- WITHSTANDS HIGH TEMPERATURE DUE TO ITS THERMOSETTING NATURE.
- HAS OUTSTANDING ELECTRICAL PROPERTIES.
- HAS LOW SPECIFIC GRAVITY—IS STRONG AND RIGID WITH UNUSUALLY HIGH COMPRESSIVE AND TENSILE STRENGTHS.
- HAS EXCELLENT IMPACT STRENGTH AND HARDNESS, ALLOWING ITS USE UNDER HIGHLY ABUSIVE CONDITIONS.
- ITS DIMENSIONAL STABILITY AND UNUSUAL CHEMICAL INERTNESS ALLOW ITS USE WHERE OTHER MATERIALS FAIL.
- READILY MACHINABLE TO EXTREMELY CLOSE TOLERANCES.
- AVAILABLE AS CENTERLESS GROUND RODS IN ANY DIAMETER UP TO 1". ALSO AVAILABLE IN LARGER DIAMETER RODS AND SHEETS.

#### HEAT RESISTANCE

Heat Distortion (ASTM-D648-41T) 105-113°C.

Rexolite #1422 has been specifically formulated to resist high temperature. Having a heat distortion temperature a full 30°C above Polystyrene, it will withstand very high temperatures for short times, and permits the use of high-frequency induction heating for connector assembling. Under load-free conditions Rexolite #1422 maintains its original shape up to temperatures of 200°C (392°F). Even in this range it does not flow but merely becomes flexible, and upon cooling it regains its former rigidity without any dimensional changes. By loading at these high temperatures, Rexolite #1422 will distort and maintain this change if cooled while still under the distorting force. If the load is removed and the part is heated again to its softening point, the distortion vanishes and the piece regains its original form. Rexolite #1422 does not exhibit cold flow.

High frequency insulators and connector beads made from Rexolite #1422 will thus maintain their shape under light load up to 200°C (392°F) and when fully loaded they surpass the highest operating temperatures recommended for RG type coaxial cables.

#### ELECTRICAL PROPERTIES

Dielectric Constant—at 3000 MC 2.4 - 2.5  
Power Factor—at 3000 MC 0.0006 - .0009

The low dielectric constant and power factor exhibited by Rexolite #1422 at ultra-high frequencies—plus its high heat resistance—recommend the use of Rexolite #1422 for UG connector beads, UHF antenna and oscillator coils, stand-off insulators, feeder spreaders, supports for air-wound coils, terminal strips and rigid coaxial spacers.

#### PHYSICAL PROPERTIES

Specific Gravity 1.045 - 1.050

The low specific gravity of Rexolite #1422 permits a greater number of insulator parts to be fabricated per pound of material than is possible with a plastic of higher density. This advantage is reflected in lower cost per finished unit through the use of Rexolite #1422.

Tensile Strength—p.s.i. 8,000 - 10,000  
Flexural Strength—p.s.i.—(ASTM-D638-42T) 15,000 - 18,000  
Modulus of Elasticity in Flexure—p.s.i. 2.9 - 3.3 x 10<sup>6</sup>  
Compressive strength—p.s.i.—  
(ASTM-D649-42T) 18,500 - 19,000  
Impact Strength Izod—ft. lbs. per inch of  
notch (ASTM-D256-43T) 0.25 - .35  
Rockwell Hardness—H scale 68 - 72

The above data indicates that Rexolite #1422 is a strong and rigid material with high tensile and good impact strengths. This makes Rexolite #1422 especially favored for certain applications where the finished article must be able to withstand considerable strains and abuse under severe service conditions.

Coefficient of Linear Thermal Expansion—  
cm./cm./°C. (ASTM-D696-42T) 5.9 - 7.0 x 10<sup>-5</sup>  
Thermal Conductivity—cal./sec./sq. cm./°C./cm. 0.00025

Rexolite #1422 displays extremely low coefficients of thermal expansion. In applications where this plastic is used for high frequency insulation, compensations for dimensional changes with temperature are reduced to a minimum. In the engineering of UG type connectors, for example, closer fits of the beads within the connector are thus possible with minimum allowances for thermal contraction and expansion of the insulators. With proper designing, Rexolite #1422 assures no migration or distortion of the contact points in the temperature range under which the connector must operate.

# POLYSTYRENE ROD — TUBING — SHEET

For radio and electronic applications, because of its very low loss factor at ultra high frequencies, Polystyrene is the ideal material for insulators, coil forms, shields, etc. It has excellent arc resistance, is non-tracking and has splendid insulating properties. Because its water absorption is practically zero it has excellent dimensional stability.

Low-cost, satisfactory, adjustable Steel Antennas for commercial, municipal, amateur, civil defense and other installations are made of high-tensile, copper-nickel steel tubing, heavily cadmium-plated and highly resistant to corrosion. They are fully telescoping and adjustable to any height by means of a positive locking device that also provides efficient electrical contact between the sections. We recommend the guying of all vertical antennas or supporting them by stand-off insulators against abnormal winds or severe strains. Steel antennas NOT recommended for marine use on salt water.

