Readjust C21, C16, C11 and C7 for correct curve shape, frequency and band width.

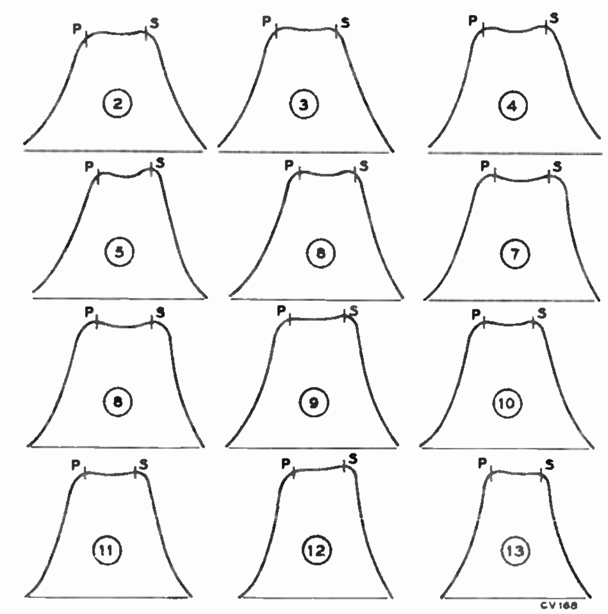

Figure 24—KRK29A R-F Response

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off it may be necessary to adjust the oscillator frequency

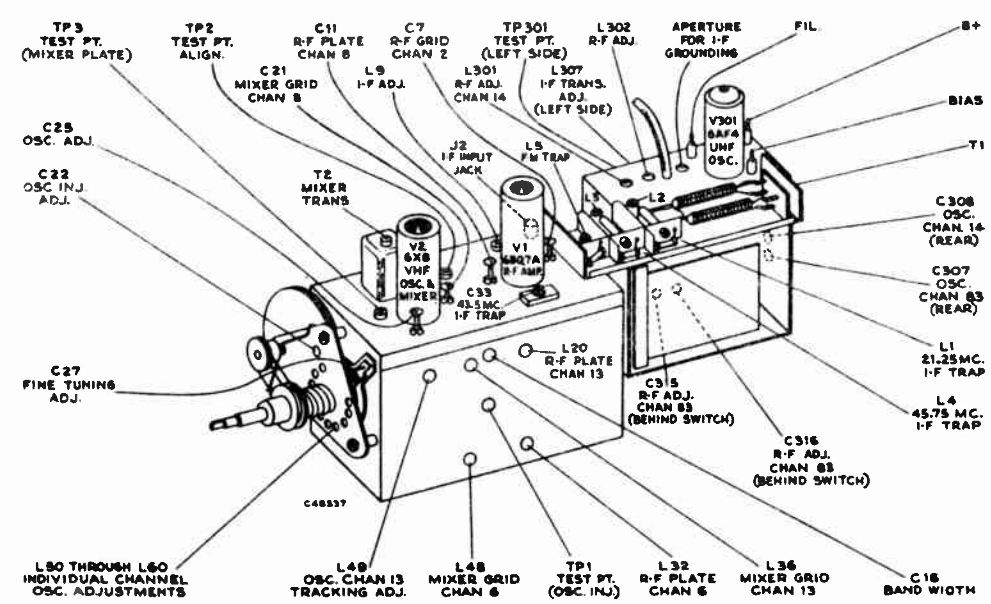

Figure 25—KRK29A/27 Tuner Adjustments

ALIGNMENT PROCEDURE

and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L48 and L32 for proper curve shape as shown in figure 24. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 24 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 24 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

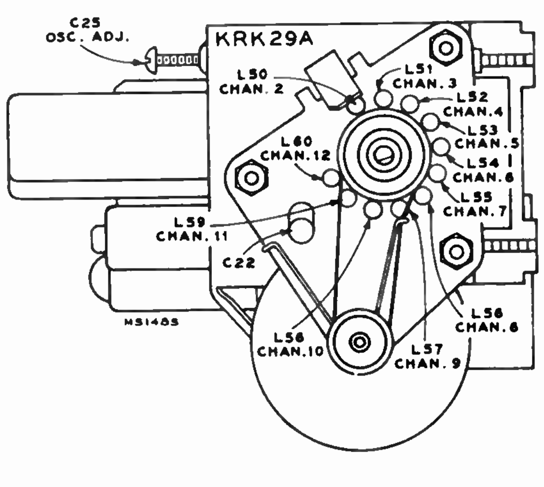

Figure 26—KRK29/27 Oscillator Adjustments

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

UHF ALIGNMENT.—Ground the I-F transformer L307 by inserting a clip lead through the aperture provided in the top of the tuner. Ground the other end of the clip lead to the tuner case.

Connect the oscilloscope to the test point TP301, employing the preamplifier if needed with the oscilloscope used.

Connect the output of the UHF sweep generator, through a 300 ohm attenuator pad, to the antenna terminals and set the sweep generator to sweep channel 83, centered on 887.5 mc. Adjust the output of the sweep generator to full sweep width.

A test dial made to fit over the split gear on the tuner shaft is necessary for accurate alignment. Scribe marks at 0°, 9° and 168° should be marked on the test dial for reference. The 0° reference point is located with the capacitor plates fully meshed. By placing a 1/16" shim between the stop pin on the tuner and the stop plate on the gear assembly the plates will be in the proper fully meshed position.

Rotate the tuning dial to the 168°, Channel 83, position.

Connect the VHF signal generator in series with a 1000 ohm resistor to the rear terminal of the crystal holder and insert markers for 41.25 mc., 43.5 mc. and 45.75 mc.

Connect the UHF marker generator loosely to the antenna terminals and insert a marker at 887.5 mc.

Adjust R-F trimmer capacitors C315 and C316 for a maximum amplitude overcoupled response curve centered at 887.5 mc. as shown in figure 27(A).

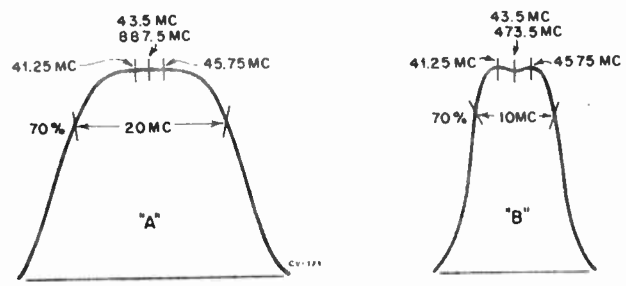

Figure 27—KRK27 R-F Response

Adjust the oscillator trimmer capacitor C307 until the 43.5 mc. marker coincides with the marker at 887.5 mc. The markers for 41.25 and 45.75 should be symmetrically located on the top of the response curve as in figure 27(A).

Set the UHF sweep and marker generators to 473.5 mc. Rotate the tuning dial to the 9°, Channel 14, position.

Adjust R-F coils L1 and L2 for a maximum amplitude overcoupled curve centered at 473.5 mc. as shown in figure 27(B). Adjust the oscillator trimmer C308 until the 43.5 mc. marker coincides with the 473.5 mc. marker, with the 41.25 and 45.75 markers as shown.

Repeat the above adjustments, as necessary, until the proper responses are obtained. Tune through the entire range and check the tracking. When perfectly tracked the three markers will be on the top of the response curves, however, mistracking to the extent that the 41.25 mc. and 45.75 mc. ride down the sides of the curves to a point not less than 70% will not seriously affect the alignment. Should the markers fall below this level, it will be necessary to knife the RF plates to correct the mistracking. The plates may be knifed through the two holes provided on the left side of the tuner. Always knife the plates while tuning lower in frequency to prevent affecting the tracking above the point of knifing. Check which section requires knifing by touching the plates with the knifing tool while observing the response, then proceed with the knifing of the proper section or of both sections if required.

Connect the "VoltOhmyst" to test point TP301. Set the "VoltOhmyst" to the 1.5v. DC scale. Tune over the entire range observing the reading on the meter. A reading between .05 and .4 volts should be obtained. Voltages outside these limits are an indication of low B voltage, low or high crystal impedance or an oscillator tube outside allowable limits.

Connect the "VoltOhmyst" to the "bias" terminal of the tuner (refer to figure 25). A reading between 0.5 and 2.5 volts should be obtained. Readings above or below this range will cause crystal currents outside allowable limits and in such cases the oscillator tube should be replaced. Replacement of the oscillator tube will require recalibration at the high and low frequency ends of the band as previously outlined.

RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first sound i-f grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. In such a case, connect the calibrator to the grid of the third pix i-f amplifier, pin 1 of V108.

Set the frequency of the calibrator to 45.75 mc. (pix carrier) and modulate with 4.5 mc. crystal. The 4.5 mc. signal will be picked off at L103 and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst." Adjust the signal level from the signal generator for 6 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R108 and C109.

Tune the ratio detector secondary T102 bottom core for zero d-c on the "VoltOhmyst."

Repeat adjustments of T102 top for maximum d-c at pin 2 of V103 and T102 bottom for zero d-c at the junction of R108 and C109. Make the final adjustments with the signal input level adjusted to produce 6 volts d-c on the "VoltOhmyst" at pin 2 of V103.

SOUND I-F ALIGNMENT.—Connect the signal generator to the first sound i-f amplifier grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed as above.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the T101 top core for maximum d-c on the "VoltOhmyst."

The output from the signal generator should be set to produce approximately 6.0 volts on the "VoltOhmyst" when the final touches on the above adjustment are made.

4.5 MC. TRAP ADJUSTMENT.—Connect the signal generator in series with a 100 ohm resistor to pin 2 of V109. Set the generator to 4.5 mc. and modulate it 30% with 400 cycles. Set the output to approximately 0.5 volt.

Short the third pix i-f grid to ground, pin 1, V108, to prevent noise from masking the output indication.

Connect the crystal diode probe of an oscilloscope to the plate of the video amplifier, pin 9 of V110.

Adjust the core of L104 for minimum output on the oscilloscope.

Remove the short from pin 1, V108 to ground.

As an alternate method, this step may be omitted at this point in the alignment procedure and the adjustment made "on the air" after the alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L104 requires no adjustment. If a 4.5 mc. beat is present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L104 for minimum beat.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 9 of V110.

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

HORIZONTAL OSCILLATOR ADJUSTMENT.—Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R196, then adjust the T114 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T114 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T114 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C174B, the width control L109 and the linearity control L111 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T114 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T114 frequency core (on the rear apron) until the picture falls out of sync and three or four diagonal black bars sloping down to the right appear on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain three or four diagonal black bars on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T114 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture falls out of sync with the diagonal bars sloping down to the right. Continue to turn the frequency core in the same direction. No more than three or four bars should appear on the screen. Instead, the horizontal oscillator should begin the motorboat. Retouch the adjustment of the T114 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T114. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. Adjust the waveform adjustment core of T114 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment.—Set the horizon. hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C174A slightly clockwise. If less than 2 bars are present adjust C174A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present

Turn the horizontal hold control to the maximum clockwise position. Adjust the T114 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves to the left side of the screen leaving the picture in synchronization.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 15000 microvolt test pattern signal was fed into the receiver the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

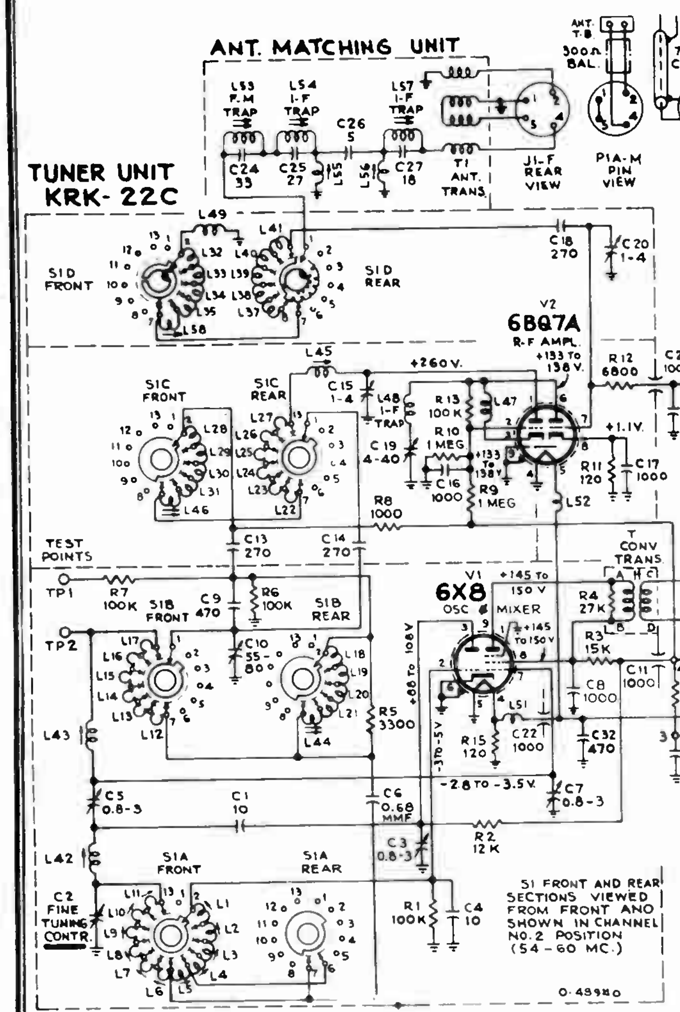
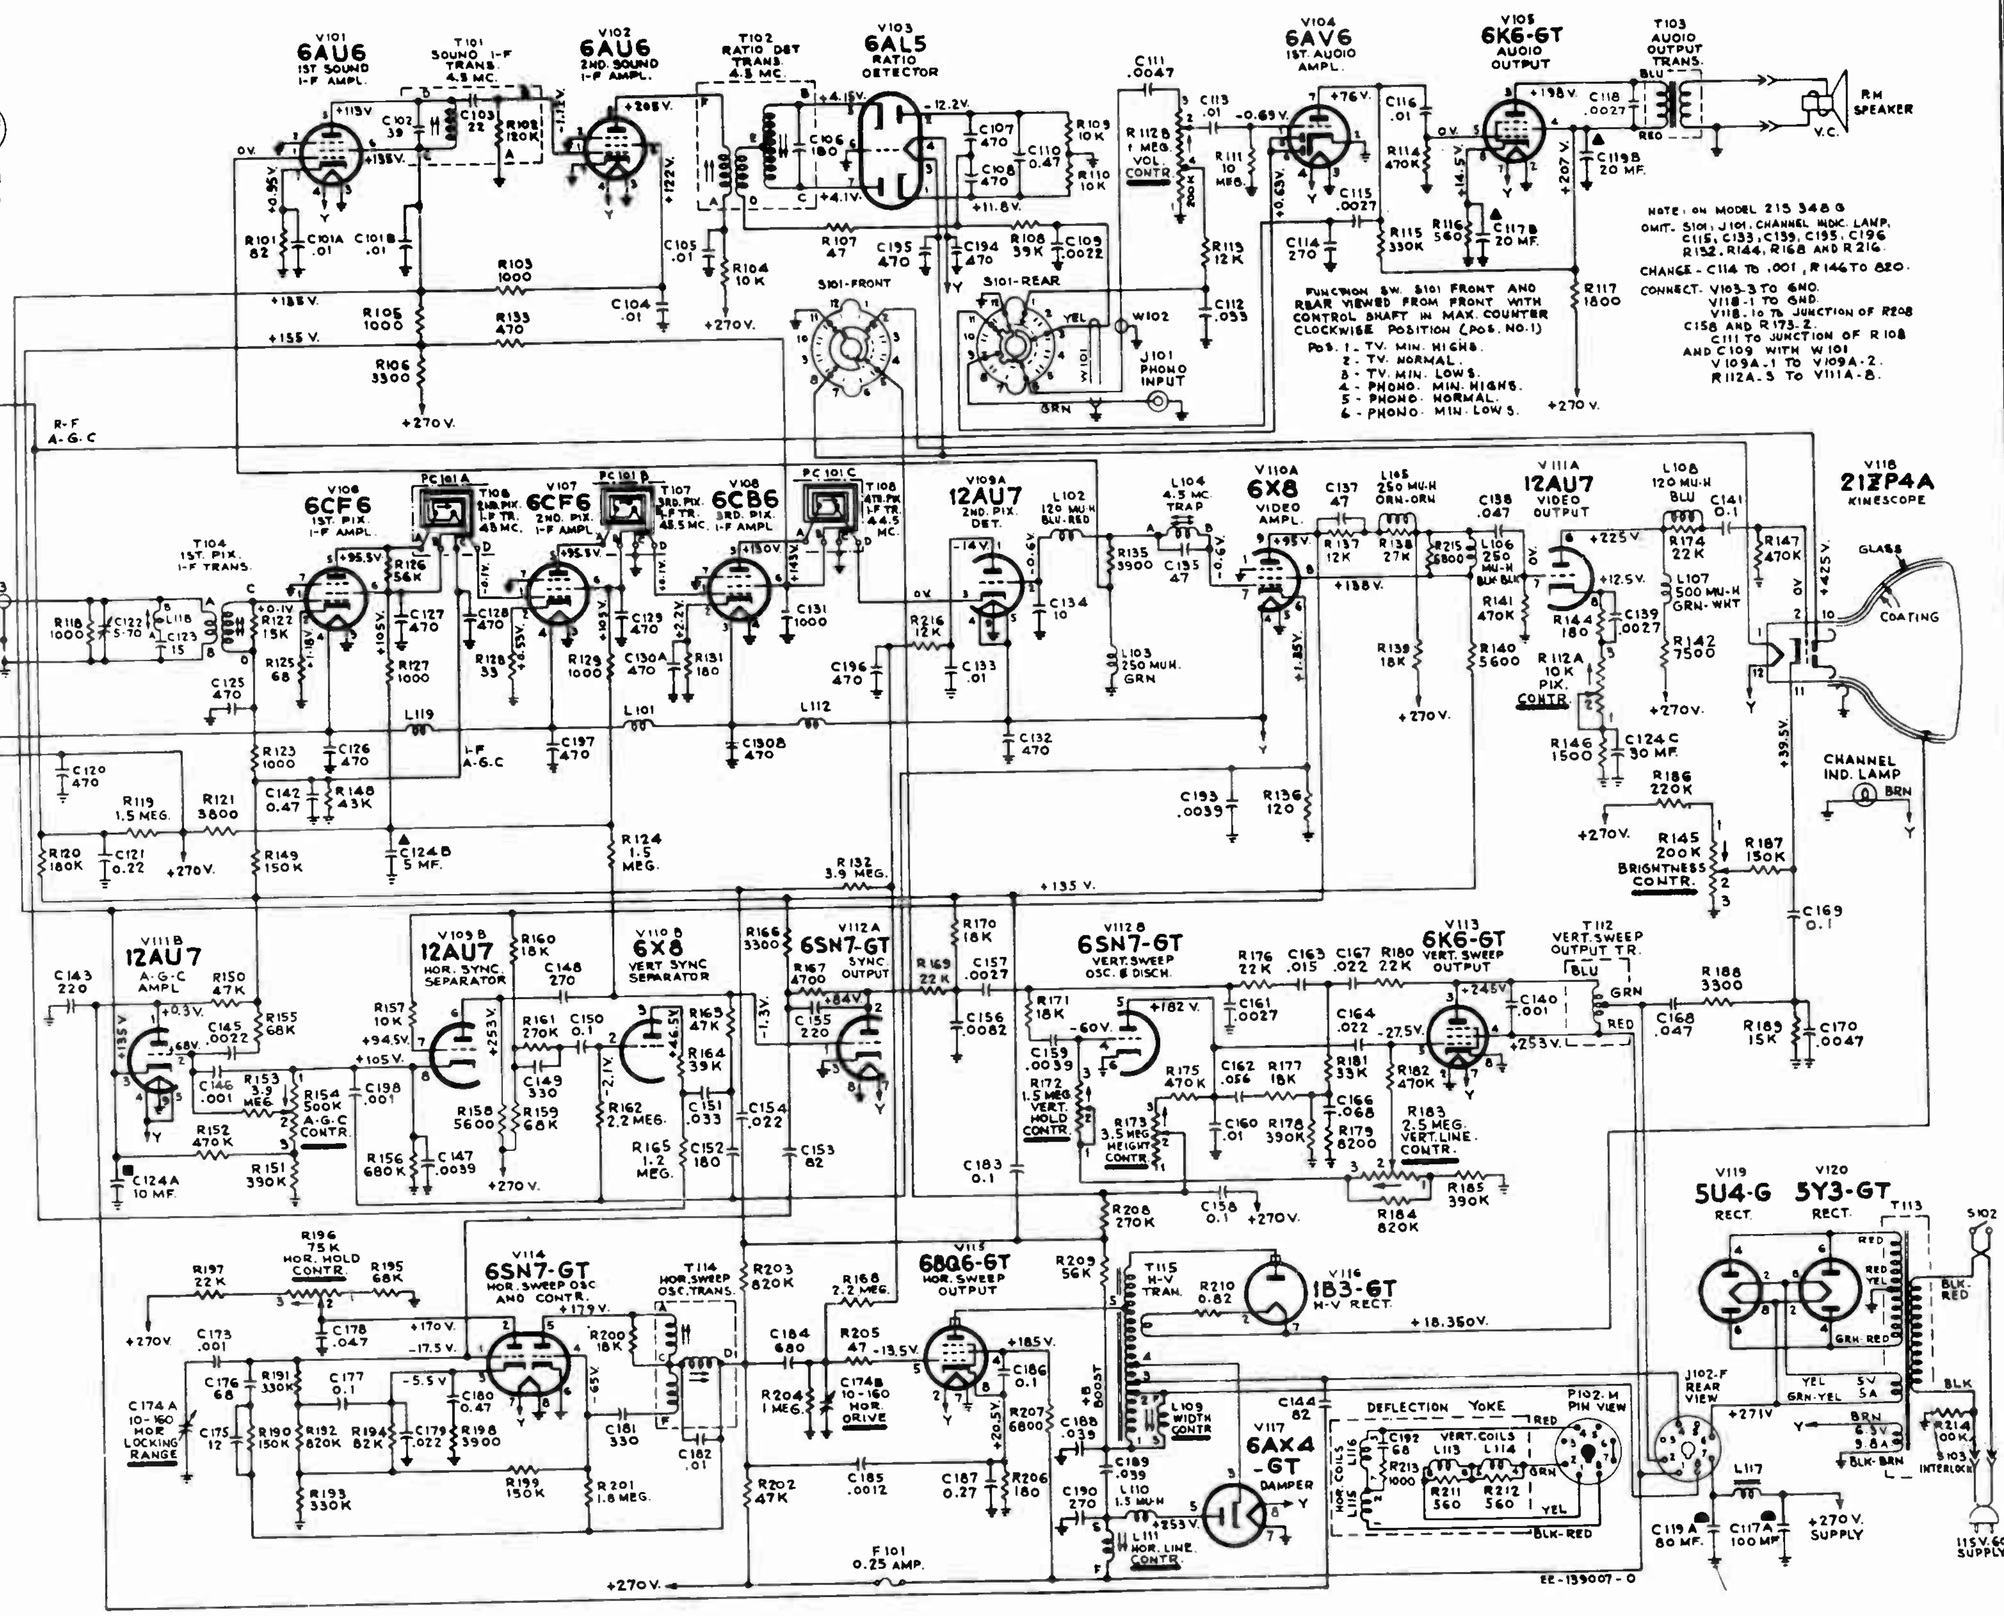
CIRCUIT SCHEMATIC DIAGRAM KCS83PK, KCS83PL   21-S348 to 21-S-369G incl.

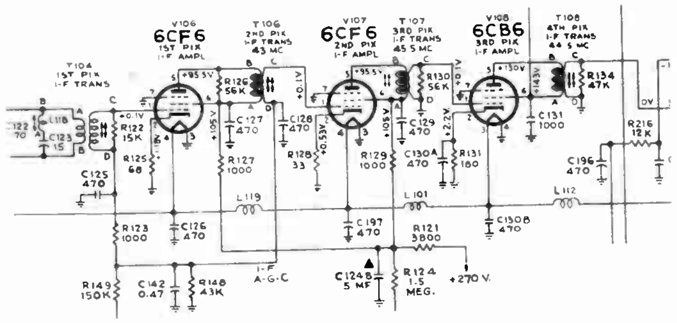




PRODUCTION CHANGES IN KCS83 SERIES CHASSIS

The schematics are shown in the latest condition. The note below tells how early receivers differed from the schematics shown above and on pages 24 and 26.

In early production receivers I-F transformers T106, T107 and T108 were individual and were connected as shown below:



(See page 23 for additional changes.)

The schematic is shown in the latest condition at the time of printing. All resistance value in ohms. K = 1000.

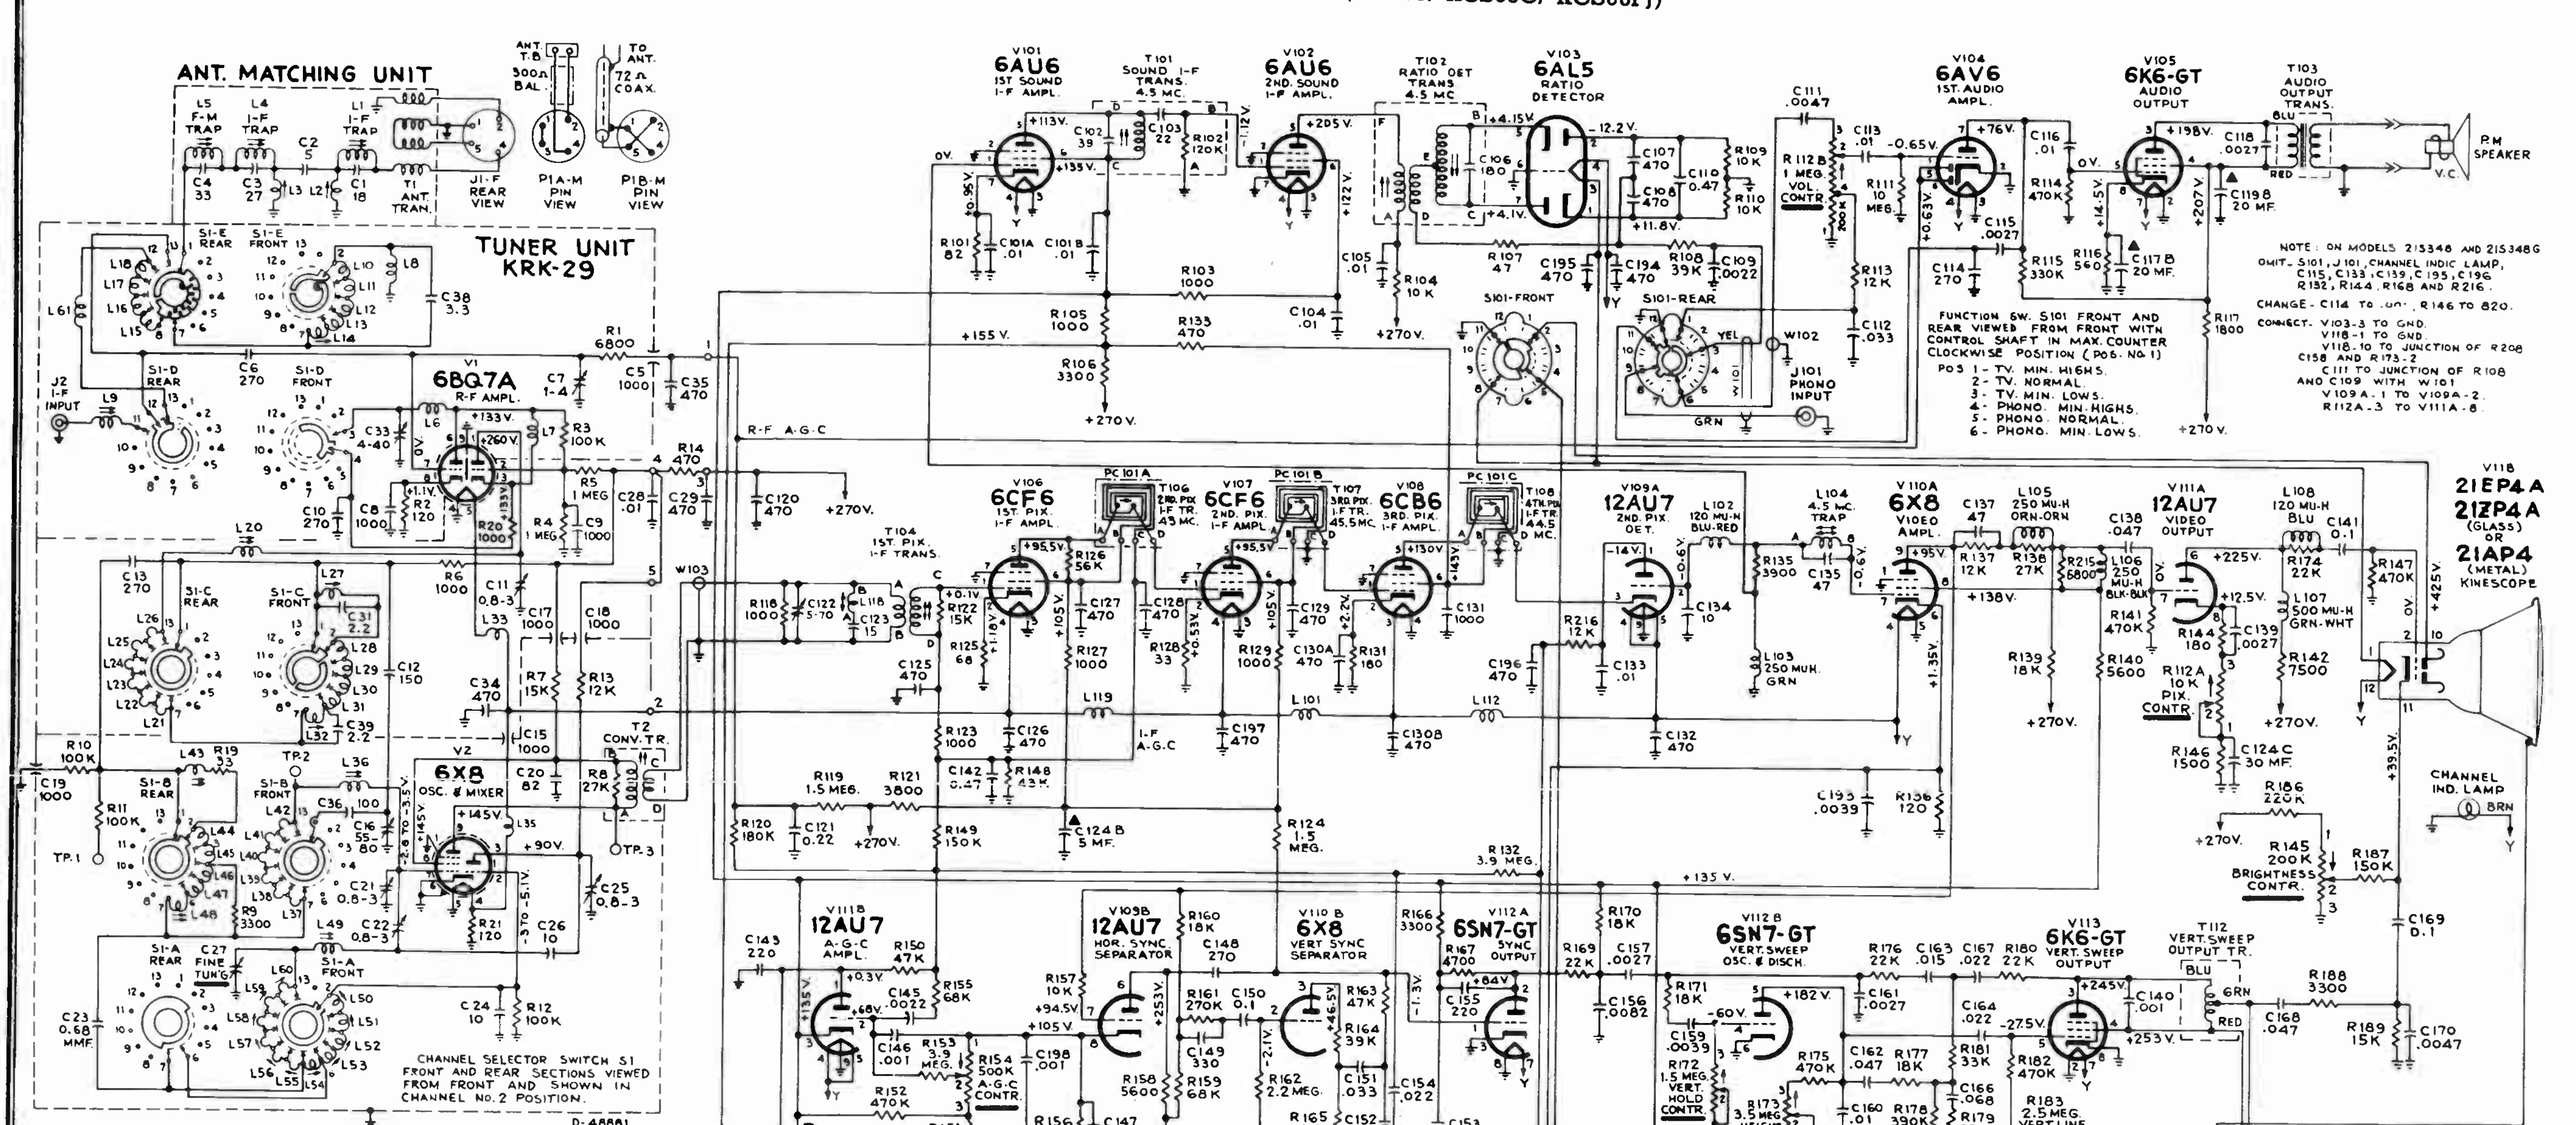
All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

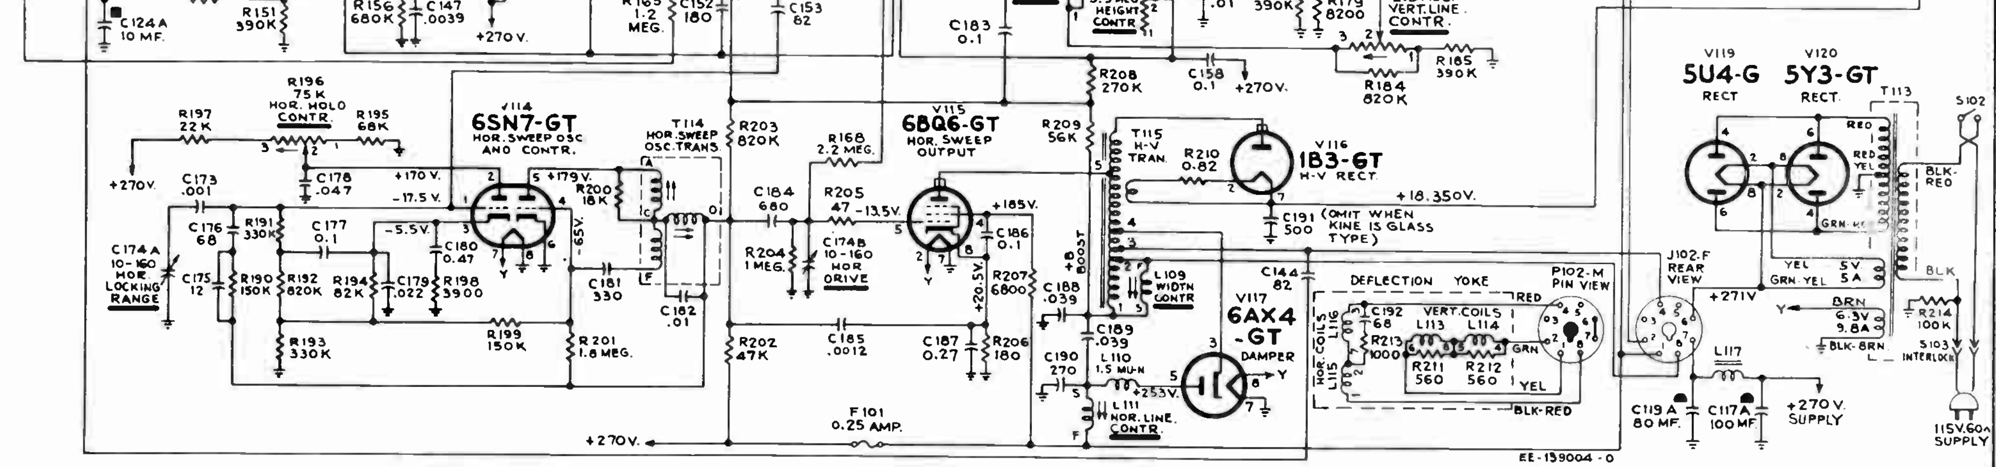
Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

Figure 30—Circuit Schematic Diagram KCS83PK, KCS83PL

CIRCUIT SCHEMATIC DIAGRAM KCS83PC (KCS83, KCS83C, KCS83PJ)





PRODUCTION CHANGES IN KCS83 SERIES CHASSIS

The schematics are shown in the latest condition. The notes below tell how early receivers differed from the schematics shown above and on pages 20 and 26.

In some receivers C7, in KRK29 and KRK29A tuners, was 0.8-3 mmf.

In some receivers C11, in KRK29 and KRK29A tuners, was 1-4 mmf.

In some receivers C20, at Pin 8 of V2, was 1000 mmf. in KRK29 and KRK29A tuners.

In some receivers a 3.3 mmf. capacitor, C32, was connected on S1B rear, in KRK29 and KRK29A tuners.

In some receivers C36 on S1B, in KRK29 and KRK29A tuners, was omitted.

In some receivers C37 on S1A, in KRK29 and KRK29A tuners, was omitted.

In some receivers C38 on S1E front, in KRK29 and KRK29A tuners, was omitted.

In some receivers C162, at pins of V112B, was .047 mfd.

In some receivers C198, .001 mfd., at pin 8 of V109B, was omitted.

In some receivers R9 was connected to terminal 2 of S1B rear in KRK29 and KRK29A tuners.

In some receivers a 39 ohm resistor R-18, was connected on S1C front from L27 to L28 in KRK29 and KRK29A tuners.

In some receivers R158, at pin 6 of V109B, was 6800 ohms.

In some receivers R185, at terminal 1 of the vertical linearity control R183, was 470,000 ohms.

In some receivers R187, at pin 11 of the Kinescope, was 270,000 ohms.

In some receivers T106, T107 and T108 were individual transformers (see page 19).

In some receivers pin 6 of V110A was connected to the junction of R162 and C152.

The schematic is shown in the latest condition at the time of printing.
All resistance value in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

78466	Coil—R.F. choke coil (L48)
77860	Connector—Grounding strap connector
77859	Connector—RF grid switch return connector (L49)
76460	Contact—Test point contact
77852	Core—Adjustable core for fine tuning capacitor
78803	Detent—Detent mechanism with steel shaft
77861	Guide—Bakelite guide for fine tuning lever
78270	Lever—Fine tuning lever
	Resistor—Fixed, composition:
503112	120 ohms, ±10%, ½ watt (R11)
504147	470 ohms, ±20%, ½ watt (R14)
504268	6800 ohms, ±20%, ½ watt (R12)
523312	12,000 ohms, ±10%, 2 watts (R2)
523315	15,000 ohms, ±10%, 2 watts (R3)
504410	100,000 ohms, ±20%, ½ watt (R1, R13)
503510	1.0 megohm, ±10%, ½ watt (R9, R10)
14343	Retainer—Fine tuning shaft retainer ring
77849	Retainer—Retainer for fine tuning spring
78232	Shaft—Fine tuning shaft and cam
78236	Shield—Front shield
76534	Shield—Tube shield
77851	Shield—"U" shape shield for underside of unit
76336	Socket—Tube socket, 9 pin miniature, saddle mounted
77856	Spring—Fine tuning core spring
78241	Spring—formed for stabilizing fine tuning lever
78800	Stator—Mixer stator complete with rotor, coils, capacitors and resistors (S2, C6, C9, C13, L12, L13, L14, L15, L16, L17, L18, L19, L20, L21, L43, L44, R5, R6, R7)
77911	Stator—Oscillator stator complete with rotor, coils and trimmer (S1, C5, L1, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L42)
78801	Stator—R.F. plate stator complete with rotor, coils, capacitors and resistors (S3, C14, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L45, L46, R8)
78802	Stator—RF grid stator complete with rotor and coils (S4, L32, L33, L34, L35, L36, L37, L38, L39, L40, L41)
78396	Transformer—Antenna matching transformer complete (T2, C24, C25, C26, C27, J1, L53, L54, L55, L56, L57)
78399	Transformer—Converter transformer (T1)

STOCK No.	DESCRIPTION
	TUNER UNIT ASSEMBLIES KRK29
76539	Board—Antenna matching transformer terminal board less coils and capacitors
78235	Board—Terminal board, 5 contact and ground
78233	Bracket—Side bracket for mounting coil and stators
77853	Capacitor—Ceramic, variable, for fine tuning capacitor—plunger type (C27)
	Capacitor—Adjustable, mica:
77616	4-40 mmf. (C33)
	Capacitor—Adjustable, steatite:
77151	0.8-3.0 mmf. (C11, C21, C25)
77913	0.8-3.0 mmf. (C22)
76532	1-4 mmf. (C7)
	Capacitor—Ceramic:
77084	Feed-thru, 1000 mmf. (C5, C15, C17, C18, C19)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0:
77865	10 mmf., ± 1 mmf., 500 volts (C26, C37)
	Capacitor—Fixed, ceramic, High "K" disc:
77293	470 mmf., +100%, —0%, 500 volts (C29, C34, C35)
77252	1000 mmf., +100%, —0%, 500 volts (C8, C9, C14)
73960	10,000 mmf., +100%, —0%, 500 volts (C28)
	Capacitor—Fixed, ceramic, insulated, High "K":
75437	100 mmf., ±20%, 500 volts (C36)
78276	150 mmf., ±10%, 500 volts (C12)
75199	270 mmf., ±20%, 500 volts (C6, C10, C13)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0:
93056	5 mmf., ±0.5 mmf., 500 volts (C2)
54207	18 mmf., ±10%, 500 volts (C1)
70935	27 mmf., ±10%, 500 volts (C3)
76739	33 mmf., ±10%, 500 volts (C4)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750:
78247	10 mmf., ±10%, 500 volts (C24)
	Capacitor—Fixed, ceramic, Temp coef.—N1400:
78603	82 mmf., ±10%, 500 volts (C20)
	Capacitor—Fixed, headed-lead:
71504	0.68 mmf., ±20%, 500 volts (C23)
71502	2.2 mmf., ±20%, 500 volts (C31, C39)
71503	3.3 mmf., ±20%, 500 volts (C38)
	Capacitor—Mica trimmer:
78397	80-150 mmf. (C16)
77854	Clip—Fine tuning clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T1)
73874	Coil—Channel #6 mixer coil (L48)
73458	Coil—Channel #6 r.f. grid coil (L14)
73460	Coil—Channel #6 r.f. plate coil (L32)
78401	Coil—Channel #6 antenna coil (L61)
77915	Coil—Channel #13 oscillator coil (L49)
77919	Coil—Channel #13 mixer coil (L36)
77921	Coil—Channel #13 r.f. plate coil (L20)
77206	Coil—Filament choke coil (L33)
76763	Coil—Heater choke coil (L34, L35)
78271	Coil—I.F. input coil complete with adjustable core (L9)
78583	Coil—Mixer I.F. Coil (L43)
78584	Coil—R.F. plate I.F. coil (L27)
76562	Coil—R.F. amplifier coupling coil (L7)
76537	Coil—Shunt coil complete with adjustable core (L3)
76538	Coil—Shunt coil complete with adjustable core (L2)
77860	Connector—Grounding strap connector
77859	Connector—RF grid switch return connector (L8)
78237	Connector—Single contact female connector for UHF connection (J2)
38853	Connector—4 contact female connector—part of antenna matching transformer (J1)
76460	Contact—Test point contact
77852	Core—Adjustable core for fine tuning capacitor
76543	Core—Adjusting core for F.M. trap
77918	Core ¼-20 x ½" adjusting core for L14, L32, L48
77914	Core—#8-32 x 27/64" adjustable core for L20, L30, L49

REPLACEMENT PARTS (Continued)

STOCK No.	DESCRIPTION
78582	Core—#10-32 x ½" adjusting core for L27, L43
78231	Detent—Detent mechanism and fibre shaft
77917	Form—Channel #6 coil form complete with core
77912	Form—Channel #13 coil form complete with core
78581	Form—Coil form complete with adjustable core for I.F. coils L27, L43
77861	Guide—Bakelite guide for fine tuning lever
78270	Lever—Fine tuning lever
76728	Nut—Speednut for capacitors 76532, 77151
78234	Plate—Mounting plate for shafts (front)
	Resistor—Fixed, composition
503033	33 ohms, ±10%, ½ watt (R19)
503112	120 ohms, ±10%, ½ watt (R2)
503147	470 ohms, ±10%, ½ watt (R14)
503210	1000 ohms, ±10%, ½ watt (R6, R20)
503233	3300 ohms, ±10%, ½ watt (R9)
503268	6800 ohms, ±10%, ½ watt (R1)
523312	12,000 ohms, ±10%, 2 watts (R13)
523315	15,000 ohms, ±10%, 2 watts (R7)
503410	100,000 ohms, ±10%, ½ watt (R3, R10, R11, R12)
503510	1 megohm, ±10%, ½ watt (R4, R5)
14343	Retainer—Fine tuning shaft retainer ring
77849	Retainer—Retainer for fine tuning spring
76549	Screw—#4-40 x ⅜" adjusting screw for L50, L51, L52, L53
75176	Screw—#4-40 x 7/16" adjusting screw for L54
76547	Screw—#4-40 x ¼" adjusting screw for L55, L56, L57, L58, L59, L60
78232	Shaft—Fine tuning shaft and cam
78236	Shield—Front shield
76534	Shield—Tube shield
77851	Shield—"U" shape shield for under-side of unit
76336	Socket—Tube socket, 9 pin, miniature saddle-mounted
77856	Spring—Fine tuning spring
78241	Spring—Formed spring for fine tuning lever
78277	Stator—Input selector switching stator complete with rotor and capacitor (S4, C10)
78272	Stator—Mixer stator complete with rotor (S2, C13, C23, C32, C36, L36, L37, L38, L39, L40, L41, L42, L43, L44, L45, L46, L47, L48, R9, R10, R11, R19)
77911	Stator—Oscillator coil and stator complete with rotor, coils and trimmer (S1, C22, C37, L49, L50, L51, L52, L53, L54, L55, L56, L57, L58, L59, L60)
78398	Stator—RF grid stator complete with rotor and coils (S5, C38, L10, L11, L12, L13, L14, L15, L16, L17, L18)
78274	Stator—RF plate stator complete with rotor, coils, capacitors and resistors (S3, C12, C31, C39, L20, L21, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L32, R6)
76740	Stud—#6-32 x 1" adjusting stud for capacitor 77913
78396	Transformer—Antenna matching transformer complete (T1)
78399	Transformer—Converter transformer (T2, R8)
76540	Trap—FM trap complete with adjustable core (L5)
78466	Trap—IF trap
76542	Trap—IF trap (41.25 mc) complete with core (L1)
76541	Trap—IF trap (45.75 mc) complete with core (L4)
75190	Washer—Insulating washer (neoprene) for capacitor
	TUNER UNIT ASSEMBLIES KRK29A
76539	Board—Antenna matching transformer terminal board less coils and capacitors
78467	Board—Terminal board—6 contact
78233	Bracket—Side bracket for mounting coil and stators
78430	Cam—Actuating cam for antenna slide switch
78417	Cam—Fine tuning cam for VHF
	Capacitor—Adjustable, mica:
77616	4-40 mmf. (C33)
	Capacitor—Adjustable, steatite:
77151	0.8-3.0 mmf. (C11, C21, C25)
77913	0.8-3.0 mmf. (C22)

STOCK No.	DESCRIPTION
76532	1-4 mmf. (C7)
	Capacitor—Ceramic:
77853	Variable, for fine tuning capacitor—plunger type (C27)
77084	Feed-thru, 1000 mmf. (C5, C15, C17, C18, C19)
	Capacitor—Fixed, ceramic, High "K" disc:
77293	470 mmf., +100%, −0%, 500 volts (C29, C34, C35, C51)
77252	1000 mmf., +100%, −0%, 500 volts (C8, C9, C14, C20)
73960	10,000 mmf., +100%, −0%, 500 volts (C28)
	Capacitor—Fixed, ceramic, insulated, High "K":
75437	100 mmf., ±20%, 500 volts (C36)
78276	150 mmf., ±10%, 500 volts (C12)
75199	270 mmf., ±20%, 500 volts (C6, C10, C13)
	Capacitor—Fixed, ceramic, noninsulated, Temp. coef. = 0:
93056	5 mmf., ±0.5 mmf., 500 volts (C2)
77865	10 mmf., ±1 mmf., 500 volts (C26, C37)
54207	18 mmf., ±10%, 500 volts (C1)
70935	27 mmf., ±10%, 500 volts (C3)
76739	33 mmf., ±10%, 500 volts (C4)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = −750:
78247	10 mmf., ±10%, 500 volts (C24)
	Capacitor—Fixed, ceramic, Temp. coef.—N1400
78603	82 mmf., ±10%, 500 volts (C20)
	Capacitor—Fixed, headed-lead:
71504	0.68 mmf., ±20%, 500 volts (C23)
71502	2.2 mmf., ±20%, 500 volts (C31)
71503	3.3 mmf., ±20%, 500 volts (C32)
77854	Clip—Fine tuning clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T1)
78401	Coil—Channel #6 antenna coil (L61)
73874	Coil—Channel #6 mixer coil (L48)
73460	Coil—Channel #6 r.f. plate coil (L32)
77919	Coil—Channel #13 mixer coil (L36)
77915	Coil—Channel #13 oscillator coil (L49)
77921	Coil—Channel #13 r.f. plate coil (L20)
78224	Coil—Choke coil (.47 muh) (L27)
77206	Coil—Filament choke coil (L33)
76763	Coil—Heater choke coil (L34, L35)
78271	Coil—I.F. input coil complete with adjustable core (L9)
76562	Coil—R.F. amplifier coupling coil (L7)
76537	Coil—Shunt coil complete with adjustable core (L3)
76538	Coil—Shunt coil complete with adjustable core (L2)
39153	Connector—4 contact male connector (P51)
38853	Connector—4 contact female connector—part of antenna matching transformer (J1)
77860	Connector—Grounding strap connector
77859	Connector—RF grid switch return connector (L8)
78237	Connector—Single contact female connector for UHF connector (J2)
76460	Contact—Test point contact
77852	Core—Adjustable core for fine tuning capacitor
76543	Core—Adjusting core for FM trap
77918	Core—¼-20 x ½" adjusting core for L32, L48
77914	Core 8-32 x 27/64" adjustable core for L20, L36, L49
78231	Detent—Detent mechanism and fibre shaft
77917	Form—Channel #6 coil form complete with core
77912	Form—Channel #13 coil form complete with core
77861	Guide—Bakelite guide for fine tuning lever
78431	Insulator—Insulator for antenna slide switch
78270	Lever—Fine tuning lever
76728	Nut—Speednut for capacitors 76532, 77151
78421	Pin—Clutch mechanism operating pin
78234	Plate—Mounting plate for shafts (front)
78423	Pulley—UHF channel marker escutcheon pulley
78420	Pulley UHF tuner drive pulley
	Resistor—Fixed, composition
503015	15 ohms, ±10%, ½ watt (R19)
503039	39 ohms, ±10%, ½watt (R18)
503112	120 ohms, ±10%, ½ watt (R2)
503147	470 ohms, ±10%, ½ watt (R14, R54)

STOCK No.	DESCRIPTION
503210	1000 ohms, ±10%, ½ watt (R6, R20)
503233	3300 ohms, ±10%, ½ watt (R9)
503268	6800 ohms, ±10%, ½ watt (R1)
523312	12,000 ohms, ±10%, 2 watts (R13)
523315	15,000 ohms, ±10%, 2 watts (R7)
523322	22,000 ohms, ±10%, 2 watts (R52)
523327	27,000 ohms, ±10%, 2 watts (R53)
503410	100,000 ohms, ±10%, ½ watt (R3, R10, R11, R12)
503510	1 megohm, ±10%, ½ watt (R4, R5)
14343	Retainer—Fine tuning shaft retainer ring
77849	Retainer—Retainer for fine tuning spring
78419	Ring—Retaining ring for UHF channel marker escutcheon pulley
76547	Screw—#4-40 x ¼" adjusting screw for L55, L56, L57, L58, L59, L60
76549	Screw—#4-40 x ⅜" adjusting screw for L50, L51, L52, L53
75176	Screw—#4-40 x 7/16" adjusting screw for L54
78418	Shaft—VHF channel selector knob shaft and clutch disc
78236	Shield—Front shield
76534	Shield—Tube shield
77851	Shield—"U" shape shield for underside of unit
76336	Socket—Tube socket, 9 pin, miniature saddle-mounted
78427	Spring—Clutch mechanism operating pin coil spring
77856	Spring—Fine tuning spring
78241	Spring—Formed spring for fine tuning lever
78422	Spring—Formed spring for actuating clutch disc
78428	Spring—UHF channel marker escutcheon pulley coil spring
78277	Stator—Input selector switching stator complete with rotor and capacitor (S4, C10)
78272	Stator—Mixer stator complete with rotor (S2, C13, C23, C36, L36, L37, L38, L39, L40, L41, L42, L43, L44, L45, L46, L47, L48, R9, R10, R11, R19)
77911	Stator—Oscillator coil and stator complete with rotor, coils and trimmer (S1, C22, C37, L49, L50, L51, L52, L53, L54, L55, L56, L57, L58, L59, L60)
78398	Stator—RF grid stator complete with rotor and coils (S5, L10, L11, L12, L13, L14, L15, L16, L17, L18)
78274	Stator—RF plate stator complete with rotor, coils, capacitors and resistors (S3, C12, C31, L20, L21, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L32, R6, R18)
76740	Stud—#6-32 x 1" adjusting stud for capacitor 77913
78429	Switch—Antenna slide switch (S51)
78396	Transformer—Antenna matching transformer complete (T1)
78399	Transformer—Converter transformer (T2, R8)
76540	Trap—FM trap complete with adjustable core (L5)
78466	Trap—I.F. trap (L6)
76542	Trap—I.F. trap (41.25 mc) complete with core (L1)
76541	Trap—I.F. trap (45.75 mc) complete with core (L4)
78426	Washer—"C" washer for clutch mechanism
75190	Washer—Insulating washer (neoprene) for capacitor
78424	Washer—Retaining washer for knob shaft spring
78425	Washer—Spring washer for clutch mechanism
	TUNER UNIT ASSEMBLIES KRK27
76522	Bracket—Vertical bracket for oscillator tube shield
76961	Spring—Retaining spring for oscillator tube shield and vertical bracket
	Capacitor—Adjustable, steatite:
78259	0.6-1.4 mmf. complete with adjustable core (C7, C8)
	Capacitor—Fixed, ceramic:
77084	1000 mmf., feed-thru (C2, C10, C11, C12)

STOCK No.	DESCRIPTION
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0:
78262	7 mmf., ±0.5 mmf., 500 volts DC (C6)
78261	22 mmf., ±5%, 500 volts DC (C5)
70596	33 mmf., ±5%, 500 volts DC (C9)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = −750:
78263	0.75 mmf. ±0.25 mmf., 500 volts DC (C13)
	Capacitor—Fixed, headed-lead:
78137	0.51 mmf., ±10%, 500 volts DC (C3)
78260	0.62 mmf., ±10%, 500 volts DC (C4)
71502	2.2 mmf., ±10%, 500 volts DC (C14)
78257	Capacitor—Variable tuning capacitor (C1A, C1B, C1C, C1D, C15, C16, L1, L2)
78258	Coil—I.F. coil complete with adjustable core (L7)
78264	Coil—Peaking coil (L3, R1)
72618	Coil—Peaking coil (20 muh) (L4)
78267	Coil—RF choke coil (0.15 muh) (L10, L11)
77279	Coil—RF choke coil (0.33 muh) (L8, L9)
78269	Connector—Single contact male connector for I.F. output cable
78255	Connector—2 contact female connector for UHF antenna (J1)
78256	Holder—Crystal holder
77489	Rectifier—Crystal rectifier IN82 (CR1)
	Resistor—Fixed, composition:
503110	100 ohms, ±10%, ½ watt (R2)
503215	1500 ohms, ±10%, ½ watt (R3)
503222	2200 ohms, ±10%, ½ watt (R5)
503268	6800 ohms, ±10%, ½ watt (R4)
78252	Shield—Oscillator shield
78253	Shield—RF shield
78254	Shield—Shield for crystal rectifier
76967	Shield—Tube shield
77274	Socket—Tube socket, miniature, 7 pin, ceramic, saddle-mounted
78265	Strip—Inductance strip (L5)
78266	Strip—Inductance strip and plate (L6)
78268	Transformer—Antenna input transformer (T1)
	CHASSIS ASSEMBLIES KCS83 (VHF-KRK29), KCS83A (VHF/UHF-KRK29A/27), KCS83C (VHF-KRK29), KCS83D (VHF-KRK29), KCS83PC (VHF-KRK29), KCS83PD (UHF/VHF-KRK29A/27), KCS83PJ (VHF-KRK29), KCS83PK (VHF-KRK22C), KCS83PL (VHF-KRK22C), KCS83PM (UHF/VHF-KRK29A/27)
78402	Board—Antenna terminal board for KCS83A, KCS83D, KCS83PD, KCS83PM
	Capacitor—Adjustable, mica:
78220	5-70 mmf. (C122)
	Capacitor—Fixed, ceramic:
78225	82 mmf., ±10%, 3500 volts (C144)
76488	500 mmf., 25,000 volts for KCS63, KCS83A only
	Capacitor—Fixed, ceramic, High "K" disc:
	470 mmf., ±20%, 500 volts (C127, C129)
77293	470 mmf., +100%, −0%, 500 volts (C120, C125, C126, C128, C132, C194, C195, C196, C197)
77672	Dual 470 mmf., +100%, −0%, 500 volts (C130A, C130B)
78623	1000 mmf., ±20%, 500 volts (C131)
73960	10,000 mmf., +100%, −0%, 500 volts (C104, C105, C133)
76991	Dual 10,000 mmf., +100%, −0%, 500 volts (C101A, C101B)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = −750:
33098	10 mmf., ±1 mmf., 500 volts (C134)
33380	12 mmf., ±10%, 500 volts (C175)
39044	15 mmf., ±5%, 500 volts (C123)
39042	47 mmf., ±5%, 500 volts (C137)
71922	180 mmf., ±10%, 500 volts (C152)
47617	270 mmf., ±10%, 500 volts (C114)—except KCS83PJ, KCS83PL, KCS83PM
	Capacitor—Fixed, mica:
76475	68 mmf., ±5%, 1000 volts (C176)
76474	82 mmf., ±5%, 1000 volts (C153)

STOCK No.	DESCRIPTION
39636	220 mmf., ±10%, 500 volts (C155)
75248	220 mmf., ±10%, 1000 volts (C143)
76579	270 mmf., ±10%, 1000 volts (C148, C190)
39640	330 mmf., ±10%, 500 volts (C149)
76476	330 mmf., ±5%, 1000 volts (C181)
39644	470 mmf., ±5%, 500 volts (C107, C108)
	Capacitor—Mica trimmer:
75217	Dual 10-160 mmf. (C174A, C174B)
	Capacitor—Electrolytic:
78213	Comprising: 1 section of 10 mfd., 350 volts 1 section of 5 mfd., 350 volts and 1 section of 30 mfd., 50 volts (C124A, C124B, C124C)
77644	Comprising: 1 section of 80 mfd., 400 volts and 1 section of 20 mfd., 400 volts (C119A, C119B)
78212	Comprising: 1 section of 100 mfd., 400 volts and 1 section of 20 mfd., 50 volts (C117A, C117B)
	Capacitor—Fixed, paper, oil impregnated:
75643	.001 mfd., 1000 volts (C140, C146, C173, C198) C114 in KCS83PJ, KCS83PL, KCS83PM only
73595	.002 mfd., 600 volts (C109, C145)
73599	.0027 mfd., 600 volts (C115, C139, C157, C161)
73818	.0027 mfd., 1600 volts (C118)
73796	.0039 mfd., 600 volts (C147, C193)
73920	.0047 mfd., 600 volts (C111, C170)
73808	.0082 mfd., 1000 volts (C156)
73561	.01 mfd., 400 volts (C113, C116)
73551	.01 mfd., 400 volts (C150, C158, C169, C177)
73565	.01 mfd., 1000 volts (C160)
73797	.015 mfd., 600 volts (C163)
73562	.022 mfd., 400 volts (C179)
73798	.022 mfd., 600 volts (C164, C167)
73810	.022 mfd., 1000 volts (C154)
73552	.033 mfd., 400 volts (C112, C151)
73813	.039 mfd., 1000 volts (C188, C189)
73553	.047 mfd., 400 volts (C178)
73592	.047 mfd., 600 volts (C138, C162, C168)
73792	.068 mfd., 400 volts (C166)
73557	.1 mfd., 600 volts (C141, C183, C186)
73794	.22 mfd., 400 volts (C121)
73786	.27 mfd., 200 volts (C187)
73787	.47 mfd., 200 volts (C110, C142, C180)
	Capacitor—Fixed, moulded paper, mineral oil impregnated:
76479	.00068 mfd., 600 volts (C184)
76995	.0012 mfd., 600 volts (C185)
78221	.0039 mfd., 600 volts (C159)
73594	.01 mfd., 600 volts (C182)
77676	Choke—Filter choke (L117)
73477	Coil—Filament choke coil (L101, L112, L119)
76442	Coil—Horizontal linearity coil complete with adjustable core (L111)
75253	Coil—Peaking coil (120 muh) (L102)
71529	Coil—Peaking coil (120 muh) (L108, R174)
71526	Coil—Peaking coil (250 muh) (L103)
77674	Coil—Peaking coil (250 muh) (L105, R138)
78222	Coil—Peaking coil (250 muh) (L106, R215)
75252	Coil—Peaking coil (500 muh) (L107)
76640	Coil—RF choke coil (1.5 muh) (L110)
78205	Coil—Width coil complete with adjustable core (L109)
74594	Connector—2 contact male connector for power cord
78306	Connector—2 contact male connector for antenna cable W106 for KCS83A, KCS83D
50367	Connector—6 contact female connector for yoke leads (J102)
78244	Connector—Anode connector for KCS83C, KCS83D
35787	Connector—Phono input connector (J101)—except KCS83PJ, KCS83PL, KCS83PM
75474	Connector—Single contact male connector for speaker leads
76975	Control—AGC control (R154)
78209	Control—Brightness control (R145)—except KCS83PJ, KCS83PL, KCS83PM

STOCK No.	DESCRIPTION
79088	Control—Brightness control—for KCS83PJ, KCS83PL, KCS83PM
78206	Control—Height control (R173)
77639	Control—Horizontal hold control (R196)
78208	Control—Picture control, volume control and power switch (R112A, R112B, S102)
78210	Control—Vertical hold control (R172)
78207	Control—Vertical linearity control (R183)
72953	Cord—Tuner drive cord (approx. 25" overall) for KCS83A, KCS83D
72953	Cord—UHF channel marker escutcheon drive cord (approx. 16" overall) for KCS83A, KCS83D
78199	Cover—Hi-voltage compartment cover
78214	Fuse—.3 amps., 250 volts (F101)
78406	Gear—Tuner drive gear—for KCS83A, KCS83D
76459	Grommet—Rubber grommet for 2nd anode lead connector
78218	Holder—Fuse holder
78215	Insulator—Polystyrene insulator for hi-voltage socket
78226	Lead—Anode lead complete with eyelet for KCS83, KCS83A
78743	Printed Circuit—I.F. transformer circuit (T106, T107, T108)—for KCS83PC, KCS83PD, KCS83PJ, KCS83PK, KCS83PL, KCS83PM
78404	Pulley—Tuner driven pulley (2½" dia.) complete with bushing for KCS83A, KCS83D)
78405	Pulley—UHF channel marker escutcheon drive pulley for KCS83A, KCS83D
	Resistor—Fixed, wire wound:
76382	0.82 ohms, 1/3 watts (R210)
76639	180 ohms, 2 watts (R206)
77670	3300 ohms, 7 watts (R106)
77671	3800 ohms, 7 watts (R121)
	Resistor—Fixed, composition:
502033	33 ohms, ±5%, ½ watt (R128)
503047	47 ohms, ±10%, ½ watt (R107, R205)
502068	68 ohms, ±5%, ½ watt (R125)
503082	82 ohms, ±10%, ½ watt (R101)
503112	120 ohms, ±10%, ½ watt (R136)
502118	180 ohms, ±5%, ½ watt (R131)
503118	180 ohms, ±10%, ½ watt (R144)
503147	470 ohms, ±10%, ½ watt (R133)
513156	560 ohms, ±10%, 1 watt (R116)
503182	820 ohms, ±10%, ½ watt (R146)—for KCS83PJ, KCS83PL, KCS83PM only
503210	1000 ohms, ±10%, ½ watt (R103, R118, R123, R127, R129)
513210	1000 ohms, ±10%, 1 watt (R105)
503215	1500 ohms, ±10%, ½ watt (R146)—except KCS83PJ, KCS83PL, KCS83PM
523218	1800 ohms, ±10%, 2 watts (R117)
30733	3300 ohms, ±5%, ½ watt (R166)
503233	3300 ohms, ±10%, ½ watt (R188)
502239	3900 ohms, ±5%, ½ watt (R135)
503239	3900 ohms, ±10%, ½ watt (R198)
503247	4700 ohms, ±10%, ½ watt (R167)
503256	5600 ohms, ±10%, ½ watt (R140, R158)
523268	6800 ohms, ±10%, 2 watts (R207)
512275	7500 ohms, ±5%, 1 watt (R142)
503282	8200 ohms, ±10%, ½ watt (R179)
502310	10,000 ohms, ±5%, ½ watt (R109, R110)
503310	10,000 ohms, ±10%, ½ watt (R157)
523310	10,000 ohms, ±10%, 2 watts (R104)
503312	12,000 ohms, ±10%, ½ watt (R113, R137, R216)
503315	15,000 ohms, ±10%, ½ watt (R122, R189)
502318	18,000 ohms, ±5%, ½ watt (R177)
503318	18,000 ohms, ±10%, ½ watt (R160, R170, R171, R200)
523318	18,000 ohms, ±10%, 2 watts (R139)
502322	22,000 ohms, ±5%, ½ watt (R180)
503322	22,000 ohms, ±10%, ½ watt (R169, R176, R197)
502333	33,000 ohms, ±5%, ½ watt (R181)
503339	39,000 ohms, ±10%, ½ watt (R108, R164)
502343	43,000 ohms, ±5%, ½ watt (R148)
503347	47,000 ohms, ±10%, ½ watt (R134, R163)
512347	47,000 ohms, ±5%, 1 watt (R202)
513347	47,000 ohms, ±10%, 1 watt (R150)

STOCK No.	DESCRIPTION
502356	56,000 ohms, ±5%, ½ watt (R126, R130)
503356	56,000 ohms, ±10%, ½ watt (R209)
503368	68,000 ohms, ±10%, ½ watt (R155, R159, R195)
503382	82,000 ohms, ±10%, ½ watt (R194)
503410	100,000 ohms, ±10%, ½ watt (R214)
502415	150,000 ohms, ±5%, ½ watt (R149)
503415	150,000, ±10%, ½ watt (R187, R190)
512415	150,000 ohms, ±5%, 1 watt (R199)
502418	180,000 ohms, ±5%, ½ watt (R120)
503422	220,000 ohms, ±10%, ½ watt (R186)
503427	270,000 ohms, ±10%, ½ watt (R161, R208)
503433	330,000 ohms, ±10%, ½ watt (R115, R191, R193)
503439	390,000 ohms, ±10%, ½ watt (R151, R178)
502447	470,000 ohms, ±5%, ½ watt (R185)
503447	470,000 ohms, ±10%, ½ watt (R114, R141, R147, R152, R175, R182)
503468	680,000 ohms, ±10%, ½ watt (R156)
502482	820,000 ohms, ±5%, ½ watt (R184)
503482	820,000 ohms, ±10%, ½ watt (R192, R203)
503510	1 megohm, ±10%, ½ watt (R204)
503512	1.2 megohm, ±10%, ½ watt (R165)
502515	1.5 megohm, ±5%, ½ watt (R119, R124)
512518	1.8 megohm, ±5%, 1 watt (R201)
503522	2.2 megohm, ±10%, ½ watt (R162, R168)
503539	3.3 megohm, ±10%, ½ watt (R132, R153)
503610	10 megohm, ±10%, ½ watt (R111)
78408	Screw—#6-32 x ¼" square head cup point set screw for pulleys and drive gear for KCS83A, KCS83D
78407	Shaft—Tuner connecting shaft for KCS83A, KCS83D
78198	Shield—Shield for hi-voltage compartment
73584	Shield—Tube shield for V101, V102, V103, V108
76972	Shield—Tube shield for V109
75718	Socket—Channel indicator lamp socket
74834	Socket—Kinescope socket
78216	Socket—Tube socket, 6 pin, wafer complete with shield for V116
50367	Socket—Tube socket, 6 pin, moulded saddle-mounted for V117
73117	Socket—Tube socket, 7 pin, miniature wafer for V101, V102, V103, V104, V106, V107, V108
31251	Socket—Tube socket, octal, wafer for V105, V112, V115, V119, V120
50367	Socket—Tube socket, octal, moulded saddle-mounted for V113
77645	Socket—Tube socket, octal, wafer for V114
76971	Socket—Tube socket, 9 pin, miniature wafer for V109, V119, V111
78409	Spring—Tuner drive cord tension spring for KCS83A, KCS83D
78410	Spring—UHF channel marker escutcheon drive cord tension spring for KCS83A, KCS83D
78403	Stop—Metal stop for connecting shaft for KCS83A, KCS83D
78243	Strap—Polystyrene strap (8½") for 2nd. anode lead for KCS83C, KCS83D
78217	Support—Support to hold RF unit on side of chassis—except KCS83PJ, KCS83PK, KCS83PL
78211	Switch—TV—phono-tone switch (S101)—except KCS83PJ, KCS83PL, KCS83PM
78201	Transformer—Hi-voltage transformer (T115)
76440	Transformer—Horizontal. oscillator transformer complete with adjustable core (T114)
76997	Transformer—Output transformer (T103)
78200	Transformer—Power transformer, 117 volts, 60 cycle (T113)
77112	Transformer—Ratio detector transformer complete with adjustable core (T102, C106)
76981	Transformer—Sound I.F. transformer complete with adjustable core (T101, C102, C103, R102)
78202	Transformer—Vertical output transformer (T112)
78203	Transformer—1st I.F. pix transformer complete with adjustable core (T104)
76433	Transformer—2nd, 3rd, 4th, I.F. transformer (T106, T107, T108)—except KCS83PC, KCS83PD, KCS83PJ, KCS83PK, KCS83PL, KCS83PM

STOCK No.	DESCRIPTION
78204	Trap—1st I.F. grid trap complete with adjustable core (L118)
76983	Trap—4.5 MC trap (L104, C135)
78219	Washer, Vellutex washer for tube socket and shield
	YOKE & MAGNET ASSEMBLIES
76863	Connector—Anode connector complete with contact and terminal for Models 21S362M, 21S362MU
75542	Connector—6 contact male connector for deflection yoke (P102)
78309	Cushion—Round rubber cushion for deflection yoke
74956	Cushion—Rubber cushion for deflection yoke hood
78308	Hood—Deflection yoke hood less rubber cushions
76168	Magnet—Focus magnet
76141	Magnet—Ion trap magnet
76633	Magnet—Pin cushion correction magnet complete with support arm for either glass kinescope
78307	Plate—Metal plate for deflection yoke
78817	Plate—Deflection yoke hood plate—(all chassis with printed circuit IF)
78445	Spring—Grounding spring (coil) for deflection yoke
78310	Strap—Ground strap (formed) for deflection yoke hood for Models with glass kinescopes
76636	Stud—Adjusting stud complete with guard for focus magnet
76616	Yoke—Deflection yoke complete with 6 contact male connector (L113, L114, L115, L116, P102, C192, R211, R212, R213)
77697	Yoke—Deflection yoke complete with 6 contact male connector (L113, L114, L115, L116, C192, R211, R212, R213) for all chassis with printed circuit IF
	SPEAKER ASSEMBLIES 971636-1W RL101C5 RMA274 (For Models 21S348, 21S348U, 21S348G, 21S348GU, 21S353, 21S353U, 21S354, 21S354U, 21S354G, 21S354GU)
77000	Speaker—5" PM speaker complete with cone and voice coil (3.2 ohms)
	SPEAKER ASSEMBLIES 971490-3W 971490-3R RL105E6 RMA-274 RMA-285 (For Models 21S362M, 21S362MU)
75024	Cone—Cone and voice coil for speakers stamped 971490-3W
77129	Cone—Cone and voice coil for speakers stamped 971490-3W 971490-3R
75022	Speaker—8" PM speaker complete with cone and voice coil (3.2 ohms)
	SPEAKER ASSEMBLIES 971490-4W RL105E11 RMA-274 (For Models 21S362G, 21S367G, 21S369G, 21S362GU, 21S367GU, 21S369GU)
75024	Cone—Cone and voice coil (3.2 ohms)
77872	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms)

NOTE: If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to Model number of instruments, number stamped on speaker and full description of part required.

Models
17-S-350, 17-S-350U
"Brent"
Metal-Brown
Maroon, Blonde

Models
17-S-351, 17-S-351U
"Bristol"
Metal-Mahogany Grain

Models
17-S-360, 17-S-360U
"Denham"
Antique Dark Red

GENERAL DESCRIPTION

Models 17-S-350, 17-S-350U, 17-S-351, 17-S-351U, 17-S-360 and 17-S-360U are "17 inch" television receivers. Models 17-S-350, 17-S-351 and 17-S-360 are identical except for kinescopes, cabinets, and speakers. Models 17-S-350U, 17-S-351U and 17-S-360U are identical except for kinescopes, cabinets, and speakers. Models 17-S-350, 17-S-351 and 17-S-360 feature full 12 channel VHF coverage. Models 17-S-350U, 17-S-351U and 17-S-360U feature full 12 channel VHF coverage plus any UHF channels desired.

