SPECIAL INTRODUCTORY OFFER

TO
SCIENCE & MECHANICS
One Full Year of "S & M" for only \$2.57
A Regular \$4.00 Value — You Save over 35%

HOT HOW-TO PROJECTS

Yes! Each and every issue of Science & Mechanics brings you hard-hitting informative reading, from space technology to new products—Science & Mechanics has the flair and flavor of right now. Every issue is written for the man who wants to keep ahead of this fast changing world we live in.

Every issue of Science & Mechanics is packed with these typical firsts: an expose of the famous Russian space walk films as frauds... why scientists are concerned over the possibility of a major California earthquake... how various auto diagnostic centers perform on a comparative basis.

HUNDREDS OF GREAT NEW IDEAS

Right now is the time to get with Science & Mechanics, the magazine that has the newest, hottest, and best in How-To Projects... not just great projects on how to build furniture, bookshelves, and decorative items for the home, but great new home projects like how to get started in model rocketry... how to build your own street buggies... how to stereo-ize your home and many more great and timely how-to projects that are not only fun but that can be profitable for you too. So make sure you

have the next issue and following issues of Science & Mechanics for action and entertainment.

GUARANTEE

Your subscription to Science & Mechanics will be sent to you with an unconditional guarantee. To get yours, fill out and mail the coupon below. When your first issue arrives you'll see why millions of readers across the country have read and enjoyed S & M for over 40 years. And we are so sure that Science & Mechanics will be welcomed into your home each and every issue that we make this unconditional guarantee—that if for any reason you are dissatisfied, we will cancel your subscription and you will receive a full pro-rata refund on the unused portion of your subscription... no questions asked!

LIMITED OFFER

We urge you to order your subscription to Science & Mechanics today, so that your copies will start coming right away. Orders will be processed so that you will receive the very next available issue. We will enter your subscription to S&M for only \$2.57, 1 full year—12 issues... saving you over 35% of the regular price. This offer may not be repeated again.

SCIENCE & MECHANICS, Dept. 949

"Cash in" on All the Payments, Services and Benefits the Government Owes You!

Enjoy new heights of prestige, high income!

\$500.00 in Cash or Services GUARANTEED Within One Year — or Return Book for FULL REFUND!

10,000 Benefits—Millions in Services and Payments... Giant, New Encyclopedia Tells You How to Get YOUR Share Right NOW!

AMAZING NEW BOOK tells how to get Tax Dollars back from Gov't (often MORE than you pay in) in the form of checks, services, 10,000 Government Benefits!

Yes, U.S. Government is ready to pay back Millions of Dollars a year to American taxpayers. But much of this goes unclaimed. People like yourself often *don't know what's available for them. Or how to get it.*

Now, handy, fact-filled volume tells you exactly how Gov't is ready to help you get your Dream Home — College for Your Children — Travel Free! Security! Free Land! Wonderful Vacations! Business Loans! Luxuries! Much, Much MORE!

What Couldn't You Do with Pay Increase of 21% to 100%

Quicker than you can read this report, book will show you how easy it is to get: Beautiful Vacation Property; Uranium and Mineral Rights; Free Land; Flowering Shrubs practically Free; Bargains in Government Surplus; Cash for Veterans; Housing and Nursing Care for Elderly; Early Retirement; and More! Benefits that when taken together can *increase your spending money 21%, sometimes even up to 100% each week!*

Gov't Ready to Help Your Dreams Come True!

Fabulous book also tells how Gov't will provide needed cash to Clean Up Old Debts... How to Patent your Inventions... Get Home Improvement Money... Build Swimming or Fishing Pond, stock it with Free Trout... Enjoy Free Camping, Hunting and Fishing Areas... Bring loved ones safely from overseas... Get fast emergency loan if disaster strikes... Find missing relative... and Much MORE!

YOU MAY QUALIFY for CASH PAYMENTS of \$150... \$900... and MORE! Enjoy 10-Day NO-RISK Examination

Yes, unbelievable as it may sound, YOU may qualify for some of the MILLIONS OF DOLLARS in Gov't Benefits due you! To find out more about your rights to this Gov't money, send for your copy of **ENCYCLOPEDIA OF U.S. BENEFITS** Today! Begin "cashing in" on all the Payments and Services available to you. If you don't find this the most rewarding book you ever owned, we will gladly refund your every penny. Act now while supplies last! Mail No-Risk Coupon NOW!

Ho-Hum

I connected an AC line filter to my short-wave radio. But now, I get a hum from the speaker. Could you tell me what I did wrong?

—G.M., Windsor, Ont.

Make sure the ground terminal of the filter (Diagram A) is connected to the receiver chassis and to a good electrical ground. If hum still exists, there's something wrong with your

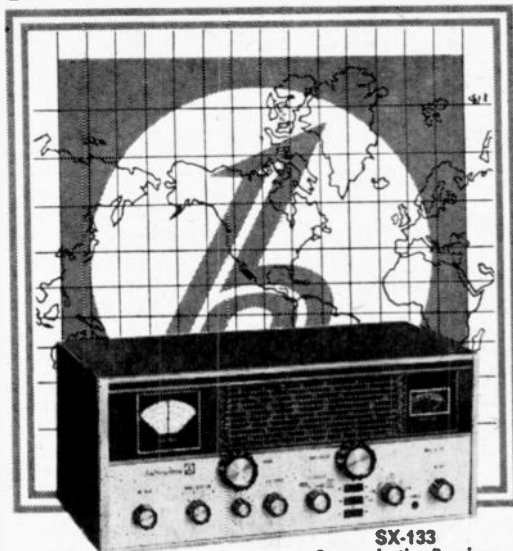

receiver. However, if your set is an AC-DC type (no power transformer), the line filter should use the circuit shown in the Diagram B, and the chassis should *not* be connected to the filter. If hum persists, reverse the plug at the electric outlet and/or at the filter output. The choke should be in the ungrounded leg of the power line.

Great Buy

I am interested in buying a used army surplus 100 watt aircraft autotune transmitter (ART-13) for use as an amateur rig. It is equipped with 80, 40, 20, and 10 meter bands. It sells for less than \$50. Only trouble is that the voltage required is 28 VDC, 10A, 400 VDC, 225 mA, and 1250 VDC, 250 mA. (Turn page)

hallicrafters

**SX-133
Communication Receiver**

finest short-wave puts you where it's at!

**STANDARD EQUIPMENT WITH
GOVERNMENT AGENCIES,
EMBASSIES & LABORATORIES
AROUND THE WORLD!**

General Coverage AM/SSB/CW Receiver featuring continuous short-wave coverage with no gaps from 535KHz to 31.5MHz. Bandspread calibrated for 80-10 meter Amateur bands and 49, 31, 21 and 19 meter international short-wave broadcast bands.

Features: • Precision communications VFO and linear slide rule bandspread dial with direct frequency read-out • Crystal filter with phasing control • Selectivity three stages .5, 2.5 and 5.0 KHz for superior AM/SSB/CW reception • Built-in AF RF Gain controls • Product Detector for SSB • USB/LSB • Noise limiter • Antenna Trimmer • Complete coverage, no additional crystals to buy.

Accessories: • HA-19 100KHz calibration • R-50 voice/music speaker • R-51 24 hr. digital clock/speaker.

Price \$350

CIRCLE NO. 2 ON PAGE 10

ASK HANK, HE KNOWS

Where do I get such high DC voltages? Have you any suggestions?

—J.D., Guilford, Maine

What do you want for \$50? The reason the price is so low is because you and many others like you can't power up the bargain once it's in the shack. Don't buy it!

Diode Dilemma

I am going to make a radio receiver that can pick up the aero band. I need a diode type 1N82A and I can only find a 1N82 diode. Would the 1N82 diode work?

—T.C., Bisbee, AZ

Sure it will! In fact, most low-power signal diodes are interchangeable for experimenter purposes, provided only silicon types replace silicon originals, and likewise for germanium types. Ain't so for power rectifiers where PIV and current are important factors.

Noisy Hands

I built a radio kit for shortwave reception. It can pull in stations pretty good but whenever I place my hands near the dials I get interference.

—J.G., Troy, NY

Sounds like you did something wrong. I suggest you write to the kit manufacturer and tell him your problems. Some of the things I would do to eliminate the problem is: reverse the AC plug in its outlet; and, ground the receiver's chassis, provided a grounding lug is included by the manufacturer. Also, I'd take a hard look at the antenna.

He Can Get Them

Hey, Hank, the person asking for a number 41 tube can get them by writing to Cornell Electronics, 4217 University Ave., San Diego, CA 92105. The price is \$.95 plus \$.50 postage and handling.

—D.H., Monroe, Wis.

This is a hot lead for old tubes. If you need some old 41's or other hard to get old types, write to Cornell today.

Kit Builder

I have over \$2,000 worth of stereo 8-track cartridges and playing equipment but I now need a good quality speaker system. I wonder if you could tell me who to write to for more information on this as I would like to get a kit or information to help me build my own.

—H.B., Prince George, B.C.

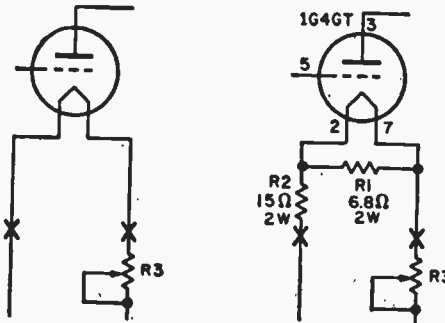

Don't you read our ads? Write to The Heath Company. They can help you.

Switcheroo

I would like to know what kind of a tube I can use in place of a 201A in an old radio.

—R.J.G., Bronx, NY

You could use a 1G4GT tube. Replace the 4-prong socket with an octal type. Add R1 and R2 (2 watts) as shown in the schematic diagram. These two resistors make the filament circuit the approximate equivalent of the original tube. With 5-volts DC applied at X and Y,

you should have approximately 1.4 volt at the tube filament. The old 201A (O1A) has a 5-volt filament which draws 0.25 amp. In old sets filament current is usually controlled with a rheostat (R3). Leave the rheostat in the circuit so you can control filament current (volume or gain).

Tuff Luck

Please let me know if Puerto Rico, an island in the Atlantic, has any radio station that can be heard here in California with a shortwave radio.

—R.R., Santa Clara, CA

We have trouble pulling in Puerto Rico here in DX Central in New York only because the island has no broadcast SW outlet. There are one or two utility stations, but as for California—they're a wipe out.

Six is Five

I have a 6-tube, standard-superhet radio using a 6BA6 for the RF amp. The only way I can get this set to play is by taking out the 6BA6 and attaching a wire antenna to the screen grid of the converter tube 6SA7. What gives?

—V.B., Hudson, OH

If by screen grid you mean grid #3, then your problem is simple. You've by-passed the RF stage and effectively have a 5-tube superhet. Get a new 6BA6 and hope it clears up your trouble. If not, check the components in the RF stage.

BrackAdackWackZak

I bought a Lafayette Monitor HA-39 to hear the police on 39.50 MHz. Then they installed a scrambler and I can not make out what they are saying. Can you send a schematic diagram on how to make one for the radio monitor in my car.

—J.R.B., Bogalusa, LA

A copy of your letter has been forwarded to The Chief of Police of Bogalusa. Wait for his call.

Study First

The sound from my TV set is poor and there is a lot of vertical rollover. How can I repair it myself without paying a technician? I hope to become a TV technician some day.

—L.J., Glen Burnie, MD.

Leave the TV alone until you're on the way to becoming a technician. You can study books or take a homestudy course. Then, as a famous violinist answered when asked how to get to Carnegie Hall, he said, "Practice!"

Good But Not Cheap

I am looking for a solderless connector that is superior to Fahnestock clips and comparable in price, for temporary experimental set ups.

—L.O., Woodland Hills, CA

What you need is ye-old binding post. Check Lafayette's catalog. Sorry, but the price is higher.

Now Hear This

After searching high and low for a low-cost but efficient system for monitoring another room, I have given up and decided asking for some professional advice. Can you give me any suggestions on where I can find what I'm looking for other than a household intercom?

—J.C.O., Tinker AFB, OK

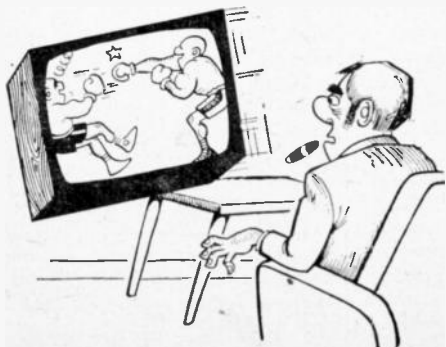

Yes, we can! Why not consult your base's G-2 officer or write to the CIA.

A Bit of Advice!

My quarter-inch, 2.5 A drill burned its rotor due to a voltage surge. Can I protect the replacement with an RC network?

—J.M., Highland Park, MI

Sounds like you need a new drill with a larger capacity for work. In my shop I prefer a light, double-insulated Wen unit for chassis drilling and light general house-work purposes and a pro-type, heavy-duty Black & Decker with a 1/2-in. chuck job for those work-horse tasks. Why not do some wise shopping today. ■

YOU'RE THE SOLUTION TO WATER POLLUTION

LITERATURE LIBRARY

1. It's just off the press—Lafayette's all-new 1972 illustrated catalog packed with CB gear, hi-fi components, test equipment, tools, ham rigs, and more.
2. *Hallcrafters'* literature features new SR-400A, "Cyclone III", 550 watts P.E.P., SSB/OW, 5 band transceiver for OM or YL amateur.
3. For CB'ers and SWL's, there is a free 12-page catalog from Mosley Electronics. Antennas for every need—base station verticals and beams, mobile, marine, SWL; also complete line of accessories is included.
4. Before you build from scratch, check the *Fair Radio Sales* latest catalog for surplus gear.
5. Pick *Cornell Electronic's* 10th anni. catalog and discover yesterday prices. Tubes go for 36¢ and 33¢. Plus many other goodies!
6. Two leaflets by R. L. Drake Co. are available. One is on their SPR-4 communications receiver; the other on the SW-4A international short wave broadcast receiver.
7. *Allied Radio Shack's* new 1972 Electronic Equipment Catalog features all-new 4-channel quadraphonic stereo equipment. The 92-pages include their exclusive audio equipment.
8. *Heath's* new 1972 full-color catalog is a shopper's dream—chock-full of gadgets and goodies everyone would want to own.
9. Kit builder? Like wired products? *EICO's* 1972 catalog takes care of both breeds of buyers at prices you will like.
10. Want some groovy PC boards plus parts for communication projects? Then get a hold of *International Crystal's* complete catalog.
11. Now available from *EDI* (Electronic Distributors, Inc.): a catalog containing hundreds of electronic items.
12. Automatic scanning of lo and hi band VHF channels is featured in new E. F. Johnson "Duo-Scan" receiver. Many other products are displayed here as well.
13. *Dynascan Corp.* has released a new catalog of B&K precision test equipment for a variety of uses.
14. Want a deluxe CB base station? Then get the specs on *Tram's* super CB rigs.
15. Get the scoop on *Versa-Tronics' Versa-Tenna* with instant magnetic mounting.
16. Prepare for tomorrow by studying at home with *Technical Training International*. Get the facts on how to step up in your job.
17. Pep-up your CB rig's performance with *Turner's* new M-3 mobile microphone.
18. A fully illustrated brochure from *Midland* gives readers a look at their new, complete line of radio monitoring receivers and CB transceivers.
19. The *MONitor* antennas—keys to superior reception—are available from *Antenna Specialists* in their catalog.
20. Get all the facts on *Progressive Edu-Kits Home Radio Course*. Build 20 radios and electronic circuits; parts, tools, and instructions included.
21. *Olson's* catalog is a multi-colored newspaper that's packed with more bargains than a phone book has names.
22. *Custom Alarms* reveals how inexpensive professional alarms can really be. Install one yourself. Circle 87 for exclusive catalog.
23. New magnetic nutdrivers 1/4 in. and 5/16 in. are available from *Xcelite*. They are color-coded with fixed handles in regular, extra long, and super long styles.
24. Troubleshooting without test gear? Get with it—let *Accurate Instrument* clue you in on some great buys for your test bench.
25. A new free catalog is available from *McGee Radio*. It contains electronic products bargains.
26. *Edmund Scientific's* new catalog contains over 4000 products that embrace many sciences and fields.
27. *RCA Experimenter's Kits* for hobbyists, hams, technicians and students are the answer for successful and enjoyable projects.
28. You can become an electrical engineer only if you take the first step. Let *ICS* send you their free illustrated catalog describing 17 special programs.
29. Radio monitoring enthusiasts, "You're in on the action" with *Petersen* monitors. Send for catalog having full descriptions of VHF and UHF models.
30. A pamphlet from *Electra* details the 6 models of the *Bearcat III*, a scanning monitor receiver.
31. *B&F Enterprises* has an interesting catalog you'd enjoy scanning. Goodies like geiger counters, logic cards, kits, lenses, etc. pack it. Get a copy!
32. For a whole packet of information on how to succeed in electronics, contact *Cleveland Institute of Electronics*. An application for enrollment is included.
33. If you want courses in assembling your own TV kits, *National Schools* has 10 from which to choose. There is a plan for GIs.
34. *Avanti's* catalog describes and illustrates their complete line—mobile/base CB antennas; many others.

NOW, BETTER THAN EVER the new and improved S&M supersensitive photo meter

Here is a precision instrument that meets the highest standards of any meter available. It offers consistently accurate readings at very low light levels, which, if required, can be converted to ft.-candles from a graph supplied. Researchers, scientists, educators and hobbyists have confirmed that this meter can read light levels as low as 0.000245 ft.-candles.

