Service Approved DYNAMOTORS

From THE SMALLEST IN SIZE
To THE LARGEST IN OUTPUT

Engineered and built by specialists, EICOR DYNAMOTORS have earned their fine reputation through years of exacting service. These dependable units furnish the necessary high voltage power for communications, direction finding, radio compass and other controls.

Our complete line of frame sizes makes possible the widest available range of dynamotor output ratings in the most compact sizes and weights. This assures the *most economical size and weight for every need!*

The experience and skill of Eicor Engineers are instantly available to help you on any problem involving Dynamotors, Motors, or Inverters.

*Send for Helpful
DATA FOLDER*

This handy folder gives useful data and information on EICOR Dynamotors, D. C. Motors, and other Rotary Electrical Equipment. Write for it!

| SERIES NO. | OUTPUT WATTS | DIAMETER | LENGTH | WEIGHT |

PRECISE-OHM RESISTORS

The very highest quality ceramic tubes, alloy wire and specially compounded vitreous enamel go into the manufacture of Precise-Ohm Resistors. A new, continuous, high-temperature, high production furnace is among our modern equipment; adaptable to manufacture of various size resistors, any size order, with closest possible control of critical fusing process in the application of vitreous enamel. If your product design requires wire wound resistors, insist on PRECISE-OHM.

FIXED: Wire wound vitreous enamel type; alloy wire, ceramic cores.

ADJUSTABLE: Fixed types, but with narrow longitudinal tract on side, bare of enamel.

TAPPED AND MULTISECTION: Like fixed type except that any number of taps may be incorporated.

PIGTAIL: 10 watt and smaller are space wound on low-loss ceramic cores with low temperature coefficient wire.

FERRULE TERMINAL: Ferrules are monel metal; oxidation and corrosion proof.

APPROX. WATTAGE RATING: 5 to 190 Watts

TUBE DIMENSIONS: (Outside diameter) $5/16$ to $1\frac{1}{8}$ " (length) 1 to $11\frac{1}{2}$ ".

RESISTANCE: (Min.) .03 to .78 (Max.) 10,000 to 125,000.

PRECISION RESISTORS

Precision, Price, and Promptness—our bywords on precision resistors. Tolerance to 1/50% available on order. Price—as always—very competitive. Promptness—unequaled in the field. Write for further information on our many types.

GOSLIN AIRCRAFT TRANSFORMERS

GUARANTEED TERMINAL PERFORMANCE

Specialists in Transformer miniaturization for aircraft application. Designed for lightweight, high altitude, vibration, humidity, temperature, etc., competent engineering, controlled quality, skilled workmanship.

CUSTOM-MADE TRANSFORMERS FOR RADAR, ELECTRONIC AND MANY OTHER ELECTRICAL EQUIPMENT APPLICATIONS: POWER PULSE • CHOKE • BIAS • AUDIO • FILAMENT • MODULATION PHASE SHIFT • ISOLATION • INDUCTOR • STEPDOWN, ETC. AND FULL RANGE OF TOROID TRANSFORMERS & COILS.

Hermetically sealed or open framed airbourne units meet or surpass all military and civilian specifications. Complete facilities for all JAN-tests. Consult GOSLIN on your Transformer requirements—they can be engineered to your specifications.

MAGNETIC-AMPLIFIER CIRCUITS

This practical treatment of fundamental principles, characteristics, and applications logically develops the various kinds of basic and more complex magnetic amplifier circuit arrangements without extended mathematical considerations. Descriptive and graphical methods are used to give qualitative and quantitative interpretation of essential facts. Material is systematically classified according to circuit functions so you can compare and select solutions best suited to your special problem. By William A. Geyger, U. S. Naval Ord. Lab. 277 pp., 135 illus., \$6.00

PROBABILITY AND INFORMATION THEORY WITH APPLICATIONS TO RADAR

Shows in easy stages how the theory of probability applies to electronics, communication, and particularly radar. Using basic mathematics, it discusses the theory of probability distribution, mathematical description of waveforms, Shannon's information theory, applications of inverse probability to problems of signal and noise, etc. By P. M. Woodward, Telecomm. Research Establishment, Malvern, England. 128 pp., \$4.50

TELEVISION BROADCASTING

Practical manual for radio engineers, operations personnel, and others interested in the technical aspects of television broadcasting. Covers in detail the equipment, facilities, and techniques involved in the running of a television studio—topics such as lighting, staging, television recording, and color television equipment. Gives a valuable insight into the whole field without the use of complex mathematics. By Howard A. Chinn, Columbia Broadcasting System. 688 pp., 346 illus., \$10.00

ELECTRONICS FOR COMMUNICATION ENGINEERS

Saves research time and effort on electronic problems in communications. Its 252 articles from *Electronics* contain a wealth of design equations, charts, nomographs, tables, etc. Covers amplifiers — antennas — audio — cathode-ray tubes — components — electronic music — filters — measurements — microwaves — oscillators — power supplies — propagation — pulses — receivers — transmission lines — transmitters. Edited by John Markus and Vin Zeluff, Assoc. Editors, *Electronics*. 624 pp., hundreds of illus., \$10.00

A NEW SERVICE TO GOVERNMENT SUPPLIERS

Federal Manufacturing and Engineering Corp. has traditionally been a government supplier, a relationship which has existed over a period of many years, dating back to well before the last war. During World War II, Federal received five successive Army-Navy E Awards for its achievements in both the electronic and mechanical fields.

Federal's Transit Case Division, originally established to take care of its continually growing requirements, has now been expanded to meet the demands of other manufacturers.

Federal's experience and facilities in this field are now available to you, and we would welcome an opportunity to quote on your specifications.

Federal Manufactures Precision Electronic Equipment

- Signal Generators
10 kc. to 4000 mc.
- Heterodyne Frequency Meters
100 mc. to 10,000 mc.
- High Frequency Communication Systems
- Precision Butterfly Capacitors, Etc.

ADVERTISERS:

Interested in the NUCLEAR field?

There are a good many advertisers in this BUYERS' GUIDE who should be advertising in NUCLEONICS. Particularly in instrumentation and laboratory equipment, there is a cross-over in the electronic and in the nuclear field.

There is very little cross-over in the subscriber lists of the two publications — a matter of a few percentage points.

It is quite possible that you are doing an effective presentation of your products and capabilities in this excellent issue. If you are missing such presentation in one of the fastest growing fields in our country's history — the field of nuclear energy.

Howard & James representatives of ELEC-TRONICS are also the sales representatives of NUCLEONICS. They have an audience pointing to the opportunity in this great NEW field. Ask them to show you what your potentials are.

NUCLEONICS ABP

McGraw-Hill Publication
1221 Avenue of the Americas, New York 36, N. Y.

... used extensively by the electronics industry ...

A list of our customers in the Electronics Industry includes many leading manufacturers—Philco, RCA, Federal Tel. & Tel., Collins Radio, Magnecord, Hazeltine Labs, Presto Tape Recording Co., and many more.

Universal and Direct Current

1/1000 to 1/2 h.p.

Shaded Pole 1/2000 to 1/8 h.p.

Induction types 1/1400 to 1/4 h.p.

Yes, EMC and CYCLOHM fractional h. p. motors are used by leading companies for hundreds of applications. If you have an application for fractional h. p. motors, check with us on your requirements. Write today for our catalog or better yet, ask to see a Howard representative.

TRANSFORMERS.....

- ★ ENCAPSULATED
- ★ EMBEDDED

Years of Transformer Engineering

When designing your electronic equipment, consider the advantages of our facilities to properly engineer your transformer components. FELCO designed transformers are in great demand where size and weight are important factors.

FROM STANDARD UNITS

POWER • AUDIO • CHOKES • ETC.

From the simplest choke to the most complex power transformer, available embedded or encapsulated as shown here.

TO COMPLETELY ENGINEERED SERIES

PULSE • MULTI-PURPOSE • CHOKES . . .

A series of FELCO designed transformers which have been treated with Westinghouse Fosterite, eliminating the need for expensive hermetic sealing. Impregnating the transformers with this special

compound affords greater protection against humidity and reduces corona.

This type embedment is particularly adaptable to airborne, portable and specially designed apparatus and equipment.

OR SPECIALS

Cast transformers are available for applications where size, weight and moisture resistance are important factors.

TEMPCLAD GLASS BRAIDED LEAD WIRE

Primary insulation is Teflon; secondary insulation is Teflon-impregnated glass braid. A stranded construction with unusual abrasion resistance. Non-flammable.
see #7 below

From the list below select the wire which meets your needs:

1. **TEMPRITE TEFLON MAGNET WIRE** — Sizes from 14—50 AWG incl. Withstands temperatures from -90C -260° C. Single, heavy, triple or quad thickness.
2. **TEMPRITE-X SPECIAL TEFLON MAGNET WIRE**—Same characteristics and sizes as regular Temprite magnet wire, but specially processed for severe applications.
3. **THERMALON SILICONE MAGNET WIRE** — Sizes from 14 — 50 AWG incl. Used for temperatures from -54° C—180° C. Made in single or heavy thickness.
4. **TEMPVAR W.A. ENAMEL MAGNET WIRE** — Sizes from 14—50 AWG incl. Excellent physical and electrical properties, is impervious to Freon 22. Standard space factor.
5. **TEMPRENE TEFLON HOOK-UP WIRE** — Sizes from 30—10 AWG incl. Unaffected by temperatures from -90° C—260° C. Excellent dielectric, impervious to all commercial solvents. Solid colors or spiral striped in 55 different color combinations. Made to meet MIL-W-16878A.
6. **TEMPREX TEFLON EXTRUDED HOOK-UP WIRE**—Sizes from 30—10 AWG incl. Types E and EE of MIL-W-16878A in 14 solid colors. Same characteristics as Temprene.
7. **TEMPCLAD TEFLON-FIBERGLAS LEAD WIRE**—Sizes from 30—8 AWG incl. Made to MIL-W-7139, for temperatures from -90 -260° C. Suitable where maximum abrasion protection or resistance to mechanical stress is required.
8. **RETEP TEFLON SATURATED GLASS BRAID LEAD WIRE**—Low cost, low voltage push-back type for the range -90° C—260° C. Retains flexibility after impregnation.
9. **NEBROC TEFLON-FIBERGLAS LACING CORD**—Developed especially for wiring harnesses or coil tying. Made in sizes from .009" — .076" and in tape form.
10. **TEMPTUBE TEFLON-FIBERGLAS TUBING** — Sizes up to 1 1/4" ID. Fully saturated for high dielectric and maximum abrasion resistance. Colors on request.

SPECIALISTS IN HIGH-TEMPERATURE INSULATION

Models HV1 HV2

HIGH VOLTAGE SUPPLY

300-1600 volts
up to 75 micro-amps
2" x 2" x 4" 9 oz.

The models HV1 and HV2 are compact sources of both fixed and variable, positive and negative high voltage. Small size makes them ideally suited for portable survey instruments requiring high voltage for geiger, proportional or scintillation counters. They replace expensive 900 V battery packs in geiger counter survey meters. Because of excellent stability, long life and negligible ripple they can be used in AC operated precision instruments.

In spite of small size they can deliver more than 1600 V with loads up to 75 micro-amps. They provide a means of assembling inexpensive geiger counters for classroom use. Operating life of 5,000 to 10,000 hours is usual for the low cost vacuum tube.

SPECIFICATIONS

Dimen.—2"x2"x4" wgt.—9 oz.
External Leads: B+ fil., ground, reg. tube return, H.V. output, screen return and screen (resistor return in Model HV1)

Power: 2.....67.5 V batteries
1.....1.5 V batteries

Output Voltage: Alternatives: regulated 900, 967.5, 1035 volt in steps or continuously variable 300-1600 V.

Max. load for reg. output at 900 v: 30 micro-amps—(30 megohms)—output voltage constant with B+ variation from 135 V to 110 V.

TESTING and PROCESSING EQUIP-
E: Peak-Emission Sets up to 2000 amps;
Gen-Thyratron Pulsers for all existing types;
Characteristic-Test Sets for all tubes up to 250 KW
dissipation. CRT Checkers; as well as Testers
C, ATR, etc., tubes.

RADAR EQUIPMENT: Hard- and Soft-Tube Mod-
ulators from 50 Watts to 40 Megawatts peak power;
Magnetron Signal Sources; Pulsed Cavity Sources.

MISCELLANEOUS: Pulse-Transformer Test Sets;
Wire and Cable Test Equipment and Pulse Gener-
ators; Hi-Pot Sets; Ionization Gages.

CONRAD ENVIRONMENTAL TEST CHAMBERS

★★★ Full range of sizes, tem-
perature and instrumentation.

★★★ Remote and portable liquid
chilling units to 900,000 Btu per
hr. at -100° F.

★★★ Self contained fully port-
able temperature test chambers.

FULL SELECTIVITY OF EQUIPMENT TO MEET YOUR SPECIFIC NEEDS

Cold only—cold and heat—Cold,
heat, and humidity—Heat and hu-
midity—cold and altitude—Cold,
heat and altitude—Cold, heat, alti-
tude and humidity—Heat and alti-
tude—Altitude only—Remote or
portable liquid chillers—Portable
test chambers.

Conrad Type F Chamber,
2.4 to 36 cu. ft. interior area

CONRAD DESIGN AND CONSTRUCTION ASSURES HIGH LEVEL PERFORMANCE AND RELIABILITY

Quicker draw down with patented
Conrad double cascade system. Uses
safe Freon 13 and 22.

Rigid insulation provides uniform
heat barrier.

Stainless steel interiors permit test
of any materials.

All welded cabinet construction—
no wood used.

Full selection of instrumentation
and controls.

*Write for Data Sheets, or information on
environmental chambers to meet your needs.*

*Manufacturers of
Highest Quality
Connectors*

1 AI-11022—High voltage quick disconnect plug similar to, but does not mate with BNC. Weatherproof. Teflon insert. For use with RG-59, 62, and 71/U cable. Constant impedance of 50 ohms. Operating voltage—5 kilovolts. Operates satisfactorily to 10,000 megacycles.

2 UG-154/U—AI-11070—Type LC Plug for use with RG-17/U cable. Fifty ohm impedance. Weatherproof. Five kilovolt rating. It may be used with RG-19/U cable at a rating of 10 kilovolts.

3 UG-21D/U—AI-11072—Improved Type N Plug. Mates with standard type N and Improved Type N Jacks. For use with RG-8, 9, 9A and 10/U cable. Weatherproof. Performance is good to 10,000 megacycles. Nominal impedance—50 ohms. May be used with 70 ohm cable if impedance matching is not important.

4 MX-554/U—AI-11039—Type BNC Termination. Mates with BNC Receptacles and Jacks. Weatherproof. Furnished at any desired impedance. Operating frequencies same as standard BNC.

5 AI-11047—High voltage quick disconnect right angle adapter. One male—one female end. Similar to, but does not mate with, BNC series. Weatherproof. Teflon inserts. Constant impedance of 50 ohms. Operating voltage—5 kilovolts. Operates satisfactorily to 10,000 megacycles.

6 UG-355/U—And UG-356/U—AI-11006 Klystron Coupler. The UG-355/U couples two type N Jacks to a 726 C Klystron. The UG-356/U couples two type N Jacks to a 2K29 Klystron.

7 UG-37A/U—AI-11032—Ceramic insert, pressurized, high voltage receptacle. Weatherproof. Operating voltage—15 kilovolts. Flash over does not break down insulation. May be operated with high temperatures with no break down in pressure seal.

INDEX

Volume 28 in
The Massachusetts
Institute of
Technology

RADIATION LABORATORY SERIES

THE M. I. T. RADIATION LABORATORY SERIES has been acknowledged as a "monumental" work in its field; it is now made complete with the addition of an extensive and carefully prepared Index. Thousands of entries refer you to facts, research findings, and conclusions—a mine of raw material waiting to be used by today's engineers and technicians. The Index has been compiled with the needs of the practicing engineer in mind. It is more than a compilation of the 27 separate indexes; it's a comprehensive guide designed to give you the information you need quickly and correctly. Compiled by Keith Hanney, Editorial Director, ELECTRONICS, NUCLEONICS, 160 pp., over 10,000 entries, available separately at \$4.50.

Index completes and unifies this great Series of 28 volumes

Offer applies to U. S. only

RECEIVER Model ME-117
 continuously monitors your secondary standard, 50 KC to 10 MC, with the C WWV-Standard. Direction and speed of the rotating pattern on the tube give sense and size of frequency deviation. Audio modulation available on speaker and phone

FREQUENCY SYNTHESIZER Model ME-447
 generates any multiple of 1.0 KC in a range from 1.0 to 2.0 MC out of a 100-KC local standard and with the accuracy and stability of this standard.

POT Model ME-220
POT Models ME-020—ME-120
 operate with high accuracy potentiometer settings as large scale film reader. ME-220 acts as a digital voltmeter setting the potentiometer to the input voltage by means of a servo-mechanism. ME-020 and ME-120 perform similar functions by either manual operation or remote control.

ADJUSTMENT SERVICE
 specialize in high accuracy calibrations on film, of frequency meters, potentiometers, etc. The calibrated instruments combined with the instrument techniques of the dial reading with its advantages.

ELECTRIC  **SPECIALTY** co.

178 SOUTH STREET, STAMFORD, CONN.

HIGH VOLTAGE

from Milliwatts to Kilowatts

MINIATURE HIGH VOLTAGE CONVERTER

Single compact unit contains both an efficient vibrator and special step-up transformer. Simply connect to standard flashlight cells or low voltage 60 cycles and any voltage between 50 volts and 7000 volts output can be obtained at currents

up to 1 Ma. Output can be easily stabilized to 1%. Delivery from stock. Perfect for photoflash applications, breakdown testers and portable power supplies. Full details on request.

STABILIZED POWER SUPPLIES

Many standard models to choose from. Ranges up to 100,000 Volts DC. May be obtained with or without meters. Regulated or unregulated. Regulated types

use amplifier circuits, highly accurate chopper type circuits or tubeless magnetic amplifier control. Full details on request.

HIGH CURRENT HIGH VOLTAGE

For applications requiring high power. Output available up to several amperes at high voltages. These are industrial type units intended for long continuous service under adverse conditions. Write us giving details of your needs.

BREAKDOWN TESTERS

Basic transformer. Provides output of 0 to 100,000 Volts RMS. Up to 20 Ma may be drawn from the secondary. A special metering winding accurately shows the exact output voltage. The best all around tester obtainable for those odd breakdown and insulation measurements. Write for full details.

MEGOHM BRIDGE

Direct reading to 1 million megohms. Readings may be made to the fifth place by means of patented circuit. Details on request.

MINISEL HG

Selenium Rectifiers

MINISELS — high voltage, low current, subminiature, encased selenium rectifiers. Minisel HG is glass encased, hermetically sealed. Minisel HW is a Bakelite encased cartridge, half-wave and full wave (bridge or center tap) types.

RECTISEL — Conventional open construction.

NPS — Sealed in plastic, pigtail leads.

NRS — Fully insulated, no center mounting, no hot spots.

POWERSEL — Industrial stack, power rectifier.

HERMETICALLY SEALED — Oil-filled, metal container, or plastic sealed, plastic cased.

Carefully engineered, built, tested. Fully guaranteed. Many JAN types.

Our engineering facilities are at your disposal. Phone, wire, write for complete data.

0 to 5000 Volts CALIBRATED DC PRECISE POWER SUPPLIES

- Calibrated Accuracy 0.1% or Better
- Voltage Resolution 0.002 Volt
- Line Regulation 0.002%
- Load Regulation 0.002%
- Stability, Long Term 0.01%

The Series 300 Supplies comprised of 12 models include:

Model 301C Instrument Calibrator

Voltage: 1 to 1000 volts

Current: 0 to 400 ma.

Calibration: 100, 10 and 1 volt steps, calibrated 1.1 volt vernier

Mounting: Panel 19" x 21", depth 16"

Price: \$895.00 FOB Seattle

Model 300N Calibrated Supply

Voltage: 700 to 3000 volts

Current: 0 to 30 ma.

Calibration: 100, 10 and 1 volt steps, calibrated 1.1 volt vernier

Mounting: Panel 19" x 29 3/4", depth 16"

Price: \$1425.00 FOB Seattle

The Series 300 Supplies are ideal for fast, accurate instrument calibration; for computer work; for use as secondary standards. Custom models for special needs.

The Series 400 Nuclear Supplies (not pictured) feature the following:

- Calibration accuracy 1% or better
- Line and Load Regulation 0.01%
- Stability 0.01% short term, 0.1% long term
- Ideal for scintillation spectrometer and detector applications
- Models available covering the range of 500 to 5000 volts, currents from 0 to 20 ma.
- Prices \$295.00 to \$680.00 FOB Seattle

STOP RF LEAKAGE ON THE DRAWING BOARD

... WHEN YOU DESIGN METEX ELECTRONIC WEATHERSTRIPPING INTO YOUR EQUIPMENT YOU GET ITS POSITIVE SHIELDING EFFECTIVENESS — AT MAXIMUM OVERALL ECONOMY

Plan now to take full advantage of *Metex Electronic Weatherstripping's* unusual effectiveness in shielding all types of electronic equipment. Because it is made of knitted wire mesh, *Metex Electronic Weatherstripping* is both conductive and resilient. It assures positive metal-to-metal contact between all mating surfaces. And being resilient it accommodates itself positively to surface inequalities.

In reality, *Metex Electronic Weatherstripping* can do more for you than just shield RF leakage. It can cut the cost of machining mating surfaces to close tolerances. It can eliminate the need for extra fasteners and many other costly means of making joints RF tight.

Applications in which *Metex Electronic Weatherstripping* has already proved its effectiveness include pulse modulator shields, wave-guide choke-flange gaskets, local oscillators on TV sets, dielectric heaters, etc.

For detailed information on METEX ELECTRONIC PRODUCTS, write for FREE copy of "Metex Electronic Weatherstrips" or outline your SPECIFIC shielding problem — it will receive our immediate attention.

HUNTINGTON, INDIANA

SILICONES and THEIR USES

For engineers, designers, and those who use or can use silicones, this engineering-slanted manual provides a comprehensive source of the available information on proper preparation, and applications of silicones—treated as non-technically as possible. It covers all commercially available silicone products... industries and uses they make of silicones, cost considerations... outlines history of silicone development, its possible uses in medicine, pharmacy, and the elementary chemistry of preparation of silicones from raw material to finished product. By R. R. McGregor, Administrative Fellow, Mellon Inst. 238 pp., 29 illus., 31 tables, \$6.00

ELECTRONIC MEASUREMENTS

Covers measurement fundamentals in many fields beyond conventional radio, including television, radar, and other pulsed systems, microwave techniques, and techniques of value to engineers in other areas who use electronics in their instrumentation. Treats circuit constants and impedance circuits; wave-form, phase, and time interval measurements; receiver and antenna measurements; generators of special wave-forms; attenuators and signal generators, etc. By F. E. Ferman, Dean, School of Eng., and J. M. Pettit, Assoc. Prof. of Elec. Eng. Stanford Univ. 2nd Ed., 683 pp., 450 illus., \$10.00

PRINCIPLES OF RADAR

Deals with the fundamental concepts and techniques of pulse radar. Presents the engineering principles of the pulse circuits and the high-frequency devices common to nearly all radar systems. Describes the general features of radar systems and system components; discusses pulse circuits and their application to radar modulators, indicators, and receivers. Covers radio-frequency aspects of radar, including basic concepts pertaining to transmission lines, wave-guides, cavity resonators, and antennas, and the techniques of their use in radar systems. By the Massachusetts Inst. of Technology Radar School Staff. Revised by J. F. Reintjes, MIT, and G. T. Coate, formerly of MIT. 3rd Ed., 887 pp., 563 illus., \$7.75

TELEVISION BROADCASTING

Practical manual for radio engineers, operations personnel, and others interested in the technical aspects of television broadcasting. Covers in detail the equipment, facilities, and techniques involved in the running of a television studio—topics such as lighting, staging, television recording, and color television equipment. Gives a valuable insight into the whole field without the use of complex mathematics. By Howard A. Chinn, Columbia Broadcasting System. 688 pp., 346 illus., \$10.00

Specialists In Precision Machined Plastic Components

Tri-Point specializes in the *machining* of Precision plastic components for electrical, and mechanical applications. A wealth of experience and skill has been acquired in working with all types of Plastics.

TRI-POINT is actively engaged in producing vast quantities of precision plastic parts for aircraft, instrument, radio, television and various electronic manufacturers.

TEFLON* • KEL-F† • NYLON • REXOLITE • PHENOLICS
In stock at all times.

Regardless of the complexity of the parts you need, Tri-Point possesses the technical and engineering down to earth "know how" necessary to fill your requirements promptly, efficiently and economically.

Send us your requirements and specifications.

Tri-Point engineers will welcome an opportunity to help you with any problems concerning the *MACHINING* of plastic component parts.

* DuPont Trade-Mark for tetrafluoroethylene resin.
† M. W. Kellogg Company Trade-Mark for trifluorochloroethylene polymers

meters, milliammeters, voltmeters, AC and DC meters; many with zero adjusters; and many types.

Accuracy—well within 5%. AC meters are double-throw type with jeweled bearing; DC meters are permanent-magnet type or moving magnet type.

Cases—three basic styles, round or rectangular, requiring 2-5/32" hole. Also pocket types.

Construction—metal—age and moisture resistant. Special finishes, one to five colors.

Features—current and voltage readings; battery-operated emergency lighting, fire or burglar alarm; antenna rotator indicators; voltage regulators, transmitters, receivers, plating equipment, AC field indicators, etc.

Available by leading electronics parts distributors. See Bulletin G-56(SH) showing 219 models.

RECORD ON MAGNETIC TAPE

And Realize These Advantages . . .

1. Data stored in "live" electrical form . . . ideal input to data reduction equipment.
2. High frequency data reproducible on direct writing recorders by playing back at reduced tape speeds.
3. Data accessible for immediate playback.

RECORD AT THE SOURCE

Portable Recorders

Data recorders for airborne, mobile, and extreme environmental conditions. Meet vibration Specif. MIL-E-5272A Proc. 1. Operate from 28 volts DC and/or 115 volts, 400 C. Self-contained units incorporate all electronic circuitry. Available with up to 13 tracks for data recording DC to 30 KC. Frequency multiplexing on single tape track permits recording up to 196 channels on one multichannel recorder. Any single tape speed 7.5 to 30 ips. *Small Portable Recorder* (above, left) records for 3 minutes at 30 ips, measures 20 $\frac{3}{8}$ x 12 x 12 inches including shock mounting, and weighs 55 lbs. *Long Playing Portable Recorder* (above, right) records for 16 minutes at 30 ips, measures 27 $\frac{3}{8}$ x 15 x 15 inches including shock mounting, and weighs 70 lbs.

PLAYBACK OR RECORD IN THE LABORATORY

Reproducers

For playback of data obtained on recorders described above or laboratory recording and playback. Designed specifically for data recording and reproduction—not audio. Tape speeds, 1.5 to 60 ips. Hi/Lo speed combinations available covering frequency range from DC to 60 KC using FM carrier and direct recording techniques. Operates from 115 volts 60 C with or without Frequency Lock which assures reproduction of original frequencies within 1/2%. Precision frequency drive also available. Improved and simplified wow and flutter compensation; used with FM carrier recording permits high signal-to-noise ratio at even low tape speeds. FM carrier discriminator self-contained and operates without regulator from 115-volt, 60 C line—one-hour overall stability better than 1% of maximum output (10 ma. peak at 14 volts) which will drive galvanometers and direct writing recorders—plug-in assemblies allow use at tape speeds between 1 1/2 and 60 ips. Equipment available completely assembled and wired in standard relay racks.

ANALYZE IN THE LABORATORY

Automatic Wave Analyzer

Heterodyne type analyzer provides completely automatic fourier analysis (amplitude versus frequency) of vibration, seismic, power line, transient, noise, shock, and similar data. In some instances, an amplitude versus time plot for a given frequency can be obtained. Suited for operation from any source supplying a repetitive signal such as a magnetic tape loop. Frequency range 3 to 2000 cps, variable bandwidth 1/2 to 45 cps, amplitude accuracy $\pm 5\%$ of reading on logarithmic scale, frequency accuracy 1/2% of reading, output voltage range 60 db, input impedance 2 1/2 megohms. Analysis recorded and up to 14 inputs can be handled and selected automatically.

Special Data Reduction Equipment

Equipment meeting the needs of a particular application can be designed and manufactured to order. Inquiries are invited.

Advertisers:

How about the NUCLEAR field?

There are a good many advertisers using ELECTRONICS who should also be advertising in NUCLEONICS.

Particularly in instrumentation and laboratory equipment, there is a cross-over of use in the electronic and in the nuclear field.

But, there is very little cross-over in the subscriber lists of the two publications—a matter of a few percentage points.

It is quite possible that you are doing an effective presentation of your products and abilities in this excellent issue, but are missing such presentation before one of the fastest growing fields in the country's history—the field of atomic energy.

The sales representatives of ELECTRONICS are also the sales representatives of NUCLEONICS. They have much evidence pointing to the opportunities in this great NEW field. Ask them to show you what your potentials can be.

**Centralab metallized ceramics
 have a bond of 2000 psi**

- Centralab's bond of non-ferrous metals to ceramic bodies is almost as strong as the material itself.
 - Your precision requirements met by combining most desirable properties of metals and ceramic materials with JAN-specified characteristics, including:
 - High dielectric strength — 240 volts per mil.
 - Low loss at high frequency — loss factor at 1 MC — .007.
 - High mechanical strength—18,000 psi, modulus of rupture.
 - Harder than quartz — 7.5 Mohs' scale.
 - Impervious to moisture or acids (.005%).
- Metallizing is available for variometer rotor bars, feed-thru bushings, hermetically sealed parts, precision-machined units and many other applications. Send Centralab your problem.
- Centralab is the leader in ceramic design and development**
- 1 Quality ceramics since 1928.
 - 2 Largest staff of engineers, physicists, and chemists of any ceramic producer available for consultation.
 - 3 Modern, mechanized production facilities for your volume ceramic requirements.

Write now! Before you forget... for complete details on Centralab quality ceramics.

he's working
 for you

THIS FELLOW IS TRAINED IN YOUR BUSINESS. His main duty is to travel the country — and — penetrating the plants, laboratories and management councils . . . reporting back every significant innovation in technology, engineering tactics, management strategy. He functions as your all-seeing, all-hearing, all-reaching business communications system.

THE MAN WE MEAN IS A COMPOSITE of the editorial staff of this magazine. For, obviously, no one individual could ever accomplish such a vast business news job. It's the result of the talents of a group of qualified men of diversified and specialized talents.

AND, THERE'S ANOTHER SIDE TO THIS "COMPOSITE MAN," another complete news service which complements the editorial section of this magazine — the advertising pages. It's been said in a business publication the editorial staff tell "how they do it" — "they" being the industry's front line of innovators and leaders — and the advertising pages tell "with what." Each issue unfolds an industrial exposition before you — giving a ready panorama of the latest date tools, materials, equipment.

SUCH A "MAN" IS ON YOUR PAYROLL. Be sure to "listen" regularly and carefully to the pages of business information he gathers.

TV PICTURE GENERATING EQUIPMENT

• **APERTURE EQUALIZER.** May be used as a picture crispener. Corrects for loss of resolution by providing high frequency boost. High frequency response can be continuously varied up to 10 times. Three models give selection of video bandwidths from 4.0 mcs. to 12.0 mcs.

• **HORIZONTAL SWEEP DEFLECTION AMPLIFIERS.** For use in deflecting (1) Flying Spot Tubes; (2) Monitors; (3) Monoscopes. Provide constant sweep velocity within 3.0% (excluding blanking period). No linearity control. Feedback assures linearity independent of size. Two models: one drives single deflection yoke; other drives three deflection yokes.

• **HIGH PASS—LOW PASS FILTERS.** For differential gain measurements. Fit directly on oscilloscope.

CORSON

"GLASCAP"

PLASTIC DIELECTRIC CAPACITORS

★ **DIELECTRIC and IMPREGNANT:** The thin plastic film in Corson capacitors is one of the finest dielectrics known. It has a high breakdown voltage, great tensile strength and stable physical and electrical characteristics. All units are impregnated and filled with a special silicone liquid having excellent dielectric qualities.

★ **CONSTRUCTION:** Airtight construction consists of high quality glass tubing with silver bands fused on at each end. Metal ferrules are soldered to these bands.

★ **TERMINALS:** Units with diameters of 19/32" or less have pigtail leads of #18 tinned copper wire, approximately 2 1/8" long. All others come with 3/8" long screw terminals. Special terminal types, using solder lugs, pigtails or different screw sizes are available on order.

★ **TOLERANCES:** Standard capacitance tolerance is plus or minus 10%. 5% on request. Closer tolerances can also be provided.

★ **VOLTAGE RATINGS:** Corson capacitors are factory-tested at 1.5 times rated voltages for 1 minute. In DC circuits, peak voltage should not exceed rating. In 120 cycle AC circuits, peak voltage should not exceed 10% of rating.

★ **TEMPERATURE RANGE:** Corson capacitors operate satisfactorily over a temperature range of -60 to +85° C. Also available with an extended range of -60 to +125° C.

★ **SPECIAL UNITS:** Special units also available where high resistance and low absorption are required.

GREATER DESIGN FLEXIBILITY

with ASCO® Electromagnetic Controls

All of the Electromagnetic Control devices you require for a complete control system can be found in the extensive ASCO line. ASCO Electromagnetic Controls include standard types to suit almost all normal control requirements.

To permit increased freedom of design, ASCO provides a wide variety of specialized controls for specific applications. **ASCO Controls include:**

NEW!

◀ **Electronic Relays** — for high speed response. "Brushing" of control leads — even momentarily — provides positive relay operation! Relays are also available with time delay.

