'Affordable Portable'

The Ticket to Worldwide Shortwave Reception When You are 'On the Go'

Sangean ATS-803

Just look at these features:

- AM/SSB/CW reception from 150 kHz to 30 MHz
- FM from 87.5-108 MHz
- Keypad frequency entry as well as tuning dial
- Illuminated LCD frequency readout
- Scanning with 14 memory channels
- Wide/narrow selectivity switch
- Separate bass and treble controls
- Direct selection of twelve shortwave broadcast bands
- Clock with preset frequency alarm and sleep function
- Battery or AC power
- Headphone jack for stereo FM listening
- Five-step LED signal strength indicator
- BFO and RF gain controls
- External antenna jack for long distance reception.

Clearly, the Most Feature-Packed, High Performance Portable Under $200

Sony ICF-PRO80:

Wide-Frequency-Coverage Portable

Imagine—150 KHz-216 MHz continuous coverage in a hand-held, digital receiver! Drift-free, quartz-synthesis tuning with professional features like squelch, up/down step tuning, priority scan, search, 40 memory channels, direct channel access, and accurate, illuminated LCD frequency readout.

Worldwide shortwave reception at your fingertips—AM and SSB—as well as VHF aircraft and police/fire communications, all on one 40-channel scanner! Extend the telescopic antenna and tune in those in-between frequencies as well—low frequency beacons, medium wave broadcast, hams, government, military, FM and TV broadcast, 72-76 MHz midband communications, VOR navigation, and more!

True to the professional design of the PRO80, wide and narrow selectivity (6.0 and 3.8 kHz @ -50 dB) assures excellent interference rejection. A 2¾" internal speaker is driven by a powerful 400 milliwatt audio amplifier. The radio's basic 150 kHz-108 MHz tuning range is extended to 216 MHz by a tiny, quick-connect converter.

Compact (3½" x 7" x 2") and lightweight (1½ lbs.), the handsome gray PRO80 may be secured discretely in a small attache case or may be carried by its shoulder strap and case. Operates from four AA flashlight cells (not included) or from optional AC wall adaptor.

SONY ICF-2010

"Best buy in a quality shortwave portable"
—Bob Grove

Yes, Sony has finally brought out a full-featured portable for the serious shortwave listener. With a frequency coverage from 150-30,000 kHz (AM/SSB), 76-108 MHz (FM) and 116-136 MHz (AM aircraft), the 2010 has both direct-frequency keyboard entry as well as a tuning dial. A 32-channel memory may be scanned and frequency readout is on a crisp liquid crystal display.

Narrow/wide selectivity switching, 12/24 hour clock/timer allows up to 4 automatic on/off cycles per day for frequencies and times of your choice, 10-step LED signal strength meter, audio tone selection for speech or music, and 10 station direct-access keyboard combine to make this Sony product a remarkable value for beginners or seasoned SWL's.

Accessories supplied include AC adaptor, earphone, shoulder strap, wire antenna, external antenna connector, and shortwave handbook. All this and a one-year warranty besides!

From the Publisher:

ERGONOMICS

Don't bother to look it up in your dictionary; it probably won't be there. and it would seem that most Japanese radio manufacturers have never heard of it either. Ergonomics refers to comfort engineering, the art of designing a piece of equipment to fit the tactile (touch) and visual needs of the operator.

Nature has provided man with an opposable thumb whereby he can grasp objects like radio knobs. For decades, radio knobs have been easy to manipulate. Now, for some reason knwon only to the Tokyo equivalent of Madison Avenue, knobs have started disappearing, replaced by slide controls and membrane keypads.

I have not recently examined the hand of a Japanese for the presence of a thumb, but I am getting very suspicious.

As if that anatomical assault were not bad enough, my eyesight is also being challenged. Keypad buttons are growing tinier and printed legends are ofter small, unilluminated, insufficiently contrasted with their backgrounds, or otherwise difficult to read.

My mind's eye drifts to a time in the not-too-distant future where a receiver or other electronic instrument sits on a shelf, resembling a formless mass, operated by a shout or, perhaps, a swift kick. Come to think of it, some of the equipment I have seen lately looks like a prime candidate for a swift kick.

A Welcome from the Publisher

It is always a pleasure to welcome new friends at *MT* headquarters. This month we introduce two new writers on our pages.

Bob Kay is inaugurating our Scanning column. Well equipped for the task with five scanners and an ICOM R71A for shortwave, Bob uses a Grove Scanner Beam and two Grove OMNIs for reliable VHF/UHF coverage.

An avid runner (3 miles a day!), Bob is an award-winning civic leader as well. Professionally, he is involved in guidance missile system development as a civilian working for the Department of Defense.

Dave Jones brings his expertise in federal government and military monitoring from his editorship of the All Ohio Scanner Club column. His professional employment takes him all over the country where he continously monitors and verifies his exhaustive files which will be shared with fellow fed/mil enthusiasts via *MT*'s new Federal File column.

MT continues to grow by listening and responding to requests from our readers. Let us know how you like our new columns and what areas need further development.

The LIFE and DEATH of a Pirate

by David Klopfenstein

Many pirates, past and present, have been community-based stations serving an audience that lacked such a broadcaster on a legal level. "Laser 558," "Zoom Black Magic," and WIBS" all were bridging a gap in the markets they served. Such a situation existed in Portland, Oregon, where not one of the three album-oriented rock (AOR) stations played "heavy metal" or the new "skater music." Filling that hole was the philosophy behind the creation of KCOR, "Rock-16," on 1630 kilohertz AM.

A Pirate is Born

On Wednesday, April 15, 1987, "J.R. Psycho" went on the air with a small stack of compact discs and about one and a half watts of effective radiated power (ERP). He had connected his Sony "Discman" and an old microphone to his tape deck. From there, J.R. fed the music and voice into his stereo, where he controlled the levels with the volume knob. This clumsy audio was fed into a not-yet-perfected Allied 93320 modulator and into his early 1950s Lysco "Transmaster" ham rig. KCOR's overmodulated signal was underpowered, and it only covered a few miles, but it was enough to blanket the nearby high school.

For the next few days, "Rock-16" operated from 7:00 a.m. to 12 midnight so that J.R. could better estimate the station's range. By riding up and down the streets of the neighborhood with his small Sony AM stereo (SRF-A100) tuned to KCOR, he found that although weak, KCOR could be heard over two miles away. Improvements would be needed, but KCOR already had about 25 regular listeners who braved the static to hear *their* kind of music.

Those early broadcast days were carefree for J.R., since operating the station did not entail very much. A typical day began at 6:45 a.m. with the blaring of the alarm clock. Sleepily, J.R. would warm up the transmitter and modulator, making sure all the tubes were creating that reassuring orange glow. At 7:00 a.m., he signed on, setting the Discman in the "random play" mode and left for school. This was how J.R. was able to run KCOR while he was taking classes -- or cutting them to drive around and see how far his station could be heard.

Upon his return from school, J.R. would change the disc and give an ID as "K-C-O-R, Rock-16, your emancipation station." He routinely replaced the discs when they were finished and gave the station ID's every five songs or so until midnight. At the 12:00 a.m. sign-off, J.R. made a formal goodbye to his listeners, shut everything off and went off to bed for his six hours and forty-five minutes of "downtime." Such were the early days of "Rock-16."

Growing Pains

By April 20, J.R. had a regular broadcasting schedule. 3:00 p.m. to midnight daily, sometimes later on the weekends. In April, J.R. also set official standards for KCOR by not slandering listeners or using profanities on the air--in song or voice. Although, at this time, he was the only person to keep in check, this policy became important later on as more people joined the program. J.R. also wrote down requests during school to play when he went home and fired up "Rock-16." KCOR's popularity increased and J.R. began to find new and interesting ways of giving the station publicity. Posters were drawn up and put in and around several of the high schools within earshot of "Rock-16." He enjoyed success with these ideas and soon made plans to revamp the station.

At this time, a typical day at KCOPR consisted of more than just the afternoon to evening broadcast. During school, J.R. not only solicited music requests and taped posters up in the halls, he also wrote down the dates of upcoming dances and other functions, "Rock-16" was made available to student government candidates for campaign related public service announcements. This publicity work, of course, was above and beyond J.R.'s homework and regular school activities.

As soon as the dismissal bell rang, J.R. rushed home and warmed up the tubes of the transmitter and modulator for the impending 9 hour one-man show. And, at precisely 3:00 pm, J.R.'s voice proclaimed it was the beginning of another broadcast day at "KCOR, Portland's only real rock station." By now, he was comfortable and jocked between virtually every song, giving ID's and music news.

For the most part, his equipment didn't cause any problems, but the compact disc player still skipped occasionally and J.R. had to come on the air apologizing for the problem. When the shift ended, as usual, he bid farewell to his listeners, yanked the plug and went to bed. As he lay there in the dark, he decided that if he was to pull the whole shift every night, changes at the station must be made.

By way of improvements, J.R. fixed up a quarter wave long wire antenna, improved his ground and adjusted the modulation to an acceptable level. He also purchased more compact discs and borrowed cassettes from his friends and listeners.

During May, J.R. pursued a few more ideas, including a five channel mixer with a microphone from Radio Shack. He also bought as ADC compact disc player to allow him the professional sound of segues. In addition to these items, KCOR came across a tape of sound effects and a recording of silly dubs, celebrity goofs and comedy. "Rock-16" also began to play commercials from early days of radio. This helped KCOR gain a light-hearted format and a good rapport with its now 300 listeners.

J.R. was managing fairly well on his own with KCOR and he was happy with his nightly efforts on 1630. His sights, however, were on a higher medium, or wavelength at least. And, after he weighed the possibilities, he came up with a shortwave outlet for KCOR. In late May, with some help from "Ed," his station engineer, "Free Radio Northwest" was born.

On Sunday, May 30, at exactly 1:55 p.m. Pacific Daylight Time, J.R. began the "Free Radio Northwest" interval signal, a music box version of the old syncopated folk song, "Grandfather's Clock." J.R. used the same ham transmitter but this time on 13820 kHz in the 22 meter band. "FRN's" offering was "Hip Tracks," a program featuring a popular album in the United States. The particular show was on the Irish group, "U2's" latest and number one LP, "The Joshua

---

David Klopfenstein, a broadcasting student with Portland Public Radio 1450 KBPS, has been a shortwave DX'er since 1985, and a broadcast band DX'er since 1983. He is currently a member of SPEEDX, IRCA and ANDEX and serves as a cadet communications officer for his Civil Air Patrol Squadron. In addition, he writes and edits for his high school paper.

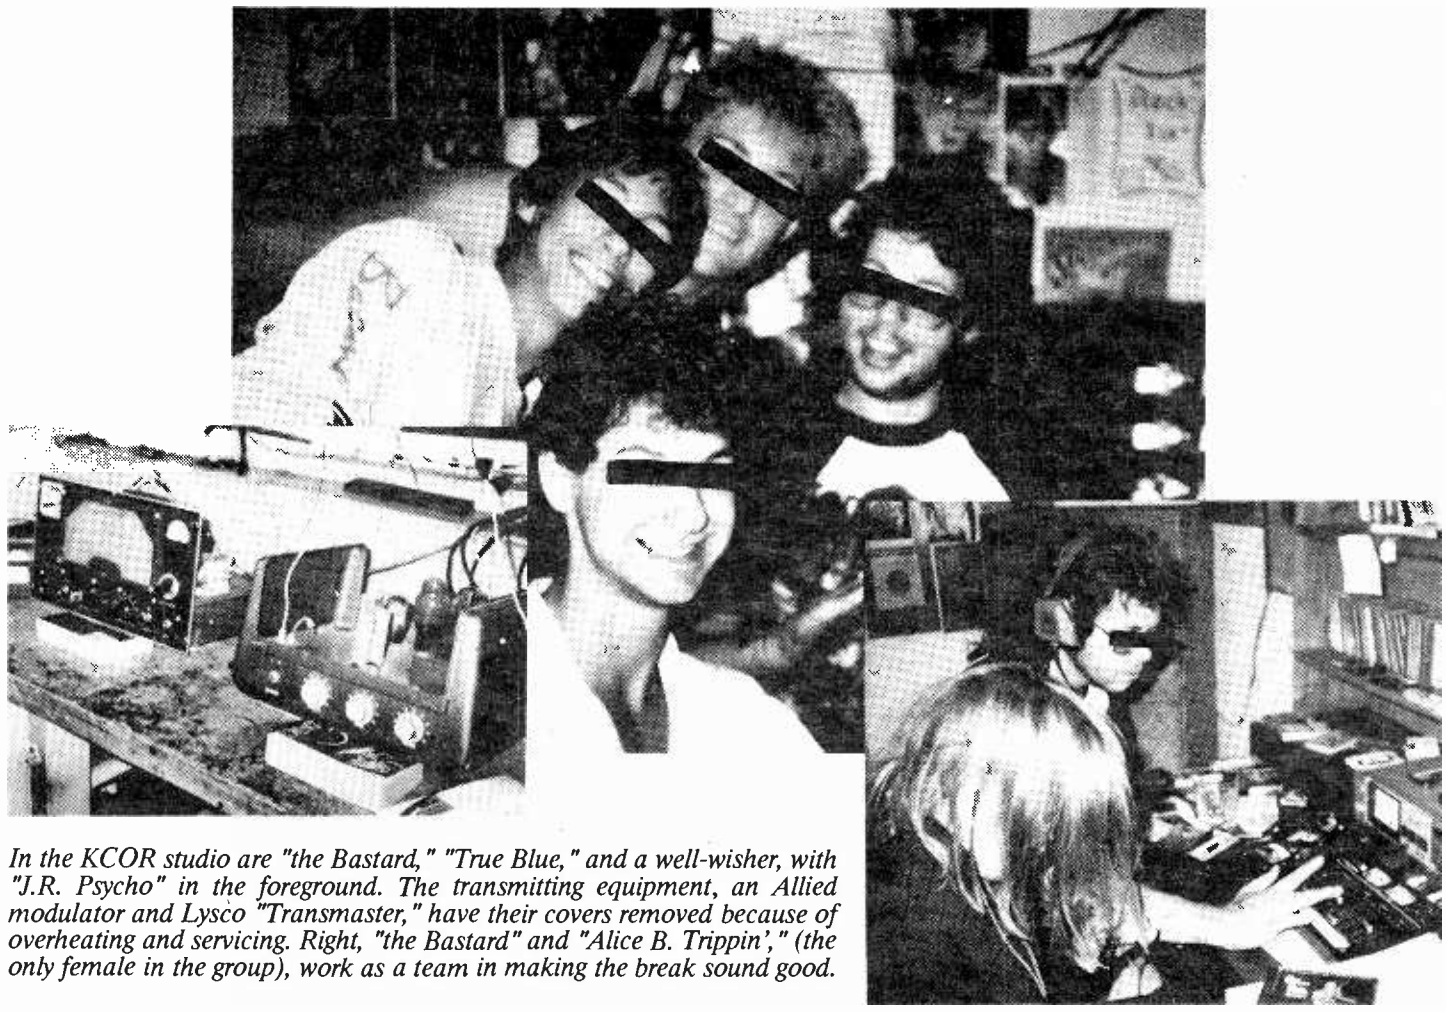
Tree." Because J.R. wanted to give the impression of being a shipborne pirate in international waters, he used numerous sound effects and played with the levels to simulate the swinging of the microphone. After "Hip Tracks" finished the feature album, the remaining ten minutes were polished off with some popular music from the Republic of China (Taiwan). At the top of the hour, "FRN" said goodbye with the interval signal as J.R. gave QSL information. The transmitter was shut down at 3:05 pm and the 1630 crystal replaced for KCOR sign-on. This made "Free Radio Northwest" one of shortwave's shortest lived and rarest broadcasters. He was still running only a watt and a half.

Coming of Age

June brought additional improvements to the station, including an upgrade from the former 5 watts peak envelope power (PEP) to a 15 watt PEP output with 5 watts of effective radiated power (ERP). Along with the increase in power came a boost in staffing, with several disc jockeys joining the KCOR team. Although there is controversy over who was the first new voice on the lineup, everyone agreed the station sounded a little fresher with more than one jock. The news announcers aliases were "Rockin' Richie," "Rick Rol-l-l-l," "Alice B Trippin'" and "Love Stallion," as well as "Phil Poser," "The Bastard," "Doctor Thrash" and "True Blue," and last but not least was "Eric--Man of the Hour." Along with the new deejays came their collection of compact discs and cassettes helping to expand even further the range of music KCOR played.

The nine new disc jockeys generated increased publicity and led to the inclusion of the two pay phones at the corner "7-Eleven" for request lines. With "Rock-16" deejays "on-line" at the phone, listeners could have a personal visit or--as in the case of broadcast band DX'er, Pat Martin of Seaside, Oregon--the ability to get the QSL address without wading through QRN. This also gave the jocks something to do when they weren't busy at the studio.

After school let out on June 9, J.R. became aware that although he had a fairly clean operation, the Federal Communications Commission might ask him to shut down. In order to reduce this risk, he changed the KCOR broadcast schedule from the former 3:00 pm to midnight to a new 5:00 pm to midnight. J.R. and the rest of the gang signed on after the FCC field office downtown closed at 5:00 and kept an eye out for, as J.R. put it, "a large white van, bristling with antennas."



In the KCOR studio are "the Bastard," "True Blue," and a well-wisher, with "J.R. Psycho" in the foreground. The transmitting equipment, an Allied modulator and Lysco "Transmaster," have their covers removed because of overheating and servicing. Right, "the Bastard" and "Alice B. Trippin'," (the only female in the group), work as a team in making the break sound good.

The typical summer vacation broadcast day was a radical change from KCOR of earlier days. No longer was the radio station a quiet operation in J.R.'s basement--it had become a full-fledged broadcaster with logs, airshifts and posted station policies. The days sometimes began early for J.R. and the crew, but most of their mornings were spent asleep, reviewing a new album or mulling over the latest music magazine for the evening show. Some of the regular deejays had slept overnight on the couch or on the in-studio bed. Once everyone was awake, though, the hustle and bustle of preparation began. Well, as soon as the crew munched their "Froot Loops" or slurped their coffee.

After lunch, KCOR became a "hang-out" for those impatient to hear the evening broadcast. J.R.'s speakers blared all afternoon as the kids came and went in a seemingly never-ending cycle. Toward the 5 o'clock sign-on, the place began to clear and the "Rock-16" staff readied themselves for the seven hours ahead. Soon, KCOR formally signed on and the program began.

Most nights had three shifts, with J.R. on backup in case the assigned jock didn't show. Every shift was filled with requests and foolishness ranging from impersonations of Jim and Tammy Bakker to satirical PSA's from Arlington National Cemetery. Round 11:30, the tone mellowed and by sign-off, everyone was ready and waiting to sleep up for the next day. The "good nights" were exchanged and KCOR turned in.

The days and nights at "Rock-16" weren't always good. Several times someone swore on the air and on one occasion, a KCOR "groupie" showed up stone drunk. However, J.R. took these situations in stride and made sure there would be no repeat offenders. He was very particular about what was said over KCOR and a couple of wrists were slapped--the groupie was not allowed to return. All of the crew knew that "Rock-16's" survival was pivotal upon listener complaints to the FCC and were forced to act accordingly.

KCOR Signs Off

J.R. had reached the peak with KCOR. He had accumulated a sizable group of listeners, nine enthusiastic disc jockeys and a large library of music. The station was doing well, but based on his own common sense, he made an intelligent and difficult decision. Reasoning that it was better to quit while he was ahead, J.R. scheduled a permanent sign-off and vowed to stick to it.

On Friday, June 26, J.R. announced at sign-on that KCOR would sign-off for good at midnight on June 28. He would, however, be broadcasting non-stop until that time. The next three days were fast and furious for the fatigued crew and equipment. Hundreds of requests came in and the station was busy all night, both nights, playing them.

At 12:15 on the morning of June 29, 1987, the last four deejays still awake passed the microphone around one last time. "J.R. Psycho," "The Bastard," "Rockin' Ritchie" and "Phil Poser" thanked everyone and each other for the great time they had at "Rock-16." Finally, after several goodbyes, Jimi Hendrix played the "Star Spangled Banner" and at 12:19 a.m., KCOR became radio history.

KCOR "Rock-16" AM had 76 days of operation, 500 listeners and quite a few reception reports from DX'ers. During its operation KCOR served its chosen audience without a single complaint to the FCC or similar authorities. If you think you may have heard them on either AM or SW, reception reports and inquiries about the station can be sent to KCOR, 4038 Northeast Halsey, Portland, Oregon 97232,

If this is a valid example of what Bruce Quinn's free broadcasters will be in the future (see *Monitoring Times*, July 1987), his arguments may be true. Pirates and legitimate stations alike will just have to wait and see whether or not the FCC will even cater such a proposal. And, if they do, the outcome is not guaranteed to either party. ■

(Photos by the author)

Wild West

By Jock Elliott

If you think the frontier disappeared when things quieted down in Dodge, or when the law came to Yellowknife, just tune your receiver between 26 and 28 MHz and have a listen. These are the badlands, hombre, the wild west of radio.

It's the home of unlicensed operators, RF gunslingers packing beam antennas and powerful linear amplifiers. They call it the "freeband" or the "extra channels."

Whatever your bent, the freebands can be mighty entertaining to monitor. Here you will find almost everything you can imagine: experienced operators with skill and polish enough to make an Extra Class amateur proud, and sophisticated discussions on radio technology, agriculture, politics and more.

It is also an insane asylum, with someone endlessly chanting "*Ray dee oh, ray dee oh*" and others spitting out the vilest of racial and geographic epithets to no one in particular.

The frequency range that is home to this diverse population is sandwiched around the legal citizens band frequencies, 26.965 to 27.405 MHz, and that's where the story begins.

As the CB craze mushroomed in the 1970s, the legally assigned channels began to get overcrowded. The Federal Communications Commission responded by expanding the frequency assignment to 40 channels. Still, the scope of the fad was such that the bands remained overcrowded.

At about this point, a number of technically-minded CBers discovered that their transceivers could be easily modified to operate in a range of frequencies that extended outside those assigned by the FCC. For example, with the addition of two wires and a couple of switches, an SSB transceiver such as the Uniden Madison can be made to operate on 15 channels below channel one and 55 channels above channel 40. The frequencies range from 26.835 MHz right up into the 10-meter ham band.

Other radios require the replacement of microchips and/or crystals, but by and large, the changeover can be done easily by any competent technician.

In twos and threes, CBers put the "extra channels" in their radios to escape the noise and confusion, and freeband was born. And although the CB craze has long since subsided, freebanding persists.

Freebanders appear to be a dedicated bunch: at the first hint of good propagation, you'll find droves of them working to establish out of state or out of country contacts. The results are often impressive. One Florida operator has contacted 50 countries so far *this year.*

The Federal Communications Commission, however, isn't impressed.

Elliott Ours, Chief of the FCC's Enforcement Branch, says, "Anyone who persists in operating out of frequency is eventually going to receive some attention from us."

Rick Engleman, the FCC's Chief of Inspections and Investigations says he sees the free banders as a problem because of the actual or potential interference they may cause with legitimate users of the frequencies and with other electronic devices like TVs and stereos. Last year, the FCC received between 28 and 29 thousand interference complaints. Fifty seven percent of them were caused by CBers.

Legally, a CBer may transmit up to 4 watts AM and 12 watts PEP single sideband. Many operators within the 26 to 28 MHz range, however, have boosted their power by modifying ham equipment (capable of running 150 watts or so), running so-called "export" radios that were designed for other countries and are illegal to own in the U.S., or installing linear amplifiers with power ratings up to several thousand watts.

"Excessive power is perhaps more of a concern than out of band operations because many of our enforcement activities are primarily complaint-driven," Engleman says. "But I wouldn't want anyone to get the idea we are going to look the other way just because we find that an operator is working illegal frequencies at low power."

Attracting the attention of "Uncle Charlie," as the FCC is known in the freeband community, can be a singularly unpleasant experience: fines start at $750 and can go as high as $2,000 for even a first offense. There are no warnings.

Recently, for example, the FCC field office in New York City levied more

Radio

Adventures in Freebanding

than $10,000 in fines on gypsy cab companies that were operating in the free band, using linear amplifiers and illegal export radios. The companies had attracted the attention of the FCC because of complaints of TV interference.

With perhaps hundreds of thousands of free banders and only hundreds of FCC investigators to enforce the rules, Engleman likens the situation to highway speeding: "There are lots of speeders, and we're not going to catch all of them, but we are going to catch some." To some extent, his analogy, operating out of band *and* with excessive power is somewhat like speeding and driving recklessly -- it's more likely to attract attention.

But there is another side to the freeband story, according to Bill Cheek, a.k.a. "Dr. Rigormortis," publisher of the *Eleven Meter Times and Journal* (a national newsletter for high performance CBers and freebanders). As a professional radio communications engineer and consultant, Cheek carries an impressive list of credentials, including membership in the Radio Club of America, the Institute of Electrical and Electronics Engineers, the Instrument Society of America, the National Association of Radio and Telecommunications Engineers and American MENSA.

Cheek has thought long and hard about the free band issue, and he takes exception to the FCC's position.

"In terms of operating out of band at low power -- and at high power if it is done correctly -- freebanders do virtually no harm. That's because there are vanishingly few legitimate users in that portion of the spectrum. Of the few that are licensed to operate there, such as the Civil Air Patrol on 26.620 and some mobile-to-broadcast links for local TV stations, most have moved to VHF or UHF where reception is more reliable for short-range communications," he says.

Cheek adds, "As to the issue of enforcement, you might as well pass a law that says the sun won't come up tomorrow and try to enforce that. The reality is that, as the DX cycle favors long-distance propagation on the bands, more and more operators are going to move into the extra channels for the same reason that they did ten years ago -- DX congestion will render CB channels 1-40 unusable unless you operate at very high power."

Right now, Cheek estimates that fully half of the millions of CB operators in the United States have freeband capabilities, and ten to twenty-five percent of them are using the freeband on a regular basis.

In regard to high power operations, Cheek admits there is a problem. "There is no doubt that improper high-power operations probably cause more interference problems than the FCC realizes." But the solution, he feels, lies in making sure that linear amplifiers, export radios, and ham rigs are operated properly. to this end, he has supported a non-code technical license for high-power freeband operations.

But why don't freebanders become hams and legitimize their operations?

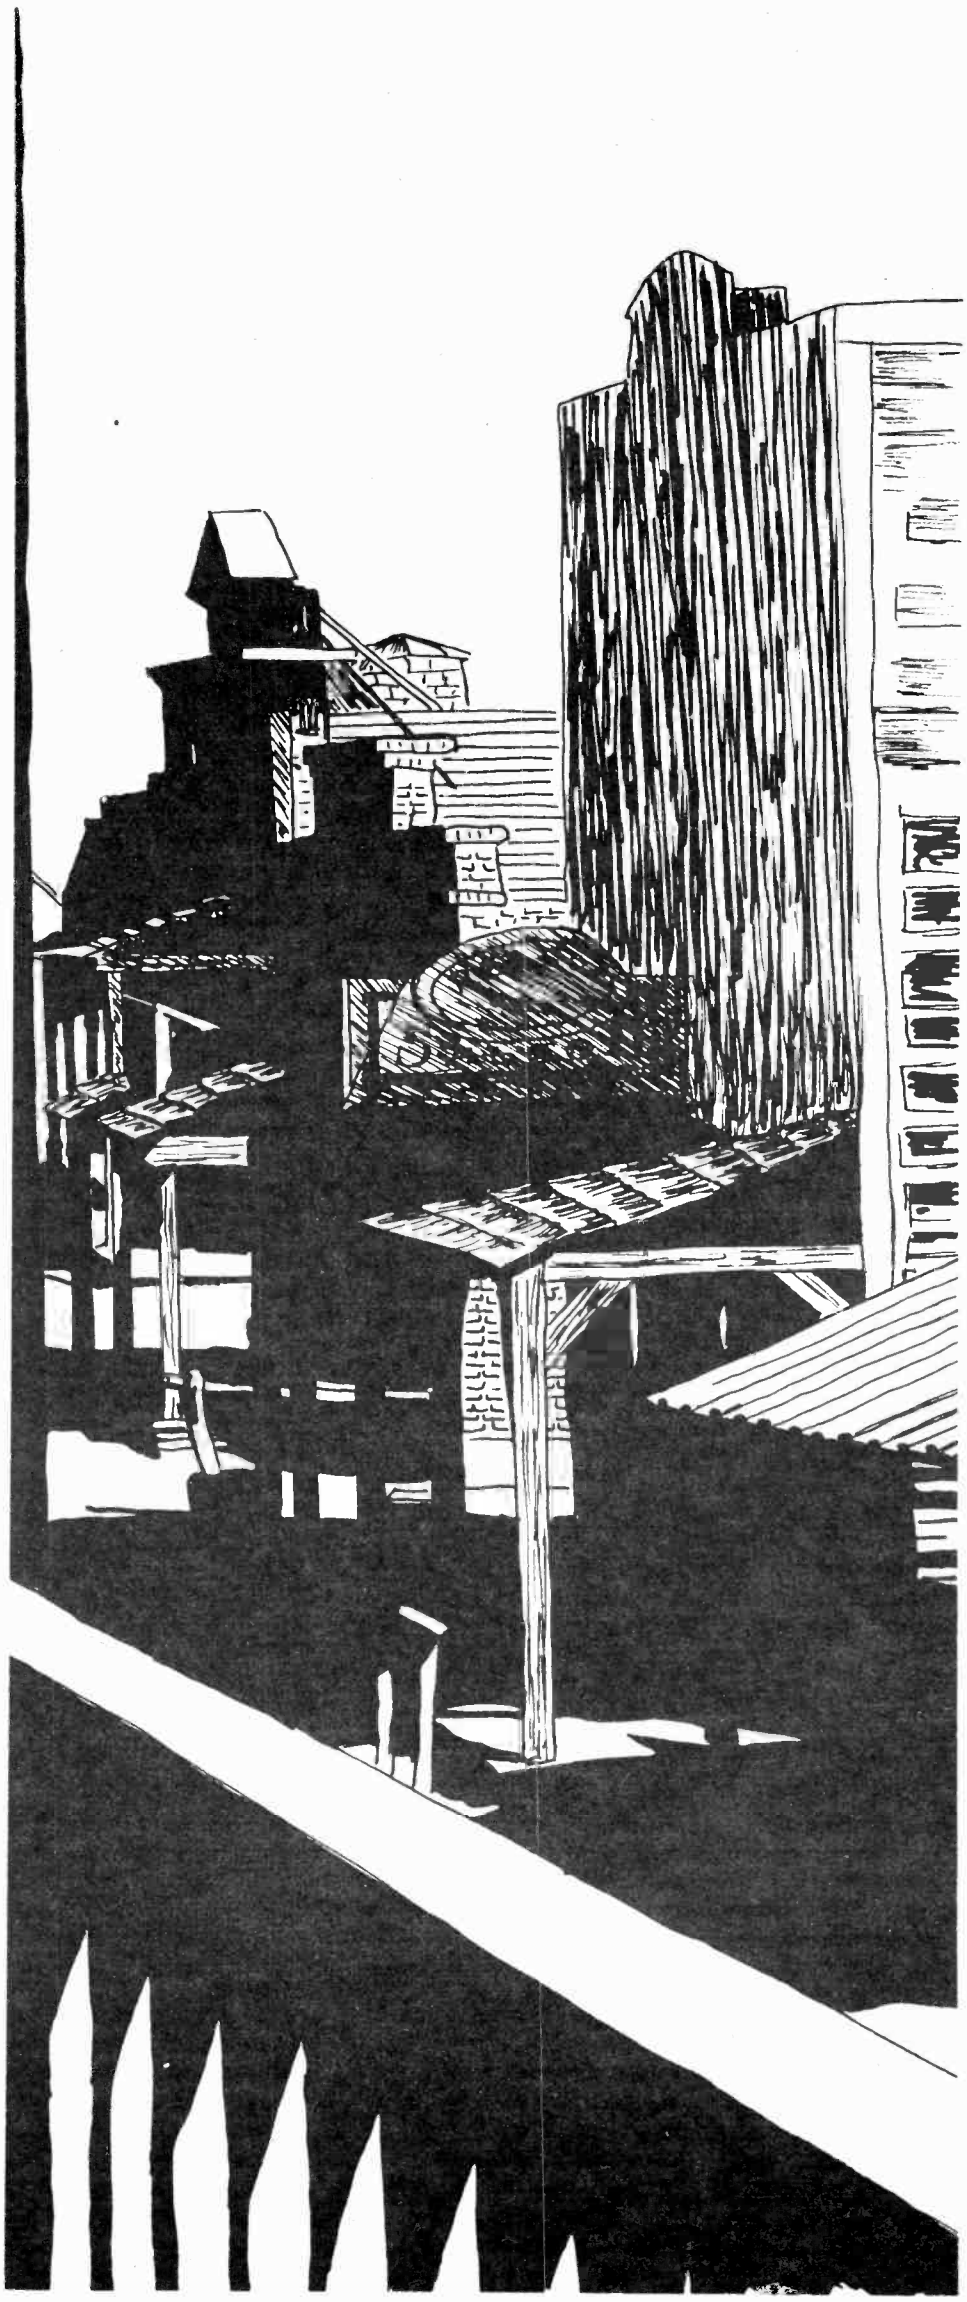
"Most freebanders have absolutely no interest in learning Morse Code. Otherwise, I think many would be willing to study for a license," says Cheek. Interestingly, though, a surprising number of freebanders are also hams.

There is, according to people like Cheek, a more important issue at stake than simply playing radio. "As a publisher and citizen," says Dr. Rigormortis, "I support the Constitution and the Bill of Rights. The founding fathers believed that taxation without representation was tyranny. Now notice this: no one elected the people at the FCC. They are making rules regarding use of the airwaves without the people's representation. Congress, which does represent the people, does *not* vote on the rules. Due process isn't involved, and I question the FCC's authority to say that freeband radio is illegal."

"In short, a kind of peaceful rebellion has taken place. The airwaves belong to everyone, and we, the people, have taken back control of the free band by right of eminent domain."

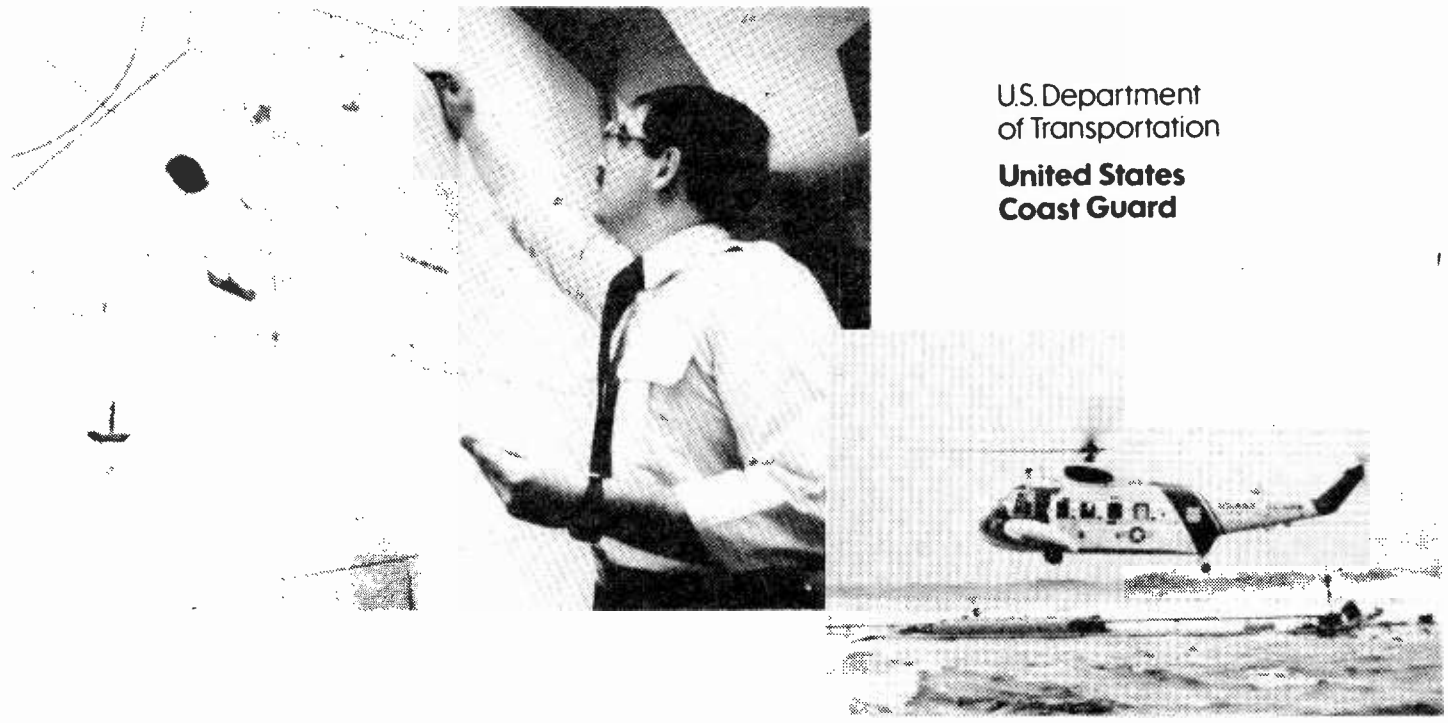
Whether the issue of freebanding as legal vs illegal or people's rights vs the tyranny of big government, the freeband appears to be here to stay, pardner. Welcome to the untamed frontier of radio. ■

Want to know more about freeband action? Write to Eleven Meter Time and Journal, P.O. Box1019, Lemon Grove, CA 92045. Send an SASE for info, $2.00 for a sample copy, or $15.00 for a one-year subscription.



