE 2. GENERAL.

Throughout this Code the word "shall" is used to indicate requirements, while the word "should" is used to indicate recommendations, or that which is advised but not required. In general, recommendations have the form of fine-print notes or paragraphs supplementing the preceding text. The following general recommendations, therefore, as well as other recommendations throughout this Code, shall be considered advisory, but not mandatory.

It is recommended that in all wiring special attention be paid to the mechanical execution of the work. Careful and neat running, connecting, soldering, taping of conductors, and securing and attaching of fittings, are especially conducive to security and efficiency.

It is recommended that in laying out an installation, except for constant-current systems, every reasonable effort be made to secure distribution centers located in easily accessible places, at which points the cutouts and switches controlling the several branch circuits can be grouped for convenience and safety of operation. The load should be divided as evenly as possible among the branches, and all complicated and unnecessary wiring avoided.

It is recommended that wire-ways be used for rendering concealed wiring permanently accessible. It is recommended that architects when drawing plans and specifications make provision for the channeling and pocketing of buildings for electric light or power wires, and also, for telephone, district messenger and other signal system wiring.

It is elsewhere provided in this Code that the number of wires and circuits confined in a single enclosure be variously restricted. It is strongly recommended that architects and others provide similar restrictions wherever practicable, to the end that the effects of break-downs from short-circuits or grounds, even though resulting fire and similar damage is confined to wires, their insulation and enclosures, may not involve entire services to premises nor interruptions of essential and independent services.

### 201. Gages.

- a. All wire sizes are given in the American (B & S) gage.

### 202. Voltages.

- a. Low potential shall mean 600 volts or less.
- b. High potential shall mean between 601 volts and 5000 volts.
- c. Extra high potential shall mean above 5000 volts.
- d. In the preceding paragraphs the potential considered is that at which the circuit operates, whether it is supplied by a generator or by a transformer.
- e. Throughout this code, unless otherwise specifically stipulated, the requirements shall be considered to be based upon the use of low-potential wiring devices, apparatus and appliances. High-potential and extra-high-potential systems are considered in articles 3 and 50.

### 203. Wire Terminals, Splices and Joints.

a. Terminal parts by which wire connections are made shall insure thoroughly good connections even under hard usage. For currents above 30 amperes, lugs into which the connecting wires may be soldered, or approved solderless connectors, shall be provided. For currents of 30 amperes or less the parts to which wiring connections are made shall securely grip the conductors. Heavy clamps or screws with terminal plates having upturned lugs, or solderless connectors, may be used.

Lugs or clamps are not required when leads are provided as part of the device.

b. Wires shall be so spliced or joined as to be mechanically and electrically secure without solder. The joints shall then be soldered, unless made with a splicing device, and shall be covered with an insulation equal to that on the wires.

c. Stranded wires, other than those used in flexible cords, shall be soldered together before being fastened under clamps or binding screws.

### 204. Railway Systems.

a. Lighting and power from railway wires shall not be permitted under any pretense from a system to which are connected trolley wires with a ground return, except in electric railway cars, electric car houses, power houses, passenger and freight stations connected with the operation of electric railways.

### 205. Approved Material, etc.

a. This Code shall be understood to treat only of approved materials, devices, fittings, appliances, machinery, apparatus and methods.

### 206. General Plan of Investigations.

a. Materials, devices, fittings, apparatus and appliances designed for use under this Code shall be judged chiefly with reference to the following five considerations which also determine the classification by types, sizes, voltages, current capacities and specific uses:

1. Suitability for installation and use in conformity with the requirements of this Code.

2. Mechanical strength and durability, including, for appliances designed to enclose and protect other equipment, the adequacy of the protection thus provided.

3. Electrical insulation.

4. Heating effects under normal conditions of use and also under abnormal conditions liable to arise in service.

5. Arcing effects.

b. Bases for the mounting of live parts shall be composed of approved non-combustible, non-absorptive insulating material, and the design shall be such that, considering the material used, the base will withstand the most severe conditions liable to arise in service. Holes for supporting screws shall be so located or countersunk that there will be at least 1/2 inch, measured over the surface, between the screw head or washer and the nearest live metal part, and in all cases, where between parts of opposite polarity, the screw head or washer shall be countersunk. Holes for supporting screws in link fuse cutout bases shall be kept outside the area included by the outside edges of the fuse terminals. Nuts or screw heads on the under side of the base shall be countersunk and sealed with a waterproof compound.

c. The set-screw form of contact shall not be used.

d. All devices provided with terminals for the attachment of wires and intended for connection to more than one side of the circuit shall, unless specifically excepted, have a pair of connecting terminals properly marked for identification, unless the electrical connection between the pair of terminals intended to be connected to the grounded conductor is clearly evident.

e. The terminals of devices having a normal current rating of over 30 amperes need not be marked for identification.

f. The terminals of utilization devices need not be marked to indicate the proper connection to the grounded conductor. If the terminals on utilization devices, including single-pole switches are marked, the switch shall not be placed in the identified side of the circuit.

g. The terminals of portable devices need not be marked for identification.

h. Devices, to the terminals of which only one side of the line is connected, need not have terminals marked for identification.

i. Two-wire attachment plug receptacles without screw shells, and two-wire attachment plug caps, unless of the polarity type, need not have their terminals marked for identification. 2-wire polarized receptacles for attachment plugs and polarized attachment plug caps shall have the terminal intended for connection to the grounded wire marked for identification.

j. Three-wire attachment plug receptacles and three-wire attachment plug caps in which one terminal may be used for the connection of a grounding conductor, shall have such terminal identified in a manner differing from that specified in paragraph 1 of this section. The other terminals need not be marked for identification.

k. In the case of devices with Edison screw shells, the identified terminal shall be the one connected to the screw shell. This does not apply to screw shells which serve as plug fuse receptacles.

l. The marking of terminals shall be done by means of a metallic plated coating substantially white in color, as nickel or zinc, or the terminals may be of material substantially white in color. The other terminals shall be of a readily distinguishable different color.

m. In the case of screw-shell devices with attached leads the wire attached to the screw shell shall have white or natural gray finish. The finish of the braid on the other conductor shall be of a solid color that will not be confused with the white or natural gray finish which is to indicate the grounded conductor.

n. The maker's name, trademark or other identification symbol shall be placed on fittings and materials, together with such other markings giving voltage, current, wattage or other appropriate ratings as are prescribed elsewhere in this Code.

## ARTICLE 3. OUTSIDE SUPPLY CONDUCTORS.

The requirements of this article apply to overhead supply conductors run between buildings, upon building walls, or as line conductors which connect with interior wiring systems, or which may come in contact with such wires.

It is fully understood that it is impracticable to include in this Code rules which will cover in detail all conceivable cases that may arise in overhead line work of such an extended and varied nature, and it is recommended that the inspection department be freely consulted as to the specific methods to be followed in any case of doubt, and that the rules of the National Electrical Safety Code, part 2, be followed.

### 301. General.

Accidental crosses between different conductors on the same or different pole lines may allow the higher-voltage currents concerned to enter buildings over the lower-voltage conductors over a large section of adjoining territory.

Overhead conductors, if carried too close to buildings, tend to hamper the work of firemen in case of fire in the buildings if the raising of ladders is a part of the fire-fighting methods employed. With the higher-voltage lines this hampering effect is greater.

a. In arranging routes for overhead conductors every reasonable precaution shall be taken to secure locations likely to be permanently useful for the circuits concerned and for necessary developments, including the limitation of present and future proximity to other electrical circuits or other pole lines and the appropriate strength, clearances and separations for the proximity concerned.

b. When separate pole lines are carried in nearer proximity than a distance equal to the height of the taller pole line, or where joint poles are used, the appropriate precautions to limit liability of contact shall include the use of wires, cross-arms, pins, insulators, conductor fastenings and poles of appropriate strength. In each such case the minimum clearances and strength shall be those required by the construction rules of the National Electrical Safety Code, Part 2.

### 302. Joint Lines.

a. The same cross-arm shall not be used for supporting both electric light or power wires and telephone, telegraph or other signal wires which enter any building. An exception is made for signal wires used for operating purposes by an operating utility and entering buildings used for such purposes.

b. When both electric light or power wires and telephone, telegraph or other signal wires are placed on the same pole, the distance between the two inside pins of each crossarm shall be not less than 24 inches for circuits operating at a potential to ground not exceeding 300 volts, and shall be not less than 30 inches for higher potentials.

### 303. Clearances.

a. Conductors shall be at least eight feet above the nearest point of buildings over which they pass, and if attached to roofs the roof structures shall be substantially constructed. Wherever feasible, wires crossing over buildings shall be supported on structures which are independent of the buildings.

b. Open wires of less than 7500 volts between conductors shall be at least three feet horizontally from buildings unless 3 feet higher than the roof. Open wires 7500 volts or more between conductors shall not be installed over buildings other than central stations, substations and transformer vaults. Open wires of voltages between 7500 and 15,000 volts between conductors shall be kept at least 8 feet horizontally, and open wires of more than 15,000 volts between conductors shall be kept at least 10 feet horizontally, from all buildings except those which they serve or central stations, substations and transformer vaults.

c. Where buildings exceed three stories, or 50 feet in height, overhead lines shall be arranged where practicable so that a clear space (or zone) at least 6 feet wide will be left either adjacent to the buildings or beginning not over 8 feet from them, to facilitate the raising of ladders when necessary for fire fighting.

### 304. Insulation.

a. Conductors shall be so placed that moisture is not liable to form a cross connection between them. They shall not be in contact with anything but their supports. They shall be not less than one foot apart except when in conduit or multiple-conductor cable or on approved racks or brackets.

### 305. Grounding Cable Sheaths.

a. Metallic sheaths of cables shall be grounded in conformity with the requirements of Article 9.

### 306. Yard Wiring.

For wiring and lamps on series circuits of constant-current systems, see section 5001.

a. All wiring on exterior of building walls shall comply with the requirements for services in section 403. For circuits exceeding 600 volts, it shall be in rigid conduit or metal-sheathed cable.

b. Conduit work on the exterior of buildings shall be waterproof and shall comply with the requirements of Article 5 for interior conduit work.

c. Open wires on exterior building walls shall be kept at least 6 inches from conductors of other supply or signal circuits not in conduit.

d. Wires strung above alleys, driveways and other open spaces shall have a clearance above ground of not less than 18 feet and if of more than 600 volts, 20 feet.

### 307. Festoon Lighting.

a. Supply shall be taken only from such points on the wiring system so that correct fusing can be provided for. Conductors shall be protected by fuses not larger than the values given in Column C of Table 1, section 612.

b. The conductors of festoon streamers shall not be smaller than No. 14, and shall have an approved rubber covering. When the span of any string of lamps exceeds 40 feet, the string shall be supported by a suitable messenger wire substantially fastened at each end.

c. Festoon lighting strings or messengers shall not be attached to any fire escape or downspout. They shall be supported by secure attachments to buildings, poles or other adequate supports by means of approved strain insulators.

d. Sockets and receptacles shall be of approved moulded composition weatherproof type, and when they are attached as pendants shall have the connections to the circuit wires staggered. All joints shall be made mechanically secure, soldered, covered with both rubber and friction tape, and painted with an insulating paint.

### 308. Trolley Wires.

a. Trolley wires shall be doubly insulated from the ground, wooden poles being considered as one insulation.

b. Trolley wires and feeders shall be provided with switches which will either disconnect them from the power station, or will so sectionalize them that they may be rendered dead in case of fire along the route.

## ARTICLE 4. SERVICES AND SERVICE EQUIPMENT (Not Over 600 Volts).

For Services and Service Equipment for more than 600 volts see Article 50.

For other outside and entrance conductors see Articles 3, 5, 37, 38.

### 401. General.

a. The wiring in any building or group of buildings, including the service connections thereto, shall be so arranged as not to serve as a shunt around any street fuse or switch.

b. No overhead service, no underground service, and no service from an isolated plant shall supply one building through another, except when such buildings are under single occupancy or management. Conductors

in conduit or duct placed under 2 inches of concrete beneath a building, or buried in 2 inches of brick or concrete within a wall, shall be considered outside the building.

c. No building shall be supplied from the same exterior distribution system through more than one set of service conductors, unless a separate service is required for fire pumps, or for emergency lights, as required by Section 3902, or unless capacity or emergency requirements make multiple services desirable, or unless there are different transformers or sets of multiphase transformers.

d. If supplied by more than one set of service leads at the same side of a building, the service equipments shall be grouped (except for fire-pump service, which may be isolated) and the type of service separately indicated.

### 402. Overhead, From Main to Building.

a. Approved weatherproof or approved rubber covering, shall be employed on single wires, and approved rubber covering on multiple-conductor cables. Wires shall not be smaller than No. 10 if of soft copper, or smaller than No. 12 if of medium or hard-drawn copper.

b. Wires or cables shall not approach nearer than 8 feet to buildings over which they pass, and, if attached to roofs thereof, shall be supported on substantial structures.

It is recommended that wires passing over a building be supported on structures which are independent of the building.

c. When a service from overhead supply wires to a building is carried underground, the portion of the wires underground and running up the pole to a point at least 8 feet above the ground shall be suitably protected from mechanical injury and shall be protected from moisture by a covering of lead or other means approved for the purpose.

d. Multiple-conductor cables shall be kept at least 6 inches from adjacent woodwork and at least 12 inches from overhanging projections of combustible material, unless fittings approved for the purpose are used.

### 403. On Exterior of Building.

a. Wires or cables which are liable to contact with awnings, swinging signs, shutters or other movable objects, shall be enclosed in approved conduit. All conduit systems on exterior of buildings shall be made weatherproof.

b. Open wires shall not be within 8 feet from the ground, shall not be readily accessible and shall not be subject to mechanical disturbance. If exposed to the weather they shall be supported on approved insulators, racks, brackets, or other supports approved for the purpose. Such supports shall be placed at intervals not exceeding 9 feet and shall separate the wires at least 6 inches from each other and at least 2 inches from the surface wired over; provided, however, that supports may be placed at intervals not exceeding 15 feet if they hold the wires at least 12 inches apart. Open wires if not exposed to the weather may be supported on glass or porcelain knobs placed at intervals not exceeding 4½ feet and maintaining the wires at least 1 inch from the surface wired over.

c. Multiple-conductor cables run on the exterior of building walls shall not be within 8 feet from the ground, shall not be readily accessible, and shall not be subject to mechanical disturbance. They shall be supported at intervals not exceeding 15 feet. Unless provided with metal sheath or armor they shall be mounted upon insulating supports so as to be separated at least 2 inches from the surface wired over.

d. Open wires on exterior of buildings shall have approved rubber or weatherproof coverings for single wires and approved rubber covering for multiple-conductor cables.

e. Rigid conduit systems made weatherproof shall be used for wiring on exterior of buildings where open wiring cannot readily comply with the above requirements or where the voltage exceeds 600, and may be used in lieu of such open wiring under any conditions.

### 404. Entrance.

a. All service wires shall enter the building at a point as near as practicable to the location of the service switch. Service conductors may be run through but shall not be run within a building wall unless in conduit embedded in brick, tile, concrete, or other fire resistive construction, or unless protected by fuses at the outer end of the service conduit.

b. Wires entering building shall be rubber-covered from the point of support on the outside of the building nearest the entrance to the building. The service wires shall be not smaller than No. 8.

c. Where a run of grounded rigid service conduit is interrupted by metallic flexible conduit, the two ends of rigid conduit thus interrupted or the end of the rigid conduit and the service entrance cabinet if the flexible conduit shall be connected thereto shall be bonded together by a copper wire not smaller than No. 8 using approved clamps or other approved means, and both the bonding devices and bonding wire shall, if exposed to mechanical injury be effectively protected therefrom.

d. Overhead wires shall enter buildings only in rigid conduit or as separate individual wires. Where open wires are used, drip loops shall be formed on the individual wires which shall then pass upward and inward through slanting, non-combustible, non-absorbent insulating tubes. Where rigid conduit is used it shall have weatherproof threaded joints and be equipped with approved service head.

Where service switch is inside building, it is recommended that conductors entering the building from overhead lines be encased in approved rigid metal conduit.

e. Where a conduit enters from an underground distribution system, the end within the building shall be sealed with suitable compound so as to prevent the entrance of moisture and gases.

f. Where conduit is used to contain service conductors, the inner end of the service conduit shall enter a terminal box or service switch cabinet or be made up directly to an equivalent device, enclosing all live metal parts, and shall be electrically connected to the box or equivalent device unless isolated from conducting surfaces and unexposed to contact by persons or materials which may be in contact also with other conducting surfaces, including the terminal box or equivalent device.

g. Service conduit shall be grounded unless isolated from grounded surfaces, and unexposed to contact by persons or materials which may be in contact with other conducting surfaces, and containing no wire of more than 150 volts to ground and no wire of an ungrounded circuit exposed to or connected to other circuits of more than 150 volts to ground. Conduit and metal pipe if not electrically connected to an interior conduit system shall be considered sufficiently grounded if containing lead-sheathed cable bonded to a continuous underground lead-sheathed cable system.

It is sometimes advisable to insulate interior conduit or sheathing from service conduit or sheathing to prevent burnouts of small interior conduit, armored cable sheaths, or metal moulding by large currents which might flow from exterior conduit to interior conduit and waterpipes.

#### 405. Service Equipment.

a. In this section the word "switch" shall be construed as including a circuit-breaker that is capable of manual operation.

b. A service switch shall be provided for each set of service conductors and shall indicate plainly whether it is open or closed. The switch or switches shall be placed at the nearest readily accessible point to the entrance of the service, either inside or outside the building wall and shall be of a type approved for the prevailing conditions such as exposure to the weather. This switch shall be installed in one of the following ways:

1. As an air-break or oil-immersed switch enclosed in a metal case;

2. As an air-break or oil-immersed switch mounted on a switchboard or panelboard which is accessible to qualified persons only.

c. A service switch shall simultaneously interrupt all conductors of the circuit in which it is inserted and disconnect the meter and overload protective devices, except that

1. Where the switch, fuses and meter are combined in an approved device or compact combination of such devices having no live parts or wiring exposed, and capable of being sealed or locked, the switch may be so connected that it will not disconnect the fuses or the meter from the supply line; and the potential coils of the meter may be connected on the supply side of the service cutout;

2. Where the switch and fuses are mounted in an approved cabinet having no live parts or wiring exposed and capable of being sealed or locked, the switch blade may be omitted in any grounded conductor of a direct-current or single-phase circuit or any grounded neutral if other approved means is provided within the cabinet for disconnecting such conductor.

3. Where a service switch is mounted on a switchboard, the switch blade in the grounded conductor may be omitted if other approved means is provided on the switchboard to disconnect the grounded conductor.

4. In buildings served through 2, 3, or 4 meters from a single set of service conductors not exceeding 150 volts to ground, the service conductors may be run to a separate switch and cutout for each meter if grouped at the point of entrance. The service run shall be continuous to the last service switch and cutout or to the bus on a switchboard, but taps may be made to the individual service switches. In installations involving more than 4 meters the entire current shall be taken through one main entrance switch.

5. A switch controlling a 3-wire direct-current or a 3-wire single-phase system may be so designed that one outside conductor can be opened without opening the other.

d. A service switch shall be enclosed and externally operable unless made inaccessible to other than qualified persons. A service switch shall be readily accessible and externally operable unless additional switches are provided for control of all individual feeders and circuits supplied through it, as recommended below.

It is recommended that where the current of a single circuit, or group of circuits, is separately metered, as in apartment-house installations, a switch and cutout be installed to control each separately metered installation, the switch and cutout being enclosed and the switch being externally operable. The location of this switch and cutout may, or may not, be close to the meter.

e. The service switch shall have sufficient capacity to rupture a current equal to the capacity of the cutout base or to the rating of other type of protective device in series with it.

f. Each ungrounded service conductor shall be protected by a fuse or automatic overload circuit-breaker arranged to cut off the current from all circuits fed through it, and from all devices in such circuits other than the service switch and, under the conditions specified in paragraph (c) 1, of this section, the meter. Fuses, where used, shall be controlled by the service switch except where they are located at the outer end of the service conduit or as specified in paragraph (c) 1 of this section. A circuit-breaker, where used, shall be controlled by the service switch unless it is manually operable.

g. When the service fuses are locked or sealed or are located at the outer end of the service conduit, branch fuses connected on load side of meter shall be accessible to persons concerned and shall be enclosed in an approved casing or cabinet. If the installation consists of a single branch circuit, fuses shall be inserted in series with the service fuses and shall be of smaller capacity. These fuses need not be at the meter but shall be accessible.

h. No fuse or automatic overload circuit-breaker shall be placed in a grounded service wire except a circuit-breaker which simultaneously opens all conductors of the circuit.

i. Where not located on a switchboard or panelboard, accessible only to qualified persons, live parts of switches, buses, fuses, cutout bases, and automatic overload circuit-breakers shall be enclosed so that they will not be exposed to accidental contact. The enclosure shall be grounded in accordance with the method for equipment grounding given in Article 9. *Exception:*

Grounding may be omitted where enclosures are isolated from conducting surfaces and unexposed to contact by persons or materials that may be in contact with other conducting surfaces including other enclosures, conduit, etc., and where also the voltage does not exceed 150 volts to ground and no contained live parts are connected to ungrounded circuits exposed to more than 150 volts to ground.

j. A manually operable automatic overload circuit-breaker may be used in place of both service switch and fuse, and shall be of a type approved for this use.

k. In a property comprising more than one building under single management and which has a generating plant or is served by a master service, the conductors running from one building to another shall not be considered as service conductors, in that fuses or automatic overload circuit-breakers will not be required where these supply the wiring installation within any building, provided that the fuses or circuit-breakers next back on these conductors properly protect the conductors within that building, and provided that each such set of conductors is separately controlled by a suitable feeder-control switch which is readily accessible to those persons using that installation. Such switch may be located at the entrance of the conductors to the individual building or farther back on the feeder concerned. This rule includes garages and similar outbuildings of residential installations.

l. When service wires carry a voltage exceeding 600 volts between conductors, the requirements of section 5009 of Article 50 of this Code shall apply.

#### 406. Hazardous Locations.

a. Service entrance equipment shall not be placed in the class I locations defined in paragraph (b) of section 3201 of article 32 of this Code. (See paragraph, (b), section 3233.)

b. When it is necessary to place service entrance equipment in the class II or class III location defined in paragraphs (c) and (d) respectively of section 3201, the provisions of paragraph (b), section 3204, and paragraph (b), section 3205, respectively, shall be observed.

### ARTICLE 5. WIRING METHODS

This article treats only of types of wiring recognized as suitable and of the conditions and methods of installation under which they are suitable. Special types of wiring may be used only where recognized as suitable under this and other articles of this Code. The recognized types of wiring may be installed in any type of building or any type of occupancy except as otherwise provided in any article of this Code.

#### 500. Polarity Identification of Systems and Circuits.

a. Except as otherwise permitted in paragraph c of this section, any interior wiring system shall have such an arrangement of conductors that systematic polarization, protective grounding, and connection to service may be readily accomplished, as in the following recognized systems and circuits.

##### GROUNDING SYSTEMS AND CIRCUITS WITH THE GROUNDED WIRE CONTINUOUSLY IDENTIFIED

1. A two-wire system one wire of which is continuously identified.
2. A three-wire system, Edison three-wire direct current, or three-wire single-phase alternating current, the neutral wire of which is continuously identified.
3. A multi-wire system (more than two wires, but not including an Edison three-wire system), one wire of which is continuously identified.

b. No interior wiring system shall be electrically connected to a supplying system unless the latter contains, for any grounded wire of the interior system, a corresponding wire which is grounded.

c. Interior wiring systems or circuits of other than the above types such as two-wire or multi-wire systems or circuits in which it is not intended to use a continuously identified and grounded wire, may be used as permitted by the authority enforcing this Code, as in the following recognized systems and circuits.

##### GROUNDING SYSTEMS AND CIRCUITS WITHOUT IDENTIFIED WIRE

1. A two-wire system or circuit supplied from the outside wires of an Edison three-wire system having a grounded neutral.
2. A multi-wire polyphase system or circuit with the neutral of one phase grounded.
3. A multi-wire polyphase system or circuit with the neutral wire grounded, but not used as a circuit conductor.

##### UNGROUNDING SYSTEMS AND CIRCUITS

1. Two-wire or multi-wire systems and circuits not intended to be grounded.

d. Every lighting and/or appliance branch circuit shall have one wire continuously identified, grounded and connected to each lamp or appliance on the circuit, except that two-wire branches tapped from the outside wires of a three-wire d.c. or single-phase circuit within the same premises will be permitted if no fuse is omitted and no single pole switches or sockets are used.

Such an identified branch circuit may be supplied only by direct connection from the systems or circuits described in paragraph a of this section.

e. Lighting and/or appliance branch circuits shall not be supplied from auto-transformers used as balance coils.

f. In any of the above systems no continuously identified grounded wire and no unidentified grounded wire shall have placed in it a single pole switch, or an automatic cutout, which operates to open that wire only.

g. Continuous identification of wires of an interior wiring system shall be accomplished for rubber covered wires of No. 6 gauge and less by the use of continuously identified outer covering as specified in paragraph f, of section 602, of article 6, of this Code. For larger wires and wires of other than rubber covering, the continuous identification shall be secured either as for the smaller rubber covered wires or, in process of installation by marking, and testing where necessary, all continuous lengths of wires used for that polarity for which identification is required.

h. Wires having white or natural gray covering shall not be used in identified systems or circuits except as conductors for which identification is required by this section.

The following method of "wiring in" single-pole switches in circuits of armored cable or non-metallic sheathed cable, as suggested, as the ordinary two-wire cable having one wire identified is not permitted for single pole switch loops by the above.

1. The use of two-wire cable, if the identified wire is rendered permanently unidentified by painting, or other effective means at every point where outlets, switch boxes, junction boxes or pull boxes make the wires visible and accessible.
2. The use of a three-wire cable having one identified wire, which identified wire is cut off at each end of the section of cable where the wire emerges, or which is in some manner properly marked at each end to show that the identified wire of this cable is not in the circuit.
3. By so arranging the wiring that both conductors of the circuit coming from the distribution point pass through the switch box to the outlet.

i. Where pendants are attached to a wiring system containing an identified wire, that conductor of the flexible cord which is connected to the identified wire of the system shall itself be continuously identified, as specified in paragraph f, of section 609, of article 6 of this Code. This identified conductor of the cord shall be connected to the screw shell terminal of any lamp holder attached thereto.

It is recommended that flexible cords to portables be similarly identified and connected.

#### 501. Open Wires.

a. Single wires may be installed as open wires upon walls and ceilings, when the provisions of the following paragraphs of this section shall be observed.

b. In dry places wires shall be of approved rubber-covered (R), slow-burning weatherproof (SBW), varnished-cambrie insulated (VC) slow-burning (SB) or asbestos-covered type (A).

c. In damp places or in buildings especially subject to moisture wires shall be of the rubber-covered type.

conductors larger than No. 8 and for all twin, twisted or multiple-conductor cables. Slow-burning insulation (Type SB wire) may, however be used in permanently dry and excessively hot locations by permission of the authority enforcing this Code. All wires of No. 6 or larger shall be stranded. There shall be no splice or tap within the conduit proper. With flexible metallic conduit in wet or damp places wires shall have lead coverings (Type RL).

m. Wires shall not be drawn in until all mechanical work on the building which is liable to injure the wires has been completed, as far as possible.

n. Wires of different systems shall not occupy the same conduit.

Different systems are those which derive their supply from (1) different sources of current, (2) transformers connected to separate primary circuits, or (3) transformers having different secondary voltages.

o. When alternating current is to be employed, all conductors of a circuit shall be placed within one conduit, except as provided in section 510 of this article.

It is recommended that this course be pursued in the case of direct current also, in order to obviate induction troubles if a change is made to alternating current at a later date.

p. Except in the case of stage pocket and border circuits and flasher and carriage-call wires and elevator control wires or by permission of the authority enforcing this Code, one conduit shall not contain more wires than as specified in Table 1 of this section.

q. Size of Conduits for the Installation of Wires and Cables.

The following tables apply only to complete conduit systems, and do not apply to short sections of conduit used for the protection of exposed wiring from mechanical injury.

TABLE 1. TWO-WIRE AND THREE-WIRE SYSTEMS

Size of Wire	Number of Wires in One Conduit								
	1	2	3	4	5	6	7	8	9
No. 14	1/2	1/2	3/4	3/4	3/4	1	1	1	1 1/4
12	1/2	1/2	3/4	3/4	3/4	1	1	1	1 1/4
10	1/2	1/2	3/4	3/4	3/4	1	1 1/4	1 1/4	1 1/4
8	1/2	1/2	3/4	1	1 1/4	1 1/4	2	2	2 1/2
6	1/2	1	1 1/4	1 1/4	1 1/2	2	2	2	2 1/2
5	1/2	1 1/4	1 1/4	1 1/4	2	2	2	2	2 1/2
4	1/2	1 1/4	1 1/4	1 1/2	2	2	2	2	2 1/2
3	1/2	1 1/4	1 1/2	1 1/2	2	2	2 1/2	2 1/2	2 1/2
2	1/2	1 1/2	1 1/2	2	2	2 1/2	2 1/2	3	3 1/2
1	1/2	2	2	2	2 1/2	2 1/2	3	3	3 1/2
0	1	2	2	2	2 1/2	2 1/2	3	3	3 1/2
000	1	2	2	2	2 1/2	2 1/2	3	3	3 1/2
0000	1 1/4	2	2 1/2	2 1/2	3	3	3 1/2	3 1/2	4
200000 C.M.	1 1/4	2	2 1/2	2 1/2	3	3	3 1/2	3 1/2	4
225000	1 1/4	2 1/2	2 1/2	3	3	3 1/2	3 1/2	4	4
250000	1 1/4	2 1/2	2 1/2	3	3	3 1/2	3 1/2	4	4
300000	1 1/4	2 1/2	3	3	3 1/2	3 1/2	4	4	4 1/2
350000	1 1/4	2 1/2	3	3	3 1/2	3 1/2	4	4	4 1/2
400000	1 1/4	3	3	3	3 1/2	4	4	4	4 1/2
450000	1 1/4	3	3	3	3 1/2	4	4	4	4 1/2
500000	1 1/2	3	3 1/2	4	4	4 1/2	4 1/2	5	5
550000	1 1/2	3	3 1/2	4	4	4 1/2	4 1/2	5	5
600000	1 1/2	3	3 1/2	4	4	4 1/2	4 1/2	5	5
650000	2	3 1/2	3 1/2	4	4	4 1/2	4 1/2	5	5
700000	2	3 1/2	3 1/2	4 1/2	4 1/2	5	5	5	5
750000	2	3 1/2	3 1/2	4 1/2	4 1/2	5	5	5	5
800000	2	3 1/2	4	4 1/2	4 1/2	5	5	5	5
850000	2	3 1/2	4	4 1/2	4 1/2	5	5	5	5
900000	2	3 1/2	4	4 1/2	4 1/2	5	5	5	5
950000	2	4	4	4 1/2	4 1/2	5	5	5	5
1000000	2	4	4	4 1/2	4 1/2	5	5	5	5
1100000	2 1/2	4	4 1/2	4 1/2	5	5	5	5	5
1200000	2 1/2	4 1/2	4 1/2	5	5	5	5	5	5
1250000	2 1/2	4 1/2	4 1/2	5	5	5	5	5	5
1300000	2 1/2	4 1/2	5	5	5	5	5	5	5
1400000	2 1/2	4 1/2	5	5	5	5	5	5	5
1500000	2 1/2	4 1/2	5	5	5	5	5	5	5
1600000	2 1/2	5	5	5	5	5	5	5	5
1700000	2 1/2	5	5	5	5	5	5	5	5
1750000	3	5	5	5	5	5	5	5	5
1800000	3	5	5	5	5	5	5	5	5
1900000	3	5	5	5	5	5	5	5	5
2000000	3	5	5	5	5	5	5	5	5

Where single conductor, single braid, solid wires only are used, four No. 14 wires may be installed in a 1/2-inch conduit and up to seven No. 14 wires in a 3/4-inch conduit. Three No. 12 wires may be installed in a 1/2-inch conduit, four No. 10 wires in a 3/4-inch conduit and three No. 8 wires in a 1/2-inch conduit.

TABLE 2. THREE-CONDUCTOR CONVERTIBLE SYSTEM

two	Size of Wires		10	Size Conduit Electrical Trade Size, Inches
	14	and one

TABLE 3. STAGE POCKET AND BORDER CIRCUITS, AND ELSEWHERE BY SPECIAL PERMISSION

Size of Wire	Maximum Number of Wires in Conduit					
	Inch	Inch	Inch	Inch	Inch	Inch
14	1	1 1/4	1 1/2	2	2 1/4	3
12	1	1 1/4	1 1/2	2	2 1/4	3
10	1	1 1/4	1 1/2	2	2 1/4	3
8	1	1 1/4	1 1/2	2	2 1/4	3
6	1	1 1/4	1 1/2	2	2 1/4	3

For groups or combinations not included in the above tables, consult the authority enforcing this Code. For such groups or combinations, it is recommended that the conduit be of such size, that the sum of the cross-sectional areas of the several conductors will not be more than 40 per cent of the interior cross-sectional area of the conduit.

r. Wires in vertical conduits shall be supported at the following intervals:

No. 14	to No. 0	not greater than 100 feet
No. 00	" No. 0000	" " " 80 "
No. 0000	" 350000 C. M.	" " " 60 "
350001 C. M.	" 500000 C. M.	" " " 50 "
500001 C. M.	" 750000 C. M.	" " " 40 "
	above 750000 C. M.	" " " 35 "

The following methods of supporting cables are recommended:

1. By approved clamping devices constructed of or employing insulating wedges inserted in the ends of the conduits.
2. By inserting junction boxes at the required intervals in which insulating supports of approved type are installed and secured in a satisfactory manner to withstand the weight of the conductors attached thereto, the boxes being provided with covers.
3. In approved junction boxes, by deflecting the cables not less than 90 degrees and carrying them horizontally to a distance not less than twice the diameter of the cable, the cables being carried on two or more insulating supports, and additionally secured thereto by the wires if desired.

s. Vertical wires of No. 1 or larger shall not be deflected where they enter or leave a cabinet unless a gutter having a width in accordance with the following table is provided.

Feeder Size (A.W. gauge)	Minimum Width of Gutter in Inches
0-200,000cm.	3
211,600cm. to 500,000cm.	4
600,000cm. to 900,000cm.	6
1,000,000cm. to 1,400,000cm.	8
1,500,000cm. to 2,000,000cm.	12

504. Surface Metal Raceways (Metal Moulding Work).

a. When wires are installed in surface metal raceways (metal moulding work), the provisions of the following paragraphs of this section shall be observed.

b. Raceways shall be of approved types and shall be used only in exposed dry locations and where the maximum difference of potential does not exceed 300 volts between conductors nor 150 volts to ground. They shall not be placed in hoistways nor where they may be subjected to severe mechanical injury nor where corrosive vapors are present. (For use in underplaster extensions see section 510 of this article.)

c. Wires shall be of approved rubber-covered type, and shall be continuous from outlet to outlet, or from fitting to fitting, no joints or taps being located in the raceway proper except that with metal raceway wires exposed to surrounding temperatures exceeding 120° F. (49°C.) shall be type (A) or type (SB).

d. Surface metal raceways shall not be used for wires larger than No. 8 or fused at more than 30 amperes nor for a number of wires greater than that for which the raceway is approved and in no case for more than nine wires.

e. Metal raceways shall be of such construction as will distinguish them from rigid conduit. All surfaces of raceway, elbows, bends and similar fittings shall be suitably protected from corrosion.

f. Metal raceways and their elbows, couplings and similar fittings shall be so designed that the sections can be electrically and mechanically coupled together, while protecting the wires from abrasion. Holes for screws or bolts inside the raceway shall be so designed that when screws or bolts are in place their heads will be flush with the metal surface.

g. Where alternating current is to be employed in connection with metal raceway work, all wires of a circuit shall be placed in one raceway, except as provided in section 510 of this article.

It is recommended that this course be pursued in the case of direct current also, in order to obviate induction troubles if a change is made to alternating current at some later date.

h. A metal raceway shall be continuous from outlet to outlet, or from approved fitting to approved fitting and shall be securely fastened in place. It may be extended through dry walls or dry partitions if in unbroken lengths where passing through; but, where the wall or partition is damp, or where the raceway passes through a floor, an iron pipe sleeve shall be placed over the raceway and shall extend clear of either side of the wall or partition, or from the ceiling below to a point at least 3 inches above the flooring. Where protection from mechanical injury is necessary, the iron pipe sleeve shall extend to a point at least 5 feet above the flooring.

i. Metal raceways shall be grounded as prescribed in article 9 of this Code.

j. When combination metal raceways are used both for signal and for lighting and power circuits, the different systems shall be run in separate compartments, identified by sharply contrasting colors of the interior finish, and the same relative position of compartment shall be maintained throughout the premises, in which case the provisions of paragraph (m), section 503, and of paragraphs (a) to (d) inclusive, section 6003 of this Code, shall be considered as having been observed. When such combination metal raceways are used, ten No. 14 wires shall be permitted in the compartment for light, heat and power circuits. Wires of light and power systems shall enter and leave combination raceways by means of conduit work. In all other respects, the provisions of this section covering single compartment raceways, shall apply.

505. Armored Cable.

a. When armored cable, types AC or ACL, is used as the wiring method, the provisions of the following paragraphs of this section shall be observed.

b. Armored cable shall not be used for systems of more than 600 volts nor where its surrounding temperature will exceed 120° F. (49° C.).

c. Type AC armored cable may be used for open or concealed work in dry locations and may be fished; when run on walls of brick or similar masonry it may be embedded in the plaster finish.

d. Wires of armored cables shall be of rubber-covered type. The armored cable shall carry a distinctive marker throughout its entire length.

e. Approved outlet boxes or fittings shall be installed at all outlets and switch points as required by paragraphs (a) and (b) of section 703. The cable shall be continuous from outlet to outlet, or from fitting to fitting, and the armor shall be mechanically and electrically connected to all fittings in a manner to substantially close the openings at entrance points and to hold the cable securely. The entire cable system shall be secured in place by approved fastenings.

f. When in exposed or concealed wiring, cable is run through bored holes in studs, joists or similar wood members, such holes shall be bored at the approximate center of such timbers and not less than two inches from the nearest edge, if their depth will permit.

g. When the cable is employed in accessible attics or roof spaces, it shall be installed as follows:

1. When run within five feet of the floor or floor joists, through bored holes in rafters or studs, or when run through bored holes in floor joists, cable shall be protected by substantial running boards extending at least one inch on each side of the cable or cables, and be securely fastened in place.

2. When within five feet of floor or joist, across the face of rafters or studding, or across the top or face of floor joists, cable shall be protected by substantial guard strips at least as high as the cable.

3. When carried along the sides of rafters, studs or floor joists, neither guard strips, nor running boards shall be required.

h. All bends shall be so made that the armor of the cable will not be injured, and the radius of the curve of the inner edge of any bend shall be not less than five times the diameter of the cable.

i. At all points where the armor terminates, additional protection shall be afforded to the conductors by approved connectors or clamps so that the conductor will be adequately bushed.

j. Type ACL (having a lead sheath under the armor) shall be used in underground service runs and where other circuits are embedded in masonry, concrete or fill in buildings in course of construction, and elsewhere, if the location is such that the cable will be exposed to the weather or to continuous moisture or dampness.

k. For the use of armored cable in under-plaster extensions, see section 510 of this article.

l. Where alternating current is to be employed, all conductors of a circuit shall be contained within one armor except as provided in section 510 of this article.

It is recommended that in the case of direct current also all conductors of a circuit be placed within one armor, in order to obviate induction troubles if a change is made to alternating current at a later date.

m. The armor shall be grounded as prescribed in Article 9 of this Code.