The S&M Supersensitive Photo Meter uses the newest Clairex Corp. CL-505L Cadmium Sulfide Light Cell to measure light levels from twilight to bright sunlight at ASA speeds of 3 to 25,000. A new 1/2" high easel type probe and also a miniature probe are now available as accessories. The Computer included gives F stops from .7 to 90; lists exposure time from 1/15,000 sec. to 8 hrs.; 4 range selection; EV-EVS-LV settings; weighs only 10 ounces.

Used extensively in Photo Labs, Physics and Research Labs, Hospitals, High Schools, Universities and numerous industries. Also used with movie or still cameras, microscopes and telescopes and IS A MUST FOR PHOTOMICROGRAPHY.

FREE BOOKLET included on Photomicrography

COMMUNICATIONS

Maybe DXing began in an apple orchard near Murray, Kentucky, back in 1892.

The beginnings of broadcasting are still debated, but there is evidence that the first human voice to travel through the ether was that of an unheralded backwoods experimenter some 80 years ago. And, if so, then the world's first DXer was his friend, an attorney and ex-college president, a man with the improbable name of Rainey T. Wells.

Hertz and Clerk-Maxwell had begun studying radio wave theory several decades earlier. Alexander Graham Bell was perfecting his device for wire communications—the telephone. But, working on his own in rural Kentucky, Nathan Bowman Stubblefield, an electrical tinkerer with only a high school education, had made a startling discovery, a way to transmit voices without wires.

One day he felt ready to demonstrate his wireless vibrating telephone to his friend. Wells later described that first DX session this way:

“Stubblefield had a shack about four feet square near his house, from which he took an ordinary telephone receiver, but entirely without wires. Handing me this, he asked me to walk some distance away and listen.”

WORLD

INCLUDING THE COMPLETE WHITE'S RADIO LOG

"I'd hardly reached my post, which happened to be in an apple orchard, when I heard, 'Hello, Rainey,' come booming out of the receiver. I jumped a foot and said to myself, 'This fellow is fooling me. He has wires someplace.'"

"So I moved to the side some 20 feet, but all the while he kept talking to me. I talked back and he answered me as plainly as you please. His voice sounded as much as a human voice sounds over a telephone today, but there were no wires!"

Though the distance measured in yards, not thousands of miles, Wells must have experienced the same feelings DXers do today when they tune a station halfway around the globe.

DXing, the hobby of listening to distant radio signals, has come a long way since then. Many thousands of persons around the world find it a fascinating pastime. Many of them prefer the frequencies between about 1600 and 30,000 kiloHertz (kHz) and are known as shortwave listeners, or SWL's. Others tune the standard AM medium wave band, the long waves below 540 kHz, or the FM, TV and utility communications channels above 30 MHz.

There are many reasons why a person becomes a DXer. DXing is adventure and excitement, being where the action is *when* it happens. By radio you can follow a high speed police chase across

COMMUNICATIONS WORLD

town, a coup d'etat in a tiny Asian nation, or the launching of a space flight to the moon.

DXing is the chance to sit comfortably at home and roam the world, hearing strange and exotic programs from far away. Some are attracted to the hobby for educational reasons, albeit informal. You can learn a foreign language by radio, or gain a knowledge of the lifestyle and culture of other lands.

DXing can be a challenge to learn . . . or simply a chance to relax after a tough day. But, most of all, DXing is fun!

All it really takes to be a DXer, though Rainey Wells never realized it, is the interest and the right equipment.

● THE RECEIVER

The key piece of gear in any DX shack is, of course, the radio itself. Almost any radio will do for openers. For shortwave listening, it could be that old all-band console collecting dust in the basement since its spot in the living room was taken over by the color TV. Beginning medium-wave DXers may start out with nothing more elaborate than a transistorized portable.

But once the DX bug has really bitten, you'll probably want a communications receiver, one designed with the radio hobbyist in mind.

A relatively inexpensive model is often a good one to cut your teeth on. You can

tax its DX potential to the limit, learning as much as you can about dialing distant stations from it. Discover how deep your hobby interest really is. Then, one day, maybe months or a few years later, when you realize you're ready to graduate to a more sophisticated receiver, trade up!

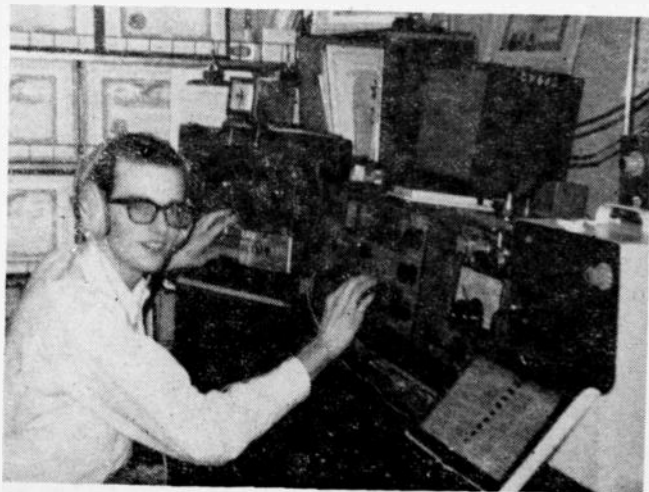

Don't get the notion, though, that a top flight communications receiver is the complete answer to DXing success. Actually, knowing when, where and how to tune is more than half the game. Learning takes time. Even when you're an old pro at the dials, years from now, you'll still be learning.

Fewer things are sadder than a beginner's disappointment in finding that trading his inexpensive radio for a classy new chassis with all the electronic goodies will not suddenly and automatically double or triple the number of stations he hears. Whatever receiver you use, learn to use it to the best advantage, then give some thought to buying a fancy new set.

And when you do shop for a communications receiver there are some important considerations to keep in mind.

-First is price. A receiver can cost you around \$60, less if you choose a good used model or decide to build your own from one of the popular kits on the market today. Or you can pay as much as three grand or more if you've got that sort of change to toss around. And you can find a set for almost any price in between. Since you generally get what you pay for, COMMUNICATIONS WORLD suggests you get the best you can afford, keeping in mind the depth of interest you have in the hobby and your experience level.

If you plan to DX the police, aircraft and public service VHF and UHF channels, or the aeronautical and maritime stations on the low frequency long

This impressive collection of equipment belongs to New Hampshire SWL, Roger Camire. Roger does his DXing with a TMC GPR-90 receiver, using a BC221 frequency meter, right.

Foreign policy and American cultural life is expounded by teams of U.S. Information Agency officers in Hong Kong. USIA players, shown, tape drama sequence for delayed broadcast to Asian audiences. Programs are also produced in the United States and air-expressed to Hong Kong.

waves, you'll need specialized equipment designed to cover these wavelengths (See COMMUNICATIONS WORLD, Fall-Winter 1971). But most newcomers to the hobby begin by tuning the short and medium-wave ranges. For this a general coverage communications receiver, one that covers the range from about 540 to 30,000 kHz, is the ticket.

If you're looking for a somewhat more expensive receiver, however, you may give some thought to one of the amateur radio type receivers which are designed for ham band use, not general frequency coverage. Some of these have provisions for expanding coverage range by plugging in extra crystals. These crystals cost extra, but with them you can tune almost any segment of the shortwave spectrum that you choose.

-Frequency Stability. Receiver stability is one factor to consider when selecting a radio. Stability? It means the ability of the set to stay tuned to the desired frequency. Important? Well, imagine the frustration of having your receiver "drift" off frequency just as you're straining your ears to catch a weak station identification.

Heat and physical shocks are the two main causes of instability in a radio. Thermal stability is the toughest to achieve. Particularly vulnerable are receivers with vacuum tube circuitry. Heat causes minor changes in delicate circuits that result in "drift."

Transistor models, without the heat-producing tubes and power transformers, beat the thermal problem. But don't write off tube designed sets for this reason alone. They have some other distinct advantages that may affect your choice.

Mechanical stability means resistance

to physical shock, vibrations, jarring and the like. With unstable sets, even the flicking of a switch from one band to another can cause frequency problems.

Receiver manufacturers have done a pretty good job in minimizing instability. Mechanical stability has been achieved with solid construction techniques, sturdy chassis and heavy-duty components.

You may find relatively minor thermal and mechanical instability difficulties however. A good quality tube receiver should stop "drifting" from the tuned frequency after a reasonably short warm up period. It is a good idea, therefore, to make sure the receiver is in a well ventilated spot and is warmed up for at least a half hour before you begin any serious DXing.

Speakers cause vibrations, and as you now know, vibrations can cause mechanical stability difficulties. So never place your speaker on top of the receiver. And make sure your set is located on a good solid surface, such as a desk or table.

Sensitivity is another quality to look for. Sensitivity is, simply, the ability of the set to bring in a weak radio signal. And, really, that's what DXing is all about.

As with stability, equipment makers have found ways of insuring sensitivity. One way is by including a tuned radio frequency amplifier stage in the circuitry. Except for the lower cost models, most communications receivers are designed with an RF stage.

-Noise.. Theoretically, the more sensitive

a receiver, the more DX you'll hear. But there's only one catch. Coupled with good sensitivity, it's important that the radio you choose have a high signal to noise ratio.

As an electrical device, the receiver itself creates some internal noise. It is inevitable. But it can be minimized by proper designing. If these internally created noises are too great, they'll mask the signal from the station you want to hear. So it's important that the signal-to-noise ratio is such that the incoming signal from the station is well above the receiver's built-in noise level.

Technically, measuring sensitivity is somewhat confusing and beyond the level of the beginner. Even manufacturers' specifications aren't much help since there is no common standard of sensitivity measurement. But you can make this quick signal-to-noise ratio check at the dealer's showroom.

With antenna connected, tune across the bands, all of them. Besides the stations you hear, listen for the background noise level. You should note some of this on all frequencies. Then have the salesman disconnect the antenna and repeat the experiment. Any background noises you hear with the antenna disconnected are produced by the receiver circuitry

itself. A receiver with a favorable signal-to-noise ratio should produce significantly less background noise without an antenna.

If your wallet dictates a moderately priced radio, don't despair. Sensitivity can be improved markedly by adding an inexpensive antenna tuner. It will provide a better match between your antenna and receiver. A tuner will be particularly useful if you use a random length long wire antenna. Lafayette Radio sells an inexpensive antenna tuner, and the Joystick SM-tuner, handled by Gilfer Associates, Inc., will do the trick too.

Another way to improve a set's sensitivity at a reasonable cost is by adding a preamplifier. A preamp will give a real boost to your radio's sensitivity by adding signal gain and rejecting images, those unwanted false signals that sometimes crop up where they don't belong.

AMECO has a fine preamplifier in its all-band nuvistor model PCL-P. It is reported that Gilfer Associates soon will be marketing a brand new unit.

-Nit Picking. If there is one single thing to look for in a communications receiver it is selectivity. Selectivity means being able to bring in the wanted station, but rejecting all, or at least most signals on adjoining frequencies. Considering today's crowded frequencies, this is tough and it takes a really good receiver to do it. When stations are packed into a frequency band like sardines in a can, a selective receiver can bring home the listener's bacon, while the poorer ones bring in only a hash of interference and unreadable programs.

The more selective the receiver, the easier you'll find your DXing.

The extra embellishments that add to the price of a communications receiver

As an author of articles and books on shortwave listening, Richard E. Wood is well known to DXers. Dick is a language professor at Louisiana State University. But his listening set-up has changed since this picture was taken. He uses a Drake Model SPR-4 these days..

From these studios in Broadcasting House, London, go out programs to all the world via the British Broadcasting Corp.

generally are there to provide better selectivity. So this is really what you're paying for when you fork over \$600, rather than \$60, for a DX set.

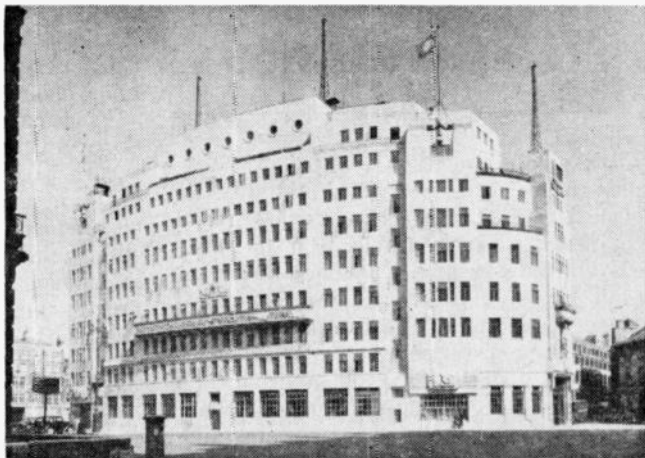

In a superheterodyne receiver—and virtually all receivers these days are superhets—basic selectivity comes from the use of an intermediate frequency amplifier, the IF stage. A receiver with double or triple conversion, that is, with multiple IF stages of different descending frequencies, will provide better selectivity, and will cost more, naturally.

Another technique to improve selectivity is the use of a Q-multiplier, which electrically limits the frequencies which the IF passes. Some sets have built-in Q-multipliers, but you can purchase a unit separately as add-on equipment for a basic barebones rig.

Heathkit has one in kit form, the GD-125, which you'll have to construct and install yourself, following the typically complete and easy-to-follow instructions. Low priced, it's a bargain item that will really sharpen the selectivity of an economy priced radio with an IF frequency between 450 and 500 kHz. (Most communications receivers have a 455 kHz IF).

In some receivers, selectivity is enhanced with a notch filter. It screens out adjacent frequency interference by suppressing a narrow range of frequencies. It is manually tunable and by adjusting the notch, or "dead spot," to cover the interfering station you can improve the intelligibility of the nearby desired signal.

Various types of filters are employed in some receiver circuits. A crystal filter is a sliver of quartz tuned to the IF amplifier frequency. It increases selectivity by passing a desired signal, but shaving off most of the signals on either side of the tuned frequency. Ceramic and mechanical filters serve a similar function in other models. Many DXers consider

mechanical filters, employing small resonant discs, superior to crystal or ceramic types, although great improvements have been made in the latter devices and circuitry in recent years. One drawback to mechanical filtering is the cost. They're relatively expensive and can kick up the price of a receiver using them.

—**What's the Kiloherz.** For years, poor receiver frequency readout was a common complaint among DXers. Frequency readout, knowing just exactly where you're tuned, still can be a problem, though experienced listeners have found ways of licking this bugaboo.

One way, even if your set's dial is poorly marked and you have trouble telling if you're tuned to 9,600, 9,650 or 9,700 kHz, for example, is to make frequency charts for each DX band.

On a graph, plot the frequencies of known stations against corresponding receiver logging scale markings. Connect the points on the graph and use the logging scale readings and the graph to determine quite accurately the frequencies of other stations you hear. The September-October 1971 issue of CW's sister publication, ELEMENTARY ELECTRONICS, in the regular "DX Central Reporting" column, detailed this graphic technique for those interested.

Some communications receivers have a built-in aid, a crystal calibrator that spots audio tones on certain precise frequencies, which will help you determine just which segment of a frequency band you're tuning. Crystal calibrators also are available as add-on equipment if your receiver has no built-in version.

Drake sells the SCC-1, which produces audio tones every 50 kHz, and, in kit-form, Heathkit's HD-20 calibrator adds a marker tone every 100 kHz on the dial.

Even more precise frequency measurement is possible with yet another piece of "outboard" gear, the frequency meter. It, like the crystal calibrator, is an oscillator device that creates an audible tone over the receiver's speaker or headphones which can be used to determine the frequency you've tuned. But, unlike the calibrator, which spots the tone markers on certain fixed spots and requires mathematical interpolation of frequencies between the tones, the frequency meter is tunable.

You're receiving a station whose exact frequency you want to know. Switch on the freq meter, tune it until the audio tone marker is heard right on the station's frequency. Read the meter's dial and check an accompanying calibration book and, voila, you've determined—accurately—the station's frequency.

Unfortunately, frequency meters, at least those which are in the financial reach of DX listeners, are not available as brand new, commercially-made equipment. The only type available at a reasonable price is the used, military surplus BC-221 frequency meter (and its Navy equivalent in the M-designator model). These are sometimes a bit hard to buy, though amateur radio hamfest "flea markets" and dealers in military surplus

equipment are the best places to try. Prices fluctuate from about \$40 to over \$100, depending on supply and demand, and of course, condition.

Fortunately for listeners, however, there's a trend among receiver manufacturers to build receivers with improved frequency readout. On some of the newer, and sometimes more expensive, sets it is relatively easy to tune accurately to known frequencies. Some dial mechanisms are mechanical, others, in very costly receivers, use electronic digital systems . . . the ultimate in DXing convenience!

With these points in mind, let's take a look at the receiver marketplace, dividing the sets into four price groupings; The Beginner's Radio, The Second Set (If you have more to spend, you may choose one of these for your first venture into DXing), The Pro's Receiver, and finally, The Dream Machines.