When the Waves turn Minutes into Hours ...

The U.S. Coast Guard is Listening and Ready to Help -- And you can too!



U.S. Department of Transportation

United States Coast Guard

An exclusive interview by Jock Elliott with Lt. Commander Dave Smith, Chief of Telecommunications Branch for the Atlantic Area of the United States Coast Guard.

MT: Lt. Commander, what exactly is your job?

Smith: As Chief of Telecommunications Branch, I have responsibility for overall management of Coast Guard communications, including radio communications, in the Atlantic Area. The Atlantic Area covers the Eastern half of the country, from the North Atlantic to the Caribbean. The Western half of the country, as well as Alaska, Hawaii and some of the islands in the Pacific is the responsibility of the Coast Guard's Pacific Area Command.

MT: At any given time, how many people do you have monitoring various radio frequencies?

Smith: Well, over 100, but it changes. First, it would probably be useful if you understood that we have an extremely varied mission. The Coast Guard has responsibilities in search and rescue, law enforcement and maritime defense of the coasts. We call it "save 'em, seize 'em or sink 'em."

MT: How are you organized?

Smith: Under the Atlantic Area there are five major districts in Portsmith, Virginia; Boston, Massachusetts; Miami, Florida; New Orleans, Louisiana; and San Juan, Puerto Rico. There are similar districts in the Pacific. Each district is a major research and rescue coordination center. Within each district is a series of groups--some 50 of them Coast Guard wide--that are responsible for smaller geographic areas such as a portion of the New Jersey Coast. Finally, within each group there are a number of individual search and rescue stations, equipped with boats, planes and helicopters.

MT: That seems like a lot of organization.

Smith: It is, but it is necessary to provide the coordination and allocation of resources that we need to do our job. For example, do you remember the Russians who were rescued from a freighter a while back?

MT: You mean the ones who eventually were brought to the White House to meet the President?

Smith: That's right. Well, they were aboard a bulk grain carrier that suddenly began to sink rapidly. Their distress call was first received at the Cape May Group in New Jersey. But they were sinking fast, and Cape May didn't have the large helicopters that were need for the rescue. So word was passed up the chain of command to the Atlantic Area command, which contacted Boston. The choppers that safely lifted all 34 Russians off were actually dispatched out of Cape Cod. Now, if Cape May had to contact all the other groups to find out who had large helicopters available, it's possible that we wouldn't have gotten to the freighter on time. So, yes, there is a lot of organization, but it is there for a purpose, and most of the time it serves pretty well.

MT: What about your radio facilities and the frequencies the Coast Guard listens to?

Smith: Let's start at the bottom. At several places along the coast we have stations that "guard" the 500 kHz international distress frequency. This is the old fashioned SOS/Morse code frequency that was used back in the days of the Titanic. Most of these stations have 300 ft. towers and 2 kilowatt transmitters. Under the worst conditions, the range of these stations is about 300 miles. Incidentally, when I say that we "guard" a frequency, that means we have someone listening to it 100 percent of the time.

The next frequency we guard is 2.182 MHz upper sideband. The stations are usually equipped with 1 kilowatt transmitters, we figure that they are good for reliable communications for about 70 miles. Of course, when conditions are good, we can do a lot better than that.

MT: Don't you put out "notices to mariners" on that frequency?

Smith: Well, actually, we call on 2182 to announce that there will be a notice to mariners and request that they listen to the notice on 2670. That way, we can keep 2182 clear.

Another frequency that we guard is 8364, which is the transmitting frequency of the old "Gibson Girl" lifeboat radios. These are old hand-cranked CW radios with the antenna pulled aloft by a kite or a balloon. There are a surprising number of vessels equipped with these devices, so we listen there.

MT: What about VHF?

Smith: We also guard 158.6 MHz FM, which is marine channel 16. Each of our research and rescue stations is equipped with 50 or 100 watt transmitter, and because we have taken care to locate antennas on mountain tops and high buildings, we actually have continuous coverage on this frequency around the lower 48 coast line out to 20 miles at sea. We also have continuous coverage in Hawaii and some coverage in Alaska. That coverage assumes the worst case: we can hear a 1 watt signal from a handheld transceiver with a unity gain antenna only 6 feet above the sea. If you have a sailboat with an antenna on top of the mast as a 25 watt radio, we can hear you a lot farther away.

MT: Have you ever had a ham or an SWL help you out in a rescue?

Smith: Certainly. Many times, in fact. The most dramatic case involved a ham. It occurred while I was stationed in the Pacific area.

A father, his son and three other boys were diving from a private yacht in the Christmas Islands. The islands are near the equator, more than 1000 miles south of Hawaii. One day, after making three dives beyond 100 feet in the same day, the four boys were struck with severe bends. The father was a ham, and he contacted a ham in Honolulu, who contacted the rescue center in Hawaii.

The Coast Guard dispatched a C-130 aircraft to the Christmas Islands. The plane picked up the boys and headed back out for a decompression chamber in Hawaii. Unfortunately, the son died on the way. Of the other boys, one recovered very quickly and two were hospitalized for some time.

MT: What should one of our readers do if he or she should hear a distress call that is apparently unanswered?

Smith: The first thing is to listen carefully. Tape the transmission if you can, and if you can't write down as much as you can word for word. This is extremely important. Make sure that it is, in fact a call for help.

In Hawaii, we used to go nuts with people who named their boats "Hey Day," "Pay Day," or "Hey Hey"--because they all sounded like Mayday

ATLANTIC AREA COAST GUARD DISTRESS AND WORKING FREQUENCIES

Freq	Purpose	Station Guarding	Mode
500 kHz	Dist & Call	Communcation Stns	CW
2182 kHz	Dist & Call	Groups, SAR Stns & COMMSTA San Juan	SSB/Voice

12718.5/12700 kHz	Half duplex	Portsmouth/S.J.xmit	Day/night
16 MHz Ch4,5,6	Call	COMMSTA Ports/Sn Jn	CW
16976/16983.2 kHz	Half duplex	Portsmouth/S.J.xmit	Day

on the VHF band. If you can, find out the specific nature of the distress: is the vessel sinking, on fire, going aground, or is there an injured person on board, and if so, what kind of injury. We also need to know the number of people on board. This information makes a big difference in the kind of help that will be dispatched.

MT: Anything else?

Smith: Yes. The location is obviously very important: we can't render assistance if we can't find the vessel. So copy down the position *exactly as stated*. This is critical because people who are in an emergency situation often give several contradictory statements of their position. So, if it turns out that someone says "We're on the south side of Long Island between Long Island and Connecticut" and it turns out that you can't be in both of those locations at the same time, we want to have the exact wording so that we can check the most likely positions.

A good description of the vessel is helpful as well -- it's length, color, name, registration number, and type (power boat, sail boat, fishing boat, tanker, and so forth). You would be surprised how often we get calls about white boats of indeterminate length that are "pointed at one end and round at the other" -- that pretty well describes half the pleasure craft in the U.S.!

MT: Any other information that a listener should take note of when monitoring a distress call?

Smith: Yes, in the event a vessel is being abandoned, we would like to know if they have life rafts. A raft is much more visible in the water than a person in a life jacket.

MT: Once a listener has gathered as much information as possible, then what?

Smith: Call the Coast Guard. We are sometimes listed under emergency phone numbers in the beginning of the white pages. If that doesn't work, look in the blue pages under U.S. Government listings: Coast Guard. Call the number for a rescue center if there is one or any number that you find there except a recruiter -- they are not on duty 24 hours a day. If that doesn't work, call 911.

Most law enforcement agencies have cooperative arrangements with us. Whoever you talk to, insist that they take your name and telephone number so that we can get back to you if we need more information.

MT: What about satellites in your work?

Smith: That's a good point. If the people in distress mention that they have triggered an EPIRB (pronounced ee-purb) -- emergency position indicating radio beacon, we want to know. The EPIRB is a 2-tone oscillating pair signal, kind of like a European police siren, on 121.5 MHz, with a strong harmonic on 243.0 MHz, the military aircraft distress frequency.

If an EPIRB has been triggered, the COSPAS/SARSAT satellite system (that's a Soviet/American cooperative system) can be very helpful in pinpointing the location of the distressed vessel. On the first pass overhead, the satellite will give us a line of position on the vessel. On the second pass, it gives us an exact location.

At one time, we had a sailboat that lost its sails 600 miles north of Hawaii, and the owner was trying to motor back. He radioed that he was running low on fuel and was nearly out of food and water. He tripped his EPIRB, and we were able to fly directly to him using coordinates from the satellite and to drop food and water to him. Then we called a tug to tow him back to Honolulu.

Eventually, there will be a Global Maritime Distress and Safety System in place that will make our lives a lot easier.

MT: Does that mean that there will be no need for people to listen for distress calls?

Smith: Absolutely not. Not everyone will participate in the satellite system.

So we will always need people to guard the frequencies, and we are glad for all the help we can get. ■

CFCX: Canada's First Station

by Kenneir P. Phillips, Ph.D

In two years, CFCF radio will celebrate its seventieth anniversary -- the first such station to reach those impressive numbers anywhere in the world. From its humble beginnings as XWA to today's CFCF, it has been a long and fascinating chapter in the history of communications.

CFCF is one of just five commercial stations in Canada to have a separate shortwave outlet (CFCX) for rebroadcasting their local programs. Today on your shortwave radio you can hear CFRB in Toronto (6070 and the most widely heard), CFCN in Calgary (6030), CHNS in Halifax (6130), and flea-powered CKWX in Vancouver (6080). Tune to 6005 kHz, however, and most listeners in North America will have the opportunity to hear a bit of radio history in the making -- or more specifically, continuing. The fifth station, CFCF on 6005, is, arguably, the first radio station in the world to hold regularly scheduled broadcasts.

Numerous experimental broadcasts, both here and in Europe, laid the foundation for CFCF and many other stations quickly followed. The first broadcast on record was made by R.A. Fessenden, who was born in East Bolton, Quebec, and was a chemist with the Edison Laboratories. The broadcast originated from Brant Rock, Massachusetts on Christmas Eve, 1906. It was heard by wireless operators on ships hundreds of miles away. Others followed, including Lee de Forest's broadcast of Caruso's voice from the stage of the Metropolitan Opera in 1910 and the first transmission of the results of a Presidential election in 1916.

Where Were You Feb 16, 1931?

The 1930s brought a wealth of U.S. programs to Montrealers when CFCF became an affiliate of the National Broadcasting Company. To a broadcaster, nothing is more nostalgic than an old program log. Here's the lineup for Monday, February 16, 1931:

7:27 a.m.	Time announcement
7:30 a.m.	Northeastern Breakfast Entertainers
8:00 a.m.	Quaker Early Birds -- Gene and Glenn (NBC)
8:15 a.m.	Northeastern Breakfast Entertainers
9:00 a.m.	Parnassus Trio (NBC)
9:15 a.m.	Studio
9:45 a.m.	Miracles of Magnolia (NBC)
10:00 a.m.	Sunshine Hour
11:00 a.m.	Gloom Chasers (NBC)
11:15 a.m.	Studio
11:30 a.m.	Organ Melodies (NBC)
12:00 p.m.	Shavers Musical Bits (NBC)
12:15 p.m.	On Wings of Song (NBC)
1:00 p.m.	Stock Quotations
1:15 p.m.	Palais d' Or Orchestra (NBC)
1:30 p.m.	Hotel New Yorker Concert Ensemble (NBC)
2:00 p.m.	Wilder Radio Hour
3:00 p.m.	Ross Hall Feature
4:00 p.m.	Canadian Electrical Supplies
5:00 p.m.	Hartney's Eventide Music
5:55 p.m.	Weather forecast/Program Resume/Time
6:00 p.m.	Twilight Hour
6:45 p.m.	Stock Quotations
7:00 p.m.	Amos and Andy (NBC)
7:15 p.m.	Pepper and Salt -- Xylophone and piano popular music
7:30 p.m.	Phil Cook -- The Quaker Man (NBC)
7:45 p.m.	Montreal Light Aeroplane Club -- Aviation Charts
8:00 p.m.	Conner Washer Orchestra
8:30 p.m.	Mount Royal Hotel Concert Orchestra (Remote)
9:00 p.m.	Melody Mike's Music Shop (CPR Network)
10:00 p.m.	Stromberg Carlson (NBC)
10:30 p.m.	Willard robinson Deep river Orchestra (NBC Remote)
11:00 p.m.	Hotel Paramount Orchestra (NBC Remote)
11:30 p.m.	Time Announcement, Sign Off.

The question of which radio station was the first to broadcast on a regular schedule is an interesting one. As E.A. Weir points out in *The Struggle for National Broadcasting in Canada* (McClellan and Stewart; 1965): "During 1920, regular concerts began to be broadcast from The Hague. Also in 1920, in February, the Marconi Company began to broadcast from Chelmsford. KDKA, Pittsburgh, operating experimentally from 1916, made its first scheduled broadcast on November 2, 1920, when the Harding-Cox election results were announced. However, WWJ of Detroit has long claimed that on August 20, 1920, a radio program was aired by them and that the service that commenced on that day continued on a regular basis.

"There seems no doubt, however, that both stations were antedated by XWA of the Canadian Marconi Company in Montreal as a public broadcaster of regularly scheduled programs. Indeed, it would appear that CFCF is the oldest regularly operated broadcasting station in the world."

The origins of XWA are shrouded in obscurity. Company files place its inception as the fall of 1918 when test experiments were carried out from the Marconi Wireless Telegraphy Company of Canada factory building at 173 William Street. Certainly by 1919, tests had begun on a semi-regular basis. It was often difficult for those program pioneers to know if they were even being received, as the only audience consisted of a few "hams" and a handful of ships in the St. Lawrence River which were equipped with crystal receiving apparatus.

Speaking to the Parliamentary Committee of March 11, 1932, Commander C.P. Edwards, Director of Radio, Department of Marine, said, "Broadcasting in Canada started with some test programs in 1919 carried out by the Canadian Marconi Company of Montreal. Regular organized programs commenced in December, 1919, by the same company, and by 1922, broadcasting had been definitely established throughout the country."

The Marconi station was, of course, XWA, which became CFCF on November 4, 1920. These early programs of XWA/CFCF consisted mainly of weather reports and the playing of Gramophone records on a wind up Victrola. The first operator was J.V. Argyle, who, until his death a decade ago, was with the Department of National Defense in Ottawa. One of the first musical sounds aired by XWA, which was merely a box of wireless equipment in the corner of the factory building, was that of a small Swiss music box, owned now as then, by D.P. Coates of Calgary.

On May 20, 1920, a special program with an orchestra and soloist Dorothy Lutton was broadcast by XWA in conjunction with the annual meeting of the Royal Society of Canada at the Chateau Laurier in Ottawa. Reception was good in Ottawa, more than a hundred miles away, and both the Ottawa Citizen and the Montreal Star carried feature stories the next day -- one of the first times that the newspapers had even acknowledged this brash new "toy." Among those who heard the broadcast at the Chateau were Sir Robert Borden, the Duke of Devonshire, William Lyon MacKenzie King, and Sir Henry Drayton.

The impact of this activity was immediate and mounting. People were lining up at the counters of electrical shops to buy home receivers or "crystal sets" as they became known. Department stores established radio departments. CFCF programs were wired into local theatres for broadcast during intermission. Often, the broadcasts received larger billing than the picture! All over the country, amateurs were assembling sets for friends or relatives, or going into business by starting radio shops. The assembling of crystal sets became a national preoccupation.

Complete sets were promised for sale in the near future and the public awaited not-so-patiently. Newspaper coverage increased, with columns of radio news and comment making their first appearance. Plans for new stations were widely publicized, including CKAC, Montreal, which began regular programming in 1921, completely equipped with Canadian Marconi apparatus. Early photos of the studio confirm the legend that the need to overcome microphone jitters sometimes reached bizarre

proportions. The two CKAC microphones resembled huge floor lamps, complete with shades!

The word "radio" was still unused. Broadcasting was called "wireless telephony." One of the first companies to realize the importance of broadcasting advertising was the Berliner Gramaphone Company of Canada, forerunner of the Victor Company of Canada. They were advertising in April of 1920, "His Master's Voice Records by Wireless Telephone, by arrangement with the Marconi Wireless Telegraphy company of Canada, a His Master's Voice Victrola Concert, featuring the latest and most popular selections, will be given tonight and every Thursday from 8 to 9 p.m. for the benefit of wireless students. Captains and officers of ships in port are invited to enjoy this entertainment aboard their vessels. Operators tune to 1200 meters."

By 1922, broadcasting was well on its way in the United States and Canada. In that year, thirty-nine commercial stations were licensed by the Department of Marine in Ottawa. Half of them never started, or, if they did, closed by the end of the year. Of more than ninety-one licenses issued up to 1926, only forty stations were operating. The mushrooming of stations was even greater in the U.S.. By the end of 1924, there were 530 broadcasters on the air -- over 1100 had been licensed but the toll had been great.

All stations shared common problems, the fight to maintain a dominant place in the community, the multiplying difficulties of programming, the demands of composers for payment and the utter inadequacy of their financial backing.

In 1922, CFCF equipped and moved into its first real broadcast studio located in the Canada Cement Building in Phillips Square. An early photograph shows the ever-present drapes and a slightly larger pile of equipment in the corner. Microphones were now on stands. The two most important pieces of equipment in the studio were a piano and a Gramophone. The piano was used for live performances, the Gramophone for recorded.

Remote broadcasting had already begun. Regular performers heard from the Phillips Square location were the dance bands of Joseph Smith from the Mount Royal, Andy Tipaldi from the Ritz-Carlton, ands Harold Leonard from the Windsor. Even the 1923 yacht race from Lake St. Louis was described, using a portable, hand-cranked transmitter. Artists broadcast under the names of their sponsors -- Cliquot Club Eskimos, A & P Gypsies, Ipana Troubadours, Goodrich Silvertown Orchestra, and the Lucky Strike Orchestra. Billy Jones and Ernie Hare, the Happiness Boys, were known at various times as the Taystee Breadwinners, the Interwoven Pair, and the Best Food Boys!

CFCF and broadcasting in Canada came of age in 1927. Large, fully-equipped studios were completed in the Mount Royal Hotel. The new transmitter was set up in the penthouse. The main studio was completely covered with drapes, as was the practice to deaden the sound. More complex equipment was installed just in time for Canada's greatest broadcast venture of the decade -- the Confederation Diamond Jubilee celebrations in Ottawa. A coast-to-coast network was improvised, with 23 stations involved. CFCF was the key Eastern anchor, bringing to Montreal -- as did stations in each of their areas -- the sound of the Peace Tower Bells for the first time in history. CFCX shortwave, then called VE9DR, carried the signal to the world.

1928 brought to Canada the first Trans-Atlantic broadcast, the Thanksgiving Service from Westminster Abbey. The Marconi receiving station in Yamachiche, Quebec, picked up the BBC program and fed it to the CNR network, the fore-runner of the CBC. This was followed on November 11 with a live transmission of the Armistice Service in Whitehall. What is now so commonplace was tremendously exciting. For the first time, the distances that separate the world's cities began to shrink. Even the first live satellite television transmissions from Europe pale in comparison with the enthusiasm that these Trans-Atlantic radio broadcasts generated. One elderly lady in Saskatchewan wrote that "it was a shame to get our dear King up at such an hour..." The broadcast, of course, was heard in that province at 4:00 a.m.

E.A. Weir, in his *Struggle for National Broadcasting in Canada* says, "here a belated but long-deserved tribute must be paid to the unselfish cooperation of the Canadian Marconi Company. This company repeatedly placed its beam stations, Yamachiche (Receiving) and Drummonville (Sending), at the disposal of the national service for many Trans Atlantic broadcasts between 1929 and 1932 without any monetary remuneration whatsoever and, indeed, with but a modicum of recompense in the way of publicity. No one in this country knows better than I how wholeheartedly Canadian Marconi cooperated in those numerous inter-empire and international broadcasts."

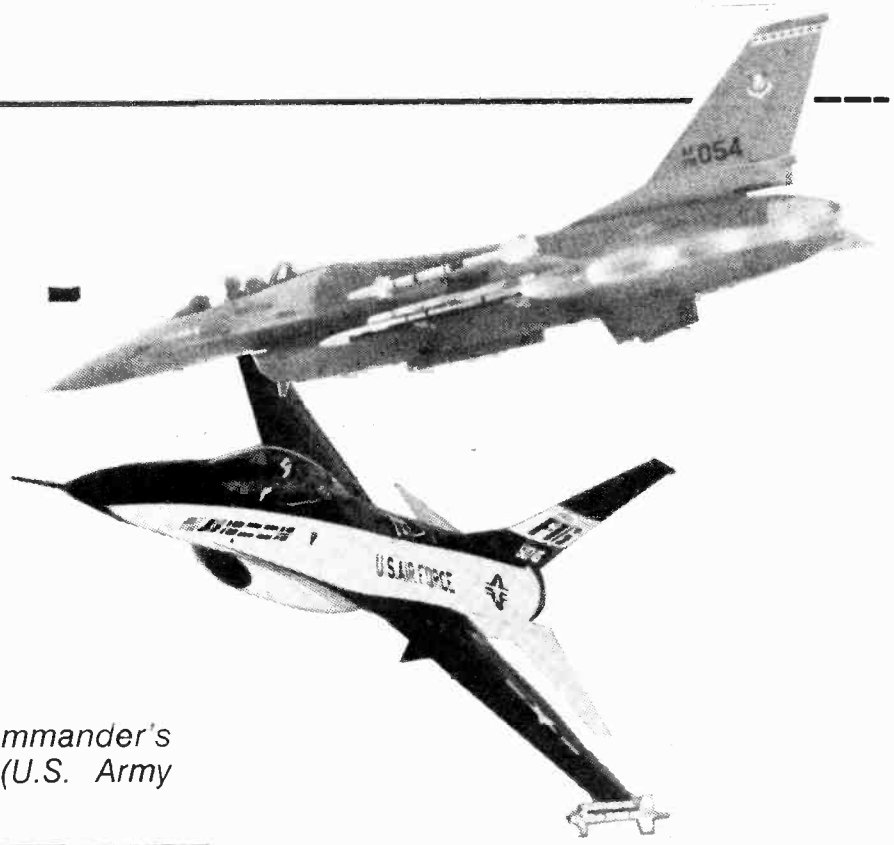
Those were exciting years indeed. Virtually the entire broadcast day was music, either local or network. As you may notice, there was a complete absence of schedule newscasts. Instead, listeners were treated to nightly "Miracles of Magnolia" and "Amos 'n Andy" broadcasts from the States. And with this cream of U.S. talent available to Canadians, there grew an increased interest in local programming.

Every night, CFCF joined with stations in the Maritimes, CNRO in Ottawa, CFRB -- another station with a shortwave outlet still on the air today -- CKOC in Hamilton and CFPL in London to form the first regular Canadian Broadcast network. It was a cooperative venture with Canadians hearing the best of their talent as well. Big companies -- Imperial Tobacco, Canada Starch, General Motors, Imperial Oil and Dominion Linoleum all began regular sponsorship.

But that was not to last. We close this chapter in the history of broadcasting with radio heading into the Depression. Radio itself survived the Depression, and the reason was that it was not only free, but it provided others, carrying the burdens of the financial downturn, with relief, however momentary, from their weight. Every major record company, however, manufacturers of radio equipment, movie industry giants, all either went into receivership or tottered near the brink of bankruptcy. In the midst of this bleak period, radio enjoyed its greatest years, broadcasting to millions of people who had bought their sets before the Depression and now could afford no other entertainment. Radio survived the Depression as it will survive other challenges. Because radio will always be free.

Special thanks to Richard Lemke for his massive assistance with this article. -- K.P. Phillips ■

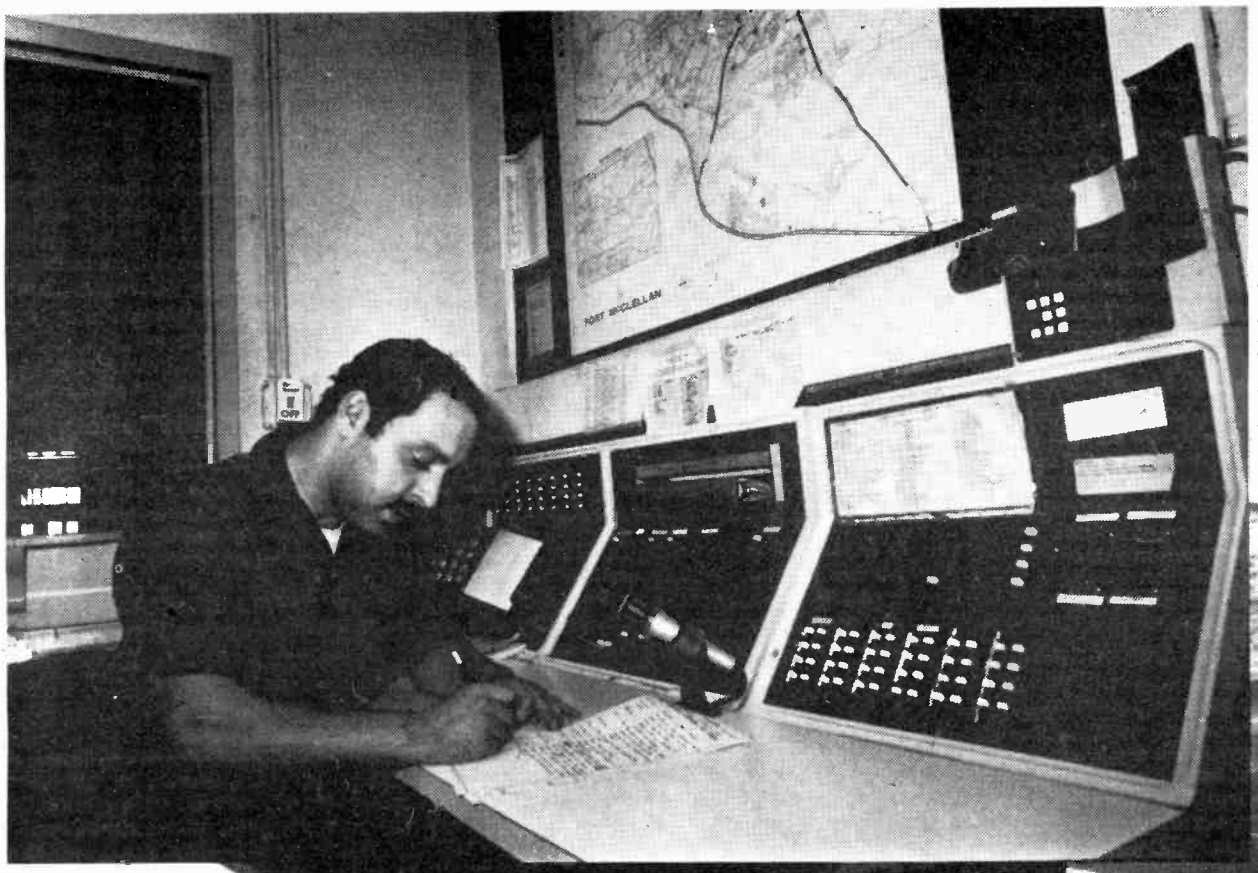
Nellis Air Crash -



by Todd Shideler

Monitoring the Aftermath

Disaster communications are coordinated through the base commander's console such as this installation at Ft. McClellan, Alabama (U.S. Army photograph)



Military Assistance Safety and Traffic (MAST) is often involved in rescue missions, such as this one in which a helicopter airlifts an injured climber at the foot of Arizona's Dragoon Mountains (Army News Features)

Chopper pilot rushes supplies to fire scene near Ft. Huachuca, Arizona (Photos by Tom Rippee)

The phone started ringing just after noon. Nellis Air Force Base had just announced that two F-16A jets had crashed about 70 miles north of Las Vegas; however, at that time they had no other information to give to the press.

The phone calls, one from a local TV reporter and the other from a reporter from Las Vegas's largest newspaper, were in search of information. It was time for my scanners, a Regency MX5000 and a Radio Shack PRO-31 handheld, to go to work.

From the information I had so far I thought it might be on BLM (Bureau of Land Management) land so I started listening there and it instantly paid off! A large brush fire was burning and was emitting a toxic smoke so fire fighters could not get close enough to fight it. All they could do was stand by and watch.

I relayed this interest to the media who were then able to find out that the fire was caused by the planes that had crashed.

Next I turned to the Nellis E.O.D. (emergency ordnance disposal) frequencies; these would come alive later in the day as the E.O.D. team was still enroute from Nellis to the crash site.

Knowing that the Indian Springs base handled all of the search and rescue operations for the bombing range I tried their ground frequency. The helicopters would check in there whenever they took off or landed.

Finally, I tried the Nellis search and rescue channel which was in the UHF air band (see accompanying frequency chart). I didn't think much would be on that frequency because the planes had been found almost 1-1/2 hours ago; boy, was I wrong! It proved to be a gold mine of information.

For several hours following the crash they were unable to establish direct communications with Nellis range command ("Blackjack") or with the base itself. The solution was to set up a relay.

A plane continuously circled the crash site, passing information between there and the base. The system worked well most of the time -- not only for them but for me as well!

When the E.O.D. team arrived on the scene they used radios in the VHF low military band. Most of their information dealt with what explosives they had on board the planes and what they found.

Surprisingly, no communications took place on the Nellis or Indian Springs fire/crash frequencies, nor was information heard on the base commander's frequencies.

The message was passed to the on-site commander to have "Redstone" come up on "4.277 HOTEL FOXTROT" when they arrived. The only problem was no one knew who Redstone was! The control station finally had to come right out and say that it was the communications personnel! Unfortunately, I was not able to monitor anything on that frequency because I have no HF equipment.

The aircraft notified Nellis the exact coordinates of the crash, information not yet revealed to the news media who wanted to know where the crash took place. The condition of the two pilots had no yet been released because Nellis did not know. The base was advised to "prepare for mortuary affairs" and soon after came the message "we have two deltas confirmed." Nellis released this information to the press about an hour later.

All through the afternoon I was able to keep track of the status of the brush fires in the area (which, by now, had broken into four) preventing Air Force personnel from doing a thorough check of the area due to excessive heat and threat of explosions from ammunition.

Postscript

I realized after this event how important it is to keep good lists of the frequencies used in your area; a frequency may never have been heard before but one incident may activate it. One scanner may be adequate for police and fire calls but, as one TV station found, complete frequency coverage is important as you never know what you may want to monitor. ■

Crash Frequencies (MHz)

Primary Search and Rescue (used as the relay)	282.800
E.O.D. & Indian Springs Helicopters (net 12)	410.350
same as above	36.390
same as above	36.330
Indian Springs Ground Party & Helicopters	148.225
HF Frequency to Nellis AFB (from crash site)	4.277

Tactical Call Signs

BLACKJACK	Bombing Range Control
BORE 61	Relay aircraft over crash site
DELTA	Deceased person
E.O.D. ONE BRAVO	E.O.D. team at crash site
E.O.D. OPS	E.O.D. Base at Nellis
REDSTONE	Communications team
STARDUST	Crash site and Nellis commanders
STING	Indian Springs helicopters
SUNRAY	Indian Springs Helicopter control
VIPER	F-16 flying over crash site (relieved by BORE 61)

Notes:

BORE is not a normal Nellis callsign for aircraft.

STARDUST is a new call sign, the old one was VEGAS but this has not been heard in a while.

STING & SUNRAY also operate in the Nevada Test Site as well as at Nellis and Indian Springs.

RADIO ROUNDUP: Broadcasting

Larry Miller

3 Lisa Drive
Thorndale, PA 91372

It was pretty exciting, for a short time. **Back a few weeks ago, smack dab between issues of Monitoring Times, America had an offshore pirate station.**

This isn't the first time for someone to park a boat offshore and broadcast to the U.S.. Old timers might remember the Reverend Carl McIntyre, who, upon losing the license to his Media, Pennsylvania AM station to the F.C.C., promptly packed his bags and headed offshore.

McIntyre's religious/political boat station didn't do all that well and went under, so to speak, a short time after it came on the air. That was back in the 1970s.

The 1980s have had no real shortage of pirate activity, up until the recent F.C.C. crackdown. One of those people who was cracked down upon was Alan Weiner.

You don't have to be too much of an old timer to remember his most recent antics. Weiner apparently had a legitimate radio station in Maine. And he had a studio-to-transnmitter relay licensed as well. Well, Weiner, who reportedly had already been shut down by the F.C.C. on a previous occasion for pirate broadcasting, put this relay on the air as an actual broadcast station in Yonkers, New York. The Commission did not approve, the station was closed, and Weiner vowed to return.

Then one night a few weeks ago, came another pirate voice from the "Good Ship Sara," anchored off Long Island. The voice identified itself as --- Weiner. This time the station was called Radio New York International and it was well equipped to do the job. Based on a Honduran-registered boat anchored off Long Island, it broadcast on -- no kidding -- AM (1620), shortwave (6240), FM (103.1) and even long wave (109).

Both the AM and shortwave frequencies were audible over a wide area, with reception reports being called in from as far away as the midwest.

Weiner, speaking over Radio New York International, said he went on the air "because radio was so bad" in New York. One station representative also mentioned that they were "big fans" of off-color New York/Philadelphia DJ, Howard Stern, who promptly had them on his program two days later.

It was said that Radio New York International was financed by a group of European pirates. Programming, while it lasted, was less than impressive, a ho-hum playlist of old rock music and rather amateurish DJs. During its short lifetime, RNI said it was "testing" for its real sign on on August 1. That sign on never came. It, too, was closed down by the ever-vigilant F.C.C..

It *was* exciting. Signal strength was good. But little else about this was, except for the fact that QSL card collectors lucky enough to hear it were promised another card for their collection. Can Weiner be kept down? Probably not. It appears this man has a mission from God. Ironically, for three nights after the station left the air, another pirate took RNI's 1620 spot on the AM dial, playing early 70s rock. The new pirate never ID'd. But its message was clearly one of defiance. Pirate radio will never die.

Still, things are better here than in the UK when it comes to pirates. There, reports *MT* reader Paul D. Youngs of Scotland, government radio investigators are being terrorized when they a' lookin' for pirates. According to an article in the *The Times*, a group of London-based anarchist groups have "latched on" to the cause of the pirates, telling them how to "disable" policemen, ambush investigators, and beaten.

Less frightening is the story by first-time *MT* contributor David Klopfenstein, who this month narrates the story of another pirate, this one based on the west coast. It's a story of teenagers dissatisfied with local radio and who had a ball -- not to mention the fame and admiration bestowed on them by their schoolmates -- competing with the "big boys." I hope you enjoy the article.

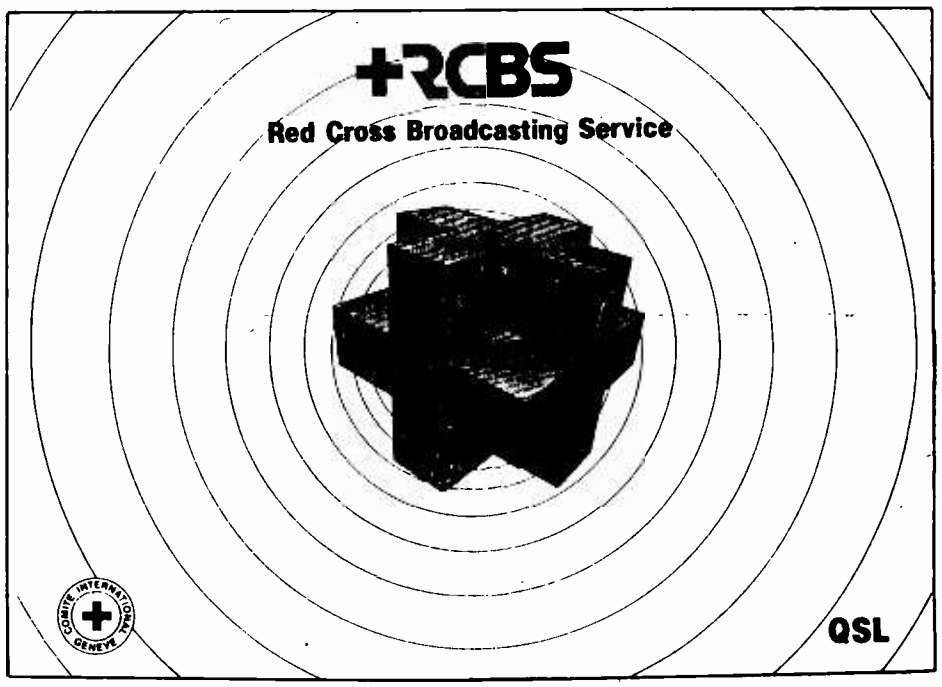
And how about a "warm fuzzy" -- a shortwave human interest story? Aw, c'mon. You can take it. But be sure to have a box of Kleenex handy.