These Electronic Relays are used as primary control elements for the equipment listed below.

◀ **Automatic Transfer Switches**

Electrically Operated . . . Mechanically or Magnetically Held . . . Complete Listings: 15-1000 Amperes . . . All Classes of Load Up to 750 Volts A-C, 250 Volts D-C.

Provide continuous, adequate voltage power. These Switches transfer connected load to emergency power source when normal power fails, or normal voltage is substantially reduced. Once the normal source is in proper operating condition, the load is automatically restored.

◀ **Close Differential Relays**

Standard Ratings: A-C — 25 Amperes, Up to 600 Volts; Coils on Current Types, 60 Amperes; higher with current transformer.

These Relays operate on voltage or current differentials of 2% — less if required. Adjustable drop-out is standard; adjustable pick-up is available.

When installed on an Automatic Transfer Switch, Relays can provide transfer on a small differential in power supply voltage.

◀ **Time Delay Relays**

Factory adjusted time delay: 1/2 to 3 seconds (longer if required). Relays with adjustable time delays available: 1/2 to 6 seconds delay.

Standard Voltages: Up to 250 Volts A-C; also available for higher A-C Voltages, and for D-C.

Relays can be furnished for time delay when coil is energized or deenergized. Relay arrangements with delay in both directions can also be provided. Time delay feature supplied as "built-in" component on ASCO Automatic Transfer Switch to ignore harmless momentary power dips and outages on the normal source.

◀ **Power Relays (Heavy Duty, Industrial Type)**

Standard Ratings: Up to 600 Volts A-C; 250 Volts D-C. Continuous Current — 10 or 25 Amperes (non-inductive load). No. of Poles — Up to 12 Poles Normally Open and 12 Poles Normally Closed.

◀ **Mechanically Held** — "Stay put" on loss of line voltage, or under low voltage conditions; no hum; no coil loss. Relays are locked in either position by sturdy linkages — no delicate hooks or latches. Operated by single coil mechanism.

Magnetically Held — Suitable for use as a unit, or as a control panel component. Wide range of types and pole combinations to meet special requirements.

S. 54-9

Combinations of any of these units may be made, with purchased equipment as needed, to provide complete control panels.

PLUS Solenoid Valves . . . well over a thousand types and sizes . . . 2, 3 and 4 Way . . . for automatic and remote control of gas and liquid flow.

Other ASCO Electromagnetic Controls include Solenoids, Remote Control Switches, Contactors, Welding Controls, Battery Chargers, Engine Generator Controls; Complete Engine Starting Control Systems, Relays (Frequency Selective, Impulse, Overload and Underload, Polarized, etc.).

Write for literature; please specify control equipment of interest to you.

Measure FREQUENCY AND **To 500 MC!**
FM DEVIATION

For development . . . production . . . and
communication testing!

LAMPKIN 105-B
MICROMETER FREQUENCY METER

Heterodyne-type, uses one crystal to measure all transmitters from 0.1 to 175 mc., and crystal-controlled transmitters to 500 mc. Accuracy better than 0.005%. Readings in absolute frequency, or percentage of error from desired frequency. Useful as precision, low-level, CW signal generator, 20 mc. up. Price \$220.00.

MEET FCC SPECS—for mobile-radio maintenance. SMALL SIZE—less than 13" wide, less than 14 lbs., apiece.

For technical data, mail coupon today!

LAMPKIN LABORATORIES, INC.
Bradenton, Florida

LAMPKIN 205-A
FM MODULATION METER

Direct indication of peak deviation on voice modulation, 0-25 kc. positive or negative. Tunable 25 to 500 mc. in one band. Doubles as relative field-strength meter. Built-in speaker. Jack for oscilloscope. Price \$240.00.

BOLOMETERS & Thermistors

N-610 B. BOLOMETER

N-821B BOLOMETER

N-333 Thermistor

N-334 Thermistor

Features:

BOLOMETERS

- N-610B—Interchangeable with IN21 and IN23 crystals
- 200 ohms at 8.75 ma bias
 - Sensitivity 4.5 ohms/mw
 - Frequency Range DC—12.4 kmc
 - Total Power 32 mw

- N-821B—For use in bolometer or barretter mounts
- Electrical specifications same as N-610 B.

THERMISTORS

- N-333 • MOUNTS in all crystal Detector mounts
- Operates with all power meters and bridges
 - Resistance: 100 to 200 ohms depending on bias
 - Detecting Element; Victory 32A5/32A26 Thermistor
 - Frequency Range: DC to 12.4 K mc
- N-334 • MOUNTS in bolometer or barretter mounts
- Electrical specification same as N-333

ELECTRICAL ACCESSORIES

...made the way
you want them

pilot lights

A complete line of flush-mounted and hole-through pilot lights utilizing neon bulb. Simple, fast, positive mounting with speed nuts. Withstands vibration, overloads and shocks. U/L approved — outlasts associated equipment!

line cord plugs

New! Nylon body line cord practically indestructible. Smallest known replaceable plug provides automatic strain relief. Developed for defense application at commercial price. U/L approved.

insulated test clips

A real "first!" Alligator test clips completely encased in tough, high dielectric nylon. Ideal for use with test instruments, workbench power source and a 1000 other uses. Cannot short against each other, or with other components. Available in red or black for permanent lead mounting or as push-on attachment over standard phone jacks, or banana plugs.

control knobs

Nylon molded control knobs for standard size shafts and flatted shafts of Signal Corps standardized radio series. Bar knobs with set screw require no metal insert for maximum torque. Available in colors.

and . . .

a score of other interesting, useful accessories designed with you in mind. Complete engineering, tooling and production facilities ready to serve your needs in plastic molding and electrical assembling.

Advertiser

How about the NUCLEAR field?

There are a good many advertisers using this BUYERS' GUIDE who should also be advertising in NUCLEONICS.

Particularly in instrument and laboratory equipment, there is a cross-over of use in the electronic and in the nuclear field.

But, there is very little advertising space over in the subscriber list of these two publications — a matter of a few percentage points.

It is quite possible that your products and abilities are not getting an excellent issue, but are not getting such presentation before the fastest growing fields in the country's history — the field of atomic energy.

The sales representatives of NUCLEONICS are also the representatives of NUCLEAR ELECTRONICS. They have much evidence pointing to the opportunities in this NEW field. Ask them to show you what your potentials can be.

BUYERS' GUIDE

Here is the solution to most tough TOROID COIL WINDING Problems

—The **TOROYD** Machine

Developed and Manufactured by

"Accuracy is a Universal Word"

Universal Mfg. Co. of Hillside is a noted maker of precision instruments, waveguide and microwave components, and special machines. For years a separate department has been maintained for the winding of toroid coils and for the development and proving out thereby of toroidal winding machines.

Now Universal is ready for you with **A New Easily Operated Toroid Winder** that can meet your coil winding needs —at lower costs.

Write for Literature EU6

THESE MACHINES ARE LICENSE FREE!

Complete Line of Automatic Coil Winding Equipment Experimental and Production

ADVANCED DESIGN Gearless and Camless Speeds up to 15000 rpm

We can equip and service you with the right machinery for any winding problem from the smallest bobbin to the largest power transformer coil.

Our equipment eliminates gears and cams. Imagine having no gears or cams to buy or bother with!

Imagine the operator—without any set-up man—being able to change from one wire diameter to another, from one coil to another, and start winding an entirely new size coil in a few minutes!

This new equipment will increase your production, better your quality and lower your costs. It will pay for itself.

AUMANN
PVA 150/52

↑ AUMANN. For automatic paper Insertion while running (at 4000 rpm). Also cuts stick coils while in machine. Instant, infinitely variable adjustment by calibrated dial from one wire diameter to another, without gears. Instant adjustment, by micro stops, of coil width. No gears, cams, or set-up time. Write for literature EA5.

← METEOR. Range: from a tiny meter coil, using .0004" wire to a 9 1/2" transformer, .066" wire. Adjustable from one to the other in minutes, without gears or cams. A girl does it easily. Economical single and multiple precision winding of relay, choke, field, transformer, resistor coils etc. Write for literature EM5.

FURST ELECTRONIC INSTRUMENTS

WOW-METER Model 115-RA

Direct reading instrument simplifies measurements of variations in speed of phonograph turntables, wire recorders, motion picture projectors and similar recording or reproducing mechanisms. Ideal for laboratory and production applications—eliminates complex test set-ups.

WIDE-BAND DC AMPLIFIER

Model 220

A precision instrument for use as a preamplifier in conjunction with cathode-ray oscilloscopes, vacuum tube voltmeters and other instruments when unusually low frequencies are encountered—eliminates long waiting times due to coupling time-constants.

Model 210 TWIN Power Supply

Two independent sources of continuously variable DC are combined in this one convenient unit. Double utility makes it useful for laboratory and test station work. Three power ranges instantly selected with rotary switch.

Model 710 PR

A 1500 volt regulated power supply to provide proper power for making precise quantitative measurements with photomultiplier tubes. It is continuously adjustable from 600 to 1500 V.D.C. at 0-1 milliamperes.

TELEGRAPH DISTORTION ANALYZER

A VERSATILE NEW INSTRUMENT THAT SIMPLIFIES THE MEASUREMENT OF BIAS AND DISTORTION

The Stelma Telegraph Distortion Analyzer Model TDA-1 is a self-contained, portable unit designed to measure the bias and distortion of telegraph signals rapidly and accurately. The percent distortion is read directly on a calibrated scale mounted in front of a cathode-ray tube. The various components of distortion making up the total distortion are clearly indicated.

No test signals required.

Measurements are made on regular teleprinter traffic.

An Ideal Instrument For Telegraph Terminal Centers and Field Stations

SIMPLE TO CONNECT

The Telegraph Distortion Analyzer is patched in series into a telegraph or local telegraph circuit. It can be conveniently carried into the field and plugged into working circuits at various repeater or terminal points in order to check the distortion characteristics of circuits and equipment.

QUICK TO ADJUST • EASY TO OPERATE

No special skill or technical knowledge is required to operate the TDA.

CONVENIENTLY PORTABLE

The Telegraph Distortion Analyzer weighs only 17 lbs. and measures 8 x 12 inches.

GERTSCH PRODUCTS

Frequency Meters. Direct reading. Measures 1-1000 mc., generates 20-1000 mc. Accuracy $\pm .001\%$, resetability $\pm .0005\%$. Internal 1 kc modulation. Power: internal batteries; internal or external AC.

Filters. Passive units with unusual pass band characteristics. Push button, half-octave cut offs in following models: 37.5-13, 600 cps, 600 ohms; 10-160 kc, 135 ohms; 6.65-37.5 cps, 600 ohms.

VHF Interpolator. Requires 100 kc standard source and 1-2 mc. measuring equipment. Measures 1-1000 mc, generates 20-1000 mc. Accuracy $\pm .00001\%$.

Peak Reading Vacuum Tube Voltmeter. Measures positive peak, negative peak or peak to peak voltage of pulsed waveform. Accuracy $\pm 3\%$ of full scale. Range 0-100 volt full scale. Multipliers extend the range to 30 kv. Multipliers above 30 kv on special order.

Standard Ratio Transformers and Accessories. Extreme accuracy and resolution AC voltage dividers for measurement and generation of AC voltage ratios.

For descriptive literature or other information, contact your nearest Gertsch Engineering Representative or write factory direct.

what do
you
require
from a
parabolic
reflector?

Mecatrons yields almost perfectly uniform thickness with a minimum of stock. Current bead-design developments may increase rigidity against wind and ice.

We fabricate 2'—8' reflectors in parallel and 10' diameters regularly with a maximum currently—of 12'. Our drawing boards are occupied with plans to manufacture larger diameters.

Uniform hydraulic pressures exerted by Mecatrons yield minimum surface irregularity. High reflectivity becomes more important as frequency increases.

The parabolic equation, $Z^2 + Y^2 = 4ax$ held to $\pm .030''$ by Mecatrons in the diameters, even closer as size decreases.

Hydraulic Mecatrons, being semi-automatic, more accurately, faster than the usual methods—and novel, low-cost tooling—make it the least expensive process. Mecatrons backs this up with the East's most advanced spinning facilities and engineering services.

New data sheets C7, C8 cover radome and other information, free on request. C. W. Torngren Co., Inc., 236 Pearl Street, Somerville 45, Massachusetts.

| SO ₂ | 2 PPM | 0.03 PPM |

Figures for other substances on request.

The pick up section may be advantageously located up to 800 feet from electronic section. Two controls—only four tubes. Weighs 18 pounds and can be replaced in seconds with a stand-by unit.

MODEL 14
ULTRA SENSITIVE

D-C AMPLIFIER

Lowest Noise Level
Highest Zero Stability
of any commercially available
Breaker-Type D.C. Amplifier

Characteristics

Noise Level—almost theoretical limit.
Zero Stability—less than 0.005 microvolts per 8 hours.
Gain Variance—less than 0.3% per 8 hours.
Circuits—input circuits between 5 and 100,000 ohms.
Recording—direct.
Induced Signals—high discrimination to 60 cycle and other induced interferences.

How to keep informed on the “with what” part of your business

AT YOUR FINGER TIPS, issue after issue, is one of your richest veins of job information — advertising. You might call it the “with what” type — which dovetails the “how” of the editorial page. Easy to read, talking your language, geared specifically to the betterment of your business, this is the kind of practical data which may well help you do a job quicker, better — save your company money.

Each advertiser is obviously doing his level best to give you helpful information. By showing, through the advertising pages, how his product or service can benefit *you* and *your* company, he is taking *his* most efficient way toward a sale.

Add up all the advertisers and you've got a gold mine of current, on-the-job information. Yours for the reading are a wealth of data and facts on the very latest in products, services, tools . . . product developments, materials, processes, methods.

You, too, have a big stake in the advertising pages. Read them regularly and carefully to keep job-informed on the “with what” part of your business.

McGraw-Hill PUBLICATIONS

GUIDE to dealers and advertisers of**SURPLUS NEW
and USED****ELECTRONIC EQUIPMENT
COMPONENTS • SUPPLIES**

Now is a listing of dealers in surplus and new used electronic equipment, components and supplies. While every effort has been made to insure accuracy, this list is published as a reader service and we cannot be responsible for errors or omissions.

Advertisers appear in bold face types

- AMERICAN ELECTRONIC SALES**, 6025 Mt. Elliott, Detroit, Mich. See pg. 685
- Al Distr. Co.**, The, 5 E. Biddle St., Baltimore 2, Md.
- Equip. Co.**, 307 Canal St., N. Y. 13
- Surplus Equip. Co.**, 1469 W. 69 St., Chicago, Ill.
- Amson Electronics**, 589 E. Tremont Ave., Bronx, N. Y.
- Amson, Nat.**, 168 Washington St., N. Y. 6
- Nautical Instrument Radio Co.**, 49 Washington Ave., The Ferry, N. J.
- Craft Components, Inc.**, 755 Woodland Ave., Benton Harbor, Mich.
- CRAFT RADIO INDUSTRIES, INC.**, 85 St. John St., New Haven, Conn. See pg. 682
- Craft Radio Industries, Inc.**, 15 E. 40 St., N. Y.
- RADIO ELECTRONICS CO.**, 147 Front St., Hempstead, N. Y. See pg. 686
- USED ELECTRONIC SALES**, 74 Cortlandt St., N. Y. See pg. 686
- TRONICS**, Box 19, Boston 1, Mass. See pg. 686
- Electronics**, 135 Liberty St., N. Y. 7
- Aviation Co., Inc.**, Frank, 5383 Northwest 36 St., Miami Springs, Fla.
- Man Surplus Trading Co.**, 332 Canal St., N. Y.
- Radio Sales Co.**, 5 Lispenard St., N. Y. 13
- Electronics**, Hancock at Gray, Louisville, Ky.
- Appliance Co.**, Box 19, Boston 1, Mass.
- DW SALES, INC.**, 7460 Varma Ave., N. Hollywood, See pg. 689
- ated Industries**, 6855 Tujunga Ave., N. Hollywood, Calif.
- Equipment Co.**, 229 S.W. Blvd., Kansas City, Mo.
- Associates**, 124 Birchwood Rd., Paramus, N. J.
- ET ELECTRONIC SUPPLY CO.**, 34 N. Moore St., N. Y. 13. See pg. 693
- Y ELECTRONICS CORP.**, 136-C Liberty St., N. Y. See pg. 690
- DISTRIBUTORS**, 222 Fulton St., N. Y. 7. See pg. 689
- ING ELECTRONICS, GEO.**, 217-12th St., Oakland Calif. See pg. 692, 695
- The Radio Man**, 64 Dey St., N. Y.
- ite Distributors, Inc.**, 134 Hopkins St., Brooklyn 6, N. Y.
- s Radio & Television Corp.**, 84 Vesey St., N. Y. 7
- o Radio Supply**, 219-221 Genesee St., Buffalo 2, N. Y. See pg. 692
- LLAC ELECTRONICS CORP.**, 19 W. 26 St., N. Y. See pg. 692
- VERT ELECTRONICS, INC.**, 59 4th Ave., N. Y. 3. See pg. 692
- AL SUPPLY CO.**, 323 Canal St., N. Y. 13. See pg. 692
- ELECTRONICS, INC.**, 102 Warren St., N. Y. 7. See pg. 689
- uthers, Inc.**, Clarence, 79 Wall St., N. Y. 5
- Electronic Supply Co.**, 105-07 225 St., Queens Village, N. Y.
- SALES CO.**, Box 356-E, E. Pasadena Sta., Pasadena 8, Calif. See pg. 681
- Radio Co.**, 254 Rano St., Buffalo, N. Y.
- UMBIA ELECTRONIC CORP.**, 115 Liberty St., N. Y. See pg. 691
- umbia Electronic Sales**, 2251 W. Washington Blvd., Los Angeles 18, Calif.
- bus Sales Co.**, 1862 S. High St., Columbus, Ohio

State Labs SELLS TUBES — AND TUBES ONLY NATIONALLY ADVERTISED STANDARD BRANDS

As tube experts, State Labs maintains a battery of specialists who are constantly in touch with the industry's tube inventories and tube requirements, both in the U.S. and abroad. Supply and demand information is funneled into a central information section. It is from these daily entries, that State Labs gathers the highly specialized information that is published in its monthly price schedules, its U.S. Buyers' Guide, and other State Labs bulletins.

When you buy from State Labs, you buy from tube specialists, who know the tube business

ANYTHING WE

A WELL-INTEGRATED ORGANIZATION WITH FACILITIES AND TRAINED PERSONNEL FOR—

- DESIGN, MODIFICATION, PRODUCTION, AND TESTING OF COMMUNICATIONS AND RADAR EQUIPMENT
- SUPPLY AND DISTRIBUTION OF ALL TYPES OF EQUIPMENT AND TUBES

COMPASS has one of the largest and most diversified stocks of government surplus equipment—in its own warehouses

MARINE, GROUND AND AIRBORNE—RADIO, RADAR AND SONAR—IN STOCK

MOTOR GENERATORS CONVERTERS

INVERTERS DYNAMOTORS

We Have One of the Largest Stocks of Electrical Conversion Equipment in the East, including All Types of Rotating Machinery and a Variety of DC and AC Magnetic Starters and Controllers from 100 Watts to 100 Kilowatts

MOTOR GENERATOR, in 115 vac, out 220-250 vdc, @ 1/2 KVA. \$65.00

ESCO ROTARY CONVERTERS—Type R-1-41. Mounted in Steel Drip-Proof Boxes. Input 110 volts, 2.5 amps, 3600 rpm. Output 110/1/60 @ 1.8 amps, 200 watts. \$45.00

ESCO MOTOR GENERATORS—Dual unit (a) Input 32 v dc @ 8 amp. Output 110/1/60 @ 1.5 amps, 165 va 150w, 1800 rpm. (b) Input 32 volts dc @ 16 amps. Output 260 volts, 1500 cycles @ 4 amps. Rating 1.05 kva, 3,000 rpm. Filtered. These two units are mtd. together on bed plate, complete with control panel containing switch & 0-50 v dc meter. \$32.50 ea. part.

MOTOR - GENERATOR - ALTERNATOR—Mfr. Quality Electric Co. Ltd. Input 115/1/60 ac @ 22.5 amps, 1800 rpm. Outputs: #1 500/1000 v dc, 0.25/0.3 amp., 0.125/0.3 kw. #2 150 v dc, 0.667 amp., 0.1 kw. #3, 115 v ac 0.87 amp., 3000 cycles, 0.1 kva. PF-1. \$245.00

ESCO CONVERTER—Input 110 volts dc. output 110 volts ac @ 1.2 amps. Brand new. \$35.00

ALLIS CHALMERS CONVERTER 110 volts dc to 110 volts ac @ 1.25 kva output. \$165.00

PINCOR ROTARY CONVERTER—Input 110 volts dc. Output 220/1/60, 0.300 kva; .90 pf; 3000 rpm; cont. duty; 40°C. Filtered for Radio use. \$60.00

CONTINENTAL MOTOR-GENERATOR — 850 watts. Type CC-21991—Wt. 148 lbs. Input 115 volts dc @ 5.7 amps, 0.625 hp. Output 115 volts ac, 1 ph., 60 cycles @ 3.04 amps, 1800 rpm, 0.85 pf, 40°C temp. rise, sep. excited. Filtered. \$95.00

WESTINGHOUSE ELECTRIC GENERATOR — 10 KVA—AC. Output 115/1/60 @ 108.5 amps; .80 pf; 50°C; cont. duty 1800 fpm, sep. excited, 125 dc. DC generator Output 125 volts dc @ 8 amps. This generator is mounted on bed plate with room for motor mounting. It can be driven by any mechanically coupled motor, dc or ac or other drive. \$459.00

MOTOR GENERATOR 800-1D — Input 24-28 volts dc. Output 115 v, 800 cycles at 10.5 amps. Small and compact. \$29.50

M-209—Holtzer-Cabot—Filtered. Input 115/1/60. Output 115 volts, 8φ, 233 cycles; at 0.4 amps and 24 volts dc at 6.5 amps, 3500 rpm. \$125.00

MG-149—Holtzer-Cabot Inverter \$49.50

2J1F1 SELSYN—115-57.5v. 400 cycles \$4.45

5F, 5G—SYNCHRO—115 v, 60 cycles \$39.50

POWER UNIT TYPE 23—Rotary transformer, filtered. Input 24 vdc. Output 6.3 volts at 2 amps and 200 volts at 30 ma. \$19.50

And, of course, PE-73, PE-94, PE-98, DM-25, -28, -32, -33, etc.

HIGH CYCLE GENERATOR
Dual Voltage

115 volts AC; KW 1.5; PF 1.0, Single Phase. Cycles 800; DC; Volts 28.5; watts 500; r.p.m. 2666; mfgd. by D. W. Onan & Sons; frame No. 19533B\$99.50

SINE-COSINE GENERATORS
(Resolvers)

Diehl Type FJE-43-9 (Single Phase Rotor). Two stator windings 90° apart, provides two output equal to sine and cosine of the angular rotor displacement. Input voltage 115 volts, 400 cycle.....\$30.00 ea. Diehl Type FPE-43-1 same as FJE-43-9 except it supplies maximum stator voltage of 220 volts with 115 volts applied to rotor.....\$25.00 ea.

VOLTAGE GENERATORS (RATE)

ALNICO MIDGET D.C. VOLTAGE GENERATOR Type B-35-D\$17.50
ALNICO MIDGET D.C. VOLTAGE GENERATOR Type B-44-D\$17.50
D.C. GENERATOR: 67 V., 20 Cyc., 2-Phase, .015 amps. Type PM-1, 1200 R.P.M.\$15.00

SYNCHRONOUS SELSYNS

10 volt, 60 cycle, brass case, approx. 4" dia. x 6" long. Mfg. by Diehl and Bendix.

Quantities Available.

REPEATERS\$20.00 ea.
TRANSMITTERS\$20.00 ea.

AUTOSYN MOTOR TYPE 1

15 VAC; 60 cycle; 1-phase; DR. #4279 Foot mount-1; Mfg. Bendix Aviation Corp.\$15.00 ea.

SYNCHROS

General Electric MOO, 2J15M1; 115-57.5 Volts 400 cycle\$22.50 ea.
AUTOSYN MTR. KOLLSMAN Type #403; 32 VAC; 60 cycle; single phase\$22.50
AUTOSYN MTR. BENDIX Type #851; 32 VAC; 60 cycle; single phase\$22.50
AUTOSYN UNIT, Type IC-006-A\$35.00
Special Repeater (115V-400 Cy.)\$15.00 ea.
RF Generator (115-400 cyc.)\$10.00 ea.
Control Transformer: 90-50 Volt; 60 Cy.\$45.00
Motor (115/90 Volt-60 cyc.)\$45.00
Differential Generator (90-94 volts - 400 cycle)\$30.00 ea.
TRANSMITTER, BENDIX C-78248; 115 Volt, 60 cycle\$25.00 ea.
Differential-C-78249; 115 V., 60 Cy.\$5.00
REPEATER, BENDIX C-78410; 115 Volt, 60 cycle\$37.50 ea.
REPEATER, AC synchronous 115 V., 60 cycle, 78863\$15.00 ea.
REPEATER, DIEHL MFG. No. FJE 22-2; 115 Volt; 60 Cy., Secondary 90 V\$27.50
B GENERATOR (115/90) 60 cycles\$35.00
C Synchro Generator (115/90 volts; 60 cycle)\$75.00
D Synchro Generator (115/90 volt; 60 cycle)\$60.00
E Synchro Differential Generator (90/90 volt; 60 cycle)\$50.00
Selsyn Control Transformer: 105-55 Volts; 60 Cycle\$22.50
DISHAI Selsyn Generator: 115-105 Volts; 60 cycle\$50.00
RFI GENERATOR: 115-57.5 Volt; 400 cycle\$12.50 ea.
DIFFERENTIAL GENERATOR: 57.5-57.5 Volt; 400 cycle\$12.50 ea.
CONTROL TRANSFORMER: 57.5-57.5 Volt; 60 cycle\$7.50 ea.
SHELSYN GENERATOR: Mfg. G. E., 115-105 Volts, 60 Cycle\$27.50

PANORAMIC ADAPTER
Model AN/APA-10

Provides four types of presentation (a) Panoramic (b) Aural (c) Oscillographic (d) Oscilloscopic. Designed for use with AN/ARR-7, AN/ARR-5, AN/APR-4, SCR-587 or other equipment with I.F. or 455 kc., 5.2 mc or 30 mc. Includes 21 tubes with 3" scope tube. PRICE\$99.50

INVERTERS

10563 LELAND ELECTRIC

Output: 115 VAC; 400 cycle; 3-phase, 115 VA; 75 PF. Input: 28.5 VDC; 12 amp.\$59.50

PIONEER 12117

OUTPUT: 26 volts; 400 cycles; 6 volt amperes. 1-Phase. INPUT: 24 VDC; 1 amp.\$25.00 ea.

ALTERNATOR, CARTER

Mfg. Carter Motor Co.; OUTPUT: 7 VAC; 9.7 amp.; 650 cycles, and 295 VDC. 200 amps. INPUT: 26.5 VDC; 10.5 amps; 6500 rpm.\$49.50 ea.

PE 218 LELAND ELECTRIC

Output: 115 VAC; Single Phase; PF 90; 380/500 cycle; 1500 VA. INPUT: 25-28 VDC; 92 amps; 8000 RPM; Exc. Volts, 27.5 BRAND NEW\$39.95 ea.

PE 109 LELAND ELECTRIC

Output: 115 VAC, 400 cyc; single phase; 1.53 amp; 8000 RPM Input: 13.5 VDC; 29 amp.\$65.00

MG 153 HOLTZER-CABOT

Input: 24 V. DC. 52 amps. Output: 115 volts - 400 cycles, 3-phase, 750 VA. and 26 Volt - 400 cycle, 250 VA. Voltage and frequency regulated.\$95.00 ea.

PIONEER 12130-3-B

Output: 125.5 VAC; 1.5 amps. 400 cycle single phase, 141 VA. Input: 20-30 VDC, 18-12 amps. Voltage and frequency regulated\$75.00

12116-2-A PIONEER

Output: 115 VAC; 400 cyc.; single phase; 45 amp. Input: 24 VDC 5 amp.\$65.00

10285 LELAND ELECTRIC

Output: 115 Volts AC, 750 V.A., 3 phase, 400 cycle, .90 PF, and 26 volts, 50 amps, single phase, 400 cycle, .40 PF. Input: 27.5 VDC, 60 amps, cont. duty, 6000 RPM. Voltage and Frequency regulated.\$95.00

10486 LELAND ELECTRIC

Output: 115 VAC; 400 Cycle; 3-phase; 175 VA; .80 PF. Input: 27.5 DC; 12.5 amp; Cont. Duty.\$90.00 ea.

PIONEER 10042-1-A

DC INPUT 14 Volts; OUTPUT: 115 Volts; 400 Cycle 1-Phase; 50 Watt.\$75.00

94-32270-A LELAND ELECTRIC

Output: 115 Volts; 190 VA; Single Phase; 400 Cycle; .90 PF, and 26 Volts; 60 VA; 400 Cycle, .40 PF. Input: 27.5 Volts DC 18 amps cont. duty, voltage and freq. regulated\$95.00

PIONEER 12147-1

OUTPUT: 115 VAC 400 cycle; Single phase. INPUT: 24-30 VDC; 8 amps.\$79.50

MG 149F HOLTZER CABOT

OUTPUT: 26 VAC @ 250 VA; 115V @ 500VA; Single Phase; 400 cycle. INPUT: 24 VDC @ 36 amps.\$49.50

EICOR CLASS "A" NO. 1-3012/08-7

OUTPUT: 125 VAC; 400 cycle; single phase; 100 VA. INPUT: 24-30 VDC; 11 amps; Duty Int. Voltage and Frequency Regulated\$99.50

HAZELTINE PULSE GENERATOR
MODEL 1017

Electrical Characteristics: Pulse Freq: Initiating and sliding pulse-external. Pulse Width: Initiating and sliding pulses, 10 microseconds. Pulse Amplitude: Initiating and sliding pulses, plus 150 volts. Sliding Pulse Delay: variable over full trace length. Sweep Duration: 50, 200, and 1000 microseconds. TUBES: 16-6SJ7; 3-6AG7; 3-6L6; 2-6J5 gt; 2-6SN7 gt; 1-5U4 G; 1-6SK7; 1-6Y6G; 1-991; 1-9002. Power Input: 110-125 volts, 60 cyc. single phase; batteries none. Dimensions: 13 1/2" x 20 1/2" x 23". Weight 85 lbs. PRICE\$79.50

ALNICO FIELD MOTORS

(Approx. size overall . . . 3 3/4" x 1 1/4" diameter)
DELCO TYPE #5069600; 27.5 volts DC; 250 RPM.\$15.00
DELCO #5069230; 27.5 VDC; 145 rpm.\$15.00
PM Motors Delco Type #5069371; 27.5 volts; DC Alnico Field; 10,000 R.P.M.; dimensions 1" x 1" x 2" long; shaft extension 1/2" diameter 0.125".\$8.00

BODINE GEAR HEAD MOTORS

10:1 Gear Ratio; Motor operates: 24 VDC, 2 Amps, 1/50th H.P., 5000 RPM. NEW\$9.95

400 CYCLE MOTORS

EASTERN AIR DEVICES #133 Synchronous Motor 115 Volt; 400 cycle.\$17.50
PIONEER: TYPE CK-2 Phase; 400 cycles.\$25.00 ea.
EASTERN AIR DEVICES TYPE J49A; 115 V.; 0.1A; 7000 r.p.m. Single phase 400 cycle.\$17.50 ea.
AIRESEARCH: 115V; 400 CPS; Single phase 6500 RPM; 1.4 amp; Torque 4.6 in. oz.; IIP. .03.\$10.00 ea.

EASTERN AIR DEVICES TYPE JM8B: 200 VAC; 1 amp; 3 phase; 400 cycles, 6000 RPM.\$12.50 ea.
EASTERN AIR DEVICES, TYPE J31B; 115 V., 400 1200 Cycle, Single Phase.\$12.50 ea.
AIRESEARCH: AC Induction, 200 V; 3 Phase, 400 Cycle, 2 H.P.; 11,000 RPM; 8 amps.\$79.50 ea.
AIRESEARCH: AC Induction, 200 V; 3 Phase, 400 Cycle, 12 H.P., 6500 RPM; 1.5 amps.\$25.00
Electric Motor: PNT-1400-A1-1A Serial No. 207, 208 V., 400 Cycles, 3 Phase Kearfott Co., Inc.\$17.50 ea.

SERVO MOTOR 10047-2-A; 2 Phase; 400 Cycle, with 40-1 Reduction Gear \$17.50

SMALL DC MOTORS

GENERAL ELECTRIC #5BA10AJ18 . . . 27 VDC; RPM 110; 1 oz. FT.\$12.50
DELCO #5069625 . . . 27 VDC; 120 RPM; Governor controlled\$22.50
EMERSON 175; 12 Volt DC; 1/6th HP; 10 amp; 3800 RPM; Approx. size: 2 1/2" x 5".\$9.95 ea.
DELCO #5068750; 27 VDC; 160 RPM; built-in reduction gears.\$12.50 ea.
1. OSTER: series reversible motor 1/70th H.P.; 10-000 RPM; 27 1/2 VDC; 2 amps; SPERRY #806069; approx. size 1 1/2" x 3 3/4".\$7.00 ea.
General Electric Type 5AB10AJ37; 27 volts, DC; 5 amps, 8 oz. inches torque; 250 RPM, shunt wound; 4 leads; reversible\$12.50
General Electric, Mod. 5BA10FJ33; 12 oz. inches torque, 12 DC 56 RPM, 1.02 amp.\$15.00 ea.
General Electric Type 5BA10AJ52; 27 volts DC; 5 amps, 8 oz. inches torque; 145 RPM; shunt wound; 4 leads; reversible\$12.50
GENERAL ELECTRIC DC MOTOR Mod. 5BA10AJ1-64, 160 r.p.m.; 65 amp; 12-oz.-in. torque 27 1/2 VDC.\$12.50
2 1/2 H.P. MOTOR-Mfg. LEECE-NEVILLE Co. Type 1454-MO; 24VDC; 4000 RPM; 100 amp.\$35.00

115 VOLT GENERATORS

Brand new Eclipse generators: 115 VAC; 9.4 amp; 1000 watts; single phase; 800 cycles, 2400-4200 rpm. DC output is 30 volts at 25 amp. Unit has spline drive shaft and is self-excited \$29.95

BLOWER

Eastern Air Devices, Type J31B; 115 volt; 400-1200 Cycle; single phase; variable frequency; continuous duty; L & R. #2 blower; approx. 22 cu. ft./min.\$15.00

BLOWER: Mfg. John Oster; Type C2A-1B; 27 VDC; 63 amps; 1/100 H.P.; 7000 RPM; Series Wound\$9.95 ea.