(For Base Insulators and Mountings, See Page S-65)

## PREMAX STAINLESS STEEL AUTO-MANIC MARINE ANTENNA

A Marine Antenna that can be raised or lowered with one hand when passing under bridges or other obstructions. It's the Premax "Auto-Manic" which has a locking device on each of its telescoping sections which allows free movement when the sliding sections are raised inches at a time with one hand, and locks them securely at any point when reverse pressure is applied. At full extension of each section, a positive locking action occurs which is proof against severe strains and vibrations. To lower the antenna, the touch of a finger raises a special ring on the base section, which releases the lower lock and the entire antenna, section by section, telescopes to its minimum 6 to 7-foot collapsed length. This "Auto-Manic" Antenna is made up of 3 to 5 sections of a special grade of stainless steel tubing, hard-drawn to an extremely high tensile and yield strength. Standard Premax Mountings and Insulators will fit these antennas. "Auto-Manic" Stainless Steel Antennas are currently available only for military use.

### SPECIFICATIONS

A Center-Loaded Collapsible Type Antenna for marine use which provides a remarkable gain over the signal produced by a straight vertical where the loading coil is housed in the transmitter cabinet. At the high-frequency end of its 2 to 3 meg. range it gives a measured effective signal power gain of 6 db., equivalent to quadrupling transmitter power output. The base presents such a low impedance that little loss is experienced due to icing, wet weather or water spray. The line feeding the base is a low impedance line and is not critical as to length and body-capacity effects.

The Antenna consists of two telescoping adjustable base sections of seamless aluminum, monel or stainless steel tubing on which the loading coil is mounted, with a top whip section, giving a total extended length of about 17 ft. The antenna collapses to a single unit with the whip section telescoping through the coil into the lower section, making a collapsed length of 7 ft. The coil is wound on low-loss bakelite tubing and treated after assembly with weatherproof varnish. Monel and stainless steel types are currently available only for military use.

## SERIES B LOW-COST CENTER-LOADED ANTENNAS

To meet the need for low-cost center loaded antennas which are now a "must" for mobile and marine communications between 2 and 8 mc., Premax has developed an outstanding series of Antennas that have won wide acclaim. They consist of a 6 ft. tapered whip of hi-carbon heat-treated steel mounted above a loading coil and a special base rod 24" long, with couplings to fit any standard Premax Mobile Mounting, making a 9½ ft. overall height. The coil is wound on a treated wood form, then weather-proofed with low-loss insulation varnish. With these Premax Center Loaded Antennas a gain of 8 db. or more can be secured over conventional whip types, equivalent to multiplying the power by 6.3 times—a most inexpensive way of extending both transmitting and receiving range. In cases where it is impossible to use the 9½ ft. height, the 24" base section may be omitted, which reduces the effective gain to about 6 db., still equal to quadrupling the power over a straight vertical antenna.

## SERIES B MARINE ANTENNA

The Series B Marine Antenna for 2000 to 3000 ky., as described above, comes complete with either the XL or V Type mounting, or you can, at a small additional cost, include the Spring Mounting which is very effective in counteracting pitching or shock. Stainless Steel Whip and Base Section.

The basic 75 meter Antenna covers the entire mobile phone band. It may also be used for multi-band amateur operation by shorting out turns (approximately 75% on 14 Mc.) or by completely jumpering out the coil to make an efficient quarter-wave antenna on 10 meters. Can be used with any standard Premax Mounting shown on page S-65. Also available for the 2374 Ky. C.A.P. band and the 3105 Ky. Airport band. Coils for other frequencies on special order.

## PREMAX ROTARY BEAM KIT—6, 10 AND 11 METERS

A Rotary Beam Kit with braced frame of heavy-duty aluminum angle and solid bakelite insulation blocks that will not crack or snap under vibration and shock make this 20-pound Beam for 6, 10 and 11 meters popular with amateurs. Each telescoping element can be tightly clamped to provide positive adjustment. Parasitic elements may be left open at the center with tuning hairpins inserted or may be used as six elements on 6 meters. The RB-6309 Kit includes frame and three pairs of elements with necessary insulators and hardware, including T-match accessories but without transmission line. Complete in a single carton with assembly instructions.

### WALSCO TELEVISION ANTENNAS

Exclusive advantages available in WALSCO Antennas assures outstanding performance in any climate . . . anywhere. All WALSCO antennas are unconditionally guaranteed for one full year. WALSCO originated the high tensile butt-seamed tubing in order to provide greater flexibility. It will not bend or break under adverse weather conditions. As a result of the exclusive U-bolt design, using hardened, serrated steel clamps, turning or slipping of the antenna on the mast is positively prevented. Antenna elements are made of special chromium - magnesium - aluminum alloy which has a 94% higher tensile strength than regular aluminum generally used for antennas. Special fold-over terminals with built-in strain relief are supplied with all WALSCO antennas and stacking bars. Stacking Kits are precision engineered for each antenna model and are formed to provide for an exact match to the transmission line. This guarantees maximum performance on stacked arrays.