All models include intercarrier FM sound system; ratio detector; improved picture brilliance; pulsed picture A-G-C; A-F-C horizontal hold; stabilized vertical hold; noise saturation circuits; improved sync separator (3.5 mc. band width for picture channel); and reduced hazard high voltage supply. An auxiliary audio input jack is provided to permit the use of an external record playing attachment.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE
...146 sq. ins. on a 17CP4 or a 17QP4 Kinescope

TELEVISION R-F FREQUENCY RANGE

Models 17-S-350, 17-S-351 & 17-S-360

All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

Models 17-S-350U, 17-S-351U & 17-S-360U

Any of 70 UHF channels .... 470 mc. to 890 mc.
Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency .... 45.75 mc.
Sound I-F Carrier Frequency .... 41.25 mc.

POWER RATING .... 215 watts
AUDIO POWER OUTPUT RATING .... 4 watts max.
VIDEO RESPONSE .... To 3.5 mc.
SWEEP DEFLECTION .... Magnetic
FOCUS .... Magnetic

ANTENNA INPUT IMPEDANCE

Models 17-S-350, 17-S-351 & 17-S-360

Choice: 300 ohms balanced or 72 ohms unbalanced.

Models 17-S-350U, 17-S-351U & 17-S-360U

UHF—300 ohms balanced.
VHF—300 ohms balanced.

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK29 (17-S-350, 17-S-351 & 17-S-360)	
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK29A/27 (17-S-350U, 17-S-351U & 17-S-360U)	
(1) RCA 6AF4	UHF Oscillator
(2) RCA 6BQ7A	VHF R-F Amplifier UHF I-F Amplifier
(3) 6X8	VHF R-F Oscillator and Mixer UHF I-F Amplifier

A 1N82 crystal is used as the UHF mixer.

Tube Used	Function
All Models	
(1) RCA 6CF6	1st Picture I-F Amplifier
(2) RCA 6CF6	2nd Picture I-F Amplifier
(3) RCA 6CB6	3rd Picture I-F Amplifier
(4) RCA 12AU7	Picture 2nd Detector and Vert. Sync. Sep.

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
  35 to 90 mc., 1 mc. to 12 mc. sweep width
  170 to 225 mc., 12 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) Intermediate frequencies
  4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA Types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
14	471.25	475.75	517
15	477.25	481.75	523
16	483.25	487.75	529
17	489.25	493.75	535
18	495.25	499.75	541
19	501.25	505.75	547

83	885.25	889.75	931

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 5 millivolts per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

KRK29 or KRK29A ANTENNA MATCHING UNIT ALIGNMENT.—The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L5 to the channel selector switch S1-E.

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R127 and R148. Set the potentiometer to produce approximately —5.0 volts of bias at the junction of R127 and R148.

Connect an oscilloscope to pin 2, V110 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L4 in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L1 for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L5 to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L5 to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 19 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by retuning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L2 and L3 to obtain the response shown in Figure 20. L3 is most effective in locating the position of the shoulder of the curve at 52 mc. and L2 should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L5 and S1-E. Replace V106.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—

Models 17-S-350, 17-S-351 & 17-S-360

Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R147 and R148 and to ground.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction of R147 and R148.

Set the bias to produce approximately —5.0 volt of bias at the junction of R147 and R148.

Connect the "VoltOhmyst" to the juncture of R138 and L105 and to ground.

Set the VHF signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst" During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R138, L105 with minus 5.0 volts of i-f bias at the junction of R147 and R148.

44.5 mc.	T108
45.5 mc.	T107
43.0 mc.	T106

Set the VHF signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at R138, L105. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the adjustment is made.

47.25 mc.	T104 top core

Models 17-S-350U, 17-S-351U & 17-S-360U

Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R147 and R148 and to ground.

Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction of R147 and R148. Adjust the potentiometer for —5.0 volts indication on the "VoltOhmyst".

Connect the "VoltOhmyst" to the junction of R138 and L105 and to ground.

Set the VHF generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for maximum indication on the "VoltOhmyst". In each instance the generator should be checked against a crystal calibrator to insure that the generator is on frequency.

During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R138, L105 with —5.0 volts of i-f bias at the junction of R147 and R148.

44.5 mc.	T108
45.5 mc.	T107
43.0 mc.	T106

Set the signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at R138, L105. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the adjustment is made.

47.25 mc.	T104 top core

SWEEP ALIGNMENT OF PIX I-F.—

Models 17-S-350, 17-S-351 & 17-S-360

To align T2 and T104, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the r-f unit outer shield.

Set the channel selector switch to channel 4.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Preset C119 to minimum capacity.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R147 and R148. Set the AGC control fully clockwise.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T2 (top) and T104 (bottom) for maximum gain and with 45.75 mc. at 70% of maximum response.

Set the sweep output to give 0.3 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C119 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 23.

Disconnect the diode probe, the 180 ohm and two 330 ohm resistors.

Connect the oscilloscope to the junction of R138 and L105.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 24.

Models 17-S-350U, 17-S-351U & 17-S-360U

To align T2 and T104, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the r-f unit outer shield.

Set the channel selector switch to channel 4.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Preset C119 to minimum capacity.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R147 and R148. Set the AGC control fully clockwise.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T2 (top) and T104 (bottom) for maximum gain and with 45.75 mc. at 70% of maximum response.

Set the sweep output to give 0.3 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C119 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 12.

ALIGNMENT PROCEDURE

Disconnect the diode probe, the 180 ohm and two 330 ohm resistors.

Connect the oscilloscope to the junction of R138 and L105.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 13.

To align the I-F amplifier circuit of the KRK29A/27, connect the VHF sweep generator to the rear terminal of the 1N82 crystal holder in series with 1000 ohms and a 1500 mmf ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the r-f unit outer shield.

Set the UHF changeover switch to the UHF position, and the UHF tuning to channel 47 at 670 mc.

Connect a 180 ohm composition resistor and a 1500 mmf capacitor in series between test point TP3 and ground with the capacitor connected to TP3 and the resistor to ground. Connect the oscilloscope diode probe to the junction between the resistor and capacitor.

Couple the VHF signal generator loosely to the diode probe in order to obtain markers.

Connect the potentiometer arm of the second bias supply to the AGC terminal on the KRK29A tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the sweep generator to produce 0.3 volts or less peak-to-peak on the oscilloscope.

Adjust L307, on the KRK27 section, and L9, on the KRK29A section of the tuner, for maximum gain with picture and sound carrier markers as shown in Figure 14.

Remove the resistor, capacitor and diode probe from TP3. Connect the oscilloscope to the junction of R138 and L105. Use 3v. peak-to-peak on the oscilloscope. Retouch L307 and L9 slightly, if necessary to produce the curve shown in Figure 14.

Do not retouch T2, T104, T106, T107 or T108.

Connect the VHF sweep generator to the antenna terminals. Keep the AGC bias at —3.0 volts and the I-F bias at —5.0 volts. Couple the signal generator loosely to the grid of the first picture I-F amplifier, Pin 1 of V106. Switch through all VHF Channels and check for proper curve shape as in Figure 13. Retouch T107 and T108 slightly to correct for any overall tilt that is essentially the same on all channels.

Disconnect the VHF sweep generator and connect the UHF sweep generator to the antenna terminals. Check on all UHF channels for proper wave shape, as shown in Figure 13, retouching T107 and T108 if necessary to correct any overall tilt.

Remove the sweep and marker generators and the bias supplies.

KRK29 TUNER ALIGNMENT

Models 17-S-350, 17-S-351 & 17-S-360

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP2 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

NOTE:—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in Figure 19 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and band width as shown in Figure 18.

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in Figure 18.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L48 and L32 for proper curve shape as shown in Figure 18. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See Figure 18 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to Figure 18 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

KRK29A/27 TUNER ALIGNMENT

Models 17-S-350U, 17-S-351U & 17-S-360U

VHF ALIGNMENT.—A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP2 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

NOTE:—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in Figure 19 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

ALIGNMENT PROCEDURE

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and band width as shown in Figure 18.

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in Figure 18.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L48 and L32 for proper curve shape as shown in Figure 18. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See Figure 18 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to Figure 18 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

UHF ALIGNMENT.—Ground the I-F transformer by inserting a clip lead through the aperture provided in the top of the tuner. Ground the other end of the clip lead to the tuner case.

Connect the oscilloscope to the test point TP301, using the preamplifier if needed with the oscilloscope used.

Connect the output of the UHF sweep generator, through a 300 ohm attenuator pad, to the antenna terminals and set the sweep generator to sweep channel 83, centered on 887.5 mc. Adjust the output of the sweep generator to full sweep width.

A test dial made to fit over the split gear on the tuner shaft is necessary for accurate alignment. Scribe marks at 0°, 9° and 168° should be marked on the test dial. The 0° reference point is located with the capacitor plates fully meshed. By placing a 1/16" shim between the stop pin on the tuner and the stop plate on the gear assembly the plates will be in the proper fully meshed position.

Rotate the tuning dial to the 168°, channel 83, position.

Connect the VHF signal generator in series with a 1000 ohm resistor to the rear terminal of the crystal holder and insert markers for 41.25 mc., 43.5 mc. and 45.75 mc.

Connect the UHF marker generator loosely to the antenna terminals and insert a marker at 887.5 mc.

Adjust trimmer capacitors C315 and C316 for a maximum amplitude overcoupled response curve centered at 887.5 mc. as shown in Figure 11(A).

Adjust the oscillator trimmer capacitor C307 until the 43.5 mc. marker coincides with the marker at 887.5 mc. The markers for 41.25 and 45.75 should be symmetrically located on the top of the response curve as in Figure 11(A).

Set the UHF sweep and marker generators to 473.5 mc. Rotate the tuning dial to the 9°, channel 14, position.

Adjust L1 and L2 for a maximum amplitude overcoupled curve centered at 473.5 mc. as shown in Figure 11(B). Adjust the oscillator trimmer C308 until the 43.5 mc. marker coincides with the 473.5 mc. marker, with the 41.25 and 45.75 markers as shown.

Repeat the above adjustments, as necessary, until the proper responses are obtained. Tune through the entire range and check the tracking. When perfectly tracked the three markers will be on the top of the response curves, however, mistracking to the extent that the 41.25 mc. and 45.75 mc. ride down the sides of the curves to a point not less than 70% will not seriously affect the alignment. Should the markers fall below this level, it will be necessary to knife the RF plates to correct the mistracking. The plates may be knifed through the two holes provided on the left side of the tuner. Always knife the plates while tuning lower in frequency to prevent affecting the tracking above the point of knifing. Check which section requires knifing by touching the plates with the knifing tool while observing the response, then proceed with the knifing of the proper section or of both sections if required.

Connect the "VoltOhmyst" to test point TP301. Set the "VoltOhmyst" to the 1.5v. DC scale. Tune over the entire range observing the reading on the meter. A reading between .05 and .4 volts should be obtained. Voltages outside these limits are an indication of low +B voltage, low or high crystal impedance or an oscillator tube outside allowable limits.

Connect the "VoltOhmyst" to the "bias" terminal of the tuner (refer to Figure 9). A reading between 0.5 and 2.5 volts should be obtained. Readings above or below this range will cause crystal currents outside allowable limits and in such cases the oscillator tube should be replaced. Replacement of the oscillator tube will require recalibration at the high and low frequency ends of the band as previously outlined.

RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first sound i-f grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. In such a case, connect the calibrator to the grid of the third pix i-f amplifier, pin 1 of V108.

Set the frequency of the calibrator to 45.75 mc. (pix carrier) and modulate with 4.5 mc. crystal. The 4.5 mc. signal will be picked off at L104 and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst". Adjust the signal level from the signal generator for 6 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R106 and C108.

Tune the ratio detector secondary T102 bottom core for zero d-c on the "VoltOhmyst".

Repeat adjustments of T102 top for maximum d-c at pin 2 of V103 and T102 bottom for zero d-c at the junction of R106 and C108. Make the final adjustments with the signal input level adjusted to produce 6 volts d-c on the "VoltOhmyst" at pin 2 of V103.

SOUND I-F ALIGNMENT.—Connect the signal generator to the first sound i-f amplifier grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed as above.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the T101 top core for maximum d-c on the "VoltOhmyst".

The output from the signal generator should be set to produce approximately 6.0 volts on the "VoltOhmyst" when the final touches on the above adjustment are made.

4.5 MC. TRAP ADJUSTMENT.—Connect the signal generator in series with a 1,000 ohm resistor to pin 2 of V109. Set the generator to 4.5 mc. and modulate it 30% with 400 cycles. Set the output to approximately 0.5 volts.

Short the third pix i-f grid to ground, pin 1, V108, to prevent noise from masking the output indication.

Connect the crystal diode probe of an oscilloscope to the plate of the video amplifier, pin 6 of V110.

Adjust the core of L105 for minimum output on the oscilloscope.

Remove the short from pin 1, V108 to ground.

As an alternate method, this step may be omitted at this point in the alignment procedure and the adjustment made "on the air" after alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L105 requires no adjustment. If a 4.5 mc. beat is present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L105 for minimum beat.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 6 of V110.

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

HORIZONTAL OSCILLATOR ADJUSTMENT.—Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture can not be synchronized with the horizontal hold control R200, then adjust the T114 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T114 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T114 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C174B, the width control L109 and the linearity control L111 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T114 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T114 frequency core (on the rear apron) until the picture falls out of sync and three or four diagonal black bars sloping down to the right appear on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain three or four diagonal black bars on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T114 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture falls out of sync with the diagonal bars sloping down to the right. Continue to turn the frequency core in the same direction. No more than three or four bars should appear on the screen. Instead, the horizontal oscillator should begin to motorboat. Retouch the adjustment of the T114 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T114. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 25. Adjust the waveform adjustment core of T114 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C174A slightly clockwise. If less than 2 bars are present, adjust C174A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T114 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves to the left side of the screen leaving the picture in synchronization.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 15000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

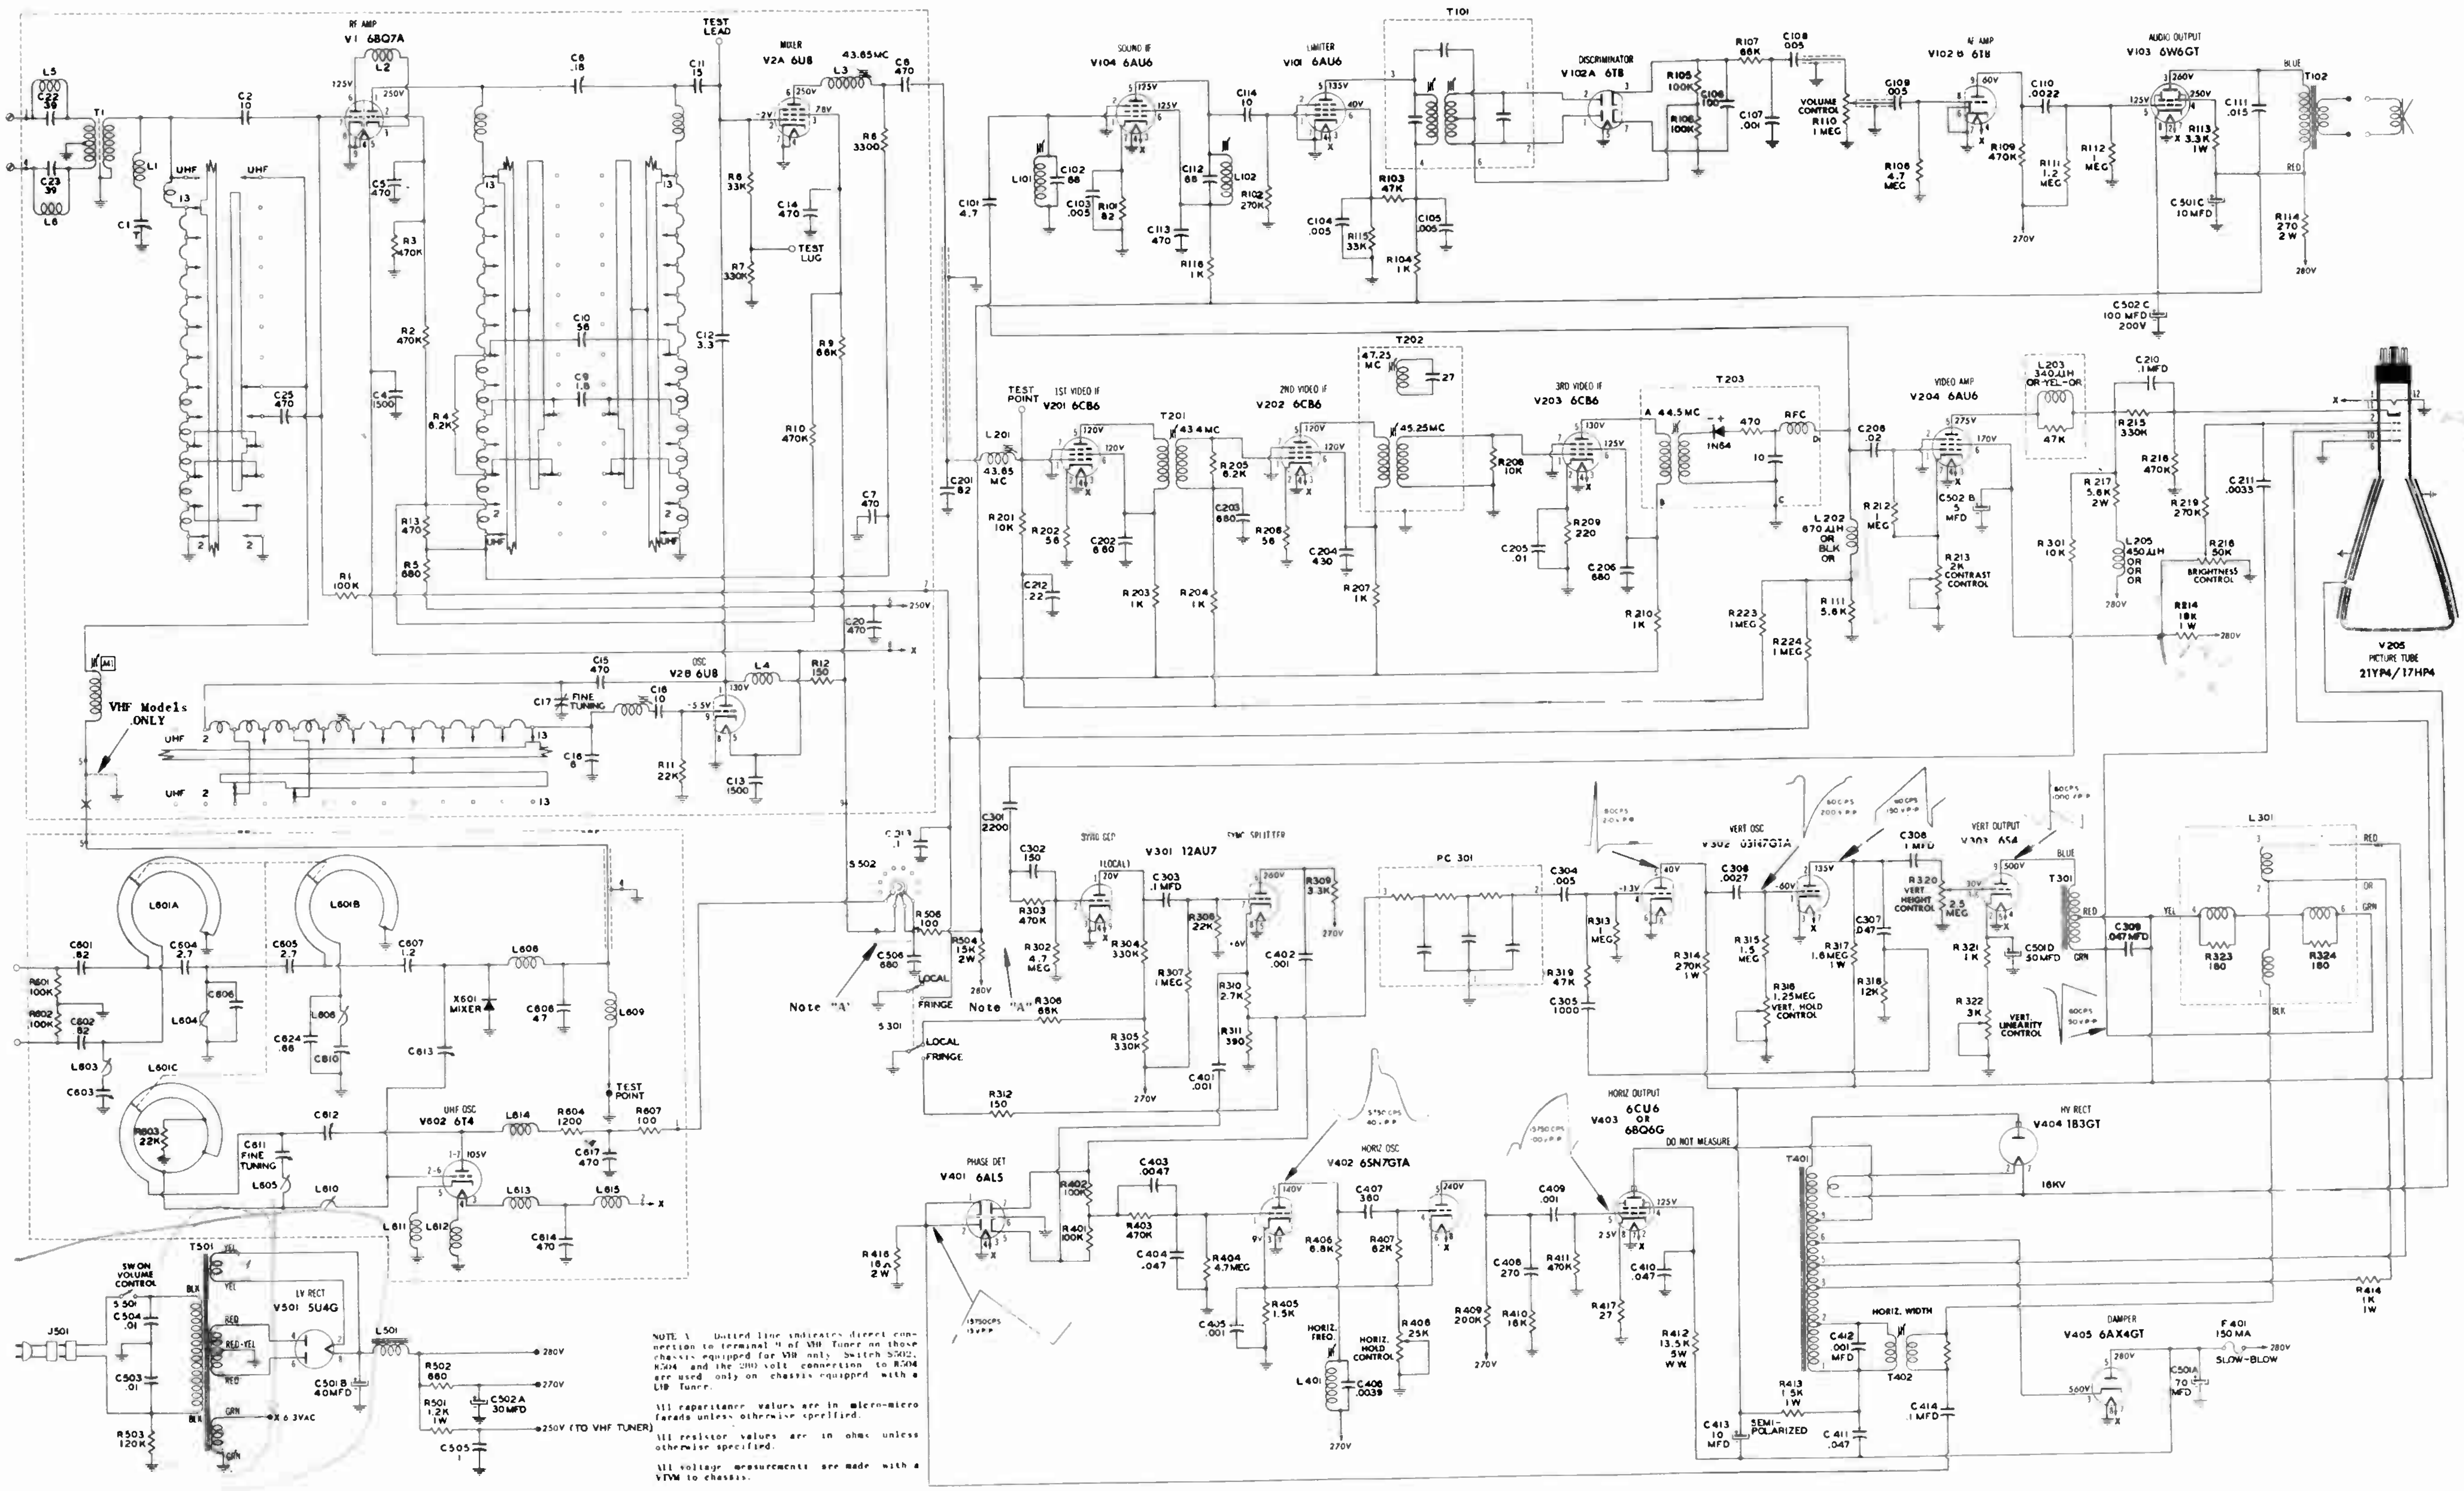
STOCK No.	DESCRIPTION
	RF UNIT ASSEMBLIES KRK29
76539	Board—Antenna matching transformer terminal board less coils and capacitors
78235	Board—Terminal board, 5 contact and ground
78233	Bracket—Side bracket for mounting coil and stators
77853	Capacitor—Ceramic, variable, for fine tuning capacitor—plunger type (C27)
	Capacitor—Adjustable, mica:—
77616	4-40 mmf. (C33)
	Capacitor—Adjustable, steatite:—
77151	0.8—3.0 mmf. (C11, C21, C25)
77913	0.8—3.0 mmf. (C22)
76532	1-4 mmf. (C7)
	Capacitor—Ceramic:—
77084	feed-thru, 1000 mmf. (C5, C15, C17, C18, C19)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0
77865	10 mmf., ±1 mmf., 500 volts (C26, C37)
	Capacitor—Fixed, ceramic, High "K" disc:—
77293	470 mmf., ±100%, —0%, 500 volts (C29, C34, C35)
77252	1000 mmf., ±100%, —0%, 500 volts (C8, C9, C14, C20)
73960	10,000 mmf., ±100%, —0%, 500 volts (C28)
	Capacitor—Fixed, ceramic, insulated, High "K"
75437	100 mmf., ±20%, 500 volts (C36)
78276	150 mmf., ±10%, 500 volts (C12)
75199	270 mmf., ±20%, 500 volts (C6, C10, C13)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0
93056	5 mmf., ±0.5 mmf., 500 volts (C2)
54207	18 mmf., ±10%, 500 volts (C1)
70935	27 mmf., ±10%, 500 volts (C3)
76739	33 mmf., ±10%, 500 volts (C4)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750
78247	10 mmf., ±10%, 500 volts (C24)
	Capacitor—Fixed, headed-lead:—
71504	0.68 mmf., ±20%, 500 volts (C23)
71502	2.2 mmf., ±20%, 500 volts (C31)
71503	3.3 mmf., ±20%, 500 volts (C32)
	Capacitor—Mica trimmer:—
78397	80-150 mmf. (C16)
77854	Clip—Fine tuning clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T1)
73874	Coil—Channel #6 mixer coil (L48)
73460	Coil—Channel #6 r.f. plate coil (L32)
78401	Coil—Channel #6 antenna coil (L61)
77915	Coil—Channel #13 oscillator coil (L49)
77919	Coil—Channel #13 mixer coil (L36)
77921	Coil—Channel #13 r.f. plate coil (L20)
78224	Coil—Choke coil (.47 muh) (L27)
77206	Coil—Filament choke coil (L33)
76763	Coil—Heater choke coil (L34, L35)
78271	Coil—I.F. input coil complete with adjustable core (L9)
76562	Coil—R.F. amplifier coupling coil (L7)
76537	Coil—Shunt coil complete with adjustable core (L3)
76538	Coil—Shunt coil complete with adjustable core (L2)
77860	Connector—Grounding strap connector
77859	Connector—RF grid switch return connector (L8)
78237	Connector—Single contact female connector for UHF connection (J2)
38853	Connector—4 contact female connector—part of antenna matching transformer (J1)
76460	Contact—Test point contact
77852	Core—Adjustable core for fine tuning capacitor
76543	Core—Adjusting core for F.M. trap
77916	Core—¼-20 x ½" adjusting core for L48
77914	Core—#8-32 x 27/64" adjustable core for L20, L36, L49
78231	Detent—Detent mechanism and fibre shaft
77917	Form—Channel #6 coil form complete with core
77912	Form—Channel #13 coil form complete with core
77861	Guide—Bakelite guide for fine tuning lever
78270	Lever—Fine tuning lever
76728	Nut—Speednut for capacitors 76532, 77151
78234	Plate—Mounting plate for shafts (front)
	Resistor—Fixed, composition:—
503015	15 ohms, ±10%, ½ watt (R19)
503039	39 ohms, ±10%, ½ watt (R18)
503112	120 ohms, ±10%, ½ watt (R2)
503147	470 ohms, ±10%, ½ watt (R14)
503210	1000 ohms, ±10%, ½ watt (R6, R20)
503233	3300 ohms, ±10%, ½ watt (R9)
503268	6800 ohms, ±10%, ½ watt (R1)
523312	12,000 ohms, ±10%, 2 watts (R13)
523315	15,000 ohms, ±10%, 2 watts (R7)
503410	100,000 ohms, ±10%, ½ watt (R3, R10, R11, R12)
503510	1 megohm, ±10%, ½ watt (R4, R5)
14343	Retainer—Fine tuning shaft retainer ring
77849	Retainer—Retainer for fine tuning spring
76549	Screw—#4-40 x ⅜" adjusting screw for L50, L51, L52, L53
75176	Screw—#4-40 x 7/16" adjusting screw for L54
76547	Screw—#4-40 x ¼" adjusting screw for L55, L56, L57, L58, L59, L60
78232	Shaft—Fine tuning shaft and cam
78236	Shield—Front shield
76534	Shield—Tube shield
77851	Shield—"U" shape shield for under-side of unit
76336	Socket—Tube socket, 9 pin, miniature saddle-mounted
77856	Spring—Fine tuning spring
78241	Spring—Formed spring for fine tuning lever
78277	Stator—Input selector switching stator complete with rotor and capacitor (S4, C10)
78272	Stator—Mixer stator complete with rotor (S2, C13, C23, C32, C36, L36, L37, L38, L39, L40, L41, L42, L43, L44, L45, L46, L47, L48, R9, R10, R11, R19)
77911	Stator—Oscillator coil and stator complete with rotor, coils and trimmer (S1, C22, C37, L49, L50, L51, L52, L53, L54, L55, L56, L57, L58, L59, L60)
78398	Stator—RF grid stator complete with rotor and coils (S5, L10, L11, L12, L13, L14, L15, L16, L17, L18)
78274	Stator—RF plate stator complete with rotor, coils, capacitors and resistors (S3, C12, C31, L20, L21, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L32, R6, R18)
76740	Stud—#6-32 x 1" adjusting stud for capacitor 77913
78396	Transformer—Antenna matching transformer complete (T1)
78399	Transformer—Convertor transformer (T2, R8)
76540	Trap—FM trap complete with adjustable core (L5)
78466	Trap—IF trap
76542	Trap—IF trap (41.25 mc) complete with core (L1)
76541	Trap—IF trap (45.75 mc) complete with core (L4)
75190	Washer—Insulating washer (neoprene) for capacitor
	RF UNIT ASSEMBLIES KRK29A
76539	Board—Antenna matching transformer terminal board less coils and capacitors
78467	Board—Terminal board—6 contact
78233	Bracket—Side bracket for mounting coil and stators
78430	Cam—Actuating cam for antenna slide switch
78417	Cam—Fine tuning cam for VHF
	Capacitor—Adjustable, mica:—
77616	4-40 mmf. (C33)
	Capacitor—Adjustable, steatite:—
77151	0.8—3.0 mmf. (C11, C21, C25)
77913	0.8—3.0 mmf. (C22)
76532	1-4 mmf. (C7)
	Capacitor—Ceramic:—
77853	Variable, for fine tuning capacitor—plunger type (C27)
77084	Feed-thru, 1000 mmf. (C5, C15, C17, C18, C19)
	Capacitor—Fixed, ceramic, High "K" disc:—
77293	470 mmf., ±100%, —0%, 500 volts (C29, C34, C35, C51)
77252	1000 mmf., ±100%, —0%, 500 volts (C8, C9, C14, C20)
73960	10,000 mmf., ±100%, —0%, 500 volts (C28)
	Capacitor—Fixed, ceramic, insulated, High "K":—
75437	100 mmf., ±20%, 500 volts (C36)
78276	150 mmf., ±10%, 500 volts (C12)
75199	270 mmf., ±20%, 500 volts (C6, C10, C13)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0
93056	5 mmf., ±0.5 mmf., 500 volts (C2)
77865	10 mmf., ±1 mmf., 500 volts (C26, C37)
54207	18 mmf., ±10%, 500 volts (C1)
70935	27 mmf., ±10%, 500 volts (C3)
76739	33 mmf., ±10%, 500 volts (C4)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750
78247	10 mmf., ±10%, 500 volts (C24)
	Capacitor—Fixed, headed-lead:—
71504	0.68 mmf., ±20%, 500 volts (C23)
71502	2.2 mmf., ±20%, 500 volts (C31)
71503	3.3 mmf., ±20%, 500 volts (C32)
77854	Clip—Fine tuning clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T1)
78401	Coil—Channel #6 antenna coil (L61)
73874	Coil—Channel #6 mixer coil (L48)
73460	Coil—Channel #6 r.f. plate coil (L32)
77919	Coil—Channel #13 mixer coil (L36)
77915	Coil—Channel #13 oscillator coil (L49)
77921	Coil—Channel #13 r.f. plate coil (L20)
78224	Coil—Choke coil (.47 muh) (L27)
77206	Coil—Filament choke coil (L33)
76763	Coil—Heater choke coil (L34, L35)
78271	Coil—I.F. input coil complete with adjustable core (L9)
76562	Coil—RF amplifier coupling coil (L7)
76537	Coil—Shunt coil complete with adjustable core (L3)
76538	Coil—Shunt coil complete with adjustable core (L2)
39153	Connector—4 contact male connector (P51)
38853	Connector—4 contact female connector—part of antenna matching transformer (J1)
77860	Connector—Grounding strap connector
77859	Connector—RF grid switch return connector (L8)
78237	Connector—Single contact female connector for UHF connection (J2)
76460	Contact—Test point contact
77852	Core—Adjustable core for fine tuning capacitor
76543	Core—Adjusting core for FM trap

RADIO CORPORATION OF AMERICA TV PAGE 14-97

STOCK No.	DESCRIPTION
	Resistor—Fixed, composition:—
503015	15 ohms, ±10%, ½ watt (R19)
503039	39 ohms, ±10%, ½ watt (R18)
503112	120 ohms, ±10%, ½ watt (R2)
503147	470 ohms, ±10%, ½ watt (R14, R54)
503210	1000 ohms, ±10%, ½ watt (R6, R20)
503233	3300 ohms, ±10%, ½ watt (R9)
503268	6800 ohms, ±10%, ½ watt (R1)
523312	12,000 ohms, ±10%, 2 watts (R13)
523315	15,000 ohms, ±10%, 2 watts (R7)
523322	22,000 ohms, ±10%, 2 watts (R52)
523327	27,000 ohms, ±10%, 2 watts (R53)
503410	100,000 ohms, ±10%, ½ watt (R3, R10, R11, R12)
503510	1 megohm, ±10%, ½ watt (R4, R5)
78396	Transformer—Antenna matching transformer complete (T1)
78399	Transformer—Converter transformer (T2, R8)
76540	Trap—FM trap complete with adjustable core (L5)
78466	Trap—I.F. Trap (L6)
76542	Trap—I.F. trap (41.25 mc) complete with core (L1)
76541	Trap—I.F. trap (45.75 mc) complete with core (L4)
78426	Washer—"C" washer for clutch mechanism
75190	Washer—Insulating washer (neoprene) for capacitor
78424	Washer—Retaining washer for knob shaft spring
78425	Washer—Spring washer for clutch mechanism
	RF UNIT ASSEMBLIES KRK27
	Capacitor—Adjustable, steatite:—
78259	0.6—1.4 mmf. complete with adjustable core (C7, C8)
	Capacitor—Fixed, ceramic:—
77084	1000 mmf., feed-thru (C2, C10, C11, C12)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0
78262	7 mmf., ±0.5 mmf., 500 volts DC (C6)
78261	22 mmf., ±5%, 500 volts DC (C5)
70596	33 mmf., ±5%, 500 volts DC (C9)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750
78263	0.75 mmf., ±0.25 mmf., 500 volts DC (C13)
	Capacitor—Fixed, headed-lead:—
78137	0.51 mmf., ±10%, 500 volts DC (C3)
78260	0.62 mmf., ±10%, 500 volts DC (C4)
71502	2.2 mmf., ±10%, 500 volts DC (C14)
78257	Capacitor—Variable tuning capacitor (C1A, C1B, C1C, C1D, C15, C16, L1, L2)
78258	Coil—I.F. coil complete with adjustable core (L7)
78264	Coil—Peaking coil (L3, R1)
72618	Coil—Peaking coil (20 muh) (L4)
78267	Coil—RF choke coil (0.15 muh) (L10, L11)
77279	Coil—RF choke coil (0.33 muh) (L8, L9)
78269	Connector—Single contact male connector for I.F. output cable
78255	Connector—2 contact female connector for UHF antenna (J1)
78256	Holder—Crystal holder
77489	Rectifier—Crystal rectifier IN82 (CR1)
	Resistor—Fixed, composition:—
503110	100 ohms, ±10%, ½ watt (R2)
503215	1500 ohms, ±10%, ½ watt (R3)
503222	2200 ohms, ±10%, ½ watt (R5)
503268	6800 ohms, ±10%, ½ watt (R4)
78268	Transformer—Antenna input transformer (T1)
	CHASSIS ASSEMBLIES KCS 78F—VHF Chassis KCS 78H—UHF/VHF Chassis
78402	Board—Antenna terminal board for KCS78H
76490	Bracket—Mounting bracket complete with insulator for picture control
	Capacitor—Ceramic:—
76461	500 mmf., 20,000 volts (C168)
	Capacitor—Fixed, ceramic, High "K" disc:—
77293	470 mmf., ±100%, —0%, 500 volts DC (C127, C128, C129, C130, C131, C135, C196)
77672	Dual 470 mmf., ±100%, —0%, 500 volts DC (C132A, C132B)
77252	1000 mmf., ±100%, —0%, 500 volts DC (C133)
73960	10,000 mmf., ±100%, —0%, 500 volts DC (C104, C134, C194)
76991	Dual 10,000 mmf., ±100%, —0%, 500 volts DC (C101A, C101B)
	Capacitor—Fixed, ceramic, insulated:—
77673	470 mmf., ±10%, 1500 volts DC (C144)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750
33098	10 mmf., ±1.0 mmf., 500 volts DC (C136)
33380	12 mmf., ±10%, 500 volts DC (C175)
39044	15 mmf., ±10%, 500 volts DC (C141)
73664	39 mmf., ±10%, 500 volts DC (C140)
	Capacitor—Fixed, mica:—
76475	68 mmf., 1000 volts (C177)
76474	82 mmf., 1000 volts DC (C153)
39636	220 mmf., 500 volts DC (C154)
39638	270 mmf., 500 volts DC (C139)
76579	270 mmf., 1000 volts DC (C149, C191)
39640	330 mmf., 500 volts DC (C150)
76476	330 mmf., 1000 volts (C182)

STOCK No.	DESCRIPTION
73551	0.1 mfd., 400 volts (C151, C159, C169, C170, C178)
73557	0.1 mfd., 600 volts (C160, C163, C186)
73794	0.22 mfd., 400 volts (C125)
73786	0.27 mfd., 200 volts (C187)
73787	0.47 mfd., 200 volts (C109, C143, C181)
	Capacitor—Fixed, tubular, moulded, oil impregnated:—
76479	.00068 mfd., 600 volts (C184)
76995	.0012 mfd., 600 volts (C185)
77123	.0015 mfd., 1000 volts (C164)
73594	.01 mfd., 600 volts (C172, C173, C183)
77676	Choke—Filter choke (L117)
73477	Coil—Choke coil (L101, L118)
76442	Coil—Horizontal linearity coil complete with adjustable core (L111)
76011	Coil—Peaking coil (36 muh) (L102)
77825	Coil—Peaking coil (220 muh) (L107, R146)
77124	Coil—Peaking coil (1000 muh) (L106, R218)
76640	Coil—RF choke coil (1.5 muh) (L110)
76441	Coil—Width coil complete with adjustable core (L109)
76975	Control—AGC control (R154)
77641	Control—Brightness control, volume control and power switch (R110A, R110B, S102)
77924	Control—Height control (R176)
77639	Control—Horizontal hold control (R200)
76445	Control—Picture control (R144)
77642	Control—Vertical hold control (R174)
77643	Control—Vertical linearity control (R186)
73094	390 mmf., 1000 volts DC (C157)
39644	470 mmf., 500 volts DC (C106, C107)
	Capacitor—Mica trimmer:—
71496	5-70 mmf. (C119)
75217	Dual 10-160 mmf. (C174A, C174B)
	Capacitor—Electrolytic:—
75218	Comprising:—1 section of 10 mfd., 350 volts, 1 section of 5 mfd., 350 volts and 1 section of 150 mfd., 50 volts (C126A, C126B, C126C)
77644	Comprising:—1 section of 80 mfd., 400 volts and 1 section of 20 mfd., 400 volts (C117A, C117B)
76970	Comprising:—1 section of 100 mfd., 400 volts, 1 section of 10 mfd., 350 volts and 1 section of 20 mfd., 50 volts (C116A, C116B, C116C)
	Capacitor—Fixed, tubular, paper, oil impregnated:—
75643	.001 mfd., 1000 volts (C114, C146, C156, C176)
73595	.0022 mfd., 600 volts (C108, C145, C158)
73818	.0027 mfd., 1600 volts (C118)
73796	.0039 mfd., 600 volts (C147)
73920	.0047 mfd., 600 volts (C110, C138, C162, C168)
73808	.0082 mfd., 1000 volts (C155)
73561	.01 mfd., 400 volts (C111, C115)
73562	.022 mfd., 400 volts (C180)
73798	.022 mfd., 600 volts (C166)
73810	.022 mfd., 1000 volts (C142, C189)
73811	.027 mfd., 1000 volts (C190)
73552	.033 mfd., 400 volts (C112, C152)
73596	.033 mfd., 1000 volts (C161)
73553	.047 mfd., 400 volts (C179)
73592	.047 mfd., 600 volts (C167)
73792	.068 mfd., 400 volts (C165)
73784	0.1 mfd., 200 volts (C171)
	Resistor—Wire wound:—
76796	5.1 ohms, ⅓ watt (R213)
76639	180 ohms, 2 watts (R210)
77670	3300 ohms, 7 watts (R120)
77671	3800 ohms, 7 watts (R121)
76642	6750 ohms, 10 watts (R142)
	Resistor—Fixed, composition:—
30789	33 ohms, ±5%, ½ watt (R131)
503033	33 ohms, ±10%, ½ watt (R139)
503047	47 ohms, ±10%, ½ watt (R105, R209)
34763	68 ohms, ±5%, ½ watt (R128)
503082	82 ohms, ±10%, ½ watt (R101)
502118	180 ohms, ±5%, ½ watt (R134)
503139	390 ohms, ±10%, ½ watt (R187)
503147	470 ohms, ±10%, ½ watt (R135)
513156	560 ohms, ±10%, 1 watt (R114)
503168	680 ohms, ±10%, ½ watt (R143)
503210	1000 ohms, ±10%, ½ watt (R104, R116, R127, R130, R132)
513210	1000 ohms, ±10%, 1 watt (R102)
523218	1800 ohms, ±10%, 2 watts (R115)
503222	2200 ohms, ±10%, ½ watt (R145)
523222	2200 ohms, ±10%, 2 watts (R141)
503233	3300 ohms, ±10%, ½ watt (R188)
502239	3900 ohms, ±5%, ½ watt (R138)

STOCK No.	DESCRIPTION
503239	3900 ohms, ±10%, ½ watt (R202)
502247	4700 ohms, ±5%, ½ watt (R168)
513268	6800 ohms, ±10%, 1 watt (R150)
523268	6800 ohms, ±10%, 2 watts (R211)
503282	8200 ohms, ±10%, ½ watt (R159, R169, R180, R183)
523282	8200 ohms, ±10%, 2 watts (R140)
502310	10,000 ohms, ±5%, ½ watt (R107, R108)
513310	10,000 ohms, ±10%, 1 watt (R217)
503312	12,000 ohms, ±10%, ½ watt (R111)
503315	15,000 ohms, ±10%, ½ watt (R189)
503318	18,000 ohms, ±10%, ½ watt (R157, R172, R204)
503322.	22,000 ohms, ±10%, ½ watt (R162, R166, R171, R201)
503339	39,000 ohms, ±10%, ½ watt (R106)
70351	43,000 ohms, ±5%, ½ watt (R147)
503347	47,000 ohms, ±10%, ½ watt (R136, R149, R165)
512347	47,000 ohms, ±5%, 1 watt (R206)
502356	56,000 ohms, ±5%, ½ watt (R129, R133)
503356	56,000 ohms, ±10%, ½ watt (R212)
512356	56,000 ohms, ±5%, 1 watt (R182)
503368	68,000 ohms, ±10%, ½ watt (R151, R199)
503382	82,000 ohms, ±10%, ½ watt (R198)
513410	100,000 ohms, ±10%, 1 watt (R179, R219)
503412	120,000 ohms, ±10%, ½ watt (R158)
502415	150,000 ohms, ±5%, ½ watt (R148)
503415	150,000 ohms, ±10%, ½ watt (R178, R191, R194)
512415	150,000 ohms, ±5%, 1 watt (R203)
502418	180,000 ohms, ±5%, ½ watt (R125)
503422	220,000 ohms, ±10%, ½ watt (R190, R192)
502427	270,000 ohms, ±5%, ½ watt (R181)
503427	270,000 ohms, ±10%, ½ watt (R163, R177)
503433	330,000 ohms, ±10%, ½ watt (R12, R195, R197)
503439	390,000 ohms, ±10%, ½ watt (R155, R173)
503447	470,000 ohms, ±10%, ½ watt (R113, R153, R193, R208)
503468	680,000 ohms, ±10%, ½ watt (R160, R167)
503482	820,000 ohms, ±10%, ½ watt (R196, R207)
503510	1 megohm, ±10%, ½ watt (R161)
502511	1.1 megohm, ±5%, ½ watt (R185)
503512	1.2 megohm, ±10%, ½ watt (R184)
503515	1.5 megohm, ±10%, ½ watt (R175)
11769	1.8 megohm, ±5%, ½ watt (R124, R205)
503522	2.2 megohm, ±10%, ½ watt (R164, R170)
503539	3.9 megohm, ±10%, ½ watt (R137, R152)
503610	10 megohm, ±10%, ½ watt (R109)
76795	Transformer—Hi-voltage transformer (T115)
76440	Transformer—Horizontal oscillator transformer complete with adjustable core (T114)
76982	Transformer—Output transformer (T103)
77635	Transformer—Power transformer, 117 volts, 60 cycle (T113)
77112	Transformer—Ratio detector transformer (T102, C105)
76981	Transformer—Sound I.F. transformer complete with adjustable core (T101, C102, C103, R103)
77636	Transformer—Vertical output transformer (T112)
77637	Transformer—1st pix I.F. transformer complete with adjustable cores (T104, C120, R126)
77638	Transformer—2nd pix I.F. transformer complete with adjustable core (T106)
76433	Transformer—3rd or 4th pix I.F. transformer (T107, T108)
76983	Trap—4.5 MC trap (L105, C137)
77585	Washer—"C" washer for picture control extension shaft (2 req'd)
	SPEAKER ASSEMBLIES 971636-1W RL101C5 RMA-274
	(For Models 17S350, 17S350U, 17S351, 17S351U)
77000	Speaker—5" PM speaker complete with cone and voice coil (3.2 ohms)
	SPEAKER ASSEMBLIES 971490-3W RL105E6 RMA-274 / 971490-3R RMA-285
	(For Models 17S360, 17S360U)
75024	Cone—Cone and voice coil (3.2 ohms) for speaker stamped 971490-3W
77129	Cone—Cone and voice coil (3.2 ohms) for speaker stamped 971490-3R
75022	Speaker—8" PM speaker complete with cone and voice coil (3.2 ohms)
	Note:—If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to Model number of instruments, number stamped on speaker and full description of part required.



NOTE "A" Dotted line indicates direct connection to terminal 4 of VHF Tuner on those chassis equipped for VHF only. Switch S502, R504 and the 280 volt connection to R504 are used only on chassis equipped with a UHF Tuner.

All capacitance values are in micro-micro farads unless otherwise specified.

All resistor values are in ohms unless otherwise specified.

All voltage measurements are made with a VTVM to chassis.

SCHEMATIC DIAGRAM

PARTS LIST AND DESCRIPTIONS

SYMBOL	DESCRIPTION	PART NO.
	COILS & TRANSFORMERS	
T1	Antenna input transformer	360490-2
T101	Discriminator transformer	360512-1
T102	Audio output transformer	320068-2
T201	1st IF coil	360581-1
T202	2nd IF and trap coil	360582-1
T203	3rd IF and detector coil	360607-1
T301	Vertical output transformer	320067-2
T401	H. V. transformer	360606-1
T501	Power transformer	300077-1
L1	R. F. choke	360601-8
L3	IF output coil	360603-1
L4	R. F. choke	360601-9
L101	Sound take-off coil	360584-1
L102	Sound take-off coil	360584-1
L201	1st IF input coil	360540-1
L202	Peaking, orange, black, orange	360443-37
L203	Peaking, orange, yellow, orange	360443-39
L205	Peaking, orange, orange, orange	360443-28
L301	Deflection coil	360587-3
L401	Horizontal oscillator coil	360579-1
L402	Horizontal width coil	360585-2
L501	Filter reactor	320058-2
L603	Coil, part of C603	250188-8
L604	Coil, R. F. coupling	360415-44
L606	Coil, part of C606	250188-8
L608	Coil, IF coupling	360574-12
L609	Coil, Xtal return	360574-14
L611	Choke, cathode	360522-7
L612	Choke, filament	360574-8
L613	Choke, filament	360574-8
L614	Choke, oscillator plate	360574-8
L615	Choke, filament	360574-8
A41	IF input coil	360602-1
	CAPACITORS	
C1	Trimmer	250188-6
C2	Molded, 10 mmf, 500 V.	250221-127
C4	Ceramic, .0015 mfd, 500 V.	250175-10
C5	Ceramic, 470 mmf, 500 V.	250175-8
C6	Molded, .18 mmf, 500 V. (with gimmick)	250216-4
C7	Ceramic, 470 mmf, 500 V.	250175-8
C8	Ceramic, 470 mmf, 500 V.	250175-8

DESCRIPTION AND SPECIFICATIONS

The Magnavox Model 700426 UHF tuner is a two-tube, continuously tuning unit which incorporates a 24 position detent action for simplicity of operation. It is mounted at the front left of the television receiver and consists primarily of a preselector, oscillator, crystal mixer and cascode I. F. amplifier. It covers all 70 UHF television channels and has a 41 mc. I. F. output which is coupled to the TV chassis through a UHF-VHF switch.

It has a bandpass of at least three channel widths which allows the UHF range to be covered in steps of three channels for each position of the selector detent. Stations in a particular area can be quickly and accurately tuned by this method because the FCC normally allocates UHF stations at least six channels apart and only one station will be present on every other detent position. The tuner is inoperative during VHF reception.

ALIGNMENT

The following alignment makes use of the I. F. amplifiers and video detector of the TV receiver for I. F. alignment of the tuner so it is extremely important that their alignment be correct. If I.F. alignment of the receiver is necessary, see the Service Bulletin on that instrument for instructions.

The R. F. and oscillator alignment necessitates the use of a UHF sweep generator and a signal generator which will deliver frequencies of 500 mc. to 910 mc.

If UHF equipment is not available, harmonics of VHF instruments may be used. See Magnavox pamphlet "Servicing The Magnavox 700426 UHF Tuner Using VHF Test Equipment".

PRESELECTOR

As no tubes are included in the preselector, alignment should be completed with the receiver turned off. Refer to Fig. 1 for instrument connections and alignment points.

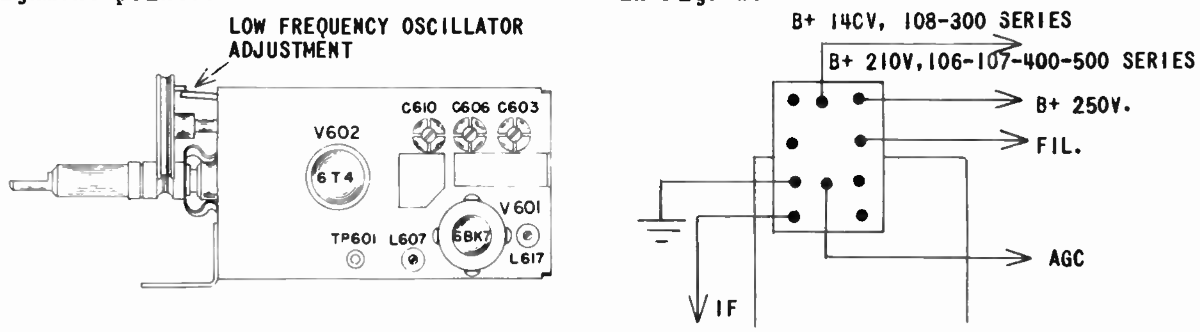

FIG.1
TOP & REAR VIEW OF TUNER

Connect oscilloscope to TP601. Connect 300 ohm output of UHF sweep generator to the UHF antenna terminals on UHF tuner. Loosely couple the signal generator to the preselector to provide markers.

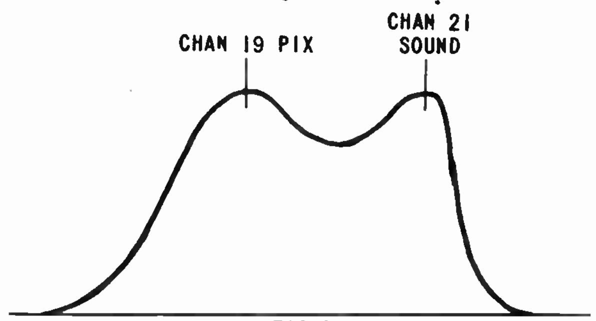

FIG.2
LOW FREQUENCY RF CURVE

Set the channel selector on channel 20, and turn the sweep generator center frequency to 509.5 mc. Insert marker frequencies of 501.25 (channel 19 pix.) and 517.75 (channel 21 sound). Adjust C603 and C610 trimmers for response curve as in Fig. 2.

Turn the channel selector to channel 77. Set the sweep generator to 851.5 mc. and adjust the marker generator to 843.25 mc. (channel 76 pix.) and 859.75 mc. (channel 78 sound). Adjust C603 and C610 trimmer lead inductances L603 and L606 by bending leads for a curve as shown in Fig. 3.

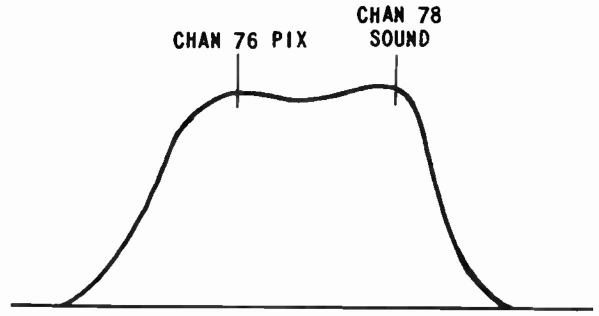

FIG.3
HIGH FREQUENCY RF CURVE

Because of interaction between high end and low end adjustments, recheck the curve on channel 20. A 30% tilt is allowable on both channels 20 and 77.

To check for tracking, turn channel selector to channel 50. Set sweep generator center frequency to 689.5 mc. and insert marker signals of 681.25 mc. (channel 49 pix.) and 697.75 mc. (channel 51 sound). A 50% tilt is allowable between the markers.

OSCILLATOR

Turn on the receiver and turn UHF-VHF switch to UHF. Connect oscilloscope to TP601, 300 ohm sweep cable to UHF antenna terminals and loosely couple signal generator to the preselector as in R. F. alignment.

Set the sweep generator center frequency to 553 mc. Turn channel selector to channel 20. Set marker signal to 565 mc, turn fine tuner fully clockwise and adjust C612 to place oscillator marker at 565 mc. Set marker signal to 541 mc., turn fine tuner fully counter-clockwise and bend the fine tuner stop to place oscillator marker at 541 mc.

Set the sweep generator to 895 mc., turn channel selector to channel 77 and fine tuner fully clockwise. Set marker signal to 907 mc., and adjust L610 inductance lead on oscillator grid by bending lead to center the oscillator marker at 907 mc. Set marker signal to 883 mc., turn fine tuner fully counter-clockwise and carefully adjust L605, inductance lead on the glass fine tuner, to center the marker at 883 mc.

Because of interaction between high end and low end oscillator adjustments, recheck the low frequency setting.

Set the channel selector to channel 50 and sweep generator frequency to 733 mc. Set marker signal to 743 mc. and turn fine tuner fully clockwise. Oscillator marker must be at 743 mc. or above. Set marker signal to 723 mc. then turn fine tuner fully counter-clockwise. Oscillator marker must be at 723 mc. or below.

IF AMPLIFIER

Turn UHF-VHF switch to UHF. Connect I.F. sweep generator to high side of the crystal mixer thru a 1000 ohm resistor and loosely couple a VHF signal generator to provide markers. Connect oscilloscope across the video detector load resistor in the TV chassis and connect bias battery to I. F. and R. F. AGC circuits (see I. F. alignment in Service Bulletin for that instrument).

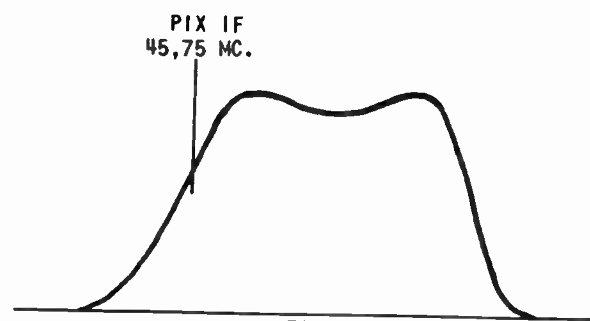

FIG.4
IF CURVE

Remove UHF tuner shield cover and adjust L617 (using insulated screwdriver in slot in bottom of iron core) for maximum curve height with 45.75 mc. marker near 50% (see Fig. 4). If necessary adjust L607 (using short aligning tool) for proper tilt (not over 10%) allowing slight reduction in curve height.

IF Deck Figure 3

ALIGNMENT AND SERVICING

Alignment and servicing of the 700359 tuner converter is a simple procedure since its bandpass is essentially predetermined by the fixed characteristics of original component design, physical layout and associated circuitry. Except as stated elsewhere in this bulletin, band-pass is not subject to serious change during alignment; however, replacement of any component within the RF or IF circuits may disturb the band-pass characteristics of the instrument. Accordingly, whenever parts within these circuits are replaced, electrical and physical specifications of the original components must be duplicated by using original parts. A parts list for the 700359 tuner converter is included in this manual. Wires, parts and other accessories must be replaced in their exact former positions.

TUBE NO.	TUBE TYPE	FUNCTION	PLATE		CATHODE		GRID	
			PIN NO.	VOLTS	PIN NO.	VOLTS	PIN NO.	VOLTS
V601	6AF4 OR 6T4	OSCILLATOR	1&7	107	5	0	2&6	-5TO-8
V602	6BK7	IF AMP	6	126	8	1.5	7	0
			1	240	3	126	2	125

Voltage Chart Figure 4

Test Equipment Required

It is recommended that the following test instruments be obtained for UHF alignment, in addition to that used on VHF, because it is evident that this new band of frequencies will become more popular as more station licenses are granted, and that the work can be performed quicker and more efficiently with equipment designed specifically for UHF. It is equally evident that the use of present VHF channels will also expand, so any VHF equipment on hand will become even more useful.

In the event that the following recommended UHF gear is not on hand, and until it can be obtained, the Magnavox Company has prepared a bulletin on the use of VHF test equipment for UHF alignment. Copies of that outline are being distributed along with this maintenance manual.

1. UHF sweep generator, with a range of 470 to 890 mc., with a minimum sweep width of 40 mc. at the low end of the band and 60 mc. at the high end. It should have a continuously calibrated attenuator, providing as low as 100 microvolts output.

2. UHF marker generator for locating frequencies of 378 and 828 mc.

3. VHF marker generator for locating frequencies of 77.25 and 87.75 mc.

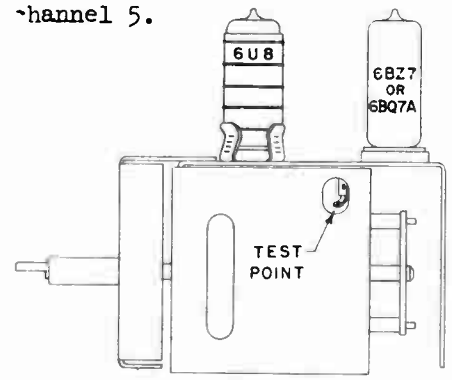
The following alignment instructions represent minimum requirements for acceptable performance of the converter. Its alignment must be performed with the unit installed in an operating television receiver.

IF Alignment on Channel 5

1. Remove the shield cover from the converter.

2. Open test point 602 and ground TP601 and TP603, see fig. 3.

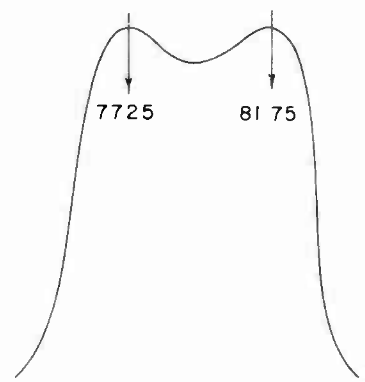
3. Connect the oscilloscope to the test point on the VHF tuner, see fig. 5. and set the tuner on channel 5.



VHF Tuner Figure 5

4. Connect the sweep generator to the converter antenna terminals, tune the converter to approximately 500 mc. (channel 19), and adjust the sweep generator for a response curve on the scope similar to fig. 6.

5. Loosely couple the VHF marker to TP602, and set it to 77.25 mc. and 81.75 mc. If the markers are not positioned as in fig. 6. spread or compress the air coil L613, located below TP601.



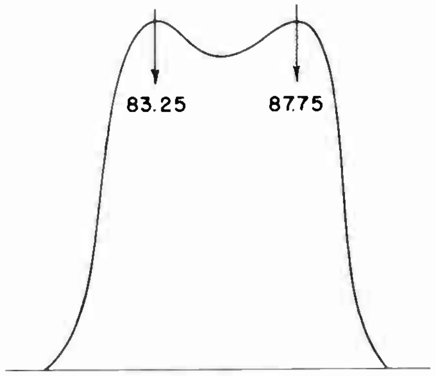
Channel 5 IF Curve - Figure 6

6. Tune the converter and sweep generator to approximately 850 mc. (channel 77) and re-adjust coil L613 if necessary, for a curve similar to that on 500 mc. Adjust L612 for maximum height at 850 mc.

   T601 may be adjusted for the best compromise.

IF Alignment on Channel 6

1. Open test points 601 and 603, and ground TP602.
2. Connect the oscilloscope to test point on the VHF tuner, and set the tuner on channel 6.
3. Tune the converter to approximately 500 mc., couple the sweep generator to the antenna terminals, and adjust it for a response curve similar to fig. 6.
4. Loosely couple the VHF marker to TP601, and set it on 83.25 mc. and 87.75 mc. If the markers are not positioned as in fig. 7. align T601 (for curve width) and L612 (for maximum height). Keep the marker level down so the "birdies" are about 1/8" high.



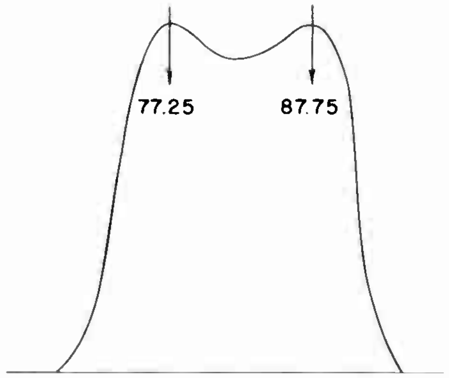
Channel 6 IF Curve - Figure 7

Oscillator Alignment

1. Remove the shield and 6BK7 tube from its socket.
2. Connect the UHF marker generator, through a .5 mmf. capacitor, to the junction of X601, L605, C611 and C612.
3. Connect the oscilloscope to test point 602, through a 10,000 ohm isolating resistor.
4. Tune the converter to its lowest frequency (extreme counter-clockwise) position.
5. Set the marker generator frequency on 378 mc. and adjust the oscillator trimmer C615 for a beat on the scope.
6. Tune the converter to its highest frequency (extreme clockwise) position.
7. Set the marker generator frequency to 828 mc. and adjust the end inductor L610 for a beat on the scope.
8. Recheck both high and low frequency positions so the beats appear without further adjustment.

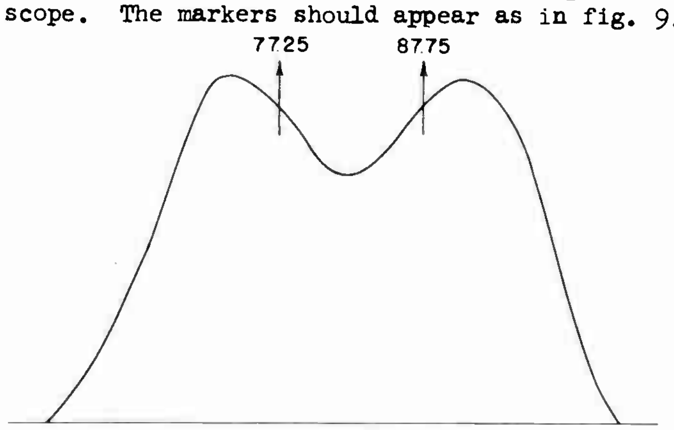
Preselector Alignment

1. Connect the properly terminated UHF sweep generator to the antenna terminals.
2. Tune the converter to approximately 500 mc. (Channel 19) and adjust the sweep generator for a flat topped response curve on the scope.
3. Loosely couple the VHF marker generator to the antenna terminals and set it on 77.25 mc. and 87.75 mc. The markers should appear on the edge of the pass-band as shown in fig. 8.



RF Curve at 500 mc. Figure 8

4. If they do not, adjust RF trimmers C603 and C608 and the coupling capacitor C606 for the proper band pass.
5. Tune the converter to approximately 850 mc. (Channel 77) and adjust the sweep generator for a response curve on the 'scope. The markers should appear as in fig. 9.



RF Curve at 850 mc. Figure 9

6. If they do not, adjust the RF end inductors L602 and L603 for the proper band pass.

   Recheck both low and high frequency positions for proper location of the markers, and repeat the foregoing adjustments if necessary.

The alignment may be checked at any frequency throughout the UHF band. If the VHF markers appear within the pass-band on the 'scope, tracking is satisfactory.

1st IF grid	40mc. Adjust gain so trap suckout is visible.	Converter grid.	47.25mc modulated. Adjust gain so pip is just visible.	Across vid. det. load resistor R212	Set contrast to min. Adjust top T202 to center pip in suckout, see Fig. 1. Max. attenuation is at two core positions. Use one with slug farthest out.
"	40mc. Set gen. output for 2V P/P output at scope	"	Unmodulated 42.75 mc. 45.0 mc. 45.75 mc.	"	Check for response curve similar to Fig. 2. Adjust 3rd IF coil (T203) for max. gain. Tune 1st IF coil (T201) so 42.75 mc. marker is 60% up on curve. Tune bottom T202 so 45.75 mc. marker is 60% up on curve. Recheck 47.75 trap adjustment, top T202.
Converter grid	"	Loosely couple	Unmodulated 45.75 mc. 45.0 mc. 42.75 mc.	"	Tune channel selector to high channel. Tune converter plate coil L3 for max. with 45.75 marker 50% up on curve. Tune 1st IF grid coil L201 for max. gain and proper tilt.
VHF ant. terms. Use network in Fig. 3 if cable is not balanced	Channels 2 thru 13 R.F.	"	Unmodulated 42.75 mc. 45.0 mc. 45.75 mc.	"	Check all channels for bandwidth, slope and position of carrier.
High side of UHF crystal, junction of C607 and L608 Use 1K ohm isolation resistor.	40 mc. same gain	"	Unmodulated 45.75 mc.	"	Set UHF-VHF switch to UHF. Remove UHF tuner shield and adjust IF ampl. plate coil L617 for max. with marker 50% up on curve. Do not change T201 or L201.

NO. 700379 VHF TUNER

SOUND IF ALIGNMENT			
SIG. GEN. COUPLING	**SIG. GEN. FREQUENCY**	**VTVM CONNECTION**	**ADJUSTMENTS**
Couple thru .005 mfd. capacitor to term "D" of video det. transformer	Unmodulated 4.5 mc.	Across R105, ratio det. load resistor. Use 100K resistor in series with VTVM probe.	Align sound take-off coil L101, sound IF coil L102 and ratio det. primary (bottom) for max. Keep signal low enough to obtain 6½ or 7 volts across R105.
"	"	Connect two matched 100K resistors in series across R105. Connect ground lead of VTVM to their junction and probe to junction of R103, R104 and C104. Short out limiter grid; zero meter; remove short.	Align ratio det. secondary (top) for zero. Note: The true zero point is where the meter goes positive and negative on either side of zero when the secondary is tuned through zero. If more than two turns oft of alignment, repeat peaking of primary and zeroing the secondary.

General Information

POWER SUPPLY—These receivers are designed to operate from a power source of 117 volts at 60 cycles A.C. It will, however, operate satisfactorily from a line whose voltage is no lower than 105 volts, or no greater than 125 volts at 60 cycles A.C. Always measure the voltage of the line with a dependable a-c voltmeter if it is suspected that the line voltage is beyond the above acceptable limits.

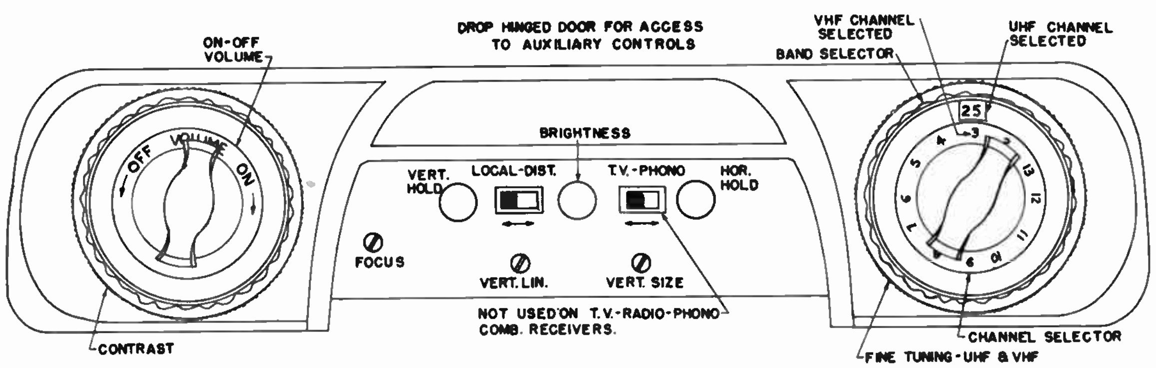

FIG. 1. FRONT PANEL ADJUSTMENTS

SERVICE ADJUSTMENTS

Below is given a description of the steps required in adjustment of the Beam Bender and Deflection Yoke and the adjustment of the Focus, Vertical Size and Linearity, and Horizontal Size, Linearity, Drive and A.F.C. controls. However, it should be remembered that these adjusments are to be made only when picture quality is such that service adjustment is warranted. Use this description as a check-list and if a particular phase of quality is good, leave it alone and go on to the next operation. Refer to figure 1 for location of front panel controls, and to figure on the schematic diagram for location of rear panel controls.

IMPORTANT—The adjustment of the Beam Bender (Ion Trap magnet) must be performed immediately after the receiver warms up. If any length of time is permitted to elapse while the receiver is on, and while the Beam Bender is misadjusted, serious damage to the internal structure of the cathode-ray gun may result.

A. PREPARATION FOR SERVICE ADJUSTMENTS

1. Remove the wood screws on the back cover and the one hex-head P.K. screw adjacent the line cord bracket, disengage the interlock, and remove the back and the line cord.
2. Drop hinged door on front panel for access to the auxiliary controls as illustrated in Fig. 1. The lower set of these controls is adjusted by means of a narrow shanked screwdriver.
3. Connect a substitute interlock line cord between receiver and suitable power outlet and turn on the receiver allowing about 30 seconds of warm-up period before proceeding. Keep the BRIGHTNESS control turned fully counter-clockwise.

B. BEAM BENDER (ION TRAP) ADJUSTMENT

1. Position the beam bender on the glass neck approximately ½" from the picture tube base.
2. Advance the BRIGHTNESS control almost fully clockwise.
3. Starting from this position, adjust the Beam Bender by moving it forward or backward, and at the same time rotating it slightly around the neck of the tube until the brightest raster appears on the screen. If two maximum brightness positions are found, the one nearest the tube base is the correct setting. This adjustment should be done quickly to avoid damaging the gun structure.
4. Adjust the BRIGHTNESS control to maximum, fully clockwise.
5. Re-adjust the Beam Bender carefully for maximum raster brilliance.
6. The Beam Bender must be adjusted at all times for maximum brightness. A misadjusted Beam Bender can damage the picture tube in a matter of seconds and it is of utmost importance to make this the first adjustment when the set is turned on and the last adjustment before the cabinet back is reinstalled.