BLOWER ASSEMBLY

115 Volt, 400 Cycle, Westinghouse Type FL 17CFM, complete with capacitor. New.\$9.95 ea.

CONNECT *with* Wilgreen

**8 TO 36 HOUR DELIVERIES
ON AN CONNECTORS**

Gentlemen:

Wilgreen Industries, through service and satisfaction, has developed into the largest jobber-distributor of AN connectors. Our many satisfied customers have been receiving immediate and scheduled deliveries as requested from our immense stock on hand.

Because we have been able to give such prompt attention on connectors these same customers have been asking us for similar service on other electronic components.

In view of these continuing requests we are going to handle all types of capacitors, electronic tubes, potentiometers, relays, resistors, rheostats, switches, transformers, etc. Also a complete series of "M" type connectors.

This expansion program is being handled by our sales manager Sol Sandler, and his staff, who will be glad to care for your inquiries and expedite delivery on them.

We, of Wilgreen, thank you for your past patronage and assure you of complete satisfaction no matter how large or small your requirements are.

Sincerely yours,

DAVID GREENBERG
WILLIAM GREENBERG

All AN Connectors are cadmium plated with Melamine inserts of yellow or blue—Dielectric. Olive Drab on request.

**RECORDER SIGNAL GENERATOR—
AMPLIFIER, & Voltage REGULATOR**

RECORDER, SIGNAL GENERATOR—AMPLIFIER, AND VOLTAGE REGULATOR UNIT OF BC-963 TRAINER — Used for assimilated Radar identification when used with BC-412 Scope. Signal Generator generates various AC wave forms. Recorder was used to record difference in scope and generator wave forms as guided by operator. 110 Volt 60 cycle operation with Manual. Shipping Weight: 270 lbs. Complete Unit. **\$59.50**

OR AVAILABLE AS SEPARATE ITEMS:
SIGNAL GENERATOR—AMPLIFIER: Can be adjusted for various wave forms. 110 Volt 60 cycle operation. Voltage regulated supply 300 Volt 100 MA. 6.3, 5 A.: 5 Volt 3 A. Power Supply. 15 Tubes: 1/7A6, 3/7A8, 3/7T7, 3/7N7, 1/5Y3GT, and 4/VR1150. With Tubes and Manual. **\$19.95**

RECORDER—Complete with 115 V. 60 cycle 1/125 HP Gear Head Motor, Veeeder Counter. Pen, etc. and with Manual. **\$19.95**

CONSTANT VOLTAGE REGULATOR—115 V. 60 cycle, 80 VA, Sola #30726. **\$14.95**

BLOWERS:

115 Volt 60 cycle BLOWER (pictured) — approx. 100 CFM Dis. 2 1/4" intake; 2" outlet. Quiet running. Motor size: 2 1/2" x 3 1/4". NEW — Not Govt. surplus. **\$8.95**

Order No. 1C939. Same as RN-520 above, except has blower assembly in each side of motor. Order No. 1C880. approx. 100 CFM. Order No. CUMPACT TYPE — 108 CFM motor built inside squirrel case, 4 1/2" Intake; 3 3/8" x 3" Dis. Complete size: 4 1/4" W. x 9 3/8" H. x 3 1/2" D. Order No. 2C067. \$14.50
FLANGE TYPE—140 CFM, 3 1/2" Intake; 2 1/2" Dis. Complete size: 8 1/2" W. x 7 1/4" H. x 6 3/4" D. Order No. 1C807. \$13.95
FLANGE TWIN—275 CFM, 4 1/2" Intake; 3 1/4" x 3" Dis. Complete size: 11 3/4" W. x 9 3/8" H. x 8 1/16" D. No. 2C069. \$21.95
MINIATURE BLOWERS—24 VDC; oblong Outlet 1" x 3/8". Dual 20 CFM \$7.95. Single 10 CFM \$5.95

TRANSFORMERS:

110 VOLT 60 CYCLE PRIMARIES:
5 VOLT CT-25A—10,000 V. Ins. OPEN FRAME—3" x 5" 4 1/2". \$7.95
Sec. Two 12 V. 4A Winding — gives 12 V. 8 A. or 24 V. 4 A. \$5.95
Sec. 24 V. 1/2 A. \$1.50 Sec. 24 V. 1 A. \$4.95

TCS

Manufactured by Collins Radio Co. for U. S. Navy. Frequency range: 1500-12,000 Kcs. master oscillator and four crystal controlled channels in transmitter and receiver. Conservatively rated at 40 watts telegraphy and 20 watts radiotelephone. For field, mobile and fixed station use. Includes:

- 1 ea. TCS transmitter
- 1 ea. TCS receiver
- 1 ea. remote control speaker unit
- 1 ea. antenna tuning unit
- 1 ea. microphone
- 1 ea. headset
- 1 ea. telegraph key
- 1 set of three cables
- 1 ea. 12 volts DC dynamotor supply or
- 1 ea. 110/220 volt AC power supply
- 1 ea. technical manual

.00015 mfd—10,000 V.
6 amps at 3 MC.
\$9.95 each

BATHTUB CONDENSER —1MFD
600 V.—Side Term.
Standard Manufacturers—
standard size. **\$39.00/100**

SPEAKER—5"—OXFORD with output transformer to match 6K6 or 6V6 tube.
Box of 40 for only **\$56.00**

TOGGLE SWITCH — DPDT — Arrow solder terminals
#20905. 3 Amp—125 volt, ball handle, solder terminals **\$35.00/100**

IMPEDANCE BRIDGE—GR 650A
This famous bridge, a standard equipment in practically every well-equipped laboratory, is now offered at the unheard of low price of
\$195.00 each
Brand new in original manufacturer's carton.

PULSE FORMING NETWORK —SPRAGUE 15-A—1-400-5
1 microsecond pulse width 400 cycle repetition frequency. 15 KV; 50 ohms impedance; hermetically sealed; capacitor type. Offered at a small fraction of original cost.
\$19.95 each

SENSITIVE RELAY—SIGMA #550
Hermetically sealed, plug-in relay, standard octal base; 2-50 ohm coils. One coil alone, pulls in 12 MA, drops out 5 MA; in series, pulls in 6 MA, drops out 2 1/2 MA.
\$2.49 each — \$210.00/100

OUNCER TRANSFORMER—UTC #0-1
Mike pickup or line to grid. Primary impedance 50, 200/250, 500/600 ohms. Secondary—50,000 ohms. Available in 100 lots. **\$3.95 each**

CHANNEL CONDENSER—1MFD—500V
Choice of top or bottom mounting.
\$40.00/100

TUBE SOCKET—JAN MIP OCTAL. AMPHENOL #59-113
Clover leaf contact—brass plate. Less than 1/2 manufacturers price
\$8.00/100 \$70.00/1000

Write for catalog No. 654 for our latest complete listing. We carry the most extensive stock in the country of each of the following items: Toggle Switches, Glass Fuses, Oil Condensers, Mica Capacitors, Rheostats and Tube Sockets. Our prices are low because we sell our own merchandise.

"Dear Mr. Anthony"...

Do you have a problem? Do you have an electronic problem? Do you have an "AN CONNECTOR problem?"

AVNET WILL SOLVE IT.

AVNET, a name long associated with connectors, takes pride in adding to its roster of fine lines THE BENDIX-SCINTILLA CONNECTORS. —What does this mean to Purchasing? What does this mean to Engineering? Simply this; —From our stocks of over 4,000,-000 connectors, your requirements can

be met with dispatch whether it be black phenolic, melamine, polychloroprene or blue (diallyl phthalate) inserts, or whether it be moisture proof, vibration proof, water proof, hermetic sealing, pressurized through bulk head, firewall or environment resistant, AVNET has it.

• Our staff of sales consultants will assist you in solving your connector problem, be it BENDIX-SCINTILLA, G.E. MONOWATT, CANNON, or AMPHENOL.

Phone, write or wire your inquiries

AN/APR-4 LABORATORY RECEIVERS

Complete with all five Tuning Units, covering the range 38 to
4,000 Mc.; wideband discone and other antennas, wavetraps,
mobile accessories, 100 page technical manual, etc. Versatile
accurate, compact—the aristocrat of lab receivers in this
range. Write for data sheet and quotations.

We have a large variety of other hard-to-get equipment,
including microwave, aircraft, communications, radar; and
laboratory electronics of all kinds. Keleket alpha scalars
and chambers, dosimeters and other nucleonics now in stock.
Quality standards maintained.

NEW TS-13/AP X-BAND SIGNAL GENERATORS with manual
\$575.00; TS-175/U Frequency Meter 85-1,000 Mc. \$485.00;
H-P, Boonton, G-R, Measurements, many others in stock.

RELAYS

Immediate
Delivery!

Relay Sales maintains the world's largest stock of relays for practically every application. Nothing but first line products of leading manufacturers are carried. Each relay is brand new, individually inspected and unconditionally guaranteed. Prices less than market.

Special attention is given to orders for one or more relays for engineering and lab samples or for experimental purposes. 24 hour delivery will be given you to draw from our stock rather than schedule your orders for months in advance.

Hundreds of Types in Stock

- STANDARD TELEPHONE RELAYS
- SHORT TELEPHONE RELAYS
- MIDGET RELAYS
- TIMERS
- AIRCRAFT CONTACTORS
- ROTARY RELAYS
- WESTERN ELECTRIC TYPE "E" RELAYS
- KEYING RELAYS
- HERMETICALLY SEALED RELAYS
- VOLTAGE REGULATORS AND CUTOUPS
- DIFFERENTIAL POLARIZED SPECIAL RELAYS BK-SERIES
- ANTENNA AND CERAMIC RELAYS
- MOTOR AND CONTROL RELAYS
- RELAY AND ASSEMBLY LATCHING AND LOCKING MECHANICAL RELAYS
- RATCHET AND TRIP PING RELAYS

Thousands of other tubes

NEW
 TS-147 B/UP TEST SET
 TS-147 C/UP TEST SET
Hard-to-get X-Band SIGNAL GENERATOR
 Now Available

Test Set TS 147 UP is a portable Microwave Signal Generator designed for testing and adjusting beacon equipment and radar systems which operate within the frequency range of 8500 MC to 9600 MC.

NEW UNUSED SURPLUS TS 259 K BAND
 23400-24500 MEGACYCLES SIGNAL GENERATOR

NEW MICROWAVE TEST EQUIPMENT TS148/UP SPECTRUM ANALYZER

Field type X Band Spectrum Analyzer, Band 8430-9580 Megacycles. Will Check Frequency and Operation of various X Band equipment such as Radar Magnetrons, Klystrons, TR Boxes. It will also measure pulse width, c-w spectrum width and Q or resonant cavities. Will also check frequency of signal generators in the X band. Can also be used as frequency modulated Signal Generator etc. Available new complete with all accessories, in carrying case.

SPECIAL! 5,000 V. POWER SUPPLY
 For IP25 Infrared Image Converter from 3 V. Battery Source. **\$990**
 NEW, Complete with RCA 1654 Tube.

30,000 5BPI SCOPES IN STOCK

Other test equipment used checked out, surplus

HOW ARE YOUR COMMUNICATIONS

Do the booklets, pamphlets, and manuals you use really *work* for you? Are these vital publications, that tell the story of your products and your company, as effective, readable, well designed and illustrated as they should be? Today more than ever, your entire operation is judged by each annual report, employee manual, and public relations piece that you produce. Have you examined your communications lately? If you have any doubts as to the impact of your instructional and promotional literature, remember . . .

COMMUNICATION IS OUR BUSINESS

For a good many decades McGraw-Hill has stood for complete competence in the business literature field. Now the McGraw-Hill TECHNICAL WRITING SERVICE offers a new approach to your publication problems — an integrated writing, editing, illustrating, and printing service for the complete production of: INSTRUCTION MANUALS, PRODUCT BULLETINS, TRAINING MATERIAL, INDUSTRIAL RELATIONS LITERATURE, ANNUAL REPORTS, COMPANY HISTORIES, PROCEDURAL GUIDES and other collateral literature. More than 150 editorial and graphic experts are at your disposal, ready to prepare high-quality material to your own or government specifications. Save time, save money . . . and make your communications work! Let *our* staff be your staff for all technical and business publications.

SYLVANIA RADIO and TV TUBES

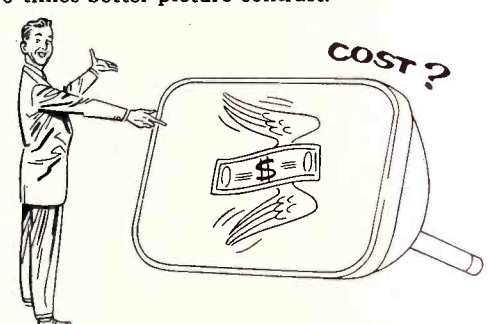

What are your
Aluminized
Picture Tubes
 Problems?

Now Sylvania offers a full line!

Today, because of greatly increased facilities and improved manufacturing techniques, Sylvania is in a position to offer you perfect answers to your aluminized picture tube problems.

And, much more than your physical spec requirements, Sylvania Aluminized Tubes also offer the finest *performance!* These tubes give whiter whites and blacker blacks . . . a 6-times better picture contrast.

means Sylvania's new aluminized tubes make your sets stand out
 of competition. The improvement is obvious . . . and immediate.
 the low prices will amaze you!

for the full story concerning Sylvania's complete aluminized tube
 and how they can help your future sales, write a note on your
 headed to Dept. 4R-74, Sylvania Electric Products Inc., 1740
 Broadway, New York 19, N. Y.

. . . and for the finest in Receiving Tubes

During more than a quarter of a century, Sylvania Receiving Tubes have earned a world-wide reputation for the finest quality and performance. So remember — for any electronic application, there's a Sylvania Electronic Tube.

Note 1 - Units are matched in the forward direction at 1 volt so that the current flowing through the lower resistance unit is within 10% of that through the higher resistance unit. Ratings are shown for each diode.

Note 2 - Consists of four specially selected and matched diodes whose resistances are balanced within $\pm 2.50\%$ in the forward direction at 1.5 volts. For additional balance, the forward resistance of each varistor pair is matched to within three ohms. Ratings shown are for each diode.

Note 3 - Units are tested in a circuit employing an input of 1.6 volts rms at 40 MC, 75% modulated at 400 cycles. Demodulated output across a 4700 ohm resistor shunted by a $5\mu\text{mf}$ capacitor is a minimum of 1.55 volts peak to peak.

Note 4 - Minimum specified reverse resistance applies to all points between 0 and -10 volts with 60 cps sweep.

*Indicates JAN type

Note 5 - Consists of four specially selected diodes whose forward currents are matched within a range of 1 ma. with 1 volt applied. Ratings shown are for each diode.

Note 6 - The 1N82, 1N82A, and 1N172 are low noise and low conversion loss UHF television mixer crystals. The noise factor of the 1N82 is 15 db max., that of the 1N82A and the 1N172 is 14 db max. The noise factor is measured at 700 mc with a local oscillator drive (bias current) of 0.5 ma.

Note 7 - Units are tested in a circuit employing a fundamental frequency of 126 MC. The rectified 3rd harmonic output is 0.5 ma. minimum.

Note 8 - Minimum specified reverse resistance applies at 55°C for all points between -10V and -50V with 60 cps sweep.

Note 9 - Reverse recovery time for these units is specified and defined as the time required for the diode to recover to a given reverse cur-

rent when the operating voltage negative 30 ma. forward conduction is switched to -35 volts.

| Type | Reverse Current μa max | Reverse Resistance ohms min. |
|-------|-----------------------------------|------------------------------|
| 1N119 | 700 | 50K |
| | 87.5 | 400K |
| 1N120 | 700 | 50K |
| | 175 | 200K |

Note 10 - Units are tested in a circuit employing an input of 0.1 volts rms at 140 MC. Rectified output is a minimum of 140 mV across a 3600 ohm load and 65 uH shunted capacitor.

Note 11 - Normally supplied with minimum leads but will be supplied with clip-in applications upon request. The polarity of all Sylvania crystal diodes is indicated by a graphic symbol on the body, the arrow of which indicates the direction of easier (conventional) current flow.

Sylvania Germanium Diodes are long-life, lightweight, heaterless components that have found hundreds of applications in clippers, limiters, discriminators and other circuits calling for low power rectification at frequencies up to several hundred megacycles. They have low shunt capacity and no contact potential. Convenient pigtail leads

eliminate the need for mounting hardware.

Sylvania Duo-Diodes consist of two matched diodes mounted in a single unit.

Sylvania Varistors, types 1N40, 1N41 and 1N42, consist of 4 specially selected and matched germanium diodes whose resistances are

balanced within $\pm 2.5\%$ in the forward direction at 1.5 volts. Varistor Type 1N71 consists of matched low impedance diodes whose forward currents are within a range of 1 ma. with +0.5 volt applied. Ratings shown are for each diode. Types 1N40, 1N42 and 1N71 are plug-in type; 1N41 is lug type.

MICROWAVE CRYSTALS, Transistors, Photodiodes and Glow Transfer Tubes

MICROWAVE CRYSTAL DIODES

Sylvania Silicon Diodes

1N21B, 1N21C, 1N23B, 1N23C, 1N25, 1N26, 1N53 and 1N78 are used chiefly as first detectors in radar and other microwave superheterodyne receivers.

Type 1N79 is designed for use in microwave test probes, power indicators and other instruments.

Types 1N31 and 1N32 are used as video detectors.

| Type | Design Freq. (mc) | Max. Conv. Loss (db) | Max. Output Noise Ratio | Burnout Test | I.F. Imp. (ohms) |

Transistors

Hermetically sealed. Leads can be clipped for plug-in applications.

2N32—Point contact for pulse and switching circuits in large signal medium speed applications.

2N34—PNP Junction general purpose amplifier for high gain, low power, low frequency circuits.

2N35—NPN Junction designed for audio amplifier use.

2N68—PNP Junction medium gain, high power, output transistor. Provides 3 watts output in push pull Class B amplifier.

3N21—Point Contact tetrode for switching and small signal applications.

Glow Transfer Tubes

Cold cathode, bi-directional, direct reading decade counter tubes, 350 volt supply.

6476—Multiple output cathode—25 volts output across cathode resistor.

6482—Single output cathode—15 volts output across cathode resistor.

Photodiode 1N77A

Miniature highly sensitive junction photodiode for operation in visible and infra-red regions. Peak sensitivity at 15,000 Angstrom units.

Total energy in simulated spike of pulse TR box in radar service.

Peak power pulse under pulsed condi-

MICROWAVE COMPONENTS

ROCKET TUBES

Sylvania Rocket Tubes are planar-electrode disc-seal triodes for use as oscillators and amplifiers at frequencies up to 3300 mc. Design permits broad band operation. Tuning is simpler and covers a greater continuous range than that of many other types of uhf tubes.

6BL6

KLYSTRONS

Sylvania Types 6BL6 and 6BM6 are intended for use as c.w. oscillators. They are of the separate cavity type, with oscillation frequency depending chiefly on external tuning. 6BMA, 5836 and 5837 are suitable for either c.w. or pulsed operation. Write for catalog EC-40B.

| Type | Mode | Frequency Range (mc) |
|------|-----------------|----------------------|
| 6BL6 | 1 $\frac{1}{2}$ | 1600-4000 |
| | 2 $\frac{3}{4}$ | 2100-4500 |
| | 3 $\frac{3}{4}$ | 4000-5500 |
| 6BM6 | 1 $\frac{1}{2}$ | 550-2300 |
| 6BMA | 2 $\frac{3}{4}$ | 1100-3000 |
| 5836 | 1 $\frac{1}{2}$ | 1600-4000 |
| | 2 $\frac{3}{4}$ | 2100-4500 |
| | 3 $\frac{3}{4}$ | 4000-5500 |
| 5837 | 1 $\frac{1}{2}$ | 550-2300 |
| | 2 $\frac{3}{4}$ | 1100-3000 |
| 6468 | 3 $\frac{3}{4}$ | 6125-6425 |
| 6469 | 3 $\frac{3}{4}$ | 6575-6875 |

Integral Cavity Waveguide Output

For microwave relay link or local oscillator

- * 6465-5950—6400 mc—Integral 2 Cavity Klystrons
- * 6466-6800—7175 mc—Integral 2 Cavity Klystrons

* 6-9 watt output for master oscillator amplifier or synchrodyne mixer

- 20—is a pulse-modulated oscillator for frequencies up to 3300 mc.
- 21—is designed for use as a c.w. oscillator up to 3300 mc. disc is flat, grid disc folded.
- 22—is a pulse-modulated oscillator for use up to 3300 mc.
- 23—is for use as a c.w. oscillator without external feed-in the range from 900 to 3000 mc.
- 24—is a c.w. oscillator for use up to 3300 mc. Both discs folded.
- 25—is intended for use as a c.w. amplifier-mul-tiple up to 3000 mc.
- 26—is intended for use as a c.w. amplifier-mul-tiple up to 3000 mc.
- 27—High gain, low noise, UHF television am-plifier.

HYDROGEN THYRATRONS

Sylvania Hydrogen Thyratrons are designed for service at high repetition frequencies, high currents and high voltages. An outstanding feature is very short de-ionization time, which results in an unusually high switching rate.

- 4C35 — 90 amp peak anode current
- 5C22 — 325 amp peak current
- HT415 — Special jitter free 5C22
- 5948/1754 — 1000 amp peak current
- 5949/1907 — 500 amp peak current

ELECTRONIC DIVISION LITERATURE

Germanium Diode Applications Literature

Sylvania offers you the most complete collection of germanium diode applications ever published. "Industrial Uses for Germanium Crystals" contains 27 never-before-published circuits for industrial applications of Germanium Crystals.

"40 Uses for Germanium Diodes" covers applications in receiver, transmitter instruments and control circuits. "Electronics Shortcuts for Hobbyists" describes applications in all types of devices of interest to the home hobbyist, "screwdriver mechanic," and electrical experimenter. "Crystal Diode Circuit Kinks" describes many new applications of germanium diodes in crystal meters, TV receivers, and electrical experiments. Price of each book — \$0.25.

NEW SYLVANIA SOCKETS Save Assembly Time...Cut Costs ...Improve Performance!

Look over these new Sylvania 7-pin Miniature Printed-circuit Sockets. Contacts and center shield are shaped so that sockets can be stacked one upon another for automatic feeding and assembly. Small slots are used on the circuit board to receive the contacts. This results in stronger chassis construction.

Only one socket assembly need be stocked since terminals can be interconnected by printing the circuit on the chassis board rather than using a metallic connector on the socket itself.

Insulator is molded of general-purpose or low-loss phenolic. Contacts are brass or phosphor bronze, plated to suit your specification. Supplied with or without center shield. Now available in 7-pin construction with 9-pin miniature and other types to follow. Tube Shield Ground Strap can also be furnished.

Also find out about the New Sylvania less-type Sockets for wire-wrapped connections. These are now being made in all 7 miniature sizes. Contacts are shaped to provide reliable connections with the use of wire-wrapping tools.

For full information concerning these or other Sylvania parts, or special quantities of components engineered to your own specifications, write to Dept. 4A-74, Sylvania Electric Products Inc., 1740 Broadway, New York 19, N. Y.

SYLVANIA ELECTRONIC COMPONENTS

**"MORE QUALITY PARTS
...BY SYLVANIA"**

Sylvania now offers you a wide variety of highest quality terminal strips... equipped with from 2 to 10 lugs... depending on style, suitable for many different applications. 3 different styles are available in lug spacings of $\frac{3}{8}$ " and $\frac{1}{2}$ " spacings. 2 types are available with lugs in 2 to 10 positions. The 3rd type is available with 2 to 7 lugs.

Terminal strips are made of NEMA grade P laminated phenolic—chocowaxed, unwaxed or XXX P natural phenolic, waxed or unwaxed. Contacts are of brass, solder plated. Contacts are brass or cadmium-plated. Sylvania Terminal Strips can be supplied to your specifications.

Today, with enlarged, modern plastic molding equipment and metal stamping facilities, Sylvania offers you precision-built components of the highest quality. For new illustrated sheets showing the complete line of Sylvania Terminal Strips and other radio and electronic components available, write to: Sylvania Electric Products Inc., Dept. 4A-74, 400 Broadway, New York 19, N. Y.

TUNGSTEN AND CHEMICAL PRODUCTS

WIRE ...

ROD ...

COILS ... POWDER

Sylvania Tungsten wire, rod, and components are quality controlled from ore to finished products and tested in the laboratory and in the field. Suppliers to all leading manufacturers in the radio and television industry, Sylvania offers you tungsten and chemical products that meet the highest standards of purity, precision, and uniformity.

Let Sylvania help you

Sylvania maintains large diversified metallurgical and chemical laboratories for the development and perfection of its many products. Today,

these facilities are also available to help you. Sylvania engineers, Sylvania "know-how," and Sylvania equipment will aid you in product development or in the solution of tough manufacturing problems.

If it's a question concerning anything . . . from a precision, custom-made tungsten wire to a specially-ground tungsten part, or from a high-purity phosphor to germanium dioxide for your crystals . . . put it up to Sylvania. A note on your letterhead will bring you the information you require. Address: Dept. 4T-74, Sylvania Electric Products Inc., 1740 Broadway, N. Y. 19, N. Y.

HIGH PURITY SYLVANIA TUNGSTEN and CHEMICAL PRODUCTS NOW AVAILABLE INCLUDE:

Tungsten

- Radio Heater and Grid Wire
- Support Wire and Rod
- Gold Plated Wire
- Ground Seal Rod
- Formed or Ground Parts
- Cut and Bevelled Pieces
- Hand Wound Coils

Molybdenum

- Wire, Rod
- Metal Powder

Special High Purity Chemicals and Compounds

- Potassium Silicate • Etching Inks
- Carbonate Emission Coatings
- Mica Spray Coatings
- Basing Cements

Metal Powders

- Silicon • Germanium

Phosphors

- Cathode Ray Tube Phosphors

Initial sintering of a tungsten ingot formed by high compression of tungsten metal powder.

VIDEO AMPLIFIER

Optimum transient response analysis yields design curves that permit rapid determination of parameters and evaluation of circuit performance for video amplifiers using conventional types of peaking networks. Typical examples are worked out in detail.

By **W. K. SQUIRES**
and **H. L. NEWMAN**

OF THE VARIOUS elements of television systems, the low-pass or video amplifier has probably received the most extensive investigation. The majority of the analytical work¹ has been confined to the determination of the steady-state characteristics of the various coupling networks employed. Only recently has attention been focused on the transient response.^{2,3,4}

The purpose of this paper is to show how transient analysis can provide the engineer with a direct, reliable method of resolving circuit limitations and performance specifications into an optimum video amplifier design.

The problem of attaining an optimum design is as follows: certain definite performance criteria are established; that is, gain, maximum rise time and overshoot permissible. Generally, stray circuit capacitances can be evaluated or at least estimated. The problem thus narrows down to determining the type and number of tubes to employ and the best coupling network configuration. Finally, the constants of the various circuit elements must be ascertained.

General Procedure

The general analytical procedure used in preparing the accompanying design curves was as follows: an equivalent circuit was drawn for each video coupling configuration considered, including the effect of inductance losses and distributed capacitances. Then, circuit equations were written in Laplace forms^{5,6} and solved for the relative

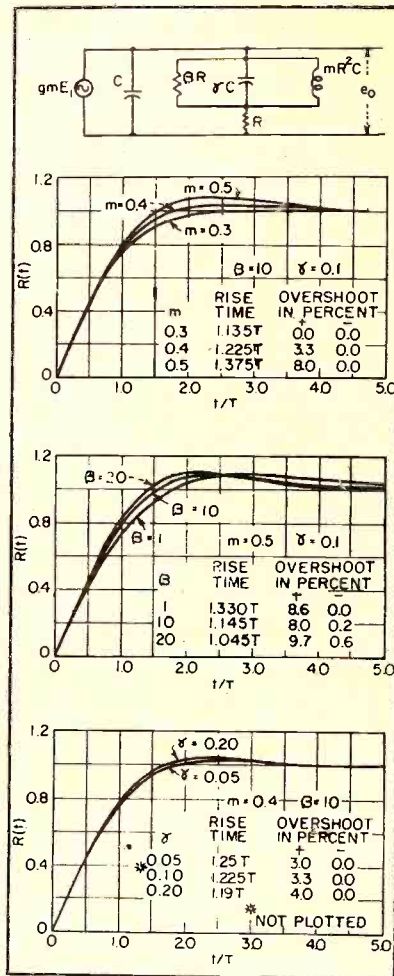

FIG. 1—Pentode shunt peaking

response to an input step function.

In most cases, the large number of energy storage elements appearing in the circuit resulted in expressions in S of high degree which would not afford a general time solution. Consequently, numerical values for each of the various parameters were chosen, and time solutions obtained and plotted for a large number of numerical cases. From these individual solutions, optimal values of the parameters were deduced and checked not only by trial time solutions but also by experimental work with model circuits. These values are presented in the design curves.

The video coupling circuits con-

FIG. 2—Pentode series peaking

sidered were those usually described as shunt, series, or series-peaked. Both triode and pentode equivalent generators were included, and in the case of the pentode, families of curves were plotted to study the effect of load resistances.

Pentode Peaking

The simplest case is the series-peaked pentode having the equivalent circuit shown in Fig. 1. The circuit elements are expressed in parametric form; for example, the distributed capacitance of the tube inductance is simply γC . It has been observed by many workers that an optimum

DESIGN CHARTS

Fig. 3—Design curves for pentode series peaking for optimum m , β and γ ($\gamma=0.1$)

lies close to 0.4. It can also be seen that distributed capacitance is the inductance causes no difficulty until γ exceeds 0.2. Since γ represents the relative loss of the inductance, the effect of coils of low Q can be determined. The curves in Fig. 1 show the effect of varying m , β and γ .

The equivalent circuit for pentode series peaking is shown in Fig. 2. As the value of α is not normally under the control of the designer, optimum values for the other parameters have been obtained and these are plotted in the design curves of Fig. 3. For any value of α , the curves give the values of m and β to produce the minimum rise time for a maximum overshoot of one percent. It should be observed that values of α near 0.4 offer the shortest rise times. In Fig. 2 the effect of varying α and β can be determined for a practical circuit design.

A combination of the shunt and series peaking circuits is shown in Fig. 4. In this case there are six storage elements, and as expected, this relatively complicated circuit is very sensitive to changes in parameters. However, if the constants are properly chosen, much shorter rise times are possible than can be obtained with the simpler circuits.

parameters and the difficulty in solving even specific numerical cases of the circuit equation, the attainment of optimum conditions for all values of α is not a simple task. Although further analytical work is still in progress, Fig. 4A shows the effect of varying both the series and shunt inductances while Fig. 4B gives optimum values for the parameters to produce minimum rise times with small overshoot for various values of α .

In all of the cases presented above, the pentode has been considered as a constant-current generator. When it is necessary to consider the effects of low plate resistances, the triode equivalent generator (the constant voltage source with finite series resistance) should be adopted. Although this approach is most valuable for triode representation, it is also useful for the analysis of low-plate-resistance pentodes.

Triode Peaking

The equivalent circuit with the triode plate resistance given parametrically as ρR is shown in Fig. 5 along with relative response for various values of the parameters.

The effect of changing ρ is particularly interesting; as may be deduced from these curves and as will be shown later, the performance of the triode is superior to that of the pentode when plate-supply power and peak output voltage become important.

The equivalent triode series peaking circuit is shown in Fig. 6. The circuit has the relative response for various values of the parameters given in the curves of Fig. 6. From the analysis of many such curves, optimum relations of the parameters are obtained and plotted in Fig. 7. When these optimums are utilized, the resulting rise times are those given by Fig. 8. All responses resulting from the use of these values have overshoots of less than one percent.

The triode combination peaked circuit is shown in Fig. 9. Of all the circuits analyzed, the triode combination is by far the most involved. At the present time, insufficient data has been obtained to attain optimum relations as given in other cases. However, typical curves which will permit some understanding and application of this

FIG. 4—Pentode combination peaking

FIG. 5—Triode shunt peaking

Video Amplifier Design Charts

circuit are given. Figure 9A shows the effect of changing α while the result of varying k is shown in Fig. 9B.

Figures of Merit

When the response of the video coupling circuits is known, the remaining step in formulating the design procedure is to provide some method of selecting the best tube for the particular application. At least from the standpoint of tube performance, this can be done with the aid of figures of merit. From these merit figures contemporary tubes can be evaluated and their figures tabulated for different applications. This has been done but the tabulation is so extensive as to be prohibitive here.⁷

Although a general design procedure applicable to the majority of situations can be outlined, certain limitations are unavoidable. As all of the optimum relations previously described are for very small overshoot cases, the overall response of multistage amplifiers can be determined from the well known rule^{4,8} that the overshoot stays practically constant and the rise time is equal to the square root of the sum of the squares of the individual stage rise times.