## TELEVISION ANTENNAS

**COMPLETELY NEW DESIGN — BUILT TO LAST**  
**RCA 12-CHANNEL TELEVISION ANTENNA —**  
**TYPE 215A1**

**BASED UPON YEARS OF FIELD EXPERIENCE**  
 • Easily Assembled • Ruggedly Constructed • Uni-Directional

Here's an RCA "Leader" to meet the majority of your everyday antenna needs. Engineered and developed by RCA for plus-value service, RCA-215A1 is intended for use in most receiver locations where both high and low-frequency stations are in the same general direction. Unique RCA "V" attachments provide uniform directional characteristics for all 12 channels.

RCA-215A1 12-Channel Television Antenna is simple in design and appearance. Sturdily built of aluminum, it will withstand high winds, sleet, and ice. Designed for use with 300-ohm transmission line, the 215A1 rates "A" for antenna achievement: — for over-all performance and unusually flat response over each of the two television bands.

Supplied with all necessary hardware but less mast. Completely illustrated instructions for installation are included.

### THE RCA REVERSIBLE-BEAM TV ANTENNA ARRAY — TYPE 212A1

**For Locations with Co-channel Interference**

The RCA Reversible-Beam TV Antenna Array receives signals from only one direction at a time; eliminates co-channel interference where stations are approximately 180° apart. It also eliminates adjacent-channel interference where the receiver lacks selectivity. RCA-developed "V" attachments provide uniform directional characteristics for all twelve channels. A high overall front-to-back ratio is achieved through the use of driven elements, instead of parasitic elements. This design also makes possible the unique feature of lobe switching.

Sturdily built throughout of high-quality aluminum, the RCA Reversible-Beam Antenna consists of an array of four eight-foot dipoles in the form of a square. A dual transmission line connects the horizontal and vertical dipoles to an attractively packaged diplexing network located at the rear of the receiver. By the mere flick of a switch on the diplexer, antenna directivity can be reversed.

### RCA FM FOLDED-DIPOLE ANTENNA AND REFLECTOR

Engineered by RCA for use with FM receivers having a 300-ohm input, the RCA 229A1 has an unusually flat signal response providing efficient coverage of the entire FM band from 88 Mc to 108 Mc. Excellent for use in fringe area installations, the 229A1 has high uni-directional gain—maximum interference rejection in opposite direction—requires no adjustment of elements, and is easily oriented for maximum signal. Constructed of lightweight aluminum elements for greater durability . . . easy to install, no special tools needed. Complete with all hardware.

## TECHNICAL NOTES

Telrex "Conical-V-Beams" technically and practically assume characteristics similar to solid cones, giving broad band and high gain response with full audio and video band pass over the entire television frequency range. Therefore, "Conical-V-Beams" outperform any other television antenna.

Nominal center impedance is 150 ohms and non-varying due to conical configuration. The dipoles are tilted forward presenting a "V" to the incoming wave, forcing the forward lobe to remain in line irrespective of channel being received. Thus the Telrex dipole is an effective 1/2 wave element on channel 2, increasing to 3/4 wavelength on channel 3, and increasing in effective "V" beam action to channel 13 where it becomes a full wavelength on each leg with the maximum receiving lobe being in line. The reflectors are effective at all frequencies with a front to back ratio of better than 12 DB on all frequencies. The "Conical-V-Beam" is the only antenna which can produce in this manner.

Unlike other methods of covering both bands, Telrex "Conical-V-Beams" do not introduce phase shift or favor one band versus the other, and, only one transmission line is used. Where stations are displaced beyond the normal acceptance lobe of a single "Conical-V-Beam" or array, the DO-X (Duo Orienting) array is recommended. This permits separate orientation of two groups of stations at any angle. Only one transmission line is needed due to the unique Telrex coupling line and phasing loop.

When the stations are within a 5 to 15 degree sector, the Telrex "Conical-V-Beam" used for maximum efficiency at low frequencies becomes a much more efficient antenna on the high frequencies than a separate cut-to-frequency stacked antenna.

The 150 ohm non-varying center impedance makes it possible to use any of the commercially available transmission lines from 75 ohm coaxial, to 300 ohm ribbon, with a standing wave ratio never exceeding 1.6 to 1 on any channel. Standing waves cause excessive phase-shift, blurred pictures, multiple images and decreased sensitivity.

**An 8X-TV "Conical-V-Beam" will outperform any cut-to-frequency antenna on the market.**

You are invited to consult our engineering staff on any unusual antenna problems.

### UHF RECEIVING ANTENNAS

TACO has a complete lines of UHF antennas ready for the trade. These antennas have been thoroughly tested and proved under actual operating conditions.

As in the case of VHF, TACO will present antennas designed to meet the varying conditions of different areas where UHF will be operating, as to gain, directivity, and bandwidth. A complete, fully detailed description of UHF antennas will be available shortly through TACO distributors.

