A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T113 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T113 frequency core (on the rear apron) until the picture falls out of sync and one diagonal black bar sloping down to the right appears on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain three or four diagonal black bars on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T113 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture begins to fall out of sync with the diagonal bars sloping down to the right. Continue to turn the frequency core in the same direction. No more than three or four bars should appear on the screen. Instead, the horizontal oscillator should begin to motorboat. Retouch the adjustment of the T113 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T113. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 19. Adjust the waveform adjustment core of T113 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T113 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C191A slightly clockwise. If less than 2 bars are present, adjust C191A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T113 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves off the screen leaving the picture in synchronization.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions. This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad.

RESPONSE CURVES.—The response curves shown on page 14 are typical though some variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

NOTES ON R-F UNIT ALIGNMENT.—Because of the frequency spectrum involved and the nature of the device, many of the r-f unit leads and components are critical in some respects. Even the power supply leads form loops which couple to the tuned circuits, and if resonant at any of the frequencies involved in the performance of the tuner, may cause serious departures from the desired characteristics. In the design of the receiver these undesirable resonant loops have been shifted far enough away in frequency to allow reasonable latitude in their components and physical arrangement without being troublesome. When the r-f unit is aligned in the receiver, no trouble from resonant loops should be experienced. However, if the unit is aligned in a jig separate from the receiver, attention should be paid to insure that unwanted resonances do not exist which might present a faulty representation of r-f unit alignment.

A resonant circuit exists between the r-f tuner chassis and the outer shield box, which couples into the antenna and r-f plate circuits. The frequency of this resonance depends on the physical structure of the shield box, and the capacitance between the tuner chassis and the front plate. This resonance is controlled in the design by using insulating washers of proper thickness in the front plate to tuner chassis mounting. The performance of the tuner will be impaired if the proper washers are not used. Obviously then, if the r-f unit is removed for service, the washers should be replaced in the correct order when the unit is replaced.

ALIGNMENT PROCEDURE

THE DETAILED ALIGNMENT PROCEDURE BEGINNING ON PAGE 4 SHOULD BE READ BEFORE ALIGNMENT BY USE OF THE TABLE IS ATTEMPTED

Step No.	CONNECT SIGNAL GENERATOR TO	SIGNAL GEN. FREQ. MC.	CONNECT SWEEP GENERATOR TO	SWEEP GEN. FREQ. MC.	CONNECT HETERODYNE FREQ. METER TO	HET. METER FREQ. MC.	CONNECT OSCILLOSCOPE TO	MISCELLANEOUS CONNECTIONS AND INSTRUCTIONS	ADJUST	REFER TO
	ANTENNA MATCHING UNIT ALIGNMENT									
1	Do not adjust this unit unless fairly certain that it requires adjustment. Disconnect lead from L58 to S5. Connect output of matching unit through 1000 mmf. to pin 1 of V107. Replace cover on matching unit. Remove V106 from socket. Connect bias box to junction of R143 and R144 and set to produce —6 volts.									
2	Antenna terminals	45.75 mc. 30% mod.	Not used	—	Not used	—	TP102. Scope gain to max.	—	L59 for min. audio on scope	Fig. 7
3	"	41.25 mc. 30% mod.	"	—	"	—	"	—	L60 for min. audio on scope	Fig. 7

SERVICE SUGGESTIONS

Following is a list of symptoms of possible failures and an indication of some of the possible faults:

NO RASTER ON KINESCOPE:

(1) Incorrect adjustment of ion trap magnet. Magnet reversed either front to back or top to bottom.

(2) V116 or V117 inoperative. Check waveforms on grids and plates.

(3) No high voltage—if horizontal deflection is operating as evidenced by the correct waveform on terminal 1 of high voltage transformer, the trouble can be isolated to the 1B3GT circuit. Either the T114 high voltage winding is open, the 1B3GT tube is defective or its filament circuit is open.

(4) V110 circuit inoperative—Refer to schematic and waveform chart.

(5) Damper tube (V119) inoperative.

(6) Defective kinescope.

(7) R216 open.

(8) No receiver plate voltage—filter capacitor shorted—or filter choke open.

NO VERTICAL DEFLECTION:

(1) V114B or V115 inoperative. Check voltage and waveforms on grids and plates.

(2) T111 open.

(3) Vertical deflection coils open.

SMALL RASTER:

(1) Low Plus B or low line voltage.

(2) V117 defective.

POOR VERTICAL LINEARITY:

(1) If adjustments cannot correct, change V115.

(2) Vertical output transformer T111 defective.

(3) V114B defective—check voltage and waveforms on grid and plate.

(4) C176, C180, C181, C178, C177 or C182 defective.

(5) Low plate voltage—check rectifiers and capacitors in supply circuits.

(6) If height is insufficient, try changing V114.

POOR HORIZONTAL LINEARITY:

(1) If adjustments do not correct, change V117, or V119.

(2) T114 or L107 defective.

(3) C205 or C206 defective.

WRINKLES ON SIDE OF RASTER:

(1) C208 defective.

(2) Defective yoke.

PICTURE OUT OF SYNC HORIZONTALLY:

(1) T113 incorrectly tuned.

(2) R226, R227 or R197B defective.

TRAPEZOIDAL OR NON SYMMETRICAL RASTER:

(1) Improper adjustment of centering of focus magnet or ion trap magnet.

(2) Defective yoke.

RASTER AND SIGNAL ON KINESCOPE BUT NO SOUND:

(1) T110 defective.

(2) Sound i-f, ratio detector or audio amplifier inoperative—check V101, V102, V103 and their socket voltages.

(3) Audio system defective.

(4) Speaker defective.

SIGNAL AT KINESCOPE GRID BUT NO SYNC:

(1) AGC control R181 misadjusted.

(2) V111 inoperative. Check voltage and waveforms at its grid and plate.

SIGNAL ON KINESCOPE GRID BUT NO VERTICAL SYNC:

(1) Check V114B and associated circuit.

(2) Integrating network inoperative—Check.

(3) V113 or V114A defective or associated circuit defective.

(4) Gas current, grid emission or grid cathode leakage in V114. Replace.

SIGNAL ON KINESCOPE GRID BUT NO HORIZONTAL SYNC:

(1) T113 misadjusted—readjust as instructed on page 11.

(2) V112 or V113 inoperative—check socket voltages and waveforms.

(3) T113 defective.

(4) C163, C191A, C190, C194, C195, C197, C196, C198 or C199 defective.

(5) If horizontal speed is completely off and cannot be adjusted check R226, R227, R197B, R228, R229, R230 and R232.

SOUND AND RASTER BUT NO PICTURE OR SYNC:

(1) Picture, detector or video amplifier defective—check CR101 and V110—check socket voltages.

(2) Bad contact to kinescope cathode.

PICTURE STABLE BUT POOR RESOLUTION:

(1) CR101 or V110 defective.

(2) Peaking coils defective—check resistance.

(3) Make sure that the focus control operates on both sides of proper focus.

(4) R-F and I-F circuits misaligned.

PICTURE SMEAR:

(1) R-F or I-F circuits misaligned.

(2) Open peaking coil.

(3) This trouble can originate at the transmitter—check on another station.

PICTURE JITTER:

(1) AGC control R181 misadjusted.

(2) If regular sections at the left picture are displaced change V117.

SERVICE SUGGESTIONS

(3) Vertical instability may be due to loose connections or noise.

(4) Horizontal instability may be due to unstable transmitted sync.

RASTER BUT NO SOUND, PICTURE OR SYNC:

(1) Defective antenna or transmission line.

(2) R-F oscillator off frequency.

(3) R-F unit inoperative—check V1, V2.

DARK VERTICAL LINE ON LEFT OF PICTURE:

(1) Reduce horizontal drive and readjust width and horizontal linearity.

(2) Replace V117.

LIGHT VERTICAL LINE ON LEFT OF PICTURE:

(1) V119 defective.

PICTURE I-F RESPONSE.—At times it may be desirable to observe the individual i-f stage response. This can be achieved by the following method:

For T107, T108 or T109, shunt all i-f transformers with a 330 ohm carbon resistor except the one whose response is to be observed.

Connect a wide band sweep generator to the second pix i-f grid and adjust it to sweep from 38 mc. to 48 mc.

Connect the oscilloscope to test point TP102 and observe the overall response. The response obtained will be essentially that of the unshunted stage.

To see the response of transformers T1, T104 and T105, T106, follow the instructions given on page 10.

Figures 28 through 36 show the response of the various stages obtained in the above manner. The curves shown are typical although some variation between receivers can be expected. Relative stage gain is not shown.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 5000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c.

R-F UNIT WIRING DIAGRAM

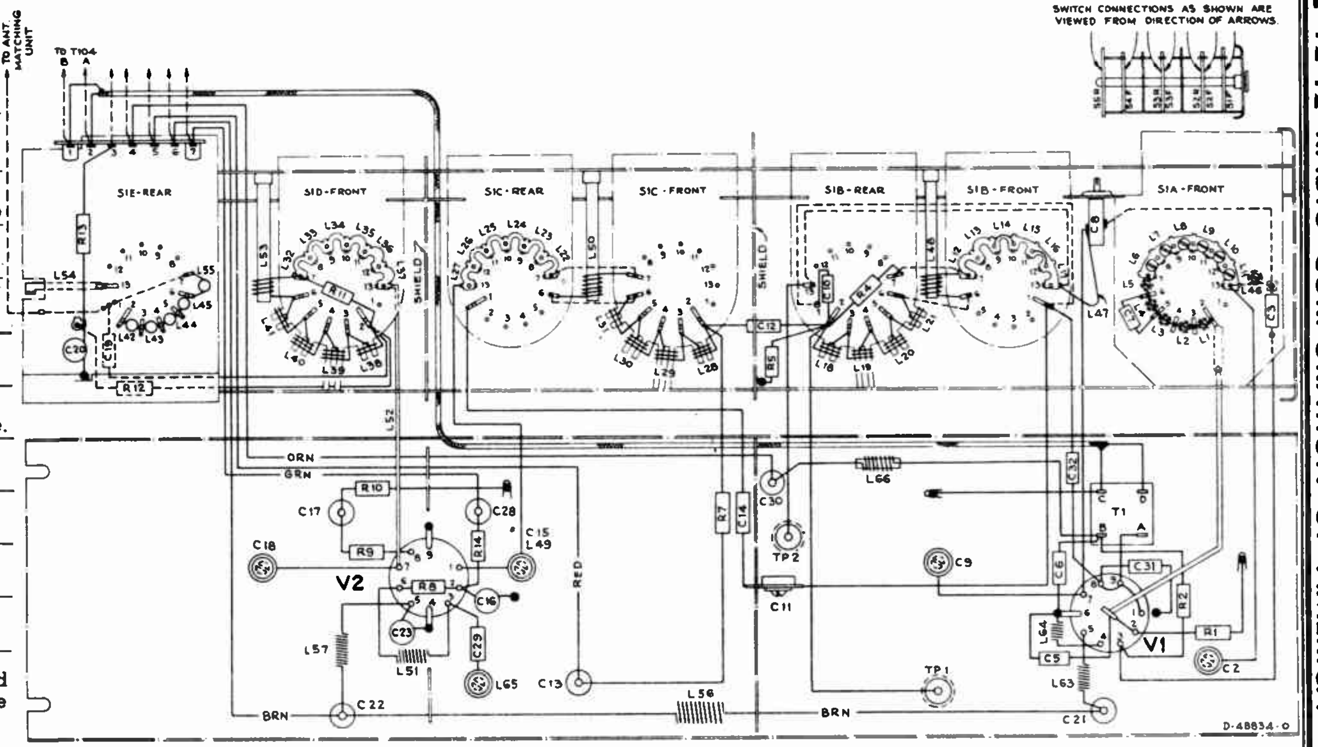

Figure 77—R-F Unit Wiring Diagram

CRITICAL LEAD DRESS

1. Keep all wiring in the pix i-f, sound i-f and video circuits as short as possible.
2. Keep the leads on C110, C111, C112, R108, R139, R150, R111, R109, R110 and R233 as short and direct as possible.
3. Do not change the bus wire connection to pin 2 of V101 and V102. Sleeving is used on these wires to insure length and to prevent shorting.
4. Dress C115 down between R114 (volume control) and wafer S101-B.
5. Ground R126 to pin 3 of V106 and R134 to pin 7 of V107.
6. Do not change the grounding of R136, R140 and R143.
7. Keep the bus wire from T109-A to C144 (plug in capacitor) short and direct.
8. Ground the filaments of sockets V107, V108 and V109 independently of the socket center pin. Use ground lances proved near each socket.
9. Dress C148 straight up to act as a shield between T101-A and V110-2.
10. Dress C155 and R160 (kine cathode) up in the air above the terminal board.
11. Keep the leads connected to T113-C and T113-D (synchoguide) down so that they will not short out when the chassis is placed in the cabinet.
12. Do not reroute any wires between T104 and the terminal board alongside it. Keep all leads on the foot side of the terminal board.
13. Dress all wires routed past T104, shielded wires W102 and W103 under the big lances near T104.
14. Dress all a-c leads to S102 under the large lances on the front apron.
15. Dress R113 close to the chassis with leads as short as possible.
16. Dress C158 and C122 up in the air and away from all other leads and components.
17. The lead from pin 5 of V111 to the terminal board under the high voltage cage should be routed between V117 socket and the rear apron.
18. Dress all 2 watt resistors away from each other and all other wires and components.
19. Dress all wires away from damper tube V119.
20. The wire from pin 5 V116 to T113-A should not be more than 5 inches long.
21. Dress all peaking coils up and away from the base.
22. Dress all leads in the high voltage compartment away from each other and away from the high voltage transformer.

STOCK No.	DESCRIPTION
	R-F UNIT ASSEMBLIES KRK11A
76539	Board—Antenna matching transformer terminal board less coils L58, L59, L60 and less capacitors C24, C25, C26, C27
76531	Board—Terminal board, 5 contact and ground
76845	Bracket—Vertical bracket for holding V1 tube shield
76965	Capacitor—Ceramic, variable, for fine tuning—plunger type (C2)
93056	Capacitor—Ceramic, 5 mmf. (C26, C32)
70597	Capacitor—Ceramic, 8 mmf. (C29)
55326	Capacitor—Ceramic, 10 mmf. (C3)
54207	Capacitor—Ceramic, 18 mmf. (C27)
76557	Capacitor—Ceramic, 22 mmf. (C19, C31)
76558	Capacitor—Ceramic, 22 mmf. (C5)
70935	Capacitor—Ceramic, 27 mmf. (C25)
76739	Capacitor—Ceramic, 33 mmf. (C24)
77460	Capacitor—Ceramic, 220 mmf. (C10)
75199	Capacitor—Ceramic, 270 mmf. (C12, C14)
75166	Capacitor—Ceramic, 1500 mmf. (stand-off) (C13, C17, C21, C22, C28, C30)
75610	Capacitor—Ceramic, 1500 mmf. (C6)
73748	Capacitor—Ceramic, 1500 mmf. (C16, C20, C23)
71088	Capacitor—Ceramic, 0.68 mmf. (C7)
77151	Capacitor—Tubular, steatite, adjustable, 0.8-3.0 mmf. (C8)
75184	Capacitor—Ceramic, adjustable, 0.80-3.8 mmf. complete with adjusting stud (C9)
76532	Capacitor—Adjustable trimmer, steatite, 1.-4. mmf. (C18)
76527	Capacitor—Mica trimmer, 55-80 mmf. (C11)
76143	Clip—Tubular clip for mounting stand-off capacitors
73591	Coil—Antenna matching coil (2 required)
73477	Coil—Choke coil (L57)
76763	Coil—Filament choke coil (L63, L64)
77206	Coil—Filament choke coil (L56)
76562	Coil—R-F amplifier coupling coil (L51)
77153	Coil—R-F choke coil (L66)
76537	Coil—Shunt coil complete with adjustable core (L61)
76538	Coil—Shunt coil complete with adjustable core (L62)
76529	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r-f section (L49, C15)
38853	Connector—4 contact female connector—part of matching transformer (J1)
76559	Connector—Oscillator grid connector
76460	Contact—Test point contact
77202	Core—Adjustable core for fine tuning capacitor
76543	Core—Adjusting core for FM trap
76521	Detent—Detent mechanism and fibre shaft
73453	Form—Coil form for coils L48, L50, L53
77203	Link—Link assembly for fine tuning
76728	Nut—Speednut for mounting adjustable trimmer 76532
	Resistor—Fixed, composition:
503047	47 ohms, ±10%, ½ watt (R9)
503082	82 ohms, ±10%, ½ watt (R10)
503115	150 ohms, ±10%, ½ watt (R13)
503210	1000 ohms, ±10%, ½ watt (R7, R14)
503233	3300 ohms, ±10%, ½ watt (R4, R11, R12)
503247	4700 ohms, ±10%, ½ watt (R2)
503410	100,000 ohms, ±10%, ½ watt (R1, R5, R6)
503447	470,000 ohms, ±10%, ½ watt (R8)
14343	Retainer—Fine tuning shaft retaining ring
75164	Rod—Actuating plunger rod (fibre) for fine tuning link
76547	Screw—No. 4-40 x ¼" adjusting screw for coils L6, L7, L8, L9, L10, L11
76549	Screw—No. 4-40 x ⅜" adjusting screw for coil L5
76548	Screw—No. 4-40 x 5/16" adjusting screw for coils L1, L2, L3, L4, L46
76519	Shaft—Channel selector shaft and plate
76134	Shaft—Fine tuning shaft and cam
77147	Shield—Front shield complete with shaft bushing and bracket
76534	Shield—Tube shield
76530	Socket—Tube socket, 9 pin, miniature, ceramic, saddle-mounted for V1
76336	Socket—Tube socket, 9 pin, miniature, bakelite, saddle-mounted for V2
77149	Spacer—Metal spacer for front plate
75163	Spring—Friction spring (formed) for fine tuning cam
30340	Spring—Hairpin spring for fine tuning link
75068	Spring—Retaining spring for tube shield
77204	Spring—Return spring for fine tuning control
76554	Stator—Antenna stator complete with rotor, coils, capacitors and resistor (S5, C20, L42, L43, L44, L45, L54, L55, R13)
77353	Stator—Convertor stator complete with rotor, coils, capacitor and resistors (S2, C10, C12, L12, L13, L14, L15, L16, L17, L18, L19, L20, L21, L47, L48, R4, R5, R6)
77205	Stator—Oscillator stator complete with rotor, coils and capacitors (S1, C3, C7, L1, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L46)
76553	Stator—R-F plate stator complete with rotor, coils, capacitor and resistor (S3, C14, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L50, R7)
76556	Stator—R-F grid stator complete with rotor, coils, capacitor and resistors (S4, C19, L32, L33, L34, L35, L36, L37, L38, L39, L40, L41, L53, R11, R12)
76561	Strap—Channel No. 13 r-f grid strap (L52)
76525	Strip—Coil segment mounting strip—RH center
76526	Strip—Coil segment mounting strip—LH lower
76544	Strip—Coil segment mounting strip — LH upper — less trimmer
75446	Stud—Capacitor stud for trimmer coil L49, C15 (uncoded and coded "ER")
75447	Stud—Capacitor stud for trimmer coil L49, C15 (coded numerically and "Hi Q")
76740	Stud—No. 6-32 x 1" adjusting stud for adjustable capacitor
77152	Terminal—Terminal for mounting C8 trimmer
76536	Transformer—Antenna matching transformer complete (T2, C24, C25, C26, C27, L58, L59, L60, L61, L62, J1)
77148	Transformer—Convertor transformer (T1, R3)
76540	Trap—FM trap complete with adjustable core (L58)
76535	Trap—I-F trap (L65)
76542	Trap—I-F trap (41.25 MC) complete with core (L60)
76541	Trap—I-F trap (45.75 MC) complete with core (L59)
75190	Washer—Insulating washer (neoprene) for adjustable capacitor
	CHASSIS ASSEMBLIES KCS74
76456	Bracket—Channel indicator lamp bracket
76454	Bracket—Mounting bracket complete with insulator for picture control
71496	Capacitor—Adjustable trimmer, 5-70 mmf. (C122)
75217	Capacitor—Mica trimmer, dual 10-160 mmf. (C191A, C191B)
33380	Capacitor—Ceramic, 12 mmf. (C193)
39044	Capacitor—Ceramic, 15 mmf. (C154)
73664	Capacitor—Ceramic, 39 mmf. (C153)
71924	Capacitor—Ceramic, 56 mmf. (C105)
76475	Capacitor—Mica, 68 mmf. (C192)
76474	Capacitor—Mica, 82 mmf. (C163)
39396	Capacitor—Ceramic, 100 mmf. (C114, C162)
75437	Capacitor—Ceramic, 100 mmf. (C152)
51416	Capacitor—Mica, 180 mmf. (C167)
76673	Capacitor—Ceramic, 220 mmf. (C184)
73091	Capacitor—Mica, 270 mmf. (C207)
47617	Capacitor—Ceramic, 270 mmf. (C118)
39640	Capacitor—Mica, 330 mmf. (C166)
76476	Capacitor—Mica, 330 mmf. (C198)
73094	Capacitor—Mica, 390 mmf. (C174)
54003	Capacitor—Mica, 470 mmf. (C110, C111)
75166	Capacitor—Ceramic, 1500 mmf. (stand-off) (C144)
73473	Capacitor—Ceramic, 4700 mmf. (C126, C127, C128, C129, C130, C131, C135, C136, C139, C142, C216)
76470	Capacitor—Ceramic, dual, 4700 mmf. (C123A, C123B, C137A, C137B, C140A, C140B, C141A, C141B, C156A, C156B)
73960	Capacitor—Ceramic, 10,000 mmf. (C145, C148)
75877	Capacitor—Ceramic, dual, 10,000 mmf. (C101A, C101B, C107A, C107B)
74521	Capacitor—Electrolytic, 5 mfd., 50 volts (C112)
28417	Capacitor—Electrolytic, 5 mfd., 450 volts (C183)
75218	Capacitor—Electrolytic, comprising 1 section of 10 mfd., 350 volts, 1 section of 5 mfd., 350 volts and 1 section of 150 mfd., 50 volts (C212A, C212B, C212C)
76451	Capacitor—Electrolytic, comprising 1 section of 100 mfd., 350 volts, 2 sections of 10 mfd., 350 volts and 1 section of 20 mfd., 50 volts (C211A, C211B, C211C, C211D)
75220	Capacitor—Electrolytic, 150 mfd., 200 volts (C209, C210)
76479	Capacitor—Tubular, moulded, oil impregnated, .00068 mfd., 600 volts (C200)
75249	Capacitor—Tubular, paper, oil impregnated, .001 mfd., 600 volts (C164, C172, C190)
76995	Capacitor—Tubular, moulded, oil impregnated, .0012 mfd., 600 volts (C201)
73802	Capacitor—Tubular, paper, oil impregnated, .0015 mfd., 600 volts (C159)
73595	Capacitor—Tubular, paper, oil impregnated, .0022 mfd., 600 volts (C113, C161, C173, C176, C177, C178)
73599	Capacitor—Tubular, paper, oil impregnated, .0027 mfd., 600 volts (C119)
73818	Capacitor—Tubular, paper, oil impregnated, .0027 mfd., 1600 volts (C121)
73795	Capacitor—Tubular, paper, oil impregnated, .0033 mfd., 600 volts (C160)
73920	Capacitor—Tubular, paper, oil impregnated, .0047 mfd., 600 volts (C115, C187)
73789	Capacitor—Tubular, paper, oil impregnated, .0068 mfd., 400 volts (C151)
73561	Capacitor—Tubular, paper, oil impregnated, .01 mfd., 400 volts (C116, C120, C165)
73594	Capacitor—Tubular, moulded, oil impregnated, .01 mfd., 600 volts (C199)
73562	Capacitor—Tubular, paper, oil impregnated, .022 mfd., 400 volts (C195)
73798	Capacitor—Tubular, paper, oil impregnated, .022 mfd., 600 volts (C179)
73810	Capacitor—Tubular, paper, oil impregnated, .022 mfd., 1000 volts (C206)
73811	Capacitor—Tubular, paper, oil impregnated, .027 mfd., 1000 volts (C205)
73596	Capacitor—Tubular, paper, oil impregnated, .033 mfd., 1000 volts (C180)
73790	Capacitor—Tubular, paper, oil impregnated, .039 mfd., 400 volts (C117)
73558	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 200 volts (C171)
73553	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 400 volts (C158, C197)
75071	Capacitor—Tubular, moulded, .047 mfd., 400 volts (C188, C189)
73592	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 600 volts (C124)
73597	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 1000 volts (C186)
73792	Capacitor—Tubular, paper, oil impregnated, .068 mfd., 400 volts (C182)
73784	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 200 volts (C155, C175)
73551	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 400 volts (C170, C185, C194)
73557	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 600 volts (C181, C203)
73786	Capacitor—Tubular, paper, oil impregnated, 0.27 mfd., 200 volts (C202)
73787	Capacitor—Tubular, paper, oil impregnated, 0.47 mfd., 200 volts (C157, C168, C196)
76498	Choke—Filter choke (L115)
76143	Clip—Tubular clip to mount stand-off capacitor
73477	Coil—Choke coil (L101)
76442	Coil—Horizontal linearity coil complete with adjustable core (L107)
76441	Coil—Width coil complete with adjustable core (L106)
76640	Coil—R-F choke coil (1.5 muh) (L109)
77195	Coil—Peaking coil (120 muh) (L103, R149)
76647	Coil—Peaking coil (180 muh) (L108, R152)
71526	Coil—Peaking coil (250 muh) (L104)
77194	Coil—Peaking coil (1000 muh) (L110)
71789	Connector—Anode connector
35787	Connector—Phono input connector (J101)
75474	Connector—Single contact male connector for speaker cable (2 required)
75482	Connector—Video connector (J102)
74594	Connector—2 contact male connector for power cord
50367	Connector—6 contact female connector for yoke leads (J103)
75542	Connector—6 contact male connector—part of deflection yoke (P103)
77200	Control—AGC control (R181)
76444	Control—Brightness control (R216)
76448	Control—Height control (R199)
77201	Control—Horizontal and vertical hold control (R197A, R197B)
76445	Control—Picture control (R158)
77199	Control—Ratio detector balance control (R139)
76449	Control—Vertical linearity control (R211)
77010	Control—Volume control and power switch (R114, S102)
76986	Cover—Back cover for hi-voltage compartment
76985	Cover—Side cover for hi-voltage compartment
74956	Cushion—Rubber cushion for deflection yoke hood
74839	Fastener—Push fastener for mounting tube socket for V116 and tube socket 76453
73600	Fuse—0.25 amps. (F101)
76459	Grommet—Rubber grommet for 2nd anode lead exit
37396	Grommet—Rubber grommet for mounting tube socket for V116 and tube socket 76453
76830	Hood—Deflection yoke hood less rubber cushions
76168	Magnet—Focus magnet
76141	Magnet—Ion trap magnet (P.M. type)
76633	Magnet—Pin cushion correction magnet complete with support arm
18469	Plate—Bakelite mounting plate for electrolytic 75220
76464	Plate—Hi-voltage plate—bakelite—complete with tube socket and corona ring
77196	Printed Circuit—Consisting of 1 section of 22,000 ohms, 2 sections of 8200 ohms, 1 section of .002 mfd., and 2 sections of .005 mfd. PC101 (C213, C214, C215, R165, R166, R167)
76675	Rectifier—Picture detector crystal rectifier (CR101)
76452	Rectifier—Selenium rectifier (CR102, CR103)
76796	Resistor—Wire wound, 5.1 ohms, 1/3 watt (R237)
76639	Resistor—Wire wound, 180 ohms, 2 watts (R235)
77193	Resistor—Wire wound, 680 ohms, 1 watt (R119)
34473	Resistor—Wire wound, 2000 ohms, 10 watts (R128)
76390	Resistor—Wire wound, 5600 ohms, 5 watts (R138)

STOCK No.	DESCRIPTION
76642	Resistor—Wire wound, 6750 ohms, 10 watts (R156)
	Resistor—Fixed, composition:
503047	47 ohms, ±10%, ½ watt (R108, R154, R233)
502056	56 ohms, ±5%, ½ watt (R134)
34763	68 ohms, ±5%, ½ watt (R140)
502082	82 ohms, ±5%, ½ watt (R101)
502110	100 ohms, ±5%, ½ watt (R126)
503110	100 ohms, ±10%, ½ watt (R122, R129)
503118	180 ohms, ±10%, ½ watt (R144)
503122	220 ohms, ±10%, ½ watt (R153)
503133	330 ohms, ±10%, ½ watt (R213)
503147	470 ohms, ±10%, ½ watt (R123)
513147	470 ohms, ±10%, 1 watt (R120, R212)
503168	680 ohms, ±10%, ½ watt (R157)
502210	1000 ohms, ±5%, ½ watt (R150)
503210	1000 ohms, ±10%, ½ watt (R107, R121, R125, R131, R133, R137, R142, R145, R175)
503212	1200 ohms, ±10%, ½ watt (R178)
503222	2200 ohms, ±10%, ½ watt (R159)
523222	2200 ohms, ±10%, 2 watts (R164)
503233	3300 ohms, ±10%, ½ watt (R218)
513233	3300 ohms, ±10%, 1 watt (R102)
502239	3900 ohms, ±5%, ½ watt (R151)
503239	3900 ohms, ±10%, ½ watt (R225)
513247	4700 ohms, ±10%, 1 watt (R155)
502256	5600 ohms, ±5%, ½ watt (R136)
503256	5600 ohms, ±10%, ½ watt (R172)
14659	6800 ohms, ±5%, ½ watt (R109, R110)
513268	6800 ohms, ±10%, 1 watt (R147)
503282	8200 ohms, ±10%, ½ watt (R210)
503310	10,000 ohms, ±10%, ½ watt (R115, R205)
513310	10,000 ohms, ±10%, 1 watt (R141)
523310	10,000 ohms, ±10%, 2 watts (R236)
503312	12,000 ohms, ±10%, ½ watt (R171, R173)
513312	12,000 ohms, ±10%, 1 watt (R176)
503315	15,000 ohms, ±10%, ½ watt (R219)
503318	18,000 ohms, ±10%, ½ watt (R105, R184, R190, R228)
513322	22,000 ohms, ±10%, 1 watt (R227)
503333	33,000 ohms, ±10%, ½ watt (R132, R183, R192)
503339	39,000 ohms, ±10%, ½ watt (R111)
513339	39,000 ohms, ±10%, 1 watt (R180)
512343	43,000 ohms, ±5%, 1 watt (R209)
30787	47,000 ohms, ±5%, ½ watt (R193)
503347	47,000 ohms, ±10%, ½ watt (R103, R169)
513347	47,000 ohms, ±10%, 1 watt (R127, R135, R191, R232)
502356	56,000 ohms, ±5%, ½ watt (R143)
523356	56,000 ohms, ±10%, 2 watts (R106)
503368	68,000 ohms, ±10%, ½ watt (R195, R201, R202)
513368	68,000 ohms, ±10%, 1 watt (R226)
513382	82,000 ohms, ±10%, 1 watt (R224)
503410	100,000 ohms, ±10%, ½ watt (R203, R217)
512410	100,000 ohms, ±5%, 1 watt (R230)
30180	120,000 ohms, ±5%, ½ watt (R206)
503415	150,000 ohms, ±10%, ½ watt (R160, R179, R215, R220)
3046	200,000 ohms, ±5%, ½ watt (R194)
503422	220,000 ohms, ±10%, ½ watt (R214)
502427	270,000 ohms, ±5%, ½ watt (R162)
503427	270,000 ohms, ±10%, ½ watt (R185)
503433	330,000 ohms, ±10%, ½ watt (R116, R221)
512433	330,000 ohms, ±5%, 1 watt (R223)
503439	390,000 ohms, ±10%, ½ watt (R196)
503447	470,000 ohms, ±10%, ½ watt (R117, R148, R168, R234)
503456	560,000 ohms, ±10%, ½ watt (R198)

STOCK No.	DESCRIPTION
503482	820,000 ohms, ±10%, ½ watt (R188, R200, R222, R231)
503510	1 megohm, ±10%, ½ watt (R177)
11769	1.8 megohm, ±5%, ½ watt (R161)
39063	1.8 megohm, ±5%, 1 watt (R229)
503522	2.2 megohm, ±10%, ½ watt (R189, R204, R207)
503539	3.9 megohm, ±10%, ½ watt (R174)
503582	8.2 megohm, ±10%, ½ watt (R163)
503610	10 megohm, ±10%, ½ watt (R113)
71456	Screw—No. 8-32 x 7/16" wing screw for mounting deflection yoke
76455	Shaft—Connecting shaft (nylon) for picture and brightness controls
73584	Shield—Tube shield for V101, V102, V103, V106, V107, V109
75718	Socket—Channel indicator lamp socket
74834	Socket—Kinescope socket
75222	Socket—Tube socket, octal, ceramic, plate mounted for V116
31251	Socket—Tube socket, octal, wafer, for V112, V113, V114, V117
50367	Socket—Tube socket, 6 pin, moulded, saddle-mounted for V119
71508	Socket—Tube socket, 6 pin, moulded for V118
73117	Socket—Tube socket, 7 pin, wafer, miniature, for V101, V102, V103, V104, V105, V106, V107, V108, V109, V111
73115	Socket—Tube socket, 7 pin, moulded, miniature, plate-mounted for V115
76453	Socket—Tube socket, octal, moulded, saddle-mounted for V110 (6AG7) for KCS47M1
76971	Socket—Tube socket, 9 pin, wafer, miniature, for V110 (6CL6) for KCS74
76636	Stud—Adjusting stud complete with guard for focus magnet
76428	Support—Bakelite support only—part of hi-voltage shield
77215	Switch—Tone control and phono switch (S101)
76463	Terminal—Screw type grounding terminal
77198	Transformer—First pix i-f grid transformer complete with adjustable cores (T104, C125, R124)
77197	Transformer—First pix i-f plate transformer complete with adjustable cores (T105, C132, C133, R130)
76435	Transformer—Second pix i-f grid transformer complete with adjustable core (T106, C134)
76433	Transformer—Third or fourth pix i-f transformer (T107, T108)
76436	Transformer—Fifth pix i-f transformer (T109, C143, C146, L102, R146, CR101)
76795	Transformer—Hi-voltage transformer (T114)
76440	Transformer—Horizontal oscillator transformer complete with adjustable cores (T113)
76997	Transformer—Output transformer (T103)
76429	Transformer—Power transformer, 117 volt, 60 cycle (T112)
76438	Transformer—Sound i-f transformer complete with adjustable cores (T101, C103, C104)
76437	Transformer—Sound take-off transformer complete with adjustable cores (T110, C147)
76439	Transformer—Ratio detector transformer complete with adjustable cores (T102, C108, C109)
76431	Transformer—Vertical output transformer (T111)
77225	Trap—4.5 MC trap (L105, C149)
76616	Yoke—Deflection yoke complete with 6 contact male connector (L111, L112, L113, L114, C208, P103, R239, R240, R241)
	SPEAKER ASSEMBLIES
	971490-3W RL-105E6 RMA-274
	(For Model 17T250DE)
75024	Cone—Cone and voice coil (3.2 ohms)
75022	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms)

STOCK No.	DESCRIPTION
	SPEAKER ASSEMBLIES
	92569-12W RL-111A1 RMA-274
	(For Model 17T261DE)
75682	Cone—Cone and voice coil (3.2 ohms)
76389	Speaker—12" P.M. speaker complete with cone and voice coil (3.2 ohms)
	NOTE: If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
77213	Back—Cabinet back complete with terminal board and power cord for Model 17T250DE
77214	Back—Cabinet back complete with power cord for Model 17T261DE
76184	Board—Antenna terminal board
76590	Bracket—Hanger bracket for deflection yoke hood assembly
77028	Bracket—Support bracket ("L" shape) for kinescope masking panel (2 required)
76599	Bracket—"U" shape bracket for deflection yoke hood support rod
77029	Clip—Retaining clip (top or bottom) for safety glass retainer
77030	Clip—Retaining clip (sides) for safety glass retainer
X1756	Cloth—Grille cloth for mahogany or walnut instruments for Model 17T250DE
X3222	Cloth—Grille cloth for blonde mahogany instruments for Model 17T261DE
X3199	Cloth—Grille cloth for mahogany or walnut instruments for Model 17T261DE
75474	Connector—Single contact male connector for antenna cable
39153	Connector—4 contact male connector for antenna cable
71457	Cord—Power cord and plug
77031	Cushion—Adhesive cushion (sponge rubber—⅜" dia.) for masking panel
76638	Cushion—Rubber cushion for kinescope masking panel support bracket
77034	Decal—Control function decal for mahogany or walnut instruments
76512	Decal—Control function decal for blonde mahogany instruments
77244	Emblem—"Deluxe" emblem for mahogany or walnut instruments for Model 17T250DE
77245	Emblem—"Deluxe" emblem for blonde instruments for Model 17T250DE
77487	Emblem—"Deluxe" emblem for Model 17T261DE
77012	Emblem—"RCA Victor" emblem
75456	Escutcheon—Channel marker escutcheon
72113	Foot—Rubber foot (4 required) for Model 17T250DE
77026	Glass—Safety glass
37396	Grommet—Rubber grommet for mounting speaker for Model 17T261DE
76596	Knob—Brightness control or vertical hold control knob—beige—for blonde mahogany instruments (outer)
76595	Knob—Brightness control or vertical hold control knob—maroon—for mahogany or walnut instruments (outer)

STOCK No.	DESCRIPTION
76594	Knob—Channel selector knob—beige—for blonde mahogany instruments (inner)
76593	Knob—Channel selector knob—maroon—for mahogany or walnut instruments (inner)
76592	Knob—Fine tuning control knob—beige—for blonde mahogany instruments (outer)
76591	Knob—Fine tuning control knob—maroon—for mahogany or walnut instruments (outer)
74963	Knob—Picture control, horizontal hold control or volume control and power switch knob—maroon—for mahogany or walnut instruments (inner)
75464	Knob—Picture control, horizontal hold control or volume control and power switch knob—beige—for blonde mahogany instruments (inner)
76598	Knob—Tone control and phono switch knob—beige—for blonde mahogany instruments (outer)
76597	Knob—Tone control and phono switch knob—maroon—for mahogany or walnut instruments (outer)
11765	Lamp—Channel marker escutcheon lamp—Mazda 51
76589	Mask—Channel marker escutcheon light mask—beige—for blonde mahogany instruments
75459	Mask—Channel marker escutcheon light mask—burgundy—for mahogany or walnut instruments
77022	Mask—Polystyrene masking panel
77013	Nut—Speednut for fastening "RCA Victor" emblem to cabinet (3 required)
73634	Nut—Speednut for speaker mounting screws for Model 17T261DE
76177	Nut—No. 10-32 special nut for deflection yoke hood support rods
76601	Pad—Kinescope edge support pad (2 required)
77027	Retainer—Safety glass retainer
77024	Rod—"L" shape threaded rod to support deflection yoke hood assembly
76632	Screw—No. 8 x ⅝" hex head wood screw for mounting hanger bracket
76808	Sleeve—Polyethylene sleeve for insulating high voltage lead—on support rod
73643	Spring—Channel marker escutcheon spring clip
76020	Spring—Formed spring for glass retainer clips (6 required)
77025	Spring—Formed spring for kinescope masking panel
77006	Spring—Retaining spring (coil) for deflection yoke hood support rod nut
30330	Spring—Retaining spring for knobs 74963, 75464
72845	Spring—Retaining spring for knobs 76591, 76592
76837	Spring—Retaining spring for knobs 76593, 76594, 76595, 76596, 76597, 76598
77032	Spring—Suspension spring clip (formed) for ground braid
36580	Spring—Suspension spring (coil) for ground braid
76600	Strap—Grounding strap (upper strip—½" x 18")
77023	Washer—Cellulose washer—gold—for knobs
75500	Washer—Felt washer for masking panel or cabinet back mounting screws
75458	Washer—Felt washer—beige—between knob and channel marker escutcheon for blonde mahogany instruments
75457	Washer—Felt washer—dark brown—between knob and channel marker escutcheon for mahogany or walnut instruments

CHASSIS WIRING DIAGRAM KCS74, KCS74M1

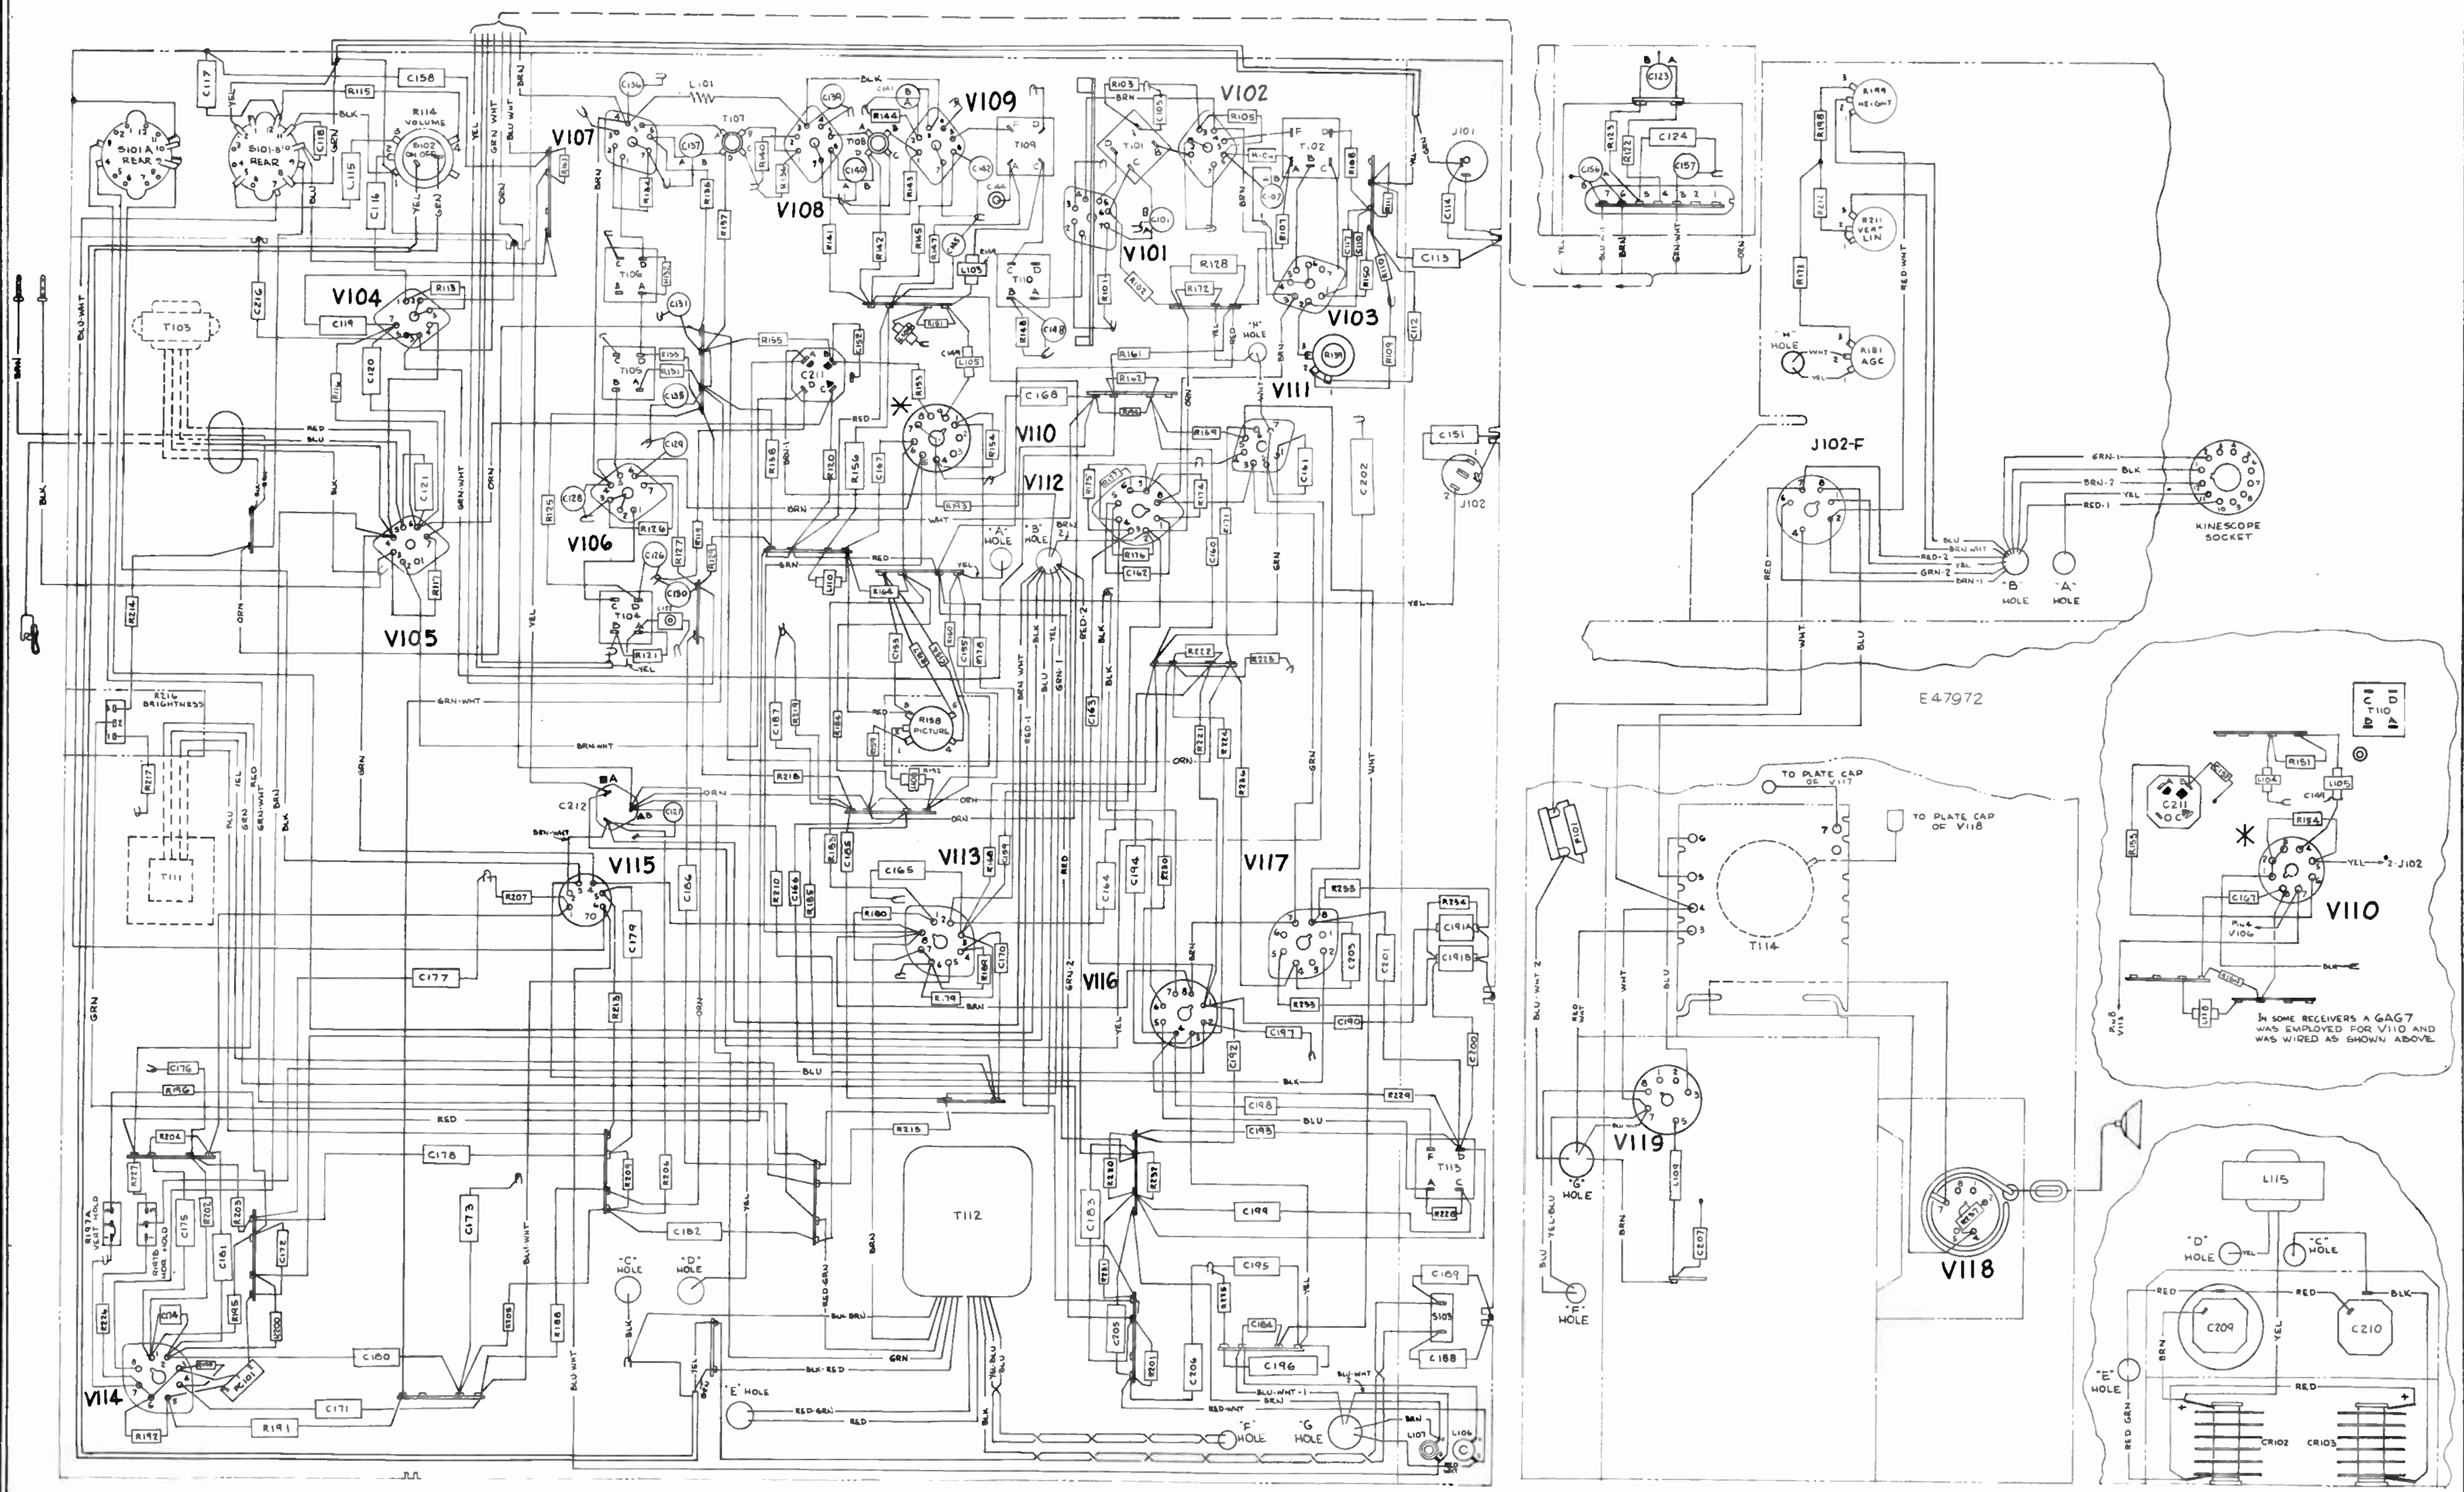

Figure 78—Chassis Wiring Diagram, KCS74, KCS74M1

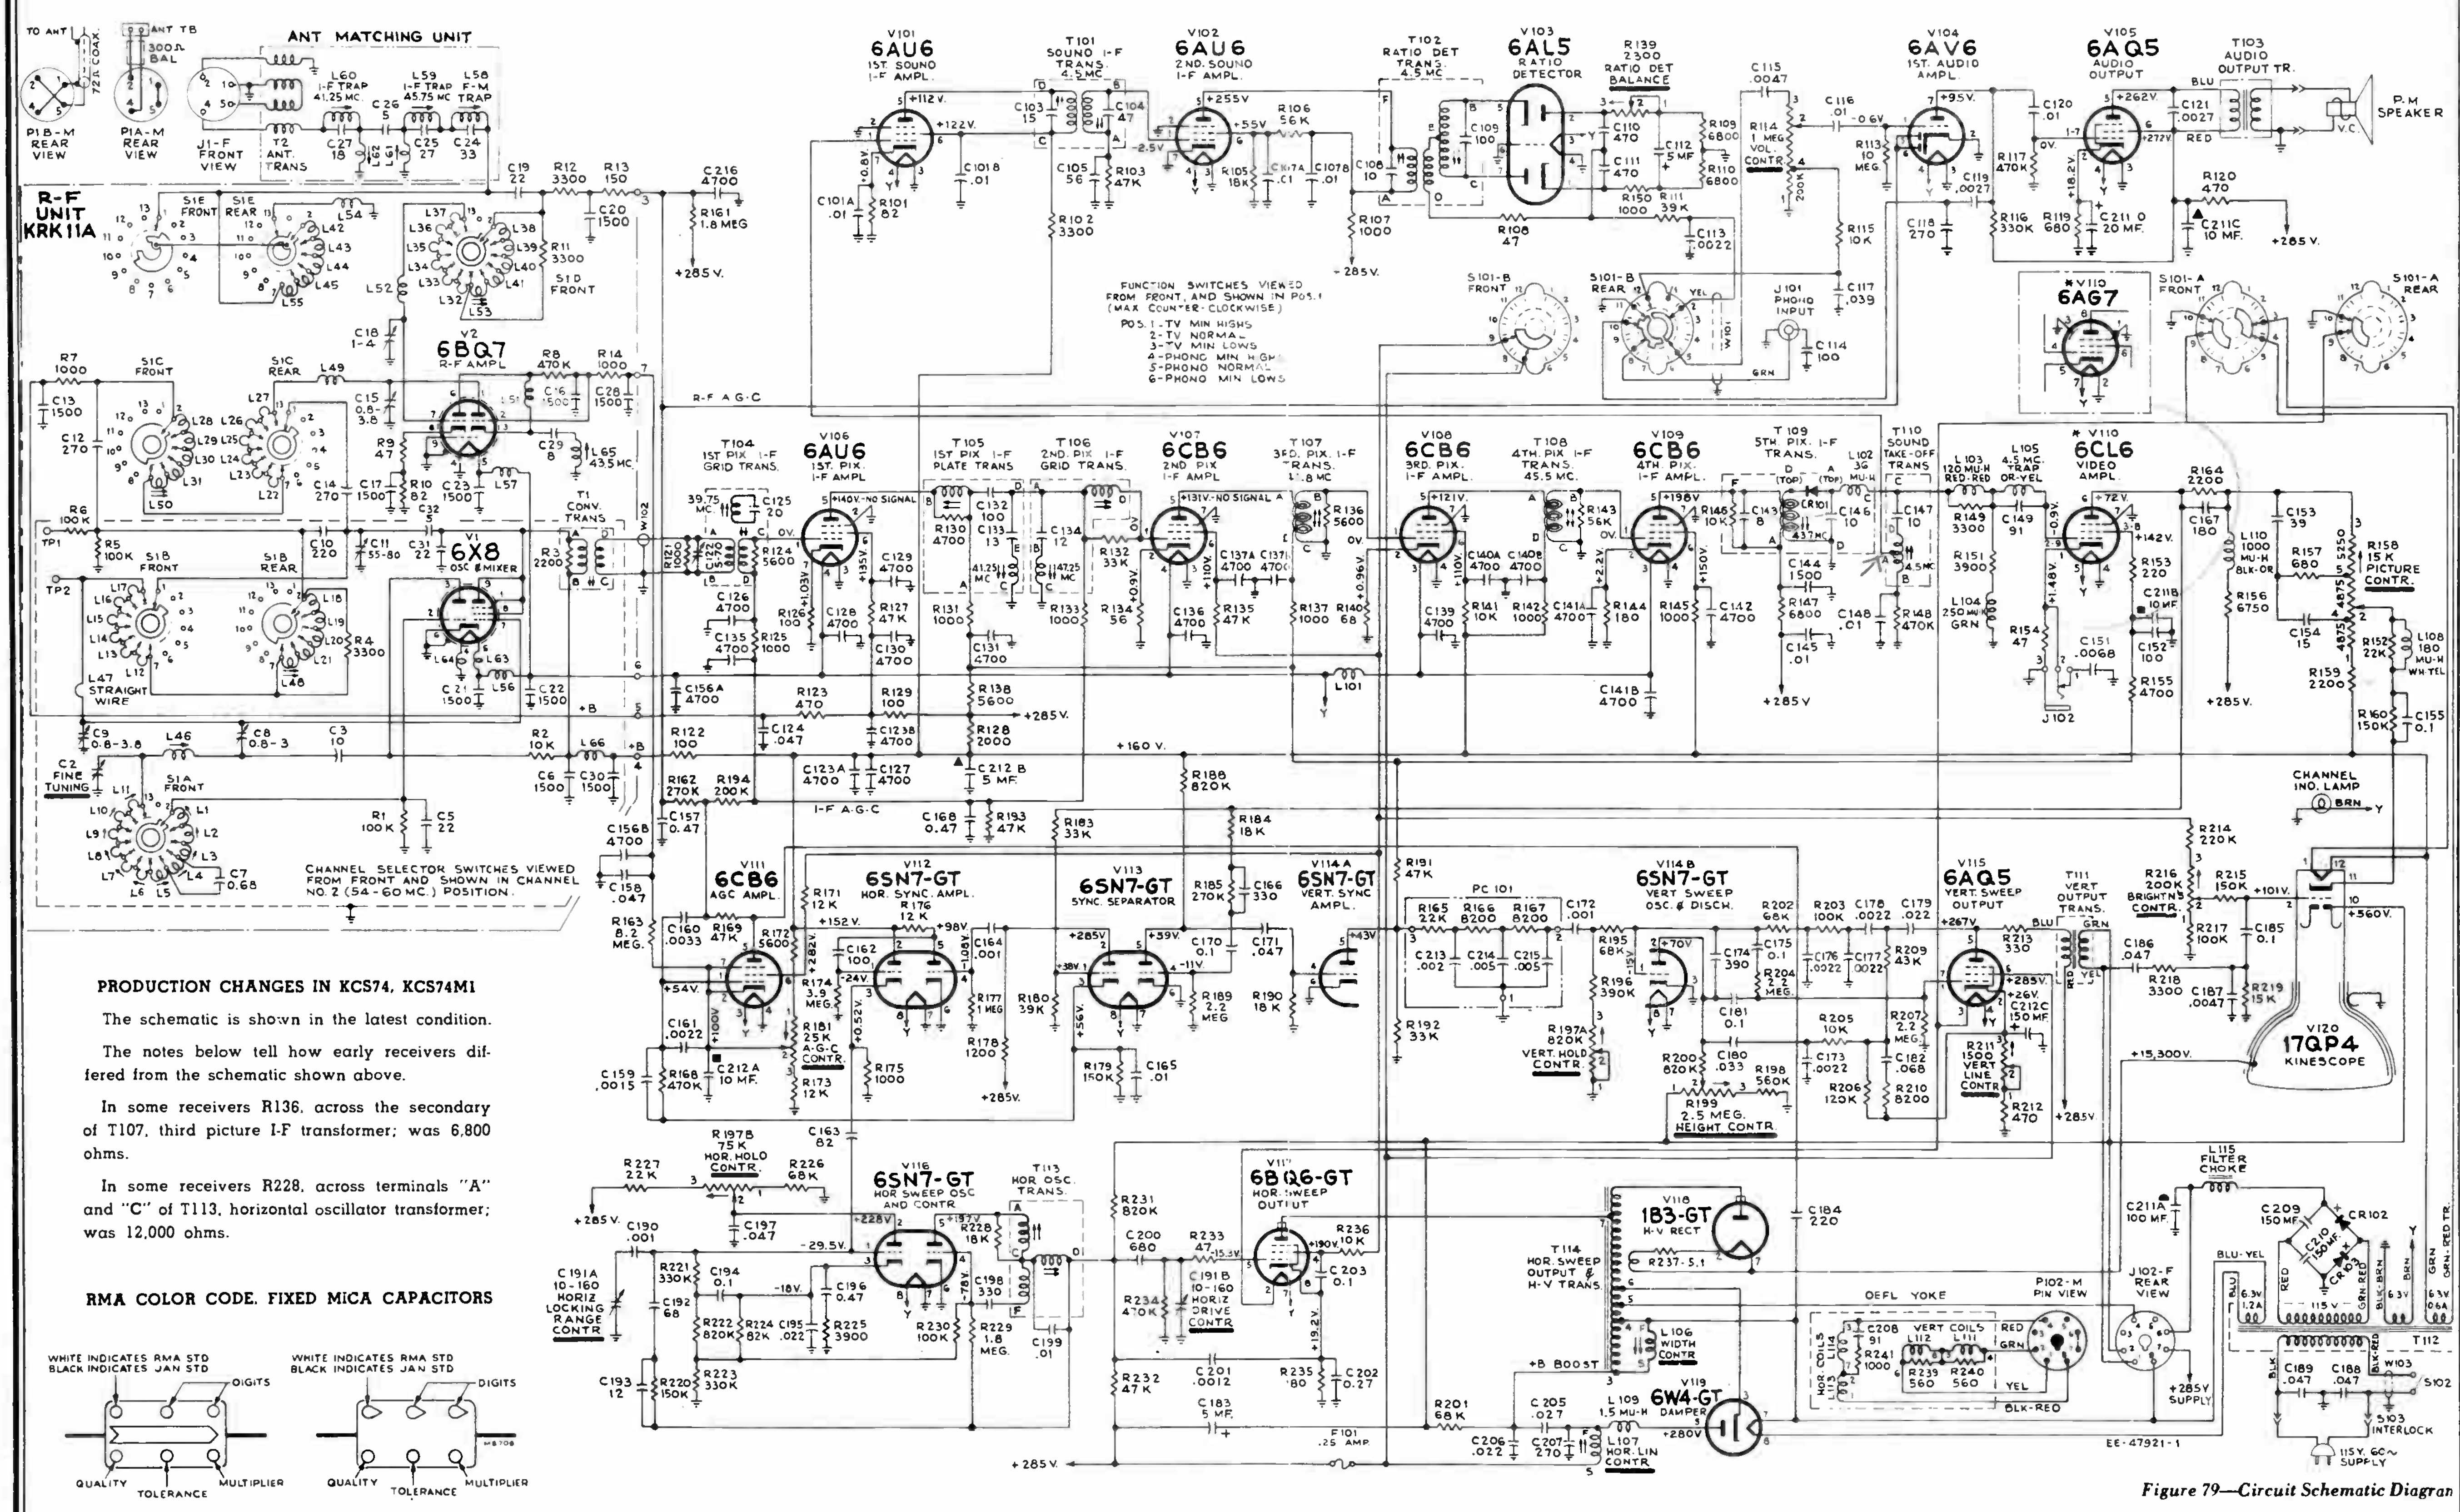
KCS74 CIRCUIT SCHEMATIC DIAGRAM (*KCS74M1)



PRODUCTION CHANGES IN KCS74, KCS74M1

The schematic is shown in the latest condition.

The notes below tell how early receivers differed from the schematic shown above.

In some receivers R136, across the secondary of T107, third picture I-F transformer; was 6,800 ohms.

In some receivers R228, across terminals "A" and "C" of T113, horizontal oscillator transformer; was 12,000 ohms.

RMA COLOR CODE, FIXED MICA CAPACITORS

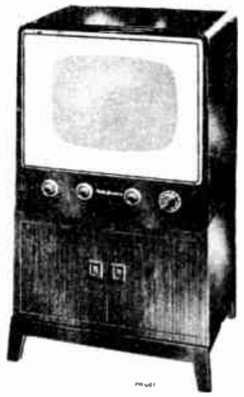
Figure 79—Circuit Schematic Diagran

All resistance values in ohms. K = 1000. All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

* In some receivers, a 6AG7 tube was employed in place of the 6CL6 video amplifier and was connected as shown in inset above.



Model 17T200 "Shelly" Ebony
Model 17T201 "Hadley" Maroon
(Shown on base)

Model 17T202 "Kentwood" Mahogany, Grained
(Shown on base)

GENERAL DESCRIPTION

Models 17T200, 17T201, 17T202, 17T211, and 17T220 are "17 inch" television receivers. The receivers are identical except for cabinets, and speakers.

Features of the television unit are: full twelve channel coverage; intercarrier FM sound system; ratio detector; improved picture brilliance; pulsed picture A-G-C; A-F-C horizontal hold; stabilized vertical hold; noise saturation circuits; improved sync separator and clipper; 3.2 mc. band width for picture channel and reduced hazard high voltage supply. An auxiliary audio input jack is provided to permit the use of an external record playing attachment.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE . . . 146 square inches on a 17QP4 Kinescope

TELEVISION R-F FREQUENCY RANGE
All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.
Picture I-F Carrier Frequency .... 25.50 mc.
Sound I-F Carrier Frequency .... 21.00 mc. and 4.5 mc.

POWER SUPPLY RATING . . 115 volts, 60 cycles, 190 watts

AUDIO POWER OUTPUT RATING .... 4.0 watts max.

VIDEO RESPONSE .... To 3.2 mc.

SWEEP DEFLECTION .... Magnetic

FOCUS .... Magnetic

LOUDSPEAKERS
In Models 17T200, 17T201 & 17T202
. . . 971636-1 5" PM Dynamic, 3.2 ohms
In Models 17T211 & 17T220
. . . (971490-3) 8" PM Dynamic, 3.2 ohms

WEIGHT AND DIMENSIONS

Model	Net Weight	Shipping Weight	Width Inches	Height Inches	Depth Inches
17T200	88 lbs.	103 lbs.	21½	22	21⅜
17T201	88 lbs.	103 lbs.	21½	22	21⅜
17T202	88 lbs.	103 lbs.	21½	22	21⅜
17T211	95 lbs.	116 lbs.	24½	35¼	21¾
17T220	106 lbs.	130 lbs.	23¾	35¼	23¾

RECEIVER ANTENNA INPUT IMPEDANCE
Choice: 300 ohms balanced or 72 ohms unbalanced.

RCA TUBE COMPLEMENT

Tube Used	Function
(1) RCA 6CB6	R-F Amplifier
(2) RCA 6J6	R-F Oscillator and Mixer
(3) RCA 6CB6	1st Picture I-F Amplifier
(4) RCA 6CB6	2nd Picture I-F Amplifier
(5) RCA 6CB6	3rd Picture I-F Amplifier
(6) RCA 12AU7	Picture 2nd Detector and Vert. Sync. Sep.
(7) RCA 6CL6 (6AC7) (6AG7)	*Video Amplifier
(8) RCA 6AU6	1st Sound I-F Amplifier
(9) RCA 6AU6	2nd Sound I-F Amplifier
(10) RCA 6AL5	Ratio Detector
(11) RCA 6AV6	1st Audio Amplifier
(12) RCA 6K6GT	Audio Output
(13) RCA 6AU6	AGC Amplifier
(14) RCA 6SN7GT	Horizontal Sync. Sep. and Sync. Output
(15) RCA 6J5	Vertical Sweep Oscillator
(16) RCA 6K6GT	Vertical Sweep Output
(17) RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(18) RCA 6BQ6GT	Horizontal Sweep Output
(19) RCA 6W4GT	Damper
(20) RCA 1B3-GT/8016	High Voltage Rectifier
(21) RCA 17QP4	Kinescope
(22) RCA 5U4G	Rectifier
(23) RCA 5Y3GT	Rectifier

*(See Figure 67)

ELECTRICAL AND MECHANICAL SPECIFICATIONS (Continued)

PICTURE INTERMEDIATE FREQUENCIES
Picture I-F Carrier Frequency .... 25.50 mc
Adjacent Channel Sound Trap .... 27.00 mc.

SOUND INTERMEDIATE FREQUENCIES
Sound I-F Carrier Frequency .... 21.00 mc.
Sound I-F Frequency .... 4.5 mc.

VIDEO RESPONSE .... To 3.2 mc.

FOCUS .... Magnetic

SWEEP DEFLECTION .... Magnetic

SCANNING .... Interlaced, 525 line

HORIZONTAL SWEEP FREQUENCY .... 15,750 cps

VERTICAL SWEEP FREQUENCY .... 60 cps

FRAME FREQUENCY (Picture Repetition Rate) .... 30 cps

OPERATING CONTROLS (Front Panel)
Channel Selector, Fine Tuning .... Dual Control Knobs
Picture, Brightness .... Dual Control Knobs
Picture Horizontal Hold, Picture Vertical Hold .... Dual Control Knobs
Sound Volume and On-Off Switch, TV Tone & Phono Switch .... Dual Control Knobs

NON-OPERATING CONTROLS (not including r-f and i-f adjustments)
Picture Centering .... top chassis adjustment
Width .... rear chassis adjustment
Height .... rear chassis adjustment
Horizontal Linearity .... rear chassis screwdriver adjustment
Vertical Linearity .... rear chassis adjustment
Horizontal Drive .... rear chassis screwdriver adjustment
Horizontal Oscillator Frequency . . . rear chassis adjustment
Horizontal Oscillator Waveform . . bottom chassis adjustment
Horizontal Locking Range .... rear chassis adjustment
Focus .... top chassis adjustment
Ion Trap Magnet .... top chassis adjustment
Deflection Coil .... top chassis wing nut adjustment
AGC Control .... rear chassis adjustment

HIGH VOLTAGE WARNING

OPERATION OF THIS RECEIVER OUTSIDE THE CABINET OR WITH THE COVERS REMOVED, INVOLVES A SHOCK HAZARD FROM THE RECEIVER POWER SUPPLIES. WORK ON THE RECEIVER SHOULD NOT BE ATTEMPTED BY ANYONE WHO IS NOT THOROUGHLY FAMILIAR WITH THE PRECAUTIONS NECESSARY WHEN WORKING ON HIGH VOLTAGE EQUIPMENT. DO NOT OPERATE THE RECEIVER WITH THE HIGH VOLTAGE COMPARTMENT SHIELD REMOVED.

KINESCOPE HANDLING PRECAUTIONS

DO NOT REMOVE THE RECEIVER CHASSIS, INSTALL, REMOVE OR HANDLE THE KINESCOPE IN ANY MANNER UNLESS SHATTERPROOF GOGGLES, AND HEAVY GLOVES ARE WORN. PEOPLE NOT SO EQUIPPED SHOULD BE KEPT AWAY WHILE HANDLING KINESCOPES. KEEP THE KINESCOPE AWAY FROM THE BODY WHILE HANDLING.

The kinescope bulb encloses a high vacuum and, due to its large surface area, is subjected to considerable air pressure. For this reason, the kinescope must be handled with more care than ordinary receiving tubes.

The large end of the kinescope bulb—particularly that part at the rim of the viewing surface—must not be struck, scratched or subjected to more than moderate pressure at any time. During service if the tube sticks or fails to slip smoothly into its socket, or deflecting yoke, investigate and remove the cause of the trouble. Do not force the tube. Refer to the Receiver Installation section for detailed instructions on kinescope installation. All RCA replacement kinescopes are shipped in special cartons and should be left in the cartons until ready for installation in the receiver.

OPERATING INSTRUCTIONS

The following adjustments are necessary when turning the receiver on for the first time.

1. See that the TV-PH switch is in the "TV" position.

2. Turn the receiver "ON" and advance the SOUND VOLUME control to approximately mid-position.

3. Set the STATION SELECTOR to the desired channel.

4. Adjust the FINE TUNING control for best pix and the SOUND VOLUME control for suitable volume.

5. Turn the BRIGHTNESS control fully counter-clockwise, then clockwise until a light pattern appears on the screen.

6. Adjust the VERTICAL hold control until the pattern stops vertical movement.

7. Adjust the HORIZONTAL hold control until a picture is obtained and centered.

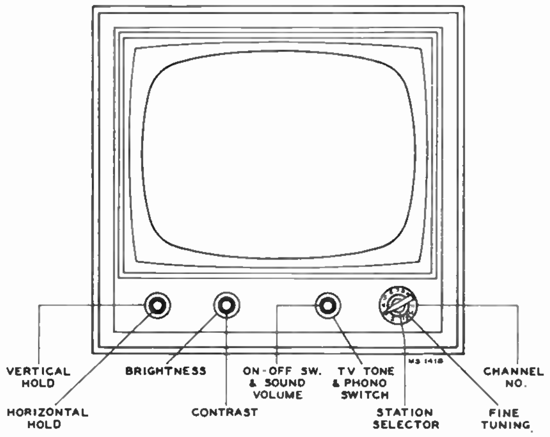

Figure 1—Receiver Operating Controls

8. Adjust the CONTRAST and BRIGHTNESS controls for suitable picture contrast and brightness.

9. In switching from one channel to another, it may be necessary to repeat steps 4 and 8.

10. When the set is turned on again after an idle period it should not be necessary to repeat the adjustment if the positions of the controls have not been changed. If any adjustment is necessary, step number 4 is generally sufficient.

11. If the positions of the controls have been changed, it may be necessary to repeat steps 2 through 8.

12. To use a record player, plug the record-player output cable into the PHONO jack on the rear apron, and set the TV-PH switch to "PH".

INSTALLATION INSTRUCTIONS

UNPACKING.—These receivers are shipped complete in cardboard cartons. The kinescope is shipped in place in the receiver.

Take the receiver out of the carton and remove all packing material.

Make sure that all tubes are in place and a firmly seated in their sockets.

Check to see that the kinescope high voltage lead clip is in place.

Plug a power cord into the 115 volt a-c power source and into the receiver interlock receptacle. Turn the receiver power switch to the "on" position, the brightness control fully clockwise, and the picture control counter-clockwise.

ION TRAP MAGNET ADJUSTMENT.—Set the ion trap magnet approximately in the position shown in Figure 2. Starting from this position immediately adjust the magnet by moving it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest raster on the screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Turn the focus control (shown in Figure 2) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches of this adjustment should be made with the brightness control at the maximum clockwise position with which good line focus can be maintained.

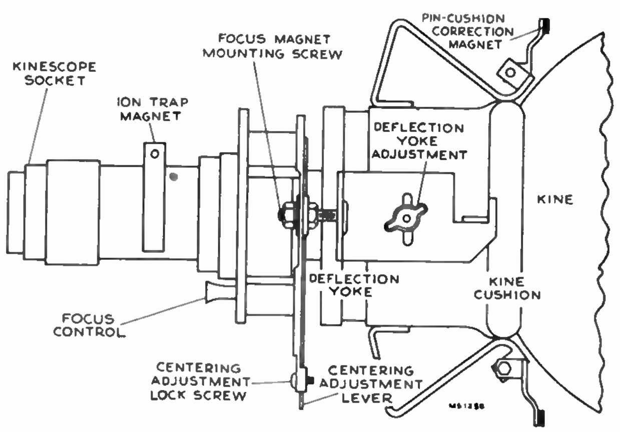

Figure 2—Yoke and Focus Magnet Adjustments

DEFLECTION YOKE ADJUSTMENT.—If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

PICTURE ADJUSTMENTS.—It will now be necessary to obtain a test pattern picture in order to make further adjustments. Connect the antenna transmission line to the receiver.

If the Horizontal Oscillator and AGC System are operating properly, it should be possible to sync the picture at this point. However, if the AGC control is misadjusted, and the receiver is overloading, it may be impossible to sync the picture.

If the receiver is overloading, turn R149 on the rear apron (see Figure 3) counter-clockwise until the set operates normally and the picture can be synced.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT.—Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel then back. Normally the picture will be out of sync. Turn the control clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 2 or 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. Pull-in should occur before the control has been turned 120 degrees from the extreme counter-clockwise position. The picture should remain in sync for approximately 90 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should remain in sync and should not show a black bar in the picture.

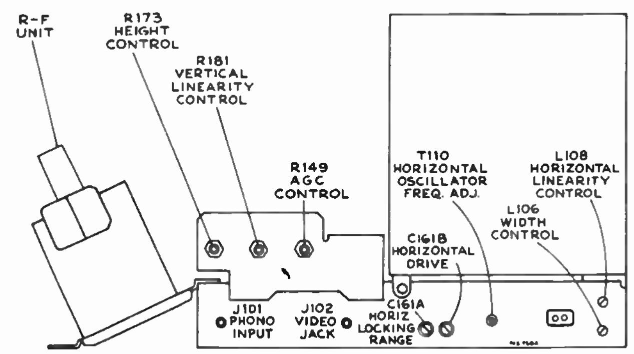

Figure 3—Rear Chassis Adjustments

If the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Focus Magnet Adjustment."

ALIGNMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync over 90 degrees of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments.

Horizontal Frequency Adjustment.—Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the T110 horizontal frequency adjustment at the rear of the chassis until the picture is just out of sync and the horizontal blanking appears as a vertical or diagonal black bar in the raster. Then turn the T110 core until the bar moves out of the picture leaving it in sync.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T110 rear core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C161A slightly clockwise. If less than 2 bars are present, adjust C161A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the conditions specified under each are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If it is impossible to sync the picture at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure on page 11: For field purposes paragraph "B" under Horizontal Oscillator Waveform Adjustment may be omitted.

FOCUS MAGNET ADJUSTMENT.—The focus magnet should be adjusted so that there is approximately three-eighths inch of space between the rear cardboard shell of the yoke and the flat of the front face of the focus magnet. This spacing gives best average focus over the face of the tube.

The axis of the hole through the magnet should be parallel with the axis of the kinescope neck with the kinescope neck through the center of the opening.

PIN-CUSHION CORRECTION.—Two pin-cushion correction magnets are employed to correct a small amount of pin-cushion of the raster due to the lens effect of the face of the kinescope. These magnets are mounted on small arms, one on each side of the kinescope as shown in Figure 2. The arms hinge in one plane on self tapping screws which act both as a hinge and an adjustment locking screw. When the magnets are swung towards the tube, maximum correction is obtained. Minimum correction is obtained when the arms are swung away from the tube. To adjust the magnets, loosen the two self tapping screws and position the magnets until the sides of the raster appear straight. Tighten the screws without shifting the position of the magnets. In some cases it may be necessary to twist or bend the magnet support arms to obtain the appearance of straight raster edges.

CENTERING ADJUSTMENT.—No electrical centering controls are provided. Centering is accomplished by means of a separate plate on the focus magnet. The centering plates include a locking screw which must be loosened before centering. Up and down adjustment of the plate moves the picture side to side and sidewise adjustment moves the picture up and down.

If a corner of the raster is shadowed, check the position of the ion trap magnet. Reposition the magnet within the range of maximum raster brightness to eliminate the shadow and recenter the picture by adjustment of the focus magnet plate. In no case should the magnet be adjusted to cause any loss of brightness since such operation may cause immediate or eventual damage to the tube. In some cases it may be necessary to shift the position of the focus magnet in order to eliminate a corner shadow.

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS.—Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage hence the brightest and best focused picture, adjust horizontal drive trimmer C161B counter-clockwise until the picture begins to "wrinkle" in the middle then clockwise until the "wrinkle" disappears.

Turn the horizontal linearity control L108 clockwise until the picture begins to "wrinkle" on the right and then counter-clockwise until the "wrinkle" disappears and best linearity is obtained.

Adjust the width control L106 to obtain correct picture width.

A slight readjustment of thes three controls may be necessary to obtain the best linearity

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R173 on chassis rear apron) until the picture fills the mask vertically. Adjust vertical linearity (R181 on rear apron), until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust centering to align the picture with the mask.

FOCUS.—Adjust the focus magnet for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

Recheck the position of the ion trap magnet to make sure that maximum brightness is obtained.

Check to see that the yoke thumbscrew and the focus magnet mounting screws are tight.

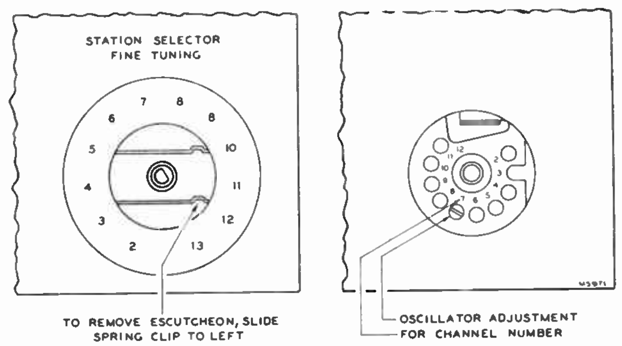

Figure 4—R-F Oscillator Adjustments

CHECK OF R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 21. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 4. Adjustment for channel 13 is on top of the chassis.

AGC THRESHOLD CONTROL.—The AGC threshold control R149 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal and sync the picture. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R149. If the picture requires an appreciable portion of a second to reappear, or bends excessively, R149 should be readjusted.

INSTALLATION INSTRUCTIONS

Turn R149 fully counter-clockwise. The raster may be bent slightly. This should be disregarded. Turn R149 clockwise until there is a very, very slight bend or change of bend in the picture. Then turn R149 counter-clockwise just sufficiently to remove this bend or change of bend.

If the signal is weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R149 clockwise until the snow in the picture becomes more pronounced, then counter-clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far clockwise on a weak signal, then the receiver may overload when a strong signal is received.

FM TRAP ADJUSTMENT.—In some instances interference may be encountered from a strong FM station signal. A trap is provided to eliminate this type of interference. To adjust the trap tune in the station on which the interference is observed and adjust the L203 core on top of the antenna matching transformer for minimum interference in the picture.

CAUTION.—In some receivers, the FM trap L203 will tune down into channel 6 or even into channel 5. Needless to say, such an adjustment will cause greatly reduced sensitivity on these channels. If channels 5 or 6 are to be received, check L203 to make sure that it does not affect sensitivity on these two channels.

Replace the cabinet back and connect the receiver antenna leads to the cabinet back. Make sure that the screws holding it are up tight, otherwise it may rattle or buzz when the receiver is operated at high volume.

KINESCOPE SCREEN CLEANING.—The kinescope safety glass is held in place by four spring clips which may be removed from the back of the front panel. This permits removing the safety glass for cleaning without the necessity of removing the chassis and kinescope.

CHASSIS REMOVAL.—To remove the chassis from the cabinet for repair or installation of a new kinescope, remove the control knobs, the cabinet back, unplug the speaker cable, the kinescope socket, the antenna cable, the yoke and high voltage cable. Take out the chassis bolts under the cabinet. Withdraw the chassis from the back of the cabinet.

KINESCOPE HANDLING PRECAUTION.—Do not install, remove, or handle the kinescope in any manner, unless shatterproof goggles and heavy gloves are worn. People not so equipped should be kept away while handling the kinescope. Keep the kinescope away from the body while handling.

REMOVAL OF KINESCOPE.—To remove the kinescope from the cabinet, loosen the two nuts and disengage the rods alongside the kinescope. Remove the screw which holds the yoke frame to the cabinet. Remove the kinescope, the yoke frame with yoke and focus magnet as an assembly.

Handle this tube by the portion at the edge of the screen. Do not cover the glass bell of the tube with fingermarks as it will produce leakage paths which may interfere with reception. If this portion of the tube has inadvertently been handled, wipe it clean with a soft cloth moistened with "dry" carbon tetrachloride.

INSTALLATION OF KINESCOPE.—Wipe the kinescope screen surface and front panel safety glass clean of all dust and fingermarks with a soft cloth moistened with "Windex" or similar cleaning agent.

Replace the kinescope and chassis by reversal of the removing process. The kinescope should be installed so that the high voltage contact is to the right when looking at it from the rear of the cabinet. The magnet of the ion trap magnet should be to the left.

CABINET ANTENNA.—A cabinet antenna is provided in Models 17T211 and 17T220 and the leads are brought out near the antenna terminal board. The cabinet antenna may be employed in place of the outdoor antenna in areas where the signals are strong and no reflections are experienced.

ANTENNAS.—The finest television receiver built may be said to be only as good as the antenna design and installation. It is therefore important to select the proper antenna to suit the particular local conditions, to install it properly and orient it correctly.

If two or more stations are available and the two stations are in different directions, it may be possible to make a compromise orientation which will provide a satisfactory signal on all such channels.

If it is impossible to obtain satisfactory results on one or more channels, it may become necessary either to provide means for turning the antenna when switching channels or to install a separate antenna for one or more channels and to switch antennas when switching channels.

In some cases, the antenna should not be installed permanently until the quality of the picture reception has been observed on a television receiver. A temporary transmission line can be run between receiver and the antenna, allowing sufficient slack to permit moving the antenna. Then, with a telephone system connecting an observer at the receiver and an assistant at the antenna, the antenna can be positioned to give the most satisfactory results on the received signal. A shift of direction or a few feet in antenna position may effect a tremendous difference in picture reception.

REFLECTIONS.—Multiple images sometimes known as echoes or ghosts, are caused by the signal arriving at the antenna by two or more routes. The second or subsequent image occurs when a signal arrives at the antenna after being reflected off a building, a hill or other object. In severe cases of reflections, even the sound may be distorted. In less severe cases, reflections may occur that are not noticeable as reflections but that will instead cause a loss of definition in the picture.

Under certain extremely unusual conditions, it may be possible to rotate or position the antenna so that it receives the cleanest picture over a reflected path. If such is the case, the antenna should be so positioned. However, such a position may give variable results as the nature of reflecting surfaces may vary with weather conditions. Wet surfaces have been known to have different reflecting characteristics than dry surfaces.

Depending upon the circumstances, it may be possible to eliminate the reflections by rotating the antenna or by moving it to a new location. In extreme cases, it may be impossible to eliminate the reflection.

INTERFERENCE.—Auto ignition, street cars, electrical machinery and diathermy apparatus may cause interference which spoils the picture. Whenever possible, the antenna location should be removed as far as possible from highways, hospitals, doctors' offices and similar sources of interference. In mounting the antenna, care must be taken to keep the antenna rods at least 1/4 wave length (at least 6 feet) away from other antennas, metal roofs, gutters or other metal objects.

Short-wave radio transmitting and receiving equipment may cause interference in the picture in the form of moving ripples. In some instances it may be possible to eliminate the interference by the use of a trap in the antenna transmission line. However, if the interfering signal is on the same frequency as the television station, a trap will provide no improvement.

WEAK PICTURE.—When the installation is near the limit of the area served by the transmitting station, the picture may be speckled, having a "snow" effect, and may not hold steady on the screen. This condition is due to lack of signal strength from the transmitter.

RECEIVER LOCATION.—The owner should be advised of the importance of placing the receiver in the proper location in the room.

The location should be chosen—

—Away from bright windows and so that no bright light will fall directly on the screen. (Some illumination in the room is desirable, however.)

—To give easy access for operation and comfortable viewing.

—To permit convenient connection to the antenna.

—Convenient to an electrical outlet.

—To allow adequate ventilation.

CHASSIS TOP VIEW

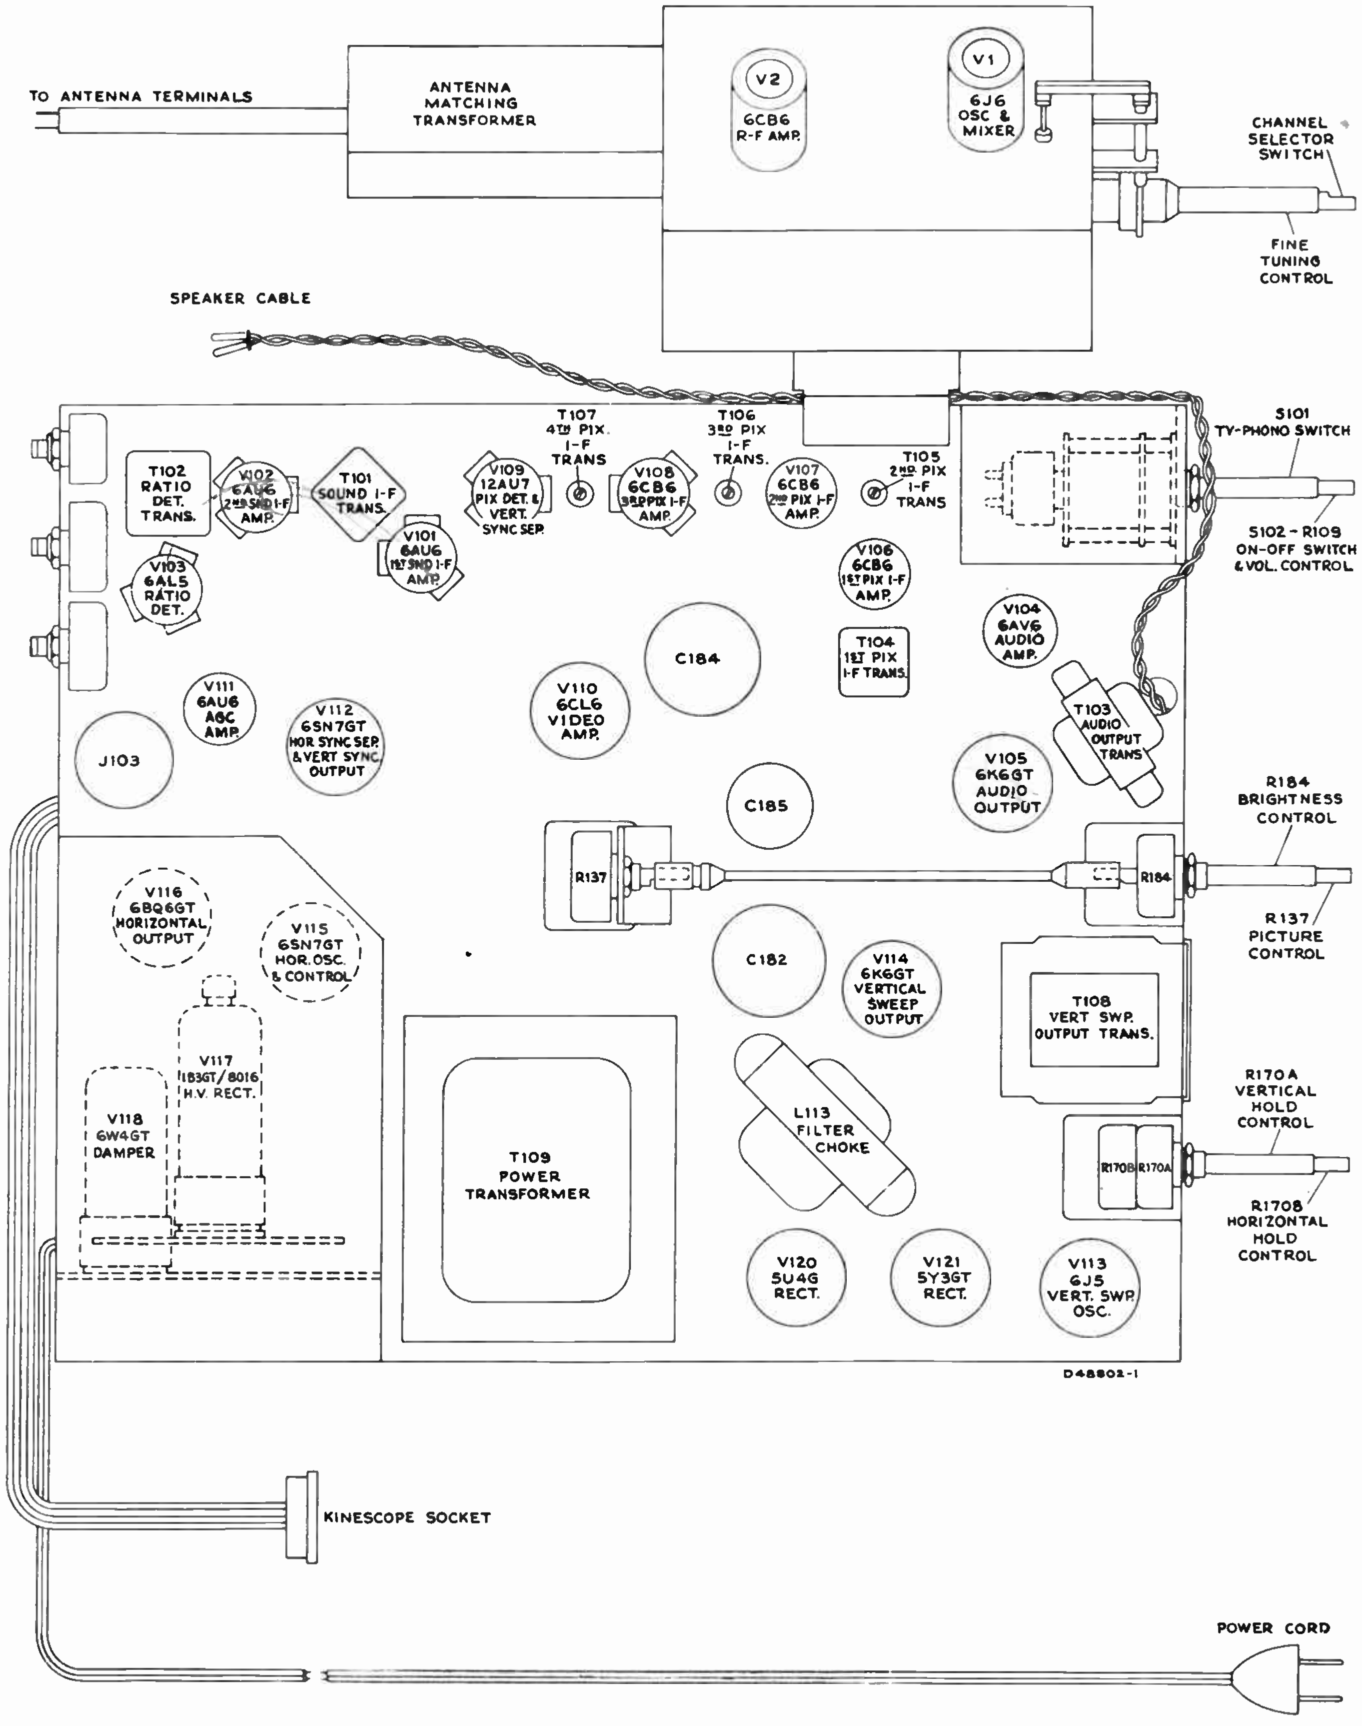

Figure 5—Chassis Top View

CHASSIS BOTTOM VIEW

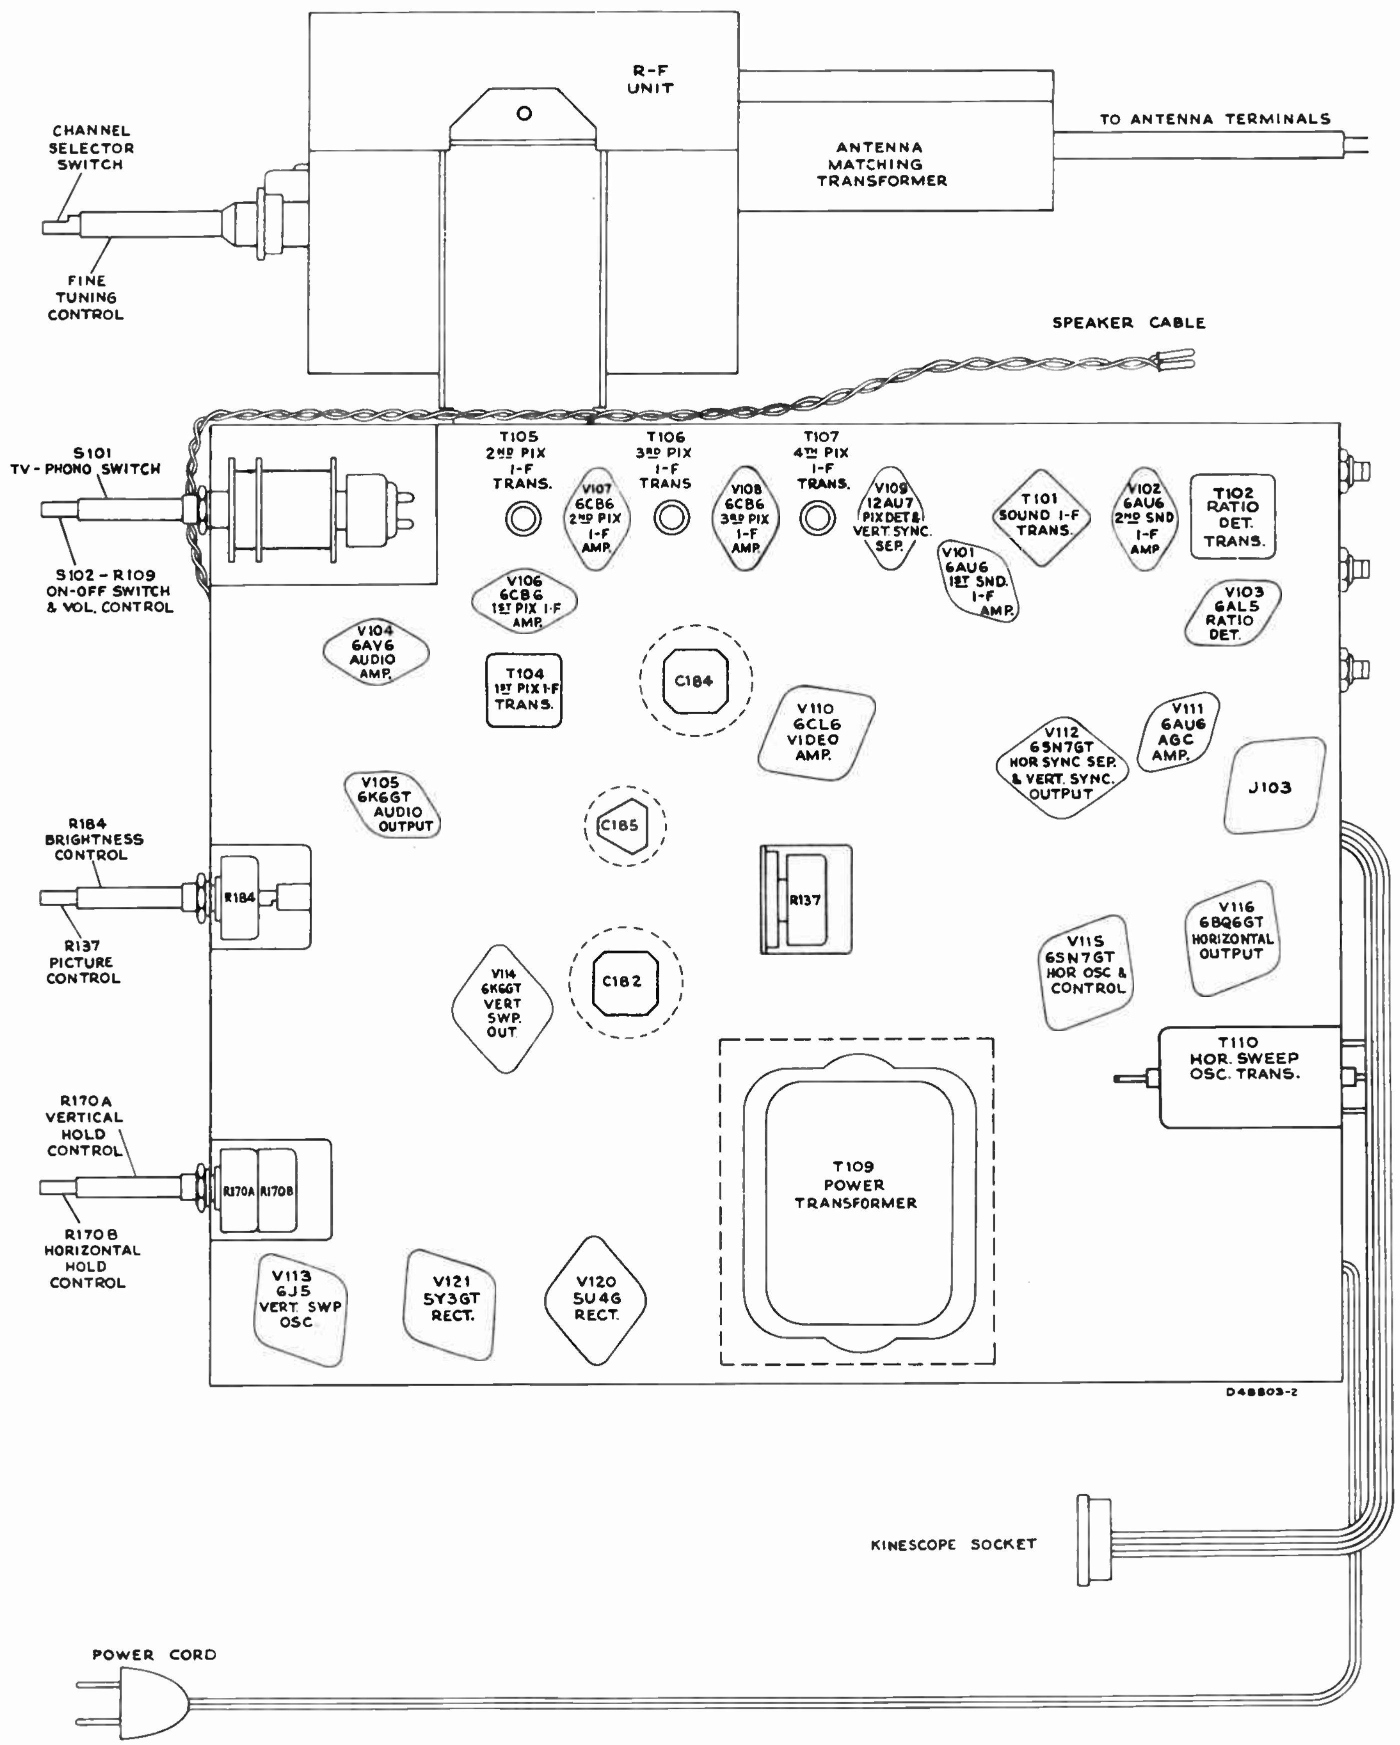

Figure 6—Chassis Bottom View

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of this receiver, it is recommended that the following test equipment be available:

R-F Sweep Generator meeting the following requirements:

(a) Frequency Ranges
 20 to 30 mc., 1 mc. and 10 mc. sweep width
 50 to 90 mc., 10 mc. sweep width
 170 to 225 mc., 10 mc. sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) "Flat" output on all attenuator positions.

Cathode-Ray Oscilloscope.—For alignment purposes, the oscilloscope employed must have excellent low frequency and phase response, and should be capable of passing a 60-cycle square wave without appreciable distortion.

For video and sync waveform observations, the oscilloscope must have excellent frequency and phase response from 10 cycles to at least two megacycles in all positions of the gain control.

Signal Generator to provide the following frequencies with crystal accuracy.

(a) Intermediate frequencies
 22.25 and 25.5 mc. conv. and first pix i-f trans.
 22.75 mc. second picture i-f transformer
 24.25 mc. fourth picture i-f transformer
 25.5 mc. third picture i-f transformer
 25.50 mc. picture carrier
 27.00 mc. adjacent channel sound trap
(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

Heterodyne Frequency Meter with crystal calibrator which covers the frequency range from 80 mc. to 109 mc. and from 200 mc. to 237 mc.

Electronic Voltmeter of Junior or Senior "VoltOhmyst" type and a high voltage multiplier probe for use with this meter to permit measurements up to 15 kv.

Service Precautions.—If possible, the chassis should be serviced without the kinescope. However, if it is necessary to view the raster during servicing, it would be a great convenience to have a bench mounted kinescope and speaker complete with a set of extension cables.

CAUTION: Do not short the kinescope second anode lead. Its short circuit current presents a considerable overload on the high voltage rectifier V117.

Adjustments Required.—Normally, only the r-f oscillator and mixer lines will require the attention of the service technician. All other circuits are either broad or very stable and hence will seldom require readjustment.

ORDER OF ALIGNMENT.—When a complete receiver alignment is necessary, it can be most conveniently performed in the following order:

(1) R-F unit
(2) Picture i-f transformers
(3) Picture i-f trap
(4) Sweep of picture i-f
(5) Ratio detector alignment
(6) Sound i-f alignment
(7) 4.5 Mc Trap Adjustment
(8) Check of overall response
(9) AGC control adjustment
(10) Horizontal oscillator alignment

R-F UNIT ALIGNMENT.—Disconnect the co-ax link from terminal 2 of the r-f unit terminal board and connect a 39 ohm composition resistor between lugs 1 and 2.

Detune T1 by backing the core all the way out of the coil.

Back the L44 core all the way out. Back the L203 core all the way out.

In order to align the r-f tuner, it will first be necessary to set the channel-13 oscillator to frequency. The shield over the bottom of the r-f unit must be in place when making any adjustments.

The oscillator may be aligned by adjusting it to beat with a crystal-calibrated heterodyne frequency meter. Couple the meter probe loosely to the receiver oscillator.

Set the channel selector switch to 13.

Adjust the heterodyne frequency meter to the correct frequency (236.75 mc).

Set the fine tuning control 30 degrees clockwise from the mechanical center of its range.

Adjust C1 for an audible beat on the heterodyne frequency meter.

Now that the channel-13 oscillator is set to frequency, we may proceed with the r-f alignment.

Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to terminal 3 of the r-f unit. Adjust the bias box potentiometer to produce −3.5 volts of bias at the r-f unit terminal board.

Connect the oscilloscope to the test point TP1 on top of the r-f unit.

Connect the r-f sweep oscillator to the receiver antenna terminals. The method of connection depends upon the output impedance of the sweep. The P300 connections for 300-ohm balanced or 72-ohm single-ended input are shown in the circuit schematic diagram. If the sweep oscillator has a 50-ohm or 72-ohm single-ended output, 300-ohm balanced output can be obtained by connecting as shown in Figure 9.

Connect the signal generator loosely to the receiver antenna terminals.

Set the receiver channel switch to channel 8.

Set the sweep oscillator to cover channel 8.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C9, C11, C16 and C22 for approximately correct curve shape, frequency, and band width as shown in Figure 11.

The correct adjustment of C22 is indicated by maximum amplitude of the curve midway between the markers. C16 tunes the r-f amplifier plate circuit and affects the frequency of the curve most noticeably. C9 tunes the converter grid circuit and affects the tilt of the curve most noticeably (assuming that C22 has been properly adjusted). C11 is the coupling adjustment and hence primarily affects the response band width.

Set the receiver channel switch to channel 6.

Adjust the heterodyne frequency meter to the correct frequency (108.75 mc.).

Set the fine tuning control 30 degrees clockwise from the mechanical center of its range.

Adjust L5 for an audible beat on the heterodyne frequency meter.

ALIGNMENT PROCEDURE

Set the sweep generator to channel 6.

From the signal generator, insert channel 6 sound and picture carrier markers, 83.25 mc. and 87.75 mc.

Adjust L42, L45 and L49 for proper response as shown in Figure 12.

L42 is adjusted to give maximum amplitude of the curve between the markers. L45 primarily affects the tilt of the curve. L49 primarily affects the frequency of response.

Connect the "VoltOhmyst" to the r-f unit test point TP1.

Adjust C7 for −3.0 volts at the test point.

Retouch L42, L45 and L49 for proper response if necessary. If necessary, retouch C11 for proper band width on channel 6. Continue these retouching adjustments until proper response is obtained and −3.0 volts of oscillator injection are present at the test point, TP1.

Set the receiver channel selector switch to channel 8 and readjust C1 for proper oscillator frequency.

Set the sweep oscillator and signal generator to channel 8.

Readjust C9, C16 and C22 for correct curve shape, frequency and band width. Readjust C11 only if necessary.

Switch the receiver, the sweep oscillator and signal generator to channel 13.

Adjust L52 for maximum amplitude of the curve midway between markers and then overshoot the adjustment by turning the slug in the same direction from the initial setting a little more than the amount of turning required to reach maximum amplitude of response.

Adjust C22 for maximum amplitude of response.

Turn off the sweep generator. Adjust the L43 core for correct channel 13 oscillator frequency, then overshoot the adjustment by turning the slug a little more in the same direction from the initial setting. Reset the oscillator to proper frequency by adjustment of C1.

Turn the sweep oscillator back on.

Check the response of channels 7 through 13 by switching the receiver channel switch, sweep oscillator and marker oscillator to each of these channels and observing the response and oscillator injection obtained. See Figure 11 for typical response curves. It should be found that all these channels have the proper shaped response with the markers above 80%, response.

If the markers do not fall within this requirement, switch to channel 8 and readjust C9, C11, C16 and C22 as necessary. If C22 required adjustment, the adjustment should be overshot a small amount and corrected by adjustment of L52 to give maximum amplitude of response between the sound and picture carrier markers. The antenna circuit (L52, C22) is broad so that tracking is not particularly critical.

If the valley in the top of the selectivity curves for the high channels is deeper than normal, the curve can be flattened somewhat by decreasing the inductance of L44 by turning the core stud in. Be sure to check for undesirable resonant suckouts on channels 7 and 8 if this is done.

Turn the sweep oscillator off and check the receiver channel 8 r-f oscillator frequency. If the oscillator is off frequency overshoot the adjustment of C1 and correct by adjusting L43.

Turn the receiver channel selector switch to channel 6. Adjust L5 for correct oscillator frequency.

Turn the sweep oscillator on and to channel 6 and observe the response curve. If necessary readjust L42, L45 and L49. It should not be necessary to touch C11.

Check the oscillator injection voltage at the test point TP1. If necessary adjust C7 to give −3 volts injection. If C7 is adjusted, switch to channel 8, and readjust C9 for proper curve shape, then recheck channel 6.

Switch the receiver through channel 6 down through channel 2 and check for normal response curve shapes and oscillator injection voltage.

Likewise check channels 7 through 13, stopping on 13 for the next step.

With the receiver on channel 13, check the receiver oscillator frequency. Correct by adjustment of C1 if necessary.

Adjust the oscillator to frequency on all channels by switching the receiver and the heterodyne frequency meter to each channel and adjusting the appropriate oscillator trimmer to obtain a beat on the freq. meter. It should be possible to adjust the oscillator to the correct frequency on all channels with the fine tuning control 30 degrees clockwise from the mechanical center of its range.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.	Channel Oscillator Adjustment
2	55.25	59.75	80.750	L1
3	61.25	65.75	86.750	L2
4	67.25	71.75	92.750	L3
5	77.25	81.75	102.750	L4
6	83.25	87.75	108.750	L5
7	175.25	179.75	200.750	L6
8	181.25	185.75	206.750	L7
9	187.25	191.75	212.750	L8
10	193.25	197.75	218.750	L9
11	199.25	203.75	224.750	L10
12	205.25	209.75	230.750	L11
13	211.25	215.75	236.750	C1

Switch to channel 8 and observe the response.

Adjust T1 clockwise while watching the change in response. When T1 is properly adjusted, the selectivity curve will be slightly wider with a slightly deeper valley in its top.

Switch through all channels and observe response, oscillator injection and r-f oscillator frequency. Minor touch-ups of adjustments may be made at this time. However, if C7 or C9 are changed appreciably, then a recheck of the oscillator frequency on all channels should be made.

Reconnect the link from T101 to terminal 2 of the r-f unit terminal board.

Since T1 was adjusted during the r-f unit alignment it will be necessary to sweep the overall i-f response.

R-F UNIT TUBE CHANGES.—Since most of the circuits are low capacitance circuits the r-f unit may require readjustments when the tubes are changed.

If the 6CB6 r-f amplifier tube is changed, it may be necessary to readjust C16 and C22.

If the 6J6 oscillator and mixer tube is changed, then more extensive adjustments are required.

For good conversion efficiency, the oscillator injection to a triode mixer must be held reasonably close to the optimum value. Although there is some latitude in this level, it is nearly expended in the normal variation in injection from channel to channel. Consequently, the adjustment of C7 is limited primarily to establishing the conditions for good conversion. Since changes in oscillator injection affect conversion gain, it also affects the input capacity of the mixer, thus also affecting tracking of the mixer grid circuit. These tube variations with their consequent effect on circuit alignment thereby require readjustment of the r-f unit if maximum conversion efficiency is to be retained after the 6J6 tube is changed. It may be possible, however, to try several 6J6 tubes and select one which gives satisfactory performance without realignment.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—Connect the "VoltOhmyst" to the junction of R142 and R143.

Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction R142 and R143. Adjust the potentiometer for −5.0 volts indication on the "VoltOhmyst".

Set the channel switch to channel number 9, 10 or 11.

Connect the "VoltOhmyst" to pin 2 of V110 (Pin 4 if 6AC7 or 6AG7 is used) and to ground.

Connect the output of the signal generator to the mixer grid test point TP2 in series with a 1500 mmf ceramic capacitor.

Connect a separate −5 volt bias supply to TP1 with the positive terminal to ground.

Set the generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for maximum indication on the "VoltOhmyst". In each instance the generator should be checked against a crystal calibrator to insure that the generator is on frequency.

ALIGNMENT PROCEDURE

Adjust the signal generator output to give 3 volts on the "VoltOhmyst" as the final adjustment is made.

(1) 24.25 mc.—T107
(2) 25.5 mc.—T106
(3) 22.75 mc.—T105

PICTURE I-F TRAP ADJUSTMENT.—With the same connections as above, tune the generator to 27.00 mc. and adjust the T104 top core for minimum d-c on the "VoltOhmyst". Set the generator output so that this minimum is about 3 volts when final adjustment is made. If necessary, the i-f bias may be reduced in order to obtain the 3 volt reading on the "VoltOhmyst".

SWEEP ALIGNMENT OF PIX I-F.—To align T1 and T104, connect the sweep generator to the mixer grid test point TP2. In series with a 1500 mmf ceramic capacitor use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the r-f unit outer shield.

Connect a separate −5.0 volt bias supply to TP1 with the positive terminal connected to ground and by-pass TP1 to ground with a 1500 mmf. ceramic capacitor.

Set the channel selector switch between channels 2 and 13.

Clip 330 ohm resistors across terminals A and B of T106 and T107.

Preset C115 to minimum capacity.

Adjust the bias box potentiometer to obtain −5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R142 and R143. Leave the AGC control fully clockwise.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T105. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T1 (top) and T104 (bottom) for maximum gain and with 25.5 mc. at 70% of maximum response.

Set the sweep output to give 0.3 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C115 until 22.25 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 12.

Disconnect the diode probe, the 180 ohm and two 330 ohm resistors.

Connect the oscilloscope to pin 2 of V110 socket (or pin 4 of 6AC7 or 6AG7).

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T105, T106 and T107 to obtain the response shown in Figure 13.

It is especially important that the 22.4 mc. marker should fall at 55% on the overall i-f response curve. If the marker should fall appreciably higher than 55%, trouble may be experienced with sound in the picture. If the marker should fall appreciably below 55% response, the sound sensitivity may be reduced and may cause the sound to be noisy in weak signal areas.

RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first sound i-f grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. In such a case, connect the calibrator to the grid of the third pix i-f amplifier, pin 1 of V108.

Set the frequency of the calibrator to 25.50 mc. (pix carrier) and modulate with 4.5 mc. crystal. The 4.5 mc. signal will be picked off at L102 and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst". Adjust the signal level from the signal generator for 6 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R106 and C108.

Tune the ratio detector secondary T102 bottom core for zero d-c on the "VoltOhmyst".

Repeat adjustments of T102 top for maximum d-c at pin 2 of V103 and T102 bottom for zero d-c at the junction of R106 and C108. Make the final adjustments with the signal input level adjusted to produce 6 volts d-c on the "VoltOhmyst" at pin 2 of V103.

SOUND I-F ALIGNMENT.—Connect the signal generator to the first sound i-f amplifier grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed as above.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the T101 top core for maximum d-c on the "VoltOhmyst".

The output from the signal generator should be set to produce approximately 6.0 volts on the "VoltOhmyst" when the final touches on the above adjustment are made.

4.5 MC. TRAP ADJUSTMENT.—Connect the signal generator in series with a 1,000 ohm resistor to pin 2 of V109. Set the generator to 4.5 mc. and modulate it 30%, with 400 cycles. Set the output to approximately 0.5 volts.

Short the third pix i-f grid to ground, pin 1, V108, to prevent noise from masking the output indication.

Connect the crystal diode probe of an oscilloscope to the plate of the video amplifier, pin 6 of V110 (pin 8 when 6AC7 or 6AG7 is used).

Adjust the core of L103 for minimum output on the oscilloscope.

Remove the short from pin 1, V108 to ground.

As an alternate method, this step may be omitted at this point in the alignment procedure and the adjustment made "on the air" after the alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L103 requires no adjustment. If a 4.5 mc. beat is present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L103 for minimum beat.

CHECK OF OVERALL RESPONSE.—If desired, the overall response of the receiver can be checked on each channel.

Connect the r-f sweep generator to the receiver antenna input terminals. If necessary, employ one of the pads shown in Figure 9 to match the sweep output cable to the r-f unit.

Connect the signal generator loosely to the first pix i-f amplifier grid.

Adjust the bias potentiometer to obtain −5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R142 and R143.

Connect the oscilloscope to pin 2 of V110 (or pin 4 if 6AC7 or 6AG7 is used).

Check the response of channels 2 through 13 by switching the receiver channel switch and sweep oscillator to each of these channels and observing the response obtained. On each channel, adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

I-F markers at 22.4 mc., 24.75 mc. and 25.5 mc. should be provided by the signal generator.

The response obtained in this manner should be very similar to that shown in Figure 13.

Some curves may show a 10% sag in the top between 22.75 mc. and 24.75 mc. while others may show a 10% peak in this region. This may be considered normal.

If the picture carrier is consistently high or low on all channels, T106 may be adjusted slightly. Do not adjust T105.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 6 of V110 (pin 8 when 6AC7 or 6AG7 is used).

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

ALIGNMENT PROCEDURE

HORIZONTAL OSCILLATOR ADJUSTMENT.—Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R170B, then adjust the T110 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T110 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T110 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C161B, the width control L106 and the linearity control L108 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T110 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T110 frequency core (on the rear apron) until the picture falls out of sync and three or four diagonal black bars sloping down to the right appear on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain three or four diagonal black bars on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T110 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture falls out of sync with the diagonal bars sloping down to the right. Continue to turn the frequency core in the same direction. No more than three or four bars should appear on the screen. Instead, the horizontal oscillator should begin the motorboat. Retouch the adjustment of the T110 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T110. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 14. Adjust the waveform adjustment core of T110 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T110 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C161A slightly clockwise. If less than 2 bars are present, adjust C161A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T110 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves to the left side of the screen leaving the picture in synchronization.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to construct the pad.

RESPONSE CURVES.—The response curves shown on page 23 and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, some variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

NOTE ON R-F UNIT ALIGNMENT.—Because of the frequency spectrum involved and the nature of the device, many of the r-f unit leads and components are critical in some respects. Even the power supply leads form loops which couple to the tuned circuits, and if resonant at any of the frequencies involved in the performance of the tuner, may cause serious departures from the desired characteristics. In the design of the receiver these undesirable resonant loops have been shifted far enough away in frequency to allow reasonable latitude in their components and physical arrangement without being troublesome. When the r-f unit is aligned in the receiver, no trouble from resonant loops should be experienced. However, if the unit is aligned in a jig separate from the receiver, attention should be paid to insure that unwanted resonances do not exist which might present a faulty representation of r-f unit alignment.

A resonant circuit exists between the r-f tuner chassis and the outer shield box, which couples into the antenna and r-f plate circuits. The frequency of this resonance depends on the physical structure of the shield box, and the capacitance between the tuner chassis and the front plate. In the KRK8 units, this resonance should fall between 120 and 135 mc. and is controlled in the design by using insulating washers of different thicknesses (in the front plate to tuner chassis mounting) to compensate for differences in the shield boxes of different models of receivers. The performance of the tuner, particularly on channels 7 and 8 will be impaired if the proper washers for the particular shield box involved are not used. Obviously then, if the r-f unit is removed for service, the washers should be replaced in the correct order when the unit is replaced.

ALIGNMENT TABLE

THE DETAILED ALIGNMENT PROCEDURE BEGINNING ON PAGE 20 SHOULD BE READ BEFORE ALIGNMENT BY USE OF THE TABLE IS ATTEMPTED

STEP. No.	CONNECT SIGNAL GENERATOR TO	SIGNAL GEN. FREQ. MC.	CONNECT SWEEP GENERATOR TO	SWEEP GEN. FREQ. MC.	CONNECT HETERODYNE FREQ. METER TO	HET. METER FREQ. MC.	CONNECT "VOLTOHMYST" TO	MISCELLANEOUS CONNECTIONS AND INSTRUCTIONS	ADJUST	REFER TO
	R-F UNIT ALIGNMENT									
1	Disconnect the co-ax link from terminal 2 of the r-f unit terminal board and connect a 39 ohm composition resistor between lugs 1 and 2. Detune T1 by backing the core all the way out of the coil. Back the L44 core all the way out. Back the L203 core all the way out. In order to align the r-f tuner, it will first be necessary to set the channel 13 oscillator to frequency. The shield over the bottom of the r-f unit must be in place when making any adjustments.									
2	Not used		Not used		Loosely coupled to r-f oscillator	236.75 MC.	Not used	Fine tuning 30 degrees clockwise from mechanical center of its range. Receiver on channel 13.	C1 for an audible beat on het. freq. meter	Fig. 7
3	"		"				Connect "Volt-Ohmyst" to terminal 3 of the r-f unit terminal board	Turn AGC control fully clockwise. Connect bias box to terminal 3 of r-f unit term. board	Adjust the bias box potentiometer for —3.5 volts.	
4	Antenna terminal (loosely)	181.25 185.75	Antenna terminals (see text for precaution)	Sweeping channel 8	Not used	—	Not used	Rec. on chan. 8. Connect oscilloscope to TP1. SERVICE SUGGESTIONS

Following is a list of symptoms of possible failures and an indication of some of the possible faults:

NO RASTER ON KINESCOPE:

(1) Incorrect adjustment of ion trap magnet. Magnet reversed either front to back or top to bottom.
(2) V115 or V116 inoperative. Check waveforms on grids and plates.
(3) No high voltage—if horizontal deflection is operating as evidenced by the correct waveform on terminal 1 of high voltage transformer, the trouble can be isolated to the 1B3GT circuit. Either the T111 high voltage winding is open, the 1B3GT tube is defective or its filament circuit is open.
(4) V110 circuit, inoperative—Refer to schematic and waveform chart.
(5) Damper tube (V118) inoperative.
(6) Defective kinescope.
(7) R184 open.
(8) No receiver plate voltage—filter capacitor shorted—or filter choke open.

NO VERTICAL DEFLECTION:

(1) V113 or V114 inoperative. Check voltage and waveforms on grids and plates.
(2) T108 open.
(3) Vertical deflection coils open

SMALL RASTER:

(1) Low Plus B or low line voltage.
(2) V116, V120 or V121 defective.

POOR VERTICAL LINEARITY:

(1) If adjustments cannot correct, change V114.
(2) Vertical output transformer T108 defective.
(3) V113 defective—check voltage and waveforms on grid and plate.
(4) C151, C152, C153, C155, or C156 defective.
(5) Low plate voltage—check rectifiers and capacitors in supply circuits.
(6) If height is insufficient, try changing V113.

POOR HORIZONTAL LINEARITY:

(1) If adjustments do not correct, change V116, or V118.
(2) T108 or L108 defective.
(3) C176 or C177 defective.

WRINKLES ON SIDE OF RASTER:

(1) C181 defective.
(2) Defective yoke.

PICTURE OUT OF SYNC HORIZONTALLY:

(1) T110 incorrectly tuned.
(2) R192, R193 or R170B defective.

TRAPEZOIDAL OR NON SYMMETRICAL RASTER:

(1) Improper adjustment of centering of focus magnet or ion trap magnet.
(2) Defective yoke.

RASTER AND SIGNAL ON KINESCOPE BUT NO SOUND:

(1) L102 defective.
(2) Sound i-f, ratio detector or audio amplifier inoperative—check V101, V102, V103 and their socket voltages.
(3) Audio system defective.
(4) Speaker defective.

SIGNAL AT KINESCOPE GRID BUT NO SYNC:

(1) AGC control R149 misadjusted.
(2) V111, inoperative. Check voltage and waveforms at its grid and plate.

SIGNAL ON KINESCOPE GRID BUT NO VERTICAL SYNC:

(1) Check V113 and associated circuit.
(2) Integrating network inoperative—Check.
(3) V109B or V112B defective or associated circuit defective.
(4) Gas current, grid emission or grid cathode leakage in V112. Replace.

SIGNAL ON KINESCOPE GRID BUT NO HORIZONTAL SYNC:

(1) T110 misadjusted—readjust as instructed on page 11.
(2) V112 inoperative—check socket voltages and waveforms.
(3) T110 defective.
(4) C142, C161A, C163, C165, C166, C167, C168, C169 or C170 defective.
(5) If horizontal speed is completely off and cannot be adjusted check R192, R193, R170B, R195, R196 and R198.

SOUND AND RASTER BUT NO PICTURE OR SYNC:

(1) Picture, detector or video amplifier defective—check V109A and V110—check socket voltages.
(2) Bad contact to kinescope cathode.

PICTURE STABLE BUT POOR RESOLUTION:

(1) V109A or V110 defective.
(2) Peaking coils defective—check resistance.
(3) Make sure that the focus control operates on both sides of proper focus.
(4) R-F and I-F circuits misaligned.

PICTURE SMEAR:

(1) R-F or I-F circuits misaligned.
(2) Open peaking coil.
(3) This trouble can originate at the transmitter—check on another station.

PICTURE JITTER:

(1) AGC control R149 misadjusted.
(2) If regular sections at the left picture are displaced change V116.
(3) Vertical instability may be due to loose connections or noise.
(4) Horizontal instability may be due to unstable transmitted sync.

RASTER BUT NO SOUND, PICTURE OR SYNC:

(1) Defective antenna or transmission line.
(2) R-F oscillator off frequency.
(3) R-F unit inoperative—check V1, V2.

DARK VERTICAL LINE ON LEFT OF PICTURE:

(1) Reduce horizontal drive and readjust width and horizontal linearity.
(2) Replace V116.

LIGHT VERTICAL LINE ON LEFT OF PICTURE:

(1) V118 defective.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 15000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

R-F UNIT WIRING DIAGRAM

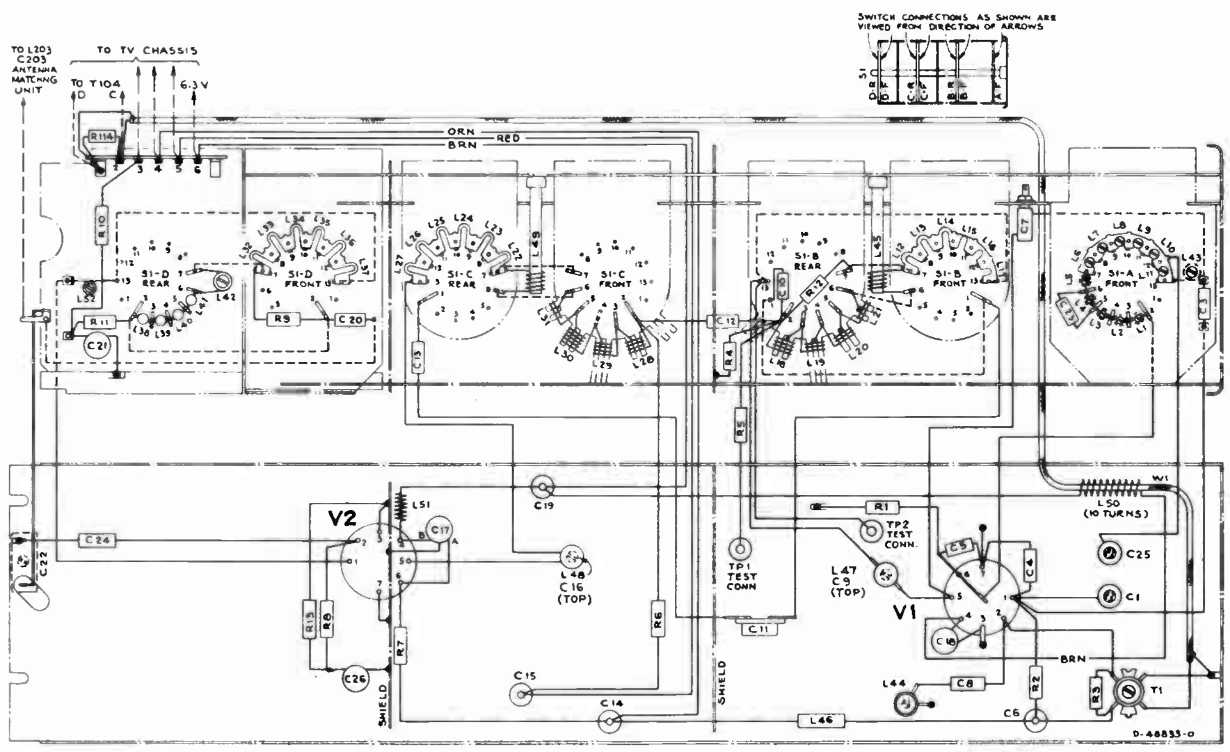

Figure 65—R-F Unit Wiring Diagram

CRITICAL LEAD DRESS:

1. Keep all wiring in the pix i-f, sound i-f and video circuits as short as possible.
2. Keep the leads on C118, C120, C122, C124, C126, R114, R121 and R123 as short and direct as possible.
3. Do not run any leads under C115 trimmer capacitor.
4. Dress C118 vertically parallel to terminals A and B of T104. Dress C135 parallel to terminals A and B of T104 close to the chassis.
5. Keep C127 away from chassis with no more than 1/4 inch leads at each end.
6. Dress the lead from T105(C) to the terminal board, close to the chassis.
7. Keep all filament leads dressed close to the chassis.
8. Ground filaments of V106, V107 and V108 independently of tube shields (pin 8). Use ground lances provided near pins of each socket.
9. Dress lead from pin 5 of V110 to J102-2 close to the chassis.
10. Keep leads to L103 as short as possible.
11. Dress C130, C132, L102, L104, L105, L114, R131, R133, R135 and R139 away from the chassis.
12. Do not tape kinescope cathode lead in with other kinescope leads.
13. Do not change the bus wire connections to pin 2 of V101 and V102. Sleeving is used to insure length and to prevent shorting.
14. Keep leads on C136 short and direct. Dress the lead from C136 to pin 5 of V111 as shown in wiring diagram.
15. Do not dress C170 in such a position that adjustment of T110 is inaccessible.
16. Keep the leads on R201 as short and direct as possible.
17. Dress the lead from pin 3 of V113 to C153 as shown in the wiring diagram.
18. Mount C183 directly on the terminal board provided keeping it as far away from T109 as possible.
19. Dress all leads in the high voltage compartment away from each other and away from the high voltage transformer.

CHASSIS WIRING DIAGRAM

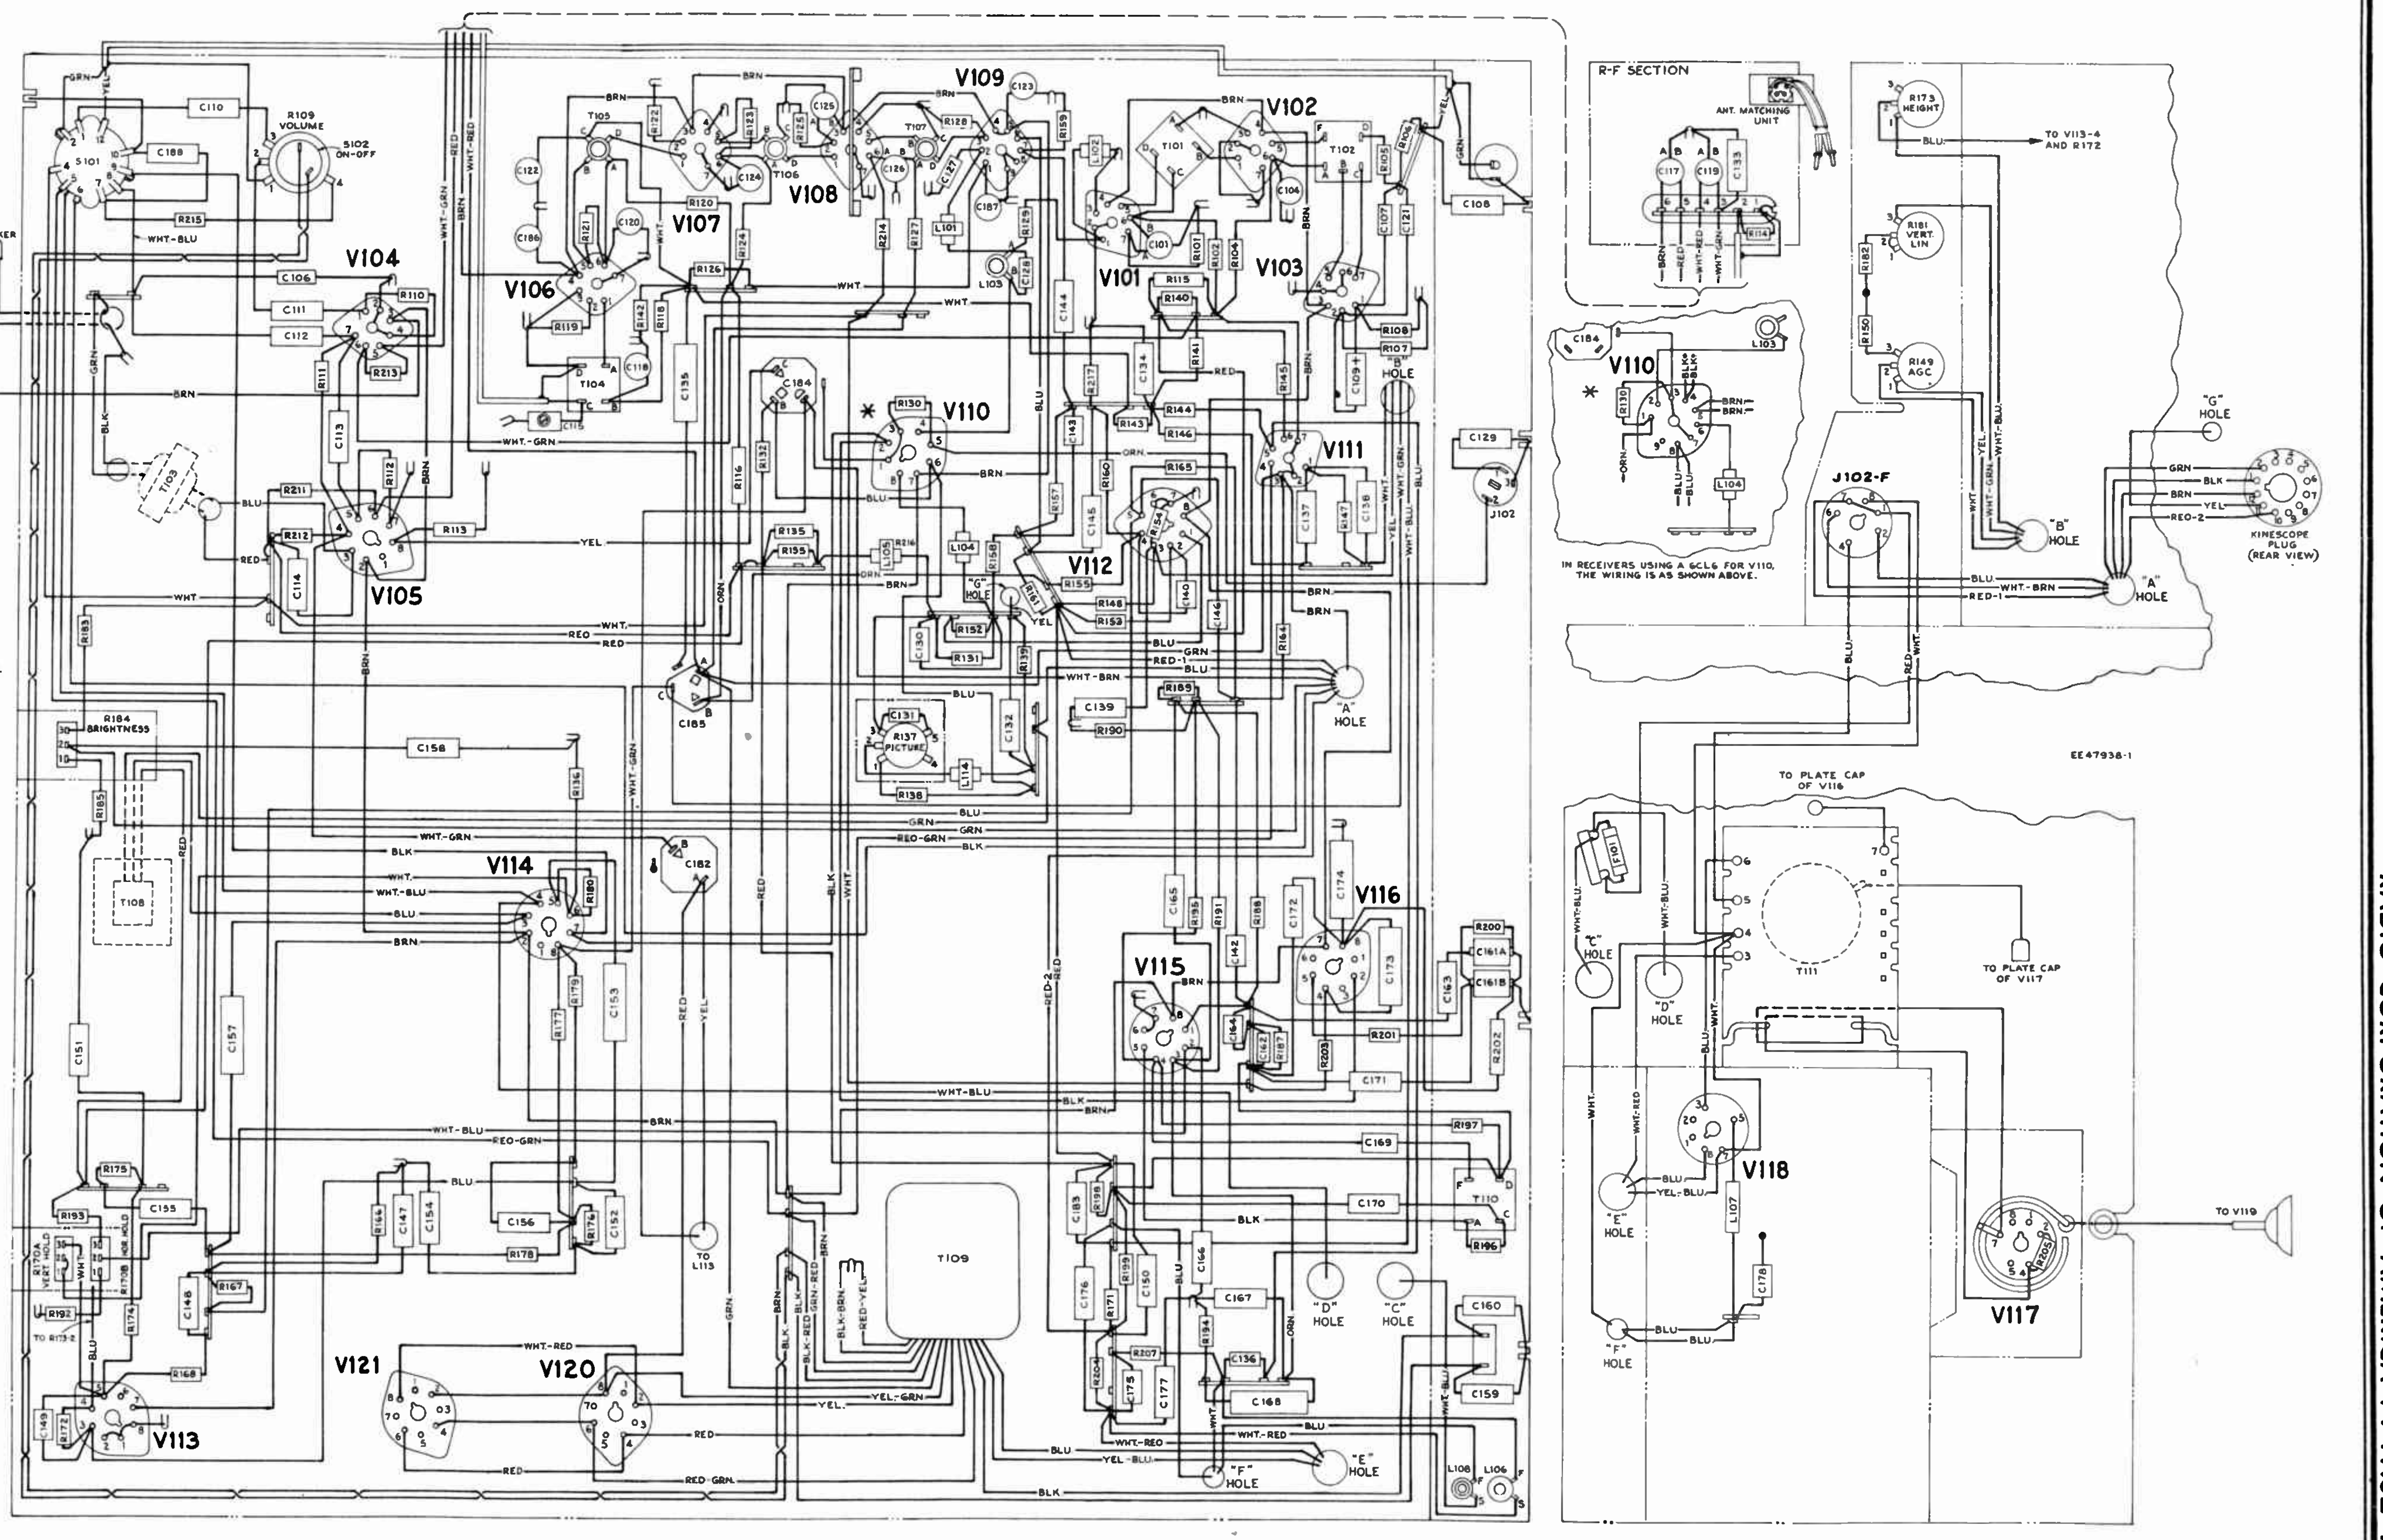

Figure 66—Chassis Wiring Diagram

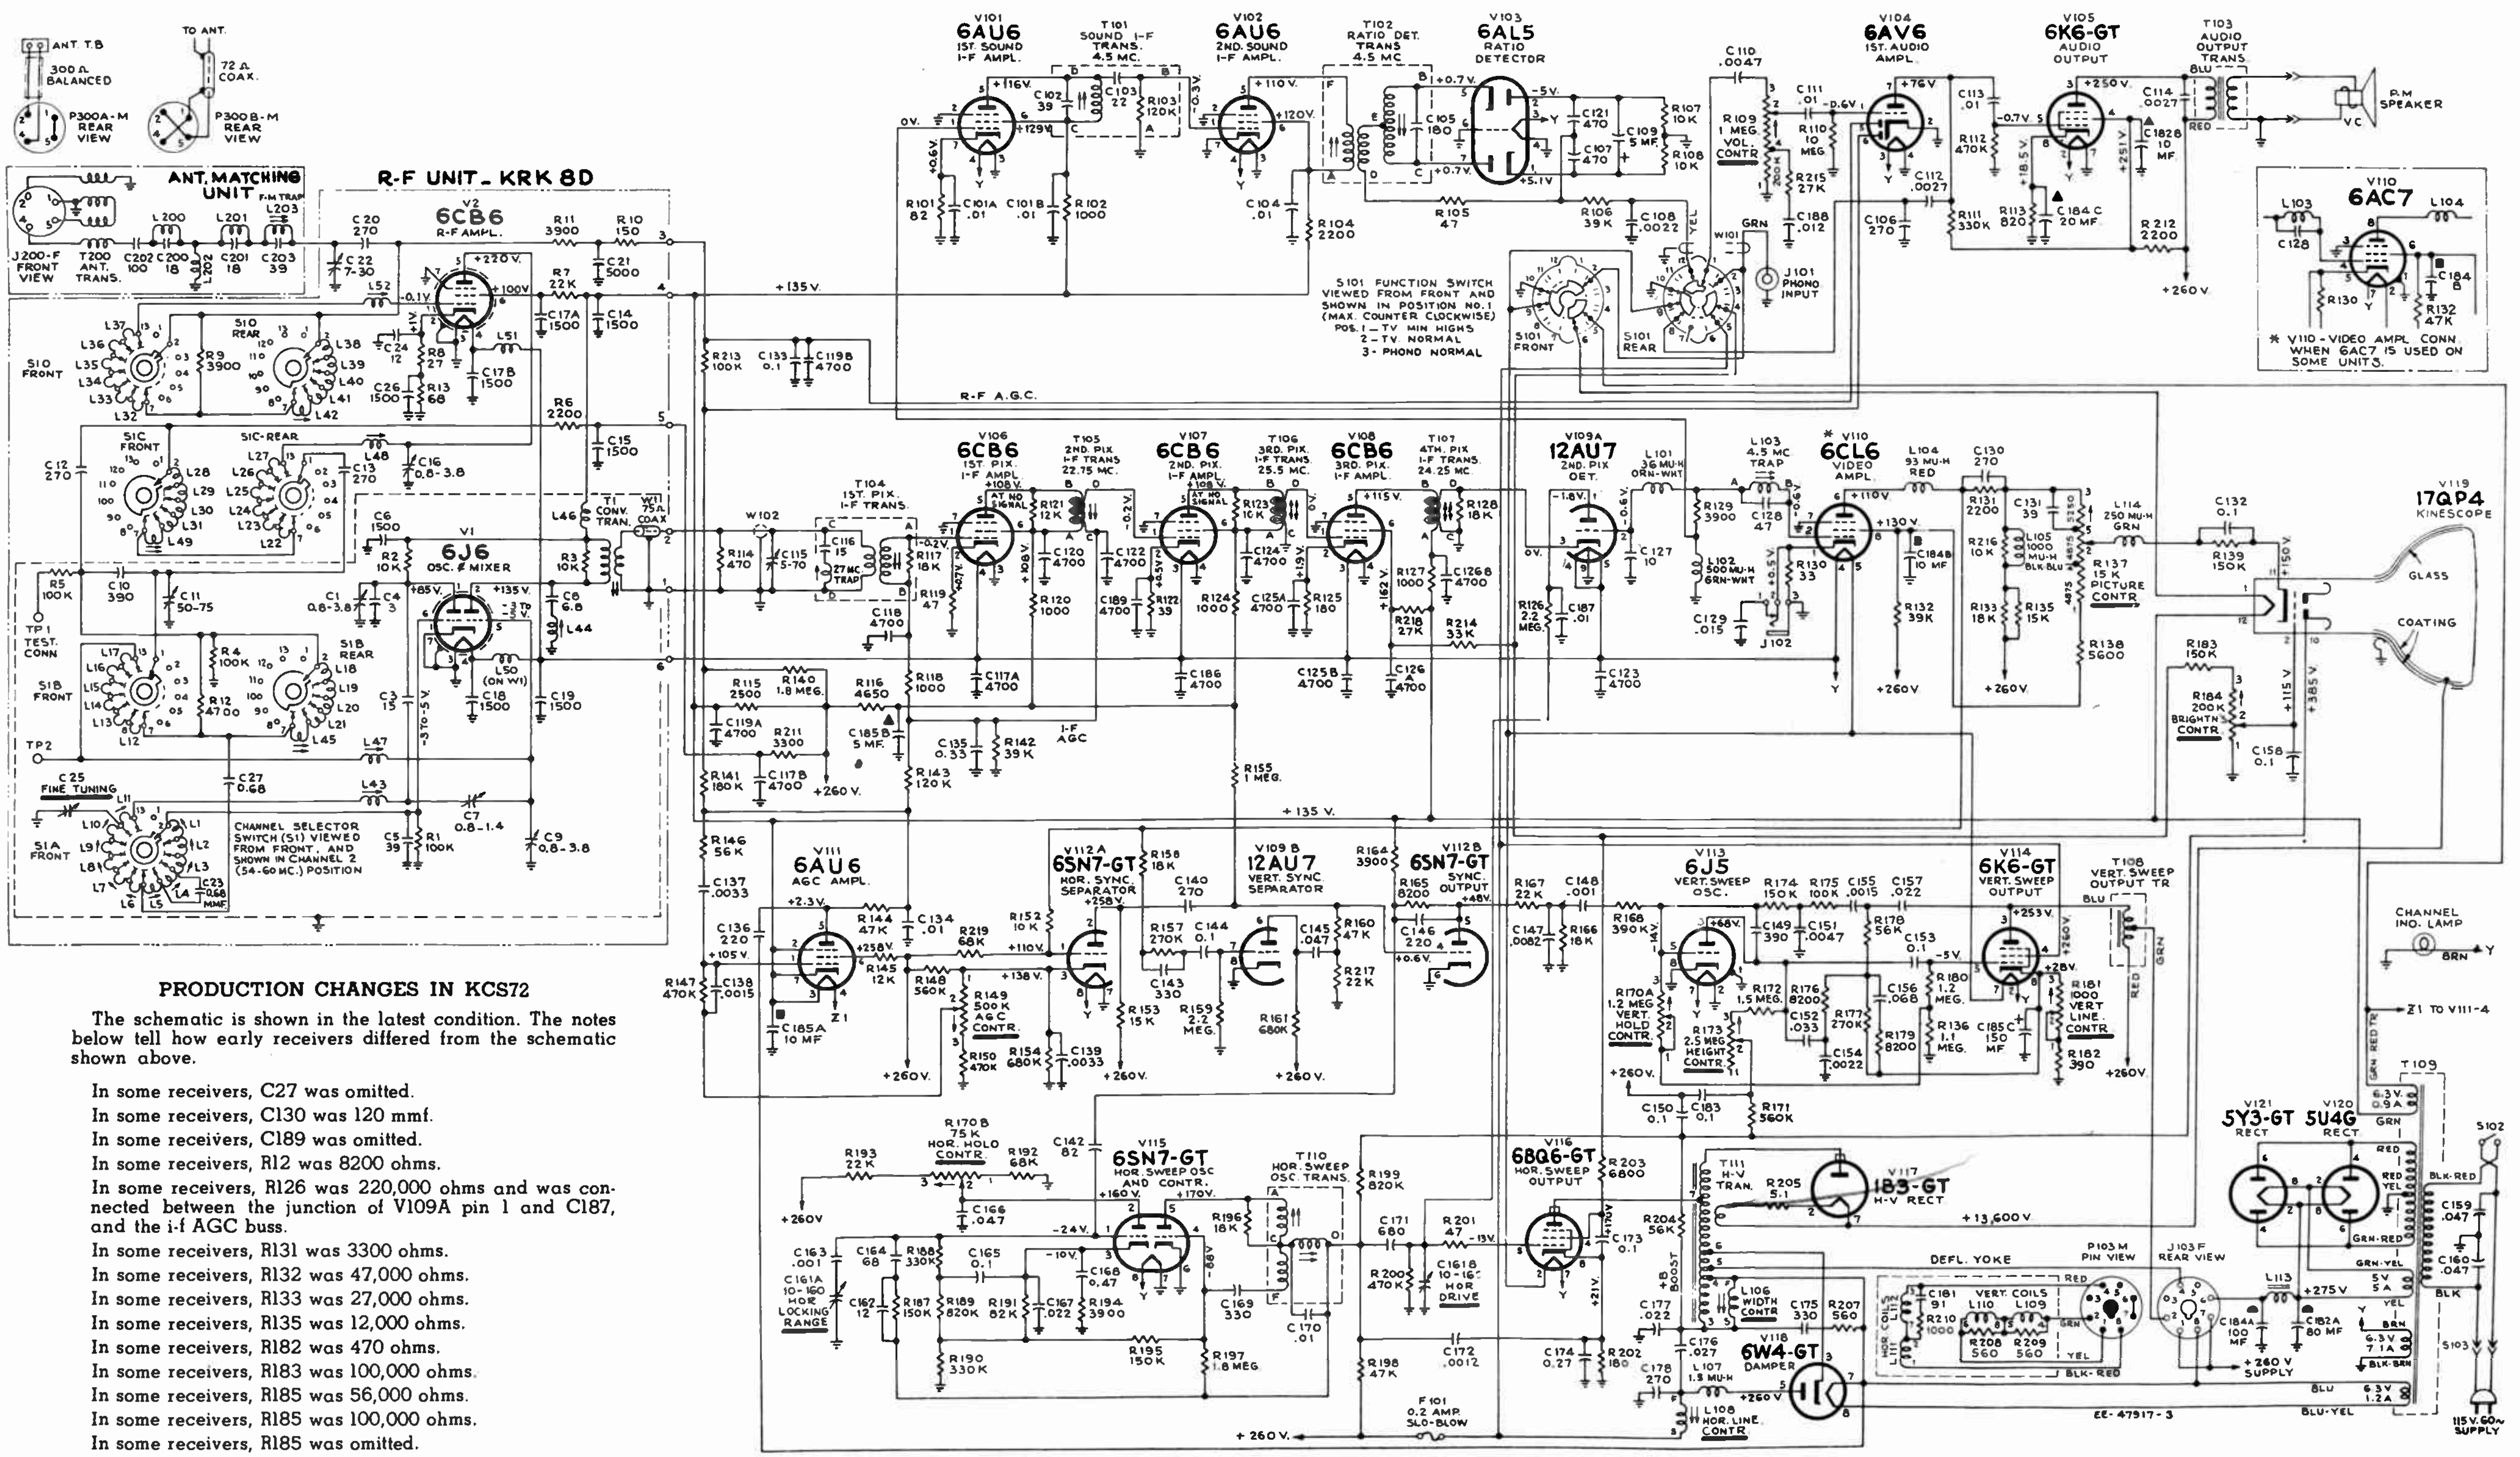
CIRCUIT SCHEMATIC DIAGRAM KCS72M2



PRODUCTION CHANGES IN KCS72

The schematic is shown in the latest condition. The notes below tell how early receivers differed from the schematic shown above.

In some receivers, C27 was omitted.
In some receivers, C130 was 120 mmf.
In some receivers, C189 was omitted.
In some receivers, R12 was 8200 ohms.
In some receivers, R126 was 220,000 ohms and was connected between the junction of V109A pin 1 and C187, and the i-f AGC buss.
In some receivers, R131 was 3300 ohms.
In some receivers, R132 was 47,000 ohms.
In some receivers, R133 was 27,000 ohms.
In some receivers, R135 was 12,000 ohms.
In some receivers, R182 was 470 ohms.
In some receivers, R183 was 100,000 ohms.
In some receivers, R185 was 56,000 ohms.
In some receivers, R185 was 100,000 ohms.
In some receivers, R185 was omitted.
In some receivers, R218 was omitted.
In some receivers, R219 was omitted.
In some receivers, V119-10 was connected to the junction of R171 and C183.

All resistance values in ohms. K=1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

* In KCS72 V110 was a 6AC7.
In KCS72M1 V110 was a 6AG7 (same pin connections as 6AC7).

73473	Capacitor—Ceramic, 5000 mmf. (C21)
75172	Capacitor—Tubular, steatite, adjustable, 0.65 - 1.2 mmf. (C7)
71504	Capacitor—Ceramic, 0.68 mmf. (C23)
75184	Capacitor—Ceramic, adjustable, 0.75 - 4 mmf., complete with adjusting stud (C1)
75197	Capacitor—Ceramic, 6.8 mmf. (C8)
75189	Capacitor—Adjustable, 7-30 mmf. (C22)
75174	Capacitor—Ceramic, trimmer, 50-75 mmf. (C11)
76143	Clip—Tubular clip for mounting stand-off capacitors
73477	Coil—Choke coil (L51)
75202	Coil—Choke coil, .56 muh (L46)
75185	Coil—Converter plate loading coil (L44)
75182	Coil—Trimmer coil (1½ turns) with adjustable inductance core and capacitor stud (screw adjustment) for converter section (C9, L47)
75183	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r-f section (L48, C16)
76460	Contact—Test point contact
76966	Core—Adjustable core for fine tuning capacitor
75162	Detent—Detent mechanism and fibre shaft
73453	Form—Coil form for L45, L49
75165	Link—Link assembly for fine tuning
76518	Plate—Front plate and shaft bearing
	Resistor—Fixed, composition:—
503027	27 ohms, ±10%, ½ watt (R8)
503068	68 ohms, ±10%, ½ watt (R13)
504115	150 ohms, ±20%, ½ watt (R10)
503222	2200 ohms, ±10%, ½ watt (R6)
503239	3900 ohms, ±10%, ½ watt (R9, R11)
503247	4700 ohms, ±10%, ½ watt (R12)
502310	1000 ohms, ±5%, ½ watt (R3)
504310	10,000 ohms, ±20%, ½ watt (R2)
503322	22,000 ohms, ±10%, ½ watt (R7)
504410	100,000 ohms, ±20%, ½ watt (R1, R4, R5)
14343	Retainer—Fine tuning shaft retaining ring

STOCK No.	DESCRIPTION
75164	Rod—Actuating plunger rod (fibre) for fine tuning link
71476	Screw—#4-40 x ¼" adjusting screw for L6, L7, L8, L9, L10, L11
75177	Screw—#4-40 x ⅜" adjusting screw for L1, L2, L3, L4, L43
75176	Screw—#4-40 x 7/16" adjusting screw for L5
73640	Screw—#4-40 x 7/16" adjusting screw for L52
74575	Screw—#4-40 x .359" adjusting screw for L42
76519	Shaft—Channel selector shaft and plate
76134	Shaft—Fine tuning shaft and cam
76962	Shield—Oscillator and converter sections shield—snap-on type
76967	Shield—Tube shield for V1, V2
75088	Socket—Tube socket, 7 contact, miniature, ceramic, saddle-mounted
75191	Spacer—Insulating spacer for front plate
75163	Spring—Friction spring (formed) for fine tuning cam
30340	Spring—Hair pin spring for fine tuning link
74578	Spring—Retaining spring for adjusting screws
76961	Spring—Retaining spring for oscillator tube shield
73457	Spring—Return spring for fine tuning control
75180	Stator—Antenna stator complete with rotor, coils, capacitors (C20, C21) and resistors (R9, R10, R11) (S1-4, C20, C21, L32, L33, L34, L35, L36, L37, L38, L39, L40, L41, L42, L52, R9, R10, R11)
77459	Stator—Converter stator complete with rotor, coils, capacitors and resistors (S1-2, C10, C12, L12, L13, L14, L15, L16, L17, L18, L19, L20, L21, L45, R4, R5, R12)
76963	Stator—Oscillator section stator complete with rotor, segment, coils, adjusting screws and capacitors C3, C23 (S1-1, C3, C23, L1, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L43)
76964	Stator—R-F amplifier stator complete with rotor, coils, capacitors (C13) and resistor (R6) (S1-3, C13, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L49, R6)
75170	Strip—Coil segment mounting strip—L.H. lower
75171	Strip—Coil segment mounting strip—L.H. upper—less trimmer C7
75169	Strip—Coil segment mounting strip—R.H. center
75446	Stud—Capacitor stud—brass—#4-40 x 3/16" with 3/64" screw driver slot for trimmer coils L47, L48 and capacitor C1 uncoded and coded "ER"
75447	Stud—Capacitor stud—brass—#4-40 x 3/16" with 3/64" screw driver slot for trimmer coils L47, L48 and capacitor C1 coded numerically and "Hi-Q"
75173	Stud—#6-32 x 13/16" adjusting stud for trimmer C7
75181	Transformer—Converter transformer (T1)
75607	Washer—Insulating washer (hex)
75190	Washer—Insulating washer (neoprene) for trimmer C7
	CHASSIS ASSEMBLIES
	KCS72
76456	Bracket—Channel indicator lamp bracket
76454	Bracket—Mounting bracket complete with insulator for picture control
71496	Capacitor—Adjustable, mica, 5-70 mmf. (C115)
33098	Capacitor—Ceramic, 10 mmf. (C127)
33380	Capacitor—Ceramic, 12 mmf. (C162)
75450	Capacitor—Ceramic, 39 mmf. (C203)
73664	Capacitor—Ceramic, 39 mmf. (C131)
76475	Capacitor—Mica, 68 mmf. (C164)
76474	Capacitor—Mica, 82 mmf. (C142)
75437	Capacitor—Ceramic, 100 mmf. (C202)

STOCK No.	DESCRIPTION
76673	Capacitor—Ceramic, 220 mmf. (C136)
75248	Capacitor—Mica, 220 mmf. (C146)
47617	Capacitor—Ceramic, 270 mmf. (C106)
39638	Capacitor—Mica, 270 mmf. (C130)
73091	Capacitor—Mica, 270 mmf. (C140, C178)
76476	Capacitor—Mica, 330 mmf. (C169, C175)
39640	Capacitor—Mica, 330 mmf. (C143)
73094	Capacitor—Mica, 390 mmf. (C149)
39644	Capacitor—Mica, 470 mmf. (C107, C121)
76990	Capacitor—Ceramic, dual 4700 mmf. (C117A, C117B, C119A, C119B, C125A, C125B, C126A, C126B)
73473	Capacitor—Ceramic, 4700 mmf. (C118, C120, C122, C123, C124, C186, C189)
73960	Capacitor—Ceramic, 10,000 mmf. (C104, C187)
76991	Capacitor—Ceramic, dual 10,000 mmf. (C101A, C101B)
74521	Capacitor—Electrolytic, 5 mfd., 50 volts (C109)
75218	Capacitor—Electrolytic, comprising 1 section of 10 mfd., 350 volts, 1 section of 5 mfd., 350 volts and 1 section of 150 mfd., 50 volts (C185A, C185B, C185C)
75217	Capacitor—Mica trimmer, dual 10-160 mmf. (C161A, C161B)
76987	Capacitor—Electrolytic, comprising 1 section of 80 mfd., 400 volts and 1 section of 10 mfd., 350 volts (C182A, C182B)
76970	Capacitor—Electrolytic comprising 1 section of 100 mfd., 400 volts, 1 section of 10 mfd., 350 volts and 1 section of 20 mfd., 50 volts (C184A, C184B, C184C)
76479	Capacitor—Tubular, moulded paper, oil impregnated, .00068 mfd., 600 volts (C171)
75643	Capacitor—Tubular, paper, oil impregnated, .001 mfd., 1000 volts (C148, C163)
76995	Capacitor—Tubular, moulded paper, oil impregnated, .0012 mfd., 600 volts (C172)
76508	Capacitor—Tubular, paper, oil impregnated, .0015 mfd., 600 volts (C138)
77123	Capacitor—Tubular, moulded paper, oil impregnated, .0015 mfd., 1000 volts (C155)
73595	Capacitor—Tubular, paper, oil impregnated, .0022 mfd., 600 volts (C108, C154)
73599	Capacitor—Tubular, paper, oil impregnated, .0027 mfd., 600 volts (C112)
73818	Capacitor—Tubular, paper, oil impregnated, .0027 mfd., 1600 volts (C114)
73795	Capacitor—Tubular, paper, oil impregnated, .0033 mfd., 600 volts (C137, C139)
73920	Capacitor—Tubular, paper, oil impregnated, .0047 mfd., 600 volts (C110, C151)
73808	Capacitor—Tubular, paper, oil impregnated, .0082 mfd., 1000 volts (C147)
73561	Capacitor—Tubular, paper, oil impregnated, .01 mfd., 400 volts (C111, C113, C134)
73594	Capacitor—Tubular, moulded paper, oil impregnated, .01 mfd., 600 volts (C170)
74938	Capacitor—Tubular, paper, oil impregnated, .012 mfd., 200 volts (C188)
73797	Capacitor—Tubular, paper, oil impregnated, .015 mfd., 600 volts (C129)
73562	Capacitor—Tubular, paper, oil impregnated, .022 mfd., 400 volts (C167)
73798	Capacitor—Tubular, paper, oil impregnated, .022 mfd., 600 volts (C157)
73810	Capacitor—Tubular, paper, oil impregnated, .022 mfd., 1000 volts (C177)
73811	Capacitor—Tubular, paper, oil impregnated, .027 mfd., 1000 volts (C176)
73596	Capacitor—Tubular, paper, oil impregnated, .033 mfd., 1000 volts (C152)

STOCK No.	DESCRIPTION
73553	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 400 volts (C145, C166)
75071	Capacitor—Tubular, moulded paper, .047 mfd., 400 volts (C159, C160)
73792	Capacitor—Tubular, paper, oil impregnated, .068 mfd., 400 volts (C156)
73784	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 200 volts (C132, C133)
73551	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 400 volts (C144, C150, C158, C165, C183)
73557	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 600 volts (C153, C173)
73786	Capacitor—Tubular, paper, oil impregnated, 0.27 mfd., 200 volts (C174)
76994	Capacitor—Tubular, paper, oil impregnated, 0.33 mfd., 200 volts (C135)
73787	Capacitor—Tubular, paper, oil impregnated, 0.47 mfd., 200 volts (C168)
76498	Choke—Filter choke (L113)
73591	Coil—Antenna matching coil (2 req'd) (Part of T200)
75241	Coil—Antenna shunt coil (L202)
76442	Coil—Horizontal linearity coil complete with adjustable core (L108)
76441	Coil—Width coil complete with adjustable core (L106)
76640	Coil—Peaking coil (1.5 muh) (L107)
76011	Coil—Peaking coil (36 muh) (L101)
71527	Coil—Peaking coil (93 muh) (L104)
71526	Coil—Peaking coil (250 muh) (L114)
75252	Coil—Peaking coil (500 muh) (L102)
77124	Coil—Peaking coil (1000 muh) (L105, R216)
71789	Connector—Anode lead connector complete
35787	Connector—Phono input connector (J101)
75474	Connector—Single contact male connector for speaker cable
75482	Connector—Video connector (J102)
74594	Connector—2 contact male connector for power cord
38853	Connector—4 contact female connector for antenna transformer (J200)
50367	Connector—6 contact female connector for yoke lead (J103)
75542	Connector—6 contact male connector—part of deflection yoke (P103)
76975	Control—AGC control (R149)
76444	Control—Brightness control (R184)
76448	Control—Height control (R173)
76974	Control—Horizontal and vertical hold control (R170A, R170B)
76445	Control—Picture control (R137)
76976	Control—Vertical linearity control (R181)
77010	Control—Volume control and power switch (R109, S102)
71498	Core—Adjustable core and stud for FM trap 75449
76986	Cover—Back cover for hi-voltage compartment
76985	Cover—Side cover for hi-voltage compartment
74956	Cushion—Rubber cushion for deflection yoke hood
74839	Fastener—Push fastener for mounting tube socket 76453
73600	Fuse—0.25 amps., 250 volts (F101)
37396	Grommet—Rubber grommet for mounting tube socket 76453
76459	Grommet—Rubber grommet for 2nd. anode lead exit
76830	Hood—Deflection yoke hood less rubber cushions
76168	Magnet—Focus magnet
76141	Magnet—Ion trap magnet (P.M. type)

PARTS (Continued)

STOCK No.	DESCRIPTION
76633	Magnet—Pin cushion correction magnet complete with support arm
78464	Plate—Hi-voltage plate (bakelite) assembly complete with tube socket and corona ring
76796	Resistor—Wire wound, 5.1 ohms, 1/3 watt (R205)
76639	Resistor—Wire wound, 180 ohms, 2 watts (R202)
76988	Resistor—Wire wound, 820 ohms, 1 watt (R113)
76469	Resistor—Wire wound, 2500 ohms, 10 watts (R115)
76989	Resistor—Wire wound, 4650 ohms, 7 watts (R116)
	Resistor—Fixed, composition:—
503033	33 ohms, ±10%, ½ watt (R130)
502039	39 ohms, ±5%, ½ watt (R122)
502047	47 ohms, ±5%, ½ watt (R119)
503047	47 ohms, ±10%, ½ watt (R105)
504047	47 ohms, ±20%, ½ watt (R201)
503082	82 ohms, ±10%, ½ watt (R101)
502118	180 ohms, ±5%, ½ watt (R125)
503139	390 ohms, ±10%, ½ Watt (R162)
503147	470 ohms, ±10%, ½ watt (R114)
513156	560 ohms, ±10%, 1 watt (R207)
504210	1000 ohms, ±20%, ½ watt (R102, R118, R120, R124, R127)
503222	2200 ohms, ±10%, ½ watt (R104, R212)
523222	2200 ohms, ±10%, 2 watts (R131)
504233	3300 ohms, ±20%, ½ watt (R211)
523223	3300 ohms, ±10%, 2 watts (R131)
502239	3900 ohms, ±5%, ½ watt (R129, R164)
503239	3900 ohms, ±10%, ½ watt (R194)
503256	5600 ohms, ±10%, ½ watt (R138)
523268	6800 ohms, ±10%, 2 watts (R203)
503282	8200 ohms, ±10%, ½ watt (R176, R179)
513282	8200 ohms, ±10%, 1 watt (R165)
502310	10,000 ohms, ±5%, ½ watt (R107, R108, R123)
504310	10,000 ohms, ±20%, ½ watt (R152)
502312	12,000 ohms, ±5%, ½ watt (R121)
503312	12,000 ohms, ±10%, ½ watt (R145)
523312	12,000 ohms, ±10%, 2 watts (R135)
503315	15,000 ohms, ±10%, ½ watt (R153)
503318	18,000 ohms, ±10%, ½ watt (R128, R158, R166, R196)
523318	18,000 ohms, ±10%, 2 watts (R133)
503322	22,000 ohms, ±10%, ½ watt (R167, R217)
513322	22,000 ohms, ±10%, 1 watt (R193)
603327	27,000 ohms, ±10%, ½ watt (R215)
513327	27,000 ohms, ±10%, 1 watt (R218)
613333	33,000 ohms, ±10%, 1 watt (R214)
503339	39,000 ohms, ±10%, ½ watt (R106, R142)
513339	39,000 ohms, ±10%, 1 watt (R132)
503347	47,000 ohms, ±10%, ½ watt (R160)
504347	47,000 ohms, ±20%, ½ watt (R144)
512347	47,000 ohms, ±5%, 1 watt (R148)
513347	47,000 ohms, ±10%, 1 watt (R132)
503356	56,000 ohms, ±10%, ½ watt (R146, R165, R204)
512356	56,000 ohms, ±5%, 1 watt (R178)
503368	68,000 ohms, ±10%, ½ watt (R219)
513368	68,000 ohms, ±10%, 1 watt (R192)
513382	82,000 ohms, ±10%, 1 watt (R191)
504410	100,000 ohms, ±20%, ½ watt (R213)
513410	100,000 ohms, ±10%, 1 watt (R175)
30180	120,000 ohms, ±5%, ½ watt (R143)
503415	150,000 ohms, ±10%, ½ watt (R174, R183, R187)
504415	150,000 ohms, ±20%, ½ watt (R139)
512415	150,000 ohms, ±5%, 1 watt (R195)
502418	180,000 ohms, ±5%, ½ watt (R141)
502427	270,000 ohms, ±5%, ½ watt (R177)
503427	270,000 ohms, ±10%, ½ watt (R157)
503433	330,000 ohms, ±10%, ½ watt (R111, R168)
512433	330,000 ohms, ±5%, 1 watt (R190)
503439	390,000 ohms, ±10%, ½ watt (R168)
503447	470,000 ohms, ±10%, ½ watt (R150, R200)
504447	470,000 ohms, ±20%, ½ watt (R112, R147)
503456	560,000 ohms, ±10%, ½ watt (R148, R171)
503468	680,000 ohms, ±10%, ½ watt (R154, R181)
503482	820,000 ohms, ±10%, ½ watt (R189, R199)
503510	1 megohm, ±10%, ½ watt (R155)
502511	1.1 megohm, ±5%, ½ watt (R136)
503512	1.2 megohm, ±10%, ½ watt (R180)
503515	1.5 megohm, ±10%, ½ watt (R172)
11769	1.8 megohm, ±5%, ½ watt (R140)
39063	1.8 megohm, ±5%, 1 watt (R197)
503522	2.2 megohm, ±10%, ½ watt (R126, R159)
504610	10 megohm, ±20%, ½ watt (R110)
71456	Screw—#8-32 x 7/16″ wing screw to mount deflection yoke
76455	Shaft—Connecting shaft (nylon) for picture and brightness controls
73584	Shield—Tube shield for V101, V102, V103, V108
76972	Shield—Tube shield for V109
75718	Socket—Channel indicator lamp socket and leads
74834	Socket—Kinescope socket
31251	Socket—Tube socket, octal, wafer for V105, V110, V112, V113, V116, V120, V121 for KCS72 (KCS72 uses 6AC7 for V110)
71508	Socket—Tube socket, 6 pin, moulded—for V117
50367	Socket—Tube socket, 6 pin, moulded, saddle mounted for V118
73117	Socket—Tube socket, 7 pin, wafer miniature for V101, V102, V103, V104, V106, V107, V108, V111
76453	Socket—Tube socket, octal, moulded, saddle-mounted for V110 for KCS72-M1 (KCS72-M1 uses 6AG7 for V110)
50367	Socket—Tube socket, 8 pin, moulded saddle-mounted for V114
72627	Socket—Tube socket, 8 pin, steatite saddle mounted for V115
76971	Socket—Tube socket, 9 pin, wafer miniature for V109
77470	Socket—Tube socket, 9 pin, miniature, wafer for V110 for KCS72-M2 (KCS72-M2 uses 6CL6 for V110)
76636	Stud—Adjusting stud complete with guard for focus magnet
77011	Switch—Tone control and phono switch less volume control and power switch (S101)
76483	Terminal—Screw type grounding terminal
76977	Transformer—Antenna matching transformer complete (T200, C200, C201, C202, C203, L200, L201, L202, L203, J200)
76795	Transformer—Hi-voltage transformer (T111)
76440	Transformer—Horizontal oscillator transformer complete with adjustable cores (T110)
76982	Transformer—Output transformer (T103)
76984	Transformer—Power transformer, 117 volts 60 cycle (T109)
77112	Transformer—Ratio detector transformer (T102, C105)
76981	Transformer—Sound i-f transformer complete with adjustable core (T101, C102, C103, R103)
76976	Transformer—Vertical output transformer (T108)
76979	Transformer—First pix, i-f transformer complete with adjustable cores (T104, C116, R117)
76980	Transformer—Second, third or fourth pix i-f transformer complete with adjustable core (T105, T106, T107)
75449	Trap—FM trap complete with adjustable core and stud (L203, C203)
75242	Trap—I-F trap (L200, L201, C200, C201)
76983	Trap—4.5 MC trap (L103, C128)
76616	Yoke—Deflection yoke complete with 6 contact male connector (L109, L110, L111, L112, C161, P103, R208, R209, R210)
	SPEAKER ASSEMBLIES
	971636-1W RL-101C5 RMA-274
	(For Models 17T200, 17T201 & 17T202)
77000	Speaker—5″ P.M. speaker complete with cone and voice coil (3.2 ohms)
	SPEAKER ASSEMBLIES
	971490-3W RL-105E6 RMA-274
	(For Models 17T211 & 17T220)
75024	Cone—Cone and voice coil (3.2 ohms)
75022	Speaker—8″ P.M. speaker complete with cone and voice coil (3.2 ohms)
	NOTE: If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.
	MISCELLANEOUS
77189	Back—Cabinet back complete for Models 17T200, 17T201, 17T202
77190	Back—Cabinet back complete for Models 17T211, 17T220
76184	Board—"Antenna" terminal board
76811	Bracket—Hanger bracket for deflection yoke hood for Models 17T200, 17T201, 17T202
77001	Bracket—Hanger bracket for deflection yoke hood for Model 17T211
76812	Bracket—Hanger bracket for deflection yoke hood for Model 17T220
76814	Bracket—Stiffening bracket for kinescope cradle (4 req'd) for Models 17T200, 17T201, 17T202
76829	Bracket—Stiffening bracket for kinescope cradle for Models 17T211, 17T220
71892	Catch—Bullet catch and strike for Model 17T220
76823	Clip—Spring clip for spacing ground braid
X3128	Cloth—Grille cloth for Models 17T201, 17T202
X3199	Cloth—Grille cloth for mahogany cabinet for Model 17T211
X1756	Cloth—Grille cloth for mahogany and walnut instruments for Model 17T220
75474	Connector—Single contact male connector for antenna cable (2 req'd)
39153	Connector—4 contact male connector for antenna cable
71457	Cord—Power cord and plug
76818	Cushion—Rubber cushion (1/16″ x 1″ x ⅝″ x ¼″) for kinescope and cradle support (4 req'd)
77014	Decal—Control panel function decal for mahogany or walnut instruments for Models 17T201, 17T202, 17T211 & 17T220
71984	Decal—Trade mark decal for Model 17T220
77012	Emblem—"RCA Victor" emblem for Models 17T202, 17T211, 17T220
75456	Escutcheon—Channel marker escutcheon—gold
74889	Foot—Felt foot (4 req'd) for Models 17T200, 17T201 & 17T202
76806	Glass—Safety glass
74308	Hinge—Cabinet door hinge (1 set) for Model 17T220
76595	Knob—Brightness control or vertical hold control knob —maroon—(outer)
76593	Knob—Channel selector knob—maroon—(inner)
76591	Knob—Fine tuning control knob—maroon—(outer)
74963	Knob—Picture control, horizontal hold control or volume control and power switch knob—maroon—(inner)
76597	Knob—Tone control and phono switch knob—maroon—(outer)
76596	Knob—Brightness control or vertical hold control knob —beige—(outer)
76594	Knob—Channel selector knob—beige—(inner)
76592	Knob—Fine tuning control knob—beige—(outer)
75464	Knob—Picture control, horizontal hold control or volume control and power switch knob—beige—(inner)
76598	Knob—Tone control and phono switch knob—maroon—(outer)
77264	Knob—Brightness control or vertical hold control knob —ebony—(outer)
77261	Knob—Channel selector knob—ebony—(inner)
77262	Knob—Fine tuning control knob—ebony—(outer)
77265	Knob—Picture control, horizontal hold control or volume control and power switch knob—ebony—(inner)
77263	Knob—Tone control and phono switch knob—ebony—(outer)
11765	Lamp—Channel marker escutcheon lamp—Mazda #51
75459	Mask—Channel marker escutcheon light mask—burgundy
76589	Mask—Channel marker escutcheon light mask—beige
77267	Mask—Channel marker escutcheon light mask—ebony
78177	Nut—#10-32 special nut for deflection yoke hood support rods (2 req'd)
76822	Nut—Speed nut to lock flexible straps for kinescope
77013	Nut—Speed nut for fastening "RCA Victor" emblem on metal panel for Models 17T202, 17T211 & 17T220
73634	Nut—Speed nut for speaker mounting screws for Model 17T211
76825	Pad—Rubber pad (channel) mounted on cradle support to cushion Kinescope
76819	Pad—Rubber pad (channel) for flexible straps (2 req'd)
77005	Panel—Metal front panel for mahogany or walnut instruments for Models 17T211 & 17T220
77260	Panel—Metal front panel for blonde instruments for Model 17T211
77187	Pull—Door pull for television compartment doors for Model 17T220
77188	Pull—Door pull for false door (2 req'd) for Model 17T220
77002	Retainer—Safety glass retainer (2 req'd) for maroon, mahogany grain, mahogany or walnut instruments
76816	Retainer—Safety glass retainer (2 req'd) for blonde instruments
76809	Rod—"L" shape threaded rod to support deflection yoke hood assembly (2 req'd) for Models 17T200, 17T201 & 17T202
76810	Rod—"L" shape threaded rod to support deflection yoke hood assembly (2 req'd) for Models 17T211 & 17T220
76632	Screw—#8 x ⅝″ hex head screw for mounting front panel or hanger bracket for Models 17T211 & 17T220
74113	Screw—#8-32 x 1″ trimit head screw for door pull for Model 17T220
76821	Screw—#10 x 1⅜″ hex head screw to lock flexible straps for kinescope
76808	Sleeve—Polyethylene sleeve for insulating high voltage lead—on support rod
73643	Spring—Channel marker escutcheon spring clip
76820	Spring—Formed spring for safety glass retainers
77006	Spring—Retaining spring for deflection yoke hood support rods
30330	Spring—Retaining spring for knobs 74963, 75464, 77265
72845	Spring—Retaining spring for knobs 76591, 76592, 77262
76837	Spring—Retaining spring for knobs 76593, 76594, 76595, 76596, 76597, 76598, 77261, 77264, 77263
74938	Spring—Suspension spring for kinescope socket leads
36580	Spring—Suspension spring (coil) for ground braid
72936	Stop—Cabinet door stop for Model 17T220
76813	Strap—Flexible steel strap to secure kinescope
76600	Strap—Ground strap (.005″ x ½″ soft copper strip) for Models 17T211 & 17T220
77003	Support—Cradle support for kinescope
76836	Washer—Cellulose washer—gold—for knobs
75457	Washer—Felt washer—dark brown—between knob and channel marker escutcheon
75458	Washer—Felt washer—beige—between knob and channel marker escutcheon
77266	Washer—Felt washer—ebony—between knob and channel marker escutcheon
75500	Washer—Felt washer for cabinet back mounting screws

RECEIVER ANTENNA INPUT IMPEDANCE

Choice: 300 ohms balanced or 72 ohms unbalanced.

RCA TUBE COMPLEMENT

Tube Used	Function
(1) RCA 6CB6	R-F Amplifier
(2) RCA 6J6	R-F Oscillator and Mixer
(3) RCA 6CB6	1st Picture I-F Amplifier
(4) RCA 6CB6	2nd Picture I-F Amplifier
(5) RCA 6CB6	3rd Picture I-F Amplifier
(6) RCA 12AU7	Picture 2nd Detector and Vert. Sync. Sep.
(7) RCA 6AG7 (6AC7, 6CL6)	Video Amplifier
(8) RCA 6AU6	1st Sound I-F Amplifier
(9) RCA 6AU6	2nd Sound I-F Amplifier
(10) RCA 6AL5	Ratio Detector
(11) RCA 6AV6	1st Audio Amplifier
(12) RCA 6K6GT	Audio Output
(13) RCA 6AU6	AGC Amplifier
(14) RCA 6SN7GT	Horizontal Sync. Sep. and Sync. Output
(15) RCA 6J5	Vertical Sweep Oscillator
(16) RCA 6K6GT	Vertical Sweep Output
(17) RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(18) RCA 6BQ6GT	Horizontal Sweep Output
(19) RCA 6W4GT	Damper
(20) RCA 1B3-GT/8016	High Voltage Rectifier
(21) RCA 21AP4 (21EP4)	Kinescope
(22) RCA 5U4G	Rectifier
(23) RCA 5Y3GT	Rectifier

PICTURE INTERMEDIATE FREQUENCIES

Picture Carrier Frequency......................25.50 mc.

Adjacent Channel Sound Trap.................27.00 mc.

SOUND INTERMEDIATE FREQUENCIES

Sound Carrier Frequency.......................21.00 mc.

Sound I.F. Frequency.............................4.5 mc.

VIDEO RESPONSE..........................To 3.2 mc.

FOCUS..Magnetic

SWEEP DEFLECTION.........................Magnetic

SCANNING........................Interlaced, 525 line

HORIZONTAL SWEEP FREQUENCY........15,750 cps

VERTICAL SWEEP FREQUENCY...............60 cps

FRAME FREQUENCY (Picture Repetition Rate)..30 cps

OPERATING CONTROLS (Front Panel)

Channel Selector / Fine Tuning ....Dual Control Knobs

Picture / Brightness ....Dual Control Knobs

Picture Horizontal Hold / Picture Vertical Hold ....Dual Control Knobs

Sound Volume and On-Off Switch / TV Tone & Phono Switch ....Dual Control Knobs

NON-OPERATING CONTROLS (not including r-f and i-f adjustments)

Picture Centering...................top chassis adjustment

Width...........................rear chassis adjustment

Height.........................rear chassis adjustment

Horizontal Linearity....rear chassis screwdriver adjustment

Vertical Linearity.................rear chassis adjustment

Horizontal Drive.......rear chassis screwdriver adjustment

Horizontal Oscillator Frequency...rear chassis adjustment

Horizontal Oscillator Waveform..bottom chassis adjustment

Horizontal Locking Range..........rear chassis adjustment

Focus...............................top chassis adjustment

Ion Trap Magnet...................top chassis adjustment

Deflection Coil.............top chassis wing nut adjustment

AGC Control.......................rear chassis adjustment

Pin Cushion Correction Magnets (21T207G only) rear chassis adjustment

HIGH VOLTAGE WARNING

OPERATION OF THIS RECEIVER OUTSIDE THE CABINET OR WITH THE COVERS REMOVED, INVOLVES A SHOCK HAZARD FROM THE RECEIVER POWER SUPPLIES. WORK ON THE RECEIVER SHOULD NOT BE ATTEMPTED BY ANYONE WHO IS NOT THOROUGHLY FAMILIAR WITH THE PRECAUTIONS NECESSARY WHEN WORKING ON HIGH VOLTAGE EQUIPMENT. DO NOT OPERATE THE RECEIVER WITH THE HIGH VOLTAGE COMPARTMENT SHIELD REMOVED.

KINESCOPE HANDLING PRECAUTIONS

DO NOT REMOVE THE RECEIVER CHASSIS, INSTALL, REMOVE OR HANDLE THE KINESCOPE IN ANY MANNER UNLESS SHATTERPROOF GOGGLES ARE WORN. PEOPLE NOT SO EQUIPPED SHOULD BE KEPT AWAY WHILE HANDLING KINESCOPES. KEEP THE KINESCOPE AWAY FROM THE BODY WHILE HANDLING.

The kinescope bulb encloses a high vacuum and, due to its large surface area, is subjected to considerable air pressure. For this reason, the kinescope must be handled with more care than ordinary receiving tubes.

The large end of the kinescope bulb—particularly that part at the rim of the viewing surface—must not be struck, scratched or subjected to more than moderate pressure at any time. During service if the tube sticks or fails to slip smoothly into its socket, or deflecting yoke, investigate and remove the cause of the trouble. Do not force the tube. Refer to the Receiver Installation section for detailed instructions on kinescope installation. All RCA replacement kinescopes are shipped in special cartons and should be left in the cartons until ready for installation in the receiver.

The following adjustments are necessary when turning the receiver on for the first time.

1. See that the TV-PH switch is in the "TV" position.

2. Turn the receiver "ON" and advance the SOUND VOLUME control to approximately mid-position.

3. Set the STATION SELECTOR to the desired channel.

4. Adjust the FINE TUNING control for best pix and the SOUND VOLUME control for suitable volume.

5. Turn the BRIGHTNESS control fully counter-clockwise, then clockwise until a light pattern appears on the screen.

6. Adjust the VERTICAL hold control until the pattern stops vertical movement.

7. Adjust the HORIZONTAL hold control until a picture is obtained and centered.

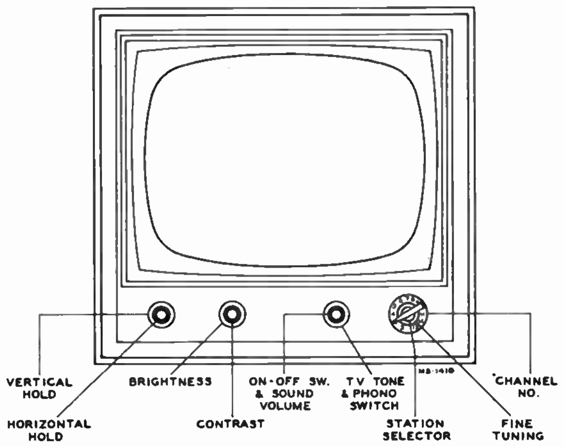

Figure 1—Receiver Operating Controls

8. Adjust the CONTRAST and BRIGHTNESS controls for suitable picture contrast and brightness.

9. In switching from one channel to another, it may be necessary to repeat steps 4 and 8.

10. When the set is turned on again after an idle period it should not be necessary to repeat the adjustment if the positions of the controls have not been changed. If any adjustment is necessary, step number 4 is generally sufficient.

11. If the positions of the controls have been changed, it may be necessary to repeat steps 2 through 8.

12. To use a record player, plug the record-player output cable into the PHONO jack on the rear apron, and set the TV-PH switch to "PH"

INSTALLATION INSTRUCTIONS

UNPACKING.—These receivers are shipped complete in cardboard cartons. The kinescope is shipped in place in the receiver.

Take the receiver out of the carton and remove all packing material.

Make sure that all tubes are in place and are firmly seated in their sockets.

Check to see that the kinescope high voltage lead clip is in place.

Plug a power cord into the 115 volt a-c power source and into the receiver interlock receptacle. Turn the receiver power switch to the "on" position, the brightness control fully clockwise, and the picture control counter-clockwise.

ION TRAP MAGNET ADJUSTMENT.—Set the ion trap magnet approximately in the position shown in Figure 2. Starting from this position immediately adjust the magnet by moving it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest raster on the screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Turn the focus control (shown in Figure 2) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches of this adjustment should be made with the brightness control at the maximum clockwise position with which good line focus can be maintained.

DEFLECTION YOKE ADJUSTMENT.—If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

PICTURE ADJUSTMENTS.—It will now be necessary to obtain a test pattern picture in order to make further adjustments. Connect the antenna transmission line to the receiver.

If the Horizontal Oscillator and AGC System are operating properly, it should be possible to sync the picture at this point. However, if the AGC control is misadjusted, and the receiver is overloading, it may be impossible to sync the picture.

If the receiver is overloading, turn R149 on the rear apron (see Figure 3) counter-clockwise until the set operates normally and the picture can be synced.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT.—Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel then back. Normally the picture will be out of sync. Turn the control clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 2 or 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. Pull-in should occur before the control has been turned 120 degrees from the extreme counter-clockwise position. The picture should remain in sync for approximately 90 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should remain in sync and should not show a black bar in the picture.

If the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Focus Magnet Adjustment."

ALIGNMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync over 90 degrees of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments.

Horizontal Frequency Adjustment.—Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the T110 horizontal frequency adjustment at the rear of the chassis until the picture is just out of sync and the horizontal blanking appears as a vertical or diagonal black bar in the raster. Then turn the T110 core until the bar moves out of the picture leaving it in sync.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T110 rear core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C161A slightly clockwise. If less than 2 bars are present, adjust C161A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the conditions specified under each are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If it is impossible to sync the picture at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure on page 11: For field purposes paragraph "B" under Horizontal Oscillator Waveform Adjustment may be omitted.

FOCUS MAGNET ADJUSTMENT.—The focus magnet should be adjusted so that there is approximately three-eighths inch of space between the rear cardboard shell of the yoke and the flat of the front face of the focus magnet. This spacing gives best average focus over the face of the tube.

The axis of the hole through the magnet should be parallel with the axis of the kinescope neck with the kinescope neck through the center of the opening.

PIN-CUSHION CORRECTION.—Two pin-cushion correction magnets are employed to correct a small amount of pin-cushion of the raster due to the lens effect of the face of the kinescope. These magnets are mounted on small arms, one on each side of the kinescope as shown in Figure 2. The arms hinge in one plane on self tapping screws which act both as a hinge and an adjustment locking screw. When the magnets are swung towards the tube, maximum correction is obtained. Minimum correction is obtained when the arms are swung away from the tube. To adjust the magnets, loosen the two self tapping screws and position the magnets until the sides of the raster appear straight. Tighten the screws without shifting the position of the magnets. In some cases it may be necessary to twist or bend the magnet support arms to obtain the appearance of straight raster edges.

CENTERING ADJUSTMENT.—No electrical centering controls are provided. Centering is accomplished by means of a separate plate on the focus magnet. The centering plates include a locking screw which must be loosened before centering. Up and down adjustment of the plate moves the picture side to side and sidewise adjustment moves the picture up and down.

If a corner of the raster is shadowed, check the position of the ion trap magnet. Reposition the magnet within the range of maximum raster brightness to eliminate the shadow and recenter the picture by adjustment of the focus magnet plate. In no case should the magnet be adjusted to cause any loss of brightness since such operation may cause immediate or eventual damage to the tube. In some cases it may be necessary to shift the position of the focus magnet in order to eliminate a corner shadow.

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS.—Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage hence the brightest and best focused picture, adjust horizontal drive trimmer C161B counter-clockwise until the picture begins to "wrinkle" in the middle then clockwise until the "wrinkle" disappears.

Turn the horizontal linearity control L108 clockwise until the picture begins to "wrinkle" on the right and then counter-clockwise until the "wrinkle" disappears and best linearity is obtained.

Adjust the width control L106 to obtain correct picture width.

A slight readjustment of these three controls may be necessary to obtain the best linearity.

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R173 on chassis rear apron) until the picture fills the mask vertically. Adjust vertical linearity (R181 on rear apron), until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust centering to align the picture with the mask.

FOCUS.—Adjust the focus magnet for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

Recheck the position of the ion trap magnet to make sure that maximum brightness is obtained.

Check to see that the yoke thumbscrew and the focus magnet mounting screws are tight.

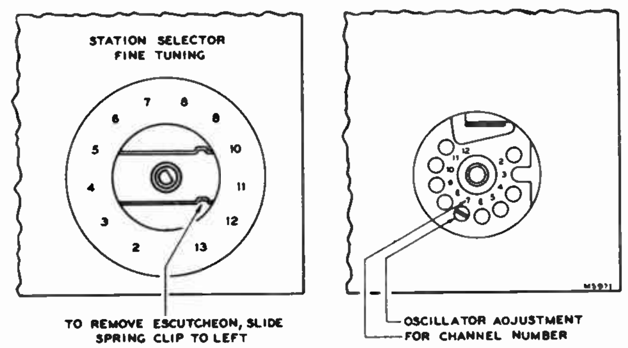

Figure 4—R-F Oscillator Adjustments

CHECK OF R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 9. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 4. Adjustment for channel 13 is on top of the chassis.

AGC THRESHOLD CONTROL.—The AGC threshold control R149 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal and sync the picture. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R149. If the picture requires an appreciable portion of a second to reappear, or bends excessively, R149 should be readjusted.

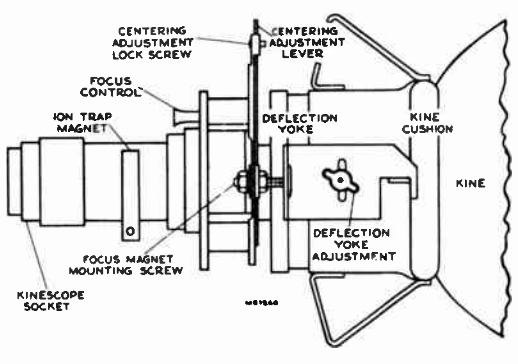

Figure 2—Yoke and Focus Magnet Adjustments

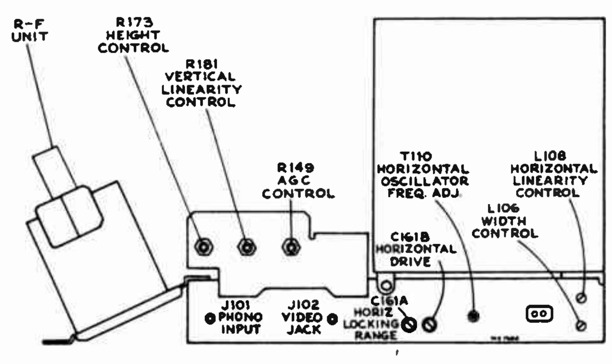

Figure 3—Rear Chassis Adjustments

Turn R149 fully counter-clockwise. The raster may be bent slightly. This should be disregarded. Turn R149 clockwise until there is a very, very slight bend or change of bend in the picture. Then turn R149 counter-clockwise just sufficiently to remove this bend or change of bend.

If the signal is weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R149 clockwise until the snow in the picture becomes more pronounced, then counter-clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far clockwise on a weak signal, then the receiver may overload when a strong signal is received.

FM TRAP ADJUSTMENT.—In some instances interference may be encountered from a strong FM station signal. A trap is provided to eliminate this type of interference. To adjust the trap tune in the station on which the interference is observed and adjust the L203 core on top of the antenna matching transformer for minimum interference in the picture.

CAUTION.—In some receivers, the FM trap L203 will tune down into channel 6 or even into channel 5. Needless to say, such an adjustment will cause greatly reduced sensitivity on these channels. If channels 5 or 6 are to be received, check L203 to make sure that it does not affect sensitivity on these two channels.

Replace the cabinet back and connect the receiver antenna leads to the cabinet back. Make sure that the screws holding it are up tight, otherwise it may rattle or buzz when the receiver is operated at high volume.

KINESCOPE SCREEN CLEANING.—The kinescope safety glass is held in place by four spring clips which may be removed from the back of the front panel. This permits removing the safety glass for cleaning without the necessity of removing the chassis and kinescope.

CHASSIS REMOVAL.—To remove the chassis from the cabinet for repair or installation of a new kinescope, remove the control knobs, the cabinet back, unplug the speaker cable, the kinescope socket, the antenna cable, the yoke and high voltage cable. Take out the chassis bolts under the cabinet. Withdraw the chassis from the back of the cabinet.

KINESCOPE HANDLING PRECAUTION.—Do not install, remove, or handle the kinescope in any manner, unless shatterproof goggles and heavy gloves are worn. People not so equipped should be kept away while handling the kinescope. Keep the kinescope away from the body while handling.

REMOVAL OF KINESCOPE.—To remove the kinescope from the cabinet, loosen the two nuts and disengage the rods alongside the kinescope. Remove the screw which holds the yoke frame to the cabinet. Remove the kinescope, the yoke frame with yoke and focus magnet as an assembly.

Handle this tube by the portion at the edge of the screen. Do not cover the glass bell of the tube with fingermarks as it will produce leakage paths which may interfere with reception. If this portion of the tube has inadvertently been handled, wipe it clean with a soft cloth moistened with "dry" carbon tetrachloride.

INSTALLATION OF KINESCOPE.—Wipe the kinescope screen surface and front panel safety glass clean of all dust and fingermarks with a soft cloth moistened with "Windex" or similar cleaning agent.

Replace the kinescope and chassis by reversal of the removing process. The kinescope should be installed so that the high voltage contact is to the right when looking at it from the rear of the cabinet. The magnet of the ion trap magnet should be to the left.

CABINET ANTENNA.—A cabinet antenna is provided in some receiver models and the leads are brought out near the antenna terminal board. The cabinet antenna may be employed in place of the outdoor antenna in areas where the signals are strong and no reflections are experienced.

ANTENNAS.—The finest television receiver built may be said to be only as good as the antenna design and installation. It is therefore important to select the proper antenna to suit the particular local conditions, to install it properly and orient it correctly.

If two or more stations are available and the two stations are in different directions, it may be possible to make a compromise orientation which will provide a satisfactory signal on all such channels.

If it is impossible to obtain satisfactory results on one or more channels, it may become necessary either to provide means for turning the antenna when switching channels or to install a separate antenna for one or more channels and to switch antennas when switching channels.

In some cases, the antenna should not be installed permanently until the quality of the picture reception has been observed on a television receiver. A temporary transmission line can be run between receiver and the antenna, allowing sufficient slack to permit moving the antenna. Then, with a telephone system connecting an observer at the receiver and an assistant at the antenna, the antenna can be positioned to give the most satisfactory results on the received signal. A shift of direction or a few feet in antenna position may effect a tremendous difference in picture reception.

REFLECTIONS.—Multiple images sometimes known as echoes or ghosts, are caused by the signal arriving at the antenna by two or more routes. The second or subsequent image occurs when a signal arrives at the antenna after being reflected off a building, a hill or other object. In severe cases of reflections, even the sound may be distorted. In less severe cases, reflections may occur that are not noticeable as reflections but that will instead cause a loss of definition in the picture.

Under certain extremely unusual conditions, it may be possible to rotate or position the antenna so that it receives the cleanest picture over a reflected path. If such is the case, the antenna should be so positioned. However, such a position may give variable results as the nature of reflecting surfaces may vary with weather conditions. Wet surfaces have been known to have different reflecting characteristics than dry surfaces.

Depending upon the circumstances, it may be possible to eliminate the reflections by rotating the antenna or by moving it to a new location. In extreme cases, it may be impossible to eliminate the reflection.

INTERFERENCE.—Auto ignition, street cars, electrical machinery and diathermy apparatus may cause interference which spoils the picture. Whenever possible, the antenna location should be removed as far as possible from highways, hospitals, doctors' offices and similar sources of interference. In mounting the antenna, care must be taken to keep the antenna rods at least ¼ wave length (at least 6 feet) away from other antennas, metal roofs, gutters or other metal objects.

Short-wave radio transmitting and receiving equipment may cause interference in the picture in the form of moving ripples. In some instances it may be possible to eliminate the interference by the use of a trap in the antenna transmission line. However, if the interfering signal is on the same frequency as the television station, a trap will provide no improvement.

WEAK PICTURE.—When the installation is near the limit of the area served by the transmitting station, the picture may be speckled, having a "snow" effect, and may not hold steady on the screen. This condition is due to lack of signal strength from the transmitter.

RECEIVER LOCATION.—The owner should be advised of the importance of placing the receiver in the proper location in the room.

The location should be chosen—

—Away from bright windows and so that no bright light will fall directly on the screen. (Some illumination in the room is desirable, however.)

—To give easy access for operation and comfortable viewing.

—To permit convenient connection to the antenna.

—Convenient to an electrical outlet.

—To allow adequate ventilation.

CHASSIS TOP VIEW

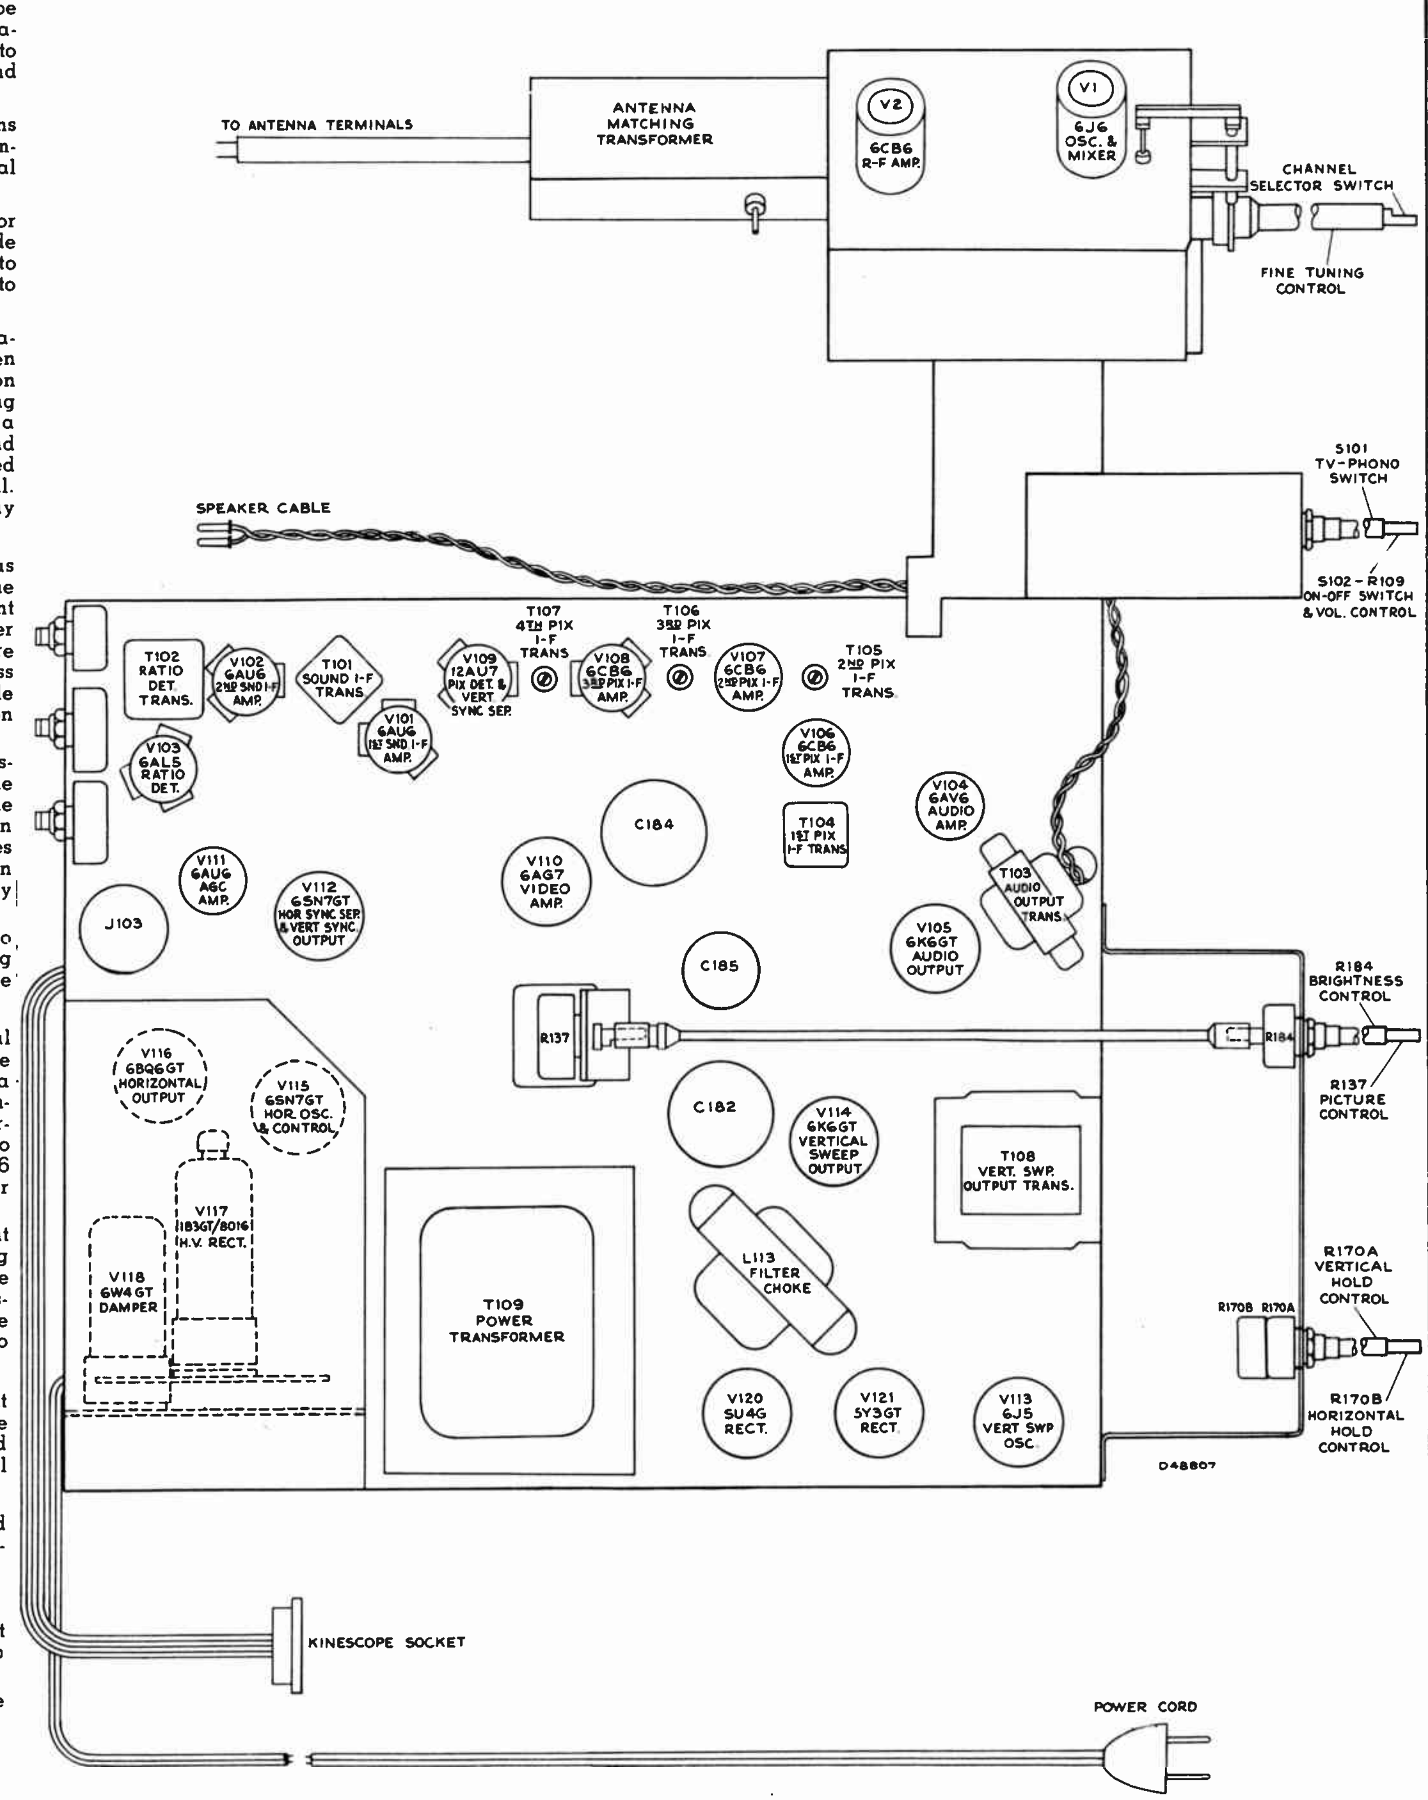

Figure 5—Chassis Top View

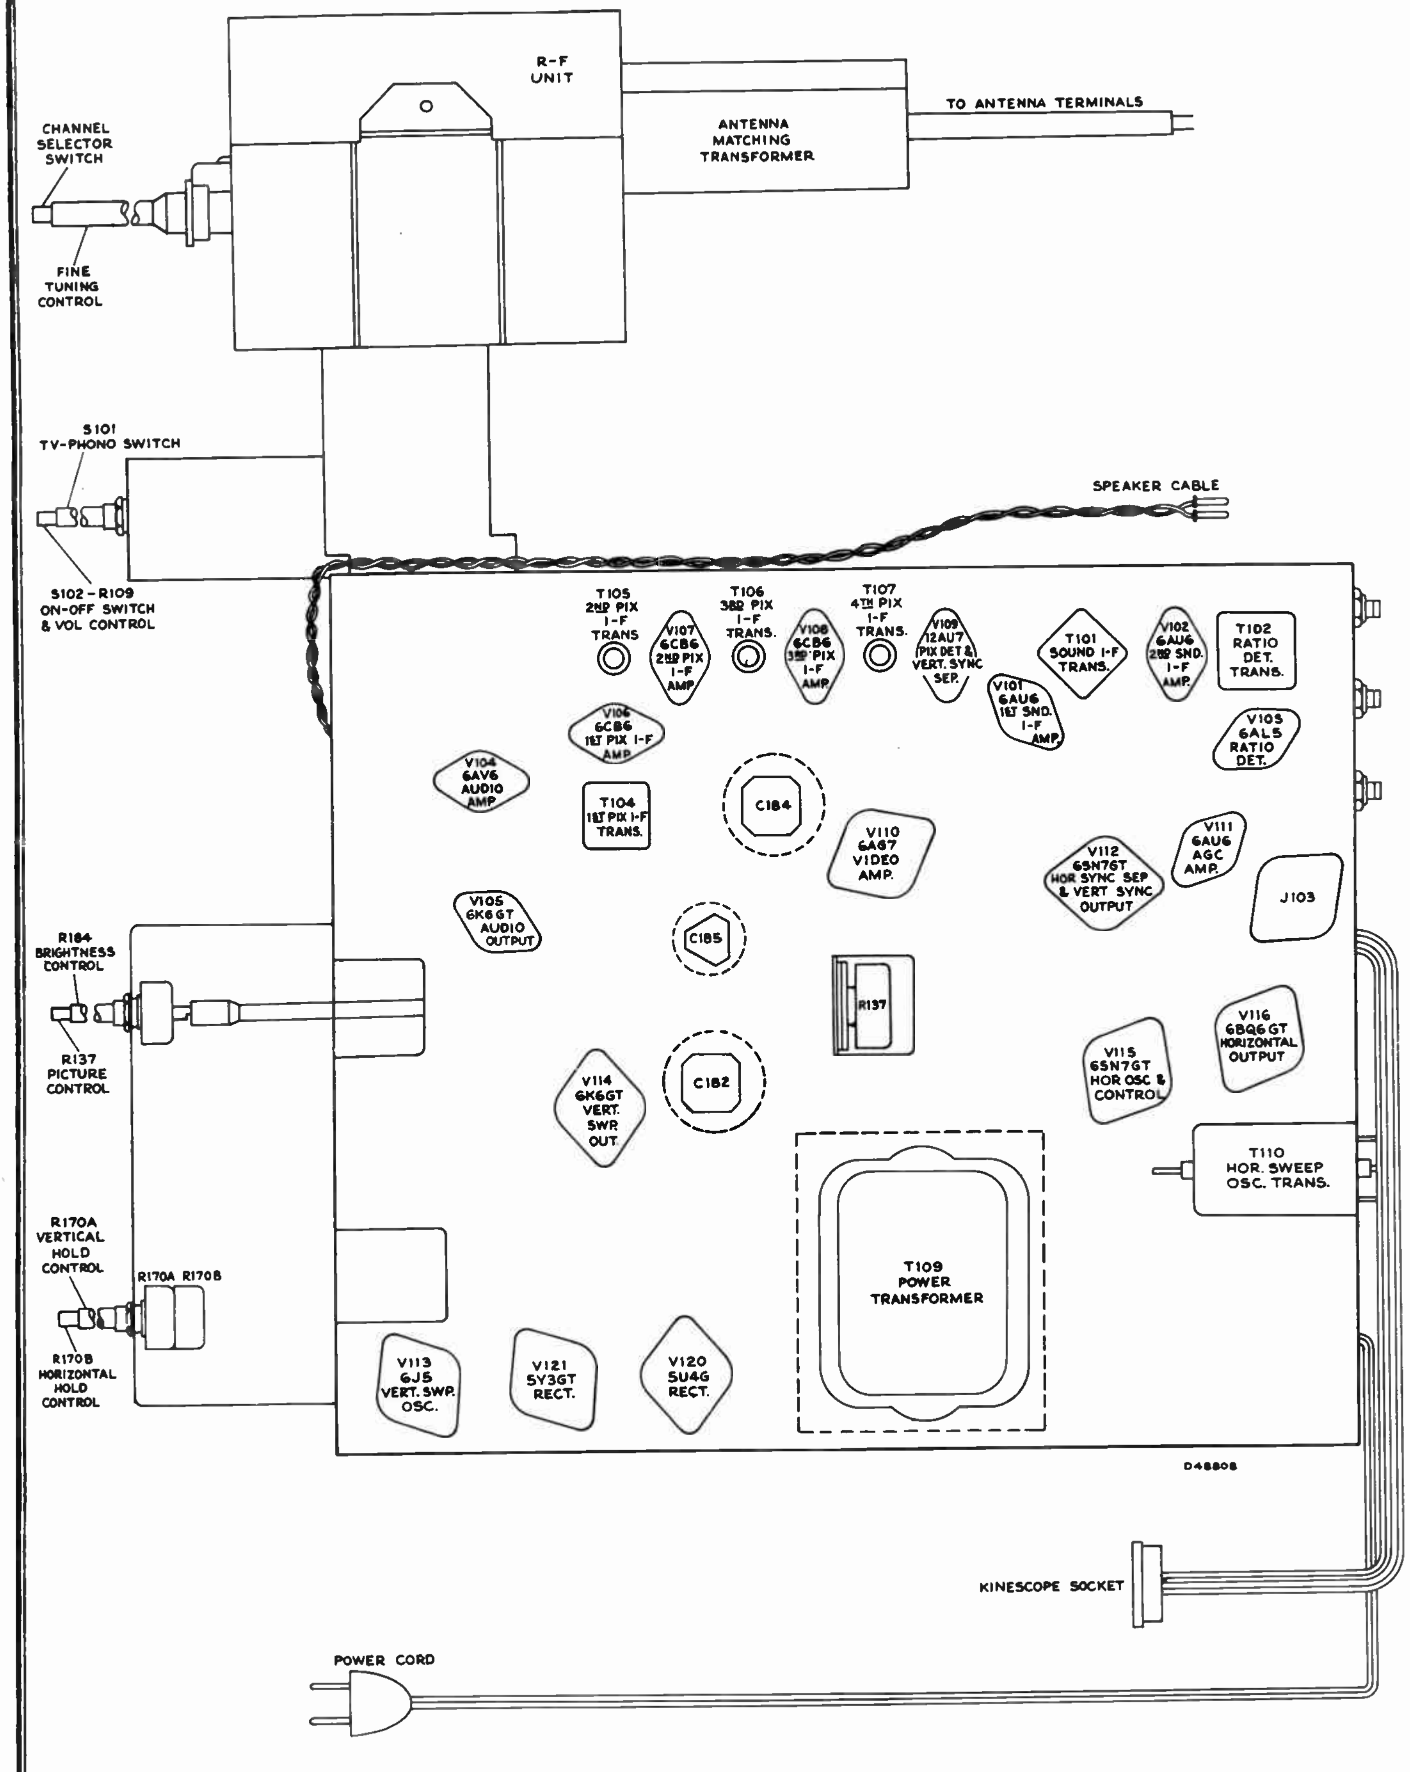

Figure 6—Chassis Bottom View

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of this receiver, it is recommended that the following test equipment be available:

R-F Sweep Generator meeting the following requirements:

(a) Frequency Ranges
- 20 to 30 mc., 1 mc. and 10 mc. sweep width
- 50 to 90 mc., 10 mc. sweep width
- 170 to 225 mc., 10 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

Cathode-Ray Oscilloscope.—For alignment purposes, the oscilloscope employed must have excellent low frequency and phase response, and should be capable of passing a 60-cycle square wave without appreciable distortion.

For video and sync waveform observations, the oscilloscope must have excellent frequency and phase response from 10 cycles to at least two megacycles in all positions of the gain control.

Signal Generator to provide the following frequencies with crystal accuracy.

(a) Intermediate frequencies
- 22.25 and 25.5 mc. conv. and first pix i-f trans.
- 22.75 mc. second picture i-f transformer
- 24.25 mc. fourth picture i-f transformer
- 25.5 mc. third picture i-f transformer
- 25.50 mc. picture carrier
- 27.00 mc. adjacent channel sound trap

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

Heterodyne Frequency Meter with crystal calibrator which covers the frequency range from 80 mc. to 109 mc. and from 200 mc. to 237 mc.

Electronic Voltmeter of Junior or Senior "VoltOhmyst" type and a high voltage multiplier probe for use with this meter to permit m asurements up to 15 kv.

Service Precautions.—If possible, the chassis should be serviced without the kinescope. However, if it is necessary to view the raster during servicing, it would be a great convenience to have a bench mounted kinescope and speaker complete with a set of extension cables.

CAUTION: Do not short the kinescope second anode lead. Its short circuit current presents a considerable overload on the high voltage rectifier V117.

Adjustments Required.—Normally, only the r-f oscillator and mixer lines will require the attention of the service technician. All other circuits are either broad or very stable and hence will seldom require readjustment.

ORDER OF ALIGNMENT.—When a complete receiver alignment is necessary, it can be most conveniently performed in the following order:

(1) R-F unit
(2) Picture i-f transformers
(3) Picture i-f trap
(4) Sweep of picture i-f
(5) Ratio detector alignment
(6) Sound i-f alignment
(7) 4.5 Mc Trap Adjustment
(8) Check of overall response
(9) AGC control adjustment
(10) Horizontal oscillator alignment

R-F UNIT ALIGNMENT.—Disconnect the co-ax link from terminal 2 of the r-f unit terminal board and connect a 39 ohm composition resistor between lugs 1 and 2.

Detune T1 by backing the core all the way out of the coil.

Back the L44 core all the way out. Back the L203 core all the way out.

In order to align the r-f tuner, it will first be necessary to set the channel-13 oscillator to frequency. The shield over the bottom of the r-f unit must be in place when making any adjustments.

The oscillator may be aligned by adjusting it to beat with a crystal-calibrated heterodyne frequency meter. Couple the meter probe loosely to the receiver oscillator.

Set the channel selector switch to 13.

Adjust the heterodyne frequency meter to the correct frequency (236.75 mc).

Set the fine tuning control 30 degrees clockwise from the mechanical center of its range.

Adjust C1 for an audible beat on the heterodyne frequency meter.

Now that the channel-13 oscillator is set to frequency, we may proceed with the r-f alignment.

Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to terminal 3 of the r-f unit. Adjust the bias box potentiometer to produce −3.5 volts of bias at the r-f unit terminal board.

Connect the oscilloscope to the test point TP1 on top of the r-f unit.

Connect the r-f sweep oscillator to the receiver antenna terminals. The method of connection depends upon the output impedance of the sweep. The P300 connections for 300-ohm balanced or 72-ohm single-ended input are shown in the circuit schematic diagram. If the sweep oscillator has a 50-ohm or 72-ohm single-ended output, 300-ohm balanced output can be obtained by connecting as shown in Figure 9.

Connect the signal generator loosely to the receiver antenna terminals.

Set the receiver channel switch to channel 8.

Set the sweep oscillator to cover channel 8.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C9, C11, C16 and C22 for approximately correct curve shape, frequency, and band width as shown in Figure 11.

The correct adjustment of C22 is indicated by maximum amplitude of the curve midway between the markers. C16 tunes the r-f amplifier plate circuit and affects the frequency of the curve most noticeably. C9 tunes the converter grid circuit and affects the tilt of the curve most noticeably (assuming that C22 has been properly adjusted). C11 is the coupling adjustment and hence primarily affects the response band width.

Set the receiver channel switch to channel 6.

Adjust the heterodyne frequency meter to the correct frequency (108.75 mc.).

Set the fine tuning control 30 degrees clockwise from the mechanical center of its range.

Adjust L5 for an audible beat on the heterodyne frequency meter.

ALIGNMENT PROCEDURE

Set the sweep generator to channel 6.

From the signal generator, insert channel 6 sound and picture carrier markers, 83.25 mc. and 87.75 mc.

Adjust L42, L45 and L49 for proper response as shown in Figure 12.

L42 is adjusted to give maximum amplitude of the curve between the markers. L45 primarily affects the tilt of the curve. L49 primarily affects the frequency of response.

Connect the "VoltOhmyst" to the r-f unit test point TP1.

Adjust C7 for −3.0 volts at the test point.

Retouch L42, L45 and L49 for proper response if necessary. If necessary, retouch C11 for proper band width on channel 6. Continue these retouching adjustments until proper response is obtained and −3.0 volts of oscillator injection are present at the test point, TP1.

Set the receiver channel selector switch to channel 8 and readjust C1 for proper oscillator frequency.

Set the sweep oscillator and signal generator to channel 8.

Readjust C9, C16 and C22 for correct curve shape, frequency and band width. Readjust C11 only if necessary.

Switch the receiver, the sweep oscillator and signal generator to channel 13.

Adjust L52 for maximum amplitude of the curve midway between markers and then overshoot the adjustment by turning the slug in the same direction from the initial setting a little more than the amount of turning required to reach maximum amplitude of response.

Adjust C22 for maximum amplitude of response.

Turn off the sweep generator. Adjust the L43 core for correct channel 13 oscillator frequency, then overshoot the adjustment by turning the slug a little more in the same direction from the initial setting. Reset the oscillator to proper frequency by adjustment of C1.

Turn the sweep oscillator back on.

Check the response of channels 7 through 13 by switching the receiver channel switch, sweep oscillator and marker oscillator to each of these channels and observing the response and oscillator injection obtained. See Figure 11 for typical response curves. It should be found that all these channels have the proper shaped response with the markers above 80% response.

If the markers do not fall within this requirement, switch to channel 8 and readjust C9, C11, C16 and C22 as necessary. If C22 required adjustment, the adjustment should be overshot a small amount and corrected by adjustment of L52 to give maximum amplitude of response between the sound and picture carrier markers. The antenna circuit (L52, C22) is broad so that tracking is not particularly critical.

If the valley in the top of the selectivity curves for the high channels is deeper than normal, the curve can be flattened somewhat by decreasing the inductance of L44 by turning the core stud in. Be sure to check for undesirable resonant suck-outs on channels 7 and 8 if this is done.

Turn the sweep oscillator off and check the receiver channel 8 r-f oscillator frequency. If the oscillator is off frequency overshoot the adjustment of C1 and correct by adjusting L43.

Turn the receiver channel selector switch to channel 6. Adjust L5 for correct oscillator frequency.

Turn the sweep oscillator on and to channel 6 and observe the response curve. If necessary readjust L42, L45 and L49. It should not be necessary to touch C11.

Check the oscillator injection voltage at the test point TP1. If necessary adjust C7 to give −3 volts injection. If C7 is adjusted, switch to channel 8, and readjust C9 for proper curve shape, then recheck channel 6.

Switch the receiver through channel 6 down through channel 2 and check for normal response curve shapes and oscillator injection voltage.

Likewise check channels 7 through 13, stopping on 13 for the next step.

With the receiver on channel 13, check the receiver oscillator frequency. Correct by adjustment of C1 if necessary.

Adjust the oscillator to frequency on all channels by switching the receiver and the heterodyne frequency meter to each channel and adjusting the appropriate oscillator trimmer to obtain a beat on the freq. meter. It should be possible to adjust the oscillator to the correct frequency on all channels with the fine tuning control 30 degrees clockwise from the mechanical center of its range.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.	Channel Oscillator Adjustment
2	55.25	59.75	80.750	L1
3	61.25	65.75	86.750	L2
4	67.25	71.75	92.750	L3
5	77.25	81.75	102.750	L4
6	83.25	87.75	108.750	L5
7	175.25	179.75	200.750	L6
8	181.25	185.75	206.750	L7
9	187.25	191.75	212.750	L8
10	193.25	197.75	218.750	L9
11	199.25	203.75	224.750	L10
12	205.25	209.75	230.750	L11
13	211.25	215.75	236.750	C1

Switch to channel 8 and observe the response.

Adjust T1 clockwise while watching the change in response. When T1 is properly adjusted, the selectivity curve will be slightly wider with a slightly deeper valley in its top.

Switch through all channels and observe response, oscillator injection and r-f oscillator frequency. Minor touch-ups of adjustments may be made at this time. However, if C7 or C9 are changed appreciably, then a recheck of the oscillator frequency on all channels should be made.

Reconnect the link from T101 to terminal 2 of the r-f unit terminal board.

Since T1 was adjusted during the r-f unit alignment it will be necessary to sweep the overall i-f response.

R-F UNIT TUBE CHANGES.—Since most of the circuits are low capacitance circuits the r-f unit may require readjustments when the tubes are changed.

If the 6CB6 r-f amplifier tube is changed, it may be necessary to readjust C16 and C22.

If the 6J6 oscillator and mixer tube is changed, then more extensive adjustments are required.

For good conversion efficiency, the oscillator injection to a triode mixer must be held reasonably close to the optimum value. Although there is some latitude in this level, it is nearly expended in the normal variation in injection from channel to channel. Consequently, the adjustment of C7 is limited primarily to establishing the conditions for good conversion. Since changes in oscillator injection affect conversion gain, it also affects the input capacity of the mixer, thus also affecting tracking of the mixer grid circuit. These tube variations with their consequent effect on circuit alignment thereby require readjustment of the r-f unit if maximum conversion efficiency is to be retained after the 6J6 tube is changed. It may be possible, however, to try several 6J6 tubes and select one which gives satisfactory performance without realignment.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—Connect the "VoltOhmyst" to the junction of R142 and R143.

Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction R142 and R143. Adjust the potentiometer for −5.0 volts indication on the "VoltOhmyst".

Set the channel switch to channel number 9, 10 or 11.

Connect the "VoltOhmyst" to pin 4 of V110 (pin 2 if 6CL6 is used) and to ground.

Connect the output of the signal generator to the mixer grid test point TP2 in series with a 1500 mmf ceramic capacitor.

Connect a separate −5 volt bias supply to TP1 with the positive terminal to ground.

Set the generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for maximum indication on the "VoltOhmyst". In each instance the generator should be checked against a crystal calibrator to insure that the generator is on frequency.

ALIGNMENT PROCEDURE

Adjust the signal generator output to give 3 volts on the "VoltOhmyst" as the final adjustment is made.

(1) 24.25 mc.—T107
(2) 25.5 mc.—T106
(3) 22.75 mc.—T105

PICTURE I-F TRAP ADJUSTMENT.—With the same connections as above, tune the generator to 27.00 mc. and adjust the T104 top core for minimum d-c on the "VoltOhmyst". Set the generator output so that this minimum is about 3 volts when final adjustment is made. If necessary, the i-f bias may be reduced in order to obtain the 3 volt reading on the "VoltOhmyst".

SWEEP ALIGNMENT OF PIX I-F.—To align T1 and T104, connect the sweep generator to the mixer grid test point TP2. In series with a 1500 mmf ceramic capacitor use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the r-f unit outer shield.

Connect a separate −5.0 volt bias supply to TP1 with the positive terminal connected to ground and by-pass TP1 to ground with a 1500 mmf. ceramic capacitor.

Set the channel selector switch between channels 2 and 13.

Clip 330 ohm resistors across terminals A and B of T106 and T107.

Preset C115 to minimum capacity.

Adjust the bias box potentiometer to obtain −5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R142 and R143. Leave the AGC control fully clockwise.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T105. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T1 (top) and T104 (bottom) for maximum gain and with 25.5 mc. at 70% of maximum response.

Set the sweep output to give 0.3 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C115 until 22.25 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 12.

Disconnect the diode probe, the 180 ohm and two 330 ohm resistors.

Connect the oscilloscope to pin 4 (pin 2 if 6CL6 is used) of V110 socket.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T105, T106 and T107 to obtain the response shown in Figure 13.

It is especially important that the 22.4 mc. marker should fall at 55% on the overall i-f response curve. If the marker should fall appreciably higher than 55%, trouble may be experienced with sound in the picture. If the marker should fall appreciably below 55% response, the sound sensitivity may be reduced and may cause the sound to be noisy in weak signal areas.

RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first sound i-f grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. In such a case, connect the calibrator to the grid of the third pix i-f amplifier, pin 1 of V108.

Set the frequency of the calibrator to 25.50 mc. (pix carrier) and modulate with 4.5 mc. crystal. The 4.5 mc. signal will be picked off at L102 and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst". Adjust the signal level from the signal generator for 6 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R106 and C108.

Tune the ratio detector secondary T102 bottom core for zero d-c on the "VoltOhmyst".

Repeat adjustments of T102 top for maximum d-c at pin 2 of V103 and T102 bottom for zero d-c at the junction of R106 and C108. Make the final adjustments with the signal input level adjusted to produce 6 volts d-c on the "VoltOhmyst" at pin 2 of V103.

SOUND I-F ALIGNMENT.—Connect the signal generator to the first sound i-f amplifier grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed as above.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the T101 top core for maximum d-c on the "VoltOhmyst".

The output from the signal generator should be set to produce approximately 6.0 volts on the "VoltOhmyst" when the final touches on the above adjustment are made.

4.5 MC. TRAP ADJUSTMENT.—Connect the signal generator in series with a 1,000 ohm resistor to pin 2 of V109. Set the generator to 4.5 mc. and modulate it 30% with 400 cycles. Set the output to approximately 0.5 volts.

Short the third pix i-f grid to ground, pin 1, V108, to prevent noise from masking the output indication.

Connect the crystal diode probe of an oscilloscope to the plate of the video amplifier, pin 8 (pin 6 if 6CL6 is used) of V110.

Adjust the core of L103 for minimum output on the oscilloscope.

Remove the short from pin 1, V108 to ground.

As an alternate method, this step may be omitted at this point in the alignment procedure and the adjustment made "on the air" after the alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L103 requires no adjustment. If a 4.5 mc. beat is present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L103 for minimum beat.

CHECK OF OVERALL RESPONSE.—If desired, the overall response of the receiver can be checked on each channel.

Connect the r-f sweep generator to the receiver antenna input terminals. If necessary, employ one of the pads shown in Figure 9 to match the sweep output cable to the r-f unit.

Connect the signal generator loosely to the first pix i-f amplifier grid.

Adjust the bias potentiometer to obtain −5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R142 and R143.

Connect the oscilloscope to pin 4 (pin 2 if 6CL6 is used) of V110.

Check the response of channels 2 through 13 by switching the receiver channel switch and sweep oscillator to each of these channels and observing the response obtained. On each channel, adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

I-F markers at 22.4 mc., 24.75 mc. and 25.5 mc. should be provided by the signal generator.

The response obtained in this manner should be very similar to that shown in Figure 13.

Some curves may show a 10% sag in the top between 22.75 mc. and 24.75 mc. while others may show a 10% peak in this region. This may be considered normal.

If the picture carrier is consistently high or low on all channels, T106 may be adjusted slightly. Do not adjust T105.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 8 (pin 6 if 6CL6 is used) of V110.

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

ALIGNMENT PROCEDURE

HORIZONTAL OSCILLATOR ADJUSTMENT.—Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R170B, then adjust the T110 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T110 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T110 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C161B, the width control L106 and the linearity control L108 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T110 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T110 frequency core (on the rear apron) until the picture falls out of sync and three or four diagonal black bars sloping down to the right appear on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain three or four diagonal black bars on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T110 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture falls out of sync with the diagonal bars sloping down to the right. Continue to turn the frequency core in the same direction. No more than three or four bars should appear on the screen. Instead, the horizontal oscillator should begin the motorboat. Retouch the adjustment of the T110 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T110. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 14. Adjust the waveform adjustment core of T110 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T110 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C161A slightly clockwise. If less than 2 bars are present, adjust C161A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T110 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves to the left side of the screen leaving the picture in synchronization.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to construct the pad.

RESPONSE CURVES.—The response curves shown on page 14 and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, some variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

NOTE ON R-F UNIT ALIGNMENT.—Because of the frequency spectrum involved and the nature of the device, many of the r-f unit leads and components are critical in some respects. Even the power supply leads form loops which couple to the tuned circuits, and if resonant at any of the frequencies involved in the performance of the tuner, may cause serious departures from the desired characteristics. In the design of the receiver these undesirable resonant loops have been shifted far enough away in frequency to allow reasonable latitude in their components and physical arrangement without being troublesome. When the r-f unit is aligned in the receiver, no trouble from resonant loops should be experienced. However, if the unit is aligned in a jig separate from the receiver, attention should be paid to insure that unwanted resonances do not exist which might present a faulty representation of r-f unit alignment.

A resonant circuit exists between the r-f tuner chassis and the outer shield box, which couples into the antenna and r-f plate circuits. The frequency of this resonance depends on the physical structure of the shield box, and the capacitance between the tuner chassis and the front plate. In the KRK8 units, this resonance should fall between 120 and 135 mc. and is controlled in the design by using insulating washers of different thicknesses (in the front plate to tuner chassis mounting) to compensate for differences in the shield boxes of different models of receivers. The performance of the tuner, particularly on channels 7 and 8 will be impaired if the proper washers for the particular shield box involved are not used. Obviously then, if the r-f unit is removed for service, the washers should be replaced in the correct order when the unit is replaced.

ALIGNMENT TABLE

THE DETAILED ALIGNMENT PROCEDURE BEGINNING ON PAGE 16 SHOULD BE READ BEFORE ALIGNMENT BY USE OF THE TABLE IS ATTEMPTED

STEP. No.	CONNECT SIGNAL GENERATOR TO	SIGNAL GEN. FREQ. MC.	CONNECT SWEEP GENERATOR TO	SWEEP GEN. FREQ. MC.	CONNECT HETERODYNE FREQ. METER TO	HET. METER FREQ. MC.	CONNECT "VOLTOHMYST" TO	MISCELLANEOUS CONNECTIONS AND INSTRUCTIONS	ADJUST	REFER TO
	R-F UNIT ALIGNMENT									
1	Disconnect the co-ax link from terminal 2 of the r-f unit terminal board and connect a 39 ohm composition resistor between lugs 1 and 2. Detune T1 by backing the core all the way out of the coil. Back the L44 core all the way out. Back the L203 core all the way out. In order to align the r-f tuner, it will first be necessary to set the channel 13 oscillator to frequency. The shield over the bottom of the r-f unit must be in place when making any adjustments.									
2	Not used		Not used		Loosely coupled to r-f oscillator	236.75 MC.	Not used	Fine tuning 30 degrees clockwise from mechanical center of its range. Receiver on channel 13.	C1 for an audible beat on het. freq. meter	Fig. 7
3	"		"				Connect "Volt-Ohmyst" to terminal 3 of the r-f unit terminal board	Turn AGC control fully clockwise. Connect bias box to terminal 3 of r-f unit term. board	Adjust the bias box potentiometer for —3.5 volts.	
4	Antenna terminal (loosely)	181.25 185.75	Antenna terminals (see text for precaution)	Sweeping channel 8	Not used	—	Not used	Rec. on chan. 8. Connect oscilloscope to TP1. Adjust C9, C11, C16 and C22 for correct curve shape, frequency and band width. C22 is adjusted to give max. amplitude between markers. C9 affects tilt and C16 affects the frequency of response. C11 affects the response band width.		Fig. 7 Fig. 8
5	Not used		Not used	Not used	Loosely coupled to r-f oscillator	108.75	"	Rec. on channel 6	L5 for audible beat on het. freq. meter.	Fig. 8
6	Antenna terminal (loosely)	83.25 87.75	Antenna terminals (see text for precaution)	Channel 6	Not used	—	"	Rec. on chan. 6. Adjust L42, L45 and L49 for proper response. L42 is adjusted to give max. amplitude between markers. L45 primarily affects tilt and L49 primarily affects freq. of response. If necessary, retouch C11 for proper width.		Fig. 12
7	Not used	—	Not used	—	Not used	—	Connect "Volt-Ohmyst" to r-f unit test point TP1	Rec. on channel 6	Adjust C7 for —3.0 volts at the test point	Fig. 7 Fig. 9
8	Repeat above steps until the specified conditions are obtained.									
9	Not used		Not used	—	Loosely coupled to r-f oscillator	206.75		Rec. on chan. 8	C1 for audible beat on het. freq. meter	Fig. 7
10	Antenna terminal (loosely)	181.25 185.75	Antenna terminals (see text for precaution)	Sweeping chonnel 8	Not used	—	Not used	Rec. on chan. 8. Readjust C9, C16 and C22 for correct curve shape, frequency and band width. Readjust C11 only if necessary.		Fig. 7 Fig. 12 (8)
11	"	211.25 215.75	"	Sweeping channel 13	Not used	—	Not used	Rec. on chan. 13. Adjust L52 for max. amplitude between markers, overshoot a little more than required to reach max. response. Adjust C22 to regain max. amplitude of response.		Fig. 7 Fig. 12 (13)
12	"	215.75	Not used	—	Loosely coupled to r-f oscillator	236.75		Receiver on chan. 13. Adjust L43 for correct channel 13 osc. freq. then overshoot. Reset the osc. to proper freq. by adjustment of C1.		Fig. 7 Fig. 8
13	"	205.25 209.75	Antenna terminals (see text for precaution)	channel 12	Not used	—	Connect "Volt-Ohmyst" to r-f unit test point TP1	Rec. on chan. 12	Check to see that response is correct and —3.0 volts of osc. injection is present	Fig. 8 Fig. 12
14	"	199.25 203.75		channel 11	"	—	"	Rec. on chan. 11	"	Fig. 12 (11)
15	"	193.25 197.75	"	channel 10	"	—	"	Rec. on chan. 10	"	Fig. 12 (10)
16	"	187.25 191.75	"	channel 9	"	—	"	Rec. on chan. 9	"	Fig. 12 (9)
17	"	181.25 185.75	"	channel 8	"	—	"	Rec. on chan. 8	"	Fig. 12 (8)
18	"	175.25 179.75	"	channel 7	"	—	"	Rec. on chan. 7	"	Fig. 12 (7)
19	If the response of any channel (steps 13 through 18) is below 80% at either marker, repeat step 10 and adjust C9, C11, C16 and C22 as necessary to pull response up on the low channel yet maintain correct response on channel 8. If C22 required adjustment, the adjustment should be overshot a small amount and corrected by adjustment of L52 to give maximum amplitude of response between the sound and picture carrier markers.									
20	Repeat step 9. If the oscillator is off frequency overshoot the adjustment of C1 and correct by adjusting L43.									
21	Repeat steps 13 through 20 until all requirements are obtained.									
22	Not used	—	Not used	—	Loosely coupled to r-f oscillator	108.75		Rec. on chan. 6	L5 for zero beat on het. freq. meter	Fig. 8
23	Antenna terminals (loosely)	83.25 87.75	Ant. terminals (see text for precaution)	Sweeping channel 6	Not used	—	Not used	Observe response. If necessary readjust L42, L45 and L49. It should not be necessary to touch C11.		Fig. 7 Fig. 12
24	Not used	—	Not used	—	Not used	—	Connect "Volt-Ohmyst" to the r-f unit test point TP1	Check osc. injection. If necessary adjust C7 to give —3 volts. If C7 is adjusted, switch to channel 8, and readjust C9 for proper response then repeat step 23.		Fig. 7 Fig. 12
25	Antenna terminals (loosely)	77.25 81.75	Ant. terminals (see text for precaution)	channel 5	"	—	"	Rec. on chan. 5	Check to see that response is correct and —3.0 volts of osc. injection is present	Fig. 12 (5)

ALIGNMENT TABLE

STEP No.	CONNECT SIGNAL GENERATOR TO	SIGNAL GEN. FREQ. MC.	CONNECT SWEEP GENERATOR TO	SWEEP GEN. FREQ. MC.	CONNECT HETERODYNE FREQ. METER	HET. FREQ. METER MC.	CONNECT "VOLTOHMYST" TO	MISCELLANEOUS CONNECTIONS AND INSTRUCTIONS	ADJUST	REFER TO
26	Antenna terminals (loosely)	67.25 71.75	Ant. terminals (see text for precaution)	channel 4	Not used	—	Connect "VoltOhmyst" to the r-f unit test point TP1	Rec. on chan. 4	Check to see that response is correct and —3.0 volts of osc. injection is present	Fig. 12 (4)
27	"	61.25 65.75	"	channel 3	"	—	"	Rec. on chan. 3	"	Fig. 12 (3)
28	"	55.25 59.75	"	channel 2	"	—	"	Rec. on chan. 2	"	Fig. 12 (2)
29	Likewise check channels 7 through 13, as outlined in steps 18 back through 13, stopping on channel 13 for next step.									
30	Antenna terminals	215.75	Not used	—	Loosely coupled to r-f oscillator	236.75	Not used	Fine tuning 30 degrees clockwise from mechanical center of its range. Receiver on channel 13	C1 for zero beat on het. freq. meter	Fig. 7
31	"	209.75	"	—	"	230.75	"	Rec. on chan. 12	L11 as above	Fig. 8

SERVICE SUGGESTIONS

Following is a list of symptoms of possible failures and an indication of some of the possible faults:

NO RASTER ON KINESCOPE:

(1) Incorrect adjustment of ion trap magnet. Magnet reversed either front to back or top to bottom.
(2) V115 or V116 inoperative. Check waveforms on grids and plates.
(3) No high voltage—if horizontal deflection is operating as evidenced by the correct waveform on terminal 1 of high voltage transformer, the trouble can be isolated to the 1B3GT circuit. Either the T111 high voltage winding is open, the 1B3GT tube is defective or its filament circuit is open.
(4) V110 circuit, inoperative—Refer to schematic and waveform chart.
(5) Damper tube (V118) inoperative.
(6) Defective kinescope.
(7) R184 open.
(8) No receiver plate voltage—filter capacitor shorted—or filter choke open.

NO VERTICAL DEFLECTION:

(1) V113 or V114 inoperative. Check voltage and waveforms on grids and plates.
(2) T108 open.
(3) Vertical deflection coils open.

SMALL RASTER:

(1) Low Plus B or low line voltage.
(2) V116, V120 or V121 defective.

POOR VERTICAL LINEARITY:

(1) If adjustments cannot correct, change V114.
(2) Vertical output transformer T108 defective.
(3) V113 defective—check voltage and waveforms on grid and plate.
(4) C151, C153, C152, C155, or C156 defective.
(5) Low plate voltage—check rectifiers and capacitors in supply circuits.
(6) If height is insufficient, try changing V113.

POOR HORIZONTAL LINEARITY:

(1) If adjustments do not correct, change V116, or V118.
(2) T108 or L108 defective.
(3) C176 or C177 defective.

WRINKLES ON SIDE OF RASTER:

(1) C181 defective.
(2) Defective yoke.

PICTURE OUT OF SYNC HORIZONTALLY:

(1) T110 incorrectly tuned.
(2) R192, R193 or R170B defective.

TRAPEZOIDAL OR NON SYMMETRICAL RASTER:

(1) Improper adjustment of centering of focus magnet or ion trap magnet.
(2) Defective yoke.

RASTER AND SIGNAL ON KINESCOPE BUT NO SOUND:

(1) L102 defective.
(2) Sound i-f, ratio detector or audio amplifier inoperative—check V101, V102, V103 and their socket voltages.
(3) Audio system defective.
(4) Speaker defective.

SIGNAL AT KINESCOPE GRID BUT NO SYNC:

(1) AGC control R149 misadjusted.
(2) V111, inoperative. Check voltage and waveforms at its grid and plate.

SIGNAL ON KINESCOPE GRID BUT NO VERTICAL SYNC:

(1) Check V113 and associated circuit.
(2) Integrating network inoperative—Check.
(3) V109B or V112B defective or associated circuit defective.
(4) Gas current grid emission or grid cathode leakage in V112. Replace.

SIGNAL ON KINESCOPE GRID BUT NO HORIZONTAL SYNC:

(1) T110 misadjusted—readjust as instructed on page 11.
(2) V112 inoperative—check socket voltages and waveforms.
(3) T110 defective.
(4) C142, C161A, C163, C165, C167, C166, C168, C187 or C188 defective.
(5) If horizontal speed is completely off and cannot be adjusted check R192, R193, R170B, R196, R195 and R198.

SOUND AND RASTER BUT NO PICTURE OR SYNC:

(1) Picture, detector or video amplifier defective—check V109A and V110—check socket voltages.
(2) Bad contact to kinescope cathode.

PICTURE STABLE BUT POOR RESOLUTION:

(1) V109A or V110 defective.
(2) Peaking coils defective—check resistance.
(3) Make sure that the focus control operates on both sides of proper focus.
(4) R-F and I-F circuits misaligned.

PICTURE SMEAR.

(1) R-F or I-F circuits misaligned.
(2) Open peaking coil.
(3) This trouble can originate at the transmitter—check on another station.

PICTURE JITTER:

(1) AGC control R149 misadjusted.
(2) If regular sections at the left picture are displaced change V116.
(3) Vertical instability may be due to loose connections or noise.
(4) Horizontal instability may be due to unstable transmitted sync.

RASTER BUT NO SOUND, PICTURE OR SYNC:

(1) Defective antenna or transmission line.
(2) R-F oscillator off frequency.
(3) R-F unit inoperative—check V1, V2.

DARK VERTICAL LINE ON LEFT OF PICTURE:

(1) Reduce horizontal drive and readjust width and horizontal linearity.
(2) Replace V116.

LIGHT VERTICAL LINE ON LEFT OF PICTURE:

(1) V118 defective.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 15000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

R-F UNIT WIRING DIAGRAM

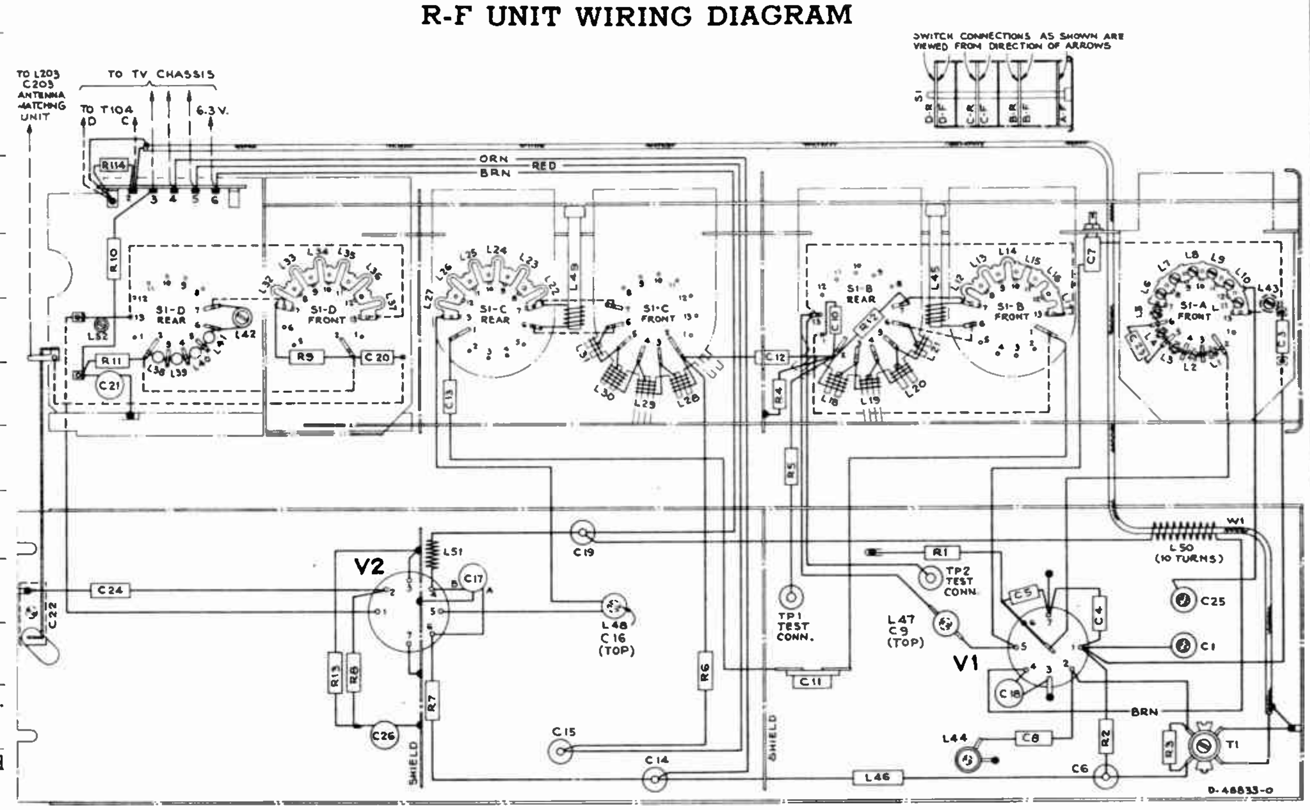

Figure 65—KRK-8D R-F Unit Wiring Diagram

CRITICAL LEAD DRESS:

1. Keep all wiring in the pix i-f, sound i-f and video circuits as short as possible.
2. Keep the leads on C118, C120, C122, C124, C126, R114, R121 and R123 as short and direct as possible.
3. Do not run any leads under C115 trimmer capacitor.
4. Dress C118 vertically parallel to terminals A and B of T104. Dress C135 parallel to terminals A and B of T104 close to the chassis.
5. Keep C127 away from chassis with no more than 1/4 inch leads at each end.
6. Dress the lead from T105(C) to the terminal board, close to the chassis.
7. Keep all filament leads dressed close to the chassis.
8. Ground filaments of V106, V107 and V108 independently of tube shields (pin 8). Use ground lances provided near pins of each socket.
9. Dress lead from pin 5 [illegible] to the chassis.
10. Keep le[illegible]
11. Dress L102, L104, L105, L114, C130, R131, R133, R135, R139 and C132 away from the chassis.
12. Do not tape kinescope cathode lead in with other kinescope leads.
13. Do not change the bus wire connections to pin 2 of V101 and V102. Sleeving is used to insure length and to prevent shorting.
14. Keep leads on C136 short and direct. Dress the lead from C136 to pin 5 of V111 as shown in wiring diagram.
15. Do not dress C170 in such a position that adjustment of T110 is inaccessible.
16. Keep the leads on R201 as short and direct as possible.
17. Dress the lead from pin 3 of V113 to C153 as shown in the wiring diagram.
18. Mount C183 directly on the terminal board provided keeping it as far away from T109 as possible.
19. Dress all leads in the high voltage compartment away from each other and away from the high voltage transformer.

CHASSIS WIRING DIAGRAM

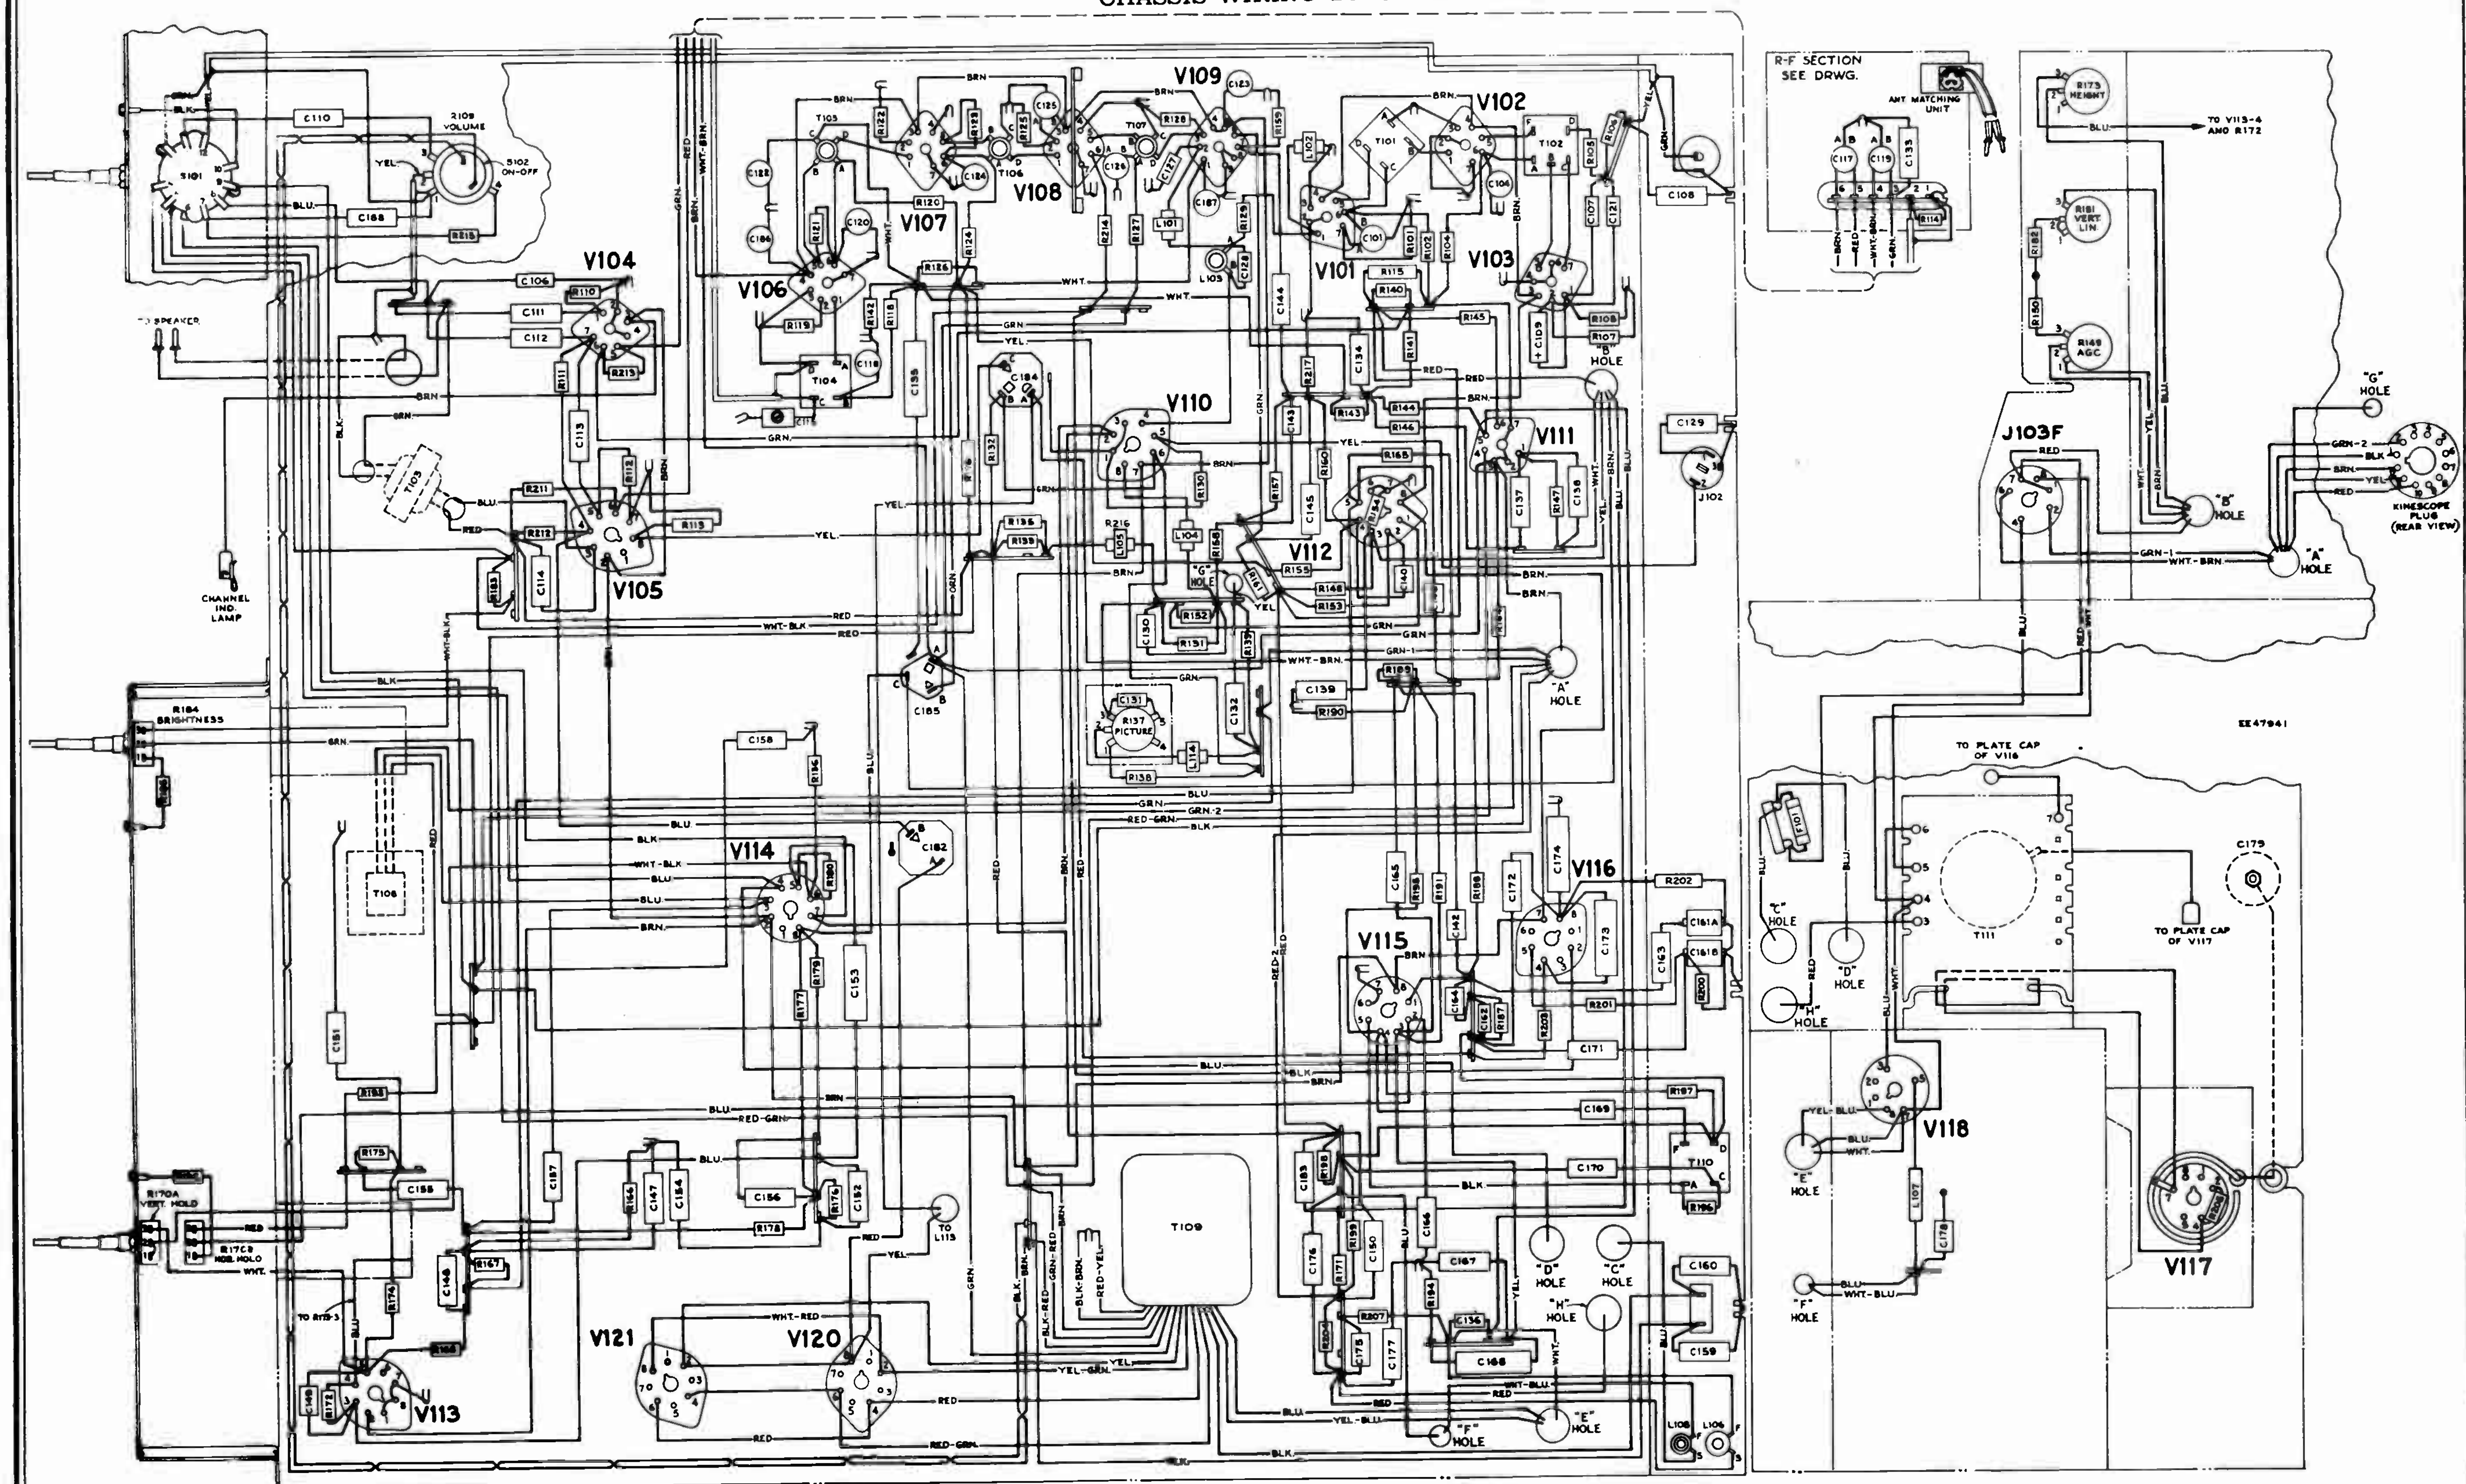

Figure 66—Chassis Wiring Diagram

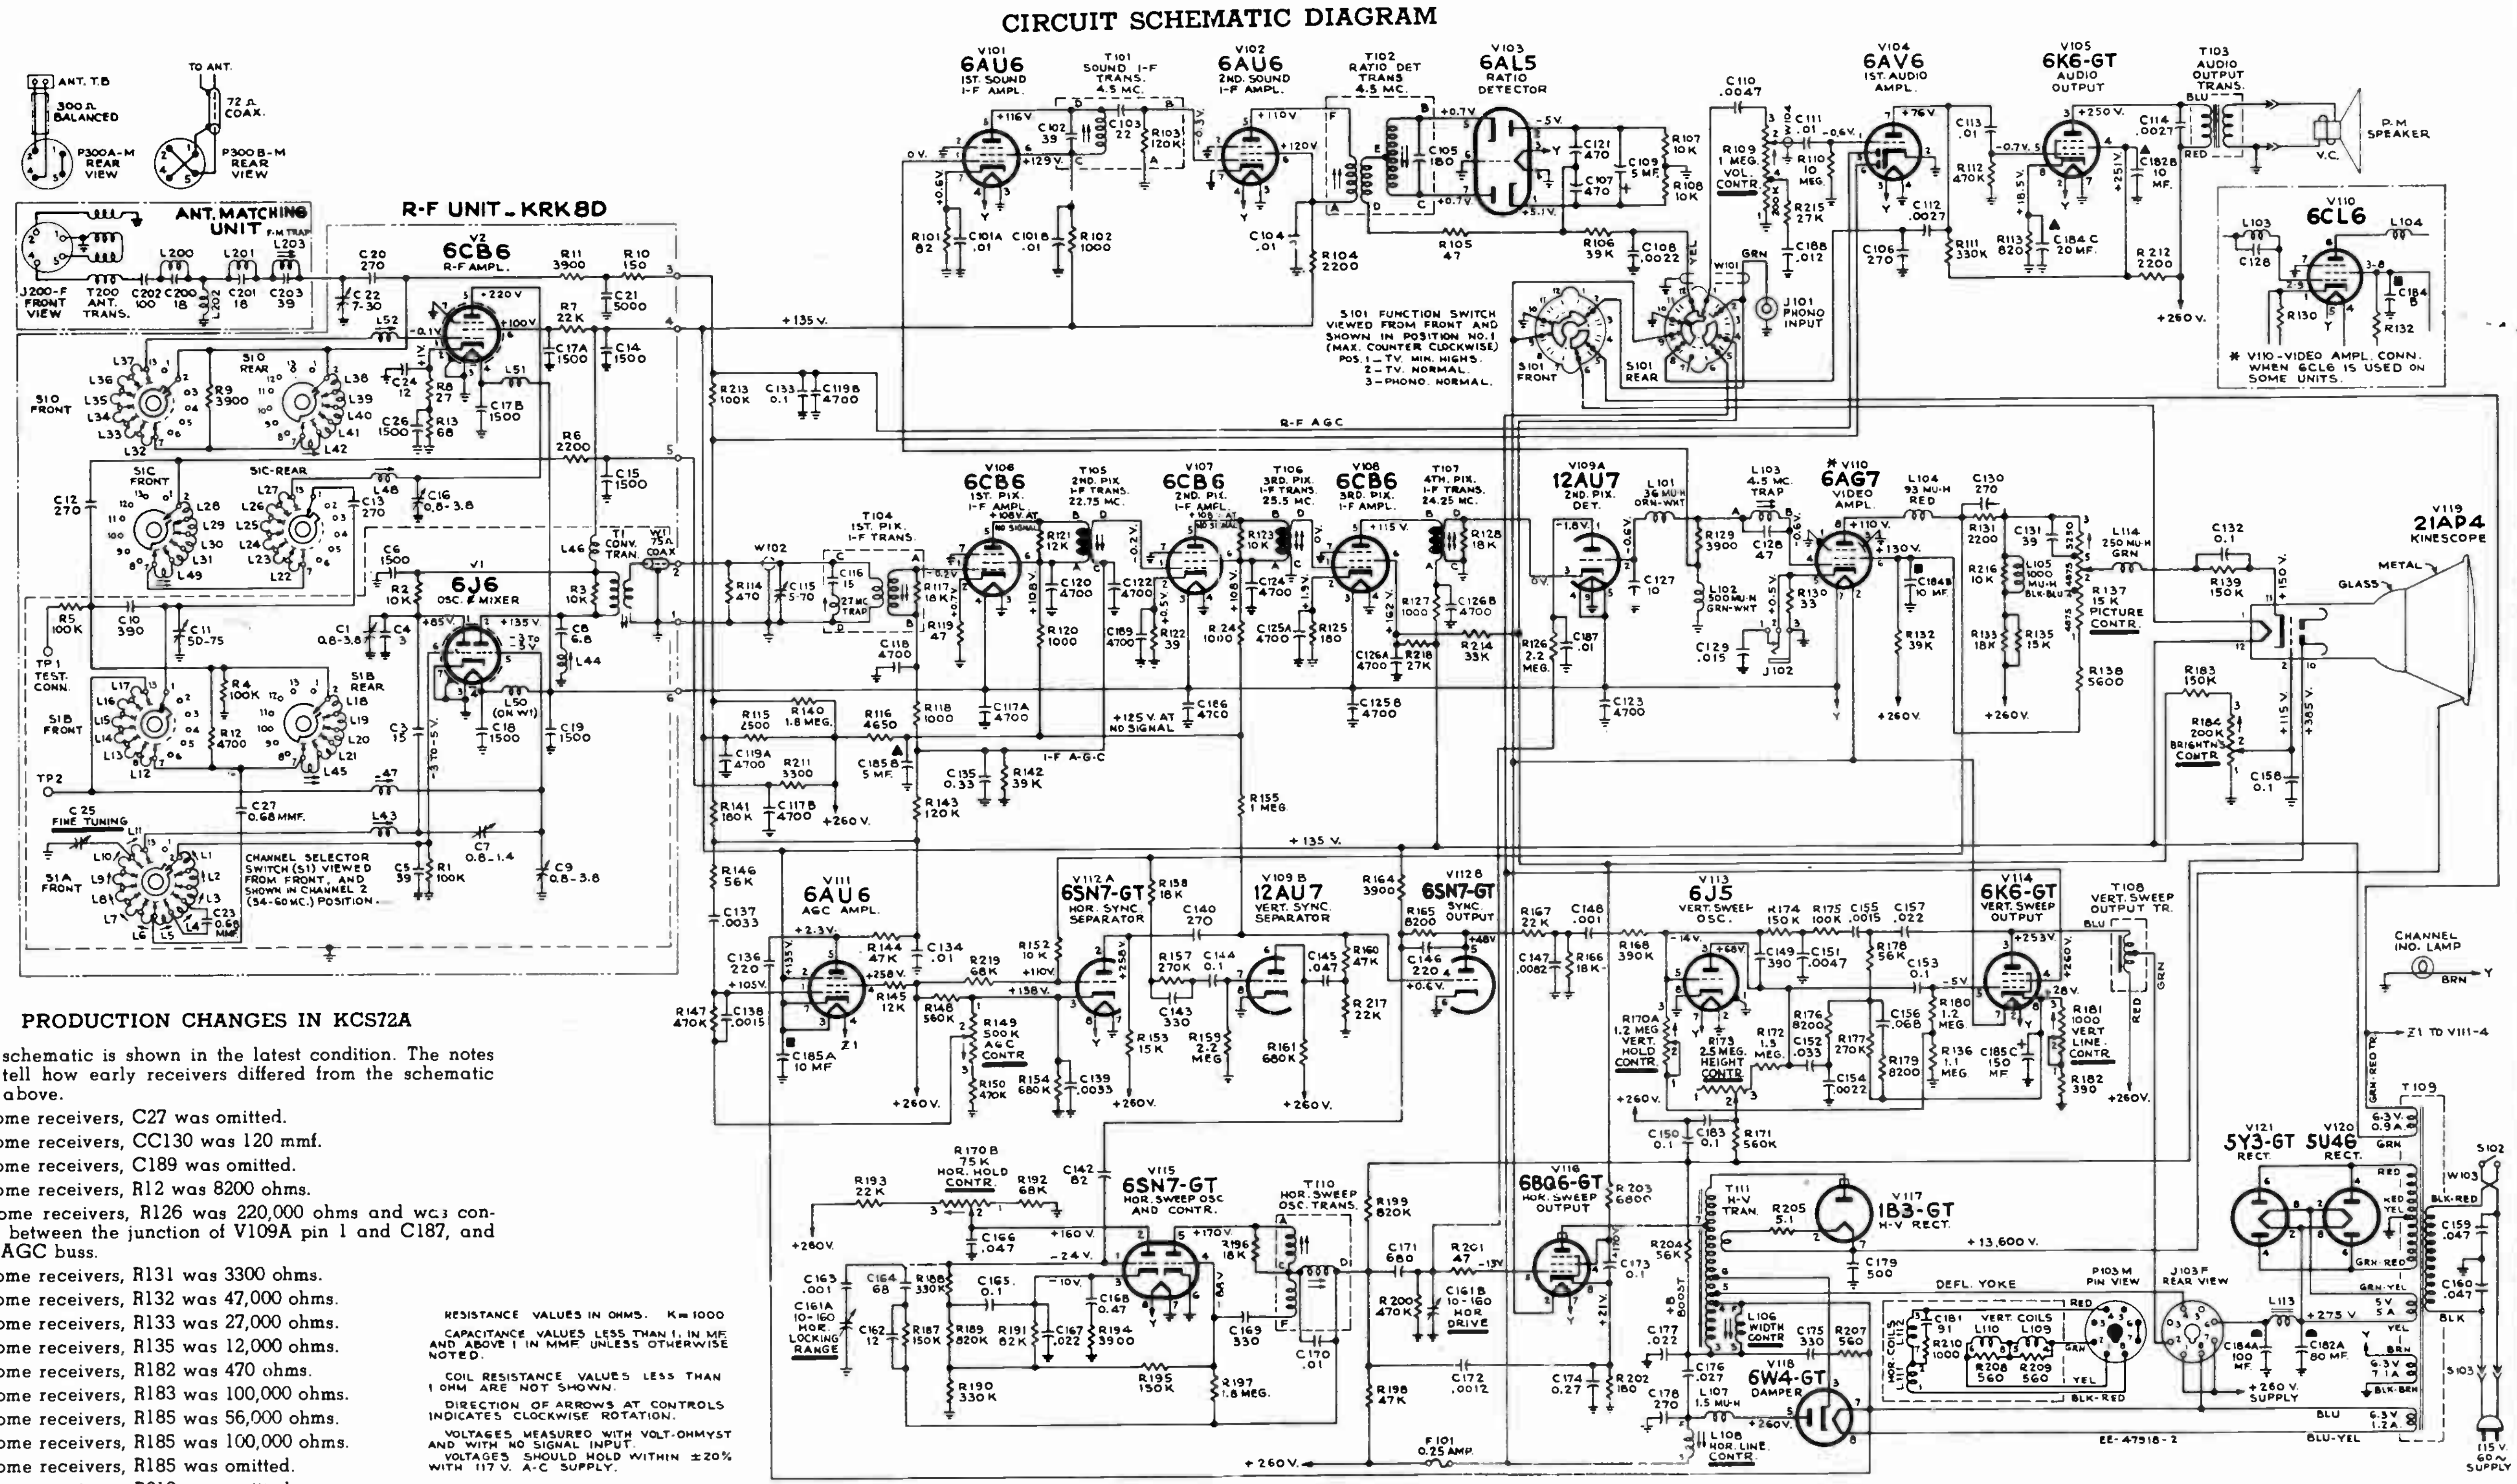

PRODUCTION CHANGES IN KCS72A

The schematic is shown in the latest condition. The notes below tell how early receivers differed from the schematic shown above.

In some receivers, C27 was omitted.

In some receivers, CC130 was 120 mmf.

In some receivers, C189 was omitted.

In some receivers, R12 was 8200 ohms.

In some receivers, R126 was 220,000 ohms and was connected between the junction of V109A pin 1 and C187, and the i-f AGC buss.

In some receivers, R131 was 3300 ohms.

In some receivers, R132 was 47,000 ohms.

In some receivers, R133 was 27,000 ohms.

In some receivers, R135 was 12,000 ohms.

In some receivers, R182 was 470 ohms.

In some receivers, R183 was 100,000 ohms.

In some receivers, R185 was 56,000 ohms.

In some receivers, R185 was 100,000 ohms.

In some receivers, R185 was omitted.

In some receivers, R218 was omitted.

In some receivers, R219 was omitted.

In some receivers, V119-10 was connected to the junction of R171 and C183.

In some receivers, V110 used 6AC7 tube.

All resistance values in ohms. K = 1000.
KCS72A-M1 chassis uses 6AG7 video amplifier.
KCS72A-M2 chassis uses 6CL6 video amplifier.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.
Model 21T207G uses glass Kinescope 21EP4.

Directions of arrows at controls indicates clockwise rotation.