According to Ken MacHarg, HCJB's "Saludos Amigos" program was responsible for the marriage of an Idaho man and a woman from Capetown, South Africa.

Melanie Hawes had written to Saludos Amigos, asking MacHarg to broadcast her name in an appeal for pen pals. Over a dozen people responded, one of whom was Jeff Berg, in Firth, Idaho. The exchange of letters continued and the relationship grew until finally, Ms. Hawes visited Berg in May.

"When she walked off the plane," said Berg, "she was just the same as she appeared in her letters." By the time you read this, the happy couple will be formally united in Holy Matrimony.

Just think, on the very same medium that callously shouts figures of battlefield deaths in Iran and Iraq, that fills our ears with political propaganda, two lonely people found love. Isn't that special? I think I'm going to gag.



Ed Provencher of Biddeford, Maine, sends in a copy of his prized QSL card from the Red Cross Broadcasting Service. He heard that on 9870 kHz at 0315 UTC.

Came across the sharp way of keeping track of what you've heard on the shortwave bands. Mark Swarbrick takes a very small date stamp -- the sort of thing you can pick up real cheap in any office supply store -- and stamps the date he heard a station, right above the time and frequency he heard it, in his *Radio Database International*. It's an amazingly neat, easy and accurate way of keeping track of what you've heard. Finally, I can get rid of my index cards.

Speaking of Radio Database, there are a number of new RDI White Papers out. These are in-depth receiver reviews and

they're available from many shortwave stores. *RDI* White papers are where you should go before you buy a radio.

Before I lose my composure again over Jeff and Melanie, let's take a look at some station news. Sniff.

There have been continuing problems for the Finnish at their new transmitter site in Pori. The problems are technical, but because the relay is unmanned, the breaks, when they occur, often last for hours, even days. Radio Finland apologizes for the situation. Incidentally, Finland says that their toll-free number has been a smashing success.

Radio Australia says it may soon be allowed to send a reporter to Jakarta for the first time since 1980. The Indonesian government had banned RA from stationing a reporter their because of what it saw as an anti-Indonesian bias.

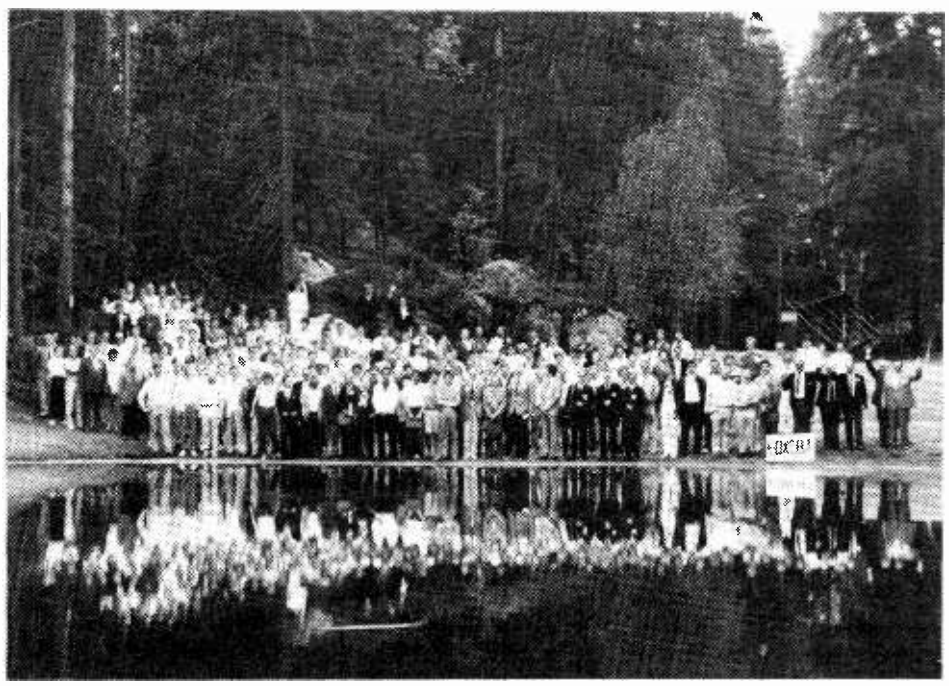
Warwick Beutler, who had been RA's reporter on the island nation since 1977, refused to extend his stay permit. Warwick then left for Singapore, which refused to allow him to stay there. No word on where Warwick is today.

Incidentally, next time you're "down under," **be sure to tune in the Australian Broadcasting Corporation's metropolitan and regional stations.** They're now rebroadcasting Radio Australia's international shortwave service.

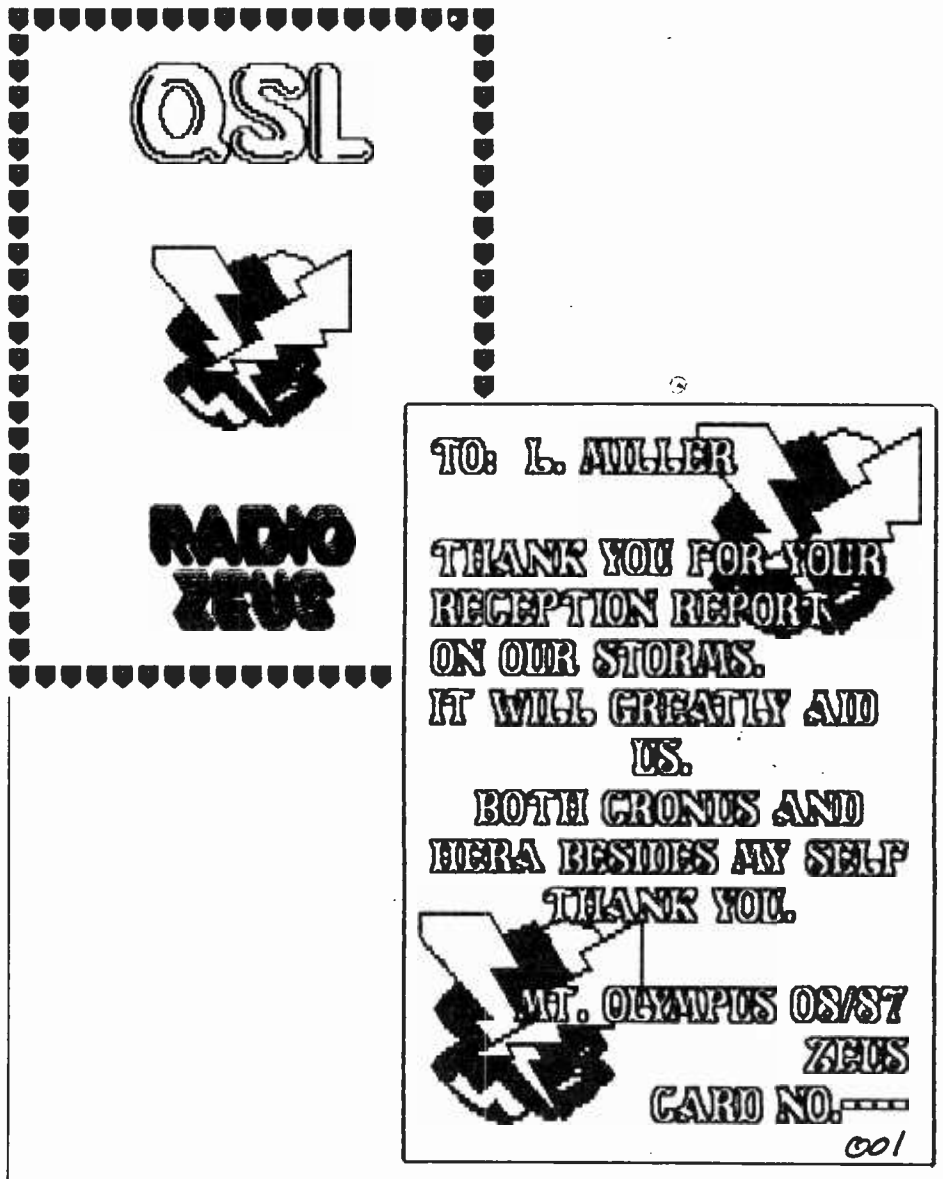
The results are in. **Spanish Foreign Radio took a survey of its listeners and found that SFR came in number two behind Radio Netherlands.** In third, fourth and fifth places, respectively, were BBC, Deutsche Welle, and Radio Sweden.

XEW, La Voz de la America Latina (The Voice of Latin America) has been heard on 6165, 9515, and 15160 kHz. It's been among the missing for several months.

Try 7355, 9740, 11625, or 12085 for the anti-government **Voice of Iraq.** It's a longshot, but occasionally audible.



Attendees at this year's EDXC convention (European DX Council) are pictured above meeting in Helsinki, Finland. Photo courtesy of George Wood, Radio Sweden International.



Who says thunderstorms don't QSL? Larry Miller received this card from an anonymous reader in Delaware. Now that's a one-of-a-kind QSL!

Rumor has it that the Japanese will be building a relay station for Radio Tanzania next year. That'll be located in Dodoma, which is Tanzania's yet-to-be-completed future capital city.

The Soviets have ended all transmissions to China from their Radio Station Peace and Progress. This represents a reduction in broadcast time from 138 hours to 40 hours a week.

A new Ethiopian opposition radio station has begun broadcasting on 7200 and 9660 kHz. It calls itself the Radio Voice of Ethiopian Unity and is on the air for one hour a day. The BBC Monitoring Service, which uncovered the station, says it is heard at about 1900 UTC.

All India Radio is in the process of installing new transmitters -- six 250 kilowatt units. And these are for the external service, which the Indian government feels, is inadequate in many parts of the world. Here! Here!

Thanks to everyone who sent in clippings this month, including Art Blair of San Francisco. I raise my bottle of Frisco's finest, Anchor Steam beer, to Art, and the fine folk who submitted the following loggings...

RADIO ROUNDUP: Broadcast Loggings

0000 UTC on 11855 kHz
Brazil: Radio Aparecida in Portuguese. Brazilian ballad program. Heavy interference from Asian on 11855. (Fred Carlisle, Tumwater, WA)

0009 UTC on 7470 kHz
Clandestine: Radio Caiman in Spanish. Clear "Radio Caiman" ID and talk about Cuban involvement in Angola. (Carl Volz, Valparaiso, IN)

0014 UTC on 15140 kHz
Chile: Radio Sistema Nacional, Santiago in Spanish. IDs as "Santiago." Correspondents with reports on Catholic church's role in Columbia and Nicaragua. Fair signal. (Carl Volz, Valparaiso, IN)

0015 UTC on 15190 kHz
Brazil: Radio Inconfidencia in Portuguese. Two announcers conduct sports interview followed by live-soccer coverage.

0015 UTC on 9630 kHz
Spain: Spanish Foreign Radio in English. Feature on recent archeological find in Tampa, Florida. Spanish guitar ballads and commentary on relations with Australia. (Wayne Bekins, San Antonio, TX)

0036 UTC on 4864 kHz
Bolivia: Radio Emisora 16 de Marzo in Spanish. Two clear IDs at 0038 and 0101 UTC. Very good signal but notuseable the next night. (John Tuchscherer, Neenah, WI) John is one of the "experts" in the "Shortwave Listening with the Experts," book. Welcome, John. --ed.

0050 UTC on 11926 kHz
Brazil: Radio Bandeirantes in Portuguese. Announcer with station ID followed by Brazilian pop music. (Fred Carlisle, Tumwater, WA)

0115 UTC on 5040 kHz
Ecuador: La Voz del Upano in Spanish. Singing station IDs plus Andean folk music. Slight fading. (Mark Gibson, Memphis, TN)

0125 UTC on 4985 kHz
Brazil: Radio Brazil Central in Portuguese. Usual rapid-fire sports commentary. Clear signal with only occasional fading.

0130 UTC on 17815 kHz
Brazil: Radio Cultura Sao Paulo in Portuguese. Fading signal and very weak. Audible ID at 0130 and into Brazilian pop music.

0135 UTC on 4805 kHz
Brazil: Radio Dif. do Amazonas in Portuguese. Excited soccer coverage with long "goooooooal!" after each point scored. Brief break for ID.

0145 UTC on 4845 kHz
Brazil: Radio Nacional, Manaus in Portuguese. Live soccer coverage (sounded like the same game and announcers as Radio Dif. do Amazonas (see 0135 UTC logging). Occasional ad break and Nacional ID at 0201 followed by more soccer.

0205 UTC on 4885 kHz
Brazil: Radio Clube do Para in Portuguese. Interview, ID and sports coverage -- but not soccer!

0220 UTC on 11745 kHz
Brazil: Radio Nacional do Brasil in English. Popular Brazilian rock stars sing plus feature on "Contemporary Brasil."

0230 UTC on 5095 kHz
Columbia: Radio Sutatenza in Spanish. Slight fade as ID was given by announcer. Local music between Latin vocals.

0255 UTC on 15150 kHz
New Zealand: Radio New Zealand International in English. Time check as "it's one and a half minutes till three." Short classical music interlude and time check at 0300 UTC. ID as "Wellington" followed by comedy routines for a half hour. Another ID at 0330 and music from Englebert Humperdink. (Carl Volz, Valparaiso, IN)

0320 UTC on 8515 kHz
Peru: Radio Amistad in Spanish. Romantic Spanish ballads and Peruvian folk music. Heard clear "Amistad" at 0406 UTC. Heavy utility interference, as usual. Logging tentative. (Fred Carlisle, Tumwater, WA)

0324 UTC on 6150 kHz
Costa Rica: Radio Impacto in Spanish. Talk about Cuba and mention of Batista and the history of the revolution. ID given as "Impacto." (Carl Volz, Valparaiso, IN)

0345 UTC on 6282 kHz
Peru: Radio Huancabamba in Spanish. Fast-talking male with ID and station location at 0400 UTC. Peruvian "campesino" music. Recheck found station on until a 0504 UTC sign off (local Peruvian midnight). Some utility and heterodyne interference. (Fred Carlisle, Tumwater, WA)

0349 UTC on 5930 kHz
Czechoslovakia: Radio Prague in English. Two lady announcers discussing how to cook pancakes. Announcer joked that the dough was heavy enough to sink a ship. Really a silly show! (Carl Volz, Valparaiso, IN)

0405 UTC on 4850 kHz
Cameroon: Radio Nacional in French. Fast-talking announcer with African pop music. No ID heard and station listed as tentative. (Fred Carlisle, Tumwater, WA)

0410 UTC on 3220 kHz
Ecuador: HCJB. Wait. This isn't just another HCJB logging. This is HCJB's 10 kw domestic service in Spanish. Very easy to hear. (Carl Volz, Valparaiso, IN)

0442 UTC on 6115 kHz
Mexico: Radio Universidad in Spanish. ID at 0503 and Latin pop music. Several mentions of Hermosillo. Interference from Radio Union, Peru. (Fred Carlisle, Tumwater, WA)

0510 UTC on 4830 kHz
Gabon: Africa No. 1 in French. ID from announcer as "Music on Africa No. 1" at 0517. African pop music followed. (Fred Carlisle, Tumwater, WA)

0520 UTC on 4904 kHz
Chad: Radio Dif. Nationale, Ndjamena in French. DJ chatter with program of French-African hi-life music. Signal buried by a strong jammer at 0540 UTC. Never heard a positive ID. Submitted as tentative. (Carl Volz, Valparaiso, IN)

0520 UTC on 11825 kHz
Tahiti: Radio Tahiti in French and Polynesian. Nice mix of music island and current music; great programming. (Carl Volz, Valparaiso, IN)

0540 UTC on 7245 kHz
Angola: Radio Nacional, Luanda. Announcer in local African language with "Radio Nacional" ID followed by presumed news program at 0600 UTC. A poor signal with distorted audio. (Fred Carlisle, Tumwater, WA)

0545 UTC on 4000 kHz
Cameroon: Radio Bafoussam, in French. Extremely weak and fading signal. Religious music sung in French. No ID observed but definite African accent by announcer. Submitted as tentative. (Carl Volz, Valparaiso, IN)

0545 UTC on 4945 kHz
Columbia: Caracol Neiva in Spanish. Announcers interviewing a guest in the studio. Station promo and "Caracol" ID at 0600 UTC with Latin American newscast following. (Carl Volz, Valparaiso, IN)

0545 UTC on 3340 kHz
Tanzania: Radio Tanzania-Zanzibar in Swahili. Talk from announcer was definitely Swahili but interference prohibited me from picking up any full sentences. Weak signal with pop music and voice breaks. No IDs heard. Reception on this night was good. (Carl Volz, Valparaiso, IN) Another tentative I'd bet on. --ed.

0552 UTC on 4770 kHz
Nigeria: Radio Nigeria, Kaduna in a local language. ID as "Radio Nigeria" at 0600 after going into English for a newscast. (Fred Carlisle, Tumwater, WA)

0658 UTC on 7215 kHz
Ivory Coast: RTV Iviorienne, Abidjan in French. Radio Drama followed by ID and time check at 0700 UTC then into newscast. Top story was the Iran scandal. (also known as "Gippergate.") (Carl Volz, Valparaiso, IN)

0715 UTC on 9655 kHz
Australia: Radio Australia in English. DX program call "Radio Waves from the South Pacific." Gave report on Radio Cook Islands and Radio Tahiti. (Carl Volz, Valparaiso, IN)

0750 UTC on 11705 kHz
Japan: Radio Japan in English. Weak signal. Commentary on the economy of Japan and how they will survive the oil crisis. (Carl Volz, Valparaiso, IN)

0950 UTC on 4945 kHz
Brazil: Radio Nacional Porto Velho, in Portuguese. Easy-listening Portuguese music and several Nacional IDs at 1000 UTC. News briefs and local announcements. (Kevin Burdette, Arlington, TX)

1015 UTC on 6175 kHz
Costa Rica: Faro del Caribe in Spanish. Male announcer with station ID and location at 1015 UTC. Latin pop music and interference from WYFR. Station's signal was temporarily in the clear with a 1045 UTC sign off. (Fred Carlisle, Tumwater, WA)

1045 UTC on 4864 kHz
Columbia: La Voz de Cinaruco in Spanish. Male announcer with ID and Latin pop music. (Fred Carlisle, Tumwater, WA)

1155 UTC on 9535 kHz
China: Radio Beijing in English. Just caught the sign-off announcement, but heard closing for the North America Service and frequency schedule. Announcer gave his name, ID and "thanks for listening." (Carl Volz, Valparaiso, IN)

1158 UTC on 15575 kHz
South Korea: Radio Korea in English. Listener's questions, like, "How many sports at the 1988 Olympics?" (Carl Volz, Valparaiso, IN) Including gas bomb tossing? -- ed.

1215 UTC on 9715 kHz
North Korea: Radio Pyongyang in English. Korean folk music, the usual feature on reunification of North and South and -- are you ready for this -- rock music. (Kevin Burdette, Arlington, TX)

Send your loggings to Gayle Van Horn, 160 Lester Drive, Orange Park, Florida 32073 USA. All loggings are of English broadcasts unless otherwise noted.

1245 UTC on 9940 kHz
Clandestine: La Voz de CID in Spanish. Spanish guitar ballads from male singer. Slight fading during "La Voz de CID" ID. Discussion ábout Cuba with continuing Latin style music.

1245 UTC on 11937 UTC
Kampuchea: Voice of the People of Kampuchea in Lao/Viet dialect. March music follwed by English ID at 1300 UTC. Many mentions of Kampuchea. Asian music and sign off at 1318 UTC. Reception down after 1300 UTC but still audible. (Fred Carlisle, Tumwater, WA)

1245 UTC on 3395 kHz
Papua New Guinea: Radio Eastern Highlands in Pidgin. Male announcer with native island drum music and English pop. Papua New Guinea mentioned but no definite ID heard. (Fred Carlisle, Tumwater, WA)

1250 UTC on 2325 kHz
Australia: ABC, Tennant Creek. Good reception with strong signal. Featuring pop music and news at 1300 UTC. Usual ID at 1230 followed by "cry in your beer" music from Bill Anderson. Parallel 2310 not heard so well. (Fred Carlisle, Tumwater, WA)

1250 UTC on 3375 kHz
Papua New Guinea: Radio Western Highlands in Pidgin and English. Heard mentions of Papua New Guinea at 1301 but no ID. Male preacher with English religious sermon. Station abruptly off at 1325 UTC but no formal sign off. (Fred Carlisle, Tumwater, WA)

1325 UTC on 4450 kHz
Afghanistan: Radio Kabul via the Dushanbe, USSR relay. Program of Arabic and Asian music in presumed Kabul. Afghanistan mentioned by female announcer at 1333 UTC. Signal degrading somewhat by 1350 UTC with occasional fading. Some utility QRM also. (Fred Carlisle, Tumwater, WA) -- Based on these details, let's call this a tentative logging. -- ed.

1325 UTC on ???
Philippines: Maharlika Broadcasting System - Radio NG Bayan in English and unknown Asian dialect. Male announcer with sports reports and station ID as "This is your all sports radio network, up to date '78!" Announcer also ID'd on the hour as "Radio Bayan" (heard no mention of NG). U.S. pop music and world news at 1400 UTC by female announcer. (Fred Carlisle, Tumwater, WA) Great catch, Fred! -- ed. [Agreed. A fantastic catch. But it would be even better if we had a frequency here, folks. --Miller]

1325 UTC on 9775 kHz
Bangladesh: Radio Bangladesh in presumed Nepalese. Fair reception of great sub-continental music. "Radio Bangladesh" ID at 1345 with a sign-off by female announcer. Radio Bangladesh back on for unscheduled broadcast at 1400-1500 UTC with same programming. (Fred Carlisle, Tumwater, WA) Extended broadcast because of religious holiday, Ramadan. -- ed.

1345 UTC on 3275 kHz
Papua New Guinea: Radio Southern Highlands in Pidgin. U.S. pop music and no ID but two mentions of Papua New Guinea at 1400 UTC. National anthem and sign off at 1402 UTC. (Fred Carlisle, Tumwater, WA)

1423 UTC on 9820 kHz
Guam: KTWR (Trans World Radio) in Tamil. Talk from announcer with ID and sign-off in English with frequency and station announcement at 1440 UTC. (Fred Carlisle, Tumwater, WA)

1519 UTC on 11900 kHz
Northern Marianas Islands: KYOI in English. Suprised to hear KYOI still on the air with plenty of IDs and rock/pop music by the Eagles, ELO, and Billy Joel. (James Kline, Santa Monica, CA)

1525 UTC on 11940 kHz
Iran: Voice of the Islamic Republic of Iran in Arabic. Talk by two announcers with Arabic music. English ID at 1601 UTC. Some interference. (Fred Carlisle, Tumwater, WA)

1605 UTC on 11615 kHz
Pakistan: Radio Pakistan in English. World news report and ID followed by local news. Sign off at 1630 UTC. 9465 kHz frequency not heard. (Fred Carlisle, Tumwater, WA)

1730 UTC on 15505 kHz
Kuwait: Radio Kuwait in Arabic. Presumed newscast amd Arabic music. "Hua al Kuwait" ID at 1801 UTC. Fred Carlisle, Tumwater, WA)

1745 UTC on 15145 kHz
East Germany: Radio Berlin International in English. This is reported to be their Africa Service, but is heard clearly on the west coast of North America. Program of music and listener's letters. Good signal. (James Kline, Santa Monica, CA)

1850 UTC on 21685 kHz
Netherlands: Radio Netherland in English. Interviews and discussion on the increasing problems of the aging in Kenya and the Christian organizations that assist them. Parallel 17605 kHz.

1856 UTC on 15045 kHz
Dominican Republic: Radio Discovery in English and Spanish. IDs in both languages with several station promotions. Spanish pop music and more IDs. Very good signal strength in Florida.

2040 UTC on 11920 kHz
Morocco: RTM Morocco in Arabic. Uninterupted Arabic music for over 30 minutes. One brief break at 2100 UTC with a possible ID and into more Arabic music. Submitted as tentative. (Y. Lee Kyotee, Yuma, AZ)

2112 UTC on 9675 kHz
Belgium: BRT in English. Talk of how Ramadan is celebrated in Belgium, followed by discussion on the South African Council of Churches. (Carl Volz, Valparaiso, IN)

2115 UTC on 7245 kHz
Libya: Radio Jamahiriya in English. Signal barely audible as two announcers spoke ot the "computerized, institutionalized system in the U.S. that causes psychological terror." Huh? Anyone know what they're talking about? (Carl Volz, Valparaiso, IN) I'd like to discuss it with you but I'm putting my MT column into the computer and worrying about making the deadline. --ed.

2200 UTC on 15365 kHz
Canary Islands: Radio Nacional de Espana in Spanish. ID as "Radio Nacional Espana en Canarias." News briefs and announcements followed by excerpts from a speech. Ocassional Spanish instrumental music. -- I'm really curious about this. There's no external service from the Canary Islands although there is a Spanish Foreign Radio relay there. The ID you heard, however, was for the mediumwave-AM Canary Islands national service. Could bear watching. -- ed.

2235 UTC on 4870 kHz
Benin: La Vox de la Revolution in French. French and native African music on drums and flutes. Chit-chat between two male announcers and a drum roll introducing each new portion of the program. Closing ID and station announcements with national anthem. Sign-off at 2300 UTC. (John Bonet, Lafayette, LA)

2320 UTC on 4783 kHz
Mali: RTV Malienne in French. French and African music and many local station features. ID with frequency, closing announcements and martial national anthem. Sign off at 0000 UTC. (Wayne Bekins, San Antonio, TX) ■

RADIO ROUNDUP: Communications

Bob Grove, WA4PYQ

P.O. Box 98
Brasstown, NC 28902

Sensors are being used to bug illegal aliens. Recent newspaper reports of illegal aliens crossing into the United States from Mexico have prompted inquiries of the Immigration and Naturalization Service (Border Patrol) of the Department of Justice. How are they attempting to control the influx?

Magnetic, seismic and infrared sensors are planted to detect vehicular and pedestrian movements at 180 strategic points across the U.S.-Mexican border, connected to an electronic center at Chula Vista, California, where dispatchers can alert agents by radio.

Additionally, some 450 agents are assigned to crossover points near San Diego. With night-vision scopes and radios, they assemble via van, truck, car, horseback, and on foot to catch the wave of unauthorized emigrants from Mexico. *(From H.E.Miller, Seattle, WA)*

Meanwhile, customs also beefs up its electronic surveillance. The United States Customs Service has awarded a $25 million contract to Eaton Corporation of Westlake Village, California, to develop a sophisticated command, control, communications, and intelligence system for drug interdiction along the southern border.

Eaton is expected to have initial phases of the elaborate system operational within the year, utilizing air and vessel traffic control with radar displays and signal processing. *(Item sent in by David Branscombe, Newark, OH)*

Word reached us at press time that **Regency Electronics has closed their Satellite Beach, Florida, land mobile division,** apparently as an economy move. Operations are scheduled to be recombined under one roof at Regency's Indianapolis headquarters.

The Satellite Beach facility was to have been the focus for manufacturing of several new scanners including the delayed Turboscan, the future of which now rests in Indianapolis.

An unexpected, but serious radio threat may be posed by skip. On June 17th, 1987, a Delaware state trooper collided on I-95 with a car carrying two purse snatching suspects and a child. The trooper was seriously injured; all three in the other car were killed.

The local chief of police erroneously pursued a different set of suspects because his radio was being jammed--not by malicious interference, but by legitimate users being heard by skip from hundreds or even thousands of miles away.

Communications on the local channel was tied up for nearly six hours because of a combination of accident traffic and skip interference. Had another disaster or serious accident occurred during that period, police communications would have been useless.

Skip is a well-documented phenomenon on low band (30-50 MHz) and the 39 MHz "Delcom" (Deleware County Emergency Communications system) is a typical victim. For the last several years, skip has been minimal because it is caused by sunspots and radio listeners know that we have been in a sunspot minimum.

But radio skip is now increasing at a rapid rate with daytime reception, especially late afternoon and early evening, often obliterated by long-distance signals. The only solution is to use higher frequencies; the higher the better from a skip-elimination standpoint. *(Item from Bob Kay, Glenolden, PA)*

The FCC is cracking down in California... An 18 month investigation culminated in the arrest of a west coast shop owner July 16 and 17, 1987. Roger S. Williams, proprietor of the Mud Shack, a San Diego CB outlet, was arrested for selling linear amplifiers and out-of-band modified CB radios.

Simultaneously, FCC officers assigned fines totalling $14,000 to seven other California CB vendors for similar infractions.

But the FCC gives up in Oregon. FCC licensed loggers in southern Oregon have been pleading with salmon trollers to stop using their frequencies for unlicensed chit-chat. The illegal use of the loggers' channels has caused serious disruptions in legitimate communications.

The loggers are concerned about the prospect of an emergency requiring reliable two-way radio. The fishermen have been ignoring the complaints and the FCC so far has said they can't do anything either.

According to Wayne Craig, engineer in charge of the Portland office, one of his investigators had died and hadn't been replaced; the other was on another assignment out of the state.

The fishermen in the meantime continue to use the radio frequencies with impunity, signing only by their first names to avoid identification and giving no locations. *(From Gary Westfall, Beaverton, OR)*

In an unrelated complaint filed with a Florida congressman, amateur radio operator Henry Luhrman, W4PZV, has cited swordfisherman off the coast with using illegal beacons in the amateur 160 meter band. The FCC says that of 85 beacons originally in use, roughly ten are left. Luhrman says the number will increase when the fall fishing season starts up again.

Speaking of fishing, remember Ray Jefferson and Jefferson-Travis? Wally Travis, skipper of the Shanghai Express party boat off Long Island Sound in the 1930s, finally agreed that his scheme of releasing carrier pigeons as an intercom wasn't the most reliable method of assuring that the message would get through.

A local radio repairman, Raymond Jefferson, came to the rescue and in 1935 the first marine radiotelephone was installed on Travis's boat. It was crystal controlled and licensed by the FCC--2738 kHz ship to ship, 2198 kHz ship to shore.

Unfortunately, one radio wasn't enough--there was no one to talk to! New York Telephone had been granted a license for a shore station but hadn't built one and the FCC refused to grant Jefferson a license.

The enterprising radioman was not to be outdone and, instead, outfitted a second boat (Walter Frankenheimer's "Ramona", a 38-foot Matthews sportsfishing boat) with a marine radio. With the number of marine radios in service now doubled, Jefferson went back to the phone company who finally capitulated and built a coastal station.

The antenna for shore station WOX was mounted atop St. Georges Theater on Staten Island and Ray Jefferson made the first paid radiotelephone call, inaugurating marine radio. Soon after, Jefferson and Travis formed their own company, producing 12 marine radios in 1937, expanding their production considerably during World War II.

Ray Jefferson now lives in retirement at Duck Key, Florida, having sold his business in 1970. But Ray Jefferson Electronics continues to move forward as a pacesetter for the marine electronics industry. *(Item received from Herbert Gesell, Amityville, NY)*

Whether for terrorism or ransom, kidnapping of key statesmen or diplomats is a serious threat to international relations and serious business to law enforcement interests.

CCS Communications Control of Port Chester, New York, has pioneered electronic security systems and now offers a line of disguised homing transmitters which may be tracked by a radio-direction-finding receiver.

The beacon-emitting transmitter may be housed in the victim's pen, wristwatch, belt, cigarette pack, or even magnetically latched under his car bumper. The tracking vehicle is equipped with four whip antennas

to resolve the bearing of the radio signal, the direction and relative course of which is displayed on a 360-degree screen.

The Rig of Tomorrow: Recently, Wayne Green, W2NSD, feisty publisher of *73* Magazine, proffered some private predictions regarding the functions of ham rigs of the future. Let's read Wayne's own words:

"How soon before we see our calls blown into a PROM by ham dealers when we buy a rig? With it sending our call using narrow-band FSK, the LCDs on our HTs and low band rigs could read out the call of every station received.

"Using voice audio redundancy reduction chips we should be able to reduce the voice bandwidth to perhaps 300 Hz, thus permitting ten times as many QSOs in the same voice bands.

"Then there's time splitting, which could allow up to seven simultaneous contacts on each channel, each seemingly duplex, giving us the ability to cram up to seven hundred times as many contacts in a band, yet with less QRM than today.

"It's been years since we hams came up with anything really new in communications. With today's microchips, perhaps it's getting time for us to start experimenting again."

When it comes to the electronics market, what are Americans buying? By midyear 1987, the Electronic Industries Association (EIA) was able to list figures representing the penetration of various electronic products into American households. There are no real surprises other than, perhaps, the degree of penetration.

Right at the top are home radios and television sets (98% each), followed closely by color TV specifically (93%) and audio entertainment systems (89%). VCRs are still edging upward (45%), but the expense of camcorders has discouraged many of us from buying them (3%).

How do scanners and shortwave radios fit into the picture? An inquiry sent by *MT* to the EIA some months ago was never answered.

It is always heartening to hear another instance in which **a ham/scanner listener saves a life.** Gene Northington, K4NWU, is a lieutenant at Fire Station No. 32 in Birmingham, Alabama. He is also an avid scanner listener, constantly on vigil for fire calls. While on his way with his children to a baseball game one evening this past July, a fire call came over his scanner dispatching fire equipment to an apartment complex just a block away.

Racing to the scene, Northington found Bernard Rayford unable to get through a broken patio door. Smashing the glass out of the door, Northington then wrapped Rayford in a curtain to keep him from being cut as he assisted the victim through the broken door.

Suffering nothing more than a cut finger, Northington then went on to the baseball game with his children! All in a day's work for a dedicated firefighter. *(Clipping sent in by Dave Beck, Birmingham AL)*

Radio also saved the lives of a shipwrecked crew. The Iron Cumberland was only able to manage a brief distress call before it sank Friday the 13th (March?), 1987, near Pitcairn Island, legendary home of the descendants of the HMS Bounty mutineers. Fortunately, their mayday call was picked up by a radio station operator on the island who then contacted the U.S. Coast Guard in Honolulu via the newly installed PEACESAT communications satellite for rescue coordination.

The 29 crew members were reported in good condition after they were recovered from the sea, adrift in lifeboats, by the British freighter Act 5 which steamed 500 miles out of its way for the rescue. *(Clipping sent by H.E.Miller, Seattle, WA)*

It was an obscure FCC monitoring post that snared the short-lived pirate "Radio New York International," although it was aboard a rusty freighter anchored off Long Island Sound, and the FCC monitoring station was located in Allegan, Michigan.

One of 13 monitoring stations across the U.S., Allegan is the official training ground for FCC engineers and technicians, a couple of whom were cruising the frequencies the night of July 23, 1987.

Right smack in the middle of a radioteletype frequency, rock and roll sprang forth from the sophisticated receiver; clearly, something unusual was going on here! Allegan alerted other FCC monitoring posts and their combined direction finding bearings pinpointed the unlicensed offender. *(Clipping sent in by L.J.Demers, Saginaw, MI)*

This year's Association of North American Radio Clubs conference was held at the Novotel Hotel in Mississauga, Ontario, a friendly city adjacent to Toronto which was also hosting British royalty and provided a hotel-rocking fireworks display during the convention.

Shortwave dignitaries attending the convention included *MT*'s publisher Bob Grove, the keynote speaker at the banquet which was attended by approximately 200 guests.

MT presented engraved plaques to Ian McFarland of Radio Canada International, voted most popular shortwave program host by the readers of *MT*; and to The British Broadcasting Corporation, voted by *MT* readers as the most popular broadcaster. This second award was accepted by the BBC's Graham Mytton.