C. DEFLECTION YOKE ADJUSTMENT

1. Loosen the wing thumb screw located at the top of the deflection yoke frame.
2. Check to see that the deflection yoke mounting bracket rubber cushions press firmly against the flare of the tube.
3. Press the yoke firmly against the flare of the tube.
4. Rotate the yoke until the lines of the raster are horizontal and squared with the picture mask, and tighten the wing screw.

D. FOCUSING ADJUSTMENTS

1. Adjust BRIGHTNESS and CONTRAST controls so that the raster brilliance corresponds to that of an average picture.
2. If a corner of the raster is shadowed, it indicates that the electron beam is striking the neck of the tube. Loosen the Focus Coil Wing Screws and rotate the coil about its horizontal and vertical axis until the entire raster is visible, approximately centered, and with no shadowed corners. The Focus Coil should be kept close to, but not necessarily touching, the rear of the deflection coil for optimum range of the focus control. A slight readjustment of the Beam Bender may now be required.
3. Adjust the focus control (see Fig. 1) so that the lines of the raster are sharp and distinct over the greatest screen area.

E. SYNC STABILITY ADJUSTMENT

1. Tune in a weak station preferably at a time when the noise level is high.
2. Turn the SYNC STABILITY control clockwise to the position of best picture stability.
3. Tune in a strong station and check the picture for twist. If excessive twist is noticed, turn the SYNC STABILITY control counterclockwise until the twist disappears.
4. The point of best SYNC STABILITY and least twist will coincide under most conditions. If two distinct positions are found, a compromise will usually be satisfactory. The noise stability will improve with clockwise rotation. In good signal areas, the control should be left in its counterclockwise position.

F. HORIZONTAL A.F.C. ADJUSTMENT

In order to check this adjustment tune in a station, preferably one that is transmitting a test pattern. If difficulty is encountered in locking the picture horizontally or if it locks-in only when the Horizontal Hold Control is at either end of its rotation, adjust the Horizontal A.F.C. control as follows:

1. Turn CONTRAST down about half way.
2. Turn HORIZONTAL HOLD CONTROL fully counter-clockwise.
3. Check that the SYNC STABILITY control is properly adjusted.
4. If the picture is not locked in, turn the HORIZONTAL A.F.C. control till it does lock-in.
5. Momentarily interrupt the signal by switching the channel selector off channel and then back. The picture should just fall out of sync. If it does not, turn the

SERVICE ADJUSTMENTS *(Continued)*

of the other. If vertical synchronization "falls-out," re-adjust the VERTICAL HOLD control. (Refer to Fig. 1)

3. Adjust the HORIZONTAL DRIVE trimmer for the elimination of drive lines in the picture as follows: While observing the raster, turn the trimmer counterclockwise until thin vertical white (drive) lines appear at the left center of the screen. Then turn the control clockwise until the lines just disappear. Do not turn the trimmer any further clockwise than necessary to eliminate the drive lines. This adjustment is extremely critical and improper adjustment may shorten the life of the horizontal output tube. Turning the trimmer clockwise (closing plates) reduces the drive to the horizontal output tube and insufficient drive may increase the plate current to excessive proportions.

4. Readjustment of the HORIZONTAL A.F.C. control may now be necessary.

5. Adjust the HORIZONTAL SIZE control slotted screw, located at the rear of the High Voltage cage at the rear of the chassis, for correction of horizontal width. The large outer arcs of the test pattern should coincide with the edge of the picture mask. (Refer to schematic diagram.)

6. Adjust the HORIZONTAL LINEARITY control slotted screw, located at the rear of the High Voltage cage, for central alignment of the inner circles of the test pattern. If no test pattern is available, the linearity can be adjusted with fair accuracy by adjusting for minimum cathode current of the horizontal output tube. As the control is rotated, a dip in cathode current will be observed.

Horizontal A.F.C. adjustment screw slightly clockwise and again momentarily interrupt the signal. Continue this procedure until the picture just falls out of sync., only when the signal is interrupted.

6. Rotate the Horizontal Hold Control clockwise until the picture falls into sync. The picture should now stay in sync. throughout most of the range of the Horizontal Hold Control.

7. If the picture cannot be made to hold sync., carefully repeat the above procedure. If difficulty is still encountered, it may be necessary to make a complete alignment on the horizontal oscillator transformer using an oscilloscope, as described on page 10 of this folder.

G. PICTURE CENTERING, SIZE AND LINEARITY

1. Horizontal or Vertical Centering is accomplished mechanically. To center the picture, loosen the Focus Coil Wing Nut sufficiently to twist the Focus Coil slightly about its horizontal or vertical axis. Make sure the corners of the raster are not shadowed. See step D.2. Note: Some receivers are equipped with a magnetic centering disc, located between the focus coil and the deflection yoke. To center the picture in the mask, rotate and slightly vary the position of the disc in its vertical plane. This adjustment should be made in conjunction with positioning of Focus Coil (described above).

2. Adjust the VERTICAL SIZE and VERTICAL LINEARITY controls until the test pattern is vertically linear and symmetrical from top to bottom, and fills the mask. Adjustment of either control may require readjustment

Alignment Instructions
Video I-F and Sound Alignment Procedure

TV VIDEO I-F ALIGNMENT

1. Set channel selector to quiet portion of VHF band.
2. Set contrast control fully counterclockwise.
3. Apply 3V. negative bias between the A.G.C. bus (at C53) and ground. (Use 2—1½ V. cells in series.)
4. Connect TV I-F Signal Generator through a 1500 mmf condenser to Test Point (A) of tuner unit: low side to ground. (See schematic diagram.)
5. Connect negative lead of V.T.V.M. or 20,000 ohm per volt meter to pin 7 of V7A 6AL5 diode TEST POINT (B) positive lead to ground. (See schematic diagram.)
6. During alignment maintain Signal Generator output below 1.5 volts peak on V.T.V.M. (Note: High Signal Generator input may cause overloading, resulting in incorrect alignment.)
7. Feed 43.8 MC (±.05 MC) from Signal Generator and adjust T5 for maximum output.
8. Adjust top tuning core of T4 to its maximum counterclockwise position (all out). This is an adjacent sound trap which is not used in most signal areas. Its use may be necessary to reduce or eliminate adjacent sound interference. When found necessary align for **minimum** output at 47.25 mc.
9. Feed 45.5 mc (±.05 mc) from Signal Generator and adjust T4 bottom core for maximum output.
10. Feed 41.25 mc (±.05 mc) from Signal Generator and adjust T3 top core for minimum output.
11. Feed 42.8 mc (±.05 mc) from Signal Generator and adjust T3 bottom core for maximum output.
12. Feed 41.0 mc (±.05 mc) from Signal Generator and adjust T2 for maximum output.
13. Feed 45.2 mc (±.05 mc) from Signal Generator and adjust T1 for maximum output (adjacent to 6U8 on top of tuner).
14. Replace the meter with the vertical input of an Oscilloscope to test point (B) through a 10K isolating resistor, low side of scope to ground.
15. Remove Signal Generator. Feed a video I.F. Sweep Generator signal (40-48 mc) through the loosely coupled shield of the 6U8 VHF converter tube, making sure the shield is not grounded. (Refer to fig. 4.)
16. Observe response curve on the Oscilloscope (refer to fig. 4). Use marker frequencies 41.25 mc, 42.5 mc, 45.0 mc, 47.25 mc and 45.75 mc. It is absolutely important to keep Sweep Generator output at the lowest usable level to prevent response distortion due to overloading.
17. If response curve does not approximate that shown in fig. 4, repeat alignment steps 7 to 12. Check bias battery potential and proper connections. A slight touch up of individual tuning cores may be necessary to approximate the recommended response curve of fig. 4.

NOTE: Top and bottom cores accessible from either end of I.F. transformers. See fig. 3 for proper alignment tool.

IMPORTANT: Keep the sweep generator and marker generator outputs at minimum to avoid curve distortion. Marker pips should be kept barely visible.

TV SOUND ALIGNMENT

NOTE: TV-phono switch if used must be in TV position.

1. Connect a 4.5 MC Signal Generator (±.01 MC) through a 1500 MMF condenser to TEST POINT (B). See schematic diagram.
2. Obtain two resistors of approximately 100,000 ohms each, whose resistances have been matched accurately with an ohmmeter. Connect them in series across the 18K resistor (R178) at the 6T8 tube socket (V11A).
3. Connect negative lead of V.T.V.M. to junction of matched resistors of step 2; positive lead to ground.
4. Feed 4.5 MC (±.01 MC) from signal generator, and adjust L22, sound take-off coil, for maximum deflection on V.T.V.M.
5. Adjust the top and bottom cores of T6 sound I.F. transformer for maximum deflection on V.T.V.M.
6. Adjust the bottom core of T7 for maximum deflection on V.T.V.M.
7. Repeat steps 4 to 6 using minimum signal input necessary for proper meter deflection.
8. Connect positive lead of V.T.V.M. to junction of C152 and R177 TEST POINT (C), leaving negative lead of V.T.V.M. Connected as in step 3. See schematic diagram.
9. Adjust top slug of T7 for zero output on V.T.V.M. between two opposite polarity peaks.

SOUND I.F. ALIGNMENT USING STATION SIGNAL
If accurate 4.5 mc. signal generator is not available, the following procedure may be used only when the video IF's and tuner are properly aligned.

1. Connect antenna to appropriate antenna terminals and tune in station signal.
2. Follow steps 2 to 9 of TV SOUND ALIGNMENT.

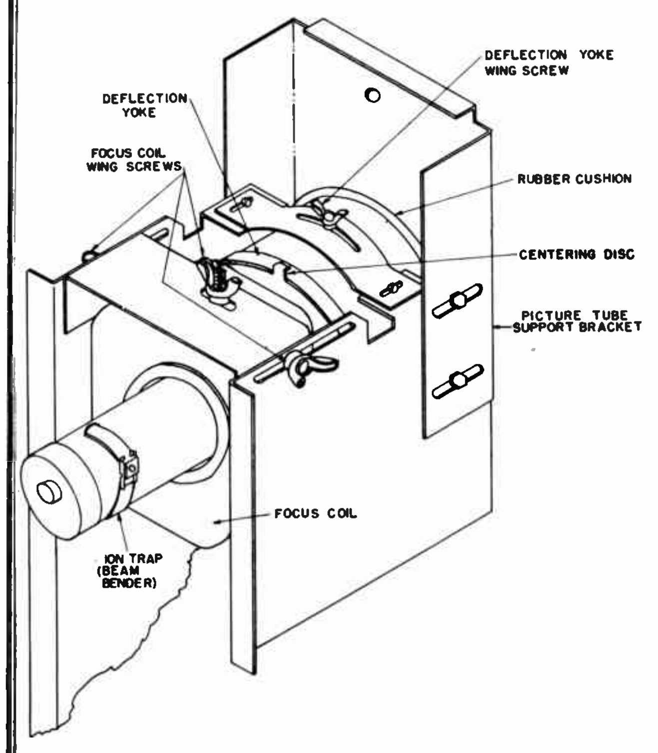

FIG. 2. DEFLECTION YOKE AND FOCUS COIL ASSEMBLY

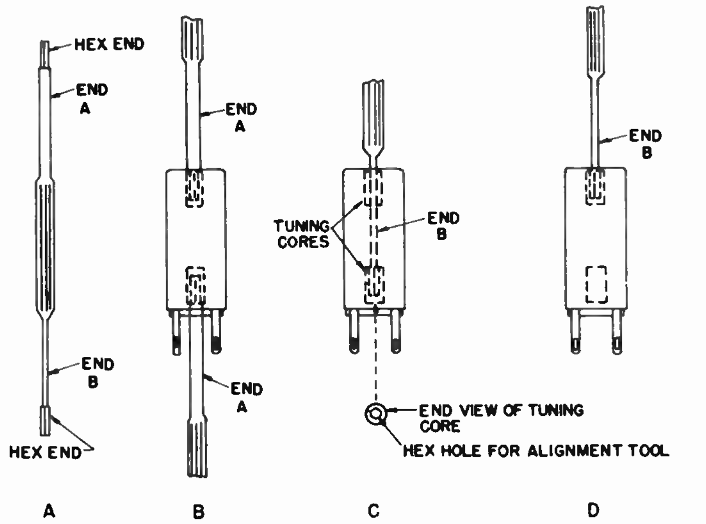

A. Proper non-metallic tool for alignment of video I.F. transformers has two (2) hex-shaped ends.

B. End "A" can be used for tuning top or bottom core from one side of transformer at a time.

C & D. By using end "B" of alignment tool, both top and bottom cores can be rotated from either top or bottom of chassis.

FIG. 3. ALIGNMENT TOOL

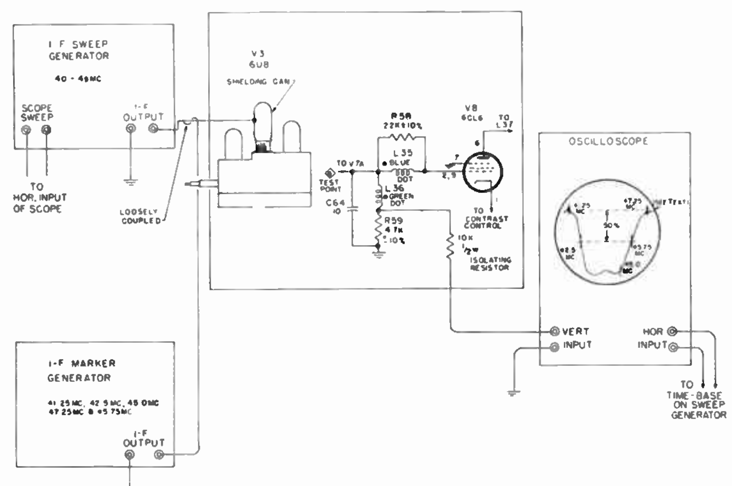

FIG. 4. IF ALIGNMENT BLOCK DIAGRAM

TABLE I RF ALIGNMENT FREQUENCIES — VHF

CHANNEL NUMBER	SWEEP GEN. CENTER FREQ. (10MC.SWEEP)	MARKER GENERATOR FREQUENCIES	
		VIDEO CARRIER	SOUND CARRIER
2	57 MC.	55.25 MC.	59.75 MC.
3	63 MC	61.25 MC.	65.75 MC.
4	69 MC.	67.25 MC.	71.75 MC.
5	79 MC.	77.25 MC.	81.75 MC.
6	85 MC.	83.25 MC.	87.75 MC.
7	177 MC.	175.25 MC.	179.75 MC.
8	183 MC.	181.25 MC.	185.75 MC.
9	189 MC.	187.25 MC.	191.75 MC.
10	195 MC.	193.25 MC.	197.75 MC.
11	201 MC.	199.25 MC.	203.75 MC.
12	207 MC	205.25 MC	209.75 MC.
13	213 MC.	211,25 MC	215.75 MC.

4.5 MC TRAP ALIGNMENT

1. Remove V6 (6CB6 3rd I-F amplifier)
2. Connect a 4.5 MC Signal Generator (±0.01 MC)* which has A.M. modulation, through a 1500 MMF condenser to the grid of V8 (pin 9 6CL6). Low side to ground.
3. Set A.M. modulation for approximately 30% modulation.
4. Set generator output to 0.1 volt.
5. Connect input of diode detector to CRT cathode. (See fig. 11 for suggested diode detector construction.)
6. Connect diode detector output to either a VTVM (D.C. (—) Volts scale) or an Oscilloscope.
7. Short out L22 (sound take-off coil) by connecting a jumper from the junction of C140 and C141 to ground.
8. Adjust L15 (4.5 MC trap) for minimum reading on VTVM or minimum pattern on Oscilloscope.

*Note: If accurate 4.5 MC generator is not available, use station signal. Short out L22 as in step 7 above. Note presence of 4.5 beat in picture. Adjust L15 for minimum beat.

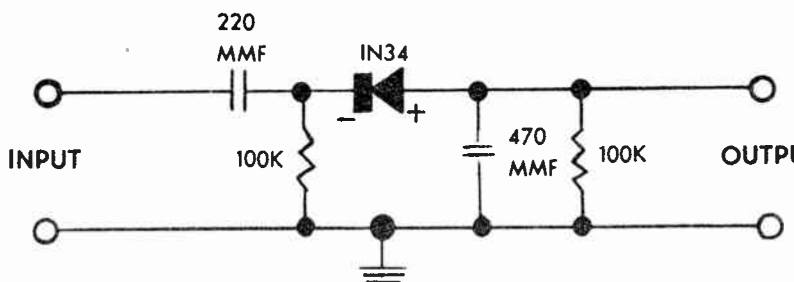

FIG. 11

HORIZONTAL OSCILLATOR TRANSFORMER ALIGNMENT

Refer to Service Adjustment "F" before proceeding with this alignment.

1. Tune in a TV station, preferably one that is transmitting a test pattern.
2. If after attempting the Horizontal A.F.C. Service Adjustment, described above, the picture cannot be made to sync. pre-set the Horizontal Stabilizing adjustment (inner slug of T11, beneath chassis) 5 turns in from its maximum out position.
3. Set the Horizontal Hold control to the center of its range and adjust the Horizontal A.F.C. adjustment until the picture is in sync.
4. Connect a low capacity probe of an oscilloscope to terminal "C" of the Horiontal oscillator transformer, T11; low side to ground. Set horizontal sweep to 7875 C.P.S. If a low capacity probe is unavailable, connect a 10K resistor in series with the vertical scope lead.
5. Adjust the Horizontal Stabilizing brass slotted screw until the broad and narrow peaks of the pattern on the oscilloscope are of equal height. (See illustration.) During Horizontal Stab. adjustment, picture must be kept in sync. by adjusting the Horizontal A.F.C. adjustment, if necessary.
6. Disconnect oscilloscope and follow Service Adjustment "F" above.

NOTES

1. Tune receiver to unused V.H.F. channel—no signal applied unless otherwise specified.
2. All front panel controls at maximum clockwise position.
3. Screwdriver service adjustments, set for normal raster.
4. All voltages measured with V.T.V.M. at 117 volts A.C. line.
5. Values shown are D.C. voltages measured from socket to ground unless otherwise specified.
6. N.C. designates no connection.
7. A dash designates the non existence of socket connections.
8. "Local-Distance" switch in "local" position.
9. "TV-Phono" switch (if used) in TV position.

* Use high voltage insulated probe only.

† Top value is D.C. voltage to ground. Bottom value connect A.C. meter across socket connections 7 and 8.

** Top value is D.C. voltage to ground. Bottom value connect A.C. meter across socket connections 2 and 8.

KEY TO SCHEMATIC

"K"=KILOHMS "M"=MEGOHMS

Unless otherwise noted:

All capacitors are in MMF, ±20%, and rated at 400W. V.

All resistors are in ohms, ±20%, and rated at 1/2 w.

All waveshapes shown are with an input signal sufficient to develop a 3 volt peak to peak composite video signal at the video detector. Contrast set at maximum, all other controls set for normal operation.

ALL CAPACITORS WITH THE SAME SUFFIX LETTER ARE PART OF ONE MULTISECTION UNIT. SEE ALSO CHART OF ELECTROLYTIC CAPACITOR CONNECTIONS.

V.H.F. R.F. ALIGNMENT

1. Connect balanced 300 ohm sweep generator to VHF antenna terminals. (Top terminals at rear of chassis.) See fig. 8 for suitable matching pads.
2. Connect R.F. Marker Generator loosely to VHF antenna terminals.
3. Connect vertical amplifier of Oscilloscope through a 10K resistor to TEST POINT (A), fig. 4.
4. Short A.G.C. bus to ground across C53, 5000 mmf discap condenser.
5. Set TV channel selector to Channel 10.
6. Adjust Sweep Generator for Channel 10, 10 mc sweep and 193.25 mc and 197.75 mc fixed frequencies from R.F. Marker Generator.
7. Observe response curve on Oscilloscope. If necessary, adjust C3 and C12 for overcoupled pattern and C6 for maximum response in center of bandpass. Repeat C3 and C12 adjustments for flat response. See fig. 6.
8. Chcek markers on response curve of all remaining channels setting Sweep and Marker Generators at corresponding frequencies for each channel. See Table 1 for convnient tabulation of proper frequencies. If the R.F. Markers do not fall in automatically in their proper places on all channels, a compromise must be made by slight readjustments of C3, C6 and C12.

V.H.F. OSCILLATOR ALIGNMENT

1. Connect TV R.F. Sweep Generator to VHF antenna terminals.
2. Couple R.F. Marker Generator loosely to the VHF antenna terminals.
3. Connect vertical input of Oscilloscope through a 10K de-coupling resistor to pin 7 of 6AL5 diode V7A. TEST POINT (B).
4. Couple 45.75 MC video I.F. Marker Generator loosely to first I.F. grid (Pin 1 of 6CB6 V4).
5. Rotate Fine Tuning control to center of range.
6. Set channel selector to Channel 10.
7. Set Sweep Generator to Channel 10, and Marker Generator to 193.25 MC (Video carrier).
8. Observe response curve and adjust C11 oscillator adjustment, see fig. 7 for zero-beat with 45.75 MC marker. Zero beat is indicated by an unmistakable break-up of the response curve.
   NOTE: Quality of response curve does not affect accuracy of oscillator alignment, so long as a zero-beat is obtained.
9. Check for zero beat on all channels by adjusting each individual oscillator coil slug with the fine tuning control set in the mechanical center of its range and the channel selector, Sweep Generator and Marker Generator at the corresponding frequencies. See Table 1, Fig. 5.
   NOTE: Adjust oscillator slug from front end of tuner with a long non-metallic screwdriver. A clearance hole is provided through the UHF unit when the UHF drum is turned to VHF. See fig. 7.

U.H.F. R.F. ALIGNMENT

1. The UHF R.F. alignment should be made with the receiver turned off.
2. Connect unbalanced 300 ohm UHF Sweep Generator to the bottom antenna terminals, at the rear of the chassis. See fig. 8 for suitable matching pads.
3. Loosely couple Marker Generator output to the bottom antenna terminals.
4. Remove UHF I.F. plug from UHF I.F. input jack and insert 100 ohm ½ w. non-inductive resistor between center conductor and ground shield of plug. Connect vertical input of Oscilloscope across the 100 ohm resistor. Low side of scope to ground. See fig.
5. Set TV channel and band (decade) selector for Channel 69.
6. Feed 803 mc at 40 mc sweep from Sweep Generator.
7. Observe response curve on Oscilloscope and if necessary, adjust C33 and C34, see fig. 7, so that response curve falls within limits. Vary Marker Generator to check bandwidth. See Table 2 Fig. 10 for corresponding frequencies.
8. Check response curves on at least one channel in each decade setting (14-19, 20-29, etc.), and set the Sweep Generator to the corresponding frequencies. See table 2. If the response curves do not fall within the specified limits, a compromise adjustment of C33 and C34 should be made.
9. Reinsert UHF I.F. plug. The R.F. alignment is now complete for all UHF channels.

U.H.F. OSCILLATOR ALIGNMENT

1. Turn receiver on and allow a 10 minute warmup period before proceeding with adjustments.
2. Connect UHF Sweep Generator to bottom antenna terminals. See fig. 8 for suitable matching pads. (Note: matching pads for oscillator alignment is not generally required. However, to suit various input matching conditions, its use may be warranted.)
3. Couple UHF Marker Generator loosely to bottom antenna terminals.
4. Couple 45.75 mc video carrier I.F. Marker Generator loosely to first I.F. grid (Pin 1 of 6CB6 V4).
5. Connect vertical amplifier input of Oscilloscope through a 10K de-coupling resistor to TEST POINT (B) pin 7 of 6AL5 V7A diode.
6. Rotate fine tuning control to center of its range.
   NOTE: There is one oscillator adjustment for each decade of UHF channels. If local stations fall into different decades, the oscillator adjustments can be set to make each station come in at the same point of the fine tuning control. If there is more than one local station in any one decade, a compromise adjustment must be made. It will be necessary to readjust the fine tuning control when changing stations.
7. Set the TV channel and decade selector for a station in the area.
8. Set the Sweep Generator to the corresponding channel and the UHF Marker to the video carrier frequency of the channel. See table 2.
9. Adjust the UHF oscillator adjustment for zero-beat between the UHF Marker and the I.F. Marker. This zero-beat is indicated by an unmistakable breakup of the observed response curve.
   NOTE: Quality of response curve does not affect accuracy of oscillator alignment, so long as a zero-beat is obtained.
10. Check for zero-beat on all channels expected to be received in the area. See table 2.

V.H.F. R.F. and Oscillator Alignment

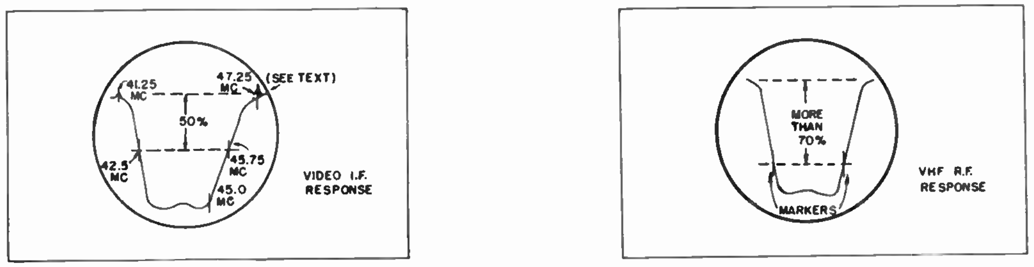

FIG. 6. RECOMMENDED RESPONSE CURVES.

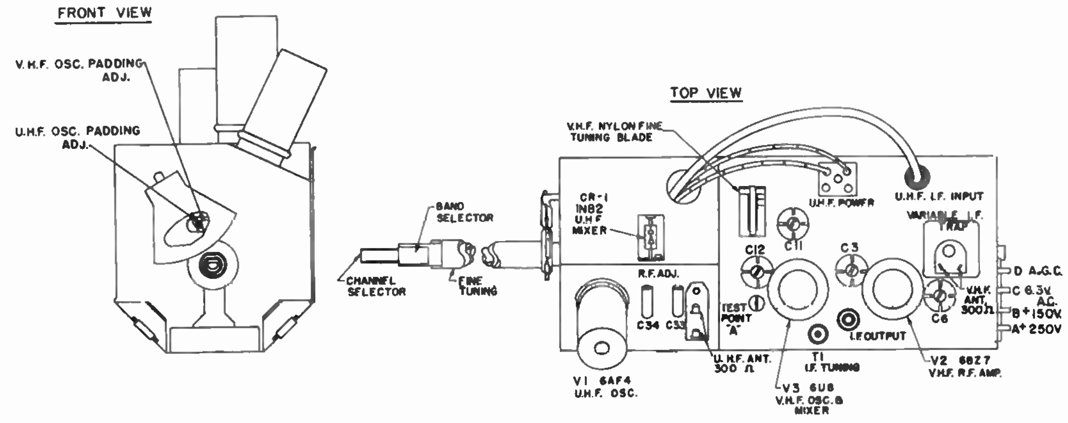

FIG. 7. R.F. TUNER ADJUSTMENT POINTS (STANDARD COIL UHF-VHF 82 CHANNEL CASCODE TUNER)

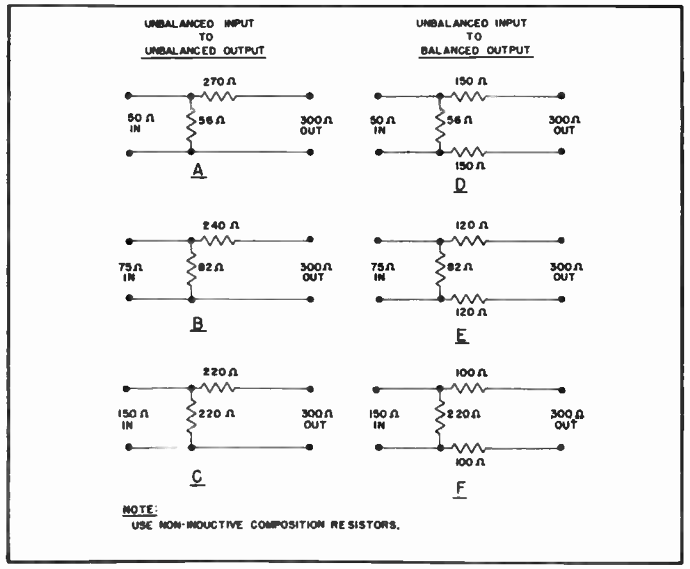

FIG. 8. MATCHING PADS

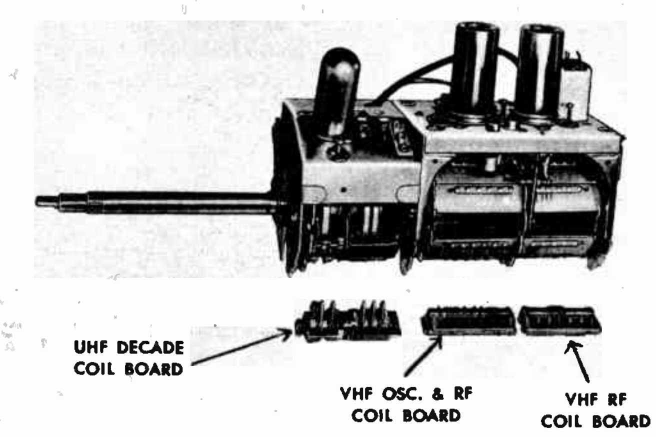

FIG. 9. TUNER WITH COVER REMOVED

ALIGNMENT OF THE TUNER SHOULD NOT BE ATTEMPTED UNLESS IT HAS BEEN DEFINITELY DETERMINED THAT IT IS NECESSARY, AND SHOULD ONLY BE MADE WITH ADEQUATE AND PROPERLY CALIBRATED EQUIPMENT.

MATTISON TELEVISION AND RADIO CORPORATION
Alignment Procedure
MATTISON SILVER ROCKET CHASSIS

a) Use an RCA V. T. V. M. or equivalent.
b) Use RCA sweep generator or equivalent.
c) Use an RCA marker generator or equivalent.

PROCEDURE:

1) Adjust fourth I. F. Coil, No. T105 to 23.9 m.c. for maximum (bottom slug).
2) Adjust marker oscillator to 21.75--adjust to minimum (top slug).
3) Adjust marker oscillator to 25.75 m.c. Adjust bottom slug on L183 for maximum reading on V. T. V. M.
4) Adjust top slug at same coul 27.75 minimum on V. T. V. M.
5) Adjust marker to 22.8 m.c. --adjust T104 for maximum (bottom slug).
6) Adjust top slug at same transformer, No. T104 for minimum.
7) Adjust T103 bottom slug for maximum 22.3 m.c. Adjust top slug for minimum.
8) Adjust converter coil on R. F. tuner to 25.7 m.c. maximum.
9) With sweep generator connected to antenna binding post and marker oscillator loosely coupled to the R. F. oscillator at the tuner, check over-all I. F. sweep response with oscilloscope. Make sure that picture carrier does not fall beyond 50% of the curve. Curve should be 4 m.c. wide from 21.75 sound carrier to 25.75 picture carrier.

* Peak to Peak, measured with oscilloscope
** These readings may be erratic due to action of V-123 with no signal input.

All readings were taken under the following conditions unless otherwise noted;

With Focus Control in center position
Without Signal Input
With Yoke and Focus Coil attached but without kinescope
All controls in maximum clockwise position

All voltages measured to ground at 115 volts line voltage with R.C.A. Voltohmyst and are positive D.C. unless preceded by a minus sign (-) or designated A.C.

NC - No Connection   TP - No tube connection - used as tie point

All measurements were made with a Senior Voltohmyst VTVM. Measurements were made with the Focus Coil and Deflection Yoke connected but without a kinescope. The resistance measurements were made with no power applied to the chassis.

All readings were taken under the following conditions unless otherwise noted:

Focus Control in center position.
Brightness Control in maximum counter-clockwise position (minimum brightness) just before Phono switch clicks.
All readings are in ohms and measured to ground.
Measured with R.C.A. voltohmyst.
All controls in maximum clockwise position.

ANTENNA INPUT- - - - - - - - - - - - - - - - -	300 ohms, Balanced

Re-Adjust the beam bender or ion trap if necessary.

*The chassis contains electrostatically focused picture tubes. These tubes will ordinarily have the focus electrode wired to the 140 volt B+supply. Due to line voltage variations, however, it may become necessary to raise or lower the voltage on this electrode for best focus. Any well filtered voltage from zero, or ground, to a positive 400 volts is permissable on this electrode. If satisfactory focus is not obtained within this range of voltages, re-check the width and horizontal drive adjustments. If these adjustments are found to have been correctly made, check the second anode voltage on the picture tube. For this measurement, a voltmeter which will range to at least fifteen thousand volts is necessary. The picture tube second anode voltage should range between 11.5 and 13.5K.V. positive. The picture is centered by means of a centering magnet, located just to the rear of the deflection yoke, in the position formerly occupied by the focus unit. This magnet may be rotated in any direction to correctly center the pattern. When this ring is in a vertical plane, the thumbscrew will adjust vertical centering. When the ring is in a horizontal plane, horizontal centering will be effected by adjustment of the thumbscrew. (See assembly instruction.)

Alignment Procedure

Necessary Equipment:
- Television Sweep Generator
- Marker Frequency Generator
- Vacuum Tube Voltmeter
- 4.5MC CrystallGenerator, or equivalent, Oscilloscope

Sound I.F. Alignment

1. Connect 4.5MC generator to the grid of the video amplifier tube. Low signal level is important here. Metering may be accomplished at the sound take-off point of the rationdetector (at the juncture of R-155 and C-160) with the meter ground connected to pin eight of the 6V6.

2. Adjust the slug of L-18 (sound take-off coil) for maximum negative meter indication. Attenuate the output of the generator so that not more than five volts is measured on the meter, as the alignment progresses.

3. Adjust the top slug of T-5 (ratio det. primary) for the maximum negative reading. This adjustment is on the bottom for sets employing TS-10062 for T-5.

4. Move the meter ground to the juncture of two 100K 1% resistors placed across R-156 in the sound detector circuit, and adjust the bottom (top for TS-10062) slug of T-5 (ratio det.) for zero voltage. The other meter lead remains connected as in step 1. No. 4.5MC trap adjustment is necessary. The trap consists of a coil L-17 which is self-resonant at 4.5MC.

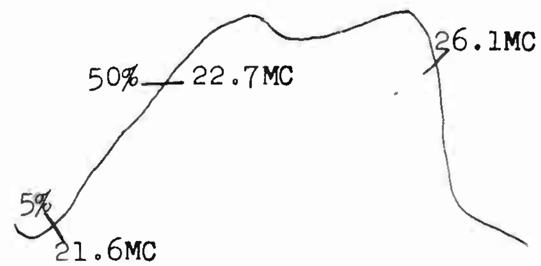
Video I.F. Alignment

The I.F. amplifier contains five tuned circuits, no traps being necessary The video carrier is passed through the I.F. at a freq. of 26.1MC, and the sound carrier at 21.6MC. Extreme care must be taken in alignment, to assure that the sound carrier is attenuated substantially below the level of the video carrier. This is necessary to assure that the slight AM modulation on the sound carrier due to picture modulation will be sufficiently low to be removed by the detector, and not produce spurious phase modulation of the sound I.F. A band width of 3.4MC (6DB down) with a stage gain of from 12 to 15 times is attained. Earlier sets employed a staggered quintuple, which resulted in a different order of stagger of the I. F. coils. (See peaking frequencies below.) These sets may be identified by the values of the grid load resistors on the last two I.F. amplifier tubes, (R-109 and R-113) 6800 ohms. In the later sets, employing a staggered double, the third I.F. grid resistor, R-109, is 10,000 ohms, while the fourth, R-113 remains 6800. Another difference which will serve to help identify the quintuple stagger, lies in the wiring of the A.G.C. to the second I.F. amplifier. In the staggered quintuple alignment, the grid return of the tube is wired directly to the .1 mfd. A.G.C. filter capacitor (C-106). In the staggered triple-staggered double alignment, a 470 ohm resistor (R-106) and a .001 mfd. capacitor (C-105) have been added as additional A.G.C. decoupling.

Peaking Frequencies

Adjust curve for band width of 3.4MC.

1st IF tuner slug to high side	25.9
2nd IF slug to middle of band	24.3
3rd IF slug to low side	23.1
4th IF slug to low side	22.9
5th IF slug to high side	25.7



Use only sufficient input to give pattern on scope with scope vertical control at maximum gain.

Should A.G.C. be developed with this decreased input apply a D.C. battery of -3V. to A.G.C. line and align as above .

An I.F. alignment signal is best introduced to the chassis by means of a suitable cup, or tube shield floated over the mixer tube to capacity couple the signal to the plate circuit. It may be necessary to disable the local oscillator* to prevent R.F. harmonics from distorting the trace on the scope screen. The oscilloscope is connected to the grid of the video amplifier, through a 100,000 ohm isolating resistor. Metering is done on the A.G.C. line, keeping the input attenuated to produce no more than a negative 1 volt reading. The resulting overall response should coincide with the curve shown below.

*A dummy 6J6 may be substituted for the mixer tube with the #1 pin removed, to facilitate alignment.

R.F. Alignment

The R.F. tuner in the receiver has to be pre-aligned by the manufacturer and adjustment in the field is not recommended. It may be necessary on occasional sets, however, to re-set the local oscillator tuning slug. This may be accomplished without test equipment, if it is possible to receive a signal of good quality, and if the I.F. and R.F. portions of the set are functioning correctly. Simply set the fine tuning in the center of its range and adjust the oscillator slug for best picture detail. The oscillator adjustment is recessed in a hole in the tuner front directly to the right of the tuner shaft. This adjustment must be checked on each channel to be received. It is important that a non-metalic alignment screwdriver be used to prevent detuning when the adjustment is completed and the screwdriver withdrawn. On sets using a wooden front panel, a small hole is proved under the flanged tuner knob which will accommodate this alignment tool, and make possible re-setting the osc. slug without removing the set from its cabinet. If a signal of sufficient strength is not available, oscillator adjustment may be made with the sweep generator connected as for I.F. alignment, and the video R.F. carrier frequency applied to the antenna terminals of the receiver from an accurately calibrated signal generator. With the hook-up outlined above, a pip, or marker indicating the video carrier for the particular channel being set will appear on the I.F. response curve. This pip will ride up and down on the curve, when the fine tuning control is moved, and the oscillator is correctly set when the pip is passing through the point on the curve marked 26.1 in Fig. 5, with the fine tuning at the center of its rotation.

* Readings taken from Pin Socket with +140 as common negative reference.

1. Where readings may vary according to control settings, min. & max. readings are given.
2. Measurements are from socket pin to chassis, unless otherwise stated.
3. All measurements taken with line voltage maintained at 117 A.C.

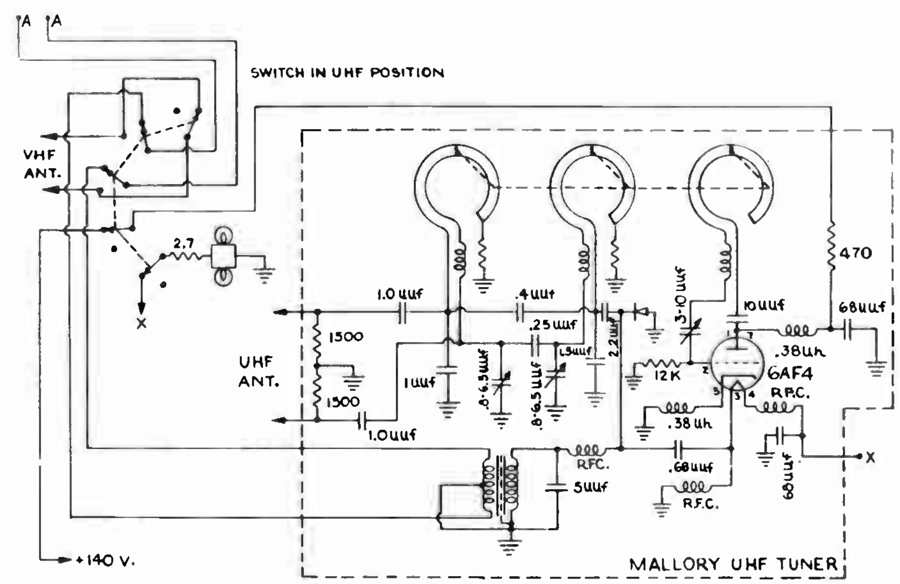
IMPORTANT NOTICE

In previous models, the filament winding on the power transformer which supplied heater voltage to the 6W4 was connected directly to the positive 140 volt supply. This was done to minimize the potential between heater and cathode of the 6W4 damper.

In these models, this heater winding is maintained at a positive 220 volts by means of a voltage divider connected between B+ and ground. The filament winding is bypassed by a .05mfd 600 volt capacitor to ground.

Below is a circuit diagram which shows the interconnections between the U.H.F. tuner unit and the V.H.F. tuner. The switch mentioned above performs the following functions:

1. Transfers the V.H.F. tuner input from the V.H.F. antenna to the output of the U.H.F. unit.
2. Shorts the V.H.F. antenna when switched to U.H.F.
3. Applies B+ to U.H.F. unit for its oscillator supply.
4. Supplies filament voltage for U.H.F. dial lights.



SCHEMATIC
MALLORY UHF TUNER
XXB-10815

CAUTION:
ION TRAP SHOULD BE MOVED CIRCULARLY AND LATERALLY ON NECK OF PICTURE TUBE FOR BRIGHTEST PICTURE WHEN BRILLIANCE CONTROL IS SET AT SLIGHTLY MORE THAN NORMAL VIEWING BRILLIANCY.

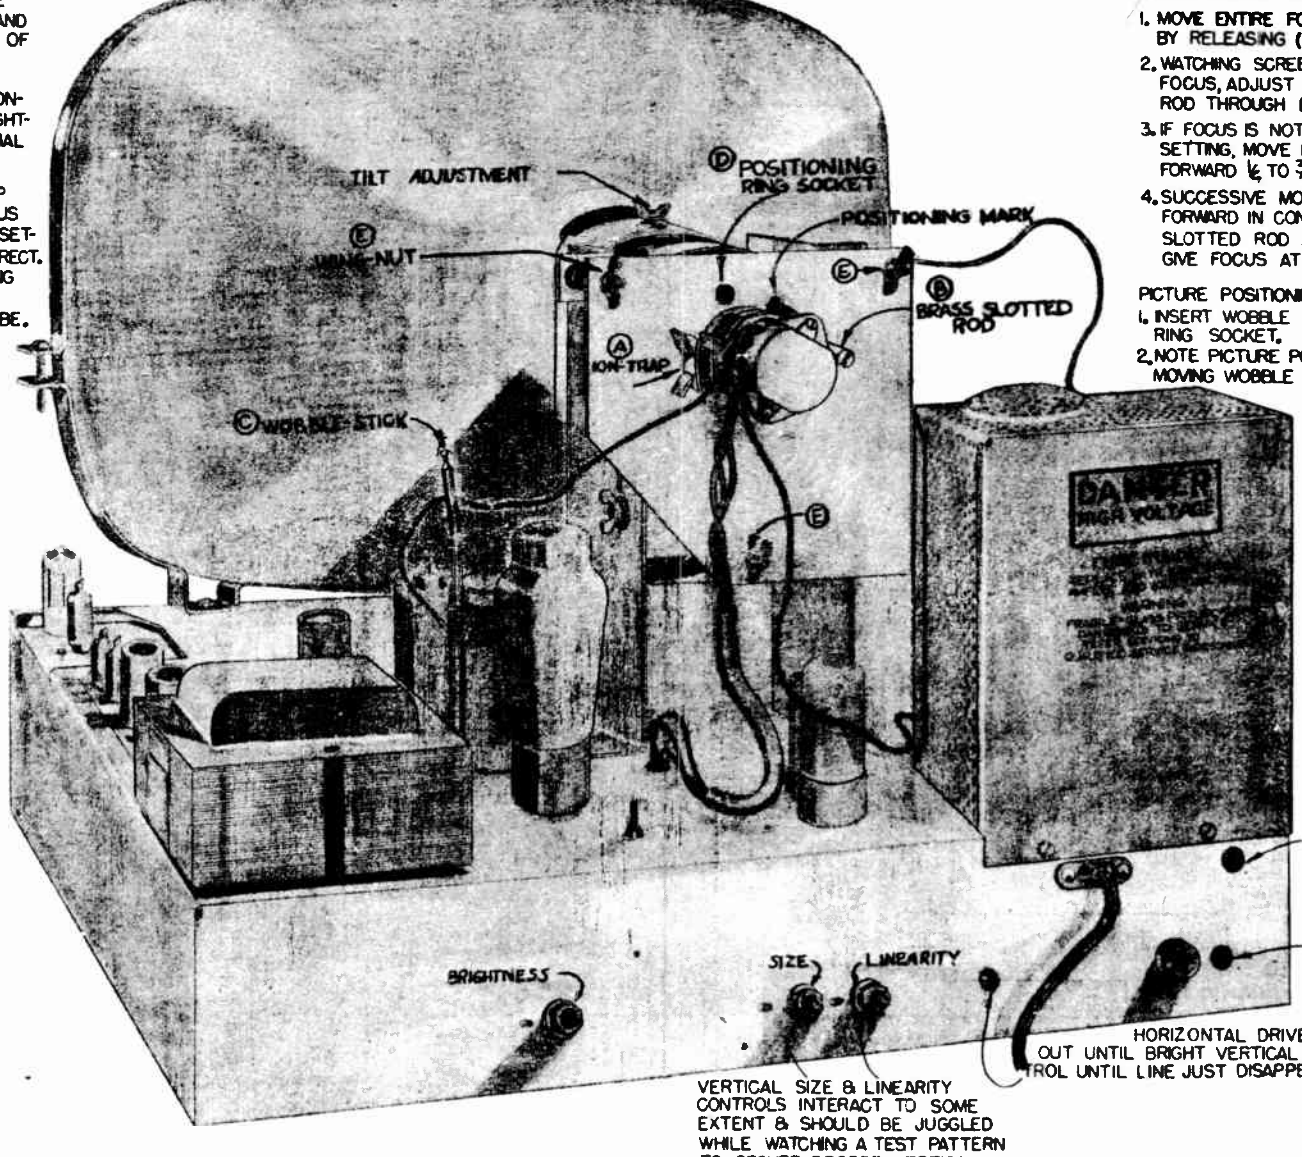
NEVER USE ION TRAP TO POSITION OR FOCUS PICTURE. ONLY ONE SETTING OF TRAP IS CORRECT. AN INCORRECT SETTING WILL PERMANENTLY DAMAGE PICTURE TUBE.

FOCUS ADJUSTMENT:

1. MOVE ENTIRE FOCUS UNIT TO REAR BY RELEASING (3) WING NUTS.
2. WATCHING SCREEN FOR SHARPEST FOCUS, ADJUST BRASS SLOTTED ROD THROUGH ENTIRE RANGE.
3. IF FOCUS IS NOT REACHED WITH THIS SETTING, MOVE ENTIRE ASSEMBLY FORWARD 1/8 TO 3/8" AND REPEAT STEP 2.
4. SUCCESSIVE MOVING OF THE UNIT FORWARD IN CONJUNCTION WITH BRASS SLOTTED ROD ADJUSTMENT, WILL GIVE FOCUS AT SOME POINT.

PICTURE POSITIONING:

1. INSERT WOBBLE STICK IN POSITIONING RING SOCKET.
2. NOTE PICTURE POSITION IN MIRROR WHILE MOVING WOBBLE STICK FOR PICTURE CENTERING.



HORIZONTAL SIZE

HORIZONTAL LINEARITY SHOULD BE ADJUSTED WHILE WATCHING A TEST PATTERN.

HORIZONTAL DRIVE CONTROL SHOULD BE TURNED OUT UNTIL BRIGHT VERTICAL LINE APPEARS. SCREW IN CONTROL UNTIL LINE JUST DISAPPEARS. THIS IS PROPER SETTING.

VERTICAL SIZE & LINEARITY CONTROLS INTERACT TO SOME EXTENT & SHOULD BE JUGGLED WHILE WATCHING A TEST PATTERN TO SECURE PROPER VERTICAL SIZE & LINEARITY.

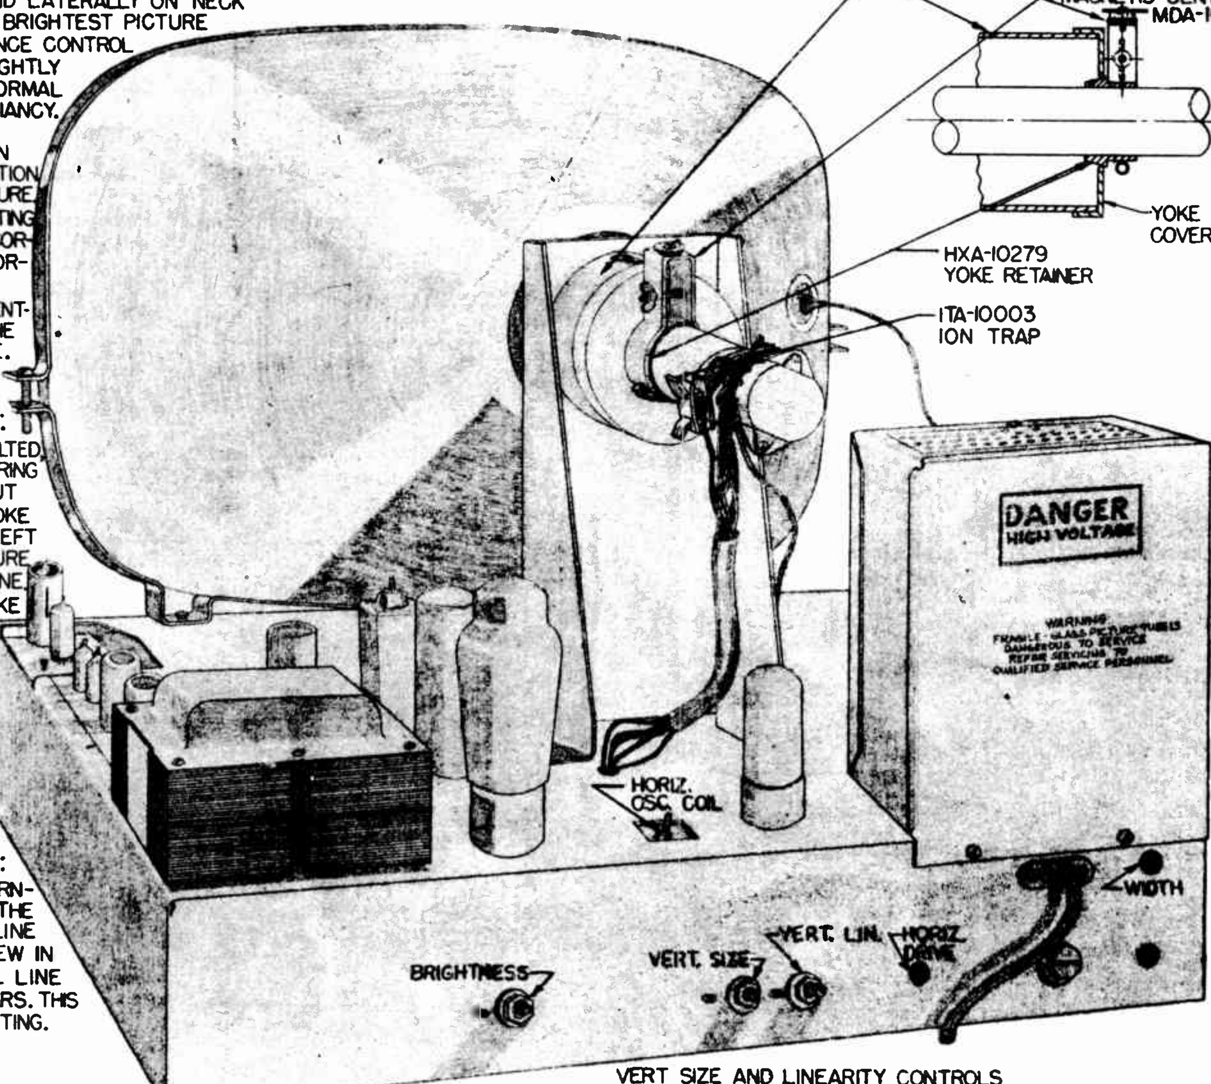
REAR VIEW OF CHASSIS
XXD-10691

CAUTION: ION TRAP SHOULD BE MOVED CIRCULARLY AND LATERALLY ON NECK OF TUBE FOR BRIGHTEST PICTURE WHEN BRILLIANCE CONTROL IS SET AT SLIGHTLY MORE THAN NORMAL VIEWING BRILLIANCY.

NEVER USE ION TRAP TO POSITION OR FOCUS PICTURE. ONLY ONE SETTING OF TRAP IS CORRECT. AN INCORRECT SETTING WILL PERMANENTLY DAMAGE THE PICTURE TUBE.

PICTURE ANGLE:
IF PICTURE IS TILTED, LOOSEN CENTERING DEVICE WING NUT AND ROTATE YOKE TO RIGHT OR LEFT TO BRING PICTURE INTO HORIZ. PLANE. BE CERTAIN YOKE REMAINS SEATED AGAINST CRT BELL. RECHECK CENTERING DEVICE & ION TRAP & TIGHTEN WING NUT.

HORIZONTAL DRIVE CONTROL:
SHOULD BE TURNED OUT UNTIL THE BRIGHT VERT. LINE APPEARS. SCREW IN CONTROL UNTIL LINE JUST DISAPPEARS. THIS IS PROPER SETTING.



TO PROPERLY ASSEMBLE THE YOKE CENTERING DEVICE AND ION TRAP ON THE PICTURE TUBE REFER TO ILLUSTRATION. THE PURPOSE OF THE YOKE RETAINER (RUBBER SLEEVE WITH CONE SHAPED END) IS TO CENTER THE BACK OF THE YOKE ON THE PICTURE TUBE NECK AND HOLD THE YOKE AGAINST THE PICTURE TUBE.

TO ASSEMBLE, HOLD THE YOKE IN POSITION AND SLIP THE PICTURE TUBE NECK THROUGH THE YOKE AND FIRMLY SEAT THE PICTURE TUBE IN ITS HARDWARE.

AFTER THE TUBE IS FASTENED SECURELY, CENTER THE YOKE ON TUBE NECK BY SLIDING THE YOKE RETAINER ON THE NECK WITH THE CONE PORTION TOWARD THE YOKE.
INSERT THE YOKE RETAINER IN THE REAR OF THE YOKE AND CENTER THE YOKE AT THE SAME TIME HOLDING THE YOKE AGAINST THE TUBE BELL. SLIP THE CENTERING DEVICE AROUND THE SLEEVE PORTION OF THE YOKE RETAINER WITH CLAMPING SCREW LOOSENED. INSTALL THE ION TRAP AND PICTURE TUBE SOCKET AND ADJUST THE ION TRAP. CENTER THE PICTURE BY BOTH ADJUSTING THE KNOB ON THE CENTERING DEVICE AND ROTATING THE CENTERING DEVICE AROUND THE SLEEVE PORTION OF THE YOKE RETAINER.
AFTER THE CENTERING HAS BEEN ACCOMPLISHED, TIGHTEN THE WING NUT ON THE CENTERING DEVICE TO HOLD THE YOKE IN PLACE. RECHECK THE ION TRAP ADJUSTMENT.

VERT SIZE AND LINEARITY CONTROLS INTERACT TO SOME EXTENT AND SHOULD BE JUGGLED WHILE WATCHING A TEST PATTERN TO SECURE PROPER SIZE & LINEARITY.

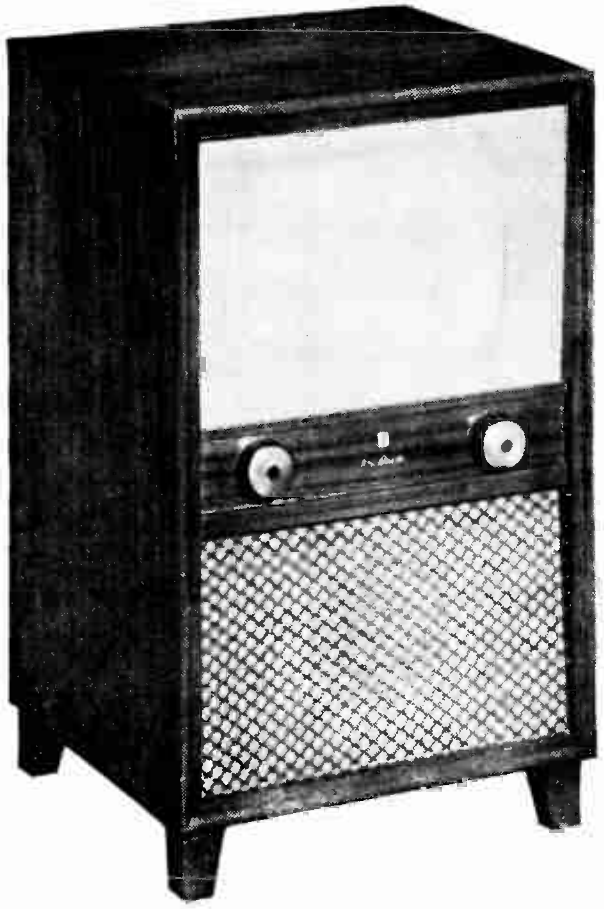
LEAD DRESS

The following lead dress is important. When such leads are properly dressed it will aid in the correction of "Audio Buzz". However, the sound alignment should be throughly checked before condeming any lead dress of the chassis.

(1) The yellow and the black twisted leads leading from the Volume control to the 15K resistor of the Ratio Detector should be dressed away from all components in the vertical circuits as much as possible. These leads should remain as close to the chassis as possible.

(2) The Blue lead from the primary of the audio output transformers to the plate of the 6V6 tube should be dressed away from the yellow and black twisted leads leading from the volume control to the grid (pin #2) of the 12AX7 tube.

(3) The green lead leading from the vertical speed control to the 1 meg resistor should be dressed away from all components as much as possible. Do not dress this lead close to the chassis.



ELECTRICAL SPECIFICATIONS

Power Supply	105-125 Volts AC 60 Cycles Only
Power Consumption	170 Watts
Power Output	2.7 Watts (Max.) 1.55 Watts (10% Distortion)
Tuning Range	12 Channel
Antenna Input Imp.	300 Ohms balanced
Intermediate Frequencies	Picture 26.4 MC Sound 21.9 MC
Intercarrier Sound System	4.5 MC
Loud Speaker	Electro-Magnetic
Voice Coil Imp.	3.2 Ohms 400 Cycles
Field Coil Resistance	90 Ohms

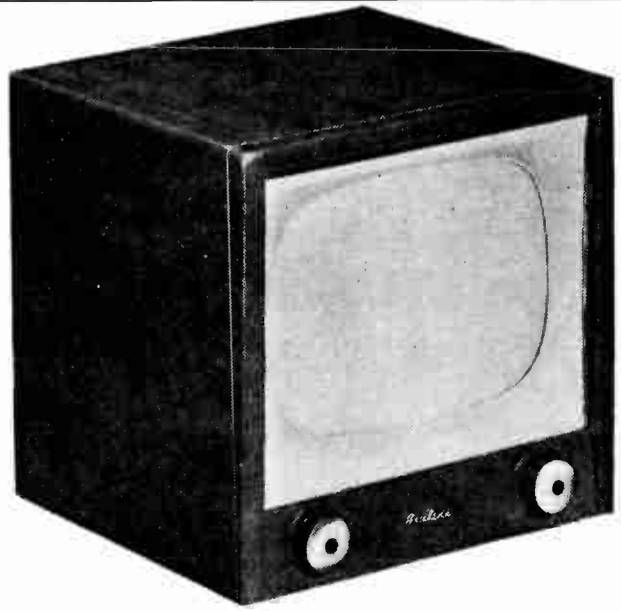
SUPPLEMENTARY MANUAL

Models GSL-3064C and GSL-3083C are identical to the issue "A" and "B" covered in Manual No. 4113A except for the following changes:

V19 (Metal Picture Tube) 17TP4 has been changed to 17HP4 (Glass Picture Tube).

Due to the difference in the mounting of the glass picture tube the necessary brackets, straps, insulating strips, etc., are incorporated in the Parts List in this supplement.

A schematic diagram together with a complete parts list are included in this manual. For test patterns, alignment procedure, wave forms and other service information refer to Manual No. 4113A.



GENERAL DESCRIPTION

These models use 19 tubes, (including picture tube and rectifier) have a crystal diode video detector, employ a intercarrier sound circuit, have safety interlock and a fuse in the low voltage power supply. Picture tube has electrostatic focus, which is automatic and permanent.

TUBE COMPLEMENT

Symbol	Type	Function
V1 Tuner	6BC5	R-F Amplifier
V2 Tuner	6J6	R-F Osc. & Mixer

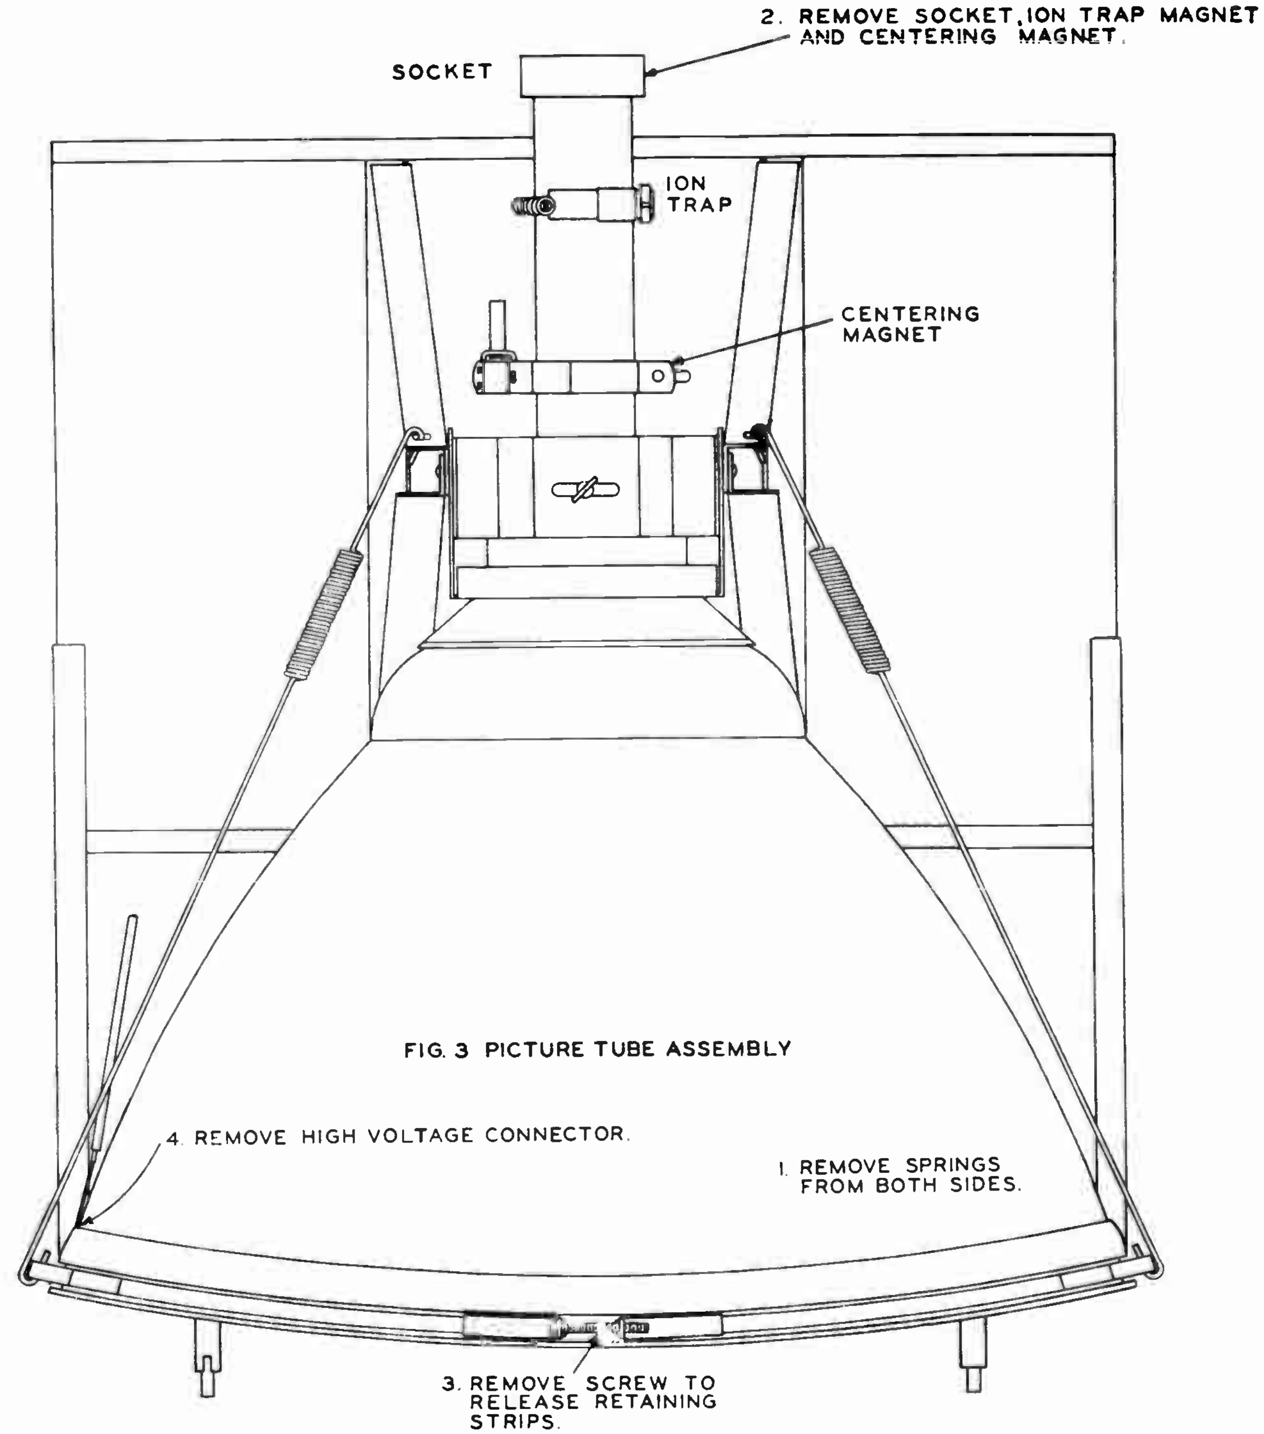

FIG. 3 PICTURE TUBE ASSEMBLY

PICTURE TUBE REPLACEMENT: To replace the picture tube it is necessary to remove the chassis from the cabinet. This may be accomplished in the following manner:

1. Remove the front panel control knobs by pulling them straight from their shafts.
2. Remove the cabinet back. Remove antenna terminal board from cabinet back. You will not that the interlocked line cord disconnects the power when the cabinet back is removed.
3. Disconnect speaker plug from chassis, remove the five chassis mounting bolts. Pull chassis CAREFULLY out of the cabinet.
4. Remove the picture tube as shown and outlined in the illustration. To install a new picture tube, reverse the procedure making sure that the picture tube fits close against the picture tube cushion. If the picture tube sticks or fails to slip into place smoothly, investigate and remove the source of the trouble. Never force the tube. It is important that all the clips and shims used in mounting the tube be replaced, otherwise difficulty may be encountered when horizontal or vertical centering is required.

WARNING: Before handling the picture tube, it will be necessary to remove the static charge. In receivers with metal picture tubes, remove the static charge by grounding an insulated wire from the chassis to the metal portion of the tube.

ALIGNMENT PROCEDURE

TEST EQUIPMENT: To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR meeting the following requirements:

(a) Frequency ranges:

18 to 30 mc, 10 mc sweep width

40 to 90 mc, 10 mc sweep width

170 to 225 mc, 10 mc sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled. Electronic Voltmeter and a high voltage probe for use with this meter to permit measurements up to 20 kilovolts.

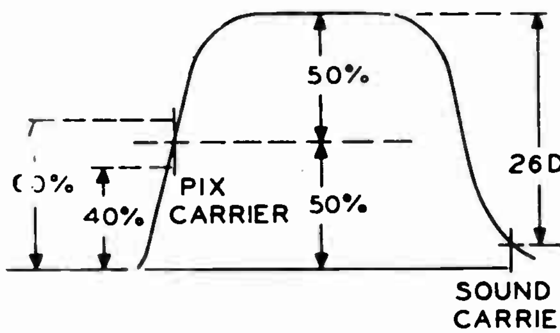

FIG.7 - OVERALL RESPONSE CURVE

SIGNAL GENERATOR to provide the following frequencies; (Output on these ranges should be adjustable and at least .1 volt maximum.)

(a) Intermediate alignment frequencies.

26.1 Plate coil tuner

24.4 1st Pix I.F. Coil

24.0 2nd Pix I.F. Coil

4.5 mc video trap and sound I.F.

26.1 3rd Pix I.F. Coil

(b) Radio frequencies.

Channel No.	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

SERVICE PRECAUTIONS: To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the cabinet back, disconnect speaker plug from chassis, remove the antenna terminal board from cabinet back, and then the 5 chassis mounting bolts. The chassis may be serviced with the picture tube in place provided the chassis is turned on its side with the power transformer on the top. The weight of the chassis will be supported against the high voltage housing.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high voltage filter resistor R-86.

LOCATION OF TUBES

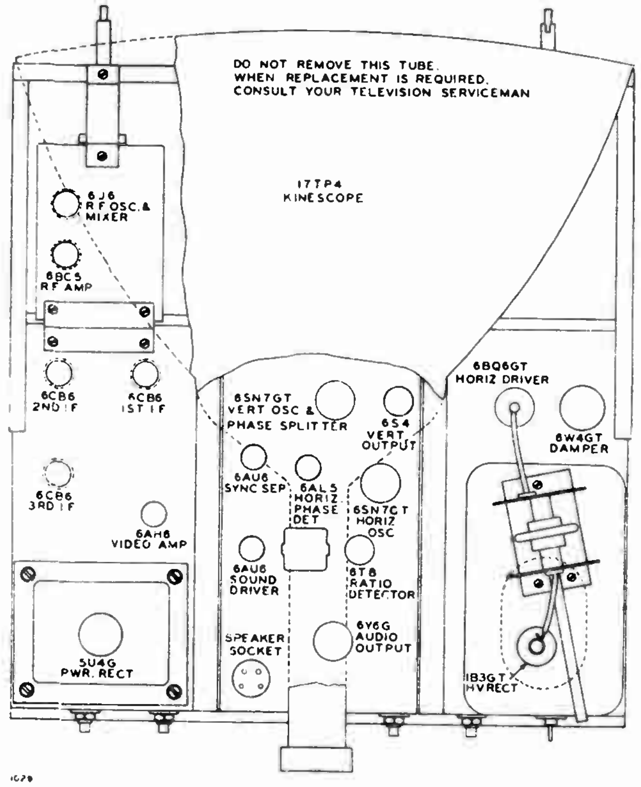

FIG 9

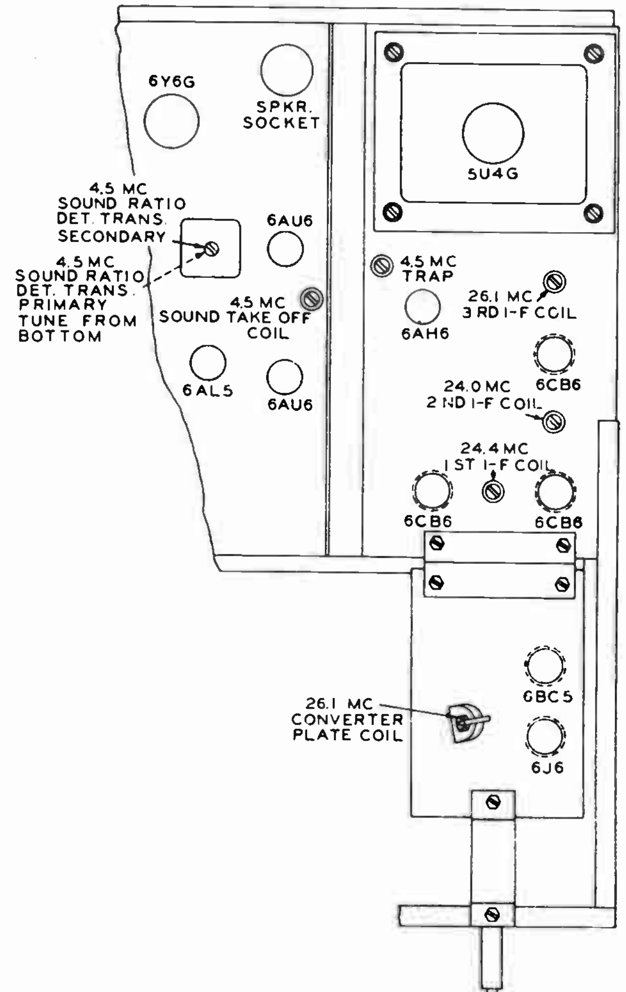

FIG. 8 TRIMMER LOCATIONS

1031

A. Unmodulated R-F signal into Converter Grid by means of tube shield insulated from base. VTVM connected to junction picture detector load resistor, (R-21) 6800 ohms, and peaking coil (L-8). Input signal level should be such that output is less than 2 volts DC. apply — 4.5 V battery Bias on AGC line.

	Frequency	Adjust
1.	26.1 MC	Converter plate coil (on top of tuner) for maximum dc at picture detector.
2.	24.4 MC	1st picture I-F coil L-5 (above chassis) for maximum dc at picture detector.
3.	24.0 MC	2nd picture I-F coil L-6 (above chassis) for maximum dc at picture detector.
4.	26.1 MC	3rd picture I-F coil L-7 (above chassis) for maximum dc at picture detector.

B. I-F Sweep Generator into converter grid by means of tube shield insulated from base. Connect oscilloscope across R-21, 6800 Ohms (in place of VTVM). Apply — 4.5 bias (battery) to AGC line.

Tuner should be switched to a channel not being used so as not to cause interference.