All voltages measured with "Volt-Ohmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

Figure 67—Chassis KCS72A Circuit Schematic Diagram

STOCK No.	DESCRIPTION
	R-F UNIT ASSEMBLIES
	KRK8D
75188	Board—Terminal board, 5 contact and ground
76845	Bracket—Vertical bracket for holding oscillator tube shield
75201	Cable—75 ohm coax cable (7¼") complete with coil (W1, L50)
76965	Capacitor—Ceramic, variable, for fine tuning—plunger type (C2)
71088	Capacitor—Headed lead, 0.68 mmf. (C27)
76968	Capacitor—Ceramic, 3 mmf. (C4)
75200	Capacitor—Ceramic, 12 mmf. (C24)
45465	Capacitor—Ceramic, 15 mmf. (C3)
75196	Capacitor—Ceramic, 39 mmf. (C5)
75199	Capacitor—Ceramic, 270 mmf. (C12, C13, C20)
75641	Capacitor—Ceramic, 390 mmf. (C10)
75166	Capacitor—Ceramic, 1500 mmf. (C6, C14, C15, C19)
73748	Capacitor—Ceramic, 1500 mmf. (C18, C26)
75089	Capacitor—Ceramic, dual 1500 mmf. (C17A, C17B)
73473	Capacitor—Ceramic, 5000 mmf. (C21)
75172	Capacitor—Tubular, steatite, adjustable, 0.65—1.2 mmf. (C7)
71504	Capacitor—Ceramic, 0.68 mmf. (C23)
75184	Capacitor—Ceramic, adjustable, 0.75—4 mmf., complete with adjusting stud (C1)
75197	Capacitor—Ceramic, 6.8 mmf. (C8)
75189	Capacitor—Adjustable, 7-30 mmf. (C22)
75174	Capacitor—Ceramic, trimmer, 50-75 mmf. (C11)
76143	Clip—Tubular clip for mounting standoff capacitors
73477	Coil—Choke coil (L51)
75202	Coil—Choke coil, .56 muh (L46)
75185	Coil—Converter plate loading coil (L44)
75182	Coil—Trimmer coil (1½ turns) with adjustable inductance core and capacitor stud (screw adjustment) for converter section (C9, L47)
75183	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r-f section (L48, C16)
76480	Contact—Test point contact
76966	Core—Adjustable core for fine tuning capacitor
75162	Detent—Detent mechanism and fibre shaft
73453	Form—Coil form for L45, L49
75165	Link—Link assembly for fine tuning
76518	Plate—Front plate and shaft bearing
	Resistor—Fixed, composition:—
503027	27 ohms, ±10%, ½ watt (R8)
503068	68 ohms, ±10%, ½ watt (R13)
504115	150 ohms, ±20%, ½ watt (R10)
503222	2200 ohms, ±10%, ½ watt (R6)
503239	3900 ohms, ±10%, ½ watt (R9, R11)
503247	4700 ohms, ±10%, ½ watt (R12)
502310	10,000 ohms, ±5%, ½ watt (R3)
504310	10,000 ohms, ±20%, ½ watt (R2)
503322	22,000 ohms, ±10%, ½ watt (R7)
504410	100,000 ohms, ±20%, ½ watt (R1, R4, R5)
14343	Retainer—Fine tuning shaft retaining ring
75164	Rod—Actuating plunger rod (fibre) for fine tuning link
71476	Screw—#4-40 x ¼" adjusting screw for L6, L7, L8, L9, L10, L11
75177	Screw—#4-40 x ⅜" adjusting screw for L1, L2, L3, L4, L43
75176	Screw—#4-40 x 7/16" adjusting screw for L5
73640	Screw—#4-40 x 7/16" adjusting screw for L52
74575	Screw—#4-40 x .359" adjusting screw for L42
76519	Shaft—Channel selector shaft and plate
76134	Shaft—Fine tuning shaft and cam
76962	Shield—Oscillator and converter sections shield—snap-on type
76967	Shield—Tube shield for V1, V2
75088	Socket—Tube socket, 7 contact, miniature, ceramic, saddle-mounted
75191	Spacer—Insulating spacer for front plate
75163	Spring—Friction spring (formed) for fine tuning cam
30340	Spring—Hair pin spring for fine tuning link
74578	Spring—Retaining spring for adjusting screws
76961	Spring—Retaining spring for oscillator tube shield
73457	Spring—Return spring for fine tuning control
75180	Stator—Antenna stator complete with rotor, coils, capacitors (C20, C21) and resistors (R9, R10, R11) (S1-4, L32, L33, L34, L35, L36, L37, L38, L39, L40, L41, L42, L52)
77459	Stator—Converter stator complete with rotor, coils, capacitors (C10, C12) and resistors (R4, R5, R12) (S1-2, L12, L13, L14, L15, L16, L17, L18, L19, L20, L21, L45)
76963	Stator—Oscillator section stator complete with rotor, segment, coils, adjusting screws and capacitors C3, C23 (S1-1, L1, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L43)
76964	Stator—R-F amplifier stator complete with rotor, coils, capacitor (C13) and resistor (R6) (S1-3, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L49)
75170	Strip—Coil segment mounting strip—L.H. lower
75171	Strip—Coil segment mounting strip—L.H. upper—less trimmer C7
75169	Strip—Coil segment mounting strip—R.H. center
75446	Stud—Capacitor stud—brass—#4-40 x 3/16" with 3/64" screw driver slot for trimmer coils L47, L48 and capacitor C1 uncoded and coded "ER"
75447	Stud—Capacitor stud—brass—#4-40 x 3/16" with 3/64" screw driver slot for trimmer coils L47, L48 and capacitor C1 coded numerically an "Hi-Q"
75173	Stud—#6-32 x 13/16" adjusting stud for trimmer C7
75181	Transformer—Converter transformer (T1)
75607	Washer—Insulating washer (hex)
75190	Washer—Insulating washer (neoprene) for trimmer C7
	CHASSIS ASSEMBLIES
	KCS72-A
76456	Bracket—Channel indicator lamp bracket
76454	Bracket—Mounting bracket complete with insulator for picture control
71496	Capactor—Adjustable, mica, 5-70 mmf. (C115)
33098	Capacitor—Ceramic, 10 mmf. (C127)
33380	Capacitor—Ceramic, 12 mmf. (C162)
75450	Capacitor—Ceramic, 39 mmf. (C203)
73664	Capacitor—Ceramic, 39 mmf. (C131)
76475	Capacitor—Mica, 68 mmf. (C164)
76474	Capacitor—Mica, 82 mmf. (C142)
75437	Capacitor—Ceramic, 100 mmf. (C202)
76673	Capacitor—Ceramic, 220 mmf. (C136)
75248	Capacitor—Mica, 220 mmf. (C146)
47617	Capacitor—Ceramic, 270 mmf. (C106)
39638	Capacitor—Mica, 270 mmf. (C130)
73091	Capacitor—Mica, 270 mmf. (C140, C178)
76476	Capacitor—Mica, 330 mmf. (C169, C175)
39640	Capacitor—Mica, 330 mmf. (C143)
73094	Capacitor—Mica, 390 mmf. (C149)
39644	Capacitor—Mica, 470 mmf. (C107, C121)
76461	Capacitor—Ceramic, 500 mmf., 20,000 volts (C179)
76990	Capacitor—Ceramic, dual 4700 mmf. (C117A, C117B, C119A, C119B, C125A, C125B, C126A, C126B)
73473	Capacitor—Ceramic, 4700 mmf. (C118, C120, C122, C123, C124, C156, C189)
73960	Capacitor—Ceramic, 10,000 mmf. (C104, C187)
76991	Capacitor—Ceramic, dual 10,000 mmf. (C101A, C101B)
74521	Capacitor—Electrolytic, 5 mfd., 50 volts (C109)
75218	Capacitor—Electrolytic, comprising 1 section of 10 mfd., 350 volts, 1 section of 5 mfd., 350 volts and 1 section of 150 mfd., 50 volts (C185A, C185B, C185C)
75217	Capacitor—Mica trimmer, dual 10-160 mmf. (C161A, C161B)
76987	Capacitor—Electrolytic, comprising 1 section of 80 mfd., 400 volts and 1 section of 10 mfd., 350 volts (C182A, C182B)
76970	Capacitor—Electrolytic, comprising 1 section of 100 mfd., 400 volts, 1 section of 10 mfd., 350 volts and 1 section of 20 mfd., 50 volts (C184A, C184B, C184C)
76479	Capacitor—Tubular, moulded paper, oil impregnated, .00068 mfd., 600 volts (C171)
75643	Capacitor—Tubular, paper, oil impregnated, .001 mfd., 1000 volts (C148, C163)
76995	Capacitor—Tubular, moulded paper, oil impregnated, .0012 mfd., 600 volts (C172)
76508	Capacitor—Tubular, paper, oil impregnated, .0015 mfd., 600 volts (C138)
77123	Capacitor—Tubular, moulded paper, oil impregnated, .0015 mfd., 1000 volts (C155)
73595	Capacitor—Tubular, paper, oil impregnated, .0022 mfd., 600 volts (C108, C154)
73599	Capacitor—Tubular, paper, oil impregnated, .0027 mfd., 600 volts (C112)
73818	Capacitor—Tubular, paper, oil impregnated, .0027 mfd., 1600 volts (C114)
73795	Capacitor—Tubular, paper, oil impregnated, .0033 mfd., 600 volts (C137, C139)
73920	Capacitor—Tubular, paper, oil impregnated, .0047 mfd., 600 volts (C110, C151)
73808	Capacitor—Tubular, paper, oil impregnated, .0082 mfd., 1000 volts (C147)
73561	Capacitor—Tubular, paper, oil impregnated, .01 mfd., 400 volts (C111, C113, C134)
73594	Capacitor—Tubular, moulded paper, oil impregnated, .01 mfd., 600 volts (C170)
74938	Capacitor—Tubular, paper, oil impregnated, .012 mfd., 200 volts (C188)
73797	Capacitor—Tubular, paper, oil impregnated, .015 mfd., 600 volts (C129)
73562	Capacitor—Tubular, paper, oil impregnated, .022 mfd., 400 volts (C167)
73798	Capacitor—Tubular, paper, oil impregnated, .022 mfd., 600 volts (C157)
73610	Capacitor—Tubular, paper, oil impregnated, .022 mfd., 1000 volts (C177)
73811	Capacitor—Tubular, paper, oil impregnated, .027 mfd., 1000 volts (C176)
73596	Capacitor—Tubular, paper, oil impregnated, .033 mfd., 1000 volts (C152)
73553	Capacitor—Tubular, paper, oil impregnated, .047 mfd., 400 volts (C145, C166)
75071	Capacitor—Tubular, moulded paper, .047 mfd., 400 volts (C159, C160)
73792	Capacitor—Tubular, paper, oil impregnated, .068 mfd., 400 volts (C156)
73784	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 200 volts (C132, C133)
73551	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 400 volts (C144, C150, C158, C165, C183)
73557	Capacitor—Tubular, paper, oil impregnated, 0.1 mfd., 600 volts (C153, C173)
73788	Capacitor—Tubular, paper, oil impregnated, 0.27 mfd., 200 volts (C174)
76994	Capacitor—Tubular, paper, oil impregnated, 0.33 mfd., 200 volts (C135)
73787	Capacitor—Tubular, paper, oil impregnated, 0.47 mfd., 200 volts (C168)
76498	Choke—Filter choke (L113)
73591	Coil—Antenna matching coil (2 req'd) (Part of T200)
75241	Coil—Antenna shunt coil (L202)
76442	Coil—Horizontal linearity coil complete with adjustable core (L108)
76441	Coil—Width coil complete with adjustable core (L106)
76640	Coil—Peaking coil (1.5 muh) (L107)
76011	Coil—Peaking coil (36 muh) (L101)
71527	Coil—Peaking coil (93 muh) (L104)
71526	Coil—Peaking coil (250 muh) (L114)
75252	Coil—Peaking coil (500 muh) (L102)
77124	Coil—Peaking coil (1000 muh) (L105, R216)
76457	Connector—2nd. anode lead connector complete—mounted on hi-voltage capacitor
77008	Connector—Anode connector complete with terminal and contact
77677	Connector—Anode connector for Kinescope (Model 21T207G only)
35787	Connector—Phono input connector (J101)
75474	Connector—Single contact male connector for speaker cable
75482	Connector—Video connector (J102)
74594	Connector—2 contact male connector for power cord
38853	Connector—4 contact female connector for antenna transformer (J200)
50367	Connector—6 contact female connector for yoke lead (J103)
75542	Connector—6 contact male connector—part of deflection yoke (P103)
76975	Control—AGC control (R149)
76444	Control—Brightness control (R184)
76448	Control—Height control (R173)
76974	Control—Horizontal and vertical hold control (R170A, R170B)
76445	Control—Picture control (R137)
76976	Control—Vertical linearity control (R181)
77010	Control—Volume control and power switch (R109, S102)
71498	Core—Adjustable core and stud for FM trap 75449
76986	Cover—Back cover for hi-voltage compartment
76985	Cover—Side cover for hi-voltage compartment
74956	Cushion—Rubber cushion for deflection yoke hood
74839	Fastener—Push fastener for mounting tube socket 76453
73600	Fuse—0.25 amp., 250 volts
76459	Grommet—Rubber grommet for 2nd. anode lead exit
37396	Grommet—Rubber grommet for mounting tube socket 76453
77035	Hood—Deflection yoke hood less rubber cushions
76830	Hood—Deflection yoke hood, less rubber cushions (21T207G only)
76480	Lead—Anode lead complete with eyelet
76168	Magnet—Focus magnet
76141	Magnet—Ion trap magnet (P.M. type)
76633	Magnet—Pin cushion correction magnet complete with support arm (Model 21T207G only)
76464	Plate—Hi-voltage plate (bakelite) assembly complete with tube socket and corona ring
76796	Resistor—Wire wound, 5.1 ohms, ⅓ watt (R205)
76639	Resistor—Wire wound, 180 ohms, 2 watts (R202)
76988	Resistor—Wire wound, 820 ohms, 1 watt (R113)
76469	Resistor—Wire wound, 2500 ohms, 10 watts (R115)
76989	Resistor—Wire wound, 4650 ohms, 7 watts (R116)
	Resistor—Fixed, composition:—
503033	33 ohms, ±10%, ½ watt (R130)
502039	39 ohms, ±5%, ½ watt (R122)
502047	47 ohms, ±5%, ½ watt (R119)
503047	47 ohms, ±10%, ½ watt (R105)
504047	47 ohms, ±20%, ½ watt (R201)
503082	82 ohms, ±10%, ½ watt (R101)
502118	180 ohms, ±5%, ½ watt (R125)
503139	390 ohms, ±10%, ½ watt (R182)

STOCK No.	DESCRIPTION
503147	470 ohms, ±10%, ½ watt (R114)
513156	560 ohms, ±10%, 1 watt (R207)
504210	1000 ohms, ±20%, ½ watt (R102, R118, R120, R124, R127)
503222	2200 ohms, ±10%, ½ watt (R104, R212)
523222	2200 ohms, ±10%, 2 watts (R131)
504233	3300 ohms, ±20%, ½ watt (R211)
502239	3900 ohms, ±5%, ½ watt (R129, R164)
503239	3900 ohms, ±10%, ½ watt (R194)
503256	5600 ohms, ±10%, ½ watt (R138)
523268	6800 ohms, ±10%, 2 watts (R203)
503282	8200 ohms, ±10%, ½ watt (R176, R179)
513282	8200 ohms, ±10%, 1 watt (R165)
502310	10,000 ohms, ±5%, ½ watt (R107, R108, R123)
504310	10,000 ohms, ±20%, ½ watt (R152)
502312	12,000 ohms, ±5%, ½ watt (R121)
503312	12,000 ohms, ±10%, ½ watt (R145)
523315	15,000 ohms, ±10%, 2 watts (R135)
503315	15,000 ohms, ±10%, ½ watt (R153)
503318	18,000 ohms, ±10%, ½ watt (R128, R158, R166, R196)
523318	18,000 ohms, ±10%, 2 watts (R133)
503322	22,000 ohms, ±10%, ½ watt (R167, R217)
513322	22,000 ohms, ±10%, 1 watt (R193)
503327	27,000 ohms, ±10%, ½ watt (R215)
513327	27,000 ohms, ±10%, 1 watt (R218)
513333	33,000 ohms, ±10%, 1 watt (R214)
503339	39,000 ohms, ±10%, ½ watt (R106, R142)
513339	39,000 ohms, ±10%, 1 watt (R132)
503347	47,000 ohms, ±10%, ½ watt (R160)
504347	47,000 ohms, ±20%, ½ watt (R144)
512347	47,000 ohms, ±5%, 1 watt (R198)
503356	56,000 ohms, ±10%, ½ watt (R146, R204)
512356	56,000 ohms, ±5%, 1 watt (R178)
503368	68,000 ohms, ±10%, ½ watt (R219)
513068	68,000 ohms, ±10%, 1 watt (R192)
513382	82,000 ohms, ±10%, 1 watt (R191)
504410	100,000 ohms, ±20%, ½ watt (R213)
513410	100,000 ohms, ±10%, 1 watt (R175)
530180	120,000 ohms, ±5%, ½ watt (R143)
503415	150,000 ohms, ±10%, ½ watt (R174, R183, R187)
504415	150,000 ohms, ±20%, ½ watt (R139)
512415	150,000 ohms, ±5%, 1 watt (R195)
502418	180,000 ohms, ±5%, ½ watt (R141)
502427	270,000 ohms, ±5%, ½ watt (R177)
503427	270,000 ohms, ±10%, ½ watt (R157)
503433	330,000 ohms, ±10%, ½ watt (R111, R188)
512433	330,000 ohms, ±5%, 1 watt (R190)
503439	390,000 ohms, ±10%, ½ watt (R168)
503447	470,000 ohms, ±10%, ½ watt (R150, R200)
504447	470,000 ohms, ±20%, ½ watt (R112, R147)
503456	560,000 ohms, ±10%, ½ watt (R148, R171)
503468	680,000 ohms, ±10%, ½ watt (R154, R161)
503482	820,000 ohms, ±10%, ½ watt (R189, R199)
503510	1 megohm, ±10%, ½ watt (R155)
502511	1.1 megohm, ±5%, ½ watt (R136)
503512	1.2 megohm, ±10%, ½ watt (R180)
503515	1.5 megohm, ±10%, ½ watt (R172)
11769	1.8 megohm, ±5%, ½ watt (R140)
39063	1.8 megohm, ±5%, 1 watt (R197)
503522	2.2 megohm, ±10%, ½ watt (R126, R159)
504610	10 megohm, ±20%, ½ watt (R110)
71456	Screw—#8-32 x 7/16" wing screw to mount deflection yoke

STOCK No.	DESCRIPTION
76487	Shaft—Connecting shaft (nylon) for picture and brightness controls
73584	Shield—Tube shield for V101, V102, V103, V108
76972	Shield—Tube shield for V109
75718	Socket—Channel indicator lamp socket and leads
74834	Socket—Kinescope socket
31251	Socket—Tube socket, octal, wafer for V105, V110, V112, V113, V116, V120, V121 (KCS72A2 uses 6AC7 for V110)
76453	Socket—Tube socket, octal, moulded, saddle mounted for V110 for KCS72A1M1 (KCS72A1M1 uses 6AG7 for V110)
71508	Socket—Tube socket, 6 pin, moulded—for V117
50367	Socket—Tube socket, 6 pin, moulded, saddle mounted for V118
73117	Socket—Tube socket, 7 pin, wafer miniature for V101, V102, V103, V104, V106, V107, V108, V111
50367	Socket—Tube socket, 8 pin, moulded saddle-mounted for V114
72627	Socket—Tube socket, 8 pin, steatite saddle mounted for V115
76971	Socket—Tube socket, 9 pin, wafer miniature for V109
76636	Stud—Adjusting stud complete with guard for focus magnet
77011	Switch—Tone control and phono switch less volume control and power switch (S101)
76463	Terminal—Screw type grounding terminal
76977	Transformer—Antenna matching transformer complete (T200, C200, C201, C202, C203, L200, L201, L202, L203, J200)
76795	Transformer—Hi-voltage transformer (T111)
76440	Transformer—Horizontal oscillator transformer complete with adjustable cores (T110)
76997	Transformer—Output transformer (T103)
76984	Transformer—Power transformer, 115 volts 60 cycle (T109)
77112	Transformer—Ratio detector transformer (T102, C105)
76981	Transformer—Sound i-f transformer complete with adjustable core (T101, C102, C103, R103)
76978	Transformer—Vertical output transformer (T108)
76979	Transformer—First pix, i-f transformer complete with adjustable cores (T104, C116, R117)
76980	Transformer—Second, third or fourth pix i-f transformer complete with adjustable core (T105, T106, T107)
75449	Trap—FM trap complete with adjustable core and stud (L203, C203)
75242	Trap—i-f trap (L200, L201, C200, C201)
76983	Trap—4.5 MC trap (L103, C128)
76616	Yoke—Deflection yoke complete with 6 contact male connector (L109, L110, L111, L112, C181, P103, R208, R209, R210)
	SPEAKER ASSEMBLIES
	971490-3W, RL-105-E6, RMA-274 (For Models 21T208, 21T217, 21T229)
75024	Cone—Cone and voice coil (3.2 ohms)
75022	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms)
	92569-12W, RL-111-A1, RMA-274 (For Models 21T218, 21T227, 21T228)
75682	Cone—Cone and voice coil (3.2 ohms)
76389	Speaker—12" P.M. speaker complete with cone and voice coil (3.2 ohms)
	971636-1, RMA-274 (For Models 21T207, 21T207G)
77000	Speaker—5" P.M. speaker complete with cone and voice coil (3.2 ohms)
	Note:—If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to model number of instrument, number stamped on speaker and full description of part required.

STOCK No.	DESCRIPTION
	MISCELLANEOUS
77211	Back—Back cover complete with power cord (21T208, 21T217, 21T218, 21T227, 21T228, 21T229)
77679	Back—Back cover complete with power cord and terminal board (Model 21T207G)
77568	Back—Back cover complete with power cord and terminal board (Model 21T207)
76184	Board—Antenna terminal board
76629	Bracket—Hanger bracket for deflection yoke hood for Models 21T218, 21T227, 21T228, 21T229
77009	Bracket—Hanger bracket for deflection yoke hood for Models 21T208, 21T217, 21T207
76697	Bracket—Masking panel support bracket (2 req'd)
76599	Bracket—"U" shape bracket for deflection yoke support rod
77680	Bracket—Mounting bracket for kinescope mounting straps (2 req'd) (Model 21T207G)
76699	Bumper—Rubber bumper for kinescope (as req'd)
71892	Catch—Bullet catch and strike for cabinet doors for Models 21T227, 21T228, 21T229
77018	Clip—Ornamental clip (metal) for wood grille bars for Model 21T227
X1756	Cloth—Grille cloth for mahogany instruments for Models 21T207, 21T208, 21T217 or walnut instruments for Model 21T217
X3199	Cloth—Grille cloth for mahogany or walnut instruments for Models 21T218, 21T227, 21T228, 21T229 or maple instruments for Model 21T228
X3222	Cloth—Grille cloth for blonde mahogany instruments for Models 21T218, 21T227 or for oak instruments for Model 21T229
75474	Connector—Single contact male connector for antenna cable
39153	Connector—4 contact male connector for antenna cable
71457	Cord—Power cord and plug
76698	Cushion—Rubber cushion for masking panel support brackets (2 req'd)
76627	Cushion—Rubber cushion for safety glass
76831	Cushion—Rubber cushion for dust sealing the kinescope
77268	Decal—Control function decal for blonde mahogany, maple, or oak instruments
77015	Decal—Control function decal for mahogany or walnut instruments
71984	Decal—"RCA Victor" decal for Models 21T227, 21T228, 21T229
77012	Emblem—"RCA Victor" emblem
75456	Escutcheon—Channel marker escutcheon
72113	Foot—Rubber foot (4 req'd) for Model 21T208
77684	Gasket—Gasket for kinescope mounting straps (Model 21T207G)
76622	Glass—Safety glass
37396	Grommet—Rubber grommet for speaker mounting for Models 21T218, 21T227, 21T228
74308	Hinge—Cabinet door hinge (1 set) for Models 21T227, 21T228, 21T229
76596	Knob—Brightness control or vertical hold control knob—beige—for blonde mahogany or oak instruments (outer)
76595	Knob—Brightness control or vertical hold control knob—maroon—for mahogany or walnut instruments (outer)
76625	Knob—Brightness control or vertical hold control knob—tan—for maple instruments (outer)
76594	Knob—Channel selector knob—beige—for blonde mahogany or oak instruments (inner)
76593	Knob—Channel selector knob—maroon—for mahogany or walnut instruments (inner)
76824	Knob—Channel selector knob—tan—for maple instruments (inner)
76592	Knob—Fine tuning control knob—beige—for blonde mahogany or oak instruments (outer)
76591	Knob—Fine tuning control knob—maroon—for mahogany or walnut instruments (outer)
76623	Knob—Fine tuning control knob—tan—for maple instruments (outer)

STOCK No.	DESCRIPTION
75464	Knob—Picture control, horizontal hold control or volume control and power switch knob—beige—for blonde mahogany or oak instruments (inner)
74963	Knob—Picture control, horizontal hold control or volume control and power switch knob—maroon—for mahogany or walnut instruments (inner)
74001	Knob—Picture control, horizontal hold control or volume control and power switch knob—tan—for maple instruments (inner)
76598	Knob—Tone control and phono switch knob—beige—for blonde mahogany or oak instruments (outer)
76597	Knob—Tone control and phono switch knob—maroon—for mahogany or walnut instruments (outer)
76626	Knob—Tone control and phono switch knob—tan—for maple instruments (outer)
11765	Lamp—Channel marker escutcheon lamp—Mazda #51
76589	Mask—Channel marker escutcheon light mask—beige—for blonde mahogany, maple or oak instruments
75459	Mask—Channel marker escutcheon light mask—burgundy—for mahogany or walnut instruments
77036	Mask—Polystyrene masking panel for kinescope
77567	Mask—Polystyrene masking panel for kinescope (Model 21T207)
77678	Mask—Polystyrene masking panel (Model 21T207G)
76177	Nut—#10-32 special nut for deflection yoke hood support rods (2 req'd)
77013	Nut—Speednut for fastening emblem to cabinet
73634	Nut—Speednut for speaker mounting screws for Models 21T218, 21T227, 21T228, 21T229
76601	Pad—Kinescope edge support pad (4 req'd)
77016	Pull—Cabinet door pull for Model 21T217
77017	Pull—Cabinet door pull for Model 21T227
77021	Pull—Cabinet door pull for Model 21T228
76628	Rod—"L" shape threaded rod to support deflection yoke hood assembly
77681	Rod—"L" shaped threaded rod for deflection yoke hood assembly (Model 21T207G)
76632	Screw—#8 x ⅝" hex head screw (wood) for kinescope support bracket or hanger bracket
74113	Screw—#8-32 x 1" trimit head screw for door pull for Model 21T227
74269	Screw—#8-32 x ¾" trimit head screw for door pull for Model 21T228
77682	Screw—#12 x 2" hex head Type "A" tapping screw (steel) for fastening kinescope mounting straps (Model 21T207G)
76808	Sleeve—Polyethlene sleeve for insulating hi-voltage lead (Model 21T207G)
73643	Spring—Channel marker escutcheon spring clip
76630	Spring—Formed spring for kinescope masking panel (6 req'd)
77006	Spring—Retaining spring for deflection yoke hood support rod nut
30330	Spring—Retaining spring for knobs #74001, 74963 and 75464
72845	Spring—Retaining spring for knobs #76591, 76592, 76623
76837	Spring—Retaining spring for knobs #76593, 76594, 76595, 76596, 76597, 76598, 76624, 76625 and 76626
74936	Spring—Suspension spring for kinescope socket lead
72936	Stop—Cabinet door stop for Models 21T227, 21T228, 21T229
77675	Strap—Top or bottom mounting strap for mounting kinescope (Model 21T207G)
77023	Washer—Cellulose washer—gold—for knobs
77569	Washer—Cellulose washer—maroon—for knobs (Models 21T207 and 21T207G)
75458	Washer—Felt washer—beige—between knob and channel marker escutcheon for blonde or oak instruments
75457	Washer—Felt washer—dark brown—between knob and channel marker escutcheon for mahogany or walnut instruments
75523	Washer—Felt washer—tan—between knob and channel marker escutcheon for maple instruments
75500	Washer—Felt washer for kinescope masking panel or back cover mounting screws

The system of employing an asterisk before the stock number of new items has been discontinued.

GENERAL DESCRIPTION

The KRK-22A R-F tuner is a 12 channel VHF unit which is independent of the receiver chassis. This unit is a four circuit, wafer switch type with incremental inductance tuning, using two tubes in a driven grounded-grid R-F amplifier circuit and a combination mixer-oscillator circuit. The twelve position switch tunes each of the four circuits to the proper frequency for reception on channels 2 to 13, inclusive. The antenna input circuit uses an elevator transformer with an associated high-pass M-derived filter contained in a common shield housing. An adjustable F-M trap is provided. The output circuit uses a link-coupled I-F transformer with low impedance coaxial cable to the receiver chassis I-F input. The extended-range fine tuning control is concentric with the channel selector detent mechanism.

ELECTRICAL SPECIFICATIONS

TELEVISION R-F FREQUENCY RANGE

All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.
Picture I-F Carrier Frequency....................41.25 mc.
Sound I-F Carrier Frequency....................45.75 mc.

ANTENNA INPUT IMPEDANCE

Choice: 300 ohms balanced or 72 ohms unbalanced.

RCA TUBE COMPLEMENT

Tube Used	Function
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer

POWER SUPPLY RATING

Plate Supply............................270 volts, 25 ma.
Filament Supply........................6.3 volts, 0.85 amp.

INSTALLATION INFORMATION

The KRK-22A tuner is now being installed as original equipment in the models listed. Early production models use the KRK-11B tuner.

Model	Name	Chassis No.
17T301	"Wayne"	KCS-78A
17T302	"Glendale"	KCS-78A
17T310	"Hanley"	KCS-78A
21T303	"Kirby"	KCS-82A
21T313 (G)	"Jeffrey"	KCS-82A
21T314 (G)	"Prentiss"	KCS-82A
21T315	"Deauville"	KCS-82A
21T316	"Hilton"	KCS-82A
21T322	"Dobson"	KCS-82A
21T323	"Lexington"	KCS-82A
21T324	"Stockton"	KCS-82A
21D305	"Cabot"	KCS-81A
21D317	"Merritt"	KCS-81A
21D326	"Staunton"	KCS-81A
21D327	"Yorktown"	KCS-81A
21D328	"Kenbridge"	KCS-81A
21D329	"Southbridge"	KCS-81A
21D330	"Clermont"	KCS-81A

The following models had the KRK-22A tuner installed originally. Service Data on these models include information on the KRK-22A tuner.

Model	Name	Chassis No.
21T342	"Lawrence"	KCS-82D
21T344	"Montgomery"	KCS-82D
21D346	"Rutherford"	KCS-81D

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly align this tuner, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:
(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:
(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.
(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal calibrated.

Cathode-Ray Oscilloscope.—For alignment purposes, the oscilloscope employed must have excellent low frequency and phase response, and should be capable of passing a 60-cycle square wave without appreciable distortion.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

KRK-22A ANTENNA MATCHING UNIT ALIGNMENT.

The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L53 to the channel selector switch S1D.

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R133 and C133B. Set the potentiometer to produce approximately —5.0 volts of bias at the junction of R133 and C133B.

Connect an oscilloscope to pin 9 of V110 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L54 in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L57 for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L53 to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L53 to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

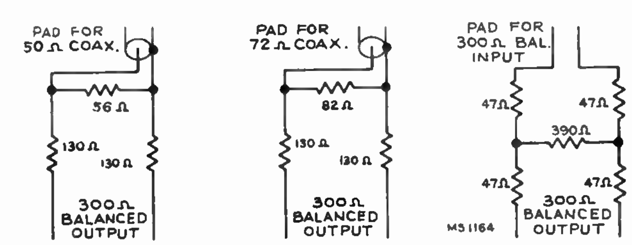

Figure 1—Sweep Attenuator Pads

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 1 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by retuning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L55 and L56 to obtain the response shown in figure 2. L55 is most effective in locating the position of the shoulder of the curve at 52 mc. and L56 should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L53 and S1D. Replace V106.

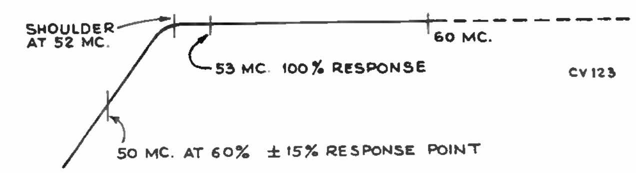

Figure 2—Antenna Matching Unit Response

KRK-22A TUNER ALIGNMENT

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C2 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T1 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 42.0 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP1 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L53 and C24 at the bottom of the F-M trap L53.

Tune the signal generator to 42.0 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C19 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C19 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce—3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C5 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst". The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C3 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C10. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C3 to obtain an audible beat with the signal generator.

Turn C2 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C3, switch to channel 13 and adjust L42 to obtain proper channel 13 oscillator frequency as indicated in the table on page 11. Then, switch to channel 12 and adjust L11 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C3 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L42 and back to channel 8 and adjust C3.

Set the T1 core for maximum inductance (core turned counter-clockwise).

Return the fine tuning control to the mechanical center of its range.

Connect the sweep generator through a suitable attenuator, as shown in Figure 1, to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C7, C10, C15 and C20 for approximately correct curve shape, frequency, and band width as shown in Figure 6.

The correct adjustment of C20 is indicated by maximum amplitude of the curve midway between the markers. C15 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C7 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C20 has been properly adjusted). C10 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C5 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C2, C7, C10 and C15 for proper response. Adjust C20 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L42 to obtain an audible beat. Slightly overshoot the adjustment of L42 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C2 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L43 and L45 for proper response as shown in Figure 6.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C5, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L43 and L45 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C2 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C7, C10, C15 and C20 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C7 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L5 for an audible beat. Adjust L44, L46 and L41 for proper curve shape as shown in Figure 6. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C5 if necessary.

If C5 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C7 for correct curve shape and recheck C2 and C3 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 6 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L44, L46 and L41 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to Figure 6 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C15, C7, or C10 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L42 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

NOTE: I.F. Response Curves of receivers using the KRK-22A are the same as those using the KRK-11B tuner. Refer to Service Data for the specific model receiver concerned.

STOCK No.	DESCRIPTION
	R-F UNIT ASSEMBLIES KRK-22A
76539	Board—Antenna matching transformer terminal board —less coils and capacitors.
76270	Board—Terminal board—4 contact
77850	Bracket—Side bracket for mounting coil and stators
77855	Can—Shield can for convertor transformer
77853	Capacitor—Ceramic, variable, for fine tuning—plunger type (C2)
77913	Capacitor—Tubular, adjustable, steatite, 0.8—3.0 mmf. (C5)
70104	Capacitor—Fixed, headed-lead type, 0.68 mmf., ±20%, 500 volts DC (C6)
77151	Capacitor—Adjustable, steatite, 0.8—3.0 mmf., (C3, C7)
76532	Capacitor—Adjustable, steatite, 1-4 mmf., (C15, C20)
77616	Capacitor—Adjustable, mica, 4-40 mmf. (C19)
93056	Capacitor—Fixed, ceramic, non-insulated, 5 mmf., ±0.5 mmf., 500 volts DC, Temp. coef. =0 (C26)
77865	Capacitor—Fixed, ceramic, non-insulated, 10 mmf., ±1.0 mmf., 500 volts DC, Temp. coef. =0 (C1)
33098	Capacitor—Fixed, ceramic, non-insulated, 10 mmf., ±1.0 mmf., 500 volts DC, Temp. coef. = —750 (C4)
54207	Capacitor—Fixed, ceramic, non-insulated, 18 mmf., ±10%, 500 volts DC, Temp. coef. =0 (C27)
70935	Capacitor—Fixed, ceramic, non-insulated, 27 mmf., ±10%, 500 volts DC, Temp. coef. =0 (C25)
76739	Capacitor—Fixed, ceramic, non-insulated, 33 mmf., ±10%, 500 volts DC, Temp. coef. =0 (C24)
76527	Capacitor—Mica trimmer, 55-80 mmf. (C10)
75199	Capacitor—Fixed, ceramic, insulated, 270 mmf., ±20%, 500 volts DC, High "K" type (C13, C14, C18)
76552	Capacitor—Fixed, ceramic, insulated, 330 mmf., ±10%, 500 volts DC, High "K" type (C9)
77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, —0%, 500 volts DC, High "K" disc (C29)
77084	Capacitor—Ceramic, feed-thru, 1000 mmf. (C11, C12, C21, C22)
77252	Capacitor—Fixed, ceramic, 1000 mmf., +100%, —0%, 500 volts DC, High "K" disc (C8, C16, C17, C23)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, —0%, 500 volts DC, High "K" disc (C28)
77854	Clip—Mounting clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T2)
73874	Coil—Channel #6 mixer coil (L44)
73460	Coil—Channel #6 R-F plate coil (L46)
77915	Coil—Channel #13 oscillator coil (L42)
77919	Coil—Channel #13 mixer coil (L43)
77921	Coil—Channel #13 R-F plate coil (L45)
77206	Coil—Filament choke coil (L52)
76763	Coil—Heater choke coil (L50, L51)
76562	Coil—R-F amplifier coupling coil (L47)
76537	Coil—Shunt coil complete with adjustable core (L55)
76538	Coil—Shunt coil complete with adjustable core (L56)
38853	Connector—4 contact female connector—part of antenna matching transformer (J1)
77860	Connector—Grounding strap connector
77859	Connector—R-F grid switch return connector (L49)
76460	Contact—Test point contact
77852	Core—Adjustable core for fine tuning capacitor
76543	Core—Adjusting core for FM trap
77918	Core—¼-20 x ½" adjusting core for L44, L46
77914	Core—#8-32 x 27/64" adjusting core for L42, L43
77846	Detent—Detent mechanism and fibre shaft
77917	Form—Channel #6 coil form complete with core
77912	Form—Channel #13 coil form complete with core
77861	Guide—Bakelite guide for fine tuning lever
77847	Lever—Fine tuning lever
76728	Nut—Speed nut for capacitor #76532
	Resistors—Fixed, composition:—
503112	120 ohms, ±10%, ½ watt (R11)
503147	470 ohms, ±10%, ½ watt (R14)
503210	1000 ohms, ±10%, ½ watt (R8)
503233	3300 ohms, ±10%, ½ watt (R5)
503268	6800 ohms, ±10%, ½ watt (R12)
523312	12,000 ohms, ±10%, 2 watts (R2)
523315	15,000 ohms, ±10%, 2 watts (R3)
502327	27,000 ohms, ±5%, ½ watt (R4)
503410	100,000 ohms, ±10%, ½ watt (R1, R6, R7, R13)
503510	1 megohm, ±10%, ½ watt (R9, R10)
14343	Retainer—Fine tuning shaft retainer ring
77849	Retainer—Retainer for fine tuning spring
75176	Screw—#4-40 x 7/16" adjusting screw for L5
76549	Screw—#4-40 x ⅜" adjusting screw for L1, L2, L3, L4
76547	Screw—#4-40 x ¼" adjusting screw for L6, L7, L8, L9, L10, L11
77848	Shaft—Fine tuning shaft and cam
77862	Shield—Front shield
76534	Shield—Tube shield
77851	Shield—"U" shape shield for underside of unit
76336	Socket—Tube socket, 9 pin, miniature, saddle mounted
77856	Spring—Fine tuning core spring Spring—Fine tuning lever spring
77916	Stator—Mixer stator complete with rotor, coils, capacitor and resistors (S2, C6, C9, C13, L12, L13, L14, L15, L16, L17, L18, L19, L20, L21, L43, L44, R5, R6, R7)
77911	Stator—Oscillator stator complete with rotor, coils and trimmer (S1, C5, L1, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L42)
77910	Stator—R-F grid stator complete with rotor and coils (S4, L32, L33, L34, L35, L36, L37, L38, L39, L40, L41)
77920	Stator—R-F plate stator complete with rotor, coils, capacitor and resistor (S3, C14, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L45, L46, R8)
76740	Stud—#6-32 x 1" adjusting stud for adjustable capacitor C5
77858	Transformer—Antenna matching transformer complete (T2, C24, C25, C26, C27, J1, L53, L54, L55, L56, L57)
77857	Transformer—Convertor transformer (T1)
76540	Trap—F-M trap complete with adjustable core (L53)
77628	Trap—I.F. trap (L48)
76542	Trap—I.F. trap (41.25 MC) complete with core (L57)
76541	Trap—I.F. trap (45.75 MC) complete with core (L54)
75190	Washer—Insulating washer (Neoprene) for adjustable capacitor C5

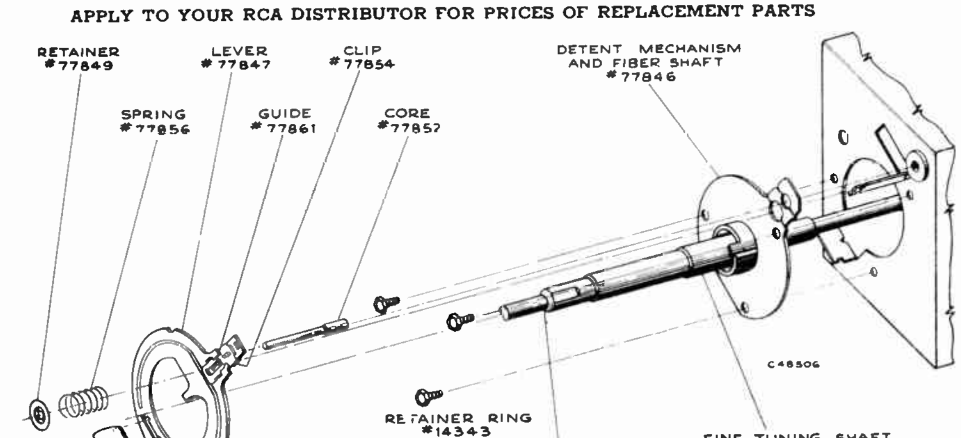

Figure 10—Exploded View of Detent Mechanism

GENERAL DESCRIPTION

UHF-VHF Tuner Kit KRK-25 includes a 16 Channel UHF-VHF tuner, mounting hardware, components for circuit modifications, coaxial link cable, FM trap, knobs for Walnut and Mahogany instruments, and instructions for installation. Knobs for Blond and Oak or Maple and Cherry instruments are available from RCA Victor Distributors (refer to parts list for proper part numbers).

The rotary type tuner is shipped with 12 pretuned VHF inserts covering Channels 2 through 13 inclusive. UHF inserts are available from RCA Victor Distributors.

The tuner employs four tubes plus a crystal rectifier. It is designed to be used with chassis Nos. KCS66, KCS66A, KCS66C, KCS66D—KCS68C, KCS68E, KCS68F, KCS68H —KCS74.

ELECTRICAL SPECIFICATIONS

TELEVISION R-F FREQUENCY RANGE

Any of 70 UHF channels .... 470 mc. to 890 mc.
Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.
(Any desired combination of 16 UHF and/or VHF channels may be used.)
Picture I-F Carrier Frequency .... 45.75 mc.
Sound I-F Carrier Frequency .... 41.25 mc.

WEIGHT AND DIMENSIONS

Net Weight	Shipping Weight	Width Inches	Height Inches	Depth Inches
7½ lbs.	11½ lbs.	5½	8	15

ANTENNA INPUT IMPEDANCE

UHF—Choice: 300 ohms balanced or 72 ohms unbalanced.
VHF—300 ohms balanced.

RCA TUBE COMPLEMENT

Tube Used	Function
(1) RCA 6BQ7A	R-F Amplifier (VHF only)
(2) RCA 6AF4	R-F Oscillator
(3) RCA 6BQ7A	I-F Amplifier
(4) RCA 6S4	Voltage Control

A 1N82 crystal is used as a mixer.

INSTALLATION INSTRUCTIONS

The UHF-VHF Tuner Kit KRK-25 may be installed in the following receivers:

Model	Name	Chassis No.	Model	Name	Chassis No.
17T150	"Colby"	KCS66C	17T250DE	"Brett"	KCS74
17T151	"Glenside"	KCS66C	17T261DE	"Ainsworth"	KCS74
17T153	"Bristol"	KCS66	21T159	"Selfridge"	KCS68E
17T154	"Whitfield"	KCS66	21T159DE	"Selfridge"	KCS68F
17T155	"Preston"	KCS66	21T165	"Meredith"	KCS68E
17T160	"Hampton"	KCS66	21T166DE	"Farmington"	KCS68
17T162	"Caldwell"	KCS66A	21T174DE	"Bancroft"	KCS68F
17T163	"Crafton"	KCS66C	21T175DE	"Benton"	KCS68F
17T172	"Covington"	KCS66A	21T176	"Suffolk"	KCS68C
17T172K	"Covington"	KCS66D	21T177	"Donley"	KCS68C
17T173	"Calhoun"	KCS66A	21T178	"Rockingham"	KCS68C
17T173K	"Calhoun"	KCS66D	21T178DE	"Rockingham"	KCS68F
17T174	"Kendall"	KCS66A	21T179	"Clarendon"	KCS68C
17T174K	"Kendall"	KCS66D	21T179DE	"Clarendon"	KCS68F
			21T197DE	"Sunderland"	KCS68H

Determine that the receiver is in proper operating condition before proceeding with the tuner installation.

CABINET MODIFICATIONS

Remove the television chassis from the cabinet.

Locate and drill two ½ inch holes in the receiver chassis shelf using the template provided. For location see Fig. 1.

Remove the channel marker escutcheon from the cabinet. On metal cabinets also remove the inside ring and bend ring tabs flush against cabinet. Cut a semi-circular notch 9/16 inches in diameter for indicator lamp clearance as shown in Fig. 2. This notch must be undercut on the inside of wooden cabinets, also refer to Fig. 2.

A portion of the plastic front mask must be removed on 21 inch receivers to allow pilot light bracket clearance, see Fig. 3.

REMOVAL OF PRESENT TUNER

Remove the cable clamp from the side of the tuner.

Color of all leads removed should be noted for reference later.

Disconnect the shielded cable from ground and terminal "A" at T104 (1st. Pix. I-F Grid Transformer).

Disconnect the AGC lead coming from the receiver chassis, at terminal 3 of the tuner.

(On all 17 inch models except 17T250DE and 17T261DE.)

Disconnect the +B lead feeding terminal 4 of the tuner through a 100 ohm resistor, at the receiver chassis terminal board. Connect the 18000 ohm 2 watt resistor supplied with the kit, between this point on the chassis terminal board and a nearby ground lance.

(On Models 17T250DE and 17T261DE only.)

Disconnect the +B lead, feeding terminal 4 of the tuner through R122, at C212B. Connect the 18000 ohm 2 watt resistor supplied with the kit, from the junction of C212B and R188 on the terminal board, to the nearby ground lance.

(On 21 inch Models only.)

Disconnect +B lead feeding the 100 ohm resistor on terminal 4 of the tuner, from the small two-terminal board on the rear of the tuner. Pull the lead inside the receiver chassis and run to unused pin 7 of V123. Connect the 18000 ohm 2 watt resistor supplied with kit, between pin 7 of V123 and a nearby ground lance.

(All Models.)

Disconnect the (265 V.) +B lead at the small two-terminal board on the rear of the tuner.

Disconnect the heater lead at terminal 6 of the tuner.

Disconnect the +B lead, leading from terminal 7 of the tuner, at the receiver chassis terminal board.

Remove the transmission line connector from the tuner input jack.

Unclip the channel indicator lamp and discard the lamp cover.

Remove the tuner and its mounting bracket from the receiver chassis.

INSTALLATION OF THE KRK-25 TUNER

Remove the KRK-25 Tuner Kit from the shipping carton. Make sure that all tubes are in place and firmly seated in their sockets.

Remove the speaker cable clamp from the receiver chassis.

Locate the mounting holes for the tuner by using the templates supplied with the kit. The two large brackets are used with 21 inch receivers and the two small brackets with 17 inch receivers. On receivers using Chassis No. KCS74 these holes are already provided.

An alternate method for locating the mounting holes may be used if desired. This is accomplished by locating the position of the top mounting hole of the front bracket, see Fig. 5. On 17 inch Models this hole is located 4¼ inches from the chassis front and 5/16 inches in from the right side of the chassis. On 21 inch Models the hole is located 2⅜ inches from the chassis front and 5/16 inches in from the right side of the chassis. The remaining holes may be located by assembling the appropriate brackets on the tuner, placing the tuner in position with the top front hole as a guide, and spotting the other holes.

CAUTION: Check the position of components and cables under the chassis before drilling holes to avoid possible damage.

Drill all chassis holes using a #30 drill to fit the self-tapping screws provided.

(On 21 inch Models only.)

A chassis lance partially occupies the location of the hole for the top screw of the rear bracket. Bend the lance flush to the chassis. Drill the hole with a #8 drill and use the machine screw, washers and nut provided in the tuner kit for this mounting hole.

Mount the tuner on the receiver chassis. A flat surface should be used to support the tuner and receiver chassis to assure proper mechanical alignment.

Mount the three-lug terminal board, attached to the tuner leads, under the top front mounting bracket screw with the terminals facing the tuner as in Fig. 5.

Connect the link cable to T2 on the tuner as shown in Fig. 5, grounding the shield on the lance provided.

Connect the other end of the link cable to terminal "A" of T104 (1st Pix. I-F Grid Transformer), grounding the shield to the adjacent chassis lance. The link cable must be shunted with a 1000 ohm resistor and a 5-70 mmf. trimmer capacitor. Add these components from the kit at T104 if they are not part of the original circuit. Remove any existing fixed resistors and capacitors which shunt the link cable in some models.

Connect the AGC feed to the white-green lead from the tuner at the terminal board previously mounted on top front of the receiver chassis. See Fig. 5.

Connect the (265 V.) +B feed to the red lead from the tuner at the terminal board.

Connect the heater feed to the brown lead from the tuner at the terminal board.

(On 21 inch Models only.)

Connect the two 1800 ohm 2 watt resistors, supplied in kit, in series between the center lug of the terminal board holding the red lead from the tuner and the rear terminal (+373 V.) of R243 bleeder resistor mounted on the top right front corner of the receiver chassis. See Fig. 5.

Clip the channel indicator lamp on the tuner lamp bracket and install the lamp cover, supplied in kit, with the aperture facing to the front.

ANTENNA INPUT MODIFICATION

The existing antenna input connector may be used when modified. Cut off the two close-spaced jumpered pins close to the bakelite disc. Insert the connector in the tuner jack and fasten in position using the retainer plate and screw provided in the kit.

An FM trap is supplied with the kit. It consists of a 4⅜ inch length of flat 300 ohm transmission line with a 5-70 mmf. shunt trimmer at one end, the opposite end is shorted. Tape the trap securely to the receiver antenna cable at some convenient location between the receiver terminal board and the tuner as shown in Fig. 5. The exact position of the trap is not important except for convenience of trimmer adjustment.

When a common UHF-VHF antenna is used in fringe areas, the contact springs under the UHF coaxial input jack J1 must be bent upwards, to prevent contact with the buttons on the inserts. Remove the tuner cover. Rotate the channel selector knob until an empty drum compartment lies under the input jack J1. The two springs will now be accessible and may be bent upwards sufficiently to clear the insert buttons.

When coaxial cable is used for the UHF input, attach the ferrule supplied on the coaxial input jack J1, to the coaxial cable. The use of a separate UHF antenna, fed to the coaxial input jack J1, will require removal of the antenna coupling loop from all UHF inserts used. Cut the coupling loop wires at the contact buttons to which they are soldered. Remove the tape securing the loop to the insert. The loop is then removed by carefully rotating until it slips out easily.

KNOB ASSEMBLY

The proper order of knob assembly is shown in Fig. 4.

Place the fine tuning knob on the shaft and rotate until one of the slots engages the projection on the fine tuning cam. Push the knob in until seated firmly against the cam.

Place the channel selector knob on the shaft. Rotate the knob until the knob teeth mesh with the drive gear, at a point where a hole in the knob face is over the channel indicator lamp. Push the knob and retainer in until firmly seated.

Remove tabs from the tab disc corresponding to any UHF channels to be used. Mount the tab disc on the indicator disc. The proper position will be indicated by the keyway on the tab disc meshing with the key on the indicator disc. Remove the required UHF channel number tabs from the sheet supplied and mount on the indicator disc.

Assemble the indicator disc and cover by matching the projection on the disc to the smallest cover recess.

Mount the indicator assembly on the shaft, matching the flats on the assembly spring and the shaft. Push the assembly into position.

REMOVAL AND INSTALLATION OF INSERTS

INSERT REMOVAL.—Remove the tuner cover shield. Rotate the channel selector to the desired channel. The channel insert position may be identified by the stampings on the insert drum which are visible through the channel indicator apertures at each end of the tuner, see Figs. 5 and 13.

Rotate the channel selector two positions counter-clockwise. Three inserts will be clearly visible in the tuner cover opening. The second insert below the contact springs is the one desired.

Remove the insert by the insert buttons, do not grip the adjusting screws. Slide the insert to the rear until the notches on the insert clear the drum tabs. Lift the insert upward and remove.

INSERT INSTALLATION.—Identify the proper insert chamber in the manner previously described.

The insert has two fingers at each end. Place the longer insert fingers in the notch at the rear of the drum and lower the insert into the drum chamber. Push the insert back against the retaining spring until the notches clear the tabs on the sides of the chamber. Carefully press the insert down until seated over its entire length. Release the tension applied against the retaining spring allowing the insert to move forward under the tabs. The short fingers on the insert will enter the slot in the front drum disc when the insert is properly seated.

Replace the tuner cover shield.

ALIGNMENT PROCEDURE

TUNER ADJUSTMENTS

INSERT ADJUSTMENTS.—Some factory prealigned UHF inserts may require minor adjustment when installed in the tuner. This can be accomplished by using the UHF station as a signal source.

CAUTION SHOULD BE TAKEN TO OBSERVE FOR REFERENCE, THE INITIAL POSITION OF ALL CORES BEFORE MAKING ANY ADJUSTMENTS.

Set the fine tuning control to the center of its range on the channel to be adjusted. Adjust the oscillator core for this channel to obtain maximum audio output without distortion. Adjustment of the triple-tuned circuit; UHF antenna, UHF link coupling and mixer cores may be made, if necessary, to obtain best picture and sound.

DETENT TENSION ADJUSTMENT.—The tension of the detent roller may be adjusted by the detent tension adjustment, see Figs. 6 and 13.

TEST EQUIPMENT.—To properly service the KRK-25 Tuner with receivers using the chassis indicated, it is recommended that the following test equipment be available:

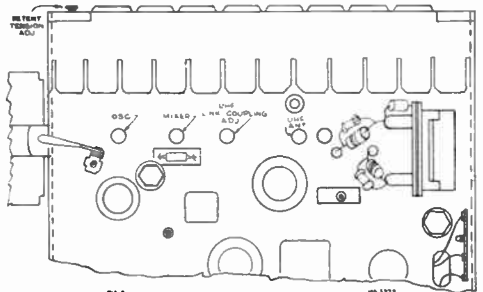

Figure 6—Tuner Adjustments

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) Intermediate frequencies
39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA Types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy:

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
14	471.25	475.75	517
15	477.25	481.75	523
16	483.25	487.75	529
17	489.25	493.75	535
18	495.25	499.75	541
19	501.25	505.75	547
20	507.25	511.75	553

81	873.25	877.75	919
82	879.25	883.75	925
83	885.25	889.75	931

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 1 millivolt per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

DC Milliammeter.—A milliammeter with a range of 0-50 milliamperes full scale.

Adapter Socket.—An adapter socket is required to meter the cathode current of the 6S4. Wiring of adapter is shown in Figure 7.

PICTURE I-F TRAP ADJUSTMENT.—Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R143 and R144. On KCS74 chassis, using a 6CL6 video amplifier, connect the "VoltOhmyst" to the junction of R193 and R194.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the positive terminal of one battery to the chassis and the potentiometer arm to the junction of R143 and R144. On KCS74 chassis with 6CL6 video amplifier, connect the battery positive terminal to the chassis and the potentiometer arm to the junction of R193 and R194.

The second bias supply will be used later.

Set the bias to produce approximately -1.0 volt of bias at the junction of R143 and R144 or R193 and R194 as noted above.

Connect the "VoltOhmyst" to pin 4 of V110, the 6AG7 video amplifier or to pin 2 of V110 if 6CL6 used as video amplifier.

Set the VHF signal generator to each of the following frequencies and adjust the corresponding circuit for minimum d-c output at pin 4 of V110 or at pin 2 if 6CL6 is used for V110. Use sufficient signal to produce 1.0 volt of d-c on the meter when the final adjustment is made.

39.25 mc. .... T104 top core
41.25 mc. .... T105 bottom core
47.25 mc. .... T106 bottom core

PICTURE I-F TRANSFORMER ADJUSTMENTS.—Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst". During alignment, reduce the input signal if necessary in order to produce 1.0 volt of d-c at pin 4 of V110 (pin 2 of V110 if 6CL6 is used) with 1.0 volt of i-f bias at the junction of R143 and R144 or R193 and R194 whichever applies.

43.7 mc. T109
45.5 mc. T108
41.8 mc. T107

To align T105 and T106, connect the sweep generator to the first picture i-f grid, pin 1 of V106 through a 1000 mmf. ceramic capacitor. Shunt R141, R149 (R136, R143 on KCS74 chassis as previously noted) and terminals "A" and "F" of T109 with 330 ohm composition resistors. Set the i-f bias to —1.0 volt at the junction of R143 and R144 or R193 and R194 as previously noted.

Connect the oscilloscope to pin 4 of V110 (pin 2 of V110 where 6CL6 is used).

Adjust T105 and T106 top cores for maximum gain and curve shape as shown in Figure 8. For final adjustment set the output of the VHF sweep generator to produce 0.5 volt peak-to-peak at the oscilloscope terminals.

CRYSTAL MIXER PLATE CIRCUIT, T2 AND T104.—To align the crystal mixer plate circuit, T2 and T104, connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep generator to the tuner case.

Set the Channel selector to Channel 5.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R135 and C132 (R131 and C131 on KCS74 chassis using 6CL6 for V110).

Connect the oscilloscope diode probe to terminal "B" of T105 and ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer across terminals A and B of T104 (C220 in KCS68, C221 in KCS66 or C122 in KCS74) is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (bottom) for maximum gain at 43.5 mc. and with 45.75 mc. at 70% of maximum response.

Adjust shunt trimmer (C220, C221 or C122) until 41.25 mc. is at 85% response with respect to the low frequency shoulder at approximately 41.9 mc. as shown in Figure 0. Adjust T1 for maximum gain. Readjust T2 and T104 if necessary to obtain proper wave shape, see Fig. 9.

Disconnect the diode probe, the 180 ohm and the three 330 ohm resistors.

SWEEP ALIGNMENT OF PIX I-F.—Connect the oscilloscope to pin 4 of V110, or pin 2 of V110 where 6CL6 is used.

Adjust the bias potentiometer to obtain —6.0 volts of bias as measured by a "VoltOhmyst" at the junction of R143 and R144, or R193 and R194 as before.

Leave the sweep generator connected to the front terminal of the 1N82 crystal holder with the shortest leads possible and with not more than one inch of unshielded lead at the end of the sweep cable. If these precautions are not observed, the receiver may be unstable and the response curves obtained may be unreliable.

Adjust the output of the sweep generator to obtain 3.0 to 5.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T108 and T109 to obtain the response shown in Figure 10. Do not adjust T107 unless absolutely necessary. If T107 is adjusted too low in frequency it will raise the level of the 41.25 mc. sound i-f carrier and may create interference in the picture. It will also cause poor adjacent channel picture rejection. If T107 is tuned too high in the frequency, the level of the 41.25 mc. sound i-f carrier will be too low and may produce noisy sound in weak signal areas.

Remove the oscilloscope, sweep and signal generator connections.

Remove the bias box employed to provide bias for alignment.

TUNER VHF ALIGNMENT.—Remove the 6S4 voltage control tube from its socket and insert the adapter. Insert 6S4 in the adapter.

Connect the 0-50 milliampere meter to the adapter socket leads and turn the adapter switch on.

Remove the tuner cover shield.

Rotate the channel selector to a point midway between channels, disengaging the insert contacts, and observe the non-oscillating plate current. Some tubes may oscillate even with the tuned circuits disengaged. To be sure the oscillator is in a non-oscillatory state, short circuit the spring contacts 12 and 13, the two contacts nearest the tuner front, with a finger.

(NOTE: The contacts are at zero d-c potential.) Should the plate current rise, keep finger on the contacts while adjusting the oscillator plate current. Adjust R6, oscillator voltage control, for a 28 milliampere reading on the meter.

Replace the tuner cover shield.

Connect the VHF sweep generator to the antenna terminals.

Connect the VHF signal generator loosely to the antenna terminals.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Turn off the adapter switch, removing plate voltage from the oscillator. This is required because of RF-IF interaction when a crystal is used as a mixer.

Set the channel selector and the sweep generator to Channel 2.

Insert markers of Channel 2 picture carrier and sound carrier, 55.25 mc. and 59.75 mc.

Adjust antenna T6, r-f amplifier plate L29 and mixer L30 adjustments for a symmetrical curve with maximum gain at the center of the pass band. The curves will have a deep valley because of no crystal loading and nonlinear detector characteristics. The limits for the 100% response points are shown in Figure 11. If the bandwidth is out of tolerance, it can usually be corrected by redressing the coupling capacitor of the double tuned circuit, C40 on insert A. Maximum bandwidth occurs when the capacitor is centered in the insert chamber.

Repeat the above steps for all VHF channels adjusting the appropriate antenna, r-f amplifier plate and mixer slugs for a symmetrical curve with maximum gain at the center of the pass band.

Turn off the sweep generator.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Turn the AGC control fully clockwise.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Connect the potentiometer arm of the second bias supply to the junction of R143 and R144 (R193 and R194 on KCS74 chassis with 6CL6 for V110), and ground the positive battery terminal. Adjust the bias potentiometer to produce —5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to pin 4 of V110 (pin 2 of V110 where 6CL6 is used). Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to Channel 13.

Set the fine tuning control to the center of its range.

Adjust the oscillator slug L22 to proper frequency, 257 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 257 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner through either of the two holes next to the oscillator tube on the right front top corner of the tuner. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust L22 oscillator slug to obtain an audio beat with the signal generator.

Turn on the sweep generator and set to Channel 13. Adjust T1 for maximum gain on the oscilloscope. Adjust mixer tank circuit L21 for maximum gain and flat-topped curve. Recheck T1 for maximum gain at center of band with the proper response. Maximum gain and flat-topped response should be obtained simultaneously.

Adjust the oscillator to frequency on all VHF channels by switching the receiver and signal generator to each VHF channel and adjusting the appropriate oscillator slug to obtain a beat with the signal generator. Adjust the appropriate mixer slug where necessary to obtain maximum gain and proper curve shape as explained above.

Adjust the tunable I-F Trap C16-L7. To do this connect the signal generator to the fixed I-F Trap C2-L2 at the end opposite the antenna terminal plug. Set the signal generator to 43.5 mc. and adjust the output of the signal generator to obtain sufficient indication on the oscilloscope. Tune the I-F Trap C16-L7 for minimum indication on the oscilloscope.

Remove the signal generator and the oscilloscope.

TUNER UHF ALIGNMENT.—To align the UHF inserts:

Turn off the adapter switch, removing plate voltage from the oscillator.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Connect the UHF sweep generator to the antenna terminals. Use a 10 DB attenuator pad to assure proper alignment.

Connect the UHF signal generator loosely to the antenna terminals.

Set the channel selector to the desired position and the sweep generator to sweep the frequency of the insert being used.

Insert markers of the picture carrier and sound carrier for desired channel.

Adjust UHF antenna link coupling and mixer adjustments for a symmetrical curve, with maximum gain, centered about the pass band.

The responses are shown in Figure 12. The curve shape will usually vary from Fig. 12 (a) to Fig. 12 (c) going higher in frequency, however any of these responses are acceptable.

Repeat the above steps for all UHF inserts used adjusting the appropriate antenna, link coupling and mixer slugs for a symmetrical curve, with maximum gain, centered about the pass band.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal.

Connect the potentiometer arm of the second bias supply to the junction of R143 and R144 (R193 and R194 on KCS74 chassis with 6CL6 for V110), and ground the positive battery terminal. Adjust the bias potentiometer to produce —5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to pin 4 or V110 (pin 2 of V110 where 6CL6 is used). Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to the lowest UHF channel to be used.

Set the fine tuning control to the center of its range.

Adjust the oscillator core to proper frequency. To do this, connect the VHF signal generator to the test point TP1 in series with a 100 mmf. capacitor and with the shortest leads possible. Insert a 45.75 mc. marker from the VHF generator.

Set the UHF sweep generator to sweep the desired channel, and observe the output on the oscilloscope. If the sweep generator is not sweeping the correct frequency range, it may be necessary to readjust the sweep in order to place the 45.75 marker on the response curve as in Fig. 9.

Set the UHF marker gen. to the picture carrier of the channel insert being adjusted and connect to TP1.

Adjust the oscillator core until the markers for 45.75 mc. and the picture carrier coincide on the sweep pattern.

Adjust mixer core for maximum gain with proper wave shape.

Connect the "VoltOhmyst" to test point TP1, using 1.5 volt D.C. scale.

Set oscillator injection adjustment to read .1 volts on the "VoltOhmyst".

Repeat the above steps for all UHF inserts adjusting the oscillator injection control only if the reading on the "VoltOhmyst" exceeds .3 volts. Adjust as necessary to read .3 volts or less at TP1.

77612	Contact—Bracket and spring contact assembly for grounding rotor—assembled to base
77618	Contact—Bracket and spring contact assembly for grounding rotor—assembled to oscillator shield
77606	Contact—Contact and support assembly—"L" shape—complete with two (2) contacts
77622	Contact—Contact and support assembly complete with two (2) contacts and UHF antenna input connector
77620	Contact—Contact and support assembly complete with four (4) contacts and holder for crystal rectifier
77607	Contact—Contact and support assembly complete with five (5) contacts—rear of chassis
77614	Control—Oscillator voltage control (R6)
77617	Control—UHF oscillator injection adjustment control
77583	Core—Fine tuning core
77593	Coupling—Indicator shaft coupling
77596	Ferrule—Ferrule for UHF antenna input cable
77588	Gear—Rotor drive gear—nylon
77602	Insert—VHF coil assembly insert for channels 2, 3 or 4 (Includes C40, C41, C42, L29, L30, L31, T6)
77603	Insert—VHF coil assembly insert for channels 5 or 6 (Includes C37, C38, C39, L26, L27, L28, T5)
77604	Insert—VHF coil assembly insert for channels 7, 8, 9 or 10 (Includes C35, C36, L23, L24, L25, T4)
77605	Insert—VHF coil assembly insert for channels 11, 12 or 13 (Includes C33, C34, L20, L21, L22, T3)
77590	Lever—Actuating lever for fine tuning link
77582	Link—Fine tuning link
77581	Plate—Front plate and ball race
77489	Rectifier—Silicon rectifier IN82 (CR1)
	Resistor—Fixed, composition:—
503047	47 ohms, ±10%, ½ watt (R16)
503110	100 ohms, ±10%, ½ watt (R10, R17)
503112	120 ohms, ±10%, ½ watt (R2, R9)
503210	1000 ohms, ±10%, ½ watt (R13, R14)
503310	10,000 ohms, ±10%, ½ watt (R12)
503322	22,000 ohms, ±10%, ½ watt (R1)
503410	100,000 ohms, ±10%, ½ watt (R18, R19)
503412	120,000 ohms, ±10%, ½ watt (R5)
503427	270,000 ohms, ±10%, ½ watt (R4)
503447	470,000 ohms, ±10%, ½ watt (R8)
503582	8.2 megohm, ±10%, ½ watt (R3, R7)
30340	Retainer—Retainer ring for fine tuning actuating lever stud
77592	Ring—Contact ring
77599	Roller—Rotor detent roller and retainer
77574	Rotor—Rotor frame
77594	Screw—#8-32 x ¼" cup point set screw for indicator shaft coupling
77576	Shaft—Channel selector drive shaft complete with two (2) gears
77595	Shaft—Indicator shaft
77611	Shield—Oscillator shield and grounding spring assembly—underside of chassis
77577	Shield—Top shield
76967	Shield—Tube shield for V2
76534	Shield—Tube shield for V1, V3
77613	Sleeve—Insulating sleeve for fine tuning adjustable core
77274	Socket—Tube socket, 7 pin, miniature, saddle mounted, steatite for V2
77608	Socket—Tube socket, 9 pin, miniature, saddle mounted, moulded mica for V1, V3, V4
77578	Spring—Formed spring for holding rotor (on back of unit)
77584	Spring—Fine tuning link adjusting spring
76961	Spring—Retaining spring for oscillator tube shield
77598	Spring—Rotor detent spring and roller complete with mounting bracket
77599	Roller—Rotor detent roller and retainer
77587	Stud—Mounting stud for fine tuning link actuating lever

STOCK No.	DESCRIPTION
77693	Stud—#6-32 x 21/32" adjusting stud for trimmer capacitor C9
77692	Stud—#6-32 x 25/32" adjusting stud for trimmer capacitors C6, C7, C8, C29, C30, C31, C32
77694	Stud—#10-32 x ⅜" adjusting stud for coils L20, L21, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31 and transformers T3, T4, T5, T6
77609	Transformer—Mixer I.F. transformer complete with adjustable cores (T1)
77610	Transformer—Primary I.F. link transformer complete with adjustable cores (T2, R15)
77626	Trap—I.F. trap (L1, C1, L2, C2)
77585	Washer—"C" washer for drive and indicator shafts (3 req'd.)
77586	Washer—"C" washer for fine tuning link spring
	MISCELLANEOUS
71496	Capacitor—Mica trimmer, 5-70 mmf. (C60)
77755	Clamp—Bakelite clamp for antenna cable
77761	Cover—Cover assembly—browh—complete with spring for channel markers for maple, or natural cherry instruments
77759	Cover—Cover assembly—maroon—complete with spring for channel markers for mahogany, walnut or red cherry instruments
77760	Cover—Cover assembly—sand gray—complete with spring for channel markers for blonde mahogany or oak instruments
77758	Disc—Polystyrene indicator disc—brown—for channel selections for maple or natural cherry instruments
77756	Disc—Polystyrene indicator disc—maroon—for channel selections for mahogany, walnut or red cherry instruments
77757	Disc—Polystyrene indicator disc—sand gray—for channel selections for blonde mahogany or oak instruments
77751	Knob—Channel selection knob—maroon—for mahogany, walnut or red cherry instruments
77752	Knob—Channel selector knob—medium beige—for blonde mahogany or oak instruments
77753	Knob—Channel selector knob—tan—for maple or natural cherry instruments
77750	Knob—Fine tuning control knob
77766	Marker—UHF channel number markers for blonde mahogany or oak instruments
77765	Marker—UHF channel number markers for mahogany, any, walnut or red cherry instruments
77767	Marker—UHF channel number markers for maple, or natural cherry instruments
77763	Marker—VHF channel number markers for blonde mahogany or oak instruments
77762	Marker—VHF channel number markers for mahogany, walnut or red cherry instruments
77764	Marker—VHF channel number markers for maple or natural cherry instruments
	Resistor—Fixed, composition:—
503210	1000 ohms, ±10%, ½ watt
523218	1800 ohms, ±10%, 2 watts
523318	18,000 ohms, ±10%, 2 watts
77754	Shade—Channel marker lamp shade
74734	Spring—Retaining spring for channel markers cover

Models 21-D-330, 21-D-330 U
"Clermont"
Maple, Red Cherry

GENERAL DESCRIPTION

All models are "21 inch" television receivers. Models 21-D-305, 21-D-317, 21-D-326, 21-D-327, 21-D-328, 21-D-329 and 21-D-330 are identical except for cabinets and speakers. These models feature full 12 channel VHF coverage. Models 21-D-305U, 21-D-317U, 21-D-326U, 21-D-327U, 21-D-328U, 21-D-329U and 21-D-330U are identical except for cabinets and speakers. These models feature full 12 channel VHF coverage plus any 4 UHF channels desired. All models have an auxilary audio input jack to permit the use of an external record playing attachment.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE............227 square inches on a 21AP4 Kinescope

TELEVISION R-F FREQUENCY RANGE
Models 21-D-305 to 21-D-330 Incl.
All 12 VHF channels..........54 mc. to 88 mc., 174 mc. to 216 mc.
Models 21-D-305U to 21-D-330U Incl.
Any of 70 UHF channels.......................470 mc. to 890 mc.
Any of 12 VHF channels......54 mc. to 88 mc., 174 mc. to 216 mc.
(Any desired combination of 16 UHF and/or VHF channels may be used.)

INTERMEDIATE FREQUENCIES
Picture I-F Carrier Frequency..........................45.75 mc.
Sound I-F Carrier Frequency............................41.25 mc.

POWER RATING....................21-D-305 to 21-D-330 295 watts
21-D-305U to 21-D-330U 305 watts

AUDIO POWER OUTPUT RATING....................4 watts max.

SWEEP DEFLECTION AND FOCUS.......................Magnetic

ANTENNA INPUT IMPEDANCE
Models 21-D-305 to 21-D-330 Incl.
Choice: 300 ohms balanced or 72 ohms unbalanced.
Models 21-D-305U to 21-D-330U Incl.
UHF—Choice: 300 ohms balanced or 72 ohms unbalanced.
VHF—300 ohms balanced.

CHASSIS DESIGNATIONS
KCS81........................In models 21-D-305, 21-D-317, 21-D-326, 21-D-327, 21-D-328, 21-D-329, 21-D-330
KCS81B................In models 21-D-305U, 21-D-317U, 21-D-326U, 21-D-327U, 21-D-328U, 21-D-329U, 21-D-330U

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK11B (21-D-305 to 21-D-330 Incl.)	
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK12 (21-D-305U to 21-D-330U Incl.)	
(1) RCA 6BQ7A	R-F Amplifier (VHF only)
(2) RCA 6AF4	R-F Oscillator
(3) RCA 6BQ7A	I-F Amplifier
(4) RCA 6S4	Voltage Control
A 1N82 crystal is used as a mixer.	
All Models	
(1) RCA 6AU6	1st Picture I-F Amplifier
(2) RCA 6CB6	2nd Picture I-F Amplifier
(3) RCA 6CB6	3rd Picture I-F Amplifier
(4) RCA 6CB6	4th Picture I-F Amplifier
(5) RCA 6CL6	Video Amplifier
(6) RCA 6AU6	1st Sound I-F Amplifier
(7) RCA 6AU6	2nd Sound I-F Amplifier
(8) RCA 6AL5	Ratio Detector
(9) RCA 6AV6	1st Audio Amplifier
(10) RCA 6AQ5	Audio Output
(11) RCA 12AU7	Vert. Sync Separator and AGC
(12) RCA 12AU7	Horiz. Sync Separator and Sync Amplifier
(13) RCA 6SN7GT	Vert. Sync Amplifier and Vert. Sweep Osc.
(14) RCA 6AQ5	Vertical Sweep Output
(15) RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(16) RCA 6CD6G	Horizontal Sweep Output
(17) RCA 6W4GT (2 tubes)	Dampers
(18) RCA 1B3GT/8016	High Voltage Rectifier
(19) RCA 5U4G (2 tubes)	Rectifiers
(20) RCA 21AP4	Kinescope

INSTALLATION INSTRUCTIONS

UNPACKING. — These receivers are shipped complete in cardboard cartons. The kinescope is shipped in place in the receiver.

Take the receiver out of the carton and remove all packing material.

Install the control knobs on the proper control shafts.

Make sure that all tubes are in place and are firmly seated in their sockets.

Check to see that the kinescope high voltage lead clip is in place.

Plug a power cord into the 115 volt a-c power source and into the receiver interlock receptacle.

Turn the receiver power switch to the "on" position, the brightness control fully clockwise, and the picture control counter-clockwise.

ION TRAP MAGNET ADJUSTMENT. — Set the ion trap magnet approximately in the position shown in Figure 1. Starting from this position immediately adjust the magnet by moving it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest raster on the screen.

DEFLECTION YOKE ADJUSTMENT. — If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

PICTURE ADJUSTMENTS. — It will now be necessary to obtain a test pattern picture in order to make further adjustments. Connect the antenna transmission line to the receiver.

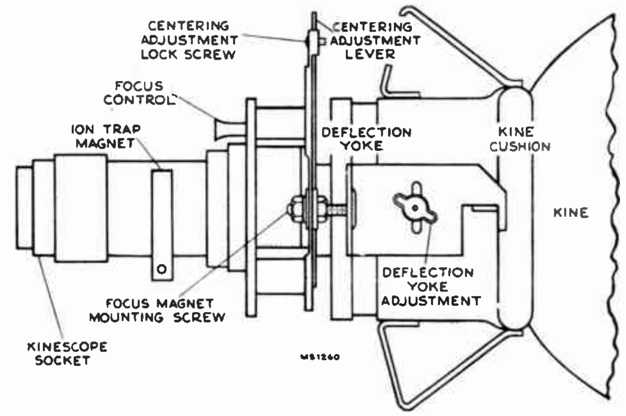

Figure 1—Yoke and Focus Magnet Adjustments

If the Horizontal Oscillator and AGC System are operating properly, it should be possible to sync the picture at this point. However, if the AGC control is misadjusted, and the receiver is overloading, it may be impossible to sync the picture.

If the receiver is overloading, turn R180 on the rear apron (see Figure 2) counter-clockwise until the set operates normally and the picture can be synchronized.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT. — Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel then back. Normally the picture will be out of sync. Turn the control clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 2 or 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. Pull-in should occur before the control has been turned 70 degrees from the extreme counter-clockwise position. The picture should remain in sync for approximately 90 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should just begin to show a black bar in the picture on the left side.

If the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Centering Adjustment."

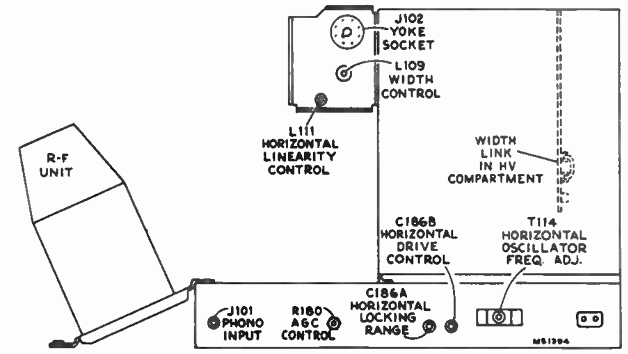

Figure 2—Rear Chassis Adjustments

ALIGNMENT OF HORIZONTAL OSCILLATOR. — If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync over 90 degrees of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments.

Horizontal Frequency Adjustment. — Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the T114 horizontal frequency adjustment at the rear of the chassis until the picture is just out of sync and the horizontal blanking appears as a vertical or diagonal black bar in the raster. Then turn the T114 core until the bar is just visible at the extreme left side of the picture.

Horizontal Locking Range Adjustment. — Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 rear core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 2 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C186A slightly clockwise. If less than 2 bars are present, adjust C186A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the conditions specified under each are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If it is impossible to sync the picture at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure on Page 11. For field purposes paragraph "B" under Horizontal Oscillator Waveform Adjustment may be omitted.

FOCUS MAGNET ADJUSTMENTS.—The focus magnet should be adjusted so that there is approximately three-eighths inch of space between the rear cardboard shell of the yoke and the flat of the front face of the focus magnet. This spacing gives best average focus over the face of the tube.

The axis of the hole through the magnet should be parallel with the axis of the kinescope neck with the kinescope neck through the middle.

CENTERING ADJUSTMENT.—No electrical centering controls are provided. Centering is accomplished by means of a separate plate on the focus magnet. The centering plate includes a locking screw which must be loosened before centering. Up and down adjustment of the plate moves the picture side to side and sidewise adjustment moves the picture up and down.

If a corner of the raster is shadowed, check the position of the

INSTALLATION INSTRUCTIONS

ion trap magnet. Reposition the magnet within the range of maximum raster brightness to eliminate the shadow and re-center the picture by adjustment of the focus magnet plate. In no case should the ion trap magnet be adjusted to cause ony loss of brightness since such operation may cause immediate or eventual damage to the tube. In some cases it may be necessary to shift the position of the focus magnet in order to eliminate a corner shadow.

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS. — Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage hence the brightest and best focused picture, adjust horizontal drive trimmer C186B for maximum drive (minimum capacity) consistent with a linear raster. Compression of the raster due to excessive drive can be seen as a white vertical bar or bars in the right half of the picture. Besides compression caused by excessive drive, another item to watch for is the change in linearity at the extreme left with changes of brightness control setting. By proper adjustment of the linearity coil, the changes in linearity with changes in brightness can be made negligible. In general, to achieve this condition, the linearity coil should be set slightly on the high inductance side (core slightly clockwise) of the optimum position.

Preset the following adjustments as directed:

A.—Place the width plug P103 in the minimum width position (top).

B.—Set the width control coil L109 in approximately mid position.

C.—Set the linearity control coil L111 near minimum inductance (counter-clockwise).

D.—Set the drive capacitor C186B in the maximum drive position (counter-clockwise).

If the raster is cramped or shows compression bars on the right half of the picture turn C186B clockwise until this condition is just eliminated.

Adjust the linearity control coil L111 clockwise until best linearity and maximum deflection or best compromise are obtained then turn one quarter turn clockwise from this position.

Retouch the drive trimmer C186B if necessary to obtain best linearity and maximum width.

Check the horizontal linearity at various settings of the brightness control R114A. There should be no compression of the right half and no appreciable change of linearity especially at the extreme left of the picture. If objectional change does occur, turn linearity coil L111 slightly clockwise and repeat the test.

Adjust the width control L109 to fill the mask.

If the line voltage is low and it becomes impossible to fill the mask, move the width plug P103 to the bottom position. The width coil L109 is inoperative in this position.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS. — Adjust the height control (R190 behind front control panel) until the picture fills the mask vertically. Adjust vertical linearity (R197 behind front control panel), until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other.

FOCUS.—Adjust the focus magnet for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

Recheck the position of the ion trap magnet to make sure that maximum brightness is obtained.

If necessary readjust centering to align the picture with the mask.

CHECK OF R-F OSCILLATOR ADJUSTMENTS. — ***(Models 21-D-305 to 21-D-330 incl. with KRK11B Tuner.)*** Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 8. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 3. Adjustment for channel 13 is on top of the chassis.

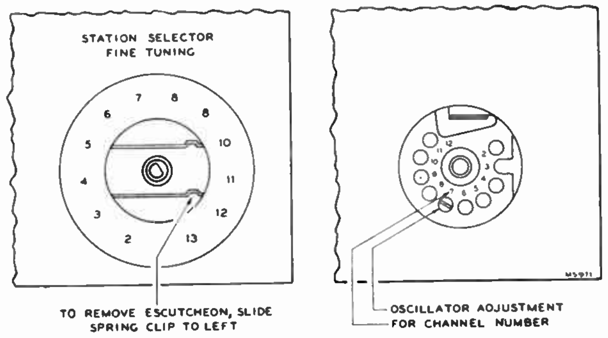

Figure 3—KRK11B R-F Oscillator Adjustments

(Models 21-D-305U to 21-D-330U incl. with KRK12 Tuner). Tune in all available VHF stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 60.

NOTE.—Some factory prealigned UHF inserts may require minor adjustment when installed in the tuner. This can be accomplished by using the UHF stations as a signal source.

CAUTION SHOULD BE TAKEN TO OBSERVE FOR REFERENCE, THE INITIAL POSITION OF ALL CORES BEFORE MAKING ANY ADJUSTMENTS.

Set the fine tuning control to the center of its range on each UHF channel to be adjusted. Adjust the oscillator core for each UHF channel to obtain maximum audio output without distortion.

AGC THRESHOLD CONTROL. — The AGC Threshold Control R180 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal and sync the picture. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not over-loading due to improper setting of R180. If the picture requires an appreciable portion of a second to reappear, or bends excessively, R180 should be readjusted.

Turn R180 fully counter-clockwise. The raster may be bent slightly. This should be disregarded. Turn R180 clockwise until there is a very, very slight bend or change of bend in the picture. Then turn R180 counter-clockwise just sufficiently to remove this bend or change of bend.

If the signal is weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R180 clockwise until the snow in the picture becomes more pronounced, then counter-clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far clockwise on a weak signal, then the receiver may overload when a strong signal is received.

FM TRAP ADJUSTMENT. — In some instances interference may be encountered from a strong FM station signal. A trap is provided to eliminate this type of interference. To adjust the trap tune in the station on which the interference is observed and adjust the L58 core on top of the antenna matching transformer for minimum interference in the picture.

CAUTION. — In some receivers, the FM trap L58 will tune down into channel 6 or even into channel 5. Needless to say, such an adjustment will cause greatly reduced sensitivity on these channels. If channels 5 or 6 are to be received, check L58 to make sure that it does not affect sensitivity on these two channels.

The FM trap on Models 21-D-305U to 21-D-330U is attached to the receiver antenna cable and should be adjusted in the same manner as L58 on Models 21-D-305 to 21-D-330.

Replace the cabinet back and connect the receiver antenna leads to the cabinet back. Make sure that the screws holding it are up tight, otherwise it may rattle or buzz when the receiver is operated at high volume.

CHASSIS BOTTOM VIEW

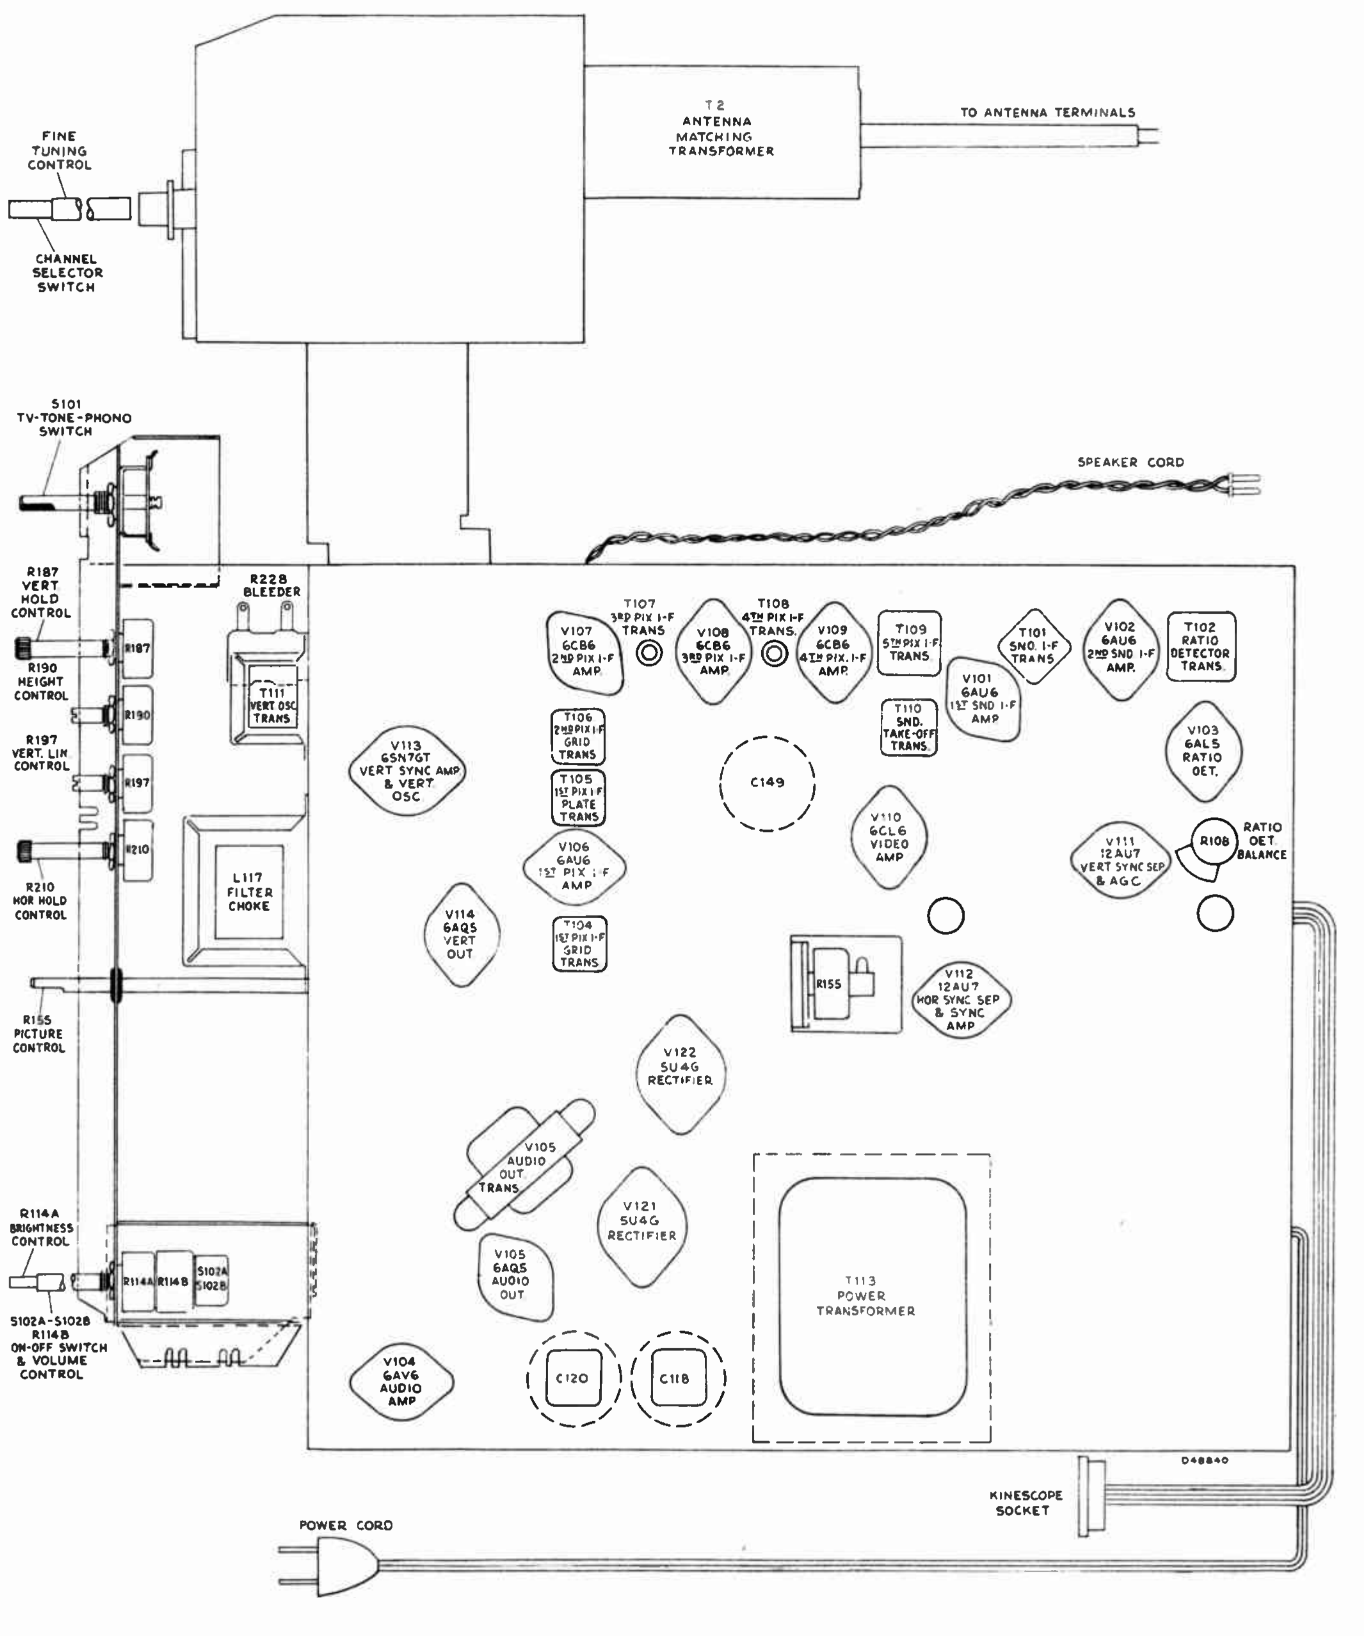

Figure 5—Chassis Bottom View (shown with KRK11B Tuner)

ALIGNMENT PROCEDURE

TEST EQUIPMENT. — To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.
(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	83.25	81.75	123
6	77.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA Types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
14	471.25	475.75	517
15	477.25	481.75	523
16	483.25	487.75	529
17	489.25	493.75	535
18	495.25	499.75	541
19	501.25	505.75	547
20	507.25	511.75	553

Cathode Ray Oscilloscope. — An oscilloscope with a sensitivity of 1 millivolt per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter. — A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

DC Milliammeter. — A milliammeter with a range of 0-50 milliamperes full scale.

Adapter Socket. — An adapter socket is required to meter the cathode current of the 6S4 voltage control tube of the KRK12 Tuner. Wiring of adapter is shown in Figure 13.

KRK11B ANTENNA MATCHING UNIT ALIGNMENT. — The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L58 to the channel selector switch S5.

With a short jumper, connect the output of the matching unit through a 1,000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R133 and C133B. Set the potentiometer to produce approximately –5.0 volts of bias at the junction of R133 and C133B.

Connect an oscilloscope to pin 9, V110 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L59 in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L60 for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

ALIGNMENT PROCEDURE

Connect a 300 ohm ½ watt composition resistor from L58 to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L58 to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 14 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by retuning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L61 and L62 to obtain the response shown in Figure 15. L61 is most effective in locating the position of the shoulder of the curve at 52 mc. and L62 should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L58 and S5. Replace V106.

PICTURE I-F TRAP ADJUSTMENT. — Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R133 and C133B.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the positive terminal of one battery to chassis and the potentiometer arm to the junction of R133 and C133B.

Set the bias to produce approximately −1.0 volt of bias at the junction of R133 and C133B.

Connect the "VoltOhmyst" to pin 9 of V110, the 6CL6 video amplifier.

Set the signal generator to each of the following frequencies and adjust the corresponding circuit for minimum d-c output at pin 9 of V110. Use sufficient signal input to produce 1.0 volt of d-c on the meter when the final adjustment is made.

39.25 mc.	T104 top core
41.25 mc.	T105 bottom core
47.25 mc.	T106 bottom core

PICTURE I-F TRANSFORMER ADJUSTMENTS. —
Models 21-D-305 to 21-D-330 Incl.

Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 1.0 volt of d-c at pin 9 of V110 with −1.0 volt of i-f bias at the junction of R133 and C133B.

43.7 mc.	T109
45.5 mc.	T108
41.8 mc.	T107

To align T105 and T106, connect the sweep generator to the first picture i-f grid, pin 1 of V106 through a 1,000 mmf. ceramic capacitor. Shunt R137, R141 and terminals "A" and "F" of T109 with 330 ohm composition resistors. Set the i-f bias to −1.0 volt at the junction of R133 and C133B.

Connect the oscilloscope to pin 9 of V110.

Adjust T105 and T106 top cores for maximum gain and curve shape as shown in Figure 19. For final adjustment set the output of the sweep generator to produce 0.5 volt peak-to-peak at the oscilloscope terminals.

To align T1 and T104, connect the sweep generator to the mixer grid test point TP2. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable.

Adjust C121 until 41.25 mc. is at 85% response with respect to the low frequency shoulder at approximately 41.9 mc. as shown in Figure 20.

Disconnect the diode probe, the 180 ohm and three 330 ohm resistors.

Models 21-D-305U to 21-D-330U Incl.

Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 1.0 volt of d-c at pin 9 of V110 with −1.0 volt of i-f bias at the junction of R133 and C133B.

43.7 mc.	T109
45.5 mc.	T108
41.8 mc.	T107

To align T105 and T106, connect the sweep generator to the first picture i-f grid, pin 1 of V106 through a 1,000 mmf. ceramic capacitor. Shunt R137, R141 and terminals "A" and "F" of T109 with 330 ohm composition resistors. Set the i-f bias to −1.0 volt at the junction of R133 and C133B.

Connect the oscilloscope to pin 9 of V110, the 6CL6 video amplifier.

Adjust T105 and T106 top cores for maximum gain and curve shape as shown in Figure 19. For final adjustment set the output of the VHF sweep generator to produce 0.5 volt peak-to-peak at the oscilloscope terminals.

To align the crystal mixer and T2 and T104, connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1,500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep generator to the tuner case.

Set the channel selector to channel 5.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R131 and C133A.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C121 across terminals A and B of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (bottom) for maximum gain at 43.5 mc. and with 45.75 mc. at 70% of maximum response.

Adjust the shunt trimmer C121 until 41.25 mc. is at 85% response with respect to the low frequency shoulder at approximately 41.9 mc. as shown in Figure 11. Adjust T1 for maximum gain. Readjust T2 and T104 if necessary to obtain proper wave shape, see Figure 11.

Disconnect the diode probe, the 180 ohm and the three 330 ohm resistors.

SWEEP ALIGNMENT OF PICTURE I.F.—

Connect the oscilloscope to pin 9 of V110.

Adjust the bias potentiometer to obtain −6.0 volts of bias as measured by a "VoltOhmyst" at the junction of R133 and C133B.

Leave the sweep generator connected to the mixer grid test point TP2 on KRK11B Tuner or to the front terminal of the 1N82 crystal holder on KRK12 Tuner. Use the shortest leads possible with not more than one inch of unshielded lead at the end of the sweep cable. If these precautions are not observed, the receiver may be unstable and the response curves obtained may be unreliable.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

ALIGNMENT PROCEDURE

Retouch T108 and T109 to obtain the response shown in Figure 21. Do not adjust T107 unless absolutely necessary. If T107 is adjusted too low in frequency it will raise the level of the 41.25 mc. sound i-f carrier and may create interference in the picture. It will also cause poor adjacent channel picture rejection. If T107 is tuned too high in frequency, the level of the 41.25 mc. sound i-f carrier will be too low and may produce noisy sound in weak signal areas.

Remove the oscilloscope, sweep and signal generator connections.

Remove the bias box employed to provide bias for alignment.

KRK11B TUNER ALIGNMENT
Models 21-D-305 to 21-D-330 Incl.

An r-f unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset all adjustments to the approximate center of their range with the following exceptions: Set C18 so that the screw head is approximately three-eighths of an inch above chassis. Set C11 near maximum capacity (one-quarter turn from tight). Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

The r-f unit is aligned with −3.5 AGC bias.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce −3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Connect the oscilloscope to the test point TP1 on top of the r-f unit. Set the oscilloscope gain to maximum.

Turn the receiver channel selector switch to channel 2.

Connect the output of the VHF signal generator to the grid of the r-f amplifier, V2. To do this, remove the tube from the socket and fashion a clip by twisting one end of a small piece of wire around pin number 7. Replace the tube in the socket leaving the end of the wire protruding from under the tube. Connect the signal generator to this wire through a 1,500 mmf. capacitor.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust L65 on top of the r-f unit for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to adjust it so as to reduce sensitivity on Channel 2.

Remove the wire clip from pin 7 of V2 and replace the tube and tube shield.

Set the channel selector switch to channel 8.

Turn the fine tuning control 30 degrees clockwise from the center of its mechanical range now and at all times when adjusting the oscillator frequency.

Adjust C2 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the r-f unit through the hole provided for the adjustment for C11. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the r-f unit oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C2 to obtain an audio beat with the signal generator.

Note. — If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C2, switch to channel 13 and adjust L46 to obtain proper channel 13 oscillator frequency as indicated in the table on page 11. Then, switch to channel 12 and adjust L11 to obtain proper channel 12 oscillator frequency. Continue down to channel 8 adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C2 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and adjust L46 and back to channel 8 and adjust C2.

Set the T1 core for maximum inductance (core turned counterclockwise).

Connect the sweep generator through a suitable attenuator as shown in Figure 14 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a useable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C9, C11, C15 and C18 for approximately correct curve shape, frequency, and band width as shown in Figure 16.

The correct adjustment of C18 is indicated by maximum amplitude of the curve midway between the markers. C15 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C9 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C18 has been properly adjusted). C11 is the coupling adjustment and hence primarily affects the response band width.

Set the receiver channel switch to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Turn the fine tuning control 30 degrees clockwise from the center of its mechanical range.

Adjust L5 for an audible beat with the signal generator as before.

Set the sweep generator to channel 6.

From the signal generator, insert channel 6 sound and picture carrier markers, 83.25 mc. and 87.75 mc.

Adjust L48, L50 and L53 for proper response as shown in Figure 16.

L50 tunes the r-f amplifier plate circuit and primarily affects the frequency of the pass band. L53 tunes the r-f amplifier grid and is adjusted to give maximum amplitude of the curve between the markers. L48 affects the tilt of the curve but not quite the same as C9 adjustment. When the circuits are correctly adjusted and L48 is rocked on either side of its proper setting, the high frequency (sound carrier) end of the curve appears to remain nearly fixed in amplitude while the picture carrier end tilts above or below this point.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the r-f unit test point TP1.

Adjust the oscillator injection trimmer C8 for −3.5 volts or at maximum if −3.5 volts cannot be reached. This voltage should fall between −2.5 and −5.5 volts on all channels when the alignment of all circuits is completed.

Turn the sweep generator and signal generator back on and recheck channel 6 response. Readjust L48, L50 and L53 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C2 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C9, C11, C15 and C18 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 6 and check the oscillator injection voltage at TP1 if C9 was adjusted in the recheck of channel 8 response.

If the initial setting of oscillator injection trimmer C8 was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 6 and repeat the procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Set the fine tuning control 30 degrees clockwise from the center of its mechanical range.

Adjust L46 to obtain an audible beat. Slightly overshoot the adjustment of L46 by turning the slug a little more in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C2 to again obtain the beat.

Check the response of channels 7 through 13 by switching the receiver channel switch, sweep generator and marker oscillator to each of these channels and observing the response and oscillator injection obtained. See Figure 16 for typical response curves. It should be found that all these channels have the proper shaped response with the markers above 80% response.

If the markers do not fall within this requirement, switch to channel 8 and readjust C9, C11, C15 and C18 as necessary.

Turn off the sweep generator and check the channel 8 oscillator frequency. If C2 has to be readjusted for channel 8, the principle of overshooting the adjustment and then correcting by adjusting L46 should be followed in order to establish the L/C ratio for the desired oscillator tracking.

Turn the receiver channel selector switch to channel 6. Adjust L5 for correct oscillator frequency, 129 mc.

Turn the sweep generator on and to channel 6 and observe the response curve. If necessary readjust L48, L50 and L53.

Switch the receiver, the sweep and signal generators to channel 2 and adjust T1 clockwise to a point where there is no change in the channel 2 response as T1 is turned.

Switch the receiver through channel 6 down through channel 2 and check for normal response curve shapes and oscillator injection voltage.

If excessive tilt in the same direction occurs on channels 2, 3 and 4, adjust C18 on channel 2 to overshoot the correction of this tilt, then switch to channel 6 and adjust L53 for maximum amplitude of curve between markers. This adjustment should produce "flat" response on the low channels if the other adjustments especially L48 are correct.

Likewise check channels 7 through 13, stopping on 13 for the next step.

With the receiver on channel 13, check the receiver oscillator frequency. Correct by adjustment of C2 if necessary.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator trimmer to obtain the audible beat. It should be possible to adjust the oscillator to the correct frequency on all channels with the fine tuning control in the middle third of its range. When employing WR39 calibrators to adjust the receiver oscillator, tune the calibrator to one-half the receiver oscillator frequency on channels 4, 5 and 6 and to one-fourth the receiver oscillator frequency on channels 11, 12 and 13.

KRK12 TUNER ALIGNMENT

Models 21-D-305U to 21-D-330U Incl.

TUNER VHF ALIGNMENT. — Remove the 6S4 voltage control tube from its socket and insert the adapter. Insert the 6S4 in the adapter.

Connect the 0-50 milliampere meter to the adapter socket leads and turn the adapter switch on.

Remove the tuner cover shield.

Rotate the channel selector to a point midway between channels, disengaging the insert contacts, and observe the non-oscillating plate current. Some tubes may oscillate even with the tuned circuits disengaged. To be sure the oscillator is in a non-oscillatory state, short circuit the spring contacts 12 and 13, the two contacts nearest the tuner front, with a finger.

(NOTE: The contacts are at zero d-c potential.) Should the plate current rise, keep finger on the contacts while adjusting the oscillator plate current. Adjust R6, oscillator voltage control, for a 28 milliampere reading on the meter.

Replace the tuner cover shield.

Connect the VHF sweep generator to the antenna terminals.

Connect the VHF signal generator loosely to the antenna terminals.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Turn off the adapter switch, removing plate voltage from the oscillator. This is required because of RF-IF interaction when a crystal is used as a mixer.

Set the channel selector and the sweep generator to channel 2.

Insert markers of channel 2 picture carrier and sound carrier, 55.25 mc. and 59.75 mc.

Adjust antenna T6, r-f amplifier plate L29 and mixer L30 adjustments for a symmetrical curve with maximum gain at the center of the pass band. The curves will have a deep valley because of no crystal loading and nonlinear detector characteristics. The limits for the 100% response points are shown in Figure 9. If the bandwidth is out of tolerance, it can usually be corrected by redressing the coupling capacitor of the double tuned circuit, C40 on insert A. Maximum bandwidth occurs when the capacitor is centered in the insert chamber.

Repeat the above steps for all VHF channels adjusting the appropriate antenna, r-f amplifier plate and mixer slugs for a symmetrical curve with maximum gain at the center of the pass band.

Turn off the sweep generator.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Turn the AGC control fully clockwise and remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce −3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Connect the potentiometer arm of the second bias supply to the junction R133 and C133B, and ground the positive battery terminal. Adjust the bias potentiometer to produce −5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to pin 9 of V110. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to channel 13.

Set the fine tuning control to the center of its range.

Adjust the oscillator slug L22 to proper frequency, 257 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 257 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner through either of the two holes next to the oscillator tube on the right front top corner of the tuner. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust L22 oscillator slug to obtain an audio beat with the signal generator.

Turn on the sweep generator and set to Channel 13. Adjust T1 for maximum gain on the oscilloscope. Adjust mixer tank circuit L21 for maximum gain and flat-topped curve. Recheck T1 for maximum gain at center of band with the proper response. Maximum gain and flat-topped response should be obtained simultaneously.

Adjust the oscillator to frequency on all VHF channels by switching the receiver and signal generator to each VHF channel and adjusting the appropriate oscillator slug to obtain a beat with the signal generator. Adjust the appropriate mixer slug where necessary to obtain maximum gain and proper curve shape as explained above.

Adjust the tunable I-F Trap C16-L7. To do this connect the signal generator to the fixed I-F Trap C2-L2 at the end opposite the antenna terminal plug. Set the signal generator to 43.5 mc. and adjust the output of the signal generator to obtain sufficient indication on the oscilloscope. Tune the I-F Trap C16-L7 for minimum marker indication on the oscilloscope.

Remove the signal generator and the oscilloscope.

ALIGNMENT PROCEDURE

TUNER UHF ALIGNMENT. — To align the UHF inserts:

Turn off the adapter switch, removing plate voltage from the oscillator.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Connect the UHF sweep generator to the antenna terminals. Use a 10 DB attenuator pad to assure proper alignment.

Connect the UHF signal generator loosely to the antenna terminals.

Set the channel selector to the desired position and the sweep generator to sweep the frequency of the insert being used.

Insert markers of the picture carrier and sound carrier for desired channel.

Adjust the UHF antenna, link coupling and mixer adjustments for a symmetrical curve, with maximum gain, centered about the pass band.

The responses are shown in Figure 10. The curve shape will usually vary from Figure 10 (a) to Figure 10 (c) going higher in frequency, however any of these responses are acceptable.

Repeat the above steps for all UHF inserts used adjusting the appropriate antenna, link coupling and mixer slugs for a symmetrical curve, with maximum gain, centered about the pass band.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce −3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal.

Connect the potentiometer arm of the second bias supply to the junction of R133 and C133B, and ground the positive battery terminal. Adjust the bias potentiometer to produce −5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to pin 9 of V110. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to the lowest UHF channel to be used, and set the fine tuning control to the center of its range.

Adjust the oscillator core to proper frequency. To do this, connect the VHF signal generator to test point TP1 with the shortest leads possible. Insert a 45.75 mc. marker from the VHF generator.

Set the UHF sweep generator to sweep the desired channel, and observe the output on the oscilloscope. If the sweep generator is not sweeping the correct frequency range, it may be necessary to readjust the sweep in order to place the 45.75 marker on the response curve as in Figure 12.

Set the UHF marker gen. to the picture carrier of the channel insert being adjusted and connect to test point TP1.

Adjust the oscillator core until the markers for 45.75 mc. and the picture carrier coincide on the sweep pattern on the oscilloscope.

Adjust the mixer core for maximum gain with proper wave shape.

Connect the "VoltOhmyst" to test point TP1, using 1.5 volt DC scale.

Set oscillator injection adjustment to read .1 volts on the "VoltOhmyst."

Repeat the above steps for all UHF inserts adjusting the oscillator injection control only if the reading on the "VoltOhmyst" exceeds .3 volts. Adjust as necessary to read .3 volts or less at TP1.

RATIO DETECTOR ALIGNMENT. — In order to obtain good ratio detector alignment an AM modulated signal generator that is exceptionally free from FM modulation must be employed. Set the signal generator at 4.5 mc. and connect it to the second sound i-f grid, pin 1 of V102. Set the generator for 30% 400 cycle modulation.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. If used, connect it to the grid of the 4th pix i-f amplifier, pin 1, V109. Set the frequency of the calibrator to 45.75 (pix carrier) and modulate with 4.5 mc. crystal. Also turn on the internal AM audio modulation. The 4.5 mc. signal will be picked off at T110A and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to the junction of R111 and C111.

Connect the oscilloscope across the speaker voice coil and turn the volume control for maximum output.

Tune the ratio detector primary, T102 top core for maximum DC output on the "VoltOhmyst." Adjust the signal level from the signal generator for minus 10 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R110 and C110.

Adjust the T102 bottom core for zero d-c on the meter. Then, turn the core to the nearest minimum AM output on the oscilloscope.

Repeat adjustments of T102 top for maximum DC and T102 bottom for minimum output on the oscilloscope making final adjustment with the 4.5 mc. input level adjusted to produce 10 volts d-c on the "VoltOhmyst" at the junction of R111 and C111.

Connect the "VoltOhmyst" to the junction of R110 and C110 and note the amount of d-c present. If this voltage exceeds ±1.5 volts, adjust R108 by turning it in until zero d-c is obtained. Readjust the T102 bottom core for minimum output on the oscilloscope. Repeat adjustments of R108 and T102 bottom core until the voltage at R110 and C110 is less than ±1.5 volts when T102 bottom core is set for minimum output on the oscilloscope.

Connect the "VoltOhmyst" to the junction of R111 and C111 and repeak T102 top core for maximum d-c on the meter and again reset the generator so as to have −10 volts on the meter.

Repeat the adjustments in the above two paragraphs until the voltage at R110 and C110 is less than ±1.5 volts when the T102 top core is set for maximum d-c at the junction of R111 and C111 and the T102 bottom core is set for minimum indication on the oscilloscope.

SOUND I-F ALIGNMENT. — Connect the sweep generator to the first sound i-f amplifier grid, pin 1 of V101. Adjust the generator for a sweep width of 1 mc. at a center frequency of 4.5 mc.

Insert a 4.5 mc. marker signal from the signal generator into the first sound i-f grid. With the WR39B or WR39C calibrators the 4.5 mc. crystal signal may be obtained at the R-F out terminal by turning the variable osc. switch off, the calibrate switch to 4.5 mc. and the volume control with mod. off.

Connect the oscilloscope in series with a 10,000 ohm resistor to terminal A of T101.

Adjust T101 top and bottom cores for maximum gain and symmetry about the 4.5 mc. marker on the i-f response. The pattern obtained should be similar to that shown in Figure 17.

The output level from the sweep should be set to produce approximately 2.0 volt peak-to-peak at terminal A of T101 when the final touches on the above adjustment are made. It is necessary that the sweep output voltage should not exceed the specified values otherwise the response curve will be broadened, permitting slight misadjustment to pass unnoticed and possibly causing distortion on weak signals.

Connect the oscilloscope to the junction of R110 and C110 and check the linearity of the response. The pattern obtained should be similar to that shown in Figure 18.

ALIGNMENT PROCEDURE

SOUND TAKE-OFF ALIGNMENT. — Connect the 4.5 mc. generator in series with a 1,000 ohm resistor to terminal "C" of T110. The input signal should be approximately 0.5 volt.

Short the fourth pix i-f grid to ground, pin 1, V109, to prevent noise from masking the output indication.

As an alternate source of signal the RCA WR39B or WR39C calibrator may be used. In such a case, disregard the above two paragraphs. Connect calibrator across link circuit, T104 A, B, and modulate 45.75 with 4.5 mc. crystal.

Connect the crystal diode probe of a "VoltOhmyst" to the plate of the video amplifier, pin 6 of V110.

Adjust the core of T110 for minimum output on the meter.

Remove the short from pin 1 V109 to ground, if used.

HORIZONTAL OSCILLATOR ADJUSTMENT. — Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment. — Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R210, then adjust the T114 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T114 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T114 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C186B, the width control L109 and the linearity control L111 until the picture is correct.

Horizontal Oscillator Waveform Adjustment. — The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T114 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T114 frequency core (on the rear apron) until the picture falls out of sync and one diagonal black bar sloping down to the right appears on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain one diagonal black bar on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T114 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture begins to fall out of sync with the diagonal bar sloping down to the right. Continue to turn the frequency core in the same direction. Additional bars should not appear on the screen. Instead, the horizontal oscillator should begin to motorboat. Retouch the adjustment of the T114 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T114. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 22. Adjust the waveform adjustment core of T114 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment. — Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture [illegible] remain in sync. If so turn the T114 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C186A slightly clockwise. If less than 2 bars are present, adjust C186A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T114 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves off the screen leaving the picture in synchronization.

SENSITIVITY CHECK. — A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to construct the pad.

RESPONSE CURVES. — The response curves shown on pages 14 and 15 and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, some variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

NOTE ON TUNER ALIGNMENT. — Because of the frequency spectrum involved and the nature of the device, many of the tuner leads and components are critical in some respects. Even the power supply leads form loops which couple to the tuned circuits, and if resonant at any of the frequencies involved in the performance of the tuner, may cause serious departures from the desired characteristics. In the design of the receiver these undesirable resonant loops have been shifted far enough away in frequency to allow reasonable latitude in their components and physical arrangement without being troublesome. When the tuner is aligned in the receiver, no trouble from resonant loops should be experienced. However, if the tuner is aligned in a jig separate from the receiver, attention should be paid to insure that unwanted resonances do not exist which might present a faulty representation of tuner alignment.

A resonant circuit exists between the KRK11B r-f tuner chassis and the outer shield box, which couples into the antenna and r-f plate circuits. The frequency of this resonance depends on the structure of the shield box. This resonance is controlled by using insulating washers of proper thickness in the front plate to tuner chassis mounting. Obviously, if the tuner is removed for service, the washers should be replaced in the correct order.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 5000 microvolt test pattern signal was fed into the receiver, the picture synchronized and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c.

STOCK No.	DESCRIPTION
	RF UNIT ASSEMBLIES
	KRK 11B
	Models 21D305, 21D317, 21D326, 21D327, 21D328 21D329, 21D330
76539	Board—Antenna matching transformer terminal board less coils and less capacitors
76531	Board—Terminal board, 5 contact and ground
76845	Bracket—Vertical bracket for holding V1 tube shield
76965	Capacitor—Ceramic, variable, for fine tuning—plunger type (C2)
71504	Capacitor—Fixed, headed-lead type, 0.68 mmf., ±20%, 500 volts (C7)
77151	Capacitor—Tubular, adjustable, steatite, 0.8-3 mmf. (C8)
75184	Capacitor—Ceramic, adjustable, 0.8-3.8 mmf., complete with adjusting stud (C9)
76532	Capacitor—Adjustable trimmer, steatite, 1-4 mmf. (C18)
	Capacitors—Ceramic, fixed, non-insulated:
93056	5 mmf., ±0.5 mmf., 500 volts DC, Temp. coef. = 0 (C26)
70597	8 mmf., ±1 mmf., 500 volts DC, Temp. coef. = 0 (C29)
55326	10 mmf., ±1 mmf., 500 volts DC, Temp. coef. = -80 (C3)
54207	18 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C27)
76557	22 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C19)
76558	22 mmf., ±10%, 500 volts DC, Temp. coef. = -750 Special—copper coated (C5)
70935	27 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C25)
76739	33 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C24)
76527	Capacitor—Mica trimmer, 55-80 mmf. C11)
75199	Capacitor—Fixed, ceramic, insulated, 270 mmf., ±20%, 500 volts DC, High "K" type (C12, C14)
75641	Capacitor—Fixed, ceramic, insulated, 390 mmf., ±10%, 500 volts DC, High "K" type (C10)
75166	Capacitor—Ceramic, 1,500 mmf. (stand-off) (C13, C21, C22, C28, C30)
75610	Capacitor—Fixed, ceramic, insulated, 1,500 mmf., ±20%, 500 volts DC, High "K" type (C6)
73748	Capacitor—Fixed, ceramic, 1,500 mmf., ±100%, -0%, 500 volts DC, High "K" disc (C16, C17, C20, C23)
76143	Clip—Tubular clip for mounting stand-off capacitors
73591	Coil—Antenna matching coil (2 req'd)
73477	Coil—Choke coil (L57)
77206	Coil—Filament choke coil (L56)
76763	Coil—Filament choke coil (L63, L64)
76562	Coil—RF amplifier coupling coil (L51)
77153	Coil—RF choke coil (L66)
76537	Coil—Shunt coil complete with adjustable core (L61)
76538	Coil—Shunt coil complete with adjustable core (L62)
76529	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r.f. section (L49, C15)
38853	Connector—4 contact female connector—part of antenna matching transformer (J1)
76559	Connector—Oscillator grid connector
76460	Contact—Test point contact
77202	Core—Adjustable core for fine tuning capacitor
76543	Core—Adjusting core for FM trap
76521	Detent—Detent mechanism and fibre shaft
73453	Form—Coil form for L48, L50, L53
77203	Link—Link assembly for fine tuning
76728	Nut—Speed nut for mounting adjustable trimmer 76532
	Resistors—Fixed, composition:
503112	120 ohms, ±10%, ½ watt (R9)
503115	150 ohms, ±10%, ½ watt (R13)
503210	1,000 ohms, ±10%, ½ watt (R7, R14)
503233	3,300 ohms, ±10%, ½ watt (R4, R11, R12)
503247	4,700 ohms, ±10%, ½ watt (R2)
503410	100,000 ohms, ±10%, ½ watt (R1, R5, R6)
503447	470,000 ohms, ±10%, ½ watt (R8)
14343	Retainer—Fine tuning shaft retaining ring
75164	Rod—Actuating plunger rod (fibre) for fine tuning link
76548	Screw—No. 4-40 x ¼" adjusting screw for coils L6, L7, L8, L9, L10, L11
75176	Screw—No. 4-40 x 7/16" adjusting screw for coil L5
76549	Screw—No. 4-40 x ⅜" adjusting screw for coils L1, L2, L3, L4, L46
76519	Shaft—Channel selector shaft and plate
76134	Shaft—Fine tuning shaft and cam
77147	Shield—Front shield complete with shaft bushing and bracket
76534	Shield—Tube shield
76530	Socket—Tube socket, 9 pin, miniature, ceramic, saddle mounted
76336	Socket—Tube socket, 9 pin, miniature, bakelite, saddle mounted
77149	Spacer—Metal spacer for front plate
75163	Spring—Friction spring (formed) for fine tuning cam
30340	Spring—Hairpin spring for fine tuning link
75068	Spring—Retaining spring for tube shield
77204	Spring—Return spring for fine tuning control
77664	Stator—Antenna stator complete with rotor, coils, capacitor and resistor (S5, C20, L42, L43, L44, L45, L54, L55, R13)
77922	Stator—Convertor stator complete with rotor, coils, capacitors and resistors (S2, C10, C12, L12, L13, L14, L15, L16, L17, L18, L19, L20, L21, L47, L48, R4, R5, R6)
77205	Stator—Oscillator stator complete with rotor, coils, and capacitors (S1, C3, C7, L1, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L46)
76556	Stator—RF grid stator complete with rotor, capacitor and resistors (S4, C19, L32, L33, L34, L35, L36, L37, L38, L39, L40, L41, L53, R11, R12)

STOCK No.	DESCRIPTION
76553	Stator—RF plate stator complete with rotor, coils, capacitor and resistor (S3, C14, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L50, R7)
76561	Strap—Channel No. 13 RF grid strap (L52)
76525	Strip—Coil segment mounting strip—R.H. center
76526	Strip—Coil segment mounting strip—L.H. lower
76544	Strip—Coil segment mounting strip—L.H. upper—less trimmer
76740	Stud—No. 6-32 x 1" adjusting stud for adjustable capacitor C8
77152	Terminal—Terminal for mounting adjustable capacitor
76536	Transformer—Antenna matching transformer — complete (T2, C24, C25, C26, C27, L58, L59, L60, L61, L62, J1)
77663	Transformer—Convertor transformer complete with adjustable core (T1, R3)
76535	Trap—I.F. trap
76542	Trap—I.F. trap (41.25 MC) complete with core (L60)
76541	Trap—I.F. trap (45.75 MC) complete with core (L59)
76540	Trap—F.M. trap complete with adjustable core (L58)
75190	Washer—Insulating washer (neoprene) for adjustable capacitor
	RF UNIT ASSEMBLIES
	KRK12
	Models 21D305U, 21D317U, 21D326U, 21D327U, 21D328U, 21D329U, 21D330U
77580	Ball—Steel ball (.125" dia.) (12 req'd)
77579	Ball—Steel ball (.187" dia.)
77575	Bracket—Drive mechanism mounting bracket
77589	Bracket—Lamp bracket
77619	Bracket—VHF input connector and bracket
76845	Bracket—Vertical bracket for oscillator tube shield
77591	Cam—Fine tuning cam
77691	Capacitor—Fixed, headed-lead type, .33 mmf., ±10%, 500 volts DC (C33, C35)
77689	Capacitor—Fixed, headed-lead type, .82 mmf., ±10%, 500 volts DC (C37)
77690	Capacitor—Fixed, headed-lead type, 1.0 mmf., ±10%, 500 volts DC (C39, C40, C42)
77210	Capacitor—Fixed, ceramic, non-insulated, 2 mmf., ±0.25 mmf., 500 volts DC, Temp. coeff. = 0 (C15)
77667	Capacitor—Fixed, ceramic, insulated, comprising 1 section of 2 mmf., and 1 section of 22 mmf., Temp. coeff. = -750 (C12, C13)
77616	Capacitor—Adjustable, mica, 4-40 mmf. (C16)
77688	Capacitor—Fixed, ceramic, non-insulated, 5 mmf., ±.5 mmf., 500 volts DC, Temp. coeff. = 0 (C34, C36, C38, C41)
74182	Capacitor—Fixed, ceramic, non-insulated, 6 mmf., ±0.5 mmf., 500 volts DC, Temp. coeff. = 0 (C5)
77621	Capacitor—Fixed, ceramic, crystal holder, 22 mmf., ±10%, Temp. coeff. -750 (C11)
71924	Capacitor—Fixed, ceramic, non-insulated, 56 mmf., ±10%, 500 volts DC, Temp. coeff. = -750 (C10)
77625	Capacitor—Fixed, ceramic, 220 mmf., +100%, -0%, 500 volts DC, High "K" disc (C18)
77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, -0%, 500 volts DC, High "K" disc (C43)
77624	Capacitor—Fixed, ceramic, 680 mmf., +100%, -0%, 500 volts DC, High "K" disc (C4)
77084	Capacitor—Ceramic, feed-thru, 1,000 mmf. (C21, C23, C25)
77615	Capacitor—Ceramic, stand-off, 1,000 mmf. (C3, C19, C24, C26)
77252	Capacitor—Fixed, ceramic, 1,000 mmf., +100%, -0%, 500 volts DC, High "K" disc (C14, C20, C22, C27)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, -0%, 500 volts DC, High "K" disc (C17)
77628	Coil—IF trap (L7)
77634	Coil—IF neutralizing coil (L12)
77629	Coil—Oscillator cathode coil (L9)
77632	Coil—Oscillator heater coil (L15)
77631	Coil—Oscillator heater coil (L14)
77630	Coil—Oscillator plate coil (L11)
77627	Coil—Peaking coil (L6, R11)
77695	Coil—RF plate coil (L8)
77633	Connector—Formed grounding connector
77623	Connector—UHF antenna input connector (J1)
77612	Contact—Bracket and spring contact assembly for grounding rotor—assembled to base
77618	Contact—Bracket and spring contact assembly for grounding rotor—assembled to oscillator shield
77606	Contact—Contact and support assembly—"L" shape—complete with two (2) contacts
77622	Contact—Contact and support assembly complete with two (2) contacts and UHF antenna input connector
77620	Contact—Contact and support assembly complete with four (4) contacts and holder for crystal rectifier
77607	Contact—Contact and support assembly complete with five (5) contacts—rear of chassis
77614	Control—Oscillator voltage control (R6)
77617	Control—UHF oscillator injection adjustment control
77583	Core—Fine tuning core
77593	Coupling—Indicator shaft coupling
77596	Ferrule—Ferrule for UHF antenna input cable
77588	Gear—Rotor drive gear—nylon
77602	Insert—VHF coil assembly insert for channels 2, 3 or 4 (Includes C40, C41, C42, L29, L30, L31, T6)
77603	Insert—VHF coil assembly insert for channels 5 or 6 (Includes C37, C38, C39, L26, L27, L28, T5)

STOCK No.	DESCRIPTION
77604	Insert—VHF coil assembly insert for channels 7, 8, 9 or 10 (Includes C35, C36, L23, L24, L25, T4)
77605	Insert—VHF coil assembly insert for channels 11, 12 or 13 (Includes C33, C34, L20, L21, L22, T3)
77590	Lever—Actuating lever for fine tuning link
77582	Link—Fine tuning link
77581	Plate—Front plate and ball race
77489	Rectifier—Germanium rectifier IN82 (CR1)
	Resistors—Fixed, composition: -
503047	47 ohms, ±10%, ½ watt (R16)
503110	100 ohms, ±10%, ½ watt (R10, R17)
503112	120 ohms, ±10%, ½ watt (R2, R9)
503210	1,000 ohms, ±10%, ½ watt (R13, R14)
503310	10,000 ohms, ±10%, ½ watt (R12)
503322	22,000 ohms, ±10%, ½ watt (R1)
503410	100,000 ohms, ±10%, ½ watt (R18, R19)
503412	120,000 ohms, ±10%, ½ watt (R5)
503427	270,000 ohms, ±10%, ½ watt (R4)
503447	470,000 ohms, ±10%, ½ watt (R8)
503582	8.2 megohm, ±10%, ½ watt (R3, R7)
30340	Retainer—Retainer ring for fine tuning actuating lever stud
77592	Ring—Contact ring
77599	Roller—Rotor detent roller and retainer
77574	Rotor—Rotor frame
77594	Screw—No. 8-32 x ¼" cup point set screw for indicator shaft coupling
77576	Shaft—Channel selector drive shaft complete with two (2) gears
77595	Shaft—Indicator shaft
77611	Shield—Oscillator shield and grounding spring assembly —underside of chassis
77577	Shield—Top shield
76967	Shield—Tube shield for V2
76534	Shield—Tube shield for V1, V3
77613	Sleeve—Insulating sleeve for fine tuning adjustable core
77274	Socket—Tube socket, 7 pin, miniature, saddle mounted, steatite for V2
77608	Socket—Tube socket, 9 pin, miniature, saddle mounted, moulded mica for V1, V3, V4
77578	Spring—Formed spring for holding rotor (on back of unit)
77584	Spring—Fine tuning link adjusting spring
76961	Spring—Retaining spring for oscillator tube shield
77598	Spring—Rotor detent spring and roller complete with mounting bracket
77599	Roller—Rotor detent roller and retainer
77587	Stud—Mounting stud for fine tuning link actuating lever
77693	Stud—No. 6-32 x 21/32" adjusting stud for trimmer capacitor C9
77692	Stud—No. 6-32 x 25/32" adjusting stud for trimmer capacitors C6, C7, C8, C29, C30, C31, C32
77694	Stud—No. 10-32 x ⅜" adjusting stud for coils L20, L21, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31 and transformers T3, T4, T5, T6
77609	Transformer—Mixer I.F. transformer complete with adjustable cores (T1)
77610	Transformer—Primary I.F. link transformer complete with adjustable cores (T2, R15)
77626	Trap—I.F. trap (L1, C1, L2, C2)
77585	Washer—"C" washer for drive and indicator shafts (3 req'd)
77586	Washer—"C" washer for fine tuning link spring
	CHASSIS ASSEMBLIES
	KCS 81 (KRK11B RF Unit)
	KCS 81B (KRK12 RF Unit)
76456	Bracket—Channel indicator lamp bracket for KCS81
76490	Bracket—Mouunting bracket complete with insulator for picture control
12118	Cap—Tube connector cap
71496	Capacitor—Mica trimmer, 5-70 mmf. (C121)
75217	Capacitor—Mica trimmer, dual 10-160 mmf. (C186A, C186B)
39044	Capacitor—Fixed, ceramic, non-insulated, 15 mmf., ±10%, 500 volts DC, Temp. coef = -750 (C152)
76577	Capacitor—Fixed, ceramic, 33 mmf., 6,000 volts (C198)
76574	Capacitor—Fixed, ceramic, 39 mmf., 3,500 volts (C180)
39042	Capacitor—Fixed, ceramic, non-insulated, 47 mmf., ±10%, 500 volts DC, Temp. coef. = -750 (C151)
71924	Capacitor—Fixed, ceramic, non-insulated, 56 mmf., ±10%, 500 volts DC, Temp. coef. = -750 (C104)
76474	Capacitor—Fixed, mica, 82 mmf., 1,000 volts DC (C165, C187)
39396	Capacitor—Fixed, ceramic, non-insulated, 100 mmf., ±10%, 500 volts DC, Temp. coef. = -750 (C168, C169, C172)
71614	Capacitor—Fixed, ceramic, non-insulated, 120 mmf., ±10%, 500 volts DC, Temp. coef. = -750 (C167)
76576	Capacitor—Fixed, ceramic, 150 mmf., 2,000 volts (C200)
76575	Capacitor—Fixed, ceramic, 180 mmf., 3,500 volts (C199)
75248	Capacitor—Fixed, mica, 220 mmf., 1,000 volts (C181)
47617	Capacitor—Fixed, ceramic, non-insulated, 270 mmf., ±10%, 500 volts DC, Temp. coef. = -750 (C115, C164)
39638	Capacitor—Fixed, mica, 270 mmf., 500 volts DC (C161)
76579	Capacitor—Fixed, mica, 270 mmf., 1,000 volts DC (C192)
39640	Capacitor—Fixed, mica, 330 mmf., 500 volts DC (C159)
39644	Capacitor—Fixed, mica, 470 mmf., 500 volts DC (C108, C109)
76488	Capacitor—Ceramic, 500 mmf., 30,000 volts (C201)
75166	Capacitor Ceramic, stand-off, 1,500 mmf. (C144)

STOCK No.	DESCRIPTION
73748	Capacitor—Fixed, ceramic, 1,500 mmf., +100%, -0%, 500 volts DC, High "K" disc (C209)
73473	Capacitor—Fixed, ceramic, 4,700 mmf., +100%, -0%, 500 volts DC, High "K" disc (C126, C128, C130, C136, C138, C141)
76470	Capacitor—Fixed, ceramic, dual 4,700 mmf., +100%, -0%, 500 volts DC, High "K" disc (C122A, C122B, C127A, C127B for KCS81) (C133A, C133B, C137A, C137B, C139A, C139B, C140A, C140B)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, -0%, 500 volts DC, High "K" disc (C145, C146)
75877	Capacitor—Fixed, ceramic, dual 10,000 mmf., +100%, -0%, 500 volts DC, High "K" disc (C101A, C101B, C105A, C105B)
74521	Capacitor—Electrolytic, 5 mfd., 50 volts (C111)
28417	Capacitor—Electrolytic, 5 mfd., 450 volts (C175)
76485	Capacitor—Electrolytic, comprising 2 sections of 35 mfd., 450 volts, 1 section of 10 mfd., 450 volts and 1 section of 10 mfd., 200 volts (C120A, C120B, C120C, C120D)
76486	Capacitor—Electrolytic comprising 1 section of 35 mfd., 450 volts, 1 section of 25 mfd., 450 volts, 1 section of 20 mfd., 200 volts and 1 section of 100 mfd., 50 volts (C118A, C118B, C118C, C118D)
77657	Capacitor—Electrolytic comprising 1 section of 70 mfd., 450 volts, 2 sections of 10 mfd., 450 volts and 1 section of 5 mfd., 450 volts (C149A, C149B, C149C, C149D)
	Capacitors—Fixed, tubular, oil impregnated:
75643	Paper, .001 mfd., 1,000 volts (C194)
77727	Moulded paper, .0013 mfd., 600 volts (C195)
73595	Paper, .0022 mfd., 600 volts (C110)
73803	Paper, .0022 mfd., 1,000 volts (C177)
73599	Paper, .0027 mfd., 600 volts (C116, C119, C156)
73920	Moulded paper, .0047 mfd., 600 volts (C112, C148, C158, C166, C171)
73789	Moulded paper, .0068 mf., 400 volts (C213)
73808	Paper, .0082 mfd., 1,000 volts (C162)
73561	Paper, .01 mfd., 400 volts (C114, C117, C170, C202)
73594	Moulded paper, .01 mfd., 600 volts (C184, C185, C193)
73562	Paper, .022 mfd., 400 volts (C113, C178, C179, C189)
73798	Paper, .022 mfd., 600 volts (C182)
73552	Paper, .033 mfd., 400 volts (C163)
73553	Paper, .047 mfd., 400 volts (C124 for KCS81) (C160, C188, C190)
73592	Paper, .047 mfd., 600 volts (C197)
73815	Paper, .068 mfd., 1,000 volts (C203, C205)
73551	Paper, 0.1 mfd., 400 volts (C183)
73557	Paper, 0.1 mfd., 600 volts (C173, C204)
73794	Paper, 0.22 mfd., 400 volts (C129, C153, C155, C157, C208, C210)
74957	Paper, 0.22 mfd., 600 volts (C176)
73787	Paper, 0.47 mfd., 200 volts (C191, C196)
77676	Choke—Filter choke (L117)
76143	Clip—Mounting clip for stand-off capacitor
73477	Coil—Choke coil (L101)
76672	Coil—Filament winding only for hi-voltage transformer (Part of T115)
76483	Coil—Horizontal linearity coil complete with adjustable core (L111)
76646	Coil—Peaking coil (72 muh) (L103, R149)
76647	Coil—Peaking coil (180 muh) (L107, R158)
75252	Coil—Peaking coil (500 muh) (L104, L106)
76640	Coil—RF choke coil (1.5 muh) (L110, L112)
76510	Coil—RF choke coil (4.7 muh) (L108)
76484	Coil—Width coil complete with adjustable core (L109)
76457	Connector—2nd anode lead connector
74594	Connector—2 contact male connector for power cord
50367	Connector—6 contact female connector for yoke leads (J102)
35787	Connector—Phono input connector (J101)
75474	Connector—Single contact male connector for speaker cable
77654	Control—AGC control (R180)
77655	Control—Brightness control, volume control and power switch (R114A, R114B, S102A, S102B)
77640	Control—Height control (R190)
76639	Control—Horizontal hold control (R210)
76445	Control—Picture control (R155)
77199	Control—Ratio detector balance control (R108)
77652	Control—Vertical hold control (R187)
77653	Control—Vertical linearity control (R197)
77647	Coupling—Coupling (nylon) for picture control
77136	Cover—Back cover for hi-voltage compartment
76985	Cover—Side cover for hi-voltage compartment
73600	Fuse—0.25 amp., 250 volts (F101)
76459	Grommet—Rubber grommet for 2nd anode lead exit
76480	Lead—Anode lead complete with eyelet
76500	Plate—Hi-voltage plate (bakelite) complete less transformer, socket and lead
76649	Radiator—Heat dissipating radiator for V116
76675	Rectifier—Picture detector crystal rectifier (CR101)
76468	Resistor—Wire wound, 1.5 ohms, 1/3 watt (R225)
74015	Resistor—Wire wound, 100 ohms, 2 watts (R221)
77651	Resistor—Wire wound comprising 1 section of 600 ohms, 16 watts, 1 section of 500 ohms, 6 watts, 1 section of 2,000 ohms, 5 watts, 1 section of 1,200 ohms, 1 watt, 1 section of 10,000 ohms, 5 watts and 1 section of 7,000 ohms, 5 watts (R228A, R228B, R228C, R228D, R228E, R228F)
76642	Resistor—Wire wound, 6,750 ohms, 10 watts (R153)
77668	Resistor—Wire wound, 4,000 ohms, 7 watts (R121 for KCS81)

STOCK No.	DESCRIPTION
77669	Resistor—Wire wound, 10,000 ohms, 5 watts (R231 for KCS81)
	Resistors—Fixed, composition:
503033	33 ohms, ±10%, ½ watt (R152)
503047	47 ohms, ±10%, ½ watt (R107, R218)
502056	56 ohms, ±5%, ½ watt (R134)
34763	68 ohms, ±5%, ½ watt (R138)
502082	82 ohms, ±5%, ½ watt (R101)
502110	100 ohms, ±5%, ½ watt (R128)
503110	100 ohms, ±10%, ½ watt (R127 for KCS81)
503118	180 ohms, ±10%, ½ watt (R142)
503122	220 ohms, ±10%, ½ watt (R151)
513133	330 ohms, ±10%, 1 watt (R118, R119)
503147	470 ohms, ±10%, ½ watt (R199)
503156	560 ohms, ±10%, ½ watt (R198)
503168	680 ohms, ±10%, ½ watt (R154)
503210	1,000 ohms, ±10%, ½ watt (R102, R104, R109, R120, R126, R131, R133, R136, R161)
502218	1,800 ohms, ±5%, ½ watt (R183)
503222	2,200 ohms, ±10%, ½ watt (R140)
502233	3,300 ohms, ±10%, ½ watt (R201)
502239	3,900 ohms, ±5%, ½ watt (R150)
503239	3,900 ohms, ±10%, ½ watt (R211)
503247	4,700 ohms, ±10%, ½ watt (R230)
502256	5,600 ohms, ±5%, ½ watt (R137)
513256	5,600 ohms, ±10%, 1 watt (R156)
14659	6,800 ohms, ±5%, ½ watt (R111, R112)
503268	6,800 ohms, ±10%, ½ watt (R176)
513268	6,800 ohms, ±10%, 1 watt (R147)
502282	8,200 ohms, ±5%, ½ watt (R191)
503282	8,200 ohms, ±10%, ½ watt (R145)
513282	8,200 ohms, ±10%, 1 watt (R182)
503310	10,000 ohms, ±10%, ½ watt (R139, R164, R200, R213, R229)
513310	10,000 ohms, ±10%, 1 watt (R157)
503315	15,000 ohms, ±10%, ½ watt (R115, R239)
523315	15,000 ohms, ±10%, 2 watts (R143)
503318	18,000 ohms, ±10%, ½ watt (R144)
503322	22,000 ohms, ±10%, ½ watt (R175)
522322	22,000 ohms, ±10%, 2 watts (R223)
503327	27,000 ohms, ±10%, ½ watt (R174, R178)
523327	27,000 ohms, ±10%, 2 watts (R222)
503333	33,000 ohms, ±10%, ½ watt (R106, R129, R132, R135, R235)
503339	39,000 ohms, ±10%, ½ watt (R110, R173, R212, R215)
503347	47,000 ohms, ±10%, ½ watt (R103) (R123 for KCS81)
502356	56,000 ohms, ±5%, ½ watt (R141)
503356	56,000 ohms, ±10%, ½ watt (R105, R209)
503368	68,000 ohms, ±10%, ½ watt (R208)
512368	68,000 ohms, ±5%, 1 watt (R193)
513368	68,000 ohms, ±10%, 1 watt (R216)
8064	82,000 ohms, ±5%, ½ watt (R167)
513382	82,000 ohms, ±10%, 1 watt (R214)
503410	100,000 ohms, ±10%, ½ watt (R166, R203, R238)
503412	120,000 ohms, ±10%, ½ watt (R124)
503415	150,000 ohms, ±10%, ½ watt (R159, R195, R202, R204)
503418	180,000 ohms, ±10%, ½ watt (R207)
502422	220,000 ohms, ±5%, ½ watt (R179)
503422	220,000 ohms, ±10%, ½ watt (R194, R233)
502427	270,000 ohms, ±5%, ½ watt (R163, R165)
503427	270,000 ohms, ±10%, ½ watt (R171, R226)
503433	330,000 ohms, ±10%, ½ watt (R116, R205, R220)
503439	390,000 ohms, ±10%, ½ watt (R219)
503447	470,000 ohms, ±10%, ½ watt (R117, R148, R160, R172, R184, R185, R189)
503468	680,000 ohms, ±10%, ½ watt (R169)
503482	820,000 ohms, ±10%, ½ watt (R206)
503510	1 megohm, ±10%, ½ watt (R181, R188, R217)
503512	1.2 megohm, ±10%, ½ watt (R186)
503533	3.3 megohm, ±10%, ½ watt (R196)
512536	3.6 megohm, ±5%, 1 watt (R162)
503539	3.9 megohm, ±10%, ½ watt (R168)
503547	4.7 megohm, ±10%, ½ watt (R170)
503582	8.2 megohm, ±10%, ½ watt (R122 for KCS81)
503610	10 megohm, ±10%, ½ watt (R113)
76650	Ring—Anchoring ring for radiator hold down spring
77660	Shaft—Extension shaft for picture control
77661	Shell—Mounting shell for hi-voltage capacitor
76489	Shield—Hi-voltage shield less side and back cover
73584	Shield—Tube shield for V101, V102, V103, V106, V107, V109
77659	Shield—Tube shield for V105
76741	Shield—Tube shield for V113
75718	Socket—Channel indicator lamp socket for KCS81
74834	Socket—Kinescope socket
71508	Socket—Tube socket, 6 pin, moulded for V117
50367	Socket—Tube socket, 6 pin, moulded, saddle mounted for V118, V119
71494	Socket—Tube socket, miniature, 7 pin, moulded, saddle mounted for V114
77658	Socket—Tube socket, miniature, 7 pin, moulded, saddle mounted for V105
73117	Socket—Tube socket, miniature, 7 pin, wafer for V101, V102, V103, V104, V106, V107, V108, V109
77645	Socket—Tube socket, octal, wafer for V115
31251	Socket—Tube socket, octal, wafer for V113, V116, V121, V122
76971	Socket—Tube socket, miniature, 9 pin, wafer for V110, V111, V112
76651	Spring—Hold down spring for heat dissipating radiator (3 req'd)
77656	Switch—Phono-tone switch (S101)

STOCK No.	DESCRIPTION
76463	Terminal—Screw type grounding terminal
77198	Transformer—1st pix I.F. grid transformer complete with adjustable cores (T104, C125, R125)
77197	Transformer—1st pix I.F. plate transformer complete with adjustable cores (T105, C131, C132, R130)
76435	Transformer—2nd pix I.F. grid transformer complete with adjustable cores (T106, C134)
76433	Transformer—3rd or 4th pix I.F. transformer (T107, T108)
76436	Transformer—5th pix I.F. transformer (T109, C142, C143, L102, R146, CR101)
76501	Transformer—Hi-voltage transformer (Part of T115)
76440	Transformer—Horizontal oscillator transformer complete with adjustable cores (T114)
76997	Transformer—Output transformer (T103)
77649	Transformer—Power transformer, 117 volts, 60 cycle (T113)
76439	Transformer—Ratio detector transformer complete with adjustable cores (T102, C106, C107)
76438	Transformer—Sound I.F. transformer complete with adjustable cores (T101, C102, C103)
76437	Transformer—Sound take-off transformer complete with adjustable cores (T110, C147)
77650	Transformer—Vertical oscillator transformer (T111)
76494	Transformer—Vertical output transformer (T112)
76482	Trap—4.5 MC trap (L105, C150)
77585	Washer—"C" washer for picture control extension shaft (2 req'd)

YOKE & MAGNET ASSEMBLIES

STOCK No.	DESCRIPTION
76863	Connector—Anode connector complete with contact and eyelet
75542	Connector—6 contact male connector—part of deflection yoke (P102)
74956	Cushion—Rubber cushion for deflection yoke hood
76654	Hood—Deflection yoke hood—less rubber cushions
76168	Magnet—Focus magnet
76141	Magnet—Ion trap magnet
71456	Screw—No. 8-32 x 7/16" wing screw for mounting deflection yoke
76636	Stud—Adjusting stud complete with guard for focus magnet
76653	Yoke—Deflection yoke complete with male connector (L113, L114, L115, L116, C206, C207, R227, P102)

SPEAKER ASSEMBLIES
971490-3W 971490-3R
RL 105E6 RMA 285
RMA 274
(For Table Models)

STOCK No.	DESCRIPTION
75024	Cone—Cone and voice coil for speakers stamped 971490-3W
77129	Cone—Cone and voice coil for speakers stamped 971490-3R
75022	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms)

SPEAKER ASSEMBLIES
92569-12W
RL 111A1
RMA 274
(For Console Models)

STOCK No.	DESCRIPTION
75682	Cone—Cone and voice coil
76093	Speaker—12" P.M. speaker complete with cone and voice coil (3.2 ohms)

NOTE: If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to Model number of instrument, number stamped on speaker and full description of part required.

MISCELLANEOUS

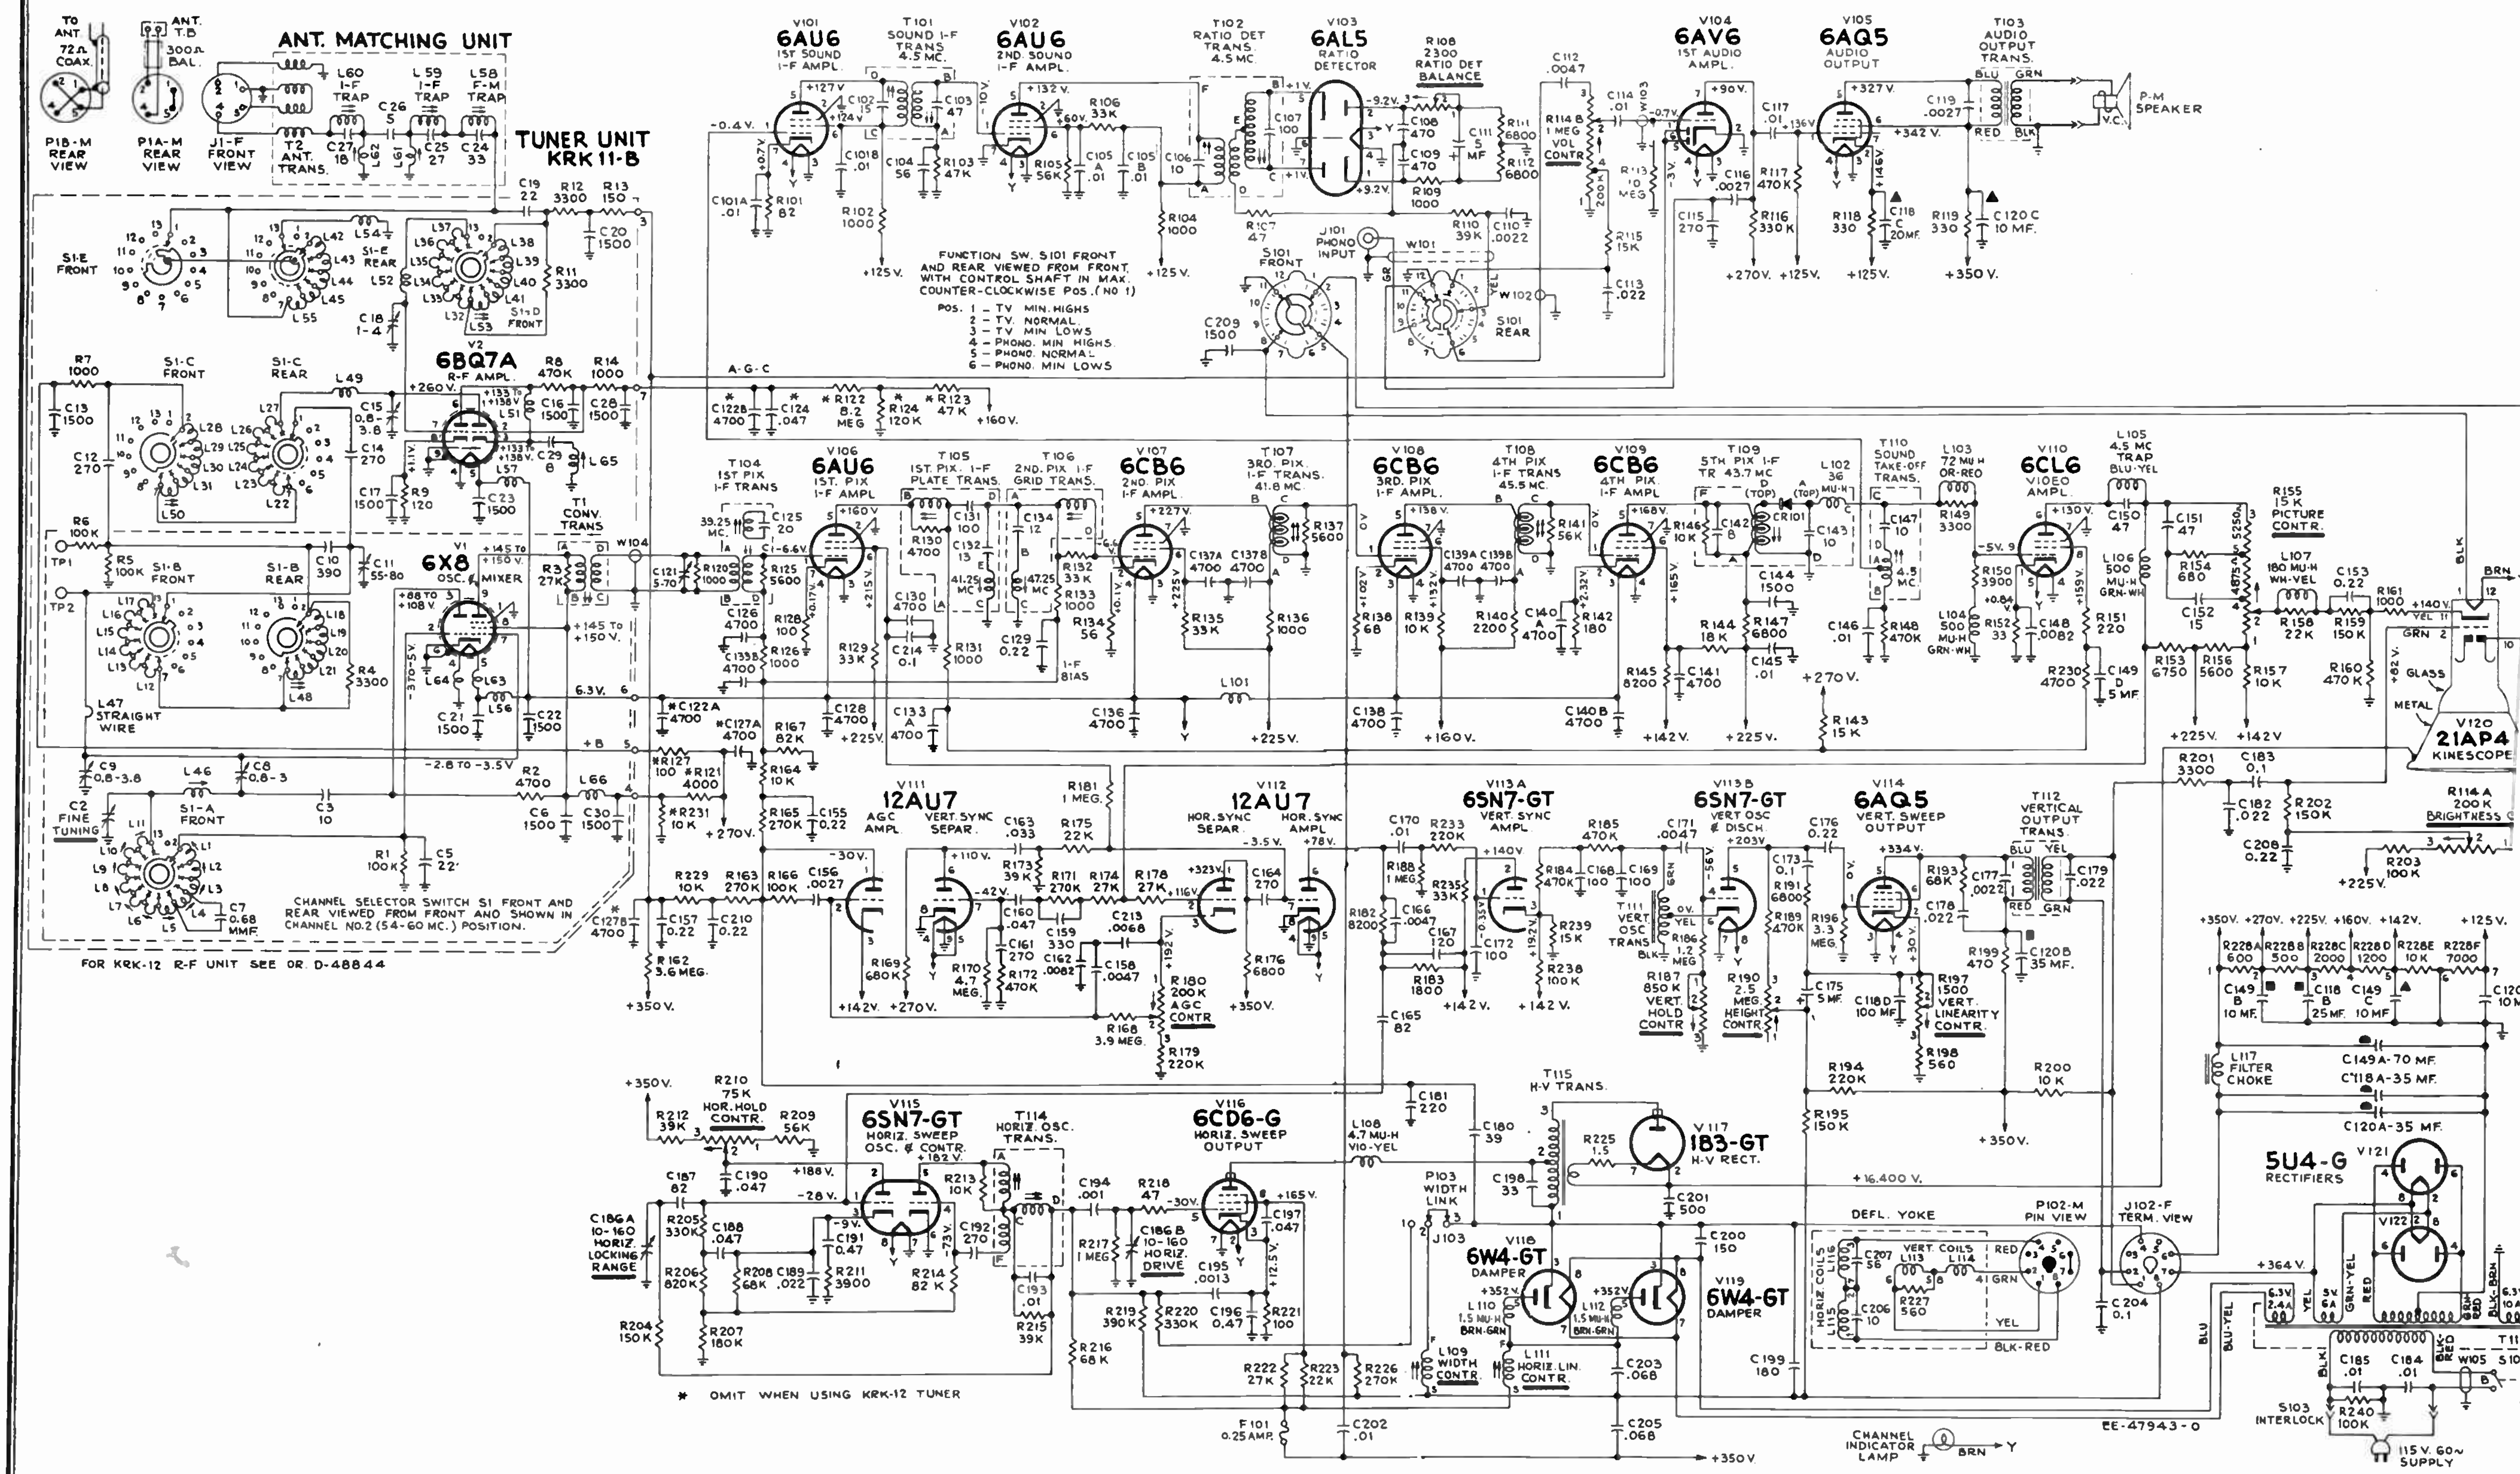
STOCK No.	DESCRIPTION
77771	Back—Cabinet back complete with terminal board and power cord for Models 21D305, 21D305U, 21D317, 21D317U
77790	Back—Cabinet back complete with power cord for Models 21D326, 21D326U, 21D327, 21D327U
77772	Back—Cabinet back complete with power cord for Models 21D328, 21D328U, 21D329, 21D329U
77773	Back—Cabinet back complete with power cord for Models 21D330, 21D330U
76184	Board—Antenna terminal board
76629	Bracket—Hanger bracket for deflection yoke hood assembly
76697	Bracket—Masking panel support bracket (2 req'd)
77748	Bracket—Mounting bracket for hidden controls cover and case assembly
76599	Bracket—"U" shape bracket for deflection yoke hood support rod
76699	Bumper—Rubber bumper for kinescope (as req'd)
71496	Capacitor—Mica trimmer, 5-70 mmf. (part of antenna cable and F.M. trap) for Models 21D305U, 21D317U, 21D326U, 21D327U, 21D328U, 21D329U, 21D330U
71892	Catch—Bullet catch and strike for Models 21D326, 21D326U, 21D327, 21D327U, 21D328, 21D328U, 21D329, 21D329U, 21D330, 21D330U
77755	Clamp—Polystyrene clamp for antenna cable and mount for F.M. trap for Models 21D305U, 21D317U, 21D326U, 21D327U, 21D328U, 21D329U, 21D330U
X1917	Cloth—Grille cloth for mahogany instruments for Model 21D305

STOCK No.	DESCRIPTION
X1918	Cloth—Grille cloth for oak instruments for Model 21D305
X3351	Cloth—Grille cloth for oak instruments for Models 21D317, 21D317U, 21D326, 21D326U, 21D328, 21D328U
X3349	Cloth—Grille cloth for natural cherry instruments for Models 21D327, 21D327U; for light walnut instruments for Models 21D328, 21D328U; for maple instruments for Models 21D330, 21D330U
X3350	Cloth—Grille cloth for mahogany instruments for Models 21D317, 21D317U, 21D326, 21D326U, 21D329, 21D329U; for red cherry instruments for Models 21D327, 21D327U, 21D330, 21D330U; for walnut instruments for Models 21D329, 21D329U
75474	Connector—Single contact male connector—part of antenna cable
77726	Connector—2 contact male connector—part of antenna cable—for 21D300U series
39153	Connector—4 contact male connector—part of antenna cable—for 21D300 series
71457	Cord—Power cord and plug
77774	Cover—Cover and case assembly—brown—for hidden controls for mahogany, walnut or red cherry instruments
77775	Cover—Cover and case assembly—medium beige—for hidden controls for oak instruments
77776	Cover—Cover and case assembly—tan—for hidden controls for maple or natural cherry instruments
77761	Cover—Cover assembly—brown—complete with spring for channel markers for maple or natural cherry instruments for 21D300U series
77759	Cover—Cover assembly—maroon—complete with spring for channel markers for mahogany, walnut or red cherry instruments for 21D300U series
77760	Cover—Cover assembly — sand gray — complete with spring for channel markers for oak instruments for 21D300U series
77770	Cushion—Adhesive cushion (1/32" x 13/32" x 15/16") for safety glass retainers
77749	Cushion—Rubber cushion for safety glass (4 req'd)
76698	Cushion—Rubber cushion for masking panel
76631	Cushion—Rubber cushion for dust sealing the kinescope
77782	Decal—Brightness, volume, fine tuning controls and channel selector switch function decal for mahogany, walnut or red cherry instruments
77781	Decal—Brightness, volume, fine tuning controls and channel selector switch function decal for oak, maple, light walnut or natural cherry instruments
77758	Disc—Polystyrene indicator disc—brown—for channel selections for maple or natural cherry instruments for 21D300U series
77756	Disc—Polystyrene indicator disc—maroon—for channel selections for mahogany, walnut or red cherry instruments for 21D300U series
77757	Disc—Polystyrene indicator disc—sand gray—for channel selections for oak instruments for 21D300U series
77783	Emblem—"Deluxe" emblem for Models 21D317, 21D317U, 21D326, 21D326U, 21D327, 21D327U, 21D328, 21D328U, 21D329, 21D329U, 21D330, 21D330U
77700	Escutcheon—Channel marker escutcheon for 21D300 series
77780	Foot—Rubber foot (4 req'd) for Model 21D305
77745	Glass—Safety glass
37396	Grommet—Rubber grommet for speaker mounting
74308	Hinge—Door hinge (1 set) for Models 21D326, 21D326U, 21D327, 21D327U, 21D328, 21D328U, 21D329, 21D329U, 21D330, 21D330U
77787	Hinge—Ornamental "H" hinge for natural cherry instruments for Models 21D327, 21D327U
77786	Hinge—Ornamental "H" hinge for red cherry instruments for Models 21D327, 21D327U
77709	Knob—Brightness control knob—brown—for mahogany, walnut or red cherry instruments (outer)
77718	Knob—Brightness control knob—medium biege—for oak instruments (outer)
77734	Knob—Brightness control knob — tan — for maple or natural cherry instruments (outer)
77751	Knob—Channel selector knob—brown—for mahogany, walnut or red cherry instruments for 21D300U series
77752	Knob—Channel selector knob—medium biege—for oak instruments for 21D300U series
77753	Knob—Channel selector knob—tan—for maple or natural cherry instruments
77708	Knob—Channel selector knob for 21D300 series (inner)
77707	Knob—Fine tuning control knob—brown—for mahogany, walnut or red cherry instruments for 21D300 series (outer)
77717	Knob—Fine tuning control knob—medium biege—for oak instruments for 21D300 series (outer)
77733	Knob—Fine tuning control knob—tan—for maple or natural cherry instruments for 21D300 series (outer)
77750	Knob—Fine tuning control knob for 21D300U series
77699	Knob—Picture control knob — brown — for mahogany, walnut or red cherry instruments
77719	Knob—Picture control knob—medium biege—for oak instruments
77738	Knob—Picture control knob—tan—for maple or natural cherry instruments
77735	Knob—Tone control and phono switch knob—brown—for mahogany, walnut or red cherry instruments
77736	Knob—Tone control and phono switch knob—medium biege—for oak instruments

STOCK No.	DESCRIPTION
77737	Knob—Tone control and phono switch knob—tan—for maple or natural cherry instruments
77710	Knob—Volume control and power switch knob (inner)
11765	Lamp—Channel marker escutcheon lamp—Mazda 51
77765	Marker—UHF channel number marker for mahogany, walnut or red cherry instruments for 21D300U series
77767	Marker—UHF channel number marker for maple or natural cherry instruments for 21D300U series
77766	Marker—UHF channel number marker for oak instruments for 21D300U series
77762	Marker—VHF channel number marker for mahogany, walnut or red cherry instruments for 21D300U series
77764	Marker—VHF channel number marker for maple or natural cherry instruments for 21D300U series
77763	Marker—VHF channel number marker for oak instruments for 21D300U series
77701	Mask—Channel marker escutcheon light mask—brown—for mahogany, walnut or red cherry instruments for 21D300U series
77720	Mask—Channel marker escutcheon light mask—medium beige—for oak instruments for 21D300 series
77739	Mask—Channel marker escutcheon light mask—tan—for maple or natural cherry instruments for 21D300 series
77768	Mask—Kinescope masking panel (tan) for mahogany, walnut or red cherry instruments
77769	Mask—Kinescope masking panel (sand) for oak, maple or natural cherry instruments
77784	Medallion—"His Master's Voice" medallion for Models 21D317, 21D317U, 21D326, 21D326U, 21D327, 21D327U, 21D328, 21D328U, 21D329, 21D329U, 21D330, 21D330U
76177	Nut—No. 10-32 special nut for deflection yoke hood support rod
73634	Nut—Speed nut for speaker mounting screws for Models 21D317, 21D317U, 21D326, 21D326U, 21D327, 21D327U, 21D328, 21D328U, 21D329, 21D329U, 21D330, 21D330U
74337	Nut—Speed nut to fasten "Deluxe" emblem for Models 21D317, 21D317U, 21D326, 21D326U, 21D327, 21D327U, 21D328, 21D328U, 21D329, 21D329U, 21D330, 21D330U
76601	Pad—Kinescope edge support pad (4 req'd)
77046	Pull—Door pull for Models 21D326, 21D326U
77785	Pull—Door pull for natural cherry instruments for Models 21D327, 21D327U
77021	Pull—Door pull for red cherry instruments for Models 21D327, 21D327U
77788	Pull—Door pull (upper) for Models 21D329, 21D329U (4 req'd)
77789	Pull—Door pull (lower) for Models 21D329, 21D329U (2 req'd)
77044	Pulls—Door pulls (1 set) for Models 21D330, 21D330U
77928	Retainer—Retainer for channel selector knob for Models 21D305U, 21D317U, 21D326U, 21D327U, 21D328U, 21D329U, 21D330U
77746	Retainer—Safety glass retainer for sides (2 req'd)
77747	Retainer—Safety glass retainer for top or bottom
76628	Rod—"L" shape threaded rod for supporting deflection yoke hood assembly
77712	Screw—No. 6 x ½" cross recessed pan head self-tapping screw (black) for fastening hidden controls cover and case to cabinet for mahogany, walnut or red cherry instruments
77725	Screw—No. 6 x ½" cross recessed pan head self-tapping screw (zinc) for fastening hidden controls cover and case to cabinet for oak, maple or natural cherry instruments
76632	Screw—No. 8 x ⅝" hex head wood screw for masking panel support bracket or hanger bracket
74279	Screw—No. 8-32 x ⅞" trimit head screw for door pulls 77044 for Models 21D330, 21D330U
74269	Screw—No. 8-32 x ¾" trimit head screw for door pulls 77021 and 77785 for Models 21D327, 21D327U and for door pull 77788 for Models 21D329, 21D329U
74113	Screw—No. 8-32 x 1" trimit head screw for door pull 77046 for Models 21D326, 21D326U
74307	Screw—No. 8-32 x 1⅛" trimit head screw for door pull 77789 for Models 21D329, 21D329U
77754	Shade—Channel marker escutcheon lamp shade for 21D300U series
73643	Spring—Channel marker escutcheon spring clip for 21D300 series
77929	Spring—Formed spring for fine tuning knob for Models 21D305U, 21D317U, 21D326U, 21D327U, 21D328U, 21D329U, 21D330U
76820	Spring—Formed spring for safety glass retainers
76630	Spring—Formed spring for kinescope masking panel
77006	Spring—Retaining spring for deflection yoke hood support rod nut
76837	Spring—Retaining spring for knobs 77699, 77708, 77709, 77718, 77719, 77734, 77735, 77736, 77737, 77738
72845	Spring—Retaining spring for knobs 77707, 77717, 77733 for 21D300 series
30330	Spring—Retaining spring for knob 77710
74734	Spring—Retaining spring for channel marker covers 77759, 77760, 77761
74936	Spring—Suspension spring for kinescope socket lead
72936	Stop—Cabinet door stop for Models 21D326, 21D326U, 21D327, 21D327U, 21D328, 21D328U, 21D329, 21D329U, 21D330, 21D330U
76600	Strap—Grounding strap (.005" soft copper strip)
75500	Washer—Felt washer for kinescope mask or cabinet back mounting screws

APPLY TO YOUR RCA DISTRIBUTOR FOR PRICES OF REPLACEMENT PARTS

KCS81 CIRCUIT SCHEMATIC DIAGRAM (KCS81B WITH KRK12 TUNER)



The schematic is shown in the latest condition at the time of printing.
All resistance values in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "Volt-Ohmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

GENERAL DESCRIPTION

Models 21-T-303, 21-T-303U, 21-T-313, 21-T-313U, 21-T-314, 21-T-314U, 21-T-315, 21-T-315U, 21-T-316, 21-T-316U, 21-T-322, 21-T-322U, 21-T-323, 21-T-323U, 21-T-324 and 21-T-324U are "21 inch" television receivers. Models 21-T-303, 21-T-313, 21-T-314, 21-T-315, 21-T-316, 21-T-322, 21-T-323 and 21-T-324 are identical except for cabinets and speakers. These receivers feature full twelve channel VHF coverage. Models 21-T-303U, 21-T-313U, 21-T-314U, 21-T-315U, 21-T-316U, 21-T-322U, 21-T-323U and 21-T-324U are identical except for cabinets and speakers. These receivers feature full twelve channel VHF coverage plus any four UHF channels.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE ....227 square inches on a 21AP4 Kinescope

TELEVISION R-F FREQUENCY RANGE

21-T-303, 313, 314, 315, 316, 322, 323, 324
Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

21-T-303U, 313U, 314U, 315U, 316U, 322U, 323U, 324U
Any desired combination of 16 VHF and/or UHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc., 470 mc. to 890 mc.

Picture Carrier Frequency .... 45.75 mc.
Sound Carrier Frequency .... 41.25 mc.

RCA TUBE COMPLEMENT

Tube Used	Function
Chassis KCS82 using KRK11B Tuner	
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer
Chassis KCS82B using KRK12 Tuner	
(1) RCA 6BQ7A	R-F Amplifier (VHF only)
(2) RCA 6AF4	R-F Oscillator
(3) RCA 6BQ7A	I-F Amplifier
(4) RCA 6S4	Voltage Control

A 1N82 crystal is used as a mixer.

Tube Used	Function
All Models	
(1) RCA 6CB6	1st Picture I-F Amplifier
(2) RCA 6CB6	2nd Picture I-F Amplifier
(3) RCA 6CB6	3rd Picture I-F Amplifier
(4) RCA 12AU7	Picture 2nd Detector and Vert. Sync. Sep.
(5) RCA 6CL6	Video Amplifier
(6) RCA 6AU6	1st Sound I-F Amplifier
(7) RCA 6AU6	2nd Sound I-F Amplifier
(8) RCA 6AL5	Ratio Detector
(9) RCA 6AV6	1st Audio Amplifier
(10) RCA 6K6GT	Audio Output
(11) RCA 12AU7	Horiz. Sync. Sep. & AGC
(12) RCA 12AU7	Vertical Osc. & Sync. Output
(13) RCA 6K6GT	Vertical Sweep Output
(14) RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(15) RCA 6BQ6GT	Horizontal Sweep Output
(16) RCA 6W4GT	Damper
(17) RCA 1B3-GT/8016	High Voltage Rectifier
(18) RCA 21AP4	Kinescope
(19) RCA 5U4G	Rectifier
(20) RCA 5Y3GT	Rectifier

POWER SUPPLY RATING

KCS82 chassis .... *115 volts, 60 cycles, 215 watts*
KCS82B chassis .... *115 volts, 60 cycles, 230 watts*

RECEIVER ANTENNA INPUT IMPEDANCE

KCS82 chassis (KRK11B)
Choice: 300 ohms balanced or 72 ohms unbalanced.

KCS82B chassis (KRK12)
UHF—Choice: 300 ohms balanced or 72 ohms unbalanced.
VHF—300 ohms balanced.

LOUDSPEAKERS

Models 21-T-303, 21-T-303U (971636-1) 5" PM, 3.2 ohms.
Models 21-T-313, 21-T-313U (971490-3) 8" PM, 3.2 ohms.
Models 21-T-314, 21-T-314U, 21-T-315, 21-T-315U, 21-T-316, 21-T-316U, 21-T-322, 21-T-322U (971692-1) 10" PM, 3.2 ohms.
Models 21-T-323, 21-T-323U, 21-T-324, 21-T-324U (92569-12) 12" PM, 3.2 ohms.

AUDIO POWER OUTPUT RATING ....4.0 watts max.
VIDEO RESPONSE ....To 3.5 mc.
SWEEP DEFLECTION ....Magnetic
FOCUS ....Magnetic

INSTALLATION INSTRUCTIONS

UNPACKING.—These receivers are shipped complete in cardboard cartons. The kinescope is shipped in place in the receiver.

Take the receiver out of the carton and remove all packing material.

Make sure that all tubes are in place and are firmly seated in their sockets.

Check to see that the kinescope high voltage lead clip is in place.

Plug a power cord into the 115 volt a-c power source and into the receiver interlock receptacle. Turn the receiver power switch to the "on" position, the brightness control fully clockwise, and the picture control counter-clockwise.

ION TRAP MAGNET ADJUSTMENT.—Set the ion trap magnet approximately in the position shown in Figure 1. Starting from this position immediately adjust the magnet by moving it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest raster on the screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Turn the focus control (shown in Figure 1) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches of this adjustment should be made with the brightness control at the maximum clockwise position with which good line focus can be maintained.

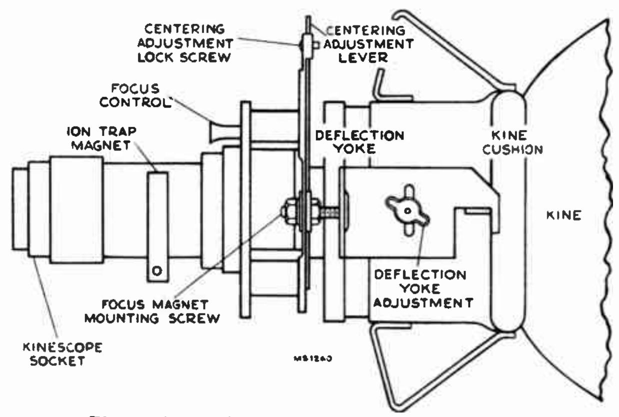

Figure 1—Yoke and Focus Magnet Adjustments

DEFLECTION YOKE ADJUSTMENT.—If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

PICTURE ADJUSTMENTS.—It will now be necessary to obtain a test pattern picture in order to make further adjustments. Connect the antenna transmission line to the receiver.

If the Horizontal Oscillator and AGC System are operating properly, it should be possible to sync the picture at this point. However, if the AGC control is misadjusted, and the receiver is overloading, it may be impossible to sync the picture.

If the receiver is overloading, turn R152 on the rear apron (see Figure 2) counter-clockwise until the set operates normally and the picture can be synced.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT.—Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel then back. Normally the picture will be out of sync. Turn the control clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 2 or 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. Pull-in should occur before the control has been turned 120 degrees from the extreme counter-clockwise position. The picture should remain in sync for approximately 90 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should remain in sync and should not show a black bar in the picture.

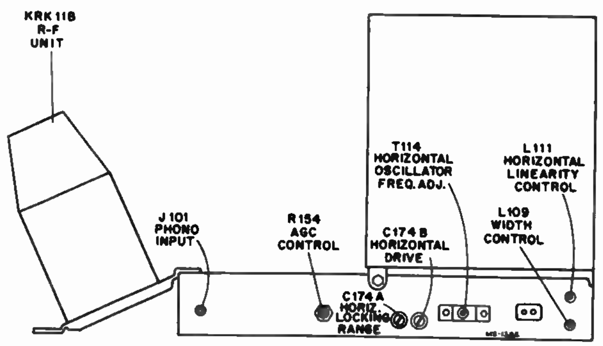

Figure 2—Rear Chassis Adjustments

If the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Focus Magnet Adjustment."

ALIGNMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync over 90 degrees of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments.

Horizontal Frequency Adjustment.—Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the T114 horizontal frequency adjustment at the rear of the chassis until the picture is just out of sync and the horizontal blanking appears as a vertical or diagonal black bar in the raster. Then turn the T114 core until the bar moves out of the picture leaving it in sync.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 rear core slightly and momentarily switch off channel. Repeat until

INSTALLATION INSTRUCTIONS

the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C174A slightly clockwise. If less than 2 bars are present, adjust C174A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the conditions specified under each are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If it is impossible to sync the picture at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure on page 11. For field purposes paragraph "B" under Horizontal Oscillator Waveform Adjustment may be omitted.

FOCUS MAGNET ADJUSTMENT.—The focus magnet should be adjusted so that there is approximately three-eighths inch of space between the rear cardboard shell of the yoke and the flat of the front face of the focus magnet. This spacing gives best average focus over the face of the tube.

The axis of the hole through the magnet should be parallel with the axis of the kinescope neck with the kinescope neck through the center of the opening.

CENTERING ADJUSTMENT. — No electrical centering controls are provided. Centering is accomplished by means of a separate plate on the focus magnet. The centering plates include a locking screw which must be loosened before centering. Up and down adjustment of the plate moves the picture side to side and sidewise adjustment moves the picture up and down.

If a corner of the raster is shadowed, check the position of the ion trap magnet. Reposition the magnet within the range of maximum raster brightness to eliminate the shadow and recenter the picture by adjustment of the focus magnet plate. In no case should the magnet be adjusted to cause any loss of brightness since such operation may cause immediate or eventual damage to the tube. In some cases it may be necessary to shift the position of the focus magnet in order to eliminate a corner shadow.

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS.—Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage hence the brightest and best focused picture, adjust horizontal drive trimmer C174B counter-clockwise until the picture begins to "wrinkle" in the middle then clockwise until the "wrinkle" disappears.

Turn the horizontal linearity control L111 clockwise until the picture begins to "wrinkle" on the right and then counter-clockwise until the "wrinkle" disappears and best linearity is obtained.

Adjust the width control L109 to obtain correct picture width.

A slight readjustment of these three controls may be necessary to obtain the best linearity.

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R176 under front control panel) until the picture fills the mask vertically. Adjust vertical linearity (R186 under front control panel), until the test pattern is symmotrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust centering to align the picture with the mask.

FOCUS.—Adjust the focus magnet for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

Recheck the position of the ion trap magnet to make sure that maximum brightness is obtained.

Check to see that the yoke thumbscrew and the focus magnet mounting screws are tight.

KRK11B R-F OSCILLATOR ADJUSTMENTS. — Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 8. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 3. Adjustment for channel 13 is on top of the chassis.

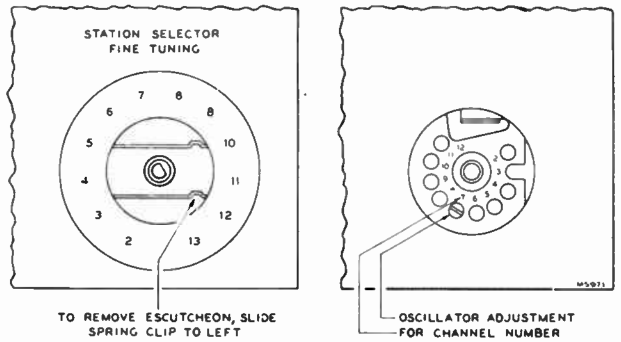

Figure 3—R-F Oscillator Adjustments

KRK12 R-F OSCILLATOR ADJUSTMENTS.—Set the fine tuning control to the center of its range on the channel to be adjusted. Adjust the oscillator core for this channel to obtain maximum audio output without distortion.

AGC THRESHOLD CONTROL.—The AGC threshold control R154 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal and sync the picture. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R154. If the picture requires an appreciable portion of a second to reappear, or bends excessively, R154 should be readjusted.

Turn R154 fully counter-clockwise. The raster may be bent slightly. This should be disregarded. Turn R154 clockwise until there is a very, very slight bend or change of bend in the picture. Then turn R154 counter-clockwise just sufficiently to remove this bend or change of bend.

If the signal is weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R154 clockwise until the snow in the picture becomes more pronounced, then counter-clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far clockwise on a weak signal, then the receiver may overload when a strong signal is received.

FM TRAP ADJUSTMENT.—In some instances interference may be encountered from a strong FM station signal. A trap is provided to eliminate this type of interference. To adjust the trap tune in the station on which the interference is observed and adjust the L58 core on the antenna matching transformer for minimum interference in the picture.

CAUTION.—In some receivers, the FM trap L58 will tune down into channel 6 or even into channel 5. Needless to say, such an adjustment will cause greatly reduced sensitivity on these channels. If channels 5 or 6 are to be received, check L58 to make sure that it does not affect sensitivity on these two channels.

The FM trap on models using the KRK12 Tuner is fastened to the receiver antenna cable and is adjusted in the same manner as described above.

Replace the cabinet back and connect the receiver antenna leads to the cabinet back. Make sure that the screws holding it are up tight, otherwise it may rattle or buzz when the receiver is operated at high volume.

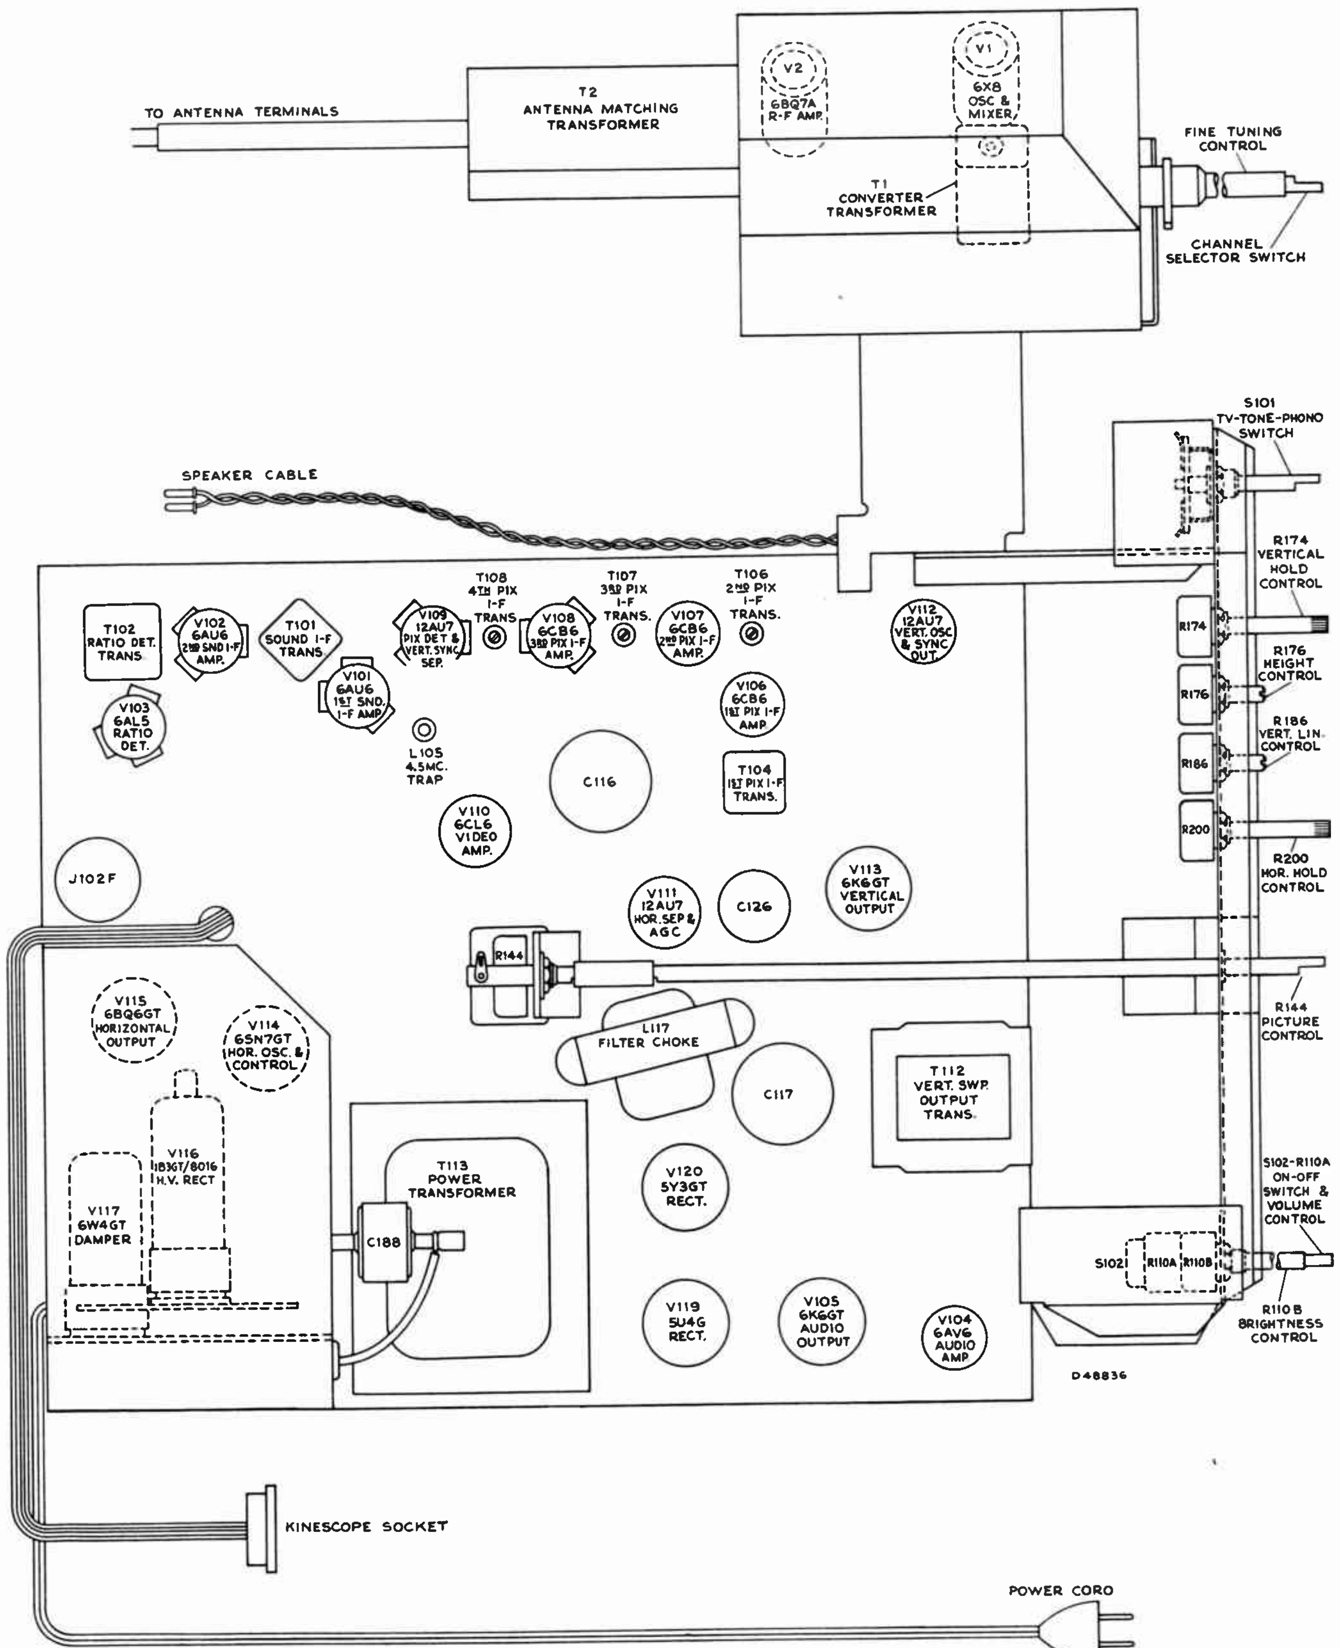

Figure 4—Chassis Top View (shown with KRK11B Tuner)

CHASSIS BOTTOM VIEW

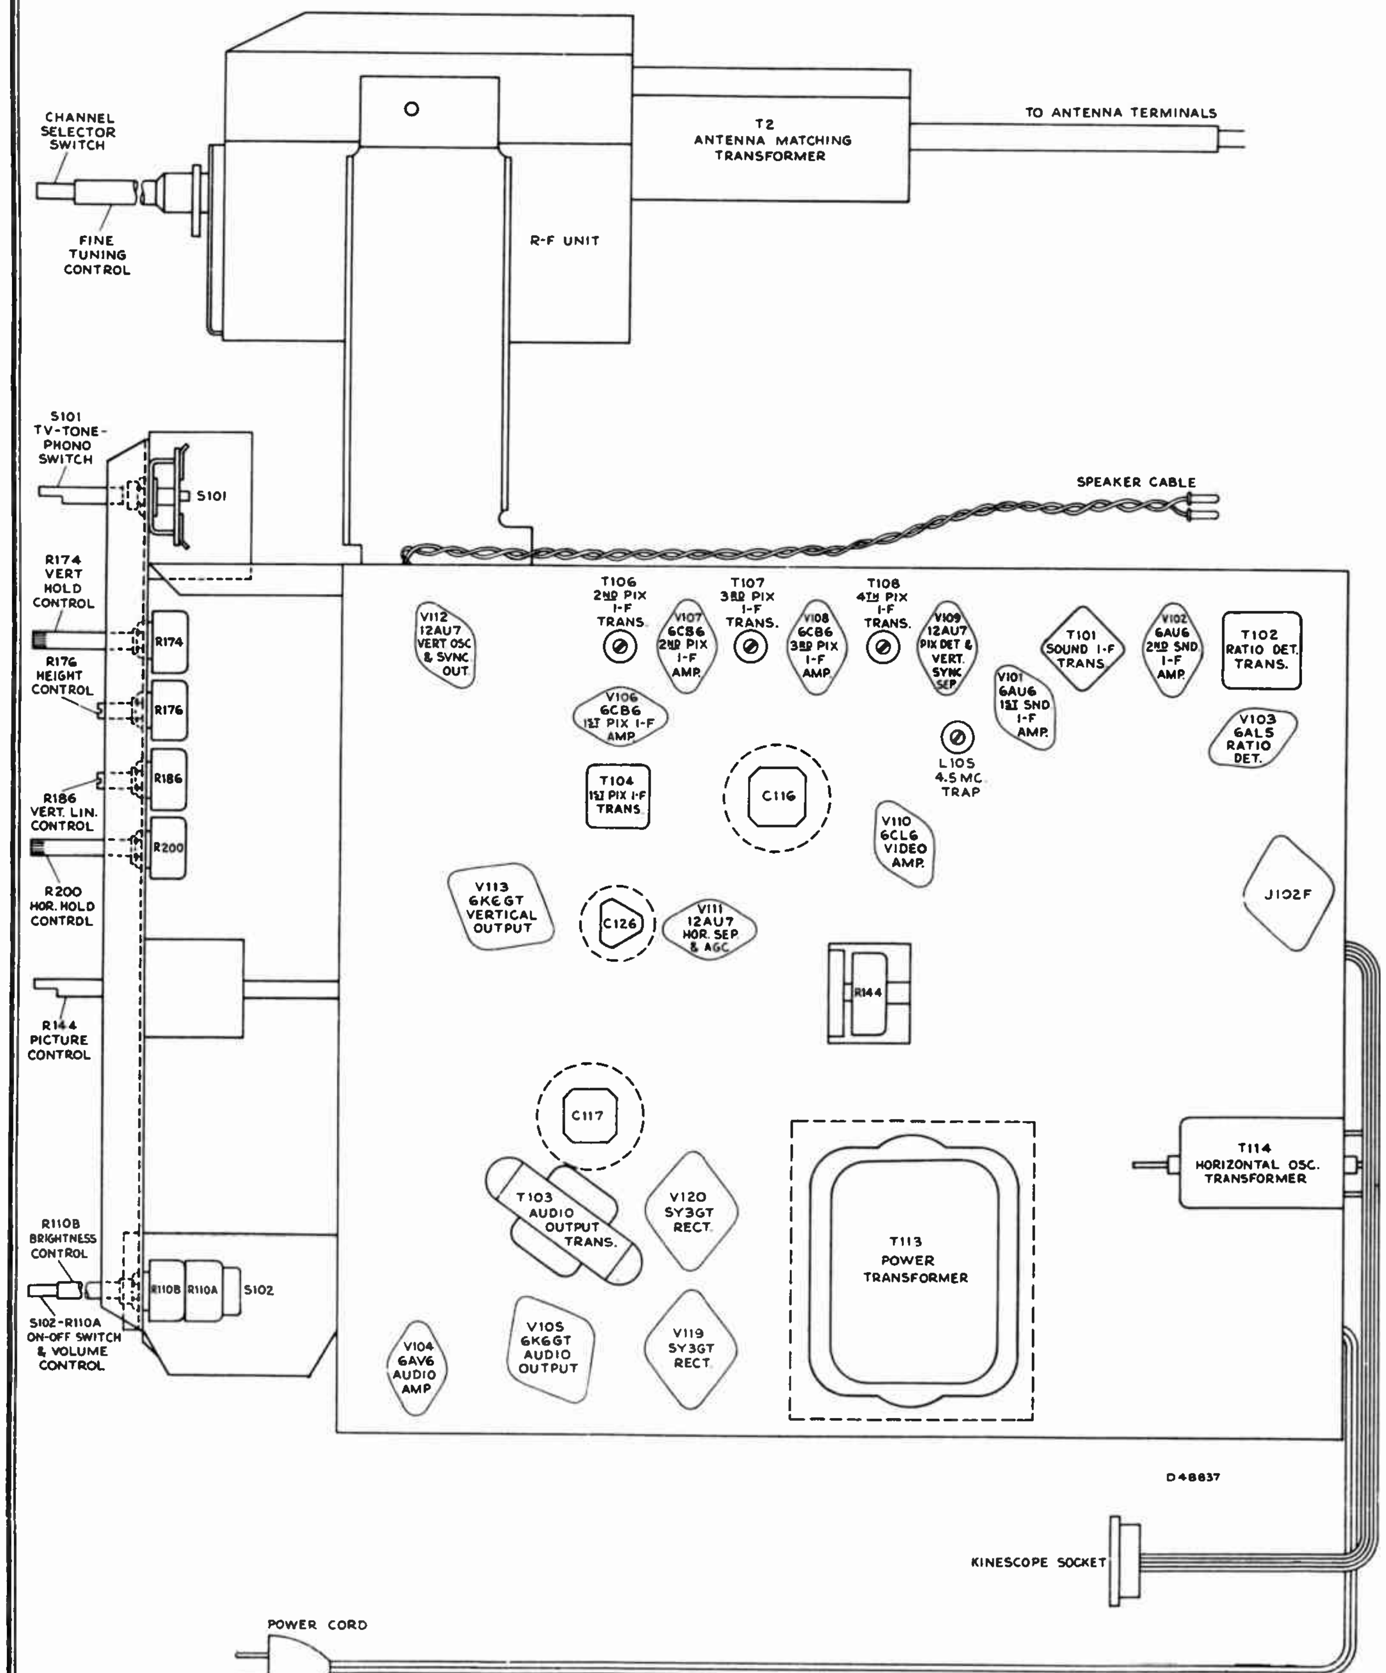

Figure 5—Chassis Bottom View (shown with KRK11B Tuner)

ALIGNMENT PROCEDURE

TEST EQUIPMENT. — To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
 35 to 90 mc., 1 mc. to 12 mc. sweep width
 170 to 225 mc., 12 mc. sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) Intermediate frequencies
 4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.
(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	83.25	81.75	123
6	77.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA Types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
14	471.25	475.75	517
15	477.25	481.75	523

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 1 millivolt per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

DC Milliammeter.—A milliammeter with a range of 0-50 milliamperes full scale.

Adapter Socket.—An adapter socket is required to meter the cathode current of the 6S4 voltage control tube of the KRK12 Tuner. Wiring of adapter is shown in Figure 13.

KRK11B ANTENNA MATCHING UNIT ALIGNMENT. — The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L58 to the channel selector switch S5.

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R127 and R148. Set the potentiometer to produce approximately —5.0 volts of bias at the junction of R127 and R148.

Connect an oscilloscope to pin 2, V110 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L59 in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L60 for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

ALIGNMENT PROCEDURE

Connect a 300 ohm ½ watt composition resistor from L58 to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L58 to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 00 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by returning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L61 and L62 to obtain the response shown in figure 15. L61 is most effective in locating the position of the shoulder of the curve at 52 mc. and L62 should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L58 and S5. Replace V106.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—

Models 21-T-303 to 21-T-324 incl.

Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R147 and R148.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the battery positive terminal of one to the chassis and the potentiometer arm to the junction of R147 and R148. The second battery will be used later.

Set the bias to produce approximately —5.0 volt of bias at the junction of R147 and R148.

Connect the "VoltOhmyst" to junction of R138 and L105 and to ground.

Set the VHF signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst". During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R138 and L105 with —5.0 volts of i-f bias at the junction of R147 and R148.

44.5 mc.	T108
45.5 mc.	T107
43.0 mc.	T106

Set the VHF signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at R138, L105. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the adjustment is made.

47.25 mc.	T104 top core

Models 21-T-303U to 21-T-324U incl.

Connect the "VoltOhmyst" to the junction of R147 and R148. Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction R147 and R148. Adjust the potentiometer for —5.0 volts indication on the "VoltOhmyst".

Connect the "VoltOhmyst" to the junction of R138 and L105 and to ground.

Connect the output of the signal generator to the front terminal of the crystal mixer in series with a 1500 mmf ceramic capacitor.

Set the VHF generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for maximum indication on the "VoltOhmyst". In each instance the generator should be checked against a crystal calibrator to insure that the generator is on frequency.

During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R138 and L105 with —5.0 volts of i-f bias at the junction of R147 and R148.

44.5 mc.	T108
45.5 mc.	T107
43.0 mc.	T106

Set the signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at junction of R138 and L105. Use sufficient signal input to produce 3.0 volts of d-c on the meter when adjustment is made.

47.25 mc.	T104 top core

SWEEP ALIGNMENT OF PICTURE I-F.—

Models 21-T-303 to 21-T-324 incl.

To align T1 and T104, connect the sweep generator to the mixer grid test point TP2. In series with a 1500 mmf. ceramic capacitor use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the r-f unit outer shield.

Set the channel selector switch to channel 4.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Preset C119 to minimum capacity.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R147 and R148. Set the AGC control fully clockwise.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T1 (top) and T104 (bottom) for maximum gain and with 45.75 mc. at 70% of maximum response.

Set the sweep output to give 0.3 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C119 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 19.

Disconnect the diode probe, the 180 ohm and two 330 ohm resistors.

Connect the oscilloscope to pin 2 of V110 socket.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 20.

Models 21-T-303U to 21-T-324U incl.

To align the crystal mixer circuit and T2 and T104 connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1500 mmf ceramic capacitor. Use the shortest leads possible, grounding the sweep generator to the tuner case.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Set the channel selector to channel 5.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C119 across terminals A and B of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (bottom) for maximum gain of 43.5 mc. and with 45.75 mc. at 70% of maximum response.

ALIGNMENT PROCEDURE

Adjust T1 for maximum gain. Readjust T2 and T104 if necessary to obtain proper wave shape, see Figure 11.

Disconnect the diode probe, the 180 ohm and the two 330 ohm resistors.

Connect the oscilloscope to the junction of R138 and L105.

Adjust the bias potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R147 and R148.

Leave the sweep generator connected to the front terminal of the 1N82 crystal holder with the shortest leads possible and with not more than one inch of unshielded lead at the end of the sweep cable. If these precautions are not observed, the receiver may be unstable and the response curves obtained may be unreliable.

Adjust the output of the sweep generator to obtain 3.0 to 5.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 12.

Remove the oscilloscope, sweep and signal generator connections.

Remove the bias box employed to provide bias for alignment.

KRK11B TUNER ALIGNMENT

Models 21-T-303 to 21-T-324 incl.

An r-f unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset all adjustments to the approximate center of their range with the following exceptions: Set C18 so that the screw head is approximately three-eighths of an inch above chassis. Set C11 near maximum capacity (one-quarter turn from tight). Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

The r-f unit is aligned with zero AGC bias. To insure that the bias will remain constant, take a clip lead and short circuit the r-f unit power terminal board terminal 3 to ground.

Connect the oscilloscope to the test point TP1 on top of the r-f unit. Set the oscilloscope gain to maximum.

Turn the receiver channel selector switch to channel 2.

Connect the output of the VHF signal generator to the grid of the r-f amplifier, V2. To do this, remove the tube from the socket and fashion a clip by twisting one end of a small piece of wire around pin number 7. Replace the tube in the socket leaving the end of the wire protruding from under the tube. Connect the signal generator to this wire through a 1,500 mmf capacitor.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust L65 on top of the r-f unit for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to adjust it so as to reduce sensitivity on channel 2.

Remove the wire clip from pin 7 of V2 and replace the tube and tube shield.

Set the channel selector switch to channel 8.

Turn the fine tuning control 30 degrees clockwise from the center of its mechanical range now and at all times when adjusting the oscillator frequency.

Adjust C2 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the r-f unit through the hole provided for the adjustment for C11. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the r-f unit oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C2 to obtain an audio beat with the signal generator.

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C2, switch to channel 13 and adjust L46 to obtain proper channel 13 oscillator frequency as indicated in the table on page 11. Then, switch to channel 12 and adjust L11 to obtain proper channel 12 oscillator frequency. Continue down to channel 8 adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C2 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and adjust L46 and back to channel 8 and adjust C2.

Set the T1 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator as shown in Figure 14 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a useable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C9, C11, C15 and C18 for approximately correct curve shape, frequency, and band width as shown in Figure 16.

The correct adjustment of C18 is indicated by maximum amplitude of the curve midway between the markers. C15 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C9 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C18 has been properly adjusted). C11 is the coupling adjustment and hence primarily affects the response band width.

Set the receiver channel switch to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Turn the fine tuning control 30 degrees clockwise from the center of its mechanical range.

Adjust L5 for an audible beat with the signal generator as before.

Set the sweep generator to channel 6.

From the signal generator, insert channel 6 sound and picture carrier markers, 83.25 mc. and 87.75 mc.

Adjust L48, L50 and L53 for proper response as shown in Figure 16.

L50 tunes the r-f amplifier plate circuit and primarily affects the frequency of the pass band. L53 tunes the r-f amplifier grid and is adjusted to give maximum amplitude of the curve between the markers. L48 affects the tilt of the curve but not quite the same as C9 adjustment. When the circuits are correctly adjusted and L48 is rocked on either side of its proper setting, the high frequency (sound carrier) end of the curve appears to remain nearly fixed in amplitude while the picture carrier end tilts above or below this point.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the r-f unit test point TP1.

Adjust the oscillator injection trimmer C8 for —3.5 volts or at maximum if —3.5 volts cannot be reached. This voltage should fall between —2.5 and —5.5 volts on all channels when the alignment of all circuits is completed.

Turn the sweep generator and signal generator back on and recheck channel 6 response. Readjust L48, L50 and L53 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C2 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C9, C11, C15 and C18 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 6 and check the oscillator injection voltage of TP1 if C9 was adjusted in the recheck of channel 8 response.

ALIGNMENT PROCEDURE

If the initial setting of oscillator injection trimmer C8 was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 6 and repeat the procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Set the fine tuning control 30 degrees clockwise from the center of its mechanical range.

Adjust L46 to obtain an audible beat. Slightly overshoot the adjustment of L46 by turning the slug a little more in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C2 to again obtain the beat.

Check the response of channels 7 through 13 by switching the receiver channel switch, sweep generator and marker oscillator to each of these channels and observing the response and oscillator injection obtained. See Figure 16 for typical response curves. It should be found that all these channels have the proper shaped response with the markers above 80% response.

If the markers do not fall within this requirement, switch to channel 8 and readjust C9, C11, C15 and C18 as necessary.

Turn off the sweep generator and check the channel 8 oscillator frequency. If C2 has to be readjusted for channel 8, the principle of overshooting the adjustment and then correcting by adjusting L46 should be followed in order to establish the L/C ratio for the desired oscillator tracking.

Turn the receiver channel selector switch to channel 6. Adjust L5 for correct oscillator frequency, 129 mc.

Turn the sweep generator on and to channel 6 and observe the response curve. If necessary readjust L48, L50 and L53.

Switch the receiver, the sweep and signal generators to channel 2 and adjust T1 clockwise to a point where there is no change in the channel 2 response as T1 is turned.

Switch the receiver through channel 6 down through channel 2 and check for normal response curve shapes and oscillator injection voltage.

If excessive tilt in the same direction occurs on channels 2, 3 and 4, adjust C18 on channel 2 to overshoot the correction of this tilt, then switch to channel 6 and adjust L53 for maximum amplitude of curve between markers. This adjustment should produce "flat" response on the low channels if the other adjustments especially L48 are correct.

Likewise check channels 7 through 13, stopping on 13 for the next step.

With the receiver on channel 13, check the receiver oscillator frequency. Correct by adjustment of C2 if necessary.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator trimmer to obtain the audible beat. It should be possible to adjust the oscillator to the correct frequency on all channels with the fine tuning control in the middle third of its range. When employing WR39 calibrators to adjust the receiver oscillator, tune the calibrator to one-half the receiver oscillator frequency on channels 4, 5 and 6 and to one-fourth the receiver oscillator frequency on channels 11, 12 and 13.

KRK12 TUNER ALIGNMENT

Models 21-T-303U to 21-T-324U incl.

TUNER VHF ALIGNMENT.—Remove the 6S4 voltage control tube from its socket and insert the adapter. Insert 6S4 in the adapter.

Connect the 0-50 milliampere meter to the adapter socket leads and turn the adapter switch on.

Remove the tuner cover shield.

Rotate the channel selector to a point midway between channels, disengaging the insert contacts, and observe the non-oscillating plate current. Some tubes may oscillate even with the tuned circuits disengaged. To be sure the oscillator is in a non-oscillatory state, short circuit the spring contacts 12 and 13, the two contacts nearest the tuner front, with a finger.

(NOTE: The contacts are at zero d-c potential.) Should the plate current rise, keep finger on the contacts while adjusting the oscillator plate current. Adjust R6, oscillator voltage control, for a 28 milliampere reading on the meter.

Replace the tuner cover shield.

Connect the VHF sweep generator to the antenna terminals.

Connect the VHF signal generator loosely to the antenna terminals.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Turn off the adapter switch, removing plate voltage from the oscillator. This is required because of RF-IF interaction when a crystal is used as a mixer.

Set the channel selector and the sweep generator to channel 2.

Insert markers of channel 2 picture carrier and sound carrier, 55.25 mc. and 59.75 mc.

Adjust antenna T6, r-f amplifier plate L29 and mixer L30 adjustments for a symmetrical curve with maximum gain at the center of the pass band. The curves will have a deep valley because of no crystal loading and nonlinear detector characteristics. The limits for the 100% response points are shown in Figure 9. If the bandwidth is out of tolerance, it can usually be corrected by redressing the coupling capacitor of the double tuned circuit, C40 on insert A. Maximum bandwidth occurs when the capacitor is centered in the insert chamber.

Repeat the above steps for all VHF channels adjusting the appropriate antenna, r-f amplifier plate and mixer slugs for a symmetrical curve with maximum gain at the center of the pass band.

Turn off the sweep generator.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Turn the AGC control fully clockwise.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Connect the potentiometer arm of the second bias supply to the junction R147 and R148, and ground the positive battery terminal. Adjust the bias potentiometer to produce —5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to the junction of R138 and L105. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to channel 13.

Set the fine tuning control to the center of its range.

Adjust the oscillator slug L22 to proper frequency, 257 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 257 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner through either of the two holes next to the oscillator tube on the right front top corner of the tuner. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust L22 oscillator slug to obtain an audio beat with the signal generator.

Turn on the sweep generator and set to Channel 13. Adjust T1 for maximum gain on the oscilloscope. Adjust mixer tank circuit L21 for maximum gain and flat-topped curve. Recheck T1 for maximum gain at center of band with the proper response. Maximum gain and flat-topped response should be obtained simultaneously.

ALIGNMENT PROCEDURE

Adjust the oscillator to frequency on all VHF channels by switching the receiver and signal generator to each VHF channel and adjusting the appropriate oscillator slug to obtain a beat with the signal generator. Adjust the appropriate mixer slug where necessary to obtain maximum gain and proper curve shape as explained above.

Adjust the tunable I-F Trap C16-L7. To do this connect the signal generator to the fixed I-F Trap C2-L2 at the end opposite the antenna terminal plug. Set the signal generator to 43.5 mc. and adjust the output of the signal generator to obtain sufficient indication on the oscilloscope. Tune the I-F Trap C16-L7 for minimum indication on the oscilloscope.

Remove the signal generator and the oscilloscope.

TUNER UHF ALIGNMENT.—To align the UHF inserts:

Turn off the adapter switch, removing plate voltage from the oscillator.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Connect the UHF sweep generator to the antenna terminals. Use a 10 DB attenuator pad to assure proper alignment.

Connect the UHF signal geenrator loosely to the antenna terminals.

Set the channel selector to the desired position and the sweep generator to sweep the frequency of the insert being used.

Insert markers of the picture carrier and sound carrier for desired channel.

Adjust UHF antenna, link coupling and mixer adjustments for a symmetrical curve, with maximum gain, centered about the pass band.

The responses are shown in Figure 10. The curve shape will usually vary from Figure 10 (a) to Figure 10 (c) going higher in frequency, however any of these responses are acceptable.

Repeat the above steps for all UHF inserts used adjusting the appropriate antenna, link coupling and mixer slugs for a symmetrical curve, with maximum gain, centered about the pass band.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal.

Connect the potentiometer arm of the second bias supply to the junction of R147 and R148, and ground the positive battery terminal. Adjust the bias potentiometer to produce —5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to junction of R138 and L105. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to the lowest UHF channel to be used.

Set the fine tuning control to the center of its range.

Adjust the oscillator core to proper frequency. To do this, connect the VHF signal generator to test point TP1 with the shortest leads possible. Insert a 45.75 mc. marker from the VHF generator.

Set the UHF sweep generator to sweep the desired channel, and observe the output on the oscilloscope. If the sweep generator is not sweeping the correct frequency range, it may be necessary to readjust the sweep in order to place the 45.75 marker on the response curve as in Figure 12.

Set the UHF marker generator to the picture carrier of the channel insert being adjusted and connect to test point TP1.

Adjust the oscillator core until the markers for 45.75 mc. and the picture carrier coincide on the sweep pattern on the oscilloscope.

Adjust mixer core for maximum gain with proper wave shape.

Connect the "VoltOhmyst" to test point TP1, using 1.5 volt D.C. scale.

Set oscillator injection adjustment to read .1 volt on the "VoltOhmyst."

Repeat the above steps for all UHF inserts adjusting the oscillator injection control only if the reading on the "VoltOhmyst" exceeds .3 volt. Adjust as necessary to read .3 volt or less at TP1.

RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first sound i-f grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. In such a case, connect the calibrator to the grid of the third pix i-f amplifier, pin 1 of V108.

Set the frequency of the calibrator to 45.75 mc. (pix carrier) and modulate with 4.5 mc. crystal. The 4.5 mc. signal will be picked off at L104 and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst". Adjust the signal level from the signal generator for 6 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R106 and C108.

Tune the ratio detector secondary T102 bottom core for zero d-c on the "VoltOhmyst".

Repeat adjustments of T102 top for maximum d-c at pin 2 of V103 and T102 bottom for zero d-c at the junction of R106 and C108. Make the final adjustments with the signal input level adjusted to produce 6 volts d-c on the "VoltOhmyst" at pin 2 of V103.

SOUND I-F ALIGNMENT.—Connect the signal generator to the first sound i-f amplifier grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed as above.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the T101 top core for maximum d-c on the "VoltOhmyst".

The output from the signal generator should be set to produce approximately 6.0 volts on the "VoltOhmyst" when the final touches on the above adjustment are made.

4.5 MC. TRAP ADJUSTMENT.—Connect the signal generator in series with a 1,000 ohm resistor to pin 2 of V109. Set the generator to 4.5 mc. and modulate it 30% with 400 cycles. Set the output to approximately 0.5 volt.

Short the third pix i-f grid to ground, pin 1, V108, to prevent noise from masking the output indication.

Connect the crystal diode probe of an oscilloscope to the plate of the video amplifier, pin 6 of V110.

Adjust the core of L103 for minimum output on the oscilloscope.

Remove the short from pin 1, V108 to ground.

As an alternate method, this step may be omitted at this point in the alignment procedure and the adjustment made "on the air" after the alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L103 requires no adjustment. If a 4.5 mc. beat is present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L103 for minimum beat.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 6 of V110.

Connect an antenna to the receiver antenna terminals.

ALIGNMENT PROCEDURE

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

HORIZONTAL OSCILLATOR ADJUSTMENT. — Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R200, then adjust the T114 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T114 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T114 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C174B, the width control L109 and the linearity control L111 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T114 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T114 frequency core (on the rear apron) until the picture falls out of sync and three or four diagonal black bars sloping down to the right appear on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain three or four diagonal black bars on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T114 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture falls out of sync with the diagonal bars sloping down to the right. Continue to turn the frequency core in the same direction. No more than three or four bars should appear on the screen. Instead, the horizontal oscillator should begin the motorboat. Retouch the adjustment of the T114 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T114. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 21. Adjust the waveform adjustment core of T114 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C174A slightly clockwise. If less than 2 bars are present, adjust C174A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T114 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves to the left side of the screen leaving the picture in synchronization.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to construct the pad.

RESPONSE CURVES.—The response curves shown on pages 14 and 15 and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, some variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

NOTE ON TUNER ALIGNMENT.—Because of the frequency spectrum involved and the nature of the device, many of the tuner leads and components are critical in some respects. Even the power supply leads form loops which couple to the tuned circuits, and if resonant at any of the frequencies involved in the performance of the tuners, may cause serious departures from the desired characteristics. In the design of the receiver these undesirable resonant loops have been shifted far enough away in frequency to allow reasonable latitude in their components and physical arrangement without being troublesome. When the tuners are aligned in the receiver, no trouble from resonant loops should be experienced. However, if the tuners are aligned in a jig separate from the receiver, attention should be paid to insure that unwanted resonances do not exist which might present a faulty representation of tuner alignment.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 15000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

Tube No.	Tube Type	Function	Operating Condition	E. Plate		E. Screen		E. Cathode		E. Grid		Notes on Measurements

CIRCUIT SCHEMATIC DIAGRAM KCS82 (KCS82B with KRK12 Tuner)

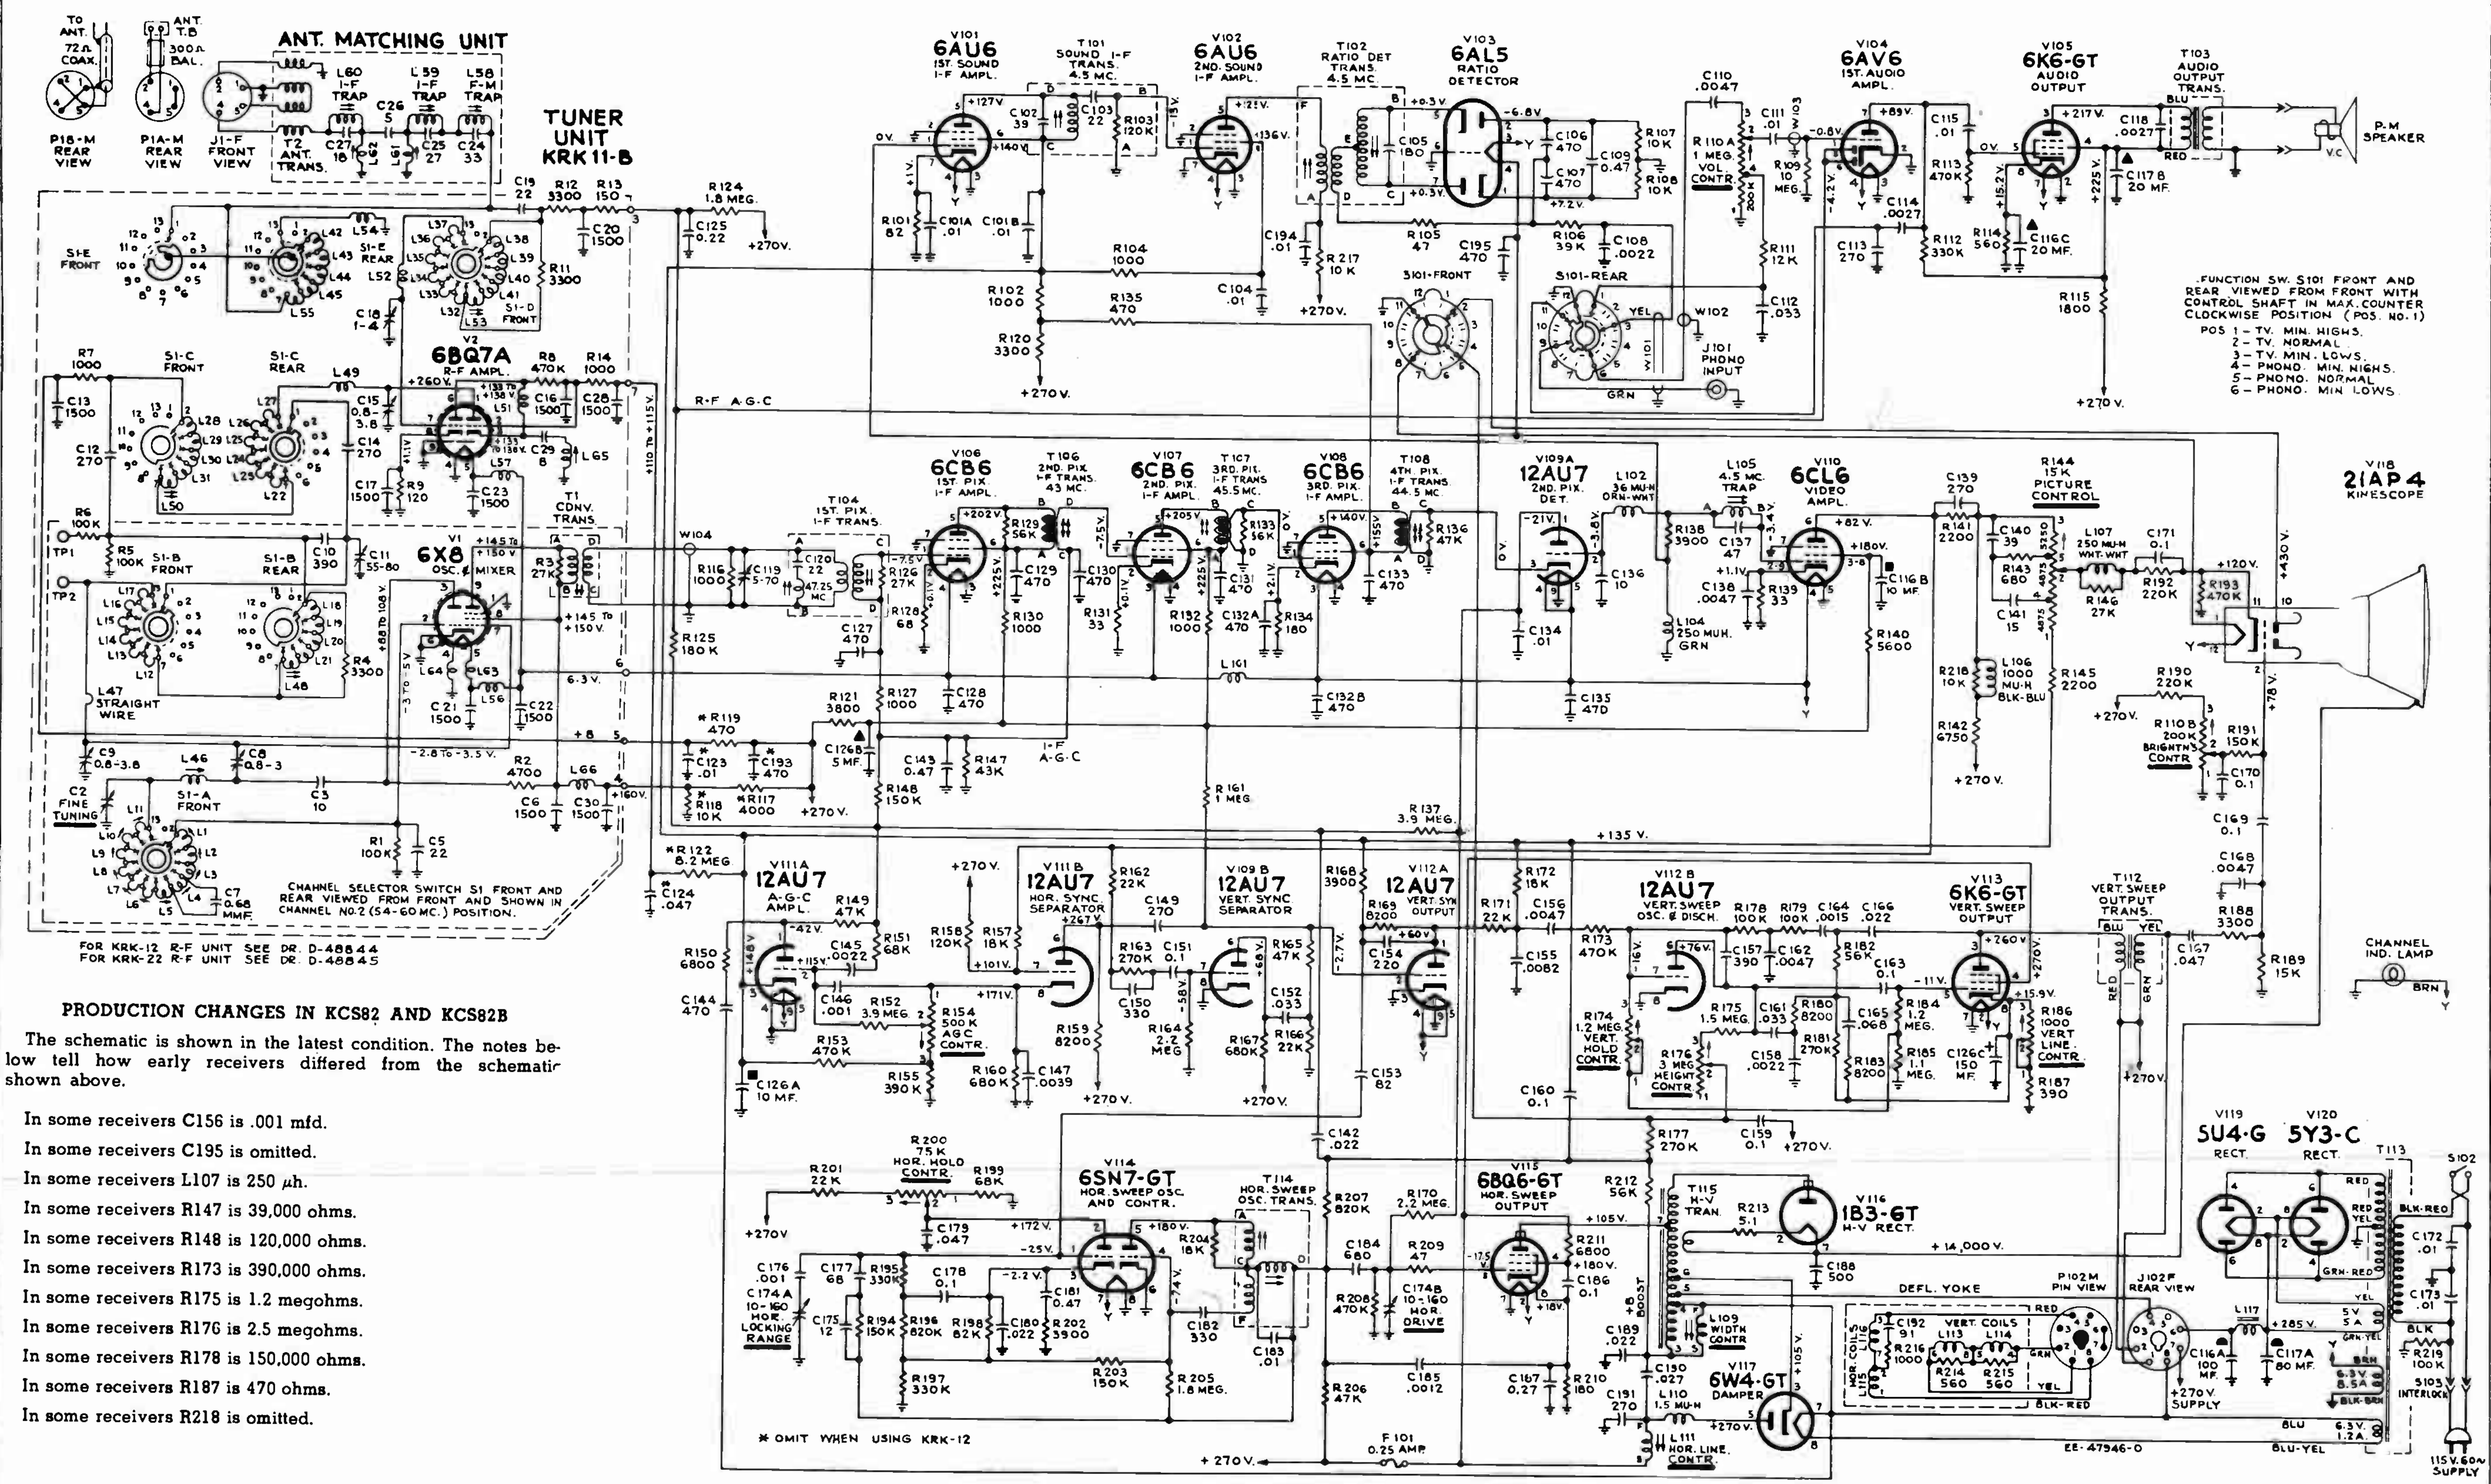

Figure 25—Circuit Schematic Diagram

PRODUCTION CHANGES IN KCS82 AND KCS82B

The schematic is shown in the latest condition. The notes below tell how early receivers differed from the schematic shown above.

In some receivers C156 is .001 mfd.
In some receivers C195 is omitted.
In some receivers L107 is 250 μh.
In some receivers R147 is 39,000 ohms.
In some receivers R148 is 120,000 ohms.
In some receivers R173 is 390,000 ohms.
In some receivers R175 is 1.2 megohms.
In some receivers R176 is 2.5 megohms.
In some receivers R178 is 150,000 ohms.
In some receivers R187 is 470 ohms.
In some receivers R218 is omitted.

The schematic is shown in the latest condition at the time of printing.
All resistance values in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

PARTS

STOCK No.	DESCRIPTION
	TUNER UNIT ASSEMBLIES KRK 11B
	Models 21T303, 21T313, 21T314, 21T315, 21T316, 21T322, 21T323, 21T324
76539	Board—Antenna matching transformer terminal board—less coils and less capacitors
76531	Board—Terminal board, 5 contact and ground
76845	Bracket—Vertical bracket for holding V1 tube shield
76965	Capacitor—Ceramic, variable, for fine tuning—plunger type (C2)
71504	Capacitor—Fixed, headed-lead type, 0.68 mmf., ±20%, 500 volts (C7)
77151	Capacitor—Tubular, adjustable, steatite, 0.8–3 mmf. (C8)
75184	Capacitor—Ceramic, adjustable, 0.8–3.8 mmf., complete with adjusting stud (C9)
76532	Capacitor—Adjustable trimmer, steatite, 1–4 mmf. (C18)
	Capacitors—Ceramic, fixed, non-insulated:
93056	5 mmf., ±0.5 mmf., 500 volts DC, Temp coef. = 0 (C26)
70597	8 mmf., ±1 mmf., 500 volts DC, Temp. coef. = 0 (C29)
55326	10 mmf., ±1 mmf., 500 volts DC, Temp. coef. = −80 (C3)
54207	18 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C27)
76557	22 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C19)
76558	22 mmf., ±10%, 500 volts DC, Temp. coef. = −750. Special—copper coated (C5)
70935	27 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C25)
76739	33 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C24)
76527	Capacitor—Mica trimmer, 55–80 mmf. (C11)
75199	Capacitor—Fixed, ceramic, insulated, 270 mmf. ±20%, 500 volts DC, High "K" type (C12, C14)
75641	Capacitor—Fixed, ceramic, insulated, 390 mmf., ±10%, 500 volts DC, High "K" type (C10)
75166	Capacitor—Ceramic, 1500 mmf. (stand-off) (C13, C21, C22, C28, C30)
75610	Capacitor—Fixed, ceramic, insulated, 1500 mmf., ±20%, 500 volts DC, High "K" type (C6)
73748	Capacitor—Fixed, ceramic, 1500 mmf., +100%, −0%, 500 volts DC, High "K" disc (C16, C17, C20, C23)
76143	Clip—Tubular clip for mounting stand-off capacitors
73591	Coil—Antenna matching coil (2 req'd)
73477	Coil—Choke coil (L57)
77206	Coil—Filament choke coil (L56)
76763	Coil—Filament choke coil (L63, L64)
76562	Coil—RF amplifier coupling coil (L51)
77153	Coil—RF choke coil (L66)
76537	Coil—Shunt coil complete with adjustable core (L61)
76538	Coil—Shunt coil complete with adjustable core (L62)
76529	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r.f. section (L49, C15)
38853	Connector—4 contact female connector—part of antenna matching transformer (J1)
76559	Connector—Oscillator grid connector
76460	Contact—Test point contact
77202	Core—Adjustable core for fine tuning capacitor
76543	Core—Adjusting core for FM trap
76521	Detent—Detent mechanism and fibre shaft
73453	Form—Coil form for L48, L50, L53
77203	Link—Link assembly for fine tuning
76728	Nut—Speed nut for mounting adjustable trimmer 76532
	Resistors—Fixed, composition:
503112	120 ohms, ±10%, ½ watt (R9)
503115	150 ohms, ±10%, ½ watt (R13)
503210	1000 ohms, ±10%, ½ watt (R7, R14)
503233	3300 ohms, ±10%, ½ watt (R4, R11, R12)
503247	4700 ohms, ±10%, ½ watt (R2)
503410	100,000 ohms, ±10%, ½ watt (R1, R5, R6)
503447	470,000 ohms, ±10%, ½ watt (R8)
14343	Retainer—Fine tuning shaft retaining ring
75164	Rod—Actuating plunger rod (fibre) for fine tuning link
76548	Screw—#4-40 x ¼" adjusting screw for coils L6, L7, L8, L9, L10, L11
75176	Screw—#4-40 x 7/16" adjusting screw for coil L5
76549	Screw—#4-40 x ⅜" adjusting screw for coils L1, L2, L3, L4, L46
76519	Shaft—Channel selector shaft and plate
76134	Shaft—Fine tuning shaft and cam
77147	Shield—Front shield complete with shaft bushing and bracket
76534	Shield—Tube shield
76530	Socket—Tube socket, 9 pin, miniature, ceramic, saddle—mounted
76336	Socket—Tube socket, 9 pin, miniature, bakelite, saddle—mounted
77149	Spacer—Metal spacer for front plate
75163	Spring—Friction spring (formed) for fine tuning cam
30340	Spring—Hairpin spring for fine tuning link
75068	Spring—Retaining spring for tube shield
77204	Spring—Return spring for fine tuning control
77664	Stator—Antenna stator complete with rotor, coils, capacitor and resistor (S5, C20, L42, L43, L44, L45, L54, L55, R13)
77922	Stator—Convertor stator complete with rotor, coils, capacitors, and resistors (S2, C10, C12, L12, L13, L14, L15, L16, L17, L18, L19, L20, L21, L47, L48, R4, R5, R6)
77205	Stator—Oscillator stator complete with rotor, coils, and capacitors (S1, C3, C7, L1, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L46)
76556	Stator—RF grid stator complete with rotor, capacitor, and resistors (S4, C19, L32, L33, L34, L35, L36, L37, L38, L39, L40, L41, L53, R11, R12)
76553	Stator—RF plate stator complete with rotor, coils, capacitor, and resistor (S3, C14, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L50, R7)
76561	Strap—Channel #13 RF grid strap (L52)
76525	Strip—Coil segment mounting strip—R.H. center
76526	Strip—Coil segment mounting strip—L.H. lower
76544	Strip—Coil segment mounting strip—L.H. upper—less trimmer
76740	Stud—#6-32 x 1" adjusting stud for adjustable capacitor C8
77152	Terminal—Terminal for mounting adjustable capacitor
76536	Transformer—Antenna matching transformer complete (T2, C24, C25, C26, C27, L58, L59, L60, L61, L62, J1)
77663	Transformer—Convertor transformer complete with adjustable core (T1, R3)
76535	Trap—I.F. trap
76542	Trap—I.F. trap (41.25 MC) complete with core (L60)
76541	Trap—I.F. trap (45.75 MC) complete with core (L59)
76540	Trap—F.M. trap complete with adjustable core (L58)
75190	Washer—Insulating washer (neoprene) for adjustable capacitor
	TUNER UNIT ASSEMBLIES KRK12
	Models 21T303U, 21T313U, 21T314U, 21T315U, 21T316U, 21T322U, 21T323U, 21T324U
77580	Ball—Steel ball (.125" dia.) (12 req'd)
77579	Ball—Steel ball (.187" dia.)
77575	Bracket—Drive mechanism mounting bracket
77589	Bracket—Lamp bracket
77619	Bracket—VHF input connector and bracket
76845	Bracket—Vertical bracket for oscillator tube shield
77591	Cam—Fine tuning cam
77691	Capacitor — Fixed, headed-lead type, .33 mmf., ±10%, 500 volts DC (C33, C35)
77669	Capacitor — Fixed, headed-lead type, .82 mmf., ±10%, 500 volts DC (C37)
77690	Capacitor — Fixed, headed-lead type, 1.0 mmf., ±10%, 500 volts DC (C39, C40, C42)
77210	Capacitor—Fixed, ceramic, non-insulated, 2 mmf., ±0.25 mmf., 500 volts DC, Temp. coef. = 0 (C15)
77667	Capacitor—Fixed, ceramic, insulated, comprising 1 section of 2 mmf., and 1 section of 22 mmf., Temp. coef. = −750 (C12, C13)
77616	Capacitor—Adjustable, mica, 4–40 mmf. (C16)
77688	Capacitor—Fixed, ceramic, non-insulated, 5 mmf., ±0.5 mmf., 500 volts DC, Temp. coef. = 0 (C34, C36, C38, C41)
74182	Capacitor—Fixed, ceramic, non-insulated, 6 mmf., ±0.5 mmf., 500 volts DC, Temp. coef. = 0 (C5)
77621	Capacitor—Fixed, ceramic, crystal holder, 22 mmf., ±10%, Temp. coef. = −750 (C11)
71924	Capacitor—Fixed, ceramic, non-insulated, 56 mmf., ±10%, 500 volts DC, Temp. coef. = −750 (C10)
77625	Capacitor—Fixed, ceramic, 220 mmf., +100%, −0%, 500 volts DC, High "K" disc (C18)
77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, −0%, 500 volts DC, High "K" disc (C43)
77624	Capacitor—Fixed, ceramic, 680 mmf., +100%, −0%, 500 volts DC, High "K" disc (C4)
77084	Capacitor—Ceramic, feed-thru, 1000 mmf. (C21, C23, C25)
77615	Capacitor—Ceramic, stand-off, 1000 mmf. (C3, C19, C24, C26)
77252	Capacitor—Fixed, ceramic, 1000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C14, C20, C22, C27)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +1000%, −0%, 500 volts DC, High "K" Disc (C17)
77628	Coil—IF trap (L7)
77634	Coil—IF neutralizing coil (L12)
77629	Coil—Oscillator cathode coil (L9)
77632	Coil—Oscillator heater coil (L15)
77631	Coil—Oscillator heater coil (L14)
77630	Coil—Oscillator plate coil (L11)
77627	Coil—Peaking coil (L6, R11)
77695	Coil—RF plate coil (L8)
77633	Connector—Formed grounding connector
77623	Connector—UHF antenna input connector (J1)
77612	Contact—Bracket and spring contact assembly for grounding rotor—assembled to base
77618	Contact—Bracket and spring contact assembly for grounding rotor—assembled to oscillator shield
77606	Contact—Contact and support assembly — "L" shape—complete with two (2) contacts
77622	Contact—Contact and support assembly complete with two (2) contacts and UHF antenna input connector
77620	Contact—Contact and support assembly complete with four (4) contacts and holder for crystal rectifier
77607	Contact—Contact and support assembly complete with five (5) contacts—rear of chassis
77614	Control—Oscillator voltage control (R6)
77617	Control — UHF oscillator injection adjustment control
77583	Core—Fine tuning core
77593	Coupling—Indicator shaft coupling
77596	Ferrule—Ferrule for UHF antenna input cable
77588	Gear—Rotor drive gear—nylon
77602	Insert—VHF coil assembly insert for channels 2, 3 or 4 (Includes C40, C41, C42, L29, L30, L31, T6)
77603	Insert—VHF coil assembly insert for channels 5 or 6 (Includes C37, C38, C39, L26, L27, L28, T5)
77604	Insert—VHF coil assembly insert for channels 7, 8, 9 or 10 (Includes C35, C36, L23, L24, L25, T4)
77605	Insert—VHF coil assembly insert for channels 11, 12 or 13 (Includes C33, C34, L20, L21, L22, T3)
	APPLY TO YOUR RCA DISTRIBUTOR FOR INFORMATION ON UHF COIL ASSEMBLY INSERTS
77590	Lever—Actuating lever for fine tuning link
77582	Link—Fine tuning link
77581	Plate—Front plate and ball race
77489	Rectifier—Germanium rectifier Type IN82 (CR1)
	Resistors—Fixed, composition:
503047	47 ohms, ±10%, ½ watt (R16)
503110	100 ohms, ±10%, ½ watt (R10, R17)
503112	120 ohms, ±10%, ½ watt (R2, R9)
503210	1000 ohms, ±10%, ½ watt (R13, R14)
503310	10,000 ohms, ±10%, ½ watt (R12)
503322	22,000 ohms, ±10%, ½ watt (R1)
503410	100,000 ohms, ±10%, ½ watt (R18, R19)
503412	120,000 ohms, ±10%, ½ watt (R5)
503427	270,000 ohms, ±10%, ½ watt (R4)
503447	470,000 ohms, ±10%, ½ watt (R8)
503582	8.2 megohms, ±10%, ½ watt (R3, R7)
30340	Retainer—Retainer ring for fine tuning actuating lever stud
77592	Ring—Contact ring
77599	Roller—Rotor detent roller and retainer
77574	Rotor—Rotor frame
77594	Screw—#8-32 x ¼" cup point set screw for indicator shaft coupling
77576	Shaft—Channel selector drive shaft complete with two (2) gears
77595	Shaft—Indicator shaft
77611	Shield—Oscillator shield and grounding spring assembly—underside of chassis
77577	Shield—Top shield
76967	Shield—Tube shield for V2
76534	Shield—Tube shield for V1, V3
77613	Sleeve—Insulating sleeve for fine tuning adjustable core
77274	Socket—Tube socket, 7 pin, miniature, saddle mounted, steatite for V2
77608	Socket—Tube socket, 9 pin, miniature, saddle mounted, moulded mica for V1, V3, V4
77578	Spring—Formed spring for holding rotor (on back of unit)
77584	Spring—Fine tuning link adjusting spring
76961	Spring—Retaining spring for oscillator tube shield
77598	Spring—Rotor detent spring and roller complete with mounting bracket
77599	Roller—Rotor detent roller and retainer
77587	Stud—Mounting stud for fine tuning link actuating lever
77693	Stud—#6-32 x 21/32" adjusting stud for trimmer capacitor C9
77692	Stud—#6-32 x 25/32" adjusting stud for trimmer capacitors C6, C7, C8, C29, C30, C31, C32
77694	Stud—#10-32 x ⅜" adjusting stud for coils L20, L21, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31 and transformers T3, T4, T5, T6
77609	Transformer—Mixer I.F. transformer complete with adjustable cores (T1)
77610	Transformer—Primary I.F. link transformer complete with adjustable cores (T2, R15)
77626	Trap—I.F. trap (L1, C1, L2, C2)
77585	Washer—"C" washer for drive and indicator shafts (3 req'd)
77586	Washer—"C" washer for fine tuning link spring
	CHASSIS ASSEMBLIES
	KCS 82 (KRK11B Tuner Unit)
	KCS 82B (KR12 Tuner Unit)
76456	• Bracket — Channel indicator lamp bracket for KCS82
76490	Bracket—Mounting bracket complete with insulator for picture control
71496	Capacitor—Mica trimmer, 5–70 mmf. (C119)
33098	Capacitor—Fixed, ceramic, non-insulated, 10 mmf., ±1.0 mmf., 500 volts DC, Temp. coef. = −750 (C136)

PARTS (Continued)

STOCK No.	DESCRIPTION
75217	Capacitor — Mica trimmer, dual 10–160 mmf. (C174A, C174B)
33380	Capacitor—Fixed, ceramic, non-insulated, 12 mmf., ±10%, 500 volts DC, Temp. coef. = —750 (C175)
39044	Capacitor—Fixed, ceramic, non-insulated, 15 mmf., ±10%, 500 volts DC, Temp. coef. = —750 (C141)
73664	Capacitor—Fixed, ceramic, non-insulated, 39 mmf., ±10%, 500 volts DC, Temp. coef. = —750 (C140)
76475	Capacitor — Fixed, mica, 68 mmf., 1000 volts (C177)
76474	Capacitor—Fixed, mica, 82 mmf., 1000 volts DC (C153)
39636	Capacitor—Fixed, mica, 220 mmf., 500 volts DC (C154)
39638	Capacitor—Fixed, mica, 270 mmf., 500 volts DC (C139)
47617	Capacitor — Fixed, ceramic, non-insulated, 270 mmf., ±10%, 500 volts DC, Temp. coef. = —750 (C113)
76579	Capacitor—Fixed, mica, 270 mmf., 1000 volts DC (C149, C191)
39640	Capacitor—Fixed, mica, 330 mmf., 500 volts DC (C150)
76476	Capacitor -- Fixed, mica, 330 mmf., 1000 volts (C182)
73094	Capacitor—Fixed, mica, 390 mmf., 1000 volts DC (C157)
77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, —0%, 500 volts DC, High "K" disc (C127, C128, C129, C130, C131, C133, C135, C195, C193 for KCS82)
77672	Capacitor — Fixed, ceramic, dual 470 mmf., +100%, —0%, 500 volts DC, High "K" disc (C132A, C132B)
77673	Capacitor—Fixed, ceramic, insulated, 470 mmf., ±10%, 1500 volts DC, Special H.V. (C144)
39644	Capacitor—Fixed, mica, 470 mmf., 500 volts DC (C106, C107)
76461	Capacitor—Ceramic, 500 mmf., 20,000 volts (C188)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, —0%, 500 volts DC, High "K" disc (C104, C134, C194, C123 for KCS82)
76991	Capacitor — Fixed, ceramic, dual 10,000 mmf., +100%, —0%, 500 volts DC, High "K" disc (C101A, C101B)
75218	Capacitor—Electrolytic, comprising 1 section of 10 mfd., 350 volts, 1 section of 5 mfd., 350 volts and 1 section of 150 mfd., 50 volts (C126A, C126B, C126C)
77644	Capacitor—Electrolytic, comprising 1 section of 80 mfd., 400 volts and 1 section of 20 mfd., 400 volts (C117A, C117B)
76970	Capacitor—Electrolytic, comprising 1 section of 100 mfd., 400 volts, 1 section of 10 mfd., 350 volts and 1 section of 20 mfd., 50 volts (C116A, C116B, C116C)
	Capacitors—Fixed, tubular, oil impregnated:
76479	Moulded, .00068 mfd., 600 volts (C184)
75643	Paper, .001 mfd., 1000 volts (C146, C176)
76995	Moulded, .0012 mfd., 600 volts (C185)
77123	Moulded, .0015 mfd., 1000 volts (C164)
73595	Paper, .0022 mfd., 600 volts (C108, C145, C158)
73599	Paper, .0027 mfd., 600 volts (C114)
73818	Paper, .0027 mfd., 1600 volts (C118)
73796	Paper, .0039 mfd., 600 volts (C147)
73920	Paper, .0047 mfd., 600 volts (C110, C138, C156, C162, C168)
73808	Paper, .0082 mfd., 1000 volts (C155)
73561	Paper, .01 mfd., 400 volts (C111, C115)
73594	Moulded, .01 mfd., 600 volts (C172, C173, C183)
73562	Paper, .022 mfd., 400 volts (C180)
73798	Paper, .022 mfd., 600 volts (C166)
73810	Paper, .022 mfd., 1000 volts (C142, C189)
73811	Paper, .027 mfd., 1000 volts (C190)
73552	Paper, .033 mfd., 400 volts (C112, C152)
73596	Paper, .033 mfd., 1000 volts (C161)
73553	Paper, .047 mfd., 400 volts (C124 for KCS82, C179)
73592	Paper, .047 mfd., 600 volts (C167)
73792	Paper, .068 mfd., 400 volts (C165)
73784	Paper, 0.1 mfd., 200 volts (C171)
73551	Paper, 0.1 mfd., 400 volts (C151, C159, C169, C170, C178)
73557	Paper, 0.1 mfd., 600 volts (C160, C163, C186)
73794	Paper, 0.22 mfd., 200 volts (C125)
73786	Paper, 0.27 mfd., 400 volts (C187)
73787	Paper, 0.47 mfd., 200 volts (C109, C143, C181)
77676	Choke—Filter choke (L117)
73477	Coil—Choke coil (L101)
76442	Coil—Horizontal linearity coil complete with adjustable core (L111)
76011	Coil—Peaking coil (36 muh) (L102)
71526	Coil—Peaking coil (250 muh) (L104)
77925	Coil—Peaking coil (220 muh) (L107, R146)
77124	Coil—Peaking coil (1000 muh) (L106, R218)
76640	Coil—RF choke coil (1.5 muh) (L110)
76441	Coil—Width coil complete with adjustable core (L109)
35787	Connector—Phono input connector (J101)
75474	Connector — Single contact male connector for speaker cable (2 req'd)
76457	Connector—2nd anode lead connector
74594	Connector—2 contact male connector for power cord
50367	Connector—6 contact female connector for yoke leads (J102)
76975	Control—AGC control (R154)
77655	Control—Brightness control, volume control and power switch (R110A, R110B, S102)
77924	Control—Height control (R176)
77639	Control—Horizontal hold control (R200)
76445	Control—Picture control (R144)
77642	Control—Vertical hold control (R174)
77643	Control—Vertical linearity control (R186)
77647	Coupling—Coupling (nylon) for picture control
76986	Cover—Back cover for hi-voltage compartment
76985	Cover—Side cover for hi-voltage compartment
73600	Fuse—0.25 amp., 250 volts (F101)
76459	Grommet—Rubber grommet for 2nd anode lead connector
76480	Lead—Anode lead complete with eyelet
76464	Plate—Hi-voltage plate (bakelite) complete with tube socket and corona ring
76796	Resistor—Wire wound, 5.1 ohms, 1/3 watt (R213)
76639	Resistor—Wire wound, 180 ohms, 2 watts (R210)
77670	Resistor—Wire wound, 3300 ohms, 7 watts (R120)
77671	Resistor—Wire wound, 3800 ohms, 7 watts (R121)
77668	Resistor—Wire wound, 4000 ohms, 7 watts (R117 for KCS82)
76642	Resistor — Wire wound, 6750 ohms, 10 watts (R142)
77669	Resistor—Wire wound, 10,000 ohms, 5 watts (R118 for KCS82)
	Resistors—Fixed, composition:
30789	33 ohms, ±5%, ½ watt (R131)
503033	33 ohms, ±10%, ½ watt (R139)
503047	47 ohms ±10%, ½ watt (R105, R209)
34763	68 ohms, ±5%, ½ watt (R128)
503082	82 ohms, ±10%, ½ watt (R101)
502118	180 ohms, ±5%, ½ watt (R134)
503139	390 ohms, ±10%, ½ watt (R187)
503147	470 ohms, ±10%, ½ watt (R119 for KCS82, R135)
513156	560 ohms, ±10%, 1 watt (R114)
503168	680 ohms, ±10%, ½ watt (R143)
503210	1000 ohms, ±10%, ½ watt (R104, R116, R127, R130, R132)
513210	1000 ohms, ±10%, 1 watt (R102)
523218	1800 ohms, ±10%, 2 watts (R115)
503222	2200 ohms, ±10%, ½ watt (R145)
523222	2200 ohms, ±10%, 2 watts (R141)
503233	3300 ohms, ±10%, ½ watt (R188)
502239	3900 ohms, ±5%, ½ watt (R138, R168)
503239	3900 ohms, ±10%, ½ watt (R202)
513256	5600 ohms, ±10%, 1 watt (R140)
513268	6800 ohms, ±10%, 1 watt (R150)
523268	6800 ohms, ±10%, 2 watts (R211)
503282	8200 ohms, ±10%, ½ watt (R159, R169, R180, R183)
502310	10,000 ohms, ±5%, ½ watt (R107, R108)
513310	10,000 ohms, ±10%, 1 watt (R217)
503312	12,000 ohms, ±10%, ½ watt (R111)
503315	15,000 ohms, ±10%, ½ watt (R189)
503318	18,000 ohms, ±10%, ½ watt (R157, R172, R204)
503322	22,000 ohms, ±10%, ½ watt (R162, R166, R171, R201)
503339	39,000 ohms, ±10%, ½ watt (R106)
502339	39,000 ohms, ±5%, ½ watt (R147)
503347	47,000 ohms, ±10%, ½ watt (R136, R149, R165)
512347	47,000 ohms, ±5%, 1 watt (R206)
502356	56,000 ohms, ±5%, ½ watt (R129, R133)
503356	56,000 ohms, ±10%, ½ watt (R212)
512356	56,000 ohms, ±5%, 1 watt (R182)
503368	68,000 ohms, ±10%, ½ watt (R151, R199)
503382	82,000 ohms, ±10%, ½ watt (R198)
503410	100,000 ohms, ±10%, ½ watt (R178, R219)
513410	100,000 ohms, ±10%, 1 watt (R179)
30180	120,000 ohms, ±5%, ½ watt (R148)
503412	120,000 ohms, ±10%, ½ watt (R158)
503415	150,000 ohms, ±10%, ½ watt (R191, R194)
512415	150,000 ohms, ±5%, 1 watt (R203)
502418	180,000 ohms, ±5%, ½ watt (R125)
503422	220,000 ohms, ±10%, ½ watt (R190, R192)
502427	270,000 ohms, ±5%, ½ watt (R181)
503427	270,000 ohms, ±10%, ½ watt (R163, R177)
503433	330,000 ohms, ±10%, ½ watt (R112, R195, R197)
503439	390,000 ohms, ±10%, ½ watt (R155)
503447	470,000 ohms, ±10%, ½ watt (R113, R153, R173, R193, R208)
503468	680,000 ohms, ±10%, ½ watt (R160, R167)
503482	820,000 ohms, ±10%, ½ watt (R196, R207)
503510	1 megohm, ±10%, ½ watt (R161)
502511	1.1 megohm, ±5%, ½ watt (R185)
503512	1.2 megohm, ±10%, ½ watt (R184)
503515	1.5 megohm, ±10%, ½ watt (R175)
11769	1.8 megohm, ±5%, ½ watt (R124)
39063	1.8 megohm, ±5%, 1 watt (R205)
503522	2.2 megohm, ±10%, ½ watt (R164, R170)
503539	3.9 megohm, ±10%, ½ watt (R137, R152)
503582	8.2 megohm, ±10%, ½ watt (R122)
503610	10 megohm, ±10%, ½ watt (R109)
77660	Shaft—Extension shaft for picture control
76969	Shield—Hi-voltage shield less side and back covers
73584	Shield—Tube shield for V101, V102, V103, V108
76972	Shield—Tube shield for V109
75718	Socket—Channel indicator lamp socket
74834	Socket—Kinescope socket
71508	Socket—Tube socket, 6 pin, moulded for V116
50367	Socket — Tube socket, 6 pin, moulded, saddle mounted for V117
73117	Socket—Tube socket, miniature, 7 pin, wafer for V101, V102, V103, V104, V106, V107, V108
31251	Socket—Tube socket, octal, wafer for V105, V115, V119, V120
50367	Socket — Tube socket, octal, moulded, saddle mounted for V113
77645	Socket—Tube socket, octal, wafer for V114
76971	Socket—Tube socket, miniature, 9 pin, wafer for V109, V110, V111, V112
77656	Switch—Phono-tone control switch (S101)
76463	Terminal—Screw type grounding terminal
76795	Transformer—Hi-voltage transformer (T115)
76440	Transformer — Horizontal oscillator transformer complete with adjustable core (T114)
76997	Transformer—Output transformer (T103)
77635	Transformer — Power transformer, 117 volt, 60 cycle (T113)
77112	Transformer—Ratio detector transformer (T102, C105)
76981	Transformer — Sound I.F. transformer complete with adjustable core (T101, C102, C103, R103)
77636	Transformer—Vertical output transformer (T112)
77637	Transformer—1st pix I.F. transformer complete with adjustable cores (T104, C120, R126)
77638	Transformer—2nd pix I.F. transformer complete with adjustable core (T106)
76433	Transformer—3rd or 4th pix I.F. transformer (T107, T108)
76983	Trap—4.5 MC trap (L105, C137)
77585	Washer—"C" washer for picture control extension shaft (2 req'd)

YOKE AND MAGNET ASSEMBLIES

STOCK No.	DESCRIPTION
77008	Connector—Anode connector complete with contact and eyelet
75542	Connector—6 contact male connector—part of deflection yoke (P102)
74956	Cushion—Rubber cushion for deflection yoke hood
76654	Hood — Deflection yoke hood — less rubber cushions
76168	Magnet—Focus magnet
76141	Magnet—Ion trap magnet
71456	Screw—#8-32 x 7/16" wing screw for mounting deflection yoke
76636	Stud—Adjusting stud complete with guard for focus magnet
77697	Yoke—Deflection yoke complete with male connector (L113, L114, L115, L116, C192, R214, R215, R216, P102)

SPEAKER ASSEMBLIES

971636-1W
RL101C5
RMA-274

(For Models 21T303, 21T303U)

STOCK No.	DESCRIPTION
77000	Speaker—5" P.M. speaker complete with cone and voice coil (3.2 ohms)

SPEAKER ASSEMBLIES

971490-3W / RL105E6 / RMA-274 — 971490-3R / RMA-285

(For Models 21T313, 21T313U)

STOCK No.	DESCRIPTION
75024	Cone—Cone and voice coil for speakers stamped 971490-3W
77129	Cone—Cone and voice coil for speakers stamped 971490-3R
75022	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms)

SPEAKER ASSEMBLIES

971692-1

(For Models 21T314, 21T314U, 21T315, 21T315U, 21T316, 21T316U, 21T322, 21T322U)

STOCK No.	DESCRIPTION
77777	Speaker—10" P.M. speaker complete with cone and voice coil (3.2 ohms)

SPEAKER ASSEMBLIES

92569-12W
RL111A1
RMA-274

(For Models 21T323, 21T323U, 21T324, 21T324U)

STOCK No.	DESCRIPTION
75682	Cone—Cone and voice coil
76093	Speaker—12" P.M. speaker complete with cone and voice coil (3.2 ohms)

NOTE: If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to Model number of instrument, number stamped on speaker and full description of part required.

PARTS (Continued)

STOCK No.	DESCRIPTION
	MISCELLANEOUS
77791	Back—Cabinet back complete with terminal board and power cord for Models 21T303, 21T303U
77743	Back—Cabinet back complete with power cord for Models 21T313, 21T313U, 21T323, 21T323U, 21T324, 21T324U
77744	Back—Cabinet back complete with power cord for Models 21T314, 21T314U, 21T315, 21T315U, 21T322, 21T322U
77792	Back—Cabinet back complete with power cord for Models 21T316, 21T316U
76184	Board—Antenna terminal board
76629	Bracket—Hanger bracket for deflection yoke hood assembly
76697	Bracket—Masking panel support bracket (2 req'd) for Models 21T314, 21T314U, 21T315, 21T315U, 21T322, 21T322U, 21T323, 21T323U, 21T324, 21T324U
77748	Bracket—Mounting bracket for hidden controls cover and case assembly
76599	Bracket—"U" shaped bracket for deflection yoke hood support rods
76699	Bumper—Rubber bumper for kinescope (as req'd)
71496	Capacitor—Mica trimmer, 5-70 mmf. (part of antenna cable and F-M trap) for Models using KRK-12 Tuner unit.
71892	Catch—Bullet catch and strike for Models 21T323, 21T323U, 21T324, 21T324U
73754	Catch—Bullet catch and strike for Models 21T322, 21T322U
77755	Clamp—Polystyrene clamp for antenna cable and mount for F-M trap for models using KRK-12 tuner unit
X3351	Cloth—Grille cloth for oak instruments for 21T316, 21T316U
X3349	Cloth—Grille cloth for maple instruments for Models 21T315, 21T315U, 21T323, 21T323U
X3350	Cloth—Grille cloth for mahogany instruments for Models 21T313, 21T313U, 21T314, 21T314U, 21T322, 21T322U, 21T324, 21T324U; for walnut instruments for Models 21T324, 21T324U; for red cherry instruments for Models 21T323, 21T323U
75474	Connector—Single contact male connector—part of antenna cable
77726	Connector—2 contact male connector—part of antenna cable—for models using KRK-12 tuner unit
39153	Connector—4 contact male connector—part of antenna cable—for models using KRK-11B tuner unit
71457	Cord—Power cord and plug
77740	Cover—Cover and case assembly—brown—for hidden controls for mahogany, walnut or red cherry instruments
77741	Cover—Cover and case assembly—medium beige —for hidden controls for blonde mahogany or oak instruments
77742	Cover—Cover and case asembly—tan—for hidden controls for maple instruments
77761	Cover—Cover assembly—brown—complete with spring for channel markers for maple instruments for models using KRK-12 tuner unit
77759	Cover—Cover assembly—maroon—complete with spring for channel markers for mahogany, walnut or red cherry instruments for models using KRK-12 tuner unit
77760	Cover — Cover assembly — sand gray — complete with spring for channel markers for blonde mahogany or oak instruments for models using KRK-12 tuner unit
77770	Cushion—Adhesive cushion (1/32" x 13/32" x 15/16") for safety glass retainers
77749	Cushion—Rubber cushion for safety glass (4 req'd)
76631	Cushion—Rubber cushion for dust sealing the kinescope
76698	Cushion—Rubber cushion for masking panel support bracket for Models 21T314, 21T314U, 21T315, 21T315U, 21T322, 21T322U, 21T323, 21T323U, 21T324, 21T324U
77781	Decal—Brightness, volume, fine tuning controls and channel selector switch function decal for blonde mahogany, oak or maple instruments
77782	Decal—Brightness, volume, fine tuning controls and channel selector switch function decal for mahogany, walnut or red cherry instruments
77758	Disc — Polystyrene indicator disc — brown — for channel selections for maple instruments for models using KRK-12 tuner unit
77756	Disc — Polystyrene indicator disc — maroon — for channel selections for mahogany, walnut or red cherry instruments for models using KRK-12 tuner unit
77757	Disc—Polystyrene indicator disc—sand gray—for channel selections for blonde mahogany or oak instruments for models using KRK-12 tuner unit
77700	Escutcheon—Channel marker escutcheon for models using KRK-11B tuner unit
72113	Foot—Rubber foot (4 req'd) for Models 21T303, 21T303U
77745	Glass—Safety glass
77793	Grille—Metal grille for Models 21T315, 21T315U
37396	Grommet—Rubber grommet for speaker mounting (3 req'd) for Models 21T323, 21T323U, 21T324, 21T324U
74308	Hinge—Door hinge (1 set) for Models 21T322, 21T322U, 21T323, 21T323U, 21T324, 21T324U
77709	Knob—Brightness control knob—brown—for mahogany, walnut or red cherry instruments (outer)
77718	Knob—Brightness control knob—medium beige—for blonde mahogany or oak instruments (outer)
77734	Knob—Brightness control knob—tan—for maple instruments (outer)
77708	Knob—Channel selector knob for models using KRK-11B tuner unit (inner)
77751	Knob — Channel selector knob — brown — for mahogany, walnut or red cherry instruments for models using KRK-12 tuner unit
77752	Knob—Channel selector knob—medium beige—for blonde mahogany or oak instruments for models using KRK-12 tuner unit
77753	Knob — Channel selector knob — tan — for maple instruments for models using KRK-12 tuner unit
77707	Knob — Fine tuning control knob — brown — for mahogany, walnut or red cherry instruments for models using KRK-11B tuner unit (outer)
77717	Knob—Fine tuning control knob—medium beige—for blonde mahogany or oak instruments for models using KRK-11B tuner unit (outer)
77733	Knob—Fine tuning control knob—tan—for maple instruments for models using KRK-11B tuner unit (outer)
77750	Knob—Fine tuning control knob for models using KRK-12 tuner unit (outer)
77699	Knob — Picture control knob — brown — for mahogany, walnut or red cherry instruments
77719	Knob—Picture control knob—medium beige—for blonde mahogany or oak instruments
77738	Knob—Picture control knob—tan—for maple instruments
77735	Knob — Tone and phono control switch knob — brown—for mahogany, walnut, or red cherry instruments
77736	Knob — Tone and phono control switch knob — medium beige — for blonde mahogany or oak instruments
77737	Knob — Tone and phono control switch knob — tan—for maple instruments
77710	Knob—Volume control and power switch knob (inner)
11765	Lamp—Channel marker escutcheon lamp—Mazda 51

PARTS (Continued)

STOCK No.	DESCRIPTION
77766	Marker — UHF channels numbers markers for blonde mahogany or oak instruments for models using KRK-12 tuner unit
77765	Marker—UHF channels numbers markers for mahogany, walnut or red cherry instruments for models using KRK-12 tuner unit
77767	Marker—UHF channel number markers for maple instruments for models using KRK-12 tuner unit
77763	Marker—VHF channel number markers for blonde mahogany or oak instruments for models using KRK-12 tuner unit
77762	Marker—VHF channel number markers for mahogany, walnut or red cherry instruments for models using KRK-12 tuner unit
77764	Marker—VHF channel number markers for maple instruments for models using KRK-12 tuner unit
77701	Mask—Channel marker escutcheon light mask—brown—for mahogany, walnut or red cherry instruments for models using KRK-11B tuner unit
77720	Mask—Channel marker escutcheon light mask—medium beige—for blonde mahogany or oak instruments for models using KRK-11B tuner unit
77739	Mask—Channel marker escutcheon light mask—tan—for maple instruments for models using KRK-11B tuner unit
73634	Nut—Speed nut for speaker mounting screws
76177	Nut—#10-32 special nut for deflection yoke hood support rods
76601	Pad—Kinescope edge support pad (4 req'd)
77732	Panel—Kinescope masking panel (light taupe) for blonde, oak or maple instruments
77731	Panel—Kinescope masking panel (mint green) for mahogany, walnut or red cherry instruments
77017	Pull—Door pull for Models 21T322, 21T322U
77794	Pull — Door pull (upper) for Models 21T323, 21T323U
77795	Pull — Door pull (lower) for Models 21T323, 21T323U
77796	Pull — Door pull (upper) for Models 21T324, 21T324U
77797	Pull — Door pull (lower) for Models 21T324, 21T324U
77746	Retainer—Safety glass retainer for sides (2 req'd)
77747	Retainer—Safety glass retainer for top or bottom
77928	Retainer—Retainer for channel selector Knob for models using KRK-12 tuner unit
76628	Rod—"L" shape threaded rod for supporting deflection yoke hood assembly
77712	Screw—#6 x ½" cross recessed pan head self-tapping screw (black) for fastening hidden controls cover and case to cabinet for mahogany, walnut or red cherry instruments
77725	Screw—#6 x ½" cross recessed pan head self-tapping screw (zinc) for fastening hidden controls cover and case to cabinet for blonde mahogany, oak or maple instruments
75623	Screw—#8-32 x ⅝" trimit head screw for door pull 77797 for Models 21T324, 21T324U
75676	Screw—#8-32 x 3/16" trimit head screw for door pull 77795 for Models 21T323, 21T323U
75626	Screw—#8-32 x 1¼" trimit head screw for door pull 77794 for Models 21T323, 21T323U
74113	Screw—#8-32 x 1" trimit head screw for door pull 77017 for Models 21T322, 21T322U and for door pull 77796 for Models 21T324, 21T324U
76632	Screw — #8 x ⅝" hex head wood screw for hanger bracket
77754	Shade—Channel marker escutcheon lamp shade for models using KRK-12 tuner unit
73643	Spring—Channel marker escutcheon spring clip for models using KRK-11B tuner unit
76630	Spring — Formed spring for kinescope masking panel
76820	Spring—Formed spring for safety glass retainers
76837	Spring—Retaining spring for knobs 77699, 77709, 77718, 77719, 77734, 77735, 77736, 77737, 77738
72845	Spring—Retaining spring for knobs 77707, 77717, 77733 for 21T300 series
30330	Spring—Retaining spring for knob 77710
74734	Spring—Retaining spring for channel markers covers 77759, 77760, 77761
77006	Spring—Retaining spring for deflection yoke hood support rod nut
77929	Spring—Formed spring for fine tuning Knob for models using KRK-12 tuner unit
72936	Stop—Cabinet door stop for Models 21T322, 21T322U, 21T323, 21T323U, 21T324, 21T324U
76600	Strap—Grounding strap (.005" soft copper)
75500	Washer—Felt washer for kinescope masking panel or back cover screws

MODEL 21TW7

MODEL 621CW7

MODEL 21CW7

ALIGNMENT PROCEDURE

NOTE: Test-socket pins are numbered like tube-sockets, i.e. counterclockwise from the keyway at the lug side of the socket.

I. Video I. F. Spot Frequency Alignment

A. Connect 3 volts bias between pins 1 and 2 of the Test-Socket, with negative lead connected to pin 2.
B. Set tuner on a low band channel which does not have a strong local station. Short the antenna input terminal. Set contrast control at maximum clockwise position.
C. Feed the output of an audio-modulated signal generator through a condenser to the tuner test point.
D. Connect the high side of an AC Voltmeter to the Test-Socket, pin no 4, and the low side of the meter to pin no. 1. If necessary, the kinescope lead may be removed.
E. Control output of the signal generator so that the reading on the AC voltmeter goes no higher than 20 volts.
F. Use the proper alignment tool--an internal male screwdriver for the coil studs, and proceed as follows:

Step Number	Signal Generator Frequency	Adjust	Remarks
1	25.7 MC	T3-Top	Adjust for maximum reading of voltmeter
2	25.7 MC	T1-Top	Same
3	23.6 MC	T2-Top	Same
4	23.6 MC	Tuner Top Slug	Same

II. Intercarrier Sound I. F. Alignment.

A. Remove the 6AL5 video detector from its socket. Set contrast control at maximum clockwise.
B. Connect the high side of the signal generator, through a condenser, to pin 7 of this tube socket. Connect the low side to the chassis. (NOTE: Pins are numbered from the lug side of the socket.)
C. Connect a DC voltmeter or VTVM to the Test-Socket, the negative lead to pin 1 and the positive lead to pin 6.
D. Set the signal generator to 4.5 MC, unmodulated, and adjust output of generator so the DC meter reads no higher than 10 volts.
E. Use proper alignment tool: one internal male tool for stud; one external male tool for K-tran Ratio Detector.

Proceed as follows:

Step Number	Signal Generator Frequency	Adjust	Remarks
5	4.5 MC	T4-Top	Adjust for maximum reading of voltmeter
6	Same	T5-Bottom	Same

F. Now disconnect voltmeter from Test-Socket, and replace with a matched pair of resistors. (NOTE: These resistors should be around 270K each, and should be connected in series between pins 6 and 1 of the test-socket.)

G. Connect the positive lead of the voltmeter to the mid-point of these resistors, and the negative lead to pin 7 of the test-socket.

H. Use 5-volt range of meter, and proceed as follows:

Step Number	Signal Generator Frequency	Adjust	Remarks
7	4.5MC	T5-Top	Adjust for zero which occurs between a maximum negative and a maximum positive feeding

III. Tuner Oscillator Alignment.

(A) Set fine-tuning in mid-position of its range.

(B) Align all twelve channels with either an "off the air" station or a monoscope modulated local transmitter.

(C) Procedure: Tune oscillator screws until 4.5 MC sound "wiggles" are just visible at all vertical edges.

CHASSIS MODELS

The following table lists current models of Douglas Chairside Control Television Receivers identifying the Tuner Chassis, Sweep Chassis, and picture tube used with each model.

MODEL	TUNER CHASSIS MODEL	*SWEEP CHASSIS MODEL	PICTURE TUBE TYPE
24-100 Mahogony	T-100	S-100	24BP4
24-100 Maple	T-100	S-100	24BP4
24-100 Blonde	T-100	S-100	24BP4
24-200 Mahogony	T-100	S-100	24BP4
24-200 Maple	T-100	S-100	24BP4
24-200 Blonde	T-100	S-100	24BP4
21-100 Mahogony	T-100	AS-100	21FP4A
21-200 Mahogony	T-100	AS-100	21FP4A

* The only difference between Sweep Chassis models S-100 and AS-100 is as follows:

1. The high-voltage lead on model S-100 is designed for a 24-inch picture tube but on model AS-100 it is made for a 21-inch picture tube.

2. The yoke assembly on model AS-100 has an additional lead which grounds the picture tube assembly.

DETAILED ALIGNMENT INSTRUCTIONS
FOR TUNER CHASSIS T-100

This procedure describes detailed Alignment Instructions for the sound i-f amplifier stages and the stagger-tuned video i-f amplifier stages. The following discussion also includes recommended methods and equipment to be used and precautions to be observed during the alignment procedure. The Alignment Chart on page 1 offers a ready reference alignment guide, to be followed after studying these more detailed Alignment Instructions.

In order to obtain satisfactory results it is recommended that alignment be performed on a metal-topped bench with a good common ground connection between all instruments and equipment. All leads should be as short as is practicable, particularly in the input and output circuits. Allow about fifteen minutes for the test equipment and receiver to warm-up before beginning the alignment. The input and output connections should be made through isolation circuits. Composition resistors (1/2-watt), and disc-type ceramic capacitors should be used in the isolation networks, so that a minimum amount of external inductance is added to the tuned circuits being adjusted.

The following equipment will be required in order to properly align the sound and video i-f stages:

1. An accurate cw signal generator (marker generator) covering the following frequencies:

20.1 mc
21.6 mc (Sound I-F)
22.1 mc
26.1 mc (Video I-F)
27.6 mc

The cw signal generator must have an attenuation control which will vary the output signal level.

2. A sweep-frequency generator with a sweep center-frequency of approximately 25.0 mc and a 10-mc sweep-width.

3. A cathode-ray oscilloscope with at least a moderately high vertical gain. It should have an external sweep input or internal sweep-frequency equal to the sweep generator sweep-frequency and capable of phase control.

4. A d-c voltmeter with sensitivity of 20,000 ohms-per-volt, or higher, and voltage scale ranges which include approximately 10 volts and 3 volts (full-scale deflection). A VTVM with zero-center scale adjustment is an ideal type.

5. A 0.005 mfd cw signal generator isolating capacitor.

6. A 10-K, 1/2-watt composition resistor and a 0.001 mfd r-f filter capacitor for the detection-isolation network.

Before alignment is begun, turn the tuner to an off-channel position by turning the channel-selector shaft so that the detent roller rests on one of the high points of the drum disc.

ORDER OF ALIGNMENT

1. Sound I-F and Ratio Detector Primary.
2. Ratio Detector secondary.
3. 21.6-mc Traps.
4. 20.1-mc Trap.
5. 27.6-mc Trap.
6. 25.9-mc 4th Video I-F Coil.
7. 25.9-mc 1st Video I-F Plate Coil.
8. 23.4-mc 3rd Video I-F Coil.
9. 22.5-mc 2nd Video I-F Coil.
10. 23.7-mc 1st Video I-F Grid Coil.
11. 23.5-mc Converter-Plate Coil.

Since there is a slight amount of interaction between stages, it is strongly recommended that the alignment procedure be followed exactly as outlined here. Steps 13 and 15, of the Alignment Chart on page 1, must be performed with special care.

NOTE

It is NOT necessary to connect either Sweep Chassis S-100 or AS-100 to the Tuner Chassis while performing this alignment procedure.

SOUND I-F ALIGNMENT

1. Connect the "hot" lead of the cw signal generator to the converter grid, pin 5, of the 6J6 in r-f tuner through a 0.005 mfd isolating capacitor. Tune the generator frequency to 21.6 mc, unmodulated. If the generator does not have a low-impedance output, it is suggested that a 1/2-watt composition resistor, of about 75 ohms resistance, be shunted across its output terminals. Connect the negative voltmeter lead in series with a 10-K isolating resistor to pin 7 of V3 (sound detector, 6AL5). It is important that the 10-K isolating resistor be at the very end of the meter lead to avoid regeneration. Connect the positive voltmeter lead to ground.

2. Adjust the primary (bottom) of T2, and L2 to obtain maximum voltmeter readings. The maximum voltage reading should be held at about 6.0 to 6.5 volts by decreasing the generator output while tuning the coils to resonance.

With the generator connected as in the preceding step and the input at the same level that produced 6.0 to 6.5 volts in the preceding step connect the voltmeter between the junction of R7 and R8 and R10, C10 and C11; polarity will depend upon which side of resonance the secondary winding of T2 is tuned. If a VTVM is being used, set the zero-voltage point up scale so that both plus and minus readings may be observed without changing the polarity selector switch on the VTVM. Start with one of the higher scales of the meter and decrease the scale setting as the null point is obtained.

3. Tune the secondary (top) of T2 for a zero reading on the voltmeter. Do not change the generator output level from that which produced the 6.0 to 6.5 volts in the first step. Repeat tuning of T2 primary and secondary until adjustments do not change.

TUNING TRAPS

1. Connect the "hot" lead of the cw signal generator to the converter grid, pin 5, of the 6J6 in the r-f tuner through a 0.005 mfd isolating capacitor. Another method of coupling is to pull the 6J6 tube shield up on the tube until it is not grounded. Clip the "hot" lead of the generator directly to the tube shield. The tube shield and tube electrodes form a capacitor which couples the signal to the mixer grid. A much higher level of generator output will be required if the latter method is utilized.

2. Connect the negative lead of the voltmeter to pin 7 of V10 (video detector, 6AL5), using the 10-K isolating resistor at the end of the lead. Connect the positive voltmeter lead to ground.

3. Turn the contrast control to its minimum position (extreme counterclockwise) for the remainder of the alignment procedure.

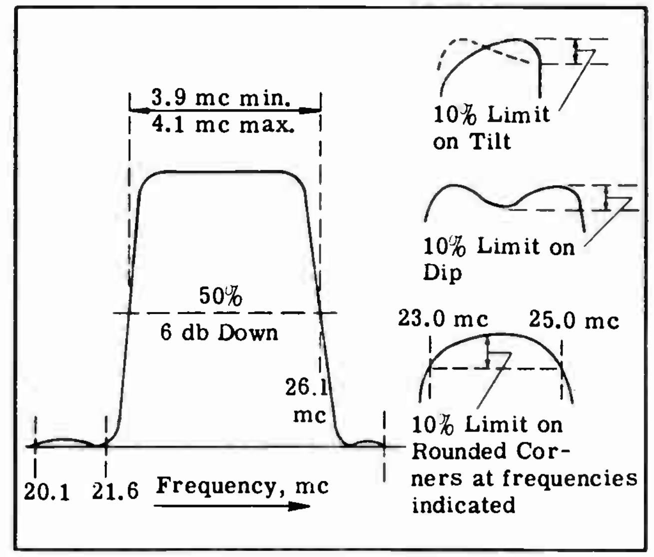
4. Tune the traps by setting the trap frequency on the cw generator and adjusting each trap slug for a minimum voltmeter reading. The order of tuning the traps is given in steps 3 through 7 in the Alignment Chart on page 1.

VIDEO I-F COILS

1. Instruments and set-up remain the same as for trap alignment during the first part of the procedure. For final adjustment the sweep-frequency generator is also used and the voltmeter is replaced by an oscilloscope.

2. Tune each i-f coil by setting the coil frequency on the cw signal generator and adjusting the coil for a maximum voltmeter reading in each case. The cw signal generator output must be attenuated so that the d-c output voltage of the video detector (indicated on the voltmeter), remains at 1-volt as the i-f coils are tuned. The order of tuning is from the last i-f stage toward the tuner. (See steps 8 through 12, page 1.) Before tuning the grid coil of the 1st i-f stage, temporarily tune the converter plate coil for a minimum voltmeter reading at 23.7 mc. After the 1st video i-f grid coil has been tuned, tune the converter plate coil to 23.5 mc and repeat the trap and i-f alignment procedure until no additional change in adjustment is necessary.

3. When no further change takes place, replace the voltmeter with the oscilloscope and replace the cw signal



Video I.F. Bandpass Curve

generator with the sweep-frequency generator. Use the same isolating capacitor and input connection to the converter grid. Loosely clip or connect the cw signal generator "hot" lead to the unshielded insulated end of the sweep-frequency generator "hot" lead. This will afford a small amount of capacitive coupling. If the cw and sweep-frequency generators are both part of the same instrument it will only be necessary to switch on the sweep-frequency generator in order to continue the procedure. Tune the sweep-frequency generator to a center frequency of approximately 25 mc. Use a sweep width of 10 mc, so that the base of both response curve shirts is well within the ends of the oscilloscope trace. Check the over-all bandwidth, position of the video carrier, dip in bandpass, and trappage by using the marker pip to locate frequency points on the response curve. (Refer to the accompanying curve.) Tune the cw signal generator to 26.1 mc. The marker pip should appear at approximately the 50% point on the curve skirt. Adjust the 1st i-f grid coil (L14) to eliminate any tilt of the response curve and adjust the converter-plate coil to set the picture carrier at the 50% response point.

4. It should not be necessary to readjust the other video i-f coils. Once the picture carrier has been correctly positioned, tune the cw signal generator so that the marker pip moves to the 50% response point on the opposite skirt. Note the frequency calibration of the cw signal generator dial and subtract this value from 26.1 mc. The difference should be between 3.9 and 4.1 mc. If the bandpass does not lie within these limits, touch up the other i-f coils until correct curve is obtained. If other coils than the converter plate coil and the 1st i-f grid coil (L14) have to be readjusted to obtain the correct bandpass it will be necessary to go back and realign the traps.

ADJUSTMENT OF CONTROLS ON SWEEP CHASSIS S-100 & AS-100

The controls on Sweep Chassis S-100 and AS-100 have been carefully adjusted at the factory. These adjustments should be checked in the customer's home by the dealer or his service representative at the time of installation or during a service call. Once adjusted correctly, these controls need not be changed over long periods of time or unless a specific service problem developes. The location of the controls is clearly marked on the front flange of the chassis below each control. The ion-trap magnet and centering magnet are located on the neck of the picture tube. The horizontal linearity control is located in the high-voltage cage and is accessable from the rear of the chassis.

ION-TRAP MAGNET

The effects produced by the orientation of the focus control, ion-trap magnet, and centering magnet are slightly interacting. Consequently one or two compensating adjustments of each control may be necessary to obtain optimum results. Set the brightness and contrast controls to about mid-range, NEVER at their maximum settings! Move the ion-trap magnet over the "flags" of the picture tube first anode. Rotate the ion-trap magnet on the picture tube neck until light appears on the screen. After the initial light has been obtained, move the ion-trap magnet back and forth and rotate it until you obtain the brightest possible picture raster.

WARNING

Final adjustment of ion-trap magnet must be made after the centering magnet has been properly adjusted.

FOCUS

The picture tube in these chassis type uses electrostatic focusing. In addition to the usual number of electrodes, the picture tube employs a focusing electrode very similar to that used by most cathode-ray tubes used in oscilloscopes. This additional focusing electrode is connected to pin six. The tube is designed for optimum focus at some fixed potential relative to its cathode, the value depending chiefly on the tube type, but there is a very slight variation of focus with several hundred volts change in focus potential. The focus control in these chassis types is a 2-megohm potentiometer connected between the B-boost voltage (approximately 600 volts) and ground. The arm of the potentiometer is connected to pin 6 of the picture tube.

With a picture on the cathode-ray tube screen, turn the focus control until the sharpest picture is obtained at the center of the picture tube.

BRIGHTNESS ADJUSTMENT

The brightness control sets the average background illumination of the picture.

1. Be sure the band switch on the tuner is in the TV position.

2. Temporarily turn the contrast control to its minimum setting (extreme counterclockwise).

3. Turn the brightness control so that a minimum usable picture is visible on the screen.

This setting produces a picture with average background characteristics at about half-contrast setting. For individual tastes that vary from this recommendation, the brightness control may be set so the picture is most pleasing to the customer.

HORIZONTAL DRIVE

Turn the horizontal-drive control counterclockwise until a drive bar (thin, light vertical line) appears near the center of the raster. Turn the control clockwise until the drive bar just disappears. If no drive bar is obtained, set control at maximum counterclockwise position.

HORIZONTAL HOLD

The horizontal-frequency control, L103, is a coarse frequency adjustment relative to the horizontal-hold control. Set the horizontal-hold control at mid-range and turn the horizontal-frequency control until vertical lines appearing near the top portion of the picture appear to be straight (no "hook"). At this setting the picture should either hold syncronization at either end of the hold control setting, or appear with an equal number of diagonal bars at either end of the hold control setting after the channel selector is switched off channel and returned to the same channel.

HORIZONTAL WIDTH

Adjust the picture width by turning the width control, L109. Clockwise rotation of control increases the width. Counterclockwise rotation produces a decrease in width.

NOTE

When adjusting the width, remember to take the line voltage into account. If the line voltage differs by more than several volts from the value usually existing when and/or where the receiver is to be operated, make allowance for the voltage difference when adjusting the width. Remember, the width increases for higher line voltages. It is usually best to adjust for a slightly wider raster, which will automatically compensate for reductions in line voltage and component aging.

HORIZONTAL LINEARITY

Turn the horizontal-linearity control, L106, for best horizontal linearity as determined with a test pattern. It may be necessary to re-set the horizontal-drive and horizontal-hold controls after the linearity adjustment has been made.

VERTICAL HOLD

The vertical-hold control has a hold-in range over which the picture will stay in vertical sync. Turn the control so the picture is brought up just into synchronization from a downward moving picture.

VERTICAL HEIGHT & VERTICAL LINEARITY

The vertical height and linearity controls operate together to adjust the vertical height and proportion the picture. The height control effects the height of the entire picture but not in a linear manner. When the height control is turned the bottom portion of the picture is expanded at a greater rate than the top portion, and the center of the picture tends to move toward the top of the tube.

Turn the height control counterclockwise to increase the height of the picture and clockwise to decrease picture height.

The vertical-linearity control affects the upper portion of the picture and compensates for non-linearity created by changes made by the height control.

Turn the vertical-linearity control clockwise to expand the upper portion of the picture and counterclockwise to compress the upper portion of the picture.

The height of the picture is effected by line voltage fluctuations in much the same manner as the width of the picture as previously described. Consequently, it is wise to adjust the picture for slightly greater height and width (approximately one inch) to compensate for possible "shrinkage" due to line voltage variations or tube and component aging.

CENTERING

It is best to adjust the picture linearity and size using a test pattern, before centering the picture. If picture tilt exists, temporarily loosen the screw at the top of the deflection yoke and rotate the yoke until the tilt is eliminated. Make certain the deflection yoke is seated as far forward on the picture tube neck as possible.

Bear in mind that picture non-linearity and poor centering are not always due to misadjustment in the receiver. Occasionally the fault originates at the transmitter. It is advisable to look at as many test patterns as are available when making receiver adjustments, and compromise the adjustment if necessary.

Raster centering is accomplished by adjusting two permanent-magnet rings that are part of a centering assembly which is placed on the neck of the picture tube just behind the yoke. The centering assembly should be positioned as near as possible to the deflection yoke. The effects produced by the two magnets are interacting, and it will be necessary to rotate both to obtain correct centering in most instances.

WARNING

Never attempt to center the picture by misadjusting the ion-trap magnet. After the picture has been properly centered the ion-trap magnet should be readjusted as previously prescribed.

4.5-MC TRAP ALIGNMENT

Detune the picture, by means of the fine-tuning control on the tuner chassis, until slight sound bars are present in the picture. Under this condition the horizontal sweep lines will have an appearence of tweed cloth. This tweed effect is the 4.5-mc beat between the video and sound carriers.

With the 4.5-mc trap, L108, slug all the way out, tune the slug in until the 4.5-mc beat just disappears or is noticeably reduced.

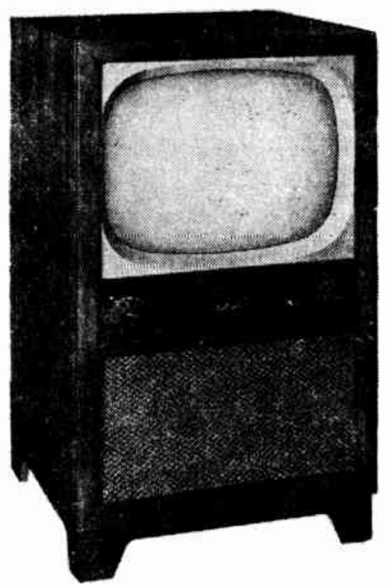
GENERAL DESCRIPTION

1184-20 television receiver is a direct view console model using a 20″ rectangular picture tube. Full twelve channel station coverage is provided by a turret type channel selector which has separate coils for each channel. A stagger tuned intermediate frequency amplifier system carries both picture and sound intermediate frequencies, using the inter-carrier sound system. Picture adjustments which are not normally made by the operator are located at the rear of the receiver chassis.

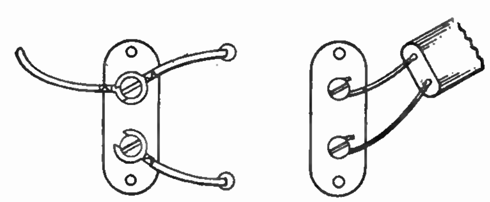


SPECIFICATIONS

Power Supply
These models operate from a 105-125 volts 50 to 60 cycle AC source. Power consumption is 210 watts.

Frequency Range
Channels 2 through 13. For specific channel frequencies, see table on page .

Antenna Equipment
This receiver has a built-in antenna system and may also be connected to an external antenna system using 300-ohm ribbon type lead-in. The receiver is shipped with the built-in antenna leads connected to the antenna terminal strip at the rear of the cabinet. If an external antenna system is to be used, the built-in antenna leads must be disconnected. When connecting the 300-ohm lead-in, either wire may be connected to either terminal, since the antenna input system is balanced.



BUILT-IN ANTENNA CONNECTIONS

ANTENNA CONNECTIONS USING 300-OHM RIBBON TYPE LEAD-IN

Fig. 1. Antenna Connections

COLOR TELEVISION

The internal wiring of the chassis covered by this RL has been modified to provide for reception of color television signals. The circuit points affected (see schematic diagram) are connected to the color adapter socket on the rear panel (see Fig. 4,).

For normal operation a plug with an insulated jumper wire connecting pins 2 and 3 is inserted into the color adapter socket.

When the color adapter made to receive color television programs, transmitted in accordance with the standards established by the FCC on October 10, 1950, is available, it can be connected to this television receiver in two simple steps: 1. Remove the plug from the color adapter socket; 2. Plug-in the color adapter at the color adapter socket.

CIRCUIT DESCRIPTION

This television receiver operates with sixteen tubes, plus one high voltage rectifier, one low voltage rectifier and a rectangular picture tube. (See list above.) There are two dual operating controls on the front panel. On the left-hand side: OFF-ON-VOLUME (outer knob) and PICTURE (inner knob); on the right-hand side: CHANNEL SELECTOR (outer knob) and FINE TUNING (inner knob).

For convenience in tracing the circuit a block diagram of the complete receiver is shown in Fig. 2.

The antenna input system is designed to operate from either the built-in antenna or from an external antenna installation.

The built-in antenna system permits satisfactory local reception in most areas. It consists of three leads. Connect them two at a time first, in various combinations; then try all three at the same time. Observe the picture quality obtained and leave the leads connected in whichever position gives the best results. The best position will vary according to local reception conditions.

This receiver is designed to operate with an external antenna installation using a 300-ohm transmission line. This transmission line connects to the same antenna terminals (at the back of the cabinet) as the built-in antenna system. When an external antenna system is used, the leads of the built-in antenna system MUST BE DISCONNECTED from the antenna terminal strip.

The received signal is fed to the input of the RF tuner. The tuner is the turret type which switches in a separate set of coils for each channel. A description of the R.F. tuner and its operation will be found in a separate section of this manual

The unity coupled, stagger tuned I.F. amplifier stages amplify both video and sound carriers. At the video detector stage the video intermediate frequencies and the 4.5 mc. beat frequency, which is the difference between the picture carrier intermediate frequency (25.75 mc.) and the sound carrier intermediate frequency (21.25 mc.), are detected and passed on to the video amplifier stage. Note that the 4.5 mc. beat still contains the FM modulation at this point.

At the video amplifier plate, the 4.5 mc. signal containing the FM carrier is taken off and fed to one stage of IF amplification before being detected at the FM detector stage. The audio frequency signal is then fed through one stage of voltage amplification to the power output stage and speaker.

The video amplifier plate also carries the video signal which is fed to the cathode of the picture tube.

Automatic gain control voltage is obtained from the rectified diode current flowing in the AGC detector stage (pins 6 and 7, V7). This negative voltage which is a function of signal level is applied to the grid of the RF amplifier in the tuner and to the first and second IF amplifier stages to control the over-all gain over large variations in received signal levels.

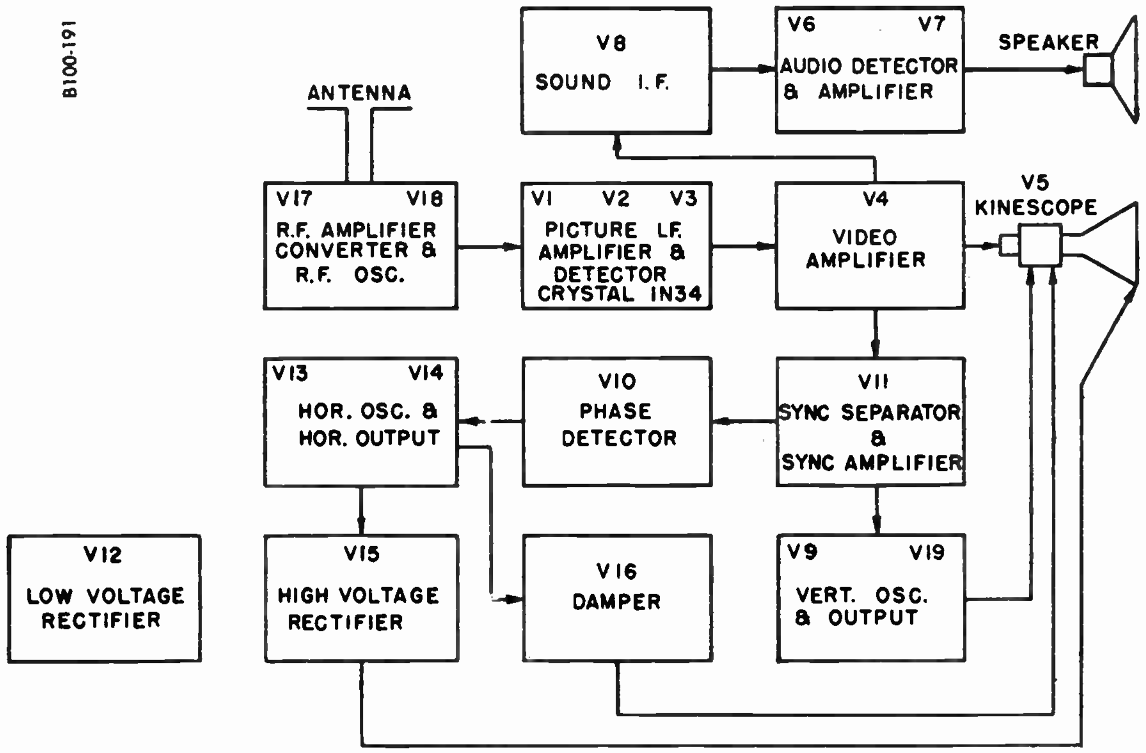


Fig. 2. Circuit Block Diagram

The synchronizing pulses transmitted by the TV station are carried along through the IF amplifier, video detector and video amplifier stage and they are separated from the video signal by the sync separator and DC restorer (right half of 12AU7-V11). The grid and cathode form a diode that clips the sync signal from the composite signal. The voltage developed across the resistor connected between cathode (pin 3, V11) and ground is a function of the average applied signal and thus provides the required DC restoration. A small positive voltage is applied to the plate of this tube. During conduction, electrons are first drawn to the plate because it is positive with respect to the grid until its voltage drops to approximately that of the grid. At this point the excess electrons go to the grid thus holding the plate to approximately zero potential. This clips the sync on the other side and prevents noise pulses from exceeding the peak amplitude of the sync signal.

The left half of the 12AU7 tube (V11) is used to amplify and reverse the phase of the vertical sync pulses that are taken from the plate in positive phase and fed through an integrating network to the vertical sweep oscillator.

The horizontal pulses are also taken from the plate and cathode in both positive and negative form of equal amplitude and fed to the horizontal phase detector.

A 6AL5 tube is used as a phase detector to compare the phase of the horizontal sync pulses with the phase of the saw tooth voltage derived from the pulses across the secondary of the horizontal output transformer. The D.C. voltage developed by the difference in phase of the above two pulses is used to control the frequency of the horizontal oscillator.

A 6SN7 tube is used as a Horizontal oscillator. The output of the oscillator which is a sawtooth with a peaking component is fed to the grid of a 6BG6 Horizontal output tube.

The horizontal output stage is coupled to the horizontal deflection coils of the picture tube by the horizontal output transformer. The output transformer serves the dual purpose of matching the output of V14 (6BG6) to the horizontal deflection coils of the picture tube and supplying high voltage for the second anode potential required by the picture tube.

When each horizontal sweep line is completed, the sweep voltage in the primary of T9 drops. The collapsing magnetic field thus produced generates a voltage of T9 which is stepped up by autotransformer action by the upper part of the primary winding (the section between the blue and red leads). This high voltage is rectified by V15 (1B3) and applied to the high voltage anode of the picture tube. V15 also receives its filament voltage from a secondary winding on T9.