#### 506. Underfloor Raceways.

a. Underfloor raceways shall be used only in dry locations, free from corrosive, hazardous and extra hazardous conditions, in buildings of fire-resistive construction and where embedded in concrete or concrete fill of floors which are of sufficient thickness to exceed the height of raceways at all points. They shall not be used for circuits of more than 300 volts nor for any wire larger than No. 8 nor any wire protected by an automatic overload protective device exceeding 30 amperes.

b. Underfloor raceways shall be of an approved type and may be placed in the concrete fill between the rough and the finished floor when there is at least 1 inch of concrete placed above the raceway, except that with a duct of approximately round or half round section, or of flat top section not exceeding 1½ inches in width, this may be reduced to ¾ inch. Upper surface of flat top ducts shall not be more than 4 inches wide nor shall be placed side by side without at least ½ inch of intervening concrete, or unless cover depth is increased to 1½ inches. Open-bottom types of underfloor raceways shall not be used in floors of monolithic construction.

c. Open-bottom types of underfloor raceways shall not be used in shallow-floor concrete fills unless proper cover is maintained and a smooth pad of 1 inch concrete having a margin of at least 1 inch on either side of the raceway, or unless approved fittings are used which will protect the wiring from contact with piping, structural steel or other obstructions, except that where transverse conduit is encountered the pad thickness may be reduced to ¼ inch. Open-bottom type shall have under it the above required pad except where approved fittings are so installed as to protect the wiring from contact with and leakages to piping, structural steel or other obstructions below.

d. Underfloor raceways shall be laid so that a straight line from the center of one junction box to the center of the next junction box will coincide with the center line of the raceway. Raceways shall be made mechanically secure to prevent disturbing this alignment during construction.

e. All joints along edges of raceways and between raceways, couplings and junction boxes, and between the junction boxes, cover plate and cover ring shall be filled with an approved waterproof cement, but with metal raceway this shall not interrupt the required electrical continuity of the raceway. Approved fittings may be used to take the place of waterproof cement between junction boxes, cover plate and cover ring. Raceways, with their fittings, should be so arranged that there will be no low points, or traps in the raceway run. Crossing shall be avoided wherever practical.

f. Where raceways are run at other angles, than right angles, special fittings shall be provided, if in the judgment of the authority enforcing this regulation, those are necessary. Connections between raceways and distribution center, or the side wall outlets, shall be by means of conduit or approved fittings. Electrical continuity shall be maintained for metal raceways and fittings. At every end of line of duct, a fitting shall be installed extending through the floor to mark the line of the duct. Where a duct line is interrupted by another duct line, but continues in a straight line beyond, and has junction boxes or outlets on either side of the crossing line, no markers shall be deemed necessary at the interrupting point. Dead ends of ducts shall be closed.

g. Inserts for outlets and junction boxes shall be made in an approved manner, with approved fittings, and shall make a tight contact with the raceway. In the case of metal raceways, inserts and junction boxes shall be of metal, electrically continuous with the raceways. Inserts in fibre raceways shall be screwed into the fibre and shall not be set until floor is laid unless inserts are made mechanically secure by separately grouting them in. All inserts and junction boxes shall be carefully leveled to the floor grade and sealed with an approved watertight plug.

h. Care shall be exercised in setting inserts and when cutting through the raceway wall that chips and other dirt do not fall into the raceway. Special tools designed to eliminate this and to prevent the tools entering the raceway and injuring wires already there, shall be employed.

i. Underfloor metal raceways, and all metal fittings, shall be of a type, and of such material, or protected by such coatings, as shall suitably resist corrosion, and any coating shall be such as will resist removal by ordinary handling.

j. Underfloor metal raceways shall be continuous from outlet to outlet, or from approved fitting to approved fitting.

k. Underfloor raceways of metal shall be electrically continuous and grounded as prescribed for other metal wiring raceways in Article 9 of this Code, and at a point as near as practical to the source of supply.

l. A combination type of underfloor raceway may be used for both signaling, and lighting and power wiring systems provided the different wiring systems are run in separate compartments, and the same relative position of compartments is maintained throughout the premises.

m. Where open-bottom raceways are used approved, double braid rubber-covered wires, type RD, armored cable or non-metallic sheathed cable shall be used. Where it is impossible to install the required pad for crossing conduits or structural steel, only armored cable or non-metallic sheathed cable shall be used. Wherever armored cable is used it shall be grounded in accordance with Article 9 of this Code.

n. For closed-bottom raceways approved rubber-covered wires, type R shall be used, or type RD, armored cable or non-metallic sheathed cable shall be used.

o. Wires used in underfloor raceways, either open or closed bottom shall be continuous from outlet to outlet, or from junction box to junction box, or from junction box to outlet. Wires shall have no joints or taps located in the raceway proper, nor at inserts. Joints or taps shall be made in junction boxes by splicing and soldering, or by use of an approved fitting approved for the purpose. Armored cable and non-metallic sheathed cable shall be secured at the outlets by approved fittings.

When an outlet is discontinued the wires feeding that outlet should be removed from the raceway.

p. Not more than ten wires shall be placed in any one raceway, nor shall the combined cross-sectional area of all conductors exceed 50 per cent of the interior cross-sectional area of the raceway; where only armored cable or non-metallic sheathed cable is contained this shall not apply. Wires or interior wiring systems not electrically connected to each other within the building shall not be contained within the same raceway.

q. Wires shall not be drawn in until all mechanical work on the building which is liable to injure the wires has been completed, so far as practical.

r. Where alternating current is to be employed for wires within a metal raceway the wires and circuits shall be so grouped that the current in one direction is substantially the same as that in the opposite direction.

#### 507. Non-Metallic Sheathed Cable.

a. Cable shall not be used for circuits exceeding 300 volts between conductors nor 150 volts to ground.

b. Cable shall only be used for wiring in residence buildings, and in outbuildings on the same premises, or for the wiring of office or mercantile occupancies in residence neighborhoods, which individual occupancies do not require more than four branch circuits.

c. Cable shall not be installed in masonry, concrete or fill in buildings in course of construction, nor where exposed to the weather, nor in continuously damp or moist locations.

d. Cable shall be of approved type, in sizes 14 to 4 inclusive and in two or three-wire assemblies and in addition shall have an approved size of non-insulated copper conductor laid in next to the insulated conductors to be used only for grounding purposes.

e. When employed for exposed wiring, cable shall be installed as follows:

1. Shall be mounted directly upon and unless substantial running boards are used, shall closely follow the surface of woodwork, plaster, cement, brick or other building finish.

2. Shall be secured between outlets with approved fastenings spaced at intervals not exceeding three feet.

3. Vertical runs shall be protected within five (5) feet of the floor by a rigid conduit or pipe, or a substantial wood or metal protecting strip, placed over the cable and securely fastened in place.

4. Horizontal runs within five (5) feet of the floor shall be protected as specified in paragraph (3) above, unless substantial protection is afforded by fixed furniture.

5. Where passing through floors or within 6 inches of floors, cable shall be protected by a length of rigid conduit or pipe passing through the floor, and extending at least 6 inches above the floor, in addition to the protection specified in sub-paragraph (3) above.

f. When employed in concealed wiring, cable shall be installed as follows:

1. In building under construction, shall be secured between outlets by approved fastenings spaced at intervals of not exceeding 4½ feet.

2. In finished buildings where impracticable to support the cable as specified in the preceding paragraph, cable may be fished from outlet to outlet.

g. Cable, exposed or concealed, shall be run in continuous lengths, without joints, splices, or taps, from outlet box to outlet box, or other approved terminal fittings, and shall be secured thereto by means of approved devices which substantially close the openings. Approved outlet boxes or fittings as required by paragraphs a and b of section 703 shall be installed at all outlets and switch points. The grounding conductor shall be connected to the boxes or fittings by approved means.

h. Bends in cable shall be so made and other handling shall be such that the protective coverings of the cable will not be injured, and no bend shall have a radius less than five times the diameter of the cable.

i. Shall not be buried in walls, floors, or ceilings of plaster, cement, or similar finish.

j. When non-metallic sheathed cable is installed in conduit or in surface or underfloor raceways, the provisions of sections 503, 504, and 506 of this article shall apply as far as practicable.

k. When in exposed or concealed wiring, cable is run through bored holes in studs, joists, or similar wood members, such holes shall be bored at the approximate center of such timbers and not less than two inches from the nearest edge, if their depth will permit.

l. Cable in accessible attics or roof spaces, shall be installed as follows: 1. When run within five feet of the floor or floor joists, through bored holes in rafters or studs, or when run through bored holes in floor joists, cable shall be protected by substantial running boards extending at least one inch on each side of the cable or cables and securely fastened in place.

2. When within five feet of floor or joist, across the face of rafters or studding, or across the top or face of floor joists, cable shall be protected by substantial guard strips at least as high as the cable.

3. When carried along the sides of rafters, studs, or floor joists, neither guard strips, nor running boards shall be required.

m. Cable in unfinished cellars or basements, if not run through bored holes in beams or floor joists, shall be run on the under side of running boards not less than 1/2 inch by 1 3/4 inches when run at angles with floor joists or timbers, or on sides or faces of floor joists or timbers when run parallel with them. 3-wire assemblies of cables larger than No. 8 run at angles with floor joists or timbers need not have the guard rails specified in sub-paragraph 2 of the preceding paragraph.

n. In other places where subject to mechanical injury, cable shall be substantially protected by one of the above methods.

**508. Electrical Metallic Tubing.**

a. When electrical metallic tubing is employed for interior wiring systems or parts of such systems, the provisions of the following paragraphs of this section shall be observed.

b. The tubing, its couplings, elbows, bends, bushings, outlet fittings, etc., shall be of approved types. Connections between lengths of tubing and between tubing and any fitting shall provide adequate mechanical strength and electrical continuity and shall not employ threads in the wall of the tubing.

c. The tubing, and elbows and bends for use with the tubing, shall have a circular cross-section and shall have such a finish or treatment of outer surfaces as will provide a permanent approved means of readily distinguishing it, when installed, from rigid conduit.

d. Unless of a non-corrodible metal, all surfaces of tubing and fittings shall have approved coatings, such as baked enamel, zinc, cadmium or other approved metal finish.

e. Metallic tubing and fittings shall be of the following electrical trade sizes, as determined by the internal diameter of the tubing.

Nominal Electrical Trade Size	Approximate Actual Internal Diameter of Tubing
3/8 Inch	0.493 Inch
1/2 Inch	0.622 Inch
3/4 Inch	0.824 Inch
1 Inch	1.049 Inch

The 3/8-inch size is recognized only when used in under-plaster extensions as provided in Section 510 of this Article.

f. The designs of fittings approved for use with electrical metallic tubing shall provide a passageway free from burrs, shoulders or other projections which reduce the internal area of the passageway or are likely to cause abrasion of wires when being pulled in.

g. Elbows, offsets, bends or field bends in the tubing shall maintain the circular cross-section and shall not cause the inner face of such bends to be of a radius of less than six times the internal diameter of the tubing.

h. Electrical metallic tubing shall not be used for interior wiring systems of more than 300 volts between conductors or of more than 150 volts to ground, nor for wires larger than No. 8 gauge or fused at over 30 amperes.

i. Electric metallic tubing shall be used only in exposed dry locations where during installation or afterwards it will not be subject to severe mechanical injury nor to corrosive vapors.

j. Electrical metallic tubing shall not have more than the equivalent of four quarter-bends between consecutive outlets or outlets and fittings, not including bends at such outlets or fittings.

k. Electrical metallic tubing shall be installed as a complete system before the wires are pulled in. The system shall be continuous from approved fitting to approved fitting and shall be firmly secured in place.

l. Wires used with electrical metallic tubing shall be Type R, unless the surrounding temperature of the wire as installed will exceed 120° F. (49° C.) when types A or SB wires shall be used.

m. Wires shall not be drawn into raceways of electrical metallic tubing until all mechanical work on the building which is liable to injure the wires has been completed, as far as possible. Wires of different systems shall not occupy the same tubing. When alternating current is to be employed, all conductors of a circuit shall be within one tube, except as provided for in under-plaster extensions in Section 510 of this Article.

It is recommended that this course be followed in the case of direct current also, in order to avoid induction troubles, if a change is made to alternating current.

n. The number of wires (none larger than No. 8) contained in any run of electrical metallic tubing shall not exceed that given in the following tables, except when special permission for a larger number is obtained.

**TABLE I.**

**Two-Wire and Three-Wire Systems. No. of Wires in One Metallic Tube.**

Size of Wire	Trade Size of Metallic Tubing, I. D.								
	1	2	3	4	5	6	7	8	9
14	1/2	1/2	3/4	3/4	1	1	1	1	1
12	1/2	3/4	1	1	1	1	1	1	1
10	3/4	1	1	1	1	1	1	1	1
8	1	1	1	1	1	1	1	1	1

Where single, solid conductor, single braid wires only are used, 1/2-inch tubing may contain four No. 14 or three No. 12 wires; 3/4-inch tubing may contain seven No. 14 wires or four wires of No. 10 or three wires of No. 8 gauge.

**TABLE II.**

**Three-Conductor Convertible System.**

Size of Wires.	Trade Size, (I. D.) of Metallic Tubing.
Two No. 14 and one No. 10.	3/4 inch
Two No. 12 and one No. 8.	3/4 inch

For groups or combinations not included in Table II, the authority enforcing this Code may be consulted.

For such groups or combinations, it is recommended that the sum of the cross-sectional area of the several conductors in the group or combination shall not exceed 40 per cent of the area of the tubing to be used.

o. Wires in vertical runs of electrical metallic tubing, exceeding 100 feet shall be supported as is specified for wires in rigid conduits in paragraph g of Section 503 of this Article.

p. Installation of metallic tubing shall be grounded as is specified for other wiring methods in Article 9 of this Code.

509. Reserved for future use.

**510. Underplaster Extensions. (Concealed.)**

a. Lighting Branch Circuits, Combination Lighting and Appliance Branch Circuits, and Ordinary and Medium-Duty Appliance Branch Circuits may be installed as underplaster or concealed extensions of existing similar branch circuits in buildings of fire-resistive construction when the provisions of the following paragraphs of this section are observed.

b. Such extensions shall be run in rigid or flexible conduit, armored cable, metal moldings, or electrical metallic tubing, of approved standard types. Standard sizes of conduit, cable, molding or tubing shall be used except that for single wires only, conduits or tubing may be not smaller than 1/2-inch. Raceways especially approved for this use may also be employed.

c. Such extensions shall be laid on the face of masonry or other material of which the walls and ceilings are composed and shall then be buried in the plaster finish. They shall not be run outside of the floor or suite in which they originate.

d. The methods of installation for such extensions shall be as given in the appropriate sections of this article for the kind of raceway employed, except that raceways may be used for single conductors even when alternating current is employed.

**511. Decorative Lighting Systems.**

a. Temporary installations of approved systems of decorative lighting shall be used only when permission therefor has been granted by the inspection department and where the difference of potential between the wires of any circuit does not exceed 150 volts and where the number of outlets and lamps connected to them is in no case such as to place more than 15 amperes on a branch circuit fuse.

**512. Auto Transformers for Derived Wiring Systems and Circuits.**

Transformers in which a part of the turns are common to both primary and secondary alternating-current circuit, ordinarily known as auto-transformers, shall not be used to supply any interior wiring system, unless the system supplied contains an identified grounded wire which is solidly connected to a similar identified grounded wire of the system supplying the auto-transformer. This rule, however, does not prohibit the use of auto-transformers in auto-starters used for controlling induction motors, nor does it prohibit the use of auto-transformers for supplying motor-starting current to individual motors, nor for the supply circuits, wholly within a device which also contains the auto-transformer.

**513. Insulation Resistance.**

a. A completed installation shall have a resistance between conductors, and between all conductors and ground, not less than:

Up to	Resistance
5 amperes	4,000,000 ohms
10 "	2,000,000 "
25 "	300,000 "
50 "	400,000 "
100 "	200,000 "
200 "	100,000 "
400 "	50,000 "
800 "	25,000 "
1,600 "	12,000 "

b. The above values shall be determined with all cutouts and safety devices in place. If lamp sockets, receptacles, fixtures and other appliances are also connected, the minimum resistance required shall be one half that specified in the table.

**514. Surface Wooden Raceways.**

a. Wooden raceways shall be coated, externally and internally, with 2 layers of waterproofing, or shall be impregnated with a moisture repellent. The raceway shall be composed of two parts, a backing and a capping, and shall afford suitable protection against abrasion of wires. It shall be so constructed as to thoroughly encase the wire, having a barrier of not less than 1/2 inch in thickness between wires, and having exterior walls which under grooves shall be not less than 3/8 inch in thickness and on sides not less than 1/4 inch in thickness.

It is recommended that only hardwood be used.

b. In installing surface wooden raceways the appropriate provisions of paragraphs (b) and (c) of section 504 shall be observed.

c. The entire raceway system shall be securely fastened in place.

**ARTICLE 6. CONDUCTORS.**

**601. Marking.**

a. Wires, cables and cords of all kinds except weatherproof wire shall have a continuous distinctive marking so that their maker may be readily identified. All wires, cables and cords shall also be plainly tagged or marked as follows:

1. The maximum working pressure or voltage for which the wire was tested or approved. This may be omitted for slow-burning, slow-burning weatherproof, weatherproof and asbestos-covered switchboard wires.
2. The words "National Electrical Code Standard."
3. Name of the manufacturing company and, if desired, trade name of the wire.
4. Month and year when manufactured. This may be omitted for slow-burning, slow-burning weatherproof, and weatherproof wires.
5. The proper type letter for the particular style of wire or cable as given in the following sections.

**602. Rubber-covered Wire.**

For installation rules, see article 5 of this code.

**a. Classification.**

R	Rubber-covered for voltages	0-600
R15	Rubber-covered for max. voltage	1500
R25	" " " " "	2600
R35	" " " " "	3500
R50	" " " " "	5000
R70	" " " " "	7000
RL	Rubber-covered, leaded.	
AC	Wires for use in armored cable	
ACL	Leaded wires for use in armored cable.	

b. All National Electrical Code Standard rubber-covered wires shall be examined and tested at the factory and shall be labeled before shipment.

c. Conductors shall be covered for their entire length with a properly applied and properly vulcanized rubber compound. This rubber covering shall be of the nominal thickness given in the following table, the requirements of which vary according to the sizes of conductors and the maximum working pressure.

**Table of Thicknesses of Rubber Insulation for Rubber-Covered Wires and Cables in 64th Inches.**

Size of Conductor American or B. & S. Gauge	Standardized Stranding	Type					
		R 600 Volts	R-15 1500 Volts	R-25 2500 Volts	R-35 3500 Volts	R-50 5000 Volts	R-70 7000 Volts
14 to 2	7/25 to 7/51	3	4	5	6	7	8
7 to 2	7/64 to 7/102	4	5	6	7	8	9
1 to 0000	19/64 to 19/107	5	6	7	8	9	10
225,000 to 500,000 C. M.	19/114 to 37/116	6	7	8	9	10	11
525,000 to 1,000,000 Over	61/102 to 61/128	7	8	9	10	11	12
1,000,000	91/114 to 91/128	8	9	10	11	12	13

The second column above refers to wires and cables having standardized stranding as given in Table II of section 612. The first column refers to solid conductors and to wires and cables stranded otherwise than in Table II.

d. All single rubber-covered wires and cables shall have a covering of fibrous material applied directly to the surface of the insulating wall. For any single-conductor wire there shall be at least one braid for sizes from No. 14 to and including No. 8. For all single-conductor cables larger than No. 8 there shall be at least two braids or a tape and a braid. For twin wires and twisted-pair wires and for all multiple-conductor cables there shall be a fibrous covering on each individual wire and in addition a braid enclosing the bunched conductors. For certain special service conditions, one or more additional coverings of fibrous material or of lead may be required. Fibrous coverings may be either braid or tape, but tape shall not be used for the final outer covering.

e. Lead coverings may be applied to single or multiple conductors. Lead-covered multiple-conductor cable with more than two conductors shall, in all cases, have the conductors helically laid. In all cases, the individual conductors of lead-covered cable shall have a fibrous covering and, except for two-conductor cables with conductors parallel, there shall be a fibrous covering over bunched conductors.

f. Single rubber-covered wires No. 6 and smaller intended for use as identified conductors of circuits shall have the outer covering finished to show a white or natural gray color. Twin and twisted pair wires and three-conductor cables shall have one conductor, and four-conductor cables shall have two conductors identified in this manner. The coverings of the other conductors shall be finished to show solid colors other than white or natural gray.

**603. Varnished-Cambric-Covered Wire. Type VC.**

For installation see Article 5.

This wire is not intended for use where moisture exists.

a. The varnished cambric shall be applied in layers and filled as may be specified, and shall have coverings conforming to the requirements for rubber-covered wire as prescribed in Section 602 of this Article.

b. The thickness of the varnished cambric and filler shall be not less than those given in the following table:

**Table of Thicknesses of Varnished Cambric and Filler in 64th Inches**

Size of Conductor, Gauge	For Working Pressures Not Over					
	600 Volts	1500 Volts	2500 Volts	3500 Volts	5000 Volts	7000 Volts
14-10	3	5	7	8	11	14
8	3	5	7	8	11	14
7-2	4	6	7	8	11	14
1-0000	5	6	7	8	11	14
225,000 to 500,000 C. M.	6	6	8	9	11	14
525,000 to 1,000,000 C. M.	7	7	8	9	11	14
1,000,000 C. M.	8	8	9	9	11	14

c. No individual conductor, whether solid or stranded, shall be less than No. 14 gage. Conductors may be either plain or tinned.

**604. Asbestos-Covered Wire. Type A.**

For asbestos-covered fixture wire see section 608. For installation see Article 5.

This wire is especially useful in hot, dry places where ordinary coverings would perish, and where wires are bunched as on the back of a large switchboard or in a wire tower, so that the accumulations of rubber covering would result in an objectionable large mass of highly inflammable material. It is not suitable for outside work or where moisture exists.

a. Asbestos-covered wire shall be of approved type.

**605. Slow-Burning Wire. Type SB.**

For slow-burning fixture wire see section 608. For installation see Article 5 and sections 1402 and 1503.

This wire is especially useful in hot, dry places where ordinary covering would perish, and where wires are bunched as on the back of a large switchboard or in a wire tower, so that the accumulations of rubber covering would result in an objectionable large mass of highly inflammable material. It is not suitable for outside work or where moisture exists.

a. Slow-burning conductors especially designed and approved for use in fixtures as prescribed in Section 608 of this Code need not necessarily comply with the requirements of paragraphs b and c of this section.

b. The insulation shall consist of three braids of cotton or other thread, all the interstices of which shall be filled with material having fire-resisting and insulating properties. Its surface shall be finished smooth and hard.

c. The thickness of the completed covering shall be not less than that prescribed in Section 602 of this Code for the rubber insulation of 0-600 volt rubber-covered wires.

**606. Slow-Burning Weatherproof Wire. Type SBW.**

For installation see Article 5.

This wire is not suitable for outside work or where moisture exists.

a. The covering shall consist of two layers, one to be weather-resistant, and the other fire-retarding. The fire-retarding coating shall be on the outside and shall comprise about six-tenths of the total thickness of the wall.

b. The thickness of the completed covering shall be not less than that prescribed in Section 602 of this Code for rubber covering of 0-600 volt rubber-covered wires.

**607. Weatherproof Wire. Type WP.**

For installation see Article 5.

This wire is for use outdoors and elsewhere where moisture is certain or corrosive vapors are present, and where fire-retardant qualities are not necessary.

a. The covering shall consist of at least three braids, or their equivalent, all of which shall be thoroughly saturated with a dense moisture-proof compound.

**608. Fixture Wire.**

For installation see Article 14.

a. Fixture wires shall be of the several types given in the following:

Type AF asbestos-covered wire.

Type RF-64 rubber-covered fixture wire— $\frac{1}{4}$  inch insulation.

Type RF-32 rubber-covered fixture wire— $\frac{1}{4}$  inch insulation.

Type RF rubber-covered fixture wire— $\frac{3}{4}$  inch insulation.

Type SBF slow-burning fixture wire.

Type AF fixture wire shall have an approved asbestos covering with or without cotton or silk braid.

b. If stranded conductor is used, the strands shall be braided, laid up concentrically or rope stranded or shall be covered with a tight close wind of fine cotton.

c. The rubber covering of types RF-64, RF-32 and RF fixture wires shall consist of properly applied and properly vulcanized rubber compound. The thickness of this rubber covering shall be not less than  $\frac{1}{4}$  inch for No. 18 wire, not less than  $\frac{1}{4}$  inch for No. 16 wire, and not less than  $\frac{1}{4}$  inch for No. 14 wire. Coverings shall be of braided cotton or silk or of other approved material, and shall be sufficiently tenacious to withstand abrasion when being pulled into fixtures.

d. The covering of type SBF fixture wire shall consist of two braids of cotton or of other thread, all the interstices of which shall be filled with material having fire-resisting and insulating properties. Its surface shall be finished smooth and hard. Outer coverings of braided cotton or silk may be provided.

**609. Flexible Cords.**

For installation see Section 612 of this Article.

a. All National Electrical Code Standard rubber-covered flexible cords shall be examined and tested at the factory and shall be labeled before shipment.

b. The rubber covering, except for heater cord (type H), shall consist of a properly applied and properly vulcanized rubber compound of the nominal thickness given in the following table:

Gauge	Thickness Inches
18 and 16	$\frac{1}{32}$
14 to 8	$\frac{1}{16}$

Exceptions: For types PO-64, P-64, and PWP-64 (with conductors of No. 18 gage), the rubber covering shall be  $\frac{1}{4}$  inch in thickness.

c. Each stranded conductor shall, except for heater cord and hard-service cord, be covered with a tight, close wind of cotton, or some other method shall be employed to prevent a broken strand puncturing the rubber covering. Cords of the several types shall conform to the descriptions given in the following table:

Type Letter	Trade Name	Braid on Each Conductor	Filler	Outer Cover
PO-64	Parallel Cord	Cotton	None	1 Cotton or Silk
PO-32	Lamp Cord	Cotton or Silk	None	None
PO	Twisted Portable	Cotton	None	1 Cotton or Silk
C	Reinforced Cord	Cotton	Rubber Jacket	1 Cotton or Silk
PD,	Reinforced Cord	Cotton	Rubber Jacket	1 Cotton or Silk
P-64	Armored Cord	Cotton	None	1 Standard Armor
P-32	Armored Cord	Cotton	None	2 Cotton & Standard Armor
CA	Armored Reinforced Cord	Cotton	Rubber Jacket	2 Cotton & Standard Armor
PA	Armored Reinforced Cord	Cotton	Rubber Jacket	2 Cotton & Standard Armor

**As Pendants and Portables in Dry Places Where not Subject to Hard Usage**

**Pendants—Damp Places Where not Subject to Hard Usage**

Type	Trade Name	Cotton Moisture-proofed	Filler	Outer Cover
CB	Brewery Cord	Cotton Moisture-proofed	None	None
CC	Canvasite Cord	Cotton Moisture-proofed	None	1 Cotton Moisture-proofed
FWP64 PWP32 PWP	Moisture proof Reinforced Cord	Cotton	Rubber Jacket	1 Cotton Moisture-proofed

**Portable—Damp Places Where Subject to Hard Usage**

Type	Trade Name	Cotton	Filler	Outer Cover
PKWP*	Packing House Cord	Cotton	Jute or Twisted Paper	2° Cotton Moisture-proofed
PAWP	Moisture Proof Armored Reinforced Cord	Cotton	Rubber Jacket	2° Cotton Moisture-proofed Standard Armor
SJ	Jun'r Hard Service Cord	None	Special Rubber Jacket	None
S†	Hard Service Cord	None	Special Rubber Jacket	None

**Theatre Borders**

Type	Trade Name	Cotton Moisture-proofed	Filler	Outer Cover
B	Border Light Cable	Cotton Moisture-proofed	None	2° Cotton Moisture-proofed

Elevator Lighting and Control

Type	Trade Name	Braid on Each Conductor	Filler	Outer Cover
F	Elevator Cable	Cotton	Rubber Jacket	1 Cotton Moisture-proofed
			None	3 Cotton Outer One Moisture-proofed
H	Heater Cord	One Cotton or Silk Braid on Each Conductor or Over All Conductors		

\*Type PKWP is suitable for use on theatre stages.  
 †Type S is suitable for use on theatre stages, for elevator lighting and control and in garages wherever flexible cords except Type H are permitted by this Code.  
 \*Rubber-filled or varnished-cambric tapes may be substituted for the inner braids.  
 Except for types PO-64, PO-32 and PO, individual conductors are twisted together.

d. The cords listed in the table are recognized in sizes of 18 B. & S. Gauge and larger, except that types PO-64, PO-32, P-64, P-32, PWP-64 and PWP-32 are recognized in 18 gauge only, and types PO, P, PWP, and E are recognized in 16 gauge and larger.

e. Other types of flexible cords than those listed in the table shall be submitted for special investigation and shall be approved before being used.

f. One conductor of flexible cords shall have a continuous identifying marker readily distinguishing it from the other conductors. This marker shall be a tracer in the braid of any color contrasting with that of the braid or, in case of cords having no braids, the insulation of one conductor shall be of a white or natural gray color, and the insulation of the other conductor or conductors shall be of a color or colors which may be readily distinguished from white or natural gray.

610. Armored Cable.

For insulation, see Section 505.  
 For armored cord, see Section 609.

a. The conductors shall comply with the requirements for rubber-covered wires of the specific type.

b. The cable shall have a continuous distinctive marking so that the maker may be readily identified.

611. Non-Metallic Sheathed Cable.

For installation see 507.

a. The conductors shall comply with the requirements for rubber-covered wires, except that no braid need be provided directly over the rubber covering.

b. Cable shall be of approved type, in sizes 14 to 4, inclusive, and in two or three-wire assemblies and in addition shall have an approved size of non-insulated copper conductor laid in next to the insulated conductor for grounding purposes.

c. The cable shall have a continuous distinctive marker so that the maker may be readily identified.

612. Carrying Capacity of Conductors.

a. The following tables give the allowable continuous current carrying capacities of copper wires and cables of 98 per cent conductivity, according to the standard adopted by the American Institute of Electrical Engineers.

See following section for Demand Calculations for Feeder Sizes.

TABLE I. ALLOWABLE CARRYING CAPACITIES OF WIRES.

Gauge No.	Diameter of Solid Wires in Mils	Area in Circular Mils	Column A Rubber Insulation Amperes	Column B Varnished Cambric Insulation Amperes	Column C Other Insulation Amperes
18	40.3	1,624	3		5
16	50.8	2,583	6		10
14	64.1	4,107	15	18	20
12	80.8	6,530	20	25	25
10	101.9	10,380	25	30	30
8	128.5	16,510	35	40	50
6	162.0	26,250	50	60	70
5	181.9	33,100	55	65	80
4	204.3	41,740	70	85	90
3	229.4	52,630	80	95	100
2	257.6	66,370	90	110	125
1	289.3	83,690	100	120	150
0	325.	105,500	125	150	200
00	364.8	133,100	150	180	225
000	409.8	167,800	175	210	275
		200,000	200	240	300
0000	460.	211,600	225	270	325
		250,000	250	300	350
		300,000	275	330	400
		350,000	300	360	450
		400,000	325	390	500
		500,000	400	480	600
		600,000	450	540	680
		700,000	500	600	760
		800,000	550	660	840
		900,000	600	720	920
		1,000,000	650	780	1,000
		1,100,000	690	830	1,080
		1,200,000	730	880	1,150
		1,300,000	770	920	1,220
		1,400,000	810	970	1,290
		1,500,000	850	1,020	1,360
		1,600,000	890	1,070	1,430
		1,700,000	930	1,120	1,490
		1,800,000	970	1,160	1,560
		1,900,000	1,010	1,210	1,610
		2,000,000	1,050	1,260	1,670

1 Mil = 0.001 inch.

b. For aluminum wire the allowable carrying capacities shall be taken as 81 per cent of those given in the table for the respective sizes of copper wire with the same kind of covering.

c. Conductors of sizes Nos. 18 and 16 shall be used only for flexible cords and for fixture wires.

d. Conductors may be placed in multiple only by permission of the authority enforcing this Code.

e. Varnished cambric insulated wires smaller than No. 6 shall be used only by permission of the authority enforcing this Code.

TABLE II. STANDARDIZED STRANDING.

No. of Strands	Strands	Mils Dia.	Gauge	Area in Cir. Mils	Allowable Carrying Capacities in Amperes

\*These individual strands are odd sizes not listed in the American Wire Tables.

613. Demand Calculations for Feeder Sizes.

a. General and definitions.

**Demand Factor.** The demand factor of any system, or part of a system, is the ratio of the maximum demand of the system, or part of a system, to the total connected load of the system, or of the part of the system under consideration.

1. This section discusses "estimated or calculated" demand factors rather than measured demand and corresponding demand factors according to the above definition.

2. For conciseness the calculated demand factor will be referred to hereafter in this section as the "demand."

3. The "demand" values given in the following paragraphs of this section are those percentages of the total load upon the conductors as computed on the basis of watts for the area and the occupancy as in the following and which may reasonably be expected under the conditions indicated.

4. The word "Area" means gross area, which shall be determined by the outside dimensions of the building and by the number of floors. Unoccupied cellars, unfinished attics, and open porches need not be included in this computation.

5. All conductors of an interior wiring system, also including overhead service conductors between the service head and the service switch, and underground conductors between buildings under one ownership or management, mains, feeders and sub-feeders, up to the final distributing center, are referred to herein as feeders.

b. Scope and application.

Voltage drop due to length of feeders has not been considered. However, it is recommended that the outside feeder conductors shall be of such size as to cause not more than 3% voltage drop up to the final distributing point on any feeder after the demand, if any, has been applied:

1. This rule applies to an interior wiring system which supplies both lights and appliances on the same circuits, but does not include capacity for industrial or other apparatus requiring special circuits. The calculation of current load for ranges is treated in item 15 of the Table of paragraph d-3 of this section.

2. The values and "demands" set forth in this section are based on average load conditions and may be used safely for all installations which have been adequately designed. However, if at any time after the equipment is put in service it shall be found that conductors are of insufficient capacity to carry the actual load without over-fusing, they shall be increased to comply with the requirements for overload protection applying thereto. In any event the size of feeders shall be sufficient to carry, without overheating, the loads imposed upon them.

It is recommended that a diagram showing contemplated feeder details be furnished the authority enforcing this Code as necessary advance information. This to show:

- Area in square feet
- Computed load
- Demand selected
- Load after applying demand
- Sizes of conductors

c. To determine the size of feeders that supply both light and power loads, the current in amperes for the lighting load shall be determined as specified herein, the current in amperes for the power load as specified in paragraph k of Section 808, of this Code, and the sum of these shall determine the size in accordance with Section 612 of this Article.

d. 1. The current load for lighting and appliances shall be determined in accordance with the following tables and under conditions specified for each, unless the authority enforcing this Code shall decide that conditions require larger sizes and shall specify the sizes to be used.

2. Current-carrying capacities to prevent overheating shall be determined in accordance with Section 612 of this Article.

3. The sizes of feeders shall be not smaller than as determined by the areas supplied, multiplied by the "demand" values tabulated below representing the watts or fractions of a watt per unit of area for each kind of building and occupancy served.

Table of Required Minimum Watts Per Unit Area and Demand Factors Applying Thereto.

1. Buildings constructed and used for single family dwellings:

One watt per square foot, plus 1000 watts for appliances. For area of 2000 or less square feet, demand 100; for all excess over 2000 square feet, 60.

2. Buildings constructed and used for multi-family dwellings (other than hotels):

One watt per square foot, plus 1000 watts per apartment for appliances.

For area of 2000 square feet, or less—demand 100.

For that part of the area in excess of the first 2000 square feet, a demand of 70, provided the number of apartments does not exceed ten. If the number of apartments is between 11 and

40, the second factor (70) shall be 60. For 41 or more apartments, the second factor (70) shall be 50. The demand for each feeder shall be determined in the same manner, i.e., by the area and the number of apartments supplied.

**3. Apartment Hotels (having provision for individual electric cooking):**

One watt per square foot, plus 1000 watts per apartment for appliances.

For area of 2000 square feet or less, demand 100.

For that part of the area in excess of 2000 square feet, a demand of 70, provided the number of apartments does not exceed 10. If the number of apartments is between 11 and 40, the second factor (70) shall be 60. For 41 or more apartments, the second factor (70) shall be 50.

**4. Hotels (having no provision for individual electric cooking):**

One watt per square foot, except for the ballrooms.

For areas 10,000 square feet or less per feeder, demand 100.

For that part of the area in excess of 10,000 square feet and not more than 50,000 square feet per feeder, a demand of 80.

For the excess above 50,000 square feet per feeder, a demand of 70.

**5. Stores and Department Stores (excluding Display Cases and Show-Window Lighting):** Two watts per square foot.

To this shall be added an allowance for special display lighting as follows:

Counter Cases (silent salesmen): 25 watts per linear foot.

Wall or Standing Display Cases: 50 watts per linear foot.

Show Windows: See Item No. 6 below. Demand 100.

**6. Show Windows:** 200 watts per linear foot, measured horizontally along the base of the show window—demand 100.

**7. Office Buildings:** 2 watts per square foot.

For areas 10,000 square feet or less per feeder—demand 100.

For all excess above 10,000 square feet per feeder—demand 70.

**8. Industrial Commercial (Loft) Buildings:** One watt per square foot—demand 100.

For the purpose of this section an industrial commercial building is defined as a building of more than one floor used for manufacturing or merchandising, occupied by more than one tenant.

**9. Garages:** ½ watt per square foot, exclusive of the machine shop or display rooms, if any—demand 100.

**10. Hospitals (except in the operating suite and X-ray department):** ¾ watt per square foot.

For areas of 25,000 square feet or less per feeder—demand 100.

For the excess area above 25,000 square feet per feeder—demand 60.

**11. Schools:** 1½ watts per square foot. For areas of 10,000 square feet or less per feeder—demand 100.

For the excess area above 10,000 square feet per feeder—demand 50.

**12. Storage Warehouses:** ¼ watt per square foot.

For areas of 50,000 square feet or less per feeder—demand 100.

For the excess area above 50,000 square feet per feeder—demand 50.

**13. Factory Buildings:** Feeder sizes shall be based on the specific load which they are to serve.

For the purpose of this section a factory is defined as a building or a portion of a building occupied by one tenant, which is used for manufacturing purposes.

**14. Other Kinds of Buildings and Occupancies:** Theatres, churches, and other places of public assemblage, ballrooms, dance halls, restaurants, club and lodge rooms, community centers, armories, libraries, operating suites and X-ray departments in hospitals, etc., and buildings for special purposes, such as banks, motion picture studios, etc., vary so widely due to geographical location, individual requirements, architectural ornamental treatment, that no standard has been established upon which the watts per square foot may be determined with accuracy. Therefore, the feeders for these and other buildings or occupancies not listed above, shall be determined by the specific load which they are to serve and as ordinarily computed. This applies also to special uses, such as flood and outline lighting, signs, etc.

**15. Electrically Heated Cooking and Baking Appliances:**

The sizes of feeders supplying electrically heated cooking and baking appliances, each rated at more than 1650 watts, may be determined on the basis of the demand values shown in the following table:

Number Ranges	Demand Factor	Number Ranges	Demand Factor
1	100	14	42
2	100	15	40
3	95	16	39
4	90	17	38
5	85	18	37
6	80	19	36
7	75	20	35
8	65	21	34
9	55	22	33
10	52	23	32
11	48	24	31
12	46	25	30
13	44	Over 25	30

The following examples illustrate the application of the table. In these examples the 2-wire system has been used solely for simplicity of illustrations. The same general method of calculation may be applied to other systems of distribution such as 3, 4 or 5-wire.