A special ANARC award was presented to Ian McFarland by Ron Hopkins (foreground) and Don Hosner. Ian celebrated simultaneously ten years of service to the *SWL Digest*, 20 years with Radio Canada International, 25 years with the Canadian Broadcasting Corporation, his 25th wedding anniversary, and his 50th birthday! *(Photos by David Rosenthal)*

Fort Wayne, Indiana, Monitoring

by Jack Forbing K9LSB

Jack concentrates his scanner listening on 200 active channels in his area and has quite an antenna farm to do it. He uses a Grove Scanner Beam, Motorola ten-meter vertical, Polaris Adcock RDF antenna, Diamond D130 discone, amateur triband vertical, Diamond two-meter vertical, Cushcraft six-meter Yagi, Cushcraft A3 tribander, Cushcraft UHF beam, Channel Master 5094 Monitenna, and an HF inverted vee for shortwave coverage.

Jack Forbing's antenna farm

AMVER

In order to increase the number of distressed ships which are assisted each year, the U.S. Coast Guard, in 1955, set up the Automated Mutual-Assistance Vessel Rescue System, known as AMVER. This system is a computerized method of taking information supplied by ships about their course, speed, and destination, and when an emergency arises, using that information to determine which ships are in the best positions to assist. Additional information is stored in the computer about the ships' facilities for search and rescue.

The AMVER program extends around the world, and is participation is compulsory by commercial ships making transoceanic voyages or voyages of more than 24 hours between ports. Many other vessels also participate in the program and help to make it extremely successful.

For those monitoring maritime radio traffic, the AMVER messages can yield some interesting information, such as the destination of ships and the route they are taking. There are four possible types of radio messages which can be field, and each of these has its own purpose. First we will look at the messages and then the communications system.

Message Types:

The first type of message is called type 1 and in effect is a sailing plan. The following information is given, the name and call sign of the ship, her position and the date and time of the position, her intended sailing plan, her speed, her destination and ETA, the call sign of the coast station being guarded during the voyage, and whether there is any medical personnel aboard. This message is either filed just before the vessel's departure, or as soon as possible thereafter.

Type D is the next message, which is a deviation report. This message should be sent whenever a change in course, speed, destination, etc., will cause the predicted position of the ship at any time to be more than 25 miles from her actual position. Other than the name and call sign of the ship, the type D message need only contain the information which has changed from that sent previously in the sailing plan.

The type 2 message is a position report which should be sent every 36 hours during the voyage. This message should contain the name and call sign of the vessel, her position and the date and time of the position, and the call sign of the coast station being guarded, and medical personnel aboard. In addition to these reports, ships' positions are also extracted from ship weather observations sent by those ships participating in the International Weather Observation Programme.

The last type of report is type 3, the arrival report. Along with name and call sign of the vessel it should contain the position of the ship and the date and time of that position. In this case it should indicate the name of the port and the time of arrival. This report is used to increase the accuracy of the plot being maintained by the computer, although the computer will automatically end the plot when it predicts the ship's arrival in port.

The computer takes the information from these messages, plus ship's positions from weather observations and maintains plots of the predicted positions of participating ships. When a distress call is received the appropriate Search and Rescue authority can get information about the positions of the ships which are best in a position to render assistance, along with information about the Search and Rescue characteristics of the ships.

In order to maintain accurate information, messages must be sent regularly, and there there must be a good communications network. Many countries have coast stations which accept AMVER messages at no charge to the ship, and forward these to the appropriate authorities in their own country, who in turn send them on to the U.S. Coast Guard at Governors Island. While space will not allow detailed information to be given here about each station, below is a list of the stations which do accept AMVER messages.

Information about some of these stations has been given in past columns, and it is certain that information will be forthcoming about others in the future.

UTILITY INTRIGUE

Don Schimmel
516 Kingsley Road SW
Vienna, VA 22180

MAIL CALL

It is always a pleasure to hear from readers and particularly those new to the hobby. Most recently I received a note from Matt Hastan, TN, in which he indicated he was a sophomore in high school and since becoming interested in SWLing he has been encouraging all of his friends to also take up the hobby.

Matt forwarded some information on two activities he had monitored. The first was on 7465.5 kHz at 0230 (UTC?) on USB when he heard testing on this Department of Energy frequency. The second net copied was on 6761 kHz at 0115 (UTC?) on USB with UTAH Control working UTAH 1 and then UTAH 1 making contact with FIRELIGHT 1. The net was not identified.

A couple of readers have asked me about a term "Mission Radio System" that they ran across. This designates the radio system for HF secure or non-secure voice point to point communications between USSOUTHCOM, its components, and U.S. Military Missions throughout Central and South American and the Caribbean areas. An Air Force station (the only AF station on the net) acts as Net Control Station (NCS) and it is located at Howard Air Force Base, Panama. USSOUTHCOM has operational control of the system. Air Force Communications Command provides operation and maintenance for the NCS but maintenance only for the other 21 low power stations.

SPECIAL INTEREST ITEMS

6944.1 kHz 032018Z CW

I came upon this very slowly sent transmission which was noted as being Cut Numbers. The transmission consisted of three groups UND UNDAW GTDTN and was repeated until 2019Z. There was approximately a one minute pause and at 2020Z GTI AAIWT WURRT was sent and repeated until 2022Z at which time the transmission ceased.

6989.8 kHz 010140Z CW

An unidentified station was sending B B B B etc. and then sent BT TNR DE TAN QRU QTC NR 4592 URGENTE GR 9 QTR 2141 NR31 NR5 NR87 AL M/N PLAYA LARGA DEL MGR BT QSM BT and at this point went into a text of 9 groups of 5F. After a short pause, TAN again sent a string of B's and sent the message again; this time however, the QTR was changed to 2146.

It was quickly apparent that each time the message (with the identical text and heading, except for QTR designation) was sent, the QTR was updated. I do not understand the purpose of the repeated transmissions with just the QTR being changed but it certainly seems like this activity may very well be a practice net.

7905 kHz 072316Z CW

When I cut in on this transmission a string of K's was being transmitted. This was followed by GI7576 K K K K K GI7576 K K 19248 43182 97818 K K K GI7576 and then continued with a lengthy string of K's. At 2318Z the groups were changed to K K K 45453 K K 57710 51656 and this sequence repeated until 2320Z at which time the K's were again sent but now at a slower rate than previously. The K's continued and after listening to many minutes of them I discontinued coverage of the frequency. I should point out that it is very possible the first copied group of GI7576 might be 77576 with the GI being the faulty keying of the digit 7.

10118 kHz 1400128Z CW

I have no clues regarding the purpose of this monitored sequence. The dashes were very slowly sent with a definite space between each grouping. The sequence was as follows: five dashes, space, six dashes, space, six dashes, space, seven dashes and down at 0129Z.

14547 kHz 121436Z RTTY 75-850

This was a garbage (encrypted) transmission but in copying the signal for quite some time it was readily evident that a possible message separator was used between individual messages because of the appearance at various intervals of a string of Y's. I stayed with this frequency for close to an hour but did not come up up any identifiable details. ■

Inauguration of a Column

Welcome to the Federal File, a monthly column encompassing the interesting and ever challenging world of federal monitoring, including military operations. The radio frequency (RF) spectrum offers much to the avid monitor in search of both elusive and routine federal radio operations.

The Federal File will provide coverage of federal and military radio operations "from DC to daylight," with one or two gigahertz being the upper bound, limited to readily-available commercial equipment.

Reader comments and contributions are highly encouraged; in the world of federal monitoring there does not exist a single expert, or a single published source of data that is all encompassing. The best source of data is the collective ability of many monitors channeled through a single source -- the Federal File.

B-O-R-I-N-G ?

Some scanner listeners deem federal monitoring boring; In fact, it is just not as active as the local police or fire department. Also, federal and military frequencies are not as readily available as public safety lists and the local Radio Shack does not have a "federal frequency directory to go." This is discouraging among would-be federal/military monitors.

The goal of this column is to provide accurate and up-to-date listings of active frequencies and associated data to further assist the federal/military monitor and to encourage newcomers to join the ranks.

Tuning in the feds...

Federal monitoring is an art and a science. A key aspect, be it HF or VHF/UHF, is the collection and gathering of data from your individual loggings and the print and news media (commercial radio and television).

Keep a log of your federal monitoring activities; it can take weeks, months or even years to complete the puzzle. In your log place the date, time and other basic facts as well as comments that you may have heard. A lot of buzzwords are utilized by various agencies and organizations. Even if you can not determine the meaning of the phrase now you may be able to at a future date when more data is obtained.

Intelligence Begins at Home!

The print and news media offer invaluable assistance to the monitor and the solution of the puzzle. An individual item may appear insignificant at first, but combined with several other apparently similar pieces the puzzle begins to be solved. A serious federal monitor is a miniature intelligence collection agency.

Information can be obtained from many sources, far more than you'd think. After the local paper and news media stop by the public library. The data than can be found upon searching the card file is amazing. Look up the agency of interest and go from there.

Professional engineering magazines and procurement newspapers abound with data useful to the monitor. In many cases frequencies are listed which are not published on unclassified microfiche cards or in frequency directories.

Commerce Business Daily is one such publication. *CBD* lists most requests from government agencies for procurements and proposals concerning radio systems and subsystems, often including frequencies.

Microwaves and RF is a professional engineering magazine that covers state-of-the-art military and commercial radios and other related subjects. Spend several hours at the local library, main branch preferred, and do some research! It will be time well spent.

A highly recommended aid to all federal monitors is the *Government Master File* microfiche set available from Grove Enterprises. The file set is now five years old; however, I can personally attest to the accuracy as of this date. I have traveled to the corners of the continental U.S. (CONUS) within the last year and the file has proven to have an eighty percent (80%) confirmation rate for both military and non-military operations.

Note that the file does not list most Justice or Treasury Department frequencies (FBI, Secret Service, etc.). The file set does indicate the prime user, such as USAF or USN, and location of transmitter. Emission type (AM, NBFM, etc.) and output power are also listed. The file set does not indicate the actual use of the frequency, but it does cover 9 kHz to over 100 GHz.

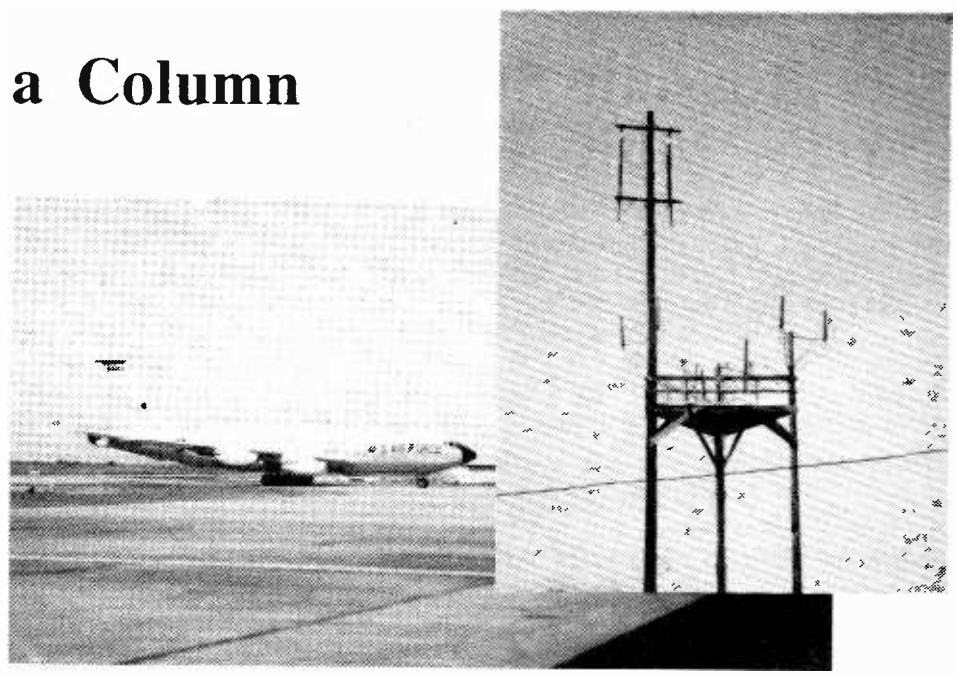
Dayton Data!

The first system profile presented in the Federal File is that of Wright-Patterson AFB (WPAFB) located near Dayton, Ohio. Wright-Pat is the headquarters for the USAF Logistics Command and much engineering is performed at all levels.

All VHF/UHF frequencies listed are NBFM except those between 225-400 MHz, the military aircraft band, which are AM (other exceptions are noted). Updates and corrections are welcomed as this list was confirmed in early 1986.

Coming Up

Request for material for planned columns: Secret Service updates as a major election year occurs in 1988; MAC/SAC/TAC confirmed 225-400 MHz aircraft frequencies, especially nationwide assignments; federal government operations in the 800 MHz land mobile band. Please enclose an SASE if a personal response is desired. Anonymous contributions will not be printed; however, if a contributor wishes not to be identified in print, the request will be honored.



A KC-135 "Strato-tanker" taxies into WPAFB; right, a typical USAF 225-400 MHz communications tower deploying several discones.

Key to Abbreviations

MARS	Military Affiliate Radio System
OSHP	Ohio State Highway Patrol
SATCOM	Satellite Communications
OSI	Office of Special Investigations
TFG	Tactical Fighter Group
AFLC	Air Force Logistics Command
AC	Aircraft
CAP	Civil Air Patrol
ATIS	Automatic Terminal Info Service
ASD	Aeronautical Systems Division

New Russian Satellite Carries Multi-Transponder Packages

The Radio Moscow announcement said Cosmos 1861 had been launched earlier in the day. That was Tuesday, June 23. The announcement confirmed amateur radio communications relay equipment was in fact on board. The new RS's were aloft at last!

Within hours, AMSAT'S G3IOR, Pat, had his first access and QSO confirming the new birds were up and running, but not signing the expected RS-9. These birds surprisingly were signing RS-10 and RS-11 on their telemetry and robot channels.

RS-10 and RS-11 were launched from the Soviet launch site, Plesetsk. The two new Russian "Oscars" were launched from the Soviet Union at 0724 UTC. The launch was letter perfect, placing the RS's and the primary payload, Cosmos 1861, in a 105 minute orbit inclined 83 degrees.

RS-10 and RS-11 share the spacecraft with the primary payload. They share the power and other support from the overall spacecraft system. There is but one spacecraft populated by at least three payloads: RS-10, RS-11 and Cosmos 1861.

The desired orbit was attained very precisely. The nodal period is 105.0245 minutes; the orbital increment is 26.3824 degrees west per orbit. A reference orbit for Sunday, July 5 is 00:14:31 at 61.2 degrees west. Average height is close to 1000 km (612 miles).

In comparison to other Oscars, the new RS's are higher than UO-11 at 700 km, higher than AO-8 at 900 km, but lower than AO-7 at 1400 km. In fact, RS-10 and RS-11 are much lower than any prior RS's. RS-1 through RS-8 were very high for low earth orbiters (LEO) at 1700 km. This may have substantially decreased their life expectancy since they came close to the lower edges of the Van Allen Radiation Belts at that altitude. Prospects are RS-10 and RS-11 will perform much longer at 1000 km. Moreover, their altitude assures they will maintain stable orbits for several decades at least.

NORAD has designated Cosmos 1861 (and its parasites RS-10 and RS-11) Object 18129. Its international designation is 87-54A.

Here is a recent element set for the satellite:

Element set: 20
Ref. Epoch: 87 186.48411794
Inclination: 82.9260
RAAN: 44.5413
Eccentricity: 0.0009224
Argument of perigee: 231.8894
Mean anomaly: 128.1418
Mean motion: 13.71882498
Decay rate: 6.0E-08
Rev. #: 167

RS-10 and 11 were built at the Tsiolkovskiy Museum for the History of Cosmonautics in Kuluga, an industrial center 180 km southwest of Moscow. The chief architects of the transponders, called BRTK-10, were Aleksandr Papkov and Viktor Samkov. BRTK stands for the Russian equivalent of "Equipment for Radio Amateur Satellite Communication." The overall project management is in the hands of DOSAAF, a military related organization whose major mission is the training of pre-draft-age youth in military significant technology.

RS-10 and RS-11 are, according to current information, identical except with regard to frequency. Each apparently uses three bands in various combinations to achieve five distinct modes of operation in addition to its auxiliary robot repeaters. On each unit, 15 meters is used exclusively as an uplink band, 10 meters is used exclusively as a downlink band as 2 meters can be employed either as uplink or downlink band. Specifically:

Mode K - 15m up & 10m down.
Mode T - 15m up & 2m down.
Mode A - 2m up & 10m down.
Mode KT - 15m up & both 10 & 2m down.
Mode KA - both 15 & 2m up & 10m down.

The new modes KT and KA are simply combinations of Modes K and T and A. Beacons can carry telemetry or robot downlink (See Table I).

Please turn to page 61

TABLE I
RS Frequencies

Radio Sputnik 10

Mode A:	145.860-145.900 MHz up yields 29.360-29.400 MHz down. Beacons–29.357/29.403 MHz.
Robot A:	145.820 up yields 29.357 or 29.403 MHz.
Mode K:	21.160-21.200 MHz up yields 29.360-29.400 MHz down. Beacons–29.357/29.403 MHz.
Robot K:	21.120 MHz? up yields 29.403 MHz.
Mode T:	21.160-21.200 up yields 145.860-145.900 MHz. Beacons–145.857/145.903 MHz.
Robot T:	21.120 MHz? up yields 145.857 or 145.903 MHz down.
Mode KT:	21.160-21.200 up yields 29.360-29.400 and 145.860-145.900 MHz. Beacons–29.357/29.403/145.857/145.903 MHz.
Mode KA:	21.160-21.200 and 145.860-145.900 up yields 29.360-29.400 MHz down. Beacons–29.357/29.403 MHz.

Radio Sputnik 11

Mode A:	145.910-145.950 MHz up yields 29.410-29.450 MHz. Beacons–29.403.29.453 MHz.
Robot A:	145.830 MHz up yields 29.407 or 29.453 MHz down.
Mode K:	21.210-21.250 up yields 29.410-29.450 MHz down. Beacons–29.403/29.453 MHz.
Robot K:	21.130 MHz up yields 29.403 or 29.453 down.
Mode T:	21.210-21.250 up yields 145.910-145.950 MHz down. Beacons–145.907/145.953 MHz.
Robot T:	21.130 MHz up yields 145.907 or 145.953 MHz down.
Mode KT:	21.210-21.250 up yields 29.410-29.450 and 145.910-145.950 MHz down. Beacons–29.407/29.453/145.907/145.953 MHz.
Mode KA:	21.210-21.250 and 145.910-145.950 up yields 29.410-29.450 MHz down. Beacons–29.407/29.453 MHz.

TABLE II
Telemetry

In the table below, the alpha part of a channel is designated by "A" and the numeric part by "N" as in channel "1A" and "1N".

Channel Number	Status Designators	Meaning/Equations
1A	IS	Telemetry data source sampling period 90 minutes or
	NS	Telemetry data source sampling period 10 minutes
1N		Power supply voltage over sample period where v = N/4 volts.
2A	IR	2 meter receiver with -20 DB attenuator in or
	NR	2 meter receiver with -20 DB attenuator out
2N		Output power of 2 meter transmitter where w = N/10 in watts.
3A	ID	15 meter receiver with -10 DB attenuator in or
	ND	15 meter receiver with -10 DB attenuator out
3N		Output power of 10 meter transmitter where w = N/10 watts.
4A	IG	15 meter uplink off or
	NG	15 meter uplink on
4N		15 meter receiver AGC voltage where v = N/5 in volts.
5A	IU	2 meter receivers off or
	NU	2 meter receiver on
5N		2 meter receiver AGC voltage where v = N/5 in volts.
6A	IW	special command station channel off or
	NW	special command station channel on
6N		Special command station AGC voltage where v = N/5 volts.
7A	IK	output power of 10 meter beacon = 1 watt or
	NK	output power of 10 meter beacon = 300 milliwatts
7N		Service command, parameter, 10 meter mode.
8A	IO	output power of 2 meter beacon = 1 watt or
	NO	output power of 2 meter beacon = 300 milliwatts
8N		Service command, parameter, 2 meter mode.
9A	AS	status of 1st memory board = off or
	MR	status of 2nd memory board = on
9N		10 meter transmitter temperature where t = N - 10 in degrees C
10A	AR	status of 2nd memory board = off
	MR	status of 2nd memory board = on
10N		2 meter transmitter temperature where t = N - 10 in degrees C
11A	AD	special service channel for loading memory is open or
	MD	special service channel for loading memory is closed
11N		20 volt power supply temperature where t = N - 10 in degrees C
12A	AG	code store memory status is open or
	MG	code store memory status is closed
12N		9 volt power supply temperature where t = N - 10 in degrees C
13A	AU	output information from memory via 10 meter beacon of
	MU	output information from memory via 2 meter beacon
13N		control parameter backup 9 v power supply where v = N/5 volts
14A	AW	attenuator of 15 meter robot receiver = -10 DB or
	MW	attenuator of 15 meter robot receiver = 0 DB
14N		If voltage of 15 meter robot receiver v = N/5 in volts
15A	AK	attenuator of 2 meter robot receiver = -10 DB or
	MK	attenuator of 2 meter robot receiver = 0 DB
15N		if voltage of 2 meter robot receiver where v = N/5 in volts
16A	AO	special command channel 2 meter output power = 1 watt or
	MO	special command channel 2 meter output power = 300 milliwatts
16N		robot QSO counter where 00-32 QSOS logged is indicated as 00 and 33–128 QSOS indicates in the range of 80-99

Scanning Philadelphia's Constitutional Celebration

On September 17th, 1987, the President, members of Congress and other dignitaries will converge on Philadelphia to celebrate the 200th anniversary of the Constitution. Philadelphia is the fifth largest city in the country, with an estimated population of 1.6 million. The surrounding population is about four million. Imagine scanning the action when more than five million people decide to have a party!

When monitoring a national event, the fun, excitement and extraordinary amount of radio traffic can be overwhelming. A scanner in the hands of a novice will miss more than half the action. Here's how to monitor a major event with professional results.

Begin by asking yourself the following questions. "Who is visiting?" If it is the President, then Secret Service frequencies will be needed. Next, ask yourself, "When and where will the event take place?" Is it in center city? At the water front? In a state park? The frequency coverage will differ with each location.

Lastly, ask, "What if?" What if an unidentified subject appears on a roof top? Rapid response team, SWAT and hospital frequencies may be needed. In brief, when the action gets hectic, there won't be time to research frequencies!

Thinking Ahead

Obtaining information on scheduled events can be simplified by a visit to the area's visitor information center. A wide variety of maps and pamphlets will be provided free for the asking. If a toll-free number is available, check the phone information against published listings for any last-minute changes.

Many activities will be scheduled before and after the feature attraction; neglecting these "smaller" gatherings will prevent you from hearing all the action. For example, if a balloon race is scheduled, call the sponsoring club and ask for specific frequencies that can be monitored. As a last resort, search the frequencies between 151 and 152 MHz for balloon traffic.

Fireworks that are near a large airport cause concern for air traffic. If the fireworks are held over a river, the Coast Guard and Marine Police will be needed to stop river traffic. Should a fire start, both fire boats and land equipment will become active.

Parades and crowd control in a large city are usually handled by a special task force that operates on its own separate frequency. In Philadelphia, this operation is code-named "M band." It operates on 453.55 MHz.

During a recent visit by Vice President Bush to Philadelphia, the "M band" was occupied by SWAT, FBI, Secret Service and Rapid Response Teams. If your area has designated channels for emergency use, check them out!

Public transportation will be operating at full capacity. Any type of equipment breakdown or schedule change will produce unwanted delays that have the potential to quickly grow into monumental problems. Have the security frequencies for trains and buses on hand.

Philadelphia has the unique advantage of being located within a 50-mile radius of two other coastal states: Delaware and New Jersey; this region is often referred to as the "Tri-State Area." It is recommended that scanner enthusiasts in similar regions have the emergency medical frequencies for adjoining states. In an emergency, many hospitals within a "tri-state area" may come into service.

News media coverage of major events can also provide plenty of scanning action. Look for the technical crew frequencies. These crews will be providing "live" coverage of important news stories. When prime locations for filming are limited, film crews will often ignore both police and air traffic boundaries. It is not uncommon to hear a news chopper pilot being "chewed out" by an air traffic controller!

Major highways in the Philadelphia area are patrolled by the state police whose coordination with city police can be monitored on 154.755 MHz. Pennsylvania state police helicopters and aircraft also operate on this frequency.

Other related areas that may also be of interest include traffic reporters, institutes, museums, colleges and universities, hotels, and inns. By now, you're probably saying, "How can I listen to all of this at one time?" How? By training your ear to listen to at least three or four scanners at one time! At first, this may seem confusing; however, it's simply a matter of ignoring what isn't important.

One method that works is to adjust each radio's volume in relation to priority. If the President is landing at the airport, then the volume on that particular scanner should be raised slightly above the others. You can still hear the city police, airport security and hospital frequencies. Unless your ear detects something unusual, keep your attention focused on the President. Working the traffic in this manner allows for maximum coverage.

Use your scanner's features to your advantage. Don't program the delay feature into all the channels. This is especially true if you are using multiple scanners. Having the scan delay on every busy channel will slow things down unnecessarily. Without the delay, a large amount of routine traffic can be quickly sampled. If the action starts to get hot, simply stop the scan or add the delay function to those channels that are beginning to perk.

The priority channel feature should also be given careful consideration. If the channel isn't truly one that must be heard above all others, then don't use the priority mode! Unnecessary priority channels can actually make you miss more action than you will hear!

Generally, a quick, random sampling of 160 channels on four scanners will provide plenty of action. If this sounds hectic, you're right; it is! But that's the way it should be.

To fully enjoy the thrill of scanning a major event, don't sit down at the dials with a beer and sandwich. When the action starts, you should be busier than an air traffic controller! Notes and frequency lists will need constant attention. As the action shifts, frequency banks will need to be added or subtracted. You may even want to have a fifth radio searching for *new* frequencies!

If there is an all-news AM station in your area, have it on, too! If you hear the action before the radio station broadcasts it as a "news flash," congratulations! That's professional scanning!

Scanning a major event such as Philadelphia's 200th Constitutional Celebration can be informative, exciting and intriguing. Do your homework, use a little common sense and don't forget to make a tape of the action. It will become a permanent souvenir of your efforts. ■

The History Continues .. and Ends!

- The 1960s, '70s & '80s

Solid State Arrives

Last month we beat down TVI, saw SSB grow like a weed, got back into the saddle again after surviving World War II, started the trend toward buying instead of building, and saw the future of electronics in the arrival of semiconductors.

The future was really brought home to amateurs when OSCAR 1 (Orbital Satellite Carrying Amateur Radio No.1) was launched on December 12, 1961. A great achievement in the history of amateur radio. And another nail in the coffin for the tube, except as a high power amplifier.

The VHF/UHF regions of spectrum continued to grow in use during the '60s. By 1960, phone use was about 50% AM and 50% SSB, with the exception of 20 meters which was about 70% SSB. By 1970, AM was only a few percent anywhere.

The '60s and '70s saw amateur radio equipment get smaller and smaller with more and more bells and whistles as solid state design advanced. And along with ICs (Integrated Circuits) and microprocessors, two significant advances were PLL (Phase Locked Loop) tuning and digital displays.

The newfound frequency accuracy and capabilities in the typical transceiver made the earlier equipment look crude by comparison. However, even though they might have been crude, in the hands of a competent operator, that earlier equipment performed beautifully.

Change for the Worse

All the technical marvels of that age, however, could not save amateur radio from itself. In a move which was at best a grave error, and at worst, stupid arrogance, the ARRL board voted to push for a plan known as incentive licensing. They did that, the FCC did it, and amateur radio hasn't yet recovered from it to this day!

After 20 years of growth wherein the numbers doubled three times during the period 1947 to 167, growth slowed such that we haven't even doubled one in the 20 years since! The reason was simple. Instead of grandfathering the then current licensees who already had certain phone and other privileges, they took them away!!

Even then, with electronic RTTY and other digital improvements in place and on the way, all the oldtimers still wanted CW to be the measure of a persons suitability to be a ham. After all their arguments went, "I had to do it, so why not you?!" Staggering logic, that!

As we have seen in this history, hamming is a social hobby. It's very hard for only one to play. And while many U.S. hams are comfortable with CW as a mode of communication and even like or prefer it (and the author of this column is one of that group!), most hams are not comfortable with it!

Most hams want to talk with their mouths, into a microphone, not with their fingers, on a key! And a lot of all their hard won privileges were taken away from them. They did the natural thing. They quit! And found a hobby not controlled by a clique of old men in Hartford.

Amateur radio never recovered. The timing was horrible for several reasons, and the manufacturers in Japan (who have more hams than the rest of the world combined!) took full advantage of the fact that American manufactures had less people to sell to and price cut most of them right out of business.

Novice Enhancement might just turn the situation around if we can show the computer whizkids of today how they can put their computers on the air and talk with them too! A VHF/UHF digital class no code license would also help. But we shouldn't hold our breath waiting for that.

Thanks mainly to the actions of the late Vic Clark, immediate past president of ARRL, and a few others, a lot of progressive changes have been made at ARRL in recent years. They still have a long way to go, but they need your help to do it.

So join them. You get lots of great benefits including a fine monthly magazine (ARRL; 225 Main Street, Newington, CT 06111; $25.00 a year - and well worth it. And be sure to tell them that the club code number for your initial membership is 1877.) Help to complete Vic Clark's work for progressive change in the ARRL.

The growth of repeaters and quality built, small hand-helds really helped the emergency and public service support capability of hams. AREC and RACES provide improved service to the public in general as well as to the Red Cross.

The '80s has brought us digital and solid state capabilities we never dreamed of even 15 years ago. Error free RTTY (but you still have to spell it wright er . . . write uh . . .that is correctly!), packet, miniaturization, and much more to come. I don't know about you, but I can hardly wait.

The End

Well that's it! 100 years of amateur radio. "100 years?," you ask. Certainly. You don't think Heinrich Hertz was a professional do you? He was just an amateur experimenter like the rest of us when he first propagated electromagnetic waves through space in 1886. And while Marconi turned professional in 1898 or so, up till then he too was an amateur.

So it can honestly be said that when I began this ham history a year ago in the October 1986 *MT*, it was to celebrate the first 100 years of amateur radio. And that's why I did it!

I know that I sort of eased over the last 27 years or so in this months installment, but writing recent history which one has lived through (I was first licensed in 1954) and has emotional attachment to is very hard to do objectively. And as I see it, the solid state and digital (plus microprocessor) revolution plus the incentive licensing debacle are the big happenings of the period.

I have received letters about the history which said "Who needs it!," and letters which said "It's great!" (one of the latter from the editor of a major ham magazine!). At least it's a dialog, and we certainly need all of that we can get.

Besides, if you don't read and learn history, you are condemned to repeat it! And this great hobby can not afford another 1967 type error. If you have any comments on this history, be sure to write me. I'm as close as your mailbox!

Next Month: More room to write about the main subject of each column, to report current events in hamming, and to print and discuss your letters!!

CONTESTING - Games Hams Play

If you have ever seen the commodities trading area (the pit) on TV, you have seen an example of a ham contest. A lot of people stand around quietly until the bell rings to indicate start time. Then they start all shouting at each other all at once in total bedlam, all the while noting the contacts they have made and the info regarding them on a log they carry in their hands. And when the bell rings again to indicate the time is up they settle down to tote up their counts for the day.

No joke. It's just like that for many contests. There is a start time. At that time, the bands come alive with "CQ Contest" transmissions. Contacts are made with a quick standard reports and noted on paper then on to the next one. When it's over, the participants review their logs and tally up the points. The logs are sent into the contest sponsors where they are graded, and a report of winners appears in one or more of the ham magazines.

Now so far this sounds like a totally zany and confusing way to spend time. One might also expect that it takes little talent or brains to compete in such contests. Both perceptions are totally wrong!

Almost all contests have well worked out rules and procedures which somewhat control and limit the actions of participants. And those who win are those who plan ahead, use all their skills to the utmost, and develop and carry out practices which increase efficiency, contact rates, etc.

It's a lot of fun, but it's also a lot of work if you want to be a winner. So why do it? Because it is fun and a challenge too!

DXing and contesting (in all its forms) are the two most popular forms of hamming after rag chewing. And not all contesting is like what I have described above, although it is a common form for the big national and international contests.

Fresh Wallpaper Anyone?

Some contesting consists of certificate (or awards, as some of the certificates are called) gathering. DX Century Club, Worked All States, Worked All Continents, Worked All

Zones, are some of the top level certificates.

Worked All Reardon Township Hams, Worked 10 King County Hams, Worked All Districts Of Zurich Canton, etc. are typical of the smaller level certificates.

There are those who quite literally have their ham shacks papered with such certificates. And some of the smaller level (less prestigious) certificates are actually the hardest to get.

The number of possible certificates is staggering. Some ham magazines have had columns running for years just reporting on the 10 to 15 new certificates available each month.

Certificate hunting is sort of like collecting oversized stamps. There's a lot of them, and you know that you will never get them all, but you keep trying, and occasionally get a rare (hard) one.

Most hams do it in one form or another. Check it out. Read up on it in the back issues of your ham magazines. You too may soon be repapering the wall of your shack

But getting back to the type of contests we first mentioned, let's see how you can join in the fun. To be a success in contesting you have to learn to listen well, develop winning strategies, and work hard, long hours. You will also have to deal with the terms "Big Guns," "Medium Guns," and "Little Guns."

To give you a feel for those terms, a Big Gun would have 1500 watts on all bands feeding several rhombics or beams. A Medium Gun might have a single multiband beam and an amplifier. A Little Gun typically has just the transceiver (100 watts) and a vertical, a dipole or the like.

Have Brains, Will Contest

But that's just the equipment. Brains most often make the real difference. Smart operators with Big Gun brains can do very well with a Little Gun station!

And speaking of brains, let's get one thing straight. There is no one best way which works for everyone. You have to develop your own style and do what you are comfortable with. Trying to exactly copy someone else's style is a mistake. Learn what has to be done and work out how to do it in a manner that works . . . for you!

OK. Now that we have that straight, let's contest. The first few times you do it, don't worry about winning. Worry about learning, and getting practice in doing it right.

Use those first few contests to improve your capabilities and get the station layout right. Practice is very important in finding out what does work for you.

Your goal in all your practice is to speed up your contacts so you get as many per hour of activity as possible. This doesn't mean just talking faster. It means you are on the right bands at the right times. It means using the minimum of moves to make and log your contacts. It means listening, really listening to pull in those important contacts out of the QRM.

Practice also means getting comfortable with the standard exchange for the particular contest so you do it fast and clear. It means knowing when and where to call CQ. It also means knowing when to search and how to analyze who is able to talk to whom for current band propagation info.

Another thing practice and study means is thoroughly understanding the multiplier factors for a contest (most contests have them). It can make a big difference in who you talk to when there are choices. And in most large contests there will be choices.

About now you are saying "This is crazy. Who needs this hassle? To hell with contesting. I'm going to chew the rag with Charlie (or whomever!)." Sorry about that, but that's definitely the wrong response. I am only trying to show you that contesting is not a simple, worthless endeavor. Contesting takes real talent and practice.

The Challenge

Contesting is a real challenge. So if your mind is up to it and you're willing to put in some time, it could be just the challenge for you. The feeling of achievement you get when you do well in a contest is just fantastic. But when your call and point totals show you to be a winner for your area, section, country, or overall class, now *that's fantastic!!*

So start reading the back issues of your ham magazines, the *ARRL Operating Manual* and *Radiosporting* Magazine (a magazine that thoroughly covers contesting and low band challenges very well - P. O. Box 282, Pine Brook, NJ 07058, $18.00 per year - tell them you read about it in *MT*).

Also be sure to get a copy of *The Contesting Cookbook* by Bill Zachary, N6OP, and his many contest winning friends (*73* Magazine, WGE Center, Peterborough, NH 03458, ATTN: Uncle Wayne [honest!!] - $6.95 including postage and handling). It's a great book with hints on everything you need to know plus lots of good advice, but it's almost out of print, so hurry. And be sure to tell them you heard about it in *MT* too.

Next Month: Morse Code and CW - It'll Be Dahdahdit Didahdit Dit Didah Dah!

BITS AND PIECES

Now that the history is over, there is more room for current (recent) events and activity. I have mentioned before that this is your column too and have always encouraged you to write. Send in your questions and suggestions for subjects to be covered or things you would like to read about. I will try to get them covered for you. This column will always be better if it contains dialog rather than monolog.

Also if you have info you would like to have appear in the column, send it in. No absolute promises, but if it looks OK it will be here.