The vertical sync pulses taken from the plate of V11 are fed to the Vertical oscillator (right half of V9) through the blocking transformer T6. The blocking oscillator is tripped by the incoming sync signal. The oscillator is brought into sync by adjusting the grid resistor R42 (V. Hold). The left half of this tube is the vertical amplifier. The height control in the plate circuit of this tube varies the amplitude of the signal by changing the load resistance. The signal is then fed to the Vertical output tube. Vertical linearity is controlled in this stage by adjusting the bias on the vertical sweep output tube. The plate of the vertical output tube is connected to a transformer which in turn is connected to the vertical coils in the yoke and provides them with a saw tooth current.

Focusing is accomplished magnetically by an electro-magnet. The load current of the receiver flows through the focusing control and focus coil winding so that the amount of focus coil current is controlled by the setting of the focus control.

FUSE PROTECTION

There are two fuses in this receiver. The 5 ampere fuse on the primary side of the power transformer protects the power transformer and associated components against damage from overload. For example, if either C42 or C43 should short circuit, the overload on the 5U4G rectifier tube and the power transformer would destroy both components. However, such a short circuit will blow the fuse before any damage is done. The 1/8 ampere fuse in the B plus lead to T9 protects that transformer and associated tubes from injury in case of overload caused by a short circuit. If either fuse blows, the circuit should be examined to determine the cause and correct it before inserting a new fuse.

CAUTION

HIGH VOLTAGES are used in the operation of this receiver. The back cover, while in place, prevents accidental contact with this voltage and therefore should not be removed by anyone except a qualified television serviceman.

THE HIGH VOLTAGE LEAD, which supplies 12 to 16 kilovolts to the picture tube, should be momentarily shorted to the chassis whenever it is disconnected for service purposes. This discharges the high voltage filter condenser and prevents a shock hazard when working on the receiver after it has been turned off.

THE PICTURE TUBE is highly evacuated and if broken, glass fragments will be violently expelled. Scratching, chipping, undue pressure, or careless handling such as lifting the tube by its neck is dangerous and should be avoided. If it is necessary to handle the picture tube, use safety goggles and heavy gloves. Be sure to discharge the voltage developed across the capacitor formed by the inner and outer coating of the picture tube. This can be done by connecting the high voltage socket on the tube to the outer coating.

PICTURE TUBE INSTALLATION

DISMANTLING

Remove the two front panel control knobs by pulling them straight from their shafts. They are dual control knobs and must be removed in two pieces, removing the outer unit first.

Remove the back cover, speaker plug and antenna leads.

Remove the four chassis bolts holding the receiver chassis in the cabinet and slide the entire assembly from the cabinet.

REMOVING THE PICTURE TUBE

READ ALL WARNING NOTICES.

Disconnect the picture tube socket at the base of the picture tube.

Slip the ion trap from the neck of the picture tube past the picture tube base connector.

Remove the rubber sleeve around the neck of the tube under the focus coil.

Loosen the three thumb screws on the yoke mounting.

Remove the steel band at the front rim of the picture tube and carefully slip the neck of the picture tube out of the focus coil and deflection yoke. If the tube fails to slip out smoothly, investigate and remove the cause of the trouble. **DO NOT USE FORCE.**

INSTALLING THE PICTURE TUBE

Position the tube so that the anode contact is to the left as viewed from the screen.

Slip the neck of the picture tube through the deflection yoke and focus coil. The flare of the tube should seat firmly against the rubber guard on the yoke mounting. The front edge of the tube should be against the turned-up edge of the front support brackets. If the tube fails to slip smoothly into place, investigate and remove the cause of the trouble. **DO NOT FORCE THE TUBE.**

Temporarily tighten the two outside thumb screws on the yoke mounting so that the yoke mounting is held in position with the rubber guards against the flare of the tube.

Replace the rubber sleeve on the neck of the tube under the focus coil.

Slip the ion trap over the neck of the tube. The arrow points toward the screen of the tube.

Reconnect the picture tube socket and anode connector.

Check the grounding springs mounted on the chassis under the tube. Be sure that they are making contact with the outside coating of the tube.

Make the adjustments outlined under "Television Service Adjustments" before reassembling the chassis in the cabinet.

TELEVISION SERVICE ADJUSTMENTS

HIGH VOLTAGE WARNING

Operation of this receiver outside the cabinet or with covers removed involves a shock hazard from the receiver power supplies. Work on the receiver should not be attempted by personnel not thoroughly familiar with the precautions necessary when working on high-voltage equipment. Do not operate the television receiver with its compartment cover removed.

ION TRAP MAGNET ADJUSTMENT

If the ion trap has an arrow stamped on its frame, the arrow should point toward the picture tube screen and approximately in line with the second anode contact. Turn the brightness control clockwise and start with the ion trap placed over the small ion trap flags in the picture tube. The ion trap flags are small, rectangular plates in the neck of the picture tube about one inch from the base of the tube. The new "bent gun" tubes do not have ion trap flags. The single magnet ion trap is intended for use with such tubes.

Starting from this position, adjust the trap by moving it forward or backward until the raster (Illuminated area of picture tube) is observed. Rotate it slightly about the axis of the tube as well as back and forth along the neck of the tube until the raster is the brightest. Back off the brightness control adjustment as required. With the brightness control set for slightly above average brilliance, adjust the focus control until the line structure of the raster is clearly visible. Readjust the ion trap for maximum raster brilliance. The final touches on this adjustment should be made with the brightness control at the maximum position with which good line focus can be maintained.

DEFLECTION YOKE ADJUSTMENT

If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Push the yoke as far forward toward the tube flare as possible. Tighten the yoke adjustment screw.

PICTURE ADJUSTMENTS

A test pattern picture will be required to make the following adjustments. Normal picture contrast and brightness should be maintained during the adjustment for best results.

FOCUS COIL ADJUSTMENT

If a corner of the raster is shadowed, it indicates that the electron beam is striking the neck of the tube. Adjust the three focus coil adjustment screws for a centered evenly illuminated test pattern. Corner-cutting or shadows at the corners may be caused by misadjustment of either the ion trap magnet or the focus coil, and the two may require simultaneous adjustment to secure the brightest, yet evenly distributed light on the screen. Four self-tapping screws on the focus coil U-bracket are provided to permit vertical movement of the focus coil when necessary.

CAUTION: While adjusting the focus coil, make sure that there is no strain exerted by the focus coil on the neck of the picture tube.

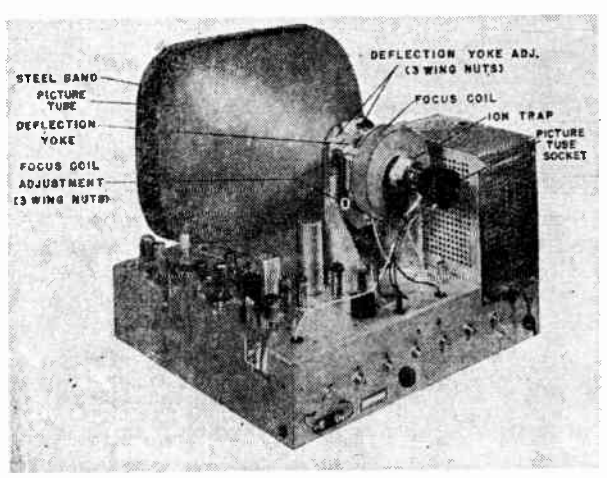

Fig. 3. Picture Tube Mounting Detail

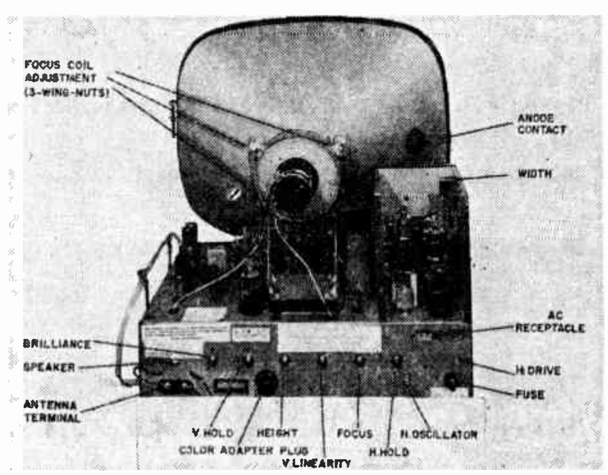

Fig. 4. Rear Chassis View

HORIZONTAL OSCILLATOR ALIGNMENT

If the horizontal hold control fails to restore sync. the horizontal oscillator adjustment should be reset. To re set this screwdriver adjustment (see Fig. 4,) set the horizontal hold control in the center of its range and sync. the picture with the adjustment screw. Check the control action on various stations and alter the screw adjustment as required to provide positive sync. on all channels with these two controls.

HORIZONTAL DRIVE ADJUSTMENT

Adjust the HORIZONTAL DRIVE control counter clockwise (Fig. 4,). as far as possible without causing fold over of the test pattern. (Vertical white line). Insufficient horizontal drive will cause low second anode voltage with consequent loss of picture brilliance. After this adjustment is completed a minor readjustment of the horizontal oscillator may be required.

HORIZONTAL LINEARITY ADJUSTMENT

Set the HORIZONTAL LINEARITY control (see L13, Fig. 13,) for a symmetrical pattern from left to right.

WIDTH ADJUSTMENT

Set the WIDTH control (Fig. 4,) so that the test pattern fits the horizontal dimension of the picture tube escutcheon.

HEIGHT ADJUSTMENT

Set the HEIGHT control (Fig. 4,) so that the test pattern fits the vertical dimension of the picture tube escutcheon. A minor adjustment of the focus coil position may be required to recenter the pattern.

VERTICAL LINEARITY ADJUSTMENT

Set the VERTICAL LINEARITY control (Fig. 4) for a symmetrical test pattern in the vertical dimension. A slight readjustment of the height control may be required when making this adjustment.

FOCUS

Carefully adjust the receiver for best picture definition and set the picture and brightness controls for normal picture brilliance. Adjust the FOCUS control (Fig. 4,) for maximum picture definition watching the wedges of the test pattern. An alternate method for focusing consists of switching to an unused TV channel and with the brightness control turned up so that the raster is illuminated, set the focus control for well defined scanning lines.

TELEVISION ALIGNMENT PROCEDURE

PRELIMINARY

This alignment is an exacting procedure and should be undertaken only when necessary. Before fully deciding that alignment is necessary and before removing the chassis from the customer's home:

1. Be sure of the antenna installation.
2. Check all operating controls and adjustments including the channel selector.
3. Check reception on all channels.
4. Check tubes by substitution of known good tubes.

In the repair shop.

5. Substitute a known good picture tube.
6. If the picture is still inadequate, observe the overall IF response curve of the receiver. (See Fig. 5).

TEST EQUIPMENT REQUIRED

1. Signal generator (with an output variable and at least 0.1 volt max.) to provide the following frequencies:

   (a) 4.5 mc Sound IF
   (b) 21.25 mc Trap (L14)
   (c) 22.8 mc 1st IF (L15)
   (d) 25.6 mc 2nd IF (T1)
   (e) 23.3 mc 3rd IF (T2)
   (f) 24.6 mc 4th IF (T3)

2. R.F. Sweep Generator with a frequency range from 40 to 220 megacycles with a sweep width of 10 megacycles and an adjustable output of at least 0.1 volts.
3. Crystal controlled or crystal calibrated markers for the sound carrier of each channel. Picture carrier markers are desirable but not necessary.
4. Cathode ray oscilloscope, preferably with a wide band vertical amplifier and an input calibrating source.
5. Vacuum tube voltmeter (VTVM).

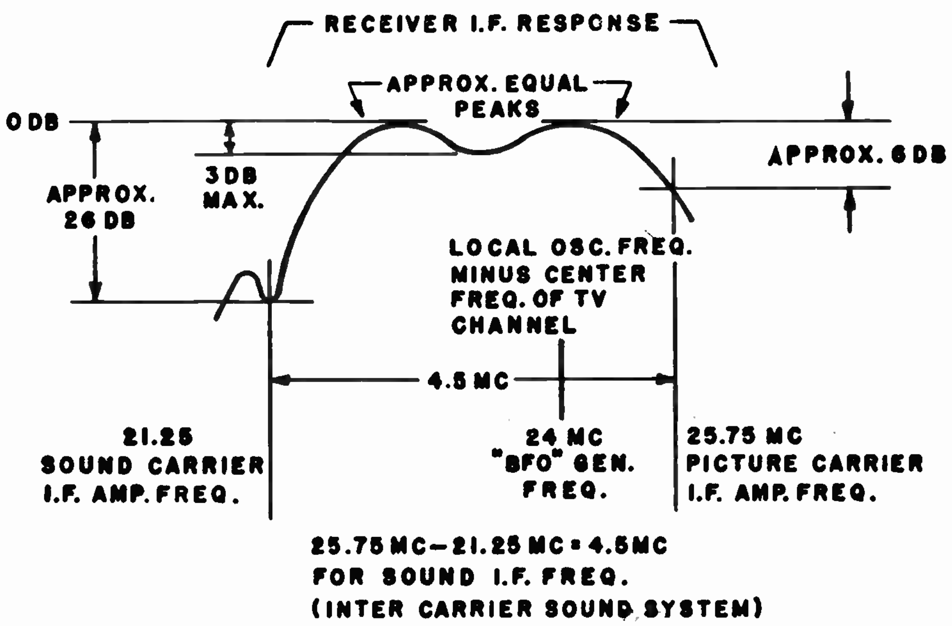

Fig. 5. I.F. Amplifier Response

ALIGNMENT TABLE

DISCRIMINATOR AND SOUND I-F ALIGNMENT

Step No.	Connect Signal Generator to	Signal Gen. Freq. Mc.	Connect Voltmeter to	Miscellaneous Connections and Instructions	Adjust
1	Video Grid (pin 1, V-4)	4.5 .1 volt output	Pin 2 V-7	Meter on 10 Volt scale	T4 (bottom) and L6 for max. on meter. L7 for min.
2	Video Grid (pin 1, V-4)	4.5 .1 volt output	See Note 1	Meter on 3 volt scale	T4 (top) for zero on meter

NOTE 1: Connect two 100 K resistors in series. Connect one end to pin 2 of V-7 (6T8) and the other end to ground. Connect the hot side of the VTVM to center of the two 100 K resistors and ground side to junction of R29 (150 ohms) and R28 (47K ohms).

R. F. TUNER

DESCRIPTION

The R. F. Tuner is a separate sub-chassis of the receiver. On this sub-chassis are located the R.F. amplifier, R.F. converter, R.F. oscillator, fine tuning control, channel drum, sound channel trap, converter transformer, and all R.F., converter, and oscillator adjustments. This tuner operates on all the television channels number two thru number thirteen. Its function is to select the desired picture and sound carriers, amplify and convert to the proper I.F. frequency. See Fig. 14.

TUBE COMPLEMENT

No.	Tube	Function
V17	6AG5 or 6BC5	R.F. Amplifier
V18	6J6	Converter and Oscillator

R.F. AMPLIFIER — CONVERTER

Referring to the Schematic diagram L20 is the center tapped primary coil inductively coupled, (by being wound on the same form) to L19. L19 is the grid coil of V17. It is series tuned to the desired channel by C59 fixed condenser and C65 variable condenser. It is also shunt tuned by the input capacitance of V17. The band-pass response of L19 is increased by shunting it with a 3900 ohm resistor R76.

In the plate circuit of the R.F. amplifier there is a coil L18 that is shunt tuned by the output capacitance of the tube and the variable capacitor C60. This coil is tuned to the same frequency as L19 and its band-pass is broadened by the 10,000 ohm shunt resistor R77.

The coil L18 is inductively coupled (by being wound on the same form) to coil L17 in the grid of the converter tube. Coil L17 is shunt tuned to the same frequency as L18 by the input capacitance of V18 and by the variable capacitor C61.

OSCILLATOR

The oscillator coil L16 is inductively coupled to L17 (by being wound on the same form). This provides the proper injection voltage. The coil is series tuned to its proper frequency by means of the variable capacitor C62 shunted by the fine tuning capacitor C63. The coil is also shunt tuned by the fixed capacitor C64 and its inductance is varied by means of an adjustable brass core.

BAND SWITCHING

This tuner is switched from channel to channel by means of a rotating drum. This provides a different set of coils, L16, L17, L18, L19 and L20 for each channel. The oscillator tuning coil (L16) for each channel is individually tuned by its brass core. This is indicated on the schematic diagram by the arrow through L16. The other coils (L17, L18, L19 and L20) for each channel are fixed inductances. For each channel, these fixed inductances are tuned to the proper frequency by capacitors C59, C60, C61, C65 and the tube and wiring capacitances, as explained above. Since each set of coils must tune to its proper frequency in conjunction with only one set of tuning capacitances, the coil inductances must be very accurately adjusted at the factory. For this reason, it is important that the coils be handled with great care. When working on the tuner, do not do anything which will disturb these coils or change their inductance.

TUNER ALIGNMENT PROCEDURE

Before attempting to align the R.F. tuner it is necessary that the I.F. amplifier be correctly aligned. It is desirable that all adjustments of the trimmers be made at channel No. 12. To align the tuner proceed as follows:—

(1) Connect an R.F. sweep generator to the antenna terminals

(2) If the generator is not provided with internal crystal controlled or crystal calibrated markers connect a marker generator to the antenna terminals.

(3) Connect a Cathode Ray Oscilloscope across the picture detector diode load resistor R13. (8200 ohms)

(4) Adjust the R.F. generator for a 10MC. sweep width with a center frequency at approximately 207MC.

(5) Adjust the marker generator for the sound carrier of channel 12 (209.75 MC.).

(6) Set the range switch to channel 12 with the fine tuning in the middle of its range.

(7) Set the PICTURE control for one volt measured from pin "7" to chassis. (V4-6AC7).

(8) Turn the receiver on and allow it about 15 minutes for the receiver to warm up and stabilize.

(9) Align C65, C60 and C61 for a curve similar to that shown in FIGURE 7.

(10) Adjust C62 until the sound carrier marker is at the base of the curve.

(11) Change the Station selector to the various channels and using the correct setting of the R.F. generator to center it in the channel and the correct marker frequency for the sound carrier, adjust the brass core in L16 so that the sound marker will be in the correct position on the curve. FIGURE 7.

NOTE: Each core is independent of the one in another channel. This enables you to adjust any channel without changing the adjustment of all other channels.

(12) This completes the alignment of the R.F. tuner with the exception of the converter transformer and sound channel trap which you have aligned when you aligned the I.F.

Channel No.	Channel Frequency	Sound Carrier
2	54 - 60	59.75
3	60 - 66	65.75
4	66 - 72	71.75
5	76 - 82	81.75
6	82 - 88	87.75
7	174 - 180	179.75
8	180 - 186	185.75
9	186 - 192	191.75
10	192 - 198	197.75
11	198 - 204	203.75
12	204 - 210	209.75
13	210 - 216	215.75

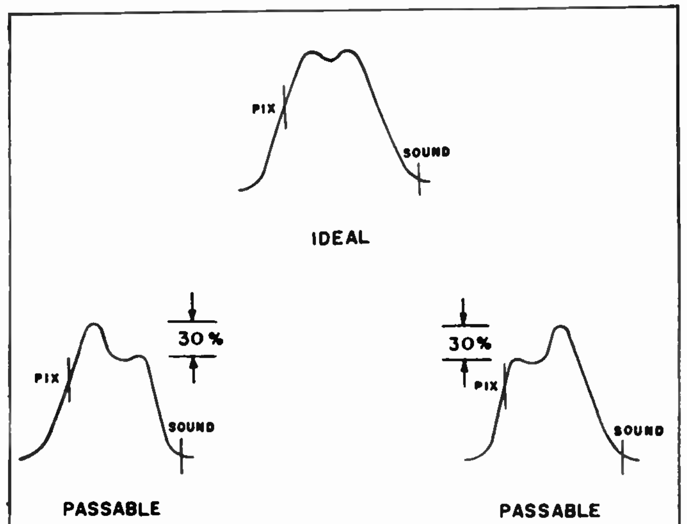

Fig. 7. Overall Response—Antenna to Picture Detector

SERVICE NOTES

READJUSTMENT OF R.F. OSCILLATOR WITHOUT EQUIPMENT

(1) Tune the receiver to the channel you wish to align.

(2) Turn the fine tuning control to the center position.

(3) Adjust the oscillator brass core, located in the hole on the upper right side of the front of the tuner chassis, for the best picture.

(4) Proceed to the next channel you wish to adjust and repeat the operation above, etc. Each adjustment is independent so that you may adjust any one or all channels as desired.

CHANGING TUBES

Due to the high frequencies at which the receiver operates the adjustments are critical and may be affected by a tube change. In replacement, if an old tube can be matched for frequency by trying several new ones, this practice is recommended. At best, however, it will probably be necessary to adjust the oscillator slug for each active channel, when changing the oscillator tube.

REMOVING BOTTOM COVER OF TUNER

The R.F. Tuner used with this receiver has a bottom cover plate. The cover plate is attached to the tuner at the rear by means of two tabs which fit into slots in the back apron of the tuner. At the front it is held in place by two screws which fasten to threaded holes in the front apron of the tuner. To take off the bottom cover, remove the two screws securing it at the front, pull down slightly at the front, then slide the cover backward to disengage the tabs and the cover will come off. It is not necessary to remove the tuner from the chassis to take the bottom cover off. To facilitate removal, two screwdriver access holes have been provided in the front apron of the receiver chassis. Insert a screwdriver through these holes to remove the screws at the front. It is, of course, necessary to remove the "V-shaped" shaft supporting bracket first. It is fastened to the chassis by means of two self-tapping screws.

Unfortunately the utility of the screwdriver access holes was not realized at the beginning of production and some chassis were made without them. It is suggested that servicemen in the field will find it more practical to drill the holes in such chassis than to remove the tuner from the chassis (each time the tuner is serviced) in order to get the bottom cover off. Therefore, the data for the location of the holes is given in Fig. 9.

The third hole shown in Fig. 9 (at the top) permits removal of the screw which holds the Fine Tuning ground plate in place.

The tuners used in later production do not use screws at the front to fasten the bottom cover. Instead, two dimples (or detent bumps) are stamped into the bottom cover at the same position that the screw holes occupy in the earlier model tuners. These dimples engage matching holes in the front apron of the tuner chassis. To remove this type of bottom cover, press down on the front edge with a screwdriver until the dimples are disengaged. Otherwise, removal is the same as before.

REMOVING CHANNEL COIL UNITS

To remove a channel coil unit insert a screwdriver blade between the coil retainer spring (on the outside end of each unit) and the turret plate. Twist the blade away from the turret and lift the end of the coil upward and remove. Do not lift the spring any more than is necessary.

OSCILLATOR SLUG IN TOO FAR

If the oscillator slug is tuned in too far it will become disengaged with its retaining spring and fall into the coil. To correct this condition proceed as follows:—

(1) Remove the channel coil unit as described above.

(2) Move the slug retaining spring to one side.

(3) Tap the coil assembly until the slug slips forward.

(4) Set the slug retaining spring into position. It should rest firmly against the slug.

(5) Replace the channel coil unit.

REMOVING THE TURRET ASSEMBLY

To remove the turret assembly proceed as follows:—

(1) Remove the screw holding the fine tuning control grounded stator plate.

(2) Slide the fine tuning rotor, spring, and bushing from the turret shaft.

(3) Remove the shaft retainer spring from the front and rear of the tuner.

(4) Grasp the turret shaft and slip the turret from the tuner chassis being careful not to loosen the detent roller.

(5) Reassemble by reversing the above operations.

RESETTING THE DETENT SPRING

(1) Loosen the detent mounting screw.

(2) Grasp the turret and the roller end of the detent spring while observing the contacts on the contact plate. Rotate the drum slightly in both directions until a point is reached where the contacts appear to have the greatest rise.

(3) Check to see that the detent roller is setting in the center of the depression in the turret detent plate.

(4) Tighten the detent spring mounting screw.

(5) Rotate the turret and check the contacts on all channels.

TUBE VOLTAGES

All voltages are measured with a D.C. Vacuum Tube Voltmeter and with the PICTURE Control and BRIGHTNESS Control in the minimum position, unless otherwise specified. No incoming signals are being received at the time the measurements are being made. The following voltages were taken on a production receiver with 117 volts 60 cycle AC input. A variation of 10% in the voltages should be considered normal.

Tube No.	Tube Type	Function	Element	Pin No.	Voltage	Notes
V17	6AG5	R.F.	Plate	5	140	
	or	Amplifier	Screen	6	140	
	6BC5		Grid	1	-.8	
			Cathode	2	0	
V18	½ 6J6	Converter	Plate	2	100	The cathode is common to
			Grid	5	-1.5	both the converter and
			Cathode	7	0	oscillator
	½ 6J6	Oscillator	Plate	1	100	
			Grid	6	-2

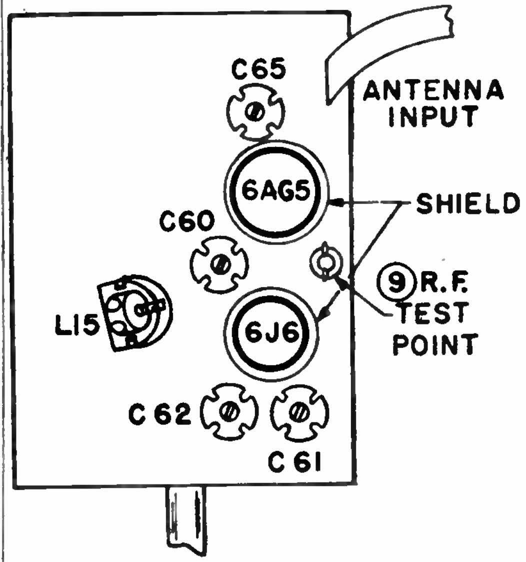
V19	Vertical Output	6S4	Inf.	1K	2 M	0	0	2 M	Inf.	Inf.	510K

Conditions: 1. All readings taken with a vacuum tube voltmeter. 3. Switch OFF; line cord disconnected.
2. All controls at "normal" setting. 4. All tubes left in sockets.

*These tube pins do not have a DC path to ground, therefore there is no resistance reading given. With the circuit in normal operating condition (i.e. no shorts, no open circuits), the ohmmeter will give a gradually increasing reading because the battery in the ohmmeter is charging up the condensers in the circuit. If the ohmmeter is left connected long enough, it will eventually give a reading which is the leakage resistance of all the condensers. The foregoing reading would be correct, of course, only if the ohmmeter is connected in the current polarity with respect to any electrolytic condensers in the circuit. If the ohmmeter *immediately* gives a definite resistance reading (either infinite resistance or zero or very low resistance), it is an indication of an open circuit (infinite resistance) or of a short circuit (very low resistance).



See chassis voltage chart.

SERVICE SUGGESTIONS

NO RASTER ON PICTURE TUBE—If raster cannot be obtained, check below for possible causes.

1. Ion trap magnet adjustment is incorrect.
2. Check 1/8 amp. fuse in plate circuit of V14.
3. No high voltage—check V14 (6BG6) and V15 (1B3-GT) tubes and circuits. If the horizontal deflection circuits are operating as evidenced by the correct waveform measured on terminal 1 of horizontal output transformer (T9), the trouble can be isolated to the high voltage rectifier circuit (V15). Either the high voltage winding (between red and blue leads) on T9 is open, tube V15 is defective or its filament circuit is open.
4. Damper tube V16 (6W4) defective. Plate voltage supply for V14 (6BG6) horizontal output tube is obtained through the damper tube. Check tube and heater winding on power transformer (T7).
5. Defective picture tube. Heater open, cathode return circuit open.
6. No plate voltage. Electrolytic capacitor shorted. All B voltages are accessible for measurement underneath the chassis.

HORIZONTAL DEFLECTION ONLY — If only horizontal deflection is obtained as evidenced by a straight line across the face of the picture tube, it can be caused by the following:

1. Vertical oscillator V9 (6SN7-GT) inoperative. Check voltages on grid and plate.
2. Vertical output transformer (T5) open.
3. Yoke vertical coils (L7) open.
4. Vertical blocking transformer (T6) open or shorted.
5. Vertical output tube V19 (6S4) defective.

POOR VERTICAL LINEARITY—If adjustment of the vertical height and linearity controls will not correct this condition, any of the following may be the cause:

1. Vertical output transformer (T5), capacitors C30, C31, C32, or resistor R38.
2. V9 (6SN7GT) defective; check voltages.
3. Low plate and bias voltages. Check rectifier tube and capacitors in B supply.

POOR HORIZONTAL LINEARITY—Check the following:

1. V14 (6BG6) screen voltage.
2. Horizontal drive (C56) for incorrect adjustment.
3. Horizontal output tube V14 (6BG6).
4. Damper tube V16 (6W4).

TRAPEZOIDAL OR NON-SYMMETRICAL RASTER—Check for:

1. Improper adjustment of focus coil or ion trap magnet.
2. Defective yoke.

WRINKLES ON LEFT SIDE OF RASTER—This condition can be caused by incorrect adjustment of the horizontal drive C56.

SMALL RASTER—This condition can be caused by:

1. Low B or line voltage.
2. Insufficient output from horizontal output tube V14 (6BG6). Replace tube.
3. Insufficient output from vertical output tube V19 (6S4) or V9 (6SN7GT). Replace tube.

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND—This condition can be caused by:

1. No signal on picture tube cathode. Check for open coupling condenser C13.
2. Bad contact to picture tube or lead to socket broken.

SIGNAL APPEARS ON PICTURE TUBE CATHODE BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE HORIZONTALLY AND VERTICALLY—A condition of this nature can be caused by:

1. Defective sync limiter V11 (12AU7) or phase detector V10 (6AL5).
2. If tubes are O.K. check voltages and associated circuits.

SIGNAL ON PICTURE TUBE CATHODE AND HORIZONTAL SYNC ONLY—Check:

1. Vertical integrating network capacitors C31, C34, C35, and resistors R44, R45, R46.

PICTURE STABLE BUT WITH POOR RESOLUTION—If the picture resolution is not up to standard, it may be caused by any of the following:

1. Defective picture detector (crystal 1N34) or video amplifier V4 (6AC7).
2. Open video peaking coil. Check coils L1, L2, L3, L4 and L5 for continuity. Note that L3 and L5 have shunting resistors. L4 is 4.5 MC trap.
3. Leakage in V4 (6AC7) grid capacitor C11, or C13 on V5 (picture tube).

If the above components are not found to be defective, check the following:

A. Check all potentials in video circuits.
B. Check the picture tube grid for poor or dirty contacts.
C. Check adjustment of focus control R58. It should be effective on either side of proper focus.
D. Check and re-align if necessary, the picture I.F. and the local oscillator.
E. Check for proper coils in turret switch.

PICTURE SMEAR:

1. Normally, smear can be attributed to phase shift at the low frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits.
2. This trouble can also originate at the transmitter. Check reception from another station.

PICTURE JITTER:

1. Vertical instability may be due to loose connections or noise received with the signal.
2. Horizontal instability may be due to unstable transmitted sync or to noise.

TELEVISION RECEIVER

ALTERNATE TUBES FOR VIDEO AMPLIFIER STAGE

The 6AC7 Video Amplifier tube (V4) may be replaced by either a 6AH6 or a 6CB6. When either tube substitution is made, coils L3 and L5 must be changed as well as the socket and the socket wiring. When the 6CB6 is used, resistor R15 must be changed in addition to the coils.

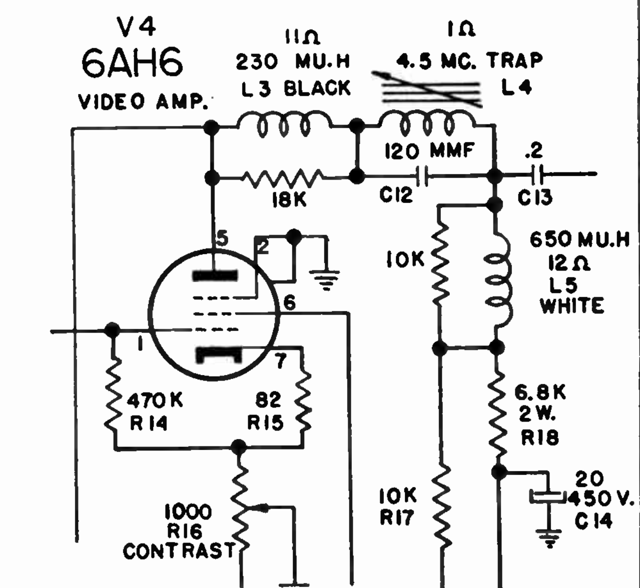
SUBSTITUTION OF THE 6AH6

REMOVE:

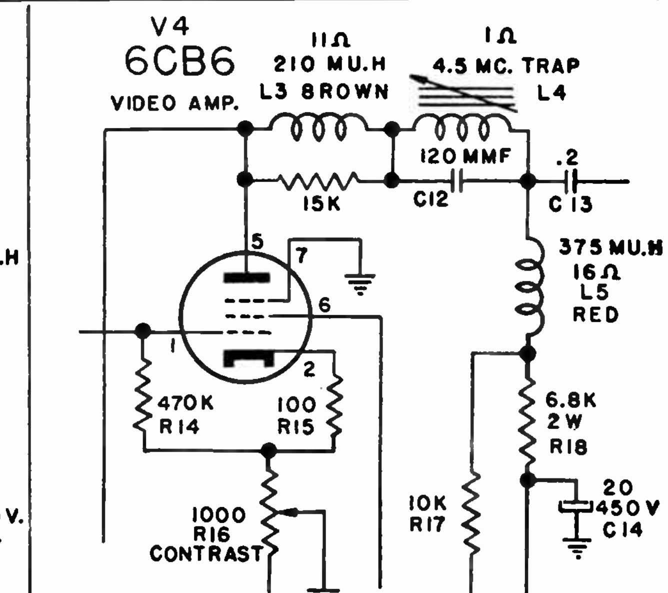
L3	10-566	Coil, peaking, 186 uh (gray) (on 12K resistor)
L5	10-565	Coil, peaking, 380 uh (purple) (on 10K resistor)

ADD:

L3	10-559	Coil, peaking, 230 uh (black) (on 18K resistor)
L5	10-548	Coil, peaking, 650 uh (white) (on 10K resistor)
	68-49	Socket, miniature, 7 pin



A100-288



A100-207

SUBSTITUTION OF THE 6CB6

REMOVE:

L3	10-566	Coil, peaking, 186 uh (gray) (on 12K resistor)
L5	10-565	Coil, peaking, 380 uh (purple) (on 10K resistor)
R15	60-776	Resistor, carbon, 82 ohm, ½ w. 10%
	68-18	Socket, octal

ADD:

L3	10-567	Coil, peaking, 210 uh (brown) (on 15K resistor)
L5	10-558	Coil, peaking, 375 uh (red)
R15	60-752	Resistor, carbon, 100 ohm, ½ w. 10%
	68-49	Socket, miniature, 7 pin

ALTERNATE TUBES FOR THE No. 3 I. F. STAGE

The 6CB6 I.F. Amplifier Tube may be replaced by a 6AG5 or 6BC5. When this substitution is made, the ground connection on pin 7 of the socket will be removed.

HOW TO ORDER REPAIR PARTS

1. Use Correct Order Form.
2. On the Purchase Order always give the following information:
   (1) PART NUMBER (number printed on the part if differeot from that shown in this list) and DESCRIPTION for each part ordered. When no part number is assigned, order by description and rating. Also give PRICE of part (indicate if no selling).
   (2) The CHASSIS NUMBER, which is 528.631 is found on a metal plate at the rear of the chassis.

REPAIR PARTS & PRICE LIST

Ref. Number	Part Number	Description
		CAPACITORS
C1, C2, C4, C5, C7, C8, C20, C21, C24	T16-177	Capacitor, ceramic; 5000 mmfd.
C3, C16	T16-188	Capacitor, tubular; .2-400 v. 85°C
C6, C26; C42, C43, C44, C49	T18-295	Capacitor, electrolytic; 100 mfd. 200 v. 40-40 mfd. 450 v.
C9	T15-196	Capacitor, ceramic; 100 mmfd.
C10	T15-223	Capacitor, ceramic; 10 mmfd.
C11, C39	T16-189	Capacitor, tubular; .05-400 v. 85°C
C12		Part of L4—capacitor, ceramic; 120 mmfd.
C13	T16-212	Capacitor, tubular; .2-600 v. 85°C
C14	T18-276	Capacitor, electrolytic; 20 mfd. 450 v.
C15	T18-299	Capacitor, electrolytic; 40 mfd. 250 v.
C17, C35	T16-198	Capacitor, tubular; .002-600 v. 85°C.
C18, C40	T18-292	Capacitor, electrolytic; 4 mfd. 50 v.
C19	T15-200	Capacitor, mica; 470 mmfd.
C22	T15-228	Capacitor, ceramic; 2000 mmfd.
C23	T15-230	Capacitor, mica; 220 mmfd.
C25	T15-222	Capacitor, ceramic; 5 mmfd.
C27	T16-218	Capacitor, molded tubular; .22-600 v.
C28, C50	T16-208	Capacitor, tubular; .1-600 v. 85°C
C29, C32	T16-193	Capacitor, tubular; .05-600 v. 85°C
C30	T16-220	Capacitor, molded tubular; .0047-600 v.
C31, C34	T16-209	Capacitor, tubular; .006-600 v. 85°C
C33	T16-190	Capacitor, tubular; .005-600 v. 85°C
C36, C37	T15-220	Capacitor, ceramic; 1000 mmfd.
C38, C45	T16-201	Capacitor, tubular; .01-600 v. 85°C
C41	T15-210	Capacitor, ceramic; 33 mmfd.
C46	T15-226	Capacitor, silver mica; 330 mmfd.
C47, C48	T15-231	Capacitor, mica; 390 mmfd.
C51	T16-219	Capacitor, tubular; .02-1000 v. 85°C
C52	T16-216	Capacitor, tubular; .05-1000 v. 85°C
C53	T15-233	Capacitor, mica; 50 mmfd. 800 v.
C54	T16-217	Capacitor, tubular; .25-400 v. 85°C
C55	T18-298	Capacitor, electrolytic; 8 mfd. 500 v.
C56	T20-145	Capacitor, trimmer; HORIZONTAL DRIVE
C57	T18-302	Capacitor, electrolytic; 60 mfd. 200 v.
C58	T15-234	Capacitor, ceramic; 500 mmfd. 20,000 v.
		RESISTORS
R1, R8, R64	T60-759	Resistor, carbon; 4.7K ohm, ½ w. 10%

CAUTION

HIGH VOLTAGES are used in the operation of this receiver. The back cover, while in place, prevents accidental contact with this voltage and therefore should not be removed by anyone except a qualified television serviceman.

THE HIGH VOLTAGE LEAD, which supplies 12 to 16 kilovolts to the picture tube, should be momentarily shorted to the chassis whenever it is disconnected for service purposes. This discharges the high voltage filter condenser and prevents a shock hazard when working on the receiver after it has been turned off.

THE PICTURE TUBE is highly evacuated and if broken, glass fragments will be violently expelled. Scratching, chipping, undue pressure, or careless handling such as lifting the tube by its neck is dangerous and should be avoided. If it is necessary to handle the picture tube, use safety goggles and heavy gloves. Be sure to discharge the voltage developed across the capacitor formed by the inner and outer coating of the picture tube. This can be done by connecting the high voltage socket on the tube to the outer coating.

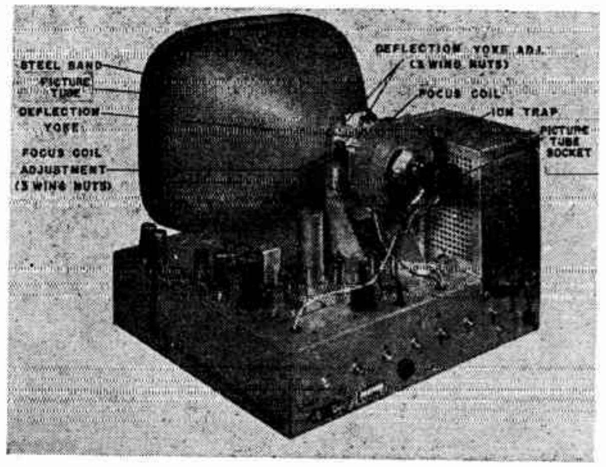

Fig. 4. Side View of Chassis.

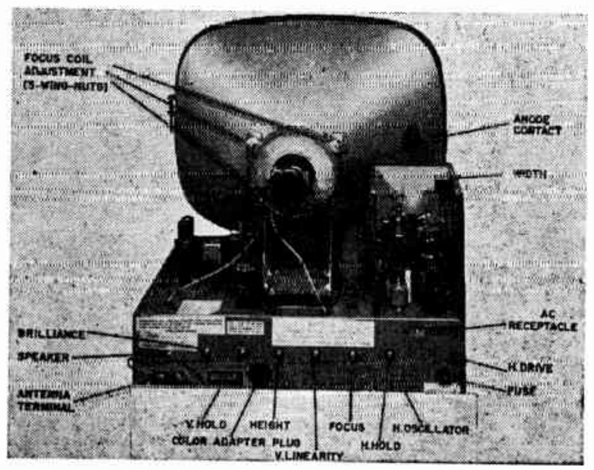

Fig. 5. Rear View of Chassis.

HORIZONTAL OSCILLATOR ALIGNMENT

If the Horizontal Hold control fails to maintain sync, the horizontal oscillator should be reset. To reset this screwdriver adjustment, set the horizontal hold control in the center of its range and sync the picture with the horizontal oscillator adjustment screw. Check the control action on various channels and alter the screw adjustment as required to provide sync on all channels with these two controls.

DEFLECTION YOKE, ION TRAP AND FOCUS ADJUSTMENT

Following is the proper procedure for adjusting the Deflection Yoke, Ion Trap and Focus.

The receiver should be turned on but *not* connected to an antenna. These steps should then be taken in the following order:

1. The Deflection Yoke should be moved as far forward as possible on the neck of the CRT.
2. The Brilliance control should be turned to maximum (clockwise) and the Picture control should be turned to minimum (counterclockwise).
3. The Ion Trap should be rotated and at the same time moved forward and backward to find the position which produces the brightest raster on the screen.
4. The Deflection Yoke should be rotated so that the top and bottom edges of the raster are parallel to the top of the chassis.
5. The Brilliance control should now be reduced (ccw) to a point where the raster is slightly above normal brilliance.
6. Center the picture within the opening of the mask and eliminate shaded corners by adjusting the three positioning wing-nuts on the focus coil. Corner-cutting or shadows at the corners may be caused by mis-adjustment of either the ion trap magnet or the Focus coil, and the two may require simultaneous adjustment to secure the brightest, yet evenly distributed light on the screen. Four self-tapping screws on the focus coil U-bracket are provided to permit vertical movement of the focus coil when necessary.
7. With Brilliance and Picture controls at normal positions, adjust the Focus control (rear of chassis) for well-defined scanning lines.

HEIGHT, WIDTH AND LINEARITY

To adjust the overall size and linearity of the picture it is almost mandatory that a test pattern transmitted from a local station be used. Linearity adjustments, particularly, cannot be accurately made on moving transmissions. It should also be remembered that in areas where more than one station is being received, that pictures transmitted from different stations will vary slightly in size. The smallest transmitted picture should be made to fill the area delineated by the mask.

The Width control (in the H.V. cage) should be adjusted to give a picture that will fill the mask horizontally.

The Height and Vertical Linearity controls (both rear of chassis) should then be adjusted for a linear picture that will fill the mask vertically. At this point the Focus adjustment previously set, should be retouched for maximum definition of the lines in the vertical wedge of the test pattern. Proper adjustment and alignment of the receiver should result in clear and sharp definition.

TELEVISION ALIGNMENT PROCEDURE

PRELIMINARY

This alignment is an exacting procedure and should be undertaken only when necessary. Before fully deciding that alignment is necessary and before removing the chassis from the customer's home:

1. Be sure of the antenna installation.
2. Check all operating controls and adjustments including the channel selector.
3. Check reception on all channels.
4. Check tubes by substitution of known good tubes.

TEST EQUIPMENT REQUIRED

1. Signal generator (with an output variable and at least 0.1 volt max.) to provide the following frequencies:

   (a) 4.5 mc Sound IF
   (b) 21.75 mc Trap (L14)
   (c) 24.0 mc 1st IF (L15)
   (d) 25.5 mc 2nd IF (T1)
   (e) 23.8 mc 3rd IF (T2)
   (f) 26.1 mc 4th IF (T3)

2. R.F. Sweep Generator with a frequency range from 40 to 220 megacycles with a sweep width of 10 megacycles and an adjustable output of at least 0.1 volts.
3. Crystal controlled or crystal calibrated markers for the sound carrier of each channel. Picture carrier markers are desirable but not necessary.
4. Cathode ray oscilloscope, preferably with a wide band vertical amplifier and an input calibrating source.
5. Vacuum tube voltmeter (VTVM).

ALIGNMENT PROCEDURE

I-F ADJUSTMENTS

Step No.	Connect Signal Generator to	Signal Gen. Freq. Mc.	Connect Voltmeter to	Miscellaneous Connections and Instructions	Adjust
3	Raise tube shield on V18 (tuner-oscillator), so that it is not grounded, then clip the "hot" lead of the signal generator to the tube shield.	26.1	Junction R13 and L2	Disconnect the antenna. Set channel selector to channel on which there is no signal and no interference (such as harmonics of I.F.).	T3 (top) maximum
4		23.8			T2 (top) maximum
5		25.5			T1 (top) maximum
6		24.0			L15 maximum
7		21.75			L14 minimum

ALIGNMENT TABLE

DISCRIMINATOR AND SOUND I-F ALIGNMENT

Step No.	Connect Signal Generator to	Signal Gen. Freq. Mc.	Connect Voltmeter to	Miscellaneous Connections and Instructions	Adjust
1	Video Grid (pin 1, V-4)	4.5 .1 volt output	Pin 2 V-7	Meter on 10 Volt scale	T4 (bottom) and L6 for max. on meter. L4 for min.
2	Video Grid (pin 1, V-4)	4.5 .1 volt output	See Note 1	Meter on 3 volt scale	T4 (top) for zero on meter

NOTE 1: Connect two 100 K resistors in series. Connect one end to pin 2 of V-7 (6T8) and the other end to ground. Connect the hot side of the VTVM to center of the two 100 K resistors and ground side to junction of R29 (150 ohms) and R28 (47K ohms).

Conditions: 1. All readings taken with a vacuum tube voltmeter. 2. All controls at "normal" setting. 3. Switch OFF; line cord disconnected. 4. All tubes left in sockets.

*These tube pins do not have a DC path to ground, therefore there is no resistance reading given. With the circuit in normal operating condition (i.e. no shorts, no open circuits), the ohmmeter will give a gradually increasing reading because the battery in the ohmmeter is charging up the condensers in the circuit. If the ohmmeter is left connected long enough, it will eventually give a reading which is the leakage resistance of all the condensers. The foregoing reading would be correct, of course, only if the ohmmeter is connected in the current polarity with respect to any electrolytic condensers in the circuit. If the ohmmeter *immediately* gives a definite resistance reading (either infinite resistance or zero or very low resistance), it is an indication of an open circuit (infinite resistance) or of a short circuit (very low resistance).

REPAIR PARTS LIST

HOW TO ORDER REPAIR PARTS

1. Use Correct Order Form.
2. On the Purchase Order always give the following information:
   (1) PART NUMBER (number printed on the part if different from that shown in this list) and DESCRIPTION for each part ordered. When no part number is assigned, order by description and rating. Also give PRICE of part (indicate if no selling).
   (2) The CHASSIS NUMBER. This number is found on a metal plate (pictured on page one) at the rear of the chassis.

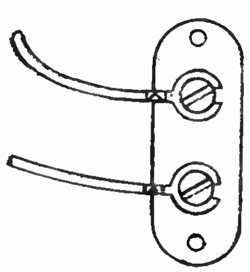
The Parts List for Chassis 528.631-1 is the same as 528.631 except for the parts listed below:

OMIT THE FOLLOWING PARTS:

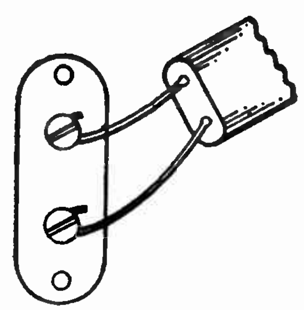
Schematic Location	Part Number	Part Description
		CAPACITORS
C48	T15-231	Capacitor, 390 mmfd.
C51	T16-219	Capacitor, .02 mfd., 1000 v.
		RESISTORS
R64	T60-759	Resistor, 4700 ohm, 10%
R68	T60-805	Resistor, 47 ohm, 1 w., 10%

ADD THE FOLLOWING PARTS:

Schematic Location	Part Number	Part Description
		CAPACITORS
C48	T15-236	Capacitor, 180 mmf., 10%
C51	T16-222	Capacitor, .025 mfd., 1000 v., 10%
		RESISTORS
R64	T60-703	Resistor, carbon, 1K ohm, 1/2 w., 10%
R68	T60-804	Resistor, wirewound, 15K ohm, 5 w., 10% (from pin 3 of 6W4 tube to pin of color socket
R77	T60-664	Resistor, 15 megohm, 1/2 w., (from Junction of R11 and R12 to Junction of R6 and R24)



BUILT-IN ANTENNA CONNECTIONS



ANTENNA CONNECTIONS USING 300-OHM RIBBON TYPE LEAD-IN

Beginning with production of chassis 528.632 and 528.632A, the antenna connection was changed to the type illustrated at left in order to provide an improvement in built-in antenna performance. The use of this connection was continued through all other chassis numbers covered

Fig. 14 Antenna Connections.

	T68-44	Socket, miniature, 9 pin (V7 & V11)
	T68-50	Socket, picture tube
	T68-53	Socket, octal, wafer (V15) 4 pins only
	T70-153	Spring, tube grounding (2 Req.)
	T27-24	Strap, picture tube support
	T83-693	Yoke mounting hood

CHASSIS 528.632-1 and 528.632A-1

SEE SCHEMATIC DIAGRAM ON INSERT AT END OF RL.

The parts list for chassis 528.632-1 and 528.632A-1 is the same as for chassis 528.632 and 528.632A. The difference between these models was a change in the I.F. frequencies, which were changed to the following:

1st IF	24.0 Mc.	3rd IF	23.8 Mc.
2nd IF	25.5 Mc.	4th IF	26.1 Mc.

The sound trap frequency has been changed to 21.75 Mc.

CHASSIS 528.632-2 and 528.632A-2

SEE SCHEMATIC DIAGRAM

The Parts List for Chassis 528.632-2 and 528.632A-2 is the same as for 528.632 and 528.632A except for the parts listed below:

OMIT THE FOLLOWING PARTS:

Schematic Location	Part Number	Part Description
		CAPACITORS

SPECIFICATIONS

POWER REQUIREMENTS

117 volts 60 cycles 200 watts

PICTURE SIZE

21" Rectangular

SPEAKER

	Type	Size	V.C. Imped.
1176-21	P.M. Dynamic	6"	3.2 ohms
1186-21	P.M. Dynamic	6" x 9"	3.2 ohms

ANTENNA INPUT IMPEDANCE

Balanced input for ribbon type transmission line—300 ohms.

BUILT-IN ANTENNA

Broad band dipole.

R. F. TUNER

Turret type construction; individually removable coil assemblies for all channels. All components are easily accessible for servicing.

INTERMEDIATE FREQUENCIES

Sound Carrier—22.25 Mc.
Picture Carrier—26.75 Mc.

I.F. SYSTEM

Three Stages—stagger tuned—for composite signal. One additional stage for sound channel.

VIDEO AMPLIFIER

Broad band.

RETRACE LINE SUPPRESSOR

Eliminates retrace lines thruout the normal range of picture brightness and contrast.

FOCUS

Electromagnetic with an auxiliary control on the front panel.

DEFLECTION

Magnetic

DETECTOR

Sound—Ratio Type
Picture—Germanium Crystal Type

HORIZONTAL SYNCHRONIZATION

Automatic frequency control A.G.C. provides excellent picture stability and noise immunity.

HIGH VOLTAGE POWER SUPPLY

"Fly-back" type. Completely enclosed in a shielded compartment.

GENERAL DESCRIPTION

SILVERTONE 1176-21
(21" RECTANGULAR PICTURE TUBE)

The information contained in this service RL covers numbers 1176-21 and 1186-21. Both receivers utilize the same chassis 100.208 and differ only as to cabinet design, one being a table model while the other is a console model.

Seventeen tubes are used solely for reproduction of the visual and aural portions of the television broadcast. In addition, a heavy duty transformer and two rectifier tubes provide power for operation of all stages.

Outstanding circuit features of the receivers include a high gain R.F. tuner which is noted for its stability and rugged mechanical construction, an inter-carrier sound system which is free from distortion normally caused by oscillator drift, automatic frequency control of horizontal sync system, automatic gain control, and retrace line suppression.

Exceptional sensitivity is achieved by a thoroughly stable and A.G.C. controlled R.F. amplifier and three stages of I.F. amplification followed by a broad-band video amplifier. Another important feature is the compactly designed built-in antenna.

SILVERTONE 1186-21
(21" RECTANGULAR PICTURE TUBE)

Suppression of retrace lines by an ingenious circuit arrangement contributes to ease of operation of the receiver. This highly desirable performance feature permits a wide variety of picture brightness and contrast control settings without appearance of retrace lines.

Orderly and well spaced arrangement of all components on a generously proportioned chassis pan permits easy access to all circuits for measurements and analysis.

TUBE COMPLEMENT

TUBE NO.	TUBE TYPE	FUNCTION
V1	6AU6	1st Sound Amplifier—Limiter

13	210 — 216	211.25	215.75	238.00

RECEIVER OPERATING CONTROLS

The various controls on the receiver may be divided into two classes, Operating and Pre-Set. Operating controls are those which control program selection as well as sound and picture quality.

All the operating controls of the receiver are located on the front panel and the name and use of each are described in Figure 1. More detailed instructions on the application of the operating controls are given in the following section, while a description and function of each of the Pre-set controls will be found in the section entitled "Control Adjustment Procedure."

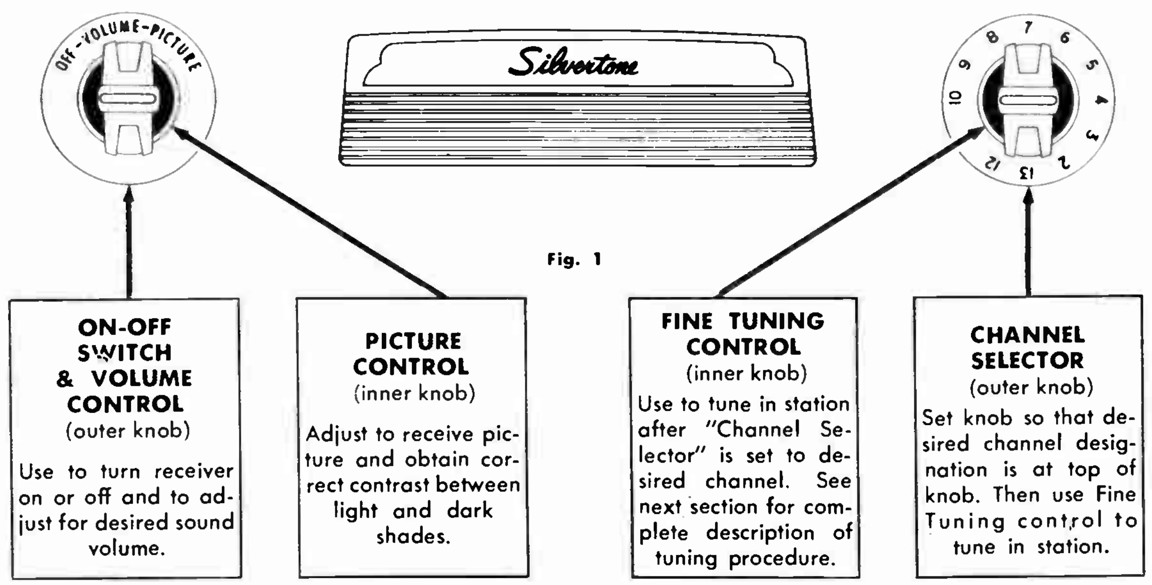

Fig. 1

HOW TO TUNE THE RECEIVER

This receiver is designed to be used for reception of sight and sound programs from local television transmitting stations operating on any of the twelve commercial television channels assigned by the Federal Communications Commission.

In order to select a particular station and adjust the various operating controls for correct picture and accompanying aural reception, proceed as follows:

1. Check to be sure that a television station is on the air at the time you wish to operate the receiver. Program schedules are usually published in daily newspapers and many stations will mail copies of their weekly broadcast schedule to set owners upon request.

2. Rotate the "On-Off Switch and Volume" knob approximately ½ turn clockwise to turn set on and obtain sufficient sound volume during the tuning process. Allow several minutes for all tubes in the receiver to warm up and for circuits to stabilize before attempting to obtain a picture on the screen.

3. Turn the "Picture" control knob approximately ¾ turn clockwise.

4. Set "Channel Selector" by turning this knob so that the desired television channel is at the top of the knob. Channel numbers for all television stations operating in your area will be found in your local newspaper.

5. After "Channel Selector" knob has been set, then use the "Television Fine Tuning" control to obtain the correct tuning point for both picture and sound. That is accomplished as follows:

   a. Turn "Television Fine Tuning" control in either direction until sound volume is maximum—if sound cannot be heard, advance the volume control and repeat fine tuning.

   b. When the point of maximum sound volume has been reached it will be noted that the picture has a "ragged" or "saw-tooth" appearance or is partially obscured by "sound bars" (dark horizontal bars of varying width—see Fig. 2).

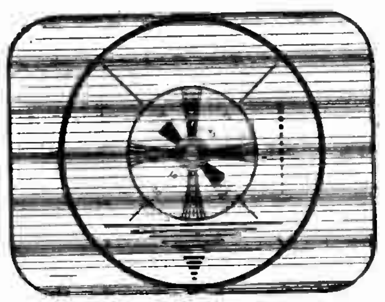

Fig. 2—SOUND INTERFERENCE CAUSED BY INCORRECT TUNING

THE CORRECT SETTING OF THE TELEVISION FINE TUNING CONTROL is now obtained by turning it away from the maximum volume position only far enough to eliminate the "sound bar" interference and permit sharp reproduction of the picture.

6. Readjust the setting of the "Volume" control until the sound accompanying the television broadcast is received at a satisfactory level.

7. The Setting of the "Picture" control should now be adjusted for the most pleasing picture. This control adjusts the black and white contrast between the various picture elements. Too much contrast is apparent when the picture is lacking in gradations between black and white or the picture loses form (see Fig. 3). Too little contrast (or a very weak signal from the station) causes the picture to appear faded as illustrated in Fig. 4.

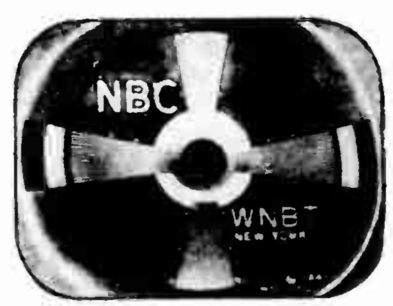

Fig. 3—REDUCE CONTRAST; ADJUST PICTURE CONTROL

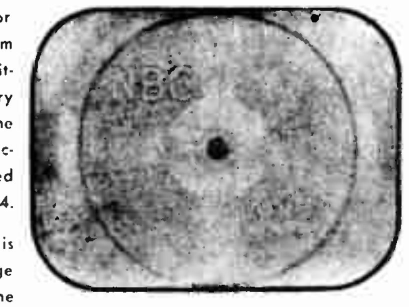

Fig. 4—INCREASE CONTRAST; ADJUST PICTURE CONTROL

If picture brightness is not as desired, change the position of the pre-set "Brightness" control located under the Name Plate on the front panel. This plate is hinged at the bottom; to gain access to the control, merely tilt plate forward.

8. After all of the aforementioned controls have been correctly adjusted, the picture should be clear and steady and all shades between black and white will be readily discernible. It is preferable to adjust the "Picture" control during the test pattern transmission which usually precedes the regular telecast as use of the test pattern permits much finer adjustment than can be made with ordinary pictorial scenes.

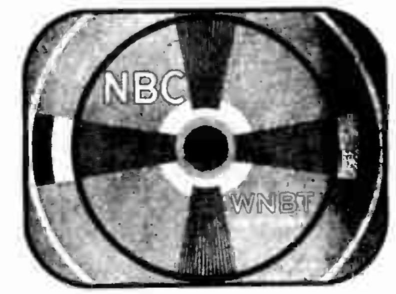

Fig. 5
CORRECTLY ADJUSTED PICTURE

9. During intervals in which stations are only televising their test patterns, the sound will be a sustained note. These test patterns (Fig. 5) and special sound transmissions are used by television installation men to adjust certain pre-set controls at the time a receiver is installed.

ANTENNA REQUIREMENTS

USE OF BUILT-IN ANTENNA—This television receiver is equipped with the new built-in antenna intended to provide satisfactory reception in locations where fairly strong signals may be obtained from local transmitting stations and where electrical interference is not excessive.

To insure maximum performance of the built-in antenna it will be necessary to properly orient the entire receiver. A trial will reveal the position of best reception with the least interference. Avoid locating the receiver near large metal objects such as a radiator or too close to a wall which is known to contain metal lath or steel beams.

USE OF AN OUTDOOR ANTENNA—In cases where station signals are very weak, or reflections prove troublesome, and the built-in antenna does not provide satisfactory reception, then an outdoor antenna will be required. Use of the outdoor type antenna is particularly desirable in weak signal or "fringe" areas as it can be located at greater height above the ground (where signals are stronger) and free of surrounding obstructions.

The outdoor antenna should have a broad frequency response characteristic whose impedance closely matches the 300 ohm input impedance of the receiver.

Before connecting the lead-in from an outdoor antenna to the receiver's terminal strip, it first will be necessary to disconnect the receiver's built-in antenna leads from this strip.

CONTROL ADJUSTMENT PROCEDURE

The various controls on the receiver may be divided into two classes, Operating and Pre-set. Operating controls are those which control program selection as well as sound and picture quality and their functions are indicated in Fig. 1.

There are nine Pre-set controls, two of which are located at the back of the chassis (see Figure 16). Six controls are located under the Name Plate on the front panel. This plate is hinged at the bottom; to obtain access to controls, merely tilt plate forward. The Auxiliary Fine Tuning Screw can be reached by removing the "Channel Selector" and "Television Fine Tuning" knobs.

To gain access to the centering adjustments and ion trap, it will be necessary to remove the back of the cabinet by taking out the screws around edges.

Operate the receiver according to the instructions given in the section of this manual entitled "How To Tune The Receiver" and make the following adjustments as required.

1. **ADJUST ION TRAP**—If screen remains dark or is only dimly illuminated when "Brightness" control is turned clockwise, the ion trap may require adjustment.

   The ion trap is located on the neck of the picture tube as shown in Figure 16 and consists of a magnet held in position by metal bands. With "Brightness" control (located behind Name Plate) set approximately ½ turn clockwise, rotate the entire ion trap assembly while sliding it back and forth until picture tube screen is illuminated to maximum brilliance. Reduce "Brightness" control setting and repeat this operation to assure accurate positioning of ion trap.

   Do not turn "Brightness" control to its maximum clockwise position until ion trap is correctly adjusted—failure to observe this precaution may result in damage to the picture tube.

   CAUTION: There is only ONE correct setting of the ion trap. This position is attained when maximum brilliancy occurs on the picture tube screen. If defocusing of picture or neck shadow results, DO NOT adjust position of ion trap—see instructions located elsewhere in this manual for removing these aforementioned faults. Failure to observe this precaution will result in an ion burn (brown spot) on the face of the picture tube. Since this condition is brought about by lack of proper ion trap adjustment at time of receiver installation, the picture tube will not be eligible for warranty adjustment.

2. **AUXILIARY FINE TUNING ADJUSTMENT**—If it is found that the tuning range of the "Fine Tuning" control is inadequate to permit correct tuning of a station in its assigned channel, then adjustment of the "Auxiliary Fine Tuning" screw will be necessary. This special screw is accessible after removal of the "Channel Selector" and "Fine Tuning" knobs. They may be removed by merely pulling them forward.

   Adjustment of the "Auxiliary Fine Tuning" screw may be undertaken in accordance with the following procedure.

   a. Set "Channel Selector" to desired channel; then remove this knob.

   b. Set "Fine Tuning" knob to the center of its range; then remove this knob. The flat portion of the main tuning shaft (outer shaft) should now be in the uppermost position. Note the location of the "Auxiliary Fine Tuning" adjustment screw on receiver chassis—see Fig. 13

c. Using a thin screwdriver (preferably non-metallic), adjust the setting of "Auxiliary Fine Tuning" screw for correct tuning of the desired television station—**CAUTION: Do not attempt to rotate this screw more than two full turns in either direction, as further rotation may release it from the thread clip within the tuning mechanism and the coil for that channel (located in R.F. Tuner Unit) would then have to be removed in order to restore the screw to the correct position.** If a metal screwdriver is used, detuning occurs when the screwdriver is removed but it will be noted that this degree of detuning can now be compensated by resetting the "Television Fine Tuning" control (outer shaft). Thus the range of the "Television Fine Tuning" control (after knob is replaced on the shaft) will be adequate to tune in the station.

d. This completes the adjustment of the "Auxiliary Fine Tuning" screw for one channel. Identical screws are provided on each channel and they are all accessible thru the same opening in the tuning mechanism as each successively moves into position when the "Channel Selector" knob is rotated.

3. **HORIZONTAL HOLD**—Should the picture appear to move horizontally across the screen or break up into a series of light and dark streaks as shown in Figure 6 adjust the "Horizontal Hold" control (located behind Name Plate) until the picture remains stationary and does not slip horizontal sync when operating "Channel Selector" knob.

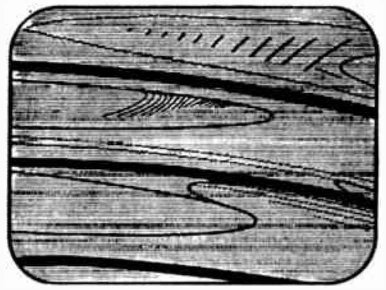

Fig. 6—HORIZONTAL MOVEMENT; ADJUST HORIZ. HOLD CONTROL

4. **VERTICAL HOLD**—Should the picture appear to roll by in a vertical direction or cause multiple vertical images as shown in Figure 7, it will be necessary to adjust the "Vertical Hold" control located behind the Name Plate (see Figure 13).

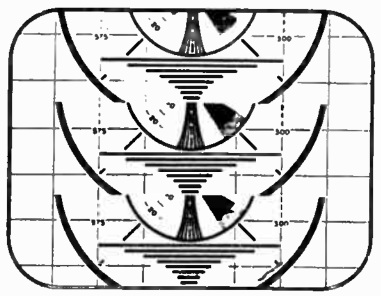

Fig. 7—VERTICAL MOVEMENT; ADJUST VERTICAL HOLD CONTROL

After this adjustment is made, reduce contrast until picture is barely visible and check setting of "Vertical Hold" control for proper picture synchronization.

5. **INITIAL FOCUS**—Adjust the "Focus" control, located behind name plate, until picture is clearly defined. Fuzzy picture may also be due to reproduction of poor quality film when station is televising a motion picture. Incorrect tuning of receiver produces a similar effect. Check for proper tuning point as described in step 5 of section entitled "How To Tune the Receiver."

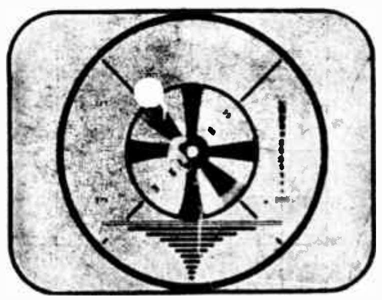

Fig. 8—BLURRED APPEARANCE; ADJUST FOCUS CONTROL

The following adjustments should be made while the station is transmitting its circular test pattern.

6. **STRAIGHTENING TILTED RASTER**—if the pattern should appear on the screen in a tilted position as shown in Figure 9, loosen the deflection yoke locking screw labeled A in Fig. 16 and rotate the yoke sufficiently to correct this condition. Be sure to re-tighten the screw securely.

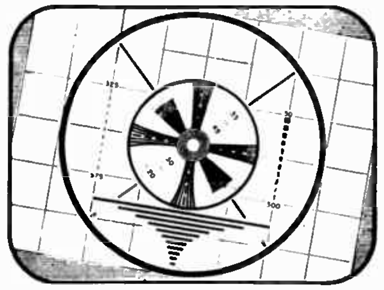

Fig. 9—TILTED PICTURE; ADJUST YOKE POSITION

7. **CENTERING**—To center the test pattern on the screen, position focus coil by adjusting the three nuts labeled B in Fig. 16.

NOTE: If a decrease in picture tube brilliance is noted when making the centering adjustment readjust ion trap as explained in step #1.

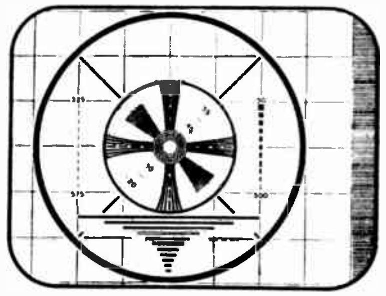

Fig. 10—OFF CENTER; ADJUST FOCUS COIL POSITION

8. **HEIGHT** — Control of picture size in the vertical direction is accomplished by means of the "Height" control located behind the Name Plate. Height and width adjustments should be checked for all transmitting stations to be sure that picture properly fills the viewing area. It may be necessary to change the setting of the "Height" control after the "Vertical Linearity" control is adjusted.

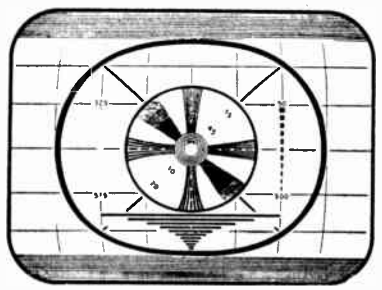

Fig. 11—TOO SHORT; ADJUST HEIGHT CONTROL

9. **WIDTH** — Control of picture size in the horizontal direction is accomplished by means of the "Width" control located on the rear of H. V. power supply (see Fig. 16).

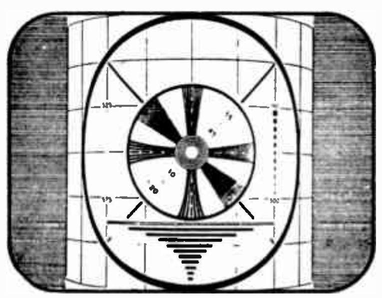

Fig. 12—TOO NARROW; ADJUST WIDTH CONTROL

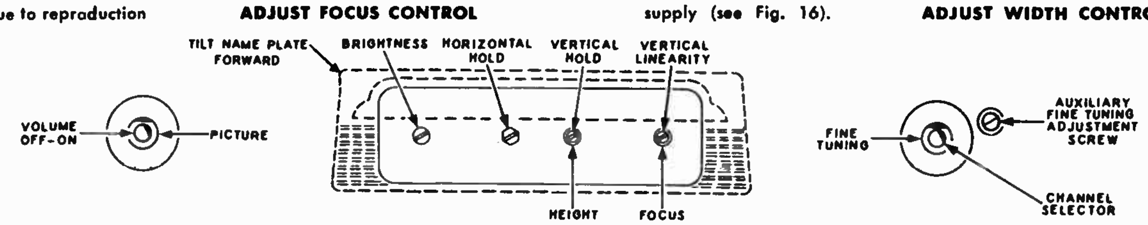

Fig. 13—LOCATIONS OF PRE-SET CONTROLS

If abnormally low line voltage makes it difficult to obtain sufficient picture width when using the "Width" control, then the setting of the "Horizontal Drive" control may be incorrect. The method of adjusting this control is explained in paragraph # 12.

10. **VERTICAL LINEARITY** — Improper vertical linearity causes the circular test pattern to appear condensed on the upper edge of the screen and extended on the lower edge or vice versa. This effect is illustrated in Figure 14. Adjust for proper linearity by using "Vertical Linearity" control located behind Name Plate. It may be necessary to readjust the "Height" control if an appreciable change is made in the linearity control setting.

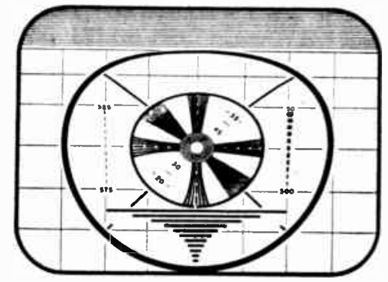

Fig. 14—VERTICAL DISTORTION; ADJUST VERTICAL LINEARITY CONTROL

11. **ELIMINATING SEMI-CIRCULAR SHADOW** — This shadow is caused by the electron stream striking the neck of the tube and it can generally be corrected by applying one or a combination of the following procedures:

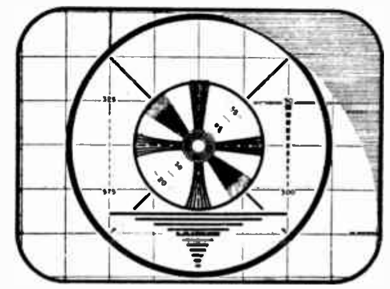

Fig. 15 SEMI-CIRCULAR SHADOW

a. Make sure deflection yoke is symmetrically positioned with respect to the neck of the picture tube by loosening the three wing nuts labeled C in Fig. 16 and adjusting yoke position.

Should a change in height of the defection yoke be required to obtain symmetry of yoke around neck of picture tube, it will be necessary to loosen the four wing nuts labeled D in Fig. 16 (two nuts located on each leg of mounting frame) and raise or lower yoke as required. After adjustment has been completed be sure to retighten nuts securely.

b. Shift deflection yoke as far forward as possible after loosening the yoke locking screw labeled A in Fig. 16. If raster becomes tilted during this adjustment refer to step #6.

12. **HORIZONTAL DRIVE** — The "Horizontal Drive" control located at rear of chassis (see Fig. 16) should be rotated clockwise to the point where any vertical bars near the left side of the picture are eliminated. As width and linearity of the picture are affected by the setting of "Horizontal Drive" control, it may be necessary to adjust this control in conjunction with the Width control to obtain desired picture width and linearity.

13. **BRIGHTNESS**—The "Brightness" control (located behind the Name Plate) should be initially adjusted in conjunction with the "Picture" control for the brightness level desired by set owner—check all active station channels. Too much brightness will have the same effect as too little contrast, and vice versa, therefore, it is necessary to strike a proper balance between contrast and brilliance.

14. **FINAL ADJUSTMENTS**—With all controls set for normal reception of a television station, recheck setting of "Focus" control for best picture focus.

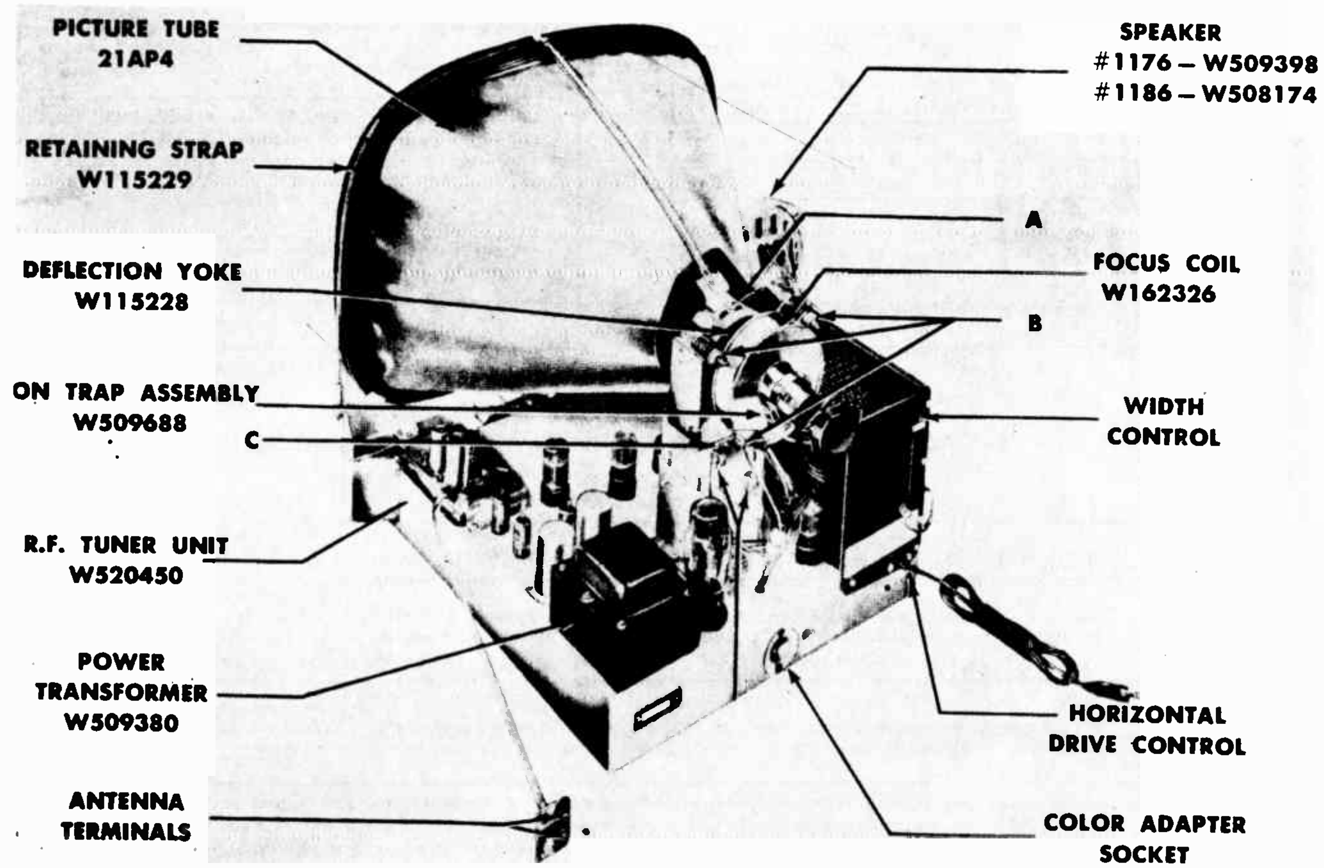

Fig. 16—CHASSIS AND PICTURE TUBE ASSEMBLY

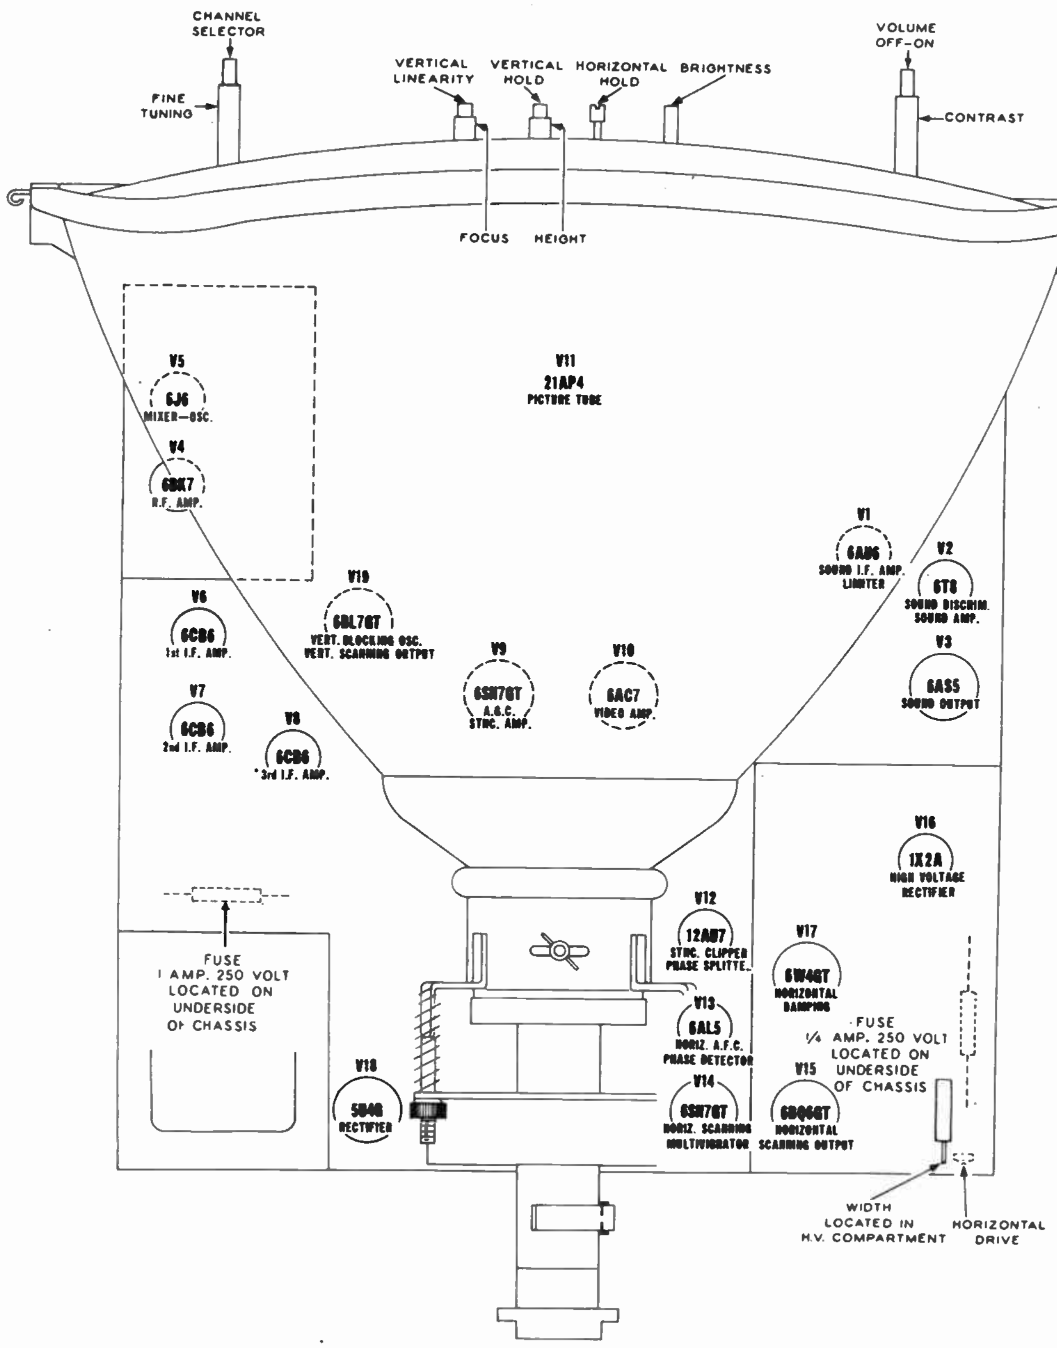
CLEANING GLASS WINDOW AND PICTURE TUBE FACE

Should an accumulation of dust be noted on the inside of the glass window or on the face of the picture tube, it can be removed in the following manner:

1. Remove power cord from wall outlet.
2. Take off the gold colored picture frame or escutcheon by taking out the six cross-slotted screws located around edge of frame while at the same time supporting the glass window to keep it from falling forward.
3. Carefully remove the glass window avoiding any possibilit of scratching or chipping it.
4. Using a slightly dampened lint free soft cloth, carefully wipe t inside of the glass window and the face of the picture tube. Avoi any scratching, scraping, or chipping that might impair the glas surface.
5. When replacing the glass window and re-installing the escutcheon be sure that the cross-slotted screws are securely tightened.

TUBE LOCATIONS AND FUNCTIONS



SOCKET VOLTAGES

CAUTION

THE PICTURE TUBE is highly evacuated and if broken, glass fragments will be violently expelled. Scratching, chipping, undue pressure, or careless handling such as lifting the tube by its neck is dangerous and should be avoided. If it is necessary to handle the picture tube, use safety goggles and heavy gloves.

HIGH VOLTAGE (10 to 13 kilovolts) is produced in a supply circuit of this receiver. Exercise care to avoid contact with elements of this circuit and particularly the tube terminals which are labeled "CAUTION" in the adjoining voltage chart.

THE HIGH VOLTAGE LEAD, which supplies approximately 10 to 13 kilovolts to the picture tube, should be momentarily shorted to the chassis whenever it is disconnected for service purposes. This discharges the high voltage filter condenser and prevents a shock hazard when working on the receiver after it has been turned off.

INTERMEDIATE B+ VOLTAGES, are dangerous and caution should be observed when the receiver chassis components are exposed for service purposes.

THE VOLTAGES SHOWN IN THE ADJOINING CHART WERE MEASURED UNDER THE FOLLOWING CONDITIONS

1.	Power Supply—117 volts 60 cycle AC.
2.	All voltages are measured between socket terminals and chassis unless otherwise indicated on adjoining chart.
3.	* Measurements made with voltmeter having sensitivity of 20,000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.
4.	Channel Selector and Fine Tuning Controls set for normal reception of a local station.
5.	All controls are set for normal reception of the transmitted signal unless the voltage shown on the chart is followed by a letter or letters indicating a special condition of measurement as explained in subsequent notes.
6.	The external or built-in antenna should remain connected to the receiver only when taking voltage measurements in the sweep and sync circuits—for all other measurements, disconnect antenna, short antenna terminals together and connect them to ground.
7.	Certain voltages were measured with two different settings of specific controls. It should therefore be understood that in these instances all controls, with the exception of one or two, were set for normal reception—letters following the voltage shown on the chart indicate the exceptions and are explained below.

EXPLANATION OF NOTES

B.	Brightness Control max. clockwise
C.	Brightness Control max. counter-clockwise
D.	Contrast Control max. clockwise
E.	Contrast Control max. counter-clockwise
G.	Height Control max. clockwise
H.	Height Control max. counter-clockwise
J.	Vertical Hold Control max. clockwise
K.	Vert. Hold Control max. counter-clockwise
M.	Vertical Linearity Control max. clockwise.
N.	Vertical Linearity Control max. counter-clockwise.
Q.	Do not attempt to measure the voltage at the tube cap. There is a high R. F. potential at this point.
R.	Channel Selector set to channel #4
S.	Channel Selector set to channel #9
T.	Horiz. Drive Control max. clockwise
U.	Horiz. Drive Control max. counter-clockwise.
V.	Before measuring this voltage, connect external antenna and adjust controls for normal reception of station signal.
W.	The measurement should be made with a vacuum tube voltmeter. The voltage reading will fluctuate in the vicinity of 0.1 volts.
X.	Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.
Y.	Horiz. Hold Control turned in a clockwise direction until picture approaches loss of sync.
Z.	Horiz. Hold Control turned in a counter-clockwise direction until picture approaches loss of sync.

ALIGNMENT PROCEDURE

Alignment of all RF and IF tuned circuits in this receiver may be accomplished by utilizing the procedures described in the following charts.

SEQUENCE OF ALIGNMENT: These procedures should preferably be applied in the order in which they are presented, however, alignment of the Sound Channel or IF Channel may be accomplished individually if desired.

The RF Amplifier and Mixer alignment may also be accomplished independent of Sound or IF Channel alignment, but oscillator calibration can only be done after IF Channel has been correctly aligned. Proper IF band pass characteristic is necessary for Oscillator alignment as results of RF circuit tuning are observed by means of an oscilloscope connected to the output of the crystal detector.

REMOVAL OF CHASSIS: The receiver chassis must be removed from the cabinet in order to accomplish alignment of all tuned circuits as there are adjustment points located on the underside of the unit.

This can be accomplished by first removing all knobs and disconnecting the receiver "built-in" antenna and speaker. The chassis may then be removed by releasing the hold-down screws located on the underside of the cabinet chassis mounting board.

CAUTION

The picture tube is highly evacuated and if broken, glass fragments will be violently expelled. Handle with care, using safety goggles and gloves.

INSTRUMENTS: The following instruments will be required as signal sources and output indicators during the alignment process. Since accurate alignment of a television receiver is heavily dependent upon the performance of your instruments, it is imperative that they meet the essential specifications described here.

1. **STANDARD SIGNAL GENERATOR** to provide unmodulated (pure RF) signals at the following frequencies. Maximum output on all ranges should be at least .1 volt with provision for attenuation as desired. This instrument must have good frequency stability and be accurately calibrated. Generators which incorporate a separate crystal controlled oscillator and heterodyne circuit are self calibrating and therefore capable of providing the accuracy of frequency calibration required for television circuit alignment.

   a. IF Frequencies:
      - 4.5 Mc. Sound Channel
      - 22.25 Mc. Sound IF marker
      - 23.5 Mc. Converter and 1st IF stages
      - 25.9 Mc. 2nd and 3rd IF stages
      - 26.75 Mc. Picture IF marker

   b. RF Frequencies:
      - 54 to 88 Mc.
      - 174 to 216 Mc.

2. **RF SWEEP GENERATOR** to provide frequency modulated signals at the following frequencies:
   - 20 to 30 Mc. with 10 Mc. sweep width.
   - 54 to 88 Mc. with 10 Mc. sweep width.
   - 174 to 216 Mc. with 10 Mc. sweep width.

   Output adjustable with at least .1 volt maximum.

   Output should be "flat" (no amplitude variation) for all settings of the sweep width control.

   Provision for connection of generator sweep modulating voltage to horizontal deflection system of an oscilloscope.

   Provision for blanking the output signal on each return sweep so that oscillogram will not show retrace.

3. **CATHODE RAY OSCILLOSCOPE,** preferably a unit with vertical amplifier having wide range frequency response and low capacity pick-up probe.

4. **VACUUM TUBE VOLTMETER.** The lowest voltage range of this instrument should preferably permit a 1.0 volt reading to be indicated at not less than one third of full scale deflection.

INSTRUMENT CONNECTIONS: The method of connection, including details of matching and coupling networks, for instruments used in this alignment procedure is given in several illustrations on subsequent pages. Specific instructions for each instrument application will be found in various sections of the alignment charts.

GENERAL INSTRUCTIONS: When aligning IF and RF circuits it is necessary to apply a fixed bias voltage to the AGC system of the receiver. This fixed bias is obtained by using a 3 volt battery and connecting it as described in Fig. 15.

IMPORTANT

When observing the receiver band pass characteristic on an oscilloscope, it is exceedingly important to avoid distortion of that characteristic which would occur when using a large input signal from the sweep generator or standard generator (marker signal). Always set attenuator on sweep generator so that the reading on the vacuum tube voltmeter does not exceed one-half volt (when meter is connected from high side of video detector load, symbol 122, to receiver chassis). The sweep width should never be set greater than that needed to fully display the receiver band pass characteristics on the oscilloscope. Standard generator output should also be attenuated so that marker signal does not pull or tear the band pass characteristic as shown on the 'scope.

SOUND CHANNEL ALIGNMENT PROCEDURE

1. Short antenna terminals together with a jumper wire.
2. Set receiver Channel Selector to any inactive television channel and contrast control to its maximum counter-clockwise position; other controls may be left at any desired setting.
3. No special aligning tool is required to adjust the cores in the Sound IF and discriminator transformers. The blade of a small screwdriver will fit the slot in these cores, however, the screwdriver should be of a non-metallic or insulated type to prevent detuning when inserted in the transformer con.

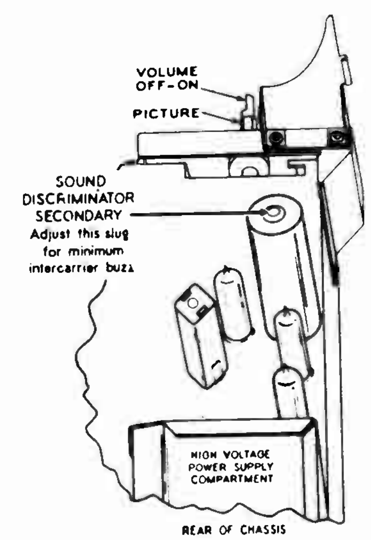
STANDARD SIGNAL GENERATOR		VTVM CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY				
Connect as shown in Fig. 1.	**4.5 MC.** unmodulated IMPORTANT This signal must be accurate within ¼ of 1% of 4.5 Mc. Check generator calibration against a crystal controlled signal source by "zero beating" (heterodyning) with harmonics of the crystal frequency.	Connect as shown in Fig. 2.	1. Set Contrast control to its maximum clockwise position. 2. A special detector must be utilized when aligning the 4.5 Mc. Sound Trap Coil. This unit can be constructed in accordance with the information contained in the circuit shown below. If a VTVM containing a high frequency A.C. probe is available, this probe can be utilized in place of the crystal detector shown in Fig. 2. 3. During this adjustment only, remove one of the three 6CB6 IF amplifier tubes (V6, V7 or V8). This will prevent noise in the RF stages from effecting the voltage reading while adjusting the sound trap.	#1 4.5 MC Sound Trap	Adjust for minimum reading on VTVM.
		Connect as shown in Fig. 3.	A "swishing" sound may be heard in the speaker during Sound Channel Alignment. This spurious oscillation is caused by horizontal sweep voltage being picked up in the audio system thru stray coupling of instrument leads; it should be disregarded as it will have no effect on alignment of the sound channel.	#2 Discriminator Secondary	Adjust for maximum reading on VTVM.
				#3 Discriminator Primary	Adjust for maximum reading on VTVM.
				#4 Sound JF Transformer	Adjust for maximum reading on VTVM.
Same as above.	Same as above.	Connect as shown in Fig. 4.	To obtain zero balance of the discriminator circuit, two 68,000 ohm resistors will be required. These resistors must be matched so that their respective resistances do not differ by more than 1%—the accuracy of the total resistance is not critical. Connect the two resistors in series from pin 2 of the 6T8 tube to chassis ground as shown in Fig. 4.	#2 Discriminator Secondary	Note that as slug #2 is rotated, a point will be found where the voltmeter will swing rather sharply from a positive to a negative reading or vice versa. The correct setting of slug #2 is obtained when the meter reads zero as the slug is moved thru this point.

REDUCTION OF INTERCARRIER BUZZ

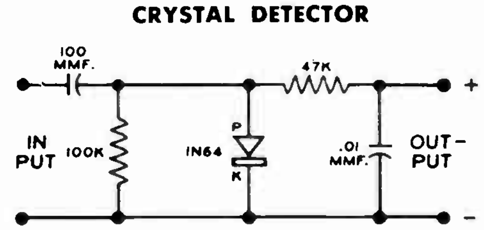
Slight "dynamic" unbalance of the discriminator secondary can emphasize intercarrier buzz due to incomplete amplitude modulation rejection. Therefore it is vitally important to obtain an accurate setting of the discriminator secondary slug under actual reception conditions.

Disconnect all instruments (be sure that I.F. tube removed for the adjustment of Sound Trap has been replaced) and then connect an antenna to the receiver to obtain program reception from a local station. If intercarrier buzz is prominent, a slight readjustment of the discriminator secondary slug (#2) should be made to obtain the "dip" point for the buzzing sound. Note that program sound will be clear and free from distortion at this point. Buzz should now be at an acceptable minimum if station transmission is not at fault.

LOCATION OF DISCRIMINATOR SECONDARY SLUG



CIRCUIT DIAGRAM FOR CRYSTAL DETECTOR



INSTRUMENT CONNECTIONS FOR SOUND CHANNEL ALIGNMENT

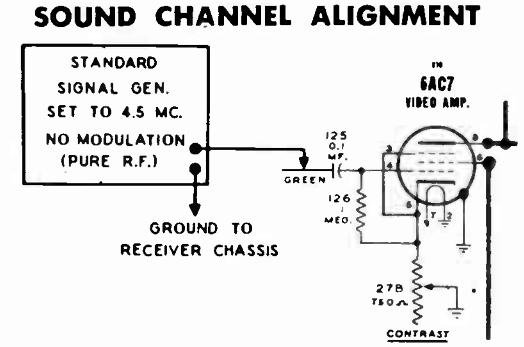


FIG. 1
Generator Connections for Sound Channel and 4.5 Mc. Sound Trap Alignment

IF CHANNEL ALIGNMENT PROCEDURE

1. A special aligning tool designed to fit the stems on adjustable cores of the IF and Trap coils (see points 5, 6, 7 and 8 in Fig. 14) is available and may be obtained from Sears and Roebuck by requesting IF Alignment Tool #W507479.

2. Turn receiver Channel Selector to television channel #12 and short antenna terminals together with a jumper wire.

3. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to the AGC line and positive terminal of battery connects to receiver chassis. See Fig. 15 for convenient point of connection.

4. If the IF channel is badly misaligned, oscillation may occur. Such oscillation shows up as an excessive voltage across the video detector load, symbol 122, and is indicated by the VTVM that is connected to this point during alignment. It should be noted that voltage due to IF oscillation is unaffected by strength of signal from the generator.

Where IF oscillation is encountered, it is generally possible to correct the condition by detuning the IF coils in different directions. If that does not have the desired effect, increase fixed bias on AGC line by using a 4½ volt battery instead of the 3 volt battery referred to in instruction #3. After stopping the oscillation in this manner it will then be possible to align all IF stages using the following procedure, however, the AGC bias battery must be changed back to 3 volts when using the oscilloscope to observe band pass characteristics. Once all stages have been aligned using the 4½ volt bias, the IF channel should be stable with reduced bias.

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNECTIONS	OSCILLOSCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY	CONNECTIONS	FREQ.					
Use a 330 Mmf. Isolating condenser and connect as shown in Fig. 5.	23.5 MC.	Connect as shown in Fig. 5 but keep generator power switch turned off during this step.	—	Connect as shown in Fig. 6.	Not used.	—	#5 Converter plate coil	Adjust for maximum reading on VTVM.
							#6 1st I.F.	Adjust for maximum reading on VTVM.
Same as above.	25.9 MC.	Same as above.	—	Same as above.	Not used.	—	#7 2nd I.F.	Adjust for maximum reading on VTVM.
							#8 3rd I.F.	Adjust for maximum reading on VTVM.
Same as above.	26.75 MC.	With connections made as shown in Fig. 5, turn on this generator and set controls for operation as specified in next column.	25 MC. Sweeping ± 5 Mc.	Same as above.	Connect as shown in Fig. 6	IMPORTANT: 1. Adjust output attenuator on sweep generator so that reading on VTVM is approximately one-half volt. 2. Set attenuator on standard signal generator so that marker signal does not distort the pattern on the oscilloscope. 3. Be sure that a 3 volt battery is connected to AGC line as specified in instruction #3 at the head of this chart. Do not use a battery of any other voltage.	The IF band pass characteristic now displayed on the 'scope should be compared with the curve shown in Fig. 7. If top of curve is not properly shaped, make a slight readjustment of slug #7. Should that adjustment fail to yield the desired result, then note whether the curve has a peak on the high or low frequency side. Slugs #7 and #8 control high frequency response (25.9 Mc.) and slugs #5 and #6 affect the low frequency response (23.5 Mc.); by making a small change in the settings of the high or low frequency slugs, it will be possible to obtain correct band pass curve.  FIG. 7 The 26.75 Mc. picture IF carrier marker should now appear at the 35% amplitude position on side of the band pass characteristic (see Fig. 7). If position of the marker appears too high or too low, slight readjustment of slugs #7 and/or 8 is required.	
Same as above.	22.25 MC.	Same as above.	Same as above.	Same as above.	Same as above.	Same as above.	Adjust the vertical gain control on the 'scope in order to magnify the sound portion of the response curve. The 22.25 Mc. sound IF carrier marker should appear at the position indicated in Fig. 7. If the position of the sound marker is incorrect, readjustment of slugs #5 and/or 6 is required.	

IF CHANNEL ALIGNMENT PROCEDURE

1. A special aligning tool designed to fit the stems on adjustable cores of the IF and Trap coils (see points 5, 6, 7 and 8 in Fig. 14) is available and may be obtained from Sears and Roebuck by requesting IF Alignment Tool #W507479.

2. Turn receiver Channel Selector to television channel #12 and short antenna terminals together with a jumper wire.

3. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to the AGC line and positive terminal of battery connects to receiver chassis. See Fig. 15 for convenient point of connection.

4. If the IF channel is badly misaligned, oscillation may occur. Such oscillation shows up as an excessive voltage across the video detector load, symbol 122, and is indicated by the VTVM that is connected to this point during alignment. It should be noted that voltage due to IF oscillation is unaffected by strength of signal from the generator.

Where IF oscillation is encountered, it is generally possible to correct the condition by detuning the IF coils in different directions. If that does not have the desired effect, increase fixed bias on AGC line by using a 4½ volt battery instead of the 3 volt battery referred to in instruction #3. After stopping the oscillation in this manner it will then be possible to align all IF stages using the following procedure, however, the AGC bias battery must be changed back to 3 volts when using the oscilloscope to observe band pass characteristics. Once all stages have been aligned using the 4½ volt bias, the IF channel should be stable with reduced bias.

CHANNEL #12	Connect as shown in Fig. 13	Connect as shown in Fig. 13.	Set Channel Selector to #12 Be sure that Fine Tuning control has been properly positioned (tooth on the cam pointing down—see Fig. 9). During this step and thru-out all succeeding steps it is necessary to: 1. Keep output of sweep generator at a level that does not allow reading on VTVM to exceed one-half volt. 2. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.	#12 Oscillator	Adjust height of Oscillator trimmer #12 to be approximately 3/8" from the top of trimmer screw to the top surfoce of RF tuner unit (see Fig. 9). NOTE: Before making the following adjustment, advance the verticol gain control on the 'scope in order to magnify the sound portion of the response curve. Then, use o non-metollic screwdriver to odjust channel #12 oscillator slug (accessible thru hole on front of RF Tuner Unit—see Fig. 9) and shift response curve so that sound carrier marker is located at the position indicoted in Fig. 14. Now, reduce goin control setting of 'scope to restore pattern to normol omplitude ond observe position of picture carrier marker. This marker should appear at the 50% omplitude position on the low frequency side of the chorocteristic curve (see Fig. 14).
Some os above.	*215.75 MC. ‡211.25 MC.	Same as above.	CHANNEL #13	Same as above.	Same os above.	Set Chonnel Selector to #13		Adjust the RF sweep generotor and morker generotor for operotion on the other television chonnels; set morker generotor to sound corrier frequency. After setting Chonnel Selector to corresponding channel, odjust oscillotor slug thru hole on front of RF Tuner Unit (see Fig. 9). This permits response curve to be shifted so thot sound corrier marker will appear ot the position indicoted in Fig. 14. The picture corrier morker for the corresponding channel should then appear at the 50% amplitude position on the opposite side of the band poss chorocteristic curve. NOTE: Moke sure that com on fine tuning control shoft remains properly positioned during this step (tooth on the com pointing downword—see Fig. 9).
	*203.75 MC. ‡199.25 MC.		CHANNEL #11			Set Chonnel Selector to #11		
	*197.75 MC. ‡193.25 MC.		CHANNEL #10			Set Chonnel Selector to #10

	* 87.75 MC. ‡ 83.25 MC.		CHANNEL #6			Set Chonnel Selector to #6		
	* 81.75 MC. ‡ 77.25 MC.		CHANNEL #5			Set Chonnel Selector to #5		
	* 71.75 MC. ‡ 67.25 MC.		CHANNEL #4			Set Chonnel Selector to #4		
	* 65.75 MC. ‡ 61.25 MC.		CHANNEL #3			Set Chonnel Selector to #3		
	* 59.75 MC. ‡ 55.25 MC.		CHANNEL #2			Set Chonnel Selector to #2		

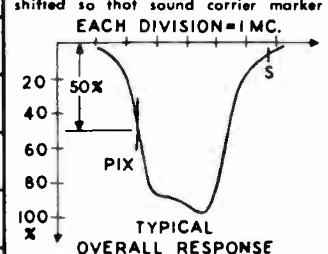

FIG. 10 TYPICAL OVERALL RESPONSE CURVE

If an oscillotor slug "falls into" its coil form during odjustment, remove the Chonnel Coil from the turret assembly ond lift the Slug Retaining Spring oside. By topping the coil form it should be possible to make the slug move toword the end so that its threods will be engoged by the Slug Retoining Spring when thot spring is returned to its normol position.

If an unsatisfoctory overall response is obtoined for o porticular channel, observe RF Amp. and Mixer response curve for that chonnel (os described on page 16). If choracteristic does not conform reasonobly well within the typicol curve shown in Fig. 8, then, (1) ottempt to obtain o better compromise for RF response on oll channels by reoligning RF Amp. ond Mixer circuits, or (2) try replocing Antenna, RF ond Oscillotor coils for the porticulor channels.

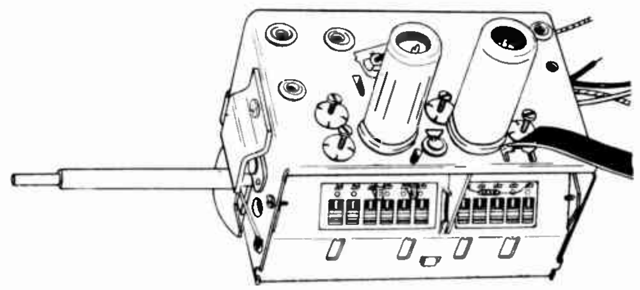
REPAIR DATA FOR W520450 RF TUNER UNIT

All replacement parts for the RF Tuner Unit are included in the complete receiver parts list



R.F. TUNER CIRCUIT DESCRIPTION

The turret type tuner W520450 is of the latest design and incorporates a 6BK7 tube (V4) as the R.F. Amplifier and a 6J6 tube (V5) as the Mixer-Oscillator.

Channel selection is accomplished by rotation of the turret containing two sets of easily removable coil assemblies for each channel. The individual antenna coil sections consist of a balanced primary to minimize noise pick-up on the transmission line and an R.F. grid coil which couples the incoming signal to the grid of the first section of the 6BK7 R.F. Amplifier tube. The inductance and amount of coupling of the tuned antenna input circuit are changed for each channel so that a constant input impedance of 300 ohms is maintained. This provides maximum transfer of energy to the R.F. Amplifier stage, particularly when interconnection between an outdoor antenna and the receiver is made with 300 ohm transmission line.

The 6BK7 R.F. Amplifier is a dual-triode tube and is connected in the circuit as a direct coupled grounded-grid type amplifier. This circuit was developed to meet the demand for an R.F. Amplifier that would provide more nearly equal gain on both the low and high Television Channels, while keeping inherent tube noise to a minimum. The circuit can be thought of very simply as two triode tubes in series, the first or driver unit acting not as an amplifier, but rather as an antenna impedance matching device and also as a variable cathode impedance, or bias source, for the second, or grounded-grid unit. In addition the first unit of the 6BK7 acts as a power amplifier due to its extremely low plate impedance, which is in reality the cathode circuit of unit two, and converts the weak signal voltage from the antenna to a low voltage-high current signal which is then applied to the cathode of unit number two. The signal coupling unit between the first and second units is a series peaking coil, symbol 406, similar to that found in a video amplifier circuit. Its purpose is to form a series resonant circuit with the input capacity of the second unit. The coil is so made as to resonate at a frequency slightly higher than channel 13. In a standard pentode type amplifier, the gain falls off rapidly as progressively higher channels are selected. With the use of the plate to cathode peaking coil an almost equal gain can be realized for all channels.

The 6BK7 tube has inherently low interelectrode capacity due to physical design and this factor in conjunction with the low output impedance of the first section is responsible for the low noise factor at this stage. While neutralization of the first unit is not necessarily due to its low plate to grid capacity, additional noise reduction has been realized, with only a slight decrease in gain, by the addition of a neutralizing condenser, item 405. Due to the low output impedance of the stage, it is not necessary that the neutralizing condenser be tunable.

Because of the circuits' excellent internal shielding, low input impedance and radiation rejection, the second section of the 6BK7 is connected as a driven grounded-grid amplifier. While this might not be apparent at first glance due to the fact that grid has no direct D.C. return, it will be found upon further examination that any high frequency A.C. potentials are by-passed to ground through condenser 407.

The second section of turret coils includes the tuned R.F. amplifier plate coil, tuned mixer grid coil, and oscillator coil. The output of the R.F. amplifier stage is coupled to the grid of the mixer stage, which utilizes one triode section of a 6J6 tube (V5). The other half of the 6J6 is connected as a modified Colpitts oscillator which injects oscillator voltage into the mixer stage through coupling between the oscillator coil and the mixer grid coil. Course oscillator tuning is accomplished by adjusting the positions of the slugs in the individual oscillator coils, while Fine Tuning is obtained when using condenser #417 in the oscillator plate circuit. This Fine Tuning condenser is composed of two fixed plates, and its capacitance is changed by the insertion of a bakelite cam between these plates.

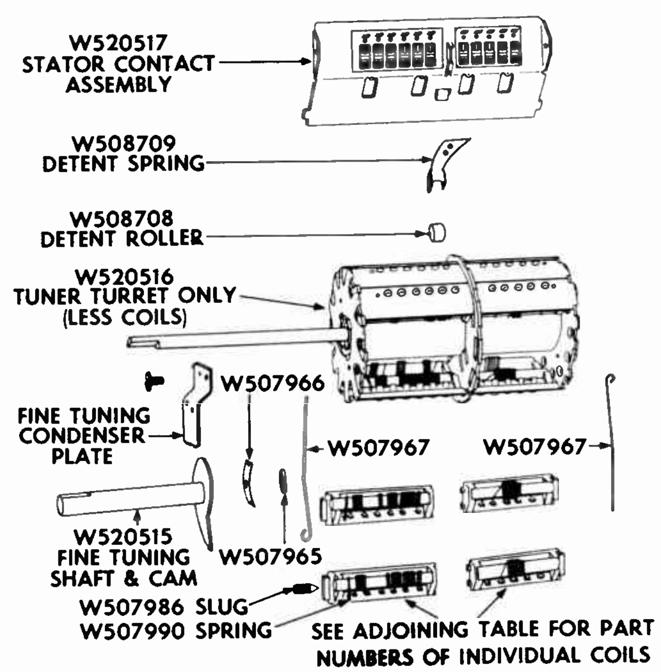
Signal output from the mixer stage is coupled to the IF amplifiers through the converter plate I.F. coil, diagram #427, located on the tuner unit.

SERVICE PRECAUTIONS

SUBJECT	PRECAUTIONS
ELECTRICAL COMPONENTS	The high frequencies used in the RF section of a television receiver make it necessary that considerable care be exercised in servicing the tuner. Lead dress and location of components are very critical at these frequencies. When replacing parts, it is important to use components of identical electrical characteristics and physical size. Always reconnect the replacement item in the same location and position in the tuner as the original component.
TUBES	Replacement of tubes in the Tuner Unit may cause slight detuning of RF circuits due to inherent differences in inter-electrode capacitances. When replacing tubes (especially 6J6 mixer-oscillator tube) make sure that Fine Tuning control will tune in television stations at approximately the middle of its range. It may be necessary to change the setting of the individual oscillator coil slugs for some channels to accomplish this.
CHANNEL COILS AND SLUGS	Channel Coils must be handled with care. **Do not disturb coil windings.** If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position.
FINE TUNING CONTROL	Rubbing of the bakelite Fine Tuning Cam against the Fine Tuning Condenser Plate is intentional in order to avoid vibration with resulting microphonics. However, the Fine Tuning Cam should **not** rub or contact the small circular plate located on the body of the tuner.

REMOVAL AND REPLACEMENT OF PARTS

ITEM	PROCEDURE
RF TUNER UNIT	To remove the Tuner Unit from receiver chassis, proceed as follows: 1. Remove screws which hold tuner to front and rear support brackets. 2. Disconnect the leads from the tuner to the main chassis. See illustration on circuit diagram page showing tuner connections. 3. Tuner unit may now be withdrawn from underside of chassis.
CHANNELS COILS	It is not necessary to remove entire tuner unit to replace a snap-in channel coil but removal of bottom shield will be required. This may be accomplished by grasping the front end of the shield and pulling downward and unhooking it from rear of tuner frame. Insert a screwdriver blade between Coil Retainer Spring and the end of the Tuner Turret. Twist the blade to pull spring away from the molded body of Channel Coil. Lift this end of coil body upward and remove individual coil assembly from tuner. When replacing Channel Coils, be sure they are reinstalled in their correct positions. Coil numbers should increase consecutively in a counter-clockwise direction when tuner is viewed from the front. If all the Channel Coils have been removed from the Tuner Turret, rotate turret until flat surface on end of tuner shaft points down. Install #3 Channel Coils into bottom position on turret. Then follow the correct sequence indicated above to replace other coils.
TUNER TURRET ASSEMBLY	To remove turret from RF Tuner Unit, remove complete tuner and bottom shield as described in section entitled "Channel Coils" and proceed as follows: 1. Remove rear Turret Shaft Retaining Spring by disengaging straight end of spring from projection on tuner frame. 2. Remove Fine Tuning Condenser Plate from front of Tuner Unit. This plate forms one side of Fine Tuning control condenser and is held in place by one screw. 3. Slide Fine Tuning Cam and Shaft off of main Channel Selector Shaft. 4. Remove Spring Contactor Washer and Fiber Spacer Washer from Channel Selector Shaft. 5. Remove Shaft Retaining Spring at front of tuner by disengaging straight end of spring from projection on frame. 6. Remove turret assembly from frame. To replace turret, reverse the above procedure. Tooth on bakelite Fine Tuning Cam should point downward during assembly so that it does not become locked between the stops on the Fine Tuning Condenser Plate. Also be sure to replace bottom shield.
STATOR CONTACT ASSEMBLY	To remove this assembly, remove complete tuner as described in section entitled "Channel Coils" and proceed as follows: 1. Remove side shield by taking out the two retaining screws and unsolder shield at one point. Now, disengage shield from upper edge of tuner frame. 2. Remove the two screws at the front and rear of the Stator Contact Assembly. 3. Unsolder all electrical connections to contact plate. 4. Unsolder five soldered joints between Stator Contact Assembly and Tuner Unit. 5. Contact Assembly may now be withdrawn from frame. To reinstall this assembly: 1. Place Stator Contact Assembly in position and replace, but do not tighten, the two screws at the front and rear of the assembly. 2. Remove 3 consecutive pairs of Channel Coils from the turret (for example, the antenna and rf-osc. coils for channels #5, 6 and 7). 3. Position Tuner Turret so that the edges of the next highest Channel Coils (in this case, the coils for channel #8) just pass the row of 11 contacts on the Stator Contact Assembly. 4. Adjust position of the Stator Contact Assembly so that there are a few thousandths of an inch spacing between the contacts on the contact plate and the molded body of the Channel Coils. 5. The Contact Assembly is now correctly positioned and screws at front and rear may be tightened. 6. Solder Stator Contact Assembly to tuner frame at same points that were used previously. 7. Make all electrical connections to contact plate. 8. Replace Channel Coils. 9. Replace side shield.



CHANNEL NUMBER	ANTENNA COIL PART NUMBER	RF & OSC COIL PART NUMBER

HOW TO ORDER PARTS

1. Use Correct Order Form.
2. On the Purchase Order always give the following information:
   (a) PART NUMBER (number printed on the part if different from that shown in this list) and DESCRIPTION for each part ordered. When no part number is assigned, order by description and rating. Also give PRICE of part (indicate if no selling).
   (b) The CHASSIS NUMBER, which is 100.208, will be found on a metal plate at the rear of the chassis.

In all correspondence relating to cabinets, always mention the source code letter stamped into the bottom of table models, and the CATALOG NUMBER shown on the sticker on the back, bottom or inside of cabinet.

PARTS LIST FOR CHASSIS

Notice: Some parts listed below have special characteristics. Do not use substitutes for replacement purposes.

PARTS LIST FOR CHASSIS (Contd.)

SCHEMATIC LOCATION	PART NO.	DESCRIPTION	LIST PRICE
		RESISTORS—Continued	
418	W510148	Resistor—carbon 4700 Ohms ± 10% ½ watt	$ .12
419	W510179	Resistor—carbon 220,000 Ohms ½ watt	.12
422,423	W510154	Resistor—carbon 10,000 Ohms ± 10% ½ watt	.12
424	W510101	Resistor—carbon 10 Ohms ½ watt	.12
426	W510158	Resistor—carbon 15,000 Ohms ½ watt	.12
		COILS AND TRANSFORMERS	
12	W509378	Transformer—audio take-off	1.50
20	W509706	Transformer—TV sound discriminator (includes condensers 20-A and 20-B)	3.00
40	W509376	Transformer—audio output	1.85
96	W507343	Coil—1st video I.F. (less slug)	.70
	W507357	Slug core for 1st video I.F. coil	.20
103	W507367	Coil—choke	.70
105	W507343	Coil—2nd video I.F. (less slug)	.70
	W507357	Slug core for 2nd video I.F. coil	.20
112	W509613	Coil—3rd video I.F. (less slug)	.60
	W507357	Slug core for 3rd video I.F. coil	.20
115	W507367	Coil—choke	.70
121	W509340	Coil—peaking	.55
122	W509342	Coil—peaking	.60
127	W509603	Coil—4.5 Mc. trap (includes slug and condenser #128)	1.20
	W507357	Slug core for 4.5 Mc. trap	.20
129	W509341	Coil—peaking	.60
132	W509342	Coil—peaking	.60
142	W162326	Coil—focus (includes cable and plug)	14.00
146	W115228	Yoke—picture tube deflection (includes cable and plug)	12.50
172	W508967	Coil—Horizontal Hold (includes slug and clip)	1.10
	W508963	Slug core for Horizontal Hold coil	.15
192	W509384	Transformer—horizontal sweep	12.50
193	W509361	Coil—Width (includes slug and clip)	2.00
	W507429	Slug core for Width coil	.60
201	W509380	Transformer—power	17.00
202	W507584	Coil—choke	.28
204	W507584	Coil—choke	.28
206	W507584	Coil—choke	.28
209	W508341	Choke—filter	3.60
214	W507584	Coil—choke	.28
221	W508076	Transformer—vertical blocking oscillator	1.90
233	W509375	Transformer—vertical output	4.00
401	W520502	Coil-antenna; channel #2 (coded "2K")	1.40
	W520503	Coil-antenna; channel #3 (coded "3K")	1.40
	W520504	Coil-antenna; channel #4 (coded "4K")	1.40
	W520505	Coil antenna; channel #5 (coded "5K")	1.40
	W520506	Coil-antenna; channel #6 (coded "6K")	1.40
	W520507	Coil-antenna; channel #7 (coded "7K")	1.15
	W520508	Coil-antenna; channel #8 (coded "8K")	1.15
	W520509	Coil-antenna; channel #9 (coded "9K")	1.15
	W520510	Coil-antenna; channel #10 (coded "10K")	1.15
	W520511	Coil-antenna; channel #11 (coded "11K")	1.15
	W520512	Coil-antenna; channel #12 (coded "12K")	1.15
	W520513	Coil-antenna; channel #13 (coded "13K")	1.15
406	W520514	Coil-cathode coupling	—
413	W520522	Coil-R.F. and osc.; channel #2 (coded "2K")	1.85
	W520523	Coil-R.F. and osc.; channel #3 (coded "3K")	1.85
	W520524	Coil-R.F. and osc.; channel #4 (coded "4K")	1.85
	W520525	Coil-R.F. and osc.; channel #5 (coded "5K")	1.85
	W520526	Coil-R.F. and osc.; channel #6 (coded "6K")	1.85
	W520527	Coil-R.F. and osc.; channel #7 (coded "7K")	1.70
	W520528	Coil-R.F. and osc.; channel #8 (coded "8K")	1.70
	W520529	Coil-R.F. and osc.; channel #9 (coded "9K")	1.70
	W520530	Coil-R.F. and osc.; channel #10 (coded "10K")	1.70
	W520531	Coil-R.F. and osc.; channel #11 (coded "11K")	1.70
	W520532	Coil-R.F. and osc.; channel #12 (coded "12K")	1.70
	W520533	Coil-R.F. and osc.; channel #13 (coded "13K")	1.70
	W507986	Slug for osc. coil; auxiliary fine tuning adj.	.05

SCHEMATIC LOCATION	PART NO.	DESCRIPTION	LIST PRICE
		COILS AND TRANSFORMERS—Continued	
427	W520501	Coil-converter plate (I.F.) (includes slug and clip)	$ .55
	W509062	Slug core for converter plate coil	.12
434	W520518	Coil-choke	.10
436	W520520	Coil-choke	.10
		CONTROLS	
27-A,B,C	W520292	Volume and Contrast control (includes OFF-ON switch) A—Volume control; 1 Meg ¼ watt B—Contrast control; 750 Ohms 2 watt C—Off-On switch	3.50
138	W509893	Brightness potentiometer (100,000 Ohms)	1.00
172	W508967	Horizontal Hold coil (includes slug and clip)	1.10
	W508963	Slug core for Horizontal Hold coil	.15
180	W520127	Horizontal Drive trimmer condensor (25-280 Mmfd.)	.50
193	W509361	Width coil (includes slug and clip)	2.00
	W507429	Slug core for Width coil	.60
224-A, B	W508893	Height and Vertical Hold potentiometers A—Vertical Hold control; 1 Meg. B—Height control; 2.5 Meg.	1.75
232-A,B	W509302	Vertical Linearity and Focus potentiometers A—Vertical Linearity control; 5,000 Ohms ½ watt B—Focus control; 10,000 Ohms ±10% 4 watt	3.75
417	*	Fine Tuning condenser (3.5 Mmfd)	—
		OTHER ELECTRICAL PARTS	
41	W509398	Speaker—P.M. Dynamic (6") for Model 1176-21	4.50
	W508174	Speaker—P.M. Dynamic (6" x 9"); for Model 1186-21	8.40
116	W509386	Crystal detector	2.00
141	W509688	Ion trap	.85
191	W508063	Fuse for horizontal sweep circuit; ¼ Amp. 250 volt	.30
220-A to G	W508062	Integrator Coupling Unit A—Condenser—ceramic .01 Mfd. 450 volt B—Resistor—carbon 22,000 Ohms ⅓ watt C—Condenser—ceramic 2000 Mmfd. 450 volt D—Resistor—carbon 8200 Ohms ⅓ watt E—Condenser—ceramic 5000 Mmfd. 450 volt F—Resistor—carbon 8200 Ohms ⅓ watt G—Condenser—ceramic 5000 Mmfd. 450 volt	1.40
240	W509517	Fuse; 1 Amp.; 250 volt	.25
400	W509695	Built-in antenna	1.00
		MECHANICAL PARTS OF R.F. TUNER (for electrical parts see preceding classified listings of condensers, resistors and coils)	
	W520450	R.F. tuner complete with coils and tubes	37.50
	W508081	Bracket for mounting R.F. tuner (front)	.16
	W520233	Bracket for mounting R.F. tuner (rear)	.25
	W507339	Clip for mounting video converter plate coil	.10
	W520515	Fine Tuning cam and shaft	.70
	W508708	Roller—detent	.10
	W520535	Shield, bottom cover	.50
	W520536	Shield, side cover	.35
	W520534	Shield-tube; miniature for 6J6 tube	.15
	W520519	Shield-tube; miniature for 68K7 tube	.20
	W509062	Slug core for converter plate coil	.12
	W507986	Slug for osc. coil; auxiliary fine tuning adj.	.05
	W507987	Socket—miniature (7 pin) for 6J6 (includes base for mounting shield)	.45
	W520521	Socket—miniature (9 pin) for 6BK7 (includes base for mounting shield)	.50
	W507966	Spring—contactor washer (on front turret shaft)	.08
	W508709	Spring—detent	.08
	W507990	Spring—retains osc. fine tuning slug	.10

*—This part is not supplied as a Service replacement item.

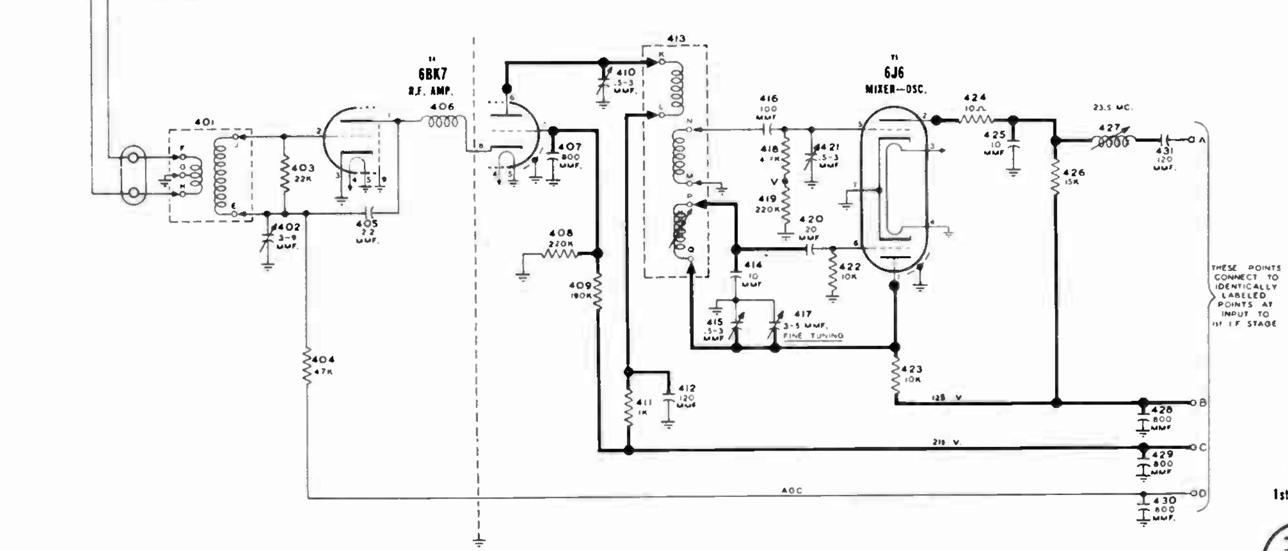
SCHEMATIC LOCATION	PART NO.	DESCRIPTION	LIST PRICE
		MECHANICAL PARTS OF R.F. TUNER—Continued	
	W507967	Spring—turret shaft retaining	$ .03
	W520517	Stator contact assembly (includes 11 contacts and metal frame)	3.75
	W520516	Tuner turret and shaft assembly (less coils)	3.00
	W507965	Washer, fiber spacer (on turret shaft)	.01
		CABINET PARTS	
	W115226	Back for cabinet on Model 1176-21	3.00
	W115225	Back for cabinet on Model 1186-21	3.00
	W520460	Cabinet for Model 1176-21 (Table model)	55.00
	W520400	Cabinet for Model 1186-21 (Console model)	90.00
	W520437	Escutcheon for glass window	10.00
	W520435	Glass window	10.00
	W520454	Hinge bracket for name plate	.60
	W520441	Knob, channel selector	1.00
	W520440	Knob, Fine Tuning	.30
	W520439	Knob, "OFF-VOLUME-PICTURE"	1.00
	W520438	Knob, Picture	.30
	W520436	Mask for picture tube	8.00
	W520455	Name plate (less hinges and springs)	2.00
	W170986	Screw—#6-32 Philips oval brass head; retains escutcheon	.02
	W18796	Screw—#10 x 1"; mounts TV chassis	.02
	W520453	Spring for hinge on name plate	.15
	W162163	Terminal strip for TV antenna connections	.22
		MISCELLANEOUS PARTS	
	W301270	Base for mounting electrolytic condenser	.06
	W508153	Bracket base for support of yoke and focus coil (left or right hand)	.25
	W520425	Bracket, chassis extension (left hand)	1.50
	W520426	Bracket, chassis extension (right hand)	1.50
	W520312	Bracket for mounting picture tube (left hand)	1.00
	W520311	Bracket for mounting picture tube (right hand)	1.00
	W520424	Bracket for mounting pre-set controls	.75
	W508081	Bracket for mounting R.F. tuner (front)	.16
	W520233	Bracket for mounting R.F. tuner (rear)	.25
	W509005	Bracket mounts yoke and focus coil	2.75
	W508154	Bracket ("U" shaped) for support of yoke and focus coil	.55
	W508964	Clip for mounting Horizontal Hold or Width coil	.04
	W505101	Clip for mounting sound take-off transformer	.05
	W507339	Clip for mounting video converter plate, 1st video I.F., 2nd video I.F., 3rd video I.F., or 4.5 Mc. trap coil	.10
	W520428	Connector for H.V. terminal (includes cap and lead)	1.00

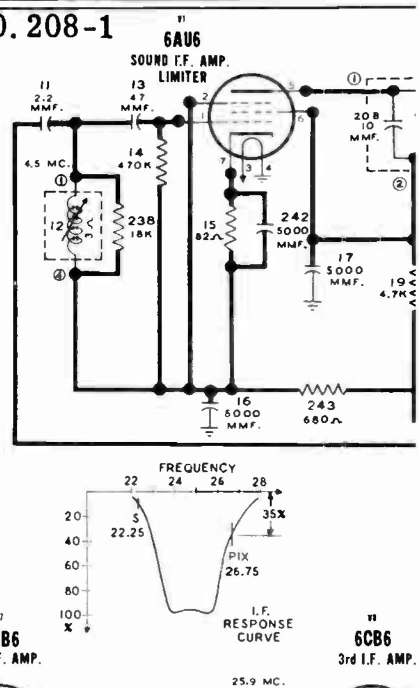
SCHEMATIC LOCATION	PART NO.	DESCRIPTION	LIST PRICE
		MISCELLANEOUS PARTS—Continued	
	W509688	Ion trap	$ .85
	*	Jumper for color socket—1¼" of #11 wire	—
	W508617	Nut for retaining focus coil	.12
	W508962	Nut on end of Horizontal Hold control slug	.10
	W508878	Plug (3 pin) for focus coil leads	.25
	W508515	Plug (8 pin) for yoke cable	.70
	W507699	Power cord assembly (includes plugs at both ends)	1.00
	W509383	Ring—corona shield	.10
	W520313	Ring, insulating for mounting picture tube	3.50
	W507422	Rubber sleeve between neck of picture tube and focus coil	.30
	W507793	Rubber spacer support between flared neck of picture tube and yoke bracket	.15
	W18796	Screw—#10 x 1"; mounts TV chassis	.02
	W162353	Shield for 3rd I.F. coil and crystal detector	.30
	W162138	Shield—H.V. supply (front section)	2.70
	W508088	Shield—H.V. supply (rear section)	2.10
	W520534	Shield—tube; miniature for 6J6 tube	.15
	W520519	Shield—tube; miniature for 68K7 tube	.20
	W520429	Sleeve, insulating for picture tube (includes H.V. contact)	3.00
	W509062	Slug core for converter plate coil	.12
	W507357	Slug core for 1st, 2nd or 3rd video I.F. coil or 4.5 Mc. trap coil	.20
	W508963	Slug core for Horizontal Hold coil	.15
	W507429	Slug core for Width coil	.60
	W520097	Socket and cable assembly for picture tube	1.20
	W162334	Socket assembly for 1X2A tube (includes mounting frame)	1.25
	W508879	Socket (3 pin) for focus coil leads	.35
	W508419	Socket (8 pin) for yoke cable	.70
	W507932	Socket—male, power cord interlock	.25
	W507364	Socket—miniature (7 pin)	.24
	W507987	Socket—miniature (7 pin) for 6J6 (includes base for mounting shield)	.45
	W508044	Socket—miniature (9 pin)	.35
	W509507	Socket—miniature (9 pin) (for 12AU7 tube)	.25
	W520521	Socket—miniature (9 pin) for 6BK7 (includes base for mounting shield)	.50
	W508703	Socket—octal	.15
	W508703	Socket—octal (for color TV adapter)	.15
	W506469	Socket—octal (for 6W4 tube)	.18
	W509320	Spring—tension for focus coil mounting	.10
	W520444	Strap, anchor for picture tube	.65
	W115229	Strap, tube retaining	1.50
	W520443	Support for tuner shaft (plastic)	.04
	W520488	Tab, U.H.F., for Selector knob	.15
	W162163	Terminal strip for TV antenna connection	.22
	W170195	Wing nut—#8-32; for mounting yoke and focus coil	.10
	W170817	Wing screw—#10-24; for height adj. of yoke and focus coil	.05
	W170741	Wing screw—#10-32; for mounting or forward adj. of yoke	.10

*—This part is not supplied as a Service replacement item.

MODEL 2195-21, Ch. 100. 208-1

TELEVISION CHASSIS 100.208-1





PRODUCTION CHANGES

The following tabulation furnishes complete details on circuit changes which occurred during early television chassis production. The circuit shown on this page includes all of these changes.

1. The following change was incorporated so that proper centering can be obtained without introducing neck shadow and chassis that incorporate this change are coded "SERIES A" which is stamped on rear surface of chassis.
   a. Yellow lead of focus coil 142 was disconnected from 315 volt supply and reconnected to pin 7 of deflection yoke socket.

OSCILLOGRAMS

All oscillograms taken with ground lead of 'scope connected to receiver chassis (unless otherwise indicated) and with receiver controls set for normal reception of a station transmitting its standard test pattern.

Number appearing below asterisk specifies setting of horizontal sweep frequency control on 'scope.

*—This symbol on illustration indicates that wave form was observed on a 'scope whose vertical amplifier had very limited high frequency response (50 to 100 Kc).

**—This symbol indicates that wave form was observed on a 'scope whose vertical amplifier frequency response was flat to within 20% up to 2 Mc.

PRODUCTION CHANGES

The following tabulation furnishes complete details on circuit changes whic production. The circuit shown on this page includes all of these changes.

1. The following change was incorporated to improve the stability of the
   a. Resistor 321 (10 Meg.) was removed from the grid circuit of tube was connected from pin 4 of tube V9B to 140 volt supply.
2. The following changes were incorporated to provide increased width.
   a. Resistor 325 (33,000 Ohms) was connected in parallel across resistor
   b. Condenser 235, connected across the width coil 237, was changed from

RADIO-TV SELECTOR SWITCH 520545

GENERAL DESCRIPTION

MODEL 2195-21

The information contained in this service RL Supplement covers number 2195-21. This is a combination receiver containing a 21" picture tube, an A.C. operated AM-FM radio receiver and a three speed, inter-mix type, phonograph.

The television section of this combination utilizes chassis 100.208-1 which is basically the same as chassis 100.208 The differences are a change in the size of speaker, the length of the A.C. line cord, and a addition of a junction box and selector switch to facilitate the changing from television to radio or phono operation. A complete circuit diagram and parts list, including production changes, for the 100.208-1 television chassis is furnished with this Supplement.

NOTE: For additional service data, see Chassis 100.208

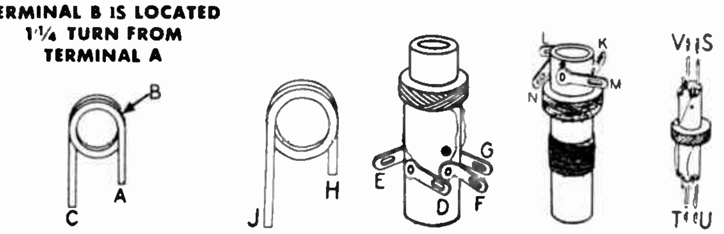
PRODUCTION CHANGES

The following tabulation furnishes complete details on circuit changes which occurred during early radio chassis production. The circuit shown on this page includes all of these changes.

1. The following change was incorporated to reduce hum. Radio receiver chassis that incorporates this change are coded "SERIES A" which is stamped on rear surface of chassis.
   a. Condenser 110 (.01 Mfd.) was added to one side of the A. C. power supply.

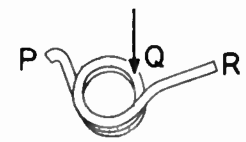
Lettered terminals in illustrations correspond to similarly lettered terminals on the circuit diagram.

TERMINAL B IS LOCATED 1¼ TURN FROM TERMINAL A

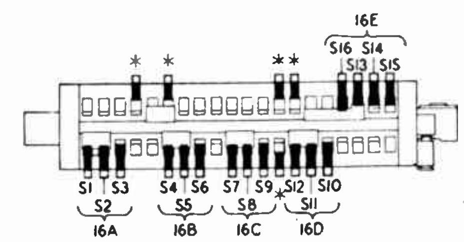


FM ANT. COIL 506353 | **FM R.F. COIL 506351** | **AM ANT. COIL 506354** | **AM R.F. COIL 506345** | **AM OSC. COIL 506335**

TERMINAL Q IS LOCATED ⅞ TURN FROM TERMINAL R



FM OSC. COIL 506352



★ Not used; may serve as wiring junction point.

BAND SWITCH 506347

HOW TO ORDER PARTS FOR YOUR SILVERTONE TELEVISION RECEIVER

These authorized replacement parts may be ordered through any Sears Retail Store or the Mail Order Store which serves the territory in which you live. Prices upon application from Sears, Roebuck and Co. The parts are shipped prepaid. When ordering parts, always give:

1. The PART NUMBER (number printed on the part if different from that shown in this list) and the DESCRIPTION. When no number is assigned order by description and rating.
2. The CHASSIS and CATALOG NUMBERS. The chassis number will be found on a metal plate at the rear of the chassis. This plate is pictured below. The catalog number will be found on a sticker on the back, inside or bottom of the cabinet.

PARTS LIST FOR TELEVISION CHASSIS 100.208-1

Notice: Some parts listed below have special characteristics. Do not use substitutes for replacement purposes.

SILVERTONE 2170-C
(21" RECTANGULAR PICTURE TUBE)

GENERAL DESCRIPTION

The information contained in this service Supplement cover number 2170-C.

This television receiver utilizes chassis 100.209 which is basically the same as chassis 100.208 The differences between the two chassis is that the 100.209 utilizes a 1B3GT type tube for H.V. Rectification. The associated Horizontal Sweep Transformer was also changed. In addition the 100.209 chassis uses a new Power Transformer.

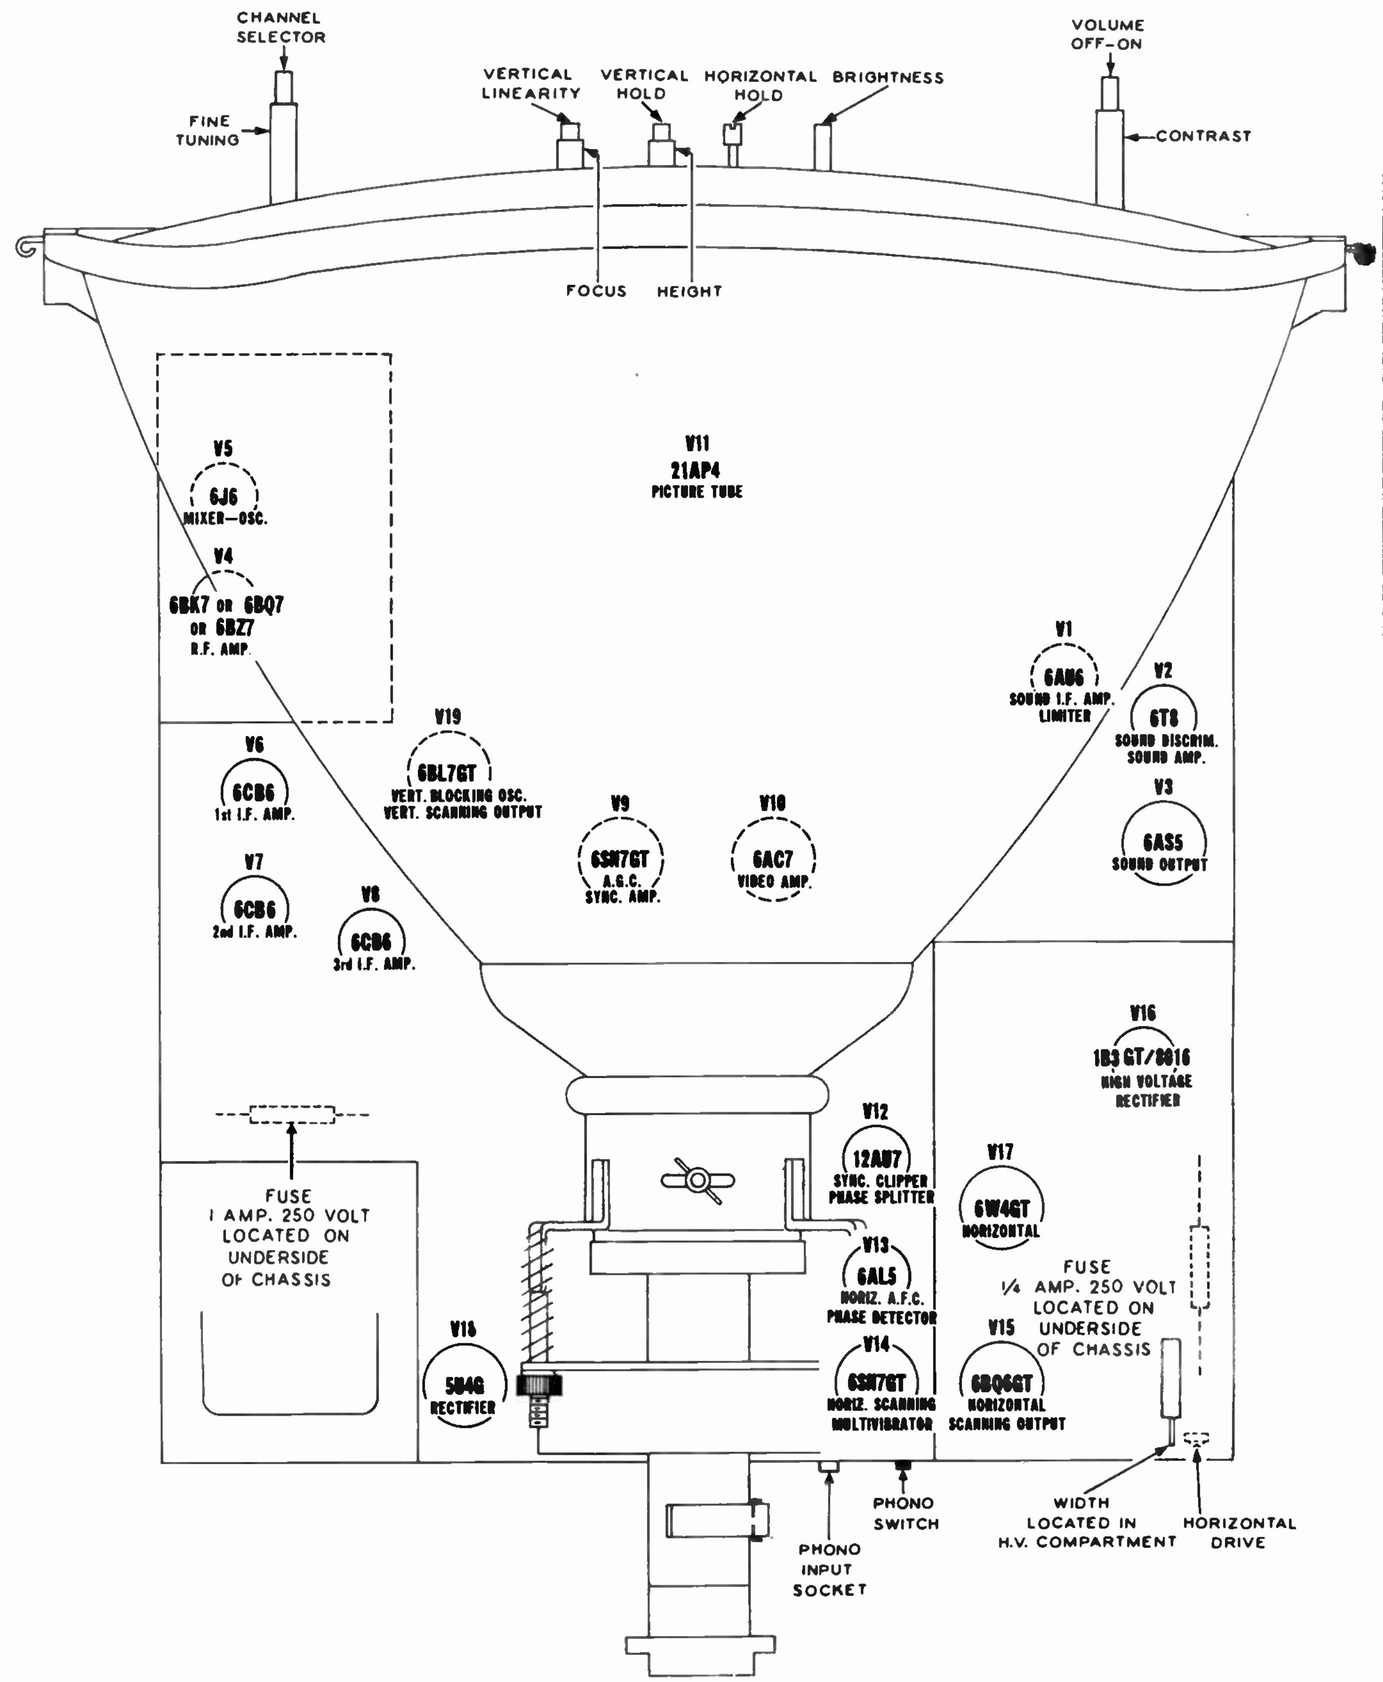
The correct Tube Location and Function Chart for the 100.209 chassis, and a new Socket Voltage Measurement Chart, are included in this Supplement.

When performing Oscillator Alignment on a 100.209 chassis which utilizes a W520645 R.F. Tuner (SERIES F or G) it will be noted that Oscillator Trimmer #12 has been omitted and therefore this step should be eliminated in the alignment procedure. On the W520645 R.F. Tuner instrument connection, point "V", shown in Fig. 12, has been moved to the location formerly occupied by trimmer #12.

The complete Schematic and Parts List for the 100.209 chassis is included with this RL Supplement. All production changes except for SERIES H are included on the schematic page. The SERIES H change is itemized in a subsequent section entitled Additional Production Changes.

For additional data, see Chassis 100.208.

TUBE LOCATIONS AND FUNCTIONS



PRODUCTION CHANGES

For a complete description of the changes as well as an explanation of the SERIES coding, refer to the heading "Production Changes," pg 47.

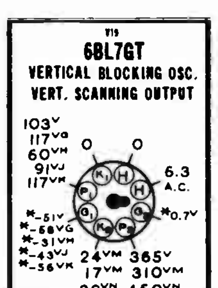
LETTER INCLUDED IN SERIES DESIGNATION	LOCATION OF VOLTAGE INFORMATION OR EFFECT OF CHANGE ON MEASUREMENT
"A"	Voltage readings token on a chassis thot incorporotes the letter "A" will be lower than those shown in the large chart by approximately 10%.
"B"	SERIES B Change does not affect circuit voltages.
"C"	Voltage readings taken on affected tube V26-6BL7 is shown in small chart below under the heading "SERIES C CHART."
"D"	No chassis were produced with the SERIES D designation.
"E"	No chassis were produced with the SERIES E designation.
"F" & "G"	Although R.F. tuner 520645 uses a 6BQ7 R.F. tube and tuner 520450 uses a 6BK7 R.F. tube, all tuner voltages are identical with the following exception. Pin 7 6BQ7 .... 150L Volts.
"H"	SERIES H Change does not affect circuit voltages.

ADDITIONAL PRODUCTION CHANGES

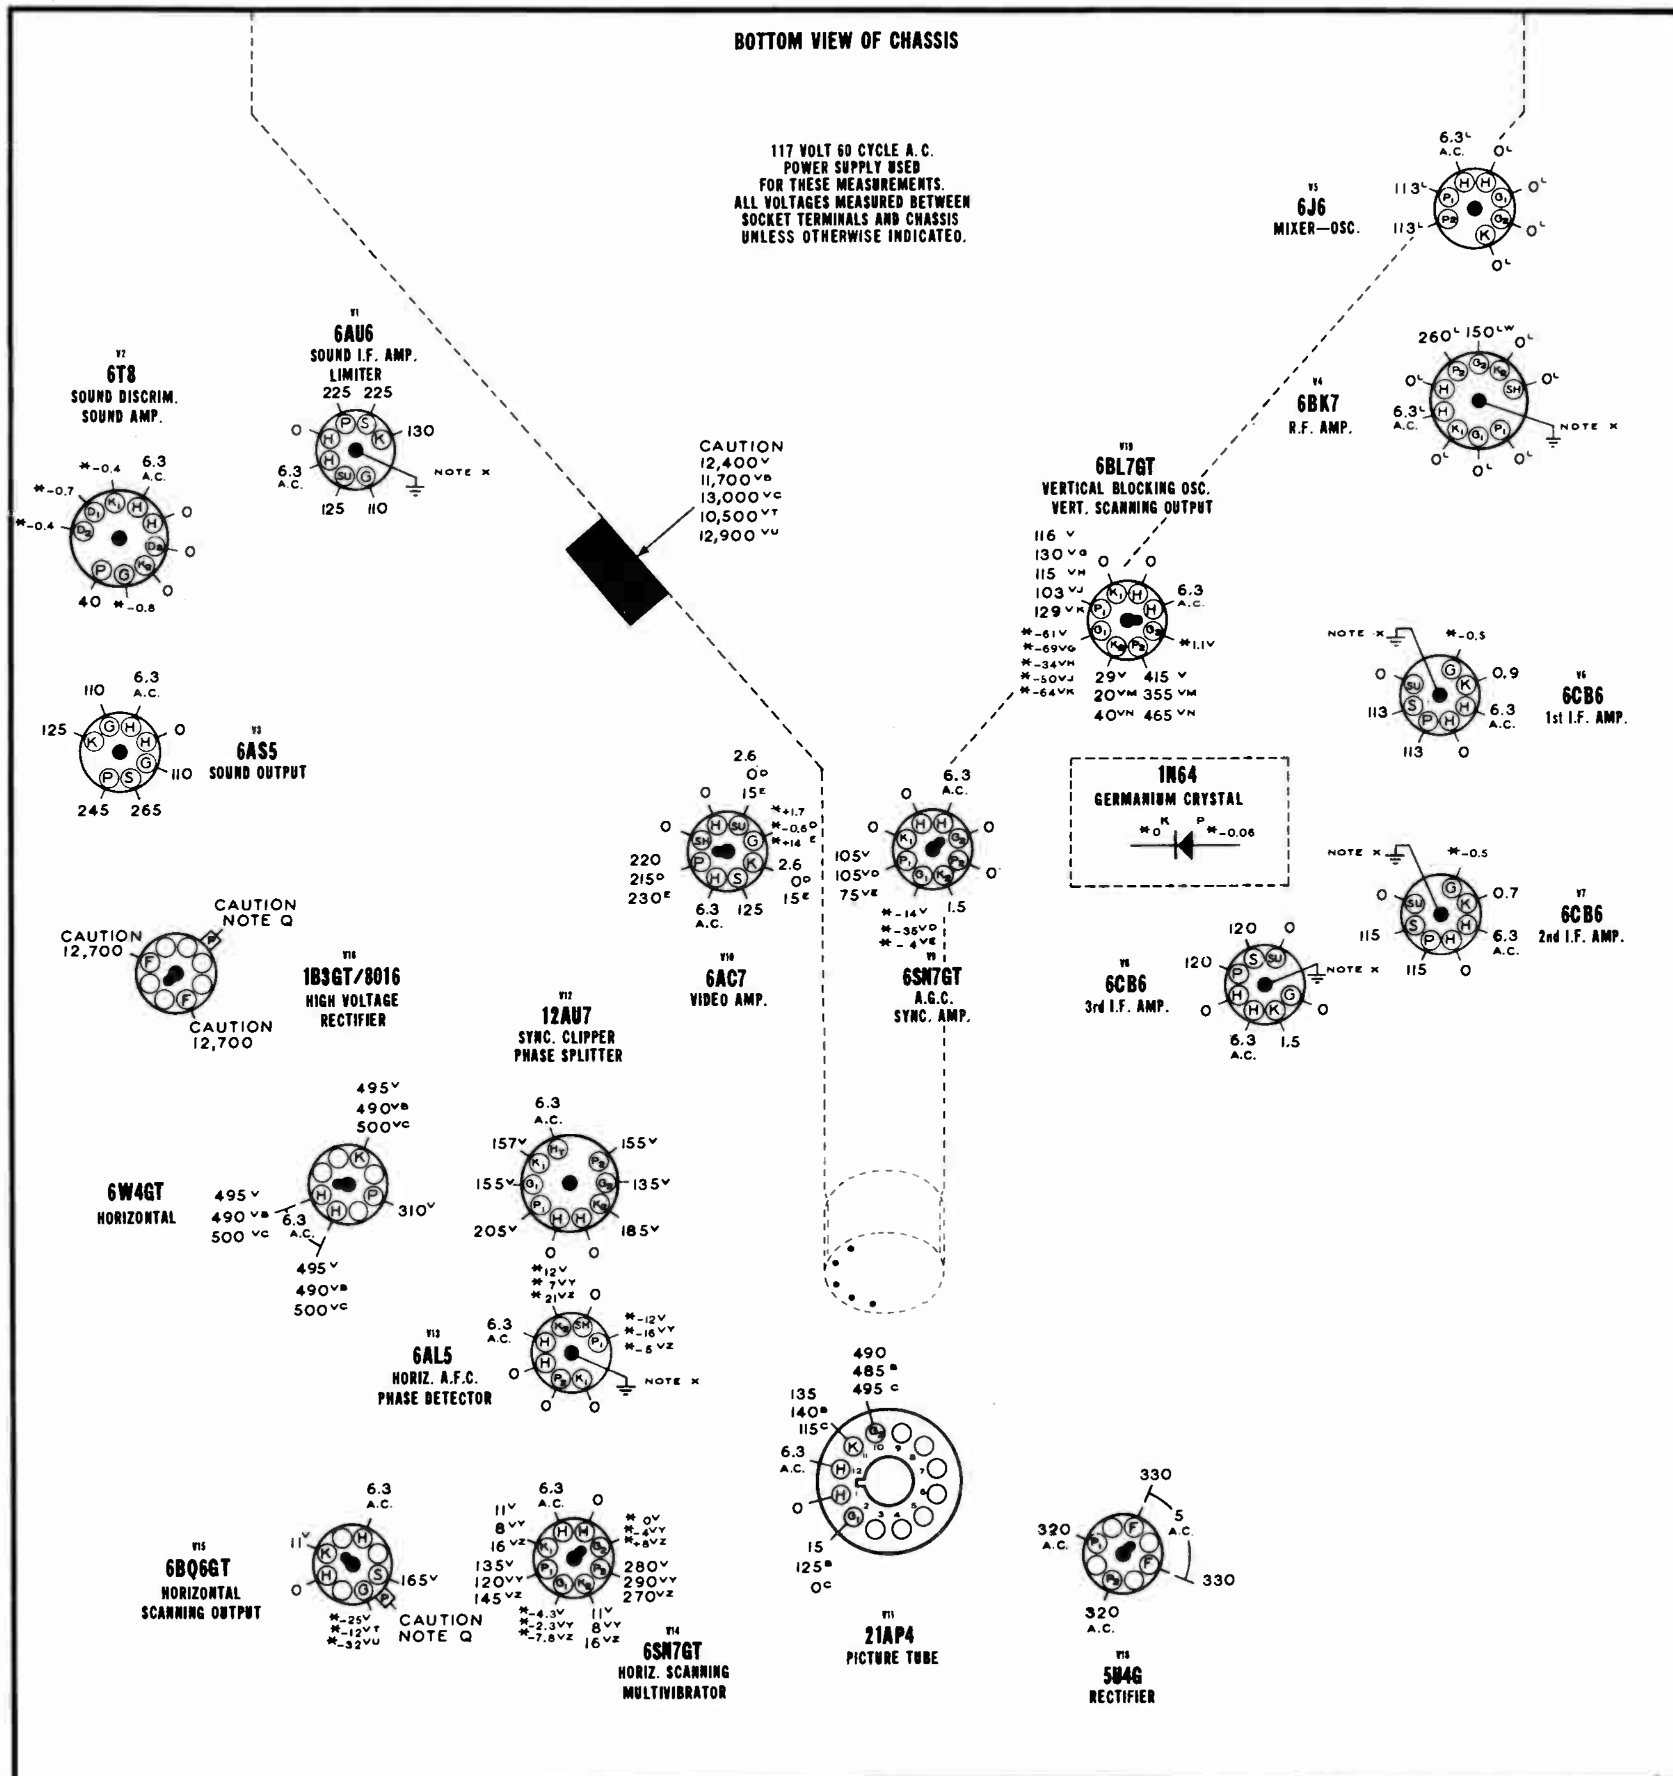
See schematic page for complete explanation of the SERIES coding as well as details on all previous changes.

LETTER DESIGNATION	DESCRIPTION OF CHANGE
"H"	The following change was incorporated to provide increase width when operating receiver at a line voltage that is below normal. 1. Condenser 235, connected across the width coil 237, was changed from .01 Mfd. to .02 Mfd. The above change is **not** to be undertaken if the SERIES coding at rear of chassis includes a letter "A".

SERIES "C" CHART



BOTTOM VIEW OF CHASSIS



REAR OF CHASSIS

SOCKET VOLTAGES

CAUTION

THE PICTURE TUBE is highly evacuated and if broken, glass fragments will be violently expelled. Scratching, chipping, undue pressure, or careless handling such as lifting the tube by its neck is dangerous and should be avoided. If it is necessary to handle the picture tube, use safety goggles and heavy gloves.

HIGH VOLTAGE (10 to 13 kilovolts) is produced in a supply circuit of this receiver. Exercise care to avoid contact with elements of this circuit and particularly the tube terminals which are labeled "CAUTION" in the adjoining voltage chart.

THE HIGH VOLTAGE LEAD, which supplies approximately 10 to 13 kilovolts to the picture tube, should be momentarily shorted to the chassis whenever it is disconnected for service purposes. This discharges the high voltage filter condenser and prevents a shock hazard when working on the receiver after it has been turned off.

INTERMEDIATE B+ VOLTAGES, are dangerous and caution should be observed when the receiver chassis components are exposed for service purposes.

THE VOLTAGES SHOWN IN THE ADJOINING CHART WERE MEASURED UNDER THE FOLLOWING CONDITIONS

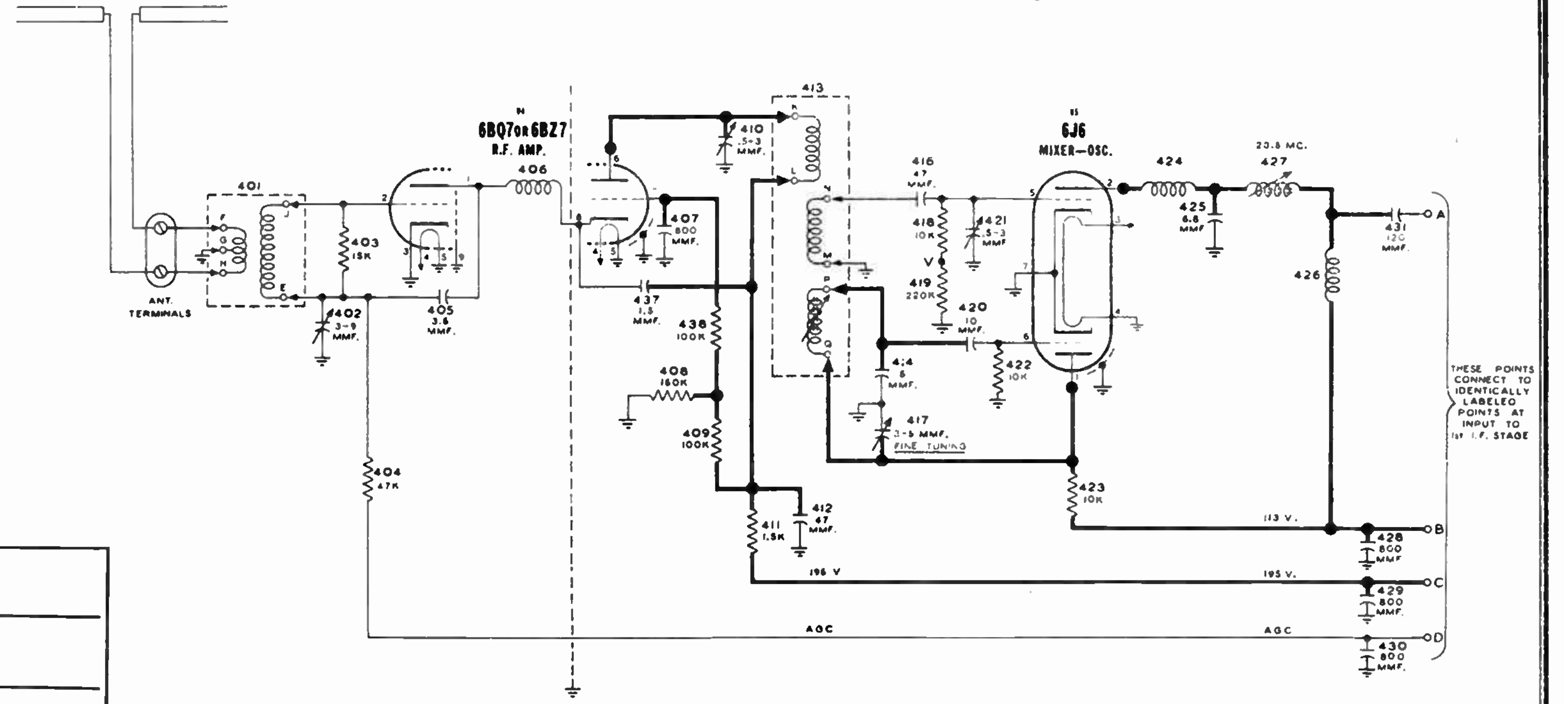
1.	Power Supply—117 volts 60 cycle AC.
2.	All voltages are measured between socket terminals and chassis unless otherwise indicated on adjoining chart.
3.	* Measurements made with voltmeter having sensitivity of 20,000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.
4.	Channel Selector and Fine Tuning Controls set for normal reception of a local station.
5.	All controls are set for normal reception of the transmitted signal unless the voltage shown on the chart is followed by a letter or letters indicating a special condition of measurement as explained in subsequent notes.
6.	The external or built-in antenna should remain connected to the receiver only when taking voltage measurements in the sweep and sync circuits—for all other measurements, disconnect antenna, short antenna terminals together and connect them to ground.
7.	Certain voltages were measured with two different settings of specific controls. It should therefore be understood that in these instances all controls, with the exception of one or two, were set for normal reception—letters following the voltage shown on the chart indicate the exceptions and are explained below.

EXPLANATION OF NOTES

B.	Brightness Control max. clockwise
C.	Brightness Control max. counter-clockwise
D.	Contrast Control max. clockwise
E.	Contrast Control max. counter-clockwise
G.	Height Control max. clockwise
H.	Height Control max. counter-clockwise

J.	Vertical Hold Control max. clockwise
K.	Vert. Hold Control max. counter-clockwise
L.	This voltage measurement was taken from the top of the tuner chassis with the tube removed from its socket.
M.	Vertical Linearity Control max. clockwise.
N.	Vertical Linearity Control max. counter-clockwise.
Q.	Do not attempt to measure the voltage at the tube cap. There is a high R. F. potential at this point.
R.	Channel Selector set to channel #4
S.	Channel Selector set to channel #9
T.	Horiz. Drive Control max. clockwise
U.	Horiz. Drive Control max. counter-clockwise.
V.	Before measuring this voltage, connect external antenna and adjust controls for normal reception of station signal.
W.	On early production tuners, the value of resistor 409 was 220,000 Ohms and consequently the voltage measured at pin 7 of tube V4 6BK7 R.F. Amp., may be reduced as low as 125 volts.
X.	Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.
Y.	Horiz. Hold Control turned in a clockwise direction until picture approaches loss of sync.
Z.	Horiz. Hold Control turned in a counter-clockwise direction until picture approaches loss of sync.

SCHEMATIC DIAGRAM FOR W520645 R.F. TUNER



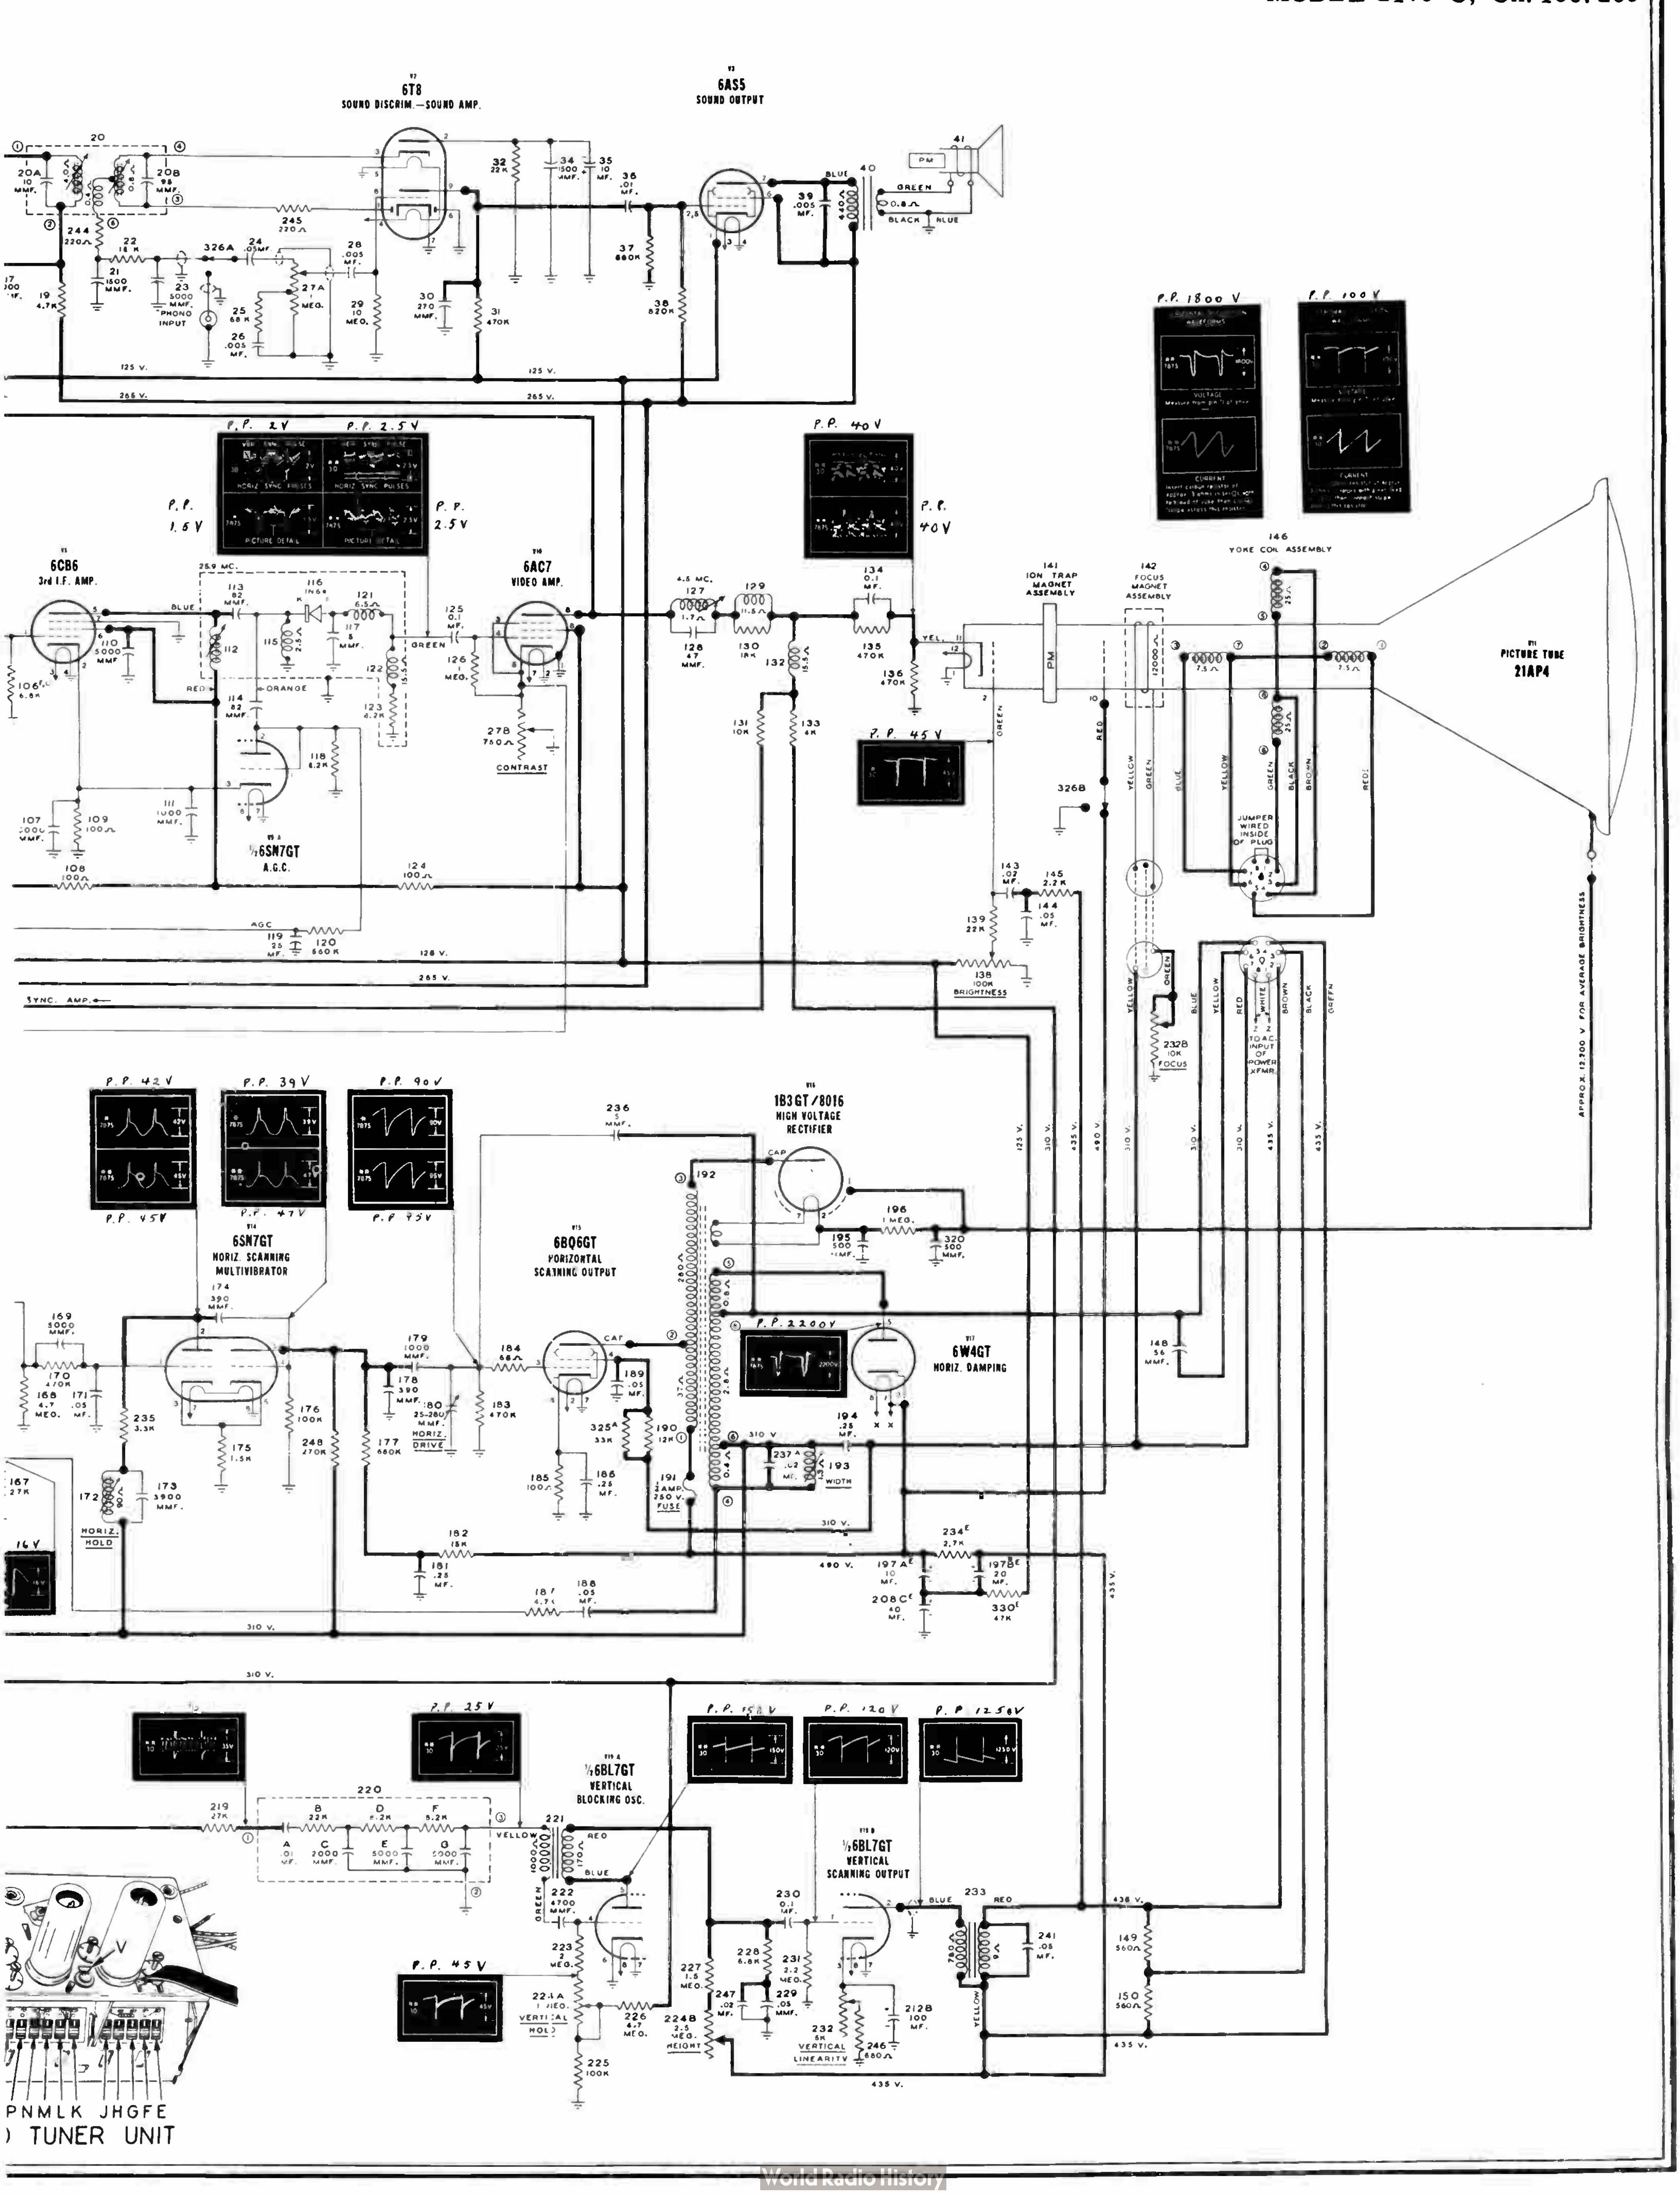
PRODUCTION CHANGES

The following tabulation furnishes complete details on changes which occurred during receiver production. The receivers incorporating these changes are identified by coding stamped on rear surface of chassis. This coding consists of one or more letters following the word SERIES, as SERIES B, SERIES AC, etc., and corresponds to similarly lettered changes shown below. Chassis incorporate only that change indicated by letter designation; i.e., chassis stamped "SERIES BE" does not include changes "A" or "C" or "D"

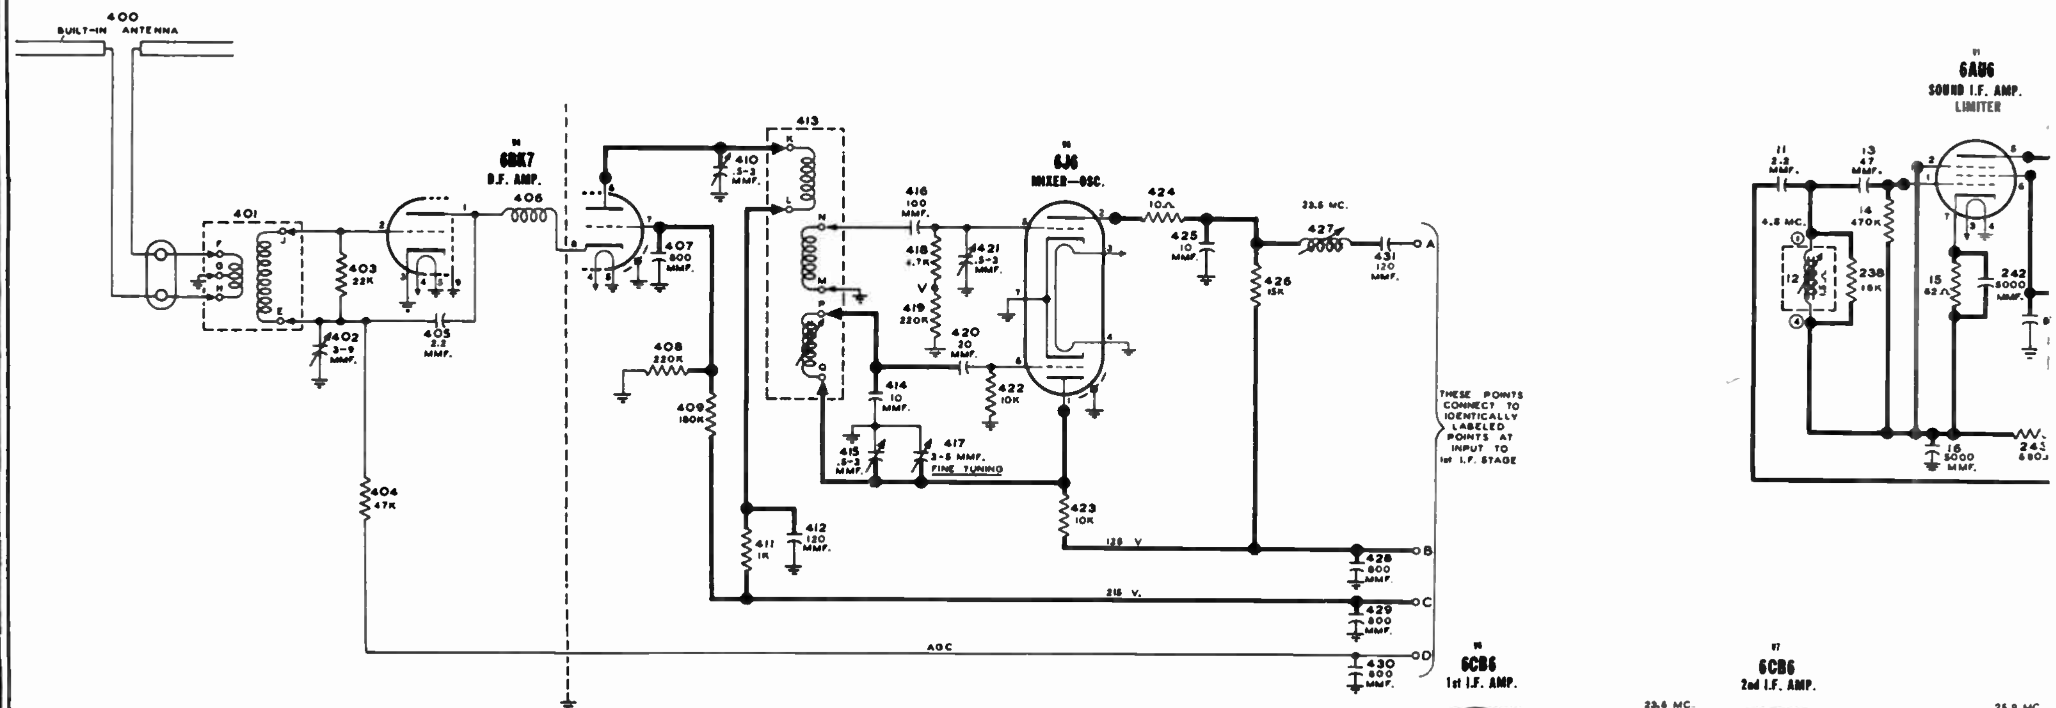
The circuit shown on this page applies to "SERIES A B E F G" chassis.

LETTER DESIGNATION	DESCRIPTION OF CHANGE
A	This change was incorporated to provide for use of an alternate type power transformer W509380. Both transformers are wired in the same manner as shown on circuit diagram. 1. Add resistor 325 (33,000 Ohms) in parallel across resistor 190 (12,000 Ohms.) 2. Change condenser 237, connected across the width coil 193, from .01 Mfd. to .02 Mfd. The "SERIES C" change, as itemized in this column, must **not** be incorporated when the above power transformer (W509380) is used.
B	This change was incorporated so that proper centering can be obtained without introducing neck shadow. 1. Disconnect yellow lead of focus coil 142 from 310 volt supply and reconnect it to pin 7 of deflection yoke socket.
C	This change was incorporated to prevent a breakdown of electrolytic condenser 208-C due to the boost voltage exceeding the rating of the condenser under certain operating conditions. 1. Add resistor 329 (2700 Ohms) in series with resistor 234. The above change is **not** to be undertaken if the SERIES coding at rear of the chassis includes a letter "A".
D	No chassis were produced with this series designation.
E	The following change was incorporated to prevent a breakdown of electrolytic condenser 208-C and still provide sufficient voltage for the operation of the vertical system. It is intended to replace the "SERIES C" change described previously. 1. Remove resistor 329 (2700 Ohms) on those chassis that incorporate a letter "C" in their SERIES designation. 2. Change condenser 197 from a single section (10 Mfd.) condenser to a dual section condenser 197-A (10 Mfd.) and 197-B (20 Mfd.) part number W520641. Connect low potential side of condenser 197-A and 197-B to resistor 330 (47,000 Ohms). The low potential side of the single section condenser formerly was connected to chassis ground. 3. Change condenser 208-C from 10 Mfd. to 40 Mfd. As the present condenser is a part of a tri-section electrolytic the part number for the new condenser is W520434. Connect 208-C (40 Mfd.) from resistor 330 (47,000 Ohms) to chassis ground. 208-C (10 Mfd.) was formerly connected to chassis ground. 4. Add resistor 330 (47,000 Ohms) from junction of condenser 197-A and 197-B and condenser 208-C to 125 volt supply.
F	This change was incorporated to accommodate an alternate type R.F. Tuner W520645. 1. Chassis that include the letter "F" in series designation utilize converter plate coil (item 427) W520501. 2. Add condenser 333 (5 Mmfd.) in the grid circuit of the tube V6 (6CB6) 1st I.F. Amp. from pin 1 to chassis ground. 3. Change condenser 213, in the tuner filament supply circuit, from 1000 Mmfd. to 82 Mmfd. 4. Change resistor 98, in the grid circuit of tube V7 (6CB6) 2nd I.F. Amp., from 10,000 Ohms to 6800 Ohms. 5. Change resistor 106, in the grid circuit of tube V8 (6CB6) 3rd I.F. Amp., from 5600 Ohms to 6800 Ohms.
G	This change was incorporated to accommodate an alternate type R.F. Tuner W520645. 1. Chassis that include the letter "G" in the series designation utilize converter plate coil (item 427) W520734. There is a red identification dot on the tuner frame adjacent to this converter plate coil. 2. Condenser 333, described in step 2 of the "SERIES F" change, is omitted. 3. Change condenser 213, in the tuner filament supply circuit, from 1000 Mmfd. to 82 Mmfd. 4. Change resistor 98, in the grid circuit of tube V7 (6CB6) 2nd I.F. Amp., from 10,000 Ohms to 6800 Ohms. 5. Change resistor 106, in the grid circuit of tube V8 (6CB6) 3rd I.F. Amp., from 5600 Ohms to 6800 Ohms.

MODEL 2170-C, Ch. 100. 209



SCHEMATIC DIAGRAM FOR W520450 R.F. TUNER



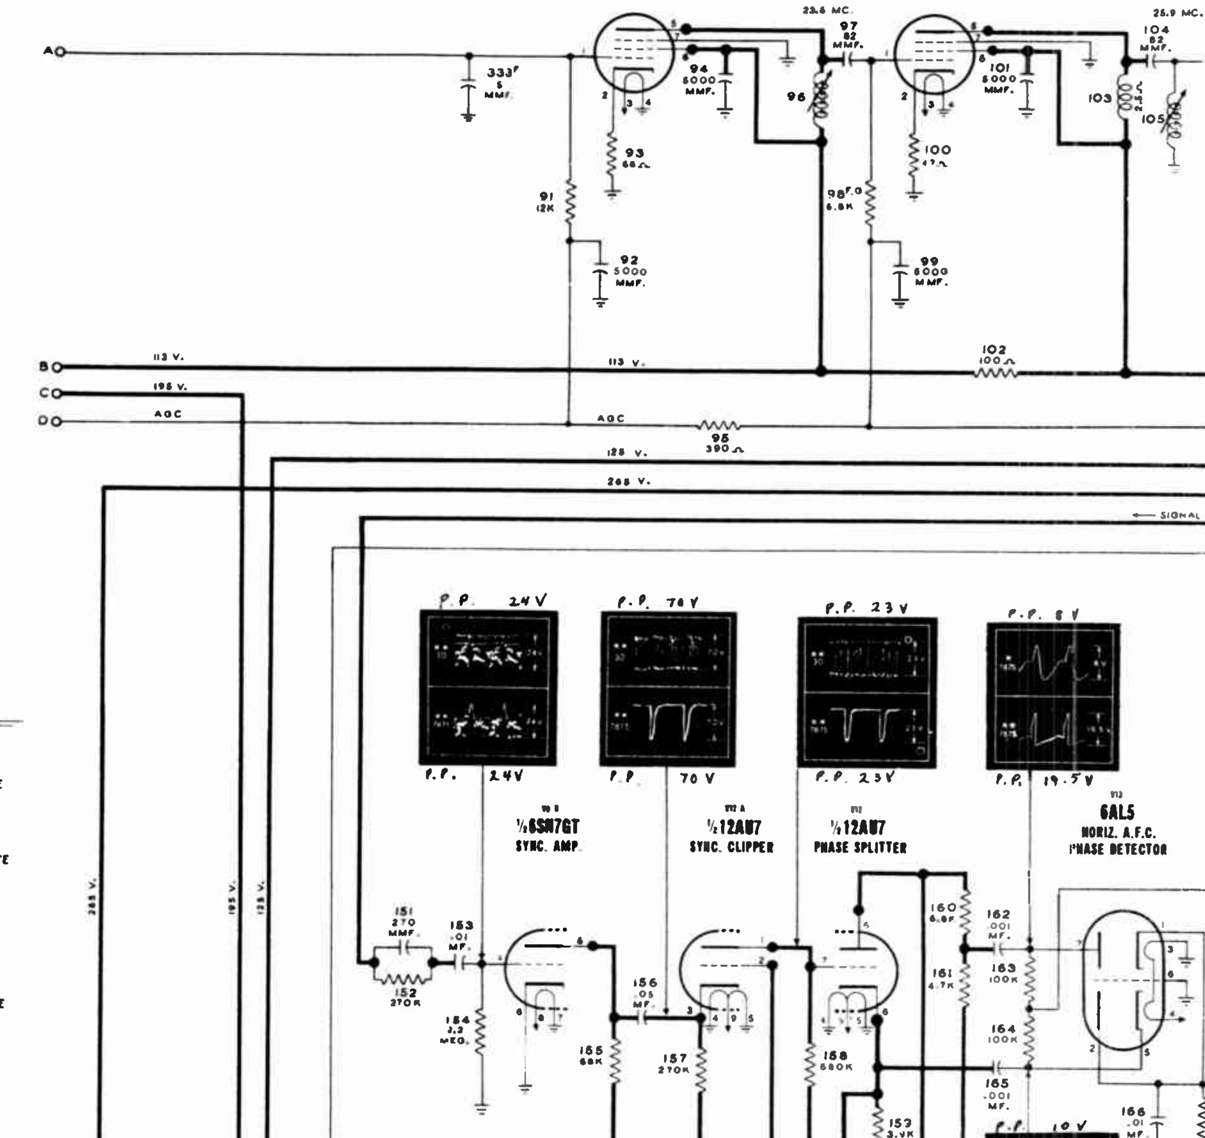
OSCILLOGRAMS

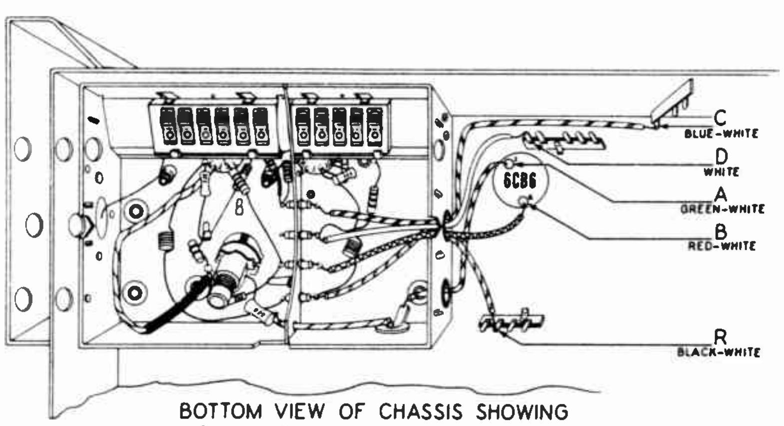
All oscillograms taken with ground lead of 'scope connected to receiver chassis (unless otherwise indicated) and with receiver controls set for normal reception of a station transmitting its standard test pattern.

Number appearing below asterisk specifies setting of horizontal sweep frequency control on 'scope.

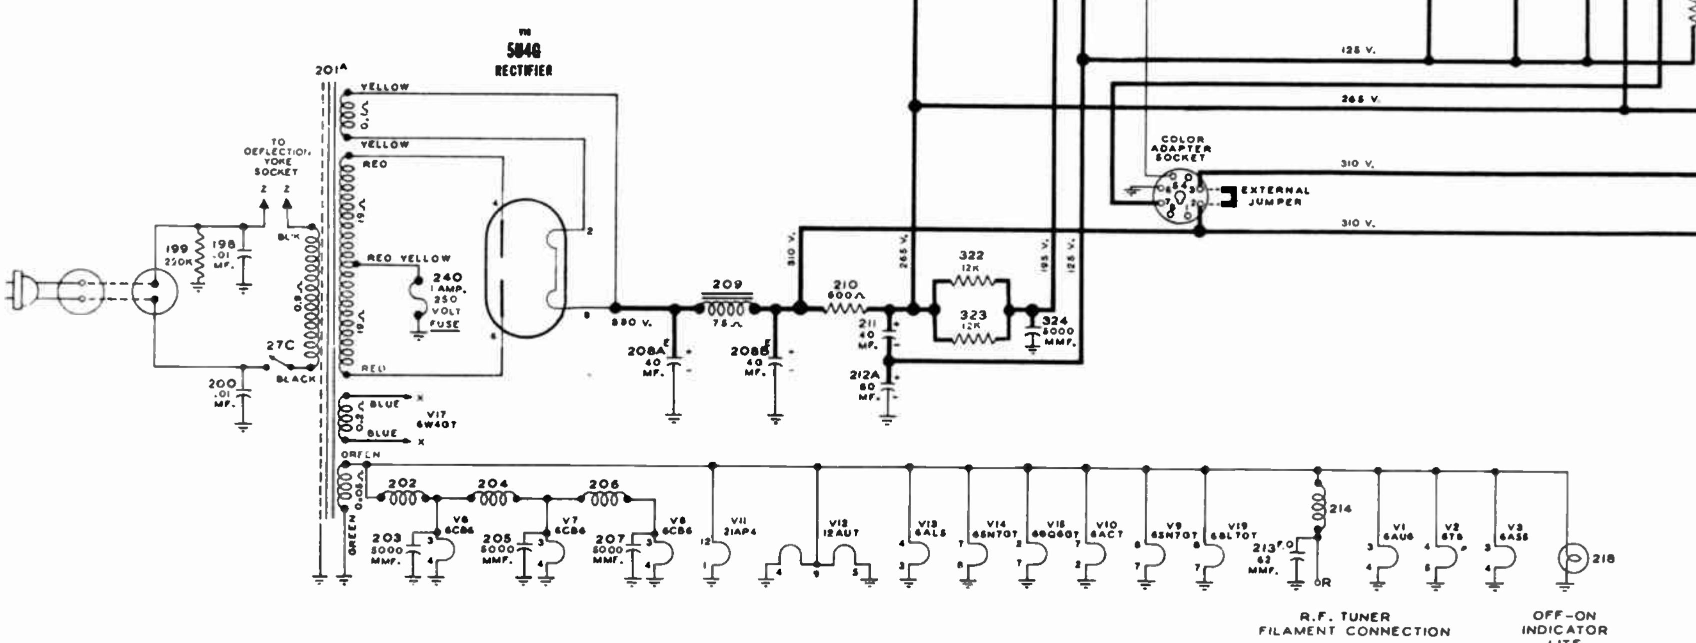
*—This symbol on illustration indicates that wave form was observed on a 'scope whose vertical amplifier had very limited high frequency response (50 to 100 Kc).

**—This symbol indicates that wave form was observed on a 'scope whose vertical amplifier frequency response was flat to within 20% up to 2 Mc.



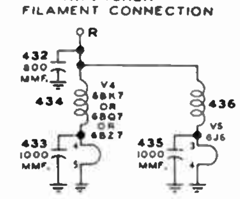


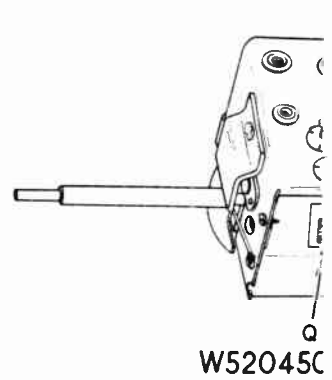
BOTTOM VIEW OF CHASSIS SHOWING
CONNECTIONS TO RF TUNER UNIT



VOLTAGES SHOWN ON CIRCUIT DIAGRAM WERE MEASURED WITH ANTENNA TERMINALS SHORTED TO GROUND AND CHANNEL SELECTOR SET TO AN INACTIVE CHANNEL. MEASUREMENTS WERE TAKEN ON A CHASSIS THAT DOES NOT INCLUDE THE LETTER "A" IN THE "SERIES" DESIGNATION.

READINGS TAKEN ON A CHASSIS THAT INCORPORATES THE LETTER "A" WILL BE LOWER THAN THOSE SHOWN BY APPROXIMATELY 10%





W52045C

HOW TO ORDER PARTS FOR YOUR SILVERTONE TELEVISION RECEIVER

These authorized replacement parts may be ordered through any Sears Retail Store or the Mail Order Store which serves the territory in which you live. Prices upon application from Sears, Roebuck and Co. The parts are shipped prepaid. When ordering parts, always give:

1. The PART NUMBER (number printed on the part if different from that shown in this list) and the DESCRIPTION. When no number is assigned order by description and rating.
2. The CHASSIS and CATALOG NUMBERS. The chassis number will be found on a metal plate at the rear of the chassis. This plate is pictured below. The catalog number will be found on a sticker on the back, inside or bottom of the cabinet.

PARTS LIST FOR CHASSIS

Notice: Some parts listed below have special characteristics. Do not use substitutes for replacement purposes.

333	W513432	Condenser—ceramic 5 Mmfd. ±10% 500 volt (Temperature compensating) (used when letter "F" is included in series designation at rear of chassis)	.30

CONDENSERS FOR R.F. TUNER

The following condensers are used only in the W520645 R.F. Tuner and this tuner is incorporated when the letter "F" or "G" is included in the series designation stamped on rear of chassis.

402	W509064	Condenser—trimmer 3-9 Mmfd.	.50
405	W520721	Condenser—ceramic 3.6 Mmfd. ±10% 500 volt	.35
407	*	Condenser—ceramic 800 Mmfd. (Feed thru type) (part of center shield)	—
410	W507968	Condenser—trimmer 0.5-3 Mmfd.	.40
412	W520719	Condenser—ceramic 47 Mmfd. ±10% 500 volt (Temperature compensating)	.40
414	W520717	Condenser—ceramic 5 Mmfd. ±5% 500 volt (Temperature compensating)	.35
416	W520719	Condenser—ceramic 47 Mmfd. ±10% 500 volt (Temperature compensating)	.40
417	*	Condenser—ceramic 3-5 Mmfd. (Fine Tuning)	—
420	W520718	Condenser—ceramic 10 Mmfd. ±10% 500 volt (Temperature compensating)	.30
421	W507968	Condenser—trimmer 0.5-3 Mmfd.	.40
425	W520716	Condenser—ceramic 6.8 Mmfd. ±5% (Temperature compensating)	$ .35
428	*	Condenser—ceramic 800 Mmfd. (Feed thru type) (part of center shield)	—
429	*	Condenser—ceramic 800 Mmfd. (Feed thru type) (part of center shield)	—
430	*	Condenser—ceramic 800 Mmfd. (Feed thru type) (part of center shield)	—
431	W513029	Condenser—ceramic 120 Mmfd. ±10% 500 volt	.35
432	*	Condenser—ceramic 800 Mmfd. (Feed thru type) (part of center shield)	—
433	W520735	Condenser—ceramic 1000 Mmfd. 500 volt	.30
435	W520735	Condenser—ceromic 1000 Mmfd. 500 volt	.30
437	W520720	Condenser—ceramic 1.5 Mmfd. 500 volt	.35

The following condensers are used only in the W520450 R.F. Tuner and this tuner is incorporated when the letter "F" or "G" is not included in the series designation stamped on rear of chassis.

402	W509064	Condenser—trimmer 3-9 Mmfd.	.50

PARTS LIST FOR CHASSIS (Contd.)

RESISTORS—Continued

SCHEMATIC LOCATION	PART NO.	DESCRIPTION	LIST PRICE
325	W510263	Resistor—Carbon, 33,000 Ohms ±10% 1 watt (used only when letter "A" is incorporated in series designation at rear of chassis)	$ .16
329	W510344	Resistor—carbon 2700 Ohms ±10% 2 watt (used when letter "C" is included in series designation at rear of chassis)	.35
330	W510366	Resistor—carbon 47,000 Ohms ±10% 2 watt (used when letter "E" is included in series designation at rear of chassis)	.35

RESISTORS FOR R.F. TUNER

The following resistors are used only in the W520645 R.F. Tuner and this tuner is incorporated when the letter "F" or "G" is included in the series designation stamped on rear of chassis.

SCHEMATIC LOCATION	PART NO.	DESCRIPTION	LIST PRICE
403	W510157	Resistor—carbon 15,000 Ohms ±10% ½ watt	.12
404	W510167	Resistor—carbon 47,000 Ohms ½ watt	.12
408	W510774	Resistor—carbon 160,000 Ohms ±5% ½ watt	.16
409	W510751	Resistor—carbon 100,000 Ohms ±5% ½ watt	.20
411	W510139	Resistor—carbon 1500 Ohms ±10% ½ watt	.12
418	W510154	Resistor—carbon 10,000 Ohms ±10% ½ watt	.12
419	W510179	Resistor—carbon 220,000 Ohms ½ watt	.12
422, 423	W510154	Resistor—carbon 10,000 Ohms ±10% ½ watt	.12
438	W510172	Resistor—carbon 100,000 Ohms ±10% ½ watt	.12

The following resistors are used only in the W520450 R.F. Tuner and this tuner is incorporated when the letter "F" or "G" is not included in the series designation stamped on rear of chassis.

SCHEMATIC LOCATION	PART NO.	DESCRIPTION	LIST PRICE
403	W510160	Resistor—carbon 22,000 Ohms ±10% ½ watt	.12
404	W510167	Resistor—carbon 47,000 Ohms ½ watt	.12
408	W510179	Resistor—carbon 220,000 Ohms ½ watt	.12
409	W510177	Resistor—carbon 180,000 Ohms ±10% ½ watt	.12
411	W510137	Resistor—carbon 1000 Ohms ½ watt	.12
418	W510148	Resistor—carbon 4700 Ohms ± 10% ½ watt	.12
419	W510179	Resistor—carbon 220,000 Ohms ½ watt	.12
422, 423	W510154	Resistor—carbon 10,000 Ohms ±10% ½ watt	.12
424	W510101	Resistor—carbon 10 Ohms ½ watt	.12
426	W510158	Resistor—carbon 15,000 Ohms ½ watt	.12

COILS AND TRANSFORMERS

SCHEMATIC LOCATION	PART NO.	DESCRIPTION	LIST PRICE
12	W509378	Transformer—audio take-off	1.50
20	W509706	Transformer—TV sound discriminator (includes condensers 20-A and 20-B)	3.00
40	W509376	Transformer—audio output	1.85
96	W507343	Coil—1st video I.F. (less slug)	.70
	W507357	Slug core for 1st video I.F. coil	.20
103	W507367	Coil—choke	.70
105	W507343	Coil—2nd video I.F. (less slug)	.70
	W507357	Slug core for 2nd video I.F. coil	.20
112	W509613	Coil—3rd video I.F. (less slug)	.60
	W507357	Slug core for 3rd video I.F. coil	.20
115	W507367	Coil—choke	.70
121	W509340	Coil—peaking	.55
122	W509342	Coil—peaking	.60
127	W509603	Coil—4.5 Mc. trap (includes slug and condenser #128)	1.20
	W507357	Slug core for 4.5 Mc. trap	.20
129	W509341	Coil—peaking	.60
132	W509342	Coil—peaking	.60
142	W162326	Coil—focus (includes cable and plug)	14.00
146	W115228	Yoke—picture tube deflection (includes cable and plug)	12.50
172	W508967	Coil—Horizontal Hold (includes slug and clip)	1.10
	W508963	Slug core for Horizontal Hold coil	.15
192	W520489	Transformer—horizontal sweep	12.50
193	W509361	Coil—Width (includes slug and clip)	2.00
	W507429	Slug core for Width coil	.60
201	W520487	Transformer—power (used when letter "A" is not included in series designation at rear of chassis)	17.00
	W509380	Transformer—power (used when letter "A" is included in series designation)	17.00
202	W507584	Coil—choke	.28
204	W507584	Coil—choke	.28
206	W507584	Coil—choke	.28
209	W508341	Choke—filter	3.60
214	W507584	Coil—choke	.28
221	W508076	Transformer—vertical blocking oscillator	1.90
233	W509375	Transformer—vertical output	4.00

COILS FOR R.F. TUNER

The following coils are used only in the W520645 R.F. Tuner and this tuner is incorporated when the letter "F" or "G" is included in the series designation stamped on rear of chassis. See special note on item 427 Converter Plate Coil.

SCHEMATIC LOCATION	PART NO.	DESCRIPTION	LIST PRICE
401	W520702	Coil-antenna; channel #2 (coded "2Q")	1.40
	W520703	Coil-antenna; channel #3 (coded "3Q")	1.40
	W520704	Coil-antenna; channel #4 (coded "4Q")	1.40
	W520705	Coil-antenna; channel #5 (coded "5Q")	1.40
	W520706	Coil-antenna; channel #6 (coded "6Q")	1.40
	W520707	Coil-antenna; channel #7 (coded "7Q")	1.15
	W520708	Coil-antenna; channel #8 (coded "8Q")	1.15
	W520709	Coil-antenna; channel #9 (coded "9Q")	1.15
	W520710	Coil-antenna; channel #10 (coded "10Q")	1.15
	W520711	Coil-antenna; channel #11 (coded "11Q")	1.15
	W520712	Coil-antenna; channel #12 (coded "12Q")	1.15
	W520713	Coil-antenna; channel #13 (coded "13Q")	1.15
406	W520701	Coil-cathode coupling	.15
413	W520722	Coil-R.F. and osc; channel #2 (coded "2Q")	1.85
	W520723	Coil-R.F. and osc; channel #3 (coded "3Q")	1.85
	W520724	Coil-R.F. and osc; channel #4 (coded "4Q")	1.85
	W520725	Coil-R.F. and osc; channel #5 (coded "5Q")	1.85
	W520726	Coil-R.F. and osc; channel #6 (coded "6Q")	1.85
	W520727	Coil-R.F. and osc; channel #7 (coded "7Q")	1.70
	W520728	Coil-R.F. and osc; channel #8 (coded "8Q")	1.70
	W520729	Coil-R.F. and osc; channel #9 (coded "9Q")	1.70
	W520730	Coil-R.F. and osc; channel #10 (coded "10Q")	1.70
	W520731	Coil-R.F. and osc; channel #11 (coded "11Q")	1.70
	W520732	Coil-R.F. and osc; channel #12 (coded "12Q")	1.70
	W520733	Coil-R.F. and osc; channel #13 (coded "13Q")	1.70
	W507986	Slug for osc coil; auxiliary fine tuning adj.	.05
424	W520714	Coil-choke	.15
426	W520715	Coil-choke	.45
427	W520734	Coil—converter plate (I.F.) (includes slug and clip) (used when letter "G" is included in the series designation at rear of television chassis and these tuners have a red identification dot on the tuner frame adjacent to coil)	.75
	W520501	Coil converter plate (I.F.) (includes slug and clip) (used when letter "F" is included in the series designation at rear of television chassis)	.55
	W509062	Slug core for either converter plate coil	.12
434	W520518	Coil-choke	.10
436	W520520	Coil-choke	.10

The following coils are used only in the W520450 R.F. Tuner and this tuner is incorporated when the letter "F" or "G" is not included in the series designation stamped on rear of chassis.

SCHEMATIC LOCATION	PART NO.	DESCRIPTION	LIST PRICE
401	W520502	Coil-antenna; channel #2 (coded "2K")	1.40
	W520503	Coil-antenna; channel #3 (coded "3K")	1.40
	W520504	Coil-antenna; channel #4 (coded "4K")	1.40
	W520505	Coil antenna; channel #5 (coded "5K")	1.40

MECHANICAL PARTS OF R.F. TUNER

(for electrical parts see preceding classified listings of condensers, resistors and coils)

PART NO.	DESCRIPTION	LIST PRICE
W520645	R.F. Tuner complete with coils and tubes (used when letter "F" or "G" is included in the series designation stamped on rear surface of chassis)	37.50
W520450	R.F. Tuner complete with coils and tubes (used when letter "F" or "G" is not included in the series designation stamped on rear surface of chassis)	37.50
W508081	Bracket for mounting R.F. tuner (front)	.16
W520233	Bracket for mounting R.F. tuner (rear)	.25
W507339	Clip for mounting video converter plate coil	.10
W520515	Fine Tuning cam and shaft	.70
W508708	Roller—detent	.10
W520535	Shield, bottom cover	.50
W520536	Shield, side cover	.35
W520534	Shield-tube; miniature for 6J6 tube	.15
W520519	Shield-tube; miniature for 6BK7, 6BQ7 or 6BZ7 tube	.20
W509062	Slug core for converter plate coil	.12
W507986	Slug for osc. coil; auxiliary fine tuning adj.	.05
W507987	Socket—miniature (7 pin) for 6J6 (includes base for mounting shield)	.45
W520521	Socket—miniature (9 pin) for 6BK7, 6BQ7 or 6BZ7 (includes base for mounting shield)	.50
W507966	Spring—contactor washer (on front turret shaft	.08
W508709	Spring—detent	.08
W507990	Spring—retains osc. fine tuning slug	.10
W507967	Spring—turret shaft retaining	.03
W520517	Stator contact assembly (includes 11 contacts and metal frame)	3.75
W520516	Tuner turret and shaft assembly (less coils)	3.00
W507965	Washer, fiber spacer (on turret shaft)	.01

CABINET PARTS

PART NO.	DESCRIPTION	LIST PRICE
W115225	Back for cabinet	3.00
W520630-A	Cabinet for Catalog #2170-C (Mahogany)	75.00
W520437	Escutcheon for glass window	10.00
W520454	Hinge bracket for nameplate	.60
W520435	Glass window	10.00
W520632-A	Knob, Channel Selector	.65
W520634-A	Knob, Fine Tuning	.30
W520633-A	Knob, "OFF-VOLUME-PICTURE"	.65
W520635-A	Knob, Picture	.30
W520436	Mask for picture tube	8.00
W520455	Name plate (less hinges and springs)	2.00
W18796	Screw—#10 x 1"; mounts TV chassis	.02
W520453	Spring for hinge on nameplate	.15
W520488	Tab, U. H. F., for Selector knob	.15
W162163	Terminal strip for TV antenna connection	.22

MISCELLANEOUS PARTS

PART NO.	DESCRIPTION	LIST PRICE
W301270	Base for mounting electrolytic condenser	.06
W508153	Bracket base for support of yoke and focus coil (left or right hand)	.25
W520425	Bracket, chassis extension (left hand)	1.50
W520426	Bracket, chassis extension (right hand)	1.50
W520312	Bracket for mounting picture tube (left hand)	1.00
W520311	Bracket for mounting picture tube (right hand)	1.00
W520424	Bracket for mounting pre-set controls	.75
W508081	Bracket for mounting R.F. tuner (front)	.16
W520233	Bracket for mounting R.F. tuner (rear)	.25
W509005	Bracket mounts yoke and focus coil	2.75
W508154	Bracket ("U" shaped) for support of yoke and focus coil	.55
W508681	Clip for mounting electrolytic condenser #197	.10
W508964	Clip for mounting Horizontal Hold or Width coil	.04
W505101	Clip for mounting sound take-off transformer	.05
W507339	Clip for mounting video converter plate, 1st video I.F., 2nd video I.F., 3rd video I.F., or 4.5 Mc. trap coil	.10
W520428	Connector for H.V. terminal (includes cap and lead)	1.00
W509688	Ion trap	.85
*	Jumper for color socket—1¼" of #11 wire	—
W508617	Nut for retaining focus coil	.12
W508962	Nut on end of Horizontal Hold control slug	.10
W508878	Plug (3 pin) for focus coil leads	.25
W500966	Plug (1 pin) for phono pick-up cable	.10
W508515	Plug (8 pin) for yoke cable	.70
W507699	Power cord assembly (includes plugs at both ends)	1.00
W509290	Ring—corona shield for 1B3GT/8016 tube	.10
W520313	Ring, insulating for mounting picture tube	3.50
W520133	Rubber gasket between mask and picture tube	.75
W507422	Rubber sleeve between neck of picture tube and focus coil	.30
W507793	Rubber spacer support between flared neck of picture tube and yoke bracket	.15
W18796	Screw—#10 x 1"; mounts TV chassis	.02
W162353	Shield for 3rd I.F. coil and crystal detector	.30
W162324	Shield for TV channel lite	.20
W162138	Shield—H.V. supply (front section)	2.70
W508088	Shield—H.V. supply (rear section)	2.10
W520534	Shield—tube; miniature for 6J6 tube	.15
W520519	Shield—tube; miniature for 6BK7, 6BQ7 or 6BZ7 tube	.20
W520429	Sleeve, insulating for picture tube (includes H.V. contact)	3.00
W509062	Slug core for converter plate coil	.12
W507357	Slug core for 1st, 2nd or 3rd video I.F. coil or 4.5 Mc. trap coil	.20
W508963	Slug core for Horizontal Hold coil	.15
W507429	Slug core for Width coil	.60
W509761	Socket and cable assembly for picture tube	1.05
W520571	Socket and mounting bracket for TV channel lite	.35
W162259	Socket assembly for 1B3GT/8016 tube (includes mounting frame)	1.20
W508879	Socket (3 pin) for focus coil leads	.35
W160039	Socket—(1 pin) for Phono. pick-up cable	.12
W508419	Socket—(8 pin) for yoke cable	.70
W507932	Socket—male, power cord interlock	.25
W507364	Socket—miniature (7 pin)	.24
W507987	Socket—miniature (7 pin) for 6J6 (includes base for mounting shield)	.45
W508044	Socket—miniature (9 pin)	.35
W509507	Socket—miniature (9 pin) (for 12AU7 tube)	.25
W520521	Socket—miniature (9 pin) for 6BK7, 6BQ7 or 6BZ7 (includes base for mounting shield)	.50
W508703	Socket—octal	.15
W508703	Socket—octal (for color TV adapter)	.15
W506469	Socket—octal (for 6W4 tube)	.18
W509320	Spring—tension for focus coil mounting	.10
W520444	Strap, anchor for picture tube	.65
W520623	Strap, tube retaining	.50
W520443	Support for tuner shaft (plastic)	.04
W162163	Terminal strip for TV antenna connection	.22
W170195	Wing nut—#8-32; for mounting yoke and focus coil	.10
W170817	Wing screw—#10-24; for height adj. of yoke and focus coil	.05
W170741	Wing screw—#10-32; for mounting or forward adj. of yoke	.10

*—This part is not supplied as a Service replacement item.

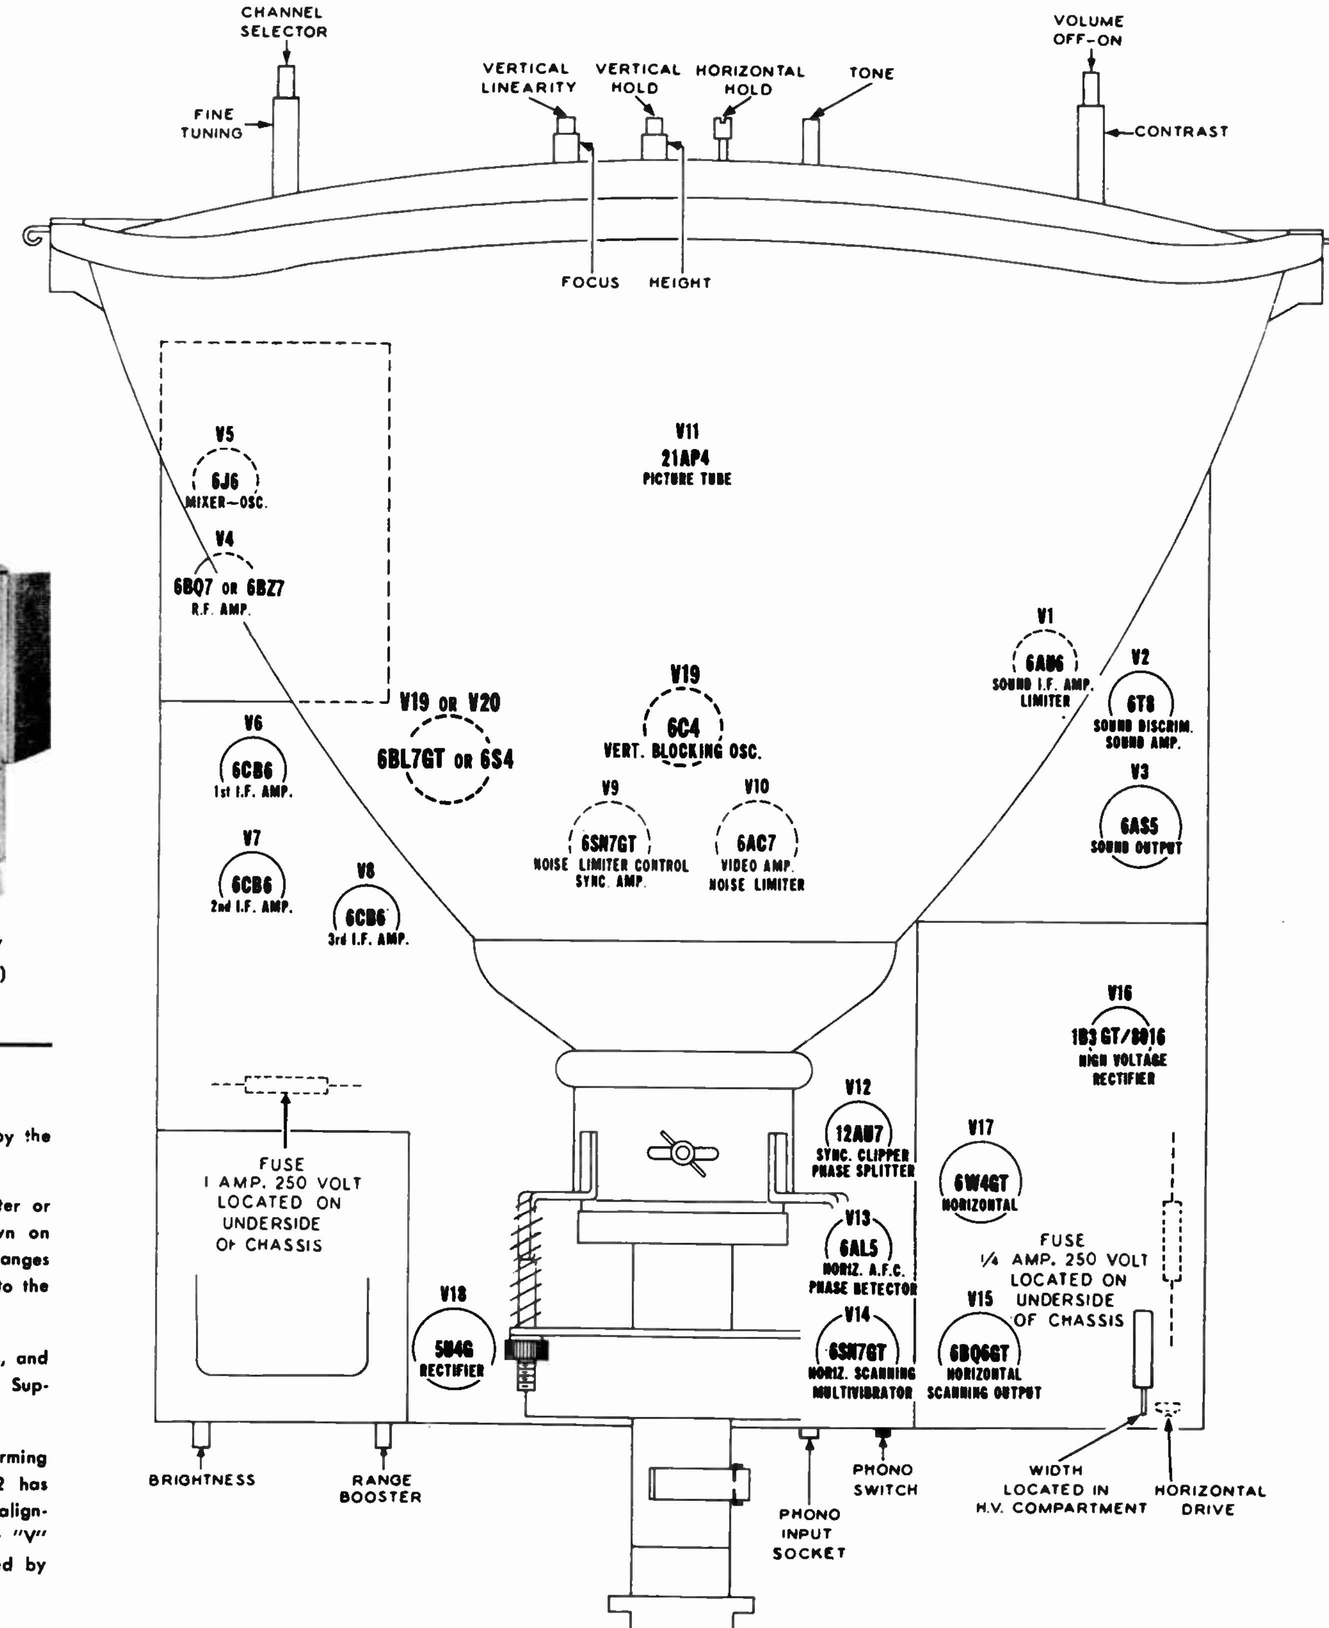
TUBE LOCATIONS AND FUNCTIONS



* Two different types of vertical systems are used on this series of receivers.

Chassis that do not have a letter "E" included in the SERIES designation at rear of chassis use a 6BL7GT tube (V19) for both the Vertical Blocking Oscillator and Vertical Scanning Output stages.

Chassis that have the letter "E" included in the SERIES designation utilize a 6C4 tube (V19) as a Verticle Blocking Oscillator and a 6S4 tube (V20) as the Vertical Scanning Output.

For a complete explanation of this change as well as a description of the SERIES coding refer to the "Production Change" column of the circuit diagram.

GENERAL DESCRIPTION

The information contained in this service Supplement covers numbers 2130, 2170-D, 2170-E, 2172, 3127, 3170-B, 3177 and 3187.

These television receivers utilize chassis 100.210 series which is basically the same as chassis 100.208

For technical information relating to the 100.210 series chassis, refer to the 100.208 series service data However, due to the differences between the 100.208 and the 100.210 series chassis, it is necessary to first read the 100.210 series service data before referring to the 100.208 series service literature. Important information, indicating the differences existing between chassis, will be discussed in the succeeding paragraphs.

The differences between the two chassis are that the 100.210 utilizes a 1B3GT type tube for H.V. Rectification, the associated Horizontal Sweep Transformer was changed, a new Power Transformer was used, a Range Booster Control (located at back of chassis) was added, a Tone Control was also added and is accessible from the front of receiver, the Brightness Control was relocated to the back of the receiver to make provision for the Tone Control, the function of tube V9A was changed from A.G.C. to a Noise Limiter Control, and the Video Amplifier, tube V10, was modified to also serve as a Noise Limiter.

Chassis 100.210-1 is identical to the basic chassis 100.210. In chassis 100.210-3, the Vertical Blocking Oscillator and Vertical Scanning Output, tube V19, 6BL7GT—a duo-triode, was removed and replaced by two sepatate triode type tubes—a 6C4 and a 6S4. This change is also indicated by the series coding letter "E".

Any production changes on the 100.210 chassis indicated by a letter or letters stamped on the rear surface of the chassis pan and shown on 100.210 series schematic page, are entirely different from those changes on the 100.208 series chassis that has a similar letter. Always refer to the 100.210 series schematic.

The correct Tube Location and Function Chart for the 100.210 chassis, and a new Socket Voltage Measurement Chart, are included in this Supplement.

100.210 chassis utilizes a W520645 R.F. tuner and when performing Oscillator Alignment, it will be noted that Oscillator Trimmer #12 has been omitted and therefore this step should be eliminated in the alignment procedure. On this R.F. tuner, the instrument connection, point "V" shown in Fig. 12, has been moved to the location formerly occupied by trimmer #12.

The complete schematic and chassis parts list covering the 100.210, 100.210-1 and 100.210-3 chassis is included with this Supplement. All production changes are shown in the schematic. A complete cabinet parts and accessories list, arranged numerically by the catalog number of the receiver and also alphabetically according to the name of the part, will be found on page 53

SOCKET VOLTAGES

CAUTION

THE PICTURE TUBE is highly evacuated and if broken, glass fragments will be violently expelled. Scratching, chipping, undue pressure, or careless handling such as lifting the tube by its neck is dangerous and should be avoided. If it is necessary to handle the picture tube, use safety goggles and heavy gloves.

HIGH VOLTAGE (10 to 13 kilovolts) is produced in a supply circuit of this receiver. Exercise care to avoid contact with elements of this circuit and particularly the tube terminals which are labeled "CAUTION" in the adjoining voltage chart.

THE HIGH VOLTAGE LEAD, which supplies approximately 10 to 13 kilovolts to the picture tube, should be momentarily shorted to the chassis whenever it is disconnected for service purposes. This discharges the high voltage filter condenser and prevents a shock hazard when working on the receiver after it has been turned off.

INTERMEDIATE B+ VOLTAGES, are dangerous and caution should be observed when the receiver chassis components are exposed for service purposes.

THE VOLTAGES SHOWN IN THE ADJOINING CHART WERE MEASURED UNDER THE FOLLOWING CONDITIONS

1.	Power Supply—117 volts 60 cycle AC.
2.	All voltages are measured between socket terminals and chassis unless otherwise indicated on adjoining chart.
3.	* Measurements made with voltmeter having sensitivity of 20,000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.
4.	Channel Selector and Fine Tuning Controls set for normal reception of a local station.
5.	All controls are set for normal reception of the transmitted signal unless the voltage shown on the chart is followed by a letter or letters indicating a special condition of measurement as explained in subsequent notes.
6.	The external or built-in antenna should remain connected to the receiver only when taking voltage measurements in the sweep and sync circuits—for all other measurements, disconnect antenna, short antenna terminals together and connect them to ground.
7.	Certain voltages were measured with two different settings of specific controls. It should therefore be understood that in these instances all controls, with the exception of one or two, were set for normal reception—letters following the voltage shown on the chart indicate the exceptions and are explained below.

EXPLANATION OF NOTES

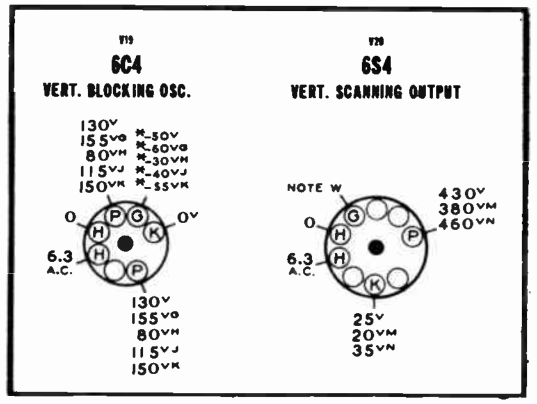
A.	Range Booster control max. clockwise
B.	Brightness Control max. clockwise
C.	Brightness Control max. counter-clockwise
D.	Contrast Control max. clockwise
DD.	Contrast control set to max. voltage reading but not necessarily max. clockwise setting of control
E.	Contrast Control max. counter-clockwise
F.	Range Booster control max. counter-clockwise.
G.	Height Control max. clockwise
H.	Height Control max. counter-clockwise
J.	Vertical Hold Control max. clockwise
K.	Vert. Hold Control max. counter-clockwise
L.	This voltage measurement was taken from the top of the tuner chassis with the tube removed from its socket.
M.	Vertical Linearity Control max. clockwise.
N.	Vertical Linearity Control max. counter-clockwise.
Q.	Do not attempt to measure the voltage at the tube cap. There is a high R. F. potential at this point.
T.	Horiz. Drive Control max. clockwise
U.	Horiz. Drive Control max. counter-clockwise.
V.	Before measuring this voltage, connect external antenna and adjust controls for normal reception of station signal.
W.	This measurement should be made with a vacuum tube voltmeter. This voltage reading will fluctuate in the vicinity of 0.15 volts.
X.	Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.
Y.	Horiz. Hold Control turned in a clockwise direction until picture approaches loss of sync.
Z.	Horiz. Hold Control turned in a counter-clockwise direction until picture aproaches loss of sync.

PRODUCTION CHANGES

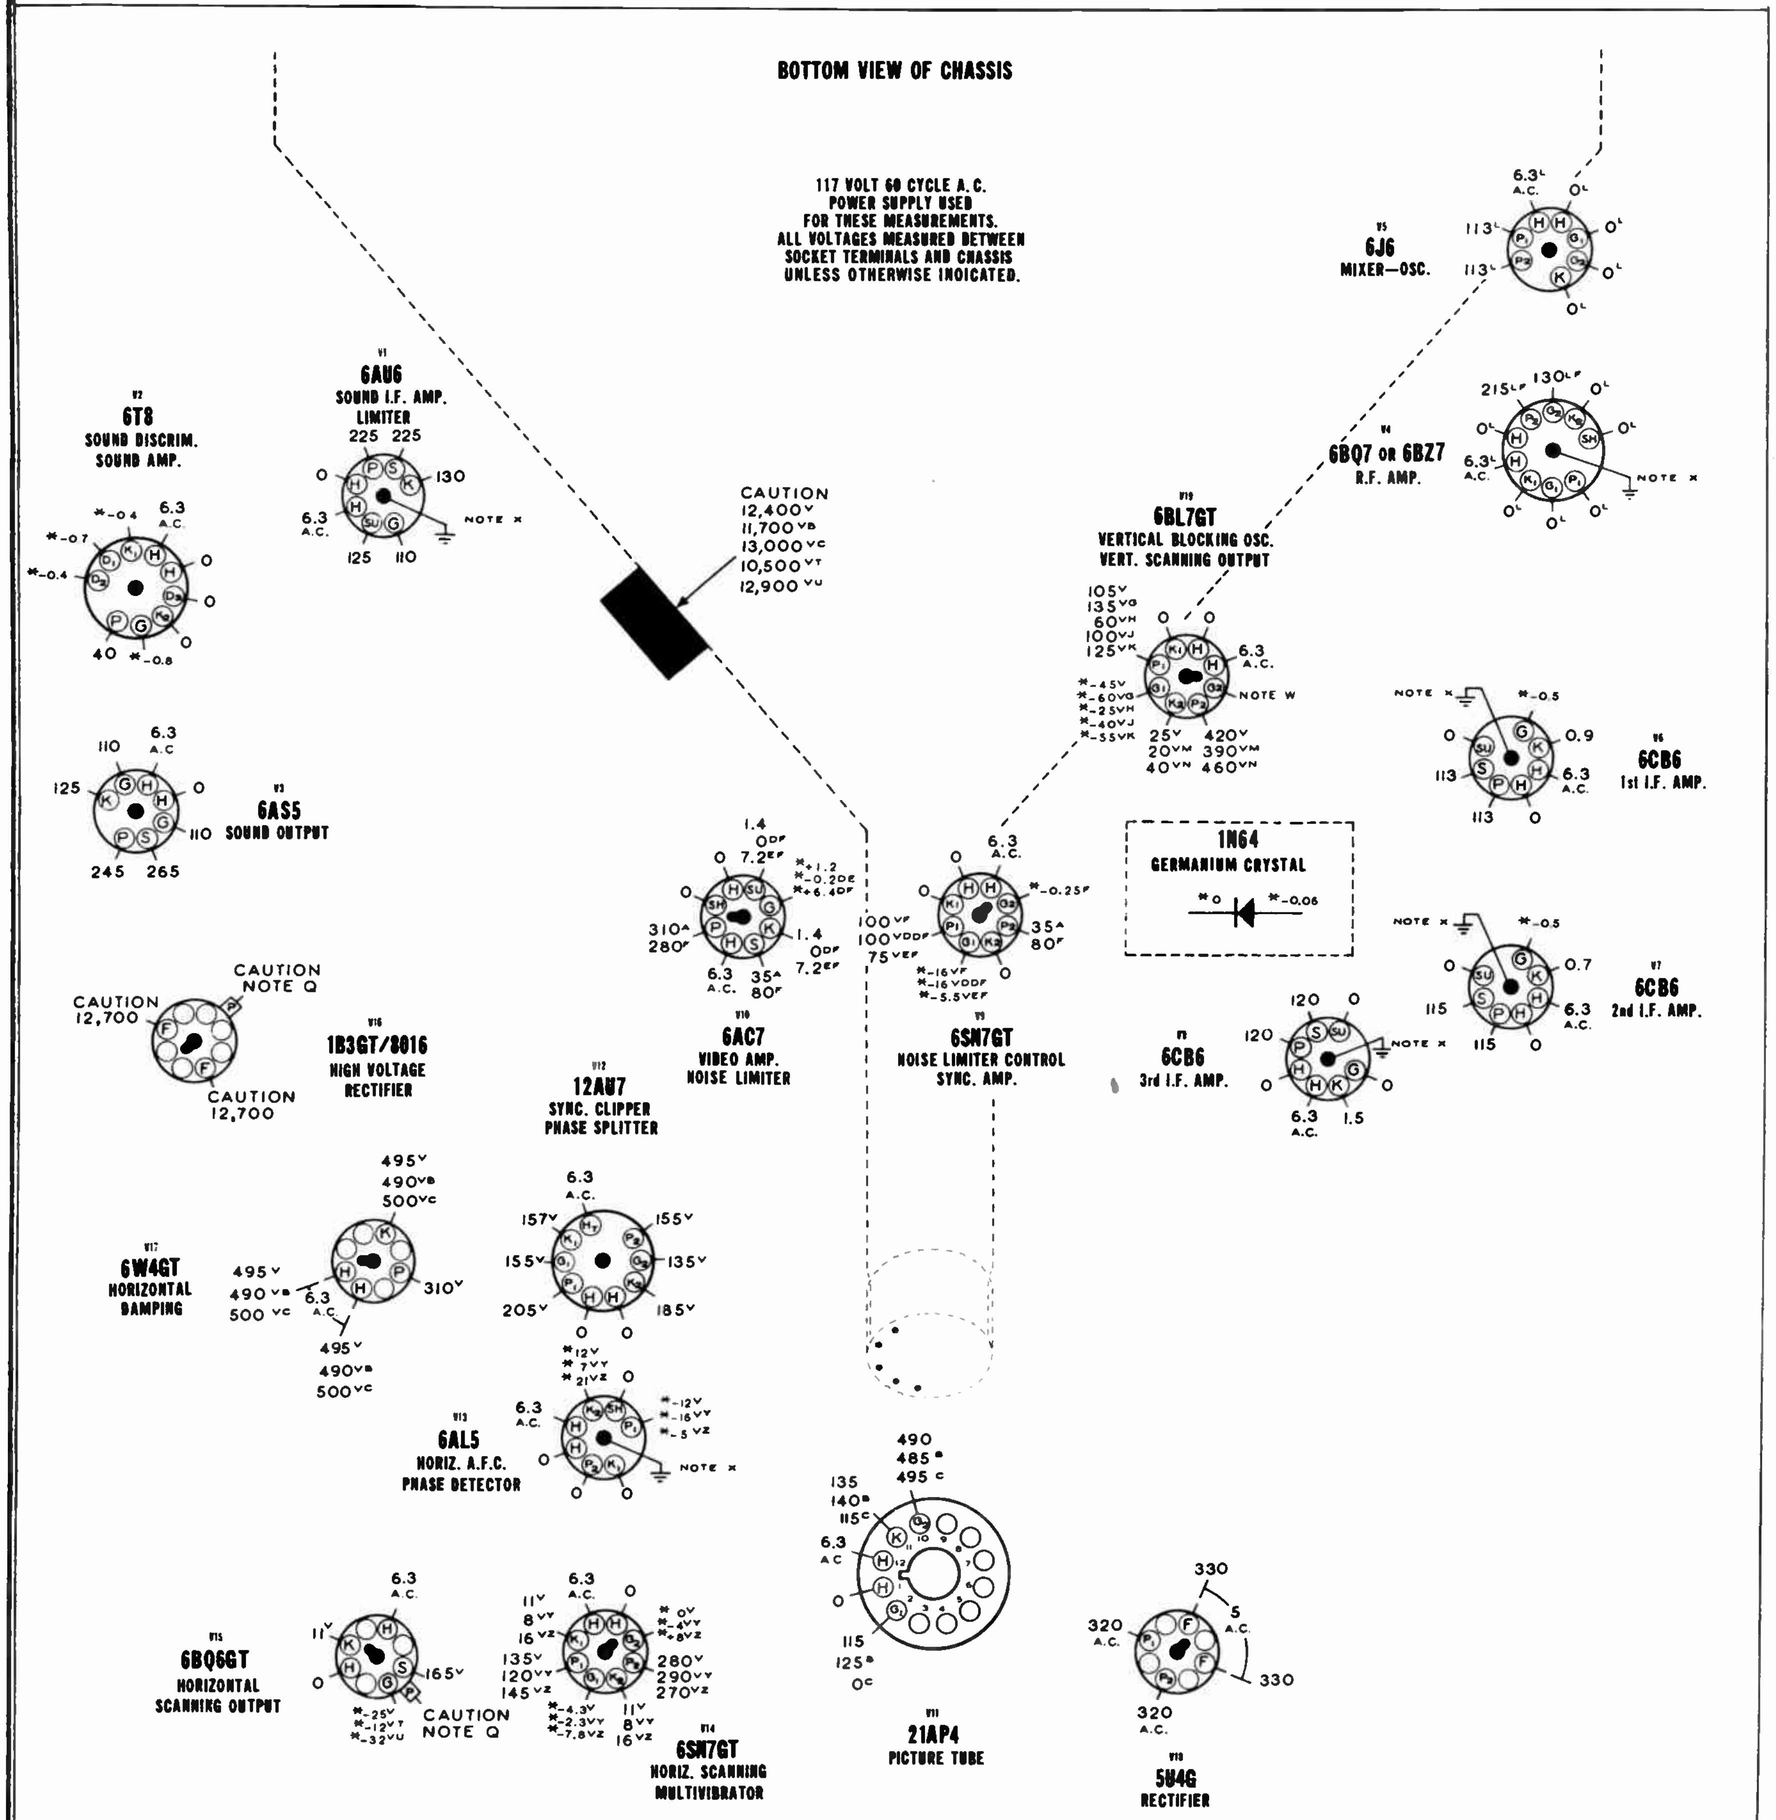
For a complete description of the changes as well as an explanation of the SERIES coding, refer to the circuit diagram page 9, under the heading "Production Changes."

LETTER INCLUDED IN SERIES DESIGNATION	LOCATION OF VOLTAGE INFORMATION OR EFFECT OF CHANGE ON MEASUREMENT
"A"	SERIES "A" change does not affect circuit voltages.
"B"	SERIES "B" change does not affect circuit voltages.
"C"	SERIES "C" change does not affect circuit voltages.
"D"	SERIES "D" change does not affect circuit voltages.
"E"	Chassis incorporating this change have V19-6BL7GT replaced by V19-6C4 and V20-6S4. Voltage measurement readings taken on these two latter tubes are shown in the small chart below headed "SERIES E CHART."
"F"	No chassis were produced with this series designation.
"G"	SERIES "G" change does not affect circuit voltages.

SERIES "E" CHART



SEARS, ROEBUCK TV PAGE 12-51



PRODUCTION CHANGES

The following tabulation furnishes complete details on changes which occurred during receiver production. The receivers incorporating these changes are identified by coding stamped on rear surface of chassis. This coding consists of one or more letters following the word SERIES, as SERIES B. SERIES AC, etc., and corresponds to similarly lettered changes shown below. Chassis incorporate only that change indicated by letter designation; i.e., chassis stamped "SERIES BE" does not include changes "A" or "C" or "D".

The circuit shown on this page applies to "SERIES ACDE" chassis.

A letter following the component circuit diagram number thus—201A, indicates that this particular item was affected by a circuit change. The letter corresponds to the series code letter listed in the production change column, from which complete change information can be obtained.

LETTER DESIGNATION	DESCRIPTION OF CHANGE
UNCODED	**INITIAL PRODUCTION**
"A"	This change was incorporated to improve the response characteristic of the video amplifier. 1. Change peaking coil 129 in plate circuit of tube V10 (6AC7) Video Amp. from part W509341 to part W520689. 2. Change resistor 130 in plate circuit of tube V10 (6AC7) Video Amp. from 18,000 Ohms to 12,000 Ohms. 3. Change peaking coil 132 in plate circuit of tube V10 (6AC7) Video Amp. from part W509342 to part W509340.
"B"	No chassis were produced with this series designation.
"C"	The following change was incorporated to allow vertical hold control to operate in the center of its range. 1. Resistor 223 in grid circuit of V19A (Vertical Blocking Oscillator) was changed from 2 Meg. to 1.8 Meg.
"D"	The following change was incorporated only to facilitate production in bringing about a more consistent I.F. response curve. 1. Resistor 106 in grid circuit of V8 (3rd. I.F. Amp.) was changed from 6800 Ohms ± 10% to 4700 Ohms ± 5%.
"E"	This change was incorporated due to the unavailability of type 6BL7GT tube. 1. Tube V19 (Vert. Blocking Oscillator and Vert. Scanning Output) 6BL7GT, a duo-triode, was removed and replaced by two separate triode type tubes—V19, a 6C4 which is utilized as the Vert. Blocking Oscillator and V20, a 6S4 which is used for the Vertical Scanning Output stage. 2. Resistor 223 in grid circuit of V19 (Vert. Blocking Oscillator) was changed to 1.5 Meg. 3. Resistor 226 (4.7 Meg.) in grid circuit of V19-A—6BL7GT (Vert. Blocking Oscillator) was omitted. 4. The value of all the other components as well as their schematic location, utilized in the two stages remain the same.
"F"	No chassis were produced with this series designation.
"G"	This change was incorporated to improve the response characteristic of the video amplifier. 1. Change peaking coil 121 in plate circuit of diode detector from part W509340 to part W520620. 2. Change peaking coil in plate circuit of diode detector from part W509342 to part W520985. 3. Change peaking coil in plate circuit of tube V10 (6AC7) Video Amp. from part W520340 to part W520342.

PARTS LIST FOR CABINETS

CABINET PARTS— 2130

PART NO.	DESCRIPTION	LIST PRICE
W115225	Back for cabinet	$ 3.00
W520460-A	Cabinet	55.00
W520437	Escutcheon for glass window	10.00
W520435	Glass window	10.00
W520454	Hinge for nameplate	.60
W520632-A	Knob, Channel Selector (Maroon)	.65
W520634-A	Knob, Fine Tuning (Gold)	.30

W520700-A	Cabinet	85.00
W520492	Caster for cabinet	.50
W520437	Escutcheon for glass window	10.00
W520435	Glass window	10.00
W520454	Hinge for nameplate	.60
W520632-A	Knob, Channel Selector (Maroon)	.65
W520634-A	Knob, Fine Tuning (Gold)	.30
W520633-A	Knob, "OFF-VOLUME-PICTURE" (Maroon)	.65
W520635-A	Knob, Picture (Gold)	.30
W520436	Mask for picture tube	8.00
W520455	Nameplate (less spring and hinge) (Maroon)	2.00
W170986	Screw—#6-32, Phillips oval brass head; retains escutcheon	.02
W18796	Screw—#10x1"; mounts TV chassis	.02
W520453	Spring for nameplate	.15
W520488	Tab, U.H.F., for selector knob	.15

CABINET PARTS— 2172

PART NO.	DESCRIPTION	LIST PRICE
W115225	Back for cabinet	3.00
W520640-A	Cabinet	90.00
W520437	Escutcheon for glass window	10.00
W520435	Glass window	10.00
W520454	Hinge for nameplate	.60
W520632-B	Knob, Channel Selector (Beige)	.65
W520634-A	Knob, Fine Tuning (Gold)	.30
W520633-B	Knob, "OFF-VOLUME-PICTURE" (Beige)	.65
W520635-A	Knob, Picture (Gold)	.30
W520436	Mask for picture tube	8.00
W520637	Nameplate (less spring and hinge) (Beige)	2.00
W170986	Screw—#6-32, Phillips oval brass head; retains escutcheon	.02
W18796	Screw—#10x1"; mounts TV chassis	.02
W520453	Spring for nameplate	.15
W520488	Tab, U.H.F., for selector knob	.15

CABINET PARTS— 3127

PART NO.	DESCRIPTION	LIST PRICE
W115238	Back for cabinet	$ 2.25
W520810-A	Cabinet	65.00
W520818	Frame for glass window (wooden)	3.75
W520806	Glass window	8.75
W520684-B	Knob, Channel Selector (Green)	.85
W520686-A	Knob, Fine Tuning (Clear)	.75
W520685-B	Knob, Off-On-Volume (Green)	.70
W520687-A	Knob, Picture (Clear)	.45
W520817	Leg for cabinet	4.00
W520805-B	Mask for picture tube	5.75
W520678-B	Nameplate (includes spring and hinge) (Beige)	3.00
W18796	Screw—#10x1"; mounts TV chassis	.02
W520754-A	Tab, U.H.F., for selector knob	.15

MECHANICAL PARTS OF R.F. TUNER

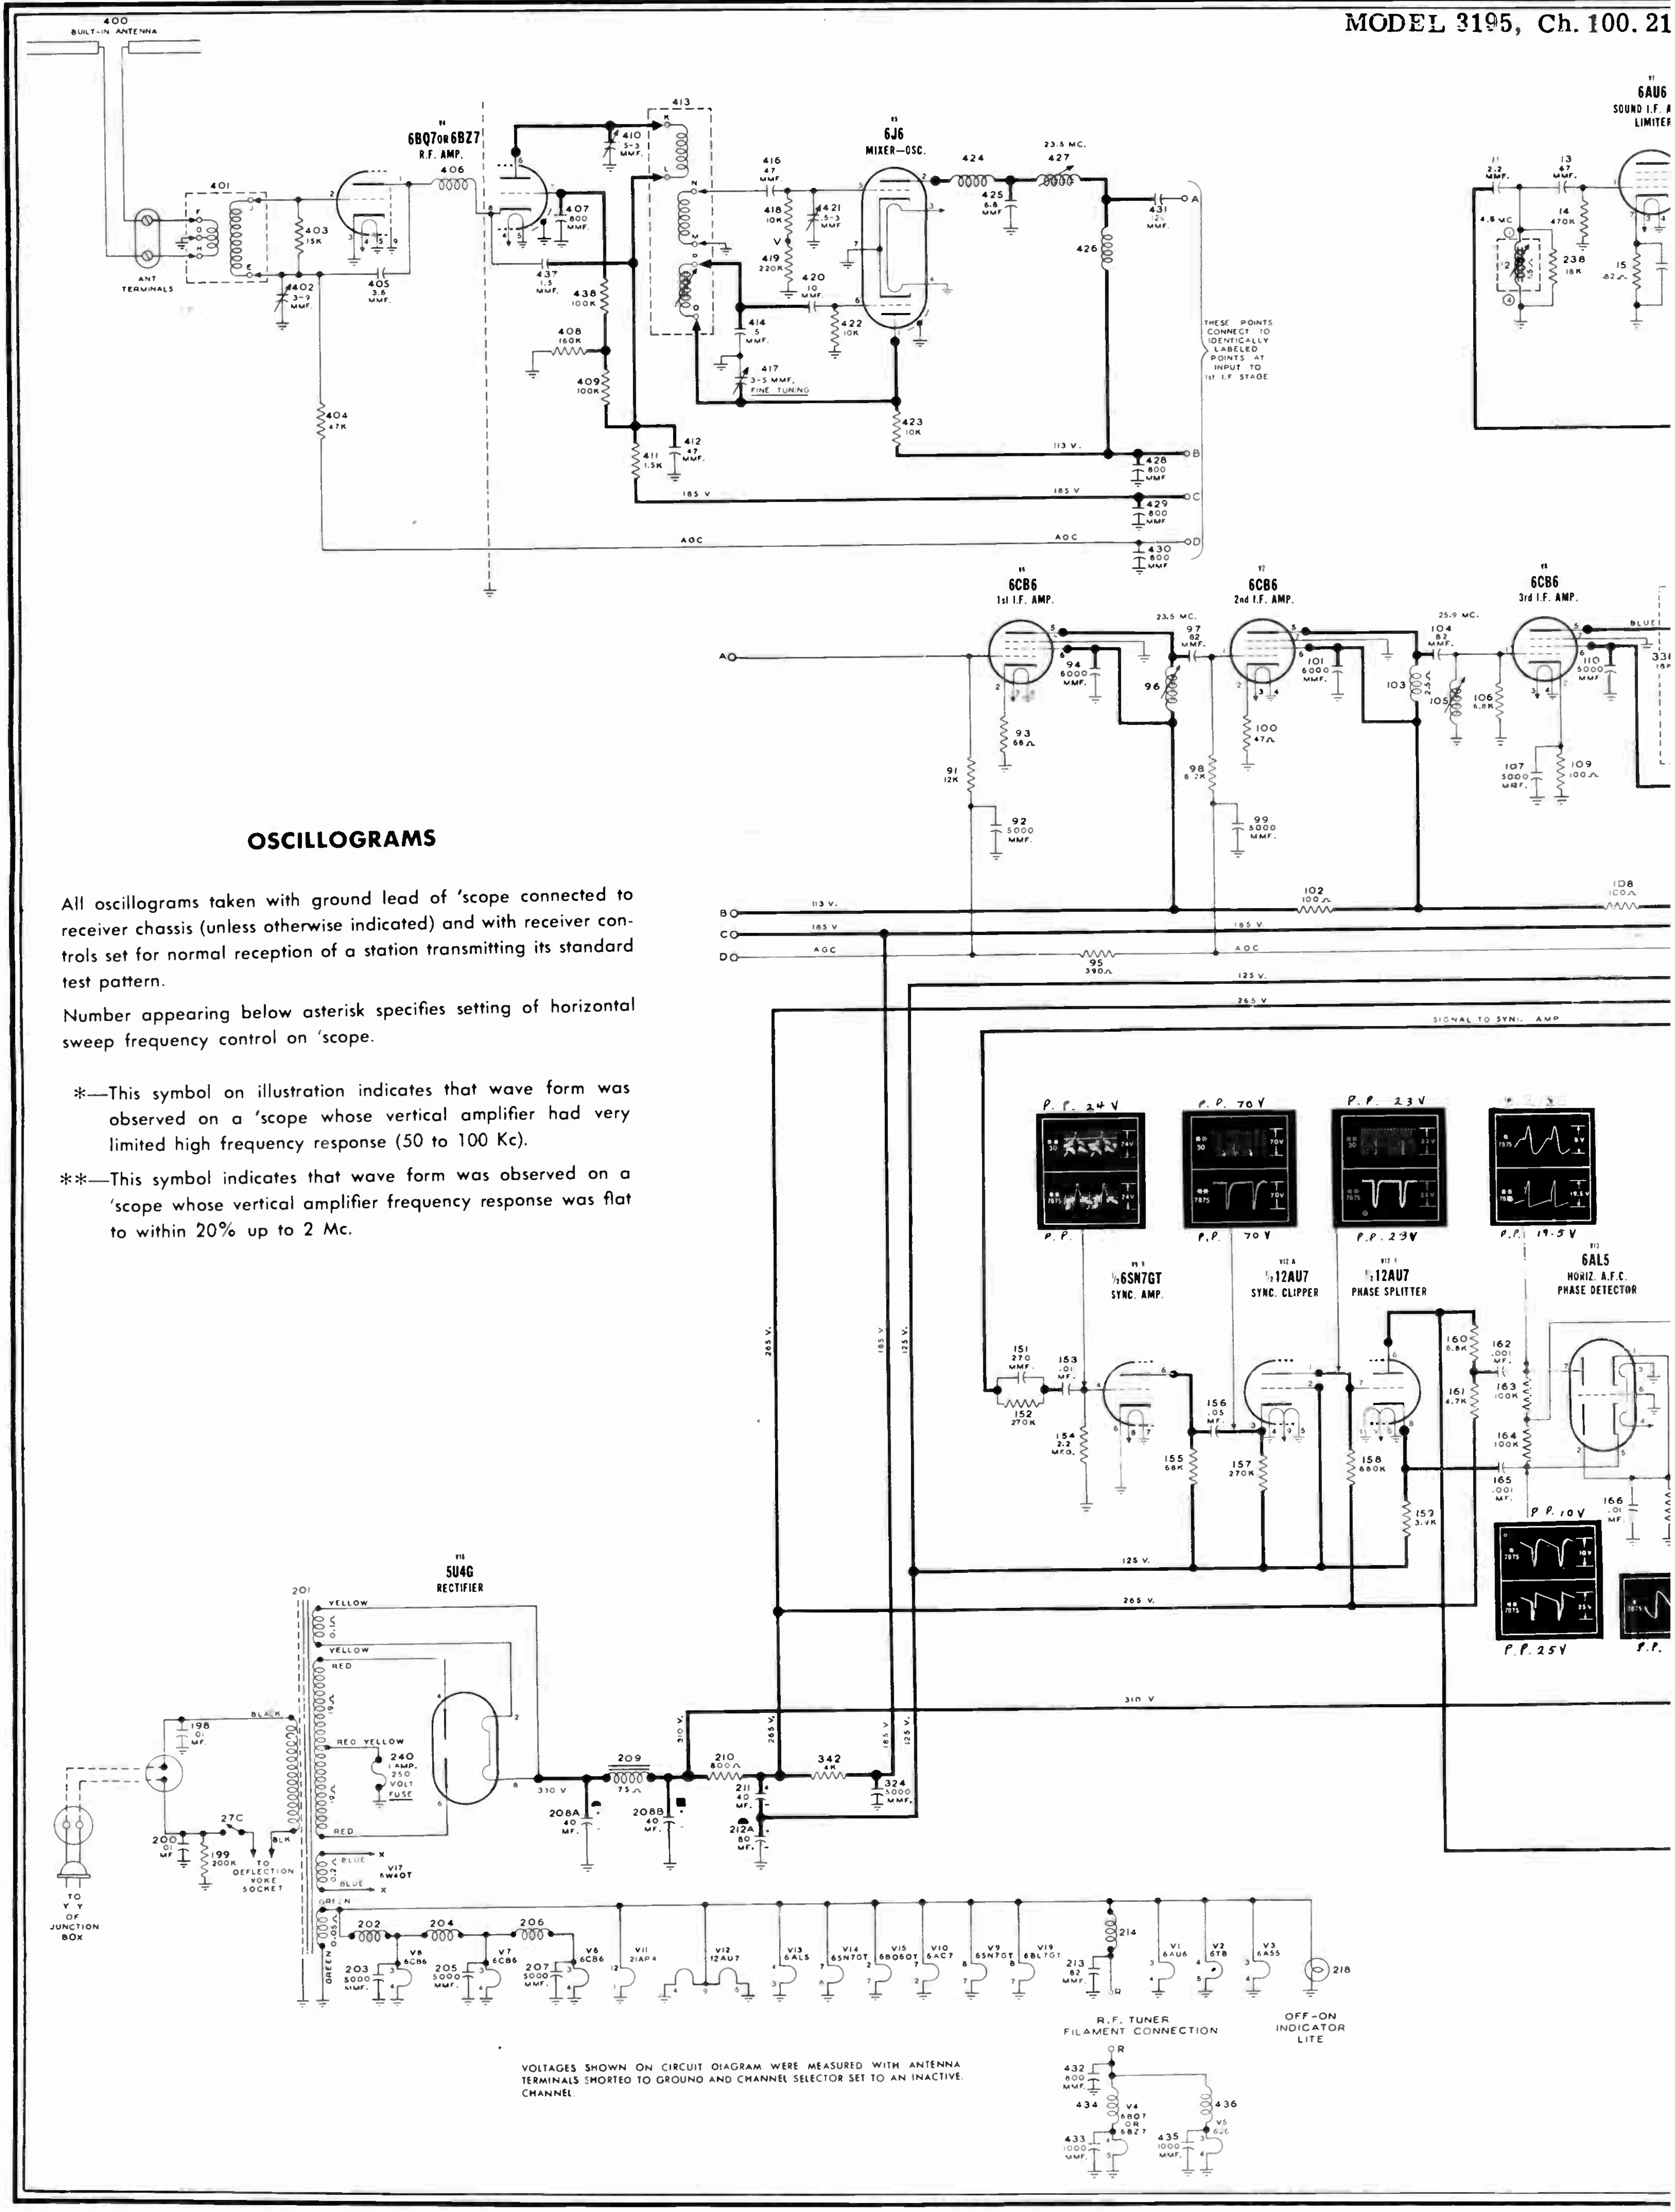
(for electrical parts see preceding classified listings of condensers, resistors and coils)

PART NO.	DESCRIPTION	LIST PRICE
W520645	R.F. Tuner complete with coils and tubes	37.50
W508081	Bracket for mounting R.F. tuner (front)	.16
W520233	Bracket for mounting R.F. tuner (rear)	.25
W507339	Clip for mounting video converter plate coil	.10
W520515	Fine Tuning cam and shaft	.70
W508708	Roller—detent	.10
W520535	Shield, bottom cover	.50
W520536	Shield, side cover	.35
W520534	Shield—tube; miniature for 6J6 tube	.15
W520519	Shield—tube; miniature for 6BQ7 or 6BZ7 tube	.20
W509062	Slug core for converter plate coil	.12
W507986	Slug for osc. coil; auxiliary fine tuning adj.	.05
W507987	Socket—miniature for 6J6 tube (includes base for mounting shield)	.45
W520521	Socket—miniature (9 pin) for 6BQ7 or 6BZ7 tube (includes base for mounting shield)	.50
W507966	Spring—contactor washer (on front turret shaft	.08
W508709	Spring—detent	.08
W507990	Spring—retains osc. fine tuning slug	.10
W507967	Spring—turret shaft retaining	.03
W520517	Stator contact assembly (includes 11 contacts and metal frame)	3.75
W520516	Tuner turret and shaft assembly (less coils)	3.00
W507965	Washer, fiber spacer (on turret shaft)	.01

MISCELLANEOUS PARTS

PART NO.	DESCRIPTION	LIST PRICE
W301270	Base for mounting electrolytic condenser	.06
W508153	Bracket base for support of yoke and focus coil (left or right hand)	.25
W520425	Bracket, chassis extension (left hand)	1.50
W520426	Bracket, chassis extension (right hand)	1.50
W520312	Bracket for mounting picture tube (left hand)	1.00
W520311	Bracket for mounting picture tube (right hand)	1.00
W520424	Bracket for mounting pre-set controls	.75
W508081	Bracket for mounting R.F. tuner (front)	.16
W520233	Bracket for mounting R.F. tuner (rear)	.25
W509005	Bracket mounts yoke and focus coil	2.75
W508154	Bracket ("U" shaped) for support of yoke and focus coil	.55
W508681	Clip for mounting electrolytic condenser #197	.10
W508964	Clip for mounting Horizontal Hold or Width coil	.04
W505101	Clip for mounting sound take-off transformer	.05
W507339	Clip for mounting video converter plate, 1st video I.F., 2nd video I.F., 3rd video I.F., or 4.5 Mc. trap coil	.10
W520428	Connector for H.V. terminal (includes cap and lead)	1.00
W509688	Ion trap	.85
W508617	Nut for retaining focus coil	.12
W508962	Nut on end of Horizontal Hold control slug	.10
W500966	Plug (1 pin) for phono pick-up cable	.10
W508878	Plug (3 pin) for focus coil leads	.25
W508515	Plug (8 pin) for yoke cable	.70
W507699	Power cord assembly (includes plugs at both ends)	1.00
W509290	Ring—corona shield for 1B3GT/8016 tube	.10
W520313	Ring, insulating for mounting picture tube	3.50
W507422	Rubber sleeve between neck of picture tube and focus coil	.30
W507793	Rubber spacer support between flared neck of picture tube and yoke bracket	.15
W18796	Screw—#10 x 1"; mounts TV chassis	.02
W162353	Shield for 3rd I.F. coil and crystal detector	.30
W162138	Shield—H.V. supply (front section)	2.70
W508088	Shield—H.V. supply (rear section)	2.10
W520534	Shield—tube; miniature for 6J6 tube	.15
W520519	Shield—tube; miniature for 6BQ7 or 6BZ7 tube	.20
W520429	Sleeve, insulating for picture tube (includes H.V. contact)	3.00
W509062	Slug core for converter plate coil	.12
W507357	Slug core for 1st, 2nd or 3rd video I.F. coil or 4.5 Mc. trap coil	.20
W508963	Slug core for Horizontal Hold coil	.15
W507429	Slug core for Width coil	.60
W509761	Socket and cable assembly for picture tube	1.05
W520571	Socket and mounting bracket for TV channel lite	.35
W162259	Socket assembly for 1B3GT/8016 tube (includes mounting frame)	1.20
W160039	Socket—(1 pin) for Phono. pick-up cable	.12
W508879	Socket—(3 pin) for focus coil leads	.35
W508419	Socket—(8 pin) for yoke cable	.70
W507932	Socket—male, power cord interlock	.25
W507364	Socket—miniature (7 pin)	.24
W507987	Socket—miniature for 6J6 tube (includes base for mounting shield)	.45
W508044	Socket—miniature (9 pin)	.35
W509507	Socket—miniature (9 pin) (for 12AU7 tube)	.25
W520521	Socket—miniature (9 pin) for 6BQ7 or 6BZ7 tube (includes base for mounting shield)	.50
W508703	Socket—octal	.15
W506469	Socket—octal (for 6W4 tube)	.18
W509320	Spring—tension for focus coil mounting	.10
W520444	Strap, anchor for picture tube	.65
W520623	Strap, tube retaining	.50
W520443	Support for tuner shaft (plastic)	.04
W162163	Terminal strip for TV antenna connection	.22
W170195	Wing nut—#8-32; for mounting yoke and focus coil	.10
W170817	Wing screw—#10-24; for height adj. of yoke and focus coil	.05
W170741	Wing screw—#10-32; for mounting or forward adj. of yoke	.10

*—This part is not supplied as a Service replacement item.



OSCILLOGRAMS

All oscillograms taken with ground lead of 'scope connected to receiver chassis (unless otherwise indicated) and with receiver controls set for normal reception of a station transmitting its standard test pattern.

Number appearing below asterisk specifies setting of horizontal sweep frequency control on 'scope.

*—This symbol on illustration indicates that wave form was observed on a 'scope whose vertical amplifier had very limited high frequency response (50 to 100 Kc).

**—This symbol indicates that wave form was observed on a 'scope whose vertical amplifier frequency response was flat to within 20% up to 2 Mc.

SPECIFICATIONS

Power Supply - 105 to 125 Volts - 60 Cycle AC

Power Consumption - 200 Watts

Power Output (Audio) - 2 Watts (Undistorted)

Input Impedance - 300 Ohms

Speaker - Voice Coil - 3.2 Ohms

Vertical Scanning Frequency - 60 Cycles Per Second

FREQUENCY CHART

Sound IF - 21.6 MC

Picture IF - 26.1 MC

Channel	Frequency	Picture Frequency	Sound Frequency	RF Osc. Frequency
2	54-60	55.25	59.75	81.35
3	60-66	61.25	65.75	87.35

INDOOR ANTENNA

Silvertone indoor antennas have a length of cable or transmission line attached to the base. This line ends with two terminal lugs. Connect these legs to the terminals after disconnecting the Built-In Antenna. In using the Silvertone Indoor Antenna No. 6738, lower the aerial arms to a wide "V" or horizontal position as shown in Fig. 2. Extend arms fully -- pull out all the way -- for reception on Television Channels Numbers 1 to 4. Shorten arms approximately 7 inches for best reception on Television Channels 5 and 6. Shorten arms -- push in all the way -- for Television Channels Numbers 7 to 13.

The antenna will work best when the arms are placed broadside toward the Television Transmitting Station. However, the antenna should be rotated and the reception observed for best results. In checking the antenna, keep hands away from the metal part of the antenna. It is desirable to keep the antenna above the floor and provision is made on the base for hanging to the wall, if that position is favorable to reception. It may be necessary to try different positions of the antenna until the most satisfactory results are obtained. A little experience will determine the best location, length and position of the antenna for each channel.

OUTDOOR ANTENNA:

In certain cases improved reception can be obtained by the use of an outdoor television antenna such as No. 6724, "piggy-back" straight dipole; 6713, single conical; 6714, stacked conical; 6715, folded in-line; 6716, stacked in-line. This will be true when:

1. Improved reception is desired on stations with signals of insufficient power and more than 15 miles distant from your home.
2. Your home is in a particularly bad location for television reception, that is, near heavy automobile traffic, in a valley surrounded by hills or tall buildings, etc.
3. Your receiver is operating inside a building with steel frame construction, which diverts television signals, or in a basement location below street level.

BRIEF CIRCUIT ANALYSIS:

This receiver uses the Inter-carrier sound system. In this system the R.F. section of the receiver receives both the picture and sound carriers which are converted by the Mixer and then fed into the I.F. No separation takes place until after the video amplifier. At this point the sound component of the dual signal is picked off by the 4.5 MC transformer and fed through the audio I.F. amplifier, ratio detector, audio amplifier and the audio output stage. The picture I.F. frequency is 26.1 MC and the sound I.F. is 21.6 MC.

VIDEO AMPLIFIER:

A 6AC7 is used in this section of the receiver. The output of the detector is fed to the grid of the 6AC7 and ultimately taken off the plate of the tube. It is at this point the three basic components of the received signal are separated and fed to their respective circuits. The picture intelligence is fed to the cathode of the picture tube, and the synchronization pulses to the grid of the 1st sync amplifier. At this point the 4.5 MC sound carrier is also taken off.

SOUND SYSTEM:

The carrier is taken off the plate of the video amplifier by a 4.5MC take-off coil and fed thru audio I.F. amplifier to the ratio detector, and then to the sound amplifier, audio output and speaker.

SWEEP SYSTEM - VERTICAL:

One triode section of a 6SN7 serves as the vertical oscillator. The vertical sweep amplifier is also a 6SN7. The plate circuit of the vertical sweep amplifier is transformer coupled to the vertical windings of the deflection yoke.

SWEEP SYSTEM - HORIZONTAL:

The horizontal system is cathode coupled sine wave multivibrator combination, using one-half of a 6SN7 as a horizontal osc. and the other triode section as a discharge tube.

A. G. C.:

This receiver uses an A.G.C. circuit operating on the first two I. F. stages and the R. F. amplifier which proves quite effective.

HIGH VOLTAGE POWER SUPPLY:

This receiver used the "fly-back" type of high voltage power supply. The horizontal output tube is a 6BG6 with a 1B3 as a rectifier.

LOW VOLTAGE POWER SUPPLY:

The low voltage power supply is conventional, consisting of a center tapped power transformer used in conjunction with a 5U4 full wave rectifier. After power dissipations for filtering, approximately 360 volts are available for application to the deflection circuits. It is interesting to note that the I. F. -R. F. portions and the sound-audio portions of the receiver are in series across 360 volt supply, 220 volts being used for sound supply and the remaining 140 volts for I. F. and R. F. supply, supply potential. See Fig. 1.

CONTROL FUNCTIONS - FRONT PANEL CONTROLS:

On-Off-Sound:

The volume control is an audio control only and has no effect on the picture. It is connected in the grid circuit of the audio amplifier. The power on and off switch is combined with the volume control.

Picture:

The contrast control is virtually a tone control for the picture. When set too low, it will give a weak, washy picture and when set too high, it will produce a stark black and white picture.

Vertical:

The vertical hold control should be adjusted in the event of picture roll. Slight readjustment will cause the picture to lock vertically.

Horizontal:

The horizontal hold control should be set in the center of its range. The control will be used only if the picture should resolve into a series of heavy, oblique black and white lines. A slight readjustment of the control will then cause the picture to correct itself.

Station Selector:

The inner knob will activate the fine tuning control, which is a corrector for the R. F. oscillator. The (outer) indicator knob of this control will operate the station selector.

RECEIVER REAR CHASSIS CONTROLS:

Brightness:

This control operates by varying the D. C. potential on the cathode of the kinescope.

Vertical Size or Height:

This control is a variable resistor operating in the plate circuit of the vertical sweep oscillator. Since changes in height will affect picture linearity, this height control must be adjusted in conjunction with the vertical linearity control.

Note: The height control will affect mainly the bottom half of the picture, and the vertical linearity control will affect mainly the top portion of the picture.

Vertical Linearity Control:

This is a variable resistor control in the cathode of the vertical sweep amplifier. This control is to be adjusted as height control is adjusted.

RECEIVER REAR CHASSIS CONTROLS:

P. M. Focus Coil Adjustment:

This receiver uses a permanent magnet type focus unit. This unit provides an easy method for both focusing and centering adjustments. The unit is spring mounted for ease of positioning. A brass, screw driver slotted rod, is located to the right of the CR tube socket at the rear of the set, and may be adjusted for best focus. If the focusing ring (outer ring) is drawn completely to the rear and a focus is approached, but not obtained, the entire assembly should be moved to the rear. This may be accomplished by loosening all three wing nuts on the spring mounted assembly. Conversely, if focus is approached with the focus ring completely forward, tighten the three wing nuts. The raster may be centered by movement of the positioning ring (inside the focusing ring) with the "Wobble Stick" which is taped to an electrolytic condenser on the top of the chassis.

Horizontal Size:

The horizontal size adjustment should be attempted only when it is possible to receive a test pattern.

Horizontal Linearity:

The horizontal linearity control is adjusted to give best linearity between the left and right wedges of the test pattern consistant with good width.

Check of AFC Control:

The AFC control is located on the rear portion of the chassis under the yoke riser bracket. Set the horizontal hold control midway of its range. Tune in a station, then adjust the AFC coil until the picture is "locked in" on the screen.

If at a later time, the horizontal size controls are changed it may be necessary to repeat the above.

Height, Width, Linearity Alignment:

To adjust the overall size and linearity of the picture it is mandatory that a test pattern transmitted from a local station be used. Linearity adjustments, particularly, cannot be made accurately on moving transmissions. In an area where more than one station is being received, the pictures transmitted from different stations will vary slightly in size. The smallest transmitted picture should be made to fill the mask opening.

1. The horizontal hold control should be set at the center of its range and the AF coil adjusted until the picture locks in.

2. The horizontal linearity coil should be adjusted until the left and right wedges of the test pattern are as nearly equal as possible consistant with good width.

3. If the center of the picture is compressed horizontally or if a white line is evident on the left side, adjust the horizontal drive trimmer.

4. The height and vertical linearity controls should now be adjusted for a linear picture that will fill the mask vertically. The focus adjustment should also be checked for maximum definition of lines in the vertical wedge of the test pattern.

Deflection Yoke Adjustment:

The deflection yoke should be placed in position closest to the "bell" of the picture tube, as far forward as possible. The yoke riser mounting should also be as far forward as possible.

If the lines of the raster are not horizontal or squared with the picture mask, loosen the deflection yoke adjusting screw and rotate yoke until this condition is remedied. Tighten yoke adjustment screw.

INSTALLATION AND ADJUSTMENT

BUILT-IN ANTENNA--This receiver is equipped with a built-in antenna which should provide favorable reception of television signals within the primary service area, and where local interferences are not excessive. Do not locate the receiver near a large metal surface such as a radiator or metal partition, or a serious reduction of signal will result.

RECEIVER INSTALLATION--The receiver was shipped from the factory with all components pre-adjusted for normal operation. However, if in checking receiver performance, it becomes evident that one or more of the installation controls are out of adjustment, due to handling, it is necessary to re-adjust the affected controls. A complete adjustment of installation controls is outlined in the step by step procedure which follows. It will be noted that adjustment of some of the controls will interact on one or more of the others. These controls should be adjusted alternately, and in the given sequence of the procedure. Power should never be applied to the receiver for any great length of time, prior to the installation, without checking the ion trap adjustment for best screen illumination.

SEQUENCE OF ADJUSTMENTS

Ion Trap Adjustment

1. Remove the cabinet back cover. (In some cases, this will open circuit the A. C. interlock, and another line cord with appropriate fittings must be used temporarily until the necessary adjustments have been completed). With power applied to the receiver, and after allowing adequate warm-up time, set the brightness control in the center of its range and rotate the ion trap, or beam bender magnet, until light appears on the screen. After initial screen illumination is obtained, move the magnet forward or backward, and further rotate it to obtain the brightest raster. If two positions are noted which seem to give equal screen brightness, the setting closest to the picture tube base should be used. This is the only setting of the ion trap that is correct. NEVER ATTEMPT TO COMPENSATE FOR NECK SHADOWS OR FOCUS WITH THE ION TRAP OR BEAM BENDER ADJUSTMENT, IF BY SUCH ADJUSTMENT THE SCREEN BRIGHTNESS IS DECREASED.

Horizontal Drive Adjustment

2. Check the horizontal drive setting by turning the drive trimmer several turns counter-clockwise until one or more vertical white lines are observed on the left side of the screen. Then, turn the trimmer just far enough clockwise to eliminate these "drive lines".

In the event that no drive lines are observed on the picture tube face, leave the trimmer set to the position of minimum capacity consistent with sufficient trimmer screw pressure and good horizontal linearity.

Vertical Sweep Adjustments

3. Adjust the vertical size and the vertical linearity controls on the rear of the chassis for correct height and best vertical linearity. Do not attempt this adjustment unless a test pattern is available.

Width Adjustment

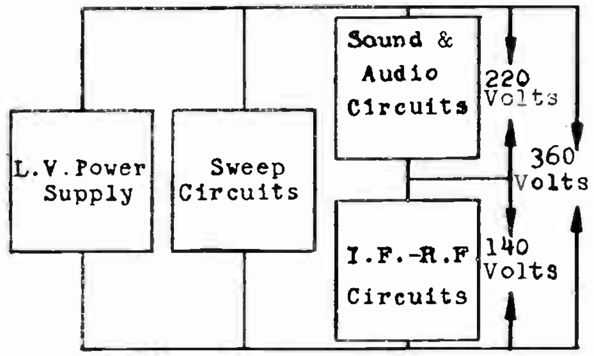
4. Check the width coil for proper setting, and correct if necessary.

Caution

5. Re-Adjust the beam bender or ion trap if necessary.

GENERAL CIRCUIT DESCRIPTION

THE LOW VOLTAGE POWER SUPPLY is conventional, consisting of a center tapped power transformer used in conjunction with a 5U4 full wave rectifier. This supply provides a filtered output of approximately 360 volts for application to the sweep or deflection circuits. It is interesting to note that the I. F. - R. F. portions and the sound-audio portions of the receiver are in series across the 360 volt supply. This arrangement provides 220 volts for application to the sound and audio circuits, and the remaining 140 volts is available for I. F. - R. F. supply potential. The audio power amplifier tube (6V6) is also used as a series voltage regulator. Its grid is returned to a high impedance voltage divider, tapped at approximately 130 volts, while its cathode is wired directly to the 140 volt line. Any change in the 140 volt drain due to A. G. C. fluctuations thus changes the grid to cathode voltage of the 6V6 almost instantaneously, and the resulting cathode current change in this tube acts to maintain the 140 volt supply substantially constant. It should, therefore, become apparent that if the 140 volt supply measures considerably higher than 140 volts, a short exists across the sound-audio circuits. If this voltage is considerably lower than the nominal 140 volts, and the 390 ohm resistor (R80) in the plate supply circuit of the 6V6 is observed to overheat, a short exists across the 140 volt supply. If the 140 volt supply is measured considerably lower than its nominal value, and the 390 ohm resistor does not overheat, an open circuit is indicated in the 200 volt sound-audio portion of the receiver. (See Diagram.)



SYNC CLIPPER - AMPLIFIER--Half of a 12AU7 dual triode is used as the sync separator or sync clipper. This tube is biased approximately to cut-off at the pedestal level, and therefore, will conduct only on positive going sync pulses. The grid of this tube, by means of RC time constants, is rendered relatively immune to noise pulses of either long or short duration. The output of this triode is coupled to the cathode of the second triode section. The output of this section can never exceed the plate voltage, approximately 30 volts. Thus additional sync clipping is obtained.

Sets employing a vertical blocking oscillator, will be found to contain a 6AL5 horizontal phase detector, while those using a vertical multivibrator will have a 12AX7 phase detector. A brief outline of the operation of both circuits will be described below. The wiring diagrams and wave forms of both systems are included in this manual.

12AX7 HORIZONTAL PHASE DETECTOR--The clipped, negative going horizontal sync pulses from the plate of the 12AU7 are coupled by C53 to the cathode of one section of a 12AX7 phase detector. In the absence of a signal this triode is held at approximately xxxx bias by virtue to its cathode. The negative going sync pulses cause this tube to draw grid current, which will vary with changes in plate voltage. Thus, the horizontal reference sawtooth which is applied to this triode plate (25 to 30 volts peak to peak amplitude is compared as to phase and frequency with the incoming sync pulses. The changing grid current of the tube acts to correct the firing time of the horizontal oscillator, due to the D. C. connection between the grids of the two tubes.

6AL5 HORIZONTAL PHASE DETECTOR--The clipped sync pulses are coupled to the grid of one section of the 6SN7 vert. osc. This triode provides amplification of the vertical sync pulses, and serves as a phase splitter for the horizontal pulses. The output of this phase inverter provides pulses of equal amplitude and 180 phase defference, which are applied to the 6AL5 phase detector for phase and frequency comparison with sawtooth pulses from the horizontal deflection system. Any difference in phase or frequency results in the production of a small correction bias which is applied to the horizontal oscillator, thus, maintaining correct horizontal frequency.

ALIGNMENT PROCEDURE

Necessary Equipment:

- Television Sweep Generator
- Marker Frequency Generator
- Vacuum Tube Voltmeter
- 4.5MC Crystal Generator, or equivalent, Oscilloscope

SOUND I. F. ALIGNMENT

1. Connect 4.5MC generator to the grid of the video amplifier tube. Low signal level is important here. Metering may be accomplished at the sound take-off point of the ratio detector (at the juncture of R-155 and C-160) with the meter ground connected to pin eight of the 6V6.

2. Adjust the slug of L-18 (sound take-off coil) for maximum negative meter indication. Attenuate the output of the generator so that not more than five volts is measured on the meter, as the alignment progresses.

3. Adjust the top slug of T-5 (ratio det. primary) for the maximum negative reading.

4. Move the meter ground to the juncture of R-156 and R-157 (6800 ohm resistors) in the sound detector circuit, and adjust the bottom slug of T-5 (Ratio Det.) for zero voltage. The other meter lead remains connected as in Step 1. No 4.5MC trap adjustment is necessary. The trap consists of a coil L-17 which is self-resonant at 4.5MC

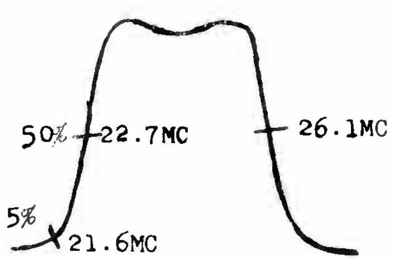
VIDEO I. F. ALIGNMENT -- The I. F. amplifier contains five tuned circuits, no traps being necessary. The video carrier is passed through the I. F. at a freq. of 26.1 MC, and the sound carrier at 21.6 MC. Extreme care must be taken in alignment to assure that the sound carrier is attenuated substantially below the level of the video carrier. This is necessary to assure that the slight AM modulation on the sound carrier due to picture modulation, will be sufficiently low to be removed by the detector, and not produce spurious phase modulation of the sound I. F.

A band width of 3.4 MC (6DB. Down) with a stage gain of from 12 to 15 times is attained. Earlier sets employed a staggered quintuple, which resulted in a different order of stagger of the I. F. coils. (See peaking frequencies below.) These sets may be identified by the values of the grid load resistors on the last two I. F. amplifier tubes, (R-109 and R-113) 6800 ohms. In the later sets, employing a staggered triple followed by a staggered double, the third I. F. grid resistor, R-109, is 10,000 ohms, while the fourth, R-113, remains 6800. Another difference which will serve to help identify the quintuple stagger, lies in the wiring of the A. G. C. to the second I. F. amplifier. In the staggered quintuple alignment, the grid return of this tube is wired directly to the .1 mfd. AGC filter capacitor (C-106). In the staggered triple-staggered double alignment, a 470 ohm resistor (R-106) and a .005 mfd. capacitor (C-105) have been added as additional A. G. C. decoupling.

PEAKING FREQUENCIES -

Peak	at Quintuple	Triple-Double
L-10	25.9MC	25.8MC
L-11	25.6MC	24.4MC
L-12	23.1MC	22.8MC
L-13	22.9MC	23.2MC
L-14	24.4MC	25.4MC

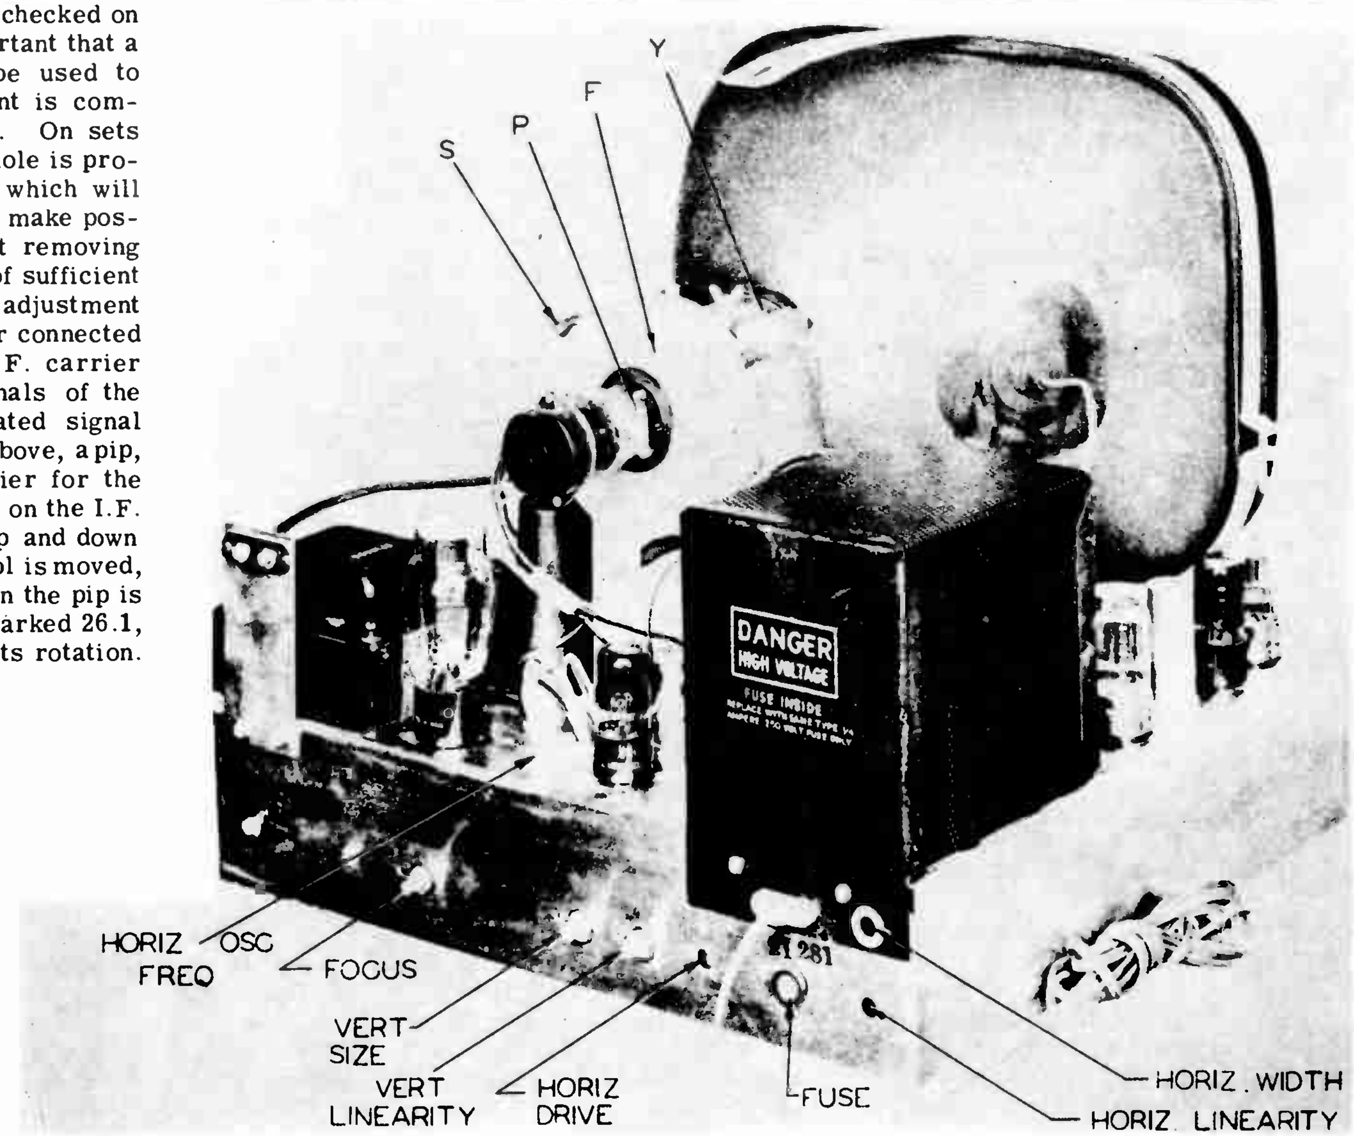
An I. F. alignment signal is best introduced to the chassis by means of a suitable cup, or tube shield floated over the mixer tube to capacity couple the signal to the plate circuit. It may be necessary to disable the local oscillator* to prevent R.F. harmonics from distorting the trace on the scope screen. The oscilloscope is connected to the grid of the video amplifier, through a 100,000 ohm isolating resistor. Metering is done on the A.G.C. line, keeping the input attenuated to produce no more than a negative 1 volt reading. The resulting



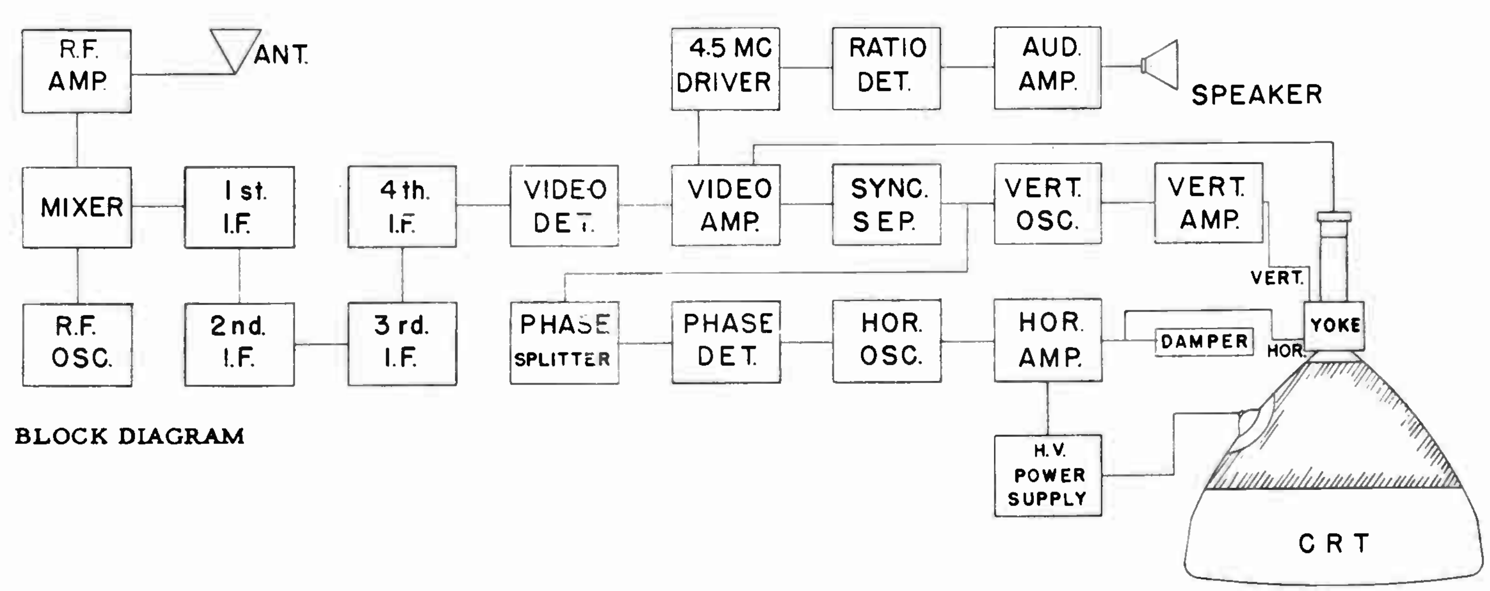
overall response should coincide with the curve shown above.