The procedure that will be described is intended for single-stage design but with consideration of system problems it can be employed with multistage amplifiers. It is clear that no design procedure can take into account all the probabilities of individual problems such as cost, space and maintenance factors, but it can provide a general technical approach which should simplify the organization of the overall design problem.

Typical Problem

To illustrate the design procedure, let it be required to design a single-stage video amplifier having maximum possible voltage gain, less than one percent overshoot and a rise time of 0.1 microsecond. The stage is to work into a load having a total input capacitance of 20 μf ;

FIG. 6—Triode series peaking

the stray capacitance at the output of the tube itself is estimated to be 8 μf . The coupling network is to be relatively simple of adjustment.

These performance requirements indicate that series peaking should be used since this configuration yields low rise time and only moderate circuit complication. Calculations will be made for both pentodes and triodes, with the former being considered first.

Reference to the figures of merit for pentodes used for voltage gain indicates that the 6AH6 represents the best choice of tubes for this application. The significant data for this tube are: $g_m = 9,000 \mu\text{mhos}$, $C_{out} = 2.0 \mu\text{f}$, $C = 2.0 + 8.0 + 20.0 = 30.0 \mu\text{f}$, $\alpha C = 2.0 + 8.0 = 10.0 \mu\text{f}$ and $\alpha = 0.333$. Then, from Fig. 3: $t_r = 1.51 RC$, $m = 1.5$ and $\beta = 2.0$.

Therefore $R = 0.1 \times 10^{-8} / 1.51 \times 30 \times 10^{-12} = 2,210$ ohms
 $L = mR^2C = 0.333 \times 1.5 \times$

$$(2,210)^2 \times 30 \times 10^{-12} = 73$$

$$R = 2.0 \times 2,210 = 4,420$$

$$\text{gain} = g_m R = 19.9$$

This completes the design of the pentode stage. The triode stage is approached in a similar manner. The 12AV7 is found to have the following figures of merit to be the best choice and has the following characteristics: $\mu = 41$, $r_p = 4,800 \Omega$, $C_{out} = 0.45 \mu\text{f}$ so that $C = 8.0 + 20.0 = 28.45 \mu\text{f}$ giving $R = 845 \mu\text{f}$ and $\alpha = 0.297$.

From this point, the design procedure for triodes is not as straightforward as that for pentodes since t_r is a function of α and ρ . A rapidly converging trial and error process can be used to determine ρ and R as follows: assume $\rho = 0.5$. Then $R = 9,600$ ohms. From Fig. 7: $m = 0.54 RC$, and $R = 0.1 \times 10^{-8} / 0.54 \times 28.45 \times 10^{-12} = 6,250$ ohms.

This means the assumed value of ρ is too small: assume $\rho = 0.4$ which requires $R = 4,800$ ohms.

Again, from Fig. 7 and $R = 4,570$ ohms, $m = 0.77 RC$, and $R = 4,570$ ohms is still too low. Another trial indicates that a value of $\rho = 0.42$ is probably correct. This is probably so and yields a value $R = 4,570$ ohms. Then, from Fig. 7: $m = 0.42$ and $\beta = 1.05$. The

FIG. 7—Triode series peaking for determining optimum m and β

the actual constants are calculated
 $\tau = mR^2C = 70.5 \mu\text{h}$
 $R = 1.05 \times 4,450 = 4,670 \text{ ohms}$
 $\text{gain} = \mu / (1 + \rho) = 41 / 2.08 =$

Special Characteristics

Examination of any of the triode response curves showing the results of varying ρ , discloses the fact that as ρ increases so does the rise time. If at the same time reference is made to typical triode characteristic curves, it can be seen that r_p and consequently ρ varies very rapidly with grid voltage, particularly in the region near cut-off. As a result, the rise time of the triode amplifier is a function of its driving voltage; when the grid voltage is far negative, the rise time is long, decreasing as the grid voltage becomes less negative. Over the normal operating range of typical triodes when used as video amplifiers in class A, this effect is relatively negligible as the variation of ρ is slight.

However, this characteristic of variable rise time can be exploited when triodes are used to amplify asymmetrical voltage such as a video signal. If a video signal of sufficient amplitude, with the synchronizing signal polarized negative is applied to the grid of a triode amplifier the rise time of the signal will be longer during synchronizing time than during picture time. It is possible under these circumstances to have the rise time necessary to good video amplification and at the same time have a slow rise time, or narrow bandwidth channel, for the synchronizing signal.

As a ratio of maximum to minimum rise time of the order of five is possible, it can be seen that considerable improvements in signal-to-noise ratio for the synchronizing signal can be obtained. The design of a triode stage to be operated in this manner is made with the same procedure previously described and the rise time and subsequent bandwidth reduction determined from

FIG. 8—Triode series peaking curves for determining optimum f_r .

FIG. 9—Triode combination peaking

the optimum curves for the peaking circuit.

From the transient analysis of several video coupling networks, relationships among the various parameters have been obtained to produce optimum transient responses. When these optimum relationships are combined with applicable figures of merit, a de-

sign procedure is formulated which permits direct and concise design of both pentode and triode amplifiers.

Summary and Conclusion

From study of the triode response curves and experience with actual circuits, it is clear that the triode amplifier is quite superior to the pentode when the attainment of maximum output voltage is the major criterion. For the same plate supply power and tube dissipation, a triode, properly peaked, can produce from two to three times as much voltage output as a pentode. Of course the problems of cascading and driving the triode are relatively complex, but in many applications the increase in complexity would be a small price to pay for the increase in overall performance. In addition, the triode offers certain advantages in synchronizing signal-to-noise ratio.

From the standpoint of circuit synthesis, the use of the direct solution of circuit equations in terms of their primary functions, in this case reproduction of transients, leads to simple and interpretable design formulation.

The authors are particularly indebted to Karl R. Wendt for his general guidance and criticism and to Laverne H. Hardy for his extensive assistance in the analytical work.

AUDIO NOMOGRAPHS

Three nomographs give component values needed to obtain desired gain and bandwidth in a pentode audio-frequency amplifier, without use of sliderule. Method involves use of equivalent circuits for high, low and middle frequency ranges

DESIGN of a pentode a-f amplifier is simplified by reducing the basic circuit to equivalent circuits for mid-range, high and low frequencies¹, as shown in Fig. 1. Optimum values of circuit components can be obtained directly from the nomograph in Fig. 2, 3 and 4. An actual example will serve to illustrate the design procedure, after which the condensed instructions alongside Fig. 4 should suffice for practical use.

Example. Design an amplifier having 40 db (100 times) voltage gain with a -3 db passband of 50 to 20,000 cps. This is to drive a 6V6 self-biased power amplifier, for which a 500,000-ohm grid resistor R_g is recommended for self-biased operation.

Choose a pentode that will give the required gain. Here the 6SJ7 would seem to be a good choice since it has high transconductance and the same heater voltage requirement as the 6V6. Reference to a tube manual gives a g_m of 1,600 micromhos and $R_p = 1$ meg for 250 plate volts and -3 grid volts.

To find R_L , first locate 40 db (or 100 times) on the A scale and 1,600 on the g_m scale of Fig. 2. Draw a straight line through these points and read 63,000 ohms for R_{equiv} . Draw a second straight line from R_{equiv} to 0.5 meg on R_p , to intersect R_L at 75,000 ohms. Use 82,000 ohms, the closest 10-percent RETMA value, as the plate load resistance.

By **JOSEPH F. SODARO**

To check the upper 3-db-down frequency limit f_1 , add 7 $\mu\mu\text{f}$ for the 6SJ7 output capacitance C_o , 9.5 $\mu\mu\text{f}$ for the 6V6 input capacitance C_i and an estimated 13.5 $\mu\mu\text{f}$ for stray and wiring capacitance C_w to get 30 $\mu\mu\text{f}$ for C_s . (A safe guess for C_w in conventional circuits is 10 to 15 $\mu\mu\text{f}$.) Draw a line from 63,000 on R_{equiv} (Fig. 3) to 30 on C_s and read 83,000 cps on f_1 . Thus, the upper 3-db-down frequency f_1 is

more than adequate with the estimated shunt capacitance. If f_1 is too low, the shunt capacitance or R_L must be reduced. Lower R_L will reduce the mid-frequency gain, however.

To determine the minimum allowable coupling capacitance C_c , add 500,000 and 82,000 to get 582,000 ohms for $R_p + R_L$. Draw a line on Fig. 4 from this to 50 cps on f_2 and read 0.0055 μf on C_c as the minimum allowable coupling value. The reactance of this capacitance equals $R_p + R_L$ at the lower 3-db-down frequency f_2 . Use 0.006 or 0.01 μf .

Next, determine the minimum allowable screen bypass capacitance. From tube and circuit data, choose 370,000 ohms for screen dropping resistor R_s . Divide $f_2 = 50$ by 10 to get 5 for f_3 . Draw a line through these R_s and f_3 values on Fig. 4, and read 0.09 μf on C_s . Use 0.1 μf .

Finally, determine the minimum allowable cathode bypass capacitance. From tube and circuit data, choose 680 ohms for R_k . Multiply this by $G_m = 1,600 \times 10^{-6}$ mhos to get 1.08 which is approximately one. According to the tabulation alongside Fig. 4, f_4 is then $f_3 \div 10$, or 5. Connect 680 on R_k with 5 on f_4 and read 47 μf on C_k as a minimum allowable cathode bypass capacitance.

FIELD-POWER CONVERSION

Direct-reading conversion chart enables quick transfer of propagation data from field-strength to power-density values. Gain in db above 1 microvolt per meter or gain or loss in db above 1 microwatt per square meter shows at a glance

IN calculations involving propagation curves it is often convenient to do the computation in terms of power density rather than in terms of field strength, which is given in most propagation curves. Changing field intensity into power density can be greatly simplified by the conversion chart.

The chart is based upon the equation

$$P = \frac{E^2}{120\pi}$$

By **ROBERT E. PERRY**

where E is the field intensity, P is the power density and 120π is the resistance of free space.

The conversion chart is direct reading. A value on the left scale

can be found in terms of the right scale on the right side by reading directly across, or it can be read in terms of the upper or lower scale by reading over the diagonal line and then down to the desired scale.

For example, a field of 50 μV per meter corresponds to a power density of approximately 10^{-10} watts per square meter, which is 54 db above 1 μV per meter or about 32 db below 1 μW per square meter.

TRANSISTOR EQUATIONS USING h-PARAMETERS

Equations based on four h-parameters of base-input common-emitter circuit permit rapid calculation of operating characteristics for other circuit configurations, using easily obtained measurements

By C. C. CHENG

SIMPLIFICATION of transistor circuit calculations and measurements result from specifying the four-terminal network with input current i_1 and output voltage v_2 as independent variables and output current i_2 and input voltage v_1 as dependent variables. The h -parameters are thus introduced, and circuit equations become

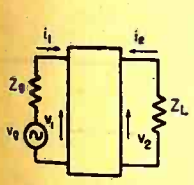

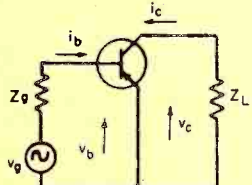

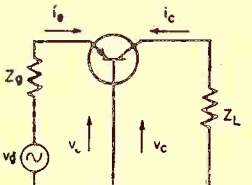

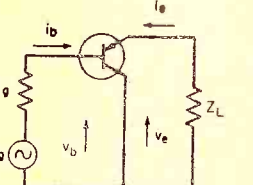

$$v_1 = h_{11}i_1 + h_{12}v_2 = \frac{1}{y_{11}}i_1 + \mu_{12}v_2$$

$$i_2 = h_{21}i_1 + h_{22}v_2 = \alpha_{21}i_1 + \frac{1}{Z_{22}}v_2$$

where h_{11} , h_{12} , h_{21} and h_{22} are the

four h -parameters and $y_{11} = 1/h_{11}$ is defined as the short-circuit input admittance, $\mu_{12} = h_{12}$ the reverse open-circuit voltage gain, $\alpha_{21} = h_{21}$ the forward short-circuit current gain, and $Z_{22} = 1/h_{22}$ the open-circuit output impedance. These parameters are comparatively easy to measure and show directly the funda-

mental properties of the transistor, such as current gain. The fundamental parameters selected in this paper are the four h -parameters of the base-input common-emitter circuit. They are $y_{11e} = 1/h_{11e}$, $\mu_{bc} = h_{12e}$, $\alpha_{cb} = h_{21e}$, and $Z_{22e} = 1/h_{22e}$. All the circuit equations summarized in the following table for three basic circuit configurations are in terms of these four h -parameters so that application engineers can use them directly whenever the transistor h -parameters are specified.

| CIRCUIT CONFIGURATION | COMMON EMITTER | COMMON BASE | COMMON COLLECTOR |
|--|--|--|---|
|  |  |  |  |
| h-Parameter $y_{11} = \frac{1}{h_{11}}$ $\mu_{12} = h_{12}$ $\alpha_{21} = h_{21}$ $Z_{22} = \frac{1}{h_{22}}$ $S = 1 - \mu_{12}\alpha_{21}y_{11}Z_{22}$ | y_{11e} μ_{bc} α_{cb} Z_{22e} $S_e = 1 - \mu_{bc}\alpha_{cb}y_{11e}Z_{22e}$ | $(1 + \alpha_{cb})y_{11e}$ $\mu_{ec} = \mu_{bc} \frac{S_e}{1 - S_e}$, if $ \alpha_{cb} > 1$ $\alpha_{ce} = \frac{-\alpha_{cb}}{1 + \alpha_{cb}} = -\alpha$ $\alpha \equiv -\alpha_{ce}$ $(1 + \alpha_{cb})Z_{22e}$ $S_b = 1 + (1 + \alpha_{cb})S_e$ | y_{11e} $\mu_{bc} = 1 - \mu_{bc} \approx 1$ $ \mu_{bc} < 1$ $\alpha_{cb} = -(1 + \alpha_{cb})$ Z_{22e} $S_c = 1 + (1 - \mu_{bc})(1 + \alpha_{cb})y_{11e}Z_{22e}$ $\approx 1 + \alpha_{cb}y_{11e}Z_{22e}$ $\left \frac{\alpha_{cb}}{\mu_{bc}} \right > 1$ $ \mu_{bc} < 1$ |

TRANSISTOR EQUATIONS

Circuit gain and impedance characteristics are given in terms of transistor parameters for grounded base, grounded emitter and grounded collector configurations. Simplifying approximations are given where appropriate

By F. R. STANSEL

THE ACCOMPANYING tabulation summarizes some of the important circuit equations useful to engineers in the application of transistors.

All equations are given in terms of the transistor parameters: collector resistance r_c , base resistance r_b , emitter resistance r_e , and current amplification constant α . These quantities are all described in

references listed in the bibliography. The quantity r_c is almost always much larger than r_b , and r_e , and often is even much larger than the load resistance. This makes possible approximations that greatly simplify the complicated exact equations. To evaluate these approximations in this tabulation, the exact expression is always given first followed, where appropriate, by a

simpler approximation equation. The other quantities listed are self-explanatory.

SHUNT-SERIES PEAKING

Nomograph solves design equations to give shunt and series inductance values required for given high-frequency cutoff and existing shunt input and output capacitance. Available gain with combination is 80 percent greater than either alone

By JOSEPH F. SODARO

SHUNT-SERIES peaking is illustrated by the basic circuit shown. This network is often used in television video amplifiers and other pulse systems where greater amplification is required than that obtainable from either shunt or series peaking alone. The gain is 80 percent greater than simple shunt peaking under certain conditions.¹ One of these conditions is that the input capacitance C_2 is twice the output capacitance C_1 .

Design procedure is as follows: measure or estimate C_1 and C_2 taking into account wiring, tube socket, and other strays, and adjust to make $C_2 = 2C_1$ using a shunt trimmer if necessary. Next, choose the desired high-frequency cutoff, f . Total C_1 and C_2 plus strays to obtain C_s . With these values calculate R_L , the load resistance, from

$$R_L = \frac{1.8}{2\pi f C_s} \quad (1)$$

The shunt compensating inductance L_1 is determined next from

$$L_1 = \frac{0.216 R_L}{2\pi f} \quad (2)$$

Finally, the required series in-

ductance is evaluated from

$$L_2 = \frac{0.937 R_L}{2\pi f} \quad (3)$$

Equations 1, 2 and 3 are the other required conditions for 1.8 times simple-shunt gain. These form the basis for the nomograph.

To use the nomograph, construct a straight line from the shunt capacitance value on the C_s scale to the cutoff frequency on the f scale. At the intersections of this line with the R_L , L_1

and L_2 scales read load resistance, shunt inductance, and series inductance values.

As an example, assume a 4-MHz high-frequency cutoff is required for a total shunt capacitance of $30 \mu\text{f}$. Construct a straight line from 30 on C_s to 4 on f . Read 21 μh on L_1 , 90 μh on L_2 and estimate 2,400 ohms on R_L .

CATHODE FOLLOWER RESPONSE

Chart gives permissible cathode-follower pulse drive at video frequencies in terms of low-frequency sinusoidal input. Video-frequency overloading and distortion in conventionally loaded circuits originate in output time constant

By RALPH H. BAER

CATHODE FOLLOWERS frequently overload and distort on video signals when designed on the basis of low-frequency formulas. This behavior results from the effect of the time constant associated with

the output impedance of the cathode follower and the load capacitance. The usual formula for the peak signal permissible is

$$e_{p \text{ peak}} = \frac{E_B}{\mu} \left[\frac{1 + \frac{R_k}{R_p} (\mu + 1)}{\frac{R_k}{R_p} + 2} \right] \quad (1)$$

which is readily calculated. Inspection of Eq. 1 shows that medium values of μ (15-30) are

desirable for maximum permissible input signal.

When a video signal with rise time t microseconds is applied to a cathode follower this permissible grid swing is reduced by a factor of

$$1 + \frac{\frac{R_k}{R_p}}{\frac{R_k}{R_p} + 1} \left(\frac{1 - e^{-\frac{t}{T}}}{\frac{t}{T}} \right) \quad (2)$$

where T is the time constant. Whenever T approaches the pulse rise time in order of magnitude, the reduction in permissible grid signal can no longer be neglected and the correction factor of Eq. 2 becomes essential.

The graph is a solution of Eq. 2; the following procedure applies when a pulse waveform of rise time t is to be handled without distortion where

$$T = \frac{C_T R_k}{1 + g_m R_k}$$

(a) Determine the value of R_k/R_p and t/T . (b) On the graph, connect R_k/R_p with μ . (c) At the intersection of line A with the line drawn in step (b), read vertically up or down to the proper t/T curve. The solution is then obtained from the percent scale by reading horizontally to the left.

As an example, consider a tube with $\mu = 40$, $R_p = 20,000$ and a load impedance of $R_k = 1,000$ and $C_i = 250 \mu\mu\text{f}$ in parallel. From Eq. 1 $e_{p \text{ peak}} = 5.6$ volts for $E_B = 150$ volts. Suppose a video signal with rise time $t = 0.42 \mu\text{sec}$ is handled by the cathode follower. Then $T = 0.0834 \mu\text{sec}$ and $t/T = 5$. From the graph the permissible peak signal is seen to be 72.3 percent of $e_{p \text{ peak}}$ at low frequencies, or 4 volts.

PHASE-SELECTIVE DETECTORS

Half-wave, full-wave and electromechanical circuits for use in self-balancing bridge phase discriminators and a-c null detectors. Applications include automatic motor control and operation, radar search-track and navigation systems

By CURTIS R. SCHAFER

IN ALL DETECTOR applications it is desirable to operate at fairly high current and voltage levels to minimize errors due to unbalance in the circuit.

Input V_1 is the unknown signal, or carrier modulated by the unknown signal. The other input V_2 is a reference voltage of the same frequency and phase as the signal to be detected. Output is a pulsating d-c.

Basic Operation

FULL-WAVE

Half-Wave Type

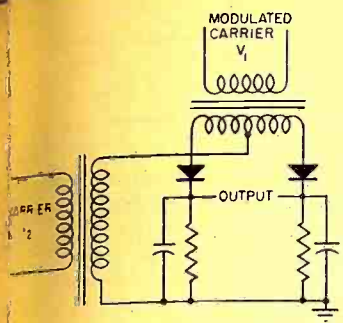

WALTER PHASE-SELECTIVE RECTIFIER^{1, 2}— Gives square-law response, with sensitivity decreasing near balance point. Meter reads zero if V_1 and V_2 are 90 deg out of phase

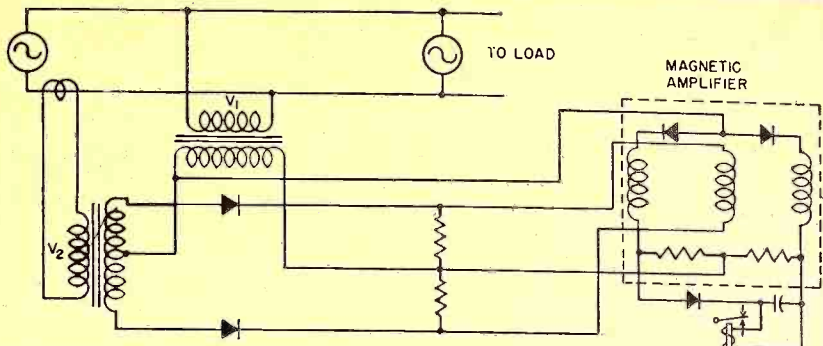

VARIATION OF WALTER CIRCUIT— Suitable for output stage of amplifier in self-balancing bridge. Germanium power rectifiers or diffused-junction diodes can be used

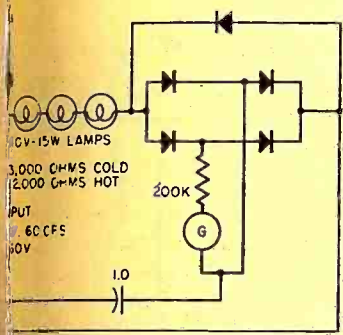

VHF RADIO-RANGE CARRIER PHASE INDICATOR³— Meter indicates zero when V_1 and V_2 are 90 degrees out of phase. Used to demodulate 10-kc f-100

PHASE-SENSITIVE DEMODULATOR⁴— Has push-pull output. Input may be from balanced or single-ended carrier. Carrier signal is reference

MAMON PHASE DISCRIMINATOR⁵— Uses balanced, polarized magnetic amplifier to boost output of phase-selective detector. Application shown is used to operate relay to disconnect alternator in case of field-excitation failure, loss of synchronization or drive failure

WINGSTONE PHASE SEQUENCE INDICATOR⁶— A fifty-volt voltage change will cause a four-fold change in the meter indication

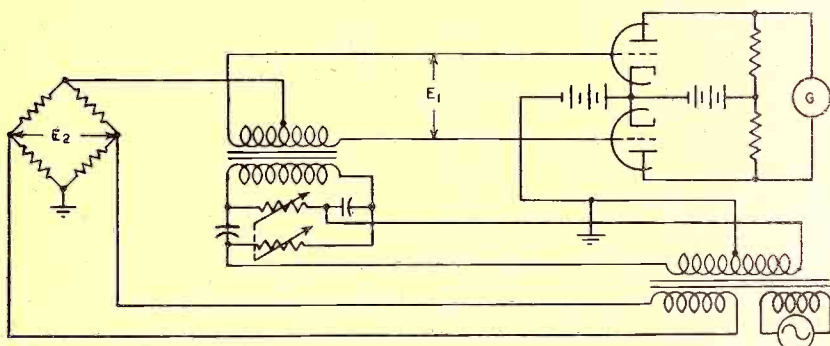

COSENS PHASE-SELECTIVE BRIDGE⁷— Triode amplification provides high sensitivity. Output proportional to phase angle divided by $V_1 V_2$

MODIFIED COSENS BRIDGE DETECTOR⁸— Applicable to servo control. Coils L_1 and L_2 are differential relay coils or fields of d-c servo motor

DOWN DISCRIMINATOR⁹— Electronic potentiometer. Modification of Cosens circuit for use with two-phase a-c servo motor

BRIDGE-BALANCE DETECTOR¹⁰— Current in meter is proportional to $E_1 E_2 \cos \theta$. By adjusting phase of E_1 , output current can be made dependent on only the reactive or resistive component of either voltage. Phase is adjusted by dual potentiometer in phase shifting circuit

YAMAMURA PHASE BRIDGE¹¹— Has accuracy of 0.1 percent with an input of 20 volts at frequencies up to 50 kc

GATED-GRID DETECTOR⁸— Rectangular reference waveform produced from sine wave V_1 by diode and R-C circuit

Phase-Selective Detectors

GATED-CATHODE DETECTOR⁸— Similar in operation to gated-grid circuit except that pulses are applied to cathodes. Common cathode resistor for all tubes provides nearly push-pull grid-cathode voltages

CATHODE-GATED DETECTOR WITH CURRENT OUTPUT⁸— Used with d-c servo motor. Coils L_1 and L_2 are split field of servo motor or differential relay. Provides differential current with low output impedance

MORTON SCREEN-GRID PHASE DETECTOR¹³— Reference voltage V_2 is applied to control grids and variable voltage V_1 is applied to screens. System puts light load on power supply of variable phase

PENTODE PHASE DETECTOR¹²— Used in radar units. Has a gain of 70 using 6SJ7 tubes; with 6AS6 tubes gain is 120 with 40-volt, 2,000-cps reference voltage on V_2

GATED-BEAM PHASE DETECTOR¹⁴— Plate current is at maximum for in-phase operation, and at a minimum for 180-degree phase difference

BALANCED-TRIODE DEMODULATOR¹⁵— Push-pull modulated signal is applied to grids. Unmodulated carrier is used as reference and to supply plate voltage. Output is push-pull error signal

VHF OMNIRANGE DEMODULATOR — Recovers 60-cps modulating signal from 10-kc f-m subcarrier

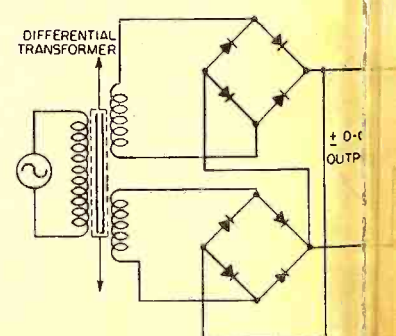

Full-Wave Type

PHASE-SELECTIVE DETECTOR FOR BRIDGES¹⁷— Double-bridge system for use at high frequencies

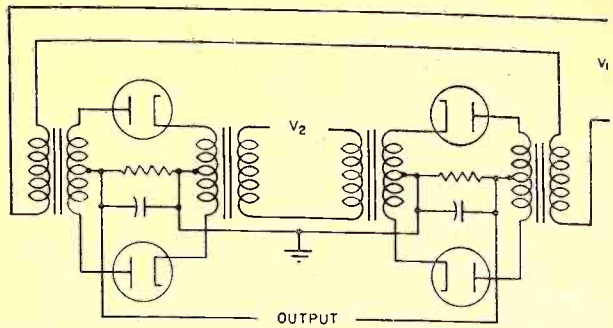

DOUBLE-BRIDGE PHASE DETECTOR — Used in CAA landing system as part of crossed-pointer indicator

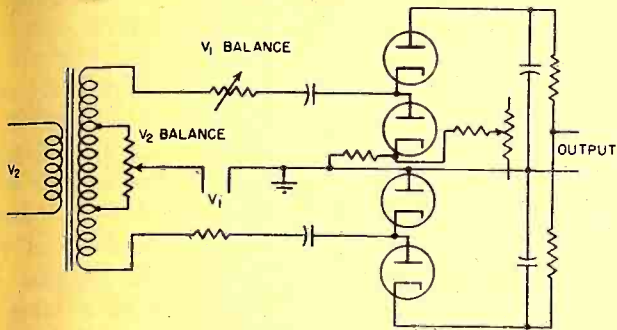

DENSITROL RECTIFIER BRIDGE¹⁸— Core of differential transformer is actuated by float

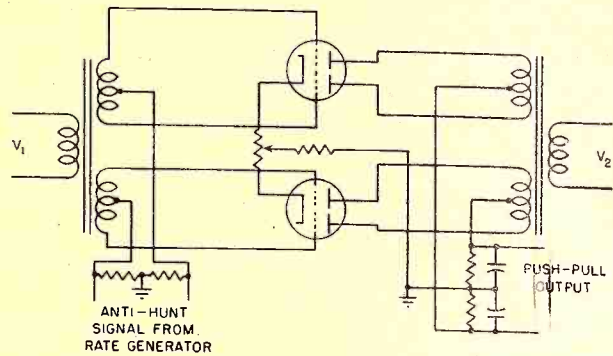

FULL-WAVE DEMODULATOR¹⁵— Push-pull inputs and output. Inputs are carrier-balanced. Signal V_1 is compared to unmodulated carrier signal V_2

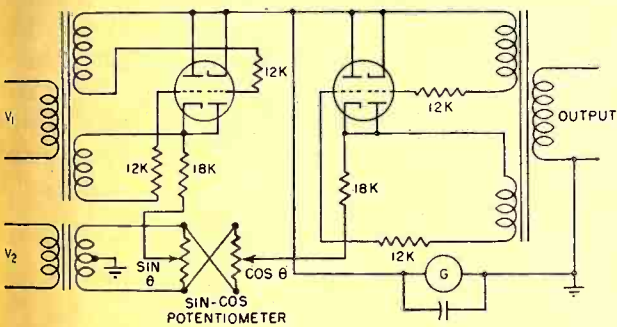

WARD-LEONARD SYSTEM DETECTOR¹⁸— Commercial variation of full-wave demodulator system. Output is used to control d-c motor through d-c amplifier

R. L. FRANK PHASE COMPARATOR²⁰— Insensitive to the third and all even harmonics of both input voltages. Combines two 120-degree-conduction cascade doubler circuits

AMPLIDYNE SYSTEM PHASE DETECTOR¹⁸— Has provision for antihunt signal injection from rate generator. Circuit gives high power amplification

DOUBLE-CLAMP PHASE DETECTOR²⁰— Used in British omnidirectional beacon. A 200-pps signal is applied to sine-cosine potentiometer as a reference signal. Output is indicated on a zero-center course meter

SCR-615 PHASE-SENSITIVE AMPLIFIER¹⁶— Radar application with cathode-ray tube display. Cathodes are gated by sine-wave generator. Reference voltage comes from two-phase generator synchronized with antenna

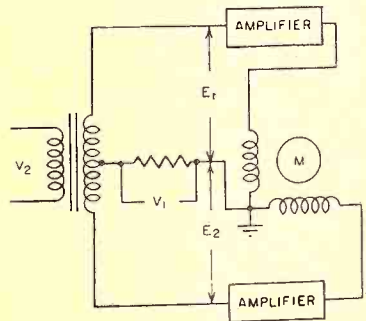

Electromechanical Type

WALD PHASE INDICATOR²²— Has high input impedance. Accuracy is ± 1 percent. Average output current $I_{max} \cos \theta/\pi$. Upper frequency limit is determined by chopper used

WALD REBALANCING PHASE INDICATOR²²— Similar to Wald indicator, but higher precision. Resolver is rotated so meter indicates zero. Phase shift is indicated on resolver dial

SERVO MOTOR PHASE DETECTOR— Phase detection is accomplished in two-phase motor. Output is a mechanical torque of reversible polarity. $E_1 = V_1 + V_2$, $E_2 = V_1 - V_2$

CATHODE-FOLLOWER

Graphical procedure simplifies design and eliminates cut-and-try. Charts show output impedance vs input voltage for nine tube types commonly used in cathode-follower circuits and give required resistor value for operating point selected

CATHODE FOLLOWERS are widely used as sources of low output impedance but it is often troublesome to find the d-c operating point required to achieve a desired value of impedance.

The output impedance as seen by an external load is equivalent to the parallel combination of $1/g_m$, r_p , and R_k . Since the tube parameters g_m and r_p are usually given in handbooks for only a few values of plate voltage and current, cathode-follower design often reduces to a tedious cut-and-try procedure.

The accompanying charts, however, enable the designer to choose circuit components directly to achieve the desired output impedance with either direct or a-c coupling to the

By N. O. SOKAL

cathode-follower grid. They also furnish information needed to calculate gain and input impedance and plot input-output curves.

The charts show output impedance R_o plotted against d-c grid-to-ground voltage for various values of cathode resistance. Nine tube types commonly used in cathode-follower circuits are considered.

Assumptions

The expression for output impedance is derived from the

small-signal linear-equivalent circuit and is applicable for small excursions of input voltage about a given operating point such that R_o does not change appreciably during the cycle. This is the case for most cathode followers where the a-c component of the input waveform is a few volts or less.

When the input wave is large enough, the excursions of E_{gk} make appreciable changes in R_o , and account must be taken of the rates of rise and fall of the input and output waveforms. When the input rises and falls slowly enough, the large-signal cathode follower can be analyzed point-by-point using the charts. If the input falls faster than the cathode circuit can follow, the waveform is large, the tube can be cut off. This case violates the linearizing assumption and will not be treated.

Chart Makeup

The charts show output impedance R_o plotted against grid-to-ground voltage E_{gk} for various values of cathode resistor R_k . The circuit is shown in Fig. 1A.

Curves also are plotted for various values of R_b/R_k , where R_b is the bias resistor in a self-biased a-c coupled circuit, as in Fig. 1B, and R_k is the total resistance from cathode to ground.

The dashed lines intersecting the solid R_k lines show successive values of E_{gk} , starting with zero at the right and progressing left toward cutoff.