TACO enters the UHF field with a definite advantage over other antenna equipment manufacturers. During World War II and again in the present rearming program, TACO has played an important role in the development and manufacture of UHF equipment for our armed forces. This experience in the reception and handling of UHF is clearly shown in the performance of the present commercial TACO UHF antennas.

## ANTENNA SUPERCHARGER

The TACO Antenna Supercharger has proved itself the most successful television signal preamplifier on the market. It is unique in that it is a high-gain, dependable power amplifier located on the antenna mast, at the antenna. As such, it amplifies the signal before it is

weakened through line-loss, and before noise pickup in the transmission line. This results in a much higher signal-to-noise ratio than is possible with old-fashioned boosters located at the receiver.

Through sharp frequency tuning, signals outside the desired frequency are rejected, and a gain of 14 db is realized. When used with a TACO Twin-Driven "Silver Streak" Yagi, the overall gain is in the order of 28 db.

Special emphasis has been placed upon dependability so necessary in fringe area installations where the antenna and amplifier are located on a high mast or tower.

The amplifier unit is powered by means of a transformer, located at the receiver, that provides 24 volts through the transmission line up to the amplifier. The same transmission line is used to carry the signal down to the power unit. From the power unit, the signal is fed into the receiver antenna terminals. The receiver power cord is plugged into the power unit for operation of the automatic relay switch. This provides automatic operation when the receiver is turned on.

This type of signal amplification is very necessary with today's receivers incorporating the cascode-type front-end. Signals amplified through boosters located at the receiver have a far greater noise level than the front-end itself, thus defeating the purpose of this high-gain receiver design.

The Antenna Supercharger comes tuned for any one of the low-band or high-band channels or for the combined channel 4 and 5 setup. They are recommended for use with any high-gain, sharply tuned antenna such as the TACO Twin-Driven Yagi, the Silver Streak antenna or the TACO Yagis listed in the general catalog.

# MASTER TV ANTENNA SYSTEMS

## SERIES 1500 TACOPLEX

The Series 1500 Master TV Antenna Distribution System is in wide use for apartments, hotels, stores and community antenna systems. All units making up the system are designed and manufactured to provide the utmost in dependable and economical operation.

The Series 1500 TACOPLEX System consists of the antenna installation, the Master Chassis with Amplifier Strips, Mixer Unit, Electronic Multi-Line Units, and Isolation Units. Detailed information on all units and their functions is available from your TACOPLEX distributor.

The signal is captured by sharply-tuned, high-gain antennas for each channel. If signal strength is not up to the desired 500 microvolt strength, a TACO Antenna Supercharger is employed at the antenna to boost the signal. The signal is then transmitted to the Master Chassis and through an Amplifier Strip. The TACOPLEX Amplifier Strips are available in two types — one incorporating three tubes and the other four tubes. Depending upon the requirements of the individual system, the correct type is selected. After amplification in the Amplifier Strips, the individual channels are mixed by means of the Mixer Unit.

The TACOPLEX Mixer Units are available for various system requirements. It is possible to provide isolation for several receivers directly from the Mixer outputs. Other models provide high-strength outputs for long transmission line runs.

After combining the channels in the Mixer, the TACOPLEX System utilizes coaxial transmission line for distribution of the signals. If runs are in excess of 2500 feet, it is necessary to reamplify the signals. This is done by means of additional TACOPLEX Master Chassis and Amplifier Strips. The signal is fed through a TACOPLEX Signal Separator and then into the respective Amplifier Strips. Again the signal is mixed by means of a TACOPLEX Mixer Unit and fed into the transmission line.

TACOPLEX Multi-Line Units provide a means of splitting the transmission lines into several separate lines with minimum loss of energy. Isolation Units of selective attenuation are available for use at receiver take-offs. These units provide a minimum of 30 db isolation between receivers. TACOPLEX Termination Units provide a constant level of signal throughout the system.

## SERIES 2500 TACOPLEX

Designed for master antenna systems requiring more RF power than provided in the 1500 Series. The TACOPLEX 2500 Series Master Antenna Distribution System provides several times more power than any other master antenna system ever offered. The output is 6 volts, peak-to-peak, as compared to 1 volt, or less, provided by most systems. This power has been found necessary not only in systems where long runs of transmission line are used, but also in areas of high signal strength. In strong signal areas it has been found that ghosts are caused by the pick-up of signals through the transmission line at the receiver, or in some cases within the receiver. The super power of this system overcomes this signal, and thus eliminates the ghosting effect.

The Series 2500 represents the culmination of several years of research and engineering. In operation principle, it is similar to the 1500 Series, but incorporates Mixer Units as integrated parts of the Master Chassis. Amplifier Strips are of greater gain, utilizing four tubes in low-band and five tubes in high-band.

Other advanced features include superior rectification by means of tubes in place of selenium rectifiers, and test jack points for fast, easy checking. Automatic attenuation provides positive control of overloading in the amplifier strips.

The Series 2500 provides a far higher signal level throughout than any master antenna system previously available. It is recommended for apartments, stores and community systems where the finest performance is desired. Complete specifications and details are available from your TACOPLEX distributor in the form of engineering bulletins and a fully illustrated catalog.