*A dummy 6J6 may be substituted for the mixer tube with the #1 pin removed, to facilitate alignment.

R. F. ALIGNMENT
The R. F. tuner in the receiver has been prealigned by the manufacturer and adjustment in the field is not recommended. It may be necessary on occasional sets, however, to reset the local oscillator tuning slug. This may be accomplished without test equipment, if it is possible to receive a signal of good quality, and if the I. F. and R. F. portions of the set are functioning correctly. Simply set the fine tuning in the center of its range and adjust the oscillator slug for best picture detail. The oscillator adjustment is recessed in a hole in the tuner front, directly to the right of the tuner shaft. This adjustment must be checked on each channel to be received. It is important that a non-metalic alignment screwdriver be used to prevent de-tuning when the adjustment is completed and the screwdriver withdrawn. On sets using a wooden front panel, a small hole is provided under the flanged tuner knob, which will accommodate this alignment tool, and make possible re-setting the osc. slug without removing the set from its cabinet. If a signal of sufficient strength is not available, oscillator adjustment may be made with the sweep generator connected as for I. F. alignment, and the video R. F. carrier frequency applied to the antenna terminals of the receiver from an accurately calibrated signal generator. With the hook-up outlined above, a pip, or marker indicating the video carrier for the particular channel being set will appear on the I.F. response curve. This pip will ride up and down on the curve when the fine tubing control is moved, and the oscillator is correctly set when the pip is passing through the point on the curve marked 26.1, with the fine tuning at the center of its rotation.



S — Centering Springs
P — Ion Trap
F — Focus Coil
Y — Yoke



BLOCK DIAGRAM

TROUBLE SHOOTING

DEFECTS OF THE I. F. AND R. F. CIRCUITS

A. NO PICTURE, NO SOUND, RASTER NORMAL
1. Check tuner, and all I.F. and R.F. Tubes.
2. Check crystal detector.
3. Check video amplifier tube V-30 and circuit.

B. SNOW IN THE PICTURE
1. Open or shorted antenna input circuit.
2. Defective antenna installation or transmission line.
3. Antenna orientation.

C. LACK OF PICTURE DETAIL (FOCUS SATISFACTORY)
1. Misalignment of I. F.
2. Misalignment of R. F.
3. Mismatch of antenna input impedances at antenna input terminals.

D. SOUND BARS IN THE PICTURE
1. Check fine tuning setting.
2. Microphonic I. F. R. F. or video amplifier tubes.
3. C-84 open.

DEFECTS OF THE VIDEO AMPLIFIER

A. NO PICTURE, SOUND AND RASTER SATISFACTORY
1. Open capacitor C-133 -- L-17 open.
2. Picture tube defective.

B. LACK OF PICTURE DETAIL (FOCUS SATISFACTORY)
1. Open or shorted peaking coils L-15 or L-16.

DEFECTS OF SYNC SECTION

A. NO VERTICAL SYNC, OR WEAK VERTICAL SYNC (HORIZONTAL SYNC SATISFACTORY
1. Check integrator network.
2. Check capacitor C-10 for leakage.

B. WEAK OR NO HORIZONTAL OR VERTICAL SYNC
1. Check V-9.
2. Open capacitor C-50 or C-52.
3. Improper B/ on tube V-9.

C. WEAK OR NO HORIZONTAL SYNC (VERTCAL SYNC SATISFACTORY)
1. Check V-9 and V-10.
2. Check horizontal osc. coil L-3 for short.
3. Check capacitors C-54, C-30 for short.
4. Check capacitor C-53 for open circuit.
5. Check value of R-60 and C-54. Check continuity of reference pulse winding on the horizontal output transformer.

DEFECTS OF VERTICAL SWEEP

A. NO VERTICAL DEFLECTION
1. Open vertical yoke winding.
2. Open vertical output transformer.
3. Open height or linearity control.
4. Check V-2 and V-3.
5. Open or shorted vertical oscillator transformer.
6. Shorter Capacitor C-15B. (Resistor R-20 will overheat)

B. INSUFFICIENT HEIGHT
1. High resistance of R-20 or R-15.
2. Incorrect voltage on V-2 or V-3.
3. Open C-15A.
4. Shorted turns on yoke or vertical output trans.
5. Defective V-2 or V-3.

C. POOR VERTICAL LINEARITY
1. Defective V-2 or V-3.
2. Shorted capacitor C-15A.
3. Inadequate drive voltage from V-2.

D. FOLDOVER AT BOTTOM OF PICTURE
1. C-14 leaky.
2. V-3 defective.
3. R-17 off value.

DEFECTS OF THE HORIZONTAL SWEEP

A. INSUFFICIENT SWEEP WIDTH
1. Low B/ boost voltage.
2. Defective V-5 or V-6.
3. Shorted turns of width coil.
4. Width coil partially effective, check for broken off slug.

B. TOO GREAT A SWEEP WIDTH
1. Open width coil.
2. Low picture tube anode voltage.

DEFECTS OF THE HORIZONTAL SWEEP (Cont'd.)

C. POOR HORIZONTAL LINEARITY
1. Check capacitors C-40, C-39 and C-36.
2. Check horizontal drive adjustment.

D. KEYSTONE RASTER
1. Deflection yoke.

E. HALF SPEED OSCILLATION OF THE HORIZONTAL OSCILLATOR
1. Check V-10 and V-4.
2. Resistor R-31, R-32 or R-33 off value, capacitor C-31 off value.
3. Horizontal osc. coil shorted turns.

DEFECTS OF THE AUDIO SYSTEM

A. NO SOUND, PICTURE NORMAL
1. This indicates a defect in the circuits of V-40, V-41, V-10, V-11, or the speaker.
2. Misalignment of L-18 or T-5 will cause weak sound to be received.
3. Check for shorted capacitors C-80, or C-83.

B. SYNC BUZZ
1. Check A.G.C. and all I. F. -R. F. Tubes.
2. Check alignment of L-18 and T-5.
3. Check ground connection of picture tube aquadag.
4. Check germanium diode by substitution.
5. Shorted cathode bypass on last IF stage.
6. Check IF alignment.

PRODUCTION CHANGES

1. Resistor R-59 was changed from 1 meg. to 680 K and capacitor C-53 was changed from 430 mmf. to prevent "S" distortion.

2. Capacitor C-11 was added to prevent vertical jitter.

3. Resistor R-15 was changed to 820 K and capacitor C-13 was changed to .1 mfd. to extend the range of the vertical size control.

4. Capacitor C-16 was changed from 3900 mmf. to 5000 mmf. to increase bass response.

DC RESISTANCE MEASUREMENTS

DC RESISTANCE

HOW TO ORDER PARTS

1. Use Correct Order Form.
2. On the Purchase Order always give the following information:

(1) PART NUMBER (number printed on the part if different from that shown in this list) and DESCRIPTION for each part ordered. When no part number is assigned, order by description and rating.

(2) SELLING PRICE of part. Indicate if no selling price is given.

(3) The CHASSIS NUMBER. This is the number found on the metal plate at the rear of the chassis

SPECIFICATIONS

Power Supply — 105-125 volts, 60 cycle AC

Power Consumption — 225 watts

Power Output (Audio) — 2 watts undistorted
3.5 watts maximum

Input Impedance — 300 ohms
(some receivers may have a matching network at the antenna terminal strip to permit the use of either 72 ohm coaxial lead-in or 300 ohm flat twin lead-in.)

Picture Tube Size — 21" rectangular

Picture Size — 13-15/16" x 18⅜"

Speaker — 1175-21 5 inch round
1182-21 & 1189-21 10 inch round
Permanent Magnet type, 3.2 ohms voice coil impedance

Vertical Scanning Frequency — 60 cycles per second

Horizontal Scanning Frequency — 15,750 cycles per second

Dimensions —
1175-21 22" high x 23¾" wide x 19½" deep
1182-21 38" high x 26¾" wide x 20" deep
1189-21 28" high x 25" wide x 19⅛" deep
(depth of tube cup not included)

Shipping Weight — 1175-21 Approx. 104 lbs.
1182-21 & 1189-21 Approx. 125 lbs.

Conditions:
1. Switch on - set connected to 117 Volt 60 cycle AC.
2. No antenna connected and set tuned to unused channel.
3. All controls at "Normal Setting".
4. Measurements taken with a Vacuum tube Voltmeter.

Notes:
* Reading will vary with setting of Picture Control.
** Reading will vary with setting of Horizontal Hold Control.
+ Reading will vary with setting of Vertical Hold Control.
++Reading will vary with setting of Height Control.

PARTS REMOVAL

TO REMOVE THE CHASSIS FROM THE CABINET:

1 — Remove the knobs on the front panel by pulling them straight forward, in line with the shafts on which they are mounted.
2 — Remove the screws holding the masonite back to the cabinet and remove the back.
3 — Loosen the screws holding the antenna terminal strip to the cabinet and slide out the antenna terminal strip.
4 — Reach into the cabinet from the rear and remove the speaker plug from the front of the chassis.
5 — Remove the six chassis mounting screws from the bottom of the cabinet.
6 — Slide the chassis straight out, being careful not to hit the picture tube.

CAUTION:

THE PICTURE TUBE ENCLOSES A HIGH VACUUM, AND DUE TO ITS LARGE AREA, IS SUBJECTED TO CONSIDERABLE AIR PRESSURE. THEREFORE, PICTURE TUBES MUST BE HANDLED WITH EXTREME CARE.

THE LARGE END OF THE PICTURE TUBE, PARTICULARLY THAT PART AT THE RIM OF THE VIEWING SURFACE, MUST NOT BE SUBJECTED TO ANY IMPACT, SCRATCH, OR MORE THAN MODERATE PRESSURE AT ANY TIME.

IN INSTALLATION OR REMOVING, IF THE TUBE STICKS OR FAILS TO SLIP SMOOTHLY INTO ITS MOUNTING OR DEFLECTION YOKE, INVESTIGATE AND REMOVE THE CAUSE OF THE TROUBLE. DO NOT FORCE THE TUBE.

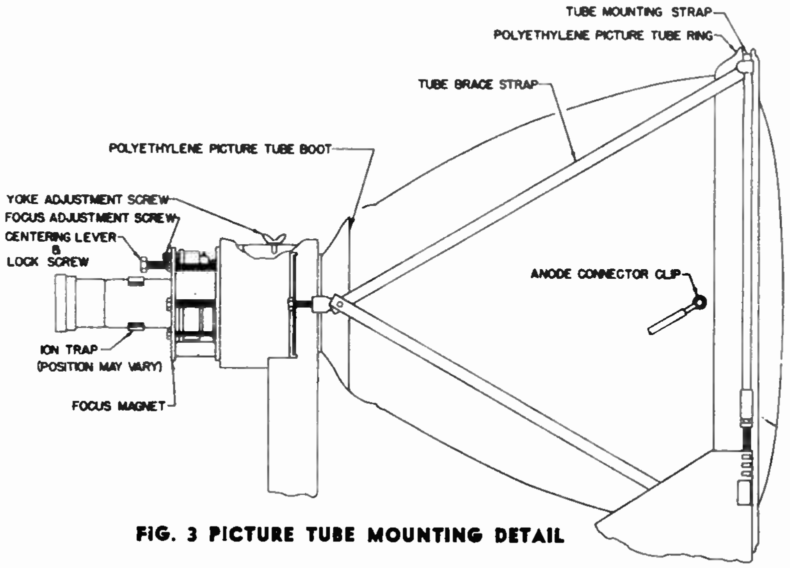

FIG. 3 PICTURE TUBE MOUNTING DETAIL

TO REMOVE THE PICTURE TUBE FROM THE CHASSIS:

1 — Remove the chassis from the cabinet by following procedure outlined.

2 — Discharge the tube and filter capacitor by touching a screwdriver from chassis ground to the metal jacket of the picture tube (NOT from the picture tube to chassis ground).

3 — Disconnect the anode lead by unsnapping the fastener on the side of the polyethylene picture tube boot.

4 — Remove the tube socket at the base of the tube by pulling the socket straight back.

5 — Slip the ion trap from the neck of the tube.

6 — Loosen the tube brace straps by unfastening the screws on either side of the deflection yoke support.

7 — Remove the mounting strap from the front rim of the picture tube by removing the screws to the front brackets on both sides of the tube. The bottom tube brace straps should remain fastened to the front brackets.

8 — Lift the picture tube slightly so as to clear the front brackets and slide the tube straight forward until the neck is clear of the deflection yoke and focus magnet.

CAUTION: If the tube sticks or fails to slip out smoothly, investigate and remove the cause of the trouble. DO NOT FORCE THE TUBE.

9 — Remove band on rim of tube holding the polyethylene ring and boot in place and remove the ring and boot.

10 — To replace the picture tube reverse the above operations making sure that the picture tube rests firmly on the front support brackets and that the deflection yoke is as far forward on the tube as possible. The joint of the polyethylene picture tube ring should be at the top and the high voltage connector on the boot should be at the right side (looking from the rear of the chassis), and clipped to the front rim of the picture tube. The second connector is used for positioning the boot and is clipped to the bottom of the front rim of the picture tube.

PICTURE ADJUSTMENTS

DEFLECTION YOKE, ION TRAP AND FOCUS MAGNET ADJUSTMENTS

If it should become necessary to readjust the picture tube adjustments (i.e. — after replacing the picture tube), proceed as follows:

1 — Turn the Off-On-Volume control to the On position.

2 — Turn the Brightness control to maximum (clockwise).

3 — Turn the Picture control to minimum (counterclockwise).

4 — Rotate the Ion Trap on neck of the picture tube and at the same time move it backward and forward until the brightest raster is obtained.

5 — The Deflection Yoke should be moved as far forward on the neck of the picture tube as possible and rotated so that the top and bottom edges of the raster are parallel to the mask.

6 — Reduce the Brightness control (counterclockwise) until the raster is slightly above normal brilliance.

7 — Adjust the Focus Adjustment Screw for clearest definition of the horizontal sweep lines in the raster. It is recommended that a brass screwdriver be used for this operation, as contact between this screw and a steel object will affect the focus of the picture. Shaded corners are eliminated at a later adjustment.

8 — Turn the Horizontal Centering control until it is at approximately the center of its range of rotation.

9 — Move the Centering Adjustment Lever (or Centering Arm) on the Focus Magnet in any direction necessary to eliminate shaded corners.

10 — Readjust the Ion Trap for maximum brilliance. Steps, 7, 8, and 9 may be repeated for final touch-up.

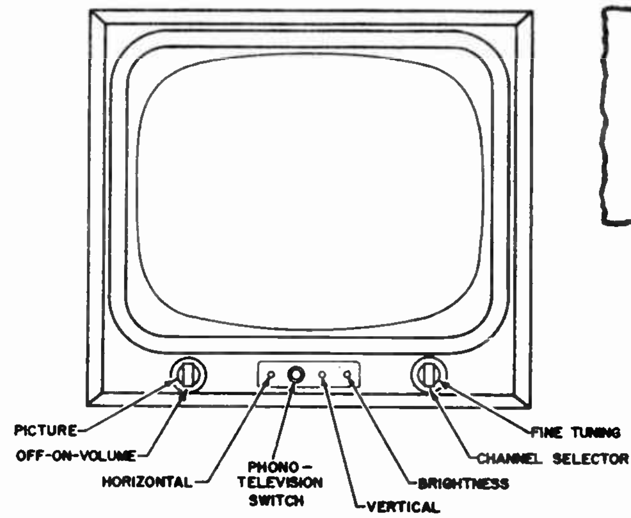

FIG. 4 FRONT PANEL CONTROLS

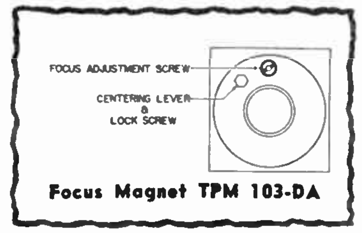

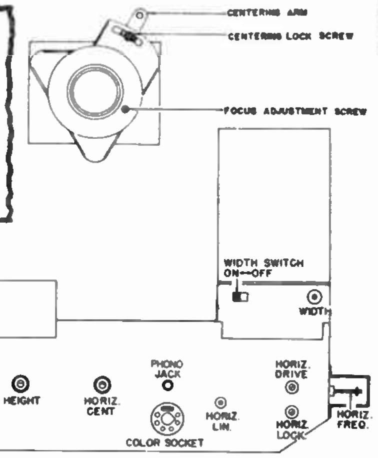

FIG. 5 RECEIVER REAR CHASSIS CONTROLS

(Using Focus Magnet TPM 110-D)

HEIGHT, WIDTH AND LINEARITY

To adjust the overall size and linearity of the picture, it is necessary to use a test pattern transmitted from a local station. Linearity adjustments, particularly, cannot be made from moving transmissions. It will be noted that patterns transmitted from different stations will vary slightly in size. The smallest test pattern should be used, and made to fill the area delineated by the mask.

1 — Turn the Width control all the way in (clockwise).

2 — Turn the Horizontal Drive trimmer in either direction until the greatest width is obtained without a vertical line or tear. The setting of this control should be at least ½ turn from its maximum clockwise position. This control will mainly affect the left side of the picture.

3 — The Horizontal Linearity control should then be adjusted so that both horizontal wedges are of the same length, and the center test pattern circles are horizontally symmetrical. This control will affect the right side of the picture primarily.

4 — Turn the Horizontal Centering control so that the picture is horizontally centered within the mask opening.

5 — Readjust the Width control to achieve a picture that will fill the mask horizontally. The picture may be made larger by use of the Width Switch which disconnects the width coil. In that case, the Width control will have no affect on the picture, as the width coil is no longer in the circuit.

6 — Adjust the Height control until the picture fills the mask.

7 — Adjust the Vertical Linearity Control until the test pattern is symmetrical from top to bottom and the center test pattern circles are round. Note that the Height control primarily affects the bottom half of the picture while the Vertical Linearity control primarily affects the top half of the picture. However, the Height and Vertical Linearity controls are interdependent and an adjustment of either control usually requires a slight readjustment of the other.

8 — The setting of the Horizontal Centering control and the Centering Lever of the focus magnet may be readjusted so that proper centering and vertical and horizontal linearity are obtained.

9 — Retouch the Focus Adjustment Screw, previously set, for maximum definition of the lines in the vertical wedges of the test pattern.

RF TUNER

(SARKES-TARZIAN TT5 TUNER, SILVERTONE PART NO. TTU 109-D)

TUNER CIRCUIT DESCRIPTION

The signal from the antenna is brought through a transformer network which couples the lead-in line to the single ended RF Amplifier (V18-6BC5). The input circuit to this stage consists of a high and low band transformer feeding a switch controlled single tuned circuit (S1, see schematic), in addition to a switch controlled shunt loading (S2) on the low band to improve the match. The output circuit is a double tuned, switch controlled (S3 and S4) overcoupled stage which, in conjunction with the input stage characteristic, gives the proper uniform RF bandpass on all channels. An AGC voltage is also introduced at the grid of this stage.

The amplified signal is fed into the grid of the Mixer section of the RF Oscillator and Mixer tube (V19-6J6). The second section of this tube is a modified Colpitts oscillator. The output of this local oscillator is capacitive-coupled (C417) to the Mixer grid where it is heterodyned with the amplified RF signal to generate the IF output at the Mixer plate. The Channel Selector switch functions in this circuit (S5) to select suitable fixed tank circuit elements so that the local oscillator frequency is always above the RF frequencies by an amount equal to the desired IF frequencies. The front panel Fine Tuning control is mechanically connected to a variable capacitor (C414) in this oscillator tank circuit to provide vernier adjustment of the local oscillator frequency.

RF TUNER ALIGNMENT

The alignment of the RF tuner has been carefully checked at the factory to give best possible performance. Do not tamper with the adjustments inasmuch as much of the alignment procedure consists of moving or spreading coils. If any major adjustment of the tuner must be made, it is recommended that the entire tuner unit be replaced, and the defective tuner returned to the source for repair.

The following instructions are given for your information and in the event that some slight adjustment may be necessary after tubes or parts are changed.

NOTE: BEFORE ATTEMPTING TO ALIGN THE TUNER, IT IS NECESSARY THAT THE IF AMPLIFIER STRIP BE CORRECTLY ALIGNED SINCE A FREQUENCY SHIFT OF THE IF RESPONSE WILL APPEAR AS AN EQUIVALENT LOCAL OSCILLATOR ERROR. BE CERTAIN THAT IT IS THE TUNER AND NOT THE IF STRIP THAT NEEDS ALIGNMENT.

CONDITIONS OF ADJUSTMENTS:

1 — Tube shields and the tuner cover are on.

2 — The receiver should have been operating for about 15 minutes prior to adjustment to allow it to warm up and stabilize.

3 — The Fine Tuning control should be at approximately the center of its range of rotation for all measurements and adjustments.

4 — A non-metallic screwdriver is used for the actual adjustment.

5 — Proper power supply voltages should be fed to the tuner from the receiver.

These are: B+ — 135-160 volts.
Filament — 6.3 volts.

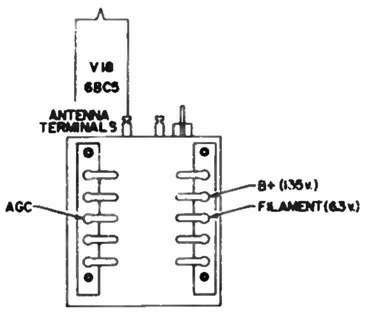
TOP VIEW
FIG. 6B



REAR VIEW
TERMINAL LOCATIONS
FIG. 6C

PROCEDURE — LOCAL OSCILLATOR ALIGNMENT

1 — Connect the RF sweep generator to the antenna terminals. Put 3 volts negative bias across an AGC terminal (across C12 to chassis).

2 — If the sweep generator is not provided with internally crystal-controlled or crystal-calibrated markers, loosely couple a marker generator to the antenna terminal lead.

3 — Connect the cathode ray oscilloscope between Test Point B (of the Test Socket on the receiver chassis) and ground, through a 47,000 ohm isolating resistor.

4 — Adjust the RF sweep generator for at least 6 mc sweep width, with center frequency at approximately 213 mc.

5 — Adjust the marker generator for the picture carrier frequency of channel 13 (211.25 mc).

6 — Set the Channel Selector switch of the tuner to channel 13, with the fine tuning control at approximately the center of its rotation range.

7 — The picture carrier marker (211.25mc) should fall at about the center of the picture carrier slope on the response curve as seen on the oscilloscope. (See Fig.7A). If it is necessary to make any adjustments, rotate the slug in the channel 13 oscillator coil (L404, front of tuner, Fig. 6A) until the picture carrier marker falls at about the center of the picture carrier slope on the response curve. This will bring all the high band channels 7 to 13 into adjustment. Do not back-up the screw more than 8 turns from tight. At that point the electrical effect has ceased and further backing-up will cause the screw to drop out. Clockwise rotation of the screw will increase the frequency of the local oscillator.

8 — Set the Channel Selector switch of the tuner to channel 6, with the fine tuning control at approximately the center of its rotation range.

9 — Adjust the sweep generator to channel 6 center frequency (85mc) and the marker generator to the picture carrier frequency of channel 6 (83.25mc).

10 — Again the picture carrier marker should fall at about the center of the picture carrier slope on the response curve as seen on the oscilloscope. (See Fig. 7). If it is necessary to make any adjustment, rotate the slug in the channel 6 oscillator coil (L405, front of tuner, Fig. 6A) until the picture carrier marker falls at about the center of the picture carrier slope on the response curve. This will bring all the low band channels (2 to 6) into adjustment. Again, do not back the screen more than 8 turns from tight. Clockwise rotation of the screw increases the frequency of the local oscillator.

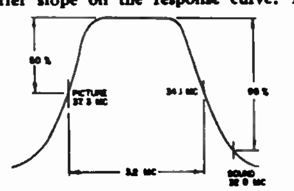


FIG. 7A IDEAL WAVEFORM

ACCEPTABLE VARIATIONS

FIG. 7B

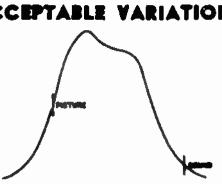

FIG. 7C

FIG. 7D

FIELD PROCEDURE

It is possible to adjust the local oscillator of this tuner in the field by connecting the television receiver to a working antenna and, using the highest channel in each band operating in that particular area, adjust the high band (L404) and low band (L405) adjustments for the best picture and sound. The Channel Selector switch should be set to the channel on which the adjustment is made, with the Fine Tuning control at the approximate center of its range of rotation. These two adjustments will provide sufficient range for the other channels on each band in addition to the ones on which the actual adjustments were made.

RF TUNER BANDPASS ALIGNMENT

Tuner bandpass alignment should never be attempted in the field. It is not even recommended that this type of adjustment be made in the service shop. When a tuner is found to be badly misaligned in a receiver and the local oscillator adjustments cannot bring it back into range, then the entire tuner should be removed and returned to the source for repair. Following is the procedure to be followed in the event of a situation arising where replacement of the tuner is not feasible. It should be attempted only if proper equipment is available.

If it is suspected that the RF Tuner bandpass is out of alignment, it may be checked in the following manner:

1 — Set the Channel Selector switch of the tuner to channel 2, with the fine tuning control at approximately the center of its rotation range.

2 — Connect the cathode ray oscilloscope between the Test Point on the tuner chassis (see Fig. 6B) and ground through a 47,000 ohm isolation resistor.

3 — Adjust the RF sweep generator for at least 12mc sweep width, with a center frequency at approximately 57mc.

4 — Adjust the marker generator for the picture carrier frequency of channel 2 (55.25mc.) and then for the sound carrier frequency of channel 2 (59.75mc.).

5 — Carefully observe the response curve at this Test Point. The bandpass should include both carriers and have steep sides. The bandwidth should be at least 4.5 mc. wide at the 70% points. The maximum allowable tilt and peak to valley distance shall not be more than 30% of the maximum response.

PROCEDURE — RF TUNER BANDPASS ALIGNMENT

1 — Connect the RF Sweep Generator, Marker Generator, and Oscilloscope as described above in the tuner bandpass check. Use frequencies for channel 13 as in chart below. Note that the Test Point used is still the one on the tuner chassis (Fig. 6B).

2 — Align channel 13 RF Plate (L407) and channel 13 RF Grid (L408) end inductances (top of tuner, Fig. 6B) for proper RF response curve as descibed above in the tuner bandpass check. The RF Grid inductance should be adjusted for maximum output combined with best overall bandpass characteristics.

3 — Channel 13 Mixer Grid end inductance (L406) may be adjusted if necessary. This coil is inside the tuner chassis, connected to pin 5 of the Oscillator-Mixer tube (V19, 6J6). It is adjusted by spreading or compressing its turns. Again, the RF bandpass response curve should include both carriers, have steep sides, and have maximum gain. Since the RF Amplifier output circuit is double-tuned, the RF Plate (L407) and Mixer Grid (L406) end inductances are interdependent, and an adjustment of one usually necessitates an adjustment of the other. Normally the adjustment of these three end inductances on channel 13 will bring all the other channels into alignment and no further bandpass adjustments should be necessary.

4 — If the end inductances have been properly adjusted for channel 13 and the RF response curves are still unsatisfactory for the other channels, then the response curve for each individual channel may be made to approach the desired form by either spreading or compressing the particular coils in the tuner circuits at the particular channel setting. Referring to the five decks of the tuner switch, note that the deck nearest the front (shaft) end of the tuner contains those coils regulating the local oscillator, and these should NOT be touched during any bandpass adjustments. On the second, third, fourth and fifth decks of the tuner switch are the coils for the Mixer Grid, the RF Amplifier Plate, low band shunt loading, and RF Grid input respectively. On these rear decks are the coils which should be compressed or expanded to achieve the desired RF bandpass characteristic, however, the switch section containing the shunt loadings for the low band should not be touched.

5 — Proceed with the Channel Selector switch at channel 12, and with the sweep and marker generators set per the chart below align the incremental loops of the RF plate, RF grid, and Mixer Grid in that order for a bandpass which should include both carriers, have steep sides, and have maximum gain. Note that too broad a curve results in deterioration of both sensitivity and rejection.

6 — Repeat if necessary for channels 11, 10, 9, 8, 7, in that order, using the proper frequencies and the proper Channel Selector switch setting.

7 — Align channel 6 RF plate, RF grid and Mixer grid to obtain a flat RF response with maximum gain. Spreading the coils increases the frequency.

8 — If necessary align the incremental coils of the RF plate, RF grid and the Mixer grid for channels 5, 4, 3, 2 in that order, using the proper frequencies and Channel Selector switch settings. Spreading the coils increases the frequency.

RF TUNER ALIGNMENT FREQUENCIES

Channel Selector Switch	2	3	4	5	6	7	8	9	10	11	12	13
R.F. Sweep Generator Setting	57 mc	63	69	79	85	177	183	189	195	201	207	213

ALIGNMENT PROCEDURE

The alignment of this receiver can be broken down into three basic parts.

1 — Video IF Alignment (including Mixer output)

2 — RF Alignment

3 — Sound Alignment

TEST EQUIPMENT

CATHODE RAY OSCILLOSCOPE — The tube size is relatively unimportant, however, anything under 5" usually makes fine adjustment quite difficult.

SWEEP GENERATOR — The sweep generator used should have linear frequency coverage from a center range of 30 to 220 megacycles. The output should be fairly flat over the maximum sweep width, which should be at least 10 mc. It should be capable of an adjustable output of about 0.1 volt maximum. It is preferable that the generator provide the horizontal sweep for the test oscilloscope with provision for phase adjustment.

AM SIGNAL GENERATOR—This generator should have a frequency range of from 4.5 to 220 megacycles. As this generator is used occasionally as a marker generator, accuracy is an important factor. It should be capable of an adjustable output of 0.1 volt maximum.

VACUUM TUBE VOLTMETER—Almost any standard make VTVM will do. It should preferably have a polarity switch so that both positive and negative voltages can be measured.

WAVE TRAP — 32.8 mc.

TEST SOCKET

In this model a Test Socket is provided which gives convenient access to the various points where either a vacuum tube voltmeter or an oscilloscope should be inserted for proper alignment. A letter diagram in the margin of the schematic will locate these points by means of corresponding letters in the schematic proper. A typical octal socket is used and it should be noted that the diagram shows a *top* view. Two ground points are supplied on separate pins of the test socket for easy metering. Reference is made, in the following alignment procedures, to the pins on this Test Socket.

VIDEO IF ALIGNMENT

An adequate signal can be fed through the video IF string by feeding the output of the signal generator into a tube shield placed over the Oscillator-Mixer tube (6J6) (V19). Care should be taken that this shield is *not* grounded. The ground side of the generator output can be conveniently grounded to the shield of the adjacent RF Amplifier tube.

The vacuum tube voltmeter should be connected across the 3900 ohm detector load resistor (R14, Pin B Test Socket) and should be set on the *minus* 3 volt scale. Set the channel selector to an unused low band channel.

The signal generator should be set to a frequency of 36.9 mc. The output of the generator should be adjusted to the point where the reading on the VTVM is between —1 to —1.5 volts.

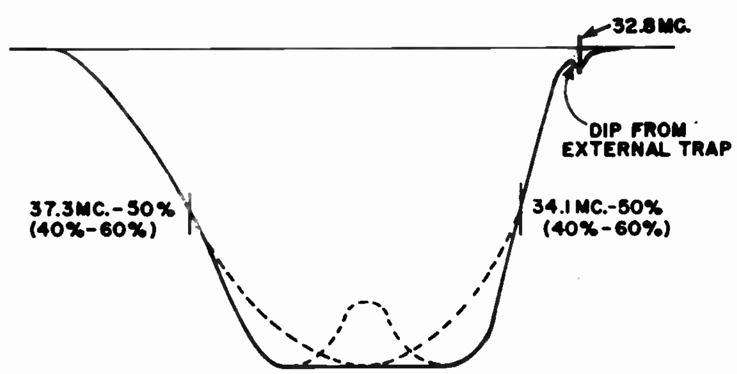
The first and third IF coils should be peaked for a maximum reading on the VTVM. As the voltage reading increases with tuning, the generator should be attenuated to maintain a maximum of —1.5 volts.

Set the signal generator to a frequency of 34.8 mc and tune the second and fourth IF coils in the same manner. The generator should now be shut off (or tuned to a different band) and the VTVM should read approximately —.5 volt.

To look at the overall response curve including both the RF section and the IF Amplifier section connect the sweep generator to the antenna terminals and loosely couple the AM signal generator to the antenna by clipping the signal generator leads to the insulated portion of the antenna lead.

Then connect the "hot" or "high" side of the oscilloscope to Pin B of the Test Socket. The "low" or ground side should be connected to the nearest convenient ground point. Care should be taken to separate the oscilloscope leads from the generator leads.

The sweep generator is set at the approximate mid-frequency of the unused low channel and the signal generator is set at the RF sound carrier frequency of the channel used. The sweep generator amplitude is set so that a VTVM will read —1.5 volts DC at Test Point B. Loosely couple a wave trap tuned to 32.8 mc into one of the IF coils until a small dip is noticed on the trace (see Fig. 8). The fine tuning control on the tuner should now be adjusted to make the signal generator marker coincide with the trap valley. The signal generator can now be tuned to the RF picture carrier frequency and the position of the picture carrier on the response curve noted. It should be between the 40% and 60% points on the slope of the curve. The band width between 50% points should be approximately 3.2 mc. Slight readjustment of the IF transformers may be necessary to obtain the desired response. Small variations from the ideal are acceptable as shown in Fig. 8.



IDEAL VIDEO IF RESPONSE CURVE
DOTTED LINES INDICATE ACCEPTABLE VARIATIONS

FIG. 8

SOUND ALIGNMENT

Sound alignment on these receivers is best accomplished by using an actual transmission received on an antenna and fed in the normal manner to the antenna terminals. A vacuum tube voltmeter should first be inserted between the output plate of the Ratio Detector Diode (pin 2, V 15) and ground. This point may be reached through pin C of the Test Socket. The meter should be set on the *minus* 10 volt scale. With the equipment so placed the 4.5 mc pick-off coil (T8) and the primary of the ratio detector transformer (bottom adjustment, T9) should be adjusted for a maximum deflection of the meter, using a relatively weak signal. The "hot" lead of the meter should now be moved to the junction point of R71, C60 and C61 (Pin A, Test Socket), and the secondary of the ratio detector transformer should be adjusted for a ZERO reading. (Note: There are 3 points at which the meter will zero. Only one of these is correct. At the proper setting the meter should swing negative on one side and positive on the other side of zero. See "S" curve, Fig. 10).

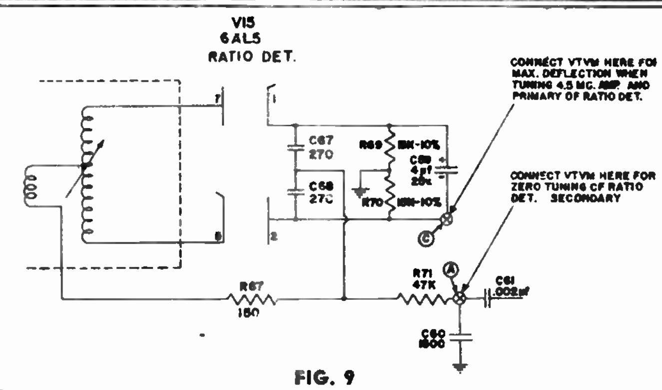


FIG. 9

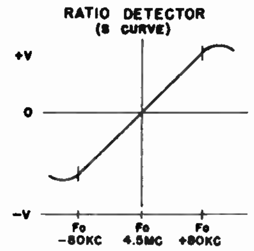

FIG. 10

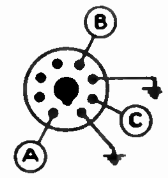

TEST SOCKET
(BOTTOM VIEW)

FIG. 11

In cases where it is necessary to align the sound section when no station transmission is available, a single frequency signal generator tuned to 4.5 mc may be fed into the output circuit of the Video Detector (Pin B Test Socket) through a 2200 ohm isolating resistor. The receiver should then be aligned in the same manner as described above. The disadvantage of this method is that any inaccuracy in the signal generator will show up as misalignment when the set is in actual operation since proper adjustment is extremely critical. This method is not recommended and should only be used when no alternative method is available.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT

Turn the Horizontal Hold control (on the front panel) to the extreme counterclockwise position. The picture should remain in sync. Momentarily remove the signal by switching to another channel and then switching back again. The picture should break horizontal sync and the picture will be resolved into a series of black bars sloping down to the left.

Turn the Horizontal Hold control clockwise, slowly bringing the picture into sync again. At the extreme clockwise position the picture will again show a tendency to break sync as indicated by anything from a shimmy to 2-1/2 black diagonal bars sloping down to the right.

If the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is adjusted and need not be aligned.

HORIZONTAL OSCILLATOR ALIGNMENT

1 — The Horizontal Hold Control should be set at approximately the center of its mechanical range. The Horizontal Locking Range and the Horizontal Drive trimmers should be set at two full turns counterclockwise from maximum capacity.

2 — Turn the Horizontal Drive trimmer clockwise until any bright vertical bars in the picture are eliminated. If, in so doing, the picture should fall out of sync it should be brought back by readjusting the Horizontal Oscillator Coil. This is the long screw adjustment which extends through the side of the chassis.

3 — Rotate the Horizontal Hold control (front panel) to the maximum clockwise position. The Horizontal Oscillator Coil should now be adjusted to a point where the black horizontal blanking bar starts to come into the picture from the left side.

4 — The Horizontal Hold control should now be rotated to its maximum counterclockwise position. The picture should stay in sync. However, shorting the antenna terminals or rapidly switching to an unused channel and back should cause the picture to fall out of sync. If this condition does not exist, readjust in accordance with step 3 above.

5 — When the Horizontal Hold control is rotated to maximum clockwise position it is acceptable for the picture to vary in sync from a horizontal flutter to 2-1/2 bars sloping downward to the right. The picture should stay locked, however, through approximately 3/4 of the mechanical rotation of the Horizontal Hold control.

6 — If the Horizontal Drive trimmer must be re-adjusted at this time for improved width or linearity, steps 3, 4 and 5 should be rechecked.

HORIZONTAL OSCILLATOR STABILIZING COIL ADJUSTMENT

NOTE: In the foregoing Horizontal Oscillator Alignment procedure the Horizontal Oscillator Coil is mentioned several times. The adjustment referred to is the long screw which extends from the Horizontal Oscillator Coil (T6) through the side of the chassis below the high voltage cage (labeled "Hor Freq" in Fig. 1, Top View of chassis). This is adjusted from outside the chassis. There is an adjustment at the other (inside) end of the same coil can. This is the Horizontal Phase control, used in the stabilizing circuit of the horizontal oscillator. It is important to note that this latter adjustment is a factory adjustment and should not be attempted in the service shop. If this circuit is suspected of being defective or detuned the entire assembly, including C43, the .01 mfd 600 volt molded paper condenser, should be removed and returned to the source as a defective part. The following procedure is given in the event that replacement of the entire Horizontal Oscillator Coil is not feasible. It should be attempted only if proper equipment is available.

It is important that an oscilloscope with a bandwidth of at least 150 kc be used. The oscilloscope must also have a minimum input impedance of 1 megohm, and a maximum input capacitance of 10 mmfd. In cases where the bandwidth is ample but the input capacitance is large, a 10 mmfd condenser should be used in series with the oscilloscope lead. When this is done, a 200 mmfd condenser should be placed from the oscilloscope to ground to insure equal attenuation at all frequencies. Using an oscilloscope that meets these specifications, the following procedure should be used:

1 — Connect the 10 mmfd condenser going to the vertical input lead of the oscilloscope to terminal pin C of the Horizontal Oscillator Transformer.

2 — Adjust the Horizontal Phase control (horizontal oscillator frequency stabilizing adjustment, bottom adjustment of the Horizontal Oscillator Transformer) until the broad and narrow peaks of the waveform on the scope are of equal height as indicated in Fig. 12A below. If necessary during adjustment, the Horizontal Oscillator Frequency (top adjustment) and the Horizontal Hold control may be reset to keep the picture in sync. Once set, realignment of any other component in the circuit will not affect this adjustment.

HOW TO ORDER PARTS

1 — Use Correct Order Form.
2 — On the Purchase Order always give the following information:
(1) PART NUMBER (number printed on the part if different from that shown on this list) and DESCRIPTION for each part ordered. When no part number is assigned, order by description and rating. Also give PRICE of part (indicate if no selling).
(2) The CHASSIS NUMBER, which is found on a metal plate at the rear of the chassis.

SPECIAL NOTES

The following changes were made to further reduce vertical buzz & hum pickup in the audio circuits.

A—To reduce buzz:

1—Return R28, (8.2K) in picture tube cathode-vertical retrace suppression network circuit, to +235 volts instead of to +140 volts.

2—Return C32, (.01mfd) in vertical retrace suppression circuit, to pin 6 of deflection yoke socket instead of to ground.

3—Add tube shields to V15, 6AL5 (Ratio Detector), and to V16, 6AT6 (1st Audio Amplifier).

B—To reduce hum:

1—Return R79, (22K) from center tap of volume control to low end of control instead of to chassis.

2—Disconnect wire shields from chassis at Phono-TV switch, (front of chassis) clip short and tape up exposed ends.

3—Disconnect cable shield from jack at Phono Jack (rear of chassis).

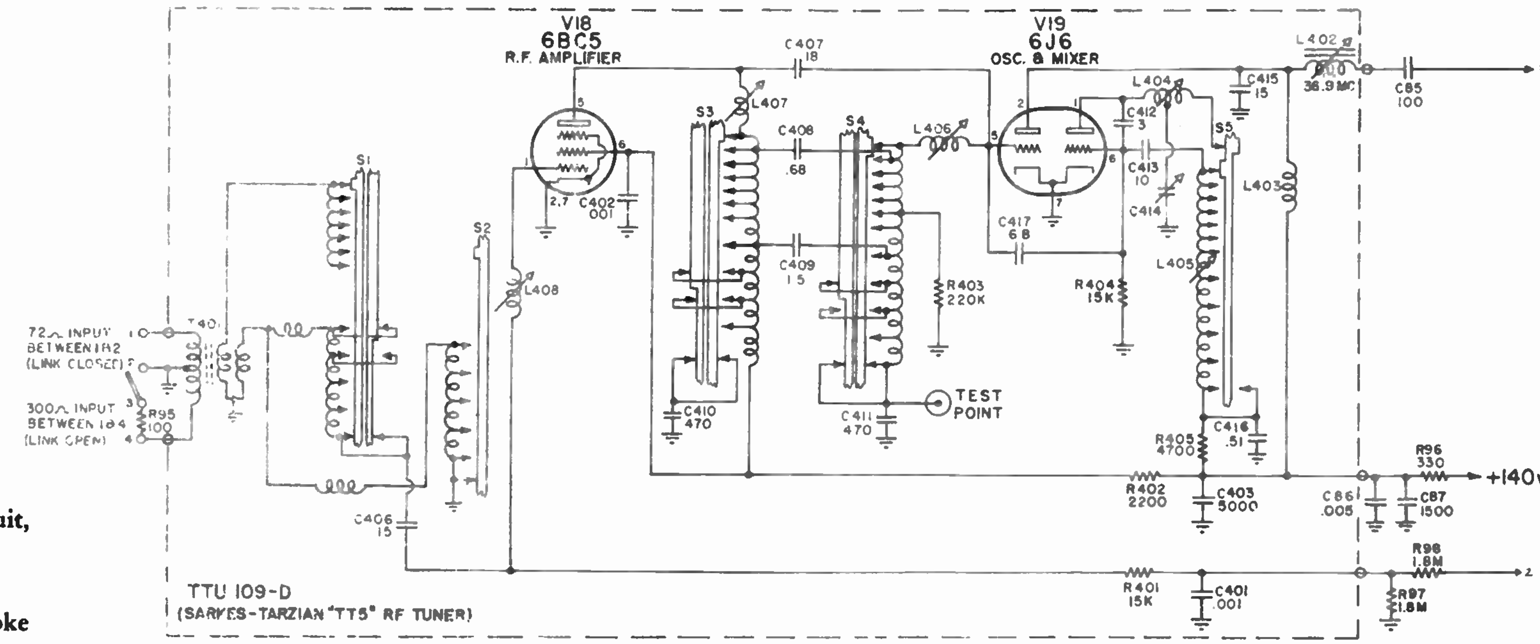
C—The following are critical lead dress items which should be watched closely when servicing in order that vertical buzz and hum may be eliminated:

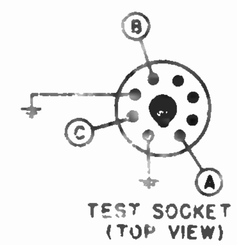
1—All audio condensers should be behind the shield and as close to the chassis as possible.

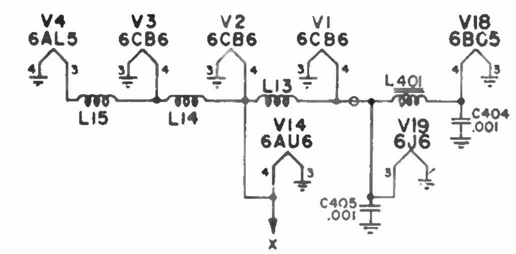
2—C28, (.0047mfd) Vertical Oscillator coupling condenser and circuitry should be as close to the side of chassis as possible and as far away from the audio circuitry as possible.

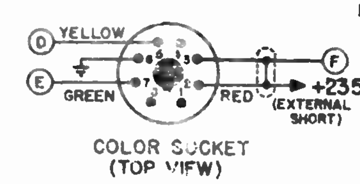
3—V8, 6S4 Vertical Amplifier plate lead should be as short as possible and as close to the chassis as possible.

4—C31, .22mfd Vertical Amplifier grid coupling condenser should be pushed as close to the chassis as possible and as far away as possible from audio circuitry.









NOTES

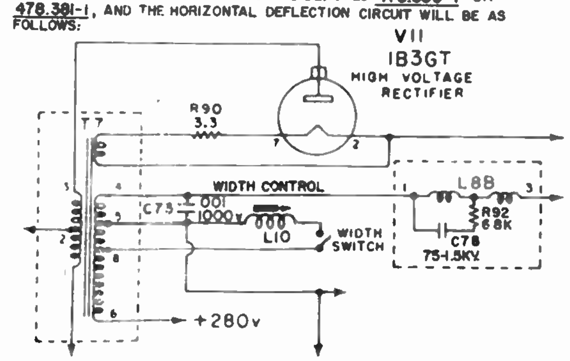
1 UNLESS OTHERWISE NOTED ALL CARBON RESISTORS ARE 1/2 WATT 20% & CONDENSER VALUES ARE IN μμf WITH 500V RATINGS

2. ⊕=MOLDED PAPER, K=1,000, M=1,000,000

3. VOLTAGES MEASURED WITH A VACUUM TUBE VOLTMETER.

4. RESISTANCE READINGS OF WINDINGS ARE APPROXIMATE AND MAY VARY ±15%.

5 IN SOME RECEIVERS A 30 mh. DEFLECTION YOKE (TTR 224-D) MAY HAVE BEEN USED INSTEAD OF THE 8.3 mh. DEFLECTION YOKE (TTR 242-D). IN THESE RECEIVERS THE CHASSIS ARE DENOTED 478.380-1 OR 478.381-1, AND THE HORIZONTAL DEFLECTION CIRCUIT WILL BE AS FOLLOWS:



478.380 and 478.381 CHASSIS

BLOCK DIAGRAM CIRCUIT DESCRIPTION

BLOCK V20, V21

The 6BQ7 (V20) is operated as a cascode type RF amplifier which is characteristically an extremely "low-noise" circuit. The plate (pin 6) of one triode is connected to the cathode (pin 3) of the other triode resulting in a low-plate circuit impedance for the input-triode section. The input-triode has no voltage amplification but acts as an impedance transformer changing the low-current high-impedance signal on the grid to a high-current low-impedance signal in the cathode of the succeeding triode. This high signal current overrides the inherent circuit noise-level and since the second triode section does have voltage gain, the overall result of the cascode circuit is good sensitivity combined with less noise or "snow".

V21A serves as the RF oscillator and V21B as the RF mixer.

The oscillator operates 45.75 mc above the received picture carrier. The fine-tuning-control of the receiver is mechanically connected to a variable capacitor (C12) to provide tuning of the oscillator.

The picture and sound carrier are fed to the grid of the mixer — beating with the oscillator to convert to the IF frequency. The picture carrier is converted to 45.75 mc and the sound carrier to 41.25 mc.

BLOCKS V5—V6—V7—V8

The picture carrier has been converted down to 45.75 mc and the sound carrier to 41.25 mc. A wide band width is accomplished by stagger tuning the IF stages — each to a different frequency of the band from 41.25 to 45.75 mc. This wide flat band width is obtained by 6 tuned poles, L8, T103, T104, T105, T106 and T108, and is essential for good picture detail. The sound carrier is passed through at about 5% of the level of the picture carrier. This is done to insure that there will be no amplitude modulation on the 4.5 mc sound carrier at the 2nd detector.

The IF response curve is adjusted to have a sound-porch at the 5% level for the 41.25 mc sound-carrier. This sound porch is formed by traps T103 and T107. The sound porch is tilted so that on weak signal, when the picture carrier (by fine tuning) is tuned higher on the response curve to give a better picture, the sound will also ride higher on the tilted sound porch — thus giving greater sound sensitivity. This insures simultaneous good sound and picture at all operating levels.

The alignment of the IF strip is critical and the Video Alignment Chart should be carefully followed. The IF strip has 6 traps. Traps T105 and T108 are adjacent-channel sound-traps (47.25 mc). Traps T104 and T106 are adjacent-channel picture-traps (39.75 mc). It should be noted that the screen-by-pass capacitors used in each IF stage are to be replaced with exact values since they serve effectively to "neutralize" plate-to-grid interelectrode coupling at 41 mc IF frequencies. Factory lead-dress and lengths should also be duplicated when repairs are necessary.

BLOCK V9A

V9A is used as a twin diode in this circuit.

The 2nd det uses ½ of a 12AU7. The grid (Pin 2) performs the operation of a diode plate for detection of the Video information. The plate (Pin 1) is used as another diode plate, detecting the IF signal for use as an AGC Voltage.

Delay of the AGC Voltage is accomplished by raising the cathode to a +2.4 volts. The plate (Pin 1) is returned to ground through R144. The cathode (Pin 3) is +2.4 volts above ground (bias developed across R148.) This 2.4 volts serves as a "delay" — meaning that an IF signal of 2.4 volts must be developed before the AGC diode will conduct.

The grid (video diode) has no bias and will conduct current on a very low signal for video detection.

BLOCK V10

The video amplifier (V10) is a 6AC7 television amplifier pentode.

The video signal from the 2nd detector is capacity coupled to the grid of the 6AC7.

This stage amplifies the composite picture signal which is composed of horizontal and vertical synchronizing pulses and picture information.

The 4.5 mc sound present in the plate circuit could produce interfering herringbone pattern in the picture. A trap L111 is tuned to 4.5 mc which traps out this interference.

The composite video signal from this stage is applied to the cathode of the picture tube (V22).

BLOCK V14

An automatic frequency control (AFC) is used in this receiver to maintain stable horizontal framing. Two 180° displaced horizontal sync pulses from V12A are fed to the 6AL5 (V14) phase discriminator. A pulse is taken from the secondary winding on the width coil which is made into a sawtooth wave shape by integration through R194 and C171. Since pin 5 and pin 7 of V14 are tied together, both sections of the diode are controlled by this sawtooth on which the two 180° out-of-phase sync pulses ride. The phase discriminator then is so designed that if the sawtooth arrives late relative to the sync pulses, a positive voltage will be fed to the horizontal oscillator to raise the frequency causing the horizontal oscillator to come back in sync. Conversely, if the sawtooth arrives early, a negative voltage is developed which in turn reduces the oscillator frequency. Any phase displacement between the sync pulses and the sawtooth will result in a DC voltage change at the junction of R190 and R191. This voltage is the control voltage for the Horizontal Oscillator.

This voltage which is fed to the horizontal oscillator is essentially a well filtered DC voltage. Thus, ignition noise or other types of electrical interference will not cause lines to tear out because it is filtered out before it gets to the oscillator.

BLOCK V15

V15 operates as a cathode-coupled multivibrator utilizing a ringing tank-circuit, L113. This circuit allows for more positive frequency control than is available from conventional multivibrator circuits. The frequency of the oscillator is controlled manually by the Horizontal Hold Control, R198, and the Horizontal Lock, L113. The frequency is controlled automatically by the DC voltage on pin 1, V14 as developed by V14. The output of the oscillator is a sawtooth which is used to drive the horizontal output tube. C180, drive trimmer, controls the amplitude of the sawtooth fed to the horizontal output tube.

If this sawtooth voltage is too high, the horizontal output tube will be overdriven and a vertical white line will show up on the raster. If the sawtooth input to the horizontal output is too low, the raster will be narrow and the high voltage will be low.

BLOCK V16—V17—V18

The Horizontal output stage, V16, supplies a current waveform through T111 to the yoke (L117-L118) shaped to produce linear horizontal sweep. T112 serves as a width-control. By turning its "slug" in, its inductance will be increased — reducing the loading on T111 and increasing the horizontal scan (width). V17 is the Hi-V Rectifier and V18 is the Damper Tube. V18 serves effectively to damp-out the parasitic-oscillations occurring at the end of the "retrace" part of each horizontal sweep-cycle. The energy from these damped-oscillations is conveniently utilized to "boost" the nominal 300V B+ voltage to approximately 515V as seen on the schematic on one side of R177.

BLOCK V9B-V1-V2

At the second detector (V9A) the picture carrier (45.75 mc) and sound carriers (41.25 mc) beat to give a 4.5 mc "intercarrier" beat frequency difference. This frequency modulated 4.5 mc carrier is fed to V9B and amplified. V1 serves as a combination amplifier and limiter to clip off noise and other forms of amplitude modulation. V2 operates as a balanced ratio detector. The output is the audio portion of the transmitted TV signal.

BLOCK V3-V4

From the output of the balanced ratio-detector the audio signal is fed through the phono-jack to the volume control. The phono-jack itself acts as its own "switch". For TV operation the phono-plug must be pulled out. V3 is the 1st Audio Amplifier and V4 is the audio output stage with a maximum output of 3 watts. The B+ circuit for V4 is isolated from the other chassis B+ circuits by L114 minimizing the effects of audio on the picture.

BLOCK V11-V12A

V11 operates as a sync amplifier and separator. The sharp cut-off characteristics of its two triode sections combined with the grid-bias developed on pin 2 and the cathode-bias developed on pin 8 result in amplified sync-pulses completely separated from video. The operating voltages on V11 determine the waveforms illustrated on the schematic and both voltages and waveforms should be carefully checked when troubleshooting this circuit. V12A serves as a sync splitter. From the junction of R161 and R162 positive horizontal sync pulses are fed to V14, pin 2. From V12A, pin 6, negative horizontal sync-pulses are fed to V14, pin 1. These out-of-phase sync pulses are used in the "phase-comparator" circuit of V14 for Automatic Frequency control of the Horizontal Oscillator. From the plate, pin 5, of V12A the sync pulses are coupled through a vertical integrating network, CP-1, the output of which controls the vertical oscillator, V12B.

VERTICAL RETRACE BLANKING

Vertical retrace blanking is accomplished by cutting the picture tube off during vertical retrace time. This is done by feeding a negative voltage pulse to the grid of the picture tube during vertical retrace. This pulse is taken off the vertical output choke and is shaped by pulse shaping network C166 - C168 - R185. No diagonal vertical retrace lines will appear in the picture.

BLOCK V12B

Vertical sync pulses from the output of the sync splitter are separated from the horizontal sync pulses by an integrating network (CP-1) composed of R168, R167, R166, C160, C159 and C158. These vertical sync pulses are used to control the frequency of a conventional type Blocking Oscillator. This oscillator utilizes one triode section of a 6SN7 tube V12B and its free-running frequency is determined by the resistance and capacity time constant (including the vertical hold control) in the grid circuit. The sync pulses are impressed at the tube grid just before the oscillator would normally trigger and are of sufficient amplitude to drive the tube to conduction and cause the oscillator to lock in at the sync frequency. The output amplitude of this stage is controlled by the height control.

BLOCK (V13)

The Blocking Oscillator drives 6K6 triode, connected as a vertical scanning output stage. Adjustment of vertical-linearity is accomplished in the cathode of this stage by varying the bias and thus changing the plate-current operating-point of the tubes non-linear characteristic curve. Sawtooth current output is applied to the vertical deflection coils through the vertical output transformer T110.

YOKE ADJUSTMENTS

The picture tube cone should fit snugly into the large front hole rimmed in rubber in the Yoke Mount Frame. The "Yoke Mount Feet Adjustment" allows the frame to be properly positioned.

The Yoke Radial Adjustment allows the yoke to be rotated right or left --- rotating the picture right or left.

The Yoke Vertical Adjustment allows centering of the yoke coaxially with the tube neck.

Proper positioning of the yoke is important so that picture corner-cutting and side-shadows can be readily removed by the Centering-Ring.

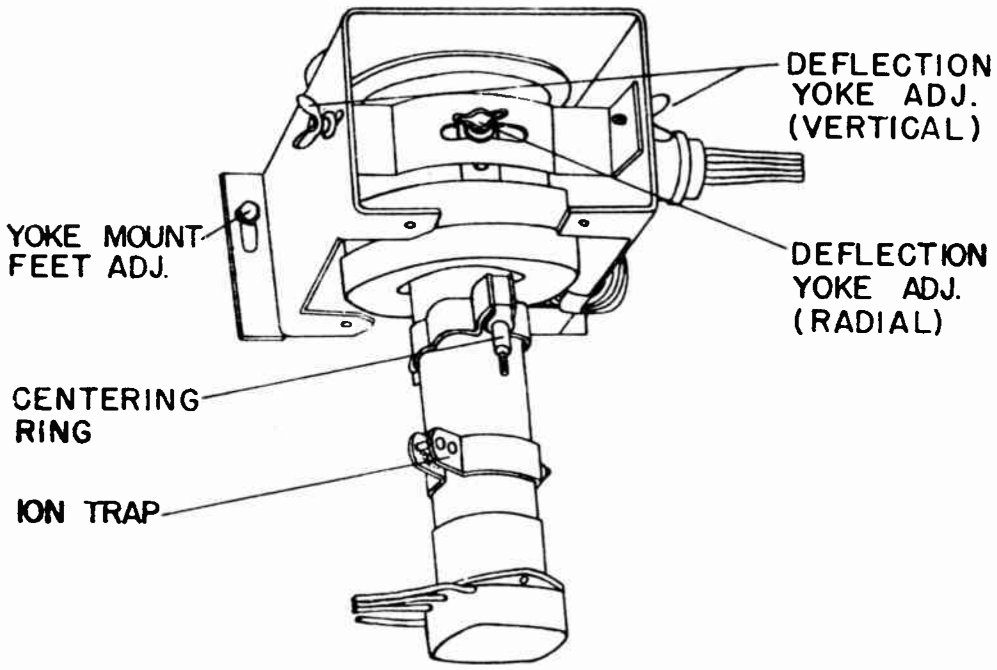
ION-TRAP (BEAM BENDER)

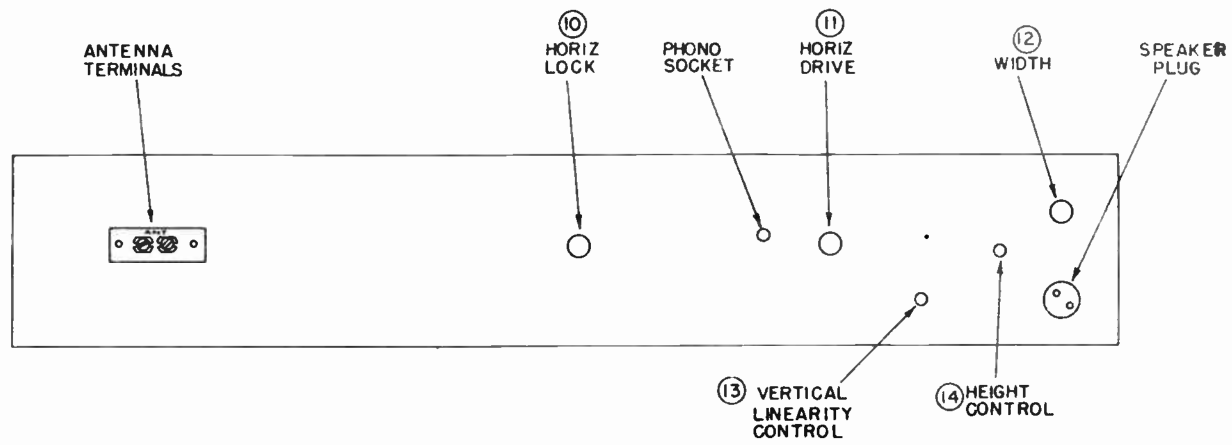
A single magnet -- "Beam-Bender" is used with the 17HP4A picture tube. The magnet should adjust to the left side of the tube neck (looking from the rear). The smooth heads of the rivets should be on top. Carefully rotate and slide the trap for brightest raster. It should adjust to be approximately one-half inch forward from the bakelite base of the tube. A new trap should be used if it adjusts too far back to the bakelite.

CENTERING

The Centering Ring should be positioned one-fourth inch to one-half inch from the yoke. Center the raster by turning the knurled knob on the Centering Ring and at the same time rotating the Ring around the tube neck. After the picture is centered, check the Ion Trap setting.

The Horizontal Hold Control will move the picture horizontally and should be set first to the middle of its range of movement of the picture. The Centering-Ring should then be used to center the picture within the mask and remove corner-shadows. If corner-shadows persist, check to see that the Yoke and Mounting Frame are as far forward onto the cone of the picture tube as possible. When the Yoke and Ion-Trap are positioned properly, the ring will readily center the picture without corner-shadows.





HORIZONTAL LOCK ADJUSTMENT (11)

1. Set the Horizontal Hold Control (6) to the center of its range.
2. Adjust the Horizontal Lock (11) until picture is in sync. Then turn the Horizontal Lock (11) right until the picture goes out of sync. Next turn the Horizontal Lock (11) to the left until the picture just pulls into sync.
3. Turn the Horizontal Hold Control (6) full left. Switch the Channel Selector (4) off station then on again. The picture should go out of sync. Turn the Horizontal Hold Control (6) full right. Switch the Channel Selector (4) off station then on again. The picture should go out of sync.
4. Adjust the Horizontal Lock (11) until the number of diagonal bars are the same for both the right and left out of sync positions.

WIDTH (13)

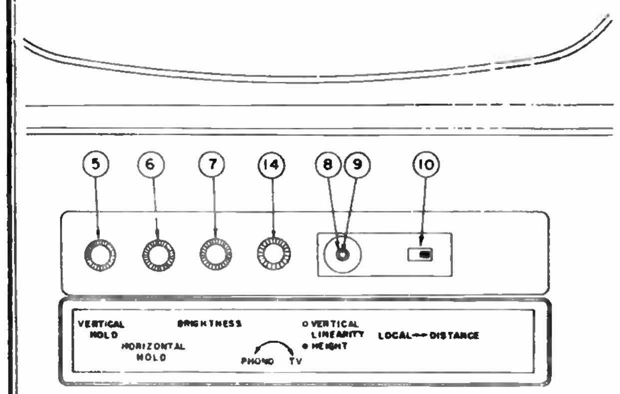
This control regulates the amount of deflection current flowing in the Horizontal Deflection Coils controlling the horizontal dimension or width of the picture. Maximum width occurs when the screw protrudes about 1/2" from the coil mounting clip.

HORIZONTAL DRIVE (12)

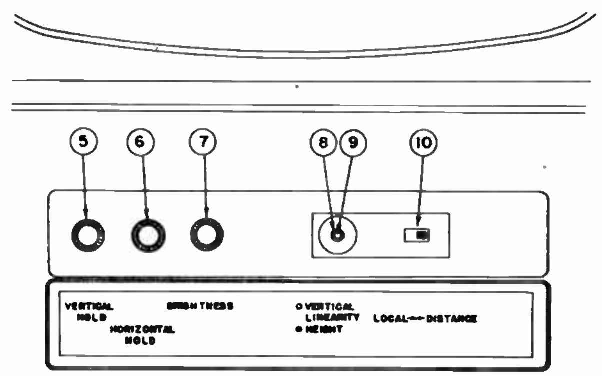
Adjust HORIZONTAL DRIVE TRIMMER (12) slightly beyond the point where "overdrive" lines just disappear. "Overdrive" lines appear as a vertical white line in the left portion of the picture. The Horizontal Drive Trimmer is located in the control grid circuit of the Horizontal Output Tube (6BQ6) controlling the operating characteristics of the tube. Turning the HORIZONTAL DRIVE TRIMMER (12) to the right reduces the horizontal drive.

PHONO CONNECTION

This receiver employs a Phono Jack on the back of the receiver chassis (see Rear View). To play records, plug the shielded phono lead from the record player into the phono jack. The VOLUME CONTROL (1) will control the volume. The phono lead must be removed from the phono jack for television sound reception. During phono operation the light will remain on the screen. The Brightness Control (7) should be turned full left to darken the screen. For Chassis 132.024-3 only the TV-Phono switch (14) behind the control door must be turned to the left.



132.024-3,-31



132.024-1 & -2

VERTICAL LINEARITY (8)

This control, located in the cathode of the Vertical Output Stage, changes the operating characteristics of this tube affecting vertical linearity of the top of the picture.

HEIGHT (9)

This control, located in the plate circuit of the Vertical Oscillator Stage, determines the amplitude of the vertical sweep which governs the vertical dimension of the picture. This control affects overall picture height and the vertical linearity of the bottom of the picture.

LOCAL-DISTANCE SWITCH (10)

In the "Local" position AGC voltage is connected to the grid of the R.F. Amplifier - - preventing overload on strong signal input. In the "Distance" position the AGC voltage is removed from the R.F. grid allowing the receiver to operate at maximum gain for weaker signal areas. For "fringe" areas there will be no noticeable affect of the switch in either position, since there will be insufficient signal to develop AGC voltage.

VIDEO I.F. AND TRAP ALIGNMENT

1. SET TUNER TO CHANNEL 9 - 10 OR 11.
2. SET LOCAL-DISTANCE SWITCH IN LOCAL POSITION.
3. CONNECT A 3V BIAS TO THE JUNCTION OF R141 & R143 AND GROUND.
4. MAKE SURE THE T.V. RECEIVER, SIGNAL GENERATORS AND SCOPE ARE BONDED BY A COMMON GROUND.

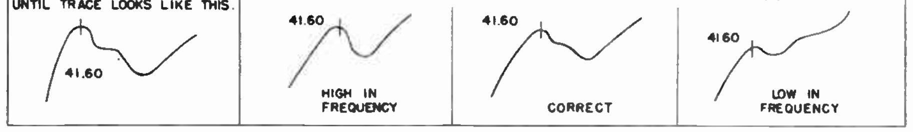
C. T103 AND T104 AFFECT WIDTH OF CURVE AND SLOPE OF RIGHT SIDE.

INCREASE SCOPE GAIN TUNE T107 UNTIL TRACE LOOKS LIKE THIS.

POSSIBLE POSITIONS OF CURVE AFFECTED BY CATHODE TRAP T107



USE OF MARKER SIGNALS

The illustrated response curves show where markers fall. For sweep generators that do not have built-in marker signals, calibrated signals from an R.F. generator must be used. The "hot-side" of the generator output lead hooked to the chassis near the 1st I.F. input will spray enough signal into the circuit to be seen on the scope. Marker beats will show best when the sweep-input is low and the scope gain set high.

SOUND I.F. ALIGNMENT AND 4.5 TRAP ALIGNMENT

TUNER UNIT

TUNER OSCILLATOR ADJUSTMENT

A High-Channels adjustment, A3, and a Low-Channels adjustment, A4, of the R.F. oscillator is accessible when the channel tuning knobs are removed. These two adjustments are shown on the Tuner Unit View.

HIGH-CHANNELS

1. Set the Channel Selector Switch to the highest available station between channels 7 and 13.

2. Set the Fine Tuning to mid-position.

3. Adjust A3 for best picture definition.

4. The remaining lower "High-Channels" should be within the range of the Fine-Tuning.

LOW-CHANNELS

1. Set the Channel Selector Switch to the highest available station between channels 2 and 6.

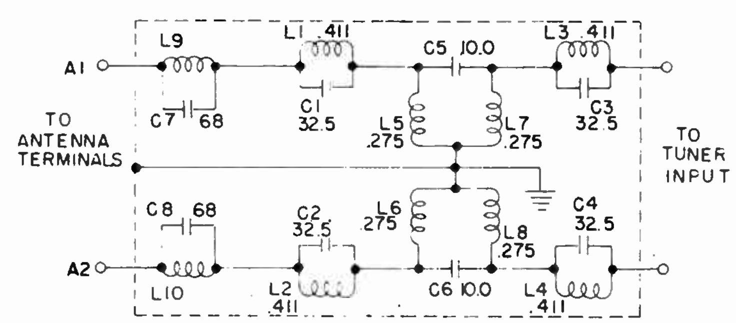
2. Set the Fine-Tuning to mid-position.

3. Adjust A4 for best picture definition.

4. The remaining lower "Low-Channels" should be within the range of the Fine-Tuning.

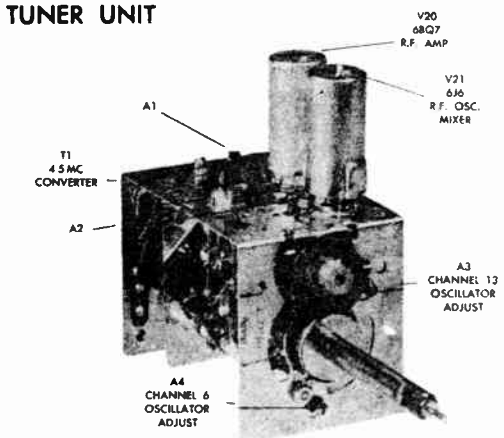
NOTE: The design purpose of A3 and A4 is to provide adjustment for channel 13 and channel 6 --- for optimum High and Low channels coverage. The above procedure, therefore, gives optimum adjustment for any available stations.

I.F. AND F.M. TRAP ASSY



COILS "L" ARE IN UH; CONDENSERS "C" ARE IN UUF

TUNER UNIT



HOW TO ORDER PARTS

1. Use correct order form.
2. On the Purchase Order always give the following information:
   (1) PART NUMBER (number printed on the part if different from that shown in this list) and DESCRIPTION for each part ordered. When no part number is assigned, order by description and rating. Also give PRICE of part (indicate if no selling).
   (2) The CHASSIS NUMBER, which is 132.024. This number is found on a metal plate at the rear of the chassis.
3. MARK-UP: Selling prices in the following list produce a MARK-UP of AA5, unless otherwise noted in the M. U. Code Column.
4. In all correspondence relating to cabinets, always mention the source code letter stamped into the upper rear rail of consoles or on sticker on the back, bottom or inside of cabinet.

PRODUCTION CHANGES

132.024-1 Chassis is the initial production run, and is an earlier chassis than 132.024.

132.024 Chassis Incorporates the Following Production Changes:

1. C171 changed from .01 mfd. to .022 mfd.
2. R194 changed from 12K. to 15K.
3. R204 changed from 220 ohm to 300 ohm.
4. R216, 68 ohm, added from pin 5 of V10 to junction of R151 and C4.
5. Color socket wired in and color plug added.

Color socket wired as follows:

a. Pin 2 to B+ source.
b. Pin 3 to B+ load.
c. Pin 4 to junction of R151 and R216.
d. Pin 5 to Pin 5 of V10.
e. Pin 6 to ground
f. Pin 7 to pin 5 of V12A.
g. Pins 8 and 1 not wired.

Color plug wired as follows:

a. Pins 4 and 5 shorted together.
b. Pins 2 and 3 shorted together.

6. C192, 1000 uuf, added from RF AGC (in parallel with C188) to ground.
7. R217, 220 K., added from junction of R154 and C153 to ground.
8. R153, 4700 ohm, wired from junction of L112 and R155 to +300 V. instead of to +130 V.
9. R189 wired to +300 V. through 100 K. (R218).

132.024-2 Chassis Incorporates the Following Production Changes:

1. T112 Width Control (N24991) changed to T112-1 Width Control (N40027).
2. R215, 68K resistor changed to R215-1, 22K resistor to reduce horizontal jitter.
3. R161, 1800 ohm resistor changed to R161-1, 1500 ohm resistor.
4. R162, 820 ohm resistor changed to R162-1, 1500 ohm resistor.
5. R194-1, 15K resistor changed to R194-2, 12K resistor to improve horizontal stability (132.024-1 only).
6. C161-1, .022 capacitor changed to C171-2, .01 capacitor to improve horizontal stability (132.024-1 only).

Additional changes not shown on dash 2 schematic, but which were made before production of 132.024-2 chassis are as follows:

1. R161-1, 1500 ohm resistor changed back to R161-2, 1800 ohm resistor.
2. R162-1, 1500 ohm resistor changed back to R162-2, 820 ohm resistor.
3. R193, 470K resistor changed to R193-1, 1 megohm resistor.
4. C172, .01 capacitor changed to C172-1, .005 capacitor to remove vertical twist in picture.

132.024-3 Chassis Incorporates the Following Production Changes:

1. Phono-TV switch added to chassis.
2. Make-break phono socket changed to phono jack.

Additional changes not shown on dash 3 schematic but which were made before production of 132.024-3 chassis are as follows:

1. R186-1, 680K was R186, 22K.
2. R186-1 rewired from TV contact of Ph-TV Switch to tap of T110.
3. C169 rewired from junction of R186-1 and TV contact of Ph-TV Switch to ground.

132.024-31 Chassis Incorporates the Following Production Changes:

1. R216 removed from Pin 5 of V10 and junction of C4 and R151.
2. R116 changed from 47K to R116-1, 100K.
3. Color socket and color plug removed
   a. B+ source connected to B+ load.
   b. Lead from Pin 5 of V12A removed
   c. Pin 5 of V10 connected directly to junction of C4 and R151.
4. Picture tube mask changed from N25596 to N50211.

Note —— Later production of chassis 132.024-3 also incorporated this new mask. Masks are not interchangeable. The new mask has N40211 stamped on the back side for identification.

ANTENNA SYSTEM

All models covered in this manual feature a built-in antenna which is shipped connected to the receiver input. In those installations where an external antenna is desired, it will be necessary to disconnect the built-in antenna from terminals shown in Fig. 2 and connect the external antenna lead-in to these terminals.

CIRCUIT DESCRIPTION

TUNER CIRCUIT DESCRIPTION IS GIVEN IN SECTION ON TUNERS.

INTERMEDIATE FREQUENCY AMPLIFIERS — BLOCKS V3, V4, AND V5:

The I. F. picture and sound signals are amplified by 3 stages of wide-band I. F. amplification, V3, V4, and V5. A stagger-tuned I. F. system is utilized in this receiver, and correct response is obtained by aligning the R. F. converter plate load inductance to 22.8 mc., the plate load inductance of the 1st I. F. stage to 25.4 mc., the inductance coupling the 2nd and 3rd I. F. stages to 22.8 mc., and the inductance in the video detector plate to 25.4 mc.

VIDEO DETECTOR AND AUTOMATIC GAIN CONTROL V6:

This Stage detects the video signal and acts as a converter for sound information in producing the 4.5 mc. difference frequency between the 25.75 mc. and 21.25 mc. carrier frequencies. A portion of the demodulated signal from this stage is properly filtered and of proper polarity for effecting the grid bias on the R. F. amplifier of the tuner and the first two I. F. stages to accomplish Automatic Gain Control.

VIDEO AMPLIFIER V7:

The output of the video detector is directly-coupled to the grid of the first triode amplifier. The signal is amplified and capacity-coupled to the grid of the second amplifier. The output of this triode amplifier is capacity-coupled to the grid of the picture tube. In the plate circuit of the second video amplifier is the tuned sound trap which is adjusted to attenuate the 4.5 mc. beat pattern appearing on the screen. Contrast control setting regulates the amount of degenerative cathode feedback in the second video amplifier.

SOUND DETECTOR DRIVER — BLOCK V8:

The frequency-modulated 4.5 mc. difference between the 25.75 mc. picture intermediate frequency and the 21.25 mc. sound intermediate frequency is separated from the composite video amplifier output by means of a tuned take-off coil, the voltage across which is applied to the grid of the Detector driver, V8. This stage amplifies the 4.5 mc. frequency-modulated signal for delivery to the following ratio detector stage. Plate limiting to clip unwanted AM interference is also provided in this detector driver stage.

SOUND RATIO DETECTOR — BLOCK V9:

The amplified and clipped 4.5 mc. frequency-modulated sound information is coupled through a tuned transformer to the twin diodes of V9, the sound detector. This is a conventional ratio-type FM sound detector, wherein the frequency modulated 4.5 mc. information is converted to audio.

AUDIO VOLTAGE AMPLIFIER — BLOCK V10:

The previously detected audio is taken from the tertiary winding of the discriminator transformer and delivered through a voltage dropping potentiometer (front panel Volume control) to the grid of the audio voltage amplifier. A 6SQ7 is used as the audio voltage amplifier. The diode section of the 6SQ7 is grounded.

AUDIO TUBE — BLOCK V11:

The previously amplified audio is fed to the grid of 6V6-GT tube, which is used as a conventional single-ended power amplifier. The output of this stage is coupled to the voice coil of the permanent magnet speaker through a speaker transformer.

SYNC AMP. — BLOCK V12A:

To provide a sync signal which is independent of contrast control settings, the composite signal to be used for sync is taken-off at the video detector, (V6) and is fed sync negative to the sync amplifier, (V12A). Here it is amplified, inverted, and then fed through a noise-immune double-time-constant coupling network to the grids of the Sync Separator.

SYNC SEPARATOR — BLOCK V13:

The positive-going composite signal appearing at the grids of the sync separator is of such magnitude that only the sync information is permitted to be amplified by this stage V13; the video information being driven below cut-off of V13, and therefore not amplified. Note that the two halves of V13 are connected essentially in parallel, forming a "dual-channel" sync separator to provide superior impulse-noise-immunity.

PHASE INVERTER — BLOCK V12B:

The negative sync pulses supplied to the grid of this stage from the previous stage are distributed to provide equal amplitude but out-of-phase horizontal pulses for delivery to the horizontal phase detector, as well as single-ended vertical pulses to the vertical Sweep Oscillator. The two out-of-phase horizontal pulses result from taking balanced outputs from both the cathode and plate of this stage. The long duration vertical pulses are taken from the plate circuit only, and are passed through a suitable integrating network for delivery to the vertical oscillator.

VERTICAL SWEEP BLOCKING OSCILLATOR — BLOCK V14A:

This is a conventional Blocking Oscillator wherein the integrated vertical pulse is used to trigger the grid of the oscillator. This oscillator frequency is controlled from the rear chassis (Vertical Hold), which is a potentiometer affecting the time constant (discharge rate) of this grid.

VERTICAL SWEEP OUTPUT — BLOCK V14B:

The oscillations from the Vertical Oscillator are coupled to the grid of this stage for amplification and delivery to the vertical output transformer. There is a control in the plate circuit of V14A (rear chassis "Height Control") which is a potentiometer affecting the plate voltage of the blocking oscillator. There is also a control in the cathode of V14B (rear chassis Vertical Linearity) which affects the gain of the stage.

HORIZONTAL PHASE DETECTOR — BLOCK V15:

The balanced, but out-of-phase horizontal sync pulses from the phase inverter above are delivered to the plate of one section of this twin diode, and to the cathode of the other section. In this stage these two pulses (negative and positive) are compared with a portion of the output saw-tooth horizontal sweep. If the subsequent horizontal sweep oscillator tends to drift, there will result in this phase detector a phase change in the relationship of the sync pulses to the saw-tooth sweep, which is converted into a D. C. bias delivered to the grid of the horizontal sweep oscillator, thus correcting the frequency of the horizontal oscillator.

HORIZONTAL SWEEP OSCILLATOR — BLOCK V16:

This oscillator is a conventional cathode-coupled multivibrator with control voltage derived from V15, the Horizontal phase detector. There is a rear chassis AFC control which provides frequency adjustment of this oscillator. This control is a tunable inductance which affects a resonant tank circuit in one of the plates of this stage.

HORIZONTAL SWEEP OUTPUT — BLOCK V17:

The sawtooth output of the horizontal oscillator is fed through the adjustable voltage-dropping horizontal drive network to the grid of the Horizontal Sweep Output tube. The amount of drive applied to this grid can be adjusted on the rear of the chassis by varying a capacitance in the voltage dividing network. The output of this stage is applied to the horizontal deflection coils through the impedance-matching Horizontal Output Transformer. A portion of the secondary of this transformer is shunted by a variable inductance (rear chassis "WIDTH" control) which offers an adjustment on the width of the picture.

HORIZONTAL DAMPER — BLOCK V19:

The 6W4 Horizontal Damping tube is connected across the transformer secondary to damp out oscillations created during rapid retrace of the sawtooth current wave. This circuit provides control of horizontal linearity and also uses some of the inductive kickback voltage to supply additional B+ for the horizontal and vertical sweep systems.

POWER SUPPLY — BLOCK V20:

This is a conventional power supply providing D. C. potential to all stages of the chassis with the exception of the picture tube 2nd Anode, the High Voltage rectifier and the Horizontal damper. In addition to providing 6.3 volt filament supply for all stages, there is a separate 6.3 volt filament winding for the heater of the horizontal damper tube. Filter networks in the 117 volt 60 cycle supply, in the D. C. plate supply, and in the filament supply, minimize unwanted interference, interaction and fluctuation.

PARTS REMOVAL

TO REMOVE THE CHASSIS FROM THE CABINET:

1 - Remove the screws holding the back to the cabinet and interlock bracket.
2 - Remove the screws holding the antenna terminal strip to the cabinet.
3 - Reach into the cabinet from the rear and remove the speaker plug from the speaker socket. (In some table models it may be necessary to remove the speaker.)
4 - Remove all the knobs from the front of the cabinet by pulling them straight out.
5 - Remove the mounting screws from the base of the chassis. These screws will be found under the cabinet in the table models and under the chassis mounting board in the console models.
6 - Slide the chassis straight out being careful not to hit the picture tube.
7 - To replace the chassis reverse the operations listed above.

TO REMOVE THE PICTURE TUBE FROM THE CHASSIS:

1 - Remove the socket from the base of the tube by sliding the socket straight back.
2 - Slide ion trap magnet straight back off the neck of the tube.
3 - Remove the screw holding the strap around the face of the picture tube.
4 - Lift the picture tube slightly so as to clear the front brackets and slide the tube straight forward.
5 - To replace reverse the above operations making sure that the picture tube rests against its front stop bracket and that the yoke is as far forward on the tube as possible.

ADJUSTMENTS OF PICTURE TUBE CONTROLS

IF IT SHOULD BECOME NECESSARY TO READJUST THE PICTURE TUBE CONTROLS PROCEED AS FOLLOWS:

ION TRAP MAGNET ADJUSTMENT:

1 - Turn the OFF-ON switch to the ON position.
2 - Turn the PICTURE control fully counterclockwise.
3 - Turn the BRIGHTNESS control fully clockwise. (This control will be found on the rear apron of the chassis.)
4 - The ion trap magnet should be approximately 1/2 inch from the top edge of the picture tube base. Starting from this position adjust the ion trap magnet by moving it forward and backward, at the same time rotating it slightly around the neck of the tube for the brightest raster on the screen.
5 - Reduce the Brightness control until the raster is slightly above average brilliance.
6 - The final touches on this adjustment should be made with the brightness control at the maximum position in which good line focus can be maintained. THIS ADJUSTMENT SHOULD BE MADE ONLY AFTER THE PICTURE IS PROPERLY CENTERED, FOCUSED, AND FRAMED AS DESCRIBED IN THE FOLLOWING PARAGRAPHS.

NOTE: THE RECEIVER SHOULD BE TUNED TO A TEST PATTERN FOR ALL OF THE FOLLOWING ADJUSTMENTS:

A recommended sequence for the following operations is that the serviceman, set the horizontal and vertical controls for a picture lock-in position. Then adjust the focus, horizontal and vertical centering controls. Next adjust the horizontal and vertical size controls in conjunction with the respective linearity controls.

The serviceman should then go back and make the final adjustments so that the picture holds on all channels. The sequence of steps of the following operations is not significant.

CENTERING PICTURE AND REMOVAL OF NECK SHADOW:

1 - Adjust the vertical and horizontal centering control located on the rear apron of the chassis Figure 5, to the center of their range.
2 - Place the yoke as far forward as possible on the neck of the tube. BE SURE THAT IT IS NOT CATCHING ON THE MOUNTING HOOD. THE YOKE WINDING MUST BE IN CONTACT WITH THE FLARE OF THE PICTURE TUBE. Tighten the yoke in position by means of its adjusting thumb screw. BE SURE THAT THE PICTURE IS NOT TILTED. IF IT IS, ROTATE THE YOKE UNTIL THE PICTURE IS STRAIGHT BEFORE TIGHTENING THE THUMB SCREW, FIGURE 5.
3 - Center the picture by adjusting the horizontal and vertical centering controls on the rear apron of the chassis.

FOCUS ADJUSTMENT:

THE PICTURE TUBE EMPLOYED IN THIS TELEVISION RECEIVER IS CONSTRUCTED TO PROVIDE PREFIXED FOCUSING. THE FOCUS CONTROL ON THE REAR CHASSIS APRON IS PROVIDED IF ADJUSTMENT IS REQUIRED.

HORIZONTAL AFC ADJUSTMENT

1 - Adjust the AFC control screw on the rear of the chassis so that the picture locks into horizontal sync.
2 - Turn The Channel Selection Switch through the various stations and make sure that it always lock into horizontal sync. If it should fail to do this readjust the AFC control screw until this condition is obtained.

HEIGHT AND VERTICAL LINEARITY:

1 - Adjust the height control, located on the rear of the chassis, until the picture fills the mask.
2 - Adjust the vertical linearity control on the rear of the chassis, until the test pattern is symmetrical from top to bottom.

NOTE: AN ADJUSTMENT OF EITHER CONTROL MAY REQUIRE READJUSTMENT OF THE OTHER CONTROL.

VERTICAL HOLD CONTROL:

1 - Adjust the vertical hold control, on the rear apron of the chassis Figure 5, until the picture locks in vertically.
2 - Switch the "Channel Selector" through the various stations and make sure that the picture always locks into vertical sync. If it should fail to do this readjust the vertical hold control until this condition is obtained.

WIDTH, HORIZONTAL DRIVE AND LINEARITY:

1 - Turn the horizontal drive control on the rear of the chassis Figure 5, in either direction until you obtain the greatest width without a vertical line or tear. Make sure this control is at least 3/4 of a turn from its maximum clockwise position to prevent damage to output tube and transformer.

2 - Adjust the width control until the picture fills the mask horizontally. The width control is located in the rear of the high voltage shield. Figure 5.

3 - Adjust the horizontal linearity coil, located on top of the chassis near the high voltage shield, for the best picture. Figure 16.

NOTE: AN ADJUSTMENT OF THE HORIZONTAL DRIVE MAY AFFECT THE ADJUSTMENT OF THE HORIZONTAL AFC CONTROL.

TELEVISION ALIGNMENT PROCEDURE

Aligning a television receiver is an exacting procedure and involves tying up bench space, test equipment and skilled personnel at the service shop, as well as the cost of making two trips to the user's home. Before deciding that the chassis must be pulled and aligned at the shop, the serviceman should check these very common sources of trouble;

1 - The antenna and installation.
2 - Front panel and rear chassis controls, including Picture Tube adjustments.
3 - Reception on all available channels.
4 - Tube failures. Substitute from your kit of known good replacements.
5 - Visual inspection of under side of chassis for obvious faults, such as loose connections, etc.

CAUTION: THE SECOND ANODE LEAD TO THE PICTURE TUBE HAS A POTENTIAL OF APPROXIMATELY 12,000 VOLTS. DURING THIS ALIGNMENT IT IS ADVISABLE TO REMOVE THE 6BQ6 TUBE FROM ITS SOCKET, THUS ELIMINATING THIS HIGH VOLTAGE HAZARD.

SEQUENCE OF ALIGNMENT:

It is recommended that the ratio detector driver be aligned first, followed by the ratio detector, I. F., and tuner alignments in that order unless the location of the misalignment is known.

AIDS IN SERVICING:

In addition to step-by-step alignment procedures following, see the instrument connection figures, and voltages and waveshapes charts.

TELEVISION CHANNEL VS CARRIER AND I-F AMPLIFIER

CHANNEL NO.	CHANNEL Freq. (mc.)	PICTURE CARRIER Freq. (mc.)	SOUND CARRIER Freq. (mc.)	RECEIVER OSC. Freq. (mc.)	PICTURE IF Freq. (mc.)	SOUND IF Freq.(mc.)	PICTURE IF less SOUND IF (mc.)

FIG. 6

RATIO DETECTOR DRIVER, RATIO DETECTOR, AND 4.5 MC TRAP ALIGNMENT

In aligning this section of the television receiver, the sound take-off must be resonated at 4.5 mc. to separate the sound from the picture information, and the ratio detector transformer must be adjusted to complete balance in the secondary winding for maximum AM rejection. The sound take-off coil is L113, located between the video amplifier V7 and the detector driver V8. The discriminator transformer is T100, located between the detector driver V8 and the ratio detector V9. A 4.5 mc. signal is fed into the video amplifier, and the sound trap and ratio detector are adjusted in proper sequence to obtain VTVM readings across the detector load resistor R126. To reduce visibility of 4.5 mc. beat pattern on screen, L110 is adjusted to attenuate the 4.5 mc. signal.

1 - Connect the VTVM across R126 with the positive lead from the meter to the chassis, and the negative lead to the other side of R126. This connection will be at pin 7 of the 6AL5, V9. See Figure 7A showing connection.
2 - Connect the signal generator output through a .001 mfd mica capacitor to pin 2 of the 12BH7 Video Amp. (input to the first video amplifier, V7A): Ground the other side of the generator to the chassis.
3 - Set the signal generator to precisely 4.5 mc. and adjust its output to provide about 10 volts reading on the VTVM.
4 - Adjust sound take-off coil L113 for maximum reading on the VTVM. This coil can be peaked at two points, and the peak point selected should be the one closest to the full counter-clockwise position of the slug. This setting minimizes the possibility of intercarrier buzz.
5 - Adjust the bottom slug on the discriminator transformer T100 for maximum reading on the VTVM.
6 - Connect signal generator to either side of C116, picture tube coupling capacitor; ground side to chassis.
7 - Adjust L110 for minimum reading on VTVM.
8 - Connect two 100K resistors across R126 as shown in figure 7B.
9 - Reconnect the VTVM, running one lead to the junction point of these two 100K resistors, and the other lead to the tertiary winding center lug of the discriminator transformer T100. See Figure 7B for these connections.
10 - Reconnect Signal Generator as in step 2, and adjust the top slug on T100. Note that during this adjustment, a point will be found where the VTVM will swing rather sharply from positive to negative, or vice versa. The correct setting of this adjustment is obtained when the VTVM pointer reads zero, as the slug is passed through this point.

INTERMEDIATE FREQUENCY ALIGNMENT

The IF alignment of the models covered in this manual is based on peaking one set of IF coils at 22.8 mc. and the other set of IF coils at 25.4 mc. A signal generator feeds these frequencies to the IF strip, and a VTVM connected across the video detector load resistor R113 in proper polarity, serves as a measuring device for this peaking operation. The 22.8 mc. coils are on the tuner sub-chassis, and L103, located between the second and third IF stages. The 25.4 mc. coils are L101, located between the first and second IF stages, and L104, located between the third IF and the video detector. A recommended step-by-step procedure is given below:

1 - Set front panel "CONTRAST" control 1/4 turn clockwise.
2 - Connect the VTVM in proper polarity across the video detector (V6) load resistor R113. Connect positive lead to the chassis, and negative to the junction of shunt peaking coil L107 and R113. See Figure 8B.
3 - Connect the signal generator through a .001 mfd capacitor to the test loop located between the two tubes on top of the tuner sub-chassis. See Figure 8A.
4 - Inject minus 3 volt bias to AGC terminal on tuner. (Refer to tuner descriptions for location of AGC terminal.)
5 - Set the signal generator to 22.8 mc. and adjust its output so that the VTVM shows a reading of 2.5 volts maximum.
6 - Adjust L103 and 22.8 mc. coil on tuner for maximum reading on the VTVM.
7 - Reset the signal generator to 25.4 mc. and adjust its output so that the VTVM shows a reading of 2.5 volts maximum.
8 - Adjust L101 and L104 for maximum VTVM reading.
9 - Reset the signal generator to 21.25 mc. and adjust its output so that the VTVM reads 5 volts maximum.
10 - Adjust L114 for minimum VTVM reading.

NOTE: In early production receivers, the 21.25 mc. IF trap (L114) was not incorporated. The alignment procedure described above remains unchanged, except that reference to the IF trap is ignored. However, the following components differ:

	WITH L114 IF TRAP	WITHOUT L114 IF TRAP
R100	3.9K 1/2w	5.6K 1/2w
R101	33 Ohm 1/2w	47 Ohm 1/2w
R103	47K 1/2w	22K 1/2w
R104	47 Ohm 1/2w	56 Ohm 1/2w

TUNER ALIGNMENT - GENERAL INFORMATION

DO NOT TOUCH TUNER ALIGNMENT UNLESS ABSOLUTELY NECESSARY. BEFORE ATTEMPTING TUNER ALIGNMENT CHECK I.F. ALIGNMENT AND THE ANTENNA TO BE SURE THAT THE TUNER IS AT FAULT.

EQUIPMENT NEEDED FOR ALIGNMENT OF TUNERS

1 - SWEEP GENERATOR
2 - STANDARD SIGNAL GENERATOR (MARKER GENERATOR)
3 - OSCILLOSCOPE
4 - VACUUM TUBE VOLTMETER
5 - 3 VOLT DRY CELL
6 - SLEEVE TYPE TUBE SHIELD
7 - INSULATED ALIGNMENT TOOLS
8 - METAL GROUND PLATE. ALL EQUIPMENT AND T.V. SET TO BE PUT ON THIS PLATE TO PREVENT SPURIOUS SIGNALS PICK UP AND STANDING WAVES ON CONNECTIONS.

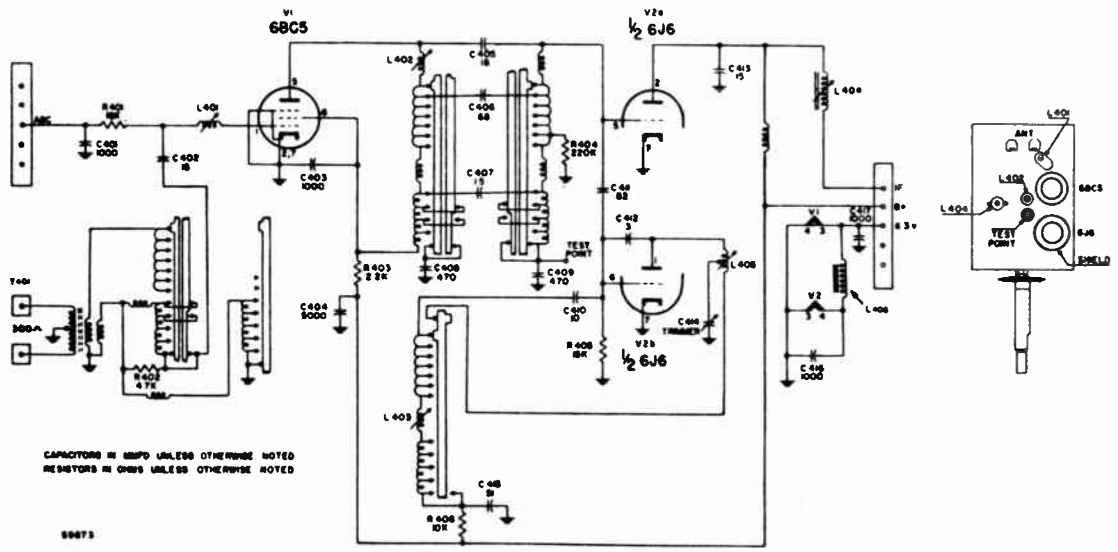
FIG. 11

SWITCH TYPE TUNER

PART NO. 541114

R. F. AMPLIFIER

The signal from the Television receiving antenna is brought into the single-ended R.F. amplifier through a coupling transformer which couples the balanced-to-ground twin-lead transmission line to the unbalanced single-ended grid drive of this stage. The channel switch picks out suitable lumped resonant elements in the plate circuit of this stage to permit selective amplification of the desired frequency. A.G.C. is introduced at the grid of this stage also. The values of the shunt loading, the degree of the transformer coupling, and the values of the tuning inductances are chosen by the selector switch to provide uniform bandpass on all channels.



TUNER SCHEMATIC & TUBE LOCATION
TUNER TT5AL PART NO. PC541114

FIG. 12

R. F. CONVERTER

The amplified signals from the previous R.F. stage are delivered to the input grid of V2. The 2nd section of the V2 is a modified Hartley oscillator, and the output of this local oscillator is heterodyned with the amplified R.F. in the mixer load. The channel selector functions in this circuit to select suitable fixed tank circuit elements so that the local oscillator frequency is always above the R.F. frequencies by an amount equal to the desired I.F. frequencies. The front panel "Fine Tuning" is mechanically connected to a variable capacitor in this oscillator tank circuit to provide vernier adjustment on the local oscillator frequency.

TUNER RF BANDPASS ALIGNMENT

NOTE: DO NOT ATTEMPT RF BANDPASS ALIGNMENT UNTIL THE IF AMPLIFIERS ARE PROPERLY ALIGNED.

1 - Connect the R.F. Sweep Generator, Marker Generator, and Oscilloscope as shown in Fig. 9a. Refer to Fig. 11 for instruments setting for each channel alignment. Put minus 3 volt bias between ground and AGC by means of the 3 volt battery.

2 - Set the RF sweep generator for 10mc. sweep width, and its center frequency at 213 mc.

3 - Set the CHANNEL SELECTOR switch to channel 13, and the fine tuning control at the middle of its rotation range.

4 - Turn on the television receiver and test equipment and allow about 15 minutes for the set to warm up and stabilize.

5 - Set the oscilloscope gain control for a maximum gain and the sweep attenuator for minimum output necessary to give a convenient size trace.

6 - (See Note 1). See permissible response curves, Figure 10. If the response curve on the oscilloscope does not fall within these limits, the picture on the oscilloscope can be made to approach the desirable form by either spreading or compressing the particular coils in the tuner circuit at channel 13 setting. Referring to the 5 decks on the master switch in the tuner, note that the deck nearest the front (shaft) end of the tuner contains those coils regulating the local oscillator, and these should NOT be touched during any bandpass adjustments. On the second, third and fourth decks of the master switch are the coils for the mixer grid, the RF amplifier plate, and the antenna coupling transformer, respectively, and the particular coils connected in the circuit for channel 13, on these three rear decks are the ones that should be compressed or expanded to achieve the desired bandpass characteristics. Note that too broad a curve results in loss of sensitivity, and rejection.

7 - Proceed with Channel Selector switch at 12, and with Sweep and marker generators set per Figure 11, repeat 6 above to achieve proper curve. Repeat for channel 11, then 10, 9, etc. When completion of channel 2 is reached, the bandpass alignment is finished.

Note #1 - Late model switch type tuners part #541114 have an additional screw adjustment on the top of the tuner. These adjustments are in the end inductance of the RF and antenna coil. Before adjusting any individual coil, use these adjustments for aligning channel 13. It is likely that after this adjustment is made, it will not be necessary to touch the other coils. This is especially true in the misalignment developed because of a change in tubes as these adjustments will compensate for the interelectrode capacitance variations in tubes. Refer to the diagram for the location of the above mentioned screw adjustments.

TUNER RF LOCAL OSCILLATOR ALIGNMENT

1 - Connect the RF sweep generator to the antenna terminals as in figure 9A. Put minus 3 volt bias between ground and an AGC terminal by means of the 3 volt battery.

2 - If the sweep generator is not provided with internal crystal-controlled or crystal-calibrated markers, connect a marker generator to the antenna terminals as in figure 9A.

3 - Connect the cathode ray oscilloscope across the video detector load resistor R113. See figure 9B.

4 - Adjust the R.F. sweep generator for 10 mc. sweep width, with center frequency at approximately 213 mc.

5 - Adjust the marker generator for the picture carrier of channel 13 (211.25 mc.)

6 - Set the Channel Selector switch to channel 13, with the fine tuning control at the middle of its rotation range.

7 - Turn on the receiver and test equipment and allow about 15 minutes for it to warm up and stabilize.

8 - Set the oscilloscope gain control for a convenient size picture on the oscilloscope.

9 - Adjust the slug in channel 13 oscillator coil until the oscillator pip is at the middle of the picture side of the response curve on the oscilloscope.

10 - Set the channel Selector switch to channel 12, and using the frequencies shown in figure 11, adjust by displacing the channel 12 increment loop until the oscillator pip is at the middle of the picture side of the response curve on the oscilloscope.

11 - Repeat operation 10 above using the appropriate frequencies and increment loops for channel Selector switch settings of 11, 10, 9, 8, and 7 in that order. This completes the high band oscillator alignment.

12 - Set Channel Selector switch to 6, and proceed as in 9 above, using the proper slug and frequencies.

HOW TO ORDER PARTS

1. Use Correct Order Form.
2. On the Purchase Order always give the following information:
   (1) PART NUMBER (number printed on the part if different from that shown on this list) and DESCRIPTION for each part ordered. When no part is assigned, order by description and rating. Also give PRICE of part (indicate if no selling).

   (2) The CHASSIS NUMBER, is this tound on a metal plate at the rear of the Chassis.

GENERAL INSTALLATION INSTRUCTIONS

While each receiver is correctly aligned at the factory rough handling in transit, ageing, drift, etc., may throw the receiver off, so we suggest that the proper oscillator trimmers, ratio detector, and rear panel controls (see pages 4 and 5) be checked for correct adjustment with a transmitted television pattern, in the customer's home at the time of installation. Be sure to have the receiver operating for one-half hour before making these adjustments. Listed below is the correct procedure to follow in making these adjustments.

(A) Check all operating channels, using FINE TUNING CONTROL for best picture detail. (See paragraph PEAKING THE INDIVIDUAL OSCILLATOR TRIMMERS.)

(B) Check LOCALITY ADJUSTER CONTROL located on back of chassis for proper setting.

NOTE: The signal strength (too strong or too weak) will be affected by location and distance from the station, type of antenna used, terrain obstructions such as tall buildings, electrical disturbances.

PEAKING THE INDIVIDUAL VHF OSCILLATOR TRIMMERS

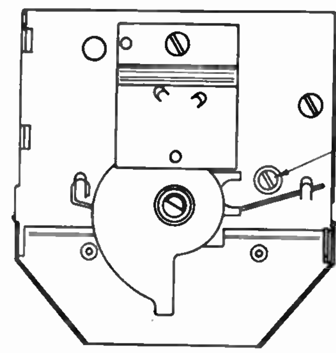
(A) Set channel selector knob to the desired channel.

(B) Set the FINE TUNING CONTROL to the center position.

(C) Remove the channel and fine tuning knobs. This will expose the individual channel adjustment screw opening just to right of the channel shaft. See Fig. 1.

(D) Use a non-metallic screwdriver such as polysterene or nylon.

Adjust the individual oscillator screw for best picture detail. A slight adjustment in either direction is all that is necessary. CAUTION: DO NOT ADJUST INDISCRIMINATELY, this may cause the adjustment screw to fall from its locking position.



THE PROPER ADJ. SCREW FOR THE CHANNEL TUNED TO WILL APPEAR HERE

FIG. I

ADJUSTMENT FOR STATION BUZZ

If station buzz is excessive and is NOT DUE to "contrast control" being advanced too far in a clockwise direction or the locality adjuster control in the incorrect position, adjust the ratio detector secondary adjustment screw located on top of the ratio detector for minimum buzz. MAKE SURE THAT THIS POSITIOIN IS BETWEEN the two MAXIMUM buzz peaks that will be noticed when adjustment screw is turned to the right or left of the minimum buzz position.

27" PICTURE TUBE HANDLING PRECAUTIONS

EXTREME CARE MUST BE EXERCISED WHEN HANDLING OR SERVICING THE PICTURE TUBE. ACCIDENTS ARE ONLY CAUSED BY CARELESSNESS.

Listed below are precautions which must be taken when removing the picture tube.

1. To remove the picture tube mounting assembly.
   (a) Disconnect the second anode lead, the picture tube socket assembly, and the deflection yoke plug.
   (b) Remove the main chassis and the four picture tube support braces.
   (c) Remove the wood screws holding the picture tube mounting board assembly to the cabinet.
   (d) Slide picture tube assembly out. Because of its size and weight two persons are required to handle this assembly. The balance or center of weight is at the face of the picture tube.
2. Always wear goggles when handling picture tube.
3. Never hold the picture tube close to the body.
4. Never handle the picture tube by its neck.
5. Never bump or scratch the picture tube.
6. Always clean the neck of the picture tube before adjusting the ion trap.
7. If it becomes necessary to remove the picture tube from its mounting board, always place on a clean soft cloth face down.

HIGH VOLTAGE AND CORONA

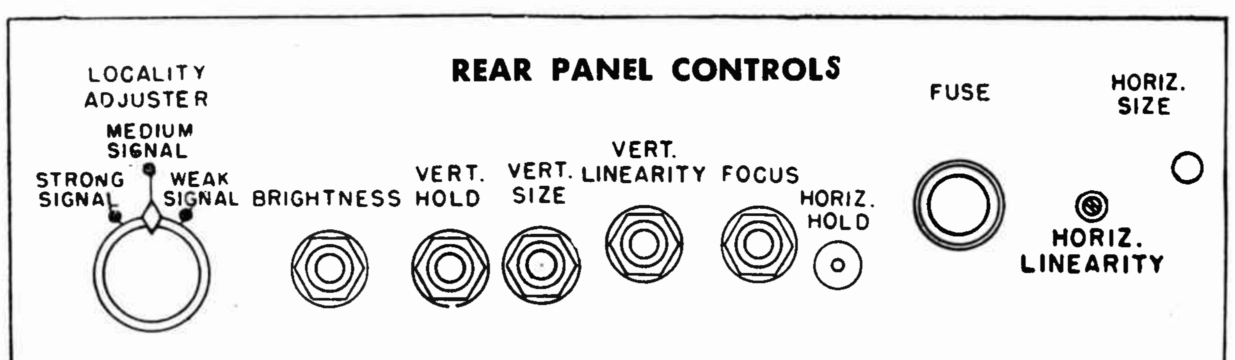
WARNING: HIGH VOLTAGE DEVELOPED IN THIS RECEIVER IS IN EXCESS OF 18,000 VOLTS.

Increased high voltage not only presents the problem of safety precautions, it also increases the problems of arcing and corona.

When servicing or replacing any part of the high voltage compartment of this receiver the following precautions and suggestions should be followed.

1. All connections to the high voltage transformer, condenser, and socket terminal should be made mechanically tight and all excessive wire clipped off, leaving no sharp points from these terminals.
2. A clean, round and smooth solder connection should be made, covering all sharp points. (Do not use excessive solder.)
3. All lead dresses in the high voltage compartment are critical.
   B+ leads or leads of ground or near ground potential too close to any high voltage leads will cause corona and/or arcing to the extent it may cause the insulation of the wires to burn.
4. All insulating wax when removed around the high voltage socket and condenser must be replaced. Insulating wax may be procured through the Sentinel Service Department.
5. Repairing high voltage transformers is not recommended. Always replace the defective transformer with a new one.
6. Before replacing the high voltage shield cover make a careful inspection of wire dress, soldered connections, and wax insulated parts.

REAR PANEL CONTROLS



The UHF TUNER has been aligned for optimum operation by special factory equipment and should never require alignment.

The 6AF4 OSCILLATOR and 1N82 CRYSTAL are readily accessible through the bottom panel. The 1N82 crystal is a snap-in type and no soldering is required.

In the UHF position the 6BQ7 is used as an additional IF stage.

Great care should be taken that parts location and lead dress are not altered in the UHF TUNER.

FOR VHF ALIGNMENT SEE ALIGNMENT DATA LISTED ON PAGES 17 and 18.

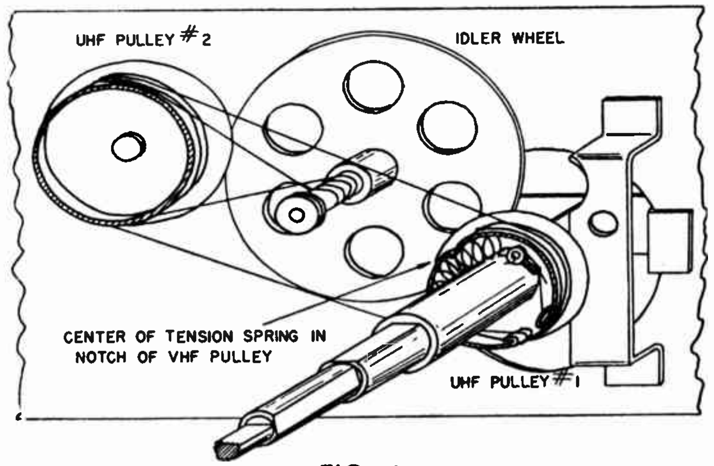


FIG. 6

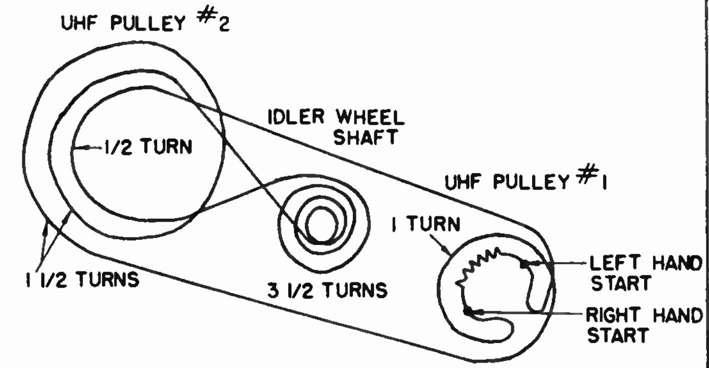

FIG. 7

STRINGING OF UHF PULLEYS

BOTH UHF pulleys must be in the extreme counter-clockwise position before stringing pulley.

The string should be fastened to the ends of the spring so that it measures 28½ inches end to end with no tension on spring.

Stringing is simplified by using both hands. Place center of tension spring into notch of UHF pulley No. 1. Bring string out of opening of pulley. Grasp the string with right and left hand as indicated in figure 7.

With the right hand make a complete turn around UHF pulley No. 1 in a clockwise direction. With the left hand make a half turn around UHF pulley No. 2 in a counter-clockwise direction, then continue in a clockwise direction around the idler wheel shaft making 3½ turns, follow back around the UHF pulley No. 2 in a counter-clockwise direction making 1½ turns, to complete the stringing.

Turn the FINE TUNING SHAFT only until the strings are properly seated.

If the UHF pulleys do not come to a stop in the opposite directions simultaneously, turn the UHF pulley No. 2 until it does so.

UHF IDLER OR CLUTCH ADJUSTMENT

1. If the fine tuning shaft turns when the UHF channel selector is operated the brass hex head adjustment screw part of idler wheel shaft is too tight. Loosen brass adjustment screw very slightly.
2. If by operating the fine tuning control and it does not turn the UHF tuner, the brass hex head adjustment screw part of idler wheel shaft is too loose. Tighten brass adjustment screw very slightly.

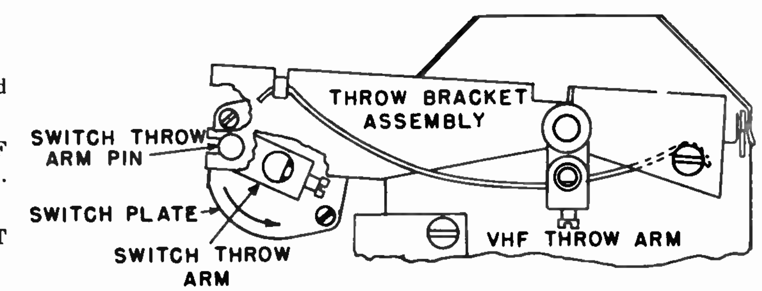
UHF SWITCH POSITIONING

The switch must be positioned carefully to avoid damage to the switch and switch assembly.

1. Set VHF and UHF position (roller on VHF throw arm engaging throw bracket assembly).
2. Loosen switch mounting nut.

NOTE: LOCATING PIN ON SWITCH IS NOT USED.

3. Move switch as shown by arrow in fig. 8 gently, until stop is reached. Set detent stop of switch so that a space of 1/64 inch is between detent stop and switch plate stop. Tighten switch mounting nut.
4. Turn channel selector ON and OFF of UHF position. Recheck stops. Detent stop must not touch switch plate stop or have more than 1/64 inch space between stops when in the UHF position.



REAR VIEW OF SWITCH ASSEMBLY IN UHF POSITION

FIG. 8

5. If switch is properly positioned the switch throw arm pin will not bind in slot of throw bracket at any setting of VHF tuner.

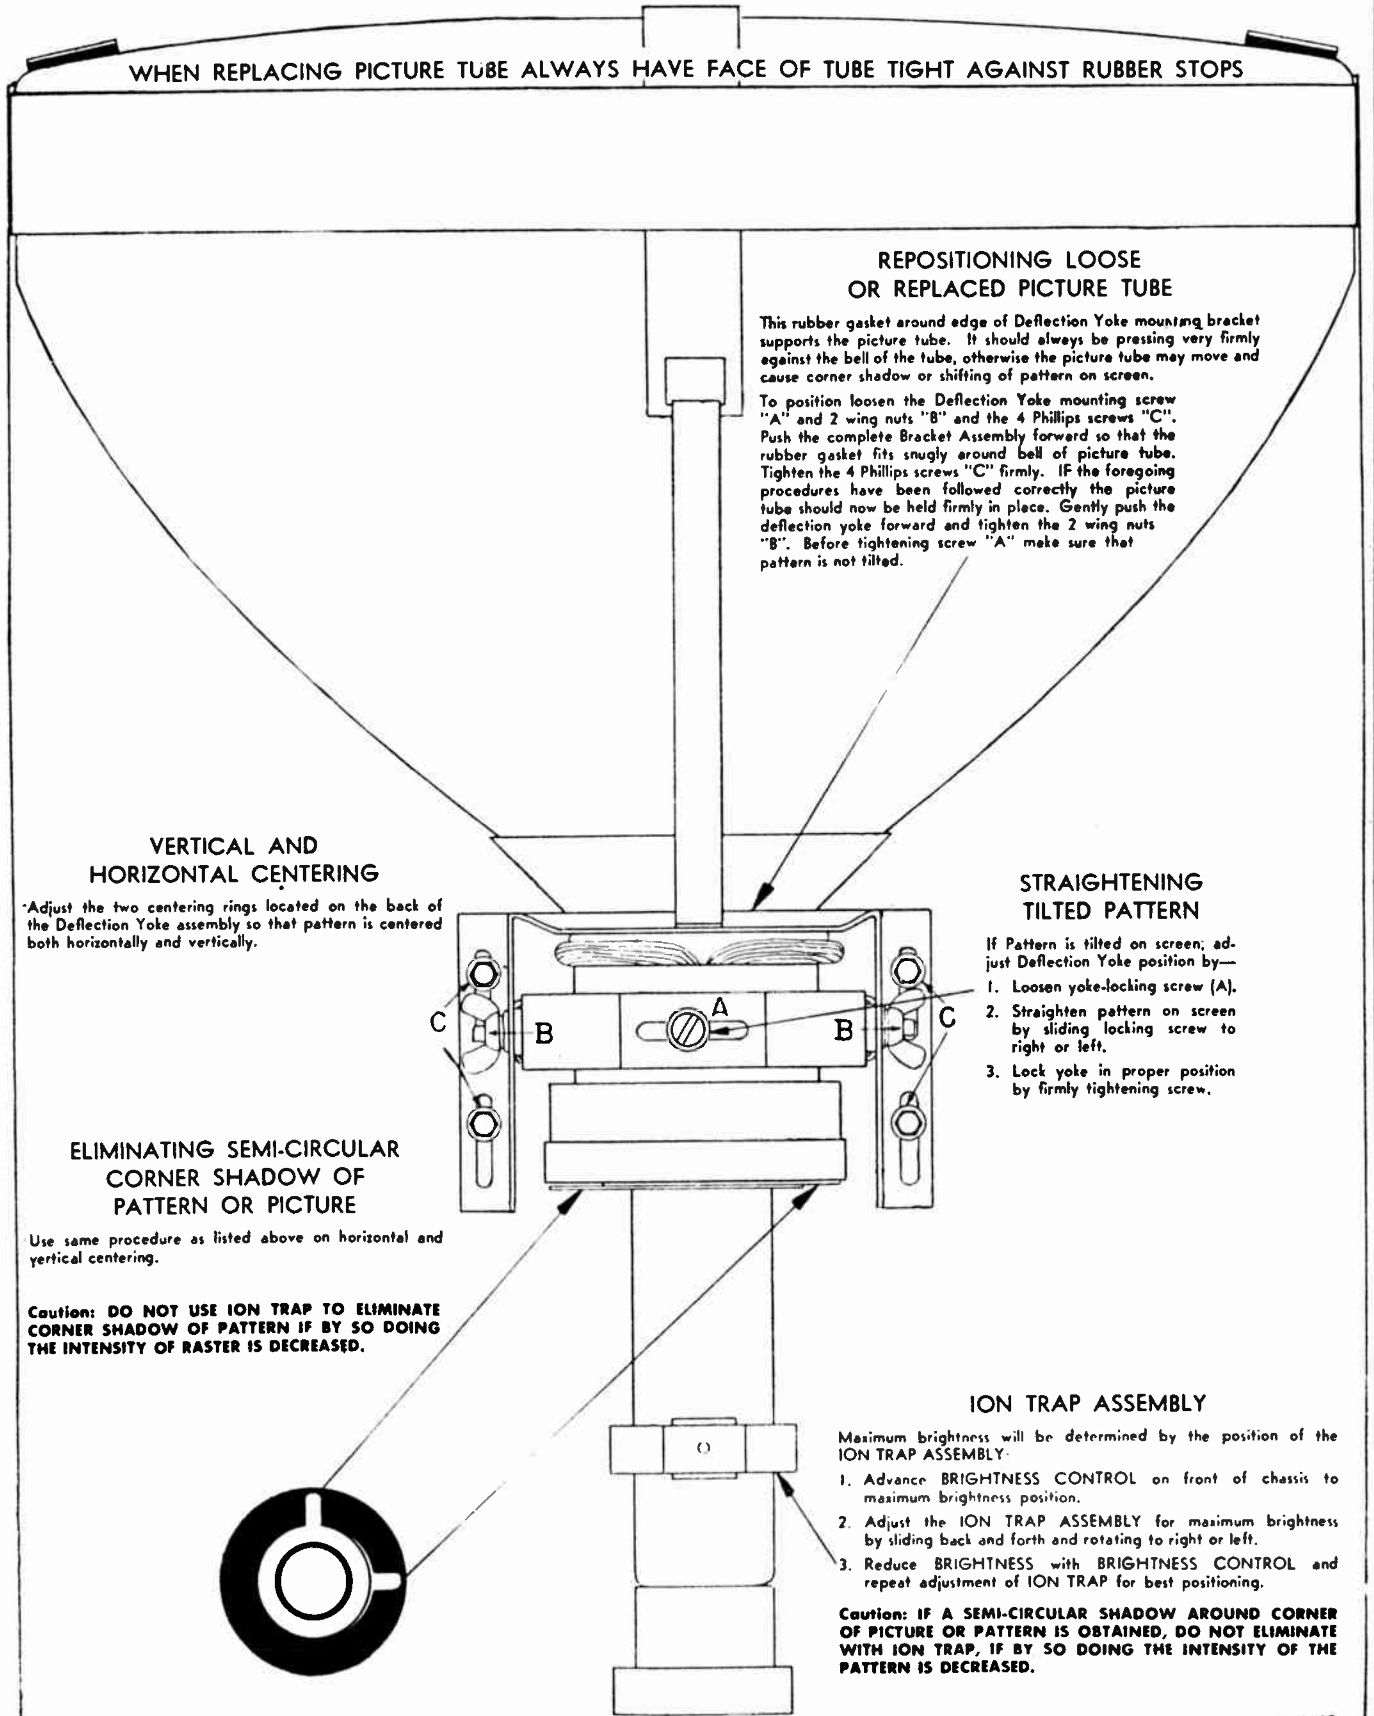
ADJUSTMENT PROCEDURE FOR ELECTROSTATIC FOCUS PICTURE TUBES, DEFLECTION YOKE, ION TRAP, HORIZONTAL AND VERTICAL CENTERING, CORNER SHADOW, AND PICTURE TUBE ALIGNMENT.



REPOSITIONING LOOSE OR REPLACED PICTURE TUBE

This rubber gasket around edge of Deflection Yoke mounting bracket supports the picture tube. It should always be pressing very firmly against the bell of the tube, otherwise the picture tube may move and cause corner shadow or shifting of pattern on screen.

To position loosen the Deflection Yoke mounting screw "A" and 2 wing nuts "B" and the 4 Phillips screws "C". Push the complete Bracket Assembly forward so that the rubber gasket fits snugly around bell of picture tube. Tighten the 4 Phillips screws "C" firmly. If the foregoing procedures have been followed correctly the picture tube should now be held firmly in place. Gently push the deflection yoke forward and tighten the 2 wing nuts "B". Before tightening screw "A" make sure that pattern is not tilted.

VERTICAL AND HORIZONTAL CENTERING

Adjust the two centering rings located on the back of the Deflection Yoke assembly so that pattern is centered both horizontally and vertically.

STRAIGHTENING TILTED PATTERN

If Pattern is tilted on screen, adjust Deflection Yoke position by—

1. Loosen yoke-locking screw (A).
2. Straighten pattern on screen by sliding locking screw to right or left.
3. Lock yoke in proper position by firmly tightening screw.

ELIMINATING SEMI-CIRCULAR CORNER SHADOW OF PATTERN OR PICTURE

Use same procedure as listed above on horizontal and vertical centering.

Caution: DO NOT USE ION TRAP TO ELIMINATE CORNER SHADOW OF PATTERN IF BY SO DOING THE INTENSITY OF RASTER IS DECREASED.

ION TRAP ASSEMBLY

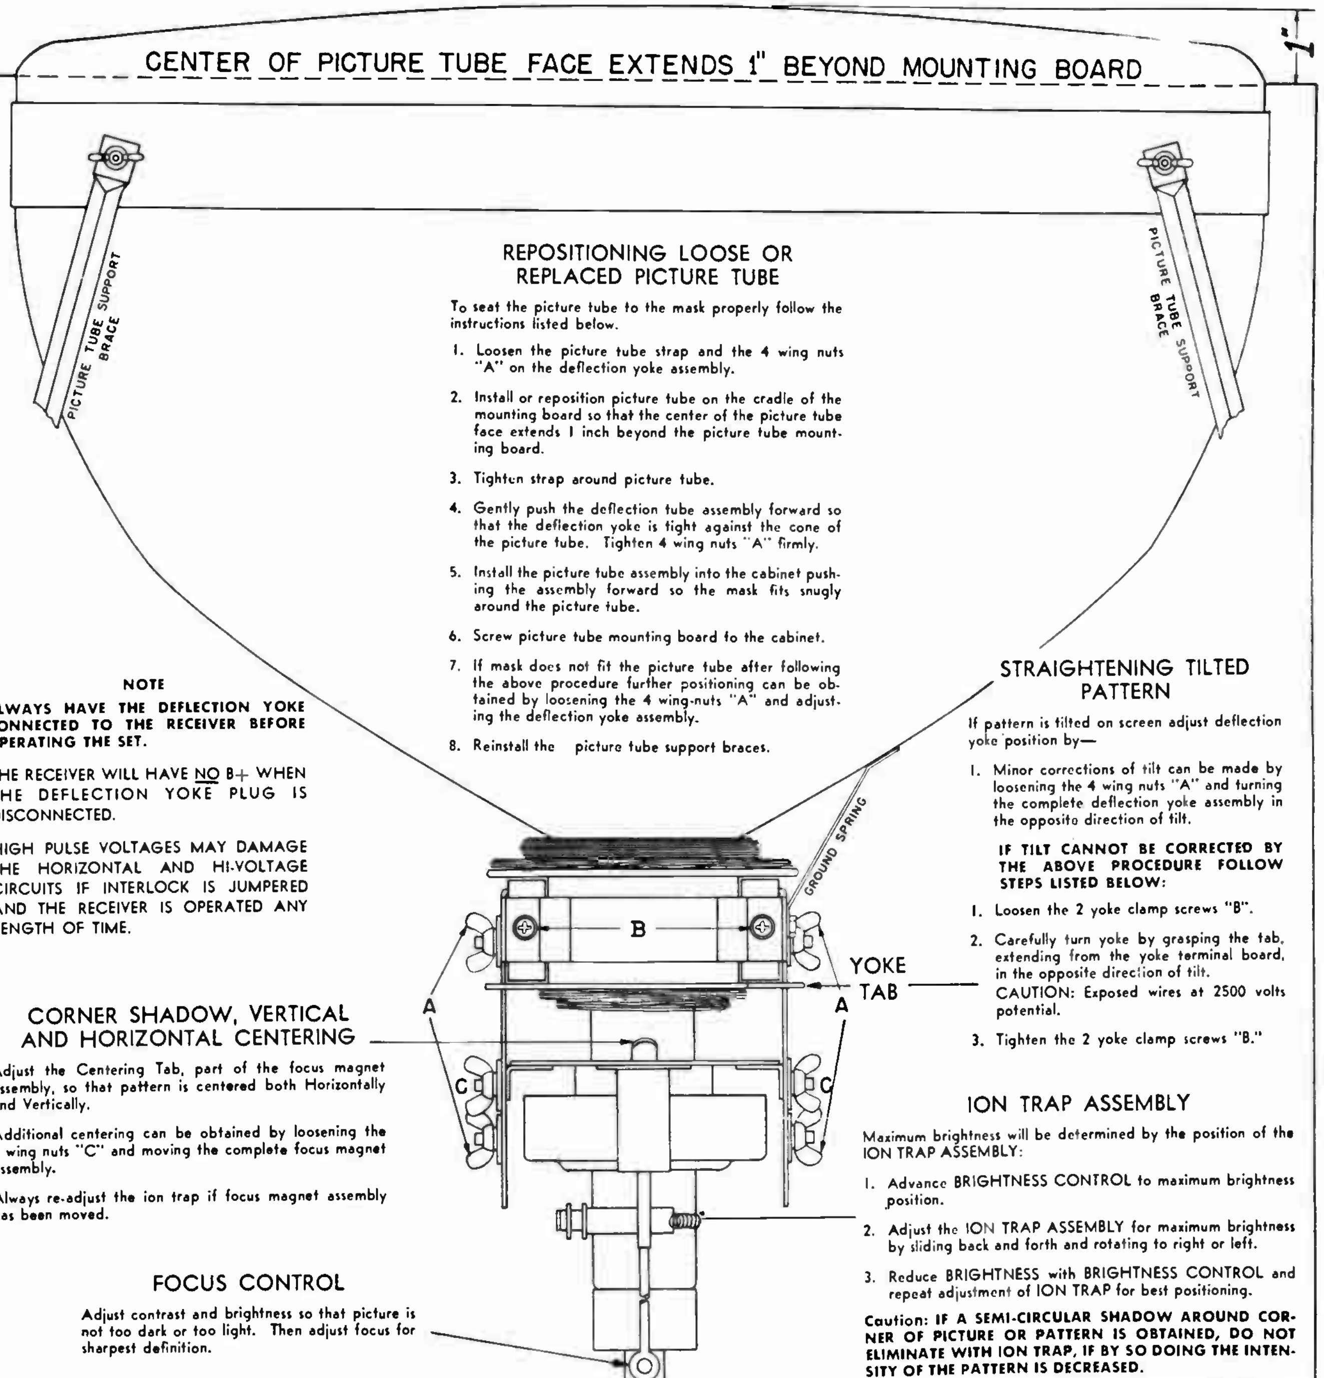
Maximum brightness will be determined by the position of the ION TRAP ASSEMBLY.

1. Advance BRIGHTNESS CONTROL on front of chassis to maximum brightness position.
2. Adjust the ION TRAP ASSEMBLY for maximum brightness by sliding back and forth and rotating to right or left.
3. Reduce BRIGHTNESS with BRIGHTNESS CONTROL and repeat adjustment of ION TRAP for best positioning.

Caution: IF A SEMI-CIRCULAR SHADOW AROUND CORNER OF PICTURE OR PATTERN IS OBTAINED, DO NOT ELIMINATE WITH ION TRAP, IF BY SO DOING THE INTENSITY OF THE PATTERN IS DECREASED.

SM-1002

24" AND 27" PICTURE TUBE
ADJUSTMENT PROCEDURE FOR FOCUS, DEFLECTION YOKE, ION TRAP, HORIZONTAL AND VERTICAL CENTERING, CORNER SHADOW, AND PICTURE TUBE ALIGNMENT.



REPOSITIONING LOOSE OR REPLACED PICTURE TUBE

To seat the picture tube to the mask properly follow the instructions listed below.

1. Loosen the picture tube strap and the 4 wing nuts "A" on the deflection yoke assembly.
2. Install or reposition picture tube on the cradle of the mounting board so that the center of the picture tube face extends 1 inch beyond the picture tube mounting board.
3. Tighten strap around picture tube.
4. Gently push the deflection tube assembly forward so that the deflection yoke is tight against the cone of the picture tube. Tighten 4 wing nuts "A" firmly.
5. Install the picture tube assembly into the cabinet pushing the assembly forward so the mask fits snugly around the picture tube.
6. Screw picture tube mounting board to the cabinet.
7. If mask does not fit the picture tube after following the above procedure further positioning can be obtained by loosening the 4 wing-nuts "A" and adjusting the deflection yoke assembly.
8. Reinstall the picture tube support braces.

NOTE

ALWAYS HAVE THE DEFLECTION YOKE CONNECTED TO THE RECEIVER BEFORE OPERATING THE SET.

THE RECEIVER WILL HAVE NO B+ WHEN THE DEFLECTION YOKE PLUG IS DISCONNECTED.

HIGH PULSE VOLTAGES MAY DAMAGE THE HORIZONTAL AND HI-VOLTAGE CIRCUITS IF INTERLOCK IS JUMPERED AND THE RECEIVER IS OPERATED ANY LENGTH OF TIME.

STRAIGHTENING TILTED PATTERN

If pattern is tilted on screen adjust deflection yoke position by—

1. Minor corrections of tilt can be made by loosening the 4 wing nuts "A" and turning the complete deflection yoke assembly in the opposite direction of tilt.

IF TILT CANNOT BE CORRECTED BY THE ABOVE PROCEDURE FOLLOW STEPS LISTED BELOW:

1. Loosen the 2 yoke clamp screws "B".
2. Carefully turn yoke by grasping the tab, extending from the yoke terminal board, in the opposite direction of tilt. CAUTION: Exposed wires at 2500 volts potential.
3. Tighten the 2 yoke clamp screws "B."

CORNER SHADOW, VERTICAL AND HORIZONTAL CENTERING

Adjust the Centering Tab, part of the focus magnet assembly, so that pattern is centered both Horizontally and Vertically.

Additional centering can be obtained by loosening the 2 wing nuts "C" and moving the complete focus magnet assembly.

Always re-adjust the ion trap if focus magnet assembly has been moved.

ION TRAP ASSEMBLY

Maximum brightness will be determined by the position of the ION TRAP ASSEMBLY:

1. Advance BRIGHTNESS CONTROL to maximum brightness position.
2. Adjust the ION TRAP ASSEMBLY for maximum brightness by sliding back and forth and rotating to right or left.
3. Reduce BRIGHTNESS with BRIGHTNESS CONTROL and repeat adjustment of ION TRAP for best positioning.

Caution: **IF A SEMI-CIRCULAR SHADOW AROUND CORNER OF PICTURE OR PATTERN IS OBTAINED, DO NOT ELIMINATE WITH ION TRAP, IF BY SO DOING THE INTENSITY OF THE PATTERN IS DECREASED.**

FOCUS CONTROL

Adjust contrast and brightness so that picture is not too dark or too light. Then adjust focus for sharpest definition.

ADJUSTMENTS FOR CORNER SHADOW, VERTICAL AND HORIZONTAL CENTERING CAN BE MADE WITHOUT REMOVING THE CABINET BACK. THE CENTERING TAB CAN BE REACHED BY REMOVING THE 4 SCREWS HOLDING CUP TO THE CABINET BACK.

24" PICTURE TUBES

Except for repositioning and mounting of picture tube the above listed adjustments are used for 24" picture tubes.

VHF ALIGNMENT DATA

ALIGNMENT PROCEDURE

All circuits are very stable and will seldom require adjustment. Only when major parts of the tuner or the video I-F strip have been replaced or tampered with will it be necessary to realign the receiver.

Generally under normal conditions only the INDIVIDUAL CHANNEL TRIMMERS in the tuner unit may require adjustment by the service technician.

RATIO DETECTOR AND SOUND I-F ALIGNMENT

In most cases only the secondary of the ratio detector coil will require adjustment. This can be done simply by adjusting the top adjustment screw of the ratio detector for minimum buzz with the sound carrier of a TV station. For complete alignment use steps 1, 2, and 3 in the alignment table.

PICTURE I-F ALIGNMENT

Receiver should be run for at least ½ hour before proceeding with alignment.

EQUIPMENT REQUIRED

VACUUM TUBE VOLTMETER
For video IF alignment maintain readings in middle of low volt scale.

SIGNAL GENERATOR supplying a 4.5 MC. (within .25%) 40 to 216 MC. (within 1%) signal. With output adjustable to at least .1 volt maximum.

CATHODE-RAY OSCILLOSCOPE. Must have good frequency and phase response from 10 cycles to at least 2 MC.

SWEEP GENERATOR. Capable of covering 40 to 270 MC. with a 10 MC. sweep with output adjustable to at least .1 volt maximum.

3 VOLT "A" BATTERY to provide fixed bias during video I-F and R-F alignment.

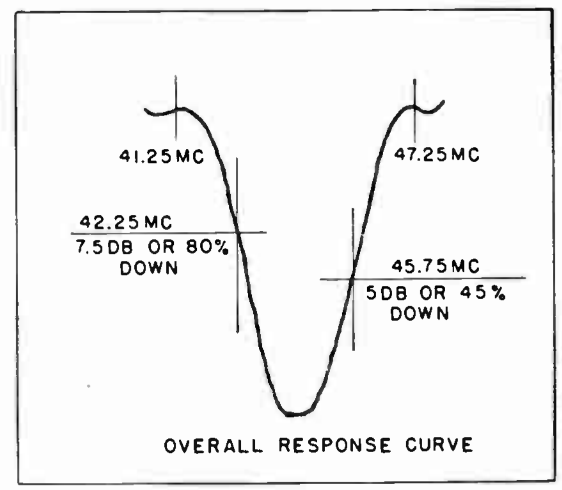


FIG. 2

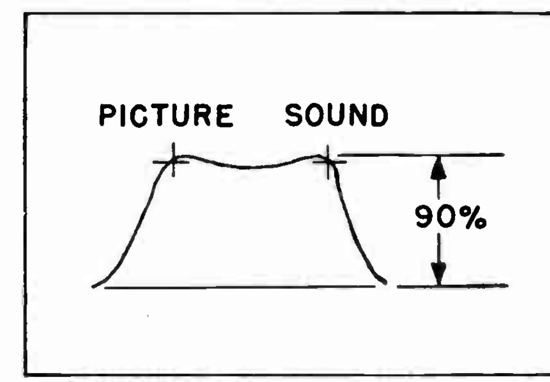

FIG. 3

VHF ALIGNMENT TABLE

RATIO DETECTOR AND SOUND ALIGNMENT

Step No.	Connect Signal Generator to	Sig. Gen. Freq.	Connect Voltmeter to	Miscellaneous Instructions	Adjust
1	In series with .001 Mfd. Cond. to junction of C-97 and L-13 terminal 3 of 4th I.F. See fig. 5	4.5 MC.	In series with 47,000 ohm res. across C-23 a 10 Mfd. cond. See fig. 5	Maintain reading on 10 volt scale contrast at maximum. Remove 3rd video IF tube 6CB6.	T-7 (top) and T-8 (bottom) for max. reading. See fig. 4 & 5
2	In series with .001 Mfd. Cond. to junction of C-97 and L-13 terminal 3 of 4th I.F. See fig. 5	4.5 MC.	In series with 47,000 ohm res. to junction of R-30 and C-44. See fig. 5	Maintain reading on 10 volt scale contrast at maximum. Remove 3rd video IF tube 6CB6.	T-8 (top) for zero reading. See fig. 4
3	In series with .001 Mfd. Cond. to cathode of picture tube yellow lead. See fig. 5	4.5 MC.	In series with 47,00 ohm res. across C-23 a 10 Mfd. cond. See fig. 5	Maintain reading on low volt scale. Remove 3rd video IF tube 6CB6.	T-6 (top) for minimum reading. See fig. 4

NOTE 1: For **minimum buzz** always adjust T-8 (top) with the sound carrier of a TV station.
NOTE 2: Alternate 4.5 MC. trap alignment: Adjust T-6 (top) for minimum 4.5 MC. beat on picture with a strong station signal.

PICTURE I-F ALIGNMENT

Step No.	Connect Signal Generator to	Sig. Gen. Freq.	Connect Voltmeter to	Miscellaneous Instructions	Adjust
4	Ungrounded converter tube (6J6) shield	44.0 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5	Tuner on channel 3, 3 volts bias across C-51 positive side to ground. Locality switch in strong position. See fig. 5	T-5 (top) for maximum reading. See fig. 4
5	Ungrounded converter tube (6J6) shield	43.0 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5	Tuner on channel 3, 3 volts bias across C-51 positive side to ground. Locality switch in strong position. See fig. 5	T-4 (top) for maximum reading. See fig. 4
6	Ungrounded converter tube (6J6) shield	41.25 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5	Tuner on channel 3, 3 volts bias across C-51 positive side to ground. Locality switch in strong position. See fig. 5 Repeat Steps 5 & 6	T-4 (bottom) for maximum reading. See fig. 5
7	Ungrounded converter tube (6J6) shield	45.4 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5	Tuner on channel 3, 3 volts bias across C-51 positive side to ground. Locality switch in strong position. See fig. 5	T-3 (top) for maximum reading. See fig. 4
8	Ungrounded converter tube (6J6) shield	47.25 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5	Tuner on channel 3, 3 volts bias across C-51 positive side to ground. Locality switch in strong position. See fig. 5 Repeat Steps 7 & 8	T-3 (bottom) for maximum reading. See fig. 5
9	Ungrounded converter tube (6J6) shield	44.6 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5	Tuner on channel 3, 3 volts bias across C-51 positive side to ground. Locality switch in strong position. See fig. 5 **NOTE:** Detune T-2 by turning slug out as far as possible.	T-1 (top) or minimum reading. See fig. 4
10	Ungrounded converter tube (6J6) shield	45.75MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5	Tuner on channel 3, 3 volts bias across C-51 positive side to ground. Locality switch in strong position. See fig. 5	T-2 (top) for minimum reading See fig. 4

NOTE 3: For visual check of IF response curve (see fig. 2) connect signal and sweep generator to ungrounded converter tube shield (6J6). Connect oscilloscope in series with 47,000 ohm resistor to junction of R-37 and L-7.

TUNER R.F. ALIGNMENT

NOTE 4: NEVER ADJUST C-3, C-7 and C-12 UNLESS ABSOLUTELY NECESSARY. THEY ARE FACTORY PRESET BY SPECIAL EQUIPMENT.

Step No.	Connect Marker Generator to	Marker Gen. Freq.	Connect Sweep Gen. to	Sweep Gen. Chan.	Connect Oscilloscope to	Miscellaneous Connections	Adjust
11	Loosely couple to sweep gen. leads.	205.25 MC. and 209.75 MC.	300 ohm antenna terminals.	12	Lead extending from top of tuner. See fig. 4	Tuner on channel 12 3 volt bias to junction of C-51 locality switch in strong position.	C-3, C7 and C-12 for max. response having linear peaks with picture and sound markers at 90% maximum response. See fig. 3
12	OBSERVE RESPONSE CURVE FOR ALL CHANNELS USING CORRECT FREQUENCIES AND CHANNELS. A SLIGHT COMPROMISE SHOULD BE MADE WITH C-3, C-7 and C-12 IF MARKERS ARE BELOW 70%.						

NOTE 5: FOR RF OSCILLATOR ALIGNMENT, SET FINE TUNING CONTROL IN CENTER POSITION. ADJUST INDIVIDUAL CHANNEL TRIMMERS FOR BEST PICTURE DETAIL WITH THE PATTERNS OF A TV STATION. NOTE: USE A NON-METALLIC SCREW-DRIVER.

NOTE 6: C-18 (See fig. 4) part of a 40 MC. tuned trap need only be adjusted when local interferences from 40 thru 45 MC. affect the picture. Adjust C-18 for minimum 40 MC. beat on picture with a station signal. Not used in Models with UHF Tuner.

TRIMMER LOCATION AND ALIGNMENT CONNECTION POINTS

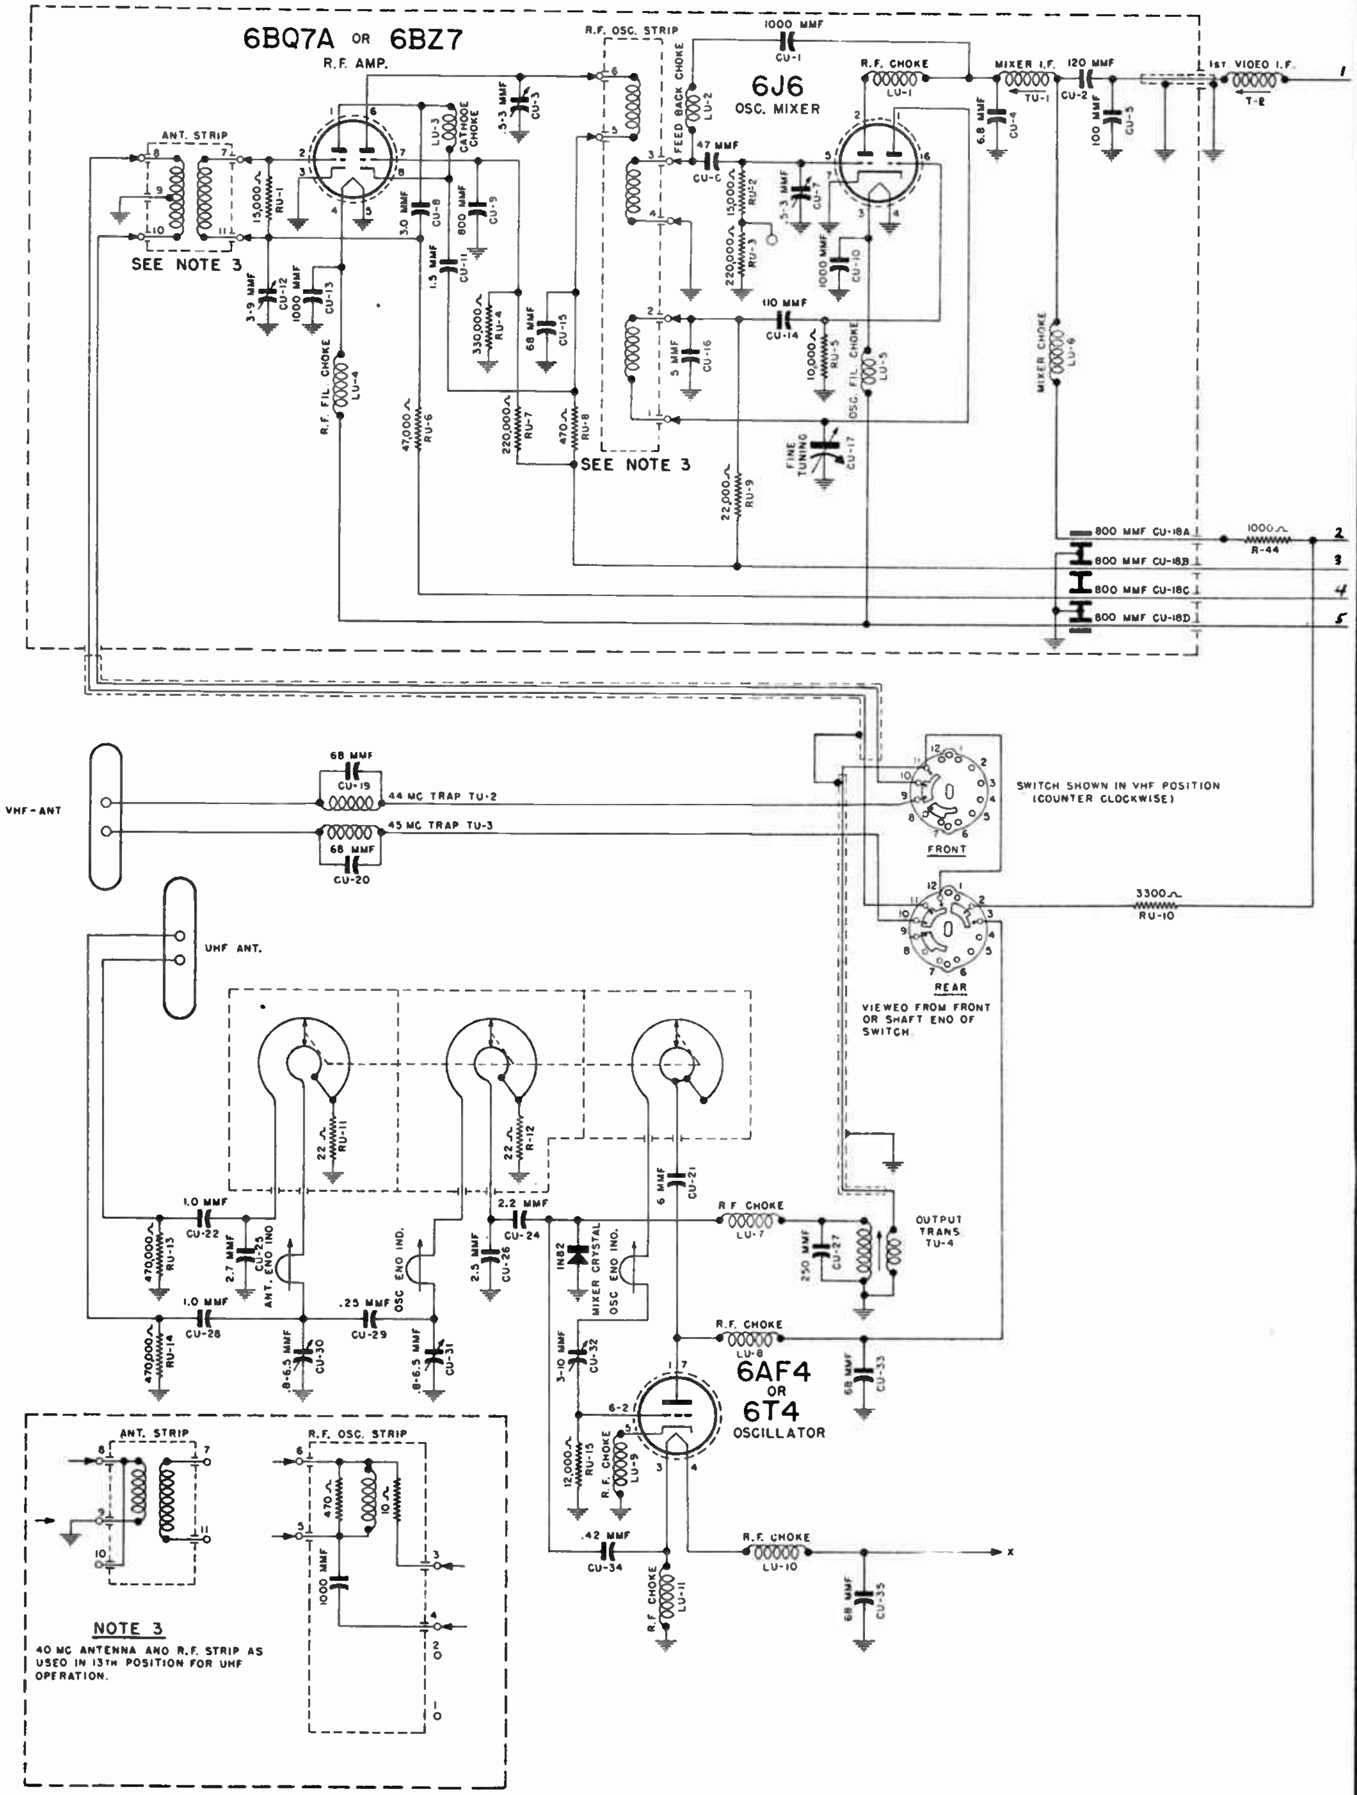
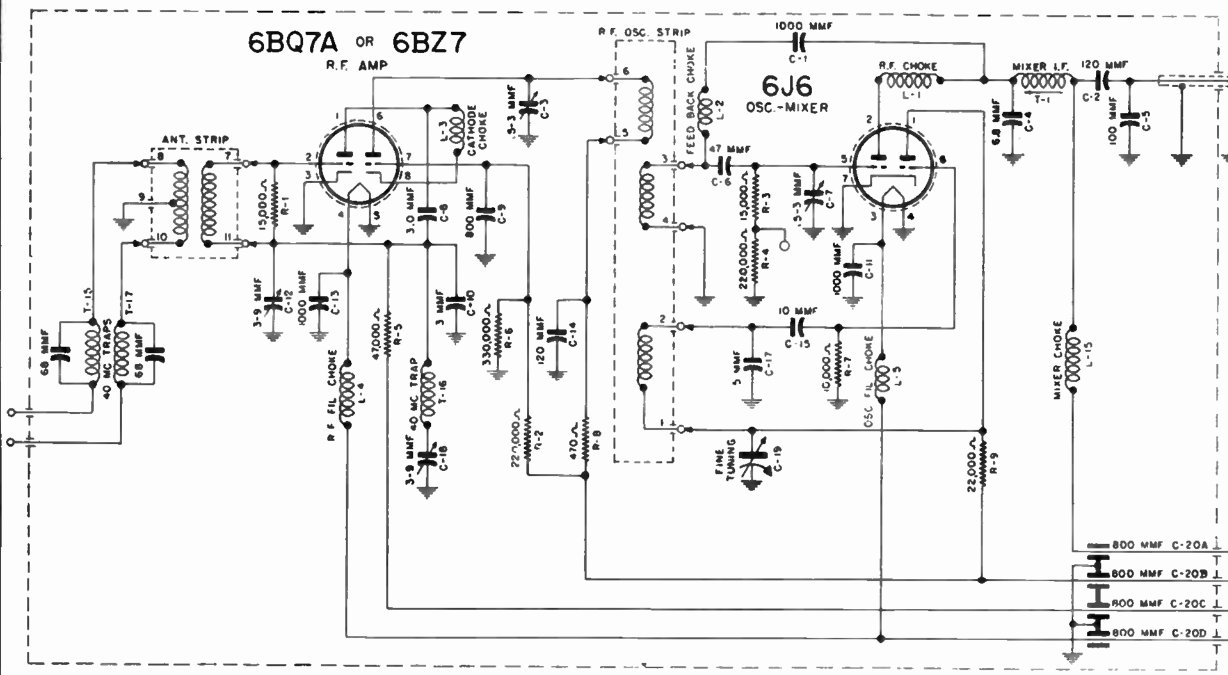
37E87	Knob, Channel Selector VHF For Models 552, 554	1.19
37E87-2	Knob, Channel Selector VHF for Blonde Cabinet Models 552, 554	1.30
37E88	Knob, Channel Selector UHF For Models 562, 564	.35
37E88-2	Knob, Channel Selector UHF for Blonde Cabinet Models 562, 564	.95

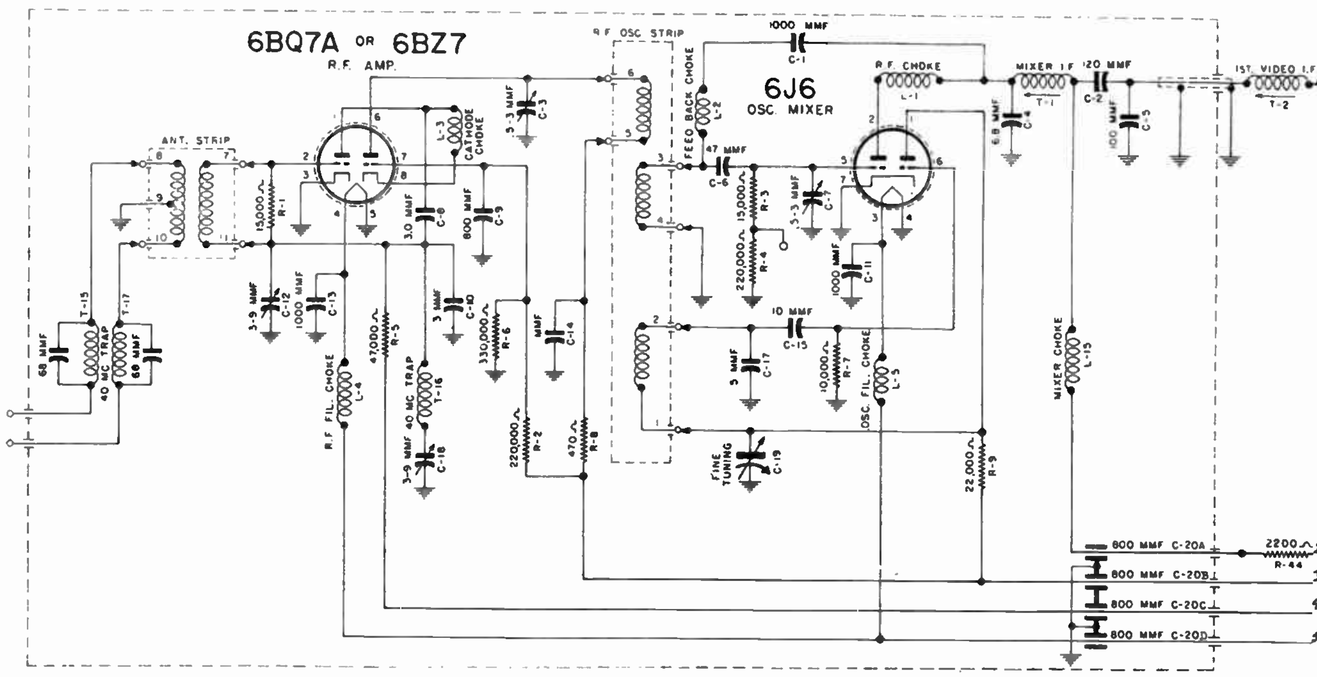
UHF CIRCUIT DIAGRAM FOR MODELS 520, 521, 522, 523, 525, 542, 562, 564

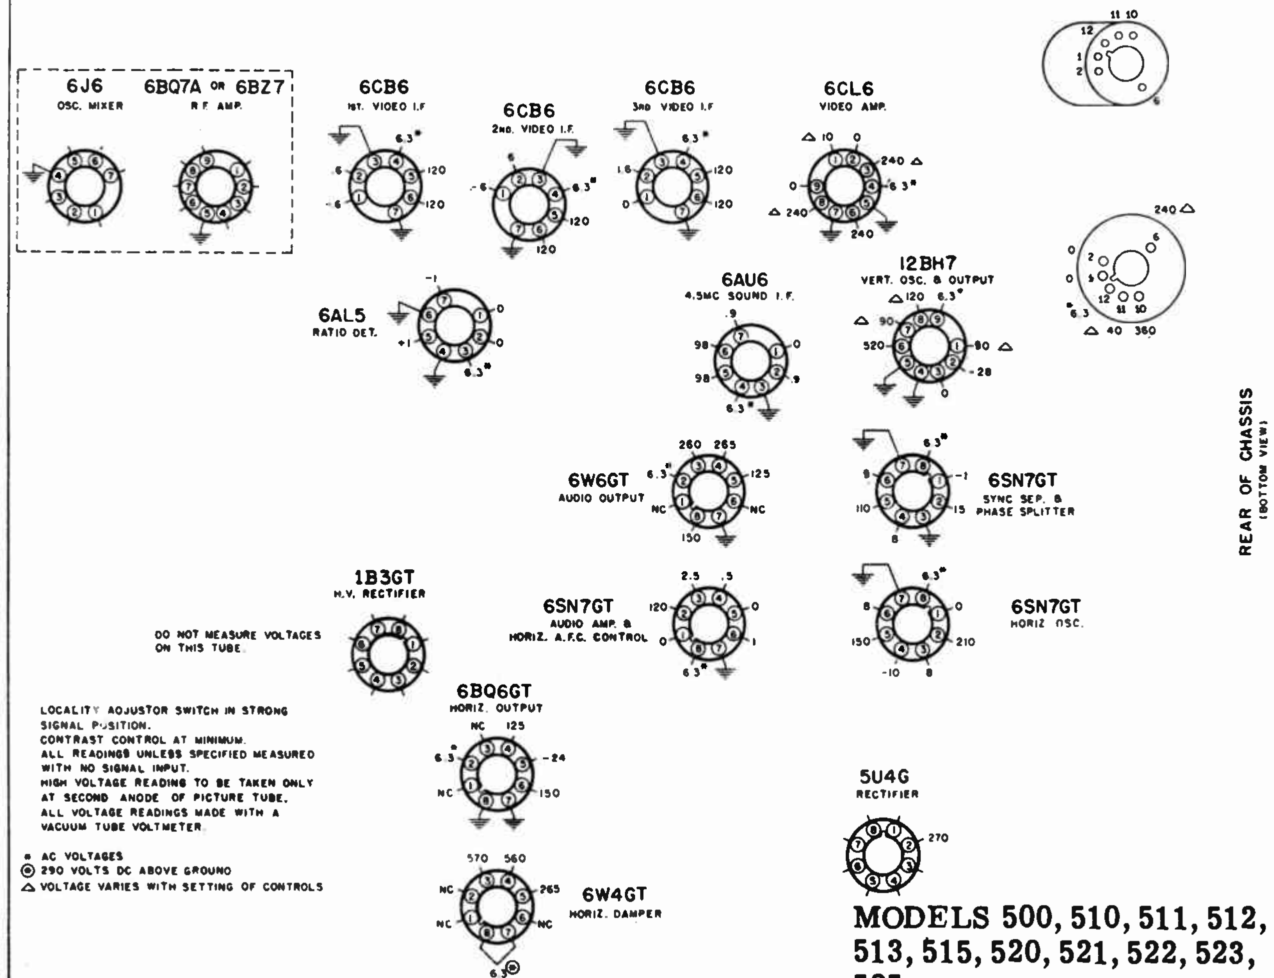


CIRCUIT DIAGRAM FOR MODELS 500, 510, 511, 512, 513, and 515.



CIRCUIT DIAGRAM FOR MODELS 532, 552 AND 554.

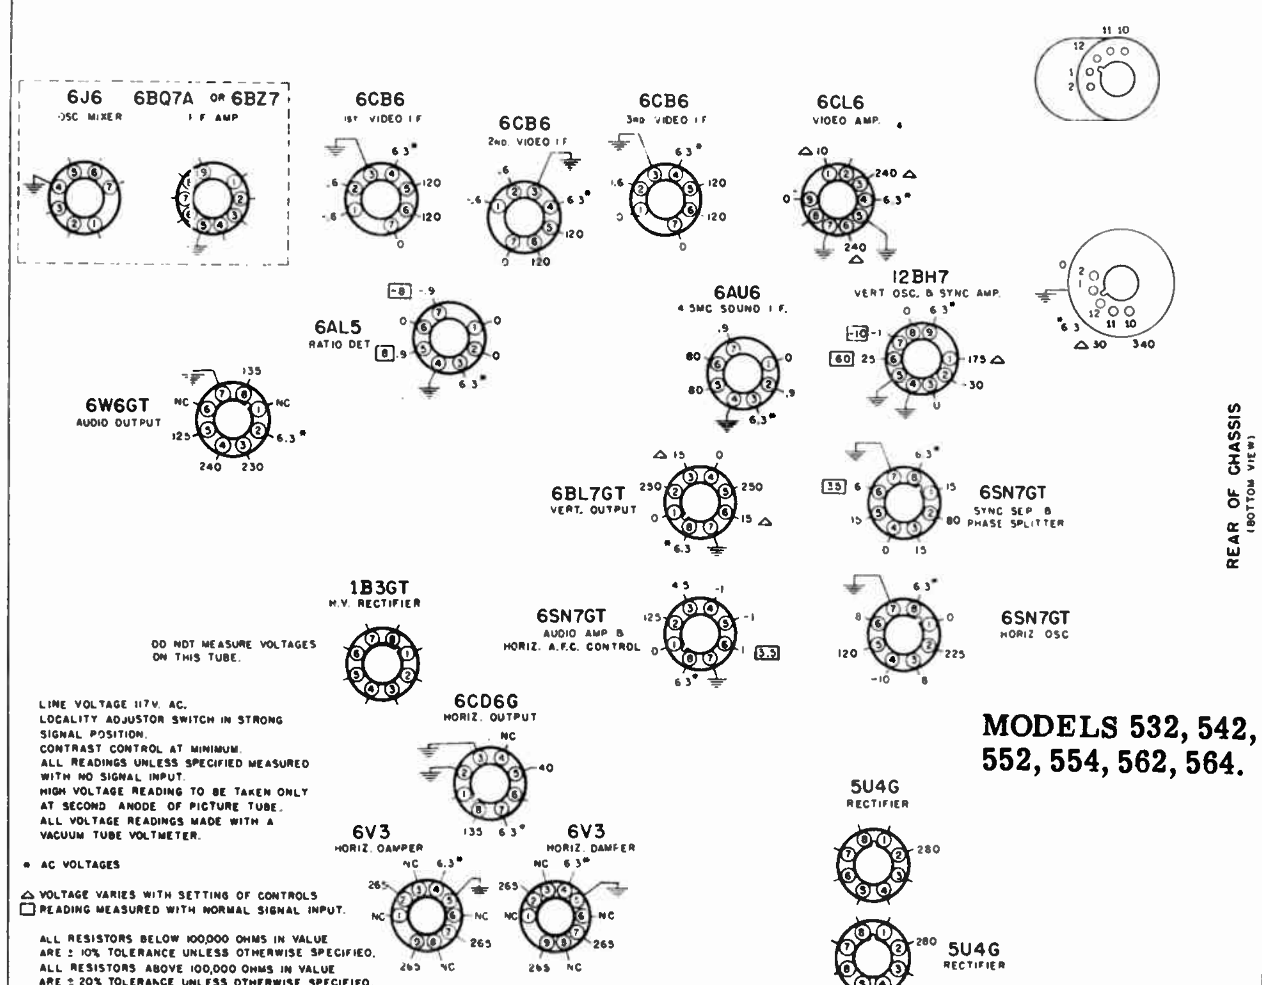




LOCALITY ADJUSTOR SWITCH IN STRONG SIGNAL POSITION.
CONTRAST CONTROL AT MINIMUM.
ALL READINGS UNLESS SPECIFIED MEASURED WITH NO SIGNAL INPUT.
HIGH VOLTAGE READING TO BE TAKEN ONLY AT SECOND ANODE OF PICTURE TUBE.
ALL VOLTAGE READINGS MADE WITH A VACUUM TUBE VOLTMETER.

* AC VOLTAGES
◎ 290 VOLTS DC ABOVE GROUND
△ VOLTAGE VARIES WITH SETTING OF CONTROLS

MODELS 500, 510, 511, 512, 513, 515, 520, 521, 522, 523, 525.

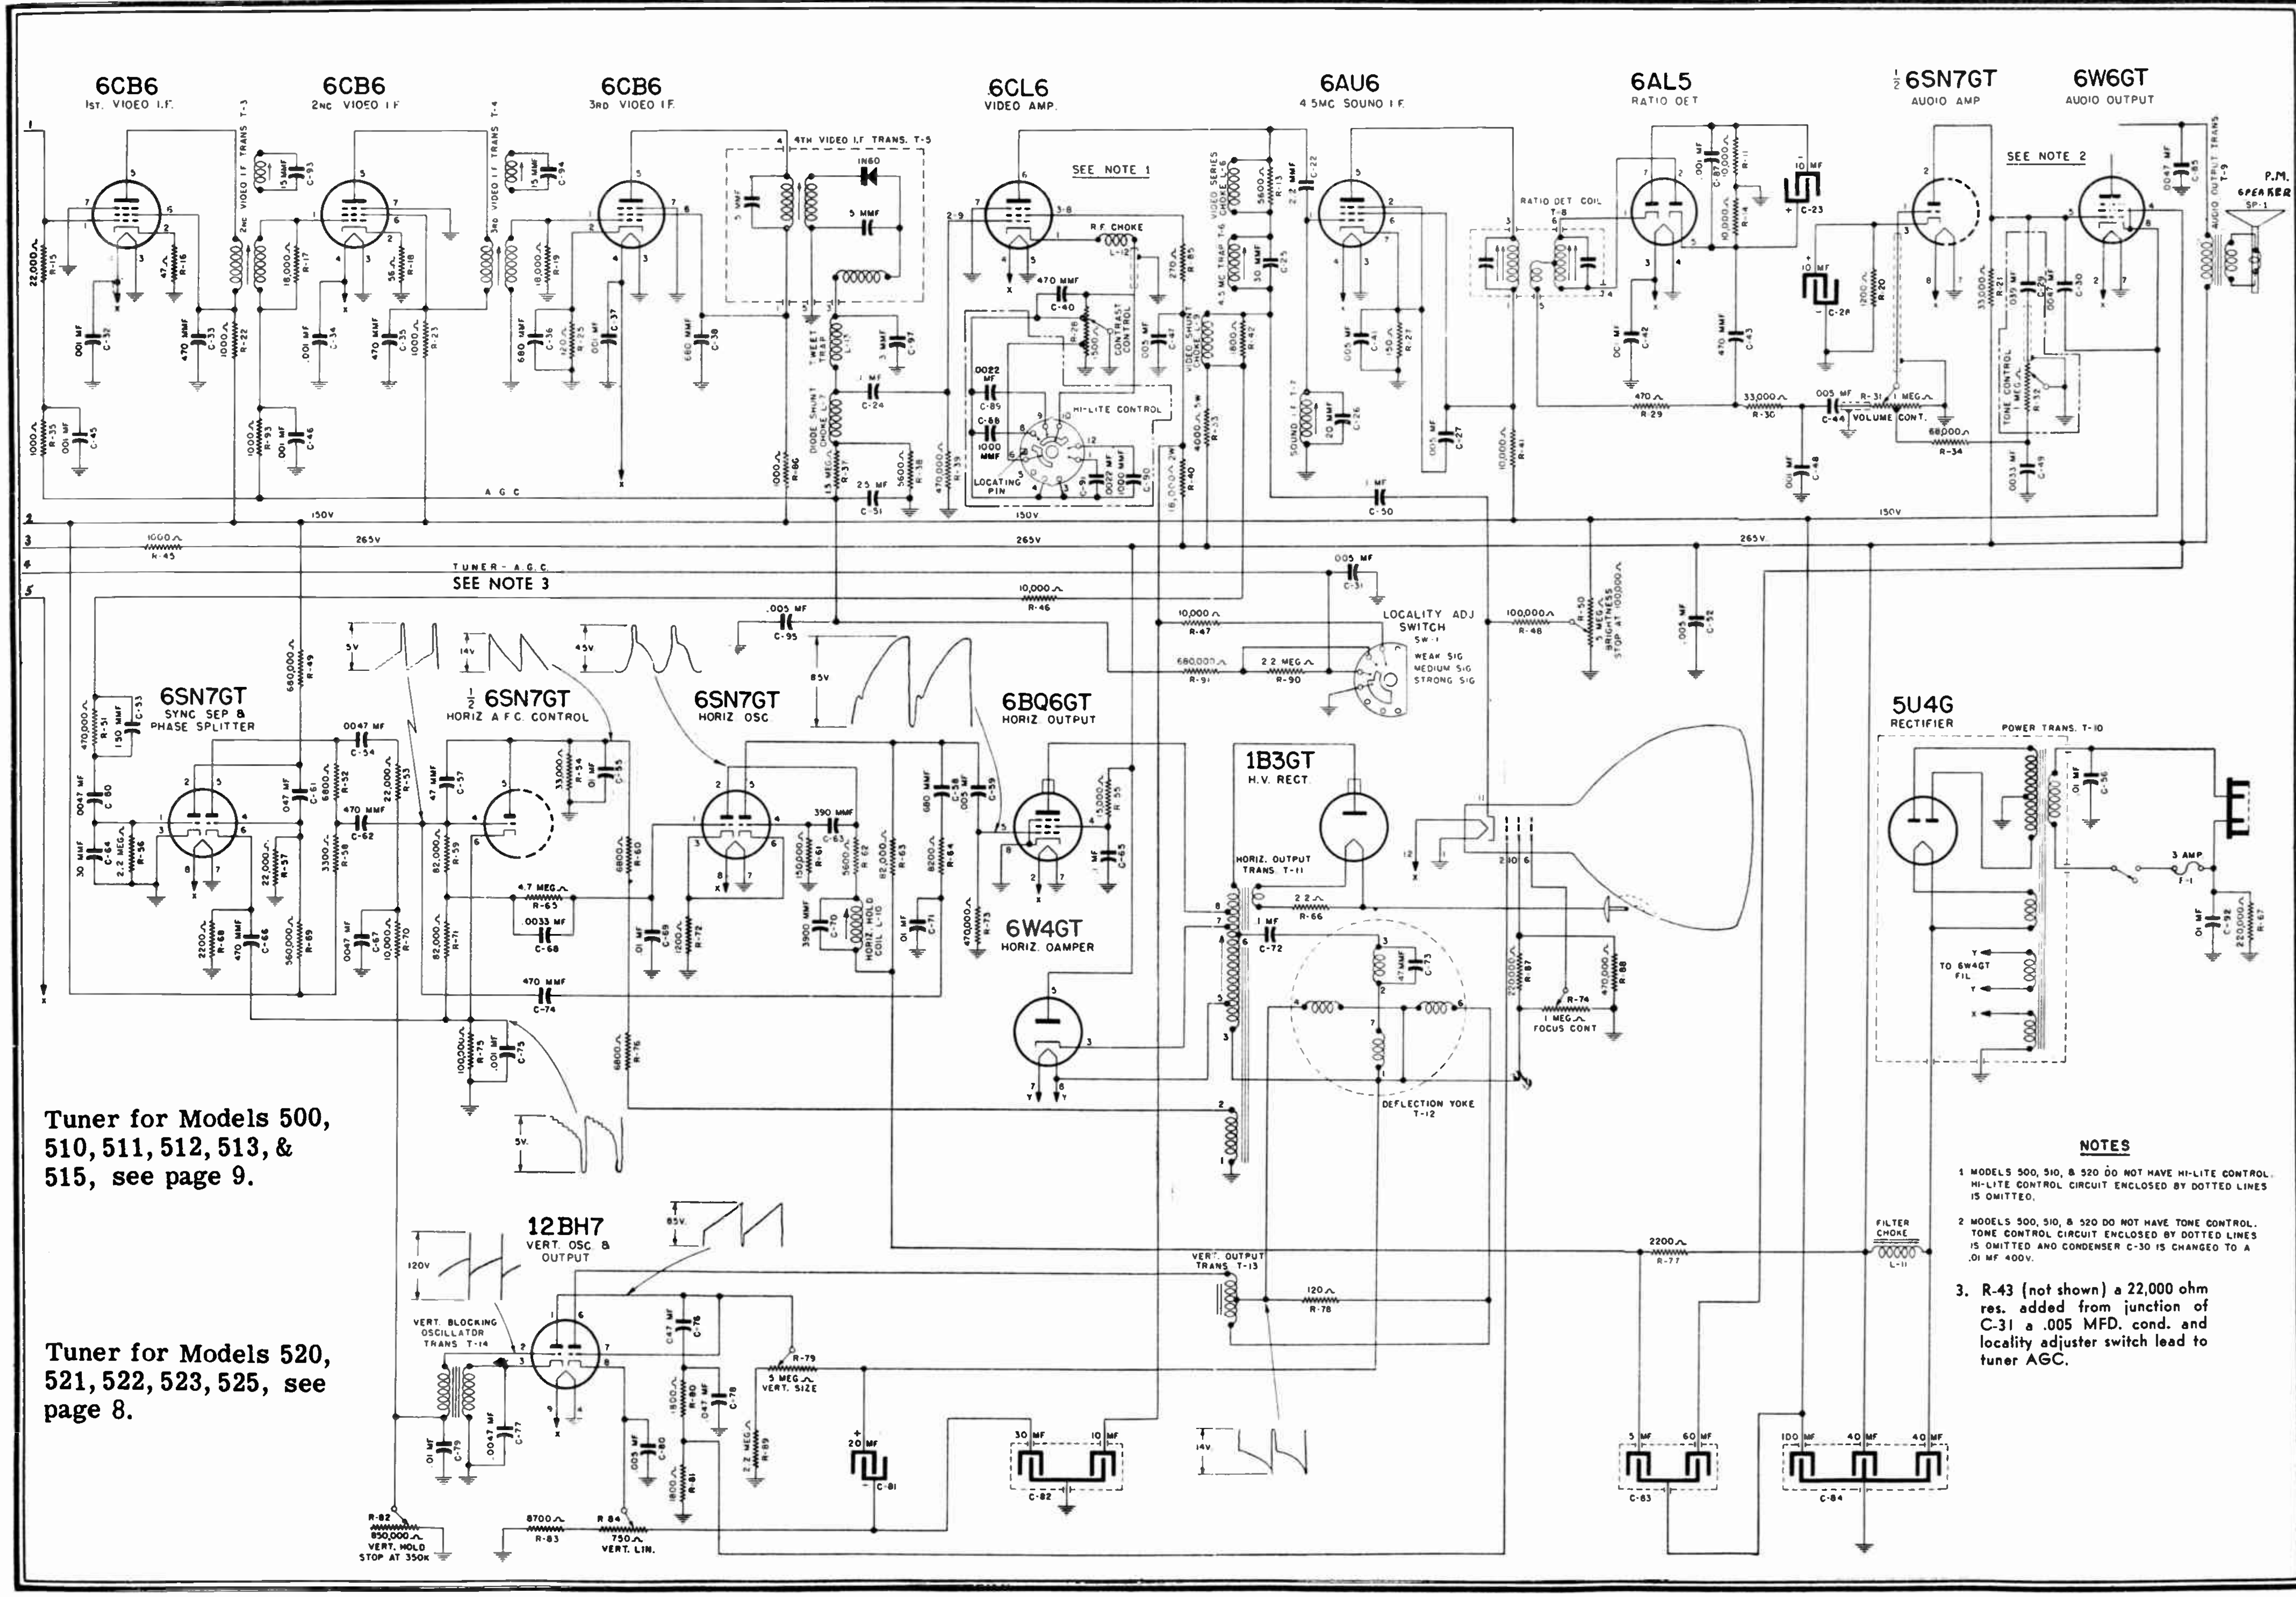


LINE VOLTAGE 117V. AC.
LOCALITY ADJUSTOR SWITCH IN STRONG SIGNAL POSITION.
CONTRAST CONTROL AT MINIMUM.
ALL READINGS UNLESS SPECIFIED MEASURED WITH NO SIGNAL INPUT.
HIGH VOLTAGE READING TO BE TAKEN ONLY AT SECOND ANODE OF PICTURE TUBE.
ALL VOLTAGE READINGS MADE WITH A VACUUM TUBE VOLTMETER.

* AC VOLTAGES
△ VOLTAGE VARIES WITH SETTING OF CONTROLS
□ READING MEASURED WITH NORMAL SIGNAL INPUT.

ALL RESISTORS BELOW 100,000 OHMS IN VALUE ARE ± 10% TOLERANCE UNLESS OTHERWISE SPECIFIED.
ALL RESISTORS ABOVE 100,000 OHMS IN VALUE ARE ± 20% TOLERANCE UNLESS OTHERWISE SPECIFIED.

MODELS 532, 542, 552, 554, 562, 564.

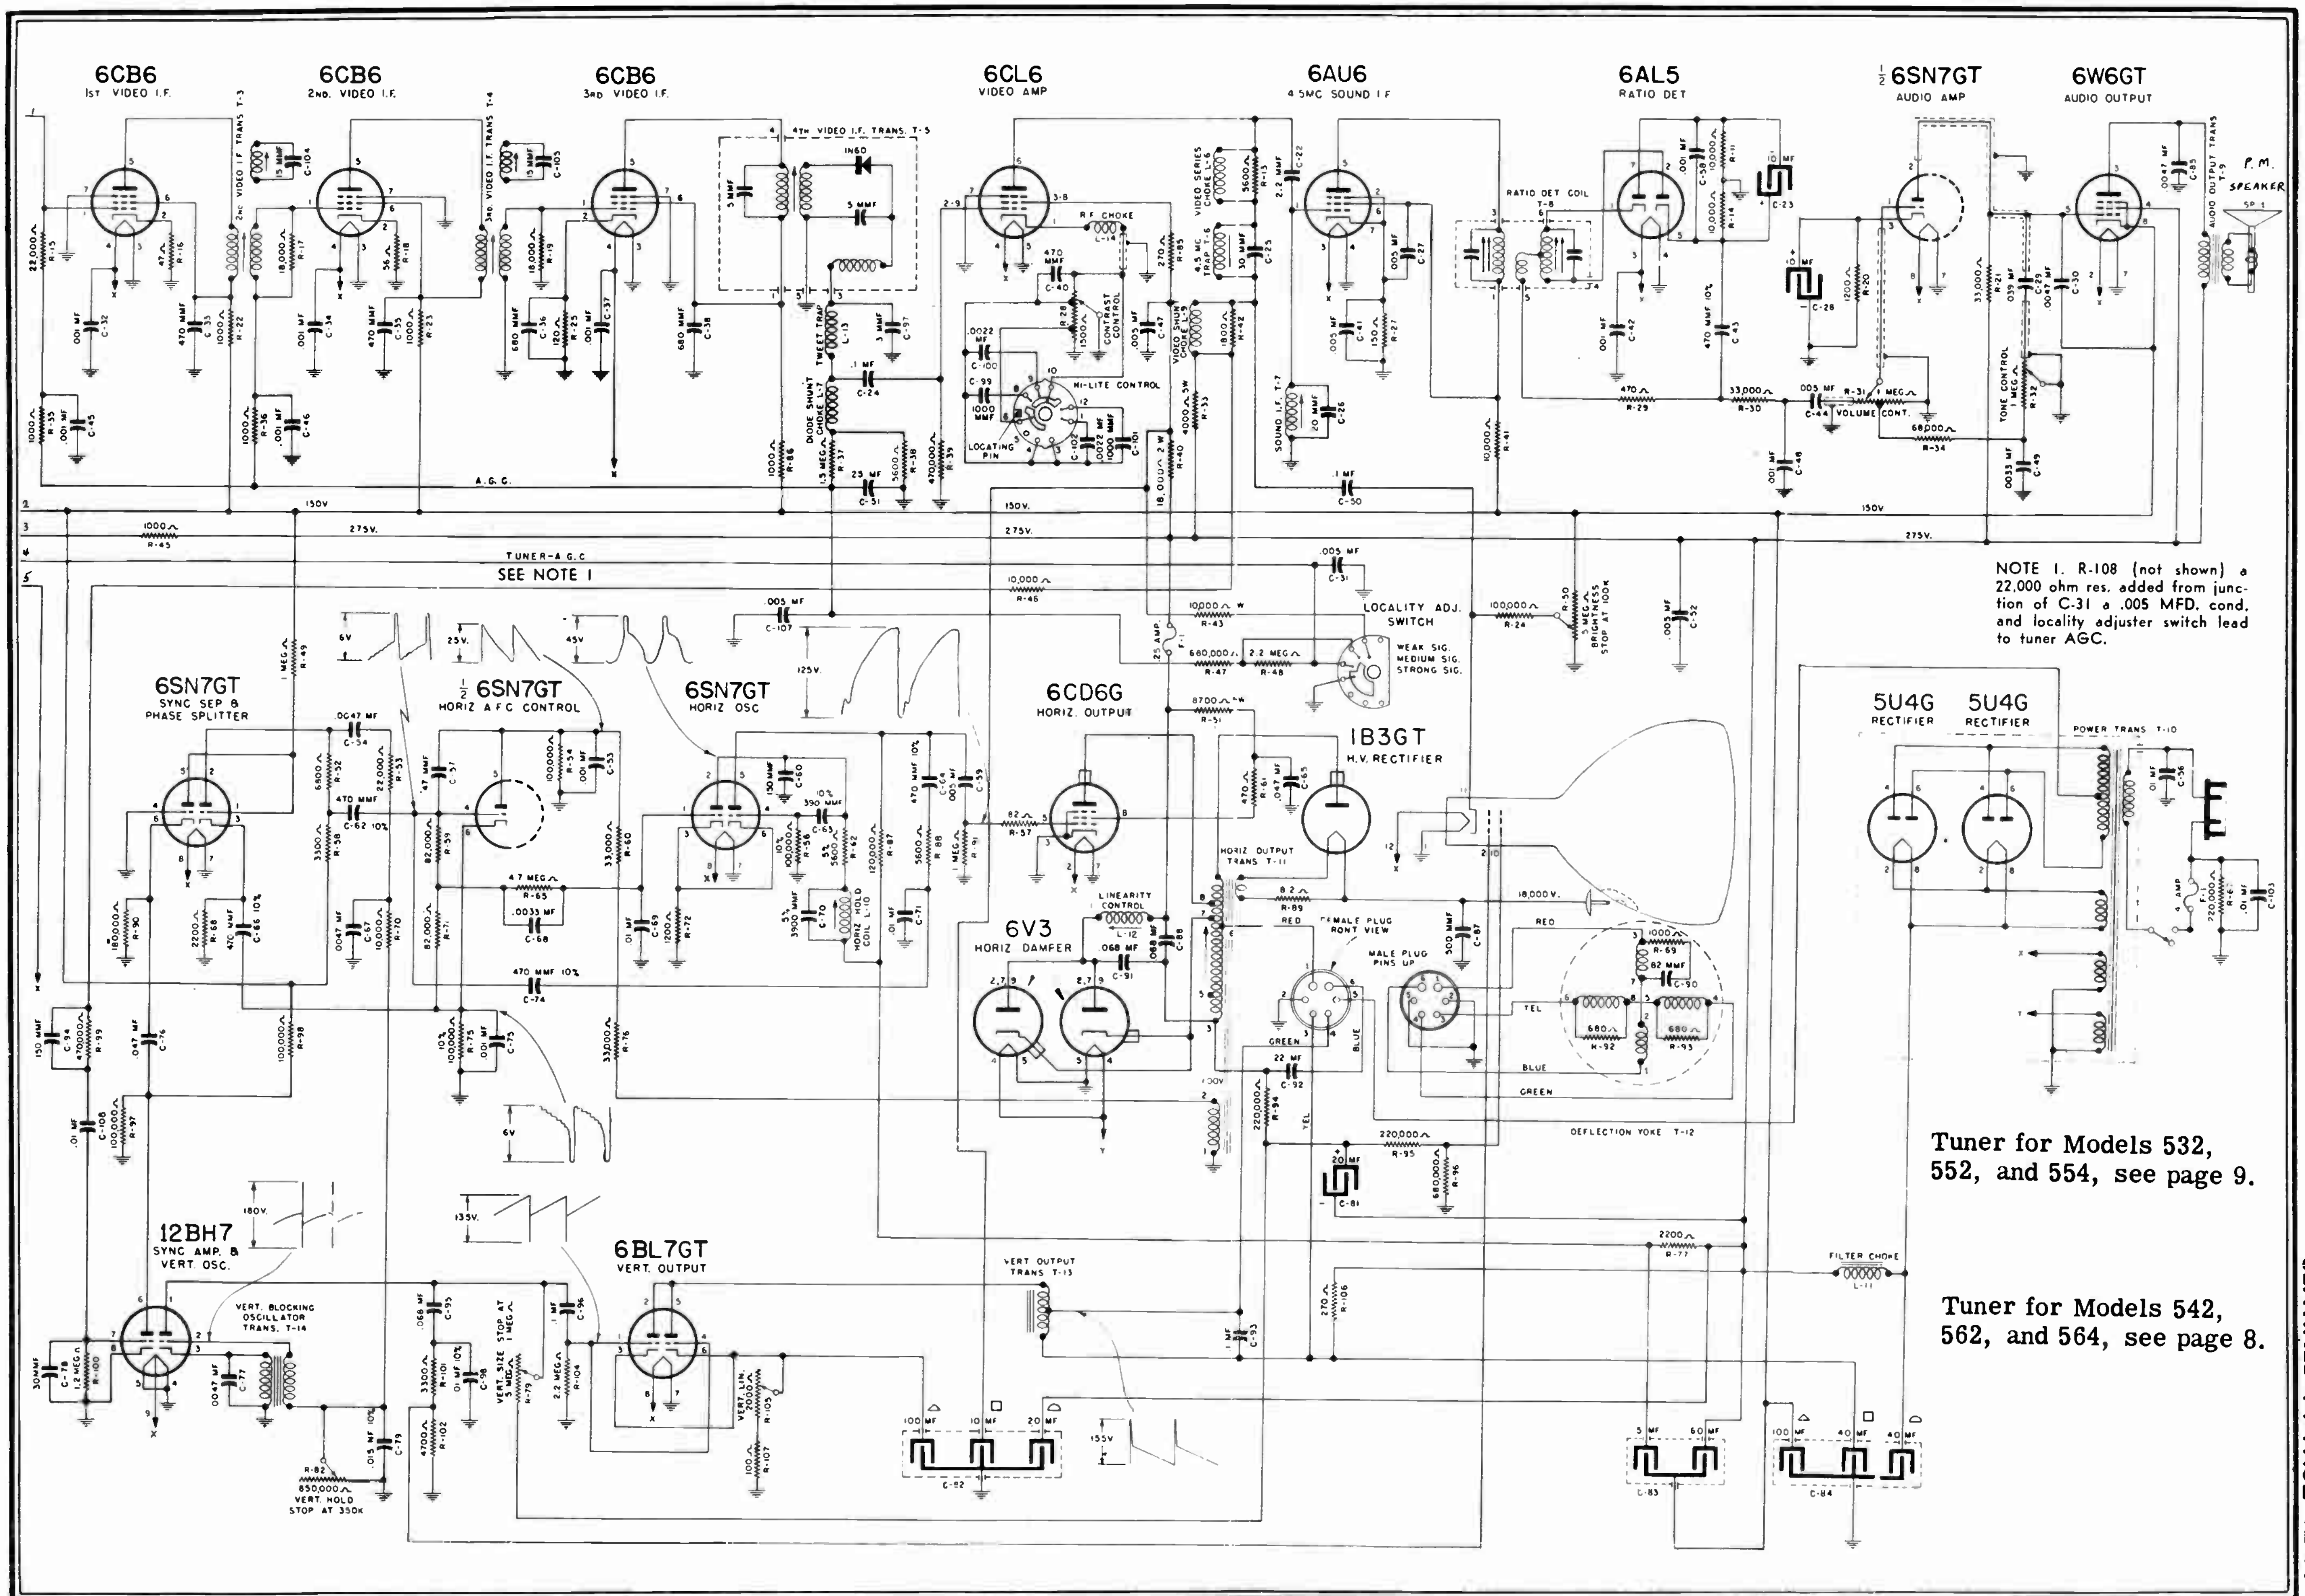


Tuner for Models 500, 510, 511, 512, 513, & 515, see page 9.

Tuner for Models 520, 521, 522, 523, 525, see page 8.

NOTES

1. MODELS 500, 510, & 520 DO NOT HAVE HI-LITE CONTROL. HI-LITE CONTROL CIRCUIT ENCLOSED BY DOTTED LINES IS OMITTED.
2. MODELS 500, 510, & 520 DO NOT HAVE TONE CONTROL. TONE CONTROL CIRCUIT ENCLOSED BY DOTTED LINES IS OMITTED AND CONDENSER C-30 IS CHANGED TO A .01 MF 400V.
3. R-43 (not shown) a 22,000 ohm res. added from junction of C-31 a .005 MFD. cond. and locality adjuster switch lead to tuner AGC.



NOTE 1. R-108 (not shown) a 22,000 ohm res. added from junction of C-31 a .005 MFD. cond. and locality adjuster switch lead to tuner AGC.

Tuner for Models 532, 552, and 554, see page 9.

Tuner for Models 542, 562, and 564, see page 8.

TUBE COMPLEMENT

6BQ7 or 6BZ7	R.F. AMPLIFIER
6J6	OSCILLATOR, MODULATOR
6CB6	VIDEO I.F. AMPLIFIER
6AH6	VIDEO AMPLIFIER
6AU6	SOUND I.F. AMPLIFIER
6AL5	RATIO DETECTOR
6SN7GT	A.F. AMPLIFIER, HORIZONTAL AFC CONTROL
6W6GT	AUDIO OUTPUT
6SN7GT	SYNC SEPARATOR, PHASE SPLITTER
6SN7GT	HORIZONTAL OSCILLATOR
1B3GT	HIGH VOLTAGE RECTIFIER
6CD6G	HORIZONTAL OUTPUT
6V3	HORIZONTAL DAMPERS
12BH7	VERTICAL OSCILLATOR, SYNC AMPLIFIER
6BL7GT	VERTICAL AMPLIFIER
5U4G	POWER RECTIFIERS
27EP4A	27" PICTURE TUBES

ELECTRICAL SPECIFICATIONS

Power Supply	110 to 120 Volts 60 Cycle AC
Power Consumption	250 Watts
Power Output	Undistorted 2.2 Watts Maximum 4.0 Watts
Antenna Input Imp.	300 Ohms Balanced
Tuning Range	12 Channel
Loud Speaker	12" P.M.
Voice Coil Impedance	3.2 Ohm at 400 Cycles
I.F. CIRCUIT	Inter-Carrier Sound
R.F. STAGE	One
I.F. STAGES	Three "Combined Picture and Sound" and one "Sound" 21.9 M.C. Sound Carrier 26.4 M.C. Video Carrier 4.5 M.C. Sound

These Television receivers are equipped with the very latest type of CASCODE TUNER (with duo-matic control) which makes them instantly adjustable to any UHF channel.

Merely remove the small snap out strips from any VHF channel which is not operating in your locality and replace them with the proper small UHF snap-in strips designed for the UHF channel broadcasting in your area.

See parts list for information on ordering the correct UHF channel strips.

PICTURE TUBE HANDLING PRECAUTIONS

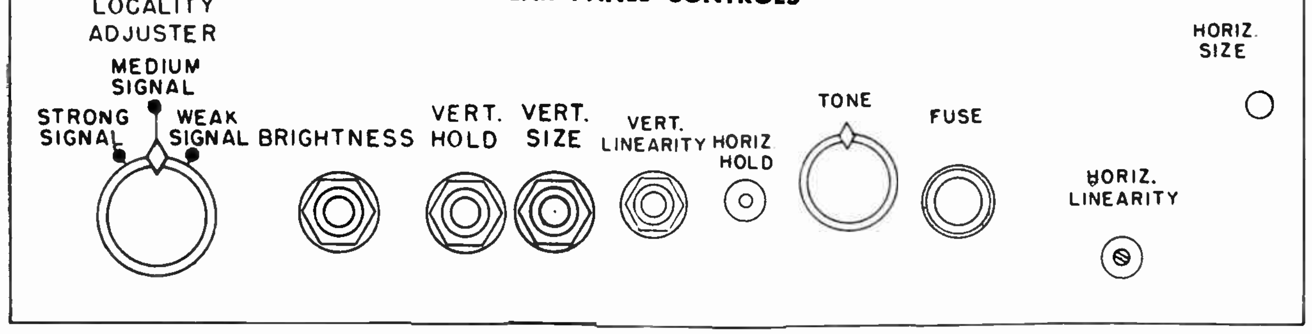
EXTREME CARE MUST BE EXERCISED WHEN HANDLING OR SERVICING THE PICTURE TUBE. ACCIDENTS ARE ONLY CAUSED BY CARELESSNESS.

Listed below are precautions which must be taken when removing the picture tube.

1. To remove the picture tube mounting assembly.
   (a) Disconnect the second anode lead, the picture tube socket assembly, and the deflection yoke plug.
   (b) Remove the main chassis and the two picture tube support braces.
   (c) Remove the wood screws holding the picture tube mounting board assembly to the cabinet.
   (d) Slide picture tube assembly out. Because of its size and weight two persons are required to handle this assembly. The balance or center of weight is at the face of the picture tube.
2. Always wear goggles when handling picture tube.
3. Never hold the picture tube close to the body.
4. Never handle the picture tube by its neck.
5. Never bump or scratch the picture tube.
6. Always clean the neck of the picture tube before adjusting the ion trap.
7. If it becomes necessary to remove the picture tube from its mounting board, always place on a clean soft cloth face down.

SM-1004

REAR PANEL CONTROLS



HIGH VOLTAGE AND CORONA

WARNING: HIGH VOLTAGE DEVELOPED IN THIS RECEIVER IS IN EXCESS OF 18,000 VOLTS.

Increased high voltage not only presents the problem of safety precautions, it also increases the problems of arcing and corona.

When servicing or replacing any part of the high voltage compartment of this receiver the following precautions and suggestions should be followed.

1. All connections to the high voltage transformer, condenser, and socket terminal should be made mechanically tight and all excessive wire clipped off, leaving no sharp points from these terminals.
2. A clean, round and smooth solder connection should be made, covering all sharp points. (Do not use excessive solder.)
3. All lead dresses in the high voltage compartment are critical.
   B+ leads or leads of ground or near ground potential too close to any high voltage leads will cause corona and/or arcing to the extent it may cause the insulation of the wires to burn.
4. All insulating wax when removed around the high voltage socket and condenser must be replaced. Insulating wax may be procured through the Sentinel Service Department.
5. Repairing high voltage transformers is not recommended. Always replace the defective transformer with a new one.
6. Before replacing the high voltage shield cover make a careful inspection of wire dress, soldered connections, and wax insulated parts.

GENERAL INSTALLATION INSTRUCTIONS

While each receiver is correctly aligned at the factory rough handling in transit, ageing, drift, etc., may throw the receiver off, so we suggest that the proper oscillator trimmers, ratio detector, and rear panel controls be checked for correct adjustment with a transmitted television pattern, in the customer's home at the time of installation. Be sure to have the receiver operating for one-half hour before making these adjustments. Listed below is the correct procedure to follow in making these adjustments.

(A) Check all operating channels, using FINE TUNING CONTROL for best picture detail. (See paragraph PEAKING THE INDIVIDUAL OSCILLATOR TRIMMERS.)

(B) Check LOCALITY ADJUSTER CONTROL located on back of chassis for proper setting.
NOTE: The signal strength (too strong or too weak) will be affected by location and distance from the station, type of antenna used, terrain obstructions such as tall buildings, electrical disturbances.

PEAKING THE INDIVIDUAL OSCILLATOR TRIMMERS

(A) Set channel selector knob to the desired channel.

(B) Set the FINE TUNING CONTROL to the center position.

(C) Remove the channel and fine tuning knobs. This will expose the individual channel adjustment screw opening just to right of the channel shaft. See Fig. 1.

(D) Use a non-metallic screwdriver such as polystyrene or nylon.

Adjust the individual oscillator screw for best picture detail. A slight adjustment in either direction is all that is necessary. CAUTION: DO NOT ADJUST INDISCRIMINATELY, this may cause the adjustment screw to fall from its locking position.

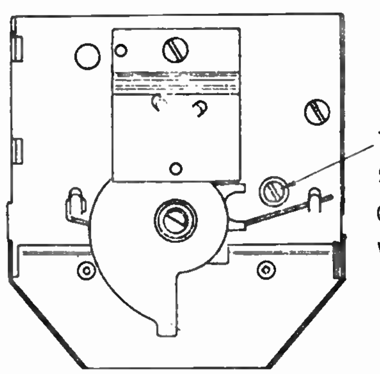


FIG. 1

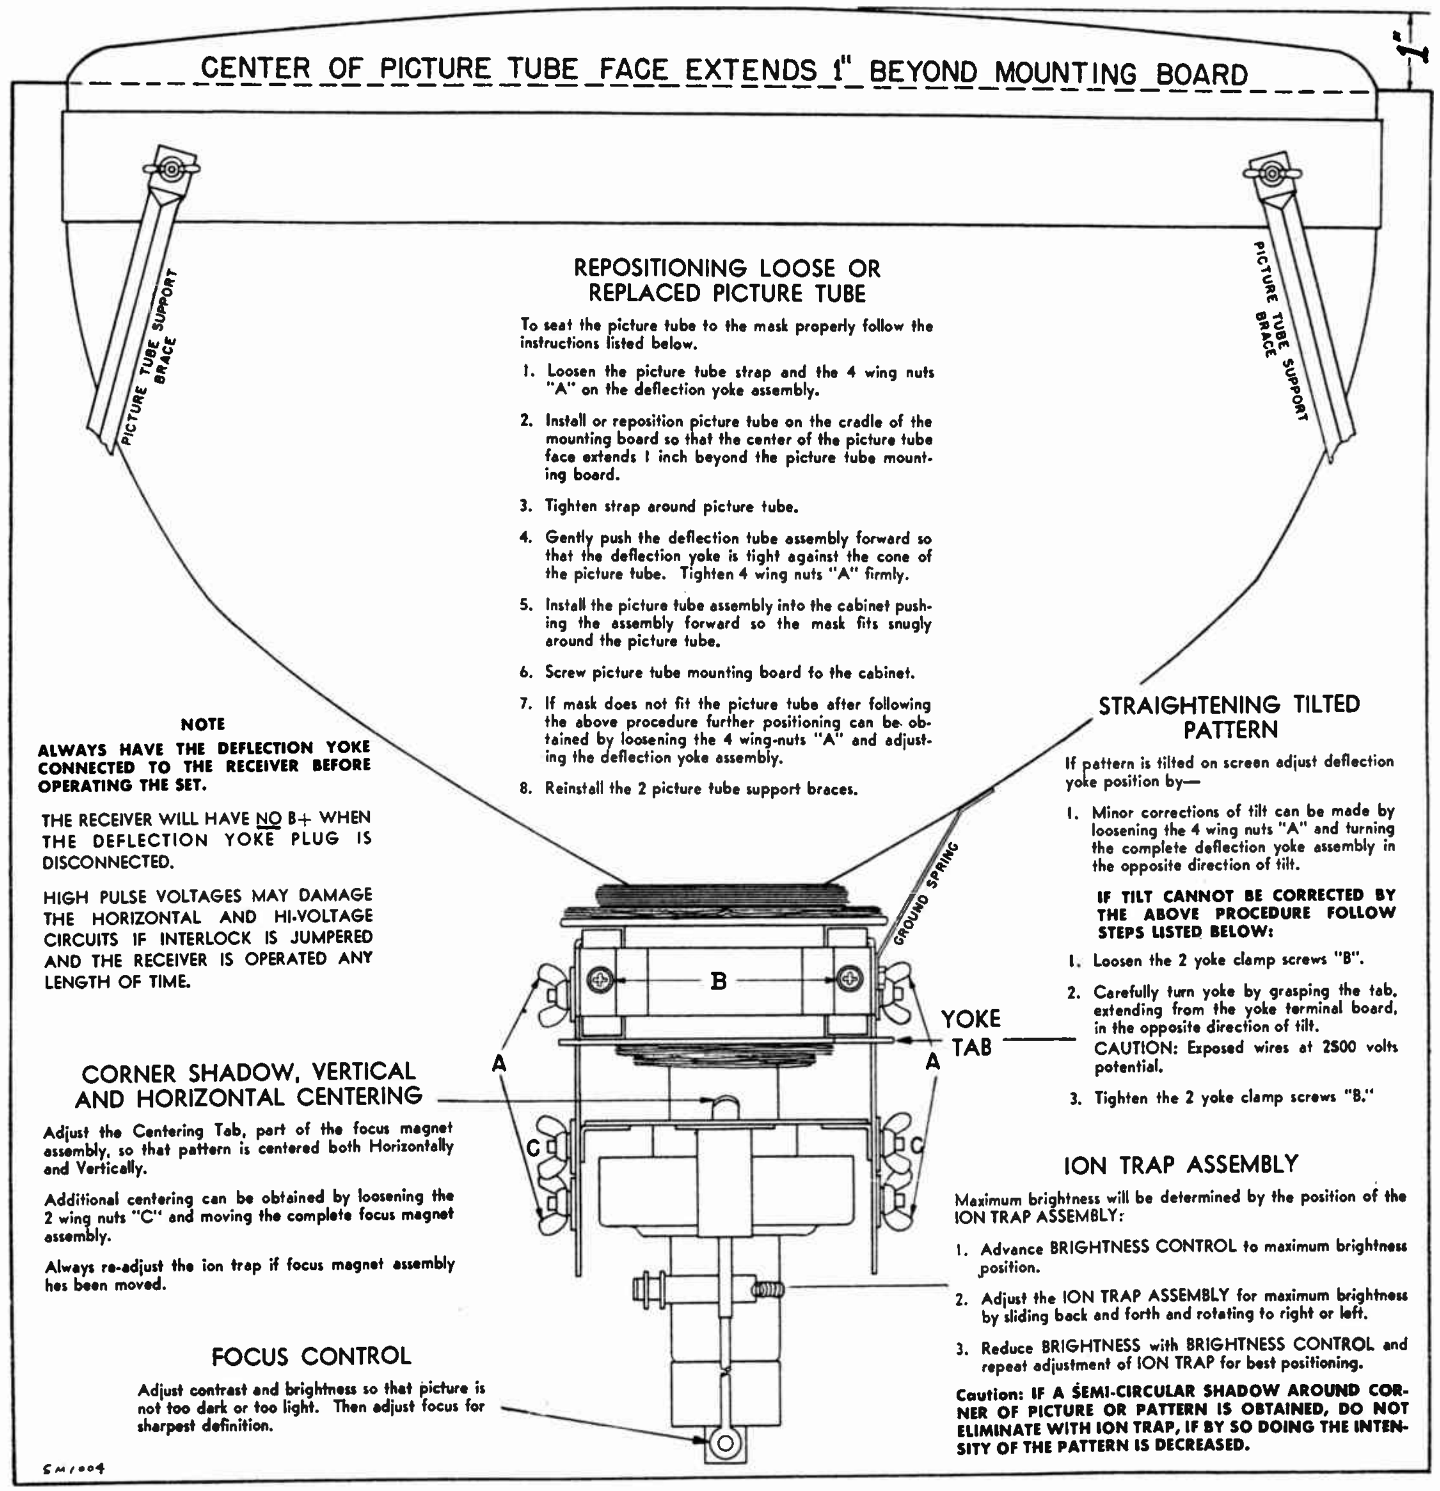
ADJUSTMENT FOR STATION BUZZ

If station buzz is excessive and is NOT DUE to "contrast control" being advanced too far in a clockwise direction or the locality adjuster control in the incorrect position, adjust the ratio detector secondary adjustment screw located on top of the ratio detector for minimum buzz. MAKE SURE THAT THIS POSITION IS BETWEEN the two MAXIMUM buzz peaks that will be noticed when adjustment screw is turned to the right or left of the minimum buzz position.

ADJUSTMENT PROCEDURE FOR FOCUS, DEFLECTION YOKE, ION TRAP, HORIZONTAL AND VERTICAL CENTERING, CORNER SHADOW, AND PICTURE TUBE ALIGNMENT.



REPOSITIONING LOOSE OR REPLACED PICTURE TUBE

To seat the picture tube to the mask properly follow the instructions listed below.

1. Loosen the picture tube strap and the 4 wing nuts "A" on the deflection yoke assembly.
2. Install or reposition picture tube on the cradle of the mounting board so that the center of the picture tube face extends 1 inch beyond the picture tube mounting board.
3. Tighten strap around picture tube.
4. Gently push the deflection tube assembly forward so that the deflection yoke is tight against the cone of the picture tube. Tighten 4 wing nuts "A" firmly.
5. Install the picture tube assembly into the cabinet pushing the assembly forward so the mask fits snugly around the picture tube.
6. Screw picture tube mounting board to the cabinet.
7. If mask does not fit the picture tube after following the above procedure further positioning can be obtained by loosening the 4 wing-nuts "A" and adjusting the deflection yoke assembly.
8. Reinstall the 2 picture tube support braces.

NOTE

ALWAYS HAVE THE DEFLECTION YOKE CONNECTED TO THE RECEIVER BEFORE OPERATING THE SET.

THE RECEIVER WILL HAVE NO B+ WHEN THE DEFLECTION YOKE PLUG IS DISCONNECTED.

HIGH PULSE VOLTAGES MAY DAMAGE THE HORIZONTAL AND HI-VOLTAGE CIRCUITS IF INTERLOCK IS JUMPERED AND THE RECEIVER IS OPERATED ANY LENGTH OF TIME.

STRAIGHTENING TILTED PATTERN

If pattern is tilted on screen adjust deflection yoke position by—

1. Minor corrections of tilt can be made by loosening the 4 wing nuts "A" and turning the complete deflection yoke assembly in the opposite direction of tilt.

IF TILT CANNOT BE CORRECTED BY THE ABOVE PROCEDURE FOLLOW STEPS LISTED BELOW:

1. Loosen the 2 yoke clamp screws "B".
2. Carefully turn yoke by grasping the tab, extending from the yoke terminal board, in the opposite direction of tilt.
CAUTION: Exposed wires at 2500 volts potential.
3. Tighten the 2 yoke clamp screws "B."

CORNER SHADOW, VERTICAL AND HORIZONTAL CENTERING

Adjust the Centering Tab, part of the focus magnet assembly, so that pattern is centered both Horizontally and Vertically.

Additional centering can be obtained by loosening the 2 wing nuts "C" and moving the complete focus magnet assembly.

Always re-adjust the ion trap if focus magnet assembly has been moved.

ION TRAP ASSEMBLY

Maximum brightness will be determined by the position of the ION TRAP ASSEMBLY:

1. Advance BRIGHTNESS CONTROL to maximum brightness position.
2. Adjust the ION TRAP ASSEMBLY for maximum brightness by sliding back and forth and rotating to right or left.
3. Reduce BRIGHTNESS with BRIGHTNESS CONTROL and repeat adjustment of ION TRAP for best positioning.

Caution: IF A SEMI-CIRCULAR SHADOW AROUND CORNER OF PICTURE OR PATTERN IS OBTAINED, DO NOT ELIMINATE WITH ION TRAP, IF BY SO DOING THE INTENSITY OF THE PATTERN IS DECREASED.

FOCUS CONTROL

Adjust contrast and brightness so that picture is not too dark or too light. Then adjust focus for sharpest definition.

ADJUSTMENTS FOR CORNER SHADOW, VERTICAL AND HORIZONTAL CENTERING CAN BE MADE WITHOUT REMOVING THE CABINET BACK. THE CENTERING TAB CAN BE REACHED BY REMOVING THE 4 SCREWS HOLDING CUP TO THE CABINET BACK.

ALIGNMENT DATA

ALIGNMENT PROCEDURE

All circuits are very stable and will seldom require adjustment. Only when major parts of the tuner or the video I-F strip have been replaced or tampered with will it be necessary to realign the receiver.

Generally under normal conditions only the INDIVIDUAL CHANNEL TRIMMERS in the tuner unit may require adjustment by the service technician.

RATIO DETECTOR AND SOUND I-F ALIGNMENT

In most cases only the secondary of the ratio detector coil will require adjustment. This can be done simply by adjusting the top adjustment screw of the ratio detector for minimum buzz with the sound carrier of a TV station. For complete alignment use steps 1, 2, and 3 in the alignment table.

PICTURE I-F ALIGNMENT

Receiver should be run for at least ½ hour before proceeding with alignment.

EQUIPMENT REQUIRED

VACUUM TUBE VOLTMETER

SIGNAL GENERATOR supplying a 4.5 MC. (within .25%) 20 to 30 MC. and 50 to 216 MC. (within 1%) signal. With output adjustable to at least .1 volt maximum.

CATHODE-RAY OSCILLOSCOPE. Must have good frequency and phase response from 10 cycles to at least 2 MC.

SWEEP GENERATOR. Capable of covering 20 to 30 MC. and 40 to 270 MC. with a 10 MC. sweep with output adjustable to at least .1 volt maximum.

3 VOLT "A" BATTERY to provide fixed bias during video I-F and R-F alignment.

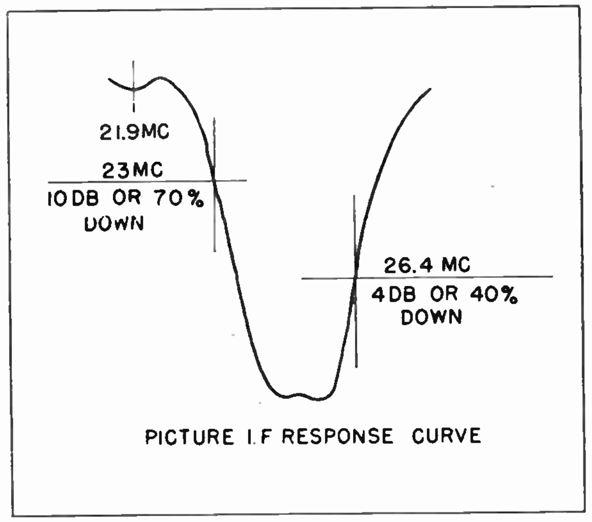


FIG. 2

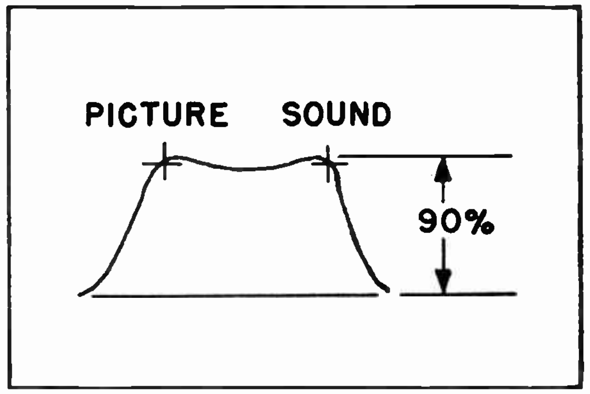

FIG. 3

ALIGNMENT TABLE

RATIO DETECTOR AND SOUND ALIGNMENT

Step No.	Connect Signal Generator to	Sig. Gen. Freq.	Connect Voltmeter to	Miscellaneous Instructions	Adjust
1	In series with .001 Mfd. Cond. to junction of L-7 and L-13 terminal 3 of 4th I.F. See fig. 5	4.5 MC.	In series with 47,000 ohm res. across C-23 a 10 Mfd. cond. See fig. 5	Maintain reading on 10 volt scale contrast at maximum. Remove 3rd video IF tube 6CB6.	T-7 (top) and T-8 (bottom) for max. reading. See fig. 4 & 5
2	In series with .001 Mfd. Cond. to junction of L-7 and L-13 terminal 3 of 4th I.F. See fig. 5	4.5 MC.	In series with 47,000 ohm res. to junction of R-30 and C-44. See fig. 5	Maintain reading on 10 volt scale contrast at maximum. Remove 3rd video IF tube 6CB6.	T-8 (top) for zero reading. See fig. 4
3	In series with .001 Mfd. Cond. to cathode of picture tube yellow lead. See fig. 5	4.5 MC.	In series with 47,000 ohm res. across C-23 a 10 Mfd. cond. See fig. 5	Maintain reading on low volt scale. Remove 3rd video IF tube 6CB6.	T-6 (top) for minimum reading. See fig. 4

NOTE 1: For **minimum buzz** always adjust T-8 (top) with the sound carrier of a TV station.
NOTE 2: Alternate 4.5 MC. trap alignment: Adjust T-6 (top) for minimum 4.5 MC beat on a strong station signal.

ALIGNMENT TABLE—(Cont.)

PICTURE I-F ALIGNMENT

Step No.	Connect Signal Generator to	Sig. Gen. Freq.	Connect Voltmeter to	Miscellaneous Instructions	Adjust
4	In series with .001 Mfd. cond. to lead extending from top of tuner. See fig. 4	24.3 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5.	Tuner on channel 3, 3 volts bias to junction of C-51 positive side to ground. Locality switch in strong position. See fig. 5	T-5 (bottom) for maximum reading. See fig. 4
5	In series with .001 Mfd. cond. to lead extending from top of tuner. See fig. 4	21.9 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5.	Tuner on channel 3, 3 volts bias to junction of C-51 positive side to ground. Locality switch in strong position. See fig. 5 Repeat steps 4 & 5.	T-5 (top) for minimum reading. See fig. 5
6	In series with .001 Mfd. cond. to lead extending from top of tuner. See fig. 4	22.9 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5.	Tuner on channel 3, 3 volts bias to junction of C-51 positive side to ground. Locality switch in strong position. See fig. 5	T-4 (top) for maximum reading. See fig. 4
7	In series with .001 Mfd. cond. to lead extending from top of tuner. See fig. 4	25.9 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5.	Tuner on channel 3, 3 volts bias to junction of C-51 positive side to ground. Locality switch in strong position. See fig. 5	T-3 (top) for maximum reading. See fig. 4
8	In series with .001 Mfd. cond. to lead extending from top of tuner. See fig. 4	24.7 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5.	Tuner on channel 3, 3 volts bias to junction of C-51 positive side to ground. Locality switch in strong position. See fig. 5 **NOTE:** Detune T-2 by turning slug to center of coil.	T-1 (top) for maximum reading. See fig. 4

SWEEP ALIGNMENT FOR T-2 TO OBTAIN RESPONSE CURVE IN FIG. 2

Step No.	Connect Marker Generator to	Marker Gen. Freq.	Connect Sweep Gen. to	Sweep Freq.	Connect Oscilloscope to	Miscellaneous Connections	Adjust
9	Loosely couple to ungrounded converter tube shield.	26.4 MC.	Ungrounded converter tube shield	20 to 30 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7.	3 volt bias to junction C-51 locality switch in strong position.	T-2 so that 26.4 marker is 4 DB or 40% down with flat response. See fig. 2

NOTE 3: Set the signal generator to provide a 23 MC. marker and observe the response curve. The 23 MC. marker should be at 10 DB or 70% down. Set the signal generator to provide a 21.9 and observe the response curve: The 21.9 marker should be in the hole of the curve. See fig. 2. IF THERE ARE ANY GREAT DEVIATIONS OF THE MARKERS OR THE RESPONSE CURVE STEPS 4 THRU 9 SHOULD BE REPEATED.

TUNER R.F. ALIGNMENT

NOTE 4: NEVER ADJUST C-2, C6 and C-9 UNLESS ABSOLUTELY NECESSARY. THEY ARE FACTORY PRESET BY SPECIAL EQUIPMENT.

Step No.	Connect Marker Generator to	Marker Gen. Freq.	Connect Sweep Gen. to	Sweep Gen. Chan.	Connect Oscilloscope to	Miscellaneous Connections	Adjust
10	Loosely couple to sweep gen. leads.	205.25 MC. and 209.75 MC.	300 ohm antenna terminals.	12	Lead extending from top of tuner. See fig. 4	Tuner on channel 12 3 volt bias to junction of C-51 locality switch in strong position.	C-2, C-6 and C-9 for max. response having linear peaks with picture and sound markers at 90% maximum response. See fig. 3
11	OBSERVE RESPONSE CURVE FOR ALL CHANNELS USING CORRECT FREQUENCIES AND CHANNELS. A SLIGHT COMPROMISE SHOULD BE MADE WITH C-2, C-6 AND C-9 IF MARKERS ARE BELOW 70%.						

NOTE 5: FOR RF OSCILLATOR ALIGNMENT. SET FINE TUNING CONTROL IN CENTER POSITION. ADJUST INDIVIDUAL CHANNEL TRIMMERS FOR BEST PICTURE DETAIL WITH THE PATTERNS OF A TV STATION. NOTE: USE A NON-METALLIC SCREW-DRIVER.

Kits containing the necessary strips to convert to any UHF channel are available. When ordering please be sure to: Give required UHF channel number. Give tuner part number, Ink stamped on front of tuner. It is not necessary to remove chassis, just remove the channel and fine tuning knobs. Tuner part number begins with 20E—Series letter on back of chassis may also be used as a reference number.

COVERING MODELS

462 and 463

SUBJECT:

Manufacturers variations of 1B3GT high voltage rectifier tubes.

REASON:

In all makes of 1B3GT tubes except General Electric pin #5 is an open pin.

In General Electric 1B3GT tubes pins #5 and #7 are internally connected.

In the above listed models the 8.7 ohm filament current limiting resistor R 89 is connected between terminals #5 and #7 of the 1B3GT socket.

Because of this if a General Electric 1B3GT tube is used (with pins #5 and #7 internally connected) the current limiting resistor would be bypassed resulting in excessive filament voltage, and therefore short tube life.

We have been informed that General Electric will soon manufacture and distribute 1B3GT tubes that do not have pins #5 and #7 internally connected. However, until such GE 1B3GT tubes are available DO NOT USE GE 1B3GT TUBES AS REPLACEMENTS IN MODELS 462 and 463, unless pin #5 is clipped off the tube base.

SUBJECT: The 40E8-10 3 ampere slo-blo line fuse used in models 462 and 463 blowing under normal operating conditions.

REASON: Surge current when the receiver is turned ON or OFF may cause the 3 ampere line fuse to blow.

REMEDY: Always replace the 3 ampere fuse with a 4 ampere slo-blo fuse part no. 40E8-11. The 4 ampere fuse is being used in currently produced models 462 and 463.

Blonde 17" Table Model

These models use 19 tubes (Including picture tube and rectifier) plus a crystal diode video detector and employ a intercarrier sound circuit. Picture tube has Electro Static focus which is automatic and permanent.

SAFETY PRECAUTIONS: The kinescope should be handled with extreme care. The person handling this tube should wear gloves and protective goggles as an added precaution.

When power is connected, care must be taken in servicing the HIGH VOLTAGE supply of these receivers. As a safety precaution the AC line is open when the cabinet back is removed. For servicing with chassis out of cabinet a separate line cord must be used.

VOLTAGE READINGS: The voltage readings to be obtained at various locations in the receiver have been indicated on the schematic diagram. These voltages will be very advantageous when "trouble shooting." Check voltages, tubes, fuse and inspect for damaged or burned parts before attempting to re-align receiver. A ¼ amp fuse is located in the low voltage power supply of the receiver.

All voltages were taken with a 117.5 V. 60 Cycle line and with no signal input. The contrast control set at the maximum clockwise position; the brightness control at 50% rotation and all other controls in normal operating position. All voltages are positive with respect to ground unless otherwise indicated.

FREQUENCY CHART

CHANNEL NO.	CHANNEL FREQ. MC.	PICTURE CARRIER M. C.	SOUND CARRIER M. C.	RECEIVER RF. OSC. M. C.
2	54-60	55.25	59.75	81.65
3	60-66	61.25	65.75	87.65
4	66-72	67.25	71.75	93.65
5	76-82	77.25	81.75	103.65
6	82-88	83.25	87.75	109.65

13	210-216	211.25	215.75	237.65

IF. FREQ. M.C.
Picture Carrier 26.4
Sound Carrier 21.9

CENTERING OF PICTURE: The picture may be centered in relation with the opening of the glass panel at the face of the receiver by shifting the centering magnet at the neck of the picture tube. The centering magnet should be rotated and the control adjusted until the picture is properly framed keeping in mind that the effect of the control is governed by the position of rotation. If the control is above or below the neck of the picture tube, the picture will be moved up or down. To the left or right of the neck of the picture tube, the picture will be moved either to the left or right.

CONTROL ADJUSTMENT

VERTICAL HEIGHT & VERTICAL LINEARITY CONTROLS: The vertical height and linearity controls should both be adjusted at the same time. For best results adjust while a test pattern is being transmitted. The linearity control affects the upper portion of the picture while the height control affects the overall size especially the lower portion of the picture. Adjust both controls simultaneously until the test pattern is symmetrical and fills the entire screen vertically.

WIDTH ADJUSTMENT: Adjust width by turning slug either clockwise or counter-clockwise. A clockwise rotation will decrease width. Proper width is obtained when raster covers entire screen of picture tube.

HORIZONTAL FREQ.: Tune in a station and adjust the horizontal hold control until the picture falls into sync. Momentarily remove the signal by switching off channel and then back. The picture should pull into sync. If in the above check the receiver fails to hold sync, reset horizontal hold slightly.

4.5 MC TRAP ALIGNMENT: 1. Connect the signal generator to the grid (pin 1) of the video amplifier tube v-6, through a 1000 MMF. Capacitor. 2. Connect the germanium crystal detector and voltmeter, between the cathode of the kinescope and chassis, as shown in note 5. 3. Set the signal generator at 4.5 MC and maximum output (setting of 4.5 MC must be accurate). Adjust 4.5 MC trap (L10) for minimum reading on the lowest voltage scale of the meter.

1036

NOTE 7

STEP NO.	CONNECT SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	CONNECT SWEEP GENERATOR TO	SWEEP GENERATOR FREQUENCY	CONNECT OSCIL-LOSCOPE TO	REMARKS	ADJUSTMENTS
1. RF & MIXER ALIGNMENT	Connect to piece of wire and wrap around 300 Ohm antenna lead.	205.25 MC (Picture Carrier).) 209.75 MC (Sound Carrier.)	Antenna lead of receiver. (Generator must terminate in 300 ohms.)	TO SWEEP TV CHANNEL 12.	Through 10,000 Ohm resistor to test point (T) on tuner.	Connect negative of 1½ volt battery to junction of R10 and R12 and positive of battery to chassis ground.	With tuner set to channel 12, adjust Mixer Grid Trimmer (C9), RF Amplifier Plate Trimmer (C3), and RF Amplifier Grid Trimmer (C1) to obtain response curve shown in Note 4. Response curve should have maximum amplitude with proper band width.
2. RF & MIXER ALIGNMENT	SAME AS ABOVE	Correct sound and picture carrier for each channel. (See listing on first page of booklet.)	SAME AS ABOVE	TO SWEEP PROPER TV CHANNEL.	SAME AS ABOVE	Check response curve of each channel without disturbing trimmers.	If satisfactory response is not obtained for some particular channel try replacing coils for that channel or repeat step 1 of tuner alignment favoring weak channel without seriously offecting other channels.
3. OSCILLATOR ALIGNMENT FOR INDIVIDUAL CHANNEL	SAME AS ABOVE	Correct sound and picture carrier for each channel. (See listing on first page of booklet.)	SAME AS ABOVE	TO SWEEP PROPER TV CHANNEL.	JUNCTION OF C25 and L8.	All adjustments to oscillator coils (T9) must be made with non-metallic alignment tool with ⅛" blade. If slug "falls in" during adjustment, remove strip from tuner and raise slug retention spring. By tapping coil slightly, slug will return to a position retainable by spring.	For fine oscillator adjustment of channel, set tuner to channel and adjust slug of oscillator coil (T9) through hole in face plate of tuner (See Note 7) to position markers in the exact position on the response curve indicated in Note 3 under I. F. alignment. REPEAT OSC. ALIGNMENT FOR EACH CHANNEL AFTER SETTING TUNER TO PROPER CHANNEL.

N-9196

I. F. ALIGNMENT PROCEDURE

STEP NO.	CONNECT SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY MC	CONNECT SWEEP GENERATOR TO	SWEEP GENERATOR FREQUENCY	CONNECT OSCIL-LOSCOPE TO	REMARKS	ADJUSTMENTS (Use peak obtained when screw is farthest out of can or coil.)
1. AUDIO IF ALIGNMENT	Grid of Video Amp. (6AH6) Pin No. 1. Contrast control at maximum.	4.5 MC. No Modulation. See Adjustments column.	NOT USED		NOT USED	Connect Vacuum Tube Voltmeter and zero center Microammeter as shown in Note 1 (50,000 ohm resistors shown in Note 1 must match within 5%).	Adjust L12 and T3 (Bottom) for maximum on Vacuum Tube Voltmeter. This adjustment should be made with Voltage on Vacuum Tube Voltmeter under 12 Volts. Adjust T3 (Top) for zero on Microammeter. If the receiver is receiving a signal, the above adjustment can be made off a weak station keeping the reading on the Vacuum Tube Voltmeter under 12 Volts.
2. PRELIMINARY VIDEO IF ALIGNMENT	Tube shield over 6J6. Disengage shield from clip to remove ground.	26.1 MC. No Modulation.	NOT USED		NOT USED	Connect —4.5 V. Battery to Junction of R20 and C24. Connect Vaccum Tube Voltmeter to A. G. C. point. Junction of R20 and R21.	Adjust 1st and 4th I. F. coils (L3 in Tuner and L7) for maximum on Vacuum Tube Voltmeter. Adjust at approximately one volt.
3. PRELIMINARY VIDEO IF ALIGNMENT	Tube shield over 6J6. Disengage shield from clip to remove ground.	24.0 MC. No Modulation.	NOT USED		NOT USED	Connect —4.5 V. Battery to Junction of R20 and C24. Connect Vaccum Tube Voltmeter to A. G. C. point. Junction of R20 and R21.	Adjust 3rd I. F. coil (L6) for maximum on Vacuum Tube Voltmeter. Adjust at approximately one volt.
4.	Tube shield over 6J6. Disengage shield from clip to remove ground.	24.4 MC. No Modulation.	NOT USED		NOT USED	SAME AS ABOVE	Adjust 2nd I. F. coil (L5) for maximum on VTVM. Adjust at approximately one volt.
5. FINAL VIDEO IF ALIGNMENT	Signal Generator as shown in Note 2.	26.4 and 23.7 MC. No Modulation. See Note 3.	Tube shield over 6J6. Disengage shield from clip to remove ground.	24.3 Center Frequency and at least 6 MC wide.	Junction of R21 and L8.		With signal generator set at 26.4 MC adjust 1st and 4th I. F. coils to give correct marker position as shown in Note 3. Set signal generator at 23.7 MC and adjust 2nd and 3rd I. F. coils for pattern shown in Note 3. A slight readjustment of 1st and 2nd coils may be necessary.

MODELS 413, 414, 415, 416, 421, 422, 423, 424, 425, 426, 427, 428, 429, 445

Service Instructions for Radio and Phonograph of Models

413	Mahogany	21" Combination, Consolette
414	Blonde	21" Combination, Consolette
415	Mahogany	21" Combination, Console
416	Blonde	21" Combination, Console

These combination models have a 5 tube Radio (plus selenium rectifier), and a three speed automatic record changer.

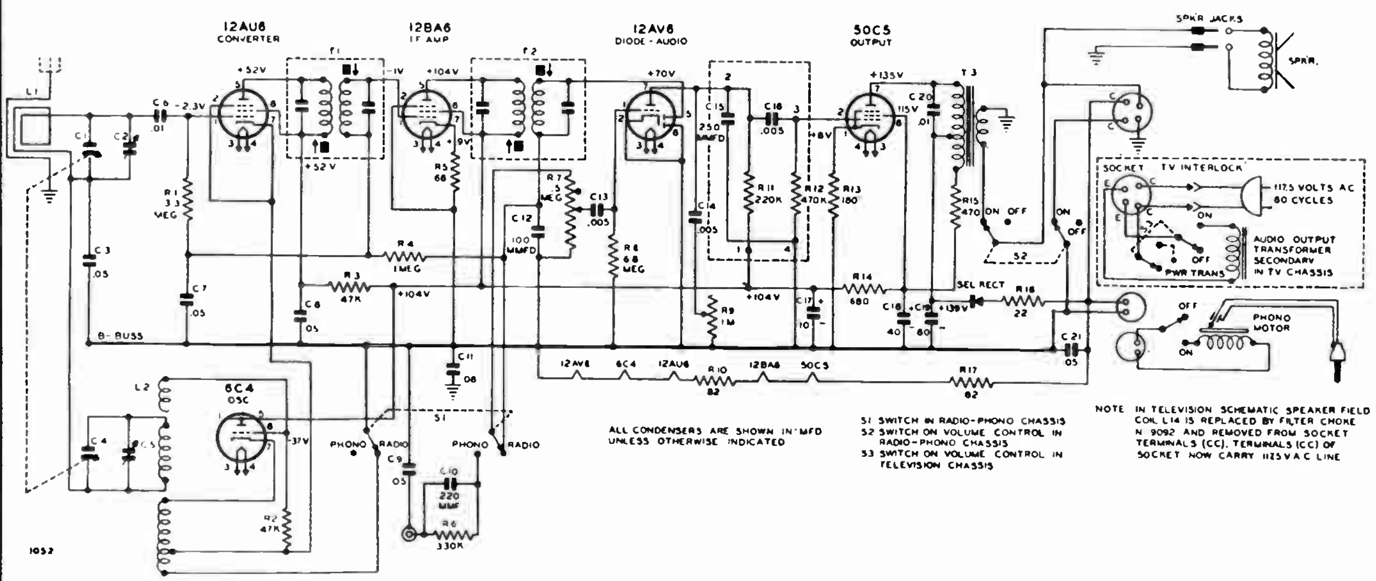
POWER SUPPLY: This receiver is designed to operate on an alternating current supply (AC) ranging from 110 to 120 volts, 60 cycles.

DESCRIPTION OF COMBINATION CONNECTIONS FOR OPERATION

The television and radio receiver both operate off the same speaker. The television Off-Volume control switch (S3) and radio Off-Volume control switch (S2) both incorporate a double pole single throw switch. When television receiver is turned on the secondary of the audio output transformer in the television chassis is connected across the voice coil of the speaker. The radio receiver has a separate output transformer and the secondary connects across voice coil of speaker when turned on. For proper operation the television and radio receiver should not be turned on at the same time. The phono motor operates on power received from the radio chassis and is turned on by turning speed selector to speed indicated on record to be played and depressing start-reject button. Motor is turned off automatically when last record has played. Sound for phono is amplified through the audio section of radio, when Radio-Phono/switch (S1) on radio chassis is turned to phono.

For servicing radio chassis when out of cabinet, (AC) source must be connected to the two prongs (CC) of male socket when removed from television chassis. The two leads with pin jacks can be connected directly across speaker.

For Servicing television chassis when out of cabinet (AC) source is applied to interlock socket. Speaker voice coil may be connected directly to two prongs (EE) of female socket on television chassis.



ALIGNMENT PROCEDURE

The signal source must be an accurately calibrated signal generator capable of supplying 455 Kc and up to 1620 Kc signals modulated 30% with a 400-cycle audio signal.

Volume control at maximum for all adjustments.

Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

Loop antenna should be connected to receiver and in its proper position when making the adjustments.

SIGNAL GENERATOR				TUNER SETTING	ADJUST FOR MAXIMUM OUTPUT
FREQUENCY	COUPLING CAPACIOR	CONNECTION TO RADIO	GROUND CONNECTION		
455 Kc	.05 Mfd.	Rear stator plates of tuning condenser.	B Minus Buss Lead	Any point near center where no interfering signal is received.	Slugs at top and bottom of 2nd I. F. (T2) and then both slugs of 1st I. F. (T1).
1620 Kc	.05 Mfd.	Rear stator plates of tuning condenser.	B Minus Buss Lead	Fully Open	Oscillator trimmer of Gang. (C5).
1400 Kc		Lay Generator lead near back of cabinet.	B Minus Buss Lead	Tune in signal from generator.	Antenna trimmer of Gang. (C2).

CHASSIS DESCRIPTION AND SPECIFICATIONS

CHASSIS DESCRIPTION

Chassis type 25D213 with a self-contained power supply, contains twenty-five tubes and two Selenium Rectifiers, full range tone control and is equipped with the Sparton Ultra-tuner for superior long range reception.
Models 5390 & 5391 are Television-Radio Phonograph combinations using the 6L3 radio chassis and VM950 record player

ELECTRICAL SPECIFICATIONS

Power Supply........................105-125 Volts AC 60 Cycle only

Power Consumption..................230 Watts

Audio Power Output.................Maximum Undistorted 2.5 Watts

Tuning Range........................T.V. Channels 2 thru 13

Antenna Input Impedance............300 Ohms Balanced

Intermediate Frequencies...........Picture 26.25 Mc.

Intercarrier Sound System.........4.5 Mc.

Voice Coil Impedance................3.2 Ohms at 400 Cycles

VOLTAGE TEST SPECIFICATIONS

1. Line Voltage = 117 Volts A.C.
2. Channel Switch Position = Channel #2.
3. Brightness Control Position = Maximum Brilliance on Picture Tube.
4. Contrast Control Position = Maximum (Clockwise).
5. Horizontal and Vertical Hold Control Positions = Set correct position to lock in picture.
6. Horizontal width control position = Set for Maximum
7. Vertical size and Linearity Control Position = Set for normal size & Best linearity.
8. Focus Control Position = Properly focused.
9. Volume Control Position = Maximum Counter-Clockwise.
10. Tone Control Position = Maximum Counter-Clockwise.
11. Instrument (Meter) used = (V.T.V.M.) Vacuum Tube Volt Meter.
12. No signal input applied to set.
13. Unless otherwise designated all voltages measured in respect to Chassis Ground.

NOTE: The points indicated by the letters A,B,C,D,E,F & G are the alignment test points referred to in the following alignment procedure.
These points indicate the terminals for attaching test equipment and are shown in Figure 2.

ALIGNMENT EQUIPMENT AND TEST SET UP

TEST EQUIPMENT. In order to align and service Sparton television receivers properly the following test equipment should be available:

FIRST: AN R.F. SWEEP GENERATOR or reliable quality that performs the following functions:

A. Provides sweep outputs in the following frequency ranges:

19 to 30 Mc.	10 Mc. sweep width
40 to 90 Mc.	10 Mc. sweep width
170 to 225 Mc.	10 Mc. sweep width

B. Provides an output signal that can be varied by means of an attenuator up to a maximum of at least .1 volt.

SECOND: AN R.F. SIGNAL GENERATOR That will provide an adjustable output signal up to a maximum of at least .1 volt on the following fixed frequencies:

A. I.F. Frequencies

21.75 Mc.	Sound Trap
22.5 Mc.	1st Video I.F. Coil
25 25 Mc.	2nd Video I.F. Coil
24 25 Mc.	3rd Video I.F. Coil
23.25 Mc.	4th Video I.F. Coil
26.0 Mc.	5th Video I.F. Coil
26.25 Mc.	Picture I.F. Carrier
4.5 Mc.	Sound I.F. & Traps
27.75 Mc.	Adjacent Channel Sound Trap

THIRD: A CATHODE-RAY OSCILLOSCOPE of good quality that has a fairly wide band vertical amplifier and a low capacity input probe.

FOURTH: AN ELECTRONIC VOLTMETER with ranges to read 1V. DC, 10V. DC and 7V. AC at 400 cycles and 4.5 Mc.

FIFTH: A CRYSTAL CALIBRATOR that can be used for checks on the accuracy of the output frequencies of the R.F. signal generator.

GENERAL INSTRUCTIONS: Practically all servicing with the exception of some tube replacement will require removal of the receiver chassis from the cabinet.

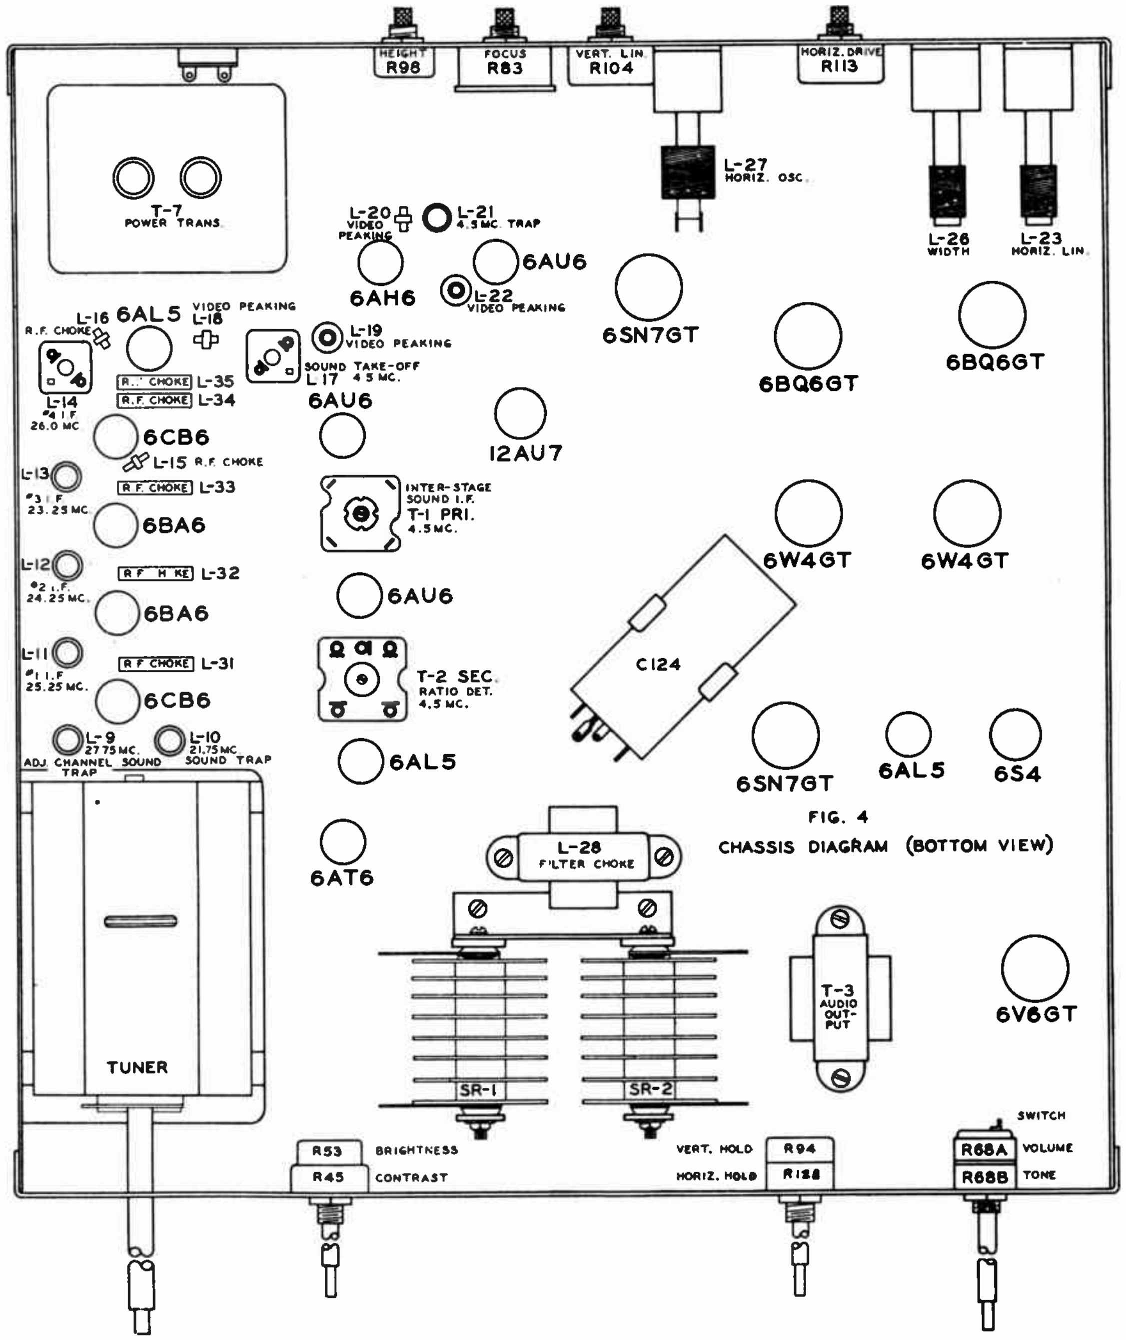

FIG. 4
CHASSIS DIAGRAM (BOTTOM VIEW)

A convenient arrangement that makes both the top and bottom of the chassis accessible for alignment and servicing can be realized by orienting the receiver chassis in such a manner that it rests on its side and on the horizontal output shield can.

ALIGNMENT REQUIREMENTS: Under normal conditions complete receiver realignment will seldom be necessary in the field. However, a detailed description of the overall alignment procedure is included to provide all necessary information if it should be required.

In general it is not recommended that the R.F. and the converter circuits of the R.F. tuner be realigned by the service engineer unless absolutely necessary. In cases where tuner components have been damaged or where complete realignment is indicated, the R.F. tuner assembly should be removed from the chassis and sent back to the factory in exchange for a new unit which will be shipped complete with tubes.

When the new R.F. unit is assembled to the chassis it will be necessary in all cases to realign L6 which is located on the tuner chassis. Normally this is the only adjustment that will be required with tuner change but a check on overall receiver alignment and sensitivity should be made for the sake of certainty and assured customer satisfaction.

EFFECTS OF TUBE REPLACEMENT ON THE ALIGNMENT OF R.F. TUNER CIRCUITS: The alignment of the R.F. and converter circuits of the R.F. tuner is critical and may be affected by a tube change. In cases where these tubes (6BK7 or 6J6) are replaced, it will be necessary for the service engineer to check for satisfactory receiver operation. If realignment is indicated it can usually be avoided by selection of replacement tubes until correct receiver operation is realized.

ORDER OF ALIGNMENT: When complete receiver realignment is indicated it should be performed in the following order:

1. Sound Traps
2. Picture I.F.
3. Sound I F. and 4.5 Mc. Trap
4. Ratio Detector Transformer
5. Retouch Picture I.F.
6. Sound and Picture I.F. Sensitivity Check
7. R.F. and Converter Circuits (not recommended)
8. Overall Sensitivity Check

PRELIMINARY ADJUSTMENTS: Before alignment the receiver controls should be adjusted to the approximated operation positions specified in the table below. The controls should remain in these positions for all checks unless otherwise specified.

Contrast Control - to maximum clockwise
Brightness Control - to position where raster is visible on the kinescope
Focus Control - to position where focus is obtained
Vertical Hold - to center position
Vertical Linearity - to center position
Vertical Size - adjusted to give normal raster height
Horizontal Hold - to center position
Horizontal Size - adjusted to give normal raster width

TEST EQUIPMENT SET UP: A certain amount of experimentation must be employed to secure a stable test set up before alignment or service of the receiver is attempted. It is recommended that the top of the test bench be covered with a sheet of aluminum to insure good grounds between the various pieces of test equipment and the receiver chassis. In general all test signal input leads should be kept away from output leads as much as possible.

SOUND TRAP ALIGNMENT: FIRST, Connect the R.F. Signal generator to the grid of V-2 by means of the I.F. input adapter as shown in Figure 5.

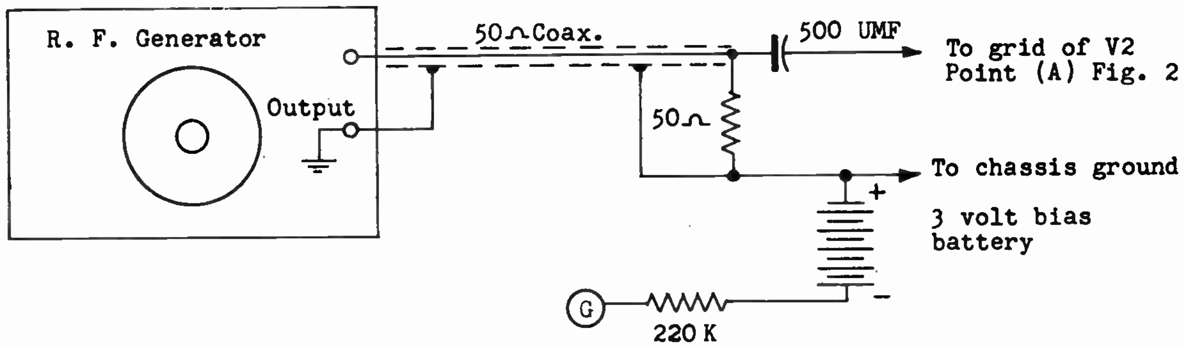

Figure 5 I.F. Input Adapter

SECOND: Set the R.F. tuner to channel #13.

THIRD: Connect a 4.5 volt bias battery between the A.G.C. buss(Point G.Fig.2) and chassis ground so that the voltage on the A.G.C. buss is -4.5 volts in respect to the chassis. Remove AGC tube 6AU6 V8.

FOURTH: Connect the electronic voltmeter across the picture detector load resistor R41, Point C, Fig. 2 and set the voltmeter on the low D.C. volt scale.

FIFTH: Set the R.F. signal generator to the frequency shown below and tune the specified adjustment for minimum indication on the voltmeter. It is advisable to check the output of the generator with the crystal calibrator to make certain that it is exactly on frequency.

27.75 Mc. L9 (Top of chassis Fig. 3)
21.75 Mc. L10(Top of chassis as shown in Figure 3).

PICTURE I.F. ALIGNMENT: FIRST: Connect the R.F. Signal generator, voltmeter and bias battery to the receiver as described in steps 1,2,3 and 4 of the sound trap alignment instructions.

SECOND: Set the signal generator to each of the following frequencies and peak the specified adjustments for maximum indication of the voltmeter.

22.5 Mc.	L6	(Top of tuner as shown in Fig. 3)
25.25 Mc.	L11	(Top of chassis as shown in Fig. 3)
24.25 Mc.	L12	(Top of chassis as shown in Fig. 3)
23.25 Mc.	L13	(Top of chassis as shown in Fig. 3)
26.0 Mc.	L14	(Top of chassis as shown in Fig. 3)

SOUND I.F. ALIGNMENT FIRST: Connect the R.F. signal generator to Point C Fig. 2.

SECOND: Set the signal generator accurately to 4.5 Mc. This is very important because the picture and sound carriers sent out from the television stations are exactly 4.5 Mc. apart.

THIRD: Connect the electronic voltmeter across R69 from Point E to ground as shown in Fig. 2.
Set the voltmeter on the 10 volt scale.

FOURTH: Peak the following coils for maximum reading on the voltmeter.

L17	Top of chassis as shown in Fig. 3.
T1	Top of chassis as shown in Fig. 3 and bottom of chassis as shown in Fig. 4.
T2	(Pri. Ratio Det) Top of chassis as shown in Fig. 3.

RATIO DETECTOR TRANSFORMER ALIGNMENT: FIRST: Connect the R.F. signal generator to the receiver as described in Step 1 of the sound I.F. alignment instructions.

SECOND: Connect the electronic voltmeter from Point F, Fig. 2 to ground. Set the voltmeter on the lowest DC scale.

THIRD: Set the signal generator output to 4.5 Mc. Adjust the secondary of T2 (Bottom view of chassis as shown in Fig. 4) Notice that it is possible to produce a positive or negative voltage indication on the meter by varying this adjustment. As the voltage swings from positive to negative, adjust T2 for zero output as indicated by the voltmeter. This point is called zero ratio detector output and indicates correct alignment of T2 transformer.
If the secondary of T2 is found to be way out of alignment it will be necessary to re-peak the primary as described in the preceeding section on sound I.F. alignment.

4.5 MC. TRAP ALIGNMENT FIRST: Connect the R.F. signal generator as described in Step 1 of the sound I.F. alignment.

SECOND: Connect the electronic voltmeter from the cathode of the picture tube to ground (Point D Fig. 2)
The voltmeter must be capable of giving a reading at 4.5 Mc. at approximately 1 to 2 volts.

THIRD: Peak L21(Top of chassis as shown in Fig. 3) for minimum output on the voltmeter.

PICTURE I.F. TOUCH UP: Connect the R.F. sweep generator output to the grid of V-2 by means of the I.F. input adapter shown in Figure 5.

SECOND: Apply bias to A.G.C. line as described in Step 3 of sound trap alignment. Set R.F. selector to channel #13.

THIRD: Connect the oscilloscope across the picture detector load resistor R41 (Point C Fig. 2) by means of the shielded cable and the filter system shown in Figure 6.

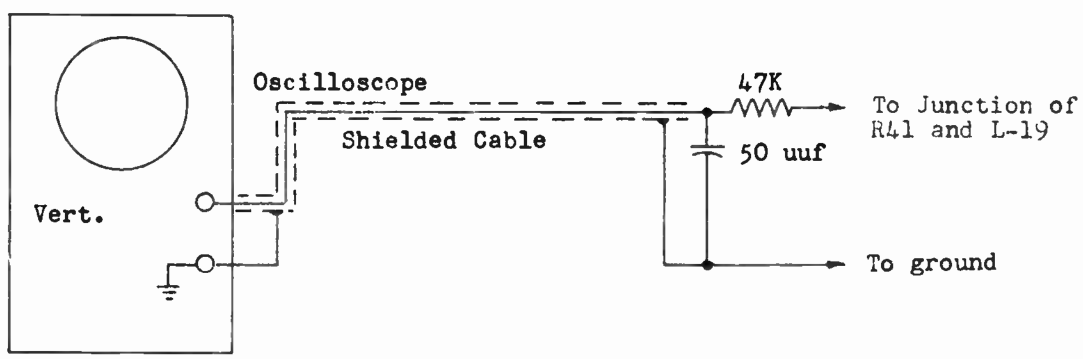

Fig. 6 FILTER SYSTEM FOR SCOPE CONNECTION

FOURTH: Set the R.F. sweep generator so that it sweeps from approximately 20 to 30 Mc.

FIFTH: Adjust the oscilloscope so that the swept I.F. response is visible on the cathode-ray tube screen.

SIXTH: Loosely couple the output of the R.F. signal generator to the grid of V-2 so that marker signals of proper frequency can be mixed in with the R.F. sweep signal.

SEVENTH: Observe the band width, relative position of the picture carrier, and flatness of the overall I.F. response curve. If necessary slightly vary the tuning of the picture I.F. coils L6, L11, L12, L13, L14 until the picture I.F. responseshown in Figure 7 is obtained. The solid curve in Fig. 7 depicts the ideal I.F. response while the dotted curves show permissable variations.

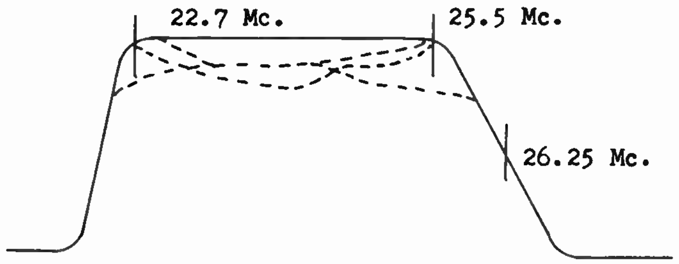

FIGURE 7 IDEAL I.F. RESPONSE WITH PERMISSABLE VARIATIONS

The picture I.F. carrier should appear approximately half way down the I.F. response curve as shown in Figure 7. Variation in the pix carrier position should not exceed $\pm$ 10% from the half way point.

PICTURE I.F. SENSITIVITY CHECK: Connect the R.F. signal generator to the receiver as specified in Steps 1 and 2 of the sound trap alignment instructions. (When making sensitivity checks no bias battery is connected to the A.G.C. buss).

SECOND: Connect the electronic voltmeter across the picture detector load resistor R41 Point C, Fig. 2 and set the meter on the low D.C. volts scale.

THIRD: Set the generator output frequency at approximately 23 Mc. Adjust the generator output until the voltmeter reads approximately 1.0 volt. Record the R.F. signal input in microvolts. Repeat the procedure with the generator output frequency set at 24.2 and 25.4 Mc. In all cases the I.F. input voltage should be 100 Microvolts or less. The sensitivity at the I.F. Picture carrier 26.25 Mc. should be approximately half of the I.F.sensitivity between 24.2 Mc(Maximum of 100 microvolts.)
If the generator output is not calibrated in microvolts, comparative sensitivity measurements can be made by using another receiver that is known to be in good operating condition as a standard. This applies to all sensitivity measurements and good results can be obtained if sufficient care is used.

R.F. TUNER (S.W. CO. PART NO. PD93158-1)

This Sparton chassis is equipped with a Standard Coil R.F. tuner. With exception to L-6 slug (22.5 Mc.) as shown in Fig. 3, field alignment for this tuner has been purposely omitted from the alignment procedure. Factory experience dictates that this unit can not be properly aligned in the field as special test equipment is required. Therefore any R.F. tuner adjustment in the field should be held to a minimum.

Field Alignment for Standard Coil Tuners has appeared in some set manufacturers service manuals; it is not recommended by our Engineering Department.
After receiver analysis proves the R.F. Tuner to be defective, and in need of realignment, the complete tuner assembly (With tubes) should be returned to Our Factory Service Department for repair or replacement.

* L2 in Consoles only.

SPECIAL INFORMATION: Inductance L3 is mixer grid coil and couples the R.F.Amplifier plate to the mixer grid. The coil contains an iron core and threaded stud for use in factory adjustment only. The slug in this coil should not be varied from the factory setting unless equipment is available to check mutual inductance of the coil after readjustment. Improper adjustment may cause various symptoms of poor performance. All replacements ordered from the Factory Service Dept. will be preset and should not be adjusted after installation.

WHEN ORDERING PARTS ALWAYS SPECIFY PART NUMBER AND MODEL FOR WHICH PART IS INTENDED.

BRIEF DESCRIPTION

Television chassis type 21S212 is a twenty-one tube "Standard" chassis with a self-contained power supply, an Electro-Static type focusing system and uses a 21FP4A picture tube. This chassis is equipped with the Sparton Ultra-tuner for superior long range reception. The Ultra-tuner will receiver telecasts on all present channels and, with the insertion of simple tuner strips on new U.H.F. channels.

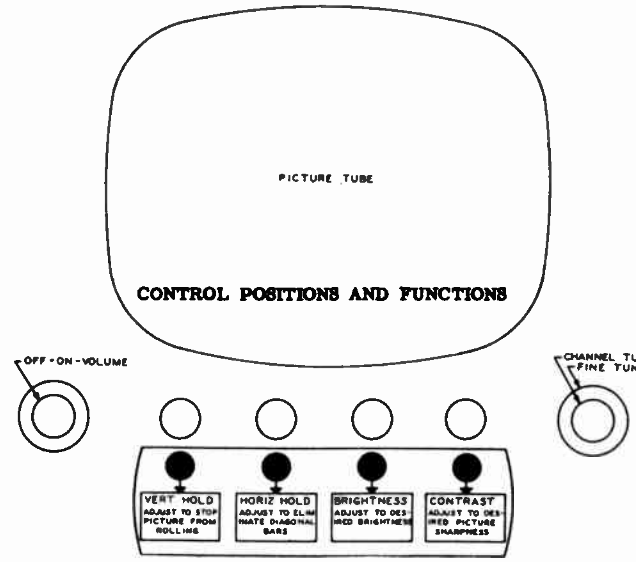
FIG. I



ALIGNMENT EQUIPMENT AND TEST SET UP

TEST EQUIPMENT:

FIRST: In order to align and service Sparton television receivers properly the following test equipment should be available:

AN R.F. SWEEP GENERATOR of reliable quality that performs the following functions:

A. Provides sweep outputs in the following frequency ranges:

19 to 30 Mc.	10 Mc. sweep width
40 to 90 Mc.	10 Mc. sweep width
170 to 225 Mc.	10 Mc. sweep width

B. Provides an output signal that can be varied by means of an attenuator up to a miximum of at least .1 volt.

SECOND: AN R.F. SIGNAL GENERATOR That will provide an adjustable output signal up to a maximum of at least .1 volt on the following fixed frequencies:

A. I. F. Frequencies

21.75 Mc.	Sound Trap
23.0 Mc.	1st Video I.F. Coil
25.0 Mc.	2nd Video I.F. Coil
23.8 Mc.	3rd Video I.F. Coil
26.0 Mc.	4th Video I.F. Coil
26.25 Mc.	Picture I.F. Carrier
4.5 Mc.	Sound I.F. & Traps

B. R.F. Frequencies

Channel No.	Picture Carrier	Sound Carrier
2	55.25 Mc.	59.75 Mc.
3	61.25 Mc.	65.75 Mc.
4	67.25 Mc.	71.75 Mc.
5	77.25 Mc.	81.75 Mc.
6	83.25 Mc.	87.75 Mc.
7	175.25 Mc.	179.75 Mc.
8	181.25 Mc.	185.75 Mc.
9	187.25 Mc.	191.75 Mc.
10	193.25 Mc.	197.75 Mc.
11	199.25 Mc.	203.75 Mc.
12	205.25 Mc.	209.75 Mc.
13	211.25 Mc.	215.75 Mc.

THIRD: A CATHODE-RAY OSCILLOSCOPE of good quality that has a fairly wide band vertical amplifier and a low capacity input probe.

FOURTH: AN ELECTRONIC VOLTMETER with ranges to read IV.DC, 10V. DC and 7V. AC at 400 cycles and 4.5 Mc.

FIFTH: A CRYSTAL CALIBRATOR that can be used for checks on the accuracy of the output frequencies of the R.F. Signal generator.

GENERAL INSTRUCTIONS: Practically all servicing with the exception of some tube replacement will require removal of the receiver chassis from the cabinet.

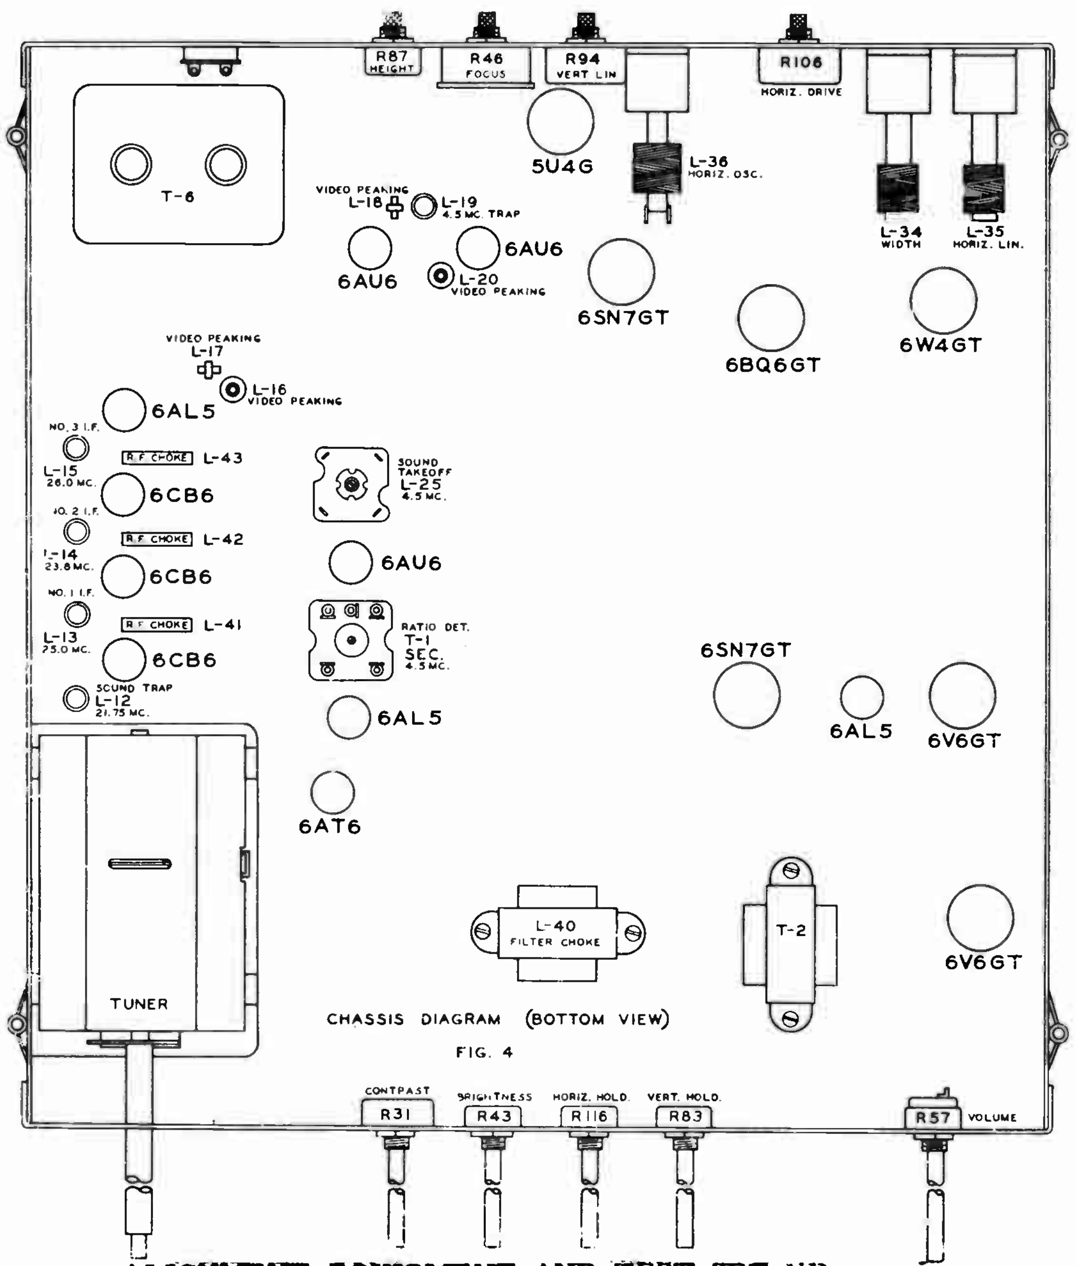
TRIMMER AND SLUG LOCATIONS (BOTTOM VIEW)



CHASSIS DIAGRAM (BOTTOM VIEW)

FIG. 4

ALIGNMENT EQUIPMENT AND TEST SET UP

A convenient arrangement that makes both the top and bottom of the chassis accessible for alignment and servicing can be realized by orienting the receiver chassis in such a manner that it rests on its side and on the horizontal output shield can.

ALIGNMENT REQUIREMENTS: Under normal conditions complete receiver realignment will seldom be necessary in the field. However, a detailed description of the overall alignment procedure is included to provide all necessary information if it should be required.

In general it is not recommended that the R.F. and the converter circuits of the R.F. tuner be realigned by the service engineer unless absolutely necessary. In cases where tuner components have been damaged or where complete realignment is indicated, the R.F. tuner assembly should be removed from the chassis and sent back to the factory in exchange for a new unit which will be shipped complete with tubes.

When the new R.F. unit is assembled to the chassis it will be necessary in all cases to realign L6 which is located on the tuner chassis. Normally this is the only adjustment that will be required with tuner change but a check on overall receiver alignment and sensitivity should be made for the sake of certainty and assured customer satisfaction.

EFFECTS OF TUBE REPLACEMENT ON THE ALIGNMENT OF R.F. TUNER CIRCUITS: The alignment of the R.F. and converter circuits of the R.F. tuner is critical and may be affected by a tube change. In cases where these tubes (6BK7 & 6BQ7 or 6J6) are replaced, it will be necessary for the service engineer to check for satisfactory receiver operation. If realignment is indicated it can usually be avoided by selection of replacement tubes until correct receiver operation is realized.

ORDER OF ALIGNMENT: When complete receiver realignment is indicated it should be performed in the following order:

1. Sound Traps
2. Picture I.F.
3. Sound I.F. and 4.5 Mc. Trap
4. Ratio Detector Transformer
5. Retouch Picture I.F.
6. Sound and Picture I.F. Sensitivity Check
7. R.F. and Converter Circuits (not recommended)
8. Overall Sensitivity Check

PRELIMINARY ADJUSTMENTS: Before alignment the receiver controls should be adjusted to the approximated operation positions specified in the table below. The controls should remain in these positions for all checks unless otherwise specified.

Contrast Control	-	to maximum clockwise
Brightness Control	-	to position where raster is visible on the kinescope
Focus Control	-	to position where focus is obtained
Vertical Hold	-	to center position
Vertical Linearity	-	to center position
Vertical Size	-	adjusted to give normal raster height
Horizontal Hold	-	to center position
Horizontal Size	-	adjusted to give normal raster width

ALIGNMENT PROCEDURE

TEST EQUIPMENT SET UP: A certain amount of experimentation must be employed to secure a stable test set up before alibnment or service of the receiver is attempted. It is recommended that the top of the test bench be covered with a sheet of aluminum to insure good grounds between the various pieces of test equipment and the receiver chassis. In general all test signal input leads should be kept away from output leads as much as possible.

SOUND TRAP ALIGNMENT: FIRST, Connect the R.F. signal generator to the grid of V-2 by means of the I.F. input adapter as shown in Figure 5.

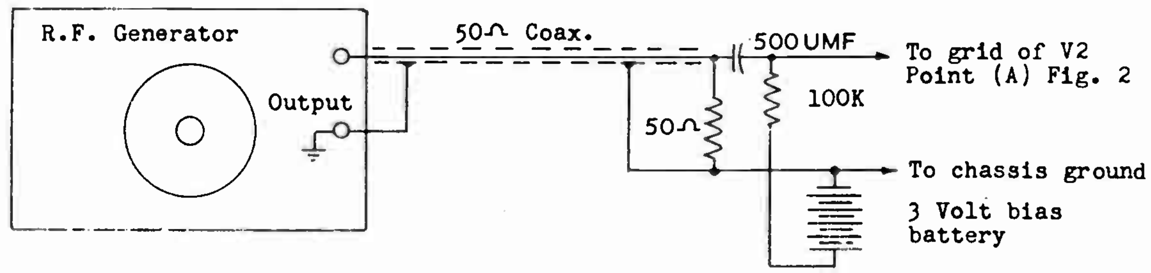


Figure 5 I.F. Input Adapter

SECOND: Set the R.F. tuner to Channel #13.

THIRD: Connect a 3.0 volt bias battery between the A.G. buss (Point F. Fig. 2) and chassis ground so that the voltage on the A.G.C. buss is 3.0 volts in respect to the chassis.

FOURTH: Connect the electronic voltmeter across the picture detector load resistor R-32 Point B, Fig. 2 and set the voltmeter on the low D.C. volt scale.

FIFTH: Set the R.F. signal generator to the frequency shown below and tune the specified adjustment for minimum indication on the voltmeter. It is advisable to check the output of the generator with the crystal calibrator to make certain that it is exactly on frequency.

21.75 Mc. L12 (Top of chassis as shown in Figure 3).

PICTURE I.F. ALIGNMENT: FIRST: Connect the R.F. Signal generator, voltmeter and bias battery to the receiver as described in Steps 1, 2, 3 and 4 of the sound trap alignment instructions.

SECOND: Set the signal generator to each of the following frequencies and peak the specified adjustments for maximum indication of the voltmeter.

23.0 Mc.	L6	(Top of tuner as shown in Fig. 3)
25.0 Mc.	L13	(Top of chassis as shown in Fig. 3)
23.8 Mc.	L14	(Top of chassis as shown in Fig. 3)
26.0 Mc.	L15	(Top of chassis as shown in Fig. 3)

SOUND I.F. ALIGNMENT: FIRST: Connect the R.F. signal generator to Pin #1 of V-6.

SECOND: Set the signal generator accurately to 4.5 Mc. This is very important because the picture and sound carriers sent out from the television stations are exactly 4.5 Mc. apart.

THIRD: Connect the electronic voltmeter across C58 from Point D to ground as shown in Fig. 2.
Set the voltmeter on the 10 volt scale.

FOURTH: Peak the following coils for maximum reading on the voltmeter.

L 25 Top of chassis as shown in Fig. 3.

T-1 (Pri. Ratio Det)Top of chassis as shown in Fig. 3.

RATIO DETECTOR TRANSFORMER ALIGNMENT: FIRST: Connect the R.F. signal generator to the receiver as described in Step 1 of the Sound I.F.Alignment instructions.

SECOND: Connect the electronic voltmeter from Point E, Fig. 2 to ground.
Set the voltmeter on the lowest DC scale.

THIRD: Set the signal generator output to 4.5 Mc. Adjust the secondary of T-1 (Bottom view of chassis as shown in Fig. 4.) Notice that it is possible to produce a positive or negative voltage indication on the meter by varying this adjustment. As the voltage swings from positive to negative, adjust T-1 for zero output as indicated by the voltmeter. This point is called zero ratio detector output and indicates correct alignment of T-1 transformer. If the secondary of T-1 is found to be way out of alignment it will be necessary to re-peak the primary as described in the preceeding section on sound I.F. alignment.

4.5 MC. TRAP ALIGNMENT: FIRST: Connect the R.F. signal generator to Pin #1 of V-7.

SECOND: Connect the electronic voltmeter from the cathode of the picture tube to ground (Point C Fig. 2)
The voltmeter must be capable of giving a reading at 4.5 Mc. at approximately 1 to 2 volts.

THIRD: Peak L-19 (Top of chassis as shown in Fig. 3)for minimum output on the voltmeter.

PICTURE I.F. TOUCH UP: Connect the R.F. Sweep generator output to the grid of V-2 by means of the I.F. input adapter shown in Figure 5.

SECOND: Apply bias to A.G.C. line as described in Step 3 of sound trap alignment. Set R.F. selector to Channel #13.

THIRD: Connect the oscilloscope across the picture detector load resistor R-32 (Point B Fig. 2) by means of the shielded cable and the filter system shown in Figure 6.

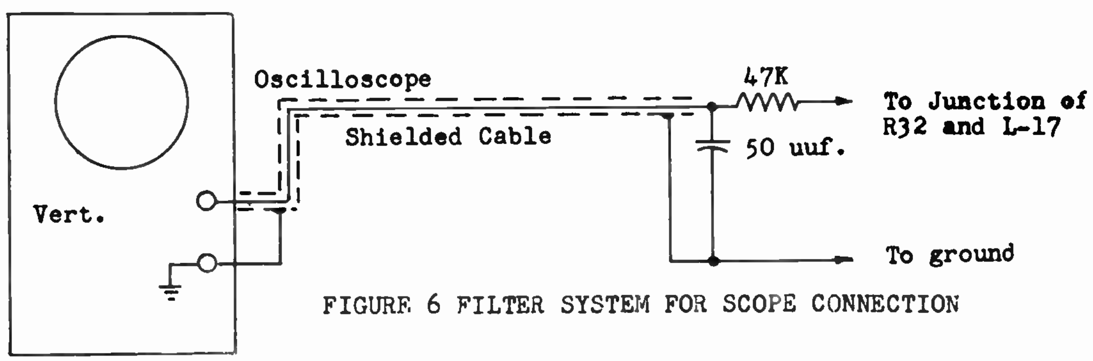

FIGURE 6 FILTER SYSTEM FOR SCOPE CONNECTION

FOURTH: Set the R.F. sweep generator so that it sweeps from approximately 20 to 30 Mc.

FIFTH: Adjust the oscilloscope so that the swept I.F. response is visible on the cathode-ray tube screen.

SIXTH: Loosely couple the output of the R.F. signal generator to the grid of V-2 so that the marker signals of proper frequency can be mixed in with the R.F. sweep signal.

SEVENTH: Observe the band width, relative position of the picture carrier, and flatness of the overall I.F. response curve. If necessary slightly vary the tuning of the picture I.F. coils L6, L13, L14, L15, until the picture I.F. response shown in Figure 7 is obtained. The solid curve in Figure 7 depicts the ideal I.F. response while the dotted curves show permissable variations.

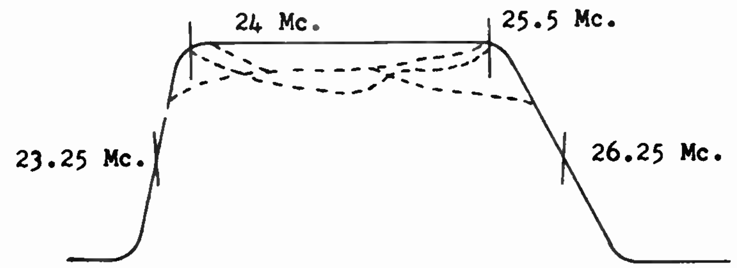

Figure 7 IDEAL I.F. RESPONSE WITH PERMISSABLE VARIATIONS

The picture I.F. Carrier should appear approximately half way down the I.F. response curve as shown in Figure 7. Variation in the pix carrier position should not exceed $\pm$ 10% from the half way point.

PICTURE I.F. SENSITIVITY CHECK: FIRST: Connect the R.F. signal generator to the receiver as specified in Steps 1 and 2 of the sound trap alignment instructions.(When making sensitivity checks no bias battery is connected to the A.G.C. buss.)

SECOND: Connect the electronic voltmeter across the picture detector load resistor R-32 Point B, Fig. 2 and set the meter on the low D.C. volts scale.

THIRD: Set the generator output frequency at approximately 24.5 Mc. Adjust the generator output until the voltmeter reads approximately 1.0 volt. Record the R.F. signal input in Microvolts. Repeat the procedure with the generator output frequency set at 24.2 and 25.4 Mc. In all cases the I.F. input voltage should be 200 MIcrovolts or less. The sensitivity at the I.F. picture carrier 26.25 Mc. should be approximately half of the I.F. Sensitivity between 24.2 Mc. (Maximum of 100 Microvolts.)
If the generabor output is not calibrated in microvolts, comparative sensitivity measurements can be made by using another receiver that is known to be in good operating condition as a standard. This applies to all sensitivity measurements and good results can be obtained if sufficient care is used.

R.F. TUNER (S.W. CO. PART NO. PD93158-1

Sparton chassis type 21S212 is equipped with a standard coil R.F. tuner (Series 2000). With exception to L-6 slug (22.5 Mc.) as shown in Fig. 3, field alignment for this tuner has been purposely omitted from the alignment procedure. Factory experience dictates that this unit can not be properly aligned in the field as special test equipment is required. Therefore any R.F. tuner adjustment in the field should be held to a minimum.

Field Alignment for Standard Coil Tuners has appeared in some set manufacturers service manuals; it is not recommended by our Engineering Department.
After receiver analysis proves the R.F. tuner to be defective, and in need of realignment, the complete tuner assembly (with tubes) should be returned to our Factory Service Department for repair or replacement.

WHEN ORDERING PARTS ALWAYS SPECIFY PART NUMBER AND MODEL FOR WHICH PART IS INTENDED.

BRIEF DESCRIPTION

Television chassis type 25D173A is a twenty-five tube "Deluxe" chassis with a self-contained power supply, an electro-static type focusing system and uses either a 17KP4 or a 17HP4 picture tube. Dual type infrequent controls are readily available on the front panel. This chassis is equipped with the Sparton Ultra-tuner which may be easily converted for the new U.H.F. reception.

VOLTAGE TEST SPECIFICATIONS

1. Line Voltage = 117 Volts A.C.
2. Channel Switch Position = Channel #2.
3. Brightness Control Position = Maximum Brilliance on Picture Tube.
4. Contrast Control Position = Maximum (Clockwise).
5. Horizontal and Vertical Hold Control Positions = Set correct position to lock in picture.
6. Horizontal width and Vertical Size Controls Positions = Set for Maximum Size.
7. Vertical Linearity Control Position = Set for Best Linearity.
8. Focus Control Position = Properly focused.
9. Volume Control Position = Maximum Counter-Clockwise.
10. Tone Control Position = Maximum Counter-Clockwise.
11. Instrument (Meter) used = (V T.V.M.) Vacuum Tube Volt Meter.
12. No signal input applied to set
13. Unless otherwise Designated All Voltages Measured In Respect To Chassis Ground.

NOTE: The points indicated by the letters A,B,C,D,E F & G are the alignment test points referred to in the following alignment procedure. These points indicate the terminals for attaching generator leads and are shown in Figure 2.

(A) Pin #5 of V2(6J6) osc. & Mixer Tube.
Apply signals here for spot I.F. alignment or I.F. sweep.

(B) Diode Load Resistor
Read D.C. output here for spot I.F. alignment.
Connect scope here for visual I.F. alignment.
Apply 4.5 Mc. here for sound I.F. trap alignment.

(C) Cathode Of Picture Tube
Read A.C. output here for overall sensitivity.
Read 4.5 Mc. output here for aligning 4.5 Mc. trap.

(D) Ratio Det. Output
Read D.C. here for alignment of sound take-off trap, inter-stage sound I.F. transformer and primary of Ratio Det. Trans.

(E) Ratio Det. Balanced Output
Read D.C. here for alignment of secondary of Ratio Det. Trans.

(F) A.G.C. Line
Apply 4.5 volts bias here for visual check of I.F. or overall with oscilloscope.

(G) Apply minus 3 volts through 220K Ohms to test terminal, located between the tubes on top of R.F. Tuner (See Fig. 3).

CHASSIS DIAGRAM (BOTTOM VIEW)
FIG. 4

ALIGNMENT EQUIPMENT AND TEST SET UP

TEST EQUIPMENT: In order to align and service Sparton television receivers properly the following test equipment should be available:

FIRST: AN R.F. SWEEP GENERATOR or reliable quality that performs the following functions:

A. Provides sweep outputs in the following frequency ranges:

19 to 30 Mc.	10 Mc. sweep width
40 to 90 Mc.	10 Mc. sweep width
170 to 225 Mc.	10 Mc. sweep width

B. Provides an output signal that can be varied by means of an attenuator up to a maximum of at least .1 volt.

SECOND: AN R.F. SIGNAL GENERATOR That will provide an adjustable output signal up to a maximum of at least .1 volt on the following fixed frequencies:

A. I.F. Frequencies

21.75 Mc.	Sound Trap
22.5 Mc.	1st Video I.F. Coil
25.25 Mc.	2nd Video I.F. Coil
24.25 Mc.	3rd Video I.F. Coil
23.25 Mc.	4th Video I.F. Coil
26.0 Mc.	5th Video I.F. Coil
26.25 Mc.	Picture I.F. Carrier
4.5 Mc.	Sound I.F. & Traps
27.75 Mc.	Adjacent Channel Sound Trap

B. R. F. Frequencies

Channel No.	Picture Carrier	Sound Carrier
2	55.25 Mc.	59.75 Mc.
3	61.25 Mc.	65.75 Mc.
4	67.25 Mc.	71.75 Mc.
5	77.25 Mc.	81.75 Mc.
6	83.25 Mc.	87.75 Mc.
7	175.25 Mc.	179.75 Mc.
8	181.25 Mc.	185.75 Mc.
9	187.25 Mc.	191.75 Mc.
10	193.25 Mc.	197.75 Mc.
11	199.25 Mc.	203.75 Mc.
12	205.25 Mc.	209.75 Mc.
13	211.25 Mc.	215.75 Mc.

THIRD: A CATHODE-RAY OSCILLOSCOPE of good quality that has a fairly wide band vertical amplifier and a low capacity input probe.

FOURTH: AN ELECTRONIC VOLTMETER with ranges to read 1V. DC, 10V. DC and 7V. AC at 400 cycles and 4.5 Mc.

FIFTH: A CRYSTAL CALIBRATOR that can be used for checks on the accuracy of the output frequencies of the R.F. signal generator.

GENERAL INSTRUCTIONS: Practically all servicing with the exception of some tube replacement will require removal of the receiver chassis from the cabinet.
A convenient arrangement that makes both the top and bottom of the chassis accessible for alignment and servicing can be realized by orienting the receiver chassis in such a manner that it rests on its side and on the horizontal output shield can.

ALIGNMENT REQUIREMENTS: Under normal conditions complete receiver realignment will seldom be necessary in the field. However, a detailed description of the overall alignment procedure is included to provide all necessary information if it should be required.

In general it is not recommended that the R.F. and the converter circuits of the R.F. tuner be realigned by the service engineer unless absolutely necessary. In cases where tuner components have been damaged or where complete realignment is indicated, the R.F. tuner assembly should be removed from the chassis and sent back to the factory in exchange for a new unit which will be shipped complete with tubes.

When the new R.F. unit is assembled to the chassis it will be necessary in all cases to realign L6 which is located on the tuner chassis. Normally this is the only adjustment that will be required with tuner change but a check on overall receiver alignment and sensitivity should be made for the sake of certainty and assured customer satisfaction.

EFFECTS OF TUBE REPLACEMENT ON THE ALIGNMENT OF R.F. TUNER CIRCUITS: The alignment of the R.F. and converter circuits of the R.F. tuner is critical and may be affected by a tube change. In cases where these tubes (6BK7 or 6J6) are replaced, it will be necessary for the service engineer to check for satisfactory receiver operation. If realignment is indicated it can usually be avoided by selection of replacement tubes until correct receiver operation is realized.

ORDER OF ALIGNMENT: When complete receiver realignment is indicated it should be performed in the following order:

1. Sound Traps
2. Picture I.F.
3. Sound I.F. and 4.5 Mc. Trap
4. Ratio Detecter Transformer
5. Retouch Picture I.F.
6. Sound and Picture I.F. Sensitivity Check
7. R.F. and Converter Circuits (not recommended)
8. Overall Sensitivity Check

PRELIMINARY ADJUSTMENTS: Before alignment the receiver controls should be adjusted to the approximated operation positions specified in the table below. The controls should remain in these positions for all checks unless otherwise specified.

Contrast Control	to maximum clockwise
Brightness Control	to position where raster is visible on the kinescope
Focus Control	to position where focus is obtained
Vertical Hold	to center position
Vertical Linearity	to center position
Vertical Size	adjusted to give normal raster height
Horizontal Hold	to center position
Horizontal Size	adjusted to give normal raster width

ALIGNMENT PROCEDURE

TEST EQUIPMENT SET UP: A certain amount of experimentation must be employed to secure a stable test set up before alignment or service of the receiver is attempted. It is recommended that the top of the test bench be covered with a sheet of aluminum to insure good grounds between the various pieces of test equipment and the receiver chassis. In general all test signal input leads should be kept away from output leads as much as possible.

SOUND TRAP ALIGNMENT: FIRST, Connect the R.F. signal generator to the grid of V-2 by means of the I.F. input adapter as shown in Figure 5.

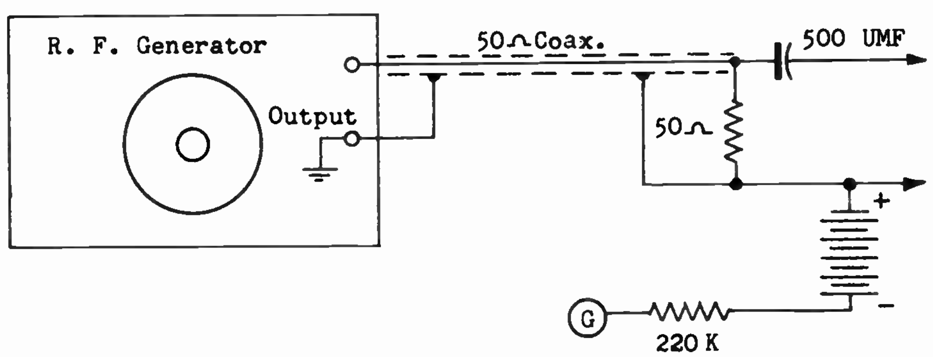

Figure 5 I.F. Input Adapter

ALIGNMENT PROCEDURE (CONT'D)

SECOND: Set the R.F. tuner to Channel #13.

THIRD: Connect a 4.5 volt bias battery between the A.G.C. buss (Point F. Fig. 2) and chassis ground so that the voltage on the A.G.C. buss is -4.5 volts in respect to the chassis. Remove A.G.C. tube (6AU6) V8.

FOURTH: Connect the electronic voltmeter across the picture detector load resistor R37, Point B, Fig. 2 and set the voltmeter on the low D.C. volt scale.

FIFTH: Set the R.F. signal generator to the frequency shown below and tune the specified adjustment for minimum indication on the voltmeter. It is advisable to check the output of the generator with the crystal calibrator to make certain that it is exactly on frequency.

21.75 Mc. L12 (Top of chassis as shown in Figure 3)

PICTURE I.F. ALIGNMENT: FIRST: Connect the R.F. signal generator, voltmeter and bias battery to the receiver as described in Steps 1, 2, 3 and 4 of the sound trap alignment instructions.

SECOND: Set the signal generator to each of the following frequencies and peak the specified adjustments for maximum indication of the voltmeter.

22.5 Mc.	L6	(Top of tuner as shown in Fig. 3)
25.25 Mc.	L13	(Top of chassis as shown in Fig. 3)
24.25 Mc.	L14	(Top of chassis as shown in Fig. 3)
23.25 Mc.	L15	(Top of chassis as shown in Fig. 3)
26.0 Mc.	L17	(Top of chassis as shown in Fig. 3)

SOUND I.F. ALIGNMENT: FIRST: Connect the R.F. signal generator to Point B, Fig. 2.

SECOND: Set the signal generator accurately to 4.5 Mc. This is very important because the picture and sound carriers sent out from the television stations are exactly 4.5 Mc. apart.

THIRD: Connect the electronic voltmeter across R65 from Point D to ground as shown in Fig. 2.
Set the voltmeter on the 10 volt scale.

FOURTH: Peak the following coils for maximum reading on the voltmeter.

L 27 Top of chassis as shown in Fig. 3.
T 6 Top of chassis as shown in Fig. 3.
Bottom of chassis as shown in Fig. 4.
T 7 (pri. Ratio Det) Top of chassis as shown in Fig. 3.