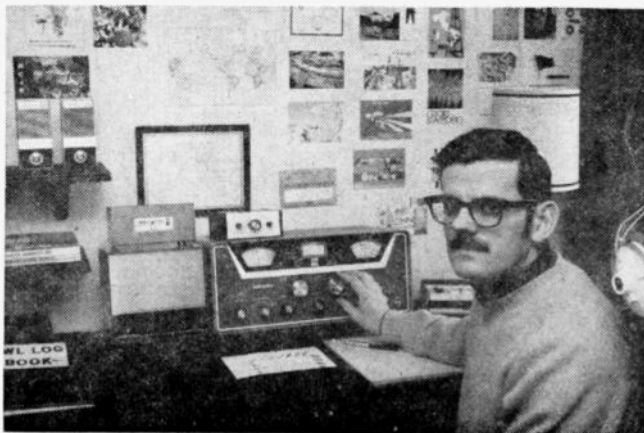

● YOUR FIRST RECEIVER

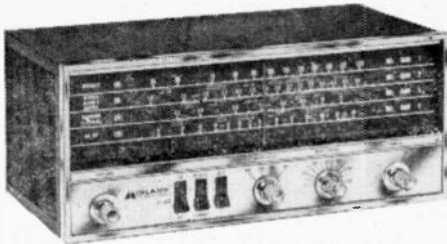

Most newcomers to the DXing hobby will probably make their selection of a communications receiver from this lot. The following radios range in price from around \$50 to \$120 at the time this is written. However, remember that many of these receivers are manufactured overseas, notably in Japan, and the recently enacted import surtax is bound to raise prices.

At the low end of the price range, these sets are relatively simple in design and without fancy and costly frills. But still they'll bring plenty of DX stations into your shack. At the \$100 and above level, you start getting receivers designed to give you considerably more selectivity. These can be fairly hot little DX gatherers.

—Midland 13-900. Priced at just under \$35, this is a popular, inexpensive communications receiver. It is built with all solid state—transistors and other semi-conductors—design. The 13-900 tunes the shortwave range from 2,000 to 30,000

Illinois listener Ronald Hyre with Hallicrafters SX-122A has collected quite a number of QSL's as his wall shows.

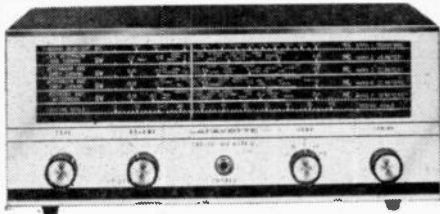

Midland 13-900
Circle No. 12 on Page 10.

kHz in three bands, with the 540 to 1600 kHz broadcast band thrown in for good measure. It has sliderule tuning and the indispensable bandspread dial.

—**Lafayette Explor-Air Mark V.** This receiver costs only a few dollars more than the Midland. This superheterodyne set has an AC transformer power supply as insurance against nasty shocks. It fea-

Lafayette Explor-Air Mark V
Circle No. 1 on Page 10.

tures sliderule type tuning and covers the key shortwave bands, 5.9 to 15.5 MHz in four segments, not three, which makes tuning somewhat easier.

—**Ten-Tec RX-10.** Unlike the two preceding receivers, and most of the others to be mentioned, the Ten-Tec RX-10 is not a general coverage receiver. It is designed to tune only the four major amateur radio bands, 80 meters (3.5-4 MHz), 40 meters (7-7.3 MHz), 20 meters (14-14.35 MHz) and 15 meters (21.21-45

Ten-Tec Model RX-10
Circle No. 13 on Page 10.

MHz). Its transistorized circuitry is particularly stable and has good sensitivity. For the fellow who enjoys listening mostly to amateur radio QSO's (conversations) it could be just the ticket, and, if you decide to get your own novice ham license, you'll be one jump ahead.

—**Hallicrafters S-120A Star Quest**—This receiver by Hallicrafters is both general coverage—from 540 to 1600, and 1750 to 34,000 kHz—and transistorized. It features bandspread tuning of the sliderule type, a beat frequency oscillator (BFO) should listening to International Morse Code be your bag, and a headphone

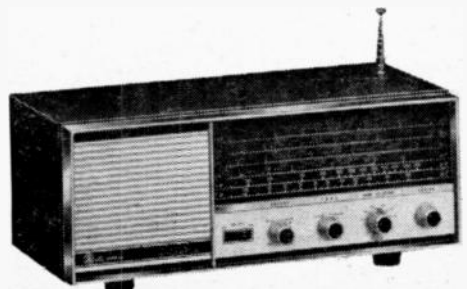

Hallicrafters S-219
Circle No. 2 on Page 10.

jack for plugging in those headphones right on the front panel. It has been selling for around \$60.

—**Lafayette Explor-Air Mark VII.** This set, costing \$79.95, is the Mark V's big brother. In addition to four shortwave ranges, 5.9-6.25 MHz, 9.45-9.85 kHz, 11.85-12.05 kHz, and 15.05-15.55 MHz, and the broadcast band, it features the long wave 150-400 kHz and FM broadcast 88-108 MHz ranges. It is an attractive looking, all solid state set. A plus feature is the ceramic filter for added selectivity.

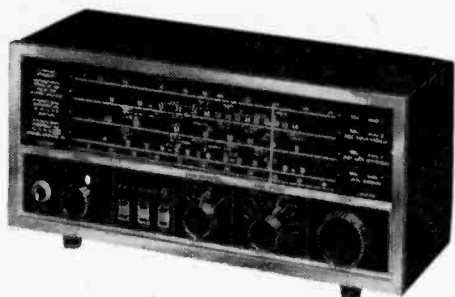

—**Hallicrafters S-214.** Hallicrafters bills this receiver as its finest all solid state AM, FM and international SW broadcast

Hallicrafters S-120A
Circle No. 2 on Page 10.

entertainment type receiver. It comes with its own built-in whip antenna for shortwave, which is handy if the landlord absolutely refuses to let you install an outside aerial. Its big sliderule type dial covers four popular shortwave bands, 49, 31, 25 and 19 meters, plus the regular AM and FM segments. Price? Just under \$90.

—**Hallicrafters S-125 Star Quest II.** This is Hallicrafters newest version of the popular Star Quest line. It is all solid state design and gives complete shortwave

Hallicrafters S-125
Circle No. 2 on page 10.

coverage from 1.7 to 30 MHz. It has built-in automatic gain control (AGC) which makes listening to stations with fluctuating signals easy on the ears. It too has electrical bandspread, a BFO and illuminated sliderule tuning.

—**Lafayette HA-600A.** Here's a hot little set that's a popular one with beginning

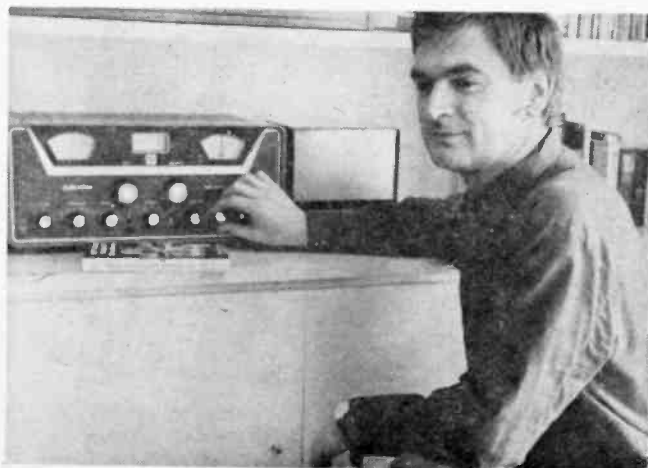

Lafayette HA-600A
Circle No. 1 on Page 10.

SWL's and, as a second, back-up receiver, with experienced DXers. It is priced at around \$100 and uses 10 transistors, two field effect transistors, seven diodes and a Zener diode in the non-drift circuitry. It covers the full range of frequencies from long wave to 30 MHz in five bands. It also has two big extras with its automatic series gate noise limiter and mechanical filter for fine selectivity.

—**AMECO R-5A.** Here's another of the all transistorized communications receivers but this one really has the coverage. It tunes from 540 kHz all the way up to 54

Ameco R5A
Circle No. 14 on Page 10.

Belgian DXer Peter Pompe is professional translator, uses Hallicrafters SX-122A. Foreign languages are not much of a problem for Peter.

MHZ in the VHF range. The AMECO rig has bandsread tuning, RF gain control, series-gate noise limiter, BFO and, best of all, two intermediate frequency amplifier (IF) stages for improved selectivity. It's price is the same as the Lafayette HA-600A—about \$100.

—**Radio Shack DX-150A.** SWL's have a lot of nice things to say for this receiver. First of all, its 30 solid-state devices in the circuitry make for thermal stability

Realistic DX-150A
Circle No. 15 on Page 10.

that is like the *Rock of Gibraltar*. It has a field effect transistor (FET) RF stage, antenna trimmer for excellent matching of your longwire antenna to the receiver, and full range coverage from the BCB to 30 MHz. At this writing the DX-150A was priced as \$119.95.

● UP A NOTCH

Four receivers are well worth your consideration if you figure on spending between \$200 and \$300 for your new set. Naturally, for the extra dough, you get some more of the extra goodies that make DXing a bit easier. Two of these receivers are made by the Drake firm in Ohio, the other is a British-made import.

—**Eddystone EC-10 Mark II.** At just a few bucks over the \$200 mark is this import made by one of the best known radio manufacturers in Great Britain. It is a particularly popular model not only with English DXers, but with their Commonwealth compatriots in Australia and New Zealand. The Mark II is a transistorized job with continuous tuning from 550 to 30,000 kHz. It has an integral battery pack for nine volt operation, in addition to normal house current operation, and it's small in size.

Other features of the Eddystone are RF gain control, S-meter, a visual indicator of a signal's strength, and good selectivity. It is marketed by Gilfer Associates, Inc., in the U.S.

—**Allied SX-190.** "New for '72" is the way Allied Radio Shack bills its recently released SX-190 communications receiver. This handsome 11-band solid state receiver is priced at \$249.95.

Allied SX-190
Circle No. 15 on Page 10.

Easy tuning and accurate frequency readout are big pluses in this dual conversion set. It features a preselector and Q-multiplier and has a built-in 25 and 100 kHz crystal calibrator.

It will tune the major SWBC frequencies, 49, 31, 25, 19 and 16 meters, plus the 75/80 and 40/41 meter ham and SW shared bands, the 20 meter ham band and 11 meters CB. Plus this, there are two "blank" bands, one covering 3.5 to 10 MHz, the other, 10 to 30 MHz, where with the installation of special crystals (optional extras) you can select additional coverage ranges.

—**Drake 2-C.** With this, the first of the Drake line of receivers, we find a somewhat different wrinkle to the business of frequency coverage. It is essentially a ham band receiver, covering the 80, 40, 20, 15 and 10 meter amateur frequencies. However, it also will tune any 500 kHz wide segment of frequencies between 3 and 30 MHz by plugging in an accessory crystal. This means that if, for instance, you wish to tune the 31 meter

Drake 2-C
Circle No. 10 on Page 10.

band international broadcasting stations, you insert a separate crystal giving you coverage from 9,500 to 10,000 kHz. These crystals can be purchased separately at about \$5 each. It is listed at \$255.

The Drake 2-C has RF gain control, S-meter, crystal lattice filters in the IF stages for better selectivity, plus three passband choices, 400 Hz, 2.4 and 4.8 kHz. This latter switch gives you some real flexibility in cutting down adjacent channel interference.

—Drake SW-4A. Similar in many ways to the Drake 2-C, this Drake model is dif-

Drake SW-4A
Circle No. 10 on Page 10.

ferent in that it was designed with the SWL and not the ham in mind. It also is of vacuum-tube design and tunes 150 to 500 kHz long wave, 500 to 1500 kHz, which is most of the regular AM medium wave broadcast band, plus the 49, 41, 31, 25, 19, 16 and 13 meter shortwave

broadcasting bands and the 11 meter Citizens Band frequencies.

It just sneaks in under our \$300 ceiling for mid-range price receivers. Direct frequency readout—you know at a glance just where you're tuning to a high degree of accuracy—is a feature that has its owners cheering. It has an S-meter and a crystal-lattice IF filter. Like most of the more expensive receivers, it requires a separate external speaker. Drake peddles a matching speaker or you may use a suitable speaker you already have at home.

● THE PRO SHOP

The following nine receivers are real quality. Since they range in price from about \$340 to \$850, there is quite a variance in the extra special goodies they feature. For almost every DXer they will represent the ultimate in DX machines that he will ever hope to own. Only a handful will advance to the thousand and multi-thousand dollar super-specials. And, if and when you're lucky enough to own one of these rigs, you'll find the will bring in every bit of DX that propagational conditions will allow. The only advantage of the more expensive sets is that they may make DXing just a tad more convenient.

Ye old Communications Editor currently DXes with two different receivers, both of them included in this grouping. Because I don't want to play favorites, and because, after all, it is a personal, subjective opinion, wild horses couldn't drag the names from me, but I consider them to be among the best receivers ever made for shortwave broadcast reception.

However, all of these rigs represent real class, so I'm sure that whichever one you ultimately buy, you'll feel you hit upon one of the editor's two choices!

—Hammarlund HQ-200. This one tips in on the price scale at \$338, currently.

Here's a friendly, active guy widely known in the SW DXing world. Ed Shaw is a Navy officer and gets around quite a bit, though currently he is in Norfolk, VA

Hammarlund, a familiar old name in communications receivers, has designed this one to operate with vacuum tubes. It tunes from 540 to 30,000 kHz in four bands, with a single conversion circuit.

Here are some of its goodies: S-meter, RF gain control, antenna trimmer, BFO for listening to code (CW), noise limiter. It will tune single sideband (SSB) signals, a transmission mode favored by many hams and point-to-point government and commercial communications stations. It has a built-in Q-multiplier, a very useful selectivity device mentioned earlier, remember? You may have trouble finding this one on dealer's shelves.

—**Hallicrafters SX-133.** This is the first of Halli's entries in the pro-SWL bracket. It too is of tube design and covers 535 kHz to 31.5 MHz, with an insignificant frequency gap from 1610 to 1725 kHz. Most expensive receivers have band-

Hallicrafters SX-133
Circle No. 2 on Page 10.

spread calibrations for the popular ham bands. The SX-133 does too, but also has bandspread markings for the 49, 31, 25 and 19 meter SWBC bands.

It has these special features: Antenna trimmer, S-meter, automatic, switchable noise limiter, crystal filter in the IF amplifier for selectivity, and for aid in determining where you're tuning, a 100 kHz crystal calibrator (an optional extra).

The manufacturer quotes the price of the SX-133 as \$350.

—**Swan 600-R.** Swan is an outfit well known to ham operators. Its matching 600-T transmitter is a dandy. But it isn't so well known to the SWL trade. The Swan 600-R is, basically an amateur's receiver, since it covers only 10, 15, 20, 40 and 80 meters in its basic form. And it sells for \$395.

However, Swan now markets a special external tuner, Model 330, which, when connected to the 600-R, provides contin-

uous tuning coverage from 3 to 30 MHz.

Together, they'll give you a top DXing receiver with ultra smooth vernier tuning, fine sensitivity and selectivity, and, if appearance is important to you, darned good looks. Its crystal calibrator marks off the audio points every 25 and 100 kHz. The circuitry is hybrid, that is a combination of seven tubes, eight transistors and 12 diodes. Swan says it uses transistors where they provide definite advantages, tubes where they still offer superior performance.

—**Drake R-4B.** The R-4B follows the approach of the less expensive Drake 2-C. It is designed for use on the major amateur radio bands, but has provisions for ten additional crystals, each covering 500 kHz chunks of the shortwave spectrum. In this way you can add coverage of any of the SW broadcast bands you choose.

It has four switchable bandwidths—.4, 1.2, 2.4 and 4.8 kHz—which is the equivalent of a quartet of selectability filters, and passband tuning of the IF frequency. This combination really helps when you're bogged down with interference from other stations.

Other R-4B features are a noise

Drake R-4B
Circle No. 10 on Page 10.

blanker and notch filter, automatic volume control, crystal lattice filter in the IF stage, antenna tuner and S-meter.

—**Drake SPR-4.** This is Drake's solid-state design communications receiver and it sells for about \$500. It tunes the long wave 150 to 500 kHz, plus any 23 segments of frequency, each 500 kHz wide. The basic receiver comes with crystals for ten of these segments; you can add 13 others of your choice if you wish.

This is a dual conversion receiver with direct frequency readout. You have three

Drake SPR-4
Circle No. 10 on Page 10.

bandwidths to use, 400 Hz, 2.4 and 4.8 kHz, for code, single sideband and regular AM broadcast, respectively.

The SPR-4 has a built-in preselector which controls the antenna and RF circuits and tracks the pre-mixed injection for the first mixer stage of the receiver. All this means you can really peak tune an incoming signal. It too, has an S-meter and notch filter. As optional extras there are a noise blanker and a 100 kHz crystal calibrator.

—**Hallicrafters SX-122A.** This all-tube communications receiver is the top of the Hallicrafter line. Its price is listed at \$550, and, naturally, it is a lot of radio.

It tunes from 540 to 1600 kHz, and from 1750 kHz to 34 MHz. Among its notable features are dual conversion circuitry, antenna trimmer, RF gain con-

Hallicrafters SX-122A
Circle No. 2 on Page 10.

trol, switchable automatic noise limiter and BFO. It has fine sensitivity and selectivity, leading the firm to label it "Hallicrafters best professional type communications receiver." A 100 kHz crystal calibrator, designated the HA-19, is an optional extra.

—**Hammarlund HQ-180A.** This receiver has been around a few years and has a very good record in the DX derby. Even at a price just \$575, it is popular with many experienced DXers.

The HQ-180A has vacuum tube circuitry and is double conversion in the frequency range below the 41 meter band. It provides continuous tuning from the medium waves right up to 30 MHz shortwave. Selectivity is very good, using four switchable selectivity options, vernier passband tuning, and slot filter.

Other pluses include S-meter, series-type noise limiter, built-in 100 kHz crystal calibrator and independently selectable upper and lower sidebands.

—**Galaxy R-530.** In upper range of this price bracket, the R-530 lists at \$795. It is an all solid state job with full frequency range coverage from 500 to 30,000 kHz, and dual conversion circuitry.