Keep those cards and letters coming! Write today. ■

6358.3	Y5M Ruegen	50/170r Summary, GG, of GDR ship info. 0150. New here.
8908.3	? ?	ARQ idling 2330-0000. Can you identify? New here.
10953.7	FDX Paris	T425 (PQA/PQB) RFFP to FGQPCS, Djibouti//FDX Paris 13649.5, same msg at same time, 0045.
11420.1	Y2V59 Berlin	50/425n ADN Nx SS 0040. New Nx pgm, new time.
11628.1	CLP-1 Habana	45/425r ry and zzzzz then SS to Embacuba. 0149. New.
12110.1	LZC-3? Sofia	75/425n Bulgarian Nx to embassies, 2130, then to embassy "PMO" at 2152 and to CW. Off 2155. New here.
13449.3 or	9RB334 Bukavu VHC Canberra?	T350, Chan A&B idle 1200 to 1240 when left the air. Both of these stations are register with ITU for multi-channel service on this freq.
13465.3	CT-(RPFN) Monsanto	50/850r ry, fox count, test. New channel 0115.
13674.3	N?? US Navy	75/850r...very quick brown fox...1550. New channel
14764.0	A9M70Manama	75/350r GNA (TB) Nx AA 1716, still on at 1950
14800.6	Y2V24A Berlin	50/400n ADN Nx PP has been added, 1810.
15710.1	RED-52 USSR	50/425r TASS & ADN Nx FF 1530-1830, then ry REM-56 RBX-42 RIC-71 RED-52 1830. Another day, RWN-76 Moscow, this frequency also, TASS Nx FF at 1855 then ry saying // RGW-26 and RIC-71 (16190 and 14940). RED-52 probably not in Moscow. Where?
15776.3	ZRH93 Cape Town	75/850r fox jumps (note present tense) 1240. Later in day he usually contacts NMN and NAU.
15780.1	RWM-71 Moscow	50/425r TASS Nx EE on later now. 1510.
15925.1	RPT-32 Tachkent	50/425r ry and signing as a single at 1040 tune-in. Lining up for TASS Nx broadcast at 1100.
15977.1	FPP97G Paris	50/425n ry QRA de FPN-72/H3 FTJ-39A/G, 1800. He suddenly realized FPP97G was on, too, and pulled 15977 off at 1800, before starting Nx on 13729.7 and 9396.4.
16010.0	CLP-8 Conakry	50/510n very urgent code group msg to CLP-1 Havana, from CLP-4 Bissau, 1240 - then African Nx SS for Minrex, Havana
16039-42.2	MKK London	VFCT System, channels, 50/170, now more channels added (formerly 16039-41). All ryi fox at 0030.
16045.5	CLP-1 Habana	50/425n Circular, SS, to Embacubas (Cuban Nx) 1805. New channel - one of many many new channels.
16075.1	RNN?RMS49? Moscow?	75/425r TASS Nx EE 1040. At 1055 APN USSR Sports Nx in EE! At 1120 Nx RR then tgm from Konec. New.
16112.1		50/210r encryption 0000-0100. Can you help? New.
16120.2	? ?	ARQ-425 shift! His pal is on 16150, also ARQ-425 shift. Off 1430. On again, off 2052 without giving callsign or location. Here the stronger is 16150.
16153.0	AIE?AGB4?	VFCT top chan at 16153.0 50/85r, AP & UPI Nx EE for AFRTS Stns abroad. Tune-in 0000. Still on 16040.
16200.4	? ?	75/525n 5L cd grp msgs - each headed by "No.--, EKSTENA." Sign off 0000 with EE ok tks om ge sk. Very strong here - Like Wash.DC or Ottawa. Can you help?
16249.9	RME22 Moscow	100/425r TASS Nx EE 0935. Msg RR signed "Konec at 0943." New here. Nx EE continued after msg.
16356.7	Y??? Berlin	50/300n cd grp msgs, then at 2000 went to 100/300n and MFA (Folgt) Nx GG. New here. See next item.
16356.9	Y??? Berlin	50/425n MFA Nx GG to Embassies. New here. Y7A67 is registered with ITU for use on 16358.0. Y7A66 used to be on 16352.
16397.6	FTQ39 Paris	Diplo Nx SS now at 2300. Update records.
17549.9	9HA(LMMM) Malta	50/375r ry meteo 1719. New channel
17570.0	RBX-42 Tachkent?	50/425r ry at 1540//RGW-26 REM-57 RED-52. New callsign, maybe new station.
17599.1	? ?	75/425r code groups, very interesting, SK and off at 1330. About same time daily.
17442.2	Y7K37 Berlin	50/425n Code groups msgs to GG Embassies then Diplo Nx (Folgt) GG. Says 2nd run. 1230. At 1250 ry // Y7A37, 49 and 57. New channel here.
18047.1	YZ--(DFZG) Belgrade	75/425n msgs to Yugoslav Embassies 25 & 26 at 1445. Off 1456. New freq. Moved from 18042 to 18045, now moved here.
18502.3	FUB RFFIV Paris	T850B Now using Circuit Indicator "ILA" for msgs FF to FUF RFLIA Ft. de France. 2340. Why do C.I.s keep changing?

frequency SECTION

The MT Monitoring Team

Joe Hanlon, PA

Rich Foerster, NE

Greg Jordan, NC

LEGEND:

- The first four digits of an entry are the broadcast start time in UTC.
- The second four digits represent the end time.
- In the space between the end time and the station name is the broadcast schedule.
  S=Sunday M=Monday T=Tuesday W=Wednesday
  H=Thursday F=Friday A=Saturday

If there is no entry, the broadcasts are heard daily. If, for example, there is an entry of "M," the broadcast would be heard only on Mondays. An entry of "M,W,F" would mean Mondays, Wednesdays and Fridays only. "M-F" would mean Mondays through Fridays. "TEN" indicates a tentative schedule and "TES" a test transmission.

- The last entry on a line is the frequency. Codes here include "SSB" which indicates a Single Sideband transmission, and "v" for a frequency that varies.
- Frequencies in bold are most likely to be heard regularly in North America.

We suggest that you begin with the lower frequencies that a station is broadcasting on and work your way up the dial. Remember that there is no guarantee that a station will be audible on any given day. Reception conditions can change rapidly, though, and if it is not audible one night, it may well be on another.

YEMEN: The North and South of it

by Terry Fielding, NdB

There was a study done some time ago that showed something like 39 out of 100 teenagers thought Brasil was in Africa. Worse yet, 17 of them couldn't tell what ocean washes the U.S. west coast.

Shortwave listeners would score vastly higher on this kind of test. They pride themselves on their knowledge of where things are on the world map.

But even a diligent shortwave listener might be forgiven if he momentarily pauses to think about Yemen -- and wonder about the difference between North and South. San'a is the capital of North... or is it South. And, yes, one *is* communist and the other is ... not? One *is* the Yemen Arab Republic and the other is the People's Democratic Republic of Yemen.

The case of the two Yemens may tend to be even more confusing because the radio stations are not well heard in North America. And neither airs any English programming. So these are not sources that immediately pop to mind when we want the latest news about Yemen. Or the Middle East for that matter.

Yemen - one of the most unusual, under-reported, volatile and truly mysterious countries in the world! Terry Fielding grants a glimpse behind a few of her veils.

Insofar as shortwave listeners are concerned, the two Yemens offer two potential additions to the log sheets and little else. They are reception challenges that are not soon forgotten.

Which makes this background briefing on the two countries and their radios perhaps more advisable than some other features of this kind.

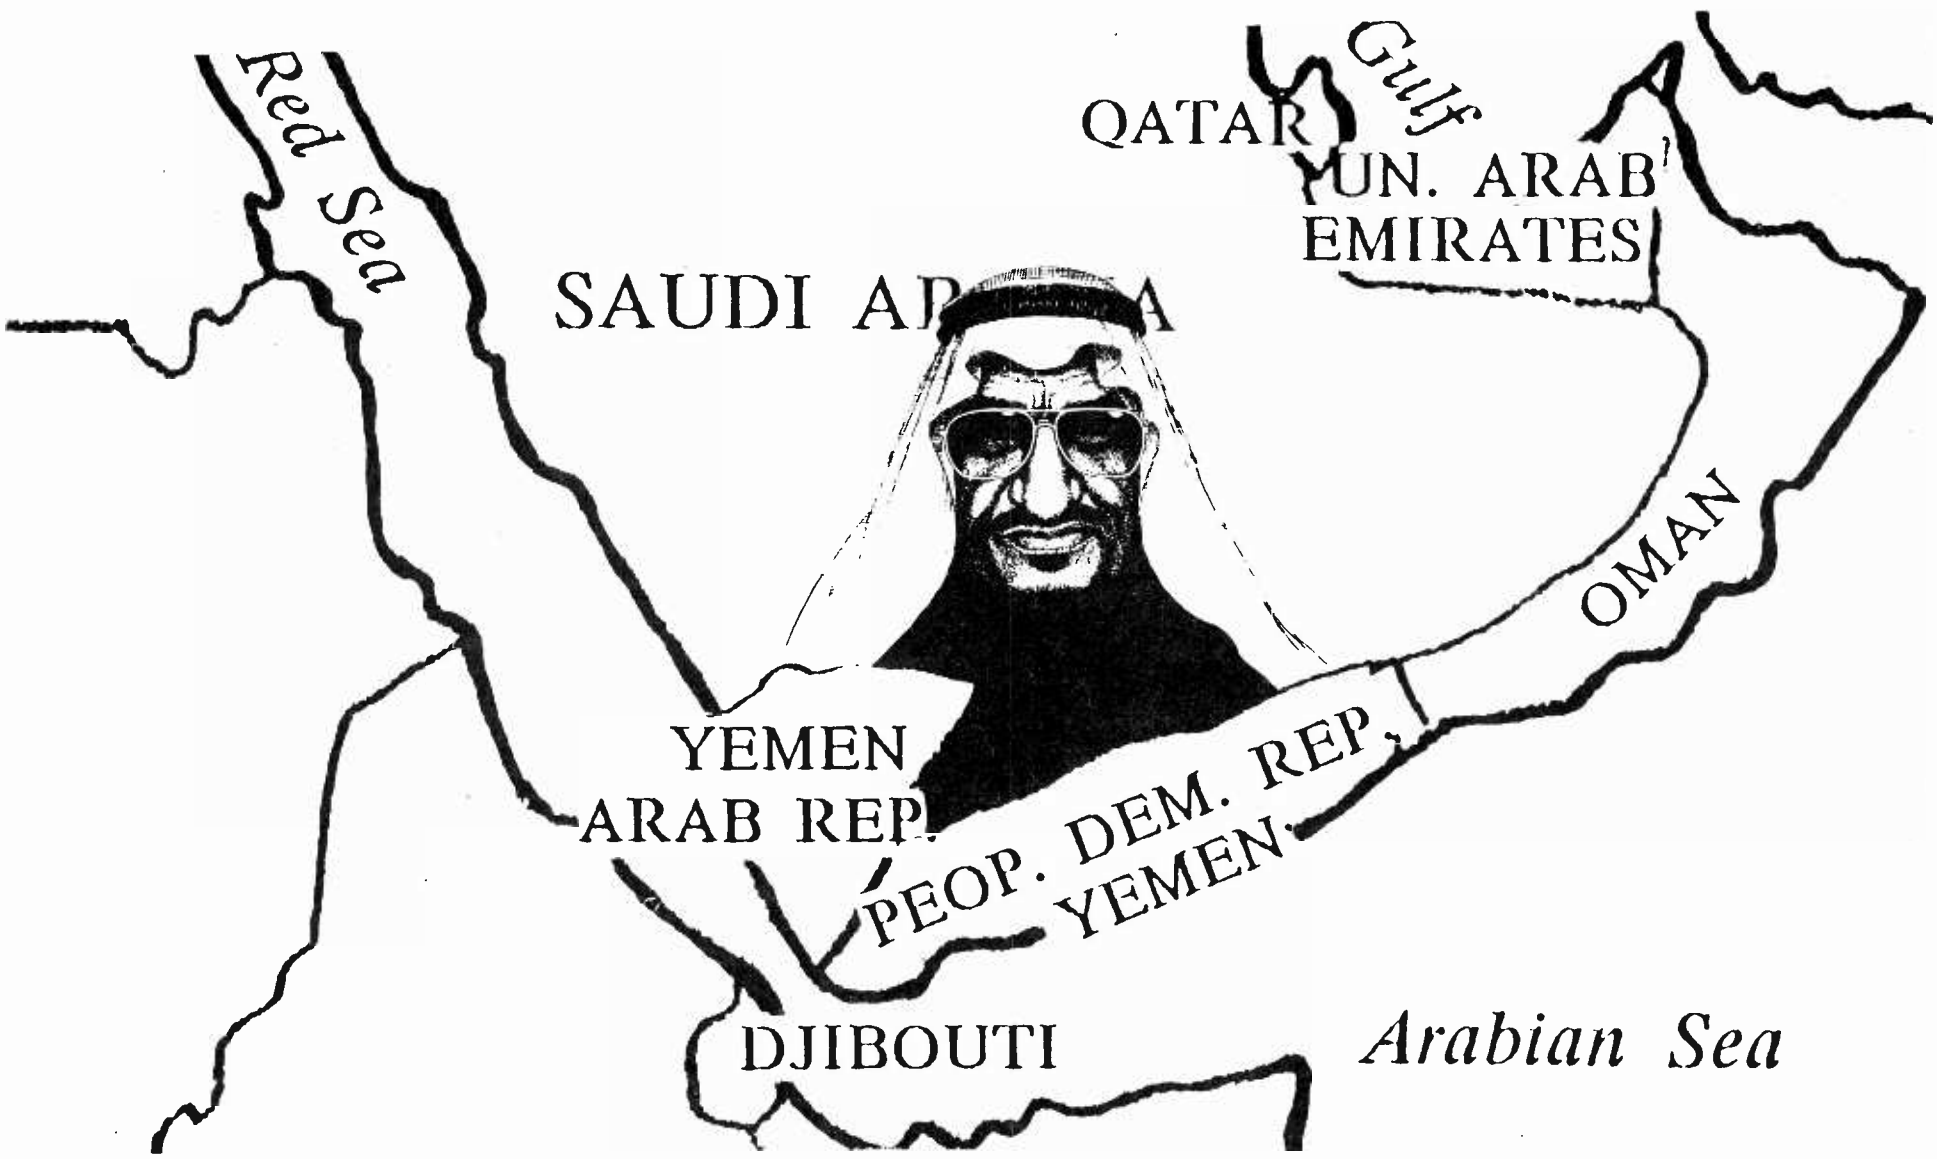
NORTH YEMEN

So. San'a is the capital of North Yemen. Which is the Yemen Arab Republic. And is the non-communist half of the duo. What is today North Yemen was once the largest segment of the ancient kingdom of Sheba and even before that, the Minaean Kingdom (circa 1200-650 BC). It has, over the centuries, been ruled or influenced by all manner of countries and sects, a process which included the introduction of Islam in the 7th century.

The last outsiders, the Turks, left in 1918 when the area at last achieved independence. Treaties were signed with Saudi Arabia which promised to recognize Yemen's borders and the Imam as the Yemeni King.

The King was assassinated in 1962 after which a republic was established by anti-Royalist elements. The Imam's heir fled into the mountains where, supported by the local tribes and the Saudis, he fought a civil war against the new government and its Egyptian supporters. The war ended in 1970 with the royalists still on the outs but at least holding many positions within the government.

There is little in the way of what most would consider political parties active in the Yemen Arab Republic. The constitution has been suspended and day to day politics are largely the business of local tribes. The central government rules largely by granting



YEMEN
continued from p.39

fiefs to local tribal rulers. Courts are mainly local and run along tribal or Islamic lines. As one writer put it, outside of San'a, Yemen is "more or less in the 14th century."

Many of the 6 million population work outside the country, particularly in Saudi Arabia, which, through those lost wages as well as via direct government-to-government aid, accounts for a large portion of the entire national income.

The republic is largely a mountainous area said to contain the purest of Arab bloodlines.

The station from North Yemen is Radio San'a, which is operated as a division of the state's Ministry of Information. Three frequencies are listed for operation on shortwave: 4853 and 6135 kHz -- both using 20 kilowatt transmitters -- and 9780 with 100 kW.

4853 is heard only rarely; 6135 virtually never. 9780, however, is heard with a fair degree of regularity. Sign on is at 0300 and the programs run until 0700 UTC then activity resumes at 1000 UTC and runs until 2115. On Fridays, operations are continuous from 0300 to 2115.

The prime opportunities for North American reception are at the 0300 sign on (on 9780 kHz) and again, especially in the east and midwest, to 2115 sign off. Programming is entirely in Arabic.

QSLs often require three or four attempts but most correct reports will eventually be answered by form letter. The station's address is simply Radio San'a, Ministry of Information, San'a, Yemen Arab Republic.

SOUTH YEMEN

Southward is, not unexpectedly, South Yemen. The capital, Aden. The People's Democratic Republic of Yemen. Communist, with a Khadaffi-like proclivity for meddling in the affairs of its neighbors.

The British took the South Yemen capital of Aden in 1839, establishing a British protectorate there by the early 20th century. Aden eventually grew into a large and strategically important naval base. By 1965, however, several leftist revolutionary groups had emerged and fighting between them over the next couple of years left the country in chaos by the time the British pulled up anchor and sailed away in 1967.

In the absence of the British, a socialist/communist National Liberation Front took control, only to be replaced by an even more radical communist NLF contingent two years later. That date marked the beginning of South Yemen's attempts to export the revolution to Saudi Arabia. Things got so rough, in fact, that toward 1973, the two sides were actually fighting inside Saudi Arabia.

The early 1970s also saw the country playing host to several guerilla terrorist groups and establishing training camps for them, including the PLO and the more radical Popular Front for the Liberation of Palestine. During the same period, the government was also trying to overthrow the government of Oman, supporting the Dhofar rebellion and hosting an Omani government in exile. Busy beavers, they were.

In 1979, a friendship treaty was signed with the USSR which provided for Moscow's use of the Aden naval base. South Yemeni troops operate alongside those of East Germany and Cuba, in such operations as the Eritrean resistance in Ethiopia.

The two Marxist factions in South Yemen still have not settled their differences and have clashed several times in recent years, including last year's flare-up in which no one knew who was in charge for several days.

South Yemen's population is about 1.8 million. The capital has a large African and Indian population and a strong labor union movement.

The Aden government maintains a leftist "National Democratic Front" organization which has the sole purpose of opposing the government in San'a. There have been numerous skirmishes and mini wars along the border of the two nations over the years. Despite that, however, there have also been several instances where talks have been held looking toward the eventual reunification. The north does not want any part of a communist government and negotiators have been unable to get past that rather major sticking point.

The Democratic Yemen Broadcasting Service (DYBC) is the official South Yemen government radio. It runs under the auspices of the State Committee for Information and 100 kilowatt transmitters are listed for operation on 5970 and 11950 kHz with a two part schedule from 0300 to 0600 and again from 1100 to 2100. Like San'a, Fridays go straight through, from 0300 to 2100. Programs are in Arabic.

The 5970 kHz frequency is known to be active. 7190 is also active as is 11770, the latter probably a replacement for 11950 kHz. All three have been heard up to the 2100 sign off and at the 0300 UTC sign on.

One cautionary note: at times there is a Soviet station on 7190 after 0300. It also broadcasts in Arabic so extra care is advised here.

Verifications from DYBS are about at the same difficulty level as those from the North. You can reasonably expect to have to make three or four attempts or you can as easily luck out and get a reply on the first try. It isn't necessary for either station to send your report in Arabic. English reports seem to be perfectly acceptable. The address for reports on DYBS is P.O. Box 1222. Aden, People's Democratic Republic.

And good luck. Listen to either of these stations and you'll have made contact with one of the most unusual, under-reported, volatile and truly mysterious countries in the world. ■

EEB HP Options

R71 (HP) High Performance. EEB has the reputation of excellence when it comes to R71A modifications. Many of our modifications are proprietary and not offered by any other source. EEB now offers a package deal including our most popular option—known as the R71(HP) High Performance and includes the following:

- 24 hour bench test.
- Narrow filter (choice of 3, see below). Replaces stock ceramic SSB filter. Improved selectivity and shape factor.
- Front end upgrade—improves dynamic range (plus) preamp enabled below 1600 KHz.
- 4 KHz filter replaces stock. 6 KHz wide filter—improves AM selectivity.
- Audio output modification—increases audio output; reduces distortion.
- AGC time constant changed to better suit SW listening.
- Spike protection added.
- RFI line filter.
- Installation of ICOM options purchased with your R71A HP.
- Final alignment and overall checkout.
- Free extended 6 month warranty.

R71HP (MF) Mechanical Filter	add $200
R71HP (XF) 8 Pole, 2.4 KHz xtal filter	add $250
R71HP (XFS) Super 2.1 KHz filter	add $300

NRD-525 General Coverage Receiver

- 90 kHz to 34 MHz
- Options for 34-60 MHz, 114-174 MHz and 423-456 MHz
- 200 Memory Channels
- 2 Clocks/Timer To Control Radio & Extra Equipment (tape recorder)
- Computer Interface Option.

Sale Price $1179.00

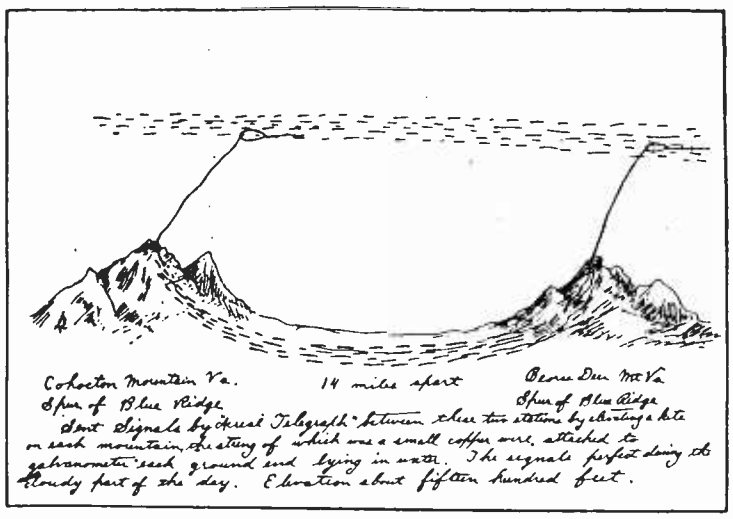
Paul Swearingen is taking the month off, but will return with the October issue.

Who Said Marconi Invented Wireless?

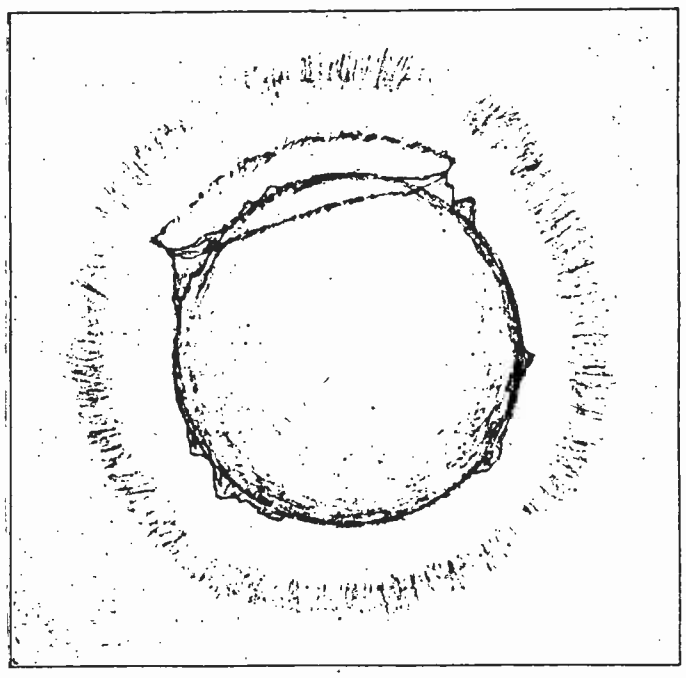
by D.K. deNeuf, WA1SPM

Marconi never made such a claim. He said he only took the discoveries made by Hertz, Righi, Branly, and others years before and forged them into a workable practical means of communication without wires. Yet many school and other books credit him with this feat.* He was granted a British patent in 1896 for an invention for "improvements in transmitting electrical impulses and signals."

Marconi probably never heard of an American Patent (#129,971) issued in 1872 to Dr. Mahon Loomis, a Philadelphia dentist, for "a system of aerial telegraphy" (Dr. Loomis also held both U.S. and British patents on the "kaolin" process for making dentures).



The First Antenna: Reproduction from Loomis's sketch, 1865



Reproduction of a drawing made in 1865 by Loomis, showing his idea of how setting up "disturbances in the atmosphere" would cause electric waves to travel through the atmosphere and the ground, thus establishing wireless telegraph communication between two distant points. The aura around the earth represents what he termed the "static sea."

And Marconi probably never saw the *Washington Chronicle* newspaper issue of Nov. 1, 1872, which reported show Loomis had conducted his experiments with fine light copper gauze kites. A sketch drawn by him in 1865 depicted his kites being flown from two mountaintops in Virginia (see sketch).

Each kite was tethered with a copper wire "attached to a galvanometer, each end lying in water." His caption says, "the signals were perfect during the cloudy part of the day."

The essential part of the patent issued to Loomis indicated "...the utilization of natural electricity... relying upon the disturbance produced in the two electro-opposite bodies of earth and atmosphere." (Ben Franklin's famous kite experiments were carried out in 1752 resulting in sparks jumping from the key attached to the tether during lightning storms.)

Congress, on May 21, 1872, listened to a long speech relative to the "Loomis Aerial Telegraph Bill" requesting an appropriation of $50,000. Just how Dr. Loomis proposed to send telegraph signals or messages and to receive them never seemed to be fully explained.

We generally think we can't transmit DC through the air without wire. But hold on--if you connect a sensitive DC galvanometer between an antenna and ground you'll see deflection from lightning flashes. Now if the impulse striking the antenna as a result of a distant discharge were AC the galvanometer should read zero; i.e., no net reaction to opposing half cycles. But that is not the case.

Dick Hilferty, W5TOS, has proven that each flash produces either a positive or negative indication - but not both and not zero.

A well-elevated antenna like a kite can accumulate rather large voltages; the normal gradient is said to be about 33 volts per foot above the earth.

Could Loomis have been setting up scratchy discharges just by grounding and ungrounding the "transmitting antenna" which were detected by a DC instrument? One of Loomis' drawings in 1865 showed his idea of how setting up "disturbances in the atmosphere" would "cause electric waves to travel through the atmosphere and the ground...thus establishing wireless communications between two distant points."

Apparently Loomis did not actually transmit and receive (detect) electromagnetic waves. Eduoard Branly invented the "coherer" - the first detector of any kind to respond to wireless waves - but this was not until 1890.

The coherer, a glass tube containing a fine metal powder, operated on the principle that while many powdered metals behave as poor conductors to DC voltages they have a relatively high conductivity at high frequency voltages. When electromagnetic waves passed through the powder, the microscopic sparks bridged the interstices (gaps) thus causing the particles to adhere to each other. The powder could then be restored to its original loose state by tapping or vibrating the glass container.

Congress denied the Loomis appropriation request, allegedly calling the whole idea "absurd." ■

This book is dedicated to the memory of Dr. Mahlon Loomis, who, in 1865, sent the first aerial telegraph messages.

A word from Dr. Rogers.

"It was my pleasure to know Dr. Loomis in the early days when he was trying to convince a skeptical world of his new and wonderful discovery. So impressed was I that I went to see Professor Joseph Henry, then at the Smithsonian Institution, and unfolded to him Dr. Loomis' plans. *Time has vindicated this great pioneer in the art of wireless communication.*

Very sincerely yours,

J. HARRIS ROGERS,
Hyattsville, Md.,
July 13th, 1920."

Was this the same Dr. Rogers who invented the Rogers Underground Antenna circa 1920?

Dr. Mahlon Loomis

---

* *One of the world's greatest inventors apparently thought so, too. Note his comment written in his unmistakable "telegraphic script":*

I have great admiration and high regard for Marconi the pioneer inventor of Wireless Telegraphic Communication

Thos A. Edison

It is said Loomis died in 1866 of a broken heart over his nation's failure to recognize him.

Dr. John Santosuosso
P.O.Box 1116
Highland City, FL 33846

Scott McClellan
P.O. Box 982
Battle Creek, MI 49016

Dr. Santosuosso Returns ...

and so does Havana Moon!

It is good to be back after spending some very pleasant time in Europe. More about that later, but first here are a few clandestine items.

Several months ago we recommended keeping an ear tuned to Radio Caiman, which puts out the strongest signal of any clandestine. We still think that is a good idea, but you will probably find them on 9960 rather than the old 7470. Look for them mornings and evenings.

It was almost inevitable that a Guatemalan clandestine would eventually turn up. The country has been faced with insurgency movements for years. Look for a station by the name of Voz Popular on 6950. This one may not be very easy to hear.

John Demmitt of Pennsylvania furnishes us some interesting information about Miami-based Radio Mambi on 710 kHz. This anti-Castro broadcaster recently found itself in the peculiar position of having the FCC reject its application to reduce its night time power from 50,000 to 25,000 watts. The station is thus forced to run excess power it does not need or want. Is the FCC trying to jam a frequency the Cubans already jammed by placing a Radio Reloj transmitter on 710?

From Texas, Dave Larson writes that the unknown clandestine log reported by Matt Varick on 6610 in the June column is anti-El Salvador government Radio Farabundo Marti. You will find programming on this similar to that of Radio Venceremos, although it is less active and reported less often.

Report from the Emerald Isle: If you have not yet logged and verified unlicensed Radio Dublin on 6910, time may be running out. Ireland was one country I recently visited. While in the Dublin area I was told that as many as twenty commercial pirates are currently operating, but by October they could all be gone.

Rumors of government legislation to shut down the Irish pirates are nothing new. However, this time the situation does look more serious. Part of the problem is the irresponsible behavior of the stations themselves. In March, the authorities raided one of the facilities of Boyneside Radio, which operates in several communities. Word has it a competitor encouraged the government to act, falsely claiming the station was causing interference. Because of this raid, station personnel are somewhat paranoid, and it was impossible to visit the studios of any of them.

At present time there is still plenty to be heard on the medium wave and FM bands as you travel about the country. Although I had little free time to monitor the bands, I managed to tune in several pirates in the Dublin area including Sunshine Radio (531 kHz), Radio Dublin (1188), BLB Community Radio (657), and Energy 103 (103 MHz). In Cork, WBEN (98 MHz) was logged, while Limerick's Sound Channel (97.7) was heard in that city.

All these were logged on a small pocket radio. When you travel to a foreign country, or even a different part of your own, take advantage of the situation to hear something different. You do not have to haul a lot of expensive equipment along.

And if you are not traveling to Ireland, there is still time to hear Radio Dublin on shortwave. It is on 6910, 24 hours a day, and can be heard throughout the year in the Eastern United States if conditions are right. It has made it through all the way to the West Coast on occasion. The station is a good verifier. Reports go to 5B Inchicore Road, Kilainham, Dublin 8, Ireland, but play it safe. Don't wait too long. Speaking of pirates, it's time to hear from Scott.

The McClellan Report:

It appears as though an effort is being made to get U.S. pirate stations to move away from the overcrowded 41-meter band, in favor of the area just above the 90-meter tropical band. Radio North Coast International is sending letters to various stations urging them to give the range between 3400-3500 a try. Test transmissions on this band have produced excellent results. So far, KROK and Zepplin Radio Worldwide are joining RNCI in moving most of their transmissions to this band. Keep an ear open!

Scott also sent along an interesting report on the English offshore pirate station. We will have to hold that until next month. At that time, I will also report on what I managed to hear on some of these stations during my recent trip.

And now...

The Return of Havana Moon

by Havana Moon: I'm back! That roar of approval (?) is just what I expected. It's so darned nice to know that so many of you missed (?) my column and welcome (?) it back.

And why did it stop in the first place? Well that's not an embarrassing question to answer. Let's just say that other commitments were catching up with me. Were they ever!

During my hiatus, I've marked a number of milestones. Most notable is my book on numbers stations, *Unio, Dos, Cuatro* (Tiear Publications). It's available from Imprime, Box 241, Radnor Station, Radnor, PA 19087, as well as several other *Monitoring Times* advertisers. Get the hint? Buy the book!

And if you are new to *Monitoring Times*, I'm the guy shrouded in black wearing a fedora that used to do a column entitled "Los Numeros." I wrote a lot about "numbers" transmissions and other things that go bump-in-the-night. I also--at times--managed to offend U.S. Government agencies, a few readers, and one foreign government that shall remain nameless.

And all it takes to be included in this column is for you to forward your intercepts, comments, or whatever to Havana Moon in care of *Monitoring Times*. Nothing could be easier. Nothing that is--except hearing a "numbers" transmission. I understand, however, that there are many of you that have never heard a numbers transmission! I find that very strange. But in future columns I'll tell you the best frequencies, times and many other things about "numbers" transmissions in non-technical language.

I'm a former member of the intelligence community and and have been involved in communications activities for almost more years than I care to remember. And if you think I'm going to discuss my former days as a "spook"--forget it. Suffice it to say I was not Director of NSA! I was also not night porter at the KGB outpost in Managua as has been suggested! Try somewhere in between. Maybe it was night porter at PTL.

As there is a *Monitoring Times* team, so there is a Havana Moon team. I've often been derelict in my duties by not giving the Havana Moon team proper credit for their very able assistance and friendship. They play a very important part in this column. There's Detective Lieutenant John Fuard and the nearly famous Eric Conners. Eric is the guy who's a first class pro when it comes to the ins-and-outs of governments.

And there's a new Havana Moon team member, and she's a somewhat mysterious member. Her name is Diane H. Diane, for some strange reason, and had the audacity to be born in Alaska; however, she now calls Pennsylvania home. Diane is a most methodical research expert. She's also, of all things, a Ouija specialist and likes "silent flowers!" Now, if Diane would only tell her story...

Hot "Numbers" Frequency List: 3090 kHz, 3120, 3125, 3130, 3690. Some, but not all, "numbers" transmissions on the above frequency do originate from downtown Havana! Repeat frequency for the above is 4030 kHz at 30 past the hour. 3445, 4030, 4445, 4670, 4780. The above is a very important frequency to watch. It is a FEMA (Mt. Weather) frequency. FEMA--for reasons known only to FEMA--does not like to talk about "numbers"transmissions. 4825, 5060, 5080, 5090, 5135. Note that 5134.5 is a discrete FEMA frequency! 5810, 6802, 6825, 6835, 6840, 7404, 7527. The above frequency is but another curious "numbers" frequency. Seems that "numbers" transmissions literally forced U.S. Customs to abandon this frequency.

And speaking of Mt. Weather and FEMA, be sure to pick up a copy of William Poundstones's *Bigger Secrets* (Houghton Mifflin). Be sure to read every word in chapter nine. Poundstone, as only Poundstone can, reveals a lot of things about Mt. Weather that FEMA would just as soon you not know.

I'm not really sure if I'm allowed to mention Tecate or not in this column. But what the heck. And time now for a Tecate and...Adios, from Havana Moon y Amigas

That's it from the Outer Limits team. See you in 30. ■

Lawrence Magne

Editor-in-Chief
Radio Database International

The Sony ICF-PRO80

A Scanner That Doubles as A World Band Radio

Most advanced-technology radios are specialty products designed to do one thing well: bring in the world by radio. Some also excel at receiving FM broadcasts, and yet others succeed at receiving specialized radio signals -- ships at sea and the like.

Sony's new ICF-PRO80, however, is designed to do all of these and more. With this $419.95 portable, you can tune in all manner of police, fire and aircraft communications, along with such arcane chitchat as the back-and-forth of security agents. In short, this is what's referred to as a "hand-held scanner". And it's a pretty sharp-looking one, at that. Hold one in your hand and you can easily picture yourself directing dozens of hooks and ladders at a seven-alarm blaze.

Few World Band Features

What makes Sony's scanner different is that it also picks up world band broadcasts. However, the PRO80 lacks many of the features found on competing world band portables. There's no tuning knob, no signal strength indicator, no clock and no timer or sleep control. If you want to receive single sideband signals, you have to settle for just that: single sideband. There's no way to separate lower from upper sideband as there is on better world band radios. And the excellent synchronous detector found on Sony's less-costly ICF-2010/ICF-2001D portable is missing here.

Too, the PRO80 tunes only in 5 kHz increments. There's a supplementary fine tuning control, just as on the Sony ICF-2003/ICF7600DS that costs half as much. Also like the '2003, the PRO80 has a set of up/down slewing buttons for bandscanning. In addition to the keypad, there are no less than 40 memories (four banks, ten channels each) to store your favorite stations.