RATIO DETECTOR TRANSFORMER ALIGNMENT: FIRST: Connect the R.F. signal generator to the receiver as described in Step 1 of the Sound I.F. Alignment instructions.

SECOND: Connect the electronic voltmeter from Point E, Fig. 2 to ground.
Set the voltmeter on the lowest DC scale.

THIRD: Set the signal generator output to 4.5 Mc. Adjust the secondary of T7 (Bottom view of chassis as shown in Fig. 4). Notice that it is possible to produce a positive or negative voltage indication on the meter by varying this adjustment. As the voltage swings from positive to negative, adjust T7 for zero output as indicated by the voltmeter. This point is called zero ratio detector output and indicates correct alignment of T7 transformer. If the secondary of T7 is found to be way out of alignment it will be necessary to re-peak the primary as described in the preceeding section on sound I.F. alignment.

4.5 Mc. TRAP ALIGNMENT FIRST: Connect the R.F. signal generator as described in Step 1 of the sound I.F. alignment.

SECOND: Connect the electronic voltmeter from the cathode of the picture tube to ground (Point C Fig. 2)
The voltmeter must be capable of giving a reading at 4.5 Mc. at approximately 1 to 2 volts.

THIRD: Peak L22 (Top of chassis as shown in Fig. 3) for minimum output on the voltmeter.

PICTURE I.F. TOUCH UP: Connect the R.F. sweep generator output to the grid of V-2 by means of the I.F. input adapter shown in Figure 5.

SECOND: Apply bias to A.G.C. line as described in Step 3 of sound trap alignment. Set R.F. selector to Channel #13.

ALIGNMENT PROCEDURE (CONT'D)

THIRD: Connect the oscilloscope across the picture detector load resistor R37 (Point B Fig. 2) by means of the shielded cable and the filter system shown in Figure 6.

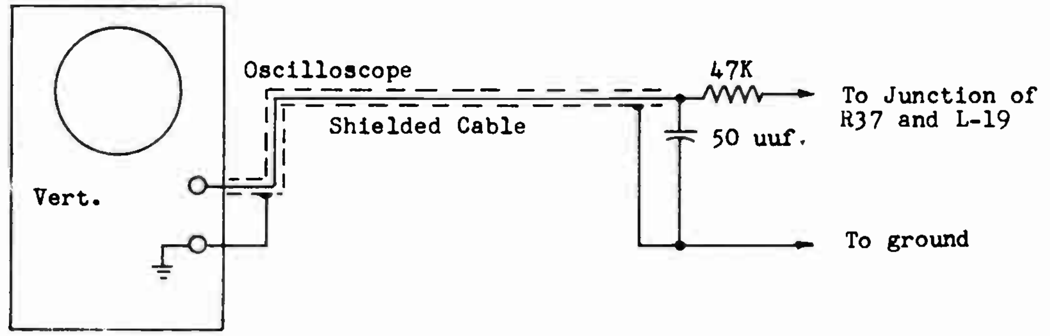

FIGURE 6 FILTER SYSTEM FOR SCOPE CONNECTION

FOURTH: Set the R.F. sweep generator so that it sweeps from approximately 20 to 30 Mc.

FIFTH: Adjust the oscilloscope so that the swept I.F. response is visible on the cathode-ray tube screen.

SIXTH: Loosely couple the output of the R.F. signal generator to the grid of V-2 so that the marker signals of proper frequency can be mixed in with the R.F. sweep signal.

SEVENTH: Observe the band width, relative position of the picture carrier, and flatness of the overall I.F. response curve. If necessary slightly vary the tuning of the picture I.F. coils L6, L13, L14, L15, L17 until the picture I.F. response shown in Figure 7 is obtained. The solid curve in Figure 7 depicts the ideal I.F. response while the dotted curves shown permissable variations.

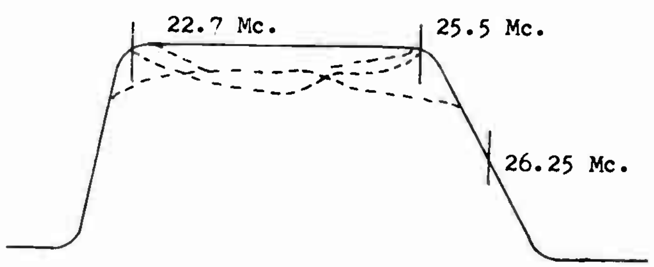

FIGURE 7 IDEAL I.F. RESPONSE WITH PERMISSABLE VARIATIONS

The picture I.F. carrier should appear approximately half way down the I.F. response curve as shown in Figure 7. Variation in the pix carrier position should not exceed ±10% from the half way point.

PICTURE I.F. SENSITIVITY CHECK: FIRST: Connect the R.F. signal generator to the receiver as specified in Steps 1 and 2 of the sound trap alignment instructions. (When making sensitivity checks no bias battery is connected to the A.G.C. buss.)

SECOND: Connect the electronic voltmeter across the picture detector load resistor R37 Point B, Fig. 2 and set the meter on the low D.C. volts scale.

THIRD: Set the generator output frequency at approximately 23 Mc. Adjust the generator output until the voltmeter reads approximately 1.0 volt. Record the R.F. signal input in microvolts. Repeat the procedure with the generator output frequency set at 24.2 and 25.4 Mc. In all cases the I.F. input voltage should be 100 Microvolts or less. The sensitivity at the I.F. picture carrier 26.25 Mc. should be approximately half of the I.F. Sensitivity between 24.- Mc. (Maximum of 100 microvolts.)
If the generator output is not calibrated in microvolts, comparative sensitivity measurements can be made by using another receiver that is known to be in good operating condition as a standard. This applies to all sensitivity measurements and good results can be obtained if sufficient care is used.

R.F. TUNER (S.W. CO. PART NO. PD93158)

Sparton chassis type 25D173A is equipped with a standard coil R.F. tuner (Series 2000). With exception to L-6 slug (22.5 Mc.) as shown in Fig. 3, field alignment for this tuner has been purposely omitted from the alignment procedure. Factory experience dictates that this unit can not be properly aligned in the field as special test equipment is required. Therefore any R.F. tuner adjustment in the field should be held to a minimum.

Field Alignment for Standard Coil Tuners has appeared in some set manufacturers service manuals; it is not recommended by our Engineering Department.
After receiver analysis proves the R.F. tuner to be defective, and in need of realignment, the complete tuner assembly (with tubes) should be returned to our Factory Service Department for repair or replacement.

BRIEF DESCRIPTION

Television chassis type 25D173 is a twenty-five tube "Deluxe" chassis with a self-contained power supply, an electro-static type focusing system and uses either a 17KP4 or 17HP4 picture tube. The infrequent controls are concealed by the small trap door on the instrument panel, however, as noted above this chassis is related very closely to chassis type 25D173A.

BRIEF DESCRIPTION

TELEVISION CHASSIS TYPE 26SS172 is a twenty-six tube standard chassis with a self-contained power supply, an Electro-magnet type focusing system, and uses a 17BP4A picture tube. This chassis is equipped with the Sparton Ultra-Tuner for superior long-range reception. The Ultra-Tuner will receive telecasts on all present channels and, with the insertion of simple tuner strips on new U.H.F. channels.

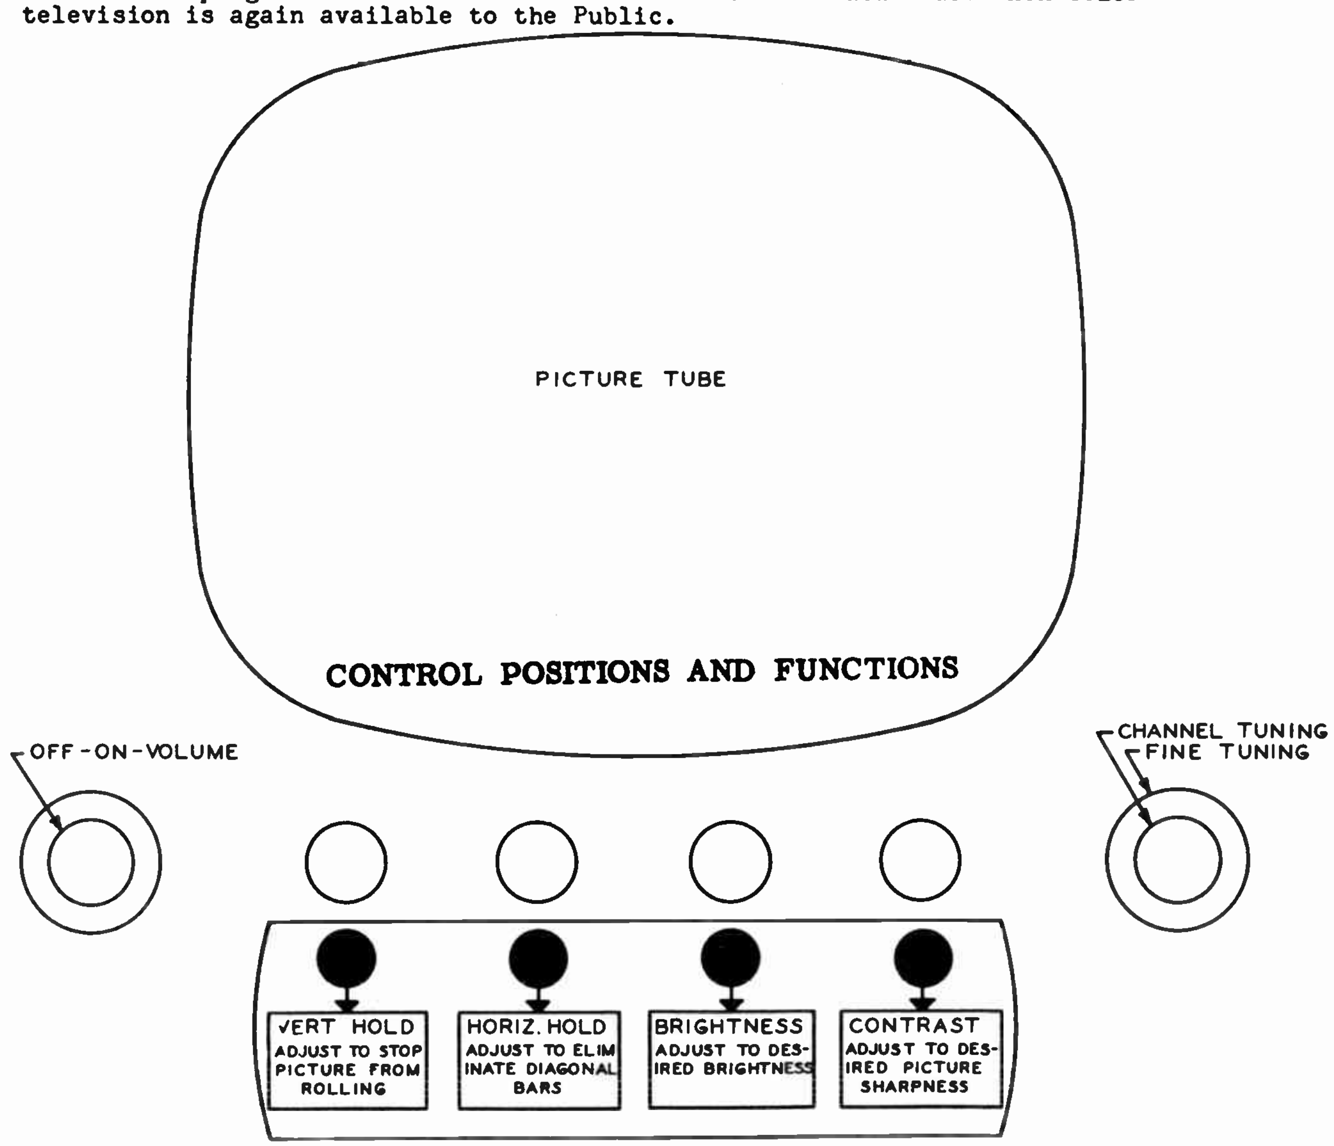
TELEVISION CHASSIS TYPE 26SS172A is equipped as described above, however, relocation of both the operating and non-operating controls accounts for the difference in chassis type designation.

NOTE: For the reason stated above this chassis may not be interchanged with chassis type 26SS172.

SPECIAL NOTE

Initial production of the above chassis included a color socket, which thru use of a convertor, would have permitted the reception of color television. National Production Authority Order M-90 prohibited the use of such a device, therefore, in order to conform to the terms of Order M-90 the use of the color socket was discontinued. However the accompanying Schematic diagram includes the hook-up of the color socket.

A knock-out plug has been retained in the chassis for future use when color television is again available to the Public.



VOLTAGE CHART AND ALIGNMENT TEST POINTS

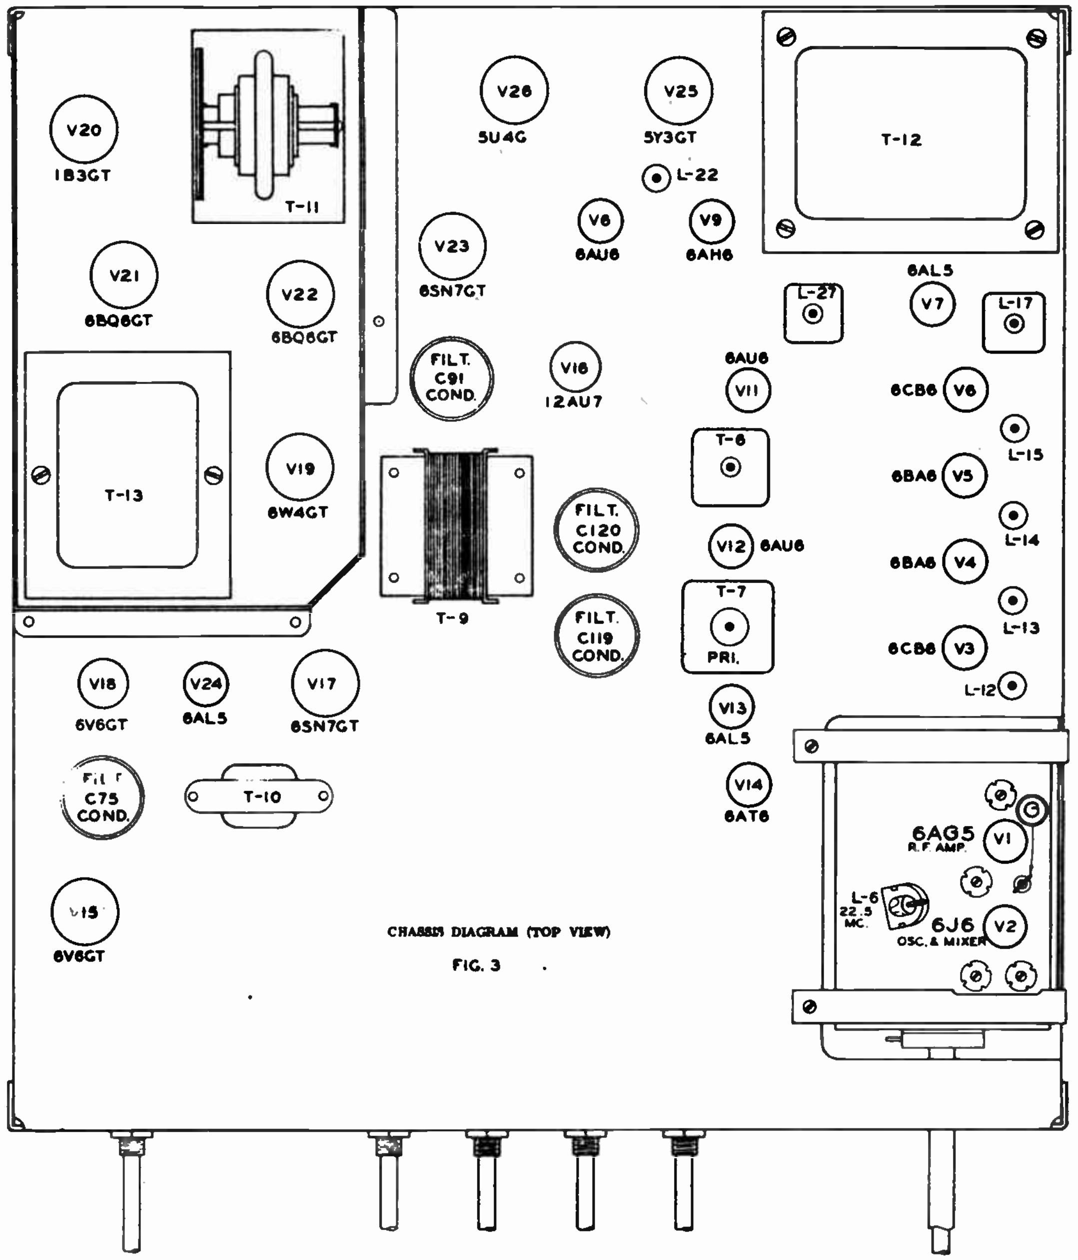
FIG. 2

CHASSIS TYPE 26SS172 & 26SS172A



CHASSIS DIAGRAM (TOP VIEW)

FIG. 3

VOLTAGE TEST SPECIFICATIONS

1. Line Voltage = 117 Volts A.C.
2. Channel Switch Position = Channel #2.
3. Brightness Control Position = Maximum Brilliance on Picture Tube.
4. Contrast Control Position = Maximum (Clockwise).
5. Horizontal and Vertical Hold Control Positions = Set correct position to lock in picture.
6. Horizontal width and Vertical Size Controls Positions = Set for Maximum Size.
7. Vertical Linearity Control Position = Set for Best Linearity.
8. Focus Control Position = Properly focused.
9. Volume Control Position = Maximum Counter-Clockwise.
10. Tone Control Position = Maximum Counter-Clockwise.
11. Instrument (Meter) used = (V.T.V.M.) Vacuum Tube Volt Meter.
12. No signal input applied to set.
13. Unless otherwise Designated All Voltages Measured In Respect To Chassis Ground.

NOTE: The points indicated by the letters A, B, C, D, E, F & G are the alignment test points referred to in the following alignment procedure. These points indicate the terminals for attaching Generator Leads and are shown in Figure 2.

(A) Pin #5 of V2 (6J6) osc. & Mixer Tube.
Apply signals here for spot I.F. alignment or I.F. sweep.

(B) Diode Load Resistor
Read D.C. output here for spot I.F. alignment.
Connect scope here for visual I.F. alignment.
Apply 4.5 Mc. here for sound I.F. trap alignment

(C) Cathode Of Picture Tube
Read A.C. output here for overall sensitivity.
Read 4.5 Mc. output here for aligning 4.5 Mc. trap.

(D) Ratio Det. Output
Read D.C. here for alignment of sound take-off trap, inter-stage sound I.F. transformer and primary of Ratio Det. Trans.

(E) Ratio Det. Balanced Output
Read D.C. here for alignment of secondary of Ratio Det. Trans.

(F) A.G.C. Line
Apply 4.5 volts bias here for visual check of I.F. or overall with oscilloscope.

(G) Apply minus 3 volts through 220K Ohms to test terminal, located between the tubes on top of R.F. Tuner (See Fig. 3).

ALIGNMENT EQUIPMENT AND TEST SET UP

TEST EQUIPMENT: In order to align and service Sparton television receivers properly the following test equipment should be available:

FIRST: AN R.F. SWEEP GENERATOR of reliable quality that performs the following functions:

A. Provides sweep outputs in the following frequency ranges:

19 to 30 Mc.	10 Mc. sweep width
40 to 90 Mc.	10 Mc. sweep width
170 to 225 Mc.	10 Mc. sweep width

B. Provides an output signal that can be varied by means of an attenuator up to a maximum of at least .1 volt.

SECOND: AN R.F. SIGNAL GENERATOR that will provide an adjustable output signal up to a maximum of at least .1 volt on the following fixed frequencies:

A. I.F. Frequencies

21.75 Mc.	Sound Trap
22.5 Mc.	1st Video I.F.Coil
25.25 Mc.	2nd Video I.F.Coil
24.25 Mc.	3rd Video I.F.Coil
23.25 Mc.	4th Video I.F.Coil
26.0 Mc.	5th Video I.F.Coil
26.25 Mc.	Picture I.F. Carrier
4.5 Mc.	Sound I.F. & Traps

B. R.F. Frequencies

Channel No.	Picture Carrier	Sound Carrier
2	55.25 Mc.	59.75 Mc.
3	61.25 Mc.	65.75 Mc.
4	67.25 Mc.	71.75 Mc.
5	77.25 Mc.	81.75 Mc.
6	83.25 Mc.	87.75 Mc.
7	175.25 Mc.	179.75 Mc.
8	181.25 Mc.	185.75 Mc.
9	187.25 Mc.	191.75 Mc.
10	193.25 Mc.	197.75 Mc.
11	199.25 Mc.	203.75 Mc.
12	205.25 Mc.	209.75 Mc.
13	211.25 Mc.	215.75 Mc.

THIRD: A CATHODE-RAY OSCILLOSCOPE of good quality that has a fairly wide band vertical amplifier and a low capacity input probe.

FOURTH: AN ELECTRONIC VOLTMETER with ranges to read 1V. DC, 10V. DC and 7V. AC at 400 cycles and 4.5 Mc.

FIFTH: A CRYSTAL CALIBRATOR that can be used for checks on the accuracy of the output frequencies of the R.F. Signal generator.

GENERAL INSTRUCTIONS: Practically all servicing with the exception of some tube replacement will require removal of the receiver chassis from the cabinet.

A convenient arrangement that makes both the top and bottom of the chassis accessible for alignment and servicing can be realized by orienting the receiver chassis in such a manner that it rests on its side and on the horizontal output shield can.

ALIGNMENT REQUIREMENTS: Under normal conditions complete receiver realignment will seldom be necessary in the field. However, a detailed description of the overall alignment procedure is included to provide all necessary information if it should be required.

In general it is not recommended that the R.F. and the converter circuits of the R.F. tuner be realigned by the service engineer unless absolutely necessary. In cases where tuner components have been damaged or where complete realignment is indicated, the R.F. tuner assembly should be removed from the chassis and sent back to the factory in exchange for a new unit which will be shipped complete with tubes. When the new R.F. unit is assembled to the chassis it will be necessary in all cases to realign L6 which is located on the tuner chassis. Normally this is the only adjustment that will be required with tuner change but a check on overall receiver alignment and sensitivity should be made for the sake of certainty and assured customer satisfaction.

EFFECTS OF TUBE REPLACEMENT ON THE ALIGNMENT OF R.F. TUNER CIRCUITS: The alignment of the R.F. and converter circuits of the R.F. tuner is critical and may be affected by a tube change. In cases where these tubes(6AG5 or 6J6) are replaced it will be necessary for the service engineer to check for satisfactory receiver operation. If realignment is indicated it can usually be avoided by selection of replacement tubes until correct receiver operation is realized.

ORDER OF ALIGNMENT: When complete receiver realignment is indicated it should be performed in the following order:

1. Sound Traps
2. Picture I.F.
3. Sound I.F. and 4.5 Mc. Trap
4. Ratio Detector Transformer
5. Retouch Picture I.F.
6. Sound and Picture I.F. Sensitivity Check
7. R.F. and Converter Circuits(not recommended)
8. Overall Sensitivity Check

PRELIMINARY ADJUSTMENTS: Before alignment the receiver controls should be adjusted to the approximated operation positions specified in the table below. The controls should remain in these positions for all checks unless otherwise specified.

Contrast Control - to center position
Brightness Control - to position where raster is visible on the kinescope
Focus Control - to position where focus is obtained
Vertical Hold - to center position
Vertical Linearity - to center position
Vertical Size - adjusted to give normal raster height
Horizontal Hold - to center position
Horizontal Size - adjusted to give normal raster width
Horizontal Centering- to center raster on tube

ALIGNMENT PROCEDURE

TEST EQUIPMENT SET UP: A certain amount of experimentation must be employed to secure a stable test set up before alignment or service of the receiver is attempted. It is recommended that the top of the test bench be covered with a sheet of aluminum to insure good grounds between the various pieces of test equipment and the receiver chassis. In general all test signal input leads should be kept away from output leads as much as possible.

SOUND TRAP ALIGNMENT: FIRST, Connect the R.F. signal generator to the grid of V-2 by means of the I.F. input adapter as shown in Figure 6.

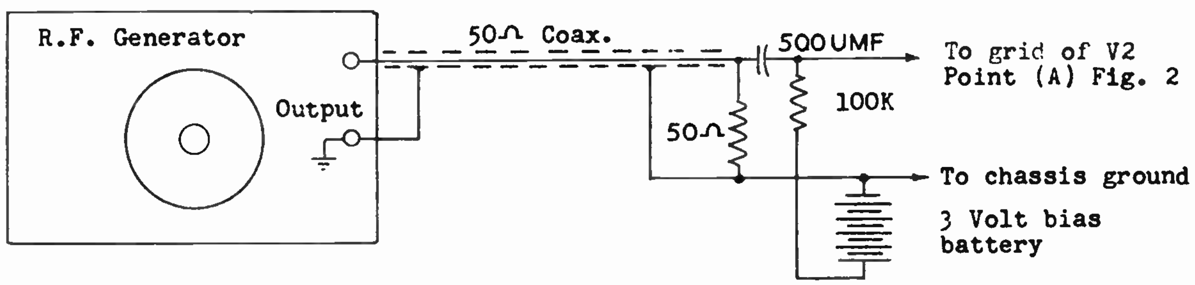

Figure 6 I.F. Input Adapter

SECOND: Set the R.F. tuner to Channel #13.

THIRD: Connect a 4.5 volt bias battery between the A.G.C. buss (Point F. Fig. 2) and chassis ground so that the voltage on the A.G.C. buss is -4.5 volts in respect to the chassis.

FOURTH: Connect the electronic voltmeter across the picture detector load resistor R37, Point B, Fig. 2 and set the voltmeter on the low D.C. volt scale.

FIFTH: Set the R.F. signal generator to the frequency shown below and tune the specified adjustment for minimum indication on the voltmeter. It is advisable to check the output of the generator with the crystal calibrator to make certain that it is exactly on frequency.

21.75 Mc. L12 (Top of chassis as shown in Figure 3)

PICTURE I.F. ALIGNMENT: FIRST: Connect the R.F. Signal generator, voltmeter and bias battery to the receiver as described in steps 1, 2, 3 and 4 of the sound trap alignment instructions.

SECOND: Set the signal generator to each of the following frequencies and peak the specified adjustments for maximum indication of the voltmeter.

22.5 Mc.	L6	(Top of tuner as shown in Fig. 3)
25.25 Mc.	L13	(Top of chassis as shown in Fig. 3)
24.25 Mc.	L14	(Top of chassis as shown in Fig. 3)
23.25 Mc.	L15	(Top of chassis as shown in Fig. 3)
26.0 Mc.	L17	(Top of Chassis as shown in Fig. 3)

SOUND I.F. ALIGNMENT: FIRST: Connect the R.F. signal generator to Point B, Fig. 2

SECOND: Set the signal generator accurately to 4.5 Mc. This is very important because the picture and sound carriers sent out from the television stations are exactly 4.5 Mc. apart.

THIRD: Connect the electronic voltmeter across C71 from Point D to ground as shown in Fig. 2
Set the voltmeter on the 10 volt scale.

FOURTH: Peak the following coils for maximum reading on the voltmeter.

L 27 Top of chassis as shown in Fig. 3.
T 6 Top of chassis as shown in Fig. 3.
Bottom of chassis as shown in Fig. 4
T 7 (Pri Ratio Det)Top of chassis as shown in Fig. 3.

RATIO DETECTOR TRANSFORMER ALIGNMENT: FIRST: Connect the R.F. signal generator to the receiver as described in Step 1 of the Sound I.F. Alignment instructions.

SECOND: Connect the electronic voltmeter from Point E, Fig. 2 to ground.
Set the voltmeter on the lowest DC scale.

THIRD: Set the signal generator output to 4.5 Mc. Adjust the secondary of T7 (Bottom view of chassis as shown in Fig. 4). Notice that it is possible to produce a positive or negative voltage indication on the meter by varying this adjustment. As the voltage swings from positive to negative, adjust T7 for zero output as indicated by the voltmeter. This point is called zero ratio detector output and indicates correct alignment of T7 transformer. If the secondary of T7 is found to be way out of alignment it will be necessary to re-peak the primary as described in the preceeding section on sound I.F. alignment.

4.5 MC. TRAP ALIGNMENT FIRST: Connect the R.F. signal generator as described in Step 1 of the sound I.F. alignment.

SECOND: Connect the electronic voltmeter from the cathode of the picture tube to ground (Point C Fig. 2)
The voltmeter must be capable of giving a reading at 4.5 Mc. at approximately 1 to 2 volts.

THIRD: Peak L22 (Top of chassis as shown in Fig. 3) for minimum output on the voltmeter.

ALIGNMENT PROCEDURE (CONT'D)

PICTURE I.F. TOUCH UP: Connect the R.F. Sweep generator output to the grid of V-2 by means of the I.F. input adapter shown in Figure 6.

SECOND: Apply bias to A.G.C. line as described in Step 3 of sound trap alignment. Set R.F. selector to Channel #13.

THIRD: Connect the oscilloscope across the picture detector load resistor R37 (Point B Fig. 2) by means of the shielded cable and the filter system shown in Figure 7.

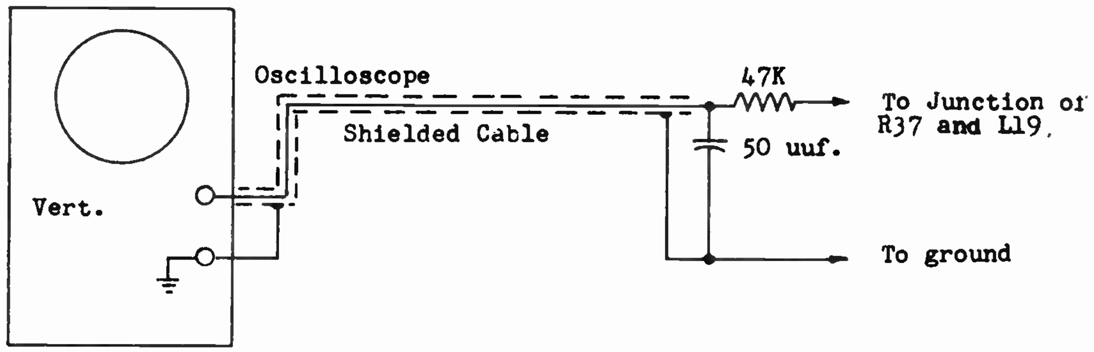

Figure 7 FILTER SYSTEM FOR SCOPE CONNECTION

FOURTH: Set the R.F. sweep generator so that it sweeps from approximately 20 to 30 Mc.

FIFTH: Adjust the oscilloscope so that the swept I.F. response is visible on the cathode-ray tube screen.

SIXTH: Loosely couple the output of the R.F. signal generator to the grid of V-2 so that the marker signals of proper frequency can be mixed in with the R.F. sweep signal.

SEVENTH: Observe the band width, relative position of the picture carrier, and flatness of the overall I.F. response curve. If necessary slightly vary the tuning of the picture I.F. coils L6, L13, L14, L15, L17 until the picture I.F. response shown in Figure 8 is obtained. The solid curve in Figure 8 depicts the ideal I.F. response while the dotted curves shown permissable variations.

ALIGNMENT PROCEDURE (CONT'D)

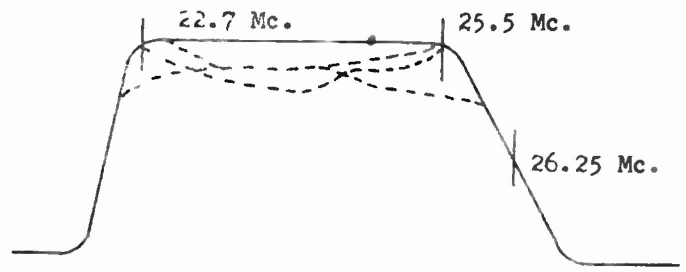

Figure 8 IDEAL I.F. RESPONSE WITH PERMISSABLE VARIATIONS

The picture I.F. carrier should appear approximately half way down the I.F. response curve as shown in Figure 8. Variation in the pix carrier position should not exceed ≠10% from the half way point.

PICTURE I.F. SENSITIVITY CHECK: FIRST: Connect the R.F. signal generator to the receiver as specified in Steps 1 and 2 of the sound trap alignment instructions.(When making sensitivity checks no bias battery is connected to the A.G.C. buss.)

SECOND: Connect the electronic voltmeter across the picture detector load resistor R37 Point A, Fig. 2 and set the meter on the low D.C. volt scale.

THIRD: Set the generator output frequency at approximately 23 Mc. Adjust the generator output until the voltmeter reads approximately 1.0 volt. Record the R.F. signal input in microvolts. Repeat the procedure with the generator output frequency set at 24.2 and 25.4 Mc. In all cases the I.F. input voltage should be 100 microvolts or less The sensitivity at the I F picture carrier 26.25 Mc. should be approximately half of the I.F. Sensitivity between 24.2 Mc. (Maximum of 100 microvolts) If the generator output is not calibrated in microvolts comparative sensitivity measurements can be made by using another receiver that is known to be in good operating condition as a standard. This applies to all sensitivity measurements and good results can be obtained if sufficient care is used.

R.F.TUNER (S.W. Co. Part No. PD93157)
Sparton Chassis types 26SS172 & 26SS172A are equipped with a standard coil R.F. tuner (Type 1311) With exception to L-6 slug (22.5 Mc.) as shown in Fig. 3, page 28, field alignment for this tuner has been purposely omitted from the alignment procedure. Factory experience dictates that this unit can not be properly aligned in the field as special test equipment is required Therefore any R.F. tuner adjustment in the field should be held to a minimum.

Field Alignment for Standard Coil tuners has appeared in some set manufacturers service manuals; it is not recommended by our Eng. Dept. After receiver analysis proves the R F. tuner to be defective, and in need of realignment the complete tuner assembly (with tubes) should be returned to our Factory Service Department for repair or replacement.

BRIEF DESCRIPTION

TELEVISION CHASSIS TYPE 26SD172 is a twenty-six tube "Deluxe" chassis with a self-contained power supply, an electro-magnet type focusing system, full range tone control, built-in adjustable Dipole antenna and uses a 17BP4A picture tube. This chassis is equipped with the Sparton Ultra-tuner for superior long range reception. The Ultra-tuner will receiver telecasts on all present channels and, with the insertion of simple tuner strips on new U.H.F. channels.

TELEVISION CHASSIS TYPE 26SD172A is equipped as described above, however, relocation of both the operating and non-operating controls accounts for the difference in chassis type designation.

NOTE: For the reason stated above this chassis may not be interchanged with chassis type 26SD172.

BRIEF DESCRIPTION

TELEVISION CHASSIS TYPE 26SS172B is a twenty-six tube "Standard" chassis with a self-contained power supply and uses a 17BP4A picture tube. This chassis is equipped with a line cord antenna and uses an Electro-magnet type focusing system.

SPECIAL NOTE

Initial production of the above chassis included a color socket, which thru use of a convertor, would have permitted the reception of color television. National Production Authority Order M-90 prohibited the use of such a device, therefore, in order to conform to the terms of Order M-90 the use of the color socket was discontinued. However the accompanying Schematic diagram includes the hook-up of the color socket.

A knock-out plug has been retained in the chassis for future use when color television is again available to the Public.

VOLTAGE TEST SPECIFICATIONS

1. Line Voltage = 117 Volts A.C.
2. Channel Switch Position = Channel #2.
3. Brightness Control Position = Maximum Brilliance on Picture Tube.
4. Contrast Control Position = Maximum (Clockwise).
5. Horizontal and Vertical Hold Control Positions = Set correct position to lock in picture.
6. Horizontal width and Vertical Size Controls Positions = Set for Maximum Size.
7. Horizontal and vertical Linearity Control Position = Set for Best Linearity.
8. Focus Control Position = Properly focused.
9. Volume Control Position = Maximum Counter-Clockwise.
10. Tone Control Position = Maximum Counter-Clockwise.
11. Instrument (Meter) used = (V.T.V.M.) Vacuum Tube Volt Meter.
12. No signal input applied to set.
13. Unless Otherwise Designated All Voltages Measured In Respect To Chassis Ground.

NOTE: The Points indicated by the letters A, B, C, E & F are the alignment test points referred to in the following alignment procedure. These points indicate the terminals for attaching Generator Leads and are shown in Figure 4 on the reverse side of this sheet.

(A) Pin #2 of 12AT7
Apply signals here for spot I.F. alignment or I.F. sweep.
Apply -3 volts bias through 100,000 Ohms.

(B) Diode Load Resistor
Read D.C. output here for spot I.F. alignment.
Connect scope here for visual I.F. alignment.
Apply 4.5 Mc. here for sound I.F. trap alignment

(C) Cathode Of Picture Tube

ALIGNMENT EQUIPMENT AND TEST SET UP

TEST EQUIPMENT: In order to align and service Sparton television receivers properly the following test equipment should be available:

FIRST: AN R.F. SWEEP GENERATOR of reliable quality that performs the following functions:

A. Provides sweep outputs in the following frequency ranges:

19 to 30 Mc.	10 Mc. sweep width
40 to 90 Mc.	10 Mc. sweep width
170 to 225 Mc.	10 Mc. sweep width

B. Provides an output signal that can be varied by means of an attenuator up to a maximum of at least .1 volt.

SECOND: AN R.F. SIGNAL GENERATOR that will provide an adjustable output signal up to a maximum of at least .1 volt on the following fixed frequencies:

A. I.F. Frequencies

21.75 Mc.	Sound Trap
22.5 Mc.	1st Video I.F.Coil
25.25 Mc.	2nd Video I.F.Coil
24.25 Mc.	3rd Video I.F.Coil
23.25 Mc.	4th Video I.F.Coil
26.0 Mc.	5th Video I.F.Coil
26.25 Mc.	Picture I.F. Carrier
4.5 Mc.	Sound I.F. & Traps

B. R.F. Frequencies

Channel No.	Picture Carrier	Sound Carrier
2	55.25 Mc.	59.75 Mc.
3	61.25 Mc.	65.75 Mc.
4	67.25 Mc.	71.75 Mc.
5	77.25 Mc.	81.75 Mc.
6	83.25 Mc.	87.75 Mc.
7	175.25 Mc.	179.75 Mc.
8	181.25 Mc.	185.75 Mc.
9	187.25 Mc.	191.75 Mc.
10	193.25 Mc.	197.75 Mc.
11	199.25 Mc.	203.75 Mc.
12	205.25 Mc.	209.75 Mc.
13	211.25 Mc.	215.75 Mc.

THIRD: A CATHODE-RAY OSCILLOSCOPE of good quality that has a fairly wide band vertical amplifier and a low capacity input probe.

FOURTH: AN ELECTRONIC VOLTMETER with ranges to read 1V. DC, 10V. DC and 7V. AC at 400 cycles and 4.5 Mc.

FIFTH: A CRYSTAL CALIBRATOR that can be used for checks on the accuracy of the output frequencies of the R.F. Signal generator.

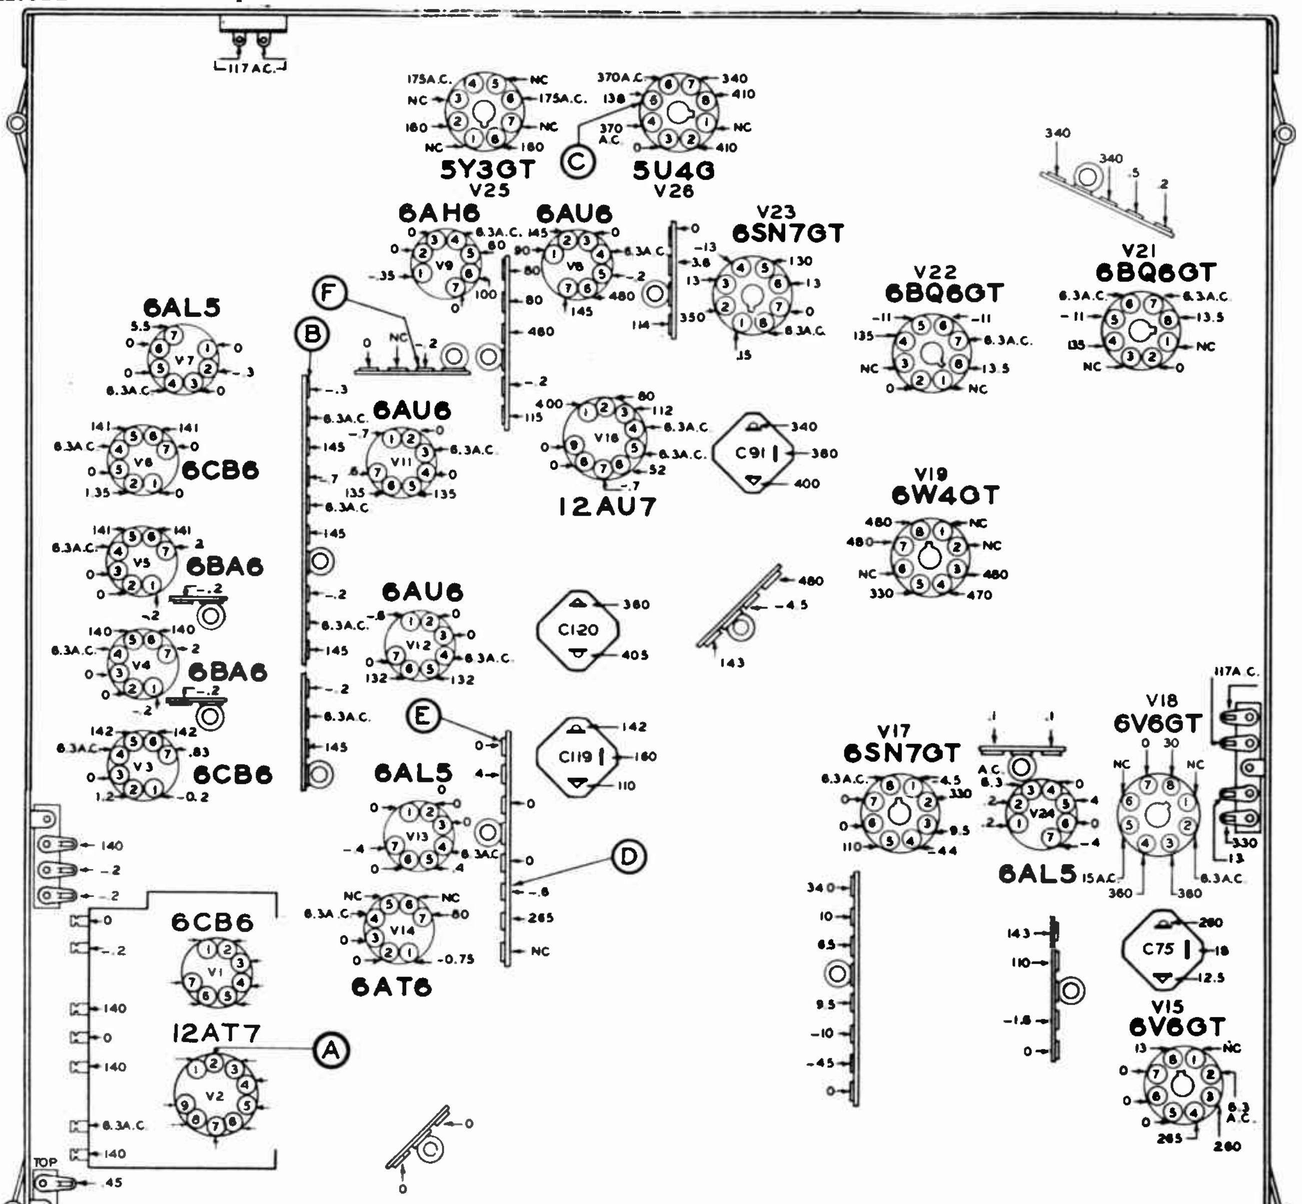
GENERAL INSTRUCTIONS: Practically all servicing with the exception of some tube replacement will require removal of the receiver chassis from the cabinet.

A convenient arrangement that makes both the top and bottom of the chassis accessible for alignment and servicing can be realized by orienting the receiver chassis in such a manner that it rests on its side and on the horizontal output shield can.
ALIGNMENT REQUIREMENTS: Under normal conditions complete receiver realignment will seldom be necessary in the field. However, a detailed description of the overall alignment procedure is included to provide all necessary information if it should be required.

In general it is not recommended that the R.F. and converter circuits of the R.F. tuner be realigned by the service engineer unless absolutely necessary. In cases where tuner components have been damaged, or where complete realignment is indicated, the R.F. tuner assembly should be removed from the chassis and sent back to the factory in exchange for a new unit which will be shipped complete with tubes.

When the new R.F. unit is assembled to the chassis it will be necessary in all cases to realign L6 which is located on the tuner chassis. Normally this is the only adjustment that will be required with tuner change but a check on overall receiver alignment and sensitivity should be made for the sake of certainty and assured customer satisfaction.

EFFECTS OF TUBE REPLACEMENT ON THE ALIGNMENT OF R.F. TUNER CIRCUITS: The alignment of the R.F. and converter circuits of the R.F. tuner is critical and may be affected by a tube change. In ceses where these tubes (6CB6 or 12AT7) are replaced it will be necessary for the service engineer to check for satisfactory receiver operation. If realignment is indicated it can usually be avoided by selection of replacement tubes until receiver operation is realized.



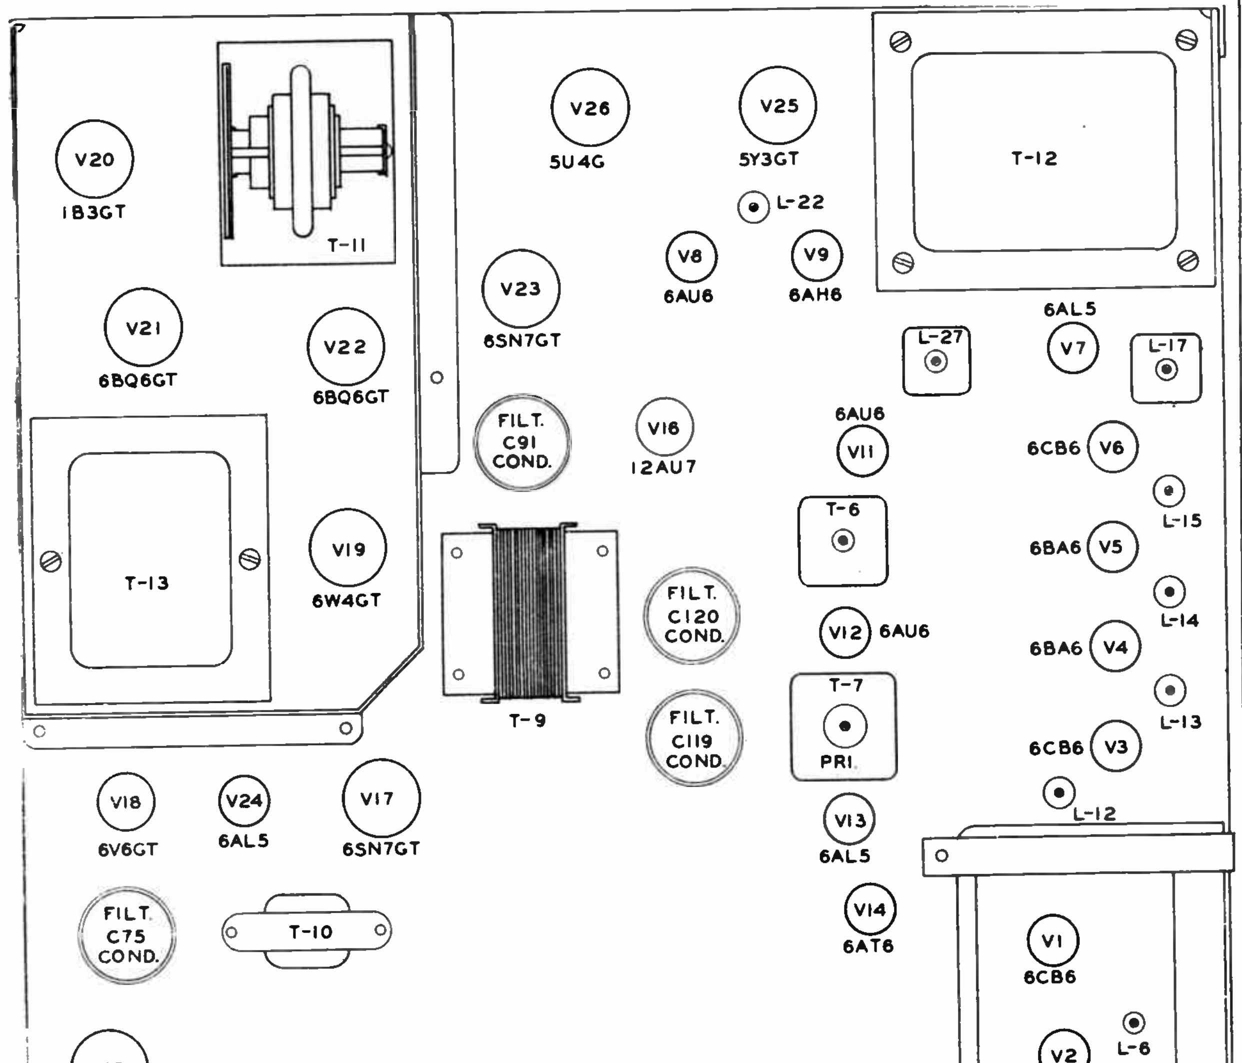
VOLTAGE CHART AND ALIGNMENT TEST POINTS

FIG. 4

ORDER OF ALIGNMENT: When complete receiver realignment is indicated it should be performed in the following order:

1. Sound trap
2. Picture I.F.
3. Sound I.F. and 4.5 Mc. Trap
4. Ratio Detector Transformer
5. Retouch Picture I.F.
6. Sound and Picture I.F. Sensitivity Check
7. R.F. and Converter Circuits(not recommended)
8. Overall Sensitivity Check

PRELIMINARY ADJUSTMENTS: Before alignment the receiver controls should be adjusted to the approximated operation positions specified in the table below. The controls should remain in these positions for all checks unless otherwise specified.



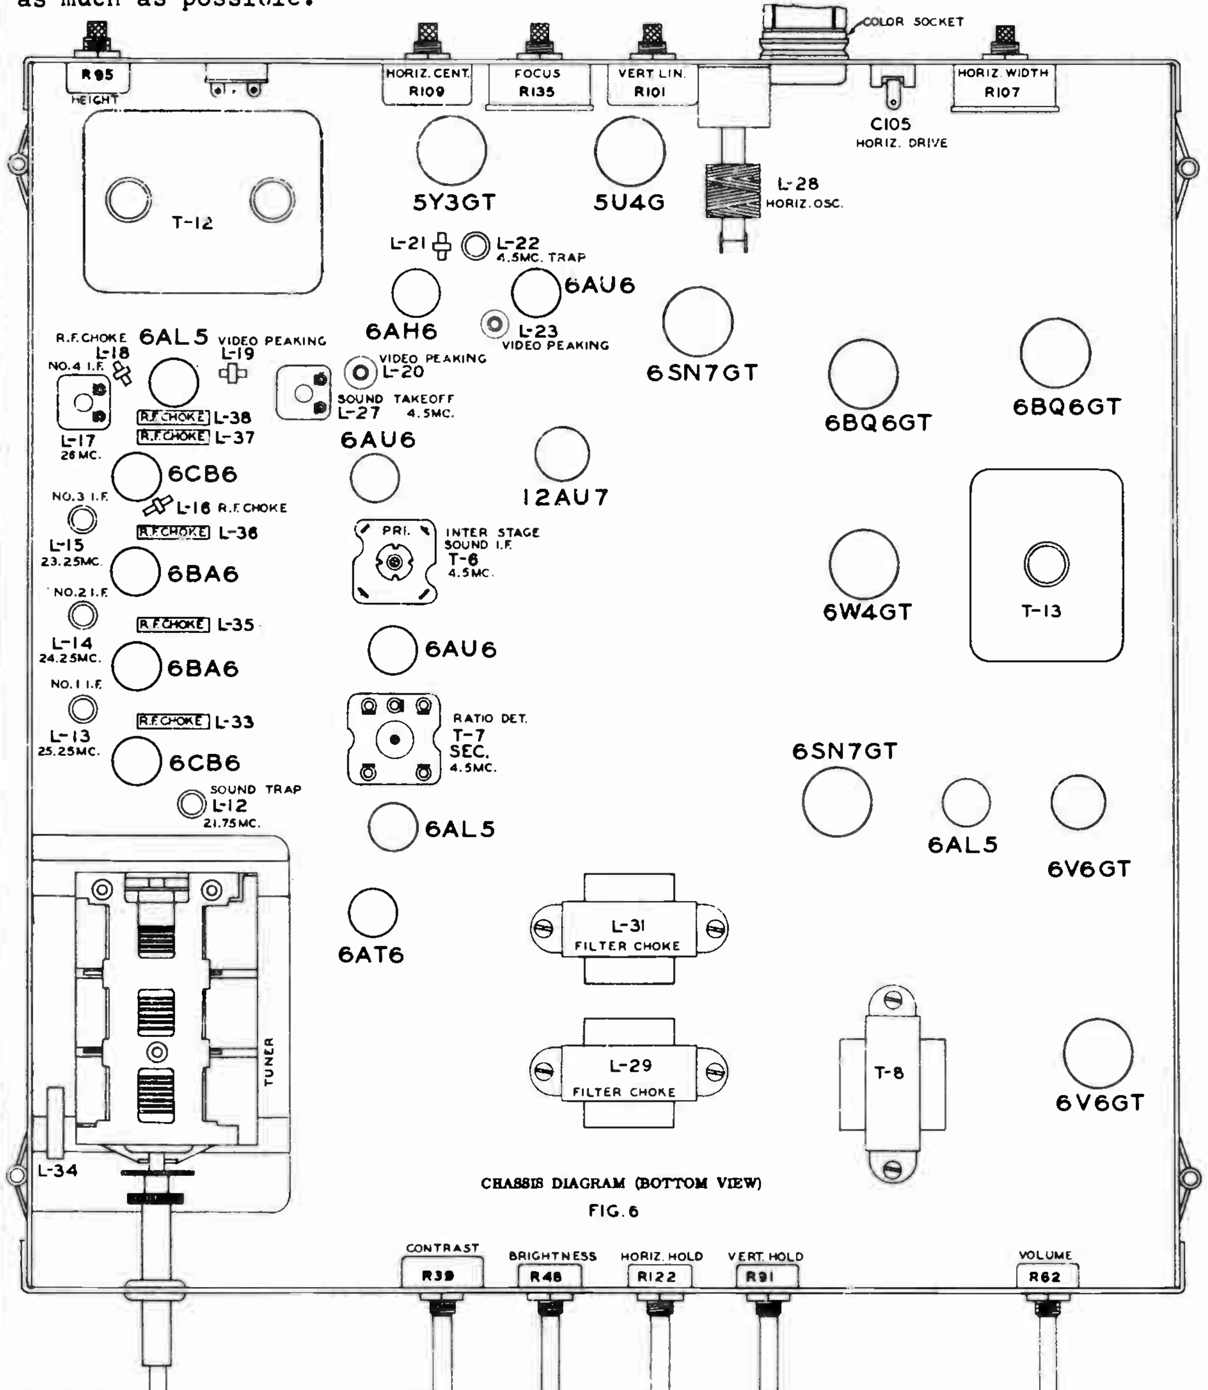
CHASSIS DIAGRAM (TOP VIEW)

FIG. 5

Contrast Control - to center position
Brightness Control- to position where raster is visible on the kinescope
Focus Control - to position where focus is obtained
Vertical Hold - to center position
Vertical Linearity - To center position
Vertical Size - adjusted to give normal raster height
Horizontal Hold - to center position
Horizontal Size - adjusted to give normal raster width
Horizontal Centering - to center raster on tube

ALIGNMENT PROCEDURE

TEST EQUIPMENT SET UP: A certain amount of experimentation must be employed to secure a stable test set up before alignment or service of the receiver is attempted. It is recommended thet the top of the test bench be covered with a sheet of aluminum to insure good grounds between the various pieces of test equipment andthe receiver chassis. In general all test signal input leads should be kept away from output leads as much as possible.



CHASSIS DIAGRAM (BOTTOM VIEW)
FIG. 6

SOUND TRAP ALIGNMENT: FIRST, Connect the R.F. Signal generator to the grid of V-2 by means of the I.F. input adapter as shown in Figure 7.

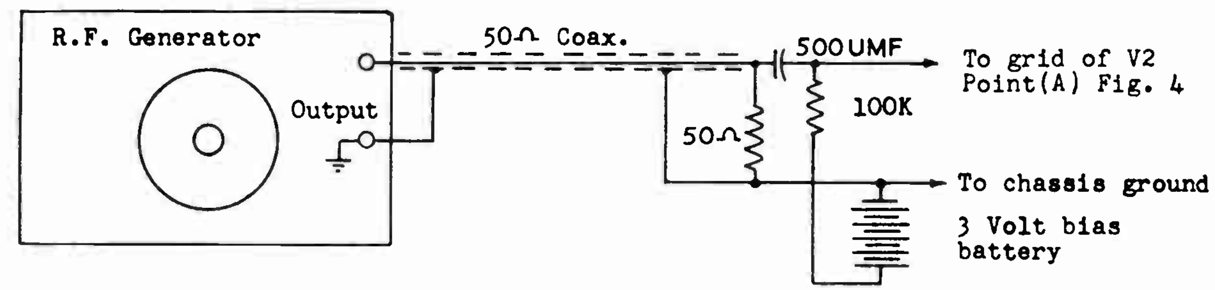


Figure 7 I.F. Input Adapter

SECOND: Set the R.F. tuner to channel #13.

THIRD: Connect a 4.5 volt bias battery between the A.G.C. buss(Point F.Fig.4) and chassis ground so that the voltage on the A.G.C. buss is-4.5 volts in respect to the chassis.

FOURTH: Connect the electronic voltmeter across the picture detector load resistor R37, Point B, Fig. 4 and set the voltmeter on the low D.C. volt scale.

FIFTH: Set the R.F. signal generator to the frequency shown below and tune the specified adjustment for minimum indication on the voltmeter. It is advisable to check the output of the generator with the crystal calibrator to make certain that it is exactly on frequency.

21.75 Mc. L12(Top of chassis as shown in Figure 5)

PICTURE I.F. ALIGNMENT: FIRST: Connect the R.F. Signal generator, voltmeter and bias battery to the receiver as described in steps 1, 2, 3 and 4 of the sound trap alignment instructions.

SECOND: Set the signal generator to each of the following frequencies and peak the specified adjustments for maximum indication of the voltmeter.

22.5 Mc.	L6	(Top of tuner as shown in Fig.5)
25.25 Mc.	L13	(Top of chassis as shown in Fig. 5)
24.25 Mc.	L14	(Top of chassis as shown in Fig. 5)
23.25 Mc.	L15	(Top of chassis as shown in Fig. 5)
26.0 Mc.	L17	(Top of chassis as shown in Fig. 5)

SOUND I.F. ALIGNMENT FIRST: Connect the R.F. signal generator to Point B. Fig. 4.
SECOND: Set the signal generator accurately to 4.5 Mc. This is very important because the picture and sound carriers sent outfrom the television stations are exactly 4.5 Mc. apart.

THIRD: Connect the electronic voltmeter across C71 from Point D to ground as shown in Fig. 4.
Set the voltmeter on the 10 volt scale.

FOURTH: Peak the following coils for maximum reading on the voltmeter.

L 27 Top of chassis as shown in Fig. 5.
T 6 Top of chassis as shown in Fig. 5 and bottom of chassis as shown in Fig. 6.
T 7 (Pri. Ratio Det)Top of chassis as shown in Fig. 5.

RATIO DETECTOR TRANSFORMER ALIGNMENT: FIRST: Connect the R.F. signal generator to the receiver as described in step 1 of the sound I.F. alignment instructions.

SECOND: Connect the electronic voltmeter from Point E, Fig. 4 to ground.
Set the voltmeter on the lowest DC scale.
THIRD: Set the signal generator output to 4.5 Mc. Adjust the secondary of T7 (Bottom view of chassis as shown in Fig. 6). Notice that it is possible to produce a positive or negative voltage indication on the meter by varying this adjustment. As the voltage swings from positive to negative, adjust T7 for

zero output as indicated by the voltmeter. This point iscalled zero ratio detector output and indicates correct alignment of T7 transformer.
If the secondary of T7 is found to be way out of alignment it will be necessary to re-peak the primary as described in the preceeding section on sound I.F. alignment.

4.5 MC. TRAP ALIGNMENT FIRST: Connect the R.F. signal generator as described in Step 1 of the sound I.F. alignment.

SECOND: Connect the electronic voltmeter from the cathode of the picture tube to ground (Point C Fig. 4)
The voltmeter must be capable of giving a reading at 4.5 Mc. at approximately 1 to 2 volts.

THIRD: Peak L22 (Top of chassis as shown in Fig. 5) for minimum output on the voltmeter.

PICTURE I.F. TOUCH UP: Connect the R.F. sweep generator output to the grid of V-2 by means of the I.F. input adapter shown in Figure 7.

SECOND: Apply bias to A.G.C. line as described in Step 3 of sound trap alignment. Set R.F. selector to channel #13.

THIRD: Connect the oscilloscope across the picture detector load resistor R37 (Point B Fig. 4) by means of the shielded cable and the filter system shown in Figure 8.

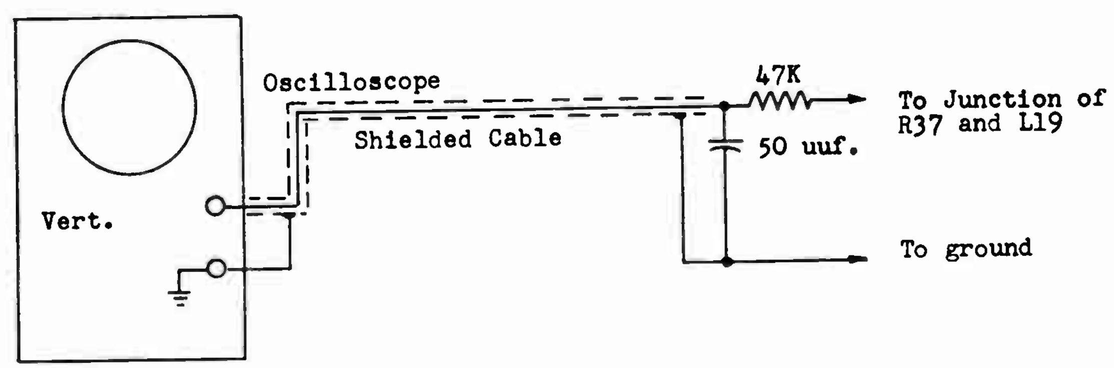

Fig. 8 FILTER SYSTEM FOR SCOPE CONNECTION

FOURTH: Set the R.F. sweep generator so that it sweeps from approximately 20 to 30 Mc.

FIFTH: Adjust the oscilloscope so that the swept I.F. response isvisible on the cathode-ray tube screen.

SIXTH: Loosely couple the output of the R.F. signal generator to the grid of V-2 so that marker signals of proper frequency can be mixed in with the R.F. sweep signal.

SEVENTH: Observe the band width, relative position of the picture carrier, and flatness of the overall I.F. response curve. If necessary slightly vary the tuning of the picture I.F. coils L6, L13, L14, L15, L17 until the picture I.F. response shown in Figure 9 is obtained. The solid curve in Fig. 9 depicts the ideal I.F. response while the dotted curves show permissable variations.

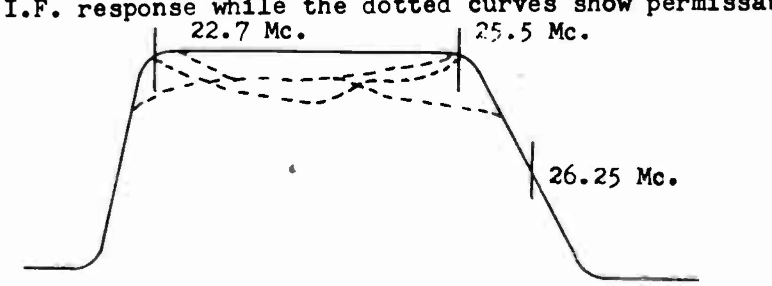

Figure 9 IDEAL I.F. RESPONSE WITH PERMISSABLE VARIATIONS

The picture I.F. carrier should appear approximately half way down the I.F. response curve as shown in Figure 9. Variation in the pix carrier position should not exceed ± 10% from the half way point.

PICTURE I.F. SENSITIVITY CHECK: FIRST: Connect the R.F. signal generator to the receiver as specified in Steps 1 and 2 of the sound trap alignment instructions. (When making sensitivity checks no bias battery is connected to the A.G.C. buss.)

SECOND: Connect the electronic voltmeter across the picture detector load resistor R37 Point A, Fig. 4, and set the meter on the low D.C. volts scale.

THIRD: Set the generator output frequency at approximately 23 Mc. Adjust the generator output until the voltmeter reads approximately 1.0 volt. Record the R.F. signal input in microvolts. Repeat the procedure with the generator output frequency set at 24.2 and 25.4 Mc. In all cases the I.F. input voltage should be 100 Microvolts or less. The sensitivity at the I.F. picture carrier 26.25 Mc. should be approximately half of the I.F. sensitivity between 24.2 Mc. (Maximum of 100 microvolts.)
If the generator output is not calibrated in microvolts, comparative sensitivity measurements can be made by using another receiver that is known to be in good operating condition as a standard. This applies to all sensitivity measurements and good results can be obtained if sufficient care is used.

TUNER ALIGNMENT: The alignment of the R.F. circuits of the tuner is a difficult and tedious task when it must be performed without benefit of special factory test equipment. For this reason it is not recommended that the re-alignment of these circuits be attempted by the service engineer. The information provided in the paragraphs below is intended primarily for descriptive purposes and cases where slight adjustments may be necessary.

An overcoupled tuned circuit is used between the R.F. plate and the converter grid. This overcoupled circuit is tracked with the oscillator. All circuits are gang condenser tuned and shunt trimmer condensers are used. The capacity curves of the gang condenser sections and the high frequency series tracking condensers have been carefully chosen to guarantee a minimum of tuning condenser mistracking. It should never be necessary to adjust the gang condenser capacity by knifing the plates.

In order to correctly track the R.F. and mixer coils to achieve maximum tuner gain and to obtain best response curve symmetry, a system of padding double tuned, overcoupled transformers is used utilizing capacity loading. Capacity loading may be achieved by using a small blade screw driver, and adding additional capacity by touching the screw driver shank with one or more of the fingers. This additional capacity severely detunes one side of the double tuned, overcoupled transformer, so that the single peaked, resonant response of the other side may be observed.

TO ALIGN THE TUNER PROCEED AS FOLLOWS: FIRST: Picture I.F. must be properly aligned.

SECOND: Connect R.F. sweep generator to antenna Terminals through 300 ohm balanced dummy antenna. Dummy antenna may consist of two 150 ohms carbon resistors, one from each terminal of the generator to the antenna terminals marked "A".

THIRD: Connect oscilloscope across the picture detector load resistor R-37 (point B Fig. 4) by means of the shielded cable and the filter system shown in Fig.8.

FOURTH: Perform the operations listed below. In each case adjust for flat wide band overall response with maximum gain as indicated on the oscilloscope screen. The shape of the overall response curve on all channels should be approximately the same as that of the video I.F. response curve shown in Fig.9. Marker pulses of proper frequency should be mixed in with the R.F. sweep input to check overall band width and relative position of the picture carrier on each channel. Always keep the R.F. input signal low so that slight variations in the tuning of the circuits are easily discernable on the oscilloscope screen. The physical location of all the adjustments is shown in Fig. 11,12 & 13.

FIRST: Rotate the tuner to the channel 6 index position.

SECOND: Capacity load the R.F. coil (first stator plate) and adjust the low band mixer trimmer so that the single peaked response curve falls midway between the R.F. carrier markers. (See Figure 10

THIRD: Capacity load the mixer coil (second stator plate) and adjust the low band R.F. trimmer, so that the single peaked response curve falls midway between the R.F. carrier markers.

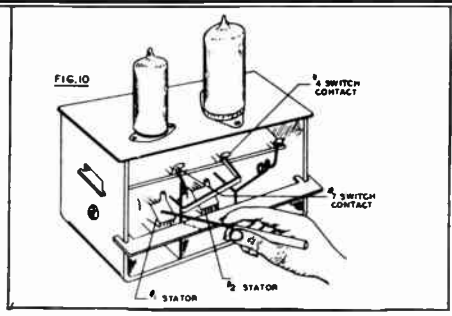

FIG. 10

FOURTH: With no loading on the double tuned circuits adjust the low band oscillator trimmer so that the channel 6 picture carrier marker falls at the 50% voltage reference level. Without loading, the response curve should have symmetrical double humps, the valley between them not being more than 30% down from the peaks.

FIFTH: Check all low band channels. The response curve should remain substantially unchanged through all channels.

HIGH BAND ALIGNMENT: FIRST: Rotate the tuner to the channel 13 index position.

SECOND: Capacity load the R.F. coil (#7 switch lug) and adjust the high band mixer trimmer so that the single peaked response curve falls midway between the R.F. carrier markers.

THIRD: Repeat step 2, loading the mixer coil(#4 switch lug) and adjust the high band R.F. trimmer.

FOURTH: With no loading on the double tuned circuits adjust the high band oscillator trimmer so that the channel 13 picture carrier marker falls at the 50% voltage reference level.

FIFTH: Check all high band channels. The response curve should remain substantially unchanged through all channels.

OVERALL PICTURE SENSITIVITY CHECK:

After alignment of the various sections of the receiver has been completed, the following overall sensitivity checks should be made. (In cases where the signal generator output is not calibrated in microvolts comparative sensitivity measurements can be made by using another receiver which is known to be in good operating condition as a standard.).

FIRST: Connect the R.F. signal generator to the receiver antenna terminals through 300 ohm balanced dummy antenna as described in step #2 of tuner alignment.

SECOND: Connect the D.C. voltmeter across R37 as previously described. Set the voltmeter on the low D.C. volts scale.

THIRD: Set the signal generator at the center frequency of the channel to be measured and tune receiver dial for maximum reading of the D.C. meter. Adjust R.F. level until meter reads 1.0 volts(contrast control in maximum clockwise position). Generator output should be 100 microvolts or less in all bands.

SOUND SENSITIVITY CHECK:

Two R.F. signal generators are required, one of which shall be frequency modulated ± 7.5 Kc. at 400 cycles.

FIRST: Connect both R.F. signal generators to the receiver antenna terminals through separate dummy antenna resistors, doubling the resistance value used for the picture sensitivity test.

SECOND: Open speaker voice coil and connect a 3.ohm audio output meter across output transformer secondary.

THIRD: Connect the D.C. voltmeter across R-37 as previously described.

FOURTH: Set the unmodulated signal generator at the picture carrier frequency of the channel desired. Set the F.M. modulated signal generator at the sound carrier frequency. Keep the two generator outputs equal at all times. Tune receiver for maximum reading of the D.C. meter and then detune toward a lower frequency until the D.C. meter reading is reduced to half. Rock dial of frequency modulated generator for maximum reading on audio meter. Set signal generator outputs for 1.0 watt reading on audio meter. Divide generator microvolts by two since there is a 6DB insertion loss due to the dummy antenna used. This sensitivity reading should be 100 microvolts or less in all channels.

MAXIMUM AUDIO OUTPUT:

With signals applied as in the sound sensitivity check above, and the output of each generator set at 10,000 microvolts, the audio power output should be 3 watts or more.

SPECIFICATIONS

Direct View Electromagnetic Picture Tube
- 17" Rectangular
- 20" Rectangular
- 21" Rectangular
- 24" Round

Operating Voltage
110-120 60 Cycles

Wattage
175 Watts

Input Impedance and Transmission Line
300 ohm balanced (between antenna terminals)
75 ohm coaxial cable may be used by connecting shield to chassis and inner conductor to either antenna terminal

Intermediate Frequencies
Video - 25.75 Mc.
Sound - 21.25 Mc.
Intercarrier Sound - 4.5 Mc.

Fuse Location
Horizontal output fuse, F_1, is located inside the high voltage enclosure.
The line fuse, F_2, is located in a fuse holder on the rear apron of the chassis.

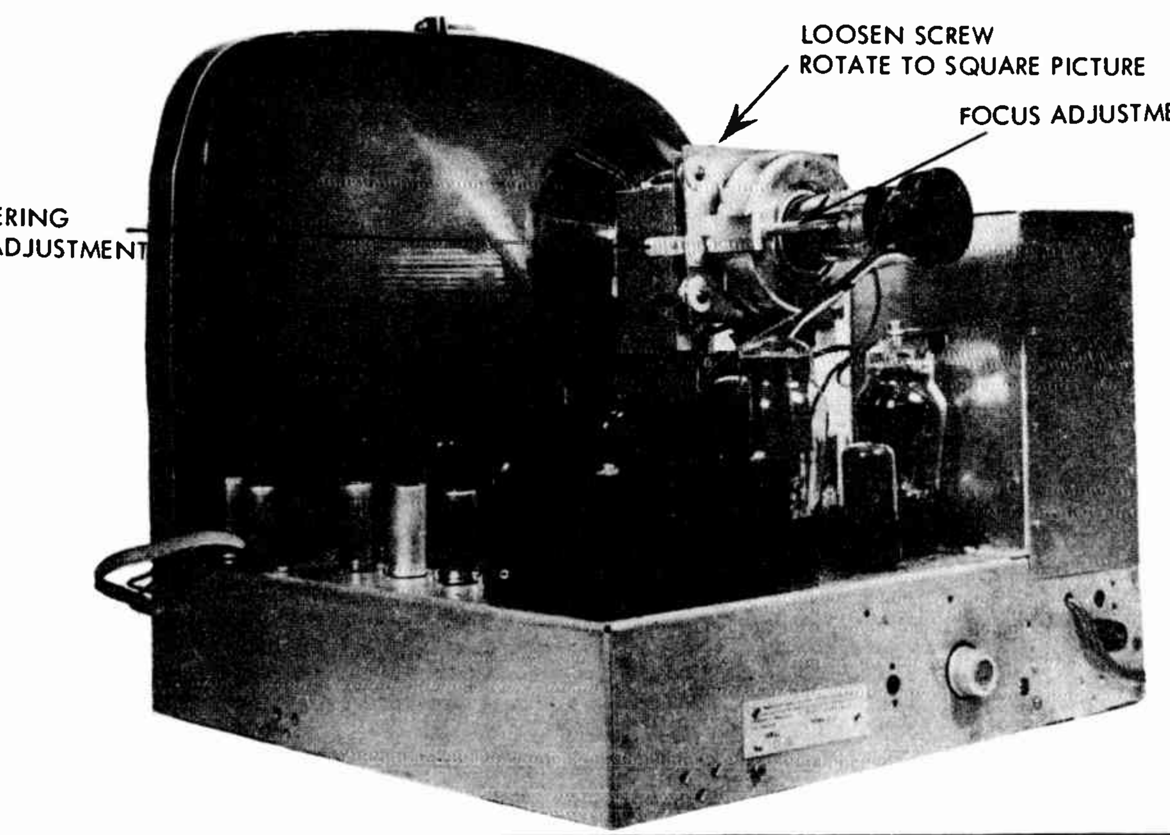
	24AP4	- 24" CRT



SPECIFICATIONS

When installing, each set should be checked for picture centering, picture tilt, shaded corners, proper size, linearity, etc., to insure best performance. It is especially important that the Ion Trap be checked, and that the Channel Slugs be adjusted upon installation or servicing of every set to insure ease of tuning. Any adjustments required should be made as described here.

For best results, all checks or adjustments should be made using a transmitted television test pattern. A mirror placed in front of the picture tube screen will be of help in observing the picture while adjusting rear chassis controls.

HIGH VOLTAGE WARNING

Operation of this receiver outside of its cabinet involves a shock hazard from the power supplies. No work should be attempted on this receiver by anyone who is not thoroughly familiar with the precautions necessary when working on the high voltage equipment.

EXTERNAL ANTENNA

When an external indoor or an outdoor antenna is required, be sure to disconnect the built-in antenna leads from the antenna terminal board, tape them and place them away from the chassis.

OPERATING THE TELEVISION RECEIVER

The controls of this receiver are operated conventionally. When tuning, carefully adjust the TUNING control for the best picture.

INDIVIDUAL CHANNEL SLUG ADJUSTMENT "A3" USING TELEVISION SIGNAL

Individual channel oscillator adjustment of every receiver should be checked upon installation or servicing. If this adjustment is properly made, it is possible to tune from one station to another by merely turning the CHANNEL control. With correct oscillotor channel adjustment, best picture will be located at the approximate center of the range of the Tuning control.

Channel slug adjustment can be made without removing the chassis from the cabinet. Adjust as follows:

a. Turn the set on and allow 15 minutes to warm up.
b. Set the CHANNEL knob for a station in operation. Set all other controls for a normal picture.
c. Set TUNING control at center of its range by rotating it approximately half-way.
d. Remove the CHANNEL and TUNING knobs.
e. Insert a 1/8" blade, NON-METALLIC screwdriver in the 1/4" hole adjacent to the channel tuning shaft. For each channel in operation, carefully adjust the channel slug for the best picture with clear detail. Be sure that the Tuning control is set at the center of its range before adjusting each channel slug. Only slight rotation of the slug will be required; turning the slug in too far will cause it to fall into the coil. (If the slug falls into the coil, remove the coil, move the retaining spring aside, lightly tap the open end of the coil until the slug slips out. Replace slug and re-set retaining spring;)

If a number of slugs are found to tune all the way in or all the way out, or if the 6J6 oscillator-mixer tube has been replaced, it may be necessary to make the "Overall Oscillator Adjustment" as discussed below.

OVER-ALL OSCILLATOR ADJUSTMENT "A1" USING TELEVISION SIGNAL

Over-all oscillator adjustment should only be necessary when replacing the oscillator-mixer tube (6J6), or when all channel slugs are off in the same direction. When replacing the oscillator-mixer tube (6J6), it is recommended that several tubes be tried to select one which will cause least oscillator frequency shift.

A1 is generally adjusted so that approximately 3/16" of screw thread is exposed.

Adjust as follows:

a. Follow steps "a", "b", and "c" above.
b. Carefully adjust trimmer C6 (figure 8) for best picture with clear detail.
c. Check and, if necessary, make individual channel adjustments as indicated above.

ION TRAP ADJUSTMENT

To properly adjust the Ion Trap, Focusing Device and the Deflection Yoke the following procedure should be followed.

The Deflection Yoke should be placed in position closest to the "bell" of the Cathode Ray Tube as far forward on the neck of the tube as is possible. The Focus Device is next in line and Ion Trap last. See Figure 1.

The antenna should be connected to the receiver, the set should be turned on, the brilliance control turned to MAXIMUM and the contrast control at MAXIMUM.

The Ion Trap should be moved forward and backward and at the same time rotated to achieve the brightest raster on the face of the CRT.

Reduce the brilliance control to a point slightly over normal brightness and adjust the Focus Control on the rear of the Focus Device with a non-magnetic screwdriver for clearest and sharpest horizontal sweep lines. The Ion Trap should then be readjusted slightly for the brightest response on the face of the tube.

The Focus Device aperture should be moved to secure a complete raster centered and with no corners cut off.

Finally the Deflection Yoke should be rotated to "square" the raster with the chassis as a reference. The screws on the yoke brackets should then be set.

HEIGHT, WIDTH AND LINEARITY

To adjust the overall size and linearity of the picture it is almost mandatory that a pattern transmitted from a local station be used. Linearity adjustments, particularly, cannot be accurately made on moving transmissions. It should also be remembered that in areas where more than one station is being received, that pictures transmitted from different stations will vary slightly in size. The smallest transmitted picture should be made to fill the area delineated by the mask.

The first step in linearity and size adjustment is to turn the Width Control (rear of chassis) all the way in. (clockwise)

The Horizontal Drive trimmer should then be adjusted for the best compromise between maximum brightness and good horizontal linearity. Misadjustment of the Horizontal drive condenser will show as bright vertical bars on the left hand side of the picture. The Width Control should then be backed out until the picture is the correct width.

Vertical Linearity and height adjustment are made in the conventional manner. It will be noted that there is some interaction between these controls.

HORIZONTAL OSCILLATOR ADJUSTMENT

The set should hold horizontal sync over approximately one turn of the horizontal hold control. This will vary with signal strength of the received station. The control will bind at the extreme ends of its rotation. Do not attempt to force it to turn after binding is encountered or serious damage will result. If the set does not hold at a point in the center of the control range it indicates trouble in the horizontal oscillator or sync phase detector.

PICTURE TUBE REPLACEMENT

Important: After replacing any picture tube, be sure to make all deflection adjustments -- Picture Centering, Deflection Yoke, and Ion Trap -- Especially note comments on picture centering.

WARNING: Because of the high 2nd anode voltage used (approximately 12KV) and the possibility of danger of implosion due to high vacuum, the following precautions should be noted when removing or replacing picture tubes:

a. Before handling a picture tube, remove the 2nd anode static charge from both the picture tube and the 2nd anode connector by shorting them to chassis.
b. Shatterproof goggles and heavy gloves should be worn while handling or installing a picture tube.
c. Always handle the picture tube very carefully. DO NOT pick the tube up by the neck.

TELEVISION ALIGNMENT PROCEDURE

GENERAL

Complete alignment consists of the following individual procedures. Complete alignment should be performed in this sequence.

a. IF Amplifier Alignment.
b. 4.5 MC Sound IF Alignment.
c. RF and Mixer Alignment.
d. Overall RF and IF Response Curve Check and High Frequency Oscillator Alignment.

TEST EQUIPMENT

To properly service this receiver, it is recommended that the following test equipment be available. Note: Equipment below may be available as a single unit, except for the vacuum tube voltmeter.

SWEEP GENERATOR

Sweep generator must provide sweep frequencies from
18 to 30 MC range: 10 MC sweep width.
50 to 90 MC range: 10 MC sweep width.
170 to 225 MC range: 10 MC sweep width.
Output: adjustable; at least one-tenth volt maximum.
Output impedance: 300 ohms balanced to ground.
Sweep generator should preferably have a built-in marker generator with calibration crystal for checking dial accuracy.

SIGNAL GENERATOR with crystal calibrator which can also be used as a marker generator.
4.5 MC frequency.
18 to 30 MC frequency range.
50 to 90 MC frequency range.
170 to 225 MC frequency range.
Must have a built-in calibration crystal for checking dial accuracy.

OSCILLOSCOPE

Standard oscilloscope, preferably one with a wide band vertical deflection, vertical sensitivity at least .5 volt peak-to-peak per inch.

VACUUM-TUBE VOLTMETER

Standard Vacuum-tube Voltmeter with high resistance input and low voltage DC Range (3 volts or less). In addition, a zero center low voltage range will be found useful.

ALIGNMENT TOOLS

An alignment tool kit consisting of one metallic and one non-metallic screwdriver is necessary.

SWEEP GENERATOR NOTE

A sweep generator which does not have constant output voltage and reasonably linear sweep frequency distribution, will produce curves which are widely different from the "IF" Response Curve" or Overall RF and IF Response Curve" Shown in the following pages. If repeated difficulty is encountered in obtaining these curves, the sweep generator should be checked. A simple check is to observe the response curve for a set that is known to be in alignment.

Before suspecting the generator, be sure the alignment instructions in this manual have been followed carefully.

IF AMPLIFIER ALIGNMENT

a. Disconnect antenna; connect jumper wire across terminals.
b. Set receiver to channel 13 or other unassigned high channel to prevent interference during IF alignment. Set Picture control fully to right.
c. Allow about 15 minutes for receiver and test equipment to warm up.

Step	Signal Gen. Frequency (MC)	VTVM and Signal Generator Connections	Instructions	Adjust
1	25.2	VTVM high side to test point "T", low to chassis. R.F. gen. high side to floating tube shield on 6J6. Low to chassis.	Use VTVM 3 volt DC scale. Adjust signal generator to maintain approximately 1 volt output.	L4 & L2 for Max.
2	23.0			L1 & L3 for Max.
3	To insure correct I.F. alignment, make the "I.F. Response Curve Check" given below.			

IF RESPONSE CURVE CHECK

(Using sweep generator and oscilloscope with sweep input to RF Mixer V2).

Differences in tube gain and component values affect IF response. These differences are not apparent in alignment of IFs when using a signal generator and VTVM (single frequency alignment); hence it is preferable that an IF response curve check be made after completion of the IF amplifier alignment.

The IF response curve check can be made as indicated directly below. However, also note that a better check can be made by feeding the sweep signal through the entire RF and IF system as given under "Overall RF and IF Response Curve Check (Step 1)". The overall check should be made after making all other alignments.

a. Make all control settings and connections as given in "a" through "c" the IF amplifier alignment chart above.
b. Connect oscilloscope* between point "T" and chassis ground, see fig. 4. Keep leads away from receiver.
c. Connect sweep generator high side to tube shield of 6J6 (V2) osc-mixer tube. Be sure to insulate tube shield from chassis. Connect sweet generator low side to chassis close to 6J6 tube base. Set sweep generator to sweep the IF band pass (19 to 29 MC).
d. If sweep generator does not have a built-in marker generator, loosely couple marker generator high side to the sweep generator lead connected to tube shield on tuner; low side to chassis ground.

To avoid distortion of the response curve, keep the sweep generator and marker generator outputs at a very minimum.

Marker pips should be just kept barely visible. To minimize distortion, set sweep generator output for VTVM reading of approximately .6 volt DC, measured between test point "T" and chassis. Connecting a 1-1/2 volt battery (negative to AGC Line, positive to chassis) will allow greater signal input without distorting the response curve.

e. Check curve obtained against the ideal IF response curve shown in figure 3. Since it is not always possible to get ideal curves, it should be noted that the height of opposite peaks should be within 30% of each other. The dip or valley in the center of the curve should not be greater than 30% down from the highest peak of the curve. Check video and sound IF carrier points by means of marker generator. It is important that marker pips be in the proper location on the response curve. The 25.75 MC marker, should be 50% below the highest peak on the high frequency side of the curve. The 22 MC marker should be at the opposite side of the response curve, located approximately 85% below the highest peak. The 21.25 MC marker should be located at least 95% below the highest peak, and may or may not be visible.

Consistent with proper band width and correct location of markers, the response curve should preferably have maximum amplitude, symmetry, and flat top appearance.

If the procedure given has been carefully followed and the response curve obtained differs greatly from the curve shown, repeat the IF Amplifier Alignment, making sure generator frequencies are precise and adjustments are accurately made.

***OSCILLOSCOPE NOTE**

• In dealing with RF and IF response curves, it is well to remember that an inverted or mirror image may result, depending on the sweep generator and oscilloscope used. The general waveform should still be identical.
When using a wide band oscilloscope for alignment, marker pips will be more distinct if condenser from 100 to 1,000 mmfd. is connected across the oscilloscope input. Caution: Use the smallest condenser possible, since too high a capacity will affect the shape of the response curve.

ALIGNMENT HINT

After becoming familiar with alignment procedure, some servicemen simplify subsequent alignment of sets by merely using the essential alignment data given in figures below.

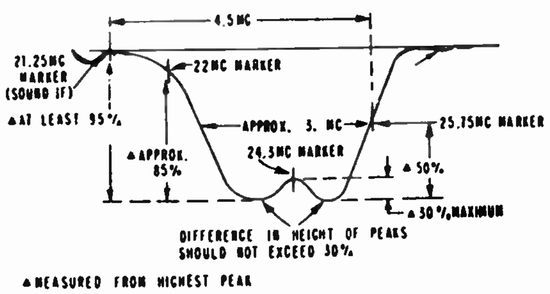

Figure 3 IF Response Curve.

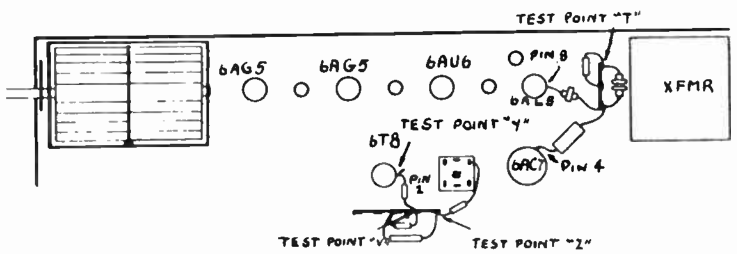

Figure 4 Bottom View Showing Test Point Connections.

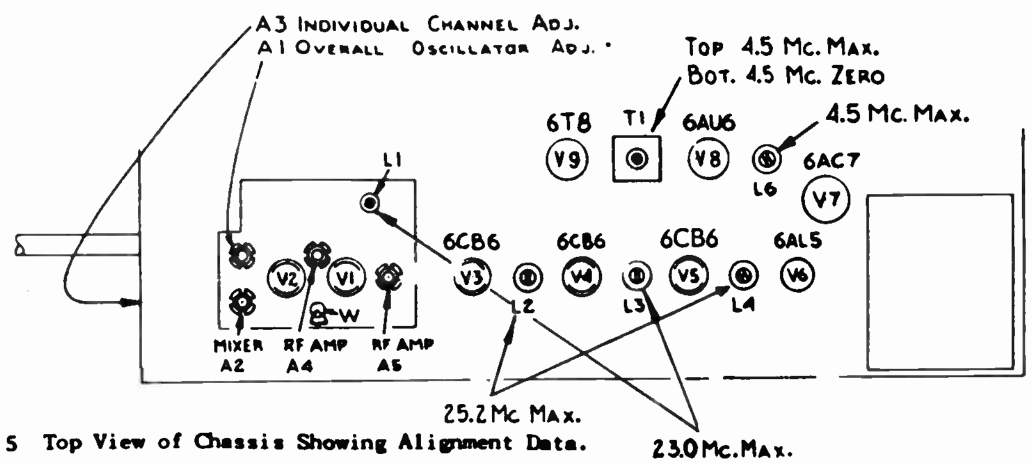

Figure 5 Top View of Chassis Showing Alignment Data.

4.5 MC SOUND IF ALIGNMENT

a. Disconnect antenna. Connect jumper wire across terminals.
b. Connect signal generator high side to Pin 4 V7, connect low side to chassis.
c. Allow about 15 minutes for receiver and test equipment to warm up.
d. Set Picture control fully to the right (clockwise).

Step	Signal Gen. Freq. (MC)	VTVM Connections	Instructions	Adjust
1	Since the transmitted video and sound carriers have an accurate 4.5 MC frequency difference, it is adviseable to use a TV station signal instead of a signal generator for accurate alignment of steps below. When using a television signal, it may be necessary to use a higher scale on the VTVM. (30V) IMPORTANT: When using a signal generator, be sure to check it against a crystal calibrator or other frequency standard for accurate frequency calibration at 4.5 MC. Accuracy required is within one kilocycle.			
2	4.5 unmodulated or AM modulated. See step 1 for use of station signal.	High side to test point "Y"; common to chassis.	Use 3 volt DC scale on VTVM. Keep VTVM leads well separated from signal generator (if used) and chassis wiring.	L6 and top of T1 for maximum (keep reducing generator output to keep VTVM at approx. 1 volt).
3		High side to test point "Z" common to test point "V"	Use 3 volt zero center scale on VTVM, if available. Keep VTVM leads well separated from signal generator (if used) and chassis wiring.	Bottom of T1 for zero on VTVM (the correct zero point is located between a positive and a negative maximum).

(See MC Chart, Fig. 6. RF Response Curve, Fig. 7. Front view of T V Tuner and Fig. 8. Top of TV Tuner, Showing Adjustment Location) Fig. 4 For Test Point Location.

RF AND MIXER ALIGNMENT

a. If used earlier, disconnect 1-1/2 volt battery.
b. Disconnect antenna from receiver.
c. Connect sweep generator to antenna terminals. If sweep generator does not have a built-in marker generator, loosely couple a marker generator to the antenna terminals. To avoid distortion of the response curve, keep sweep generator output at a minimum, marker pips just barely visible.
d. Connect oscilloscope through a 10,000 ohm resistor to test point "W" on tuner (Fig. 8). Keep scope leads away from chassis.
e. Allow about 15 minutes for receiver and test equipment to warm up.

Step	Marker Gen. Freq. (MC)	Sweep Gen. Frequency	Instructions
1	205.25 (Video Carrier) 209.75 (Sound Carrier)	Sweeping Channel 12	Check for curve resembling RF Response Curve shown below. If necessary, adjust A8, A9 and A10 (figure 9) as required. Note that adjusting A9 will shift the center of the response curve in relation to the video and sound carrier markers. A8 and A10 should be alternately adjusted for best gain with flat top appearance. Consistent with proper band width and correct marker location, response curve should have maximum amplitude and flat top appearance.
2	See frequency table below. Set the sweep generator to sweep the channel to be checked. Set the marker generator for the corresponding video carrier frequency and sound carrier frequency.		Check each channel operating in the service area for curve resembling RF Response Curve shown below. In general, the adjustment performed in step 1 is sufficient to give satisfactory response curves on all channels. However, if reasonable alignment is not obtained on a particular channel, (a) check to see that coils have not been intermixed, or (b) try replacing the pair of coils for that particular channel, or (c) repeat step 1 for the weak channel as a compromise adjustment to favor this particular channel. If a compromise adjustment is made, other channels operating in the service area should be checked to make certain that they have not been appreciably affected.

OVERALL RF and IF RESPONSE CURVE CHECK (Step 1) and HF OSCILLATOR ALIGNMENT (Step 2)

(Using sweep generator and oscilloscope.)

IMPORTANT

Since HF Oscillator alignment requires absolute frequency accuracy, a station signal is generally best suited for alignment of the individual channel oscillator slugs A3. The procedure for using a station signal (and without removal of chassis) is given in "Individual Channel Slug Adjustment Using Television Signal" on page 1.

The procedure for HF Oscillator alignment with an oscilloscope and a sweep generator is given below.

a. Disconnect antenna.
b. Disconnect signal generator and VTVM (if used earlier).
c. Set the Tuning control at half rotation by rotating it approximately 150° as shown in Figure 7.
d. Connect sweep generator to antenna terminals. If sweep generator does not have a built-in marker generator, loosely couple a marker generator to the antenna terminals. To avoid distortion of the response curve, keep sweep generator output at a minimum, marker pips just barely visible. Connecting a 1-1/2 volt battery (negative to AGC Line; positive to chassis) will allow greater signal input without distorting response curve.
e. Connect oscilloscope between point "T" and chassis ground (see Figure 4). Keep oscilloscope leads away from chassis.
f. Allow about 15 minutes for receiver and test equipment to warm up.
g. When adjusting A3, use a NON-METALLIC alignment screwdriver with a 1/8 inch blade.

Step	Marker Gen. Freq. (MC)	Sweep Gen. Frequency	Instructions
1	Sweep the RF band pass (channel 13 or other unassigned high channel) and check the shape of the overall response curve obtained against the ideal curve shown below. If shape of curve is not within limits shown, it will be necessary to repeat the IF Amplifier Alignment. The IFs must be accurately aligned before correct oscillator adjustment can be made.		
2	See frequency table on page 11. Set the sweep generator to sweep the channel to be checked. Set the marker generator for the corresponding video carrier frequency and sound carrier frequency. Marker generator must have, or be used with, a calibrating source providing an accuracy of at least .05%.		Set the Tuning control at half rotation (see figure 7). Check to see whether oscillator alignment is required by comparing the location of the video and sound carrier markers (sound carrier marker may or may not be visible) on the response curve obtained for each channel with the "Overall RF and IF Response Curve" shown below. Note whether mis-alignment is evident on a major number of channels or on only a few channels. *If the markers for a major number of channels* are far off in the same direction, adjust the overall oscillator adjustment A1 (on channel 13 or other unassigned high channel) so that the video carrier marker is located as shown in the response curve given below. (If the video carrier marker is at the proper point on the curve, the sound carrier marker should locate at the proper point on the curve.) Be sure the Tuning control is at half rotation while making this adjustment. Recheck all channels individually for proper marker location. *If only individual channel adjustment is required,* adjust the particular individual channel slug A3, (using a NON-METALLIC alignment tool with a 1/8" blade) so that the video carrier marker is located as shown in the response curve given below. Only slight rotation of the slug will be required; turning the slug in too far will cause the slug to fall into the coil.[1] (If the video carrier marker is at the proper point on the curve, the sound carrier marker should locate at the proper point on the curve.) Be sure the Tuning control is at half rotation while making this adjustment.
3	To insure best reception and ease of tuning, a "touchup" adjustment of the individual channel slugs A3, using the station signal from each of the stations in the service area, must be made, preferably in the customer's home. See "Individual Channel Slug Adjustment Using Television Signal"		

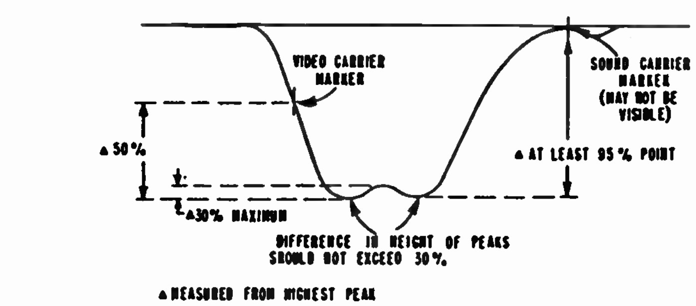

Fig. 9 Overall RF and IF Response Curve.

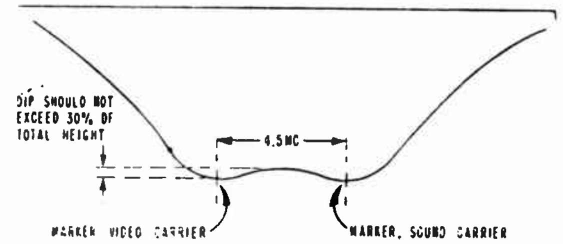
[1] If an oscillator slug should fall into a coil, remove the coil, move the slug retaining spring aside, lightly tap the open end of the coil against a solid object until the slug slips out. Replace slug and set the retaining spring into its cut-out slot.

Channel Number	Channel Freq. MC	Video Carrier, MC	Sound Carrier, MC
2	54- 60	55.25	59.75
3	60- 66	61.25	65.75
4	66- 72	67.25	71.75
5	76- 82	77.25	81.75
6	82- 88	83.25	87.75
7	174-180	175.25	179.75
8	180-186	181.25	185.75
9	186-192	187.25	191.75
10	192-198	193.25	197.75
11	198-204	199.25	203.75
12	204-210	205.25	209.75
13	210-216	211.25	215.75



Full skirt of curve will not be visible unless generator sweep width extends beyond 10 MC.
Figure 6. RF Response Curve.

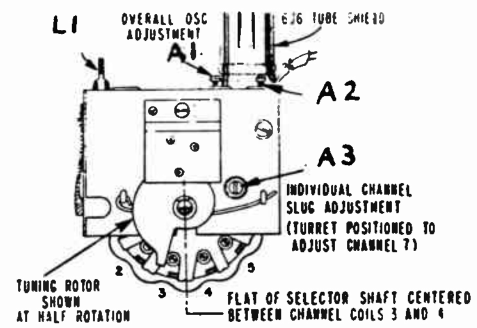


Fig. 7. Front View of TV Tuner.

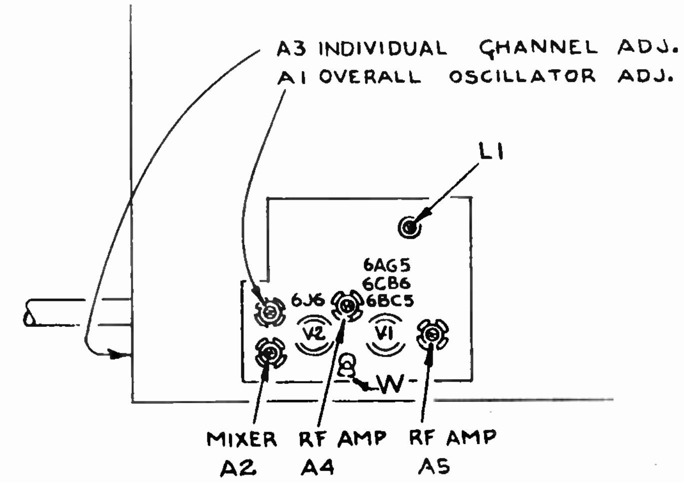

Figure 8. Top of TV Tuner, Showing Adjustment Location.

TELEVISION TUNER SERVICE

GENERAL

The TV tuner is a sub-chassis consisting of an RF amplifier stage and a mixer-oscillator stage.

Three different RF amplifier tubes, either 6AG5, 6BC5, or 6CB6, are used in this tuner. Although these tubes have similar characteristics and are generally interchangeable, it is advisable to check the RF amplifier curve with a sweep generator and oscilloscope after replacement. A dual triode 6J6 tube is used in the mixer-oscillator stage.

Channel selection is accomplished by rotation of the tuner turret assembly, which has a separate set of two coils for each of the 12 television channels. Each set consists of an antenna coil in one assembly, and a mixer-oscillator coil in another. Coils are the snap-in type. Coils can be identified as to channel by the number stamped on the outside of the coil assembly. A Tuning control permits fine adjustment of oscillator frequency.

The high frequencies used in television make it necessary that extreme care be exercised in servicing tuners.

Location and lead dress of components and wiring are usually very critical. Wiring leads, acting as small inductances or capacities, may appreciably alter electrical characteristics of critical circuits at high frequencies.

Parts location and ground connections should be as originally made. When replacing components, *it is important that they be replaced with parts of identical electrical characteristics and physical size.* Refer to parts list for temperature coefficients, tolerances, and other essential description.

Note resemblance between some ceramic condensers and resistors. If in doubt, check Schematic.

Also note that replacement of tubes (especially 6J6 oscillator-mixer tube) may cause some slight detuning of tuner circuits. This is due to the inherent differences of inter-electrode capacitances. When replacing 6J6 tube, it is recommended that several tubes be tried in order to select a tube which will cause least oscillator frequency shift. This is easily checked by noting the amount of rotation of the Tuning control required to tune in the television signal. It is recommended that this check be made on the high channels. Make individual channel slug adjustments as instructed on page

Channel snap-in coils must be handled with care. Do not disturb coil windings. Also be sure the coils are properly paired for the indicated channel number, and that coils follow proper sequence when reassembled in the turret drum. For proper reference of tuner shaft in relation to coil position refer to figure 7.

TUNER REPLACEMENT

Replacement of the complete tuner should generally never become necessary since electrical and mechanical parts are easily replaceable.

TUNING CONTROL

The Tuning control is a variable dielectric type condenser. The normal tuning range of the Tuning control for high channels is plus or minus 3 MC, for low channels plus or minus 1.5 MC.

Slight rubbing of the dielectric rotor of M104 against the grounded stator plate M107 is intentional, in order to avoid vibration with resulting microphonics. However the dielectric rotor should not be allowed to contact the circular disc riveted to the body of the tuner.

The Tuning control is permanently set at the factory and cannot be readjusted for frequency tuning range.

REMOVING CHANNEL COILS

Insert a screwdriver blade between the coil retainer spring and the turret end plate. Twist the blade away from the turret and lift the end of the coil upward.

CLEANING CONTACTS

Remove several sets of coils from turret and rotate turret to position making contact points of contact plate accessible for cleaning.

Using a small, stiff brush and carbon tetrachloride, clean contact surfaces of stationary contacts.

Remove accumulated dust or grease from stationary contacts and contact plate with a soft canvas cloth dampened with carbon tetrachloride. Accumulated rosin may be removed with a soft cloth dampened with alcohol.

Clean contact surfaces of rotating coils in same manner.

TUNER LUBRICATION

In general the lubrication applied to points of wear or friction at time of manufacture should make lubrication seldom, if ever necessary. However, should tuner lubrication become necessary, it is important that the correct amount and type of lubricant be used.

Using a clean brush, apply a film of switch contact oil, Viscosity Oil Co. #7069) to the surfaces of the coil contacts and stationary contact points.

Lubricate bearing surfaces of all other moving parts with light vaseline or preferably Viscosity Oil Co. #8857 lubricant.

CAUTION: Do not use lubriplate or any similar lubricant containing zinc or cadmium.

ADJUSTING CONTACT SPRINGS

Should the stationary contact springs make poor contact due to insufficient tension, remove several sets of coils from the turret. Rotate the turret to position making the bottom of the contact strip accessible for observation. With a narrow blade screwdriver, adjust the contact spring tension by carefully bending the spring inward until highest point on the spring extends about 9/64 of an inch above the plastic surface of the contact plate. With correct tension of the contact spring, the spring should clear the flat surface of the turret coil by about 1/64 of an inch.

OSCILLATOR SLUGS IN TOO FAR

If HF oscillator slugs "fall into" coil form, remove the channel coil, move the slug retaining spring M112 aside, and tap the coil assembly until the slug slips forward. Set the slug retaining spring into position; it should rest firmly against the slug.

REMOVING TUNER TURRET ASSEMBLY

a. Remove retaining bracket M107 in front of the tuner.
b. Remove rotor shaft assembly M104, rotor contact spring M124 and fibre washer M113. For reassembly, note order of parts removal.
c. Remove front and rear turret retaining springs M125 by pressing straight end away from tab on chassis.
d. Using a screwdriver blade at the side of the tuner, press the detent spring M122 and roller M121 away from the turret detent plate.
e. Grasp tuner shaft and slip out of end plate bearings.

REPLACEMENT OF THE UNGROUNDED STATOR PLATE OF TUNING CONTROL

Stator plate M118 is replaced with wiring lead and trimmer condenser C5 attached, because it is difficult to solder the wire lead to the silver plated surface on the ceramic stator plate disc.

To replace the stator plate, remove the turret assembly. Remove mounting rivets from stator plate by drilling out or clipping them out with diagonal wire cutters. Remove trimmer screw M115 and locking nut M114 from trimmer condenser C5. Unsolder wiring lead connecting trimmer to terminal on contact plate.

Assemble the replacement stator plate (M118) by placing the ceramic button over the 5/8" hole in the chassis with the wiring lead extending into the chassis. Place the mounting bracket over the ceramic button and mount securely using #4x3/16 round head machine screws with #4-40x3/16 hex nuts and #4 shake proof lock washers. Mount trimmer condenser C5 in chassis and solder wire lead to its original terminal on the contact plate making this lead as short as possible. Dress wiring lead from ceramic stator plate to trimmer condenser C5 so it does not come in contact with the turret drum. After replacement of the stator plate, adjust trimmer condenser C5 (overall oscillator adjustment).

REMOVING CONTACT PLATE ASSEMBLY M123

a. Remove turret.
b. Remove the mounting screws at the front and rear of Contact Plate and Bracket Assembly M123.
c. Unsolder both ends of contact plate assembly. Press outward the front and rear tuner chassis end plates.
d. To free contact plate assembly, release the contact plate tabs by pushing them away from the slots in the end plates.
e. Unsolder all connections to contact plate. Unsolder the solder joint holding contact plate to the center partition of the tuner chassis.
f. Reassemble in the same manner.

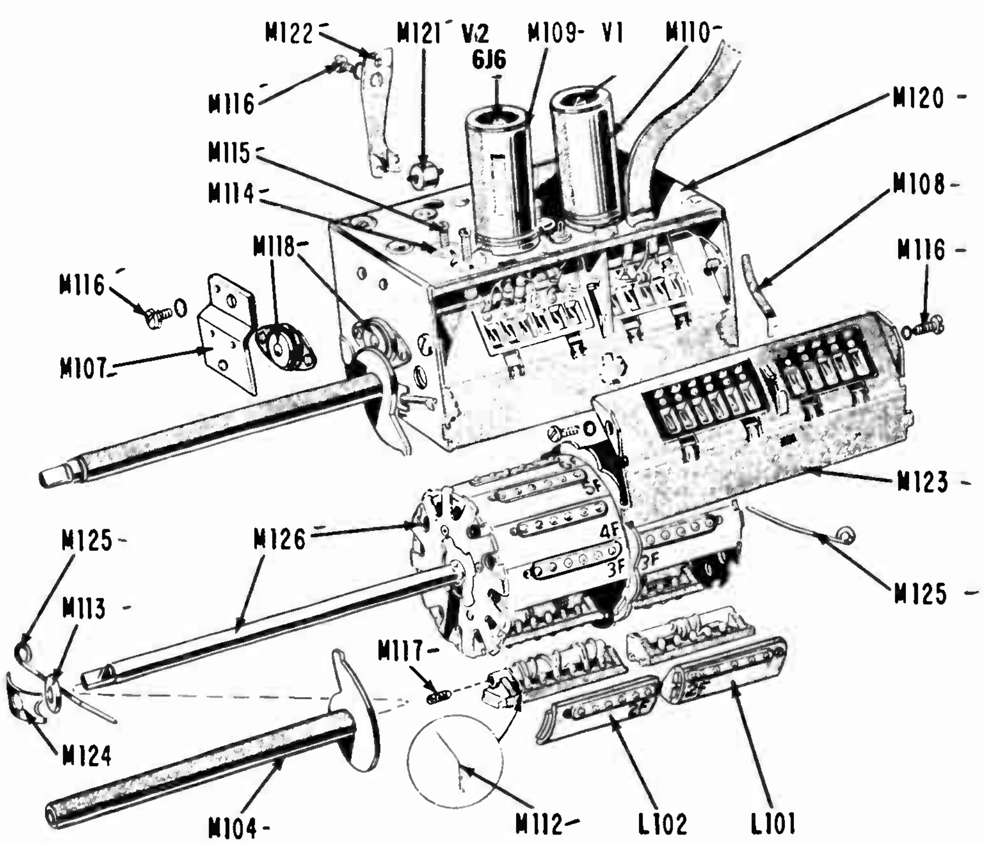

Figure 10. Exploded View, TV Tuner.

INTERMITTENT PICTURE AND SOUND

This trouble is most commonly due to an intermittent tube, loose tube socket contacts, dirty or loose coil contacts, loose or cold (rosin) soldered joints, or loose or vibrating parts in the underside of the tuner chassis.

When replacing tubes, see tube note under "General"

Loose tube socket contacts may sometimes be tightened by compressing contacts with an ice pick or a large needle. Defective tube socket contacts can sometimes be replaced individually.

For cleaning and adjusting coil contacts, see "Cleaning Contacts" and "Adjusting Contact Springs"

Loose or intermittent connections can be found by tapping components or rotating the channel selector and watching the pattern on an oscilloscope. A visual inspection or a continuity check will also be helpful.

Apply a hot soldering iron to soldered joints which appear doubtful. Caution: Do not change lead lengths or move components other than to slightly separate parts or leads which have caused trouble by contact with the chassis or other parts. See discussion under "General".

SOUND BARS IN PICTURE (DUE TO MICROPHONICS)

Microphonics in the TV Tuner will generally produce sound bars in the picture or a ringing sound as the volume is turned up or as the cabinet is tapped lightly.

Check for microphonic oscillator mixer tube, V2 (6J6). It is recommended that several tubes be tried, in order to select a tube which will be least microphonic and at the same time, causes a minimum of oscillator frequency shift, as noted with rotation of Tuning control. In some cases, replacement of the oscillator mixer tube, may necessitate readjustment of trimmer condenser A1 (C5) (overall oscillator adjustment).

Microphonics can also be due to vibration of loose wires or loose components. In some instances, the ceramic stator plate M118 (tuning stator) has been a source of microphonics since the rivets which fasten this part to the tuner chassis may be loose. This can be remedied by soldering the plate mounting bracket to the tuner chassis. To solder the plate mounting bracket to the tuner chassis, remove the grounded Tuning stator plate M107, and move the tuner shaft M104 forward.

Also, check for any mechanical "rub" such as loose screws which hold the tuner sub-chassis to the main chassis, loose solder connection from tube shield base to chassis, or extremely dry tuner shaft.

CHANGES AND NOTES

CHASSIS 317B, 317D, 321B, 321D

These chassis use a keyed AGC system and unless certain precautions are observed some difficulties may be encountered when IF or RF alignment adjustments are made. First be sure to read carefully the "Television Alignment Procedure"

A 1 1/2 volt bias battery should be connected across the AGC line (negative to junction of C24 and R52, positive to chassis), when making all alignment adjustments. This will prevent the amplifiers from overloading in the event that it is not possible to attenuate the signal generator sufficiently. Also, when the RF or IF amplifiers are sweep aligned the response curves will be distorted if a fixed bias is not applied to the AGC line due to the fact that the time constant of the keyed AGC circuit is short compared to the sweep frequency of the sweep generator. Therefore, the gain of the IF and RF amplifiers will not remain constant while the signal is sweeping through the response curve. When a sweep generator which does not have blanking is used, it will be impossible to make the forward and reverse response curves coincide unless a fixed bias is used.

In order to check the keyed AGC circuit for proper operation, the following simple test will be useful. When the grid of the AGC key tube (pin 1 V13) is shorted to the cathode (pin 7) the voltage on the AGC bus (across C24) should be approximately 40 to 70 volts negative as measured with a VTVM. In the event that this voltage is not obtained the trouble will probably be in the key tube V13, the horizontal output transformer T5, in one of the coupling or bypass condensers in the AGC line, or R52.

It may be found that in some cases there are minor deviations in the receivers in part values from those specified in the schematic. For example, a .047 mfd condenser may be used in place of a .05 mfd condenser or a .22 mfd condenser in place of a .25 mfd condenser. In decoupling circuits in the AGC and B+ lines 100 ohm or 200 ohm resistors may be used in place of the 150 ohm resistors specified with negligible effect on the performance. When such substitutions are made they are always made in locations where the value of the part is not critical for it to effectively perform its function. There are many locations where tolerances of 100% or more are permissible. However, when replacements are made, if there is any doubt as to the suitability of the replacement part, the value as specified in the manual should be used.

Occasionally 6AG5 tubes are used in place of the 6CB6 tubes specified for the IF amplifiers V3, V4, and V5. It should be noted that these tubes are not directly interchangeable due to the different internal wiring of the tubes. Therefore, when replacing these tubes, be sure to use the same type that was originally supplied in the receiver. If 6AG5 tubes were originally used this type number will appear on the chassis near the tubes.

On chassis serial numbered approximately 79,600 or greater the following changes were made referring to the schematic diagram and the parts list.

1. Capacitor C24 was 1.0 mfd 200 volts in early production and has been changed to .5 mfd 200 volts as indicated.

2. Capacitor C50 has been changed from a 10,000 mmf ceramic disc to a .01 mfd 400 volt paper part #CPZ04103M.

3. Capacitor C34 has been changed from a .001 mfd paper condenser to a 220 mmf ±20% mica condenser part#CMA03221M.

4. Video load resistor R29 has been changed from 6800 ohms 1 watt to 5600 ohms 1 watt ±10% part #RCF562K.

5. Peaking coil L12 has been changed from a 36 microhenry coil to a 120 microhenry coil part #A-1482-10.

6. Peaking coil L13 has been changed from a 120 microhenry peaking coil to a 600 microhenry peaking coil part #A-1485-10.

7. The hot end of R31 is now connected to the junction of C32, C33, and R30.

8. A decoupling filter consisting of an 8 mfd 450 volt condenser and a 1000 ohm 2 watt resistor has been added in series with the B+ 240 volt lead to the audio output tube V10 on all chassis.

The following changes are incorporated on chassis marked 317D and 321D:

1. High Voltage filter condenser returns to damper plate (pin #5) instead of to chassis ground.

2. AGC keying coil removed from horizontal output transformer and wound on width coil. Both the pulse to AGC keyer and feed back to horizontal multivibrator are taken off AGC winding on width coil. (Part No. B-1467-10)

3. Horizontal output transformer part no. B-1675-13A or B-1676-13A is used.

4. A type 6BZ7 RF amplifier tube is used in tuner rather than 6BQ7. These tubes are directly interchangeable.

GENERAL SPECIFICATIONS

DIMENSIONS

Model	Height	Width	Depth
9132-A	22-3/16"	22-1/4"	21-5/8"

WEIGHTS (packed)

9132-A—108 lbs.

POWER REQUIREMENTS

117 volts 60 cycles 245 watts

PICTURE SIZE

21" Rectangular

SPEAKER

Type	Size	V. C. Imped.
P.M. Dynamic	6" x 9"	3.2 ohms

ANTENNA INPUT IMPEDANCE

300 ohms—balanced to ground.

BUILT-IN ANTENNA

Broad band dipole.

R. F. TUNER

Turret type construction; individually removable coil assemblies for all channels. All components are easily accessible for servicing.

"KEYED" AUTOMATIC GAIN CONTROL

Outstanding new development; minimizes "airplane flutter"; reduces contrast variation when changing from one channel to another; increases immunity of sync system to external interference.

INTERMEDIATE FREQUENCIES

Sound Carrier 22.25 Mc.
Picture Carrier 26.75 Mc.

I.F. SYSTEM

Four Stage—stagger tuned—for composite signal.
Two additional stages for sound channel.

VIDEO AMPLIFIER

Two Stage—broad band.

RETRACE LINE SUPPRESSOR

Eliminates retrace lines thruout the normal range of picture brightness and contrast.

DEFLECTION & FOCUS

Magnetic

HORIZONTAL SYNCHRONIZATION

Automatic frequency control and "keyed" A.G.C. provide excellent picture stability and noise immunity.

HIGH VOLTAGE POWER SUPPLY

"Fly-back" type. Completely enclosed in a shielded compartment.

CONTROL ADJUSTMENT PROCEDURE

The various controls on the receiver may be divided into two classes, Operating and Pre-set. Operating controls are those which control program selection as well as sound and picture quality and their functions are indicated in Fig. 1.

The Pre-set controls are those which require adjustment at the time the receiver is installed and they rarely need attention thereafter. Although they have been factory adjusted for optimum performance, it is usually necessary to make some fine adjustment of these controls at the time of installation.

There are eleven Pre-set controls, four of which are located at the back of the chassis (see Figure 19). Six controls are located under the Name Plate on the front panel. This plate is hinged at the bottom; to obtain access to controls, merely tilt plate forward. The Auxiliary Fine Tuning Screw can be reached by removing the "Channel Selector" and "Television Fine Tuning" knobs.

To gain access to the centering adjustments and ion trap, it will be necessary to remove the back of the cabinet by taking out the screws around edges.

Operate the receiver according to the instructions given in the section of this manual entitled "How To Tune The Television Receiver" and make the following adjustments as required.

1. **ADJUST ION TRAP**—If screen remains dark or is only dimly illuminated when "Brightness" control is turned clockwise, the ion trap may require adjustment.

The ion trap is located on the neck of the picture tube as shown in Figure 19 and consists of a magnet held in position by metal bands.

With "Brightness" control (located at rear of receiver) set approximately ½ turn clockwise, rotate the entire ion trap assembly while sliding it back and forth until picture tube screen is illuminated to maximum brilliance. Reduce "Brightness" control setting and repeat this operation to assure accurate positioning of ion trap.

Do not turn "Brightness" control to its maximum clockwise position until ion trap is correctly adjusted—failure to observe this precaution may result in damage to the picture tube.

CAUTION: There is only ONE correct setting of the ion trap. This position is attained when maximum brilliancy occurs on the picture tube screen. If defocusing of picture or neck shadow results, DO NOT adjust position of ion trap—see instructions located elsewhere in this manual for removing these aforementioned faults. Failure to observe this precaution will result in an ion burn (brown spot) on the face of the picture tube. Since this condition is brought about by lack of proper ion trap adjustment at time of receiver installation, the picture tube will not be eligible for warranty adjustment.

2. **AUXILIARY FINE TUNING ADJUSTMENT**—If it is found that the tuning range of the "Fine Tuning" control is inadequate to permit correct tuning of a station in its assigned channel, then adjustment of the "Auxiliary Fine Tuning" screw will be necessary. This special screw is accessible after removal of the "Channel Selector" and "Fine Tuning" knobs. They may be removed by merely pulling them forward.

Adjustment of the "Auxiliary Fine Tuning" screw may be undertaken in accordance with the following procedure.

a. Set "Channel Selector" to desired channel; then remove this knob.

b. Set "Fine Tuning" knob to the center of its range; then remove this knob. The flat portion of the main tuning shaft (outer shaft) should now be in the uppermost position. Note the location of the "Auxiliary Fine Tuning" adjustment screw on receiver chassis—see Fig. 14.

c. Using a thin screwdriver (preferably non-metallic), adjust the setting of "Auxiliary Fine Tuning" screw for correct tuning of the desired television station—**CAUTION: Do not attempt to rotate this screw more than two full turns in either direction, as further rotation may release it from the thread clip within the tuning mechanism and the coil for that channel (located in R.F. Tuner Unit) would then have to be removed in order to restore the screw to the correct position.** If a metal screwdriver is used, detuning occurs when the screwdriver is removed but it will be noted that this degree of detuning can now be compensated by resetting the "Television Fine Tuning" control (outer shaft). Thus the range of the "Television Fine Tuning" control (after knob is replaced on the shaft) will be adequate to tune in the station.

d. This completes the adjustment of the "Auxiliary Fine Tuning" screw for one channel. Identical screws are provided on each channel and they are all accessible thru the same opening in the tuning mechanism as each successively moves into position when the "Channel Selector" knob is rotated.

3. **HORIZONTAL HOLD**—Should the picture appear to move horizontally across the screen or break up into a series of light and dark streaks as shown in Figure 10 adjust the "Horizontal Hold" control (located behind Name Plate) until the picture remains stationary and does not slip horizontally when operating "Channel Selector" knob.

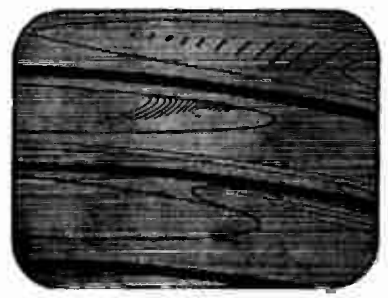

Fig. 10—HORIZONTAL MOVEMENT; ADJUST HORIZ. HOLD CONTROL

4. **VERTICAL HOLD**—Should the picture appear to roll by in a vertical direction or cause multiple vertical images as shown in Figure 11, it will be necessary to adjust the "Vertical Hold" control located behind the Name Plate (see Figure 14). After this adjustment is made, reduce contrast until picture is barely visible and check setting of "Vertical Hold" control for proper picture synchronization.

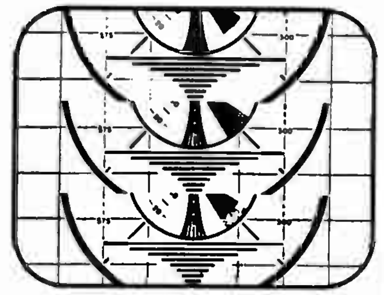

Fig. 11—VERTICAL MOVEMENT; ADJUST VERTICAL HOLD CONTROL

5. **INITIAL FOCUS**—Adjust the "Focus" control, located behind name plate, until picture is clearly defined.

Fuzzy picture may also be due to reproduction of poor quality film when station is televising a motion picture.

Incorrect tuning of receiver produces a similar effect. Check for proper tuning point as described in step 5 of section entitled "How To Tune the Receiver."

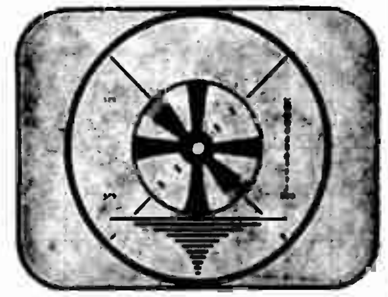

Fig. 12—BLURRED APPEARANCE; ADJUST FOCUS CONTROL

6. **TONE**—This television receiver is equipped with a tone control located under the name plate—see Fig. 14. This control should be adjusted for most pleasing tone. To increase bass emphasis, turn control counter-clockwise.

The following adjustments should be made while the station is transmitting its circular test pattern.

7. **STRAIGHTENING TILTED RASTER** — If the pattern should appear on the screen in a tilted position as shown in Figure 13, loosen the deflection yoke locking screw labeled A in Fig. 19 and rotate the yoke sufficiently to correct this condition. Be sure to re-tighten the screw securely.

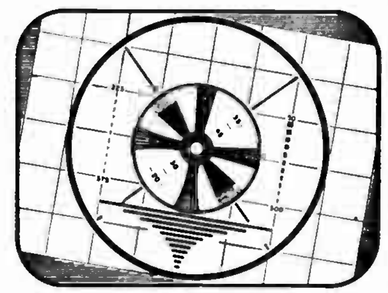

Fig. 13—TILTED PICTURE; ADJUST YOKE POSITION

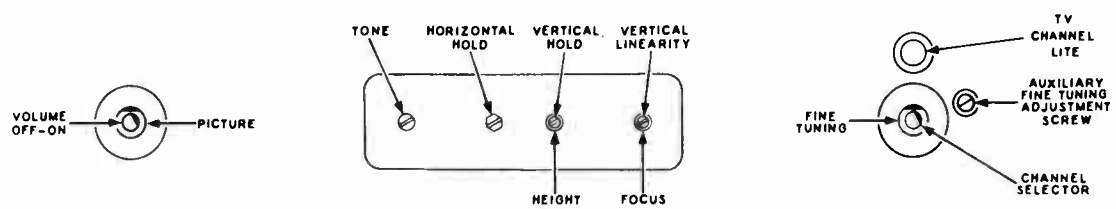

Fig. 14—LOCATIONS OF PRE-SET CONTROLS

8. **CENTERING**—To center the test pattern on the screen, position focus coil by adjusting the three nuts labeled B in Fig. 19.

NOTE: If a decrease in picture tube brilliance is noted when making the centering adjustment readjust ion trap as explained in step #1.

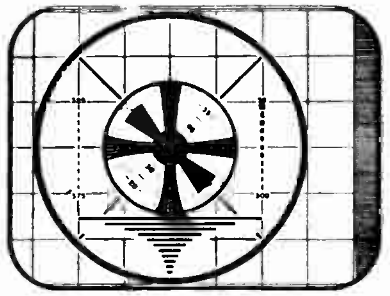

Fig. 15—OFF CENTER; ADJUST FOCUS COIL POSITION

9. **HEIGHT** — Control of picture size in the vertical direction is accomplished by means of the "Height" control located behind the Name Plate. Height and width adjustments should be checked for all transmitting stations to be sure that picture properly fills the viewing area. It may be necessary to change the setting of the "Height" control after the "Vertical Linearity" control is adjusted.

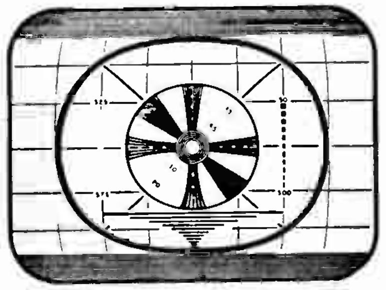

Fig. 16—TOO SHORT; ADJUST HEIGHT CONTROL

10. **VERTICAL LINEARITY** — Improper vertical linearity causes the circular test pattern to appear condensed on the upper edge of the screen and extended on the lower edge or vice versa. This effect is illustrated in Figure 17. Adjust for proper linearity by using "Vertical Linearity" control located behind Name Plate. It may be necessary to readjust the "Height" control if an appreciable change is made in the linearity control setting.

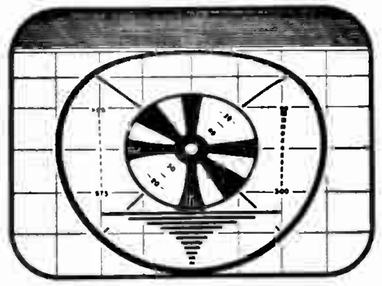

Fig. 17—VERTICAL DISTORTION; ADJUST VERTICAL LINEARITY CONTROL

11. **WIDTH** — Control of picture size in the horizontal direction is accomplished by means of the "Width" control located on the rear of H. V. power supply (see Fig. 19).

If abnormally low line voltage makes it difficult to obtain sufficient picture width when using the "Width" control, then the setting of the "Horizontal Drive" control may be incorrect. The method of adjusting this control is explained in paragraph #13.

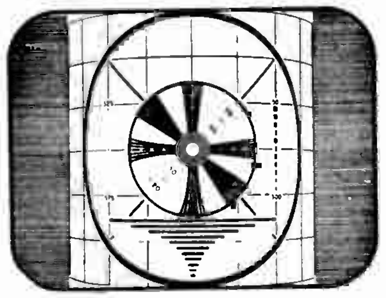

Fig. 18—TOO NARROW; ADJUST WIDTH CONTROL

12. **HORIZONTAL LINEARITY** — Improper horizontal linearity causes the circular test pattern to appear condensed on the right edge of the screen and extended on the left edge or vice versa. This effect is illustrated in Figure 20. Adjust for proper linearity by using "Horizontal Linearity" control located at rear of chassis (see Figure 19). In event that proper horizontal linearity cannot be obtained by adjusting this control, then check the setting of the "Horizontal Drive" control to be sure it has been correctly adjusted.

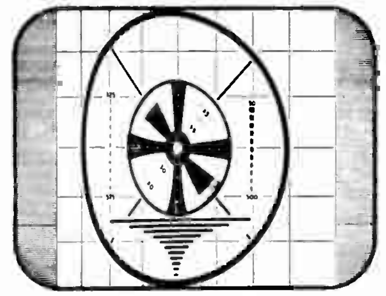

Fig. 20—HORIZONTAL DISTORTION; ADJUST HORIZONTAL LINEARITY CONTROL

13. **HORIZONTAL DRIVE**—The "Horizontal Drive" control located at rear of chassis (see Fig. 19) should be rotated clockwise to a point just prior to where the picture tube brilliancy and size decrease. Then adjust this control ½ turn **counter-clockwise.**

14. **ELIMINATING SEMI-CIRCULAR SHADOW**—This shadow is caused by the electron stream striking the neck of the tube and it can generally be corrected by applying one or a combination of the following procedures:

a. Make sure deflection yoke is symmetrically positioned with respect to the neck of the picture tube by loosening the three wing nuts labeled C in Fig. 19 and adjusting yoke position.

Should a change in height of the deflection yoke be required to obtain symmetry of yoke around neck of picture tube, it will be necessary to loosen the four wing nuts labeled D in Fig. 19 (two nuts located on each leg of mounting frame) and raise or lower yoke as required. After adjustment has been completed be sure to retighten nuts securely.

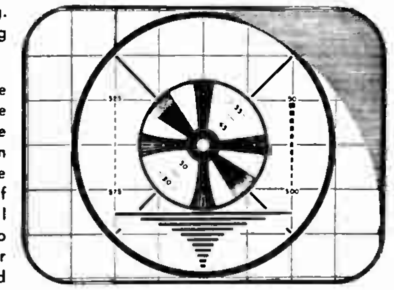

Fig. 21 SEMI-CIRCULAR SHADOW

b. Shift deflection yoke as far forward as possible after loosening the yoke locking screw labeled A in Fig. 19. If raster becomes tilted during this adjustment refer to step #7.

15. **BRIGHTNESS**—The "Brightness" control (located at rear of receiver Chassis—see Fig. 19) should be initially adjusted in conjunction with the "Contrast" control for the brightness level desired by set owner—check all active station channels. Too much brightness will have the same effect as too little contrast, and vice versa, therefore, it is necessary to strike a proper balance between contrast and brilliance.

16. **FINAL ADJUSTMENTS**—With all controls set for normal reception of a television station, recheck setting of "Focus" control for best picture focus.

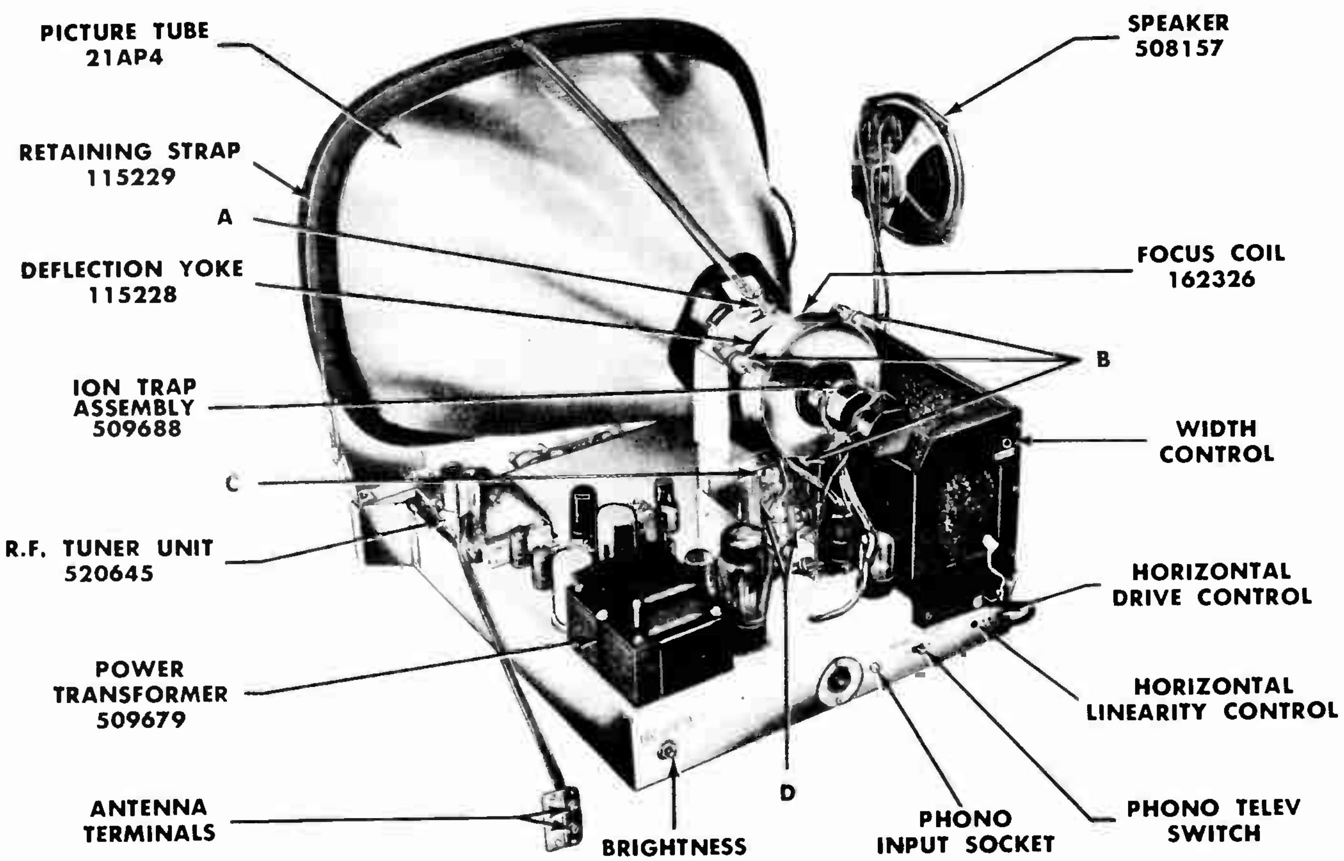

Fig. 19—CHASSIS AND PICTURE TUBE ASSEMBLY

REDUCTION OF INTERCARRIER BUZZ

If a prominent humming or buzzing sound is noted in the sound reception of a television broadcast, it may be due to a fault in transmission from the station, or incorrect adjustment of the discriminator transformer (tuning of secondary circuit) in the receiver.

This type of disturbance, which is only present when receiving a station signal, is known as "Intercarrier Buzz" and it should not be confused with power supply hum that would occur upon failure of a filter condenser.

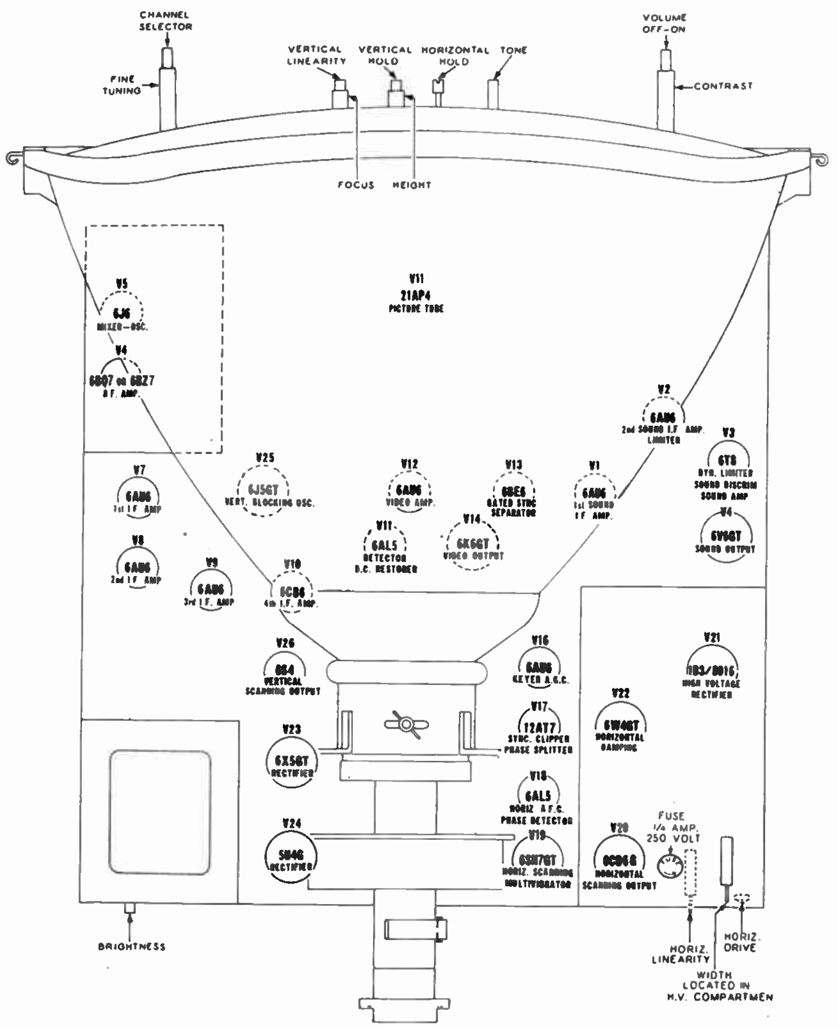
Where "Intercarrier Buzz" is objectionable, first be sure that the receiver has been properly tuned to the station—see section of this manual entitled "How To Tune The Receiver." If Intercarrier Buzz is still too prominent, then it is advisable to check the adjustment of the sound discriminator secondary slug. This slug is accessible from the top of the discriminator transformer which is located on top of the chassis at the right front side. As the slug is rotated approximately ½ turn in either direction, a "dip" point in the buzzing sound will be noted. At this position program sound will be clear and free from distortion and buzz should be at an acceptable minimum if station transmission is not at fault.

PICTURE TUBE REPLACEMENT

REPLACEMENT PROCEDURE—When replacement of a picture tube is necessary, proceed as follows:

1. Disconnect power cord from wall outlet.
2. Remove chassis from cabinet.
3. Remove high voltage lead from side of picture tube Insulating Sleeve and **momentarily short this lead to chassis to discharge high voltage filter condenser.**
4. Remove the tube socket at base of picture tube.
5. Disengage ion trap from neck of tube.
6. Remove retaining screw that holds anchor strap to yoke mounting assembly.
7. Loosen the two bolts on the ends of the Strap Assembly that encircles the front Insulating Ring of the tube.
8. Carefully remove picture tube by pulling it forward.
9. Remove Insulating Ring from front edge of tube and slip Insulating Sleeve off rear of tube.
10. When replacing tube, be sure it has the same type number and observe the following precautions. Be sure that Insulating Sleeve fits under Insulating Ring all around edge of tube. Also that copper high voltage strap on Insulating Sleeve fits around rim of tube. This rim is the high voltage contact of the tube, therefore, a good contact must be made with copper strap and rim.

TUBE LOCATIONS



REAR OF CHASSIS

CIRCUIT DESCRIPTION FOR 520645 RF TUNER

The turret type tuner incorporated in this chassis is of the latest design and utilizes a 6BQ7 or 6BZ7 tube as the R.F. amplifier (V5) and a 6J6 tube (V6) as the Mixer-Oscillator.

Channel selection is accomplished by rotation of the turret containing two sets of easily removable coil assemblies for each channel. The individual antenna coil sections consist of a balanced primary to minimize noise pick-up on the transmission line and an R.F. grid coil which couples the incoming signal to the grid of the first section of the R.F. Amplifier tube (V5). The inductance and amount of coupling of the tuned antenna input circuit are changed for each channel so that a constant input impedance of 300 ohms is maintained. This provides maximum transfer of energy to the R.F. Amplifier stage, particularly when interconnection between an outdoor antenna and the receiver is made with 300 ohm transmission line.

The R.F. Amplifier tube is a dual-triode tube and is connected in the circuit as a direct coupled grounded-grid type amplifier. This circuit was developed to meet the demand for an R.F. Amplifier that would provide more nearly equal gain on both the low and high Television Channels, while keeping inherent tube noise to a minimum. The circuit can be thought of very simply as two triode tubes in series, the first or driver unit acting not as an amplifier, but rather as an antenna impedance matching device and also as a variable cathode impedance, or bias source, for the second, or grounded-grid unit. In addition the first unit of the R.F. Amp. acts as a power amplifier due to its extremely low plate impedance, which is in reality the cathode circuit of unit two, and converts the weak signal voltage from the antenna to a low voltage-high current signal which is then applied to the cathode of unit number two. The signal coupling unit between the first and second units is a series peaking coil, symbol 406, similar to that found in a video amplifier circuit. Its purpose is to form a series resonant circuit with the input capacity of the second unit. The coil is so made as to resonate at a frequency slightly higher than channel 13. In a standard pentode type amplifier, the gain falls off rapidly as progressively higher channels are selected. With the use of the plate to cathode peaking coil an almost equal gain can be realized for all channels.

The R.F. Amp. tube has inherently low interelectrode capacity due to physical design and this factor in conjunction with the low output impedance of the first section is responsible for the low noise factor at this stage. While neutrolization of the first unit is not necessarily due to its low plate to grid capacity, additional noise reduction has been realized, with only a slight decrease in gain, by the addition of a neutralizing condenser, item 405. Due to the low output impedance of the stage, it is not necessary that the neutralizing condenser be turnable.

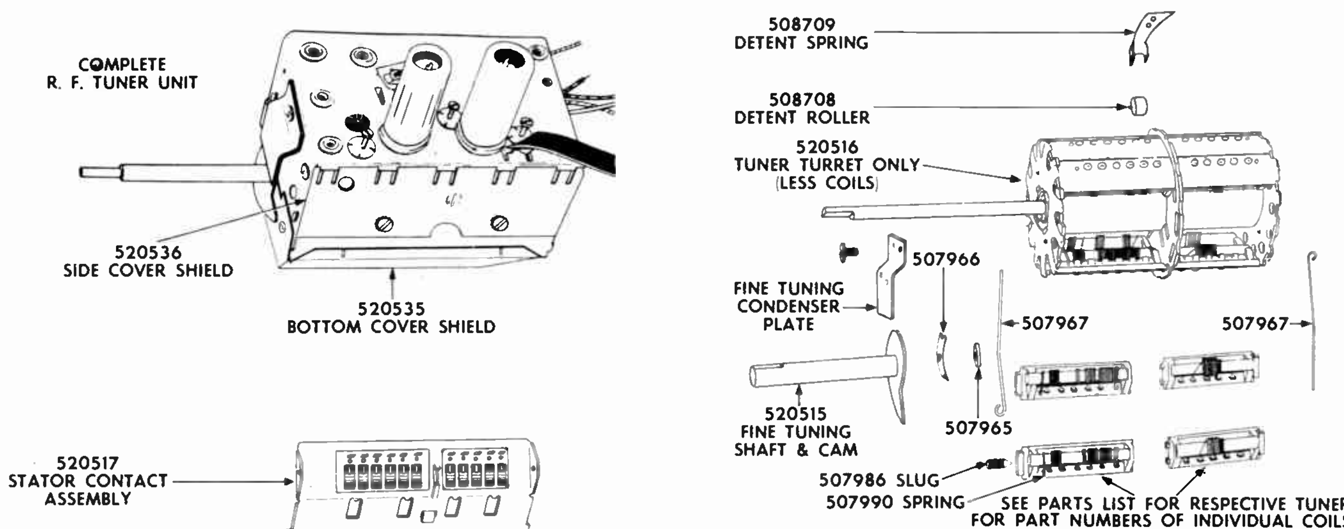
Because of the circuits' excellent internal shielding, low input impedance and radiation rejection, the second section of the R.F. Amp. is connected as a driven grounded-grid amplifier. While this might not be apparent at first glance due to the fact that grid has no direct D.C. return, it will be found upon further examination that any high frequency A.C. potentials are by-passed to ground through condenser 407.

The second section of turret coils includes the tuned R.F. amplifier plate coil, tuned mixer grid coil, and oscillator coil. The output of the R.F. amplifier stage is coupled to the grid of the mixer stage, which utilizes one triode section of a 6J6 tube (V6). The other half of the 6J6 is connected as a modified Colpitts oscillator which injects oscillator voltage into the mixer stage through coupling between the oscillator coil and the mixer grid coil. Course oscillator tuning is accomplished by adjusting the positions of the slugs in the individual oscillator coils, while Fine Tuning is obtained when using condenser #417 in the oscillator plate circuit. This Fine Tuning condenser is composed of two fixed plates, and its capacitance is changed by the insertion of a bakelite cam between these plates.

Signal output from the mixer stage is coupled to the IF amplifiers through the converter plate I.F. coil, diagram #427, located on the tuner unit.

REPAIR DATA FOR 520645 RF TUNER

All replacement parts for the RF Tuner Unit are included in the complete receiver parts list

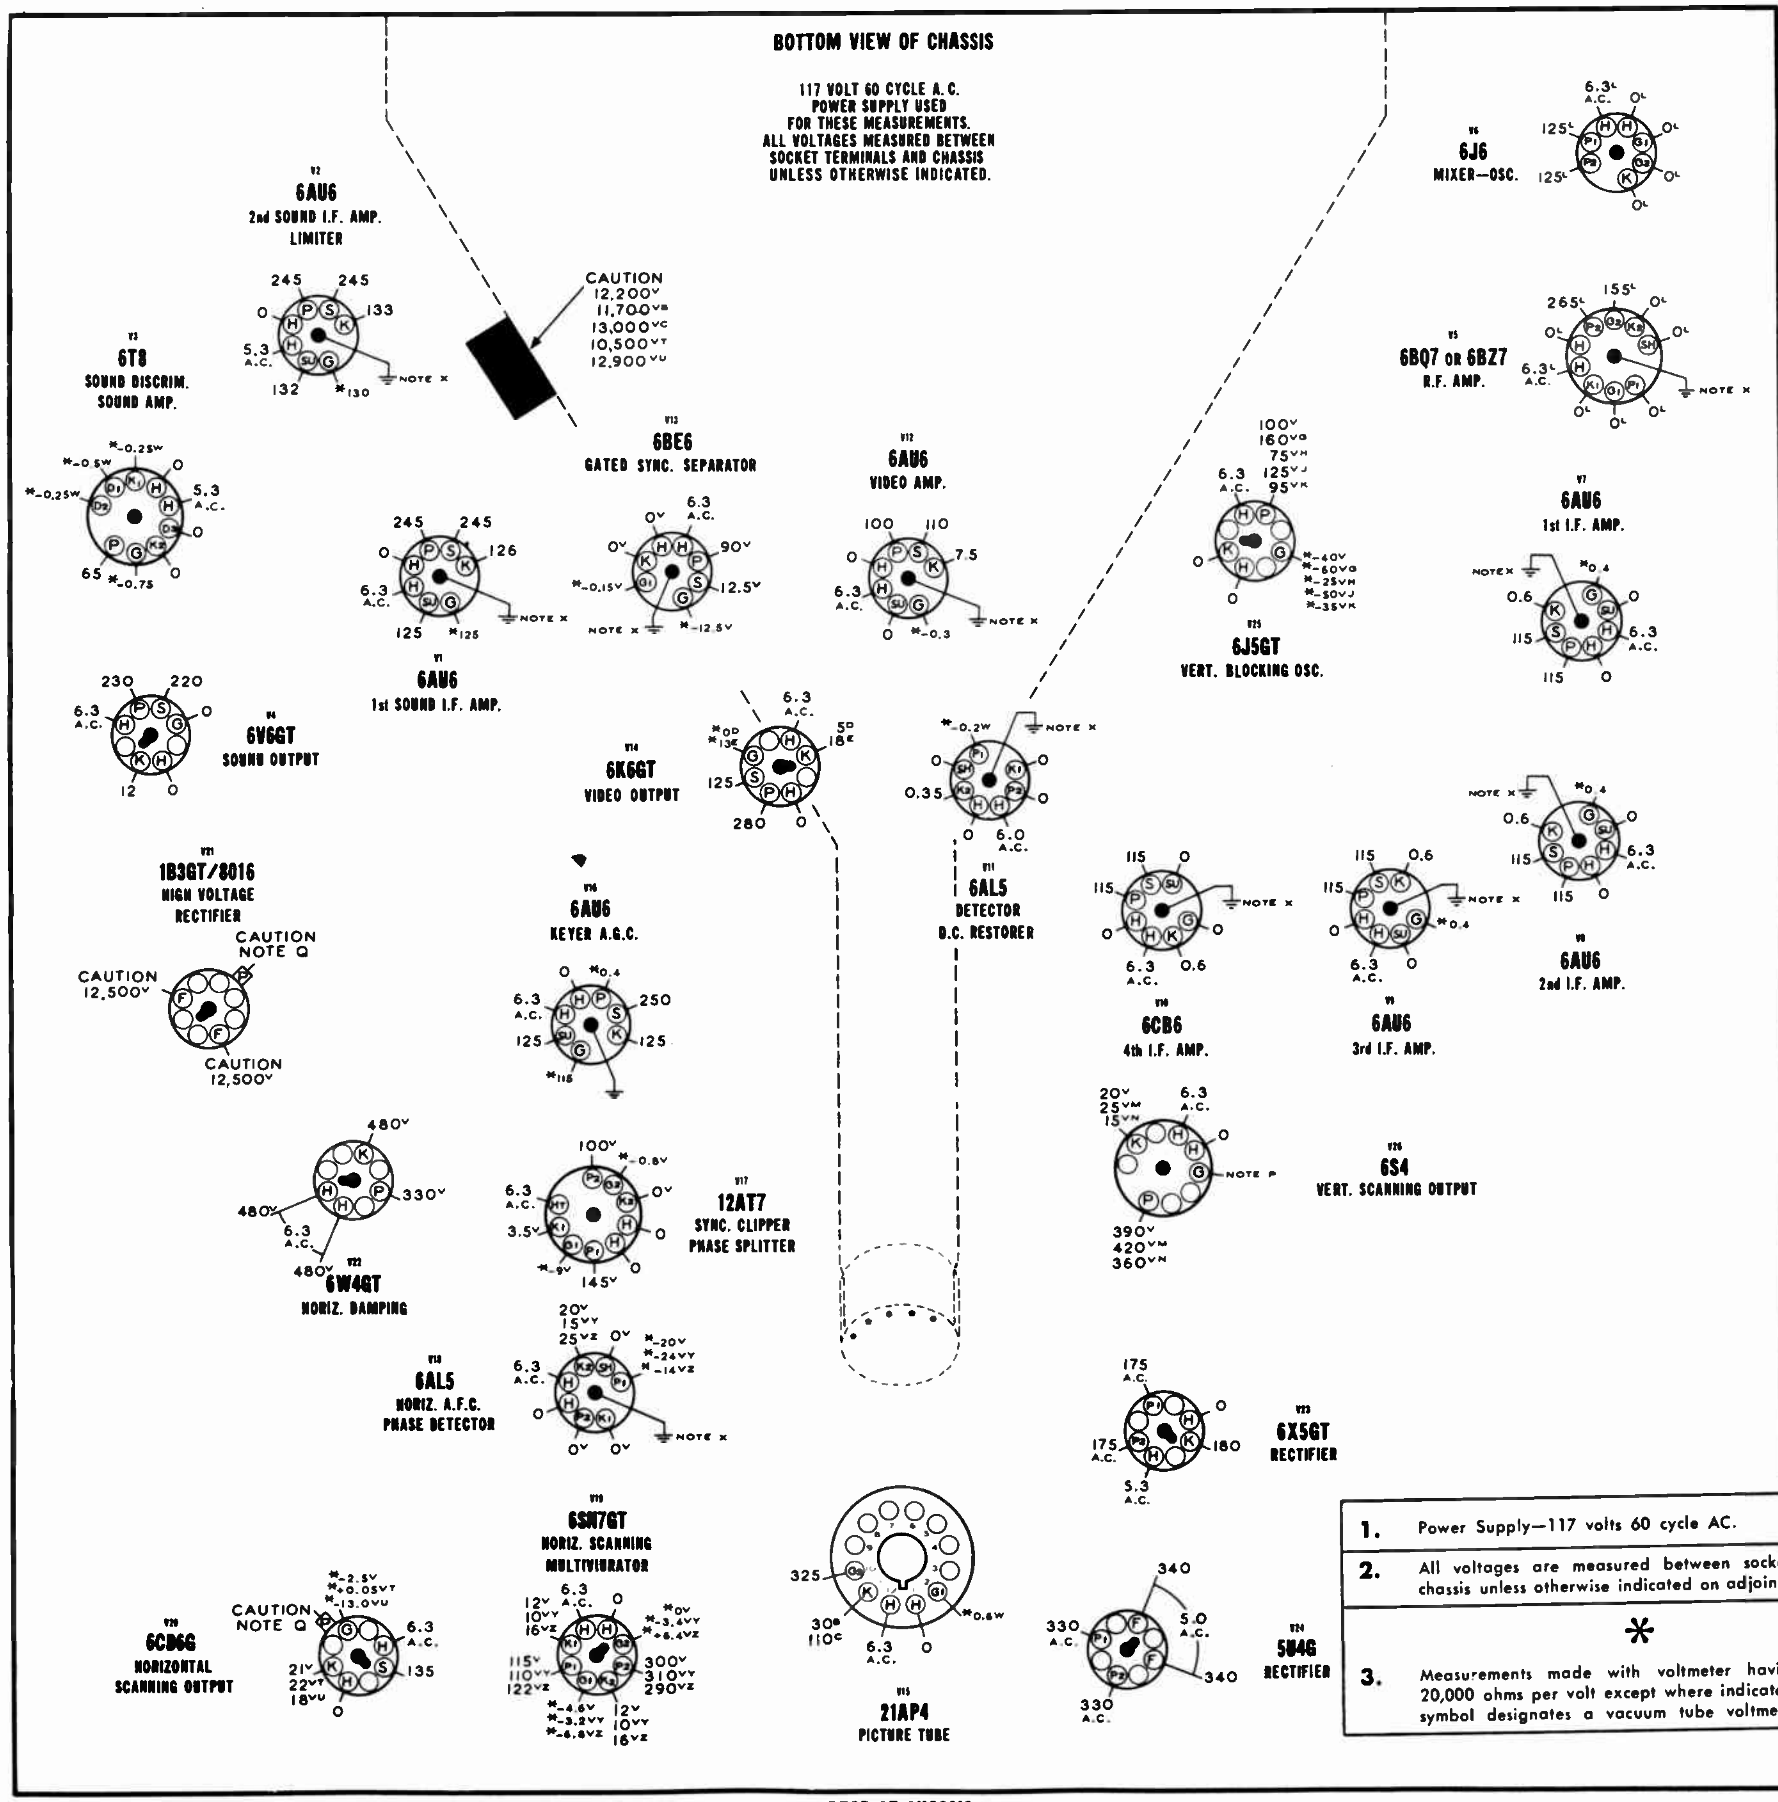


SERVICE PRECAUTIONS

SUBJECT	PRECAUTIONS
ELECTRICAL COMPONENTS	The high frequencies used in the RF section of a television receiver make it necessary that considerable care be exercised in servicing the tuner. Lead dress and location of components are very critical at these frequencies. When replacing parts, it is important to use components of identical electrical characteristics and physical size. Always reconnect the replacement item in the same location and position in the tuner as the original component.
TUBES	Replacement of tubes in the Tuner Unit may cause slight detuning of RF circuits due to inherent differences in inter-electrode capacitances. When replacing tubes (especially 6J6 mixer-oscillator tube) make sure that Fine Tuning control will tune in television stations at approximately the middle of its range. It may be necessary to change the setting of the individual oscillator coil slugs for some channels to accomplish this.

EXPLANATION OF NOTES

B.	Brightness Control max. clockwise
C.	Brightness Control max. counter-clockwise
D.	Contrast Control max. clockwise
E.	Contrast Control max. counter-clockwise
G.	Height Control max. clockwise
H.	Height Control max. counter-clockwise
J.	Vertical Hold Control max. clockwise
K.	Vert. Hold Control max. counter-clockwise
L.	This voltage measurement was taken from the top of the tuner chassis with the tube removed from its socket.
M.	Vertical Linearity Control max. clockwise.
N.	Vertical Linearity Control max. counter-clockwise.
P.	The measurement should be made with a vacuum tube voltmeter. The voltage reading will fluctuate in the vicinity of 0.05 volts.
Q.	Do not attempt to measure the voltage at this position. There is a high R. F. potential at this point.
T.	Horiz. Drive Control max. clockwise.
U.	Horiz. Drive Control max. counter-clockwise.
V.	Before measuring this voltage, connect external antenna and adjust controls for normal reception of station signal.
W.	Before making this measurement, remove 6CB6 (V10 4th I.F. Amp.). This will prevent noise in the R.F. and I.F. stages from affecting voltage measured at this point.
X.	Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.
Y.	Horiz. Hold Control turned in a clockwise direction until picture approaches loss of sync.
Z.	Horiz. Hold Control turned in a counter-clockwise direction until picture approaches loss of sync.



1.	Power Supply—117 volts 60 cycle AC.
2.	All voltages are measured between socket terminals and chassis unless otherwise indicated on adjoining chart.
	*
3.	Measurements made with voltmeter having sensitivity of 20,000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

SUBJECT	PRECAUTIONS
CHANNEL COILS AND SLUGS	Channel Coils must be handled with care. **Do not disturb coil windings.** If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position.
FINE TUNING CONTROL	Rubbing of the bakelite Fine Tuning Cam against the Fine Tuning Condenser Plate is intentional in order to avoid vibration with resulting microphonics. However, the Fine Tuning Cam should not rub or contact the small circular plate located on the body of the tuner.

REMOVAL AND REPLACEMENT OF PARTS

ITEM	PROCEDURE
RF TUNER UNIT	To remove the Tuner Unit from receiver chassis, proceed as follows: 1. Remove channel selector dial lamp socket. 2. Remove screws which hold tuner to front and rear support brackets. 3. Disconnect the leads from the tuner to the main chassis. See illustration on circuit diagram page showing tuner connections. 4. Tuner unit may now be withdrawn from underside of chassis.
CHANNELS COILS	It is not necessary to remove entire tuner unit to replace a snap-in channel coil but removal of bottom shield will be required. This may be accomplished by grasping the front end of the shield and pulling downward and unhooking it from rear of tuner frame. Insert a screwdriver blade between Coil Retainer Spring and the end of the Tuner Turret. Twist the blade to pull spring away from the molded body of Channel Coil. Lift this end of coil body upward and remove individual coil assembly from tuner. When replacing Channel Coils, be sure they are reinstalled in their correct positions. Coil numbers should increase consecutively in a counter-clockwise direction when tuner is viewed from the front. If all the Channel Coils have been removed from the Tuner Turret, rotate turret until flat surface on end of tuner shaft points down. Install #3 Channel Coils into bottom position on turret. Then follow the correct sequence indicated above to replace other coils.
TUNER TURRET ASSEMBLY	To remove turret from RF Tuner Unit, remove complete tuner and bottom shield as described in previous sections and proceed as follows: 1. Remove rear Turret Shaft Retaining Spring by disengaging straight end of spring from projection on tuner frame. 2. Remove Fine Tuning Condenser Plate from front of Tuner Unit. This plate forms one side of Fine Tuning control condenser and is held in place by one screw. 3. Slide Fine Tuning Cam and Shaft off of main Channel Selector Shaft. 4. Remove Spring Contactor Washer and Fiber Spacer Washer from Channel Selector Shaft. 5. Remove Shaft Retaining Spring at front of tuner by disengaging straight end of spring from projection on frame. 6. Remove turret assembly from frame. To replace turret, reverse the above procedure. Tooth on bakelite Fine Tuning Cam should point downward during assembly so that it does not become locked between the stops on the Fine Tuning Condenser Plate. Also be sure to replace bottom shield.
STATOR CONTACT ASSEMBLY	To remove this assembly, remove complete tuner as described in previous sections and proceed as follo : 1. Remove side shield by taking out the two retaining screws and unsolder shield at one point. Now, disengage shield from upper edge of tuner frame. 2. Remove the two screws at the front and rear of the Stator Contact Assembly. 3. Unsolder all electrical connections to contact plate. 4. Unsolder five soldered joints between Stator Contact Assembly and Tuner Unit. 5. Contact Assembly may now be withdrawn from frame. To reinstall this assembly: 1. Place Stator Contact Assembly in position and replace, but do not tighten, the two screws at the front and rear of the assembly. 2. Remove 3 consecutive pairs of Channel Coils from the turret (for example, the antenna and rf-osc. coils for channels #5, 6 and 7). 3. Position Tuner Turret so that the edges of the next highest Channel Coils (in this case, the coils for channel #8) just pass the row of 11 contacts on the Stator Contact Assembly. 4. Adjust position of the Stator Contact Assembly so that there are a few thousandths of an inch spacing between the contacts on the contact plate and the molded body of the Channel Coils. 5. The Contact Assembly is now correctly positioned and screws at front and rear may be tightened. 6. Solder Stator Contact Assembly to tuner frame at same points that were used previously. 7. Make all electrical connections to contact plate. 8. Replace Channel Coils. 9. Replace side shield.

ALIGNMENT PROCEDURE
MODEL 9132-A

Alignment of all RF and IF tuned circuits in this receiver may be accomplished by utilizing the procedures described in the following charts.

SEQUENCE OF ALIGNMENT: These procedures should preferably be applied in the order in which they are presented, however, alignment of the Sound Channel or IF Channel may be accomplished individually if desired.

The RF Amplifier and Mixer alignment may also be accomplished independent of Sound or IF Channel alignment, but oscillator calibration can only be done after IF Channel has been correctly aligned. Proper IF band pass characteristic is necessary for Oscillator alignment as results of RF circuit tuning are observed by means of an oscilloscope connected to the output of the detector stage.

REMOVAL OF CHASSIS: The receiver chassis must be removed from the cabinet in order to accomplish alignment of all tuned circuits as there are adjustment points located on the underside of the unit.

This can be accomplished by first removing all knobs and disconnecting the receiver "built-in" antenna and speaker. The chassis may then be removed by releasing the hold-down screws located on the underside of the cabinet.

CAUTION

The picture tube is highly evacuated and if broken, glass fragments will be violently expelled. Handle with care, using safety goggles and gloves.

INSTRUMENTS: The following instruments will be required as signal sources and output indicators during the alignment process. Since accurate alignment of a television receiver is heavily dependent upon the performance of your instruments, it is imperative that they meet the essential specifications described here.

1. **STANDARD SIGNAL GENERATOR** to provide unmodulated (pure RF) signals at the following frequencies. Maximum output on all ranges should be at least .1 volt with provision for attenuation as desired. This instrument must have good frequency stability and be accurately calibrated. Generators which incorporate a separate crystal controlled oscillator and heterodyne circuit are self calibrating and therefore capable of providing the accuracy of frequency calibration required for television circuit alignment.

   a. IF Frequencies:
      - 4.5 Mc. Sound Channel
      - 22.25 Mc. Sound IF marker
      - 22.4 Mc. 1st IF Trap Coil
      - 23.5 Mc. 1st and 3rd IF stages
      - 24.9 Mc. 4th IF stage
      - 26.1 Mc. Converter and 2nd IF stages
      - 26.75 Mc. Picture IF marker

   b. RF Frequencies:
      - 54 to 88 Mc.
      - 174 to 216 Mc.

2. **RF SWEEP GENERATOR** to provide frequency modulated signals at the following frequencies:
   - 20 to 30 Mc. with 10 Mc. sweep width.
   - 54 to 88 Mc. with 10 Mc. sweep width.
   - 174 to 216 Mc. with 10 Mc. sweep width.

   Output adjustable with at least .1 volt maximum.

   Output should be "flat" (no amplitude variation) for all settings of the sweep width control.

   Provision for connection of generator sweep modulating voltage to horizontal deflection system of an oscilloscope.

   Provision for blanking the output signal on each return sweep so that oscillogram will not show retrace.

3. **CATHODE RAY OSCILLOSCOPE,** preferably a unit with vertical amplifier having wide range frequency response and low capacity pick-up probe.

4. **VACUUM TUBE VOLTMETER.** The lowest voltage range of this instrument should preferably permit a 1.0 volt reading to be indicated at not less than one third of full scale deflection.

INSTRUMENT CONNECTIONS: The method of connection, including details of matching and coupling networks, for instruments used in this alignment procedure is given in several illustrations on subsequent pages. Specific instructions for each instrument application will be found in various sections of the alignment charts.

GENERAL INSTRUCTIONS: When aligning IF and RF circuits it is necessary to apply a fixed bias voltage to the AGC system of the receiver. This fixed bias is obtained by using a 3 volt battery and connecting it as described in Fig. 14.

IMPORTANT

When observing the receiver band pass characteristic on an oscilloscope, it is exceedingly important to avoid distortion of that characteristic which would occur when using a large input signal from the sweep generator or standard generator (marker signal). Always set attenuator on sweep generator so that the reading on the vacuum tube voltmeter does not exceed one volt (when meter is connected from high side of video detector load, resistor symbol 196, to receiver chassis). Standard generator output should also be attenuated so that marker signal does not pull or tear the band pass characteristic as shown on the 'scope.

SOUND CHANNEL ALIGNMENT PROCEDURE

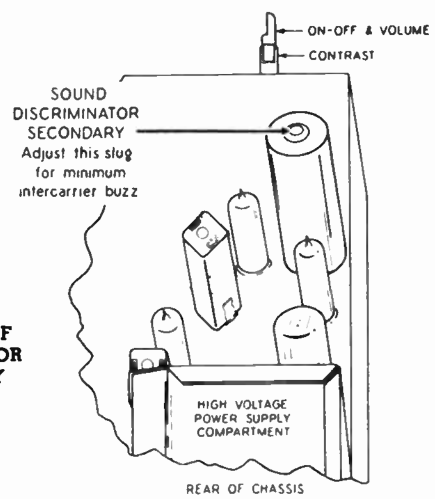
1. Short antenna terminals together with a jumper wire.
2. Set receiver Channel Selector to any inactive television channel; other controls may be left at any desired setting.
3. No special aligning tool is required to adjust the cores in the Sound IF and discriminator transformers. The blade of a small screwdriver will fit the slot in these cores, however, the screwdriver should be of a non-metallic or insulated type to prevent detuning when inserted in the transformer can.

STANDARD SIGNAL GENERATOR: CONNECTIONS	STANDARD SIGNAL GENERATOR: FREQUENCY	VTVM CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
Connect as shown in Fig 1.	**4.5 MC.** unmodulated **IMPORTANT** This signal must be accurate within 1/4 of 1% of 4.5 Mc. Check generator calibration against a crystal controlled signal source by "zero beating" (heterodyning) with harmonics of the crystal frequency.	Connect as shown in Fig. 2.	A "swishing" sound may be heard in the speaker during Sound Channel Alignment. This spurious oscillation is caused by horizontal sweep voltage being picked up in the audio system thru stray coupling of instrument leads; it should be disregarded as it will have no effect on alignment of the sound channel.	**#1** Discriminator Secondary	Adjust for maximum reading on VTVM.
				#2 Discriminator Primary	Adjust for maximum reading on VTVM.
				#3 2nd Sound IF Secondary	Adjust for maximum reading on VTVM.
				#4 2nd Sound IF Primary	Adjust for maximum reading on VTVM.
				#5 1st Sound IF Secondary	Adjust for maximum reading on VTVM.
				#6 1st Sound IF Primary	Adjust for maximum reading on VTVM.
Same as above.	Same as above.	Connect as shown in Fig 3.	To obtain zero balance of the discriminator circuit, two 68,000 ohm resistors will be required. These resistors must be matched so that their respective resistances do not differ by more than 1%—the accuracy of the total resistance is not critical. Connect the two resistors in series from pin 2 to the 6T8 tube to chassis ground as shown in Fig. 3.	**#1** Discriminator Secondary	Note that as slug #1 is rotated, a point will be found where the voltmeter will swing rather sharply from a positive to a negative reading or vice versa. The correct setting of slug #1 is obtained when the meter reads zero as the slug is moved thru this point.

REDUCTION OF INTERCARRIER BUZZ

Slight "dynamic" unbalance of the discriminator secondary can emphasize intercarrier buzz due to incomplete amplitude modulation rejection. Therefore it is vitally important to obtain an accurate setting of the discriminator secondary slug under actual reception conditions.

Disconnect all instruments and then connect an antenna to the receiver to obtain program reception from a local station. If intercarrier buzz is prominent, a slight readjustment of the discriminator secondary slug (#1) should be made to obtain the "dip" point for the buzzing sound. Note that program sound will be clear and free from distortion at this point. Buzz should now be at an acceptable minimum if station transmission is not at fault.



LOCATION OF DISCRIMINATOR SECONDARY SLUG

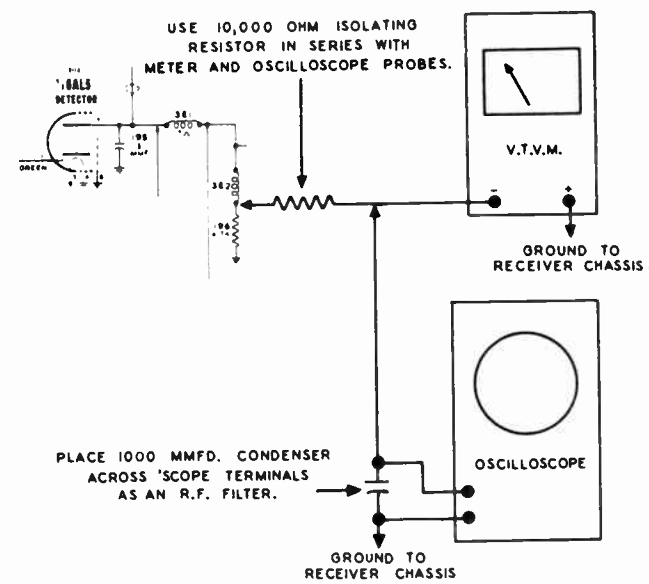

FIG. 10
VTVM and Oscilloscope Connections for IF Channel Alignment

IF CHANNEL ALIGNMENT PROCEDURE

1. A special aligning tool designed to fit the stems on adjustable cores of the IF and Trap coils (see points 8, 9, 10, 11 and 12 in Fig. 13) is available and may be obtained from Stewart-Warner by requesting IF Alignment Tool #507479.
2. Turn receiver Channel Selector to television channel #12 and short antenna terminals together with a jumper wire.
3. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to the AGC line and positive terminal of battery connects to receiver chassis. See Fig. 14 for convenient point of connection.
4. If the IF channel is badly misaligned and two or more immediately adjoining IF stages are tuned to the same frequency, oscillation may occur. Such oscillation shows up as a voltage across the video detector load resistor, symbol 196, and is indicated by the VTVM that is connected to this point during alignment. It should be noted that voltage due to IF oscillation is unaffected by strength of signal from the generator.

Where IF oscillation is encountered, it is generally possible to correct the condition by detuning the IF coils in different directions. If that does not have the desired effect, increase fixed bias on AGC line by using a 4½ volt battery instead of the 3 volt battery referred to in instruction #3. After stopping the oscillation in this manner it will then be possible to align all IF stages using the following procedure, however, the AGC bias battery must be changed back to 3 volts when using the oscilloscope to observe band pass characteristics. Once all stages have been aligned using the 4½ volt bias, the IF channel should be stable with reduced bias.

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNECTIONS	OSCILLOSCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY	CONNECTIONS	FREQ.					
Connect as shown in Fig. 4.	26.1 MC.	Use a 330 Mmf. isolating condenser and connect as shown in Fig. 4 but keep power switch turned off during this step.	——	Connect as shown in Fig. 5.	Not used.	——	#7 Converter plate coil	Adjust for maximum reading on VTVM.
							#8 2nd I.F.	Adjust for maximum reading on VTVM.
Same as above.	24.9 MC.	Same as above.	——	Same as above.	Not used.	——	#9 4th I.F.	Adjust for maximum reading on VTVM.
Same as above.	23.5 MC.	Same as above.	——	Same as above.	Not used.	——	#10 1st I.F.	Adjust for maximum reading on VTVM.
							#11 3rd I.F.	Adjust for maximum reading on VTVM.
Same as above.	22.4 MC.	Same as above.	——	Same as above.	Not used.	——	#12 1st IF Trap Coil	Adjust for minimum reading on VTVM.
Same as above.	26.75 MC.	With connections made as shown in Fig. 4, turn on this generator and set controls for operation as specified in next column.	25 MC. Sweeping ± 5 Mc.	Same as above.	Connect as shown in Fig. 5.	IMPORTANT: 1. Adjust output attenuator on sweep generator so that reading on VTVM is approximately one volt. 2. Set attenuator on standard signal generator so that marker signal does not distort the pattern on the oscilloscope. 3. Be sure that a 3 volt battery is connected to AGC line as specified in instruction #3 at the head of this chart. Do not use a battery of any other voltage.	The IF band pass characteristic now displayed on the 'scope should be compared with the curve shown in Fig. 6. If top of curve is not properly shaped, make a slight readjustment of slug #9. Should that adjustment fail to yield the desired result, then note whether the curve has a peak on the high or low frequency side. Slugs #7 and #8 control high frequency response (26.1 Mc.) and slugs #10 and #11 affect the low frequency response (23.5 Mc.); by making a small change in the settings of the high or low frequency slugs, it will be possible to obtain correct band pass curve. (Fig. 6 below) The 26.75 Mc. picture IF carrier marker should now appear at the 40% amplitude position on side of the band pass characteristic (see Fig. 6). If position of the marker appears too high or too low, slight readjustment of slugs #7, 8 and 9 is required.	
Same as above.	22.25 MC.	Same as above.	Same as above.	Same as above.	Same as above.	Same as above.	Adjust the vertical gain control on the 'scope in order to magnify the sound portion of the response curve. The 22.25 Mc. sound IF carrier marker should appear at the position indicated in Fig. 6. If the position of the sound marker is incorrect, readjust Trap Coil #12.	

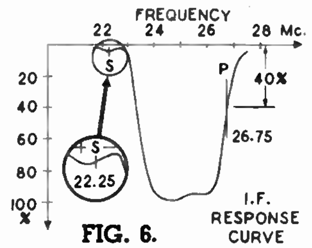

FIG. 6.

RF CHANNEL ALIGNMENT PROCEDURE

Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to AGC line and positive terminal of battery connects to receiver chassis. (See Fig. 14 for convenient point of connection.)

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNECTIONS	OSCILLOSCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY	CONNECTIONS	FREQ.					
RF AMPLIFIER AND MIXER ALIGNMENT								
Connect as shown in Fig. 10.	*209.75 MC. ‡205.25 MC.	Connect as shown in Fig. 10 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #12	Not used.	Connect as shown in Fig. 11.	Set Channel Selector to #12 —— IMPORTANT: Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the scope.	#13 Mixer Grid.	Adjust these trimmers to obtain properly shaped RF band pass characteristic as shown in Fig. 7. Use Mixer Grid trimmer #13; and RF Amplifier Plate trimmer #14 to obtain correct amplitude of characteristic in vicinity of picture and sound carrier markers. Then adjust RF Amp. Grid trimmer #15 to equalize overall amplitude. Repeat adjustment of trimmers to be sure correct response has been obtained.
							#14 RF Amp. Plate.	
							#15 RF Amp. Grid.	IMPORTANT: When adjusting trimmers #13, 14 and 15 it will be noted that the band pass characteristic can be broadened by sacrificing amplitude. It is undesirable to overly broaden the curve as that would result in a loss of sensitivity.
Same as above.	*215.75 MC. ‡211.25 MC.	Same as above.	CHANNEL #13	Not used.	Same as above.	Set Channel Selector to #13	The RF band pass characteristic of the other television channels should now be checked without disturbing the settings of trimmers #13, 14 and 15. Adjust the RF sweep generator and marker generator for operation on the other television channels, observing position of both the sound carrier and picture carrier markers. (Fig. 7 below) Band pass characteristic of these channels should conform to the RF response curve in Fig. 7. If necessary, a compromise may be obtained to compensate for small variations in channel response by returning to channel #12 and making slight changes in the settings of trimmers #13, 14 and 15.	
	*203.75 MC. ‡199.25 MC.		CHANNEL #11			Set Channel Selector to #11		
	*197.75 MC. ‡193.25 MC.		CHANNEL #10			Set Channel Selector to #10

OSCILLATOR ALIGNMENT

1. **IMPORTANT:** Before undertaking oscillator alignment be sure IF circuits are correctly aligned for band pass characteristic illustrated in Fig. 6.
2. During oscillator alignment, it is necessary to set the Fine Tuning control so that the tooth on the bakelite fine tuning cam points downward (correct position for this control is shown in Fig. 8).

Connect as shown in Fig. 10.	*209.75 MC. ‡205.25 MC.	Connect as shown in Fig. 10 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #12	Connect as shown in Fig. 12	Connect as shown in Fig. 12	Set Channel Selector to #12 — Be sure that Fine Tuning control has been properly positioned (tooth on the cam pointing down—see Fig. 8). — During this step and thru-out all succeeding steps it is necessary to: 1. Keep output of sweep generator at a level that does not allow reading on VTVM to exceed one volt. 2. Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the 'scope.	NOTE: Before making the following adjustment, advance the vertical gain control on the 'scope in order to magnify the sound portion of the response curve. Then, use a non-metallic screwdriver to adjust channel #12 oscillator slug (accessible thru hole on front of RF Tuner Unit—see Fig. 8) and shift response curve so that sound carrier marker is located at the position indicated in Fig. 9. Now, reduce gain control setting of 'scope to restore pattern to normal amplitude and observe position of picture carrier marker. This marker should appear at the 50% amplitude position on the low frequency side of the characteristic curve (see Fig. 9).
Same as above.	*215.75 MC. ‡211.25 MC.	Same as above.	CHANNEL #13	Same as above.	Same as above.	Set Channel Selector to #13	Adjust the RF sweep generator and marker generator for operation on the other television channels; set marker generator to sound carrier frequency. After setting Channel Selector to corresponding channel, adjust oscillator slug thru hole on front of RF Tuner Unit (see Fig. 8). This permits response curve to be shifted so that sound carrier marker will appear at the position indicated in Fig. 9. The picture carrier marker for the corresponding channel should then appear at the 50% amplitude position on the opposite side of the band pass characteristic curve. NOTE: Make sure that cam on fine tuning control shaft remains properly positioned during this step (tooth on the cam pointing downward—see Fig. 8).
	*203.75 MC. ‡199.25 MC.		CHANNEL #11			Set Channel Selector to #11	
	*197.75 MC. ‡193.25 MC.		CHANNEL #10			Set Channel Selector to #10	
	*191.75 MC. ‡187.25 MC.		CHANNEL #9			Set Channel Selector to #9	
	*185.75 MC. ‡181.25 MC.		CHANNEL #8			Set Channel Selector to #8	
	*179.75 MC. ‡175.25 MC.		CHANNEL #7			Set Channel Selector to #7	
	* 87.75 MC. ‡ 83.25 MC.		CHANNEL #6			Set Channel Selector to #6	
	* 81.75 MC. ‡ 77.25 MC.		CHANNEL #5			Set Channel Selector to #5	
	* 71.75 MC. ‡ 67.25 MC.		CHANNEL #4			Set Channel Selector to #4	
	* 65.75 MC. ‡ 61.25 MC.		CHANNEL #3			Set Channel Selector to #3	
	* 59.75 MC. ‡ 55.25 MC.		CHANNEL #2			Set Channel Selector to #2	

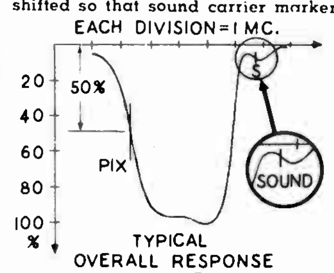

FIG. 9

If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position.

If an unsatisfactory overall response is obtained for a particular channel, observe RF Amp. and Mixer response curve for that channel (as described on page 1950-60D). If characteristic does not conform reasonably well within the typical curve shown in Fig. 7, then, (1) attempt to obtain a better compromise for RF response on all channels by realigning RF Amp. and Mixer circuits, or (2) try replacing Antenna, RF and Oscillator coils for the particular channels.

261	510139	Resistor—carbon 1500 Ohms ± 10% ½ watt	.12
262	510172	Resistor—carbon 100,000 Ohms ± 10% ½ watt	.12
263	510180	Resistor—carbon 270,000 Ohms ± 10% ½ watt	.12
267	510184	Resistor—carbon 470,000 Ohms ± 10% ½ watt	.12
268	510116	Resistor—carbon 68 Ohms ½ watt	.12
270	510716	Resistor—wire wound 220 Ohms ± 10% 5 watt	.90
273	510356	Resistor—carbon 12,000 Ohms ± 10% 2 watt	.24
277	510254	Resistor—carbon 10,000 Ohms ± 10% 1 watt	.16
279	510725	Resistor—carban 3.3 Ohms ± 10% ½ watt	.16
282	510390	Resistor—carbon 1 Meg. ± 10% 2 watt	.30
286	510713	Resistor—carbon 3000 Ohms ± 5% 2 watt	.40
290	510179	Resistor—carbon 220,000 Ohms ½ watt	.12
299	510319	Resistor—carbon 100 Ohms 2 watt	.24
303	510726	Resistor—wire wound 850 Ohms 5 watt	.80
306	510754	Resistor—wire wound 1000 Ohms ± 10% 10 w.	.85
315	510704	Resistor—wire wound 4.3 Ohms ± 10% 1 watt	.25
317-B	508062	Resistor—carbon 22,000 Ohms ⅕ watt (part of Integrator Unit)	1.40
317-D	508062	Resistor—carbon 8200 Ohms ⅕ watt (part of Integrator Unit)	1.40
317-F	508062	Resistor—carbon 8200 Ohms ⅕ watt (part of Integrator Unit)	1.40
320	510767	Resistor—carbon 1.5 Meg. ± 5% ½ watt	.20
322	510766	Resistor—carbon 100,000 Ohms ± 10% ½ watt	.12
323	510771	Resistor—carbon 6.8 Meg. ½ watt	.12
324	510770	Resistor—carbon 1.2 Meg. ± 10% ½ watt	.12
326	510151	Resistor—carbon 6800 Ohms ± 10% ½ watt	.12
328	510193	Resistor—carbon 2.2 Meg. ½ watt	.12
329	510133	Resistor—carbon 680 Ohms ± 10% ½ watt	.12
356	510133	Resistor—carbon 680 Ohms ± 10% ½ watt	.12
363	510356	Resistor—carbon 12,000 Ohms ± 10% 2 watt	.24
367	510124	Resistor—carbon 220 Ohms ± 10% ½ watt	.12
368	510124	Resistor—carbon 220 Ohms ± 10% ½ watt	.12
370	510157	Resistor—carbon 15,000 Ohms ± 10% ½ watt	.12
371	510194	Resistor—carbon 3.3 Meg. ½ watt	.12
375	510137	Resistor—carbon 1000 Ohms ½ watt	.12
376	510185	Resistor—carbon 470,000 Ohms ½ watt	.12
380	510185	Resistor—carbon 470,000 Ohms ½ watt	.12
383	510119	Resistor—carbon 100 Ohms ½ watt	.12
384	510139	Resistor—carbon 1500 Ohms ± 10% ½ watt	.12
385	510155	Resistor—carbon 10,000 Ohms ½ watt	.12
386	510166	Resistor—carbon 47,000 Ohms ± 10% ½ watt	.12
387	510772	Resistor—carbon 2.7 Meg. ± 5% ½ watt	.12
389	510743	Resistor—carbon 1.8 Meg. ± 5% ½ watt	.16
391	510171	Resistor—carbon 82,000 Ohms ± 10% ½ watt	.12
392	510172	Resistor—carbon 100,000 Ohms ± 10% ½ watt	.12
393	510169	Resistor—carbon 68,000 Ohms ± 10% ½ watt	.12
395	510149	Resistor—carbon 4700 Ohms ½ watt	.12
396	510191	Resistor—carbon 1 Meg. ½ watt	.12
397	510162	Resistor—carbon 27,000 Ohms ± 10% ½ watt	.12
398	510236	Resistor—carbon 1000 Ohms ± 10% 1 watt	.16
403	510157	Resistor—carbon 15,000 Ohms ± 10% ½ watt	.12
404	510167	Resistor—carbon 47,000 Ohms ½ watt	.12
408	510774	Resistor—carbon 160,000 Ohms ± 5% ½ watt	.16
409	510751	Resistor—carbon 100,000 Ohms ± 5% ½ watt	.20

PARTS LIST (Cont.)

RESISTORS—Continued

DIAGRAM NO.	PART NO.	DESCRIPTION	LIST PRICE
411	510139	Resistor—carbon 1500 Ohms ± 10% ½ watt	.12
418	510154	Resistor—carbon 10,000 Ohms ± 10% ½ watt	.12
419	510179	Resistor—carbon 220,000 Ohms ½ watt	.12
422, 423	510154	Resistor—carbon 10,000 Ohms ± 10% ½ watt	.12
438	510172	Resistor—carbon 100,000 Ohms ± 10% ½ watt	.12

CONTROLS

DIAGRAM NO.	PART NO.	DESCRIPTION	LIST PRICE
90-A,B,C	520663	Contrast and Volume control (includes ON-OFF switch) A—Volume control; 1 Meg. ¼ watt B—Contrast control; 3000 Ohms ± 10% 4 watt C—On-Off switch	3.50
229	520642	Brightness potentiometer (50,000 Ohms)	1.00
257	508967	Horizontal Hold coil (includes slug and clip)	1.10
	508963	Slug core for Horizontal Hold coil	.15
266	508071	Horizontal Drive trimmer condenser (10-160 Mmfd.)	.40
276	508667	Width coil (includes slug and clip)	1.75
	508784	Slug core for Width coil	.65
284	162190	Coil—Horizontal Linearity (includes slug & clip)	1.60
	507429	Slug core for Horizontal Linearity coil	.60
321-A,B	508893	Height and Vertical Hold potentiometers A—Vertical Hold control; 1 Meg. ¼ watt B—Height control; 2.5 Meg. ¼ watt	1.75
330-A, B	509302	Vertical Linearity and Focus potentiometers A—Vertical Linearity control; 5,000 Ohms ½ watt B—Focus control; 10,000 Ohms ± 10% 4 watt	3.75
375-A,B	520563	Switch, "PHONO-TELEV."	.55
379	520651	Tone potentiometer (500,000 Ohms)	1.00
417	*	Fine Tuning condenser (3-5 Mmfd.)	—

COILS AND TRANSFORMERS

DIAGRAM NO.	PART NO.	DESCRIPTION	LIST PRICE
68	508061	Transformer—1st sound I.F. (includes condensers 68-A and 68-B)	1.85
71	507373	Coil—choke	.80
74	508061	2nd Sound I.F. transformer (includes condensers 74-A and 74-B)	1.85
83	509706	Transformer—TV sound discriminator (includes condenser 83-A and 83-B)	3.00
108	505912	Transformer—sound output	2.05
160	520341	Coil—I.F. trap (includes slug and clip)	1.00
	507357	Slug core for I.F. trap coil	.20
165	507343	Coil—1st video I.F. (less slug)	.70
	507357	Slug core for 1st video I.F. coil	.20
173	507343	Coil—2nd video I.F. (less slug)	.70
	507357	Slug core for 2nd video I.F. coil	.20
185	507343	Coil—3rd video I.F. (less slug)	.70
	507357	Slug core for 3rd video I.F. coil	.20
187	507367	Coil—choke	.70
194	507367	Coil—choke	.70
192	507591	Coil—4th video I.F. assembly (includes condenser 193 and choke coil 194)	2.45
	507357	Slug core for 4th video I.F. coil	.20
200	520643	Coil—peaking	.65
209	520622	Coil—peaking	.70
218	508069	Coil—peaking	.55
220	508070	Coil—peaking	.65
236	162326	Coil—focus (includes cable and plug)	14.00
239	115185	Yoke—picture tube deflection (includes cable and plug)	12.50
257	508967	Coil—Horizontal Hold (includes slug and clip)	1.10
	508963	Slug core for Horizontal Hold coil	.15
275	508679	Transformer—horizontal sweep	12.50
276	508667	Coil—Width (includes slug & clip)	1.75
	508784	Slug core for Width coil (includes mtg. clip)	.65
284	162190	Horizontal Linearity coil (includes slug and clip)	1.60
	507429	Slug core for Horizontal Linearity coil	.60
291	509679	Transformer—power	19.00
293	507586	Coil—choke	.28
296	507587	Coil—choke	.30
300	507584	Coil—choke	.28
304	508341	Choke—filter	3.60

COILS AND TRANSFORMERS

DIAGRAM NO.	PART NO.	DESCRIPTION	LIST PRICE
308	507586	Coil—choke	.28
310	507584	Coil—choke	.28
318	508076	Transformer—vertical blocking oscillator	1.90
332	508956	Transformer—vertical output	3.65
354	509615	Coil—trap	.45
381	520620	Coil—peaking	.65
382	520621	Coil—peaking	.65
401	520702	Coil-antenna; channel #2 (coded "2Q")	1.40
	520703	Coil-antenna; channel #3 (coded "3Q")	1.40
	520704	Coil-antenna; channel #4 (coded "4Q")	1.40
	520705	Coil-antenna; channel #5 (coded "5Q")	1.40
	520706	Coil-antenna; channel #6 (coded "6Q")	1.40
	520707	Coil-antenna; channel #7 (coded "7Q")	1.15
	520708	Coil-antenna; channel #8 (coded "8Q")	1.15
	520709	Coil-antenna; channel #9 (coded "9Q")	1.15
	520710	Coil-antenna; channel #10 (coded "10Q")	1.15
	520711	Coil-antenna; channel #11 (coded "11Q")	1.15
	520712	Coil-antenna; channel #12 (coded "12Q")	1.15
	520713	Coil-antenna; channel #13 (coded "13Q")	1.15
406	520701	Coil-cathode coupling	.15
413	520722	Coil-R.F. and osc; channel #2 (coded "2Q")	1.85
	520723	Coil-R.F. and osc; channel #3 (coded "3Q")	1.85
	520724	Coil-R.F. and osc; channel #4 (coded "4Q")	1.85
	520725	Coil-R.F. and osc; channel #5 (coded "5Q")	1.85
	520726	Coil-R.F. and osc; channel #6 (coded "6Q")	1.85
	520727	Coil-R.F. and osc; channel #7 (coded "7Q")	1.70
	520728	Coil-R.F. and osc; channel #8 (coded "8Q")	1.70
	520729	Coil-R.F. and osc; channel #9 (coded "9Q")	1.70
	520730	Coil-R.F. and osc; channel #10 (coded "10Q")	1.70
	520731	Coil-R.F. and osc; channel #11 (coded "11Q")	1.70
	520732	Coil-R.F. and osc; channel #12 (coded "12Q")	1.70
	520733	Coil-R.F. and osc; channel #13 (coded "13Q")	1.70
	507986	Slug for osc coil; auxiliary fine tuning adj.	.05
424	520714	Coil-choke	.15
426	520715	Coil-choke	.45
427	520734	Coil-converter plate I.F. (includes slug and clip)	.75
	509062	Slug core for converter plate coil	.12
434	520518	Coil-choke	.10
436	520520	Coil-choke	.10

OTHER ELECTRICAL PARTS

DIAGRAM NO.	PART NO.	DESCRIPTION	LIST PRICE
109	508157	Speaker—P.M. Dynamic (6")	7.40
235	509688	Ion Trap	.85
274	508713	Fuse for horizontal sweep circuit; ¼ Amp. 250 volt	.20
316	118921	Channel Lite (Mazda #47) 6-8V. 150 Ma.	.15
317-A to G	508062	Integrator coupling unit A—Condenser-ceramic .01 Mfd. 450 volt B—Resistor-carbon 22,000 Ohms 1/5 watt C—Condenser-ceramic 2000 Mmfd. 450 volt D—Resistor-carbon 8200 Ohms 1/5 watt E—Condenser-ceramic 5000 Mmfd. 450 volt F—Resistor-carbon 8200 Ohms 1/5 watt G—Condenser-ceramic 5000 Mmfd. 450 volt	1.40
343	509517	Fuse; 1 Amp. 250 volt	.25
400	509695	Built-in antenna	1.00

MECHANICAL PARTS FOR 520645 R.F. TUNER

(for electrical parts see preceding classified listings of condensers, resistors and coils)

DIAGRAM NO.	PART NO.	DESCRIPTION	LIST PRICE
	520645	R.F. Tuner complete with coils and tubes	37.50
	508081	Bracket for mounting R.F. tuner (front)	.16
	520233	Bracket for mounting R.F. tuner (rear)	.25
	507339	Clip for mounting video converter plate coil	.10
	520515	Fine Tuning cam and shaft	.70
	508708	Roller-detent.	.10
	520535	Shield, bottom cover	.50
	520536	Shiled, side cover	.35
	520354	Shield—tube; miniature for 6J6 tube	.15
	520519	Shield—tube; miniature for 6BQ7 or 6BZ7 tube	.20
	509062	Slug core for converter plate coil	.12
	507986	Slug for osc. coil; auxiliary fine tuning adj.	.05
	507987	Socket—miniature (7 pin) for 6J6 tube (includes base for mounting shield)	.45
	520521	Socket—miniature (9 pin) for 6BQ7 or 6BZ7 tube (includes base for mounting shield)	.50
	507966	Spring—contactor washer (on front turret shaft)	.08
	508709	Spring—detent.	.08
	507990	Spring—retains osc. fine tuning slug	.10
	507967	Spring—turret shaft retaining	.03
	520517	Stator contact assembly (includes 11 contacts and metal frame)	3.75
	520516	Turner turret and shaft assembly (less coils)	3.00
	507965	Washer, fiber spacer (on turret shaft)	.01

CABINET PARTS

	520534	Shield—tube; miniature for 6J6 tube	.15
	520429	Sleeve, insulating for picture tube (includes H.V. contact)	3.00
	509062	Slug core for converter plate coil	.12
	507357	Slug core for 1st, 2nd, 3rd or 4th video I.F. coil, or trap coil	.20
	508963	Slug core for Horizontal Hold coil	.15
	507429	Slug core for Horizontal Linearity coil	.60
	508784	Slug core for Horizontal Width coil (includes mounting clip)	.65
	508049	Socket and cable assembly for picture tube	1.05
	520244	Socket and mounting bracket for TV Channel Lite	.25
	162259	Socket assembly for 1B3GT/8016 tube (includes mounting frame)	1.20
	508419	Socket (8 pin) for deflection yoke cable	.70
	508879	Socket (3 pin) for focus coil leads	.35
	507932	Socket—male, power cord interlock	.25
	507364	Socket—miniature (7 pin)	.24
	507987	Socket—miniature (7 pin) for 6J6 (includes base for mounting shield)	.45
	508044	Socket—miniature (9 pin)	.35
	509507	Socket—miniature (9 pin) (for 6S4 tube)	.25
	520521	Socket—miniature (9 pin) for 6BQ7 or 6BZ7 (includes base for mounting shield)	.50
	508703	Socket—octal	.15
	508703	Socket—octal; for color TV adapter	.15
	506469	Socket—octal (for 6W4 tube)	.18
	160039	Socket—(1 pin) for phono. pick-up cable	.12
	509320	Spring—tension for focus coil mounting	.10
	520672	Strap, anchor for picture tube	.45
	520623	Strap, tube retaining	.50
	520443	Support for tuner shaft (plastic)	.04
	162163	Terminal strip for TV antenna connections	.22
	170195	Wing nut—#8-32; for mounting yoke and focus coil	.10
	170817	Wing screw—#10-24; for height adj. of yoke and focus coil	.05

*—This part is not supplied as a Service replacement item.

ALL PRICES ON THIS PARTS LIST ARE SUBJECT TO CHANGE WITHOUT NOTICE.

In those cases where the mask of a particular model was changed during production and it is not inter changeable with the original mask, the series letter stamped on the rear of the chassis, which identifies this change, will also be shown.

MODEL NO.	ORIGINAL MASK NO.	SUBSTITUTE FOR ORIGINAL MASK NO.	LATEST TYPE MASK NO.	CHASSIS LETTER IDENTIFYING LATEST MASK
9132-A	520475-A†	520475-B	520834-A*	"A"

PRODUCTION CHANGES

The following tabulation furnishes complete details on changes which occurred during receiver production. The receivers incorporating these changes are identified by coding stamped on rear surface of chassis. This coding consists of one or more letters following the word SERIES, as SERIES B, SERIES AC, etc., and corresponds to similarly lettered changes shown below. Chassis incorporate only that change indicated by letter designation; i.e., chassis stamped "SERIES BE" does not include changes "A" or "C" or "D".

The circuit shown on this page applies to "UNCODED" chassis.

A letter following the component circuit diagram number thus —201[A], indicates that this particular item was affected by a circuit change. The letter corresponds to the series code letter listed in the production change column, from which complete change information can be obtained.

LETTER INCLUDED IN DESIGNATION FOLLOWING THE WORD "SERIES"	CHANGE INCORPORATED IN CHASSIS
UNCODED	INITIAL PRODUCTION
‡	On some chassis the Color Adaptor Socket was not incorporated. There is no series letter identification on rear of chassis to identify this change.

GENERAL SPECIFICATIONS

DIMENSIONS

Model	Height	Width	Depth
27C-9212A	43¾"	29¼"	24"

WEIGHT (packed)

Model 27C-9212A 194 lbs.

POWER REQUIREMENTS

117 volts 60 cycles 275 watts

PICTURE SIZE

27" Rectangular

SPEAKER

Type	Size	V.C. Imped.
P.M. Dynamic	6"x9"	3.2 ohms

ANTENNA INPUT IMPEDANCE

300 ohms—balanced to ground.

BUILT-IN ANTENNA

Broad band dipole.

R. F. TUNER

Turret type construction; individually removable coil assemblies for all channels. All components are easily accessible for servicing.

INTERMEDIATE FREQUENCIES

Sound Carrier—22.25 Mc.
Picture Carrier—26.75 Mc.

I.F. SYSTEM

Three Stages—stagger tuned—for composite signal.
One additional stage for sound channel.

DETECTOR

Sound—Ratio Type
Picture—Germanium Crystal Type

RETRACE LINE SUPPRESSOR

Eliminates retrace lines thruout the normal range of picture brightness and contrast.

DEFLECTION & FOCUS

Magnetic

HORIZONTAL SYNCHRONIZATION

Automatic frequency control provides excellent picture stability.

HIGH VOLTAGE POWER SUPPLY

"Fly-back" type. Completely enclosed in a shielded compartment.

Due to the operating characteristic of the 27" picture tube, additional modifications have been incorporated. A different power transformer as well as an additional low voltage rectifier tube, V19, a type 5U4G, were utilized. The horizontal sweep transformer, deflection yoke and its associated circuits and components were modified. The Horizontal Scanning Output tube, V15, was changed to a type 6CD6G, the Horizontal Damping tube, V17, was changed to a type 6AX4GT, and the Vertical Scanning Output tube, V21, was changed to a type 6BQ6GT.

SOCKET VOLTAGES
MODEL 27C-9212A

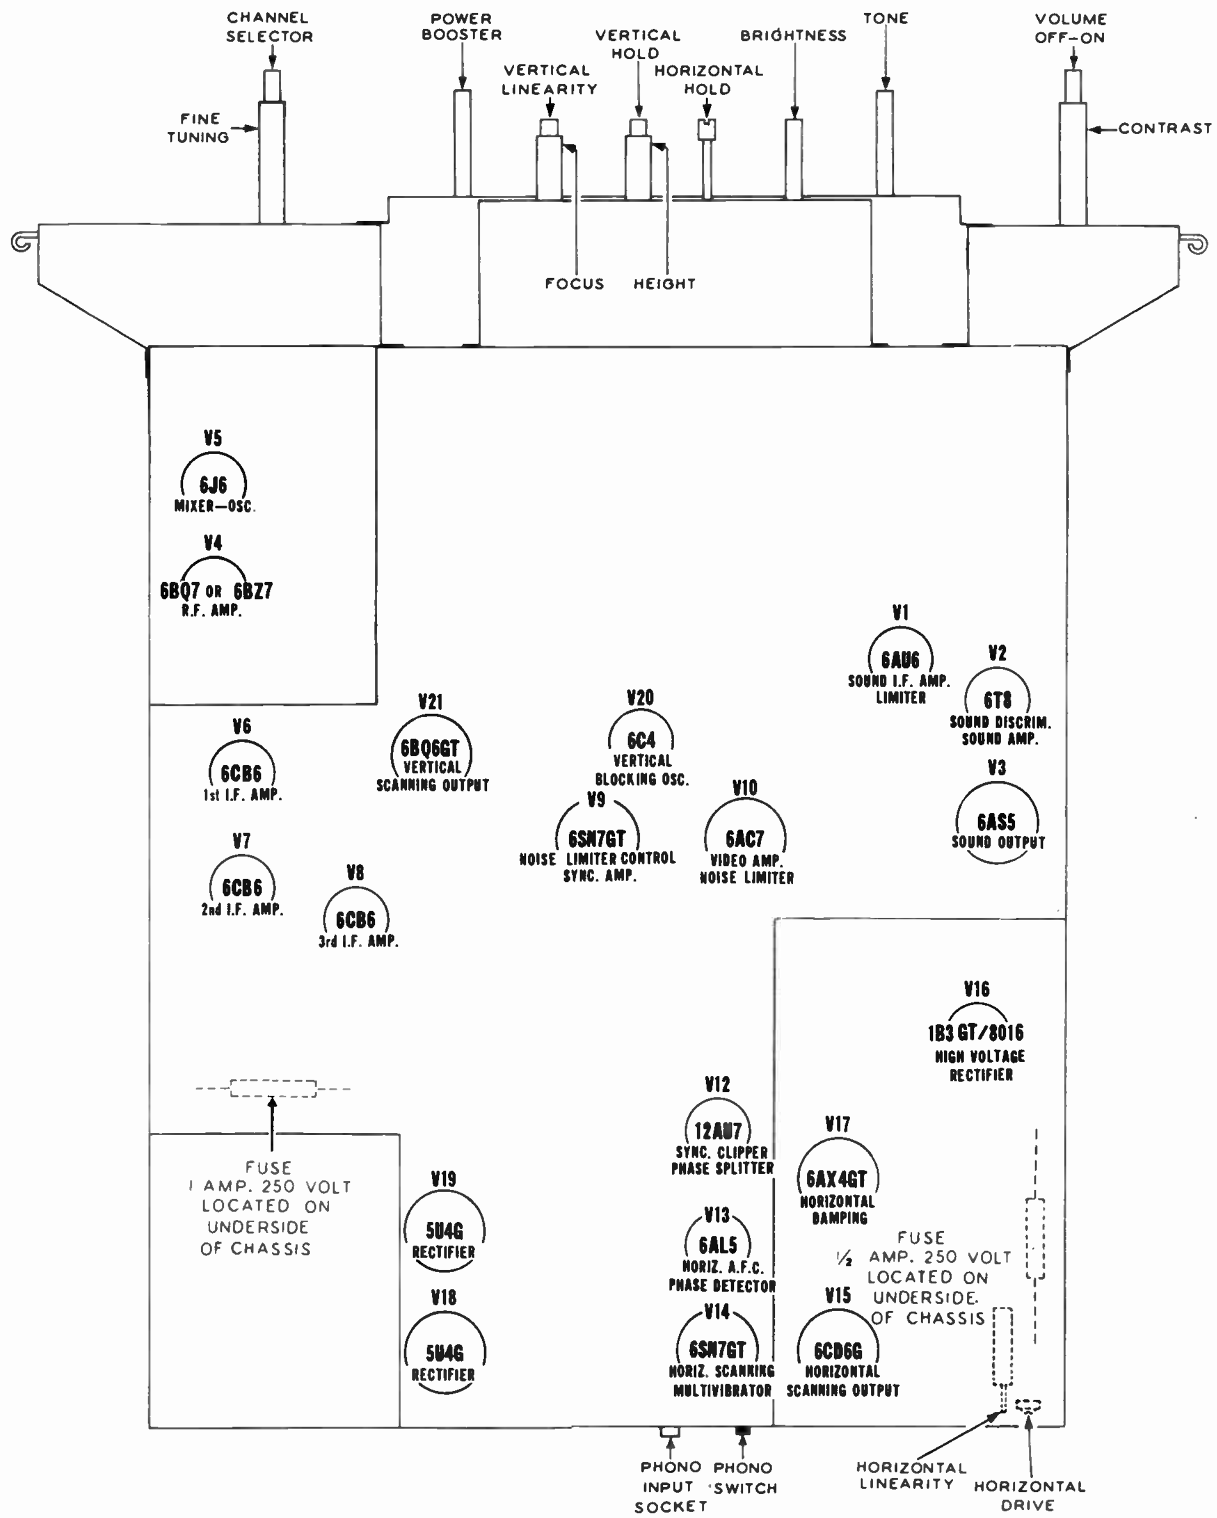
CAUTION

THE PICTURE TUBE is highly evacuated and if broken, glass fragments will be violently expelled. Scratching, chipping, undue pressure, or careless handling such as lifting the tube by its neck is dangerous and should be avoided. If it is necessary to handle the picture tube, use safety goggles and heavy gloves.

HIGH VOLTAGE (10 to 18 kilovolts) is produced in a supply circuit of this receiver. Exercise care to avoid contact with elements of this circuit and particularly the tube terminals which are labeled "CAUTION" in the adjoining voltage chart.

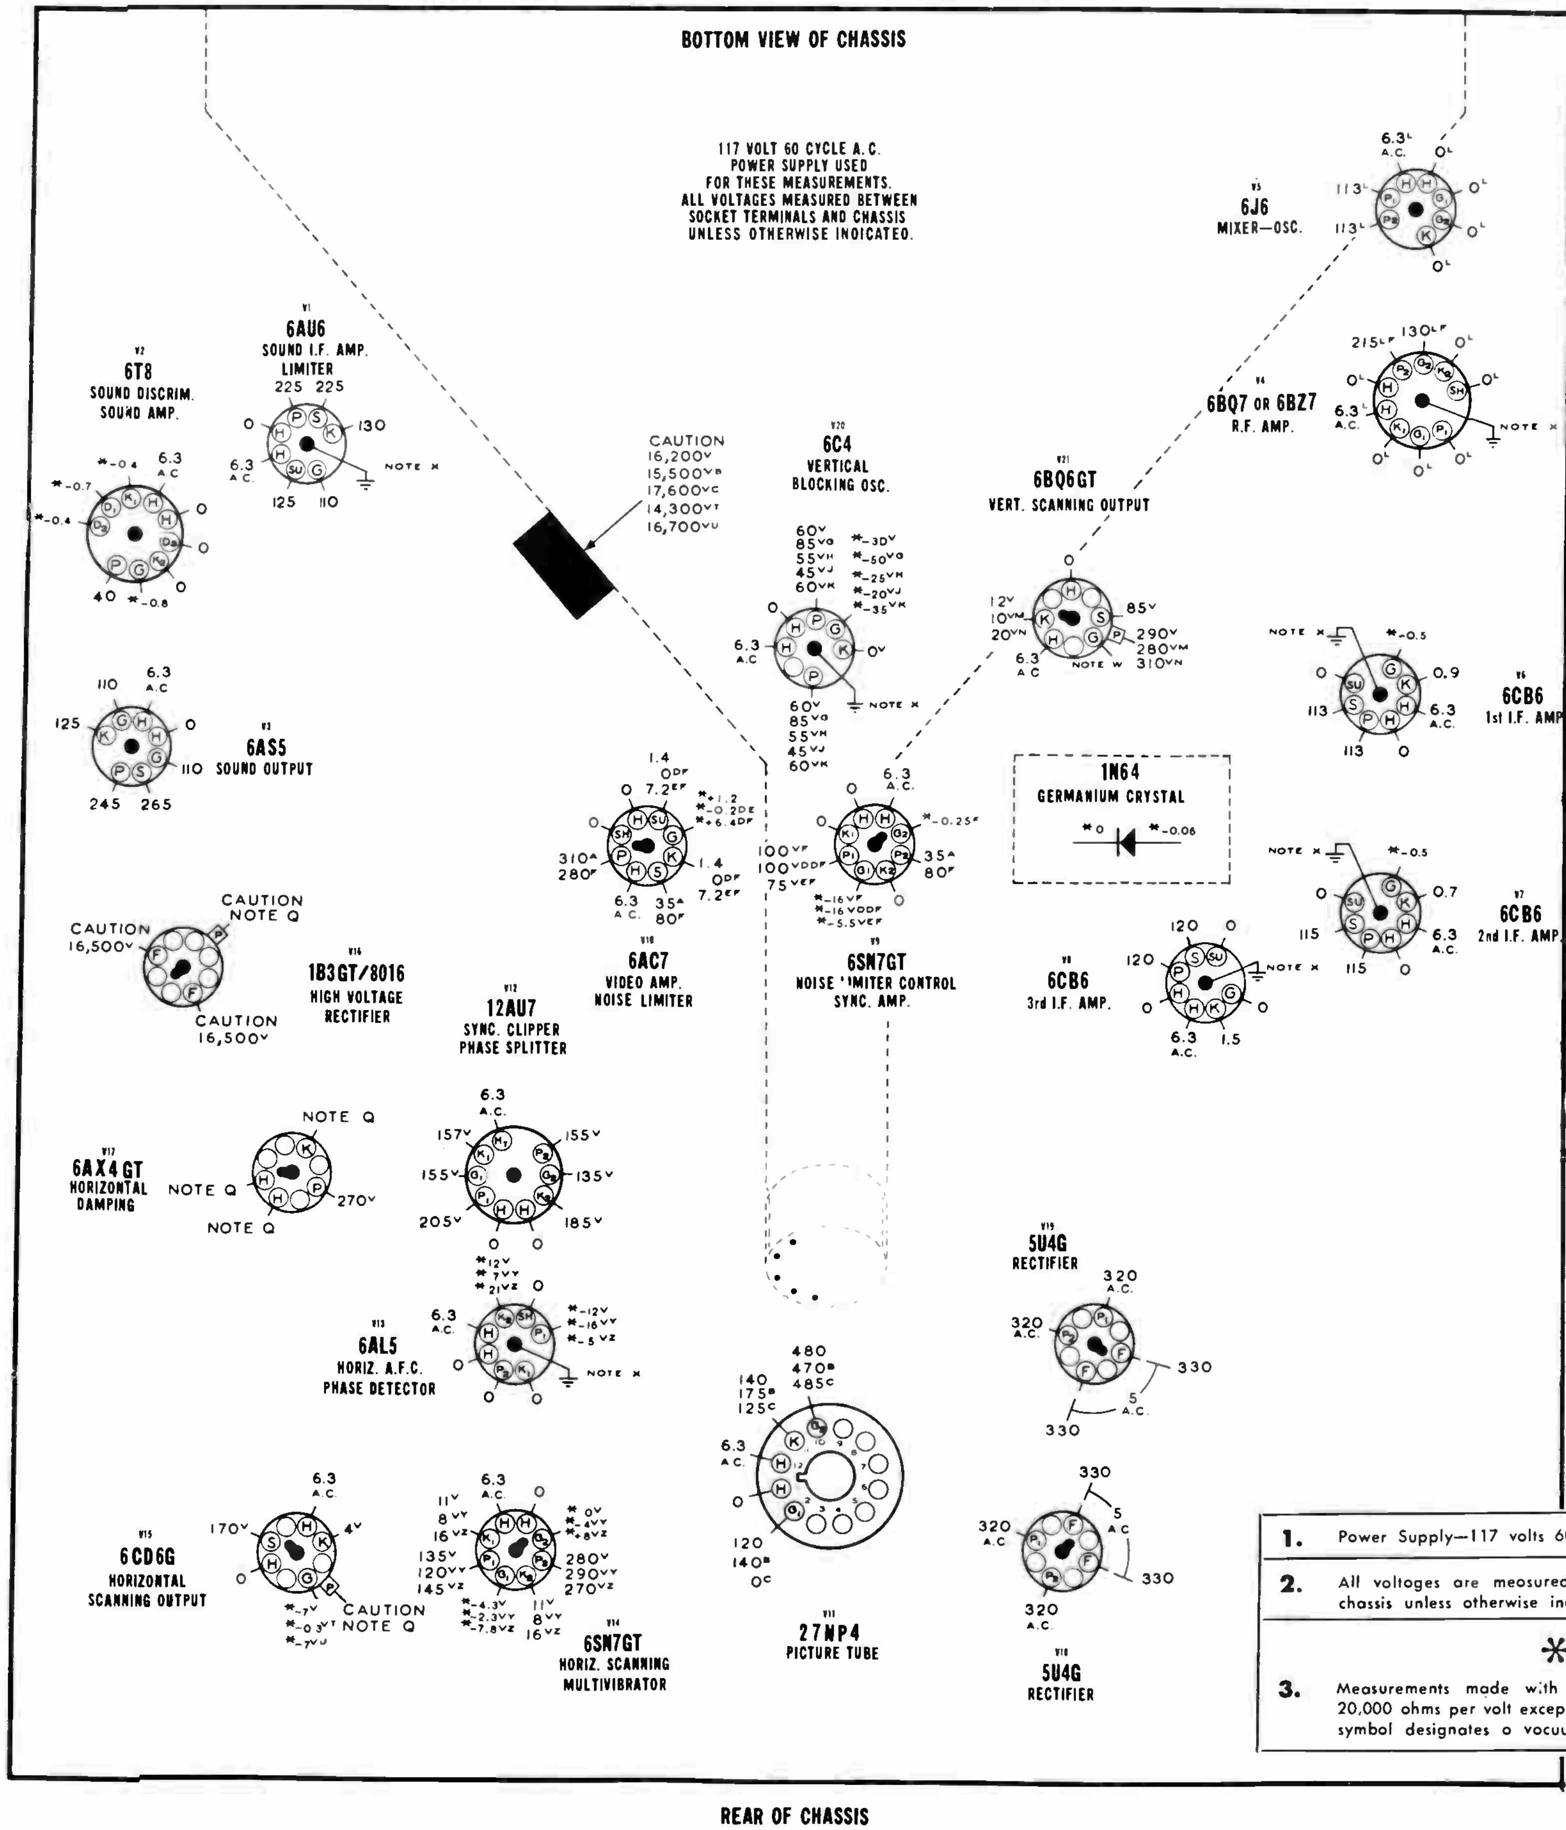
THE HIGH VOLTAGE LEAD, which supplies approximately 10 to 18 kilovolts to the picture tube, should be momentarily shorted to the chassis whenever it is disconnected for service purposes. This discharges the high voltage filter condenser and prevents a shock hazard when working on the receiver after it has been turned off.

INTERMEDIATE B+ VOLTAGES, are dangerous and caution should be observed when the receiver chassis components are exposed for service purposes.



EXPLANATION OF NOTES

A.	Power Booster control max. clockwise
B.	Brightness Control max. clockwise
C.	Brightness Control max. counter-clockwise
D.	Contrast Control max. clockwise
DD.	Contrast control set to max. voltage reading but not necessarily max. clockwise setting of control
E.	Contrast Control max. counter-clockwise
F.	Power Booster control max. counter-clockwise.
G.	Height Control max. clockwise
H.	Height Control max. counter-clockwise
J.	Vertical Hold Control max. clockwise
K.	Vert. Hold Control max. counter-clockwise
L.	This voltage measurement was taken from the top of the tuner chassis with the tube removed from its socket.
M.	Vertical Linearity Control max. clockwise.
N.	Vertical Linearity Control max. counter-clockwise.
Q.	Do not attempt to measure the voltage at this position. There is a high R. F. potential at this point.
T.	Horiz. Drive Control max. clockwise
U.	Horiz. Drive Control max. counter-clockwise.
V.	Before measuring this voltage, connect external antenna and adjust controls for normal reception of station signal.
W.	This measurement should be made with a vacuum tube voltmeter. This voltage reading will fluctuate in the vicinity of 0.15 volts.
X.	Grounding of center stud on tube socket is necessary to reduce capacity coupling between other pins. Oscillation may result if this ground is omitted.
Y.	Horiz. Hold Control turned in a clockwise direction until picture approaches loss of sync.
Z.	Horiz. Hold Control turned in a counter-clockwise direction until picture approaches loss of sync.



1.	Power Supply—117 volts 60 cycle AC.
2.	All voltages are measured between socket terminals and chassis unless otherwise indicated on adjoining chart.
3.	* Measurements made with voltmeter having sensitivity of 20,000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

520645 RF TUNER

Channel selection is accomplished by rotation of the turret containing two sets of easily removable coil assemblies for each channel. The individual antenna coil sections consist of a balanced primary to minimize noise pick-up on the transmission line and an R.F. grid coil which couples the incoming signal to the grid of the first section of the R.F. Amplifier tube (V4). The inductance and amount of coupling of the tuned antenna input circuit are changed for each channel so that a constant input impedance of 300 ohms is maintained. This provides maximum transfer of energy to the R.F. Amplifier stage, particularly when interconnection between an outdoor antenna and the receiver is made with 300 ohm transmission line.

The R.F. Amplifier tube is a dual-triode tube and is connected in the circuit as a direct coupled grounded-grid type amplifier. This circuit was developed to meet the demand for an R.F. Amplifier that would provide more nearly equal gain on both the low and high Television Channels, while keeping inherent tube noise to a minimum. The circuit can be thought of very simply as two triode tubes in series, the first or driver unit acting not as an amplifier, but rather as an antenna impedance matching device and also as a variable cathode impedance, or bias source, for the second, or grounded-grid unit. In addition the first unit of the R.F. Amp. acts as a power amplifier due to its extremely low plate impedance, which is in reality the cathode circuit of unit two, and converts the weak signal voltage from the antenna to a low voltage-high current signal which is then applied to the cathode of unit number two. The signal coupling unit between the first and second units is a series peaking coil, symbol 406, similar to that found in a video amplifier circuit. Its purpose is to form a series resonant circuit with the input capacity of the second unit. The coil is so made as to resonate at a frequency slightly higher than channel 13. In a standard pentode type amplifier, the gain falls off rapidly as progressively higher channels are selected. With the use of the plate to cathode peaking coil an almost equal gain can be realized for all channels.

The R.F. Amp. tube has inherently low interelectrode capacity due to physical design and this factor in conjunction with the low output impedance of the first section is responsible for the low noise factor at this stage. While neutralization of the first unit is not necessarily due to its low plate to grid capacity, additional noise reduction has been realized, with only a slight decrease in gain, by the addition of a neutralizing condenser, item 405. Due to the low output impedance of the stage, it is not necessary that the neutralizing condenser be turnable.

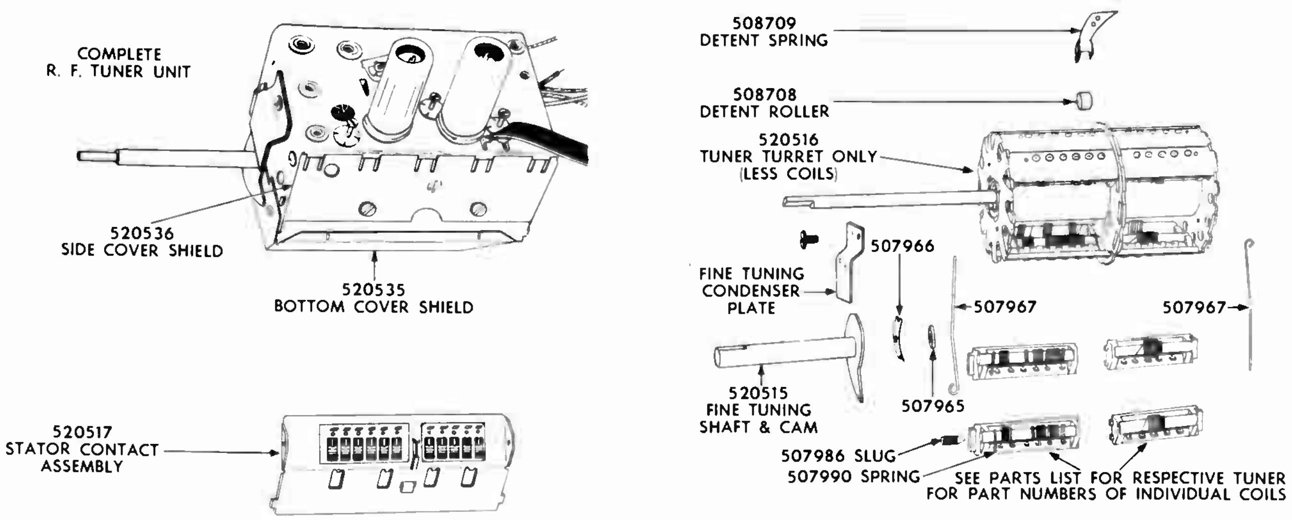
Because of the circuits' excellent internal shielding, low input impedance and radiation rejection, the second section of the R.F. Amp. is connected as a driven grounded-grid amplifier. While this might not be apparent at first glance due to the fact that grid has no direct D.C. return, it will be found upon further examination that any high frequency A.C. potentials are by-passed to ground through condenser 407.

The second section of turret coils includes the tuned R.F. amplifier plate coil, tuned mixer grid coil, and oscillator coil. The output of the R.F. amplifier stage is coupled to the grid of the mixer stage, which utilizes one triode section of a 6J6 tube (V5). The other half of the 6J6 is connected as a modified Colpitts oscillator which injects oscillator voltage into the mixer stage through coupling between the oscillator coil and the mixer grid coil. Course oscillator tuning is accomplished by adjusting the positions of the slugs in the individual oscillator coils, while Fine Tuning is obtained when using condenser #417 in the oscillator plate circuit. This Fine Tuning condenser is composed of two fixed plates, and its capacitance is changed by the insertion of a bakelite cam between these plates.

Signal output from the mixer stage is coupled to the IF amplifiers through the converter plate I.F. coil, diagram #427, located on the tuner unit.

REPAIR DATA FOR 520645 RF TUNER

All replacement parts for the RF Tuner Unit are included in the complete receiver parts list



SERVICE PRECAUTIONS

SUBJECT	PRECAUTIONS
ELECTRICAL COMPONENTS	The high frequencies used in the RF section of a television receiver make it necessary that considerable care be exercised in servicing the tuner. Lead dress and location of components are very critical at these frequencies. When replacing parts, it is important to use components of identical electrical characteristics and physical size. Always reconnect the replacement item in the same location and position in the tuner as the original component.
TUBES	Replacement of tubes in the Tuner Unit may cause slight detuning of RF circuits due to inherent differences in inter-electrode capacitances. When replacing tubes (especially 6J6 mixer-oscillator tube) make sure that Fine Tuning control will tune in television stations at approximately the middle of its range. It may be necessary to change the setting of the individual oscillator coil slugs for some channels to accomplish this.

SUBJECT	PRECAUTIONS
CHANNEL COILS AND SLUGS	Channel Coils must be handled with care. **Do not disturb coil windings.** If an oscillator slug "falls into" its coil form during adjustment, remove the Channel Coil from the turret assembly and lift the Slug Retaining Spring aside. By tapping the coil form it should be possible to make the slug move toward the end so that its threads will be engaged by the Slug Retaining Spring when that spring is returned to its normal position.
FINE TUNING CONTROL	Rubbing of the bakelite Fine Tuning Cam against the Fine Tuning Condenser Plate is intentional in order to avoid vibration with resulting microphonics. However, the Fine Tuning Cam should **not** rub or contact the small circular plate located on the body of the tuner.

REMOVAL AND REPLACEMENT OF PARTS

ITEM	PROCEDURE
RF TUNER UNIT	To remove the Tuner Unit from receiver chassis, proceed as follows: 1. Remove channel selector dial lamp socket. 2. Remove screws which hold tuner to front and rear support brackets. 3. Disconnect the leads from the tuner to the main chassis. See illustration on circuit diagram page showing tuner connections. 4. Tuner unit may now be withdrawn from underside of chassis.
CHANNELS COILS	It is not necessary to remove entire tuner unit to replace a snap-in channel coil but removal of bottom shield will be required. This may be accomplished by grasping the front end of the shield and pulling downward and unhooking it from rear of tuner frame. Insert a screwdriver blade between Coil Retainer Spring and the end of the Tuner Turret. Twist the blade to pull spring away from the molded body of Channel Coil. Lift this end of coil body upward and remove individual coil assembly from tuner. When replacing Channel Coils, be sure they are reinstalled in their correct positions. Coil numbers should increase consecutively in a counter-clockwise direction when tuner is viewed from the front. If all the Channel Coils have been removed from the Tuner Turret, rotate turret until flat surface on end of tuner shaft points down. Install #3 Channel Coils into bottom position on turret. Then follow the correct sequence indicated above to replace other coils.
TUNER TURRET ASSEMBLY	To remove turret from RF Tuner Unit, remove complete tuner and bottom shield as described in previous sections and proceed as follows: 1. Remove rear Turret Shaft Retaining Spring by disengaging straight end of spring from projection on tuner frame. 2. Remove Fine Tuning Condenser Plate from front of Tuner Unit. This plate forms one side of Fine Tuning control condenser and is held in place by one screw. 3. Slide Fine Tuning Cam and Shaft off of main Channel Selector Shaft. 4. Remove Spring Contactor Washer and Fiber Spacer Washer from Channel Selector Shaft. 5. Remove Shaft Retaining Spring at front of tuner by disengaging straight end of spring from projection on frame. 6. Remove turret assembly from frame. To replace turret, reverse the above procedure. Tooth on bakelite Fine Tuning Cam should point downward during assembly so that it does not become locked between the stops on the Fine Tuning Condenser Plate. Also be sure to replace bottom shield.
STATOR CONTACT ASSEMBLY	To remove this assembly, remove complete tuner as described in previous sections and proceed as follows: 1. Remove side shield by taking out the two retaining screws and unsolder shield at one point. Now, disengage shield from upper edge of tuner frame. 2. Remove the two screws at the front and rear of the Stator Contact Assembly. 3. Unsolder all electrical connections to contact plate. 4. Unsolder five soldered joints between Stator Contact Assembly and Tuner Unit. 5. Contact Assembly may now be withdrawn from frame. To reinstall this assembly: 1. Place Stator Contact Assembly in position and replace, but do not tighten, the two screws at the front and rear of the assembly. 2. Remove 3 consecutive pairs of Channel Coils from the turret (for example, the antenna and rf-osc. coils for channels #5, 6 and 7). 3. Position Tuner Turret so that the edges of the next highest Channel Coils (in this case, the coils for channel #8) just pass the row of 11 contacts on the Stator Contact Assembly. 4. Adjust position of the Stator Contact Assembly so that there are a few thousandths of an inch spacing between the contacts on the contact plate and the molded body of the Channel Coils. 5. The Contact Assembly is now correctly positioned and screws at front and rear may be tightened. 6. Solder Stator Contact Assembly to tuner frame at same points that were used previously. 7. Make all electrical connections to contact plate. 8. Replace Channel Coils. 9. Replace side shield.

ALIGNMENT PROCEDURE

Alignment of all RF and IF tuned circuits in this receiver may be accomplished by utilizing the procedures described in the following charts.

SEQUENCE OF ALIGNMENT: These procedures should preferably be applied in the order in which they are presented, however, alignment of the Sound Channel or IF Channel may be accomplished individually if desired.

The RF Amplifier and Mixer alignment may also be accomplished independent of Sound or IF Channel alignment, but oscillator calibration can only be done after IF Channel has been correctly aligned. Proper IF bond pass characteristic is necessary for Oscillator alignment as results of RF circuit tuning are observed by means of an oscilloscope connected to the output of the crystal detector.

REMOVAL OF CHASSIS: The receiver chassis must be removed from the cabinet in order to accomplish alignment of all tuned circuits as there are adjustment points located on the underside of the unit.

This can be accomplished by first removing all knobs and disconnecting the receiver "built-in" antenna and speaker. The chassis may then be removed by releasing the hold-down screws located on the underside of the cabinet chassis mounting board.

CAUTION

The picture tube is highly evacuated and if broken, glass fragments will be violently expelled. Handle with care, using safety goggles and gloves.

INSTRUMENTS: The following instruments will be required as signal sources and output indicators during the alignment process. Since accurate alignment of a television receiver is heavily dependent upon the performance of your instruments, it is imperative that they meet the essential specifications described here.

1. **STANDARD SIGNAL GENERATOR** to provide unmodulated (pure RF) signals at the following frequencies. Maximum output on all ranges should be at least .1 volt with provision for attenuation as desired. This instrument must have good frequency stability and be accurately calibrated. Generators which incorporate a separate crystal controlled oscillator and heterodyne circuit are self calibrating and therefore capable of providing the accuracy of frequency calibration required for television circuit alignment.

   a. IF Frequencies:
      - 4.5 Mc. Sound Channel
      - 21.6 Mc. Sound IF marker
      - 23.5 Mc. Converter and 1st IF stages
      - 25.9 Mc. 2nd and 3rd IF stages
      - 26.1 Mc. Picture IF marker

   b. RF Frequencies:
      - 54 to 88 Mc.
      - 174 to 216 Mc.

2. **RF SWEEP GENERATOR** to provide frequency modulated signals at the following frequencies:

   20 to 30 Mc. with 10 Mc. sweep width.
   54 to 88 Mc. with 10 Mc. sweep width.
   174 to 216 Mc. with 10 Mc. sweep width.

   Output adjustable with at least .1 volt maximum.

   Output should be "flat" (no amplitude variation) for all settings of the sweep width control.

   Provision for connection of generator sweep modulating voltage to horizontal deflection system of an oscilloscope.

   Provision for blanking the output signal on each return sweep so that oscillogram will not show retrace.

3. **CATHODE RAY OSCILLOSCOPE,** preferably a unit with vertical amplifier having wide range frequency response and low capacity pick-up probe.

4. **VACUUM TUBE VOLTMETER.** The lowest voltage range of this instrument should preferably permit a 1.0 volt reading to be indicated at not less than one third of full scale deflection.

INSTRUMENT CONNECTIONS: The method of connection, including details of matching and coupling networks, for instruments used in this alignment procedure is given in several illustrations on subsequent pages. Specific instructions for each instrument application will be found in various sections of the alignment charts.

GENERAL INSTRUCTIONS: When aligning IF and RF circuits it is necessary to apply a fixed bias voltage to the AGC system of the receiver. This fixed bias is obtained by using a 3 volt battery and connecting it as described in Fig. 15.

IMPORTANT

When observing the receiver band pass characteristic on an oscilloscope, it is exceedingly important to avoid distortion of that characteristic which would occur when using a large input signal from the sweep generator or standard generator (marker signal). Always set attenuator on sweep generator so that the reading on the vacuum tube voltmeter does not exceed one-half volt (when meter is connected from high side of video detector load, symbol 122, to receiver chassis). The sweep width should never be set greater than that needed to fully display the receiver band pass characteristics on the oscilloscope. Standard generator output should also be attenuated so that marker signal does not pull or tear the band pass characteristic as shown on the 'scope.

SOUND CHANNEL ALIGNMENT PROCEDURE

1. Short antenna terminals together with a jumper wire.
2. Set receiver Channel Selector to any inactive television channel and contrast control to its maximum counter-clockwise position; other controls may be left at any desired setting.
3. No special aligning tool is required to adjust the cores in the Sound IF and discriminator transformers. The blade of a small screwdriver will fit the slot in these cores, however, the screwdriver should be of a non-metallic or insulated type to prevent detuning when inserted in the transformer can.

STANDARD SIGNAL GENERATOR		VTVM CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY				
Connect as shown in Fig. 1.	**4.5 MC.** unmodulated IMPORTANT This signal must be accurate within ¼ of 1% of 4.5 Mc. Check generator calibration against a crystal controlled signal source by "zero beating" (heterodyning) with harmonics of the crystal frequency.	Connect as shown in Fig. 2.	1. Set Contrast control to its maximum clockwise position. 2. A special detector must be utilized when aligning the 4.5 Mc. Sound Trap Coil. This unit can be constructed in accordance with the information contained in the circuit shown below. If a VTVM containing a high frequency A.C. probe is available, this probe can be utilized in place of the crystal detector shown in Fig. 2. 3. During this adjustment only, remove one of the three 6CB6 IF amplifier tubes (V6, V7 or V8). This will prevent noise in the RF stages from effecting the voltage reading while adjusting the sound trap.	#1 4.5 MC Sound Trap	Adjust for minimum reading on VTVM.
		Connect as shown in Fig. 3.	A "swishing" sound may be heard in the speaker during Sound Channel Alignment. This spurious oscillation is caused by horizontal sweep voltage being picked up in the audio system thru stray coupling of instrument leads; it should be disregarded as it will have no effect on alignment of the sound channel.	#2 Discriminator Secondary	Adjust for maximum reading on VTVM.
				#3 Discriminator Primary	Adjust for maximum reading on VTVM.
				#4 Sound IF Transformer	Adjust for maximum reading on VTVM.
Same as above.	Same as above.	Connect as shown in Fig. 4.	To obtain zero balance of the discriminator circuit, two 68,000 ohm resistors will be required. These resistors must be matched so that their respective resistances do not differ by more than 1%—the accuracy of the total resistance is not critical. Connect the two resistors in series from pin 2 of the 6T8 tube to chassis ground as shown in Fig. 4.	#2 Discriminator Secondary	Note that as slug #2 is rotated, a point will be found where the voltmeter will swing rather sharply from a positive to a negative reading or vice versa. The correct setting of slug #2 is obtained when the meter reads zero as the slug is moved thru this point.

REDUCTION OF INTERCARRIER BUZZ

Slight "dynamic" unbalance of the discriminator secondary can emphasize intercarrier buzz due to incomplete amplitude modulation rejection. Therefore it is vitally important to obtain an accurate setting of the discriminator secondary slug under actual reception conditions.

Disconnect all instruments (be sure that I.F. tube removed for the adjustment of Sound Trap has been replaced) and then connect an antenna to the receiver to obtain program reception from a local station. If intercarrier buzz is prominent, a slight readjustment of the discriminator secondary slug (#2) should be made to obtain the "dip" point for the buzzing sound. Note that program sound will be clear and free from distortion at this point. Buzz should now be at an acceptable minimum if station transmission is not at fault.

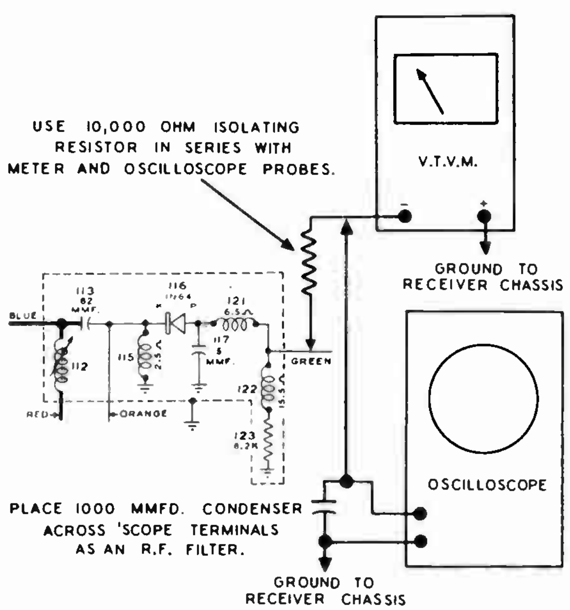

FIG. 6
VTVM and Oscilloscope Connections for IF Channel Alignment

IF CHANNEL ALIGNMENT PROCEDURE

1. A special aligning tool designed to fit the stems on adjustable cores of the IF and Trap coils (see points 5, 6, 7 and 8 in Fig. 14) is available and may be obtained from Sears and Roebuck by requesting IF Alignment Tool #507479.
2. Turn receiver Channel Selector to television channel #12 and short antenna terminals together with a jumper wire.
3. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to the AGC line and positive terminal of battery connects to receiver chassis. See Fig. 15 for convenient point of connection.
4. If the IF channel is badly misaligned, oscillation may occur. Such oscillation shows up as an excessive voltage across the video detector load, symbol 122, and is indicated by the VTVM that is connected to this point during alignment. It should be noted that voltage due to IF oscillation is unaffected by strength of signal from the generator.

Where IF oscillation is encountered, it is generally possible to correct the condition by detuning the IF coils in different directions. If that does not have the desired effect, increase fixed bias on AGC line by using a 4½ volt battery instead of the 3 volt battery referred to in instruction #3. After stopping the oscillation in this manner it will then be possible to align all IF stages using the following procedure, however, the AGC bias battery must be changed back to 3 volts when using the oscilloscope to observe band pass characteristics. Once all stages have been aligned using the 4½ volt bias, the IF channel should be stable with reduced bias.

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNECTIONS	OSCILLOSCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY	CONNECTIONS	FREQ.					
Connect as shown in Fig. 5.	23.5 MC.	Connect as shown in Fig. 5 but keep generator power switch turned off during this step.	—	Connect as shown in Fig. 6.	Not used.	—	#5 Converter plate coil	Adjust for maximum reading on VTVM.
							#6 1st I.F.	Adjust for maximum reading on VTVM.
Same as above.	25.9 MC.	Same as above.	—	Same as above.	Not used.	—	#7 2nd I.F.	Adjust for maximum reading on VTVM.
							#8 3rd I.F.	Adjust for maximum reading on VTVM.
Same as above.	26.1 MC.	With connections made as shown in Fig. 5, turn on this generator and set controls for operation as specified in next column.	25 MC. Sweeping ± 5 Mc.	Same as above.	Connect as shown in Fig. 6	IMPORTANT: 1. Adjust output attenuator on sweep generator so that reading on VTVM is approximately one-half volt. 2. Set attenuator on standard signal generator so that marker signal does not distort the pattern on the oscilloscope. 3. Be sure that a 3 volt battery is connected to AGC line as specified in instruction #3 at the head of this chart. Do not use a battery of any other voltage.	The IF band pass characteristic now displayed on the 'scope should be compared with the curve shown in Fig. 7. If top of curve is not properly shaped, make a slight readjustment of slug #7. Should that adjustment fail to yield the desired result, then note whether the curve has a peak on the high or low frequency side. Slugs #7 and #8 control high frequency response and slugs #5 and #6 affect the low frequency response; by making a small change in the settings of the high or low frequency slugs, it will be possible to obtain correct band pass curve.  **FIG. 7** The 26.1 Mc. picture IF carrier marker should now appear at the 50% amplitude position on side of the band pass characteristic (see Fig. 7). If position of the marker appears too high or too low, slight readjustment of slugs #7 and/or 8 is required.	
Same as above.	21.6 MC.	Same as above.	Same as above.	Same as above.	Same as above.	Same as above.	Adjust the vertical gain control on the 'scope in order to magnify the sound portion of the response curve. The 21.6 Mc. sound IF carrier marker should appear at the position indicated in Fig. 7. If the position of the sound marker is incorrect, readjustment of slugs #5 and/or 6 is required.	

STEWART-WARNER TV PAGE 12-19

RF AMPLIFIER AND MIXER ALIGNMENT

Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to AGC line and positive terminal of battery connects to receiver chassis. (See Fig. 15 for convenient point of connection.)

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNECTIONS	OSCILLOSCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY	CONNECTIONS	FREQ.					
Connect as shown in Fig. 11.	*209.75 MC. ‡205.25 MC.	Connect as shown in Fig. 10 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #12	Not used.	Connect as shown in Fig. 12	Set Channel Selector to #12 — IMPORTANT: Keep output of standard signal generator at a level that provides a readable marker but does not distort the curve that is being observed on the scope.	#9 Mixer Grid. #10 RF Amp. Plate. #11 RF Amp. Grid.	Adjust these trimmers to obtain properly shaped RF band pass characteristic as shown in Fig. 8. Use Mixer Grid trimmer #9; and RF Amplifier Plate trimmer #10 to obtain correct amplitude of characteristic in vicinity of picture and sound carrier markers. Then adjust RF Amp. Grid trimmer #11 to equalize overall amplitude. Repeat adjustment of trimmers to be sure correct response has been obtained. IMPORTANT: When adjusting trimmers #9, 10 and 11 it will be noted that the band pass characteristic can be broadened by sacrificing amplitude. It is undesirable to overly broaden the curve as that would result in a loss of sensitivity.
Same as above.	*215.75 MC. ‡211.25 MC.	Same as above.	CHANNEL #13	Not used.	Same as above.	Set Channel Selector to #13		The RF band pass characteristic of the other television channels should now be checked without disturbing the settings of trimmers #9, 10 and 11. Adjust the RF sweep generator and marker generator for operation on the other television channels, observing position of both the sound carrier and picture carrier markers.  FIG. 8 Band pass characteristic of these channels should conform to the RF response curve in Fig. 8. If necessary, a compromise may be obtained to compensate for small variations in channel response by returning to channel #12 and making slight changes in the settings of trimmers #9, 10 and 11.
	*203.75 MC. ‡199.25 MC.		CHANNEL #11			Set Channel Selector to #11

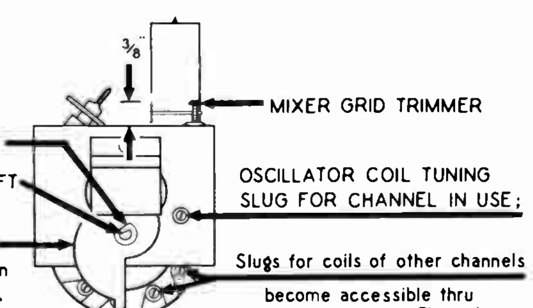

FIG. 9
Front view of RF Tuner Unit

R.F. OSCILLATOR ALIGNMENT

1. **IMPORTANT:** Before undertaking oscillator alignment be sure IF circuits are correctly aligned for band pass characteristic illustrated in Fig. 7.
2. During oscillator alignment, it is necessary to set the Fine Tuning control so that the tooth on the bakelite fine tuning cam points downward (correct position for this control is shown in Fig. 9).
3. Connect a 3 volt battery to the receiver AGC system so that negative terminal of battery connects to A.G.C. line and positive terminal of battery connects to receiver chassis. (See Fig. 15 for convenient point of connection).

STANDARD SIGNAL GENERATOR		SWEEP GENERATOR		VTVM CONNECTIONS	OSCILLOSCOPE CONNECTIONS	MISCELLANEOUS INSTRUCTIONS	TRIMMER OR SLUG	TYPE OF ADJUSTMENT AND OUTPUT INDICATION
CONNECTIONS	FREQUENCY	CONNECTIONS	FREQ.					
Connect as shown in Fig. 11.	*215.75 MC. ‡211.25 MC.	Connect as shown in Fig. 11 and set controls for sweep width of 10 Mc. on television channel specified in the next column.	CHANNEL #13	Connect as shown in Fig. 13	Connect as shown in Fig. 13.	Set Channel Selector to #13		Adjust the RF sweep generator and marker generator for operation on the other television channels; set marker generator to sound carrier frequency. After setting Channel Selector to corresponding channel, adjust oscillator slug thru hole on front of RF Tuner Unit (see Fig. 9). This permits response curve to be shifted so that sound carrier marker  FIG. 10 will appear at the position indicated in Fig. 10. The picture carrier marker for the corresponding channel should then appear at the 50% amplitude position on the opposite side of the band pass characteristic curve. If overall response curve for all channels is not reasonably similar to that shown in Fig. 10, undertake slight readjustment of I.F. slugs.
	*203.75 MC. ‡199.25 MC.		CHANNEL #11			Set Channel Selector to #11		
	*197.75 MC. ‡193.25 MC.		CHANNEL #10			Set Channel Selector to #10		
	*191.75 MC. ‡187.25 MC.		CHANNEL #9			Set Channel Selector to #9		
	*185.75 MC. ‡181.25 MC.		CHANNEL #8			Set Channel Selector to #8		
	*179.75 MC. ‡175.25 MC.		CHANNEL #7			Set Channel Selector to #7		
	* 87.75 MC. ‡ 83.25 MC.		CHANNEL #6			Set Channel Selector to #6		
	* 81.75 MC. ‡ 77.25 MC.		CHANNEL #5			Set Channel Selector to #5		
	* 71.75 MC. ‡ 67.25 MC.		CHANNEL #4			Set Channel Selector to #4		
	* 65.75 MC. ‡ 61.25 MC.		CHANNEL #3			Set Channel Selector to #3		
	* 59.75 MC. ‡ 55.25 MC.		CHANNEL #2			Set Channel Selector to #2		

If an unsatisfactory overall response is obtained for a particular channel, observe RF Amp. and Mixer response curve for that channel (as described on preceding page). If characteristic does not conform reasonably well within the typical curve shown in Fig. 8, then, (1) attempt to obtain a better compromise for RF response on all channels by realigning RF Amp. and Mixer circuits, or (2) try replacing Antenna, RF and Oscillator coils for the particular channel.

FIG. 14

HIGH VOLTAGE ARCING ON MODEL 27C-9212A

Several cases of high voltage failure, reduced brightness and intermittant arcing have been traced to a faulty H. F. condenser, circuit diagram #195, part 508888 (500 Mmfd. -20,000 volts). If this occurs, replace with part 521479 (500 Mmfd. - 20,000 volts). This new condenser should be mounted in the hole above and to the right of the previous position. Model 9212 receivers which contain the Letter "D" in the "SERIES" coding, already incorporate this modification.

PRODUCTION CHANGES

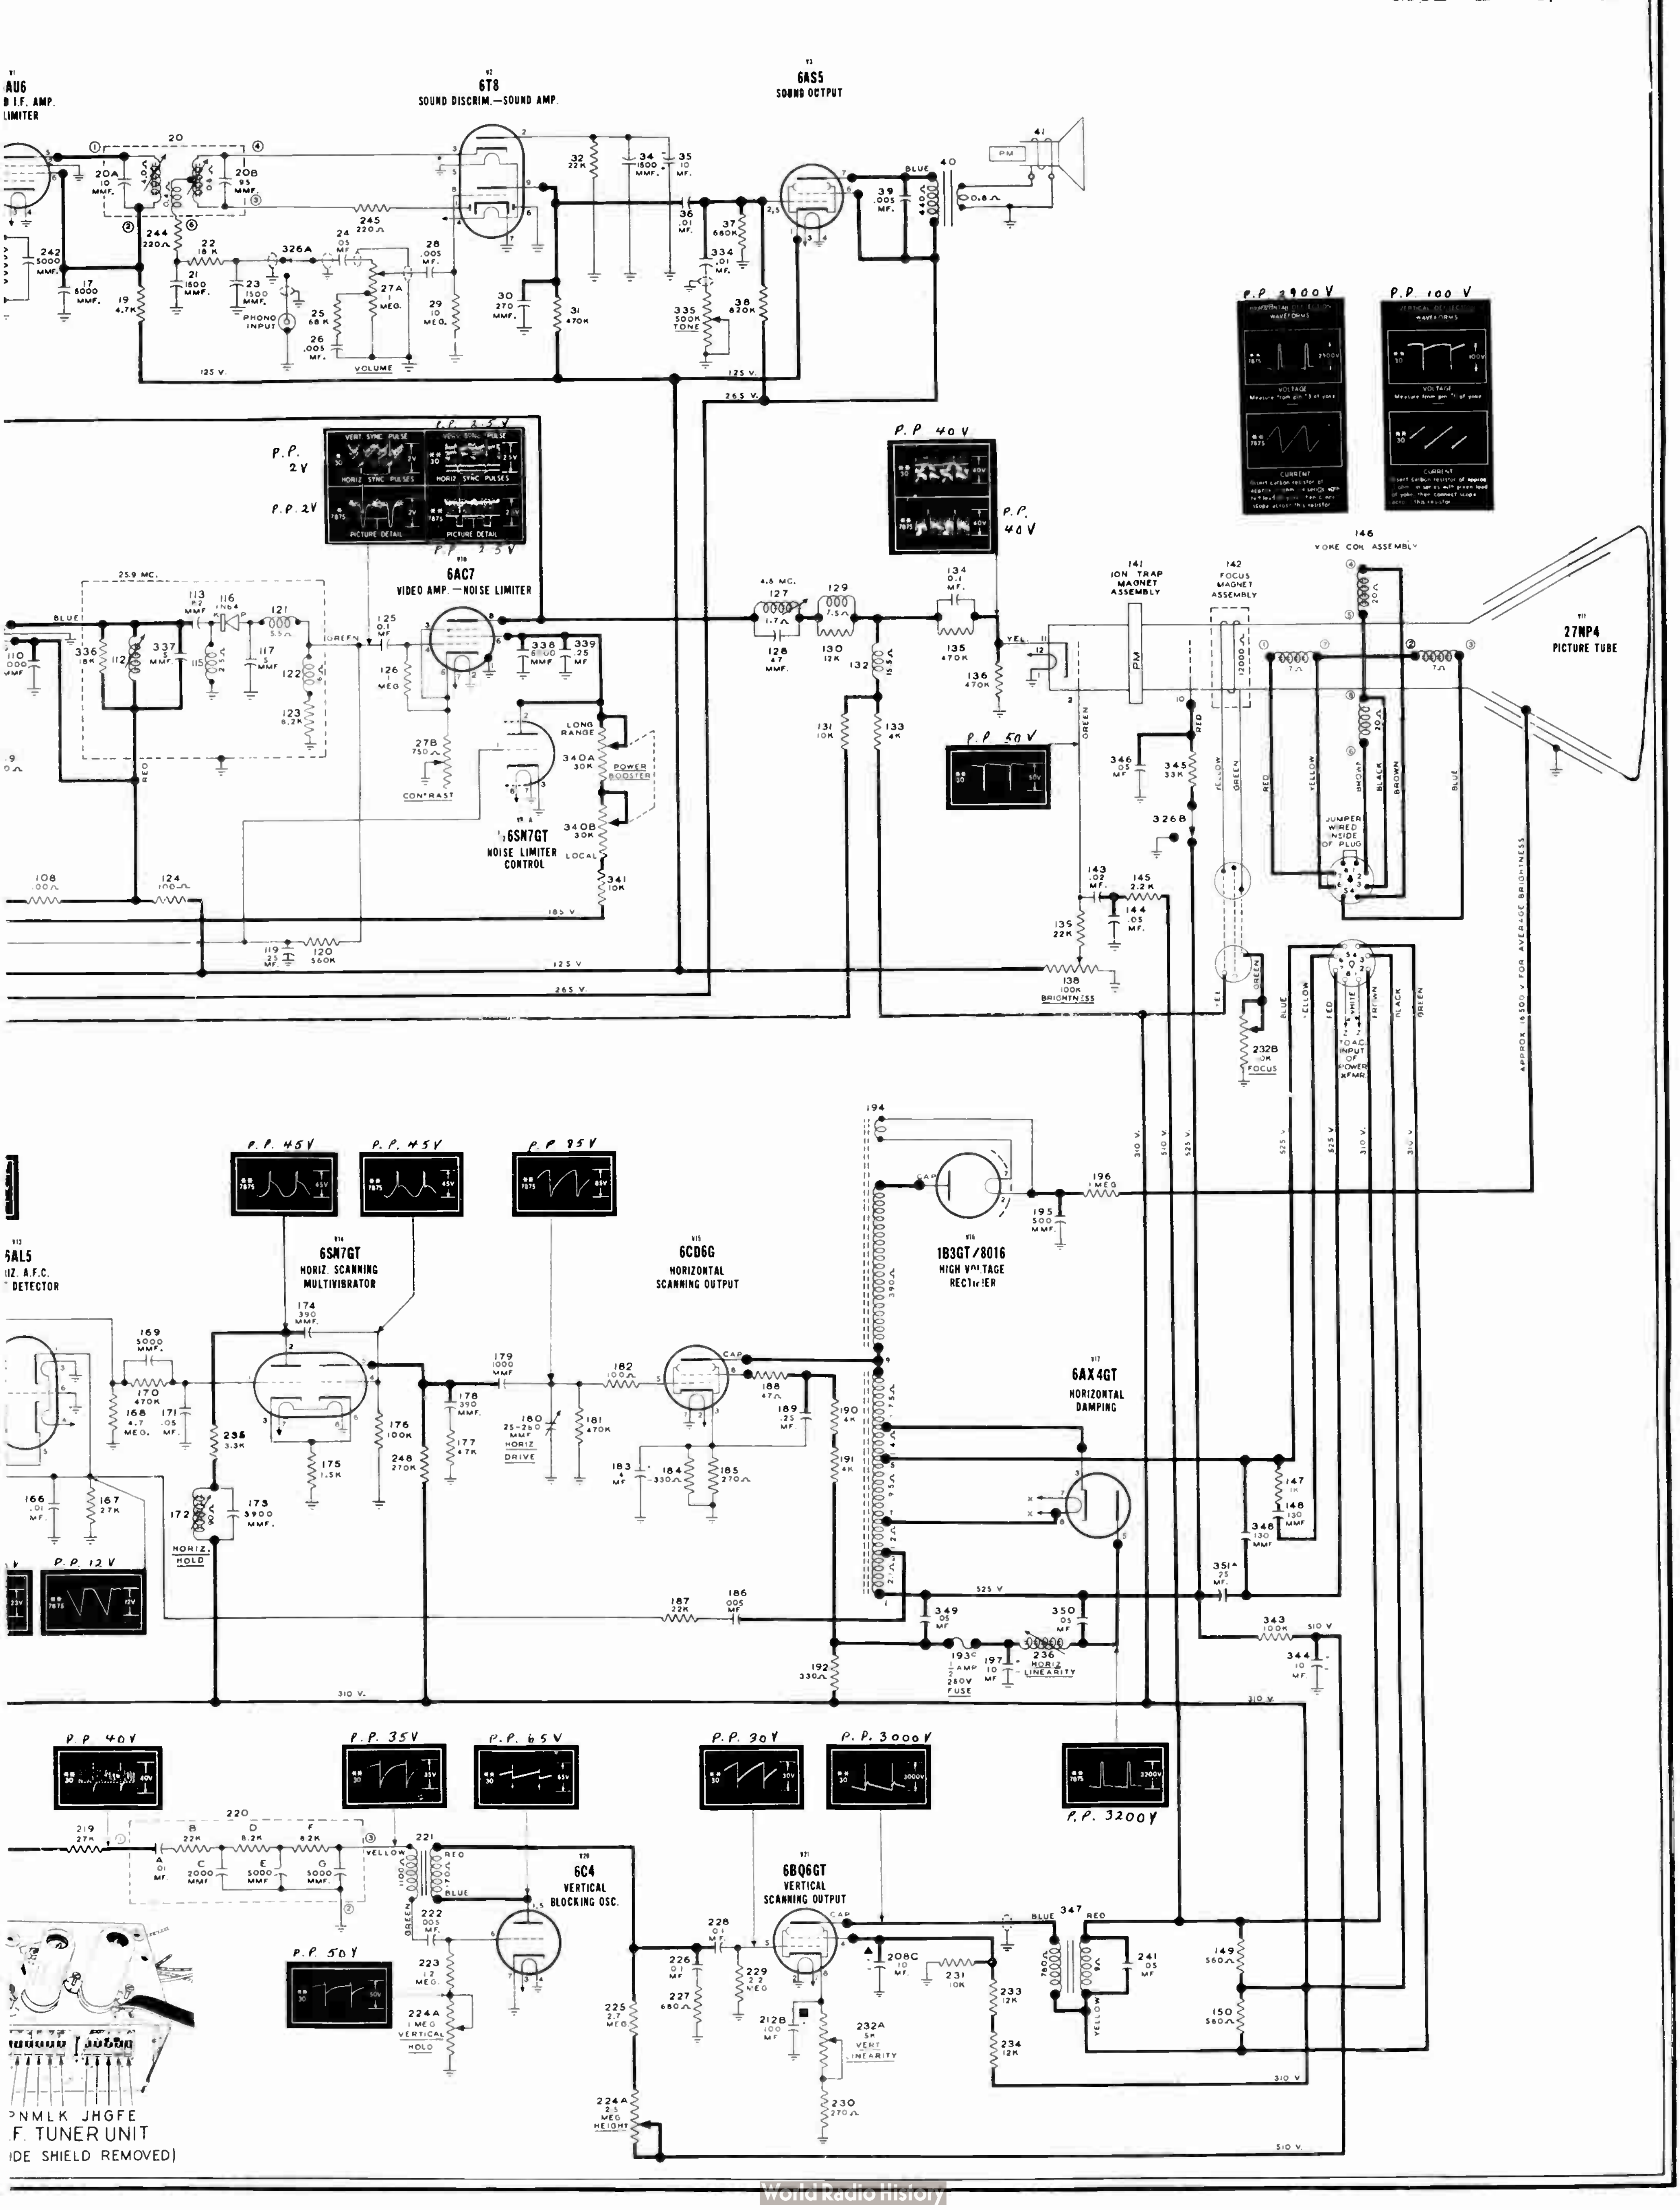
The following tabulation furnishes complete details on changes which occurred during receiver production. The receivers incorporating these changes are identified by coding stamped on rear surface of chassis. This coding consists of one or more letters following the word SERIES, as SERIES B, SERIES AC, etc., and corresponds to similarly lettered changes shown below. Chassis incorporate only that change indicated by letter designation; i.e., chassis stamped "SERIES BE" does not include changes "A" or "C" or "D".

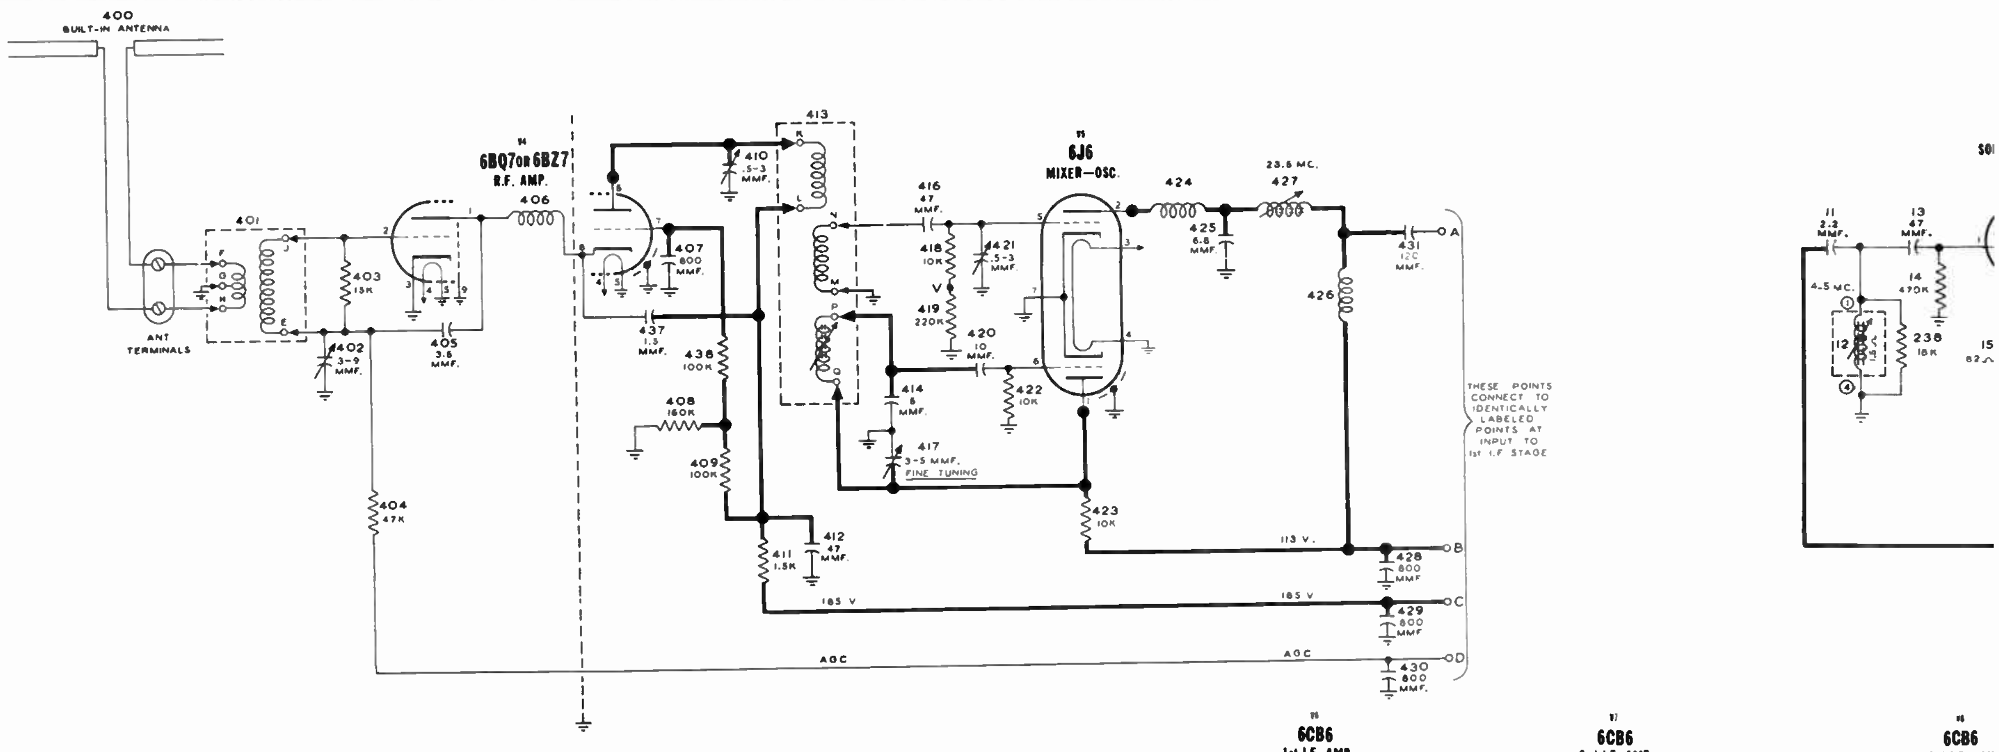
The circuit shown on this page applies to "SERIES ABC" chassis.

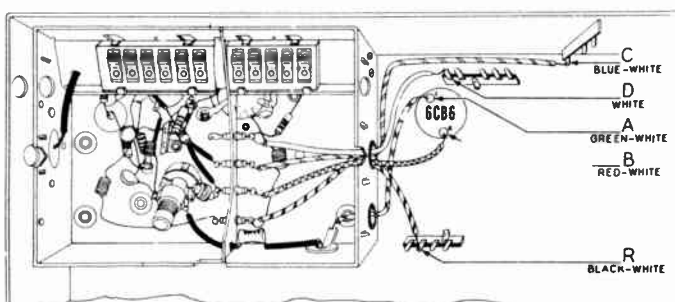
A letter following the component circuit diagram number thus —201A, indicates that this particular item was affected by a circuit change. The letter corresponds to the series code letter listed in the production change column, from which complete change information can be obtained.

LETTER INCLUDED IN DESIGNATION FOLLOWING THE WORD "SERIES"	CHANGE INCORPORATED IN CHASSIS
UNCODED	INITIAL PRODUCTION
"A"	The following change was incorporated to minimize the ringing effect of the horizontal sweep transformer. 1. Disconnect condenser 351 (.25 Mfd.) in horizontal sweep circuit from terminal #3 of horizontal sweep transformer and reconnect it to terminal #1 of this transformer.
"B"	The following change was incorporated to facilitate production I.F. alignment. 1. Change resistor 106 in grid circuit of V8 (3rd I.F. Amp.) from 4700 Ohms to 5600 Ohms.
"C"	The following change was incorporated to eliminate fuse blow-out during surge voltages. 1. Change fuse 193 in horizontal sweep circuit from ¼ Amp. 250 volt to ½ Amp. 250 volt.

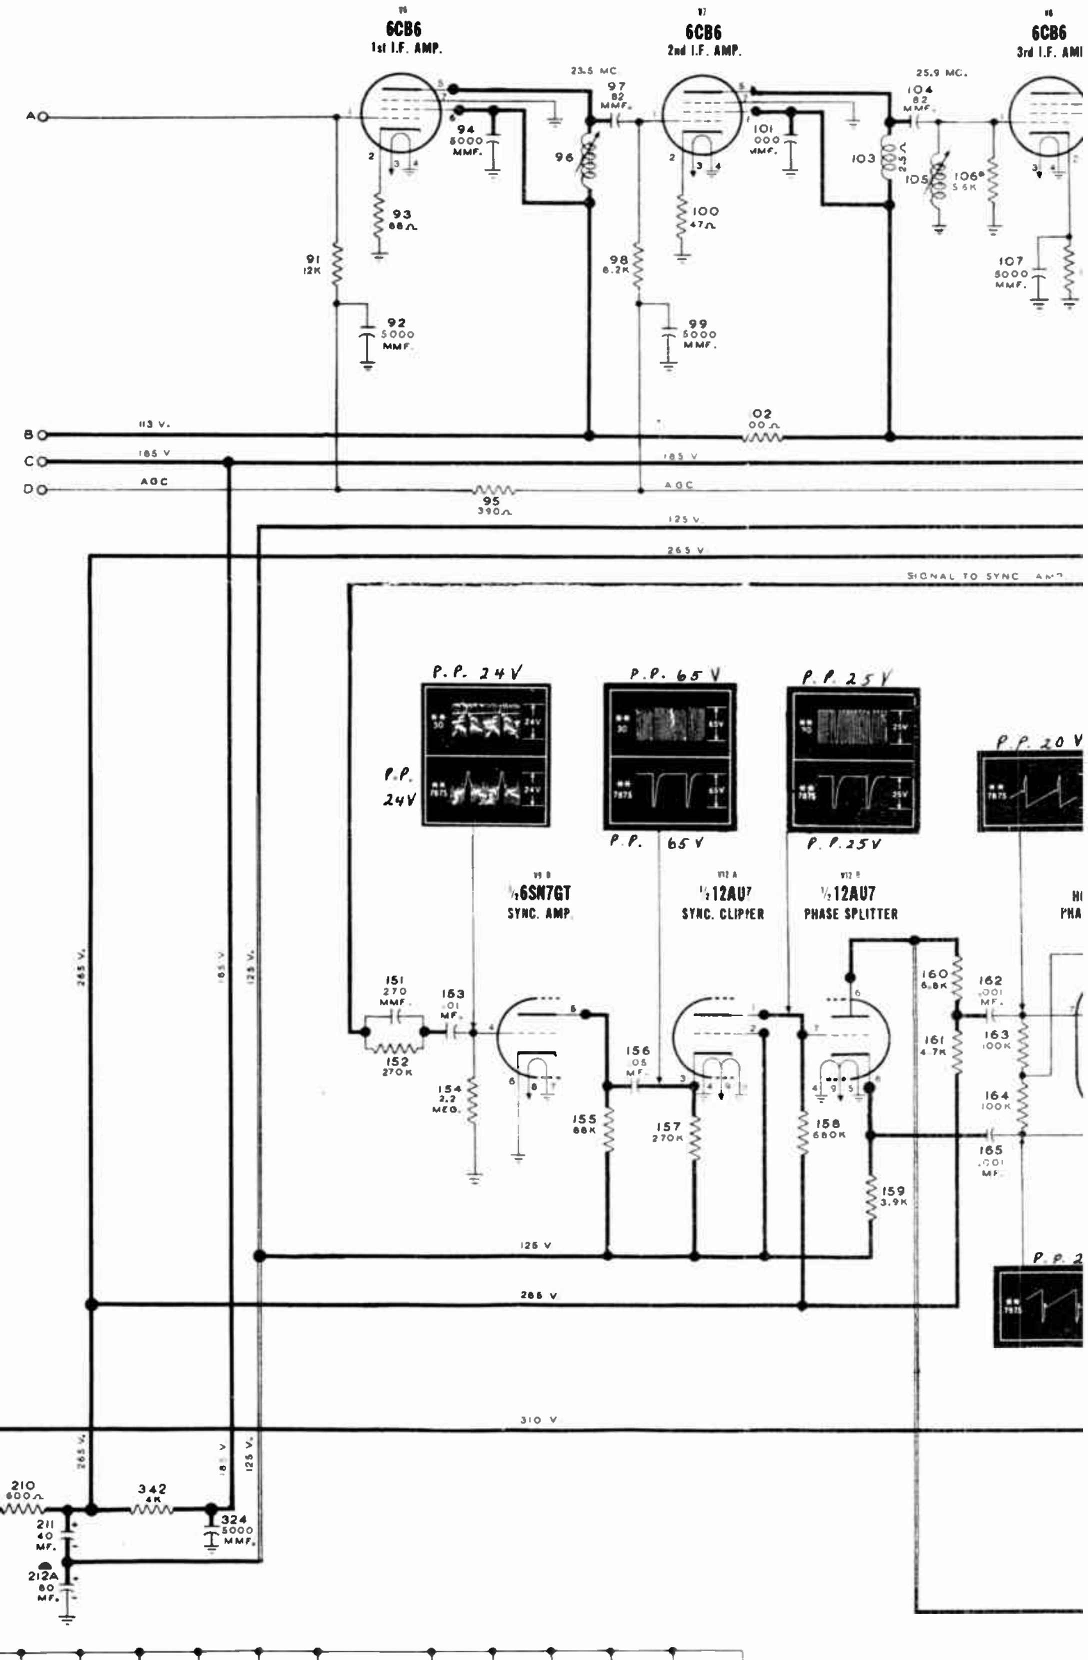
MODEL 27C-9212A







BOTTOM VIEW OF CHASSIS SHOWING CONNECTIONS TO RF TUNER UNIT



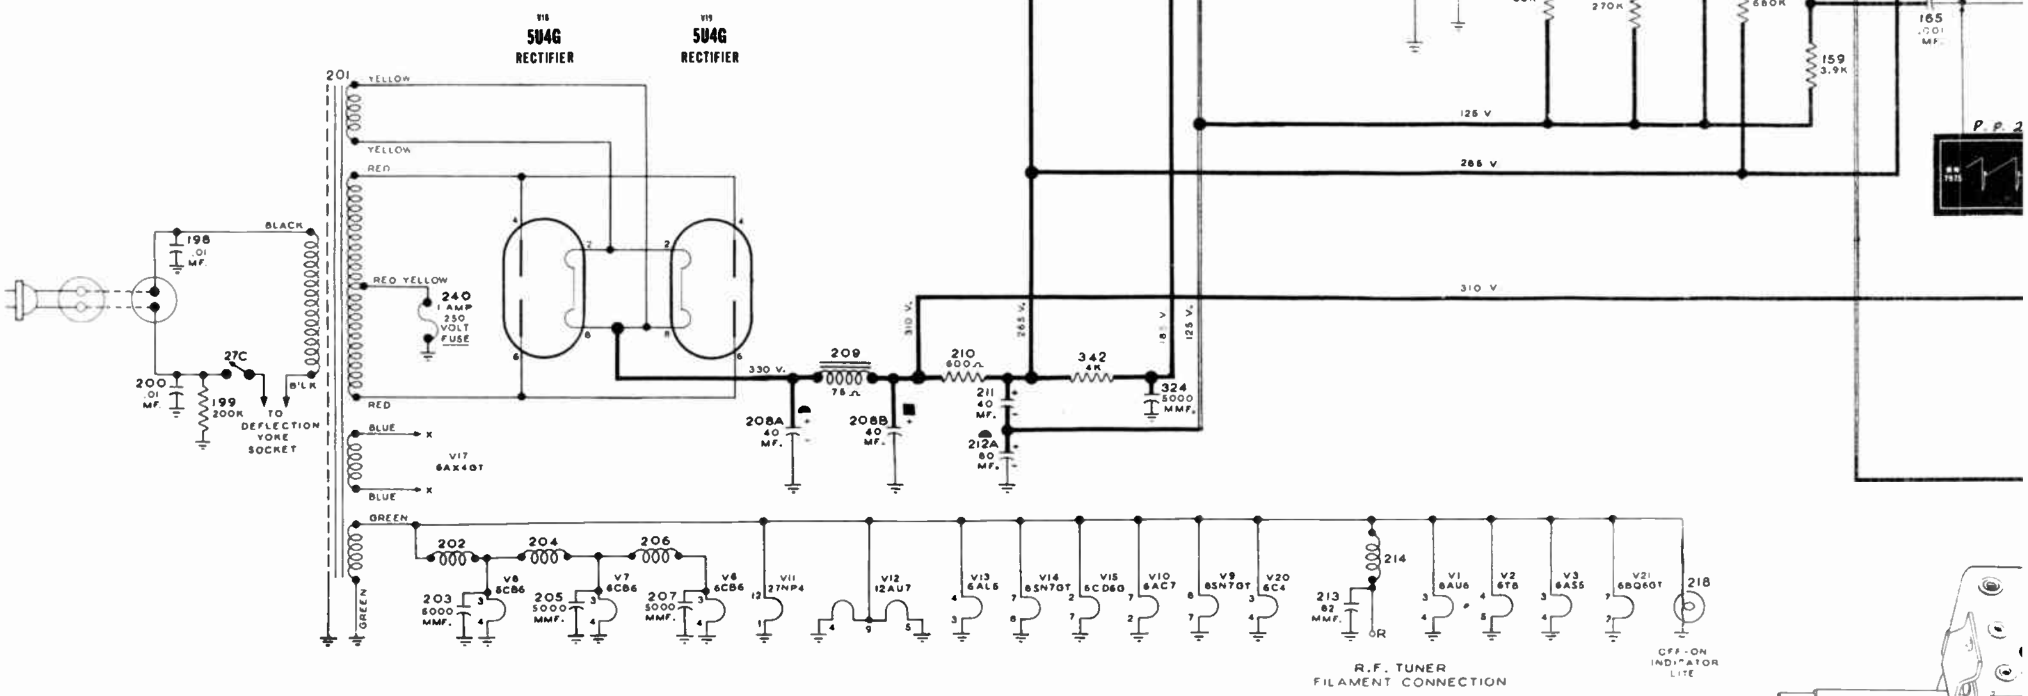
OSCILLOGRAMS

All oscillograms taken with ground lead of 'scope connected to receiver chassis (unless otherwise indicated) and with receiver controls set for normal reception of a station transmitting its standard test pattern.

Number appearing below asterisk specifies setting of horizontal sweep frequency control on 'scope.

*—This symbol on illustration indicates that wave form was observed on a 'scope whose vertical amplifier had very limited high frequency response (50 to 100 Kc).

**—This symbol indicates that wave form was observed on a 'scope whose vertical amplifier frequency response was flat to within 20% up to 2 Mc.



VOLTAGES SHOWN ON CIRCUIT DIAGRAM WERE MEASURED WITH ANTENNA TERMINALS SHORTED TO GROUND AND CHANNEL SELECTOR SET TO AN INACTIVE CHANNEL. ALL CONTROLS ARE SET FOR NORMAL OPERATION EXCEPT FOR POWER BOOSTER CONTROL WHICH WAS SET TO MAXIMUM COUNTER-CLOCKWISE POSITION.

TUBE VOLTAGE CHART

1. Measurements are made at 117 V. line using vacuum tube voltmeter. All voltages are D.C. and are positive with respect to chassis ground except where noted.
2. Contrast control set at minimum, brightness control set at minimum, antenna disconnected.

			PIN 1	PIN 2	PIN 3	PIN 4	PIN 5	PIN 6	PIN 7	PIN 8	PIN 9

TUNER Blue Lead—Plate RF 240 Volts
TUNER Red Lead—B+ to Conv. 120 Volts

NOTE — NC = No connection.
TP = Tie Point.

Typical AGC voltage developed across C-160 vs. second detector voltage at Pin 9 of V-9, 6U8.

Strong local signal	18 V AGC	1.5 Second detector voltage.
Medium signal (slight snow)	6 V AGC	1.3 Second detector voltage.
Weak signal	3 V AGC	1. Second detector voltage.

Apply ADC bias of approximately —3 V to AGC line (across C-160). Maintain the output level of the sweep generator such that the detector output is 2 volts peak to peak.

NOTE: USE A NON METALLIC ALIGNING TOOL AND LIGHT PRESSURE ON ALL SLUGS.

	Signal Generator Connection	Oscilloscope or VTVM Connection	Adjustments and Notes
1 Quadruple Alignment	Output of sweep generator to grid of 1st IF tube, pin 1 of V-5, 6BA6 thru 100 MMF isolating capacitor.	Input of scope to grid of video amplifier, pin 9 of V-9, 6U8 thru 47K ohm isolating resistor.	1. Adjust the bottom slug of T-3, 1st IF Transformer for low intermediate frequency. (23.7 mc. approx). 2. Adjust the bottom slug of T-4, 2nd IF Transformer for low frequency. (23.0 mc. approx). 3. Adjust the bottom slug of T-5, 3rd IF transformer for high frequency. (26.0 mc. approx). 4. Adjust the bottom slug of T-6, 4th IF transformer for high intermediate frequency. (25.3 mc. approx). 5. Maintaining the above relative frequency positions of the individual stages, adjust the slugs to produce a curve as shown with the 22.7 mc. and 26.4 mc. markers at 70% response. See Fig. 1.
2 Sound Traps	Same as Step #1 Using 21.9 mc. marker.	Same as Step #1.	1. Adjust the top slug of T-4 for minimum response at 21.9 mc. 2. Adjust the top slug of T-3 for curve shown in Fig. 2.
3 Adjacent Sound Trap	Same as Step #1 using 27.9 mc. marker.	Same as Step #1.	1. Adjust the top slug of T-5 for minimum response at 27.9 mc. 2. Repeat Step #1 (Quadruple alignment) to reproduce the curve as shown in Fig. 1.
4 Double-Tuned Stage Alignment	Couple the output of the sweep generator into the converter plate by means of the split tube shield.	Same as Step #1.	1. Adjust L-8 on tuner assembly and T-2 for curve as shown in Fig. 4 for maximum gain, maintaining the 22.7 mc. and 26.4 mc. markers at 50% response.
5 Sound IF Alignment	Connect an unmodulated 4.5 mc. signal to the grid of the 1st sound IF amp. pin 2 of V-9, 6U8.	Connect 2-100K resistors in series from plate of ratio detector pin 2 of V-13, 6T8 to ground. Connect VTVM from junction of the 2-100K resistors to ground.	1. Adjust L-10, T-7, and bottom slug of T-8 for maximum response.
6 Ratio Detector Balance	Same as Step #5.	Reconnect the VTVM from the junction of the 2-100K resistors (see 5 above) to the junction of C-134 and R-131.	1. Adjust the secondary (top slug) of T-8 for zero volts between the positive and negative excursions.

MODELS 521 SERIES RECEIVERS — Service Notes Corrections.

1. The Tube Voltage Chart in the 521 Series Service Notes incorrectly lists the screen voltage at pin 4 of the 6BQ6 Horizontal Amplifier tube as 465 volts. This should be corrected to read 165 volts.

2. Resistor R-50, 5600 ohm, 1/2 watt, is listed in the parts list as S.C. No. 28165. The parts list should be corrected to read R-50, S.C. No. 28167, 5600 ohms, 1/2 watt, 10%.

MODELS 521 SERIES RECEIVERS — Vertical Output Transformer.

A few vertical output transformers (S.C. # 161255) used in the production of the 521 series receivers hod the center tap and B + Lead colors reversed. Normally the B + Lead is red and the center tap lead is green.

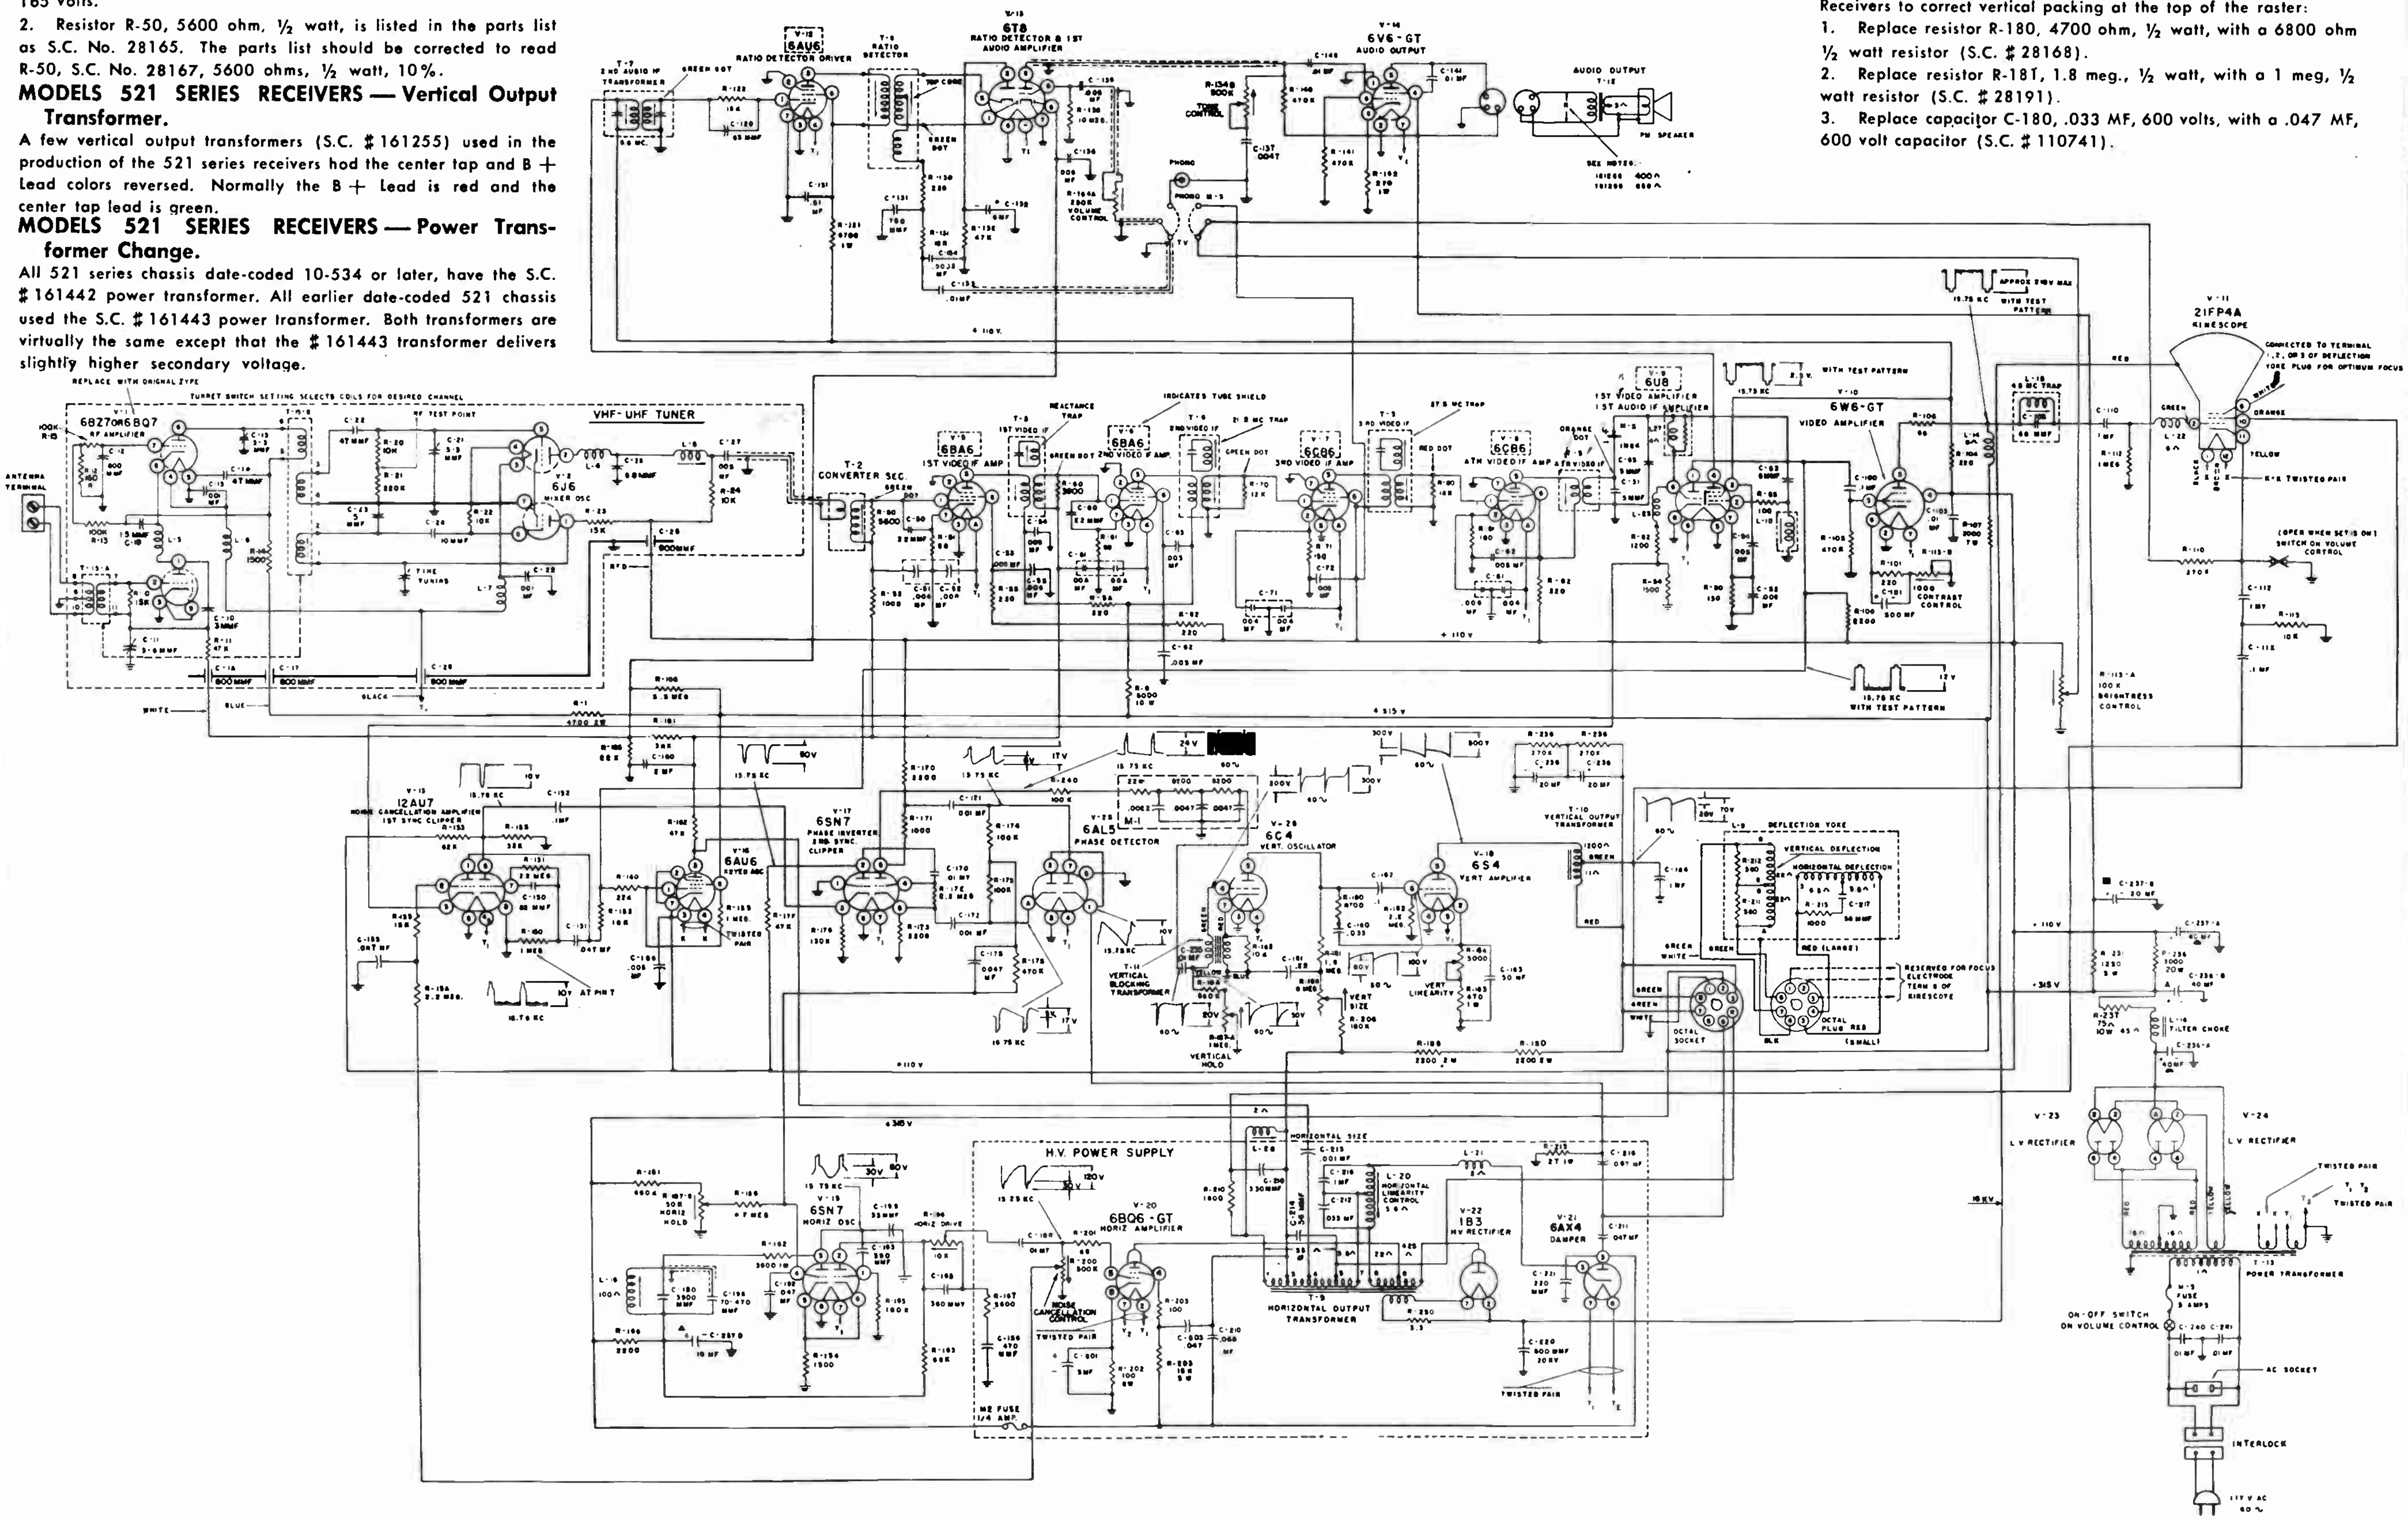
MODELS 521 SERIES RECEIVERS — Power Transformer Change.