The small bars perpendicular to the R_k curves mark points of maximum allowable plate dis-

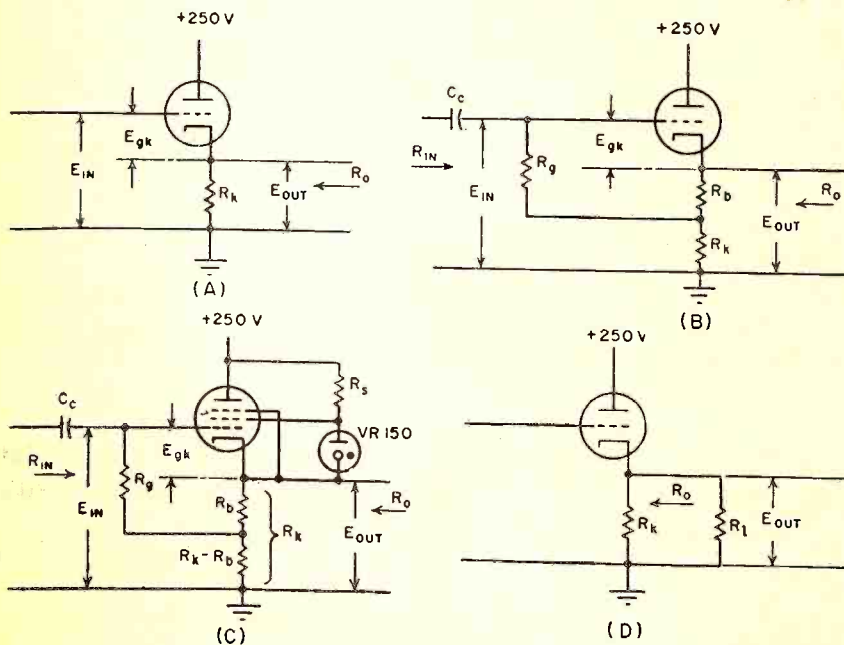

FIG. 1—Design procedure applies to direct-coupled cathode followers (A), a-c coupled, self-biasing circuits (B and C) and to cathode followers whose output is directly coupled to a resistive load (D)

DESIGN CHARTS

FIG. 2—Design curves for types 6C4 and 12AU7

FIG. 3—Output impedance chart for 6AV6 and 1/2 12AX7

pation. Points to the right of a bar require greater than allowable average dissipation. This area can still be used in on-off service if the duty ratio keeps the average dissipation below the rated value.

Two sets of bars are shown in Fig. 2. The upper bars, which occur at lower input voltages, refer to 1/2-12AU7. The others refer to the 6C4. In Fig. 3 all of the conditions shown on the chart are below the maximum rated plate dissipation of the 1/2-12AX7; the bars refer to the 6AV6. In Fig. 4 the 6AB4 and 1/2-12AT7 are both rated for the same dissipation, so only one set of bars is shown. The upper bars in Fig. 5 and 6 occur at low input voltages and apply to the 6CL6; the lower bars apply to the 6AG7.

The charts are usable directly for circuits with plate-supply voltages within 20 percent of design value. For voltage-supply variations greater than this amount, the designer may have to refer to the tube characteristics for corrections to the

nominal operating point.

Design Relations

The output impedance is

$$R_o = \frac{1}{\frac{1}{r_p} + g_m + \frac{1}{R_k}} \quad (1)$$

Circuit gain is

$$A = \frac{d E_{out}}{d E_{in}} = \frac{d [E_{in} + E_{gk}]}{d E_{in}} = 1 + \frac{d E_{gk}}{d E_{in}} \quad (2)$$

For graphical use, this becomes

$$A = 1 - \left| \frac{\Delta E_{gk}}{\Delta E_{in}} \right| \quad (3)$$

To find the gain of the circuit, take a step in E_{gk} straddling the operating point, read off the corresponding change in E_{in} and apply in Eq. 3.

The input resistance is

$$R_{in} = \left[\frac{R_o}{1 - A \frac{(R_k - R_b)}{R_k}} \right] \quad (4)$$

The cathode current is

$$i_k = \frac{E_{out}}{R_k} = \frac{E_{in} + |E_{gk}|}{R_k} \quad (5)$$

Voltages E_{in} and E_{gk} can be read from the chart. For triodes,

i_k is the plate current; for pentodes it is the sum of plate and screen currents. In both cases it represents the total drain on the B+ supply.

The input-output curve, E_{out} vs E_{in} , is easily obtained, since $E_{out} = E_{in} + |E_{gk}|$. Voltage E_{gk} can be read in steps along any desired R_k curve, and the corresponding E_{in} read off the horizontal axis. The sum plotted against E_{in} gives the input-output curve.

Design Procedure

Example 1—For a direct-coupled cathode follower (Fig. 1A) using 1/2-12AU7 it is desired to find the proper cathode resistor for a nominal output impedance $R_o = 600$ ohms when E_{in} , the d-c signal level at the grid, is +80 volts.

Solution: In Fig. 2 the intersection of $E_{in} = 80$ volts with $R_o = 600$ ohms lies just below the $R_k = 22$ K curve, so R_k is slightly less than 22 K. By interpolation it is seen to be about 20 K.

Example 2—It is desired to distribute the audio output of a

Cathode-Follower Design Charts

FIG. 4—Type 6AB4 and 1/2 12AT7 design charts

FIG. 5—Chart for 6CL6 and 6AG7 in triode connection

radio tuner to a number of amplifiers in different locations. The total amount of cable connecting the tuner to the amplifiers is 500 feet, and the capacitance of the signal wire to ground is 26.5 μf per ft. It is desired to have the upper and lower half-power frequencies, f_2 and f_1 , be 20,000 cps and 20 cps respectively. The tube to be used is a 6C4 connected as an a-c coupled, self-biased cathode follower (Fig. 1B).

Solution: For the upper half-power frequency to be 20,000 cps, an output impedance $R_o = 1/2\pi f_2 C$ is required, where C is the capacitance to ground of the signal wire, which is 26.5 μf per ft \times 500 feet = 1,330 μf . The output impedance required is $R_o = 1/2\pi \times 20,000 \times 1330 \times 10^{-12} = 600$ ohms.

When self-bias is used, the cathode resistance can be any convenient value, and the bias resistor will be chosen to provide the proper d-c conditions for the tube.

Choosing 22 K for the cathode resistance, the intersection of the $R_k = 22$ K curve in Fig. 2 with

$R_o = 600$ ohms lies between $R_b/R_k = \frac{1}{3}$ and $\frac{1}{16}$. By interpolation, it is seen to be at about $R_b/R_k = \frac{1}{13}$. Then $R_b = \frac{1}{13} R_k = \frac{1}{13} \times 22 \text{ K} \approx 1.8 \text{ K}$, and the bottom resistor is $R_k - R_b = 22 \text{ K} - 1.8 \text{ K} \approx 20 \text{ K}$.

To find the gain under these conditions, take a five-volt step in E_{gk} straddling the operating point; E_{gk} goes from -15 volts to -10 volts, while E_{in} goes from 47 volts to 103 volts. Substituting into Eq. 3

$$A = 1 - \left| \frac{15 - 10}{47 - 103} \right|$$

$$= 1 - \frac{5}{56} = 0.91$$

The input resistance from Eq. 4 is

$$R_{in} = \frac{R_g}{1 - 0.91 \left(\frac{20 \text{ K}}{21.8 \text{ K}} \right)}$$

$$= 6.1 R_o$$

If the coupling network is to have a lower half-power frequency f_1 , the coupling capacitor C_c should equal $1/2\pi f_1 R_{in}$. For most tubes, R_o is not recommended to be greater than one megohm; lower values are preferred to reduce the bias-shifting

effect of grid current. If $R_o = 100 \text{ K}$, then $R_{in} = 6.1 R_o = 610 \text{ K}$ and if $f_1 = 20$ cps is required, $C_c = 1/2\pi \times 20(610 \text{ K}) = 0.013 \mu\text{f}$. The closest nominal value is 0.01 μf and $R_o = 180 \text{ K}$ instead of the assumed 100 K gives the required R-C product with allowance for a -20-percent tolerance on the capacitance and a -10-percent tolerance on the resistance.

The cathode current, from Eq. 5, is $i_k = (87 + 6\frac{1}{2})/22 \text{ K} = 4 \text{ ma}$.

Design Notes

If the cathode follower is to deliver small voltages across high-impedance loads, a low-power tube such as the 12AU7 or 12AX7 can be used. If the tube is to deliver large voltages across low-impedance loads, a high-power tube such as the 6AG7 or 6AS7 should be used. If the tube is to be direct-coupled to input voltages near zero or slightly negative, a high-cutoff-voltage (low- μ) tube such as the 12AU7 or 6AS7 is indicated.

When a cathode follower is to be operated at a high cathode

FIG. 6—Pentode connected 6CL6 and 6AG7

FIG. 7—Design chart for 1/2 6AS7 tube

voltage, care should be taken not to exceed the maximum allowable heater-to-cathode voltage rating of the tube. If a grounded heater supply causes the voltage to exceed the ratings, the heater supply can be connected either to cathode or to a point of positive voltage. If it is connected to the cathode, the capacitance to ground of the heater transformer and wiring will be in parallel with the load. The heater-cathode voltage rating for the 6C4, 6AV6, 6AB4, 12AT7, 6CL6 and 6AG7 is 90 volts. For the 12AU7 and 12AX7 it is 180 volts. For the 6AS7 it is 300 volts.

If a-c coupling is used, self-bias is usually preferable to fixed bias, since variations of the tube from the nominal characteristics tend to be counteracted.

Operation within a fraction of a volt of zero-bias may prove more erratic than with a volt or more of bias, since there may be fractional-volt variations in contact potential between grid and cathode and in initial velocity of electrons leaving the cathode. These effects tend to shift the bias point and will make

less difference when there is appreciable bias already on the tube.

Special Cases

For the 6AG7 shown pentode-connected in Fig. 1C, the VR-150 can be replaced by a bypass capacitor. Resistor R , may be adjusted to give 150 volts.

If the cathode follower output is direct-coupled to a resistive load, as in Fig. 1D, R_L changes the d-c conditions on the tube, affecting g_m and r_p , and thus changing the output impedance. This can be taken into account by considering the cathode load as R_k in parallel with R_L when looking up the bias conditions on the chart. The output impedance read off the chart will then be R_o in parallel with R_L . Resistor R_L can easily be taken out to find the true R_o .

$$\text{True } R_o = \frac{R_o \text{ chart}}{1 - \frac{R_o \text{ chart}}{R_L}}$$

The true R_o and true R_k are still related by the R_b/R_k ratio, and E_{in} read off the chart is also correct.

If the output impedance is re-

quired to be lower than can be obtained within the power dissipation rating of the best available tube, either connect in parallel N cathode followers each designed to have an output impedance NR , where R is the required output impedance, or reduce the plate-supply voltage so that the operating point can be shifted to one of higher d-c current without exceeding rated dissipation. The higher current produces higher g_m and lower impedance. For such changes in supply voltage, new charts must be constructed.

Allowance should be made for normal tolerances of the components, including the tube. Under given voltages, the g_m of the tube can vary on the order of ± 40 percent from the nominal. Self-biasing tends to minimize these variations, but if the output impedance must be held below some maximum value, the nominal design value should be sufficiently lower to allow for tolerance on g_m .

The author wishes to thank Vladimir Kenn of Raytheon Manufacturing Co. for supplying special data on tubes.

TEN R-F TRANSMISSION LI

Ten equations commonly used to compute relationships between electrical and mechanical properties of radio-frequency transmission lines have been converted to convenient nomographs covering both two-wire and coaxial lines for frequencies up to 20,000 mc

By PHILLIP H. SMITH

TEN of the most useful transmission-line equations have been plotted as nomographs as a convenience to the radio engineer. The derivation of the formulas is based upon certain simplifying assumptions which are generally considered justifiable for r-f lines.

1. *Characteristic Impedance of Transmission Lines.* For radio-frequency transmission lines where the losses per wavelength are relatively small, the characteristic impedance is essentially a pure resistance. The characteristic impedance is numerically equal to the square root of the ratio of the distributed inductance to the distributed capacitance per unit length. Since both of these parameters are uniquely related to the physical size and spacing of the conductors, it is possible to express the characteristic impedance in terms of the physical dimensions of the line.

Thus, the characteristic impedance Z_0 in ohms of an open 2-wire line is

$$Z_0 = 276 \log_{10} (2D/d) \quad (1)$$

where D is the wire separation on centers and d is the wire diameter, both in the same units. Figure 1 shows the characteristic impedance of an open 2-wire line as a function of the conductor dimensions and their center-line spacing.

2. *Characteristic Impedance of a Coaxial Line.* The characteristic impedance Z_0 in ohms of a coaxial transmission line is

$$Z_0 = 138 \log_{10} (D/d) \quad (2)$$

where D is the inner diameter of

the outer conductor and d is the outer diameter of the inner conductor. This applies only to a line where the medium between conductors is predominantly a gas, such as air, at low pressures.

If the coax line is filled with a uniform dielectric material other than a low-pressure gas, the characteristic impedance is reduced by a factor equal to $1/k^{\frac{1}{2}}$, where k is the relative dielectric constant of the material. For a line with bead insulators at small uniform intervals, the

effective dielectric constant may be computed from

$$k_e = (k t + s)/(t + s)$$

where t is the thickness of the bead and s is the spacing between two beads, both t and s being in the same units, and k is the relative dielectric constant of the bead.

A number of optimum arrangements for the characteristic impedance of coaxial lines exist which are based upon different considerations such as the maximum power handling capability

NOMOGRAPHS

minimum loss. Several of these optimum values are indicated along the characteristic impedance scale on the right-hand side of the nomograph. Fortunately, all of these optimum values are relatively broad in their characteristics and a considerable departure can generally be tolerated for any particular application.

Figure 2 shows the characteristic impedance of a gas dielectric coaxial transmission line as a function of the two conductor diameters.

High-Frequency Resistance of a Coaxial Line. The high-frequency resistance of a coaxial transmission line is one of the principal factors which determine the attenuation along the line. It is also one of the factors which determine the minimum anti-resonant imped-

ance and the minimum resonant impedance of a line section when used as a circuit element. The high-frequency resistance of a coaxial line is a function of both conductor dimensions and of the frequency (due to skin effect). It is also a function of the resistivity of the material of which the conductors are made.

For copper coaxial lines the high-frequency loop resistance R in ohms per 1,000 feet is

$$R = 0.0315 f^{1/2} \left[\frac{1}{d} - \frac{1}{D} \right] \quad (3)$$

where f is the frequency in kilocycles, D is the inner diameter of the outer conductor in inches, and d is the outer diameter of the inner conductor in inches.

For conductors other than copper, the high-frequency resistance is proportional to the square root of the ratio of the

resistivity of the conductor to that of copper.

Figure 3 shows the resistance of a copper coaxial line as a function of the conductor dimensions and the frequency. Dielectric losses, which are negligible in a gas dielectric line, are not included.

The nomograph in Fig. 3 is used as follows: draw a straight line connecting points on the first and fourth scales from the left, which show, respectively, the line conductor diameters. Obtain the intersection of this line with the second scale, marked Size Factor. Now project this intersection to a corresponding point on the third scale, marked Pivot Line, as shown in the example on the nomograph. Finally, connect this new pivot point with a straight line intersecting the desired value on the sixth or frequency scale. The intersection of this latter straight line with the scale marked Resistance in ohms per 1,000 feet gives the desired loop resistance value.

4. Conversion of Loss Resistance to Decibels Attenuation per Unit Length. It is sometimes convenient to convert loop resistance of a transmission line (as obtained from Fig. 3) to decibels (db) per unit length. This may be done if the characteristic impedance of the line is known. The conversion equation is simply

$$\text{db} = R/0.23025 Z_0 \quad (4)$$

where R is the loop resistance and Z_0 is the characteristic impedance. This relationship is plotted on the nomograph of Fig. 4. The nomograph applies to either open-wire or coaxial lines and does not require the line conductors to be of copper.

5. Antiresonant Impedance of a Transmission Line Section. The antiresonant impedance Z_{AR} of a transmission line section either open or short-circuited at its far end is a function of the

Ten R-F Transmission Line Nomographs (continued)

FIG. 3
LOSS RESISTANCE
COPPER LINE

FIG. 4
RESISTANCE VS DB

total conductor resistance, the characteristic impedance of the section. The relationship

$$Z_{AR} = 2 Z_0^2 / R$$

where Z_0 is the characteristic impedance and R is the resistance of the antiresonant line section.

The shortest antiresonant section is one-quarter wavelength long (short-circuited at its far end) and according to its antiresonant impedance. A line section one-half wavelength long short-circuited at the far end will have only half as high an antiresonant impedance because its resistance R is twice as great.

Figure 5 shows the antiresonant impedance of a transmission line as a function of the transmission-line resistance and the characteristic impedance of the section. This nomograph applies equally to either coaxial or open-wire lines.

The resonant impedance of a transmission-line section is simply one-half of its transmission-line resistance (obtained from Fig. 3), and accordingly, no nomograph has been plotted for this.

6. *Input Reactance of a Transmission-Line Section.* A section of transmission line is sometimes used as a reactance element in high-frequency circuits. The input reactance is a function of the electrical length of the line section and its characteristic impedance. The reactance varies between values essentially equivalent to plus or minus one half of the antiresonant impedance (obtained from Fig. 5). In air or gas dielectric coaxial lines, the electrical length is very nearly the same as the physical length measured in terms of free space wavelengths. A dielectric other than a gas results in a reduction of the length of the wave in the line which is proportional to the square root of the average dielectric constant. Thus a polyethylene coaxial cable with a dielectric constant of 2.5 will be electrically $(2.5)^{1/2}$ or 1.6 times as long as if the dielectric were gas.

The electrical length and the characteristic impedance of a section as well as its termination (either open circuit or short circuit) determine the magnitude and sign of the input reactance. For an open-wire or coaxial line section, open-circuited at its far end, the input reactance X , in ohms is

$$X_o = -Z_o \cot(360 l/\lambda) \quad (6)$$

where l/λ is the electrical length in wavelengths and Z_o is the characteristic impedance.

For an open-wire or coaxial line section, short circuited at its far end, the input reactance X , in ohms is

$$X_s = Z_o \tan(360 l/\lambda) \quad (6a)$$

Figure 6 shows the input reactance of an open or short-circuited transmission-line section as a function of the electrical length, the characteristic impedance and the termination.

Quarter-Wave Transmission-Line Impedance Transformer

Impedance transformers can be made along radio-frequency transmission lines by employing a quarter-wave section of transmission line of selected characteristic impedance as an impedance transformer. When a line section is terminated in a pure resistance its input impedance will be a pure resistance which depends upon the load resistance value and the value of the characteristic impedance of the quarter-wave line section.

Figure 7 shows the input reactance R , in ohms of a quarter-wave open-wire or coaxial line section terminated in a pure resistance load. The relationship is

$$R = Z_o^2/R_l \quad (7)$$

where R is the terminating resistance and Z_o is the characteristic impedance.

Current-Phase Relationship Along a Transmission Line

The relationship of the current at any point along a radio-frequency transmission line will be uniform with length when the line is terminated in an impedance equivalent to the characteristic impedance;

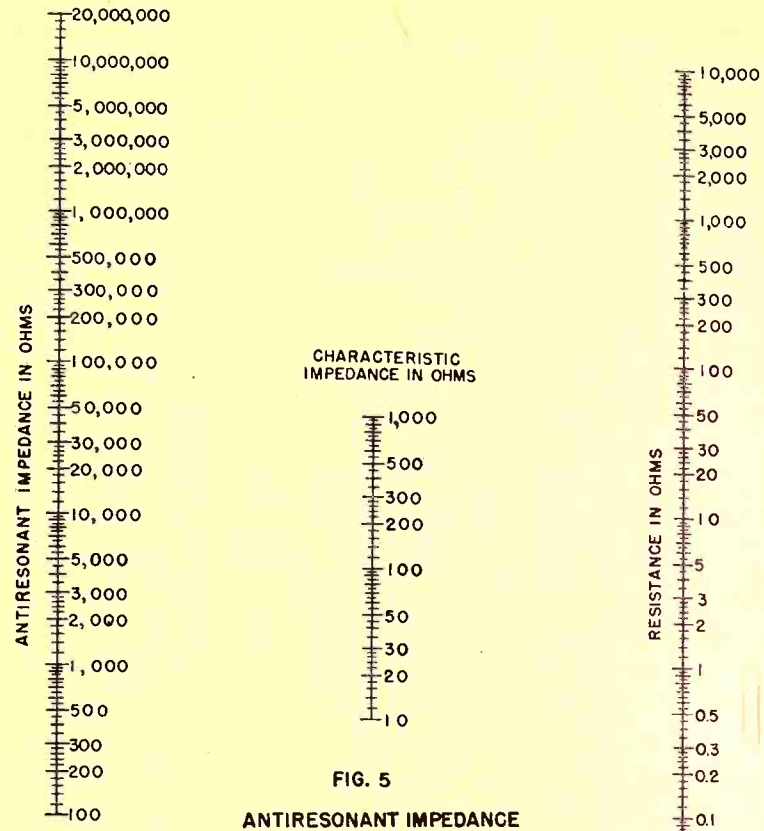

FIG. 5

FIG. 6

* ELECTRICAL LENGTH = \sqrt{K} X ACTUAL LENGTH WHERE K = DIELECTRIC CONSTANT

Ten R-F Transmission Line Nomographs (continued)

otherwise the phase will vary nonuniformly along the line.

Figure 8 shows the phase relationship of the current at the sending end of a line, with respect to the current in a resistance load, as a function of the ratio of the load resistance to the characteristic impedance of the line, and of the effective length of line. The relationship giving line length in degrees is

$$\phi = \arctan \left[\frac{R_l}{Z_0} \tan \left(360 \frac{l}{\lambda} \right) \right] \quad (8)$$

where R_l is the load resistance, Z_0 is the characteristic impedance and l/λ is the electrical length in wavelengths.

The current in the load will always lag the current at the sending end of a transmission line. It will undergo exactly 180 degrees of phase shift in each electrical halfwave length regardless of the ratio of the load resistance to the characteristic impedance.

9. Voltage Gradient along a Coaxial Line. In a coaxial transmission line the maximum voltage gradient occurs at the surface of the inner conductor. When this gradient exceeds the critical value of approximately 20,000 volts (rms) per cm, breakdown will occur in the form of either corona or arcover. If the characteristic impedance of the line is less than the optimum breakdown value of 60 ohms, arcover will occur without corona; if it is more than 60 ohms, corona will precede arcover.

Figure 9 shows the maximum voltage gradient G_{max} in rms volts per cm on a coaxial line as a function of the characteristic impedance of the line, the physical size of the inner conductor and the applied voltage. The relationship is

$$G_{max} = 47.2E/dZ_0 \quad (9)$$

where E is the applied rms voltage, d is the diameter of the inner conductor in inches, and Z_0 is the characteristic impedance.

FIG. 9
VOLTAGE GRADIENT

This nomograph, Fig. 9, is used as follows: first, connect with a straight line points on the first and third scales from the left which represent the inner conductor diameter and the characteristic impedance (see example on nomograph). The intersection of this line with the second scale, labeled Pivot Line, is next connected with a second straight line passing through the desired point on the fourth scale, labeled Applied Volts RMS. The intersection of this second straight line with the fifth scale gives the desired value for the gradient on the surface of the inner conductor in rms volts per cm.

Bead insulators may cause higher gradients in their vicinity, resulting in premature voltage breakdown, particularly if they fit loosely on the inner conductor.

10. *Diminution of Standing-Wave Ratio Due to Line Loss.* A high-frequency transmission line whose characteristic impedance is not matched by the load impedance will have standing waves along its length. The standing-wave ratio in the vicinity of the load will be numerically equal to the ratio of the load resistance to the characteristic impedance (or its reciprocal if this is less than unity). If the line has attenuation, there will be a gradual diminution of the standing-wave ratio in the direction of the generator.

Figure 10 shows the relationship between the standing-wave ratio in a region near the generator (assuming that the wavelength is small compared to the line length), the standing-wave ratio near the load, and the line loss in decibels (as obtained from Fig. 3 and 4). The relationship is

$$db = \left[10 \log_{10} \frac{(S_L + 1)(S_G - 1)}{(S_L - 1)(S_G + 1)} \right]^{1/2} \quad (10)$$

where S_L is the voltage-standing-wave ratio near the load and S_G is the voltage standing wave ratio near the generator.

DIMINUTION OF VOLTAGE STANDING WAVE RATIO ALONG A TRANSMISSION LINE DUE TO LINE LOSS

GRAPHICAL SOLUTION OF SKY-WAVE PROBLEMS

Chart shows relationship between great-circle distance, virtual height of reflecting ionosphere, equivalent path distance, angle of departure and angle of incidence at ionosphere. Any three can be found if other two are known

By R. A. HELLIWELL

IN RADIO communication problems involving transmission by means of sky-waves reflected from the ionosphere it is often necessary to relate: (1) great-circle distance between transmitter and receiver, (2) virtual height of reflection, (3) equivalent path distance between transmitter and receiver, (4) angle of departure, and (5) angle of incidence at the ionosphere. It is the purpose of this paper to present a simple graphical method whereby these factors can be determined rapidly without recourse to the analytical expressions. If any two factors are given, the other three can be found.

It is assumed that propagation can be represented by a ray and that the characteristics of the actual path of the ray can be represented with sufficient accuracy by the so-called equivalent path, shown in Fig. 1 as the lines AB and BC . The height h' of the apex B is called the virtual height, and D is the great-circle distance between the endpoints A and C . The angle β between AB and the tangent at A is called the vertical angle or

angle of departure. The ionosphere is assumed to be horizontally stratified and earth's magnetic field effects are neglected. The path is therefore symmetrical about the midpoint, and the angle of arrival is equal to the angle of departure.

Graphical computations are facilitated with the aid of the sky-wave transmission chart shown in Fig. 2. This is simply a vertical cross-section of the earth's atmosphere up to a height of 600 km. Great-circle

distance D on the earth's surface is plotted against virtual height h' appearing at left with the chart held sideways.

The vertical angle β is determined by aligning a straight edge with the origin and the midpoint of the equivalent path (co-ordinates h' and $D/2$) and reading the upper scale. The angle of incidence ϕ_0 is interpolated in the family of curves of constant ϕ_0 plotted on the chart. Secant ϕ_0 is read from the conversion chart below the main chart.

Since there are five basic variables (D, P, h', β , and ϕ_0) only two of which can be independent, there are ten possible combinations of independent variables. For any given pair of variables, the other three are determined from the chart. The procedure is illustrated in the following example for a selected pair of variables (D and h').

Example

Problem: Given a great-circle distance D of 3,000 km and a virtual height h' of 310 km, find the vertical angle β , the angle

FIG. 1.—Diagram shows geometry of sky-wave propagation

of incidence ϕ_0 at the ionosphere, sec ϕ_0 , the path distance P , and the transmission time t .

Solution: Locate the apex of the path at $D/2 = 1,500$ km and $h' = 310$ km on Fig. 2. Align straight edge with origin and apex. Read $\beta = 4.5$ degrees on the upper scale. Read $\phi_0 = 72$ degrees by interpolating in family of curves of constant ϕ_0 . Obtain sec $\phi_0 = 3.2$ from conversion scale. Obtain $P = 3,140$ km by measuring distance from origin to apex, using the height scale on the chart, and multiplying result by 2. The transmission time $t = 10,470 \times 10^{-6}$ seconds is obtained by dividing the path distance P by the speed of light (3×10^8 km per sec).

The author wishes to acknowledge the helpful comments of A. M. Peterson.

Appendix

Some of the more important analytical expressions, based on Fig. 1, are given below for reference. Others can be derived readily.

$$\begin{aligned} & \sin \frac{D}{2R} \frac{180}{\pi} \\ = \tan^{-1} & \frac{\sin \frac{D}{2R} \frac{180}{\pi}}{1 - \cos \frac{D}{2R} \frac{180}{\pi} + \frac{h'}{R}} \\ = 90 - \phi_0 - & \frac{D}{2R} \frac{180}{\pi} \\ = R \left[\frac{\cos \beta}{\cos \left(\frac{D}{2R} \frac{180}{\pi} + \beta \right)} - 1 \right] \\ = \left[\cos^{-1} \left(\frac{R}{R + h'} \cos \beta \right) - \frac{\pi}{180} \beta \right] \\ = 2 \times & \frac{2R(R + h') \left(1 - \cos \frac{D}{2R} \frac{180}{\pi} \right) + h'^2}{2} \end{aligned}$$

- where D = great circle distance in km
- h' = virtual height in km
- P = path distance in km
- β = vertical angle in degrees
- ϕ_0 = angle of incidence in degrees
- R = earth radius (6,367 km)

FIG. 2—Sky-wave transmission chart relates great-circle distance $D/2$ (see Fig. 1), virtual height, path distance, vertical angle and angle of incidence

PHASE SHIFT BY CRO

Two measurements of crt deflection against a cross-hatch grid-overlay show possible phase angles when entered in the nomogram. Rotation of beam resolves the ambiguity

By JOSEPH F. SODARO

PHASE ANGLE is most frequently measured by the cathode-ray oscilloscope pattern method. In this technique a reference-phase alternating voltage is one input and an unknown-phase alternating voltage is the quadrature input to the cathode-ray tube. The resulting pattern is a straight line, circle or ellipse depending upon the phase difference. The sine of the phase angle is the ratio of the intercept B to maximum A as shown in Fig. 1A.

Procedure

Adjust the undeflected beam to the crt center as indicated by the intersection of the midlines of the cross-hatch grid. Apply the unknown voltage to the vertical or y -input terminals and adjust the gain for any convenient deflection. Disconnect or turn off this input and apply the reference voltage to the horizontal or x -input terminals. Adjust this gain for an equal deflection. Reconnect the unknown voltage without changing amplification controls. Measure B and A in any equal units such as centimeters or tenths of inches. The arc-sine of the B -to- A ratio is the desired angle.

The nomograms shown in Fig. 2 facilitate this calculation. A general solution can be obtained by using scales A , B , and θ . Place a straight-edge between the pattern height value on the A scale and the intercept value

on the B scale. Read the unknown angle on the θ scale at the intersection of the straight-edge and this scale.

The 20-unit chart (C) shown in Fig. 2 is a simplified version designed on the basis that crt cross-hatch grids are often divided so that 40 divisions of total deflection along each axis can be used conveniently. Thus, A is a constant 20 units and need not be used with this nomogram. In fact, the peak of the composite trace may be off the circular crt without concern since constant input amplitude is essential in any case.

In using this calculator simply read phase angle opposite the intercept value. Multiples and sub-multiples of the intercept scale may be substituted if desired. For example, if the maximum is 10, divide intercept scale values by 2 and read.

Beam Rotation

The nomograms show that two answers can be obtained for each pattern. This ambiguity can be resolved by determining the crt beam rotation. One method of

resolution is that of superimposing a low-amplitude, higher-frequency sawtooth voltage upon the vertical input.¹ A typical pattern is shown in Fig. 1B.

Another method requires delaying the unknown phase by a small amount. This can be done by means of a phase-shifting network connected in series between the source and the oscilloscope. The small additional delay will modify the pattern. The modification will be toward different limiting patterns depending upon the beam rotation. For example, a 45-deg ellipse will become rounded and tend toward a circle when delayed. On the other hand the 315-deg pattern that looks similar will shift toward a straight line when the delay is added.

As an example in the use of the chart, assume that the maximum deflections are 32 units, the intercept is 5 units, the ellipse major-axis tilt is to the right and the beam rotation is clockwise. Construct a straight line from 32 on the A scale to 5 on the B scale. This line intercepts the θ scale at the 9, 171, and 351-deg point. By the ellipse tilt the choice is reduced to 9 or 351 deg. For clockwise rotation of the beam select 9 deg. Thus, there is a 9-deg phase difference between the applied voltages.

PARALLEL-RESISTOR CHART

Permits quick choice of the best combination of two available RTMA preferred-value resistors in either 10-percent or 20-percent tolerance ranges to give a desired higher power rating at a particular resistance value

ONE problem that often comes up in laboratories is making full use of the most readily available standard components. Virtually all labs have a constant supply of $\frac{1}{2}$, 1 and 2 watt composition resistors in the standard 10-percent and 20-percent tolerance ranges. A typical problem might be combining two of these to get a 3-watt resistor of the required value. If making conventional calculations combined with trials, three or four trials are usually needed to find the resistor required. The chart in Fig. 1 reduces all of the calculation to a simple glance. The simplicity of the chart results from the solution of two simultaneous equations.

$$y = \frac{R_2}{A} x \quad (1)$$

$$y = \frac{R_1}{A} x + R_1 \quad (2)$$

Solving these two simultaneous equations, their point of intersection is at

$$x = \frac{R_1 A}{R_2 + R_1} \quad (3)$$

$$y = \frac{R_1 R_2}{R_1 + R_2} \quad (4)$$

The y ordinate is the solution for the parallel combination of two resistors or the series combination of two capacitors.

The choice of parallel resistors is, however, dependent upon the power dissipation in each resistor. This information can be derived by multiplying both sides of Eq. 3 by R_2 , then substituting

By MITCHELL ARON

combined parallel resistance R for $R_1 R_2 / (R_1 + R_2)$ to get

$$R_2 x = RA \quad (5)$$

Multiplying both sides by E^2 and rearranging gives

$$\frac{E_2}{R} x = \frac{E^2}{R^2} A \quad (6)$$

Now assume that the power being dissipated in the parallel combination is 1 watt, and let A be also arbitrarily made equal to 1. Equation 6 then becomes $x = E^2/R_2$. Since E^2/R_2 is the power dissipated in R_2 , the abscissa is proportional to the power dissipated in R_2 . Thus, for every watt dissipated in the parallel combination R , x watts will be dissipated in R_2 . The power dissipated in R_1 is of course the difference between the total and that dissipated in R_2 .