Mixed Performance

World band performance varies from the mediocre to the outstanding. On one hand, the PRO80 is stable, so it doesn't need retuning from time-to-time. Additionally, it's sensitive throughout the world band spectrum, so even weak stations tend to be heard. Its dynamic range is superior for a portable, too, so it's likely to function nicely even in such high-signal-strength parts of the world as Europe and North Africa.

Hold a PRO80 in your hand and you can easily picture yourself directing dozens of hooks and ladders at a seven-alarm blaze.

Selectivity, however, is a mixed bag. On one hand, ultimate selectivity is remarkable for a portable -- or even a costly tabletop communications receiver. Too, there are fully three bandwidths, two of which are useful for listening to world band broadcasts. These bandwidths are well chosen. However, skirt selectivity is inferior to that found on less-costly Sony portables, such as the ICF2010/ICF-2001D.

At the other end of the quality scale, spurious signal rejection is mediocre. As a result, unwanted signals tend to pop up in various parts of the world radio bands where they don't belong. The problem with this is that these "repeats" can cause unnecessary interference to stations you are trying to hear.

Modest Audio Quality

The PRO80 might be OK if it stopped here, but its audio quality -- because of moderately high distortion and a tiny speaker -- is mediocre. Listening to chitchat from the local fire house with this device is one thing, but trying to enjoy a clear broadcast from, say, France with the PRO80 requires some degree of aural forbearance.

Mixed Ergonomics

The major ergonomic characteristic is that the PRO80's role as a hand-held scanner has resulted in a set that is unusually complicated to operate. For example, its keypad tuning scheme requires more button-pushing than do those of most other portables. And changing bandwidth calls for pushing two buttons (rather than the usual one) simultaneously.

The volume control is shared with the two-step tone control, and it's located right next to the screw-on telescopic antenna. As a result, this often-used control is awkward to operate, especially when the button control is depressed to the "low" tone position.

All ergonomic characteristics aren't negative, however; the PRO80 comes equipped with an easy-to-use display light that fades out automatically after several seconds. This makes nighttime listening much handier than on such unilluminated portables as the Sony ICF-7700/ICF-7600DA.

In short, the Sony ICF-PRO80 occupies a niche for scanner buffs who wish to have a handheld portable that also brings in world band broadcasts. Also, "DXer's" who find the '2010 too large and heavy may find the PRO80 useful on trips. •

You can hear Larry Magne's equipment reviews, along with reports from Radio Database International's Don Jensen and Tony Jones, the first Saturday night each month over Radio Canada International's "SWL Digest" at 8:10 PM Eastern time on 5960 and 9755 kHz. Larry's "What's New in Equipment" is also featured over "SWL Digest" various other Saturdays throughout the month.

In the U.S., RDI White Papers are carried by Electronic Equipment Bank, Imprime and Universal Shortwave. A free catalogue of the latest editions of all available RDI White Papers, including those covering the best in communications receivers and antennas, may be obtained by sending a self-addressed stamped envelope to Publications Information, Radio Database International, Box 300, Penn's Park, PA 18943 USA.

The Sony PRO80 at VHF

by Bob Grove

The new Sony PRO80 is a paradox: Is it a shortwave portable or a VHF hand-held scanner? It cannot be used for both at the same time, and even the converted VHF range cannot be scanned continuously--a switch must be thrown to select between two frequency ranges.

Dedicated radios for either shortwave or VHF/UHF scanning are infinitely easier to use, probably smaller, and cost less for better performance. For example, on a Bearcat 100XLT scanner to listen to a new frequency, you press "MANUAL", the frequency, and "ENTER".

But on the PRO80 you first must remove the battery cartridge and flip a switch to change the readout range, then reinsert the battery cartridge; then you remove the whip, attach the converter, put the whip back on, press "PROGRAM" and "DIRECT" simultaneously, then enter "115.000", press "EXECUTE", press "DIRECT", enter the frequency, and press "EXECUTE".

The laborious procedure must be repeated each time the user wants to switch from shortwave to converted VHF monitoring. Scanning from the memory channels on shortwave, frequencies between 115 and 174 MHz, and frequencies between 174-223 MHz at the same time is not possible; nor is it possible to memorize SSB mode (only AM and FM), or frequencies in less than 5 kilohertz increments.

On the Plus Side

The PRO80 is function-rich, allowing considerable variance in individual listening tastes. Shortwave DXers, broadcast listeners, utilities buffs, scanner monitors--all classes will have fun with the little radio.

The telescopic whip antenna for shortwave and VHF reception may be removed and a BNC adaptor (supplied) attached for use with an external antenna. Reception below 1600 kHz is accomplished through an internal ferrite rod loop antenna.

Sensitivity is excellent, SSB reception is rock stable, scan/search speed is adequate (about 8 increments per second), and quality of construction and cosmetic appearance is typically Sony--plastic but professional.

Frequencies may be stored in the 40 memory channels individually as FM or AM (wide or narrow selectivity), but not SSB. The radio comes with a shoulder strap and case; batteries (4 AAs are required) and AC adaptor are optional.

The Bottom Line

The Sony PRO80 may be succinctly described as cumbersome but competent. So who will buy the Sony PRO80? Anyone who wants compact portability coupled with good performance covering the widest MF/HF/VHF frequency range presently on the market.

While the Sony ICF2010 will give better world band performance, and a dedicated hand-held scanner will give better VHF (and add UHF) performance, the piecemeal approach will cost well over $500. Grove Enterprises is listing the unit at an introductory discount price of only $329 (plus $5 shipping); it is also available from other *MT* advertisers.

Delivery date for the PRO80 in the United States has been delayed; September is the earliest likely at this writing. ■

COMING NEXT MONTH

Mike Mitchell reviews the AEA PK232 multi-mode demodulator. Don Jensen previews the shortwave bands ... not just for October, but until the end of the century. Who is likely to be signing on? Who will be leaving? What will the radios be like? America's elder statesman of shortwave reports.

GTI Preamplifier

Most VHF/UHF receivers and scanners can use a boost in the sensitivity department. While additional gain is not usually necessary, an external low-noise-figure stage can accomplish wonders.

The new 1000P preamplifier from GTI is an effective package featuring good gain, low noise figure and excellent strong-signal-overload immunity. It is housed in a substantial diecast box and outfitted with BNC connectors. It is powered by 12 to 15 volts DC at approximately 60 mA (available from the Spectra-Display if used with that accessory).

The interior circuitry is nicely laid out around two GaAsFETs and features positive feedback to encourage high gain right through 1000 MHz. The input is protected against destruction by accidental high signal overload or nearby lightning strokes by a gas discharge device. ⇨

GTI 's 1000P preamplifier substantially improves signals above 500 MHz

GTI PREAMP
continued from p.45

The gain of our evaluation unit showed 18.5 dB at 3 MHz, 23.0 dB at 10 MHz, 21 dB from about 100-900 MHz, and was still 18 dB at 1100 MHz. Its noise figure averaged 4 dB throughout the VHF/UHF land mobile frequency ranges.

Perhaps most important, especially to those listeners in metropolitan areas, is the compression point, the level of an incoming signal which will drive the gain of the amplifier down 1 dB--greater than 10 dBm in the 1000P.

Third order intercept, a figure used to express immunity from producing "intermod" (intermodulation), is a healthy 30 dBm at VHF, equivalent to that found in the most expensive receivers, and decreasing only 3 dB at 800 MHz.

A Comparison

It was too much of a temptation to resist; how would this premium $150 preamplifier compare with the popular $39 Grove PRE-3 Power Ant? The two preamps were repetitively switched between a Grove Scanner Beam antenna and an R7000 receiver, watching signal levels and listening for background hiss and intermod products at various frequencies.

Under about 500 MHz gain and noise figures were very close; there did seem to be somewhat more intermod interference from strong shortwave breakthrough on the PRE-3, however. This was substantially reduced by soldering the shunt coil in place as shown in the instruction sheet.

At 1100 MHz there was significant difference favoring the 1000P; signals from aircraft transponders were clearly stronger in the GTI than on the Grove unit which utilizes one stage of bipolar amplification and no positive feedback to emphasize the upper reaches of spectrum. The manufacturers' specifications corroborate the difference in gain.

The Bottom Line

The GTI 1000P receiver preamplifier is better than the Grove PRE-3, but it costs over $100 more. Its choice would be preferred with an outdoor antenna installation in a large city (dense RF) environment, and when reception of signals above 500 MHz is an important consideration.

(1000P wideband preamplifier, $149.95 from GTI Electronics, RD 1 Box 272 Dept MT, Lehighton, PA 18235; ph. 1-717-386-4032)

TEXPRO Snap-on Choke

With incidental electrical noise saturating the airwaves, listeners are always looking for relief from the assault by interference. Although shielded cables and adequate grounding can do wonders, there is always room for more assistance.

While internal modifications can be made to noise-generating equipment (motors, computers, transmitters, fluorescent lights, microwave ovens, TV sets, etc.), wouldn't it be nice if a simple external fix could do the job? In some cases it can.

Many sources of interference radiate or conduct their electrical noise via interconnecting cables and power cords; if a barrier can be added which prevents the signal from coming out of the box, it won't continue down the cable.

The miracle of ferrite and powdered iron cores has been known for years; often a rod of this material can serve as a core, around which the cable is wrapped to prevent undesirable interference currents from travelling any further.

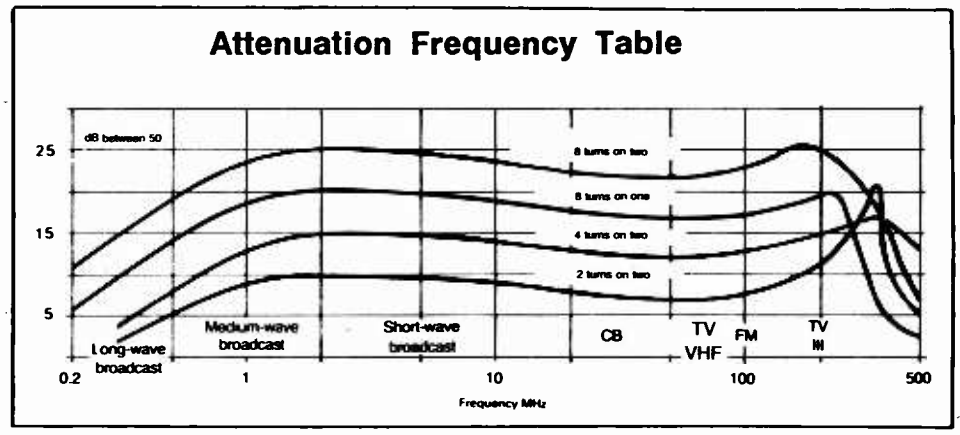
Even better, toroid (donut-shaped) cores are even more efficient, confining the unwanted signal within its RF-conductive ring. But toroids are closed; what do you do about a cable which already has a connector on the end and won't fit through the opening?

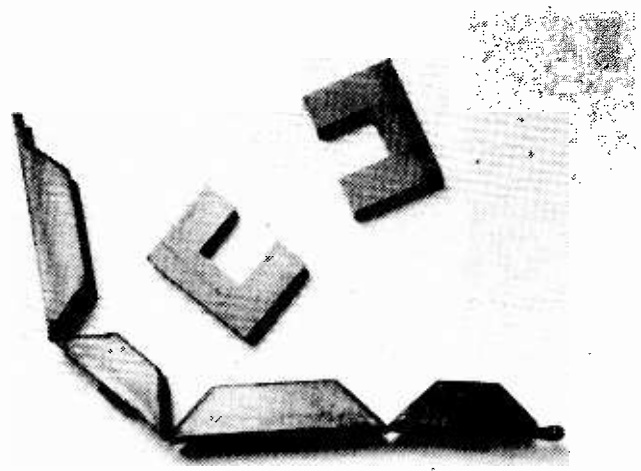
TEXPRO Manufacturing has introduced a split toroid which can be assembled over the cable, or permit the cable to be wound around it, then reassembled for use (see accompanying photos). The manufacturer recommends it for applications from medium wave broadcast right through VHF. But will it work?

Our Test

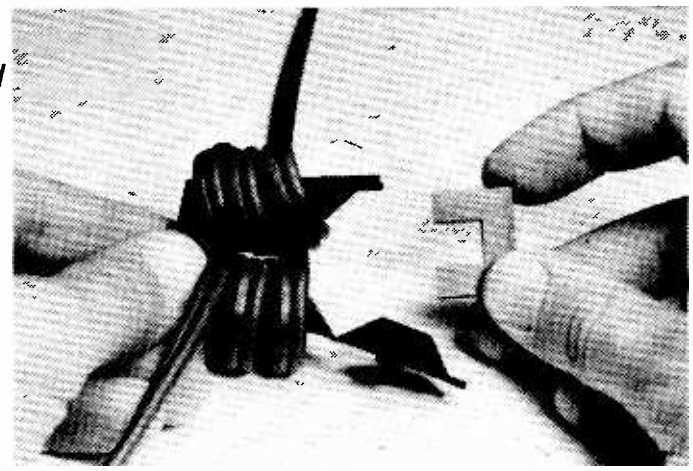
The *Monitoring Times*/Grove Enterprises office building is located within fifty feet of our monitoring post and when the four business computers are going, there is considerable temptation to consider another hobby. Could the TEXPRO Snap-On Chokes help?

One at a time, the computers were turned on and their interference frequencies tuned in on the shortwave and VHF/UHF receivers. With one person watching the S meters, the other would install the TEXPRO filters on various cables. Intercommunication was coordinated via hand-held transceivers.

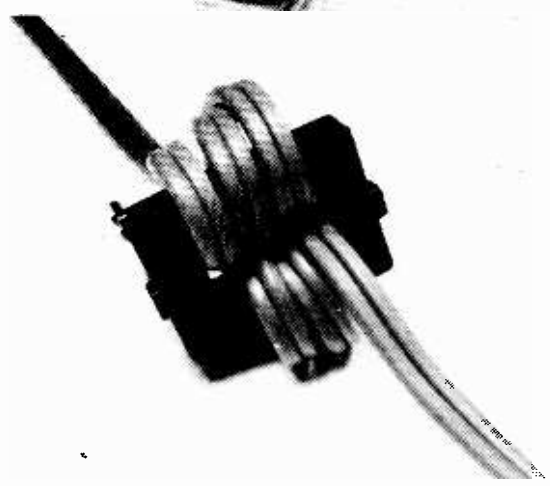




The TEXPRO Snap-On Choke disassembled



Winding an AC line cord around the core section



The line filter completed and ready for use.

As the cable to the video monitor was wound around the choke, the interference was substantially reduced--anywhere from 10 to 20 dB, depending upon frequency. Combinations of chokes and windings of the cable could be optimized by experimentation.

Complete instructions come with the little devices which sell typically for about $3-$4 apiece, depending upon quantity. They are also available under private label from some *MT* advertisers.

(TEXPRO Manufacturing, 533 Galway Drive, Dept MT, Burlington, Ontario, Canada L7L 2S6; ph. 416-333-1344)

■

NOVICE VOICE CLASS STUDY PACKAGE from W5YI-VEC

(Vinyl binder, book, cassettes, $19.95 plus $1.50 shipping from W5YI-VEC, PO Box 10101, Dept MT, Dallas, TX 75207 and from Radio Shack stores)

About 37 years ago the FCC created a new license class to encourage newcomers into the ranks of ham radio--the Novice class. Although it limited operation to low power, narrow frequencies and crystal control, it did permit voice operation on the growing 2-meter band.

Than came the debacle called "incentive licensing" which removed voice privileges from the Novice class and discouraged new blood from being infused into ham radio. Now, decades later, with the average age of amateurs at about 50 years, a renewed attempt is being mounted to once again encourage young entrants into a fascinating and largely overlooked hobby.

Fred Maia and Gordon West collaborate on what may be the most widely distributed license preparation program in amateur history.

Recently, the FCC reinstated voice operating privileges for the Novice, and this time on the amateur 10-meter band which is wide open to global communications. With a basic test and only 5 words per minute of code speed required, anyone interested in getting into ham radio should jump at the chance.

Few names in amateur license test instruction are as widely known and respected as Fred Maia (Publisher of the *W5YI Report*) and Gordon West (Gordon West Radio School). Now the two have combined their individual successes to produce what may be the most widely distributed license preparation package in amateur history.

Consisting of two Morse code cassettes (complete with musical fanfare, no less!), a superbly prepared and printed study manual, a license application form, and a sample test, the package makes entering into ham radio easier than ever before.

THE "TOP SECRET" REGISTRY OF U.S. GOVERNMENT RADIO FREQUENCIES

New 6th edition by Tom Kneitel (192 pages, 8-1/2" x 11", paperbound; $17.95 plus $1.50 shipping from Grove Enterprises and other MT advertisers)

It has been more than a year now since a major organized crime bust in Florida turned up an elaborate listening post for intercepting drug interdiction communications, and a copy of Tom Kneitel's *"Top Secret" Registry*. While there is really nothing "top secret" about its contents, it is the largest massing of sensitive government radio frequencies in commercial publication.

Now, Kneitel has printed his sixth edition of the work, updating many earlier listings and adding some as well. While utilizing private rather than official sources, the new volume boasts improved accuracy, a common criticism of earlier editions.

Kneitel displays no pangs of guilty conscience in the contents of the Registry; in its pages are largely-confirmed listings of Secret Service, Customs, DEA, CIA, NSA, White House, Border Patrol, ATF, and dozens of other governmental departments and bureaus, many of whom would really rather not have their communications frequencies widely propagated.

An introductory chapter lends excellent perspective to the world of monitoring. His various suggestions for equipment and accessories are good with one exception: Kneitel continues in each edition of his *Registry* to implore readers not to use RG-6/U or RG-59/U coax cable "since they are intended for TV sets and not for communications equipment." There is no justification for that caveat.

The book is divided into two basic schemes for looking up listings: by location and by agency. Many tactical identifications and official call signs are included.

Honed with each successive edition, the 6th edition of Tom Kneitel's *"Top Secret" Registry* is the leading source of VHF/UHF frequency information for monitoring federal government and military communications.

RADIOTELETYPE MONITORING

by Dallas W. Williams (54 pages, 8-1/2" x 11", paperbound; $9.95 plus $1 shipping from Tiare Publications, PO Box 493, Dept MT, Lake Geneva, WI 53147)

Inexpensive and informative are the first words that come to mind upon examining the contents of this new publication from Gerry Dexter's organization. While there are other more massive frequency listings and more sophisticated discussions of RTTY, Williams has managed to explain the art and the science concisely.

The introductory chapters abound with useful orientation for the newcomer to RTTY as well as the seasoned listener who could benefit from an easy-to-read refresher course. Williams describes receivers, demodulators, modes of transmission including crypto, machines, press agencies, interpreting the messages, and tuning techniques.

Over 300 discrete frequency listings, mostly for meteorological and diplomatic channels, include information on speed, shift, call sign, location, and schedule. A separate glossary is provided for circuit identifiers and agency abbreviations. ■

Scanner Sneak Preview

by Bob Grove

A spate of new scanners being released from several major manufacturers includes some real surprises! Although full details have not yet been revealed on all of them, here's what *MT* was able to learn at press time.

Radio Shack

A major new product introduction in the fall catalog is the PRO-38, a miniature pocket programmable scanner with full features at a stunning low price. With frequency coverage of 29-54, 136-178 and 406-512 MHz, the mighty midget measures a scant 2" x 1" x 6" and retails for only $139.95.

Volunteer firefighters will love the new, low-cost PRO-27 crystal scanner. Two channels may be selected in high band and/or UHF in a 4-5/8" x 2-3/4" x 1" package. Only $50!

A number of new products from other manufacturers will be nipping at the heels of Radio Shack's popular PRO-2004 desktop scanner, presently conceded to be the best scanner on the market although the price has edged upward to $419.95 (still discounted at $379 from Grove Enterprises).

Fox Technology

Following a volley of on-again, off-again acquisition attempts, the present Fox organization is taking a wait-and-see attitude toward their proposed Micro 100 pocket programmable scanner, on hold until technical problems are ironed out. No further development has taken place on their Tracer series scanners, in the planning stage now for several years.

Regency Electronics

Introduction of the only two new models from Regency, the Turboscan models TS-1 and TS-2, have been delayed due to technical problems. Regency expects delivery on the TS-2 as early as late August and on the TS-1 in late September.

Uniden

The biggest surprises are coming from Uniden. Will Bearcat regain its position of eminence in the scanner market? Let's take a look at some of their imminent offerings and see.

Clockwise from above: Bearcat BC-210XLT, BC-600XLT, BC-580XLT, and BC-70XLT

The immensely popular BC-100XL hand-held will become a BC-100XLT and sport 100 memory channels; introduction is expected in October with a slight increase in cost.

A new hand-held programmable, the BC-200XLT, will include the 800 MHz band in addition to the customary land mobile and VHF aeronautical bands. 200 memory channels may be scanned in 10 banks of 20 channels each; features include priority, search, lockout, and delay.

The 200 comes with a detachable NICAD battery pack and AC charger, leather holster and BNC equipped flex whip. Look for it in October with a suggested retail of $499.95.

Improvements in the recently-introduced BC70XLT have addressed the poor squelch sensitivity problem. And an upgraded model, the BC75XLT, will add aircraft reception and 100 channels of memory--at a slight increase in cost.

Watch for the new BC580XLT, a compact version of the popular--but discontinued--BC300. This base/mobile scanner measures less than 2" high by 7" wide and deep, flaunts 100 memory channels (5 banks of 20 channels each), and has pre-programmed automatic search capability for police, fire, emergency, aircraft, weather, and marine frequencies.

Additional features include programmable search, priority, lockout, direct channel access, and delay. Illuminated controls support nighttime use. The 580 should be substantially discounted from the suggested retail of $399.95.

A special upgraded version of the BC580XLT, the BC600XLT, offers two remarkably innovative options: a preamplifier for weak signal improvement ($25) and a CTCSS tone-squelch decoder ($60), both of which plug into the underside of the BC600XLT. Accessories which are included are a tilt-down bracket for desktop use, plug-in telescopic antenna, AC and DC cords for base and mobile operation, and mobile mounting bracket. Rear panel jacks allow the use of an external antenna, tape recorder and external speaker or headphones. The BC600XLT is available for $224.95 plus $5 shipping from Grove Enterprises.

Slightly upgraded from the BC580XLT will be the BC960XLT, possibly available by Christmas, sporting 200 memory channels and 800 MHz coverage as well.

The frosting on the new product cake, however, will be the exciting BC1000XLT, boasting continuous, no-gap coverage from 25 through 1300 MHz, an S meter, tuning dial as well as direct frequency entry, 200 memory channels (sequential or banked), and automatic tracking of 800 megahertz trunked signals! But don't look for this one until next year.

After a painful period of reorganization under Japanese acquisition management, Bearcat could once again ascend the throne of scanner leadership. ■

Ike Kerschner

Kunkletown, PA 18058

ACCESSORIES: Part 2

Radio, by its very nature, appeals to folks who are curious and interested in the world around them. Without such interest, radio would not exist. It follows, then, that as our knowledge about radio increases, we become more interested in other areas of the hobby.

Consider the anguish of the radio hobbyist who, after taking out a mortgage on the farm to purchase a super deluxe general coverage receiver, finds his new interests exceed the limits of "general coverage."

The purchase of an additional receiver that will satisfy the new interest more often than not is out of the question. The bank won't take a third mortgage, and our spouse has mentioned divorce or homicide --- or even both -- if we bring another radio into the house. Now, what?

The best course of action is to purchase a frequency converter that will extend the range of our regular general coverage receiver to cover higher or lower ranges that it presently does.

Using Converters

In general terms, there are two types of converters. The down converter produces signals on a band that is lower in frequency than the normal range of general coverage receivers. The other converter is, of course, the up converter and it allows us to tune frequencies higher than our general coverage receiver can handle.

First, connect an antenna for the frequency range the converter is designed for to the antenna terminal on the converter (see figure 1). Now run a short coax cable from the output of the converter to the antenna terminal of the receiver. Most converters do not have a built in power supply and the user must provide power either from batteries or an external power supply (some receivers provide low voltage output to power a converter).

Now our station receiver is tuned across the IF (intermediate frequency), this will usually be the 28 to 30 MHz band for up converters and 3.5 to 4 MHz for down converters. Often the user can specify the frequency range he wishes to use as an IF. It depends on the manufacturer of the converter.

Now, by tuning the general coverage receiver through the IF range, you will hear signals on the band the converter is designed for. To determine the frequency of the incoming signal, the operator simply uses the converter's frequency coverage range in place of the IF. For example, if we have an up converter designed for 220 to 222 MHz and an IF frequency of 28 to 30 MHz, then 28 MHz becomes 220 MHz and 30 is now 222 MHZ. So if the receiver is tuned to 28.100, the received frequency will be 220.100 MHz.

Some modern receivers are designed to be used with converters made specifically for that receiver. The receiver, then, will display the exact received frequency. If you use a converter other than the one specifically designed for that receiver, it will operate in similar manner to that illustrated in the preceding paragraph.

Limitations

Modern converters cover only a frequency range of 2 MHz with any degree of sensitivity. It is possible to purchase units that cover much wider ranges although this type of converter is not widely available.

Tunable Converters

Some wide band converters are constructed so that the general coverage receiver is set to one frequency and left there and the converter itself is tuned across the frequency range. This type of unit was popular from after World War II until the mid fifties. Diligent searching at a hamfest will often turn up such a converter. Tunable converters will always, however, suffer instability problems and are really not satisfactory for serious use.

If the listener is interested in several frequency bands not covered by his receiver, general practice is to purchase several converters for the ranges desired and switch them into the receiver as shown in figure 2.

Down converters are available from the Heath Company, Palomar Engineers. This is far from a complete listing of converter manufacturers, however, perusal of any radio magazine or catalogue will often turn up many more, some offering rather unique features. Prices vary from about thirty to eighty-five dollars.

Antenna Switches

In a busy radio shack, one of the handiest add ons is the antenna or coax switch. Take a look at figure 2. In this diagram, we have a three position switch which will switch from either one of the two converters or the station antenna to the receiver. It is just as easy to switch one converter and two antennas or whatever. Coax switches are available with two to twelve positions, most common are five and six position units (See figure 3.)

The normal coax or antenna switch will automatically ground all unused positions. Generally, the coax switch will have one position that causes all inputs to be grounded for added lightning protection.

There are many manufacturers of coax switches, among them Heath, B&W, Daiwa, MFJ and others. All are fine for the SWL although the amateur who wants to transmit should be sure the switch is able to handle the amount of power his transmitter is capable of. All radio stores carry coax switches.

Improving Selectivity

Frequently, while listening to amateurs and utilities, interference is severe and many less expensive receivers simply are not selective enough to enable the listener to copy stations easily in a crowded band.

A neat device that has been kicking around for many years but which receives little attention from the SWL gang is the audio filter. Audio filters cause the received audio to be restricted to a very narrow band width and limits noise and interference nicely. Ranges from a few hundred Hertz for Morse reception to about 3.5 kHz for SSB reception are common in these audio filters, making them well worthwhile for use in crowded conditions.

The audio filter connects between the receiver and headphones, or speaker. Normally, the audio filter is self-powered by a battery or built-in power supply. Consequently, it is only necessary to plug your headphones or speaker into the unit and turn it on.

Using an audio filter often make the difference between perfect copy and no copy. I use one at my shack to help dig out the weak signals on 160 and 80 meter CW. Many contacts would not have been possible without this little gem.

The most popular audio filter is made by MFJ and prices range from $49.95 to $99.95.

That's all for this month. Please remember the SASE if you require a personal response to a query.

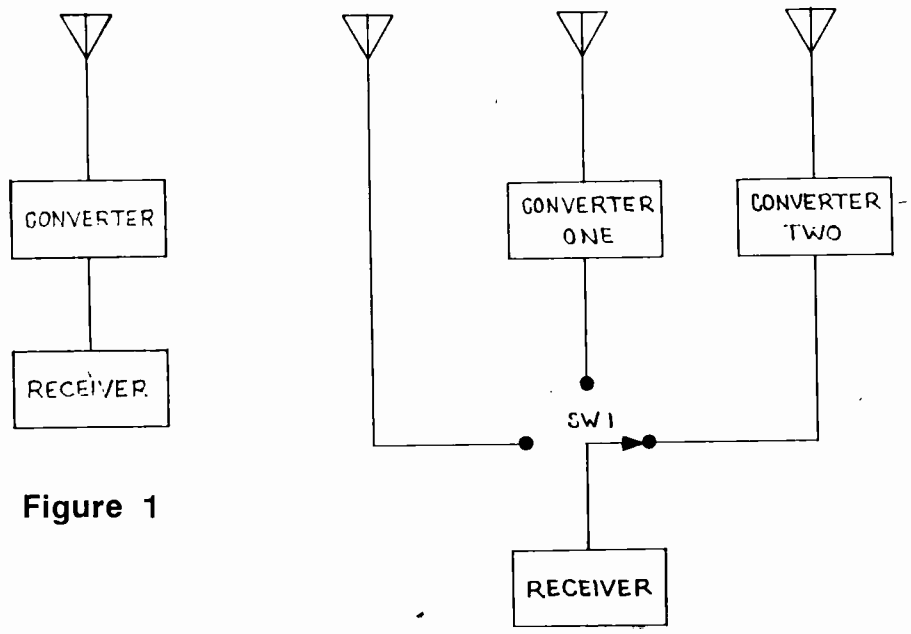

Figure 1

Figure 2

Coax switches are available with two to twelve positions - five and six positions being the most common.

Figure 3

Foreign Pro-2004 Freq Restoration

As shipped to the United States, only the cellular portion of the 806-960 MHz band has been disabled on the popular Radio Shack PRO-2004 by the installation of a diode, D513. Its removal and subsequent restoration of that coverage has been the topic of previous issues of *MT*.

We have learned that for European distribution, another diode (deleted for U.S. sales), D512, is added to disable 66-88 MHz coverage. European owners of this scanner may wish to follow the same directions as provided in the April 1987 issue of *MT*, substituting "D512" for "D513".

A complete set of instructions is provided by Grove Enterprises with each PRO-2004 sold through their catalog. Copies are available for $2 from *MT*.

We would like to thank Tom McElvy of the Old Dominion DX Association for sharing his interesting findings with fellow *MT* readers.

A Mobile Bracket for the PRO-2004

Although there is no commercial bracket presently available specifically for the popular Realistic PRO-2004 scanner, *MT* reader David Branscome of Newark, Ohio, has come up with an excellent substitute.

Dave has discovered that the strain relief bracket which is made for the Uniden Bearcat BC210XW (and similar sized scanners) fits the PRO-2004 after pulling out slightly on the ends of the bracket.

In the past, other readers have pointed out that some of the universal auto stereo mounting brackets can be adjusted to hold scanners as well.

We appreciate these hints sent in by our readers to be shared with fellow listening hobbyists.

CAVEAT

A slight correction is in order for the diagram in our April issue (page 28). While author Fissell's approach to bypass the preselector and preamp is excellent, the labels are switched on the two boxes.

A preselector should always be placed before the preamplifier (between the antenna and the preamp) in order to restrict the frequency range, thus eliminating broadband overload problems that would occur if a large antenna is connected directly to the preamp.

Scratch-Proof Mag Mount

While magnetic-mount mobile antennas like the popular Grove ANT-10 scanner antenna have good holding power, they can mar paint if they are dragged across the car's surface when dust or grit are trapped on the attachment surface. H. M. Beck of Tustin, California, has a solution.

He cut a circle of thin rubber gasket material used on outdoor electrical boxes, about two inches in diameter and 1/16 inch thick, and cemented it to the bottom surface of the antenna mount. Not only does the pad prevent scratching but, according to Beck, even adds better gripping of the surface--all with no loss of magnetic hold.

Sony ICF2010 Volume Boosters

I read with interest the remarks of low volume on the Sony 2010 in the March issue of *MT*, p.60 ("Sony ICF2010 Going Soft"). It is not a matter of quality control by Sony; low audio output allows for better battery consumption which was a problem with the ICF2001. ICF2010 has only 380 MW power output. The SonyICF2002 has 400 MW output. Both units allow for 30-40 hours of battery life with this type of power.

If I do have a problem on low signal stations such as Tarawa (Kiribati), I use my tape recorder for amplification. Also Heath Co. has a 1 watt kit amplifier that helps boost audio--the SK104 for boosting audio and the SK107 for synthesized stereo (two speakers), each priced at $14.95.

Radio Shack also lists a 9" speaker with volume control with 1 W output, $19.00, and a 5 W+ unit that is AC unit with speaker and amplified for public service use. It lists for $99 and is on sale at times for $80. *(Paul Donegan)*

Instant Weather Button on Your Scanner

From Philip Smith: The "Priority Scan" feature on many scanners is handy for someone who wishes to keep a close eye on a certain frequency while scanning or searching others. However, I tend to find the frequent audio interruptions annoying for everyday listening.

Until recently, I rarely made use of the priority feature...that is, until I made a simple discovery. By moving the local weather station to channel #1 and locking out that channel, I had converted the priority button to a "weather button." Within two seconds after pressing the button, I have the weather. Another push sends the radio back to normal scanning or searching.

Planning Your Listening Post

by Larry Wiland

If you're like most radio enthusiasts I know, you own more than one scanner or receiver and may have dozens of accessories for monitoring those elusive stations. You will also find it necessary to stack it to the ceiling if you accumulate "piece-by-piece" and do not plan in advance for a place for each item as your acquire it. I have compiled some possible solutions to teetering piles of unstable equipment and fire hazards as well from unsafe practices.

Electrical Power: You will first be faced with the dilemma of having ten pieces of equipment and two outlets. You will either have to install larger, multi-plug outlet boxes or purchase a "temporary" multiple-plug power strip.

These strips are fused, switch-operated boxes which contain four to six plug-in outlets in a single unit and may be mounted along the baseboard on on your radio table. Some power strips such as the Grove ACC23 include built-in surge spike protection. Simple power strips usually cost $7-$15 while surge-protected units bring $20-$30 or more.

Tables & Chairs: The ultimate table for a listening post is a computer table with the accessory monitor stand; this double-decked console provides storage for books and frequency guides as well as space for a video terminal, shortwave receiver(s), clock, and scanners. There may also be room for lamps, under-counter lighting, and just about anything else you might need. The adjustable shelves allow great flexibility.

Remember to provide adequate lighting for nighttime operations and "dark days." Make sure the chair you select for your monitoring post is comfortable and consider one with casters for mobility. Nothing is worse than spending several hours in an uncomfortable chair and having aches and pains hours later as a reminder! Buy carefully.

Antennas: Be sure to locate your operating position near a window or someplace in the house where cables for outdoor antennas can be run inside with a minimum of hassle or without need of excessive cable length.

Some type of antenna selecting switch or connector panel is also something to consider when dealing with multi-antenna setups. Plan the route of your wiring in advance to avoid a great deal of time and frustration later.

Other Considerations: All equipment should be grounded. Not only does this decrease the electrical line noise in your receivers, it also decreases the possibility of electrocution. Provide a means of disconnecting antennas during a storm to protect you, your equipment and your home.

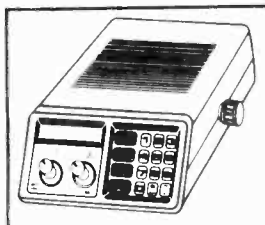
Equipment should be arranged so as to be readily accessible with the most-used items the easiest to reach. Clocks and other readouts should be clear of obstructions and easy to see. Equipment ventilation slats in equipment cabinets should not be obstructed or covered, and radios should be dusted or cleaned periodically.

With a bit of advance planning, coupled with common sense, a listening post can not only be safe, but a thing of beauty, too.

"The Largest Dealer of Scanners in the World"

SCANNER WORLD, USA®

10 New Scotland Ave., Albany, NY 12208 518/436-9606



— SPECIAL —

Regency®

MX-3000

Special $169.99

($7.00 shipping)

30 CHANNELS—MOBILE/BASE

—SCANNER WORLD EXCLUSIVE—

Features include simple programming of the following frequency ranges: 30-50 MHz, 144-174 MHz, 440-512 MHz. Digital display, priority, search, lockout, delay, dim control, top mounted speaker, one year factory warranty. Includes AC & DC cords, mobile mounting bracket, telescopic antenna. All for only **$169.99** plus $7.00 shipping (optional extended warranty: 3 years $39.99; 2 years $29.99.) MX3000 Service Manual $5.00.

Cobra SR-15

$219.99 *($7.00 shipping)*

100 channel pocket sized hand-held scanner (6"Hx2 3/4"W), no crystal, portable scanner, 29-54 MHz, 118-174MHz, 406-512 MHz, bank scanning, backlit LCD display, automatic search, lockout, scan delay, priority, key lock, plus much more. Includes rubber antenna, rechargeable Ni-Cad battery pack, AC adapter charger, earphone, and carry case. optional cigarette lighter adapter #15MPC $12.99.