All 521 series chassis date-coded 10-534 or later, have the S.C. # 161442 power transformer. All earlier date-coded 521 chassis used the S.C. # 161443 power transformer. Both transformers are virtually the same except that the # 161443 transformer delivers slightly higher secondary voltage.

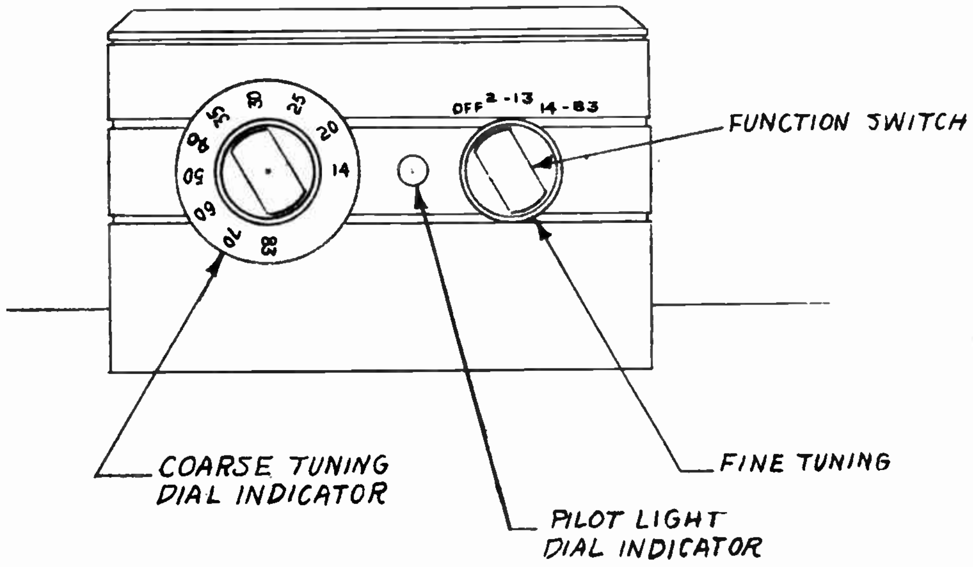
MODELS 521 SERIES RECEIVERS — Vertical Packing.

The following circuit revisions may be made in the 521 Series Receivers to correct vertical packing at the top of the raster:

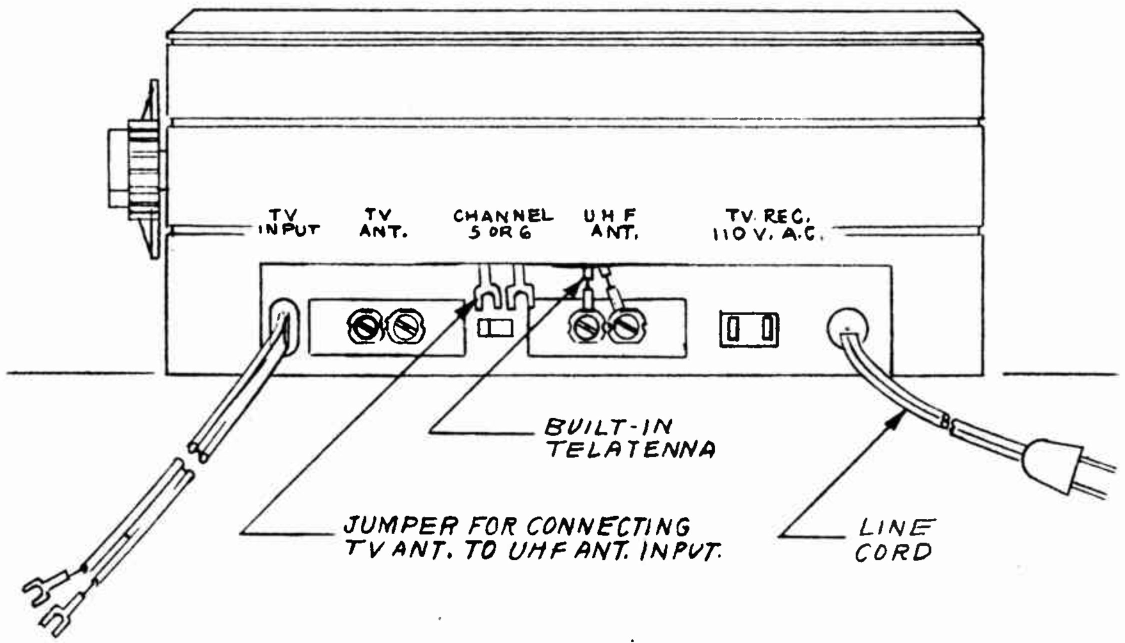
1. Replace resistor R-180, 4700 ohm, 1/2 watt, with a 6800 ohm 1/2 watt resistor (S.C. # 28168).
2. Replace resistor R-18T, 1.8 meg., 1/2 watt, with a 1 meg, 1/2 watt resistor (S.C. # 28191).
3. Replace capacitor C-180, .033 MF, 600 volts, with a .047 MF, 600 volt capacitor (S.C. # 110741).



Number of Operating Controls (Located on right side of cabinet):



Service Controls: At Rear of Chassis



Dial Type: Calibrated Coarse Tuning Knob.

Antenna: Built-in Stromberg Carlson Telatenna.
Provision also available to employ present Channel 2-13 antenna for UHF reception or, if necessary, a separate UHF antenna.

Voltage Rating: 117 Volts, 60 Cycles, 20 Watts.

Tuning Range: Continuous tuning covering all proposed UHF Channels 14-83 (470 mc. to 890 mc.)

Number of Tubes: 2 tubes plus 1 selenium power rectifier and 1 germanium crystal mixer.

Tubes and Functions:

Tube	Function
1 - 6AF4	UHF Local Oscillator
1 - 6BQ7	Lo-Noise Cascode Pre-Amplifier
1 - 1N72 Crystal	UHF Mixer
1 - Selenium Rectifier	Power Rectifier

The UHF tuner is housed in a sturdy wood cabinet. This cabinet is covered with a rich gold embossed simulated leather.

Padded mounting feet are used to prevent the UHF tuner from marring any polished cabinet top.

CIRCUITS:

A. The converter uses a double-superheterodyne circuit employing Channel 5 or
C Channel 6 of an existing television receiver as the first IF. Instant selection of either 5 or 6 is provided by a simple slide switch in the rear of the converter.

B. All proposed UHF channels can be received. (Channel 14-83, 470 mc. -890mc.)

C. Low-noise 1N72 crystal is used as a UHF mixer.

D. Very low-noise cascode IF pre-amplifier used in converter to provide excellent fringe area reception.

E. Three possible UHF antenna combinations are provided for varying reception conditions:
(1) Built-in Telatenna for strong signal areas.
(2) Built-in facilities for using present Channel 2-13 antenna for medium signal areas.
(3) Facilities for using separate high-gain UHF antenna for fringe area reception.

F. AC power supply using power transformer eliminates the possibilities of short circuits, hum, and shock hazard between converter and television receiver.

G. Easy customer installation.

H. Jewel-box cabinet styling harmonizes with all receivers.

I. Function switch on converter turns on television receiver and selects Channel 2-13 or Channel 14-83.

J. Pilot light which also acts as channel marker.

K. After the initial warm-up period has passed, the user can switch from VHF to UHF at will and at no time encounter any delay in operation.

The cabinet is styled in green leatherette and proportioned to harmonize with the television receiver. The outside cabinet dimensions are approximately 8" wide, 4" high and 6" deep. The unit weighs 5 1/2 pounds and has a power consumption of about 10 watts. Channel indicator, vernier tuning knob and function switch are all located on the right side of the unit.

GENERAL

The converter is designed for connection between the antenna lead-in and the television receiver. Receiver power is obtained from a socket in the rear of the converter chassis which in turn is plugged directly into the AC line. A single three-position function switch provides the following combinations:

1. Off - Both converter and television receiver.
2. VHF - AC power to television receiver on, VHF antenna directily connected to television input. Converter heaters on.
3. UHF - AC power to both units and choice of separate UHF antenna, VHF antenna or built-in cabinet antenna depending upon signal conditions.

The converter can be operated by tuning the receiver to either of two channels (#5 or 6) which is not occupied by a local station. This choice is made during installation by a switch in the rear of the converter chassis, which shifts the first IF tuning 6 mc. The bandwidth of the UHF pre-selector circuits is 12 mc., allowing this shift without loss of tracking. Selection of this IF is a compromise providing a mean between the extremes of the high noise factor in the high channels and the undesirable spurious responses of the very low frequency channels. The rapid attenuation with increasing distance of UHF signals which might cause spurious interference appears to make it practical to use a lower IF than would otherwise be possible.

RF PRE-SELECTION AND MIXER CIRCUITS

In both the antenna and mixer circuits, the tuning elements are inductively padded in order to secure the proper tuning range. This is accomplished by extending both conductors of the antenna section and one of the conductors of the mixer section about 7/8" external to thetuning unit. The balanced 300 ohm antenna is coupled into the extended section of the tuning unit with the aid of an ungrounded loop.

A combination of high-side capacitive and inductive coupling is used between the antenna and mixer tuned circuits in order to provide a bandwidth of 12 mc. throughout the UHF band.

The 1N72 crystal mixer is coupled capacitively to the mixer tuned circuit, and an RF choke provides a D. C. return path for this circuit.

Grounding of the low frequency ends of the antenna and mixer lines and the grounding of the rotor of the antenna section eliminate spurious suckouts within the band.

LOCAL OSCILLATOR

The oscillator design utilized a miniaturized version of the 6F4. A series trimmer condenser effectively sets the low frequency end of the tuning range, and a series trimmer inductance consisting of the grid and plate leads control the total range and the high frequency limit. This adjustment consists of varying the separation between these leads. "Holes" in the frequency range are avoided by using resistors rather than chokes in the plate and grid return circuits and by using dissimilar chokes in the cathode and ungrounded heater leads. A special UHF low-capacity tube socket is used to prevent bypassing the tuned circuit by the grid-plate socket capacity.

Tube "warm-up" drift, although somewhat a function of individual tubes, is nearly complete within one minute after application of plate voltage, with heaters previously warmed up. This initialadrift is minimized by using the lowest plate power which will give reliable performance.

Complete shielding of the oscillator tube, circuit, and tuner section together with low oscillator plate voltage reduces oscillator radiation.

CASCODE PRE-AMPLIFIER

The conversion loss of the crystal mixer is overcome by the addition of allow noise amplifier. A "cascode" circuit using a 6BQ7 tube was selected because of its inherently good noise factor. This circuit consists of a neutralized grounded cathode input section followed by a grounded grid stage.

Both the input grid and the interstage circuit of the cascode are adjusted to have bandwidths of about 12 mc., i.e., to include both Channels #5 and 6. The plate of the output triode, however, is adjusted for a 6 mc. bandwidth and a switch is provided on the rear of the chassis to select the desired channel.

Economy is achieved by the use of a simple slide switch as a channel selector which varies the value of capacity in series with the plus B end of the plate tuning coil.

Balanced output is used in order to eliminate interference pickup on the lead coupling the converter to the VHF receiver.

POWER SUPPLY

Since most television receivers have no provision for supplying power to an external converter, this converter is self-powered. Both chassis height limitations and power economy dictated the use of a selenium rectifier in preference to a vacuum tube, but a power transformer is used to eliminate hum interference between converter and television receiver.

AC power for the television receiver can be secured from the rear of the chassis, and a switch on the converter energizes both units and selects either VHF or UHF reception.

The heaters of the converter tubes remain on for both types of reception with a plus B switch being provided in the ground return of the power transformer secondary. Switching in this manner allows instantaneous change from VHF to UHF and also removes the voltage from the converter filter condensers during VHF operation.

ANTENNA SELECTION

Input terminals for both VHF and UHF antennas are provided on the rear of the chassis. When receiving signals on Channels #2 to 13, the VHF antenna is directly connected to the television receiver input. For reception on Channels #14 to 84, a separate UHF antenna may be used, or if signal conditions allow, either the VHF antenna or a built-in cabinet antenna may be selected.

GENERAL DESCRIPTION

All models described in this bulletin are direct viewing television receivers reproducing the picture on a 21 inch black faced, electromagnetically deflected, cylindrical picture tube.

Chassis 1-508-1 and 1-510-1 provide reception of the twelve commercial VHF television channels, 2 through 13 inclusive. In these chassis provisions are made for the simple addition of a UHF tuner, thus permitting reception of channels 14 through 83 of the UHF band. Cabinet versions, including these chassis, show a single alphabetical suffix after the body number. (For example: 176M.)

Chassis 1-508-2 and 1-510-2 include the UHF tuner and thus provide reception of VHF channels 2 through 13 and UHF channels 14 through 83 inclusive. Cabinet versions including these chassis, show a double alphabetical suffix after the body number. (For example: 176MU.)

Combination models incorporating these chassis also include a 1-603-1 radio chassis which provides reception of standard and frequency modulation broadcast bands and a 1-312-3 three speed automatic record changer.

Representative cabinet styling of the receivers is illustrated in the photographs. Models not shown in the illustrations differ from those shown only in cabinet finish. HaloLight is featured exclusively on models incorporating the 1-508-1 and 1-508-2 chassis.

NOTE: For convenience in servicing, separate schematics are furnished with their respective Repair Parts List and Wave Forms appearing on the reverse side.

SPECIFICATIONS

Frequency Range

Television

Channels 2 to 6 (all chassis)	54 to 88 Mc.
Channels 7 to 13 (all chassis)	174 to 216 Mc.
Channels 14 to 83 (chassis 1-508-2, 1-510-2)	470 to 890 Mc.
Picture IF Carrier	45.75 Mc.
Sound IF Carrier	4.5 Mc. and 41.25 Mc.

Standard Broadcast (AM 540 to 1600 Kc.
IF Carrier 455 Kc.
(Models 178B, 178BU, 178M, 178MU)

Frequency Modulation (FM) 88 to 108 Mc.
IF Carrier 10.7 Mc.
(Models 178B, 178BU, 178M, 178MU)

Power Supply 105 to 128 Volts, 60 Cycle AC

Power Consumption in Watts

CAUTION NOTICE

THE HIGH VOLTAGE LEAD TO THE PICTURE TUBE HAS A POTENTIAL OF 17,000 VOLTS. PRECAUTIONS SHOULD BE OBSERVED WHEN THE CHASSIS IS REMOVED FROM THE CABINET FOR SERVICE PURPOSES.

DO NOT OPERATE THE RECEIVER WITH THE H V COVER REMOVED.

ALWAYS USE SAFETY GOGGLES AND GLOVES IF IT IS NECESSARY TO REMOVE THE PICTURE TUBE.

CIRCUIT DESCRIPTION

The Sylvania television receiver chassis 1-508-1 and 1-508-2 operate with twenty-three and twenty-four tubes, respectively. In addition, there are two high voltage rectifiers, two low voltage rectifiers, one germanium diode and one picture tube on each chassis. Television chassis 1-510-1 and 1-510-2 operate with nineteen and twenty-one tubes, respectively. On these chassis, two high voltage rectifiers, one low voltage rectifier, one germanium diode and one picture tube are included. The operating controls on the front panel of the television receiver on all models are the Volume and Tone controls, with the 1-508-1 and 1-508-2 chassis featuring a Brightness control and the 1-510-1 and 1-510-2 a Contrast control on the front panel also. On models with HaloLight*, the control for this is also incorporated on the front panel. The remaining controls which are seldom adjusted are located on the rear of the chassis.

Combination models include an AM-FM radio which operates with seven tubes plus one rectifier. The AM-FM radio controls are ON-OFF-Volume, Tone, AM-FM radio tuning and function switch, all located on the front panel.

All models include a broad-band VHF built-in antenna. In addition, a di-fan type UHF antenna is built-in for all 1-508-2 and 1-510-2 models. Combination models also include built-in AM and FM antennas. These antennas will provide satisfactory reception in most strong signal locations.

For convenience in tracing circuits, Figure 1 shows a block diagram of chassis 1-508-1 and 1-508-2, and Figure 2 shows a block diagram of chassis 1-510-1 and 1-510-2. The antennas are connected to the inputs of the UHF and the VHF tuners. The VHF tuner selects the desired television channel by switch tuning and a fine tuning control. The output of the VHF tuner is at intermediate frequency and of sufficient bandwidth to pass both picture and sound carriers of the desired channel. When the UHF tuner is in operation, the oscillator in the VHF tuner becomes inoperative and the output of the UHF tuner, which is also at intermediate frequency, is fed through the R. F. and bandpass stages of the VHF tuner.

On the 1-508-2 and 1-510-2 chassis, the UHF tuners, while differing physically, function essentially the same. The desired UHF channel is preselected by continuous tuning. The incoming signal is combined with a local oscillator signal. A crystal in the 1-508-2 and a triode in the 1-510-2 function as mixers.

*Sylvania Trade-Mark

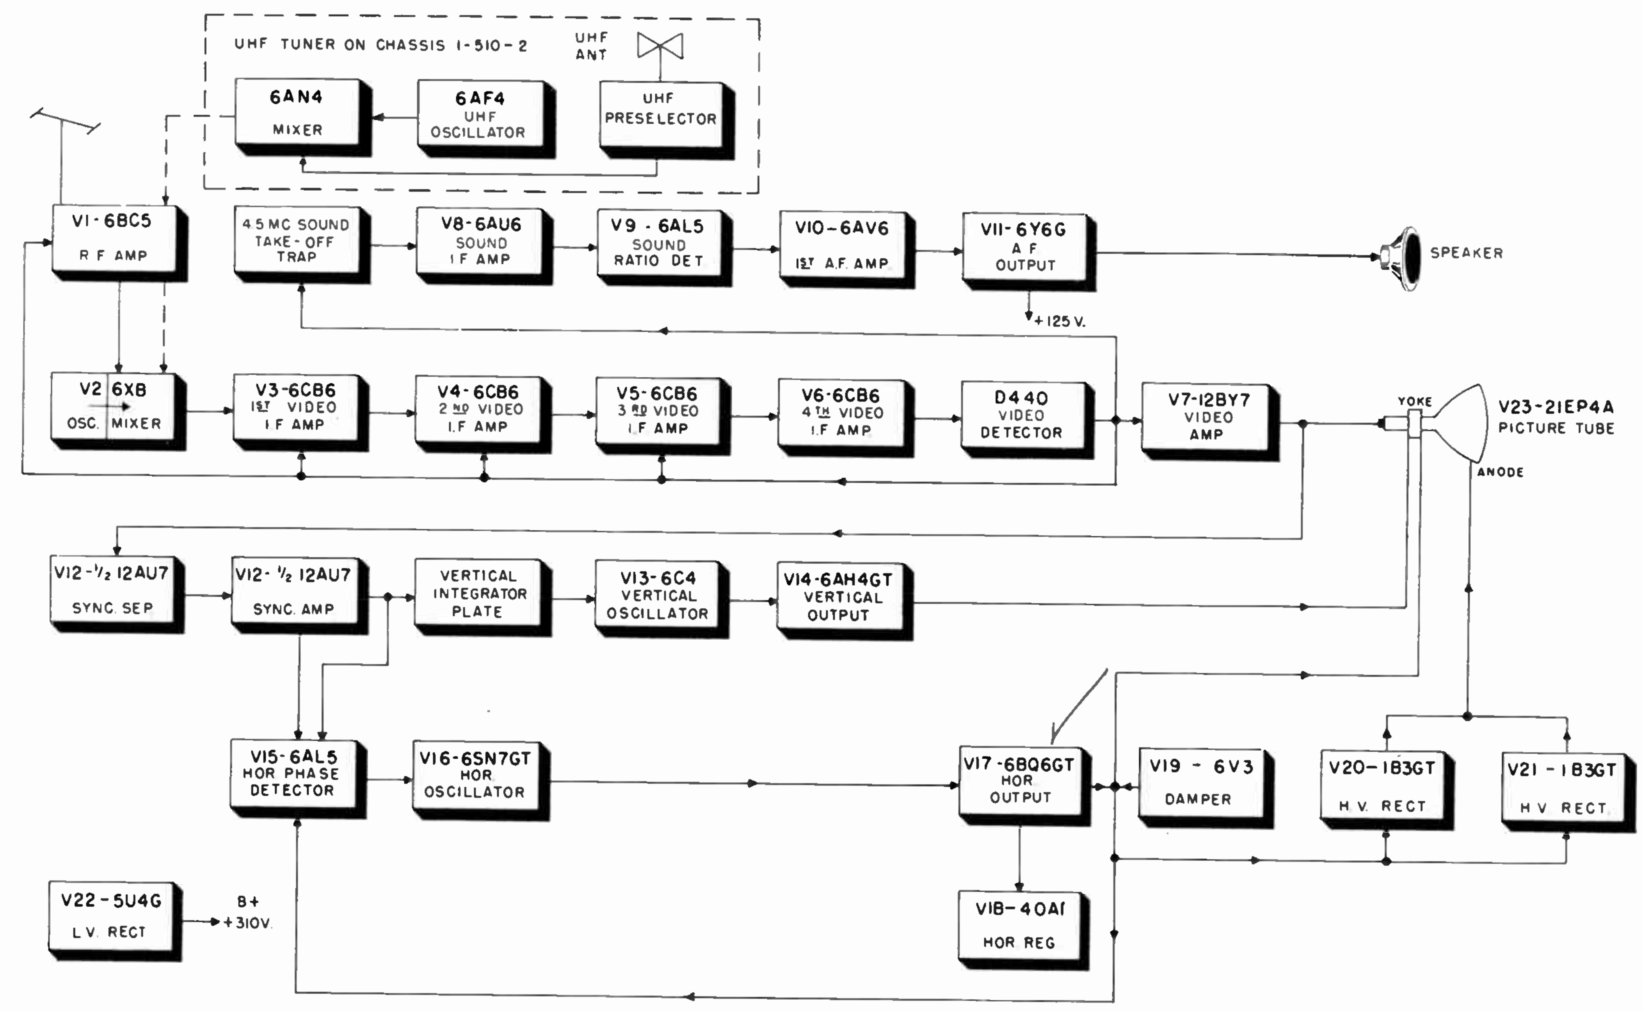

FIGURE 2 - BLOCK DIAGRAM FOR 1-510-1 AND 1-510-2 TV CHASSIS

The output of each tuner is fed to the VHF tuner on the respective chassis.

The output of the VHF tuner is applied to the Video IF Amplifier consisting of 4 stagger-tuned stages. The adjacent channel carriers and co-sound carrier are attenuated by this IF Amplifier.

The amplified signal at the output of the Video IF Amplifier is fed to a crystal diode functioning as the Video Detector.

The video signal out of the Video Detector is amplified by a single stage and applied to the Picture Tube.

On the 1-510-1 and 1-510-2, an automatic gain control voltage is obtained from the Video Detector load resistor and applied to the RF and IF Amplifiers.

On the 1-508-1 and 1-508-2, automatic gain control is obtained from the AGC Rectifier, amplified by the AGC Amplifier and applied to the R. F. and IF Amplifiers. The Tuner AGC Clamp prevents the tuner AGC line from going positive under weak signal conditions.

The sync pulses are separated from the video signal, amplified, and clipped and then fed to the Horizontal Discriminator and Vertical Integrator Plate on the 1-508-1 and 1-508-2. On the 1-510-1 and 1-510-2 chassis, the sync pulses are separated from the video signal, amplified and fed to the Horizontal Phase Detector and Vertical Integrator Plate. The vertical sync information from the Vertical Integrator Plate is applied to the Vertical Oscillator to keep this oscillator in step with the vertical sync pulses from the station. The Vertical Oscillator produces a peaked saw-tooth wave which is applied to the Vertical Output stage energizing the vertical deflection coils.

On chassis 1-508-1 and 1-508-2, horizontal sync information from the Sync Clipper is supplied to the Horizontal Discriminator. A voltage from the Horizontal Oscillator is also supplied to the Horizontal Discriminator. The output of the Horizontal Discriminator is then applied to the Horizontal Control tube which functions to hold the Horizontal Oscillator in synchronism with the incoming horizontal sync pulses.

On the 1-510-1 and 1-510-2 chassis, a pair of horizontal sync pulses of opposite polarity from the Sync Amplifier are supplied to the

Horizontal Phase Detector. Also supplied to the Horizontal Phase Detector is a saw-tooth voltage coupled back from the horizontal output circuit. The Horizontal Phase Detector compares the phase of the two pulses with the phase of the saw-tooth voltage and produces a resultant correction voltage. This correction voltage is applied to the Horizontal Oscillator and functions to hold its multivibrator circuit in synchronism with the incoming transmitted signal.

On the 1-510-2 and 1-510-2, the Horizontal Oscillator produces a peaked saw-tooth wave which is applied to the Horizontal Output tube. Part of the saw-tooth component of this wave causes current to flow in the plate circuit of the Horizontal Output tube. For the 1-508-1 and 1-508-2, the Horizontal Oscillator actuates the Horizontal Discharge tube through the Horizontal Ringing Coil producing a peaked saw-tooth wave. Approximately one-half of the saw-tooth component of this wave causes current to flow in the plate circuit of the Horizontal Output tube. On all chassis, this current energizes the horizontal deflection coils through the horizontal scanning transformer to provide the right half of the horizontal scan. During the right half of the scan a small current is also flowing through the Damper tube. At the end of the saw-tooth, the negative pulse component acts on the grid of the Horizontal Output tube to cut off plate current flow. When this occurs, the energy in the horizontal deflection circuit transfers rapidly from the inductive branch of the circuit to the capacitive branch.

The transfer of energy in the horizontal deflection circuit results in a voltage peak of approximately 3,000 volts across the horizontal deflection coils. This voltage is stepped up to approximately 9,000 volts by the turns ratio of the horizontal scanning transformer and is fed to the voltage doubling rectifier circuit to provide approximately 17,000 volts for the Picture Tube H.V. anode.

The Damper tube does not conduct during the high voltage pulse period because of the polarity of the pulse. During this pulse period, when the energy transfers from the inductive branch of the horizontal deflection circuit to the capacitive branch and back again to the inductive branch, the electron beam in the Picture Tube is moved rapidly from the right to the left edge of the raster to accomplish retrace.

At the completion of retrace, energy again flows out of the inductive branch of the circuit. The Horizontal Output tube is still cut off during this time and a high current flows through the Damper tube. This current decreases to zero in a linear manner, to provide the left half of the scan. As the current approaches zero, the Horizontal Output tube again begins to conduct and the entire cycle is repeated.

The Horizontal Regulator tube protects the Horizontal Output tube from excessive plate current due to line voltage fluctuations.

SPECIAL INSTALLATION AND SERVICE INSTRUCTIONS

Chassis Handling Precaution

Whenever handling a 1-508-1, 1-508-2, 1-510-1 or 1-510-2 chassis exercise extreme caution at all times. The chassis should be carried by means of the handle provided on the rear tube mounting bracket and the front center lower lip of the picture tube. When carrying a chassis in this manner care should be observed that the hands are free of dirt and grease to prevent slipping on the smooth surface of the glass.

Alignment of Picture Tube To Mask

(All Models)

Replacement of the chassis after normal servicing should not necessitate alignment of the mask and picture tube. However, if the tube support members have been disturbed as in the case of tube replacement it will be necessary to observe the following procedure. See Figure 3

1. Locate the tube and its associated mounting brackets in their approximate normal position, with the front face of the tube tilted forward about 3 degrees, then tighten the following just enough to permit further adjustment in the cabinet.
   a. Mounting stud nuts on tube holddown strap.
   b. Nuts on holddown strap rods.
   c. Nut on rear mounting bracket rod.
   d. Wing nuts on yoke.
   e. Screws at base of rear mounting bracket, if previously loosened.
2. Carefully slide chassis in cabinet, replace and tighten chassis holddown screws.
3. Replace all knobs and electrical connections. If tuner shaft does not center, loosen tuner rear bracket wing nuts and shift tuner until knobs function freely.
4. By carefully moving the tube in its mountings align the mask and face of the tube so that no space remains between them. Complete the tightening of the mounting assemblies listed in step one, exercising caution when drawing down the holddown strap so that equal tension is applied to each rod. CAUTION: DURING THE ABOVE OPERATIONS CARE SHOULD BE TAKEN AT ALL TIMES TO AVOID PUTTING ANY STRAIN ON NECK OF THE TUBE.
5. Correctly position deflection yoke and adjust ion trap, pin cushion corrector, centering and focus magnets as described.

UHF Tuner

The use of the Ultra-High Frequency band for television broadcasting necessitates a high degree of precision in the manufacture of suitable tuners. This precision manufacture applies expecially to component placement, lead lengths, lead dress, and component size. Thus, the servicing of a UHF tuner results in problems not usually encountered in conventional radio and television receivers. Also, because of the high cost and scarcity of suitable UHF test equipment, the alignment of the UHF tuner presents unusual problems. Therefore, it is recommended that no servicing or alignment of a UHF tuner be attempted in the field. Sylvania stocks a number of UHF tuners which are available to Sylvania set distributors on an exchange basis.

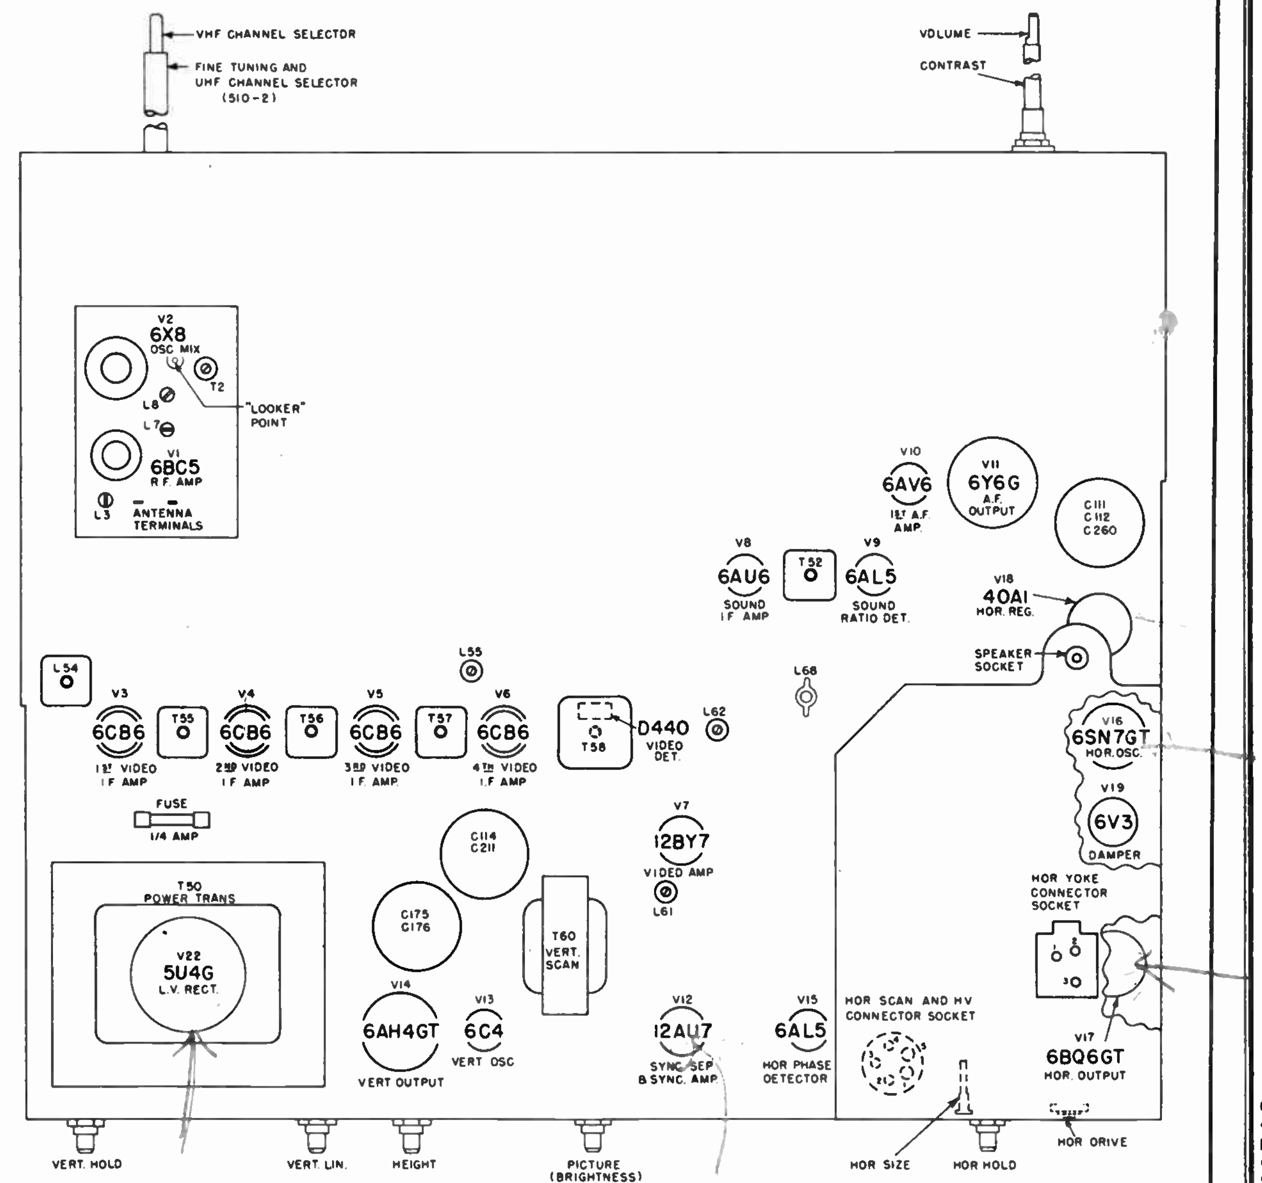

FIGURE 5 - TOP LAYOUT FOR 1-510-1, 1-510-2 TV CHASSIS

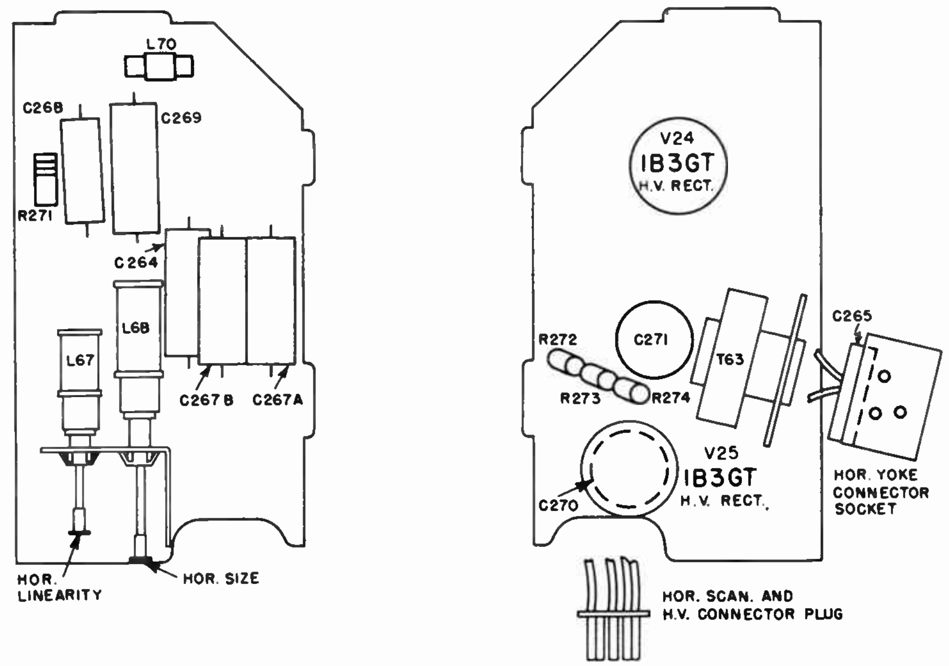

FIGURE 6 - HIGH VOLTAGE ASSEMBLY 1-508-1, 1-508-2

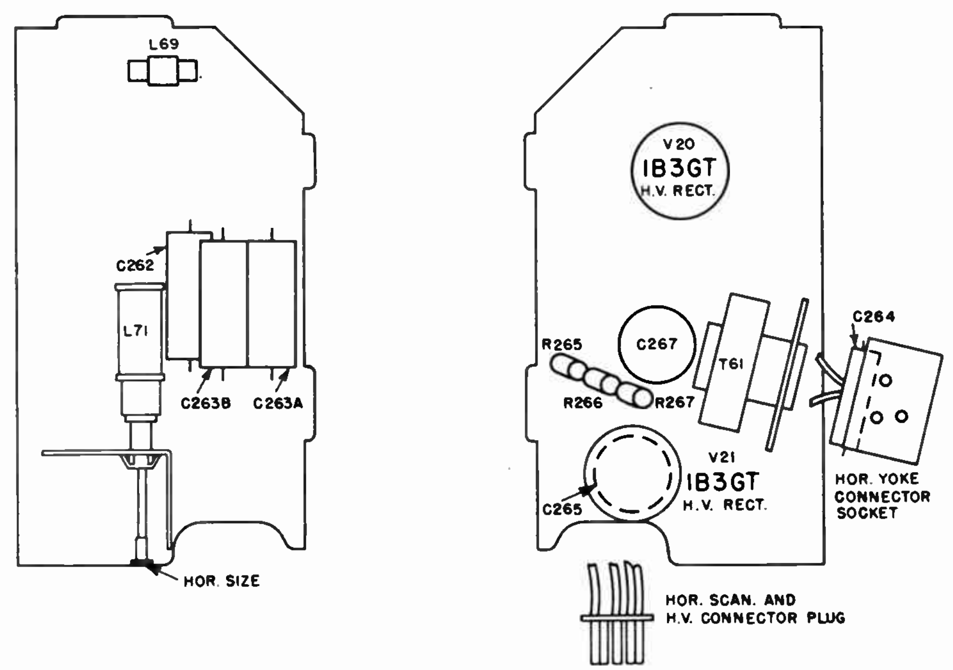

FIGURE 7 - HIGH VOLTAGE ASSEMBLY 1-510-1, 1-510-2

Preset Controls Adjustments

All preset controls except the Horizontal Frequency adjustment 1-510-1, 1-510-2, are located at the rear of the receiver and are readily available without removing the interlock cover. However, the Horizontal Frequency adjustment (L68) necessitates the removal of this cover for adjustment. See top layout for 1-510-1, 1-510-2 TV chassis on page 5 for physical location.

AGC (1-508-1, 1-508-2 only) - See "AGC control Adjustment". (Page 9.)

Horizontal Hold (1-508-1, 1-508-2 only) - See "Check of Horizontal AFC Operation".(Page 16)

Horizontal Hold and Horizontal Frequency (1-510-1, 1-510-2 only) - With a normal air signal rotate the Horizontal Hold control to mid-position. Adjust the Horizontal Frequency lug (L68 on top of chassis) until the picture locks in.

Horizontal Drive (1-508-1, 1-508-2 only) - Turn the Horizontal Drive control clockwise as far as possible without crowding the center of the picture or causing a vertical white line to appear.

Horizontal Drive (1-510-1, 1-510-2 only) - Turn the Horizontal Drive trimmer counterclockwise as far as possible without crowding the center of the picture or causing a vertical white line to appear.

Picture (Contrast: 1-508-1, 1-508-2) - Adjust to obtain best contrast with a good picture or test pattern.

Picture (Brightness: 1-510-1, 1-510-2) - Adjust to obtain most pleasing picture.

Vertical Linearity and Height (All models) - Adjust the Height control until the picture fills the screen vertically. Adjust the Vertical Linearity control until the pattern is symmetrical from top to bottom. The Vertical Linearity and Height controls are interdependent and adjustment of one will necessitate readjustment of the other.

Vertical Hold (All models) - Rotate the Vertical Hold control until the pattern is slowly moving downward. Back off on the control to a point just beyond where the picture moves upward and locks in.

Horizontal Size (All models) - Adjust the Horizontal Size slug until the picture fills the mask horizontally. This adjustment must be made with the mask and bezel in place and chassis in position in cabinet.

Horizontal Linearity (1-508-1, 1-508-2 only) - Adjust the Horizontal Linearity control until the picture is symmetrical left to right.

The Horizontal Drive Adjustment of all models should be rechecked after adjusting Horizontal Size or Linearity controls or both.

Note: On the 1-508-1 and 1-508-2 models, the Horizontal Linearity control and the Pincushion Corrector Magnets are interdependent. If the Pincushion Corrector Magnets have been moved, it is recommended that they be repositioned according to instructions under "Adjustment of Ion Trap Magnet, Focus Magnet, Centering Shutter and Pincushion Corrector Magnets" (page 8) before proceeding with adjustment of Horizontal Linearity control.

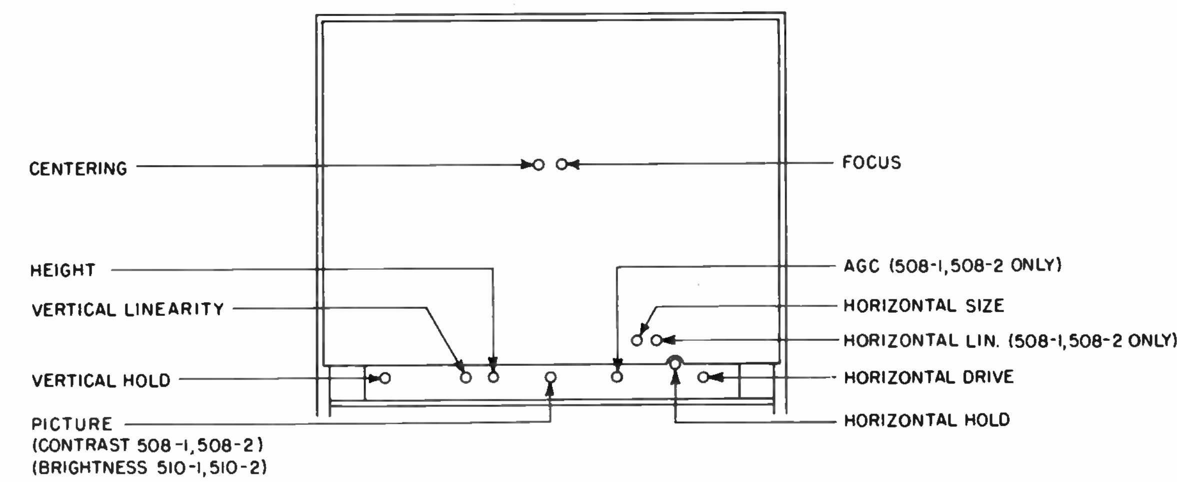

FIGURE 8 - REAR PANEL CONTROLS

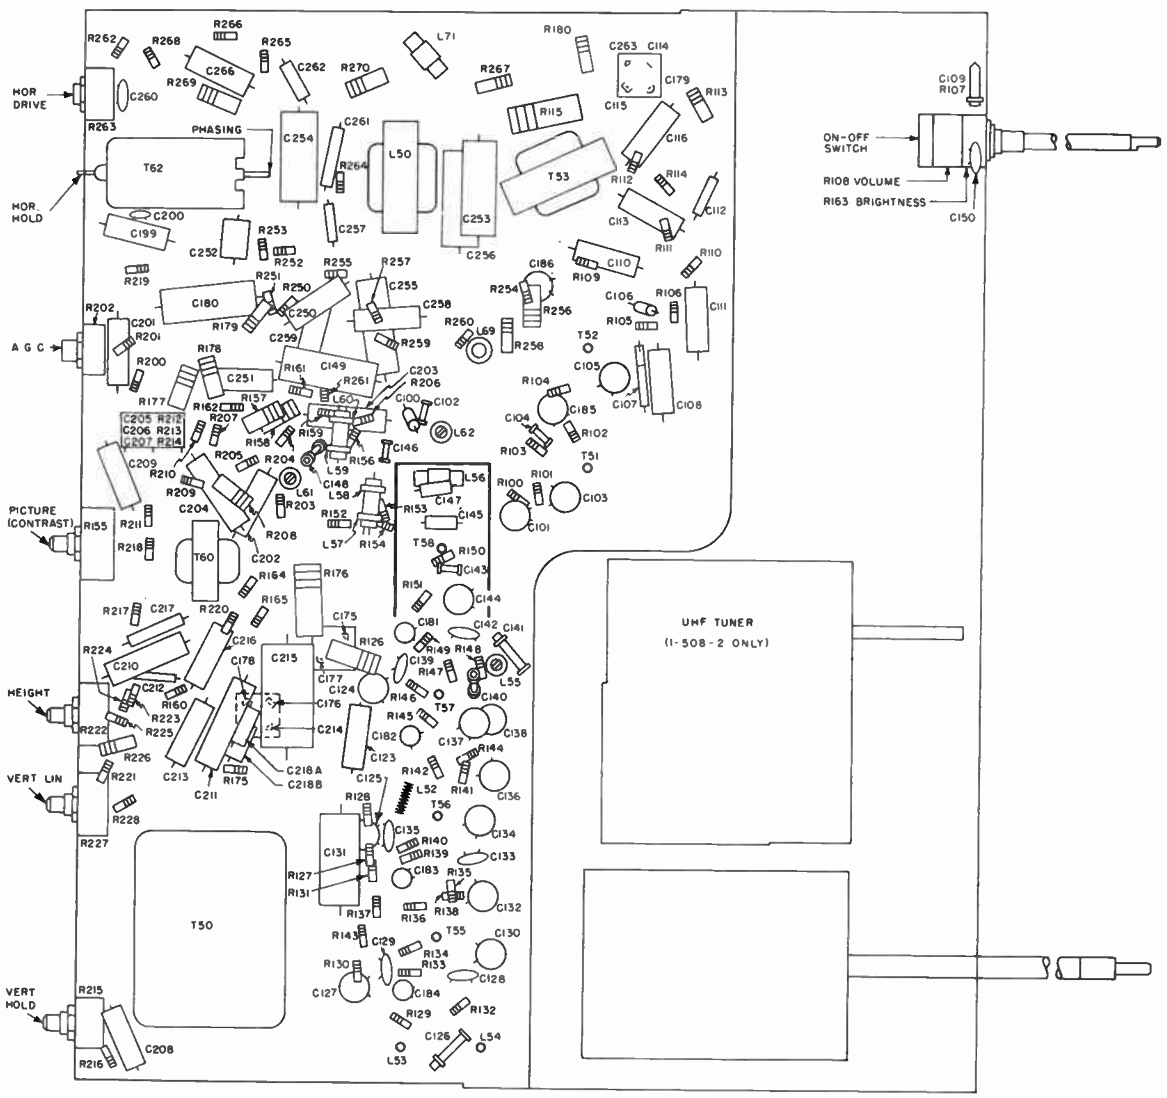

FIGURE 9 - BOTTOM LAYOUT FOR 1-508-1, 1-508-2 CHASSIS

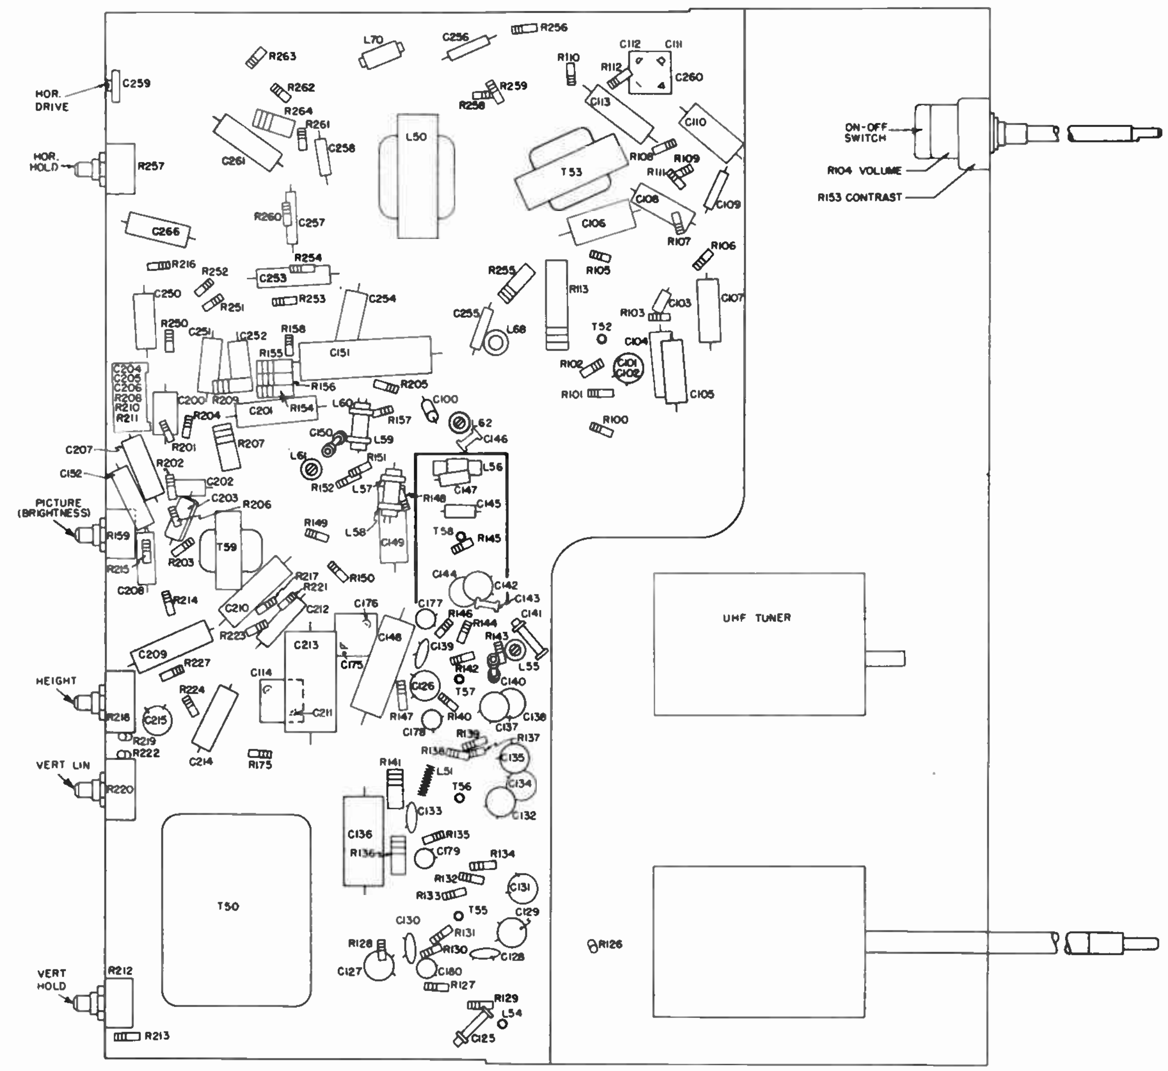

FIGURE 10 - BOTTOM LAYOUT FOR 1-510-1, 1-510-2 CHASSIS

Adjustment of Ion Trap Magnet, Focus Magnet, Centering Shutter, and Pincushion Corrector Magnets

The Ion Trap Magnet, Focus Magnet, and Centering Shutter adjustments are interdependent so all three must be checked at the same time.

Before making any adjustments, the function of each magnet should be noted.

The Ion Trap Magnet is used to obtain maximum brilliance of the raster or picture and should be adjusted to obtain maximum brilliance as described below.

The Focus Magnet is used to obtain correct focus of the picture.

The Centering Shutter is an integral part of the focus magnet assembly. Its function is to position the picture, both horizontally and vertically.

Before making any adjustments, check that the deflection yoke is positioned so that it is pressing against the flare of the picture tube. To ensure this, loosen the wing-fasteners located at each side of the yoke and push the yoke as far forward as it will go. If the picture is not square with the screen mask, rotate the yoke and then tighten the wing-fasteners.

Next, check that the Focus Magnet is firmly held in position.

When adjusting the focus of the receiver it is to be noted that optimum focus of the picture is not necessarily attained when either the vertical or horizontal definition is adjusted to maximum. Optimum focus is frequently a compromise between these two settings. It is highly desirable, therefore, that a transmitted picture, containing both vertical and horizontal lines, be available for correct focusing of the receiver.

Make sure the Ion Trap Magnet is correctly adjusted before proceeding with the receiver focus adjustment.

Adjust the Picture control (Contrast) on the 1-508-1 and 1-508-2 chassis and the Contrast control on the 1-510-1 and 1-510-2 chassis to approximately 3/4 maximum position. Position the Ion Trap Magnet on the picture tube neck approximately 1/2" forward of the tube base. Set the Brightness control on the 1-508-1 and 1-508-2 chassis and the Picture control (Brightness) on the 1-510-1 and 1-510-2 chassis to maximum.

Do not operate receiver longer than necessary with brightness at maximum. Rotate and move the Ion Trap Magnet backwards and forwards on picture tube neck until picture or raster is visible on screen. Continue adjustment of trap until greatest possible brilliance is obtained. Adjust brightness to less than normal and readjust Ion Trap Magnet for maximum brilliance.

The adjustment screw on the Focus Magnet should now be turned to obtain a picture which is focused - this preliminary adjustment will not be necessary if the picture is already in focus.

If the picture is not centered on the screen, properly position it by adjustment of the Centering Shutter, and with brightness at a low level, check to see that no corner cutting exists.

Adjust contrast and brightness controls to obtain a normal picture and then adjust Ion Trap Magnet to obtain the highest possible brilliance level. The focus should now be adjusted to obtain the best horizontal and vertical focus, as previously mentioned.

Note:

(a) In some cases optimum adjustment of the Ion Trap Magnet may be obtained with the magnet located on either side of the diagonal slot in the picture tube electrode assembly; it is permissible for the magnet to be located either between the slot and the tube base or over the slot. Do not locate magnet between slot and Focus Magnet.

(b) Optimum adjustment of the Ion Trap Magnet may be obtained irrespective of which way around it is placed on the picture tube neck. It should be noted, however, that in some cases one way around will result in a better focus characteristic than the other.

(c) Some receivers may have the facility to allow the Focus Magnet to be rotated. On such receivers a better focus characteristic may be obtained by rotating the Focus Magnet to a different angular position and again adjusting the Focus screw. This will require a check of the centering shutter to make sure that there is no corner cutting with the picture properly centered on the screen. Recheck the Ion Trap Magnet as previously mentioned with brightness and contrast adjustments set for a normal picture. Carefully adjust the focus for the best possible compromise between horizontal and vertical focus. Since these adjustments are interdependent, recheck all three until the best possible picture is obtained.

The Pincushion Corrector Magnets eliminate curvature of the edges of the raster. Move the Centering Shaft on the Focus Magnet so that one edge of the raster is approximately 1/2" from the edge of the picture tube screen. Adjust the Pincushion Corrector Magnet on the corresponding side of the picture tube until the edge of the raster is a straight vertical line. Repeat this procedure for the other edge, using the magnet on the opposite side of the picture tube. Move the picture up and then down the screen to check the top and bottom edges. The Pincushion Corrector Magnets should be adjusted for the best overall compromise.

ADJUSTMENT OF HORIZONTAL AFC CIRCUIT

(1-508-1, 1-508-2)

Check of Operation

The operation of the AFC circuit should be checked as follows:

A. Tune the receiver to a channel on which no signal is received and return to the original channel. The picture should immediately fall into synchronization.

B. Switch off the power to the receiver for about five minutes and then switch back on. Picture should immediately fall into synchronization.

C. Check for correct phasing of Horizontal AFC Circuit by noting that there is approximately 1/4" of blanking visible on the right hand edge of the picture. It will be necessary to turn the Picture (Contrast) control towards minimum and readjust the Brightness Control to see the blanking.

NOTE: Before making check "C" above, be sure the Horizontal Drive control is correctly adjusted. Refer to "Preset Controls Adjustments," page 6. If the receiver passes the above checks, no adjustments to the Horizontal AFC Circuit need be made.

If the receiver cannot pass checks "A," "B," or "C" the adjustment of the Horizontal Hold control as noted under "Horizontal Hold Adjustment" should be made.

Horizontal Hold Adjustment

A. Tune in a station and adjust the Channel Selector for best picture quality. Adjust the Picture Contrast and Brightness controls for normal picture.

B. Remove V18 - 6AL5 - Horizontal Discriminator tube.

C. Turn the Horizontal Hold control until the picture moves back and forth across the screen with blanking bar vertical.

D. Replace the Horizontal Discriminator tube and repeat A, B, and C under "Check of Operation" above.

E. If receiver still will not pass these checks, it will be necessary to proceed with "Phase Adjustment".

Phase Adjustment

A. Turn the core in Ringing Coil - L69 - all the way out (counterclockwise). Short out the 4,700 ohm horizontal charge circuit peaking resistor - R264.

With the horizontal size coil set for approximately the correct picture width, and with the horizontal linearity coil adjusted for best linearity, rotate the Horizontal Drive control fully counterclockwise. Slowly turn the drive control clockwise until crowding is visible in the center of the picture. Now carefully turn the control back (counterclockwise) just enough to remove the crowding or vertical lines in the picture or pattern.

NOTE: Do not operate the receiver with the Horizontal Drive control maladjusted.

B. Remove the Horizontal Discriminator tube V18 - 6AL5 from its socket.

C. Carefully turn the horizontal hold (frequency adjustment) screw top of Horizontal Discriminator Transformer - T62 until the picture moves back and forth across the screen with the blanking bar vertical.

D. Replace the 6AL5 in its socket.

E. Adjust the phase adjustment screw bottom of Horizontal Discriminator Transformer - T62 until approximately 1/4" of "blanking" is visible on the right-hand edge of the picture. In order to see the "blanking" it will be necessary to readjust the Brightness Control and turn the Picture (Contrast) control towards minimum.

F. Check the "free-running" of the horizontal oscillator as described under paragraphs "B," "C," and "D," and, if necessary, readjust the frequency adjustment screw on top of Horizontal Discriminator Transformer - T62.

G. Make a final check of the phasing as described in paragraph "E" above. It is important that both the "free-running" and the phasing are correct.

H. Remove the short from across the 4,700 ohm resistor R264 and readjust the Horizontal Drive control as described in "A". Turn the core in the Horizontal Ringing Coil - L69 - clockwise until approximately 1/4" of "blanking" is again visible on the right-hand edge of the picture.

I. Before the horizontal synchronization circuit is adjusted to the final position, it will be necessary to check the operation as follows:

Slowly turn the oscillator frequency adjustment screw (top of transformer T62) in either direction until the picture suddenly falls out of synchronization as indicated by the presence of a number of diagonal bars. Slowly turn the adjustment screw so as to decrease the number of bars and note the total number of bars visible just before the picture again falls into synchronization. The last number of bars visible must not be less than three, or more than six. The two half-bars at the top and bottom of the screen are counted as only one bar. In order to get an accurate indication of the minimum number of bars obtainable, the adjustment screw must be turned very slowly and carefully once the number of bars has been reduced to six or seven. Turn the adjustment screw in the opposite direction until the picture suddenly falls out of synchronization in the opposite direction and repeat the foregoing procedure. Again, not less than three or more than six bars must be visible just before the picture falls into synchronization.

J. After checking the operation as in "I," it is necessary to repeat the procedure described in paragraphs "B," "C," and "D."

K. Remove the signal by tuning to a "free" channel, then retuning to the original channel. The picture should immediately fall into synchronization.

L. Switch off the power to the receiver for about five minutes and then switch receiver on and check that the picture pulls into synchronization.

AGC CONTROL ADJUSTMENT

The AGC control should be readjusted according to the following procedure each time the receiver is connected to a different antenna installation.

1. Connect a good antenna installation to the receiver.

2. Set Picture (Contrast) control to approximately 7/8 of maximum position.

3. Tune receiver to the strongest station available in area.

4. Turn AGC control fully clockwise so that picture is "blacked" out.

5. Retard control to a point where the picture reappears and does not tear or fall out of synchronization as the fine tuning control is rocked through the picture.

6. If, when the AGC control is finally adjusted, the picture has too much contrast, reduce the contrast with the Picture (contrast) control. DO NOT use the AGC control as a contrast control.

7. Turn Volume control to normal level. Intercarrier buzz should be negligible as the Fine Tuning control is rocked near the correct tuning point. (Note: Intercarrier buzz is merely a reference for correct adjustment of the AGC control and only a slight touch up should be necessary. If much adjustment is required to remove intercarrier buzz, the sound section is maladjusted and requires realignment.)

Note: The intent of the AGC control adjustment is to ensure proper AGC voltage consistent with correct synchronizing action and negligible intercarrier buzz. This condition ensures the best possible synchronization under interference conditions, and also the greatest amount of picture contrast.

TEST EQUIPMENT REQUIREMENTS

1. RF Sweep Generator or Generators with frequency range from 4-220 Mc. having sweep width adjustable from 50 Kc. to 10 Mc. with an output of at least 0.1 volt, a marker system, either built-in or external type and flat within $\pm$ 1 Db.

2. Signal Generator or Generators with a frequency range from 4-222 Mc. and an adjustable output of at least 0.1 volt.

3. Sylvania Cathode Ray Oscilloscope type 400 or equivalent capable of passing a 60 cycle square wave.

4. Sylvania Polymeter type 221 or equivalent Vacuum Tube Voltmeter.

5. Sylvania High Voltage Probe Adapter type 225 or equivalent with 0-30 KV DC range.

6. Sylvania Tube Tester type 220 or equivalent capable of testing shorts with proper voltages and performance under dynamic conditions.

ALIGNMENT PROCEDURE

Should any chassis under service require realignment, carry out the alignment procedure in the following listed order.

PREALIGNMENT INSTRUCTIONS - READ CAREFULLY BEFORE ATTEMPTING ALIGNMENT.

1. Lay chassis on side for under chassis adjustments.

2. Ground all test equipment unless otherwise stated.

3. When constructing detector circuit, keep leads short.

4. Use proper insulated alignment tools for powdered iron cores with hex holes or slots and metallic screw drivers for those cores adjusted by brass screws. The sound interstage transformer T51 (chassis 1-508-1 and 1-508-2) may have either hex holes in the cores and thus be adjustable from either top or bottom, or slots which necessitate adjustment of the primary from the bottom of the chassis and the secondary from the top of the chassis.

5. Before attempting alignment, allow the receiver approximately fifteen minutes warm up time.

RF TUNER ALIGNMENT

(1-508-1, -2)

NOTES ON VHF TUNER ALIGNMENT

Observe the following procedure in making the equipment setup shown in Figure 12.

1. Construct the detector circuit so as to maintain leads as short as possible. Connection of the detector circuit to the 1st IF plate terminal (see Figure 12 for location) should also be made with short leads.

2. Use shielded leads in making the following connections to reduce hum and synchronous voltage pick-up.

   (a) The lead for observation of the RF response from the scope isolating resistor (10,000 ohms located at the tuner "looker" point) to the RF output switch position of the scope switch.

   (b) The connection from the IF detector circuit output to the IF switch position of the scope switch.

   (c) The connection from the sweep generator to the horizontal input of the scope. (Use externally generated sweep instead of internal oscilloscope sweep in order to obtain synchronization).

3. Locate the single pole double throw "scope switch" at the vertical input terminals of the scope. This switching arrangement will permit observation of either the IF response or the overall RF response. The aforementioned positions will be re-

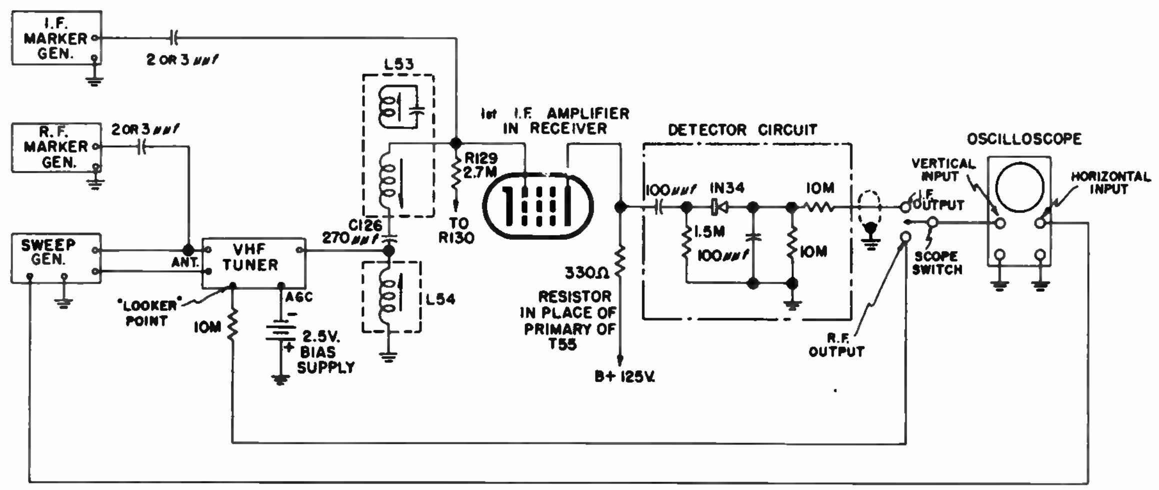

FIGURE 12 - RF TUNER ALIGNMENT SETUP 1-508-1, -2

ferred to in subsequent text as the "IF" and "RF" positions respectively.

4. The marker generator coupling capacitors should be as small a value as possible to prevent any effect on tuner response, but must be large enough to permit easy observation of markers on either the IF response or overall RF response. (Approximately 2 or 3 Mmfd. should be satisfactory in most cases).

5. During tuner alignment, remove the second IF amplifier tube to prevent coupling back from the receiver IF system.

6. In all of the following tests the oscilloscope vertical gain should be as close to maximum gain as possible, consistent with hum and synchronous voltage interference limitations. This precaution will allow the use of low levels from RF sweep Generator and increase the visibility of IF and RF markers.

7. Disconnect the primary winding of T55 by unsoldering lead from plate (pin 5) of 6CB6 1st video IF Amp. Connect 330 ohm resistor in place of primary winding.

8. Refer to the VHF Tuner Layout, Figure 15 for location of adjustment points.

VHF TUNER ALIGNMENT — CHASSIS 1-508-1, 1-508-2

STEP	TUNER SET TO CHANNEL	GENERATORS SWEEP (10 Mc.)	IF MARKER	RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS

VHF TUNER ALIGNMENT — CHASSIS 1-508-1, 1-508-2

STEP	TUNER SET TO CHANNEL	GENERATORS SWEEP (10 Mc.)	IF MARKER	RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS
2	13	Channel 13 213 Mc.	—	211.15 Mc. (P) 215.75 Mc. (S)	Same as 1	C9 and L9 (See "Comments")	 P 30% S	C9 determines passband. If band width is too narrow, move C8 and C10 apart. A valley that is too deep can be flattened by adjusting turns spacing on L9. Overall band width also depends on antenna selectivity. Adjust interstage band width so proper overall band width occurs with antenna circuit aligned.
3	4	Same as 1	—	Same as 1	Same as 1	C4—Antenna Trimmer	 30% TILT P S	Obtain symmetrical response curve.
4	4	Same as 1	Alternate 42 Mc. and 45.75 Mc. or two Markers	—	IF Output	L8, then L54 and L53 (both on TV Chassis)		Adjust for symmetrical overcoupled, double peaked response curve with markers on peaks. L8 and L53 determine position of 45.75 Mc. marker. L54 determines band width or position of 42.1 Mc. marker.
5	2	Channel 2 57 Mc.	Same as 4 for steps 5 through 16	55.75 Mc. (P) 59.75 Mc. (S)	Same as 4 for steps 5 through 16	L7		Check Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels.
6	3	Channel 3 63 Mc.		61.25 Mc. (P) 65.75 Mc. (S)		L7	 P 30% S	See note below.
7	4	Channel 4 69 Mc.		67.25 Mc. (P) 71.75 Mc. (S)		L7		
8	5	Channel 5 79 Mc.		77.25 Mc. (P) 81.75 Mc. (S)		L7		Same as 5 and 6.
9	6	Channel 6 85 Mc.		83.25 Mc. (P) 87.75 Mc. (S)		L7		
10	7	Channel 7 177 Mc.		175.25 Mc. (P) 179.75 Mc. (S)		L7	P=PICTURE MARKER S=SOUND MARKER COINCIDE 45.75 MC. MARKER WITH PICTURE MARKER	
11	8	Channel 8 183 Mc.		181.25 Mc. (P) 185.75 Mc. (S)		L7		
12	9	Channel 9 189 Mc.		187.25 Mc. (P) 191.75 Mc. (S)		L7		
13	10	Channel 10 195 Mc.		193.25 Mc. (P) 197.75 Mc. (S)		L7		
14	11	Channel 11 201 Mc.		199.25 Mc. (P) 203.75 Mc. (S)		L7		
15	12	Channel 12 207 Mc.		205.25 Mc. (P) 209.75 Mc. (S)		L7		
16	13	Channel 13 213 Mc.		211.25 Mc. (P) 215.75 Mc. (S)		L7		

NOTE: If one or more coil strips cannot be made to track properly, replace strips. Do not peak coils to correct passbands. If Channels 7 and 8 show deep valley, adjust L9 as in step 2. If this does not correct condition, change V2, the 6J6 Oscillator-Mixer Tube. This will necessitate repetition of steps 1 through 5.

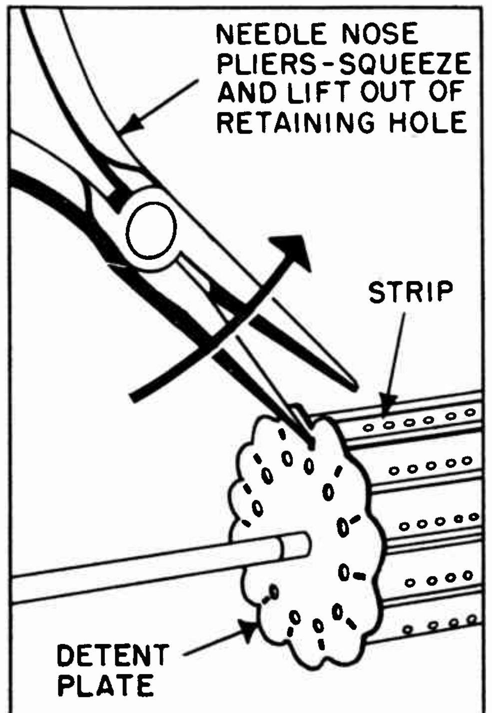

FIGURE 13 - TUNER STRIP REMOVAL 1-508-1

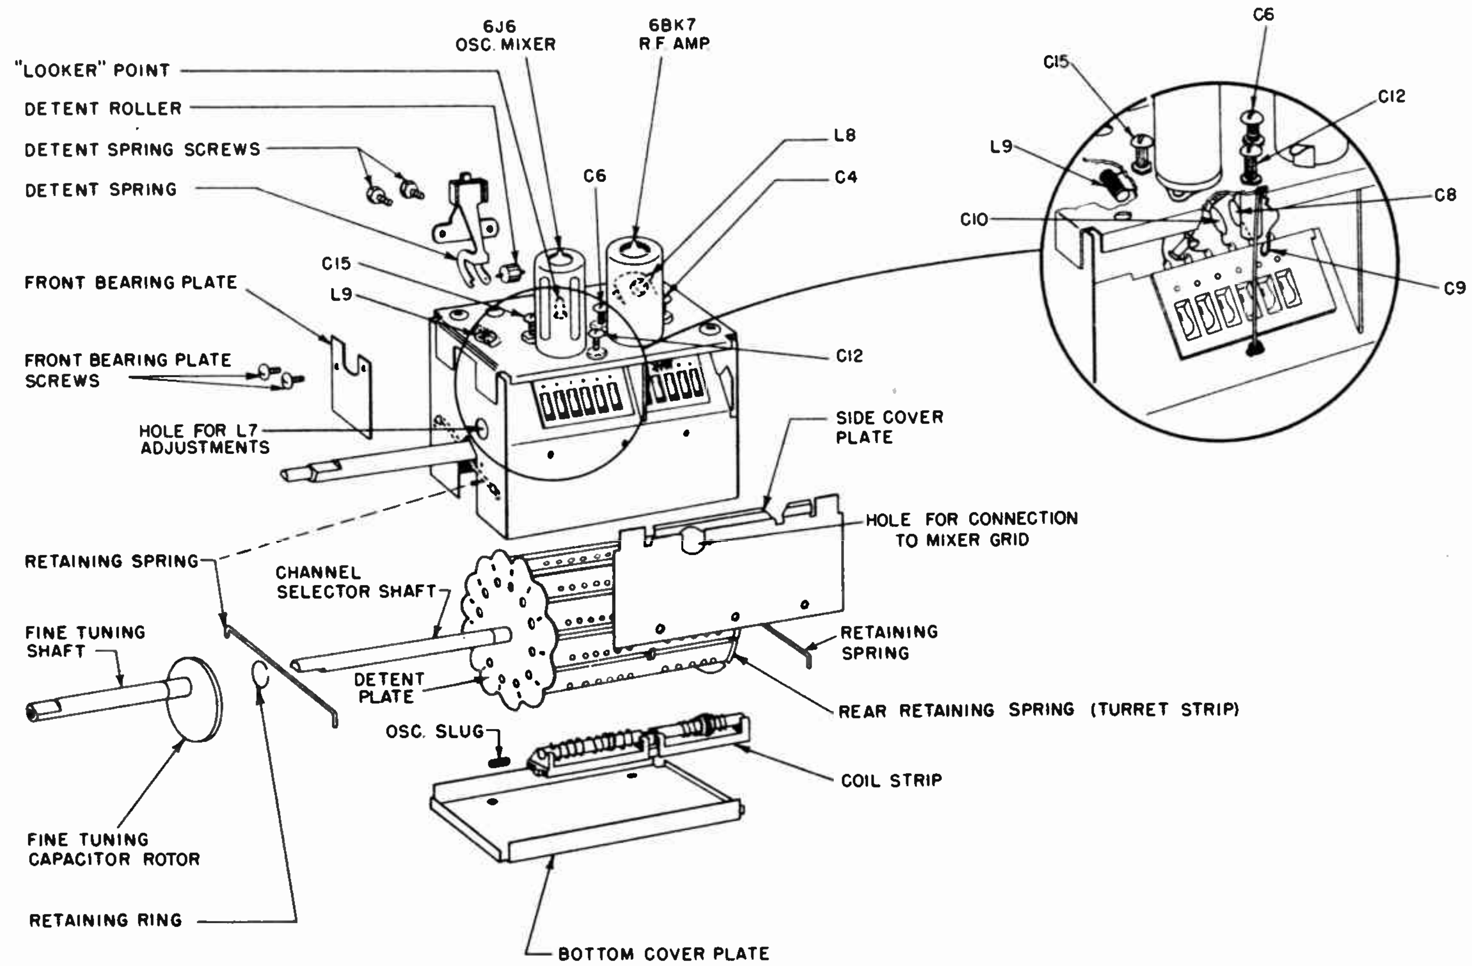

Note: This R.F. tuner has been thoroughly tested at the factory and should provide trouble-free reception. However, if service other than alignment is required, return the complete tuner to your Sylvania Distributor for replacement.

FIGURE 15 - VHF TUNER LAYOUT 1-508-1, 1-508-2

NOTES ON VHF TUNER DISASSEMBLY

To remove turret drum from VHF tuner it is not necessary to remove the tuner from the chassis. With the chassis lying on its side, remove the following items in the order given. See Figure 15.

1. Bottom cover plate.
2. Shaft retaining springs (front and rear).
3. Front bearing plate.

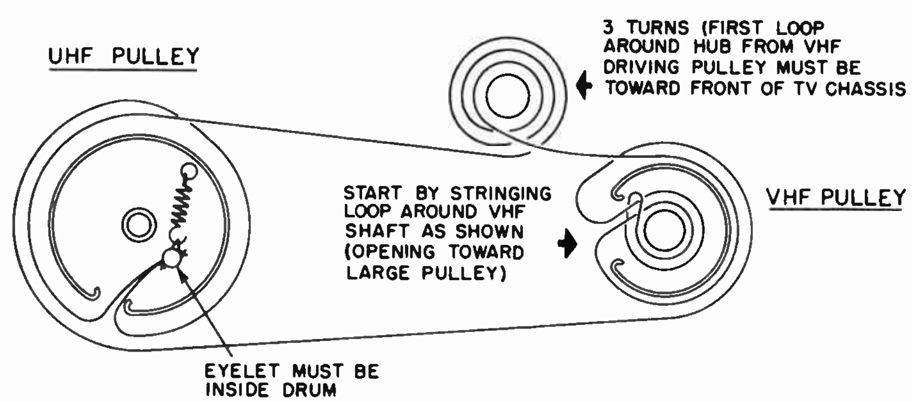

FIGURE 14 - VHF-UHF DIAL CORD HOOKUP 1-508-1, 1-508-2

The drum should now be free of its mounting and readily removed from the tuner housing through the slots provided.

To replace the turret, reverse the above steps, exercising caution when inserting in housing to make sure that the rotor of the fine tuning capacitor meshes with the stator plates.

Replacement of Coil Strips in Tuner

When received from the front the coil strips are numbered consecutively from 2 to 13 in clockwise rotation with one blank strip between numbers 13 and 2. The flat on the channel selector shaft (as viewed from the front) is in line with coil strip for channel 3.

To remove and replace coil strips proceed as follows: (Note: It is not necessary to remove tuner from chassis)

1. Remove bottom cover plate.
2. Rotate channel selector shaft so that coil to be removed is in line with slots in end of tuner case.
3. Using needle nose pliers release base on strip from detent plate as shown in Figure 13.
4. Carefully lift strip up and then free from rear retaining spring.

To replace strip, insert boss on rear of strip into retaining spring and apply only enough pressure against spring so that from boss clears detent plate. Push strip into position so that front boss engages slot in detent plate. Replace bottom cover.

RF TUNER ALIGNMENT

(1-510-1, -2)

NOTES ON VHF TUNER ALIGNMENT

Observe the following procedure in making the equipment setup shown in Figure 16 for the 1-510-1 and 1-510-2 chassis.

1. The detector circuits should be constructed and connected so as to maintain leads as short as possible.

2. Use shielded leads for the following connections in order to minimize hum and synchronous voltage pickup.

   a. Lead from "looker" point to detector #1.
   b. Lead from detector #1 to scope switch.
   c. Lead from detector #2 to scope switch.
   d. Lead from sweep generator to the horizontal input of the scope. (To obtain synchronization use externally generated sweep instead of internal oscilloscope sweep).

3. The single pole double throw "Scope Switch" should be located at the vertical input terminals of the scope. This switching arrangement will permit observation of either the IF response or the overall RF response. These switch positions will be referred to in the tuner alignment charts as the "IF" and "RF" positions respectively.

4. The marker generator coupling capacitors should be as small in value as possible, to prevent any effect on tuner response, but must be large enough to permit easy observation of markers in either the "IF" or "RF" switch positions. (2 or 3 Mmfd. should be satisfactory in most cases.

Observe the following general instructions for alignment of the 1-510-1 and 1-510-2 VHF tuner.

1. Connect a sweep generator with a 300 Ohm balanced output impedance to the antenna terminals of the tuner. Use a 10 Mc. sweep setting.

2. Connect the negative terminal of a 1.5 volt battery to the AGC terminal (terminal "C" on schematic and tuner layout drawings) and positive terminal to ground.

3. Set the fine tuning control, C19, to half capacity by noting that the variable capacitor plates are approximately half meshed.

4. Use a non-metallic pick to spread or compress the necessary coils.

5. During tuner alignment, remove the 2nd Video IF Amplifier tube - V4 - 6CB6, to prevent coupling back from the receiver IF system.

6. In all of the following tests the oscilloscope vertical gain should be as close to maximum setting as possible, consistent with hum and synchronous voltage interference limitations. This precaution will permit the use of low levels from RF sweep generator thereby increasing visibility of IF and RF markers.

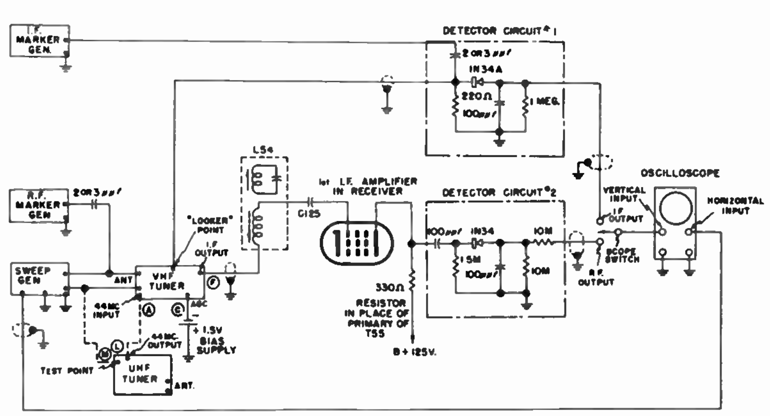

FIGURE 16 - RF TUNER ALIGNMENT SETUP 1-510-1, 1-510-2

VHF TUNER ALIGNMENT — CHASSIS 1-510-1, 1-510-2

HIGH BAND OSCILLATOR ALIGNMENT

STEP	TUNER SET TO CHANNEL	GENERATORS: SWEEP (10 Mc.)	IF MARKER	RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS
1	13	Channel 13 213 Mc.	45.75 Mc.	211.25 Mc.	RF Output	L9 Screw	See Curves below	Coincide Markers as shown.

NOTE: Refer to VHF Tuner Layout (Fig. 18) and VHF Tuner Schematic for location of specified Wafers, Coil Increments, and Screw Adjustments mentioned in the following steps. As Channels 12 to 7 and 5 to 2 are aligned by means of consecutive coil increments, the aligned increments that precede must not be disturbed.

STEP	TUNER SET TO CHANNEL	SWEEP (10 Mc.)	IF MARKER	RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS

AM-FM Radio

(1-603-1)

ALIGNMENT PROCEDURE

WARNING: No attempt should be made to adjust the alignment of this receiver without using the following equipment: Signal Generator, FM Sweep Generator, Output Meter, Insulated Screw Driver.

AM ALIGNMENT

Output meter connection	Across speaker voice coil
Generator ground lead connection	Receiver chassis
Generator modulation	30% 400 cycles
Position of volume control	Extreme Clockwise
Position of tone control	Extreme Counterclockwise
Position of FM-AM-PHO Switch	AM

A Hazeltine Loop may be used to radiate a signal into the receiver loop instead of dummy antenna connections listed below.

Keep generator output at lowest usable value and obtain maximum output meter indication.

TUNER POSITION	GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR CONNECTION	CORE & TRIMMER ADJUSTMENTS (IN ORDER SHOWN)	CORE OR TRIMMER FUNCTION
Open	455 KC.	0.1 Mfd.	Signal Grid (Pin 7) 6BE6	T28-A Bot., T28-B Top T26-A Top, T26-B Bot.	I. F.
1650 KC.	1650 KC.	50 Mmfd.	Ext. Ant.	C60	Osc.
1400 KC.	1400 KC.	50 Mmfd.	Ext. Ant.	C52	Ant.

FM IF ALIGNMENT

Sweep generator frequency	10.7 MC.
Sweep generator deviation	300 KC.
Dummy antenna	0.1 Mfd.
Sweep generator ground lead connection	Receiver chassis
Position of tuner	Open
Position of volume control	Extreme Clockwise
Position of tone control	Extreme Counterclockwise
Position of FM-AM-PHO switch	FM

Make shielded probe shown in Figure for use with Oscilloscope where indicated below.

Keep generator output at lowest usable value and obtain maximum vertical amplitude for curves in Figures A and B.

GENERATOR CONNECTION	OSCILLOSCOPE CONNECTION	CORE ADJUSTMENTS	ADJUST FOR CURVE IN	CORE FUNCTION
FM - First IF grid (Pin 1) 6BA6	Probe - across T29 - Primary	T27-A, T27-B	Figure A	IF
Signal Grid (Pin 7) 6BE6	Probe - across T29 - Primary	T25-A, T25-B	Figure A	IF
FM - Second IF Grid (Pin 1) 6AU6	Across C85	T29-A, T29-B	Figure B	Disc.

FM RF ALIGNMENT

Output meter connection	Across speaker voice coil
Sweep generator deviation	22.5 KC.
Sweep generator modulation	400 cycle
Dummy antenna	Two 120 ohm resistors
Sweep generator connection	FM antenna board
Position of volume control	Extreme Clockwise
Position of tone control	Extreme Counterclockwise
Position of FM-AM-PHO switch	FM

Keep generator output at lowest usable value and obtain maximum output meter indication.

POSITION OF TUNER	GENERATOR FREQUENCY	TRIMMER & COIL ADJUSTMENT	TRIMMER OR COIL FUNCTION
Open	108.5 MC.	C58	Osc.
108 MC.	108.0 MC.	C56	Mixer
Closed	88.5 MC.	L29	Osc.
88 MC.	88.0 MC.	L28	Mixer

Note 1: The terms "Horizontal," "Vertical," or "60 cps sine wave" refer to the oscilloscope sweep employed.

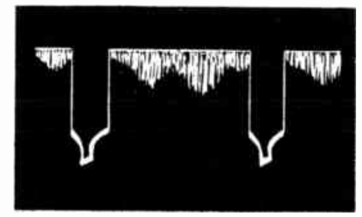
Note 2: All waveforms are taken with the oscilloscope horizontal sweep direction from left to right and with upward deflection corresponding to positive polarity.

Note 3: In some instances the waveforms obtained will not be identical with those shown, due to the electrical characteristics of the oscilloscope used.

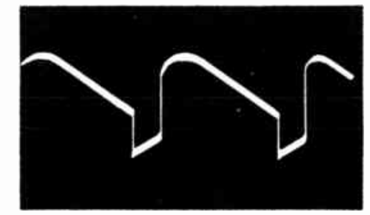
Note 4: All waveforms are measured with respect to chassis unless otherwise indicated.

Note 5: Have Picture Contrast control at maximum.

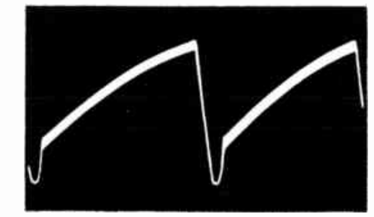
*The peak to peak (PP) voltages of these waveforms are dependent on the depth of modulation of the transmitted signal; voltages shown are obtained when modulation is approximately 90 percent.



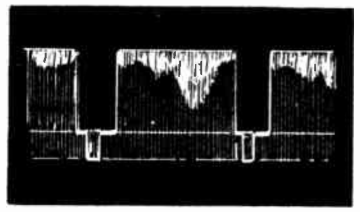
*12BY7 (V7) Video Amplifier Control Grid (Pin 2) 7.5 Volts (PP) Horizontal



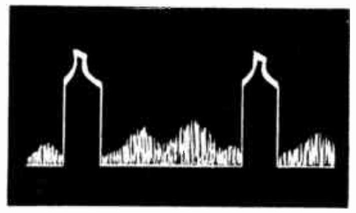
6AL5 (V15) Horizontal Phase Detector (Pin 7) 28 Volts (PP) Horizontal



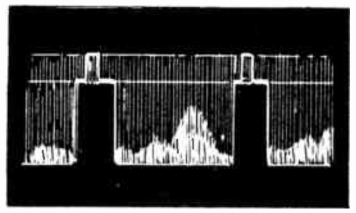
6SN7GT (V16) Horizontal Oscillator Plate (Pin 2) 150 Volts (PP) Horizontal



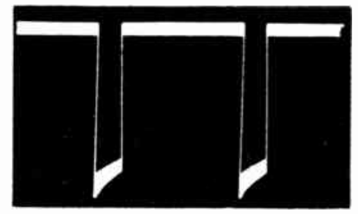
*12BY7 (V7) Video Amplifier Control Grid (Pin 2) 7.5 Volts (PP) Vertical



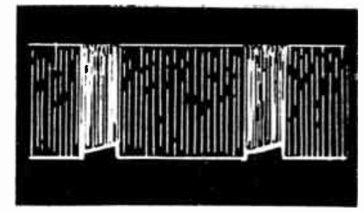
*12BY7 (V7) Video Amplifier Plate (Pin 7) 60 Volts (PP) Horizontal



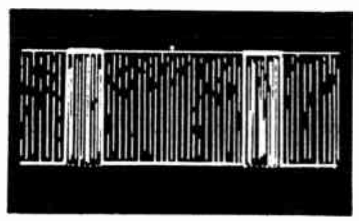
*12BY7 (V7) Video Amplifier Plate (Pin 7) 60 Volts (PP) Vertical



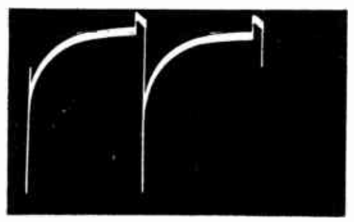
12AU7 (V12) Sync Separator Plate (Pin 6) 60 Volts (PP) Horizontal



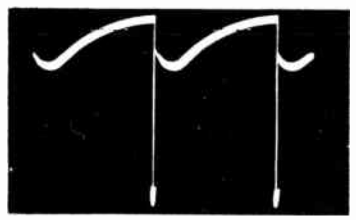
12AU7 (V12) Sync Separator Plate (Pin 6) 60 Volts (PP) Vertical



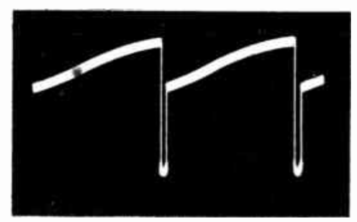
12AU7 (V12) Sync Amplifier Plate (Pin 1) 90 Volts (PP) Vertical



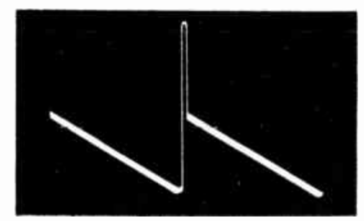
6C4 (V13) Vertical Oscillator Grid (Pin 6) 180 Volts (PP) Vertical



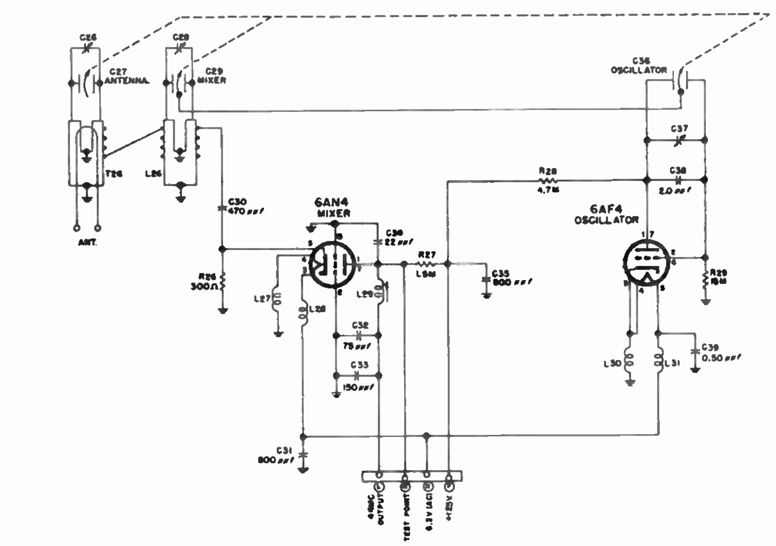
6C4 (V13) Vertical Oscillator Plate (Pin 5) 250 Volts (PP) Vertical



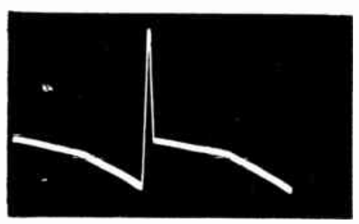
6AH4GT (V14) Vertical Output Grid (Pin 1) 80 Volts (PP) Vertical



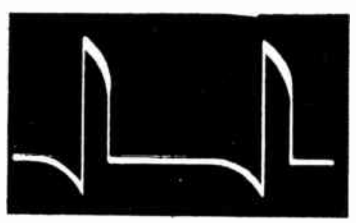
6AH4GT (V14) Vertical Output Plate (Pin 5) 810 V. (PP) Vertical



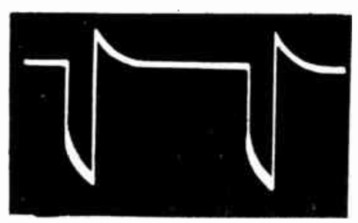
UHF TUNER SCHEMATIC



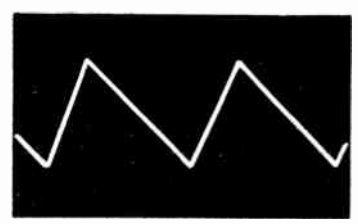
Vertical Deflection Coils (White lead - Vertical Output Transformer) 70 Volts (PP) Vertical



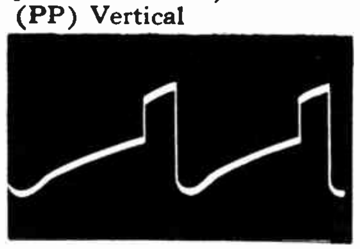
Junction of R207 and R209 27 Volts (PP) Horizontal



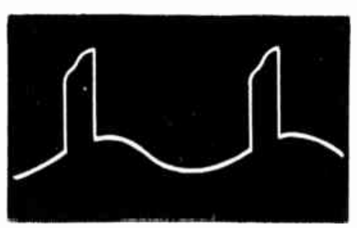
12AU7 (V12) Sync Amplifier Cathode (Pin 3) 27 Volts (PP) Horizontal



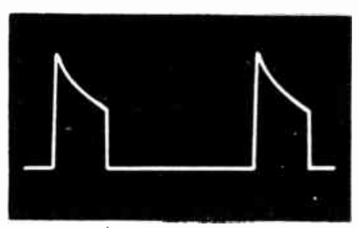
6AL5 (V15) Horizontal Phase Detector (Pin 1 or 2) 9 Volts (PP) Horizontal



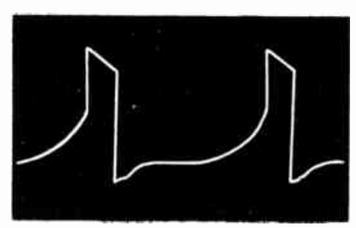
6AL5 (V15) Horizontal Phase Detector (Pin 5) 28 Volts (PP) Horizontal



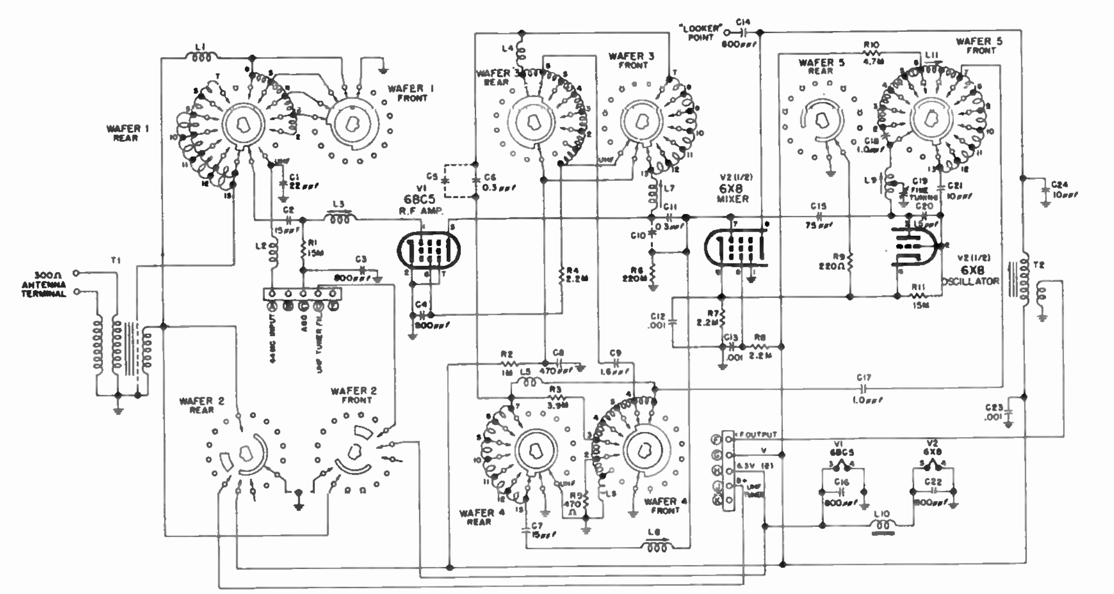
6SN7GT (V16) Horizontal Oscillator Plate (Pin 5) 65 Volts (PP) Horizontal



6SN7GT (V16) Horizontal Oscillator Cathodes (Pin 3 or 6) 25 Volts (PP) Horizontal



6SN7GT (V16) Horizontal Oscillator Grid (Pin 1) 65 Volts (PP) Horizontal



NUMBERS AT WAFER TERMINALS INDICATE CHANNEL POSITIONS. WAFER SWITCH SHOWN IN CHANNEL 13 POSITION.

VHF TUNER SCHEMATIC

SCHEMATIC DIAGRAM FOR 1-510-1 AND 1-510-2 TV CHASSIS

PARTS CODING

VHF TUNER SECTION	C1 TO C24,	R1 TO RT1
UHF TUNER SECTION	C26 TO C39,	R26 TO R29
SOUND SECTION	C100 TO C114,	R100 TO R113
VIDEO SECTION	C125 TO C152,	R126 TO R159
L.V. POWER SUPPLY SECTION	C175 TO C180,	R175 AND R176
SYNC. SEPARATOR AND VERTICAL SWEEP SECTION	C200 TO C215,	R200 TO R227
HOR. SWEEP AND H.V. POWER SUPPLY SECTION	C250 TO C267,	R250 TO R268

THE HIGHEST COMPONENT NUMBERS ON THIS SCHEMATIC DIAGRAM ARE: C267, L71, R268, T61 AND V23

- MEASURED WITH AN ELECTROSTATIC OR ZERO CURRENT METER AND AT LINE VOLTAGE METER READING OF 117 VOLTS, UNDER CONDITIONS OF NORMAL SIGNAL AND NO BRIGHTNESS.
- SOURCE OF VOLTAGE.
- * PICTURE CONTRAST CONTROL AT MINIMUM.
- BRIGHTNESS CONTROL AT MAXIMUM.
- → CONNECTED TO INDICATED VOLTAGE SOURCE.
- ▲ HIGH PEAK VOLTAGE OF SHORT DURATION (APPROX. 5,000V.) MAY DAMAGE METER USED FOR THIS MEASUREMENT.
- HIGH PEAK VOLTAGE (MORE THAN 1000 VOLTS)

VOLTAGES ARE MEASURED TO CHASSIS UNLESS OTHERWISE INDICATED, D.C. TAKEN AT 20,000 OHMS PER VOLT, A.C. AT 1,000 OHMS PER VOLT. MEASUREMENT CONDITIONS, UNLESS OTHERWISE NOTED: SOURCE 117 VOLT 60 CYCLE, ANTENNA DISCONNECTED WITH NO SIGNAL INPUT, PICTURE CONTRAST AT MAXIMUM, BRIGHTNESS AT MINIMUM — OTHER CONTROLS AT NORMAL POSITIONS.
AVERAGE VOLTAGES AND COIL RESISTANCES ARE INDICATED. RESISTANCE OF TAPPED COILS IS FOR ENTIRE WINDING. COIL RESISTANCE IS NOT SHOWN WHERE READINGS ARE TOO SMALL OR WIDELY VARIABLE.

	323-0021	Tuner Unit - UHF (with Tubes) (1-510-2 only)
	323-0018	Tuner Unit - VHF (with Tubes)
	553-4010	Washer - Rubber - H.V. Ceramic Insulator
L66, L67	100-0009	Yoke - Deflector Coils - Horizontal
L64, L65		Vertical

Note 1: The terms "Horizontal," "Vertical," or "60 cps sine wave" refer to the oscilloscope sweep employed.

Note 2: All waveforms are taken with the oscilloscope horizontal sweep direction from left to right and with upward deflection corresponding to positive polarity.

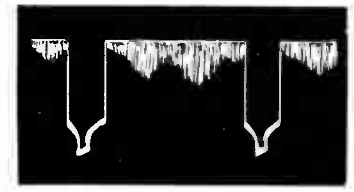
Note 3: In some instances the waveforms obtained will not be identical with those shown, due to the electrical characteristics of the oscilloscope used.

Note 4: All waveforms are measured with respect to chassis unless otherwise indicated.

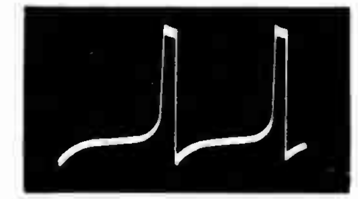
Note 5: Have Picture (Contrast) control at maximum.

*The peak to peak (PP) voltages of these waveforms are dependent on the depth of modulation of the transmitted signal; voltages shown are obtained when modulation is approximately 90 percent.

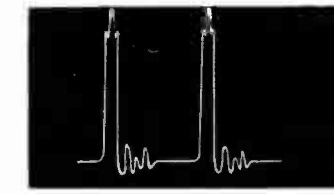
*12BY7 (V7) Video Amplifier Control Grid (Pin 2) 3.5 Volts (PP) Vertical



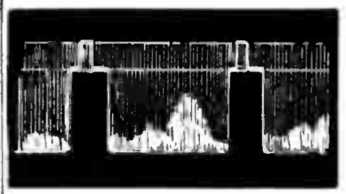
*12BY7 (V7) Video Amplifier Control Grid (Pin 2) 3.5 Volts (PP) Horizontal



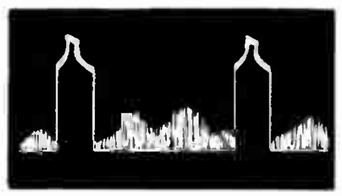
6AL5 (V18) Horizontal Discriminator Plate (Pin 2) 55 Volts (PP) Horizontal



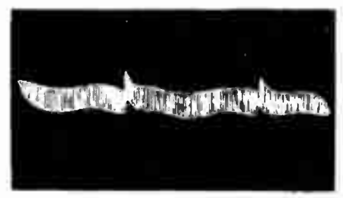
AGC Winding of Horizontal Output Transformer (Point X to Ground) 300 Volts (PP) Horizontal



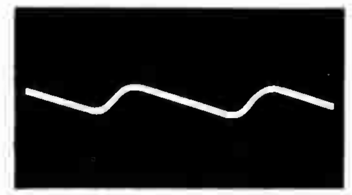
*12BY7 (V7) Video Amplifier Plate (Pin 7) 75 Volts (PP) Vertical



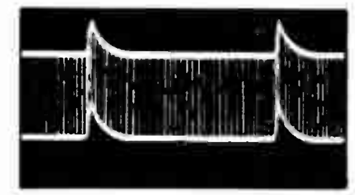
*12BY7 (V7) Video Amplifier Plate (Pin 7) 75 Volts (PP) Horizontal



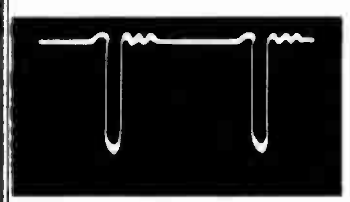
12AX7 (V14) Hor. Sync Separator and AGC Rectifier Cathode (Pin 3) 6 Volts (PP) Vertical



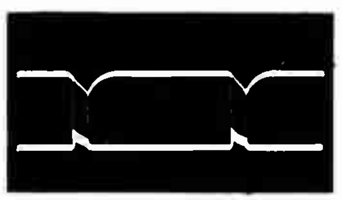
12AX7 (V14) Hor. Sync Separator and AGC Rectifier Cathode (Pin 3) 4.0 Volts (PP) Horizontal



12AX7 (V14) Hor. Sync Separator and AGC Rectifier Plate (Pin 1) 45 Volts (PP) Vertical



12AX7 (V14) Hor. Sync Separator and AGC Rectifier Plate (Pin 1) 45 Volts (PP) Horizontal



12AX7 (V14) Sync Separator Plate (Pin 6) 40 Volts (PP) Vertical

REVISIONS AND CODE CHANGES TO CHASSIS 1-508-1, -2, 1-510-1, -2 AS NOTED

CHASSIS 1-508-1, 1-508-2, 1-510-1, 1-510-2

All chassis covered are now using a 1/4 Amp slow blow fuse, Service Part 191-0014 instead of the original type.

C267A and C267B (chassis 1-508-1 and 1-508-2), and 263A and C263B (chassis 1-510-1 and 1-510-2), .1 Mfd. 600 V. capacitors are combined into C267 and C263 respectively, .22 Mfd. 600 V. capacitors, Service Part 160-06022.

These revisions bear no code change numbers.

CHASSIS 1-508-1 C01, C02, C03 AND 1-508-2

Reduction of sound interference in the picture is accomplished under code change C01 on chassis 1-508-1 and in original production of chassis 1-508-2 by connecting pin 6 of V11, the 6AV6 1st A. F. Amplifier and Tuner AGC Clamp as indicated in Figure 27. Correct the note on AGC delay (at junction of resistors R127, 1.5 megohm and R131, 100M ohms) to read "To pin 5 on V11".

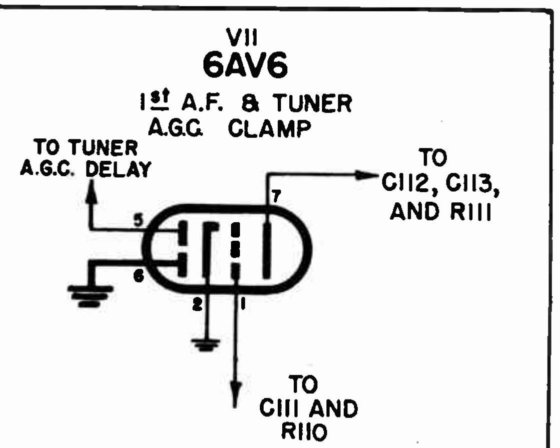

FIGURE 27 - PARTIAL SCHEMATIC DIAGRAM CHASSIS 1-508-1 C01

R215, the Vertical Hold control on chassis 1-508-1 and 1-508-2 is changed from 1.5 megohms to 2.0 megohms, Service Part 153-0018, to increase its range. This revision is coded C02 in chassis 1-508-1 and incorporated in initial production of chassis 1-508-2.

Under code change C03, a high pass filter, Service Part 114-0001 is now used on chassis 1-508-1 between the VHF antenna and the VHF tuner to improve IF rejection of the tuner.

C218A and C218B, 470 Mmfd., 500V. capacitors are combined into C218, a 220 Mmfd., 1000 V. capacitor, Service Part 160-1032 on chassis 1-508-1 and 1-508-2. This revision bears no code change number in either chassis.

CHASSIS 1-510-1 C01, C02, C03, C04 AND 1-510-2

C215, .0047 Mfd., 500 V. ceramic capacitor is changed to a .0047 Mfd., 600 V. paper unit, Service Part 162-06247 in chassis 1-510-1 as C01 and in original production of chassis 1-510-2. The revision provides greater voltage tolerance for this capacitor.

The following revisions constitute code change C02 in chassis 1-510-1. These revisions will be included in initial production of chassis 1-510-2.

1. C106, 2 Mfd. capacitor and R105, 68M ohm resistor are now connected as in Figure 28 to prevent possible sound interference in the picture at high volume levels.

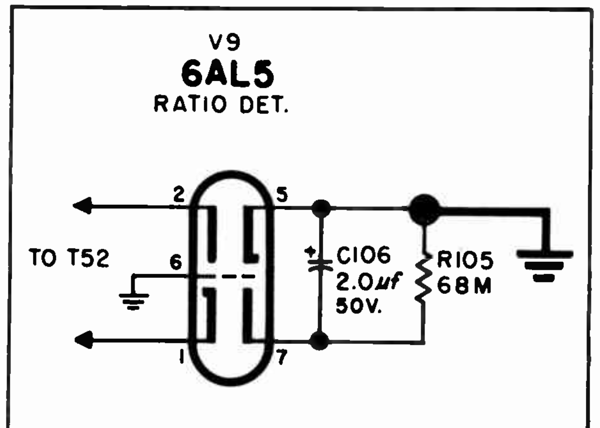

FIGURE 28 - RATIO DETECTOR CIRCUIT CHANGE CHASSIS 1-510-1 C02.

2. The ventilation of R176, 68 ohm resistor (75 ohms in certain initially produced chassis) is improved by physically relocating both this resistor and C136, .22 Mfd. capacitor.

3. R255, 5,600 ohm resistor has been physically relocated as a factory change.

Sensitivity in chassis 1-510-1 and 1-510-2 is increased by the following component changes. These changes constitute code C03 in chassis 1-510-1 and are incorporated in initial production of chassis 1-510-2.

1. R126 - 680 ohm resistor is removed.

2. R130, R135 and R140 are changed from 6,800 ohms to 4,700 ohms Service Part 181-0472.

3. R136 and R141 are changed from 12,000 ohms to 6,800 ohms, Service Part 183-0682.

A factory revision under code change C03 also eliminates C215 - .0047, 600 V. capacitor, previously added by code change C01.

Code change C04 in Chassis 1-510-1 and initial production of chassis 1-510-2 includes the following changes.

1. R222 has been changed from 680 ohms to 1000 ohms, Service Part 182-0102 to improve the range of R220, the Vertical Linearity control.

2. The stability of the horizontal oscillator has been improved by changing R258 from 680 ohms to 820 ohms, Service Part 181-0821.

3. A high pass filter, Service Part 114-0001 is now incorporated between the VHF antenna terminals and the VHF tuner to improve rejection of IF by the tuner.

Revise the Repair Parts Lists appearing on pages 21 and 24 to include these changes as noted below.

THE HIGHEST COMPONENT NUMBERS ON THIS SCHEMATIC DIAGRAM ARE: C267, L71, R268, T61 AND V23

▣ MEASURED WITH AN ELECTROSTATIC OR ZERO CURRENT METER AND AT LINE VOLTAGE METER READING OF 117 VOLTS, UNDER CONDITIONS OF NORMAL SIGNAL AND NO BRIGHTNESS.

■ SOURCE OF VOLTAGE.

* PICTURE CONTRAST CONTROL AT MINIMUM.

♦ BRIGHTNESS CONTROL AT MAXIMUM.

→ CONNECTED TO INDICATED VOLTAGE SOURCE.

▲ HIGH PEAK VOLTAGE OF SHORT DURATION (APPROX. 5,000V.) MAY DAMAGE METER USED FOR THIS MEASUREMENT.

♦ HIGH PEAK VOLTAGE (MORE THAN 1000 VOLTS)

VOLTAGES ARE MEASURED TO CHASSIS UNLESS OTHERWISE INDICATED, D.C. TAKEN AT 20,000 OHMS PER VOLT, A.C. AT 1,000 OHMS PER VOLT. MEASUREMENT CONDITIONS, UNLESS OTHERWISE NOTED: SOURCE 117 VOLT 60 CYCLE, ANTENNA DISCONNECTED WITH NO SIGNAL INPUT, PICTURE CONTRAST AT MAXIMUM, BRIGHTNESS AT MINIMUM — OTHER CONTROLS AT NORMAL POSITIONS.
AVERAGE VOLTAGES AND COIL RESISTANCES ARE INDICATED. RESISTANCE OF TAPPED COILS IS FOR ENTIRE WINDING. COIL RESISTANCE IS NOT SHOWN WHERE READINGS ARE TOO SMALL OR WIDELY VARIABLE.

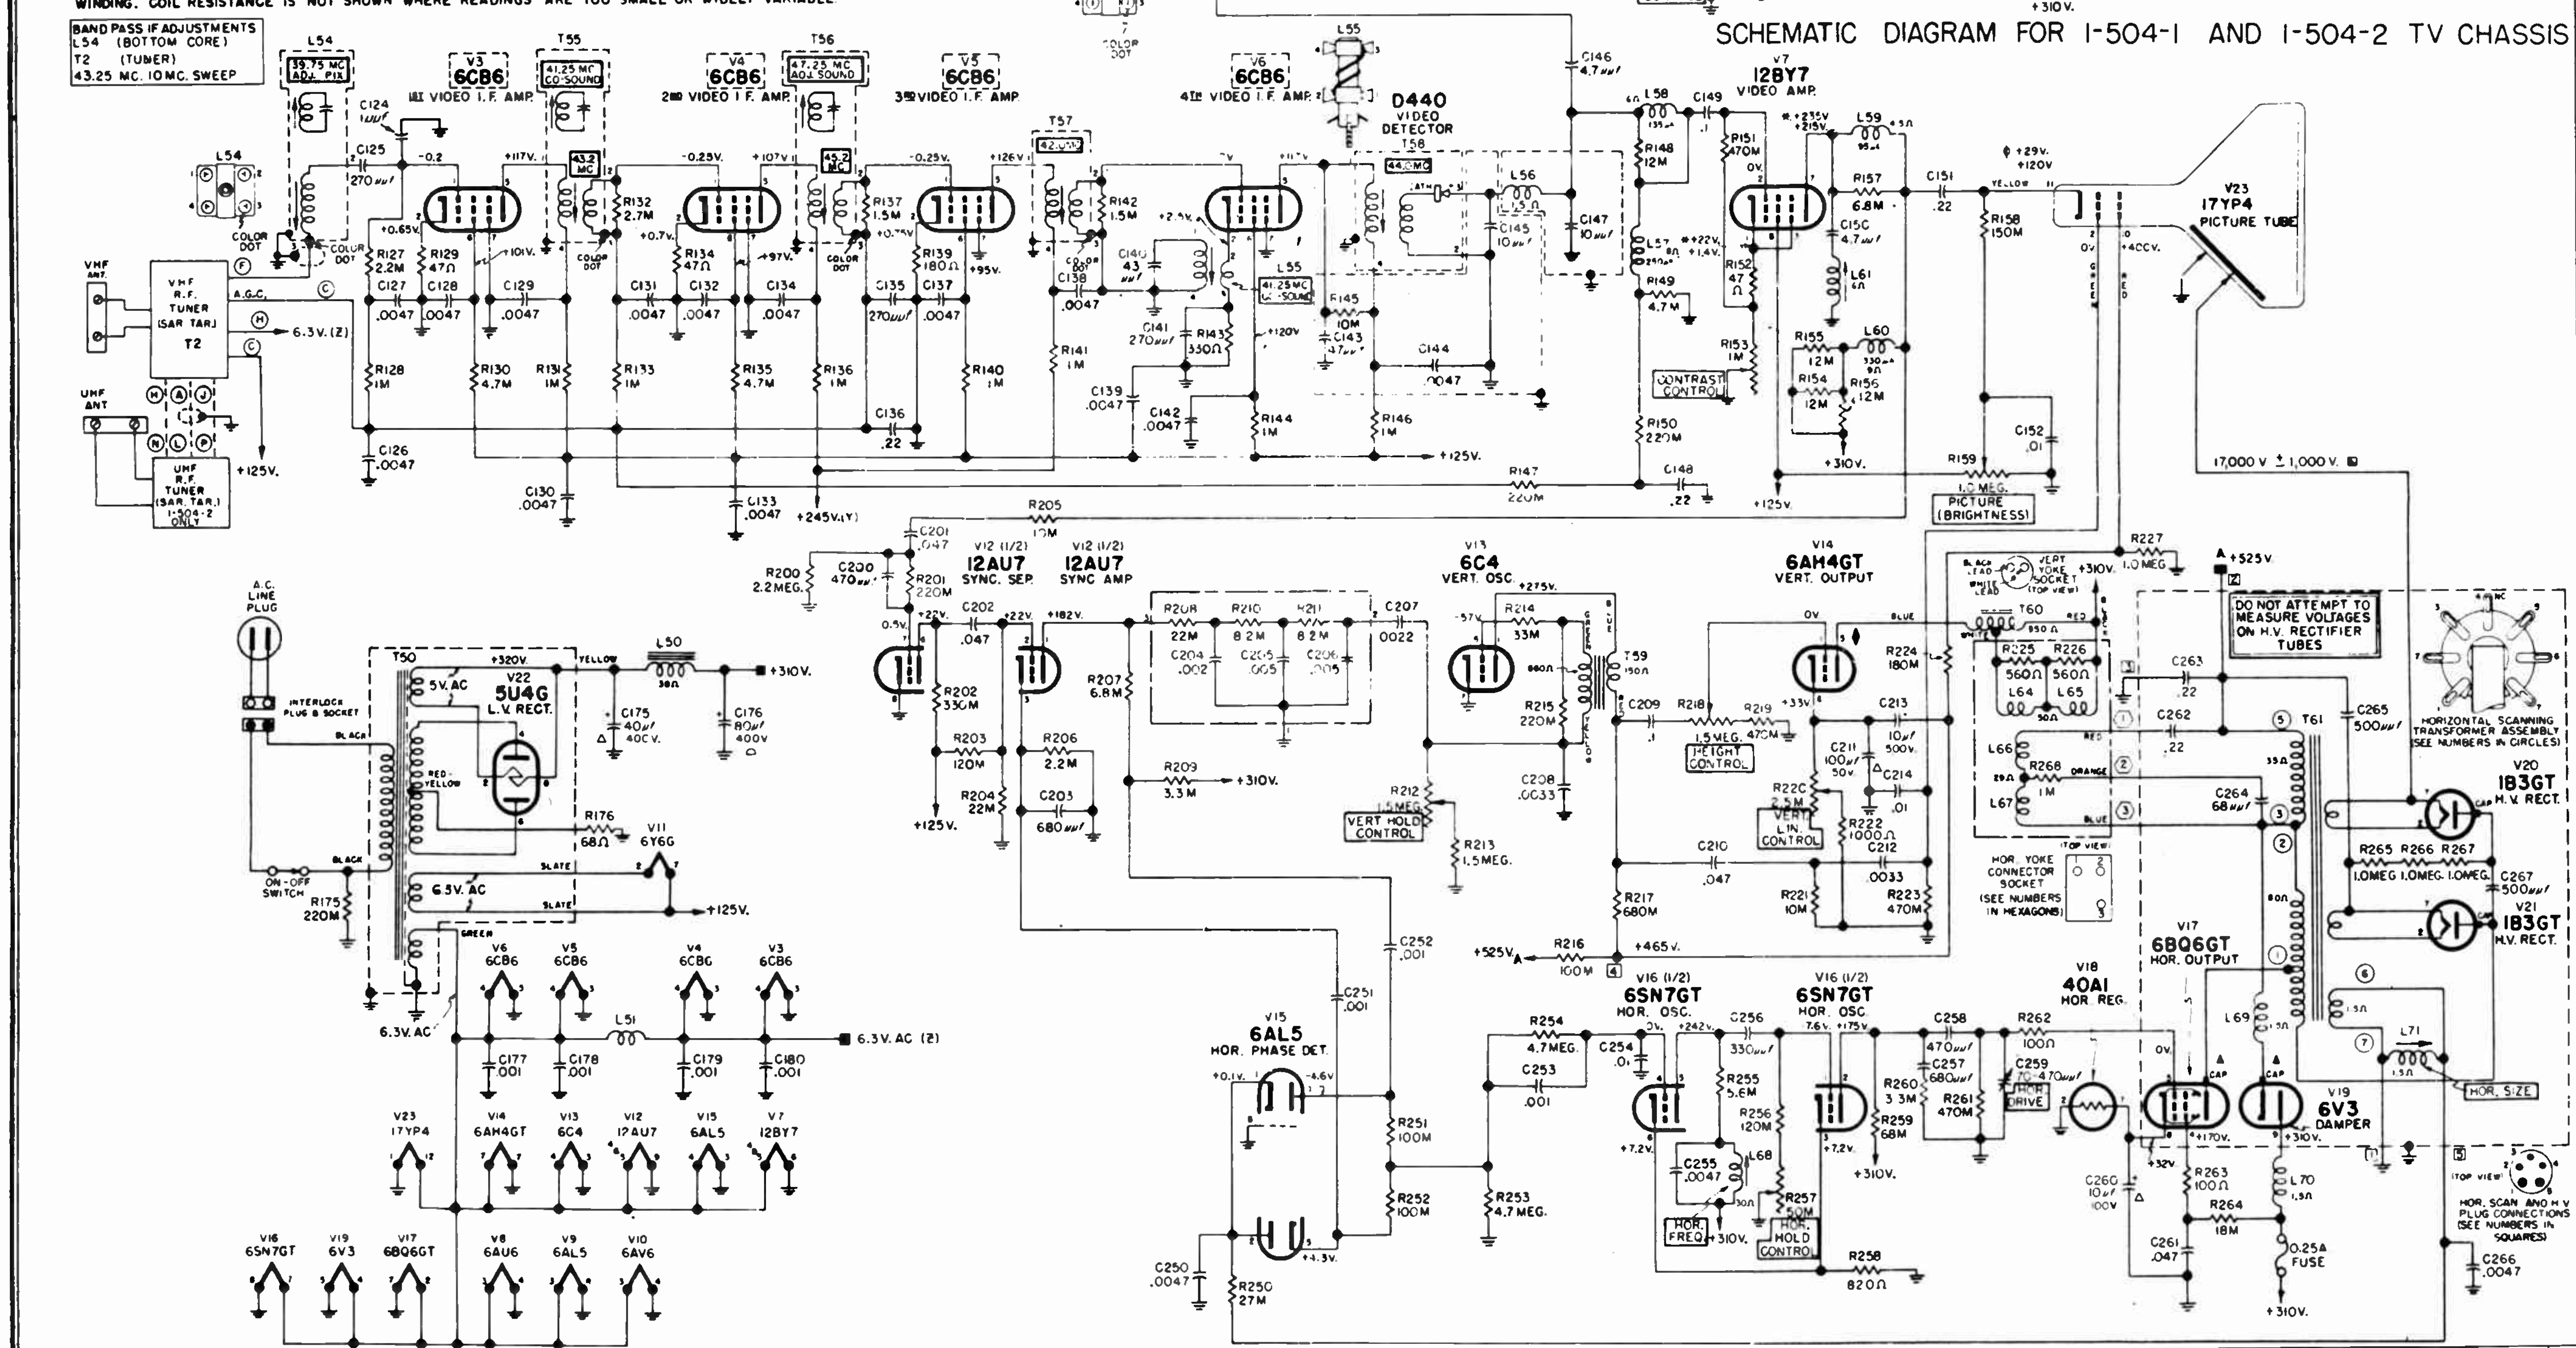
SCHEMATIC DIAGRAM FOR 1-504-1 AND 1-504-2 TV CHASSIS



CHASSIS 1-508-2, 1-510-2

The two Bearing Rings, Service Part 554-0022, employed on the VHF-UHF drive assembly of TV chassis 1-508-2 and 1-510-2, have been replaced by two new parts as listed below:

1. A new Bearing Ring, Service Part 554-0024, is used in place of the old front bearing ring.
2. A new Bushing Ring, Service Part 554-0025, is used in place of the old rear bearing ring.

These new parts provide for easier assembly and disassembly of the VHF-UHF drive assembly.

CHASSIS 1-504-1, 1-504-2

To bring the 1-504-1 and 1-504-2 Repair Parts List up to date, add the following service part numbers for the appropriate part:

1. Service Part Number 163-4700, Capacitor - Polystyrene - .0047 Mfd. - 500 V. - C255
2. Service Part Number 554-0024, Ring - Bearing (1-504-2 only).
3. Service Part Number 554-0025, Ring - Bushing (1-504-2 only).

To include the changes contained in this supplement, revise the Repair Parts Lists appearing on pages 21 and 24 as noted below.

REPAIR PARTS LIST CHASSIS 1-508-1, 1-508-2

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION
		DELETE
R208	183-0103	Resistor - 10,000 Ohm - 2 W.
	554-0022	Ring - Bearing (1-508-2 only)
		ADD
R199	182-0333	Resistor - 33,000 Ohm - 1 W.
R198	182-03645	Resistor - 360,000 Ohm - 1 W.
R208	183-0153	Resistor - 15,000 Ohm - 2 W.

	554-0025	Ring - Bushing (1-510-2 only)

ADDITION OF MODELS 200M, 200MU 225M, 225MU

The 200M and 200MU are direct viewing table model TV receivers varying only in frequency range. Model 200M contains the 1-504-1 chassis, and provides reception of the 12 commercial VHF channels; Model 200MU contains the 1-504-2 chassis, and provides reception of all commercial channels - VHF channels 2 through 13 and UHF channels 14 through 83. The 225M and 225MU are direct viewing table model television receivers that vary only in frequency range. Model 225M contains the 1-510-1 chassis, and provides reception of VHF channels 2 through 13. Chassis 1-510-2 is used in Model 225MU, providing reception of all commercial television channels - VHF channels 2 through 13 and UHF channels 14 through 83.

MODEL 200M

MODEL 225M

To include the models listed in this supplement, the following parts should be added

REPAIR PARTS LIST CHASSIS 1-504-1, 1-504-2

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION
	714-0018	Bezel Assembly - 17"
	487-0023	Clip - Bezel Mounting

CHASSIS 1-504-1 C01, C02 — CHASSIS 1-508-1 C07, C08, C09 — 1-508-2 C02, C03
CHASSIS 1-510-1 C07, C08

CHASSIS 1-504-1 C01

Code change C01 for TV chassis 1-504-1 includes the following changes to improve sensitivity:

1. C139 - .0047 Mfd. capacitor is removed.
2. R146 - 1000 ohm resistor is changed to a 6800 ohm resistor.

Refer to the revised 1-504-1, -2 schematic diagram included in this supplement for revisions in B+ connections to the plate circuits of V4, V5, and V6 accompanying these component changes.

CHASSIS 1-510-1 C07

The following component changes constitute code change C07 for the 1-510-1 TV chassis and result in improved sensitivity:

1. R113 - 680 ohm, 10 watt resistor is changed to a 680 ohm, 2 watt resistor.
2. R114 - 680 ohm, 2 watt resistor is added and connected in parallel to R113.
3. R136 - 6,800 ohm resistor is changed to a 1,000 ohm resistor.
4. R140 - 4,700 ohm resistor is changed to a 1,000 ohm resistor.

5. R141 - 6,800 ohm resistor is changed to a 1,000 ohm resistor.

6. R138 - 1,000 ohm resistor is removed.

7. R139 - 47 ohm resistor is changed to a 180 ohm resistor.

8. R146 - 1,000 ohm resistor is changed to a 6,800 ohm resistor.

9. C135 - .0047 Mfd. capacitor is changed to a 270 Mmfd. capacitor.

10. C139 - .0047 Mfd. capacitor is removed.

Refer to the revised 1-510-1, -2 schematic diagram included in this supplement for revisions in B+ connections to the plate circuits of V4, V5, and V6 accompanying these component changes.

A factory change also identified as code change C07 for the 1-510-1 TV chassis removes the high pass filter, Service Part 114-0001.

CHASSIS 1-508-1 C07, C08, C09
CHASSIS 1-508-2 C02, C03

Code change C07 for the 1-508-1 TV chassis removes the high pass filter, Service Part 114-0001, as a factory change. This filter was formerly added by code change C03.

Code change C08 for 1-508-1 chassis changes the voltage rating for C256 - .22 Mfd. capacitor from 200 V. to 400 V.

Code change C09 for the 1-508-1 chassis consists of the following revisions:

1. C121 - .047 Mfd. capacitor is added and connected across R131 - 100,000 ohm resistor as a factory change.

2. C122 - .22 Mfd. capacitor is added and connected from the VHF tuner AGC line to ground. This change serves to eliminate a white flash type of interference in the picture.

Under code change C02 for TV chassis 1-508-2, the VHF tuner, Service Part 323-0017, is changed to Service Part 323-0031. This version of the 1-508-2 VHF tuner includes the 40 Mc. IF strip.

Code changes C08 and C09 for the 1-508-1 have been incorporated in the 1-508-2 chassis; however, they are identified on the 1-508-2 as code change C03.

On both chassis 1-508-1 and 1-508-2, the shield has been removed from the lead connecting Vertical Hold control R215 to the yellow lead of the Vertical Oscillator transformer T60.

This factory revision bears no code change number for either chassis.

See schematic on page 35.

CHASSIS 1-504-1 C02; CHASSIS 1-510-1 C08

Code changes C02 for TV chassis 1-504-1 and C08 for chassis 1-510-1 add a Noise Inverter stage, plus an improved filtering circuit for the +125 V. source, on the respective chassis. The Noise Inverter stage improves sync stability under noise conditions, and improved filtering of +125 V. removes possible vertical scan instability caused by sound interference.

Component revisions under these code changes on both chassis series are as follows:

1. C253 - .001 Mfd. capacitor is changed to .0047 Mfd.

2. C254 - .01 Mfd. capacitor is changed to .047 Mfd.

3. R205 - 10,000 ohm resistor is changed to 33,000 ohms.

4. R115 - 68 ohm resistor is inserted in series with pin 8 of V11 - A.F. Output 6Y6G and +125 V. source.

5. C115 - 20 Mfd. capacitor is connected to pin 8 of V11 - A.F. Output 6Y6G. (This capacitor consists of the ⌓ section of electrolytic C111 - C112 - C260, formerly wired as C112 to pin 4 of V11.)

6. C112 - 20 Mfd. capacitor, ⌓ section of C111 - C112 - C260, is replaced by a wire-in type electrolytic rated at 10 Mfd. 350 V.

7. C111 - 200 Mfd. capacitor is rewired to +125 V. source side of R115 - 68 ohm resistor.

8. R200 - 470,000 ohm resistor on chassis 1-510-1 and 2.2 megohm on chassis 1-504-1, is replaced by a 1.2 megohm resistor.

9. C203 - 680 Mmfd. is changed to a 70 to 470 Mmfd. variable capacitor and becomes the Sync Balancing adjustment. Adjust C203 as described in the procedure on this page.

See schematic on page 36.

Component revisions peculiar to the C02 change on chassis 1-504-1 are as follows:

1. C200 - 470 Mmfd. capacitor is changed to a 220 Mmfd. capacitor.

2. C201 - .047 Mfd. is replaced by a .01 Mfd. capacitor.

3. R201 - 220,000 ohm resistor is changed to a 470,000 ohm resistor.

See schematic on page 37.

In addition to the above listed component revisions, an entire new stage consisting of a 12AU7 tube functioning as a Noise Inverter has been added to both chassis series. Parts coding assigned to components in this stage are: capacitors - C230 to C232, resistors - R230 to R237, and the 12AU7 tube - V24.

Refer to the complete revised schematic diagrams of TV chassis 1-504-1, -2 and 1-510-2, -2 for both new and revised circuits accompanying the 1-504-1 C02 and 1-510-1 C08 changes.

ADJUSTMENT OF C203
SYNC BALANCING TRIMMER

1. Tune in air signal.

2. Short pin 2 of V15 Horizontal Phase Detector 6AL5 to chassis.

3. Connect VTVM from pin 4 of V16 Horizontal Oscillator 6SN7GT to chassis.

4. Adjust C203 for minimum voltage.

5. Remove VTVM from circuit.

6. With Horizontal Hold control in mechanical center position, adjust L68 Horizontal Frequency control until picture moves back and forth across screen with blanking bar vertical.

7. Remove short from pin 2 of V15 Horizontal Phase Detector 6AL5.

8. With Contrast control in extreme counterclockwise position, rotate Horizontal Hold control until picture locks in and appears normal.

9. Advance Contrast control to normal position and check Horizontal Hold control on all available channels. A slight readjustment of Horizontal Hold control may be necessary.

CHASSIS 1-504-1, 1-504-2

A factory change on the 1-504-1 and 1-504-2 television chassis adds two pincushion corrector magnets to eliminate curvature of the edges of the raster. Adjust these magnets as described on page 8.

CHASSIS 1-504-1, -2; 1-508-1, -2; 1-510-1, -2

The type designation for the D440 germanium diode functioning as the Video Detector on all chassis covered has been changed to the RTMA assigned number 1N105. All references to the D440 number should be changed to 1N105

CHASSIS 1-504-1, -2; 1-510-1, -2

As mentioned previously, a coding of V24 has been assigned to the new 12AU7 Noise Inverter stage on chassis 1-504-1, -2 and 1-510-1, -2. To eliminate confusion, the coding assigned to the UHF tuner tubes, i.e. - V24 for the 6AN4 UHF Mixer, and V25 for the 6AF4 UHF Oscillator - has been changed to V30 and V31, respectively. All references to these tubes should be changed to the new coding numbers.

Production of 1-504-1, -2 and 1-510-1, -2 chassis now include VHF tuners with the terminal board lugs identified by numbers stamped on the tuner. The revised schematic diagrams for these chassis use the new numbers for terminal locations. Figure 31 provides a means of cross-checking the former schematic letter designations against later production tuners with numbers.

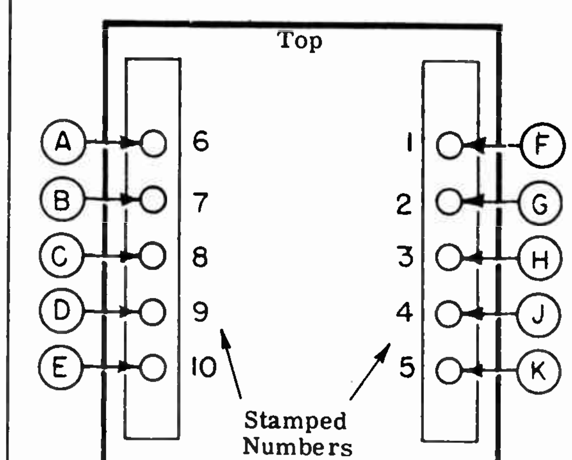

FIGURE 31 - VHF TUNER TERMINALS
1-504-1, -2 & 1-510-1, -2

Note: For convenience in servicing, complete schematic diagrams of the 1-504-1 and -2, 1-508-1 and -2, and 1-510-1 and -2 TV chassis are included in this supplement. All revisions described in this supplement are incorporated on the respective schematic diagrams and Revised Repair Parts Lists.

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION

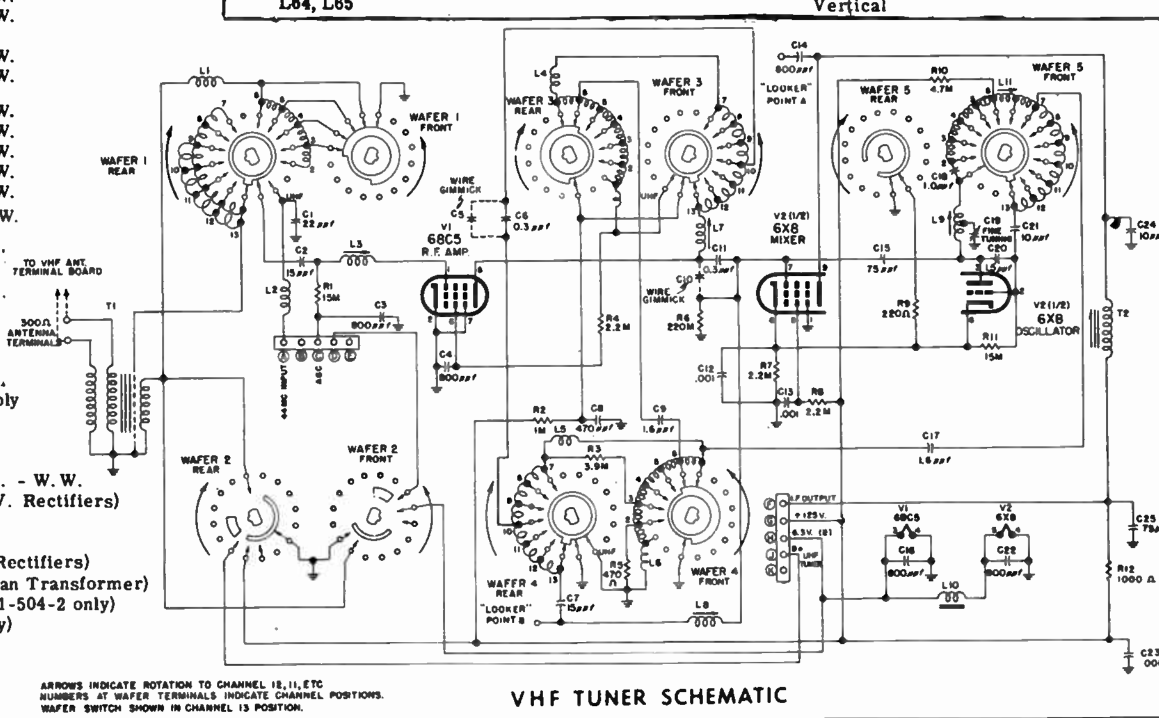
	415-0002	Plug - 2 Prong - Interlock
	415-0011	Plug - 5 Prong - Hor. Scan and H.V. Connector
	494-0009	Pulley and Sleeve Assembly (1-504-2 only)
R111, R129, R134, R152	181-0470	Resistor - 47 Ohm - 1/2 W.
R101, R262, R263	181-0101	Resistor - 100 Ohm - 1/2 W.
R139	181-0181	Resistor - 180 Ohm - 1/2 W.
R143	181-0331	Resistor - 330 Ohm - 1/2 W.
R225, R226	181-0561	Resistor - 560 Ohm - 1/2 W.
R258	181-0821	Resistor - 820 Ohm - 1/2 W.
R102, R128, R131, R133, R136, R140, R141, R144, R146, R268	181-0102	Resistor - 1,000 Ohm - 1/2 W.
R137, R142	181-0152	Resistor - 1,500 Ohm - 1/2 W.
R127, R206	181-0222	Resistor - 2,200 Ohm - 1/2 W.
R132	181-0272	Resistor - 2,700 Ohm - 1/2 W.
R260	181-0332	Resistor - 3,300 Ohm - 1/2 W.
R130, R135, R140, R149	181-0472	Resistor - 4,700 Ohm - 1/2 W.
R157	181-0682	Resistor - 6,800 Ohm - 1/2 W.
R145, R205	181-0103	Resistor - 10,000 Ohm - 1/2 W.
R221	181-01035	Resistor - 10,000 Ohm - 1/2 W.
R148	181-0123	Resistor - 12,000 Ohm - 1/2 W.
R204	181-0223	Resistor - 22,000 Ohm - 1/2 W.
R250	181-0273	Resistor - 27,000 Ohm - 1/2 W.
R214	181-0333	Resistor - 33,000 Ohm - 1/2 W.
R100	181-0473	Resistor - 47,000 Ohm - 1/2 W.
R105, R259	181-0683	Resistor - 68,000 Ohm - 1/2 W.
R103, R109, R216, R251, R252	181-0104	Resistor - 100,000 Ohm - 1/2 W.
R108	181-01045	Resistor - 100,000 Ohm - 1/2 W.
R203, R256	181-0124	Resistor - 120,000 Ohm - 1/2 W.
R158	181-0154	Resistor - 150,000 Ohm - 1/2 W.
R224	181-0184	Resistor - 180,000 Ohm - 1/2 W.
R110	181-01845	Resistor - 180,000 Ohm - 1/2 W.
R107, R147, R150, R175, R201, R215	181-0224	Resistor - 220,000 Ohm - 1/2 W.
R202	181-0334	Resistor - 330,000 Ohm - 1/2 W.
R151, R219, R223, R261	181-0474	Resistor - 470,000 Ohm - 1/2 W.
R217	181-0684	Resistor - 680,000 Ohm - 1/2 W.
R227	181-0105	Resistor - 1.0 Megohm - 1/2 W.
R213	181-0155	Resistor - 1.5 Megohm - 1/2 W.
R200	181-0225	Resistor - 2.2 Megohm - 1/2 W.
R253, R254	181-0475	Resistor - 4.7 Megohm - 1/2 W.
R106	181-0156	Resistor - 15 Megohm - 1/2 W.
R222	182-0102	Resistor - 1,000 Ohm - 1 W.
R209	182-0332	Resistor - 3,300 Ohm - 1 W.
R255	182-0562	Resistor - 5,600 Ohm - 1 W.
R112	182-0103	Resistor - 10,000 Ohm - 1 W.
R113, R114	183-0681	Resistor - 680 Ohm - 2 W.
R207	183-0682	Resistor - 6,800 Ohm - 2 W.
R154, R155, R156	183-0123	Resistor - 12,000 Ohm - 2 W.
R264	183-0183	Resistor - 18,000 Ohm - 2 W.
	189-0024	Resistor Assembly - H.V. Supply
R265		1 Megohm - 2 W.
R266		1 Megohm - 2 W.
R267		1 Megohm - 2 W.
R176	187-0013	Resistor - 68 Ohm - 10 W. - W.W.
	486-0007	Retainer - Filament Leads (H.V. Rectifiers)
		Ring - Bearing (1-504-2 only)
		Ring - Bushing (1-504-2 only)
	554-0021	Ring - Tube Socket Cap (H.V. Rectifiers)
	551-1007	Screw - 4-40 x 2-1/2" (Hor. Scan Transformer)
	551-0018	Screw - 6-32 x 5/32" Special (1-504-2 only)
	493-0031	Shaft - UHF Drive (1-504-2 only)
	486-0008	Shield - Corona - Resistor

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION
	482-0007	Shield - Tube (7 Prong Miniature)
	417-0002	Socket - 1 Prong (Speaker)
	414-0006	Socket - 3 Prong - Yoke Connecting
	417-0014	Socket - 5 Prong - Hor. Scan and H.V. Connector
	412-0015	Socket - 7 Prong - Miniature
	412-0020	Socket - 7 Prong - Miniature with Base
	412-0006	Socket - 8 Prong - Octal
	412-0022	Socket - 8 Prong - Octal - H.V. Assembly
	412-0018	Socket - 8 Prong - Octal - Shock Mounted
	412-0012	Socket - 8 Prong - Miniature
	412-0021	Socket - 9 Prong - Miniature (Damper Tube)
	558-0006	Spacer (1-504-2 only)
	558-0005	Spacer - H.V. Assembly Mounting
	558-0003	Spacer - Shock Mounted Socket
	539-0602	Speaker - 6-1/2" P.M.
	496-0080	Spring - Picture Tube Grounding
T53	143-0023	Transformer - Audio Output
T61	241-0007	Transformer - Horizontal Scanning Assembly
T55	119-0003	Transformer - IF - Video
T56	119-0004	Transformer - IF - Video
T57	119-0005	Transformer - IF - Video
T58	126-0001	Transformer - IF - Video (Output)
T50	141-0024	Transformer - Power - 117 V. - 60 Cycle
T52	128-0008	Transformer - Sound Discriminator
T59	242-0002	Transformer - Vertical Oscillator
T60	241-0008	Transformer - Vertical Scanning
V20, V21		Tube - 1B3GT
V22		Tube - 5U4G
V25		Tube - 6AF4 (1-504-2)
V14		Tube - 6AH4GT
V24		Tube - 6AN4 (1-504-2)
V9, V15		Tube - 6AL5
V8		Tube - 6AU6
V10		Tube - 6AV6
V1		Tube - 6BC5
V17		Tube - 6BQ6GT
V13		Tube - 6C4
V3, V4, V5, V6		Tube - 6CB6
V16		Tube - 6SN7GT
V19		Tube - 6V3
V2		Tube - 6X8
V11		Tube - 6Y6G
V12		Tube - 12AU7
V7		Tube - 12BY7
V23		Tube - 17YP4
V18		Tube - 40A1
	323-0030	Tuner Unit Assembly - VHF (with tubes and UHF drive components)
	323-0021	Tuner Unit - UHF (with tubes) (1-504-2 only)
	323-0027	Tuner Unit - VHF (with tubes) (less UHF drive components)
	553-4010	Washer - H.V. Ceramic Insulator Mounting
L66, L67	100-0009	Yoke - Deflection - Horizontal
L64, L65		Vertical



VHF TUNER SCHEMATIC

REVISED REPAIR PARTS LIST

CHASSIS 1-504-1, 1-504-2

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION
	582-0015	Antenna - UHF (1-504-2 Chassis Models)
	714-0016	Bezel Assembly (105 Models)
	714-0018	Bezel Assembly (200 Models)
	822-0002	Board - Mounting (H.V. Assembly)
	486-0005	Button - Corona - H.V. Power Supply
	417-0008	Cable and Socket - Picture Tube
	483-0018	Cap - Tube Socket (H.V. Rectifiers)
C143, C146, C150	168-0008N	Capacitor - Ceramic - 4.7 Mmfd. - 500 V.
C100, C145, C147	166-0010P	Capacitor - Ceramic - 10 Mmfd. - 500 V.
C140	166-0043P	Capacitor - Ceramic - 43 Mmfd. - 500 V.
C264	174-0068	Capacitor - Ceramic - 68 Mmfd. - 2,000 V.
C125, C135, C141	166-0270N	Capacitor - Ceramic - 270 Mmfd. - 500 V.
C103	166-0330	Capacitor - Ceramic - 330 Mmfd. - 500 V.
C265, C267	169-0015	Capacitor - Ceramic - 500 Mmfd. - 20,000 V.
C177, C178, C179, C180	166-1000D	Capacitor - Ceramic - .001 Mfd. - 500 V.
C126, C127, C128, C129, C130, C131, C132, C133, C134, C137, C138, C142, C144	166-4700D	Capacitor - Ceramic - .0047 Mfd. - 500 V.
C101, C102	168-0011D	Capacitor - Ceramic - Dual - .0047 Mfd. - 500 V.
C106, C110	161-1001	Capacitor - Electrolytic - 2 Mfd. - 50 V.
C112	161-1007	Capacitor - Electrolytic - 10 Mfd. - 350 V.
C213	161-1010	Capacitor - Electrolytic - 10 Mfd. - 500 V.
C175	161-2004	Capacitor - Electrolytic - 40 Mfd. - 400 V. △
C176		80 Mfd. - 400 V. ⌓
C114	161-2005	Capacitor - Electrolytic - 40 Mfd. - 400 V. ⌓
C211		100 Mfd. - 50 V. △
C260	161-3014	Capacitor - Electrolytic - 10 Mfd. - 100 V. △
C115		20 Mfd. - 300 V. ⌓
C111		200 Mfd. - 200 V. □
C109	163-0100	Capacitor - Mica - 100 Mmfd. - 500 V.
C200	163-0220	Capacitor - Mica - 220 Mmfd. - 500 V.
C256	163-0330	Capacitor - Mica - 330 Mmfd. - 500 V.
C258	163-0470	Capacitor - Mica - 470 Mmfd. - 500 V.
C104, C257	163-0680	Capacitor - Mica - 680 Mmfd. - 500 V.
C207	162-0622	Capacitor - Paper - .0022 Mfd. - 600 V.
C208, C212	162-0623	Capacitor - Paper - .0033 Mfd. - 600 V.
C113, C250, C253, C266	162-06247	Capacitor - Paper - .0047 Mfd. - 600 V.
C105, C107, C108, C152, C214, C231, C232	162-0611	Capacitor - Paper - .01 Mfd. - 600 V.
C202, C254	162-0215	Capacitor - Paper - .047 Mfd. - 200 V.
C210	162-06147	Capacitor - Paper - .047 Mfd. - 600 V.
C149	162-0201	Capacitor - Paper - .1 Mfd. - 200 V.
C136, C148	162-0202	Capacitor - Paper - .22 Mfd. - 200 V.
C151	162-0402	Capacitor - Paper - .22 Mfd. - 400 V.
C251, C252	162-0421	Capacitor - Paper - Molded - .001 Mfd. - 400 V.
C201	160-0411	Capacitor - Paper - Molded - .01 Mfd. - 400 V.
C261	160-04147	Capacitor - Paper - Molded - .047 Mfd. - 400 V.
C209, C230	160-0401	Capacitor - Paper - Molded - .1 Mfd. - 600 V.
C262, C263	162-06022	Capacitor - Paper - Molded - .22 Mfd. - 600 V.
C255	163-4700	Capacitor - Polystyrene - .0047 Mfd. - 500 V.
	190-0007	Capacitor - Resistor Combination - Integrator Plate
C204		.002 Mfd. - 500 V.
C205		.005 Mfd. - 500 V.
C206		.005 Mfd. - 500 V.
R210		8,200 Ohm - 1/2 W.
R211		8,200 Ohm - 1/2 W.
R208		22,000 Ohm - 1/2 W.
C259	172-0032	Capacitor - 70 to 470 Mmfd. Trimmer (Horizontal Drive Control)
C203	172-0032	Capacitor - 70 to 470 Mmfd. Trimmer (Sync Balancing Adjustment)
L50	145-0004	Choke - Filter - B+
L51	147-0014	Choke - Heater
	487-0022	Clamp - Bearing (1-504-2 only)
	196-0007	Clip and Lead Assembly - Damper Cathode, Horizontal Output Plate
	196-0010	Clip and Lead Assembly - H.V. Rectifier Plate
	487-0023	Clip - Bezel Mounting
	487-0008	Clip - Fuse
	487-0004	Clip - IF Transformer Mounting
L56, L69, L70	118-0010	Coil - Filter
L68	132-0001	Coil - Horizontal Frequency
L71	132-0002	Coil - Horizontal Size
L57, L58	131-2003	Coil - Peaking - Dual
L59, L60	131-2008	Coil - Peaking - Dual

L61, L62	130-0001	Coil - Trap - 4.5 Mc.
L55	118-0011	Coil - Trap - IF Cathode
L54	119-0002	Coil - Tuner Coupling
	196-0014	Connector - H.V. Anode and Lead Assembly
R104, R153	157-0021	Control - Dual - Contrast, Volume and On-Off
R218	153-0014	Control - Height
R257	153-0017	Control - Horizontal Hold
R159	153-0016	Control - Picture (Brightness)
R212	153-0014	Control - Vertical Hold
R220	153-3011	Control - Vertical Linearity
	195-0001	Cord - Line
	760-0037	Cover - Interlock Assembly (Includes Line Cord)
		Detector - Crystal Diode 1N105
	722-0030	Dial - UHF (1-504-2 only)
	722-0028	Dial - UHF Dummy
	191-0014	Fuse - 1/4 Amp. - 250 V. - Slow Blow
	491-0016	Gasket - Dust (Tube Mask)
	484-0013	Gear and Hub Assembly (1-504-2 only)
	710-0011	Glass - Picture Window
	818-0010	Insert - UHF (200 Models)
	486-0006	Insulator - Ceramic (Hor. Scan and H.V. Assembly)
	486-0009	Insulator - Tube Socket Cap (H.V. Rectifiers)
	744-0023	Knob - Inner - Contrast
	740-0029	Knob - Inner - Fine Tuning
	743-0022	Knob - Outer and Dial Assembly (105 Models)
	743-0024	Knob - Outer and Dial Assembly (200 Models)
	744-0022	Knob - Outer - Volume and On-Off
	715-0009	Lens - Bezel
	400-0014	Magnet - Focus and Centering Unit
	400-0013	Magnet - Ion Trap
	400-0016	Magnet - Pin Cushion Corrector
	716-0005	Mask - 17"
	552-0001	Nut - 8-32 Wing - Yoke Mounting
	552-0024	Nut - 8-32 - Speaker Mounting
	488-0002	Pad - Rubber (Hor. Scan Transformer Assembly)
	484-0014	Pinion and Screws Assembly (1-504-2 only)
	415-0004	Plug - 1 Prong - Speaker
	415-0002	Plug - 2 Prong - Interlock
	415-0011	Plug - 5 Prong - Hor. Scan and H.V. Connector
	494-0009	Pulley and Sleeve Assembly (1-504-2 only)
R111, R129, R134, R152	181-0470	Resistor - 47 Ohm - 1/2 W.
R101, R262, R263	181-0101	Resistor - 100 Ohm - 1/2 W.
R139	181-0181	Resistor - 180 Ohm - 1/2 W.
R143	181-0331	Resistor - 330 Ohm - 1/2 W.
R225, R226	181-0561	Resistor - 560 Ohm - 1/2 W.
R258	181-0821	Resistor - 820 Ohm - 1/2 W.
R102, R128, R131, R133, R136, R140, R141, R144, R268	181-0102	Resistor - 1,000 Ohm - 1/2 W.
R137, R142	181-0152	Resistor - 1,500 Ohm - 1/2 W.
R127, R206	181-0222	Resistor - 2,200 Ohm - 1/2 W.
R132	181-0272	Resistor - 2,700 Ohm - 1/2 W.
R234, R260	181-0332	Resistor - 3,300 Ohm - 1/2 W.
R130, R135, R149	181-0472	Resistor - 4,700 Ohm - 1/2 W.
R146, R157	181-0682	Resistor - 6,800 Ohm - 1/2 W.
R145	181-0103	Resistor - 10,000 Ohm - 1/2 W.
R221	181-01035	Resistor - 10,000 Ohm - 1/2 W. - 5%
R148, R236	181-0123	Resistor - 12,000 Ohm - 1/2 W.
R204	181-0223	Resistor - 22,000 Ohm - 1/2 W.
R250	181-0273	Resistor - 27,000 Ohm - 1/2 W.
R205, R214	181-0333	Resistor - 33,000 Ohm - 1/2 W.
R100	181-0473	Resistor - 47,000 Ohm - 1/2 W.
R232	181-0563	Resistor - 56,000 Ohm - 1/2 W.
R105, R259	181-0683	Resistor - 68,000 Ohm - 1/2 W.
R237	181-0823	Resistor - 82,000 Ohm - 1/2 W.
R103, R109, R216, R251, R252	181-0104	Resistor - 100,000 Ohm - 1/2 W.
R108	181-01045	Resistor - 100,000 Ohm - 1/2 W. - 5%
R203, R256	181-0124	Resistor - 120,000 Ohm - 1/2 W.
R158	181-0154	Resistor - 150,000 Ohm - 1/2 W.
R224	181-0184	Resistor - 180,000 Ohm - 1/2 W.
R110	181-01845	Resistor - 180,000 Ohm - 1/2 W. - 5%
R107, R147, R150, R175, R201, R215	181-0224	Resistor - 220,000 Ohm - 1/2 W.
R202	181-0334	Resistor - 330,000 Ohm - 1/2 W.
R151, R201, R219, R223, R230, R231, R261	181-0474	Resistor - 470,000 Ohm - 1/2 W.
R217	181-0684	Resistor - 680,000 Ohm - 1/2 W.
R227	181-0105	Resistor - 1.0 Megohm - 1/2 W.
R200	181-0125	Resistor - 1.2 Megohm - 1/2 W.
R213	181-0155	Resistor - 1.5 Megohm - 1/2 W.
R253, R254	181-0475	Resistor - 4.7 Megohm - 1/2 W.

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION
R106	181-0156	Resistor - 15 Megohm - 1/2 W.

R267		1 Megohm - 2 W.
R176	187-0013	Resistor - 68 Ohm - 10 W. - W.W.
	486-0007	Retainer - Filament Leads (H.V. Rectifiers)
	554-0024	Ring - Bearing (1-504-2 only)
	554-0025	Ring - Bushing (1-504-2 only)
	554-0021	Ring - Tube Socket Cap (H.V. Rectifiers)
	551-1007	Screw - 4-40 x 2-1/2" (Hor. Scan Transformer)
	551-0018	Screw - 6-32 x 5/32" Special (1-504-2 only)
	493-0031	Shaft - UHF Drive (1-504-2 only)
	486-0008	Shield - Corona - Resistor
	482-0007	Shield - Tube (7 Prong Miniature)
	417-0002	Socket - 1 Prong (Speaker)
	414-0006	Socket - 3 Prong - Yoke Connecting
	417-0014	Socket - 5 Prong - Hor. Scan and H.V. Connector
	412-0015	Socket - 7 Prong - Miniature
	412-0020	Socket - 7 Prong - Miniature With Base
	412-0006	Socket - 8 Prong - Octal
	412-0022	Socket - 8 Prong - Octal - H.V. Assembly
	412-0018	Socket - 8 Prong - Octal - Shock Mounted
	412-0021	Socket - 9 Prong - Miniature
	412-0021	Socket - 9 Prong - Miniature (Damper Tube)
	558-0006	Spacer (1-504-2 only)
	558-0005	Spacer - H.V. Assembly Mounting
	558-0003	Spacer - Shock Mounted Socket
	539-0503	Speaker - 5" P.M. (200 Models)
	539-0602	Speaker - 6-1/2" P.M. (105 Models)
	496-0080	Spring - Picture Tube Grounding
T53	143-0023	Transformer - Audio Output
T61	241-0007	Transformer - Horizontal Scanning Assembly
T55	119-0003	Transformer - IF - Video
T56	119-0004	Transformer - IF - Video
T57	119-0005	Transformer - IF - Video
T58	126-0001	Transformer - IF - Video (Output)
T50	141-0024	Transformer - Power - 117 V. - 60 Cycle
T52	128-0008	Transformer - Sound Discriminator
T59	242-0002	Transformer - Vertical Oscillator
T60	241-0068	Transformer - Vertical Scanning
V20, V21		Tube - 1B3GT
V31		Tube - 6AF4 (1-504-2)
V14		Tube - 6AH4GT
V30		Tube - 6AN4 (1-504-2)
V9, V15		Tube - 6AL5
V8		Tube - 6AU6
V10		Tube - 6AV6
V1		Tube - 6BC5
V17		Tube - 6BQ6GT
V13		Tube - 6C4
V3, V4, V5, V6		Tube - 6CB6
V16		Tube - 6SN7GT
V19		Tube - 6V3
V2		Tube - 6X8
V11		Tube - 6Y6G
V12, V24		Tube - 12AU7
V7		Tube - 12BY7
V23		Tube - 17YP4
V18		Tube - 40A1
	323-0030	Tuner Unit Assembly - VHF (With Tubes and UHF Drive Components)
	323-0021	Tuner Unit - UHF (With Tubes) (1-504-2 only)
	323-0027	Tuner Unit - VHF (With Tubes) (Less UHF Drive Components)
	553-4010	Washer - H.V. Ceramic Insulator Mounting
L66, L67	100-0009	Yoke - Deflection - Horizontal
L64, L65		Vertical

REVISED REPAIR PARTS LIST

CHASSIS 1-508-1, 1-508-2

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION
	582-0015	Antenna - UHF [illegible]-508-[illegible] Models)
	714-0011	Bezel - 21" Rectangular (172, 178 Models)
	714-0010	Bezel - 21" Rectangular (175 Models)
	714-0012	Bezel - 21" Rectangular (176, 177 Models)
	822-0002	Board - Mounting (H. V. Assembly)
	480-0001	Board - Terminal - HaloLighting Transformer
	486-0005	Button - Corona - H. V. Power Supply
	417-0019	Cable and Socket - Picture Tube
	926-0009	Cam and Screw Assembly (1-508-2)
	483-0018	Cap - Tube Socket (H. V. Rectifiers)
C102, C143, C146, C148	168-0008N	Capacitor - Ceramic - 4.7 Mmfd. - 500 V.
C100, C145, C147	166-0010P	Capacitor - Ceramic - 10 Mmfd. - 500 V.
C140	166-0043P	Capacitor - Ceramic - 43 Mmfd. - 500 V.
C104	166-0047N	Capacitor - Ceramic - 47 Mmfd. - 500 V.
C265	174-0068	Capacitor - Ceramic - 68 Mmfd. - 2,000 V.
C126, C141	166-0270N	Capacitor - Ceramic - 270 Mmfd. - 500 V.
C106	166-0330	Capacitor - Ceramic - 330 Mmfd. - 500 V.
C270, C271	169-0015	Capacitor - Ceramic - 500 Mmfd. - 20,000 V.
C181, C182, C183, C184, C200	166-1000D	Capacitor - Ceramic - .001 Mfd. - 500 V.
C262	166-1000P	Capacitor - Ceramic - .001 Mfd. - 500 V.
C101, C103, C105, C124, C125, C127, C128, C129, C130, C132, C133, C134, C135, C136, C137, C138, C139, C142, C144, C150, C185, C186, C260	166-4700D	Capacitor - Ceramic - .0047 Mfd. - 500 V.
C110, C123	161-1001	Capacitor - Electrolytic - 2 Mfd. - 50 V.
C215	161-1010	Capacitor - Electrolytic - 10 Mfd. - 500 V.
C263	161-4006	Capacitor - Electrolytic - 10 Mfd. - 100 V.
C115		10 Mfd. - 400 V.
C179		20 Mfd. - 400 V.
C114		25 Mfd. - 25 V.
C175	161-2004	Capacitor - Electrolytic - 40 Mfd. - 400 V.
C177		- 80 Mfd. - 400 V.
C176	161-3012	Capacitor - Electrolytic - 40 Mfd. - 200 V.
C178		- 80 Mfd. - 200 V.
C214		100 Mfd. - 50 V.
C112, C252, C257	163-0100	Capacitor - Mica - 100 Mmfd. - 500 V.
C107, C212, C217, C261	163-0680	Capacitor - Mica - 680 Mmfd. - 500 V.
C209	162-0621	Capacitor - Paper - .001 Mfd. - 600 V.
C201, C208, C213	162-06233	Capacitor - Paper - .0033 Mfd. - 600 V.
C116, C199, C202, C250, C251	162-06247	Capacitor - Paper - .0047 Mfd. - 600 V.
C108, C111, C113, C204, C216, C259	162-0611	Capacitor - Paper - .01 Mfd. - 600 V.
C121	162-02147	Capacitor - Paper - .047 Mfd. - 200 V.
C122, C131, C149, C180, C253	162-0202	Capacitor - Paper - .22 Mfd. - 200 V.
C256	162-0402	Capacitor - Paper - .22 Mfd. - 400 V.
C218	160-[illegible]322	Capacitor - Paper - Molded - 220 Mmfd. - 1,000 V.
C258	160-06222	Capacitor - Paper - Molded - .0022 Mfd. - 600 V.
C268	160-06133	Capacitor - Paper - Molded - .033 Mfd. - 600 V.
C203, C211, C266	160-04147	Capacitor - Paper - Molded - .047 Mfd. - 400 V.
C210, C255, C269	160-0601	Capacitor - Paper - Molded - .1 Mfd. - 600 V.
C264	160-02022	Capacitor - Paper - Molded - .22 Mfd. - 200 V.
C267	160-06022	Capacitor - Paper - Molded - .22 Mfd. - 600 V.
C254	169-0010	Capacitor - Polystyrene - .015 Mfd. - 400 V.
C109	190-0006	Capacitor - Resistor Combination - Tone Compensating .01 Mfd.
R107		47,000 Ohm - 1/2 W.
C205	190-0007	Capacitor - Resistor Combination - Integrator Plate .002 Mfd.
C206		.005 Mfd.
C207		.005 Mfd.
R213		8,200 Ohm - 1/2 W.
R214		8,200 Ohm - 1/2 W.
R212		22,000 Ohm - 1/2 W.
L50	145-0006	Choke - Filter - B+ (+330 V.)
L51	145-0002	Choke - Filter - B+ (+125 V.)
L52	147-0014	Choke - Heater
	487-0022	Clamp - Bearing (1-508-2)
	196-0007	Clip and Lead Assembly - Damper Cathode and Horizontal Output Plate
	196-0010	Clip and Lead Assembly - H. V. Rectifier Plate
	487-0019	Clip - Cold Cathode Tube Mounting
	487-0008	Clip - Fuse
	487-0020	Clip - Glass Mounting - Top
	487-0004	Clip - IF Transformer Mounting
L56, L70, L71	118-0010	Coil - Filter
L67	133-0002	Coil - Horizontal Linearity
L68	132-0002	Coil - Horizontal Size
L54	115-0001	Coil - Link Shunt
L57, L58	131-2010	Coil - Peaking - Dual
L59, L60	131-2007	Coil - Peaking - Dual
L69	146-0005	Coil - Ringing
L61, L62	130-0001	Coil - Trap - 4.5 Mc.
L55	118-0011	Coil - Trap - IF Cathode
L53	119-0002	Coil - Tuner Coupling
	196-0014	Connector - Anode and Lead Assembly
R202	153-0009	Control - AGC
R106, R163	157-0019	Control - Brightness, Volume and On-Off
R49	153-0015	Control - HaloLight
R222	153-0014	Control - Height
R263	153-0007	Control - Horizontal Drive
R155	153-3007	Control - Picture (Contrast)
R215	153-0018	Control - Vertical Hold
R227	153-3011	Control - Vertical Linearity
	195-0008	Cord and Receptacle Assembly (178 Models)
	195-0001	Cord - Line
	760-0036	Cover - Interlock Assembly (Includes Line Cord) 172 Models

	760-0032	Cover - Interlock Assembly (Includes Line Cord) 175 Models
	760-0033	Cover - Interlock Assembly (Includes Line Cord) 176 Models
	760-0034	Cover - Interlock Assembly (Includes Line Cord) 177 Models
	760-0035	Cover - Interlock Assembly (Includes Line Cord) 178 Models
	722-0027	Dial - UHF (1-508-2 Models)
	722-0028	Dial - UHF - Dummy (1-508-1 Models)
		Detector - Crystal Diode 1N105
	339-0035	Drum and Shaft Assembly - VHF Tuner
	191-0014	Fuse - 1/2 Amp. - 250 V. - Slow Blow
	484-0013	Gear and Hub Assembly (1-508-2)
	710-0009	Glass - Picture Window
	486-0006	Insulator - Ceramic - Horizontal Scan and H. V. Assembly
	486-0009	Insulator - Tube Socket Cap
	818-0008	Jewel - TV (172, 177, 178 Models)
	740-0029	Knob - Fine Tuning
	744-0021	Knob - Halo Control
	744-0023	Knob - Inner - Brightness
	743-0023	Knob - Outer and Dial Assembly
	744-0022	Knob - Outer - Volume and On-Off
	611-0047	Lamp - #47
	715-0009	Lens - Bezel
	400-00[illegible]	Magnet - Focus and Centering Unit
	400-0013	Magnet - Ion Trap
	400-0016	Magnet - Pin Cushion Corrector
	716-0003	Mask - 21"
	818-0004	Nameplate - Sylvania
	552-0001	Nut - #8-32 Wing - Yoke Mounting
	488-0002	Pad - Rubber (Horizontal Scan Transformer Assembly)
	484-0014	Pinion and Screws Assembly (1-508-2)
	415-0004	Plug - 1 Prong - Speaker
	415-0010	Plug - 2 Prong - HaloLight Connector
	415-0002	Plug - 2 Prong - Interlock
	415-0015	Plug - 4 Prong - HaloLight and Channel Indicator Light
	415-0011	Plug - 5 Prong - Horizontal Scan and H. V. Connector
	494-0008	Pulley and Sleeve Assembly (1-508-2)
R179, R267	189-0007	Resistor - 4.3 Ohm - 1/2 W. - W. W.
R114, R132, R138, R144	181-0470	Resistor - 47 Ohm - 1/2 W.
R101, R266, R268	181-0101	Resistor - 100 Ohm - 1/2 W.
R105	181-0271	Resistor - 270 Ohm - 1/2 W.
R148, R211, R254	181-0331	Resistor - 330 Ohm - 1/2 W.
R229, R230	181-0561	Resistor - 560 Ohm - 1/2 W.
R102, R130, R134, R136, R140, R142, R146, R149, R151, R257, R275	181-0102	Resistor - 1,000 Ohm - 1/2 W.
R141, R147	181-0152	Resistor - 1,500 Ohm - 1/2 W.
R129, R135	181-0272	Resistor - 2,700 Ohm - 1/2 W.
R152	181-0332	Resistor - 3,300 Ohm - 1/2 W.
R153, R159	181-0392	Resistor - 3,900 Ohm - 1/2 W.
R264	181-0472	Resistor - 4,700 Ohm - 1/2 W.
R133, R139, R145	181-0682	Resistor - 6,800 Ohm - 1/2 W.
R154, R255	181-0822	Resistor - 8,200 Ohm - 1/2 W.
R150, R204, R206, R209	181-0103	Resistor - 10,000 Ohm - 1/2 W.
R228	181-01235	Resistor - 12,000 Ohm - 1/2 W. - 5%
R207	181-0123	Resistor - 12,000 Ohm - 1/2 W.
R156	181-0153	Resistor - 15,000 Ohm - 1/2 W.
R143	181-0183	Resistor - 18,000 Ohm - 1/2 W.
R104, R260	181-0223	Resistor - 22,000 Ohm - 1/2 W.
R200, R203, R217	181-0333	Resistor - 33,000 Ohm - 1/2 W.
R100, R103	181-0473	Resistor - 47,000 Ohm - 1/2 W.
R128, R137	181-0563	Resistor - 56,000 Ohm - 1/2 W.
R109	181-0683	Resistor - 68,000 Ohm - 1/2 W.
R262	181-0823	Resistor - 82,000 Ohm - 1/2 W.
R106, R131, R219, R251, R252	181-0104	Resistor - 100,000 Ohm - 1/2 W.
R261	181-0154	Resistor - 150,000 Ohm - 1/2 W.
R111, R175, R218, R225	181-0224	Resistor - 220,000 Ohm - 1/2 W.
R161, R164	181-0334	Resistor - 330,000 Ohm - 1/2 W.
R112, R160, R201, R221, R250, R259, R265	181-0474	Resistor - 470,000 Ohm - 1/2 W.
R205, R210, R220	181-0684	Resistor - 680,000 Ohm - 1/2 W.
R165, R253	181-0105	Resistor - 1.0 Megohm - 1/2 W.
R127	181-0155	Resistor - 1.5 Megohm - 1/2 W.
R216	181-0185	Resistor - 1.8 Megohm - 1/2 W.
R223	181-0225	Resistor - 2.2 Megohm - 1/2 W.
R162	181-0475	Resistor - 4.7 Megohm - 1/2 W.
R224	181-0106	Resistor - 10 Megohm - 1/2 W.
R110	181-0156	Resistor - 15 Megohm - 1/2 W.
R180	189-0029	Resistor - 4.7 Ohm - 1 W.
R113	182-0391	Resistor - 390 Ohm - 1 W.

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION
R226	182-0122	Resistor - 1,200 Ohm - 1 W.
R258	182-0153	Resistor - 15,000 Ohm - 1 W.
R199	182-0333	Resistor - 33,000 Ohm - 1 W.
R198	182-0364	Resistor - 360,000 Ohm - 1 W.
R271	183-0102	Resistor - 1,000 Ohm - 2 W.
R177, R178	183-0472	Resistor - 4,700 Ohm - 2 W.
R157, R158	183-0682	Resistor - 6,800 Ohm - 2 W.
R208	183-0153	Resistor - 15,000 Ohm - 2 W.
R269	183-0183	Resistor - 18,000 Ohm - 2 W.
R47, R48	189-0026	Resistor - 33,000 Ohm - 2 W.
R256	183-0333	Resistor - 33,000 Ohm - 2 W.
R270	183-0393	Resistor - 39,000 Ohm - 2 W.
	189-0024	Resistor Assembly - H. V. Power Supply
R272		1.0 Megohm - 2 W.
R273		1.0 Megohm - 2 W.
R274		1.0 Megohm - 2 W.
R115, R176	187-0005	Resistor - 2,000 Ohm - 5 W. - W. W.
R126	187-0012	Resistor - 3,300 Ohm - 5 W. - W. W.
	486-0007	Retainer - Filament Leads (H. V. Rectifier)
	554-0024	Ring - Bearing (1-508-2)
	554-0025	Ring - Bushing (1-508-2)
	554-0021	Ring - Tube Socket Cap (H. V. Rectifiers)
	551-1007	Screw - #4-40 x 2-1/2" (Horizontal Scan and H. V. Supply)
	551-0018	Screw - Special - VHF Tuner Unit Assembly (1-508-2)
	493-0031	Shaft - UHF Drive (1-508-2)
	486-0008	Shield - Corona - Resistor
	483-0019	Shield - Light
	482-0007	Shield - Tube (7 Prong Miniature)
	417-0002	Socket - 1 Prong (Speaker)
	414-0006	Socket - 3 Prong - Yoke Connecting
	413-0006	Socket - 4 Prong - Channel Indicator Light and HaloLighting
	417-0014	Socket - 5 Prong - Horizontal Scan and H. V. Connector
	412-0015	Socket - 7 Prong Miniature
	412-0020	Socket - 7 Prong Miniature with Base
	412-0006	Socket - 8 Prong Octal
	412-0022	Socket - 8 Prong Octal - H. V. Rectifiers
	412-0018	Socket - 8 Prong Octal - Shock Mounted
	412-0012	Socket - 9 Prong Miniature
	412-0021	Socket - 9 Prong Miniature - Damper Tube
	558-0005	Spacer - H. V. Assembly Mounting
	558-0003	Spacer - Shock Mounted Socket
	558-0006	Spacer - VHF Tuner Unit Assembly (1-508-2)
	539-0602	Speaker - 6-1/2" P. M. (175 Models)
	539-1004	Speaker - 10" P. M. (176 Models)
	539-1005	Speaker - 10" P. M. (172, 177 Models)
	539-1205	Speaker - 12" P. M. (178 Models)
	496-0079	Spring - Picture Tube Grounding
	339-0036	Spring - Retaining - VHF Tuner Drum
	495-0009	String - Drive Assembly (1-508-2)
L1, L2, L4, L5, L7	110-0002	Strip - Coil - VHF Tuner - Channel 2
"	110-0003	Channel 3
"	110-0004	Channel 4
"	110-0005	Channel 5

L1, L2, L4, L5	110-0001	40 Mc. IF Strip (1-508-2 only)
	577-0004	Switch Assembly - UHF - VHF (1-508-2)
T53	143-0022	Transformer - Audio Output
T30	141-0023	Transformer - HaloLighting
T62	128-0009	Transformer - Horizontal Discriminator
T63	241-0007	Transformer - Horizontal Scan
T51	120-0003	Transformer - IF Sound
T55	119-0003	Transformer - IF - Video
T56	119-0004	Transformer - IF - Video
T57	119-0005	Transformer - IF - Video
T58	126-0001	Transformer - IF - Video (Output)
T50	141-0021	Transformer - Power - 117 V. - 60 Cycle
T52	128-0008	Transformer - Sound Discriminator
T60	242-0002	Transformer - Vertical Oscillator
T61	241-0008	Transformer - Vertical Scanning
	611-2100	Tube - Cold Cathode - HaloLight
V24, V25		Tube - 1B3GT
V26, V27		Tube - 5U4G
V17		Tube - 6AH4GT
V10, V18		Tube - 6AL5
V8, V9, V13		Tube - 6AU6
V11		Tube - 6AV6
V1		Tube - 6BK7
V22		Tube - 6BQ6GT
V16		Tube - 6C4
V3, V4, V5, V6, V19		Tube - 6CB6
V2, V29, (1-508-2)		Tube - 6J6
V23		Tube - 6V3
V12		Tube - 6V6GT
V15, V20		Tube - 12AU7
V14		Tube - 12AX7
V7		Tube - 12BY7
V28		Tube - 21EP4A
V21		Tube - 40A1
	323-0019	Tuner Unit - UHF (with tubes) - 1-508-2
	323-0017	Tuner Unit - VHF (with tubes, less UHF drive components)
	323-0031	Tuner Unit - VHF (with tubes and 40 Mc. IF strip) - 1-508-2
	323-0026	Tuner Unit Assembly - VHF (with tubes and UHF drive components)
	553-4010	Washer - Neoprene - H. V. Ceramic Insulator Mounting
	554-0023	Washer - VHF Tuner Unit (1-508-2)
L65, L66	100-0009	Yoke - Deflection - Horizontal
L63, L64		Vertical

REVISED REPAIR PARTS LIST

CHASSIS 1-510-1, 1-510-2

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION
R225, R226	181-0561	Resistor - 560 Ohm - 1/2 W.

	743-0024	Knob - Outer and Dial Assembly (225 models)
	744-0022	Knob - Outer - Volume and On-Off
	715-0009	Lens - Bezel
	400-0014	Magnet - Focus and Centering Unit
	400-0013	Magnet - Ion Trap
	400-0016	Magnet - Pin Cushion Corrector
	716-0003	Mask - 21"
	818-0004	Nameplate - Sylvania
	552-0001	Nut - #8-32 Wing - Yoke Mounting
	552-0024	Nut - #8-32 - Speaker Mounting
	488-0002	Pad - Rubber (Hor. Scan Transformer Assembly)
	484-0014	Pinion and Screws Assembly (1-510-2 only)
	415-0004	Plug - 1 Prong - Speaker
	415-0002	Plug - 2 Prong - Interlock
	415-0011	Plug - 5 Prong - Hor. Scan and H.V. Connector
	494-0008	Pulley and Sleeve Assembly (1-510-2 only)
R111, R129, R134, R152	181-0470	Resistor - 47 Ohm - 1/2 W.
R101, R262, R263	181-0101	Resistor - 100 Ohm - 1/2 W.
R139	181-0181	Resistor - 180 Ohm - 1/2 W.
R143	181-0331	Resistor - 330 Ohm - 1/2 W.

CHASSIS 1-508-1 C04, C05, & 1-508-2 C00 CHASSIS 1-510-1 C05, & 1-510-2 C00

CHASSIS 1-508-1 C04, C05 & 1-508-2 C00

C110, 2 Mfd. capacitor and R109, 68M ohm resistor are now connected as shown in Figure 29 to eliminate a 4.5 Mc. harmonic interference in the picture. This revision is coded C04 in the 1-508-1 chassis, and is included in initial production of chassis 1-508-2.

Code change C05 for chassis 1-508-1 adds a shield that extends over the 3rd and 4th Video IF Amplifier tube sockets on the underside of the chassis in addition to the existing Video Detector circuit shield. Original production of chassis 1-508-2 incorporates this change.

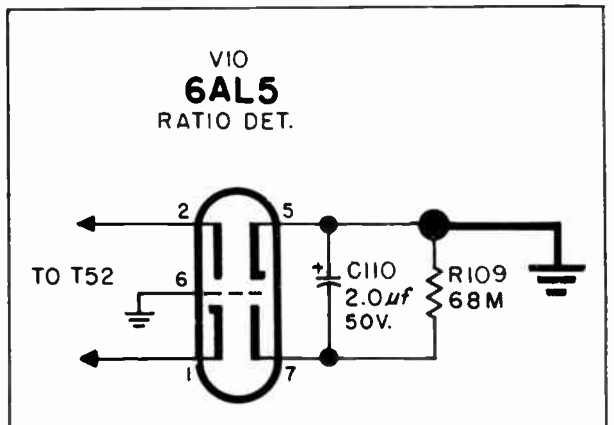

FIGURE 29 - PARTIAL SCHEMATIC CHASSIS 1-508-1 C04

CHASSIS 1-510-1 C05 & 1-510-2 C00

A shield over the 3rd and 4th Video IF Amplifier tube sockets on the underside of the chassis has been added to the 1-510-1 chassis. Used in addition to an existing shield over the Video Detector circuits, this change is coded C05. Initial production of chassis 1-510-2 will include this change.

To bring the 1-508-1, 1-508-2, 1-510-1 and 1-510-2 Parts Lists up to date, add the following item:

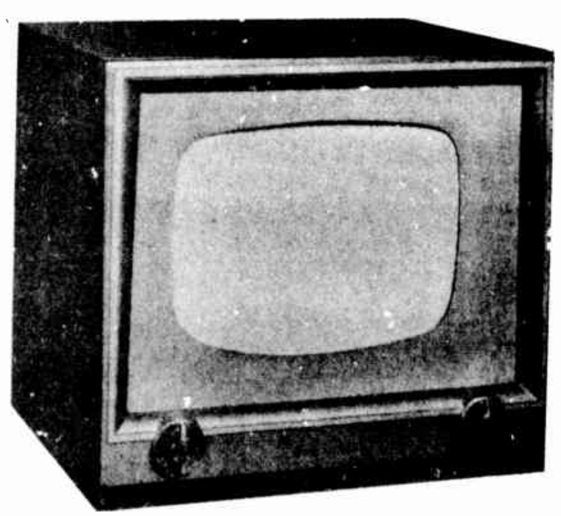
SERVICE PART NUMBER	DESCRIPTION
483-0024	Shield - Video IF

ADDITION OF CHASSIS 1-504-1, 1-504-2 & MODELS 105 B, 105 BU, 105 M, 105 MU

GENERAL DESCRIPTION

Sylvania television chassis 1-504-1 and 1-504-2 are the 17 inch versions of the 1-510-1 and 1-510-2 TV chassis, respectively. Electrically, the two chassis series are very similar; and all specifications, service, and adjustment information for the 1-510-1 and 1-510-2 apply to the 1-504-1 and 1-504-2 chassis, except as noted in this supplement.

Chassis 1-504-1 provides reception of the twelve commercial VHF television channels, 2 through 13 inclusive. In this chassis, provisions are made for the simple addition of a UHF tuner, thus permitting reception of channels 14 to 83 of the UHF band.



MODEL 105 M

Chassis 1-504-2 includes the UHF tuner and thus provides reception of all commercial television channels - VHF channels 2 through 13 and UHF channels 14 through 83.

The 105 series of models are direct viewing table model TV receivers varying only in cabinet finish and frequency range. Models 105B and 105M contain the 1-504-1 chassis and models 105BU and 105MU contain the 1-504-2 chassis. All 105 models feature a 6-1/2" P.M. speaker.

CHASSIS 1-508-1 C06 & 1-508-2 C01 — CHASSIS 1-510-1 C06

CHASSIS 1-508-1 C06 & 1-508-2 C01

Code change C06 for TV chassis 1-508-1 and code change C01 for chassis 1-508-2 revise the circuits of V14 12AX7 - the Sync Separator & AGC Rectifier, and V15 12AU7 - the Sync Amplifier & Clipper. The change, in effect, adds a "noise gate" action between the sync take-off circuit and the sync separator circuit, and functions to stabilize vertical and horizontal sync and AGC operation under interference conditions.

Component changes are as follows:

1. C203 - .047 Mfd. capacitor is changed from a 200 volt to a 400 volt capacitor. (A 400 volt replacement part is already called for in the Repair Parts List.)
2. R208 - 10M ohm resistor is changed to a 15M ohm resistor.
3. R199 - 33M ohm resistor is added and connected in parallel with R208.
4. R198 - 360M ohm resistor is added and connected between +560 volts and V14 and V15 as shown in the partial schematic.

Wiring revisions for these 1-508-1 and 1-508-2 code changes are illustrated in the partial schematic in Figure 30.

CHASSIS 1-510-1 C06

Code change C06 for TV chassis 1-510-1 changes the values of the following components in the sync separator circuit to improve sync stability.

1. C200 - 470 Mmfd. capacitor is changed to a 220 Mmfd. capacitor.
2. C201 - .047 Mfd. capacitor is replaced by a .01 Mfd. capacitor.
3. R200 - 2.2 Megohm resistor is replaced by a 470M resistor.
4. R201 - 220M resistor is changed to a 470M resistor.

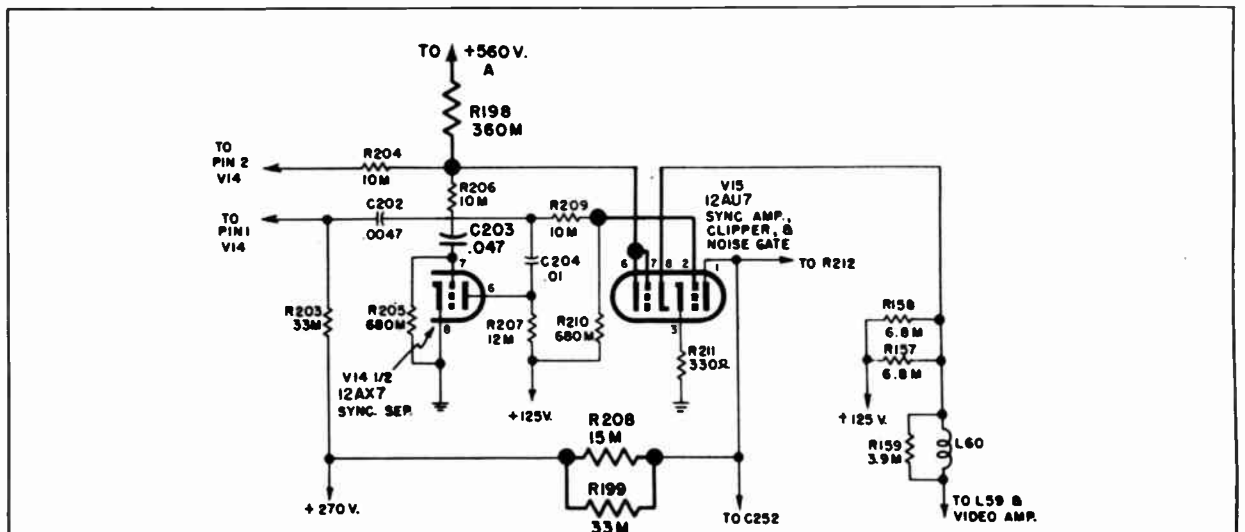


FIGURE 30 - PARTIAL SCHEMATIC OF CHASSIS 1-508-1 C06, 1-508-2 C01

SUPPLEMENTARY SERVICE INFORMATION

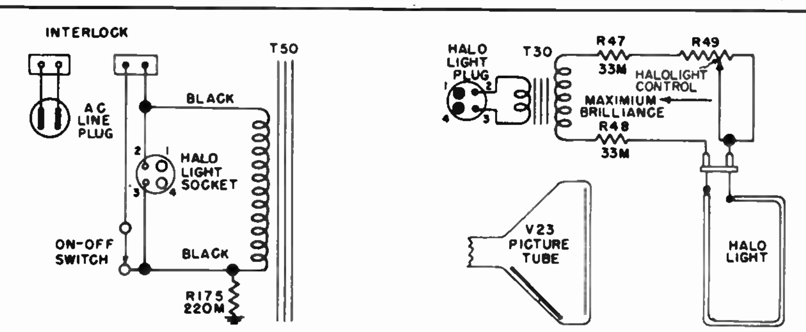
covering

CHASSIS	MODELS
1-504-1, -2, -4	ALL
1-508-1, -2, -3	ALL
1-510-1, -2, -4	ALL

ITEM 1 SUBJECT: Code Changes 1-504-1 C05 and 1-504-4 C01.
REASON: Reduction of Possible Microphonism.
DESCRIPTION: Horizontal Oscillator tube socket is changed from a rigid to a shock-mounted type and this stage, plus the Audio Output transformer T53 are physically relocated on the chassis.

ITEM 2 SUBJECT: Horizontal Hold and Picture Controls of Later Production Chassis.
REASON: To Facilitate Adjustment.
DESCRIPTION: New Horizontal Hold and Picture (Brightness) controls are incorporated in initial production of chassis 1-504-4, 1-510-4 and later production of chassis 1-504-1, 1-510-1 and 1-510-2. The new controls are provided with a knob to permit finger adjustment and are electrically equivalent to the old controls.

ITEM 3
SUBJECT: Models 270 and 271 Added to Line.
DESCRIPTION: Sylvania models in the 270 and 271 series are HaloLight versions of the 120 and 126 series, respectively - differing only by the addition of HaloLight.

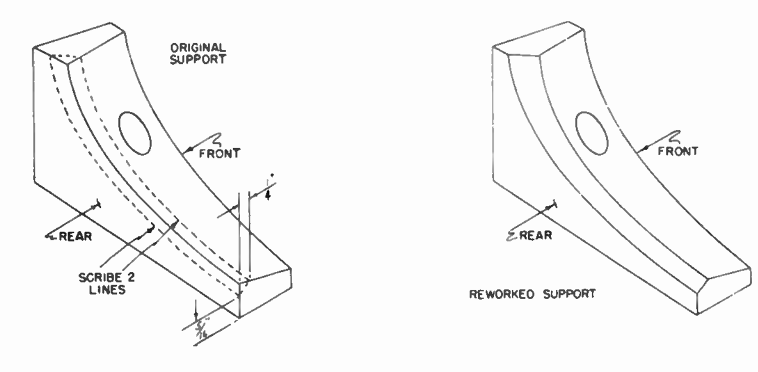


WIRING OF HALOLIGHT COMPONENTS IN 1-510 TV CHASSIS

ITEM 4 SUBJECT: The following components should be added to the parts list
REASON: To pickup parts changes noted in items 2 and 3.

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION
	480-0001	Board - Terminal - HaloLight Transformer
	487-0019	Clip - HaloLight Tube mounting
R49	153-0015	Control - HaloLight
R257	153-0021	Control - Horizontal Hold (knob-adjusted)
R159	153-0020	Control - Picture (Brightness) (knob-adjusted)
	744-0025	Knob - HaloLight Control
	740-0038	Knob - Horizontal Hold Control
	740-0039	Knob - Picture (Brightness) Control
	552-0031	Nut - HaloLight Control knob mounting
	415-0010	Plug - 2 Prong - HaloLight Tube connector
	415-0015	Plug - 4 Prong - HaloLight Transformer connector
R47, R48	189-0026	Resistor - 33,000 Ohm - 2 W.
	483-0019	Shield - Mask
	413-0006	Socket - 4 Prong - HaloLight Transformer connector
T30	141-0039	Transformer - HaloLight Power
	611-2100	Tube - Cold Cathode - HaloLight

ITEM 5 SUBJECT: Picture Tube Replacement on 1-508 and 1-510 Chassis.
REASON: Glass Weld on Later 21EP4A Tubes.
DESCRIPTION: A raised glass weld around the front face of later 21EP4A picture tubes will necessitate reworking both lower front picture tube supports on all 1-508 and 1-510 TV chassis not initially incorporating the beveled type support. When replacement with this type tube becomes necessary, grind or file off the rear edge of each support to clear this glass weld; thus, any irregular strain on the tube will be avoided when tightening the picture tube hold down strap.
First, remove the rubber pad on each support and then scribe two lines as shown. Grind or file down the support to these lines. Before the supports are reinstalled, cement the rubber pads to the reworked supports.



PICTURE TUBE SUPPORT - 1-508 AND 1-510 TV CHASSIS

Picture Tube Replacement

Use extreme caution at all times when handling these chassis. Carry 21" chassis by handle on rear tube mounting bracket and center of lower front lip of picture tube. Make sure hands are free of dirt and grease to prevent slipping on smooth surface of glass. Carry 17" chassis by the two side picture tube braces.

Alignment of the mask and picture tube should not be necessary after normal servicing of the chassis. However, if tube support members have been disturbed during picture tube replacement, observe the following procedure. See Picture Tube Installation illustrations.

1. Position tube with face tilted forward about 3 degrees with brackets in approximately normal position. Tighten the following just enough to permit further adjustment in cabinet.
   - (a) Tube holddown strap mounting nuts (21" chassis only).
   - (b) Holddown strap rod or rod nuts.
   - (c) Rear tube mounting rod nut.
   - (d) Yoke mounting wing nuts.
   - (e) Rear tube mounting bracket screws if previously loosened.
2. Carefully slide chassis into cabinet, replace and tighten chassis holddown screws.
3. Replace all knobs and electrical connections. If tuner does not center, loosen tuner rear bracket wing screws and shift tuner until knobs function freely. Retighten wing screws.
4. Carefully move tube in mountings to align face of tube with mask so that no space remains between them. Tighten mounting assemblies listed in step one completely. Make sure that equal tension is applied to tube holddown strap rod nuts.
5. Correctly position deflection yoke. Adjust ion trap, focus, centering and pincushion corrector magnets.

CAUTION: DURING ALL ABOVE OPERATIONS AVOID PUTTING ANY STRAIN ON NECK OF TUBE.

HaloLight Tube Replacement

1. Remove chassis from cabinet.
2. Unfasten the nuts that hold the bezel assembly to the cabinet and remove assembly.
3. Lay bezel assembly face down on a surface that will not scratch bezel.
4. Remove clamps holding light shield and mask to bezel.
5. Remove HaloLight plug, and transformer and control assembly.
6. Remove retaining channels and lift HaloLight shield from assembly.
7. Remove tape holding HaloLight tube mounting clips and leads to shield.
8. Remove vinyl tubing from ends of tube and carefully lift tube from shield.
9. Unsolder leads from tube.
10. To replace tube, follow the foregoing steps in reverse order. It is important that all tape removed from assembly be replaced to minimize dust collection on picture tube face.

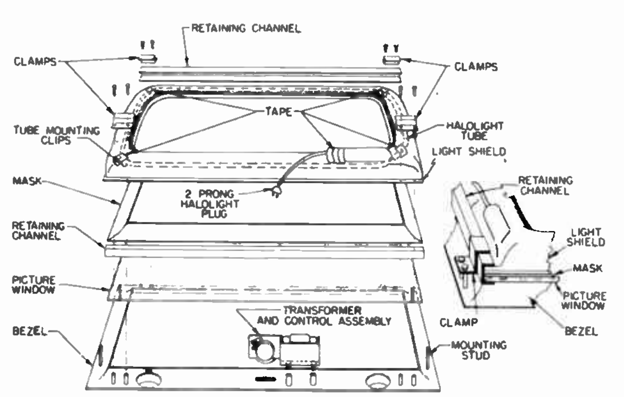
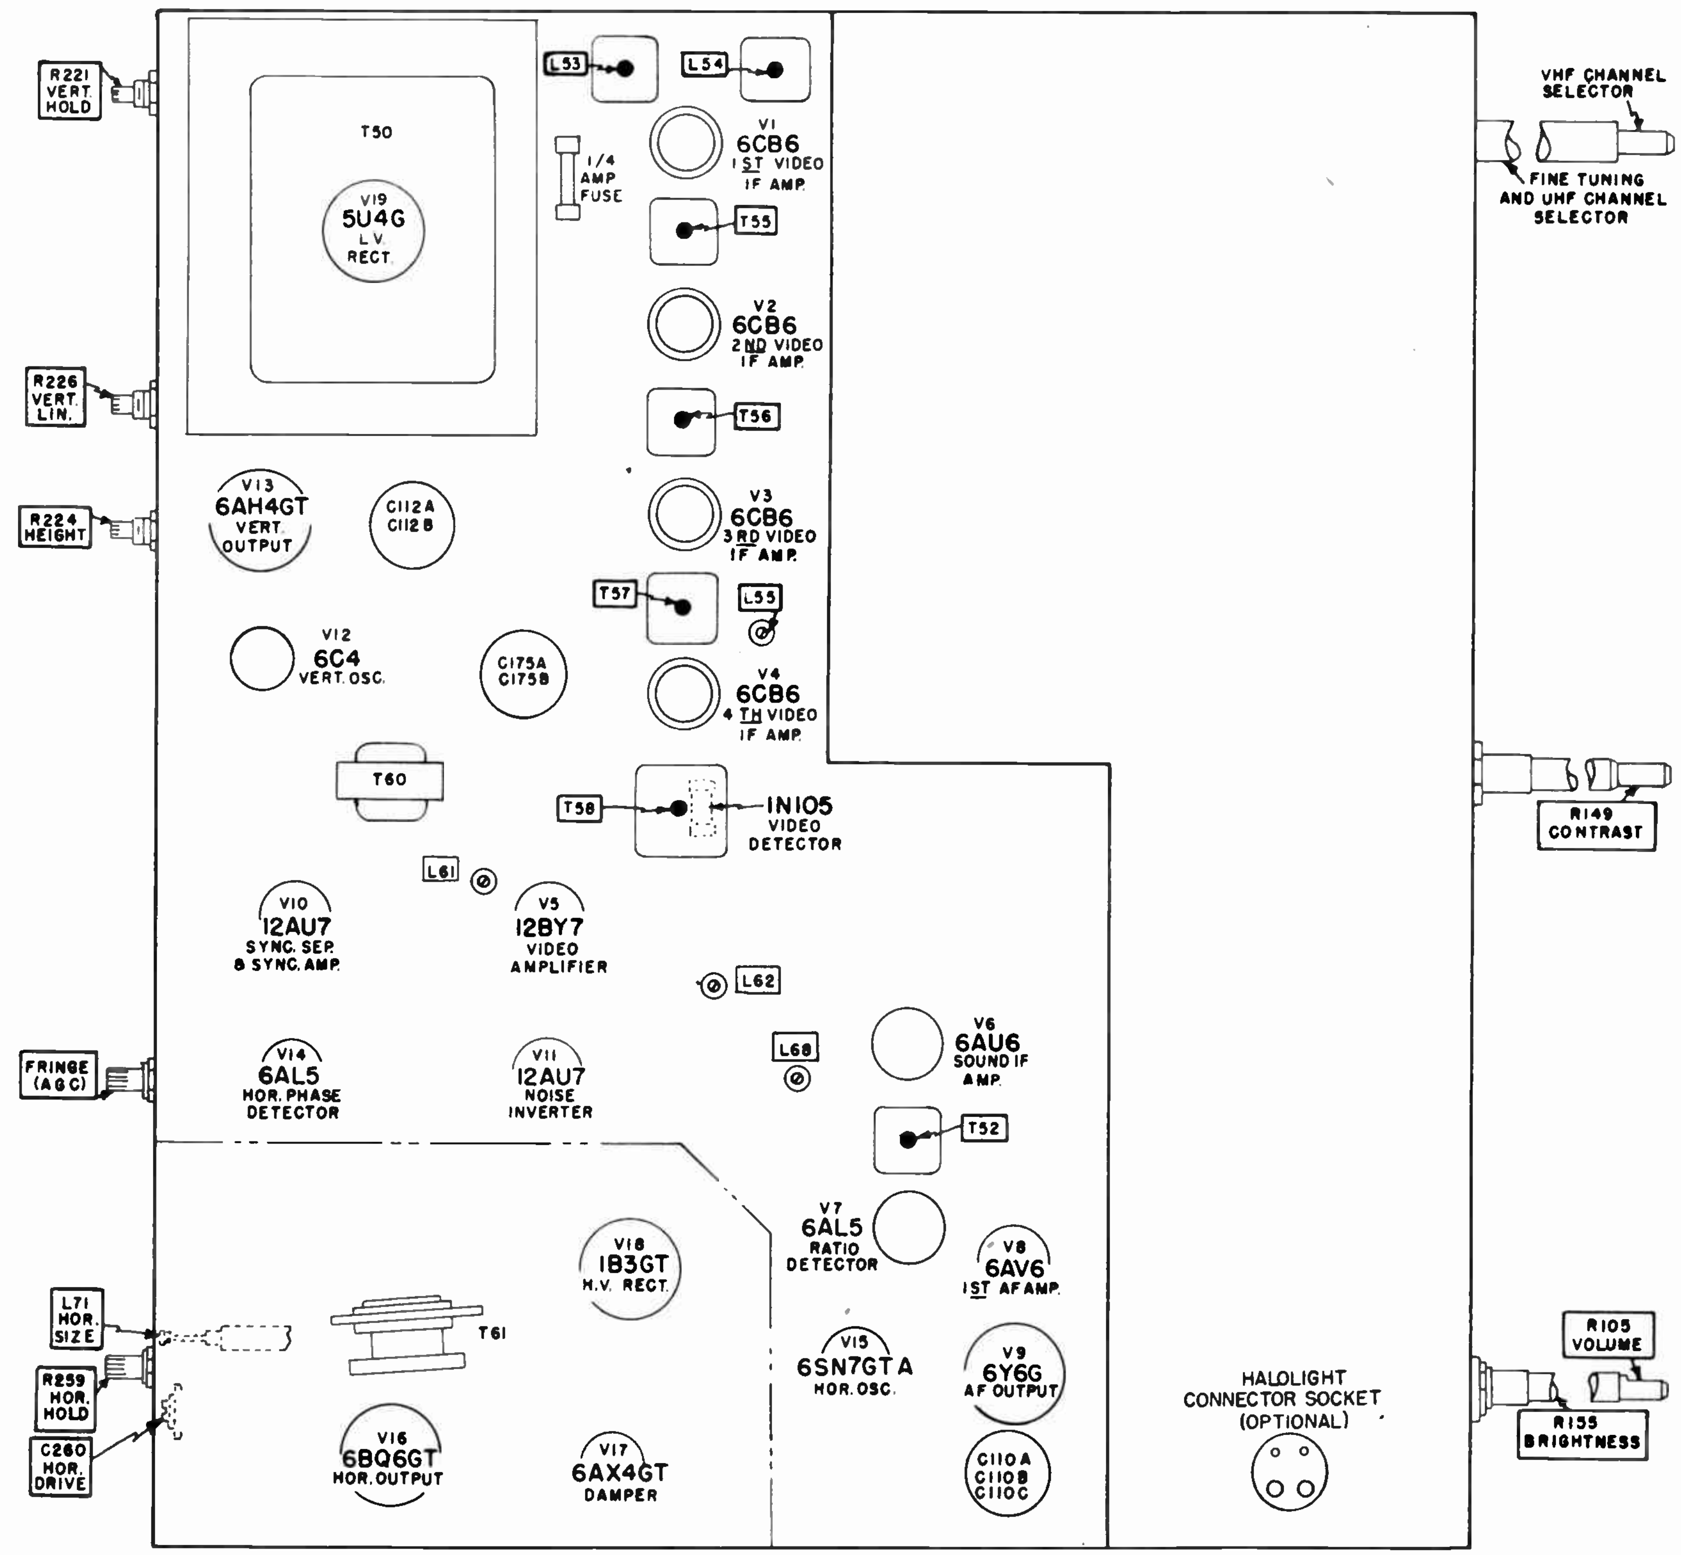
PICTURE TUBE INSTALLATION

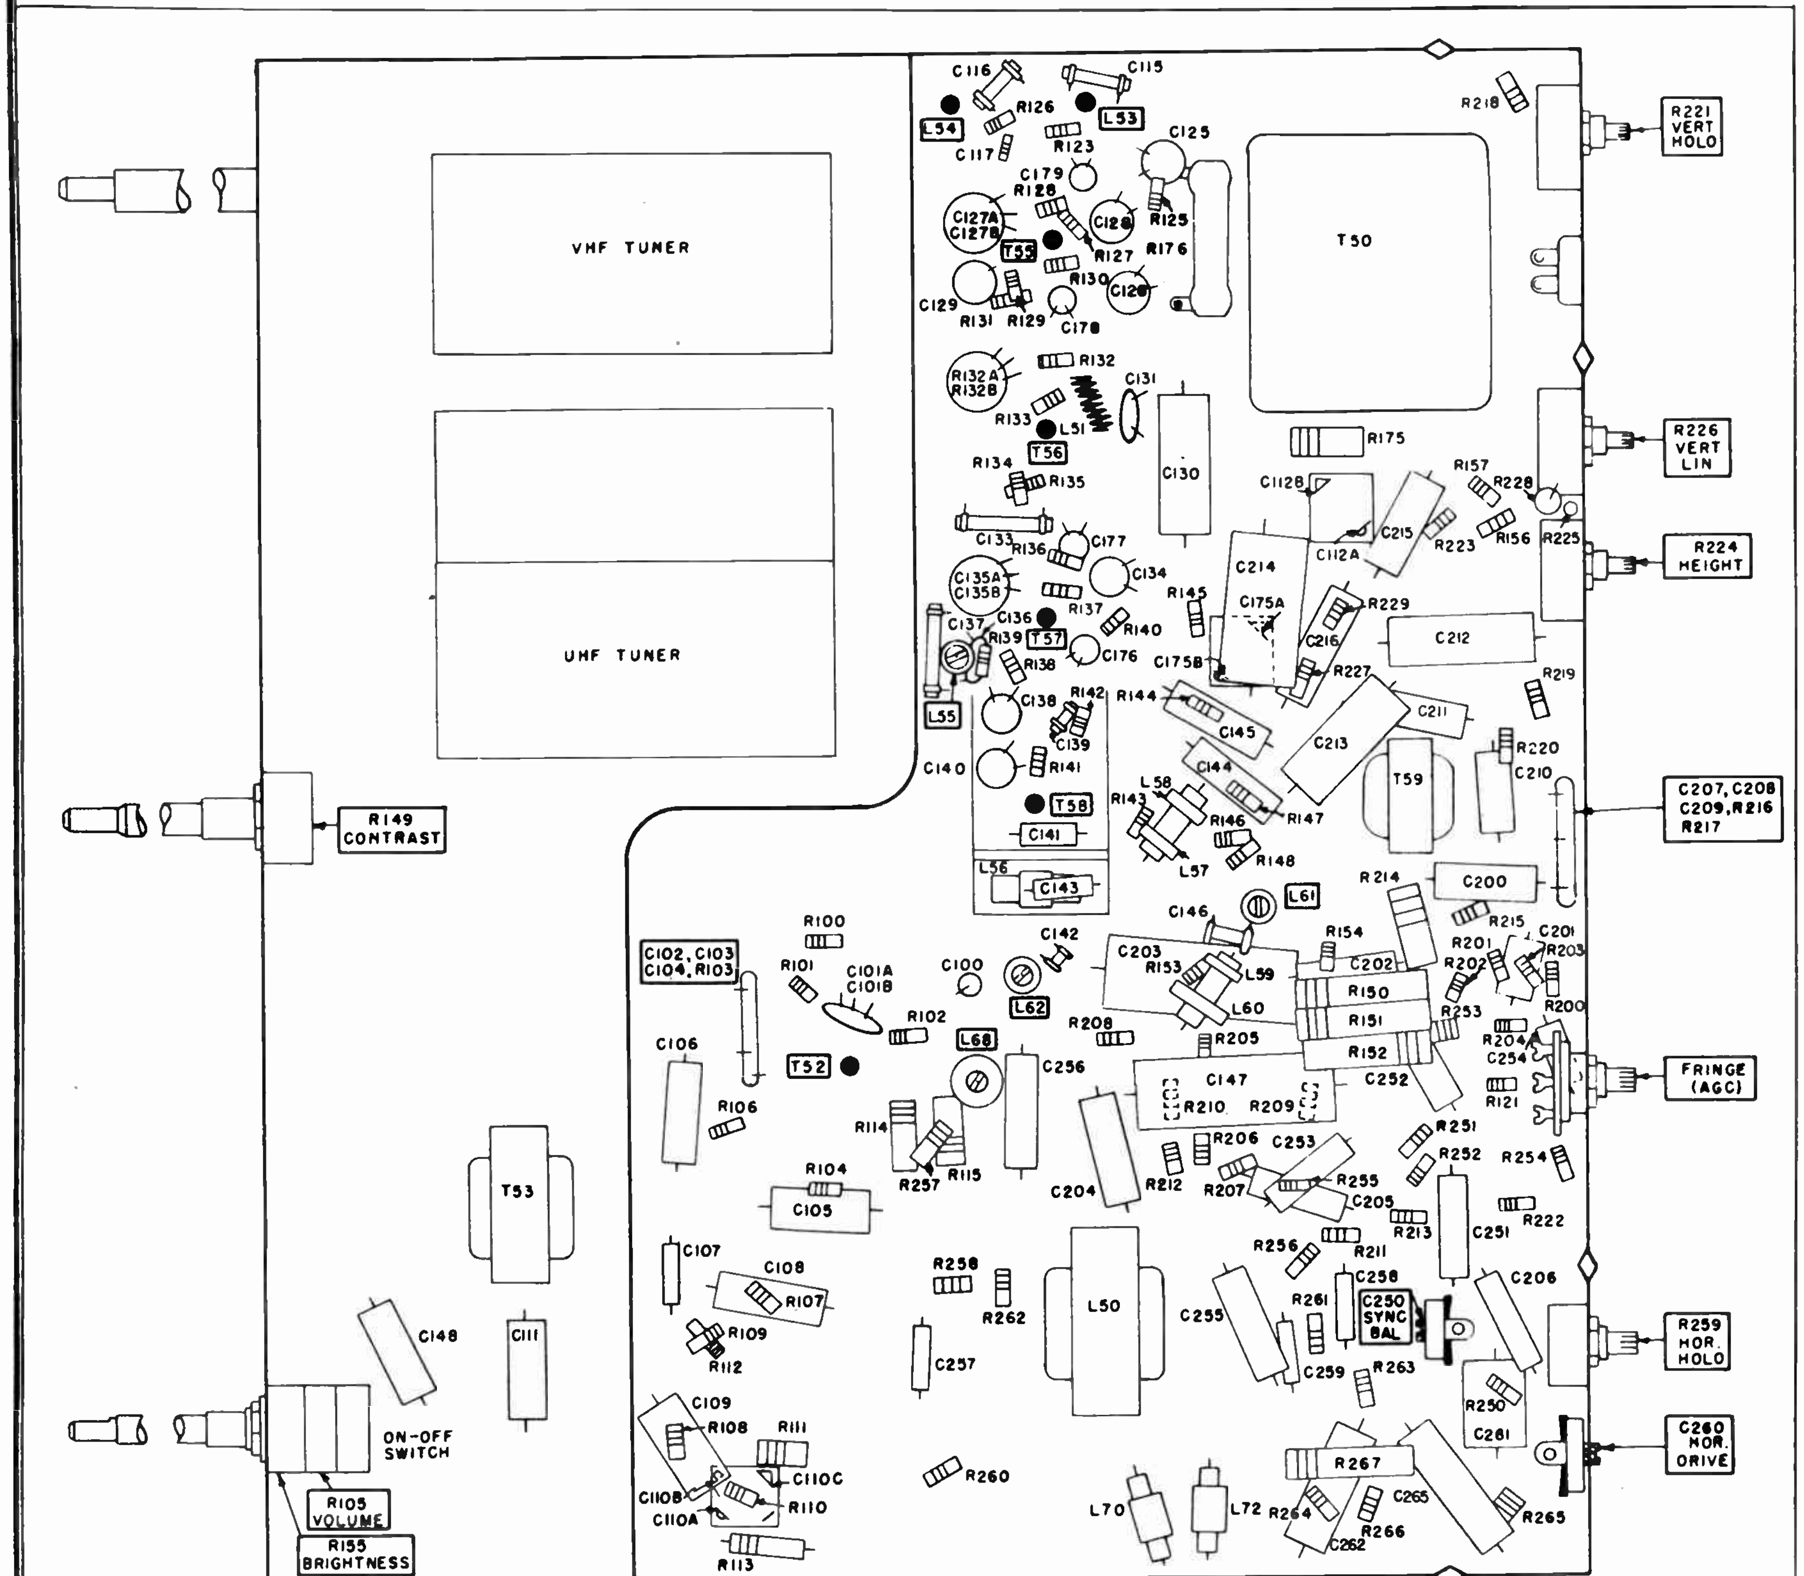


HALOLIGHT TUBE REMOVAL



TOP LAYOUT

NOTES ON VHF AND UHF TUNER DISASSEMBLY



BOTTOM LAYOUT

ALL G.I. VHF AND UHF CHASSIS
REMOVAL OF DRIVE ASSEMBLY

1. Code and unsolder leads to VHF tuner.
2. Remove dial cord.
3. Remove tuner from chassis by unscrewing one front and two rear (wing) mounting screws.
4. Remove drive components as shown in UHF Drive Assembly drawing.

NOTE: To remove bushing ring and bearing ring, first loosen set screws in pinion and then slide both pinion, and pulley and sleeve assembly toward tuner case; thus exposing front bearing ring. Remove bearing ring. Slide pulley and sleeve assembly off fine tuning sleeve to expose rear bushing ring. Remove bushing ring. Caution: Do not spread front bearing ring any more than is necessary to slide it off the front of the fine tuning sleeve.

When replacing the drive assembly, reverse the above procedure, making sure that the front bearing ring is fully seated in the end of the pulley and sleeve assembly. Proper action of the anti-backlash gears is obtained by holding one gear stationary and advancing the other one tooth, so that tension is applied to the springs. This must be done during assembly when engaging pinion and gear.

REMOVAL OF SWITCH ASSEMBLY

1. Code and unsolder leads to switch.
2. Remove switch and cam as shown in UHF Switch Assembly drawing.

After replacing the switch assembly, rotate the cam through its complete travel to insure that it clears all projections and that the switch operates freely. Note that when the cam is fully engaged (flat on shaft parallel to and facing bottom of tuner case) the switch is in the down (UHF) position.

TURRET DRUM REMOVAL - VHF TUNER

To remove turret drum from VHF tuner, it is not necessary to remove the tuner from the chassis. With the chassis lying on its side, remove the following items in the order given. See the VHF Tuner Layout illustration

1. Bottom cover plate.
2. Shaft retaining springs (front and rear).
3. Front bearing plate.

The drum should now be free of its mounting and readily removed from the tuner housing through the slots provided.

To replace the turret, reverse the above steps, exercising caution when inserting in housing to make sure that the rotor of the fine tuning capacitor meshes with the stator plates.

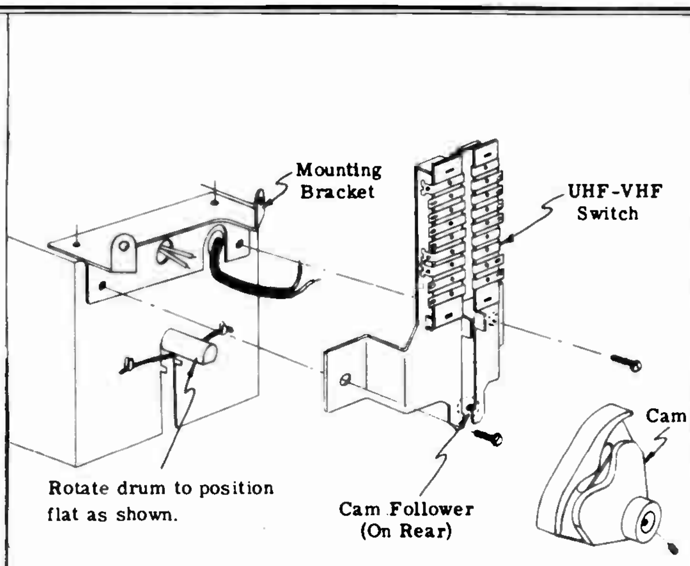
COIL STRIP REPLACEMENT - VHF TUNER

When viewed from the front, the coil strips are numbered consecutively from 2 to 13 in clockwise rotation with the 40 MC IF strip between numbers 13 and 2. The flat on the channel selector shaft (as viewed from the front) is in line with coil strip for channel 3.

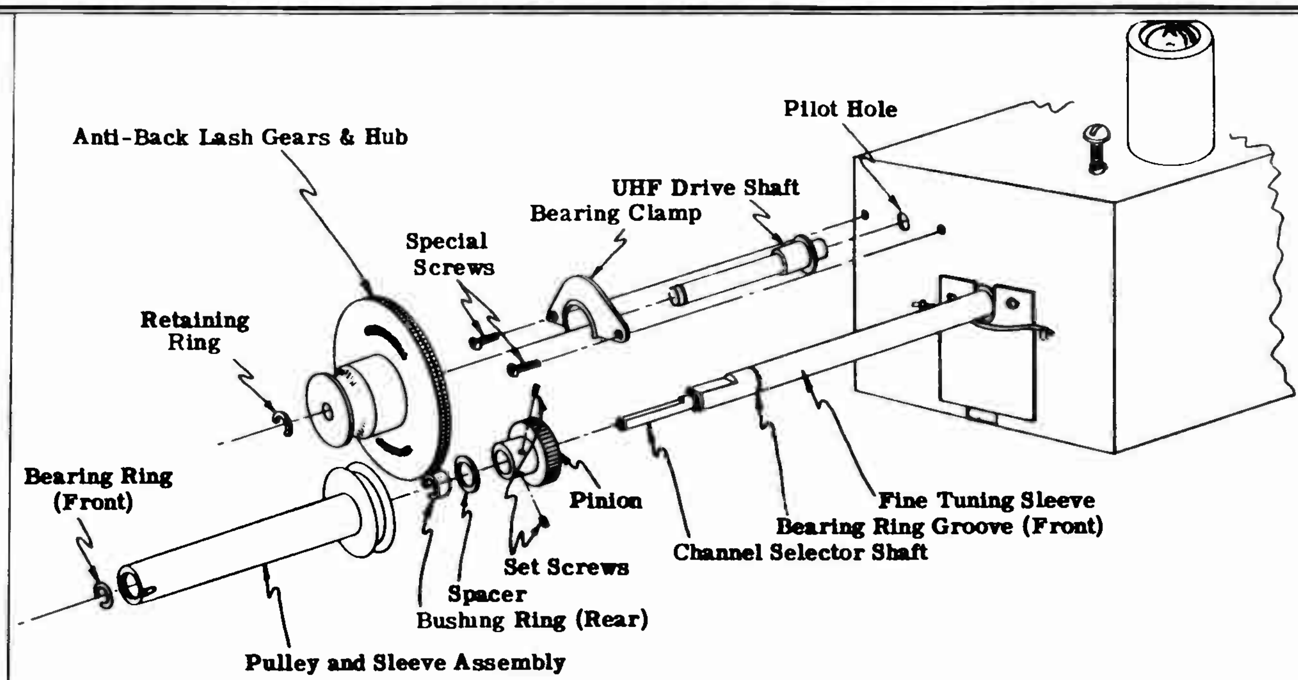
To remove and replace coil strips proceed as follows: (Note: It is not necessary to remove tuner from chassis).

1. Remove bottom cover plate.
2. Rotate channel selector shaft so that coil to be removed is in line with slots in end of tuner case.
3. Using needle nose pliers release boss on strip from detent plate as shown in the VHF Tuner Strip Removal illustration.
4. Carefully lift strip up and then free from rear retaining spring.

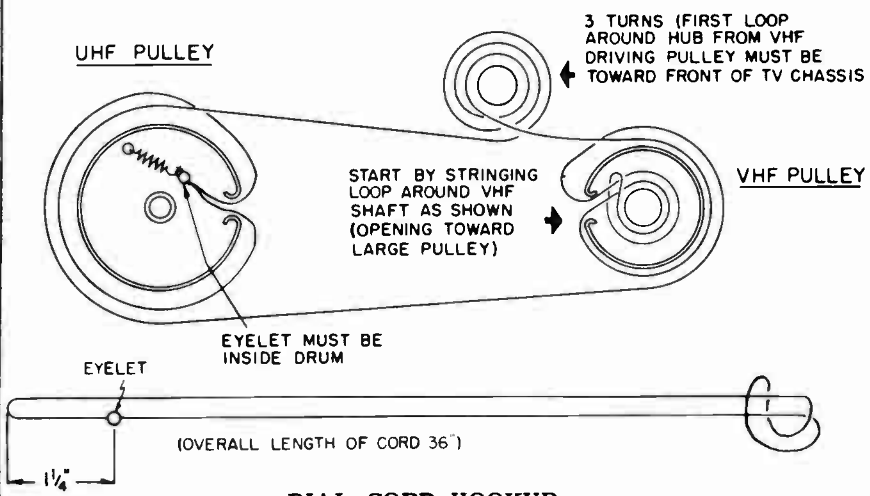
To replace strip, insert boss on rear of strip into retaining spring and apply only enough pressure against spring so that front boss clears detent plate. Push strip into position so that front boss engages slot in detent plate. Replace bottom cover.



UHF/VHF SWITCH ASSEMBLY



UHF DRIVE ASSEMBLY

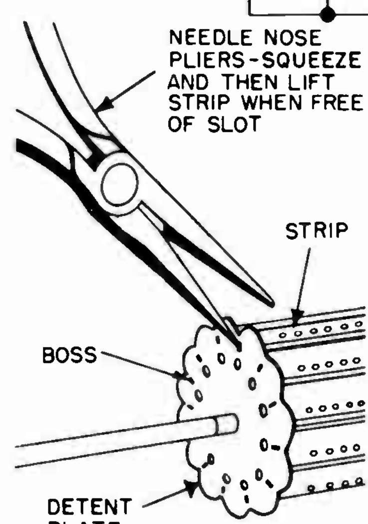


DIAL CORD HOOKUP

DIAL CORD STRINGING

In replacing the dial drive cord, position the eyelet in the cord as shown and proceed in the following order. See VHF/UHF Dial Cord Hookup drawing.

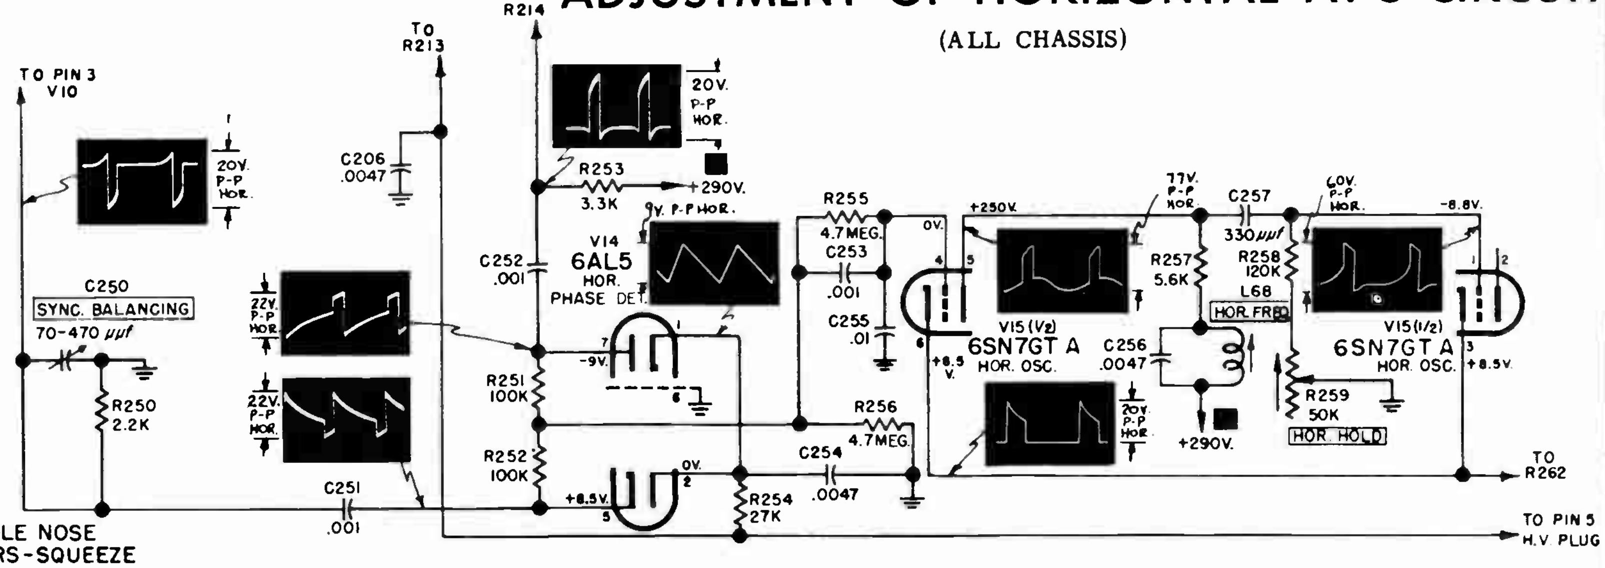
1. Loop around shaft of VHF pulley.
2. Loops around VHF pulley in each direction.
3. Three turns around hub on anti-backlash gear.
4. Loops around UHF pulley in each direction.
5. Feed eyelet through opening in UHF pulley and hook to spring.



VHF TUNER STRIP REMOVAL

ADJUSTMENT OF HORIZONTAL AFC CIRCUIT

(ALL CHASSIS)



1. Tune in air signal.
2. Short pin 2 of V14 Horizontal Phase Detector 6AL5 to chassis.
3. Connect VTVM from pin 4 of V15 Horizontal Oscillator 6SN7GT/A to chassis.
4. Adjust C250 for minimum voltage.
5. Remove VTVM from circuit.
6. With Horizontal Hold control in mechanical center position, adjust L68 Horizontal Frequency adjustment screw until picture moves back and forth across screen with blanking bar vertical.
7. Remove short from pin 2 of V14 Horizontal Phase Detector 6AL5.
8. With Contrast control in extreme counterclockwise position, rotate Horizontal Hold control until picture locks in and appears normal.
9. Advance Contrast control to normal position and check Horizontal Hold control on all available channels. A slight readjustment of Horizontal hold control may be necessary.

UHF TUNER ALIGNMENT

CHASSIS 1-514-4; CHASSIS 1-520-4; CHASSIS 1-520-8

Notes on VHF Tuner Alignment

Observe the following general procedure for connecting equipment for VHF tuner alignment setups.

1. The detector circuits should be constructed to maintain leads as short as possible.

2. Use shielded leads where indicated to minimize hum and synchronous voltage pickup.

3. The single pole double throw "scope switch" should be located at the vertical input terminal of the scope. This switching arrangement will permit observation of either the IF response or the overall RF response.

4. Use very loose coupling for the marker generators to prevent any affect on tuner response. A turn or two of wire around the points indicated in the tuner alignment setup should be sufficient.

5. Disconnect the primary winding of T55 by unsoldering lead from plate (pin 5) of 6CB6 1st Video IF Amplifier. Connect 330 ohm resistor in place of primary winding.

6. During tuner alignment, remove the 2nd Video IF Amplifier tube - V2 - 6CB6, to prevent coupling back from the receiver IF system.

7. In all of the following tests the oscilloscope vertical gain should be as close to maximum setting as possible, consistent with hum and synchronous voltage interference limitations. This precaution will permit the use of low levels from RF Sweep Generator thereby increasing visibility of IF and RF markers.

The Fine Tuning control on all chassis should be set to mid-capacity as follows:

1. On 1-514-3, 1-514-4, 1-520-3, 1-520-4 and 1-520-8 chassis, orient Fine Tuning Shaft as shown in VHF Tuner Layout illustration.

2. On 1-514-1, 1-520-1 and 1-520-7 chassis, set the Fine Tuning variable capacitor plates to halfmeshed position.

PRELIMINARY INSTRUCTIONS

1. Allow receiver to warm up before performing UHF alignment.
2. Check Video IF bandpass response as outlined in step 2 of "Video IF Alignment". Leave detector circuit connected for use in UHF tuner alignment.
3. When the bandpass adjustments have been checked, switch VHF tuner to "UHF" position and proceed with UHF alignment as indicated in the following paragraphs.

OUTPUT CIRCUIT ALIGNMENT

1. Apply 43.25 MC sweep (10 MC sweep width) into Test Point on UHF tuner.
2. Apply 42.1 MC and 45.75 MC markers as shown in "VHF Tuner Alignment Setup".
3. Adjust T25 on UHF tuner for response curve shown in Figure A.

PRESELECTOR ALIGNMENT

1. Inject 42.1 MC and 45.75 MC markers as shown in "VHF Tuner Alignment Setup".
2. Apply UHF sweep signal to UHF antenna terminals through a properly terminated output cable (matched to 300 Ohms) or through the matching pad shown in Figure B.
3. Tune UHF sweep generator and UHF tuner simultaneously across entire tuning range from 464 MC to 896 MC and observe response curve.
4. Adjust trimmers C37, C38 and C39 for best compromise on dip and tilt; if necessary, additional adjustment may be accomplished by bending the rotor plates slightly. Overall response curves should appear as in Figure C.

CAUTION - Do not attempt to correct for excessive tilt in overall UHF response curves by adjusting band pass circuit (L8, L53, L54). Readjustment of these circuits will adversely affect VHF reception of receiver.

5. Disconnect test equipment, remove 330 Ohm resistor and reconnect T55 into circuit.

OSCILLATOR ALIGNMENT

1. Apply UHF RF signal to UHF antenna terminals through a properly terminated output cable (matched to 300 Ohms) or through the matching pad in Figure B.
2. Connect DC VTVM across video detector load resistor R147 - 4.7K.
3. Turn UHF tuning shaft to extreme high frequency end of dial. At this point, UHF tuning capacitor plates are fully unmeshed.
4. Adjust C28 on UHF tuner for maximum reading on VTVM.

VHF TUNER ALIGNMENT

CHASSIS 1-514-3, 1-514-4, 1-520-3, 1-520-4, 1-520-8

STEP	TUNER SET TO CHANNEL	SWEEP (10 MC)	GENERATORS IF MARKER	RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS
1.	4	Channel 4 69 MC	———	67.25 MC (P) 71.75 MC (S)	RF Output	C12, C6, C4, then C9*(wire loop near C12)	30% deviation permissible as shown below: 	Connect 300 ohm resistor across Antenna Leads. Pass-band should be somewhat broader than that with antenna circuit operating and with picture marker inside.
2.	13	Channel 13 213 MC	———	211.25 MC (P) 215.75 MC (S)	RF Output	See "Comments" and note at bottom of chart.		Interstage band width is adjusted by C9*. When proper band width cannot be obtained by adjustment of C9, it may be necessary to move C8* and C10* slightly farther apart. Overall band width also depends on antenna selectivity. Interstage band width should be adjusted so that proper overall band width occurs with antenna circuit aligned.
3.	4	Channel 4 69 MC	———	67.25 MC (P) 71.75 MC (S)	RF Output	C4 Antenna Trimmer		Obtain symmetrical response curve.
4.	Set VHF Tuner between any two channels. Connect 43.25 MC Sweep Generator sweeping 10 MC through hole in VHF tuner cover to pin 5 of 6J6 Osc. - Mixer. Inject 42.1 MC and 45.75 MC Markers.					L8, then L54 and L53 (both on TV Chassis)		Adjust for symmetrical overcoupled, double peaked response curve with markers on peaks. L8 and L54 determine position of 45.75 MC marker. L53 determines band width or position of 42.1 MC marker.
5.	4	Channel 4 69 MC	45.75 MC	71.75 MC	IF Output	C15		If C15 cannot be made to track properly, L7 is out of adjustment and must be tuned as in step 8.
6.	2	Channel 2 57 MC	Alternate 42.1 MC and 45.75 MC or two Markers	55.25 MC (P) 59.75 MC (S)	IF Output	L7		Check RF Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels.
7.	3	Channel 3 63 MC		61.25 MC (P) 65.75 MC (S)		L7		
8.	4	Channel 4 69 MC		67.25 MC (P) 71.75 MC (S)		L7		
9.	5	Channel 5 79 MC		77.25 MC (P) 81.75 MC (S)		L7		
10.	6	Channel 6 85 MC		83.25 MC (P) 87.75 MC (S)		L7		
11.	7	Channel 7 177 MC		175.25 MC (P) 179.75 MC (S)		L7		See note below.
12.	8	Channel 8 183 MC		181.25 MC (P) 185.75 MC (S)		L7		
13.	9	Channel 9 189 MC		187.25 MC (P) 191.75 MC (S)		L7		Same as for steps 6 through 18.

NOTE: If one or more coil strips cannot be made to track properly, replace strips. Do not peak coils to correct passbands. If Channels 7 and 8 show deep valley, adjust L9 as in step 18. If this does not correct conditions change the 6J6 Oscillator/Mixer tube. This will necessitate repetition of steps 1 through 5.

STEP	TUNER SET TO CHANNEL	SWEEP (10 MC)	IF MARKER	RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS
14.	10	Channel 10 195 MC	Alternate 42.1 MC and 45.75 MC or two Markers	193.25 MC (P) 197.75 MC (S)	IF Output	L7	See curves above	Check Passbands on each channel. If necessary slightly readjust C15, C12, C6 and C4 for satisfactory compromise on all channels.
15.	11	Channel 11 201 MC		199.25 MC (P) 203.75 MC (S)		L7		
16.	12	Channel 12 207 MC		205.25 MC (P) 209.75 MC (S)		L7		
17.	13	Channel 13 213 MC		211.25 MC (P) 215.75 MC (S)		L7		
18.	13	Channel 13 213 MC		211.25 MC (P) 215.75 MC (S)		See "Comments" and note at bottom of chart.		A valley that is too deep can be flattened by adjusting turns spacing on L9*.

*In order to adjust C8, C9, C10 and L9, it is necessary to remove side cover of tuner. Remove side cover screw by means of a small wrench and slide cover out between chassis and tuner. The above mentioned adjustments may then be made through hole in chassis opposite tuner. Replace cover when adjustments are complete.

VHF TUNER ALIGNMENT

CHASSIS 1-514-1; 1-520-1; 1-520-7

HIGH BAND OSCILLATOR ALIGNMENT

STEP	TUNER SET TO CHANNEL	GENERATORS SWEEP (10 MC)	GENERATORS IF MARKER	GENERATORS RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS
1.	13	Channel 13 213 MC	45.75 MC	211.25 MC	RF Output	L9 Screw	See Curves below	Coincide Markers as shown.

NOTE: Refer to VHF Tuner Layout and VHF Tuner Schematic for location of specified Wafers, Coil Increments, and Screw Adjustments mentioned in the following step. As Channels 12 to 7 and 5 to 2 are aligned by means of consecutive coil increments, the aligned increments that precede must not be disturbed.

STEP	TUNER SET TO CHANNEL	SWEEP (10 MC)	IF MARKER	RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS
2.	12	Channel 12 207 MC	45.75 MC	205.25 MC	RF Output	Channel 12 Loop on Wafer 5	TYPICAL CURVES  Note: Curves may not be symmetrical until RF alignment is complete.	Squeeze or spread loop for Channel 12 on Wafer 5 to coincide Markers as shown.
3.	11	Channel 11 201 MC	45.75 MC	199.25 MC	RF Output	Channel 11 Loop on Wafer 5		Adjust each succeeding Hi-Channel Loop on Wafer 5 (steps 3 to 7) to coincide appropriate Markers for that Channel.
4.	10	Channel 10 195 MC	45.75 MC	193.25 MC	RF Output	Channel 10 Loop on Wafer 5		
5.	9	Channel 9 189 MC	45.75 MC	187.25 MC	RF Output	Channel 9 Loop on Wafer 5		
6.	8	Channel 8 183 MC	45.75 MC	181.25 MC	RF Output	Channel 8 Loop on Wafer 5		
7.	7	Channel 7 177 MC	45.75 MC	175.25 MC	RF Output	Channel 7 Loop on Wafer 5		

LOW BAND OSCILLATOR ALIGNMENT

STEP	TUNER SET TO CHANNEL	SWEEP (10 MC)	IF MARKER	RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS
8.	6	Channel 6 85 MC	45.75 MC	83.25 MC	RF Output	L11 Screw	See Curves above	Coincide Markers as shown.
9.	5	Channel 5 79 MC	45.75 MC	77.25 MC	RF Output	Channel 5 Coil on Wafer 5		Squeeze or spread turns of Channel 5 Coil on Wafer 5 to coincide Markers as shown.
10.	4	Channel 4 69 MC	45.75 MC	67.25 MC	RF Output	Channel 4 Coil on Wafer 5		Adjust each succeeding Lo-Channel Coil on Wafer 5 (steps 10 to 12) to coincide appropriate Markers for that Channel.
11.	3	Channel 3 63 MC	45.75 MC	61.25 MC	RF Output	Channel 3 Coil on Wafer 5		
12.	2	Channel 2 57 MC	45.75 MC	55.25 MC	RF Output	Channel 2 Coil on Wafer 5		

HIGH AND LOW BAND RF ALIGNMENT

STEP	TUNER SET TO CHANNEL	SWEEP (10 MC)	IF MARKER	RF MARKER	SCOPE SWITCH POSITION	ADJUST	ACCEPTABLE RESPONSE CURVES	COMMENTS
1.	13	Channel 13 213 MC	—	211.25 MC (P) 215.75 MC (S)	RF Output	L3, L7, L8 Screws		Adjust L3 for maximum mid-band height regardless of skirts. Adjust L7 for proper skirt figuring. Adjust L8 for flat top. Pix carrier must be at 100%; sound carrier may ride down 30%.
2.	13	Same as 1	45.75 MC and 42.1 MC		IF Output	T2 on Tuner and L54 on Main Chassis		Adjust for response curve shown.
3.	13	Same as 1	—	211.25 MC (P) 215.75 MC (S)	RF Output	L8 Screw		Touch up for flat top if necessary. There must not be more than 5% dip.
4.	12	Channel 12 207 MC	—	205.25 MC (P) 209.75 MC (S)	RF Output	Channel 12 Loops on Wafers 1, 3 and 4		Squeeze or spread loops for Channel 12 to acquire acceptable response curve. Loop on Wafer 1 adjusts mid-band amplitude; Loop on Wafer 3 adjusts skirt frequency; Loop on Wafer 4 adjusts for flat top. Align each succeeding channel (steps 5 to 14) adjusting inductances of appropriate loops or coils on Wafers 1, 3, and 4. Refer to VHF Tuner Schematic and Parts Layout for locations of specified loop increments. Picture and Sound carriers must remain on top of curve.
5.	11	Channel 11 201 MC	—	199.25 MC (P) 203.75 MC (S)	RF Output	Channel 11 Loops on Wafers 1, 3 and 4		
6.	10	Channel 10 195 MC	—	193.25 MC (P) 197.75 MC (S)	RF Output	Channel 10 Loops on Wafers 1, 3 and 4		
7.	9	Channel 9 189 MC	—	187.25 MC (P) 191.75 MC (S)	RF Output	Channel 9 Loops on Wafers 1, 3 and 4		
8.	8	Channel 8 183 MC	—	181.25 MC (P) 185.75 MC (S)	RF Output	Channel 8 Loops on Wafers 1, 3 and 4		
9.	7	Channel 7 177 MC	—	175.25 MC (P) 179.75 MC (S)	RF Output	Channel 7 Loops on Wafers 1, 3 and 4		
10.	6	Channel 6 85 MC	—	83.25 MC (P) 87.75 MC (S)	RF Output	Channel 6 Coils on Wafers 1, 3 and 4		
11.	5	Channel 5 79 MC	—	77.25 MC (P) 81.75 MC (S)	RF Output	Channel 5 Coils on Wafers 1, 3 and 4		
12.	4	Channel 4 69 MC	—	67.25 MC (P) 71.75 MC (S)	RF Output	Channel 4 Coils on Wafers 1, 3 and 4		
13.	3	Channel 3 63 MC	—	61.25 MC (P) 65.75 MC (S)	RF Output	Channel 3 Coils on Wafers 1, 3 and 4		
14.	2	Channel 2 57 MC	—	55.25 MC (P) 59.75 MC (S)	RF Output	Channel 2 Coils on Wafers 1, 3 and 4		

NOTE: As each Channel is aligned by adjustment of its inductance increments in the order listed in steps 4 to 14, care must be exercised not to disturb the aligned increments preceding the one being adjusted.

15.	Recheck all channels for flat top response curve, touching up L8 for Channel 13 and appropriate coil increments. Dip up to 30% is permissible for all channels. If bandwidth on any channel is insufficient after these adjustments, touch up by means of gimmick capacitors C5 and C10 near C6 and C11, respectively. Adjust these gimmicks by bending wires toward or away from C6 and C11.

VIDEO IF, 4.5MC TRAP AND SOUND ALIGNMENT PROCEDURES

PREALIGNMENT INSTRUCTIONS - READ CAREFULLY BEFORE ATTEMPTING ALIGNMENT.

1. Lay chassis on side with H. V. supply down for under-chassis adjustments.
2. Ground all test equipment unless otherwise stated.
3. Keep detector leads short.
4. Use proper non-metallic alignment tools for powdered iron cores with hex holes or slots. Metallic screw drivers may be used for cores adjusted by brass screws.
5. Receiver should warm up for approximately 15 minutes before alignment.
6. During Video IF Alignment, when indicated, raise shield on Oscillator/Mixer tube so ground contact is broken.
7. Set Fringe (AGC) switch to maximum counterclockwise position on 1-514-3, 1-514-4, 1-520-3, 1-520-4 and 1-520-8 chassis.

VIDEO IF ALIGNMENT

STEP	SIGNAL GENERATOR Connection	SIGNAL GENERATOR Freq.	SWEEP GENERATOR Connection	SWEEP GENERATOR Freq.	VTVM CONNECTION	OSCILLOSCOPE CONNECTION	ADJUST	OUTPUT READING	COMMENTS
1.	To raised tube shield on Osc. /Mix. tube.	39.75 MC			Across diode load resistor R147-4.7K.		L54 (Top Core)	Min.	Set VHF tuner to free channel. Apply -3V. between C130 - .22 Mfd. and chassis. Use sufficient output for satisfactory reading.
2.	CHASSIS 1-514-1, 1-520-1 AND 1-520-7 ONLY:								Remove AGC voltage. Disconnect T55 primary lead from pin 5 of V1 - 6CB6; connect 330 Ohm resistor in its place (from R128 - 1K to pin 5 of V1). Lower Osc./Mix. tube shield to normal position. On chassis 1-514-1 and 1-520-1 and -7, set VHF tuner to any free high channel; on chassis 1-514-3, 1-514-4, 1-520-3, 1-520-4 and 1-520-8, set VHF tuner between any two channels. L53 controls width of curve on 1-514-3, 1-514-4, 1-520-3, 1-520-4 and 1-520-8 chassis.
	Loosely couple marker to Looker Point "B" on VHF tuner.	42.1 & 45.75 MC	Looker Point "B" on VHF tuner.	43.25 MC 10 MC Sweep		Pin 5 of 1st Video IF Amp. thru detector circuit.	L54 (Bot. Core); T2 (VHF tuner)	Response curve shown in Fig. A.	
	CHASSIS 1-514-3, 1-514-4, 1-520-3, 1-520-4, 1-520-8 ONLY:								
	Loosely couple marker to pin 5, 6J6 thru hole in VHF tuner.	42.1 & 45.75 MC	Pin 5, 6J6 thru hole in VHF tuner.	43.25 MC 10 MC Sweep		Pin 5 of 1st Video IF Amp. thru detector circuit.	L54 (Bot. Core); L8 (VHF tuner); L53	Response curve shown in Fig. C.	
3.	Repeat step 2 adjustments until curve is flat with 42.1 MC and 45.75 MC markers on corners. REMOVE 330 OHM RESISTOR AND RECONNECT T55 before proceeding with step 4.								
4.	To raised tube shield on Osc. /Mix. tube.	41.25 MC			Across diode load resistor R147-4.7K.		L55 4th Video IF trap.	Min.	Set VHF tuner to free channel. Apply -3V. between C130 - .22 Mfd. and chassis. Use sufficient output for satisfactory reading.
5.	Same as 4	47.25 MC	———	——	Same as 4	———	T56 (Top Core)	Min.	Same as 4
6.	Same as 4	41.25 MC	———	——	Same as 4	———	T55 (Top Core)	Min.	Same as 4
7.	Same as 4	44.0 MC	———	——	Same as 4	———	T58	Max.	Same as 4. Reduce signal generator output to keep VTVM reading between 1 and 2 volts.
8.	Same as 4	42.0 MC	———	——	Same as 4	———	T57	Max.	Same as 7
9.	Same as 4	45.2 MC	———	——	Same as 4	———	T56 (Bot. Core)	Max.	Same as 7
10.	Same as 4	43.2 MC	———	——	Same as 4	———	T55 (Bot. Core)	Max.	Same as 7
11.	Repeat steps 4 to 6 inclusive.								
12.	Loosely couple marker to raised tube shield on Osc. /Mixer.	41.25 MC 42.1 MC 45.75 MC 47.25 MC	To raised tube shield on Osc. /Mixer tube.	43.25 MC 10 MC Sweep	———	Across diode load resistor R147 - 4.7K with 33K resistor in series with hot scope lead.	T58 T57 T56 (Bot. Core) T55 (Bot. Core)	Response Curve shown in Fig. B	Same as 4. Use low signal input and high scope gain. Retouch T58, T57, T56 and T55 adjustments slightly to obtain response curve shown.

415-0013	Plug - 3 Prong - Hor. Yoke Connector
415-0015	Plug - 4 Prong - HaloLight Connector
415-0011	Plug - 5 Prong - Hor. Scan Connector
494-0009	Pulley and Sleeve Assembly (1-514-4 Chassis)
494-0013	Pulley and Sleeve Assembly (1-520-4, -8 Chassis)
486-0007	Retainer - H.V. Rectifier Filament Leads
554-0024	Ring - Bearing (1-514-4, 1-520-4, -8 Chassis)
554-0025	Ring - Bushing (1-514-4, 1-520-4, -8 Chassis)
554-0028	Ring - Retaining ((1-514-4, 1-520-4, -8 Chassis)
554-0021	Ring - Tube Socket Cap (H.V. Rectifier)
551-5000	Screw - #8/32 Wing - VHF Tuner Unit Mounting
551-0018	Screw - Special (1-514-4, 1-520-4, -8 Chassis)
482-0007	Shield - 7 Prong Miniature Tube
417-0002	Socket - 1 Prong - Speaker
419-0007	Socket - 2 Prong - Vertical Yoke Connector
414-0006	Socket - 3 Prong - Hor. Yoke Connector
413-0006	Socket - 4 Prong - HaloLight Connector
417-0014	Socket - 5 Prong - Hor. Scan Connector
412-0015	Socket - 7 Prong - Miniature Tube
412-0026	Socket - 7 Prong - Miniature Tube (Vert. Osc.)
412-0020	Socket - 7 Prong - Miniature Tube (with base)
412-0006	Socket - 8 Prong - Octal Tube
412-0022	Socket - 3 Prong - Octal Tube (H.V. Rectifier)
412-0018	Socket - 8 Prong - Octal Tube - Shock Mounted
412-0012	Socket - 9 Prong - Miniature Tube
558-0005	Spacer - H.V. Assembly Mounting
558-0003	Spacer - Shock Mounted Tube Socket
558-0006	Spacer - Drive Assembly (1-514-4, 1-520-4, -8 Chassis)
496-0023	Spring - String Drive (1-514-4, 1-520-4, -8 Chassis)
496-0079	Spring - Picture Tube Grounding (1-520 Chassis)
496-0080	Spring - Picture Tube Grounding (1-514 Chassis)
495-0009	String Assembly - UHF Drive (1-514-4, 1-520-4, -8 Chassis)
553-4010	Washer - Neoprene - H.V. Insulator Mounting

MISCELLANEOUS CABINET PARTS

714-0024	Bezel Assembly (105-14 Models)
714-0023	Bezel Assembly (120-20 Models)
714-0025	Bezel Assembly (300 Models)
714-0022	Bezel Assembly (320 Models)
714-0021	Bezel Assembly (325, 326 Models)
715-0009	Bezel Lens (105-14, 120-20, 300 Models)
715-0010	Bezel Lens (320, 325, 326 Models)
487-0023	Clip - Bezel Mounting
487-0019	Clip - HaloLight Tube Mounting (326 Models)
760-0037	Cover - Interlock Assembly (Includes Line Cord) (105-14, 300 Models)
760-0051	Cover - Interlock Assembly (Includes Line Cord) (120-20 Models)
760-0047	Cover - Interlock Assembly (Includes Line Cord) (320 Models)
760-0050	Cover - Interlock Assembly (Includes Line Cord) (325 Models)
760-0052	Cover - Interlock Assembly (Includes Line Cord) (326 Models)
722-0027	Dial - UHF (1-514-4, 1-520-4, - 8 Models)
722-0028	Dial - UHF Dummy (1-514-1, - 3, 1-520-1, - 3, - 7 Models)
491-0016	Gasket - Tube Mask (17")
491-0017	Gasket - Tube Mask (21")
710-0011	Glass - Picture Window (17" Models)
710-0009	Glass - Picture Window (21" Models)
740-0045	Knob - Contrast
744-0025	Knob - HaloLight Control (326 Models)
740-0038	Knob - Horizontal Hold, Fringe (AGC) Switch
744-0023	Knob - Inner - Brightness
740-0029	Knob - Inner - Fine Tuning
743-0023	Knob - Outer and Dial Assembly (VHF Models, Except 300's)
743-0022	Knob - Outer and Dial Assembly (UHF/VHF Models)
743-0024	Knob - Outer and Dial Assembly (300B, M Models)
744-0022	Knob - Outer - Volume and On/Off
716-0005	Mask - 17" (1-514-1, -3, -4 Chassis)
716-0007	Mask - 21" (1-520-1, -3, -4 Chassis)
716-0003	Mask - 21" (1-520-7, -8 Models)
818-0004	Nameplate - Sylvania
552-0021	Nut - #6/32 - Speaker Mounting (300, 320 Models Only)
552-0024	Nut - #8/32 - Speaker Mounting
558-0007	Spacer - Dial
553-4011	Washer - Outer Knob

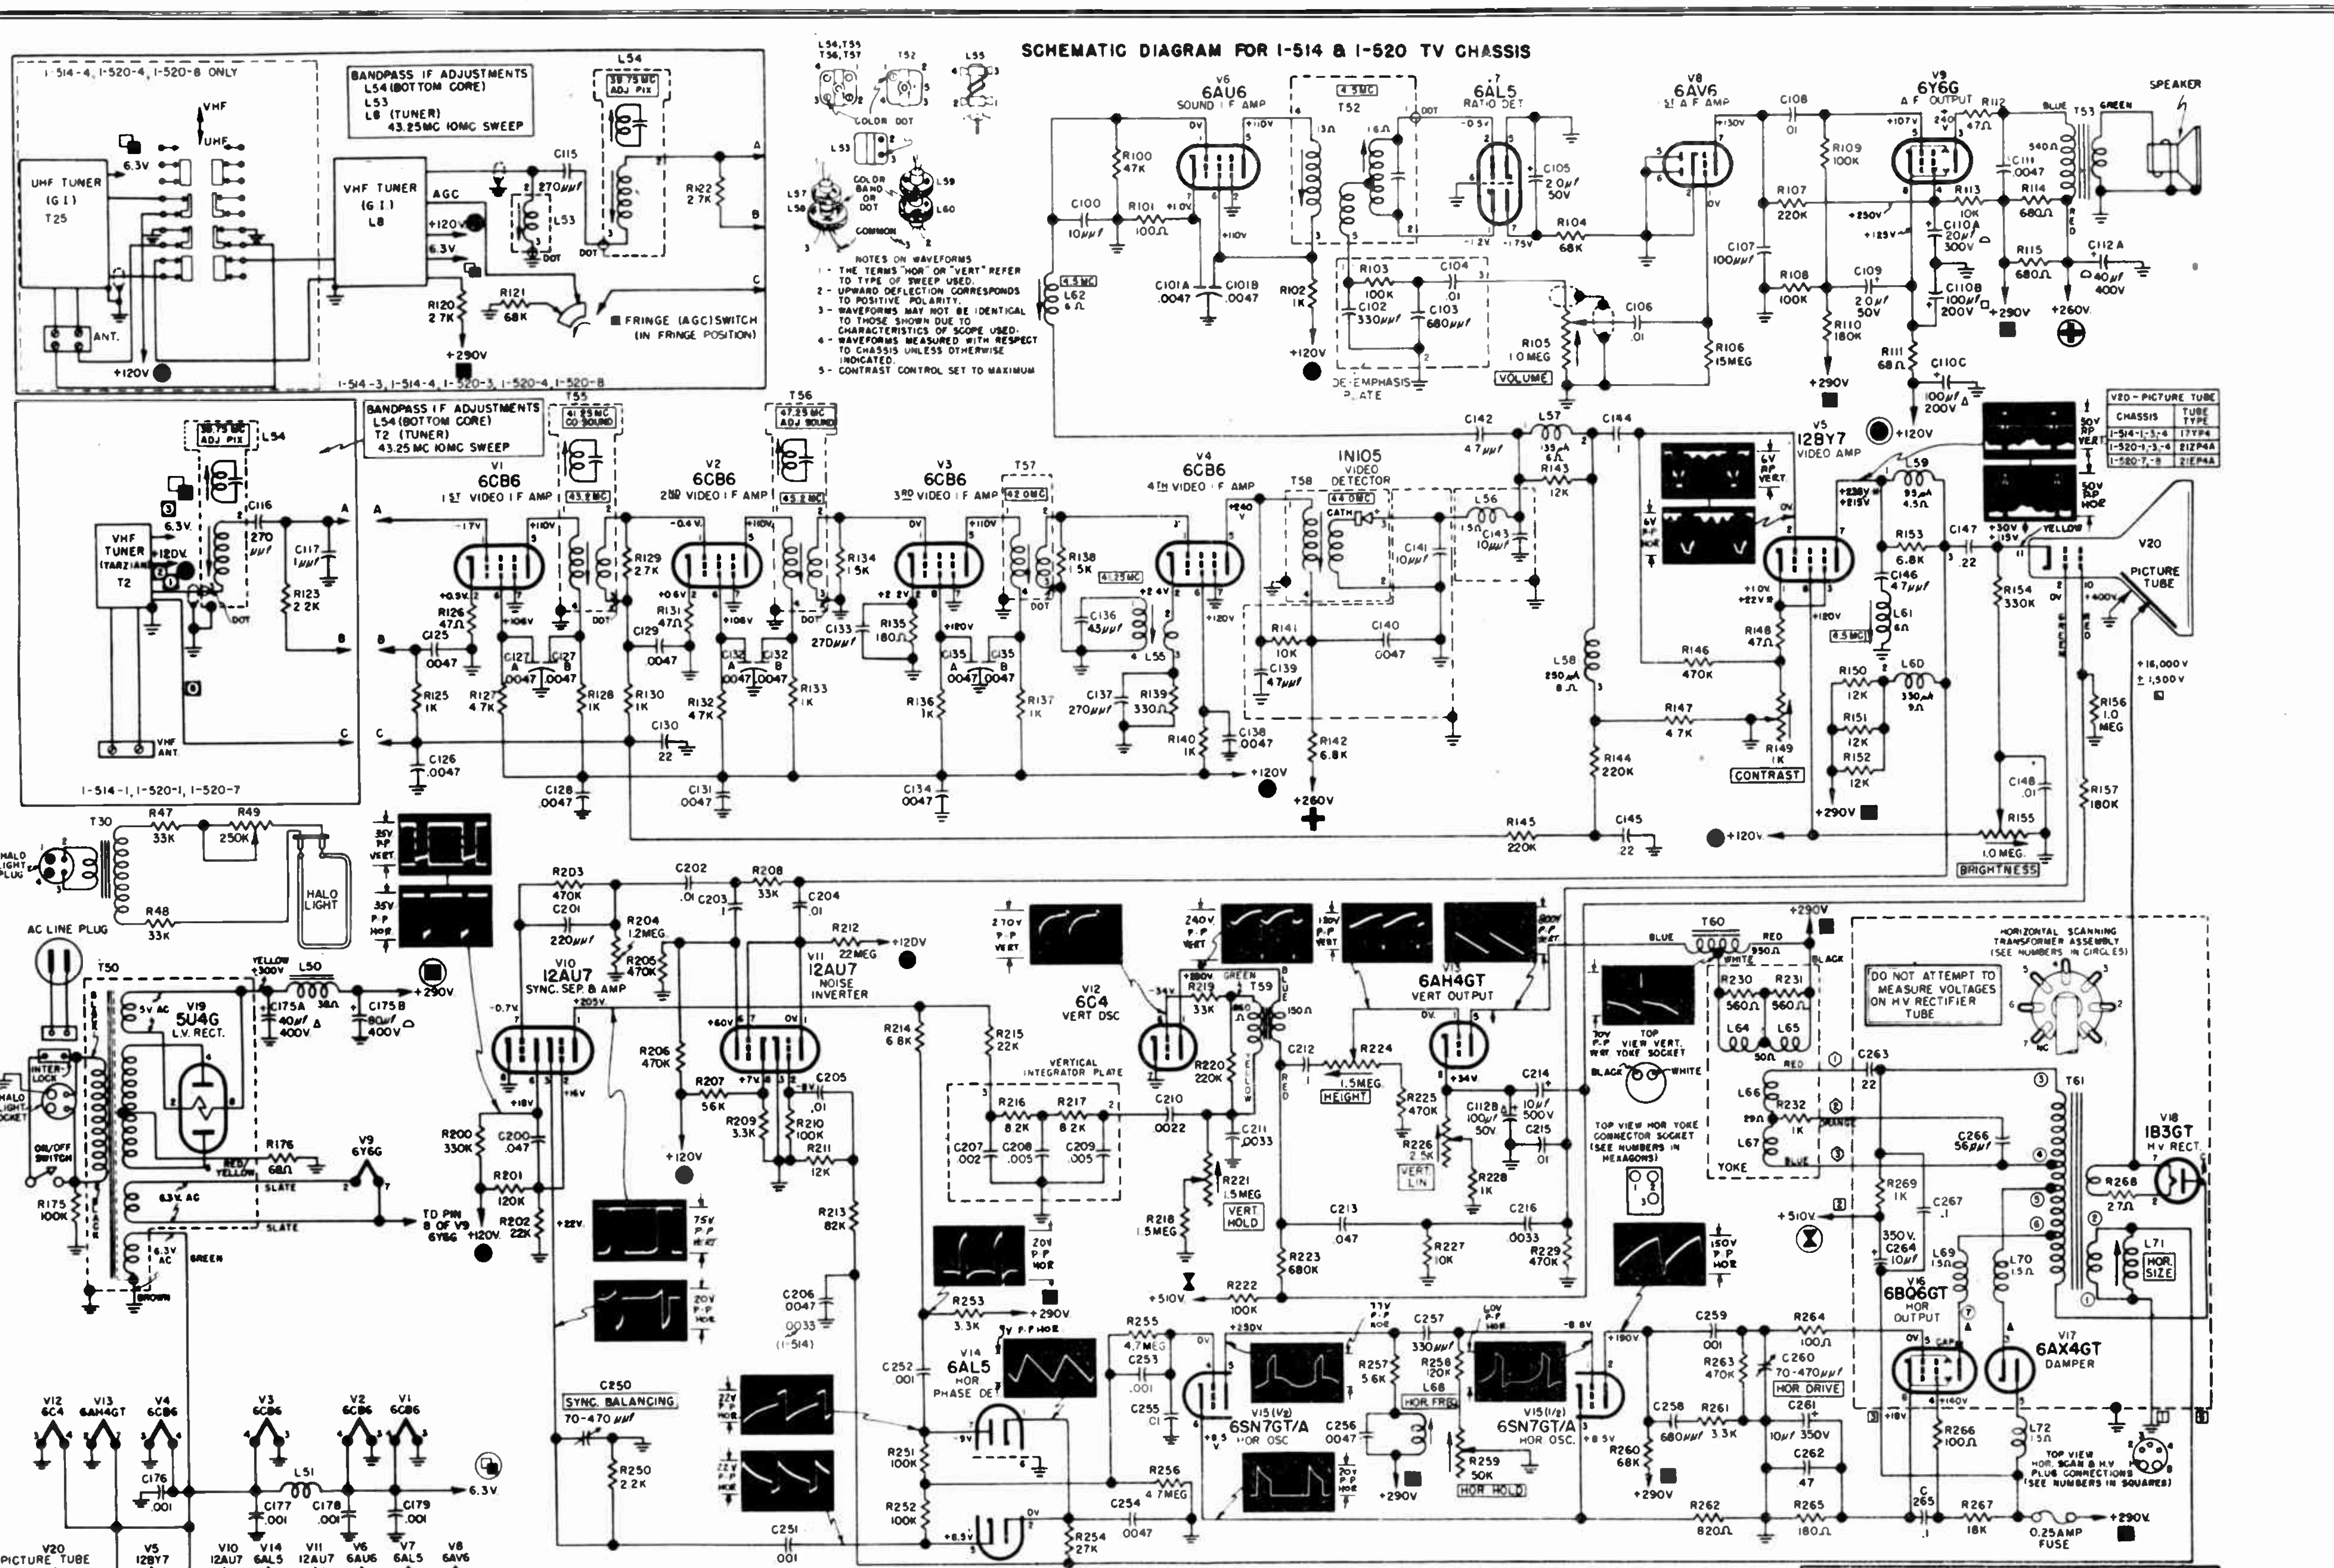
SCHEMATIC DIAGRAM FOR 1-514 & 1-520 TV CHASSIS



■ MEASURED WITH AN ELECTROSTATIC OR ZERO CURRENT METER AND AT LINE VOLTAGE METER READING OF 117 VOLTS, UNDER CONDITIONS OF NORMAL SIGNAL AND NO BRIGHTNESS.

♦ HIGH PEAK VOLTAGE (MORE THAN 1,000 VOLTS)

◊ BRIGHTNESS CONTROL AT MAXIMUM.

■ FRINGE (AGC) SWITCH AT MAXIMUM COUNTERCLOCKWISE POSITION.

* PICTURE CONTRAST CONTROL AT MINIMUM.

▲ HIGH PEAK VOLTAGE OF SHORT DURATION (APPROX. 5,000 V.) MAY DAMAGE METER USED FOR THIS MEASUREMENT.

VOLTAGE SOURCES ARE INDICATED BY ENCIRCLED SYMBOLS; CORRESPONDING SYMBOLS WITHOUT CIRCLES INDICATE VOLTAGE TIE POINTS.

VOLTAGES ARE MEASURED TO CHASSIS UNLESS OTHERWISE INDICATED, D.C. TAKEN AT 20,000 OHMS PER VOLT. MEASUREMENT CONDITIONS, UNLESS OTHERWISE NOTED: SOURCE 117 VOLT 60 CYCLE, ANTENNA DISCONNECTED WITH NO SIGNAL INPUT, PICTURE CONTRAST AT MAXIMUM, BRIGHTNESS AT MINIMUM — OTHER CONTROLS AT NORMAL POSITIONS.

AVERAGE VOLTAGES AND COIL RESISTANCES ARE INDICATED. RESISTANCE OF TAPPED COILS IS FOR ENTIRE WINDING. COIL RESISTANCE IS NOT SHOWN WHERE READINGS ARE TOO SMALL OR WIDELY VARIABLE.

ARROWS AT CONTROLS INDICATE CLOCKWISE ROTATION OF CONTROLS.

CAUTION NOTICE

THE HIGH VOLTAGE LEAD TO THE PICTURE TUBE HAS A POTENTIAL OF 16,000 VOLTS. PRECAUTIONS SHOULD BE OBSERVED WHEN THE CHASSIS IS REMOVED FROM THE CABINET FOR SERVICE PURPOSES.

DO NOT OPERATE THE RECEIVER WITH THE H.V. COVER REMOVED.

ALWAYS USE SAFETY GOGGLES AND GLOVES IF IT IS NECESSARY TO REMOVE THE PICTURE TUBE.

SUPPLEMENTARY SERVICE INFORMATION

EARLY PRODUCTION PARTS REVISIONS

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION
	DELETIONS	
C261	161-1012	10 Mfd. - 350V. - Electrolytic

See Item 4.		C01	C05	C01		I.P.	C04		C03
I. P. - Change incorporated in initial production.									

ITEM 1 SUBJECT: Code Changes as Noted in Above Chart.
REASON: Prevention of Possible Audio Interference in Horizontal Oscillator Circuit.
DESCRIPTION: C111 - .0047 Mfd., formerly across primary of T53, is reconnected from blue lead of T53 to +290V. (This change is incorporated on the initial 514/520 schematic)

ITEM 2 SUBJECT: Code Changes, as Noted in Above Chart.
REASON: Improved Video IF Response.
DESCRIPTION: R138 - 1,500 Ohm resistor is changed to 1,200 Ohms. (This component is included under "Early Production Parts Revisions")

ITEM 3 SUBJECT: Code Changes as Noted in Above Chart.
REASON: To Increase Wattage Tolerance.
DESCRIPTION: R269 - 1,000 Ohm 1/2W. resistor is changed to 1,000 Ohm 1W. resistor.

ITEM 4 SUBJECT: Code Changes as Noted in Above Chart.
REASON: Additional RF Filtering for Tuner B+ Lead.
DESCRIPTION: C114 - .0047 Mfd. capacitor is added and connected from junction of tuner B+ lead and R120-2.7K, to ground.

ITEM 5 SUBJECT: Addition of New Chassis.
DESCRIPTION: The following chassis should be added to the "Chassis Variations" chart on sheet 1.

CHASSIS	PICTURE TUBE	TUNERS VHF	TUNERS UHF	HALOLIGHT	MODELS
1-520-0	21EP4A(Cyl.)	G.I.	——	Yes	Same as 1-520-7. (326 Models)

All parts peculiar to 1-520-7 chassis are used in the 1-520-0 with the exception of the VHF tuner. This component is the same as that used in the 1-520-8 chassis.

ITEM 6 SUBJECT: Omission of Specific UHF RF Generator Setting.
DESCRIPTION: In Oscillator Alignment section of "UHF Tuner Alignment", change step 4 to read, "Set UHF RF signal generator to 896 MC and adjust C28 on UHF tuner for maximum reading on VTVM."

ITEM 7 SUBJECT: Light Shield on 326 HaloLight Models.
DESCRIPTION: Order light shield, service part number 483-0019 when replacement of this item on 326 models becomes necessary.

ITEM 8 SUBJECT: Outer Knob and Dial Assemblies.
DESCRIPTION: The outer knob and dial assemblies for the various 514/520 models are outlined below by service part number.

743-0022: 1-514-3, -4 (105-14; 300 models)
1-520-0, -3, -4, -8 (120-20; 320; 325; 326 models)
743-0023: 1-514-1 (105-14 models only)
1-520-1, -7 (120-20; 320; 325; 326 models)
743-0024: 1-514-1 (300 models only)

(Note that the same models may contain different chassis. This condition necessitates a close check on chassis type when ordering this particular knob.

ITEM 9 SUBJECT: The parts list should be revised as shown below.
REASON: To include parts changes noted in items 3, 4, 5 and 7 of this supplement.

SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION
	ADDITIONS	
C114	166-4700D	.0047 Mfd. - 500V. - Ceramic
	483-0019	Shield - Light (326 Models)
	CHANGES	
R269	182-0102	1,000 Ohm - 1W.

(—) Designates no change from previous issue.									

ITEM 1 SUBJECT: Code Changes as Noted in Above Chart.
REASON: To Reduce Excessive Horizontal Drive.
DESCRIPTION: C259-.001 Mfd. mica capacitor is changed to 820 Mmfd. mica capacitor.

ITEM 2 SUBJECT: Code Changes as Noted in Above Chart.
REASON: To Improve Video Response.
DESCRIPTION: R150, R151 and R152-12,000 Ohm 2 Watt resistors are changed to new type units smaller physically than original type. This substitution effectively reduces the combined inductance of this resistor group; however, resistance and wattage ratings remain the same.

ITEM 3 SUBJECT: Code Changes as Noted in Above Chart.
REASON: To Standardize Vertical Hold Control Types.
DESCRIPTION: R221-1.5 Megohm Vertical Hold control is changed to 2.0 Megohm control.

ITEM 4 SUBJECT: Code Changes as Noted in Above Chart.
REASON: To Improve Audio Performance.
DESCRIPTION: C111-.0047 Mfd. capacitor is changed to .015 Mfd. capacitor.

ITEM 5 SUBJECT: Change in Power Transformer Type.
REASON: To Provide a More Satisfactory L.V. Rectifier Tube Mounting.
DESCRIPTION: Early production of 1-514 and 1-520 chassis substitute a new type power transformer, service part 141-0039 for the original transformer. This new transformer is electrically similar to the original but features an external bracket and socket assembly for the L.V. Rectifier Tube. (These components are included under "Early Production Parts Revisions".)

ITEM 6 SUBJECT: Addition of 306 Model Series.
REASON: Revise the "Chassis Variations" chart as follows:

CHASSIS	PICTURE TUBE	TUNERS VHF	TUNERS UHF	HALOLIGHT	MODELS
1-514-3	17YP4 (Cyl.)	G.I.	—	No	105-14; 300; 306
1-514-4	17YP4 (Cyl.)	G.I.	G.I.	No	105-14; 300; 306 ("U" Models)

All parts peculiar to 306 models are listed in item 7 of this supplement.

ITEM 7 SUBJECT: Parts List Revisions.
REASON: To include parts changes noted in items 1, 2, 3, 4 and 6 of this supplement.

EFF. CHASSIS SERIAL NO.	SCHEMATIC LOCATION	SERVICE PART NUMBER	DESCRIPTION

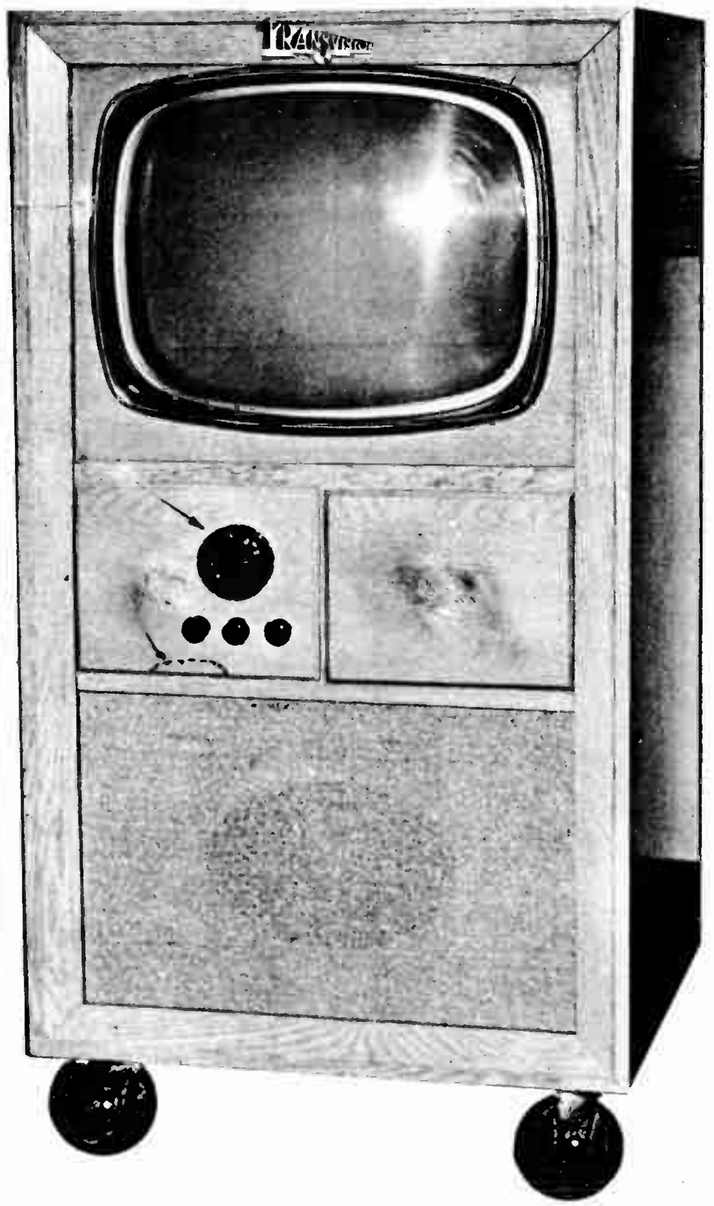
Transvision C-1 chassis used on table model set as shown and on consoles too.



Minimum Brightness Level on rear skirt of chassis is set by serviceman for at least minimum picture brightness when front brightness level control is at *minimum*. Thus customer will not miss the action of Free-Viewer.

Master Volume Control on rear skirt of chassis, set by serviceman for maximum permissible volume when front volume control is at *maximum*. Have the operator advise proper volume maximum desired.

To service chassis make certain shorting plug, or similar shorting device is inserted in UHF-COLOR socket on rear skirt of chassis, otherwise there will be open circuit in primary power.

The Yoke-Focus-Coil plug contains provision for interlock. In use this is properly inserted in socket next to the power transformer. In no case can chassis operate with this plug removed. If absolutely necessary to work with CRT in jig then octal extension cord should be used.

Picture Touch-Up. Set your tuning on a Test Pattern. Use fine tuning for best response. A non-metallic screwdriver should then be used for all adjustments: Adjust A-4 slug (tilted) on the tuner, watching especially for clear-cut lines on vertical wedges of pattern. Adjust A-3 slug next to 6AG5 tube. The first hole in top of can 175 (A1) is peaked for best pix. The second hole in top of can 174 is similarly peaked for best pix. A-9 slug under focus coil removes sound bars in picture. *Use with caution, since this affects sound takeoff. CAUTION in touching up Sound IF slugs. Make certain this is indeed your sound problem. Then adjust Sound I.F. as in steps 1 and 2 in Alignment Instructions shown.*

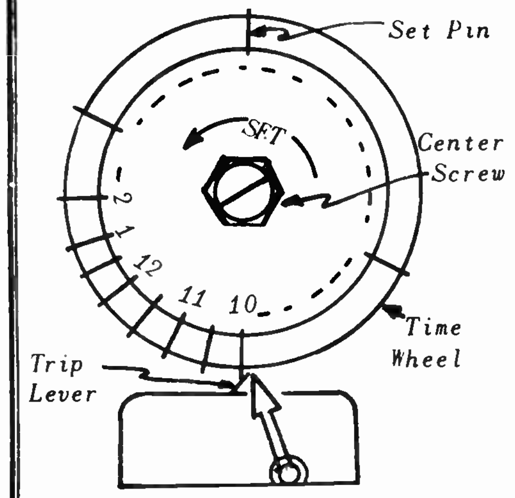
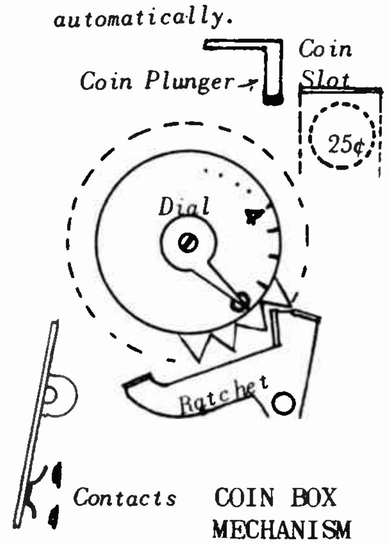
TRANSVISION C-1 ALIGNMENT INSTRUCTIONS

Step	Signal	Frequency	Measuring Instrument	Adjust	Procedure
SOUND I.F. Alignment, using A.M. Generator, Sweep Generator, V.T.V.M. and Scope.					
1	*A.M. Generator through .01 ufd. capacitor to pin 4 of Video Amplifier V-10.*	*4.5 MC*	*Connect VTVM through 10 K external resistor to V-3 grid return, junction of R98 and C81.*	*Sound Takeoff top & bottom 3092, A9. Audio I.F. top & bottom 3093.*	*Adjust for maximum voltage. Reduce A.M. Generator output so that VTVM does not read over 20 volts.*
2	*Sweep Generator.* *A.M. Generator In Parallel as Marker.*	*4.5 MC* *1 MC wide* *4.5 MC*	*Replace VTVM with scope connected through 10 K external resistor to Audio Detector output, junction of R4 and C5.*	*Ratio detector transformer 874 top & bottom.*	*Position 4.5 MC marker at center of S-curve by adjusting secondary. Peak primary for maximum amplitude and linearity. Disconnect one end of C8 for test to avoid incorrect curve. Fig. 2.*
TRAP ADJUSTMENT, using A.M. Generator and V.T.V.M.					
3	*Sweep Generator* *A.M. Generator in Parallel as Marker.*	*4.5 MC* *1 MC wide* *4.5 MC*	*Use VTVM DC Probe at AGC Bus, point 'G'.*	*Top of 175 can A1.* *Top of 174 can A2.*	*Adjust for MINIMUM deflection.*
4.5 MC TRAP ADJUSTMENT, using Scope.					
4	*A.M. Generator to pin 4 (grid) of 6SN7 Video Amplifier V10A.*	*4.5 MC* *unmodulated*	*Apply Scope through Detector probe to pin 2 of CRT. (See Probe, Fig. 1.)*	*Sound Takeoff 3092, bottom.*	*Adjust for MINIMUM deflection.*
I.F. Alignment, using Sweep Generator and Scope.					
5	*Sweep Generator to ungrounded tube shield floating over mixer tube 6BK7. A.M. Generator in Parallel as Marker.*	*23 MC* *10 MC sweep* *21.9 MC* *22.5 MC* *26.4 MC*	*Apply Scope to point D, Video Detector output at junction of R38 and the 125 uH Peaking Coil.*	*A3, top of 603 coil, next to 6AG5 tube. A4, tilted slug on tuner.*	*Adjust for response curve similar to Fig. 3.*



Transvision FREE-VIEWER

1. Gently unscrew Center Screw. Lift off time wheel. See set pins on every ¼ hour slot on 24 hour face.
2. To remove Set Pin lift it up while pulling it away outward from center. REMOVE ALL SET PINS FROM 10 EVENING THROUGH 10 MORNING. THEN REMOVE THE ALTERNATE PINS REMAINING FOR Free-Viewer ACTION OPERATING FROM 10AM TO 10PM, REMAINING INOPERATIVE ALL NIGHT.
3. If the set operator requests different Free-Viewer timing from STANDARD METHOD shown above, pins may be re-set.
4. Replace Time Wheel remembering that it must rotate only in direction of arrow. Screw Center Screw back on gently.
5. To SET Time Wheel turn it in counter-clockwise direction, FIRMLY. Hear internal click of wheel ratchet. Now listening VERY INTENTLY hear the Trip Lever click even BEFORE trips past Set Pin. A click here means INTERNAL CONTACT. Identify this click positively by gently rocking without tripping Set Pin. THIS SETTING IS 1- MINUTE BEFORE THE TIME OF THAT SET PIN. Insert line plug in A.C. receptacle in the wall, watching an external correct clock setting for co-ordination. Reset if correction needed by pulling out plug for a few seconds.
6. Power interruption will make it necessary to re-set Free-Viewer as in (5) above.
7. At these settings Television Set will turn on every ½hour remaining on for 4 minutes.
8. The line plug of Free-Viewer goes to A.C. receptacle. The 6-pin female socket receives the Coin Box plug. A female unit remains for the T.V set line-cord plug. Thus, set's current must be fed via this unit.
9. When a QUARTER in fed in the COIN BOX a circuit is closed by-passing FREE-VIEWER, permitting COIN BOX to exercise control of current to set. When the COIN BOX control is ended FREE-VIEWER takes over automatically.



COIN BOX MECHANISM

By jiggling the ratchet from one extreme position to the other you can make the dial step and provide a quick test of Coin Box.

YOU CANNOT PASS ZERO IN EITHER DIRECTION. Do not force it. Manipulate the ratchet with the left and return the dial with right hand and you can return the dial to the first marking representing 25¢ worth of operation-- ½ hour.

Make your tests and leave the Coin Box to run out its time. Now it is ready for use. The large numerals on the dial indicate COINS, not time. TIME is always in ½ hour intervals. The coin is always 25¢.

To TEST: Leave Dial at ZERO. Now, insert coin. PUSH COIN PLUNGER. Note that Dial now is at 1. Box may be primed up to 20 quarters in advance, following instructions above.

When a quarter has been inserted and the plunger pushed down, the CONTACTS close, remaining closed until ½ hour has passed and the ratchet has stepped up one notch on the dial.

The Coin Box key is different from the TV Set back key. Thus only the operator can open the Coin Box. The serviceman may use the Coin Box key only upon specific individual consent of operator, and must be returned to the operator after use.

The Coin- Box plug terminates in a 6-prong male plug. This is inserted in 6-pin female socket in Free-Viewer (IF FREE-VIEWER IS USED). In that case the UHF COLOR socket on the back skirt of the chassis has a dummy plug inserted, shorting out pins 3 and 6 of 6-pin chassis socket.

IF FREE-VIEWER IS NOT USED, remove the dummy plug from rear chassis socket and insert Coin-Box Plug instead. Now, coin-operation controls the chassis direct.

HOSPITAL SET with BEDSIDE CONTROL (may be operated as shown extreme right without removing control from cubicle). Above schematic are shown the cable plugs.

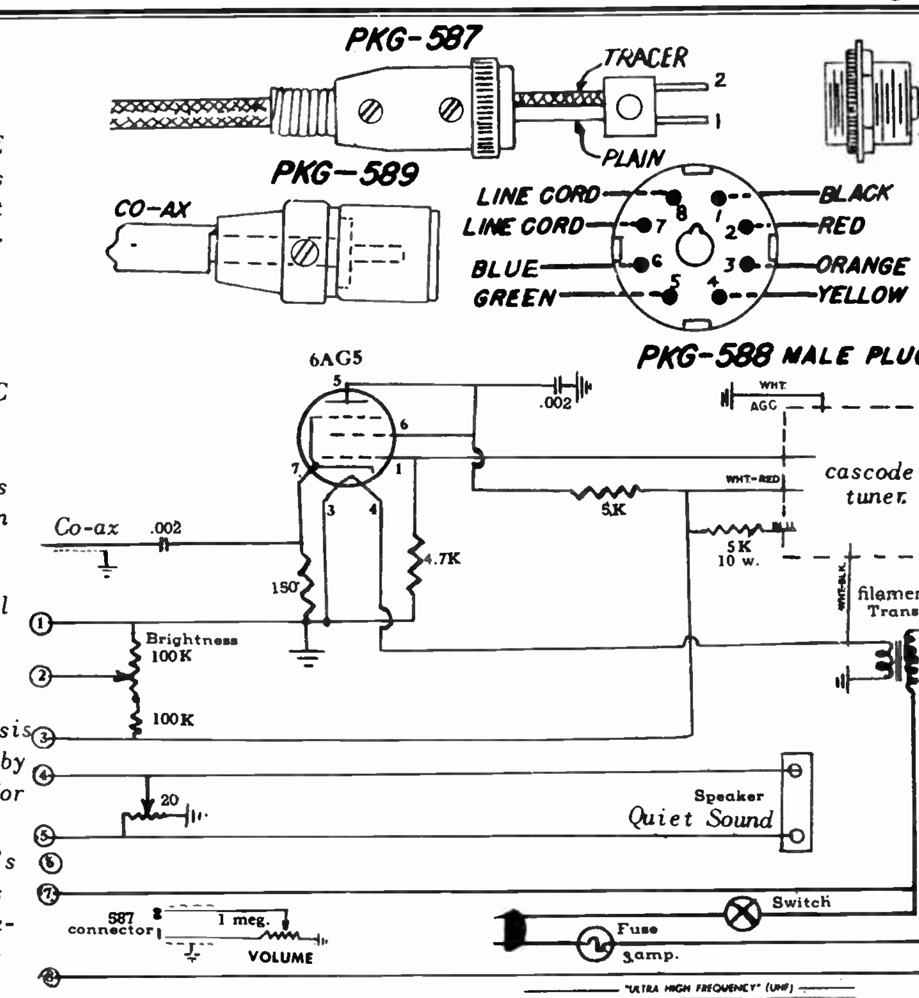
Essentially the control is a self-powered complete front end (plugged into A.C like portable radio). The antenna is connected here.