**EXAMPLE No. 1.**

A dwelling having an area of 4500 square feet, exclusive of unoccupied cellars, unfinished attics, and open porches.  
**AREA IN SQUARE FEET, 4500 x 1 watt—sq. ft. = 4500 watts**  
 Allowance for appliances = 1000 watts

**COMPUTED LOAD = 5500 watts**  
**DEMAND SELECTED FOR THIS OCCUPANCY, first 2000 square feet—demand 100. Excess above 2000 square feet—demand 60.**  
 4500 square feet area = 5500 watts  
 —2000 square feet at 1 watt—sq. ft. x 1 (Demand 100) = 2000 watts

2500 square feet at 1 watt—sq. ft. x 0.6 (Demand 60) = 1500 watts  
 Allowance for appliances = 1000 watts  
**LOAD AFTER APPLYING DEMAND = 4500 watts**

For 110-volt, 2-wire system:  
 4500 watts ÷ 110 volts = 40.9 amperes.  
**SIZE OF CONDUCTORS = 2-No. 6.**  
 (From table No. 612 of allowable carrying capacities of wires.)  
 For 220-volt, 2-wire system:  
 4500 watts ÷ 220 volts = 20.45 amperes.  
**SIZE OF CONDUCTORS = 2-No. 10.**  
 (From table No. 612 of allowable carrying capacities of wires.)  
 For 110-220-volt, 3-wire system:  
 4500 watts ÷ 2 x 110 volts = 20.45 amperes.  
**SIZE OF CONDUCTORS = 3-No. 10.**  
 For 110-220-volt, 4-wire, 3-phase system:  
 4500 ÷ 3 x 110 volts = 13.63 amperes.  
**SIZE OF CONDUCTORS = 4-No. 14.**  
 (From table No. 612 of allowable carrying capacities of wires.)  
 The above calculation does not take account of ranges or other appliances using more than 1650 watts each.

**EXAMPLE No. 2.**

Multi-family dwelling having an area of 30,800 square feet with 44 apartments. Meters in the cellar in two banks of 22 each, and individual sub-feeders to each apartment.

**AREA IN SQ. FT. per apt. = 700 x 1 watt—sq. ft. = 700 watts**  
 Allowance for appliances = 1000  
**COMPUTED LOAD per apt. = 1700 watts**  
**DEMAND 100.**  
 1700 ÷ 110 volts = 15.4 amps., therefore for each apt. feeder from meter bank the **SIZE OF CONDUCTORS IS No. 12** for each of two wires.

**SUB-FEEDS.**

**AREA IN SQ. FT. supplied through each meter bank:**  
 22 apts. of 700 sq. ft. each, 15,400—at 1 watt per sq. ft.  
 Allowance for appliances = 15,400 watts  
**COMPUTED LOAD = 37,400 watts**

**Demand selected for this occupancy:**  
 For first 2000 sq. ft., none—2000 x 1 = 2,000  
 For area in excess of the first 2000 sq. ft., 35,400 x 0.6 = 21,240  
**Load after applying Demand = 23,240**  
 23,240 ÷ 110 volts = 211 amperes; therefore, from service to each meter bank, **SIZE OF CONDUCTORS, from table No. 612, is—No. 4/0** for each wire.

**MAINS**

**AREA IN SQ. FT. 700 x 44 = 30,800 sq. ft. at 1 watt per sq. ft. = 30,800 watts**  
 Allowance for appliances 44 x 1000 = 44,000 watts  
**COMPUTED LOAD = 74,800 watts**

**DEMAND SELECTED for this occupancy for first 2000 sq. ft., none—2000 x 1 = 2,000 watts**  
 For area in excess of first 2000 sq. ft. 72,800 x 0.5 = 36,400 watts  
**LOAD AFTER APPLYING DEMAND = 38,400 watts**  
 38,400 ÷ 110 volts = 349; therefore, from the service supply to the cutout where the main is divided into two feeders, one to each meter bank, the **SIZE OF CONDUCTORS, from table 612, is 450,000 C.M. each.**

The above calculation does not take account of ranges or other appliances using more than 1650 watts each.

**LOAD AFTER APPLYING DEMAND** 38,400 watts  
 38,400 ÷ 110 volts = 349; therefore, from the service supply to the cutout where the main is divided into two feeders, one to each meter bank, the **SIZE OF CONDUCTORS, from table 612, is 450,000 C.M. each.**

**6. One neutral conductor may be employed for three sets of 3-wire or two sets of four or five-wire interior feeders.** Where single two-wire final circuits are run from a meter bank to the premises of individual tenants, the circuits may be balanced on each side of the system and a common neutral be employed for not more than eight circuits, on 3-wire direct-current or single-phase, and 5-wire, 2-phase alternating-current systems, and not more than six circuits on 4-wire, 3-phase systems. All wires of the A.C. systems shall be run in the same conduit. The size of the neutral and the demand applying thereto shall be determined as specified in the previous paragraphs. In addition, the following further demand may be applied:

Type of System	Current Load in Outside Conductors After Applying Demand	Further Demand for Neutral Conductors
3-wire, D.C. or 1-phase and 4-wire, 3-phase	0 to 200 amperes	100
3-wire, D.C. or 1-phase, and 4-wire, 3-phase	above 200 amperes	70
5-wire, 2-phase	0 to 200 amperes	140
5-wire, 2-phase	above 200 amperes	100

**614. Use of Flexible Cords.**

a. Flexible cord shall be used only for pendants, wiring of fixtures and portable devices.

b. For all portable work and pendants which are liable to be moved about sufficiently to come in contact with surrounding objects, flexible wires and cables especially designed to withstand this severe service shall be used; for portable devices, or pendants which are not liable to be so located or to be moved about sufficiently to cause abrasion of the insulation, approved flexible cord of type C may be used.

c. Unless provided with approved metal armor, flexible cords shall not be used in show windows or in show cases, except that approved portable cord may be used for the purpose of supplying current to portable lamps and other devices for exhibition purposes, and flexible cord may be used for chain fixtures.

d. Flexible cords shall be protected by approved insulating bushings where they enter sockets.

e. Flexible cords shall be so connected to all fittings that the strain will be taken from the joints and terminal screws by a knot in the cord, winding with tape, a special fitting for the purpose, or other suitable means.

f. Flexible cords shall, where passing through covers of outlet boxes, be protected by approved bushings especially designed for this purpose; or the cover shall be provided with a smooth, well-rounded surface on which the cord will bear. So-called hard-rubber or composition bushings shall not be used.

g. Flexible cords used where the voltage between any two conductors exceeds 300 shall have insulating covering at least 3/64-inch in thickness for all conductor sizes No. 8 and less, except where type S cord is used.

h. Flexible cords not smaller than No. 18 gauge, and flexible cord of smaller sizes approved for use with specific devices, may be attached to circuits fused at not over 15 amperes for not exceeding 150 volts and not over 10 amperes for not exceeding 300 volts, and shall be considered as protected by such circuit fuses. Flexible cords No. 18 gauge, or larger if required by column 1 of table 1 of section 612, may be approved for use with specific devices on the medium-duty appliance branch circuit described in section 1602 and which are fused at not over 25 amperes.

i. No wire smaller than No. 18 shall be used for fixture work or flexible cords, except as approved for specific devices.

**ARTICLE 7. BOXES, CABINETS, AND OUTLET AND TERMINAL FITTINGS.**

**701. Construction of Outlet, Switch, Junction and Pull Boxes and Outlet and Terminal Fittings.**

a. Boxes and fittings unless of corrosion-resistive metal shall be well galvanized, enameled, or otherwise properly coated, inside and out, to prevent oxidation.

It is recommended that the protective coating of conductive material, such as cadmium, tin or zinc, in order to secure better electrical contact.

b. Boxes and fittings not over 100 cubic inches in size, shall be composed of pressed steel, not less than No. 14 U. S. Sheet Steel Gauge (0.078 inch) in thickness, or of cast metal, having a wall thickness of not less than 1/8 inch.

c. Boxes of over 100 cubic inches in size shall be composed of metal and shall conform to the requirements for cabinets and cutout boxes, except that the covers may consist of single flat sheets secured to the box proper by screws, or bolts instead of hinges. Boxes having covers of this form are for use only for enclosing joints in wires or to facilitate the drawing in of wires or cables. They are not intended to enclose switches, cutouts or other control devices.

d. Covers of boxes and fittings shall be of a thickness at least that specified for the walls of boxes of the same material as that used for the cover and of the size under consideration, or shall be lined with firmly attached insulating material not less than 1/32 inch in thickness. Covers of porcelain or other approved insulating material may be used if of such form and thickness as to afford the requisite protection and strength.

e. Covers of outlet boxes and outlet fittings having holes through which flexible cord pendants may pass, shall be provided with approved bushings or shall have smooth, well-rounded surfaces, upon which the cord may bear. Where wires other than flexible cord may pass through a metal cover, there shall be provided a separate hole for each wire, said hole being equipped with a non-combustible, non-absorptive insulating bushing.

f. Flush switch and receptacle plates, if of metal, shall be not less than 0.04 inch in thickness.

g. A fixture stud which is not an integral part of the outlet box shall be composed of steel, malleable iron or other approved material.

h. Outlet boxes intended for use where gas outlets are present shall be so designed that they may be securely fastened to the gas pipes in an approved manner.

i. Boxes and fittings intended for outdoor use shall be of approved weatherproof type.

**702. Construction of Cabinets and Cutout Boxes.**

a. Metal cabinets and cutout boxes shall be well galvanized, plated with cadmium or other approved metallic finish, enameled or otherwise properly coated, inside and out, to prevent oxidation.

It is recommended that the protective coating be of conductive material, such as cadmium, tin or zinc, in order to secure better electrical contact.

b. The design and construction of cabinets and cutout boxes shall be such as to secure ample strength and rigidity.

c. Wooden and (or) composition cabinets, whether for flush or surface mounting, shall be of rigid and substantial design. Doors shall fit closely. The requirements for spacings, barriers and other details of construction, given elsewhere in this section, shall be followed, so far as they apply. Wooden cabinets shall be composed of well-seasoned material at least 3/4 inch in thickness, thoroughly filled and painted. They shall be lined throughout with a non-combustible material, such as 1/2 inch rigid asbestos board firmly secured in place. Linings of slate, marble or approved composition shall be at least 1/4 inch in thickness. Sheet metal lining shall be at least .063 inch in thickness. (No. 16 U. S. sheet metal gauge.)

d. Composition cabinets shall be submitted for approval prior to installation.

e. The spacing within cabinets and cutout boxes shall be sufficient to provide ample room for the distribution of wires and cables placed in them, and for a separation between metal parts of devices and apparatus inclosed within them as follows:

1. There shall be an air space of at least 1/16 inch, except at points of support, between the case of the device and the wall of any metal cabinet or cutout box, on which the device is mounted.
2. There shall be an air space of at least 1 inch between any live metal part (including live metal parts of enclosed fuses) and the door, unless the door is lined with an approved insulating material or is of a thickness of metal not less than No. 12 U. S. sheet metal gauge (0.103 inch), when the air space shall be not less than 1/2 inch.
3. There shall be a space of at least 2 inches between open link fuses and metal lined walls or metal, metal lined or glass paneled doors.
4. Except as noted above, there shall be an air space of at least 1/2 inch between the walls, back, gutter partition, if of metal, or door of any cabinet or cutout box and the nearest exposed current-carrying part of devices mounted within the cabinet where the potentials do not exceed 250 volts. This spacing shall be increased to at least one inch where the potentials exceed 250 volts.

f. Cabinets and cutout boxes shall be deep enough to allow of the closing of the doors when 30-ampere branch circuit panelboard switches are in any position, or when combination cutout switches are in any position or when other single throw switches are opened as far as their construction will permit.

g. Cabinets and cutout boxes which contain devices or apparatus connected within the cabinet or box to the wires of more than four circuits, including branch circuits, meter loops, sub-feeder circuits, power circuits and similar circuits, but not including the supply circuit or a continuation thereof, shall have back wiring spaces or one or more side wiring spaces, side gutters or wiring compartments, unless the wires leave the cabinet or cutout box directly opposite their terminal connections.

h. Side wiring spaces, side gutters or side wiring compartments of cabinets shall be rendered tight enclosures by means of covers, barriers or partitions extending from the bases of the devices, contained in the cabinet, to the door, frame, or sides of the cabinet, provided, however, that where the enclosure contains only those wires or cables which are led from the cabinet at points directly opposite their terminal connections to devices within the cabinet, such covers, barriers or partitions may be omitted. Partially enclosed back wiring spaces shall be provided with covers to complete the enclosure.

i. Cabinets and cutout boxes intended for outdoor use shall be of approved weatherproof type.

**703. Installation of Boxes, Cabinets, and Outlet and Terminal Fittings.**

a. At each outlet, switch, or junction point of conduit, metal raceway, armored cable or non-metallic sheathed cable, and at each outlet and switch point of concealed knob-and-tube-work, an approved box shall be installed. In completed installations, the box shall be provided with a cover, unless a fixture canopy is present.

b. Outlet boxes for concealed work shall have an internal depth of at least 1 1/2 inches, except that where the installation of such a box will result in injury to the building structure, a box of not less than 1/2 inch internal depth may be installed.

c. An approved outlet or terminal fitting shall be used at ends of conduit, armored cable and metal raceway systems from which wires are run without splice to appliances or to knob-and-tube wiring. The fitting shall provide a bushed hole for each wire. It need not be accessible when in knob-and-tube-work. Such fitting shall not be used at outlets for fixtures.

d. Approved metal supports shall be used in new work for boxes and fittings which are not secured to a stud, joist, or similar fixed structural unit. Blocks of wood at least 3/4 inch in thickness may be used for supports if the blocks are rigidly secured to such structural units. Lath, of wood, metal, or composition, shall not be considered a fixed structural unit.

e. Boxes used to enclose flush devices shall be of such type that the devices will be completely enclosed on back and sides, and that substantial support for the devices will be provided. Screws for supporting the box shall not be used for the attachment of the device contained therein. Floor-outlet boxes shall be so designed as to protect receptacles and attachment plugs from mechanical injury and moisture.

f. Covers of outlet boxes and outlet fittings having holes through which flexible cord pendants pass, shall be provided with approved bushings or shall have smooth, well-rounded surfaces on which the cord may bear. Where wires, other than flexible cord pass through a metal cover, there shall be provided a separate hole for each wire, said hole being equipped with a non-combustible, non-absorptive insulating bushing.

g. Boxes, cabinets and fittings shall be securely fastened in place. Boxes and fittings not over 100 cubic inches in size and which are attached to firmly secured, exposed conduit by threading or other connection approved for the purpose are considered as so fastened.

h. Outlet boxes used where gas outlets are present shall be so fastened to the gas pipes as to be mechanically secure.

i. Junction boxes shall be so installed that the wiring contained in them may be rendered accessible without removing any part of the building.

j. Boxes, cabinets and fittings when installed in walls or ceilings shall be so installed that the front edge of the fitting will not set back of the finished surface more than 1/4 inch. On wooden walls or ceilings, the front edges of the fitting shall be flush with the finished surface, or project therefrom. A plaster surface which is broken or incomplete shall be repaired, so that there will be no gaps or open spaces at the edge of the fitting. These requirements do not apply to walls or ceilings composed of concrete, tile or other non-combustible material.

k. In moist places, boxes, cabinets, and fittings shall be so placed or equipped as to prevent moisture from entering and accumulating within the device.

l. Openings in boxes, cabinets and fittings shall be equipped, either separately or as a part of the fitting, with couplings or bushings which will serve to secure the conduit, raceway, armored cable, non-metallic sheathed cable, or flexible tubing to the fitting, and including open wires shall close the opening adequately, and at the same time protect the wires from abrasion. Where a hardwood cabinet is used, as provided for in section 805-e, each opening shall be equipped with a non-combustible, non-absorptive insulating bushing which shall fit securely in the opening and be so closed by the wire, and tape, if necessary, as to fit tightly. In dry places where open work or knob-and-tube-work is used, approved flexible tubing may be employed as an insulating bushing if it extends from the last insulating support and is firmly secured in place.

m. Unused openings in boxes, cabinets and fittings shall be effectively closed by metal plugs or plates affording protection substantially equivalent to that of the wall of the fitting.

n. Metal boxes, cabinets, and fittings shall be grounded where used with conduit, armored cable or metal raceway, or elsewhere when and in the manner specified in sections 904 and 905 of this Code. Boxes, cabinets and fittings used with grounded conduit, armored cable and metal raceways are considered to be grounded by the connection to the conduit, cable or raceway.

For special provisions in hazardous locations see Article 32.

o. In making a surface extension from an existing outlet of concealed wiring, a box, extension ring or blank cover shall be mounted over the original box and electrically and mechanically secured to it. The extensions shall then be connected to this box in the manner prescribed for the method of wiring employed in making the extension.

**ARTICLE 8. AUTOMATIC OVERLOAD PROTECTION OF CIRCUITS AND APPLIANCES.**

Cutout Bases, Fuses, Thermal Cutouts and Circuit-Breakers; Protection of Wires, Circuits, Motors and Appliances.

**801. Cutout Bases.**

a. The requirements of this article shall not apply to attachment plugs, car-lighting cutouts or protective devices for signal systems. Cutout bases for link fuses shall be approved only in capacities above 300 amperes and their spacing shall be at least as great as those given in the following table, which applies only to plain, open fuse blocks mounted on slate, marble or composition bases. If the fuse tips overhang the edges of the fuse block terminals, the spacings shall be measured between the nearest edge of the tips.

Ampere Capacity Not over 125 Volts	Minimum Separation of Nearest Metal Parts of Opposite Polarity.	Minimum Break Distance.
301-1500	1 1/2	1 1/2
Not over 250 Volts		
301-1500	2 3/4	2

b. A space shall be maintained between the fuse terminals of link fuses of the same polarity of at least 1/4 inch for voltages up to 125 and of at least 3/8 inch for voltages from 126 to 250. This is the minimum distance allowable and greater separation shall be provided when practicable.

c. For 3-wire systems link-fuse cutouts shall have the break-distance required for circuits of the potential of the outside wires, except that in 125-250-volt systems with grounded neutral the cutouts in 2-wire, 125-volt branch circuits may have the spacings specified for not over 125 volts.

d. Except for sealable service and meter cutouts the fuse terminals of enclosed fuse cutout bases, shall be of either the Edison plug, spring-clip, knife-blade or other approved standardized type to take corresponding standard enclosed fuses. They shall be secured to the base by two screws or the equivalent, so as to prevent them from turning, and shall be so made as to secure a thoroughly good contact with the fuse.

e. End stops shall be provided to insure the proper location of the cartridge fuse in the cutout base.

f. Cutout bases for enclosed plug or cartridge fuses shall be classified as regards both current and voltage as given in the following table, and shall be so designed that the bases of one class cannot be used with fuses of another class rated for a higher current or voltage.

### STANDARD PLUG OR CARTRIDGE CUTOUTS

Not over 250 volts		Not over 600 volts	
0-30 amperes		0-30 amperes	
31-60 "		31-60 "	
61-100 "		61-100 "

61-100 "		61-100 "	
101-200 "		101-200 "	

### 802. Link Fuses.

a. Link fuses shall not be used when of capacities of 300 amperes or less. When used in capacities of from 301 to 1500 amperes, they shall be rated to correspond to the ratings of cutout bases as given in the table of paragraph a, section 801, of this Code.

b. Contact surfaces or tips of link fuses shall be of copper or aluminum, having good electrical connections with the fusible part of the strip.

c. Link fuses shall be stamped with 80% of the maximum current which they can carry indefinitely, thus allowing about 25% overload before the fuse melts.

d. Link fuses may be used only when mounted on approved bases which, except on switchboards shall be placed in approved cutout boxes or cabinets. A space of at least 2 inches shall be provided between the open-link fuses and metal, or metal-lined walls or metal, metal-lined or glass-paneled doors of cabinets or cutout boxes.

### 803. Enclosed Fuses.

a. The requirements of paragraphs c to g, inclusive, of this section, do not apply to fuses for attachment plugs, car-lighting cutouts, nor to protective devices for signal systems.

b. The casings of enclosed fuses shall be sufficiently tight so that lint and dust cannot collect around the fusible link and become ignited when the fuse is blown. For non-renewable fuses the fusible wire shall be attached to the terminals in such a way as to make it difficult for it to be replaced when melted.

c. Enclosed fuses shall be classified to correspond with the different classes of cutouts, and shall be so designed that it will be impossible to put any fuse of a given class into a cutout which is designed for a current or voltage lower than that of the class to which the fuse belongs.

d. Enclosed fuses shall be marked with the words "N. E. Code Std." All fuses shall be marked with the ampere capacity. On ferrule contact fuses this marking shall be on the tube or ferrules, and on knife blade fuses on the tubes or caps. In addition to the above marking each cartridge enclosed fuse shall be provided with a paper label, red for 600-volt fuses, navy blue for 250-volt fuses, of 15 amperes or less capacity and green for 250-volt fuses of over 15 amperes capacity. The label for cartridge fuses shall bear the following: The name or trademark of the manufacturer and the voltage for which the fuse is designed.

e. Plug fuses of 15 amperes capacity or less shall be distinguished from those of larger capacity as follows: By an hexagonal opening in the cap through which the mica or similar window shows; or by an hexagonal shaped recess in the top of fuses having porcelain or moulded composition tops, and when labels are used with such plug fuses the labels shall also be hexagonal in shape and fill the recess; or on plugs having solid metal caps, by an hexagonal impression either raised or lowered on the caps.

f. The fuse terminals shall be sufficiently heavy to insure mechanical strength and rigidity. The styles of enclosed plug and cartridge fuse terminals, except for use in sealable service and meter cutouts, shall be as follows:

Not over 250 volts.	
0-30 Amps.	A. Cartridge fuse (ferrule contact).
	B. Approved plugs or cartridge fuses in approved casings for Edison plug cutouts not exceeding 125 volts, but including any feeder or circuit of a system having a grounded neutral, if no wire of the feeder or circuit exceeds 125 volts to ground.
	Cartridge fuse (ferrule contact) for use also in approved casings for large size Edison plug type 250-volt cutouts.
	Cartridge fuse (knife-blade contact).
	Cartridge fuse (knife-blade contact).
31-60 "	Cartridge fuse (ferrule contact).
	Cartridge fuse (knife-blade contact).
	Cartridge fuse (knife-blade contact).
	Cartridge fuse (knife-blade contact).
	Cartridge fuse (knife-blade contact).
Not over 600 volts.	0-30 Amps. Cartridge fuse (ferrule contact).
	31-60 "
	61-100 "
	101-200 "
	201-400 "
401-600 "	Cartridge fuse (knife-blade contact).

g. Cartridge enclosed fuses and corresponding cutout bases, except for sealable service and meter cutouts shall conform to the dimensions given in the table following.

### TABLE OF DIMENSIONS OF THE NATIONAL ELECTRICAL CODE STANDARD CARTRIDGE ENCLOSED FUSES

Form 1. CARTRIDGE FUSE—Ferrule Contact.

Form 2. CARTRIDGE FUSE—Knife Blade Contact.

Rated Capacity Amperes	Length Over Term. Inches A	Distance between Contact Clips Inches B	Width of Contact Clips Inches C	Diam. of Min. Lgth. Ferrules or Thick. of Term. Blades Outside Tube, in.			Diam. Tube Inches F	Width Term. Blades Inches G
				Form 1	Form 2	Form 1		
Voltage Not Over 250								
0-30	2	1	1/2	1/16	1/8	1/8	...	...
31-60	3	1 3/4	3/4	3/16	3/8	3/8	...	...
Voltage Not Over 600								
61-100	5 7/8	4	3/4	1/8	1/4	1/4	...	...

201-400	8 3/4	5	1 3/4	1/4	1 1/4	2	...	1 3/4
401-600	10 3/4	6	2 1/4	1/2	1 3/4	2 1/2	...	2

### 804. Circuit-Breakers and Thermal Cutouts.

a. Circuit-breakers shall be substantial in construction, and shall have ample metal for stiffness. The contact parts shall be arranged so that thoroughly good bearings are obtained. All circuit-breakers shall be provided with easily accessible means of manual tripping and resetting without injury to the operator.

b. Thermal cutouts shall be approved types and shall be mounted in approved metal enclosures.

c. An air circuit-breaker of 0-15 ampere capacity, used for branch lighting and appliance circuits, shall be of such a design that any alteration of its trip point (calibration) or in the time required for its operation on over-current will be difficult.

### 805. General: Use of Automatic Overload Protective Devices.

a. In general, automatic overload protective devices shall be provided in all constant-potential interior wiring systems, and shall be of such character and so placed as to protect each ungrounded conductor.

b. Nothing in this section shall be considered as prohibiting the use of two single-pole circuit-breakers for the protection of ungrounded 2-wire circuits.

c. In general a conductor shall be considered as properly protected by the automatic overload protective device employed in series with it when the automatic overload protective device is so selected and adjusted as to open and interrupt the circuit at a predetermined overload.

1. When fuses are used they shall be selected so as to have ratings not greater than the allowable carrying capacities of wires, as established in Table 1, section 612, Article 6 of this Code.

2. When time-limit automatic overload protective devices are used, they shall be so selected and adjusted as to operate at not greater than 110% of the allowable carrying capacities of wires as established in Table 1, section 612, Article 6 of this Code.

3. When instantaneous circuit-breakers are used, they shall be so selected and adjusted as to operate at not greater than 160% of the allowable carrying capacities of wires as established in Table 1, section 612, Article 6 of this Code.

Under certain limited conditions as provided for under specific uses and as covered in subsequent sections of this Article of this Code, the above general requirements shall be modified. These cases are covered under special headings, such as Motors and Motor Circuits.

d. Each ungrounded conductor of a circuit shall be protected by an automatic overload protective device inserted in series with said conductor, except when the automatic overload protective device next back in line of the supplying circuit sufficiently protects the supplied conductor or as provided in paragraph p of this section. The automatic overload protective device shall be located at the point where the conductor receives its supply except where specifically permitted by other sections of this Article, to be located elsewhere.

e. No automatic overload protective device shall be placed in any permanently grounded wire, except a circuit-breaker which simultaneously opens all conductors of the circuit and except as provided in sections 807 and 808 of this Article.

f. At the locations in interior wiring systems where the size or capacity of conductors is changed and automatic overload protective devices are inserted to properly protect the smaller conductors, it is understood

that if the circuit contains a grounded conductor the size of the grounded conductor may be changed in proportion to the reduction in size of ungrounded conductors although no protective device is provided for such ungrounded conductor.

It is recommended that the automatic overload protective device employed at any one point of an interior wiring system shall embody the same identical type of protection for each ungrounded conductor of the circuit.

g. Except when placed on switchboards or the equivalent which are located in approved rooms or fireproof electric closets, all cutout bases, circuit-breakers and fused switches shall be enclosed in approved cabinets or cutout boxes or shall be so designed or otherwise protected or located so that live parts will not be exposed to accidental contact. They shall, in all cases, be placed in readily accessible locations.

h. Cutout bases, fused switches and circuit-breakers when installed in locations exposed to moisture shall be mounted in approved weather-proof cutout boxes or cabinets.

i. Cutout bases and circuit-breakers shall not be placed where exposed to mechanical injury nor in the vicinity of easily ignitable material. If the occupancy of the building is such that a suitable location free from exposure to mechanical injury or remote from easily ignitable material cannot be found, an approved metallic enclosure shall be provided.

For equipments in hazardous locations, see Article 32.

j. Cabinets shall in all cases be placed in a vertical position except by special permission and under conditions whereby automatic overload protective devices installed in such cabinets are thoroughly safeguarded from attendant hazards.

k. Except as provided in sections 805, 807 and 808 of this article the rated capacity of fuses shall not exceed the allowable carrying capacity of the wire as given in section 612 of this Code; and the circuit-breakers of the time-limit and of the instantaneous types, shall not be set more than 10 per cent and 60 per cent respectively above the allowable carrying capacity of the wire unless a fuse of a rating which properly protects the wires is also installed on the circuit.

l. For the protection of wires having safe carrying capacities exceeding the rated capacity of the largest approved enclosed-type fuse, approved enclosed fuses arranged in multiple may be used, provided as few fuses as possible are used and the fuses are of equal capacity and provided the cutout terminals are mounted on a single continuous pair of substantial bus bars or have an equivalent arrangement that will eliminate any potential difference between them. The total capacity of the fuses shall not exceed the safe carrying capacity of the wires. This paragraph shall not apply to motor-branch circuits.

m. Fixture wires or flexible cords of No. 16 or No. 18 gauge shall be considered as protected by 15-ampere fuses. Flexible cords of No. 18 gauge or larger, approved for use with specific devices which may be used on the medium-duty appliance branch circuits described in section 1802, shall be considered as protected by the 25-ampere fuses of such circuits.

n. Fused rosettes shall not be used.

o. An automatic circuit-breaker, except as provided for generators in section 1002 of this Code, when installed without other automatic overload protective devices, shall have one pole in each ungrounded conductor.

p. The number of over-current units for circuit protection shall not be less than shown in the following table.

(For table of over-current units for motor protection, see paragraph 803 a (6))

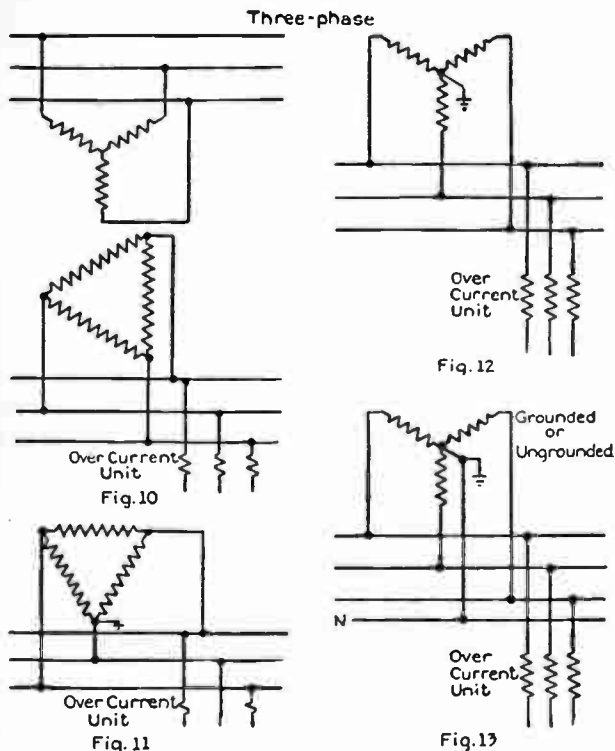

SYSTEM	*Number and Location of over-current units, such as fuses, trip coils, or relays.
2-Wire, Single-phase A.C. or D.C. Ungrounded.	One (in either conductor. Place always in conductors connected to same side of the circuit. Fig. 1.)
2-Wire, Single-phase A.C. or D.C., One Wire Grounded.	One (in ungrounded conductor. Fig. 2.)
2-Wire, Single-phase A.C. or D.C., Mid-point Grounded.	Two (one in each conductor. Fig. 3.)
2-Wire, Single-phase A.C. Derived from 3-Phase, with Ungrounded Neutral.	Where a group of feeders is fed from the three phases of a common three-phase bus, each conductor served by either of two conductors of the three-phase bus must be equipped with one over-current unit. This will result in some circuits being equipped with one unit and other with two units. Fig. 4.
2-Wire, Single-phase Derived from 3-Phase, Grounded Neutral System by Using outside Wires of 3-Phase Circuit.	Two (one in each conductor. Fig. 5.)
3-Wire, Single-phase A.C. or D.C., Neutral Grounded or Ungrounded.	Two (one in each conductor except neutral conductor. Fig. 6.)
3-Wire, 2-Phase, A.C., Common Wire Grounded or Ungrounded.	Two (one in each conductor except common conductor. Fig. 7.)
4-Wire, 2-Phase, Ungrounded, Phases Separate.	Two (one in each phase. Place always in conductors connected to same side of the circuit in each phase. Fig. 8.)
4 or 5-Wire, 2-Phase, Neutral Grounded or Ungrounded.	Four (one in each conductor except neutral conductor. Fig. 9.)
3-Wire, 3-Phase, Ungrounded.	a. Three (one in each conductor if the circuit is served by transformers whose primaries are connected in Y and neutral not connected to system or grounded. Fig. 10). b. Two, under all other conditions. Place always in same phases.
3-Wire, 3-Phase, 1 Wire Grounded.	Two (one in each ungrounded conductor. Fig. 11).
3-Wire, 3-Phase, Grounded Neutral.	Three (one in each conductor. Fig. 12).
4-Wire, 3-Phase, Neutral Grounded or Ungrounded.	Three (one in each conductor except neutral conductor. Fig. 13).

\*1. Where the above table calls for one overload unit, this may consist of one fuse, one series over-current tripping device, or the combination of one current transformer and one secondary over-current tripping device.  
2. Where it calls for two overload units, these may consist of two fuses, two series over-current tripping devices, or the combination of two current transformers and two secondary over-current tripping devices.

- Where it calls for three over-current units, these may consist of three fuses, three series over-current tripping devices, the combination of two or three secondary over-current tripping devices with three current transformers, or two series or secondary over-current tripping devices and one fuse.
- Where it calls for four over-current units, these may consist of four fuses, four series over-current tripping devices, four current transformers with four secondary over-current tripping devices, or two series or secondary over-current tripping devices with two fuses.  
The combination of fuses with series or secondary over-current tripping devices mentioned under (3) and (4) above are to be discouraged for obvious reasons.

Note Neutral Grounded or Ungrounded for 2Phase, 5 Wire System  
Fig. 9

**806. Services.**  
For equipment at services including automatic overload protective devices, see section 405 of Article 4, and section 5009 of Article 50 of this Code.

**807. Lighting and Appliance Branch Circuits.**  
a. For the purpose of this section the terms "Outlets" and "Appliances" shall be defined as follows:

"Outlet"—  
An outlet is that fixed point on a branch circuit at which current is taken to supply lighting fixtures or appliances. An outlet having a fixture with more than one socket attached shall be considered as one outlet. An outlet having a multiple receptacle installed therein shall be considered as one outlet.

"Appliances"—  
Appliances are current consuming devices for domestic or general commercial use, such as heating, cooking and small motor operated devices, etc., suitable for use on the branch circuits described in section 1602 of Article 16.

For definitions of "Branch Circuit," "Lighting Branch Circuits," "Appliance Branch Circuits" and "Combination Lighting and Appliance Branch Circuits" see Article 1 of this Code.

b. All ungrounded wires of a branch circuit shall be protected by fuses or circuit-breakers. When the grounded conductor is identified and properly connected, branch circuits shall be so protected in the ungrounded wires only. In locations where the conditions of grounding or the liability of the reversal of connections warrant, the inspection department may require, on systems having a grounded neutral or having one side grounded that both wires of two-wire branch circuits shall be so protected, even though the grounded conductor is identified and properly connected.

c. Two-wire branch circuits on ungrounded systems shall be protected by a fuse in each wire.

d. Circuit-breakers, if used in lieu of fuses, shall be of a type specifically approved for this purpose.

e. Three-wire branch circuits may be run from direct-current or single-phase alternating-current systems having a grounded neutral, in which case the neutrals of the branch circuits shall not be inter-connected except at the center of distribution.

f. Branch circuits in general, and except as described elsewhere in this Code, shall be protected by fuses of no greater rated capacity than:

- 15 amperes..... at 125 volts or less
- 30 amperes..... at 126 to 250 volts

g. In general, on a two-wire branch circuit and on either side of a three-wire branch circuit the number of outlets shall not exceed 12.

For lighting branch circuits and combination lighting and appliance branch circuits and appliance branch circuits which do not supply floor areas greater than 1200 square feet per circuit, the above outlet restriction may be waived, provided such circuits do not have connected loads greater than 15 amperes for lighting branch circuits nor greater than 10 amperes for combination lighting and appliance branch circuits.

It is understood that by connected load is meant fixed load, exclusive of loads which may be connected to appliance outlets.

h. Branch circuits supplying only sockets or receptacles of the mogul type shall have the wires protected by fuses having a rated capacity not greater than:

- 40 amperes..... at 125 volts or less
- 20 amperes..... at 126 to 250 volts

i. If protected by 40 or 20 ampere fuses as above, wire not smaller than No. 12 shall be used for wiring fixtures with mogul sockets and receptacles and may also be used for taps not over 18 inches long from the circuit wires to the points of suspension of the fixtures.

j. The number of mogul sockets on a 2-wire branch circuit and on either side of a 3-wire branch circuit shall not exceed eight (8) except by permission of the authority enforcing this Code.

## 808. Motors and Motor Circuits.

a. Motors used for continuous duty. Except as otherwise provided in this section, the following tables shall govern the minimum allowable size of the conductors of any individual motor circuit from the main or feeder to the motor, and the maximum allowable rating or setting of the circuit and motor automatic overload protective devices to be used in each ungrounded conductor of any individual motor circuit. These tables are based upon a conductor current-carrying capacity and a rating or setting of motor-running protective device of 125% of the motor full-load current rating, with branch-circuit fuse protection according to the following percentages of the motor full-load current.

Type of Motor	Per Cent Motor Full-Load Current
Single-phase, repulsion or split-phase starting.....	300
Squirrel-cage, full-voltage starting.....	300
Squirrel-cage, reduced-voltage starting (not more than 30 amperes).....	250
High-reactance squirrel-cage (not more than 30 amperes).....	250
Squirrel-cage reduced-voltage starting (more than 30 amperes).....	200
High-reactance squirrel-cage (more than 30 amperes).....	200
Slip-ring A.C. and D.C.....	150

1. For motors having larger full-load current ratings than those given in these tables, calculations for the sizes of conductors and rating or setting of protective devices shall be made on the same basis as the foregoing.

2. The maximum setting of circuit-breakers for such use shall not be in excess of that specified in sub-paragraph 5 of this section.

3. Although it is desirable to keep the branch-circuit protection at as low a rating as is possible, cutout bases for such branch-circuit fuses shall not be of a smaller size than that required to accommodate the branch fuses specified in the following tables for any value of motor full-load current.

4. The rating of a combination cutout and switch used as a motor-controller shall be such that the cutout will accommodate the size of fuse specified in the table for motor-running protection. The rating of a combination cutout and a switch at a service supplying motors or at a tap for a motor branch-circuit shall be such that the cutout will accommodate fuses rated not less than is specified in the table for motor branch-circuit fuses.

5. Where thermal cutouts or thermal relays are used for time-limit automatic overload protection and the values given in Column 6 of Table 1 following do not correspond to standard sizes or ratings, the next higher standard rating or size of thermal cutout or relay may be used. For long runs, it may be necessary, in order to avoid excessive voltage drops, to use conductors of sizes larger than the minimum sizes given in the following tables:

**TABLE 1.**  
**For Selecting Wire and Fuse Sizes for Motor Branch-Circuits.**

Full-load current rating of motor Amperes	Minimum allowable size of copper wire, Am. gauge or str. mils.				For Running Protection of Motors		Maximum Allowable Rating of Branch Circuit Fuses

7 1/2	140	74	30	—	—	—	—	—	—

The following exceptions to the foregoing tables shall be recognized  
1. Motors of 2 H.P. or less shall be considered as being sufficiently protected by the automatic overload protective devices used to protect the conductors of the motor circuits as specified in the foregoing tables.

It is recommended that the running protection specified in the tables be provided for all such small motors when they are located out of sight of the operator.

2. Two or more small motors grouped under the protection of a single set of fuses and with or without other current-consuming devices in the circuit shall be considered as being sufficiently protected if the rating of the fuses does not exceed 15 amperes and the total wattage of the circuit does not exceed 1320 or by the 25 ampere fuses of the medium-duty appliance branch circuits, described in section 1602 of Article 16. No individual motor of such a group shall have a full-load rated current of more than 6 amperes.  
3. Automatic overload protective devices may be omitted at the point where the conductors carrying the current of only one motor are connected to the mains, provided either that, (a) conductors having a carrying capacity equal to that of the remains are carried to the motor running protective devices, or that (b) the carrying capacity of these conductors is at least 1/3 of that of the mains to which they are connected, the length of such conductors to the motor running protective devices is not greater than 25 feet and they are suitably protected from mechanical injury. In such cases consideration should be given to the interrupting capacity of the motor running protective device. When thermal cutouts are used this will require the installation of National Electrical Code fuses for the protection of these mains, the fuses to have a rating not exceeding that indicated on the smallest thermal cutout in the group protected.