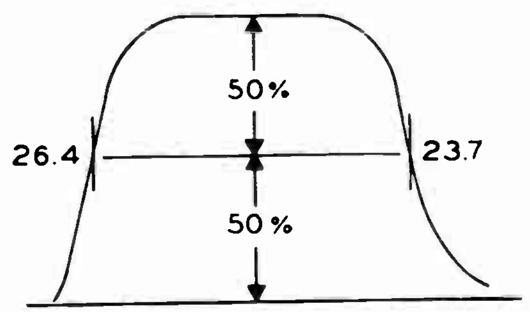

FIG. 10 OVERALL I.F. RESPONSE CURVE

1035

Observe overall I-F response, which should be as shown above: A slight touch-up may be required. At no time should it be necessary to turn any of the picture I-F coils more than ½ turn of the slug. The following comments are suggestions only:

1. The height of the 26.4 MC marker is controlled by the (26.1 MC) converter plate coil on tuner and the (26.1 MC) 3rd P.I.F. coils.

2. The 23.7 MC marker position is controlled by the 2nd picture I-F coil (24.0 MC) and the 1st picture I-F coil (24.4 MC).

4.5 MC TRAP ALIGNMENT:

1. Tune in a station.
2. Adjust fine tuning rotar until sound bars just appear in picture.
3. Turn L-10 slug all the way out (counter clockwise).
4. Turn the slug in (clockwise) until the horizontal scanning lines are smooth and continuous.

SOUND I-F ALIGNMENT: Connect signal generator to grid of video amp. (6AH6), adjust contrast control to maximum. Set signal generator to 4.5 MC (no modulation) (setting of 4.5 MC must be accurate). Connect (2) two 50,000 ohm resistors across C-39 (resistors must match within 5%). 1. VTVM is connected across C-39. **See Fig. 12.** Adjust L-12 and T-3 (Bottom) for maximum on VTVM. This adjustment should be made with voltage on VTVM under 12 volts. 2. Connect VTVM between junction of R-39, R-40 and junction of the (2) two 50,000 ohm resistors. **See Fig. 12.** Adjust T-3 (Top) for zero on VTVM. If VTVM reads below zero, reverse leads and again adjust T-3 (Top) for zero reading. Re-check step one.

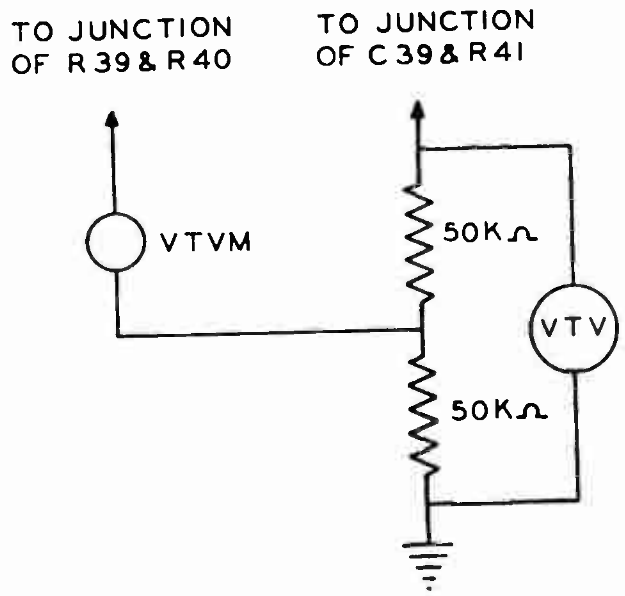

FIG. 12

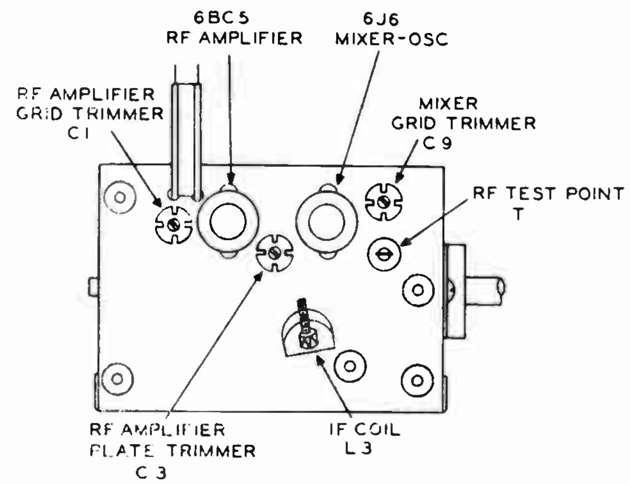
1039

TUNER ALIGNMENT

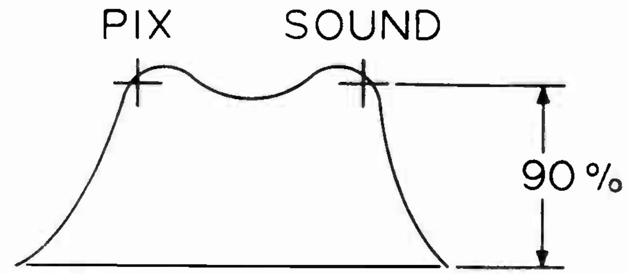
A. Sweep generator with balanced 300 ohm output to antenna terminals. Marker generator output to antenna terminals. Oscilloscope to "Test Point" on tuner. Ground AGC line at junction of R-12 and C-17.



1043 FIG 13 TUNER ADJUSTMENTS

B. RF and converter adjustment:
1. With channel selector on channel 12, adjust C-1, C-9 and C-3 for response as in Figure 14. Picture and Sound markers at 90% maximum response.

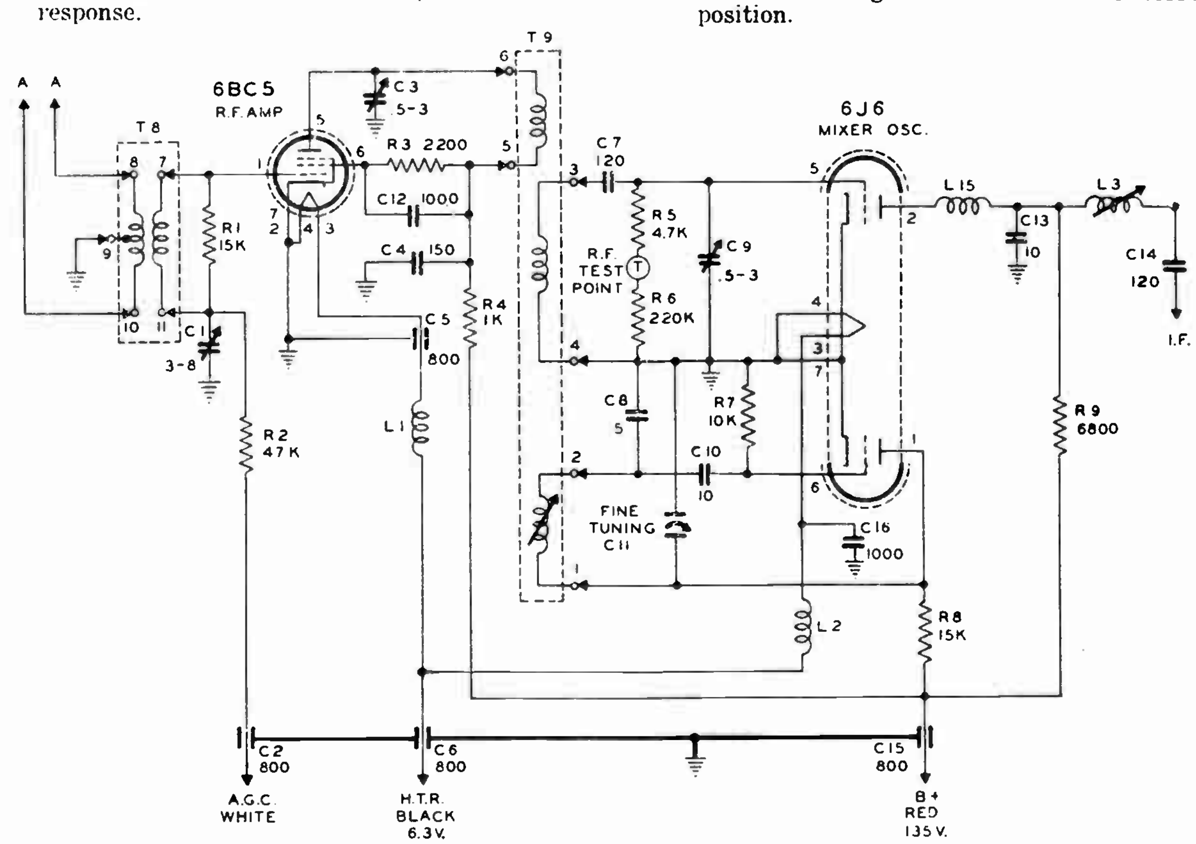
2. Check response on all channels. If markers are below 70% on any channel, readjust C-1, C-9 and C-3. Re-check all channels.



1047

FIG. 14 – PIX AND AUDIO MARKERS

C. Oscillator adjustment:
1. Remove AGC ground. Apply — 4.5 Volts on I-F AGC line.
2. Connect oscilloscope to output of video detector. Place fine tuning in center of range. Check response on all channels. Picture marker should be at 50%. **See Fig. 7.**
3. If some channels are off, individual oscillator coil slugs will require adjustment. Adjust each channel slug, accessible through hole in front of chassis with a non-metallic screwdriver to bring Picture Marker to correct position.



1. ALL CAPACITANCE VALUES STATED IN MMF.

CHECK OF R-F OSCILLATOR ADJUSTMENTS

The oscillator is preset at the factory and normally needs no adjustment. However, if adjustments are required, they can be made without removing the chassis from the cabinet. Remove the channel selector and fine tuning knobs from the tuning shaft.

TEST PROCEDURE:

1. Set channel selector to receive desired station.
2. Set fine tuning control in center of its range.
3. Adjust oscillator slug, with bakelite type screwdriver, for best picture resolution.
4. Repeat steps 1, 2 and 3 on all channels used.

MODEL
WG-3190 (OAK)

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 Volts AC 60 Cycles Only
Power Consumption	Television—210 Watts Radio—35 Watts Phonograph—55 Watts
Power Output	2.4 Watts (Max.) 1.8 Watts (10% Distortion)
Tuning Ranges	VHF—Channels 2 thru 13 UHF—Channels 14 thru 83 AM-540-1600 KC
Intermediate Freq. (Tel.)	Picture—26.20 MC Sound—21.70 MC
I-F (UHF Position Only)	Picture 121.75 MC Sound 126.25 MC
Intermediate Freq. (Radio)	455 KC
Selectivity (Radio)	45 KC Broad at 1,000 Times Signal, measured at 1,000 KC
Sensitivity (Radio)	(For .5 Watt Output) 10 Microvolts Average
Tel. Antenna Input Imp.	300 Ohms Balanced
Intercarrier Sound System	4.5 MC
Loud Speaker	8" PM Dynamic
Voice Coil Impedance	3.2 Ohms 400 Cycles
Record Changer	See Manual 5096A (VM-950)
Cartridge	Shure P77V (60H17)
Needles—78 RPM —33⅓ & 45 RPM	Shure 85-16 (61H2) —Shure 85-18 (61H13)

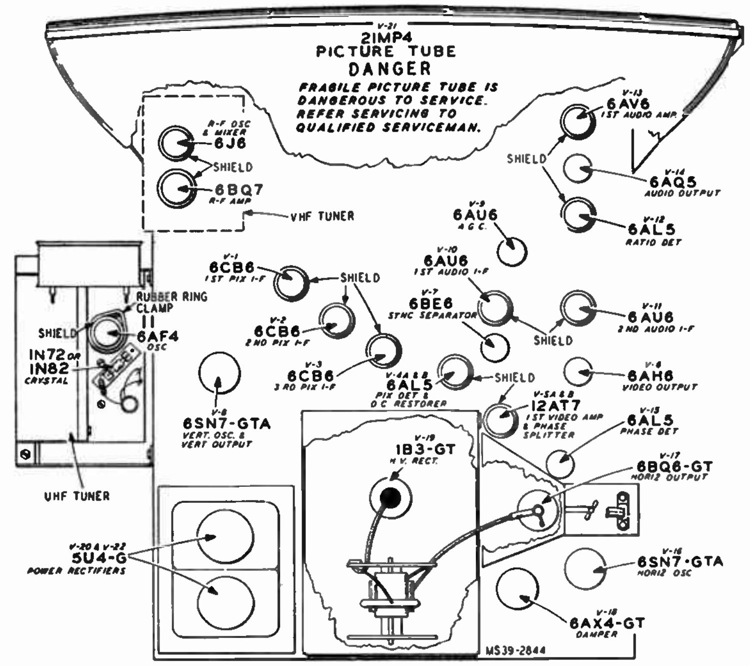

Fig. 1—Tube Layout.

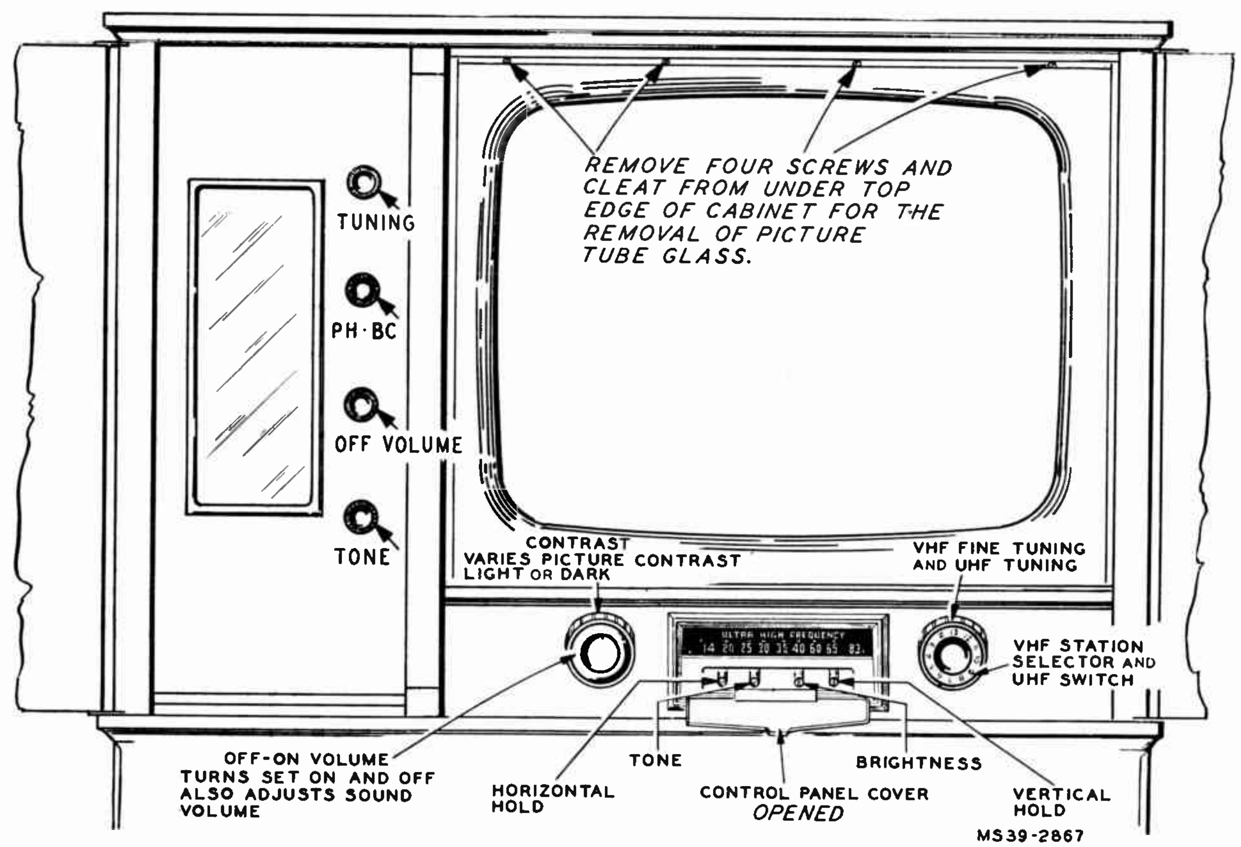

Fig. 2—Front Panel Controls

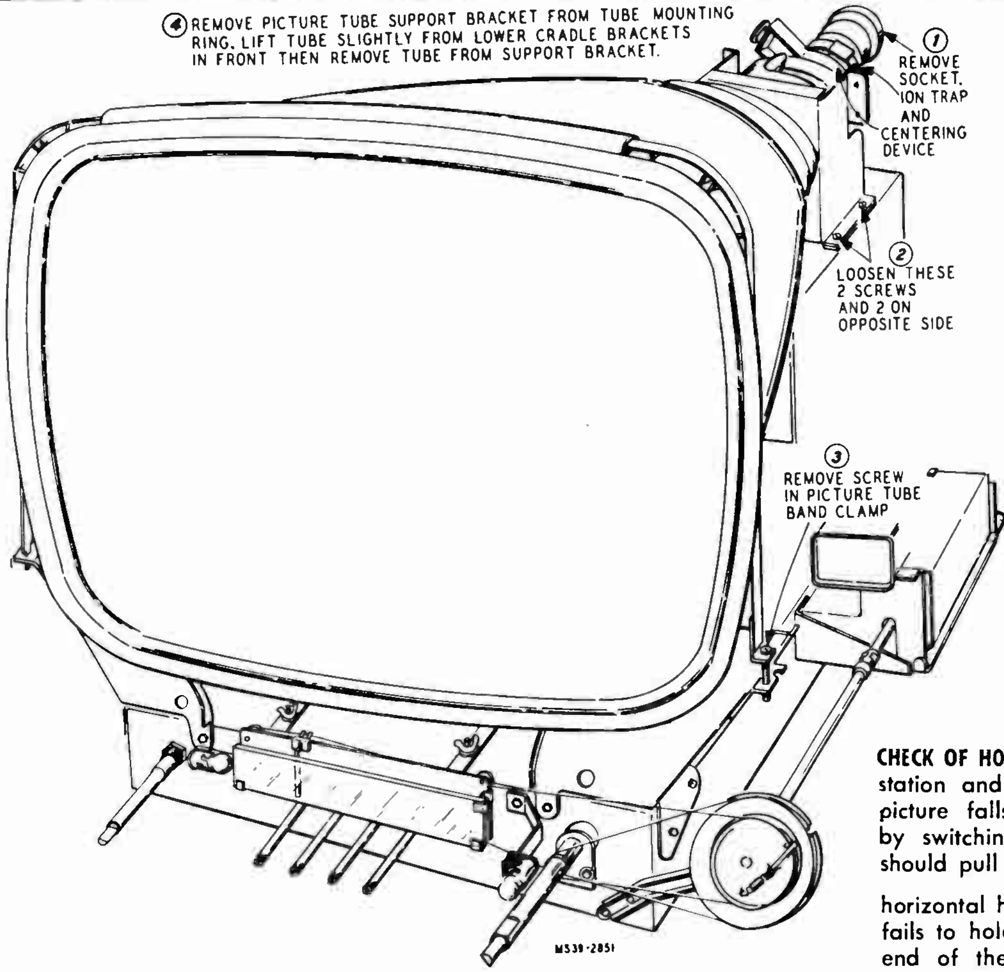

Fig. 3—Removal of Picture Tube

ADJUSTMENT OF AGC THRESHOLD CONTROL — Tune the receiver will be used. While observing the picture and listen-ceiver to the strongest station in the area in which the re-ing to the sound, turn the control clockwise until signs of overloading (buzz in sound, washed-out picture) appear. Then turn the control a few degrees counter-clockwise from the point at which overloading occurs. (The stronger the signal input, the more counter-clockwise this setting will be.) In areas where the strongest signal does not exceed 10,000 uv the setting will usually be maximum clockwise. With the control set correctly, the AGC will automatically adjust the bias on the R.F. and I.F. amplifiers so that the best possible signal to noise ratio (Minimum snow) will be obtained for any signal input to the receiver.

ADJUSTMENT OF SYNC STABILITY CONTROL — When receiving strong (500 MV or more) signals, set hold controls so that the picture is locked in. Turn the sync control slowly clockwise until bending occurs at top of picture. Then turn the control a few degrees counter-clockwise until bending disappears. If the control is set incorrectly bending, tearing, etc., will be present and when switching from channel to channel the picture will not lock in quickly.

In weak signal areas the control should be set for maximum picture stability. In general the weaker the signal the more clockwise the control should be turned.
When the sync stability control is correctly adjusted the receiver will hold sync without tearing or rolling under even the most adverse noise conditions.

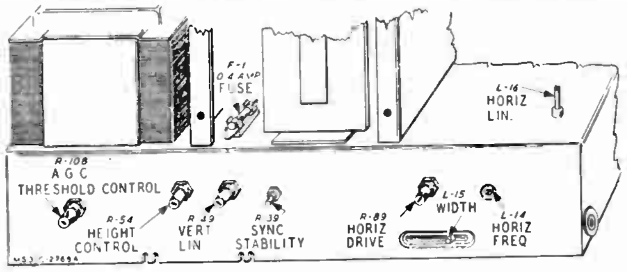

Fig. 4—Adjustments Rear of Chassis

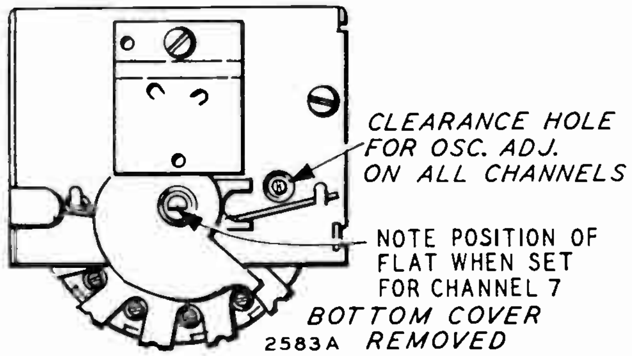

Fig. 5—Tuner Oscillator Adjustments

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT — Tune in a station and adjust the horizontal hold control until the picture falls into sync. Momentarily remove the signal by switching off channel and then back. The picture should pull into sync over a range of 90° rotation of the horizontal hold control. If in the above check the receiver fails to hold sync or the pull-in range is at the extreme end of the control, it will be necessary to make the following adjustment.

HORIZONTAL FREQUENCY ADJUSTMENT — With the horizontal hold control set to the center of its range of rotation, adjust the horizontal frequency control (L-14) until the picture pulls into sync. Recheck the "Horizontal Oscillator Alignment."

HEIGHT AND VERTICAL LINEARITY ADJUSTMENT — Adjust the height control (R-54) until the picture fills the mask vertically. Adjust the vertical linearity control (R-49) until the picture is symmetrical from top to bottom. Adjust the picture centering device to align picture with the mask. Adjustment of any control will require a re-adjustment of the other control.

WIDTH, DRIVE AND LINEARITY ADJUSTMENTS— While receiving a signal from a station (with picture locked in sync) turn contrast control fully counter-clockwise, turn the brightness control (R-25) up so that the picture appears washed out. Adjust width control (L-15) until the picture fills the mask. Turn the horizontal drive control (R-89) clockwise until white bars appear in the left center portion of the raster, then turn counter-clockwise until the white bars just disappear. This adjustment will allow the horizontal system to operate at maximum efficiency. Adjust horizontal linearity control (L-16) for best linearity. If adjustment of the horizontal drive (R-89) or horizontal linearity (L-16) is required, it usually will be necessary to recheck the horizontal oscillator alignment. If adjustment of the horizontal linearity control (L-16) is required, readjustment of the horizontal drive control (R-89) will be necessary. Adjust the picture centering device to align the picture with the mask.

CHECK OF R-F OSCILLATOR ADJUSTMENTS

The oscillator is preset at the factory and normally needs no adjustment. However, if adjustments are required, they can be made without removing the chassis from the cabinet. Remove the channel selector and fine tuning knobs from the tuning shaft.

TEST PROCEDURE:

1. Set channel selector to receive desired station.
2. Set fine tuning control in center of its range.
3. Adjust oscillator slug, with bakelite type screwdriver, for best picture resolution.
4. Repeat steps 1, 2 and 3 on all channels used.

CAUTION—These adjustments are intended only for VHF Channels. For information regarding UHF alignment, see paragraph "Tuner Alignment" on page 11.

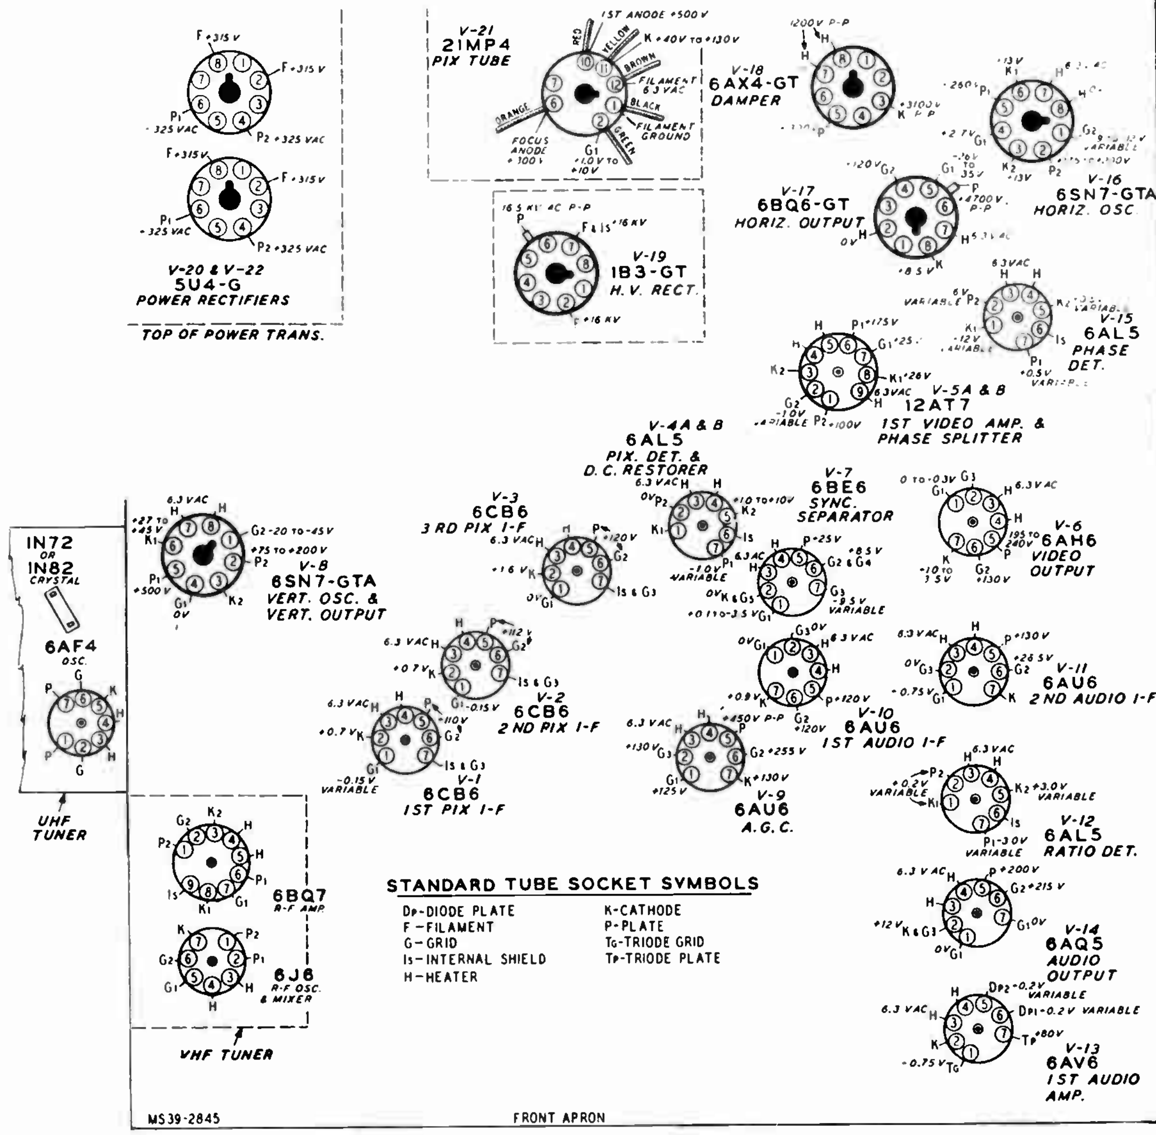

Fig. 6—Bottom Socket Voltages

SERVICE SUGGESTIONS

NO RASTER ON PICTURE TUBE — If raster cannot be obtained check below for the possible causes.
1: Ion trap magnet adjustment is incorrect.
2: No +B voltage. Check 4/10 ampere fuse. Replace if defective. If fuse continually burns out, check
 (A) Horizontal output tube V-17 (6BQ6-GT)
 (B) Check damper tube V-18 (6AX4-GT).
 (C) Check horizontal oscillator tube V-16 (6SN7-GTA) for proper operation.
 (D) With an ohm meter, check for a short between terminal 1 of the horizontal output transformer (T-9) and the chassis.
 (E) Check DC resistance of T-9.
3: No high voltage. Check V-17, V-18 and V-19 tubes and circuits. If the horizontal deflection circuits are operating as evidenced by the correct voltage (600V) measured on terminal No. 1 of T-9, the trouble can be isolated to the high voltage rectifier circuit. Either the high voltage winding to the 6BQ6-GT plate and 1B3 plate is open, tube V-19 is defective, its filament circuit is open, R-105 and C-75 defective or pix tube elements shorted internally.
4: Defective picture tube heater open or cathode return circuit open.

HORIZONTAL DEFLECTION ONLY — If only horizontal deflection is obtained as evidenced by a straight line across the face of the picture tube, it can be caused by the following:
1: Vertical oscillator and vertical output tube V-8 inoperative. Check socket voltages.
2: Vertical oscillator transformer (T-4) defective.
3: Vertical output transformer (T-5) open or shorted.
4: Yoke vertical coils open or shorted.
5: Vertical hold, height or linearity controls may be defective.

POOR VERTICAL LINEARITY — If adjustment of the height and linearity controls will not correct this condition, any of the following may be the cause.
1: Check variable resistors R-49 and R-54.
2: Vertical output transformer (T-5) defective.
3: Capacitors C-47B, C-70 or C-71 defective.
4: V-8 defective, check voltages.
5: Excess leakage or incorrect value of capacitor C-68, or open or incorrect value of resistors R-90 & R-92.
6: Low plate voltages. Check rectifier tube and capacitors in +B supply circuits.
7: Capacitor C-67 defective.
8: Vertical deflection coils (L-12) defective.

POOR HORIZONTAL LINEARITY — If adjustment of the Horizontal drive and linearity controls does not correct this condition, check the following:
1: Check or replace horizontal output tube V-17.
2: Check or replace damper tube V-18 (6AX4-GT).
3: Check capacitors C-77, C-78, C-79 and horizontal linearity control (L-16) for defects.
4: Horizontal deflection coils (L-17) defective.

TRAPEZOIDAL OR NONSYMMETRICAL RASTER
1: Defective yoke.

WRINKLES ON LEFT SIDE OF RASTER — This condition can be caused by:
1: Defective yoke due to C-76 or R-106 (internal in yoke assembly) being wrong value or open. These components are mounted in rear of yoke assembly.
2: V-18 (6AX4-GT) defective.

SMALL RASTER — This condition can be caused by:
1: Low +B or line voltage. Check V-20 & V-22 (5U4G).
2: Insufficient output from horizontal output tube V-17. Replace tube.
3: Insufficient output from vertical oscillator and vertical output tube V-8. Replace tube.
4: Incorrect setting of horizontal drive control R-89.
5: V-18 (6AX4-GT) defective.
6: Incorrect setting of (L-15) width control.

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND — This condition can be caused by:
1: No signal on picture tube grid. Check V-5A (12AT7) and V-6 (6AH6) tubes and associated circuits.
2: Bad contact to picture tube grid (lead to socket broken).
3: AGC tube (V-9) may be defective. Check tube and its associated circuit.

SIGNAL APPEARS ON PICTURE TUBE GRID BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE VERTICALLY AND HORIZONTALLY — A condition of this nature can be caused by:
1: Defective sync separator V-7 or phase splitter V-5B.
2: If tubes are O.K. check voltages, and associated circuits.
3: AGC system inoperative. Check V-9 (6AU6) AGC tube and associated circuits.

SIGNAL ON PICTURE TUBE GRID AND HORIZONTAL SYNC ONLY — If this condition is encountered, check:
1: Vertical integrating network capacitors C-53A, B & C, and resistors R-68A, B & C.
2: Vertical hold control (R-51) defective.

SIGNAL ON PICTURE TUBE GRID AND VERTICAL SYNC ONLY
1: V-15 or V-16 defective.
2: Improper setting of (L-14) horizontal frequency control.
3: Check setting of horizontal drive control and horizontal linearity control.
4: Check V-15 and V-16 socket voltages.

PICTURE STABLE BUT WITH POOR RESOLUTION — If the picture resolution is not up to standard, it may be caused by any of the following:
1: Defective pix I-F tubes V-1, 2 & 3, (6CB6's).
2: Defective picture detector V-4A, (6AL5) or video amplifier V-5A or video output V-6 (6AH6).
3: Defective picture tube.
4: Open video peaking coil. Check all peaking coils L-5, L-6, L-8, L-9, L-10 and L-11 for continuity. Note that L-5, L-9 and L-10 have shunting resistors.
5: Leakage in V-6 (6AH6) grid capacitor C-36. If the capacitor is not found to be defective, check the following:
 1: Check all potentials in video circuits.
 2: Check picture tube grid circuit for poor or dirty contact.
 3: Check and realign, if necessary, the picture I-F and R-F circuits.

SERVICE SUGGESTIONS—(continued)

PICTURE SMEAR:
1: A smear can be attributed to phase shift at the low or high frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits. Check for grid current on video output tube V-6 (6AH6), open or shorted peaking coils, video amplifier load resistors are of improper value (high).
2: This trouble can also originate at the transmitter. Check reception from another station.
3: Check and realign, if necessary, the picture I-F and R-F circuits.

MAN MADE NOISE IN SOUND (Ignition, etc)
1: Check sound I-F tubes V-10, 11 & 12 and associated circuits.
2: Check sound I-F alignment.

BENDING OR S-ING
1: Check sync stability control adjustment.
2: Check capacitors C-47A and C-49A.
3: V-17 (6BQ6-GT) defective or V-16 (6SN7-GTA) defective.
4: Check sync separator tube V-7 (6BE6) and phase splitter V-5B (12AT7) and V-5A (12AT7) video amplifier.
5: Check AGC threshold control.

PICTURE NORMAL—NO SOUND OR WEAK OR DISTORTED SOUND
1: Check sound I-F alignment.
2: Check V-10 (6AU6) V-11 (6AU6) V-12 (6AL5) V-13 (6AV6) V-14 (6AQ5) and associated circuits.

RASTER ON TUBE BUT NO PICTURE OR SOUND
This condition can be caused by,
1: Defective pix I-F Amplifier tubes V-1, V-2 or V-3
2: Defective pix detector tube V-4A (6AL5). Check tube and its associated circuit.
3: Defective R-F Amplifier or oscillator mixer tubes in the tuner.
4: UHF—VHF switch defective.

POOR FOCUS
1: Improper setting of Ion Trap magnet.
2: Defective picture tube or picture tube socket.

PICTURE JITTER:
1: If regular sections at left of the picture are displaced, replace the horizontal oscillator tube V-16.
2: Vertical instability may be due to loose connections or noise received with the signal.
3: Horizontal instability may be due to unstable transmitted sync.
4: Check receiver AGC system for proper operation.
5: Check phase splitter V-5B, (12AT7) and sync separator V-7 (6BE6).
6: Check for improper setting of sync stability control.
7: Picture tube grid lead not held in position by support spring, ie: close proximity of grid lead to sync and horizontal tubes will cause picture to jitter at high contrast setting.
8: Check AGC threshold control.

NO PICTURE OR SOUND OR WEAK PICTURE OR SOUND IN UHF POSITION
If this condition is encountered
1: Check to see whether or not a UHF station is operating in the vicinity.
2: The 6AF4 oscillator tube or the IN72 (or IN82) crystal may be defective.
3: Pre-selector in UHF tuner defective.
4: Low pass filter defective.
5: The UHF antenna and oscillator strips in the VHF tuner defective.
6: Defective switch on UHF tuner.

ALIGNMENT PROCEDURE

TEST EQUIPMENT — To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR meeting the following requirements:
(a) Frequency ranges:
 18 to 30 mc, 10 mc sweep width
 40 to 90 mc, 10 mc sweep width
 120 to 130 mc, 10 mc sweep width
 170 to 225 mc, 10 mc sweep width
 470 to 890 mc, 10 mc sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR to provide the following frequencies: (Output on these ranges should be adjustable and at least .1 volt maximum.)
(a) Intermediate alignment frequencies.
 23.1 mc first picture I-F coil.
 24.1 mc third picture I-F coil.
 25.9 mc second picture I-F coil.
 21.7 mc sound trap.
 4.5 mc video trap & sound I-F.
 25.2 mc converter plate coil (Tuner).

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal controlled.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 20 kilovolts.

SERVICE PRECAUTIONS — To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the cabinet back, disconnect the leads from the speaker, the radio chassis, remove the antenna terminal boards at rear of cabinet, and then the 5 chassis mounting bolts. The chassis may be serviced with the picture tube in place provided the chassis is turned on its side with the power transformer on the bottom. The weight of the chassis will be supported against the power transformer and pix tube brackets.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high voltage filter resistor R-105.

ALIGNMENT PROCEDURE
PIX I-F

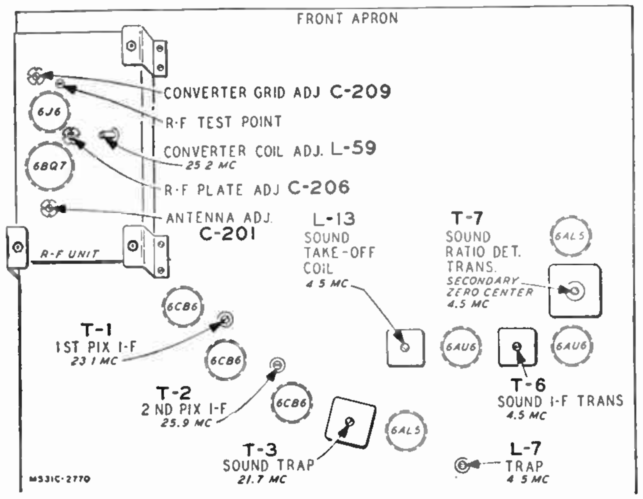

Fig. 8—Top Chassis Video and Audio I-F Adjustments

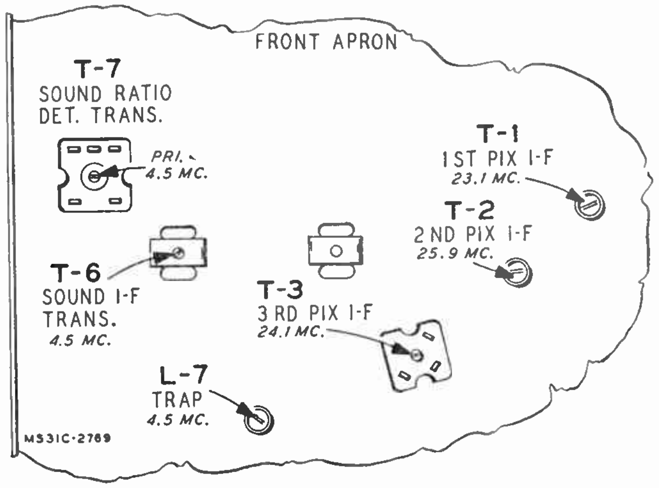

Fig. 9—Bottom Chassis Video and Audio I-F Adjustments.

A. Unmodulated R-F signal into Converter Grid by means of tube shield insulated from base. VTVM with filter in lead of 22 K ohms and 5000 mmf connected to pic. det. load resistor, (R-37) 4700 ohms, in series with peaking coil (L-6) from Pin 7 of 6AL5. Input signal level should be such that output is less than 2 volts DC. Apply -4.5V battery bias on AGC line.

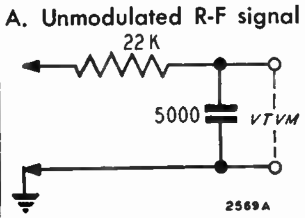

Fig. 10—VTVM Connections

	FREQUENCY	ADJUST
1.	25.2 MC	Converter plate coil on top of tuner for maximum dc at picture detector.
2.	23.1 MC	1st picture I-F coil (T-1) for maximum dc at picture detector.
3.	25.9 MC	2nd picture I-F coil (T-2) for maximum dc at picture detector.
4.	24.1 MC	3rd picture I-F coil (T-3 below chassis) for maximum dc at picture detector.
5.	21.7 MC	3rd picture I-F trap (T-3 in can above chassis) for minimum dc at picture detector.

B. I-F Sweep Generator into converter grid by means of tube shield insulated from base.

Connect oscilloscope across R-37 (in place of VTVM). Apply -4.5V bias (DC) to AGC line (battery).

Tuner should be switched to dead channel so as not to cause interference.

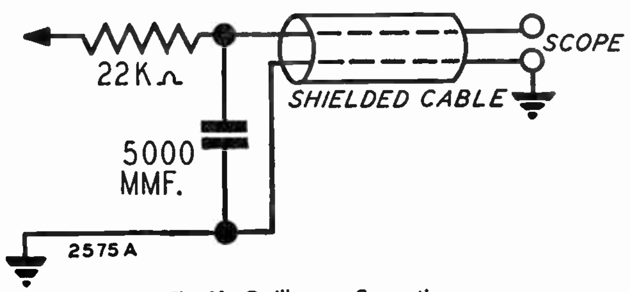

Fig. 11—Oscilloscope Connections

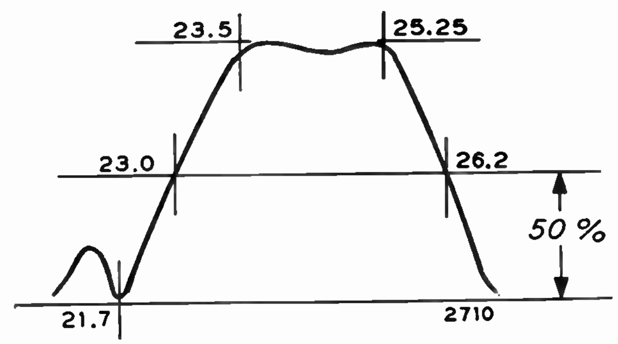

Fig. 12—Overall Response Curve

Observe overall I-F response, which should be as shown above: A slight touch-up may be required. At no time should the trap coil be re-adjusted, nor should it be necessary to turn any of the picture I-F coils more than 1/2 turn of the slug. The following comments are suggestions only:

ALIGNMENT PROCEDURE (Continued)

1. The height of the 26.2 MC marker is controlled by the 25.2 MC (Converter Plate Coil on tuner) and the 25.9 MC (2nd P.I.F.) coils.
2. The uniformity of response (flatness across top and position of 23.5 MC) marker is controlled for the most part by the 24.1 MC third picture I-F coil.
3. The 23.0 MC marker position is controlled by the first picture I-F (23.1 MC coil). However, it is NOT advisable to change the setting of the coil, due to its effect on sound rejection. Its adjustment should be avoided unless believed to be absolutely necessary.

VIDEO

With 4.5 MC unmodulated signal from a high impedance source, (10,000 ohms in series with the generator) into plate of the picture detector tube (Pin 7-6AL5) and VTVM on picture tube grid, tune 4.5 MC trap (L-7 Top) for minimum response. VTVM on 0-10 V AC scale. This adjustment can also be made while observing a picture from a station. Tune trap for least 4.5 MC beat in picture.

AUDIO I-F

1: With signal generator set to 4.5 MC and dc VTVM connected to junction of R-13 and C-14, adjust sound take-off coil (L-13 Top) and sound I-F transformer slugs (T-6 Top & Bottom) for maximum.

2: With VTVM connected to pin 7 of V-12 (6AL5) adjust the ratio detector primary (T-7 Bottom) for maximum.

3: With VTVM connected to junction of R-17, R-20 and C-18, adjust ratio detector secondary (T-7 Top) for cross over (zero voltage) on lowest scale.

NOTE — If no signal generator is available, the procedure above may be followed by tuning in a station and using the 4.5 MC beat between picture and sound carrier.

TUNER ALIGNMENT

A. Sweep generator with balanced 300 ohm output to antenna terminals. Marker generator output to antenna terminals. Oscilloscope to "test point" (Figure 13) on tuner. Connect 1½ V bias to AGC line at junction of R-34 and C-29 on the receiver.

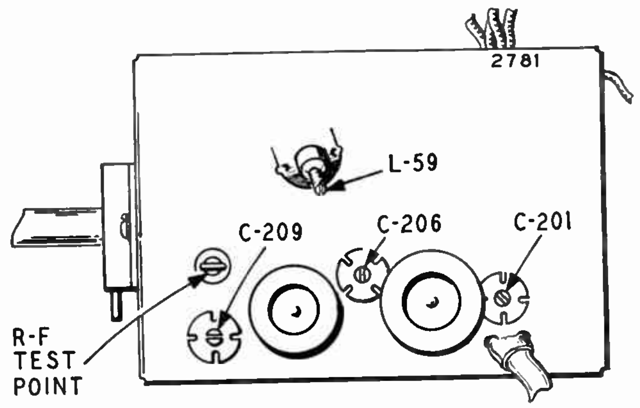

Fig. 13—Top Tuner Adjustments

B. RF AND CONVERTER ADJUSTMENT.

1. With channel selector on Channel 12, adjust C-201 slightly favoring the Pix carrier, then adjust C-206 and C-209 for response as in Figure 14. Picture and sound markers at 90% maximum response.
2. Check response on all channels. If markers are below 70% on any channels, readjust C-201, C-206, and C-209. Recheck all channels.

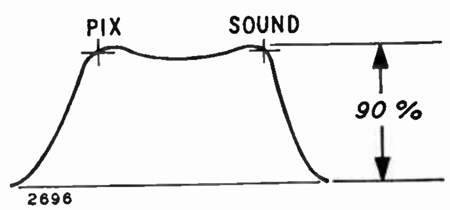

Fig. 14—Pix & Audio Markers

C. OSCILLATOR ADJUSTMENT.

1. Apply -4.5 volts on I-F AGC line at junction of R-1 and C-30A.
2. Connect oscilloscope to output of video detector. Place fine tuning in center of range. Check response on all channels. Sound marker should be in notch and picture marker at 50%. (See Figure 12).
3. If markers are off, individual oscillator coil slugs will require adjustment. Adjust each channel slug, accessible through hole in front of chassis with a non-metallic screwdriver to bring sound marker to correct position.
4. To adjust oscillator on UHF position, feed the sweep generator with center frequency of 124 MC and markers at 121.75 and 126.25 into the input of the low pass filter (output of UHF tuner). Adjust oscillator slug in the VHF tuner so that the 121.75 pix carrier marker is at 50% and that 126.25 marker marker is in the sound notch. If a sweep generator is not available, a single frequency generator set to 126.25 MC and VTVM may be used. Connect VTVM to the pix detector load resistor R-37. Feed generator into the low pass filter. Adjust oscillator slug in the VHF tuner so that the 126.25 marker is in the sound notch of the I-F curve.
5. If the 6AF4 oscillator tube in the UHF tuner is replaced, it may be necessary to adjust the oscillator trimmer C-309 on the UHF tuner located underneath the chassis. (See Figure 15). Adjust this trimmer until the tuner will cover a range of below 470 MC to above 890 MC.

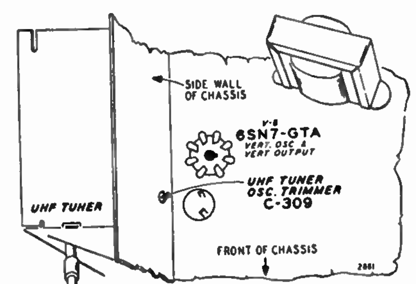

Fig. 15—UHF Tuner Adjustment.

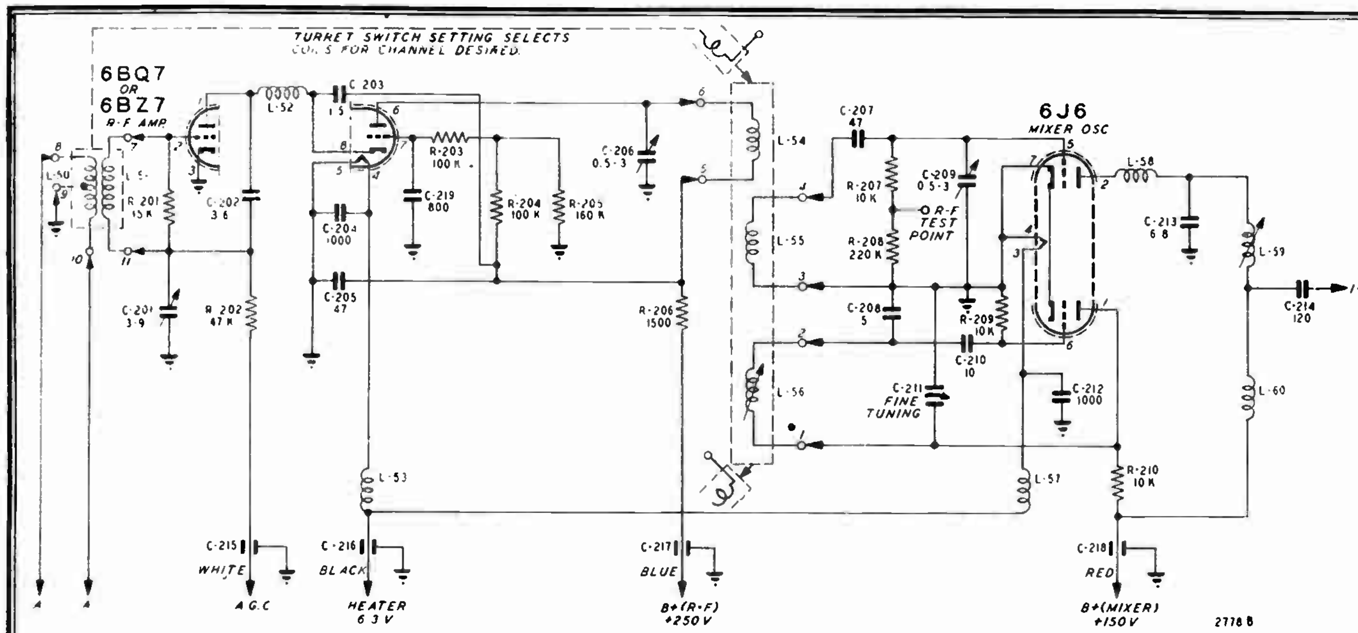

Fig. 17—Tuner Schematic Diagram.

ALIGNMENT PROCEDURE

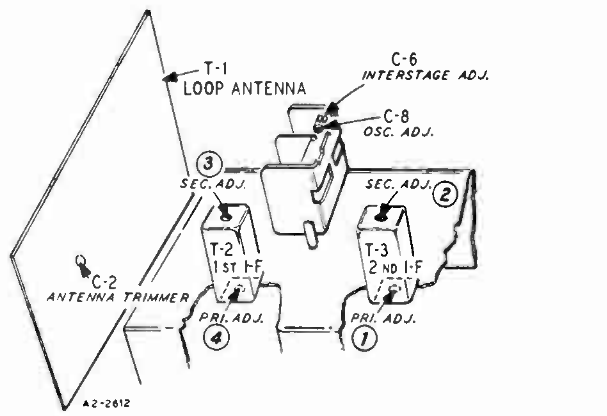
RADIO

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

Volume Control Maximum all Adjustments.
Connect Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid I-F 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. (1) and Sec. (2)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. (4) and Sec. (3)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. (1) and Sec. (2)	Maximum Output
1620 KC	Control Grid R-F 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-8	Maximum Output
1400 KC	Control Grid R-F 6BA6 Pin No. 1	.1 mf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Interstage C-6 See Note B	Maximum Output
1400 KC	External Antenna Terminal	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-2 See Note B	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.
NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.



DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new S-10X77 drive cord assembly or a new length of cord 48 inches long for the installation. Install the cord as shown in the illustration, winding three turns counterclockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.

REPLACEMENT PARTS LIST

RADIO AND RECORD CHANGER

Use only genuine factory tested parts to insure service jobs you can depend on and to obtain original set performance.

UHF TUNER INFORMATION

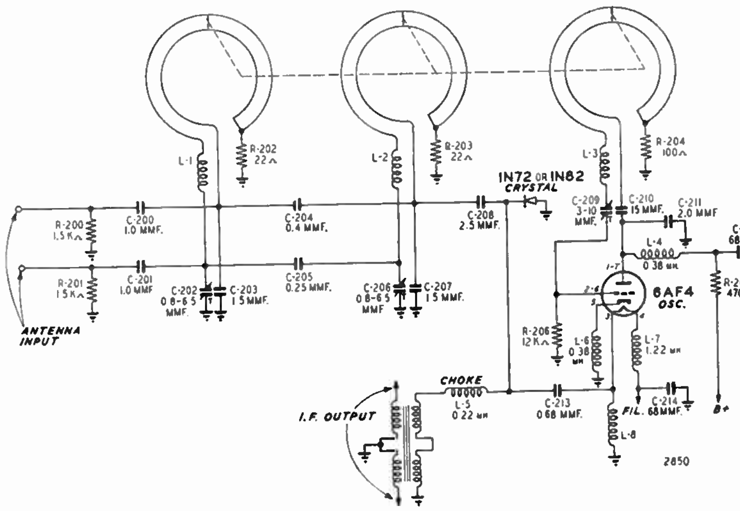

Fig. 18—UHF Tuner Schematic Diagram.

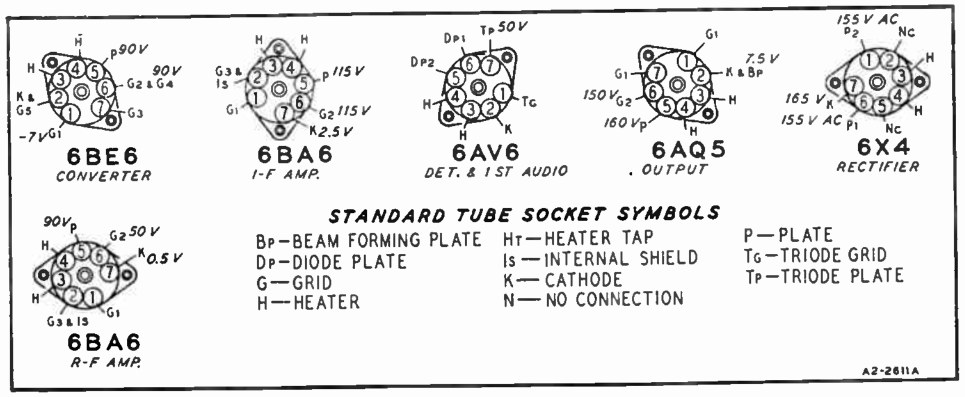
Due to the complexity of the UHF tuner, neither servicing nor aligning is encouraged in the field because replacement of any component within the R-F circuit may disturb the band-pass characteristics of the tuner. However, the 6AF4 tube or the 1N72 (or 1N82) crystal may be replaced in the field if found to be defective. A schematic diagram of this tuner is shown only for the purpose of outlining the circuit used.

If the UHF tuner does not operate satisfactorily after the tube or crystal replacement, disconnect the tuner and return it to the factory for repair.



DRIVE CORD REPLACEMENT

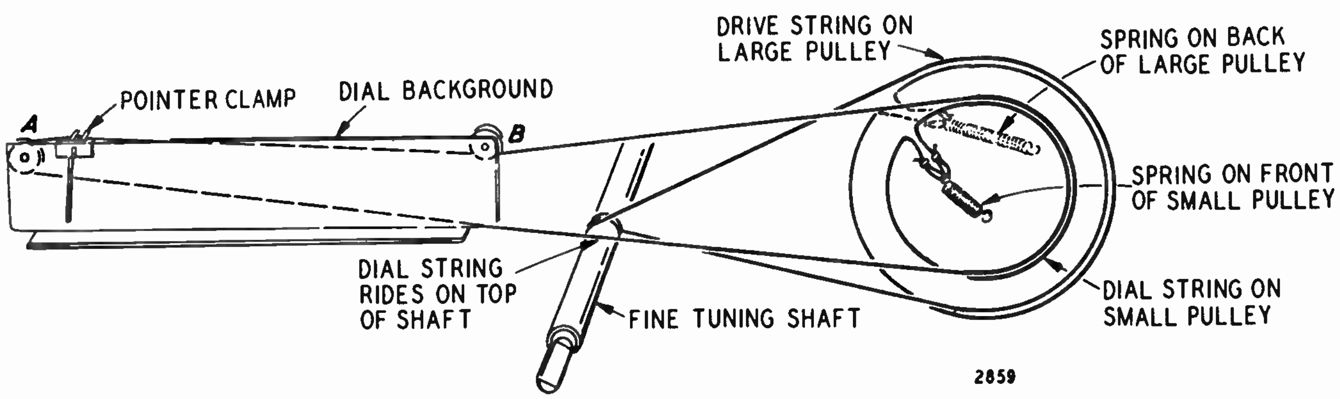


Fig. 19—Drive Cord Stringing.

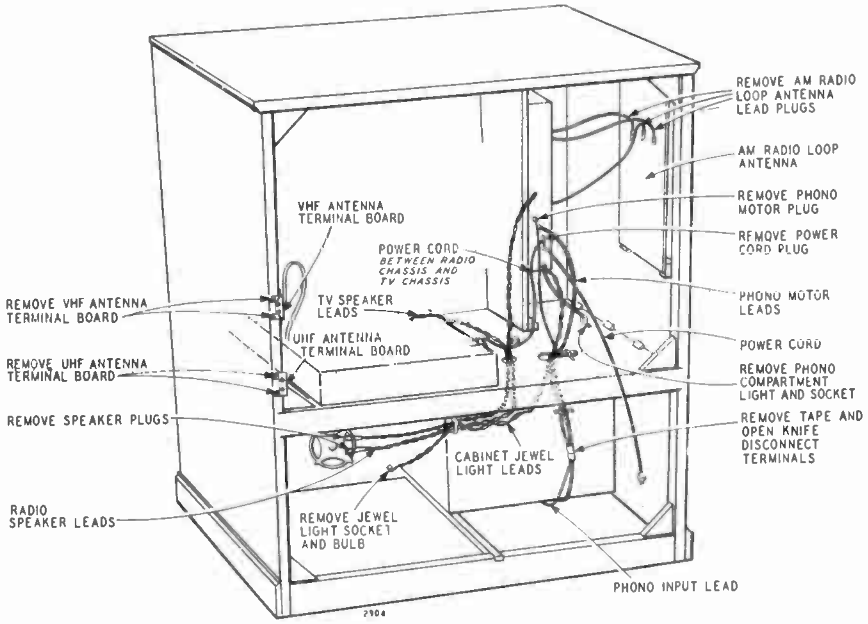
TUBE SOCKET VOLTAGES

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage ....117 Volts AC
Signal Input ....None
A Variation of ±10% is usually permissible.

You will note that there are two cords used for the pointer drive system on this receiver. Part number 10X88 Drive Cord assembly and part number 28X603 Spring are used on the tuning shaft and large pulley, while part number 10X89 Drive Cord and a part number 28X603 Spring are used on the small pulley system and the pointer. Install the cords as shown in the illustration. After completing the installation rotate the fine tuning shaft a few turns to take up the slack in the cord.



NOTE—UHF Antenna Terminal board used only on UHF-VHF combinations.

ION TRAP MAGNET ADJUSTMENT—The ion trap magnet should be positioned close to the base of the tube with the magnet of the ion trap on the side where the electron gun is nearest the glass neck of the picture tube. From this position adjust the magnet by moving it back and forth and at the same time rotating it slightly around the neck of the picture tube until the brightest raster is obtained on the picture screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Readjust the ion trap magnet for maximum raster brilliance and best focus. MAXIMUM RASTER BRILLIANCE AND BEST FOCUS OCCUR AT THE SAME POINT. Do not sacrifice brilliance for best focus. The ion trap magnet adjustment is a very critical one especially with the electrostatic type zero focus picture tube. Consequently, great care should be taken to make sure that the ion trap magnet is correctly adjusted.

DEFLECTION YOKE ADJUSTMENT — If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the yoke adjustment wing screw.

CENTERING ADJUSTMENT — If horizontal or vertical centering is required, adjust each ring in the centering device until proper centering is obtained. If a clamp type centering device is used, rotate the device to the left or right and turn the knob located at the top of the device until the picture is centered correctly.

PICTURE ADJUSTMENT — For further adjustments, obtain a test pattern on the receiver. Turn on receiver and follow tuning procedure on page 4. When a test pattern is obtained it may be necessary to slightly re-adjust the fine tuning control for clearest picture.

OSCILLOSCOPE WAVEFORM PATTERNS

The waveforms on this page were taken with the receiver tuned to a normal picture. The numbers on the waveforms correspond to the numbers on the schematic diagram which identifies each test point.

The voltages shown on each waveform are the approximate peak to peak amplitudes. The frequencies shown indicates the repetition rate of the waveform, not the sweep rate of the oscilloscope. If the waveforms are observed on the oscilloscope with a poor high frequency response, the corners of the pulses will tend to be more rounded than those shown below and the amplitudes of any high frequency pulse will tend to be less.

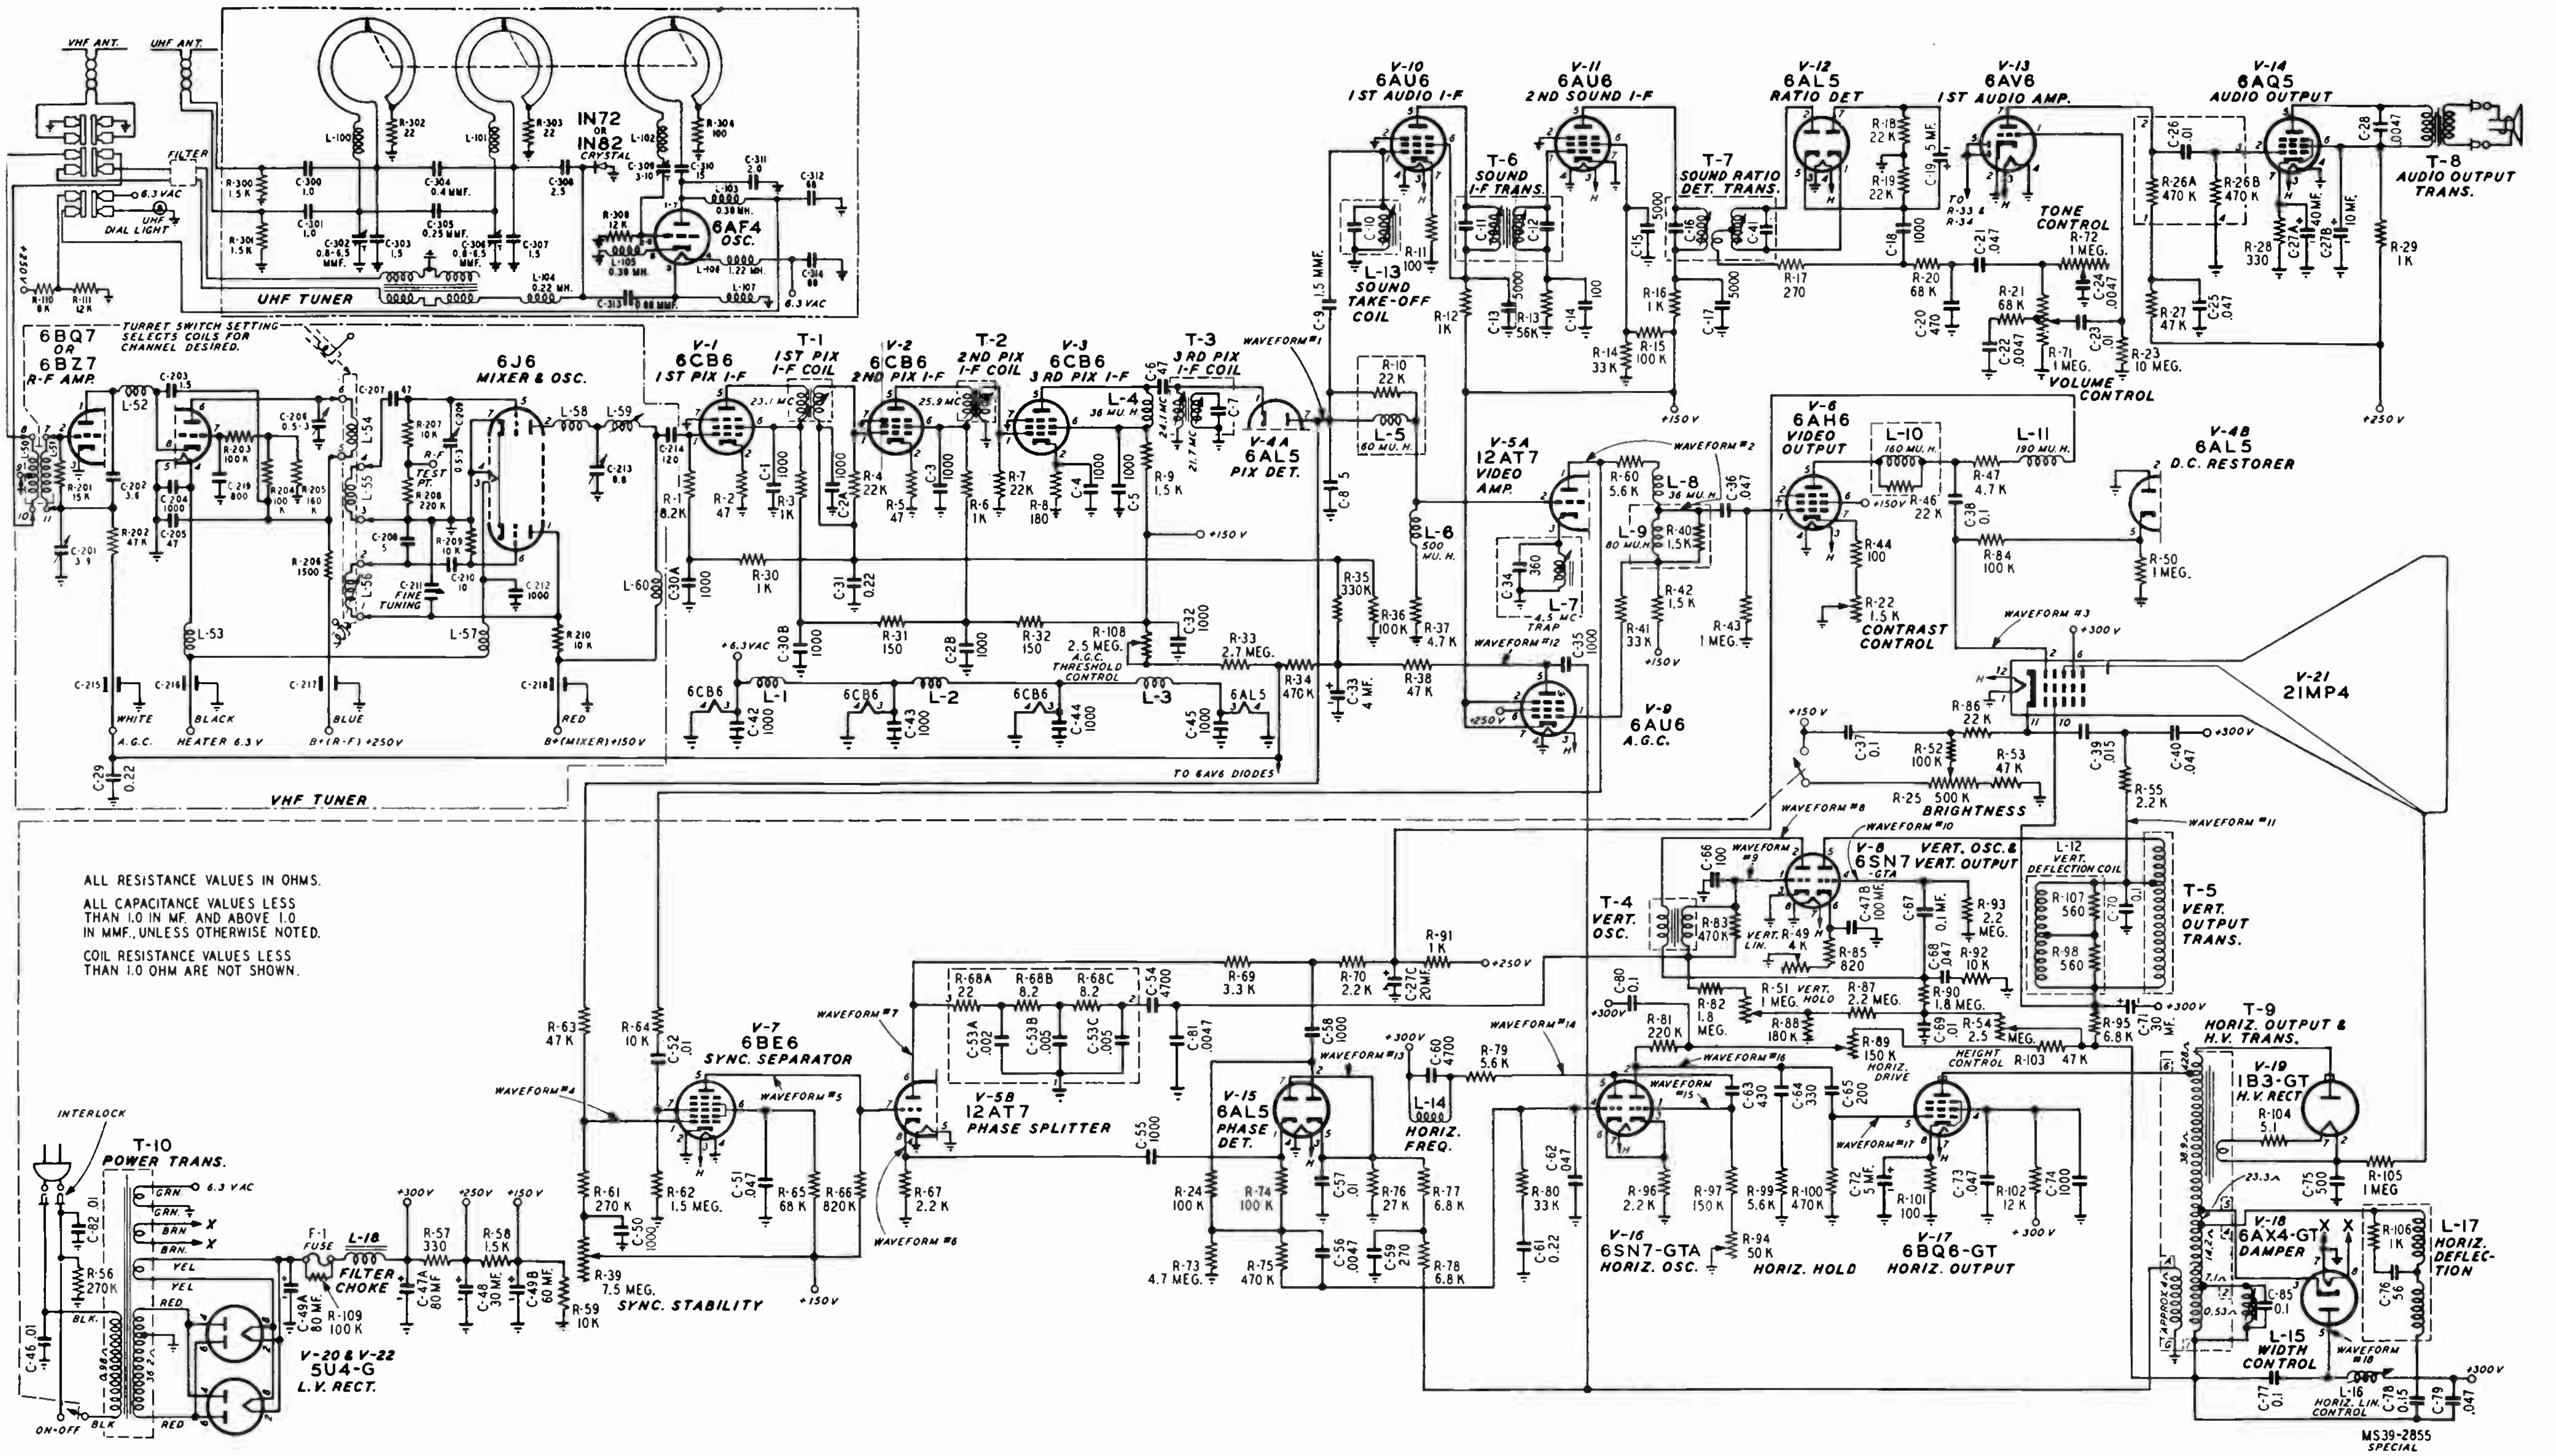
21" UHF-VHF TELEVISION RECEIVER



ALL RESISTANCE VALUES IN OHMS.
ALL CAPACITANCE VALUES LESS THAN 1.0 IN MF. AND ABOVE 1.0 IN MMF., UNLESS OTHERWISE NOTED.
COIL RESISTANCE VALUES LESS THAN 1.0 OHM ARE NOT SHOWN.

PRODUCTION CHANGES

There are two different ratio detector transformers (T-7) used in these receivers, Part Numbers 9A2269 and 9A2295. The T-7 circuit shown in this schematic diagram covers the 9A2269 ratio detector. Receivers using the 9A2295 ratio detector can be identified by the following changes:

C-18 becomes 47X570 330 mmf molded mica condenser

R-15 becomes B84333 33K ohms 0.5 W carbon resistor

R-18, R-19 become B83103 10K ohm 0.5 W carbon resistors

In addition, the 9A2295 ratio detector has terminals with numerical identification (1, 2, 3 etc.) whereas the 9A2269 ratio detector has terminals with alphabetical identification (A, B, C etc.)