This Galaxy Electronics offering has three built-in bandwidth choices, .5, 1.5 and 6 kHz widths, and crystal lattice filtering in the IF stage, for selectivity

Marion Ely, Del Ray Beach, Florida, does her listening with a Hammarlund HQ145C. She's made many friends via the eight radio clubs to which she belongs. Snapshots of a number of them are taped to the front of her receiver,

purposes. Frequency readout is a snap with the R-530, readers report.

Features include RF gain control and input attenuator, S-meter and audio level output meter, variable BFO, provisions for tuning upper and lower sidebands and a crystal calibrator that marks frequency every 50 kHz.

—**Collins 75S-3C.** Collins has long been a “name” in the amateur equipment market. The 75S receiver is basically a ham receiver, but the 3C model—there is also a 3B type—can be used for tuning frequencies other than the ham bands. The 3-C has an additional high frequency crystal board for the addition of separate crystals which can provide for tuning ranges outside the amateur radio frequencies.

The Collins 75S-3C costs \$850, and is designed with vacuum tube circuitry, although the power supply is regulated by solid state components. Regular fre-

Collins 75S-3C

Circle No. 16 on Page 10.

quency coverage includes the 80, 40, 20 and 15 meter ham bands, but up to 14 additional crystals, each covering a 200 kHz segment of frequencies of your choice.

The 3-C features mechanical filters and three built-in bandwidth selections, S-meter, antenna trimmer, preselector, BFO, upper and lower sideband tuning, and much more.

● PORTABLES

There are a flock of portable receivers on the market which will tune at least part of the short wave spectrum. Many of them are small and inexpensive, by communications receiver standards. They are handy to cart about for casual SWLing at the beach or while camping out. They are nice as supplementary receivers, particularly if you travel frequently and don't want to get out of touch with the world of short wave. But, dollar for

dollar, at least in the lower prices ranges, you'll get more DX-ability from a regular communications radio.

There are several of the more costly portables that can produce some pretty good DX, though.

—**Zenith Transoceanic Royal 7000-1.** This is the granddaddy of the portable rigs. In various forms it has been around since the '30's and in years past has traveled with explorers and scientists to the ends of the world.

The Royal 7000-1 is the current model. It has its own built-in battery pack but also can be used on regular AC house current. It has what Zenith calls a “Norm-Sharp” IF switch which increases sensitivity on the weaker signals. A whip type antenna means it is ready to go, anywhere and anytime, without the installation of a separate external antenna. The Zenith has all transistorized circuitry, manual RF gain controls and a BFO. Its tuning range covers long wave, medium wave, short wave and the FM frequencies in 11 bands. It has a headphone jack for private listening.

—**Panasonic RF-5000A.** National Panasonic, a Japanese manufacturer, makes this high quality, \$289.95 portable. It is all solid state and long wave, 525 to 30,000 kHz medium and short wave, plus

Panasonic RF-5000A

Circle No. 17 on Page 10.

FM signals in the 76 to 108 MHz range. It is dual conversion on the shortwaves.

The Panasonic includes noise limiter, BFO, automatic gain control for constant level listening volume, a built-in antenna for portable listening, S-meter and tone control. It can be operated on batteries or 117 volts AC. Narrow and wide bandwidths are offered for improved shortwave selectivity.

COMMUNICATIONS WORLD

—**Sony CRF-230.** Another Japanese-made receiver in the portable category is the CRF-230, which lists for \$695. It covers a wide range of frequencies; 150-400 kHz long wave, 530 to 4,100 kHz medium and lower short waves, plus 10 popular short wave broadcast ranges, the 11 meter CB band, 10 meter ham band and two VHF groupings, 64-90 mHz, and 87-108 MHz FM.

It has dual conversion on short wave with broad and sharp selectivity options, a BFO and noise limiter, built-in antennas and much more. Naturally, it operates from either batteries or normal AC power source.

● ROLL-YOUR-OWN'S

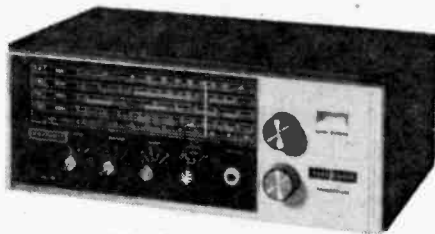

No discussion of communications receivers would be complete without mentioning the receiver kits on the market. The two important names in kits are Knightkits, distributed by Allied Radio Shack, and Heathkits.

For the fellow who has the patience and a minimum amount of construction skills, building your own set from a kit can be immensely satisfying and a good way to save some money.

—**Heathkit GR-81.** At the bottom end of the price scale is this barebones, four-band regenerative shortwave receiver kit. It is a simple three-tube set with its own transformer operated power supply, headphone jack and built-in speaker. It will give the beginner the fun of kit building and the adventure of hearing

some of the more powerful international broadcast stations. It covers a frequency range of up to 18 MHz. It is priced at just \$29.95.

—**Heathkit SW-717.** For just \$30 more, Heath has come out with a new, solid-state, four band SWL receiver which tunes from 550 to 30,000 kHz. For the price it has some interesting features, including variable BFO, switchable automatic noise limiting, S-meter, built-in

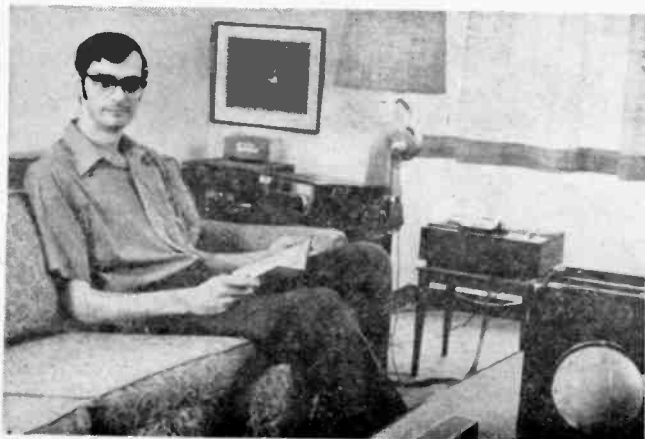

Heathkit SW-717
Circle No. 18 on Page 10.

rod antenna and external SWL antenna connection, Zener diode regulated oscillator power supply and ceramic IF filters. Heath says it will go together with about 15 hours of work.

—**Knight-Kit Star Roamer.** This is Allied Radio Shack's economy priced receiver kit, a set that has been popular with be-

Knight-Kit Star Roamer
Circle No. 15 on Page 10.

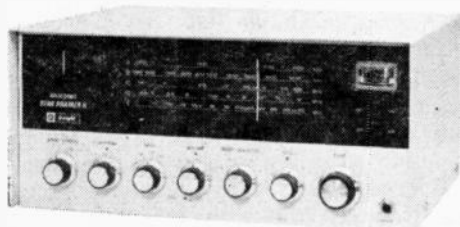

An active listener whose name frequently appears in club bulletins is Philadelphian Larry Magne. The key piece of equipment in Larry's apartment listening set-up is a Drake R4B receiver. Larry uses tape recorder for logging stations in living room listening area.

ginning SWL/constructors for a few years. It is a tube-type superheterodyne which covers 200-400 kHz long wave, the medium wave band, and shortwave from 1.8 to 30 MHz, in three SW bands.

It has a switchable automatic noise limited, sensitivity control, automatic volume control to reduce fading and blasting, an antenna trimmer and illuminated S-meter. Construction is easy and the cost is just under \$50.

—**Knight-Kit Star Roamer II**—At \$69.95, this kit is a solid-state upgraded version of the original Star Roamer and is relatively new on the market. It features the same frequency coverage as its baby brother. Construction problems are eased by modular concept assembly. The Star

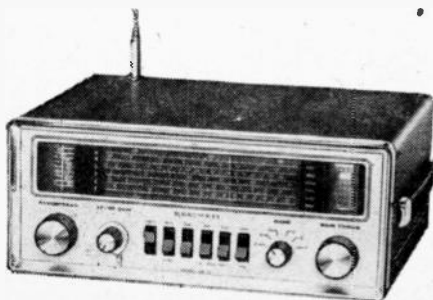

Knight-Kit Star Roamer II
Circle No. 15 on Page 10.

Roamer II has a BFO, automatic noise limiter and volume controls, antenna tuner and FET front end for greater sensitivity.

—**Heathkit GR-78**. This is a solid state kit that offers wide frequency coverage, from 190 kHz to 30 MHz, and is portable besides. As Heath says, the receiver is great for travelers and the "portable people" who want a SW radio that's ready to go when they are.

This kit, easily constructed, provides switchable automatic noise limiter, automatic volume control, S-meter, built-in antenna and external antenna connec-

Heathkit GR-78
Circle No. 18 on Page 10.

tion, 500 kHz crystal calibrator and modern FET circuitry for stability and sensitivity. Four ceramic IF filters deliver sharp selectivity. It operates from its own rechargeable nickel-cadmium battery with self-contained recharger. It costs about \$130, in kit form.

—**Heathkit SB-310**. This, the top of the kit line, can hold its own with the pre-built communications receivers described earlier as pro jobs! But for the guy willing to build from a kit, it offers a real savings, at \$279.

This piece of communications-quality gear has ten switch selected bands, six shortwave broadcast ranges, three ham bands and the 11 meter citizens band frequencies. It has a 5 kHz crystal filter for improved selectivity. Dial calibration is accurate and easy to read. Features include separate RF and AF gain controls, calibrates S-meter, 100 kHz crystal calibrator and switch-selected automatic noise limiter. Construction time is about

Heathkit SB-310
Circle No. 18 on Page 10.

20 hours, with only a VTVM (vacuum tube volt meter) needed for accurate alignment.

● GOLD-PLATED SPECIALS

These seven deluxe communications receivers, priced at from about \$1,500 to over \$4,000 are probably only for the select few for whom price is no object.

One feature included in a number of these receivers has not appeared in less expensive models. This is direct frequency digital readout. It is accomplished in various ways, depending on the receiver. What it means, simply, is that instead of having to look at a calibrated dial with a tunable pointer or sliderule type indicator, frequency can be read directly and numerically. In other words, the frequency is displayed

COMMUNICATIONS WORLD

with numerals in the same way an odometer on a car shows miles traveled. The difference is that the odometer uses a mechanical system of numerical readout; the receivers use an illuminated, electronic system in many cases.

—**Collins 51-51.** This is Collins top quality receiver. It is a vacuum tube unit with tuning from 200 to 2,000 kHz, and 2 to 30 MHz, in 30 different bands, each one MHz wide. It has nearly every receiver refinement you could ask, including mechanical and crystal lattice filtering, notch filter and direct digital frequency readout.

—**Hammarlund SP-600 JX-21A.** Another old timer that's been around for a long time because it is a top flight unit. It is a dual conversion receiver that tunes from .54 to 54 MHz.

This receiver sells for about \$1,600, and for that price you get a lot. It has crystal selectivity positions of 200, 500 and 1,300 Hz. widths, and non-crystal selectivity positions of 3, 8 and 13 kHz. It is ruggedly built and a hefty size that allows for packaging all those features that make DXing easier.

—**National HRO-500.** The National Radio Company makes this all solid state rig with tuning, in 60 separate 500 kHz ranges, from virtually the bottom of the spectrum, 5 kHz, up to 30 MHz. It is dual conversion and uses a fascinating phase lock oscillator that gives accurate tuning

and frequency readout, though not a digital display. This is a tough one to find on dealer's shelves.

Again, you name it and the HRO-500 has it as part of its complex design.

—**Drake DSR-1.** The highlight of the DSR-1 is the direct digital frequency readout displayed with illuminated numerals. It is of all solid state design and provides continuous coverage of frequencies between 10 kHz to 30 MHz. It has all the

Drake DSR-1

Circle No. 10 on Page 10.

goodies, notch filter, phase locked digital readout frequency synthesizer, squelch—only a signal causes it to break silence, meaning listening is easy on the ears—and a noise blanker, to name a few.

—**Marconi EC-958.** This is another British-made entry in the receiver marketplace. It too is all transistorized with the new integrated circuits and field effect transistor RF stage. It tunes from 10 kHz to 30 MHz, continuously, or in 100 kHz stages in the shortwave range. It is triple conversion in the lower frequencies and has selectivity options of .4, 1.3, 2.1, 3 and 8 kHz.

The Marconi will operate from 117 volts AC, or from batteries, with an external converter. It goes for something under three grand!

—**National HRO-600, Collins 651S-1.** These two receivers have direct digital frequency readout with electronic numerical display. Their ultra sophisticated refinements are really too exotic to go into in detail. What more can one really say, except the HRO-600 goes for \$3,380; the Collins for \$4,135!

North Dakotan, Mrs. Mildred Marshall is one part of a DXing family. Her son, Larry was an active DXer until he joined the Navy. She uses an SX-122.

● A USED RECEIVER

Buying a secondhand communications receiver can be a wise investment. . . or a big mistake. Among the many used sets on the market at a particular time are both peaches and lemons, so if you pick the wrong one you're in for nothing but grief.

SWLs have a habit of buying a receiver, keeping it a few years, then trading up to newer and plusher models. Many dealers take the older, but often perfectly good, radios in trade. Sometimes they are reconditioned and returned to top operating condition before they're resold. Sometimes they're sold as is. They are usually priced at from a quarter to more than half off the original cost. Or, perhaps you can find another SWL or a ham who'll sell you his used set. Then the old horsetrading bit establishes the price. In such cases, it's helpful to know the seller personally and how he treated it when it was the pride and joy of his shack.

The big plus in buying a used receiver is the cost. Maybe you can't afford more than a \$100 receiver. For that money you could get a fairly good new receiver, or you might be able to buy a used set, which can still bring in the DX, that sold for \$250 when brand new. And some sets, built five, ten or even more years ago, if kept up, are as good or better than some models being built today.

Still, purchasing a secondhand receiver is a case of *let the buyer beware*. You could get a real DX machine or nothing more than a pretty piece of junk. It is a decision that you alone can make.

But seldom is it wise to buy a radio sight unseen. If you're not too knowledgeable about electronics, it's not a bad idea to take along someone who does, an experienced ham or radio technician, even if you have to pay him a few bucks for his disinterested appraisal.

Before you call in your appraiser, however, here are a few simple checks you can make on a secondhand receiver you're considering.

✓ Take a look at its general appearance. Does it look like its had a rough life? Is the exterior worn, scratched or dented? Has it been repainted to cover these con-

ditions? Under the chassis, are there tell-tale charred resistors, a faint, lingering odor of burnt bakelite? These often are signs of past trouble. Does it appear that the original factory wiring has been altered?

✓ Turn on the set and check both the medium and shortwave bands. Does the audio sound muffled? How about a high level 60 cycle per second hum? Both are tipoffs to aging capacitors. Does the S-meter operate? Do the controls work?

✓ Check the calibration. Tune several of the standard time and frequency stations, such as WWV on 5,000 and 15,000 kHz, and the Canadian CHU on 7.335 MHz. Do they show up on the proper frequencies?

✓ Check the signal-to-noise ratio as described earlier.

✓ Look for unwanted image signals on several bands. Find a strong signal, then tune above and below in frequency, particularly at points 910 kHz away. You may hear a repeat signal of the station, but it should not be strong. If the receiver has a built-in preselector, and if it's working properly, images should be practically non-existent.

✓ To judge mechanical stability, tune a shortwave signal, then switch the band selector to another range and then

return it to the original position. Is the station still coming in loud and clear, or do you have to repeak the tuning to bring it in again? Check thermal stability by determining how much the set drifts from a tuned station during the first 20 or 25 minute warm-up period. If it's a transistor set, forget this thermal stability check.

✓ As previously mentioned, selectivity is a critical factor. Unfortunately, it's not that easy to check in a quick test at the dealer's showroom. But you can determine which type of system it uses to obtain this selectivity. Does it have a notch filter, crystal, ceramic or mechanical filters, or maybe none of these? Is it double or triple conversion? Then use the various selectivity controls. Can you improve the readability of a signal in a crowded band with plenty of side frequency interference?

These seven check points can give you an idea of you should give the possible purchase a second thought. And, the same tests can be useful in selecting a new set too.

At this point, a few comments are in order about communications receiver kits. For the right person, they can be a real moneysaver. The reason is simple. Labor costs are what really boost a set's price. But with a kit, most of the tedious, time-consuming work is done by you, not at the factory. This means the maker can peddle it for less. As a result, for a given amount of cash, you can

wind up with a better quality receiver by constructing it yourself from a kit.

Anyone who can read and follow directions explicitly, should have no trouble with kit-building. The instruction manuals are carefully written, even to the point of anticipating specific problems you may encounter. Building a kit,

With a Lafayette HE-30, Cesar Objio, who lives in the Dominican Republic, is well known in Latin American DX circles.

admittedly, does take a bit of self confidence. You have to believe at the outset, that after sinking your dough in this boxful of parts, you're not going to botch the job. Most difficulties occur because the builder got overconfident and careless in reading the step-by-step directions and took a shortcut or two. A second cause of problems is poor soldering techniques. It's worth a little practice with the soldering iron before you begin the kit.

● SKYWIRES

Radio was first known, and still is in some parts of the world, as wireless. Any kitbuilder who has fumbled with all those multi-colored leads can tell you it is anything but that. Doubtless the most important wire to a DXer, though, is the one that snags the broadcasts out of thin air, his antenna.

The antenna's job is to receive the electromagnetic energy transmitted by stations and deliver it to your radio receiver, where it can be changed into audio signals you can hear.

In its simplest form the aerial or antenna is a piece of wire, isolated from the ground, attached at one end to the receiver, with the other as high above the earth as is possible.