4. For the protection of motors used on cranes and hoists see section 3006 of this Code.

5. Except for the protection of thermal cutouts, automatic overload circuit-breakers of the time-limit type may be used for A.C. or D.C. motor branch-circuit protection and automatic overload circuit-breakers of the instantaneous type may be used for D.C. motor branch-circuit protection under the conditions specified in paragraph d, provided the settings are not greater than those given in the following table:

Type of Motor	Circuit-Breaker Setting Per Cent. of Motor Full-Load Current	Instantaneous Type	Time-Limit Type
Single-phase, repulsion or split-phase starting.	—	—	250
Squirrel-cage, full-voltage starting	—	—	250
Squirrel-cage, reduced-voltage starting (not more than 30 amperes)	—	—	200
Squirrel-cage, reduced-voltage starting (more than 30 amperes)	—	—	200
High-reactance squirrel-cage (more than 30 amperes)	—	—	200
Slip-Ring	—	—	

Kind of Motor	Supply System	Number and location of over-load units, such as trip coils, relays or thermal cutouts
2-phase A.C.	3-wire, 2-phase A.C., one conductor grounded	2 in ungrounded conductors
2-phase A.C.	4-wire, 2-phase A.C., grounded or ungrounded	2, one per phase in ungrounded conductors
2-phase A.C.	5-wire, 2-phase A.C., grounded neutral or ungrounded	2, one per phase in any ungrounded phase wire
3-phase A.C.	3-wire, 3-phase A.C., ungrounded	2 in any 2 conductors
3-phase A.C.	3-wire, 3-phase A.C., one conductor grounded	2 in ungrounded conductors
3-phase A.C.	3-wire, 3-phase A.C., grounded-neutral	2 in any 2 conductors
3-phase A.C.	4-wire, 3-phase A.C., grounded-neutral or ungrounded	2 in any 2 conductors, except the neutral

b. Motors used for short time duty. When motors are used in classes of service having short time duty (A.I.E.E. Standard) conductors having carrying capacities differing from those given in the tables in paragraph (a) will be required in motor circuit. In the majority of cases the carrying capacity need not exceed the percentages of the motor name-plate current ratings given in the following table. Motors of this class are considered as being sufficiently protected by the branch-circuit protective devices.

Classification of Service	Percentage of Name-Plate Current Rating				
	5- Minute Rating	10 & 15 Minute Rating	30 & 60 Minute Rating	2-Hour Rating	Continuous Rating
Operating valves raising or lowering rolls.....	110	120	150	200	250
Rolling tables.....	110	120	135	180	200
Hoists, rolls, ore and coal-handling machines.....	110	115	120	150	170
Freight and passenger elevators, shop cranes, tool hoists, pumps, etc.....	110	110	110	120	140

c. The secondary conductors of a wound-rotor A.C. motor between the slip rings and the controller shall have a carrying capacity which is not less than 125% of the full-load secondary current of the motor and between the controller and resistor a carrying capacity which is not less than that given in the following table:

Resistor Duty Classification (NEMA Apparatus Division)	Carrying Capacity of Wire in Per Cent. of Full-Load Secondary Current
Light starting duty.....	35
Heavy starting duty.....	45
Extra heavy starting duty.....	55
Light intermittent duty.....	65
Medium intermittent duty.....	75
Heavy intermittent duty.....	85
Continuous duty.....	110

d. Fuses shall not be required in series with automatic overload protective devices (except thermal cutouts) of other types (a) on main switchboards, (b) where otherwise subject to competent supervision, (c) where next back on the line there are fuses rated or a time-limit circuit-breaker set at not more than 500%, or an instantaneous-type circuit-breaker set at not more than 700% of the motor name-plate current rating.

e. Automatic overload protective devices other than fuses, used for either motor or motor-circuit protection, shall have a continuous current-carrying capacity of at least 115% of the full-load current rating of the motor.

f. A controller for a D.C. motor, which has an overload-release device operative during the starting as well as the running period, may also serve as the running overload protective device.

g. The controller for an A.C. motor may also serve as the running overload protective device if it is equipped with the number of overload units (trip coils, relays or thermal cutouts) called for in the table of sub-paragraph a-6 of this section, and if it is operative when in the running position to open all of the ungrounded conductors automatically under overload.

h. Motor running protective devices may be shunted or cut out during the period for starting the motor, and the motor and its circuit shall be considered sufficiently protected during this starting period, provided that next back on the line there are fuses rated or a time-limit circuit breaker set at not more than 500% or an instantaneous-type circuit-breaker set at not more than 700% of the motor name-plate current rating.

i. When a switch is used to shunt the motor running protective device during the starting period, it shall be of a type that cannot be left in the starting position.

j. The control circuits of a magnetic controller shall be considered as being sufficiently protected by the motor-circuit protective device, provided they are suitably protected from mechanical injury and do not extend beyond the machine on which the controller may be installed.

k. In many cases conductors of a feeder or main circuit supplying a group of motors need not have a carrying capacity equal to the sum of the full-load current ratings of the motors supplied. A diversity factor may be permitted by the authority enforcing these regulations to be used in determining the carrying capacity of these feeders or main circuits, the value of this factor depending on the size and number of the motors supplied and the character of the load.

809. Protection of Generators.

See section 1002 of article 10 of this Code.

810. Protection of Electrically Heated Appliances.

See article 16 of this Code.

811. Protection of Theatre Footlights and Border Lights.

a. Theatre footlights and border lights shall be so wired that the number of outlets and the lamps connected to them shall in no case be such as to place more than 15 amperes on a branch circuit fuse.

812. Protection of Signs and Outline Lighting.

a. Circuits shall be so arranged that the number of outlets and the lamps connected to them shall in no case be such as to place more than 15 amperes on the branch-circuit fuse.

813. Protection of Switchboard Instruments.

a. Enclosed fuses shall be used to protect instruments and pilot lights on switchboards. N. E. Code standard enclosed fuses are preferred, but other types may be used provided the rating of such fuses does not exceed two amperes.

814. Protection of Feeders at Supply Stations.

a. Each constant-potential circuit entering or leaving a supply station, except grounded neutral conductors of three-wire systems, shall be protected from excessive current by an approved automatic overload circuit-breaker or by an equivalent device of approved design. Such protective devices shall be located as near as practicable to point where conductors enter or leave the building. For outgoing circuits not connected with other sources of power, however, the protective devices may be placed on the supply side of transformers or similar devices.

ARTICLE 9. GROUNDING.

NOTE: The whole subject of grounding of equipment and appliances in interior wiring systems including methods of grounding by means of auxiliary conductors, what fixed equipment should be grounded and whether portables in domestic establishments need be grounded and if so how, is to be submitted to a general conference during 1923 with a view to a special report to the next meeting of the Electric Committee—N.F.P.A., and appropriate action for the next edition of this Code.

901. General.

a. Where low-potential circuits, arresters, equipment, conduit, armored cable, metal raceways and the like are grounded as a protective measure, they shall be so arranged that there will be no objectionable passage of current over the grounding conductors. The temporary currents, which are set up under accidental conditions while the grounding conductors are performing their intended functions, are not to be considered as objectionable. Where an objectionable flow of current occurs over a grounding conductor, due to the use of multiple grounds, (1) one or more of such grounds shall be abandoned, or (2) their location shall be changed, or (3) the continuity of the conductor connecting the grounding connections shall be suitably interrupted, or (4) other means shall be taken to limit the current.

b. The grounding connection, including electrode and grounding conductor, shall be permanent and effective and shall always be made on a continuous-metallic underground water piping system if one is available. The protective grounding of electrical circuits and equipment to water piping systems, when done in accordance with this article, is essential since such grounding offers the most efficient protection to life and property and is not injurious to the piping system. In the absence of such a water piping system, a system ground conductor or a secondary neutral grid shall be used if available.

c. Where such a water piping system, a system ground conductor, or a secondary neutral grid is not available the grounding connection shall be made in a manner to secure the most suitable ground and, by one of the following methods:

1. A continuous metallic underground steam piping system;
2. A continuous metallic underground gas piping system;
3. The metal frame of the building;
4. A local metallic underground piping system, metal well casing and the like;
5. An artificial ground whose electrode consists of driven pipe, driven rod, buried plate, or other devices approved for the purpose.

d. Where artificial grounds are used they shall, as far as practicable, be embedded below permanent moisture level. Each electrode shall present not less than 2 square feet of surface to exterior soil. Electrodes of plate copper shall be at least .06 inch in thickness. Electrodes of iron or steel plates shall be at least ¼ inch in thickness. Electrodes of iron or steel pipe shall be galvanized and not less than ¾ inch internal diameter. Electrodes of rods of steel or iron shall be at least ¾ inch minimum cross-section dimension. Approved non-ferrous rods used for electrodes shall be not less than ½ inch in diameter. Driven electrodes of pipe or rods, when of less than standard commercial length, shall preferably be of one piece and shall be driven, except where rock bottom is encountered, to a depth of at least eight feet regardless of size or number of pipes or rods used.

e. The combined resistance of an individual grounding conductor and its connection with the ground shall not exceed 3 ohms for water-pipe or other continuous underground metallic-piping electrodes, nor 25 ohms for artificial grounds. Where resort must be had to artificial grounds the number of electrodes shall be determined as follows: not more than one is required for lightning arresters except where for large current capacity. Not more than one is required for conduit, equipment and other non-current carrying parts. Not more than one is required for grounding low-voltage alternating-current distribution circuits where such ground connection constitutes one of a multiplicity of grounds on the same circuit; but otherwise at least two electrodes shall be provided and shall be at least 6 feet apart and at least 6 feet from other grounding electrodes. The combined area in contact with exterior soil shall be not less than four square feet. If the resistance to ground is in excess of 3 ohms the grounding conductor, except in rural districts, shall be protected and guarded by being enclosed in insulating conduit or moulding to protect persons from injury by coming in contact with it.

It is recommended that ground connections when installed be tested for resistance unless multiple grounding to water piping system is used.

f. Where a system ground conductor or secondary neutral grid is employed it shall be effectively grounded at intervals which will satisfy the requirements as to current-carrying capacity and resistance prescribed in this article.

902. Grounding for Distribution Systems and Interior Wiring.

a. Two-wire direct current systems supplying interior wiring systems and operating at not to exceed 300 volts between wires shall be grounded on one conductor and at the supply station but not at individual services.

It is recommended that 2-wire direct-current systems be grounded if a neutral point can be established and if the maximum difference of potential between the neutral point and any other point on the circuit does not exceed 300 volts. It is recommended that 2-wire direct-current systems be not grounded if the potential to ground of either conductor would exceed 300 volts after grounding.

b. Three-wire direct-current systems supplying interior wiring systems shall be grounded on the neutral at one or more supply stations but shall not be grounded at individual service entrances.

c. Secondary alternating-current distribution systems supplying interior wiring systems shall be grounded on one conductor if they can be so grounded that the maximum voltage to ground does not exceed 150. Similar systems operating with the voltage to ground exceeding 150 volts may be grounded.

It is recommended that such systems be grounded as provided herein, if the difference of potential exceeds 150 volts, but does not exceed 300 volts.

d. The ground connection for a grounded-secondary alternating-current distribution system shall be made, except as provided below, on every individual service. Additional ground connections may be made on the leads of the transformer or transformers or at one or more points on the system. By permission of the authority enforcing this Code (1) any individual ground connection may be omitted provided there are other good ground connections or (2) transformer or system grounding solely may be used.

e. Electric furnace circuits need not be grounded.

f. Where transformers supply a common set of distribution mains, such fuses as are installed shall be so placed as not to leave any portion of the secondary system without ground protection after they have been blown.

g. For alternating-current interior wiring systems the conductor to be grounded shall be as follows:

1. Single-phase, 2-wire: the identified conductor.
2. Single-phase, 3-wire: the identified neutral conductor.
3. Multiphase systems having one wire common to all others; the identified common conductor.

### 903. Method of Grounding Circuits.

a. Where a grounding connection is made on an interior wiring system, it shall be made on the line side of the service switch, and before the interior wiring system is put in use. It shall always be made upon the identified wire, commonly known as "the white wire."

b. The grounded conductor of an interior wiring system shall be connected from one point only within building to the grounding electrode or electrodes.

### 904. Grounding for Metal Enclosures, Coverings and Fixed Equipment.

a. Exposed non-current carrying metal parts of fixed equipment, such as the frames and metal exteriors of generators, motors, transformers, controllers, fixed appliances, lighting fixtures, conduit, armor of cable, metal raceways, and the like but not including lined covers of surface type snap switches nor lined shells of standard sockets, shall be grounded and the point of attachment of the grounding conductor for service conduit systems, devices and appliances shall be accessible. The point of attachment of the grounding conductors for conduit, armored cable, metal raceways and the like shall be such that no part is grounded through a run of smaller size.

b. The following exceptions are permitted where the voltage of contained conductors does not exceed 150 to ground, and the contained conductors are on grounded circuits or on circuits unexposed to voltages above 150 to ground, and the installation is not in an industrial establishment, nor in a moist, corrosive, hazardous, or conductive location, the following need not be grounded, but in all cases may be grounded.

1. Service runs of conduit, under the further conditions stated in Section 404, paragraph g, of Article 4.
2. Runs of less than 25 feet of conduit, armor of cable, metal raceways, etc., when these runs are free from metallic contact with the ground and from adjacent grounded metal and are guarded when within reach from grounded surfaces.
3. Boxes, cabinets, outlets and terminal fittings.
4. Objects exempted from grounding by other rules of this Code.

Conductive Locations are defined as

1. Any room, all or part of which is below normal ground level.
2. Laundries, kitchens, bath rooms.
3. Ground floors of garages, stables and outbuildings with earth or concrete floor.
4. Rooms having floors, walls, or ceilings containing metal lath, metal reinforcement or metal covering.
5. Any particular location so designated by the authority having jurisdiction.

### 905. Method of Grounding Metal Enclosures, Coverings and Fixed Equipment.

For the purpose of this section, fixed equipment devices and appliances shall include all motors, heaters, ranges, fixtures, pendant sockets and all other similar devices which have a metallic exterior and which are connected to the circuit by permanent wires, i. e., without attachment plugs.

a. Where the service conduit or service cable sheath is grounded, its grounding conductor shall be run from it directly to the ground, no portion of the service switch box, or house conduit being interposed in the grounding circuit. The following exceptions are permitted: Where the service switch box or house conduit is grounded, and is installed in dry, non-corrosive locations, the service switch box may be interposed in the grounding circuit of the service conduit provided that bonding jumpers or ground clamps or lugs or devices approved for the purpose are used.

b. Where sections of conduit, armored cable, metal raceways and equipment are grounded they shall be either bonded together and grounded or each section or piece grounded separately.

c. The service conduit, service cable sheath, equipment and the like may use the conductor which grounds the system and its electrode for grounding provided that the system is grounded at two or more locations not in the same building to a continuous metallic underground piping system, otherwise where grounded they shall each have a separate grounding conductor and where artificial grounds are used they shall each have a separate electrode.

d. Metal enclosures and coverings for conductors, and separate grounding wires run in wire assemblies with the circuit conductors, are considered as suitable grounding conductors for protective grounding of fixed equipment, devices and appliances, when installed and used in compliance with the requirements of Article 5 of this Code.

### 906. Grounding Conductors.

a. The conductor for grounding a copper conductor of an interior wiring system shall be of copper and shall be without joint or splice. The conductor for grounding conduit, equipment and other non-current carrying parts may be of copper, or may be a metal pipe or rigid electric conduit, except that under conditions favorable to corrosion, copper only shall be used.

b. On all service-entrance conduit and where an interior wiring system operates at over 150 volts to ground and pipe, conduit or raceway is used as the grounding conductor for fixed equipment, conduits, raceways and fittings, approved bonding jumpers, or other approved devices shall be used. Such bonding jumpers shall not be required with properly cleaned threaded joints, made up tight, on pipe, conduit or fittings, nor, except for service conduit, when approved threadless joints, made up tight to pipe, conduit or fittings, or when two lock-nuts are used.

c. No automatic cutout, or switch for interior wiring systems shall be placed in a grounding conductor, unless the opening of the cutout or switch disconnects all sources of energy.

d. The installation of the grounding conductor for systems, when not consisting of or enclosed in metallic piping, and the insulating covering of the conductor shall comply with all requirements of this Code applying to wires of the voltage of the circuit to which the grounding conductor is attached. Where a wire for grounding an interior wiring system is installed in metallic piping and is bonded to it at both ends a bare copper conductor may be used.

e. Approved ground clamps or other approved fittings shall be used and unless approved for general use without protection they shall be protected from ordinary mechanical injury by being placed where they are not liable to be damaged or by being enclosed in metal, wood or equivalent protective covering. Grounding wires smaller than No. 4, within five (5) feet from the floor, shall be protected from ordinary mechanical injury by being enclosed in metal, wood, or equivalent protective covering. Lightning-arrester grounding wires shall be protected by non-magnetic material, unless the grounding conductor is electrically connected to both ends of the protective covering.

f. The path to ground provided by a system grounding conductor shall, in general, have current-carrying capacity sufficient to insure the continuity and continued effectiveness of the path under conditions of excess current caused by accidental grounding of any normally ungrounded conductor of the circuit or the system to which it is electrically connected.

g. The grounding conductor for a direct-current system shall have a current-carrying capacity not less than that of the largest feeder of the same system leaving the station. In no case shall the grounding conductor be smaller than No. 8.

h. The grounding conductor for an alternating-current circuit or system shall have a current-carrying capacity not less than one-fifth that of the conductor to which it is attached. In no case shall the grounding conductor be smaller than No. 8.

i. The grounding conductor for a lightning arrester shall not be connected to an artificial ground electrode which is used for circuits or equipment and the like, but shall be kept at a distance of at least 20 feet where practicable. The grounding conductor shall have a current-carrying capacity sufficient to insure the continuity and continued effectiveness of the path to ground under conditions of excess current caused by or following the discharge of the arrester. No individual grounding conductor shall be smaller than No. 6.

j. For grounding service conduit of size not larger than 1½ inches, the grounding wire shall be not smaller than No. 8; for two-inch conduit the grounding wire shall be not smaller than No. 4; for larger conduits not smaller than No. 2.

k. The size of the wire or the pipe used for grounding interior conduit, armored cable, metal raceway, equipment and the like, shall be not less than that given in the following table:

Capacity of nearest cutout protecting conductor in conduit, armored cable, metal raceway, equipment and the like.	Size of copper wire.	Nominal size of pipe.
	Not less than two sizes smaller than that of current-carrying conductors.	½ inch.
0 to 30 amperes	No. 10	½ inch
31 to 100 amperes	No. 6	½ inch
101 to 200 amperes	No. 4	¾ inch
201 to 500 amperes	No. 2	1 inch
over 500 amperes		

l. For grounding portable or pendant equipment the conductors to which are protected by fuses or circuit-breakers not greater than 15 amperes, No. 18 copper wire may be used. For grounding fixtures No. 14 or larger shall be used except that a smaller wire may be permitted for the grounding conductor of non-metallic sheathed cable. For grounding portable equipment fused for more than 15 amperes, the above table shall be followed.

m. The grounding conductors for circuits, conduit, equipment, and the like shall not be connected to lightning rods.

n. Instruments, meters, or relays which operate with windings or working parts at 300 volts or more to ground shall have the cases and other exposed bare metal parts grounded unless isolated by elevation or protected by suitable insulating barriers or guards, except where inaccessible to other than qualified persons, in which case this requirement is made only when the voltage to ground exceeds 750. Where instruments, meters or relays are operated from current or potential instrument transformers, on circuits of 300 volts or more to ground, having ungrounded secondary circuits and ungrounded primary circuits, the cases and other exposed bare metal parts shall be grounded. The grounding conductor for cases and for secondary circuits of instrument transformers shall be not smaller than No. 12.

For exception, see paragraph g of section 1302, of Article 13 of this Code.

o. Secondaries of current and potential instrument transformers and the cases of instruments connected to such circuits shall, when grounded, have separate grounding conductors, and shall not be connected with a grounding conductor used for other circuits or for conduit, equipment and the like, except where a general ground bus is provided.

### 907. Grounding Connections.

a. Where a non-conductive protective coating such as paint or enamel is used to protect the equipment, conduit-couplings and fittings, such coating shall be completely removed from threads and other surfaces in order to insure a good contact between ground clamp and equipment. Pipes and rods used as ground electrodes shall have clean metal surfaces, and shall not be covered with paint, enamel, or other poorly conducting materials.

b. At supply stations, grounding conductors for circuits, equipment and lightning arresters shall be permanently and effectively connected to all available active, continuous, metallic underground piping systems between which no appreciable difference of potential normally exists; otherwise to one system only. Elsewhere than at supply stations, the grounding conductor shall be connected to at least one such piping system, if available. (Gas piping shall be avoided wherever practicable,

except as provided in paragraph e of this section.) Where underground metallic piping systems are not available, other grounds which will provide the desired permanence and conductance may be permitted.

e. The point of connection to the water piping system shall be located on the street side of the water meter or at a water pipe near the equipment to be grounded, in which case the connection with the piping system shall be made continuous and permanent, by bonding all parts of the piping system which are liable to become physically disconnected, such as at meters and service unions, by means of a suitable shunt whose joints, current-carrying capacity, and mechanical protection shall be not less than that required for the grounding conductor. Where practicable the point of connection shall be readily accessible.

d. The grounding conductor shall be attached to the pipe or rod (1) by means of an approved bolted clamp to which the conductor is soldered or otherwise connected in an approved manner or (2) by means of a brass plug screwed into the pipe and provided with a lug to receive the conductor or (3) by other approved means.

e. Gas piping systems within buildings connected to continuous-metallic underground exterior systems may be used as a ground electrode but only when water piping is not available. Gas piping, however, may serve as the sole ground for small fixtures located at a considerable distance from water piping. Where gas piping on the house side of the meter is utilized for grounding small fixtures it shall be bonded to the water piping system at their points of entrance. If no water piping is available a bonding jumper around the gas meter shall be used. Where grounding connection is made to gas piping, except for such small fixtures, it shall follow the same requirements as for water piping in paragraph e, of this section, except that the connection shall always be made on the street side of the meter. Gas piping need not be insulated from otherwise well-grounded fixtures.

f. Rails or other grounded conductors of electric railway circuits shall not be used as a ground for other than railway lightning arresters and railway equipment, conduit, armored cable, metal raceway and the like, when other effective grounds are available and in no case shall such rails or other grounded conductors of railway circuits be used for grounding electrode for interior wiring systems other than those supplied from the railway circuit itself.

#### 908. Method of Grounding Portable Equipment in Industrial Establishments.

For the purpose of this section an industrial establishment is defined as a building or part of a building (other than office or exhibit space) where persons are employed in manufacturing processes or material handling as distinguished from dwellings, offices, public utilities and like occupancies.

a. In industrial establishments portable devices, having exposed metal parts, used in industrial operations shall

1. be equipped with a cord containing an additional insulated conductor to be used for grounding purposes only and easily distinguishable from the circuit conductors, or with metal armor such as type CA, PA, etc.;
2. be equipped with non-reversible polarized attachment plug properly fastened to the terminals of the cord;
3. have the grounding conductor (wire or metal armor) connected to the frame or casing of the appliance and to the grounding pole of the plug, and
4. shall have the grounding pole of the receptacle grounded as required in this article.

Appliances to which this rule applies are those which are electrically operated or motor-driven, and are of a portable nature, such as drills, grinders, glue pots, heaters, soldering irons, pumps, air compressors, hammers, conveyors, elevators, hand and stand lamps, and other similar portable hand tools and devices. Exempted are fan motors, pressing irons, and those appliances which are so located as to be ordinarily out of reach, infrequently handled during manufacturing operations or regularly employed in non-conductive locations.

The use of portable devices on circuits operating in excess of 300 volts to ground, is not recommended.

#### ARTICLE 10. ROTATING MACHINERY AND ITS CONTROL APPARATUS

For special provisions for hazardous locations see Article 32.

##### 1001. General.

a. Machines shall be provided with suitable drip pans if required by the authority enforcing this Code.

b. Live parts of rotating equipment of more than 150 volts to ground, except slip rings and brush rigging which do not extend beyond the frames of induction motors, shall not be exposed to accidental contact where accessible to unqualified persons. For the purpose of this rule ungrounded circuits fed from transformers or overhead supply circuits are considered as being more than 150 volts to ground.

c. If terminal blocks are used they shall be composed of approved non-combustible, non-absorptive insulating material, such as slate, marble or porcelain.

d. Where the wiring to fixed motors is accessible to unqualified persons and is in conduit, armored cable, metal raceways or similar construction, terminal enclosures or housings of substantial metal construction shall be provided at the motor terminals. The conduit, armored cable or metal raceways shall be mechanically and electrically connected to the terminal enclosures or housings. The terminal enclosures or housings shall be of ample size to properly make connections.

e. Soft rubber bushings may be used to protect lead wires where they pass through the frame, provided they will not be exposed to oils, grease, oily vapors or other substances having a deleterious effect on rubber. Where so exposed, bushings composed of porcelain, micanite or hardwood treated with a preservative shall be used.

##### 1002. Generators (Other than in Central Stations).

a. Generators shall be located in dry places. They shall not be placed in a room where any hazardous process is carried on, nor where they will be exposed to inflammable gases or flogings of combustible materials.

It is recommended that waterproof covers be provided for use in an emergency.

b. Constant-potential generators, except alternating-current machines and their exciters, shall be protected from excessive currents by automatic circuit-breakers or fuses. Single-pole protective shall be accepted for 2-wire direct-current generators if the protective device is actuated by the entire current generated, except that in the shunt field. The protective device shall not open the shunt field.

c. If a generator not electrically driven supplies a 2-wire grounded system, the protective device shall be so placed as to disconnect the generator from all wires of the circuit.

d. Two-wire, direct-current generators, used in conjunction with balancer sets to obtain neutrals for 3-wire systems, shall be equipped with protective devices which will disconnect the 3-wire systems in the case of excessive unbalancing of voltages.

e. Three-wire, direct-current generators, whether compound or shunt wound, shall be equipped with protective devices, one in each armature lead and so connected as to be actuated by the entire current from the armature. Such protective device shall consist either of a double-pole, double-coil, overload circuit-breaker, or of a 4-pole circuit-breaker connected in the main and equalizer leads and tripped by two overload devices, one in each armature lead. Such protective devices shall be so interlocked that no one pole can be opened without simultaneously disconnecting both leads of the armature from the system.

f. The frame shall be grounded in the manner prescribed in Article 9 if the generator operates at a voltage in excess of 150 volts and is accessible to other than qualified persons. Where the frame is not grounded, it shall be permanently and effectively insulated from ground; and rubber mats or other suitable floor insulation shall be provided for the operator if the voltage to ground exceeds 150.

g. Each generator shall be provided with a name-plate giving the maker's name, the rating in kilowatts, if direct current, or kilovolt-amperes, if alternating current, the normal volts and amperes corresponding to the rating, and the revolutions per minute.

##### 1003. Motors.

a. Motors shall not be operated in series-multiple or multiple-series except on constant-potential systems where permission has been granted by the authority enforcing this Code.

b. For installation of motors in hazardous and extrahazardous places, see Article 32.

c. Each motor with its controller shall be provided with a separate disconnecting means, except as provided below. The disconnecting means shall be of such design and so installed that when it is in the open position it will disconnect both the controller and the motor from all ungrounded supply wires.

In the following cases a single disconnecting means may serve a group of motors.

1. Motors which drive the several parts of a single machine or apparatus, such as cranes, hoists, metal and woodworking machines, etc. See Article 30.
2. Groups of small motors under the protection of one set of automatic overload protective devices, as permitted elsewhere in the Code.
3. Groups of motors in a single room within sight of the disconnecting means.

4. Motors which are each controlled by a knife or snap switch alone.

d. For connected loads of 50 H.P. and less, and also where the controller does not open all ungrounded main leads to a motor, a motor-circuit switch shall be used as the disconnecting means, except that a plug connector may be used with portable apparatus. For larger loads, where the controller opens all the ungrounded wires and all auxiliary circuits are fused, a disconnecting switch may be used. For a small motor, where permitted by the authority enforcing this Code, plug fuses may serve as the disconnecting means. For motors controlled solely by a knife or snap switch the disconnecting means may be at the distribution center.

By main leads to the motor is meant all armature circuits (not including shunt-field circuits) in the case of D.C. motors, and all primary leads (not including the secondary leads of slip-ring motors or the field leads of synchronous motors) in the case of A.C. motors.

e. The disconnecting means shall be of the indicating type, and in its open position make all ungrounded conductors of the controllers and motor "dead." One pole of the motor controller and one pole of the disconnecting means may be placed in a permanently grounded conductor of circuits supplying current to motor, provided these devices are so designed that the pole in the grounded conductors cannot be opened without opening simultaneously all of the conductors of the circuit. The disconnecting means shall be a continuous duty rating of at least 115% of the name-plate current rating of the motor and be located within sight of the controller or arranged to be locked in the open position.

f. A single-pole switch may be used as a controller in an ungrounded wire of a 2-wire motor not larger than ¼ H.P. operating at not more than 300 volts.

g. A motor and its driven machinery shall be within sight of the point where the motor is controlled, unless permission to locate the control point elsewhere is given by the authority enforcing this Code. For exception see Article 32.

h. A double-throw switch used to shunt the motor protective device during the starting period shall be of such type that it cannot be left in the starting position.

i. Adjustable-speed motors, if controlled by means of a field regulation shall be so equipped and connected that they cannot be started under weakened field, unless this safeguard is incorporated in the design of the machine.

j. The control circuits of electrically operated speed-limiting devices and remote-control switches shall be in conduit.

k. Alternating-current motors operating freight or passenger elevators or cranes that are dependent on phase relation for the direction of rotation shall be protected by approved automatic circuit-breakers (or reverse-phase relays) operative in the event of any phase reversal that would cause a reverse motor rotation, or in the event of the motor being connected to the line single-phase.

l. The frame, except for portable motors, shall be grounded unless the motor is inaccessible to other than qualified persons, by reason of guarding or isolation. Where the frame is not grounded, owing to the motor being inaccessible to unqualified persons, it shall be permanently and effectively insulated from ground; and rubber mats, or other suitable floor insulation, shall be provided for the operator if the voltage to ground exceeds 150 volts. The frames of portable motors which operate at more than 150 volts shall be guarded or grounded.

m. Each motor shall be provided with a name plate giving the maker's name, the rating in volts and amperes, including those for the secondary of a slip-ring-type motor, the normal full-load speed and the interval during which it can operate, starting cold. The time interval given shall be either 5, 10, 15, 30, 60 or 120 minutes, or continuous.

##### 1004. Control Apparatus.

a. Control apparatus, other than auto-transformers, shall conform to the requirements of Articles 12 and 17 of this Code.

b. The control apparatus shall have a continuous-duty rating of no less than 115% of the name-plate current rating of the motor.

**1005. Auto-Transformer Starters.**

a. Auto-transformer starters shall have no exposed live parts unless in suitable separate enclosures.

b. Cases for coils or switches shall afford access to the interior for inspection and oil renewal, and shall be so constructed that when mounted on a plane surface the case will make contact with such surface only at points of support. An air space of at least 1/4 inch shall be maintained between case and surface.

c. The oil tank shall be marked in a suitable manner to indicate the proper oil level. When such device carries a visual oil indicator, the marking shall be for the proper oil level with the starter assembled. If the visual indicator is not used, markings shall indicate the oil level prior to assembling.

d. The switch shall provide an off position, a running position and at least one starting position. It shall be so designed that it cannot rest in a starting position, or in any position which will render inoperative the overload protective devices in the circuit.

e. Cases for coils and switches of auto-transformer starters shall be grounded as required in sections 904 and 905 of Article 9 of this Code.

**ARTICLE 11. TRANSFORMERS AND CAPACITORS (STATIC CONDENSERS) NOT OVER 600 VOLTS. No winding of which is connected to a System operating at over 600 volts between Wires or from Wire to Ground.**

**1101. Exception.**

a. Nothing in this article shall be construed to apply to radio (See Article 37) nor to apparatus or fittings, the operation of which depends either wholly or in part upon special air-cooled transformers or capacitors used in connection with apparatus or fittings, but such apparatus or fittings shall satisfy the provisions of Article 17 of this Code.

**1102. General.**

a. Oil-filled transformers may be installed in, outside and adjacent to, or attached to buildings by permission of the inspection department. When installed in, or outside and adjacent to a building they shall be contained in an enclosure of fire-resistive material not communicating with the building except through openings closed by means of approved tight-fitting fire doors. When attached to a building they shall be separated therefrom by substantial supports. This paragraph shall not apply to transformers in central stations and substations.

b. The construction of an air-cooled transformer shall be such that when mounted on a plane surface the casing will make contact with such surface only at the points of support, providing elsewhere an air space of at least 1/4 inch between casing and surface. If the surface is composed of combustible material, the air space shall be increased to at least 1 foot, unless a slab of non-combustible, non-absorptive insulating material is interposed.

This will require a slab of slate, marble or soapstone, somewhat larger than the transformer.

c. The foregoing paragraph b shall not be construed to apply to bell-ringing and other signaling transformers which operate at a primary voltage not exceeding 250 volts.

d. Oil-filled capacitors for not over 600 volts shall comply with the requirements of section 5008 of Article 50 of this Code.

e. Transformer and capacitor cases shall be grounded as provided in Article 9 of this Code.

**ARTICLE 12. SWITCHES.**

**1201. Open Knife Switches.**

a. The spacing given in Tables 1 and 2 below, shall be considered standard and as the minimum allowable, except as otherwise provided for in this Article.

Table 1.

Spacings between Parts of Opposite Polarity and Break Distances within the area bounded by contact parts of the switch mechanism.

Voltage	Amps.	Spacing—Inches		Fuses	Marking
		Opposite Polarity	Break Distance		
I. 125V. D.C. or A.C.	30	1	3/4	With or Without	-A.125V.
I. For Switchboards and Panelboards only	60	1 1/4	1		
	30	1 1/4	1		
	60	1 1/2	1 1/4		
	100	1 1/2	1 1/4		
II. 125V. D.C. or A.C.	200 and *300	2 1/4	2	With or Without	-A.125V.
	400 and 600	2 3/4	2 1/2		
	800 to 6000 incl.	3	2 3/4		
III. 250V. D.C. or A.C.	30	1 3/4	1 1/2		
	60	2 1/4	2		
	100	2 1/4	2		
	200 and *300	2 1/2	2 1/4	With or Without	-A.250V.
	400 and 600	2 3/4	2 1/2		
	800 to 6000 incl.	3	2 3/4		
IV. For both 250V. D.C. and 500V. A.C.	30	2 1/4	2	Without	-A.250V.
	60	2 1/4	2		
	100	2 1/4	2		
	200 and *300	2 1/2	2 1/4	See also paragraph 270	-A.250V. D.C., 500 V. A.C.
	400 and 600	2 3/4	2 1/2		
	800 to 6000 incl.	3	2 3/4		
V. 500V. A.C.	Same as in IV			With	-A.500V. A.C.
VI. 600V. D.C. or A.C.	30	4	3 1/2	With or Without	-A.600V.
	60	4	3 1/2		
	100 to 6000 incl.	4 1/2	4		

\*The 300-ampere switches, with spacings of the 200-ampere switches, may be used only on switchboards.

Triple-pole switches with 125-volt spacings between blades for use on three-wire systems having 125 volts between adjacent wires and not over 250 volts between outside wires shall be spaced as in II and be marked — A. 125V.

Triple-pole switches with 250-volt spacings between blades, for use on three-wire systems having 250 volts between adjacent wires and not over 500 volts between outside wires, shall be spaced as in III, except 30-ampere fused switches to be spaced as in IV; they shall be marked — A. 250V. and if equipped with fuses, fuses shall be of the 600-volt classification.

Table 2.

Spacing between Parts of Opposite Polarity outside the area bounded by the contact parts of the switch mechanism (except for Link Fuses). When Mounted on Same Surface. When Clear of Surface.

Not over 125 V.	3/4 inch	1/2 inch
Not over 250 V.	1 1/4 inch	3/4 inch
Not over 600 V.	2 inch	1 inch

It is recommended that switches above 1070 amperes capacity be not used to break currents, but only as disconnecting switches.

b. Cutout bases shall satisfy the appropriate provisions of Article 8 of this Code.

c. Switches rated above 600 amperes at 600 volts and 600 amperes at 250 volts, and therefore exceeding the capacities of standard sizes of cartridge enclosed fuses, may be arranged for fuses in multiple, provided as few fuses as possible are used, and the fuses are of equal capacity, and the multiple terminals for each pole are mounted in common.

d. Switches marked with the combined rating, 250 volts, D.C. or 500 volts, A.C. shall not be provided with fuse terminals.

e. Switches having fuse terminals and intended for use in ungrounded branch circuits shall have fuse terminals in each pole.

f. Auxiliary contacts of a renewable or quick-break type or the equivalent shall be provided on all 600-volt switches designed for use in breaking currents from 200 to 1000 amperes, inclusive.

It is recommended that such auxiliary contacts be provided on all direct current switches rated at over 250 volts.

**1202. Installation of Switches—General.**

For hazardous locations see Article 32 of this Code.

a. Switches or manual circuit-breakers shall not be placed where exposed to mechanical injury, nor in the immediate vicinity of easily ignitable material. When the above conditions cannot be complied with, switches, circuit-breakers, and similar devices, unless of the oil-immersed type, shall be enclosed in approved metal boxes or cabinets, and shall be of the externally operable type.

b. Except as provided in paragraph d of this section, switches or manually operated circuit-breakers shall be placed only in dry, accessible places, and be grouped as far as possible.

c. Switches or manually operated circuit-breakers, when located where exposed to moisture, as in basements and in similar places, shall be mounted in approved boxes or cabinets, and when located in wet places or outside buildings, shall be mounted in approved weatherproof switch boxes or cabinets.

d. Enclosures for switches or circuit-breakers on circuits, any wire of which operates at over 150 volts to ground, except where accessible only to qualified operators, shall be grounded as provided in Article 9 of this Code.

e. Switches operating at over 150 volts to ground shall be of the enclosed type externally operable, except where accessible only to qualified persons.

**1203. Position and Connection of Knife Switches.**

a. Single-throw knife switches shall be so placed that gravity will not tend to close them. Double-throw knife switches may be mounted so that the throw will be either vertical or horizontal as preferred, but if the throw be vertical a locking device shall be provided, so constructed as to insure the blades remaining in the open position when so set.

b. When practicable, exposed knife switches shall be so wired that blades will be dead when the switch is open.

**1204. Number of Poles Required for Switches and Circuit-Breakers.**

a. Switches, when installed, shall disconnect all ungrounded wires of the circuit which they control.

b. Three-way and four-way switches shall be classed single pole switches and shall be so wired that only one pole of the circuit will be carried to the switch.

c. On constant-potential circuits, all service switches and all switches controlling circuits supplying current to motors or heating devices, unless otherwise provided in this Code, shall be so arranged that the opening of the switch will disconnect all the ungrounded wires.

d. Where a circuit-breaker serves as a switch, it shall conform to the requirements of this section as to the number of poles.

**1205. Mounting of Snap Switches.**

a. Sub-bases of non-combustible, non-absorptive insulating material, which will separate the wires at least 1/2 inch from the surface wired over, shall be installed under all snap switches used in open work. Sub-bases shall also be used in wooden raceway work; but they may be made of hardwood or they may be omitted if the switch is approved for mounting directly on the moulding.

**1206. Special Types of Switches.**

a. Time switches, sign flashers and similar appliances shall be of approved design and enclosed in approved cabinets.

**1207. Marking.**

a. Switches shall be marked with the current and voltage for which they are designed.

**ARTICLE 13. SWITCHBOARDS AND PANELBOARDS.**

This Article does not apply to switchboards or portions thereof used exclusively to control signal circuits operated by batteries, but does apply to the charging panels where current is taken from light or power circuits. For special provisions for hazardous locations see Article 32.

**1301. Switchboards: Location and Accessibility.**

a. Switchboards shall be so placed as to reduce to a minimum the danger of communicating fire to adjacent combustible material.

b. Switchboards shall not be built up to a non-fireproof ceiling, a space of 3 feet being left, if possible, between the ceiling and the board. The space back of the board shall be kept clear of rubbish and shall not be used for storage.

c. Switchboards shall be accessible from all sides when the connections are on the back.

It is recommended that all switchboards be set out from the wall, but they may be placed against a brick or stone wall when the wiring is entirely on the face.

d. Switchboards shall be so located that they will not be exposed to moisture.

e. Switchboard frames and structures supporting switching equipment shall be grounded, except that the frames for d-c single-polarity switchboards may be insulated for the full voltage of the circuit in lieu of grounding.