Z30

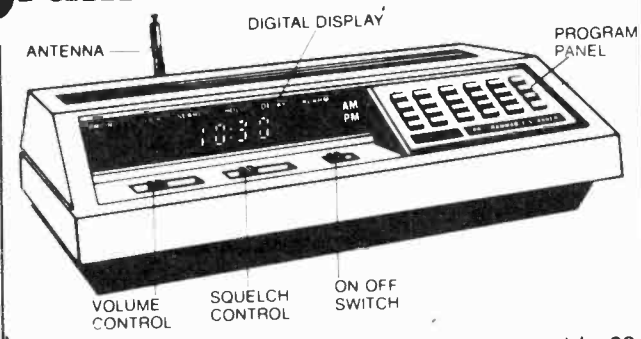
30 Channel Automatic Programmable Scanner

Scanner World Special

$129.99

(plus $5.50 shipping each)

Optional Accessories:
Cigarette Lighter Plug RGMPC . $4.95
Z Mobile Bracket — ***Special*** . . . $5.99



The Regency Z30 is a compact, programmable 30 channel, multi band, FM monitor receiver for use at home or on the road. It is double conversion, super heterodyne used to receive the narrow band FM communications in the amateur, public safety and business bands: 30-50, 144-174, and 440-512 MHz. Size 10 3/4"Wx2-7/8"Hx8-3/8"D.

Sophisticated microprocess-controlled circuitry eliminates the need for crystals, instead, the frequency for each channel is programmed through the numbered keyboard similar to the one used on a telephone. A "beep" acknowledges contact each time a key is touched. The Z30 scans approximately 15 channels per second.

Any combination of two to thirty channels can be scanned automatically, or the unit can be set on manual for continuous monitoring of any one channel. In addition, the search function locates unknown frequencies within a band.

Other features include scan delay, priority and a bright/dim switch to control the brightness of the 9-digit Vacuum-Fluorescent display. The Z30 can be operated on either 120 VAC or 12 VDC. Includes one year warranty from Regency Electronics (optional 3 yr extended warranty only $39.99, gives you a total of 4 yrs complete warranty or 2 yr extended warranty only $29.99, gives you a total of 3 yrs complete warranty.) Z-30 Service Manual $5.00.

Regency®

HX2200

$172.99

(Plus $7.00 shipping each)

Digital Programmable 20 Channel Hand-Held Scanner with raised button keyboard for easy programming of the following frequency ranges: 118-136 MHz, 138-174 MHz, 406-512 MHz, 800-950 MHz (NOTE: This is the only hand-held portable scanner which will receive the 800-950 MHz range plus high band, air, and UHF). Features include priority, scan delay, memory backup, dual scan speed, channel lockout, jacks for external antenna and earphone, 90 day factory warranty, keyboard lockswitch, sidelit liquid crystal display for night use, program AM or FM mode, search or scan, size is 3" x 7" x 1½". Complete HX2200 package includes Ni-Cad rechargeable batteries, wall charger adapter, protective carry case, and rubber antenna. All for the low price of only **$172.99** plus $7.00 shipping each. (Optional extended warranty: 3 years $39.99, or 2 years $29.99)

REGENCY HX1500

Digital programmable 55 channel hand-held scanner. Frequency coverage 29-54 MHz, 118-174 MHz, 406-420 MHz, 440-512 MHz. Covers Public Service bands plus aircraft, trains, marine, plus many others. Has priority, search, lockout, scan, banks, sealed rubber keyboard. 90 day factory warranty. Includes flexible rubber antenna, belt clip and earphone.

$224.99 *(Plus $7.00 Shipping each)*

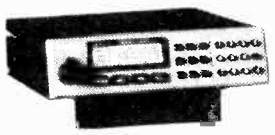
Optional Accessories Available for HX-1500: Call For Price.

REGENCY RH-256 B
PROGRAMMABLE TRANSCEIVER

RH-256B Transceiver, 16 channel 12 VDC 2-way Radio fully programmable in transmit and receive mode. includes built-in CTCSS tones for encode/decode, time-out timer, scan delay, 25 watts transmit power, priority, plus more. Frequency spread as shipped 152-158 MHz. Package includes mobile mike, bracket, mobile antenna, and all cables and instructions for installation. ***Special package deal only:*** **$359.99** *(7.75 shipping)*

(2 year extended warranty $49.99 - 3 year $69.99)

SCANNER WORLD EXCLUSIVE



Bearcat

BC-600 XLT

$224.99 *($7.00 shipping)*

Digital Programmable 100 Channel Scanner

BC-600 XLT covers the following frequencies: 29-54 MHz, 118-174 MHz, 406-512 MHz. Features compact size of 6-5/16"Wx1-5/8"Hx7-3/8"D, scan delay, priority, memory backup, channel lockout, bank scanning, key lock, AC/DC power cords, telescopic antenna, mounting bracket supplied, one year factory warranty, search, direct channel access, track tuning, service search including pre-programmed frequencies by pushing a single button for police, fire/emergency, aircraft, weather, and marine services. Plus exclusive optional features never available on any scanner before. First is an RF receive amplifier for boosting weak signals for only $24.99 plus a CTCSS tone board is available for only $59.99 to make this the number one scanner available in the USA. Optional cigarette lighter plug #600MPC $4.99.

ORDERING INFORMATION

Call (518) 436-9606 to place orders by phone or mail orders to ***Scanner World,*** 10 New Scotland Av., Albany, NY 12208. Orders will be shipped same day received by United Parcel Service. ***Scanner World*** accepts VISA, MasterCard (COD shipments by United Parcel will be for cash or certified checks only). Mail orders with personal or business checks will be held 4 weeks for bank clearance. Orders with cashiers checks or money orders shipped same day received. Prices, specifications and terms subject to change without prior notice. If items are out of stock we will backorder and notify you of delivery date. All shipments are F.O.B. ***Scanner World*** warehouse in Albany, NY. We are not responsible for typographical errors. All merchandise carries full manufacturers warranty. Bid Proposals and Purchase orders accepted from Government agencies. Free full line catalogue available upon request. No minimum order. New York State Residents add 7% sales tax.

SHIPPING CHARGES

(*) Add ($) per scanner, and $3.00* for all accessories ordered at same time. C.O.D. shipments will be charged an additional $3.00 per package. Full insurance is included in shipping charges. All orders are shipped by United Parcel Service. Shipping charges are for continental USA only. Outside of continental USA, ask for shipping charge per scanner.

Making a Good Antenna Better

(Due to the vagaries of the U.S. Mail, this month's antenna column is a rerun of a never-ending subject of interest--how can we improve the antenna we've already got?!)

When we ponder the function of the antenna in our communication system, we realize that it is, quite literally, our interface with the rest of the communications world. The importance of an adequate antenna for your communications system cannot be overemphasized.

Our requirements may be well satisfied by a mediocre antenna system if our interests are limited to such non-demanding activities as monitoring local (and therefore strong) utility signals, or casually tuning the short-wave bands. But when we want to pick up distant weak signals or transmit to far-away QTHs, then antenna performance becomes an important factor in the overall performance of our system.

Antennas Can be Tuned!

Most of the antennas in use today are of the type that are designed to be resonant at the frequency or band of operation. For example, antennas such as the half-wave dipole, groundplane, Yagi-Uda, colinear, inverted-vee, and most other antennas you can think of are of the resonant type.

Non-resonant antenna types are much fewer in number and include the Beverage, rhombic and non-resonant vee (don't confuse this with the inverted vee). Since the non-resonant antennas tend to be very large, expensive and difficult to erect, most people reading this column are probably using some type of resonant antenna system.

If the antenna is resonant, it essentially functions like a tuned circuit at the frequency or band for which it is designed. When your rig, line and antenna are matched, this resonance tends to produce the maximum signal output to your receiver and also provides the antenna's "textbook" radiation pattern when transmitting.

Most of us use commercially manufactured antennas or antennas which we have constructed at home from instructions in a "how-to-do-it" publication. These antennas were designed for some theoretically "average" site, or perhaps for theoretically ideal conditions.

Since our station site will depart to some degree from either average or ideal conditions, the antenna will not be optimally matched to our specific site in the vast majority of cases. Not only will it probably not have quite the resonant frequency for which it was designed, its radiation pattern will likely not be as anticipated, it will likely not have the impedance its design specifies and will not, therefore, match the impedance of the coaxial cable which we use.

J.D. Wells has stated this problem as follows: "Most of the ... patterns you see in the handbooks are for an antenna remote from earth. And when they say remote, they mean RE-mote! The ground has considerable effect on ham antennas below 30 megacycles because we don't get five or six wavelengths from ground.

What this means is that the directivity pattern is not ideal, the impedance at the center is probably not 72 ohms, and the angle of radiation is most likely not what we would like it to be. Also you don't have a perfectly conducting ground under it and you may get combinations of effects that would defy description."(1) Well said, Mr. Wells.

So What?...

...you may ask at this point. Am I trying to prove that most of us have less than optimal antenna systems? Well, in a way, yes. Although the average antenna is probably functioning "adequately," most of us can improve the operation of our communication systems considerably if we take the trouble to tailor the antennas which we use to the site where they are erected.

If we decide that we want to do this, the question arises as to just how to accomplish the feat. Let's survey some of the approaches and equipment types that are used for this purpose.

Common Antenna Test Gear

The most common instruments used in adapting antennas to a specific site include: the noise bridge, the dip meter, the antenna impedance meter, the field strength meter (FSM), and the standing-wave ratio meter (SWR meter).

The first three of these instruments do not require a transmitter at the station under test; The last two instruments are generally used at sites which employ a transmitter because they are designed to assess a signal after it leaves the antenna (the FSM) or as it is fed to the antenna system (SWR METER).

Noise Bridge

The noise bridge is a means of generating noise across a wide band of radio frequencies, and then detecting the response of your antenna to these frequencies. With this instrument you can determine your antenna's resonant frequency and impedance; as well as make some useful transmission line measurements.

Dip Meter

The dip meter, the modern version of the tube-type grid-dip oscillator, is a resonance-indicating device. It consists of a small portable oscillator which is affected by nearby resonant circuits.

The effect is such that a change (dip) in current in the oscillator is caused when the oscillator is tuned to the resonant frequency of the nearby circuit. By coupling the oscillator to your antenna, you can determine the antenna's resonant frequency.

Antenna Impedance Meter

An antenna impedance meter, sometimes called an "antenna bridge," "antennascope" or "Z-scope," allows you to determine the feedpoint impedance of your antenna. By shortening or lengthening the antenna, you can bring the impedance to the proper value to match the feedline, allowing maximum power transfer.

Use of an antenna impedance meter requires a source of radio frequency signal; usually, this signal is furnished by a dip-oscillator, but other low-power oscillators may be employed.

Field Strength Meter

The field strength meter is essentially a simple receiver which presents its output visually via a meter movement which increases as the antenna's output increases. Some models give an audible output as an added convenience and also for use by blind operators.

During antenna adjustments, field strength meters can be used to indicate relative signal output strength. Some models are tunable and may be used to check for the presence of specific harmonic frequencies with the antenna may be radiating.

Standing-Wave-Ratio Meter

The SWR meter is probably the best known, and perhaps most misused, of the popular antenna test instruments. An SWR higher than one indicates that some power is being reflected from the load on the transmission line (the antenna in this case) back to the source (the transmitter). This sounds bad to us and we generally get the idea that the SWR should be as close to 1/1 as possible.

Theoretically, that's true, but we have it on good authority that ratios as high as 10/1 are not unacceptable on HF when we have low feedline losses. Values of 2/1 or even 4/1 are generally not cause for much concern as far as antenna system efficiency goes, but some solid-state rigs can't tolerate such SWR levels. Everyone should read discussions such as those by Bill Orr (2) or John Haerle (3) on the relative contribution of SWR level to signal output.

In an SWR meter is inserted in the transmission line between the transmitter and the antenna tuner, the tuner can then be used to adjust the SWR of the antenna system for more efficient operation. This won't correct for mismatches at the antenna and of the transmission line, but if your transmission line is relatively low-loss, your system is likely to perform well anyhow.

Summary:

It is not the intention of this column to make you suspicious of, or unhappy with, your present antenna system; it's probably doing a fine job. Just as we don't need finely-tuned race cars to get us around town, we don't all need to fine-tune our antennas.

But some of us are concerned at times with getting the best performance possible from our antenna systems. When the going is tough and we want to read those tantalizing weak signals, an optimized antenna system can make the difference.

Specifics on how to use the test instruments described above are included in their instruction manuals, and to one degree or another in references 2 through 7 below. If you have particular questions about antenna tests and measurement, drop me a line. If enough readers show an interest on a particular topic, I'll try and cover it in a future column.

NEW! CB Radios & Scanners

Communications Electronics,™ the world's largest distributor of radio scanners, introduces new models of CB & marine radios and scanners.

NEW! Regency® TS2-RA

Allow 30-90 days for delivery after receipt of order due to the high demand for this product.

List price $499.95/**CE price $339.95**

12-Band, 75 Channel • Crystalless • AC/DC

Frequency range: 29-54, 118-175, 406-512, 806-950 MHz.

The *Regency* TS2 scanner lets you monitor Military, Space Satellites, Government, Railroad, Justice Department, State Department, Fish & Game, Immigration, Marine, Police and Fire Departments, Aeronautical AM band, Paramedics, Amateur Radio, plus thousands of other radio frequencies most scanners can't pick up. The *Regency* TS2 features new 40 channel per second *Turbo Scan*™ so you wont miss any of the action. Model **TS1-RA** is a 35 channel version of this radio without the 800 MHz. band and costs only $239.95.

Regency® Z60-RA

List price $299.95/**CE price $148.95/SPECIAL**

8-Band, 60 Channel • No-crystal scanner

Bands: 30-50, 88-108, 118-136, 144-174, 440-512 MHz.

The *Regency* Z60 covers all the public service bands plus aircraft and FM music for a total of eight bands. The Z60 also features an alarm clock and priority control as well as AC/DC operation. Order today.

Regency® Z45-RA

List price $259.95/**CE price $139.95/SPECIAL**

7-Band, 45 Channel • No-crystal scanner

Bands: 30-50, 118-136, 144-174, 440-512 MHz.

The *Regency* Z45 is very similar to the Z60 model listed above however it does not have the commercial FM broadcast band. The Z45, now at a special price from Communications Electronics.

Regency® RH256B-RA

List price $799.95/**CE price $329.95/SPECIAL**

16 Channel • 25 Watt Transceiver • Priority

The *Regency* RH256B is a sixteen-channel VHF land mobile transceiver designed to cover any frequency between 150 to 162 MHz. Since this radio is synthesized, no expensive crystals are needed to store up to 16 frequencies without battery backup. All radios come with CTCSS tone and scanning capabilities. A monitor and night/day switch is also standard. This transceiver even has a priority function. The RH256 makes an ideal radio for any police or fire department volunteer because of its low cost and high performance. A *60 Watt* VHF 150-162 MHz. version called the **RH606B-RA** is available for $459.95. A UHF 15 watt, 10 channel version of this radio called the **RU150B-RA** is also available and covers 450-482 MHz. but the cost is $439.95.

Bearcat® 50XL-RA

List price $199.95/**CE price $114.95/SPECIAL**

10-Band, 10 Channel • Handheld scanner

Bands: 29.7-54, 136-174, 406-512 MHz.

The *Uniden Bearcat* 50XL is an economical, handheld scanner with 10 channels covering ten frequency bands. It features a keyboard lock switch to prevent accidental entry and more. Also order the new double-long life rechargeable battery pack part # **BP55** for $29.95, a plug-in wall charger, part # **AD100** for $14.95, a carrying case part # **VC001** for $14.95 and also order optional cigarette lighter cable part # **PS001** for $14.95.

PC 22

NEW! Scanner Frequency Listings

The new Fox scanner frequency directories will help you find all the action your scanner can listen to. These new listings include police, fire, ambulances & rescue squads, local government, private police agencies, hospitals, emergency medical channels, news media, forestry radio service, railroads, weather stations, radio common carriers, AT&T mobile telephone, utility companies, general mobile radio service, marine radio service, taxi cab companies, tow truck companies, trucking companies, business repeaters, business radio (simplex) federal government, funeral directors, veterinarians, buses, aircraft, space satellites, amateur radio, broadcasters and more. Fox frequency listings feature call letter cross reference as well as alphabetical listing by licensee name, police codes and signals. All Fox directories are $14.95 each plus $3.00 shipping. State of Alaska–**RL019-1**; Baltimore, MD/Washington, DC–**RL024-1**; Chicago, IL–**RL014-1**; Cleveland, OH–**RL017-1**; Columbus, OH–**RL003-2**; Dallas/Ft. Worth, TX–**RL013-1**; Denver/Colorado Springs, CO–**RL027-1**; Detroit, MI/ Windsor, ON–**RL008-2**; Fort Wayne, IN /Lima, OH– **RL001-1**; Houston, TX–**RL023-1**; Indianapolis, IN–**RL022-1**; Kansas City, MO/ KS–**RL011-2**; Los Angeles, CA–**RL016-1**; Louisville/Lexington, KY–**RL007-1**; Milwaukee, WI/Waukegan, IL–**RL021-1**; Minneapolis/St. Paul, MN–**RL010-2**; Nevada/E. Central CA–**RL028-1**; Oklahoma City/Lawton, OK–**RL005-2**; Pittsburgh, PA/Wheeling, WV–**RL029-1**; Rochester/ Syracuse, NY–**RL020-1**; Tampa/St. Petersburg, FL–**RL004-2**; Toledo, OH–**RL002-3**. A regional directory which covers police, fire ambulance & rescue squads, local government, forestry, marine radio, mobile phone, aircraft and NOAA weather is available for $19.95 each. **RD001-1** covers AL, AR, FL, GA, LA, MS, NC, PR, SC, TN & VI. For an area not shown above call Fox at 800-543-7892 or in Ohio 800-621-2513.

Regency® Informant™ Scanners

Frequency coverage: 35-54, 136-174 406-512 MHz.

The new *Regency* Informant scanners cover virtually all the standard police, fire, emergency and weather frequencies. These special scanners are preprogrammed by state in the units memory. Just pick a state and a category. The Informant does the rest. All Informant radios have a feature called *Turbo Scan*™ to scan up to 40 channels per second. The **INF1-RA** is ideal for truckers and is only $249.95. The new **INF2-RA** is a deluxe model and has ham radio, a weather alert and other exciting features built in for only $324.95. For base station use, the **INF5-RA** is only $199.95 and for those who can afford the best, the **INF3-RA** at $249.95, is a state-of-the-art, receiver that spells out what service you're listining to such as Military, Airphone, Paging, State Police, Coast Guard or Press.

Regency® HX1500-RA

List price $369.95/**CE price $218.95**

11-Band, 55 Channel • Handheld/Portable Search • Lockout • Priority • Bank Select Sidelit liquid crystal display • EAROM Memory Direct Channel Access Feature • Scan delay

Bands: 29-54, 118-136, 144-174, 406-420, 440-512 MHz.

The new handheld *Regency* HX1500 scanner is fully keyboard programmable for the ultimate in versatility. You can scan up to 55 channels at the same time including the AM aircraft band. The LCD display is even sidelit for night use. Includes belt clip, flexible antenna and earphone. Operates on 8 1.2 Volt rechargeable Ni-cad batteries (not included). Be sure to order batteries and battery charger from the accessory list in this ad.

Bearcat® 100XL-RA

List price $349.95/**CE price $178.95/SPECIAL**

9-Band, 16 Channel • Priority • Scan Delay Search • Limit • Hold • Lockout • AC/DC

Frequency range: 30-50, 118-174, 406-512 MHz.

Included in our low CE price is a sturdy carrying case, earphone, battery charger/AC adapter, six AA ni-cad batteries and flexible antenna. Order your scanner now.

★★★ *Uniden CB Radios* ★★★

The *Uniden* line of Citizens Band Radio transceivers is styled to compliment other mobile audio equipment. Uniden CB radios are so reliable that they have a two year limited warranty. From the feature packed PRO 540e to the 310e handheld, there is no better Citizens Band radio of the market today.

PRO310E-RA *Uniden* 40 Ch. Portable/Mobile CB . . . $85.95
NINJA-RA PRO310E with rechargeable battery pack. $99.95
B-10-RA 1.2V AA Ni-cad batt. for Ninja (set of 10) $20.95
PRO520E-RA *Uniden* 40 channel CB Mobile $59.95
PRO540E-RA *Uniden* 40 channel CB Mobile $119.95
PRO710E-RA *Uniden* 40 channel CB Base $119.95
PC22-RA *Uniden* remote mount CB Mobile $99.95
PC55-RA *Uniden* mobile mount CB transceiver. $59.95

★★★ *Uniden Marine Radios* ★★★

Now the finest marine electronics are available through CEI. The *Unimetrics* **SH66-RA** has 50 transmit and 60 receive frequencies with 25 or 1 watt power output. Only $169.95. The *Unimetrics* **SH 88-RA** is a deluxe full function marine radiotelephone featuring 55 transmit and 90 receive channels and scanning capability for only $259.95. The *Unimetrics* **SH3000-RA** is an excellent digital depth sounder, good for 300 feet. It has an LCD continuously backlit with red light display and a 5 ft. or 10 ft. alarm. Only $189.95. Order today.

Bearcat® 800XLT-RA

List price $499.95/**CE price $289.95/SPECIAL**

12-Band, 40 Channel • No-crystal scanner Priority control • Search/Scan • AC/DC

Bands: 29-54, 118-174, 406-512, 806-912 MHz.

The Uniden 800XLT receives 40 channels in two banks. Scans 15 channels per second. Size 9¼" x 4½" x 12½."

A Receiver Instruction Manual

I know many of you have a second-hand unit that didn't come with a manual. A lot of you did receive one, but found it boring or misleading. Those with earlier Japanese units, outside of getting a big laugh, didn't fare much better: "If, upon clockwise rotary of control, finding volume bigger gets..." or "Decreasing other in same proportion, effecting switch..." You get the point.

I've got nothing against the Japanese, having been with a lot of them; they're neat folk. Now, however, with their syntax in order, they seem to have gone overboard the other way. Way too technical and assuming too much. If you'll bear with me, I'm *not* going to talk down to you. What I plan to do is simply increase your enjoyment severalfold.

Ready?

RF Gain Control... This little understood control, usually left fully clockwise for the life of the radio, can be the most useful of all! You want your initial "S" reading. Fine. After that, what do you have? I'll tell you. A signal that's, say, 5 dB over "S" 9 with a bunch of garbage running about "S" 5 - 7.

This control is directly analogous to the audio volume control, except it works at the front of the radio, not the rear. By just reducing (counter-clockwise) it, by the time your '5 over 9' signal hits around "S" 6, the crud is *gone*. Try this one and you're hooked.

When you wish to resume tuning, run it up again.

Another useful feature is "setting the noise level." Simply tune to an unoccupied area and drop your "S" 3 or 4 noise level to zero with it. You're not going to hear anything beneath that anyway and it fatigues the brain. If all of this has come as a big surprise, keep on reading.

ANL or Noise Blanker (NB)... On first observation, these controls seem to be self explanatory. Let's dig a little deeper.

An ANL (automatic noise limiter) does just that -- limit. An average value is quickly established by a capacitor and anything over that is "clipped." This can cause a slight amount of distortion that's more than offset by a small advantage in selectivity. You see, a little side "buckshot" is also perceived as noise and thus reduced. A good control to leave on all the time. Surprise!

A noise blanker, on the other hand, is an entirely different breed of cat. What it does is actually turn the receiver off during a noise pulse, punching a hole in the audio. The characteristic of this circuit is also to widen the selectivity, so it should only be used in the presence of strong pulse interference. A definite trade-off situation.

Selectivity... This controls the width of "window" of frequency your receiver "sees." It is truly fortunate if your radio has such a control, as it's definitely in the top one-third. This control isn't a doorway, however. It's shaped like a bell and usually the reference markings only refer to 1 "S" unit or so -- no kidding!

Without going into dB rations, use the tightest (smallest) number that is comfortable to listen with. In other words, 2.4 kHz on AM isn't too extreme if you have interference and can understand the information.

There is also exalted carrier reception, which requires a selectivity control. even if it's just narrow/wide for optimum results. (See BFO, next.)

BFO... This is an oscillator at the detector stage of the radio to restore the missing carrier on SSB, or, in the case of code (CW), and FSK (frequency shifting on radio teletype), to allow an audio tone to be produced so the information may be recovered. I'm aware you already knew that.

Perhaps you've also heard of "exalted carrier" reception, but never had an explanation. Well, here it is.

An AM signal consists of a constant carrier wave or signal with two identical side bands (upper and lower) on each side. Turning your BFO on and putting the control at 10:00 or 2:00 as you do to receive SSB, tune an AM signal to 'zero beat' (no tune). Depending on your BFO (or USB/LSB switch, which sets automatically), setting you are now only receiving one half of the signal.

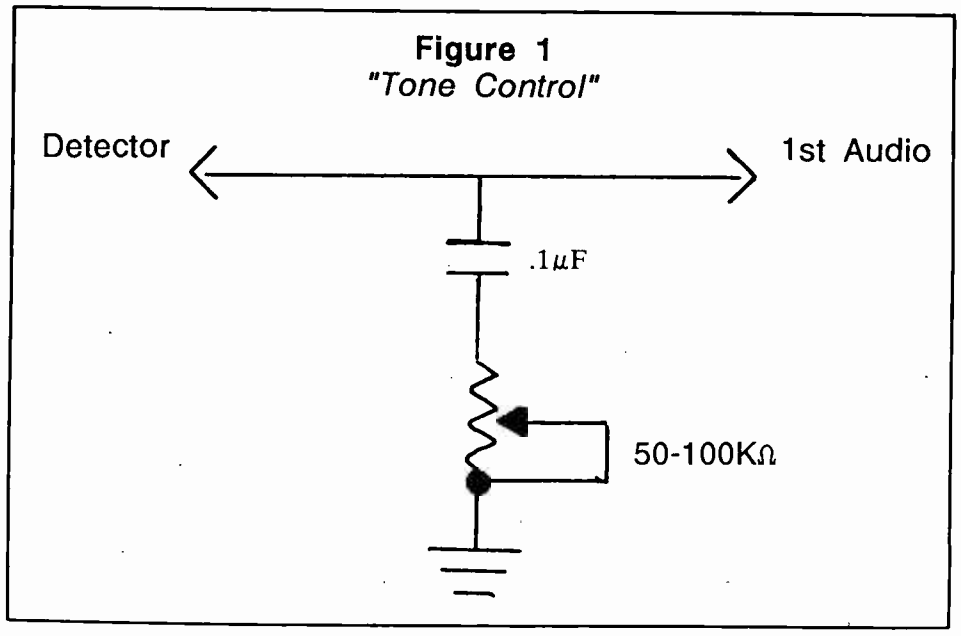

Figure 1
"Tone Control"

Remember, each "half" is identical. Why on earth would anyone do this, you ask.

Lemme tell ya. Let's say you're listening to a station on 11.800 MHz and are getting interference from a station on 11.805 MHz. A station on international shortwave is usually about 8 kHz wide (4 up, 4 down). Aha! What if we tune to the lower frequency side of our station? Why, we move away from the interference. Unless there's a strong station on 11795, which unfortunately can happen a fraction of the time, your station is in the clear!

Remember, your BFO control must be "offset", not at 12:00 for this technique to work properly. Also, you want to use some SSB.CW or "narrow" selectivity setting for truly great results. On some receivers with an USB/LSB-CW switch, the selectivity is narrowed automatically. The Yaesu FRG-7700 is an example of this. There are others.

Tone control... Is this guy nuts? He said he wasn't going to talk down to me.

I'm keeping my promise -- the manufacturer is lying through his teeth. It isn't a tone control, it's just a treble cutter. No more, no less. (See figure 1.) It is so useless that you usually put it at about 50/50, scratch your head and never touch it again.

It does have a dandy, ready made hole for a notch control, though. Now there's a function that really does something. If you have a notch control, the proper way to set this thing is to disconnect the antenna, set the control fully clockwise, run up the volume and then turn it CCS until the internal hiss of the radio drops perceptibly. Then, never touch it again.

Notch Control... This is a function found on just a few sets, but it has been around for close to 40 years. What this does is "plow" a deep groove over a range of 6 to 10 kHz to knock out heterodyne (beat tone) interference and other types of RF commotion that are trying to ruin your day.

The most important thing to remember about this control is the fact that its doesn't know who the enemy is. So do not ever leave it at 12:00. Park it at 3:00 or 9:00. Otherwise, you'll wonder just who the wizard is that has the capability of trashing every station on the air. No mystery now.

"S" meter... This is a nice little meter that adds class, ease of tuning and a relative indication of signal strength. There is an industry standard that is conspicuous by its absence, stating that "S" 9 equals 50 uv (microvolts). If you have access to a laboratory grade signal generator, it's helpful to set the "S" meter to this standard at about 10 MHz. Don't bother to check it afterwards at 1 or 30 MHz as it will be off and you'll just wind up chasing your tail around a tree trying to equalize it.

Outside of maximizing the antenna trimmer or preselector control on the frequency in use, the tuning, range and volume are self explanatory. Any questions with an S.A.S.E. will receive a personal reply. Enjoy. ■

VHF - UHF

YAESU FRG9600

60-905 MHz

Service manual order: SM9600 price: $25.00

$499.95 + $7.00 UPS

A premium VHF/UHF scanning communications receiver.

- You won't miss any local action with continuous coverage from 60 to 905 MHz.
- You have more operating modes to listen in on: upper or lower sideband—CW, AM wide or narrow, and FM wide or narrow.
- Plus there's much more, including a 24-hour clock, multiplexed output, LCD readout, signal strength graph, and an AC power adapter.

OPTIONS: *FIF-232C* for RS232 compatible computers; $69.95. *VU-9600* for tuning in TV stations with your 9600 and video monitor, $25.00. 99 memories.

ICOM R-7000

$949.00 + $10.00 UPS

Commercial Receiver VHF-UHF 25-2000 MHz

Service manual order: SMICR7000 price: $25.00

- 25-2000 MHz coverage
- Precise frequency entry via keyboard
- 96 programmable memories
- Scan-memory-mode-select memory-frequency
- 5 tuning speeds: 1, 1.0, 5, 10, 12.5, 25 KHz
- Narrow/wide filter selection
- Memory back-up • Noise blanker
- "S" meter or center meter for FM
- AM & FM wide, FM narrow. SSB, CW

EEB HP Options

- Front end upgrade improves sensitivity
- Audio mod—better volume, less distortion
- Optional band pass filters
- Power supply cooling mod to reduce chassis heat • Spike protection, on AC line
- IF output for spectral display 10.7 (STD) 21.4, 30 MHz others available
- 24 hour bench test and realignment for optimum performance
- Extended warranty to 6 months
- Final alignment and overall checkout
- Installation of ICOM options purchased with your new R7000 at no charge

AMECO Tunable Pre Amp-Antenna

- Matches Most Any Antenna
- Improves Gain and Noise Figure
- 9V Battery PWR (not included)
- AC Adapter Optional ($9.95) (Order - P9T)
- 200 kHz-30 MHz
- Preselector
- Indoor Active Antenna

$74.95 + $4.00 UPS

ANTENNAS

EAVESDROPPER SALE

$59.95 + $4.00 UPS

- Balanced trapped Dipole
- Maximum performance, Minimum local noise
- All SW Bands 60-11 meters
- Only 43 feet long - 100 ft. feed line
- Complete - Everything you need.

MFJ 1024 $119.95 + $5.00 UPS
A.C. Adapter $9.95 (MFJ-1312)

- Outdoor active antenna
- Performs as well as units costing $180.00
- WRTVH rates it high

ICOM AH7000

$89.95 + $4.00 UPS

Discone Antenna for ICR7000/others w/type 'N' antenna connector. 25-1300 MHz!

D-130 ANTENNA

$79.95 + $4.00 UPS

Same as above but with PL-259 connector.

NEW FROM EEB

ALL NEW FROM SONY! WORLD BAND RADIO THE NEW ICF-7700

- 15 Bands-12 SW, MW, LW & FM
- 15 Station memory presets
- LCD Frequency readout
- Built in clock & sleep timer
- 4 1/2" × 7 1/2" × 1 1/4"
- Earphone, carrying case, SWL book included. AC-D4L Optional AC Adaptor $21.95

$249.95 + $4.00 UPS

DON'T LET ITS SMALL SIZE FOOL YOU! A FULL FEATURED RADIO THAT WILL FIT IN YOUR POCKET. THE ULTIMATE IN PORTABILITY!

SONY ICF—PRO80

ONLY $399.95 + $4.00 UPS

SONY CALLS THIS RADIO THE 'PRO80' & HERE'S WHY:

- Covers 150 kHz to 216 MHz!! (with supplied converter)
- AM, FM, (wide & narrow); SSB • 40 Station Memories!
- Memory scan, Program scan, Limit scan, up/down manual scan and priority scan! • Automatic and manual squelch!
- Handheld radio 3 1/2" × 7 1/4" × 2" and weighs 1 lb. 7 oz.
- Rechargeable battery Pak (opt) • Comes with telescopic antenna, shoulder belt, carrying case, wave book, frequency converter and BNC adaptor.

PANASONIC RFB60 Compact multi-band radio

CALL FOR PRICE

- PLL synthesized receiver
- 6-way tuning system
- Clock/Timer with Sleep
- LCD Readout

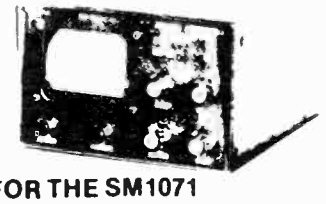
LOWE HF-125 NEW HF RECEIVER

CALL FOR PRICE

- 30 kHz TO 30 MHz • AM, SSB
- 30 Memories • 12 Vdc
- 4 Filters (selectable)
- OPTIONS: Nicad battery, keypad frequency entry, ECSS system.