For the guy who likes to experiment, but doesn't have too much electronic know-how, the antenna is a great place to start. The components you'll need, some wire, preferably copper or other good electrical conductor, some non-conductive glass or ceramic insulators, a length of insulated lead-in or transmission line, and a lightning arrester to keep a bolt from the blue from frying you or melting your rig, are cheap and easy to obtain. Sure, there's a lot of fancy theory involved in antenna design, but even if you're shy in this department, you can play around with various home-brew aerials until you find one that works for you.

● THE LONGWIRE

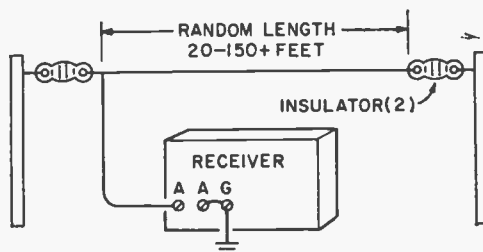

Probably more DXers use a longwire antenna than any other. The receiving portion of this is usually called the *flat top* and may be of any convenient length, though usually at least 20 feet and not more than 150 feet long. An antenna tuner, mentioned earlier, will help to "tune" this length wire for optimum performance on a particular frequency.

The longwire should be as high as possible above the ground, insulated at each end and not touch any object which will short it to ground. Preferably it should be located away from such electrical interference sources as power lines and busy streets. Auto ignition systems cause electrical noises in radios.

Soldered at one end of the longwire should be the lead-in, an insulated wire long enough to reach your receiver. The reason for the lead-in's insulation is, as with the flat top portion, the antenna cannot be "shorted out" or it will not function.

As the diagram shows, the longwire, a horizontal flat top, end-fed at right angles by the lead-in, looks like an upside-down letter "L". As a result, this type of skywire is sometimes known as the *Inverted L*.

Remember, the ends of the flat top should terminate in non-conducting insulators, attached to any convenient high points around your home, the house it-

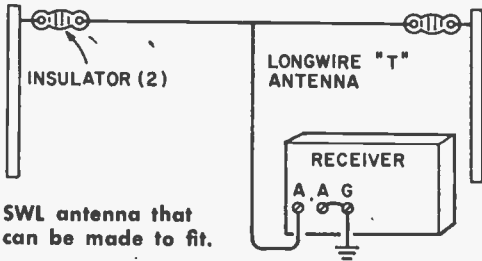

SWL's simple longwire antenna.

self, a garage, a pole, a tower, a tree. Though the flat top portion should run parallel to the earth, if the available supporting points are of different heights, and the resultant antenna looks more like a broad, inverted V, rather than a right angle L, there's no real harm done.

● COUSIN "T"

Related to the *Inverted L* is the *T antenna*. The only basic difference is that the lead-in wire is attached at the center of the flat top, rather than at an end. The reason for choosing a *T* over a conventional end-fed longwire is purely practical. You may choose a *T* if the available supporting points for the antenna are more favorable for a center-fed lead-in. You'll quickly discover, as an antenna experimenter, that the shape of your yard or the locations of trees suitable for supporting the aerial are often

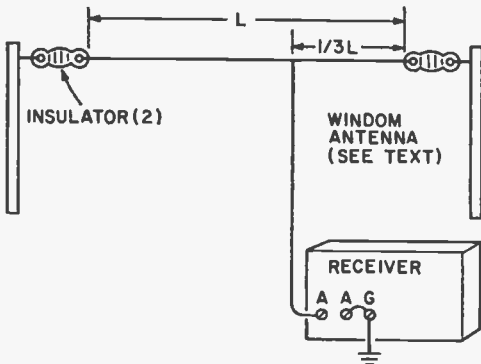

SWL antenna that can be made to fit.

the critical design factors.

Similar to the *T* is the Windom antenna. Unlike either the *Inverted L* and the *T* the Windom works best on the particular frequency band for which it was designed.

Determine the center frequency of the band you tune most. Take for example, the 31-meter band. Base your computa-

tion on a frequency of 9,800 kHz (9.8 MHz). Use it in the following formula, in which *L* stands for the length of the flat top portion:

$$L = \frac{468}{f(\text{in MHz})}$$

The antenna's length should be $468 \div 9.8$, or 47.75 feet. Forty-eight feet is close enough, and an easier figure to work with.

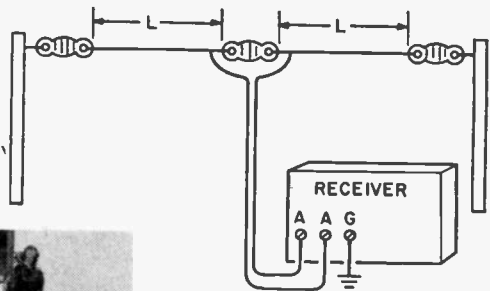

Install the Windom as you would a *T* antenna, only attach the lead-in, not at midpoint, but one-third of the way from the end nearest your receiver. In this case, 16 feet from the end.

Though you'll get optimum performance on 31 meters, this Windom will also bring in signals on other short-wave bands.

● THE DIPOLE

Not a threat uttered to a Warsaw resident, a dipole is another simple and basic antenna design. At first glance it looks similar to the longwire *T*, but there is an essential difference.

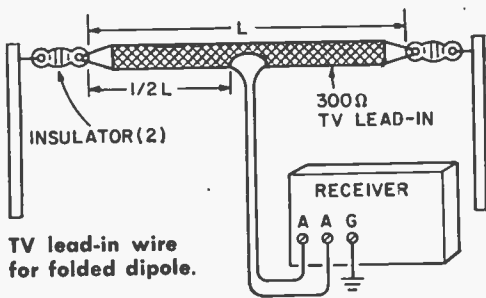

A dipole is two identical lengths of wire, separated from each other in the center by an insulator. It is fed by a twin-wire lead-in, 75-ohm transmission

Windoms and dipoles require exact lengths.

Another distaff DXer, Ginette Barratt of Quebec, wife of Canadian DXer, Frank Barratt, whose photograph appeared in *Communications World* earlier. She's a DXer in her own right however, and has tuned more than 45 countries using a Drake SW-4 receiver as shown.

TV lead-in wire for folded dipole.

line available at most ham radio supply stores. One half of the twin-lead is attached to each segment of the dipole. The other end of the lead is similarly split with each wire connected to one of the receiver's two antenna terminals.

Unlike the random length longwire which is useful over a wide range of frequencies, a dipole is designed for a specific shortwave band. A dipole "cut" for 25 meters really won't perform well on any other band, for example. And, directionality is somewhat more important with a dipole since it receives best those signals which approach from right angles to its length.

The formula for determining the length of the dipole's two top elements is:

$$L \text{ (Length of each element)} = \frac{234}{f \text{ (in MHz)}}$$

For a 31-meter band dipole (doublet is another name used to describe this type of aerial), again let's use the mid-band 9.8 MHz frequency for the calculations. Therefore, each leg of the dipole would be $234 \div 9.8$, or approximately 24 feet.

An improved version is the folded dipole. In this case, though, both the flat top and the lead-in are made from common 300 ohm twin-lead television wire.

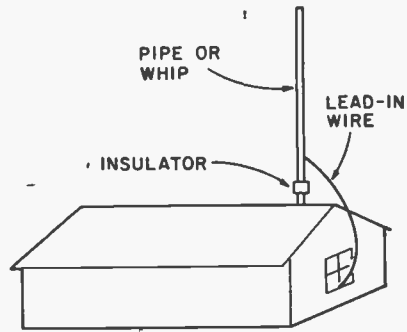

The overall length of the folded dipole's flat top should be computed using the formula:

$$L = \frac{468}{f \text{ (in MHz)}}$$

At midpoint, one, and only one, of the two wires should be cut. The twin-lead should be connected to each side of the "cut" as with the basic dipole. The two wires of the flat top should be connected at each end.

● VERTICAL ANTENNAS

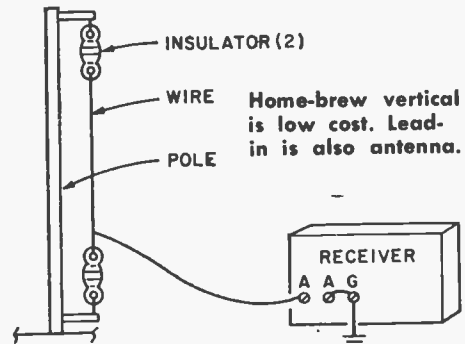

Yet another basic shortwave antenna is the vertical. It can be a good choice in some locations, though it is particularly

Omni-directional means vertical.

responsive to electrical interference from auto ignitions, neon signs, electrically "leaky" power lines and the like.

The vertical is omni-directional, receiving equally well from all directions. Its biggest advantage is that it takes lit-

tle horizontal space. For this reason it can be a boon to the apartment dweller without a large backyard.

If you can find a tall object from which to suspend a wire vertical, fine. Or a pipe or whip-type antenna may be the answer. It, again, must be insulated from the ground.

If you live on an upper floor of an apartment building or university dormitory you can create a simple temporary vertical antenna by dropping a length of insulated wire from your window, letting it hang down several stories, at least until the landlord or the tenants below get curious.

There are many more sophisticated antenna designs you may wish to try. Two books on the subject which you'll find useful in learning more about skywire topics are *The ARRL Antenna Book*, and the *Amateur Radio Antenna Handbook*, published by Howard W. Sams and Co.

● COMMERCIAL ANTENNAS

A shortcut answer to the antenna problem for many listeners is a commercially made version. Depending on the antenna and your location and reception conditions, you may find a commercial type antenna performs better than a home-made outfit. But that's not necessarily the case.

At any rate, a ready-made antenna, or a complete antenna kit, will save you the experimentation, the trial and error. And, if tinkering with skywires isn't your bag, one of the following may be:

—**Mosley** (Mosley Electronics, Inc., 4610 N. Lindberg Blvd, Bridgeton, Mo. 63042). Mosley makes two antenna designed for the SWL market. One is the popular SWL-7, actually seven dipole antennas in one. Using specially made "traps", a single horizontal aerial can be used for reception of the 49, 31, 25, 19, 16, 13 and 11 meter bands.

The SWL-7 comes in kit form; you do the cutting to length and the assembly. It takes about 40 feet of clear space to erect and about an hour to install. The whole works costs about \$27. For a bit more you can also get the TRS-57 "balun," which allows the SWL-7 to work, though not quite as well, on other frequencies.

Mosley also makes the SWV-7, a vertical antenna for the same bands. It is 13 feet tall and has seven radial wires

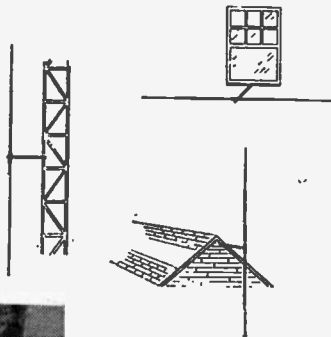

coming out from the base. You have to supply a suitable mast from which to support it. It costs around \$34.

Both the SWL-7 and the SWV-7 come ready for assembly and installation; no experimentation necessary.

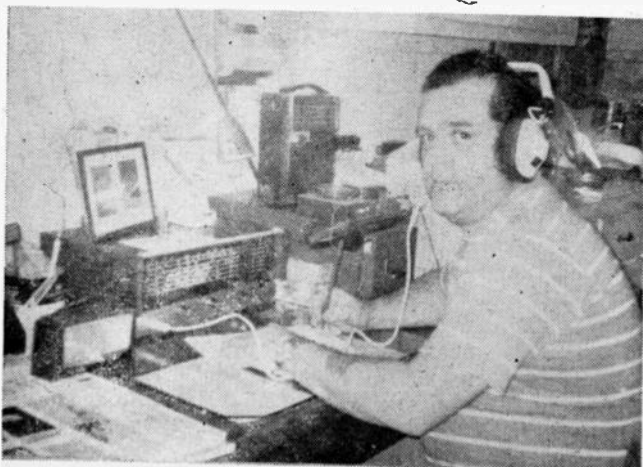

—**Hy-Gain** (Hy-Gain Electronics Corp., P.O. Box 868, Lincoln, Nebr. 68501) Hy-Gain makes two inexpensive antenna kits. There's the SW-6, a relatively simple outfit costing only about \$7. It comes with 50 feet of copper wire, styrene insulators, guying rope and lead in. Nothing fancy, just all the makings for a sturdy longwire antenna for shortwave use.

The SW-9, priced at about \$10, is a broadband antenna said to perform comparably with longer antennas. It is billed as a "window antenna," is short in length—about nine feet—and should be the answer for those living in apartments or other areas where space is at a premium and backyard or rooftop skywires are out of the question.

—**Cush Craft** (Cush Craft Corporation, 621 Hayward St., Manchester, N.H. 03103) This well-known antenna manufacturer makes the Trik Stik, which the

Apartment dwellers to home owners can find SWL antennas for every need. This one, Cush Craft's Trick Stik, can be mounted in either a vertical or horizontal plane.

Jerry Blake finds that receiving verifications from foreign stations is also a good way to build up his stamp collection. Jerry, Ft. Wayne, Indiana, uses one each Lafayette Mark II as his ocean-hopping DX grabber.

firm calls "the answer to literally hundreds of different antenna problems."

Trik Stik's unique design allows vertical or horizontal mounting almost anywhere. Complete instructions are supplied with measurements for setting Trik Stik to the correct dimensions for any range of frequencies, up to and including the FM broadcasting band.

It has two 54-inch element sections with a pair of 51 inch inserts which can be adjusted for the proper frequency. It may be fed with 52 or 72 ohm coaxial cable or 300 ohm TV-type twin lead. Assembly time is measured in just minutes. The Trik Stik sells for \$8.95.

—**Partridge** (Imported and distributed by Gilfer Associates, Inc., Box 239, Park Ridge, N.J.). This British firm makes the popular and widely used Joystick antenna.

The Joystick is an eight foot length of metal tubing with a built-in loading coil. It goes together easily, a couple of screw-type couplings do the trick. It is fed by a single wire. In order to peak the Joystick for the particular short wave range you're tuning, the Joymatch SM tuner is essential.

The Joystick is an omni-directional antenna. It can be mounted vertically, or horizontally, or, practically anyway at all. DXers have reported good results when simply leaned against a basement corner. The only caveat is to locate it away from large metal objects.

It is a good choice for the DXer with little room to spare or one who hates to shinny up trees to string a wire antenna.

The Joystick sells for \$17.50, the essential Joymatch tuner for \$15 more. —**Murch** (Distributed by Gilfer Associates, Inc.). The Murch 86D receiving antenna is an all band design that can be used for tuning between 3 and 30 MHz. It is ready to install when you take it from its carton. It consists of 100 feet of wire with a special "balun" matching transformer in the center. The lead from the balun automatically matches impedances between the antenna and receiver. The lead is 55 feet long, but may be lengthened if necessary.

Obviously, the Murch 86D takes a hundred feet of free space and it should be mounted at least 25 feet high. It costs around \$19.

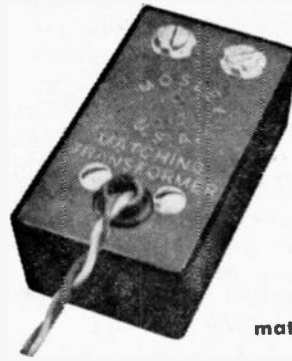

—**Space Magnet** (Worcester Electronics

Laboratory, R.D. 1, Frankfort, N.Y. 13340) Earlier medium wave loop antennas were mentioned as a necessity for BCB listening if one hunts for overseas broadcasts. Remember, because the regular MW band is so crowded with domestic signals, it really helps to have a directional antenna that can be rotated for peak signal strength and minimum co-frequency interference from stations in other direction.

For medium wave listeners, and only medium wave listeners, a newly marketed antenna known as the Space Magnet may be a good answer.

It is a ferrite core loop antenna, 12 inches long, in a three by three by 12 inch aluminum shield. It can be located inside, near you receiver. It can do a good job of receiving distant BCB stations on the medium wave.

The basic model Space Magnet is priced at \$29.95; a deluxe version costs \$34.95.

Accessories for better DXing include this antenna transformer made by Mosley.

● DX'ING MEDIUM WAVES

The medium wave broadcast band is a good place to begin your DXing. For one thing you can get your feet wet even before you buy your first communications receiver; almost any kind of radio will bring in the more powerful, though distant stations.

Secondly, there are many target stations to tune for. Many are not too hard for the newcomer, yet others are a real test of DX-ability. It is safe to say that although you continue to DX for the rest of your life, you'll never manage to hear them all. There are, presently, more than 4,500 different stations in the United States alone. A quick look at White's Radio Log will give you an idea of what the BCB has to offer.

Don't get the idea that DXing domes-

TUNING THE 50 STATES ON MEDIUM WAVE

tic stations is duck soup. The first hundred stations or so may come quickly, if you work at it. But after that it's progressively harder to log new stations.

By international agreements, as you may already have realized, U.S., Canadian and Mexican stations are located on frequencies 10 kHz apart, from 540 to 1600 kHz. These broadcasters have transmitters ranging in power from 250 watts—only 100 watts in a few rare instances—to 50,000 watts. Two exceptions to this rule are a number of low power, as low as 20 watts, unmanned Canadian relay stations, and a handful of super-strong Mexican outlets of 100 or 150 kilowatts. These latter stations are frequently and widely heard throughout the U.S.

Between 540 and 1600 kHz, there are 107 different frequency channels. These are divided into three basic categories, clear, regional and local channels.