### 1302. Switchboards; Material and Wiring.

a. The bases of switchboards shall be made of non-combustible material.

b. Busbars, if rigidly mounted, may be of bare metal.

c. If the wiring is on the back, there shall be a clear space of at least 18 inches between the wall and the apparatus on the rear of board.

d. Insulated conductors where closely grouped as in rear of switchboards shall each have a substantial flameproof outer covering.

e. Flameproofing shall be stripped back on all conductors a sufficient distance from the terminals to give the necessary insulation for the voltage of the circuit on which the conductor is used.

f. Instruments, pilot lights, potential transformers, and other switchboard devices with potential coils (except where the operation of the protective device might introduce a hazard in the operation of devices, or when the switchboard is inaccessible to other than qualified persons) shall be supplied by a circuit that is protected by standard automatic overload protective devices of a rating not larger than 15 amperes except that for ratings of two amperes or less special enclosed types of fuses may be used.

g. Instruments, meters and relays mounted on switchboards, shall comply with the requirements of section 935, paragraph n, unless inaccessible to other than qualified persons, in which case the following requirements may be followed in lieu thereof:

For alternating-current circuits:

1. The secondary circuits of current and potential instrument transformers shall be grounded.

2. Instrument, meter and relay cases (whether operated from current and potential transformers, or connected directly in the primary circuit) on switchboards having no live parts on the front of the panels shall be grounded, where operating with current-carrying parts not exceeding 750 volts to ground.

3. Instrument, meter and relay cases (whether operated from current and potential transformers or connected directly in the primary circuit) on switchboards having live parts on the front of panels shall not be grounded where operating with current-carrying parts not exceeding 750 volts to ground. Rubber mats, or other suitable floor insulation, shall be provided for the operator if the voltage to ground exceeds 150.

4. Instrument, meter and relay cases on circuits, exceeding 750 volts to ground shall be isolated by elevation or protected by suitable barriers, grounded metal or insulating covers or guards.

For direct-current circuits:

Instrument, meter and relay cases shall not be grounded. If the voltage of the circuit is less than 750 volts but above 150 volts to ground, rubber mats or other suitable floor insulation shall be provided for the operator. If the voltage to ground exceeds 750 volts, cases shall be isolated by elevation or protected by suitable barriers, grounded metal or insulating covers, or by guards.

h. The conductors of remote-control switch circuits will be considered as suitably protected by fuses rated at not more than 750% of the same carrying capacity of the conductors as given in section 612 of Article 6.

i. Switchboards which have any exposed live parts above 150 volts to ground (or live parts on ungrounded circuits exposed to a higher voltage to ground) shall be located only where under competent supervision and accessible only to qualified persons.

For switchboards having exposed live parts of lower voltages, see sections 405, 805 and 1202.

### 1303. Panelboards.

a. The requirements of this section shall apply to all panel and distributing boards used for the control of light and power circuits, but not to such switchboards in central stations, substations or isolated plants as directly control energy derived from generators or transforming devices.

b. Switches, fuses and cutout bases used on panelboards, shall conform to the requirements of Articles 12 and 8, respectively, of this Code, so far as they apply.

c. In the relative arrangement of cartridge fuses and switches the fuses shall be placed on the load side of the switches except in the case of service switches, where the requirements of Article 4 shall be observed. Branch switches shall be so arranged that the blades, if exposed during operation, will be dead when the switches are open.

d. When there are exposed live metal parts on the back of board, a space of at least ½ inch shall be provided between such live metal parts and the cabinet in which the board is mounted.

e. The following minimum distances between bare live metal parts (busbars, etc.) shall be maintained:

When mounted on the same surface	When held free in air
Not over 125 volts ¾ inch	½ inch
Not over 250 volts 1¼ inch	¾ inch
Not over 600 volts 2 inch	1 inch

At switches, enclosed fuses, etc., parts of the same polarity may be placed as close together as convenience in handling will allow.

It should be noted that the above distances are the minimum allowable, and it is recommended that greater distances be adopted wherever the conditions will permit.

f. Panelboards so installed as to be exposed to excessive moisture shall be enclosed in approved weatherproof cabinets.

## ARTICLE 14. FIXTURES, LAMP-HOLDING DEVICES, PLUG RECEPTACLES AND OTHER OUTLET DEVICES.

For special provisions for hazardous locations see Article 32.

### 1401. Construction of Lighting Fixtures.

a. Fixtures shall be composed of metal or wood, or such other material as may have been submitted for examination and approved. Materials other than metal shall be re-enforced by metal or the fixtures shall be otherwise constructed to secure the requisite mechanical strength

b. In all fixtures not made entirely of metal wire-ways shall be lined with metal unless approved armored conductors with suitable fittings are used. This requirement shall not apply to wire-ways in glass, marble or similar non-absorptive non-combustible insulating material.

c. All methods of fastening arms, sockets, bodies, supports and receptacles by threading, soldering, brazing or otherwise, shall be such as to secure in every case ample strength and reliability, and to prevent turning. Screw joints shall have not less than five threads engaging. Tubing used in making threaded arms and stems shall be composed of metal having a thickness not less than .040 inch. It shall not be kinked, flattened or cracked.

d. All burrs and fins in wire-ways shall be removed and all sharp edges rounded, where practicable, so that wires may be drawn in and withdrawn without injury. Fittings having smooth, rounded edges shall be placed at entrance to casings of fixture stems.

e. Fixtures exposed to moisture, whether located indoors or outdoors, shall be so constructed that water cannot enter or accumulate in the wire-ways, lamp holders or other electrical parts.

f. Fixture studs which are not parts of outlet boxes, hickies, tripods, and crowfeet shall be made of steel, malleable iron or other approved material.

g. All fixtures shall, where practicable, be sufficiently ventilated. All forms of fixtures in which the wiring is liable to be exposed to temperatures in excess of 120° F. (49° C.) shall be so designed or ventilated and installed as to operate at temperatures which will not cause deterioration of the wiring.

h. Canopies and outlet boxes shall, taken together, provide ample space for the reception of the wires and their connecting devices.

i. Receptacles having exposed terminals shall not be placed in canopies unless completely enclosed in metal.

j. Canopy insulators, used where insulating joints are required, shall be of approved type and shall be securely fastened in place, so as to separate the canopies effectively and permanently from the conducting surfaces from which they are intended to be insulated.

A strip of a good grade of hard fiber 1/16-inch in thickness, securely attached to the canopy at the ends and at intermediate points in such a manner that the strip will extend at least 3/16-inch beyond the upper edge of the canopy rim, will be accepted. Where this is impracticable, a flat sheet of such fiber, cut to conform to the general outline of the canopy and having the edges of the sheet at least flush with the edges of the canopy, may be employed, if permanently attached to the canopy.

k. Insulating joints shall be composed of materials especially approved for the purpose. Those which are not designed to be mounted with screws or bolts shall have a substantial exterior metal casing, insulated from both screw connections.

### 1402. Wiring of Lighting Fixtures

a. No conductor shall be smaller than No. 18. On chains or other movable parts stranded conductors shall be used, unless the wires are completely enclosed in metal. Where the fixture is externally wired, wires shall be secured in a manner which will not tend to cut or abrade the insulation, and shall be protected from abrasion where they pass through sheet-metal pans, canopies, etc. No splice or tap shall be located within an arm or a stem.

It is recommended that approved splicing devices or approved plug connections be used for attaching the fixture wires to the circuit wires.

b. Each fixture shall be so wired that all screw shells of lamp holders are connected to the same fixture stem wire or supply wire or terminal. A fixture stem wire or supply wire connected to the screw shells of lamp holders shall be identified by means of a white or natural gray covering, or by means of a tracer thread contrasting with the color of the covering. In fixtures having wire-ways of such size that it is impracticable to pull in separate conductors without injury to the insulation, the identification may consist of a band of paint contrasting with the color of the covering and located as near as possible to the point where the wire leaves the fixture. If a white or natural gray covering is employed the covering of all other fixture stem or supply wires in the fixture shall be of a contrasting color. If a tracer thread is employed there shall be no such thread in the covering of any other fixture stem or supply wire. A terminal attached to the screw shells of sockets shall be marked in the manner specified in paragraphs d to m of section 206 of article 2 of this code.

c. Chain fixtures shall be wired with flexible conductors so arranged that the weight of the fixture will not put tension on the conductor.

d. Approved fixture wire, approved flexible cord or approved rubber covered wire shall be employed, unless the wiring is exposed to temperatures in excess of 120° F. (49° C.) in which case conductors having slow-burning or other heat-resisting covering shall be used. All fixtures in dry places designed for or used with Mogul base lamps shall be considered as being exposed to these high temperatures. Fixtures intended for outdoor use shall be wired with approved rubber-covered conductors. Wire shall always be so disposed as to avoid exposure to high temperatures as far as practicable. Fixtures intended for use in rooms where inflammable gases may exist shall consist of rigid stems, internally wired with approved rubber-covered conductors, soldered directly to the circuit wires, and shall be equipped with vapor-tight globes.

e. Fixture wires, or the individual conductors of flexible cords used where the voltage between any two conductors or between any conductor and the ground is over 300 volts, shall have insulation at least 3/64 inch in thickness for sizes No. 8 and smaller unless type S cord is used.

f. Wires of different systems shall not be contained in or attached to a fixture.

g. All wiring shall be free from short-circuits and grounds, and shall be tested for these defects prior to being connected to the circuit.

h. Fixtures, including lamp holders and lamp bases if within reach of grounded surfaces, shall be so designed and installed that no current-carrying parts will normally be exposed externally.

### 1403. Installation of Lighting Fixtures.

a. Fixtures on circuits above 150 volts to ground and all electrical fixtures used with conduit, armored cable or metal raceways, not exempt from grounding elsewhere in this Code, shall be grounded.

b. Fixtures used with knob-and-tube work, non-metallic sheathed cable or wooden raceways shall be grounded except as described below:

1. Fixtures mounted on metal or metal lath ceilings or side walls may be insulated from their supports, and from the metal lath by the use of approved insulating joints or fixture supports and approved canopy insulators.

2. Fixtures not mounted on metal or metal lath ceilings or side walls need be neither insulated nor grounded.

c. Gas piping to which fixtures are attached shall be grounded as provided for in Article 9, unless the fixtures are insulated therefrom or are grounded by one of the other means specified in the following paragraph. Gas piping need not be insulated from otherwise well-grounded fixtures. Combination gas and electric fixtures shall not be installed.

d. Fixtures shall be considered as grounded when mechanically connected in a permanent and effective manner to metal conduit, tubing, armored cable, a metal-raceway system, the grounding conductor of non-metallic sheathed cable, a separate grounding wire not smaller than No. 14, or to gas piping, which are grounded in the manner specified in article 9 of this code.

e. No externally wired fixtures shall be located in the immediate vicinity of specially inflammable material; nor shall any externally wired fixture other than of the chain type be placed in a show window. Armored-cord pendants shall be considered to be internally wired fixtures.

f. Where a gas pipe, outlet box or other fitting which will provide proper support is required by this code or is present, the fixture shall be attached thereto; otherwise the fixture shall be attached to a wooden base block not less than 3/4 inch in thickness supported independently of the screws supporting the fixtures.

g. Gas pipes shall be covered with insulating tubing back of an insulating joint or blind hickey. Where outlet tubes are used they shall be of sufficient length to extend beyond the joint or hickey, and shall be firmly secured in place.

h. Fixtures shall be so installed that the connections between the fixtures, and the branch circuit wires will be easily accessible for inspection without requiring the disconnecting of any portion of the wiring, unless the fixture is attached by an approved plugging device.

**1404. Construction of Lamp-Holding Devices and Plug Receptacles.**

a. Lamp-holding devices shall be classed according to diameters of lamp bases, as Candelabra, Intermediate, Medium and Mogul base, to be known respectively as 1/2 inch, 21/32 inch, 1 inch, and 1 1/2 inch nominal sizes, with ratings, as specified in the table following this paragraph. Switched lamp-holders shall be of such construction that the switching mechanism interrupts the electrical connection to the center contact. The switching mechanism shall not interrupt the electrical connection to the screw shell unless connection to the center contact is simultaneously interrupted.

Class	Nominal Diam.	Watts		Volts	Ratings		Keyless Amp. at Any Voltage
		Min.	Max.		Key Max. Amp. at any Voltage	Keyless Max. Amp. at Any Voltage	
Candelabra	1/2 in.	75	125	125	3/4	75	125
Intermediate	21/32 in.	75	125	125	3/4	75	250
Medium	1 in.	250	250	250	2 1/2	660	250
Mogul	1 1/2 in.	(a)	660	250	6	660	600
		(b)				1500	250
						1500	600

(a) This rating may be given only to sockets having a switch mechanism which produces both a quick "make" and a quick "break" action.

(b) Ratings to be assigned later, pending further discussion with manufacturers.

Miniature Sockets and Receptacles having screw shells smaller than the Candelabra size may be used for decorative lighting systems, Christmas-tree Lighting Outfits and similar purposes.

For exceptions for Medium-Base Key Sockets and Receptacles see Article 10, Small Isolated Plants.

Receptacles for Attachment Plugs (Appliances and Convenience Outlets) are strongly recommended in order to facilitate the use of electrical appliances which, otherwise, must be connected to sockets designed primarily only for lamp holders.

If lamp holders must be used for the attachment of flexible cords they should be rated at 600 watts.

b. The inside of metal shells shall be lined with insulating material, which shall absolutely prevent the shell from becoming a part of the circuit, even though the wires inside the sockets should become loosened or detached from their position under the terminal screws.

c. The lining shall not extend beyond the metal shell more than 1/4 inch, but shall prevent any current-carrying part of the lamp base from being exposed when a lamp is in the socket.

d. The cap also shall be lined.

In sockets and receptacles of standard forms a ring of any material inserted between an outer metal shell of the device, and the inner screw shell for insulating purposes and separable from the device as a whole, is considered an undesirable form of construction. This does not apply to the use of rings in lamp clusters or in devices where the outer shell is of porcelain or of moulded composition, where such rings serve to hold the several porcelain or composition parts together, and are thus a necessary part of the whole structure of the device.

e. The socket as a whole shall be so put together that parts will not rattle loose or fall apart under the most severe conditions they are likely to meet in practice. The base of the socket shall be secured or held in the shell in such a manner as to prevent turning or displacement relative to the shell.

f. Lead wires furnished as a part of weatherproof sockets and intended to be exposed after installation shall be of approved stranded, rubber-covered wire, not less than No. 14 gauge (No. 18 gauge for candelabra sockets), and shall be sealed in place.

g. If the socket is not attached to a fixture, the inlet shall be equipped with an approved insulating bushing which, if threaded, shall not be smaller than 3/8 inch in size. The edges of bushings shall be rounded and all inside fins removed in order to provide a smooth bearing surface for the wire.

It is recommended that bushings having holes 9/32 inch in diameter be employed with plain pendant cord, and holes 13/32 inch in diameter with re-enforced cord.

**1405. Installation of Lamp-Holding Devices and Plug Receptacles.**

a. Sockets and receptacles installed over specially inflammable material shall be of the keyless type and, unless individual switches are provided, shall be located at least 7 1/2 feet, above the floor, or shall be otherwise so located or guarded that the lamps cannot readily be backed out by hand.

b. When necessary to prevent portable lamps from coming into contact with inflammable material, or to protect them from breakage, their flexible cord leads shall be equipped with handle, socket and substantial guard, the guard being securely attached to socket or handle.

c. Weatherproof sockets, especially approved for the location, shall be employed in damp or wet places or where corrosive vapors exist. If

not attached to fixtures, they shall be hung from separate stranded wires not less than No. 14, which are soldered directly to the circuit wires, but supported independently thereof.

It is recommended that these wires be twisted together if the pendant is longer than 3 feet.

d. Receptacles shall be supported in the same manner as specified for fixtures in section 1403-g of this code.

e. Flush receptacles shall be enclosed in approved metal boxes in addition to the insulating enclosure of the receptacle mechanism.

f. Attachment plugs and receptacles located in floors shall be enclosed in approved metal boxes especially designed for the purpose. Where the location is free from mechanical injury or moisture, a departure from this requirement may be permitted by the authority enforcing this code.

g. Receptacles of the Edison-base type shall be installed only for use as lamp holders. Receptacles installed for the attachment of portable cords shall be of a type not suitable for use with Edison-base screw shells.

**1406. Rosettes.**

a. When designed for use with exposed wiring, rosettes shall be provided with bases which shall have at least two holes for supporting screws, shall be high enough to keep the wires and terminals at least 1/2 inch from the surface wired over, and shall have a porcelain lug under each terminal to prevent the rosette being placed over projections which would reduce the separation to less than 1/2 inch.

b. When designed for use with conduit boxes or wire raceways, rosette bases shall be high enough to keep wires and terminals at least 3/8 inch from the surface wired over.

c. Fuseless rosettes shall be rated at 600 watts, 250 volts, with a maximum current rating of 6 amperes.

d. Fused rosettes shall not be installed.

**ARTICLE 15. LAMPS.**

**1501. General.**

a. The provisions of this article shall apply to lamps used on constant potential interior wiring systems and such outside lamps as may be connected thereto.

b. When installed in hazardous locations the appropriate provisions of Article 32 shall be observed.

**1502. Arc Lamps.**

a. Arc lamps shall be equipped only with such resistances or regulators as are enclosed in non-combustible cases, said resistances or regulators being treated as sources of heat. An incandescent lamp shall not be used as resistance or regulator. Economy and compensator coils shall be mounted on non-combustible, non-absorptive insulating supports, such as glass or porcelain, providing an air space of at least 1 inch between frame and support. Such coils shall generally be treated as sources of heat.

b. Arc lamps, except on grounded circuits of which no part exceeds 150 volts to ground, shall be effectively isolated or suitably guarded and all exposed metal parts grounded.

Isolation will ordinarily be deemed sufficient when a vertical clearance of 8 feet is provided from floors or other accessible places within buildings, of 10 feet from footways outside buildings, and of 15 feet from roadways. Horizontal clearance from windows, porches and other spaces accessible to the general public should be not less than 3 feet.

c. Leads subject to movement in raising or lowering of lamps shall have stranded conductors.

d. An automatic overload protective device and a manually operable switch shall be provided for each ungrounded conductor supplying a lamp or series of lamps. A manually operable automatic overload circuit-breaker may be used in place of both the protective device and the switch

**1503. Mercury-Vapor Lamps.**

a. Enclosed mercury-vapor lamps shall be equipped with only such resistances or regulators as are enclosed in non-combustible cases, such resistances or regulators being treated as sources of heat.

b. Except as covered below, branch circuits supplying mercury-vapor lamps shall conform to requirements of paragraph f of section 807 of this code.

c. A group of mercury-vapor lamps wired in parallel and mounted on a single frame, the total capacity of which does not exceed 4000 watts, may be used, if supplied by a separate branch circuit, and if protected by a suitable automatic overload protective device in each ungrounded conductor.

d. Exposed metal parts of such lamps or fixtures shall be grounded, as provided for equipment in article 9, of this code, if located where persons may easily touch grounded surfaces, at the same time as the exposed metal parts of lamps or fixtures.

**1504. Incandescent Lamps.**

a. Incandescent lamps shall not be equipped with medium bases if above 250 watts rating, nor with mogul bases if above 1500 watts. Above 1500 watts special approved bases or other devices shall be used.

b. Gas-filled incandescent lamps shall not be located in show windows, nor where liable to contact with inflammable material, unless installed in approved fixtures equipped with shades or guards, or suitably designed to operate at a safe temperature.

**1505. Wiring to Lamps.**

Wires connected to lamps shall have approved insulating coverings with heat-resisting qualities consistent with the temperature to be encountered. (See article 6 of this code.)

**ARTICLE 16. ELECTRICAL APPLIANCES.**

**1601. General.**

a. This article shall be construed to apply only to electrical appliances designed for domestic or general commercial use.

b. Each electrical appliance shall be provided with a nameplate, giving the maker's name and the normal rating in volts and amperes, or in volts and watts.

It is recommended that the manufacture of portable appliances operating in excess of 150 volts for domestic purposes be discontinued, except for appliances rated at more than 1650 watts and for use on heavy-duty appliance branch circuits.

**1602. Special Provisions for Branch Circuits.**

For the purposes of this section, the several types of branch circuits serving electrical appliances are further defined as follows:

**Lighting Branch Circuits** are circuits supplying energy to lighting outlets only.

**Combination Lighting and Appliance Branch Circuits** are circuits supplying energy to both lighting outlets and appliance outlets.

**Ordinary Appliance Branch Circuits** are circuits supplying energy to either permanently wired appliances or to attachment plug outlets, i.e., appliances or convenience outlets, or to a combination of permanently wired appliances and attachment plug outlets on the same circuit; such circuits to have no permanently connected lighting fixtures. These circuits are equipped with attachment plug receptacles and plugs rated at not over 15 amperes, 125 volts; 10 amperes, 250 volts; and may have wire of No. 14 gauge and be fused at 15 amperes.

**Medium-Duty Appliance Branch Circuits** are similar to Ordinary Appliance Branch Circuits but are wired with No. 10 wire and fused at 25 amperes. They are limited to 125 volts.

**Heavy-Duty Appliance Branch Circuits** are 2-wire branch circuits derived from a 125-250 volt grounded-neutral interior wiring system supplying energy to fixed or portable electrical appliances. They consist of No. 10 wire and are fused at 25 amperes. Where attachment plug receptacles and plugs are used for connecting devices to such circuits they must be rated at not less than 20 amperes, 250 volts.

a. Branch circuits, other than lighting branch circuits and except as the provisions of section 803 of article 8 or other special sections of this code apply, shall be of a type and number competent to supply electrical appliances according to the following sub-paragraphs, 1-5 inclusive.

1. One or more portable electrical appliances, each rated at 6 amperes or 660 watts or less, may be used on lighting branch circuits or on combination lighting and appliance branch circuits.

2. One or more fixed or portable electrical appliances, each rated at not over 1320 watts, may be supplied by an ordinary appliance branch circuit.

3. One or more fixed or portable electrical appliances, each rated at not over 15 amperes or 1650 watts and not over 125 volts, may be supplied by a medium-duty appliance branch circuit.

4. One or more fixed or portable electrical appliances, each rated at not less than 15 amperes or 1650 watts and at not more than 20 amperes, may be supplied by a heavy-duty appliance branch circuit.

5. Each fixed or portable electrical appliance rated at more than 20 amperes shall be supplied by an individual branch circuit and shall be controlled as provided in paragraph a of section 1603 of this article. Sub-division of the load by units within an appliance shall not be taken as a basis for determining the character of the circuit supplying a multi-unit appliance.

For number of outlets on circuits according to Nos. 1-4, inclusive, above see paragraph g of section 807 of article 8 of this code.

In locations where appliances larger than 6 amperes capacity are likely to be used, as in working spaces, it is recommended that Medium-Duty Appliance Branch Circuits shall be installed.

It is recommended that each room be provided with at least two attachment plug receptacles located at different points in order to render unnecessary use of long extension cords and the plugging of portables into lamp holders.

b. Conductors of branch circuits which supply only cooking and baking appliances rated at over 1650 watts may be of capacities determined according to sub-paragraph 3-15 of paragraph d of section 613 of article 6 of this code.

**1603. Switch or Control Methods.**

a. Each appliance rated at over 1650 watts shall be controlled by an indicating switch, not a part of the appliance, and which shall disconnect from the appliance all ungrounded conductors of its supply circuit or a single approved attachment plug and connector receptacle of appropriate rating may be used in lieu of a switch. The location of such control means shall be as follows:

1. It shall be readily accessible to the operator of the appliance.

2. In other than dwelling occupancies it shall control only the appliance.

3. In multi-family (more than two) dwellings a switch shall be within the apartment or on the same floor as the apartment in which the appliance is installed and may control lights and other appliances.

4. In two-family dwellings a switch may be outside of the apartment in which the appliance is installed but must be readily accessible. This will permit an individual service switch for the apartment to be used provided it is accessible to the user of the appliance.

5. In single family dwellings the service switch may be used for this purpose.

b. Where the switch controls a motor-operated appliance, it shall be within sight of the appliance.

c. Switches controlling the individual units of electrical appliances shall not be considered as taking the place of the indicating controlling switch required in paragraph a of this section.

d. Each portable electrical appliance shall be equipped with an approved plug connector so designed that the plug may be pulled out to open the circuit without leaving any live parts so exposed as to render likely accidental contact therewith. The connector may be located at either end of the flexible conductor or inserted in the conductor itself.

See article 32 for special types required in hazardous locations.

**1604. Wires Supplying Electrically Heated Appliances.**

a. Wires supplying stationary electrically heated appliances shall, if not in conduit, be so located as to be protected from mechanical injury and moisture.

b. Where the surrounding temperature of fixed wires exceeds 120° F. (49° C.) types A or SB wires shall be used. In all other cases the type of insulation on fixed wires shall be that specified elsewhere in this code for the conditions which prevail.

c. Wires supplying smoothing irons and all other portable electrical heating appliances which are rated at more than 50 watts and which produce temperatures in excess of 250° F. (121° C.) on surfaces with which the wire is liable to be in contact, shall be approved heater cord, Type H. For other portable electrical heating appliances approved lamp cord, Type C, or other cord specially approved for the purpose may be used.

**1605. Special Provisions for Electrically Heated Appliances.**

a. Each electrically heated appliance which is obviously intended by size, weight and service to be secured in a fixed position shall be so placed as to furnish ample protection between the appliance and adjacent combustible material.

b. Each smoothing iron and other portable electrically heated appliance, which is intended to be applied to combustible material, shall be equipped and used with an approved stand, which may be a separate device or may be a part of the appliance.

c. In other than residence occupancies each such electrically heated appliance or group of such electrically heated appliances shall be used with an approved signal, unless the appliance is provided with approved integral temperature-limiting device.

d. Subdivided circuits of electrically heated appliances need not be separately fused, but individual heating elements of such electrically heated appliances shall be fused if they are rated at more than 30 amperes.

**1606. Grounding.**

a. Appliances shall be grounded if and as specified in article 9 of this code.

**ARTICLE 17. RESISTORS, REACTORS AND CAPACITORS (Static Condensers).**

For hazardous locations, see article 32 of this Code.

**1701. Construction.**

a. Rheostats, resistance boxes and equalizers shall be of approved types.

b. Reactance coils shall be composed of non-combustible material, mounted on non-combustible bases and treated generally as sources of heat.

c. Capacitors shall be provided with non-combustible cases and supports, and shall be installed in the manner provided for other apparatus operating with equivalent voltages and currents.

d. Resistance devices shall be so constructed that when mounted on a plane surface the casing will make contact with such surface only at the points of support, an air space of at least ¼ inch being maintained between the casing and the surface.

e. The terminals of motor-starting rheostats shall be marked to indicate the part of the circuit to which each terminal is to be connected, as "line," "armature" and "field."

f. Fixed and movable contacts shall be so designed and so connected to the resistive conductor that there will be a minimum of arcing and consequent roughening of the contacts, even with careless handling or in the presence of dirt. In motor-starting rheostats, the point or plate on which the arm rests when in the starting position shall have no electrical connection with the resistive conductor.

g. Motor-starting rheostats shall be so designed that the contact arm cannot be left on intermediate segments. Such rheostats, if intended for use on direct-current circuits, shall be equipped with automatic devices which will interrupt the supply before the speed of the motor has fallen to less than one third its normal value.

h. Where insulated wire is used for connections between resistance elements and the contact device of a rheostat, except for motor-starting service, the insulation shall be of the slow-burning type. For large rheostats and similar resistances where the contact devices are not mounted upon them the connecting wires having slow-burning insulation may be so arranged in groups that the maximum difference of potential between any two wires in any group shall not exceed 75 volts. Each group of wires shall either be mounted on non-combustible, non-absorptive insulators giving at least ½ inch separation from the surface wired over, or, especially where it is necessary to protect the wires from mechanical injury, each group of wires may be encased in flexible tubing and placed in approved conduit, the flexible tubing extending at least 1 inch beyond the ends of the conduit.

**1702. Installation.**

a. Resistance devices shall be placed on a switchboard, or at a distance of at least 1 foot from combustible material, or shall be separated therefrom by a slab or panel of non-combustible, non-absorptive material, such as slate, soapstone or marble. This slab shall be somewhat larger in area than the resistance device and shall be secured in position by its own supports which shall be independent of those fastening the resistance device to the slab. Bolts which support the resistance device shall be countersunk at least ¼ inch below the rear surface of the slab and shall be covered with insulating material. The slab shall have a thickness proportioned to the size and weight of the resistance device, in order to provide proper mechanical strength, and this thickness shall be not less than ½ inch.

b. Resistors, reactors and capacitors shall not be placed where exposed to mechanical injury or in the immediate vicinity of easily ignitable material. When these conditions cannot be complied with, the devices, unless of the oil-immersed type, shall be enclosed in approved metal boxes or cabinets.

**1703. Lamp Resistances.**

a. Where protective resistances are necessary in connection with automatic rheostats, incandescent lamps may be used, provided they do not carry or control the main current nor constitute the regulating resistance of the device.

b. When used as resistance, lamps shall be mounted in porcelain receptacles attached to non-combustible supports and shall be so arranged that they cannot have impressed upon them a voltage greater than that for which they are rated. They shall in all cases be provided with a name-plate, which shall be permanently attached beside the porcelain receptacle or receptacles and stamped with the wattage and voltage of the lamp or lamps to be used in each receptacle.

c. Incandescent lamps may be used for the purpose of resistances in series with other devices, by permission of the authority enforcing this code and when mounted in porcelain receptacles upon non-combustible supports and when so arranged that they cannot have impressed upon them a voltage greater than that for which they are rated.

**ARTICLE 18. STORAGE BATTERIES.****1801. General.**

a. Wiring and appliances supplied by storage batteries shall be subject to the general requirements of this code which apply to wiring and appliances fed from generators developing the same difference of potential.

For battery installations for small isolated plants of less than 50 volts, see article 40 of this code.

### 1802. Special Requirements.

- The battery room shall be thoroughly ventilated.
- Wiring shall be enclosed in a non-corrodible or suitably protected conduit system or shall be exposed and installed in accordance with the requirements of section 501 of this code, except that in battery rooms, varnished cloth or tape insulations on conductors shall not be permitted.
- Storage batteries shall be mounted on non-absorptive, non-combustible insulators, such as glass or thoroughly vitrified glazed porcelain.
- Metal susceptible to corrosion unless suitably protected against attack from acid or acid spray, shall not be employed in the cell connections of storage batteries.

## ARTICLE 19. LIGHTNING ARRESTERS.

### 1901. In Stations.

- A lightning arrester shall be connected to each overhead wire entering a station.
- Lightning arresters shall be located in readily accessible places, away from combustible materials and as near as practicable to the point where the wires enter the station.
- Lightning arresters shall be well isolated from other equipment and, if of the oil-filled type, shall be placed in a fireproof room or compartment.
- Lightning arresters shall be grounded as provided in article 9 of this code.
- All choke coils, or other attachments inherent to the lightning-protection equipment, shall have an insulation from the ground or other conductors at least equal to the insulation required at the points of the circuit in the station.
- Kinks, coils and sharp bends in the wires between arresters and outdoor lines shall be avoided as far as practicable.

### 1902. Radio Equipment.

See article 37 of this code.

### 1903. Signal Systems.

See article 60 of this code.

### 1904. Grounding.

See article 9 of this code.

## ARTICLE 30. CRANES AND HOISTS.

### 3001. General.

- The requirements of this article shall be deemed to be additional to, or amendatory of, those prescribed in articles 1 to 19, inclusive, of this code.

### 3002. Wires.

- Wires, other than bare collector wires, shall be of approved rubber-covered or of approved slow-burning type.
- Rubber-covered wire shall be no smaller than No. 12.
- Slow-burning wire shall be employed only between resistance and contact plates of rheostats or where exposed to severe external heat. Wires between resistances and contact plates shall conform to the requirements of section 1701, paragraph h, of this code except that such wires, if exposed to moisture, shall be of the rubber-covered type.

### 3003. Installation of Wires.

- Exposed wiring, other than collector wires, shall be supported 1 inch from the surface wired over, 2½ inches apart for voltages up to 300, and 4 inches apart for voltages between 331 and 603; provided, however, that in dry places where space is limited each wire may be separately encased in approved flexible tubing securely fastened in place.
- Wiring not in conduit, other than collector wires, and whether on crane or hoist, shall be isolated beyond normal reach of operators or other persons and out of normal reach of tools and materials being handled.

### 3004. Collector Wires.

- Collector wires shall be secured at the ends by means of approved strain insulators, and shall be so mounted on approved insulators that the extreme limit of displacement of the wire will not bring the latter within less than 1½ inches from the surface wired over.
- Main collector wires carried along runways shall be supported on insulating supports placed at intervals not exceeding 20 feet. When run horizontally, such wires shall be separated not less than six inches; when run otherwise, not less than eight inches. Where necessary, intervals between insulating supports may be increased up to 40 feet, the separation between wires being increased proportionally.
- Bridge collector wires shall be kept at least 2½ inches apart and, where the span exceeds 80 feet, insulating saddles shall be placed at intervals not exceeding 50 feet.

It is recommended that the distance between wires be greater than 2½ inches, where practicable.

- Sizes of collector wire shall conform to the following table:

Distance between rigid supports	Size of wire
0—30 feet	No. 6
31—60 feet	No. 4
over 60 feet	No. 2

### 3005. Collectors.

- Collectors shall be so designed as to reduce to a minimum the sparking between them and the collector wire. See also paragraph l of section 3205 of this code.

### 3006. Switches and Cutouts.

- The main collector wires shall be protected by a cutout and the circuit shall be controlled by a switch. The switch shall be located within sight of the collector wires and shall be readily operable from the floor or ground.
- Where cranes are operated from cabs a circuit breaker or switch, capable of interrupting the circuit under heavy loads, and readily controlled by the operator, shall be provided in the leads from the main collector wires unless the current collectors can be safely removed, under heavy loads, from the trolley or third rail.

- Where more than one motor is employed on a crane, each motor with its leads shall be separately protected by a cutout in accordance with the provisions of articles 8 and 10 of this code; provided, however, that where two motors operate a single hoist, carriage, truck or bridge and are controlled as a unit by one controller the pair of motors with their leads may be protected by a single cutout. This cutout shall be located in the cab if there is one.

### 3007. Controllers.

- If the crane operates over readily combustible material, the resistances shall be placed in a well ventilated cabinet composed of non-combustible material, so constructed that it will not emit flame or molten metal.

If the resistances are located in a cab, this requirement may be met by constructing the cabinet of non-combustible material enclosing the sides of the cab from the floor to a point at least 6 inches above the tops of the resistances.

### 3008. Grounding.

- Motor frames, tracks and the entire frame of the crane shall be grounded as prescribed in article 9 of this code.

## ARTICLE 31. ELEVATORS.

### 3101. General.

- The requirements of this article shall be deemed to be additional to, or amendatory of, those prescribed in articles 1 to 19, inclusive, of this code.
- The maximum voltage permitted on the push buttons of elevator signaling circuits shall be 300 volts to ground.
- The maximum voltage permitted in the operating devices of electric elevators shall be 300 volts to ground for automatic control elevators having operating devices in the car and at the landings.
- No part of any electric circuit having a voltage in excess of 750 volts shall be used on any car control system. Circuits of higher voltage may, however, be used in machine rooms or pent houses for the operation of motors and brakes, provided that all control and signal wiring is thoroughly insulated from such power circuits and all machine frames and metal, hand-operated ropes are permanently grounded.

### 3102. Wires and Cables.

- The flexible or traveling cables of the operating control and lighting circuits shall be of approved Type E or Type S cord, as specified in section 609, article 6 of this code. Where attached to the car they shall run in approved rigid or flexible conduit, carefully fastened in place and properly bushed.
- Conductors for lighting and control cables shall not be smaller than No. 16.
- No conductor smaller than No. 14 shall be used for any elevator operating, control, power or car lighting circuit except as provided above for lighting and control cables and as otherwise provided in this code for fixture work.
- No conductor smaller than No. 16 shall be used for any elevator signal circuit except those receiving energy from primary batteries or approved bell-ringing transformers. When No. 16 conductor is used it shall be protected by not larger than 6-ampere fuses.
- Conductors, other than lighting and control cables, where located in hoistways shall be encased in approved rigid conduit provided that flexible conduit or armored cable may be used between riser and limit switch, interlocks, push buttons or similar devices. Split tees and elbows may be used on exposed conduit work except where the pipe contains feeders. For control circuits the number of wires installed in a conduit may be in accordance with Table 3, Section 503.
- No electric conduits or cables, except those used to furnish or control power, light, heat or signals for the elevator or hoistways, shall have an opening, terminal, outlet or junction within the hoistway, but shall be continuous between outlets or terminals situated entirely outside the hoistway. Pipes, conduits and armored cables shall be securely fastened to the hoistway construction.

It is not intended to prohibit the interruption of long runs for the purpose of splicing or pulling in conductors, and pull boxes may be installed for this purpose.

- Elevator circuits, except signal wires receiving energy from primary batteries or approved bell-ringing transformers, shall be installed in approved conduit equipped with approved terminal bushings having an individual outlet hole for each wire; provided that, for more than 8 wires the conduit may be terminated with an insulating bushing and the wires bunched, taped and painted with an insulating paint. The conduit shall terminate as close to the wire terminals as convenience in handling will permit, but in no case closer than six inches to the floor.
- Wires for elevator circuits including operating, control and power wires, and signal wires when an integral part of the wiring system, may be run in the same traveling cable, conduit, pull box or junction box when the supply is from the same source of power although the voltage is altered within the system, provided that all wires are insulated for the maximum voltage found in the conduit system and the equipment is insulated from ground for this maximum voltage.
- Where the current characteristics within the system are changed, the wires shall not be run in the same traveling cable, conduit, junction box or pull box, except on the car, at the controlboards, floor selectors, hatchway junction boxes and at similar points where it is impracticable to separate such wires.
- Wires of car-lighting circuits, and signal systems, when not an integral part of the elevator wiring system, shall be separated and run in separate traveling cables and conduits.
- The wires of motor circuits between motors and control panel may be grouped together without any extra insulation of the separate wires, provided the complete group is either taped or corded and painted in a manner to make same a rigid, self-supporting form, not over three feet long, and not in a position liable to mechanical damage or subject to a temperature in excess of 120° F. (49° C.).
- All wires between main circuit resistances and the back of control panels shall each have a flameproof outer covering, as prescribed in section 1701, paragraph h, of this code. All other wiring on control panels may be of the rubber-covered type, provided the wires are held in such a manner as to be immovable and free from mechanical injury, and are not subjected to a temperature exceeding 120° F. (49° C.).
- Wires having a flameproof outer covering or groups of wires covered with a flameproof tape shall not be used as connections for the operating circuits of elevator controllers.

Flameproof coverings when damp may carry enough current to cause controllers to function incorrectly and this incorrect functioning may be a life hazard.

### 3103. Switches.

a. A manually operated switch disconnecting all ungrounded wires of the motor circuit shall be located within sight of the motor, unless permission to locate it elsewhere is given by the authority enforcing this code. Where the elevator is controlled by controlling the field of a generator this requirement shall be interpreted to apply to the switch in the circuit supplying the motor which drives the generator.

b. In garages, hatch limit switches and other spark-emitting devices shall be placed at least four feet above the line of the lowest floor level.

c. Each electric elevator operated by a polyphase alternating-current motor shall be provided with a device which will prevent starting the motor if:

1. The phase rotation is in the wrong direction, or,
2. There is a failure in any phase.

### 3104. Grounding.

a. For electric elevators, the frames of all motors, elevator machines, controllers, and the metal enclosures for all electrical devices in or on the car or in the hoistway, shall be grounded.

b. For elevators other than electric, where any electrical conductors are attached to the car, the metal frame of the car, if normally accessible to persons, shall be grounded.

c. Conduit or armored cable attached to elevator cars shall be bonded to grounded metal parts of the car with which they came in contact.

d. Motors, motor-generator sets, elevator machines and controllers mounted on metal beams, which form part of the structural metal frame of a building, shall be deemed to be grounded. Metal car frames supported by metal hoisting cables attached to or running over sheaves or drums of elevator machines shall be deemed to be grounded when machine is grounded in accordance with this code.

e. The hand-operated rope (shifting cable) need not be grounded if provided with approved strain insulators.