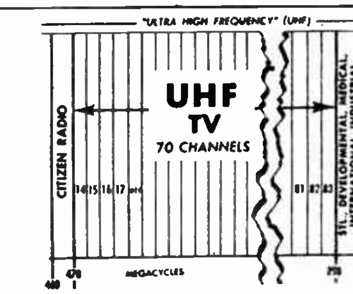
Cathode Follower supplies output to chassis proper in console through 25 to 50' of control cable.

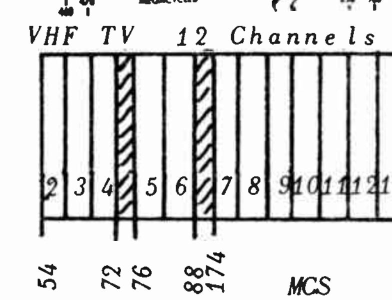
QUIET SOUND is individual small speaker in Control, with own volume control.

Automatic Contrast wired as CONTRAST CONTROL in chassis schematic may be adjusted by serviceman on rear skirt for optimum setting.

This set is Transvision's only one where the chassis is installed sideways, making room for Hospital Control.







Dual Revenuer

This exclusive Transvision device consists of switching arrangement in parallel with CONTACTS on Coin Box Mechanism (see drawing). A key kept by the TV Set Operator may be inserted in the slot in the Coin box. Turning the key closes these contacts, by-passing both Coin Box and Free-Viewer, putting the TV Set on straight operation.

You can tell if set has Dual Revenuer by simple inspection. Look on outside door. If there is provision there for TWO KEYS then they are Coin Box and Dual Revenuer.

Horizontal and Vertical Hold Controls are set in back in mid range. No front controls are required for either. The hold stays put. Blocking oscillators--most stable sort are used with blocking transformers.

Width Coil is between 5U4 and Yoke Plug socket. Adjust slug for picture width. There is also auxiliary width slug between Vertical Size and Horizontal Drive controls on back skirt. Normally this is half-way in.

RESISTOR-CONDENSER COLOR CODE

Color	Significant Figure	Decimal Multiplier	Tolerance (%)	Voltage Rating**
Black	0	1	-	—

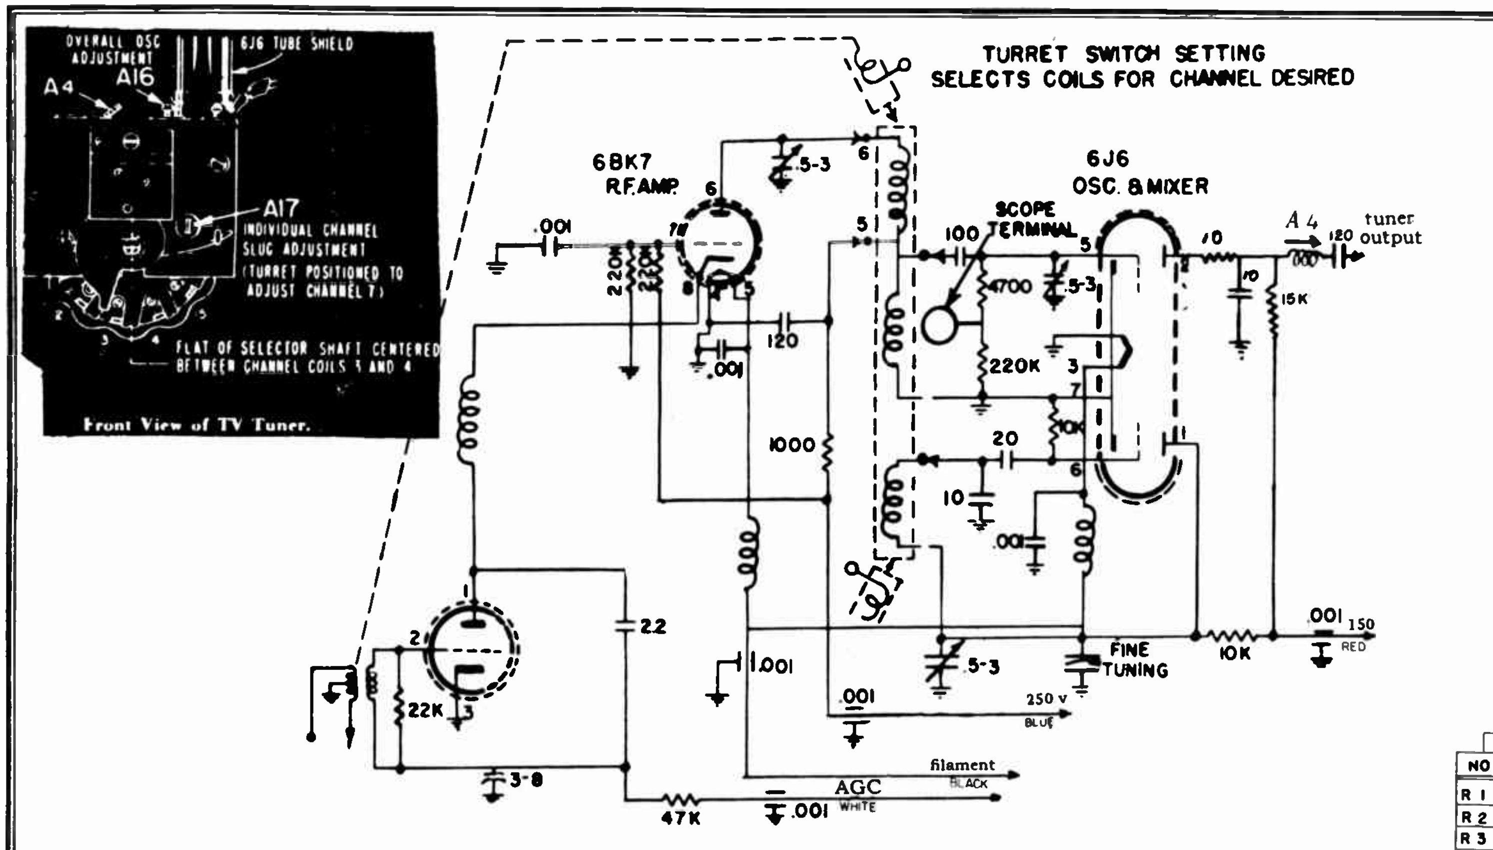
Gold	-	0.1	5	1000
Silver	-	0.01	10	2000



STANDARD CASCODE TUNER

R.F. AND MIXER ALIGNMENT

1. Set station selector to Channel 12.
2. Connect oscilloscope through 10,000 ohms to test point T (Wire loop on top of tuner).
3. For negative bias connect -3 volts DC to A.G.C. lead (white covered wire) from tuner.
4. Feed sweep generator into antenna terminals, sweeping Channel 12.
5. Adjust 3 upright screws on top of tuner (not A4 or A16) for flat top response curve and maximum gain. Check markers on all channels. They should fall in automatically on all channels.

INDIVIDUAL CHANNEL SLUG ADJUSTMENT USING A TELEVISION SIGNAL

Channel slug adjustment can be made without removing the chassis from the cabinet. Adjust as follows:

a. Turn the set on and allow 15 minutes to warm up.
b. Set the CHANNEL knob for a station in operation. Set all other controls for a normal picture.
c. Set TUNING control at center of its range by rotating it approximately half-way.
d. Remove the CHANNEL and TUNING knobs.
e. Insert a ⅛" blade, NON-METALLIC screwdriver in the ¼" hole adjacent to the channel tuning shaft. For each channel in operation, carefully adjust the channel slug for best picture with clear detail. Be sure that the Tuning control is set at the center of its range before adjusting each channel slug. Only slight rotation of the slug will be required; turning the slug in too far will cause it to fall into the coil. (If the slug falls into the coil, remove the coil, move the retaining spring aside, lightly tap the open end of the coil until the slug slips out. Replace slug and re-set retaining spring.)

If a number of slugs are found to tune all the way in or all the way out, or if the 6J6 oscillator-mixer tube has been replaced, it may be necessary to make the "Over-all Oscillator Adjustment" as instructed below.

OVER-ALL OSCILLATOR ADJUSTMENT (A16) USING TELEVISION SIGNAL

Over-all oscillator adjustment should only be necessary when replacing the oscillator-mixer tube (6J6), or when all channel slugs are off in the same direction. When replacing the oscillator-mixer tube (6J6), it is recommended that several tubes be tried to select one which will cause least oscillator frequency shift.

A16 is generally adjusted so that approximately 3/16" of screw thread is exposed.

Adjust as follows:

a. Follow steps "a", "b" and "c" under "Individual Channel Slug Adjustment Using A Television Signal."
b. Carefully adjust trimmer "A16" for best picture with clear detail.
c. Check and, if necessary, make individual channel adjustments as indicated above.

Resistance Chart

All resistance values taken with reference to chassis as GROUND.

TELEVISION RECEIVERS: MODEL 160A

SERVICE DATA

I. GENERAL DESCRIPTION

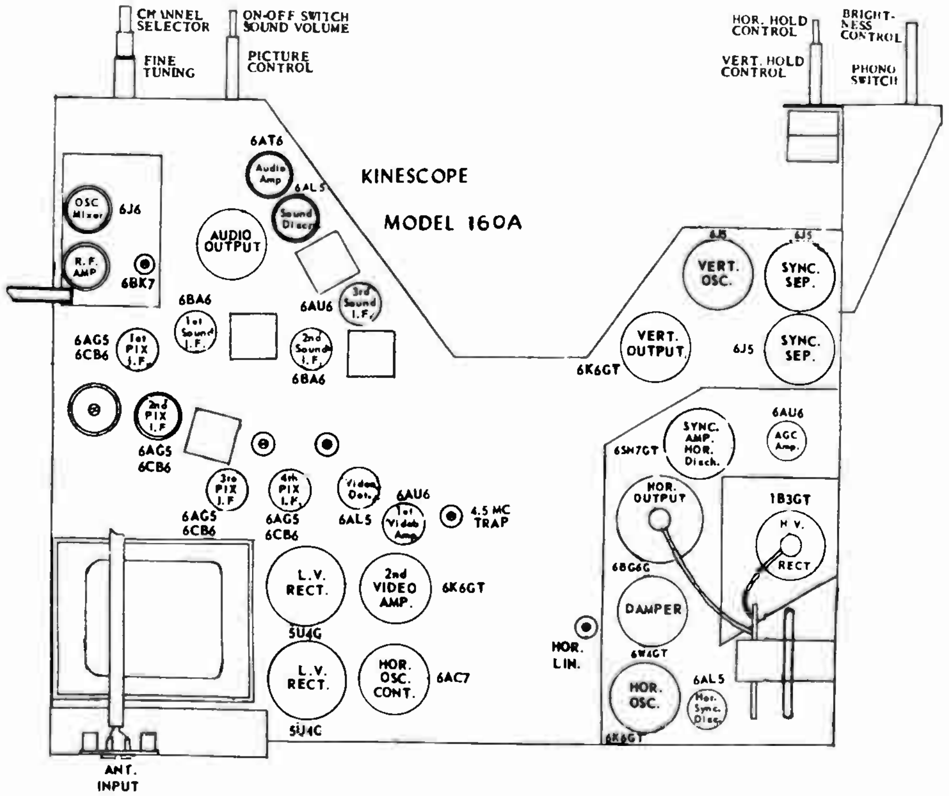
The following Series of Television Receivers are distinguished by related chassis types:

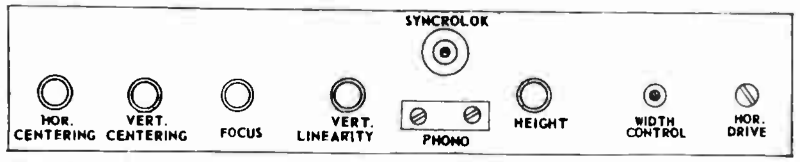
(a) Model 160A: A 32 tube receiver (including picture tube and three rectifiers). Features include: full 12 channel coverage; latest Standard Coil Cascode Circuit RF tuner, with high signal to noise ratio, UHF adaptable; limiter-discriminator FM sound system; high second anode potential for full picture brilliance and definition; automatic frequency control of the horizontal oscillator (Syncrolok); full 4 mc. band-width of the picture channel; noise saturation circuits; keyed A.G.C.; and a phono-graph input connector by means of which the sound section may be used as an audio amplifier. Reference is made to the overall Circuit Diagram of the 160A.

(b) Model 160A Loran: Includes all features of Model 160A except that the Video IF alignment, and other factors are designed for greater overall reception sensitivity for long range (Loran), as is described in Section VIII.

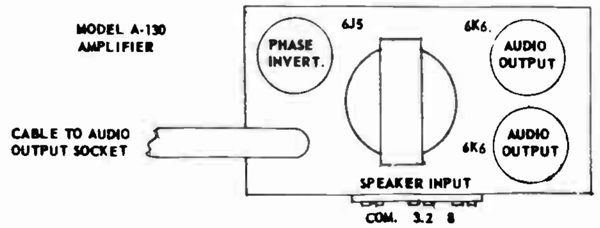
II. ELECTRICAL SPECIFICATIONS

RF Frequency Range: Channels 2 to 13 in 12 steps
Power Supply Rating: 117 volts, 60 cycles, 275 watts
Audio Power Rating: Undistorted - 5 watts
Maximum - 8 watts
Antenna Input Impedance: 300 ohms





IMPORTANT DRESS KINESCOPE SOCKET LEADS AWAY FROM DEFLECTION YOKE LEADS



III. TUBE COMPLIMENT

Circuit Symbol	Tube Type	Function
V101	6BA6	1st Sound IF Amplifier

RF amplifier and RF oscillator - Mixer tubes are also supplied. These are the 6J6, oscillator and mixer, and 6BK7 or 6BQ7, RF amplifier in the tuner.

IV. CIRCUIT DESCRIPTION

1. Video I. F.

The video I. F. section of the 160A Model is composed of the 4 amplifier stages V-107, V-108, V-109, and V-110. This video I. F. section provides ample gain and gives very satisfactory pictures in all TV signal reception areas. The I. F. sound is taken off at the plate of the 1st I. F. video amplifier (V-108) affording the advantage of extra gain by the 1st video I. F. stage. The video I. F. section is equipped with adjacent traps to eliminate interference from channels on either side of the station being received. The video I. F. picture carrier frequency is 26. 25 megacycles. Also, a 4. 5 mc trap (L205 and C152) is incorporated to eliminate sound "pebble" from the picture.

2. Video Detector and Amplifiers

All 160A Models employ a 6AL5 half-wave detector (V-111A); and a 6AU6 first video amplifier (V-112). A 6K6 (V-113) is employed as the second video amplifier. The gain of the video is controlled in the cathode of this stage by degeneration with high frequency compensation.

3. Sound Section

The sound section of the 160A Models consists of two 6BA6, (V101) (V102) sound I. F. amplifiers and one 6AU6 limiter (V103) tuned to 21. 75 megacycles; a phase discriminator using a 6AL5 duodiode (V104); a 6AT6 (V105) first audio amplifier and a 6K6 (V106) audio output tube.

Provision has been made to allow the audio section to be used as a phonograph amplifier. Phono input is located on the rear of the chassis, the picture tube and video amplifier are inactivated by turning the brightness control to the extreme counterclockwise position until phono-switch snaps into position.

4. Syncronizing Circuits

The vertical and horizontal syncronizing pusles are taken off in the plate circuit of the 1st video amplifier. They are then fed through two 6J5 (V115, V116) triode stages and one 6SN7 triode stage (V117A) for shaping and amplification. The vertical sync pulse is removed after the second stage of amplification and is applied to the grid of a 6J5 (V118) triode functioning as the vertical blocking oscillator. The resulting saw-tooth waveform is fed through a 6K6 (V119) vertical amplifier which drives the vertical deflection coils.

The horizontal sync pulse is clipped and amplified by the V-115, V-116, and V-117A and then fed to the horizontal discriminator described below. The horizontal sweep voltage is applied to the grid of a 6BG6-G (V122) horizontal amplifier which drives the horizontal deflection coils.

5. Horizontal Oscillator and Frequency Control Circuit

The horizontal oscillator and frequency control system of 160A Model receivers is the extremely dependable Syncrolok circuit. This system possesses all the characteristics required of a good horizontal frequency control circuit including excellent noise immunity and phase control.

This circuit uses three tubes, a horizontal oscillator 6K6 (V121), a horizontal control tube 6AC7 (V123), and a horizontal sync discriminator 6AL5 (V120). The discriminator compares the frequency and phase of the sync wave output of the oscillator with that of the incoming horizontal sync pulses. If there is a difference between the two, the discriminator circuit acts through the oscillator control circuit to correct the oscillator frequency.

Since the control tube circuit is designed to react only to changes in the average level of discriminator output, noise pulses have little effect on the circuit, their duration usually being too short to affect the average output level.

6. High Voltage Circuit

The high voltage supply consists of a "flyback" high voltage system, a 6W4 (V125) damper tube, and a single 1B3 (V124) high voltage rectifier. By employing a very efficient high voltage transformer, 15 KV anode voltage is consistantly obtained on the picture tube.

7. Low Voltage Supply

The low voltage supply is of the conventional type and consists of a 117V, 60-cycle power transformers, two 5U4G (V126, V127) full wave rectifiers, plus its associated filter components.

8. Vertical Blanking Circuit

The 160A series television receivers are equipped with a vertical blanking circuit which prevents the appearance of annoying "retrace lines" that result from improper adjustment of the contrast and brightness controls by the viewer. This blanking is achieved by properly "shaping" some of the voltage pulse which is available at the output of the vertical output transformer, and applying it to the cathode of the picture tube.

V. INSTALLATION NOTES

When the set is ready for installation, subject it to a thorough visual inspection to be sure that no damage has occurred in shipment.

1. Antenna

An efficient antenna installation is essential to good picture reception. In most locations, a good outdoor antenna will produce the best pictures; however, if an outdoor antenna is not feasible, an indoor or window mounted antenna can be used as a substitute. The indoor type selected should be easily adjustable in any direction; the window antenna usually proves more satisfactory for operation in steel-framed buildings. The 160A chassis uses a 300 ohm impedance line input.

When the antenna has been installed and connected to the chassis, connect the set to a 117V 60-cycle AC outlet.

2. Adjust the front panel controls, and obtain a picture.

3. In some cases, it may not be possible, as a result of transit, to immediately obtain a satisfactory picture by means of the front panel controls. If this happens, it may be necessary to re-adjust the rear panel controls. The names and locations of these controls are shown on the accompanying diagram, Fig. III.

4. Adjust the Ion Trap

In order to prolong the life of the picture tube, it is important that the following adjustment be made on every receiver upon installation and every time the receiver is serviced:

Very carefully move the ion trap forward or backward, and at the same time, rotate it in either direction; adjust for the brightest picture possible with the brightness control set for average brightness.

Note that there may be two locations where the brightest picture can be produced. The ion trap location that is further forward on the picture tube neck should not be used; use the location nearer the rear.

IMPORTANT: If the corners of the picture are shaded, be sure the ion trap has been properly adjusted. Do not sacrifice picture brightness when adjusting the ion trap to remove shaded corners. To eliminate shaded corners, see discussion under "Check Picture Centering". Be sure to readjust the ion trap each time after adjusting the focus coil.

5. If the picture or raster is off-center with respect to the mask, to the right or left, or too high or too low, it may readily be repositioned by adjustment of the Horizontal and Vertical centering controls located on the rear apron of the chassis. (See Fig. III.)

6. If the picture has a slightly blurred or fuzzy appearance, this may be cleared up by adjustment of the FOCUS control on the rear panel. The focus control should be adjusted for sharpest and clearest picture while viewing the face of the picture tube at close range, using a mirror if necessary. A good indication can be gotton by closely observing the scanning lines of the picture and adjusting for the sharpest and thinnest lines across the entire face of the picture tube.

7. When the height of the picture is not sufficient to fill the mask, or if vertical non-linearity is present (evidenced by unequal heights of the vertical wedges in the test pattern, or heads and bodies being out of proportion in a picture), the VERTICAL LINEARITY AND HEIGHT controls must be adjusted. These two controls affect each other and when one is adjusted, it is usually necessary to readjust the other to obtain a satisfactory picture. The HEIGHT CONTROL has its greatest effect on the bottom half of the picture, while the LINEARITY CONTROL mostly affects the top half. If the picture width is not right, or if horizontal non-linearity is present, (ie. one side of the picture expanded and the other side squeezed in), adjustment of the HORIZONTAL WIDTH, HORIZONTAL LINEARITY and/or HORIZONTAL DRIVE controls will be necessary (See Fig. III).

8. Check Picture Tilt

If the picture is tilted, loosen the wing screw on the deflection yoke coil and slightly rotate the yoke until the picture is straight. Before tightening the wing screw, be sure that the yoke is moved as far forward as possible,otherwise corners of the picture may become shaded.

9. If the picture does not hold in sync throughout the range of the HORIZONTAL HOLD control, it may be possible to make it do so by adjusting the SYNCROLOK control on the rear panel. If this cannot be done, a detailed adjustment of the sync system, as described in Section VI must be made.

10. Using a Record Player with the 160A Series Chassis

Provision is made on the chassis for playing a record player through the receiver. The record player may be placed at a remote point, or near the set. The means of connecting the record player to the receiver is as follows:

> A terminal-link board at the central rear chassis apron is the external means for connecting the record player through the audio amplifier of the television receiver. This is so labeled on the rear chassis apron. Also, see Fig. III. Use a shielded phono lead between the player and the television chassis. This is to minimize extraneous pickup into the sensitive audio system of the chassis. Connect the shield end of the phono lead to the link board Terminal #1, which is at ground. Connect the phono output lead to Terminal #3.

Operation: The procedure for using the record player through the television receiver after the preceding connections are installed is as follows:

> A phono switch is provided on the Brightness Control. When the Brightness Control is turned to its extreme counterclockwise positon, a click will be heard at this point, as the phono switch is thus turned on. With this simple motion all reception and light are entirely extinguished from the picture tube, and the phono circuit is put into operation. Reference may be made to the Schematic Circuit Diagram for the simple circuit involved.

The record player is now ready to be used. To adjust the phono volume, use the regular volume control on the television receiver.

When resumption of television is desired, simply turn and reset the Brightness Control clockwise in the normal manner.

VI. SERVICE INFORMATION

This television set is pre-aligned and pre-adjusted before being shipped from the factory, and should give satisfactory performance upon installation. However, should it at any time become necessary to realign either the Sound or Video I. F. stages, or readjust the horizontal syncronizing circuits, it is suggested that the following procedures be used as guides.

HIGH VOLTAGE WARNING! OPERATION OF THE TELEVISION RECEIVER OUTSIDE THE CABINET, OR WITH COVERS REMOVED INVOLVES A SHOCK HAZARD FROM THE RECEIVER POWER SUPPLIES. WHEN WORKING ON THE CHASSIS, ALL PRECAUTIONS SHOULD BE TAKEN TO PREVENT CONTACT WITH HIGH VOLTAGE POINTS. DO NOT OPERATE THE CHASSIS WITH THE HIGH VOLTAGE COMPARTMENT SHIELD REMOVED.

1. Adjustment of Horizontal Oscillator

Connect a suitable antenna to the receiver and tune to an operating television station. A picture or test pattern should appear on the screen. The picture should remain in horizontal sync with the HORIZONTAL HOLD control in both the extreme clockwise and extreme counterclockwise positions. The picture should also pull into sync with the hold control in either of these positions when the signal is momentarily removed.

If the above check reveals a lack of sync in the set, make the following adjustments:

(a) Tune in a television station and adjust the fine tuning control for best sound quality.

(b) Turn the syncrolok frequency control (on the rear of the chassis) until the picture is syncronized.

(c) If the blanking bar appears in the picture, turn the "phase adjustment" (rear slug of syncrolok transformer under the chassis) until the blanking bar moves to the right and off the raster.

(d) Turn horizontal hold to extreme counterclockwise position and turn "syncrolok frequency adjustment" (located on rear apron of the chassis) clockwise until the picture falls out of sync. Then turn the adjustment slowly counterclockwise to the point where the picture falls into sync again.

(e) Readjust the phase adjustment so that the left side of the picture is close to the left side of the raster, but does not begin to fold over.

(f) Turn HORIZONTAL HOLD to its extreme clockwise position. The right side of the picture should be close to the right side of the raster, but should not begin to fold over. If it does, readjust the phase.

(g) Momentarily remove the signal by tuning the station selector off channel and then returning. When the signal is restored, the picture should fall into sync. If it doesn't, then turn the sync frequency adjustment counterclockwise until it does.

(h) Turn horizontal hold to extreme counterclockwise position. Remove the signal momentarily. When the signal is restored, the picture should fall into sync.

2A. Video I. F. Alignment: Model 160A

The following procedures should be followed when aligning the Video I. F. sections of Model 160A. Refer to Figure 1. The next paragraph 2B describes procedure for Model 160A Loran.

Connect the FOCUS COIL and DEFLECTION YOKE to the set. Speaker and picture tube connections need not be made for I. F. alignment.

(a) Plug set into 117V, 60 cycle line; turn set on.

(b) Disable AGC by shorting Pin #1 of 6AU6 (V114) Keying Tube, to ground.

(c) Connect -1.5 volt bias between chassis and AGC strip. (Junction of R122 and C127)

(d) Connect a calibrated signal generator to the tuner by connecting the "hot" lead to the tuner mixer tube shield, and the ground lead to the chassis. Shield must be disconnected from ground so that signals can be coupled into the mixer through the shield to tube capacity.

(e) Connect one lead of a vacuum tube voltmeter to the plate side of the 3900 ohm video detector lead resistor (R139), the other lead to ground, using lowest voltage range on meter.

(f) Adjust traps first. Inject trap frequencies of 20.25 mc; 21.75 mc; and 27.75 mc, into tuner and adjust the respective traps for minimum deflection on meter.

(g) Inject video I. F. amplifier frequencies of 25.8 mc; 22.8 mc; 22.3 mc; 25.7 mc, and 23.9 mc into the tuner, adjust each stagger tuned stage at its respective frequency for maximum deflection on vacuum tube voltmeter.

(h) Repeat step (f).

(i) Connect 4.5mc generator to grid of first video amplifier (Pin #2 of V112).

(j) Connect VTVM with crystal probe across R141 and ground.

(k) Tune 4.5 mc trap (L205) for minimum deflection of the VTVM.

NOTE: In all alignment procedures, use as low a signal input as possible to prevent overload.

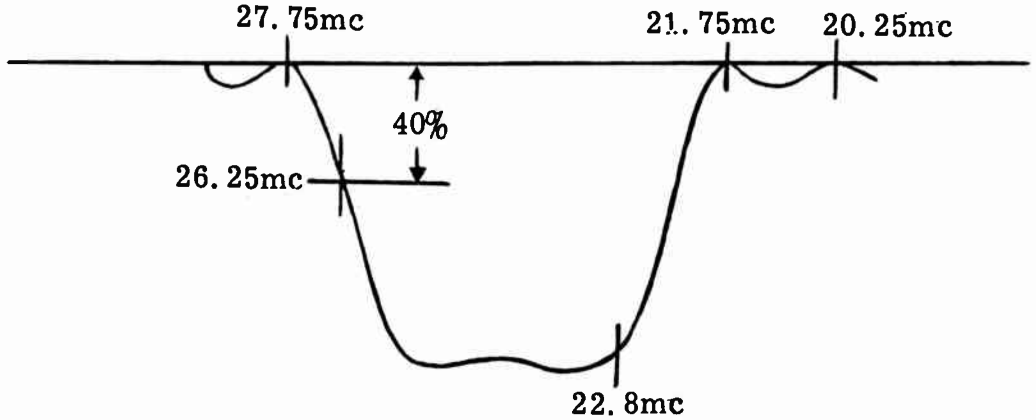

Fig. I I. F. Alignment Curve Model 160-A.

2B. Video I. F. Alignment: Model 160A Loran

The alignment of Model 160A Loran is identical to the alignment of the 160A described above, except that in tuning the Video I. F. amplifiers (step (g)), the frequencies of the tuned stages are 26.4, 23.9, 24.5, 25.9, and 22.75 mc respectively, instead of the frequencies given for the 160A.

3. Sound I. F. Alignment

The following procedures should be followed when aligning the Sound I. F. sections of all the 160A Models.

The Sound I. F. carrier frequency is 21.75 mc. Inject a 21.75 mc signal on the grid of the first sound I. F. amplifier. Connect a d. c. voltmeter in series with a 1 meg. resistor between ground and the high side of the second I. F. amplifier grid loud resistor (R106). Adjust I. F. transformers (T111 and T112) to obtain a maximum reading on the voltmeter (the voltage should be between -1 and -3 volts.)

Now connect the voltmeter and the 1. meg. resistor between ground and the junction of the discriminator load resistors. Adjust the discriminator transformer primary for minimum deflection on the meter.

Connect the voltmeter across the total discriminator load and adjust the discriminator secondary for zero reading on the meter. Make sure that the meter goes positive as the secondary is adjusted to one side of the balance point and negative as it is moved to the other side.

4. Use of Oscilloscope to Check Alignment

In all cases it is desirable to check the alignment of both the Sound and Video I. F. sections as outlined above by using an oscilloscope in conjunction with suitable sweep equipment. This procedure is outlined herewith:

To check both Video and Sound I. F. alignment, attach a sweep generator to the antenna terminal and inject I. F. markers from the crystal controlled source between the chassis and the ground side of the cathode resistor of the first Video I. F. amplifier.

(a) Switch channel selector on set to Channel Six (6) and adjust the sweep generator to sweep Channel Six.

(b) Connect horizontal input of oscilloscope to "Scope" terminal of sweep generator.

(c) Connect vertical input of oscilloscope across the video detector load resistor (R139).

(d) Slight adjustment of the Video I. F. coils should bring the I. F. curve into proper shape. Check trap frequencies and half voltage point frequencies with crystal markers only.

The curves that should be obtained from a properly aligned I. F. are shown in Figs. I and II, depending on the Model.

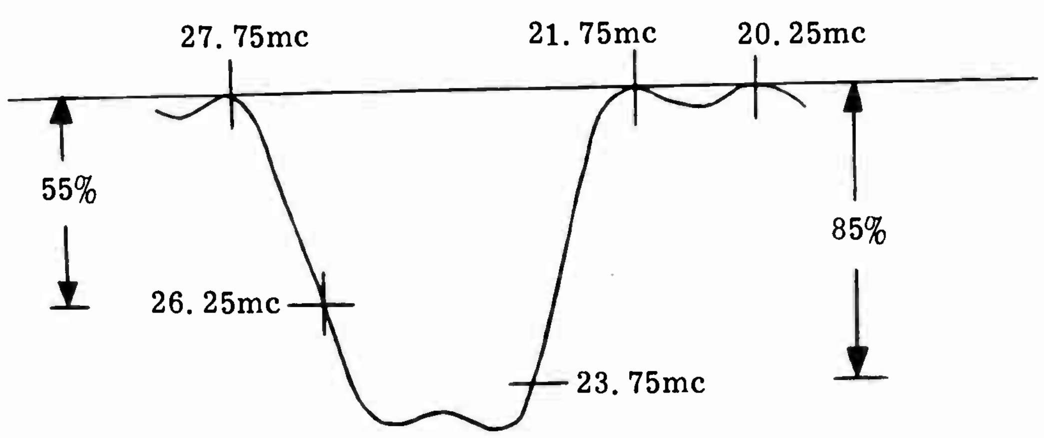

Fig. II I. F. Alignment Curve Model 160-A Loran.

The sound I. F. curves can be observed by connecting the vertical input of the oscilloscope in series with a 50K resistor between the grid side of the 6AU6 limiter tube, grid resistor (R106) and ground. The discriminator curve can be observed by connecting the vertical input of the oscilloscope across the discriminator diode load resistors (Junction R111 and R109).

5. Tuner Channel Slug Adjustment

Individual channel tuner oscillator adjustments of the television receiver should be checked, upon its installation or servicing, If such adjustments are properly made, it is possible to tune from one station to another by merely turning the CHANNEL Selector and, if necessary, slightly readjusting the fine TUNING control. With correct oscillator channel adjustment, best picture and satisfactory sound will be located at the approximate center (half rotation) of the range of the FINE TUNING control.

Channel slug adjustment can be made without removing the chassis from the cabinet. Adjust as follows:

(a) Turn the set on and allow 15 minutes to warm up.

(b) Set the CHANNEL SELECTOR knob for a station; set other controls for normal picture and sound.

(c) Set FINE TUNING control at center of its range by rotating it approximately half way.

(d) Remove the CHANNEL SELECTOR and FINE TUNING knobs.

(e) Insert a 1/8" blade, non-metallic screwdriver in the 1/4" hole (to the right of the channel tuning shaft). For each channel in operation, carefully adjust the channel slug for best picture with clear detail and best sound. Be sure that the FINE TUNING control is set at the center of its range before adjusting each channel slug. Generally, only a slight rotation of the slug will be required, turning the slug in too far will cause it to fall into its coil. (If the slug falls into the coil, remove the coil strip from the tuner, move the retaining spring aside, lightly tap the open end of the coil until the slug slips out. Replace slug and reset retaining spring.)

6. Troubleshooting Data

Reference is made to Section IX "Resistance Measurement Chart", and Section X, "Voltage Measurement Chart" for the 160A series. These charts are useful in locating the section of the chassis which may be inoperative. Any resistance or voltage measurements which do not correspond to these charts will help indicate where the source of trouble is located.

VII. TUNER DESCRIPTION

The latest type cascode circuit Standard Coil tuner is used in all models of the 160A Series. It is a rugged, sensitive 12-position turret tuner. Each channel has its individual set of coils, connected into the television circuit, when selected. The cascode circuit of this tuner provides higher gain and greater signal-to-noise reception ratios than ever before practicable. The fine tuning control permits crisp, sharp pictures to be brought in individually for each channel, at the point of best and truest sound reception. Correct UHF sets may be inserted in place of any unused VHF channel, for direct reception through this receiver of any ultra high frequency (UHF) channels that will be authorized by the F. C. C.

VIII. MODEL 160A LORAN LONG RANGE CONSIDERATIONS

These long range television receivers are an evolution of Model 160A. They embody basically the construction and components of the Model 160A. Reference is made to the Schematic Circuit Diagram for the 160A Loran. The tuner is the 12-channel cascode turret tuner described in Section VII (c) above, specifically designed for high gain, low noise, full bandwidth television reception. The Video I. F. section is a 4-stage stagger-tuned circuit designed and aligned for maximum Video I. F. gain. Reference is made to Sections IV-1 and VI-2 (b) as to this part of the chassis, and Fig. II. The overall gain of both the video and sound television signals as amplified by the 160A Loran chassis, provides a gain of ten times that of the average standard receiver on the market. The resultant video sensitivity is of the order of 4 microvolts, as measured by RTMA standards. Excellent reception is provided in remote fringe areas, in "dead" spots in city areas, or with indoor antennas in metropolitan areas. The keyed AGC materially aids in providing uniform reception against fading or interference. The strong horizontal "Syncrolok" hold keeps "weak" signals in rocksteady condition, with excellent noise immunity. All these features in the 160A Loran Models combine to produce outstanding DX television reception. Where only one distant channel is available in an installation, a Yagi type antenna tuned to that channel is recommended.

All measurements were made with a Senior Voltohmyst VTVM. Measurements were made with focus coil and deflection yoke connected, but without a kinescope. The resistance measurements were made with no power applied to the chassis.

All readings were taken under the following conditions unless other wise noted:
Focus control in center position.
Brightness control in maximum counterclockwise position (minimum brightness position) just before Phone switch clicks.
All readings are in ohms and measured to ground.
Measured with RCA voltohmyst.
All controls in maximum clockwise position.

NC - No Connection TP - No tube connection - used as tie point

*Peak to Peak, measured with oscilloscope.
**These readings may be erratic due to action of V-123 with no signal input,

All readings were taken under the following conditions unless otherwise noted:
With Focus control in center position.
Without Signal Input.
With Yoke and focus coil attached but without kinescope.
All controls in maximum clockwise position.

All voltages measured to ground at 115 volts line voltage, with RCA Voltohmyst and are positive D. C. unless preceded by a minus sign (-) or designated A. C.

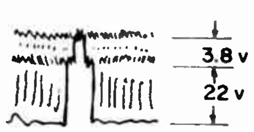
XI WAVE-FORMS

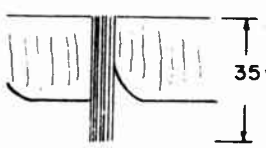
THESE WAVE-FORMS ARE SKETCHED FROM AN R.C.A. CATHODE RAY OSCILLOSCOPE WITH VERTICAL AMPLIFIERS OF EXTENDED HIGH FREQUENCY RESPONSE.

VIDEO SIGNAL OUTPUT OF PIX 2nd DETECTOR AT JUNCTION OF L188 AND R139 (60~)

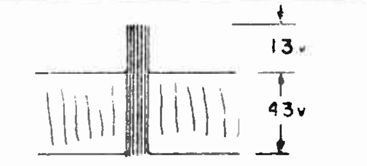


VIDEO SIGNAL OUTPUT OF 1st VIDEO AMPLIFIER AT JUNCTION OF L190 AND C149 (60~)

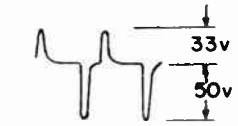
VIDEO SIGNAL OUTPUT TO GRID OF KINESCOPE AT JUNCTION OF L192 AND C151 (60~)



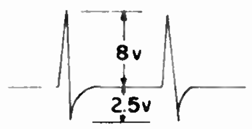
OUTPUT OF SYNC CLIPPERS V115 AND V116 AT PIN 3 OF EITHER TUBE (60~)



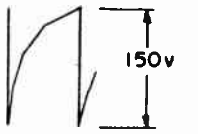
OUTPUT OF 2nd SYNC AMPLIFIER AT PIN 2 OF V117 (6SN7) (60~)



DIFFERENTIATED OUTPUT OF HORIZONTAL OSCILLATOR AT JUNCTION OF C176 AND C177 (15,750~)

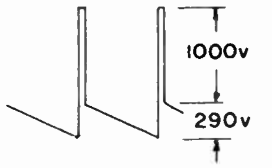


VERTICAL SYNC PULSE AT JUNCTION OF TERMINAL 3 OF THE VERTICAL INTEGRATING NETWORK AND THE YELLOW WIRE OF VERTICAL OSCILLATOR TRANSFORMER (6J5 VERT OSC (V118) REMOVED FROM SOCKET) (60~)

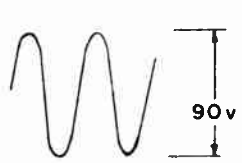


HORIZONTAL SAW TOOTH AT PIN 5 OF V122 6BG6 HORIZONTAL OUTPUT (15,750~)

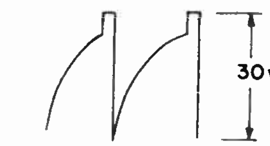
VERTICAL OSCILLATOR GRID PULSE (60 cycles) AT PIN 5 OF V118 6J5 (60~)



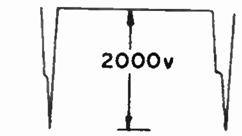
AMPLIFIED VERTICAL SAW-TOOTH AT PIN 3 OR 4 OF V119 6K6 VERTICAL OUTPUT (60~)



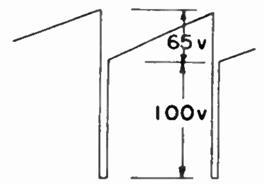
SINE WAVE AT TERMINAL A OF T108, SYNC DISCRIMINATOR TRANSFORMER (15,750~)



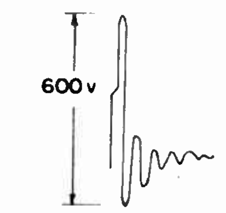
SINE WAVE PLUS HORIZONTAL SYNC PULSE AT TERMINAL F OF T108 SYNC DISCRIMINATOR TRANSFORMER (15,750~)



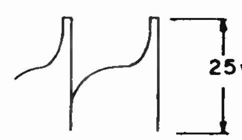
HORIZONTAL PULSE VOLTAGE TO YOKE AT TERMINAL 7 OF HORIZONTAL OUTPUT TRANSFORMER (15,750~)



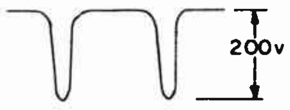
VERTICAL SAW-TOOTH AT PIN5 OF V119 6K6 VERTICAL OUTPUT (60~)



AGC KEYING PULSE AT PIN 5 OF V114 6AU6 AGC KEYING TUBE (15,750~)



SINE WAVE PLUS HORIZONAL SYNC PULSE AT TERMINAL D OF T108, SYNC DISCRIMINTOR TRANSFORMER (15,750~)



OUTPUT OF PLATE CIRCUIT OF HORIZONTAL OSCILLATOR AT PIN 3 OF V121 6K6 (15,750~)

RECEIVER LOCATION—Advise the owner as to the proper location for the television receiver. The following may be used as a guide:

1. Choose an area in the home where sunlight or light from lamps does not strike the face of the picture tube and cause glare.
2. Remember the necessity of an electrical outlet and the location of the point at which the antenna leads enter the room.
3. The receiver should be placed a short distance from the wall to allow adequate ventilation.
4. The receiver should be placed to permit easy access for operation and comfortable viewing from all angles.

ANTENNA—This receiver has been designed to use an antenna with a 300 ohm balanced transmission line. This line must be as short as possible because the longer the line the greater the chances are for picking up electrical disturbances. Stand-off insulation should be used to keep the line away from the mast, metal or walls. Twist this line about one turn per foot throughout the line to cancel out direct signal and/or noise pickup by the transmission line. It should also be securely anchored in place so that a change in weather will not affect its position.

HIGH VOLTAGE WARNING

This television receiver contains high voltages which are dangerous to life. Never operate or service the receiver outside of the cabinet or with the covers removed until all the safety precautions necessary for working with high voltage equipment have been observed.

PICTURE TUBE HANDLING PRECAUTION

Shatterproof goggles and heavy gloves must be worn by individuals while handling the picture tube or installing the picture tube into the receiver.

The picture tube encloses a high vacuum and due to the large surface area, is subjected to excessive air pressure. Therefore, care should be taken not to bump or scratch the picture tube accidentally as it may cause the tube to implode resulting in damage to property or injury to an individual.

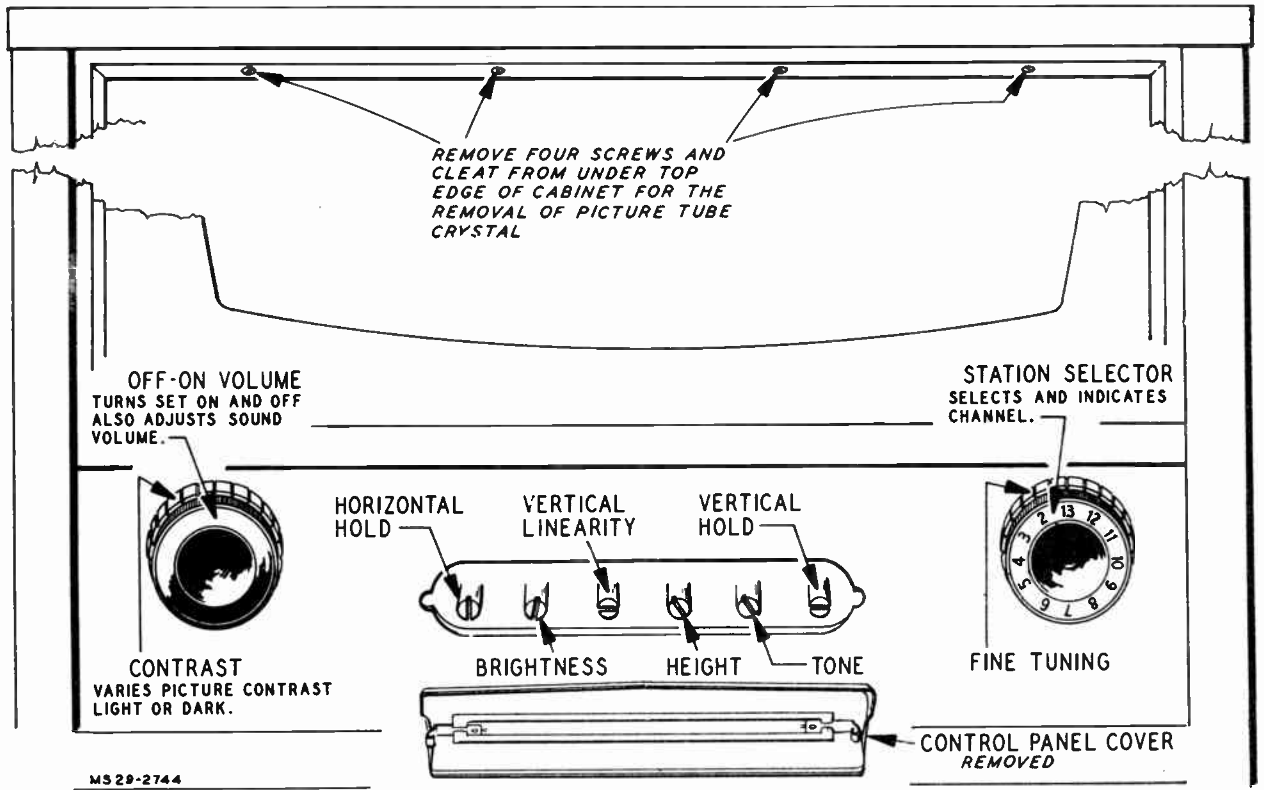

Fig. 2—Front Panel Controls.

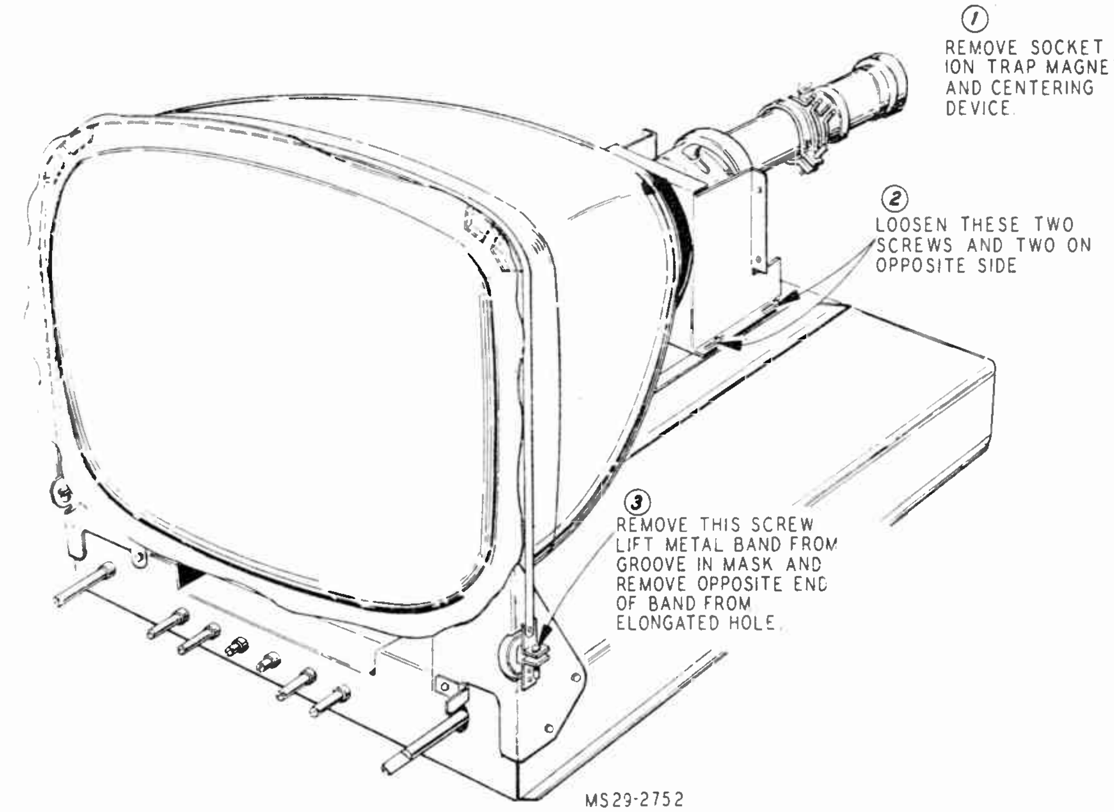

Fig. 3 — Removal Of Picture Tube

TUNING PROCEDURE

1. To turn the television receiver on, turn the OFF-ON VOLUME control clockwise until a click is heard. Allow approximately 30 seconds for the tubes to warm up.
2. Turn the STATION SELECTOR control to the desired channel. This control may be turned in either direction.
3. Turn the CONTRAST control clockwise until activity or definite form is noted on the screen.
4. Adjust the FINE TUNING control for clearest picture and the VOLUME control for desired volume.
5. To turn off the receiver, turn the OFF-ON VOLUME control counterclockwise until a click is heard.

OCCASIONAL ADJUSTMENTS TO IMPROVE PICTURE RECEPTION

There are six controls at the front of the chassis. These controls are accessible after the removal of the control panel cover at the front of the cabinet. Control panel may be removed with fingers. Pull both ends at once. (See illustration on Page . The controls are pre-set at the factory and may occasionally need adjustment due to aging of the components in the receiver and the fluctuating line voltages in different areas. If any adjustments are necessary, follow the instructions under "Controls and Functions."

IMPORTANT—Be sure that the FINE TUNING control has been set for the clearest picture before adjusting any controls.

CONTROLS AND FUNCTIONS

HORIZONTAL HOLD—Stops horizontal movement (diagonal bars.)

BRIGHTNESS—Adjusts for desired picture brilliance.

VERTICAL LINEARITY—Adjusts picture symmetry, top to bottom.

HEIGHT—Adjusts picture to fit mosk vertically.

VERTICAL HOLD—Stops upward or downward picture movement.

TONE—Adjusts for tonal quality bass or treble.

RECORD PLAYER CONNECTION AND TV-PHONO SWITCH

This receiver has a PHONO socket located at the rear of the chassis. When it is desired to play records through the receiver, insert the connector on the cable of any standard record player or changer into this socket. Push the TV-PHONO switch (at rear of receiver) to PHONO and use the volume control to adjust the sound level.

NOTE — Be sure to push the TV-PHONO switch back to the TV position when through playing records, otherwise receiver will not operate.

PICTURE TUBE SAFETY GLASS — It will be necessary to clean this glass and the face of the picture tube occasionally. Remove the safety glass carefully as outlined in the illustration on page .

CAUTION—UPON REMOVAL OF THE LAST SCREW AND THE CLEAT THE GLASS WILL FALL FORWARD. SUPPORT THE GLASS WITH ONE HAND AS YOU LIFT IT GENTLY FROM THE CABINET. Clean the safety glass and the face of the picture tube with a soft lint-free cloth dampened with water or mild soapsuds.

PICTURE TUBE REPLACEMENT — To replace the picture tube it is necessary to remove the chassis from the cabinet. This may be accomplished in the following manner:

1. Remove the front panel control knobs by pulling them straight from their shafts.
2. Remove the cabinet back. You will note that the interlocked line cord disconnects the power when the cabinet back is removed.
3. Disconnect the leads from the speaker, remove the antenna terminal board at the rear of the cabinet and then the five chassis mounting bolts. Pull chassis CAREFULLY out of the cabinet.
4. Remove the picture tube as shown and outlined in the illustration. To install a new picture tube, reverse the procedure making sure that the picture tube fits close against the picture tube cushion. If the picture tube sticks or fails to slip into place smoothly, investigate and remove the source of the trouble. Never force the tube. It is important that all the clips and shims used in mounting the tube be replaced, otherwise difficulty may be encountered when horizontal or vertical centering is required.

WARNING — Before handling the picture tube, it will be necessary to remove the static charge. In receivers with glass picture tubes, ground the anode lead to chassis, and insert an insulated wire from the well in the tube to chassis. In receivers with metal picture tubes, remove the static charge by grounding an insulated wire from the chassis to the metal portion of the tube.

FRONT OF CHASSIS

(Accessible After The Removal of Front Panel Control Cover)

Horizontal Hold	R-80
Brightness	R-32
Vertical Linearity	R-54
Height	R-47
Tone	R-115
Vertical Hold	R-43

NON-OPERATING CONTROLS
REAR OF CHASSIS

Horizontal Centering, Vertical Centering	Centering Device
Ion Trap Magnet	Wing Nut Adjustment
Deflection Yoke	Wing Screw
Width	L-19
Horizontal Linearity	L-18
Horizontal Drive	R-77
Horizontal Frequency	L-17

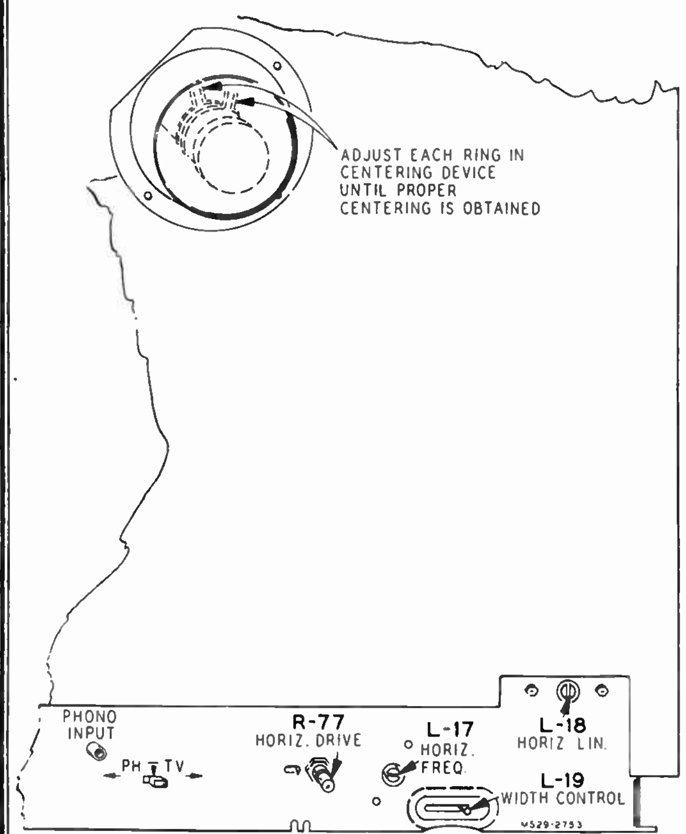

Fig. 4—Adjustments Rear of Chassis

ION TRAP MAGNET ADJUSTMENT — The ion trap magnet should be positioned close to the base of tube. From this position adjust the magnet by moving it back and forth and at the same time rotating it slightly around the neck of the picture tube until the brightest raster is obtained on the picture screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Re-adjust the ion trap magnet for maximum raster brilliance.

DEFLECTION YOKE ADJUSTMENT— If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

CENTERING ADJUSTMENT — If horizontal or vertical centering is required, adjust each ring in the centering device until proper centering is obtained.

PICTURE ADJUSTMENT — For further adjustments, obtain a test pattern on the receiver. Turn on receiver and follow tuning procedure on page 2. When a test pattern is obtained it may be necessary to slightly re-adjust the fine tuning control for clearest picture.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT —Tune in a station and adjust the horizontal hold control until the picture falls into sync. Momentarily remove the signal by switching off channel and then back. The picture should pull into sync over a range of 90° rotation of the horizontal hold control. If in the above check the receiver fails to hold sync or the pull-in range is at the extreme end of the control, and is less than 60°, it will be necessary to make the following adjustment.

HORIZONTAL FREQUENCY ADJUSTMENT —With the horizontal hold control set to the center of its range of rotation, adjust the horizontal frequency control (L-17) until the picture pulls into sync. Recheck the "Horizontal Oscillator Alignment."

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS — Adjust the height control (R-47) until the picture fills the mask vertically. Adjust the vertical linearity control (R-54) until the picture is symmetrical from top to bottom. Adjust the picture centering device to align picture with the mask. Adjustment of any control will require a re-adjustment of the other controls.

WIDTH, DRIVE AND LINEARITY ADJUSTMENTS — Turn the horizontal drive control clockwise (R-77) until white bars appear at the left center portion of the raster. Then turn counterclockwise until the white bars just disappear. This adjustment will allow the horizontal system to operate at maximum efficiency. Adjust width control (L-19) until the picture fills the mask. Adjust the horizontal linearity control (L-18) for best linearity. Adjust picture centering device to align the picture with the mask.

CHECK OF R-F OSCILLATOR ADJUSTMENTS

The oscillator is preset at the factory and normally needs no adjustment. However, if adjustments are required, they can be made without removing the chassis from the cabinet. Remove the channel selector and fine tuning knobs from the tuning shaft.

TEST PROCEDURE:

1. Set channel selector to receive desired station.
2. Set fine tuning control in center of its range.
3. Adjust oscillator slug, with bakelite type screwdriver, for best picture resolution.
4. Repeat steps 1, 2 and 3 on all channels used.

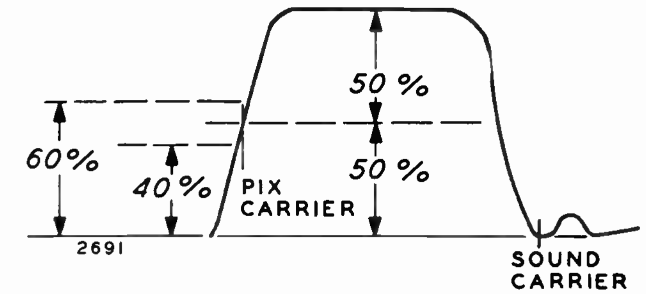

Fig. 6 — Sweep Patterns

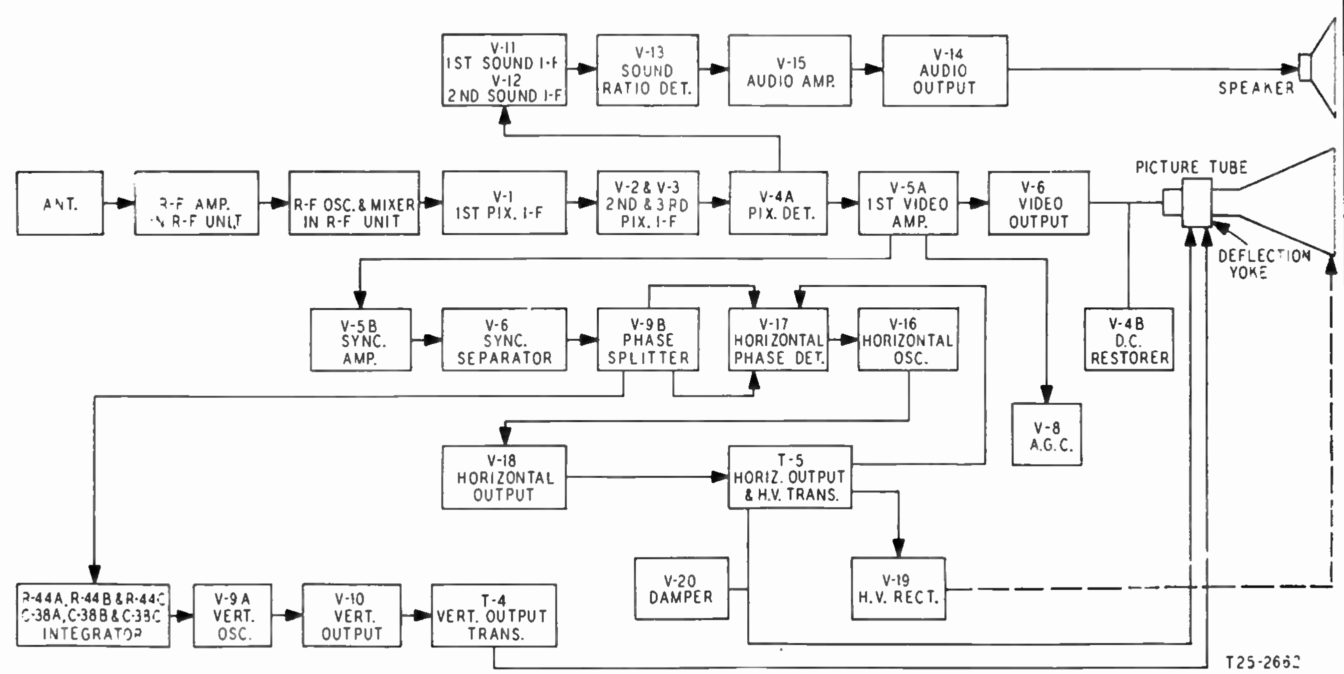

Fig. 7 — Block Diagram.

SERVICE SUGGESTIONS

NO RASTER ON PICTURE TUBE —If raster cannot be obtained check below for the possible causes.

1. Ion trap magnet adjustment is incorrect.
2. No +B voltage. Check ¼ ampere fuse. Replace if defective. If fuse continually burns out, check (A) Horizontal output tube V-18 (6BG6-G). (B) Check damper tube V-20 (6W4-GT). (C) Check horizontal oscillator V-16 (6SN7-GT) for proper operation. (D) With an ohm-meter, check for a short between terminal 4 of the horizontal output transformer (T-5) and the chassis. (E) Check DC resistance of T-9.
3. No high voltage. Check V-18, 19 and V-20 tubes and circuits. If the horizontal deflection circuits are operating as evidenced by the correct voltage measured on pin 3 of the damper tube (V-20), the trouble can be isolated to the high voltage rectifier V-19 circuit. Either the high voltage winding to the 6BG6-G plate and 1B3 plate is open, tube V-19 is defective, its filament circuit is open, or the high voltage filter capacitor C-83 is shorted.
4. Defective picture tube. Heater open or cathode return circuit open.

HORIZONTAL DEFLECTION ONLY —If only horizontal deflection is obtained as evidenced by a straight line across the face of the picture tube, it can be caused by the following:

1. Vertical oscillator V-9A (6SN7-GT) or vertical output tube V-10 (6S4) inoperative. Check voltages on grid and plate.
2. Vertical oscillator transformer (T-7) defective.
3. Vertical output transformer (T-4) open or shorted.
4. Yoke vertical coils open.
5. Vertical hold, height or linearity controls may be defective.

POOR VERTICAL LINEARITY — If adjustment of the height and linearity controls will not correct this condition, any of the following may be the cause.

1. Check variable resistors R-47 and R-54.
2. Vertical output transformer (T-4) defective.
3. Capacitors C-40, C-77 or C-88A defective.
4. V-9A (6SN7-GT) or V-10(6S4) defective, check voltages.
5. Excess leakage or incorrect value of capacitor C-41, or open or incorrect value of resistors R-50 & R-51.
6. Low plate voltages. Check rectifier tubes and capacitors in+B supply circuits.
7. Capacitor C-42 defective.
8. Vertical deflection coils defective (part of L-16 yoke).

POOR HORIZONTAL LINEARITY — If adjustment of the Horizontal drive and linearity controls does not correct this condition, check the following:

1. Check or replace horizontal output tube V18.
2. Check or replace damper tube V-20 (6W4-GT).
3. Check capacitors C-81, C-82, C-84 and horizontal linearity control (L-18) for defects.
4. Horizontal deflection coils defective (part of L-20 yoke).

TRAPEZOIDAL OR NONSYMMETRICAL RASTER

1. Improper adjustment of focus coil or ion trap magnet.
2. Defective yoke.

WRINKLES ON LEFT SIDE OF RASTER —This condition can be caused by:

1. Defective yoke due to C-85 or R-92 (internal in yoke assembly) being wrong value or open. These components are mounted in rear of yoke assembly.
2. V-20 (6W4) defective.

SMALL RASTER — This condition can be caused by:

1. Low +B or line voltage. Check V-21 (5U4G).
2. Insufficient output from horizontal output tube V18. Replace tube.
3. Insufficient output from vertical oscillator tube V-9A or vertical output tube V-10. Replace tubes.
4. Incorrect setting of horizontal drive control R-77.
5. V-20 (6W4) defective.

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND —This condition can be caused by:

1. No signal on picture tube grid. Check V-5A (12AT7) & V6A (12AU7) tubes and associated circuits.
2. Bad contact to picture tube grid (lead to socket broken).

SIGNAL APPEARS ON PICTURE TUBE GRID BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE VERTICALLY AND HORIZONTALLY —A condition of this nature can be caused by:

1. Defective sync amplifier V-5B or separator V-6A or phase splitter V-9B.
2. If tubes are O.K. check voltages, and associated circuits.
3. AGC system inoperative. Check V-8 (6AU6) AGC tube and associated circuits.

SIGNAL ON PICTURE TUBE GRID AND HORIZONTAL SYNC ONLY —If this condition is encountered, check:

1. Vertical integrating network capacitors C-38A, B & C, and resistors R-44 A, B & C.
2. Vertical hold control R-48 defective.

PICTURE STABLE BUT WITH POOR RESOLUTION —If the picture resolution is not up to standard, it may be caused by any of the following:

1. Defective pix I-F tubes V-1, 2 & 3, (6CB6's).
2. Defective picture detector V-4A (6AL5) or video amplifier V-5A or video output V-6B (12AU7).
3. Defective picture tube.
4. Open video peaking coil. Check all peaking coils L-5, L-6, L-7, L-8, L-10 and L-11 for continuity. Note that L-7, L-8 and L-10 have shunting resistors.
5. Leakage in V-6A (12AU7) grid capacitor C-24. If the above component is not found to be defective, check the following:

1. Check all potentials in video circuits.
2. Check picture tube grid circuit for poor or dirty contact.
3. Check and realign, if necessary, the picture I-F and R-F circuits.

PICTURE SMEAR:

1. Normally, smear can be attributed to phase shift at the low frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits. Check for grid current on video output tube V-6B (12AU7).
2. This trouble can also originate at the transmitter. Check reception from another station.
3. Check and realign, if necessary, the picture I-F and R-F circuits.

PICTURE JITTER:

1. If regular sections at left of the picture are displaced, replace the horizontal oscillator tube V-16.
2. Vertical instability may be due to loose connections or noise received with the signal.
3. Horizontal instability may be due to unstable transmitted sync or to noise.
4. Check receiver AGC system for proper operation.
5. Check phase splitter V-9B (6SN7-GT).

ALIGNMENT PROCEDURE

TEST EQUIPMENT —To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR meeting the following requirements:

(a) Frequency ranges:
  18 to 30 mc, 10 mc sweep width
  40 to 90 mc, 10 mc sweep width
  170 to 225 mc, 10 mc sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR to provide the following frequencies: (Output on these ranges should be adjustable and at least .1 volt maximum.)

(a) Intermediate alignment frequencies.

23.1 mc first picture I-F coil.
24.1 mc third picture I-F coil.
25.9 mc second picture I-F coil.
21.7 mc sound trap.
4.5 mc video trap & sound I-F.
25.1 mc converter plate coil (Tuner).

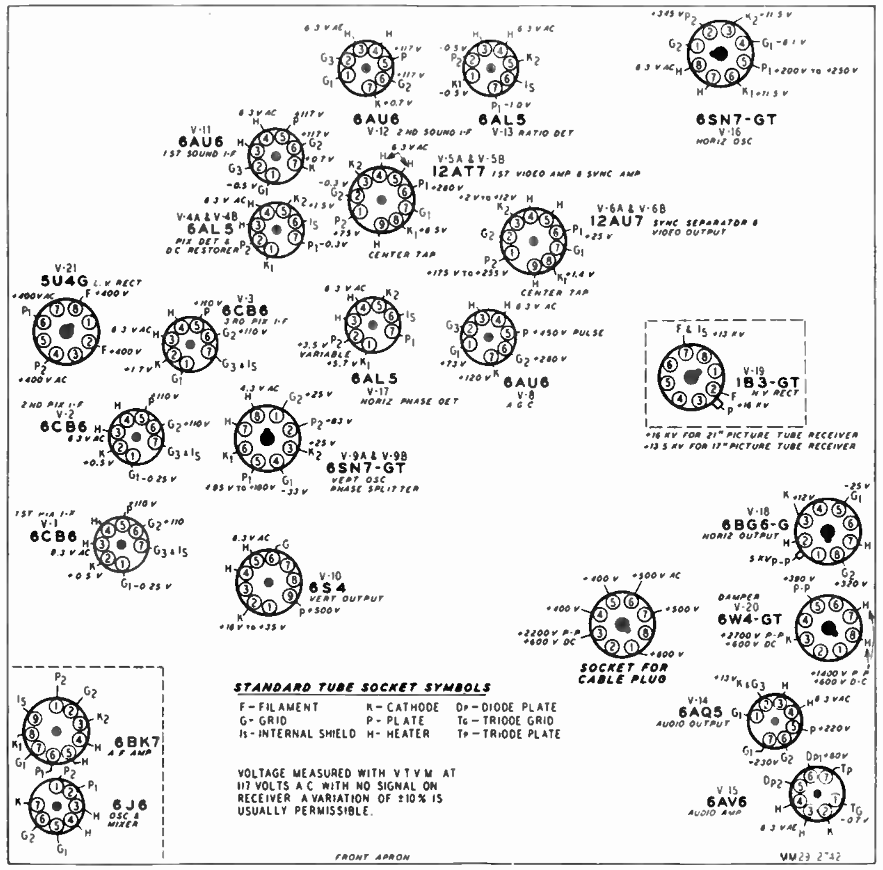

Fig. 8 — Bottom Socket Voltages

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal controlled.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 20 kilovolts.

SERVICE PRECAUTIONS — To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the cabinet back, disconnect the leads from the speaker, remove the antenna terminal board at rear of cabinet, and then the 5 chassis mounting bolts. The chassis may be serviced with the picture tube in place provided the chassis is turned on its side with the power transformer on the bottom. The weight of the chassis will be supported against the high voltage housing.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high voltage filter resistor R-99.

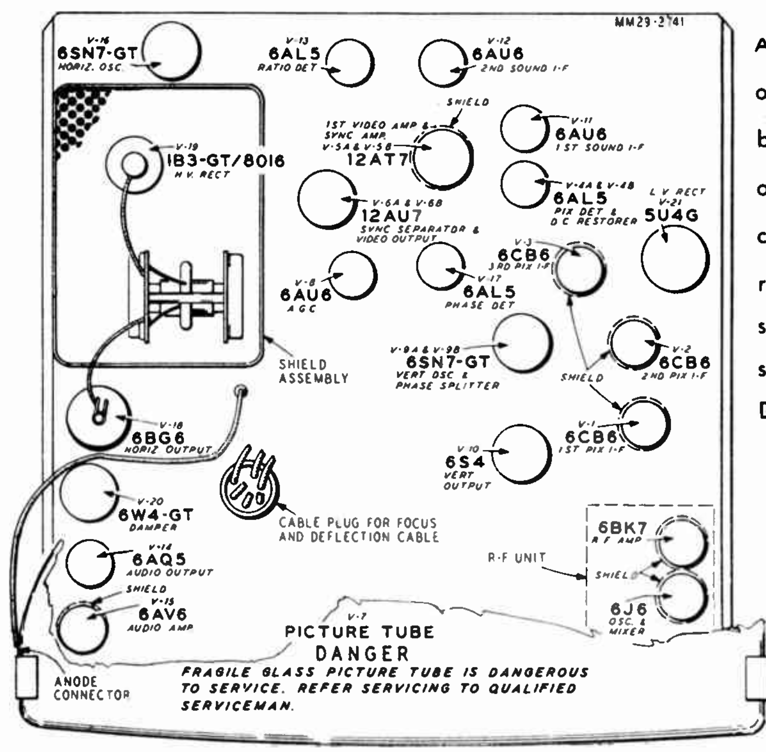

Fig. 9 — Tube Layout

ALIGNMENT PROCEDURE

PIX I-F

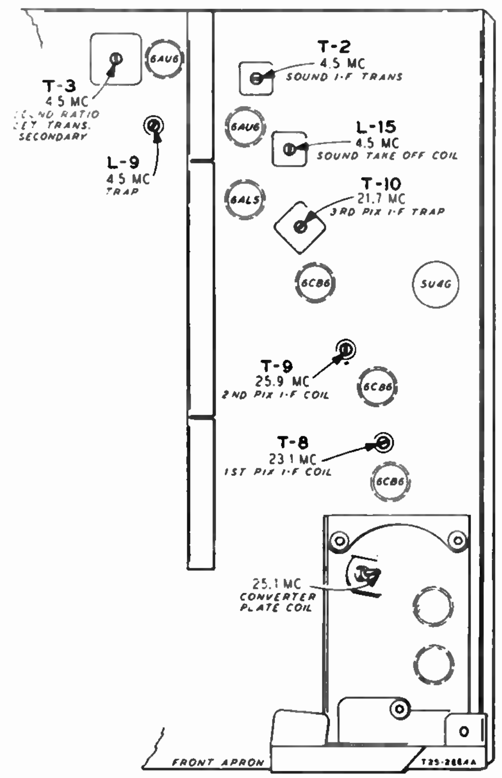

Fig. 10 — Top Chassis Video and Audio I-F Adjustments

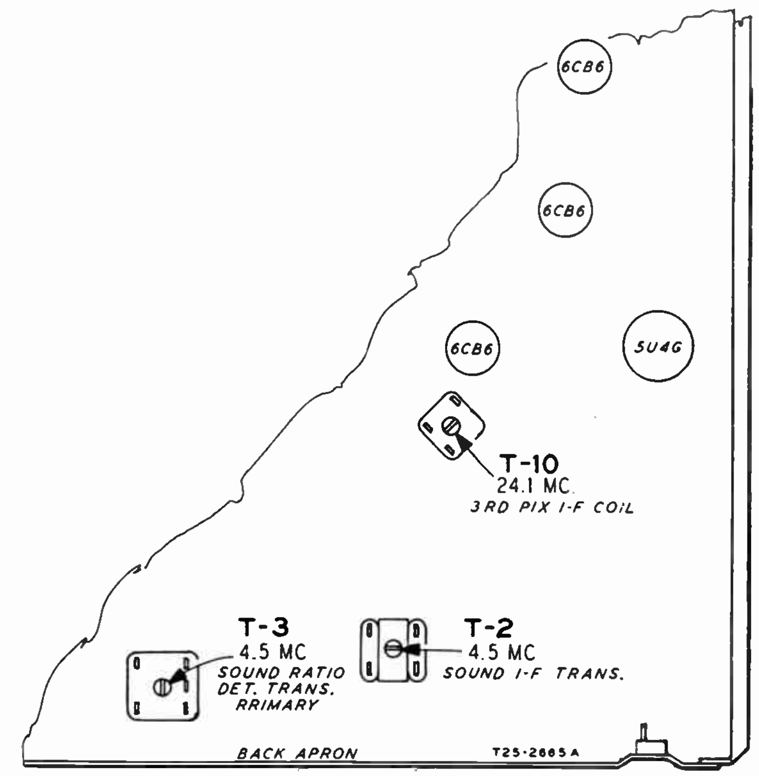

Fig. 11 — Bottom Chassis Video and Audio I-F Adjustments

A. Unmodulated R-F signal into Converter Grid by means of tube shield insulated from base. VTVM with filter in lead of 10 K ohms and 5000 mmf connected to pic. det. load resistor, (R-18) 5600 ohms, in series with peaking coil (L-6) from Pin 7 of 6AL5. Input signal level should be such that output is less than 2 volts DC. Apply -3.0V battery Bias on AGC line.

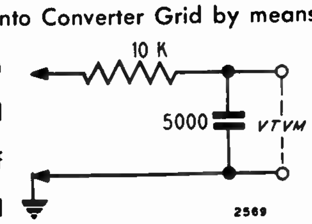

Fig. 12 — VTVM Connections

	FREQUENCY	ADJUST
1.	25.1 MC	Converter plate coil (on top of tuner) for maximum dc at picture detector.
2.	23.1 MC	1st picture I-F coil (T-8 above chassis) for maximum dc at picture detector.
3.	25.9 MC	2nd picture I-F coil (T-9 above chassis) for maximum dc at picture detector.
4.	24.1 MC	3rd picture I-F coil (T-10 below chassis) for maximum dc at picture detector.
5.	21.7 MC	3rd picture I-F trap (T-10 in can above chassis) for minimum dc at picture detector.

B. I-F Sweep Generator into converter grid by means of tube shield insulated from base. Connect oscilloscope across R-18 (in place of VTVM). Apply -3.0V bias (DC) to AGC line (battery). Tuner should be switched to dead channel so as not to cause interference.

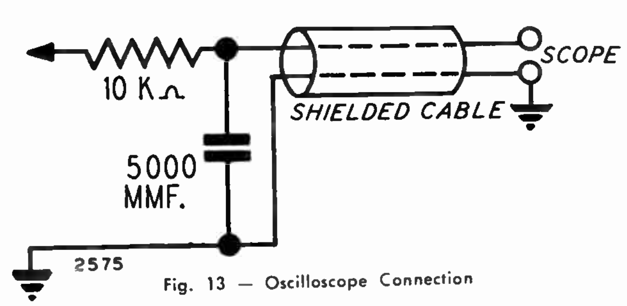

Fig. 13 — Oscilloscope Connection

ALIGNMENT PROCEDURE (continued)

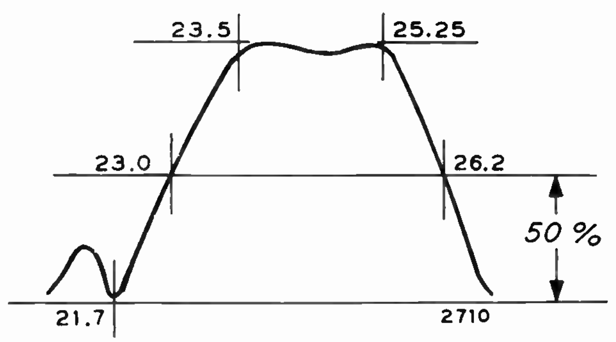

Fig. 14 — Overall Response Curve

Observe overall I-F response, which should be as shown above: A slight touch-up may be required. At no time should the trap coil be re-adjusted, nor should it be necessary to turn any of the picture I-F coils more than 1/2 turn of the slug. The following comments are suggestions only:

1. The height of the 26.2 MC marker is controlled by the 25.1 MC (Converter Plate Coil on tuner) and the 25.9 MC (2nd P.I.F.) coils.
2. The uniformity of response (flatness across top and position of 23.5 MC) marker is controlled for the most part by the 24.1 MC third picture I-F coil.
3. The 23.0 MC marker position is controlled by the first picture I-F (23.1 MC coil). However, it is NOT advisable to change the setting of the coil, due to its effect on sound rejection. Its adjustment should be avoided unless believed to be absolutely necessary.

VIDEO

With 4.5 MC unmodulated signal from a high impedance source, (10,000 ohms in series with generator), into plate of pix det. tube (Pin 7 of 6AL5 second detector) and VTVM on picture tube grid, tune 4.5 MC trap L-9 (top of chassis) for minimum response. VTVM on 0-10V AC scale.

AUDIO I-F

Ground sound AGC (bottom of sound take-off coil) With signal generator set to 4.5 MC and dc V.T.V.M. connected to ratio detector (6AL5 Pin No. 7) adjust sound take-off coil (L-15), sound I-F primary and secondary (T-2), and ratio detector primary (T-3 bottom) for max. voltage. Select output levels on signal generator which will maintain d-c voltage about 10 volts.

With same setup as above except dc V.T.V.M. is connected as follows: Ground side of V.T.V.M. is connected to junction of 5600 ohm resistors (R-63 & R-64) across pins 5 and 7 of 6AL5 ratio detector and high side of V.T.V.M. is connected to ratio detector audio output at junction of 68,000 ohm resistor (R-62) and 470 mmf condenser (C-55).

Align ratio detector secondary (T-7 Top) for crossover (0 voltage) as read on V.T.V.M. lowest scale (3 V.).

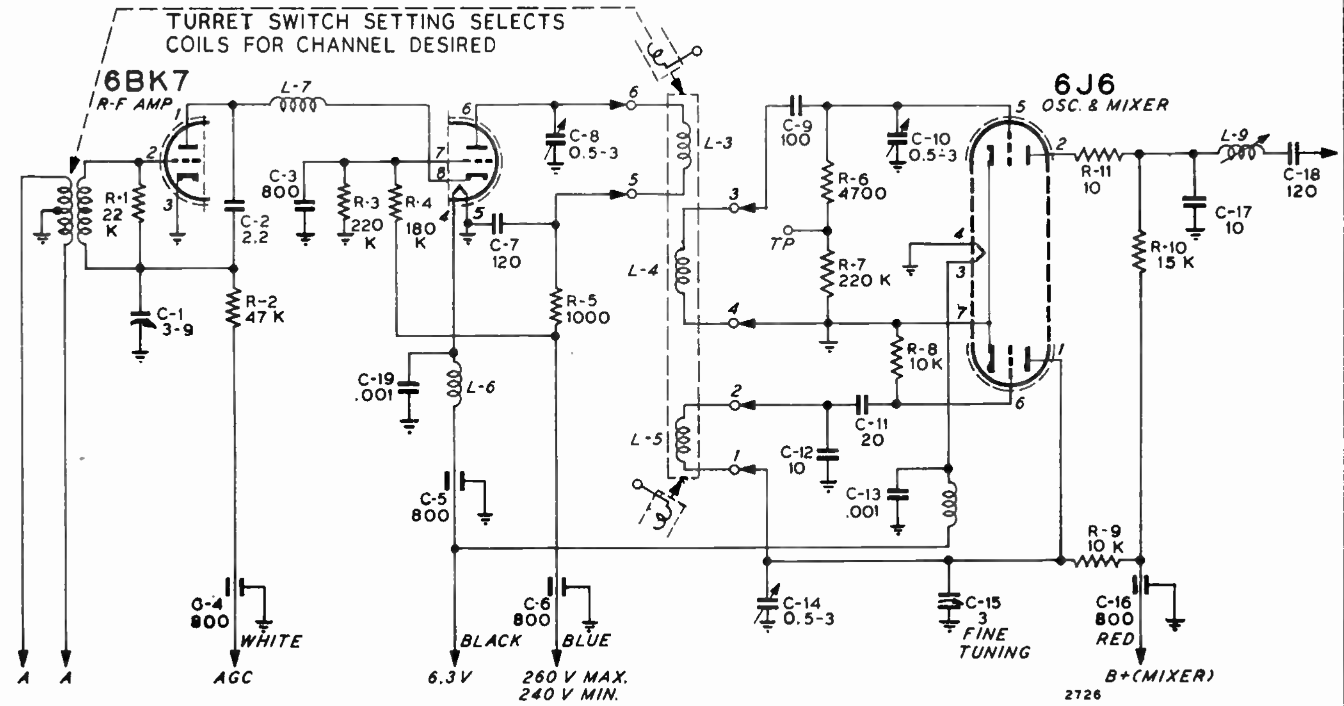

Fig. 18 — Cascode Tuner Schematic Diagram

TUNER ALIGNMENT

A. Sweep generator with balanced 300 ohm output to antenna terminals. Marker generator output to antenna terminals. Oscilloscope to "tie point" (Figure 15) on tuner. Connect 1½ V bias to AGC line at junction of R-1 and C-1 on the receiver.

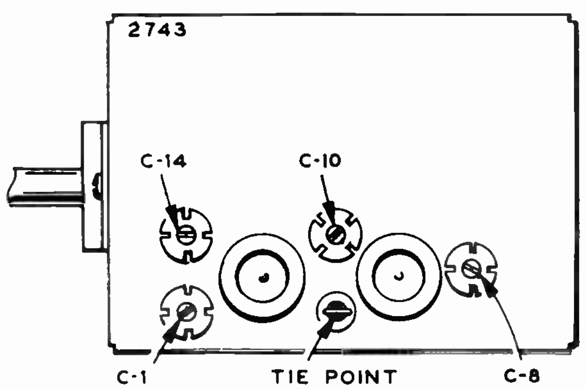

Fig. 15 — Top Tuner Adjustments

B. RF AND CONVERTER ADJUSTMENT.
1. With channel selector on Channel 12, adjust C-1 slightly favoring the Pix carrier, then adjust C-10 and C-8 for response as in Figure 16. Picture and sound markers at 90% maximum response.
2. Check response on all channels. If markers are below 70% on any channel, readjust C-1, C-10 and C-8. Recheck all channels.

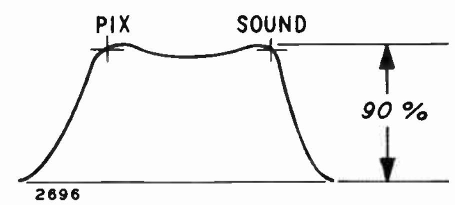

Fig. 16 — Pix and Audio Markers

C. OSCILLATOR ADJUSTMENT.

1. Apply -3 volts on IF AGC line.
2. Connect oscilloscope to output of video detector. Place fine tuning in center of range. Check response on all channels. Sound marker should be in notch and picture marker at 50%. (See Figure 14). If markers are all off in some directions set channel selector on Channel 13 and adjust C-14.
3. If some channels are off, individual oscillator coil slugs will require adjustment. Adjust each channel slug, accessible through hole in front of chassis with a non-metallic screwdriver to bring sound marker to correct position.

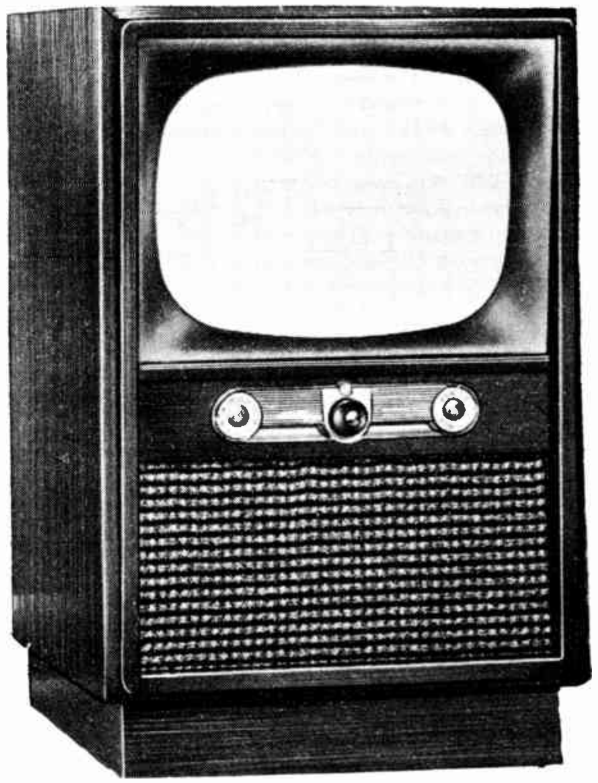
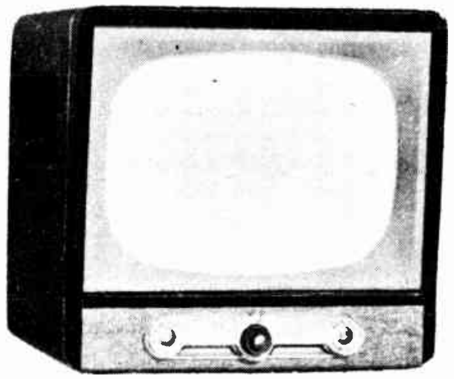
GENERAL DESCRIPTION

The models covered in this manual are an 18 tube, including the picture tube, 20 tubes with the UHF Tuner incorporated, AC operated, direct view, 17 and 21-inch rectangular television receivers. The receivers are complete in one unit and feature full coverage of all 12 V.H.F. channels and complete coverage of the entire UHF band with the UHF Tuner, automatic gain control, automatic horizontal frequency control, inter-carrier sound system, electrostatic focusing, magnetically deflected picture tube and a sync stabilizer switch and control to adjust the operational characteristics of the receiver for various signal areas.

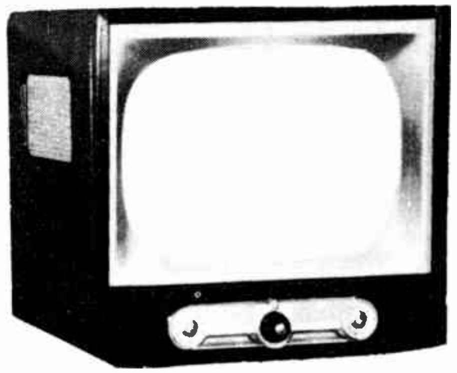
At the rear of the receivers is a safety interlock to prevent dangerous electrical shock and as an added safety measure, a fusible resistor is located in the low voltage power supply to protect the receiver in case of overloading.



2D1315A, 21" TV Mahogany.
2D1325A, 21" TV Blond.



2D2312A, 17" TV Brown Leatherette
2D2314A, 21" TV Green Leatherette



2D2321A, 21" TV Mahogany Finish
2D2322A, 21" TV Mahogany Finish with UHF Tuner installed.

WARNING

At all times during operation the top chassis plate is at 125 volts DC potential above ground and it also may be at the line-voltage potential depending on how the line cord plug is inserted in the power receptacle.

Extreme caution must be observed when working with the chassis outside the cabinet and when power is applied to the receiver with the cabinet back removed. SEVERE SHOCK may result from contact with chassis.

Use an isolation transformer between the line cord plug and power receptacle when service is required. This removes all shock hazards and is the ONLY safeguard. Damage to the receiver and test equipment may result without the use of an isolation transformer.

MODEL IDENTIFICATION CHART

MODEL	CHASSIS	CABINET	TYPE
2D-1315A	21T1A	Console	Mahogany
2D-1325A	21T1A	Console	Blond

* UHF Tuner Incorporated ** 17-Inch Receiver

CONTROLS

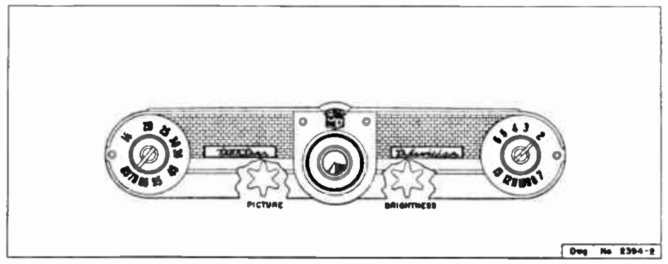

Figure 1. Front Controls.

OPERATOR'S CONTROLS

On-Off Volume – Turns the receiver on or off and adjusts the sound volume level.
Contrast or Picture – Varies the contrast between the light and dark portions of the picture.
Tuning – Tunes the receiver to the desired station or channel. May be turned in either direction.

Brightness – Controls the brilliance of the picture.

V. Hold – Controls synchronization of the picture vertically.

H. Hold – Controls synchronization of the picture horizontally.

SERVICEMAN'S CONTROLS

V. Size – Controls the size of the picture vertically.

V. Linearity – Controls vertical distribution of picture.

Fringe-Suburban-Local Switch – Three position switch for selection of the proper operational characteristics of the receiver for various signal level areas.

Sync Stabilizer Adjust – Changes the operational characteristics of the receiver for the area in which the receiver is located. Control has no effect in "local" switch position.

H. Size – Controls the size of the picture horizontally. To some extent, affects the vertical size control setting.
H. Linearity Magnet – (17" only) – Controls horizontal distribution of right side of picture.
Anti-Pin Cushion Magnet – (21" only) – Eliminates pin-cushioning and keystoning.
Centering Magnet – Controls positioning of the picture for proper framing.
Ion Trap Magnet – Controls focus and picture tube illumination.

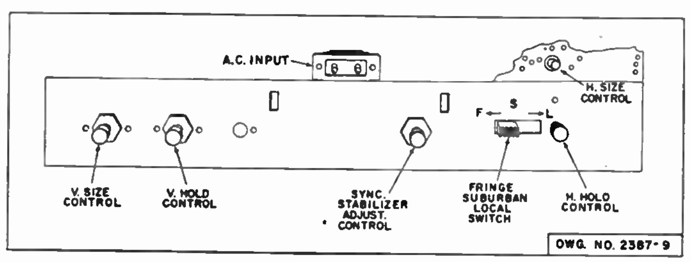

Figure 2. Rear Controls.

The front and rear controls are located as shown in figures 1, 2 and 3. Refer to figure 6 for the location of the vertical linearity control. Note that the vertical hold control in figure 2 has a red rubber knob for easy identification.

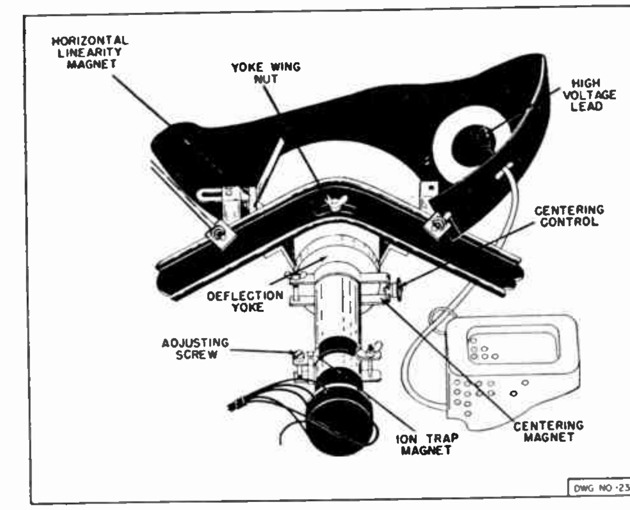

Figure 3A. 17-inch Tube Assembly.

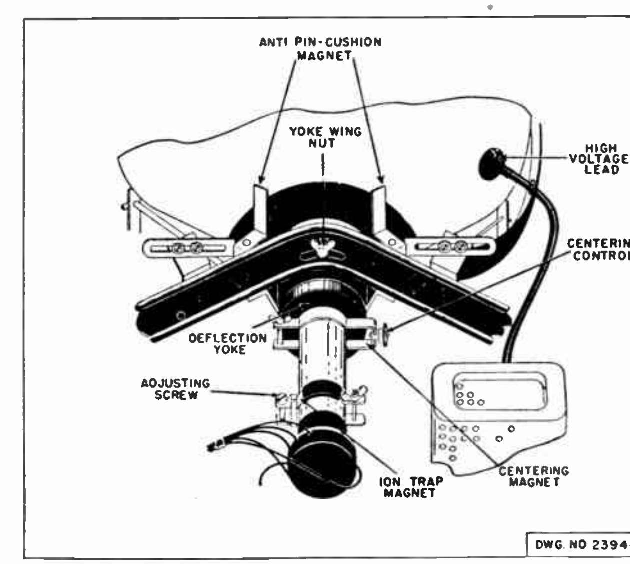

Figure 3B. 21-inch Tube Assembly.

SERVICE DATA

SPECIFICATIONS

Sensitivity at the Antenna
Video - 150 microvolts
Audio - 150 microvolts
(one volt above noise at detector)

Antenna Impedance Requirements
Balanced 300-ohm

Audio Power Output Rating
2 watts undistorted

Speaker
Permanent magnet type
3.2 ohm voice coil impedance

Power Supply Rating
115 volts 60 Cycles, AC
Power Consumption, 220 watts

Intermediate Frequencies
Video - 26.75 mc.
Audio - 22.25 mc.
Intercarrier Sound- 4.5 mc.

Dimensions
17" Chassis - 16" x 16½" x 2½"
21" Chassis - 19" x 17½" x 2½"

TUBE COMPLEMENT

17	6AX4GT	Damper
18	1X2A	High Voltage Rectifier
19	6AF4	UHF Oscillator
20	6BK7	UHF Pre-IF Amplifier

WARNING:

High voltage on the plate caps of the 1X2A high voltage rectifier and the 25BQ6 horizontal pulse amplifier. DO NOT MEASURE this voltage.

Schematic Diagram:

The schematic diagram located at the rear of this manual shows all the values of resistance and capacitance and gives all the proper voltages at the pins of the tube sockets. The voltage readings were taken with a 20,000 ohm/volt voltmeter with normal operation, no signal input, and line voltage at 115 volts A.C.

Replacing Tubes

Before replacing the tubes the cabinet back must first be removed. Removing the cabinet back disengages the safety interlock and removes the power to the receiver. Do not tamper with or attempt to defeat the purpose of the safety interlock as severe shock may result.

Before replacing the High Voltage tubes first be sure the power is turned off and then short the corona ring of the 1X2A to the chassis.

WARNING:

Do not remove any tubes while the receiver is in operation as over-loading and component failures may result. Also contact with the top chassis plate during operation may produce a severe shock.

If the receiver has been in operation for some time, the tubes become hot and gloves should be used when replacing tubes to prevent finger burns.

Picture Tube Handling:

Due to the large surface and extreme high vacuum of the picture tube, care should be used when handling the chassis outside the cabinet. Do not subject the tube to excessive pressure of rough handling as an implosion may result causing serious personal injury.

High Voltage Power Supply:

In the process of inspection, repairs, changing of tubes or transformers, or for any other reason where it is necessary to work within the high voltage power supply, the following should be closely observed.

1. Terminals on the 1X2A socket must be dressed toward the inside of the corona ring and be free of sharp protrusions.
2. The corona ring must be dressed in such a way as to make its presence useful; that is, properly centered and about 1/8-inch below the socket terminals.
3. All leads must be dressed as far away as possible from the transformer winding. Excess lead length should be transferred to the top side of the chassis.

When replacement of the H.V. deflection transformer is necessary, be sure to closely follow the precautions listed above. The transformer can easily be replaced with the chassis in the cabinet by the following procedure.

1. Remove two (2) hex head screws on either side of the H. Size control.
2. Disengage the H.V. lead holder ring. (back side of shield can)
3. Remove 25BQ6 plate cap.
4. Remove shield can by pushing back side of shield can toward front and lifting up.

SERVICE ADJUSTMENTS

Vertical Size and Vertical Linearity Controls (R-73 and R-75):

The vertical size and linearity controls should both be adjusted at the same time while a test pattern is being transmitted. The linearity control affects the upper portion of the picture while the size control affects the overall size especially the lower portion of the picture. Adjust both controls simultaneously until the test pattern is symmetrical and fills the entire screen vertically. Readjust the vertical hold control if necessary.

CAUTION:

The vertical linearity control is on the top chassis plate, therefore, severe shock may result from contact. If an isolation transformer is unavailable, use an insulated screwdriver for the adjustment to reduce shock hazards. The adjustment can be made from either the top or bottom of the chassis.

Fringe-Suburban-Local Switch (Figure 2):

The three position switch selects the proper operational characteristics of the receiver for the signal strength area in which located. The position of the switch is governed by the signal strength available.

In the Fringe position the A.G.C. voltage is reduced to a bare minimum and the sync stabilizer adjust control affects the sync clipping level to reduce noise affects.

In the Suburban position full A.G.C. is applied and the sync stabilizer adjust control functions as in the fringe position.

In the Local position full A.G.C. is applied and the sync stabilizer adjust control is disabled.

Sync Stabilizer Adjust Control (R-61):

The control varies the operational characteristics of the sync clipper stage to obtain the optimum operation point for the least effect of noise interrupting synchronization. The control should be adjusted for a steady picture.

Ion Trap Magnet (Figure 3):

The position of the ion trap magnet MUST be over the grid of the picture tube (second cylinder from the base identified by a flared forward lip). If the adjustment is necessary, loosen the wing nut and rotate until the position which gives maximum illumination is found. Adjust the screw for maximum illumination. Repeat the above two steps. Rotate and slide magnet until the best focus position is found. Tighten wing nut. Adjustment should be made with brightness and picture controls set for normal viewing.

Horizontal Size Control (Figure 2):

The horizontal size control should be adjusted until the picture fills the entire screen horizontally. A clockwise rotation will decrease size. To some extent the vertical size control setting may be affected by a major horizontal size adjustment.

Horizontal Hold Control (L-30):

The horizontal hold control is located on the rear flange of the chassis and should be adjusted in the following manner.

Set the picture control to its normal operating position. Turn the thumb screw clockwise until it reaches its stop. Turn two complete turns counter-clockwise. The thumb screw is a vernier adjustment and will then be in the center of its range.

Turn the iron core with a small screwdriver or adjusting tool until the picture is steady (no horizontal movement). Set the core to the middle of its range.

After the iron core has been properly adjusted the thumb screw should then be used as a vernier adjustment to control synchronization when necessary.

Centering Magnet (Figure 3):

The centering magnet should be rotated and the control adjusted until the picture is properly framed keeping in mind that the effect of the control is governed by the position of rotation. If the control is above or below the neck of the picture tube, the picture will be moved up or down. To the left or right of the neck of the picture tube, the picture will be moved either to the left or right.

Deflection Yoke (Figure 3):

The correct position for the deflection yoke is as far forward on the neck of the picture tube as the shape of the tube will allow. Tube shadow or a tilted raster may result from an incorrectly positioned yoke. If a positioning adjustment is necessary, loosen the yoke wing nut located at the top of the picture tube assembly (fig 2).

Horizontal Linearity Magnet - 17" only (Fig. 3A):

The horizontal linearity magnet affects the linearity of the right side of the picture only. The magnet pulls or stretches the right side and has a greater effect closer to the picture tube.

Anti-Pin Cushion Magnet - 21" only (Figure 3B):

Adjust centering until an edge of the raster is visible. Loosen the positioning screws and slide the magnet backward or forward until the edge of the raster is vertically straight. If keystoning is noticed adjust magnets in vertical plane.

SERVICE DATA

TELEVISION FREQUENCY RANGES

R.M.A. WIRE COLOR CODE

Listed below is a R.M.A. wire color code chart to aid in circuit tracing.

Wire Color	Where used
Black	B- or Ground leads
Brown	Filament leads
Red	B+ leads
Orange	Screen leads
Yellow	Cathode leads
Green	Grid or Control leads
Blue	Plate leads
Violet	Not used
Gray	A.C. leads
White	Bias leads

REMOVABLE SAFETY GLASS

To clean the inside of the safety glass or the face of the picture tube, simply follow the procedure below.

1. Remove the three (3) phillips head screws in the safety glass holder directly above the escutcheon.
2. Remove the safety glass holder.
3. Carefully remove the safety glass by pulling out and down from the bottom.

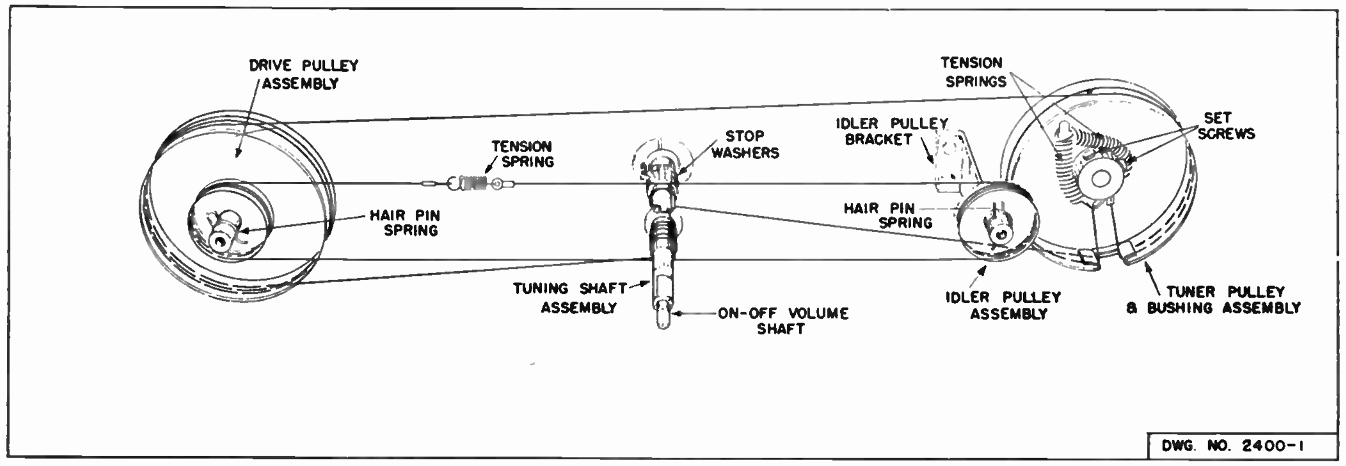

Figure 4. Dial Stringing.

DIAL CORD REPLACEMENT

DIAL CORD STRINGING: If dial cord replacement is necessary turn the tuning shaft counter-clockwise. Two separate dial cords are used and can be restrung separately.

Idler Pulley Stringing: Follow the diagram and start by attaching the dial cord to the tension spring, route to idler pulley and make 2½ clockwise turns around pulley. Route under tuning shaft to small drive pulley, make 2½ clockwise turns around pulley and connect to tension spring.

Tuner Pulley Stringing: Follow the diagram and start by attaching the dial cord to the tension spring shown at the extreme right on the tuner pulley. Route the cord through the opening in the pulley and make a ½ counter-clockwise turn around the pulley and route to the large drive pulley. Make 2½ counter-clockwise turns around the pulley and route under the tuning shaft. Make 5½ counter-clockwise turns around the tuning shaft in front of the washer. Make one counter-clockwise turn around lug on washer and continue in the counter-clockwise direction and make 1½ turns around the tuning shaft behind the washer. Route to the tuner pulley and make one complete turn before routing through the opening and then attach to the tension spring. Add second tension spring as shown.

MECHANICAL TRACKING: If for any reason the stop washers do not correspond to the stop position of the tuner, loosen the set screws on the tuner pulley and bushing assembly and reposition. Turn the tuning shaft to the extreme counter-clockwise position (stop washers in position shown in diagram) and tuner shaft also to the extreme counter-clockwise position. Retighten set screws.

GENERAL DESCRIPTION

VHF Tuner:

The Tuner is composed of a separate sub-chassis consisting of a 6BK7 (twin triode) cascode RF Amplifier and a 12AT7 tube (twin triode) for the oscillator and converter. Separate high and low band coils and trimmers are used with an automatic switching device to change bands. The tuner selects and amplifies the stations signal and converts it to the carrier IF frequency of 26.75 MC for video and 22.25 MC for sound which in turn is then fed to the IF amplifiers for further amplification.

Video IF Amplifier:

The Video IF Amplifiers are mounted on a separate sub-chassis along with a crystal video detector and the A.G.C. network. The IF amplifier section consists of three (3) staggered tuned stages with an over coupled output IF transformer using 6CB6 (pentode) tubes with self resonant core tuned coils. Since the receiver is of the intercarrier type both the video and sound IF frequencies are amplified simultaneously and then detected by a Raytheon CK-706 crystal. The signal is then coupled to the video amplifier and the first grid of the sync clipper. The A.G.C. network of R-59 and C-78 develops a negative bias voltage proportional to the average composite video signal.

Video Amplifier:

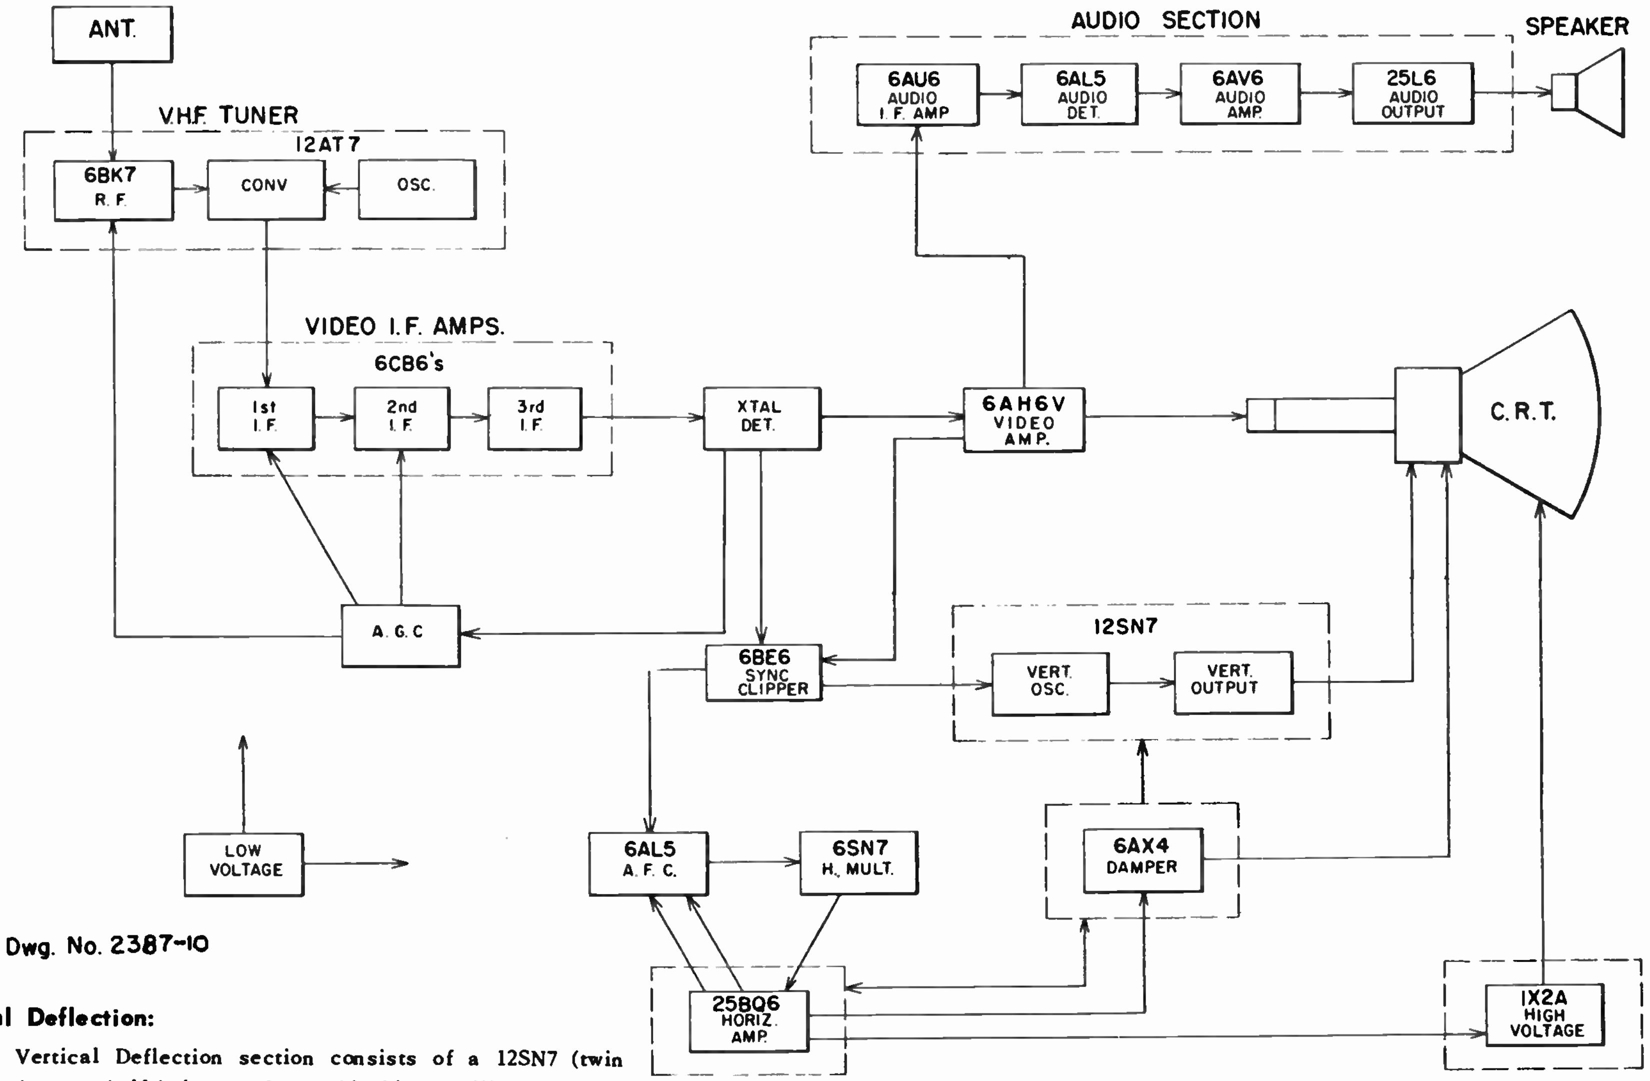
The Video Amplifier section consists of a 6AH6V (pentode) tube with a degenerative picture (or contrast) control (R-33) to vary the signal to the cathode of the picture tube. The audio signal is also amplified in this stage and then separated by a 4.5 MC trap (L-29). This trap also serves to separate or keep the audio from appearing in the picture.

Sound Section:

The Sound Section consists of a 6AU6 (pentode) 4.5 MC audio IF amplifier, 6AL5 (twin diode) ratio detector, 6AV6 (triode) audio amplifier and a 25L6 (beam power amplifier) output tube. Due to the hetrodyne action between the video and sound IF frequencies at the video detector a 4.5 MC signal is obtained containing the audio information. After the video detector the audio information is amplified by the video amplifier, separated from the video by the trap (L-29), amplified, detected and further amplified before being coupled to the speaker.

Sync Clipper:

The Sync Clipper stage utilizes a 6BE6 (heptode) tube which functions as a sync separator and noise clipper. The signal from the output of the video amplifier is coupled to pin 7 through R-34 and C-77. With the positive going signal at pin 7 and the low plate voltage sync separation is accomplished. When noise bursts are present the negative going signal from the video detector, coupled through R-58 to pin 1, cuts the tube off and eliminates false sync information in the output. A sync stabilizer adjust control (R-61) is provided to adjust the cut-off or clipping level by varying the bias voltage to pin number 1. A three position F-S-L switch is also provided to change the operational characteristics of the receiver for various signal level areas. The switch disconnects the control (R-61) from the circuit and applies a fixed bias voltage only in the "local" position. In the "fringe" position the A.G.C. source is connected to 240 volt B plus through 10 megohms of resistance (R-56, R-60). No bias voltage to the RF and IF tubes is utilized in this position allowing maximum amplification. In the "suburban" and "local" positions, full A.G.C. is applied. sync pulses are separated from the video signal without the noise effects and then coupled to the vertical blocking oscillator cathode and horizontal A.F.C.



Dwg. No. 2387-10

Vertical Deflection:

The Vertical Deflection section consists of a 12SN7 (twin triode) tube, one-half being used as a blocking oscillator and the other half as an output amplifier. The signal from the plate of the sync clipper is coupled through R-67 and C-81 to the cathode of the blocking oscillator. The vertical hold control (R-69) in the grid circuit varies the oscillator operating frequency, thus providing adjustment for synchronization. The vertical size control (R-73) varies the amplitude of the pulse to the grid of the amplifier and controls the amount of vertical deflection. The vertical linearity control (R-75) varies the cathode resistance, thus adjusting the operating characteristics of the amplifier to provide the proper wave shape to obtain a linear picture vertically. The network of C-84, C-85 and R-70, R-71 is designed to eliminate vertical retrace lines at high brightness levels.

AFC Discriminator:

The Automatic Frequency Control section utilizes a 6AL5 (twin diode) tube which functions as a discriminator. The horizontal sync pulses from the output of the sync clipper are coupled to the AFC tube through capacitor C-79. At the same time two feed back voltages of opposite polarity are intergrated and applied to the plates of the AFC tube. The two feed back voltages are obtained from a separate winding (terminals 7 and 10) of the HV deflection transformer and are of the same frequency as the horizontal multivibrator. Any phase shift between the horizontal sync pulses and the horizontal multivibrator signal will cause one diode section to conduct more than that of the other. This will result in a DC bias voltage applied to the grid of the multivibrator and change the operating frequency. The output of the AFC discriminator thus synchronizes the horizontal multivibrator to the incoming horizontal sync pulse.

Horizontal Multivibrator:

The Horizontal Multivibrator uses a 6SN7 (twin triode) tube and is of the conventional cathode coupled type. The core tuned parallel resonant circuit (L-30 and C-97) is used as a hold adjustment to stabilize the frequency of oscillation. Because of the wide pull-in range of the automatic frequency control tube a fine hold control is not necessary. The output signal of the multivibrator is coupled to the horizontal pulse amplifier through capacitor C-106. Capacitor C-107 is a negative peaking device to aid in cutting off the pulse amplifier tube at the proper time.

Horizontal Pulse Amplifier:

The Horizontal Pulse Amplifier utilizes a 25BQ6 (beam pentode) tube to develop the necessary power for the fly back pulse and the horizontal winding of the deflection yoke.

CIRCUIT DESCRIPTION

Damper:

The Damper tube (6AX4-diode) performs three functions: aids in horizontal scanning, suppresses oscillations which occur over part of the horizontal scanning cycle and gives an increase in plate supply voltage for the vertical blocking oscillator, vertical output amplifier and first anode of the picture tube.

Hi-Voltage Supply:

The High Voltage (second anode) is obtained from the auto-transformer type primary winding of the HV deflection transformer (T-8). When the plate current of the H pulse amplifier tube is cut off, the field built up in the primary winding collapses and induces a high voltage surge which is rectified by the 1X2A tube, filtered by the capacity of the aquadag coating of the picture tube and applied to the second anode. The 1X2A is a conventional half-wave high voltage rectifier and obtains its filament power from a separate secondary winding of the HV deflection transformer.

Low Voltage Supply:

The B plus voltage for the receiver is obtained from the voltage doubler arrangement of two selenium rectifiers and filter capacitors C-90 and C-91. The majority of the receivers tubes obtain its filament power from the filament transformer (T-9), however, three tubes are connected in series with resistor R-101 and placed across the 115 volt AC line. A safety interlock is provided to reduce shock hazards and a resistor type fuse is connected in series to protect the receiver in case of overloading.

SERVICE HINT

V.H.F. Tuner:

Before looking into the tuner for a particular trouble, first make the following observations. Since the receiver is of the inter-carrier type both the sound and video information are amplified simultaneously by the tuner, IF and video amplifiers. Therefore, if the sound section is functioning normally it can be assumed that there are no defects in the tuner, IF or video amplifiers. If the receiver is "dead" (no sound or picture - raster normal) first determine whether a signal is being transmitted and then check the antenna, lead-in and connections to the receiver. Next, rotate the contrast or picture control completely to the left (counter-clockwise) and observe the face of the picture tube. Advance the control to the extreme clockwise position and again observe the face of the picture tube. If no "snow" appears check the video amplifier, detector and second and third IF amplifiers. If, however, an increase of "snow" appears check the first IF amplifier before looking into the tuner.

The tuner can easily be serviced by removing the three hex-head nuts on top and the one on the bottom which holds bottom cover in place. Removing the bottom cover makes all the tuner components within easy reach and all parts can be serviced. When working inside the tuner do not move any component a great distance as a change in the distributed capacity may result and offset the alignment. When replacing components be sure to obtain the same lead length and replace them in the same position.

A majority of tuner troubles are often open and high resistance ground or coil solder connections, defective trimmers or coils and defective switch contacts.

Open or high resistance connections can easily be repaired by placing a hot soldering iron at the solder connection.

Defective switch contacts may cause an intermittent condition or the loss of one or both bands. Contact replacement is easily accomplished by removing the two switch plate tension springs, the hex-head bolt and the switch plate bracket. Lift up the switch plate assembly and remove the switch contact holder and replace contacts.

A. G. C.

The A.G.C. is a negative bias voltage proportional to the average composite video signal, developed by the network of R-59 and C-78 and applied to the RF and first and second IF amplifiers. The magnitude of the A.G.C. voltage will vary according to the strength of the signal being received. However, it will closely correspond to the detector output voltage (across R-27). As a fast and simple check to determine whether the A.G.C. voltage is normal, measure both the A.G.C. and detector output voltage. Under normal operating conditions these two voltages will be approximately the same.

Sync Stability:

For optimum sync stability the following points should be considered. A three position F-S-L switch and a sync stabilizer adjust control are provided along with the two hold controls. The position of the switch is governed by the strength of the signal being received and the control should be adjusted for a steady picture. The position of the switch and the adjustment of the control are important for good sync stability (control will not function in "local" switch position).

For good horizontal sync stability both the horizontal hold thumb screw and coil core should be set to the center of their respective ranges. (Center position before going out of sync in either direction).

For good vertical sync stability the vertical hold control can be adjusted to reduce the effect of noise that may interrupt synchronization in reception areas where noise conditions exist. Rotate the vertical hold control until the picture is moving upward and just locks into place. At this control setting, the noise will have the least tendency to interrupt vertical synchronization.

Vertical Distribution:

A fast and simple method to check the vertical distribution of a TV picture, without a test pattern, rotate the vertical hold control until the picture is moving slowly downward. Observe the black horizontal bar. If the vertical size and linearity controls are properly adjusted, the bar will not change in thickness as it moves from top to bottom.

TROUBLE-SHOOTING

Trouble	Probable Location
No Raster No Sound	1. Defective tubes 11-13-16. 2. Defective selenium rectifier. 3. Defective resistors R52-82-101. 4. Defective capacitors C70-72-74-90-91. 5. Defective transformer T9 or choke L32. 6. Defective safety interlock or on-off switch.
No Raster Sound Normal	1. Insufficient or no high voltage, (refer to "No High Voltage" section). 2. Defective picture tube. 3. Second anode lead disconnected. 4. Ion trap magnet misadjusted. 5. Defective C.R.T. socket.
No High Voltage	1. Defective tubes 15-16-17-18. 2. Defective transformer T8, yoke T7 or coil L30-31. 3. Defective capacitor C105-106-107-108-110-111-112. 4. Defective resistor R92-96-97-98-99-100.
No Picture No Sound Raster Normal	1. Defective antenna or lead-in. 2. Defective tuner tube 1-2. 3. Defective tuner (refer to page 12). 4. Defective tubes 3-4-5-6. 5. Improper voltages or resistances at sockets of tubes 3-4-5-6. 6. Improper alignment. 7. Defective crystal detector. 8. UHF power plug not in place.
No Sound Picture Normal	1. Defective tubes 8-9-10-11. 2. Improper voltages or resistances at socket of tube 8-9-10-11. 3. Defective speaker or leads broken or not in place. 4. Defective transformer T3-4 or coil L29. 5. Improper sound alignment.

Trouble	Probable Location
No Sync	1. Defective tube 12. 2. Improper voltages or resistances at socket of tube 12. 3. Defective F-S-L switch or in wrong position. 4. Sync stabilizer adjust control misadjusted.
Insufficient or no Vertical Sweep	1. Defective tube 13. 2. Defective transformer T5-6 or yoke T7. 3. Defective capacitor C70-85-86-87. 4. Defective resistor R68-73-74-75-76-77.
Picture Cannot be Centered	1. Defective picture tube. 2. Defective centering magnet. 3. Defective ion trap magnet.
Poor Focus	1. Improper adjustment of Ion trap. 2. Defective picture tube.
Poor Horizontal Linearity	1. Improper adjustment of linearity magnet (17") or anti-pin cushion magnets (21"). 2. Defective tube 16-17. 3. Defective capacitor C105-106-111. 4. Defective transformer T8 or coil L31.
Snow or Poor Picture	1. Insufficient signal input. 2. Defective antenna or lead-in. 3. Improper alignment of C1-A-B. 4. Weak tubes 1-2-3-4-5. 5. Improper video IF alignment.
Lack of Contrast	1. Defective tube 6. 2. Defective crystal detector. 3. Improper video IF alignment.
Washed Out or Picture Smear	1. F-S-L switch in wrong position. 2. Defective crystal detector. 3. Gassy tube 1-3-4. 4. Improper video IF alignment.

WAVE FORM ANALYSIS

The drawings on this page illustrate the wave forms at various positions within the receiver. The wave forms are not theoretical but exact copies of that shown by an oscilloscope and were taken under normal operating conditions, with a transmitted signal and the picture in sync at all times.

When checking the wave forms, connect the ground lead from the oscilloscope to the top chassis plate and the hot lead to the position indicated. The wave shapes may vary somewhat depending on the strength of the signal, the picture information being transmitted and the adjustments of the various controls.

Under each wave form is the schematic reference, position taken at, peak-to-peak voltage and the type of wave form indicated (Vertical -60 cycles and Horizontal -15,750 cycles).

PRE-ALIGNMENT PRECAUTIONS

1. If sweep generator does not have a balanced output, connect a 150 ohm resistor in series with the ground lead and 150 ohms minus the internal resistance of the generator in series with the hot lead.
2. Connect a 1000 mmf capacitor across scope terminals and a 10K ohm resistor in series with hot scope lead as close to test point as possible.
3. Connect signal generator through a 1000 mmf capacitor.
4. Set F-S-L switch to "Fringe" position.
5. When aligning the IF Amplifier be sure tuner is turned to high band channel 13.

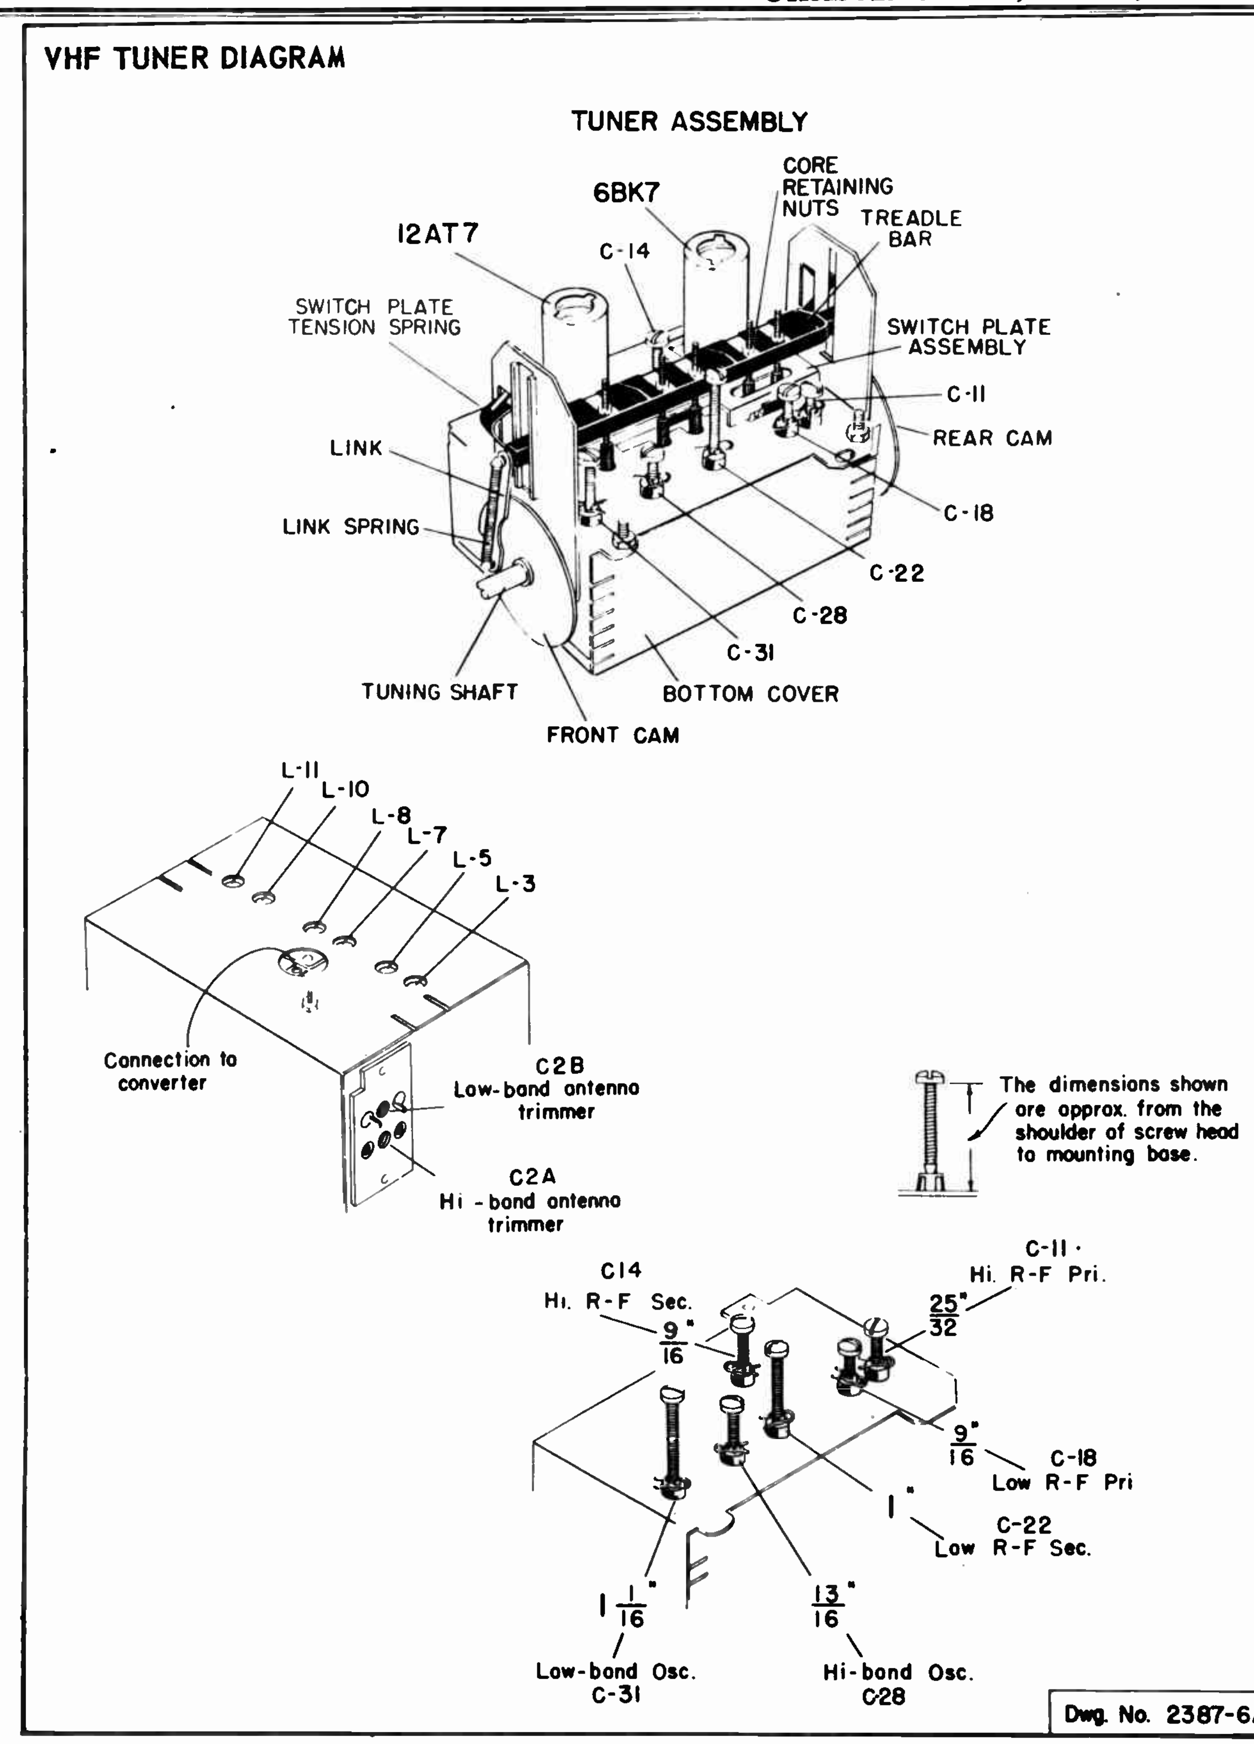

Figure 8. VHF Tuner Diagram.

TUNER ALIGNMENT

1. Preset trimmer screws C11-14-18-22-28-31- to dimensions shown on page 16.
2. Preset coil cores L3-5-7-8-10-11 in the following manner:
   - (a) In low band position, turn tuner to top of stroke (cores furthest out of coil).
   - (b) Switch will be in low band position.
   - (c) Adjust coil cores 1.6 inch from core to end of coil form (use core aligning tool if available).

COIL DC RESISTANCE CHART

The DC resistance readings shown in the chart below have been taken with a ohmmeter directly across the coil being measured. The coils not listed in the chart have a DC resistance reading of less than one ohm. A tolerance of ±5% is permissible.

COILS	RESISTANCE IN OHMS	COILS	RESISTANCE IN OHMS
L17	1.5	T3 pri.	4.7
L20	1.5	T4 pri.	170
L22	2.2	T5 pri.	960
L23	2	sec.	160
L24	2	T6 pri.	1100
L25	2	sec.	6.6
L27	8	T7A	68
L28	8	B	12.5
L29	1.5	T8 25BQ6 plate to 1X2A plate	180
L30	80	25BQ6 plate to term 4	9.5
L31	2.3	25BQ6 plate to term 3	17.5
L32	72	25 BQ6 plate to term 1	25.5
L33	8.5	term 7 to term 8	2.6
L34	2.3	term 7 to term 10	5.4
T3 pri.	4.7	T9 pri.	7

REMOVABLE SAFETY GLASS

To clean the inside of the safety glass or the face of the picture tube, simply follow the procedure below.

1. Remove the three (3) phillips head screws in the safety glass holder directly above the escutcheon.
2. Remove the safety glass holder.
3. Carefully remove the safety glass by pulling out and down from the bottom.

CAUTION

Before the chassis can be removed from the cabinet, the escutcheon, on-off-volume and tuning knobs must be removed. Pull knobs straight out and remove the two outside escutcheon screws and escutcheon.

DIAL CORD REPLACEMENT

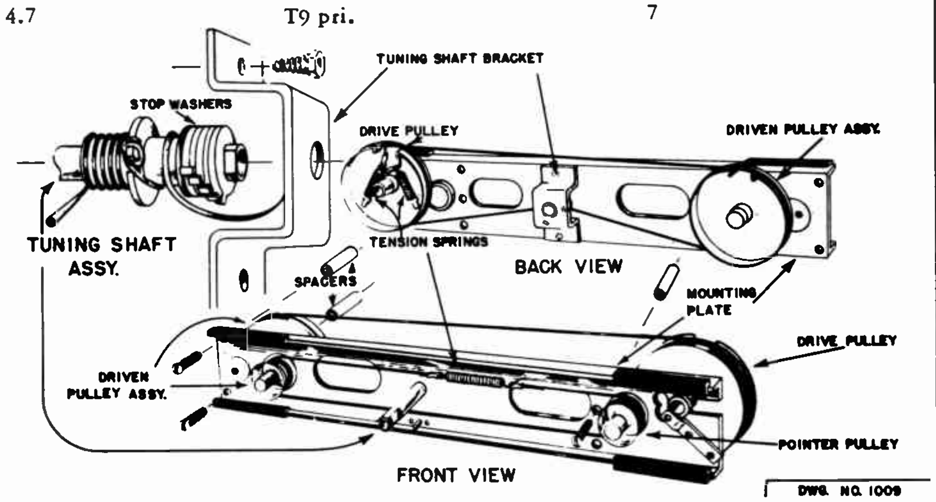
DIAL CORD STRINGING: Two separate dial cords are used and can be restrung separately if replacement is necessary.

POINTER PULLEY STRINGING: Follow the above diagram (front view) and start by attaching the dial cord to the tension spring, route to pointer pulley and make 2½ clockwise turns around pulley. Route under tuning shaft to small pulley of driven pulley assembly, make 2½ clockwise turns around pulley and connect to other end of tension spring. Tension spring must be in location shown when tuning shaft is rotated to extreme clockwise position.

MECHANICAL TRACKING: If for any reason the stop washers do not correspond to the stop position of the tuner, loosen the two(2) drive pulley allen head set screws and reposition. Turn both the tuning shaft and tuner shaft to the extreme counter-clockwise position. Turn tuning shaft only 1/6 turn clockwise. Tighten allen head set screws.

POINTER POSITIONING: If when a station is properly tuned in and the pointer is off calibration, reposition the pointers as follows.

1. Remove the on-off volume and tuning knobs. (pull straight out)
2. Remove two outside escutcheon screws and escutcheon
3. Remove pointer indicator and reposition.



DRIVE PULLEY STRINGING: Drive pulley restringing requires removal of the mounting plate assembly. To remove the mounting plate assembly follow the simple instructions below.

1. Remove two (2) star knobs
2. Remove two (2) pilot light shields and pilot light bulbs.
3. Loosen two (2) drive pulley allen head set screws.
4. Remove three (3) spaces screws
5. Pulley assembly straight out.

To restring the drive pulley turn the tuning shaft completely counter-clockwise. Follow the above diagram (back view) and start by attaching the dial cord to the tension spring shown at the extreme left on the drive pulley. Route the cord through the opening in the pulley and make a 1/2 counter-clockwise turn around the pulley and route under the tuning shaft. Make 5 1/2 counter-clockwise turn around tuning shaft between mounting plate and lugged washer. Then make one counter-clockwise turn around lug on washer and continue in the counter-clockwise direction and make 1 1/2 turn around the tuning shaft between the lugged washer. Route to the large driven pulley and make 1 1/2 turn around the pulley and route to the drive pulley. Make 2 complete counter-clockwise turns around the pulley and route through the opening and attach to the tension spring. Add second tension spring as shown.

Replace mounting plate assembly and follow directions for mechanical tracking.

GENERAL DESCRIPTION

The UHF Tuner is a single conversion, continuous tuning device which mechanically mounts directly over the VHF tuner in the receiver. The tuner is coupled to the VHF tuner by drive gears which thus provides tuning of both UHF and VHF by the same tuning knob. The tuner obtains its filament and plate supply voltages from the TV chassis and a switch is provided to select the desired tuner for operation. Signal points and filament leads are not switched.

Two variations of UHF tuners may be encountered. Only minor differences exist as can be seen by referring to figures 3 (early version) and 4 (later version). The later version tuner can easily be identified by the terminal strip below resistor R-2. (see figure 5).

The UHF Tuner selects the UHF stations video and sound carrier and converts them to the carrier IF frequency of 26.75 MC for video and 22.25 MC for sound which is coupled to the IF amplifiers in the receiver by 10 inches of RG-62U cable.

CIRCUIT DESCRIPTION

The UHF Tuner employs a double coaxial line RF cavity pre-selector. The coaxial line arrangement has the advantages of high selectivity, low insertion losses, uniform band-width and good shielding against oscillator radiation. The coaxial cavity is basically a one-quarter wave shorted tuned stub. The electrical length of the cavities is varied by a ribbon which is attached to the dial cord and pulley arrangement. In this manner tuning is accomplished similar to varying the length of a tuned stub which would change the resonant length for various frequencies. The dial cord is of a special material which is not affected by temperature or moisture and is locked to the pulleys which eliminates the possibility of slippage. Tracking screws are provided in the cavities to obtain uniform band width and sensitivity. The tracking screws vary the capacity between the ribbon and the cavity wall and thus vary the electrical length of the ribbon.

The oscillator tube used is a 6AF4 which is similar to the 6F4. Oscillator tuning is accomplished by a one-quarter wave shorted parallel wire transmission line arrangement. It differs from the RF cavities, in that a shorting bar is used to vary the electrical length of the lines. This method provides very stable operation.

Inductive or link coupling is employed to transfer the signal between stages. The arrangement of link coupling gives maximum selectivity and constant band-width over the entire UHF band. The signal from the output coupling link is mixed and detected by a CK-710 crystal detector and then applied to the tuned input of the cascode Pre-IF amplifier which is tuned to a center frequency of 25 MC and has the features of low noise and broad band-width. The signal is amplified by the cascode amplifier and then coupled to the IF amplifier section in the receiver through 10 inches of RG-62U coaxial cable.

The UHF Tuner maintains a fairly constant antenna input impedance of 300 ohms, has an overall band-width of 6 to 8 megacycles and has an oscillator injection current ratio of approximately 2 to 1. The only amplification of the signal takes place in the cascode amplifier. The signal is not amplified in the RF cavities, therefore, the sensitivity of the receiver on UHF will not quite equal that of VHF. A receiver equipped with a UHF tuner will have an overall UHF sensitivity of approximately 150 microvolts.

Service features of this tuner provides a convenient check point for measuring the oscillator grid current to determine whether the oscillator is functioning. Also provisions have been made for measuring the oscillator injection current to check both the crystal detector and the oscillator. An opening is also provided for coupling to the input grid coil when alignment of the cascode amplifier is necessary.

SERVICE HINTS

If the receiver is "dead" when attempting to view a UHF program, first check the position of the selector switch, then determine whether a signal is being transmitted and then check the antenna and lead-in connections before suspecting the tuner for trouble.

Also as a fast check, view the face of the picture tube at minimum contrast or picture control setting and advance the control to maximum. Compare the difference. If there is little or no difference (no "snow") check the video detector and IF amplifiers. If an increase of "snow" appears at maximum control setting, check the first IF stage before looking to the tuner for a defect.

If the UHF tuner is not functioning properly, first substitute the oscillator (6AF4) and cascode amplifier (6BK7) tubes. Next check the voltages at the UHF power socket or cable connections in the receiver.

If soldering iron servicing, crystal detector or component parts replacement is necessary, the picture tube must be removed. Removing the picture tube makes the majority of the UHF Tuner components within easy reach and most of the parts can be serviced. The tuner should not be removed from the chassis when service is required, also caution must be observed not to lay the chassis on the tuner side. Damage to the UHF Tuner may result.

CAUTION: When attempting to service the Tuner, do not move or rearrange components or mechanical parts as a change in distributed capacity may result and offset the alignment. When replacing a component, be sure to obtain the same lead lengths and replace in the same physical position.

SCHEMATIC DIAGRAM

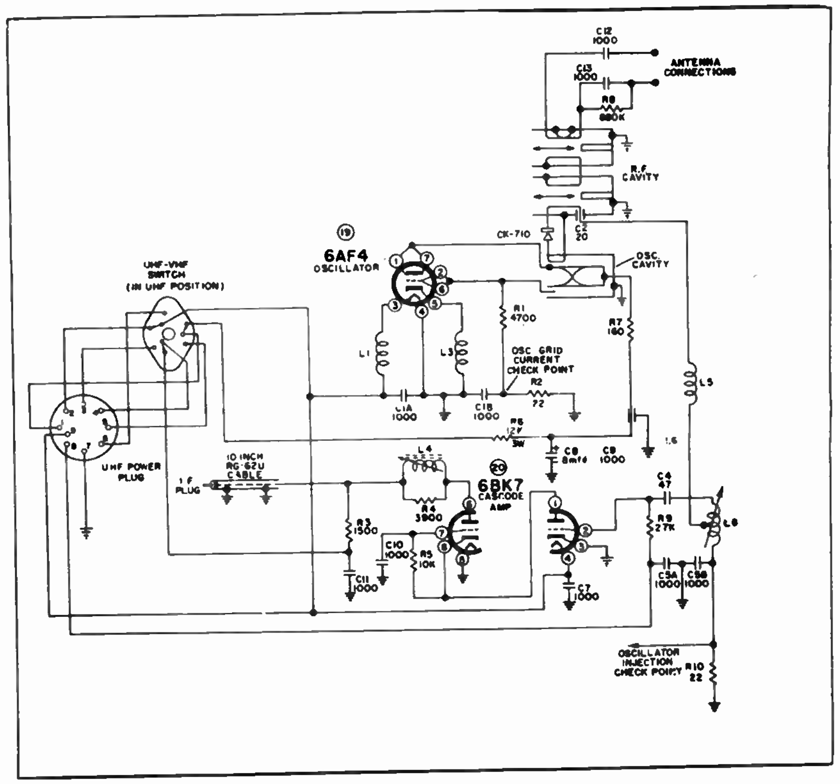

Figure 2 -- Early Version

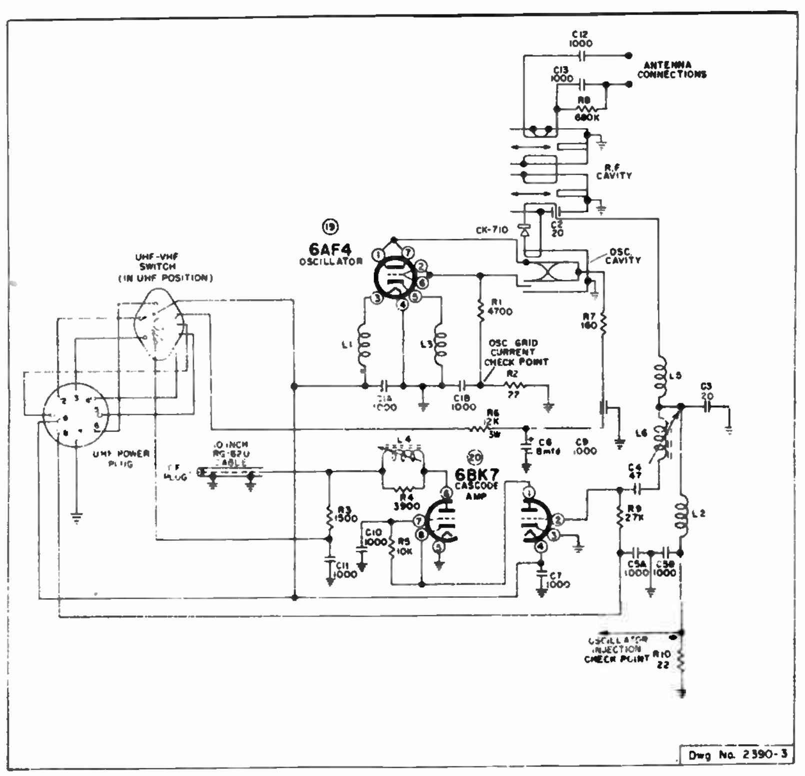

Figure 3 -- Later Version

SERVICE DATA

To determine whether the oscillator section is functioning, a convenient check point has been provided where the oscillator grid current can be measured. To measure the oscillator grid current, place a Simpson Model 260 Multimeter (or equivalent) on the 100 microamp scale across the 22 ohm resistor (R2). See figure 4. A reading of 10 to 30 microamperes should be obtained if the oscillator is functioning normally.

Both the oscillator and crystal detector can easily be checked by measuring the oscillator injection current. Place a Simpson Model 260 Multimeter (or equivalent) on the 100 microamp scale across the 22 ohm resistor (R 10) at the terminal indicated in Figure 5A or 5B depending on the version of the tuner. A reading of 5 to 40 microamperes should be obtained if both the oscillator and crystal are functioning normally.

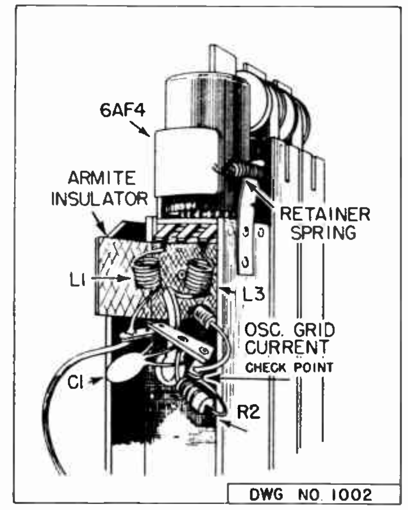

Figure 4

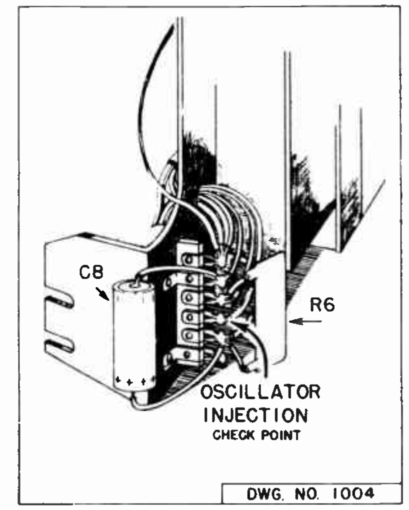

Figure 5A
Early Version

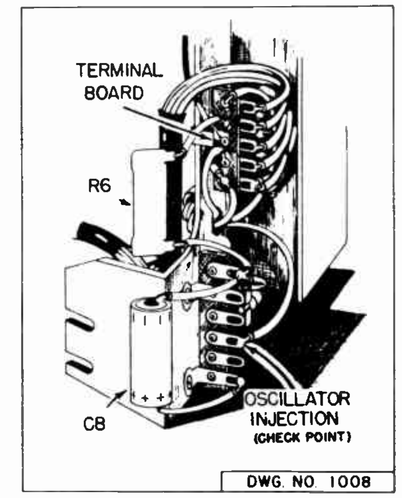

Figure 5B
Later Version

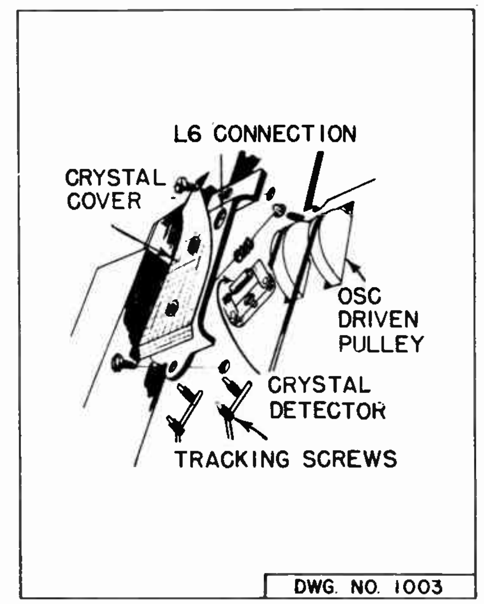

Figure 6

CRYSTAL DETECTOR: If replacement of the CK-710 Crystal Detector is necessary, the picture tube must be removed along with the crystal cover (refer to figure 6). The crystal is soldered into place and should be carefully resoldered after replacement. Overheating may damage the crystal. To dissipate the heat, grasp each crystal lead with a pliers when soldering into place.

ALIGNMENT

Since UHF is a relatively new field, test equipment necessary for RF and Oscillator Alignment is highly expensive and not readily available on the market at the present time. Therefore, a complete alignment procedure is not presented in this manual.

The cascode Pre-IF Amplifier can easily be realigned if necessary by connecting a 25 MC unmodulated signal to the center tap of L6 (see figure 7) or to the junction of Coil L-5 and Capacitor C-2 (see figure 6), depending on the version of the tuner and a VTVM at the video IF Detector output of the receiver. Connect generator through a 1 mmf capacitor. Adjust both L4 and L6 for maximum VTVM reading.

If for any reason such as dial cord replacement, component replacement, etc., the RF cavities may be adjusted for peak performance. Before attempting adjustment, note position of ribbons and mark the UHF drive gear so that original positions can be relocated if necessary. Loosen the pulley positioning screw (refer to figure 8) and rotate the pulleys for the sharpest and clearest picture.

CAUTION: Do not under any circumstances attempt adjustment of the tracking screws, oscillator trimmer screw or oscillator cavity. Precision test equipment is necessary for the adjustment.

(picture repetition rate): .... 30 CPS

HIGH VOLTAGE WARNING

The danger accompanying shock is always present when the receiver is operated outside the cabinet or when the rear cover is removed from the cabinet. Only a person familiar with the precautions to be observed when working with high-voltage equipment should service this receiver.

CATHODE RAY TUBE HANDLING PRECAUTIONS

Shatterproof goggles and heavy gloves should be worn at all times when handling a cathode ray tube. The tube should not be handled in the vicinity of any person not so equipped. When handling the tube, always keep it away from the body.

Due to the large surface area of the tube and the high vacuum contained within, more than ordinary care is required to prevent shattering the tube. The large end of the bulb, particularly the rim of the viewing surface, must not be struck, scratched, or subjected to more than moderate pressure. If the tube binds during removal or replacement, determine the cause of the trouble -- **DO NOT FORCE THE TUBE.**

An additional precaution is required when handling a cathode ray tube that has an aquadag coating on the outside of the tube. The outside aquadag coating forms one plate of a capacitor, and the inside coating to which the high voltage is applied serves as the other plate. The high voltage charge may be retained in this capacitor for a long time after the high voltage lead is disconnected. Since the charge could produce a shock that would startle the handler into dropping the tube, the charge should be dissipated before any handling of the tube is attempted. To dissipate the charge, place a jumper from the outside aquadag coating to the high voltage button on the tube. Due to the relatively high resistance of the aquadag, the jumper should be held in place for some time to insure complete discharge.

INSTALLATION INSTRUCTIONS

TO PREPARE THE RECEIVER FOR OPERATION:

These models are shipped in operating condition. There is no shipping material to be removed. Simply remove the receiver from its carton, and connect the AC plug to a 105 to 120 volt 60 cycle AC outlet.

The receiver contains a built-in antenna for use in areas of normal reception. In such areas when the built-in antenna provides good reception, external antenna is not required. However, in weak signal areas or under adverse conditions, it may be necessary to use an outside antenna.

Two sets of antenna terminals are located on the back of the receiver, one labeled UHF and the other labeled STD. If an external antenna is to be connected to the receiver, the built-in antenna wires must be disconnected from the STD terminals. This can be accomplished by loosening the terminal screws and removing the wires. The built-in antenna wires should be dressed in such a position that they do not touch the chassis or metal components. The lead-in wires from the external antenna should then be connected to the STD terminals. The UHF antenna terminals are not used unless UHF units are installed (see note under FREQUENCY RANGES on front cover).

TO CHECK THE OPERATION OF THE RECEIVER:

1. Turn on the receiver by rotating the off-on-volume control clockwise.

2. Rotate the channel selector to the desired channel number. The two channel selector positions marked UHF are not operative unless UHF units have been installed (see note on front cover of this booklet). It should be noted that the channel selector position between 6 and 7 and the position between 13 and UHF are blank positions although the channel selector will come to rest in these positions.

3. Adjust the brightness control to a position where the picture screen is moderately lighted.

4. Check the ion trap magnet adjustment as outlined under ADJUSTMENTS.

5. Rotate the picture control to the position that provides best picture contrast.

6. If the picture moves up or down on the screen, the vertical hold control should be adjusted as explained under ADJUSTMENTS.

7. If the picture is pulled into diagonal bars or if the edge of the picture quivers or tends to fold over, adjust the horizontal control for correct synchronization. This control can be adjusted so that it will seldom be necessary to re-adjust it thereafter. To obtain this adjustment, tune in a TV station, and rotate the control to the middle of the range over which the picture is synchronized. If the middle of the sync range does not correspond approximately to the middle of the mechanical range, make the adjustments described under Horizontal Ringing Coil in the ADJUSTMENTS section. Check the adjustment of the horizontal control by switching to another channel and then back again. The picture should be stable when switching from channel to channel.

8. Rotate the fine tuning control to the position that provides best picture detail.

9. Re-adjustment of the brightness and picture controls may improve the picture shading. The correct balance between these controls produces the best picture. Once the brightness control has been adjusted to suit the preference of the user, it will seldom be necessary to re-adjust it.

10. Adjust the off-on-volume control for the desired sound volume.

11. Check the operation on all available TV stations.

12. If necessary, adjust the vertical linearity, height, horizontal linearity, width, focus, or centering as explained under ADJUSTMENTS.

ADJUSTMENTS

CATHODE RAY TUBE CUSHION

The CRT cushion must fit snugly against the flare of the CRT in order that the rear of the tube will be supported firmly. If this condition is not obtained, loosen the CRT cushion adjustment screws and the deflection yoke adjustment screw, slide the CRT cushion forward as far as possible, and re-tighten the screws.

DEFLECTION YOKE

The deflection yoke must be positioned as close as possible to the flare in the CRT. If adjustment is required, loosen the deflection yoke adjustment screw, slide the deflection yoke forward as far as possible, and re-tighten the screw. Note that the CRT cushion must fit snugly against the CRT flare as described previously.

The deflection yoke adjustment screw also permits the picture to be rotated to make it square with respect to the mask. To rotate the picture, loosen the deflection yoke adjustment screw and move it to the left or right. The picture will tilt to the left or right with the movement. Tighten the screw when the picture is squared in the mask.

FOCUS

The focus control is located on the back of the chassis as shown in Fig. 4. With the brightness and picture controls set at their normal operating positions, the focus control should be adjusted for best focus.

QUIETING CONTROL

The quieting control is located at the lower left on the back of the receiver and is adjusted by means of a screwdriver inserted through the hole in the back cover. This control, which determines the AM rejection characteristics of the sound system, is normally adjusted during alignment of the sound system as described under SOUND ALIGNMENT PROCEDURE and will not ordinarily require further adjustment. In very weak signal areas, however, a reduction in noise or hiss on the sound may be obtained by slightly re-adjusting the control.

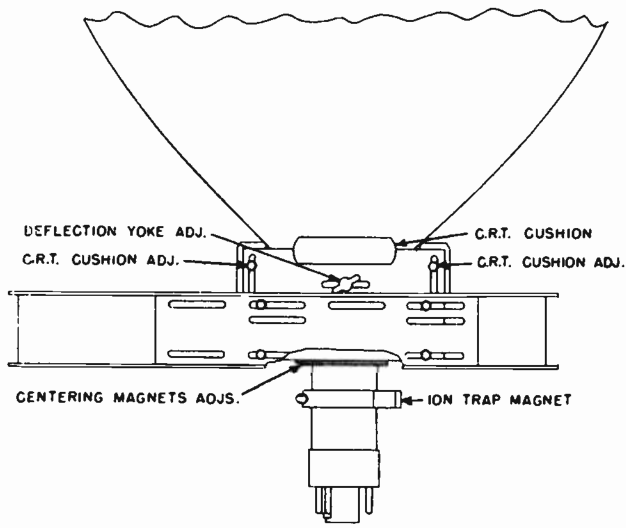

FIG. 1 — CRT ADJUSTMENTS

CENTERING

Centering is accomplished by rotating the centering magnet adjusting rings clockwise or counterclockwise as required. The two adjusting rings are located on the back of the deflection yoke as shown in Fig. 1. A tab projection on each of the rings serves to facilitate adjustment.

If difficulty is experienced in centering the picture or eliminating "neck shadows", make certain the CRT cushion is tight against the flare in the CRT. Also make certain that the deflection yoke is as far forward as possible.

ION TRAP MAGNET

It is extremely important that the ion trap magnet be correctly adjusted immediately after the set is first turned on during installation. This is true even though the set appears to be operating satisfactorily. When the magnet is not correctly oriented, the electron beam strikes the edge of the aperture in the anode top disc instead of moving cleanly through the hole. The resultant heat vaporizes the metal of the disc, thus releasing gas which has a harmful effect on the tube. Some of the vaporized material may be deposited on the screen of the tube and be apparent as darkened area. An excessively high setting of the brightness control will aggravate this condition. From this it is apparent that the brightness control should never be turned up to compensate for an incorrectly adjusted ion trap magnet. The tube can be ruined in a very short time under this condition.

To adjust the ion trap magnet, position the magnet approximately as shown in Fig. 1 with the color code mark facing upward, then rotate the magnet and move it forward and backward until the position is found where the picture is brightest. If the brightness peaks at two positions of the magnet, the position nearer the base of the tube is the correct one. Never move the ion trap magnet to remove a shadow from the raster if the brightness is decreased by so doing. Shadows should be removed by adjusting the position of the deflection yoke. *The ion trap magnet must always be adjusted for maximum picture brightness.*

HEIGHT AND VERTICAL LINEARITY

The height adjustment on the back of the chassis controls the overall height of the picture, and the vertical linearity adjustment controls the relationship between the vertical dimensions of the upper and the lower sections of the picture. A balance between the two controls is necessary to make the picture symmetrical and fill the mask vertically.

WIDTH AND HORIZONTAL LINEARITY

The width adjustment on the back of the chassis controls the overall width of the picture, and the horizontal linearity adjustment controls the relationship between the horizontal dimensions of the left and the right sections of the picture. A balance between the two controls is necessary to make the picture symmetrical with correct horizontal dimensions. These controls can be adjusted with a ¼" Spintite-type wrench.

VERTICAL HOLD

The vertical synchronization is controlled by the vertical hold adjustment. To adjust, rotate the control clockwise or counterclockwise until the picture is stabilized vertically. The adjustment should preferably be made on the weakest signal that is available, and a check should be made to see that the receiver pulls into sync on all channels.

HORIZONTAL RINGING COIL

The horizontal ringing coil (L401) should be adjusted as follows:

1. Short out the ringing coil with a short jumper wire.

2. Set the horizontal hold control to the middle of its range, and leave it in this position during the steps that follow.

3. Connect a VTVM to the junction of R477 and C456, located in the pin #2 grid circuit of the horizontal multivibrator, so as to measure the DC voltage between this point and ground.

4. With the receiver tuned to a TV station, adjust C457 (located near the horizontal multivibrator tube as shown in Fig. 4) for *zero* voltage on the meter. If zero voltage can be approached but not quite reached at one extreme of the C457 adjustment, it may be necessary to set the horizontal hold control slightly to one side of mid-position to obtain zero voltage.

5. Remove the jumper from across the ringing coil.

6. Adjust the ringing coil for *zero* voltage on the meter, and check the adjustment by switching to another channel and then back again. The receiver should pull into horizontal synchronization on all channels.

CRITICAL LEAD DRESS

Leads that are susceptible to R-F pickup with resulting interaction between stages must be dressed close to the chassis mounting plate. Leads in this category include heater, AGC, B plus, and the 125 volt bus leads. These leads must be long enough to permit dressing most of the path length close to the mounting plate. The heater wiring arrangement should not be altered.

Leads associated with the 41.25 mc. trap must be as short as possible and dressed away from the chassis.

Video peaking coils should be dressed away from the chassis and clear of adjacent parts.

The lead-in from the antenna terminals to the tuner must be dressed away from the I-F chassis to prevent an R-F "tweet" from interfering with the picture.

ALIGNMENT

TEST EQUIPMENT

To service these chassis, the following test equipment should be available:

1. R-F sweep generator that is capable of producing a 10 mc. sweep at a center frequency of 44 mc. The output must be adjustable from at least 100,000 microvolts down to a very low minimum, and the output must be flat at all positions of the attenuator.

2. Cathode ray oscilloscope, preferably one with a wide-band vertical deflection amplifier and a low-capacitance input probe. The oscilloscope should have good low-frequency response characteristics.

3. Signal generator or generators capable of producing an accurate unmodulated signal at 4.5 mc., 41.25 mc., 42.25 mc., 43.0 mc., 44.0 mc., 45.0 mc., and 45.75 mc. The accuracy of these frequencies is very important. If the signal generator does not include a crystal calibrator, a heterodyne frequency meter equipped with a crystal calibrator should be used to insure accuracy. The output level must be adjustable from at least 100,000 microvolts down to a very low minimum.

4. Vacuum tube voltmeter equipped with a high voltage multiplier probe for measurements up to 15,000 volts and an R-F probe for measuring R-F voltages.

GENERAL INFORMATION

The chassis and the test equipment should be bonded together by short lengths of heavy braided copper ribbon, and all interconnecting leads should be shielded and should be as short as possible consistent with ease in making connections. The effectiveness of the bonding can be checked during alignment by placing the hand on the chassis or test equipment case. If the response curve or meter reading changes, the bonding must be improved before the circuits are aligned.

It is important that the coaxial cable used to couple the sweep generator output to the receiver be terminated at its output end in the characteristic impedance of the sweep generator output circuit. To accomplish this, connect the appropriate value of resistance across the output leads at the open end of the cable. The oscilloscope vertical input cable and the generator output cables must be well separated from each other.

ALIGNMENT TOOL

To adjust the slugs in the common I-F transformers a special tool is required. This tool must fit into the .035" x .093" slot in slug. *An incorrectly designed tool will cause chipping of the slug.* A suitable tool is stocked under Westinghouse part number V-8345.

COMMON I-F ALIGNMENT PROCEDURE

The common I-F system uses over-coupled I-F transformers to obtain the required band width. In the alignment of this type system, the visual method of stage-by-stage alignment is used. A sweep generator is used to develop the I-F response curve on the oscilloscope, and an unmodulated signal generator (marker) is used to provide spot frequency indications on the curve.

With some of the I-F transformers, peaks may be obtained at two positions of the adjustment slugs. If a transformer is badly out of adjustment, it is advisable to turn the slug out (counterclockwise) as far as possible before beginning alignment. Then turn the slug clockwise until the first peak is reached. This procedure is recommended to obtain the correct peak rather than an undesired second peak which is sometimes obtained when the slug is turned farther clockwise.

The alignment procedure to be used is given in the following steps:

1. To avoid undesirable beat response during alignment, remove the 6BZ7 R-F amplifier tube from its socket and rotate the channel selector to channel 13. The channel selector is on channel 13 when the flat of the shaft is facing straight up.

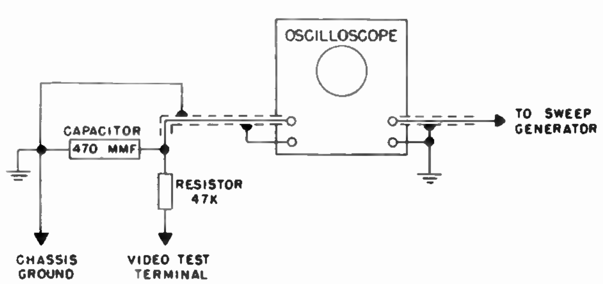

FIG. 2 — OSCILLOSCOPE CONNECTIONS

2. Connect the vertical input of the oscilloscope to the video test terminal (point "D" on Fig. 4) through the decoupling network shown in Fig. 2. The oscilloscope horizontal input should be connected to the sweep (synchronizing) output from the sweep generator *through well shielded leads.* Turn the sweep control on the oscilloscope to the "x" or "off" position.

3. Connect the negative terminal of a 9 volt bias battery to the AGC line, and connect the positive terminal to chassis ground.

4. Couple the marker generator output to the sweep generator output so that the two signals are applied together to the points specified in the steps that follow. Some sweep generators have facilities for connecting the marker output directly into the sweep generator. With other sweep generators, the marker can be coupled to the sweep by wrapping a few turns of insulated wire around the center conductor of the sweep generator output cable and connecting the marker generator to this wire. The loose coupling obtained in this manner is desirable because *excessive marker signal injection will distort the response curve.*

5. Adjust the sweep generator for a center frequency of 44 mc. with a sweep deviation of 10 mc.

6. Connect the high side of the sweep generator output cable directly to the control grid of the 3rd I-F amplifier, and connect the ground side of the cable to the chassis partition as close as possible to the ground point for the 3rd I-F amplifier tube. Keep the leads from the cable as short as possible.

7. Detune the plate circuit of the 2nd I-F amplifier by attaching an "alligator" or similar type clip to pin 5 of the 6CB6 2nd I-F amplifier tube. *Use care to avoid shock.* This step is necessary to avoid absorption of the signal that is applied at the 3rd I-F grid.

8. Adjust the oscilloscope vertical gain and the sweep generator output level to obtain a curve on the oscilloscope. To avoid a distorted curve, the recommended practice is to use maximum oscilloscope vertical gain and only enough sweep signal amplitude to obtain a good curve.

9. Set the marker generator to 44 mc. with the output attenuated until the marker pip is barely visible on the curve, and adjust the primary of the 3rd common I-F transformer, T304, until the 44 mc. marker pip is at the highest point on the response curve.

10. Adjust the secondary of T304 to make the top of the response curve symmetrical.

11. Make certain that the response curve coincides with Fig. 5A, using the marker to check at the appropriate frequencies. The 44 mc. pip must strike the center of the flat response region, the 42.25 mc. and 45.75 mc. points must be at equal heights, and the 43 mc. and 45 mc. points must be at equal heights. Re-adjust the primary and secondary of T304 if necessary to obtain these conditions.

12. Remove the detuning clip from the plate of the 2nd I-F amplifier tube, and attach it to the plate of the 1st I-F amplifier tube.

13. Move the sweep output connection from grid of the 3rd I-F amplifier to the grid of the 2nd I-F amplifier. Connect the ground side of the cable to the chassis partition as close as possible to the ground point for the 2nd I-F amplifier tube.

14. Adjust the primary of the 2nd common I-F transformer, T303, for maximum height of the response curve at 44 mc., and adjust the secondary of T303 to make the top of the curve symmetrical.

15. Make certain that the curve corresponds to Fig. 5B. The 44 mc. pip must strike the center of the flat response region, the 42.25 mc. and 45.75 mc. points must have equal heights, and the 43 mc. and 45 mc. points must have equal heights. Re-adjust the primary and secondary of T303 if necessary.

16. Remove the detuning clip from the plate of the 1st I-F amplifier.

17. Move the sweep output connection from the grid of the 2nd I-F amplifier to the grid of the 1st I-F amplifier, and connect the ground side of the cable as close as possible to the ground point for the 1st I-F amplifier tube.

18. Adjust the primary of the 1st common I-F transformer, T302, for maximum height of the response curve at 44 mc., and adjust the secondary of T302 to make the top of the curve symmetrical. If difficulty is experienced in aligning T302, adjust the adjacent channel interference trap, L308, to a higher frequency by rotating the slug completely counterclockwise. Complete information on the adjustment of L308 is given in step 26.

19. Make certain that the curve corresponds to Fig. 5C. The 44 mc. pip must strike the center of the flat response region, the 42.25 mc. and 45.75 mc. points must have equal height, and the 43 mc. and 45 mc. points must have equal heights. Re-adjust the primary and secondary of T302 if necessary.

20. Remove the sweep output connection from the 1st I-F amplifier grid, and couple it to the 6X8 mixer-oscillator tube through the coupling system illustrated in Fig. 3. This system provides adequate signal injection and at the same time provides shielding which prevents radiation of the signal. The device is constructed by flaring a piece of tubular copper braid over the top of the 6X8 tube and wrapping gummed tape over the braid to serve as insulation. The tube shield is then replaced over the tube with the braid protruding through the hole in the top of the shield. *The braid must not contact the chassis or the tube shield at any point.* The tube shield should be locked securely to its mounting base. Connect the high side of the sweep generator output cable to the copper braid, and connect the ground side to the nearest point on the chassis.

21. Rotate the slug of the 41.25 mc. trap (L301) completely clockwise.

22. It is possible to obtain two peaks when adjusting the primary of the I-F input coupling network, T101, located on the R-F tuner. These peaks

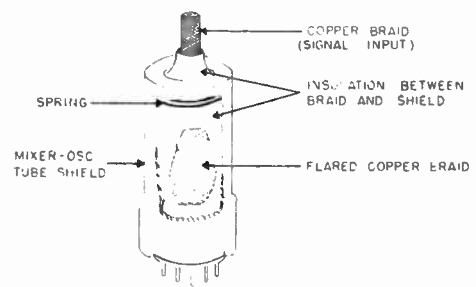

FIG. 3 — COUPLING SIGNAL GENERATOR TO MIXER TUBE

produce different overall bandwidths. The correct peak to use is normally the peak that occurs with the adjustment screw turned further counterclockwise.

Turn the adjustment screw of T101 completely counterclockwise. Then adjust T101 for maximum height of the response curve at 44 mc., and adjust the secondary of the I-F input coupling network, T301, to make the top of the curve symmetrical. If necessary, re-adjust T101 and T301 to make 44 mc. strike the center of the flat response region.

23. Set the marker generator to 41.25 mc., and increase the output until the pip is readily visible on the curve.

24. Adjust L301 to minimize the amplitude of the 41.25 mc. marker pip. L301 functions as a 41.25 mc. trap.

25. Make certain that the final response curve corresponds to Fig. 5D. Use the marker to check at the frequencies shown on the drawing. If necessary, re-adjust T101 and T301 to obtain the correct curve.

If the bandpass of the response curve is too narrow so that the 45.75 mc. marker occurs at less than 40 percent of maximum response, turn T101 clockwise until a second peak at 44 mc. is obtained. Adjust T301 for flat response at the top of the curve, and re-adjust T101 to center 44 mc. on the flat response.

26. L308 is the adjustment for the adjacent channel interference trap. If adjacent channel interference does not constitute a problem in the areas where the receiver is to be operated, L308 will not ordinarily require adjustment; however, the trap must not be mis-adjusted into the I-F response region. In areas where adjacent channel interference is not troublesome, L308 can be set to its highest tuneable frequency by rotating the slug completely counterclockwise, and it can be left in this position.

In areas where adjacent channel interference is evident, however, L308 should be adjusted to 47.25 mc. This can be accomplished in either of two ways. One is to connect an amplitude modulated signal generator that has an output of .02 volt or higher to the grid of the 1st I-F amplifier, and adjust the output frequency accurately to 47.25 mc. This will produce an indication on an oscilloscope connected to the video test terminal. Adjust L308 for minimum response on the oscilloscope. If a signal generator capable of this high output is not available, connect a good antenna to the receiver, and tune the receiver to the TV station on which the adjacent channel interference occurs, carefully adjusting the fine tuning control to its correct setting. Then, beginning with L308 in its completely counterclockwise position, rotate L308 clockwise until the position is found where the adjacent channel interference is eliminated. In some cases, the trap adjustment may affect the adjustment of T302. If this occurs, it will be necessary to repeat steps 17, 18 and 19.

4.5 MC. TRAP ALIGNMENT PROCEDURE

1. Connect the high side of the signal generator to the video test terminal (point "D" on Fig. 4) through a .001 mfd mica capacitor, and ground the low side to the chassis.

2. Adjust the signal generator to 4.5 mc. (unmodulated). The accuracy of this frequency is very important. If a crystal controlled signal generator is not available, the frequency should be checked with an accurate frequency meter.

3. Connect the common lead from the VTVM to the chassis, and connect the *R-F probe* from the VTVM to the cathode of the CRT. This point is shown as point "E" on Fig. 6. Note that this point is above ground potential and, therefore the R-F probe must contain a blocking capacitor.

4. Using a strong 4.5 mc. signal, adjust the 4.5 mc. trap, L309, for minimum indication on the meter.

SOUND ALIGNMENT PROCEDURE

The sound system can be aligned using either locally generated signals or a received TV signal. Since the latter method does not require signal generating equipment, it will be described first and will be followed by the procedure using locally generated signals.

To use an "air" TV signal for alignment:

1. Tune the receiver to a TV station and connect an attenuator between the receiver and the antenna so that the strength of the signal can be varied from weak to strong.

2. Set the quieting control (R201) located on the back of the chassis approximately to its mid-position.

3. Adjust the 4.5 mc. IF slugs (L201 and L202) for maximum program sound. If peaks occur at two different positions of the slug, use the peak that occurs when the slug is farthest counterclockwise. Reduce the signal to its lowest useable level and recheck the adjustments.

4. Apply a *strong* signal to the receiver, and adjust the quadrature coil (L204) for maximum program sound. If peaks occur at two different positions that are widely separated, use the one that occurs with the slug farthest counterclockwise. If two peaks occur within a *narrow* range of adjustment, sufficient signal is not being applied to the receiver or the quieting control is not set at the desired position.

5. Apply a very weak signal that allows noise to be heard and adjust the quieting control (R201) for minimum noise. The position at which the noise is minimized depends on the strength of the signal; therefore, the weakest useable station in the area should be used for this adjustment. This control determines the AM rejection characteristics of the sound system, and its correct setting is normally about mid-position. ***Do not leave the quieting control set at its maximum counterclockwise position.***

To use locally generated signals for alignment:

1. Connect an oscilloscope or an AC voltmeter across the volume control for use as an indicator.

2. Apply a 4.5 mc. FM signal (deviation approximately 7.5 kc.) to the video test point (D on Fig. 4).

3. Using the lowest signal level that will produce an indication, adjust L201 and L202 for maximum output.

4. Using a *strong* signal, adjust L204 for maximum output.

5. Apply a 4.5 mc. AM signal (modulated apx. 30 percent) to the video test point.

6. Beginning with a very low signal level, increase the generator output, while rotating the quieting control back and forth, until the signal level is such that the AM output across the volume control dips to *zero* with a rise on each side as the quieting control is rotated. Set the quieting control for zero output at this signal level.

H. F. OSCILLATOR ALIGNMENT PROCEDURE

If the 6X8 oscillator tube is replaced, the different inter-electrode capacitance of the new tube may change the oscillator frequency enough to necessitate re-alignment of the oscillator.

Alignment of the oscillator on the high band is accomplished by adjusting the brass slug located adjacent to the vernier drive wheel on the front of the tuner. Alignment of the oscillator on the low band is accomplished by adjusting the brass slug on the lower front of the tuner. The adjustment procedure is as follows:

1. Set the fine tuning control to the middle of its range, and keep it in this position during the following adjustments. The control is set to the middle of its range when the set-screw in the fine tuning drive wheel is straight up.

2. Set the selector switch to the highest of the low-band (channels 2 through 6) stations operating in your vicinity.

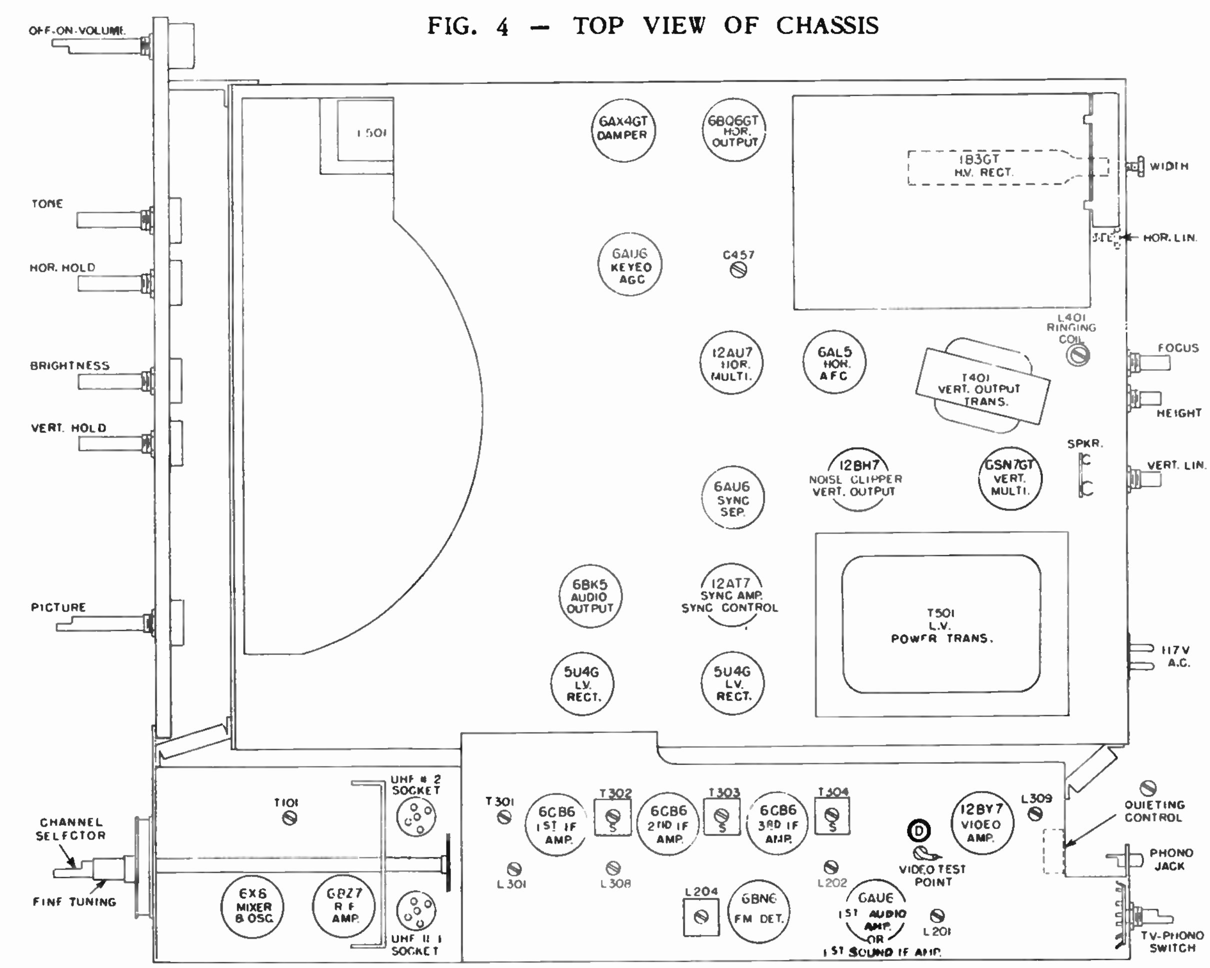
3. Peak the low band adjustment slug (L109) for the best picture detail.

4. Set the selector switch to the highest of the high-band (channels 7 through 13) stations operating in your vicinity.

5. Peak the high band adjustment slug (L110) for the best picture detail.

6. Check the previously made low band adjustment, and if the tuning has changed repeat steps 2 and 3.

FIG. 4 — TOP VIEW OF CHASSIS



ALIGNMENT CHARTS

The information in these charts is condensed from the foregoing detailed information as a convenience to the service technician. It is recommended that the detailed information be studied before using the charts.

COMMON I-F SECTION

Remove the 6BZ7 RF amplifier tube from its socket, and turn the channel selector to channel 13.

Connect the oscilloscope to the video test terminal through the decoupling network shown in Fig. 2.

Connect a 9 volt bias battery to the AGC line.

Adjust the sweep generator for a center frequency of 44 mc. with a 10 mc. sweep deviation, and couple the marker generator to the sweep generator.

Step	*Connect Sweep and Marker Generators to —*	*Marker Use*	*Connect Detuning Clip to —*	*Adjust —*
1.	3rd I-F amp. grid	Check for equal response at 42.25 mc and 45.75 mc using weak signal. Also 43 mc and 45 mc.	2nd I-F amp. plate	Pri. of T304 for max. response and sec. of T304 for symmetrical curve shown in Fig. 5A.
2.	2nd I-F amp. grid	Same as step 1	1st I-F amp. plate	Pri. of T303 for max. response and sec. of T303 for symmetrical curve shown in Fig. 5B.
3.	1st I-F amp. grid	Same as step 1	Not used	Pri. of T302 for max. response and sec. of T302 for symmetrical curve shown in Fig. 5C.
4.	6X8 mixer through coupling device shown in Fig. 3.	Check at 44 mc. Markerpip must be at center of flat region on curve	Not used	Turn L301 adj. completely clockwise and adjust T101 for max. response. Adjust T301 for symmetrical.
5.	Same as preceding step	Adjust to 41.25 mc. and increase output until pip is readily visible.	Not used	L301 to minimize amplitude of 41.25 mc. marker pip.
6.	Same as preceding step	Check curve at frequencies shown on Fig. 5.	Not used	Re-adjust T101 and T301 to obtain curve shown in Fig. 5D.
7.	Tune L308 to 47.25 mc. as described in step 26 of detailed information.			

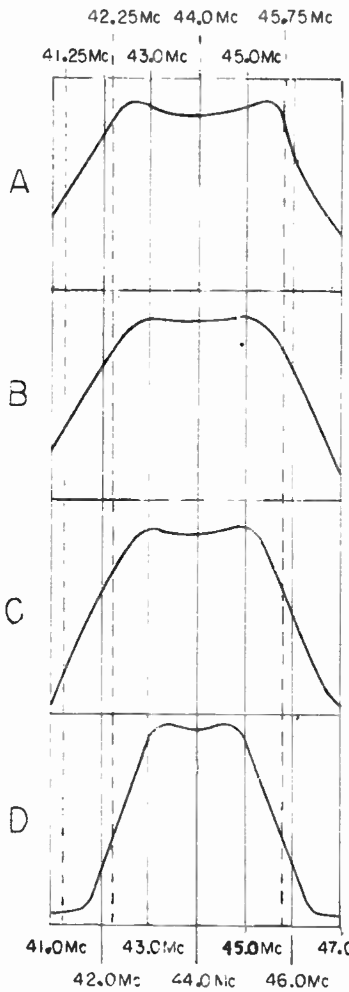


FIG. 5 — RESPONSE CURVES AT VARIOUS STAGES OF ALIGNMENT

4.5 MC. TRAP

Connect the signal generator to the video test terminal (point "D" on Fig. 4) through a .001 mfd capacitor.

Step	*Signal Gen. Frequency*	*VTVM Connections*	*Remarks*	*Adjust —*
1.	4.5 mc. unmodulated	RF probe to point "E" (see Fig. 6) and common lead to chassis.	Use strong signal from generator	L309 for minimum voltage

SOUND SECTION

Refer to SOUND ALIGNMENT PROCEDURE Using a weak signal, adjust L201 and L202 for maximum response to a 4.5 mc. FM signal. Using a strong signal, adjust L204 for maximum response to a 4.5 mc. FM signal. Using a weak signal, adjust the quieting control for minimum AM noise.

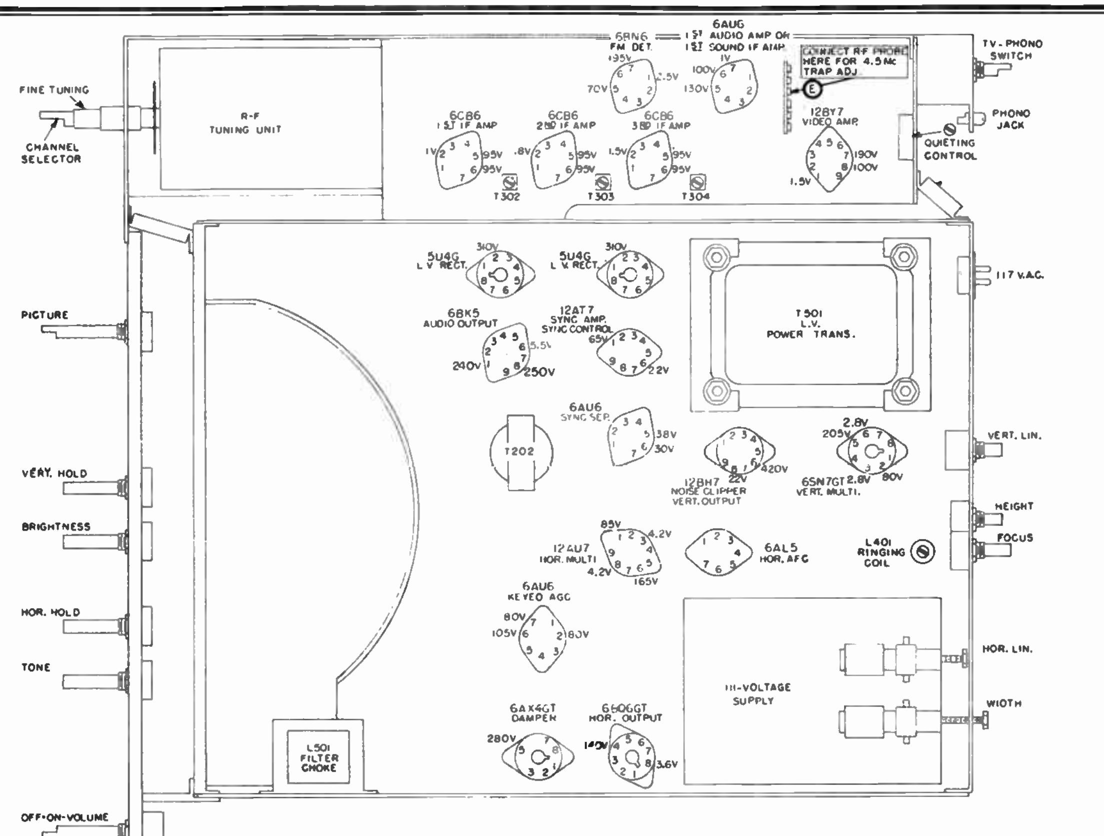

FIG. 6 — BOTTOM VIEW OF CHASSIS

PEAK-TO-PEAK VOLTAGE MEASUREMENTS USING AN OSCILLOSCOPE

To determine whether or not a television circuit is functioning correctly, it is sometimes necessary to compare the waveforms observed on an oscilloscope with those shown on the schematic diagram. In some cases, the complete story is not revealed unless peak-to-peak voltages are compared also. Peak-to-peak voltages can be measured on an oscilloscope by proceeding as follows:

1. Place a graph screen over the face of the cathode ray tube. A graph screen is a transparent sheet with lines drawn on it to form equal-sized squares, and it is normally furnished as part of the oscilloscope.

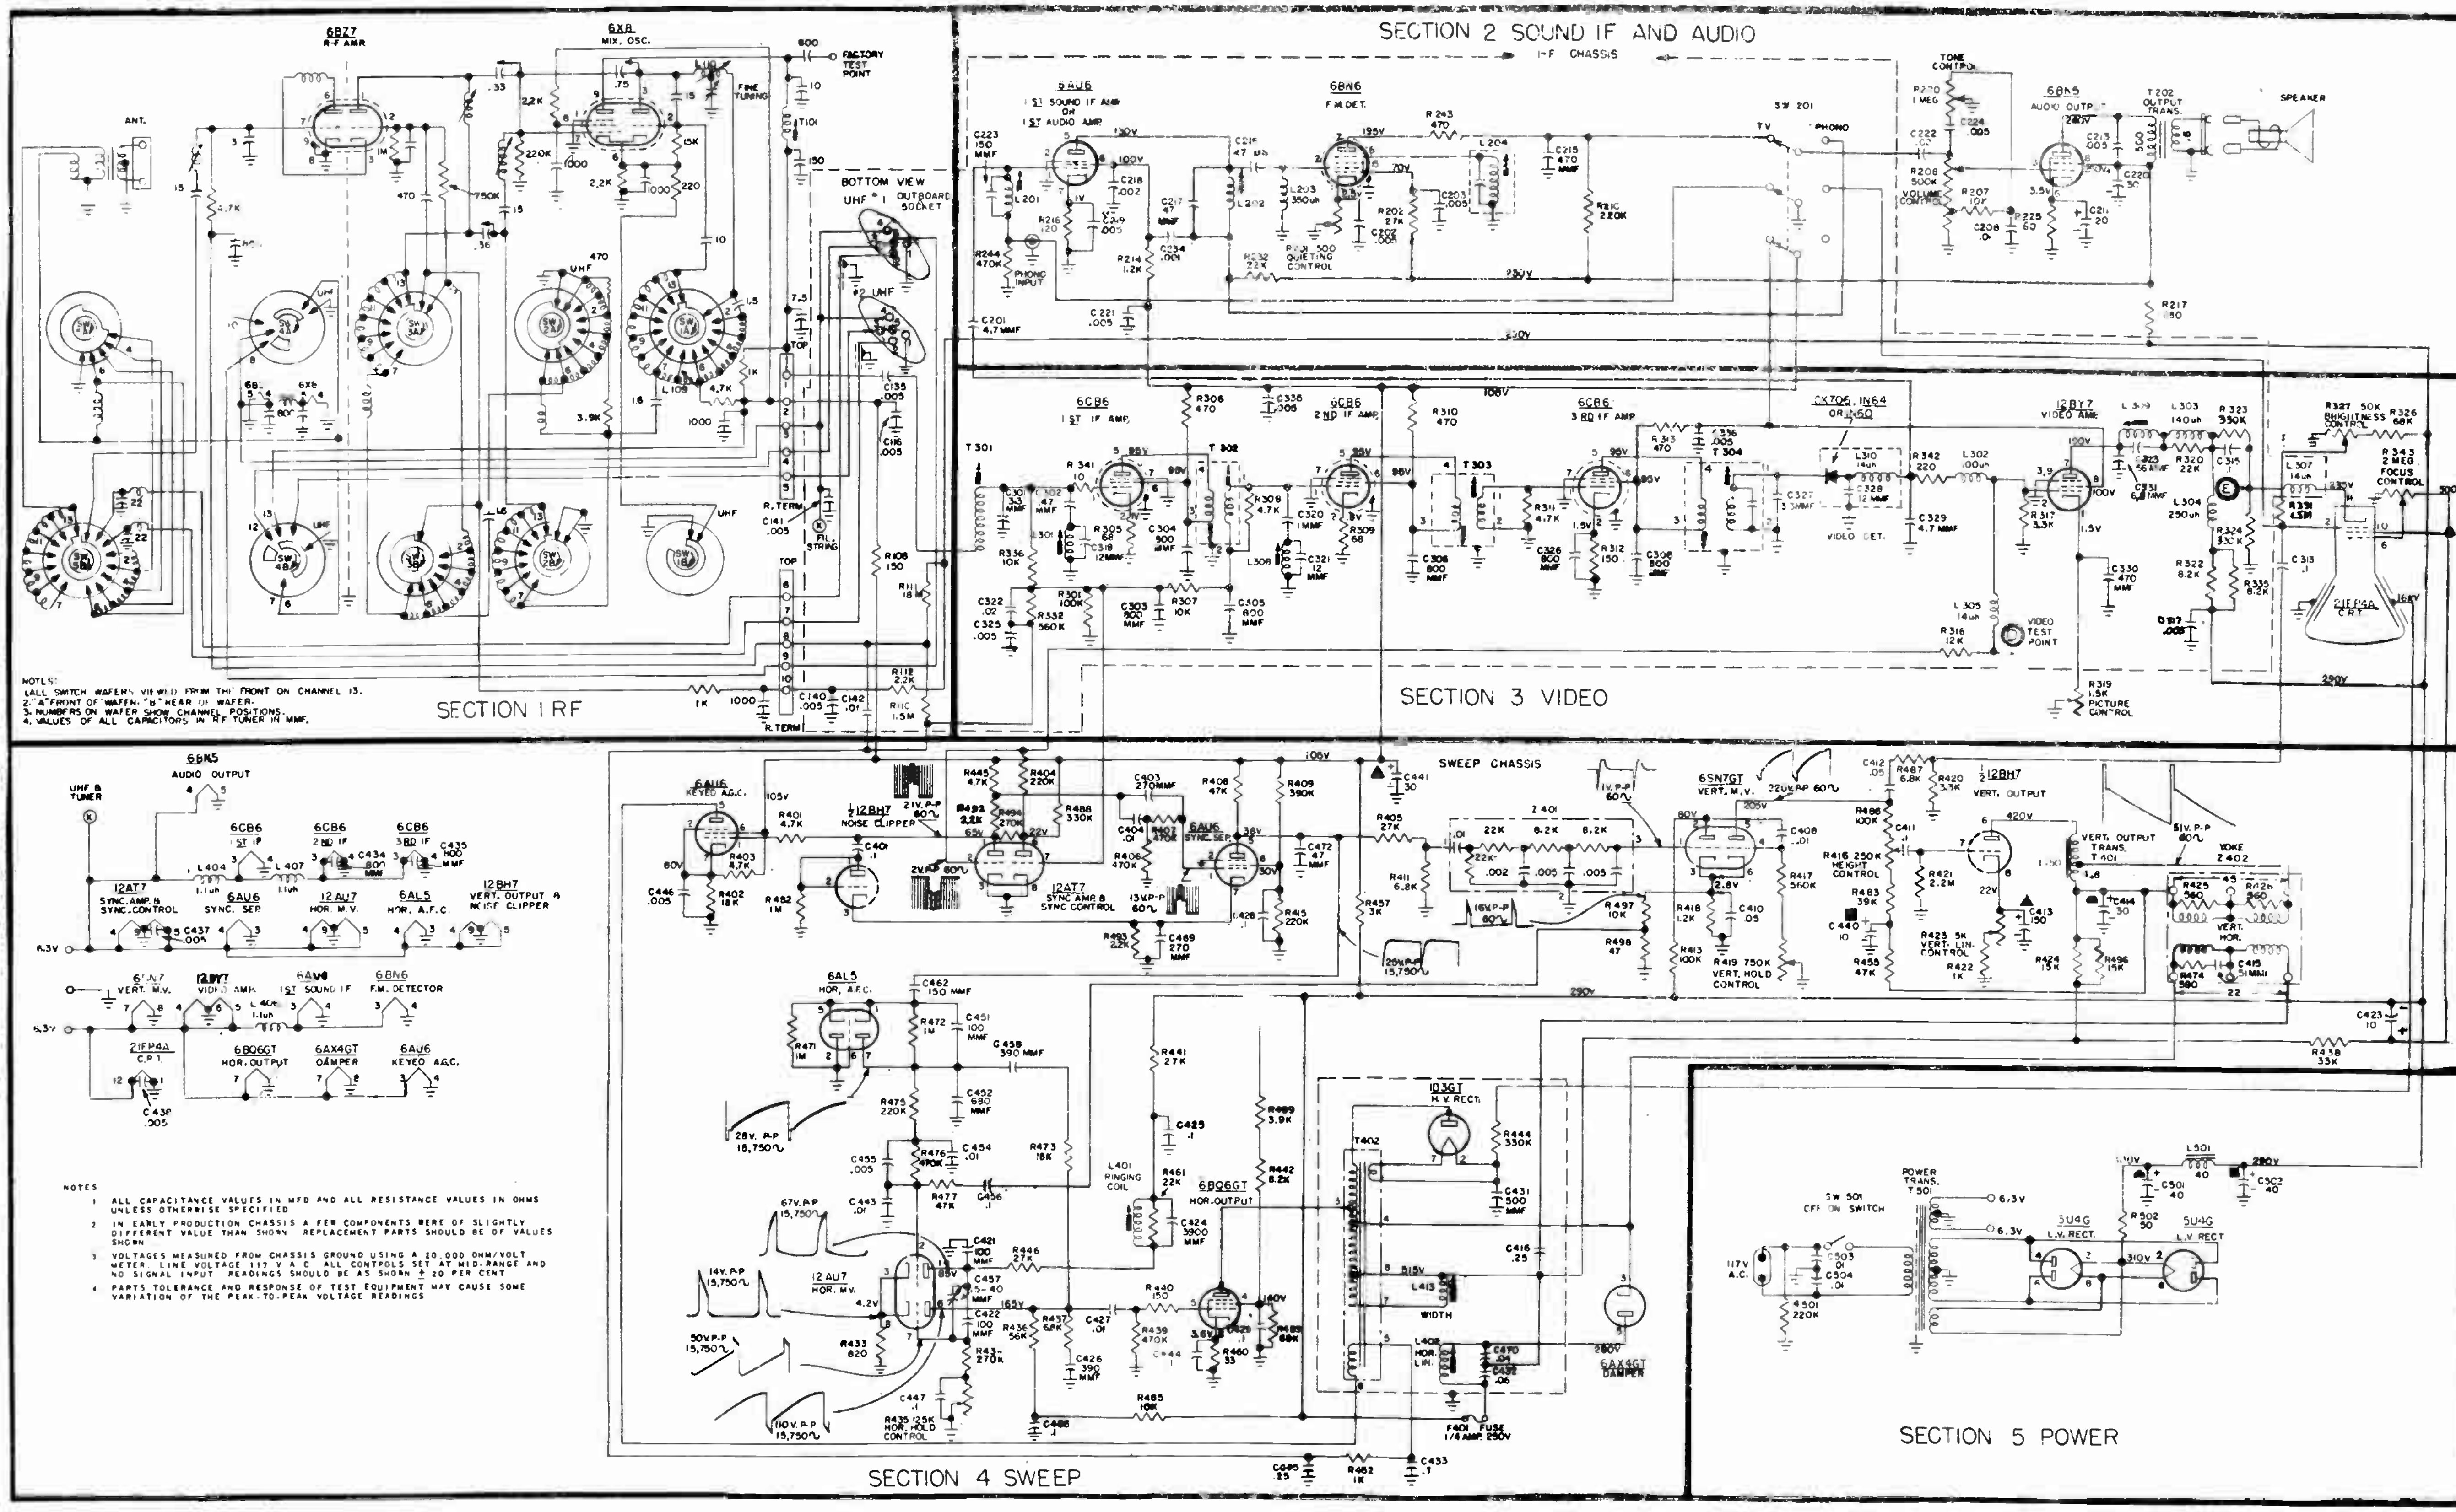
2. Connect the vertical input terminals of the oscilloscope to a source of calibrating voltage. The heater supply line in the television receiver is a convenient source. If the peak-to-peak voltage of the waveform to be measured is expected to be 20 volts or less connect the vertical input terminals across one branch of the heater line and ground so as to obtain 6.3 volts AC. If the expected peak-to-peak voltage is greater than 20 volts, connect the vertical input terminals across the two branches of the heater line so as to obtain 12.6 volts AC.

3. Compute the peak-to-peak voltage of the calibrating source. The calibrating voltage as measured on an AC voltmeter must be multiplied by 2.828 (2.83 is sufficiently accurate) to determine its peak-to-peak voltage. Thus, the peak-to-peak voltage corresponding to 6.3 volts r.m.s. is 17.8 volts, and the peak-to-peak voltage corresponding to 12.6 volts r.m.s. is 35.6 volts.

4. Adjust the vertical attenuator and vertical gain controls on the oscilloscope until the sine wave calibrating voltage is the desired size on the oscilloscope. Assuming there are 20 squares vertically and 20 squares horizontally on the usable area of the graph screen (this is common), the oscilloscope will have a response of one volt per square if the calibrating voltage is 17.8 volts peak-to-peak (6.3 volts r.m.s.) and the vertical gain of the oscilloscope is adjusted so that the calibrating sine wave occupies 17.8 squares vertically. If the calibrating voltage is 35.6 volts peak-to-peak (12.6 volts r.m.s.) and the oscilloscope gain is adjusted so the sine wave occupies 17.8 squares vertically (one-half of 35.6), the oscilloscope response is 2 volts per square. If the calibrating voltage is 35.6 volts peak-to-peak and occupies 8.9 squares vertically (one-fourth of 35.6), the oscilloscope response is 4 volts per square. This illustrates the manner in which the voltage per square response is determined. Once the voltage per square response has been established, *do not move the vertical gain or vertical attenuator controls.*

5. Disconnect the vertical input leads from the calibrating source, and connect them across the voltage to be measured. If necessary, center the waveform by adjusting the vertical centering control.

6. Multiply the number of vertical squares that the waveform occupies by the voltage per square response which was established in step 4.



CHASSIS NO. V-2233-1

FIG. 7 — SCHEMATIC DIAGRAM

IMPORTANT — Since many of the components are very critical, exact duplicates must be used for replacement purposes. However, any substiture supplied by Westinghouse will assure performance equal to or better than the list part.

PARTS LIST FOR MODELS H-740T21, H-742K21 AND H-743K21

When ordering parts, specify model number of set in addition to part number and description of part.

MODEL PARTS

	Part No.	Description	List Price Each
	V-10841-1	Baffle and Grille Cloth (H-740T21)	$ .50
†	V-1292-1	Cabinet (H-740T21)	36.67**
†	V-1293-1	Cabinet (H-742K21)	64.69**
†	V-1293-2	Cabinet (H-743K21)	66.73**
	V-5860-3	Cable Assembly, speaker (H-740T21)	.27
	V-5860-14	Cable Assembly, speaker (H-742K21, H-743K21)	.40
	V-5684-2	Clip, plate to mask	.03
	V-5522	Cord, AC power	1.25
†	V-10962-13	Cover Assembly, back	4.75
	V-11501-1	Gasket, dust seal	.65
†	V-9158-17	Grille Cloth (H-742K21)	***
†	V-10361-13	Grille Cloth (H-743K21)	***
†	V-11577-1	Knob, on-off-volume, picture (H-740T21, H-742K21)	.35
†	V-11577-2	Knob, on-off-volume, picture (H-743K21)	.35
†	V-11512-2	Knob, channel selector	1.20
†	V-11513-1	Knob, fine tuning (H-740T21, H-742K21)	.45
†	V-11513-2	Knob, fine tuning (H-743K21)	.35
	V-9547-1	Knob, phono switch	.10
†	V-11584-1	Mask, picture (H-740T21, H-742K21)	.45
†	V-11584-2	Mask, picture (H-743K21)	.45
†	V-11151-3	Nut, speed (control panel assy. mtg.)	.03
†	V-11505-2	Plate, front glass	15.50
	V-10932-1	Plate, mask (H-740T21, H-742K21)	.20
	V-10932-2	Plate, mask (H-743K21)	.25
†	V-11503-1	Panel, control assembly (H-740T21, H-742K21)	3.00
†	V-11503-2	Panel, control assembly (H-743K21)	3.20

	V-9770-1	Speaker, 10" PM (H-742K21, H-743K21)	8.00**

V-2233-1 CHASSIS PARTS

MISCELLANEOUS

	Part No.	Description	List Price Each
†	V-11338-2	Belt, dial drive	$ .35
	V-5426	Clip, IF mounting	.03
	V-10110-1	Clip, tube cap (6BQ6GT)	.10
	V-5906-7	Connector Assembly, HV	.50
	V-9867-2	Cushion, yoke hood	.06
†	V-9784-5	Magnet, ion trap	.55
	V-5549	Plug, AC power (male)	.30
	V-5926	Screw, wing, #8-32 (yoke)	.04
	V-10038-1	Shield, miniature tube (crystal det., 6CB6)	.06
†	V-10038-3	Shield, miniature tube (6BN6)	.10
	V-10907-2	Socket Assembly, CRT	.80
	V-10918-1	Socket Assembly, 12BH7	.50
	V-10918-1	Socket Assembly, HMV	.50
	V-9888-1	Socket, miniature wafer (all 7-pin tubes)	.13
	V-9889-1	Socket, miniature wafer (all 9-pin tubes)	.15
	V-8605	Socket and Capacitor Assembly, HV (includes R444, C431)	3.25
	V-4514-1	Socket, molded octal (5U4G, 6SN7GT, 6BQ6GT)	.17
	V-4514-2	Socket, molded octal (6AX4GT)	.15
	V-10958-1	Socket, miniature wafer (12BY7, 6BK5)	.20
†	V-11657-1	Socket, phono input	.10
	V-10970-1	Socket, UHF connector	.35
	V-11468-2	Strap Assembly, CRT	.30
†	V-11543-1	Superstructure, yoke	.30
†	V-11656-1	Switch, TV-phono	1.10

† New part number listed for the first time in Westinghouse radio or television service information.
* Sold only as complete assembly. Price shown covers complete assembly.
** Price includes Federal Excise Tax.
*** Price furnished on request.
NOTE: All prices are subject to change without notice.

SECTION 1 — R-F

	Ref. No.	Part No.	Description	Function	List Price Each
	C116	V-5596	Capacitor, .005 mfd	Tuner decoupling	$ .25
	C135	V-5596	Capacitor, .005 mfd	Tuner coupling	.25
	C140	V-5596	Capacitor, .005 mfd	Tuner decoupling	.25
	C141	V-5596	Capacitor, .005 mfd	Heater bypass	.25
	C142	RCP10W4103M	Capacitor, .01 mfd 400 v.	AGC filter	.20
	R108	RC20AE151K	Resistor, 150 ohms ½ w.	Tuner decoupling	.05
†	R110	RC20AE155J	Resistor, 1.5 megohms ½ w.	AGC decoupling	.15
†	R111	RC20AE186J	Resistor, 18 megohms ½ w.	AGC divider	.15
†	R112	RC40AE222K	Resistor, 2200 ohms 2 w.	B plus dropping	.25
		V-11333-1	RF tuner assembly	Tuner decoupling	47.50

SECTION 2 — SOUND I-F AND AUDIO

	Ref. No.	Part No.	Description	Function	List Price Each
	C201	V-9926-3	Capacitor, 4.7 mmf	Sound take-off	.07
	C202	V-5596	Capacitor, .005 mfd	Cathode bypass	.25
	C203	V-5596	Capacitor, .005 mfd	Screen bypass	.25
	C208	RCP10W4103M	Capacitor, .01 mfd 400 v.	Tone compensation	.20
†	*C211	V-11535-1	Capacitor, 20 mfd 50 v. (assy. consists of C211, C440, C413, C414)	Filter	3.75*
	C213	RCP10W6502M	Capacitor, .005 mfd 600 v.	Tone compensation	.15
	C215	RCM20B471K	Capacitor, 470 mmf	Bypass	.31
	C216	RCM20B470K	Capacitor, 47 mmf	IF coupling	.22
	C217	RCM20B470K	Capacitor, 47 mmf	IF tank	.22
	C218	RCP10W6202M	Capacitor, .002 mfd 600 v.	Screen bypass	.19
	C219	V-5596	Capacitor, .005 mfd	Cathode bypass	.25
	*C220	V-9891	Capacitor, 30 mfd 450 v. elec. (assy. consists of C220, C441, C501, C502)	Filter	4.35*
	C221	V-5596	Capacitor, .005 mfd	Line bypass	.25
	C222	RCP10W4203M	Capacitor, .02 mfd 400 v.	Audio coupling	.18
	C223	RCM20B151K	Capacitor, 150 mmf	IF tank	.20
	C224	RCP10W4502M	Capacitor, .005 mfd 400 v.	Tone control coupling	.17
	C234	RCP10W4102M	Capacitor, .001 mfd 400 v.	Decoupling	.17
	L201	V-9882-5	Reactor	Sound IF grid	.60
	L202	V-9882-2	Reactor	Sound IF grid	.70
	L203	V-9915-2	Reactor, 350 microhenries	RF choke	.30
	L204	V-11396-1	Coil, quadrature	FM det.	1.60
	R201	V-11345-2	Resistor, variable (0-500 ohms)	Quieting control	1.40
	R202	RC40AE273K	Resistor, 27,000 ohms 2 w.	Screen dropping	.22
	R207	RC20AE103M	Resistor, 10,000 ohms ½ w.	Tone compensation	.05
†	*R208	V-11540-1	Control, 500,000 ohms (assy. consists of R208, SW501)	Volume	1.20*
	R210	RC20AE224K	Resistor, 220,000 ohms ½ w.	Plate load	.05
	R214	RC20AE122K	Resistor, 1200 ohms ½ w.	Screen decoupling	.05
	R216	RC20AE121K	Resistor, 120 ohms ½ w.	Cathode bias	.06
†	R217	RC40AE681K	Resistor, 680 ohms 2 w.	Audio coupling	.22
†	R220	V-11636-1	Control, 1 megohm	Tone	.80
	R225	RC20AE181K	Resistor, 180 ohms ½ w.	Cathode bias	.10
	R232	RC40AE223K	Resistor, 22,000 ohms 2 w.	Plate load	.18
	R243	RC20AE471M	Resistor, 470 ohms ½ w.	Plate linearity	.05
	R244	RC20AE474K	Resistor, 470,000 ohms ½ w.	Isolation	.05
†	SW201	V-11656-1	Switch	TV-phono	1.10
	T202	V-9238	Transformer	Audio output	1.90

SECTION 3 — VIDEO

	Ref. No.	Part No.	Description	Function	List Price Each
	C301	V-9926-2	Capacitor, 3.3 mmf	1st IF tank	.10
	C302	V-5658-11	Capacitor, 0.47 mmf	IF trap coupling	.08
	C303	V-9863-1	Capacitor, 800 mmf	AGC decoupling	.20
	C304	V-9863-1	Capacitor, 800 mmf	IF screen bypass	.20
	C305	V-9863-1	Capacitor, 800 mmf	AGC decoupling	.20
	C306	V-9863-1	Capacitor, 800 mmf	IF screen bypass	.20
	C308	V-9863-1	Capacitor, 800 mmf	IF screen bypass	.20
	C313	RCP10W4104M	Capacitor, .1 mfd 400 v.	CRT grid bypass	.24

† New part number listed for the first time in Westinghouse radio or television service information.
* Sold only as complete assembly. Price shown covers complete assembly.
** Price includes Federal Excise Tax.
*** Price furnished on request.
NOTE: All prices are subject to change without notice.

PARTS LIST FOR MODELS H-740T21, H-742K21 AND H-743K21 (continued)

	Ref. No.	Part No.	Description	Function	List Price Each
	C315	RCP10W4104M	Capacitor, .1 mfd 400 v.	Video bypass	$ .24
	C317	V-5596	Capacitor, .005 mfd	B plus bypass	.25
	C318	R3CC20SL120K	Capacitor, 12 mmf	41.25 mc. trap	.19
	C320	V-5658-1	Capacitor, 1.0 mmf	Adjacent channel trap	.08
	C321	R3CC20SL120K	Capacitor, 12 mmf	Adjacent channel trap	.19
	C322	RCP10W4203M	Capacitor, .02 mfd 400 v.	AGC anti-hunt	.18
	C323	RCM20B560K	Capacitor, 56 mmf	4.5 mc. trap	.20
	C325	V-5596	Capacitor, .005 mfd	AGC bypass	.25
	C326	V-9863-1	Capacitor, 800 mmf	Cathode bypass	.20
	C327	V-9926-2	Capacitor, 3.3 mmf	IF tank	.10
	C328	R3CC20SL120K	Capacitor, 12 mmf	Plate bypass	.19
	C329	V-9926-3	Capacitor, 4.7 mmf	Det. plate filter	.07
		V-10916-1	Crystal	Video detector	1.20

NEW FEATURES IN V-2233-1 CHASSIS

FUSE

A ¼ ampere fuse is used to protect the horizontal output tube and associated circuits. The fuse is located on top, near the center of the sweep chassis.

PHONO PROVISIONS

A record player can be connected to the phono jack located on the back of the IF chassis. When the TV-PHONO switch is in the PHONO position, plate voltage is removed from the 3rd IF amplifier, screen voltage is removed from the video amplifier, the grid of the CRT is grounded, and the 6AU6 sound IF amplifier serves as an audio amplifier for the phono signal. Thus, during phono operation, the face of the CRT is completely darkened.

16 KV HIGH VOLTAGE

A high-efficiency auto-transformer provides approximately 16,000 volts for the second anode of the CRT. This high voltage is desirable for good picture definition. A new tube (6AX4GT) which features a higher cathode to heater voltage rating is used in the horizontal damper circuit. Along with these circuit variations from previous Westinghouse chassis, the 15,750 CPS pulse applied to the horizontal AFC circuit is taken from the horizontal multivibrator rather than the horizontal output stage.

NEW CIRCUIT

If 60 cycle vertical sync pulses reach the horizontal sweep circuits, they may cause improper operation which appears as a bend in the top portion of the picture. This effect is eliminated by taking some 60 cycle pulse voltage from the cathode of the vertical multivibrator, dividing it to the correct amplitude (R497 and R498), and applying it to the grid of the horizontal multivibrator so as to cancel any 60 cycle sync pulses feeding through to this point.

SUPPLEMENTARY INFORMATION

CHASSIS ASSEMBLY V-2233-1

PRODUCTION CHANGES

The changes that follow are incorporated in later production of the V-2233-1 chassis and are included on the schematic diagram in this supplement.

TUNER VOLTAGE — To prevent excessive power dissipation in the RF amplifier tube under conditions of high line voltage, a 1000 ohm 1 watt resistor (R113) is inserted in series with R112 which connects to terminal #10 of the tuner.

AUDIO TONE — To improve the tone control action and eliminate excessive high tones, C215 in the plate circuit of the 6BN6 FM detector is changed to 270 mmf and a .001 mfd capacitor (C235) is added in parallel with C215.

RESISTOR CHANGE — The audio load resistor (R232) located in the plate circuit of the 6AU6 sound IF or audio amplifier tube is changed to 18,000 ohms to decrease power dissipation in the resistor.

PARASITIC SUPPRESSION — To suppress parasitic oscillations in the audio output stage at high volume levels, a 150 ohm resistor (R219) is inserted in series with the control grid of the 6BK5 tube and a 1000 ohm resistor (R234) is inserted in series with the screen grid.

FM DETECTOR — To improve the limiting action in the 6BN6 FM detector, the plate load resistor (R210) is changed to 330,000 ohms.

PHONO INPUT — To insure against overload on phonograph operation, the phono input voltage is divided by adding a 470,000 ohm resistor (R245) in series with the phono input jack.

TWEET ELIMINATION — To eliminate tweet interference which appears on the picture in some instances, an 800 mmf capacitor (C238) is added between ground and the 250 volt line that supplies accelerator voltage to the 6BN6 FM detector.

RESISTOR CHANGE — To lower power dissipation in the video amplifier plate load resistance when the picture control is set at minimum resistance, a 10 ohm resistor (R334) is added in series with the picture control.

RESISTOR CHANGE — A single 3900 ohm 5 watt resistor (R322) is used as a video amplifier plate load resistor in place of the two 8200 ohm resistors (R322 and R335) that had been used in parallel.

INCREASED BRIGHTNESS RANGE — To improve the range of the brightness control, a 10,000 ohms resistor (R325) is inserted between the control and ground.

HORIZONTAL OVERDRIVE ELIMINATION — To eliminate a white vertical line which appears approximately one third of the way from the left side of the raster under certain conditions, R485 in the horizontal multivibrator plate circuit (pin #6) is changed to 27,000 ohms, decreasing the drive to the horizontal output stage.

VERTICAL BAND ELIMINATION — To eliminate a vertical band that appears on the right side of the raster under some conditions, a 100,000 ohm resistor (R410) is added between the boosted voltage line and the 290 volt line.

RIPPLE ELIMINATION — To reduce hum at the plate of the horizontal multivibrator which may cause vertical lines in the picture to wave slightly when the receiver is operated on a non-synchronous AC line, C466 located in the pin #6 plate circuit of the horizontal multivibrator is changed to 0.25 mfd.

WIDTH REACTOR — To reduce temperature rise in the horizontal output transformer, the width reactor, L413, is changed to part number V-11546-3.

In the original parts list for the V-2233-1 chassis, reference number T403 is erroneously listed as a width control. Since T403 is not used in the V-2233-1 chassis (the width reactor is L413), T403 should be deleted from the parts list to avoid confusion.

DAMPER TUBE SUBSTITUTE — A 6AS4GT tube can be substituted in place of the 6AX4GT horizontal damper tube.

PARTS LIST CORRECTIONS AND ADDITIONS

Ref. No.	*Part No.*	*Description*	*Function*	*List Price Each*

SUPPLEMENTARY INFORMATION
CHASSIS ASSEMBLY V-2232-2

A V-2232-2 chassis is used in later production of Model H-737T17. Included in this supplement are a schematic diagram, top view, bottom view and chassis parts list covering the V-2232-2 chassis.

For alignment, adjustment and other service information on the V-2232-2 chassis, refer to the H-740T21, H-742K21 and H-743K21 service notes.

PARTS LIST FOR V-2232-2 CHASSIS (continued)

Ref. No.	Part No.	Description	Function	List Price Each
•C413	V-11535-1	Capacitor, 150 mfd 50 v. (assy. consists of C413, C414, C440, C211)	Filter	$3.75•
•C414	V-11535-1	Capacitor, 30 mfd 450 v. (assy. consists of C413, C414, C440, C211)	Filter	3.75•
C415	V-9792-10510J	Capacitor, 51 mmf (used only with the V-11571-1 defl. yoke)	Transient damping	.25
✝ C415	V-9792-10430J	Capacitor, 43 mmf (used only with V-11571-2 defl. yoke)	Transient damping	•••
C416	RCP10W4254M	Capacitor, .25 mfd 400 v.	Hor. yoke return	.35
C421	RCM20B101K	Capacitor, 100 mmf	MV plate bypass	.22
C422	RCM20B101K	Capacitor, 100 mmf	MV coupling	.22
C423	V-10293-1	Capacitor, 10 mfd 450 v.	MV decoupling	1.25
C424	RCM30C392K	Capacitor, 3900 mmf	MV plate tank	1.17
C425	RCP10W4104M	Capacitor, .1 mfd 400 v.	MV plate decoupling	.25
C426	RCM20B391K	Capacitor, 390 mmf	Pulse shaping	.23
C427	RCP10M6103M	Capacitor, .01 mfd 600 v.	Coupling	.21
C428	RCP10W4104M	Capacitor, .1 mfd 400 v.	Screen bypass	.25
C429	RCP10M6104M	Capacitor, .1 mfd 600 v.	Screen bypass	.35
C431	V-9901-3	Capacitor, 500 mmf	HV filter	1.70
C432	RCP10W4603M	Capacitor, .06 mfd 400 v.	Linearity network	.22
C433	RCP10W4104M	Capacitor, .1 mfd 400 v.	Filter	.24
C434	V-9863-1	Capacitor, 800 mmf	Heater bypass	.20
C435	V-9863-1	Capacitor, 800 mmf	Heater bypass	.20
C437	V-5596	Capacitor, .005 mfd	Heater bypass	.25
C438	V-5596	Capacitor, .005 mfd	Heater bypass	.25
•C440	V-11535-1	Capacitor, 10 mfd 450 v. (assy. consists of C413, C414, C440, C211)	Decoupling	3.75•
•C441	V-9891	Capacitor, 30 mfd 350 v. (assy. consists of C220, C441, C501, C502)	Filter	4.35•
C443	RCP10W4103M	Capacitor, .01 mfd 400 v.	AGC delay	.20
C444	RCP10W4104M	Capacitor, .1 mfd 400 v.	Cathode bypass	.24
C445	RCP10W4254M	Capacitor, .25 mfd 400 v.	Filter	.35
C446	V-5596	Capacitor, .005 mfd	Cathode bypass	.25
C447	RCP10W4104M	Capacitor, .1 mfd 400 v.	Control bypass	.24
C451	RCM20B101K	Capacitor, 100 mmf	AFC cathode	.22
C452	RCM20B681K	Capacitor, 680 mmf	AFC plate bypass	.25
C453	RCM20B391K	Capacitor, 390 mmf	AFC coupling	.23
C454	RCP10W4103M	Capacitor, .01 mfd 400 v.	MV grid	.20
C455	RCP10W4502M	Capacitor, .005 mfd 400 v.	Coupling	.17
C456	RCP10W4104M	Capacitor, .1 mfd 400 v.	MV grid	.24
C457	V-11228-1	Capacitor, 5-40 mmf	MV trimmer	.35
C462	RCM20B151K	Capacitor, 150 mmf	AFC coupling	.20
C466	RCP10W4104M	Capacitor, .1 mfd 400 v.	HMV decoupling	.24
C469	RCM20B271K	Capacitor, 270 mmf	Cathode bypass	.20
C470	RCP10W4403M	Capacitor, .04 mfd 400 v.	Linearity network	.20
C472	RCM20B470K	Capacitor, 47 mmf	Sync sep. plate	.22
L401	V-6764	Coil	Ringing	1.45
L402	V-11545-1	Reactor	H. linearity	1.30
L404	V-4886-2	Reactor, 1.1 microhenries	Heater isolation	.38
L406	V-4886-2	Reactor, 1.1 microhenries	Heater decoupling	.38
L407	V-4886-2	Reactor, 1.1 microhenries	Heater isolation	.38
✝ L413	V-11546-3	Reactor	Width	1.40
R401	RC20AE472K	Resistor, 4700 ohms ½ w.	Keyed AGC grid	.05
R402	RC40AE183K	Resistor, 18,000 ohms 2 w.	AGC cathode	.18
R403	RC30AE472K	Resistor, 4700 ohms 1 w.	AGC screen	.09
R404	RC20AE224K	Resistor, 220,000 ohms ½ w.	Pos. bias limiting	.05
R405	RC20AE273K	Resistor, 27,000 ohms ½ w.	DC divider	.06
R406	RC20AE474K	Resistor, 470,000 ohms ½ w.	Sync sep. grid	.05
R407	RC20AE474K	Resistor, 470,000 ohms ½ w.	Coupling limiter	.05
R408	RC20AE473K	Resistor, 47,000 ohms ½ w.	Decoupling	.05
R409	RC20AE394K	Resistor, 390,000 ohms ½ w.	Sync sep. screen	.05
R411	RC20AE682K	Resistor, 6800 ohms ½ w.	Sig. divider	.05
R413	RC30AE104K	Resistor, 100,000 ohms 1 w.	Decoupling	.10
R415	RC20AE224K	Resistor, 220,000 ohms ½ w.	Bleeder	.05
R416	V-9813-4	Control, 250,000 ohms	Height	.75
R417	RC20AE564K	Resistor, 560,000 ohms ½ w.	Grid return	.05
R418	RC20AE122K	Resistor, 1200 ohms ½ w.	Cathode bias	.05

Ref. No.	Part No.	Description	Function	List Price Each
R419	V-9894-3	Control, 750,000 ohms	Vert. hold	$ .75
R420	RC20AE332K	Resistor, 3300 ohms ½ w.	Pulse shape net	.05
R421	RC20AE225K	Resistor, 2.2 megohms ½ w.	Grid return	.05
R422	RC20AE102K	Resistor, 1000 ohms ½ w.	Cath. bias	.05
R423	V-6463	Control, 5000 ohms	Vert. linearity	.76
R424	RC40AE153K	Resistor, 15,000 ohms 2 w.	Decoupling	.20
R425	RC20AE561K	Resistor, 560 ohms ½ w.	Transient damping	.05
R426	RC20AE561K	Resistor, 560 ohms ½ w.	Transient damping	.05
R433	RC20AE821K	Resistor, 820 ohms ½ w.	Cathode bias	.05
R434	RC20AE274J	Resistor, 270,000 ohms ½ w.	HMV grid	.15
R435	V-10915-1	Control, 125,000 ohms	Horiz. hold	.80
R436	RC20AE563K	Resistor, 56,000 ohms ½ w.	Plate load	.10
R437	RC20AE682K	Resistor, 6800 ohms ½ w.	Horiz. discharge	.05
R438	RC20AE333K	Resistor, 33,000 ohms ½ w.	Plate decoupling	.05
R439	RC20AE474K	Resistor, 470,000 ohms ½ w.	Grid return	.05
R440	RC20AE151M	Resistor, 150 ohms ½ w.	Suppressor	.06
R441	RC20AE273K	Resistor, 18,000 ohms ½ w.	HMV decoupling	.06
R442	V-11328-9	Resistor, 8200 ohms 5 w.	Screen decoupling	.75
R444	V-9927-7	Resistor, 330,000 ohms 1 w.	HV filter	.10
R445	RC20AE472K	Resistor, 4700 ohms ½ w.	Decoupling	.05
R446	RC20AE273K	Resistor, 27,000 ohms ½ w.	Plate load	.06
R452	RC20AE102K	Resistor, 1000 ohms ½ w.	AGC filter	.05
R455	RC20AE473K	Resistor, 47,000 ohms ½ w.	Decoupling	.05
R457	V-9375-4	Resistor, 3000 ohms 20 w.	Bleeder	1.35
R460	RC30AE330K	Resistor, 33 ohms 1 w.	Cathode bias	.11
R461	RC20AE223K	Resistor, 22,000 ohms ½ w.	Coil shunt	.06
R471	RC20AE105K	Resistor, 1 megohm ½ w.	AFC bleeder	.05
R472	RC20AE105K	Resistor, 1 megohm ½ w.	AFC cathode	.05
R473	RC20AE183K	Resistor, 18,000 ohms ½ w.	AFC take-off	.05
R474	RC20AE391K	Resistor, 390 ohms ½ w.	Transient damping	.08
R475	RC20AE224K	Resistor, 220,000 ohms ½ w.	Plate decoupling	.05
R476	RC20AE474K	Resistor, 470,000 ohms ½ w.	AFC delay	.05
R477	RC20AE473K	Resistor, 47,000 ohms ½ w.	Plate load	.05
R482	RC20AE105K	Resistor, 1 megohm ½ w.	Load	.05
R483	RC20AE393K	Resistor, 39,000 ohms ½ w.	Decoupling	.05
R485	RC20AE103M	Resistor, 10,000 ohms ½ w.	Decoupling	.05
R486	RC20AE104K	Resistor, 100,000 ohms ½ w.	Plate load	.05
R487	RC20AE682K	Resistor, 6800 ohms ½ w.	Pulse shape net	.05
R488	RC20AE334K	Resistor, 330,000 ohms ½ w.	Sync control plate	.05
R492	RC20AE222K	Resistor, 2200 ohms ½ w.	Signal divider	.05
R493	RC20AE222K	Resistor, 2200 ohms ½ w.	Cathode bias	.05
R494	RC20AE274K	Resistor, 270,000 ohms ½ w.	Divider	.06
R496	RC40AE153K	Resistor, 15,000 ohms 2 w.	Vert. decoupling	.20
R497	RC20AE103M	Resistor, 10,000 ohms ½ w.	Divider	.05
R498	RC20AE470K	Resistor, 47 ohms ½ w.	Divider	.05
R499	RC40AE222K	Resistor, 2200 ohms 2 w.	Dropping	.25
T401	V-10909-1	Transformer	Vertical output	3.90
T402	V-11548-2	Transformer	Hor. output & HV	13.75
Z401	V-11192-1	Filter	Integrating	1.30
Z402	V-11570-1	Yoke assembly (contains V-11571-1 defl. yoke)	Deflection	13.50

SECTION 5 — POWER

Ref. No.	Part No.	Description	Function	List Price Each
•C501	V-9891	Capacitor, 40 mfd 450 v. (assy. consists of C220, C441, C501, C502)	Filter output	4.35•
•C502	V-9891	Capacitor, 40 mfd 450 v. (assy. consists of C220, C441, C501, C502)	Filter input	4.35•
C503	V-5040-15	Capacitor, .01 mfd 600 v.	Line filter	.35
C504	V-5040-15	Capacitor, .01 mfd 600 v.	Line filter	.35
L501	V-6471-2	Reactor	LV filter	2.35
R501	RC30AE224M	Resistor, 22,000 ohms 1 w.	Protection	.10
R502	V-11328-8	Resistor, 50 ohms 10 w.	Current limiter	.75
•SW501	V-9877-4	Switch (assy. consists of R208, R319, SW501)	Off-on	2.15•
✝ T501	V-11544-2	Transformer	Power	19.00

CHASSIS NO. V-2232-2

FIG. 3 — SCHEMATIC DIAGRAM

IMPORTANT — Since many of the components are very critical, exact duplicates must be used for replacement purposes. However, any substitute supplied by Westinghouse will assure performance equal to or better than the list part.

MODEL H-755K21

CHASSIS ASSEMBLY V-2233-2

SERVICE NOTES

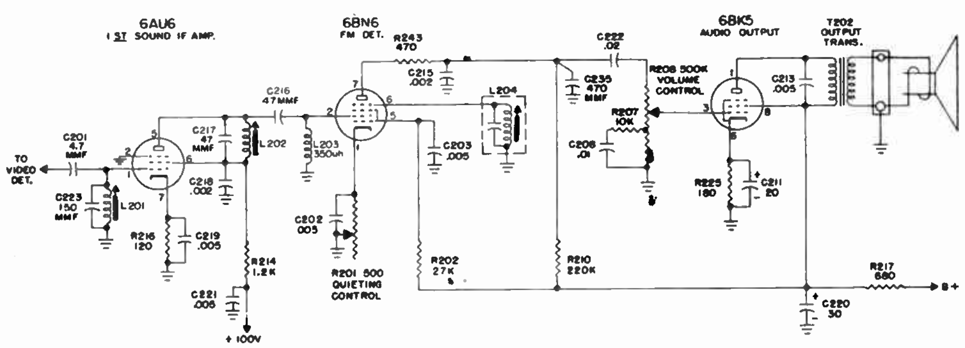

FIG. 1 — SOUND I-F AND AUDIO CIRCUITS IN V-2233-2 CHASSIS

For service information on the V-2233-2 chassis, refer to the H-740T21, H-742K21 and H-743K21 service notes and any supplementary information thereto. With a few exceptions the V-2233-2 chassis is the same as the V-2233-1 chassis used in Models H-740T21, H-742K21 and H-743K21. As shown in Fig. 1, the V-2233-2 chassis does not include the phono operation provisions nor the tone control which are in the V-2233-1 chassis. Another difference is the location of the horizontal hold, brightness, off-on-volume, and picture controls. In the V-2233-2 chassis, these controls are located as indicated in the Model H-723K21 service notes.

The following parts are used in the V-2233-2 chassis in lieu of the corresponding parts listed for the V-2233-1 chassis.

Ref. No.	*Part No.*	*Description*	*Function*	*List Price Each*
	V-11338-1	Belt, dial drive		$ .30

CHASSIS ASSEMBLY V-2233-2

MODELS H-760TU21 AND H-761TU21

These models are the same as H-760T21 and H-761T21 except that they contain a built-in all-channel UHF tuner.

SERVICE NOTES

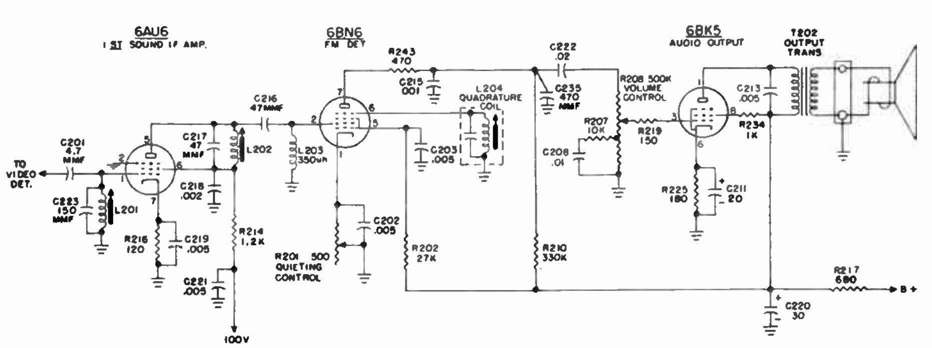

FIG. 1 — SOUND I-F AND AUDIO CIRCUITS IN V-2233-2 CHASSIS

For service information on the V-2233-2 chassis, refer to the H-740T21, H-742K21 and H-743K21 service notes and any supplementary information thereto. With a few exceptions the V-2233-2 chassis is the same as the V-2233-1 chassis used in Models H-740T21, H-742K21 and H-743K21. As shown in Fig. 1, the V-2233-2 chassis does not include the phono operation provisions nor the tone control which are in the V-2233-1 chassis. Another difference of the location of the horizontal hold, brightness, off-on-volume, and picture controls. In the V-2233-2 chassis, these controls are located as indicated in the H-723K21 service notes.

The following parts are used in the V-2233-2 chassis in lieu of the corresponding parts listed for the V-2233-1 chassis:

Ref. No.	*Part No.*	*Description*	*Function*	*List Price Each*
	V-11338-1	Belt, dial drive		$ .30
C215	RCP10W4102M	Capacitor, .001 mfd 400 v.	Tone compensation	.17
C235	RCM20B471K	Capacitor, 470 mmf	Bypass	.31
*R208	V-9877-4	Control, 500,000 ohms (assy. consists of R208, R319, SW501)	Volume	$ 2.15*
R210	RC20AE334K	Resistor, 330,000 ohms ½ w.	Plate load	.05
R219	RC20AE151M	Resistor, 150 ohms ½ w.	Suppressor	.06
R234	RC20AE102K	Resistor, 1000 ohms ½ w.	Decoupling	.05
*R319	V-9877-4	Control, 1500 ohms (assy. consists of R208, R319, SW501)	Picture	2.15*
R327	V-10914-1	Control, 50,000 ohms	Brightness	.80
R419	V-9894-3	Control, 750,000 ohms	Vert. hold	.75
R435	V-10915-1	Control, 125,000 ohms	Horiz. hold	.80
*SW501	V-9877-4	Switch (assy. consists of R208, R319, SW501)	On-Off	2.15*

H-760T21 AND H-761T21 MODEL PARTS

The following parts are used in Models H-760T21 and H-761T21 in lieu of the MODEL PARTS listed in the H-740T21, H-742K21 and H-743K21 service notes:

SUPPLEMENTARY INFORMATION CHASSIS ASSEMBLY V-2233-2

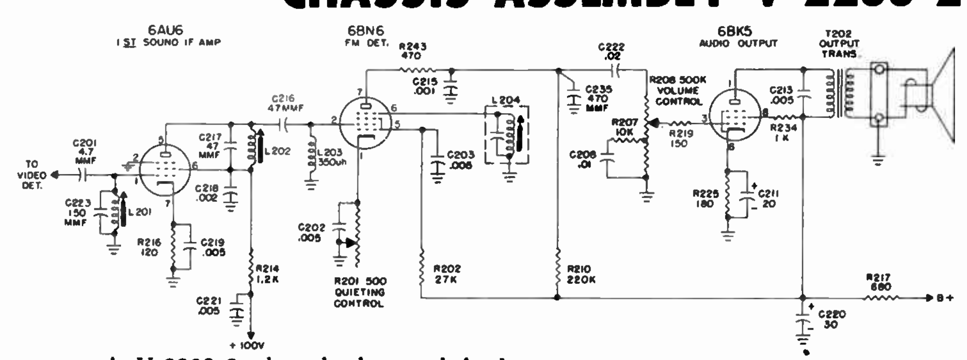

FIG. 1 — SOUND IF AND AUDIO CIRCUITS IN V-2233-2 CHASSIS

A V-2233-2 chassis is used in later production of Models H-751T21 and H-752T21. H-754K21. H-756K21 and H-757K21. H-758K21 and H-759K21.

For service information on the V-2233-2 chassis, refer to the H-740T21, H-742K21 and H-743K21 service notes and any supplementary information thereto. With a few exceptions, the V-2233-2 chassis is the same as the V-2233-1 chassis which is covered by the H-740T21, H-742K21 and H-743K21 service notes. As shown in Fig. 1, the V-2233-2 chassis does not include the phono operation provisions nor the tone control which are in the V-2233-1 chassis. Also different are the locations of the horizontal hold, brightness, off-on-volume, and picture controls. In the V-2233-2 chassis, these controls are located as indicated in the H-723K21 service notes.

The following parts are used in the V-2233-2 chassis in lieu of the corresponding parts listed for the V-2233-1 chassis:

Ref. No.	*Part No.*	*Description*	*Function*	*List Price Each*
	V-11338-1	Belt, dial drive		$ .30
C215	RCP10W4102M	Capacitor, .001 mfd 400 v.	Tone compensation	.17
C235	RCM20B471K	Capacitor, 470 mmf	Bypass	.31
*R208	V-9877-4	Control, 500,000 ohms (assy consists of R208, R319, SW501)	Volume	2.15*
R219	RC20AE151K	Resistor, 150 ohms ½ w.	Suppressor	.05
R234	RC20AE102K	Resistor, 1000 ohms ½ w.	Decoupling	.05
*R319	V-9877-4	Control, 1500 ohms (assy consists of R208, R319, SW501)	Picture	2.15*
R327	V-10914-1	Control, 50,000 ohms	Brightness	.80
R419	V-9894-3	Control, 750,000 ohms	Vert. hold	.75
R435	V-10915-1	Control, 125,000 ohms	Horiz. hold	.80
*SW501	V-9877-4	Switch (assy. consists of R208, R319, SW501)	On-off	2.15*

The MODEL PARTS listed in the original service notes apply regardless of which chassis is used.

* *Sold only as complete assembly. Price shown covers complete assembly.*
NOTE: *All prices are subject to change without notice.*

SUPPLEMENT NO. 1 TO MODELS H-750T21 AND H-753K21 SERVICE NOTES

SUPPLEMENTARY INFORMATION CHASSIS ASSEMBLY V-2233-3

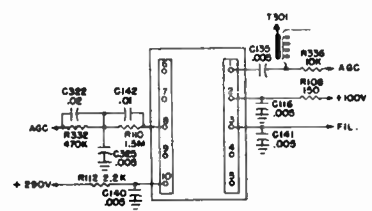

FIG. 1 — CONNECTIONS TO V-11485-1 TUNER

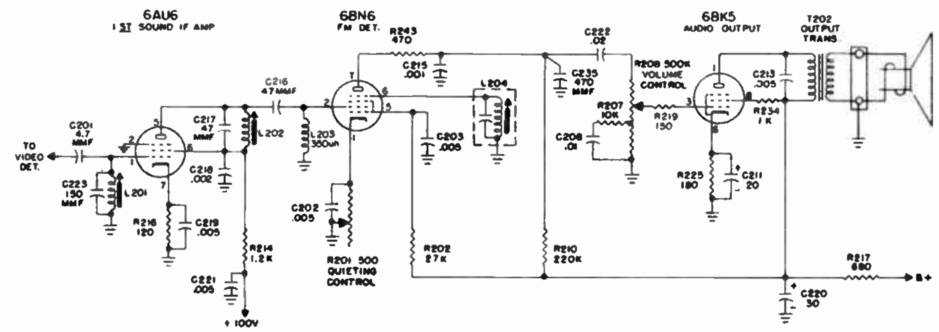

FIG. 2 — SOUND IF AND AUDIO CIRCUITS IN V-2233-3 CHASSIS

A V-2233-3 chassis is used in later production of Model H-750T21 and H-753K21.

For service information on the V-2233-3 chassis, refer to the H-740T21, H-742K21 and H-743K21 service notes and any supplementary information thereto. The information given for the V-2233-1 chassis applies also to the V-2233-3 chassis except as follows:

1. The V-2233-3 chassis contains a V-11485-1 RF tuner assembly. This tuner does not provide for the use of UHF sockets. Electrical connections to the tuner are as shown in Fig. 1.

2. As shown in Fig. 2, the V-2233-3 chassis does not include the phono operation provisions nor the tone control which are in the V-2233-1 chassis.

3. The locations of the horizontal hold, brightness, off-on-volume and picture controls are different. In the V-2233-3 chassis, these controls are located as indicated in the H-723K21 service notes.

The following parts are used in the V-2233-3 chassis in lieu of the corresponding parts listed for the V-2233-1 chassis:

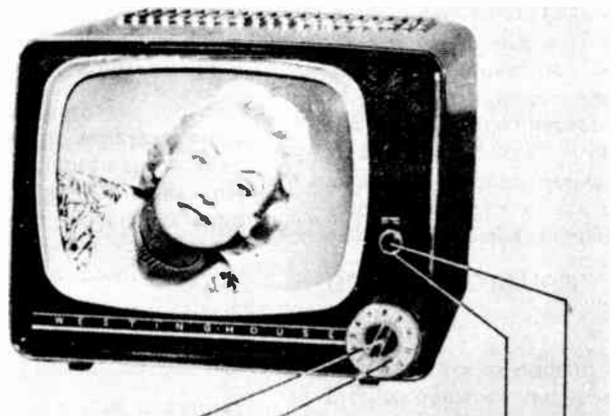
Ref. No.	*Part No.*	*Description*	*Function*	*List Price Each*
	V-11485-1	RF tuner assembly		$ 47.50
C215	RCP10W4102M	Capacitor, .001 mfd 400 v.	Tone compensation	.17
C235	RCM20B471K	Capacitor, 470 mmf	Bypass	.31
*R208	V-9877-4	Control, 500,000 ohms (assy consists of R208, R319, SW501)	Volume	2.15*
R219	RC20AE151K	Resistor, 150 ohms ½ w.	Suppressor	.05
R234	RC20AE102K	Resistor, 1000 ohms ½ w.	Decoupling	.05
*R319	V-9877-4	Control, 1500 ohms (assy consists of R208, R319, SW501)	Picture	2.15*
R327	V-10914-1	Control, 50,000 ohms	Brightness	.80
R419	V-9894-3	Control, 750,000 ohms	Vert. hold	.75
R435	V-10915-1	Control, 125,000 ohms	Horiz. hold	.80
*SW501	V-9877-4	Switch (assy consists of R208, R319, SW501)	On-off	2.15*

In later production, a different front glass plate is used. This part, listed under MODEL PARTS in the original H-750T21 and H-753K21 service notes, should be changed to read as follows:

✓ V-11858-1 Plate, front glass $14.50

The new front glass plate and the other MODEL PARTS apply regardless of which chassis is used.

✓ New part number listed for the firt time in Westinghouse radio or television service information.
** Sold only as complete assembly. Price shown covers complete assembly.*
NOTE: All prices are subject to change without notice.



MODEL H-716T17

CHASSIS ASSEMBLY V-2208-1

SERVICE NOTES

SPECIFICATIONS

FREQUENCY RANGES:

CHANNEL NUMBER	CHANNEL FREQUENCY (MC.)	VIDEO CARRIER FREQUENCY (MC.)	SOUND CARRIER FREQUENCY (MC.)	RECEIVER H-F OSCILLATOR FREQUENCY (MC.)

12	204 - 210	205.25	209.75	251
13	210 - 216	211.25	215.75	257

FINE TUNING RANGE:
1 mc. minimum; 2 mc. maximum

OPERATING VOLTAGE:
105 to 120 volts, 60 cycles A-C

POWER CONSUMPTION: .... 240 watts

AUDIO POWER OUTPUT:
Undistorted .... 1.8 watts
Maximum .... 2.8 watts

LOUDSPEAKER:
Type .... 5¼" P.M.
Voice Coil Impedance .. 3.2 ohms at 400 cycles

RECEIVER ANTENNA INPUT IMPEDANCE:
...... 300 ohms balanced or 72 ohms unbalanced

TUBE COMPLEMENT:
1 1B3GT .... High voltage rectifier
1 5U4G .... Low voltage rectifier
1 6AL5 .... Horizontal AFC
1 6AU5 .... Sound IF amplifier
1 6AU6 .... Sync separator
1 6BK5 .... Audio output
1 6BN6 .... FM detector
1 6BQ6GT .... Horizontal output
1 6BQ7 .... RF amplifier
3 6CB6 .... IF amplifiers
1 6J6 .... HF osc. and mixer
1 6SN7GT .... Vertical multivibrator
1 6W4GT .... Horizontal multivibrator
1 12AT7 .... Sync amp. and noise clipper
1 12AU7 .... Horizontal multivibrator
1 12BH7 .... Vert. output and keyed AGC
1 12BY7 .... Video amplifier
1 17HP4 .... Cathode ray tube

VIDEO CARRIER INTERMEDIATE FREQUENCY:
.... 45.75 mc.

VIDEO RESPONSE: .... 3.5 mc.

SOUND CARRIER INTERMEDIATE FREQUENCY:
.... 4.5 mc.

FOCUS: .... Electrostatic

SWEEP DEFLECTION: .... Magnetic

SCANNING: .... Interlaced 525 line

HORIZONTAL SCANNING FREQUENCY:
.... 15,750 CPS

VERTICAL SCANNING FREQUENCY: .... 60 CPS

FRAME FREQUENCY:
(picture repetition rate): .... 30 CPS

HIGH VOLTAGE WARNING

The danger accompanying shock is always present when the receiver is operated outside the cabinet or when the rear cover is removed from the cabinet. Only a person familiar with the precautions to be observed when working with high-voltage equipment should service this receiver.

CATHODE RAY TUBE HANDLING PRECAUTIONS

Shatterproof goggles and heavy gloves should be worn at all times when handling a cathode ray tube. The tube should not be handled in the vicinity of any person not so equipped. When handling the tube, always keep it away from the body.

Due to the large surface area of the tube and the high vacuum contained within, more than ordinary care is required to prevent shattering the tube. The large end of the bulb, particularly the rim of the viewing surface, must not be struck, scratched, or subjected to more than moderate pressure. If the tube binds during removal or replacement, determine the cause of the trouble — DO NOT FORCE THE TUBE.

An additional precaution is required when handling a cathode ray tube that has an aquadag coating on the outside of the tube. The outside aquadag coating forms one plate of a capacitor, and the inside coating to which the high voltage is applied serves as the other plate. The high voltage charge may be retained in this capacitor for a long time after the high voltage lead is disconnected. Since the charge could produce a shock that would startle the handler into dropping the tube, the charge should be dissipated before any handling of the tube is attempted. To dissipate the charge, place a jumper from the outside aquadag coating to the high voltage button on the tube. Due to the relatively high resistance of the aquadag, the jumper should be held in place for some time to insure complete discharge.

INSTALLATION INSTRUCTIONS

TO PREPARE THE RECEIVER FOR OPERATION:

Model H-716T17 is shipped in operating condition. There is no shipping material to be removed. Simply remove the receiver from its carton, and connect the AC plug to a 105 to 120 volt 60 AC outlet.

The receiver contains a built-in antenna for use in areas of normal reception. In such areas when the built-in antenna provides good reception, an external antenna is not required. However, in weak signal areas or under adverse conditions, it may be necessary to use an outside antenna.

The antenna terminals are located on the back of the receiver. If an external antenna is to be connected to the receiver, the built-in antenna wires must be disconnected from the terminals. This can be accomplished by loosening the terminal screws and removing all wires that can be removed without completely removing the terminal screws. The built-in antenna wires should be dressed in such a position that they do not touch the chassis or metal components. The lead-in wires from the external antenna should then be connected to the antenna terminals.

TO CHECK THE OPERATION OF THE RECEIVER:

1. Turn on the receiver by rotating the off-on-volume control clockwise.

2. Rotate the channel selector to the desired channel number.

3. Adjust the brightness control to a position where the picture screen is moderately lighted.

4. Check the ion trap magnet adjustment as outlined under ADJUSTMENTS.

5. Rotate the picture control to the position that provides best picture contrast.

6. If the picture moves up or down on the screen, the vertical hold control on the back of the receiver should be adjusted as explained under ADJUSTMENTS.

7. If the picture is pulled into diagonal bars or if the edge of the picture quivers or tends to fold over, adjust the horizontal control for correct synchronization. This control can be adjusted so that it will seldom be necessary to re-adjust it thereafter. To obtain this adjustment, tune in a TV station, and rotate the control to the middle of the range over which the picture is synchronized. If the middle of the sync range does not correspond approximately to the middle of the mechanical range, make the adjustments described under Horizontal Ringing Coil in the ADJUSTMENTS section. Check the adjustment of the horizontal control by switching to another channel and then back again. The picture should be stable when switching from channel to channel.

8. Rotate the fine tuning control to the position that provides best picture detail.

9. Re-adjustment of the brightness and picture controls may improve the picture shading. The correct balance between these controls produces the best picture. Once the brightness control has been adjusted to suit the preference of the user, it will seldom be necessary to re-adjust it.

10. Adjust the off-on-volume control for the desired sound volume.

11. Check the operation on all available TV stations.

12. If necessary, adjust the vertical linearity, height, horizontal linearity, width, focus, or centering as explained under ADJUSTMENTS.

ADJUSTMENTS

CATHODE RAY TUBE CUSHION

The CRT cushion must fit snugly against the flare of the CRT in order that the rear of the tube will be supported firmly. If this condition is not obtained, loosen the CRT cushion adjustment screws and the deflection yoke adjustment screw, slide the CRT cushion forward as far as possible, and re-tighten the screws.

DEFLECTION YOKE

The deflection yoke must be positioned as close as possible to the flare in the CRT. If adjustment is required, loosen the deflection yoke adjustment screw, slide the deflection yoke forward as far as possible, and re-tighten the screw. Note that the CRT cushion must fit snugly against the CRT flare as described previously.

The deflection yoke adjustment screw also permits the picture to be rotated to make it square with respect to the mask. To rotate the picture, loosen the deflection yoke adjustment screw and move it to the left or right. The picture will tilt to the left or right with the movement. Tighten the screw when the picture is squared in the mask.

FOCUS

The focus control is located on the back of the chassis as shown in Fig. 4. With the brightness and picture controls set at their normal operating positions, the focus control should be adjusted for best focus.

QUIETING CONTROL

The quieting control is located at the lower left on the back of the receiver and is adjusted by means of a screwdriver inserted through the hole in the back cover. This control, which determines the AM rejection characteristics of the sound system, is normally adjusted during alignment of the sound system as described under SOUND ALIGNMENT PROCEDURE and will not ordinarily require further adjustment. In very weak signal areas, however, a reduction in noise or hiss on the sound may be obtained by slightly re-adjusting the control.

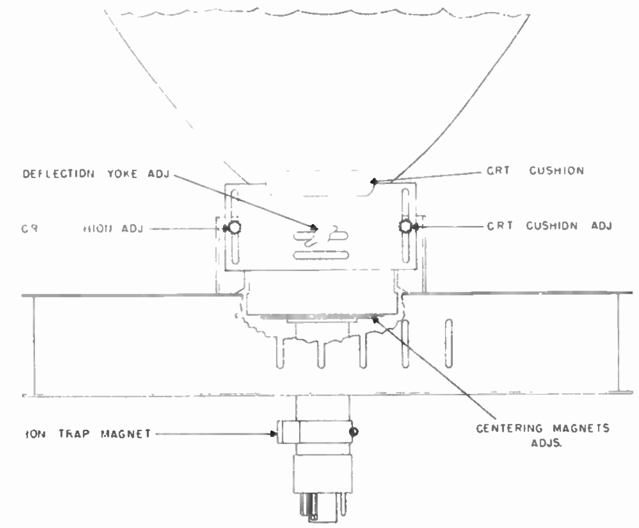

FIG. 1 — CRT ADJUSTMENTS

CENTERING

Centering is accomplished by rotating the centering magnet adjusting rings clockwise or counterclockwise as required. The two adjusting rings are located on the back of the deflection yoke as shown in Fig. 1. A tab projection on each of the rings serves to facilitate adjustment.

If difficulty is experienced in centering the picture or eliminating "neck shadows", make certain the CRT cushion is tight against the flare in the CRT. Also make certain that the deflection yoke is as far forward as possible.

ION TRAP MAGNET

It is extremely important that the ion trap magnet be correctly adjusted immediately after the set is first turned on during installation. This is true even though the set appears to be operating satisfactorily. When the magnet is not correctly oriented, the electron beam strikes the edge of the aperture in the anode top disc instead of moving cleanly through the hole. The resultant heat vaporizes the metal of the disc, thus releasing gas which has a harmful effect on the tube. Some of the vaporized material may be deposited on the screen of the tube and be apparent as darkened area. An excessively high setting of the brightness control will aggravate this condition. From this it is apparent that the brightness control should never be turned up to compensate for an incorrectly adjusted ion trap magnet. The tube can be ruined in a very short time under this condition.

To adjust the ion trap magnet, position the magnet approximately as shown in Fig. 1 with the color code mark facing upward, then rotate the magnet and move it forward and backward until the position is found where the picture is brightest. If the brightness peaks at two positions of the magnet, the position nearer the base of the tube is the correct one. Never move the ion trap magnet to remove a shadow from the raster if the brightness is decreased by so doing. Shadows should be removed by adjusting the position of the deflection yoke. *The ion trap magnet must always be adjusted for maximum picture brightness.*

HEIGHT AND VERTICAL LINEARITY

The height adjustment on the back of the chassis controls the overall height of the picture, and the vertical linearity adjustment controls the relationship between the vertical dimensions of the upper and the lower sections of the picture. A balance between the two controls is necessary to make the picture symmetrical and fill the mask vertically.

WIDTH AND HORIZONTAL LINEARITY

The width adjustment on the back of the chassis controls the overall width of the picture, and the horizontal linearity adjustment controls the relationship between the horizontal dimensions of the left and the right sections of the picture. A balance between the two controls is necessary to make the picture symmetrical with correct horizontal dimensions. These controls can be adjusted with a ¼" Spintite-type wrench.

VERTICAL HOLD

The vertical synchronization is controlled by the vertical hold adjustment on the back of the chassis. To adjust, rotate the control clockwise or counterclockwise until the picture is stabilized vertically. The adjustment should preferably be made on the weakest signal that is available, and a check should be made to see that the receiver pulls into sync on all channels.

HORIZONTAL RINGING COIL

The horizontal ringing coil (L401) should be adjusted as follows:

1. Short out the ringing coil with a short jumper wire.

2. Set the horizontal hold control to the middle of its range, and leave it in this position during the steps that follow.

3. Connect a VTVM to the junction of R477 and C456, located in the pin #2 grid circuit of the horizontal multivibrator, so as to measure the DC voltage between this point and ground.

4. With the receiver tuned to a TV station, adjust C457 (located near the horizontal multivibrator tube as shown in Fig. 4) for *zero* voltage on the meter. If zero voltage can be approached but not quite reached at one extreme of the C457 adjustment, it may be necessary to set the horizontal hold control slightly to one side of mid-position to obtain zero voltage.

5. Remove the jumper from across the ringing coil.

6. Adjust the ringing coil for *zero* voltage on the meter, and check the adjustment by switching to another channel and then back again. The receiver should pull into horizontal synchronization on all channels.

CRITICAL LEAD DRESS

Leads that are susceptible to R-F pickup with resulting interaction between stages must be dressed close to the chassis mounting plate. Leads in this category include heater, AGC, B plus, and the 100 volt bus leads. These leads must be long enough to permit dressing most of the path length close to the mounting plate. The heater wiring arrangement should not be altered.

Leads associated with the 41.25 mc. trap must be as short as possible and dressed away from the chassis.

Video peaking coils should be dressed away from the chassis and clear of adjacent parts.

The lead-in from the antenna terminals to the tuner must be dressed away from the I-F chassis to prevent an R-F "tweet" from interfering with the picture.

ALIGNMENT

TEST EQUIPMENT

To service these chassis, the following test equipment should be available:

1. R-F sweep generator that is capable of producing a 10 mc. sweep at a center frequency of 44 mc. The output must be adjustable from at least 100,000 microvolts down to a very low minimum, and the output must be flat at all positions of the attenuator.

2. Cathode ray oscilloscope, preferably one with a wide-band vertical deflection amplifier and a low-capacitance input probe. The oscilloscope should have good low-frequency response characteristics.

3. Signal generator or generators capable of producing an accurate unmodulated signal at 4.5 mc., 41.25 mc., 42.25 mc., 43.0 mc., 44.0 mc., 45.0 mc., and 45.75 mc. The accuracy of these frequencies is very important. If the signal generator does not include a crystal calibrator, a heterodyne frequency meter equipped with a crystal calibrator should be used to insure accuracy. The output level must be adjustable from at least 100,000 microvolts down to a very low minimum.

4. Vacuum tube voltmeter equipped with a high voltage multiplier probe for measurements up to 15,000 volts and an R-F probe for measuring R-F voltages.

GENERAL INFORMATION

The chassis and the test equipment should be bonded together by short lengths of heavy braided copper ribbon, and all interconnecting leads should be shielded and should be as short as possible consistent with ease in making connections. The effectiveness of the bonding can be checked during alignment by placing the hand on the chassis or test equipment case. If the response curve or meter reading changes, the bonding must be improved before the circuits are aligned.

It is important that the coaxial cable used to couple the sweep generator output to the receiver be terminated at its output end in the characteristic impedance of the sweep generator output circuit. To accomplish this, connect the appropriate value of resistance across the output leads at the open end of the cable. The oscilloscope vertical input cable and the generator output cables must be well separated from each other.

ALIGNMENT TOOL

To adjust the slugs in the common I-F transformers a special tool is required. This tool must fit into the .035" x .093" slot in slug. *An incorrectly designed tool will cause chipping of the slug.* A suitable tool is stocked under Westinghouse part number V-8345.

COMMON I-F ALIGNMENT PROCEDURE

The common I-F system uses over-coupled I-F transformers to obtain the required band width. In the alignment of this type system, the visual method of stage-by-stage alignment is used. A sweep generator is used to develop the I-F response curve on the oscilloscope, and an unmodulated signal generator (marker) is used to provide spot frequency indications on the curve.

With some of the I-F transformers, peaks may be obtained at two positions of the adjustment slugs. If a transformer is badly out of adjustment, it is advisable to turn the slug out (counterclockwise) as far as possible before beginning alignment. Then turn the slug clockwise until the first peak is reached. This procedure is recommended to obtain the correct peak rather than an undesired second peak which is sometimes obtained when the slug is turned farther clockwise.

The alignment procedure to be used is given in the following steps:

1. To avoid undesirable beat response during alignment, remove the 6BQ7 R-F amplifier tube from its socket and rotate the channel selector to channel 13. The channel selector is on channel 13 when the flat of the shaft is facing straight up.

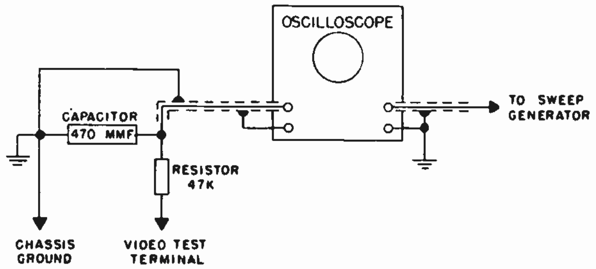

FIG. 2 — OSCILLOSCOPE CONNECTIONS

2. Connect the vertical input of the oscilloscope to the video test terminal (point "D" on Fig. 4) through the decoupling network shown in Fig. 2. The oscilloscope horizontal input should be connected to the sweep (synchronizing) output from the sweep generator *through well shielded leads.* Turn the sweep control on the oscilloscope to the "x" or "off" position.

3. Connect the negative terminal of a 9 volt bias battery to the AGC line, and connect the positive terminal to chassis ground.

4. Couple the marker generator output to the sweep generator output so that the two signals are applied together to the points specified in the steps that follow. Some sweep generators have facilities for connecting the marker output directly into the sweep generator. With other sweep generators, the marker can be coupled to the sweep by wrapping a few turns of insulated wire around the center conductor of the sweep generator output cable and connecting the marker generator to this wire. The loose coupling obtained in this manner is desirable because *excessive marker signal injection will distort the response curve.*

5. Adjust the sweep generator for a center frequency of 44 mc. with a sweep deviation of 10 mc.

6. Connect the high side of the sweep generator output cable directly to the control grid of the 3rd I-F amplifier, and connect the ground side of the cable to the chassis partition as close as possible to the ground point for the 3rd I-F amplifier tube. Keep the leads from the cable as short as possible.

7. Detune the plate circuit of the 2nd I-F amplifier by attaching an "alligator" or similar type clip to pin 5 of the 6CB6 2nd I-F amplifier tube. *Use care to avoid shock.* This step is necessary to avoid absorption of the signal that is applied at the 3rd I-F grid.

8. Adjust the oscilloscope vertical gain and the sweep generator output level to obtain a curve on the oscilloscope. To avoid a distorted curve, the recommended practice is to use maximum oscilloscope vertical gain and only enough sweep signal amplitude to obtain a good curve.

9. Set the marker generator to 44 mc. with the output attenuated until the marker pip is barely visible on the curve, and adjust the primary of the 3rd common I-F transformer, T304, until the 44 mc. marker pip is at the highest point on the response curve.

10. Adjust the secondary of T304 to make the top of the response curve symmetrical.

11. Make certain that the response curve coincides with Fig. 5A, using the marker to check at the appropriate frequencies. The 44 mc. pip must strike the center of the flat response region, the 42.25 mc. and 45.75 mc. points must be at equal heights, and the 43 mc. and 45 mc. points must be at equal heights. Re-adjust the primary and secondary of T304 if necessary to obtain these conditions.

12. Remove the detuning clip from the plate of the 2nd I-F amplifier tube, and attach it to the plate of the 1st I-F amplifier tube.

13. Move the sweep output connection from grid of the 3rd I-F amplifier to the grid of the 2nd I-F amplifier. Connect the ground side of the cable to the chassis partition as close as possible to the ground point for the 2nd I-F amplifier tube.

14. Adjust the primary of the 2nd common I-F transformer, T303, for maximum height of the response curve at 44 mc., and adjust the secondary of T303 to make the top of the curve symmetrical.

15. Make certain that the curve corresponds to Fig. 5B. The 44 mc. pip must strike the center of the flat response region, the 42.25 mc. and 45.75 mc. points must have equal heights, and the 43 mc. and 45 mc. points must have equal heights. Re-adjust the primary and secondary of T303 if necessary.

16. Remove the detuning clip from the plate of the 1st I-F amplifier.

17. Move the sweep output connection from the grid of the 2nd I-F amplifier to the grid of the 1st I-F amplifier, and connect the ground side of the cable as close as possible to the ground point for the 1st I-F amplifier tube.

18. Adjust the primary of the 1st common I-F transformer, T302, for maximum height of the response curve at 44 mc., and adjust the secondary of T302 to make the top of the curve symmetrical. If difficulty is experienced in aligning T302, adjust the adjacent channel interference trap, L308, to a higher frequency by rotating the slug completely counterclockwise. Complete information on the adjustment of L308 is given in step 26.

19. Make certain that the curve corresponds to Fig. 5C. The 44 mc. pip must strike the center of the flat response region, the 42.25 mc. and 45.75 mc. points must have equal height, and the 43 mc. and 45 mc. points must have equal heights. Re-adjust the primary and secondary of T302 if necessary.

20. Remove the sweep output connection from the 1st I-F amplifier grid, and couple it to the 6J6 mixer-oscillator tube through the coupling system illustrated in Fig. 3. This system provides adequate signal injection and at the same time provides shielding which prevents radiation of the signal. The device is constructed by flaring a piece of tubular copper braid over the top of the 6J6 tube and wrapping gummed tape over the braid to serve as insulation. The tube shield is then replaced over the tube with the braid protruding through the hole in the top of the shield. *The braid must not contact the chassis or the tube shield at any point.* The tube shield should be locked securely to its mounting base. Connect the high side of the sweep generator output cable to the copper braid, and connect the ground side to the nearest point on the chassis.

21. Rotate the slug of the 41.25 mc. trap (L301) completely clockwise.

22. It is possible to obtain two peaks when adjusting the primary of the I-F input coupling network, T101. located on the R-F tuner. These peaks

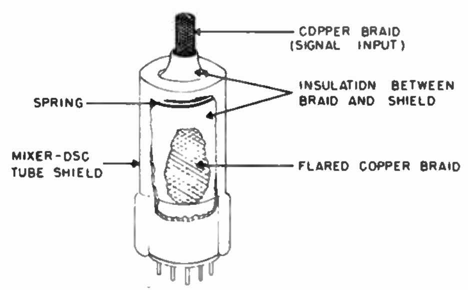

FIG. 3 — COUPLING SIGNAL GENERATOR TO MIXER TUBE

produce different overall bandwidths. The correct peak to use is normally the peak that occurs with the adjustment screw turned further counterclockwise.

Turn the adjustment screw of T101 completely counterclockwise. Then adjust T101 for maximum height of the response curve at 44 mc., and adjust the secondary of the I-F input coupling network, T301, to make the top of the curve symmetrical. If necessary, re-adjust T101 and T301 to make 44 mc. strike the center of the flat response region.

23. Set the marker generator to 41.25 mc., and increase the output until the pip is readily visible on the curve.

24. Adjust L301 to minimize the amplitude of the 41.25 mc. marker pip. L301 functions as a 41.25 mc. trap.

25. Make certain that the final response curve corresponds to Fig. 5D. Use the marker to check at the frequencies shown on the drawing. If necessary, re-adjust T101 and T301 to obtain the correct curve.

If the bandpass of the response curve is too narrow so that the 45.75 mc. marker occurs at less than 40 percent of maximum response, turn T101 clockwise until a second peak at 44 mc. is obtained. Adjust T301 for flat response at the top of the curve, and re-adjust T101 to center 44 mc. on the flat response.

26. L308 is the adjustment for the adjacent channel interference trap. If adjacent channel interference does not constitute a problem in the areas where the receiver is to be operated, L308 will not ordinarily require adjustment; however, the trap must not be mis-adjusted into the I-F response region. In areas where adjacent channel interference is not troublesome, L308 can be set to its highest tuneable frequency by rotating the slug completely counterclockwise, and it can be left in this position.

In areas where adjacent channel interference is evident, however, L308 should be adjusted to 47.25 mc. This can be accomplished in either of two ways. One is to connect an amplitude modulated signal generator that has an output of .02 volt or higher to the grid of the 1st I-F amplifier, and adjust the output frequency accurately to 47.25 mc. This will produce an indication on an oscilloscope connected to the video test terminal. Adjust L308 for minimum response on the oscilloscope. If a signal generator capable of this high output is not available, connect a good antenna to the receiver, and tune the receiver to the TV station on which the adjacent channel interference occurs, carefully adjusting the fine tuning control to its correct setting. Then, beginning with L308 in its completely counterclockwise position, rotate L308 clockwise until the position is found where the adjacent channel interference is eliminated. In some cases, the trap adjustment may affect the adjustment of T302. If this occurs, it will be necessary to repeat steps 17, 18 and 19.

4.5 MC. TRAP ALIGNMENT PROCEDURE

1. Connect the high side of the signal generator to the video test terminal (point "D" on Fig. 4) through a .001 mfd mica capacitor, and ground the low side to the chassis.

2. Adjust the signal generator to 4.5 mc. (unmodulated). The accuracy of this frequency is very important. If a crystal controlled signal generator is not available, the frequency should be checked with an accurate frequency meter.

3. Connect the common lead from the VTVM to the chassis, and connect the *R-F probe* from the VTVM to the cathode of the CRT. This point is shown as point "E" on Fig. 6. Note that this point is above ground potential and, therefore the R-F probe must contain a blocking capacitor.

4. Using a strong 4.5 mc. signal, adjust the 4.5 mc. trap, L309, for minimum indication on the meter.

SOUND ALIGNMENT PROCEDURE

The sound system can be aligned using either locally generated signals or a received TV signal. Since the latter method does not require signal generating equipment, it will be described first and will be followed by the procedure using locally generated signals.

To use an "air" TV signal for alignment:

1. Tune the receiver to a TV station and connect an attenuator between the receiver and the antenna so that the strength of the signal can be varied from weak to strong.

2. Set the quieting control (R201) located on the back of the chassis approximately to its mid-position.

3. Adjust the 4.5 mc. IF slugs (L201 and L202) for maximum program sound. If peaks occur at two different positions of the slug, use the peak that occurs when the slug is farthest counterclockwise. Reduce the signal to its lowest useable level and recheck the adjustments.

4. Apply a *strong* signal to the receiver, and adjust the quadrature coil (L204) for maximum program sound. If peaks occur at two different positions that are widely separated, use the one that occurs with the slug farthest counterclockwise. If two peaks occur within a *narrow* range of adjustment, sufficient signal is not being applied to the receiver or the quieting control is not set at the desired position.

5. Apply a very weak signal that allows noise to be heard and adjust the quieting control (R201) for minimum noise. The position at which the noise is minimized depends on the strength of the signal; therefore, the weakest useable station in the area should be used for this adjustment. This control determines the AM rejection characteristics of the sound system, and its correct setting is normally about mid-position. *Do not leave the quieting control set at its maximum counterclockwise position.*

To use locally generated signals for alignment:

1. Connect an oscilloscope or an AC voltmeter across the volume control for use as an indicator.

2. Apply a 4.5 mc. FM signal (deviation approximately 7.5 kc.) to the video test point (D on Fig. 4).

3. Using the lowest signal level that will produce an indication, adjust L201 and L202 for maximum output.

4. Using a *strong* signal, adjust L204 for maximum output.

5. Apply a 4.5 mc. AM signal (modulated apx. 30 percent) to the video test point.

6. Beginning with a very low signal level, increase the generator output, while rotating the quieting control back and forth, until the signal level is such that the AM output across the volume control dips to *zero* with a rise on each side as the quieting control is rotated. Set the quieting control for zero output at this signal level.

H. F. OSCILLATOR ALIGNMENT PROCEDURE

If the 6J6 oscillator tube is replaced, the different inter-electrode capacitance of the new tube may change the oscillator frequency enough to necessitate re-alignment of the oscillator.

Alignment of the oscillator on the high band is accomplished by adjusting the brass slug located adjacent to the vernier drive wheel on the front of the tuner. Alignment of the oscillator on the low band is accomplished by adjusting the brass slug on the lower front of the tuner. The adjustment procedure is as follows:

1. Set the fine tuning control to the middle of its range, and keep it in this position during the following adjustments. The control is set to the middle of its range when the set-screw in the fine tuning drive wheel is straight up.

2. Set the selector switch to the highest of the low-band (channels 2 through 6) stations operating in your vicinity.

3. Peak the low band adjustment slug (L109) for the best picture detail.

4. Set the selector switch to the highest of the high-band (channels 7 through 13) stations operating in your vicinity.

5. Peak the high band adjustment slug (L110) for the best picture detail.

6. Check the previously made low band adjustment, and if the tuning has changed repeat steps 2 and 3.

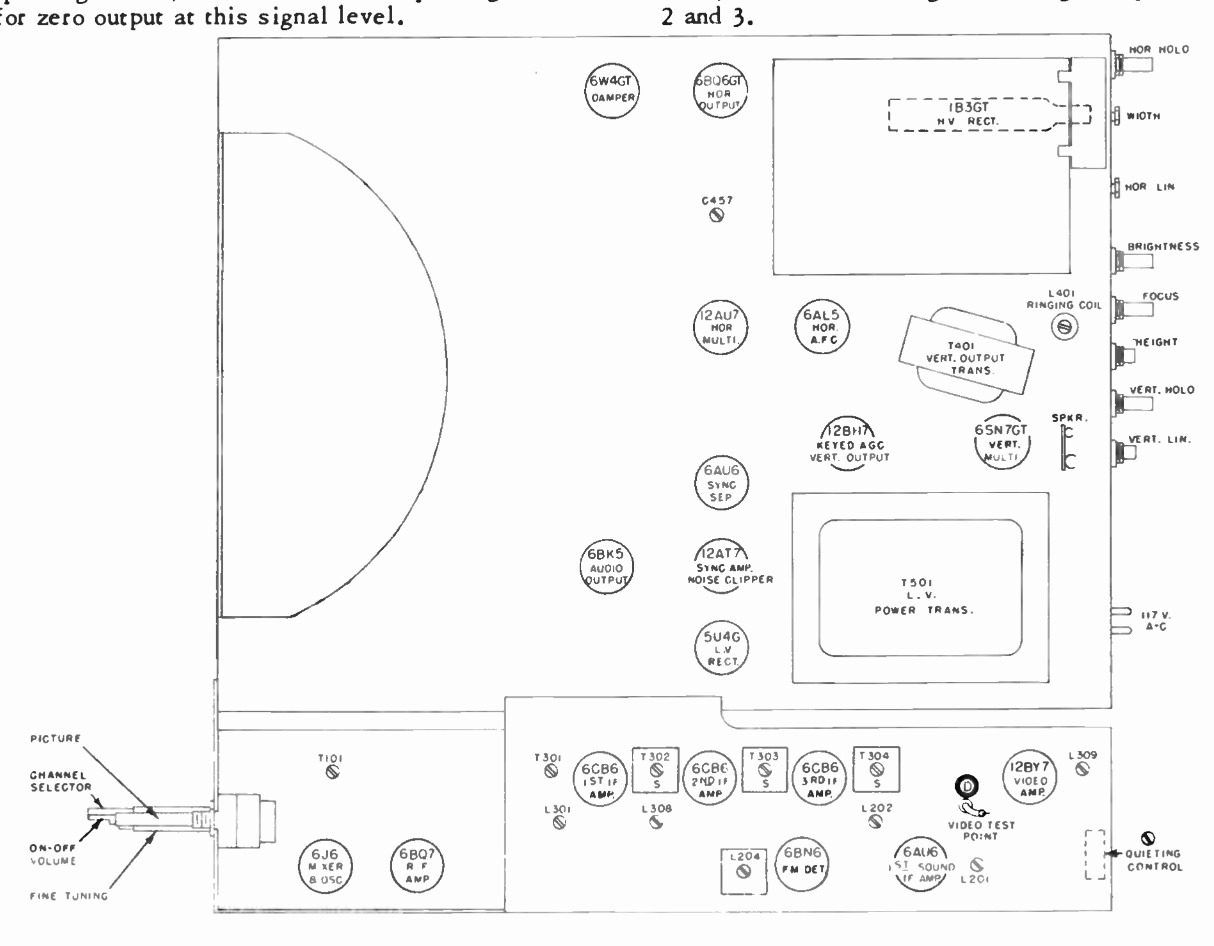

FIG. 4 — TOP VIEW OF CHASSIS

ALIGNMENT CHARTS

The information in these charts is condensed from the foregoing detailed information as a convenience to the service technician. It is recommended that the detailed information be studied before using the charts.

COMMON I-F SECTION

Remove the 6BQ7 RF amplifier tube from its socket, and turn the channel selector to channel 13.

Connect the oscilloscope to the video test terminal through the decoupling network shown in Fig. 2.

Connect a 9 volt bias battery to the AGC line.

Adjust the sweep generator for a center frequency of 44 mc. with a 10 mc. sweep deviation, and couple the marker generator to the sweep generator.

Step	*Connect Sweep and Marker Generators to —*	*Marker Use*	*Connect Detuning Clip to —*	*Adjust —*
1.	3rd I-F amp. grid	Check for equal response at 42.25 mc and 45.75 mc using weak signal. Also 43 mc and 45 mc.	2nd I-F amp. plate	Pri. of T304 for max. response and sec. of T304 for symmetrical curve shown in Fig. 5A.
2.	2nd I-F amp. grid	Same as step 1	1st I-F amp. plate	Pri. of T303 for max. response and sec. of T303 for symmetrical curve shown in Fig. 5B.
3.	1st I-F amp. grid	Same as step 1	Not used	Pri. of T302 for max. response and sec. of T302 for symmetrical curve shown in Fig. 5C.
4.	6J6 mixer through coupling device shown in Fig. 3.	Check at 44 mc. Marker pip must be at center of flat region on curve	Not used	Turn L301 adj. completely clockwise and adjust T101 for max. response. Adjust T301 for symmetrical top.
5.	Same as preceding step	Adjust to 41.25 mc. and increase output until pip is readily visible.	Not used	L301 to minimize amplitude of 41.25 mc. marker pip.
6.	Same as preceding step	Check curve at frequencies shown on Fig. 5.	Not used	Re-adjust T101 and T301 to obtain curve shown in Fig. 5D.
7.	Tune L308 to 47.25 mc. as described in step 26 of detailed information.			

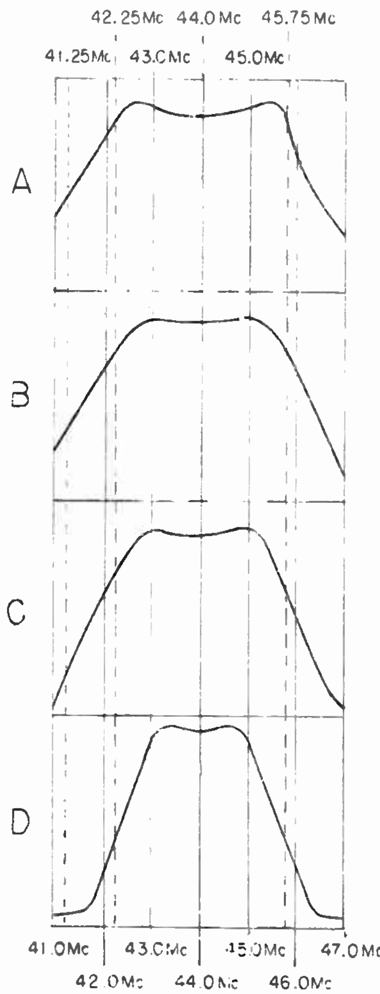

FIG. 5 — RESPONSE CURVES AT VARIOUS STAGES OF ALIGNMENT

4.5 MC. TRAP

Connect the signal generator to the video test terminal (point "D" on Fig. 4) through a .001 mfd capacitor.

Step	*Signal Gen. Frequency*	*VTVM Connections*	*Remarks*	*Adjust —*
1.	4.5 mc. unmodulated	RF probe to point "E" (see Fig. 6) and common lead to chassis.	Use strong signal from generator	L309 for minimum voltage

SOUND SECTION

Refer to SOUND ALIGNMENT PROCEDURE on page 7. Using a weak signal, adjust L201 and L202 for maximum response to a 4.5 mc. FM signal. Using a strong signal, adjust L204 for maximum response to a 4.5 mc. FM signal. Using a weak signal, adjust the quieting control for minimum AM noise.

L304	V-5902-5	Reactor, 250 microhenries	Video peaking	.39
L305	V-4886-1	Reactor, 14 microhenries	Sync decoupling	.55
L308	V-10771-1	Reactor, slug tuned	Adjacent channel trap	.70
L309	V-9882-3	Reactor, tuned	4.5 mc. trap	.70
L310	V-4886-1	Reactor, 14 microhenries	Decoupling	.55
R301	RC20AE333K	Resistor, 33,000 ohms ½ w.	AGC divider	.05
R304	RC20AE103M	Resistor, 10,000 ohms ½ w.	AGC decoupling	.05
R305	RC20AE680K	Resistor, 68 ohms ½ w.	Cathode bias	.04
R306	RC20AE272K	Resistor, 2700 ohms ½ w.	Screen decoupling	.05
R307	RC20AE103M	Resistor, 10,000 ohms ½ w.	Grid decoupling	.05
R308	V-9927-2	Resistor, 4700 ohms ½ w.	IF damping	.11
R309	RC20AE680K	Resistor, 68 ohms ½ w.	Cathode bias	.04
R310	RC20AE471M	Resistor, 470 ohms ½ w.	Screen decoupling	.05

⊬ New part number listed for the first time in Westinghouse radio or television service information.
** Sold only as complete assembly. Price shown covers complete assembly.*
*** Price includes Federal Excise Tax.*
**** Price furnished on request.*

PARTS LIST FOR MODEL H-716T17 (continued)

Ref. No.	Part No.	Description	Function	List Price Each
R311	V-9927-2	Resistor, 4700 ohms ½ w.	IF damping	.11
R312	RC20AE151K	Resistor, 150 ohms ½ w.	Cathode bias	.05
R313	RC20AE471M	Resistor, 470 ohms ½ w.	Screen decoupling	.05
R316	RC20AE123K	Resistor, 12,000 ohms ½ w.	Sync take-off	.05
R317	RC20AE332K	Resistor, 3300 ohms ½ w.	Det. load	.05
•R319	V-9877-1	Control, 1500 ohms (assy. consists of R208, R319, SW501)	Picture control	2.10•
R320	RC20AE223K	Resistor, 22,000 ohms ½ w.	Damping	.06
R322	RC40AE822K	Resistor, 8200 ohms 2 w.	Plate load	.20
R323	RC20AE274K	Resistor, 270,000 ohms ½ w.	Divider	.06
R324	RC20AE274K	Resistor, 270,000 ohms ½ w.	Divider	.06
R326	RC30AE683K	Resistor, 68,000 ohms 1 w.	Divider	.09
R327	V-9916-1	Control, 50,000 ohms	Brightness	.65
R331	RC20AE155K	Resistor, 1.5 megohms ½ w.	Retrace suppression	.05
R334	RC40AE822K	Resistor, 8200 ohms 2 w.	Plate load	.20
R341	RC20AE100K	Resistor, 10 ohms ½ w.	1st IF grid	.06
R342	RC20AE221K	Resistor, 220 ohms ½ w.	Video amp. grid	.05
R343	V-9894-2	Control, 2 megohms	Focus	.75
R344	RC20AE220K	Resistor, 22 ohms ½ w.	Cathode bias	.09
T301	V-9882-7	Transformer	IF input	.60
T302	V-9879	Transformer	1st IF	1.30
T303	V-9879	Transformer	2nd IF	1.30
T304	V-9880	Transformer	3rd IF	1.40
		SECTION 4 — SWEEP		
C401	RCP10W4104M	Capacitor, .1 mfd 400 v.	Noise clipper coupling	.24
C403	RCM20B271K	Capacitor, 270 mmf	Sync sep. grid	.20
C404	RCP10W4103M	Capacitor, .01 mfd 400 v.	Vert. sync coupling	$ .24
C408	RCP10W4103K	Capacitor, .01 mfd 400 v.	Vert. MV coupling	.19
C409	RCM20B101K	Capacitor, 100 mmf	AGC grid	.22
C410	RCP10W4503M	Capacitor, .05 mfd 400 v.	Cathode bypass	.24
C411	RCP10M6104M	Capacitor, .1 mfd 600 v.	Vert. coupling	.35
C412	RCP10W4503K	Capacitor, .05 mfd 400 v.	Pulse shaping net.	.25
•C413	V-10306-1	Capacitor, 150 mfd 50 v. (assy. consists of C414, C413 and C440)	Cathode bypass	3.25•
•C414	V-10306-1	Capacitor, 30 mfd 450 v. (assy. consists of C414, C413 and C440)	Plate decoupling	3.25•
C415	V-9792-10560K	Capacitor, 56 mmf	Transient damping	.30
C416	RCP10W4254M	Capacitor, .25 mfd 400 v.	Hor. yoke return	.35
C421	RCM20B101K	Capacitor, 100 mmf	MV plate bypass	.22
C422	RCM20B101K	Capacitor, 100 mmf	MV coupling	.22
C423	V-10293-1	Capacitor, 10 mfd 450 v.	MV decoupling	1.25
C424	RCM30C392K	Capacitor, 3900 mmf	MV plate tank	1.17
C425	RCP10W4104M	Capacitor, .1 mfd 400 v.	MV plate decoupling	.25
C426	RCM20C821K	Capacitor, 820 mmf	Pulse shaping	.40
C427	RCP10M6103M	Capacitor, .01 mfd 600 v.	Coupling	.21
C428	RCP10M4104M	Capacitor, .1 mfd 400 v.	Screen bypass	.25
C429	RCP10M6104M	Capacitor, .1 mfd 600 v.	Screen bypass	.35
C430	RCP10M6603M	Capacitor, .06 mfd 600 v.	15,750 ripple filter	.25
C431	V-9901-3	Capacitor, 500 mmf	HV filter	1.70
C432	RCP10M6603M	Capacitor, .06 mfd 600 v.	Cathode bypass	.25
C433	RCP10W2504M	Capacitor, .5 mfd 200 v.	AGC filter	.50
C434	V-9863-1	Capacitor, 800 mmf	Filament bypass	.20
C435	V-9863-1	Capacitor, 800 mmf	Filament bypass	.20
C437	V-5596	Capacitor, .005 mfd	Heater bypass	.25
C438	V-5596	Capacitor, .005 mfd	Heater bypass	.25
•C440	V-10306-1	Capacitor, 10 mfd 450 v. (assy. consists of C413, C414, C440)	Filter	3.25•
•C441	V-9891	Capacitor, 30 mfd 350 v. (assy. consists of C220, C441, C501 C502)	Filter	4.35•
C443	RCP10W4103M	Capacitor, .01 mfd 400 v.	AGC delay	.20
C444	RCP10W4104M	Capacitor, .1 mfd 400 v.	Cathode bypass	.24

R417	RC20AE564K	Resistor, 560,000 ohms ½ w.	Grid return	.05
R418	RC20AE122K	Resistor, 1200 ohms ½ w.	Cathode bias	.05
R419	V-9894-3	Control, 750,000 ohms	Vertical hold	$ .75
R420	RC20AE332K	Resistor, 3300 ohms ½ w.	Pulse shape net	.05
R421	RC20AE225K	Resistor, 2.2 megohms ½ w.	Grid return	.05
R422	RC20AE471K	Resistor, 470 ohms ½ w.	Cathode bias	.06
R423	V-6463	Control, 5000 ohms	Vert. linearity	.76
R424	V-6984-5	Resistor, (dog-bone type), 10,000 ohms 5 w.	Vert. decoupling	.66
R424	V-11328-2	Resistor (flat metal type), 10,000 ohms 5 w.	Vert. decoupling	.90
R425	RC20AE561K	Resistor, 560 ohms ½ w.	Transient damping	.05
R426	RC20AE561K	Resistor, 560 ohms ½ w.	Transient damping	.05
R433	RC20AE821K	Resistor, 820 ohms ½ w.	Cathode bias	.05
R434	RC20AE304J	Resistor, 300,000 ohms ½ w.	Grid return	.15
R435	V-10509-1	Control, 125,000 ohms	Horiz. hold	.75
R436	RC20AE274K	Resistor, 270,000 ohms ½ w.	MV plate load	.06
R437	RC20AE123K	Resistor, 12,000 ohms ½ w.	Pulse shaping net	.05
R438	RC20AE333K	Resistor, 33,000 ohms ½ w.	Plate decoupling	.05
R439	RC20AE474K	Resistor, 470,000 ohms ½ w.	Grid return	.05
R440	RC20AE151K	Resistor, 150 ohms ½ w.	Suppressor	.06
R441	RC30AE563K	Resistor, 56,000 ohms 1 w.	Hor. MV decoupling	.10
R442	V-9600-11	Resistor, (dog-bone type), 12,000 ohms 10 w.	Screen decoupling	.95
R442	V-11328-1	Resistor (flat metal type), 12,000 ohms 10 w.	Screen decoupling	1.15
R443	RC20AE562K	Resistor, 5600 ohms ½ w.	AGC filter	.06
R444	V-9927-7	Resistor, 330,000 ohms 1 w.	HV filter	.10
R445	RC20AE392K	Resistor, 3900 ohms ½ w.	Decoupling	.04
R446	RC20AE273K	Resistor, 27,000 ohms ½ w.	Plate load	.06
R452	RC20AE103K	Resistor, 10,000 ohms ½ w.	AGC filter	.05
R454	RC20AE273K	Resistor, 27,000 ohms ½ w.	Damping	.06
R455	RC20AE104K	Resistor, 100,000 ohms ½ w.	Decoupling	.05
R457	V-11229-2	Resistor, 3000 ohms 25 w.	Voltage dropping	1.55
R460	RC30AE330K	Resistor, 33 ohms 1 w.	Cathode bias	.11
R461	RC20AE223K	Resistor, 22,000 ohms ½ w.	Coil shunt	.06
R471	RC20AE105K	Resistor, 1 megohm ½ w.	AFC bleeder	.05
R472	RC20AE105K	Resistor, 1 megohm ½ w.	AFC cathode	.05
R473	RC30AE154K	Resistor, 150,000 ohms 1 w.	Error take-off	.10

PARTS LIST FOR MODEL H-716T17 (continued)

Ref. No.	*Part No.*	*Description*	*Function*	*List Price Each*
R474	RC30AE154K	Resistor, 150,000 ohms 1 w.	Limiting	.10
R475	RC20AE224K	Resistor, 220,000 ohms ½ w.	Plate decoupling	.05
R476	RC20AE474K	Resistor, 470,000 ohms ½ w.	AFC delay	.05
R477	RC20AE473K	Resistor, 47,000 ohms ½ w.	Plate load	.05
R482	RC20AE684K	Resistor, 680,000 ohms ½ w.	Load	.06
R483	RC20AE393K	Resistor, 39,000 ohms ½ w.	Decoupling	.05
R485	RC40AE393K	Resistor, 39,000 ohms 2 w.	Bleeder	.20
R486	RC20AE104K	Resistor, 100,000 ohms ½ w.	Plate load	.05
R487	RC20AE682K	Resistor, 6800 ohms ½ w.	Pulse shape net	.05
R489	RC40AE393K	Resistor, 39,000 ohms 2 w.	Screen decoupling	.20
R491	RC40AE682K	Resistor, 6800 ohms 2 w.	Tuner dropping	.18
R493	RC20AE102K	Resistor, 1000 ohms ½ w.	Cathode bias	.05
T401	V-10909-1	Transformer	Vertical output	3.90
T402	V-10214-1	Transformer	Hor. output and HV	13.15
T403	V-9902	Control	Width	1.55
Z401	V-11192-1	Filter	Integrating	1.30
Z402	V-10911-1	Yoke Assembly (contains V-10538-1 yoke)	Deflection	12.50

SECTION 5 — POWER

•C501	V-9891	Capacitor, 40 mfd 450 v. (assy. consists of C220, C441, C501, C502)	Filter input	4.35•
•C502	V-9891	Capacitor, 40 mfd 450 v. (assy. consists of C220, C441, C501, C502)	Filter input	4.35•
C504	V-5040-15	Capacitor, .01 mfd 600 v.	Line filter	.35
L501	V-6471-2	Reactor	LV filter	2.35
R501	RC30AE224M	Resistor, 220,000 ohms 1 w.	Protection	.10
R505	V-6597	Resistor, (dog-bone type), 50 ohms 10 w.	Voltage dropping	.45
R505	V-11328-8	Resistor (flat metal type), 50 ohms 10 w.	Voltage dropping	.75
•SW501	V-9877-1	Switch (assy. consists of R208, R319, SW501)	Off-on	2.10•
T501	V-9958-1	Transformer	Power	14.45

✝ New part number listed for the first time in Westinghouse radio or television service information.
• Sold only as complete assembly. Price shown covers complete assembly.
•• Price includes Federal Excise Tax.
••• Price furnished on request.