ELECTRICAL SPECIFICATIONS

Power Supply	117 Volts AC 60 Cycles Only
Power Consumption	210 Watts
Power Output	2.4 Watts (Max.) 1.8 Watts (10% Distortion)
Tuning Range	VHF—Channels 2 thru 13
Intermediate Freq. (Tel.)	Picture—26.20 MC Sound—21.70 MC
Tel. Antenna Input Imp.	300 Ohms Balanced
Intercarrier Sound System	4.5 MC
Loud Speaker	See Parts List
Voice Coil Impedance	3.2 Ohms 400 Cycles

TUBE COMPLEMENT

Symbol	Type	Function
Tuner	6J6	R-F Osc. and Mixer
*Tuner	6BQ7	R-F Amplifier
V-1	6CB6	1st Pix I-F Amplifier
V-2	6CB6	2nd Pix I-F Amplifier
V-3	6CB6	3rd Pix I-F Amplifier
V-4 A & B	6AL5	Pix Det. and DC Restorer
V-5 A & B	12AT7	1st Video Amp. and Phase Splitter
V-6	12BY7	Video Output
V-7	6CS6	Sync. Separator
V-8	6SN7-GTA	Vertical Osc. & Vertical Output
V-9	6AU6	Automatic Gain Control
V-10	6AU6	1st Audio I-F

V-12	6AL5	Ratio Detector
V-13	6AV6	1st Audio Amplifier
V-14	6AQ5	Audio Output
V-15	6AL5	Phase Detector
V-16	6SN7-GTA	Horizontal Oscillator
V-17	6BQ6-GT	Horizontal Output
V-18	6AX4	Damper
V-19	1B3-GT	High Voltage Rectifier
V-20	5U4-G	Low Voltage Rectifier
V-21	21ZP4B	Picture Tube 21" Glass Rectangular (Magnetic)

*For replacement purposes a 6BZ7 tube may be used in place of a 6BQ7 tube.

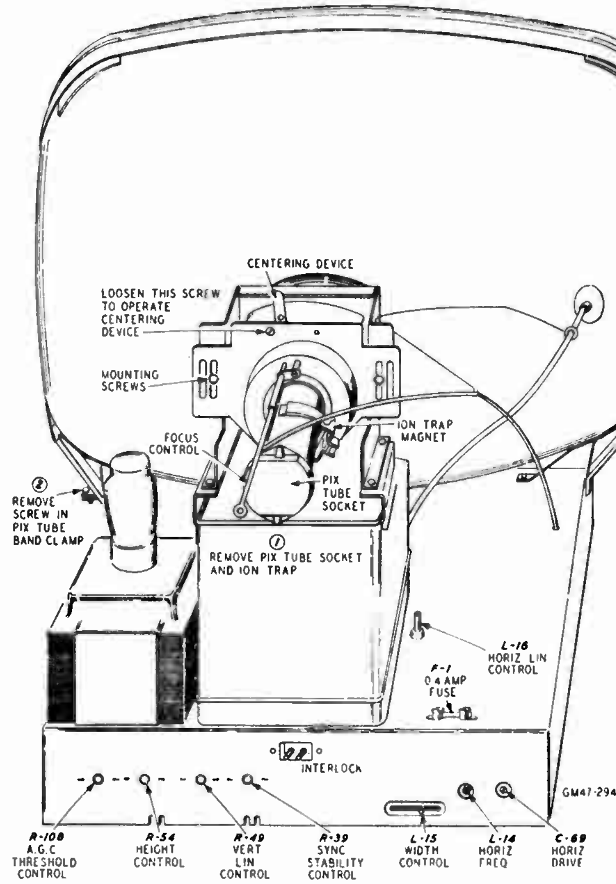

Fig. 3—Removal of Picture Tube and Rear Chassis Controls

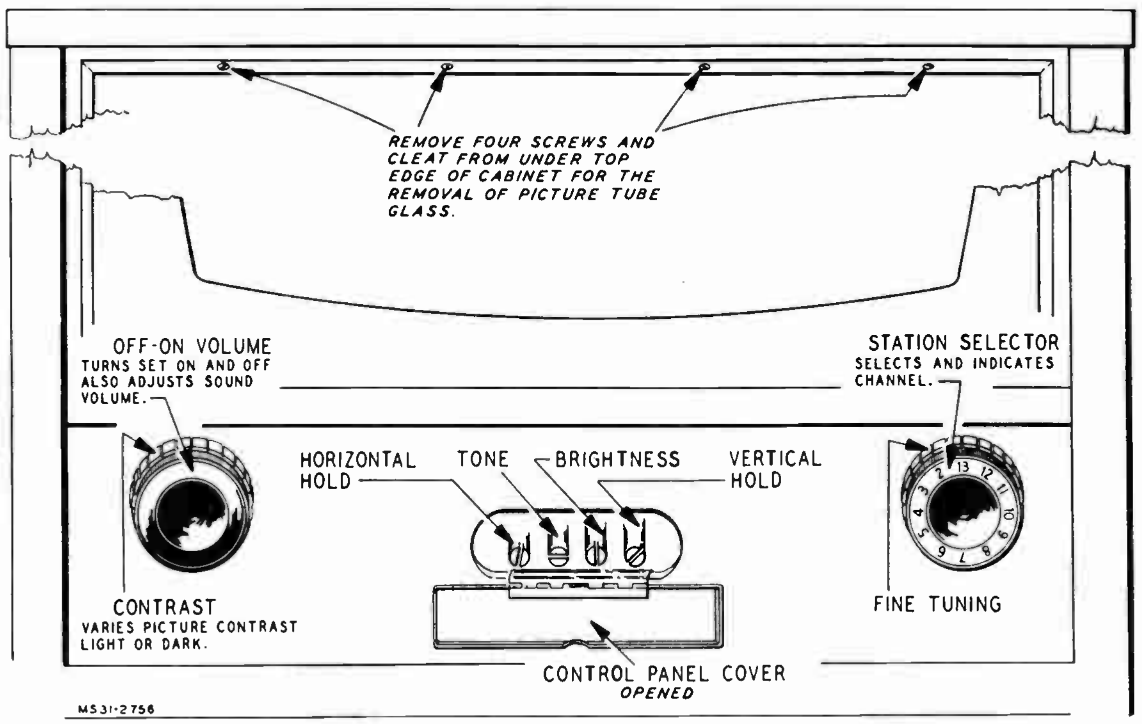

Fig. 2—Front Panel Controls

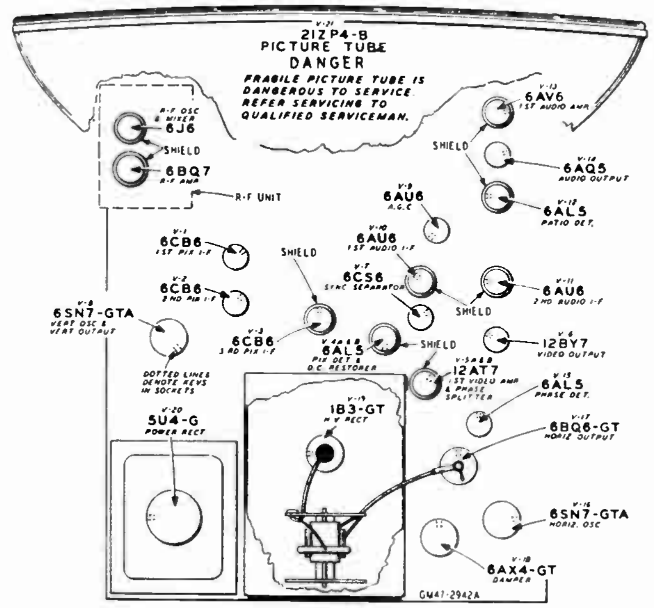

Fig. 1—Tube Layout.

ADJUSTMENT OF AGC THRESHOLD CONTROL — Tune the receiver to the strongest station in the area in which the receiver will be used. While observing the picture and listening to the sound, turn the control clockwise until signs of overloading (buzz in sound, washed-out picture) appear. Then turn the control a few degrees counter-clockwise from the point at which overloading occurs. (The stronger the signal input, the more counter-clockwise this setting will be.) In areas where the strongest signal does not exceed 1000 uv the setting will usually be maximum clockwise. With the control set correctly, the AGC will automatically adjust the bias on the R.F. and I.F. amplifiers so that the best possible signal to noise ratio (Minimum snow) will be obtained for any signal input to the receiver.

ADJUSTMENT OF SYNC STABILITY CONTROL — When receiving strong (500 MV or more) signals, set hold controls so that the picture is locked in. Turn the sync control slowly clockwise until bending occurs at top of picture. Then turn the control a few degrees counter-clockwise until bending disappears. If the control is set incorrectly bending, tearing, etc., will be present and when switching from channel to channel the picture will not lock in quickly.

In weak signal areas the control should be set for maximum picture stability. In general the weaker the signal the more clockwise the control should be turned. When the sync stability control is correctly adjusted the receiver will hold sync without tearing or rolling under even the most adverse noise conditions.

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT — Tune in a station and adjust the horizontal hold control until the picture falls into sync. Momentarily remove the signal by switching off channel and then back. The picture should pull into sync over a range of 90° rotation of the horizontal hold control. If in the above check the receiver fails to hold sync or the pull-in range is at the extreme end of the control, it will be necessary to make the following adjustment.

HORIZONTAL FREQUENCY ADJUSTMENT — With the horizontal hold control set to the center of its range of rotation, adjust the horizontal frequency control (L-14) until the picture pulls into sync. Recheck the "Horizontal Oscillator Alignment."

CHECK OF R-F OSCILLATOR ADJUSTMENTS

The oscillator is preset at the factory and normally needs no adjustment. However, if adjustments are required, they can be made without removing the chassis from the cabinet. Remove the channel selector and fine tuning knobs from the tuning shaft.

TEST PROCEDURE:

1. Set channel selector to receive desired station.
2. Set fine tuning control in center of its range.
3. Adjust oscillator slug, with bakelite type screwdriver, for best picture resolution.
4. Repeat steps 1, 2 and 3 on all channels used.

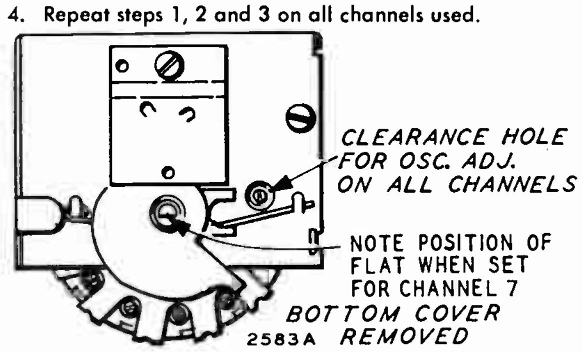

Fig. 4—Tuner Oscillator Adjustments

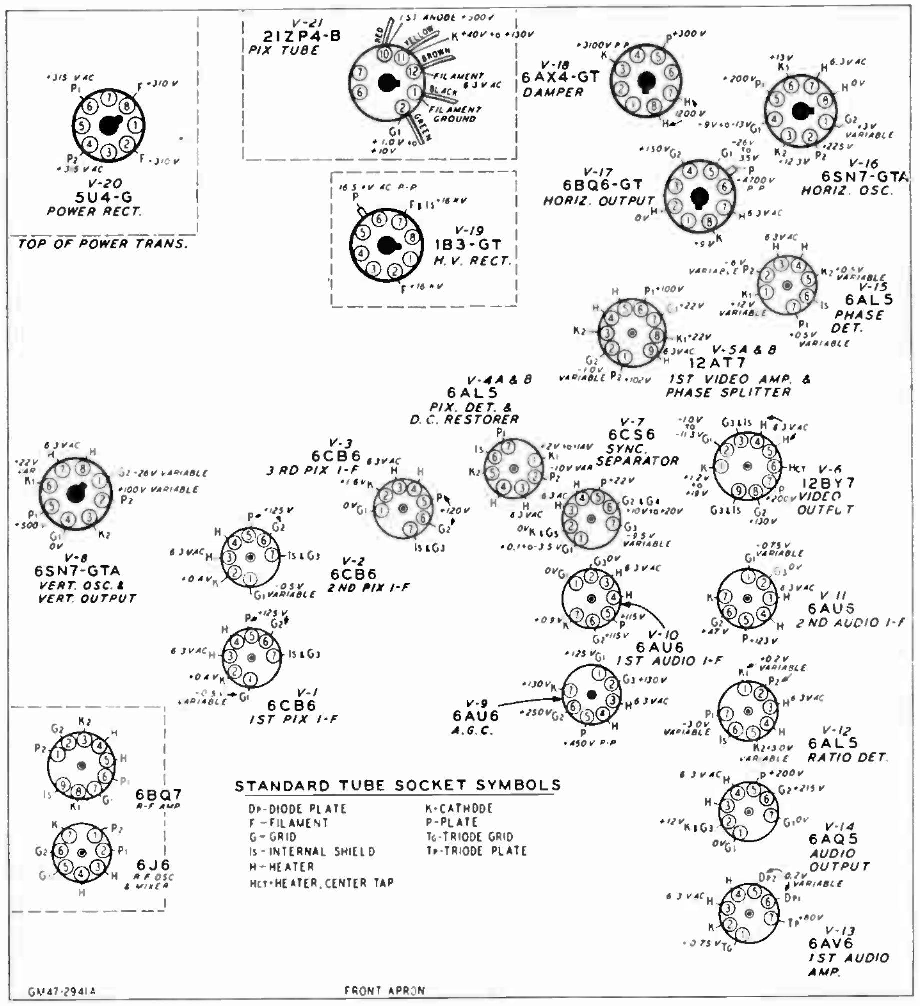

Fig. 5—Bottom Socket Voltages

SERVICE SUGGESTIONS

NO RASTER ON PICTURE TUBE — If raster cannot be obtained check below for the possible causes.

1: Ion trap magnet adjustment is incorrect.
2: No +B voltage. Check 4/10 ampere fuse. Replace if defective. If fuse continually burns out, check
   (A) Horizontal output tube V-17 (6BQ6-GT)
   (B) Check damper tube V-18 (6AX4-GT).
   (C) Check horizontal oscillator tube V-16 (6SN7-GTA) for proper operation.
   (D) With an ohm meter, check for a short between terminal 1 of the horizontal output transformer (T-9) and the chassis.
   (E) Check DC resistance of T-9.
3: No high voltage. Check V-17, V-18 and V-19 tubes and circuits. If the horizontal deflection circuits are operating as evidenced by the correct voltage (600V) measured on terminal No. 1 of T-9, the trouble can be isolated to the high voltage rectifier circuit. Either the high voltage winding to the 6BQ6-GT plate and 1B3 plate is open, tube V-19 is defective, its filament circuit is open, R-105 and C-75 defective, or pix tube elements shorted internally.
4: Defective picture tube heater open or cathode return circuit open.

HORIZONTAL DEFLECTION ONLY — If only horizontal deflection is obtained as evidenced by a straight line across the face of the picture tube, it can be caused by the following:

1: Vertical oscillator and vertical output tube V-8 inoperative. Check socket voltages.
2: Vertical oscillator transformer (T-4) defective.
3: Vertical output transformer (T-5) open or shorted.
4: Yoke vertical coils open or shorted.
5: Vertical hold, height or linearity controls may be defective.

POOR VERTICAL LINEARITY — If adjustment of the height and linearity controls will not correct this condition, any of the following may be the cause.

1: Check variable resistors R-49 and R-54.
2: Vertical output transformer (T-5) defective.
3: Capacitors C-47B or C-71 defective.
4: V-8 defective, check voltages.
5: Excess leakage or incorrect value of capacitors C-68 & C-70 or open or incorrect value of resistors R-90 & R-92.
6: Low plate voltages. Check rectifier tube and capacitors in +B supply circuits.
7: Capacitor C-67 defective.
8: Vertical deflection coils (L-12) defective.

POOR HORIZONTAL LINEARITY — If adjustment of the Horizontal drive and linearity controls does not correct this condition, check the following:

1: Check or replace horizontal output tube V-17.
2: Check or replace damper tube V-18 (6AX4-GT).
3: Check capacitors C-77, C-78, C-79 and horizontal linearity control (L-16) for defects.
4: Horizontal deflection coils (L-17) defective.

TRAPEZOIDAL OR NONSYMMETRICAL RASTER

1: Defective yoke.

WRINKLES ON LEFT SIDE OF RASTER — This condition can be caused by:

1: Defective yoke.
2: V-18 (6AX4-GT) defective.

SMALL RASTER — This condition can be caused by:

1: Low +B or line voltage. Check V-20 (5U4G).
2: Insufficient output from horizontal output tube V-17. Replace tube.
3: Insufficient output from vertical oscillator and vertical output tube V-8. Replace tube.
4: Incorrect setting of horizontal drive control C-69.
5: V-18 (6AX4-GT) defective.
6: Incorrect setting of (L-15) width control.

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND— This condition can be caused by:

1: No signal on picture tube grid. Check V-5A (12AT7) and V-6 (12BY7) tubes and associated circuits.
2: Bad contact to picture tube grid (lead to socket broken).
3: AGC tube (V-9) may be defective. Check tube and its associated circuit.

SIGNAL APPEARS ON PICTURE TUBE GRID BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE VERTICALLY AND HORIZONTALLY — A condition of this nature can be caused by:

1: Defective sync separator V-7 or phase splitter V-5B.
2: If tubes are O.K. check voltages, and associated circuits.
3: AGC system inoperative. Check V-9 (6AU6), AGC tube and associated circuits.

SIGNAL ON PICTURE TUBE GRID AND HORIZONTAL SYNC ONLY — If this condition is encountered, check:

1: Vertical integrating network capacitors C-53A, B & C, and resistors R-68A, B & C.
2: Vertical hold control (R-51) defective.

SIGNAL ON PICTURE TUBE GRID AND VERTICAL SYNC ONLY

1: V-15 or V-16 defective.
2: Improper setting of (L-14) horizontal frequency control.
3: Check setting of horizontal drive control and horizontal linearity control.
4: Check V-15 and V-16 socket voltages.

PICTURE STABLE BUT WITH POOR RESOLUTION — If the picture resolution is not up to standard, it may be caused by any of the following:

1: Defective pix I-F tubes V-1, 2 & 3, (6CB6's).
2: Defective picture detector V-4A, (6AL5) or video amplifier V-5A or video output V-6 (12BY7).
3: Defective picture tube.
4: Open video peaking coil. Check all peaking coils L-5, L-6, L-8, L-9, L-10 and L-11 for continuity. Note that L-5, L-9 and L-10 have shunting resistors.
5: Leakage in V-6 (12BY7) grid capacitor C-36. If the capacitor is not found to be defective, check the following:
   1: Check all potentials in video circuits.
   2: Check picture tube grid circuit for poor or dirty contact.
   3: Check and realign, if necessary, the picture I-F and R-F circuits.

PICTURE SMEAR:

1: A smear can be attributed to phase shift at the low or high frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits. Check for grid current on video output tube V-6 (12BY7), open or shorted peaking coils, video amplifier load resistors are of improper value (high).
2: This trouble can also originate at the transmitter. Check reception from another station.
3: Check and realign, if necessary, the picture I-F and R-F circuits.

MAN MADE NOISE IN SOUND (Ignition, etc)

1: Check sound I-F tubes V-10, 11 & 12 and associated circuits.
2: Check sound I-F alignment.

BENDING OR S-ING

1: Check sync stability control adjustment.
2: Check capacitors C-47A and C-49A.
3: V-17 (6BQ6-GT) defective or V-16 (6SN7-GTA) defective.
4: Check sync separator tube V-7 (6CS6) and phase splitter V-5B (12AT7) and V-5A (12AT7) video amplifier.
5: Check AGC threshold control.

PICTURE NORMAL—NO SOUND OR WEAK OR DISTORTED SOUND

1: Check sound I-F alignment.
2: Check V-10 (6AU6) V-11 (6AU6) V-12 (6AL5) V-13 (6AV6) V-14 (6AQ5) and associated circuits.

RASTER ON TUBE BUT NO PICTURE OR SOUND

This condition can be caused by,

1: Defective pix I-F Amplifier tubes V-1, V-2 or V-3
2: Defective pix detector tube V-4A (6AL5). Check tube and its associated circuit.
3: Detective R-F Amplifier or oscillator mixer tubes in the tuner.

POOR FOCUS

1: Improper setting or defective focus magnet.
2: Defective picture tube.

PICTURE JITTER:

1: If regular sections at left of the picture are displaced, replace the horizontal oscillator tube V-16.
2: Vertical instability may be due to loose connections or noise received with the signal.
3: Horizontal instability may be due to unstable transmitted sync.
4: Check receiver AGC system for proper operation.
5: Check phase splitter V-5B, (12AT7) and sync separator V-7 (6CS6).
6: Check for improper setting of sync stability control.
7: Picture tube grid lead not held in position by support spring, ie: close proximity of grid lead to sync and horizontal tubes will cause picture to jitter at high contrast setting.
8: Check AGC threshold control.

ALIGNMENT PROCEDURE

TEST EQUIPMENT — To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR meeting the following requirements:
(a) Frequency ranges:
18 to 30 mc, 10 mc sweep width
40 to 90 mc, 10 mc sweep width
170 to 225 mc, 10 mc sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR to provide the following frequencies: (Output on these ranges should be adjustable and at least .1 volt maximum.)
(a) Intermediate alignment frequencies.
23.1 mc first picture I-F coil.
24.1 mc third picture I-F coil.
25.9 mc second picture I-F coil.
21.7 mc sound trap.
4.5 mc video trap & sound I-F.
25.2 mc converter plate coil (Tuner).

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal controlled.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 20 kilovolts.

SERVICE PRECAUTIONS — To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the cabinet back, disconnect the leads from the speaker, remove the antenna terminal board at rear of cabinet, and then the 5 chassis mounting bolts. The chassis may be serviced with the picture tube in place provided the chassis is turned on its side with the power transformer on the bottom. The weight of the chassis will be supported against the power transformer and pix tube brackets.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high voltage filter resistor R-105.

ALIGNMENT PROCEDURE
PIX I-F

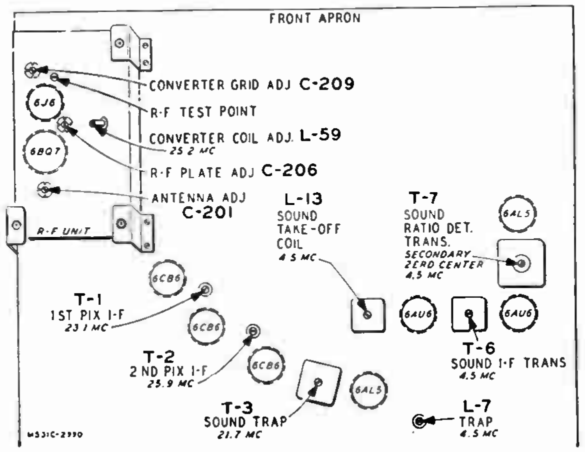

Fig. 7—Top Chassis Video and Audio I-F Adjustments

A. Unmodulated R-F signal into Converter Grid by means of tube shield insulated from base. VTVM with filter in lead of 22 K ohms and 5000 mmf connected to pic. det. load resistor, (R-37) 4700 ohms, in series with peaking coil (L-6) from Pin 2 of 6AL5. Input signal level should be such that output is less than 2 volts DC. Apply -4.5V battery bias on AGC line. (Junction of R-35 & R-36).

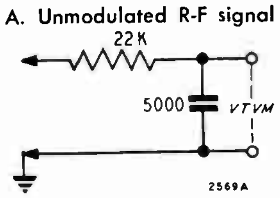

Fig. 9—VTVM Connections

	FREQUENCY	ADJUST
1.	25.2 MC	Converter plate coil on top of tuner for maximum dc at picture detector.
2.	23.1 MC	1st picture I-F coil (T-1) for maximum dc at picture detector.
3.	25.9 MC	2nd picture I-F coil (T-2) for maximum dc at picture detector.
4.	24.1 MC	3rd picture I-F coil (T-3 below chassis) for maximum dc at picture detector.
5.	21.7 MC	3rd picture I-F trap (T-3 in can above chassis) for minimum dc at picture detector.

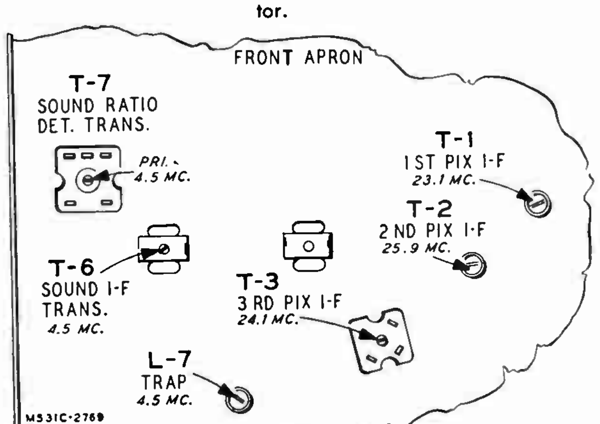

Fig. 8—Bottom Chassis Video and Audio I-F Adjustments

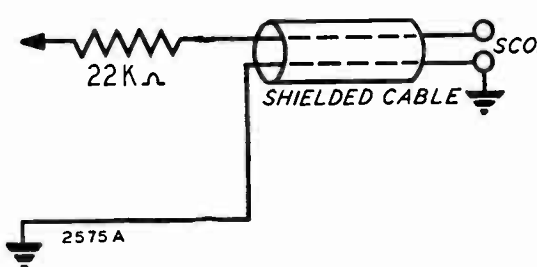

Fig. 10—Oscilloscope Connections

B. I-F Sweep Generator into converter grid by means of tube shield insulated from base.

Connect oscilloscope across R-37 (in place of VTVM). Apply -4.5V bias (DC) to AGC line (battery).

Tuner should be switched to dead channel so as not to cause interference.

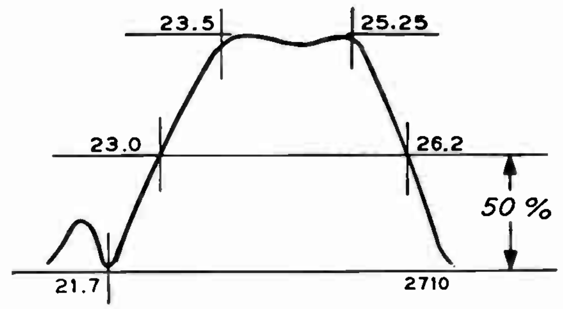

Fig. 11—Overall Response Curve

Observe overall I-F response, which should be as shown above: A slight touch-up may be required. At no time should the trap coil be re-adjusted, nor should it be necessary to turn any of the picture I-F coils more than 1/2 turn of the slug. The following comments are suggestions only:

1. The height of the 26.2 MC marker is controlled by the 25.2 MC (Converter Plate Coil on tuner) and the 25.9 MC (2nd P.I.F.) coils.
2. The uniformity of response (flatness across top and position of 23.5 MC) marker is controlled for the most part by the 24.1 MC third picture I-F coil.
3. The 23.0 MC marker position is controlled by the first picture I-F (23.1 MC coil). However, it is NOT advisable to change the setting of the coil, due to its effect on sound rejection. Its adjustment should be avoided unless believed to be absolutely necessary.

VIDEO

With 4.5 MC unmodulated signal from a high impedance source, (10,000 ohms in series with the generator) into plate of the picture detector tube (Pin 2-6AL5) and VTVM on picture tube grid, tune 4.5 MC trap (L-7 Top) for minimum response. VTVM on 0-10 V AC scale. This adjustment can also be made while observing a picture from a station. Tune trap for least 4.5 MC beat in picture.

AUDIO I-F

1: With signal generator set to 4.5 MC and dc VTVM connected to junction of R-13 and C-14, adjust sound take-off coil (L-13 Top) and sound I-F transformer slugs (T-6 Top & Bottom) for maximum.

2: With VTVM connected to pin 7 of V-12 (6AL5) adjust the ratio detector primary (T-7 Bottom) for maximum.

3: With VTVM connected to junction of R-17, R-20 and C-18, adjust ratio detector secondary (T-7 Top) for cross over (zero voltage) on lowest scale.

NOTE — If no signal generator is available, the procedure above may be followed by tuning in a station and using the 4.5 MC beat between picture and sound carrier.

TUNER ALIGNMENT

A. Sweep generator with balanced 300 ohm output to antenna terminals. Marker generator output to antenna terminals. Oscilloscope to "test point" Figure 12) on tuner. Connect 1½ V bias to AGC line at junction of R-34 and C-29 on the receiver.

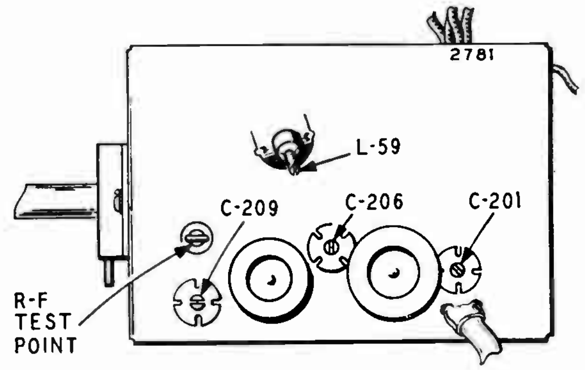

Fig. 12—Top Tuner Adjustments.

B. RF AND CONVERTER ADJUSTMENT.

1. With channel selector on Channel 12, adjust C-201 slightly favoring the Pix carrier, then adjust C-206 and C-209 for response as in Figure 13. Picture and sound markers at 90% maximum response.
2. Check response on all channels. If markers are below 70% on any channels, readjust C-201, C-206, and C-209. Recheck all channels.

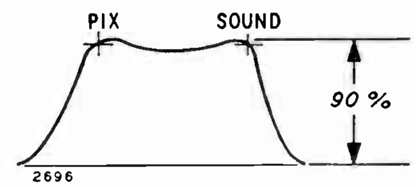

Fig. 13—Pix & Audio Markers

C. OSCILLATOR ADJUSTMENT.

1. Apply -4.5 volts on I-F AGC line at junction of R-1 and C-30.
2. Connect oscilloscope to output of video detector. Place fine tuning in center of range. Check response on all channels. Sound marker should be in notch and picture marker at 50%. (See Figure 11).
3. If markers are off, individual oscillator coil slugs will require adjustment. Adjust each channel slug, accessible through hole in front of chassis with a non-metallic screwdriver to bring sound marker to correct position.

VHF TUNER ASSEMBLY INFORMATION

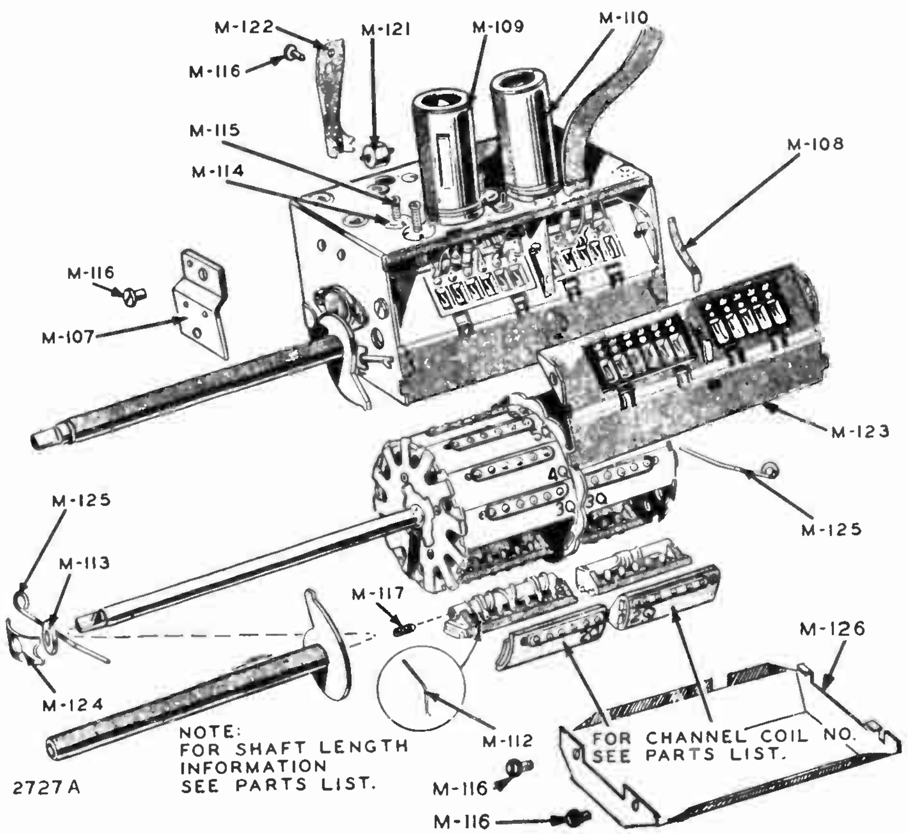

Fig. 14—"Q" Tuner Pictorial.

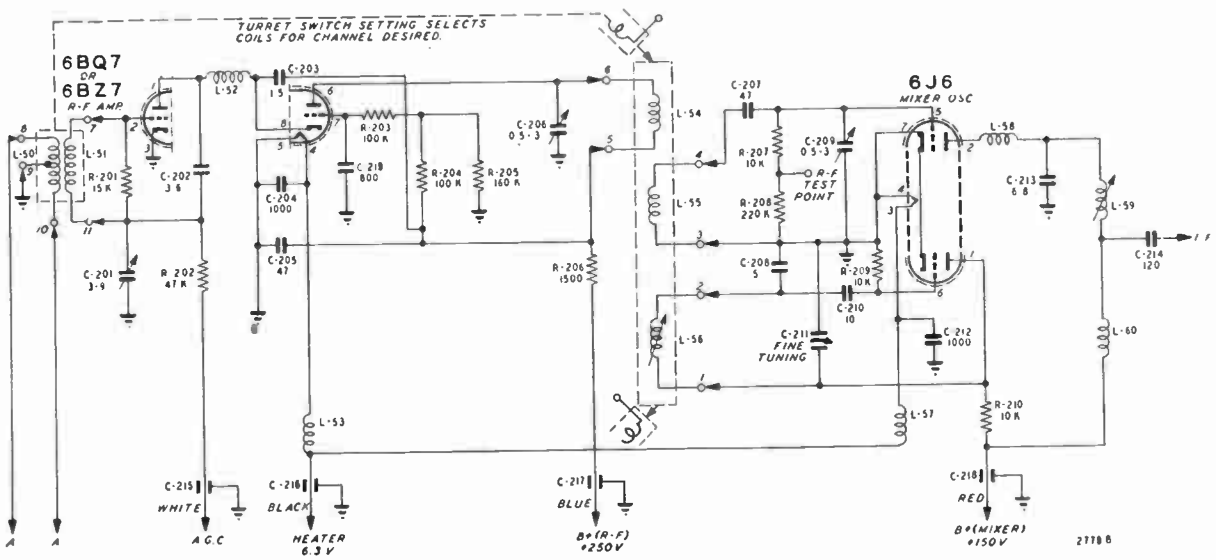

Fig. 15—Tuner Schematic Diagram.

OSCILLOSCOPE WAVEFORM PATTERNS

The waveforms on this page were taken with the receiver tuned to a normal picture. The numbers on the waveforms correspond to the numbers on the schematic diagram which identifies each test point.

The voltages shown on each waveform are the approximate peak to peak amplitudes. The frequencies shown indicate the repetition rate of the waveform, not the sweep rate of the oscilloscope. If the waveforms are observed on the oscilloscope with a poor high frequency response, the corners of the pulses will tend to be more rounded than those shown below and the amplitudes of any high frequency pulse will tend to be less.

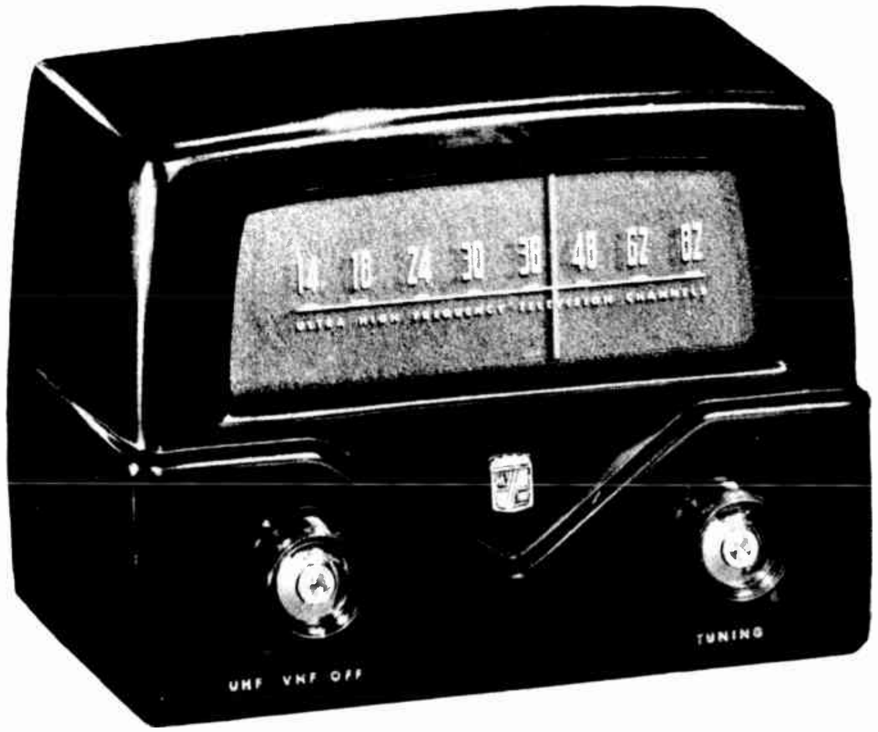
WARDS *Airline* U.H.F. CONVERTER



GENERAL DESCRIPTION

The Airline U.H.F. Converter (Model 3309A) provides complete U.H.F. television coverage of channels 14 through 83 (470 mc. to 890 mc.). It may be attached to any standard television receiver that is capable of receiving channel 5 or channel 6. The Converter is complete with own self-contained power supply. The only connection required to the V.H.F. television receiver is made to the antenna terminals.

The power cord from the television receiver may be connected to the power receptacle on the rear of the Converter, and the television receiver power switch will then be left in the "On" position. Power to both the receiver and the Converter may then be controlled by means of the single switch on the Converter. The external V.H.F. antenna, when connected to the Converter, will be connected directly to the television receiver when the Converter selector switch is set to the V.H.F. position; and will be disconnected when the Converter selector switch is set to the U.H.F. position. The Converter is turned on when the switch is in the U.H.F. position, and standby when in the V.H.F. position.

SPECIFICATIONS

ANTENNA....................Built-in U.H.F. or external
INPUT AND OUTPUT IMPEDANCE 300 ohms
FREQUENCY COVERAGE........Channels 14 through 83 (470 mc to 890 mc)
TUBES, EARLY MODEL..........3 tubes including 1 rectifier; 1 crystal diode
TUBES, LATE MODEL...........2 tubes, 1 selenium rectifier and crystal diode
POWER INPUT.................117 volts, 50 to 60 cycles AC

DIFFERENCES BETWEEN EARLY AND LATE MODELS

The major differences between the early and late models of the 3309A UHF Converter are summarized in the table below. In addition, there are numerous differences in detail. A separate schematic diagram and parts list has been included for each version of this Converter.

	EARLY MODEL	LATE MODEL
I-F AMPLIFIER	CASCODE CIRCUIT TUBE 6BQ7 OR 6BK7	PENTODE CIRCUIT TUBE TYPE 6CB6
RECTIFIER	TUBE TYPE 6X4	SELENIUM RECTIFIER 35 MA.

REPLACEMENT OF CRYSTAL DIODES

In both the early and late models of the 3309A Converter either of two types of crystal diodes may be found. A type 1N72 or type 1N82 crystal diode unit is mounted on the top of the chassis by means of a clip-in crystal holder. These crystal types are usually not interchangeable in this application unless the circuit is realigned. It is therefore recommended that the crystal unit be replaced with the same type as the original found in the set.

Polarity should be observed when replacing the crystal. The circuit will operate if the crystal is inserted backwards, but the noise level will increase. Be sure that the replacement crystal is inserted with the corresponding ends in the same position as the original unit.

ELECTRICAL DESCRIPTION

The signal from the UHF antenna is coupled to a band pass preselector network that is tuned by means of two ganged variable inductors. A third section of the variable inductance gang varies the frequency of the local oscillator in the range of 378 mc to 828 mc. The signal voltage from the preselector network and the output voltage from the local oscillator are coupled to a crystal diode mixer circuit. The useful output from the mixer will then become the intermediate frequency of the Converter. The center i-f frequency will in all cases be 82 mc. The i-f amplifier follows the mixer stage to provide effective amplification of the signal. The output from the i-f amplifier is coupled to the VHF antenna terminals of the television receiver. The VHF tuner will readily accept the 82 mc signal when tuned to either channel 5 (76 to 82 mc) or channel 6 (82 to 88 mc).

ALIGNMENT

Complicated or specially-designed test equipment is not required for practical alignment of the 3309A. Instruments used in most TV service shops for testing VHF sets usually are satisfactory for aligning the Converter. In addition to these tools, the following instruments are needed: a VHF signal generator with AM output and a sweep modulation of at least 12 megacycles; an oscilloscope or vacuum tube volt-ohmmeter for measurement of the relative signal; and an operating VHF television set. The latter is suggested as a practical amplifier for raising the output signal of the Converter to a level which permits convenient observation.

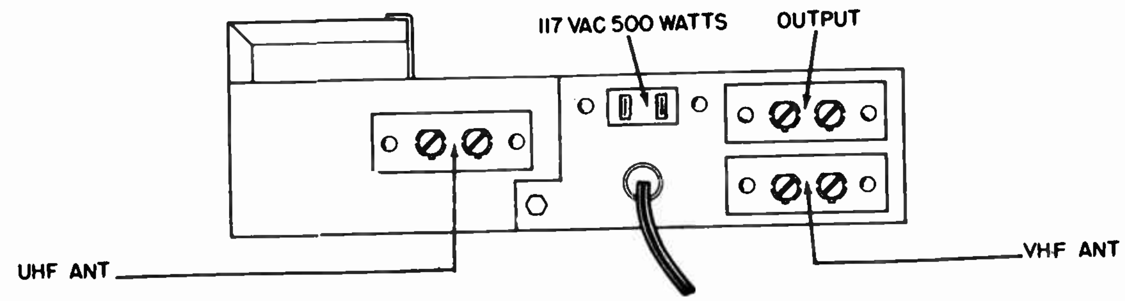


Fig. 1. Antenna and Output Connections

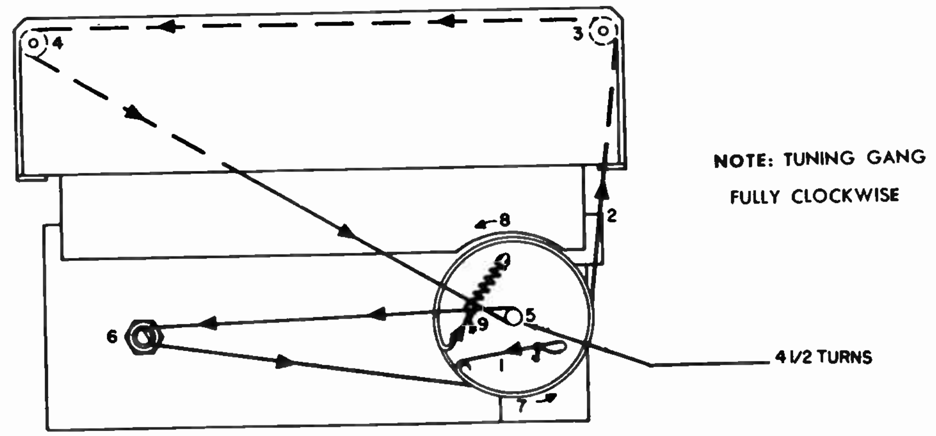

Fig. 2. Dial Stringing Detail

VOLTAGE MEASUREMENTS

NOTE: Voltage measurements made by means of an electronic voltmeter (VTVM) should be taken between tube socket terminals and the chassis. Measurements within 20 percent of the specified value usually will assure satisfactory performance of the Converter.

*Measurement made with 15K isolating resistor in series with voltmeter probe.

RESISTANCE MEASUREMENTS

NOTE: Resistance measurements, made by means of an electronic ohmmeter (VTVM), should be taken between tube socket terminals and the chassis. Measurements within 20 percent of the specified value usually will assure satisfactory performance of the Converter. When taking these measurements, the Converter switch must be turned to the "UHF" position and the line cord detached from the power line.

Selenium Rectifier to "K" Terminal to Chassis 50K or More.

ALIGNMENT

The 3309A UHF Converter to be aligned should be connected to the VHF television antenna terminals. The oscilloscope or VTVM should then be connected to the TV set at a point which permits satisfactory observation of the relative intensity and character of the AM (or sweep-modulated) signal introduced into the Converter (video detector load resistor). The procedure for alignment consists of the following steps in the suggested sequence shown: (1) alignment of the I-F stage; (2) positioning of the oscillator for proper band coverage; and (3) alignment of R-F circuits for maximum effectiveness.

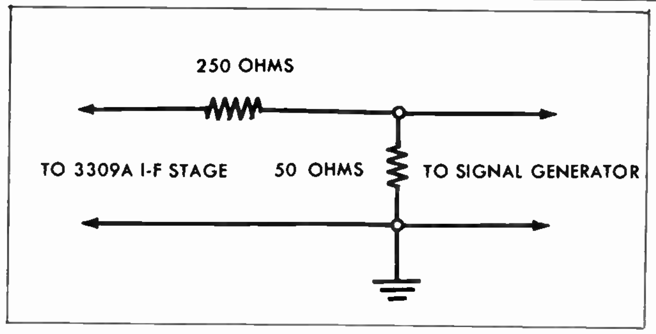

Fig. 3.

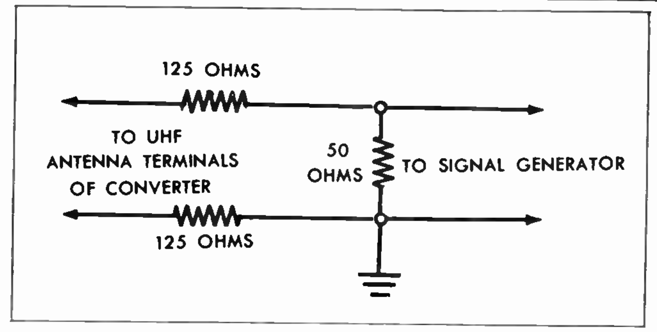

Fig. 4.

I-F ALIGNMENT

EARLY CASCODE AMP. MODEL

1. Connect the VHF signal generator, through a suitable resistor-matching network (Fig. 1) to the crystal mixer of the Converter at the junction of X1, C9, L4, and C12 (Fig. 9). Apply an AM signal centered at 82 megacycles.

2. Align input and output I-F transformers, T2 and T3, to obtain the maximum signal. Location of I-F alignment points is shown in Figs. 5 and 7.

3. Replace AM signal with a sweep of at least 12 megacycles centered at 82 megacycles. If a sweep generator with 82 megacycle center frequency is not available, switch from channel 5 to 6 to see skirts of curve.

4. Readjust slugs of double-tuned I-F output transformer, T3, for equal signal response at VHF channels 5 and 6. **The I-F amplifier must be aligned for a minimum 12-megacycle band-width, and the maximum gain possible with this band-width.**

LATE PENTODE AMP. MODEL

1. Connect the VHF signal generator, through a suitable resistor-matching network (Fig. 3), to the crystal mixer of the Converter at the junction of C9, C10, L1 and X1 (Fig. 10). Apply an AM signal centered at 82 megacycles.

2. Align input and output I-F transformers, T2 and T3, to obtain the maximum signal. Location of I-F alignment points is shown in Figs. 6 and 8.

3. Replace AM signal with a sweep of at least 12 megacycles centered at 82 megacycles.

4. Readjust slugs of double-tuned I-F transformer, T3, for equal signal response at VHF channels 5 or 6. **The I-F amplifier must be aligned for a minimum 12-megacycle band-width, and the maximum gain possible with this band-width.**

OSCILLATOR ADJUSTMENT

EARLY CASCODE AMP. MODEL

1. Adjust 3309A tuning control so that indicating pointer is positioned at extreme left-hand edge of dial.

2. Feed a 465-megacycle AM signal into Converter antenna terminals through a matching network described in Fig. 4. Adjust oscillator trimmer, C10, for maximum signal. (Use non-metallic alignment tool.) **When using a VHF signal generator, a fundamental of 93 megacycles may be employed to produce the 5th harmonic energy of 465 megacycles.**

3. Adjust 3309A tuning control so that indicator is positioned at extreme right-hand edge of dial.

4. Set signal generator for 900-megacycle output (5th harmonic of 180 megacycles). Carefully spread or pinch together the legs of the oscillator end-inductor (Fig. 5) for maximum signal.

5. Repeat above steps until no further improvement in signal is apparent. **The oscillator alignment figures of 465 and 900 megacycles are approximate only, and may not fall precisely at the maximum and minimum dial settings; however, in every case, the oscillator must be aligned so that both frequencies can be tuned by normal manipulation of the dial.**

LATE PENTODE AMP. MODEL

1. Adjust 3309A tuning control so that indicating point is positioned at extreme left-hand edge of dial.

2. Feed a 465-megacycle AM signal into the converter antenna terminals through a matching network (described in Fig. 2). Adjust oscillator trimmer, C11, for maximum signal. **When using a VHF signal generator, a fundamental of 93 megacycles may be employed to produce the 5th harmonic energy of 465 megacycles.**

3. Adjust 3309A tuning control so that indicator is positioned at extreme right-hand edge of dial.

4. Set signal generator for 900-megacycle output (5th harmonic of 180 megacycles). Carefully spread or pinch together the legs of the oscillator end-inductor (Fig. 6) for maximum signal.

5. Repeat above steps until no further improvement in signal is apparent. **The oscillator alignment figures of 465 and 900 megacycles are approximate only, and may not fall precisely at the maximum and minimum dial settings; however, in every case, the oscillator must be aligned so that both frequencies can be tuned by normal manipulation of the dial.**

R-F ALIGNMENT

EARLY CASCODE I-F AMP. MODEL

1. Adjust tuning control so that indicator is positioned at extreme left-hand edge of dial.
2. Feed a 465-megacycle signal into the Converter antenna terminals (as indicated above for oscillator alignment).
3. Adjust R-F trimmers, C6 and C3, for maximum signal.
4. Readjust tuning control so that indicator rests at extreme right-hand edge of dial.
5. Set signal generator for 900 megacycles output.
6. Adjust R-F end-inductors (Fig. 5) for maximum signal.
7. Repeat above steps until no f rther improvement in signal is apparent.
8. Readjust tuning control so that indicator is positioned at extreme left-hand edge of dial.
9. Adjust coupling trimmer, B1, for maximum signal.

LATE PENTODE I-F AMP. MODEL

1. Adjust tuning control so that indicator is positioned at extreme left-hand edge of dial.
2. Feed a 465-megacycle signal into the Converter antenna terminals (as indicated above for oscillator alignment).
3. Adjust R-F trimmers, C3 and C7, for maximum signal. Physical location of R-F alignment points is shown in Fig. 8.
4. Readjust tuning control so that indicator rests at extreme right-hand edge of dial.
5. Set signal generator for 900-megacycle output.
6. Adjust R-F end-inductors (Fig. 6) for maximum signal.
7. Repeat above steps until no further improvement in signal is apparent.

GENERAL INSTALLATION INSTRUCTIONS

While each receiver is correctly aligned at the factory rough handling in transit, ageing, drift, etc., may throw the receiver off, so we suggest that the proper oscillator trimmers, ratio detector, and rear panel controls (see pages 4 and 5) be checked for correct adjustment with a transmitted television pattern, in the customer's home at the time of installation. Be sure to have the receiver operating for one-half hour before making these adjustments. Listed below is the correct procedure to follow in making these adjustments.

(A) Check all operating channels, using FINE TUNING CONTROL for best picture detail. (See paragraph PEAKING THE INDIVIDUAL OSCILLATOR TRIMMERS.)

(B) Check LOCALITY ADJUSTER CONTROL located on back of chassis for proper setting.

NOTE: The signal strength (too strong or too weak) will be affected by location and distance from the station, type of antenna used, terrain obstructions such as tall buildings, electrical disturbances.

PEAKING THE INDIVIDUAL OSCILLATOR TRIMMERS

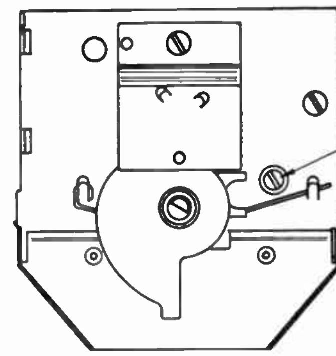
(A) Set channel selector knob to the desired channel.

(B) Set the FINE TUNING CONTROL to the center position.

(C) Remove the channel and fine tuning knobs. This will expose the individual channel adjustment screw opening just to right of the channel shaft. See Fig. 1.

(D) Use a non-metallic screwdriver such as polystyrene or nylon.

Adjust the individual oscillator screw for best picture detail. A slight adjustment in either direction is all that is necessary. CAUTION: DO NOT ADJUST INDISCRIMINATELY, this may cause the adjustment screw to fall from its locking position.



THE PROPER ADJ. SCREW FOR THE CHANNEL TUNED TO WILL APPEAR HERE

FIG. 1

ADJUSTMENT FOR STATION BUZZ

If station buzz is excessive and is NOT DUE to "contrast control" being advanced too far in a clockwise direction or the locality adjuster control in the incorrect position, adjust the ratio detector secondary adjustment screw located on top of the ratio detector for minimum buzz. MAKE SURE THAT THIS POSITION IS BETWEEN the two MAXIMUM buzz peaks that will be noticed when adjustment screw is turned to the right or left of the minimum buzz position.

HIGH VOLTAGE WARNING

This television receiver contains high voltages which are dangerous to life or may result in serious burns. Never operate or service the receiver outside of the cabinet or with the high voltage shield cover removed until all the safety precautions necessary for working with high voltage equipment have been observed.

PICTURE TUBE

HANDLING PRECAUTION

Shatterproof goggles and heavy gloves must be worn by individuals while handling or installing the picture tube into the receiver. The picture tube encloses a high vacuum and is subjected to excessive air pressure. HANDLE WITH EXTREME CARE—do not strike or scratch the tube nor subject it to more than moderate pressure when inserting into or removing from its socket. Breakage and the resulting implosion may result in damage to property or injury to an individual.

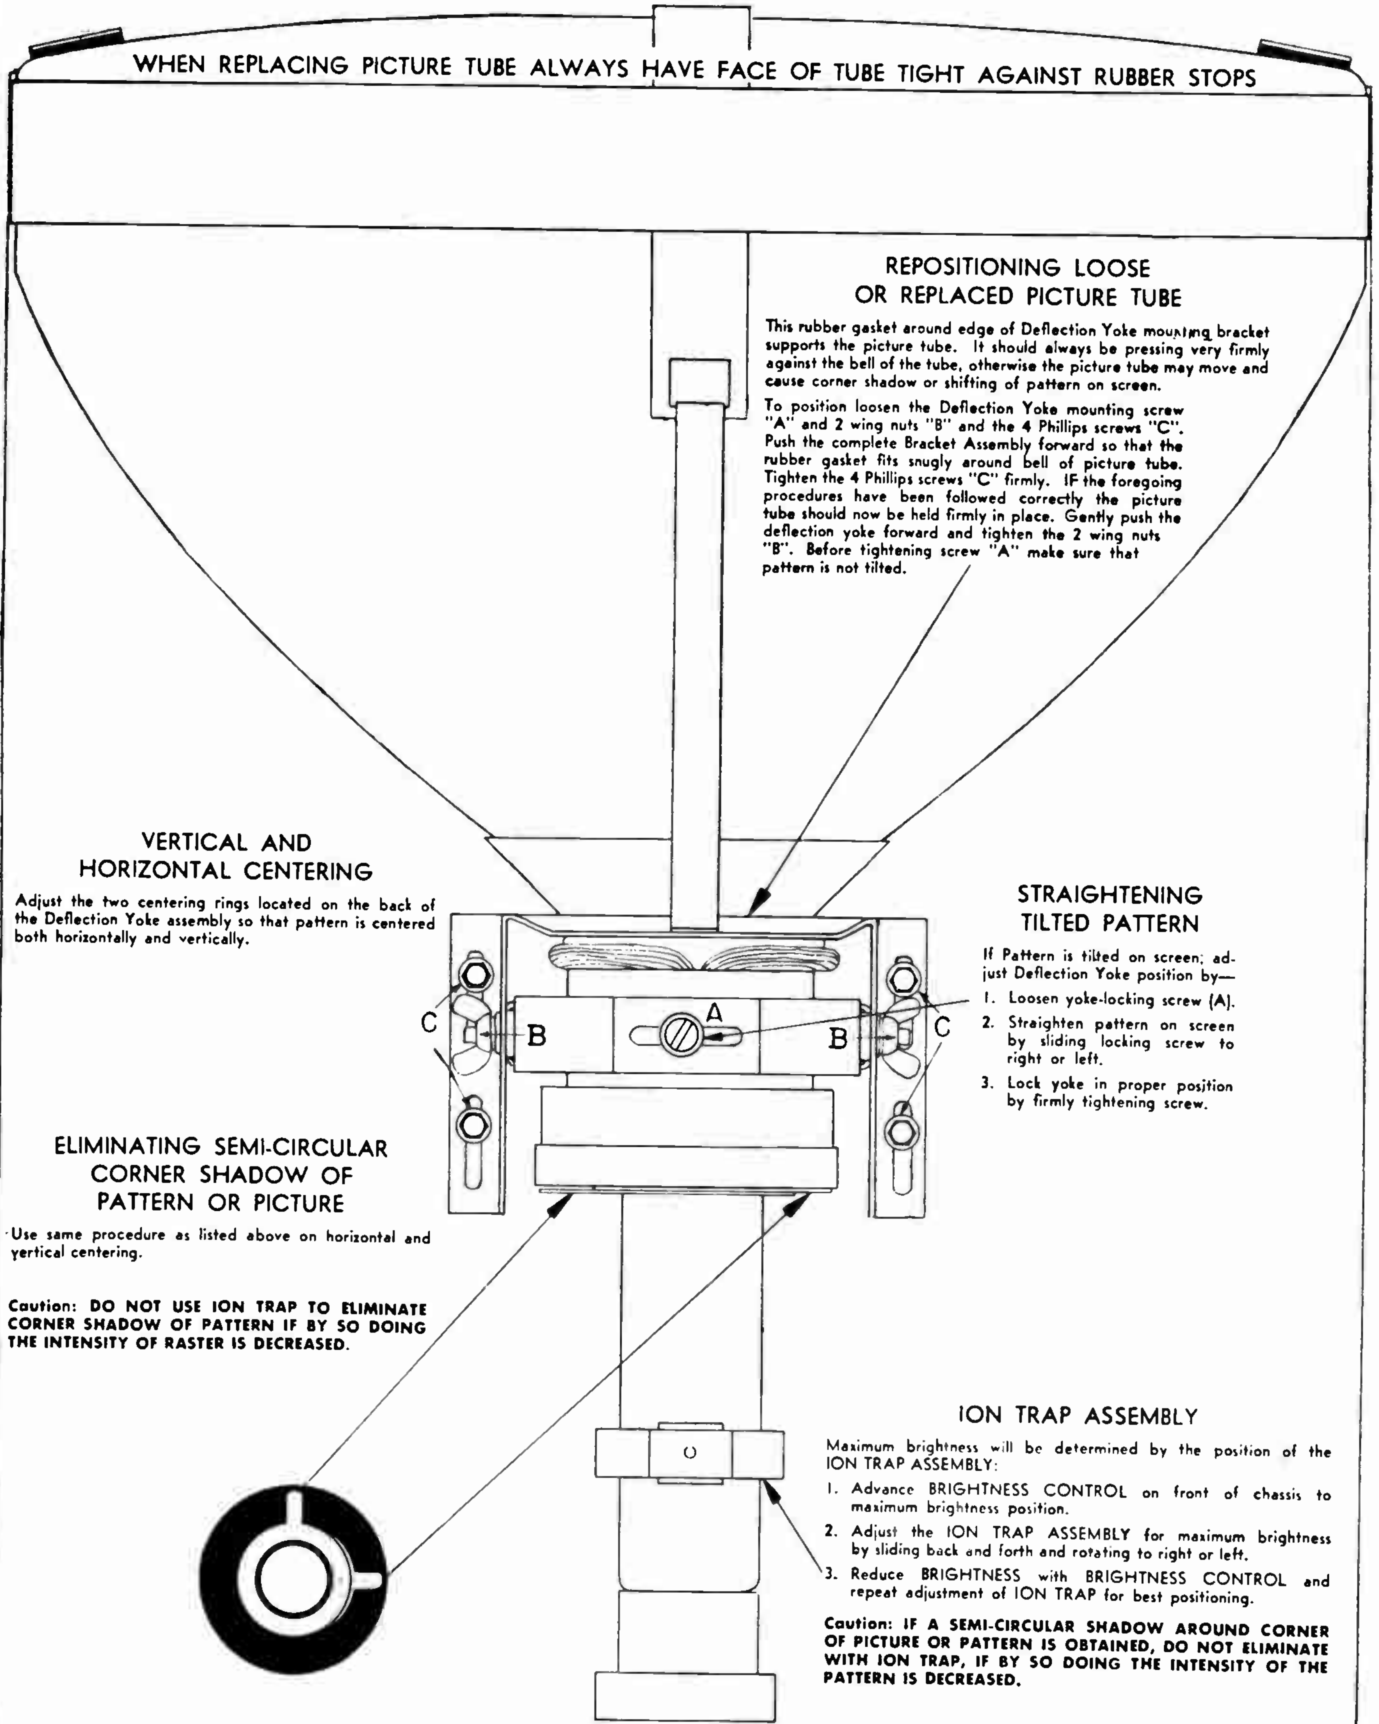
CHASSIS REMOVAL INSTRUCTIONS

To remove chassis from cabinet correctly:

1. Remove back from cabinet.
2. Disconnect speaker leads from jack mounted on chassis. (Remove speaker from table model cabinet).
3. Remove the 4 pushon type knobs.
4. Remove the 4 chassis mounting screws.

When reinstalling chassis make sure inside of safety glass is clean and face of picture tube is free of finger marks, lint, etc. Any commercial glass cleaner may be used.

ADJUSTMENT PROCEDURE FOR ELECTROSTATIC FOCUS PICTURE TUBES, DEFLECTION YOKE, ION TRAP, HORIZONTAL AND VERTICAL CENTERING, CORNER SHADOW, AND PICTURE TUBE ALIGNMENT.



REPOSITIONING LOOSE OR REPLACED PICTURE TUBE

This rubber gasket around edge of Deflection Yoke mounting bracket supports the picture tube. It should always be pressing very firmly against the bell of the tube, otherwise the picture tube may move and cause corner shadow or shifting of pattern on screen.

To position loosen the Deflection Yoke mounting screw "A" and 2 wing nuts "B" and the 4 Phillips screws "C". Push the complete Bracket Assembly forward so that the rubber gasket fits snugly around bell of picture tube. Tighten the 4 Phillips screws "C" firmly. If the foregoing procedures have been followed correctly the picture tube should now be held firmly in place. Gently push the deflection yoke forward and tighten the 2 wing nuts "B". Before tightening screw "A" make sure that pattern is not tilted.

VERTICAL AND HORIZONTAL CENTERING

Adjust the two centering rings located on the back of the Deflection Yoke assembly so that pattern is centered both horizontally and vertically.

STRAIGHTENING TILTED PATTERN

If Pattern is tilted on screen; adjust Deflection Yoke position by—

1. Loosen yoke-locking screw (A).
2. Straighten pattern on screen by sliding locking screw to right or left.
3. Lock yoke in proper position by firmly tightening screw.

ELIMINATING SEMI-CIRCULAR CORNER SHADOW OF PATTERN OR PICTURE

Use same procedure as listed above on horizontal and vertical centering.

Caution: DO NOT USE ION TRAP TO ELIMINATE CORNER SHADOW OF PATTERN IF BY SO DOING THE INTENSITY OF RASTER IS DECREASED.

ION TRAP ASSEMBLY

Maximum brightness will be determined by the position of the ION TRAP ASSEMBLY:

1. Advance BRIGHTNESS CONTROL on front of chassis to maximum brightness position.
2. Adjust the ION TRAP ASSEMBLY for maximum brightness by sliding back and forth and rotating to right or left.
3. Reduce BRIGHTNESS with BRIGHTNESS CONTROL and repeat adjustment of ION TRAP for best positioning.

Caution: IF A SEMI-CIRCULAR SHADOW AROUND CORNER OF PICTURE OR PATTERN IS OBTAINED, DO NOT ELIMINATE WITH ION TRAP, IF BY SO DOING THE INTENSITY OF THE PATTERN IS DECREASED.

SM-1002

REAR PANEL CONTROL ADJUSTMENTS

DON'T DISTURB THESE PANEL CONTROLS UNNECESSARILY—IF THE PICTURE IS GOOD, LEAVE THEM ALONE.

Normally, after the receiver has been properly installed, only the two dual operating controls on front of cabinet need be adjusted by the owner.

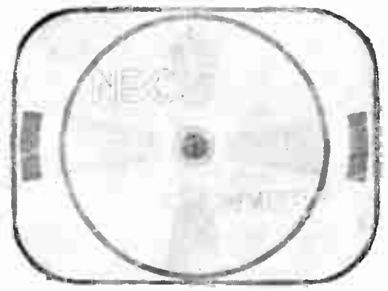
ONLY when the picture does not stay locked in the center of the screen, or is egg-shaped or very fuzzy, will it be necessary to adjust one of the rear panel controls.

If you experience a poor quality television picture, do not immediately assume that the difficulty is in your receiver. The cause may be due to temporary station transmitter difficulties.

Before adjusting any of the panel controls, study the picture you are receiving and compare it with one of the illustrative patterns below having similar characteristics. ADJUST ONLY THE CONTROL INDICATED AS THE ONE TO BE USED to correct that particular type of mis-adjustment.

By having someone hold a mirror in front of screen it is possible to adjust the required control and still look at the screen while making the adjustment. Turn the proper control slowly to the right or left until the picture stops rolling, becomes clear, etc.

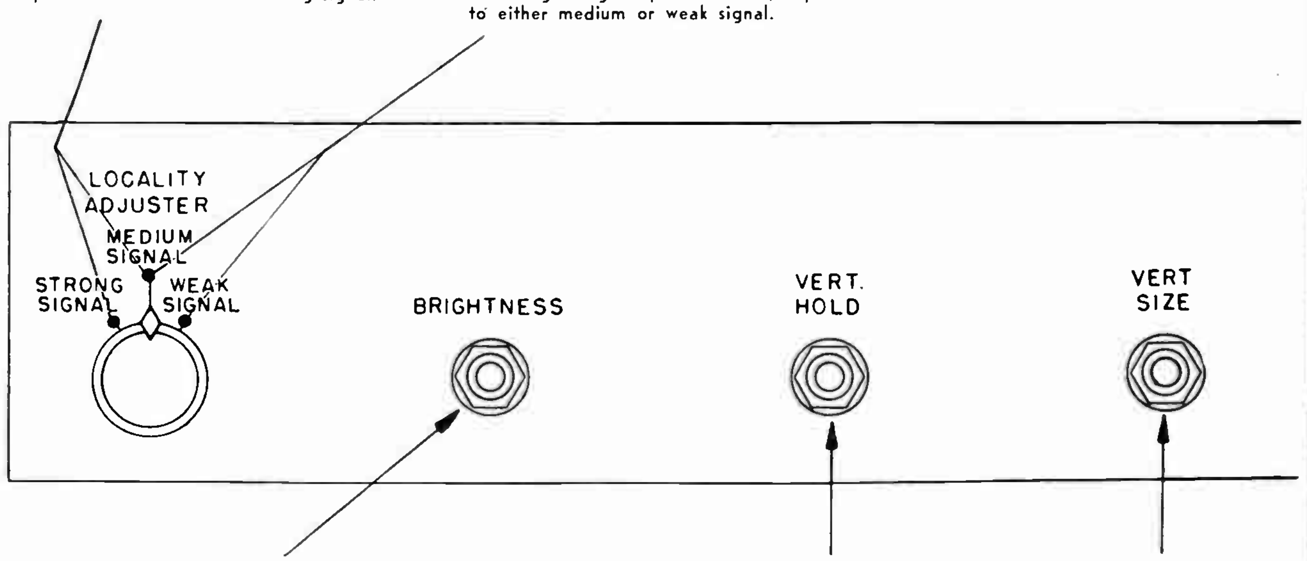
If picture is too strong and the CONTRAST CONTROL is not set too high, adjust to either medium or strong signal.

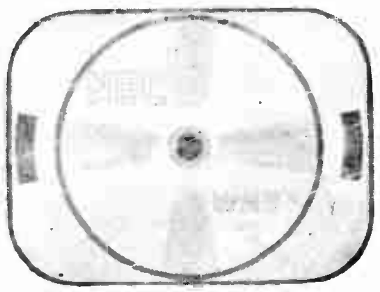


If the picture is weak and an adjustment of the FINE TUNING CONTROL does not bring out good picture detail, adjust to either medium or weak signal.

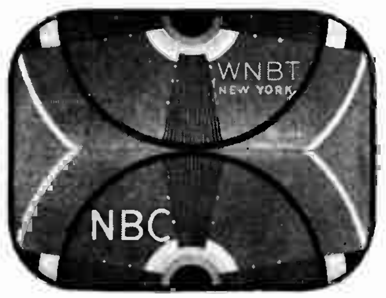
VERTICAL AND HORIZONTAL CENTERING

TO BE ADJUSTED BY A QUALIFIED TELEVISION TECHNICIAN ONLY. Adjust the 2 centering rings mounted on the back of the deflection yoke assembly for proper centered picture.

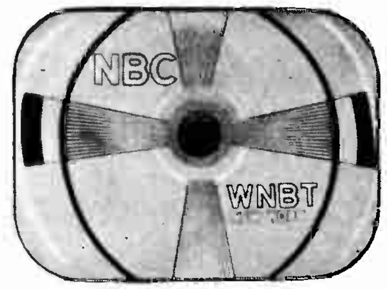




BRIGHTNESS CONTROL: This control is used in adjusting for brilliance or light intensity of the screen. When picture is too light as shown adjust Brightness Control.



IF PATTERN continuously rolls across screen in vertical direction (up or down) ADJUST VERTICAL HOLD CONTROL so that pattern stops rolling and remains stationary on screen.



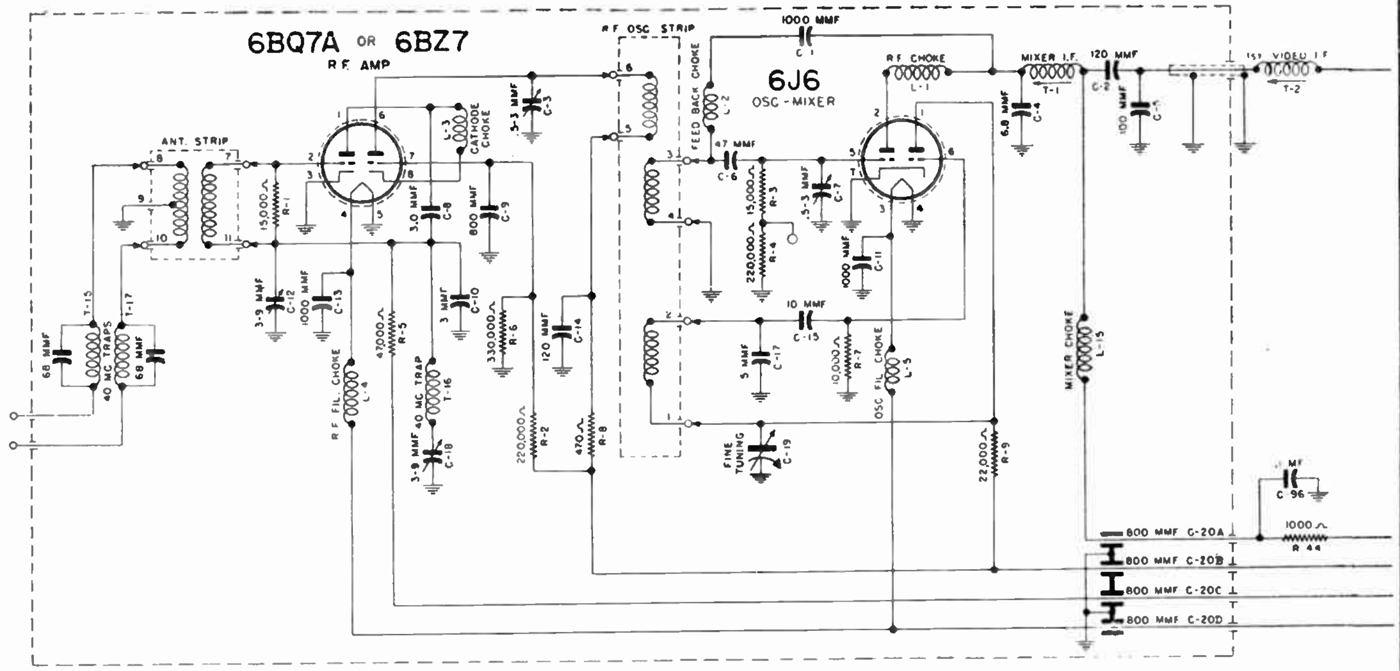
IF PATTERN extends over top and bottom of screen (too large) or is too small, in a vertical direction, adjust VERTICAL SIZE to make circle fit on screen.

NOTE: If, after this adjustment, circle is not uniformly round, a slight adjustment of the VERTICAL LINEARITY CONTROL may be necessary.

INTERFERENCE

Electrical interference, reflections and refractions, all of which will affect the quality of the picture, are problems that **cannot** be eliminated by any adjustment of the receiver controls. These sources of disturbance must be considered when the television antenna is installed.