A plot of a series of the lines just discussed is given in Fig. 1. For convenience the heavy lines are drawn to the 20-percent series of preferred values and the combination of light and heavy lines form the 10-percent series of preferred values.

Example

Let it be required to find the nearest parallel combination of two resistors in the 20-percent series of preferred values to give a combined resistance of 4,000 ohms. The parallel combination must be able to dissipate 3 watts.

Solution: 4,000 ohms can be rewritten as 4.0×10^3 ohms. Follow the 4.0 horizontal line across, noting that the nearest intersection of two heavy lines is 6.8 and 10.0 and the intersection falls at $x = 0.41$. Thus the parallel combination of 6.8 K in parallel with 10 K is the nearest combination of 20-percent resistors to 4 K, and gives an exact resistance of 4.05 K. Since $10 = R_2$ (read on the righthand side of chart), the power rating R_2 must be $= 0.41 \times 3.0 = 1.23$ watts and the dissipation of R_1 is $3 - 1.23 = 1.77$ watts. The resistors that will fulfill the needs of the problem are 6.8 K, 20-percent, 2-watt in parallel with 10 K, 20-percent, 2-watt.

Although it is not required in most calculations of the type just explained, further information can be gleaned from the chart. For example, although the resistances in the preceding problem are not equal, due to standardization, resistances of equal 2-watt power rating are called for. The maximum power that can be dissipated by the parallel combination is determined by the power at which the smaller of the two resistances will dissipate 2 watts. Thus the maximum power for the combination, using the data from the chart, is

$$\frac{2}{1 - 0.41} = \frac{2}{0.59} = 3.4 \text{ watt}$$

Because of the similarity to the arithmetic, the chart works equally well for series combinations of capacitors.

FIG. 1—Trace along horizontal line for desired parallel resistance, note nearest intersection of lines coming from lower left and right corners, and read RTMA preferred-values of required individual resistors on side and top scales for these lines

TOROID DESIGN CHARTS

Reference to these charts permits speedy determination of Q, frequency range, size and type of permalloy core, wire size and number of turns for toroidal transformers meet performance specifications in the 1-kc to 100-kc frequency range

By R. E. PROUTY

IN DESIGNING toroidal transformers it is necessary to determine the proper type (permeability) and size of core and the required size and number of turns of wire. Circuit considerations set the required Q, inductance and operating range. The accompanying charts tie all the parameters together. A majority of the possible combinations for 0.8-in. O.D., 1.06-in. O.D. and the 1.84-in. O.D. molybdenum permalloy cores are covered.

Design

In searching for the ideal toroidal transformer for a given application, the practical limits of each core and wire size are first established.

Each master chart (Fig. 1, 2 and 3) covers one core size. Each chart is plotted on 5-cycle log-log paper. The number of turns of wire necessary to obtain a given inductance for cores with typical mu values can readily be found. The horizontal lines that intersect the diagonal lines at their approximate upper limits establish, for the wire sizes indicated, the maximum number of turns that can be hand wound on that size of core.

By winding over two cores instead of one, the inductance can be exactly doubled for a given number of turns of wire. For example, referring to Fig. 1, the maximum possible inductance obtainable with No. 24 wire on a single core of 125 mu in the 1.84-in. size is 400 mh. In other words a maximum of 1,200 turns

FIG. 1—Master design chart for toroids with 1.84-in. (O. D.) cores

FIG. 2—Master design chart for toroids with 1.06-in. (O. D.) cores

FIG. 3—Master design chart for toroids with 0.8-in. (O. D.) cores

FIG. 4—Auxiliary design chart for toroids using 1.84-in. cores

FIG. 5—Auxiliary design chart for toroids using 1.06-in. cores

FIG. 6—Auxiliary design chart for toroids using 0.8-in. cores

of No. 24 wire can be wound on a 1.84-in. core. Using two superimposed cores, an inductance of 800 mh can be obtained with only 1,200 turns. Since this is a logarithmic progression, halving the number of turns will not halve the inductance.

Figure 1 is supported by a turns-against-Q chart (Fig. 4.) for each of the four core types. These show the actual Q obtained by winding the specified number of turns. Diagonal Q lines are plotted for each wire size. These are intersected by a dashed line indicating the limit of the number of turns that can be wound on a given core.

Figures 5 and 6 similarly refer to the master charts, Fig. 2 and 3 respectively.

Chokes

Since a transformer is nothing more than a multiplicity of chokes wound upon a common core, the data is valid for either a choke or transformer. In designing a transformer, the total number of turns of wire (primary and secondary) must be kept in mind. Since maximum efficiency is obtained when the toroidal core is wound fully with wire, the smallest possible core, or the largest possible wire size should always be chosen; Q, of course, holds precedence over other factors. The larger the diameter of wire used, the higher the Q. The choice of core permeability is inversely related to the operating frequency desired. The higher- μ cores operate best at the lower frequencies and conversely.

There is no set rule for using these charts. Some may find it more expedient to look first for the highest obtainable Q at a given frequency, then settle for the core that will provide it. Others may be inductance conscious and settle for the highest obtainable Q at a given inductance.

Figures 7 to 9 give quantitative data on toroids wound by the the author in compiling the accompanying charts.

Tables are on following page

TOROID DESIGN CHARTS

MAGNETIC DRUM DESIGN

Nomograph relates drum diameter, spot density, frequency, angular velocity, access time and number of spots stored, to speed determination of design having optimum compromise of cost, storage volume and access time for modern computing machines

THE SINGLE NOMOGRAPH below suffices for all quantities involved in the design of magnetic drums.

Example 1. It is required that 1,200 spots be stored on the full track. Assuming an operating frequency of 70 kc, a straight line through $N = 1,200$ and $f = 70$ kc gives $\omega = 3,500$ rpm and access time $T = 17$ milliseconds. Next, assume a reasonable value for spot density such as $d = 50$

By D. G. O'CONNOR

and project from $N = 1,200$ through this to read $D = 7.6$ inches for required drum diameter.

Example 2. An access time of $T = 8$ milliseconds is required when using a revolver section having $N = 720$ spots. Extend-

ing a line through these values gives $f = 90$ kc. Assuming 4,000 rpm as a reasonable angular velocity for a revolver, a line through this value and $f = 90$ kc gives $N = 1,350$ spots. This means that 720/1,350 or 8/15 of the complete track is used for the revolved information. Assuming $d = 40$ for spot density, project through this value from $N = 1,350$ to read $D = 10.7$ inches as drum diameter.

Nomograph for parameter relations on magnetic information-storing drums. In revolver-type drum applications, each bit of information is read by one head, erased by the next head, and rerecorded by the third head a short distance ahead. The recorded information thus revolves around the drum concurrently with rotation of the drum to reduce access time to a fraction of a revolution

AIR BREAKDOWN CHART

FOR RADAR PULSES

Chart gives approximate breakdown voltage between conductors in air in the major frequency ranges that are related to the mean free path of electrons in air. Chief use is design of high-voltage pulse circuit components for radar installations.

USE of high-power pulses in radar depends on the dielectric strength of air. The design of equipment to handle these pulses should be based on estimates of the breakdown voltage in the air gaps between conductors. The various configurations of the conductor contours make such estimates difficult, but a few simple rules and the accompanying chart are a great help.

The primary purpose of the chart is to show the variation of breakdown voltage with frequency. Breakdown by an alternating voltage is an effect of cumulative ionization by collision during successive cycles of alternation. At high frequencies, such that the electrons and ions oscillate in the field without reaching the electrodes, the free charges accumulate until the ionization and recombination rates reach equilibrium.

At low frequencies, such that the electrons and ions would oscillate further than the distance between electrodes, the free charges are partially collected during each cycle and hence do not accumulate. Consequently the breakdown gradient is greater at lower frequencies. Likewise, the breakdown gradient is greater in smaller distances, which also facilitate the clean-up. These effects are summarized by the three curves on the chart.

The transition between the

By **HAROLD A. WHEELER**

medium-frequency and high-frequency curves occurs at certain frequencies and pressures, as indicated for a few cases that have been tested. At high frequencies the gradient is constant (2.9 kv per mm at one atmosphere pressure).

Transition Frequencies

If the distance is of the order of 1,000 times the mean free path of electrons in the air, this transition between middle and lower curves occurs at frequencies of the order of 100 mc, as shown on the chart. This relation is independent of the pressure, although the value of the mean free path is inversely proportional to the pressure. In other words, the product of pressure times distance is proportional to the ratio of distance over mean free path. This is the reason why a single family of curves is valid over a great range of pressure and distance.

The transition between the upper and middle curves (not shown) occurs at frequencies about 1/100th as great, since the velocity of ions is less than that of electrons in about this ratio, and their mean free path is nearly the same.

In either case, the transition occurs at a value of pressure times distance which is inversely proportional to the frequency.

Uniform Gradient

The simplest case for consideration and formulation is a uniform voltage gradient between parallel plane conductors. Ordinary configurations have a peak gradient greater than the average, and the maximum gradient may be taken as a criterion of breakdown over a certain distance. This is valid at high frequencies; at lower frequencies the criterion is somewhere between the maximum and the average gradient, usually closer to the maximum.

A uniform gradient causes corona, just a well-defined spark. A maximum gradient greater than the average gradient causes corona below the sparking voltage, which dictates the final breakdown voltage. As the voltage is increased to the breakdown point. At high frequencies it is even possible to have a ball of fire (ball of fire) in a limited space separated from the electrodes.

At low frequencies, there can be no spark in a gas at a voltage less than a certain value (about 0.3 kv in air), because the electrons are collected before they can gather sufficient momentum. At high frequencies, this fails because most of the

Chart giving breakdown voltage in air between parallel planes. For atmospheric pressure, horizontal scale represents distance in millimeters between the plane electrodes

ns oscillate without reaching electrode.

Experimental Basis

The chart is based on a steady alternating voltage (unmodulated c-w). Short pulses of direct voltage (of the order of one microsecond) occurring at much longer intervals (of the order of one millisecond) stop before equilibrium is reached, so their breakdown voltage is naturally somewhat greater than that of a steady direct voltage, the highest curve on the chart. Such short pulses of high-frequency voltage have been presumed to show a similar tendency relative to the direct curve, and there is some experimental evidence to this effect.

The chart is valid at lower

pressures, provided that the distance is many times the mean free path of electrons, which is true over the range plotted.

In general, there is a scarcity of reliable experimental evidence either to support or to contradict these curves. It is expected that they will be verified under controlled conditions by providing some continuous supply of electrons. This supply may come from corona or other localized discharge, ultra-violet rays, x-rays or gamma rays, but hardly from thermal agitation at ambient temperatures common in electronics equipment (usually under 100C). Therefore a somewhat higher breakdown voltage may be fairly certain if such sources are precluded by design. This is especially true of short

pulses such as mentioned above. However, cosmic rays arrive about once per hour per square millimeter, and cannot be stopped by reasonable shielding:

GAIN-BANDWIDTH NOMOGRAPH

Equations involved in design of single-tuned amplifier circuits are incorporated in one large nomograph to speed up design calculations. Shows overall effect of varying the parameters when seeking the most economical tube arrangement for desired gain and bandwidth

THE design of vacuum-tube amplifiers involves determining the maximum gain and/or bandwidth using the most economical tube arrangement. The most practical first-approximation calculation for single-tuned circuits such as cascaded synchronously tuned i-f stages was found to be $G_m/2\pi C_i$, and the nomograph on the following page was therefore based on this ratio. The nomograph encompasses all of the interdependent equations used in amplifier design, hence shows the effect of variations in each parameter on the others.

Practical values of G_m and C_i that include the effect of the coupling networks can be found by taking approximately 85 percent of the maximum G_m and 160 percent of the value of C_i given in tube manufacturer's data. This makes the usable gain-bandwidth about 53 percent of the ideal, or roughly one-half. This relationship is found in Table I.

The nomograph solves the following equations:

$$\begin{aligned}
 Q &= f_o/B & (1) \\
 A &= G_m \times R_L & (2) \\
 AB &= A \times B & (3) \\
 AB &= G_m/2\pi C_i & (4) \\
 B &= 1/2\pi C_i R_L & (5) \\
 A_{max} &= 1/2\pi f_o C_{GP} R_L & (6)
 \end{aligned}$$

where $Q = R \omega C =$ circuit quality, $f_o =$ circuit resonant frequency, $B =$ 3-db bandwidth, $A =$ stage gain, $G_m =$ tube

By CHESTER W. YOUNG

transconductance, $R_L =$ total damping resistance, $C_i =$ total shunt capacitance, $A_{max} =$ maximum usable gain, and $C_{GP} =$ total effective grid-plate capacitance.

Since the bandwidth between two 3-db frequencies of a tuned circuit is equal to the 3-db frequency of a parallel or series R-C circuit, the nomograph can be used also for video types of circuits. Also, as Eq. 5 states that bandwidth is independent of L , the nomograph ignores L . Use

Table I—Examples of Ideal and Practical Tube Capacitances

| IDEAL | | | | |
|-----------|------------------------|-------------------------|---------------------|-----------------|
| Tube Type | C_o $\mu\mu f$ | C_p $\mu\mu f$ | C_i $\mu\mu f$ | G_m/C_i mc |
| 6AC7 | 11.0 | 5.0 | 16.0 | 562 |
| 6AK5 | 4.0 | 2.8 | 6.8 | 750 |
| PRACTICAL | | | | |
| Tube Type | C_{in} $\mu\mu f$ | C_{out} $\mu\mu f$ | C_i $\mu\mu f$ | G_m/C_i mc |
| 6AC7 | 17.0 | 8.0 | 25.0 | 312 |
| 6AK5 | 6.7 | 4.4 | 11.1 | 378 |

of this nomograph is best illustrated by an example.

If the known values are $f_o = 30$ mc, $B = 1$ mc, $C_i = 16 \mu\mu f$, $G_m = 5,000$, and $C_{GP} = 60 \mu\mu f$, find the values of Q , A , R_L and A_{max} .

Step 1: Align points $f_o = 30$ mc and $B = 1$ mc, and read $Q = 30$.

Step 2: Align points $C_i = 16 \mu\mu f$ and $G_m = 5,000$, and read $AB = 50$ mc.

Step 3: Align $AB = 50$ mc and $B = 1$ mc, and read $A = 50$.

Step 4: Align $A = 50$ and $G_m = 5,000$, and read $R_L = 100$ ohms.

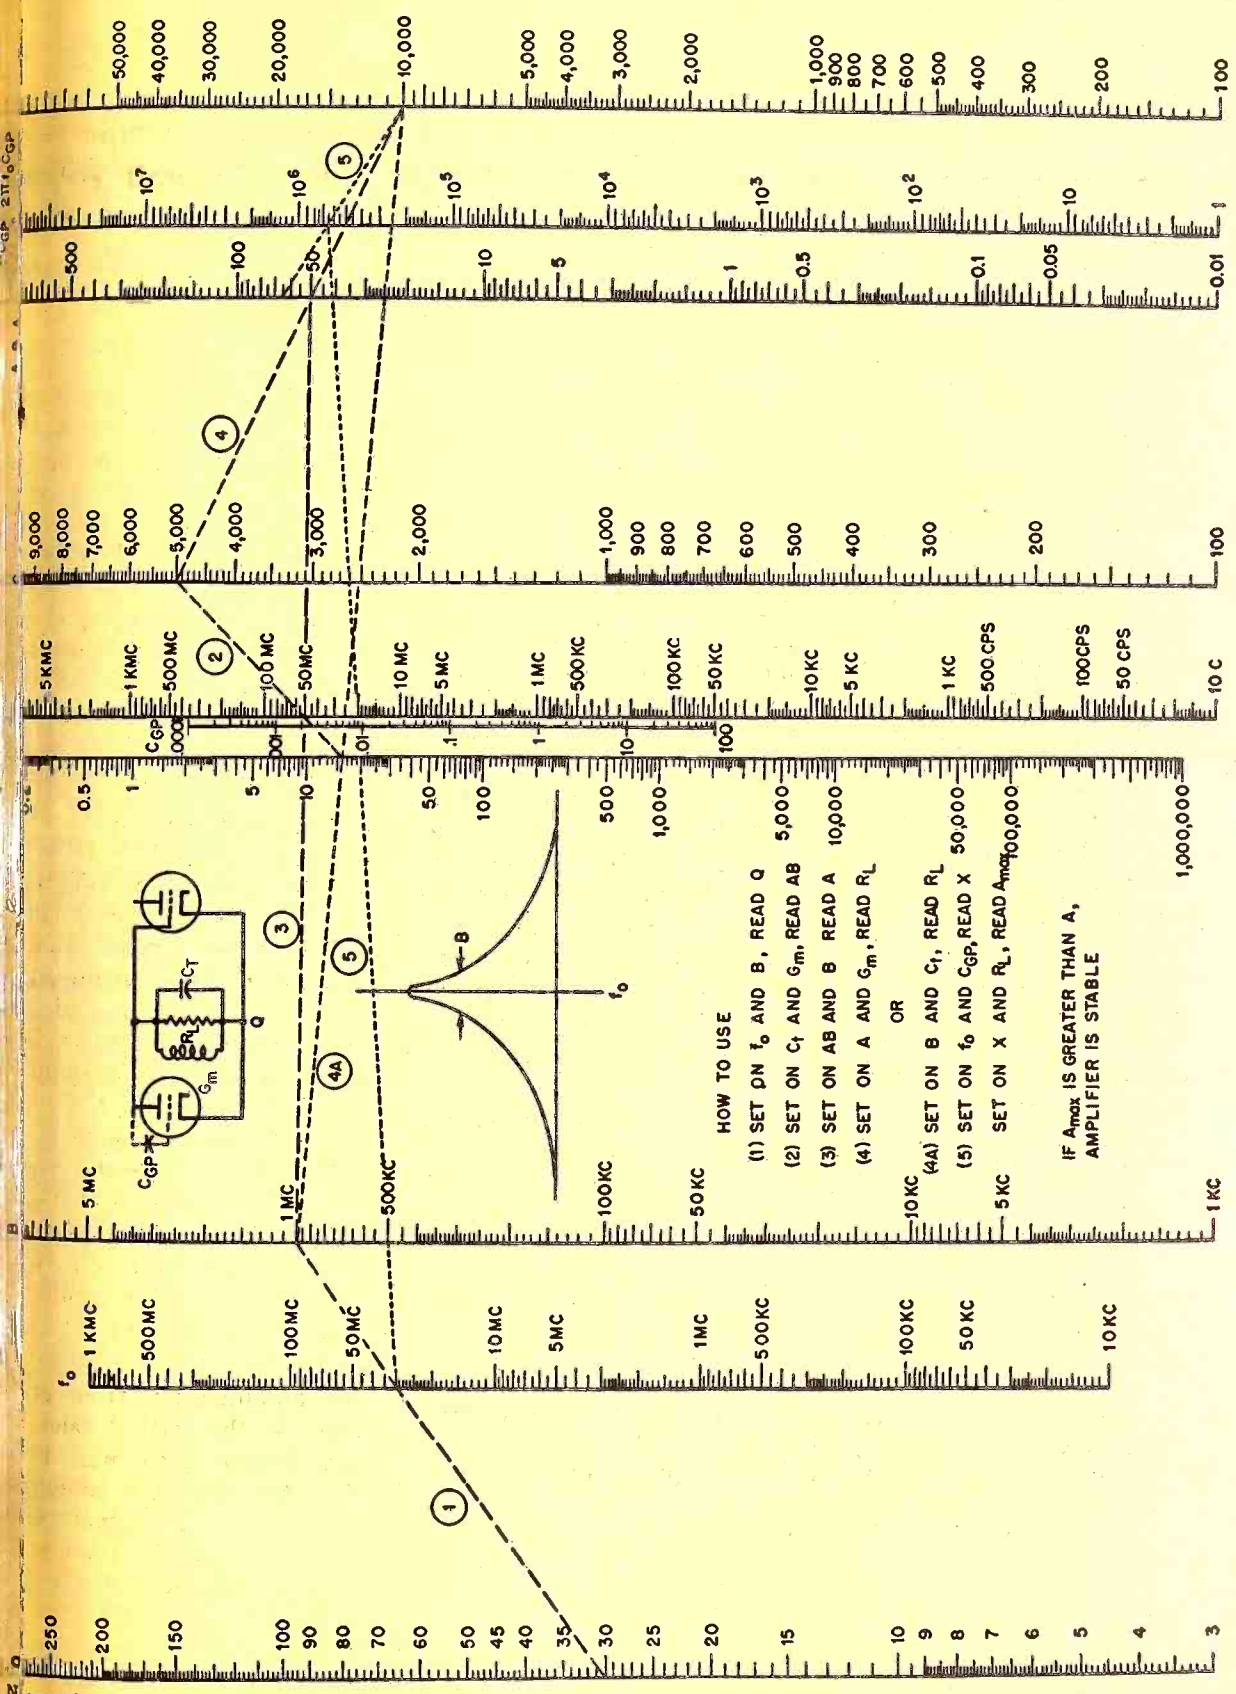

Step 4 (alternate): Since the loading resistance is directly related to bandwidth and capacitance by means of Eq. 5, it may be found by aligning $B = 1$ mc and $C_i = 16 \mu\mu f$, giving $R_L = 10,000$ ohms as before.

Step 5: To ascertain whether the value of $A = 50$ in Step 3 is a practical value of gain, a criterion of the maximum gain is determined by going back through the tube grid-plate capacitance causing oscillation. If the attenuation from plate to grid is set equal to the amplification from grid to plate as the critical value, then the desired gain must be less than the maximum usable gain. The value A_{max} is approximately 750, determined by dividing R_L by the reactance of C_{GP} and thinking of the attenuation as a negative gain. This holds true when the input and output impedance are

as in a multistage synchronous tuned i-f amplifier. The value of C_{GP} is determined by setting $f_o = 30$ mc and C_{GP}

$= 0.0082 \mu\mu\text{f}$ and reading $X = 6.5 \times 10^5$ ohms. Now align this value of X and $R_L = 10,000$ and read the maximum usable gain

as 65 on the A_{max} scale. This value is greater than the desired gain of 50, so the amplifier is deemed to be stable.

Nomograph for designing single-tuned amplifier circuits like that shown. Numbered dashed lines indicate order of steps in designing an amplifier for desired stage gain and bandwidth and checking its stability

BANDWIDTH NOMOGRAPH

FOR PULSE FILTER NETWORK

Gives minimum bandwidth required for adequate transmission of a periodic rectangular pulse, based on spectral distribution of pulse energy, for any selected efficiency of ideal and R-C filters. Law of diminishing returns applies to bandwidth increase.

By **B. L. ADAMS** and **T. M. STOUT**

WHEN A PULSE or other signal is applied to a filter with limited bandwidth, the output is a distorted version of the input because some of the frequency components of the signal are attenuated or eliminated. The importance of these components can be measured by the energy which they represent, so it is commonly stated that "such distortion is minimized by the selection of a frequency band sufficiently wide to include nearly all of the total energy of the frequency components."¹

This observation appears frequently in the literature and the principle is well understood. Quantitative application of this idea, however, appears to have been limited to simple cases involving periodic signals or to elegant attacks on the problem of

optimizing performance in the presence of noise.

Periodic Inputs

For a periodic input, the various harmonic components can be found by Fourier analysis; the Fourier series for a number of common periodic waves are readily available in the literature². The power represented by any harmonic can be found by squaring its magnitude, and the combined power of several components is found by addition. In the case of a square wave, for example, the magnitudes vary inversely with n , the order of the harmonic, where $n = 1, 3, 5, \dots$. From this information, one readily determines that the fundamental component of the square wave accounts for 81.1 percent of the total power and

that higher harmonic contribute as shown in the following table:

| Highest Harmonic Included | Percentage of Total Power |
|---------------------------|---------------------------|
| 1 | 81.1 |
| 3 | 92.2 |
| 5 | 95.2 |
| 7 | 96.7 |
| 9 | 97.6 |
| 11 | 98.1 |
| 13 | 98.4 |

Single-Pulse Input

For periodic inputs, the frequency components are distinct but form a continuous spectrum. The relative magnitudes are again determined by Fourier analysis, using the Fourier integral.

The actual signal energy in any portion of the frequency spectrum is found by squaring the amplitudes and integrating

FIG. 1—Transmission efficiency for rectangular pulse input

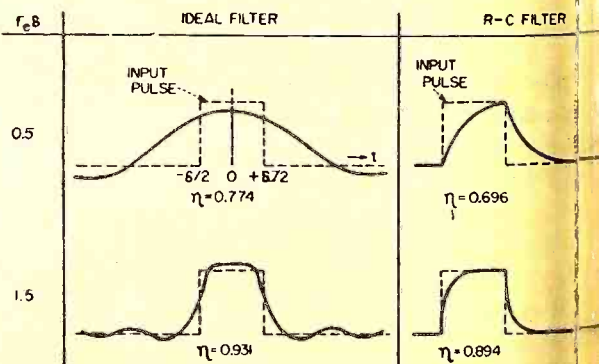

FIG. 2—Responses of filters for rectangular input pulse

pect to frequency over the re-
quired interval.

If the signal is an isolated
angular pulse of width δ , the
frequency spectrum is³

$$F(f) = \frac{\delta}{2\pi} \left[\frac{\sin \pi f \delta}{\pi f \delta} \right] \quad (1)$$

By squaring and integrating, the
fraction of the total energy in
the band between zero frequency
and an upper limit f_0 is found
to be

$$\frac{2}{\pi} \left[\frac{\cos 2\pi f_0 \delta - 1}{2\pi f_0 \delta} + \text{Si}(2\pi f_0 \delta) \right] \quad (2)$$

where $\text{Si}(2\pi f_0 \delta)$ is the sine in-
tegral, a function which has been
computed and tabulated^{4,5}.

Strictly speaking, an energy
distribution computed in this
way describes only the input sig-
nal to a network. When the net-
work is the so-called ideal filter,
however, whose gain is one for
 $f < f_0$ and zero for $f > f_0$, the
curves from Eq. 2 represent the
ratio of output to input energy.
Interpreted in this way, the
energy distribution can be re-
garded as defining an efficiency
of transmission which bears
a close relation to the fidelity of
signal reproduction.

Design of Practical Filters

For practical filters, this same
efficiency can be calculated from
either frequency or time in-
formation, by analytical or
graphical methods. For a simple
resistance-capacitance low-pass
filter whose cutoff frequency is
defined as $f_0 = 1/2\pi RC$, the ratio
of output to input energy is

$$1 - \frac{1}{2\pi f_0 \delta} \left[-e^{-2\pi f_0 \delta} \right] \quad (3)$$

Values computed from Eq. 2 and
Eq. 3 are plotted in Fig. 1. The two
curves are similar in shape and
intersect at $\eta = 0.57$, where f_0
is approximately equal to $1/\pi\delta$.

The close correspondence be-
tween the two curves is due in
part to the fortunate choice of
the -3 db or half-power point
in defining the cutoff frequency
of the R-C filter.

The relation between network

FIG. 3—Nomograph relating efficiency, bandwidth and pulse width. Multiplier k is zero when using seconds for pulse width and cycles per second for bandwidth; any other consistent units may be used, such as $k=3$ for milliseconds and kc or $k=6$ for microseconds and mc

efficiency and quality of pulse
reproduction is suggested in Fig.
2, which shows typical pulse re-
sponses for ideal and R-C filters.
From these pictures one might
conclude that 70–75 percent
efficiency is a minimum standard,
that 90–95 percent is preferable,
and that an even higher figure
might be better.

In selecting bandwidth, how-
ever, consideration should be
given to signal-to-noise ratio.
In the absence of detailed in-
formation, it is probably good
policy to use the minimum band-
width consistent with adequate
signal reproduction. In this con-
nection, Fig. 1 shows clearly a
law of diminishing returns in
increasing bandwidth. For a
given pulse width, an increase in
efficiency from 90 to 95 percent
requires doubling the band-
width; a further increase to 99
percent requires a further mul-
tiplication of bandwidth by five.

Bandwidth Nomograph

Calculations of network band-
width are simplified by the use of
the nomograph shown in Fig. 3.
A straight line drawn between
points on the upper and lower

scales determines the network
efficiency for the given pulse
width and bandwidth, for either
the ideal filter or R-C filter, de-
pending on which center scale is
used. A multiplier is included
on the pulse width and band-
width scales to emphasize that
any consistent units may be used,
such as seconds and cycles per
second, milliseconds and kilocy-
cles or microseconds and mega-
cycles.

Example of Use

As a sample problem, suppose
that a 0.5-microsecond pulse is
to be transmitted by an ideal
filter with an efficiency of 93
percent. Line 1 on the nomograph
gives the required bandwidth of
three megacycles. According to
line 2, somewhat greater band-
width (4.5 megacycles) is re-
quired with an R-C filter.

MIXER HARMONIC CHART

Chart speeds identification or prediction of spurious frequencies resulting from beating of various harmonic terms in mixer output when one input frequency is variable in wide-band signals for tv, f-m and military communication

IN MANY APPLICATIONS involving the mixing of two frequencies to produce a third, a major difficulty often encountered is the generation of spurious frequencies by beating together of harmonics. When near coincidence with the required terms, these spurious frequencies cause audible modulation of the required frequency that cannot be removed by subsequent selective circuits.

When there are only two fixed frequencies, it is fairly simple to write down all the combination terms involved. If one of the input frequencies varies, however, a graphical method is to be preferred, as this enables the immediate identification or prediction of the various beats and facilitates the choice of frequency ratios free from modulation or spurious frequencies adjacent to the wanted terms.

It was in dealing with such a problem that the accompanying chart was devised. It is based on the fact that the expression for the value of any combination frequency is $F_s = mF_o \pm nF_z$, where m and n are the orders of the harmonics of the two frequency sources F_o and F_z respectively, F_z being the higher of the two frequencies.

To use this chart, trace upward from the ratio F_o/F_z of the two primary frequencies to the heavy difference line $F_z - F_o$ or the heavy sum line $F_z + F_o$, depending on which output component is being used. From this intersection, trace up and down to the nearest slant lines; from each one, trace left to read the F_s/F_z value for that spurious combination frequency. Alternatively, the spurious frequencies can be figured from the identifying notations on the two near-

By **THOMAS T. BROWN**

est lines. Where intersections of two slant lines are nearest to the desired intersection, a beat audio modulation equal to the frequency difference will be produced.

Some problems may require the use of an expanded region of the chart showing higher combination terms. This may readily be constructed to any scale without plotting the whole curve from the origin. Assuming that the boundary limits of the required region are F_{o1}/F_z for the lower frequency limit and F_{o2}/F_z for the upper limit, the corresponding limits on the abscissa are F_{s1}/F_z and F_{s2}/F_z . Now

$$F_s = mF_o \pm nF_z \quad (1)$$

$$F_o/F_z = [(F_s/F_z) \mp n]/m \quad (2)$$

Substituting the four known boundary limits in Eq. 2 gives four equations involving m and n . Substituting for these the harmonic orders of the combination frequencies which it is desired to plot, two points are obtained which are connected by a straight line. This procedure is repeated for the main sum or difference frequency ($m = n = 1$) and other desired pairs.

A preliminary scrutiny of the structure of the general chart will be found helpful in quickly showing what order of combination frequencies are likely to be encountered in the particular region concerned.

Example of Use

In the design of a repeater station for a vhf relay, it is common practice to receive the trans-

mission at a given frequency, retransmit at a slightly higher or lower frequency to reduce feedback difficulties. Rather than convert the input to the output frequency directly, it is convenient to convert down to a lower intermediate frequency which may then be amplified more easily and reconvert to the output frequency.

Assume an input frequency of 250 mc with a 3-mc bandwidth, and a required output frequency of 240 mc. A convenient intermediate-frequency value for F_i would be in the order of 50 mc. The problem is to choose local oscillator frequencies that will avoid radiating spurious frequencies and minimize intermodulation distortion.

Trying first 50 mc for F_i as a local oscillator value F_o , because 200 mc and F_o/F_z for this is 0.775 . Tracing upward, this is immediately seen to be a bad choice because the desired main difference frequency line $F_z - F_o$ intersects both the $4F_o - 3F_z$ and $5F_o - 6F_z$ lines at this point.

By inspection, the nearest value of F_o/F_z that it is in a space on the heavy $F_z - F_o$ line is 0.775 , which corresponds to an i-f value of about 55 mc. Tracing vertically up and down to the intersection of the ordinate with the $F_z - F_o$ line, we find that the nearest spurious frequencies occur at $F_s/F_z = 3.0$ and 0.12 . Their values are quickly figured as $F_s = 0.3 \times 250 = 83.5$ mc and $F_s = 0.12 \times 250 = 30$ mc. If the bandwidth of F_i is 3 mc, these 83.5-mc and 30-mc beats will be easily filtered out of a 55-mc i-f system by tuned circuits.

Now converting up again to F_o , be 55 mc and let F_i , be

desired 240-mc output frequency, so that $F_s = 240 - 55 = 185$ mc, the frequency required of the second local oscillator to get a sum-frequency output. Then F_o/F_s is 0.298. Tracing up from this value to

the sum line $F_s + F_o$, the two nearest spurious frequencies to this intersection are at $F_o/F_s = 1.4$ and 1.2 . For 1.4 , the output is $1.4 \times 185 = 259$ mc due to the combination $2F_s - 2F_o$. For 1.2 , we have both $4F_o$ and $3F_s -$

$6F_o$, giving $1.2 \times 185 = 222$ mc. Since the bandwidth is 3 mc, adequate selectivity should not be difficult to provide at 240 mc to discriminate against these 259-mc and 222-mc spurious components.