SIGNAL DISPLAY UNIT! FOR THE ICR7000 & OTHERS

$1295.00 + $8.00 UPS



SPECIFICATIONS FOR THE SM1071

- Frequency range 10.2 to 11.2 MHz
- Sensitivity: 0.5uV min discernable signal
- Gain control range: 70 dB min.
- 2.5" × 2.0" Screen
- Log range: approx 60 dB
- 50 ohm nominal input impedance
- Size is 6" × 4" × 10.5
- Log range is approx 60 dB

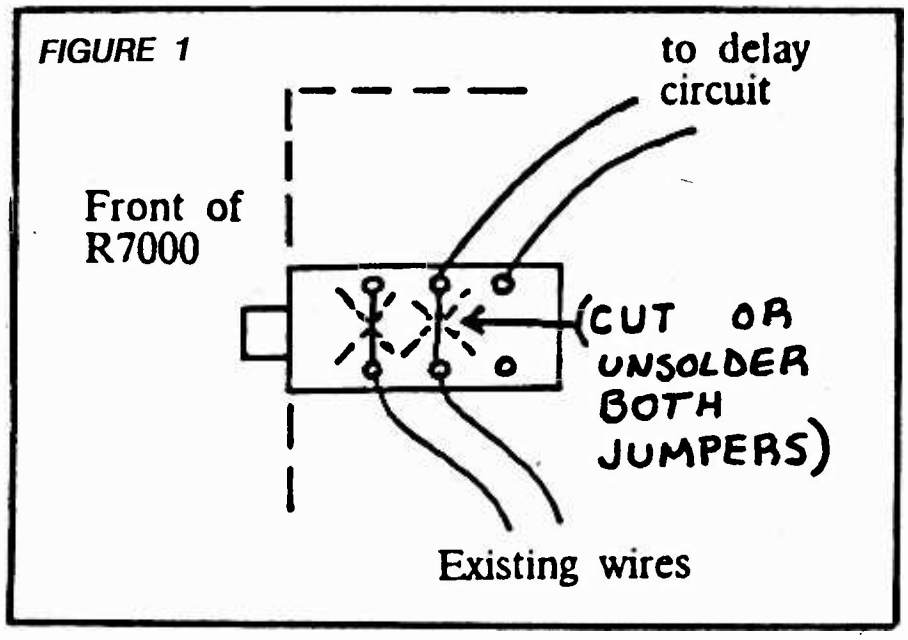
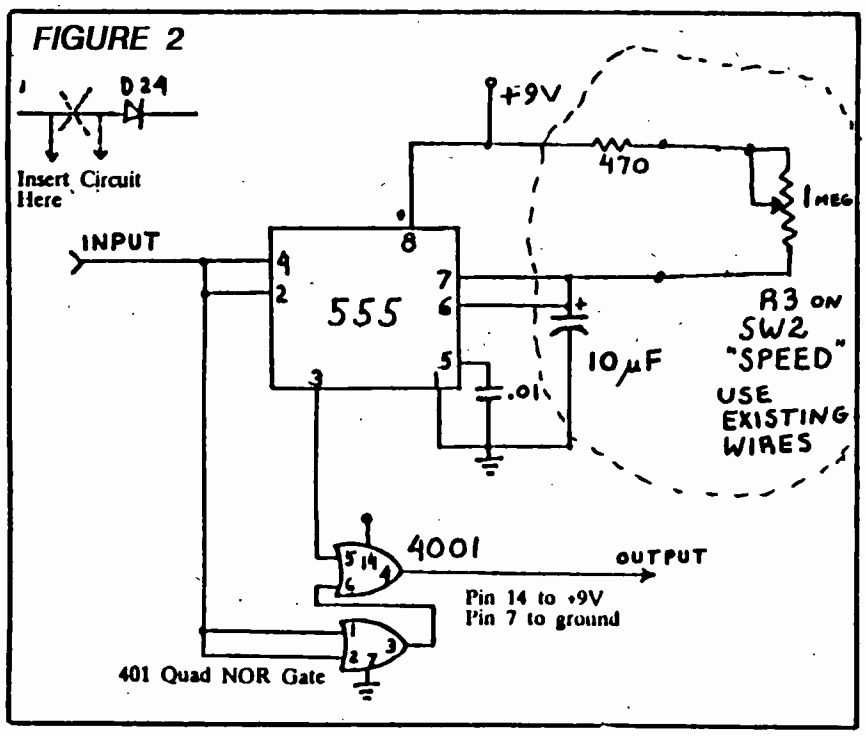
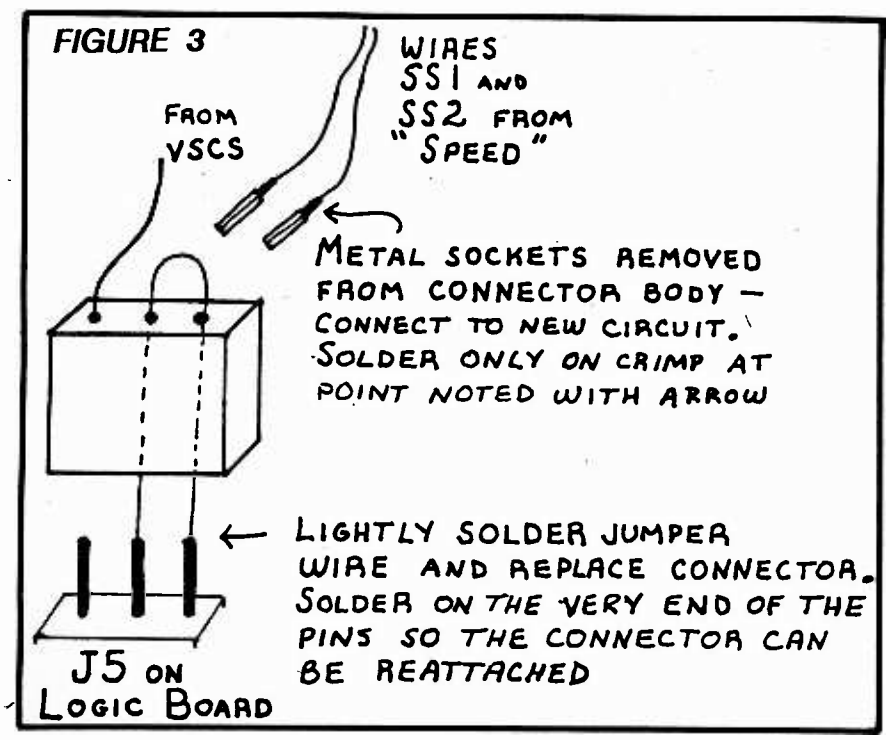
Scan Delay Improvements for the ICOM R7000







First Things First

We owe a sincere thanks to David Cook for providing us with a solution to the R7000's scan delay problem (*MT*, July 87). Having installed the mod, I can report that the receiver finally acts like one would expect it to! As Bob Grove commented in the July issue, the lack of a normal scan delay is the major source of dissatisfaction with the R7000.

The R7000 is an enthusiast's machine. Just like sports car owners are forever trying to "tweak" their machines for the ultimate in performance, we R7000 owners tend to look for ways to improve on ICOM's design. Starting with simple mods to speed up the scanning rate, we have now progressed to making functional changes in the circuitry! Each month, we anxiously await the arrival of *Monitoring Times* to see what new trick someone has discovered.

Installing the Mod

As soon as I read David's article, I high-tailed it over to Radio Shack to pick up the required parts. Since my R7000 hasn't seen its case screws since it was about one day old, it didn't take long for me to dive inside and check out what I was getting into.

David's comments about the VSC switch being in cramped quarters are distressingly true. Unless you're quite steady with a soldering iron (or have some experience in brain surgery), you're going to be intimidated by the job facing you.

The only sure way to get to the VSC switch is to completely disassemble the front panel. I took the lazy way out and only scorched a <u>few</u> wires! What I did learn, however, was a way to avoid the problem completely.

Problems with the Circuit

After installing the circuit and making the modifications to the R7000, I was faced with the usual problem of things not working as they should. With VSC pushed in, the R7000 worked normally, but with it out, it wouldn't resume scanning. A couple hours of rechecking the circuit and mumbling under my breath resulted in the discovery that the VSC switch was introducing noise or some stray voltage into the scan delay circuit.

That problem was remedied by cutting the second wire on the VSC switch -- remember David's explanation of the VSC switch being a DPDT with both poles shorted? He told you to snip the center wire. I found that you have to cut both of them -- fully isolating the two sides of the switch (see figure 1). The modified schematic shows you where to cut. Stick with me for a few more paragraphs, however, and I'll show you how to avoid the VSC switch completely!

Improving the Improvements

The only reason for using the VSC switch as a defeat is to prevent the new scan delay from clashing with the VSC. If the VSC resumes scanning while the scan delay is trying to hold up the scan, things tend to get confused and not work (was that too technical?). Nothing smokes, it "just don't work!"

For those of you without the steady hands and keen eyesight of your youth, I present the following alternative. Can you live without a scan "Speed" control? Mine hasn't known any position other than full clockwise -- who needs slow scan? I decided that a variable scan delay would be <u>much</u> more useful!

The speed control, R3 on the front panel, is a 1 meg variable resistor. In David's circuit, he uses a 2 meg resistor to give a four second delay; how about a variable delay up to around 15 seconds? Just change the timing capacitor from 2.2 microfarad to 10 microfarad, and use the speed control in place of the 2 meg resistor. This eliminates the need for the VSC defeat, since all you have to do is turn the speed control full clockwise for no delay! You now have variable delay and no need for microsurgery!

The Details

Take a look at the modified circuit drawing from David's article (figure 2). First, note the connection points for the speed control; the 470 ohm fixed resistor is still in the circuit as a current limiter -- if you omit it, you <u>will</u> damage the speed control! When the speed control is fully clockwise, it would have presented a direct short for the 9 volt supply to the 555 -- resulting in expensive smoke! The resistor safely prevents this disaster.

Next, refer to figure 3 to see how to connect to the speed control. By disassembling the connector at J5 on the logic board, you can reroute the wires from the speed control to your new scan delay circuit. Just follow the wires back to the front panel to identify the two correct ones.

After removing the metal contacts from the body of the connector, fabricate a short (four inch) piece of insulated wire into a jumper as shown on the sketch. This jumper is soldered to the pins on the logic board in place of the wiring from the speed control. By routing the jumper through the now-empty holes in the connector before soldering, you will be able to reattach the connector to the logic board.

Route the speed control wires onto the accessory tray and solder to the wiring leading from the delay circuit. I was careful to solder to the crimped part of the metal connectors so the R7000 could be easily restored to original condition later.

Mount the delay circuit on the accessory tray, being careful to insulate it from shorts -- I used a layer of electrical tape, but double-sided foam might work better. Remember that the accessory tray is on the bottom of the R7000, so your mounting will have to hold the circuit securely!

The Results

I now have a customized R7000 with a speedier scan rate, adjustable scan delay, dim display and meter for night use, modified earphone plug to eliminate hiss, and an accessory power outlet to power my Grove antenna amplifier. What ya' got under the hood in yours?

Let's keep up the information exchange in these pages. Those of us with burned fingers and solder smoke in our eyes can boast that we've picked up where the ICOM engineers left off. Until ICOM decides to come out with an R7100 (or would that be an R7001?), we have the opportunity to tweak the R7000 into a technological marvel with the consumer features we want. ICOM said scan delay was impossible -- nothing's impossible, it just might take a little longer!

Experiments with the Grove Scanner Beam

Several years ago Grove Enterprises introduced their Scanner Beam I, an innovative directional "beam" antenna for serious scanner listeners who wanted to extend their listening range. Later, the original design was improved to enhance 30-50 MHz low band performance as well.

Bill Cheek, president of Commtronics Engineering in Lemon Grove, California, and publisher of the *Eleven Meter Times Journal*, recently offered to do an objective, independent review of the Scanner Beam II if we would report his results to *MT* readers regardless of his findings. We agreed.

Reprinted below is the distillation of Bill's findings, good and bad. We are grateful to Bill for his dedication to the task and for his thorough procedure.

The Setup

Four configurations were erected and tested: a standard Scanner Beam, a modified Scanner Beam (rear low-band element cut off), a Grove OMNI antenna, and two Scanner Beams stacked and phased (side by side).

The stacked beams were separated 7 feet, 1 inch, using a length of 3/4-inch copper water pipe as the cross boom. Phasing lines were two Radio Shack #15-1529 4-foot, 75-ohm coax cables with push-on F connectors, both fed into a Radio Shack #15-1141 hybrid VHF/UHF TV splitter/combiner.

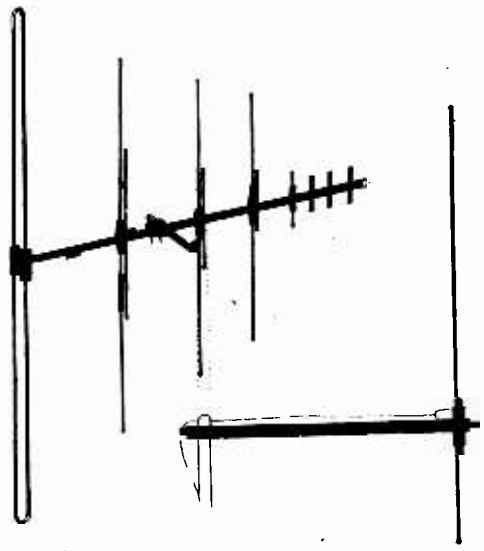
The test receiver was a Realistic PRO2002 scanner with the AGC line fed to a calibrated voltmeter. The targets were six transmitters in the San Diego region in the high and UHF frequency bands and a test oscillator (34.925 MHz) at 200 feet distance, used because of the instability of distant low-band signals.

Signal level readings were taken one at a time as antennas were alternated atop a 25-foot pole; front-to-back ratios were also measured with the three directional configurations. Gain figures in decibels (dB) were then calculated and listed in the accompanying table.

Some Brief Conclusions

The performance of the phased array was very impressive. The sharp forward directivity was accompanied on most frequencies by a sharp null on either side of the maximum signal. Dramatic front-to-back ratios and remarkable improvement in sidelobe rejection were noted as well, making it particularly useful for rejection of unwanted signals and an exciting prospect for further research and development efforts.

There is no increase in gain using two Scanner Beams over one, however, and the main lobes were rarely in line with the axis of the array, making it useless for direction finding. None of the configurations was particularly suitable for low band monitoring*.



**Ed. Note: All scanner antennas presently on the market are physically short for low band reception; a resonant 30 MHz dipole would be nearly 16 feet tall, too cumbersome for the majority of installations. The Scanner Beam is comparable to other multiband antennas for low band monitoring.*

RECEIVED SIGNAL LEVELS

"ASK BOB"

Bob Grove, WA4PYQ
P.O. Box 98
Brasstown, NC 28902

***Q.** How does one specify the filter bandwidth in a receiver for listening to radioteletype? (Fred White, St. Augustine, FL)*

A. While it's a simple matter to choose a single filter for most CW (Morse code) and single sideband (SSB) and even AM voice, all depending upon how crowded the band is, selecting an RTTY filter is a little more complicated because of the number of speeds and shifts.

We contacted an expert for this one: Al Chandler at AEA in Lynnwood, Washington. According to Al, the filter bandwidth in hertz is equal to three times the baud rate, then add the shift. For example, a 75 baud (100 WPM), 425 Hz shift signal would need to pass through a 650 Hz bandwidth filter.

This value is ideal, of course, and in the real world we don't have ideal filters. For most applications, use the next higher bandwidth available for the RTTY application, probably an 800 or 1000 Hz filter for the example above.

***Q.** Where can I find a service manual for my Bearcat DX-1000 general coverage receiver? All I can get from Uniden is a schematic. (Michael Avinor, Albuquerque, NM)*

A. I'm afraid you will have to settle for the schematic; Uniden assures me that there has never been a service manual for the DX-1000.

***Q.** Why doesn't MT review Heathkit products? If their general coverage receiver is as good as the Yaesu or Kenwood I'd probably buy it instead, but there's no unbiased reviews to compare. (Izak Luchinsky, Baltimore, MD)*

A. We would be happy to provide this free promotional service for Heathkit and have contacted them on several occasions; unfortunately, they have refused to send any factory-wired products for us to test. We have to assemble their kits ourselves and we can't justify the personnel when there are so many other reputable companies willing to send a completed product.

***Q.** Are there any modifications or programming tricks for the Realistic PRO-2004 scanner or the Regency HX1200 hand-held scanner? (Michael Fischback, Mapleshade, NJ)*

A. Realistic (Radio Shack) scanners contain dedicated microprocessors which cannot be tricked into widening their frequency coverage. This continues to be true for the PRO-2004, by far the best scanner Radio Shack has ever introduced and quite possibly the best scanner ever released to the consumer market.

Like many Regency scanners, the HX1200 will accept frequency commands outside of its advertised limits. If the frequency error prompt comes up, no signal will be received even though the radio will take the entry. It is possible to retune the radio for those "outer limits," but it may be at the expense of sacrificing performance in normal ranges.

***Q.** How do the receiver sections of amateur transceivers compare with general coverage receivers from the same manufacturers? (John Zander, Jamesville, MN)*

A. Years ago the answer would have been different, but modern general coverage receivers are usually the same circuitry as found in comparable transceivers from the same manufacturer. My Kenwood TS440S receiver section, for example, is the same circuit as found in the R5000. The same observation applies to products from Yaesu and ICOM.

***Q.** How do I connect a Sony AN-1 active antenna to a Panasonic RF3100 receiver? (C. A. Luse, Lee's Summit, MO)*

A. Since the RF3100 has two terminals, one for an antenna and one for a ground, you must improvise an adaptor for the recently-discontinued AN-1. If you use the 1/8" plug on the AN-1, mate it to a jack (available from Radio Shack) to which two wires have been soldered, one for the tip of the plug (this goes to the antenna jack of the radio) and one for the barrel of the plug (this goes to the ground terminal).

***Q.** What difference in reception can I expect when I switch from the plug-in whip that came with my scanner to an outdoor antenna? (C. A. Luse, Lee's Summit, MO)*

A. Quite a bit. Indoors you are lower, the whip is smaller, nearby metal produces signal-cancelling reflections, electrical appliances produce interference, and building construction can shield the set from signals.

An outdoor antenna will provide greater range, possibly on the order of 100-200% further than the little indoor whip. In the clear and in flat, unobstructed terrain it is possible for a good rooftop scanner antenna to receive base station signals 75-100 miles away and mobiles at 10-25 miles or more.

***Q.** Who are the companies who are trying to take scanners and their frequencies away? (Gene Perryman, Kendrick, OH)*

A. No companies are trying to ban scanners, and only one company (Radio Shack) has limited frequency coverage to thwart interception of cellular telephone calls.

***Q.** Can scanner lockup (where two side-by-side scanners interfere with each other's scanning sequence) be helped by lining the inside of the plastic scanner cabinets with metal foil? (David Smith, Clarksville, IN)*

A. Perhaps partially. Be sure to cover as much of the front, sides, top, and bottom surfaces of the cabinet as possible and connect the foil at several points to the circuit board common ground foil. Stay away from the 120VAC wiring, however, on scanners which plug directly into the wall socket!

***Q.** Lightning has zapped my solid-state shortwave receiver; where can I find a good, used tube-type radio like the Collins R388 or National NC188? (Allan Easton, St. Anthony, IA)*

A. The market on tube-type receivers has just about dried up. Try the larger amateur radio dealers who advertise in *MT* and the ham magazines, and also contact surplus outlets like Slep Electronics (Highway 441, Otto, NC 28763; ph. 1-704-524-7519) and Fair Radio Sales (1016 E. Eureka Street, Lima, OH 45802; ph. 1-419-223-2196). You may also wish to place a classified ad in *MT*.

***Q.** How do I know whether to use the low impedance (50 ohm) or high impedance (500 ohm) antenna terminals on my shortwave radio? (Barry Rader, Fostoria, OH).*

A. Use the low impedance terminals with coax line or with any random wire under 100 feet or so in length. The high impedance input might be used with a longwire at higher frequencies (like 200 feet at 10 megahertz) for closer impedance matching. In virtually every practical installation, use the low impedance connection.

***Q.** Recently I saw ads for hand-held devices which could show stock market reports and sports scores, up to the minute. How do they work? (William Ritz, Cleveland, OH)*

A. In many large cities, FM broadcasters utilize subsidiary carrier authorization (SCA), whereby they transmit a subscriber service right along with their normal broadcast programming. A special narrowband selectivity receiver (or converter) is required to extract this second service from the wideband carrier of the primary broadcast service.

In the past it was legal to tap into SCA to receive background music, talking books for the blind, and many other interesting phantom users; but the Electronic Communications Privacy Act (ECPA '86) now forbids such unauthorized reception. ■

Grove's Indoor SWL Antenna

Our "Hidden Antenna System" is your key to exciting short wave reception without an outside antenna!

Here's the apartment dweller's dream—a high performance, amplified indoor antenna system.

This 66-inch, thin profile, flexible wire antenna can be tucked in a corner, hung behind a drape—just about anywhere out of sight. And when connected to the powerful PRE-3 signal booster, you have instant total spectrum coverage from 100 kHz to over 1000 MHz!

Yes, global short wave reception will be at your fingertips, and you can operate two radios at one time!

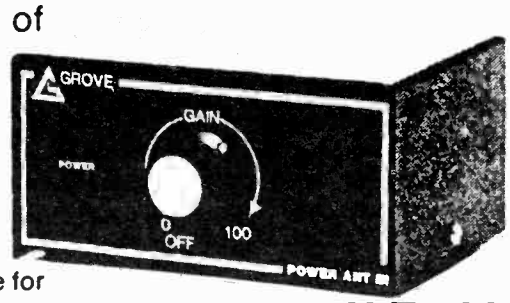
Full instructions included.

The Grove PRE-3 Power Ant has taken all the best from its successful predecessors and combined them into one powerful signal booster.

Equipped with a high gain, low noise, solid state amplifier stage, the PRE-3's front panel control allows custom selection of up to 30 dB of amplification!

What you need to order:

ANT-6 Hidden Antenna	**$8.95 (free shipping)**
PRE-3 Power Ant III	**$39 (plus $1.50 UPS, $3 U.S. Parcel Post, $4 Canada)**
ACC-20 AC adaptor	**$9.95 (free shipping with PRE-3)**
ACC-60 receiver cable	**$5.00** (you specify connector or receiver model; one for each receiver)



POWER ANT III

Add the Grove Minituner for Incredible Reception!

The addition of the Grove Minituner to the ANT 6/PRE-3 combo will allow signal peaking to perfection as well as eliminate intermodulation and image interference on your general coverage receiver.

Here's what you will need in addition to the combo above:

TUN-3 Minituner	**$39 (plus $1.50 UPS, $3 U.S. Parcel Post, $4 Canada)**
ADP-1 UHF/F adaptor	**$2.50 (free shipping)**
ADP-2 F/PL-259 adaptor	**$2.50 (free shipping)**

ESP and ECPA!

I recently returned from a very pleasant vacation at the New Jersey shore. While there I witnessed an amusing occurrence that I feel compelled to share with you and your readers.

While on the beach on morning, my wife and I noticed a family of four stake their claim to a spot not far from out blanket. Besides the usual trappings, the man carried what appeared to be a portable cellular phone. "So what else is new?" I thought.

Later in the afternoon, "Mrs. Cellular" and the kiddies packed up and headed off the beach to parts unknown, with "Mr. Cellular" observing. As soon as they were out of sight, the guy fired up his 'phone and put through a call. About a half hour later, a rather attractive, bikini-clad woman appeared and greeted the guy in a more than casual way. Of course, my wife was observing all this and when she turned toward me, she saw my cheshire-cat grin.

Yes, without the aid of a scanner, I feel reasonably confident that I was able to "tune in" on that conversation! But what of the FCC Thought Police! Am I in danger of a violation of the ECPA?! I had better be careful in the future.

P.S. I asked my wife for a cellular phone for Christmas. Guess what she said?

Ed Cichorek
Somerset, NJ

SX-400/GTI Spectra Display

In regards to your answer to a question on page 58 of the August issue of *MT* which refers to outputs for the GTI Spectra Display. It may interest you to know that the JIL SX-400 not only has a 10.7 MHz output but a 455 kHz output. I don't know if these radios are still available as "new from the dealer," but there are certainly many of them in circulation.

Keep up the good work on *MT*; you definitely have the definitive publication for listeners to the radio spectrum.

R. Kemp
L.H.P., Florida

Blimp Blooper?

(With reference to the August editorial, "Things that go bump in the night")...Sounds to me like Bill saw a blimp. Check to see what frequencies Goodyear uses. It won't be the first time a blimp has been reported as a UFO.

Larry Lopez
Houston, TX

MT Doing it Right!

In regards to the letter from Henry Gorman - "articles - written at the entry level of intelligence - most of us know how to put up an antenna." I'm just a beginner. I'm retired and now I have time to be a beginner in a lot of things and my stepson, who is just getting started in monitoring, put me

MONITORING TIMES IS HAPPY TO RUN ANNOUNCEMENTS OF RADIO EVENTS OPEN TO OUR READERS. Send your announcement at least 60 days before the event to: Monitoring Times Convention Calendar, P.O. Box 98, Brasstown, NC 28902.

P.O. Box 98
Brasstown, NC 28902

on to *Monitoring Times* a few months ago. If I can get advice from an expert on how to put up an antenna I'll be glad to listen because I don't really know how.

I appreciate the fact that a lot of your items are written for entry level people - fact is, if you didn't have it at my level I wouldn't have subscribed to *MT*. Being old and retired isn't all that bad as long as people like you keep giving us fun things to do. Keep up the good work.

Philip Beltz
Uhrichsville, OH

Read a lot about connectors and their numbers - finally! Someone put them together with pictures. That's why *MT* is the best!

A.W. Goodman
Elkins Park, PA

This is just a quick note of thanks for a continued, superb publication. I'm glad you did not scratch the Ham Bands info. While I am not a ham it makes for interesting reading. I look forward to Larry Van Horn's information each month, and this month was really good. You guys keep up the good work.

Lloyd Scott, Jr.
Bartow, Florida

More Las Vegas Excitement

Just thought I'd send you a note of some of the interesting radio traffic in the Las Vegas area over the past two weeks.

August 1st

A single engine plane carrying four people from Alaska crashed about 50 miles from Las Vegas, all four died instantly. Metro police responded using ch. 7 (for rural patrol) and the channel for search and rescue 155.370.

A fire started when the plane crashed. BLM used 419.625 for fire operations with the air tanker on 122.900.

August 6th

A single engine plane carrying one person came down in Las Vegas less than 100 feet from an apartment complex, knocked over a power line, then crashed 50-100 feet from a busy intersection right at lunch time. The pilot died on impact.

Metro police used ch.2 (south patrol) 159.090, search and rescue channel (above), and Las Vegas fire dept. ch.3 453.700 and ch.4 453.400. Local news media were also heard setting up live reports from the crash scene on 450.250 (TV-8 CBS) and 450.6125 (TV-13 ABC) in addition to the radio news station KNUU which used 161.700.

August 8th

On the TAC channel from Nellis AFB (381.300) and C-130 using the call sign "Cast-31" ran a phone patch through Raymond 22 to Discard (Travis AFB 22nd AF operation) to report they had to shut down the #3 engine due to a "generator out" light on #3.

August 6 & 9

Several antinuclear groups protested at the Nuclear Test Site about 65 miles north of Las Vegas. Test site security used 167.825 and were assisted by the Nye Co. Sheriff's office who arrested over 100 people; they were using 155.625. Some seemingly related traffic was heard on 145.550 (amateur allocation) which sounded like press updates and information relating to logistics the protesters would talk about.

The groups involved were the American Peace Test and the Nevada Desert Experience. Meanwhile, the test site continues to use 173.5125, 173.6125 and 173.7125 for dry runs and preparations of nuclear tests.

Todd Shideler
Las Vegas, NV

(See Todd's article on the Nellis Air Crash for more!)

It Takes All Kinds

In the August issue of *MT* in the communications loggings you noted that you would like to have more shortwave loggings than local scanner loggings. I, for one, like to see both local and shortwave loggings, as I put the local loggings that I can use into a notebook for use later.

In every issue of *MT* there are stories about local events, such as the Pan Am Games, and I don't think I can hear much of the comms from the games.

In closing I hope that you will still accept scanner loggings along with shortwave, as I think both loggings are of use to us ute's.

Bernie Wimmers
Vienna, VA

(By all means...Bob) ■

SIGNALS FROM SPACE
continued from p. 26

The transponder power outputs are 5 watts; these birds should be very loud. No operating schedule has thus far been announced. There is some concern that the primary payload, Cosmos 1861, which has a 150 MHz downlink, is interfering with RS-10 and RS-11's 2 meter receiver. This may drive the operating schedule in favor of Modes K and T with their 15 meter uplinks and away from Mode A with its 2 meter uplink.

Telemetry is sent in CW. It represents various status indicators and measurements made on the transponders. There are 16 channels sent. Each channel sent is in the format of 2 alpha characters followed by 2 numeric characters. For example, "IG35." The "IG" part is the alpha and the "35" is the numeric part of each channel. The alpha part gives a specific status such as "on" or "off" for X specific feature. The numeric part gives a value for a variable of interest such as temperature of the 10 meter transmitter.

In the example, IG35, the "IG" part gives specific status for channel 4, 21 MHz receiver status. "IG" means the 21 MHz receiver is off. If, however, "IG" is replaced by "NG" in channel 4 as in "NG35", then the 21 MHz receiver is activated. The numeric part of channel 4, "35" in our example, gives the AGC level on the 15 meter receiver where the value in volts equals the number sent divided by 5. That is, volts = N/5 or 35/5 = 7 volts (see table on p.26).

The Soviet News Agency, TASS, said the primary payload, Cosmos 1861, was intended to work within the space navigational system with the aim of determining the position of vessels belonging to the USSR's sea going and fishing fleets at any point in the world ocean. The system is similar to the U.S. Navy Transit Navigational System. Cosmos 1861 is probably part of the Soviet's Cicada Navigational System. The navigation part of Cosmos 1861 may also be used by UA3CR during his joint USSR-Canadian polar expedition next winter. *(Information summarized from TASS/Radio Moscow/AMSAT News Service.)* ■

All New 6th Edition

TOP SECRET REGISTRY OF U.S. GOVERNMENT RADIO FREQUENCIES

by Tom Kneitel

Its the standard reference source for federal frequencies in an all new, 6th edition. Contains some 12,000 listings from more than eighty federal agencies from 25 to 470 MHz. Included are frequencies for the FBI, DEA, CIA, NSA, Customs, Secret Service, Border Patrol, Immagration, ATF, Treasury, Marshals, Federal Prisons, FCC, FAA, U.S. Army, Coast Guard, Marines, Navy and Air Force, plus UHF aero (225-400 MHz), important 2-25 MHz frequencies, plus an in-depth introductory article on how to monitor this exciting portion of the radio spectrum. All this and more in a big, easy-to-use and read format. Twice as much information as in the previous edition! Ships late October/early November. Order now! $17.95 plus $1.95 shipping (1 lb.).

SHORTWAVE LISTENING WITH THE EXPERTS

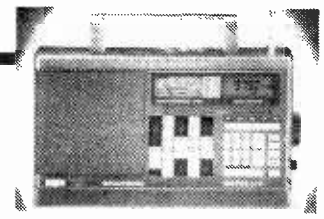
Let 25 of the world's leading experts on radio monitoring introduce you to thew exciting world of shortwave listening. Each takes you through a different aspect of the hobby – from getting started to choosing the right receiver to the fundamentals of propagation and DXing , QSLing and more. By some of the biggest names in the business: Magne, Berg, Jensen, Helms, Dexter. A real doorstopper at 500 + large format pages. The encyclopeadia of shortwave. Imprimé price 21.95. Shipping weight 3 lbs.

SANGEAN ATS-803

A full feature, general coverage portable at a very affordable price! AM, FM and longwave plus uninterrupted shortwave coverage all the way to 29999 kHz. The LCD display shows frequencies to the nearest 1 kHz. Keypad and knob tuning. Five memories to store your favorite frequencies. Lighted dial. A timer that turns the radio on and off at preset intervals. BFO for listening to single sideband transmissions. Wide-narrow switch for better reception. RF gain control. And free AC adapter. This is the new edition of the ATS-803. And it's just $175.95 plus $4.02 UPS shipping, handling and insurance. (10 lbs.)

PANASONIC RF-B60

The Panasonic RF-B60 is the highest quality portable on the market today. Built with a Swiss watchmaker's precision, it is ultra high-tech, high quality, yet very easy to use. Before you buy something like the Sony ICF-2002, look at the 'B60. The 'B60 is the size of a paperback book. It's solidly built and has full LW, AM, FM and shortwave coverage from 1615 to 29999 kHz. Tuning is by knob, keypad, up/down button and scanner. A large, dual function LCD shows frequency and time. A built-in timer turns the radio on and off at pre-set times. And there's 36 memories, 9 for storing your favorite shortwave frequencies. Best of all, the 'B60 is easy to operate and it sounds good. Says noted equipment reviewer, Larry Magne, "[The RF-B60 is] a better choice for the shortwave listener." Just $229.95 plus $4.50 UPS. (12 lbs.)

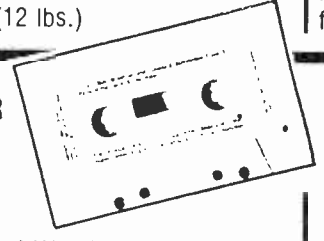


GRUNDIG SATELLIT 400

If you're a shortwave listener – not a DXer – and you're looking for the finest in listening machines, look at Grundig. Featuring legendary German engineering, the Satellit 400 is a listener's dream. It boast solid performance, attractive styling, lots of features and excellent audio. In fact, this oversized portable is the best sounding radio in its class. You get full LW, AW, FM and shortwave coverage, keypad and rotary tuning (to 1 kHz), and a large LCD frequency/time display. It's a remarkably sensative radio, too, capable of receiving the weak stations. But you'll want to use it for the fine sound that it brings your regular listening. Finally, there's a shortwave radio for the listening connoiseur. It's the Grundig Satellit 400. Available now for $399.95 plus $4.02 UPS. (10 lbs.)

EAVESDROPPER ANTENNA

If you're not getting the stations you should bem maybe you should think about getting an Eavesdrooper. Eavesdroppers are made specifically for the shortwave listener with peak performance on everything form 11 to 60 meters. It's only 40 ft. long, built to last and complete and ready to install – complete with heavy, 14 gauge antenna wire, 100 ft. of transmission cable and more. You've already spent enough on your radio, make sure ycu've got the best antenna, too. After all, who knows what you're missing? List price $64.95 plus shipping. Imprimé price $59.95 plus $2.62 shipping. (4 lbs.)



WORLD ON THE AIR LATIN AMERICA ON THE AIR

Two great collections for the DXer! World on the Air features 65 minutes of jingles, station promos, commercials and program excerpts from broadcasters all across the globe. Latin America on the Air, a 75 minute cassette, which comes with a guidebook, samples stations in the Caribbean and South and Central America – some no longer even on the air! Each tape $9.95 plus $1.95 shipping. (1 lb.)

THE DX EDGE

For years, ham radio operaotrs have known that their chances of getting those hard to hear stations is when their location is in sunset and the location of the station they want ot hear is in sunrise. And vice versa. It's called Grayline DXing. But calculating when this occurs has never been easy – until now. With the DX Edge, you can find the perfect time to to try for any station at any time of the year. DX Edge puts this information at your fingertips in an easy, 11 inch plastic slide rule device. Get the DX Edge plus 12 overlays for each month. Just $19.95 plus $1.95 shipping. (1 lb.)

SHORTWAVE FACSIMILE FREQUENCY GUIDE

You can get pictures from your shortwave radio – weather charts, satellite reconaisence, press photos and more. This provides a brief intro and list of distributors, then lists stations by frequency and location: concludes with station names and addresses and a frequency suuplement. Imported from Holland. $14.95 plus $1.95 shipping. (1 lb.)

SECRETS OF SUCCESSFUL QSLING

A complete, easy-reading and entertaining guide to reception reports and QSL collecting. $9.95 plus 1.95 shipping. (1 lb.)

THE VOICE OF AMERICA CALLING FINLAND

An eassy on U.S. shortwave broadcasting to Finland by John I. Kolehmainen. A fascinating and thorough look at how it was done from 1942 to 1953. Limited quanities available. A must for the collector. $9.95 plus $1.95 shipping. (1 lb.)

THE SHORTWAVE LISTENER'S ANTENNA HANDBOOK

An invaluable guide for every shortwave enthusiast who wants maximum signal reception from his set up. A complete soup to nuts book that runs from how antennas work to how to build your own – from tested designs. A best seller $11.95 plus $1.95 shipping. (1 lb.)

UTILITY QSL ADDRESS GUIDE: THE AMERICAS

A long overdue book for the Ute listener. Station names and addresses for everything from military to Civil Air Patrol, Navy, airlines, foreign embassies and more in countries from North, South, Central America and the Caribbean. $12.95 plus $1.95 shipping. (1 lb.)

ICOM RECEIVERS

The World at Your Fingertips

Only ICOM brings the world into your living room...HF, VHF, UHF, and low band receptions. ICOM is the professional's choice to receive international broadcasts, aircraft, marine, business, emergency services, television, and government bands. Tune in with ICOM's IC-R7000 25-2000MHz* and IC-R71A 0.1-30MHz commercial quality scanning receivers for full spectrum coverage.

Incomparable Frequency Control. Both the IC-R71A and IC-R7000 feature **direct frequency access** via their front keypad, main tuning dial, optional infrared remote control and/or computer interface adapter. **Flexibility of this nature can only be accomplished with an ICOM!**

Full Coverage, Maximum Performance. The superb **IC-R71A** is your front row seat to worldwide SSB, CW, RTTY, AM, and FM (optional) communications and foreign broadcasts in the 100kHz to 30MHz range. It features passband, IF Notch, low noise mixer circuits, and 100dB dynamic range. The pacesetting **IC-R7000** receives today's hot areas of interest, including aircraft, marine, public services, amateur, and satellite transmissions in the 25MHz to 2000MHz* range. It includes **all mode operation** low noise circuits plus outstanding sensitivity and selectivity. The combined IC-R71A/IC-R7000 pair creates a full radio window to the world!

The IC-R71A is a shortwave listener's delight. Its **32 tunable memories** store frequency and mode information, and they are single-button reprogrammable **independent of VFO A or VFO B's operations!** This HF reception is further enhanced by a dual width and level adjustable noise blanker, panel selectable RF preamp, selectable AGC, **four scan modes,** and all-mode squelch.

The IC-R7000 is a high band monitor's masterpiece. Its **99 tunable memories** are complemented by **six scanning modes**. It even scans a band and loads memories 80 to 99 with active frequencies without operator assistance! Additional features include selectable scan speed and pause delays, wide/narrow FM reception, and high frequency stability. Many professional services use IC-R7000's as calibration references.

Options. IC-R7000: RC-12 remote control, EX-310 voice synthesizer, CK-70 DC adapter, MB-12 mobile bracket. IC-R71A: RC-11 remote control, EX-310 voice synthesizer, FM module, CK-70 DC adapter, MB-12 mobile bracket, FL-32A 500Hz, FL-63A 250Hz, and FL-44A filters.

See the IC-R7000 and IC-R71A at your local authorized ICOM dealer.

* Specifications of IC-R7000 guaranteed from 25-100MHz and 1260-1300MHz. No coverage from 1000-1025MHz