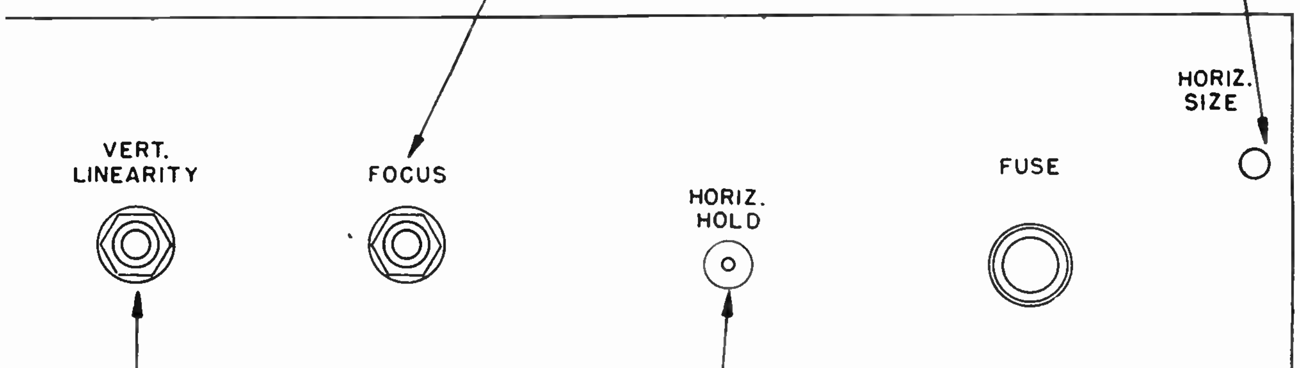
This means that both the type of antenna and its installation are of the greatest importance, and is one of the reasons why we recommend that only a trained television technician install the antenna.

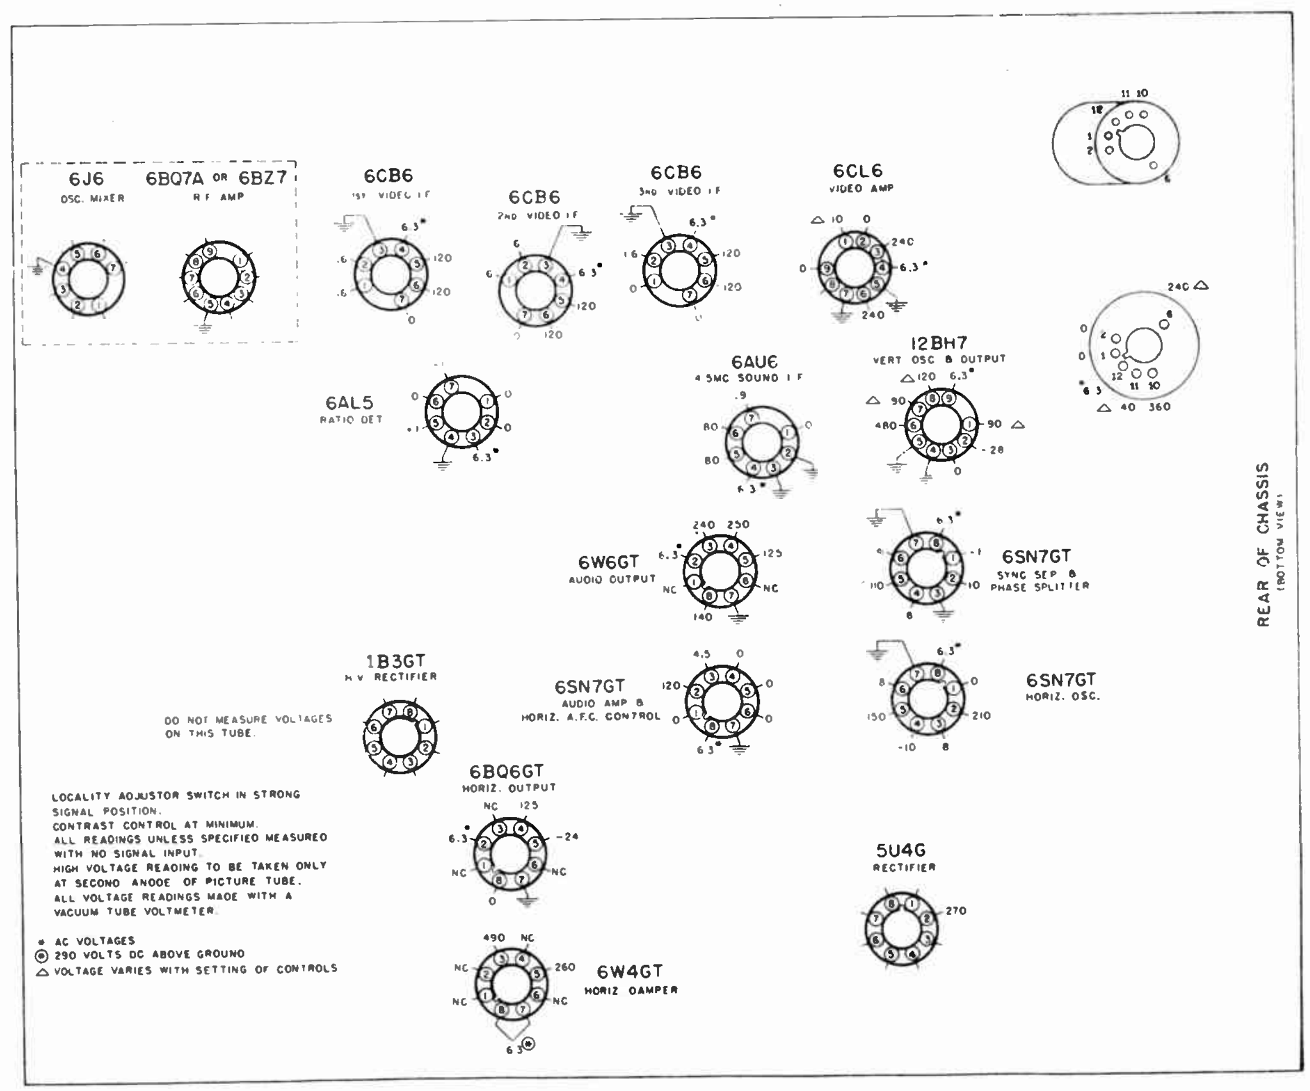


IF PATTERN IS FUZZY, ADJUST FOCUS CONTROL for sharpest definition.

NOTE: Have "Brightness" and "Contrast" controls properly adjusted before adjusting Focus Control.

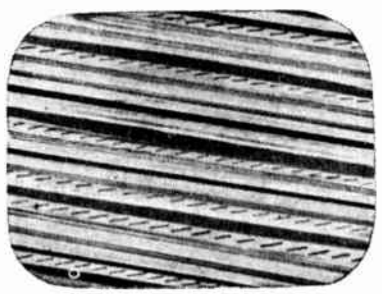
IF PATTERN IS TOO LARGE OR TOO SMALL, adjust HORIZONTAL SIZE CONTROL to make circle fit screen.





IF PATTERN is egg-shaped in vertical direction (flat on top), adjust VERTICAL LINEARITY CONTROL to make pattern round.

NOTE: If, after this adjustment, circle is round but is too small or too large, a slight adjustment of the VERTICAL SIZE will be necessary to make circle fit on screen properly.



IF PATTERN continuously breaks up in horizontal direction (LEFT TO RIGHT) ACROSS SCREEN, adjust HORIZONTAL HOLD CONTROL to bring pattern to stationary position on screen.

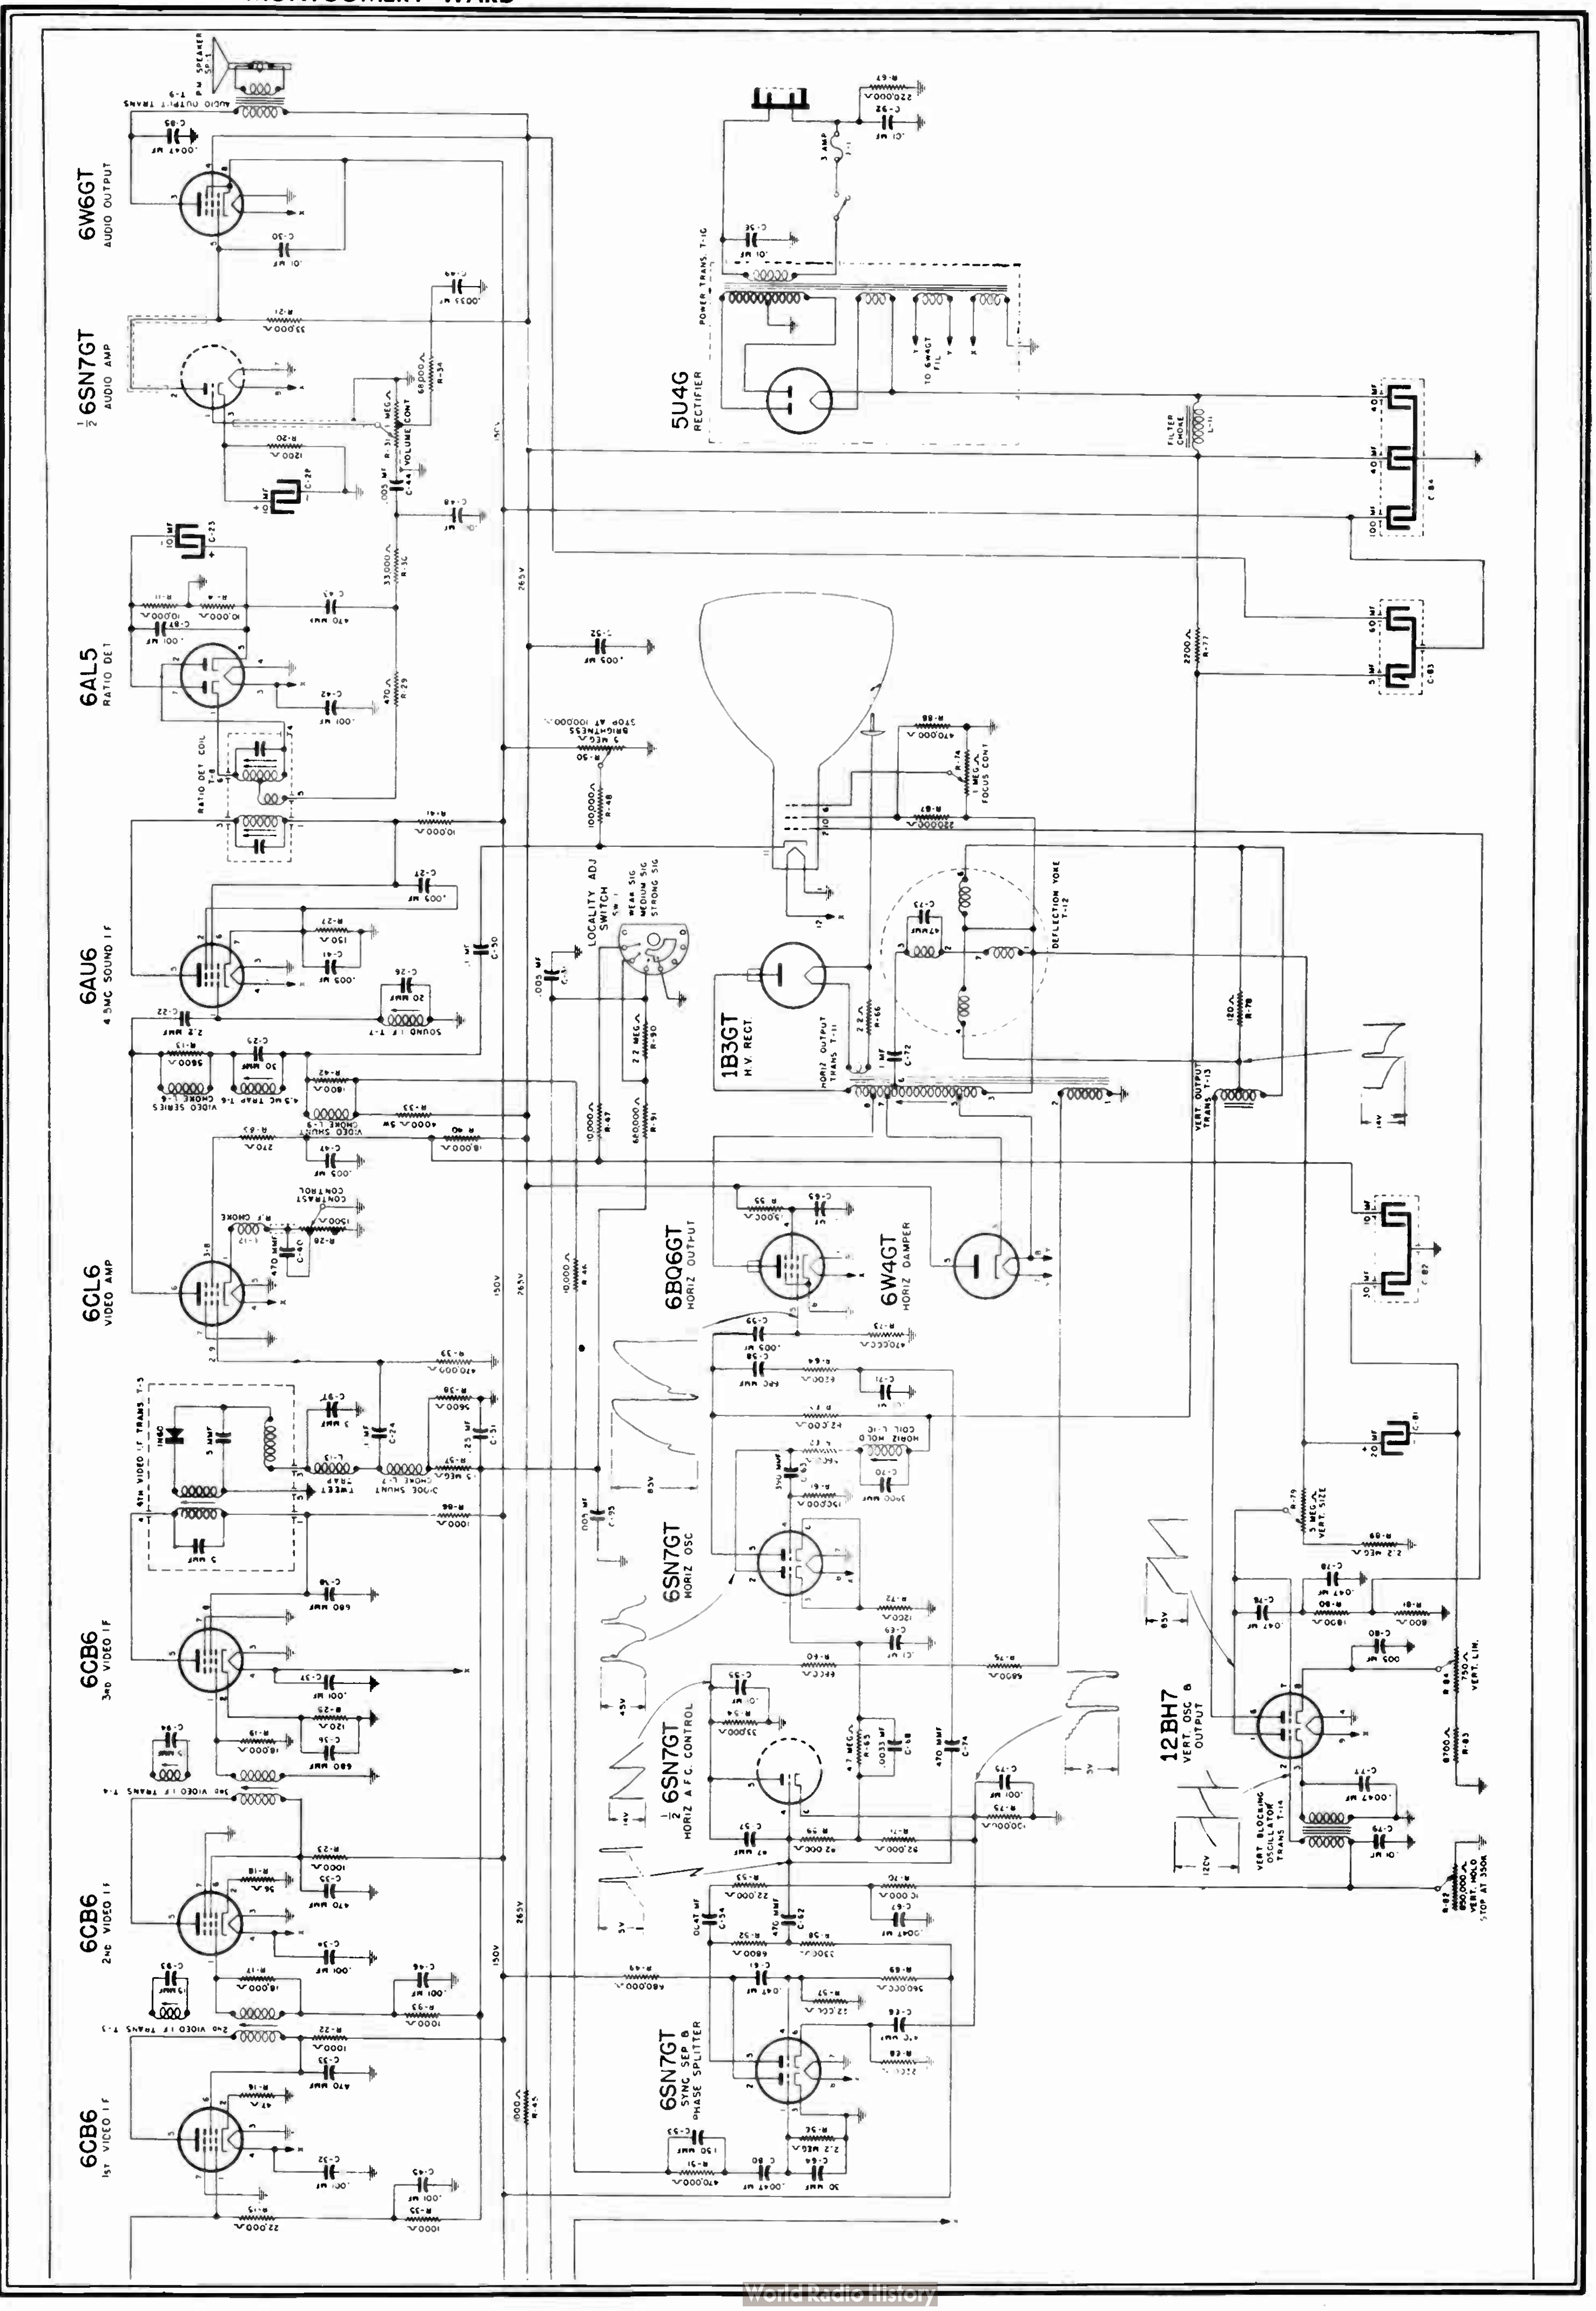
MODELS 35GSE-3076A, -3078A, -3095A, -3097A



ALIGNMENT DATA

ALIGNMENT PROCEDURE

All circuits are very stable and will seldom require adjustment. Only when major parts of the tuner or the video I-F strip have been replaced or tampered with will it be necessary to realign the receiver.

Generally under normal conditions only the INDIVIDUAL CHANNEL TRIMMERS in the tuner unit may require adjustment by the service technician.

RATIO DETECTOR AND SOUND I-F ALIGNMENT

In most cases only the secondary of the ratio detector coil will require adjustment. This can be done simply by adjusting the top adjustment screw of the ratio detector for minimum buzz with the sound carrier of a TV station. For complete alignment use steps 1, 2, and 3 in the alignment table.

PICTURE I-F ALIGNMENT

Receiver should be run for at least ½ hour before proceeding with alignment.

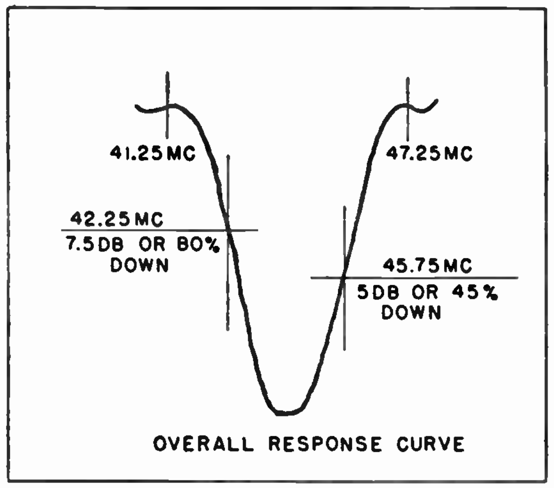


FIG. 2

EQUIPMENT REQUIRED

VACUUM TUBE VOLTMETER
For video IF alignment maintain readings in middle of low volt scale.

SIGNAL GENERATOR supplying a 4.5 MC. (within .25% 40 to 216 MC. (within 1%) signal. With output adjustable to at least .1 volt maximum.

CATHODE-RAY OSCILLOSCOPE. Must have good frequency and phase response from 10 cycles to at least 2 MC.

SWEEP GENERATOR. Capable of covering 40 to 270 MC. with a 10 MC. sweep with output adjustable to at least .1 volt maximum.

3 VOLT "A" BATTERY to provide fixed bias during video I-F and R-F alignment.

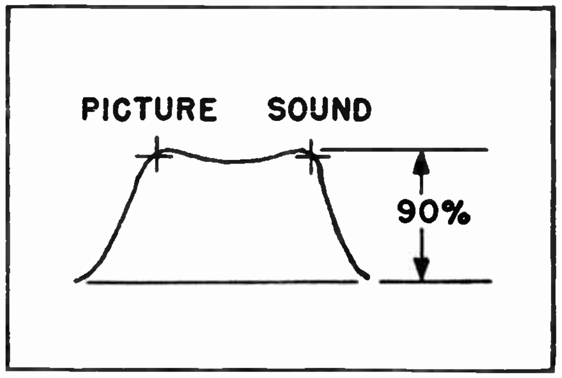

FIG. 3

ALIGNMENT TABLE

RATIO DETECTOR AND SOUND ALIGNMENT

Step No.	Connect Signal Generator to	Sig. Gen. Freq.	Connect Voltmeter to	Miscellaneous Instructions	Adjust
1	In series with .001 Mfd. Cond. to junction of C-97 and L-13 terminal 3 of 4th I.F. See fig. 5	4.5 MC.	In series with 47,000 ohm res. across C-23 a 10 Mfd. cond. See fig. 5	Maintain reading on 10 volt scale contrast at maximum. Remove 3rd video IF tube 6CB6.	T-7 (top) and T-8 (bottom) for max. reading. See fig. 4 & 5
2	In series with .001 Mfd. Cond. to junction of C-97 and L-13 terminal 3 of 4th I.F. See fig. 5	4.5 MC.	In series with 47,000 ohm res. to junction of R-30 and C-44. See fig. 5	Maintain reading on 10 volt scale contrast at maximum. Remove 3rd video IF tube 6CB6.	T-8 (top) for zero reading. See fig. 4
3	In series with .001 Mfd. Cond. to cathode of picture tube yellow lead. See fig. 5	4.5 MC.	In series with 47,000 ohm res. across C-23 a 10 Mfd. cond. See fig. 5	Maintain reading on low volt scale. Remove 3rd video IF tube 6CB6.	T-6 (top) for minimum reading. See fig. 4

NOTE 1: For **minimum buzz** always adjust T-8 (top) with the sound carrier of a TV station.
NOTE 2: Alternate 4.5 MC. trap alignment: Adjust T-6 (top) for minimum 4.5 MC. beat on picture with a strong station signal.

PICTURE I-F ALIGNMENT

Step No.	Connect Signal Generator to	Sig. Gen. Freq.	Connect Voltmeter to	Miscellaneous Instructions	Adjust
4	Ungrounded converter tube (6J6) shield.	44.0 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5	Tuner on channel 3, 3 volts bias across C-51 positive side to ground. Locality switch in strong position. See fig. 5	T-5 (top) for maximum reading. See fig. 4

8	Ungrounded converter tube (6J6) shield.	47.25 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5	Tuner on channel 3, 3 volts bias across C-51 positive side to ground. Locality switch in strong position. See fig. 5 Repeat Steps 7 & 8	T-3 (bottom) for minimum reading. See fig. 5
9	Ungrounded converter tube (6J6) shield.	44.6 MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5	Tuner on channel 3, 3 volts bias across C-51 positive side to ground. Locality switch in strong position. See fig. 5 **NOTE:** Detune T-2 by turning slug out as far as possible.	T-1 (top) for maximum reading. See fig. 4
10	Ungrounded converter tube (6J6) shield.	45.75MC.	In series with 47,000 ohm res. to junction of R-37 and L-7. See fig. 5	Tuner on channel 3, 3 volts bias across C-51 positive side to ground. Locality switch in strong position. See fig. 5	T-2 (top) for maximum reading. See fig. 4

NOTE 3: For visual check of IF response curve (see fig. 2) connect signal and sweep generator to ungrounded converter tube shield (6J6). Connect oscilloscope in series with 47,000 ohm resistor to junction of R-37 and L-7.

TUNER R.F. ALIGNMENT

NOTE 4: NEVER ADJUST C-3, C-7 and C-12 UNLESS ABSOLUTELY NECESSARY. THEY ARE FACTORY PRESET BY SPECIAL EQUIPMENT.

Step No.	Connect Marker Generator to	Marker Gen. Freq.	Connect Sweep Gen. to	Sweep Gen. Chan.	Connect Oscilloscope to	Miscellaneous Connections	Adjust
11	Loosely couple to sweep gen. leads.	205.25 MC. and 209.75 MC.	300 ohm antenna terminals.	12	Lead extending from top of tuner. See fig. 4	Tuner on channel 12 3 volt bias to junction of C-51 locality switch in strong position.	C-3, C-7 and C-12 for max. response having linear peaks with picture and sound markers at 90% maximum response. See fig. 3
12	OBSERVE RESPONSE CURVE FOR ALL CHANNELS USING CORRECT FREQUENCIES AND CHANNELS. A SLIGHT COMPROMISE SHOULD BE MADE WITH C-3, C-7 and C-12 IF MARKERS ARE BELOW 70%.						

NOTE 5: FOR RF OSCILLATOR ALIGNMENT. SET FINE TUNING CONTROL IN CENTER POSITION. ADJUST INDIVIDUAL CHANNEL TRIMMERS FOR BEST PICTURE DETAIL WITH THE PATTERNS OF A TV STATION. NOTE: USE A NON-METALLIC SCREW-DRIVER.

NOTE 6: C-1• (See fig. 4) part of a 40 MC. tuned trap need only be adjusted when local interferences from 40 thru 45 MC. affect the picture. Adjust C-18 for minimum 40 MC. beat on picture with a station signal.

TRIMMER LOCATION AND ALIGNMENT CONNECTION POINTS

PARTS LIST

R.F. TUNER UNIT

When Ordering Parts Give The Complete Part Number, Model Number and Description

TUNER UNIT CAPACITORS

Ref. No.	Part No.	Description	Price
C-1	CD8X-102Z	Fixed Ceramic, 1000 MMF GMV	$ .24
C-2	13L8D121K	Fixed Ceramic, 120 MMF ± 10% N750	.28
C-3	31B-206	Trimmer R.F., .5-3 MMF	.66
C-4	13L8C6R8C	Fixed Ceramic, 6.8 MMF ± .25 MMF NPO	.72
C-5	13XR1-30U101J	Fixed Ceramic, 100 MMF ± 5% N750	
C-6	CD8Q-470K	47 MMF ± 10% N1400	.24
C-7	31B-206	Trimmer R.F., .5-3 MMF	.66
C-8	CD8C-030C	Fixed Ceramic, 3 MMF ± .25 MMF NPO	.24
C-9	31B-611	Feed Thru Condenser 800 MMF GMV (Part of Center Shield Assembly)	.32
C-10	CD8C-030C	Fixed Ceramic, 3 MMF ± .25 MMF NPO	.24
C-11	CD8X-102Z	Fixed Ceramic, 1000 MMF GMV	.24
C-12	31B-167	Trimmer Antenna 3-9 MMF	.66
C-13	CD8X-102Z	Fixed Ceramic, 1000 MMF GMV	.24
C-14	CD8D-121K	Fixed Ceramic, 120 MMF ± 10%	.28
C-15	CD10C-100K	Fixed Ceramic, 10 MMF ± 10% NPO	.22
		68 MMF Part of 40 MC Trap T-15	
		68 MMF Part of 40 MC Trap T-17	
C-17	CD8UA-050C	Fixed Ceramic, 5 MMF ± .25 MMF N900	.24
C-18	31B-167	Trimmer Antenna 3-9 MMF	.66
C-19	31B-252	Ceramic Bushing and Lead Assembly, Fine Tuning	.40
C-20A	31B-611	Feed Thru Condenser (Part of Center Shield Assembly) 800 MMF	.32
C-20B	31B-611	Feed Thru Condenser (Part of Center Shield Assembly) 800 MMF	.32
C-20C	31B-611	Feed Thru Condenser (Part of Center Shield Assembly) 800 MMF	.32
C-20D	31B-611	Feed Thru Condenser (Part of Center Shield Assembly) 800 MMF	.32

TUNER UNIT RESISTORS

Ref. No.	Part No.	Description	Price
R-1	27E153-2	Carbon, 15,000 Ohm 1/2 W. ± 10%	.08
R-2	27E1009-6	Carbon, 220,000 Ohm 1/2 W. ± 10%	.08
R-3	27E153-2	Carbon, 15,000 Ohm 1/2 W. ± 10%	.08
R-4	27E224-2	Carbon, 220,000 Ohm 1/2 W. ± 10%	.06
R-5	27E473-2	Carbon, 47,000 Ohm 1/2 W. ± 10%	.06
R-6	27E1009-24	Carbon, 330,000 Ohm 1/2 W. ± 10%	.14
R-7	27E103-2	Carbon, 10,000 Ohm 1/2 W. ± 10%	.10
R-8	27E471-2	Carbon, 470 Ohm 1/2 W. ± 10%	.08
R-9	27E223-3	Carbon, 22,000 Ohm 1 W. ± 10%	.10

CHOKES AND COILS

Ref. No.	Part No.	Description	Price
L-1	31B-638-1	R.F. Choke	.72
L-2	31B-230	Feed Back Choke	.30
L-3	31B-629	Cathode Choke	.24
L-4	34A-546	R.F. Filament Choke	.08
L-5	34A-575	Osc. Filament Choke	.08
L-15	34A-680	Mixer Choke	.72
T-1	31B-682	Mixer I.F.	.72
T-15	31B-649	40 MC Trap (Code White)	1.68
T-16	31B-289	40 MC Trap	
T-17	31B-601	40 MC Trap (Code Black)	1.68
	31M-012-2R	Antenna Coil Assembly Channel 2, Code R	1.20
	31M-012-3R	Antenna Coil Assembly Channel 3, Code R	1.20

CHOKES AND COILS—(Cont.)

Part No.	Description	Price
31M-012-4R	Antenna Coil Assembly Channel 4, Code R	1.20
31M-012-5R	Antenna Coil Assembly Channel 5, Code R	1.20
31M-012-6R	Antenna Coil Assembly Channel 6, Code R	1.20
31M-012-7R	Antenna Coil Assembly Channel 7, Code R	1.00
31M-012-8R	Antenna Coil Assembly Channel 8, Code R	1.00
31M-012-9R	Antenna Coil Assembly Channel 9, Code R	1.00
31M-012-10R	Antenna Coil Assembly Channel 10, Code R	1.00
31M-012-11R	Antenna Coil Assembly Channel 11, Code R	1.00
31M-012-12R	Antenna Coil Assembly Channel 12, Code R	1.00
31M-012-13R	Antenna Coil Assembly Channel 13, Code R	1.00
31M-112-2R	R.F. and Oscillator Coil Assembly, Channel 2, Code R	1.60
31M-112-3R	R.F. and Oscillator Coil Assembly, Channel 3, Code R	1.60
31M-112-4R	R.F. and Oscillator Coil Assembly, Channel 4, Code R	1.60
31M-112-5R	R.F. and Oscillator Coil Assembly, Channel 5, Code R	1.60
31M-112-6R	R.F. and Oscillator Coil Assembly, Channel 6, Code R	1.60
31M-112-7R	R.F. and Oscillator Coil Assembly, Channel 7, Code R	1.50
31M-112-8R	R.F. and Oscillator Coil Assembly, Channel 8, Code R	1.50
31M-112-9R	R.F. and Oscillator Coil Assembly, Channel 9, Code R	1.50
31M-112-10R	R.F. and Oscillator Coil Assembly, Channel 10, Code R	1.50
31M-112-11R	R.F. and Oscillator Coil Assembly, Channel 11, Code R	1.50
31M-112-12R	R.F. and Oscillator Coil Assembly, Channel 12, Code R	1.50
31M-112-13R	R.F. and Oscillator Coil Assembly, Channel 13, Code R	1.50

MISCELLANEOUS TUNER PARTS

Part No.	Description	Price
31B-613-113	Fine Tuning Assembly	
31B-203-113	Drum & Shaft Assembly, Less Coils	4.08
31B-016	Roller Detent	.16
31B-005	Spring Detent	.16
31B-124	Ground Plate, Fine Tuning	.20
31B-008	Ground Spring, Fine Tuning	.16
31B-021	Mounting Strap, Ceramic Bushing	.16
11D-022	Fiber Washer	.08
31B-030	Spring, Shaft Retaining	.16
31B-278	Stator Contact Bracket Assembly	3.00
16S-004	Shield for 6BQ7	.16
16S-006	Shield for 6J6	.16
31B-103	Shield (Bottom Cover)	1.20
31B-143	Shield (Side)	1.00

Kits containing the necessary strips to convert to any UHF channel are available. When ordering please be sure to: Give required UHF channel number, model number, and code letter "R."

MAIN CHASSIS

CAPACITORS

Ref. No.	Part No.	Description	Price
C-22	23E21	Fixed Ceramic, 2.2 MMF 500 V.	.76
C-23	25E66	Dry Electrolytic, 10 MFD 50 V.	1.02
C-24	23E3216	Molded Tubular, .1 MFD 200 V.	.30
C-25	23E23	Fixed Ceramic, 30 MMF 500 V.	.24
C-26	23E22	Fixed Ceramic, 20 MMF 500 V.	.24
C-27	23E2025	Fixed Ceramic, .005 MFD 500 V. (Disc)	.30
C-28	25E66	Dry Electrolytic, 10 MFD 50 V.	1.02
C-30	23E3410	Molded Tubular, .01 MFD 400 V.	.26
C-31	23E2025	Fixed Ceramic, .005 MFD 500 V. (Disc)	.30
C-32	23E2025-3	Fixed Ceramic, .001 MFD 500 V. (Disc)	.20
C-33	23E2027-14	Fixed Ceramic, 470 MMF 500 V.	.18
C-34	23E2025-3	Fixed Ceramic, .001 MFD 500 V. (Disc)	.20
C-35	23E2027-14	Fixed Ceramic, 470 MMF 500 V.	.18
C-36	23E2027-11	Fixed Ceramic, 680 MMF 500 V.	.26
C-37	23E2025-3	Fixed Ceramic, .001 MFD 500 V. (Disc)	.20
C-38	23E2027-11	Fixed Ceramic, 680 MMF 500 V.	.26
C-40	23E2027-14	Fixed Ceramic, 470 MMF 500 V.	.18
C-41	23E2025	Fixed Ceramic, .005 MFD 500 V. (Disc)	.30
C-42	23E2025-3	Fixed Ceramic, .001 MFD 500 V. (Disc)	.20
C-43	23E3500-40	Fixed Mica, 470 MMF 500 V. ± 10%	.30
C-44	23E2025	Fixed Ceramic, .005 MFD 500 V. (Disc)	.30
C-45	23E2025-3	Fixed Ceramic, .001 MFD 500 V. (Disc)	.20
C-46	23E2025-3	Fixed Ceramic, .001 MFD 500 V. (Disc)	.20
C-47	23E2025	Fixed Ceramic, .005 MFD 500 V. (Disc)	.30
C-48	23E2027-9	Fixed Ceramic, .001 MFD 500 V. (Tubular)	.20
C-49	23E3407	Molded Tubular, .0033 MFD 400 V.	.28
C-50	23E3416	Molded Tubular, .1 MFD 400 V.	.34
C-51	23E122	Fixed Paper, .25 MFD 100 V.	.40
C-52	23E2025	Fixed Ceramic, .005 MFD 500 V. (Disc)	.30
C-53	23E2027-10	Fixed Ceramic, 150 MMF 500 V.	.18
C-54	23E3408	Molded Tubular, .0047 MFD 400 V.	.24
C-55	23E3410	Molded Tubular, .01 MFD 400 V.	.26
C-56	23E3610	Molded Tubular, .01 MFD 600 V.	.30
C-57	23E2030-15	Fixed Ceramic, 47 MMF 500 V.	.24
C-58	23E3500-85	Fixed Mica, 680 MMF 500 V. ± 5%	.38
C-59	23E2025	Fixed Ceramic, .005 MFD 500 V.	.30
C-60	23E3608	Molded Tubular, .0047 MFD 600 V.	.26
C-61	23E3414	Molded Tubular, .047 MFD 400 V.	.36
C-62	23E3500-40	Fixed Mica, 470 MMF 500 V. ± 10%	.30
C-63	23E3500-39	Fixed Mica, 390 MMF 500 V. ± 10%	.26
C-64	23E23	Fixed Ceramic, 30 MMF 500 V.	.24
C-65	23E3416	Molded Tubular, .1 MFD 400 V.	.34
C-66	23E3500-40	Fixed Mica, 470 MMF 500 V. ± 10%	.30
C-67	23E3408	Molded Tubular, .0047 MFD 400 V.	.24
C-68	23E3407	Molded Tubular, .0033 MFD 400 V.	.28
C-69	23E3410	Molded Tubular, .01 MFD 400 V.	.26
C-70	23E2033-4	Silver Mica, 3900 MMF 500 V ± 5%	1.20
C-71	23E3410	Molded Tubular, .01 MFD 400 V.	.26
C-72	23E3616	Molded Tubular, .1 MFD 600 V.	.46
C-73	23E2025-5	Fixed Ceramic, 47 MFD 2000 V. (Disc)	.30
C-74	23E3500-40	Fixed Mica, 470 MMF 500 V. ± 10%	.30
C-75	23E3404	Molded Tubular, .001 MFD 400 V.	.24
C-76	23E3414	Molded Tubular, .047 MFD 400 V.	.36
C-77	23E3408	Molded Tubular, .0047 MFD. 400 V.	.24
C-78	23E3414	Molded Tubular, .047 MFD 400 V.	.36
C-79	23E3424	Molded Tubular, .01 MFD 400 V. ± 10%	.30
C-80	23E2025	Fixed Ceramic, .005 MFD 500 V. (Disc)	.30
C-81	25E64	Dry Electrolytic, 20 MFD 450 V.	1.64
C-82	25E63	Dry Electrolytic, 30 MFD 200 V., 10 MFD 350 V.	1.84
C-83	25E62	Dry Electrolytic, 5-60 MFD 250 V.	1.94
C-84	25E65	Dry Electrolytic, 100 MFD 200 V. 40-40 MFD 350 V.	4.20
C-85	23E3608	Molded Tubular, .0047 MFD 600 V.	.26
C-87	23E2025-3	Fixed Ceramic, .001 MFD 500 V. (Disc)	.20
C-92	23E3610	Molded Tubular, .01 MFD 600 V.	.30
C-93		Fixed Ceramic, 15 MMF 500 V. Part of 2nd IF Transformer	
C-94		Fixed Ceramic, 15 MMF 500 V. Part of 3rd IF Transformer	
C-95	23E2025	Fixed Ceramic, .005 MFD 500 V. (Disc)	.30
C-96	23E3216	Molded Tubular, .1 MFD 200 V.	.30
C-97	23E20	Fixed Ceramic, 3 MMF 500 V.	.24

RESISTORS

Ref. No.	Part No.	Description	Price
R-11	27E1009-35	Carbon, 10,000 OHM ½ W. ± 5%	.16
R-13	27E1009-8	Carbon, 5,600 OHM ½ W. ± 5%	.10
R-14	27E1009-35	Carbon, 10,000 OHM ½ W. ± 5%	.16
R-15	27E223-2	Carbon, 22,000 OHM ½ W. ± 10%	.10
R-16	27E470-2	Carbon, 47 OHM ½ W. ± 10%	.06
R-17	27E183-2	Carbon, 18,000 OHM ½ W. ± 10%	.08
R-18	27E560-2	Carbon, 56 OHM ½ W. ± 10%	.08
R-19	27E183-2	Carbon, 18,000 OHM ½ W. ± 10%	.08
R-20	27E122-2	Carbon, 1,200 OHM ½ W. ± 10%	.06
R-21	27E333-3	Carbon, 33,000 OHM 1 W. ± 10%	.10
R-22	27E102-2	Carbon, 1,000 OHM ½ W. ± 10%	.06
R-23	27E102-2	Carbon, 1,000 OHM ½ W. ± 10%	.06
R-25	27E121-2	Carbon, 120 OHM ½ W. ± 10%	.08
R-27	27E151-2	Carbon, 150 OHM ½ W. ± 10%	.06
R-28	28E99	Contrast Control, 1500 OHM (Dual See R-31)	2.60
R-29	27E471-2	Carbon, 470 OHM ½ W. ± 10%	.08
R-30	27E333-2	Carbon, 33,000 OHM ½ W. ± 10%	.06
R-31	28E99	Off-On-Volume Control, 1 Megohm (Dual See R-28)	2.60
R-33	27E1022	Wirewound, 4,000 OHM 5 W.	1.14
R-34	27E683-2	Carbon, 68,000 OHM ½ W. ± 10%	.08
R-35	27E102-2	Carbon, 1,000 OHM ½ W. ± 10%	.06
R-37	27E155-2	Carbon, 1.5 Megohm ½ W. ± 20%	.08
R-38	27E1009-8	Carbon, 5,600 OHM ½ W. ± 5%	.10
R-39	27E474-2	Carbon, 470,000 OHM ½ W. ± 20%	.06
R-40	27E183-5	Carbon, 18,000 OHM 2 W. ± 10%	.22
R-41	27E103-2	Carbon, 10,000 OHM ½ W. ± 10%	.08
R-42	27E182-2	Carbon, 1,800 OHM ½ W. ± 10%	.08
R-44	27E102-2	Carbon, 1,000 OHM ½ W. ± 10%	.06
R-45	27E102-2	Carbon, 1,000 OHM ½ W. ± 10%	.06
R-46	27E103-2	Carbon, 10,000 OHM ½ W. ± 10%	.08
R-47	27E103-3	Carbon, 10,000 OHM 1 W. ± 10%	.10
R-48	27E1009-10	Carbon, 100,000 OHM ½ W. ± 10%	.08
R-49	27E684-2	Carbon, 680,000 OHM ½ W. ± 20%	.08
R-50	28E87	Brightness Control, 5 Megohm	.82
R-51	27E474-2	Carbon, 470,000 OHM ½ W. ± 20%	.06
R-52	27E682-2	Carbon, 6,800 OHM ½ W. ± 10%	.06
R-53	27E223-2	Carbon, 22,000 OHM ½ W. ± 10%	.10
R-54	27E333-2	Carbon, 33,000 OHM ½ W. ± 10%	.06
R-55	27E1016-13	Wirewound, 15,000 OHM 5 W.	.75
R-56	27E225-2	Carbon, 2.2 Megohm ½ W. ± 20%	.06
R-57	27E223-2	Carbon, 22,000 OHM ½ W. ± 10%	.10
R-58	27E332-2	Carbon, 3,300 OHM ½ W. ± 10%	.08
R-59	27E823-2	Carbon, 82,000 OHM ½ W. ± 10%	.08
R-60	27E682-3	Carbon, 6,800 OHM 1 W. ± 10%	.06
R-61	27E1009-46	Carbon, 150,000 OHM ½ W. ± 10%	.08
R-62	27E1009-8	Carbon, 5,600 OHM ½ W. ± 5%	.10
R-63	27E823-2	Carbon, 82,000 OHM ½ W. ± 10%	.08
R-64	27E1009-22	Carbon, 8,200 OHM ½ W. ± 5%	.14
R-65	27E475-2	Carbon, 4.7 Megohm ½ W. ± 20%	.06
R-66	23E1015-2	Wirewound, 2.2 OHM ½ W. ± 5%	.18
R-67	27E224-2	Carbon, 220,000 OHM ½ W. ± 20%	.06

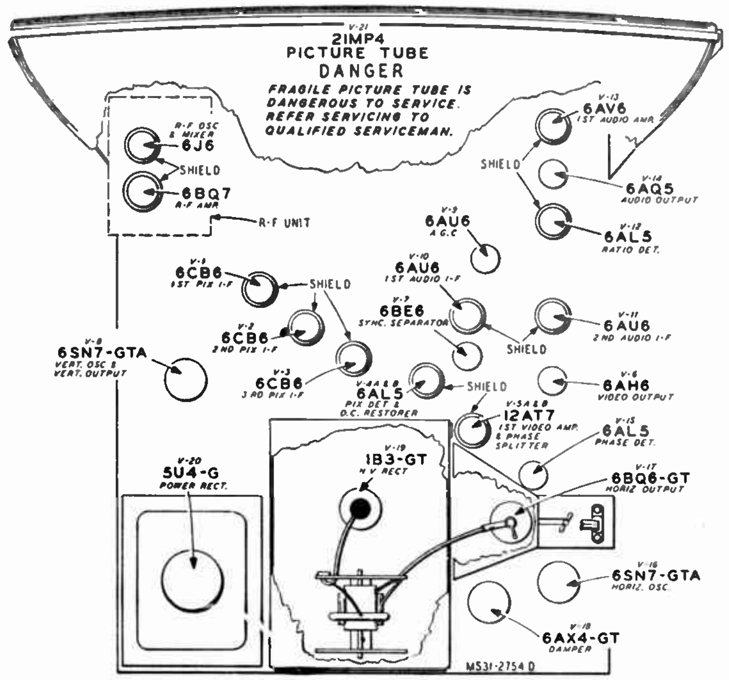

Fig. 1—Tube Layout.

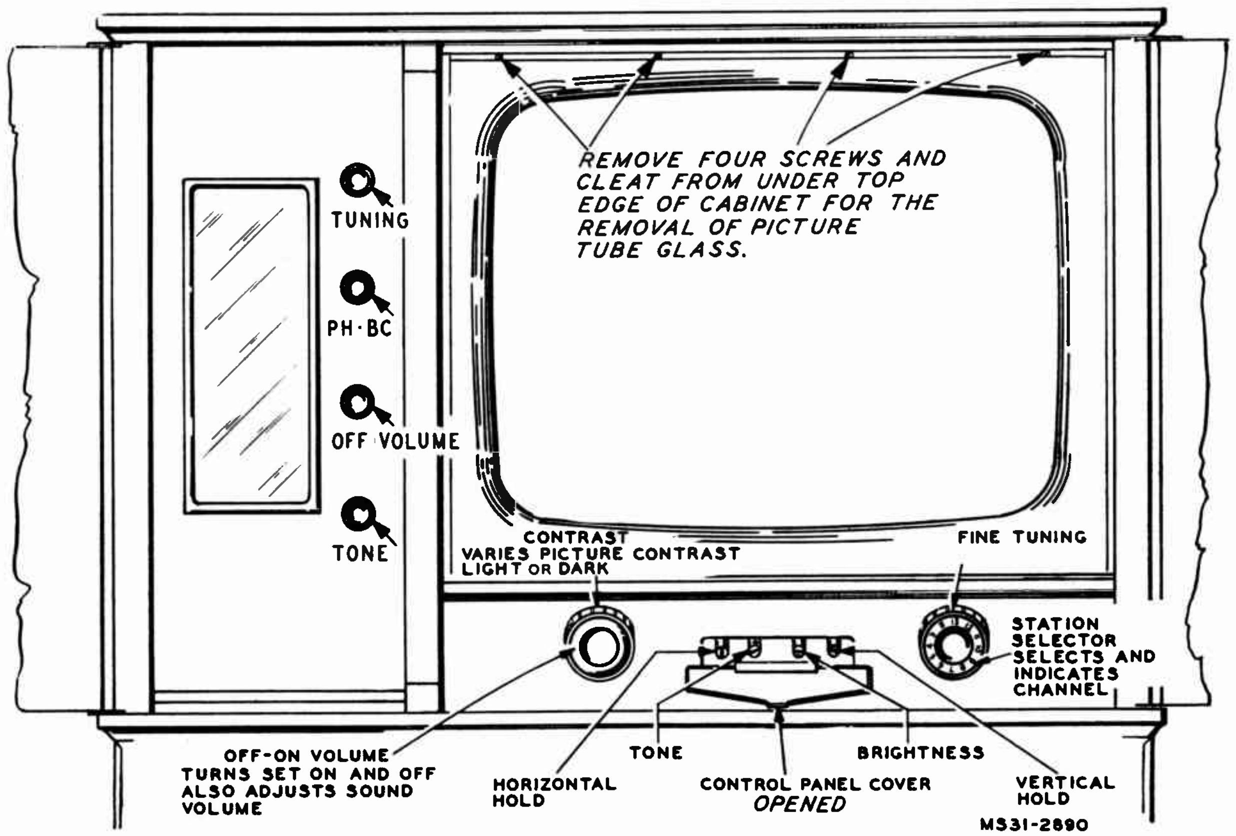

Fig. 2—Front Panel Controls

OCCASIONAL ADJUSTMENTS TO IMPROVE PICTURE RECEPTION

There are four controls at the front of the chassis which are accessible when the hinged control panel is pulled downward. See illustration Figure 2. These controls are pre-set at the factory and may occasionally need adjustment due to aging of the components in the receiver and the fluctuating line voltages in different areas.

If any adjustments are necessary follow the instructions under "Controls and Functions."

IMPORTANT — Be sure that the FINE TUNING control has been set for the clearest picture before adjusting any controls.

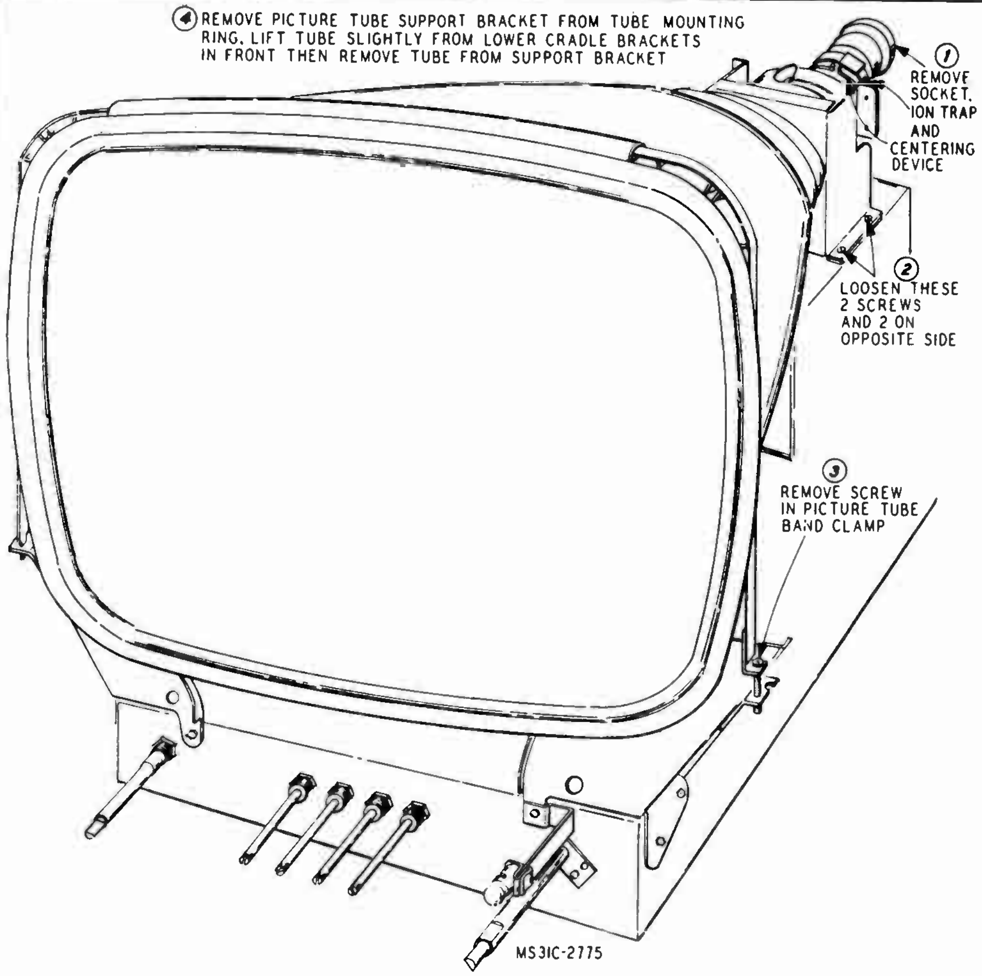

Fig. 3—Removal of Picture Tube

WARNING — Before handling the picture tube, it will be necessary to remove the static charge. In receivers with glass picture tubes, ground the anode lead to chassis, and insert an insulated wire from the well in the tube to chassis. In receivers with metal picture tubes, remove the static charge by grounding an insulated wire from the chassis to the metal portion of the tube.

PICTURE TUBE REPLACEMENT — To replace the picture tube it is necessary to remove the chassis from the cabinet. This may be accomplished in the following manner:

1. Remove the front panel control knobs by pulling them straight from their shafts.
2. Remove the cabinet back.
3. Disconnect the leads from the speaker, the radio chassis, remove the antenna terminal board at the rear of the cabinet and then the five chassis mounting bolts. Pull chassis CAREFULLY out of the cabinet.
4. Remove the picture tube as shown and outlined in the illustration. To install a new picture tube, reverse the procedure making sure that the picture tube fits close against the picture tube cushion. If the picture tube sticks or fails to slip into place smoothly, investigate and remove the source of the trouble. Never force the tube. It is important that all the clips and shims used in mounting the tube be replaced, otherwise difficulty may be encountered when horizontal or vertical centering is required.

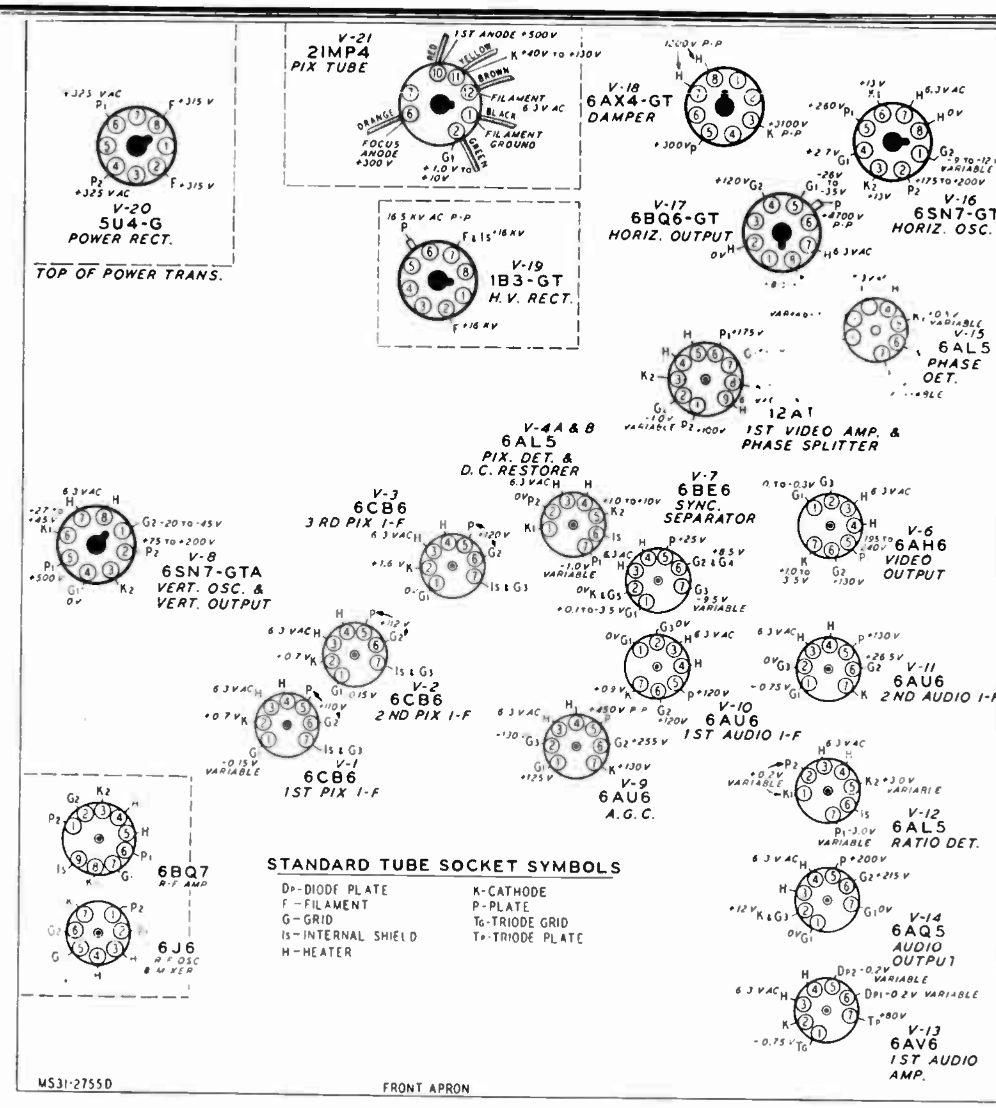

Fig. 6—Bottom Socket Voltages

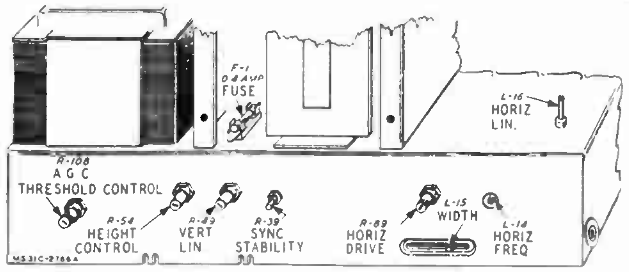

Fig. 4—Adjustments Rear of Chassis

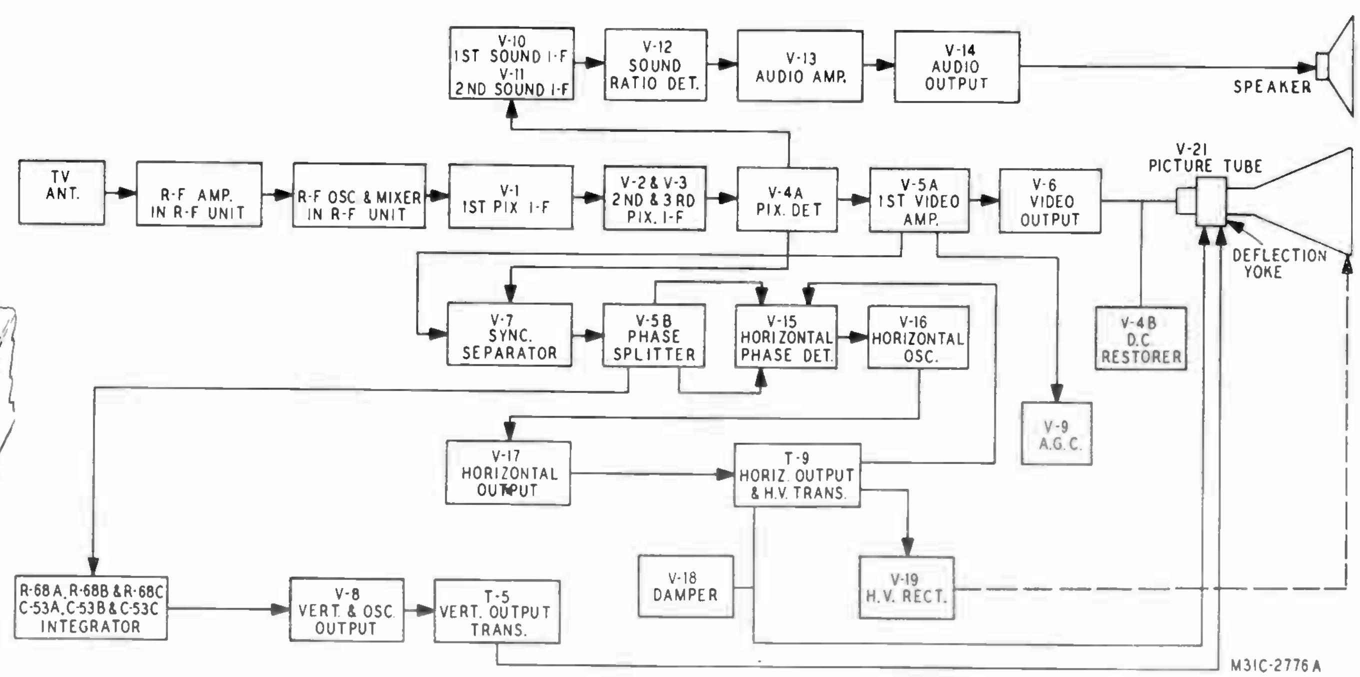

Fig. 7—Block Diagram

SERVICE SUGGESTIONS

NO RASTER ON PICTURE TUBE — If raster cannot be obtained check below for the possible causes.

1: Ion trap magnet adjustment is incorrect.
2: No +B voltage. Check 4/10 ampere fuse. Replace if defective. If fuse continually burns out, check
   (A) Horizontal output tube V-17 (6BQ6-GT)
   (B) Check damper tube V-18 (6AX4-GT).
   (C) Check horizontal oscillator tube V-16 (6SN7-GTA) for proper operation.
   (D) With an ohm meter, check for a short between terminal 1 of the horizontal output transformer (T-9) and the chassis.
   (E) Check DC resistance of T-9.
3: No high voltage. Check V-17, V-18 and V-19 tubes and circuits. If the horizontal deflection circuits are operating as evidenced by the correct voltage (600V) measured on terminal No. 1 of T-9, the trouble can be isolated to the high voltage rectifier circuit. Either the high voltage winding to the 6BQ6-GT plate and 1B3 plate is open, tube V-19 is defective, its filament circuit is open, R-105 and C-75 defective or pix tube elements shorted internally.
4: Defective picture tube heater open or cathode return circuit open.

HORIZONTAL DEFLECTION ONLY — If only horizontal deflection is obtained as evidenced by a straight line across the face of the picture tube, it can be caused by the following:

1: Vertical oscillator and vertical output tube V-8 inoperative. Check socket voltages.
2: Vertical oscillator transformer (T-4) defective.
3: Vertical output transformer (T-5) open or shorted.
4: Yoke vertical coils open or shorted.
5: Vertical hold, height or linearity controls may be defective.

POOR VERTICAL LINEARITY — If adjustment of the height and linearity controls will not correct this condition, any of the following may be the cause.

1: Check variable resistors R-49 and R-54.
2: Vertical output transformer (T-5) defective.
3: Capacitors C-47B, C-70 or C-71 defective.
4: V-8 defective, check voltages.
5: Excess leakage or incorrect value of capacitor C-68, or open or incorrect value of resistors R-90 & R-92.
6: Low plate voltages. Check rectifier tube and capacitors in +B supply circuits.
7: Capacitor C-67 defective.
8: Vertical deflection coils (L-12) defective.

POOR HORIZONTAL LINEARITY — If adjustment of the Horizontal drive and linearity controls does not correct this condition, check the following:

1: Check or replace horizontal output tube V-17.
2: Check or replace damper tube V-18 (6AX4-GT).
3: Check capacitors C-77, C-78, C-79 and horizontal linearity control (L-16) for defects.
4: Horizontal deflection coils (L-17) defective.

TRAPEZOIDAL OR NONSYMMETRICAL RASTER

1: Defective yoke.

WRINKLES ON LEFT SIDE OF RASTER — This condition can be caused by:

1: Defective yoke due to C-76 or R-106 (internal in yoke assembly) being wrong value or open. These components are mounted in rear of yoke assembly.
2: V-18 (6AX4-GT) defective.

SMALL RASTER — This condition can be caused by:

1: Low +B or line voltage. Check V-20 (5U4G).
2: Insufficient output from horizontal output tube V-17. Replace tube.
3: Insufficient output from vertical oscillator and vertical output tube V-8. Replace tube.
4: Incorrect setting of horizontal drive control R-89.
5: V-18 (6AX4-GT) defective.
6: Incorrect setting of (L-15) width control.

RASTER; NO IMAGE, BUT ACCOMPANYING SOUND — This condition can be caused by:

1: No signal on picture tube grid. Check V-5A (12AT7) and V-6 (6AH6) tubes and associated circuits.
2: Bad contact to picture tube grid (lead to socket broken).
3: AGC tube (V-9) may be defective. Check tube and its associated circuit.

SIGNAL APPEARS ON PICTURE TUBE GRID BUT IMPOSSIBLE TO SYNCHRONIZE THE PICTURE VERTICALLY AND HORIZONTALLY — A condition of this nature can be caused by:

1: Defective sync separator V-7 or phase splitter V-5B.
2: If tubes are O.K. check voltages, and associated circuits.
3: AGC system inoperative. Check V-9 (6AU6) AGC tube and associated circuits.

SIGNAL ON PICTURE TUBE GRID AND HORIZONTAL SYNC ONLY — If this condition is encountered, check:

1: Vertical integrating network capacitors C-53A, B & C, and resistors R-68A, B & C.
2: Vertical hold control (R-51) defective.

SIGNAL ON PICTURE TUBE GRID AND VERTICAL SYNC ONLY

1: V-15 or V-16 defective.
2: Improper setting of (L-14) horizontal frequency control.
3: Check setting of horizontal drive control and horizontal linearity control.
4: Check V-15 and V-16 socket voltages.

PICTURE STABLE BUT WITH POOR RESOLUTION — If the picture resolution is not up to standard, it may be caused by any of the following:

1: Defective pix I-F tubes V-1, 2 & 3, (6CB6's).
2: Defective picture detector V-4A, (6AL5) or video amplifier V-5A or video output V-6 (6AH6).
3: Defective picture tube.
4: Open video peaking coil. Check all peaking coils L-5, L-6, L-8, L-9, L-10 and L-11 for continuity. Note that L-5, L-9 and L-10 have shunting resistors.
5: Leakage in V-6 (6AH6) grid capacitor C-36. If the capacitor is not found to be defective, check the following:
   1: Check all potentials in video circuits.
   2: Check picture tube grid circuit for poor or dirty contact.
   3: Check and realign, if necessary, the picture I-F and R-F circuits.

SERVICE SUGGESTIONS—(continued)

PICTURE SMEAR:

1: A smear can be attributed to phase shift at the low or high frequency end of the video characteristic. This can be caused by improper values of resistors and capacitors in the video circuits. Check for grid current on video output tube V-6 (6AH6), open or shorted peaking coils, video amplifier load resistors are of improper value (high).
2: This trouble can also originate at the transmitter. Check reception from another station.
3: Check and realign, if necessary, the picture I-F and R-F circuits.

MAN MADE NOISE IN SOUND (Ignition, etc)

1: Check sound I-F tubes V-10, 11 & 12 and associated circuits.
2: Check sound I-F alignment.

BENDING OR S-ING

1: Check sync stability control adjustment.
2: Check capacitors C-47A and C-49A.
3: V-17 (6BQ6-GT) defective or V-16 (6SN7-GTA) defective.
4: Check sync separator tube V-7 (6BE6) and phase splitter V-5B (12AT7) and V-5A (12AT7) video amplifier.
5: Check AGC threshold control.

PICTURE NORMAL—NO SOUND OR WEAK OR DISTORTED SOUND

1: Check sound I-F alignment.
2: Check V-10 (6AU6) V-11 (6AU6) V-12 (6AL5) V-13 (6AV6) V-14 (6AQ5) and associated circuits.

RASTER ON TUBE BUT NO PICTURE OR SOUND

This condition can be caused by,

1: Defective pix I-F Amplifier tubes V-1, V-2 or V-3
2: Defective pix detector tube V-4A (6AL5). Check tube and its associated circuit.
3: Defective R-F Amplifier or oscillator mixer tubes in the tuner.

POOR FOCUS

1: Improper setting of Ion Trap magnet.
2: Defective picture tube or picture tube socket.

PICTURE JITTER:

1: If regular sections at left of the picture are displaced, replace the horizontal oscillator tube V-16.
2: Vertical instability may be due to loose connections or noise received with the signal.
3: Horizontal instability may be due to unstable transmitted sync.
4: Check receiver AGC system for proper operation.
5: Check phase splitter V-5B, (12AT7) and sync separator V-7 (6BE6).
6: Check for improper setting of sync stability control.
7: Picture tube grid lead not held in position by support spring, ie: close proximity of grid lead to sync and horizontal tubes will cause picture to jitter at high contrast setting.
8: Check AGC threshold control.

ALIGNMENT PROCEDURE

TEST EQUIPMENT — To service this receiver properly, it is recommended that the following test equipment be available:

R-F SWEEP GENERATOR meeting the following requirements:

(a) Frequency ranges:
   18 to 30 mc, 10 mc sweep width
   40 to 90 mc, 10 mc sweep width
   170 to 225 mc, 10 mc sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) Flat output in all attenuator positions.

CATHODE-RAY OSCILLOSCOPE preferably one with a wide band vertical deflection and an input calibrating source.

SIGNAL GENERATOR to provide the following frequencies: (Output on these ranges should be adjustable and at least .1 volt maximum.)

(a) Intermediate alignment frequencies.
   23.1 mc first picture I-F coil.
   24.1 mc third picture I-F coil.
   25.9 mc second picture I-F coil.
   21.7 mc sound trap.
   4.5 mc video trap & sound I-F.
   25.2 mc converter plate coil (Tuner).

HETERODYNE FREQUENCY METER with crystal calibrator if the signal generator is not crystal controlled.

ELECTRONIC VOLTMETER and a high voltage probe for use with this meter to permit measurements up to 20 kilovolts.

SERVICE PRECAUTIONS — To service the receiver remove the chassis from the cabinet. To do so, remove the knobs, the cabinet back, disconnect the leads from the speaker, the radio chassis, remove the antenna terminal board at rear of cabinet, and then the 5 chassis mounting bolts. The chassis may be serviced with the picture tube in place provided the chassis is turned on its side with the power transformer on the bottom. The weight of the chassis will be supported against the power transformer and pix tube brackets.

CAUTION: Do not permit the kinescope second-anode lead to become shorted to the chassis. To do so will cause a considerable overload on the high voltage filter resistor R-105.

ALIGNMENT PROCEDURE
PIX I-F

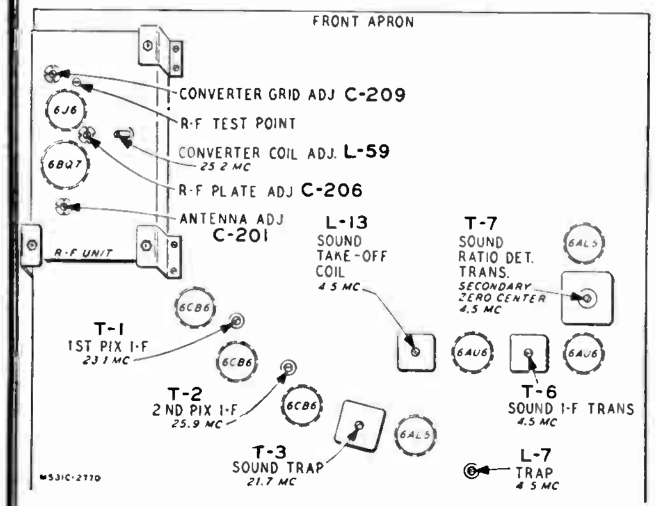

Fig. 8—Top Chassis Video and Audio I-F Adjustments

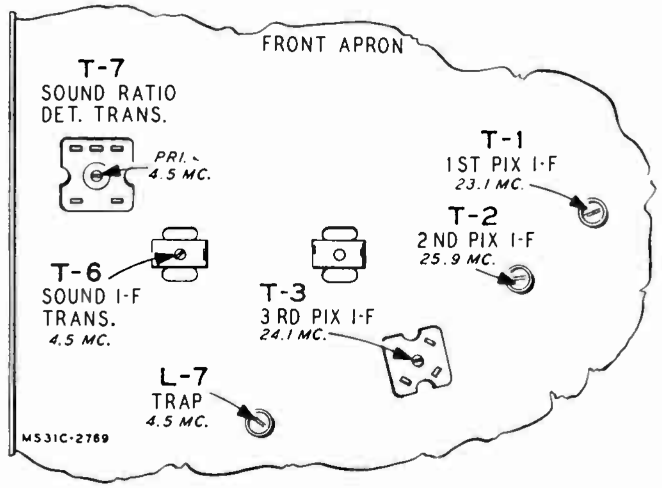

Fig. 9—Bottom Chassis Video and Audio I-F Adjustments.

A. Unmodulated R-F signal into Converter Grid by means of tube shield insulated from base. VTVM with filter in lead of 22 K ohms and 5000 mmf connected to pic. det. load resistor, (R-37) 4700 ohms, in series with peaking coil (L-6) from Pin 7 of 6AL5. Input signal level should be such that output is less than 2 volts DC. Apply -4.5V battery bias on AGC line.

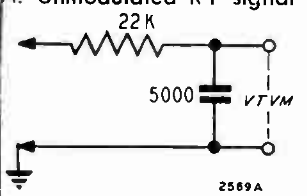

Fig 10—VTVM Connections

	FREQUENCY	ADJUST
1.	25.2 MC	Converter plate coil on top of tuner for maximum dc at picture detector.
2.	23.1 MC	1st picture I-F coil (T-1) for maximum dc at picture detector.
3.	25.9 MC	2nd picture I-F coil (T-2) for maximum dc at picture detector.
4.	24.1 MC	3rd picture I-F coil (T-3 below chassis) for maximum dc at picture detector.
5.	21.7 MC	3rd picture I-F trap (T-3 in can above chassis) for minimum dc at picture detector.

B. I-F Sweep Generator into converter grid by means of tube shield insulated from base.

Connect oscilloscope across R-37 (in place of VTVM). Apply -4.5V bias (DC) to AGC line (battery).

Tuner should be switched to dead channel so as not to cause interference.