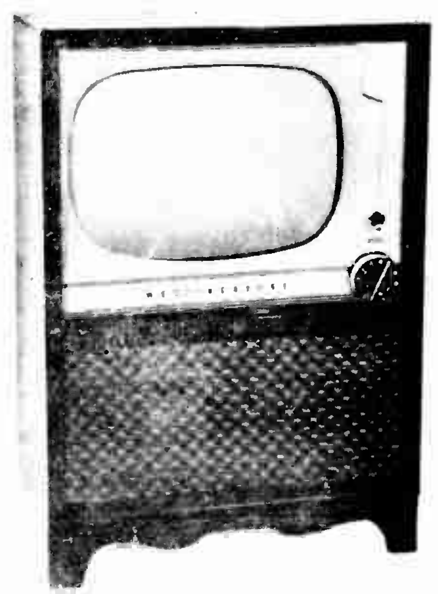
H-750T21



H-753K21

CHASSIS ASSEMBLY V-2221-1

SERVICE NOTES

For service information on the V-2221-1 chassis, refer to the H-716T17 service notes and any supplementary information thereto. With a few exceptions, the information given for the V-2208-1 chassis applies also to the V-2221-1 chassis.

The V-2221-1 chassis uses a 21" CRT (21FP4A) rather than the 17" CRT used with the V-2208-1 chassis. This necessitates the use of a different CRT strap and yoke superstructure which are listed below. Because of a different mechanical arrangement, the shafts on the volume and picture controls are longer in the V-2221-1 chassis, and the horizontal hold and brightness controls are located on the front of the chassis rather than the back. In addition, the V-2221-1 chassis uses a different power transformer (T501), deflection yoke assembly (Z402), and transient damping capacitor (C415) which are listed below.

The following parts are used in the V-2221-1 chassis. All other parts are the same as those listed for the V-2208-1 chassis in the H-716T17 service notes:

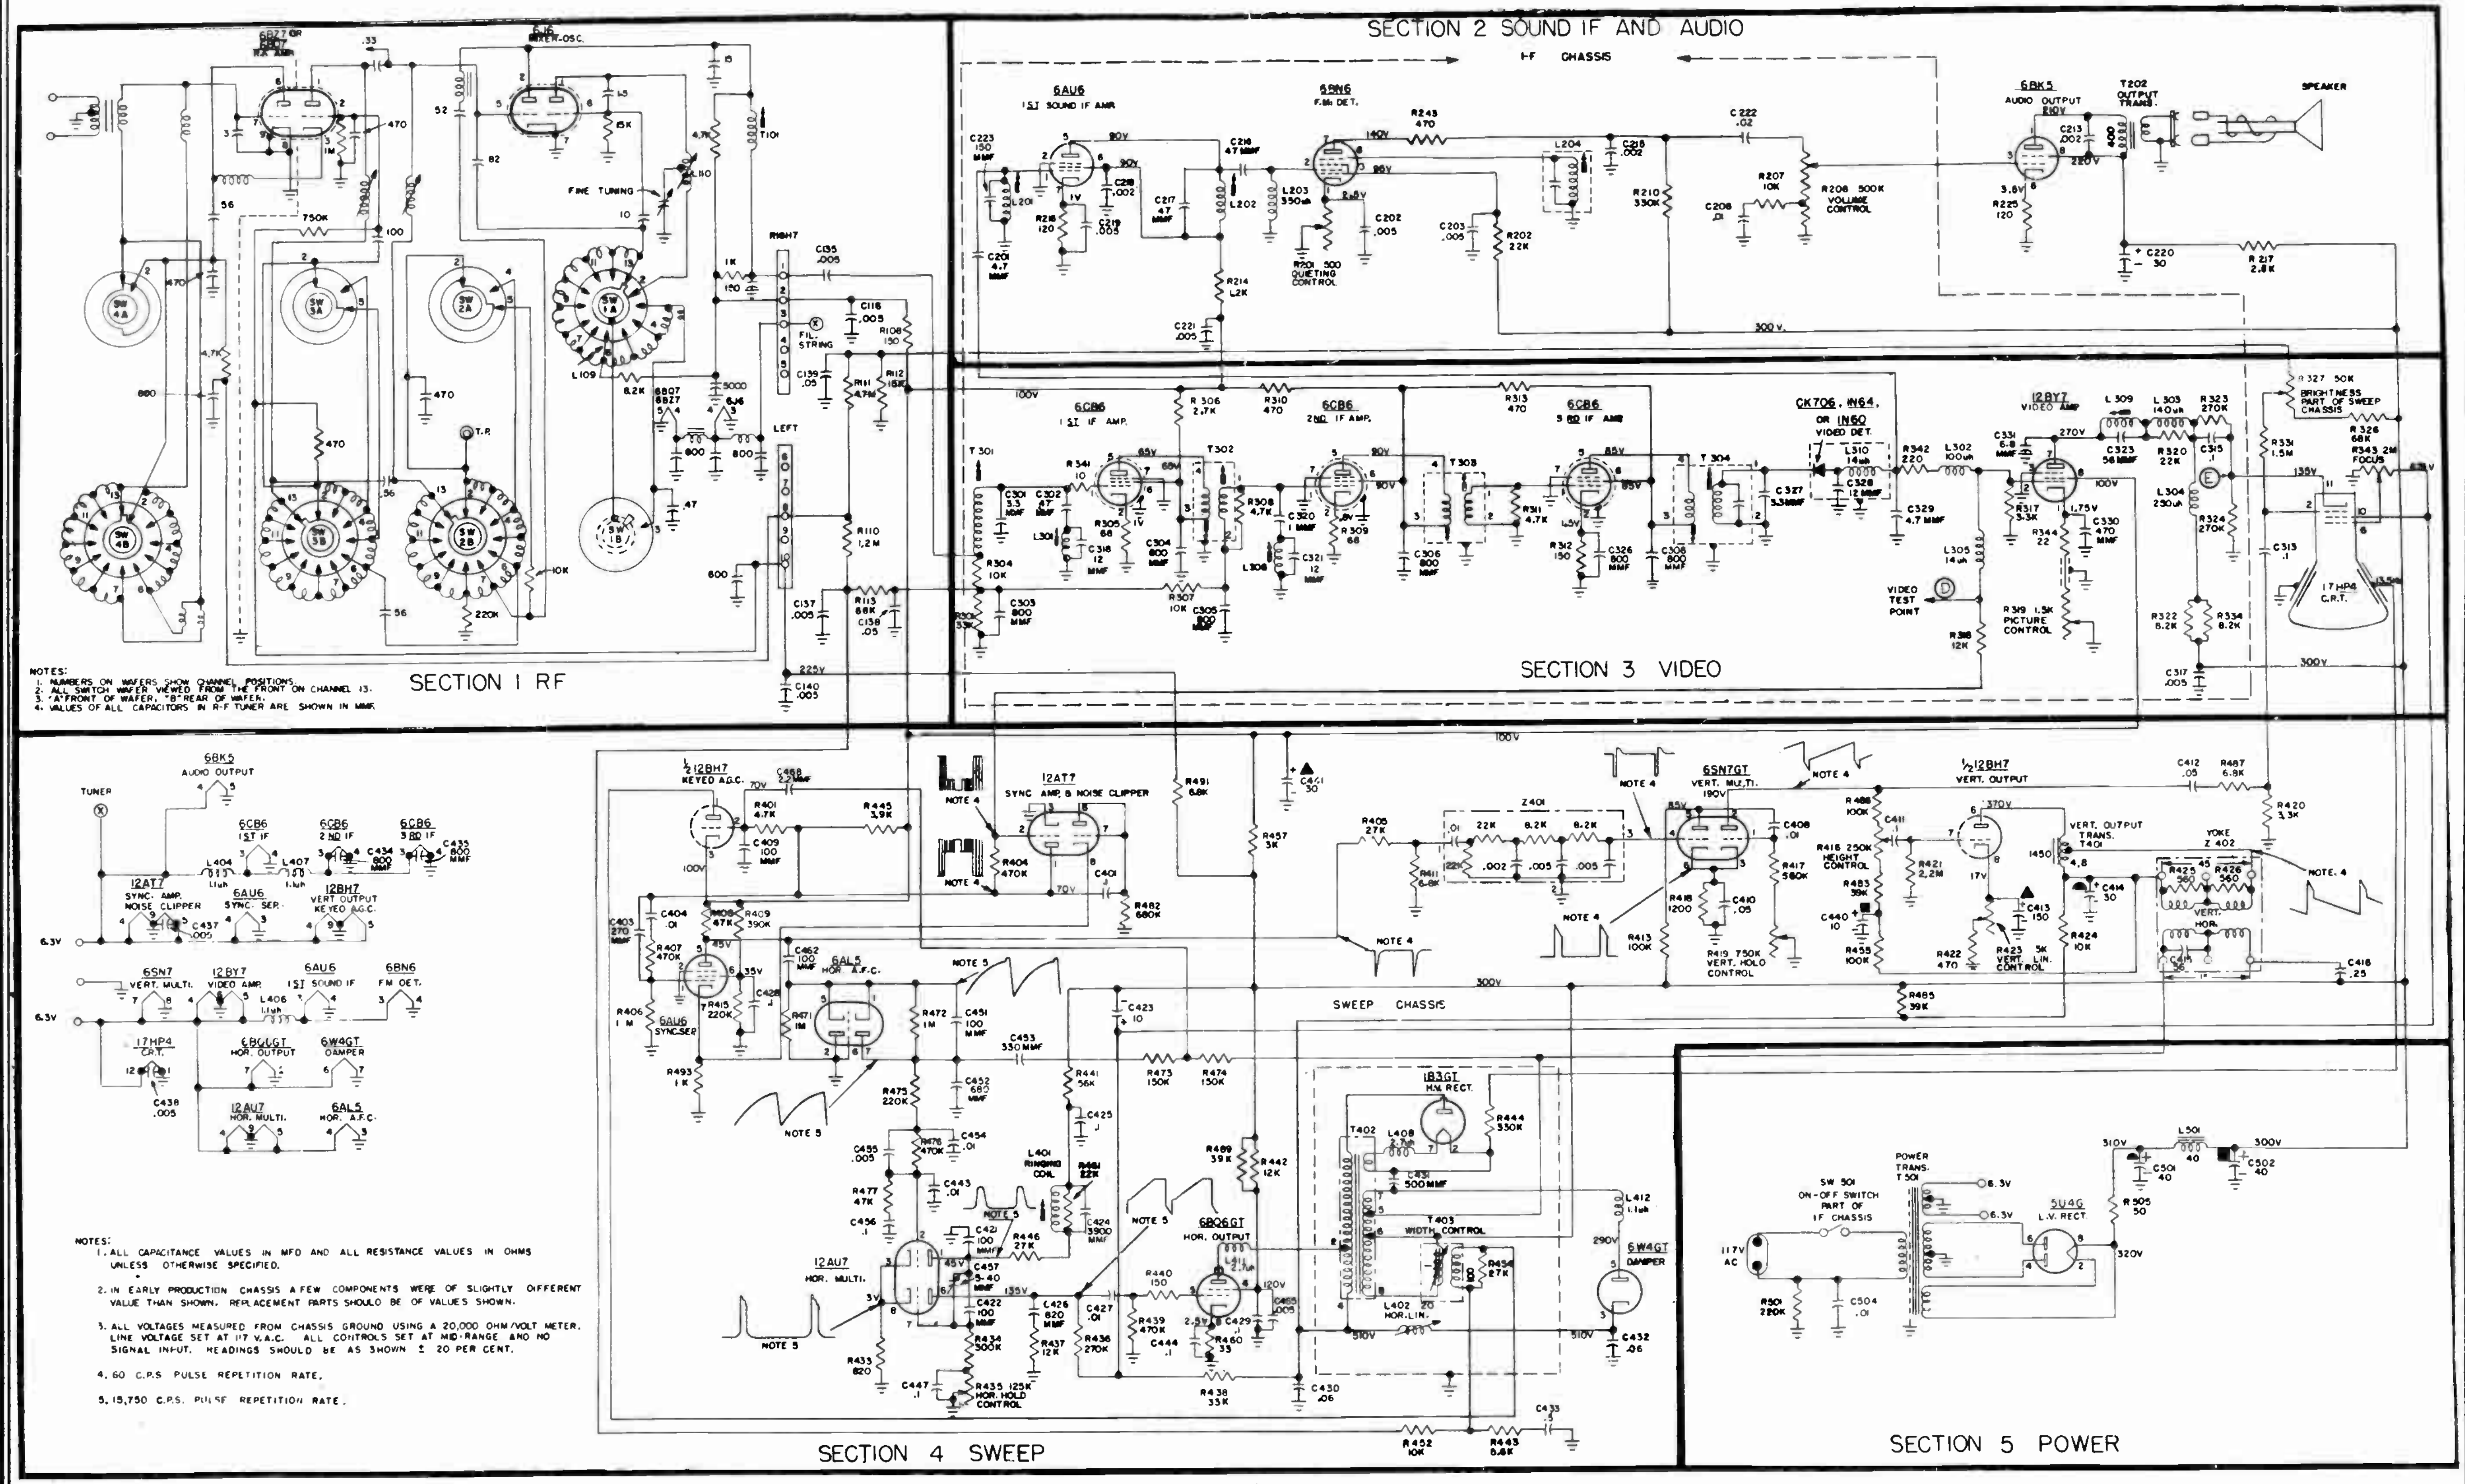
Ref. No.	*Part No.*	*Description*	*Function*	*List Price Each*
	V-11468-2	Strap Assembly, CRT		$ .30
	V-9914-2	Superstructure, yoke		1.30
•R208	V-9877-4	Control, 500,000 ohms	Volume	2.15•
•R319	V-9877-4	Control, 1500 ohms	Picture	2.15•
R327	V-10914-1	Control, 50,000 ohms	Brightness	.80
C415	V-9792-10330K	Capacitor, 33 mmf	Transient damping	.30
R435	V-10915-1	Control, 125,000 ohms	Horiz. hold	.80
Z402	V-10911-3	Yoke Assembly (contains V-10538-6 deflection yoke)	Deflection	12.50
Z402	V-10911-4	Yoke Assembly (contains V-10538-7 deflection yoke)	Deflection	12.50
•SW501	V-9877-4	Switch	On-off	2.15•
T501	V-9958-2	Transformer	Power	19.50

H-750T21 AND H-753K21 MODEL PARTS

The following parts are used in Models H-750T21 and H-753K21 in lieu of the MODEL PARTS listed in the H-716T17 service notes:

Part No.	*Description*	*List Price Each*
V-10841-1	Baffle and Grille Cloth Assembly (H-750T21)	$ .50
V-10924-4	Base, channel selector	.30
✝ V-1274-6	Cabinet (H-753K21)	48.26••
✝ V-1282-6	Cabinet (H-750T21)	29.86••
V-5860-14	Cable Assembly, speaker	.40
V-5684-2	Clip, plate to mask	.03
V-5522	Cord, AC power	1.25
✝ V-10962-14	Cover Assembly, back	4.50
V-10743-1	Foot, felt	.25
V-11501-1	Gasket, dust seal	.65
V-10749-6	Grille Cloth (H-753K21)	2.90
V-9938-1	Knob, on-off-volume	.10
V-9939-1	Knob, picture (rear)	.17
V-9940-1	Knob, fine tuning (rear)	.40
V-10676-1	Knob, channel selector	1.75
V-10926-1	Knob, horizontal and brightness	.10
V-10929-1	Mask, picture tube	4.25
V-10932-1	Plate, mask	.20
V-11625-1	Plate, front glass	15.00
V-9770-1	Speaker, 10" PM (H-753K21)	8.00••
V-10030-1	Speaker, 5¼" PM (H-750T21)	3.90••
V-10934-3	Spring, channel selector base	.06

✝ New part number listed for the first time in Westinghouse radio or television service information.
• Sold only as complete assembly. Price shown covers complete assembly.
•• Price includes Federal Excise Tax.
NOTE: All prices are subject to change without notice.



CHASSIS NO. V-2208-1

FIG. 7 — SCHEMATIC DIAGRAM

IMPORTANT—Since many of the components are very critical, exact duplicates must be used for replacement purposes. However, any substitute supplied by Westinghouse will assure performance equal to or better than the listed part.

MODEL H-730C21

SERVICE NOTES

TUBE COMPLEMENT:

TV Chassis:

1 1B3GT .... High voltage rectifier
1 5U4G .... Low voltage rectifier
1 6AK5 .... R-F amplifier
1 6AL5 .... Horizontal AFC
1 6AU5GT .... Horizontal output
1 6AU6 .... 1st sound I-F amplifier
1 6AU6 .... 2nd sound I-F amplifier
1 6AU6 .... Keyed AGC
1 6C4 .... Sync clipper
1 6CB6 .... 1st I-F amplifier
1 6CB6 .... 2nd I-F amplifier
1 6CB6 .... 3rd I-F amplifier
1 6SN7GT .... Vertical multivibrator
1 6T8 .. Ratio detector and 1st audio amplifier
1 6W4GT .... Horizontal damper
2 6W6GT .... Audio output
1 6X8 .... HF oscillator and mixer
1 12AT7 .. Sync amplifier and sync separator
1 12AU7 .... Horizontal multivibrator
1 12BH7 .... Vert. output and noise clipper
1 12BY7 .... Video output
1 21FP4A .... Cathode ray tube

AM/FM Chassis:

1 6AL5 .... FM detector
1 6AV6 .... AM det., AVC, and 1st audio amp.
2 6BA6 .... IF amplifier
1 6BJ6 .... FM RF amplifier
1 12AT7 .... HF osc., and mixer

TV ANTENNA INPUT IMPEDANCE:
...... 300 ohms balanced or 72 ohms unbalanced

TV VIDEO RESPONSE: .... 3.5 mc.

TV FOCUS: .... Electrostatic

TV SWEEP DEFLECTION: .... Magnetic

TV SCANNING: .... Interlaced, 525 Line

TV HORIZ. SCANNING FREQ: .... 15,750 CPS

TV VERT. SCANNING FREQ: .... 60 CPS

13	210 - 216	211.25	215.75	257

NOTE: Provisions for UHF reception are included. To activate UHF positions of the channel selector, small UHF units can be inserted into the UHF sockets at the rear of the RF tuner. The receiver will accommodate two such units, and each unit provides reception of one UHF channel. Installation instructions are furnished with the units.

AM/FM FREQUENCY RANGES:
Standard Broadcast .... 540 to 1600 kc.
Frequency Modulation .... 88 to 108 mc.

OPERATING VOLTAGE:
.... 105 to 120 volts, 60 cycles AC

POWER CONSUMPTION: .... 250 watts

AUDIO POWER OUTPUT:
Undistorted .... 6.5 watts
Maximum .... 10 watts

INTERMEDIATE FREQUENCIES:
TV Video Carrier .... 45.75 mc.
TV Sound .... 4.5 mc.
Amplitude Modulation .... 455 kc.
Frequency Modulation .... 10.7 mc.

SPEAKER:
Type .... 10" PM
Voice Coil Impedance .. 3.2 ohms at 400 cycles

HIGH VOLTAGE WARNING

The danger accompanying shock is always present when the receiver is operated outside the cabinet or when the rear cover is removed from the cabinet. Only a person familiar with the precautions to be observed when working with high-voltage equipment should service this receiver.

CATHODE RAY TUBE HANDLING PRECAUTIONS

Shatterproof goggles and heavy gloves should be worn at all times when handling a cathode ray tube. The tube should not be handled in the vicinity of any person not so equipped. When handling the tube, always keep it away from the body.

Due to the large surface area of the tube and the high vacuum contained within, more then ordinary care is required to prevent shattering the tube. The large end of the bulb, particularly the rim of the viewing surface, must not be struck, scratched, or subjected to more than moderate pressure. If the tube binds during removal or replacement, determine the cause of the trouble -- **DO NOT FORCE THE TUBE.**

An additional precaution is required when handling a cathode ray tube that has an aquadag coating on the outside of the tube. The outside aquadag coating forms one plate of a capacitor, and the inside coating to which the high voltage is applied serves as the other plate. The high voltage charge may be retained in this capacitor for a long time after the high voltage lead is disconnected. Since the charge could produce a shock that would startle the handler into dropping the tube, the charge should be dissipated before any handling of the tube is attempted. To dissipate the charge, place a jumper from the outside aquadag coating to the high voltage button on the tube. Due to the relatively high resistance of the aquadag, the jumper should be held in place for some time to insure complete discharge.

INSTALLATION INSTRUCTIONS

ANTENNA INFORMATION:

The receiver contains built-in antennas for use in areas of normal reception. In such areas when the built-in antennas provide good reception, external antennas are not required. However, in weak signal areas or under adverse conditions, it may be necessary to use an outside antenna.

Two sets of TV antenna terminals are located near the upper left corner of the TV section back cover, one marked UHF and the other marked STD. If an external TV antenna is to be used, disconnect the built-in TV antenna wires from the STD terminals and dress the wires in such a position that they do not touch the chassis or metal components. The lead-in wires from the external antenna should then be connected to the STD terminals. The UHF antenna terminals are not used unless UHF units are installed (see note under TELEVISION FREQUENCY RANGES on front cover).

If an external FM antenna is to be used, disconnect the built-in FM antenna wires from the two FM antenna terminals located on the rear of the shelf that supports the radio chassis, and connect the external antenna to these terminals. If desired, an external AM antenna can be connected to the solder terminal marked "EXTERNAL ANTENNA" on the loop antenna.

TO CHECK THE OPERATION OF THE RECEIVER:

1. Rotate the TV-radio-phono selector located on the radio panel completely counterclockwise (TV position).

2. Turn on the receiver by rotating the off-on and TV volume control clockwise.

3. Rotate the channel selector to the desired channel number. The two channel selector positions marked UHF are not operative unless UHF units have been installed (see note on front cover of this booklet). It should be noted that the channel selector position between 6 and 7 and the position between 13 and UHF are blank positions although the channel selector will come to rest in these positions.

4. Adjust the brightness control to a position where the picture screen is moderately lighted.

5. Check the ion trap magnet adjustment as outlined under ADJUSTMENTS.

6. Rotate the picture control to the position that provides best picture contrast.

7. If the picture moves up or down on the screen, the vertical hold control on the back of the receiver should be adjusted as explained under ADJUSTMENTS.

8. If the picture is pulled into diagonal bars or if the edge of the picture quivers or tends to fold over, adjust the horizontal control for correct synchronization. This control can be adjusted so that it will seldom be necessary to re-adjust it thereafter. To obtain this adjustment, tune in a TV station, and rotate the control to the middle of the range over which the picture is synchronized. If the middle of the sync range does not correspond approximately to the middle of the mechanical range, make the adjustments described under Horizontal Ringing Coil in the TELEVISION ADJUSTMENTS section. Check the adjustment of the horizontal control by switching to another channel and then back again. The picture should be stable when switching from channel to channel.

9. Rotate the fine tuning control to the position that provides best picture detail.

10. A re-adjustment of the brightness and picture controls may improve the picture shading.

11. Adjust the off-on and TV volume control for the desired sound volume.

12. Check the operation on all available TV stations.

13. If necessary, adjust the vertical linearity, height, horizontal linearity, width, focus or centering as explained under TELEVISION ADJUSTMENTS.

14. Rotate the TV-radio-phono selector to the center position (radio).

15. Rotate the FM-AM selector to its counterclockwise position (FM) and check the operation of the radio section on the FM band.

16. Rotate the FM-AM selector to its clockwise position (AM) and check the operation of the radio section on the broadcast band.

17. Rotate the TV-radio-phono selector completely clockwise (phono), and completely check the operation of the record changer.

TELEVISION ADJUSTMENTS

CATHODE RAY TUBE CUSHION

The CRT cushion must fit snugly against the flare of the CRT in order that the rear of the tube will be supported firmly. If this condition is not obtained, loosen the CRT cushion adjustment screws and the deflection yoke adjustment screw, slide the CRT cushion forward as far as possible, and re-tighten the screws.

DEFLECTION YOKE

The deflection yoke must be positioned as close as possible to the flare in the CRT. If adjustment is required, loosen the deflection yoke adjustment screw, slide the deflection yoke forward as far as possible, and re-tighten the screw. Note that the CRT cushion must fit snugly against the CRT flare as described previously.

The deflection yoke adjustment screw also permits the picture to be rotated to make it square with respect to the mask. To rotate the picture, loosen the deflection yoke adjustment screw and move it to the left or right. The picture will tilt to the left or right with the movement. Tighten the screw when the picture is squared in the mask.

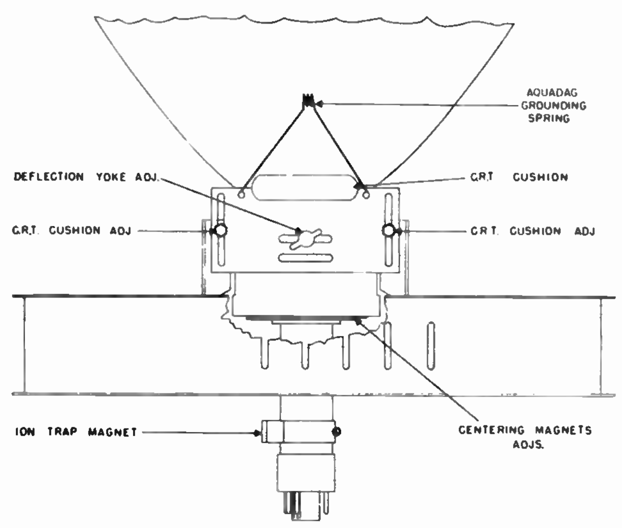

FIG. 1 — CRT ADJUSTMENTS

FOCUS

With the brightness and picture controls set at their normal operating positions, the focus control located on the back of the chassis should be adjusted for best focus.

CENTERING

Centering is accomplished by rotating the centering magnet adjusting rings clockwise or counterclockwise as required. The two adjusting rings are located on the back of the deflection yoke as shown in Fig. 1. A tab projection on each of the rings serves to facilitate adjustment.

If difficulty is experienced in centering the picture or eliminating "neck shadows", make certain the CRT cushion is tight against the flare in the CRT. Also make certain that the deflection yoke is as far forward as possible.

ION TRAP MAGNET

It is extremely important that the ion trap magnet be correctly adjusted immediately after the set is first turned on during installation. This is true even though the set appears to be operating satisfactorily. When the magnet is not correctly oriented, the electron beam strikes the edge of the aperture in the anode top disc instead of moving cleanly through the hole. The resultant heat vaporizes the metal of the disc, thus releasing gas which has a harmful effect on the tube. Some of the vaporized material may be deposited on the screen of the tube and be apparent as darkened area. An excessively high setting of the brightness control will aggravate this condition. From this it is apparent that the brightness control should never be turned up to compensate for an incorrectly adjusted ion trap magnet. The tube can be ruined in a very short time under this condition.

To adjust the ion trap magnet, position the magnet approximately as shown in Fig. 1 with the color code mark facing upward, then rotate the magnet and move it forward and backward until the position is found where the picture is brightest. If the brightness peaks at two positions of the magnet, the position nearer the base of the tube is the correct one. Never move the ion trap magnet to remove a shadow from the raster if the brightness is decreased by so doing. Shadows should be removed by adjusting the position of the deflection yoke. ***The ion trap magnet must always be adjusted for maximum picture brightness.***

HEIGHT AND VERTICAL LINEARITY

The height adjustment on the back of the chassis controls the overall height of the picture, and the vertical linearity adjustment controls the relationship between the vertical dimensions of the upper and the lower sections of the picture. A balance between the two controls is necessary to make the picture symmetrical and fill the mask vertically.

WIDTH AND HORIZONTAL LINEARITY

The width adjustment on the back of the chassis controls the overall width of the picture, and the horizontal linearity adjustment controls the relationship between the horizontal dimensions of the left and the right sections of the picture. A balance between the two controls is necessary to make the picture symmetrical with correct horizontal dimensions. These controls can be adjusted with a ¼" Spintite-type wrench.

VERTICAL HOLD

The vertical synchronization is controlled by the vertical hold adjustment on the back of the chassis. To adjust, rotate the control clockwise or counterclockwise until the picture is stabilized vertically. The adjustment should preferably be made on the weakest signal that is available, and a check should be made to see that the receiver pulls into sync on all channels.

HORIZONTAL RINGING COIL

The horizontal ringing coil (L401) should be adjusted as follows:

1. Short out the ringing coil with a short jumper wire.

2. Set the horizontal hold control to the middle of its range, and leave it in this position during the steps that follow.

3. Connect a VTVM to the junction of R477 and C456, located in the pin #2 grid circuit of the horizontal multivibrator, so as to measure the DC voltage between this point and ground.

4. With the receiver tuned to a TV station, adjust C457 (located near the horizontal multivibrator tube as shown in Fig. 4) for *zero* voltage on the meter. If zero voltage can be approached but not quite reached at one extreme of the C457 adjustment, it may be necessary to set the horizontal hold control slightly to one side of mid-position to obtain zero voltage.

5. Remove the jumper from across the ringing coil.

6. Adjust the ringing coil for *zero* voltage on

the meter, and check the adjustment by switching to another channel and then back again. The receiver should pull into horizontal synchronization on all channels.

CRITICAL LEAD DRESS IN TV CHASSIS

Leads that are susceptible to R-F pickup with resulting interaction between stages must be dressed close to the chassis mounting plate. Leads in this category include heater, AGC, B plus, and the 125 volt bus leads. These leads must be long enough to permit dressing most of the path length close to the mounting plate. The heater wiring arrangement should not be altered.

Leads associated with the 41.25 mc. trap must be as short as possible and dressed away from the chassis.

Video peaking coils should be dressed away from the chassis and clear of adjacent parts.

The lead from the width transformer to pin #5 of the 6AU6 AGC keying tube must be dressed close to the chassis and away from the ringing coil.

The lead-in from the antenna terminals to the tuner must be dressed away from the I-F chassis to prevent an R-F "tweet" from interfering with the picture.

TELEVISION ALIGNMENT

TEST EQUIPMENT

To service these chassis, the following test equipment should be available:

1. R-F sweep generator that is capable of producing a 10 mc. sweep at a center frequency of 44 mc. The output must be adjustable from at least 100,000 microvolts down to a very low minimum, and the output must be flat at all positions of the attenuator.

2. Cathode ray oscilloscope, preferably one with a wide-band vertical deflection amplifier and a low-capacitance input probe. The oscilloscope should have good low-frequency response characteristics.

3. Signal generator or generators capable of producing an accurate unmodulated signal at 4.5 mc., 41.25 mc., 42.25 mc., 43.0 mc., 44.0 mc., 45.0 mc., and 45.75 mc. The accuracy of these frequencies is very important. If the signal generator does not include a crystal calibrator, a heterodyne frequency meter equipped with a crystal calibrator should be used to insure accuracy. The output level must be adjustable from at least 100,000 microvolts down to a very low minimum.

4. Vacuum tube voltmeter equipped with a high voltage multiplier probe for measurements up to 15,000 volts and an R-F probe for measuring R-F voltages.

GENERAL INFORMATION

The chassis and the test equipment should be bonded together by short lengths of heavy braided copper ribbon, and all interconnecting leads should be shielded and should be as short as possible consistent with ease in making connections. The effectiveness of the bonding can be checked during alignment by placing the hand on the chassis or test equipment case. If the response curve or meter reading changes, the bonding must be improved before the circuits are aligned.

It is important that the coaxial cable used to couple the sweep generator output to the receiver be terminated at its output end in the characteristic impedance of the sweep generator output circuit. To accomplish this, connect the appropriate value of resistance across the output leads at the open end of the cable. The oscilloscope vertical input cable and the generator output cables must be well separated from each other.

ALIGNMENT TOOL

To adjust the slugs in the common I-F and 4.5 mc. I-F transformers a special tool is required. This tool must fit into the .035" x .093" slot in slug. *An incorrectly designed tool will cause chipping of the slug.* A suitable tool is stocked under Westinghouse part number V-8345.

COMMON I-F ALIGNMENT PROCEDURE

The common I-F system uses over-coupled I-F transformers to obtain the required band width. In the alignment of this type system, the visual method of stage-by-stage alignment is used. A sweep generator is used to develop the I-F response curve on the oscilloscope, and an unmodulated signal generator (marker) is used to provide spot frequency indications on the curve.

With some of the I-F transformers, peaks may be obtained at two positions of the adjustment slugs. If a transformer is badly out of adjustment, it is advisable to turn the slug out (counterclockwise) as far as possible before beginning alignment. Then turn the slug clockwise until the first peak is reached. This procedure is recommended to obtain the correct peak rather than an undesired second peak which is sometimes obtained when the slug is turned farther clockwise.

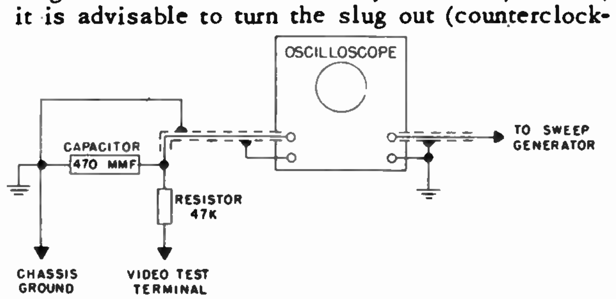

FIG. 2 — OSCILLOSCOPE CONNECTIONS

The alignment procedure to be used is given in the following steps:

1. To avoid undesirable beat response during alignment, remove the 6AK5 R-F amplifier tube from its socket and rotate the channel selector to channel 13. The channel selector is on channel 13 when the flat of the shaft is facing straight up.

2. Connect the vertical input of the oscilloscope to the video test terminal (point "D" on Fig. 4) through the decoupling network shown in Fig. 2. The oscilloscope horizontal input should be connected to the sweep (synchronizing) output from the sweep generator *through well shielded leads.* Turn the sweep control on the oscilloscope to the "x" or "off" position.

3. Connect the negative terminal of a 9 volt bias battery to the AGC line (point marked AGC Test Terminal on Fig. 4), and connect the positive terminal to chassis ground.

4. Couple the marker generator output to the sweep generator output so that the two signals are applied together to the points specified in the steps that follow. Some sweep generators have facilities for connecting the marker output directly into the sweep generator. With other sweep generators, the marker can be coupled to the sweep by wrapping a few turns of insulated wire around the center conductor of the sweep generator output cable and connecting the marker generator to this wire. The loose coupling obtained in this manner is desirable because *excessive marker signal injection will distort the response curve.*

5. Adjust the sweep generator for a center frequency of 44 mc. with a sweep deviation of 10 mc.

6. Connect the high side of the sweep generator output cable directly to the control grid of the 3rd I-F amplifier, and connect the ground side of the cable to the chassis partition as close as possible to the ground point for the 3rd I-F amplifier tube. Keep the leads from the cable as short as possible.

7. Detune the plate circuit of the 2nd I-F amplifier by attaching an "alligator" or similar type clip to pin 5 of the 6CB6 2nd I-F amplifier tube. *Use care to avoid shock.* This step is necessary to avoid absorption of the signal that is applied at the 3rd I-F grid.

8. Adjust the oscilloscope vertical gain and the sweep generator output level to obtain a curve on the oscilloscope. To avoid a distorted curve, the recommended practice is to use maximum oscilloscope vertical gain and only enough sweep signal amplitude to obtain a good curve.

9. Set the marker generator to 44 mc. with the output attenuated until the marker pip is barely visible on the curve, and adjust the primary of the 3rd common I-F transformer, T304, until the 44 mc. marker pip is at the highest point on the response curve.

10. Adjust the secondary of T304 to make the top of the response curve symmetrical.

11. Make certain that the response curve coincides with Fig. 5A, using the marker to check at the appropriate frequencies. The 44 mc. pip must strike the center of the flat response region, the 42.25 mc. and 45.75 mc. points must be at equal heights, and the 43 mc. and 45 mc. points must be at equal heights. Re-adjust the primary and secondary of T304 if necessary to obtain these conditions.

12. Remove the detuning clip from the plate of the 2nd I-F amplifier tube, and attach it to the plate of the 1st I-F amplifier tube.

13. Move the sweep output connection from grid of the 3rd I-F amplifier to the grid of the 2nd I-F amplifier. Connect the ground side of the cable to the chassis partition as close as possible to the ground point for the 2nd I-F amplifier tube.

14. Adjust the primary of the 2nd common I-F transformer, T303, for maximum height of the response curve at 44 mc., and adjust the secondary of T303 to make the top of the curve symmetical.

15. Make certain that the curve corresponds to Fig. 5B. The 44 mc. pip must strike the center of the flat response region, the 42.25 mc. and 45.75 mc. points must have equal heights, and the 43 mc. and 45 mc. points must have equal heights. Re-adjust the primary and secondary of T303 if necessary.

16. Remove the detuning clip from the plate the 1st I-F amplifier.

17. Move the sweep output connection from the grid of the 2nd I-F amplifier to the grid of the 1st I-F amplifier, and connect the ground side of the cable as close as possible to the ground point for the 1st I-F amplifier tube.

18. Adjust the primary of the 1st common I-F transformer, T302, for maximum height of the response curve at 44 mc., and adjust the secondary of T302 to make the top of the curve symmetrical. If difficulty is experienced in aligning T302, adjust the adjacent channel interference trap, L308, to a higher frequency by rotating the slug completely counterclockwise. Complete information on the adjustment of L308 is given in step 26.

19. Make certain that the curve corresponds to Fig. 5C. The 44 mc. pip must strike the center of the flat response region, the 42.25 mc. and 45.75 mc. points must have equal height, and the 43 mc. and 45 mc. points must have equal heights. Re-adjust the primary and secondary of T302 if necessary.

20. Remove the sweep output connection from the 1st I-F amplifier grid, and couple it to the 6X8 mixer-oscillator tube through the coupling system illustrated in Fig. 3. This system provides adequate signal injection and at the same time provides shielding which prevents radiation of the signal. The device is constructed by flar-

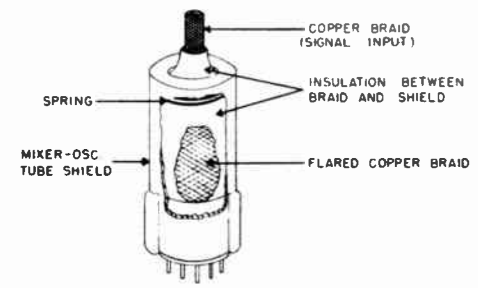

FIG. 3 — COUPLING SIGNAL GENERATOR TO MIXER TUBE

ing a piece of tubular copper braid over the top of the 6X8 tube and wrapping gummed tape over the braid to serve as insulation. The tube shield is then replaced over the tube with the braid protruding through the hole in the top of the shield. ***The braid must not contact the chassis or the tube shield at any point.*** The tube shield should be locked securely to its mounting base. Connect the high side of the sweep generator output cable to the copper braid, and connect the ground side to the nearest point on the chassis.

21. Rotate the slug of the 41.25 mc. trap (L301) completely clockwise.

22. It is possible to obtain two peaks when adjusting the primary of the I-F input coupling network, T101, located on the R-F tuner. These peaks produce different overall bandwidths. The correct peak to use is normally the peak that occurs with the adjustment screw turned further counterclockwise.

Turn the adjustment screw of T101 completely counterclockwise. Then adjust T101 for maximum height of the response curve at 44 mc., and adjust the secondary of the I-F input coupling network, T301, to make the top of the curve symmetrical. If necessary, re-adjust T101 and T301 to make 44 mc. strike the center of the flat response region.

23. Set the marker generator to 41.25 mc., and increase the output until the pip is readily visible on the curve.

24. Adjust L301 to minimize the amplitude of the 41.25 mc. marker pip. L301 functions as a 41.25 mc. trap.

25. Make certain that the final response curve corresponds to Fig. 5D. Use the marker to check at the frequencies shown on the drawing. If necessary, re-adjust T101 and T301 to obtain the correct curve.

If the bandpass of the response curve is too narrow so that the 45.75 mc. marker occurs at less than 40 percent of maximum response, turn T101 clockwise until a second peak at 44 mc. is obtained. Adjust T301 for flat response at the top of the curve, and re-adjust T101 to center 44 mc. on the flat response.

26. L308 is the adjustment for the adjacent channel interference trap. If adjacent channel interference does not constitute a problem in the area where the receiver is to be operated, L308 will not ordinarily require adjustment; however, the trap must not be mis-adjusted into the I-F response region. In areas where adjacent channel interference is not troublesome, L308 can be set to its highest tuneable frequency by rotating the slug completely counterclockwise, and it can be left in this position.

In areas where adjacent channel interference is evident, however, L308 should be adjusted to 47.25 mc. This can be accomplished in either of two ways. One is to connect an amplitude modulated signal generator that has an output of .02 volt or higher to the grid of the 1st I-F amplifier, and adjust the output frequency accurately to 47.25 mc. This will produce an indication on an oscilloscope connected to the video test terminal. Adjust L308 for minimum response on the oscilloscope. If a signal generator capable of this high output is not available, connect a good antenna to the receiver, and tune the receiver to the TV station on which the adjacent channel interference occurs, carefully adjusting the fine tuning control to its correct setting. Then, beginning with L308 in its completely counterclockwise position, rotate L308 clockwise until the position is found where the adjacent channel interference is eliminated. In some cases, the trap adjustment may affect the adjustment of T302. If this occurs, it will be necessary to repeat steps 17, 18 and 19.

SOUND I-F AND 4.5 MC. TRAP ALIGNMENT PROCEDURE

In the sound I-F alignment, a VTVM is used as the indicator instead of an oscilloscope. The procedure is as follows:

1. Connect the high side of the signal generator to the video test terminal (point "D" on Fig. 4) through a .001 mfd mica capacitor, and ground the low side to the chassis.

2. Connect the VTVM to the points indicated on the bottom view of the chassis, Fig. 6. The common lead should be connected to point "C" and the high lead should be connected to point "A". Set the meter on its 5 volt (-DC) scale.

3. Adjust the signal generator to 4.5 mc. (unmodulated). The accuracy of this frequency is very important. If a crystal controlled signal generator is not available, the frequency should be checked with an accurate frequency meter.

4. Adjust L201, L202 and the primary of T201 for maximum indication on the meter. ***During these adjustments keep the signal generator output adjusted so that the meter reading does not exceed 5 volts.***

5. Connect the common lead from the VTVM to point "A" (Fig. 6), and connect the high lead to point "B". Here it is important that the case and components of the VTVM are *not* grounded to the receiver chassis. Otherwise point "A" would be shorted to the chassis through the common lead.

6. Using the same signal generator amplitude and frequency as in step 4, adjust the secondary of T201 for *zero* voltage on the VTVM. As the adjustment is tuned through resonance, the voltage will rapidly change from one polarity to the opposite polarity. The point where the voltage is zero is the correct setting.

7. Connect the common lead from the VTVM to the chassis, and connect the ***R-F probe*** from the VTVM to the cathode of the CRT. This point is shown as point "E" on Fig. 6. Note that this point is above ground potential and, therefore the R-F probe must contain a blocking capacitor.

8. Using a strong 4.5 mc. signal applied as in step 1, adjust the 4.5 mc. trap, L309, for minimum indication on the meter.

H. F. OSCILLATOR ALIGNMENT PROCEDURE

If the 6X8 oscillator tube is replaced, the different inter-electrode capacitance of the new tube may change the oscillator frequency enough to necessitate re-alignment of the oscillator.

Alignment of the oscillator on the high band is accomplished by adjusting the brass slug located adjacent to the vernier drive wheel on the front of the tuner. Alignment of the oscillator on the low band is accomplished by adjusting the brass slug on the lower front of the tuner. The adjustment procedure is as follows:

1. Set the fine tuning control to the middle of its range, and keep it in this position during the following adjustments. The control is set to the middle of its range when the set-screw in the fine tuning drive wheel is straight up.

2. Set the selector switch to the highest of the low-band (channels 2 through 6) stations operating in your vicinity.

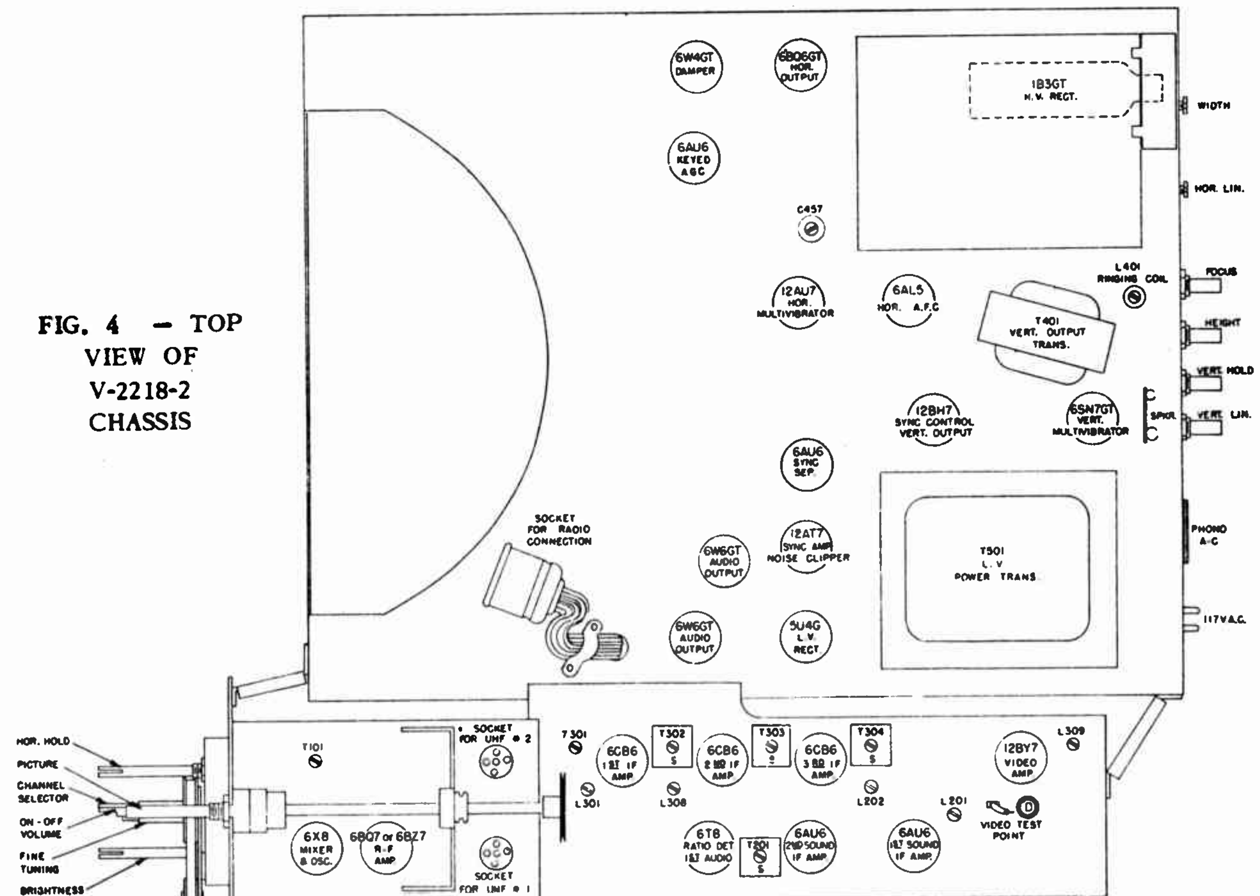
3. Peak the low band adjustment slug (L109) for the best picture detail.

4. Set the selector switch to the highest of and high-band (channels 7 through 13) stations operating in your vicinity.

5. Peak the high band adjustment slug (L110) for the best picture detail.

6. Check the previously made low band adjustment, and if the tuning has changed repeat steps 2 and 3.

FIG. 4 — TOP VIEW OF V-2218-2 CHASSIS



AM/FM ALIGNMENT

BROADCAST BAND

Connect an output meter across the speaker voice coil.

While making the following adjustments, keep the volume control set for maximum output and the signal generator output attenuated to avoid AVC action.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the AM-FM switch to AM and the phono-radio-TV control to RADIO			
2	Stator of tuning capacitor (A) through a 0.1 mfd capacitor	455 kc.	minimum capacity	Pri. and sec. of T7 and T6 for max. output in order given

NOTE: If the I-F transformers are badly mis-aligned, it may be impossible to obtain sufficient output using the above system. In this event, it will be necessary to align each transformer separately. Start with the last I-F transformer and work forward, connecting the signal generator to the control grid of the tube preceding the transformer under alignment.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
3	Radiated signal (no actual connection)	1615 kc.	minimum capacity	AM osc. trimmer (D) for max. output
4	Radiated signal (no actual connection)	1400 kc.	tune to signal	AM ant. trimmer (B) for output max. (rock-in adjustment)

FM BAND

Do not align the FM circuits until all AM adjustments have been completed.

Step	Connect Signal Generator to —	Signal Generator Frequency	Radio Dial Setting	Adjust
1	Set the AM-FM switch to FM			
2	Connect two 100,000 ohm resistors (the resistances must be equal within 5 per cent) between pin No. 7 of the 6AL5 tube and ground as shown on the schematic diagram.			
3	Connect a V.T.V.M. between points "X" and "Y" (see schematic diagram).			
4	Pin No. 2 of 12AT7 through a 0.1 mfd mica capacitor	10.7 mc.	minimum capacity	Sec. of T4 for *zero* (use medium strength signal)
5	Connect the V.T.V.M. between point "Z" and ground			
6	Same as step 4	10.7 mc.	minimum capacity	Pri. of T4 and pri. and sec. of T3 and T2 for max.
7	Reconnect the V.T.V.M. between points "X" and "Y" and increase the signal strength 10 times			
8	Same as step 4	10.7 mc.	minimum capacity	Recheck sec. of T4 for *zero* voltage
9	Reconnect the V.T.V.M. between point "Z" and ground			
10	Same as step 4	10.7 mc.	minimum capacity	Pri. of T4 for maximum voltage
11	Remove the two 100,000 ohm resistors that were inserted in step 2			
12	FM ant. terminal through a 300 ohm non-inductive resistor	98 mc.	98 mc.	FM osc. core for maximum voltage
13	Same as step 12	98 mc.	98 mc.	FM R-F trimmer (C46) for maximum voltage
14	Same as step 12	105 mc.	tune to signal	FM R-F core for maximum voltage
15	Same as step 12	90 mc.	tune to signal	FM R-F trimmer (C46) for maximum voltage (rock-in)
16	Recheck steps 14 and 15 for tracking			

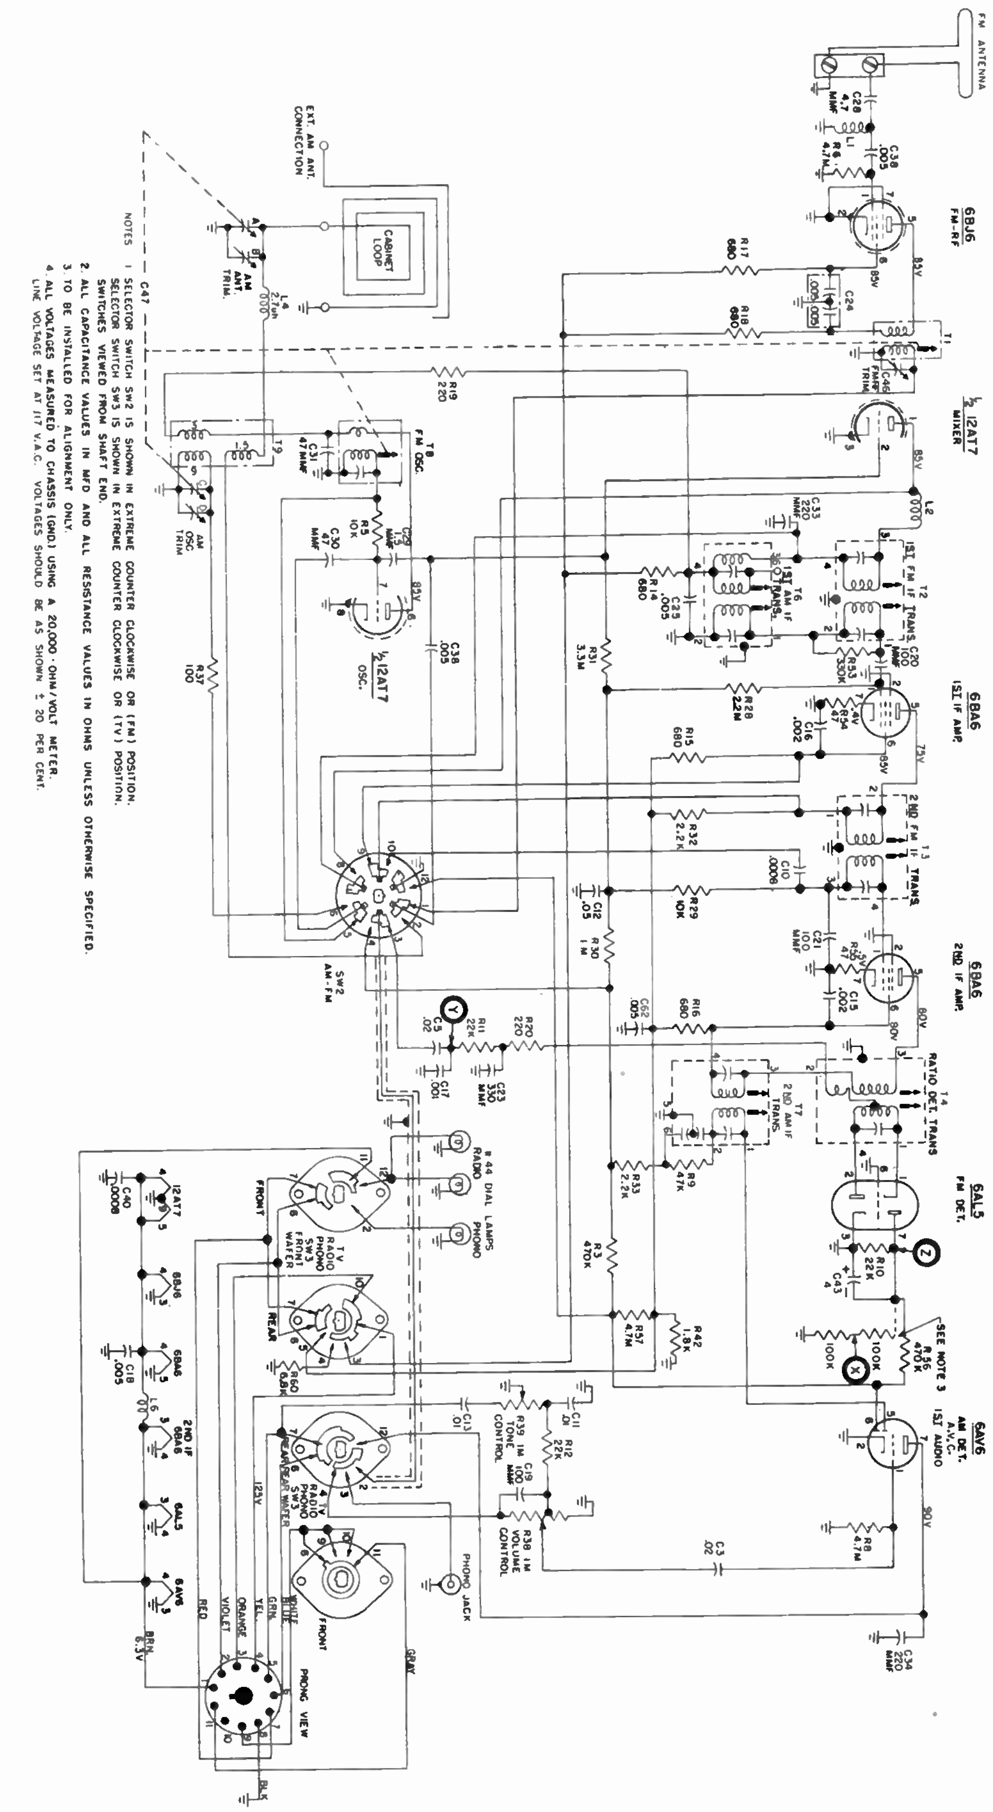


FIG. 10 — SCHEMATIC DIAGRAM OF RADIO CHASSIS

CHASSIS NO V-2180-9

TELEVISION ALIGNMENT CHARTS

The information in these charts is condensed from the foregoing detailed information as a convenience to the service technician. It is recommended that the detailed information be studied before using the charts.

COMMON I-F SECTION

Remove the 6AK5 RF amplifier tube from its socket, and turn the channel selector to channel 13.

Connect the oscilloscope to the video test terminal through the decoupling network shown in Fig. 2.

Connect a 9 volt bias battery to the AGC line.

Adjust the sweep generator for a center frequency of 44 mc. with a 10 mc. sweep deviation, and couple the marker generator to the sweep generator.

Step	*Connect Sweep and Marker Generators to —*	*Marker Use*	*Connect Detuning Clip to —*	*Adjust —*
1.	3rd I-F amp. grid	Check for equal response at 42.25 mc and 45.75 mc using weak signal. Also 43 mc and 45 mc.	2nd I-F amp. plate	Pri. of T304 for max. response and sec. of T304 for symmetrical curve shown in Fig. 5A.
2.	2nd I-F amp. grid	Same as step 1	1st I-F amp. plate	Pri. of T303 for max. response and sec. of T303 for symmetrical curve shown in Fig. 5B.
3.	1st I-F amp. grid	Same as step 1	Not used	Pri. of T302 for max. response and sec. of T302 for symmetrical curve shown in Fig. 5C.
4.	6X8 mixer through coupling device shown in Fig. 3.	Check at 44 mc Marker pip must be at center of flat region on curve	Not used	Turn L301 adj. completely clockwise and adjust T101 for max. response. Adjust T301 for symmetrical top.
5.	Same as preceding step	Adjust to 41.25 mc. and increase output until pip is readily visible.	Not used	L301 to minimize amplitude of 41.25 mc. marker pip.
6.	Same as preceding step	Check curve at frequencies shown on Fig. 5.	Not used	Re-adjust T101 and T301 to obtain curve shown in Fig. 5D.
7.	Tune L308 to 47.25 mc. as described in step 26 of detailed information			

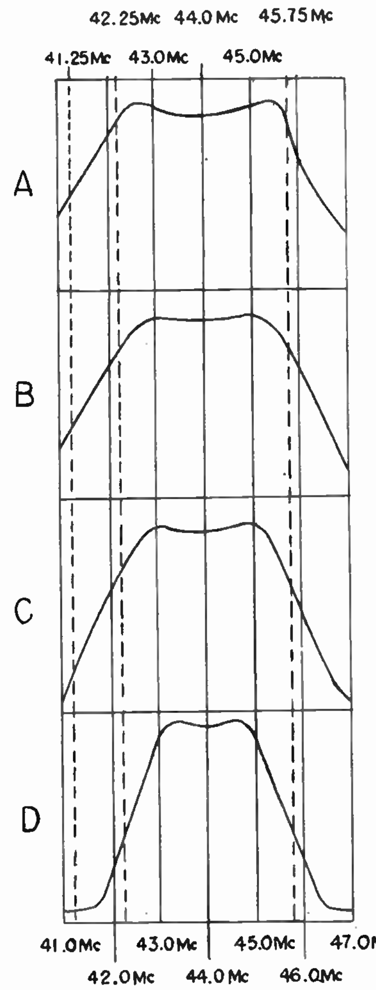

FIG. 5 — RESPONSE CURVES AT VARIOUS STAGES OF ALIGNMENT

SOUND I-F SECTION AND 4.5 MC. TRAP

Connect the signal generator to the video test terminal (point "D" on Fig. 4) through a .001 mfd capacitor.

Step	*Signal Gen. Frequency*	*VTVM Connections*	*Remarks*	*Adjust —*
1.	4.5 mc. unmodulated	Common lead to point "C" and high lead to point "A" as shown in Fig. 6.	Use 5 v. (-DC) scale on meter. Set sig. gen. output accordingly.	L201, L202 and pri. of T201 for max. voltage.
2.	4.5 mc. unmodulated	Common lead to point "A" and high lead to point "B" as shown in Fig. 6.	Use same sig. gen. output as in step 1	Sec. of T201 for zero voltage.
3.	4.5 mc. unmodulated	RF probe to point "E" (see Fig. 6) and common lead to chassis.	Use strong signal from generator	L309 for minimum voltage

* VOLTAGE MEASURED WITH CONTROL SET AT MAX. RESISTANCE.

MODEL H-730C21 PARTS LIST

When ordering parts, specify model number of set in addition to part number and description of part.

	Part No.	*Description*	*Price*
✓	V-10816-2	Antenna Assembly, AM loop	$1.50••
	V-5986-3	Antenna Assembly, FM dipole	.90••
	V-10924-3	Base, channel selector	.30
✓	V-1278-1	Cabinet	•••
	V-5860-14	Cable Assembly, speaker	.40
	V-4898-1	Catch, bullet	.06
	V-5684-2	Clip, plate to mask	.03
	V-5522	Cord, AC power	1.25
•	V-4349-16	Cord, phono AC power	.50
✓	V-10962-10	Cover Assembly, back	4.75
✓	V-11354-1	Dial, AM-FM	.50
✓	V-8609	Doors, matched pair (less hardware)	•••
✓	V-8610	Doors, center section (less hardware)	•••
✓	V-8611	Drawer, record changer (less hardware	•••
	V-10942-2	Gasket, dust seal	.75
✓	V-10749-7	Grille cloth	•••
	V-9091-1	Hinge, upper LH and lower RH	.30
	V-9091-2	Hinge, upper RH and lower LH	.30
	V-10339-1	Hinge, continuous	1.10
✓	V-9938-5	Knob, off-on-TV volume	.12
✓	V-9939-6	Knob, picture (rear)	.15
✓	V-9940-4	Knob, TV fine tuning (rear)	.45
✓	V-10408-8	Knob, AM-FM band selector and tone	.35
✓	V-10408-9	Knob, radio volume	.30
	V-10926-1	Knob, horiz. hold and brightness	.10
✓	V-11146-2	Knob, TV channel selector	1.75
✓	V-11149-3	Knob, radio tuning (rear)	.35
✓	V-11149-4	Knob, TV-radio-phono (rear)	.40
✓	V-10929-2	Mask, picture tube	4.25
	V-10024-1	Nut, speed (dial to cabinet)	.03
✓	V-11151-1	Nut, speed (dial wing to cabinet)	.03
✓	V-11291-6	Plate, front glass	•••
✓	V-11310-2	Plate, mask	.55
✓	V-11145-2	Pointer, radio dial	1.00
✓	V-11194-3	Pull, record changer drawer	•••
✓	V-11194-4	Pull, door (upper left)	•••
✓	V-11194-5	Pull, door (upper right)	•••
✓	V-11194-6	Pull, door (lower left and right)	•••
	V-10039-1	Slide mechanism, phono	2.85
✓	V-11439-1	Speaker, 10" PM	8.50••
	V-10934-1	Spring, channel selector base	.10

✓	V-11417-1	Wing, dial	•••

V-2218-2 CHASSIS PARTS

MISCELLANEOUS

V-6090-1	Base, miniature tube (6T8)	$ .10
V-11388-1	Belt, dial drive	.30
V-5426	Clip, IF mounting	.03
V-11356-1	Cable and Socket Assy., TV to radio	1.85
V-5906-7	Connector Assembly, high voltage	.50
V-9867-2	Cushion, yoke hood	.06
V-9928-2	Hood, yoke mounting	.50
V-9784-4	Magnet, ion trap	.55

V-2218-2 CHASSIS PARTS (continued)

Part No.	Description	List Price Each
V-5549	Plug, AC power (male)	.30
V-5926	Screw, wing, #8-32 (yoke)	.04
V-10038-1	Shield, miniature tube (6CB6, 6AU6 2nd sound IF, and crystal det.)	.06
V-6090-2	Shield, miniature tube (6T8)	.15
V-10907-2	Socket Assembly, CRT	.80
V-10918-1	Socket Assembly, (12BH7)	.50
V-9888-1	Socket, miniature wafer (all 7 pin tubes and crystal)	.13
V-9889-1	Socket, miniature wafer (12AT7)	.15
V-9889-1	Socket, miniature wafer (12AT7)	.15
V-4195	Socket, molded octal (6W6GT)	.14
V-5405	Socket, molded (phono AC)	.28
V-8605	Socket and Capacitor Assy., HV (includes C431, R444, L408)	3.25
V-10958-2	Socket, miniature wafer (12BY7, 12AU7)	.20
V-4514-1	Socket, molded octal (5U4G, 6SN7GT, 6W6GT)	.17
V-4514-2	Socket, molded octal (6W4GT)	.15
V-5929-2	Socket, molded octal (6AU5GT)	.20
V-10970-1	Socket, UHF connector	.35
V-9922-16	Strap Assembly, CRT	.55
V-9914-5	Superstructure, yoke	1.40

SECTION 1 — R-F

Ref. No.	Part No.	Description	Function	List Price Each
C116	V-5596	Capacitor, .005 mfd (min)	Tuner decoupling	$ .25
C135	V-5596	Capacitor, .005 mfd	Tuner coupling	.25
C140	V-5596	Capacitor, .005 mfd	Tuner bypass	.25
R108	RC20AE151K	Resistor, 150 ohms ½ w.	Tuner decoupling	.05
R110	RC20AE155K	Resistor, 1.5 megohms ½ w.	AGC divider	.05
	V-11333-1	RF tuner assembly		47.50

SECTION 2 — SOUND I-F AND AUDIO

Ref. No.	Part No.	Description	Function	List Price Each
C201	V-9926-3	Capacitor, 4.7 mmf	Sound take-off	.07
C203	V-5596	Capacitor, .005 mfd (min)	Screen bypass	.25
C204	V-4637	Capacitor, elec., 4 mfd 50 v.	Ratio det. stabilizer	.85

•C211	V-9891	Capacitor, 30 mfd 350 v., elec. (assy. consists of C211, C212, C501 & C502)	Audio decoupling	4.35•
•C212	V-9891	Capacitor, 30 mfd 350 v., elec. (assy. consists of C211, C212, C501 & C502)	Audio decoupling	4.35•
C213	RCP10W6103M	Capacitor, .01 mfd 600 v.	Tone compensation	.19
C214	RCM20C821K	Capacitor, 820 mmf	De-emphasis net.	.40
C215	RCM20B151M	Capacitor, 150 mmf	Plate bypass	.20
C216	RCM20B470K	Capacitor, 47 mmf	I-F coupling	.22
C217	RCM20B151K	Capacitor, 150 mmf	IF tank	.20
C218	RCP10W6202M	Capacitor, .002 mfd 600 v.	Screen bypass	.19
C219	V-5596	Capacitor, .005 mfd	Cathode bypass	.25
C220	V-6570	Capacitor, 30 mfd 450 v. elec.	Cathode bypass	1.65
C221	V-5596	Capacitor, .005 mfd (min)	130 v. line bypass	.25
C222	RCP10W4203M	Capacitor, .02 mfd 400 v.	Audio coupling	.18
C223	RCM20B151K	Capacitor, 150 mmf	IF tank	.20
C230	RCM20B681K	Capacitor, 680 mmf	Feedback	.25
•C231	V-10786-1	Capacitor, 30 mfd 450 v. elec. (assy. consists of C231, C310, C440)	Filter	3.10•
C232	V-6570	Capacitor, 30 mfd 450 v.	Filter	1.65
C233	RCP10W4504M	Capacitor, .5 mfd 400 v.	Audio screen	.55
L201	V-9882-5	Reactor	Sound IF grid	.60
L202	V-9882-5	Reactor	Sound IF plate	.60
R202	RC20AE123K	Resistor, 12,000 ohms ½ w.	Screen decoupling	.05
R204	RC20AE273K	Resistor, 27,000 ohms ½ w.	De-emphasis net.	.06
R205	RC20AE123K	Resistor, 12,000 ohms ½ w.	Ratio det. load	.05
R207	RC20AE103M	Resistor, 10,000 ohms ½ w.	Tone compensation	.05
•R208	V-9877-4	Control, 500,000 ohms (assy. consists of R208, R319, SW501)	Volume	2.15•
R209	RC20AE106M	Resistor, 10 megohms ½ w.	Audio grid return	.05
R210	RC20AE334K	Resistor, 330,000 ohms ½ w.	Bleeder	.05
R211	RC20AE125K	Resistor, 1.2 megohms ½ w.	Audio grid return	.10
R212	V-6067-12	Resistor, 200 ohms ½ w.	Audio cathode	.25
R213	RC40AE153K	Resistor, 15,000 ohms 2 w.	B plus bleeder	.20
R214	RC30AE472K	Resistor, 4700 ohms 1 w.	Screen decoupling	.09
R215	RC20AE224K	Resistor, 220,000 ohms ½ w.	Grid return	.05
R216	RC20AE121K	Resistor, 120 ohms ½ w.	Cathode bias	.06
R217	V-11328-6	Resistor, 470 ohms 10 w.	Decoupling	.85
R218	RC20AE105K	Resistor, 1 megohm ½ w.	Audio degeneration	.05
R219	RC20AE151K	Resistor, 150 ohms ½ w.	Suppressor	.06
R227	RC20AE475K	Resistor, 4.7 megohms ½ w.	AGC divider	.05
R231	RC20AE223K	Resistor, 22,000 ohms ½ w.	Bleeder	.06
R232	RC20AE273K	Resistor, 27,000 ohms ½ w.	Bleeder	.06
R234	RC20AE470M	Resistor, 47 ohms ½ w.	Suppressor	.05
R235	RC20AE470M	Resistor, 47 ohms ½ w.	Suppressor	.05
R236	RC20AE151K	Resistor, 150 ohms ½ w.	Screen decoupling	.05
R237	RC20AE151K	Resistor, 150 ohms ½ w.	Screen decoupling	.05
R238	RC20AE105K	Resistor, 1 megohm ½ w.	Bias divider	.05
R239	RC30AE393K	Resistor, 39,000 ohms 1 w.	Suppressor	.09
R240	V-11328-3	Resistor, 15,000 ohms 5 w.	Voltage divider	.95
R241	RC20AE151K	Resistor, 150 ohms ½ w.	Suppressor	.05
R242	RC20AE125K	Resistor, 1.2 megohms ½ w.	Bias divider	.10
T201	V-9884	Transformer	Ratio detector	$ 2.05
T202	V-11360-1	Transformer	Audio output	2.80

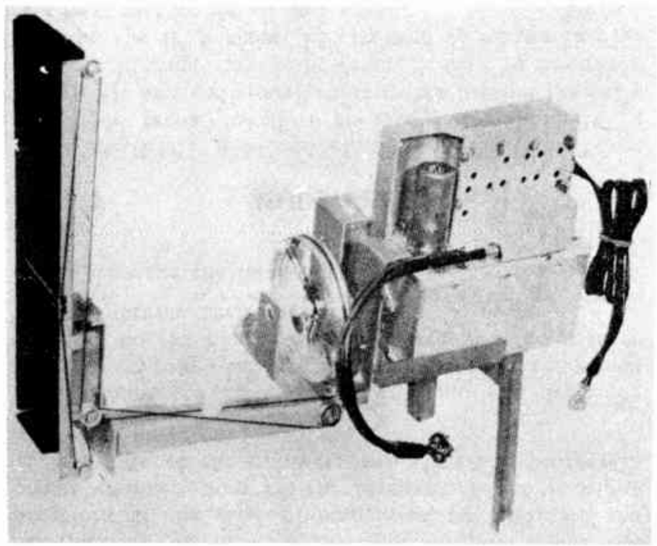
IMPORTANT — Since many of the components are very critical, exact duplicates must be used for replacement purposes. However, any substitute supplied by Westinghouse will assure performance equal to or better than the list part.

MODEL H-803

ALL-CHANNEL UHF TELEVISION TUNER

INSTALLATION AND SERVICE NOTES



GENERAL DESCRIPTION

Model H-803 All-Channel UHF Television Tuner is designed for use with Westinghouse television receivers that contain specific provisions for its use. Receivers that contain the necessary provisions have two UHF positions on the channel selector and two UHF sockets mounted on the rear of the tuner bracket. When the UHF tuner is correctly installed in such a receiver, reception of all the UHF television channels (14 through 83) is provided in addition to the VHF channels (2 through 13).

The UHF tuner contains an oscillator and a mixer circuit and can be tuned over the entire UHF TV spectrum. In the tuner, the UHF signal is converted to the intermediate frequency of the television receiver (center IF is 44 mc.), and this IF output is fed into the VHF tuner in the receiver. When the channel selector on the receiver is set to the UHF positions, the VHF oscillator in the receiver is disabled and the RF amplifier and mixer circuits serve as IF amplifier stages at 44 mc. Thus, the output of the UHF tuner is amplified in the VHF tuner and fed into the IF strip in the receiver.

IDENTIFICATION

In production, several different UHF tuners are used. They are designated V-11390-1, V-11390-2, V-11390-3, and V-11613-1, and the identifying numbers are stamped on each tuner. Figures 1, 2, 3, and 4 indicate the electrical and mechanical variations between tuners.

Model H-803 tuner assemblies are divided into six categories depending on the type of tuner employed and the type of receiver with which the assembly can be used. On tuner assemblies packed for field installation, the category is identified by a number following the basic model number (H-803) marked on the outside of the carton. The coding is as follows:

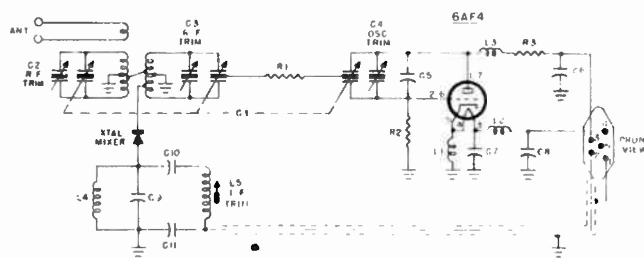


FIG. 1 — V-11390-1 TUNER

Marking on Outside of Carton	*Tuner Type*	*Type of Receiver With Which the Assembly Can Be Used*
H-803-1	V-11390-1, -2, or -3	21" Models
H-803-2	V-11390-1, -2, or -3	17" Models Except Those With Plastic Cabinets
H-803-3	V-11390-1, -2, or -3	17" Models With Plastic Cabinets
H-803-4	V-11613-1	21" Models
H-803-5	V-11613-1	17" Models Except Those With Plastic Cabinets
H-803-6	V-11613-1	17" Models With Plastic Cabinets

V-11390-1, -2 AND -3 CIRCUIT DESCRIPTIONS

As indicated in Figs. 1 and 2, the incoming UHF signal is coupled into the tuner through a 300 ohm balanced input circuit which is double tuned to provide the desired RF bandpass. Operating 45.75 mc. higher than the video carrier frequency of the received signal, the oscillator tuning is ganged with that of the bandpass circuit. A portion of the oscillator voltage is coupled into the bandpass circuit where it mixes with the incoming UHF signal. The difference frequency (center IF is 44 mc.) is extracted in the mixer circuit and fed through a shielded cable to the UHF socket on

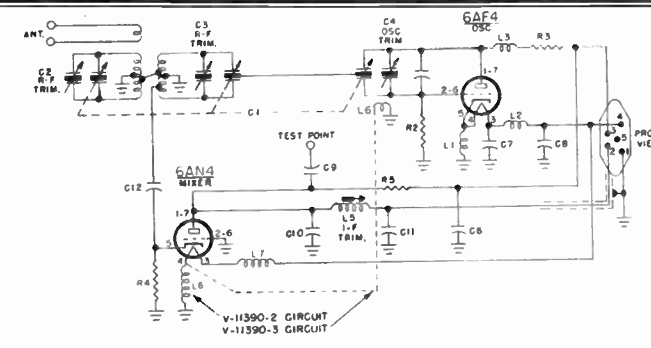

FIG. 2 — V-11390-2 AND V-11390-3 TUNERS

the television receiver. In the V-11390-1 tuner, a germanium crystal serves as the mixer, while the V-11390-2 and V-11390-3 tuners use a 6AN4 tube in a grounded-grid mixer circuit. Otherwise, the three tuners are basically alike.

V-11613-1 CIRCUIT DESCRIPTION

The bandpass circuit in the V-11613-1 tuner consists of two tuned sections as indicated on Fig. 3. Each section is a capacitor-tuned quarter-wave coaxial line, and the sections are over-coupled through the coupling loops, L3 and L4. Coupling of the UHF signal into the the circuit is effected through the antenna input coupling loops, L1 and L2, and the signal is fed from the bandpass circuit to the mixer through L6.

Also fed to the mixer (through L7) is a locally generated signal which is 45.75 mc. higher than the video carrier frequency of the received signal. This signal is not the fundamental output frequency of the oscillator, however. Instead, the oscillator operates at one-half frequency and its second harmonic is utilized. The second harmonic content of the oscillator output is increased by the action of the harmonic generating crystal and coupled into the oscillator doubler section through L8. Consisting of a quarter-wave coaxial line which is capacitor-tuned 45.75 mc. above the video carrier of the received signal, the oscillator doubler section selects the second harmonic of the oscillator and discriminates against the fundamental.

In the crystal mixer circuit, the difference frequency (center IF is 44 mc.) is derived from the UHF signal and the locally generated signal. A shielded cable carries the IF signal to the UHF socket on the television receiver.

INSTALLATION

To install a Model H-803 tuner, proceed as follows:

1. Remove the back cover, and remove the chassis from the cabinet.

2. Remove the wheel from the back end of the UHF drive shaft, and install the 13/16" pulley on the drive shaft.

3. Mount the tuner support bracket to the tuner and mounting plate assembly as shown in Fig. 4. The bracket is shock-mounted to the assembly by placing rubber

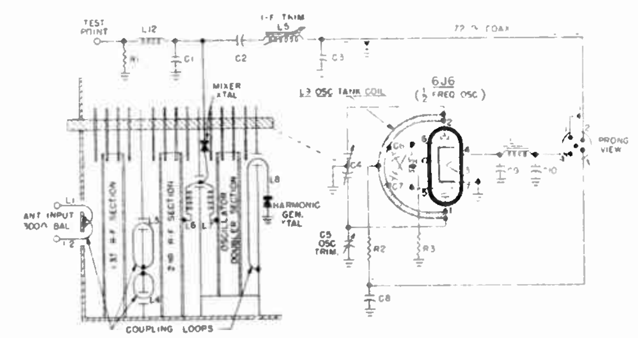

FIG. 3 — V-11613-1 TUNER

grommets in the two large mounting holes, inserting metal spacers inside the grommets, and using ½" self-tapping screws.

4. On models that have the on-off-volume and picture control mounted above the channel selector, loosen the 3/8" palnut which holds the control to the chassis.

5. Make certain the dial background bracket is fitted into the correct slots in the mounting plate assembly. As indicated on Fig. 4, the "A" slots are used for all 17" receivers and the "B" slots are used for all 21" receivers.

6. Place the tuner assembly as shown in Fig. 4. The slots in the mounting plate assembly must be placed over the tongues at the top of the UHF bracket and pressed down until firmly locked in place.

7. On models that have the on-off-volume and picture control mounted above the channel selector, the slot in the front lip of the mounting plate assembly must be positioned down over the shank of the control, between the palnut and the vertical section of chassis, and then tighten the palnut.

8. On models that have the on-off-volume and picture controls located other than above the channel selector, use a 6-32 screw, 6-32 nut and #6 lockwasher to secure the front lip of the mounting plate assembly to the vertical section of chassis. Insert the screw through the slot located near the center of the mounting plate lip and through the similar slot located near the center of the chassis vertical section, and apply the lockwasher and nut.

9. Insert a ¼" self-tapping screw into the hole located to the right of the palnut mentioned in step 7 or the screw mentioned in step 8, and tighten the screw.

10. Insert a ¼" self-tapping screw into the hole located in front of the mounting plate assembly slots which engage the tongues of the UHF bracket, and tighten the screw.

11. With the large pulley rotated to its maximum counterclockwise position, install the 19" drive string and spring as shown in Fig. 5.

12. Insert the UHF plug into the UHF socket farthest from the side of the chassis as indicated in Fig. 4. This socket corresponds to the UHF position next to channel 2 on the channel selector. *The socket nearer the side of the chassis is left unoccupied.*

13. With the large pulley rotated fully counterclockwise, see that the dial pointer is positioned as in-

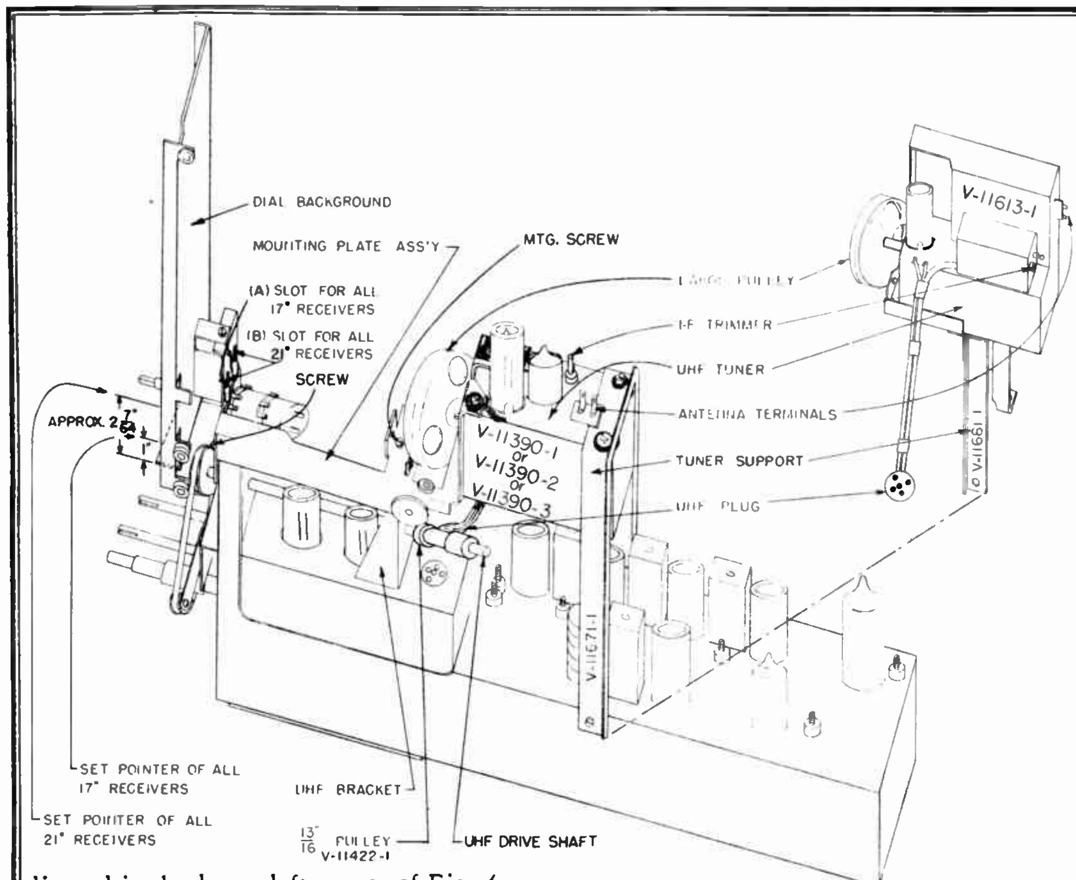

FIG. 4 — INSTALLATION DETAILS

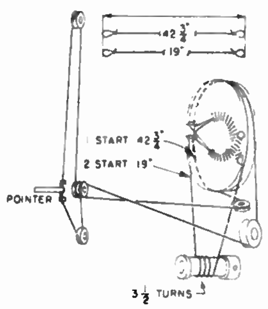

FIG. 5 — DIAL STRINGING

dicated in the lower left corner of Fig. 4.

14. Remove the plastic plate from the picture mask inside the cabinet by removing the clips which hold it in place.

15. Install the calibrated UHF dial in place of the plastic plate which was removed in step 14, and replace the clips.

16. Replace the chassis in the cabinet.

17. Connect a suitable antenna to the UHF antenna lead (SEE ANTENNA INFORMATION), and check the operation. If the dial pointer does not indicate the correct channel, turn off the receiver, reach in along the left side of the cabinet, and slide the pointer to the correct position.

18. Route the ribbon type antenna lead from the UHF tuner through the opening above the UHF antenna terminals on the back cover, and attached the lead to the UHF antenna terminals.

19. Replace the back cover.

ADJUSTMENTS

Model H-803 All-Channel UHF Television Tuner is shipped pre-adjusted to receive UHF channels 14 through 83, and additional adjustments are not normally required. In some cases, however, it may be desirable to adjust the IF trimmer, L5, located as shown in Fig. 4 for best picture detail and sound.

SERVICE

A high degree of precision is used in the manufacture of UHF television tuners. Critical factors include lead lengths, lead and component dress, and component sizes. In servicing UHF tuners, problems arise which are not encountered in ordinary service work. Therefore, troubleshooting inside the tuner is not recommended. Defective tuners should be returned through a Westinghouse distributor.

REPLACING V-11390-1, V-11390-2, OR V-11390-3 TUNER USED WITH MODELS H-803-1, H-803-2, AND H-803-3

1. Remove the two drive strings and springs from the large pulley.

2. Remove the tuner support.

3. Remove the UHF plug from its socket.

4. Unsolder the ground strap from the tuner.

5. Release the tuner from the mounting plate assembly by removing the two self-tapping screws used to shock-mount the tuner.

6. Loosen the two small set screws in the hub of the large pulley, and remove the pulley.

7. With the tuning shaft of the replacement tuner rotated completely counterclockwise, place the large pulley on the shaft so that the opening in the rim of the pulley is as indicated in Fig. 5. Tighten the set screws in the hub of the pulley.

8. Place the tuner in position, and install the shock-mount screws.

9. Solder the ground strap to the tuner, and install the tuner support.

10. String the two dial drive cords, and see that the dial pointer is positioned as shown in Fig. 4 with the large pulley rotated completely counterclockwise.

11. Insert the UHF plug into the UHF socket farthest from the side of the chassis.

12. Check the dial calibration using an air signal. If the dial pointer does not indicate the correct channel, turn off the receiver, reach in along the left side of the cabinet, and slide the pointer to the correct position.

REPLACING V-11613-1 TUNER USED WITH MODELS H-803-4, H-803-5 AND H-803-6

1. Remove the UHF plug from its socket.

2. Remove the two drive strings and springs from the large pulley.

3. Remove the self-tapping screw which secures the front lip of the mounting plate to the vertical section of chassis.

4. Loosen the off-on-volume and picture control planut or remove the 6-32 screw (whichever is used to secure the front lip of the mounting plate).

5. Remove the self-tapping screw which secures the the mounting plate to the UHF bracket.

6. Remove the two self-tapping screws that secure the tuner support to the receiver chassis.

7. Release the mounting plate assembly from the UHF bracket by pulling straight up.

8. Remove the tuner by removing the three screws from the side of the tuner.

9. Mount the replacement tuner by replacing the three screws in the side.

10. Mount the assembly to the chassis by replacing the items removed in the preceding steps.

11. Check the dial calibration using an air signal. If the dial pointer does not indicate the correct channel, turn off the receiver, reach in along the left side of the cabinet, and slide the pointer to the correct position.

ANTENNA INFORMATION

Antenna requirements for satisfactory UHF television reception are determined by the signal conditions in the particular locality. Some of the possibilities are as follows:

1. In areas where signals are strong and reflections are not troublesome, satisfactory reception may be obtained by using the existing VHF antenna (built-in or external) for both VHF and UHF. This can be done by connecting two jumper wires from the UHF antenna terminals to the STD antenna terminals so as to connect the two sets of terminals in parallel. If this method is used, make certain that it does not adversely affect reception on the standard VHF channels.

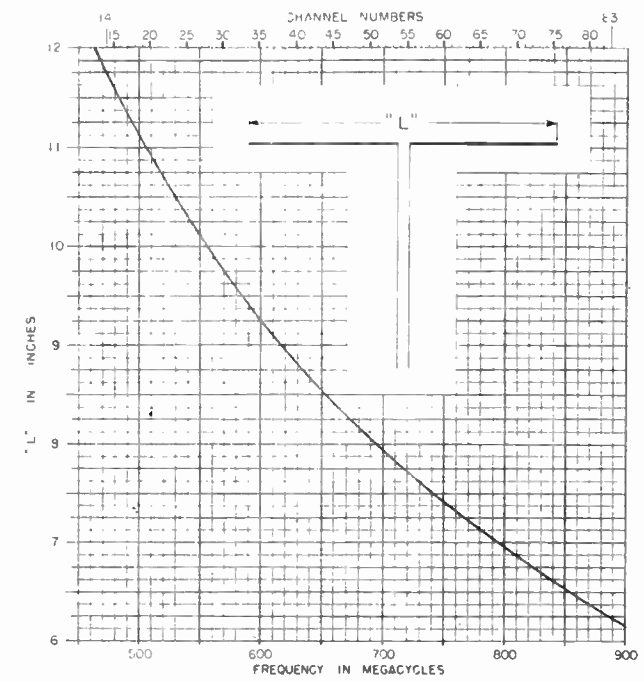

FIG. 6 — UHF DIPOLE ANTENNA LENGTH

If an external antenna is used for VHF reception, satisfactory UHF reception may be obtained by connecting the built-in VHF antenna to the UHF antenna terminals.

2. A simple, resonant dipole antenna may provide satisfactory reception in medium-signal areas. The chart, Fig. 6, gives the total length of a half-wave element for any frequency in the UHF television spectrum.

3. Where signals are weak or reflections are troublesome, a high-gain, directive antenna system should be used. Typical of this type of antenna are the corner reflector, the rhombic, and the Yagi.

MODEL H-802
UHF RECEPTOR
SERVICE NOTES

DESCRIPTION

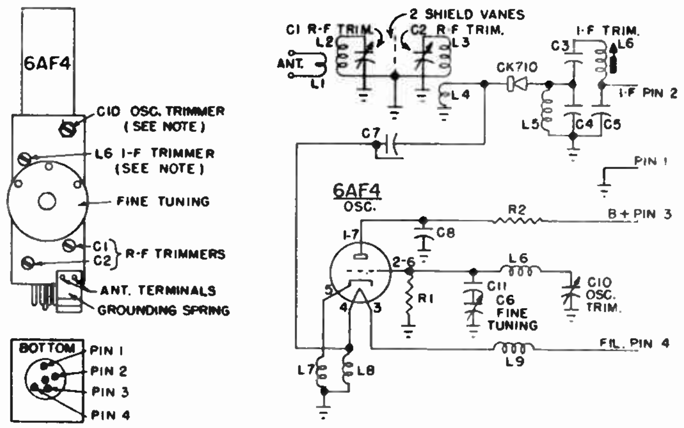
Model H-802 UHF Receptors are designed for use with Westinghouse television receivers that contain specific provisions for their use. Receivers that contain the necessary provisions will accommodate two UHF Receptors, and each receptor used will provide reception on one UHF television channel. If only one UHF station is active in a particular locality, only one UHF Receptor is required. If two UHF stations transmit in the locality, they can both be received by installing two UHF Receptors. The UHF reception provided by these receptors is in addition to the standard VHF reception provided by the VHF tuner in the television receiver.

Each receptor contains a local oscillator which employs a 6AF4 tube and operates 45.75 mc. *higher* than the video carrier frequency of the received UHF signal. The oscillator frequency is initially adjusted by the oscillator trimmer, C10, and fine tuning is provided by the fine tuning capacitor which is mechanically coupled to the fine tuning control on the television receiver. Suitable band-pass circuits tuned to the frequency of the received signal by the R-F trimmers (C1 and C2) serve as the antenna input circuit in each receptor. The incoming UHF signal mixes with the local oscillator signal in a crystal mixer circuit, and the resultant I-F output (center frequency is 44 mc.) is fed to the R-F amplifier in the television receiver. When the channel selector on the television receiver is set to either of the UHF positions, the R-F amplifier and mixer circuits in the television receiver serve as I-F amplifiers at 44 mc., and the VHF oscillator is disabled. Thus, the 44 mc. output of the UHF Receptor is amplified in these circuits and fed into the I-F strip in the receiver.

IDENTIFICATION

Model H-802 Receptors are shipped pre-adjusted to receive a particular UHF channel. The channel to which the receptor is tuned is marked on the label which is attached to the unit.

In addition, the receptors are divided into categories depending on the frequency range covered by each. The identifying markings which are stamped on the receptors and the corresponding frequency coverages are as follows:



NOTE: PHYSICAL LOCATIONS OF I-F AND OSC. TRIMMERS ARE INTERCHANGED IN SOME RECEPTORS MARKED V-11213.

FIG. 1 — MODEL H-802 UHF RECEPTOR

Receptors Marked —	*Can Be Tuned To —*
V-11900-1	Channels 14 through 29
V-11900-2	Channels 28 through 43
V-11900-3	Channels 43 through 58
V-11900-4	Channels 58 through 73
V-11900-5	Channels 73 through 83
V-11213 (early production)	Special ranges

INSTALLATION

To install a UHF Receptor:

1. Remove the rear of the television receiver.

2. Plug the receptor into either of the two UHF sockets located on the rear of the VHF tuner mounting plate in the television receiver. If the receptor is plugged into the socket nearer the side of the chassis, the UHF position nearer channel 13 on the channel selector is activated. If the receptor is plugged into the socket nearer the center of the chassis, the UHF position next to channel 2 on the channel selector is activated. The receptor should be seated firmly in the socket with the slots in the top of the receptor engaging the top of the VHF tuner bracket. If the center tongue of the tuner bracket is bent too far toward the back of the cabinet, it will catch the top of the receptor and prevent proper insertion. In this event, bend the center tongue toward the front of the cabinet just enough to allow insertion of the receptor. The sharp bend in the center tongue must bear on the top of the receptor when the receptor is fully seated. The fine tuning wheel on the receptor must engage the drive wheel located on the shaft between the two sockets. If the two wheels are not correctly aligned, undue pressure will be required to mesh the wheels, and the drive torque will be excessive. In this event, loosen the set screw in the metal drive wheel and slide the wheel to the correct position on the shaft.

3. Connect the ribbon-type antenna lead from the receptor to the UHF antenna terminals on the back cover of the receiver. To prevent impaired reception which may result if the antenna lead runs close to the receiver chassis, the lead should be passed through the same clip that supports the VHF antenna lead, but do not allow the two antenna leads to run close together for any appreciable distance.

4. Replace the rear cover of the television receiver.

5. Make appropriate antenna arrangements (see ANTENNA INFORMATION), and check the operation.

ADJUSTMENTS

It is desirable to check for best adjustment each time a receptor is installed. This is accomplished as follows:

1. Rotate the fine tuning wheel on the receptor to its center frequency position. The fine tuning capacitor is centered when the middle hole in the rim of the wheel is straight up from the center of the wheel.

2. Rotate the channel selector on the receiver to the appropriate UHF position (see step 2 under INSTALLATION).

3. Rotate the oscillator trimmer (C10) to the position that provides best picture detail. *NOTE: Since the units are pre-adjusted for a particular frequency, only a slight re-adjustment at most should be needed to bring in the station. If the station is not received, make certain the antenna facilities are adequate before moving the oscillator trimmer far from its original setting.*

4. Rotate the R-F trimmers (C1 and C2) to the positions that provide best picture detail. *NOTE: If the R-F trimmers are rotated too far counterclockwise, they will be detached from the unit, and the procedure given under SERVICE must be followed to avoid damage when replacing the screws.*

5. Rotate the I-F trimmer (L6) for best picture detail. This trimmer has a broad tuning characteristic and is effective mostly in weak signal areas.

SERVICE

Troubleshooting inside the UHF Receptor is not recommended.

There are critical adjustments inside. One critical adjustment consists of two shield vanes located between the R-F coils (L2 and L3) which determine the coupling between the coils. Since special equipment and techniques are required to make the adjustments, care must be exercised to avoid altering the original factory placement of wires and components.

The R-F trimmers (C1 and C2) will detach from the unit if they are rotated too far counterclockwise. If this occurs, the following procedure should be used to avoid damaging the ceramic part of the trimmer when replacing the screw:

1. With the screw removed from the unit and the metal locking device placed on the screw, rotate the locking device until it is near the head of the screw.

2. Insert the screw in place and rotate it clockwise several full turns.

3. While keeping the screw from turning, rotate the locking device clockwise until it is moderately tight against the outside of the receptor.

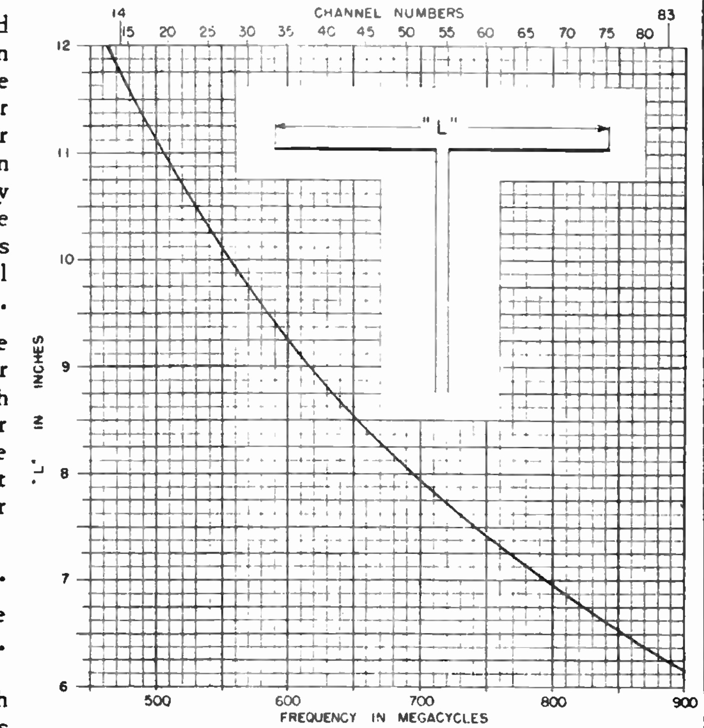


FIG. 2 — UHF DIPOLE ANTENNA LENGTH

ANTENNA INFORMATION

Antenna requirements for satisfactory UHF television reception are determined by the signal conditions in the particular locality. Some of the possibilities are as follows:

1. In areas where signals are strong and reflections are not troublesome, satisfactory reception may be obtained by using the existing VHF antenna (built-in or external) for both VHF and UHF. This can be done by connecting two jumper wires from the UHF antenna terminals to the STD antenna terminals so as to connect the two sets of terminals in parallel. If this method is used, make certain that it does not adversely affect reception on the standard VHF channels.

If an external antenna is used for VHF reception, satisfactory UHF reception may be obtained by connecting the built-in VHF antenna to the UHF antenna terminals.

2. If the above methods are not satisfactory, a simple, resonant dipole antenna may provide satisfactory reception in medium-signal areas. The chart, Fig. 2, gives the total length of a dipole element for any frequency in the UHF television spectrum.

3. Where signals are weak or reflections are troublesome, a high gain, directive antenna system should be used. Typical of this type of antenna are the corner reflector, the rhombic, and the Yagi.

INTRODUCTION

The 19L25, 19L26, 19L27, 19L28, 21L21 and 22L20 chassis described in this manual are basically alike. Alignment and adjustment procedures are identical. The slight differences which exist are as follows:

19L25: This chassis utilizes a 17 inch rectangular picture tube and is the basic chassis.

19L26: This chassis is the same as the 19L25 without the screen and tone register controls.

19L27: This is the 19L25 chassis with a 21 inch picture tube.

19L28: This is the 19L26 chassis with a 21" picture tube.

21L21: This chassis is the same as the basic 19L25 chassis except for the 21 inch picture tube and the addition of a 5U4G low voltage rectifier and a 1X2A tube in the high voltage circuit. The 1X2A is used in conjunction with the 1B3GT rectifier to boost the picture tube second anode voltage to 18.5 Kv. This chassis uses a 6CD6 in the horizontal output circuit. PM focusing and centering is utilized.

22L20: This chassis is similar to the 21L21 chassis but has a separate power supply and utilizes either the 24 or 27 inch picture tube. The 12AX7 used as the vertical oscillator in all other "L" chassis is used in the interlace circuit of this chassis. This circuit is designed to utilize the actual vertical pulse for triggering, rather than depending on the voltage build-up across an intergrating network. In this circuit the first of the six serration of the vertical pulse is differentiated, clipped by the 12AX7 (used as a diode) and applied to the 6SN7GT vertical oscillator. By using the actual pulse for triggering, the time relationship between alternate fields remains constant and positive interlacing results. This chassis utilizes the 6AV5GT vertical output and the 6AS4GT damper.

All models have provisions for reception of the new Ultra High Frequency stations by the simple addition of UHF strips as required. Connections are also provided for easy addition of Phonevision.

CONTROLS AND FUNCTIONS

Location of the various receiver controls is shown on Page 2. After the receiver has been properly adjusted, the serviceman should remove the Horizontal Hold, Brightness, Fine Tuning, Vertical Hold, and Contrast Control knobs and re-position them so that the knob markers face upward. The positioning of the knobs will aid the customer in resetting the controls should they be accidentally moved. A brief description of each control follows:

CHANNEL SELECTOR SWITCH: Is used to switch the pre-tuned RF strip into operating position for reception of the particular channel desired.

SCREEN REGISTER: This control is used to vary the response of the video amplifier much the same as a tone control varies the audio response. Clockwise rotation accentuates the high frequencies thus adding crispness to the picture, oftentimes improving the quality of the transmitted picture, particularly old films, etc. Counterclockwise rotation of this control is instrumental in reducing the ringing effect (halos, etc.) of certain transmissions and is particularly useful in fringe areas where some smearing of the snow and noise results in a much improved picture. Under normal picture conditions the setting of the control is usually near the center of its range. MIS-ADJUSTMENT OF THIS CONTROL ON A NORMAL PICTURE MAY RESULT IN A SMEARED OR OTHERWISE INFERIOR PICTURE. (NOTE-A number of 21L21 Chassis have been produced in which the screen register action is in reverse to the above. These receivers can be identified by a 100 ohm resistor which is connected to the screen register cable connecting plug)

FINE TUNING CONTROL: Provides a means of varying the frequency of the local oscillator to compensate for any frequency deviation which may result from tube and circuit variations. In operating this control it will be found that the range of sound is quite broad. Proper setting is the point where the best picture is obtained within the range of best sound.

TONE REGISTER: The tone control is used on all chassis except the 19L26 and 19L28. This control, which consists of a 1 Megohm potentiometer and a .004 Mfd capacitor across the audio detector output, is to be adjusted to the user's preference. Clockwise rotation accentuates the high audio frequencies while counterclockwise rotation accentuates the lows. In fringe or noisy areas, the tone control may be effectively used in the reduction of background noise which may accompany the sound.

VERTICAL HOLD CONTROL
VERTICAL HOLD RANGE CONTROL: The combination of these controls provide a means of changing the cathode resistance of the vertical oscillator to effect synchronization of the vertical sweep with the transmitted sync pulses. Adjustment is made by setting the Vertical Hold Control in the center of its range and adjusting the Vertical Hold Range Control for proper sync. Improper adjustment will cause the picture to "roll" vertically.

HEIGHT CONTROL: The Height Control is part of the vertical oscillator plate load. It is used in conjunction with the vertical linearity control to adjust the size of the picture vertically.

VERTICAL LINEARITY CONTROL: The Vertical Linearity Control is in the cathode circuit of the vertical output tube and is used to shift the operating point of the tube so that the sweep is amplified along that portion of the plate current curve which results in a linear output.

HORIZONTAL LINEARITY CONTROL: The Horizontal Linearity Control should be adjusted for best horizontal symmetry while observing a test pattern on the screen. The position of the horizontal drive and width controls also affect linearity and possible interaction of these controls must be taken into consideration when making linearity adjustments.

WIDTH CONTROL: Two windings in a series shunt arrangement are used to vary the current through the deflection yoke.

HORIZONTAL DRIVE CONTROL: The Horizontal Drive Control is a capacitive divider which is used to regulate the magnitude of horizontal sweep voltage applied to the grid of the horizontal output tube. Counterclockwise rotation of this control increases drive while clockwise rotation reduces drive. To obtain the greatest possible life out of the horizontal output tube, the drive should be adjusted to obtain maximum picture width. After this has been done, any excess or deficiency in width can be compensated for with the Width Control.

Fig. 9 Receiver Correctly Adjusted On Test Pattern.

FOCUS CONTROL: A three position tap is used to obtain proper focusing on all 19L series receivers. Select the tap which results in best focus.

In the 21L21 and 22L20 chassis, PM focusing is utilized. The adjustment is made at the neck of the picture tube.

BRIGHTNESS CONTROL: Controls the cathode voltage of the picture tube to afford control of picture brilliance. Must be operated in conjunction with the Contrast Control for best picture contrast.

CONTRAST CONTROL: Control is in the plate circuit of the 12BY7 video amplifier. It regulates the magnitude of video signal applied to the cathode of the picture tube.

HORIZONTAL HOLD CONTROL: The Horizontal Hold Control is used to tune the horizontal oscillator to the frequency of the transmitted sync pulses.

ADJUSTMENTS AND ALIGNMENT

THE FRINGE LOCK CIRCUIT

The fringe lock is a newly developed circuit, utilizing a 6BE6 heptode, which can be adjusted to assure sync stability over the wide range of noise and signal levels encountered in different areas. In this circuit the output of the crystal detector, approximately -3 volts peak to peak, is fed to grid #1 of the 6BE6. The same signal, after it has been inverted and amplified to approximately 40 volts peak to peak by the first video amplifier, is applied to grid #3 which in this circuit is the signal grid. The fringe lock control is used to pre-set the bias on grid #1 so that the normal 3 volt signal allows proper sync clipping action, i.e. the sync pulses, which have been stripped from the composite video signal appearing at grid #3, will appear at the plate. If a noise pulse drives grid #1 beyond the 2 volt level, plate current cutoff occurs and the noise pulse cannot get through to falsely trigger the sweep oscillators. On rare occasions, a strong noise pulse may occur at the time of the sync pulse and the tube likewise will cut off, however, the flywheel action of the sweep oscillators will maintain sync during this brief period. The entire fringe lock system is based on the fact that the loss of an occasional sync pulse is to be preferred over having a noise pulse get through to falsely trigger the sweep oscillator.

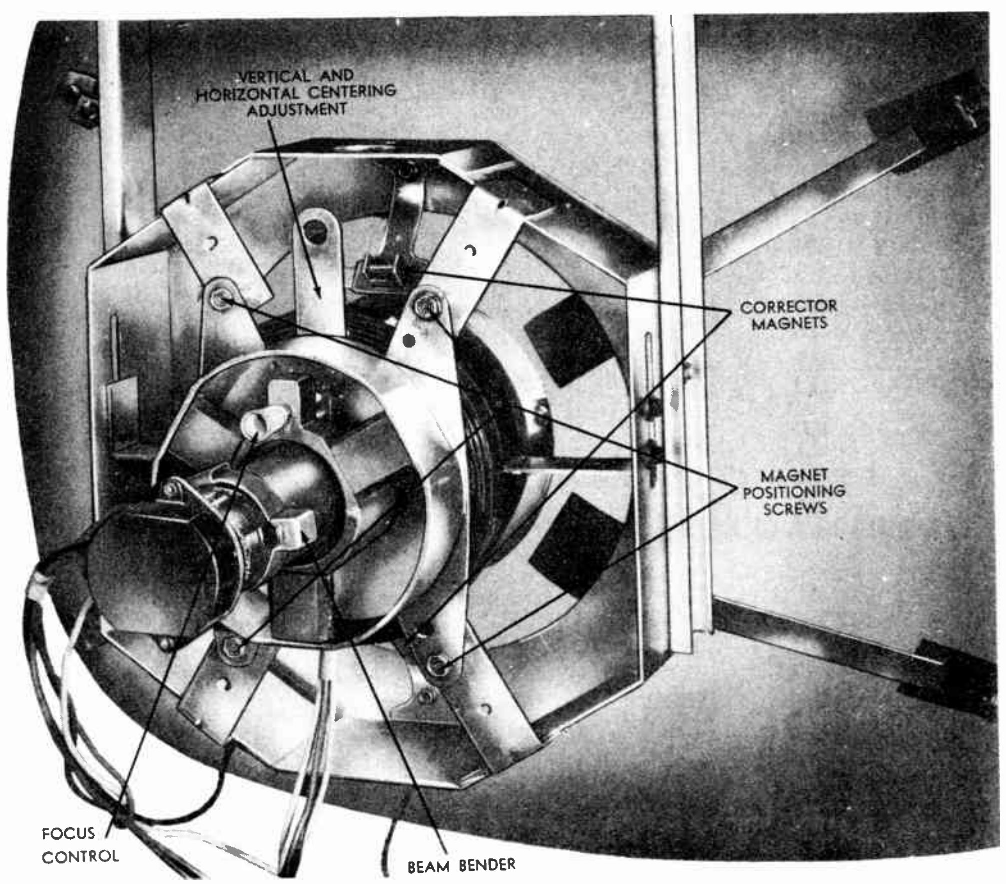

Fig. 10 Adjustments on Neck of Picture Tube 22L20 Chassis. Focusing and Centering Adjustments for the 21L21 Chassis are similar.

FRINGE LOCK ADJUSTMENT

1. Turn the fringe lock control fully clockwise and then back it off approximately 1/4 turn. Adjust the vertical and horizontal hold controls and check operation of the receiver to see that it syncs normally when the turret is switched from channel to channel.

2. If the picture jitters or shows evidence of delay, tearing, split phase, etc., back down the fringe lock control further, a few degrees at a time, each time re-adjusting the hold controls and switching from channel to channel until normal sync action is obtained. It will be found that under normal signal conditions, the correct adjustment will be near the counterclockwise position of the control.

3. In fringe and noisy areas, the best adjustment will be found at or near the maximum clockwise position of the control, however, do not automatically turn the fringe lock fully clockwise in fringe areas as has been done on previous models. Always follow the procedure outlined.

CORRECTOR MAGNET ADJUSTMENT

Two corrector magnets (See Fig. 8) are used in all chassis to obtain straight, sharply focused sweep lines across the face of the picture tube. In the 22L20 chassis, the corrector magnets are mounted top and bottom. The corrector magnets are mounted on the deflection coil mounting brackets and can be moved in and out or up and down by bending the flexible arms which support them. The corrector magnets are adjusted at the factory and should not require re-adjustment unless accidentally bent out of position. If this occurs, adjustment can then be made as follows:

1. With the vertical and horizontal size controls, reduce the size of the picture to a point where the four corners and sides of the picture are visable. (In some receivers it may not be possible to reduce the picture size sufficiently to see all the sides and in this case it may be necessary to shift the picture with the centering control to view one side at a time.)

2. Bend the corrector magnet arms until the corners become right angles and the top of the raster is parallel with the bottom and the left side is parallel with the right side. After adjustment, the picture should be restored to normal size.

NOTE: Mis-adjustment of the corrector magnets may cause pincushioning, barreling, keystoning, poor linearity, etc.

CENTERING ADJUSTMENT

In the 19L series, the centering assembly is built into the yoke housing. This assembly is made up of two magnetic rings which can be rotated by means of tabs. Centering is accomplished by gradually rotating the tabs with respect to each other then rotating both tabs simultaneously until the picture is centered.

In the 21L and 22L series, PM focusing and centering is utilized. The top screwdriver adjustment on the centering assembly is used to move the picture up or down and the bottom adjustment for side to side movement. The center adjustment is for focusing.

In some 21L and 22L receivers, a single centering lever is used for both vertical and horizontal centering. The up down movement of this lever moves the picture horizontally while a left-right movement moves the picture vertically. A screwdriver adjustment is provided for focusing.

BULLS EYE TUNER ADJUSTMENTS

To adjust the receiver for bulls-eye tuning, set the fine tuning control to its approximate center position as shown in Fig 2. Without further adjustment of the fine tuning control insert a 68-21 alignment wrench into the tuner (See Fig.11) and adjust each operating channel to resonance. It will be noted that tuning to one side of resonance results in a faded, washed-out picture with the spacing between the wedge lines fogged and tuning in the opposite direction causes the spaces between the lines to clear up. However, going beyond this point causes the picture to take on a "wormy" appearance from sound getting into the picture. Correct adjustment is obtained by tuning to the "wormy" picture and then backing the control off slightly until the picture clears up.

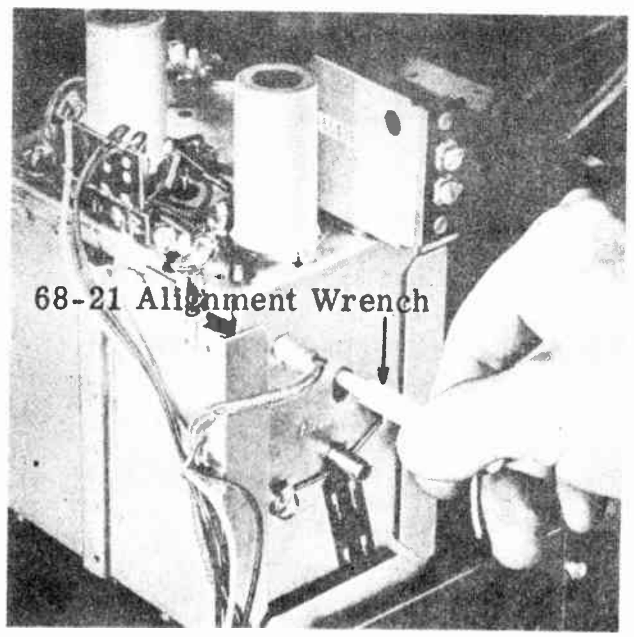

Fig. 11 Bulls-eye Tuning Adjustment.

AFC ADJUSTMENT

The AFC adjustment can effectively be made by setting the horizontal hold control L26 to a position where it is virtually impossible to "throw" the receiver out of horizontal sync when switching from channel to channel.

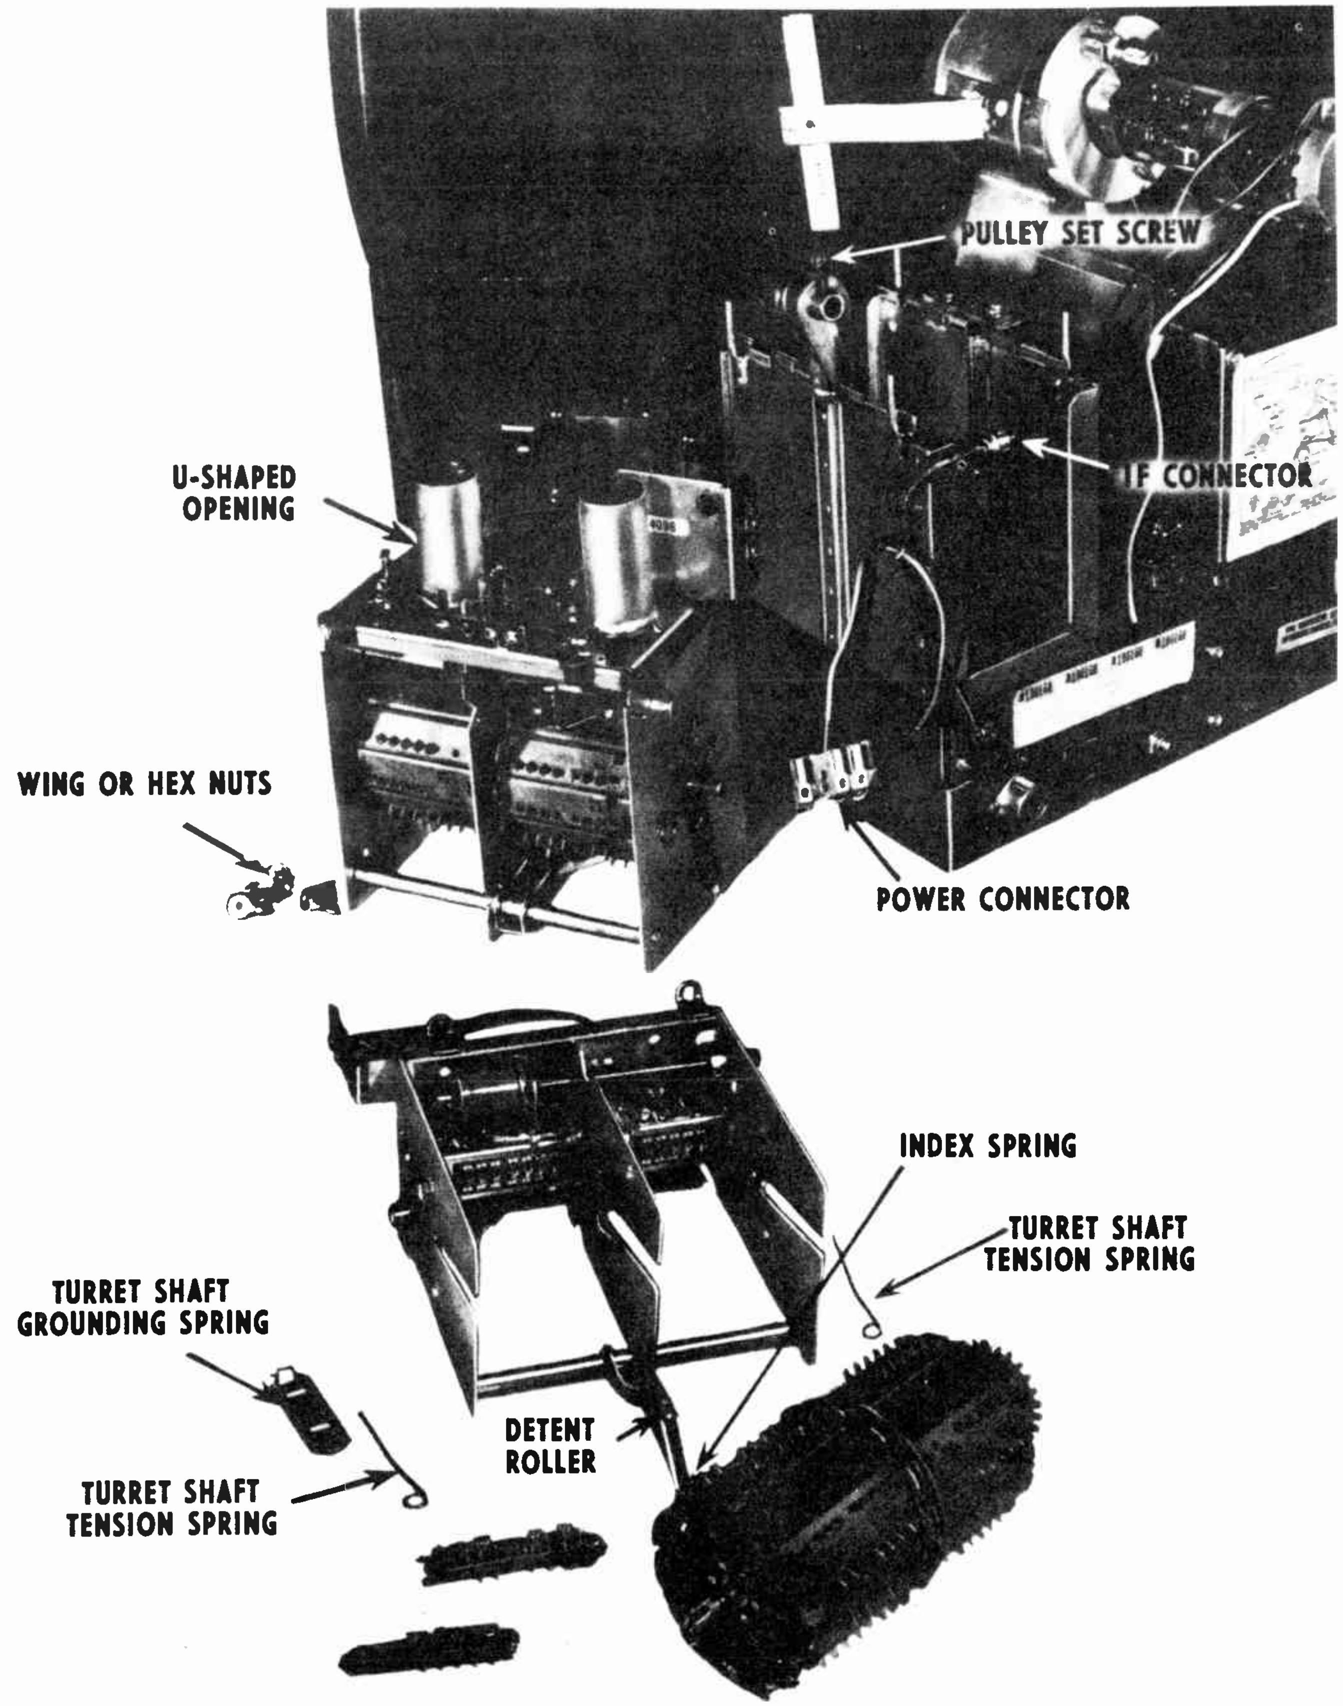

Fig. 12 Removing Turret Tuner.

REMOVING TURRET TUNER FROM CHASSIS

1. Pull out the power and IF connector cables and disconnect the antenna transmission line.

2. Look through the U shaped opening (See Figure 12) in the top of the tuner and rotate the fine tuning control until the allen head set screw (or paint mark on some tuners) is straight up.

3. Loosen (do not remove) the hex head set screw in the turret dial cord pulley assembly.

4. Slide the pulley towards the front of the chassis until it clears the fine tuning shaft.

5. Remove the four hex nuts and gently pull the tuner assembly straight out of its case.

REMOVING CHANNEL STRIPS

1. To insure proper indexing, carefully note the channel to which the receiver is tuned so that the tuner drum can be rotated back to this channel before the unit is reassembled.

2. Rotate the turret drum until the strip to be removed is readily accessible.

3. Insert a small screwdriver in the slot (See Fig.13). Push in the direction of arrow until the channel strip clears the drum slot then lift straight out in direction of screwdriver shaft. Some strips have a round hole instead of a slot and a pointed tool is used in place of the screwdriver.

CAUTION: TO AVOID DAMAGE TO CHANNEL STRIPS, DO NOT USE PRYING ACTION IN REMOVING STRIPS.

REMOVING TURRET DRUM ASSEMBLY

1. Use long nose pliers and remove the two turret shaft tension springs from the front and rear of the tuner assembly. Unsolder and slide the bronze turret shaft grounding springs out of their slots at the front and rear of the tuner.

2. With a pair of long nose pliers, grasp the first turn of the spiral index spring and lift spring off its hook. This takes pressure off the detent arm and may cause the roller to fall out and become lost.

3. Slide the drum out of its slot. Reverse this procedure to re-assemble the tuner.

SERVICING THE TURRET TUNER

In servicing tuners, satisfactory operation can be obtained by removing the tuner from its case and plugging in the power and IF connectors. For further convenience, it may be desirable to use a test chassis in which these leads have been extended 10 to 20 inches.

IMPORTANT: It must be remembered that most repairs in the turret tuner will require realignment of the tuned circuits.

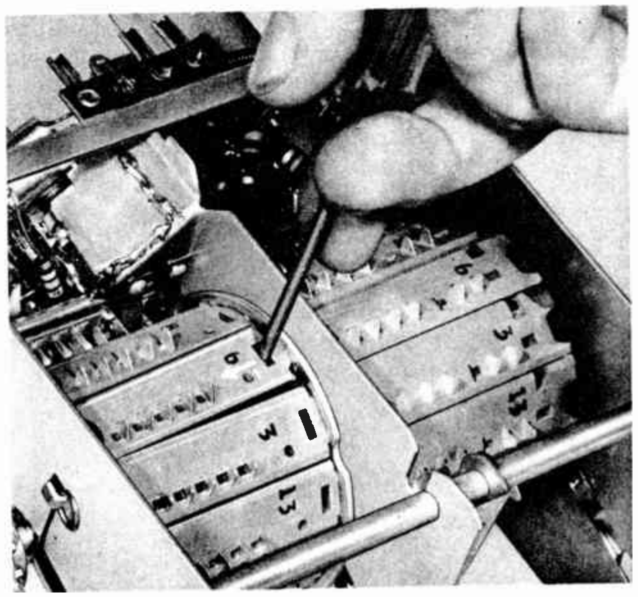

Fig. 13 Removing Channel Strips.

In replacing a 22-2404 feed through capacitor, unsolder the top and bottom leads and the center ground connection. Do not use excess heat or solder when making connections.

Some of the component parts in the tuner cannot be replaced without removing the fine tuning control and bracket assembly. This bracket can be removed as follows:

1. Unsolder the fine tuning capacitor lead.

2. Loosen the Allen head set screw on the fine tuning shaft collar and remove fine tuning shaft.

3. Remove the self tapping screw from the center top of the tuning capacitor mounting bracket, loosen the three remaining screws and remove the bracket. Reverse the above procedure when the tuner is reassembled.

DOUBLE DELAYED GATED AGC

In order to obtain the best possible performance in fringe and weak signal areas, it is important that the application of AGC voltage to the 6BK7A RF tube be withheld until the signal level reaches approximately 500 microvolts at the antenna input. The noise figure of the tuner will be optimized only under this condition of no AGC voltage. To accomplish this, the cathode of the 6CB6 1st IF tube is approximately 8 volts positive by virtue of the drop through the cathode resistor of the 6CB6 3rd IF. This voltage plus the voltage which results from current flow through the tube makes the grid of the 6CB6 1st IF approximately 9.3 volts negative with respect to its cathode. It should be noted here that the bias voltage for the 3rd IF is obtained across the 100 ohm portion of the cathode resistor only. The voltage at the junction of the two resistors varies from 8 volts with no signal to 4 volts with strong signals. The 2nd IF tube is in series with the 1st IF tube and any changes in the plate current of the 1st IF tube will also change

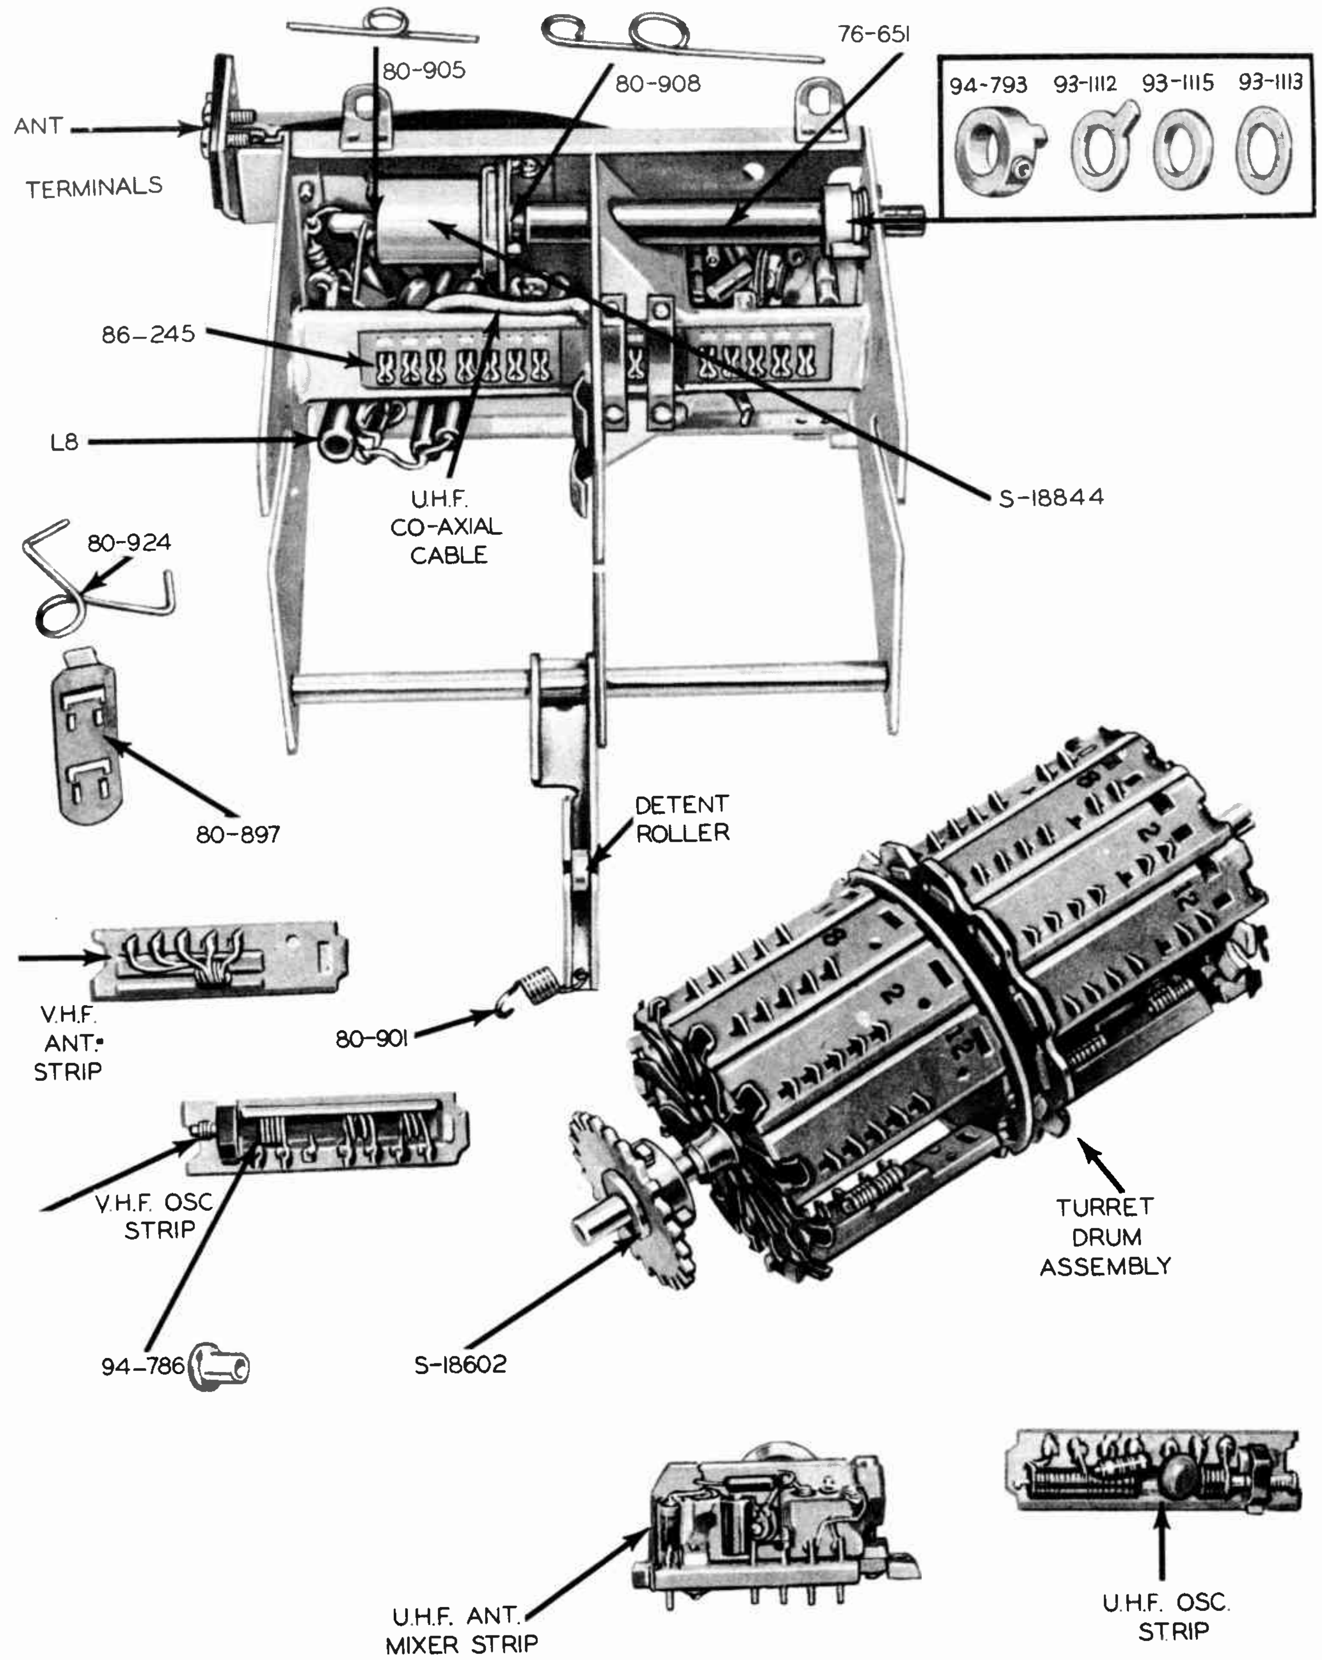

Fig. 14 Exploded View of Turret Tuner.

the 2nd IF tube thus the 2nd IF tube is also controlled indirectly by the AGC.

Under weak signal conditions, the output of the AGC tube at point "E" is approximately 8 volts positive. This positive voltage however, does not reach the grid of the 6BK7A because of the 2.2 megohm resistor. Actually the grid of this tube is slightly negative because of contact potential developed as a result of the high resistance in its grid circuit (2.2 megohms). The 8 volts positive voltage however, is applied to the grid of the 6CB6 1st IF but because the cathode is 9.3 volts positive the grid is actually 1.3 volts negative with respect to its cathode and AGC control of the IF results under weak signal conditions.

When the receiver is used with normal signals, the signal voltage applied to the grid of the AGC tube will increase and as a result the output of the AGC tube will become 4 to 5 volts negative. This negative voltage will be applied to the 6BK7A through the 2.2 megohm resistor thus both the RF and IF stages will then be controlled by the AGC.

With the application of a negative AGC voltage to the 6BK7A tube under normal signal conditions, the noise figure of the tuner will not be optimized as under weak signal conditions, however, this is not a consideration with normal signal levels.

AGC ADJUSTMENTS

IMPORTANT: THE AGC CONTROL CANNOT BE USED IN ANY WAY TO IMPROVE THE RECEIVER SENSITIVITY. The sole function of this control is to set the level applied to the video amplifier (12BY7) tube so that the output of this tube is approximately 100 volts peak (100% modulated video signal) for application to the picture tube cathode.

The adjustment can also be made by connecting a calibrated oscilloscope through a 10K isolation resistor, to test point "D" (See Fig.16) and, while receiving the strongest TV signal adjust the AGC delay control for 2.5 volts (2.75V on 19L26 and 28 models) peak output.

Satisfactory adjustment can also be made by observing the picture and slowly turning the AGC delay control from its maximum clockwise position, counterclockwise until a point is reached where the picture distorts and buzz is heard in the sound. The control should then be turned slowly clockwise and set at a point comfortably below this level of intercarrier buzz, picture distortion and improper sync.

CAUTION: Misadjustment of the AGC delay control can result in a washed-out picture, distorted picture, buzz in sound OR COMPLETE LOSS OF PICTURE AND SOUND.

ALIGNMENT

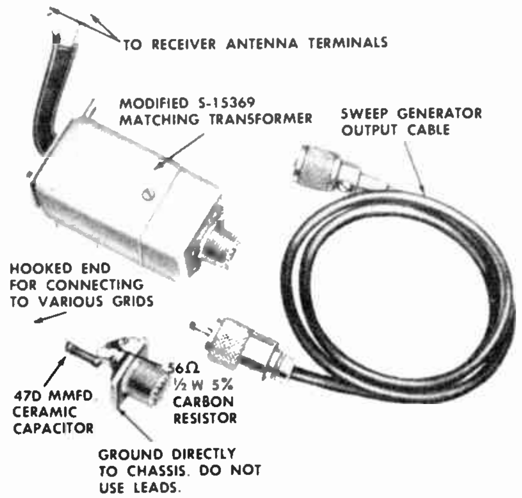

Fig. 15 IF-RF Alignment Fixtures

A suitable sweep generator in conjunction with an accurate marker must be used for alignment work. It is very important to have the sweep generator output cable properly terminated and to check whether or not its attenuator is reactive. If the attenuator is reactive or if the output cable is improperly terminated, correct alignment cannot be made since the degree of attenuation then may change the shape as well as the amplitude of the response curve. The position of the attenuator should only vary the amplitude and not the shape of the response curve.

CALIBRATING THE OSCILLOSCOPE

When aligning the RF and IF stages of the receiver, it is necessary to measure detector peak output.

This may be done with a voltage calibrator used in conjunction with an oscilloscope. If a calibrator is not available, the oscilloscope can be calibrated with a known DC voltage. To make the calibration, connect the ground lead of the vertical input cable to the negative side of a 3 volt battery supply. Turn the horizontal gain control fully counterclockwise. With the "hot" lead, make a momentary contact to the positive connection on the battery and observe the instantaneous spot deflection on the screen. Discharge the scope input capacitor by shorting out the leads and repeat the procedure, each time readjusting the scope vertical gain until the spot deflects 3 large divisions on the screen. Each division then represents 1 volt peak. The position of the vertical gain control should be marked for future reference.

VIDEO IF ALIGNMENT

1. Connect the negative lead of a 2 volt battery supply to terminal "E" (Fig.36) and the positive lead to chassis. The bias supply should be made variable so that it can be varied from negative 3 volts to positive 3 volts. Keep the supply leads short.

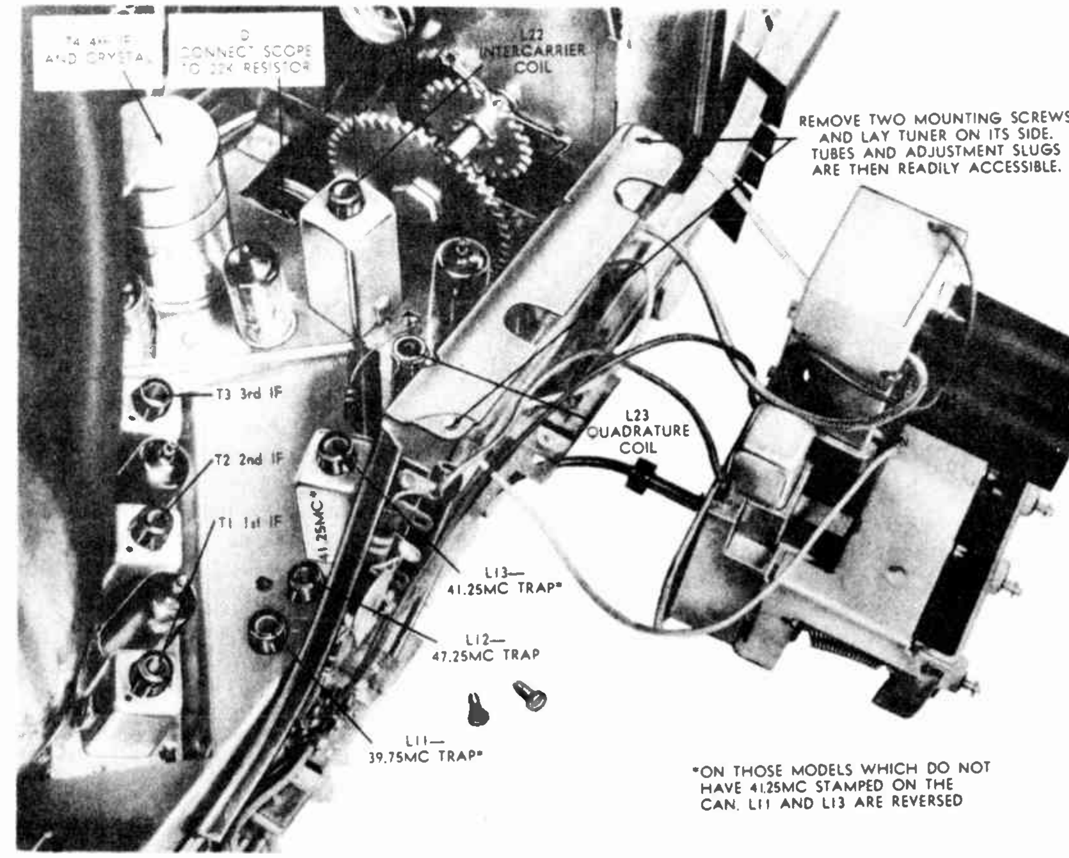

Fig. 16 IF Alignment Guide.

2. Connect the calibrated oscilloscope through a 10,000 ohm isolation resistor between terminal "D" and chassis. The sweep generator input to the receiver should be adjusted for 3 volts peak to peak detector output. Do not exceed this output level during any of the adjustments.

3. Feed the output from the sweep generator through the special termination unit shown in Fig. 15 to point "C" (Pin 1 of 6CB6, 3rd IF). Adjust the generator until a pattern similar to Fig. 17 is obtained.

4. Set the Marker Generator to 45.75 Mc and alternately adjust the top and bottom slugs of the 4th IF transformer for maximum gain with the 41.25 Mc and 45.75 Mc markers positioned as shown in fig. 17

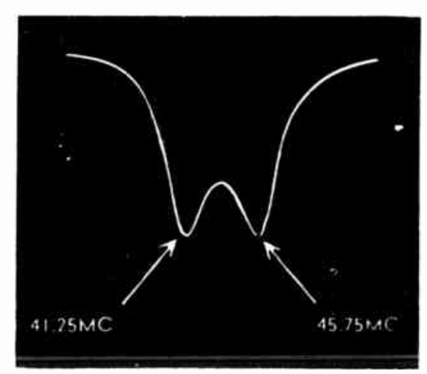

Fig. 17 4th IF Response.

If the correct response curve cannot be obtained in this step, check the position of the two slugs to see that they are entering their respective coils from the opposite ends of the coil form. The position of the slugs near the center of the coils may change the coefficient of coupling, making correct alignment difficult if not impossible.

5. Connect the sweep generator cable to terminal "A" (Mixer Grid). In this step it may be necessary to temporarily reduce the bias to zero or even to go to a slightly positive voltage in order to see the highly attenuated trap slots with the oscilloscope vertical gain near maximum.

6. Adjust the 47.25 Mc, 41.25 Mc and 39.75 Mc traps for minimum marker amplitude (See Fig.18 . It can

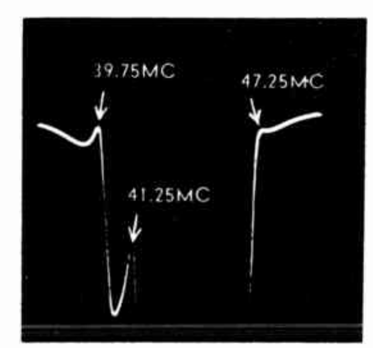

Fig. 18 Exploded View of Trap.

be seen that maximum oscilloscope gain has been used and as a result the top of the response curve has been "run off" the oscilloscope screen in order to see a "blow-up" of the trap slots.

7. Readjust the bias to -2 volts and set the oscilloscope vertical gain to the calibrated position. Adjust the sweep generator for a 3 volt peak to peak output from the video detector.

8. With the test equipment set up as in Step 7, alternately adjust the 2nd IF, 3rd IF, 1st IF and the converter plate coil until an overall response curve similar to Fig19 is obtained. It will be found that the 2nd IF affects the low side (42.75 Mc) and the 3rd IF the high side of the response curve. If the proper response curve cannot be obtained by an alternate adjustment of the above trimmers, it may be necessary to retouch the 4th IF transformer.

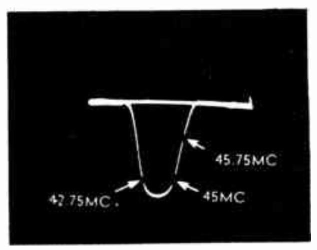

Fig. 19 Overall IF Response.

TURRET TUNER AND RF CHASSIS ALIGNMENT

The RF chassis adjustments have been made at the factory and normally do not require readjustment in the field unless tampered with. If adjustment becomes necessary check the overall IF response and proceed as follows:

1. Temporarily ground the turret AGC by connecting a jumper between the AGC bus (yellow lead) and chassis.

2. Connect the calibrated oscilloscope to the feed through terminal "H" (Fig. 1) through a 10K isolation resistor. This terminal is the screen of the 6U8 mixer.

3. Use the S-15369 matching transformer (Fig. 15) and feed the output from the sweep generator to the antenna terminals of the receiver.

4. Turn the channel selector to Channel 4 and adjust the sweep generator until a response curve somewhat similar to Fig. 20 is obtained.

5. Study Fig. 1 and adjust the converter grid capacitor (C9), the RF plate capacitor (C7) and the RF grid capacitor (C3) until a response curve similar to Fig. 20 is obtained.

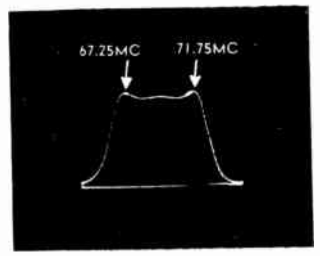

Fig. 20 Channel 4 RF Response.

6. Turn the channel selector to Channel 11 and adjust the sweep generator until a response somewhat similar to Fig. 21 is obtained. Adjust L5 and L6 to obtain symmetry. If the band pass is too great or too narrow also adjust L7.

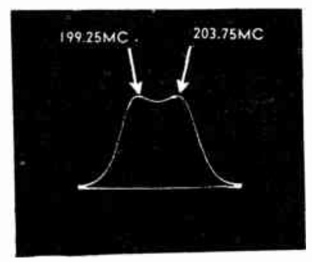

Fig. 21 Channel 11 RF Response.

7. Repeat steps 5 and 6 until the best overall symmetry is obtained. REMOVE AGC JUMPER.

MASTER OSCILLATOR ALIGNMENT

The master oscillator adjustment is to be made only if resonance cannot be obtained with the strip oscillator adjustment wrench with the fine tuning control in its center position, and after it has been determined that the channel strip itself is not at fault.

If channels 2 through 6 can be made to resonate with the bull's-eye adjustment at the rear of the turret and the high channels do not resonate, a slight readjustment of the oscillator inductance L10 (See Fig. 1) may be necessary to affect resonance on the high channels.

If the fine tuning capacitor is replaced, proper alignment of the fine tuning mechanism can be made as follows:

1. Remove the turret from the chassis (See Page 13).

2. Turn the tuning capacitor shaft until the allen head screw, as viewed through the U-shaped opening, is straight up. NOTE: On those models with a paint mark on the shaft see page 18.

3. Insert an allen wrench through the opening and loosen the screw. Leave the allen wrench in, partially slide out the shaft and tape it to prevent the stop mechanism from falling out or being turned out of position.

4. The tuning capacitor bracket can be removed by removing the four self-tapping screws which hold it in place. Unsolder the tuning capacitor lead replace capacitor and re-assemble bracket on the RF chassis. DO NOT TIGHTEN ALLEN HEAD SCREW.

5. Use a sweep generator on Channel 4 or tune in a station on the lowest available channel and turn the turret shaft until resonance is obtained. This should be approximately 2-1/4 turns from either end of the fine tuning capacitor range. Turn the collar until the allen head screw is straight up as viewed through the opening and tighten screw.

6. Check the fine tuning knob to see that it is in the center of its mechanical range.

7. Insert the dial cord pulley over the turret shaft and tighten set screw. If the set screw is in a position where it is difficult to tighten, the fine tuning shaft can be held in place and the pulley can be made to slip the dial cord until the pulley is in a position where the set screw is readily accessible.

8. It may be necessary to readjust the oscillator inductance L10 (See Fig. 1) for proper bull's-eye operation on the high channels (7-13).

NOTE: On some models, the mechanism described above has been replaced by a tuning capacitor which has a built-in stop. Proper mechanical alignment is indicated when the paint mark, as viewed through the U-shaped opening in the turret, is straight up when the fine tuning knob is in the position as shown in Figure 2 If adjustment becomes necessary, proceed as follows:

1. Loosen (do not remove) the hex head set screw in the turret dial cord pulley assembly.

2. Slide the pulley towards the front of the chassis until it clears the fine tuning capacitor shaft.

3. Turn the fine tuning capacitor shaft fully counterclockwise then rotate 1/2 turn clockwise. At this point the paint mark on the shaft should be straight up as viewed through the U shaped opening.

4. See that the fine tuning knob is in the position shown in Figure 2 , replace the drive pulley on the tuning capacitor shaft and tighten locknut.

SOUND ALIGNMENT

Proper alignment of the 4.5 Mc intercarrier sound channel can only be obtained if the signal to the receiver antenna terminals is reduced to a level below the limiting point of the 6BN6 Gated Beam Detector. This level can be easily identified by the "hiss" which then accompanies the sound.

Various methods may be used to reduce the signal level, however, it is recommended that a step attenuator similar to the S-17203 unit be used for most satisfactory results. To prevent leakage, certain precautions must be taken when connections are made. Use as short a lead as possible between the attenuator and receiver antenna terminals and approximately 6 feet of 300 ohm shielded line between the antenna transmission line and the attenuator. The shield from the transmission line should be connected to the attenuator and the attenuator itself grounded to the TV chassis under test.

After the connections have been made, proceed as follows:

1. Tune in a tone modulated TV signal and adjust the step attenuator until the signal is reduced to a level where "hiss" is heard with the sound.

2. Adjust the sound take-off coil L19 (top and bottom slugs), intercarrier coil L22, quadrature coil L23 and buzz control R39 for the cleanest sound and minimum buzz. It must be remembered that any of these adjustments may cause the "hiss" to disappear and further reduction of the signal will be necessary so that the "hiss" does not disappear during alignment.

If intercarrier buzz is in evidence, after all normal sound adjustments have been made, the cause may be attributed to one or more of the following:

1. Improper adjustment of the AGC delay control.

2. Defective 6AU6 sound limiter.

3. Extremely high signal levels which require attenuation in the antenna circuit.

4. Transmitter over modulation.

ADJUSTMENT OF THE S19670 CONTINUOUS TUNER

The Zenith continuous tuner has been aligned at the factory with precision test equipment. Adjustments should not be attempted in the field unless adequate test equipment is available. Any attempt to peak one particular channel will cause serious degradation of the other channels.

In aligning the UHF continuous tuner, it may be difficult to obtain a UHF marker generator for alignment. If a marker generator is unavailable, it is possible to use a TV signal or another receiver, equipped with a S-19670 tuner, which is known to be calibrated, as a marker. If the latter method is used, all that is necessary is to loosely couple the two tuners (operate them close together) to inject a marker. The oscillator in the UHF tuner operates fundamental plus the IF frequency, i.e., when the tuner is tuned to channel 14, its oscillator frequency is 517 MC. When the tuner is on channel 83, its oscillator operates on 931 MC. Therefore, a marker source from 517 to 931 MC for all channels above 22 is available. In practical use, the dial of the signal source tuner is set to channel 14 when an oscillator frequency for channel 22 is needed.

i.e., subtract 8 channels for the oscillator frequency required. To obtain a channel 83 marker, set the source receiver to channel 75.

If alignment becomes necessary, the 6BK7A and 6AU6 40 MC IF stages are to be aligned first before the UHF RF alignment is attempted. The complete IF-RF alignment is as follows:

1. Switch the receiver to the UHF position. (The UHF tuning knob is also used to actuate the UHF-VHF change-over switch. When the knob is pushed in, the receiver is in VHF position and when pulled out to the stop, in the UHF position).

2. Set up the test equipment as outlined under Video IF alignment on page 15.

3. Connect the signal generator to test point "X" (See Figure 25) and adjust L9 to obtain a response curve similar to the overall response as in Figure 19. Use only enough signal to obtain 3 volts peak detector output.

4. Through the matching network as shown in Figure 22 couple the tuner to the sweep generator. The

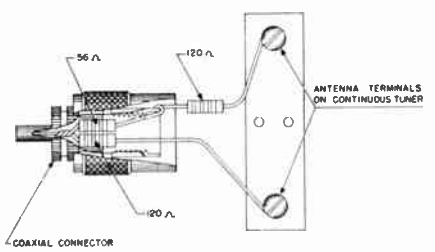

Fig. 22 Matching Network Required for UHF alignment.

matching network can be made by using a coaxial connector (without cable) and the necessary resistors. The 300 Ohm miniature line, which is part of the tuner assembly, is long enough (when the UHF antenna terminal strip is removed from chassis) for connecting directly to the terminating network when the network is plugged directly into the sweep generator.

5. Set the UHF tuning knob to channel 54. When this is done, the rocker arm on the tuner should be in the horizontal position. If the rocker arm is not horizontal loosen the set screw (See Figure 24) and adjust tuner shaft so that arm is horizontal with the indicator on channel 54.

6. Do not adjust the oscillator unless it is known that it is off calibration by more than 3 channels as checked by receiving a UHF station or by use of a UHF marker generator.

7. Adjust sweep generator to obtain a band pass response on channel 54 and set C3 so that the marker (osc.) falls at the 50% point on the response curve (See Figure 23). When adjusting the oscillator, the image (weaker response) and the fundamental will appear. The response towards the counter-clockwise position of C3 in the proper response.

8. Adjust C2 (mixer), C1 (ant.) and C8 (IF) for maximum amplitude of the response curve using just enough

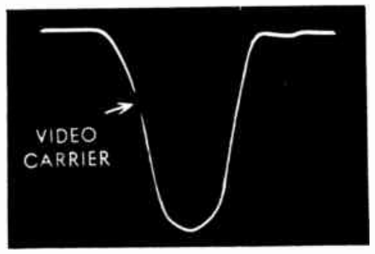

Fig. 23 UHF Response Curve.

signal to obtain 3 volt detector output. Adjustment C8 is very broad, however, it has an important bearing on noise figure.

9. Turn the UHF tuning indicator to channel 14 (or 22 if markers are not available). Adjust sweep to obtain response as in step 8 and check calibration. If the oscillator is off more than 3 channels, use a pair of slip joint pliers and adjust the oscillator travel adjustment to scale. CAUTION when adjusting the travel adjustments, it is possible to move the rocker arm out of its bearing and get an incorrect setting. Check to see that the rocker arm remains seated at all times. After the oscillator is adjusted, set the mixer and antenna travel adjustments for maximum response.

10. Turn the UHF tuning indicator to channel 83 and check for calibration as on 54 and 14. Set C13 to scale and adjust C11 and C12 for maximum response.

11. Check calibration on channels 14, 54 and 83. It may be necessary to repeat steps 7, 8, 9 and 10 to obtain best overall performance.

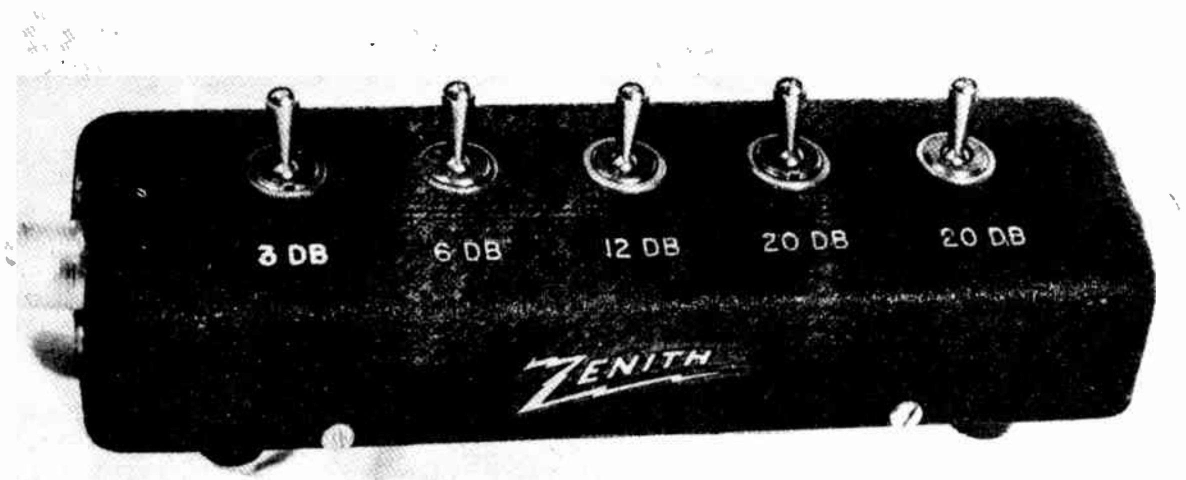

Fig. 30 S-17203 Zenith Step Attenuator.

The Zenith Diplexer is a high quality matching unit which makes it possible to use a single, low-loss tubular transmission line, part number 91-1514, for a combination UHF-VHF antenna system. (Certain tubular lines do not have double wall construction and cannot be sealed in the manner outlined below.)

The finest low-loss materials are employed in the Zenith Diplexer. Plexiglass insulation is used at the UHF connection points to prevent moisture absorption. The capacitors in the filter portions of the Diplexer are of the highest quality ceramics and the inductances are especially treated for humidity.

The Diplexer has three pairs of terminals.

a. The pair marked "VHF" are to be connected to the VHF antenna.

b. The middle pair marked "Output" are to be connected to the transmission line leading to the TV receiver.

c. The pair marked "UHF" are for the UHF antenna connection.

INSTALLATION PROCEDURE

Transmission lines for UHF frequencies must be of the low-loss tubular type. The flat ribbon line such as is used on VHF seriously attenuates the UHF signals when wet or contaminated by foreign material, such as soot, etc.

When installing a Diplexer, it is of utmost importance to seal the 300 ohm tubular line to prevent water from entering the hollow interior of the tube. In order to do this, the tube must not be cut or punctured for its entire length from the UHF antenna to the TV receiver. It is necessary, however, to pull the wires out to make the Diplexer connections as illustrated. To do this without puncturing the tube, proceed as follows:

1. Approximately 6 feet (length determined by distance between Diplexer and UHF antenna terminals) from one end of the tubular line, slice off one inch of ridge on both sides until the wires are exposed. Use extreme care not to cut any of the strands when slicing off the ridge. The knife should not be too sharp.

2. Insert a pointed tool and pull up the center of each wire and cut it in half.

3. Pull out the four ends and solder to the connecting

terminals as shown in the illustration. When the wires are pulled out in this manner, the inner wall is not punctured and the cable remains water tight.

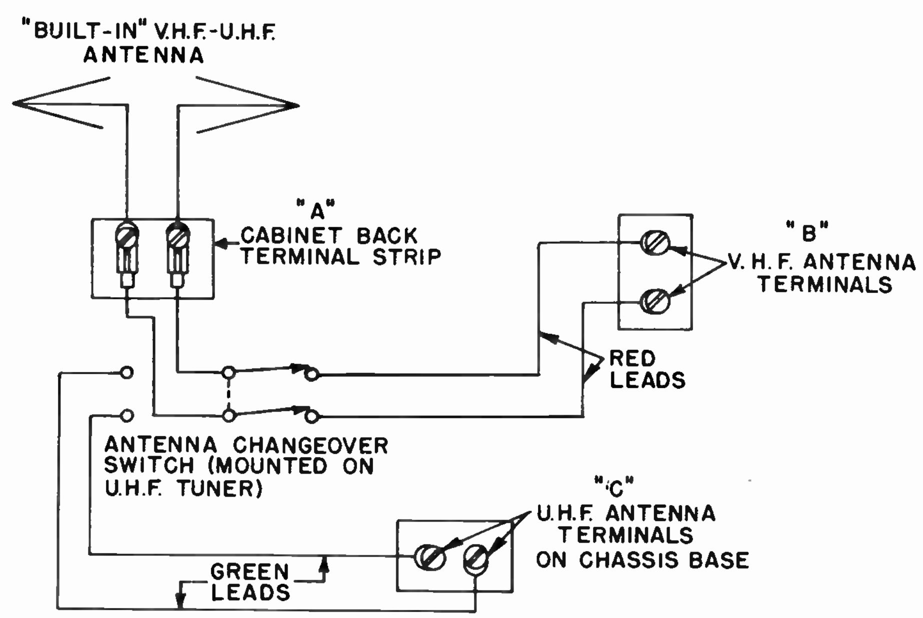
4. Affix the two plastic clamps to secure the line.

5. Mount the Diplexer on the mast FACE DOWN to prevent rain or snow from collecting on the plexiglass insulator.

6. Cut off excess tubular line and prepare the line for making connections to the UHF antenna. To do this, refer to step 1 and peel off approximately two inches of wire from each side, at the end of the cable. Cut off the tube so that it extends one inch. With a pair of long nose pliers, grasp the tube and flatten it. While holding the line flat, run a hot iron over the end until the tube is permanently sealed. Connect the leads to the terminals of the UHF antenna.

7. Run a piece of flat 300 ohm line from the VHF terminals on the Diplexer to the VHF antenna. Secure connections.

8. When running the line from the Diplexer to the receiver, use stand-off insulators and use extreme care to keep the line as far from metal pipes, gutters, etc. as is practical. Outside, at the point of entrance to the house, cut off the tubular line and splice on a flat piece of 300 ohm line from this point to receiver. Leave the tubular line open and facing downward so that any water which results from condensation can run out.



UHF-VHF Antenna Connections.

ANTENNA CONNECTIONS

On TV receivers incorporating the UHF continuous tuner there are three pairs of terminals at the rear, labeled A, B and C which enable the receiver to operate with any one of the following antenna combinations:

1. USE OF THE BUILT-IN ANTENNA FOR VHF AND UHF

See illustration for connections. The receiver is shipped from the factory connected in this manner.

2. USE OF A COMBINED VHF AND UHF ANTENNA SYSTEM WITH A ZENITH DIPLEXER AND A SINGLE TRANSMISSION LINE

Disconnect the built-in antenna from terminals "A" and connect the combined UHF-VHF antenna transmission line at this point. If you are near the station, it may be found that an existing VHF antenna works satisfactorily on UHF and should be connected in this same manner.

3. USING THE BUILT IN ANTENNA FOR VHF IN CONJUNCTION WITH EXTERNAL UHF ANTENNA

Connections are made as in illustration. Disconnect the green leads and connect the UHF antenna to terminal "C".

4. USE OF THE BUILT-IN ANTENNA FOR VHF IN CONJUNCTION WITH AN EXTERNAL VHF ANTENNA

See illustration. Disconnect red leads and connect VHF antenna to terminals "B"

5. USE OF SEPARATE EXTERNAL ANTENNAS FOR VHF AND UHF

Disconnect both the red and green leads and connect the external VHF antenna to terminals "B" and the external UHF antenna to terminals "C". This type of connection is recommended in fringe areas since the UHF-VHF changeover switch (which introduces a slight loss on some channels) is by-passed.

DIAL CORD DRIVE

RADIO CH. 8L20

The 8L20 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and one stage on the AM Band. There is one stage of RF amplification on all Bands.

When adjustments are made on the 8L20 chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground and if there is any indication of voltage, reverse the plug before handling the set.

FM RF Alignment: The tunning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

AM and FM IF Alignment: The AM and FM IF transformers in this receiver are of the new permeability tuned type. The advantage of an IF transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these IF transformers the tuning wrench 68-19 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

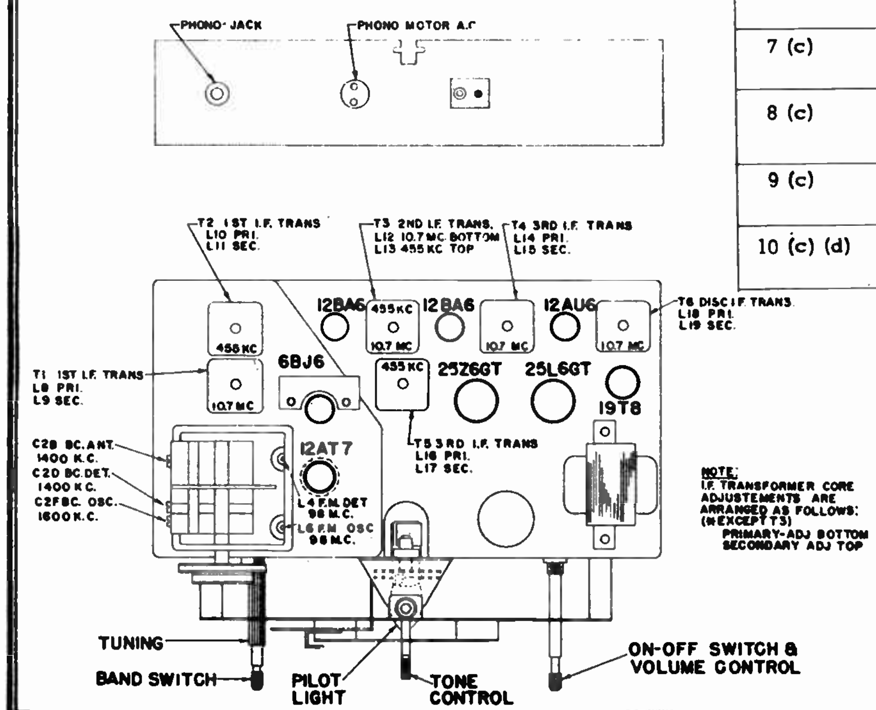
FM IF Alignment: Because ot the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator To	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 2 12AT7 Converter	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	L10, 11, 13, 16 & 17	Align I.F. channel for maximum output.
2	2 turns loosely cpld. to wavemagnet		1600 Kc. Modulated	BC	1600 Kc.	C2F	Set oscillator to dial scale.
3	2 turns loosely cpld. to wavemagnet		1400 Modulated	BC	1400 Kc.	C2D, C2B	Align detector and antenna stage.
4 (a)	Pin 1 (grid) on 12AU6 Limiter.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L18 coil slug Primary discr.	Align primary of discriminator for maximum reading.
5 (b)	Pin 1 (grid) on 12AU6 limiter	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L19 coil slug sec. of discr.	Adjust secondary ot discriminator for zero reading
6 (c)	Pin 1 (grid) on 12BA6 2nd I.F.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L14 and L15 Pri. & Sec. of 3rd IF trans.	Align 3rd. IF transformer for maximum reading.
7 (c)	Pin 1 (grid) on 12BA6 1st IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		Adjust L12 for maximum reading.	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 2 (grid) on 12AT7 converter tube socket.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L8 and L9 Prim and Sec. of 1st IF transformer	Align 1st IF transformer for maximum reading.
9 (c)	Antenna Post FM (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L6 Osc. Coil Slug.	Set Oscillator to dial scale.
10 (c) (d)	Antenna Post FM (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L4 Det. Coil Slug	Align det. stage to maximum reading.

TUBE AND TRIMMER LOCATION



IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer ir replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (half discriminator load).

(b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot. iron to the cement.

NOTES
ALL VOLTAGES MEASURED FROM CHASSIS TO POINTS INDICATED
ALL VOLTAGES ARE DC UNLESS OTHERWISE SPECIFIED
ALL DC VOLTAGES TO BE MEASURED WITH VACUUM TUBE VOLTMETER HAVING 11 MEGOHM INPUT RESISTANCE.
ALL VOLTAGE MEASUREMENTS TO BE MADE WITH NO SIGNAL PRESENT NORMAL SETTING OF CONTROLS & CHANNEL SELECTOR SET TO 2 UNLESS OTHERWISE SPECIFIED
ALL CONDENSER VALUES IN MICROFARADS UNLESS OTHERWISE SPECIFIED
ALL RESISTORS ± 20% TOLERANCE UNLESS OTHERWISE SPECIFIED
ALL CONDENSER CAPACITY TOLERANCE ±20% UNLESS OTHERWISE SPECIFIED
RESISTANCE MEASUREMENTS SHOWN WITH COILS DISCONNECTED FROM CIRCUIT
COIL RESISTANCES NOT GIVEN ARE UNDER ONE OHM
CATHODE RAY TUBE 2ND ANODE VOLTAGE TO BE MEASURED WITH ELECTROSTATIC OR 20K MIN OHM PER VOLT HIGH VOLTAGE METER
ARROWS ON POTENTIOMETERS INDICATE CLOCKWISE ROTATION
Ⓐ ALIGNMENT POINTS → CIRCLED ALPHABETS INDICATE ALIGNMENT AND TEST POINTS

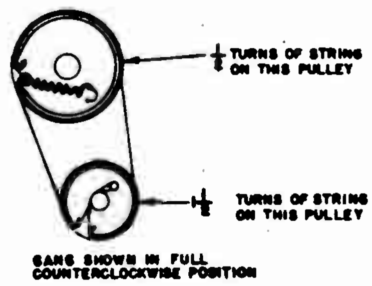
TUBE, TRIMMER LOCATION, DIAL CABLE DRAWING AND DETAILED VIEW OF I. F. TRANSFORMERS.



DIAL CORD DRIVE

The I.F. transformers incorporated in this reveiver are of the new permeability tuned type. The advantage of an I.F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I.F. transformers the tuning wrench 68-19 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

ALIGNMENT PROCEDURE

OPERATION	CONNECT OSCILLATOR TO	DUMMY ANTENNA	INPUT SIG. FREQUENCY	SET DIAL AT	TRIMMERS	PURPOSE
1	Converter Grid	.5 Mfd.	455 Kc.	600 Kc.	3, 4, 5, 6	For I.F. Alignment
2	Single Turn Loosely Coupled to Wave Magnet	--	1620 Kc.	1620 Kc.	C1D	Set Oscillator to Dial Scale.
3		--	1400 Kc.	1400 Kc.	C1B	Antenna Alignment

ALIGNMENT PROCEDURE

Operation	Connect Oscillator To	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 2 12AT7 Converter	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	L14, 15, 18, 19, 22 & 23	Align I. F. channel for maximum output.
2	2 turns loosely cpld. to wavemagnet		1600 Kc. Modulated	BC	1600 Kc.	C2E	Set oscillator to dial scale.
3	2 turns loosely cpld. to wavemagnet		1400 Kc. Modulated	BC	1400 Kc.	C2C, C2B	Align detector and antenna stage.
4 (a)	Pin 1 grid on 6AU6 limiter	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L 24	Align primary of discriminator for maximum reading.
5 (b)	Pin 1 (grid) on 6AU6 limiter	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L 25	Adjust secondary of discriminator for zero reading.
6 (c)	Pin 1 (grid) on 6 BA6 2nd. IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L 20, 21	Align 3rd. IF transformer for Maximum reading.
7 (c)	Pin 1 (grid) on 6BA6 1st. IF.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L16, 17	Align 2nd IF transformer for maximum reading.
8 (c)	Pin 2 (grid) on 12AT7 converter	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L12, 13	Align 1st. IF transformer for maximum reading.
9 (c)	Antenna Post FM (Re-	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L8 Osc. Coil Slug.	Set Oscillator to dial scale.
10 (c) (d)	move line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L5 Det. Coil Slug	Align det. stage to maximum reading.

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

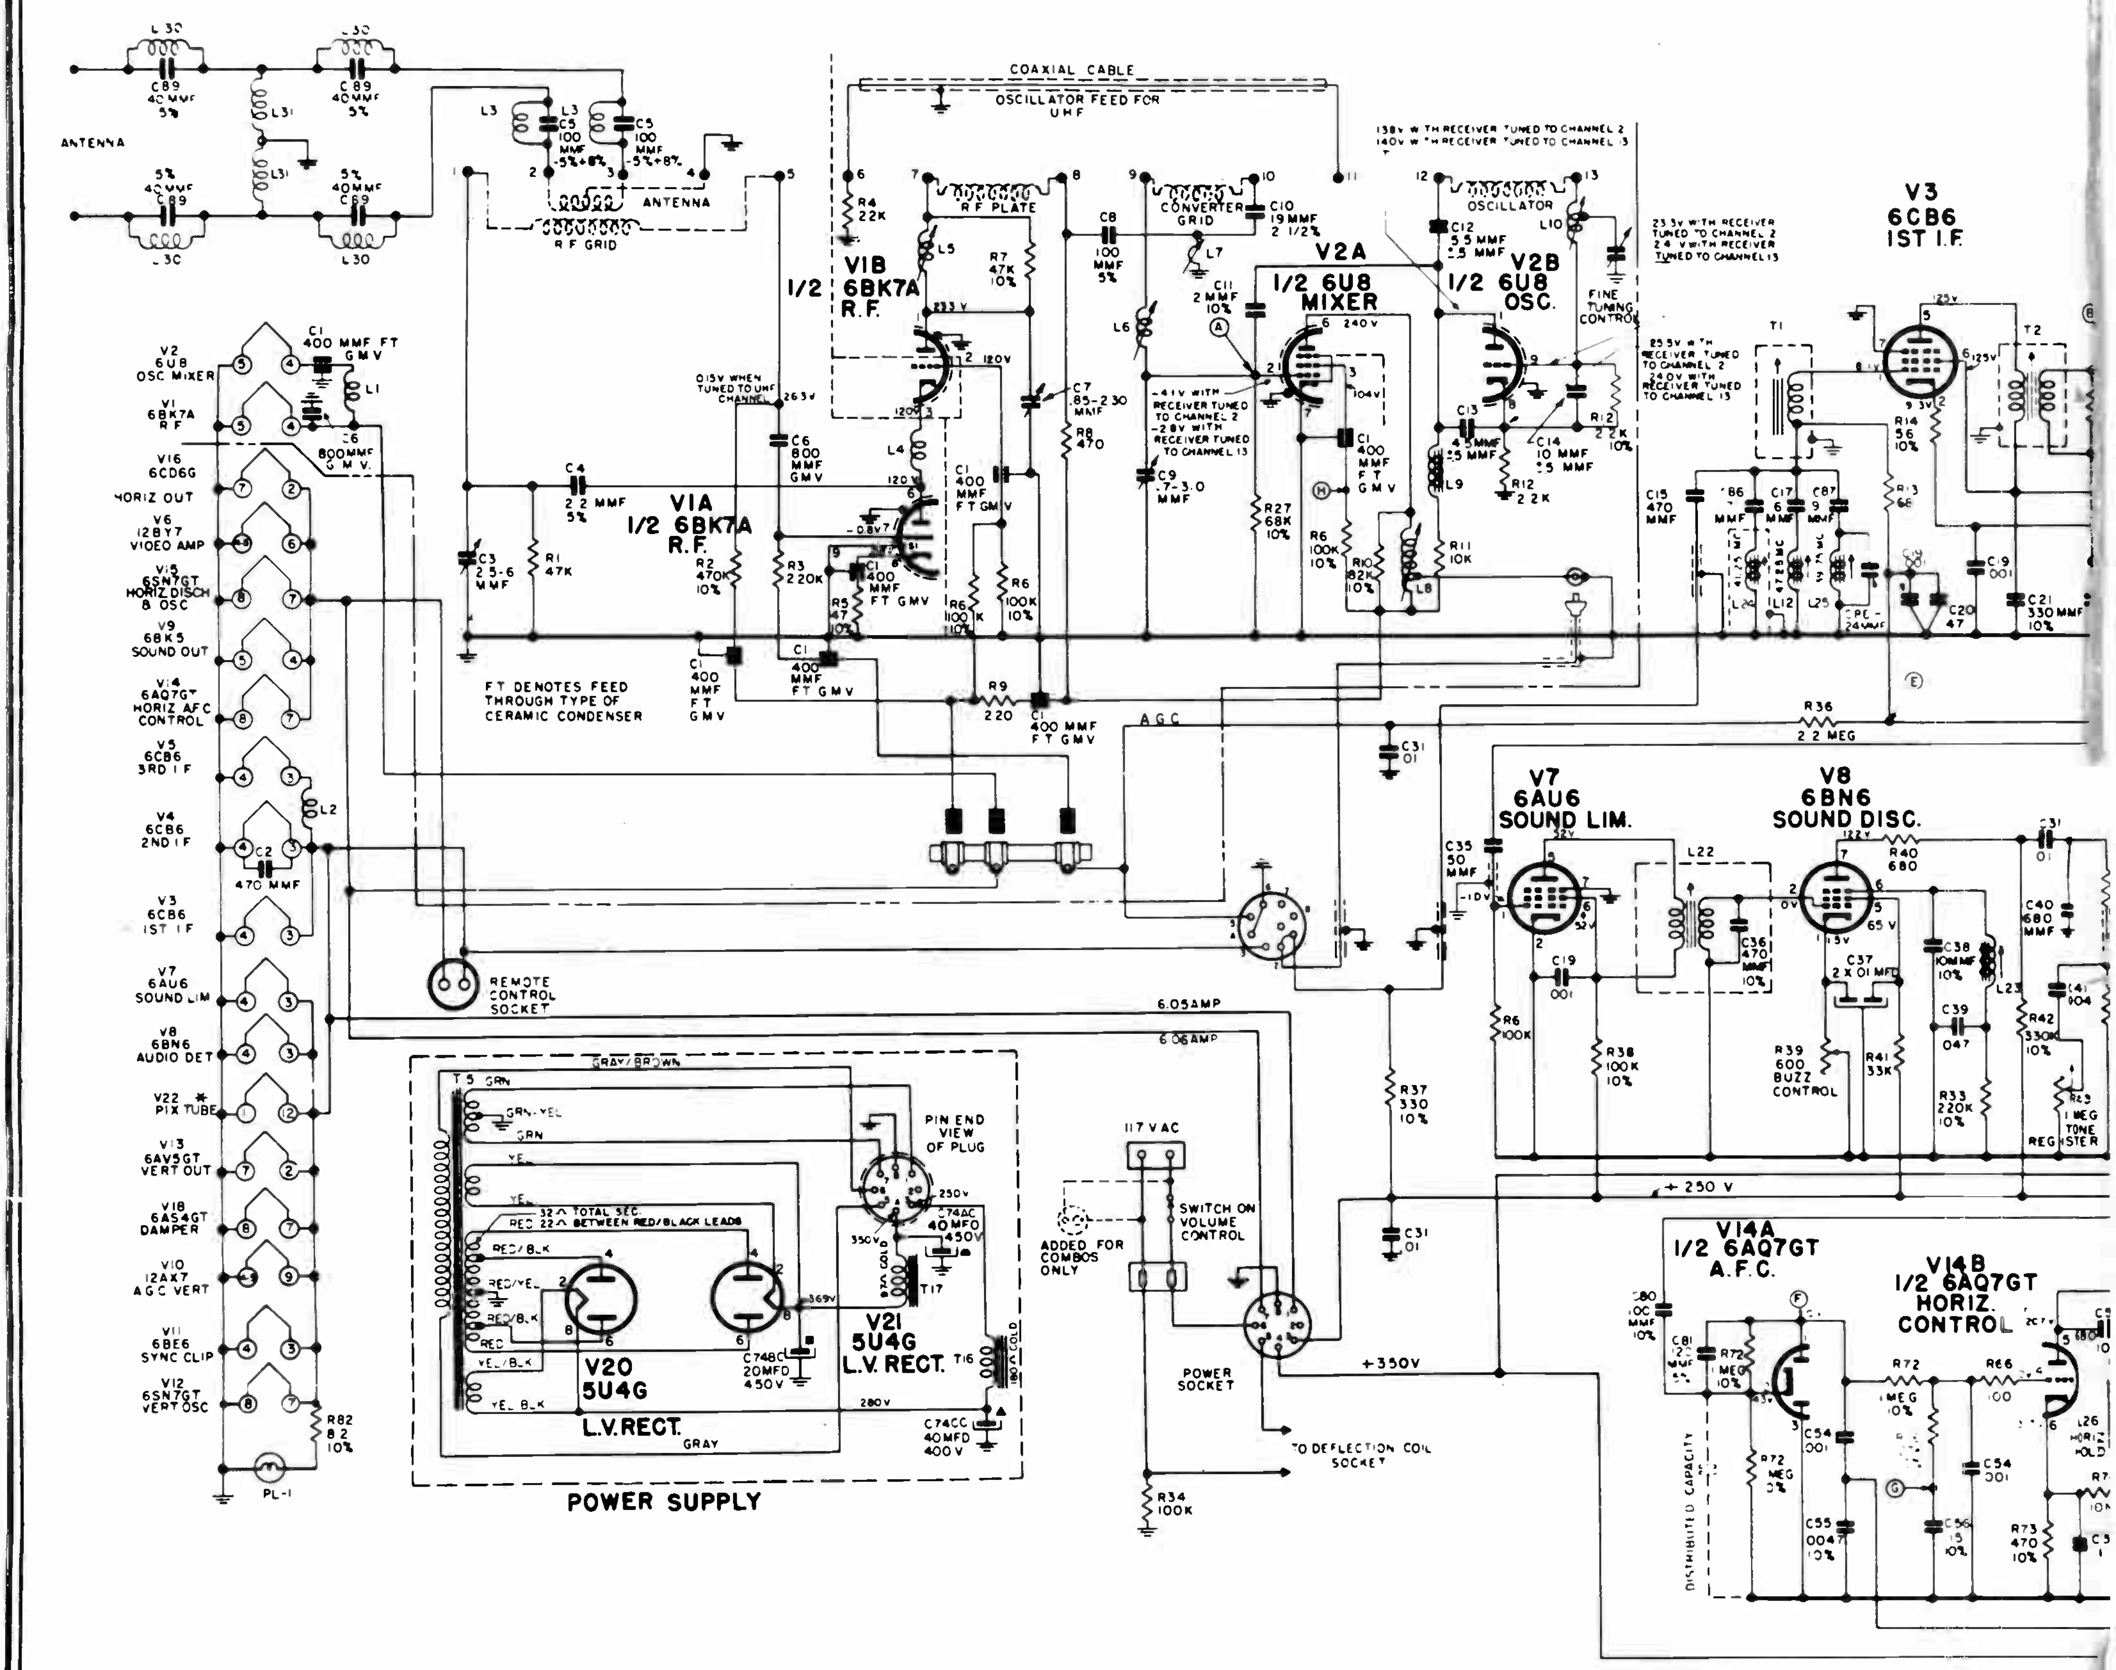
This position of an oscillation will sometimes vary with different cartridges, and in this case readjustment of C16 must be made.

(a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (Half discriminator load).

(b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (Full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot iron to the cement.



Radio Ch. 10L20

The 10L20 chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and two stages on the AM Band. There is one stage of RF amplification on all bands.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

AM and FM Alignment: The AM and FM IF transformers in this receiver are of the new permeability tuned type. The advantage of an IF transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these IF transformers the tuning wrench 68-19 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel.

If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for a zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.

The K-3 series of Zenith television receivers are similar to the "K" series

The S-18770 turret tuner as originally used in the "K" series will also be used in early production K-3 receivers. Later production K-3 receivers will utilize the S-19840 tuner. The two tuners are directly interchangeable as complete units, however the VHF channel strips are not. The S-19840 tuner will have the part number stamped in its frame and the channel strips will have the suffix letter "A" stamped after the channel number.

Although the alignment procedure remains the same, a marked improvement in sound performance has been attained in the K-3 series by the utilization of new, more sharply tuned sound IF transformers.

In all K-3 receivers and in late production "K" receivers, cathode trap L13, has been omitted and the 41.25 Mc sound trap L9 moved from the rear of the chassis to the position originally occupied by L13. Improvements in intercarrier sound transformer design obviates the need for the cathode trap. In aligning receivers in which cathode trap L13 has been omitted, follow the procedure as outlined omitting steps 11 and 12.

In the 21K20-3 chassis, the 6AH4Gt damper tube replaced the 6V3 damper originally used in the 21K20 chassis.

A three position tap is used for focusing the picture tube in the 19K20-3, 19K22-3, 19K23-3, and the 19K24-3 chassis. The 21K20-3 chassis utilizes PM focusing and centering.

"K" SERIES SERVICE DATA

This is the latest service data on the "K" series TV receivers. In using the information, it must be remembered that the suggestions offered are to be used only in those instances where the particular problem arises. Wholesale modifications in unaffected areas may lead to further difficulties.

21K20Z CHASSIS

This chassis is the same as the 21K20 chassis, except for the utilization of a 21EP4A magnetically focused picture tube, and the S-19961 PM focus and centering assembly. This assembly is similar to, and adjusted in the same way, as the unit previously used in the 20H20 chassis.

PROPER ADJUSTMENT OF CONTRAST CONTROL

The "K" series receivers have been designed with considerable contrast reserve which, when properly used, results in an outstanding picture. However, if the contrast setting is advanced too far in noisy areas, more snow and noise will be in evidence than in a receiver having limited contrast range. Therefore, when making comparison checks, always adjust both receivers to the same contrast level.

ARCING IN NECK OF 21" PICTURE TUBES

This condition is usually caused by loose particles inside the picture tube shifting into the gun structure, causing high voltage breakdown. Arcing does not necessarily indicate that the picture tube is defective, as in many instances the "short" burns itself out. There have been many cases where the "short" was cleared by removing the picture tube from the chassis, holding it face down and gently tapping the bell. The picture tube should only be replaced if it has been determined that the "short" cannot be cleared in the afore mentioned manner.

TEMPORARY CHANGE IN VERTICAL HOLD RANGE CONTROL CIRCUIT

Several thousand "K" chassis have been shipped in which the vertical hold range control has been left disconnected, and in its place a single 2200 or 3300 ohm resistor, or a parallel combination of these two substituted. The reason the controls were left unused is that they were found to be sub-standard after being riveted to the chassis.

PICTURE SHRINKS HORIZONTALLY

This condition may be caused by an increase in value of the 150K resistor in the plate (pin 2) circuit of the 6SN7GT horizontal discharge tube. Replace with a 150K 1W resistor.

HORIZONTAL PULL ON TOP OF RASTER

With certain types of transmitted signals, a definite pull can be noticed on top of the raster. To correct this condition, replace the .01 mfd. coupling capacitor (C44 in the grid circuit of the 6BE6 sync clipper) with a .0022 mfd. capacitor.

HORIZONTAL PULLING AND INSTABILITY ON COMMUNITY ANTENNA SYSTEMS

On some community distribution systems, considerable hum may be introduced into the receiver input. If this hum appears in the detector output it may cause sync instability or pulling on top of the raster. Correction can be made by replacing the .01 mfd. capacitor (C44) in the grid circuit of the 6BE6 sync clipper with a .0022 mfd. unit.

PICTURE FLICKER

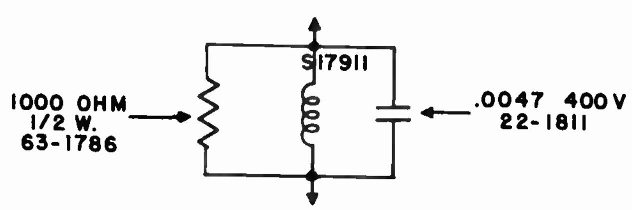
Fluctuations in line voltage often cause picture flicker. This condition can be remedied by increasing the 2nd video plate decoupling capacitor (C23) from 20 to 100mfd.

AIRPLANE FLUTTER

It may be desirable to speed up the AGC action in some areas to compensate for rapid changes in signal level caused by fading and airplane reflections. To accomplish this, replace the .47 mfd. AGC capacitor C18 with a .047 mfd. unit of the same type. In addition, change the .01 mfd 6BE6 coupling capacitor (C44) to .0022 mfd.

RINGING OR WHITE STRIPES IN "K" SERIES RECEIVERS

This condition can usually be corrected by readjusting the horizontal drive control, or by replacing the 6CD6 tube. In more stubborn cases, it may be necessary to dress peaking coil L22 and the contrast and picture control leads as far from the sweep transformer cage as is practical. Also to insert the following network in series with the red-white lead of the sweep transformer.



SERVICING "K" TUNERS

Many tuners can be satisfactorily repaired in the field, thus eliminating unnecessary delays, handling and shipping charges.

In some tuners, the bulls eye adjustment had been screwed too far into the strip causing the slug to remain in a fixed position when turned. To correct this condition, remove the channel strip, lift up the spring clip which holds the adjustment screw in place and reinstall the slug so that it moves in and out when turned.

In servicing tuners, satisfactory operation can be obtained by removing the tuner from its case and plugging in the power and IF connectors. For further convenience, it may be desirable to use a test chassis in which these leads have been extended 10 to 20 inches. In replacing a 22-2404 feed through capacitor, unsolder the top and bottom leads and the center ground connection. Do not use excess heat or solder when making connections.

Some of the component parts in the tuner cannot be replaced without removing the fine tuning control and bracket assembly. This bracket can be removed as follows:

1. Unsolder the fine tuning capacitor leads.
2. Loosen the Allen head set screw on the fine tuning shaft collar and remove fine tuning shaft.
3. Remove the self tapping screw from the center top of the tuning capacitor mounting bracket, loosen the three remaining screws and remove the bracket. Reverse the above procedure when the tuner is re-assembled.

CHANGE IN PICTURE TUBE GASKET

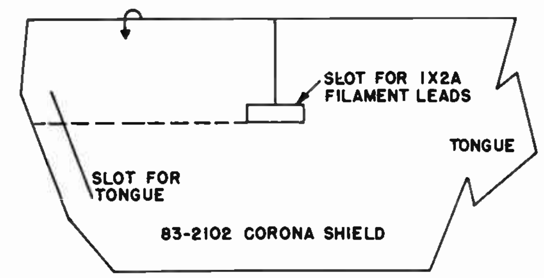
The upper half of the gasket was removed to comply with Underwriters specifications which require the picture tube to have sufficient air relief should an implosion occur. Insufficient air relief could cause the safety glass to be blown out.

LOW SENSITIVITY ON UHF

A number of tuners have been returned to the factory because of poor performance on UHF. These tuners had excessive leakage in the coaxial cable which is used to inject the oscillator signal on UHF. To check the cable, switch the tuner to a VHF position, unsolder the ground end of the 22K resistor R7, and check for leakage using the highest megohm scale on a vacuum tube voltohmeter. If the meter shows anything but infinite resistance, replace the cable.

ARCING BETWEEN THE 1X2A TUBE AND ADJACENT COMPONENTS

In areas of high humidity, high voltage breakdown may occur between the 1X2A tube and adjacent components, particularly the 6SN7GT tube. To correct this condition, install a 83-2102 polystyrene corona shield around the 1X2A tube and socket assembly.



To install the corona shield, bend on broken line, (See illustration) and hold down one half of the shield, slip this half under the filament leads and wrap around the 1X2A tube. Insert tongue through the slot to secure shield.

REMOVAL OF CATHODE TRAP L13

In late production "K" receivers, cathode trap L13 has been omitted, and the 41.25 Mc. sound trap L9 moved from the rear of the chassis to the position originally occupied by L13. Recent improvements in inter-carrier sound transformer design obviates the need for a cathode trap.

SPURIOUS RADIATION FROM THE HORIZONTAL OUTPUT TUBE

We have received reports from fringe areas of floating visible disturbance in various shapes and forms which appear on the right side of the picture tube screen. This condition is caused by 15.75 Kc. harmonics radiated by the horizontal output tube and usually appear when the receiver is switched to an unused channel, and disappearing when a station is tuned in. If it does not disappear when a station is tuned in, readjust the horizontal drive control, or replace the horizontal output tube.

ADJUSTMENTS AND ALIGNMENT

THE FRINGE LOCK CIRCUIT

The fringe lock is a newly developed circuit, utilizing a 6BE6 heptode, which can be adjusted to assure sync stability over the wide range of noise and signal levels encountered in different areas. In this circuit the output of the crystal detector, approximately -2 volts peak to peak, is fed to grid #1 of the 6BE6. The same signal, after it has been inverted and amplified to approximately 40 volts peak to peak by the first video amplifier, is applied to grid #3 which in this circuit is the signal grid. The fringe lock control is used to pre-set the bias on grid #1 so that the normal 2 volt signal allows proper sync clipping action, i.e. the sync pulses, which have been stripped from the composite video signal appearing at grid #3, will appear at the plate. If a noise pulse drives grid #1 beyond the 2 volt level, plate current cutoff occurs and the noise pulse cannot get through to falsely trigger the sweep oscillators. On rare occasions, a strong noise pulse may occur at the time of the sync pulse and the tube likewise will cut off, however, the flywheel action of the sweep oscillators will maintain sync during this brief period. The entire fringe lock system is based on the fact that the loss of an occasional sync pulse is to be preferred over having a noise pulse get through to falsely trigger the sweep oscillator.

FRINGE LOCK ADJUSTMENT

1. Turn the fringe lock control fully clockwise and then back it off approximately 1/4 turn. Adjust the vertical and horizontal hold controls and check operation of the receiver to see that it syncs normally when the turret is switched from channel to channel.

2. If the picture jitters or shows evidence of delay, tearing, split phase, etc., back down the fringe lock control further, a few degrees at a time, each time re-adjusting the hold controls and switching from channel to channel until normal sync action is obtained. It will be found that under normal signal conditions, the correct adjustment will be near the counterclockwise position of the control.

3. In fringe and noisy areas, the best adjustment will be found at or near the maximum clockwise position of the control.

CORRECTOR MAGNET ADJUSTMENT

Two corrector magnets are used (See Fig. 7) to obtain straight, sharply focused sweep lines across the face of the picture tube. These magnets are mounted on the deflection coil mounting bracket and can be moved in and out or up and down by bending the flexible arms which support them. The corrector magnets are adjusted at the factory and should not require re-adjustment unless accidentally bent out of position. If this occurs, adjustment can then be made as follows:

1. With the vertical and horizontal size controls, reduce the size of the picture to a point where the four corners and sides of the picture are visable.

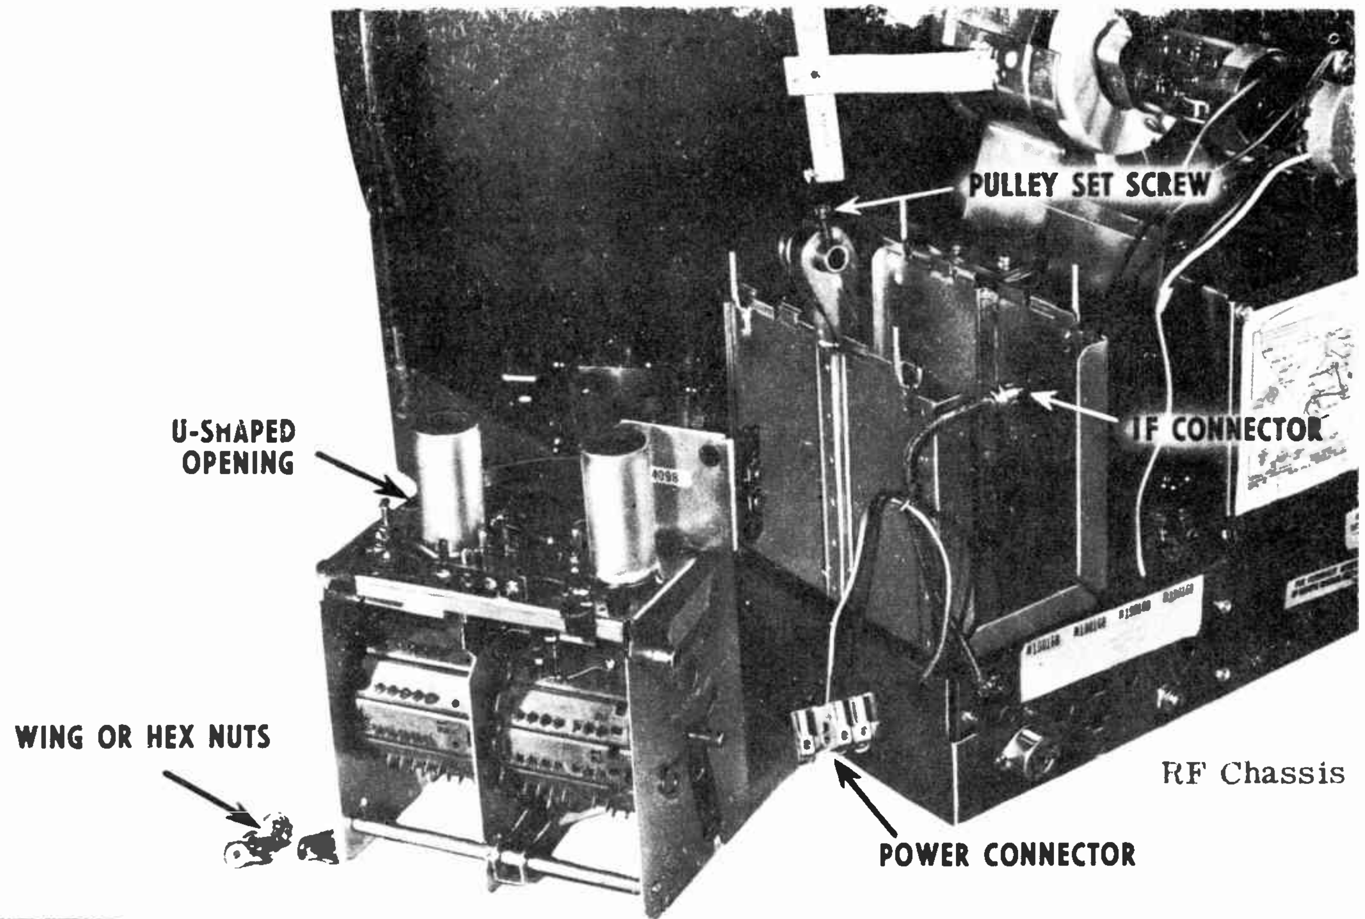
2. Bend the corrector magnet arms until the corners become right angles and the top of the raster is parallel with the bottom and the left side is parallel with the right side. After adjustment, the picture should be restored to normal size.

NOTE: Mis-adjustment of the corrector magnets may cause pincushioning, barreling, keystoning, poor linearity, etc.

CENTERING ADJUSTMENTS

Two types of centering assemblies have been used in production.

The S-18118 assembly consists of two magnetic rings mounted in two movable washers. The washers are provided with tabs so that the magnets can be turned independently of each other to vary the total magnetic flux. This unit is installed approximately 3/4" behind the yoke to prevent the yoke from demagnetizing the ring type magnets. Adjustment is made by gradually rotating the tabs with respect to each other and rotating the entire unit until the picture is centered.



RF Chassis

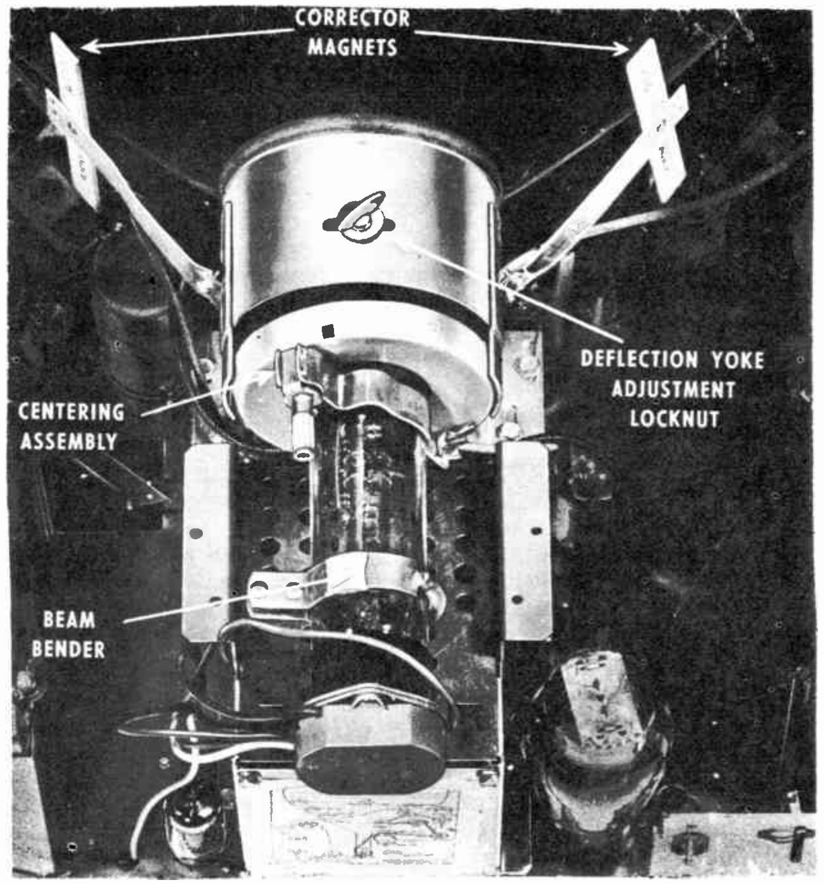


Fig. 7 Adjustments on Neck of Picture Tube

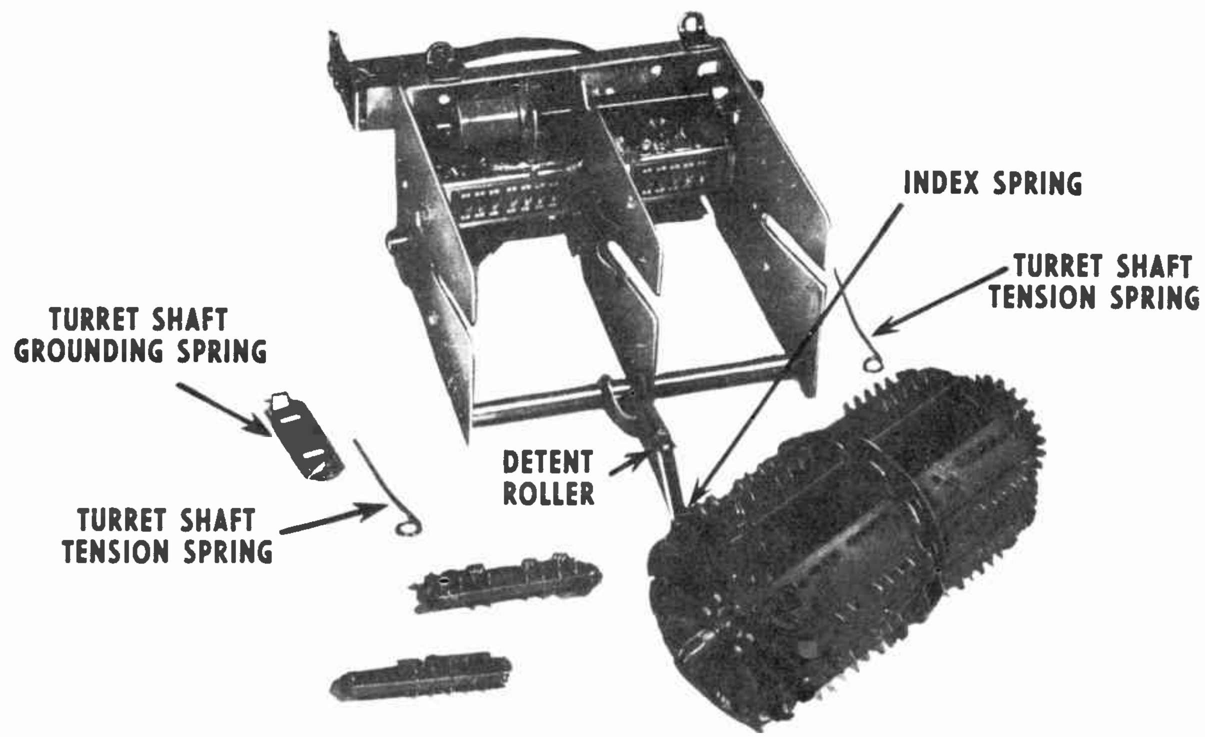

Fig. 8 Exploded View of Turret Tuner

The S-18439 assembly (See Fig. 7) utilizes a small bar type magnet which can be turned by means of a knurled shaf‘. This assembly can be installed within 1/8" of the yoke and is adjusted by turning the knurled shaft and rotating the entire unit until the picture is centered on the screen.

AFC ADJUSTMENTS

The AFC adjustment can effectively be made by setting the horizontal hold control L27 to a position where it is virtually impossible to "throw" the receiver out of horizontal sync when switching from channel to channel.

BULLS-EYE TUNER ADJUSTMENTS

To adjust the receiver for bulls-eye tuning, set the fine tuning control to its approximate center position as shown in Fig. 4 . Without further adjustment of the fine tuning control insert a 68-21 alignment wrench into the tuner (See Fig. 10) and adjust each operating channel to resonance. It will be noted that tuning to one side of resonance results in a faded, washed-out picture with the spacing between the wedge lines fogged and tuning in the opposite direction causes the spaces between the lines to clear up. However, going beyond this point causes the picture to take on a "wormy" appearance from sound getting into the picture. Correct adjustment is obtained by tuning to the "wormy" picture and then backing the control off slightly until the picture clears up.

REMOVING TURRET TUNER FROM CHASSIS

1. Pull out the power and IF connector cables and disconnect the antenna transmission line.

2. Look through the U-shaped opening (See Fig. 8) in the top of the tuner and rotate the fine tuning control until the allen head screw on the fine tuning shaft is straight up.

3. Loosen (do not remove) the hex head set screw in the turret dial cord pulley assembly.

4. Slide the pulley towards the front of the chassis until it clears the fine tuning shaft.

5. Remove the four wing or hex nuts and gently pull the tuner assembly straight out of its case.

REMOVING CHANNEL STRIPS

1. Remove the tuner from the case and lay on its side.

2. Rotate the turret drum until the strip to be removed is readily accessible.

3. Insert a small screwdriver in the slot (See Fig. 9). Push in the direction of arrow until the channel strip clears the drum slot then lift straight out in direction of screwdriver shaft.

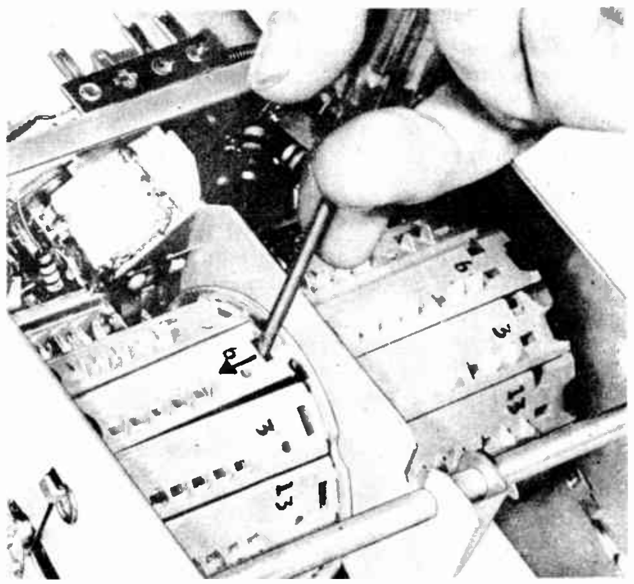

Fig. 9 Removing Channel Strips
CAUTION: DO NOT PRY

CAUTION: TO AVOID DAMAGE TO CHANNEL STRIPS, DO NOT USE PRYING ACTION IN REMOVING STRIPS.

REMOVING TURRET DRUM ASSEMBLY

1. Use long nose pliers and remove the two turret shaft tension springs from the front and rear of the tuner assembly. Slide the bronze turret shaft grounding spring out of its slot at the rear of the tuner.

2. With a pair of long nose pliers, grasp the first turn of the spiral index spring and lift spring off its hook. This takes pressure off the detent arm and may cause the roller to fall out and become lost.

3. Slide the drum out of its slot. Reverse this procedure to re-assemble the tuner.

DOUBLE DELAYED GATED AGC

In order to obtain the best possible performance in fringe and weak signal areas, it is important that the application of AGC voltage to the 6BK7 RF tube be withheld until the signal level reaches approximately 500 microvolts at the antenna input. The noise figure of the tuner will be optimized only under this condition of no AGC voltage. To accomplish this, the cathode of the 6CB6 1st IF tube is approximately 8 volts positive by virtue of the drop through the cathode resistor of the 6CB6 3rd IF. This voltage plus the voltage which results from current flow through the tube makes the grid of the 6CB6 1st IF approximately 9.3 volts negative with respect to its cathode. It should be noted here that the bias voltage for the 3rd IF is obtained across the 100 ohm portion of the cathode resistor only. The voltage at the junction of the two resistors varies from 8 volts with no signal to 4 volts with strong signals. The 2nd IF tube is in series with the 1st IF tube and any changes in the plate current of the 1st IF tube will also change the 2nd IF tube thus the 2nd IF tube is also controlled indirectly by the AGC.

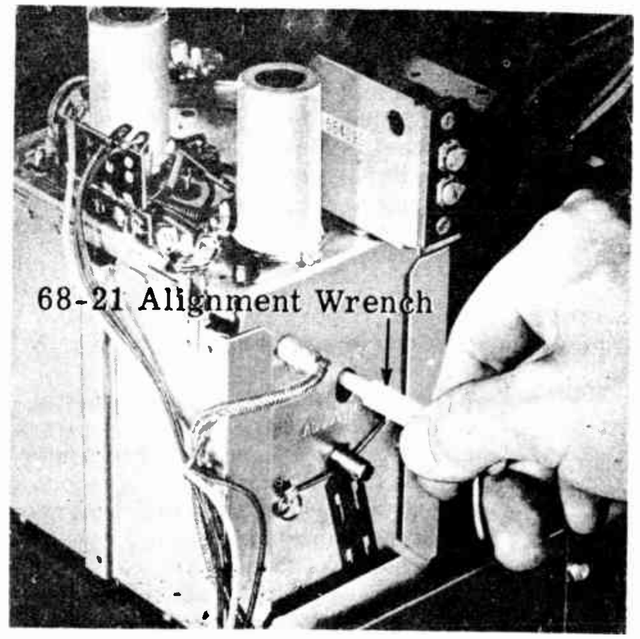

Fig. 10 Bull's-eye Tuning Adjustment

Under weak signal conditions, the output of the AGC tube at point "F" is approximately 8 volts positive. This positive voltage however, does not reach the grid of the 6BK7 because of the 2.2 megohm resistor. Actually the grid of this tube is slightly negative because of contact potential developed as a result of the high resistance in its grid circuit (2.2 megohms). The 8 volts positive voltage however, is applied to the grid of the 6CB6 1st IF but because the cathode is 9.3 volts positive the grid is actually 1.3 volts negative with respect to its cathode and AGC control of the IF results under weak signal conditions.

When the receiver is used with normal signals, the signal voltage applied to the grid of the AGC tube will increase and as a result the output of the AGC tube will become 4 to 5 volts negative. This negative voltage will be applied to the 6BK7 through the 2.2 megohm resistor thus both the RF and IF stages will then be controlled by the AGC.

With the application of a negative AGC voltage to the 6BK7 tube under normal signal conditions, the noise figure of the tuner will not be optimized as under weak signal conditions, however, this is not a consideration with normal signal levels.

AGC ADJUSTMENTS

The AGC delay control can be adjusted from the front of the cabinet.

Connect the calibrated oscilloscope through a 10K isolation resistor to terminal "E" (Fig. 25). Select the strongest TV signal and observe the deflection on the oscilloscope screen. Adjust the AGC delay control for 2 volt peak output.

Satisfactory adjustment can also be made by observing the picture and slowly turning the AGC delay control from its maximum clockwise position, counterclockwise until a point is reached where the picture distorts and buzz is heard in the sound. The control should then be turned slowly clockwise and set at a point comfortably below this level of intercarrier buzz, picture distortion and improper sync.

CAUTION: Misadjustment of the AGC delay control can result in a washed-out picture, distorted picture, buzz in sound OR COMPLETE LOSS OF PICTURE AND SOUND.

ALIGNMENT

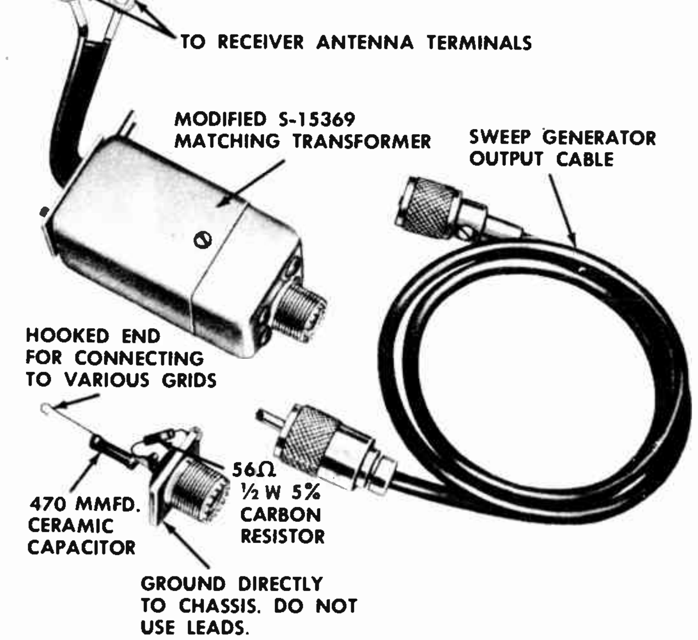

Fig. 11 IF-RF Alignment Fixtures

A suitable sweep generator in conjunction with an accurate marker must be used for alignment work. It is very important to have the sweep generator output cable properly terminated and to check whether or not its attenuator is reactive. If the attenuator is reactive or if the output cable is improperly terminated, correct alignment cannot be made since the degree of attenuation then may change the shape as well as the amplitude of the response curve. The position of the attenuator should only vary the amplitude and not the shape of the response curve.

CALIBRATING THE OSCILLOSCOPE

When aligning the RF and IF stages of the receiver,

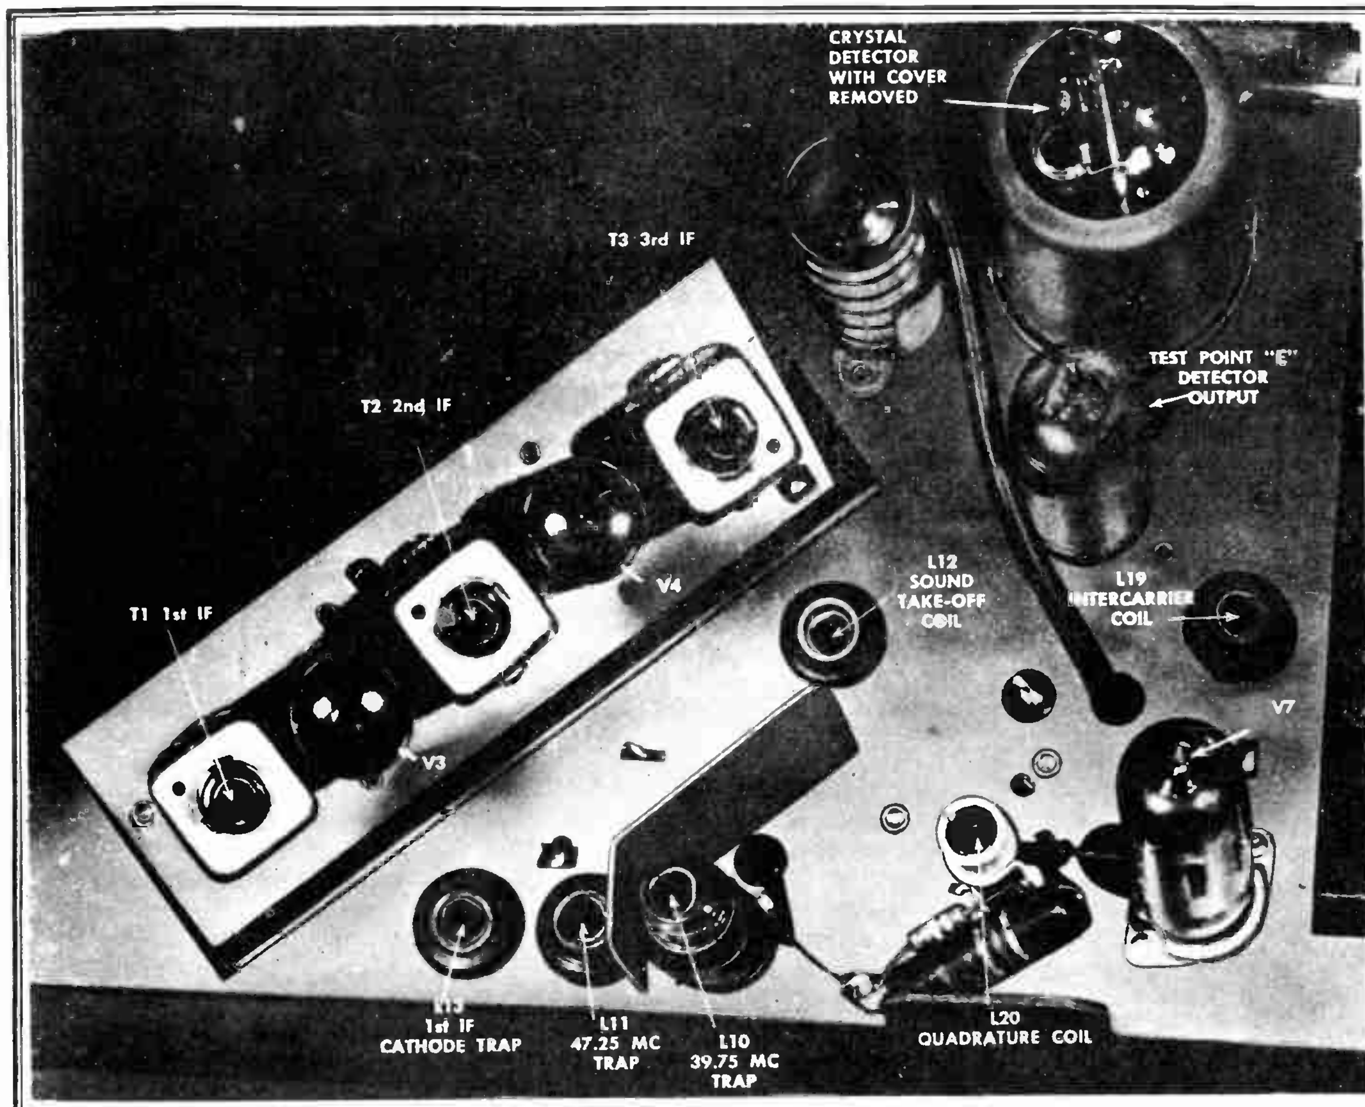

Fig. 12 IF Alignment Guide

it is necessary to measure detector peak output.

This may be done with a voltage calibrator used in conjunction with an oscilloscope. If a calibrator is not available, the oscilloscope can be calibrated with a known DC voltage. To make the calibration, connect the ground lead of the vertical input cable to the negative side of a 3 volt battery supply. Turn the horizontal gain control fully counterclockwise. With the "hot" lead, make a momentary contact to the positive connection on the battery and observe the instantaneous spot deflection on the screen. Discharge the scope input capacitor by shorting out the leads and repeat the procedure, each time readjusting the scope vertical gain until the spot deflects 3 large divisions on the screen. Each division then represents 1 volt peak. The position of the vertical gain control should be marked for future reference.

VIDEO IF ALIGNMENT

1. Connect the negative lead of a 2 volt battery supply to terminal "F" (Fig. 25) and the positive lead to chassis. The bias supply should be made variable so that it can be varied from negative 3 volts to positive 3 volts. Keep the supply leads short.

2. Connect the calibrated oscilloscope through a 10,000 ohm isolation resistor between terminal "E" and chassis. The sweep generator input to the receiver should be adjusted for 2 volts peak to peak detector output. Do not exceed this output level during any of the adjustments.

3. Feed the output from the sweep generator through the special termination unit shown in Fig. 11 to point "D" (Pin 1 of 6CB6, 3rd IF). Adjust the generator until a pattern similar to Fig.14 is obtained.

4. Set the Marker Generator to 44 Mc and alternately adjust the top and bottom slugs and the coupling adjustment of the 4th IF transformer for maximum gain and symmetry with the 44 Mc Marker in the center of the response curve. The wire rod type of coupling adjustment utilizes an insulated sleeve by means of which coupling can be changed by turning the rod in or out.

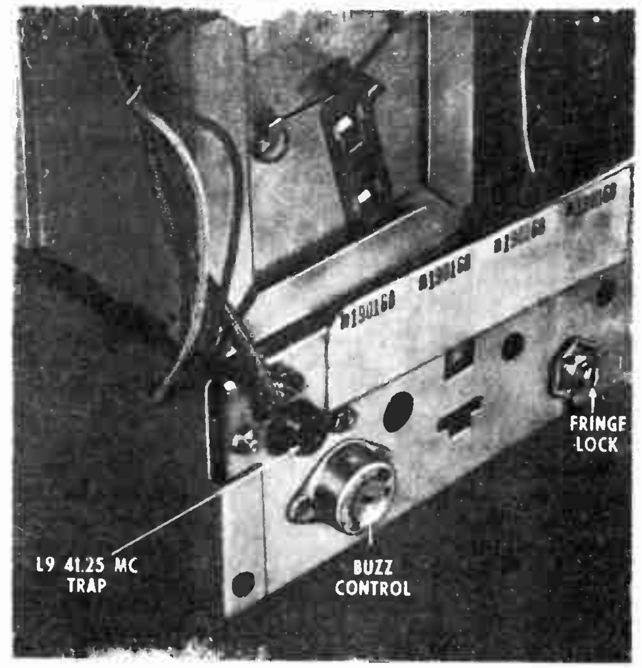

Fig. 13 41.25 Mc Trap

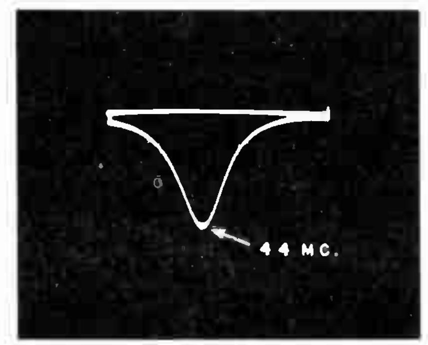

Fig. 14 4th IF Response

If the correct response curve cannot be obtained in this step, check the position of the two slugs to see that they are entering their respective coils from the opposite ends of the coil form. The position of the slugs near the center of the coils may change the coefficient of coupling, making correct alignment difficult if not impossible.

5. Connect the sweep generator cable to point "C". Adjust the attenuator for a 2 volt peak to peak detector output.

6. As a preliminary adjustment for the 3rd IF, turn the bottom slug half way into its coil and the top slug completely out of its coil. Alternately adjust the top and bottom slugs until a pattern somewhat similar to Fig. 15 is obtained. When the tuning slugs are properly positioned each slug will move both humps of the response curve.

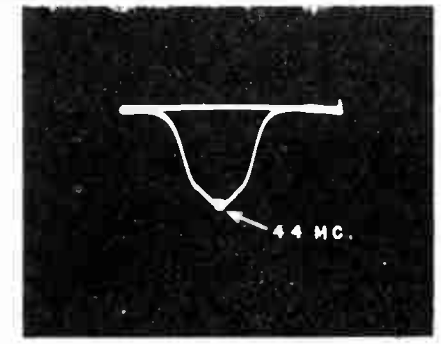

Fig. 15 3rd IF Response

7. Connect the sweep generator cable to terminal "B" (Converter Grid). In this step it may be necessary to disconnect the bias battery and temporarily ground the AGC in order to see the highly attenuated trap slots with the oscilloscope vertical gain near maximum.

8. Adjust the 47.25 Mc, 41.25 Mc and 39.75 Mc traps for minimum marker amplitude (See Fig. 16). It can be seen that maximum oscilloscope gain has been used and as a result the top of the response curve has been "run off" the oscilloscope screen in order to see a "blow-up" of the trap slots.

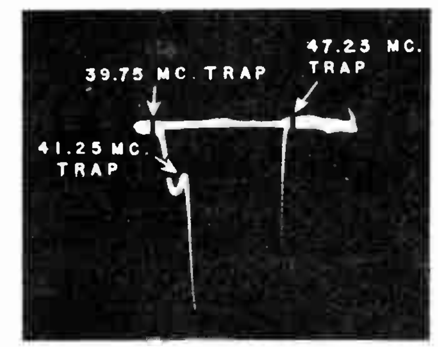

Fig. 16 Exploded View of Traps

9. Re-connect the bias battery and readjust the oscilloscope to the calibrated position. Adjust the sweep generator for a 2 volt peak to peak output from the video detector. Bear in mind that only one tuning slug is used in each of the following stages to be aligned.

10. With the test equipment set up as in Step 10, alternately adjust the converter plate coil, the 2nd IF and the 1st IF transformers until an overall response curve similar to Fig. 17 is obtained. If the proper response curve cannot be obtained, it may be necessary to retouch the 4th IF coupling adjustment or make a slight readjustment of the other stages to obtain the correct overall response curve.

11. Adjust the bias so that point "F" is 3 volts positive with respect to ground. Reduce the signal generator input to obtain 2 volts peak to peak output at terminal "E". The response curve should be similar to the solid line portion of Fig. 18 . At this point, adjust the cathode trap L13 to flatten the 45 Mc hump in the response curve as much as possible. It will be noted that with proper alignment some tuned circuits will flatten out more than others, as illustrated by the broken lines.

12. Readjust the bias to negative 2 volts as in Step 9 and check the overall response as in Step 10. A slight readjustment may be necessary after trap L13 has been aligned.

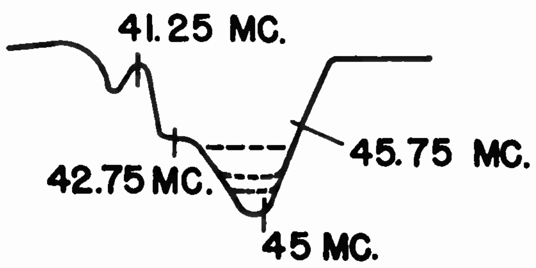

Fig. 18 Cathode Trap Response

IMPORTANT: The purpose of this procedure is to obtain a response curve similar to Fig. 17. The curves for the other stages may or may not be the same as those shown in the manual after the overall curve has been obtained.

TURRET TUNER AND RF CHASSIS ALIGNMENT

The RF chassis adjustments have been made at the factory and normally do not require readjustment in the field unless tampered with. If adjustment becomes necessary proceed as follows:

1. Connect the negative lead of a 1 volt bias supply to terminal "F" (Fig. 25) and the positive lead to chassis.

2. Connect the calibrated oscilloscope to the feed through terminal "X" (Fig. 1) through a 10K isolation resistor. This terminal is the screen of the 6U8 mixer and is used in preferance to terminal "A" in order to obtain greater amplification for the average oscilloscope.

3. Use the S-15369 matching transformer (Fig. 11) and feed the output from the sweep generator to the antenna terminals of the receiver.

4. Turn the channel selector to Channel 3 and adjust the sweep generator until a response curve somewhat similar to Fig. 19 is obtained.

5. Study Fig. 1 and adjust the converter grid capacitor (C22), the RF plate capacitor (C5) and the RF grid capacitor (C2) until a response curve similar to Fig. 19 is obtained.

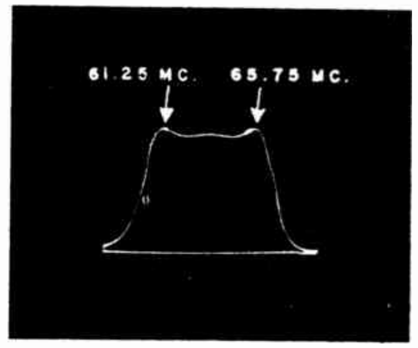

Fig. 19 Channel 3 RF Response

6. Turn the channel selector to Channel 13 and adjust the sweep generator until a response somewhat similar to Fig. 20 is obtained. Adjust L3 and L4 to obtain symmetry.

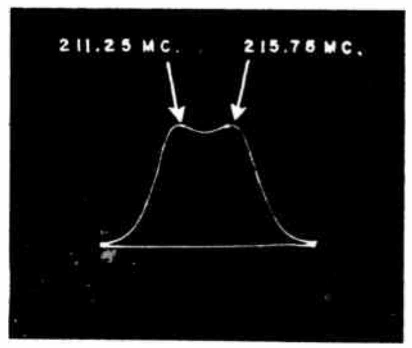

Fig. 20 Channel 13 RF Response

7. Repeat steps 5 and 6 until the best overall symmetry is obtained.

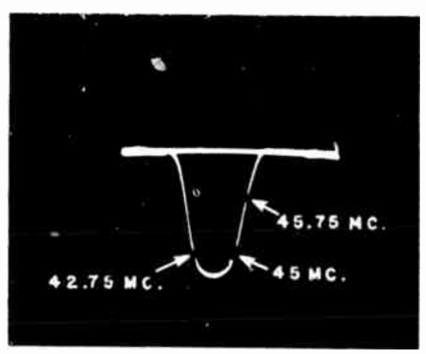

Fig. 17 Overall IF Response

MASTER OSCILLATOR ALIGNMENT

The master oscillator adjustment is to be made only if resonance cannot be obtained with the strip oscillator adjustment wrench with the fine tuning control in its center position (the allen head screw on the fine tuning shaft straight up as viewed through the U-shaped opening in the top of the tuner), and after it has been determined that the channel strip itself is not at fault.

If channels 2 through 6 can be made to resonate with the bull's-eye adjustment at the rear of the turret and the high channels do not resonate, a slight re-adjustment of the oscillator inductance L7 (See Fig. 6) may be necessary to affect resonance on the high channels.

If the fine tuning capacitor is replaced, proper alignment of the fine tuning mechanism can be made as follows:

1. Remove the turret from the chassis

2. Turn the turret tuning shaft until the allen head screw, as viewed through the U-shaped opening, is straight up.

3. Insert an allen wrench through the opening and loosen the screw. Leave the allen wrench in, partially slide out the shaft and tape it to prevent the stop mechanism from falling out or being turned out of position.

4. The tuning capacitor bracket can be removed by removing the four self-tapping screws which hold it in place. Unsolder the tuning capacitor leads, replace capacitor and re-assemble bracket on the RF chassis. DO NOT TIGHTEN ALLEN HEAD SCREW.

5. Use a sweep generator on Channel 3 or tune in a station on the lowest available channel and turn the turret shaft until resonance is obtained. This should be approximately 2-1/4 turns from either end of the fine tuning capacitor range. Turn the collar until the allen head screw is straight up as viewed through the opening and tighten screw.

6. Check the fine tuning knob to see that it is in the position shown in Fig. 4. (Center of mechanical range)

7. Insert the dial cord pulley over the turret shaft and tighten set screw. If the set screw is in a position where it is difficult to tighten, the fine tuning shaft can be held in place and the pulley can be made to slip the dial cord until the pulley is in a position where the set screw is readily accessible.

8. Remove the allen wrench. Proper alignment is indicated when the fine tuning control is in its center position and the allen head screw is straight up as viewed through the U-shaped opening.

9. It may be necessary to readjust the oscillator inductance L7 (See Fig. 6) for proper bull's-eye operation on the high channels (7-13).

SOUND ALIGNMENT

Proper alignment of the 4.5 Mc intercarrier sound channel can only be obtained if the signal to the receiver antenna terminals is reduced to a level below the limiting point of the 6BN6 Gated Beam Detector. This level can be easily identified by the "hiss" which then accompanies the sound.

Various methods may be used to reduce the signal level, however, it is recommended that a step attenuator similar to the S-17203 unit be used for most satisfactory results. To prevent leakage, certain precautions must be taken when connections are made. Use as short a lead as possible between the attenuator and receiver antenna terminals and approximately 6 feet of 300 ohm shielded line between the antenna transmission line and the attenuator. The shield from the transmission line should be connected to the attenuator and the attenuator itself grounded to the TV chassis under test.

After the connections have been made, proceed as follows:

1. Tune in a tone modulated TV signal and adjust the step attenuator until the signal is reduced to a level where "hiss" is heard with the sound.

2. Adjust the sound take-off coil L12 (top and bottom slugs), intercarrier coil L19, quadrature coil L20 and buzz control R30 for the cleanest sound and minimum buzz. It must be remembered that any of these adjustments may cause the "hiss" to disappear and further reduction of the signal will be necessary so that the "hiss" does not disappear during alignment.

If intercarrier buzz is in evidence, after all normal sound adjustments have been made, the cause may be attributed to one or more of the following:

1. Improper adjustment of the AGC delay control.

2. Defective 6U8 intercarrier sound amplifier.

3. Extremely high signal levels which require attenuation in the antenna circuit.

4. Transmitter overmodulation.

SPECIAL TEST EQUIPMENT FOR TV

Fig. 21 Waveforms and Peak to Peak Voltages

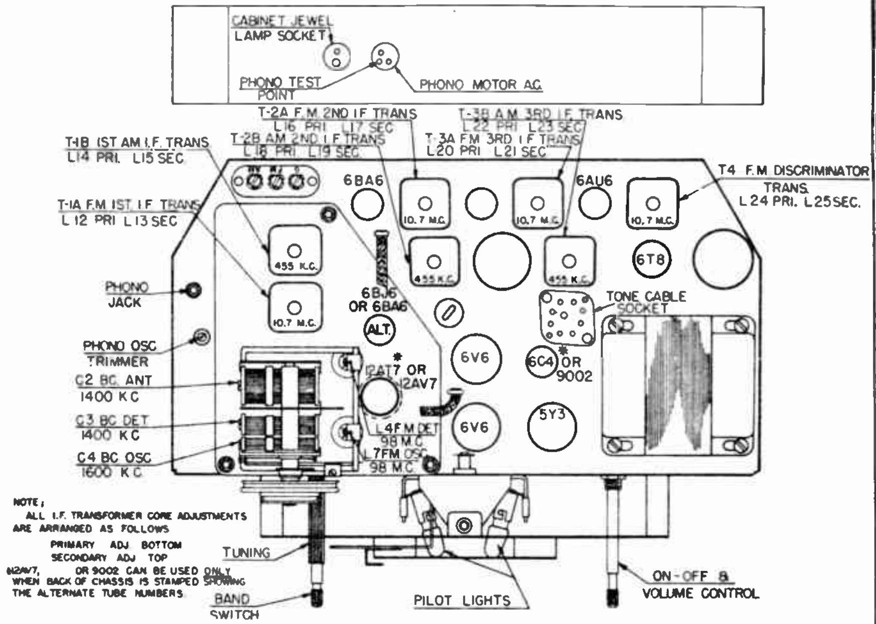
The 10H20Z chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and two stages on the AM Band. There is one stage of RF amplification on all bands.

FM RF Alignment: The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

AM and FM Alignment: The AM and FM IF transformers in this reciever are of the new permeability tuned type. The advantage of an IF transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these IF transformers the tuning wrench 68-19 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.



TUBE AND TRIMMER LOCATION

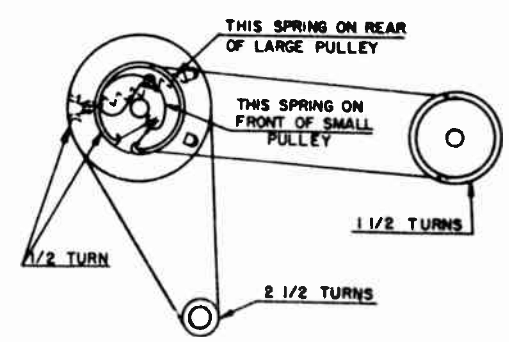
Detail of IF Transformer



DIAL CORD DRIVE

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

NOTE: If 12AT7 is replaced by a 12AV7 or vice versa the RF portion of this receiver must be realigned.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000-000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

In the event the reeeiver oscillates during phono operation, adjust C16 4-80 mmf. capacitor to a point at which the oscillation ceases.

This position of no oscillation will sometimes vary with different cartridges, and in this case readjustment of C16 must be made.

(a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (Half discriminator load).
(b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (Full discriminator load).
(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.
(d) Loosen Slugs by applying a hot iron to the cement.

BANDSWITCH POSITIONS
1ST POSITION - PHONO
2ND POSITION - STD. BROADCAST
3RD POSITION - F.M. S2 OPERATES IN THIS POSITION ONLY.
TUNING RANGES
540 - 1620 K.C. STANDARD B.C.
88 - 108 M.C. F.M.
AMP. MOD. I.F. FREQUENCY 455 K.C.
FREQ MOD. I.F. FREQUENCY 10.7 M.C.
ALL VOLTAGES MEASURED FROM COMMON RETURN TO POINTS INDICATED WITH AN A.C., D.C. OR VACUUM TUBE VOLTMETER.
ALL VOLTAGES ARE D.C. UNLESS OTHERWISE SPECIFIED.
ALL RESISTORS ARE ±20% TOLERANCE UNLESS OTHERWISE SPECIFIED.
DENOTES CHASSIS.
*NOTE
ALTERNATE TUBES 12AV7 & 9002 ARE USED ONLY WHEN STAMPING ON THE BACK OF THE CHASSIS OR TUBE LAYOUT LABEL INDICATES THE USE OF THESE TUBES. WHEN 12AV7 TUBE IS USED R9 AT TERMINAL #6 OF T1A BECOMES R39 5600 Ω, 2W ±10%

PARTS LIST

Dial Assembly

Part No.	Diag. No.	Description	Price
78-895		Dial Light Socket & Wire	.45
80-69		Dial Cord Spring	.05
80-746		Pulley Retaining Spring	.02
80-747		Dial Cord Spring	.10
114-262		8-32 x 7/16" x 1/4" A.F. Hex Hd. S.T. (2 used on S-17149)	.02
114-297		6-32 x 1/4" lg. x 1/4" Hex. Hd. (2 used on S-17165)	.01
148-122		Tuner Arm	.20
188-30		Retaining Ring (Used on S-17155)	.02
S-17149		Dial Scale & Brkt. Assem.	1.50
S-17155		Tuning Shaft & Pulley Assem.	.35
S-17157		Pointer & Pulley Assem.	.55
S-17158		Dial Cord & Eyelet Assem. (Long)	.07
S-17159		Dial Cord & Eyelet Assem. (Short)	.06
S-17165		Brkt. & Pulley Bushing Assem.	.35

ARROWS ON CONTROLS INDICATE CLOCKWISE ROTATION

The 8H20Z chassis incorporates a superheterodyne circuit with two stages of IF, on the FM Band, and one stage on the AM Band. There is one stage of RF amplification on all Bands.

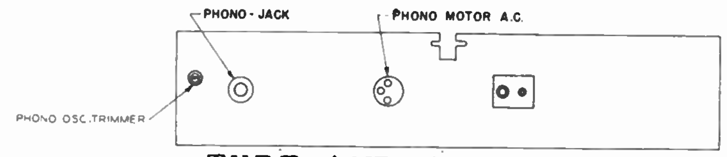
When adjustments are made on the 8H20Z chassis, a line isolation transformer (110 V input to 110V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground and if there is any indication of voltage, reverse the plug before handling the set.

FM RF Alignment: The tunning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustment the shafts must be secured with a drop of speaker cement.

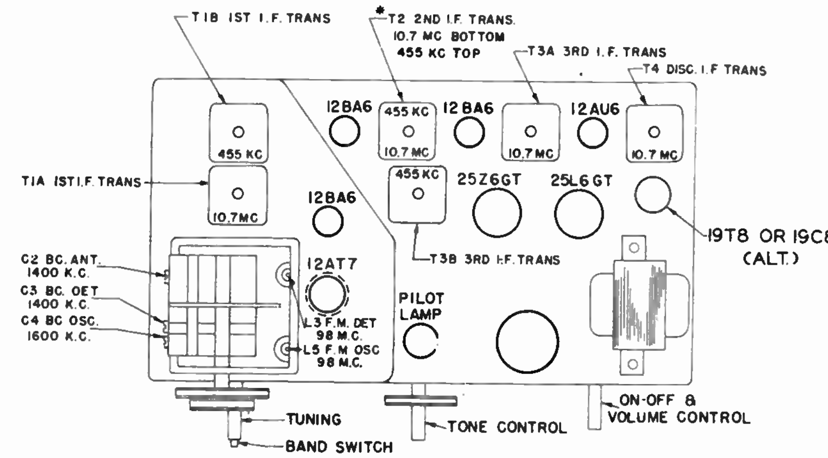
AM and FM IF Alignment: The AM and FM IF transformers in this receiver are of the new permeability tuned type. The advantage of an IF transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these IF transformers the tuning wrench 68-19 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other.

FM IF Alignment: Because of the wide band pass, it is desirable to use a FM signal generator and a cathode ray oscilloscope when aligning the FM IF channel. The instruction book for the Zenith Model 800 Signal Generator (Form Z8001) covers complete FM alignment procedure. If visual alignment equipment is unavailable, reasonably accurate alignment can be made by following the procedure outlined below.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 5) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when the meter starts to go to the left (negative) of zero will give the same results.



TUBE AND TRIMMER LOCATION



ALIGNMENT PROCEDURE

Operation	Connect Oscillator To	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 2 12AT7 Converter	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	L9, 10, 12 15 & 16	Align I. F. channel for maximum output.

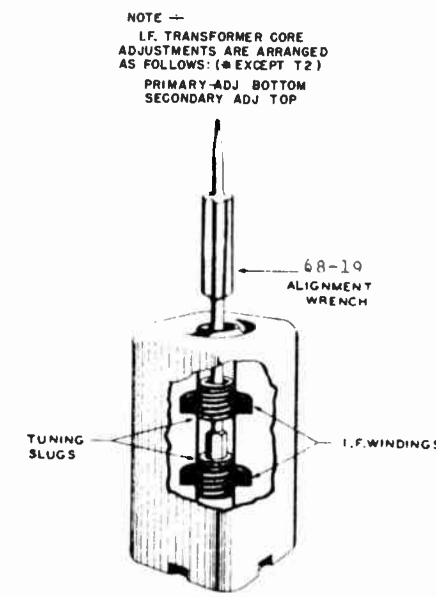
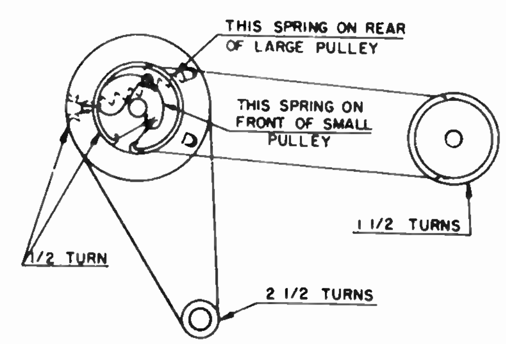
8 (c)	Pin 2 (grid) on 12AT7 converter tube socket.	.05 Mfd.	10.7 Mc. Unmodulated	FM 100		L7 and L8 Prim. and Sec. of 1st. IF transformer.	Align 1st. IF transformer for maximum reading.
9 (c)	Antenna Post FM (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L5 Osc. Coil Slug.	Set Oscillator to dial scale.
10 (c) (d)		270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L3 Det. Coil Slug	Align det. stage to maximum reading.



Detail of IF Transformer



DIAL CORD DRIVE

IMPORTANT

Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 2,000,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

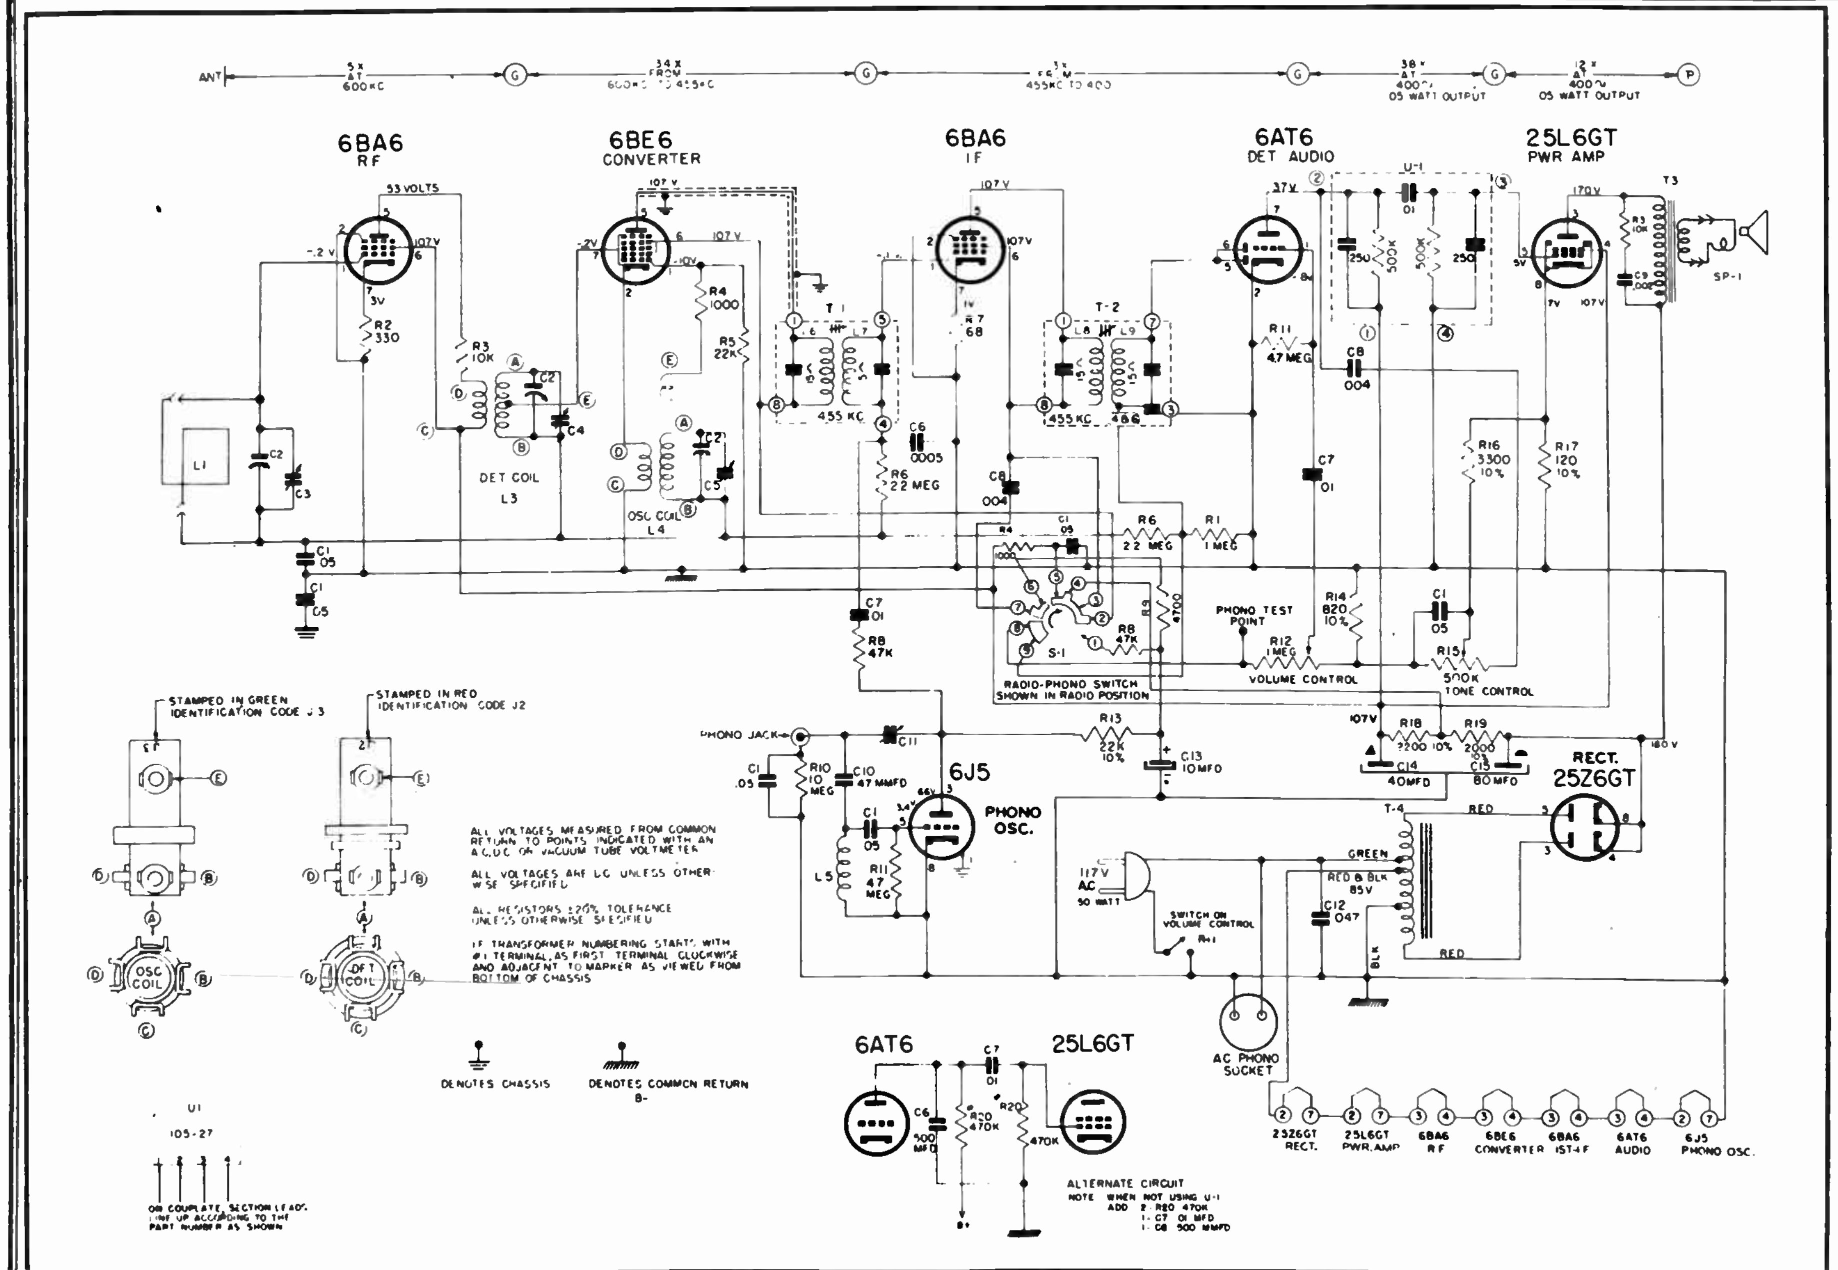
The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter Lug 7 on discriminator transformer to chassis (half discriminator load).

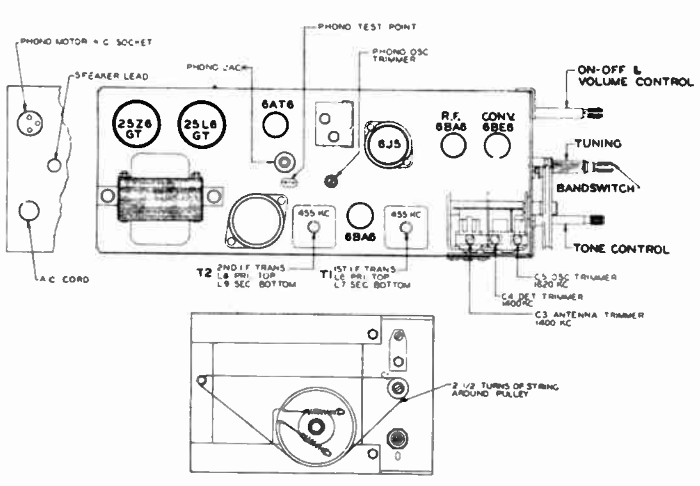
(b) Vacuum Tube Voltmeter Lug 5 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter from Limiter Grid to Chassis.

(d) Loosen Slugs by applying a hot iron to the cement.



CHASSIS 7K21 USED ON MODEL K2286R



TUBE, TRIMMER LOCATION, DIAL CABLE DRAWING AND DETAILED VIEW OF I.F. TRANSFORMERS.

The I.F. transformers incorporated in this reveiver are of the new permeability tuned type. The advantage of an I.F. transformer of this type is its extreme stability under various humidity and temperature conditions. The upper coil is the secondary and the lower the primary. When adjusting these I.F. transformers the tuning wrench 68-19 can be inserted into the top slug, rotated until maximum output is obtained and then dropped down to the lower slug and the same operation repeated. The tuning wrench is so designed that turning one slug does not affect the adjustment of the other. In the event the receiver oscillates during phono operation, adjust C11 4-80 mmf. capacitor to a point at which the oscillation ceases.
This position of no oscillation will sometimes vary with different cartridges, and in this case readjustment of C11 must be made.

28K20 CHASSIS

Parts used in the 28K20 chassis are the same as for the 21K20 chassis with the following additions:

Condensers

22-2396	27 Mmfd. ceramic disc 500V	.45
22-2375	7 Mmfd. ceramic disc 500V	.26
22-2376	47 Mmfd. ceramic disc 500V	.35
22-2378	10 Mmfd. ceramic 500V	.35
22-2380	5 Mmfd. ceramic disc 500V	.30
22-2381	6 Mmfd. ceramic disc 500V	.35
22-2319	Electrolytic 45/450V 10/475V 100/50V	4.50
22-2437	Electrolytic 80/400V 40/400V 30/400V	6.00
22-2448	Electrolytic 80/400V 40/400V 40/25V	5.50
52-600	Shielded lead	.25
58-204	Connector plug (part of S-19029)	.10

Resistors

63-1915	1.2 Meg. 1/2w 10% Ins. Res. (2 used)	.21
63-2287	330 ohm 2w 20% " " (2 used)	.33
63-3158	220 ohm 2w 10% " " (2 used)	.33
64-525	Brass eyelet (used with 76-663)	.01
78-957	C.R. tube socket & wire	1.25
93-1126	Washer (used with S-19637)	.03
95-1324	Audio output trans.	2.75
95-1326	Vertical output transf.	7.50
97-419	Idler stud (used with S-19637)	.20
S-19391	Interlock brkt. & plug	.40
S-19393	Wire & terminal assem.	.50
S-19637	Idler gear assem.	.40
S-19696	Coil shield & lug assem.	.60
S-19736	1st video IF transf. assem.	.85

63-3172	Screen control	

Model K2270R & H

49-649	10" PM speaker	11.75
	ZC10161 Cone & voice coil	3.41

Model K2271H-3

49-649	10" PM speaker	11.75
63-3171	Tone control	
63-3172	Screen control	

Model K2286R

49-714	7-1/2" PM speaker	7.00
	ZC7512G Cone & voice coil	2.63
63-1828	Resistor 10K ohm 1/2 w 20% Ins.	.21

Model K2286R-3

49-714	7-1/2" speaker	7.00
63-1828	10K ohm 1/2w 10% Ins. Res.	.21

Model K2287R-3

49-694	12" PM speaker	17.50
63-1828	10K ohm 1/2w 10% Ins. Res.	.21
63-3171	Tone control	
63-3172	Screen control	

CABINET PARTS K2290R

	49-704	12" PM Speaker (alt. is 49-694)	10.00
		ZC1216F Cone & Voice Coil	4.60
R28	63-1828	10K ohm 1/2W 20% Ins.Res.	.21

Model K2291E-3

63-1828	10K ohm 1/2 w 20% Ins. Res.	.21
63-3171	Tone control	
63-3172	Screen control	
49-694	12" PM speaker	17.50

Model K2872R

49-649	10" PM speaker (2 used)	11.75
	ZC10161 Cone & voice coil	3.41
S-19440	Power supply assem. complete	
S-19477	Def. yoke & mtg. brkt. assem.	39.00

MODEL K2872R-3

49-649	Speaker 10" PM (2 used)	11.75
S-19440	Power Supply (not stocked complete for parts list see S-19440--28K20 Chassis)	
S-19477	Deflection yoke & Mtg. Bracket (for parts list see S-19477--28K20 Chassis)	39.00

Model K2873E

49-649	10" PM speaker (2 used)	11.75
	ZC10161 Cone & voice coil	3.41
S-19440	Power supply assembly	
S-19477	Def. yoke & mtg. brkt. assem.	39.00

MODEL K2873E-3

49-649	Speaker 10" PM	11.75
S-19440	Power supply (not stocked complete for parts list see S-19440--28K20 Chassis)	
S-19477	Deflection yoke & Mtg. Bracket (for parts list see S-19477--28K20 Chassis)	39.00

TUBE COMPLEMENT

28K20 CHASSIS

SYMBOL	TUBE	FUNCTION
V1	6BK7	V1A RF Amplifier V1B RF Amplifier
V2	6U8	V2A Mixer V2B RF Oscillator
V3	6CB6	1st IF Amplifier
V4	6CB6	2nd IF Amplifier
V5	6CB6	3rd IF Amplifier
V6	6U8	V6A 1st Video Amp. V6B Intercarrier Sound Amp.
V7	6BN6	Audio Limiter Detector
V8	6J5	Sound Inverter
V9	6BK5	Sound Output
V10	6BK5	Sound Output
V11	12AX7	V11A AGC Amplifier V11B Vertical Sync
V12	12AU7	V12A 2nd Video Amp. V12B Video Output
V13	6BE6	Sync Clipper
V14	6SN7GT	V14A Vertical Oscillator V14B Vertical Oscillator
V15	6AH4GT	Vertical Output
V16	6AH4GT	Vertical Output
V17	6AQ7GT	V17A Horizontal Phase Det. V17B Horizontal Control
V18	6J5	Horizontal Oscillator
V19	5U4	Rectifier
V20	5U4	Rectifier
V21	6J5	Horizontal Discharge
V22	6CD6G	Horizontal Output
V23	6CD6G	Horizontal Output
V24	1B3GT	H.V. Rectifier
V25	1B3GT	H.V. Rectifier
V26	6V3	Damper
V27	6V3	Damper
V28	27AP4A	Picture Tube

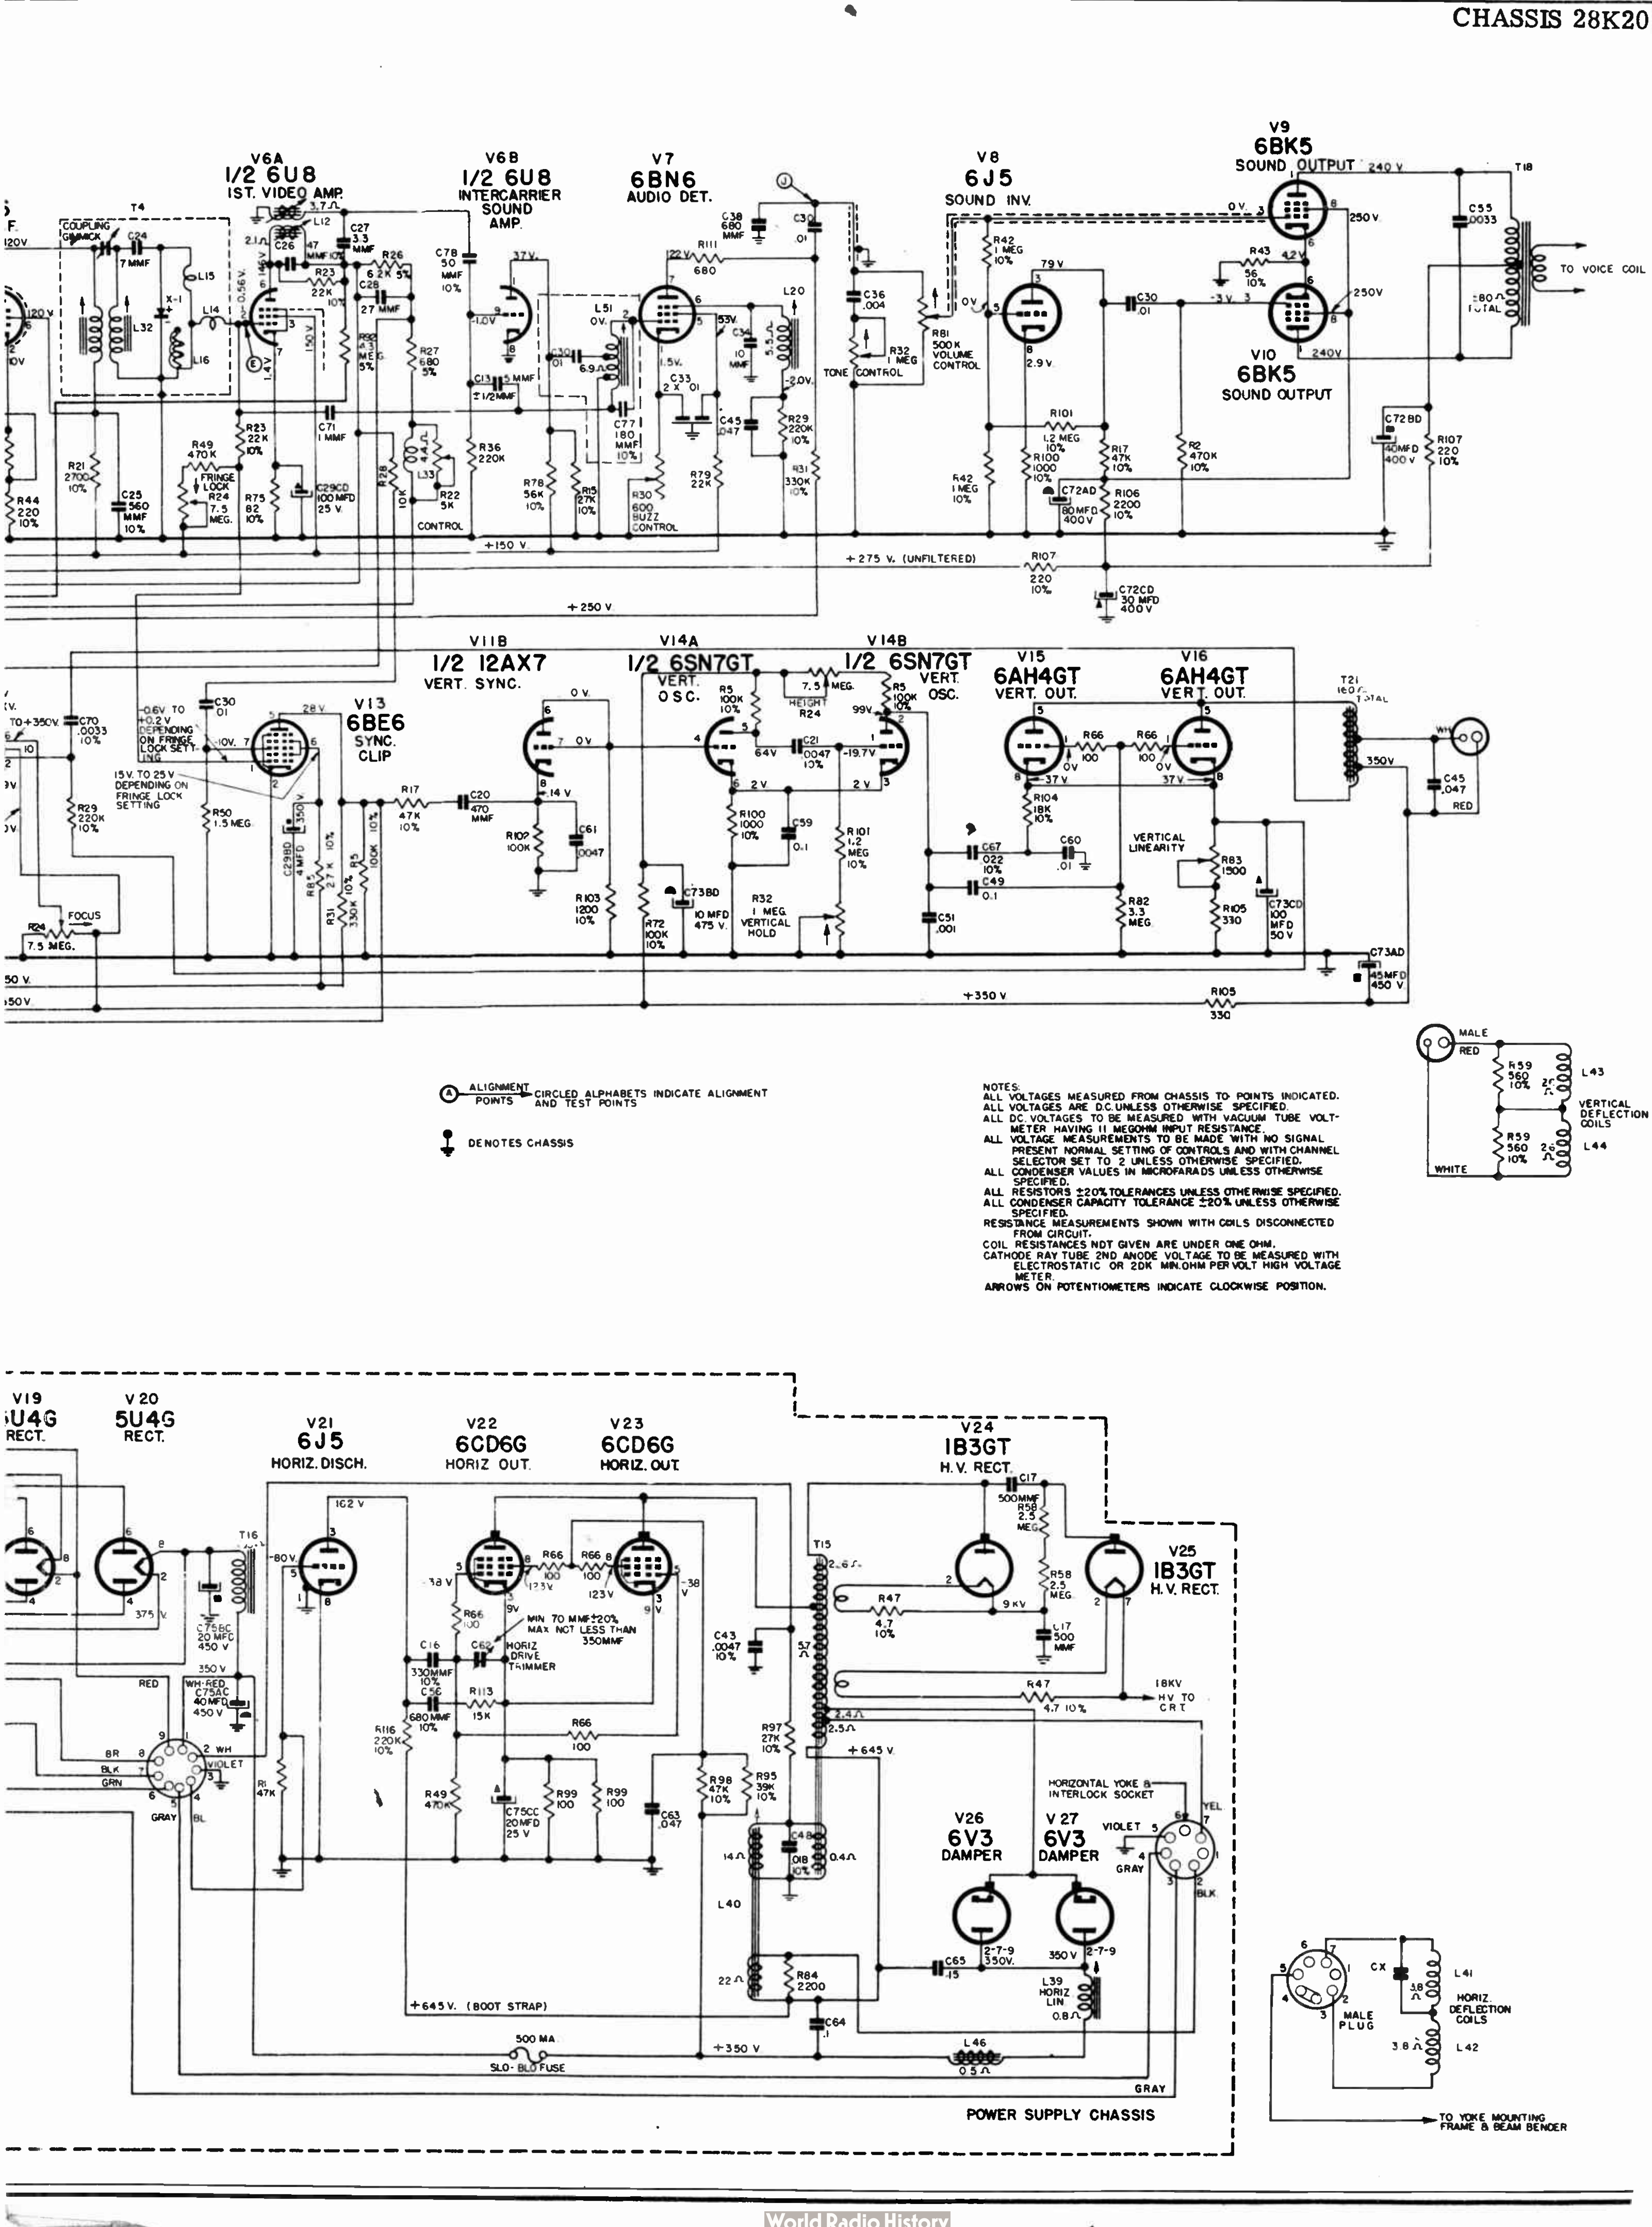
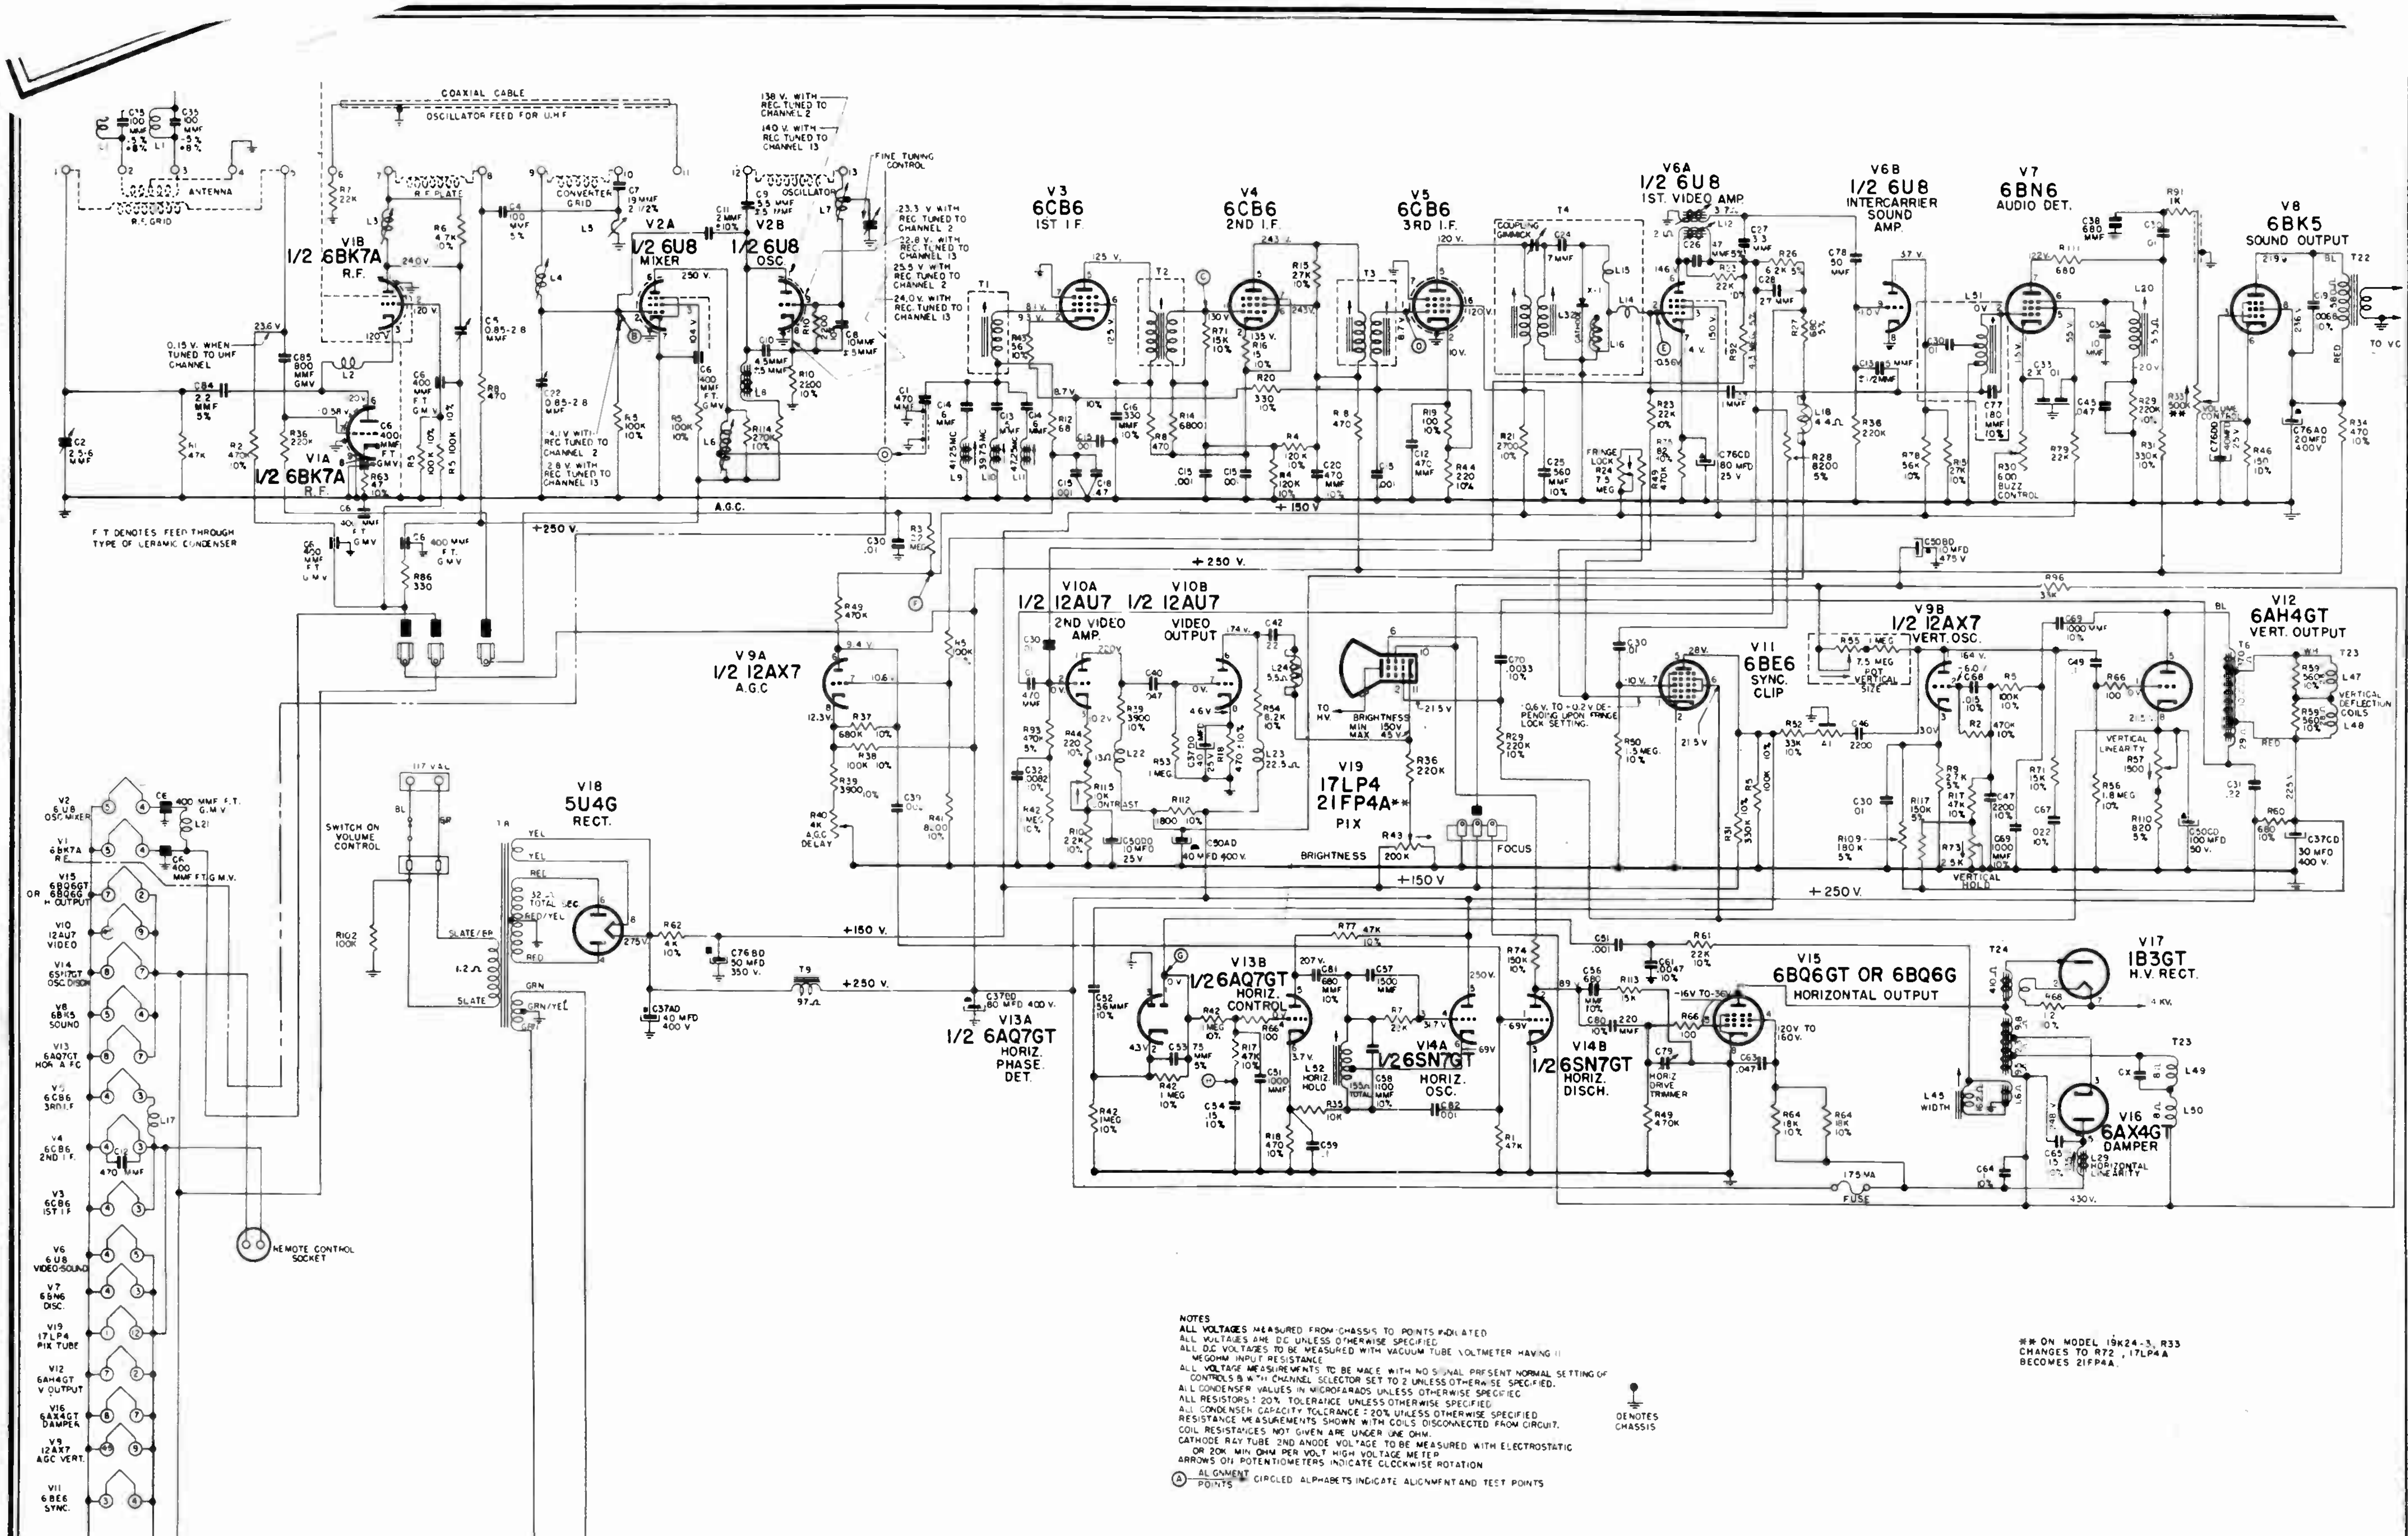
CHASSIS 28K20



NOTES:
ALL VOLTAGES MEASURED FROM CHASSIS TO POINTS INDICATED.
ALL VOLTAGES ARE D.C. UNLESS OTHERWISE SPECIFIED.
ALL DC. VOLTAGES TO BE MEASURED WITH VACUUM TUBE VOLTMETER HAVING 11 MEGOHM INPUT RESISTANCE.
ALL VOLTAGE MEASUREMENTS TO BE MADE WITH NO SIGNAL PRESENT NORMAL SETTING OF CONTROLS AND WITH CHANNEL SELECTOR SET TO 2 UNLESS OTHERWISE SPECIFIED.
ALL CONDENSER VALUES IN MICROFARADS UNLESS OTHERWISE SPECIFIED.
ALL RESISTORS ±20% TOLERANCES UNLESS OTHERWISE SPECIFIED.
ALL CONDENSER CAPACITY TOLERANCE ±20% UNLESS OTHERWISE SPECIFIED.
RESISTANCE MEASUREMENTS SHOWN WITH COILS DISCONNECTED FROM CIRCUIT.
COIL RESISTANCES NOT GIVEN ARE UNDER ONE OHM.
CATHODE RAY TUBE 2ND ANODE VOLTAGE TO BE MEASURED WITH ELECTROSTATIC OR 20K MIN. OHM PER VOLT HIGH VOLTAGE METER.
ARROWS ON POTENTIOMETERS INDICATE CLOCKWISE POSITION.



Schematic Diagram 19K22-3 And 19K24-3 Chassis.