### 3105. Live Parts.

a. All live parts of electrical apparatus in or on elevator cars or in elevator hoistways shall be suitably enclosed to protect against accidental contact.

b. Unless located in an engine room or other location accessible only to qualified persons the elevator machine and controller shall be installed in a room set aside for that purpose or isolated by elevation or by means of an enclosure or wire grill or the like to prevent accidental contact by persons or objects. This room may also contain other machinery used for the control and signaling of the elevators.

c. If the wiring is on the back of the controller panel there shall be a clear space of at least 24 inches back of the apparatus on the rear of the controller panel and at least 18 inches on the sides of a bank of controller panels, and on at least one side of a single panel. There shall also be at least three feet of clear space in front of the controller.

This rule shall not be interpreted to forbid the enclosing of the rear of control panels in steel cabinets, but when such cabinets are used there must be a clear space of at least 24 inches back of the apparatus on the rear of the controller panel when the back of the steel cabinet is removed.

## ARTICLE 32. HAZARDOUS LOCATIONS.

### 3201. Classification.

a. The provisions of this article are intended to apply to locations in which the authority enforcing this code judges the apparatus and wiring to be subject to the conditions indicated by the following classifications. Where the apparatus and wiring are installed in rooms or sections of the building in which the particular hazardous conditions do not prevail, such wiring and apparatus may be of the type approved for such locations. For garages see article 33.

b. Class I locations are those in which flammable volatile liquids, highly flammable gases, mixtures or other highly flammable substances are manufactured, used, handled, or stored in other than their original containers.

This class may include such locations as some parts of dry-cleaning and dry-dyeing plants, pyroxylin plastic manufacturing plants, spray painting establishments, gas plants, varnish manufacturing plants, and establishments or industries involving similar hazardous processes or conditions.

c. Class II locations are those in which (1) combustible dust is thrown, or is likely to be thrown, into suspension in the air in sufficient quantities to produce explosive mixtures or (2) those where it is impracticable to prevent dust from collecting in such quantities on or in motors, lamps, or other electrical devices that they are likely to become overheated because normal radiation is prevented.

This class may include such locations as some parts of flour mills, feed mills, grain elevators, starch plants, sugar, cocoa and coal pulverizing plants, and establishments or industries involving similar hazardous processes or conditions.

d. Class III locations are those in which easily ignitable fibres or materials producing combustible flyings are handled, manufactured, stored or used, and which are hazardous through such fibres or flyings collecting on or being ignited by arcing contacts, resistors, lamps or similar apparatus.

This class may include locations such as some parts of cotton and other textile mills, combustible fibre manufacturing plants and warehouses, cotton gins, clothing manufacturing plants, cotton-seed mills, woodworking plants, and establishments or industries involving similar hazardous processes or conditions.

### 3202. General.

a. The requirements of this article shall be considered additional or amendatory to those prescribed in articles 1-19, inclusive, of this code.

### 3203. CLASS I LOCATIONS.

a. In locations judged to be as described for Class I in paragraph b of section 3201 the following provisions shall be observed.

b. Service entrance equipment, and all panelboards and switchboards shall not be installed.

c. Rigid conduit with vapor-tight joints and fittings shall be employed as the type of wiring.

d. Fuses shall not be installed. Circuit-breakers, if used, shall be of the vapor-tight or oil-immersed type approved for use in explosive atmospheres.

e. Motors shall be of types approved for use in explosive atmospheres.

Motors located outside of paint-spray booths and judged by the authority enforcing this code to be outside of the hazardous area may be of any standard totally-enclosed type or of the open induction type having no brushes, make-and-break contacts, collectors, or other arcing or sparking parts.

f. Motor controllers, thermal cutouts, switches, relays, the switches and contactors of auto-transformer starters, resistance or impedance devices or other devices or apparatus, which in their normal operation tend to create arcs, sparks, or high temperatures, shall not be installed unless such devices or apparatus are of the vapor-tight or oil immersed type and approved for use in explosive atmospheres.

It is recommended that motor controllers be of the remote control type with the main contactors located at a point where the hazardous conditions of this class do not prevail, auxiliary control push buttons or switches of the oil immersed or vapor-tight type may then be placed in the most convenient locations.

g. Electric heating appliances shall not be used unless they are of a type approved for the particular location or type of material in or with which they are used.

h. Switches controlling lighting circuits shall not be installed unless of the vapor-tight or oil-immersed type.

i. Lamps in fixed positions shall be enclosed in vapor-tight globes or in other approved enclosures and shall be properly protected by substantial metal guards or other approved means where exposed to breakage. Lamps shall not be of the pendant type unless supported rigidly by conduit hangers. Where rubber covered wire is used it shall have insulation not less than 3/64 inch thick.

j. No lamps or lighting fixtures connected therewith nor in any location where there is a possibility of the spray lodging upon them.

k. The auxiliaries of mercury-vapor lamps shall be offset at least ten feet from spray booth working faces.

l. Sufficient general illumination shall be provided by fixed lighting units to eliminate, so far as possible, the need for portable lamps. When portable lamps are necessary, they shall be enclosed in vapor-tight globes properly protected by substantial metal or other approved types of guards to prevent breakage. Sockets for portable lamps shall be of non-combustible, non-absorptive, moulded composition type with no exposed metal parts, and shall be of the keyless type.

m. When necessary to use portable lamps, or other portable current-consuming devices, approved flexible cord designed for hard usage such as Type S or Type PA shall be used. Such a flexible cord shall contain one extra insulated conductor which shall be properly connected to form a grounding connection for metal lamp guards, motor frames, and all other exposed metal portions of such portable lamps and devices.

n. Connections of portable cords direct to supply conductors shall first be made mechanically secure and shall then be soldered and heavily taped. In addition the cord shall be securely supported so that the probability of a break in the conductors at this point will be minimized.

o. Receptacles and attachment plugs, if used, shall be so connected as a part of a unit device with an explosion proof interlocking switch that the plug cannot be removed while the switch is in the "on" position. Such receptacles and plugs shall be of the polarized type providing a connection for the grounding wire of the portable cord.

p. The exposed non-current carrying metal parts of equipment, such as the frames or metal exteriors of motors, fixed or portable appliances, fixtures, cabinets, cases, and conduit shall be grounded as provided in sections 905 to 908 of article 9 of this code. The locknut-bushing and the double-lock-nut type of contact shall not be depended upon for bonding purposes, bonding jumpers with proper fittings or other approved means being required to assure an effective grounding circuit.

q. There shall be no exposed live parts.

### 3204. CLASS II LOCATIONS.

a. In locations judged to be as described for Class II locations in paragraph c of section 3201 the following provisions shall be observed:

b. Service entrance equipment, and all panelboards and switchboards should not be placed in locations of this class, but, if impracticable to locate elsewhere, all live parts shall be enclosed in dust-tight metal cases or cabinets having provision for external operation only, or shall be located in a separate dust-tight room built of or lined with substantial non-combustible materials and having a self-closing door, so constructed and installed as to adequately exclude dust.

c. Fuses shall not be placed in locations described in this class unless enclosed in dust-tight metal cabinets or cases. Circuit-breakers shall be of the dust-tight or dust-tight oil-immersed type.

d. Rigid conduit shall be the wiring method employed.

e. Where explosive dusty atmospheres are likely to be present, as in (1) of paragraph c of section 3201, motors or generators having brushes or sliding contacts shall have such brushes or sliding contacts enclosed in substantial dust-tight housings or shall be of the totally enclosed, enclosed-fan-ventilated, or enclosed-pipe-ventilated types or shall be enclosed in separate dust-tight rooms or housings built of or lined with substantial non-combustible materials and so constructed as to adequately exclude dust and properly ventilated from a source of clean air.

It is recommended that all motors installed in dusty locations be of the totally enclosed, enclosed-fan-ventilated, or enclosed-pipe-ventilated types.

f. Where it is impracticable to prevent dust from collecting in dangerous quantities on or in motors as in (2) of paragraph c of section 3201, all motors shall be of the totally-enclosed, enclosed-fan-ventilated, or enclosed-pipe-ventilated types, or shall be enclosed in separate dust-tight rooms or housings built of or lined with substantial non-combustible materials and so constructed as to adequately exclude dust and properly ventilated from a source of clean air.

The above conditions often exist in sugar, cocoa and coal pulverizing rooms, cupolas, head-houses, basements and other points in grain elevators, flour-mills and feed-mills where grains are spouted, and in similar locations. Where the installation and maintenance are such that the hazardous conditions do not exist, the foregoing requirements are not called for and are waived.

g. Motor controllers, thermal cutouts, switches, relays, the switches and contactors of auto-transformer starters, resistance or impedance devices, or other devices or apparatus, which in their normal operation tend to create arcs, sparks, or high temperatures, shall not be installed in these locations unless such devices or apparatus are enclosed in dust-tight cases or cabinets or are of the dust-tight or dust-tight oil-immersed type, and so designed that the device may be operated without opening the cabinet or case.

It is recommended that motor control devices be of the remote control type with the main contactors located in separate rooms or compartments built of non-combustible materials so constructed as to exclude dust. The remote control push buttons or switches of the oil immersed or dust-tight type may then be placed in the most convenient locations.

h. Electric heating appliances shall not be used unless of a type approved for installation in dusty atmospheres.

i. Lamps in fixed positions shall be enclosed in approved dust-tight globes, and where exposed to mechanical injury, shall be protected by substantial guards. Heavy fixtures used as pendants shall be supported by conduit hangers or chains to prevent strain on the wires. Where rubber covered wire is used it shall have insulation not less than 3/64 inch thick. Sockets and receptacles shall be of the keyless type, and unless individual switches are provided, shall be located at least 7 1/2 feet above the floor, or shall be otherwise so located or guarded that the lamps cannot readily be backed out by hand.

When light is required for the interior of bins, hoppers, elevators, conveyors and similar equipment or construction, it is recommended that such light shall, whenever practicable, be supplied by means of lamps, enclosed in dust-tight globes properly protected against mechanical injury and mounted flush in the walls or floors of the equipment or construction. No wiring or fixtures should be permitted inside of bins, hoppers, elevators or conveyors.

j. Sufficient general illumination shall be provided by fixed lighting units to eliminate so far as possible the need for portable lamps. When portable lamps are necessary, they shall be enclosed in dust-tight globes properly protected by substantial metal or other approved types of guards to prevent breakage. Sockets for portable lamps shall be of the moulded composition or metal-jacketed porcelain, keyless type.

k. When necessary to use portable lamps, or other portable current consuming devices, approved flexible cord designed for hard usage such as Type S or Type PA shall be used. Such a flexible cord shall contain one extra insulated conductor which shall be properly connected to form a grounding connection for metal lamp guards, motor frames, and all other exposed metal portions of such portable lamps and devices.

l. Receptacles and attachment plugs, if used, shall be so connected, as a part of a unit device with a dust-tight interlocking switch that the plug cannot be removed while the switch is in the "on" position. Such receptacles and plugs shall be of the polarized type providing a connection for the grounding wire of the portable cord.

m. The exposed non-current carrying metal parts of equipment, such as the frames or metal exteriors of motors, fixed or portable appliances, lighting fixtures, cabinets, cases, and conduit, shall be grounded as provided in sections 905 to 908 of article 9 of this code. The locknut-bushing and double-lock-nut type of contact shall not be depended upon for bonding purposes, bonding jumpers with proper fittings or other approved means being required to assure an effective grounding circuit.

n. There shall be no exposed live parts.

### 3205. CLASS III LOCATIONS.

a. In locations judged to be as described for Class III locations in paragraph d of section 3201 the following provisions shall be observed:

b. Service entrance equipment and all switchboards and panelboards should not be placed in locations of this class, but, if impracticable to locate them elsewhere, all live parts shall be enclosed in dust-tight metal cases or cabinets with provision for external operation only, or shall be located in separate dust-tight rooms built of or lined with substantial non-combustible materials and with self-closing doors so constructed and installed as to adequately exclude flyings or lint.

c. All fuses shall be enclosed in dust-tight metal cases or cabinets. Circuit-breakers shall be of the dust-tight oil-immersed type, or shall be enclosed in dust-tight metal cases.

d. Rigid conduit shall be the wiring method employed.

e. If motors or generators having brushes or sliding contacts are used they shall:

1. be of the totally enclosed, enclosed fan ventilated, or enclosed pipe ventilated types, or
2. be enclosed in separate rooms or housings built of non-combustible materials, so constructed as to adequately exclude flyings or lint, and properly ventilated from a source of clean air, or
3. have brushes or sliding contacts enclosed in substantial tight, metal housings, or
4. Have upper half of brush or sliding contact end of motor enclosed by wire screen of not less than No. 14 mesh and lower half enclosed by solid metal covers.

f. Motor controllers, thermal cutouts, switches, relays, the switches and contactors of auto-transformer starters, or other devices or apparatus which in their normal operation tend to create arcs or sparks shall not be installed unless such devices or apparatus are enclosed in dust-tight metal cases or cabinets, or are of the dust-tight oil-immersed type, and are so designed that they may be operated without opening the cabinet or case.

g. Rheostats, resistance boxes, or other resistance devices, shall be enclosed in non-combustible cases, so constructed as to adequately exclude flyings or lint.

h. Electric heating appliances shall not be used unless of a type approved for installation in locations where combustible flyings or lint are present.

i. Where there is a possibility of flyings or lint collecting about lamps in fixed positions, such lamps shall be enclosed in globes of the dust-tight type, and when exposed to mechanical injury, shall be protected by substantial metal or other approved types of guards to prevent breakage. Heavy fixtures, used as pendants, shall be supported by conduit hangers or chains to prevent strain on the wires. Where rubber covered wire is used it shall have insulation not less than 3/64 inch thick. Socket and receptacles shall be of the keyless type and, unless individual switches are provided, shall be located at least 7 1/2 feet above the floor, or shall be otherwise so located or guarded that the lamps cannot readily be backed out by hand.

j. Sufficient general illumination shall be provided by fixed lighting units to eliminate, so far as possible, the need for portable lamps. When portable lamps are necessary, they shall be enclosed in dust-tight globes properly protected by substantial metal or other approved types of guards to prevent breakage. Sockets for portable lamps shall be of non-combustible, non-absorptive moulded composition type with no exposed metal parts, and shall be of the keyless type.

k. When necessary to use portable lamps, or other portable current consuming devices, approved flexible cord designed for hard usage such as Type S or Type PA shall be used. Such a flexible cord shall contain one extra conductor, which shall be properly connected to form a grounding connection for metal lamp guards, motor frames, and all other exposed metal portions of such portable lamps and devices.

l. Bare conductors for cranes operating in rooms used for the storage of combustible fibers shall be protected by suitable barriers so arranged as to prevent any escape of sparks or hot particles, and the moving current collectors shall be so designed as to minimize sparking at the sliding contacts.

It is recommended that where the distance of travel permits, current to the crane be supplied through Type S or PA portable conductors equipped with approved type of reel or take-up device.

m. The exposed non-current carrying metal parts of equipment such as the frames or metal exteriors of motors, fixed or portable appliances, lighting fixtures, cabinets, cases, and conduit shall be grounded as provided in sections 905 to 908 of article 9 of this code. The locknut-bushing and double-lock-nut type of contact shall not be depended upon for bonding purposes, bonding jumpers with proper fittings or other approved means being required to assure an effective grounding circuit.

## ARTICLE 33. GARAGES.

### 3301. General.

a. The requirements of this article shall be deemed to be additional to, or amendatory of, those prescribed in articles 1 to 19, inclusive, of this Code.

b. A garage shall be deemed to be a building or portion of a building in which one or more self-propelled vehicles carrying volatile, inflammable liquid for fuel or power are kept for use, sale, storage, rental, repair, exhibition or demonstration purposes, and all that portion of a building which is on or below the floor or floors on which such vehicles are kept and which is not separated therefrom by tight, unpierced fire walls and fire-resistive floors.

### 3302. Wiring.

a. Where floor area is sufficient to permit the storage of more than two vehicles, either conduit work, surface metal raceways, armored cable or electrical metallic tubing, as specified in sections 503, 504, 505 and 508 respectively of Article 5, shall be employed as the wiring method. Where the floor space will accommodate not more than two vehicles, any approved wiring method may be employed.

b. Cutouts, switches, attachment plug receptacles and fixed lamp-holding devices shall be located at least 4 feet above the floor, except in a shower room separated by a partition from the garage proper.

c. Approved reinforced cord shall be used for pendant lamps.

### 3303. Portables.

a. Approved portable cord designed for rough usage, such as hard-service cord, stage cable or packinghouse cord, shall be used to connect portable lamps, motors or other appliances. The portable cord shall carry the male end of an approved pin-plug connector, or equivalent; the female end being of such design or so hung that the connector will break apart readily at any position of the cable. The connector shall be kept at least 4 feet above the floor.

b. Flexible cord leads for portable lamps shall be equipped with handle, socket hook, and substantial guard, the guard being securely attached to the socket or the handle. Approved keyless sockets of moulded composition or metal-sheathed porcelain type or other keyless sockets approved for the purpose shall be used.

### 3304. Charging Cables.

a. Approved Type S cord shall be used for charging purposes.

b. Connectors shall be of approved type and of at least 50 amperes capacity, and shall be so designed or so hung that at least one will break apart readily at any position of the charging cable. Live parts shall be guarded from accidental contact. The fixed, or wall, connector shall be kept at least 4 feet above the floor, and, if not located on a switchboard or charging panel, shall be guarded from accidental contact. Where plugs for direct connection to vehicles are suspended from overhead wiring they shall hang at least 6 inches above the floor and no connector need be placed in the cable or at the outlet.

### 3305. Switchboards and Charging Panels.

a. Where spark-producing devices are not located at least 4 feet above the floor, or placed in vaporproof enclosures, switchboards and charging panels shall be located in a room or inclosure provided for the purpose.

### 3306. Generators, Motors and Control Apparatus.

a. Generators, motors and control apparatus, that embody the use of commutators, collector rings or other make-and-break or sliding contacts shall either be of the totally-enclosed type or be located at least four feet above floor.

b. Generators, motors, control apparatus and the like, having commutators, collector rings, or other make-and-break or sliding contacts located more than four feet above floor shall, unless of the totally-enclosed type, have wire screens of not less than No. 14 mesh placed at commutator or brush ends to prevent the falling of particles.

### 3307. Special Precautions.

a. Cutouts, switches and receptacles shall be placed at least 4 feet above the floor.

b. Live parts of all devices shall be guarded to prevent accidental contact by foreign bodies.

### 3308. Grounding.

a. Conduit, metal sheaths, raceways and exposed metal frames and enclosures of equipments (including portables) and the like shall be grounded when and in the manner prescribed in sections 904 and 905 of article 9 of this Code. This shall apply to all devices, except pendant and portable lamps operating on grounded circuits of not more than 150 volts to ground.

### 3309. Flexible Cords.

a. Flexible cords used to supply pendant or portable lamps or portables which include lamp-holding devices on polarized wiring systems, shall have one conductor identified, and such identified conductor shall be connected to the screw shell of the lamp-holding device. Receptacles, attachment plugs, connectors, and similar devices used with such cord shall be of the polarity type.

**ARTICLE 34. MOTION-PICTURE STUDIOS.****3401. General.**

a. The requirements of this article shall be deemed to be additional to, or amendatory of, those prescribed in articles 1 to 19, inclusive, of this Code, but shall not be applied where only approved slow-burning (cellulose acetate or equivalent) film is used.

b. A motion-picture exchange, factory, laboratory or studio shall be deemed to be that building or portion of a building in which motion-picture films are manufactured, exposed, developed, printed, rewound, repaired, stored, etc.

**3402. Wiring.**

a. Approved conduit, metal raceway or armored cable shall be employed as the wiring method.

b. Side wall lamp outlets shall consist of receptacles enclosed in approved outlet boxes equipped with open-end guards riveted to the covers of the boxes.

c. Pendant lamps shall be suspended by means of approved reinforced cords, armored cord or armored cable and shall be protected by substantial wire guards.

d. Each portable lamp shall be composed of approved hard service flexible cord, approved composition or approved metal-sheathed porcelain keyless socket, handle, hook and substantial guard. The cord shall carry the male end of an approved pin plug connector or equivalent, the female end being of such design or so hung that the connector will break apart readily at any position of the cord. The connector shall be kept at least 1 foot above the floor.

e. At patching tables, approved composition or metal-sheathed porcelain keyless sockets shall be employed and shall be equipped with suitable means to guard lamps from mechanical injury.

f. In film-storage vaults lamps shall be installed on rigid fixtures and enclosed in vaporproof globes. Such lamps shall be controlled by a double-pole switch, located outside the vault. Electric motors or portable lamps shall not be placed in the vault.

g. All live parts shall be enclosed to prevent accidental contact by persons and objects. All switches shall be of the externally operable type. Rheostats shall be placed in cabinets which enclose all live parts, having only the operating handles exposed.

h. If motors or generators having brushes or sliding contacts are used they shall:

1. be of the totally-enclosed, enclosed-fan-ventilated, or enclosed pipe-ventilated types, or
2. be enclosed in separate rooms or housings built of non-combustible materials, so constructed as to adequately exclude flyings or lint, and properly ventilated from a source of clean air, or
3. have brush or sliding contact end of motor enclosed by solid metal covers, or
4. have brushes or sliding contacts enclosed in substantial, tight, metal housings, or
5. have the upper half of brush or sliding contact end of the motor enclosed by a wire screen of not less than No. 14 mesh and the lower half enclosed by solid metal covers, or
6. shall have wire screens of not less than No. 14 mesh placed at the commutator or brush ends.

i. All conduit, armored cable or metal raceways, exposed metal frames, and enclosures or equipment shall be grounded as prescribed in Article 9 of this Code. This shall apply to all devices, except pendant and portable lamps operating at not more than 150 volts to ground.

**ARTICLE 35. MOTION-PICTURE PROJECTORS AND EQUIPMENT.****3501. General.**

a. The requirements of this article shall be deemed to be additional to, or amendatory of, those prescribed in Articles 1 to 19, inclusive, of this Code.

b. The so-called professional types of projectors, such as are commonly used in theatres and motion picture houses, shall be located in fireproof booths.

The professional projector employs a film which is 1½ inches wide and has on each edge 5.4 perforations per inch.

c. Projectors of the non-professional or miniature type, if employing only approved slow-burning (cellulose acetate or equivalent) film, may be operated without a booth.

d. All live parts shall be enclosed or otherwise guarded to prevent accidental contact of persons or objects.

e. All conduit, armored cable, metal raceways, exposed metal frames and enclosures of equipment shall be grounded as prescribed in article 9 of this Code. This shall apply to all devices except pendant and portable lamps operating at not more than 150 volts to ground.

**3502. Projectors of Professional Type.**

a. The arc-lamp house shall be composed entirely of metal having a thickness not less than No. 24 U. S. sheet metal gauge (.025 inch) except where the use of approved insulating material is necessary. Details of construction shall conform to the requirements of Section 1501 of this Code. An incandescent-lamp enclosure shall conform to the above requirements so far as may be practicable.

b. Wires shall be of sufficient carrying capacity for the current rating of the projector used, but in no case shall wires smaller than No. 10 be employed to supply the projector outlet.

c. Rheostats, transforming devices and any substitute therefor, shall be of types expressly designed and approved for the purpose. They shall be judged as component parts of the projector equipment as to installation and location.

d. Top and bottom magazines shall be so designed in some approved manner as to prevent the entrance of flame. No solder shall be used in their construction. The front side of each magazine shall consist of a door swinging horizontally and equipped with a substantial latch.

e. An automatic shutter shall be provided and permanently attached to the gate frame. The construction of the shutter shall be such as to shield the film from the beam of light whenever the film is not running at operating speed.

f. Motor-driven projectors shall be of a type expressly designed and approved for such operation. Such projectors shall be used only by permission of the inspection department, and when the projector is in charge of a qualified operator.

g. Switches if used shall be of externally operable type.

**3503. Enclosure for Projectors of Professional Type.**

a. The enclosure shall be constructed of suitable fireproof material, shall be properly lighted and shall be large enough to permit the operator to walk freely on either side of or back of the projectors.

b. Ventilation shall be provided by means of a vent pipe having a cross-sectional area of not less than 78 square inches, and such vent pipe shall lead to the outside of the building or to a special non-combustible flue. The vent pipe shall be kept at least 1 inch from combustible material or separated therefrom by approved non-combustible, heat-insulating material not less than ¼ inch in thickness.

c. Draft in vent pipe shall be maintained by an exhaust fan having a capacity of at least 50 cubic feet per minute. The fan motor shall be so installed that fumes passing through the flue cannot come in contact with it, shall be connected to the emergency service and shall not be controlled from the booth.

d. Openings in the enclosure shall be equipped with doors or shutters of fire-resistive material equivalent to that of the enclosure. Such door or shutter shall entirely close its opening, and shall be arranged to be held in the closed position by spring hinges or equivalent devices.

e. Rewinding of films shall be performed in the enclosure if practicable; otherwise in a separate fireproof room provided at a location approved for the purpose. Extra films shall be kept in individual metal boxes having tight-fitting covers and each booth shall be provided with an approved fireproof box for the storage of films not on the projection machine. Reels carrying films under examination or in process of rewinding shall be enclosed in magazine or approved metal boxes similar to those of the projector and not more than 2 feet of film shall be exposed.

f. A motor-generator installed in the projector enclosure shall have the commutator end or ends suitably protected from mechanical injury by wire screens or other suitable means. The measures, described in either of the sub-paragraphs 1-6, inclusive, of paragraph h of section 3402 shall be considered as providing the required protection.

**3504. Projectors of Non-Professional Type.**

a. Motion-picture projecting machines not intended for installation and use in permanent and ventilated booths shall be permitted only for projecting film of an approved slow-burning (cellulose acetate or equivalent) type.

b. All such equipment shall be expressly approved, including current-controlling devices and other essential operating parts.

c. The source of illumination of the projected view shall be an incandescent lamp of a pattern expressly intended for stereopticon use or for motion-picture projection.

d. The slow-burning (cellulose acetate or equivalent) film shall have a permanent distinctive marker for its entire length identifying the manufacturer and the slow-burning character of the film stock.

e. Machines shall be marked with the name or trademark of the maker, and with the voltage and current rating for which they are designed, and shall also be plainly marked, "For use with slow-burning films only."

**ARTICLE 36. ORGANS.****3601. General.**

a. The requirements of this article shall be deemed to be additional to, or amendatory of, those prescribed in articles 1 to 19, inclusive, of this Code. They shall be deemed to apply to those electrical circuits and parts of electrically operated organs which are employed for the control of the sounding apparatus and keyboards.

**3602. Source of Energy.**

a. The source of energy shall be either a self-excited generator rated at not over 15 volts, or a primary battery.

b. The generator shall either be permanently and effectively insulated both from ground and from the motor driving it, or both generator and motor frames shall be grounded as prescribed in article 9 of this Code.

**3603. Cables.**

a. All wires, except common return wires and wires inside the organ proper, the organ sections and the organ console, shall be cabled.

b. The separate wires of the cable shall be not smaller than No. 26, and shall have either rubber, cotton or silk insulation. The cotton or silk may be saturated with paraffine, if desired.

c. The separate wires shall be either bunched or cabled. In either event they shall be enclosed in one or more braided outer coverings. A tape may be substituted for an inner braid. The outside covering of a cable not run in conduit shall either be flameproof, or covered with a closely wound fireproof tape.

d. The common return wire shall be not smaller than No. 14, shall be of either the rubber-covered or the slow-burning type and shall not be contained in the cable. It may be run in contact with the cable or placed under an additional covering enclosing both cable and return wire.

**3604. Workmanship and Material.**

a. All wiring and devices within the organ or any of its parts shall be neatly disposed and securely fastened.

It is not found to be either necessary or feasible in organ structures to require the use of non-combustible, non-absorptive insulating material for the supports or enclosures of current carrying parts.

b. Cables between parts of the organ and between the console and the organ shall be installed in a workmanlike manner, shall be securely fastened in position and shall be kept from contact with other wires. Conduit may be used, but shall not be required.

**3605. Fuses.**

a. Feed wires shall be protected at the source by a fuse of suitable capacity, and, except common return wires, shall be so subdivided and protected at the organ sections or distribution points by approved fuses of not over 15 amperes rating that every wire will be protected by one or more such fuses.

**ARTICLE 37. RADIO EQUIPMENT.****3701. General.**

a. The requirements of this article shall neither apply to equipment installed on shipboard, nor to antennas used for coupling carrier current to line conductors; but shall be deemed to be additional to, or amendatory of, those prescribed in articles 1 to 19, inclusive, of this Code.

- b. Transformers, voltage reducers, keys and other devices employed shall be of types expressly approved for radio reception or transmission.
- c. Methods of wiring from the source of power to and between devices, related to apparatus connected to interior wiring systems, shall be in accordance with the rules covering permanent or portable fixtures, devices and appliances.

It is recommended that the authority enforcing this code be freely consulted as to the specific methods to be followed in any case of doubt relative to installation of antenna and counterpoise conductors and that the National Electrical Safety Code, Part 5, be followed.

**3702. For Receiving Stations Only.**

- a. Antenna and counterpoise conductor sizes shall be not less than No. 14 if of copper or No. 17 if of bronze or copper-clad steel. Antenna and counterpoise conductors outside buildings shall be kept well away from all electric light or power wires of any circuit of more than 600 volts, and from railway, trolley or feeder wires, so as to avoid the possibility of contact between the antenna or counterpoise and such wires under accidental conditions.
- b. Antenna and counterpoise where placed in proximity to electric light or power wires of less than 600 volts, or signal wires, shall be constructed and installed in a strong and durable manner, and shall be so located and provided with suitable clearances as to prevent accidental contact with such wires by sagging or swinging.
- c. Splices and joints in the antenna span shall be soldered unless made with approved splicing devices.
- d. The preceding paragraphs, a, b, and c, shall not apply to light and power circuits used as receiving antenna, but the devices used to connect the light and power wires to radio receiving sets shall be of approved type.

- e. Lead-in conductors, that is, conductors from antennas to sets, shall be of copper, approved copper-clad steel or other metal which will not corrode excessively, and in no case shall they be smaller than No. 14, except that bronze or copper-clad steel not less than No. 17 may be used.
- f. Lead-in conductors from the antenna to the first building attachment shall conform to the requirements for antennas similarly located. Lead-in conductors from the first building attachment to the building entrance shall, except as specified in the following paragraph, be installed and maintained so that they cannot swing closer to open supply conductors than the following distances:

Supply wires 0 to 600 volts.....	2 feet
Supply wires exceeding 600 volts.....	10 feet

Where all conductors involved are supported so as to insure a permanent separation and the supply wires do not exceed 150 volts to ground, the clearance may be reduced to not less than 4 inches. Lead-in conductors on the outside of buildings shall not come nearer than the clearances specified above to electric light and power wires unless separated therefrom by a continuous and firmly fixed non-conductor which will maintain permanent separation. The non-conductor shall be in addition to any insulating covering on the wire.

g. Each lead-in conductor shall enter the building through a non-combustible, non-absorptive, insulating bushing slanting upward toward the inside or by means of an approved device designed to give equivalent protection. The lead-in conductor from the building entrance to the set shall have rubber insulation approved for voltages 0-600 (Type R).

h. Each lead-in conductor shall be provided with an approved protective device (lightning arrester) which will operate at a voltage of 500 volts or less, properly connected and located either inside the building at some point between the entrance and the set which is convenient to a ground, or outside the building as near as practicable to the point of entrance. The protector shall not be placed in the immediate vicinity of easily ignitable stuff, or where exposed to inflammable gases or dust or flyings of combustible materials.

i. If an antenna grounding switch is employed, it shall in its closed position form a shunt around the protective device. The switch should be placed in the most direct line between the lead-in conductor and the point where the grounding connections are made. Such a switch shall not be used as a substitute for the protective device.

j. If fuses are used, they shall not be placed in the circuit from the antenna through the protective device to ground.

k. The protective grounding conductor may be bare and shall be of copper, bronze or approved copper-clad steel. The protective grounding conductor shall be not smaller nor have less conductance per unit of length, than the lead-in conductor, and in no case shall be smaller than No. 14 if of copper nor smaller than No. 17 if of bronze or copper-clad steel. The protective grounding conductor shall be run in as straight a line as possible from the protective device to a good permanent ground. The ground connections shall be made to a cold-water pipe where such pipe is available and is in service and connected to the street mains. An outlet pipe from a water tank fed from a street main or a well may be used, provided such outlet pipe is adequately bonded to the inlet pipe connected to the street water main or well. If water pipes are not available, ground connections may be made to a grounded steel frame of a building or to an artificial ground such as a galvanized iron pipe or a rod driven into permanently damp earth or to a metal plate or other body of metal buried similarly. Gas piping shall not be used for the ground.

l. The protective grounding conductor shall be guarded where exposed to mechanical injury. An approved ground clamp shall be used where the protective grounding conductor is connected to pipes or piping.

m. The protective grounding conductor may be run either inside or outside the building. The protective grounding conductor and ground, installed as prescribed in the preceding paragraphs k and l, may be used as the operating ground.

It is recommended that in this case the operating grounding conductor be connected to the ground terminal of the protective device.

If desired, a separate operating grounding connection and ground may be used, this operating grounding conductor being either bare or provided with an insulated covering.

n. Wires inside buildings, shall be securely fastened in a workmanlike manner and shall not come nearer than 2 inches to any electric light or power wire not in conduit unless separated therefrom by some continuous and firmly fixed non-conductor, such as porcelain tubes or approved flexible tubing, making a permanent separation. This non-conductor shall be in addition to any regular insulating covering on the wire.

o. Storage-battery leads shall consist of conductors having approved rubber insulation. The circuit from a filament, "A," storage battery of more than 20 ampere-hours capacity, NEMA rating, shall be properly

protected by a fuse or circuit-breaker rated at not more than 15 amperes. The circuit from a plate, "B," storage battery shall be properly protected by a fuse or circuit-breaker rated at not more than 1 ampere in the negative lead. Fuses or circuit-breakers shall be located not more than 18 inches along the wire from a battery terminal.

**3703. For Transmitting Stations Only.**

- a. Antenna and counterpoise conductors outside buildings shall be kept well away from all electric light or power wires of any circuit of more than 600 volts, and from railway trolley or feeder wires, so as to avoid the possibility of contact between the antenna or counterpoise and such wires under accidental conditions. Antenna and counterpoise conductors where placed in proximity to electric light or power wires of less than 600 volts, or signal wires, shall be constructed and installed in a strong and durable manner, and shall be so located and provided with suitable clearances as to prevent accidental contact with such wires by sagging or swinging.
- b. Antenna conductor sizes shall be not less than given in the following table:

Material	Stations to which power supplied is less than 100 watts and where voltage of power is less than 400 volts	Stations to which power supplied is more than 100 watts or voltage of power is more than 400 volts
	Soft copper.....	14
Medium-drawn copper.....	14	8
Hard-drawn copper.....	14	10
Bronze or copper-clad steel.....	14	12

c. Splices and joints in the antenna and counterpoise span shall be soldered unless made with approved splicing devices.

d. Lead-in conductors shall be of copper, bronze, approved copper-clad steel or other metal which will not corrode excessively and in no case shall be smaller than No. 14.

e. Antenna and counterpoise conductors and wires leading therefrom to ground switch, where attached to buildings, shall be firmly mounted 5 inches clear of the surface of the building, on non-absorptive insulating supports such as treated pins or brackets, equipped with insulators having not less than 5 inches creepage and air-gap distance to inflammable or conducting material, except that the creepage and air-gap distance for continuous-wave sets of 1000 watts and less input to the transmitter, shall be not less than 3 inches.

f. In passing the antenna or counterpoise lead-in into the building a tube or bushing of non-absorptive, insulating material, slanting upward toward the inside, shall be used and shall be so insulated as to have a creepage and air-gap distance in the case of continuous wave sets of 1000 watts and less input to the transmitter, not less than 3 inches, and in all other cases not less than 5 inches. If porcelain or other fragile material is used it shall be protected where exposed to mechanical injury. A drilled window pane may be used in place of a bushing provided creepage and air-gap distances as specified above are maintained.

g. A double-throw knife switch having a break distance of at least 4 inches and a blade not less than 1/4 inch by 1/2 inch, or a flexible grounding lead and clamp in place of this switch, shall be used to join the antenna lead-in to the grounding conductor. The switch or flexible grounding lead may be located inside or outside the building. The base of the switch shall be of non-absorptive insulating material. The switch or flexible grounding lead shall be so mounted that its current-carrying parts will be at least 3 inches clear of the building wall or other conductors in the case of continuous-wave sets of 1000 watts and less, and in all other cases at least 5 inches. The conductor from grounding switch or flexible grounding lead to ground shall be securely supported. These provisions shall also apply to the connection of the counterpoise lead-in to its grounding conductor.

It is recommended that the switch be located in the most direct line between the lead-in conductors and the point where grounding connection is made.

h. Antenna and counterpoise conductors shall be effectively and permanently grounded at all times when station is not in actual operation and unattended, by a conductor at least as large as the lead-in and in no case smaller than No. 14 copper, bronze or approved copper-clad steel. This protective grounding conductor need not have an insulated covering or be mounted on insulating supports. The protective grounding conductor shall be run in as straight a line as possible to a good permanent ground. The ground connections shall be made to a cold-water pipe where such pipe is available and is in service and connected to the street mains. An outlet pipe from a water tank fed from a street main, or a well may be used, provided such outlet pipe is adequately bonded to the inlet pipe connected to the street water main or well. If water pipes are not available, ground connections may be made to a grounded steel frame of a building or to an artificial ground such as a galvanized iron pipe or a rod driven into permanently damp earth or to a metal plate or other body of metal buried similarly. The protective grounding conductor shall be protected where exposed to mechanical injury. A suitable approved ground clamp shall be used where the protective grounding conductor is connected to pipes or piping. Gas pipes shall not be used for the ground.

It is recommended that the protective grounding conductor be run outside the building.

i. The operating grounding conductor shall be of copper strip not less than 3/8 inch wide by 1/32 inch thick, or of copper, bronze, or approved copper-clad steel having a periphery, or girth, of at least 3/8 inch, such as a No. 2 wire, and shall be firmly secured in place throughout its length.

j. The operating grounding conductor shall be connected to a good permanent ground. Preference shall be given to water piping. Other permissible grounds are grounded steel frames of buildings or other grounded metal work in the building, and artificial grounding devices such as driven pipes, rods, plates, cones, etc. Gas piping shall not be used for the ground.

k. Where the current supply is obtained directly from lighting or power circuits, the conductors whether or not lead-covered shall be installed in approved metal conduit, armored cable or metal raceways.

l. When necessary to protect the supply system from high-potential surges and kick-backs there shall be installed in the supply line as near as possible to each radio-transformer, rotary spark gap, motor and generator in motor-generator sets and other auxiliary apparatus one of the following:

1. Two condensers (each of not less than 1/10 microfarad capacity and capable of withstanding 600 volts test) in series across the line with mid-point between condensers grounded; across (in parallel with) each of these condensers shall be connected a shunting fixed spark-gap capable of not more than 1/32 inch separation.
2. Two vacuum tube-type-protectors in series across the line with the mid-point grounded.
3. Lightning arresters, such as the aluminum-cell type.

#### ARTICLE 38. SIGNS AND OUTLINE LIGHTING.

##### 3801. General.

- a. The requirements of this article shall be deemed to be additional to, or amendatory of, those prescribed in articles 1 to 19, inclusive, of this Code.
- b. Signs and outline lighting which employ vacuum or inert-gas tube systems shall, in addition to requirements of this article, comply with the provisions of Section 5002 of this Code.