In addition to the higher output, the Series 2500 TACOPLEX System also incorporates several new type transmission line splitters of exceptionally low loss.

In selecting any master antenna system, one important point must be remembered. The signal captured by the antenna must be sufficient to provide a good picture. The function of the system is to maintain as nearly as possible this same quality signal throughout the entire system. The last receiver should have as good a picture as the one nearest the antenna location. TACOPLEX systems meet this requirement.

## Series 75 Microphone Connectors—Single Contact

Fit almost every microphone. Standard with leading manufacturers for many years. Compact, rugged, neat. Chassis receptacles are integral parts of microphones using single conductor cable. Widely used in amplifiers, transmitters, phonoelectric devices, home recorders and similar equipment. They are also suitable for connecting various units such as PM speakers, headphones, and for theft alarms or wall type coin operated devices, etc.

In the 75 Series, plugs mate with all cable jacks and receptacles. Circuit closing contacts are the same except that they close the circuit when plug is disengaged, eliminating open circuit grid howls.

Locknut Receptacles mount in .385" holes when grounding to chassis and 1/2" holes for ungrounded 2 circuit applications.

## Series 91 Microphone Connectors—3 and 4 Contacts

Extensively used on all types of portable apparatus, these connectors were designed primarily to use with microphones. Some of the advantages of Amphenol Microphone Connectors . . .

- Accidental disconnections are eliminated by a positive screw-type connection.
- Incorrect insertions are impossible because connectors are polarized.

- Pulling and twisting strain on soldered contacts is eliminated because a squeeze-type clamp grips cable securely after assembly.

Chassis receptacles mount in 27/32" chassis holes. Maximum chassis thickness for chassis receptacle is 1/8".

### Amphenol Coax and Twinax RG Cables

Amphenol Coaxial and Twinax RG Cables are produced to standards surpassing military specifications for electrical performance and mechanical excellence. Conductors are centered 20% closer for Coax and 50% closer for Twinax Cables than required by "AN" specifications.

Most cables utilize the exceptional dielectric properties of polyethylene—low loss, flexibility, mechanical stability. The outer jacket in the majority of approved types is a tough, highly resistant vinyl jacket which is non-hygroscopic and impervious to most acids, alkalis, oils and gasoline. Other types are armored for still greater mechanical protection.

Amphenol has cables that are designed to operate efficiently at temperatures as high as 500° Fahrenheit. Teflon is used as the dielectric because of its low loss, high voltage breakdown and its ability to withstand heat.

# THE NEW AMPHENOL "AUTO-DIAL" ROTATOR

## MODEL No. 509

Designed to rotate in one direction only, the Ampheno "Auto-Dial" TV Antenna Rotator utilizes a single directional motor, permitting greater power and higher torque than usually available in reversible motors. The antenna rotates rapidly—only 22 seconds required for a complete revolution. Positive braking action prevents coasting or backlash.

The "Auto-Dial" permits axis or "in-line" mounting of antenna and supporting mast, allowing equal weight distribution on the steel bearings and gears of the rotator. There are no fiber or laminated gears to fail—all gears are steel.

The attractive control unit houses the relay, automatic step gears with nylon insulation, contact breakers, and sturdy transformer that reduces 115 volt A.C. to 24 volt A.C. required by the rotator motor.

The new "Auto-Dial" Rotator for the first time permits accurate antenna field strength measurements because it can always be brought back to exactly the same direction. This is possible because rotation is in steps of 6 degrees, accurately calibrated on the direction indicator. With "Auto-Dial," servicemen are now able to determine whether the antenna is functioning properly, has the best front-to-back ratio and if it is located properly for the best possible picture.

Operating the rotator is as simple as ABC. (A) Turn switch under dial to "On" position; (B) if necessary, refer to log card for dial number indicating desired antenna direction; (C) turn knob until pointer lies over proper number. Then, automatically, the inside knob, which rotates in synchronism with the antenna and which has an arrow—turns to line up with the pointer. This indicates that the antenna is rotating. When the desired direction is reached, rotation stops automatically.

# Vector **PLUG-IN UNITS**

## FOR UNITIZED CIRCUITS

Amplifiers, counters, oscillators and the like can be readily assembled completely on Plug-Ins, permitting quick changes of circuits. Making a Plug-In unit involves little more than soldering in a few capacitors and resistors.

### ECONOMICAL AND CONVENIENT

Plugs are standard mica-filled, ring mounted octal style with 8 prongs as standard. (9 or 11 prong plugs also available—see below). Sockets are standard mica-filled phenolic in octal, 7 Pin miniature or 9 Pin noval as ordered. Contacts are cadmium plated brass. Terminal turrets are Grade XXXP phenolic tubing 1/2" O.D. with 1/16" wall, carrying 12 plated brass terminals. Aluminum covers may be quickly detached by removing screws at base, making inside completely accessible. Miniature and noval types carry military type tube shield base. Main tube shield not furnished. Types in bold face are most widely used and generally preferred for distributor stock.