Clear channels are the easiest BCB frequencies to listen to, since there is only limited interference to the primary stations assigned. There are 60 different frequencies designated as clear channel in North America. On most of these, the primary station is American, but on some the main station is located in Canada, Mexico, Cuba or the Bahamas.

Though called clear channel, most such stations are not entirely free of at least some interference, since secondary stations are allowed to operate during the day, or with restrictive transmission patterns that protect the primary stations.

A second basic category of frequencies

State	Call	Freq. (kHz)	State	Call	Freq. (kHz)
Alabama	WYDE	850	Montana	KXLF	1370
Alaska	KFQD	750	Nebraska	KFAB	1110
Arizona	KTAR	620	Nevada	KOH	630
Arkansas	KAAY	1090	New Hampshire	WKNE	1290
California	KFBK	1530	New Jersey	WPAT	930
Colorado	KOA	850	New Mexico	KOB	770
Connecticut	WTIC	1080	New York	WABC	770
Delaware	WDOV	1410	North Carolina	WBT	1110
Florida	WQAM	560	North Dakota	KFYR	550
Georgia	WSB	750	Ohio	WLW	700
Hawaii	KORL	650	Oklahoma	KOMA	1520
Idaho	KGEM	1140	Oregon	KEX	1190
Illinois	WLS	890	Pennsylvania	KDKA	1020
Indiana	WOWO	1190	Rhode Island	WPRO	630

Minnesota	WCCO	830	West Virginia	WWVA	1170
Mississippi	WOKJ	1550	Wisconsin	WKOW	1070
Missouri	KMOX	1120	Wyoming	KWYO	1410

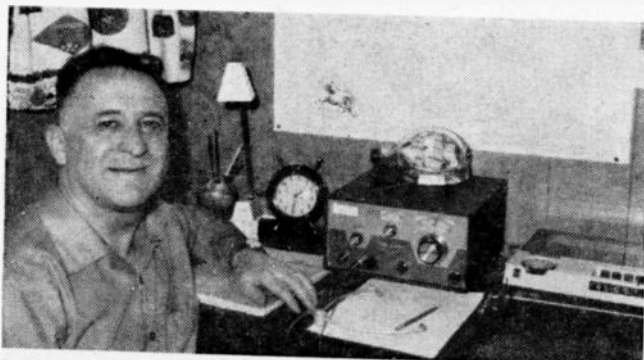

Because the BCB band is so crowded with stations, logging all 50 the United States is tougher than it used to be. But, with patience and luck, you can do it.

is the regional channel. There are 41 regional channels, each with about 25 to 50 stations. They are limited in power to 5,000 watts and many of them broadcast only during daylight hours.

The smallest category, in terms of number of frequencies, not number of stations, is the local channel. There are only six local channels—1230, 1240, 1340, 1400, 1450 and 1490 kHz—which are used by low powered stations designed to cover small audience areas. Though only a half dozen in number, these frequencies account for nearly a quarter of all American stations, with perhaps 175 operations assigned to each. Again, many of these are restricted to daytime broadcasting only.

At night, when medium wave signals reach out thousands of miles, these local channels become a mass of interference with

The key bit of equipment in this neat Iowa DX-den is a Drake SW-4 communications Rx. The owner is Curne Chadwick.

dozens of signals mixing it up on a particular wavelength. This bedlam makes for tough and challenging DXing. It is no wonder that DXers call these local channels *The Graveyard*.

● WHEN TO DX

If you've ever eavesdropped on two experienced medium wave DXers, you've probably heard them discussing *conditions*. What they mean is that there are various factors that are involved in the reception of distant BCB stations. And these factors vary greatly. The result is that there are times when you're apt to hear signals from far off stations and times when you almost certainly won't.

We've mentioned why DX is possible, but these same factors determine when as well.

Basically, there are three cycles of propagation to be considered. The first is the daily cycle. You've probably noticed it already, but medium wave signals travel further, thanks to skywave propagation, at night.

In addition, during the transitional periods from light to dark and vice versa, that is dusk and dawn, reception frequently is enhanced.

Don't forget that several thousand U.S. stations are authorized by the Federal Communications Commission to broadcast only during the daytime. Since it gets darker earlier to the east of your location, you can hear daytime stations signing off, and then hear other stations further west as the frequencies begin to have less interference from these now-silent interfering daytimers in the east.

Late at night, as your local stations sign off for the night, look toward the west for those still broadcasting. And, about dawn, again look for stations to the east, the daytime outlets particularly, as they return to the air.

The second cyclical factor to consider is the annual variation. BCB DX is better in winter than in summer. One reason, of course, is that there are fewer hours of daylight. Also, the warm months mean increased static levels.

Finally, there's the sunspot cycle. The number of sunspots, those eruptions on the sun's surface that cause heavy solar radiation affecting ionospheric ionization, varies over about an 11 year cycle. The present cycle reached its peak in

mid-1968, and after a slow tapering off, is beginning to drop quite steeply. What this means to the medium wave listener is that reception should improve over the next several years. The reason is that during the peak sunspot years, the "density" of the F layer becomes so

COMMUNICATIONS WORLD

great that it begins acting like the absorbing D and E regions and less like a radio wave reflector.

In addition to the physical laws governing the best times to BCB DX, there are some man-made decisions that play a role.

—Monday Morning DX. Many stations in North America reserve the early hours on Monday mornings for equipment maintenance and testing. Since quite a number of broadcasters regularly transmit 24-hours-a-day, these Monday mornings when they are silent is usually a good time to try for those other stations still on the air, or for foreign stations whose channels are usually blocked by the dominant stations at other times.

Experienced MW listeners frequently forego sleep on Monday mornings, between around midnight and dawn, to catch the rarer stations. If you'd like living proof of Monday morning as a prime DX time, try staying awake a few extra hours on consecutive Sunday and Monday mornings. Note how much less interference there is on the band on Monday, with many of the regular stations silent as the engineers busily tackle the basic housekeeping and maintenance chores.

Also, the several DXer clubs specializing in medium wave listening arrange with various hard-to-hear stations to conduct special DX broadcasts for listeners. These Courtesy Programs are scheduled for the quiet Monday mornings when listening chances are opti-

These are the most powerful broadcast band stations in the United States and Canada. All operate with 50,000 watts, the highest permitted power. Stations operating only during daylight hours are marked (*).

mum and interference at a minimum. These special tests usually consist of music and frequent announcements, including requests for reports and promises of verification letters or cards.

To take full advantage of these Courtesy Program opportunities, you'll have to join one or more of these clubs—and we'll have data on them a bit later—to get up-to-the-minute information on when they're scheduled.

—**Checking the Hertz.** Stations usually have two other types of special transmissions during the quiet hours on Monday mornings, and not infrequently on other days of the week too.

One of these is called the frequency check. The FCC requires stations to operate on precise assigned frequencies varying not more than plus or minus 20 Hz. To make sure they're legal, stations arrange with commercial monitoring stations to check their transmitting frequencies at regular intervals. These frequency measurements are made during the early morning hours, generally, when interference from other outlets is at a minimum.

These frequency checks usually run about 15 minutes or so and consist of audio tones and announcements identifying the station. These checks are good times to hear daytime stations which otherwise cannot be logged. Many stations conduct these checks at regular known times and the DX clubs keep track of the schedules for the convenience of members.

Longer in duration and not usually scheduled at regular intervals are equipment tests, when station engineers can play around with their transmitters to make sure they're operating properly. These on-the-air tests, often long periods of music and occasional identifications, are another good bet for the guy who wants to tune a rare station and doesn't mind giving up some of his sacktime.

—**How should you start?** Well, for the first step in your BCB DX initiation, you might even try some daylight listening. The main reason for this is to familiarize yourself with the regulars in your area, those stations which before very long you'll consider pests because their strong signals cover the weaker and more distant DX outlets you'll want to hear.

You will find a handful, or perhaps 20 or 30 loud stations, depending whether you live in a rural area or a major metropolitan center. Make note of which ones they are and their frequencies.

Then, during your first few evenings, look for other stations from your general area, but a bit more distant. These will soon be considered your regular DXing interference.

Next, when you've familiarized yourself with the band's regular inhabitants in your general area of the country, try to tune the clear channels. Here you'll get a taste of your first distant reception.

Among the broadcasters on the clear channels which you should readily hear are WSM, Nashville, 650; WNBC, New York City, 660; Chicago's WMAQ, 670, and WGN, 720; WWL, New Orleans, 870; WBZ, Boston, 1030; KSL, Salt Lake City, 1160; WOAI, San Antonio, 1200, and many more. WLW, Cincinnati, the only U.S. station on 700 kHz, and the only one that doesn't have to share its frequency with another American station, will be one of your easiest loggings.

Then note the scattering of foreign voices, French from a number of the stronger Canadian outlets, Spanish from the more powerful Mexicans and from Fidel Castro's Cuban transmitters. Despite the language differences, some

One of the best known overseas listeners is Australia's Bob Padula. A telecommunications engineer, Bob has used his Lafayette HE-230 to hear just about two hundred countries.

BEST BETS FOR BEGINNERS

Country	Freq. (kHz)	Call/SLOGAN	CITY
BAHAMAS	834	ZNS	Nassau
COLOMBIA	820	La Voz del Rio Cauca	Cali
COSTA RICA	625	La Voz de la Victor	San Jose
CUBA	640	La Voz de Cuba	Havana
EL SALVADOR	655	Radio Nacional	San Salvador
GUATEMALA	880	Radio Nuevo Mundo	Guatemala City
JAMAICA	750	Jamaica Bc. Co.	Point Galina
NETH. ANTILLES	800	Trans World Radio	Bonaire
NICARAGUA	750	Radio Equis	Managua
VENEZUELA	1020	Radio Calendario	Maracaibo

Once you've logged these stations, and there are alternates you may hear instead—Radio Rumbos, Caracas, Venezuela, 970 kHz, Colombia's Radio Minuto, Barranquilla, 1515 kHz, or other Cuban outlets, for example—you'll have ten CCB countries under your belt. Add Mexico, Canada and the U.S. and you've 13. Then turn to other foreign targets.

Beginning DXers are often puzzled to hear French-speaking stations on the medium wave dial. For the newcomer to the hobby, the French stations he hears will nearly always be Canadian broadcasters. These are the outlets which program to French-Canadians. Bi-lingual stations which sometimes transmit in French are marked (*).

COMMUNICATIONS WORLD

sharp ears will help to pick out the call identifications.

Already you will have logged three countries, in addition to the United States on broadcast band.

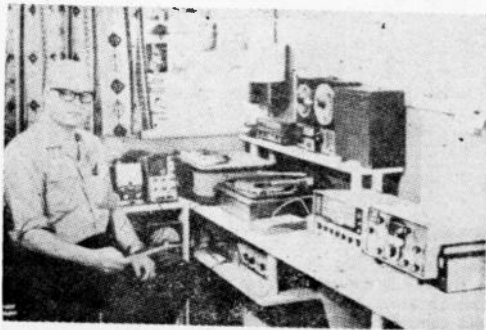

Then, turn your attention to the regional channels. Dig out those stations such as WNAX, Yankton, South Dakota, 570 kHz; KABC, Los Angeles, 790; WRC, Washington, D.C., 980; and WHBF, Rock Island, Illinois, 1270; all 5,000 watters.

Start tuning for the several hundred Canadian medium wavers. These include powerful 50,000 watt Canadian clear channel operations such as CBK, Watrous, Saskatchewan, on 540 kHz, and CBW, Winnipeg, Manitoba, on 990 kHz, dominant figures on those frequencies.

-Cold DX. The Canadian targets also include dozens of low-power relay transmitters, LPRT's, called *icebox* stations by some listeners.

The *icebox* tag comes, naturally enough, from a rough approximation of their size and shape. These stations, only 20 or 40 watts, are unmanned relay transmitters, frequently looking like nothing more than a refrigerator stuck up on a telephone pole. They are Canada's answer to the problem of providing local quality radio signals, day or night, to widespread rural audiences in areas where fullfledged stations are not economically possible.

Richard Heggs, a Canadian listener from British Columbia, likes to listen for foreign stations to learn more about other countries. A key piece of listening equipment in the Heggs den is a Heathkit SB-310.

These are the more powerful Mexican CBB stations, those with 5,000 watts of power or more. Don't make the mistake of believing, however, that all Spanish-speaking stations you hear on medium wave frequencies are Mexicans. Listen carefully for the call letters or slogan.

son Lake, Yukon Territory, and CBXE, 1240 kHz, Golden, British Columbia, with 20 watts, are just two of them. But these local call letters are not announced. Perhaps the best way for the beginning DXer, who probably will live near the

northern frontier, to tell if he's logged an LPRT is if he hears a rather weak signal with the programs of a known Canadian MW station, but not on that station's listed frequency.

Make no mistake about it, logging

LPRT's is a mark of a real DXer. But, surprisingly, some of these flea-powered icebox stations can, on occasion, get out thousands of miles.

As a BCB DXer really gets into the swing of things, he'll begin to concentrate a lot of his attention on the six local, or "graveyard" frequencies mentioned earlier. And here, as the years pass, is where he'll really catch the DX goodies!

● FOREIGN DX

Though some BCB DXers concentrate their listening on the American and Canadian medium-wave stations, sooner or later, most will have a crack at tuning the foreign outlets. The language barrier is something of a problem for most DXers, whether they tune foreign BCB or shortwave stations. But careful listening often will pay off and you'll catch a few of the words that will help you identify the station.

Make no mistake, it is a lot tougher to hear overseas medium-wave stations than our domestic counterparts in many cases. But it can be done. A beginner may well log ten or fifteen different countries without too much trouble. With experience a record of 50 or more countries is perfectly possible, and several long time BCB listeners have managed to tune over 100 countries on medium wave.

Because of the distances involved, your first foreign DX will probably be those stations operating from the Western Hemisphere. You should have no difficulty in logging a number of Mexican broadcasters, particularly those few powerful stations just south of the border, ones like XERF, 1570 kHz, which broad-

cast in English for American audiences. Another powerful and easily received Mexican is XEW, La Voz de America Latina, a Spanish-speaking station on 900 kHz, in Mexico City. Also try for XEG, 1050 kHz, and XELO, 800 kHz.

Fidel Castro's mighty outlets on 600, 670, 690 and 720 kHz also are widely heard. If you live in the southern part of the U.S., you'll also hear some of the weaker Cuban stations with little difficulty.

Except in central United States, where a Windsor, Ontario station, CKLW dominates, BCB listeners should have no problem hearing the programs of Trans-World Radio, PJB, 800 kHz, from the Caribbean island of Bonaire, in the Netherlands Antilles.

There are other stations in the West Indies, Central and northern South America which should find their way to your headphones before too long.

Early evenings, if you live along the eastern seaboard, or perhaps after midnight if your home is farther west, give a try for the more powerful European stations. The first thing to remember, an it will prove to be very helpful for Trans-Atlantic BCB DXing, is that while North American stations are assigned to frequencies 10 kHz apart, channels like 560, 680, 1040, etc., most European and African stations are located 8 or 9 kHz apart. This means many of them will be broadcasting on odd frequencies between the North American broadcasters. With a very selective receiver, these "split" frequencies are good places to hunt the Trans-Atlantics.

Africa, with one exception, is rather tough to hear on BCB. That exception is Dakar, Senegal, a 200 kilowatt medium waver on 764 kHz—you'll note, a 'split' frequency between 760 and 770 kHz.

West Coast listeners will find their best foreign logging opportunities involve Asian and Pacific broadcasters. Hawaii's KORL, 650 kHz, the exotic sounding ZCO, at Nuku'alofa, Tonga, 1020 kHz, Pyongyang, North Korea, 655 kHz, and the Red Chinese station on 835 kHz, are prime targets.

Though you might think otherwise,

Robert Scott, Kingsport, Tenn., is both a ham and SWL, has more than 30 countries verified, uses Heath SB-310, Hallicrafters SX-96.

These low powered, unmanned stations relay programs from major CCB stations to rural Canada. They run only 40 watts, except these marked (*) operate with just 20 watts.

COMMUNICATIONS WORLD

Alaska is not the easiest logging by a long shot. Still, if you try to log all 50 states, it probably won't be the last one you hear. Best bets, during the early hours before dawn usually, are Nome's KICY on 850 kHz, and KFQD, 750 kHz, Anchorage.

● THE SHORTWAVES

So far it has been pretty much medium-wave BCB listening we've been talking about. But there's a lot more to hear if you expand your DXing horizons to include the shortwave broadcast (SWBC) bands.

The operative word here is "broadcast," for there are plenty of other signals to be heard on the shorter wave lengths—things like aeronautical and marine communications, so-called point-to-point commercial and government stations, military transmissions and more. These other stations generally are called, collectively, the utilities. For a full rundown on the utility transmissions, check the Fall-Winter 1971 issue of COMMUNICATIONS WORLD.

The shortwave broadcast stations are another animal altogether. As the name indicates, these operate on the short-wave frequencies, for all practical purposes from about 2,300 kHz to just under 27 MHz, and broadcast regular type programs for general audiences. Some are called international broadcasters be-

cause they seek overseas audiences; others intend their programs for the home folks in their own countries. Some are private operations, commercial or otherwise, while others are government owned. Some lace their broadcasts heavily with political propaganda, others play their newscasts straight, just the facts, man, the facts. There are religious stations and those who aim only to entertain, and help peddle some of their sponsors' products.

In short, there is a wide range of programs, in a wide range of languages, to be heard on SWBC.

By international agreement, most of

SW BROADCAST BANDS

11 Meter Band	25600	to	26100	kHz.
13 Meter Band	21450	to	21750	kHz.
16 Meter Band	17700	to	17930	kHz.
19 Meter Band	15100	to	15450	kHz.
25 Meter Band	11700	to	11975	kHz.
31 Meter Band	9500	to	9775	kHz.
41 Meter Band	7100	to	7370	kHz.
49 Meter Band	5950	to	6200	kHz.
60 Meter Band	4750	to	5060	kHz.
90 Meter Band	3200	to	3400	kHz.