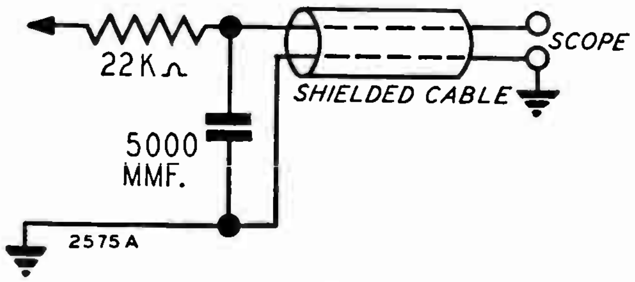

Fig. 11—Oscilloscope Connections

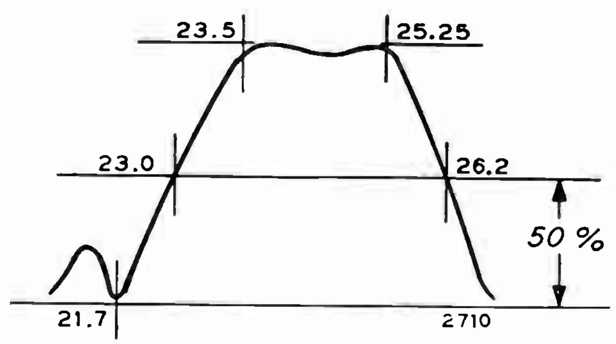

Fig. 12—Overall Response Curve

Observe overall I-F response, which should be as shown above: A slight touch-up may be required. At no time should the trap coil be re-adjusted, nor should it be necessary to turn any of the picture I-F coils more than 1/2 turn of the slug. The following comments are suggestions only:

ALIGNMENT PROCEDURE (Continued)

1. The height of the 26.2 MC marker is controlled by the 25.2 MC (Converter Plate Coil on tuner) and the 25.9 MC (2nd P.I.F.) coils.
2. The uniformity of response (flatness across top and position of 23.5 MC) marker is controlled by the most part by the 24.1 MC third picture I-F coil.
3. The 23.0 MC marker position is controlled by the first picture I-F (23.1 MC coil). However, it is NOT advisable to change the setting of the coil, due to its effect on sound rejection. Its adjustment should be avoided unless believed to be absolutely necessary.

VIDEO

With 4.5 MC unmodulated signal from a high impedance source, (10,000 ohms in series with the generator) into plate of the picture detector tube (Pin 7-6AL5) and VTVM on picture tube grid, tune 4.5 MC trap (L-7 Top) for minimum response. VTVM on 0-10 V AC scale. This adjustment can also be made while observing a picture from a station. Tune trap for least 4.5 MC beat in picture.

AUDIO I-F

1: With signal generator set to 4.5 MC and dc VTVM connected to junction of R-13 and C-14, adjust sound take-off coil (L-13 Top) and sound I-F transformer slugs (T-6 Top & Bottom) for maximum.

2: With VTVM connected to pin 7 of V-12 (6AL5) adjust the ratio detector primary (T-7 Bottom) for maximum.

3: With VTVM connected to junction of R-17, R-20 and C-18, adjust ratio detector secondary (T-7 Top) for cross over (zero voltage) on lowest scale.

NOTE — If no signal generator is available, the procedure above may be followed by tuning in a station and using the 4.5 MC beat between picture and sound carrier.

TUNER ALIGNMENT

A. Sweep generator with balanced 300 ohm output to antenna terminals. Marker generator output to antenna terminals. Oscilloscope to "test point" (Figure 13) on tuner. Connect 1½ V bias to AGC line at junction of R-34 and C-29 on the receiver.

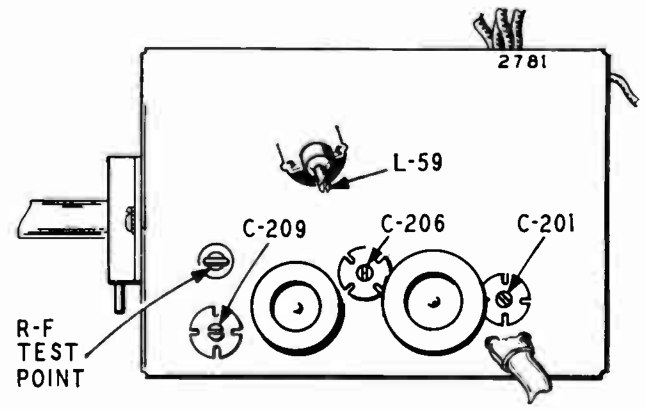

Fig. 13—Top Tuner Adjustments

B. RF AND CONVERTER ADJUSTMENT.

1. With channel selector on Channel 12, adjust C-201 slightly favoring the Pix carrier, then adjust C-206 and C-209 for response as in Figure 14. Picture and sound markers at 90% maximum response.

2. Check response on all channels. If markers are below 70% on any channels, readjust C-201, C-206, and C-209. Recheck all channels.

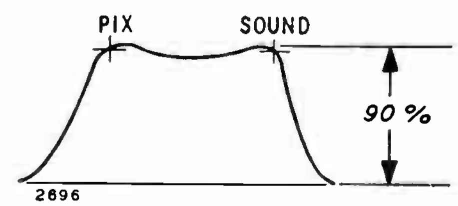

Fig. 14—Pix & Audio Markers

C. OSCILLATOR ADJUSTMENT.

1. Apply -4.5 volts on I-F AGC line at junction of R-1 and C-30A.
2. Connect oscilloscope to output of video detector. Place fine tuning in center of range. Check response on all channels. Sound marker should be in notch and picture marker at 50%. (See Figure 12).
3. If markers are off, individual oscillator coil slugs will require adjustment. Adjust each channel slug, accessible through hole in front of chassis with a non-metallic screwdriver to bring sound marker to correct position.

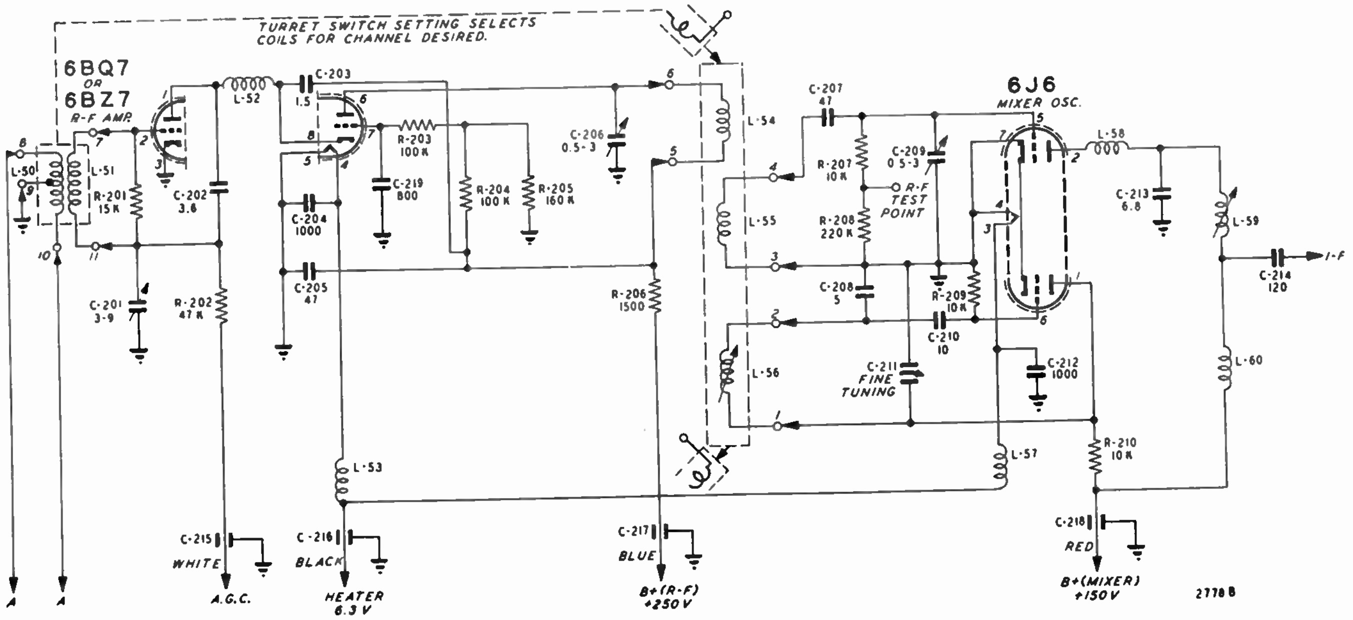

Fig. 16—"Q" Tuner Schematic Diagram.

ALIGNMENT PROCEDURE
RADIO

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

Volume Control Maximum all Adjustments.
Connect Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid I-F 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. (1) and Sec. (2)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. (4) and Sec. (3)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. (1) and Sec. (2)	Maximum Output
1620 KC	Control Grid R-F 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-8	Maximum Output
1400 KC	Control Grid R-F 6BA6 Pin No. 1	.1 mf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Interstage C-6 See Note B	Maximum Output
1400 KC	External Antenna Terminal	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-2 See Note B	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.
NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

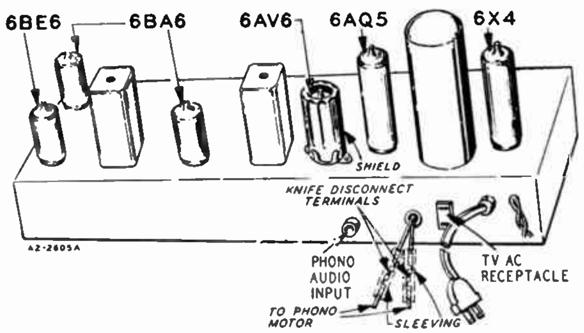
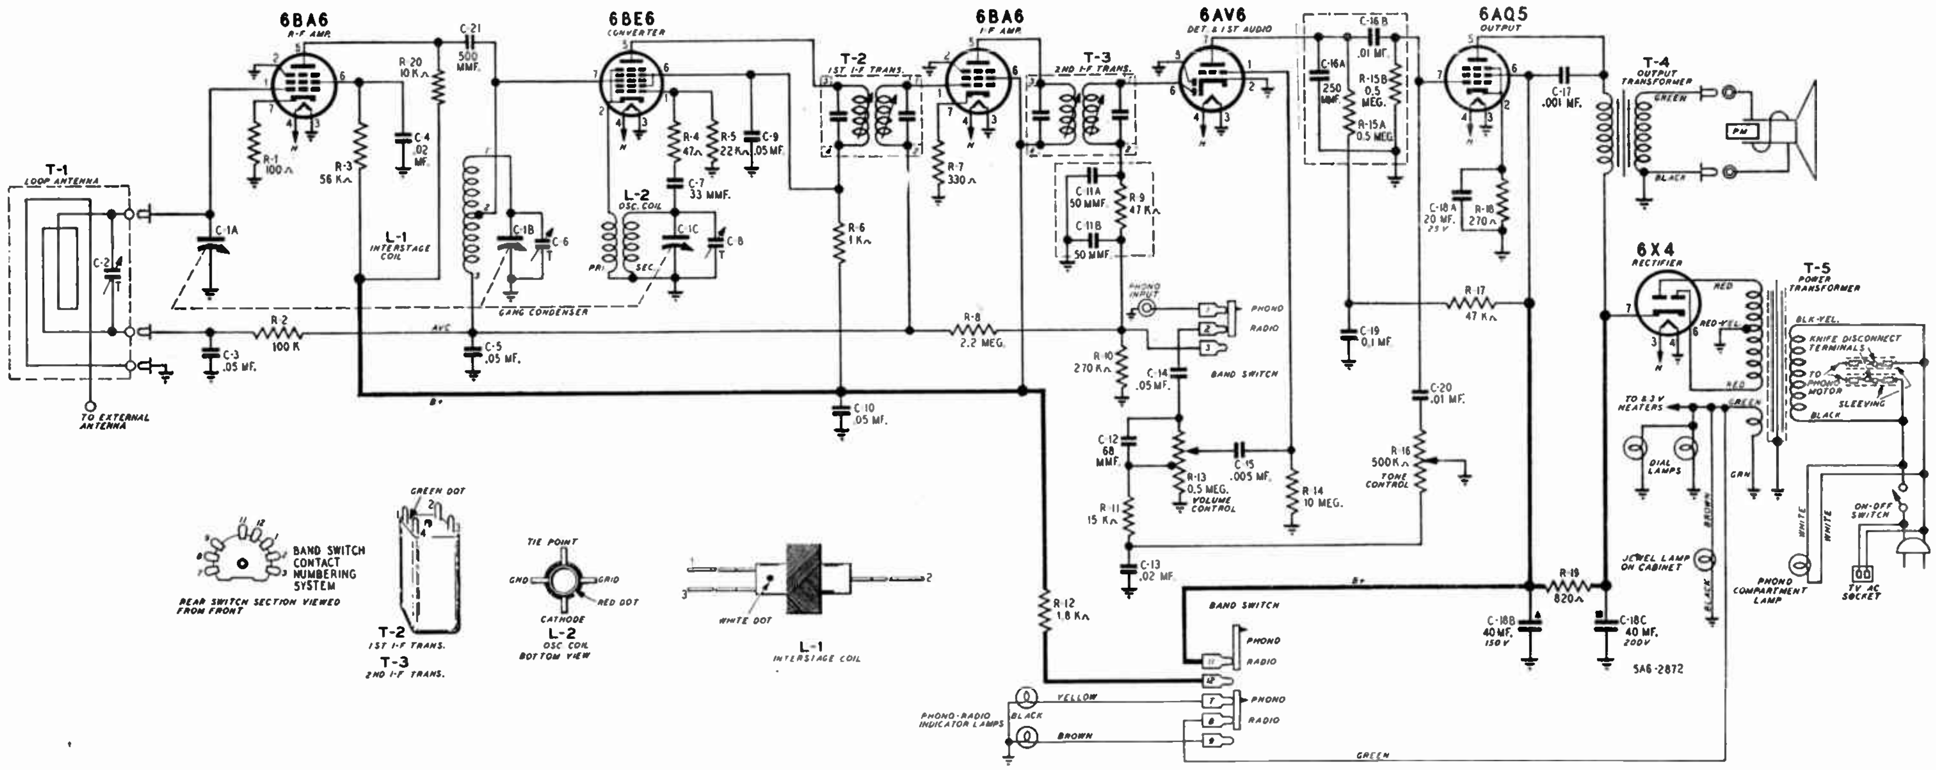
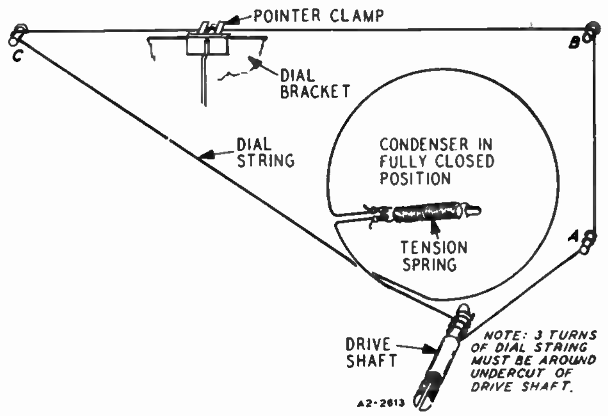
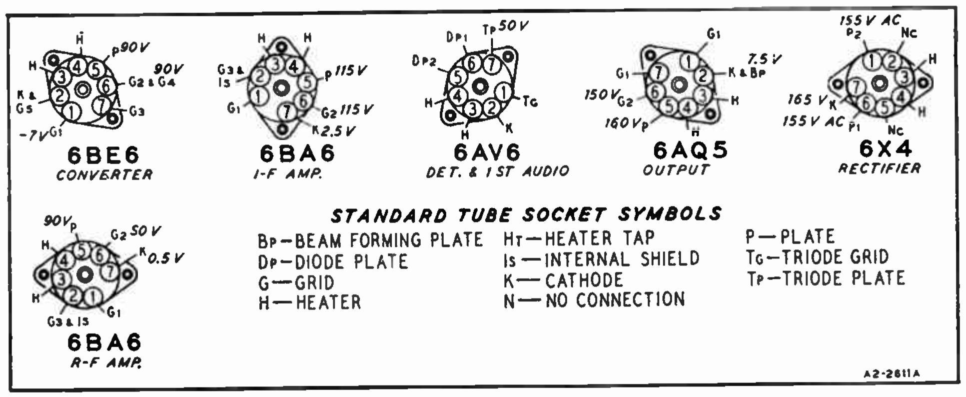
DRIVE CORD REPLACEMENT
DIAL POINTER CORD

Use a new S-10X77 drive cord assembly or a new length of cord 48 inches long for the installation. Install the cord as shown in the illustration, winding three turns counterclockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.





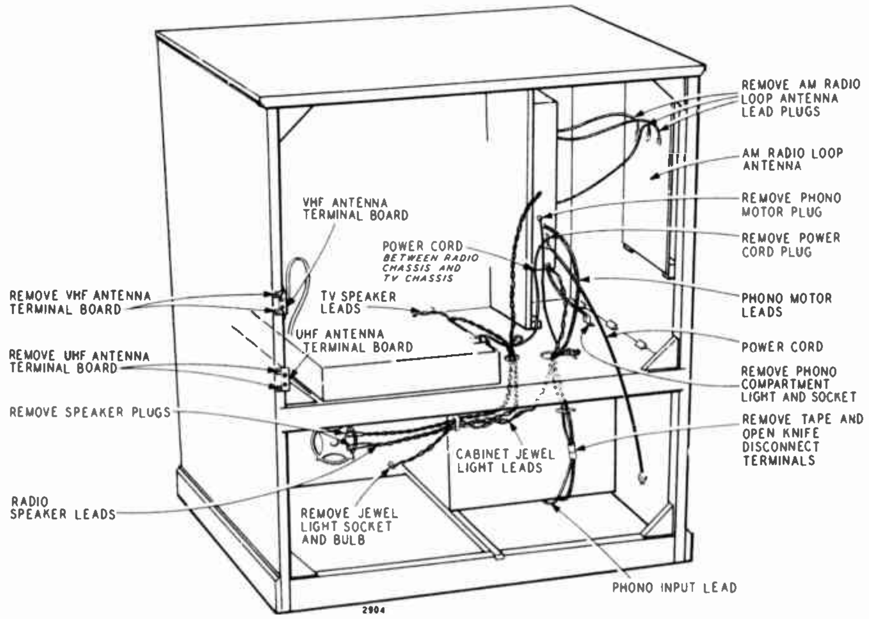




TUBE SOCKET VOLTAGES

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage ....117 Volts AC
Signal Input ....None
A Variation of ±10% is usually permissible.



NOTE—UHF Antenna Terminal board used only on UHF-VHF combinations.

TUNING PROCEDURE

1. To turn the television receiver on, turn the OFF-ON VOLUME control clockwise until a click is heard. Allow approximately 30 seconds for the tubes to warm up.
2. Turn the STATION SELECTOR control to the desired channel. This control may be turned in either direction.
3. Turn the CONTRAST control clockwise until activity or definite form is noted on the screen.
4. Adjust the FINE TUNING control for clearest picture and the VOLUME control for desired volume.
5. To turn off the receiver, turn only the OFF-ON VOLUME control counterclockwise until a click is heard.
6. TONE CONTROL — When this Control is turned clockwise, the high notes will predominate and when turned counterclockwise, a deep bass effect will result.

OSCILLOSCOPE WAVEFORM PATTERNS

The waveforms on this page were taken with the receiver tuned to a normal picture. The numbers on the waveforms correspond to the numbers on the schematic diagram which identifies each test point.
The voltages shown on each waveform are the approximate peak to peak amplitudes. The frequencies shown indicates the repetition rate of the waveform, not the sweep rate of the oscilloscope. If the waveforms are observed on the oscilloscope with a poor high frequency response, the corners of the pulses will tend to be more rounded than those shown below and the amplitudes of any high frequency pulse will tend to be less.

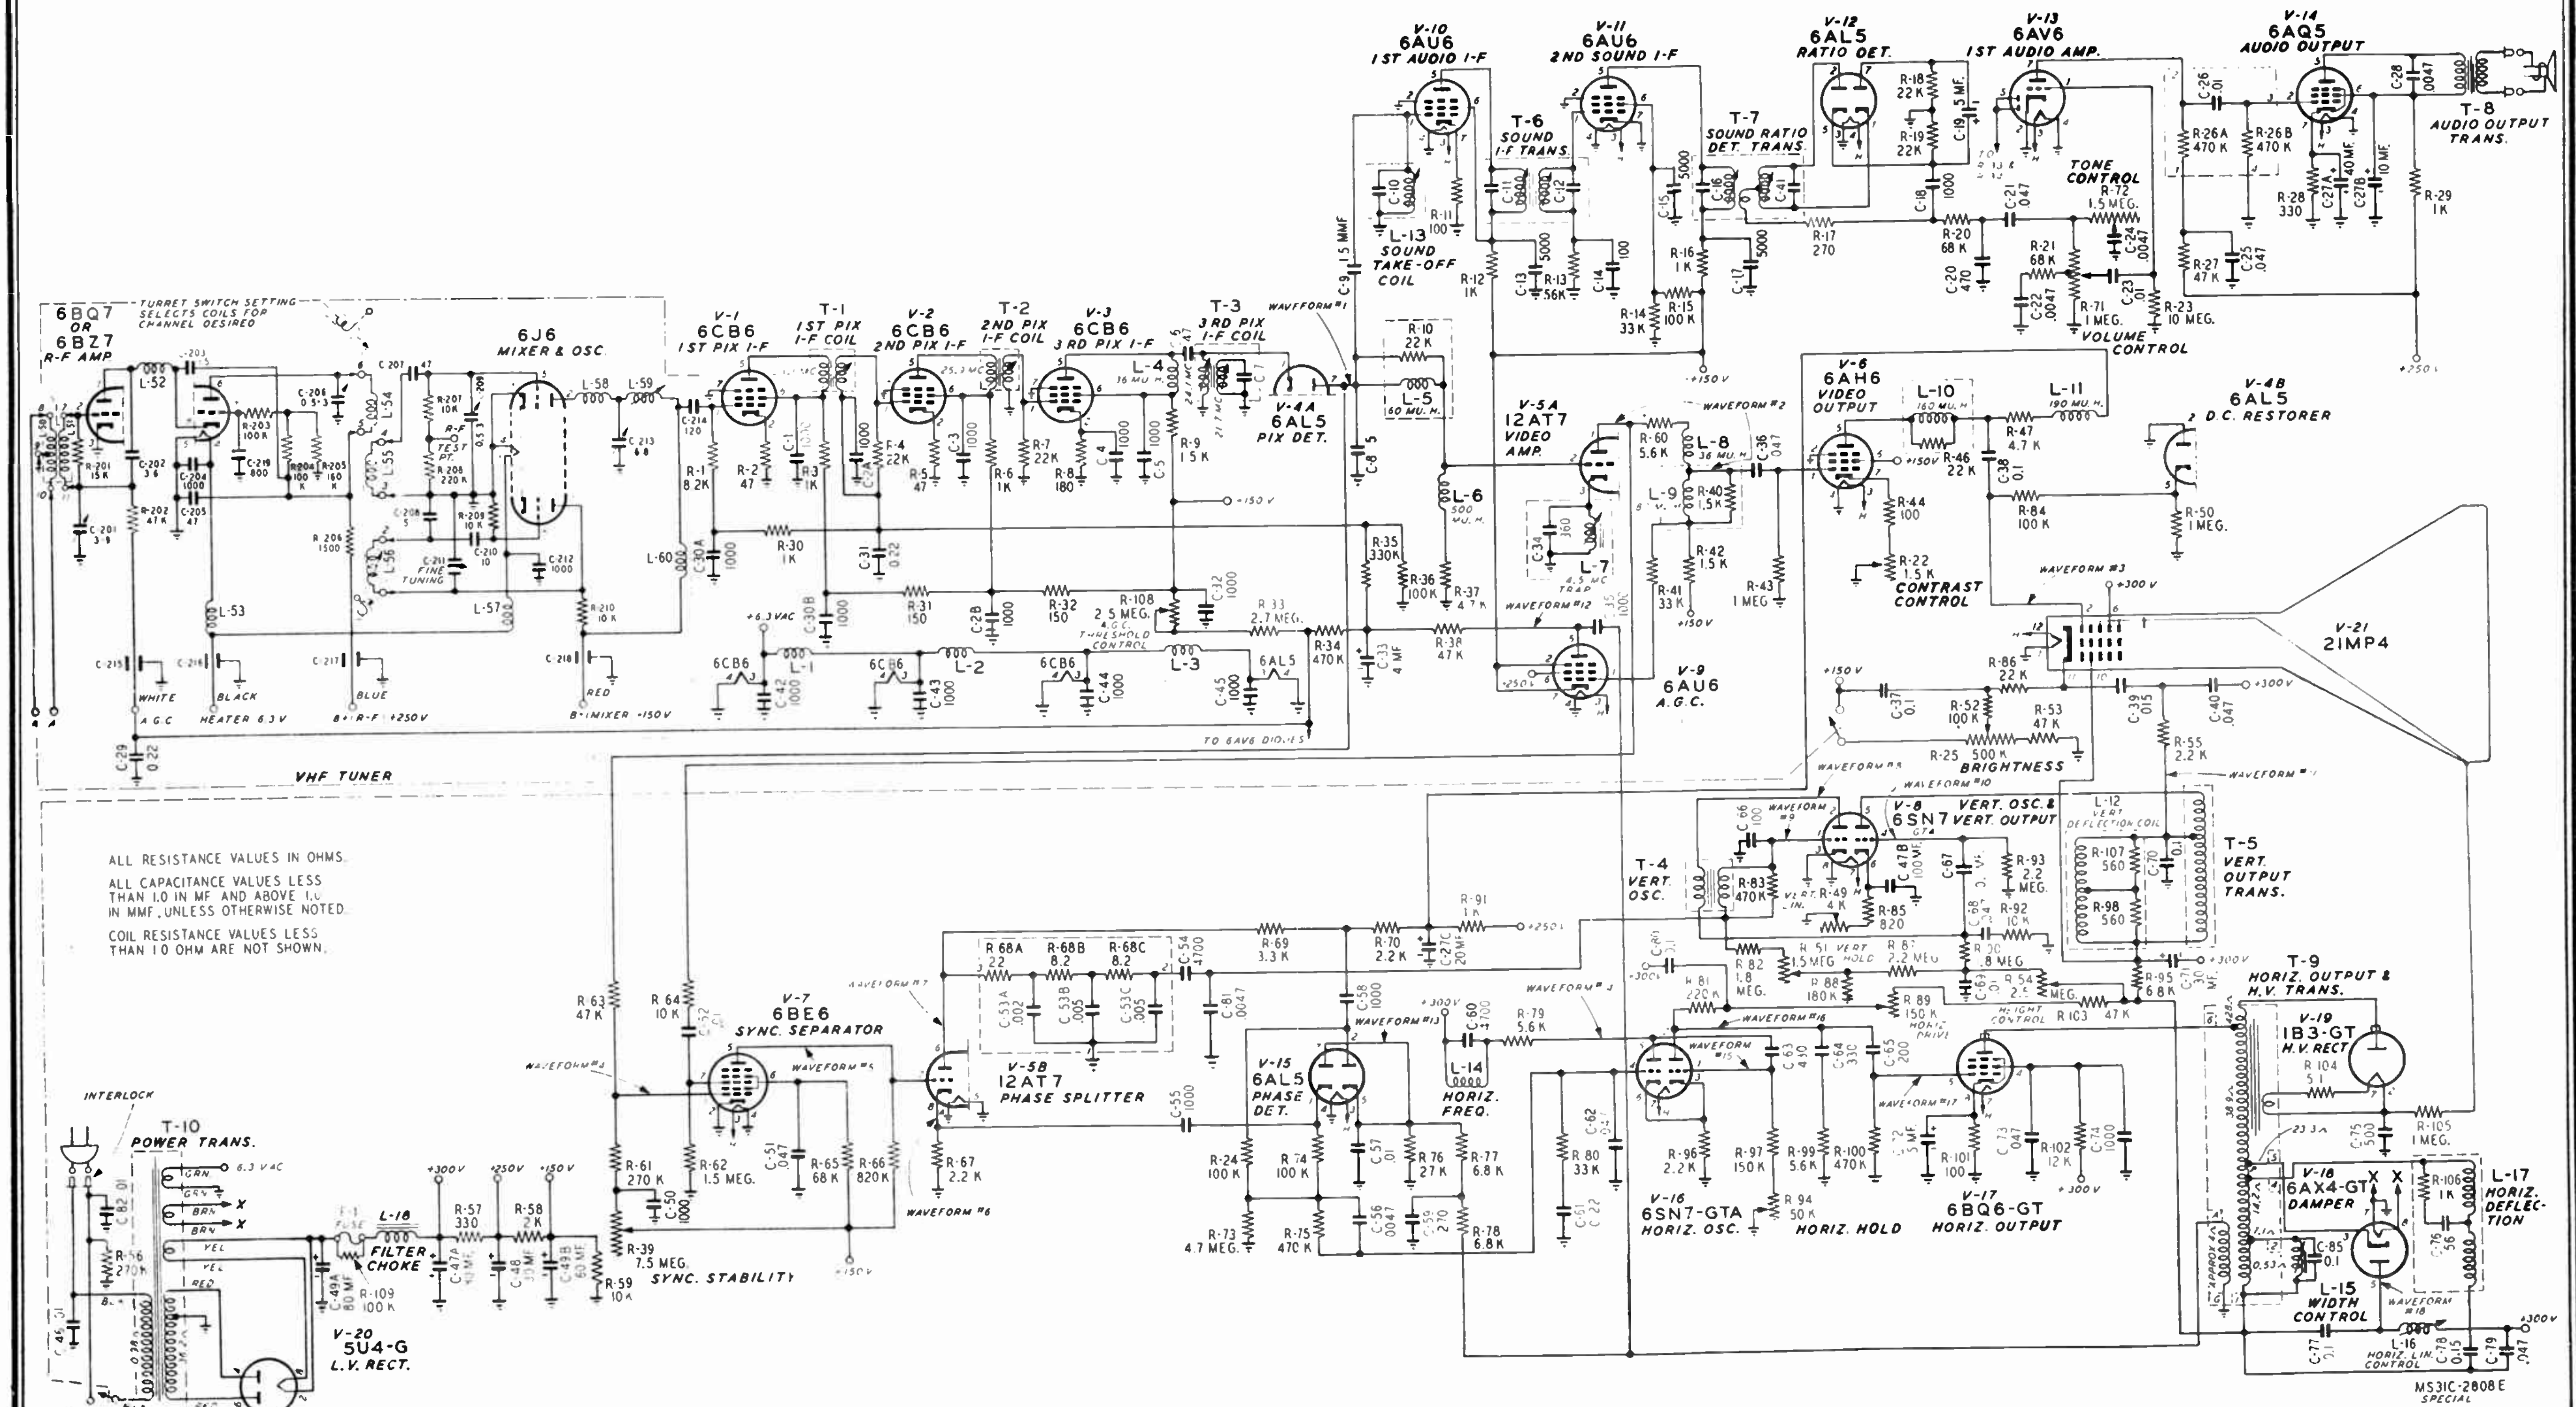
21" TELEVISION RECEIVER



PRODUCTION CHANGES

There are two different ratio detector transformers (T-7) used in these receivers, Part Numbers 9A2269 and 9A2295. The T-7 circuit shown in this schematic diagram covers the 9A2269 ratio detector. Receivers using the 9A2295 ratio detector can be identified by the following changes:

C-18 becomes 47X570 330 mmf molded mica condenser

R-15 becomes B84333 33K ohms 0.5 W carbon resistor

R-18, R-19 become B83103 10K ohm 0.5 W carbon resistors

In addition, the 9A2295 ratio detector has terminals with numerical identification (1, 2, 3 etc.) whereas the 9A2269 ratio detector has terminals with alphabetical identification (A, B, C etc.)

GENERAL INFORMATION

RECEIVER MODEL BREAKDOWN CHART

Model	Description	TV Chassis
21T15	Table, maroon	WTS-518
Y21T15	Table, maroon	WTS-518Y

TV CHASSIS - Chassis WTS-518 contains 16 circuit tubes plus a 21YP4 21" glass, rectangular, spherical face, electrostatically focused picture tube. The picture, sound, and scanning circuits, together with a selenium rectifier half-wave doubler "B" supply, are contained on a single chassis. A series heater circuit is used. The 300 ohm input impedance is matched to the 75 ohm TT-69 tuner impedance by use of a balun line. Field installation of UHF convertor in this chassis is not recommended.

TS-418 - Same as WTS-518 except uses a 17HP4B aluminized picture tube. The picture tube mounting parts are changed to accommodate smaller tube.

VTS-418 - Same as TS-418 except uses a 17HP4 non-aluminized picture tube.

VTS-518 - Same as WTS-518 except for 21YP4A aluminized picture tube.

The suffix "Y" indicates that the TV chassis has a built-in VTT-50MA UHF tuner and uses a WTT-24AY VHF tuner.

TV CHASSIS DIFFERENCES

Chassis	VHF Tuner	UHF Tuner
WTS-518	TT-69	-
WTS-518Y	WTT-24AY	VTT-50MA

Chassis	Picture Tube	VHF Tuner	UHF Tuner
TS-418	17HP4B	TT-69	-
TS-418Y	17HP4B	WTT-24AY	VTT-50MA
VTS-418	17HP4	TT-69	-
VTS-418Y	17HP4	WTT-24AY	VTT-50MA
VTS-518	21YP4A	TT-69	-
VTS-518Y	21YP4A	WTT-24AY	VTT-50MA

UHF TUNER - Refer to separate service manual for complete service information.

TUNING RANGE - VHF Tuner: channels 2 through 13; switch type
UHF Tuner: channels 14 through 83; continuous tuning type

TV IF FREQUENCY - Sound: 21.9 Mc & 4.5 Mc
Picture: 26.4 Mc

TV ANTENNA INPUT IMPEDANCE - 300 ohms

FUSE - B+ and initial surge; 7.5 ohm special resistor. This fuse is of the plug-in type and is accessible by removing the cabinet back. See Figure 2 for location.

POWER SUPPLY - 117 volts, 60 cycle AC only

POWER CONSUMPTION - VHF TV Chassis 155 watts
VHF-UHF TV Chassis 160 watts

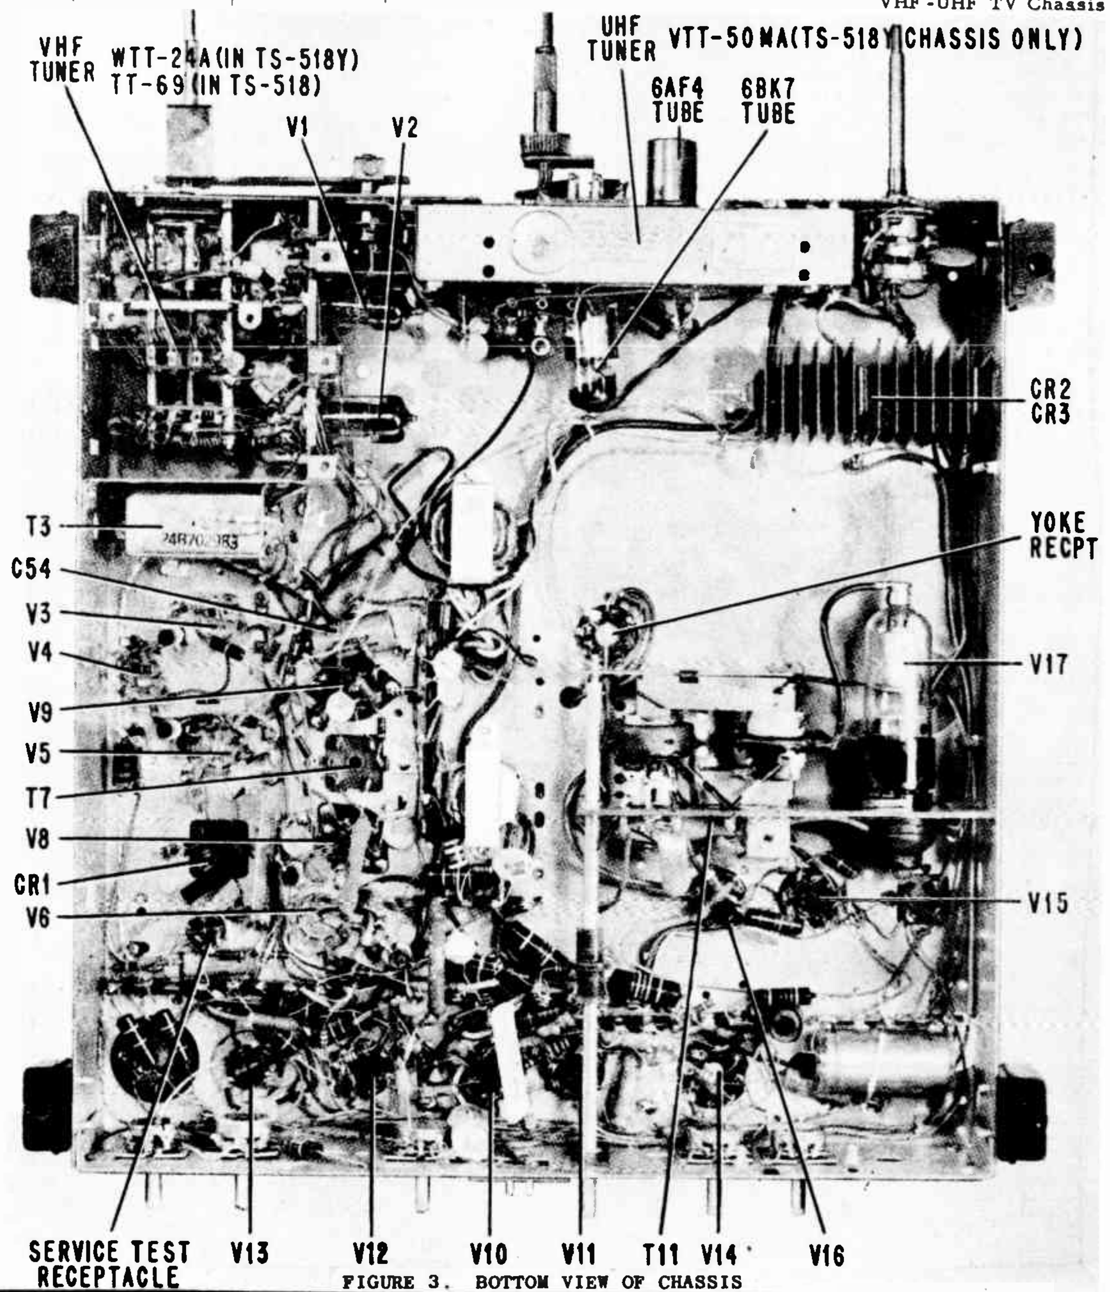

FIGURE 3. BOTTOM VIEW OF CHASSIS

DEFLECTION YOKE ADJUSTMENT

If the deflection yoke shifts, the picture will be tilted. To correct, loosen the thumbscrew on top of the deflection yoke, and rotate yoke until the picture is straight. Before tightening the thumbscrew, make certain that the deflection yoke is as far forward as possible.

If the yoke support and the picture tube have shifted in transit or, if for any reason, these parts have been removed and replaced, it is best to do a complete job of reposition-ing. See Figure 2. The picture tube should be mounted so that the front of the tube rests against the bracket on the front of the chassis. The clamp around the front of the tube should then be tightened. The picture tube rear sup-port bracket mounting screws should be loose enough to permit sliding the bracket forward until it fits snugly against the flare of the tube. Loosen the yoke adjustment thumb-screw and yoke saddle screws and push the yoke against the flare of the tube.

SERVICE NOTES

SERVICE TEST RECEPTACLE

A SERVICE TEST RECEPTACLE, accessible from the top of the chassis (see Figure 2), provides the following test points:

Pin	Connection To
1	IF AGC
2	B+
3	Video detector output
4	No connection
5	B++

CHANGING OF TUBES

1. The power should be turned off when changing tubes.
2. Indiscriminate changing or interchanging of tubes should be avoided for the following reasons:

a. A change of IF or RF tubes can cause loss of sensi-tivity or poor picture quality. Check alignment and sensi-tivity.

b. A change of limiter or ratio detector tubes can cause distorted audio, buzz, or loss of audio sensitivity. Check audio alignment and sensitivity.

c. Changing horizontal oscillator tube can result in poor noise rejection or cause the horizontal hold control to be out of range. This may necessitate readjustment of the horizontal oscillator coil.

REMOVAL OF CABINET SAFETY GLASS

1. Remove the screws and molding strip located along top edge of glass.

2. Safety glass will move outward from cabinet allowing its removal by lifting out of lower retaining channel.

3. When replacing, position rubber on glass with low side of channel facing inside of cabinet.

4. Replace molding and screws.

ALIGNMENT

GENERAL INFORMATION

Equipment Required:

A. Sweep generator: 18 to 220 Mc, 12 Mc sweep width, linear, and capable of .1 volt output. Accurately calibrated, adjustable marker genera-tor and/or AM signal generator.
B. Cathode ray oscilloscope: preferably with calibrated attenuator.
C. Variac: if line voltage is not 117 volts

NOTES: IMPORTANT

NEVER GROUND THE RECEIVER CHASSIS DUR-ING TESTING OPERATIONS OR INSTALLATION UNLESS AN ISOLATION TRANSFORMER IS USED.

At all times, keep the marker generator output low enough to prevent the marker from distorting the response curve.

Some coils resonate at two settings of the core, the correct setting is at the outer end of the winding.

For complete receiver alignment, use the following procedure in sequence. Line voltage must be 117 volts AC; if not, adjust with variac.

IF AND MIXER ALIGNMENT

1. Remove horizontal output tube (V-15) to eliminate RF interference. Complete filament circuit with a 25BQ6 tube or other type with similar filament characteristics and base connections, with all pins clipped off except heaters.
2. Remove antenna and make following connections: (See Figure 4).

a. Connect a 3 volt battery to pin 1 (AGC bus) of serv-ice test receptacle.

b. Disable tuner oscillator by grounding pin 9 of V-2 (6U8).

c. Connect sweep generator to IF test receptacle, and oscilloscope to video detector load.

3. Center sweep generator frequency at 24.6 Mc with a sweep width of 10 Mc and adjust generator output below point of receiver limiting (approximately 3 volts peak-to-peak at video detector load).

4.

Adjust	At Marker Freq	
L-12	21.9 Mc	min output (See IF response curve -Figure 4)
T-4	26.6 Mc	26.6 Mc marker (See IF re-sponse curve - Figure 4)
T-6	at top of curve	flat response (See IF re-sponse curve -Figure 4)
T-5	22.9 Mc	22.9 Mc marker (See IF re-sponse curve -Figure 4)
T-6	at top of curve	flat response (See IF re-sponse -Figure 4)

As some adjustments interact, repeat as necessary to ob-tain proper curve. (Move generator to mixer test recep-tacle and short across R-11 (4700 ohms).

T-3A & B	26.4 & 22.9 Mc	See mixer response curve -Figure 4. As adjustments interact, adjust simul-taneously.

NOTE: If desired response cannot be obtained, recheck tuning of 21.9 Mc trap (L-12). Accuracy of this adjustment is important.

Bandwidth may be determined by noting the frequencies at which the markers fall at the 50% points. Mixer and IF bandwidth over 3.5 Mc may cause loss of picture quality, and less than 3.2 Mc, a loss of audio.

5. Remove AGC bias battery, BANDWIDTH SHOULD NOT CHANGE OVER .2 Mc.

6. Decrease generator signal until there is a marked de-crease in the oscilloscope waveform. Unwanted regenera-tion will be indicated by sharp peaks on the overall response curve.

AUDIO ALIGNMENT

This alignment may be made by injecting an accurate 4.5 Mc signal at the video amplifier grid; however, the station alignment method is much more accurate and should be used whenever possible. Station alignment method fol-lows:

1. With receiver in good operating condition, tune in sta-tion.

2. Connect VTVM from positive terminal of C-54, elec-trolytic capacitor to ground.

3. Maintain 5 volts, or less, at VTVM by adjustment of fine tuning and contrast control (or by removal of antenna, if necessary) while peaking L-20 and T-7 primary (top) for maximum output.

4. Move VTVM connection to junction of C-2 (1000 mmf) and R-45 (33K). Set fine tuning for normal picture.

5. Adjust T-7 secondary (bottom) for zero reading on VTVM.

6. Recheck as in steps 2 and 3 and, if necessary, readjust primary of T-7.

4.5 MC TRAP ADJUSTMENT

Tune receiver to a local station and adjust 4.5 Mc trap (L-17) for minimum beat interference in picture by locating the two points of adjustment at which the beat is first no-ticeable, and rotating core to the center of these two points. Use the minimum amount of inductance (core out of coil) that will result in no apparent beat interference.

If a station signal is not present, use the following meth-od, which requires proper alignment of the audio system.

1. Tune the receiver to a low noise, unused channel.

2. Connect AM signal generator to picture tube cathode lead (yellow) thru a 5000 mmf capacitor. Connect ground lead to chassis.

3. Set generator to 4.5 Mc.

4. Move VTVM to positive terminal of C-54 capacitor, with ground lead to chassis.

5. Adjust 4.5 Mc trap (L-17) for minimum VTVM reading. (Generator output should be adjusted for 5 volts at VTVM.)

TUNER ALIGNMENT

GENERAL INFORMATION

It is very unlikely that the Motorola Tuner will need alignment unless it has been damaged, is being replaced, or has had components replaced in the tuned circuits. (Tubes may be changed in most cases without re-alignment, but care must be used in selection or re-alignment may be re-quired.) The tuner operates by shorting out an antenna, RF and oscillator coil section consecutively for each higher channel. When switched to the lowest channel, all coils of any one section will be series connected. Therefore, align-ment must start at the highest channel and each adjustment properly completed before the next lower channel adjust-ment is attempted. Low-band channels (6-2) may be indi-vidually adjusted by stretching or compressing coil turns, while high band channel inductances (7-13) are formed by a stamped metal plate and adjustable as a unit by L-6 and C-11 (RF) and L-8 (oscillator).

CAUTION: A small change in coil length (low channels) makes a rather large change in frequency.

In alignment, the antenna coils must be tuned to video side of bandpass, and the RF coils to the sound side of bandpass.

NOTE: Antenna, RF and oscillator coils for any one channel are in the same relative position (in line) from front to rear of the tuner.

ANTENNA AND RF ALIGNMENT

1. Remove battery used in IF alignment and ground pin 1 (AGC bus) of service test receptacle. Connect sweep gen-erator to antenna input terminal strip and adjust for 10 Mc minimum sweep width. Connect oscilloscope through a 47K resistor to mixer test receptacle.

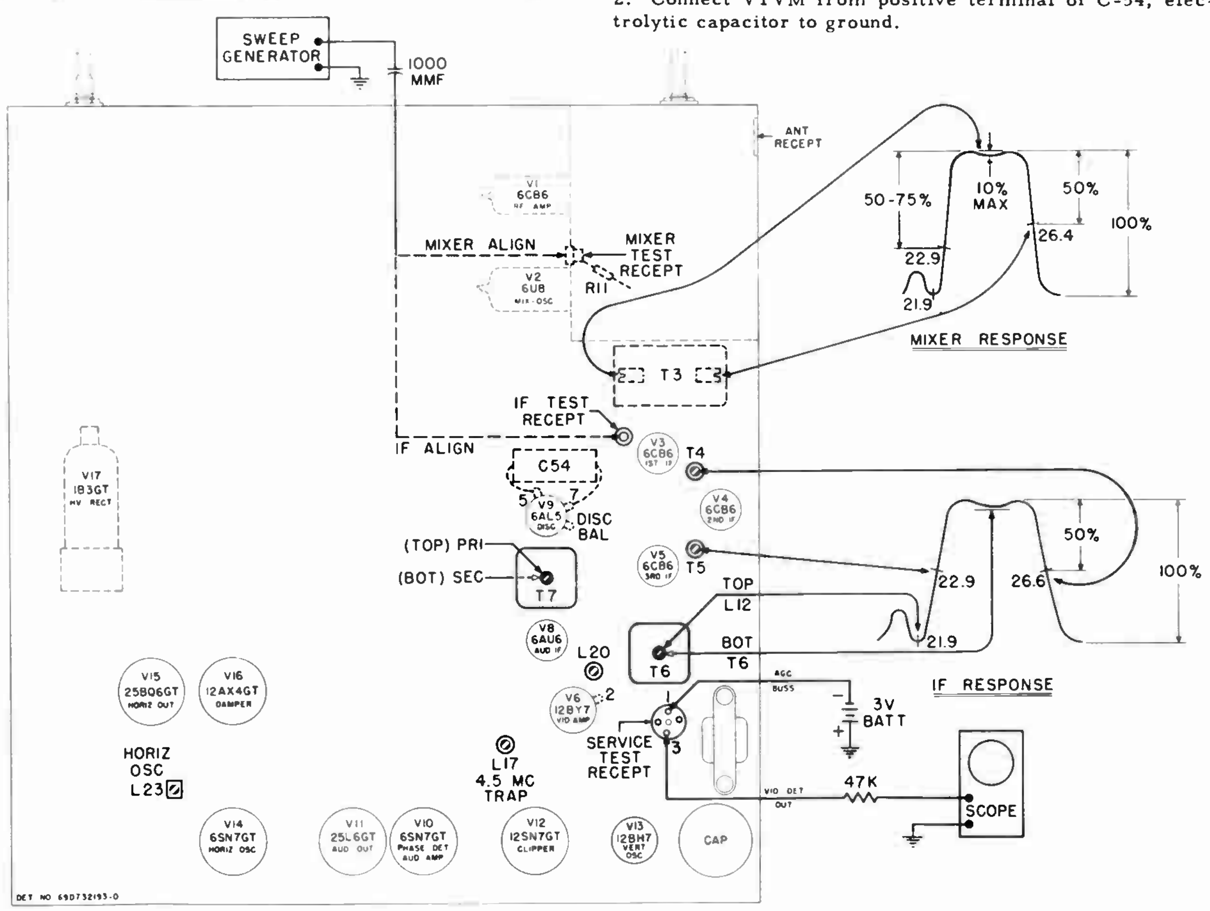

FIGURE 4. TUBE LOCATIONS & IF ALIGNMENT DETAIL

2. Set tuner to channel 7 and sweep generator to 177 Mc (center frequency). Set video marker to 175.25 Mc and sound marker to 179.75 Mc. Adjust C-11 for high channel response curve shown in Figure 5.

3. Set tuner to channel 13, and sweep generator to 213 Mc. Set video marker to 211.25 Mc and sound marker to 215.75 Mc. Adjust L-6 for high channel response curve shown in Figure 5.

4. Repeat step 2.

5. Switch tuner and generator through channels 13 to 7 and check each for correct response curve. (See chart for markers and sweep frequencies.) Coil L-1F will adjust response curve width (approximate position is 1/8" from metal shield). The amount of coil end wire extending through shield varies bandwidth, and position of markers. If this coil is moved, all previous steps must be repeated.

6. Align low channel antenna and RF coils (channels 6 thru 2) for proper markers as shown on low channel response curve (Figure 5). See alignment chart for marker and sweep frequencies.

OSCILLATOR ALIGNMENT

Preliminary Instructions:

Oscillator adjustments are made, using sound frequencies as reference, to place sound marker slightly higher than the 21.9 Mc trap dip. Sound markers must move into trap dip (within fine tuner rotation tolerances) when tuner cover is replaced.

Tuner and sweep generator must be set to channel being aligned.

The marker generator is set to the sound frequency of channel being aligned. Use at least a 10 Mc sweep width, or more if possible.

Waveform obtained should be similar to mixer waveform.

Consistent tilting of the curve when sound marker is in the trap indicates misalignment of the IF or mixer.

Procedure:

1. Remove ground added during previous procedures to pin 9 of V-2 (6U8 oscillator).

2. Connect the oscilloscope (through a 47K ohm resistor) across the video load resistor R-27 (5600) at the service test receptacle. See IF alignment, Figure 4.

3. Set fine tuner for mid-capacity position (capacity increasing in the counterclockwise direction.)

High Band Alignment

4. Adjust oscillator trimmer (C-15) on channel 10, using channel 10 sound marker and placing it just above trap null. See Figure 4 and preliminary instructions

5. Check channels 7 through 13 for correct marker positions (use fine tuner if necessary). A fine tuner rotation of over plus or minus 30 degrees from mid-point, to move marker into trap dip, requires:

a. Adjustment of coil L-8, on channel 13, for compensation of channels 10 through 13.

b. Readjustment of trimmer C-15, on channel 10, for compensation of channels 7 through 10. Repeat step 5.

Low Band Alignment

6. Reduce the capacity of fine tuner by rotating 15 degrees clockwise from mid-capacity position.

7. Adjust channel 6 oscillator coil, using channel 6 sound marker. Refer to Figure 4 and preliminary instructions. Accuracy of alignment on this channel is extremely important to alignment of following coils.

8. Adjust channel 5 through 2 oscillator coils in descending order, using proper markers.

NOTE: WHEN TUNER COVER IS REPLACED, ALL SOUND MARKERS MUST MOVE INTO TRAP DIP WITHIN FINE TUNER ROTATION LIMITS. LIMITS ARE FROM MID-POSITION TO 30 DEGREES CLOCKWISE, ON LOW CHANNELS, AND PLUS OR MINUS 30 DEGREES FROM MID-POINT ON HIGH CHANNELS.

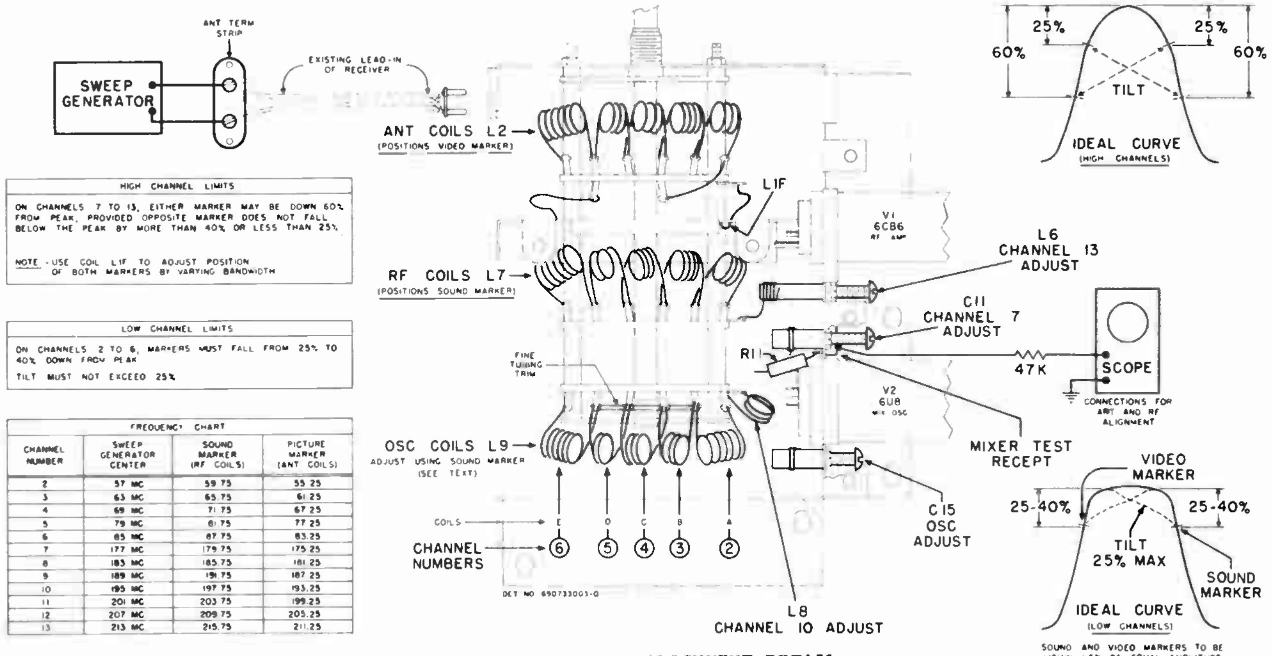
TESTS OF RECEIVER SENSITIVITY

1. Make sure AGC system is operating.

2. Short out resistor R-11 (4700 ohms) in tuner.

3. Calibrate oscilloscope by connecting the input to a 6.3 volt AC source. (This will equal approximately 18 volts peak-to-peak.) Connect scope to picture tube cathode (yellow lead).

4. Set contrast control at maximum.



HIGH CHANNEL LIMITS
ON CHANNELS 7 TO 13, EITHER MARKER MAY BE DOWN 60% FROM PEAK, PROVIDED OPPOSITE MARKER DOES NOT FALL BELOW THE PEAK BY MORE THAN 40% OR LESS THAN 25%.
NOTE - USE COIL L1F TO ADJUST POSITION OF BOTH MARKERS BY VARYING BANDWIDTH

LOW CHANNEL LIMITS
ON CHANNELS 2 TO 6, MARKERS MUST FALL FROM 25% TO 40% DOWN FROM PEAK
TILT MUST NOT EXCEED 25%

FREQUENCY CHART

CHANNEL NUMBER	SWEEP GENERATOR CENTER	SOUND MARKER (RF COILS)	PICTURE MARKER (ANT COILS)
2	57 MC	59 75	55 25
3	63 MC	65.75	61 25
4	69 MC	71 75	67 25
5	79 MC	81.75	77 25
6	85 MC	87 75	83.25
7	177 MC	179 75	175 25
8	183 MC	185.75	181 25
9	189 MC	191.75	187 25
10	195 MC	197 75	193.25
11	201 MC	203 75	199.25
12	207 MC	209 75	205.25
13	213 MC	215.75	211.25

FIGURE 5. TUNER ALIGNMENT DETAIL

IF Sensitivity Tests

5. Stop osoillator as in IF alignment.

6. Inject 23 Mc AM signal, with 30% modulation, into IF test receptacle through a 1000 mmf capacitor. Less than 500 microvolts should be required to produce 18 volts peak-to-peak at the picture tube cathode.

7. Inject the generator into mixer test receptacle. Less than 100 microvolts should be required to produce 18 volts peak-to-peak at the picture tube cathode.

Overall Sensitivity Test

8. Remove short on R-11 and oscillator and inject generator into antenna input (use resistor matching network, if necessary). Tune generator to center frequency of channel being checked, and rotate receiver fine tuner for strongest signal. 18 volts peak-to-peak should be produced at the picture tube cathode with generator outputs of less than 15 microvolts on channels 2 through 6 and less than 30 microvolts on channels 7 through 13.

Audio Sensitivity Test

9. Connect signal generator (no modulation) to video amplifier grid (pin 2) through a 5000 mmf capacitor and set to 4.5 Mc. Set contrast control to maximum.

10. Connect VTVM (DC scale) to the positive terminal of electrolytic capacitor C-54, and connect ground lead to chassis.

11. A 10,000 microvolt signal should produce approximately 10 volts.

TV CHASSIS CODING

The following chassis coding system was devised to enable the serviceman to keep abreast of circuit revisions.

The first production chassis number carries the suffix "A-00" (i.e., WTS-518A-00). With the first minor electrical revision, the suffix becomes "A-01" and with each subsequent minor change "A-02", "A-03", etc. The first major revision changes the suffix to "B-00" and, as before, each following minor change is labeled "B-01", etc.

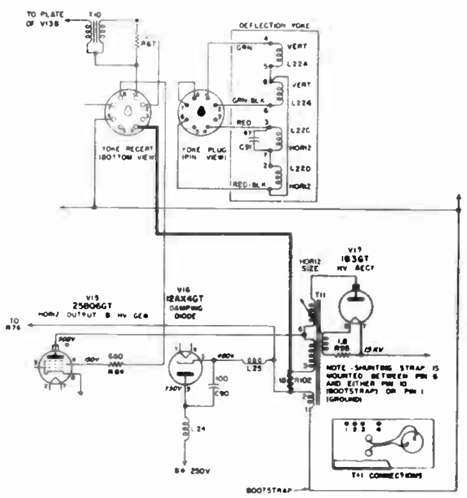
Mechanical differences between chassis are indicated by the addition of a prefix to the basic chassis (i.e., VTS-518A-00, etc.). These prefixes may be assigned in random sequence but will be confined to the end of the alphabet to avoid confusion with the A, B, C, etc., electrical change suffixes.

A "Y" suffix added to basic chassis (i.e. WTS-518YA-00, etc.,) indicates that the chassis contains a factory-installed UHF tuner.

PRODUCTION CHANGES

Chassis Coding	Changes
A-01	To improve brightness and to prevent filament breakdown on the picture tube, a new shunting strap is connected between pin 6 (focus grid) and either pin 1 (heater-a potential ground point) or pin 10 (screen grid). 5,000 mmf 2000V capacitor added between pin 1 of the picture tube and ground.
A-02	To increase sensitivity and to assure a more secure control knob fitting, VHF tuners change to WTT-24C & WTT-24CY (longer shafts). R-31 (volume-contrast) changes to Part No. 18B733977 (longer shaft). C-1 (220 mmf) changes to 470 mmf. R-7 (22,000) removed. New low frequency antenna coil (L-1) is used. Part numbers on low frequency antenna coil and VHF tuners do not change.
B-00	Area selector switch added. (See B-00 schematic.)
B-01	To increase the range of the horiz hold control, a 47,000 ohm resistor was added in parallel with the horiz osc coil L-23.

To eliminate picture tube neck shadows on some chassis, the fixed electrical horizontal centering circuit shown below was used; final centering is still performed with the magnetic centering device.



ELECTRICAL CENTERING CIRCUIT USED IN CHASSIS HAVING PICTURE TUBE NECK SHADOW PROBLEM

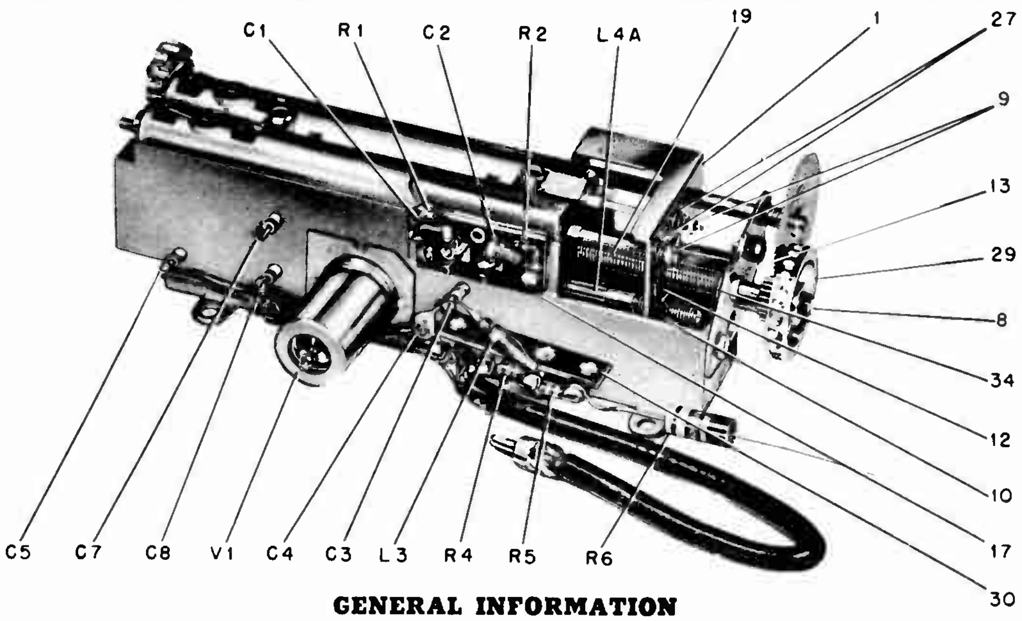
MOTOROLA TV PAGE 14-5

CHASSIS TS-418, Y, VTS-418, Y, 518, Y, WTS-518, Y



GENERAL INFORMATION

Tuner TT-37 is a continuously-tuned type UHF tuner designed to convert the UHF television channels in the 470 to 890 mc range to an intermediate frequency band of 40 to 46 mc. This tuner is designed for installation in Motorola VHF TV receivers using the TS-402, TS-502 and TS-602 series chassis. This unit may be installed in the field, in above chassis (through use of suitable kit), or may be factory-installed ("Y" series TV chassis).

This tuner is driven by means of a bead chain operated by a sprocket on the rear of VHF tuner fine tuning shaft. A sprocket on front end of UHF tuner, in turn, operates the UHF dial through another bead chain. The UHF dial scale is located behind the VHF channel selector knob, and is visible through a window only when VHF channel selector dial is set to UHF position. In this position, the VHF tuner is converted to a 2-stage 40 mc IF amplifier, which amplifies the output of the TT-37 UHF tuner.

CIRCUIT DESCRIPTION

The TT-37 is a continuously-tuned, single superheterodyne type of tuner, designed to convert the television channels in the 470 to 890 mc range to an intermediate frequency band of 40 to 46 mc. It employs a germanium or silicon crystal type of mixer (CR-1) and a 6AF4 type tube (V-1) for local oscillator. The oscillator frequency is above the signal frequency in order to remain compatible with present VHF practice. The 300 ohm balanced type of antenna, for which this tuner is designed, is coupled to the crystal mixer by means of a double-tuned transformer, the selectivity of which is sufficient to provide an image ratio of the order of 40 db. The output signal of the tuner (40-46 mc) is developed across a total capacity of 28 mmf (10 mmf, C-3, plus 18 mmf of 13-inch section of 93 ohm coaxial cable). There is no tuning provided in this unit for the IF, the tuning and impedance matching being provided in the VHF tuner of the TV receiver.

The antenna is coupled to the input tuning element of the double-tuned transformer by means of a small rectangular coil (L-1), center-tapped and balanced to ground. The tuning elements consist of two shorted quarter wave length transmission lines modified by end capacity loading such that the frequency versus length of the inner conductor provides a straight line relationship. The end capacity loading is so constructed that a total of three adjustments are available for antenna tracking. The two tuning elements are coupled together by means of a small printed circuit coupling loop (L-2). This coupling loop is made up of two elements or sections. The large section provides the forward coupling and the small section is so connected to the large that it provides a bucking action that is somewhat frequency selective because of physical location. The coupling loop maintains the coupling between the two tuning elements at approximately critical coupling throughout the tuning range.

The mixer crystal (CR-1) in this unit is of the plug-in type. The crystal is coupled to the double-tuned transformer by means of a tap on the center conductor of the output tuning element. The other end of the crystal returns to ground through a 56 ohm resistor (R-3) and a 10 mmf feed-thru type capacitor (C-3), connected in series. The 93 ohm IF output cable is connected across the 10 mmf feed-thru capacitor (C-3) through a 470 mmf coupling capacitor (C-4).

A positive bias is obtained by means of a voltage divider, consisting of a 56K ohm resistor (R-5) and a 220 ohm resistor (R-4) to ground, and is DC coupled to the crystal through a 1 microhenry RF choke (L-3) connected from the 220 ohm resistor to the 10 mmf feed-thru capacitor. This provides the crystal with a DC return path and a positive bias of approximately 0.25 volts.

The local oscillator for this tuner is a modified Colpitts type using a 6AF4 tube (V-1). Straight-line frequency versus travel tuning of the oscillator is attained by a series LC type of printed circuit (L-4) on a glass cylinder. All moving elements of the circuit are capacity-coupled to stationary elements to avoid wiping contacts. The variable capacitor portion of the tuning element is connected in the grid circuit and incorporates a small disc type 27 mmf NTC series capacitor (C-6) for drift compensation. The variable inductance portion of the tuning element is connected in the plate circuit of the tube and is so arranged as

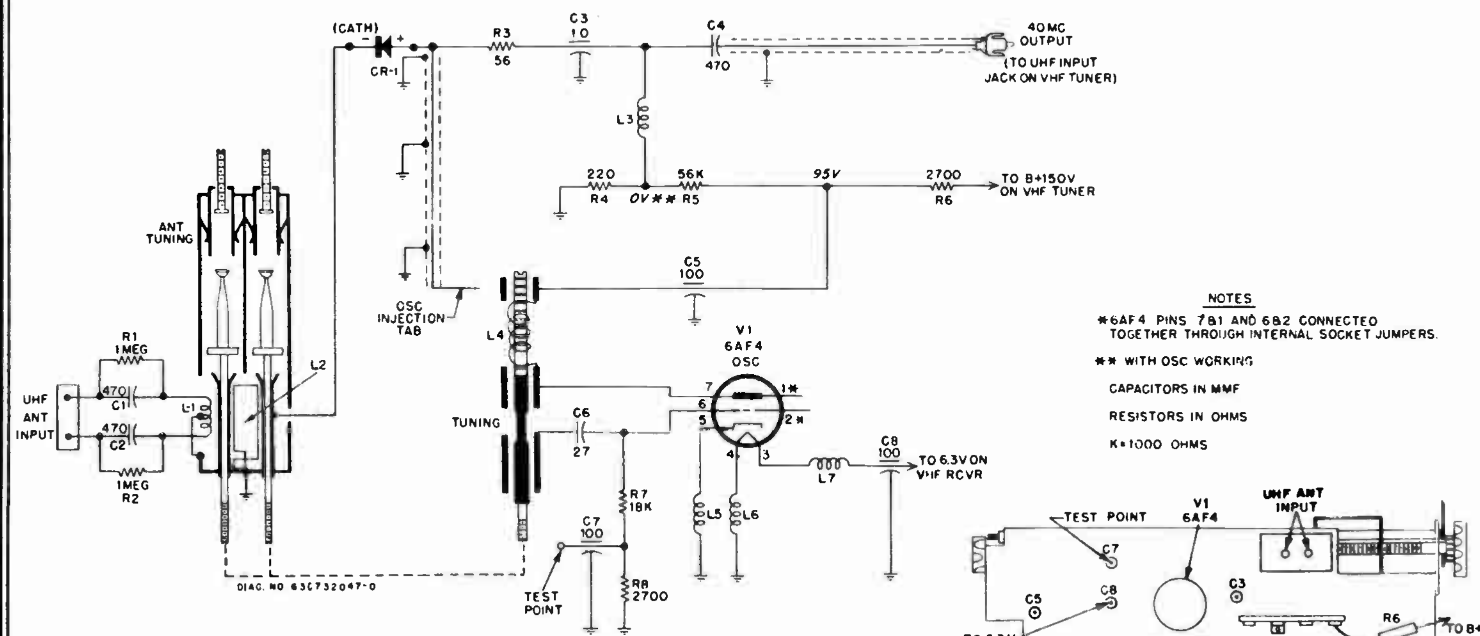


FIGURE 1. SCHEMATIC DIAGRAM

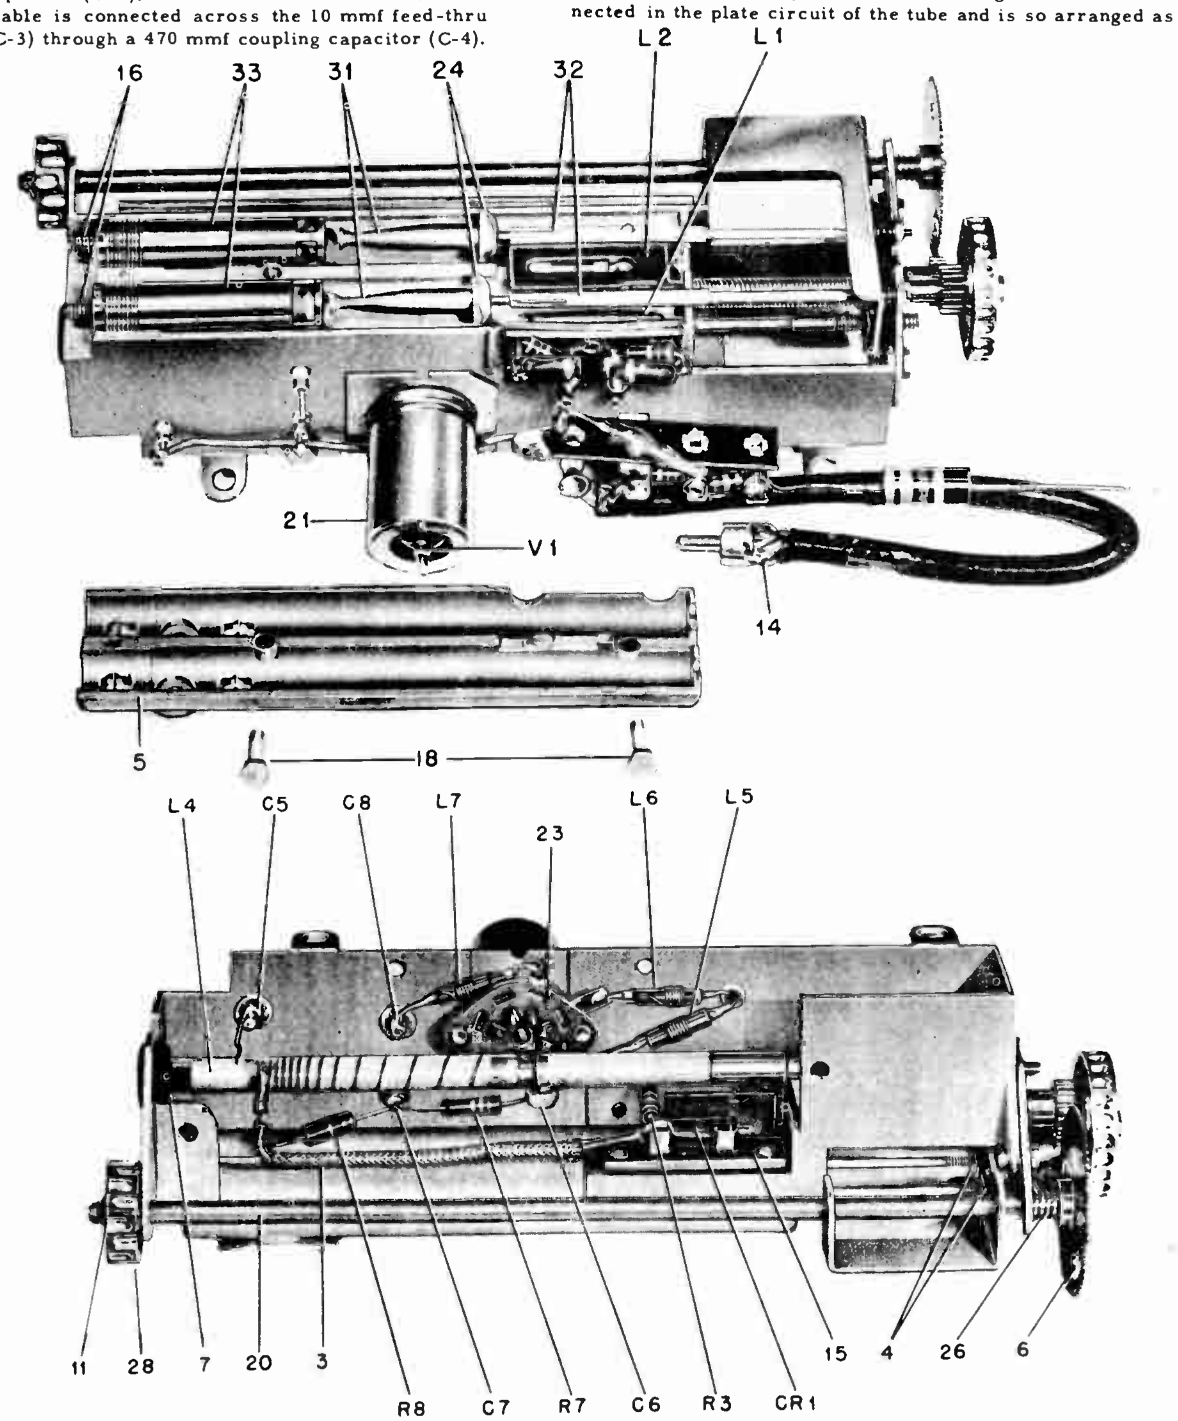

FIGURE 2. PARTS LOCATIONS

to provide its own DC path from plate to ground for B+ feed. The moving element of the oscillator circuit consists of a core whose function is to provide a variable capacitor and a variable tap on the inductance portion of the circuit and at the same time provide an electrical connection between the variable capacitor and the variable inductance. There is only one adjustment of this core.