## “500” SERIES PLUGS AND SOCKETS

For Complete Listing of 500 SERIES, Write for No. 500 Catalog

Designed for 5,000 volts and 25 amperes per contact. Circuit characteristics, however, may alter this rating one way or the other.

Long leakage path from terminal to terminal, and terminal to ground. Contacts are brass and phosphor bronze, silver plated. Metal parts of caps and brackets are steel, parkerized (rust-proofed). Plug and socket blocks are interchangeable in caps and brackets.

All sizes are polarized in a manner to prevent a smaller plug being inserted in a larger socket. Thus different sizes may be used on one installation without danger of making wrong connections.

Extreme care has been taken to make terminal connections under cap very accessible both for original wiring and subsequent inspection. The cap is insulated with canvas bakelite. Plug prong cross section  $\frac{5}{16}$ " x  $\frac{3}{32}$ ".

**IMPORTANT:** For safety with high voltages DEEP BRACKETS should always be used on one plug or socket, when the other plug or socket has a CAP. SHALLOW BRACKETS are for use only in connecting two units, each unit having plug or socket with SHALLOW BRACKET.

Cable entrance: Because of the great variation in type and size of cables, we have considered it best not to supply cable clamps of any kind. The cap end is made to accommodate standard BX clamps which may be obtained at any electrical jobbing house. The cap end will be furnished with round hole from  $\frac{1}{2}$ " diameter and  $\frac{1}{4}$ " diameter in steps of  $\frac{1}{8}$ ", if the size required is given on order. If no size is given, plain cap end with center punch locating center will be shipped.

### LOCKS FOR 500 SERIES PLUGS AND SOCKETS

Locks shown above are used in connection with any DEEP BRACKET and cap combination.

The locks securely hold the units together, but they can be released instantly.

The mounting plates are made to fit all DEEP BRACKETS, and are fastened by the same screws or rivets that hold the deep brackets to the panel. Can not be used on shallow brackets. Sold in pairs only.

## 1400 SERIES PLUGS AND SOCKETS

This series of "disconnect" plugs and sockets has the distinct advantage of low cost for a separate unit handling many circuits. Due to exposed metal parts, it is recommended for use when the complete unit is within a housing. Reduces costs of servicing units. Advantageous in shipping when it is desirable to pack units separately. Polarized—assures

correct coupling. Spring temper brass sockets assure perfect contact. Standard units are listed below from 5 to 16 contacts. However we can supply units having as many as 30 or more contacts.

On No. 1420 or larger we recommend the plug be divided into two or more units, as a single long plug is not mechanically strong. The socket will be made in one assembly.

For units with more than 16 contacts, add 7c to the No. 1416 price for each additional contact.

## BARRIER TYPE TERMINAL STRIPS

Increased insulation is provided by having Barriers placed between each Terminal. These Barriers follow around the edge of the Strips and terminate at the base. They not only make a long leakage path but prevent direct shorts from frayed wires at the terminals. Mounting holes are at the ends as illustrated. The base is molded Bakelite.

The Terminals and Binder Screws are of brass, nickel plated. Marker Strips may be ordered and imprinted to supply terminal designations. These Marker Strips mount beneath Terminal Strips and also afford insulation from metal mounting surface. See page 21 for imprinting charges. See pages 24 and 25 for dimensions.

**JONES FANNING STRIP wired and in position on Jones No. 141 Barrier Strip**

Jones Fanning Strip Terminals are of .032" Brass, Cadmium Plated. The Bakelite strips are furnished with a hole in either the right or left end for fastening the cable with a cable clamp or lacing twine. Simplifies cable or harness wiring, assuring positive connections. Makes replacement of units an easy matter and assures correct connections after servicing.

In many instances where there is not sufficient room for the standard Fanning Strips we can supply those listed formed for right angle mounting permitting use when Barrier mounts flush with the side of the chassis. Specify Series 160A, 161A and 162A instead of 160, 161 and 162. Prices slightly higher.

## ELECTRIC SOLDERING IRONS

These electric soldering irons embody features of design and construction that specialized experience dating from 1894 in the exclusive manufacture of electric heating appliances has demonstrated to be desirable for efficient and lasting service. Hundreds of thousands are in use throughout the world in a wide variety of manufacturing plants; in service, maintenance and repair shops and in telephone, telegraph, radio and TV stations. Because of their proven dependability, durability and efficiency they are preferred by those who measure the value of a tool or mechanical device by the service rendered.

No. 3128—For servicing TV, electronic and radio equipment and similar light work.

No. 3138—For TV, electronic and radio production; also for telephone, telegraph and similar work.

No. 3158—For the same purposes as the No. 3138 but for work requiring an iron of greater capacity.

No. 3178—For use on still heavier work than that for which the Nos. 3138 and 3158 irons are adapted.

No. 3198—For use on very heavy soldering operations of all kinds.