FREQUENCY vs. WAVELENGTH

At first, many SWL's are confused by the terms "frequency" and "wavelength." Actually both are different ways of saying the same thing. Wavelength refers to the length of a particular radio wave, while frequency describes the number of times per second that the wave "vibrates." These are the formulas for converting one to the other:

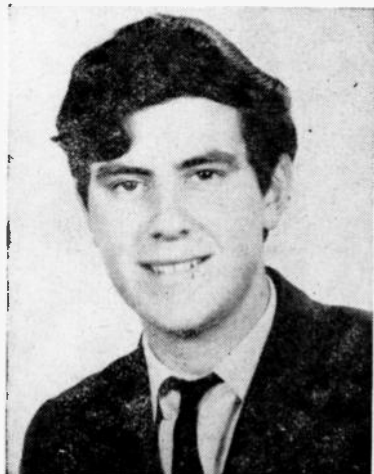

$$\text{Wavelength in meters} = \frac{300,000}{\text{Frequency in kHz.}}$$

$$\text{Frequency in kHz} = \frac{300,000}{\text{Wavelength in meters}}$$

these SWBC stations can be found in 11 separate bands of frequencies.

● DX'ING NORTH AMERICA

With the preliminaries behind, let's take a look at the world of DX on a continent by continent basis. In these continental surveys keep it in mind that SWBC stations are a mercurial lot, they change schedules and frequencies at the drop of a hat. They are intended more to give you a feeling for what can

An Australian SWL, Robert Shepherd actively dials the shortwave bands with his Marconi receiver. It resulted in 150 QSLs so far.

be heard, rather than specific data on when and where to tune.

Last minute information on that sort of thing can be found in White's Radio Log World-Wide Shortwave Stations, at the end of this issue of COMMUNICATIONS WORLD. Or in the regular bulletins of the various radio clubs. No doubt, armed with the basic data, you'll discover many of them for yourself as you tune the bands.

One of the first broadcasters most DXers will hear is our own Voice of America, the official station of the United States. We got a late start when it comes to governmental overseas broadcasting. It wasn't until World War II that "The Voice" began broadcasting America's message to the world. But the VOA has come a long way since.

Presently, the Stateside transmitters—there are also rebroadcasting relays of the VOA in Ceylon, Germany, Great

Britain, Greece, Liberia, Morocco, the Philippines and on Okinawa—are located at Bethany, Ohio, Dixon, California, and the huge new Greenville, North Carolina complex. These are easily heard, powerful stations.

In addition to airing Voice of America programs in many languages, these transmitters also broadcast programs of the American Forces Radio and Television Service and United Nations Radio.

—**U.S. SW Broadcasters.** But there also are three privately owned broadcasting operations in the U.S. KGEI, the Voice of Friendship, is one of these. It has its transmitters at Belmont, California, and they serve to broadcast the programs of Far East Broadcasting Company to the Americas. FEBC is a religious operation which programs to Asia from stations in the Philippines and elsewhere in the Far East.

COMMUNICATIONS WORLD

is a commercial venture with studios and offices in New York City and transmitters in Massachusetts. It frequently can be heard transmitting in English to Europe, and in both Spanish and English to Latin America.

The third private U.S. SWBC station is World Inter-National Broadcasters, which uses the call letters WINB for its transmitter at Red Lion, Pennsylvania. WINB is commercial, but it has the avowed purpose of "promoting the God of the Bible and country."

It has frequently been the subject of attack because of controversial programs allegedly mixing gospel messages with the politics of the far right.

-Up North. The big voice of our neighbor to the north belongs to the Canadian Broadcasting Corporation; with headquarters in Montreal and transmitters at Sackville on Canada's Atlantic coast.

The CBC broadcasts Canada's story to the world in 11 languages, but many DXers find the home services more interesting. The Northern Service, for instance, beams daily to those Canadians living in the Arctic region in three languages, English, French and, you guessed it, Eskimo!

Many of the Arctic communities are out of touch with the lower provinces during the long winter. So, like the friendly postman, CBC's Northern Service delivers personal messages and greetings from Aunt Sadie in Toronto and Grandma in Vancouver to their

Jerry Hershovitz, Philadelphia, works long hours on his government job and enjoys relaxing at his Panasonic RF5000A receiver. Jerry has collected more than 60 QSLs so far.

icebound relatives far to the north. This is a folksy touch not often found on shortwave radio.

DXers will soon find that Canada also has its private broadcasters. These are generally low powered outfits simulcasting the medium wave programs of their sister commercial outlets. Among these, the most widely heard probably are CFRX, with programs of CFRB, Toronto on 6,070 kHz, and CFCX, relaying CFCF, Montreal on 6,005 kHz.

-Down South. Turning southward, the most powerful shortwave station in Mexico, but by no means the only one, is Radio Mexico, XERMEX. While much of its programming is aimed at Mexican audiences, it has been heard in English and other languages. Among XERMEX's currently used frequencies are 9.705 and 11,835 kHz.

Still in North America . . . Central America if you want to quibble, there are dozens of other Spanish-speaking voices on shortwave.

Costa Rica has a widely heard religious station, TIFC, Faro del Caribe, which translates as the Lighthouse of the Caribbean. A good spot to try for this one is 9,645 kHz. It is mostly in Spanish, though English programs are also featured.

El Salvador's government station, Radio Nacional, YSS, can be heard frequently on 9,553 kHz, broadcasting in Spanish until around 0500 sign off.

In Nicaragua the easiest catch is another Radio Nacional, this one operating on 11,875 kHz.

A more interesting Nicaraguan though is Radio Zelaya, on about 5,950 kHz, a harder one to hear than Radio Nacional. This is located on Nicaragua's Caribbean coast in a town with the distinctly non-Spanish name of Bluefields.

The town's name, and the blue eyes of many of its inhabitants are the result of the settling in this region, several centuries ago, of bands of Anglo-Saxon ex-pirates who gave up Caribbean buccannering for the quieter life ashore.

The most powerful of the Caribbean outlets is, of course, the voice of

Fidelismo, Cuba's Radio Havana Cuba. Heavy doses of anti-Yankee propaganda are administered during English language sessions at 0400 and 2045 GMT on a number of frequencies.

Other Central American and Caribbean broadcasters to look for include the English-speaking Windward Islands Broadcasting Service—a good choice if you're musical tastes run to calypso and steel drum bands—Haiti's Gospel station, 4VEH, which has English at 0000 GMT on 6,120 kHz, and the only short-waver in the Republic of Panama, La Voz del Baru on 6,045 kHz during the pre-dawn hours in the U.S.

● LATIN LOGGINGS

South American SWBC DX runs the gamut from A to V, Argentina to Venezuela, that is. With few exceptions, the stations of South America are relatively low powered, commercial or governmental operations aimed at domestic audiences. Still, many of them can be heard, and heard well at times, by North American listeners who aren't scared off by the fact that few of the broadcasts are in English.

Most of these broadcasters transmit in Spanish, though there is a smattering of English programming from a few of them. Also, remember that the Brazilians will be using Portuguese, not Spanish, a fact that trips up some beginning SWL's.

Easiest to hear of all the South Americans is the decades-old HCJB, the religious Voice of the Andes in Quito, Ecuador. HCJB uses a variety of languages to broadcast its missionary messages to listeners not only in Latin America, but also in the U.S., Europe and Japan. It is one of two stations in Latin America to broadcast a program specifically for DX listeners. And the program, "DX Party Line" is a favorite of many SWL's.

Trans-World Radio, another religious

oriented station, also airs a DX program. The mighty TWR station is located on the island of Bonaire in the Netherlands Antilles, just off the north coast of South America.

The only other station to make anything like an effort to reach international audiences is Radiodiffusion Argentina al Exterior, or simply, RAE. This government voice at Buenos Aires can be heard in English around 0300 GMT on 9,690 kHz. The station identifies as "This is Argentina calling," or as "RAE," pronounced "rye."

The most radio-active country in the world has got to be Brazil, where the low Tropical Bands substitute to a large degree for the medium wave channels used for home services in most other nations. Brazil has more than 200 shortwave stations. And, if you concentrated your listening only on the Brazilians, you'd probably never manage to hear them all.

For openers, though, try two of the Portuguese-speaking Brazilians on the higher bands; Radio Nacional on 11,795 kHz, and Radio Tupi on 15,155 kHz, both in Rio.

If you don't mind losing some sleep, tune for a relative newcomer to the 60 meter band, Guyana Broadcasting Service on 3,290 kHz. It has been widely heard lately around 0900 GMT. But if you can't shake the cobwebs out of the cranium that early, you get a second chance during the evening hours. This is a commercial, pop music type station with some of the wackiest sponsors you can imagine—would you believe a cure-all nerve tonic?

GBS is located at Georgetown, capital of Guyana, the former British Guiana.

Elsewhere in South America, in Chile, Bolivia, Colombia, Peru, Ecuador, Venezuela, Paraguay and Uruguay, there are many hundreds of local service Spanish-speaking shortwavers!

PHONETIC SPANISH ALPHABET

Though many Latin American stations use slogans, rather than their assigned call letters, for identification. However, to help you with those Spanish-speaking outlets which do announce call letters, here is the way the Spanish spoken letters and numbers sound:

a=ah	g=geh	m=EH-meh	t=teh	1=OO-no	6=sayce
b=beh	h=AH-cheh	n=EH-neh	u=oo	2=dose	7=see-A-teh

		s=EH-seh	z=SEH-tah		

COMMUNICATIONS WORLD

● THE EUROPEANS

Europe is home of more powerful international SWBC stations than any other continent in the world. Most of the stations a newcomer to the hobby will hear first will be located in Europe.

There are several reasons for this. For one thing, many of these broadcasters aim their programs—in English—directly to North American audiences at the optimum listening times, usually during our evening hours. Secondly, most of the stations are loud and clear, running transmitters of 50, 100 or more kilowatts.

The big four are Great Britain's BBC; Radio Moscow; Deutsche Welle, the Voice of Germany; and Radio Nederland from Holland. But there are others that are received just as well, stations like Italy's RAI, Radio Nacional de Espana from Madrid, Radio Portugal's Voice of the West, the Swiss Shortwave Service, and Iron Curtain outlets such as Radio Prague, Radio Sofia, Radio Berlin International from East Germany, Radio Bucharest, Rumania and Radio Budapest, Hungary.

The British Broadcasting Corporation is one of the longtime standards for shortwave broadcasting. And while some accuse Auntie BBC of being rather staid and unimaginative in entertainment programming, no one really challenges the complete and unbiased newscasting. For excellent news coverage of world events, it is hard to find a better source than the BBC's newscasts, particularly its Radio Newsreel broadcast.

Though Holland is only a small coun-

ATTENTION, READERS!

Would you like to see yourself in COMMUNICATIONS WORLD? Then why not send us a picture of you and your DXing equipment. Any clear photograph will do, but we prefer to see you at your "rig." Along with the picture, tell us a little about yourself and your listening activities. When did you start? What do you enjoy most about the hobby? What was your biggest DXing thrill? And, also, be sure to identify the receiver and other equipment shown in the photo. We'll be seeing YOU! Sorry, we cannot return photographs.

try, it has one of the best shortwave signals around. Radio Nederland is sharp when it comes to listenable entertainment programs, which has made the station a favorite of DXers for decades.

Holland too is going the relay station route, with rebroadcasts of Radio Nederland programs aired by transmitters on Bonaire in the West Indies, and from a new station on the island of Madagascar (Malagasy Republic).

A third European operation that is relying more heavily on overseas relay transmitters is West Germany's Deutsche Welle. In addition to its stations on German soil, Deutsche Welle has a relay base in Rwanda, Africa. Another will be constructed in the Mediterranean on the island of Malta in the next year or two—we'll keep you posted!

—**The Big Red Tide.** Radio Moscow has so many transmitters going that it can use a dozen or so of them every evening to broadcast English language programs to the United States. Almost any time during the evening, DXers can find Radio Moscow broadcasting in English on a number of frequencies in the 49, 41, 31, 25 and 19 meter bands.

Compared with the hardline anti-U.S. transmissions of some years back, Radio Moscow's programming today is more the soft sell variety. Definitely pro-communist propaganda, of course, but they're realizing that they'll attract more listeners with honey—praising the virtues of communist life—than vinegar—anti-American blasts.

—**There's More.** In addition to the other European stations mentioned earlier, you'll probably find fairly easy reception from the likes of Radio Tirana, Albania, one of the last really vitriolic communist stations; Austrian Radio, the Belgian National Radio; France's ORTF, Office de Radiodiffusion-Television Francaise; Radio Denmark; Radio Belgrade, Yugoslavia; Vatican Radio; Radio Sweden; Radio Norway; Radio Luxembourg and others.

Without too much trouble, you'll find that you can log at least 15 or 20 European countries on the SWBC bands.

But there are some smaller stations that can provide really challenging DX opportunities. Some of them seldom if ever are heard on this side of the Atlantic pond.

● DX'ING AFRICA

Africa is truly the emerging continent, particularly when it comes to SWBC operations. Perhaps more high powered transmitters have been constructed on the Dark Continent during the past ten years or so than on any other.

As a result, today many countries are being heard by beginning DXers which even old SWBC hands hadn't heard a few years ago.

The first African station you're apt to hear is Radio RSA from South Africa. The South African government, acutely conscious of world opinion, tries very hard to attract overseas listeners to its programs. And, to a great degree it has succeeded. Radio RSA today is one of the more popular of the international shortwave stations.

Also quite easily heard these days is a commercial home service called Springbok Radio. Naturally many of these programs are in English . . . and you'll easily recognize commercials for products that also are widely known in our coun-

try . . . but South African domestic broadcasts also are aired in its "other" language, Afrikaans, which sounds similar to Dutch.

Egypt's Radio Cairo is another major international broadcaster. Its programs are received solidly in North America, thanks to powerful shortwave transmitters. It has an English language service, but is readily identifiable even when transmitting in Arabic. The typical Arabic music and chanting is easy to spot, as is its Arabic language identification, "Huna Kahira," "Here is Cairo."

Another relay station, this one belonging to Spain's Radio Nacional de Espana, is located just off the West African coast on Tenerife, one of the Canary Islands. These programs are all in Spanish and the unwary may mistake them for those broadcast directly from Spain.

The Ethiopian government has its own shortwave station, but far easier to hear is ETLF, the Radio Voice of the Gospel, a religious outlet belonging to the Lutheran World Federation and located in

Addis Ababa, Ethiopia. In addition to a number of programs in Arabic and African languages; ETLF also programs in English.

In West Africa, ex-English territories, English language programming is common. Two of the more easily heard stations there are Nigeria's Voice of Nigeria at Lagos, and Radio Ghana, at Accra, Ghana.

Much to the south and east, the Portuguese land of Mozambique is represented by the popular and easily tuned Radio Clube de Mozambique at Lorenzo Marques. Its programs are heavy on music and are especially listenable.

Among the North Africans, Radiodiffusion-Télévision Algérienne, at Algiers, Algeria, the Libyan Broadcasting and TV Service, and Radiodiffusion Télévision Marocaine, in Morocco, are heard. Programming is largely in Arabic though other languages are used as well.

There are numerous DX targets among the French-speaking countries in West Africa. These include Radiodiffusion Télévision Ivoirienne, at Abidjan, Ivory Coast, 4,940 kHz, Radiodiffusion Télévision Gabonaise, at Libreville, Gabon, which puts forth a good signal on 4,777 kHz, the two Congos, Radio Brazzaville in the former French area, and Radiodiffusion Télévision Nationale Congolaise in what used to be the Belgian Congo, and Radio Mali, Bamako, Mali, on several frequencies.

Considering the fact that there are over fifty different countries in Africa, this quick survey touches on only a handful of them.

A new one, expected to be broadcast as of December 1, is a commercial radio station of the Swaziland Commercial Broadcasting Co. According to information available as this is written, it will beam programs to South Africa, hence probably in English, from a 10 kilowatt transmitter in the tiny nation of Swaziland in Southern Africa. It is reported that the station will use frequencies in the 60 and 25 meter bands. It should be heard without too much trouble in North America and for virtually

all American DXers, newcomers or veterans, it will add a new country to their log books.

Because of the wide range of stations, languages used and program types featured, African SWBC DXing is a real challenge to the serious shortwave listener.

● LOGGING ASIA

We've already mentioned the many Russian transmitters scattered across that vast land, and the Soviet Union "eats up" a huge chunk of the Asian continent. But there are a number of other Asian stations in the big power category, and many, many more which are less easily heard in our country.

Red China, the People's Republic of China to use the name the Chinese insist upon, has its Radio Peking, which is widely heard. This is the one to tune if you want to hear diatribes about "imperialist Americans" and their "lackeys and running dogs!" In other words, the propaganda programs are at their abrasive worst, though the possible effect of the new "Ping Pong" diplomacy may temper Radio Peking's broadcasts in the coming months.

Radio Peking is a snap to DX, particularly during the early evening hours on the lower end of the 19 meter band.

Radio Japan is another international broadcaster with a large American audience. Japan is one of those countries that really tried hard, and usually succeeds, when it comes to listener relations. It features many English language programs and QSL collectors will quickly learn that Radio Japan sends out some of the most colorful and attractive verification cards in the world!