Chart with F_o and F_s as mixer input frequencies (with F_s the higher) and F_o as desired output frequency. Lines intersected when tracing straight up from value of F_o/F_s represent combination frequencies, values of which can be found either from labels on lines or from scale of ordinates. Only intersections near desired combination (sum or difference) need be considered. When F_s is fixed, ordinate scale can be marked to give frequency directly

VHF FIELD INTENSITIES

Nomograph shows fields in microvolts per meter for transmitter powers up to 500 watts, antennas up to 500 feet, over obstructions as high as 10,000 feet in the frequency range between 20 and 260 mc

By E. A. SLUSSER

IN PLANNING a new vhf point-to-point radio circuit, it is first necessary to make some estimate of the expected transmission between the two points in question in order to determine the feasibility of such a circuit.

Likewise, in planning a new vhf mobile system the expected coverage over flat land and into shadowed areas must be predetermined. These estimated transmission figures can be used to assist in the selection of equip-

ment and location of transmission sites. Such estimates are usually made by means of profile and transmission nomographs. Previous nomographs for estimating field intensities in the vhf frequency range have been made for small segments of the total band of frequencies, thus necessitating several nomographs to cover the entire band. This nomograph enables one to determine a given frequency in the band between 20 and 260 mc and estimate the field intensity for either transmission over flat land or transmission over a profile involving shadow losses. It assumes either horizontal or vertical polarization over land or water. It also assumes 5-watt transmitters and half-wave antennas elevated 40 feet above ground, but supplementary conversion data is given for other powers and antenna heights.

To use the nomograph it is necessary to draw an elevation profile of the intervening terrain between the two proposed transmission sites. An example is shown in Fig. 1. A triangle is constructed by drawing two lines from the station sites, X and Y, each tangent to the nearest obstruction that blocks the line-of-sight path. A baseline is also drawn to intersect the obstruction sites, and a vertical line is drawn through the apex of the triangle and intersecting the baseline.

The information taken from this figure includes: D_1 , which is always the shortest distance in miles from one of the station sites to the vertical line, which is the height in feet of the vertical line between the apex of the triangle and the intersection of the baseline and the total transmission distance D . This information, along with a given frequency F in the range, can be applied to the nomograph. The steps follow: (1) A point on graph

FIG. 1—Sample elevation profile used with nomograph

ated representing (F, D), this point is projected horizontally to a point on scale A. 2) H is determined and a line is constructed through H and the point on scale A. This line intersects B at some point. 3) A point representing the frequency and the total distance (D) is determined on graph and this point is projected horizontally to scale C. 4) A line is constructed passing through the points on scales C and B and intersecting scale D . 5) The estimated field intensity in db, referred to one microvolt per meter, is taken at the point where this line intersects scale D .

For estimating field intensity over smooth land, scale A is not used and H is taken as being the transmission estimates made by use of this nomograph based on standard conditions. The data that are obtained are in general agreement with experience for smooth or moun-

tainous terrain. The factors affecting vhf transmission are both natural (such as meteorological effects, type of soil and surrounding vegetation) and artificial (for example, antenna height, antenna gain, transmitter power and transmission-line loss). The latter items can be taken into consideration when making an estimate and a new equivalent field intensity (equivalent on the basis of a half-wave antenna) can be found.

A sample calculation can be made between locations X and Y by using the profile given in Fig. 1. Assume the following: at the transmitter end a 100-watt 150-mc transmitter using a three-element parasitic antenna having a gain of 6 db mounted on a 90-foot pole; on the receiving end another three-element 6-db-gain antenna mounted on a 30-foot pole; a combined transmission-line loss of 3 db at both ends. The answer is +14.5 db.

By comparing the estimated data with the receiver input level

FIG. 2—Conversion graph for antenna elevation and transmitter power

Table I—Expected Circuit Performance With Average Receiver

| Frequency Range in Mc | Equivalent estimated field intensity in db referred to $1\mu\text{V}$ per meter | | |
|-----------------------|---|--------------|-----------------------|
| | Probably Unsatisfactory | Questionable | Probably Satisfactory |
| 20-40 | < -5db | -5 to +5db | > +5db |
| 40-70 | < 0 | 0 to +10 | > +10 |
| 70-100 | < +5 | +5 to +15 | > +15 |
| 100-120 | < +10 | +10 to +15 | > +15 |
| 120-160 | < +10 | +10 to +20 | > +20 |
| 160-220 | < +15 | +15 to +20 | > +20 |
| 220-260 | < +15 | +15 to +25 | > +25 |

FIG. 3—Conversion graph for receiver input voltage

requirements one can determine whether or not the circuit will be probably satisfactory. For the average receiver the performance can be taken from Table I.

In making the above comparison one must take into consideration the amount of man-made noise present in the receiver area. The above figures are based on average noise conditions but in extremely noisy areas it may be necessary to increase the figures by about 20 db.

In order to compare the above data with receiver sensitivity, it may be desirable to convert field intensity, which is given in terms of db above one microvolt per meter, to microvolts appearing at the receiver terminals. This can be done by means of Fig. 3. This figure assumes a half-wave antenna connected to the receiver terminals (72 ohms input) by means of a zero-loss transmission line. The voltage (for half-wave antennas) appearing on the receiver terminals is $0.32LE$ where L is the length of the antenna in meters and E the field intensity in microvolts per meter.

For the previous example, +14.5 db equivalent field intensity at 150 mc corresponds to approximately 1.7 microvolts at the receiver terminals.

COMBINING SOUND LEVELS

Simple nomogram dispenses with the need for log tables, decibel tables or a slide rule when determining the total acoustical power resulting from the combination of two or more sounds

By W. B. CONOVER

TWO OR MORE SOUNDS combine to give a total sound whose acoustical power is the sum of the power involved in the individual components. Since sound levels are expressed in decibels, the sound level of each component must be converted to its corresponding power ratio, added to the power ratio of the other components, and the total power ratio reconverted to decibels to determine the total sound level.

A straightedge intersecting the outer scales of the nomogram at positions corresponding to the individual sound levels db_1 and db_2 intersects the center scale at db_T , which is the total sound

level. For example, individual sound levels of 8 and 10 decibels will be found to give a total of 12.1 decibels.

Any two equal sound levels combine to produce a sound which is 3 decibels higher than either of them separately. Thus 7.5 db and 7.5 db combine to yield 10.5 db; 0 db and 0 db give 3 db.

It is necessary to choose a con-

venient reference level such that the individual components be within 10 db of it. Thus, for a total of 62 db and 67 db, a reference level of 60 db is chosen. Since the components are 2 and 7 db above this reference, the resultant 8.2 db given by the nomogram is added to the reference, giving a total of 68.2 db.

When a difference of more than 10 db exists between two sound levels, the contribution of the smaller may be neglected.

Other Uses

One component of noise can be found when the other component and the total noise are known. This is useful in correcting sound-level meter readings for ambient noise. For example, if a sound-level meter shows 64.5 db in the neighborhood of a certain machine when it is operating and an ambient noise reading of 60 db when the machine is turned off. What is the noise level of the machine alone due to the machine alone? Choosing 60 db as the reference level, a straightedge is aligned with 0 db (60-60) on the db_1 scale, and 4.5 (64.5-60) on the db_T scale, giving a reading of 2.6 db on the db_2 scale. Adding this to the reference level of 60 db results in a noise level of 62.6 db for the machine alone.

When more than two sound levels are to be combined, the total of two components is determined and combined with a third component, the new total combined with a fourth component, and so on. This same procedure may be employed to determine in decibels, the rms value of complex voltage or current wave when its harmonics are expressed in decibels.

MINIMUM-LOSS MATCHING PADS

Simple nomograph gives the two resistance values needed in an L-type network for matching unequal impedances with minimum power loss, and also gives directly the amount of loss in db. Multiplying factors are easily used to extend ranges

A TWO-RESISTANCE network for matching two unequal impedances provides proper matching with a minimum of power loss. The accompanying nomograph solves for the resistance values needed.

Example 1. Match a 72-ohm line to a 52-ohm line with a minimum of power loss. Determine the loss in db.

By **JOSEPH C. BREGAR**

Solution. Adjust a straight-edge to connect 72 on the R_a scale and 52 on the R_b scale (R_a must be greater than R_b , and therefore $R_a = 72$ and $R_b = 52$). The intercept on the db loss scale

shows the matching-pad loss as 5.1 db. Next, adjust the straight-edge at right angles to the loss line and through the 5.1-db point, and read the X and Y values as $X = 0.53$ and $Y = 1.9$. The desired resistor values are then $R_1 = XR_a = 0.53 \times 72 = 38$ ohms, and $R_2 = YR_b = 1.9 \times 52 = 99$ ohms.

The scale ranges are chosen for common impedance values. The nomograph may be used for any values by the application of the same multiplier to the R_a and R_b scales. No multipliers are required for the loss scale or the X and Y values. The X and Y values are applied to the original problem values of R_a and R_b in determining R_1 and R_2 .

Example 2. Match a 3,000-ohm source to a 600-ohm load with a minimum of loss. Determine the loss.

Solution. A convenient scale factor is 1/10. Applied to the problem values, R_a becomes 300 and R_b becomes 60. Connect these points with a straightedge and read the pad loss as 12.5 db. Next, read the X and Y values as 0.89 and 1.12 respectively. Applying these values to the original problem impedances of 3,000 and 600 ohms gives $R_1 = 0.89 \times 3,000 = 2,700$ ohms and $R_2 = 1.12 \times 600 = 670$ ohms.

The matching of impedances of more than 30-to-1 ratio involves high power losses, and other types of coupling networks are employed. For impedance matching when power loss is unimportant and the ratio of impedances is more than 30-to-1, the X and Y values approach 1; then $R_a = R_1$ and $R_b = R_2$ for proper matching.

HIGH-PASS, LOW-PASS and BAND-PASS

Rearrangement of equations and accompanying charts permit design of multisection filters with only two or at most three settings of a reactance slide rule. Filter component values are specified as functions of midband frequency and terminating impedance

By C. J. MERCHANT

MUCH of the drudgery in designing high-pass and low-pass filters for audio frequencies may be eliminated by the simple expedient described here.

The formulas for L and C in a single constant- k high-pass T-section are $L = R/4\pi f_0$ and $C = 1/\pi f_0 R$ where f_0 is the cut-

off frequency and R is the terminating resistance. A simple rearrangement of these expressions gives $2\pi(f_0/R)L = \frac{1}{2}$ and $1/2\pi(f_0 R)C = 1$, or, in other words, L is the inductance whose reactance at the frequency f_0/R is equal to $\frac{1}{2}$ ohm, and in a similar manner C is the capacitance whose reactance at the frequency

$f_0 R$ is found to be equal to 1 ohm.

The method can be extended to other types of sections, and a multisection filter can be designed with only two settings of a reactance slide rule, once at f_0/R for the inductances and once at $f_0 R$ for the capacitances. In multisection filters the sharpest cutoff consistent with high attenuation outside the pass band is realized by using terminating m -derived half-sections with $m = 0.6$, a full m -derived section with $m = 0.8$, and two or more constant- k sections.

Figure 1 gives the values of the reactances in ohms in the sections, the coils being evaluated at f_0/R and the capacitors at $f_0 R$.

For example, to design a three-section low-pass filter of T-sections with $R = 500$ ohms and $f_0 = 1,000$ cps, find on the slide rule that $f_0/R = 1,000/500$ or 2 cps. Also on the slide rule find the inductance whose reactance at 2 cps is the value given in Fig. 1. Then determine C to be $1,000 \times 500$ or 500 kc. Find the capacitance whose reactance at 500 kc is the value given in Fig. 1. The complete filter and its attenuation characteristic are given in sections A and B of Fig. 2.

Low-pass or high-pass filters can be completely specified in terms of two quantities, the cutoff frequency and the terminating impedance. Band-pass filters introduce an additional

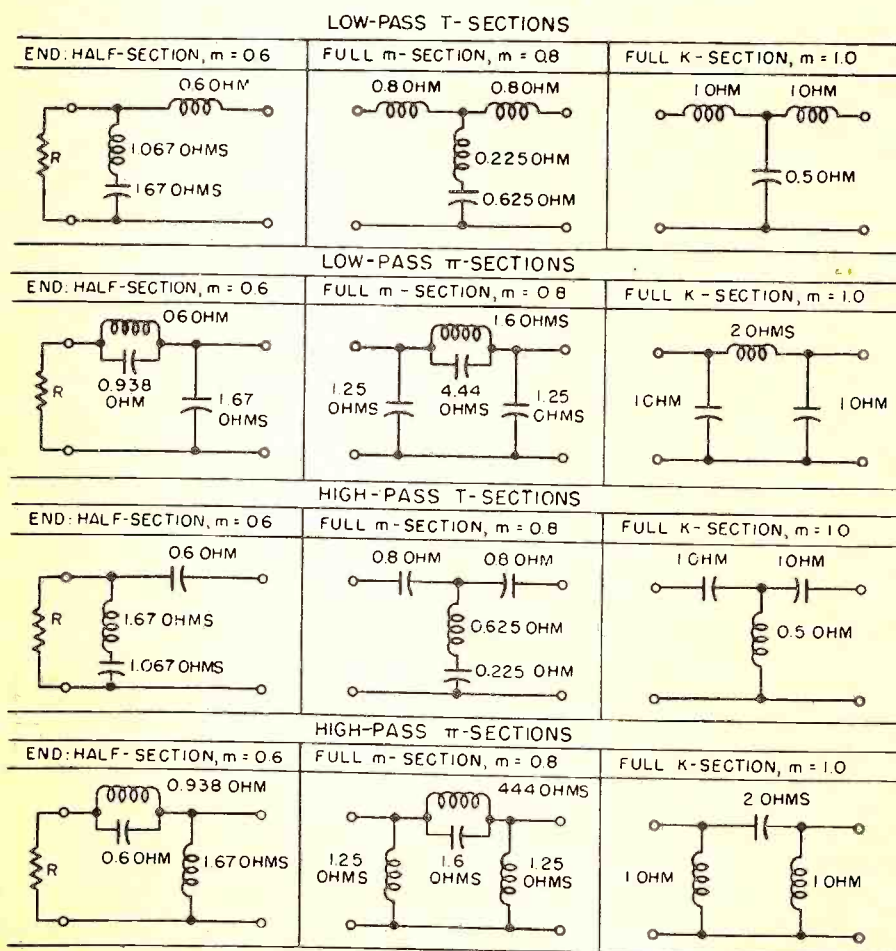

FIG. 1—Generalized impedance chart from which impedances are calculated by reactance slide rule if terminating impedance and cutoff frequency are given

FILTER DESIGN

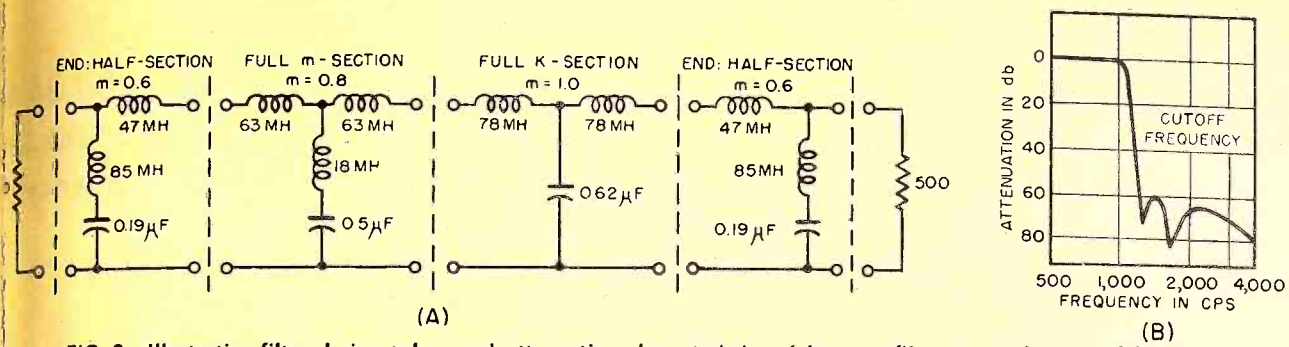

FIG. 2—Illustrative filter design values and attenuation characteristics of low-pass filter designed by use of Fig. 1

quantity, the bandwidth, and therefore require three quantities to specify their performance, but their calculation can be simplified by means of the technique used for low and high-pass filters.

The charts in Fig. 3 give the reactance constants, in ohms, of T and π band-pass sections in terms of the terminating impedance R , the upper cutoff frequency f_2 , and the midband frequency f_m , which is the geometric mean of the upper and lower cutoff frequencies and is given by $f_m = \sqrt{f_2 f_1}$.

For example, to design a band-pass filter of π -sections with cutoff frequencies at 770 cps and 1,300 cps and terminated in 1,000 ohms, find $f_m = \sqrt{770 \times 1,300} = 1,000$ cps first. Find $f_2/f_m = 1,300/1,000 = 1.30$. Then find $f_1/R = 1,000/1,000 = 1$ cps, and find the inductances whose reactances in ohms at 1 cps are the values given on the chart opposite $f_2/f_m = 1.30$. Then find $f_1/R = 1,000 \times 1,000 = 1$ mc and find the capacitances in like manner.

When f_2/f_m is greater than 1.1, the filter can be more economically designed by cascading low and high-pass sections whose pass bands overlap.

In specifying values for the equal filter design, elements appearing directly in parallel or in series after cascading should be combined.

FIG. 3—Generalized impedance tables from which filter impedances are quickly calculated if the upper cutoff frequency, midband frequency and terminating impedance of a band-pass filter are all known. These dimensionless impedance tables are obtained by specifying filter component values as functions of midband frequency and terminating impedance for various values of the ratio of upper to midband frequency

COAXIAL-STUB FILTER

Undesired signals in a coaxial transmission line can be attenuated up to 30 db by connecting two stubs to the line, one for rejection and the other to correct the line impedance. Graphs give approximate stub lengths for any interfering frequency range from 20 to 200 mc

By JAMES A. CRAIG

COAXIAL LINE stubs often can be effectively used in transmitter or receiver coaxial transmission lines to reduce or trap out specific spurious radiations or interfering signals. Stubs are well worth trying, since they are relatively inexpensive and can be depended upon to furnish up to 30-db additional attenuation to an undesired signal. Two stubs are used, one for rejection and one for correction, as shown in Fig. 1.

Receiver stubs are most easily fabricated from RG-58/U solid dielectric cable. Where stubs are to be used to suppress transmitter spurious radiations, a solid-dielectric cable should be used having the same power-handling capacity as is used between the transmitter and its antenna. The approximate length of the rejector stub for the undesired frequency can be determined from Fig. 2. A piece of

cable several inches longer than that called for should be connected into the transmission line as in Fig. 1, as close as practical to the transmitter or receiver. Use a pick or other sharp-pointed instrument to short-circuit the outer shield to the inner conductor at various points, starting from the outer end of the stub and working inward. Note at which point the short-circuit produces the greatest attenuation of the undesired signal and permanently short-circuit the cable there. Cut off the excess cable. This short-circuit may be best accomplished by collapsing the outer shield around the center conductor and soldering all around.

As Fig. 3 shows, the rejection

stub alone produces a certain amount of attenuation to the undesired signal. This is because it has been tuned to be a shorted half-wave section of line at the undesired frequency. In such a case, it presents close to zero impedance to this frequency at its point of connection to the main transmission line. However, at the desired frequency the rejection stub will not be a shorted half-wave section of line and will therefore present either a capacitive or inductive reactance to the line and thereby cause some degree of attenuation at the desired frequency. This effect can be overcome by adding a second stub called a correction stub, as shown in Fig. 1.

For various desired versus undesired frequency conditions, the length of the correction stub may vary from almost zero to one-half wavelength. The length

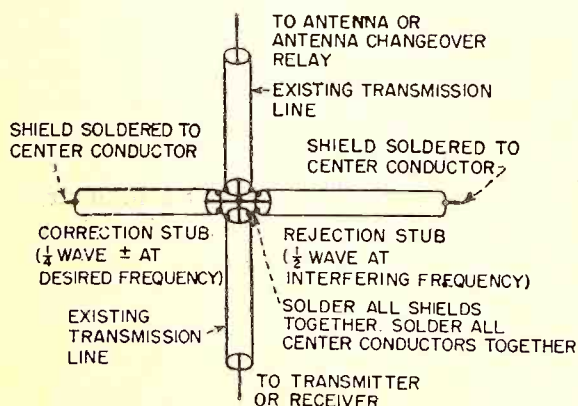

FIG. 1—Method of connecting stubs is same for both transmitting and receiving lines. Put stubs as close as possible to transmitter or receiver

FIG. 2—Correction and rejection stub lengths. Use left-hand scale for connection with Fig. 4 to determine correction stub length, since it is longer or shorter than a quarter-wavelength at some frequencies

3—Attenuation characteristics of stubs

FIG. 4—Curves showing line characteristics with stubs in place, as function of ratio of interfering signal to desired signal

one-quarter wave in solid dielectric cable is also plotted in Fig. 3 to show that the correction stub will be some value between zero and a definite upper limit. In this case, the desired frequency should be used in determining the length of the correction stub. This stub is tuned and is permanently short-circuited as in the case of the rejection stub, except that the tuning is done to produce the least attenuation of the desired signal. If the correction stub were to be made exactly one-quarter wave long at the desired frequency, it would present infinite impedance (neither capacitive or inductive) to the desired signal. While being made shorter than a quarter wave it presents progressively less inductive reactance. While being made somewhat longer than a quarter wave it presents progressively less capacitive reactance to the line. The amount of reactance in either case depends upon how much longer or shorter than a quarter wave the correction stub is made. This length is automatically arrived at in the tuning procedure given above. Figure 4 shows whether the correction stub will be longer or shorter than the quarter-wave length shown in Fig. 2. To use Fig. 4, determine what relation-

ship the interfering frequency bears to the desired frequency. As an example, if the desired frequency f is 40 mc and the interfering signal is 25 mc, the interfering frequency would be between $0.5f$ and $0.75f$. The lower curve shows that in this range the reactance presented to the line by the rejection stub is capacitive, and the upper curve shows that the correction stub should present inductive reactance and hence be shorter than a quarter wave, or shorter than the value called for on Fig. 2. The correction stub is thus utilized to balance out the reactance presented to the line by the rejection stub at the desired frequency.

Correction Stub Details

It is not necessary or desirable to show how many inches shorter or longer than a quarter wave the correction stub should be in chart form, since the precise length will be automatically arrived at as the stub is short-circuited in the tuning process. However, the upper curves in Fig. 4 do give the approximate length of the correction stub in terms of wavelength. In the example given above, these curves show that the corrector stub will be less than $\frac{1}{4}$ wave long. In this case, it is advisable to start with

a quarter-wave length of cable and short it at various points in the vicinity of an eighth wave to find the exact point.

Had Fig. 4 indicated the need for a capacitive correction stub (greater than a quarter wave and less than a half wave), it would be advisable to start with a half-wave length of cable and probe through the predicted point. Figure 4 is to be used chiefly as an aid in predicting the length of the correction stub and to help in visualizing the line conditions with the stubs in place.

A word of caution is advisable in a few specific cases. If the interfering frequency is approximately $\frac{1}{2}$, $\frac{1}{4}$ or $\frac{3}{4}$ of the desired frequency, stubs cannot be used. In these cases, the rejection stub will prove to be a full wavelength or multiple of a full wavelength at the desired frequency and will therefore present high attenuation to the desired frequency as well as to the interfering frequency. On the other hand, if the interfering frequency is exactly twice the desired frequency a correction stub will not be necessary since the one-half wave rejection stub will be an exact quarter wave at the desired frequency and will present infinite impedance to the desired frequency.

SQUARE ROOT of a COMPLEX NUMBER

Tedious and time-consuming calculations required in finding the square root of a complex number in transmission line and filter calculations can be greatly simplified through the use of this graph

By ROBERT G. NISLE

IN designing certain types of electrical networks the need frequently arises for evaluating the square root of a complex number such as an impedance. If the impedance is expressed in polar coordinates any root can be quickly and easily found, but if the expression is originally given in rectangular coordinates, the required operations are tedious and time consuming. The impedance must first be converted from rectangular to polar form, the square root is then determined, and finally the result is reconverted into rectangular coordinates, thereby requiring three separate and distinct operations.

A method by which the square root of any complex number, expressed in rectangular coordinates, can be easily and quickly determined, also in rectangular coordinates, is given here. The errors to be expected are simply those which result from reading any graph and are negligible for most engineering purposes.

To Extend the Range

If it is necessary to consider ranges outside that covered by the graph, this can be done by multiplying the original complex number by some suitable scale factor (such as 0.01 or 100) so that the problem may be fitted into the range for which the

chart is drawn. The final result will then have to be multiplied by the reciprocal of this scale factor (for example, 100 or 0.01, respectively).

If the original complex number is

$$Z = a + jb$$

the problem before us is to determine

$$Z^{\frac{1}{2}} = x + jy$$

The double set of coordinates relate the quantities x , y , b , and $K = a/b$ so that when any two are known, their intersection determines a position or point on the chart from which the remaining two quantities may be determined. To use the chart, first determine $K = a/b$. Then, knowing K and b , find the intersection of these two coordinates on the vertical and horizontal axes. The point of intersection thus found will also be the point of intersection for the desired values of x and y , read off from the slanting scale.

It should be noted that $Z^{\frac{1}{2}}$ has two roots, a positive root and a negative root. Geometrically, these two possibilities are indicated in graphical form by means of vectors which are directed in opposite directions, or are 180 deg apart. The physical requirements of the problem must be considered when deciding which of the two roots is to be used.

Example 1: Assume that we

have an impedance

$Z = a + jb = 15 + j20$
and that it is required to determine

$$Z^{\frac{1}{2}} = x + jy$$

First determine $K = a/b = 0.75$. Locate the intersection of the coordinates, $K = 0.75$ and $b = 20$. At this point read $x = 4.46$ and $y = 2.25$. The desired result is then

$Z^{\frac{1}{2}} = x + jy = 4.46 + j2.25$
or its negative value,

$$Z^{\frac{1}{2}} = -x - jy = -4.46 - j2.25$$

Example 2: If the complex number is

$$Z = -15 + j20$$

the result is

$$Z^{\frac{1}{2}} = x + jy = 2.25 + j4.46$$

or, alternatively

$$Z^{\frac{1}{2}} = -x - jy = -2.25 - j4.46$$

Example 3: If the impedance is

$$Z = -15 - j20$$

the final result is

$$Z^{\frac{1}{2}} = -2.25 + j4.46$$

or

$$Z^{\frac{1}{2}} = 2.25 - j4.46$$

Example 4: If the impedance is

$$Z = 15 - j20$$

the final result is

$$Z^{\frac{1}{2}} = -4.46 + j2.25$$

or

$$Z^{\frac{1}{2}} = 4.46 - j2.25$$

Example 5: If the impedance is

$$Z = 150 + j200$$

we find that $K = 0.75$, $b = 200$. We find that $x = 14.2$ and $y = 7.1$. The result is

$$Z^{\frac{1}{2}} = 14.2 + j7.1$$

UNIVERSAL EQUALIZER CHART

Modification of familiar Smith chart consolidates on one time-saving plot all positive-value solutions to the two general equations for series, shunt and bridged-T equalizers

THE single chart in Fig. 1 replaces as many as eleven conventional equalizer charts, yet gives all solutions containing positive resistances or conductances for the commonly used equalizer structures of Fig. 2. The chart is derived by applying to the two general forms of equalizer equations (Eq. 10 and

By **D. A. ALSBERG**

11 in Fig. 2) the bilinear transform

$$u + jv = (1 + \zeta)/(1 - \zeta) \quad (12)$$

where ζ is a complex number. This transforms the conventional rectangular grid of u and v

to a set of orthogonal circles, all of which pass through the point $\zeta = +1$, and the circle $u = 1$ is identical with the unit circle in the ζ plane. This grid of orthogonal circles representing the u and v coordinates is identical to the grid of the familiar Smith chart.

FIG. 1—Universal equalizer chart

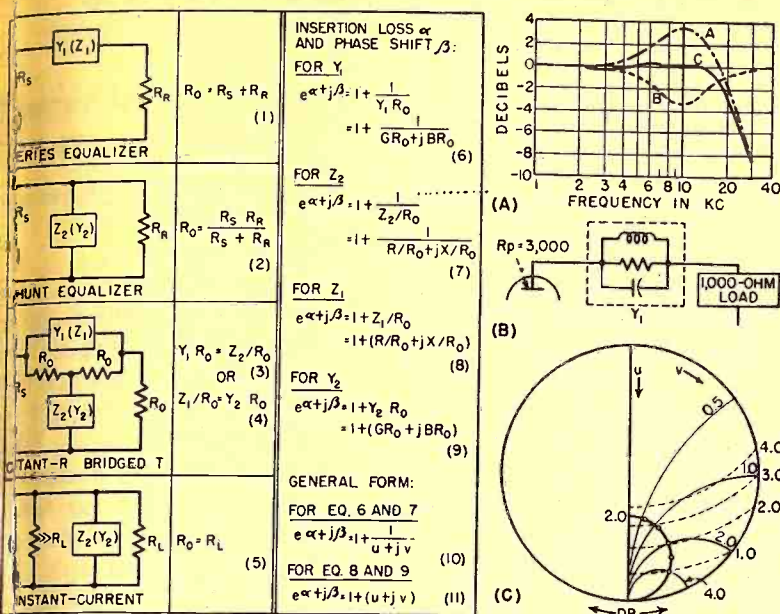

FIG. 2—Basic equalizer circuits, pertinent equations, and example

iving Eq. 10 in the ζ plane, lines of constant insertion become circles centered on point $\zeta = -1$ and whose loci defined by

$$(db) = -20 \log |(1 + \zeta)/2| \quad (13)$$

lines of constant phase shift radii through the point $\zeta = -1$ whose angle from the real axis in the ζ plane is equal to the phase shift.

The solution of Eq. 11 in the ζ plane is essentially the same as Eq. 10 except that the center for loss circles and phase shift is now the point $\zeta = +1$ and the loci of the loss circles are defined by

$$(db) = -20 \log |(1 - \zeta)/2| \quad (14)$$

Applications

Series and shunt equalizer circuits are useful when it is necessary to maintain constant impedance, such as in electron tube interstages. When the load must have constant impedance, the bridged-T equalizer is used. The constant-current equalizer is a special case of the shunt equalizer and is particularly useful in electron tube circuits which behave substantially like constant-current generators, such as pentodes. One common use is to compute the effect of shunting parasitic ca-

pacitances on the gain and phase of an electron tube stage. In this case the parasitic shunt reactance would be considered Z_2 .

While Eq. 1 to 9 have been written for a pure resistance R_o , R_o may be replaced in all these expressions by a complex impedance Z_o . Then the values u and v in the chart represent the real and imaginary components of the fraction Z/Z_o or the product YZ_o . The chart is also useful when measuring impedance using the insertion loss and phase principle.

Example of Use

Curve A in Fig. 2A represents an amplifier response curve. The objective is to flatten the response peak at 10 kc. A convenient place to perform the equalization is found in the plate circuit of a tube which has an internal plate resistance $R_p = 3,000$ ohms and works into a load of $R_L = 1,000$ ohms, as in Fig. 2B. The shape of curve A suggests use of a parallel-tuned circuit shunted by a resistance in the case of a series equalizer. With three independent elements in the equalizer, three independent parameters may be chosen. As first parameter we choose to tune the circuit to ω_1 ,

$= 10$ kc. As second parameter we choose to make the equalizer loss exactly 3.5 db at 10 kc, and as third parameter we decide to match exactly the excess gain of 1 db at $\omega_1 = 5$ kc.

Proceeding with the computation on a normalized admittance basis, at resonance the susceptance of the equalizer must be zero. Entering the chart as shown in Fig. 2C on the zero-susceptance line, we find the 3.5-db loss circle intercept at the 2.0 conductance circle. Thus the equalizer must contain a normalized conductance of $GR_o = 2.0$.

At 5 kc the loss was set to 1 db. We now find the intercept between the 2.0 conductance circle and the 1.0-db loss circle at a susceptance of 4.0. From resonance at ω_o ,

$$\omega_o CR_o - \frac{1}{\omega_o L/R_o} = 0 \quad (15)$$

From the solution of Eq. 10 at ω_1

$$\omega_1 CR_o - \frac{1}{\omega_1 L/R_o} = 4.0 \quad (16)$$

then

$$CR_o = \frac{4}{\left(\omega_1 - \frac{\omega_o^2}{\omega_1}\right)} = 4.25 \times 10^{-5} \quad (17)$$

$$L/R_o = 5.97 \times 10^{-6} \quad (18)$$

From Eq. 17 and 18 the net normalized susceptance of the network at any frequency may be determined. To find the loss associated with each of these susceptance values the equalizer chart is entered on the 2.0 conductance circle and the intercept with the computed susceptance circle is located, at which point the loss value is read. The result is plotted in curve B on Fig. 2A, and the resulting net transmission characteristic is plotted as curve C.

Assuming curve C to be adequately flat, the actual element values of the equalizer are found: From Eq. 1, R_o is 4,000 ohms. Substituting this in $GR_o = 2.0$ gives 2,000 ohms for $1/G$. From Eq. 17, C is 0.0106 μ f. From Eq. 18, L is 23.9 mh.

MICROWAVE DIFFRACTION CHARTS

The radius of the first Fresnel zone at various distances from the nearest terminal end of a microwave relay course can be determined from one nomogram. The adjusted distance required in Fresnel zone calculations is shown in the second alignment chart

By EARL D. HILBURN

MICROWAVE SIGNALS over line-of-sight courses are frequently observed to depart considerably from the free-space predictions.

Variations from free-space calculations are due to combinations of refraction and diffraction ef-

fects, as well as occasional absorption conditions due to rain, snow or fog. Of these factors, all but diffraction vary with weather conditions and combine to form the diurnal and seasonal variations noted in point-to-point relay services.