Made in standard voltages and for 32 volts. No. 3138 also made for 6, 12, 24 and 55 volts. All sizes can be equipped with 3-conductor cord, one wire grounded, at slight additional charge. Separate heat-insulating stand supplied with each iron.

### TERMINAL CONDUCTOR ASSEMBLY

This illustration shows the Terminal Connector Assembly used in all American Beauty electric soldering irons. It is designed for use with either 2- or 3-conductor standard heater cord or rubber-covered cord—Types SJ, HSJ, etc.

This assembly permits easy grounding for safety by a third conductor—particularly desirable when irons are used on 220-volt circuits or on metal benches accommodating groups of operators.

The cord is held firmly in place by a strain-clamp.

## American Beauty COPPER TIPS

American Beauty Copper Tips are made from commercially pure, drawn bar copper rod and are heavily nicked to resist corrosion and oxidation. Standard shaped tips with which various models are equipped are shown in illustration but pyramidal, instead of chisel type, and vice versa can be supplied when so specified without additional charge. For No. 3138 a special long, semi-chisel shaped tip (No. 3738-S) can be supplied for telephone, switchboard, television and radio work.

# MIDGET SOLDERING IRONS

FOR MANUFACTURING AND SERVICE  
OF RADIO AND ELECTRONIC EQUIPMENT

## APPLICATION

This 8-inch, 1 3/4-ounce featherweight iron for close-quarter soldering with pin-point precision is used where conventional irons might cause damage . . . be clumsy to handle . . . be more expensive to operate. The Midget literally goes places with greater efficiency and less power . . . with no sacrifice in heat or speed. With its fingertip operation, this iron will help make an expert out of any solderer in a short time.

The Midget has Ironclad copper tips either 1/8- or 3/16-inch diameter, as desired.

## FOR FASTER SOLDERING... LONGER IRON LIFE

MAINTAINS DESIRED IRON TEMPERATURE BETWEEN JOBS • PREVENTS OVERHEATING  
SAVES ELECTRIC CURRENT • ADJUSTABLE TO ANY SIZE IRON  
SAVES TIME • NO LONG WARM-UP PERIOD

A practical, time and money saving device which accurately regulates and maintains soldering iron temperature between jobs. Lengthens iron life by reducing tip oxidation and amalgamation of tip with solder which increases with over-heating.

When placed on stand, iron rests in a copper cradle which conducts heat of iron and actuates a bimetal to open or close a switch. Temperature is easily regulated by an adjusting slide at bottom of stand. As iron is removed from stand, full current is instantly supplied. Stem rest adjustable to accommodate various lengths of irons. Stand is a heavy gray iron casting—stays firmly fixed without being fastened.

Now—Ungar Elkaloy Tiplets make the famed Ungar Soldering Pencil 3 times more efficient. They save (1) Time (2) Money (3) Strategic Copper. Made of Elkaloy "A" for perfect tinning, stepped-up heat conductivity, and extra resistance to pitting and corrosion, each of the three tips threads into either of the heating units. In turn the heating unit fits the famed light-as-a-feather Ungar Handle. YOU CONTINUE TO USE THE HEATING ELEMENT WITH TIP AFTER TIP!

## UNGAR ELKALOY TIPLETs SCORE THESE ADVANTAGES:

**CONSERVES STRATEGIC MATERIALS.** By substituting Elkaloy "A" for the tips, and iron for the heating units, we have helped solve the copper problem — and can assure you immediate delivery of heating units and Elkaloy Tiplets IN ANY QUANTITY. (Note: Nos. 537S, and 537C and 538 Tips have been discontinued until further notice.)

**SAVES YOU MONEY** because you no longer discard the heating unit when the tip has worn down. Long-lived heating units can be used over and over again.

**EASIER TINNING.** Elkaloy "A" requires no special tinning procedure. Does not oxidize as rapidly as copper. No flux or paste ever required. Eliminates unnecessary and costly maintenance.

**EXCELLENT HEAT CONDUCTIVITY.** Elkaloy "A" absorbs heat from heating unit — delivers it directly to point of contact.

**INTERCHANGE TIPS EASILY AND QUICKLY.** When Elkaloy Tiptet is worn down, simply unthread used tip with pliers and screw in new tip. Difference in coefficient of expansion assures maximum heat conductivity — eliminates corrosion and gumming.

**PETITE**  
SOLDERING IRON

**in the home...**

*It's convenient.* Because it cools as fast as it heats, you can put it in a kitchen drawer the minute you finish the job. It is always on hand for that quick repair job on a lamp, on jewelry, on utensils.

*It eliminates fire hazards.* You don't need a special rack to hold the iron while your hands are busy. Only the tip is hot, and the plastic handle keeps the tip from burning anything if you place the iron on carpet or table top.

*It saves time.* You don't need to wait ten or fifteen minutes for the iron to warm up for a job. Five seconds after you pick it up your Quick-Heat is ready to work.

**in the shop...**

*It's a money-maker.* Your service man can take his Quick-Heat with him on the job, plug it in anywhere, and get to work on radio or electrical appliance immediately . . . without danger of damage to a customer's furniture or carpets.