##### 3802. Material.

- a. Metal used in the construction of sign boxes, cabinets or outline troughs shall be not less than No. 28 U. S. sheet metal gauge (.0156 inch). It shall be galvanized, treated with at least three coats of anti-corrosive paint, or otherwise suitably protected from corrosion.
- b. With the exception of wood employed for the external decoration of signs and kept at least 2 inches distant from the nearest socket or receptacle, signs shall be constructed entirely of metal or other approved non-combustible material.
- c. The design shall be such as to afford ample strength and rigidity, to enclose all terminals and wiring other than the leads, except as provided in Section 3805 of this article, and for outdoor signs or outline troughs to render the box or trough practically weatherproof and to provide drainage for each compartment by means of one or more holes, each not less than 1/4 inch in diameter.
- d. One or more accessible approved boxes or cabinets shall be provided to contain cutouts, flashers, or other similar devices placed on or within the body or structure of a sign or on or in a building. If outside of a building such boxes and cabinets shall be weatherproof. Non-weatherproof transformers if outside buildings shall be placed in such a box or cabinet.

##### 3803. Sockets and Receptacles.

- a. Sockets and receptacles for sign and outline lighting shall be of the keyless porcelain or moulded composition type, and if for sign use shall be so designed as to afford permanent and reliable means to prevent turning. Terminals of sign receptacles shall be kept at least 1/2 inch from metal of the sign; provided, however, that where open work is employed as the wiring method outside buildings, this separation shall be at least 1 inch. Miniature receptacles shall not be employed for outdoor work.
- b. Electric signs with changeable connections shall be so arranged that the connections can be changed manually only by approved connectors. Approved connectors shall interrupt all ungrounded conductors of the circuit.

##### 3804. Wiring.

- a. Wire of approved rubber-covered type, and not smaller than No. 14, shall be used.
- b. Wires shall be neatly run, and so disposed and fastened as to be mechanically secure.
- c. Wires shall be soldered to terminals of receptacles, and exposed parts of wires and terminals shall be treated to prevent corrosion.
- d. Approved bushings shall be employed to protect wires passing through walls or partitions of the structure. Sign leads not encased in conduit or metal armor may be cabled before passing through non-combustible, non-absorptive bushings.
- e. Wires on outside of sign structure or outline wiring, except as provided in Section 3803 of this article, shall be enclosed in approved conduit, metal armor, or metal troughs. Outside a building where conduit work is used, it shall be made weatherproof, and where armor is employed an approved lead sheath shall be placed over the wire insulation.
- f. Outline lighting shall be protected by its own cutout and controlled by its own switch.
- g. Circuits shall be so arranged that the number of outlets and the lamps connected to them shall in no case be such as to place more than 15 amperes on the branch circuit fuse.
- h. Live parts shall be enclosed or otherwise guarded unless on grounded circuits of not more than 150 volts to ground, and safe from accidental contact by objects or persons.

##### 3805. Open Wiring.

- a. Open work may be employed as the wiring method for outline lighting and for signs on walls, roofs or open ground, where not subject to mechanical injury, and not readily accessible to unauthorized persons and if on grounded circuits of not more than 150 volts to ground.
- b. Where wires are connected to approved receptacles which hold them at least 1 inch from the surface wired over, and which are placed at intervals not exceeding 1 foot, the receptacles themselves shall be considered to afford the necessary support and spacing of the wires. Where the interval between receptacles exceeds 1 foot but is less than 2 feet, an additional non-combustible, non-absorptive insulator maintaining a separation and spacing equivalent to the receptacle shall be used.
- c. Where flexible tubing must be employed in outline lighting, the ends shall be sealed and painted with a moisture repellant and the tubing shall be kept at least 1/2 inch from the surface wired over.

##### 3806. Grounding.

- a. Signs, troughs and other metal frames shall be grounded as provided in Article 9 of this Code, unless these are insulated from ground and from other conducting surfaces and are inaccessible to unauthorized persons.

##### 3807. Switches.

- a. Switches controlling sign or outline wiring shall be externally operable.
- b. Each sign shall be provided with a switch which will open all ungrounded wires supplying the sign. When signs are not within sight of the switch, the switch shall be of the locking type.

#### ARTICLE 39. THEATRES; INCLUDING MOTION-PICTURE HOUSES.

##### 3901. General.

- a. The requirements of this article shall be deemed to be additional to, or amendatory of, those prescribed in articles 1 to 19, inclusive, of this Code.
- b. A theatre shall be deemed to be that building, or part of a building, regularly or frequently used for dramatic, operatic, motion picture or other performances or shows, or which has a stage for such performances used with scenery or other stage appliances.
- c. Emergency lights shall be deemed to be exit lights, and all lights necessary to illuminate lobbies, stairways, corridors, passageways, aisles, and other portions of the theatre to which the public has access, which are normally kept lighted during the performance, to enable the public to leave the building safely in case of emergency.
- d. Where conduit, armored-cable or metal-raceway construction is employed, all such conduit, metal sheath, raceways, all exposed metal frames and enclosures of equipment, including borders, shall be grounded as prescribed in article 9 of the Code. This shall apply to all devices, except portable arc lamp standards, portable strips, and similar portable devices containing no wire of a grounded circuit over 150 volts and no wire of an ungrounded circuit exposed to higher voltages.

##### 3902. Services.

- a. Where the supply can be obtained from two street mains, two or more separate and distinct services shall be installed; one service shall be of sufficient capacity to supply current for all emergency lights, and the other service or services shall be of sufficient capacity to supply the normal demand of the theatre equipment and sufficient lights to provide equivalent illumination to that of the emergency lights; or the emergency lights shall be suitably sub-divided between two or more of the services to enable emergency illumination to be maintained in case of interruption of one of the services. Where the supply cannot be obtained from two separate sources, the feed for the emergency lights shall be taken from a point on the street side of the main fuses.
- b. Where the source of supply in an isolated plant located in the building, an auxiliary service of capacity sufficient to supply all emergency lights shall be obtained from some outside source, or from an adequate storage battery installed upon the premises.
- c. Where a source of supply at less than 50 volts is employed for one or more lighting systems in the premises, the installation shall also comply with the appropriate provisions of article 40 of this Code.

##### 3903. Auditorium.

- a. Approved conduit, metal raceway or armored cable shall be employed as the wiring method.
- b. Receptacles shall be enclosed in boxes.
- c. Not more than one set of fuses shall be interposed between service fuses and exit lights.
- d. Emergency lights shall not be connected to or controlled by the stage lighting control, but from the lobby or other convenient place in the front of the theatre.
- e. All fuses shall be enclosed in approved cabinets.

##### 3904. Stage.

- a. Approved conduit or armored cable shall be employed as the wiring method.
- b. The switchboard shall be of the dead-front type, and shall carry a metal hood running the full length of the board and protecting the latter from falling objects. Switchboards having current-carrying parts exposed on back shall be elevated or guarded by suitable railings to prevent accidental contact of persons with live parts.
- c. Dimmers shall be so connected that they will be dead when their respective circuit switches are open.
- d. Footlights shall be wired by either the conduit or the armored cable method, receptacles being enclosed in approved boxes, or the wires shall be encased in metal trough composed of No. 20 U. S. sheet metal gauge (.0375 inch), treated to prevent oxidation. Conductors shall be soldered to receptacle terminals, which shall be kept at least 1/2 inch from the metal of the trough.
- e. Footlights, border lights and proscenium sidelights shall be so wired that the number of outlets and the lamps connected to them shall in no case be such as to place more than 15 amperes on a branch-circuit fuse.
- f. Borders and proscenium sidelights shall be constructed as prescribed in paragraph d of this section, shall be suitably stayed and supported, and shall be so designed that the flanges of the reflectors or other adequate guards will protect the lamps from mechanical injury and from accidental contact with scenery or other combustible material.
- g. Border cables shall be of approved type and suitably supported. They shall be employed only where flexibility is required.
- h. Approved slow-burning wire shall be used for wiring the border.
- i. Stage and gallery receptacles shall be in approved pockets or enclosures and controlled from, and protected by individual cutouts at, the stage switchboard. Feeds for arc receptacles shall not be smaller than No. 6 and the receptacles shall have a capacity of not less than 35 amperes. Feeds for incandescent receptacles shall not be smaller than No. 12 and the receptacle shall have a capacity of not less than 15 amperes. Plugs for arc and incandescent receptacles shall not be interchangeable.
- j. Lamps installed in scene docks shall be so located and guarded as to be free from mechanical injury.
- k. Curtain motors shall be of the enclosed type.
- l. Where stage flue dampers are released by an electrical device, the circuit operating the latter shall be normally closed, and shall be controlled by at least two approved single-pole switches enclosed in approved iron boxes having self-closing doors without locks or latches, one switch being placed at the electrician's station and the other where designated by the inspection department. The device shall be designed for the full voltage of the circuit to which it is connected, no resistance being inserted. It shall be located in the loft above the scenery and shall be enclosed in a suitable iron box having a tight, self-closing door.

##### 3905. Dressing Rooms.

- a. Approved conduit or armored cable shall be employed as the wiring method.

b. Pendants for lights shall be composed of approved reinforced cord, armored cable or armored cord.

c. Lamps shall be protected by approved guards sealed or locked in place.

#### 3906. Portable Arc Lamps.

a. Arc lamps shall be substantially constructed entirely of metal not less than No. 20 U. S. sheet metal gauge (.0375 inch), except where approved insulating material is necessary. The design shall be such as to provide proper ventilation while retaining sparks, and to prevent carbons or other live parts of lamp from making contact with metal of hood.

b. Hoods for other than lens lamps shall have the front opening equipped with a self-closing hinged door frame carrying either wire gauze or glass. Hoods for lens lamps may have a stationary front, and a solid door on either back or side.

c. Mica shall be used for the insulation of the lamp frame.

d. Arc-lamp frames and standards shall be so installed and guarded as to prevent their becoming grounded.

e. The switch on the standard shall be of such design that accidental contact with any live part will be impossible.

f. Stranded connections in lamp and at switch and rheostat shall be provided with approved lugs.

g. Rheostats shall be enclosed in a substantial, properly ventilated metal case affording a clearance of at least 1 inch between case and resistance element. If the rheostat is mounted on the standard, a clearance of 3 inches above the floor shall be maintained.

h. A qualified operator shall be employed for each lamp, or for each two lamps not more than 10 feet apart and so placed that one operator can properly watch and care for both.

#### 3907. Portable Bunches.

a. Substantial metal shall be employed and the wiring shall not be exposed.

b. Where the cable passes through the metal, an approved bushing shall be employed, and the cable shall be so anchored as to relieve the connections of any mechanical strain.

#### 3908. Portable Strips.

a. Portable strips shall conform to the requirements of paragraphs d, e, and f of section 3904, of this code.

b. Where the cable passes through the metal an approved bushing shall be employed, and the cable shall be so anchored as to relieve the connections of serious mechanical strain.

#### 3909. Portable Plugging Boxes.

a. The construction shall be such that no current-carrying part will be exposed.

b. Each receptacle shall have a current-carrying capacity of 30 amperes, and shall be protected by approved fuses mounted on slate or marble bases enclosed in a fireproof cabinet equipped with self-closing doors.

c. Bus bars shall have a current-carrying capacity equal to the sum of the ampere ratings of all the receptacles. Approved lugs shall be provided for the connection of the master cable.

#### 3910. Portable Conductors.

a. Pin-plug connectors shall be so designed that tension on the cable will not cause serious mechanical strain on the connections. The female half shall be attached to the live end of the cable.

b. Flexible conductors used from receptacles to arc lamps, bunches and other portable equipments shall be approved stage cable except that for the purpose of feeding a stand lamp under conditions where conductors are not liable to severe mechanical injury, an approved reinforced cord may be used, provided cutout designed to protect same is not fused over 15 amperes capacity.

#### 3911. Lights on Scenery.

a. Brackets shall be wired internally, and the fixture stem shall be carried through to the back of the scenery, where a suitable bushing shall be placed on the end of the stem. Fixtures shall be securely fastened in place.

#### 3912. String or Festooned Lights.

a. Joints in wiring shall be staggered where practicable.

b. Lamps enclosed in lanterns or similar devices shall be equipped with approved guards.

#### 3913. Special Electrical Effects.

a. Devices used for simulating lightning, waterfalls, etc., shall be so constructed and located that flames, sparks, etc., cannot come in contact with combustible material.

### ARTICLE 40. ISOLATED PLANTS, 0-50 VOLTS.

#### 4001. General.

a. The requirements of this article shall be deemed to be additional to, or amendatory of, those prescribed in articles 1 to 19, inclusive, of this Code.

b. This article shall be deemed to apply particularly to isolated plants which employ as their prime mover a stationary internal-combustion engine, with its necessary fittings, connected to an electric generator either with or without an auxiliary storage battery with its control devices, and operating at a potential of less than 50 volts.

c. Attention shall be given to the relatively low voltage at which these plants operate, thus requiring a greater current for equivalent energy and making necessary a greater ampere capacity of conductors, fittings, devices and appliances as compared with those of the standard 0-600 volt classification used on commercial circuits.

#### 4002. Sockets and Receptacles.

a. Standard lamp sockets and receptacles of the 660-watt classification shall be used. In designing circuits, each lamp socket or receptacle shall be assumed to have a load of not less than 40 watts.

b. Receptacles of 20 ampere rating shall be provided in kitchens, laundries and similar locations where appliances are likely to be used.

#### 4003. Automatic Cutouts and Circuits.

a. The fuses in the branch circuit shall not exceed 20 amperes rating except for special circuits as in paragraph c of this section.

b. Fuses shall be so placed that no set of small motors, small heating appliances or incandescent lamps, nor more than 8 lamp sockets or receptacles, requiring more than 320 watts, shall be dependent upon one cutout.

c. Wire size shall be not less than No. 12 for any circuits. For special circuits to which appliances or appliance receptacles are attached, as in paragraph b of section 4002 of this article, the wire size shall be not less than No. 10 for supplying more than one appliance or appliance outlet.

#### 4004. Batteries.

a. Batteries shall be located in rooms or spaces having natural means of ventilation.

b. Battery jars and cells, if not composed of insulating material such as glass or hard rubber, shall be mounted on insulating supports of glass or porcelain.

#### 4005. Grounding.

a. The grounding of circuits or frames of engine or generator shall not be required.

### ARTICLE 50. CIRCUITS AND EQUIPMENT OPERATING AT MORE THAN 600 VOLTS BETWEEN CONDUCTORS.

The requirements of this article shall be in addition to, or amendatory of, those prescribed in articles 1, 2, 3, 5 to 19, inclusive, 32 and 38 of this Code.

#### 5001. Series Arc Lighting.

a. Constant-current systems shall not be installed in buildings, and lamps or fixtures shall not be attached to exterior walls of buildings, except by permission of the authority enforcing this code.

#### 5002. Vacuum and Inert-Gas Tube Systems.

a. The tube shall be substantially supported and so installed as to be free from contact with inflammable material or grounded metal objects. It shall not be unduly exposed to mechanical injury. The tube terminals shall (1) project within the sign enclosure, or (2) shall be isolated from combustible material and inaccessible to unauthorized persons, or else (3) shall be installed in separate enclosures approved for the purpose which shall consist of non-combustible, non-absorbent insulating material or of metal of thickness not less than No. 24 U. S. sheet metal gauge. Such sheet metal shall be galvanized, treated with at least three coats of anti-corrosive paint, or otherwise suitably protected from corrosion. Connections at electrodes shall be mechanically and electrically secured and, unless a solderless connector approved for the purpose is used, shall be soldered.

b. The transformers, tubes and other apparatus shall be approved for this use. High-voltage transformers of other than weatherproof type, and other high-voltage equipment shall be installed in approved cabinets unless placed within the metal enclosure provided for the complete assembly. The transformer secondary open-circuit voltage shall not exceed 15,000 volts.

c. High-voltage conductors shall be approved for the purpose and shall be not smaller than No. 14 B. & S. gauge. Outside of the cabinets and tube-terminal enclosures they shall be covered with insulation approved for the purpose. Where within reach from ground, roof or window, they shall be installed in metal conduit. Elsewhere, they shall be run in conduit or on approved insulators which maintain a separation of at least two inches from other objects.

d. Not more than one transformer shall be dependent upon a single automatic overload protective device unless the combined load is less than 1650 volt-amperes. Additional devices for the individual protection and disconnection of transformers in signs may be placed within or outside the sign structure. If exposed to the weather, they shall be of weatherproof type.

e. Enclosures for transformers and regulating coils shall be well ventilated and of such design as to prevent the emission of any flame or sparks in case of burnout of any of the coils. All metal enclosures shall be permanently and effectively grounded in accordance with article 9, except that a No. 14 wire may be used for bonding together isolated tube-terminal boxes or outline systems.

f. Enclosures for transformers, regulating coils and tube terminals shall, for indoor installations having live parts exposed within the cabinet, be arranged so that the door of the enclosure cannot be opened without breaking the primary circuit.

#### 5003. Wiring.

a. Circuits operating at more than 7500 volts between conductors shall not (except as provided in Section 5002) be installed in buildings other than central station, substations, transformer vaults and fire-resistive motor rooms. Industrial substations for such voltages, if not outdoors or in a separate detached building, shall meet the requirements for a transformer vault in Section 5037.

b. Elsewhere than in central stations, substations, generator, transformer, switching, and motor rooms, conduits shall properly enter and be secured to the casing of shields surrounding apparatus or to suitable terminal boxes bolted or otherwise secured to the casing.

c. Elsewhere than in central stations, substations, and generator, transformer, switching and motor rooms and in service runs, all wiring of circuits of more than 600 volts shall consist of approved multiple-conductor, grounded metal-sheathed cable enclosed in approved conduit. Where the cable is not exposed to moisture, the metal sheath may be omitted by permission of the inspection department. Where moisture is absent, the metal sheath need not be continued over splices; but where the metal sheath is required over the rest of the cable the ends of the sheath shall be belled out and bonded around the splices by No. 8 copper wire and ground clamps.

d. Where a cable emerges from its metal sheath, the insulation of the several conductors shall be thoroughly protected from moisture and mechanical injury by a pothead or equivalent device.

e. Open work may be employed in central stations, substations, generator, transformer and switching rooms and in motor rooms provided the wires are rigidly supported on glass or porcelain insulators which will keep them eight inches apart, except at apparatus and devices, and at least two inches from adjacent surfaces in all cases, and three inches where voltage exceeds 2500.

Rigid supporting requires supports about 4½ feet apart when wiring along flat surfaces under ordinary conditions.

f. Overhead service conductors shall be not smaller than No. 6. They shall enter the building only in rigid conduit or as separate individual wires. Open wires shall enter through waterproof insulating tubes or bushings, with drip loops on the outside. Where rigid conduit is used, it shall have weatherproof threaded joints and be equipped with an approved service pothead.

g. Underground service conductors shall be not smaller than No. 8, shall be lead-covered and if exceeding 2500 volts to ground shall terminate in suitable potheads or their equivalent located to conform with Section 5010. The end of underground service conduit shall be sealed with suitable compound.

#### 5004. Motors.

a. Motors operating at more than 7500 volts between conductors shall not be installed elsewhere than in central stations and substations and in fire-resistive motor rooms.

#### 5005. Transformers and Apparatus.

a. Transformers installed in central stations and substations shall be so located that fire and smoke from burning coils or boiling oil will be unlikely to do harm.

It is recommended that air-cooled transformers be isolated as much as possible, and that, if air blast is employed, the ducts be fireproof. It is further recommended that oil-filled transformers be placed in a compartment constructed in accordance with Section 5007 of this Code.

b. Transformers shall not be installed in buildings other than central stations or substations, except by permission of the authority enforcing this Code. Where such permission has been granted, transformers shall be located as near as possible to the point at which the primary wires enter the building and shall be contained in an enclosure of fire-resistive material large enough to provide an air space of at least 6 inches on every side of the transformers. This enclosure shall be securely locked, access being allowed only to authorized persons, and shall be thoroughly ventilated. This shall not apply to the control-circuit transformer furnished with control equipment. These transformers shall be considered as subject to the requirements applying to the equipments with which they are used.

It is recommended that ventilation be secured by means of a chimney or flue leading out of doors.

c. Transformer cases shall be grounded as prescribed for the grounding of equipment in Article 9 of this Code; provided, however, that cases or frames of transformers used exclusively to supply current to switch-board instruments need not be grounded if they are installed and grounded as required for the maximum potential at which they operate.

d. For oil-filled transformers which are not located in central stations or substations, the enclosure required by paragraph b of this section shall consist of fireproof vault construction in accordance with Section 5007 of this article.

e. For transformers in electric furnace rooms the requirements of this section and of Section 5007 of this article shall be followed so far as practicable; provided, however, that by permission of the authority enforcing this Code, oil-filled transformers having a total rating of 75 k.v.a. or less, may be located in electric furnace rooms of fire-resisting construction, if surrounded by concrete curbs not less than 6 inches high and forming a basin of sufficient capacity to retain all the oil used in such transformers.

This is to guard against the possibility of molten metal from the furnace coming in contact with the transformer casing, and also to prevent oil from the transformers reaching the furnace.

#### 5006. Control and Protective Equipment.

a. When operating at more than 600 volts, each motor, each transformer or bank of transformers operating as a unit, and each other operating unit of apparatus, shall be separately controllable and protected by a manually operable circuit-breaker which interrupts all ungrounded circuit wires and which is automatically actuated by excessive overload in any ungrounded wire and the number of over-current units shall be as specified in the table of paragraph p of Section 805; provided, that certain transformers installed in fireproof vaults may be otherwise controlled and protected when and as permitted by Section 5009 of this article. For the purposes of this rule, transformers operating in multiple shall not be considered as operating in bank and shall be separately protected. When a generator and a transformer, or bank of transformers, operate as a unit for stepping up or stepping down the voltage, they may be controlled and protected as an operating unit. Where the motor-starting device does not open all ungrounded leads to the motor, this circuit-breaker shall be installed in sight of the person operating the motor-starting device or else have provision for locking in the open position.

b. Oil circuit-breakers and switches shall be isolated from other switches and electrical apparatus wherever practicable. Where connected to circuits exceeding 2500 volts to ground they shall be placed in separate fireproof cells or closed metal compartments and controlled from outside such closed compartments.

It is recommended that switches of the oil-immersed type used to control transformers be located in a vault, preferably separate from the transformers.

Safety control truck panels and armor-clad switch-gear units on circuits not exceeding 15,000 volts are considered to comply with this rule even though the circuit-breaker is not of the remote-control type.

c. Switches and control apparatus on circuits exceeding 2500 volts to ground shall be installed in a vault complying with section 5007, or in a fire-resistive switch room or motor room.

Safety control truck panels and armor-clad switchgear units are considered to comply with this rule.

d. All switches including disconnectors shall be so located that the point from which they are operated is safely accessible to qualified and authorized persons.

#### 5007. Transformer Vaults.

a. The walls and also the roof shall consist of reinforced concrete not less than six inches in thickness, or of brick not less than eight inches in thickness, or of construction of equivalent ruggedness and equivalent fire rating as determined by tests conducted according to the Standard Fire Test Specification; except that when the total transformer capacity so enclosed is not over 100 kilovolt-amperes the above thickness

may be reduced to four inches provided approved fireproof material is employed and the construction of the vault is specifically approved by the inspection department.

It is recommended that outside walls of the building, if of fireproof construction, constitute one or more of the walls of the vault or enclosure.

b. The enclosure shall be provided with means for ventilation which will prevent the development of room temperatures in excess of those at which the transformers installed therein may be safely operated. Temperatures shall be determined as prescribed in the standards of the American Institute of Electrical Engineers, and temperatures under full load shall not exceed the values there given. All ventilating openings not connected to chimneys or flues shall be provided with automatic or manually controlled dampers made of metal of thickness not less than No. 10 (U. S. standard gauge for sheet steel) to prevent the emission of smoke or fire.

It is recommended that damper controls be arranged to be operated from a point outside the vault.

c. Where practicable, a suitable drain shall be provided which will carry off any accumulation of oil or water that may collect in the vault. Floor and drain shall have a pitch of not less than ¼ inch per foot. In vaults containing transformers having a total capacity of 100 kilovolt-amperes or less the drain may be omitted if the enclosure is so constructed as to retain all the oil used within the vault.

d. Unless access is from outside the building only, the doorway to the vault shall be thoroughly closed by means of tight-fitting fire door approved for Class A openings as defined in the Regulations of the National Board of Fire Underwriters for the Protection of Openings in Walls and Partitions Against Fire. A door sill not less than 4 inches in height shall be provided. In all cases the sill shall be of sufficient height to confine within the vault the oil from the largest transformer installed.

#### 5008. Capacitors (Static Condensers).

a. Capacitors of the type made up of small units, each of which contains less than three gallons of oil, may be installed in power houses or factory buildings if combustibles are kept well away from them. In rooms containing combustible dust or flying material, capacitors shall be enclosed.

If capacitors are accessible to other than qualified persons a non-combustible grille or guard around them may be desirable.

b. Capacitors which have all units in single tanks filled with oil shall be installed as required for transformers in Section 5005.

c. For transformers used with capacitors, the requirements of Section 5005 shall be followed; provided, however, that by permission of the authority enforcing this code, oil-filled transformers intended for and used only with capacitor installations and not subject to lightning disturbances may be installed in rooms of non-combustible construction and occupancy. Such transformers shall be of sufficient capacity to allow for ordinary rises in voltage; they shall be surrounded by concrete curbs not less than 6 inches high which form a basin of sufficient capacity to retain all the oil contained in the transformers; and be protected by an automatic overload circuit-breaker (or other protective device and switch) set to operate at a current corresponding to not over 150% of the rated capacity of the capacitor.

#### 5009. Service Equipment.

Secondary conductors and not primary conductors are regarded as constituting the service wires to the building proper in the following cases, and where any one of the following conditions is satisfied only paragraphs (g), (h), (i) and (j) of this section apply.

1. Where step-down transformers are located outdoors.
2. Where step-down transformers are located in a separate building from the one served.
3. Where step-down transformers are located in a transformer vault conforming to the requirements of Section 5007 and under the sole control of the supply company.

a. In services operating in excess of 600 volts, all ungrounded conductors supplying equipment, except as noted below in paragraphs b and c, shall be controlled and protected by an automatic circuit-breaker of suitable rupturing capacity having an over-current device in each ungrounded conductor so arranged that the operation of any one device will open all ungrounded conductors.

b. On services entering fireproof transformer vaults, where the voltage is less than 7500 and more than 4000 between conductors, and where the transformer capacity does not exceed 50 k.v.a. per phase, the following protective devices shall be provided:

1. An automatic oil circuit-breaker, or
2. A non-automatic oil switch with approved fuses.

When the transformer capacity exceeds 50 k.v.a. per phase, an automatic oil circuit-breaker shall be provided.

c. On services entering fireproof transformer vaults, where the voltage is not more than 4000 between conductors and not more than 2300 between conductors and ground, and the transformer capacity does not exceed 50 k.v.a. per phase, the following protective devices shall be provided:

1. An automatic oil circuit-breaker, or
2. A non-automatic switch with approved fuses, or
3. Approved fuses, or
4. An approved automatic air-break circuit-breaker.

When the transformer capacity exceeds 50 k.v.a. per phase, automatic oil circuit-breakers shall be used.

At the time of adoption of paragraphs b and c preceding, other devices to serve in lieu of oil circuit-breakers were not available. Such devices, if developed and found suitable by the authority enforcing this Code, may be employed in lieu of oil circuit-breakers and will satisfy the intent of this Code.

d. A lightning arrester complying with the requirements of Section 1901 of article 19 of this Code shall be placed on each ungrounded overhead service conductor ahead of the other service equipment, when required by the authority enforcing this Code.

e. Air-break disconnectors shall be installed between oil switches or circuit-breakers used as service switches and the supply wires.

f. Automatic overload circuit-breakers shall be located as near as possible to the point where the service wires enter the building, and shall be manually operable from a point which is readily accessible. Provision shall be made so that the circuit-breaker is free to open in case the circuit is closed on an overload. This can be by trip-free breakers, by multipole breakers having an operating handle per pole, or, for an air circuit-breaker, by a switch in series with each pole of the breaker. They shall indicate clearly whether they are open or closed.

g. Suitable circuit-breakers or switches and fuses shall be provided in the secondaries as required for low-voltage services in article 4 of this Code, except where the secondaries supply but one set of mains, in which case the above required primary protection, where consisting of an oil circuit-breaker manually operable from a point outside of any vault, will be considered as sufficiently protecting and controlling the secondary mains.

h. Air-break disconnectors and fuses shall be accessible to qualified attendants only. Air-break disconnectors required by this article shall be provided with means for grounding on the load side. Such grounding means need not be provided for duplicate disconnectors, if any, installed and maintained by the supply company.

i. No overhead service, no underground service, and no service from an isolated plant shall supply one building through another, except when such buildings are under single occupancy or management. Conductors in conduit or duct placed under two inches of concrete beneath a building, or buried in two inches of brick or concrete within a wall, shall be considered outside the building.

j. For services located in hazardous or extra-hazardous locations, see Article 32 (paragraph b in Sections 3203, 3204, and 3205) of this Code.

#### 5010. Guarding Live Parts.

a. All live parts, including conductors, which are connected to circuits of more than 600 volts between conductors, shall be enclosed or isolated so as to be accessible to qualified persons only.

b. Generator, switching, and motor rooms containing apparatus operated at more than 600 volts shall be securely locked except while a qualified operator is present.

#### 5011. Outdoor Substation.

a. Where step-down transformers are located outdoors they shall be so placed as not to interfere with firemen, and not be accessible to unauthorized persons. Unless isolated by elevation, they shall be surrounded by a grounded metal fence, and placarded with a warning sign which indicates the highest voltage involved. Overflow oil shall drain away from adjacent buildings and combustible material.

#### 5012. X-Ray and High-Frequency Apparatus.

a. Adequate mechanical barriers shall be provided to prevent too close approach to any high-voltage part except the operating tube and its leads, and it is recommended that all other parts be enclosed in a separate room or cabinet. Such barriers may consist of grounded metal or of insulating material such as glass. High-voltage parts enclosed in a wooden cabinet shall have adequate spacing from the wooden walls. If one side of the high-voltage circuit is grounded, the millimeter shall be connected in the grounded lead, and need not be guarded. All operating parts such as spark-gap handles and regulating handles shall be made of suitable insulating material and shall be operative from outside of the barriers.

b. Overhead high-voltage stationary conductors shall be not less than 7 feet 6 inches above the floor where the ceiling height permits and in no case less than 7 feet. The high-voltage leads on tilting tables and fluoroscopes shall be adequately insulated or so surrounded by barriers that inadvertent contact with them is improbable. Tube terminals and high-voltage wires connected thereto should be adequately insulated for a distance of 12 inches from the terminal. Shields for this purpose shall be designed to carry the high-voltage leads away from the patient in a direction at right angles to the long axis of the tube. X-ray tubes used in therapy shall be mounted in a grounded metal enclosure.

c. The low-voltage circuit of a step-up transformer shall contain a manually operable circuit-breaker having no exposed live parts. There shall be an additional switch in this circuit, which for diagnostic work shall be one of the following types:

1. A switch with spring or other mechanism to open automatically except while held closed by the operator.
2. A time switch which will automatically open after a definite time for which it has been set.

d. Where more than one piece of apparatus is operated from the same high-voltage source, each shall be provided with a high-voltage switch so as to give independent control.

e. Low-frequency current-carrying parts of machines of the quenched-gap or open-gap type shall be insulated or guarded so that they cannot be touched during operation. This applies to all parts except the high-frequency circuit proper which delivers high-frequency current normally for therapeutic purposes.

f. Transformers which are a part of an X-ray or high-frequency apparatus, even though they contain oil, are to be considered and treated as a part of the device, and need not conform to the requirements of Section 5005 for power transformers.

g. All tube stands and fluoroscopes shall have their frames, operating handles, and other non-current-carrying metal parts of apparatus grounded in conformity with the requirements of article 9. Non-metallic tables and chairs are recommended, particularly for therapeutic work. Metal or other conducting tables or chairs for supporting patients shall be suitably insulated from ground, and insulating floors, mats or platforms shall be provided for operators. It is recommended that floors of concrete or other conducting material be completely covered with linoleum, rubber tile or other insulating material.

### ARTICLE 60. SIGNAL SYSTEMS.

#### 6001. General.

a. The provisions of this article shall apply to telephone, telegraph (except radio), district messenger and call-bell circuits, fire and burglar alarms, and similar systems.

Such protective measures as are essential to safeguard these systems under the various conditions to which they are subjected are outlined in these rules.

#### 6002. Outside Wires.

a. Outside wires shall be placed in underground ducts or strung on poles. They shall not be run across or attached to roofs except by permission of the authority enforcing this Code.

b. Underground wires shall not be placed in a duct, handhole, or manhole containing electric light or power wires. Where a handhole or a manhole is divided into sections by means of partitions of brick, concrete or tile, each compartment shall be considered as a separate handhole or manhole.

c. Overhead wires shall not be attached to a crossarm carrying electric light or power wires, nor shall they, when on the exterior walls of buildings, be brought closer than four inches to electric light or power wires, unless one system is in conduit or is permanently separated from the other system by a continuous and firmly fixed non-conductor, additional to the insulation on the wires.

d. The metal sheath of aerial cables which are liable to contact with electric light or power wires shall be interrupted close to the entrance to a building by an insulating joint or equivalent device.

e. The distance between the two inside pins of any crossarm of a pole carrying signal and electric light and power wires shall be not less than 24 inches.

It is recommended that signal wires, being smaller and more liable to break and fall, be placed on the lower crossarms.

f. Aerial cables of the metal-sheathed type may have paper or other suitable insulation. If the metal sheath is omitted each wire shall have 1/32 inch rubber insulation and the bunched wires shall be covered with a substantial braid.

g. Wires from the last outdoor support to the protector, and wires attached to buildings shall have 1/32 inch rubber insulation on each wire, and in addition the wires, either individually or bunched, shall be covered with a substantial braid. Where such wires are entirely within a block the insulation on each wire may be less than 1/32 inch, but not less than 1/40 inch in thickness. Where not in conduit, such wires shall be separated from woodwork and supported on glass or porcelain insulators.

h. Wires shall enter buildings either through non-combustible, non-absorptive, insulating bushings, or through approved rigid conduit. Conduit or bushings shall slope upward from the outside, or, where this cannot be done, drip loops shall be formed in the wires immediately outside the point of entrance. The conduit shall be equipped with an approved service head. More than one wire may enter through one conduit or bushing.

i. The preceding paragraphs g and h shall not apply where the wires enter a building in the form of a cable such as is described in paragraph f, of this section, nor where the entire street circuit is run underground, and the circuit within the block is so placed as to be free from chance of accidental contact with electric light or power wires of over 250 volts.

#### 6003. In Buildings; Generally.

a. Wires beyond the protector, or wires inside buildings where no protector is employed, shall be neatly arranged and secured in place in a convenient, workmanlike manner. They shall not approach nearer than two inches to any electric light or power wire unless one system is in conduit or the two systems are permanently separated by a continuous and firmly-fixed non-conductor, additional to the insulation on the wires.

The wires would ordinarily be insulated, but the kind of insulation is not specified, as reliance is placed on the protector to stop all dangerous currents. Porcelain tubes or approved flexible tubing are considered suitable non-conductors.

b. Wires bunched together in a vertical run shall have a fire-resisting covering sufficient to prevent the carrying of fire from floor to floor. This requirement shall not apply if the wires are encased in non-combustible tubing, or are located in a fireproof shaft having firestops at each floor.

c. Signal wires and electric light and power wires may be run in the same shaft, if the two systems are separated at least two inches, or if either system is encased in non-combustible tubing.

d. Signal wires shall not be placed in a tube or compartment containing electric light or power wires, nor in the same outlet box, junction box or similar fitting or compartment unless separated from said electric light and power wires by a suitable partition, except where the power wires are introduced solely for power supply to signaling equipment or for connection to remote control equipment.

e. Transformers or other devices supplying current to signal systems from electric light or power circuits shall be of a type expressly approved for such service. The secondary wiring shall conform to the requirements of this article and the primary or the charging circuit wiring to the requirements of articles 1 to 19, inclusive, of this Code. This transforming device shall be permitted only when the primary thereof is properly grounded as required in article 9 of this Code.

#### 6004. In Building; Where the Distribution System Consists of Aerial Wires.

a. An approved protector shall be placed as near as practicable to the point of entrance to the building. The protector shall be mounted on a non-combustible, non-absorptive insulating base and shall consist of an arrester between each line wire and ground and a fuse in each line wire, the fuses protecting the arrester. The protector terminals shall be plainly marked to indicate "line," "instrument" and "ground."

b. The protector shall not be placed in the immediate vicinity of easily ignitable material or inflammable gases, or dust or flyings of combustible material.

c. Where the entire street circuit is run underground a protector shall not be required unless the circuit within the block is so placed as to be liable to accidental contact with electric light or power wires operating at a potential exceeding 250 volts.

The word "block" as used in these rules means a square or portion of a city, town or village enclosed by streets and includes the alleys so enclosed but not any street.

#### 6005. Grounding.

a. The grounding conductor of the protector shall consist of not less than No. 18 copper, having 1/32 inch rubber insulation, covered with a substantial braid. Where necessary, it shall be guarded from mechanical injury.

b. The grounding conductor shall be run in as straight a line as possible to a permanent and effective ground. Where connection is made to a gas pipe, attachment shall be made between the meter and the street main. In every case the attachment shall be made as close to the earth as practicable.

A suitable ground may be obtained by connection to either a water or a gas piping system, preferably to the former. In the absence of such piping system a ground rod or pipe driven into permanently damp earth is acceptable.

c. The grounding conductor shall be attached to the pipe by means of an approved bolted clamp to which the conductor is soldered or otherwise connected in an approved manner.

d. Steam or hot-water pipes shall not be employed as a ground for protectors.

**Tables**  
**Units of Measure**

The electrical units are derived from the following mechanical units of the metric system:

**METER.**—A unit of length equal, approximately, to one ten-millionth part of a quadrant of a meridian of the earth taken through Paris; or, approximately, to 39.37 inches.

**GRAMME.**—Unit of weight. Weight of a cubic centimeter of water at a temperature of 4 degrees centigrade.

**SECOND.**—Unit of time. The time of one swing of a pendulum making 86,400 swings in a solar day.

**Electrical Units**

**VOLT.**—Such an electromotive force as would cause a current of one ampere to flow against a resistance of one ohm. Such an electromotive force as would charge a condenser of the capacity of one farad with a quantity of electricity equal to one coulomb.

**OHM.**—The practical unit of electric resistance. Such a resistance as would limit the flow of electricity under an electromotive force of one volt, to a current of one ampere, or one-coulomb-per-second.

**MEGOHM.**—1,000,000 ohms.

**AMPERE.**—The practical unit of electric current. A rate of flow of electricity transmitting one coulomb per second. The current of electricity which would pass through a circuit whose resistance is one ohm, under an electromotive force of one volt.

**COULOMB.**—The practical unit of electric quantity. Such a quantity of electricity as would pass in one second through a circuit conveying one ampere. The quantity of electricity contained in a condenser of one farad capacity, when subjected to the E. M. F. of one volt.

**FARAD.**—The practical unit of electric capacity. Such a capacity of a conductor or condenser that one coulomb of electricity is required to produce therein a difference of potential of one volt.

**MICROFARAD (MFD.).**—One-millionth of a farad.

**WATT.**—A unit of electric power. A volt-ampere. The power developed when 44.25 foot-pounds of work are done in a minute, or 0.7375 foot-pound of work is done in a second.

**JOULE.**—A volt-coulomb or unit of electric energy or work. The amount of electric work required to raise the potential of one coulomb of electricity one volt. Ten million ergs.

**Ohm's Law**

Ohm's law is a method of expressing relationship existing between the electromotive force, current and resistance, and is practically the basis of most electrical computations. It is expressed in various forms, as follows:

$$\text{Current Flow} = \frac{\text{Electromotive Force}}{\text{Resistance}} \text{ or, } I = \frac{E}{R}$$

Electromotive force equals the current flow multiplied by resistance.

Electromotive Force = Current Flow × Resistance, or E = I × R.

Resistance equals the electromotive force divided by the current flow.

$$\text{Resistance} = \frac{\text{Electromotive Force}}{\text{Current Flow}} \text{ or, } R = \frac{E}{I}$$

I = Amperes. E = Volts. R = Ohms.

Electromotive force varies directly as the current and resistance.

Resistance varies directly with the electromotive force and inversely as the current.

Current varies directly with the electromotive force and inversely as the resistance.