Although considerable information is available in the literature to enable the engineer to predict with fair accuracy the signal strength under given con-

ditions of temperature and percentage of water vapor in the atmosphere, the usual practice is to allow certain empirical margins of safety or fading factors based on long-term observations of relay signals at various frequencies. Diffraction effects like those associated with refraction, do not change with time or weather conditions but are determined by the choice of operating sites and the intervening terrain. As the course line clearance is readily determined, it frequently is a factor under the engineer's control, diffraction factors are of practical interest in most microwave relay calculations.

Fresnel Zone

From diffraction theory, when a wave strikes an intervening object a spherical wavefront radiates from the edge of the obstruction. The field intensity at any point beyond the obstruction is thus dependent upon the vector sum of the direct and scattered wavefronts reaching the receiver. A Fresnel zone may be defined as a circular zone centered on the direct path at such a radius that the distance from a point on this circle to the receiver point has a path length that is some multiple of a half wavelength longer than the direct path. Hence, according to Fresnel's zone theory, all the odd-numbered zones will send wavefronts to the receiver in opposite phase to all those from the even-numbered zones.

The effective field intensity at the receiver will rise and fall above and below the free-space value as the scattered wavefronts alternately reinforce and cancel

FIG. 1

FIG. 2

direct wave. The energy reaching the receiver from a Fresnel zone is proportional to the area of that zone and inversely proportional to the distance from the receiver. As the width of the zone making up the zones decreases rapidly as the radius of the Fresnel circles increases, the first Fresnel zone is the only one of practical importance in diffraction studies of radio waves. It has been stated² that a good path for microwave transmission is one with full first-Fresnel-zone clearance. With an optimum path the signal strength at the receiver (excluding meteorological effects) is somewhat better than free space due to the fact that the phase shift along a line from the transmitting antenna to the top of the obstruction and from the top of the obstruction to the second antenna is

about one-half wavelength greater than the phase shift of the direct path and some signal reinforcement is obtained.

Figure 1 indicates directly the radius of the first Fresnel zone as a function of distance and operating frequency. The construction shown assumes a plane wave (that the spherical wave has expanded to the point where the front is flat over the diameter of the diffraction zones).

The results given by this chart hold true only if the obstruction is very close to one end of the course. For accurate results at any point along the path, the setting on the distance scale should be adjusted in terms of the results given by Fig. 2. This enables the retardation on both parts of the circuit to be taken into account. Figure 2 is a simple reciprocal nomogram and, as

the scales are linear, they may be multiplied by different decimal factors as required.

For example, to find the clearance required for a good microwave path, assume an operating frequency of 7,000 mc, a total course length of 11.5 miles and a principal obstruction 3 miles from the transmitter.

A line connecting 3 and 8.5 on the outside scales of Fig. 2 gives an adjusted distance of 2.2 miles. Connecting this point with 7,000 mc on Fig. 1 shows a required clearance of 40 feet at the point in question.

In addition to determining easily the requirements for a good optical path, these alignment charts permit making quantitative studies of signal intensity conditions under various diffraction conditions including grazing or even badly obstructed courses where the receiver may be in a shadow area.

The principal course obstruction should be plotted showing the projected area normal to the direct course between stations. The Fresnel zones should be drawn in as circles about the dot representing the course path, the radii being obtained from the charts. (While the nomograms show only the first zone radius, values for higher-order zones may be obtained by multiplying the indicated value by the square root of the number of the zone being considered.)

Having drawn the zone areas, with respect to the masking obstruction, the net field intensity may be obtained by integrating the area of the exposed zones. This can be accomplished graphically by means of the Cornu spiral.³ In this manner, the departure from free-space values may be accurately estimated for any course.

SERVO POWER CALCULATIONS

Chart gives required shaft output power in watts for any combination of speed and torque of subfractional motors in tube-driven servo systems. Alternative slide rule method of finding power is also given

SERVO SYSTEM calculations must of necessity start with motor shaft output power to perform the specified work in a specified time. This involves the speed of shaft rotation and the torque required to perform the work. Since motors used in servo systems are usually sub-

By **OSCAR E. CARLSON**

fractional sizes, the horsepower unit is clumsy and awkward for expressing output power. Watts of output has become a common

means of expressing such power requirements.

The conversion of speed and torque requirements to a wattage equivalent is a simple arithmetical computation, but its very simplicity lends itself to even more simplified computation. The equations are

$$\text{Horsepower} = \frac{\text{rpm} \times \text{lb per in.}}{63,000}$$

$$\begin{aligned} \text{Watts} &= \frac{746 \times \text{rpm} \times \text{lb per in.}}{63,000} \\ &= \frac{\text{rpm} \times \text{lb per in.}}{84.4} \end{aligned}$$

This last equation may readily be laid out on a loglog chart that the rpm x lb per in. factor may be translated into watts quite simply. The accompanying chart does this.

As with most loglog coordinate charts, a slide rule may be utilized for these calculations without using the slider. Set the righthand 1 of the B scale under 8.44 in the righthand log cycle of the A scale, as shown below the chart. With the A scale now representing rpm x lb per in. from 10 to 1,000, the wattage may be read directly under the product on the B scale, with the scale reading from 0.1 to 100 watts. A multiplier of 10 or 100 may of course be used to make calculations up to 1,000 watts, so required.

STAGGER-TUNED I-F DESIGN

Chart gives overall bandwidth for 3 db and any fractions of 3 db, for i-f amplifiers having 1 to 500 synchronous or stagger-tuned stages and up to 5 elements per stage

THE BANDWIDTH reduction factor R is here plotted as a function of the number of single or multituned stages n in the amplifier. The family parameter m represents the number of tuning elements in the interstage coupling network when all stages are synchronously tuned; thus, $m = 1$ for a simple RLC tuned interstage, and $m = 2$ for a double-tuned interstage. For a stagger-tuned amplifier, n is the number of n -uples and m is the number of elements in the general n -uple.

Example 1: Assume an amplifier is to have 8 stages using identical single-tuned interstage couplings. (a) For what 3-db bandwidth must each stage be designed if the overall bandwidth is to be 6 mc? (b) What will be the 0.5-db bandwidth?

Solution. (a) From the curves for $n = 8$ and $m = 1$, $R = 0.3$. Dividing overall bandwidth of 6 mc by this value of R gives 20 mc as the required bandwidth of each stage. (b) If n' stages cascaded give a certain 3-db bandwidth, each stage must be

By **MATTHEW T. LEBENBAUM**

down by $3/n'$ db and n of them will be down $(3/n') n = x$ db at that bandwidth. To determine the x -db bandwidth then, the R factor is determined for a number of stages n' where $n' = n (3/x)$; here n is the actual number of stages and $x < 3$ db. In the case at hand, $n' = 8 \times (3/0.5) = 48$, and $R = 0.12$ from the chart. The 0.5-db down bandwidth then is 0.12×20 or 2.4 mc.

Example 2: An amplifier is to be built with an overall bandwidth of 20 mc and overall gain of 80 db; 6AK5 tubes are used with an assumed gain-bandwidth product ($g_m/2\pi C_T$) of 70 mc. (a) What is the minimum staggering required to achieve this result with 12 or less tubes? (b) If equally loaded double-tuned circuits were used (gain-bandwidth = $\sqrt{2} g_m/2\pi C_T$), how many stages would be required?

Solution. (a) Assume a value

of n , and determine R from the curve. This fixes the single-stage bandwidth required. From this, the gain per stage may be calculated from the gain-bandwidth product, and from this the overall gain. It will be found that it is impossible to achieve the desired gain with a synchronous single-tuned amplifier. Twelve stages arranged in six staggered pairs will not give the desired gain, either, but 9 stages arranged in triples or 8 in quadruples will. Possible systems are:

| n/m | Tubes | db gain |
|-------|-------|---------|
| 6/2 | 12 | 75.5 |
| 3/3 | 9 | 80.5 |
| 4/3 | 12 | 102 |
| 2/4 | 8 | 80 |

(b) 12 double-tuned interstages give $R = 0.49$ ($n = 12$, $m = 2$). The overall gain then is 91.6 db for the desired bandwidth. This illustrates the superiority of multituned coupling over the corresponding order of staggering (91.6 db versus 75.5 db for the same number of staggered-pair tubes). Increasing the staggering to triples makes staggering still better, 102 db.

electronics

BUYERS' GUIDE

In the preparation of **ELECTRONICS BUYERS' GUIDE**, every effort was made to insure the completeness and accuracy of the Product Listings according to the information provided by the manufacturers.

The listings were compiled from information provided by more than 3,000 companies manufacturing electronic or allied products and include all products that will be available in the coming year, insofar as the companies themselves can determine. The completeness and accuracy of the listings are entirely due to the helpful cooperation of these manufacturers.

Products are arranged and indexed in a simple, easy-to-find, telephone-book style. Names of Manufacturers who are advertisers in the **BUYERS' GUIDE** are bold-faced in the listings and page numbers of their advertisements are shown. This makes it possible to obtain complete information on products quickly and easily by referring to the advertising pages.

Several new product headings have been added. Due to lack of sufficient information, only manufacturers who were known are included under these new headings. Listings include an index of registered trade names and an alphabetical listing of all companies engaged in the manufacture of electronic components, complete equipment or allied products.

NOTE: This punch-out tab is for your convenience in locating the Product Listings in this issue. Simply push out and fold under. It will then serve as a tab mark to indicate where the listings start.

PUSH OUT
AND FOLD

Alphabetical Listings Of All COMPONENTS—COMPLETE UNITS—ALLIED PRODUCTS Used in Electronic Equipment for All Purposes

The complete electronic and allied product lines of more than three thousand manufacturers are arranged and indexed in a simple, easy-to-use, telephone book style in the following listings.

Products are listed alphabetically by generic names followed by descriptive or type names where necessary, as **ADAPTERS—Battery**.

For example: To find the manufacturers of ionization tubes you would turn to the generic product heading **TUBES** and listed alphabetically under that you would find **TUBES—Ionization**.

The only exceptions are **INSULATING COMPOUNDS; INSULATION MATERIALS; INSULATION PARTS; METALS; PLASTIC MATERIALS; and TUBE PARTS**. Products falling in these classifications are arranged alphabetically under those six headings. A breakdown of electrical measuring

instruments is listed under the generic product heading **INSTRUMENTS, ELECTRICAL MEASURING** and cross-indexed. The same holds true for **MICROWAVE ACCESSORIES**.

Cross references are provided wherever necessary to cover names, other than the standard ones, that are sometimes used.

Manufacturers under each product heading are also arranged alphabetically. Those companies who are advertisers in this issue are bold-faced and the page numbers of their advertisements given to permit quick and easy reference for the necessary technical data.

In compiling the listings for this year's **ELECTRONICS BUYERS' GUIDE** extreme care has been taken to ascertain those products which are in production, or available within a reasonable time and, unrestricted for general industrial use.

American Electronic Labs., Inc., 641 Arch St., Philadelphia 6, Pa.

Atlas Coil, Inc., Cottage St., Derby, Conn.
BRUSH ELECTRONICS CO., 3405 Perkins Ave., Cleveland 14, Ohio. ADV. PG. 406, 407.

CENTRALAB DIV. OF GLOBE-UNION, INC., 914Y E. Keefe Ave., Milwaukee 1, Wis. ADV. PG. 252, 342, 574, 607, 659.

Consolidated Engineering Corp., 300 N. Sierra Madre Villa, Pasadena 15, Calif.

Cossor (Canada) Ltd., 301-303 Windsor St., Halifax, N. S., Canada.

Daystrom Instrument Co., Archbald, Pa.
Detectolab, Inc., 6544 N. Sheridan Rd., Chicago 26, Ill.

DOELCAM CORP., 56 Elmwood St., Newton 58, Mass. ADV. PG. 85.

EDIN CO., INC., 207 Main St., Worcester, Mass. ADV. PG. 489.

Electrodyn Co., Endicott St., Norwood, Mass.
Electrofax Corp., 30 Burtis Ave., New Canaan, Conn.

ELECTRONIC TUBE CORP., 1800 E. Mermaid Ave., Philadelphia 18, Pa. ADV. PG. 426.

El-Tronics, Inc., 5th & Noble Sts., Philadelphia 23, Pa.
EMPIRE STATE LABORATORIES, 2608 Merrick Rd., Bellmore, N. Y. ADV. PG. 478.

Engineering Research Associates, Div. of Remington Rand, Inc., 1902 W. Minnehaha Ave., St. Paul 4, Minn.

Espey Mfg. Co., Inc., 528 E. 72nd St., New York 21, N. Y.

Franklin Electronics, Inc., 415 W. Pike St., Philadelphia 40, Pa.

GLENCO CORP., Metuchen, N. J. ADV. PG. 640.

Grason-Stadler Co., Engineering Service Dept., 106 Hampshire St., Cambridge 39, Mass.

Grass Instrument Co., 101 Old Colony Ave., Quincy, Mass.
Hanover Developments, 401 E. 74th St., New York 21, N. Y.

Hathaway Instrument Co., 1315 S. Clarkson St., Denver 10, Colo.

INTERELECTRONICS CORP., 2432 Grand Concourse, New York 58, N. Y. ADV. PG. 655.

KEITHLEY INSTRUMENTS, 3868 Carnegie Ave., Cleveland 15, Ohio. ADV. PG. 533.

Maico Co., Inc., 21 N. 3rd St., Minneapolis, Minn.

Melody Master Mfg. Co., 2842 N. Cicero Ave., Chicago 41, Ill.

Offner Electronics, Inc., 5320 N. Kedzie Ave., Chicago 25, Ill.

ORTHO FILTER CORP., 198 Albion Ave., Paterson 2, N. J. ADV. PG. 312.

PENNSYLVANIA TESTING LABORATORY, Doylestown, Pa. ADV. PG. 330.

Plotron Instrument Co., 6516 Detroit Ave., Cleveland 2, Ohio.

Process & Instruments, 15 Stone Ave., Brooklyn 33, N. Y.

R-C Scientific Instrument Co., Inc., 307 Culver Blvd., Playa del Rey, Calif.

SANBORN CO., 39 Osborn St., Cambridge 39, Mass. ADV. PG. 353.

SERVO CORP. OF AMERICA, 20-20 Jericho Turnpike, New Hyde Park, N. Y. ADV. PG. 69-72.

Senotone Corp., Saw Mill River Rd., P. O. Box 200, Elmsford, N. Y.

Southwestern Industrial Electronics Co., 2831 Post Oak Rd., P. O. Box 13058, Houston 19, Texas.
Square Root Mfg. Corp., 391 Saw Mill River Rd., Yonkers, N. Y.

RESISTORS

Fixed Composition

1. Low wattage
2. Temperature sensitive
3. High frequency
4. High megohm
5. High voltage
6. High wattage
7. Voltage sensitive
8. Resistor-suppressor

Variable Composition

9. Controls
10. Controls, High Resistance
11. Controls, High Voltage

Wire Wound

12. 2 Watts and under
13. 4 to 35 Watts
14. 4 to 225 Watts
15. 4 to 500 Watts
16. 500 to 1500 Watts
17. Precision low voltage
18. Precision high voltage
19. Rf non-inductive

Variable Wire Wound

20. 4 Watts and under

21. 5 to 25 Watts
22. 25 Watts and over
23. 500 Watts and over
24. Slide wire
25. Adjustable
26. Rheostat—potentiometer types

Union Electric & Mfg. Co., 1057 Summit Ave., Jersey City, N. J.

TRADE NAME INDEX

The following list of trade names of manufacturers and products in or related to the field of electronics has been prepared from data supplied by manufacturers. This list is intended for use in determining the manufacturer's name when only a purported trade name is known. The editors for obvious reasons have not attempted to determine a manufacturer's right to the exclusive use of any such name. Addresses can be obtained by referring to the Manufacturers Index on Page D-196. Only coined trade names are listed, as it was deemed unnecessary to include a company name inasmuch as the manufacturer's identity was immediately apparent.

1954-1955 ELECTRONICS BUYERS' GUIDE

MANUFACTURERS INDEX

A listing of the companies engaged in the manufacture of all types of electronic components and complete electronic equipment. They are alphabetically arranged for convenient use and quick reference.

- A B C Radio Laboratories, 3334 N. New Jersey St., Indianapolis 5, Ind.
- A. C. Transformer Corp., 89 Madison St., Newark, N. J.
- A.C.F. Electronics, Inc., Alexandria, Va.
- A'G'A' Div. of Elastic Stop Nut Corp. of America, 1029 Newark Ave., Elizabeth 3, N. J.
- A. P. W. Co., 72 W. Main St., Rockaway, N. J.
- A. R. F. Products, Inc., 7627 Lake St., River Forest, Ill.
- Abalon Precision Mfg. Corp., 540 Casanova St., Bronx 59, N. Y.
- Accurate Electronics Corp., Courtland Bldg., 1312 Ontario St., Cleveland 13, Ohio.
- Accurate Insulated Wire Corp., 23 Fox St., New Haven, Conn.
- Accurate Mfg. Co., 44 Hepworth Place, Garfield, N. J.
- Accurate Paper Tube Co., 801 N. Peoria St., Chicago 22, Ill.
- Accurate Spring Mfg. Co., 3811 W. Lake St., Chicago, Ill.
- Ace Coil & Electronics Co., 912 Lincoln Highway, Metuchen, N. J.
- Ace Electronics Associates, 125-129 Rogers Ave., Somerville 44, Mass.
- Ace Engineering & Machine Co., Inc., 3642 N. Lawrence St., Philadelphia 40, Pa.
- Ace Plastic Co., 91-54 Van Wyck Expressway, Jamaica 35, N. Y.
- Ace Spring Mfg. Co., 77 W. Houston St., New York 12, N. Y.
- Acheson Colloids Co., 1950 Washington Ave., Port Huron, Mich.
- Ackerman Engravers, 458 Broadway, New York, N. Y.
- Ackerman-Gould Co., 92 Blecker St., New York, N. Y.
- Ackerman-Johnson Co., 625 W. Jackson Blvd., Chicago 6, Ill.
- Acme Battery Co., 59 Pearl St., Brooklyn 1, N. Y.
- Acme Electric Corp., 21 Water St., Cuba, N. Y.
- Acme Electric Heating Co., 1217 Washington St., Boston, Mass.
- Acme Electronics, Inc., 300 N. Lake Ave., Pasadena 4, Calif.
- Acme Electronix Div. of NEA Service, Inc., West Third & Lakeside, Cleveland 13, Ohio.
- Acme Tool & Specialties Co., 224 N. Loomis St., Chicago 7, Ill.
- Acme Wire Co., New Haven 14, Conn.
- Acro-Mu Switch Div., Acro Mfg. Co., Columbus, Ohio.
- Acro Products Co., 369 Shurs Lane, Philadelphia 28, Pa.
- Acro Transformer Mfg. Corp., 26-04 Fourth St., Astoria 2, N. Y.
- Acromark Company, The, 9-13 Morrell St., Elizabeth 4, N. J.
- Actioncraft Products, 8 Sagamore Hill Drive, Port Washington, N. Y.
- Adams & Westlake Co., The, Michigan St., Elkhart, Ind.
- Adel Div. of General Metals Corp., 10777 Van Owen St., Burbank, Calif.
- Adler Communications Laboratories, 1 Le Fevre Lane, New Rochelle, N. Y.
- Admiral Corp., 3800 Cortland St., Chicago 47, Ill.
- Advance Electric & Relay Co., 2435-L N. Naomi St., Burbank, Calif.
- Advance Electronics Co., 451 Highland Ave., Passaic, N. J.
- Advanced Electronics, Inc., 94 Silas Deane Highway, Rocky Hill, Conn.
- Aermotive Equipment Corp., 1632-8 Central St., Kansas City 10, Mo.
- Aero Marine Radio Corp., 135 W. 16th St., New York 11, N. Y.
- Aero Specialties, 85 Prescott St., Worcester, Mass.
- Aerocoil Inc., 24 Cliff St., Jersey City, N. J.
- Aerohm Corp., 282 Moody St., Waltham 54, Mass.
- Aerolite Electronics Corp., 507-26th St., Union City, N. J.
- Aerolux Light Corp., 653 Eleventh Ave., New York 36, N. Y.
- Aeronautical Communications Equipment, Inc., 3090 Douglas Rd., Miami 33, Fla.
- Aeronautical Electronics Inc., Raleigh-Durham Airport, P. O. Box 6043, Raleigh, N. C.
- Aerovox Corp., 740 Belleville Ave., New Bedford, Mass.
- Affiliated Products, Inc., 4802 N. Broad St., Philadelphia 41, Pa.
- Ahrendt Instrument Co., 4910 Calvert Rd., College Park, Md.
- Ainslie Electronic Products, Inc., 312 Quincy Ave., Quincy 69, Mass.
- Air Associates, Inc., Teterboro, N. J.
- Air Control Installations, Ltd., Ruislip, Middlesex, England.
- Airborne Accessories Corp., 1414 Chestnut Ave., Hillside, N. J.
- Airborne Instruments Lab., Inc., 160 Old Country Rd., Mineola, N. Y.
- Aircraft-Marine Products, Inc., 2100 Paxton St., Harrisburg 10, Pa.
- Aircraft-Marine Products, Inc., Chemicals & Dielectrics Div., 155 Park Ave., Elizabethtown, Pa.
- Aircraft Radio Corp., Doonon, N. J.
- Aircraft Transformer Corp., West & Willow Aves., Long Branch, N. J.
- Airdesign, Inc., 241 Fairfield Ave., Upper Darby, Pa.
- Aireco, Inc., 2315-10 Second Ave., Carmen, Schenectady, N. Y.
- Airflyte Electronics Co., 21 Cottage St., Bayonne, N. J.
- Air-Marine Motors, Inc., 369 Bay View Ave., Amityville, N. Y.
- Airmec, Ltd., High Wycombe, Buckinghamshire, England.
- Air-Mite, 4417 W. Carroll Ave., Chicago 24, Ill.
- Airpax Products Co., Middle River, Baltimore 20, Maryland.
- Airtron, Inc., Dept. H, 1117 W. Elizabeth Ave., Linden, N. J.
- Ajax Condenser Corp., 10905 Chandler Blvd., North Hollywood, Calif.
- Alamo Electronic Corp., 1415 N. Brazos St., San Antonio 7, Texas.
- Alcar Instruments, Inc., 20-21 Wagaraw Rd., Fair Lawn, N. J.
- Alco Electronics Mfg. Co., 3 Wolcott Ave., Lawrence, Mass.
- Alden Electronic & Impulse Recording Equipment Co., Box 125, Westboro, Mass.
- Alden Products Co., 112 N. Main St., Brockton 64, Mass.
- Alden Systems Co., 1 Alden Research Center, Westboro, Mass.
- Alfax Paper & Engineering Co., Washington St., P. O. Box 125, Westboro, Mass.
- All American Tool & Mfg. Co., 8027 Lawndale, Skokie, Ill.
- All Metal Products, 206 McWhorter St., Newark 5, N. J.
- All Star Products, Inc., Defiance, Ohio.
- All-Tronics, Inc., 2 Secatoag Ave., Port Washington, N. Y.
- All Weather Springs, 140 Cedar St., New York, N. Y.
- Allegany Instrument Co., Inc., Cumberland, Md.
- Allegheny Ludlum Steel Corp., H. W. Oliver Bldg., Pittsburgh 22, Pa.
- Allen Co., L. B., Inc., 6751 Bryn Mawr Ave., Chicago 31, Ill.
- Allen-Bradley Co., 136 W. Greenfield Ave., Milwaukee 4, Wis.
- Allen Mfg. Co., Hartford 2, Conn.
- Alliance Mfg. Co., Lakewood Park Blvd., Alliance, Ohio.
- Allied Circuit Products Co., 135 W. 41st St., New York 36, N. Y.
- Allied Control Co., Inc., 2 East End Ave., New York 21, N. Y.
- Allied Electric Products Inc., 76 Coit St., Irvington 11, N. J.
- Allied Eng. Div., Allied International Inc., South Norwalk, Conn.
- Allied Industries, Inc., 2500 Woodland Ave., Louisville 10, Ky.
- Allied Mfg. Corp., 605-07 61st St., West New York, N. J.
- Allied Products Div., Hamilton Watch Co., Lancaster, Pa.
- Allied Radio Corp., 833 W. Jackson Blvd., Chicago 7, Ill.
- Allied Recording Products Co., 32-32 Greenpoint Ave., Long Island City, N. Y.
- Allied Research & Engineering Co., 1041 N. Las Palmas, Hollywood, Calif.
- Allies Products Corp., 1028 Connecticut Ave., N. W., Washington 6, D. C.
- Allis-Chalmers Mfg. Co., 935 South 70th St., Milwaukee 1, Wis.
- Allis Co., Louis, 427 E. Stewart St., Milwaukee 7, Wis.

Zero Mfg. Co., 1121 Chestnut St., Burbank, Calif.

Zlerick Mfg. Corp., Beechwood & Rockdale Aves., New Rochelle, N. Y.

Zophar Mills, Inc., 115 26th St., Brooklyn 32, N. Y.

Distributors of ELECTRONIC COMPONENTS AND EQUIPMENT

The following is a list of distributors who are selling and stocking, for immediate delivery, electronic components, instruments, audio equipment, associated apparatus and allied products. These distributors perform a valuable service to manufacturers and users by providing quick delivery to meet the urgent requirements of designers and purchasing agents. This list is provided for the convenience of our subscribers and comprises the leading electronic distributors in the United States. Distributors who are advertisers in this issue have their names boldfaced and page number reference made to their advertisements. For further information regarding the services of these distributors, kindly refer to their advertisements.

ALABAMA

Ack Radio Supply Co., 2205 3rd Ave., N. Birmingham 3.
 Allen & Jemison Co., Tuscaloosa.
 Auto Service Co., 1916 S. 4th Avenue, Birmingham.
 Bessemer Radio Supply Co., 116-118 N. 20th, Bessemer.
 Clark & Jones, 1601 Second Ave. S., Birmingham.
 Clary Co., James W., 1713 Second Ave., Birmingham.
 Forbes Distributing Co., 2600 Third Ave., S., Birmingham 5.
 Hand Supply Co., 705 S. Oates St., Dothan.
 Hand Wholesale Radio, 231 South St., Dothan.

RCA Electronic Components INDEX

A comprehensive array of electronic components for commercial, industrial and military applications.

RCA supplies electronic equipment manufacturers with a wide range of electronic components . . . quality-engineered and manufactured to fill the exacting requirements of industrial,

commercial, and military applications.

RCA will be glad to help you select the right types for your requirements. For further details or design assistance, contact your nearest RCA Field Office:

(East) Humboldt 5-3900
415 S. 5th St.
Harrison, N. J.

(Midwest) Whitehall 4-2900
589 E. Illinois St.
Chicago 11, Ill.

(West) Madison 9-3671
420 S. San Pedro St.
Los Angeles 13, Calif.

RADIO CORPORATION of AMERICA
ELECTRONIC COMPONENTS CAMDEN, N. J.

D1 Yoke for 15GP22 tricolor Kinescope.

225° C Transformer, Light Weight, Small Size.

240T1 Flyback, 20-KV Transformer for Color-TV Receivers.

Pole, Hermetically Sealed Aircraft Relay.

Memory-Core Matrix, using RCA Torroids.

Hermetically Sealed Transformers.

Hi-Fi Speaker, new "damping ring."

2 3/4-inch Speaker for "Pocket Personal" Type Radios.

220D1 Deflecting Yoke, and 235T1 Horizontal and High Voltage Transformer for 90° Deflection Systems.

RCA ELECTRONIC COMPONENTS FOR:

AIRCRAFT—

380/1600-cycle transformers, encapsulated or hermetically sealed; high temperature transformers. Relays. Speakers.

AUDIO AMPLIFIERS—

Input, interstage, line, microphone, modulation, and output transformers.

COLOR-TV RECEIVERS—

Yokes. Flybacks. Purifying coils. Dynamic-convergence and focusing transformers. Isolation inductors.

ELECTRONIC COMPUTERS—

Memory-core matrices. High-speed switches. Torroids. Pulse transformers.

INSTRUMENTS—

Frequency modulators. Low-temperature film transformers. Reactors.

MILITARY APPLICATIONS—

Transformers. Chokes. Yokes. Blast-resistant speakers. Relays. Focusing coils. Frequency modulators.

RADAR AND LOAN—

Yokes. Pulse transformers. Magnetic amplifiers. Torroids.

RADIO/TV BROADCASTING—

Transformers. Reactors. Monitor speakers. Deflecting yokes. Band-pass filters. Frequency Blocking-oscillator transformers.

RADIO/TV MANUFACTURING—

Transformers. Chokes. Flybacks. Yokes. Reactors. Focusing Coils.

SOUND SYSTEMS—

Speakers (regular, elliptical, horn, weatherproof). Transformers. Repeaters. Tone control filters.

TELEVISION STUDIOS—

Yokes. Flybacks. Band-pass filters. Focusing and alignment coils.

THEATRES—

Transformers. Reactors. Band-pass filters. Speakers for booth, backstage, overhead drive-in.

REPRESENTATIVE TYPES

FLYBACK TRANSFORMERS—

Deflection transformers (with or without flyback windings); auto-types and isolated secondary types; universal types.

HIGH TEMPERATURE TRANSFORMERS—

Encapsulated or hermetically sealed; 50/60-cycle, 380/1600-cycle; up to 5000 VAC.

POWER TRANSFORMERS—

High-power; miniature; general purpose application; step-up, step-down; high temperature; low-temperature rise; 50/60-cycle; 380/1600-cycle.

RADAR YOKES—

Planned position indicator, large screen military television, and resolver.

RELAYS—

Military aircraft types; hermetically sealed; high-temperature, miniature, high-speed types.

SPEAKERS—

Auto-radio, "pocket personal," AC-DC, radio/TV console, drive-in theatre, PA, broadcast monitor, high fidelity.

SPECIAL TRANSFORMERS—

Pulse, high-temperature, flybacks, miniature, hermetically sealed types; instrument, military types.

TV STUDIO YOKES—

For image orthicons, flying-spot scanners, iconoscopes, monoscopes, and vidicons.

TRANSFORMER TYPES—

Encapsulated, encased, hermetically sealed; miniature; open frame, potted, shielded, torroidal.

YOKES FOR KINESCOPIES—

Direct view and projection, color and monochrome; 45° to 90° inclusive; high, low, and intermediate inductance; ferrite core.

RADIO CORPORATION of AMERICA
ELECTRONIC COMPONENTS CAMDEN, N. J.

15GP22 Yoke for 15GP22 Color Kinescope.

225° C Transformer, Light Weight, Small Size.

240T1 Flyback, 20-KV Transformer for Color-TV Receivers.

Hermetically Sealed Aircraft Relay.

Memory-Core Matrix, using RCA Torroids.

Hermetically Sealed Transformers.

Hi-Fi Speaker, new "damping ring,"

2 3/4-inch Speaker for "Pocket Personal" Type Radios.

220D1 Deflecting Yoke, and 235T1 Horizontal and High Voltage Transformer for 90° Deflection Systems.

RCA ELECTRONIC COMPONENTS FOR:

- AIRCRAFT—**
380/1600-cycle transformers, encapsulated or hermetically sealed; high temperature transformers. Relays. Speakers.
 - AUDIO AMPLIFIERS—**
Input, interstage, line, microphone, modulation, and output transformers.
 - COLOR-TV RECEIVERS—**
Yokes. Flybacks. Purifying coils. Dynamic-convergence and focusing transformers. Isolation inductors.
 - ELECTRONIC COMPUTERS—**
Memory-core matrices. High-speed switches. Torroids. Pulse transformers.
 - INSTRUMENTS—**
Frequency modulators. Low-temperature pulse transformers. Reactors.
 - MILITARY APPLICATIONS—**
Transformers. Chokes. Yokes. Blast-resistant speakers. Relays. Focusing coils. Frequency modulators.
 - RADAR AND LOGAN—**
Yokes. Pulse transformers. Magnetic amplifiers. Torroids.
 - RADIO/TV BROADCASTING—**
Transformers. Reactors. Monitor speakers. Deflecting yokes. Band-pass filters. Flybacks. Blocking-oscillator transformers.
 - RADIO/TV MANUFACTURING—**
Transformers. Chokes. Flybacks. Yokes. Yokes. Focusing Coils.
 - SOUND SYSTEMS—**
Speakers (regular, elliptical, and high impedance proof). Transformers. Reactors. Pulse transformers.
 - TELEVISION STUDIOS—**
Yokes. Flybacks. Band-pass filters. Transformers, and alignment coils.
 - THEATRES—**
Transformers. Reactors. Band-pass filters. Speakers for booth, backstage, and drive-in.
- REPRESENTATIVE TYPES**
- FLYBACK TRANSFORMERS—**
Deflection transformers (with or without deflection windings); auto-types and universal types; universal types.
 - HIGH TEMPERATURE TRANSFORMERS—**
Encapsulated or hermetically sealed; 380/1600 cycle, 380/1600-cycle; up to 5000°C.
 - POWER TRANSFORMERS—**
High-power; miniature; general purpose; isolation; step-up, step-down; high temperature; low-temperature rise; 50/60 cycle; 1800°C.
 - RADAR YOKES—**
Planned position indicator, target designation, military television, and resolution types.
 - RELAYS—**
Military aircraft types; hermetically sealed; high-temperature, miniature, high-speed types.
 - SPEAKERS—**
Auto-radio, "pocket personal," ACB, radio/TV console, drive-in theatre, PA broadcast monitor, high fidelity.
 - SPECIAL TRANSFORMERS—**
Pulse, high-temperature, flyback, miniature, hermetically sealed types; instrument, military types.
 - TV STUDIO YOKES—**
For image orthicons, flying spot scanners, iconoscopes, monoscopes, and vidicons.
 - TRANSFORMER TYPES—**
Encapsulated, encased, hermetically sealed; miniature; open frame, potted, shielded, toroidal.
 - YOKES FOR KINESCOPIES—**
Direct view and projection, color and monochrome; 45° to 90° inclusive; high, low, and intermediate inductance; ferrite core.