*It speeds the work.* A special model for shop use contains a stand-by heating arrangement . . . a resistor cord that maintains partial heat between jobs. As soon as you press the trigger, the tip is at working heat level. For all-day use in a shop, the Quick-Heat offers the user instant service the very second he wants it.

**in the factory**

*An extra bonus.* Besides all the advantages that Quick-Heat provides for other users, it makes employees on assembly lines more comfortable and more efficient by reducing heat radiation drastically. Moreover, in regular assembly-line use it can cut your electricity bill by as much as 85 percent.

**ERSIN** *Multicore* **3 CORE SOLDER**

Ersin Multicore conforms with following specifications:

Federal QQ-S-571 b

Army-Navy-Air Force Mil-S-6872 (AN-S-62)

U.S. Air Force No. 41065-B-Method 31

Made of virgin metals only:

Tin 99.95% pure

Lead 99.97% pure

Available in a wide range of alloys and gauges. Every reel or carton clearly marked as to gauge and alloy, tin/lead content, and color coded.

**MULTICORE SALES CORPORATION**

**NEW YORK 13, N. Y.**

**THE ONLY SOLDER MADE WITH NON-CORROSIVE, EXTRA-ACTIVE ERSIN FLUX**

Actual performance proves it melts more rapidly due to thin-wall construction. Removes surface oxides, prevents reforming and will bond difficult metals safely, surely and economically.

**TECHNICAL ADVANTAGES**

**ERSIN FLUX**

Ersin Flux is exclusive to Multicore and will not be found in any other solder. It is a high grade, water white rosin, homogeneously activated.

Ersin Flux has a vigorous fluxing action and possesses the non-corrosive and protective features of the original rosin. Soldered joints made with Ersin Flux do not corrode even after prolonged exposure to any degree of humidity. Ersin Flux reduces the surface tension of molten solder, causing it to wet metals rapidly, increasing speed of operation with resultant production economies.

Free from objectionable odor. Non-toxic in use.

Leaves nothing but pure rosin on the work after soldering, and may be used wherever plain rosin is specified.

**MULTICORE SOLDER**

Three separate cores of flux eliminate possibility of no flux in a portion of the wire, which may occur in single cored solder. Guaranteed continuity of the flux stream prevents "dry" joints, i.e., those having high electrical resistance.

Although there are three cores of flux in Multicore, the total percentage of flux to solder is less than many single cored solders.

Very rapid melting results from the multiple core construction which provides thinner walls of solder than are found in the same gauge single cored solder. Multicore's unique properties make perfect joints possible on difficult metals and alloys, even if oxidized.

Ability to tin rapidly produces perfect joints with less solder. Greater coverage per pound.

Simply insert the tool in a knockout or small drilled hole and give the screw a few turns with an ordinary wrench. No. 735 set has four punches for cutting  $\frac{7}{8}$ ,  $1\frac{1}{8}$ ,  $1\frac{1}{2}$ ,  $1\frac{1}{4}$ -inch holes for  $\frac{1}{2}$ ,  $\frac{3}{4}$ , 1,  $1\frac{1}{4}$ -inch conduit. Set is neatly packed in leather case illustrated. The  $\frac{1}{2}$ -inch punch will cut a  $\frac{7}{8}$ -inch hole for  $\frac{1}{2}$ -inch conduit where no standard knockout is provided when a  $\frac{7}{16}$  hole is drilled.

## Heavy Duty Drive for $\frac{1}{2}$ " Punch

To increase length of service of the  $\frac{1}{2}$ -inch Knockout Punch in cutting  $\frac{7}{8}$ -inch holes in heavier-gauge sheet metals, the No. 1387 AV Drive Screw with No. 1388 AV Drive Nut illustrated is recommended.

## NO. 737 KNOCKOUT PUNCH SET

For quickly making smooth openings for  $3\frac{1}{2}$ " and 4" conduit. Hole is clean, no filing of burrs necessary. Operation is similar to that of other GREENLEE Knockout Punches. Simply insert in hole for 1" conduit and turn drive nut with an ordinary wrench.

## No. 740 Knockout Cutter

Companion tool to GREENLEE Knockout Punches. Enlarges knockouts to take  $1\frac{1}{2}$ , 2,  $2\frac{1}{2}$  and 3-inch conduit. Operation is simple since an ordinary wrench drives the tool. Cutting is done by the drive action of two wheel cutters. Special discs

### INSTRUCTIONS — FOR MEASURING BELTS

To determine size of belt, if the old belt is available, cut the belt and measure for stretched out length. This will be "cut length" of belt. If old belt is not available or is worn out so that it cannot be properly measured, stretch a thin thread around belt pulleys on set. (Be sure to use thin thread as a thick cord will give an inaccurate reading.) Measure the thread, it will be your "circumference around pulleys." In measuring belts always remember that the circumference around pulleys is not the same as stretched out or cut length. A belt when cut, develops approximately 3/16" extra length when stretched out, depending on thickness of belt.