**Mil**

The "mil," whose expressed value is  $\frac{\text{One}}{\text{One-Thousandth}}$  (.001) of an inch, is the practical basis for determining the diameters and thereby the area of all wires used as electric conductors. The diameters being given, the area is obtained by the well-known rule, "the area of a circle, in circular units, is equal to the square of its diameter;" hence the square of the diameter of a wire expressed in mils equals the area of its cross section.

D<sup>2</sup>=A, which area is expressed in Circular Mils or CM.; hence D<sup>2</sup>=CM.

**Tables**

**Metric System of Weights and Measures**

Measures of Lengths			
1 Millimeter =	0.001 Meter	=	0.0394 Inch
1 Centimeter =	0.01 Meter	=	0.3937 Inch
1 Decimeter =	0.1 Meter	=	3.937 Inch
1 Meter =	1 Meter	=	39.37 Inch
1 Dekameter =	10 Meters	=	393.7 Inch
1 Hectometer =	100 Meters	=	328 Feet 1 Inch
1 Kilometer =	1000 Meters	=	3280 Feet 10 In.
1 Myriameter =	10000 Meters	=	6.2137 Miles

It will be noticed that 10 Millimeters equal 1 Centimeter 10 Centimeters equal 1 Decimeter and so on.

Measures of Volumes			
1 Milliliter =	0.001 Liter	=	0.061 Cu. In.
1 Centiliter =	0.01 Liter	=	0.6102 Cu. In.
1 Deciliter =	0.1 Liter	=	6.1022 Cu. In.
1 Liter =	1 Liter	=	0.9081 Quart
1 Dekaliter =	10 Liters	=	9.081 Quarts
1 Hectoliter =	100 Liters	=	2 Bu. 3.35 Pks.
1 Kiloliter =	1000 Liters	=	1.308 Cu. Yds.

Weights			
1 Milligrm. =	0.001 Gramme	=	0.0154 Grain
1 Centigrm. =	0.01 Gramme	=	0.1543 Grain
1 Decigrm. =	0.1 Gramme	=	1.5432 Grains
1 Gramme =	1 Gramme	=	15.432 Grains
1 Dekagrme. =	10 Grammes	=	0.3527 Ounce
1 Hectogrme. =	100 Grammes	=	3.5274 Ounces
1 Kilogramme =	1000 Grammes	=	2.2046 Pounds
1 Myriagramme =	10000 Grammes	=	22.046 Pounds

Measures of Surface			
1 Hectare =	10000 Sq. Meters	=	2.471 Acres
1 Are =	100 Sq. Meters	=	119.6 Sq. Yds.
1 Centiare =	1 Sq. Meter	=	1.550 Sq. Ins.

**Metric and English Equivalents**

Inches	=	Millimeters	÷	25
Feet	=	Meters	×	3.2803
Yards	=	"	×	1.09361
Miles	=	Kilometers	÷	1.60935
Square Inches	=	Sq. Millimeters	×	0.0155
Square Feet	=	Square Meters	×	10.7641
Acres	=	Sq. Kilometers	×	247.114
Cubic Inches	=	Cu. Centimeters	÷	16.3870
Cubic Feet	=	Cubic Meters	×	35.3140
Lbs. Avoirdupois	=	Kilogrammes	×	2.40262
Tons (2000 lbs.)	=	Kilogrammes	÷	907.18
Lbs. per foot	=	Kilo per meter	×	.67196
Lbs. per cwt. ft.	=	Kilo per cu. meter	×	0.6243
Square Millimeters	=	Square inches	×	645.137
Square Meter	=	Square Feet	×	.929
Grammes	=	Ounces	×	28.3495
Grammes	=	Pounds	×	453.5926
Kilogrammes	=	Pounds	×	2.2046

**Field Current in D. C. Dynamos**

It has been found that a fair average for the field amperes of different sized dynamos, is as follows:—

K. W.	1	5	10	20	30	50	75	100
Per Cent	8	6	5	4	3.5	3	3	2.75

The field current (expressed as a percentage of full load current on lines) is determined with all of the resistance out, that is, with rheostat on first notch.

**Copper Wire Resistance**

The basis for computation of resistance of copper wires is a wire one foot long and one circular mil of cross section known as a mil-foot, and which has a resistance of 24° C., or 75° F., of about 10.7 Ohms. The resistance of a copper wire varies directly as its length and inversely as its cross section; hence,

The resistance (R) of a copper wire is equal to its length (D) multiplied by the resistance of a mil-foot and divided by the cross section in circular mils (CM).

$$\text{Or, } R = \frac{D \times 10.7}{\text{CM}} \text{ also}$$

The cross section (CM) in circular mils of a wire is equal to its length (D) multiplied by the resistance of a mil-foot, divided by its resistance (R).

$$\text{CM} = \frac{D \times 10.7}{R} \text{ also}$$

The length (D) of a wire is equal to the cross section in circular mils (CM) multiplied by its resistance (R) and divided by the resistance of a mil-foot.

$$D = \frac{\text{CM} \times R}{10.7}$$

## Equivalent Values in Different Units

1 H. P. =	$\left\{ \begin{array}{l} 746 \text{ watts} \\ .746 \text{ K.W.} \\ 33,000 \text{ ft.-lbs. per minute} \\ 550 \text{ ft.-lbs. per second} \\ 2,545 \text{ heat-units per hour} \\ 42.4 \text{ heat units per minute} \\ .707 \text{ heat-units per second} \\ .175 \text{ lb. carbon oxidized per hour} \\ 2.64 \text{ lbs. water evaporated per hour} \\ \text{from and at } 212^{\circ} \text{ F.} \end{array} \right.$
1 H.P. Hour =	$\left\{ \begin{array}{l} 746 \text{ K.W. hours} \\ 1,980,000 \text{ ft.-lbs.} \\ 2,545 \text{ heat-units} \\ 273,740 \text{ k.g.m.} \\ .175 \text{ lb. carbon oxidized with perfect} \\ \text{efficiency} \\ 2.64 \text{ lbs. water evaporated from and at} \\ 212^{\circ} \text{ F.} \\ 17.0 \text{ lbs. water raised from } 62^{\circ} \text{ to } 212^{\circ} \text{ F.} \end{array} \right.$
1 Kilo-watt =	$\left\{ \begin{array}{l} 1,000 \text{ watts} \\ 1.34 \text{ H.P.} \\ 2,654,200 \text{ ft.-lbs. per hour} \\ 44,240 \text{ ft.-lbs. per minute} \\ 737.3 \text{ ft.-lbs. per second} \\ 3,412 \text{ heat-units per hour} \\ 56.9 \text{ heat-units per minute} \\ .948 \text{ heat-units per second} \\ .2275 \text{ lb. carbon oxidized per hour} \\ 3.53 \text{ lbs. water evaporated per hour} \\ \text{from and at } 212^{\circ} \text{ F.} \end{array} \right.$
1 Watt per Sq. In. =	$\left\{ \begin{array}{l} 8.9 \text{ heat-units per sq. ft. per minute} \\ 6,371 \text{ ft.-lbs. per sq. ft. per minute} \\ .193 \text{ H.P. per sq. ft.} \\ 7.233 \text{ ft.-lbs.} \end{array} \right.$
1 Kilo-gram Meter =	$\left\{ \begin{array}{l} .00000365 \text{ H.P. hour} \\ .00000272 \text{ K.W. hour} \\ .0093 \text{ heat-units} \end{array} \right.$
1 Lb. Water Evaporated from and at 212° F. =	$\left\{ \begin{array}{l} .283 \text{ K.W. hour} \\ .379 \text{ H.P. hour} \\ 965.7 \text{ heat-units} \\ 103,900 \text{ k.g.m.} \\ 1,019,000 \text{ joules} \\ 751,300 \text{ ft.-lbs.} \\ .0664 \text{ lb. of carbon oxidized} \end{array} \right.$
1 Heat-Unit =	$\left\{ \begin{array}{l} 1,055 \text{ watt seconds} \\ 778 \text{ ft.-lbs.} \\ 107.6 \text{ kilogram meters} \\ .000293 \text{ K.W. hour} \\ .000373 \text{ H.P. hour} \\ .0000588 \text{ lb. carbon oxidized} \\ .001036 \text{ lb. water evaporated from} \\ \text{and at } 212^{\circ} \text{ F.} \end{array} \right.$
1 Heat-Unit per Sq. Ft. per Min. =	$\left\{ \begin{array}{l} .122 \text{ watt per sq. in.} \\ .0176 \text{ K.W. per sq. ft.} \\ .0236 \text{ H.P. per sq. ft.} \end{array} \right.$

### Wiring Formula

Ohm's law is practically the basis for the various formulae in general use for determining the proper size of wire to use to carry various currents. It is essential to know the amount of current expressed in amperes, the distance, and to decide upon the loss to allow in transmission; the best rule is as follows:

The cross section (CM) of the necessary wire is found by multiplying twice the distance one way (2D) by the amount of current expressed in amperes (C) and this by the resistance of one mil-foot (10.7) and dividing by the loss in transmission expressed in volts (v).

$$\text{or, } CM = \frac{2D \times C \times 10.7}{v} \text{ or } CM = \frac{D \times C \times 21.4}{v}$$

## Equivalent Values in Different Units

Continued

1 Watt =	$\left\{ \begin{array}{l} 1 \text{ joule per second} \\ .00134 \text{ H.P.} \\ 3,412 \text{ heat-units per hour} \\ .7373 \text{ ft.-lbs. per second} \\ .0035 \text{ lb. water evaporated per hour} \\ 44.24 \text{ ft.-lbs. per minute} \end{array} \right.$
1 K.W. Hour =	$\left\{ \begin{array}{l} 1,000 \text{ watt hours} \\ 1.34 \text{ H.P. hours} \\ 2,654,200 \text{ ft.-lbs.} \\ 3,590,000 \text{ joules} \\ 3,412 \text{ heat-units} \\ 367,000 \text{ kilogram meters} \\ .235 \text{ lb. carbon oxidized with perfect} \\ \text{efficiency} \\ 3.53 \text{ lbs. water evaporated from and} \\ \text{at } 212^{\circ} \text{ F.} \\ 22.75 \text{ lbs. of water raised from } 62^{\circ} \text{ to} \\ 212^{\circ} \text{ F.} \end{array} \right.$
1 Joule =	$\left\{ \begin{array}{l} 1 \text{ watt second} \\ .000000278 \text{ K.W. hour} \\ .102 \text{ k.g.m.} \\ .0009477 \text{ heat-units} \\ .7373 \text{ ft.-lb.} \end{array} \right.$
1 Ft.-Lb. =	$\left\{ \begin{array}{l} 1.356 \text{ joules} \\ .1383 \text{ k.g.m.} \\ .000000377 \text{ K.W. hours} \\ .001285 \text{ heat-units} \\ .0000005 \text{ H.P. hour} \end{array} \right.$
1 lb. Carbon Oxidized with Perfect Efficiency =	$\left\{ \begin{array}{l} 14,544 \text{ heat-units} \\ 1.11 \text{ lb. anthracite coal oxidized} \\ 2.5 \text{ lbs. dry wood oxidized} \\ 21 \text{ cu. ft. illuminating gas} \\ 4.26 \text{ K.W. hours} \\ 5.71 \text{ H.P. hours} \\ 11,315,000 \text{ ft.-lbs.} \\ 15 \text{ lbs. of water evaporated from and at} \\ 212^{\circ} \text{ F.} \end{array} \right.$

## Equivalent of Electrical Units

1 H.P. =	$\left\{ \begin{array}{l} 33,000 \text{ foot-pounds per minute} \\ 746 \text{ watts} \\ 42.746 \text{ B.T.U. (British Thermal Unit)} \\ \text{per minute} \\ 2564.76 \text{ B.T.U. per hour} \end{array} \right.$
1 K.W. =	$\left\{ \begin{array}{l} 44,235 \text{ foot-pounds per minute} \\ 1.34 \text{ H.P.} \\ 0.955 \text{ B.T.U. per second} \\ 57.3 \text{ B.T.U. per minute} \\ 3,438 \text{ B.T.U. per hour} \end{array} \right.$
1 B.T.U. =	$\left\{ \begin{array}{l} 772 \text{ foot-pounds} \\ 17,452 \text{ watt minutes} \\ 0.2909 \text{ watt hours} \end{array} \right.$
1 Watt =	$\left\{ \begin{array}{l} 44.236 \text{ foot-pounds per minute} \\ 2,654.16 \text{ foot pounds per hour} \end{array} \right.$

Latent heat of evaporation of water = 966 B.T.U.  
 Latent heat of melting of water = 142 B.T.U.  
 To evaporate 1 lb. water from and at 212° = 16.859 K.W. minutes  
 To evaporate 1 lb. water from and at 212° = 0.281 K.W. hours  
 Weight per cu. ft. of water = 62.42 lbs.  
 Weight per gallon of water = 8.33 lbs.

Physical Data

The equivalent of one B.t.u. of heat=778 foot-pounds.  
 The equivalent of one calorie of heat=426 kg-m.,=3.968 B.t.u.  
 One cubic foot of water weighs 62.355 pounds at 62° Fahr.  
 One cubic foot of air weighs 0.0807 pounds at 32° Fahr. and one atmosphere.  
 One cubic foot of hydrogen weighs 0.00557 pounds.  
 One foot-pound=1.3562×10<sup>7</sup> ergs.  
 One horsepower hour=33,000×60 foot-pounds.  
 One horsepower=33,000 foot-pounds per min.=550 foot-pounds per second=746 watts,=2545 B.t.u. per hour.  
 Acceleration of gravity (g)=32.2 feet per second.  
 =980 mm. per second.  
 One atmosphere=14.7 pounds per square inch.  
 =2116 pounds per square foot.  
 =760 mm. of mercury.  
 Velocity of sound at 0° Cent. in dry air=332.4 meters per sec.  
 =1091 feet per sec.  
 Velocity of light in vacuum=299,853 km. per sec.  
 =186,325 miles per sec.  
 Specific heat of air at constant pressure=0.237.  
 A column of water 2.3 feet high corresponds to a pressure of 1 pound per square inch.  
 Coefficient of expansion of gases= $\frac{1}{273}$ =0.00367.  
 Latent heat of water=79.24.  
 Latent heat of steam=535.9.

Handy Table

Diameter of a circle ×3.1416=circumference.  
 Radius of a circle ×6.283185=circumference.  
 Square of the diameter of a circle ×0.7854=area.  
 Square of the circumference of a circle ×0.07958=area.  
 Half the circumference of a circle × half its diameter=area.  
 Circumference of a circle ×0.159155=radius.  
 Square root of a circle +0.56419=radius.  
 Circumference of a circle ×0.31831=diameter.  
 Square root of the area of a circle ×1.12838=diameter.  
 Diameter of a circle =0.86=side of inscribed equilateral triangle.  
 Diameter of a circle ×0.7071=side of an inscribed square.  
 Circumference of a circle +0.225=side of an inscribed square.  
 Circumference of a circle +0.282=side of an equal square.  
 Diameter of a circle ×0.8862=side of an equal square.  
 Base of a triangle ×  $\frac{1}{2}$  the altitude=area.  
 Multiplying both diameters and .7854 together=area of an ellipse.  
 Surface of a sphere ×  $\frac{1}{6}$  of its diameter=solidity.  
 Circumference of a sphere × its diameter=surface.  
 Square of the diameter of a sphere ×3.1416=surface.  
 Square of the circumference of a sphere ×0.3183=surface.  
 Cube of the diameter of a sphere ×0.5236=solidity.  
 Cube of the radius of a sphere ×4.1888=solidity.  
 Cube of the circumference of a sphere ×0.016887=solidity.  
 Square root of the surface of a sphere ×0.56419=diameter.  
 Square root of the surface of a sphere +1.772454=circumference.  
 Cube root of the solidity of a sphere ×1.2407=diameter.  
 Cube root of the solidity of a sphere ×3.8978=circumference.  
 Radius of a sphere ×1.1547=side of an inscribed cube.  
 Square root of ( $\frac{1}{2}$  of the square of) the diameter of a sphere=side of inscribed cube.  
 Area of its base ×  $\frac{1}{3}$  of its altitude=solidity of a cone or pyramid, whether round, square, or triangular.  
 Area of one of its sides ×6=surface of a cube.  
 Altitude of trapezoid ×  $\frac{1}{2}$  the sum of its parallel sides=area.

Table of Comparison of Centigrade and Fahrenheit Scales

64	147.2	77	170.6	90	194.0	...	...

Seventy-five deg. Fahr., or 23.8 deg. Cent. is the standard temperature for measuring electrical resistances in submarine cable tests.

Sixty deg. Fahr., or 15.5 deg. Cent. is the standard temperature for measuring the electrical resistance of wire for general telegraphic and electric light purposes; it is assumed to be the average temperature of the air.

Nine deg. Fahr.=5 deg. Centigrade=4 deg. Reaumur.

One deg. Fahr.=.5556 deg. Centigrade.

One deg. Centigrade=1.8 deg. Fahr.

To convert Fahr. to Centigrade, subtract 32, multiply by 5 and divide by 9.

To convert Fahr. to Reaumur, subtract 32, multiply by 4 and divide by 9.

To convert Centigrade to Fahr., multiply by 9, divide by 5 and add 32.

To convert Centigrade to Reaumur multiply by 4 and divide by 5.

To convert Reaumur to Fahr., multiply by 9, divide by 4 and add 32.

To convert Reaumur to Centigrade, multiply by 5, divide by 4.

If temperature is below freezing, the above formula should read "subtract from 32" in place of "subtract 32" and "add 32."

## Standard Line Construction

## Gauges of Copper Wire

### Spacing of High Tension Transmission Lines

Fig. 1

It is important that the spacing and construction should be such as to prevent lines from swinging together or against the towers or poles when subjected to wind pressure. Careful attention should be given to the fact that with the suspension type of disc insulator the radius of free movement is materially increased.

Excessive spacing distances must be guarded against in order to keep the self-induction of the system at a minimum value. Authorities vary

to some extent and local conditions will govern, but the accompanying values represent good commercial practice.

Operating Voltage	Separation Inches
2200	18 to 24
3300	18 " 24
6600	18 " 24
11000	18 " 24
15000	24 " 30
22000	30 " 36
33000	36 " 48
44000	48 " 60
66000	72
88000	96
110000	120

Fig. 2

### 33000-volt 3-phase Pole Construction

The use of 33000-volt 3-phase transmission is highly desirable for supplying large areas, and its reliability and economy are well known. The pole constructions shown have been adopted for some very large systems and can be installed at a reasonable cost. Low voltage or secondary circuits can be run on the same poles by locating cross-arms below the high tension lines.

Figure 1 shows two 33000-volt systems with ground wire at the top of the poles.

Figure 2 shows one 33000-volt

Fig. 3

system with a ground wire at the top.

Figure 3 shows a 33000-volt system with a ground wire on the top cross-arm.

Figure 4 shows a 33000-volt system without the ground wire. This latter type of construction is only recommended where the lowest possible cost line must be installed.

When a ground wire is used, it should be of the same size as the line wire and well grounded at every fifth pole. A 1-inch wooden molding strip can be used below the cross-arms.

**How to Remember the Wire Table**

**SUMMARY.**—The things to be remembered regarding B. & S. gauge copper wire are the following:

A wire which is three sizes larger than another wire has half the resistance, twice the weight and twice the area. A wire which is ten sizes larger than another wire has one-tenth the resistance, ten times the weight and ten times the area.

No. 10 wire is 0.10 inch in diameter (more precisely, 0.102); it has an area of 10,000 circular mils (more precisely, 10,380); it has a resistance of 1 ohm per thousand ft., at 20 degrees Centigrade (68 degrees Fahrenheit), and weighs 32 pounds (more precisely, 31.4 pounds) per thousand feet.

The weight of one thousand feet of No. 5 wire is 100 pounds.

The relative values of resistance (for decreasing sizes) and of weight and area (for increasing sizes) for consecutive sizes are: .50, .63, .80, 1.00, 1.25, 1.60, 2.00.

The relative values of the diameter of alternate sizes of wire are: .50, .63, .80, 1.00, 1.25, 1.60, 2.00.

**CIRCULAR MILS.**—The conductors of large sizes are usually specified in circular mils. For example, 500,000 circular mils, 750,000 circular mils.

To find resistance, drop one cypher from the number of mils; the result is the number of feet per ohm.

To find weight, drop four cyphers from the number of circular mils and multiply by the weight of No. 10 wire.

## Wiring for D.C. Motor Services

## Wiring for D.C. Motors

### Carrying Capacity Copper Wire

### How to Use Motor Tables

Size B. & S.	Diameter Inches	Pounds Bare Copper per 1000 Feet	Carrying Capacity Rubber Insulation Amperes
14	.064	12.4	15
12	.081	19.7	20
10	.102	31.4	24
8	.128	49.9	33
6	.162	79.4	46
4	.204	126	65
3	.229	159	76
2	.258	201	90
1	.289	253	107
0	.325	319	127
00	.365	402	150
000	.410	507	177
0000	.460	640	210

The table shown on previous page is compiled on a basis of 1 volt loss for convenience in using the table on other percentages of loss. It is usual to allow a loss of more than 1 volt for motor service. In such case, divide the distance by the loss allowed, which will give the number of feet in which a loss of 1 volt will occur. Find this number of feet on the table at the horse power and voltage required and you will have necessary size of wire.

**EXAMPLE.**—A 5-h.p. 220-volt motor, 400 feet from service, at 8 volts loss.

**EXPLANATION.**—A loss of 8 volts for 400 feet would be equal to a loss of 1 volt for 50 feet (400 divided by 8 equals 50). By referring to table we find that to carry a 5 horse power, 220-volt motor, 50 feet with a loss volt, a 6 B.&S. wire is required, which means that the same wire would be required to do the work called for by the example.

## Connections and Data on D.C. Generators and Motors

The various types of direct current motors and generators are known relatively by the field windings, as series, shunt, compound and interpole. They are generally self-exciting but can be separately excited, in which case they are usually supplied with current from an outside source, such as a storage battery or another generator.

**SERIES.**—The field flux increases as the load current increases. In a series wound machine the field winding is in series with the armature. The speed of a series motor varies with the load. Its torque also increases with the increase of load and decreases with speed. The armature is at the highest speed at no load, and minimum speed at full load. Series motors are mostly used for driving exhaust fans, traction work, etc.

**SHUNT.**—The field flux is practically constant at all loads. In a shunt wound machine a small portion of the current is shunted through the field winding. Shunt wound motors run at almost constant speed, with constant E. M. F. even though the load varies. Shunt wound generators are used for storage batteries, or any duty which requires a variation of E. M. F. Shunt wound motors are most suited for general work such as driving counter shafts, and constant speed machinery.

**COMPOUND.**—The field flux increases slightly with the load current. In a compound wound machine the field has two sets of windings, a shunt winding and a series winding. The shunt winding furnishes the initial field strength, while the series winding furnishes a varying field strength, increasing or decreasing with the load. This automatic variation of field excitation maintains a constant voltage if from a generator, and an automatic speed control if used as a motor on constantly varying loads requiring automatic torque variation. Mostly used for elevator service.

**INTERPOLE.**—The interpole motor or generator is sometimes known as "commutating pole type," because of its having an extra set of poles for the purpose of producing sparkless operation under extreme conditions of service. The field windings of the interpole machine are made series, shunt or compound. Highly recommended for all classes of service in preference to other types.

## Alternating Current Generators and Motors

**ALTERNATING CURRENT GENERATORS** are built in two types, known respectively as revolving field and revolving armature. The common names of the two sets of windings are rotor and stator. The revolving field type machine is the most commonly used type, because of the field current having only to pass through the brushes and collector rings and the high tension wires are all stationary. Alternating Current Generators are separately excited. That is, the field current is supplied from an auxiliary D. C. generator, known as an exciter. The current supplied from an A. C. Generator alternates in direction at regular intervals, and from this characteristic is derived the terms "frequency" or "cycles," which always has a numerical value which defines the period of the alternations. The most generally adopted systems operate at either 60 cycles, 7200 alternations, or 25 cycles, 3000 alternations, while there are some Central Stations which supply either 40 cycle, 50 cycle, or 133 cycle current. Alternating current is generated single, two or three phase, two and three phase systems being the most generally used, because of their being better adapted for the operation of large motors.

**ALTERNATING CURRENT MOTORS** are constructed single, two and three phase, and of many different types, and for all frequencies and synchronous speeds.

**SINGLE-PHASE MOTORS.**—Single-phase motors are built in several different types, viz.: Repulsion, Repulsion Induction, and Induction Types, and are for constant or variable speed service. The Repulsion Induction Type is the most generally used of all single-phase motors and furnished for constant and variable speed.

**POLYPHASE INDUCTION MOTORS.**—Polyphase Induction Motors are built in two types viz.: Squirrel Cage and Slip-Ring or Wire Wound Rotor Types. The Squirrel Cage Rotor Type motor has a nearly constant speed (starting torque high), and is the type most generally used for driving machinery. The Slip-ring motor is adapted for speed variation ranging from 50% to 100% and is also used for constant speed service. Both Squirrel Cage and Slip-ring type motors can be supplied for any frequency or voltage and for different speeds.

**STARTING TORQUE.**—The starting torque of a constant speed motor is twice full load torque on full voltage. In general, the torque varies as the square of the applied voltage. The reason for using a reduced E. M. F. at starting is to reduce the sudden shock which may throw off belts or cause mechanical injury, and to reduce the starting current. When 50% voltage is applied to the motor, half full load torque is given.

**SYNCHRONOUS MOTORS** are principally used for power factor correction and are also sometimes called "Synchronous Condensers," because they can be operated at a leading current to raise the power factor of an A. C. system. Synchronous motors for driving power are equipped with an extra starting winding, which will give from 30% to 50% full load torque, and will operate at a constant or synchronous speed with no slip. It is advisable to have one or more synchronous motors on all A. C. systems.

**STARTING OF SYNCHRONOUS MOTORS.**—The starting of synchronous motors differs from the starting of induction motors, due to the fact that they have a field which is supplied from an auxiliary, known as an exciter. Before starting the motor, first see that the field discharge switch is open from the field of the motor, but the motor field must be short circuited through the field discharge resistance. To stop the motor, first turn the rheostat back to the zero power factor position, then open the field switch and throw off the compensator, the switches and rheostat being in position for next starting. If a synchronous motor which has sufficient starting torque to meet the load conditions should fail to start when the current is thrown into the stator windings, it is probably due to the "standing" relation of the field to the stator windings, because of there being an equal number of stator to rotor coils, and should they both be in a central position to each other, the rotor will not have any starting torque. To remedy this move the rotor a slight distance in either direction, and the motor will then start.

**General Information on AC and DC Motors**

The relation of the horsepower (hp.), the volts (E), the amperes (I) and the efficiency in per cent (e) of the electric motor is expressed by the formula

$$hp. = \frac{EIe}{746}$$

This formula contains four quantities indicated by letters; if any three are known or can be assumed, the other one can be found. Efficiencies of industrial motors can be assumed at from 80% to 90%, depending upon the size.

For example, to determine the current required by a 10 hp., 220-volt motor of which the efficiency is unknown, assume 85% as an approximate value and apply the formula:

$$10 = \frac{220 \times I \times .85}{746}$$

$$\text{Therefore } I = \frac{10 \times 746}{220 \times .85} = 40 \text{ Approx.}$$

A rough approximation in determining the current required by direct-current motors is as follows:

- 8 amperes per hp. for 110-115-volt motors.
- 4 amperes per hp. for 220-230-volt motors.
- 1 3/4 amperes per hp. for 500-volt motors.

**HORSEPOWER.**—Is a measure of the time rate of doing work and is defined as the equivalent of raising 33,000 pounds one foot in one minute. 1 hp. is equivalent to 746 watts.

**TORQUE.**—Is the pull or turning moment required in applying power by rotation and varies inversely as the radius at which the power is applied. The torque T is expressed in pounds at one foot radius, sometimes called pound-feet.

**FULL LOAD TORQUE.**—Is the turning moment required to develop full rated output of a motor of given horsepower at a given speed.

The torque T of any motor at any output expressed in pounds at one foot radius can be found by means of the following formula:

$$T = \frac{5250 \times hp.}{rpm.}$$

Conversely if the torque in pounds at one foot radius is known, the horsepower at any given speed can be determined from the formula:

$$H.P. = \frac{T \times RPM.}{5250}$$

**STARTING TORQUE.**—Is the turning moment a motor will develop in starting when impressed with a given starting voltage. Starting torque is usually expressed in terms of full load torque, as 2 times full load torque, etc.

**PULLOUT TORQUE.**—Or maximum running torque, is the maximum turning moment a motor will develop under running conditions. The P.O. torque of a wound rotor induction motor may be 80% of the maximum starting torque, while the P.O. torque of a squirrel cage induction motor will exceed the maximum starting torque, in some cases by as much as 100%. P.O. torque is usually expressed in terms of full load torque.

**EFFICIENCY.**—Is the ratio of the useful "output" of a machine to its total "input."

**APPARENT POWER.**—In an alternating-current circuit is the product of the readings of the voltmeter and ammeter and is ordinarily expressed as kv-a. This value may be greater than the reading at the same time on the wattmeter.

True power in an alternating current circuit is the average value of the products of the coincident instantaneous values of the current and voltages for a complete cycle as indicated by the readings of a wattmeter and is ordinarily expressed in kw.

Power factor is the ratio of the true power (kw. or wattmeter reading) to the apparent power (kv-a. or product of voltmeter and ammeter readings). The ratio is usually expressed in per cent and cannot be greater than 100%.

**General Information on AC and DC Motors**

Continued

If true power is expressed in kilowatts (kw.) and apparent power as the product of kilovolts (1000 volts) and amperes or kv-a.

$$\text{Power factor (P. F.)} = \frac{kw.}{kv-a.}$$

For estimating purposes, power factors can be assumed as follows, except on long transmission lines; incandescent lighting load, no motors, 95%; lighting and motors, 85%; motors only, 80%.

**Measurement of Power.**—If W = watts, E = average volts between line terminals, I = average line current, and P. F. = power factor expressed as a decimal fraction, the following formula represent their relations:

- Single-phase  $W = EI \times P.F.$
- Two-phase  $W = 2EI \times P.F.$
- Three-phase  $W = 1.732 EI \times P.F.$

**Current.**—From the above formula the current can be found as follows:

$$\text{Single-phase } I = \frac{W}{E \times P.F.}$$

$$\text{Two-phase } I = \frac{W}{2E \times P.F.} = \frac{.5 W}{E \times P.F.}$$

$$\text{Three-phase } I = \frac{W}{1.732 E \times P.F.} = \frac{.578 W}{E \times P.F.}$$

**Effect of Changes of Voltage and Frequency**

The starting torque of an induction motor will vary as the square of the voltage applied to the primary: hence, the primary voltage required to produce a given starting torque can be determined by means of the formula:

$$V^1 = V \sqrt{\frac{T^1}{T}}$$

Where V<sup>1</sup> and T<sup>1</sup> signify required voltage and torque respectively, V, the full rated voltage, and T, the starting torque at full voltage. For example: if a squirrel cage induction motor is required to start with full load torque only, and if the starting torque at full voltage is 2.5 times full load torque (2.5 F.L.T.) the starting voltage should be:

$$V^1 = V \sqrt{\frac{1}{2.5}} = .63V; \text{ that is, the starting voltage should be 63\% of full voltage.}$$

The starting current of squirrel cage induction motors depends on the starting voltage applied and is independent of the torque required to start the load; the current falls almost immediately, however, to the value corresponding to the required torque and then decreases more gradually as the motor speed accelerates. From this, it follows that the starting voltage should not be greatly in excess of that required for the torque.

Wound rotor motors when started by means of resistance in the secondary circuits can usually be accelerated to full speed with full load torque with current little in excess of full load current.

A variation in either voltage or frequency not exceeding 10% is generally permissible with any induction motor. Such variations are always accompanied by changes from normal performance with either the voltage or the frequency differing from normal; the following performance change will be obtained:

Character of Change	Power Factor	Effect on		
		Torque	Slip	Efficiency
Voltage higher	Decreased	Increased	Decreased	Decreased
Voltage lower	Increased	Decreased	Increased	Increased
Frequency higher	Increased	Decreased	% slip unchanged	Increased
Frequency lower	Decreased	Increased	% slip unchanged	Decreased

The voltage and frequency should not be varied simultaneously in opposite directions, that is, one increased and the other decreased, if an induction motor must operate on frequency other than standard, the performance will be better if the voltage is changed in proportion to the square root of the frequency. For example: a 220-volt, 60 cycle motor, operating on 50 cycles, will have very nearly its normal performance

$$\text{if the voltage is decreased to } 220 \times \sqrt{\frac{50}{60}} = 200.$$

**Wiring Data for 3-Phase Motors**

Where two or more motors are installed on one circuit, wire used should be equivalent to that needed for running loads of all motors plus 50 per cent of running load of the largest motor on the circuit.

**Amperes in Alternating Current Circuits**

By Permission of the Electrical World

The following tables give the amperes per lead wire per kilowatt for single-phase and three-phase balanced loads. The single-phase table can be used for two-phase balanced loads by using a current value corresponding to twice the stated potential of the circuit or by dividing the current value at the potential of the circuit by two. That is, each wire of a two-phase circuit carries one half of the current indicated at the load specified. These tables show the value of the current at power factors varying from unity to 70 per cent. The power of any circuit in kilowatts can, therefore, be computed by dividing the reading of the ammeter by the tabulated value corresponding to the measured power factor and voltage of the circuit. These values are correct only for a balanced load (and there is generally a slight unbalancing of the loads on the phases), but the table is useful in computing the sizes of wire required for transmission purposes.

This table was derived from the following formulas:

For single-phase circuits: Amperes per wire = watts ÷ (volts × power factor).

For three-phase circuits: Amperes per wire = total watts ÷ (volts between wires × power factor × √3).

For two-phase circuits: Amperes per wire = total watts ÷ (volts between wires of one phase × power factor × 2).

In making the computations the number of watts was assumed as 1000, and the amperes were computed for various values of e.m.f. to a sufficient number of decimal places to insure accuracy. The tables were then extended by multiplication and division. If desired, these tables can be further extended to cover voltages outside of their limits by using the tabular values corresponding to potentials of one tenth (or 10 times) the desired potential, care being used to shift the decimal point in the proper direction.

The values for intermediate power factors can be approximated from the tables. For lower power factors, the value of the current for unity power factor can be divided by actual power factor of the circuit or multiplied by the reciprocal of this power factor.

**Single-phase Circuits**

## General Wiring Formula

For A.C. and D.C. Circuits

The following general formula may be used to determine the size of copper conductors, volts loss in lines, current per conductor, and of copper per circuit for any system of electrical distribution.

$$\text{Area of conductor, circular mils} = \frac{D \times W \times K}{P \times E^2}$$

$$\text{Volts loss in lines} = \frac{P \times E \times M}{100}$$

$$\text{Current in main conductors} = \frac{W \times T}{E}$$

$$\text{Pounds copper} = \frac{D \times W \times K \times A}{P \times E \times 1000000}$$

W = Total watts delivered.

D = Distance of transmission (1 way) in feet.

P = Loss in line in per cent of power delivered, that is, of W.

E = Voltage between main conductors at receiving or consumer's end of circuit.

For continuous current K = 2160, T = 1, M = 1, and A = 6.04.

System	Value of A	PER CENT POWER FACTOR				
		VALUE OF K				
		100	95	90	85	80
Single-Phase.....	6.04	2160	2400	2660	3000	3380
Two-Phase (4-Wire) ..	12.08	1080	1200	1330	1500	1690

The value of K for any particular power factor is obtained by dividing 2160, the value for continuous current, by the square of that power factor for single-phase, and by twice the square of that power factor for 3-wire 3-phase, or 4-wire 2-phase.

The value of M depends on the size of wire, frequency and power factor.

The figures given are for wires 18 inches apart and are sufficiently accurate for all practical purposes provided the displacement in phase between current and E. M. F. at the receiving end is not much greater than that at the generator. For example, the constants should not be applied at 125 cycles if the largest conductors are used and the loss 20 per cent or more of the power delivered. At lower frequencies, however, the constants are reasonably correct even under such extreme conditions. They represent about the true values at 10 per cent line loss, are close enough at all losses less than 10 per cent, and often, at least for frequencies up to 40 cycles, close enough for even much larger losses. Where the conductors of a circuit are nearer each other than 18 inches, the volts loss will be less than given by the formula, and if close together, as with multiple conductor cable, the loss will be only that due to resistance.

The value of T depends on the system and power factor. It is equal to 1 for continuous current and for single-phase current of 100 per cent power factor.

The value of A and the weights of the wires in the table are based on .00000302 pound as the weight of a foot of copper wire of 1 circular mil area.

In using the above formula and constants, it should be particularly observed that P stands for the per cent loss in the line of the delivered power, not for the per cent loss in the line of the power at the generator; and that E is the potential at the end of the line and not at the generator.

When the power factor cannot be more accurately determined, it may be assumed to be as follows for any alternating system operating under average conditions: Incandescent lighting and synchronous motors, 95 per cent; lighting and induction motors together, 85 per cent; induction motors alone, 80 per cent.

In continuous current 3-wire systems, the neutral wire for feeders should be made of 1/2 the section obtained by the formula for either of the outside wires. In both continuous and a.c. systems, the neutral conductor for secondary mains and house wiring should be taken as large as the other conductors. The 3 wires of a 3-phase circuit and the 4 wires of a 2-phase circuit should be made all the same size, and each conductor should be of the cross section given by the first formula.

## General Wiring Formula

For A.C. and D.C. Circuits

**Transformer Connections  
No. 1**

Three phase 3 wire "Closed Delta" primary to three phase 3 wire "Closed Delta" secondary.

**No. 2**

Three phase 3 wire "Open Delta" primary to three phase 3 wire "Open Delta" secondary. "Open Delta" connection, as shown, will deliver only 87 per cent of rated capacity and may cause line disturbances due to unbalancing. Only recommended in cases of emergency.

**No. 3**

Three phase 3 wire "Closed Delta" primary to 3 phase 4 wire "Star" secondary.

**No. 4**

Three phase 4 wire "Star" primary to three phase 4 wire "Star" secondary.

NOTE.—Connections shown are for 2300 volts primaries, with secondaries arranged for 20 to 1 ratio. To change secondaries for 230 volts or 10 to 1 ratio, connect X2 and X3 together (in series) in each transformer, first disconnecting X2 and X3 from X1 and X4.

**Transformer Connections  
Continued  
No. 5**

Single-phase 2-wire primary to single-phase 3-wire and also 3-wire secondary.

See note.

Two-phase 4-wire primary to two-phase 4-wire secondary. Connect transformers, one on each phase as per diagram Fig. 5. See note.

**No. 6**

Three-phase 4-wire "Star" primary to three phase 3-wire "Closed Delta" secondary.

See note.

**No. 7**

Diagram showing connections of Pittsburgh method of transformation, three-phase 3-wire to two-phase 4-wire and three-phase 3-wire. Transformers are here connected in "Closed Delta," using three single-phase units.

**No. 8**

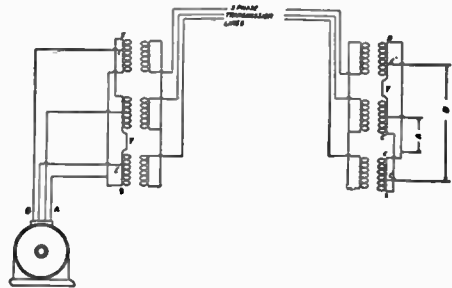

Diagram showing connections of Pittsburgh method of transformation, three-phase 3-wire to two-phase 4-wire. Transformers are here connected in "Star," using three single-phase units.

**Transformer Capacity for Motors**

In selecting proper size transformers for motors for either 1, 2 or three-phase 1-KVA transformer capacity should be allowed for each motor horse power.

NOTE.—Connections shown are for 2200 volts primaries, with secondaries arranged for 20 to 1 ratio. To change secondaries for 220 volts or 10 to 1 ratio, connect 2 and 3 together (in series) in each transformer, first disconnecting 2 and 3 from 1 and 4. To change primaries from 2200 volts line as shown to 1100 volts line, disconnect B and C. and connect B to A and C to D in each transformer.