An area of Asia that has been in the news in recent months is the Indian subcontinent. Here there are two major international stations, All India Radio and Radio Pakistan. Since India and Pakistan are bitterly antagonistic toward each other, it can be very interesting to tune the newscasts of AIR and Radio Pakistan on the same evening to see the different way each interprets the day's events, particularly those directly affecting their area of the continent.

The Koreans, North and South, also program extensively on shortwave. In the south there's the Voice of Free Korea, which is regularly audible in

FOREIGN CBB DX'ING—WHEN TO TUNE

Station Location	Reception in:	
	Eastern North America	Western North America
Central America Caribbean area Northern South America	Year around DXing, but midwinter often best	
Southern South America	Spring, summer, fall	Summer
Australia New Zealand	Spring, fall	Spring
Asia	Fall	Fall, winter
Europe	Fall, winter	Winter
North Africa		
South Africa	Spring	Unlikely

North America, but Radio Pyongyang, North Korea uses a tremendous number of frequencies and probably is the easier one to log.

Ditto for Vietnam, where Radio Hanoi, with its English programs, some of them directed at our GI's in the combat zone, is more easily heard than VTVN, the South Vietnamese station at Saigon.

As with Arica, the list of Asian countries with SWBC stations is long and varied. There is Radio Ceylon, Radio Afghanistan, the extremely hard-to-hear Radiodiffusion Nationale Lao, the somewhat easier catch, Radiodiffusion Nationale Khmère at Phnom Penh, Cambodia, the various outlets of Radio Malaysia, Taiwan's Voice of Free China and Radio Thailand, to name but some of them.

● PACIFIC RADIO WAVES

The easiest of all the stations in Oceania is Radio Australia. This is a huge operation and a popular one with listeners worldwide.

Thanks to some recently installed 250 kilowatt transmitters, the long popular Radio Australia programs are now easier to hear than ever before. RA also has the oldest program for DXers of any station in the world. Listeners to it can receive hot tips on other stations and DXing hints are plentiful. It is aired Mondays at 0125 GMT (remember that that's really Sunday night here).

New Zealand isn't quite as easy to hear, though you should have no real trouble logging Radio New Zealand's English programs if you tune during the early morning hours before dawn.

Indonesia is in some ways similar to Brazil. This island nation favors the shortwaves for its domestic service broadcasts. Of course there is an inter-

national service of the Voice of Indonesia which can be heard early in the morning, but frequently, especially during the winter, the home service broadcasts of Radio Republik Indonesia are sometimes more easily logged. Try the RRI station at Ambon, in the Maluccas Islands, 7,139 kHz around 1200 GMT, when it, like all other local stations in the RRI network, broadcasts an Indonesian language newscast originating in Djakarta.

Three religious broadcasters dominate shortwave transmissions from the Philippines. They are the Roman Catholic Radio Veritas, the protestant South East Asian Radio Voice, SEARV, and the Far East Broadcasting Company, which you'll recall, also owns the United States shortwaver, KGEI.

Powerful signals have been received lately from Radio Tahiti's new 20 kilowatt station at Papeete. The frequency to try is 15,170 kHz, after 0300 GMT sign on. Another French-speaking outlet is Radio Noumea, at Noumea, New Caledonia.

Further out in the Pacific, the Fiji Broadcasting Commission has two stations—at least for the time being. Fiji plans to leave shortwave in the near future—on 3,230 and 3,284 kHz. The former is your best bet, though not an easy one, it broadcasts in English.

Among the other stations in the Pacific area, some of which constitute real DXing challenges, are the series of transmitters belonging to the Australian Administration Broadcasting Service in the Papua and New Guinea Territories, the Solomon Islands Broadcasting Service, Radio Vila in the New Hebrides, and a handful of other rarities.

(Continued on page 112)

WHITE'S RADIO LOG

VOLUME 55

An up-to-date Directory of North American AM, FM, and TV Stations, including special sections on World-Wide Shortwave Stations and Emergency Stations for Selected Areas

White's Radio Log was founded in Providence, R. I. by Charles De Witt White as an extension of his earlier publishing activities. Interestingly enough, these, in turn, were a continuation of the business established by his father: the publication of city directories, street guides, and municipal tax guides.

In the early days of broadcasting, compiling a list of operating stations and their frequencies was no simple task. Reason was that prior to the Dill-White Radio Act of 1927, any feed merchant, auto dealer, barber, or undertaker who wanted to advertise his wares or services had only to select a frequency and go on the air. A great many experimenters and businessmen did just that.

Nevertheless, Mr. White's directory publishing experience had convinced him that he could successfully assemble a radio log. In 1924 he justified this conviction with *The Rhode Island Radio Call Book*, following this shortly after with *White's Triple List of Radio Broadcasting Stations*.

In 1927 the two publications were merged and nation-wide distribution established. In ensuing years related publications, such as *Sponsored Radio Programs*, *Radio Announcer's Guide*, *Short-Wave Schedule Guide*, and a special Canadian edition of the *Log* (which had had its title shortened to the one it bears today), were also issued.

The *Log* itself eventually reached a combined circulation of well over a million

copies. It also came up with some rather unusual bedfellows. In 1929-31 it was distributed as the *Enna Jettick Radio Log* (to promote the sale of shoes); in 1938-9 as the *General Electric Radio Log* to promote General Electric's "sensational 1939 receivers with pushbutton tuning."

The Fall-Winter number of the 1927 *Log* listed 701 U.S. stations. Most powerful were WEAJ (now WNBC), New York, with 50,000 watts; KDKA, Pittsburgh; WGY, Schenectady; and WJZ (now WABC), New York, each with 30,000 watts; WGN-WLIB, Chicago, with 15,000 watts; and Boston's WBZ, also with 15,000. Five stations listed (one a Junior High School in Norfolk, Va.) operated on a mighty 5 watts; more than 100 stations had outputs of less than 100 watts.

The current *Log* cross-indexes over 4244 U.S. standard-broadcast (AM) stations, over 2247 U.S. frequency-modulation (FM) and over 810 television stations, has a complete compilation of Canadian broadcasters, and, in addition, has a comprehensive world-wide roster of shortwave stations.

With the success of his *Log*, Charles De Witt White (a direct descendant of Peregrine White, the first child born on the Mayflower's historic crossing and bearer of the name of another illustrious ancestor, De Witt Clinton) disposed of his city directory and street guide interests. In time, he transferred his editorial operations to Bronxville, N. Y., a suburb of New York City,

where he could remain in close touch with the broadcasting industry. On April 6, 1957, having only recently completed revising and updating material for the 34th consecutive year of his *Log*, Mr. White died in his sleep. He was 76 years old.

Charles De Witt White's daughter and heir, Mrs. W. R. Washburn, sold all rights in and to the *Log* to Science & Mechanics Publishing Co., and entrusted us with continuing her father's work. This we were proud to do back in 1958 in RADIO-TV EXPERIMENTER—which later became the popular SCIENCE AND ELECTRONICS.

Beginning with our first bimonthly issue in 1964, *White's Radio Log* was divided into three parts (it had grown to 60 pages in size and was much too large to incorporate in any one issue of a bimonthly. From 1964 until the present, we published the *Log* in three parts, updating each part right up to press time.

Then, in 1969, the size of the *Log* again necessitated a change. Therefore, *White's Radio Log* was published in six parts during 1969 and 1970. In each issue, we included

a major listing for either AM Broadcasting Stations, FM Broadcasting Stations or Television Stations; plus the expanded World-Wide Shortwave Section (brand new for each issue); plus the all-new Emergency Radio Listing for major US cities (a different major city appeared in every issue).

White's Radio Log will now be published in its complete form. Because of station changes, additions, and deletions, we agree—prompted by our readers—that we should publish the *Log* in one volume and do it twice a year. Understanding this need, we plan to present *White's Radio Log* in our new, semi-annual publication COMMUNICATIONS WORLD.

As we go to press, frequency allocation changes are being made by the US and Canadian governments. So we cordially invite all readers to inform the Editor of any changes that must be made to keep the *Log* up to date. We sometimes find that our readers are on top of the FCC and DOT! Keep your cards and letters coming—we appreciate them and know you can help us make a better *Log*. ■

WHITE'S RADIO LOG

U.S. AM Stations by Frequency

U.S. stations listed alphabetically by states within groups. Abbreviations: kHz, frequency in kilocycles; W.P., power in watts; d, operates daytime only; n, operates nighttime only. Wave length is given in meters. Listing indicates stations on the air up to August 30, 1971.

kHz	Wave Length	W.P.	kHz	Wave Length	W.P.	kHz	Wave Length	W.P.	kHz	Wave Length	W.P.

1987 Spring Radio Channel chart again

Table with columns: Location, Call, MHz, Location, Call, MHz, Location, Call, MHz. Lists radio stations in the Eastern US including Nashville, Kingsville, La Grange, Lamesa, Laredo, Livingston, Lubbock, Marshall, McAllen, McKinney, Midland, Mineral Wells, Mt. Pleasant, Muleshoe, Naegodoches, New Boston, New Braunfels, Odessa, Orange, Palestine, Paris, Pasadena, Plainview, Port Arthur, Robstown, Rosenberg, San Angelo, San Antonio, San Marcos, Seguin, Sherman, Sinton, Spearman, Stephenville, Temple, Terrell Hills, Texarkana, Tyler, Victoria, Waco, Wichita Falls.

TEXAS

Table with columns: Location, Call, MHz, Location, Call, MHz, Location, Call, MHz. Lists radio stations in Texas including Abilene, Amarillo, Austin, Beaumont, Belton, Big Spring, Borger, Brenham, Brownwood, Bryan, Clear Lake City, Cleburne, College Station, Cenore, Corpus Christi, Crockett, Dalhart, Dallas, Del Rio, Denison-Sherman, Denton, Diboll, Dumas, Eagle Pass, El Campo, El Paso, Ft. Worth, Fredericksburg, Galveston, Georgetown, Harlingen, Henderson, Hereford, Highland Park-Dallas, Hillsboro, Houston, Huntsville, Jacksonville, Jasper, Kilgore.

SOUTH DAKOTA

Table with columns: Location, Call, MHz. Lists radio stations in South Dakota including Aberdeen, Brookings, Hot Springs, Huron, Madison, Rapid City, Sioux Falls, Springfield, Vermillion, Watertown, Winner.

TENNESSEE

Table with columns: Location, Call, MHz. Lists radio stations in Tennessee including Bristol, Brownsville, Chattanooga, Cleveland, Colliedale, Columbia, Cookeville, Covington, Crossville, Dickson, Dyersburg, Elizabethton, Fayetteville, Franklin, Gallatin, Greeneville, Henderson, Hendersonville, Humboldt, Jackson, Jamestown, Johnson City, Kingsport, Knoxville, Lawrenceburg, Lebanon, Lenoir City, Lewisburg, Lexington, Livingston, Manchester, Martin, MeKenzie, McMinnville, Memphis, Milan, Morristown, Murfreesboro.

UTAH

Table with columns: Location, Call, MHz. Lists radio stations in Utah including Cedar City, Centerville, Ephraim, Ogden, Parowan, Provo, Salt Lake City, Spanish Fork, Cedar City, Centerville, Ephraim, Ogden, Parowan, Provo, Salt Lake City, Spanish Fork.

VERMONT

Table with columns: Location, Call, MHz. Lists radio stations in Vermont including Burlington, Middlebury, Northfield, Randolph Center, Rutland, Springfield, St. Albans, White River Junction.

VIRGINIA

Table with columns: Location, Call, MHz. Lists radio stations in Virginia including Abingdon, Altavista, Arlington.

WASHINGTON

Table with columns: Location, Call, MHz. Lists radio stations in Washington including Aberdeen, Bellevue, Bellingham, Bemerston, Centralia, Cheney, Edmonds, Ellensburg, Hoquiam, Kennewick, Longview, Lynden, Mercer Island, Moses Lake, Opportunity, Pasco, Puyallup, Richland, Seattle, Wenatchee, Woodbridge, Yakertown, Aberdeen, Bellevue, Bellingham, Bemerston, Centralia, Cheney, Edmonds, Ellensburg, Hoquiam, Kennewick, Longview, Lynden, Mercer Island, Moses Lake, Opportunity, Pasco, Puyallup, Richland, Seattle, Wenatchee, Woodbridge, Yakertown.

Canadian AM Stations by Frequency

Canadian stations listed alphabetically by call letters within groups. Abbreviations: kHz, frequency in kilocycles; W.P., power in watts; d, operates daytime only; n, operates nighttime only. Wave length is given in meters. Listing indicates stations on the air up to January 1, 1970.

kHz	Wave Length	W.P.	kHz	Wave Length	W.P.	kHz	Wave Length	W.P.	kHz	Wave Length	W.P.
540-555.5			610-491.7			740-405.2

White's Radio Log World-Wide Shortwave Stations

SWL'ing is a fascinating hobby. Listening to distant stations from far off countries has been called "armchair traveling"—and it is! Without moving from your shortwave receiver you can capture the exotic flavors of the Orient and Africa; hear a "news" broadcast from behind the Iron Curtain, and eavesdrop on major world events as they happen.

Here is a list of some of the short-wave broadcasting stations that other DXers have been hearing, plus some times (GMT) when you may find the reception best. Some of these stations broadcast in English, some do not. And because of varying reception conditions, it may take many tries to hear some of them. Others may be heard daily. See how well you can do.

kHz	Call	Name	Location	GMT
120-Meter Band—2300 to 2400 kHz				
2346	—	South African Bc Corp	Johannesburg, S. Africa	2100

● THE DX CLUBS

COMMUNICATIONS WORLD strongly recommends that every serious DXer join one or more of the fine listeners clubs in North America. These organizations are non-profit type affairs, by and for radio listening hobbyists.

Two clubs devote themselves exclusively to the medium wave BCB DXer. They are:

National Radio Club, P.O. Box 99, Cambridge, Mass. 02138.

International Radio Club of America, 6059 Essex Street, Riverside, Cal. 92504.

Covering the world of FM, TV and UHF/VHF listening is another club, World TV-FM DX Association, Box 5001, Milwaukee, Wis. 53204.

The North American Shortwave Association, Box 989, Altoona, Pa. 16603, is a specialist in the short-wave broadcast DX field.

There are several DXers organizations which have a more general scope of coverage. They may include BCB, SWBC, the utility communications stations, ham

band listening or what have you.

These include:

Newark News Radio Club, 215 Market Street, Newark, New Jersey.

American SWL Club, 16182 Ballad Lane, Huntington Beach, Cal. 92647.

Midwest DX Club, 6636 Davis Street, Morton Grove, Ill. 60053.

SPEEDX, P.O. Box 321, Santa Ana, Cal. 92702.

A stamped, self-addressed envelope to these organizations will bring you full membership information. There is usually a nominal charge, around 50 or 60 cents, for a sample copy of the club's bulletin.

And, when you write, let them know you read about their club in COMMUNICATIONS WORLD.

And while you're at it, why not drop a line to us and tell us about your DXing and what you'd like to see in future issues. Write to Don Jensen, Communications Editor, COMMUNICATIONS WORLD, 229 Park Avenue South, New York, N.Y. 10003.

SPECIAL HALF-PRICE OFFER TO CAMPING JOURNAL

ONE FULL YEAR ONLY \$2.98!

A REGULAR \$5.95 VALUE... YOU SAVE 50%

"The world's largest selling camping magazine" covering every aspect of camping... Best boats... Pack-in trips... go-anywhere rigs... trail-tackle... conservation... and in-depth field testing of camping equipment from the newest in back-pack designs to luxury motor campers.

GREATER CAMPING ENJOYMENT

Yes! Camping Journal covers the great outdoors from backpack to luxury motor camping. Each and every issue is jam-packed with regional news about what's happening in camping. Whether you're planning a long trip or just going to your usual spot, Camping Journal will keep you abreast of the new happenings both in your area and around the country.

Renowned outdoorsmen like Bob Elliot, Pete Czura, Hank Andrews, Larry Green, and many more cover the country in regional reports that not only tell you of new camping areas, but tell you what kind of equipment to bring along to get the most use out of your camping trip.

GREAT COLUMNS AND FEATURES

Crits Gresham, probably America's best known camper, not only covers the South in regional reports, but also writes great feature stories which will open up a whole new world of camping for you.

Plus... you can look forward to great feature stories by William T. McKeown, famous boating camper—Les Morrow, "Mr. Canada Outdoors"—Clyde Ormond, pack or horseback trips—Charles Waterman, author of "The Hunter's World," and an expert on all outdoors—Jim Rutherford, go-anywhere rigs for camping—Erwin Eauer, the leading outdoor photographer working today, and many more well-known authors and outdoorsmen cover camping from every angle.

PREVIEWS AND REVIEWS

Camping Journal not only covers where to camp and what there is to do, but "C. J." previews and reviews what's new in camping equipment from the latest in backpack designs to motor campers. Every month we have a special section which covers new gear. Whether you're looking for scouting equipment or that little extra luxury item that will make camping a pleasure for you, "C.J." will let you know where to find it.

PUBLISHER'S GUARANTEE

Your subscription to Camping Journal will be sent to you with an unconditional guarantee. To start your subscription coming, just fill out and mail the coupon. When your first issue arrives you'll see why millions of readers across the country have read and enjoyed "C.J." for many years. And we are so sure that Camping Journal will be welcomed into your home each and every issue that we make this unconditional guarantee—that if for any reason you are dissatisfied, we will cancel your subscription and you will receive a full pro-rata refund on the unused portion of your subscription... no questions asked!

LIMITED OFFER

We urge you to order your subscription to Camping Journal today, so that your copies will start coming right away. Orders will be processed so that you will receive the very next available issue. We will enter your subscription to "C.J." for only \$2.98. 1 full year—12 issues... saving you 50% of the regular price. This offer may not be repeated again.