In order to maintain a feed-back path as nearly as possible determined by the internal capacities of the oscillator tube itself, the cathode and filaments of the tube are maintained off ground to RF potential by means of small RF chokes (L-5, 6, & 7) whose resonances are held at a frequency somewhat below the UHF band.

The oscillator is coupled to the crystal mixer circuit by means of a small section of braid shielded wire serving as a high loss type of transmission line. The length of line is approximately a quarter wave length at the high end of the band. One end of the line is capacity-coupled to the low impedance end of the oscillator-tuned circuit by means of a small unshielded but insulated section of the inner conductor. Moving this wire, with respect to the oscillator coil, provides some degree of variation in the coupling to oscillator signal. The shield of the line is grounded at several points along its length. The injection current in this tuner varies from approximately 0.7 ma to 2 ma.

UHF TELEVISION TUNER ADAPTOR
TK-35, 36 & 38 SERIES

GENERAL INFORMATION

The UHF tuner is mounted adjacent to the standard VHF tuner, and secured to the receiver chassis with three Phillips head screws.

UHF tuning is accomplished by a drive pulley and coupling, to the rear of the VHF fine tuning shaft. Rotation of the VHF fine tuning knob thus tunes UHF stations. Some models require a bead-chain drive (from the fine tuning shaft to the UHF tuner) and others a belt-drive. Refer to Motorola UHF Adaptor Listing (Part No. 68P732128) for selection of correct adaptor.

All chassis models utilize a front bead-chain coupling from the UHF tuner to the UHF dial scale (channel indicator). The UHF channel indicator is mounted to a shaft that rotates on the VHF tuner shaft. Insulated sleeving on both sides of the dial indicator sprocket protects the shaft from becoming "hot" should the metal bead-chain become disengaged from the sprocket.

Electrical connections required are: the UHF antenna lead-in (plug-in), the UHF tuner output to the VHF tuner (plug-in), and filament and B plus voltages as obtained from the receiver power supply. B plus connections must be made as illustrated so that plate voltage will be removed from UHF tuner when it is not in use.

Refer to illustration that is similar to receiver into which adaptor is to be installed. Position of front bead-chain sprocket, and tuner size will aid in locating the correct drawing. In the case of a belt-driven UHF tuner, use the appropriate drawing insert.

INSTALLATION INSTRUCTIONS

1. Remove VHF chassis from cabinet and support on service brackets so bottom is accessible.

2. Temporarily remove dial light assembly and light shield (not on all models) from TV chassis.

NOTE: The UHF channel indicator shaft and sprocket are factory installed on some VHF tuners, therefore these parts are not included with all adaptors. When required, they are furnished and must be installed as follows:

A. Place the "U" ring clamp in the lower groove of the VHF channel selector shaft and compress it with a pair of pliers.

B. Place the plastic rear insulator over the shaft.

C. Place the UHF channel indicator shaft and sprocket on the VHF channel selector shaft. Make sure there is a plastic front insulator on the indicator shaft.

D. Place the other "U" ring clamp in the upper groove and compress it to retain shaft. Make sure that the "U" ring clamp does not extend above shaft, as difficulty will be experienced with knob installation.

3. Mount UHF tuner on TV chassis (use appropriate drawing) using the three Phillips head screws provided. Do not tighten screws as yet.

4. Remove the fine tuning shaft bearing bracket from rear of VHF tuner.

5. Assemble spring washer and drive pulley, or sprocket, onto fine tuning shaft. The "C" washer furnished is used to retain assembly.

6. Install the short bead-chain across front sprockets of the UHF and VHF tuners (all models). NOTE: On the TS-602 series chassis, temporarily remove the fibre support bracket before installing bead-chain.

Models Using Bead-Chain Drive

7. Place long bead-chain over rear sprocket. Assemble fine tuning shaft bearing bracket, double anti-backlash spring and screws as illustrated.

8. Place other end of long bead-chain over UHF tuner sprocket.

9. Adjust position of UHF tuner so that rear anti-backlash spring exerts tension on bead-chain, but yet the chain is not stretched straight; the front chain is adjusted so it is stretched straight. While holding the UHF tuner in this position, tighten the three Phillips head mounting screws.

CAUTION! CHECK FOR BINDING IN THE DRIVE MECHANISM BY GENTLY TURNING UHF TUNING SHAFT. IF EXCESSIVE FORCE IS REQUIRED, LOCATE CAUSE OF BINDING, OTHERWISE THE BAKELITE COUPLING USED IN THE MIDDLE OF THE VHF FINE TUNING AND UHF TUNING SHAFT OF SOME MODELS MAY BE SNAPPED.

10. Adjust rear anti-backlash spring so that its flat portion contacts as many beads as possible on the long chain. This is necessary for a smooth drive action.

11. Liberally lubricate bead-chains with grease provided.

Models Using the Belt-Drive

12. Place belting over rear drive wheel.

13. Replace fine tuning shaft bearing bracket and screws.

14. Adjust position of UHF tuner so that front bead-chain is stretched straight, and rear belt-drive has sufficient tension to pull tuner. Hold the UHF tuner in this position and tighten the three Phillips head mounting screws.

15. Calibration of the UHF Dial Scale (All Models)

A. Place the UHF dial and VHF channel selector knob (furnished with adaptor) on the UHF channel indicator and VHF channel selector shafts, respectively.

B. Turn VHF channel selector knob so its window is toward top of chassis. This places the receiver in the UHF position, and exposes the UHF dial.

C. Turn UHF tuning shaft clockwise until UHF tuner cores reach their extreme inward travel stop. Grasp dial drive shaft of UHF tuner, and move it forward to disengage gears. Rotate until channel 14 is centered in VHF channel selector knob window. Release shaft to engage gears in this position.

16. Replace dial light assembly and light shield on models containing dial light. NOTE: If a light shield is furnished with adaptor, use it to replace original shield which does not have opening large enough to clear UHF channel indicator shaft.

17. Electrical Connections (All Models)

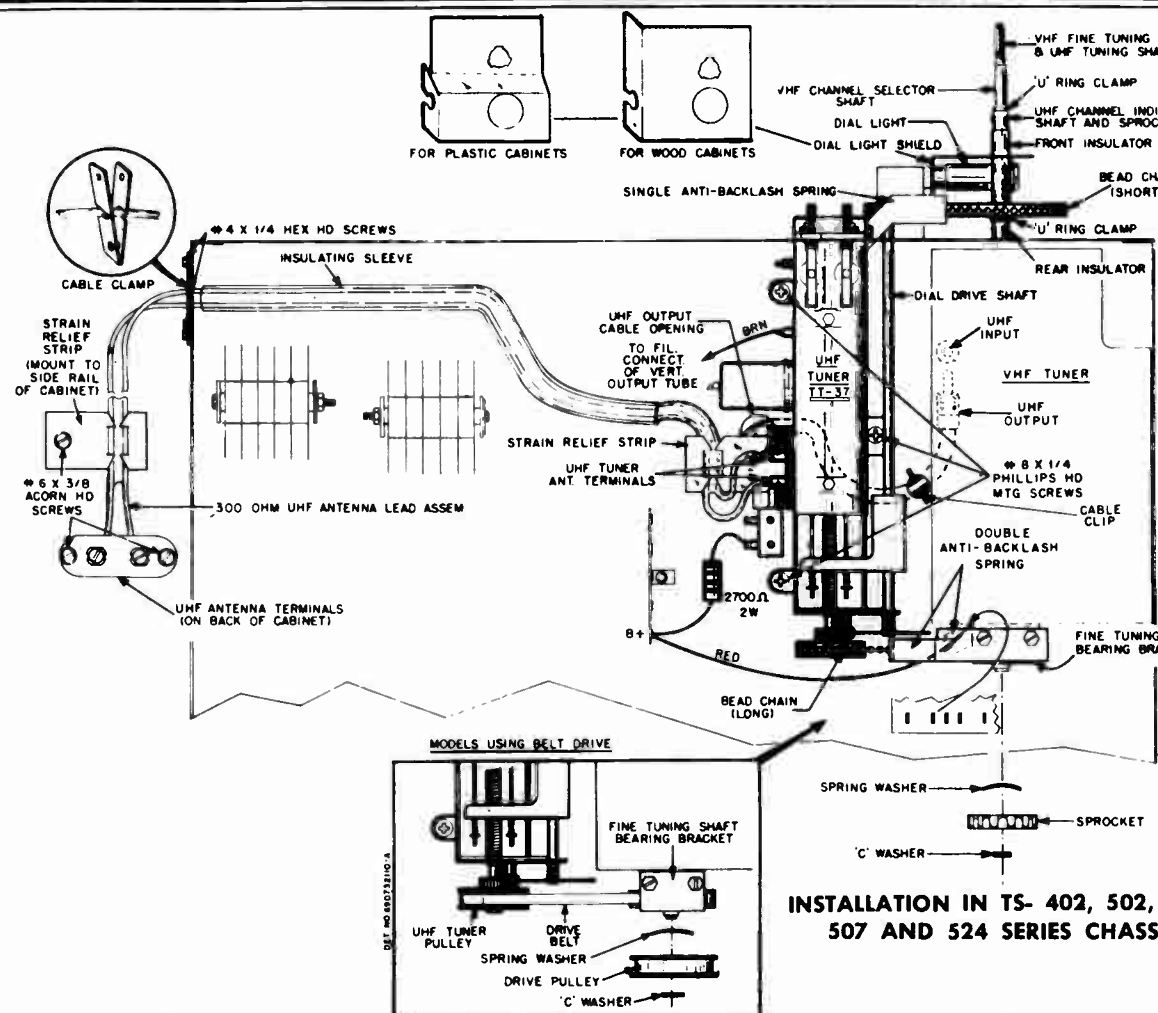
Solder the loose end of the 2700 ohm 2 watt resistor (on the UHF tuner) to the terminal strip shown. This is the B+ connection. NOTE: The red lead between the terminal strip and VHF tuner must be added to some chassis.

18. Solder brown filament lead (UHF tuner) to point shown on diagram.

19. Plug UHF output lead into UHF input receptacle on top of VHF tuner.

20. Make sure insulating sleeve is on UHF antenna lead-in and insert lead-in through chassis opening. Insert lead-in through openings of strain relief strip as illustrated and plug the 300 ohm UHF antenna lead-in assembly into UHF tuner antenna terminals. Secure to chassis with the cable clamp. Dress lead-in as shown on drawing. Ground lead-in (from UHF tuner output to VHF tuner input) to chassis by use of clip spring provided. Clip spring snaps into any convenient chassis hole.

21. Check adjustment of the UHF dial calibration. Connect speaker to TV chassis. Connect the TV set through an



INSTALLATION IN TS- 402, 502, 505, 507 AND 524 SERIES CHASSIS

ISOLATION TRANSFORMER to power line. Check dial illumination on models having a dial light. Make adjustments if necessary.

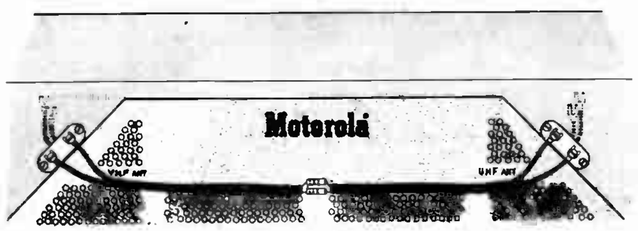
22. Remove knobs and service brackets from chassis and replace chassis in cabinet.

23. Secure UHF antenna lead-in assembly to side rail of cabinet with strain relief strip.

24. Mount antenna terminal strip to back of cabinet.

25. Reassemble balance of receiver and check operation.

USE JUMPER AS SHOWN WHEN ONLY ONE ANTENNA IS USED FOR BOTH VHF AND UHF. (SEE INSTRUCTIONS)



The Motorola BUILT-IN VHF-UHF ANTENNA will give satisfactory reception in "good signal" areas but, if you are located in a "fringe" or weak signal area, it is suggested that an outdoor antenna be used.

When the outside antenna is to be connected, be sure to disconnect the BUILT-IN ANTENNA leads first and leave them disconnected. then connect the outside antenna.

In some areas, on outdoor VHF antenna or a combination VHF-UHF single lead-in antenna will be satisfactory for both UHF and VHF reception. If you are in such an area, a special jumper connection must be made between the VHF and UHF antenna terminals on the rear of your receiver. This jumper connection (furnished with the adaptor) consists of a length of 300 ohm line, with a 150 ohm resistor in each lead. See Figure 3.

If the outdoor antenna and antenna jumper connections are used for both VHF and UHF reception, the following precautions must be taken:

1. If the receiver is located in an area where the UHF signal is stronger than the VHF signal, connect the antenna to the VHF antenna terminals on the TV receiver.

2. If the receiver is located in an area where the VHF signal is stronger than the UHF signal, connect the antenna to the UHF antenna terminals on the TV receiver instead of on the VHF side of the antenna jumper.

The above instructions will make it possible to use a single antenna for both UHF and VHF reception, but extreme caution must be taken when the antenna jumper is used, as this connector does result in a loss of signal. This signal loss cannot be tolerated if there is a very weak VHF signal as there might be too great a deterioration of the picture or, possibly, a complete loss of picture. In this case, use separate outdoor antennas for UHF and VHF reception.

Discard the antenna jumper connection and connect each antenna to the proper input terminals when two outdoor antennas are being used.

In some areas where the VHF antenna and the jumper are used, it may be necessary to experiment with the length of the leads on the antenna jumper to get the best results.

The installation procedure for the outdoor UHF antenna will, in general, be the same as for the VHF antenna. The lead-in, however, should be the tubular, unshielded 300 ohm line instead of the ribbon type, as the latter attenuates UHF frequencies when damp. As the UHF antenna is more critical in setting up than the VHF, more care should be taken in properly positioning the antenna. Setting the UHF antenna toward the station will not necessarily give the best results, so check the area in order to deliver the maximum signal to the receiver.

When using the tubular lead, it is good practice to form a drainage loop before the lead enters the house, then punch a hole in the polyethylene at the low point. Unless this is done, the condensation formed inside the 300 ohm tubular line, may create a pool of water behind the television set.

When using an outdoor antenna, always ground the antenna mast and use an Underwriters approved lightning arrestor at the point where the lead-in enters the house.

Consult your local Motorola dealer or distributor as to choice of antenna or antennas best suited for your location.

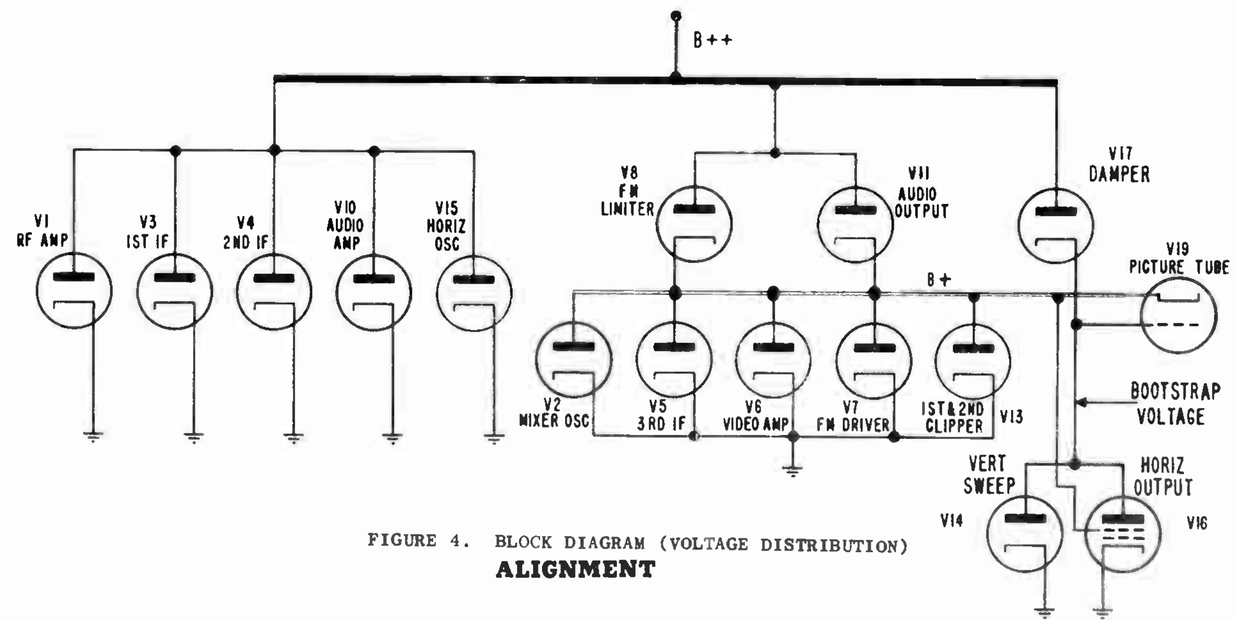

FIGURE 4. BLOCK DIAGRAM (VOLTAGE DISTRIBUTION)

ALIGNMENT

GENERAL INFORMATION

Equipment Required:

A. Sweep Generator: 18 to 220 Mc, 12 Mc sweep width, linear, and capable of .1 volt output
Accurately calibrated, adjustable marker generator and/or AM signal generator.

B. Cathode ray oscilloscope: preferably with calibrated attenuator.

C. Variac: if line voltage is not 117 volts

NOTES: IMPORTANT

NEVER GROUND THE RECEIVER CHASSIS DURING TESTING OPERATIONS OR INSTALLATION UNLESS AN ISOLATION TRANSFORMER IS USED.

Keep the marker generator output low enough, at all times, to prevent the marker from distorting the response curve.

Some coils resonate at two settings of the core, the correct setting is at the outer end of the winding.

For complete receiver alignment, use the following procedure in sequence: Line voltage must be 117 volts: if not, adjust to 117 volts with variac.

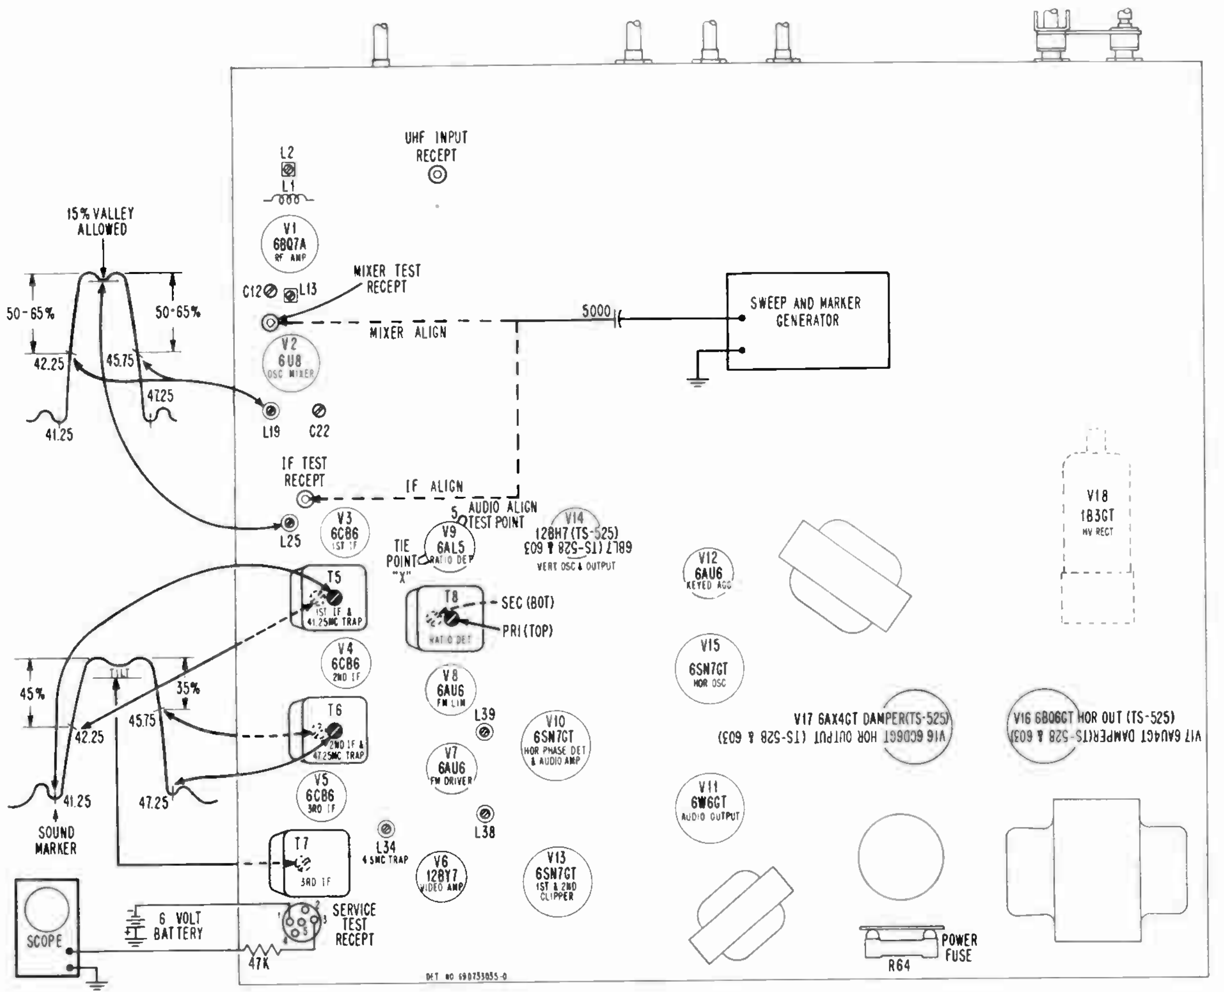

FIGURE 8. TUBE LOCATIONS & IF ALIGNMENT DETAIL

IF AND MIXER ALIGNMENT

1. Remove horizontal output tube (V-16) to eliminate RF interference. Connect a 2500 ohm 10 watt resistor from chassis ground to B++ (250V bus) to normalize voltages.

2. Remove antenna and make following connections: (See Figure 8).

a. Connect a 6 volt battery between pin 1 (IF AGC bus) of service test receptacle and ground. Positive side of battery goes to ground.

b. Disable tuner oscillator by grounding pin 9 of V-2 (6U8) and turn channel selector to channel 13.

c. Connect sweep generator to IF test receptacle and oscilloscope to detector load resistor (pin 3 of service test receptacle).

3. Center sweep frequency at 44 Mc with a sweep width of 10 Mc and adjust generator output below point of receiver limiting (approximately 3 volts peak-to-peak at detector load).

4.

Adjust	At Marker Freq.	For
T-5 top	41.25 Mc	Minimum, See Figure 8
T-6 top	47.25 Mc	Minimum, See Figure 8
T-5 bot	42.25 Mc	Marker at proper point, See Figure 8
T-6 bot	45.75 Mc	Marker at proper point, See Figure 8
T-7 bot	top of curve	Flat top, See Figure 8

As some adjustments interact, repeat as necessary to obtain proper curve.

5. Move generator to mixer test receptacle and short across R-10 (4.7K ohms). See Figure 9 for R-10 location.

L-19 & L-25	42.25 - 45.75 Mc	Proper curve, See Figure 8. If desired overall response cannot be obtained, check dressing of bypass capacitors, especially the screen bypassing of the 1st & 2nd IF tubes. These lead lengths are critical and should be kept short and dressed to obtain proper response.

CHECKS

Bandwidth may be determined by noting the frequencies at which the markers fall at the 50% points. Mixer and IF bandwidth over 3.7 Mc may cause sound bars or burble in the picture; if less than 3 Mc, a loss of resolution or fine detail in the picture may be noticed.

6. Decrease generator signal until there is a marked decrease in the oscilloscope waveform. Unwanted regeneration will be indicated by sharp peaks on the overall response curve. If regeneration is present, check IF cathode resistors, screen bypass capacitors, and lead dress. Improper alignment may also cause regeneration.

AUDIO ALIGNMENT

This alignment may be made by injecting an accurate 4.5 Mc signal in at the video amplifier grid. However, the station alignment method which follows is much more accurate and should be used whenever possible.

1. With receiver in operating condition, tune in station.

2. Connect VTVM from positive terminal of electrolytic capacitor C-50B to ground.

3. Maintain 5 volts, or less, at VTVM by adjustment of fine tuning and contrast control (or by removal of antenna, if necessary) while peaking T-8 primary (top) and L-38 & L-39 for maximum output. (See Figure 8.)

4. Tune for normal picture and carefully note voltage developed at the positive terminal of C-50B.

5. Move meter to junction of R-54 & R-56 (dummy pin on V-9 socket, marked "X" in Figure 8).

6. Adjust T-8 secondary (bottom) to give a reading on the VTVM of exactly one-half of reading in step 4.

4.5 MC TRAP ADJUSTMENT

Tune receiver to a local station and adjust 4.5 Mc trap L-34 for minimum beat interference in the picture by locating the two points of adjustment at which the beat is just noticeable. Rotate the core toward the center of these two points. Use the minimum amount of inductance (core out of coil) that will result in no apparent beat interference.

TUNER ALIGNMENT

GENERAL INFORMATION

It is very unlikely that the Motorola Tuner will need alignment unless it has been damaged, is being replaced, or has had components replaced in the tuned circuits. Tubes may be changed in most cases without realignment, but care must be used in selection or realignment may be required.

The tuner operates by shorting out an antenna, RF and oscillator coil section consecutively for each higher channel. When switched to the lowest channel, all coils of any one section will be series connected. Therefore, alignment must start at the highest channel and each adjustment properly completed before the next lower channel adjustment is attempted. Low-band channels (6-2) may be individually adjusted by stretching or compressing coil turns, while high-band channel inductances (7-13) are formed by a stamped metal plate and are adjustable as a unit by L-13 and C-12 (RF) and L-17 and C-22 (oscillator). The antenna coils are very broad in tuning and generally do not require adjustment.

All alignment procedures in receivers with built-in UHF tuners are made with the UHF tuner input plug in place during alignment. In some models without UHF tuners, a shorting link is installed in the UHF input receptacle. Be certain this plug is in place during alignment. In receivers without the shorting link installed, short UHF input receptacle with a short piece of wire during alignment and leave shorting wire in place upon completion of alignment unless UHF tuner is to be installed.

ANTENNA & RF ALIGNMENT

1. Remove battery used in IF alignment and ground RF AGC bus (white lead or white lead with color tracer on rear of VHF tuner). Connect sweep generator to antenna input socket (with leads as short as possible) and adjust for 10 Mc sweep width. Connect oscilloscope through a 47K resistor to mixer test receptacle (see Figure 9).

2. Set tuner to channel 7 and sweep generator to 177 Mc center frequency. Set video marker to 175.25 and sound marker to 179.75. Adjust C-12 for response shown in Figure 9 (high channel response curve).

3. Set tuner to channel 13 and sweep generator to 213 Mc. Set video marker to 211.25 Mc and sound marker to 215.75 Mc. Adjust L-13 and L-9D for maximum amplitude and response shown in Figure 9 (high channel response curve).

4. Repeat step 2 and 3 as necessary for correct response.

5. Check response curve on channels 13 through 7, setting tuner on proper channel and generator at proper frequencies. (See chart for marker and sweep frequencies.)

6. Turn channel selector, sweep and marker to channel 7 and turn slug out of UHF input coil L-3 until it affects curve. Turn slug back into coil until its effect is completely out of the response curve. This is the proper point of tuning for this coil and no further tuning should be done.

7. Align low channel RF coils (channels 6 through 2) for proper markers as shown on low channel response curve (Figure 9), using proper sweep and marker frequencies. CAUTION: A small change in RF or oscillator coil length on low channels makes a rather large change in frequency. When required, antenna coil L-6 (channels 5 & 6), coil L-8B (channels 3 & 4) and coil L-8A (channel 2) may be adjusted for improved low channel response. While on channel 6, adjust FM trap coil L-1 so that it just starts to affect the curve on the sound side of the response. Be sure that the UHF coil L-3 is not affecting the channel 6 response. While on channel 2, set sweep and marker to 45 Mc and adjust IF trap coil L-2 for minimum response.

8. With station selector switch on channel 6 and RF sweep and marker on channel 7, adjust C-5 for minimum response.

9. With channel selector on UHF position and the sweep generator connected to UHF input receptacle and set at 44 Mc, adjust L-20 for symmetrical response and maximum amplitude. (Make certain shorting link is in UHF jack. See General Information.)

OSCILLATOR ALIGNMENT

PRELIMINARY INSTRUCTIONS

The oscillator is adjusted on each channel using the RF sound frequency of this channel for the marker. The marker must be placed slightly higher, in frequency, on the scope curve than the 41.25 Mc trap dip. This is to compensate for the change of oscillator frequency due to the tuner cover being removed. When cover is replaced, sound marker should move into trap dip within fine tuner rotation tolerances.

Tuner and sweep generator must be set to channel being aligned.

The marker generator is set to the sound frequency of channel being aligned. Use at least a 10 Mc sweep width, or more, if possible.

Waveform to be obtained is similar to that of mixer.

Consistent tilting of the curve, when sound marker is in the trap, indicates misalignment of the IF or mixer section.

PROCEDURE

1. Remove the ground added during IF procedure to pin 9 of 6U8 (oscillator).

2. Connect the oscilloscope (through a 47K ohm resistor) across the video load resistor R-37 (4.7K ohm) at the service test receptacle (pin 3). See IF alignment, Figure 8.

3. Set fine tuner for mid-capacity position (increasing capacity in the counterclockwise direction).

HIGH-BAND ALIGNMENT

4. Adjust oscillator trimmer C-22 on channel 10, using channel 10 sound marker and placing it just above trap null. See Figure 8 and preliminary instructions.

5. Check channels 7 through 13 for correct marker positions (use proper markers and fine tuner, if necessary). A fine tuner rotation of over plus or minus 30 degrees from midpoint, to move marker into trap dip, requires:

a. Adjustment of coil L-17 on channel 13, for compensation of channels 10 through 13.

b. Readjustment of trimmer C-22 on channel 10, for compensation of channels 7 through 10. Recheck marker positions on channels 7 through 13.

LOW-BAND ALIGNMENT

6. Reduce the capacity of fine tuner by rotating 15 degrees clockwise from mid-capacity position.

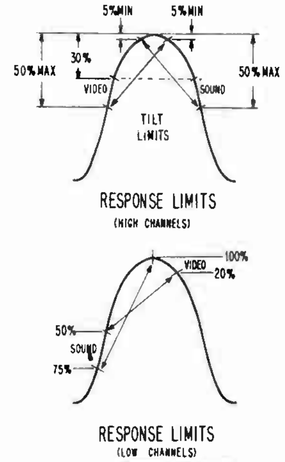
7. Adjust channel 6 oscillator coil, using channel 6 sound marker. Refer to Figure 8 and preliminary instructions. Accuracy of alignment on this channel is extremely important in the alignment of the remaining low-band coils.

8. Adjust oscillator coils of channels 5 through 2 in descending order, using proper markers.

FREQUENCY CHART			
CHANNEL NUMBER	SWEEP GENERATOR CENTER	SOUND MARKER (RF COILS)	PICTURE MARKER ANT COILS
2	57MC	59.75	55.25
3	63MC	65.75	61.25
4	69MC	71.75	67.25
5	79MC	81.75	77.25
6	85MC	87.75	83.25
7	177MC	179.75	175.25
8	183MC	185.75	181.25
9	189MC	191.75	187.25
10	195MC	197.75	193.25
11	201MC	203.75	199.25
12	207MC	209.75	205.25
13	213MC	215.75	211.25

HIGH CHANNEL LIMITS
ON CHANNELS 7 TO 13, EITHER MARKER MAY BE DOWN 50% FROM PEAK, PROVIDED OPPOSITE MARKER DOES NOT FALL BELOW THE PEAK BY MORE THAN 30% OR LESS THAN 5%

LOW CHANNEL LIMITS
ON CHANNELS 2 TO 6, THE SOUND MARKER MAY BE DOWN NO LESS THAN 50% OR NO MORE THAN 75% FROM PEAK AND THE VIDEO MARKER MAY BE DOWN NO MORE THAN 20% FROM PEAK.



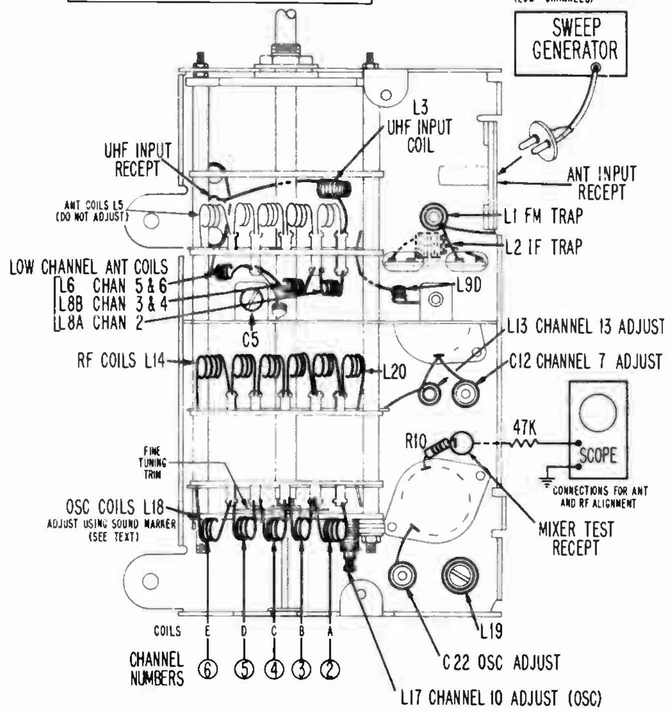


FIGURE 9. TUNER ALIGNMENT DETAIL

NOTE: WHEN TUNER COVER IS REPLACED, ALL SOUND MARKERS MUST MOVE INTO TRAP DIP WITHIN FINE TUNER ROTATION LIMITS. LIMITS ARE ±15° FROM MID-POSITION ON LOW CHANNELS AND ±30° FROM MID-POSITION ON HIGH CHANNELS.

RECEIVER SENSITIVITY TESTS

IF Sensitivity Tests

1. Set contrast control at minimum, disable horizontal sweep by removing horizontal output tube and normalize voltages by connecting a 2500 ohm 10 watt resistor from B++ to ground.

2. Stop oscillator by shorting pin 9 V-2, to ground.

3. Short IF AGC bus to ground (pin 1 of service test receptacle).

4. Set channel selector to channel 13.

5. Connect high side of VTVM to pin 3 of service test receptacle and other lead to chassis ground.

6. Inject a 45 Mc signal, with no modulation into IF test receptacle through a 1000 mmf capacitor. Less than 600 microvolts should be required to produce a one volt DC rise above noise at the detector load (pin 3 of service test receptacle).

7. Short out R-10 (4700 ohm) at V-2 (mixer) grid.

8. Inject the generator into mixer test receptacle. Less than 75 microvolts should be required to produce a one volt DC rise above noise at the detector load.

Overall Sensitivity Test

9. Remove short on R-10 and oscillator and inject generator signal into antenna input (use resistor matching network when necessary). Set generator to the center frequency of channel being checked with 30% modulation. Set fine tuning and contrast for maximum output. A peak-to-peak reading of 18 volts AC should be produced at the picture tube cathode with generator outputs of less than 15 microvolts on channels 2 through 6 and less than 25 microvolts on channels 7 through 13. This voltage may be read with a calibrated oscilloscope. To calibrate scope, connect the vertical deflection plates to a source of 6.3 volts (filament supply). This will equal approximately 18 volts peak-to-peak (6.3 x 2.4).

Sound Sensitivity Tests

10. Connect signal generator through a 5000 mmf capacitor into the video detector load (pin 3 of service test receptacle). Inject a 4.5 Mc unmodulated signal at this point.

11. Connect VTVM (DC scale) to the positive terminal of electrolytic capacitor C-50B and connect ground lead to chassis.

12. A 5000 microvolt signal should produce approximately 10 volts.

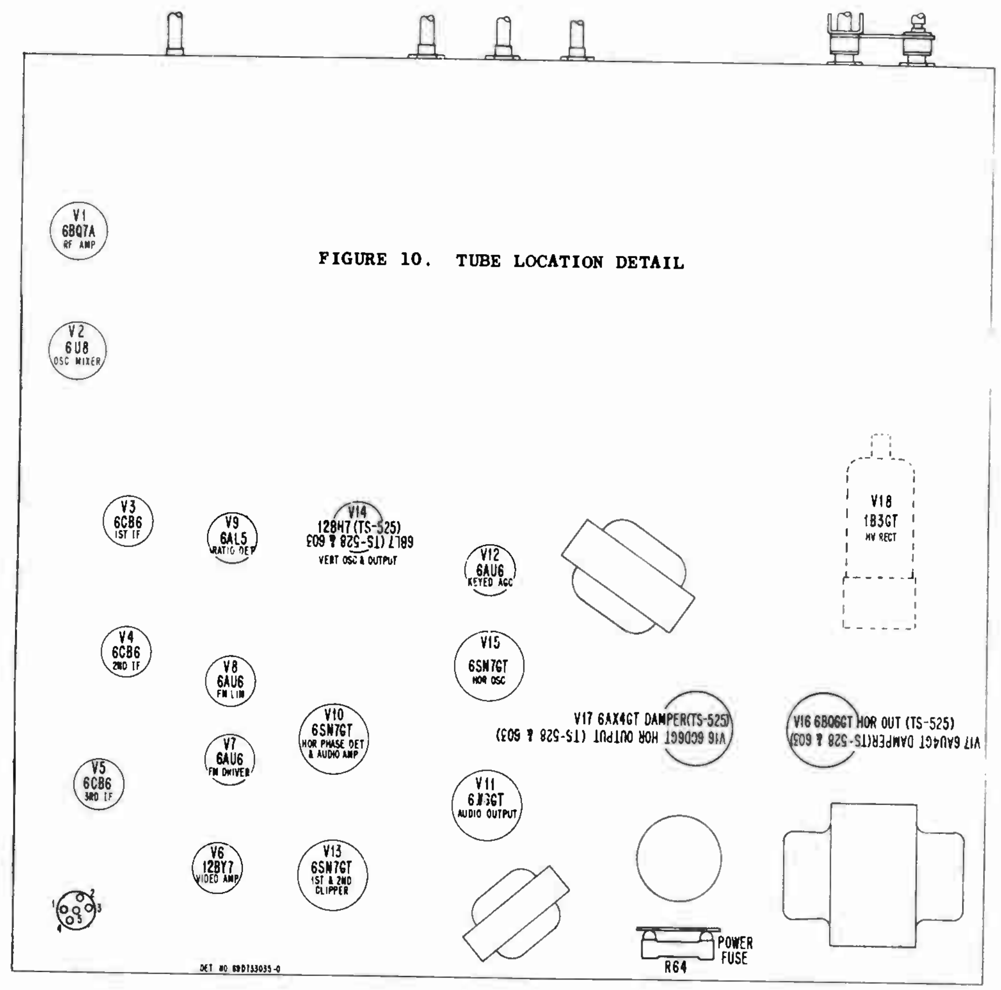

FIGURE 10. TUBE LOCATION DETAIL

SERVICE NOTES

PICTURE TUBE REPLACEMENT

To replace picture tube:

1. Remove second anode connector and short the picture tube anode to ground with a well insulated piece of wire.

2. Carefully remove picture tube socket and ion trap magnet.

3. Remove screws holding picture tube clamping band and remove band.

4. Carefully remove picture tube using caution not to damage yoke with neck of tube and not to exert any undue pressure on the tube itself.

5. Insert new tube carefully into yoke and position tube tightly against the front support bracket lugs. If at this time the rear tube support does not bear against the flare of the tube or, if it requires pressure to insert tube behind the mounting lugs, loosen rear tube support bracket mounting screws and slide forward or backward to fit against tube without forcing. If the bracket is too tight, it will cause mispositioning of the yoke. Tighten rear support bracket screws.

6. Reinstall picture tube clamping band and tighten screws securely.

7. Replace ion trap magnet, picture tube socket, and second anode connector. Loosen yoke adjustment thumbscrew and yoke saddle screws and push the yoke up against the flare of the tube. Tighten all screws.

8. Readjust yoke, ion trap and centering device.

REMOVAL OF CABINET SAFETY GLASS

1. Remove the screws and molding strip located along top edge of glass.

2. Safety glass will move outward from cabinet allowing its removal by lifting out of lower retaining channel.

3. When replacing, position rubber on glass with low side of channel facing inside of cabinet.

4. Replace molding and screws.

TONE CONTROL LINKAGE

To replace or adjust tone control linkage:

1. Set control maximum counterclockwise and install linkage with arms on top and rotated fully counterclockwise. Tighten screw.

2. With chassis in cabinet, install knob with lettering to the top.

CHANGING OF TUBES (Refer to Figure 10)

INDISCRIMINATE CHANGING OR INTERCHANGING OF TUBES MUST BE AVOIDED.

a. A change of IF or RF tubes may affect alignment. Always check alignment and sensitivity after these changes.

b. A change of audio circuit tubes may cause buzz, loss of sensitivity, and distortion. Check audio alignment and sensitivity.

c. Changing horizontal oscillator tube may cause horizontal control to be out of range and poor noise rejection. This may require readjustment of horizontal oscillator coil.

FUSE REPLACEMENT

B+ and initial surge: 7.5 ohm special resistor
Filament: fusing wire; 1" of #26 copper wire

B+ and initial surge fuse (special 7.5 ohm resistor R-64)
This fuse is of the plug-in type and is accessible by removing the cabinet back. See Figure 2 for location.

Filament fuse F-1 (1" #26 copper wire)
To replace the filament fuse, the chassis must be removed from the cabinet. See Figure 11 for location. Use a piece of #26 copper wire 1" long, soldered between the two lugs.

SERVICE TEST RECEPTACLE

A SERVICE TEST RECEPTACLE, accessible from the top of the chassis (see Figure 2) provides the following test points:

Pin	Connection To
1	IF AGC
2	B+
3	Video detector output
4	Filament
5	B++

These test points are available to the technician merely by removal of the receiver cabinet back and provide rapid checking of the power supply voltages -- giving the approximate condition of the selenium rectifiers and the line voltage. The filament connection checks the filament fuse as well as the voltage output of the filament transformer. Operation of the receiver from the antenna to the detector may be checked by the use of pin #3 (detector output). Pin #1 allows rapid checking of the IF AGC voltage. It is suggested that this voltage be checked and recorded at the first opportunity by the service technician using a receiver in normal operating condition. Such IF AGC voltage information may be invaluable when checking sets in which the AGC action is doubtful. This voltage varies according to the signal strength and may range from a very low value to about 8 volts minus.

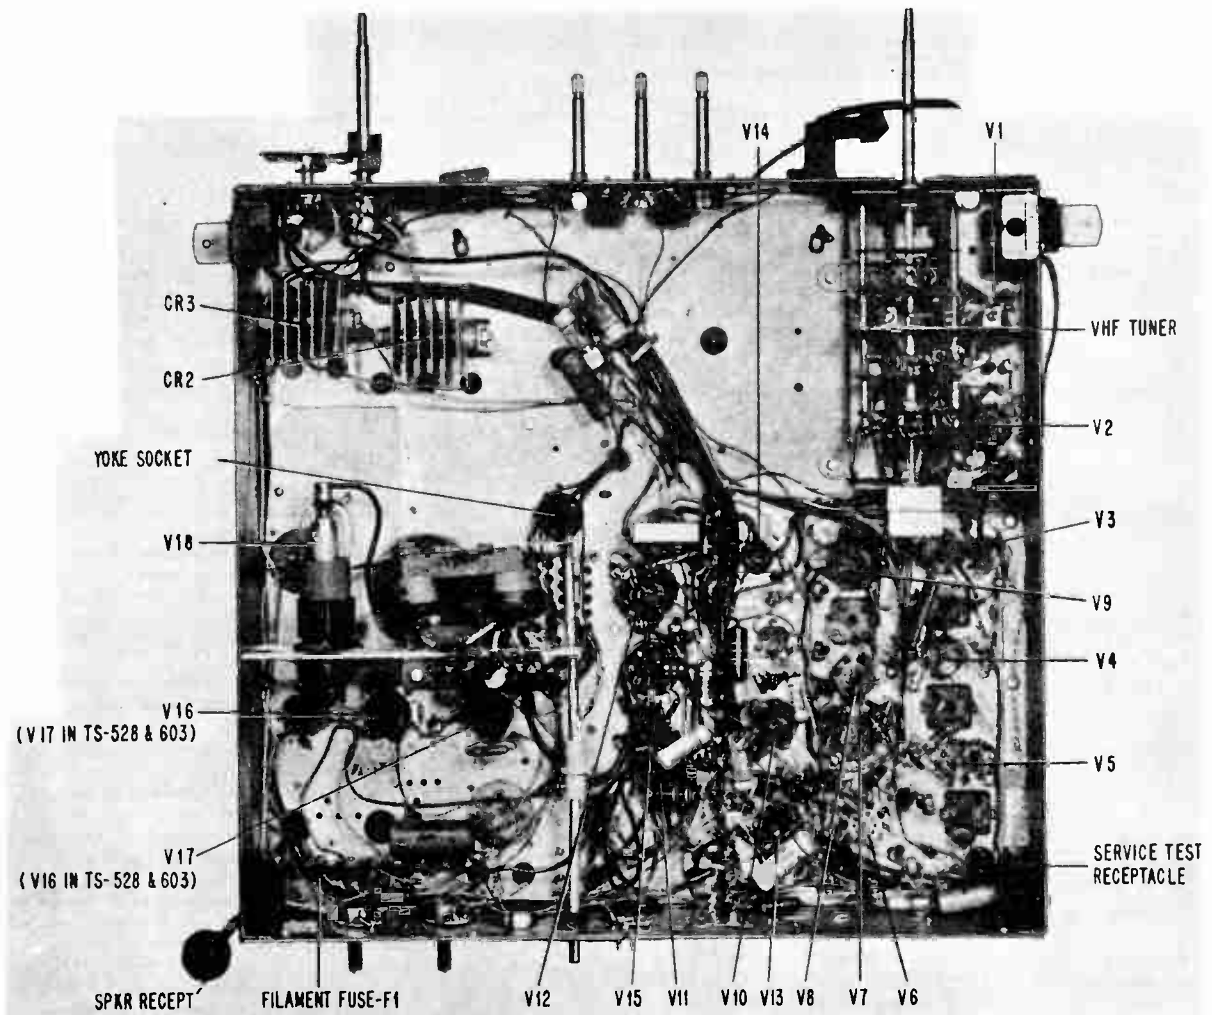

FIGURE 11. BOTTOM VIEW OF CHASSIS

SERVICE AID CHART

The following chart is designed as an aid to the technician as well as a guide to Motorola dealers, salesmen and non-technical people who may be called upon to correct some of the more simple troubles in television receivers. This chart is planned so that the more readily corrected difficulties are in the first column, the more complicated problems in the second column, etc.

In general, the information given in the MISCELLANEOUS CHECKS column should only be attempted by a trained technician.

Be certain that all applicable remedies in each section are attempted before continuing to the next column.

The television screen supplies an abundance of visible information, therefore, examine the screen very carefully, determine possible source of trouble and then proceed to make the adjustments and repairs as described in the chart.

If moving the adjustments or controls does not rectify the troubles, return them to their original position.

Turn the set to the "OFF" position when replacing tubes and replace only one tube at a time.

Before removing the picture tube, acquaint yourself with the PICTURE TUBE HANDLING PRECAUTIONS.

The following should be used in conjunction with the chart: Figure 1 (Operating Controls), Figure 2 (Rear View of Chassis) and Figure 10 (Tube Location).

This chart, if used wisely, may be of assistance even in problems not listed in this chart as in the case of a set having multiple troubles. Handling these troubles as individual problems regardless of accompanying symptoms may simplify the repairs.

TROUBLE CHART

SYMPTOM	CONTROLS	CHECK OR ADJUST	TUBES	MISCELLANEOUS CHECKS
SET DEAD (tubes not lighting)	Off-On volume	Is set plugged in? Is back cover on? Is AC line voltage available at outlet? (Check with lamp)		Filament fuse F-1
(tubes are lit)		Power fuse, R-64. Is speaker plugged in? Replace any tubes that do not light.	V-11	
NORMAL RASTER NO PICTURE NO SOUND	Channel selector (on station?)	Antenna connections. Is station on air?	V-1, 2, 3, 4, 5, 11 & 12	B+ voltage. Video detector, CR-1. AGC voltage. RF, IF or mixer stages.
WEAK PICTURE (insufficient contrast)	Contrast. Fine tuning. Channel selector on correct channel?	Antenna connections	V-1, 2, 3, 4, 5, 6 & 12	AGC voltage. Contrast control. RF, IF, mixer & AGC stages
LOW BRIGHTNESS OR NO RASTER	Brightness.	Ion trap magnet	V-15, 16, 17, 18, 19 & 11	High voltage at picture tube anode. Drive voltage, pin 5 V-16. Bootstrap voltage. B+, B++ and CRT voltages. Solder connections, base of CRT. Voltages & waveforms in V-15 & V-16 circuits. Horizontal output transformer & deflection yoke.
POOR VERTICAL LINEARITY AND/OR SIZE. HORIZ. WHITE LINE. (no vert. sweep)	Vertical size. Vert lin. Reduce brightness & return to normal when trouble is cleared.		V-14	Bootstrap voltage. Voltages in V-14 circuit. Electrolytics, C-99 & C-74C. Vertical output transformer & deflection yoke.
VERTICAL INSTABILITY, PICTURE ROLLS	Vertical hold		V-13, 14	AGC voltage. Voltages in V-13 & V-14A circuit. Interference. Sync clipping at video amplifier. Refer to tests under WEAK PICTURE. Abnormal power supply ripple. Insufficient bootstrap filtering. Video detector.

LOSS OF VERTICAL AND HORIZ. HOLD	Horiz. hold. Vert. hold.	Weak signal. Antenna and lead-in	V-13	B+ voltage. AGC voltage. Refer to test under VERTICAL INSTABILITY & NO HORIZ. HOLD.
NO HORIZ. HOLD OR CRITICAL HORIZ. HOLD	Horiz. hold	Horiz. osc. coil	V-10, 13, & 15	Refer to special "SERVICE HINTS". Waveforms in V-10B & V-15 circuits. Refer to tests under WEAK PICTURE.
INSUFFICIENT HORIZ. SIZE	Horiz. size	Center picture	V-15, 16 & 17	Bootstrap voltage. Drive voltage, pin 5, V-16. Deflection yoke and horiz. output transformer.
PICTURE NORMAL, NO SOUND OR WEAK SOUND	Fine tuning volume		V-7, 8, 9, 10 & 11	Speaker & speaker plug. Output transformer. Voltages of V-10, V-11. Sound alignment.
BUZZ IN SOUND	Fine tuning contrast	Excessive signal	V-7, 8, 9, 10 & 11	Ratio det. alignment. Sync clipping in video section. Improper AGC action. Power supply filter & sweep circuit bypass capacitors. Heater-cathode shorts in sound tubes.
VHF - NO UHF	UHF tuning UHF switch	Antenna connections	UHF Osc 6AF4	
MICROPHONICS VISUAL & AUDIBLE		Binding knobs & control shafts		Tap tubes -look & listen for microphonics.
INSUFFICIENT PICTURE SIZE HORIZ. & VERT.		Check AC line voltage		Power supply voltages Selenium rectifiers.
EXCESSIVE CONTRAST, NEGATIVE PICTURE	Contrast		V-1, 2, 3, 4, 5, 6 & 12	AGC voltage and AGC circuit. Video det. Video det. load resistor. Leakage between prim. & sec. in video IF coils. Proper pulse from horiz. output to AGC tube. Pulse coupling capacitor to AGC tube C-107 RF AGC delay resistors R-21, R-22
WIDE HORIZ. BAR OR GRADUATION IN SHADING VERTICALLY (Set may have poor vert. sync)			V-1, 2, 3, 4, 5, & 6	Heater-cathode short in any video circuit. Excessive power supply ripple (may have hum in audio). Selenium rectifiers. Heater-cathode short in V-10A (loud hum in audio). Picture tube.
INTERFERENCE IN PICTURE	Fine tuning	Ant. location Lead-in location Ant. type	V-16	Improper adjustment of 41.25 Mc and 4.5 Mc traps. Improper alignment. Open screen & decoupling bypass capacitors. Poor filter capacitors. High voltage arcs - corona. Other receivers in immediate vicinity. Radiation from signal sources in immediate vicinity. Improper horiz. hold coil adj.

PRODUCTION CHANGES

A-01 thru A-03 (TS-525 series only)

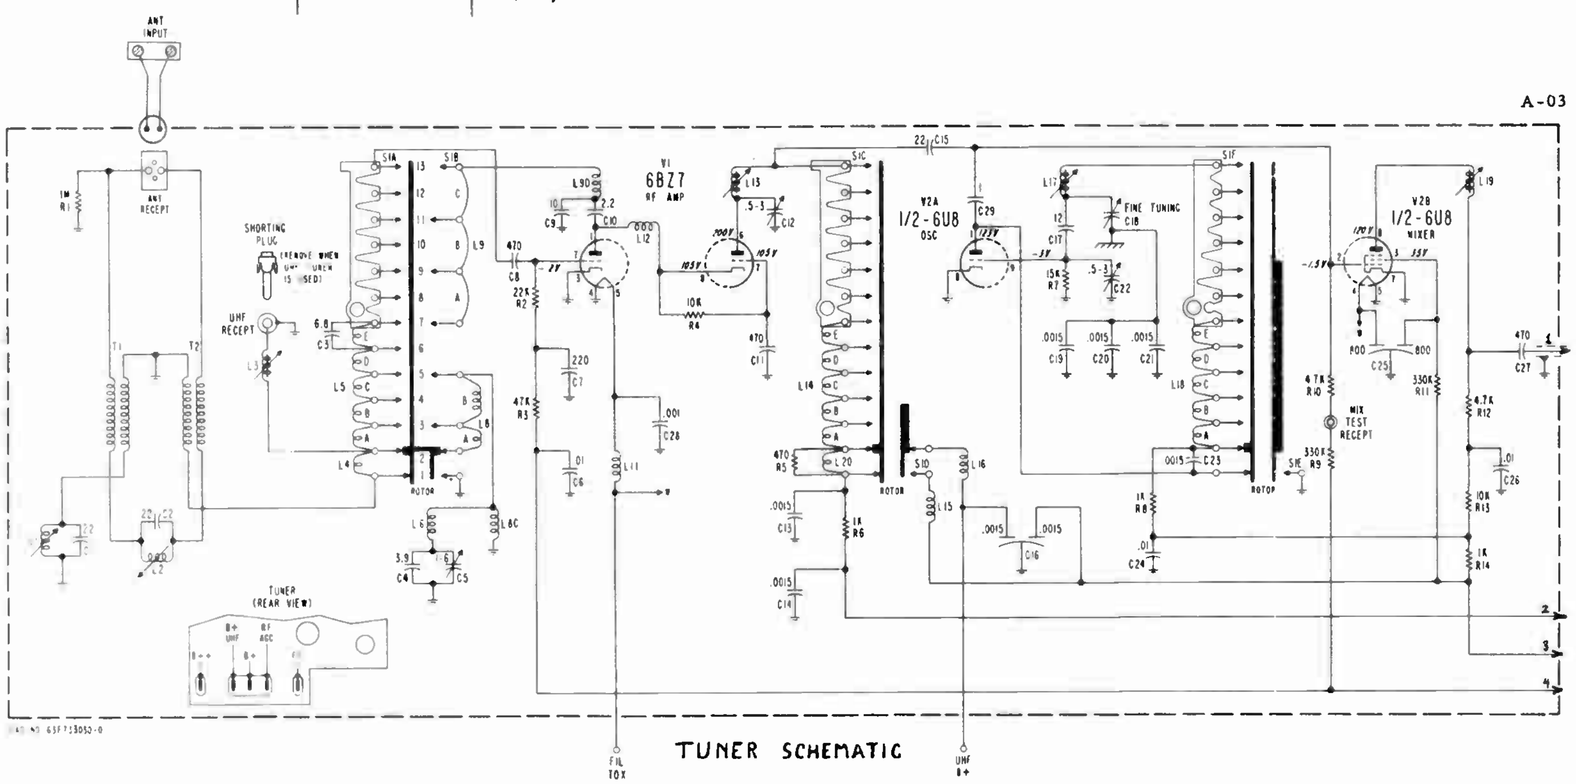
TV CHASSIS CODING

The first production chassis number carries the suffix "A-00" (i.e., TS-525A-00). With the first minor electrical revision, the suffix becomes "A-01" and with each subsequent minor change "A-02", "A-03", etc. The first major revision changes the suffix to "B-00" and, as before, each following minor change is labeled "B-01", etc.

Mechanical differences between chassis are indicated by addition of a prefix to the basic chassis (i.e., RTS-525A-00). These prefixes may be assigned in random sequence but will be confined to the end of the alphabet to avoid confusion with the A, B, C, etc., electrical change suffixes.

A "Y" suffix added to basic chassis (i.e., TS-525YA-00, etc.) indicates that the chassis contains a factory-installed UHF tuner.

Chassis Coding	Changes
(TS-525 Series Only)	
A-01	To improve the IF response C-38 (470 mmf) changed to .001 mf; C-40 (560 mmf) moved to a direct chassis ground.
A-02	To aid the magnetic centering device in horizontal centering and reduce neck shadows, a non-adjustable horizontal centering circuit is added as follows: 1. C-106 (.1 mf) replaced with linearity coil L-44 to provide a DC path through the horizontal deflection yoke. 2. Connection between lugs 4 and 5 of the horizontal output transformer (T-13) removed and an 18 ohm resistor inserted between lugs 4 and 5 to force current through yoke. 3. Leads of L-41 (RF choke) and R-83 (150K resistor) connect to lug 4 of the output transformer; the lead of L-44 connects to lug 5.
A-03	R-66 (4.7M grid to ground resistor of 1st sync separator) changed to 1.5M and ground end re-connected to cathode (pin 3) of V-13 to improve sync range at high contrast levels. NOTE: A-02 changes not incorporated into all A-03 chassis.



TUNER SCHEMATIC

CAPACITOR VALUES UNDER 1000 ARE IN MMF
ALL OTHERS IN MF UNLESS OTHERWISE SPECIFIED

⊥ = GND TO CHASSIS   = GND TO TUNER SHAFT

NOTES

VOLTAGE MEASUREMENTS

1. Made with a VTVM from point indicated to chassis
2. Line voltage - 117 volts
3. Antenna disconnected
4. Channel selector switch on channel which develops less than 1 volt noise at pin 3 of test recept
5. Contrast control maximum clockwise position
6. All other controls in normal operating position
7. Voltages associated with circuits having variable controls may vary with control settings

WAVEFORMS

1. Observed on Dumont Model 241 oscilloscope
2. Contrast control set for signal of 45V P to P at plate of video amp tube
3. All other controls in normal operating position
4. Horizontal output tube removed to eliminate HV pulse interference from scope when observing all waveforms, except those from phase det through horiz circuit

GENERAL INFORMATION

This booklet contains service information covering the Motorola TS-902A-03 (horizontal chassis) and the BP-902A-01 (vertical chassis). These individual chassis are interconnected in the 19-inch Motorola color television receiver series which incorporate the 19VP22 tri-color picture tube.

CHASSIS DESCRIPTION

The receiver circuits are built around 29 circuit tubes, a 19VP22 19-inch tri-color picture tube (aluminized-glass envelope, electrostatic focusing, 62 degree deflection angle) plus three germanium diodes and three selenium rectifiers. The horizontal chassis contains all signal circuits except those devoted strictly to color, the scanning circuits, filament and "B" supply. The vertical chassis contains the color section.

ELECTRICAL SPECIFICATIONS

POWER RATING - Source: 117 volts, 60 cycle AC
360 to 375 watts

NUMBER OF TUBES - 29 tubes plus 3 selenium rectifiers, 3 germanium diodes and a tri-color picture tube

INTERMEDIATE FREQUENCIES - Video: 45.75 Mc
Sound: 41.25 Mc and 4.5 Mc

FREQUENCY RANGE - Channels 2 through 13 (VHF tuner - WTT-67)
Channels 14 through 83 (UHF tuner - TT-37)

ANTENNA INPUT IMPEDANCE - VHF & UHF: Balanced 300 ohm

FUSES - Filament: 1 inch #26 copper wire, located beneath chassis near filament transformer
Power: Special 7.5 ohm plug-in resistor, located near filament transformer on top rear of horizontal chassis

POWER SUPPLY VOLTAGES (117 volts AC line voltage) - B triple plus 390 volts
B double plus 240 volts
B plus 125 volts

AUDIO OUTPUT - 1.5 watts undistorted

INSTALLATION & OPERATION

Locating the receiver

It is advisable to determine the approximately permanent position of the receiver before any attempt is made to erect an antenna or to install lead-in wires. Once the location of the receiver is determined, it is desirable to retain this location, due to the effect of stray external magnetic fields on the purity adjustments of the color fields, etc. Balancing adjustments have been incorporated into the receiver to compensate for such natural conditions; however, these controls may require re-adjustment for each change in receiver location. Such receiver movements should be avoided.

The selection of the permanent location of the receiver should be based upon the best picture visibility from the greatest number of room positions; so that all persons can view the picture comfortably. Locating the receiver near windows and corners should be avoided. The location should be chosen so that the cabinet will be subjected to a minimum amount of heat and moisture; otherwise the cabinet finish may suffer damage. Allow sufficient space behind the cabinet for proper ventilation of the chassis.

Room lighting

It is desirable to have some light in the room when viewing any type of television picture. A completely darkened room tends to create eye-strain. Light from a shaded lamp which does not fall directly on the face of the screen is usually satisfactory.

A condition of room lighting must be taken into consideration with color receivers, however, which was not important previously. That is the overall color tint of the lighting used. The room lighting color tint can accentuate or reduce certain color reproductions acutely. While the receiver may be adjusted to compensate for such lighting conditions, it is desirable to use a colorless bulb and lampshade during color program viewing.

It is also important that any receiver set-up adjustments made by the technician are performed while using the room lighting that will be available during program viewing. If different color lighting is used during set-up, it is quite possible to adjust for white screen conditions only to find that under the viewing lights, the screen may have a predominant blue, green, or red tinge.

Antenna requirements

Indoor antennas of the portable type are often satisfactory for color reception, provided the receiver is located in a strong signal area. However, an outdoor antenna will invariably give a better overall picture on all channels and is recommended whenever possible.

A color signal, as received from the transmitter, contains a number of additional signals which must reach the receiver for good color reproduction. Due to these extra requirements, many present antenna types and their lead-in wires are unsatisfactory. Color reception requires a broad-band type of antenna, a narrow-band single channel antenna can completely remove the color signals. The same is true of incorrect lead-in wires and mismatched lines. Keep in mind that it is entirely possible for an existing antenna installation to furnish satisfactory reception on a black/white receiver, but fail completely on color broadcasts. In the case of antennas for UHF reception, the above information applies with the extra care required for more critical UHF antenna set-up.

When deciding on an antenna type, remember that it is entirely possible for stations to change channels in the VHF group, and that single-channel, high-band or low-band antennas may have to be replaced to receive the new channels.

INITIAL INSTALLATION INSTRUCTIONS

After the receiver has been placed in its permanent position as determined by the viewing requirements and lead-in facilities, it is necessary to remove the cabinet back cover and shift the lever connected to the dynamic convergence coils to such position that the coils are moved flush against the neck of the picture tube (the convergence coils are moved away from the picture tube neck during shipment only). This lever is at the extreme top of the rear CRT mounting bracket and may be seen in the top view drawing of the tri-color picture tube(Fig1).

As stated previously, external magnetic fields of varying degrees and directions are encountered for each new receiver location and it is necessary to balance the receiver circuitry for the initial installation location, as well as to correct any misadjustment caused in shipment. The first receiver checks to be made, therefore, are those for correct purity, convergence and focus. Since it is almost always necessary to adjust the purity and convergence systems in an initial installation, a complete set-up procedure follows.

NOTE: To facilitate adjustments to the picture tube components and other parts, the cabinet is provided with a removable hinged top section. This top section may be moved only after the cabinet back has been removed.

Depending on the cabinet style, two different top panel locking mechanisms will be encountered. In one type, a small wooden slider, at the center underside of the top panel, will move to the rear; thus unlocking the top panel at the front end of the cabinet. The other type is fastened to the wooden side channels by thumbscrews.

HIGH VOLTAGE WARNING

Operation of this receiver with the chassis accessible involves shock hazard; therefore, no work should be done on this receiver by anyone not familiar with these hazards.

Due to the circuit used, there is always a potential difference between the chassis and ground. AN ISOLATION TRANSFORMER SHOULD BE USED WHEN SERVICING THIS RECEIVER.

Do not operate the receiver with the high voltage compartment shield removed. Make sure the ground springs between the chassis and the picture tube shield and between the yoke assembly and the picture tube shield are making contact.

PICTURE TUBE HANDLING PRECAUTIONS

Extreme care must be used in handling the picture tube as rough handling may cause it to implode due to atmospheric pressure. DO NOT NICK OR SCRATCH GLASS, OR SUBJECT IT TO ANY UNDUE PRESSURE IN INSTALLATION OR REMOVAL. Do not remove the receiver chassis, install, remove, or handle the picture tube in any manner unless shatterproof goggles and heavy gloves are worn. DISCHARGE 2nd ANODE LEAD BEFORE HANDLING.

THE TRI-COLOR PICTURE TUBE SET-UP (TS-902)

One of the first problems in setting up the picture tube is to make the apparent deflection centers of the three beams the same as that dictated by the particular picture tube design. The term "deflection centers" refers to the point inside or near the deflection yoke at which the three beams begin bending for horizontal and vertical sweeping. The forward and rear positioning of the deflection yoke on the neck of the tube locates the correct deflection centers of the beams. When the deflection center of any of the beams is incorrect, the beam will scan phosphor dots of incorrect colors.

The purity magnet mounted on the neck of the tube provides an adjustment whereby the three beams can be made to pass through their centers of deflection when the central area of the screen is being scanned.

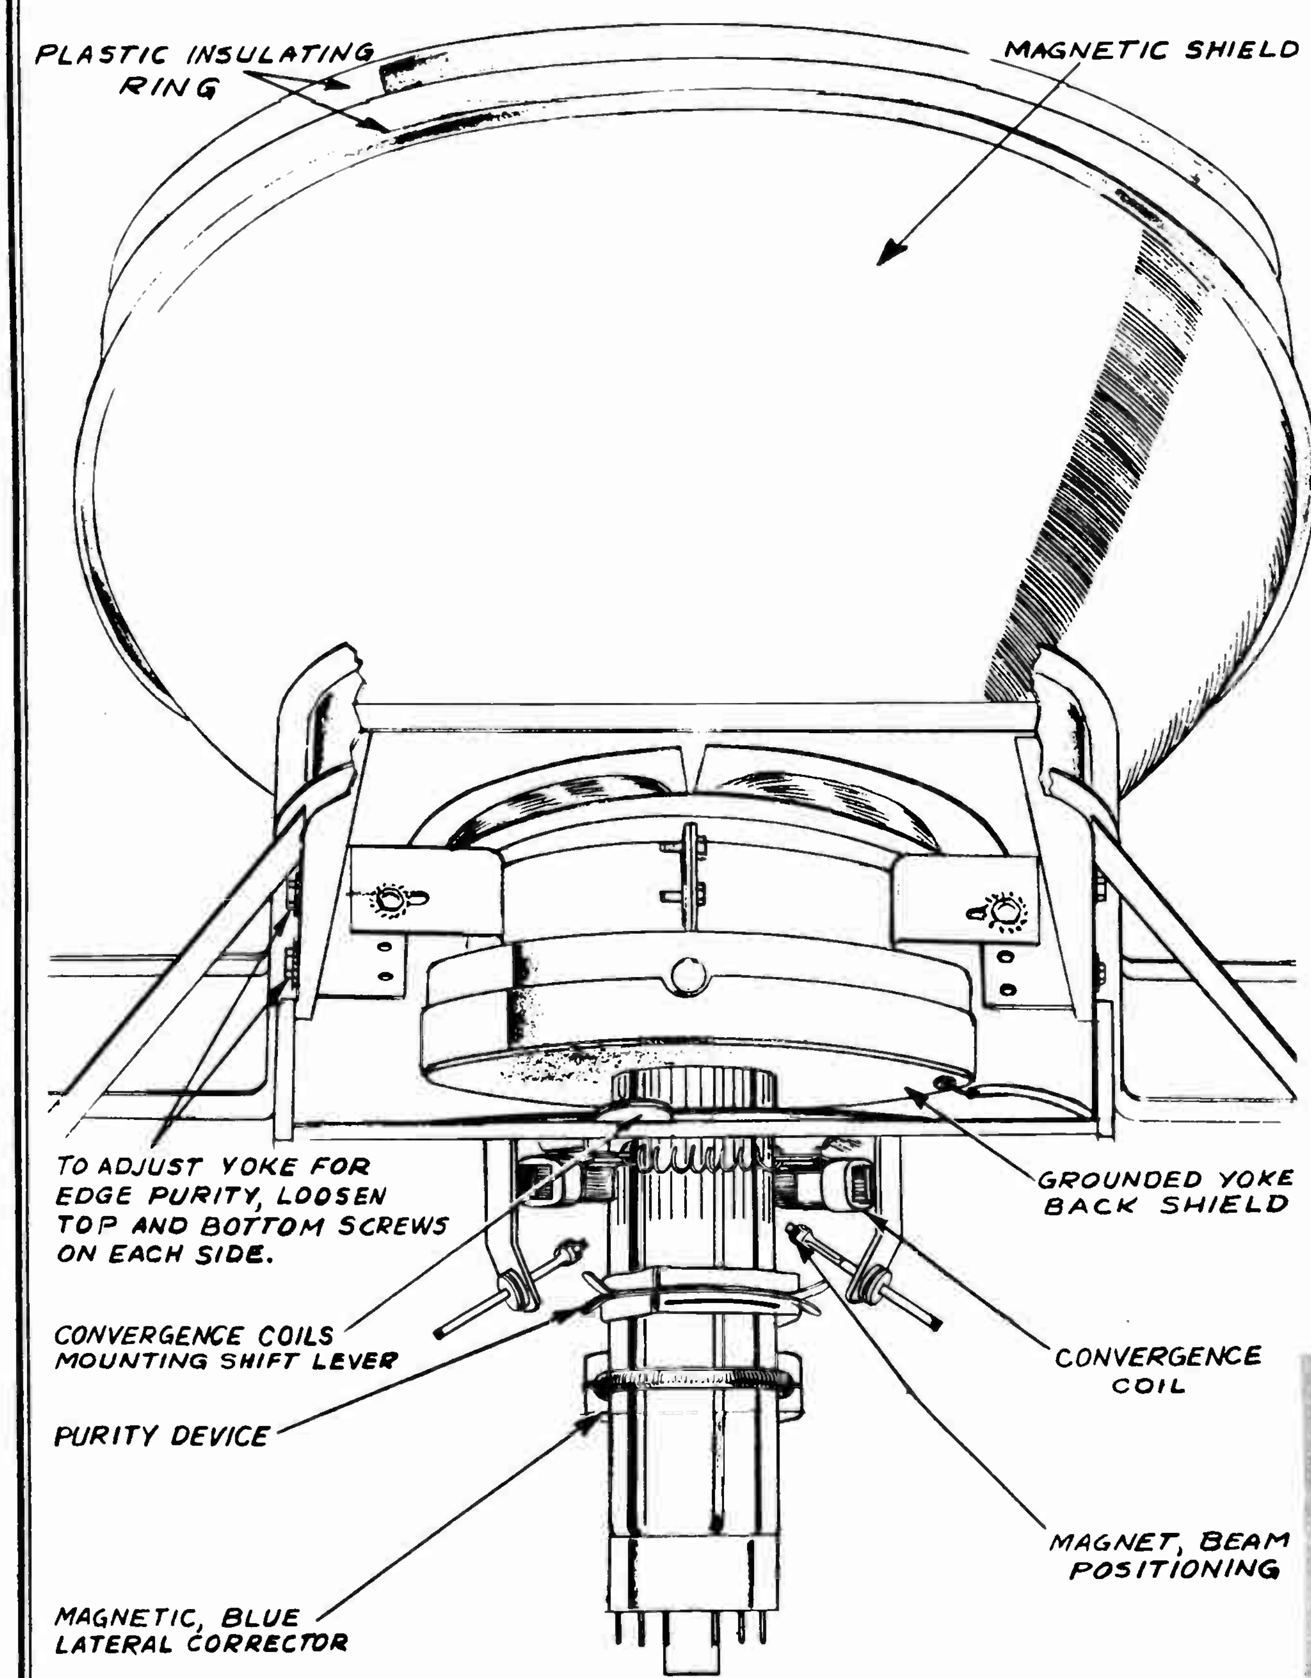

FIGURE 1. TOP VIEW OF TRICOLOR PICTURE TUBE

PURITY ADJUSTMENT

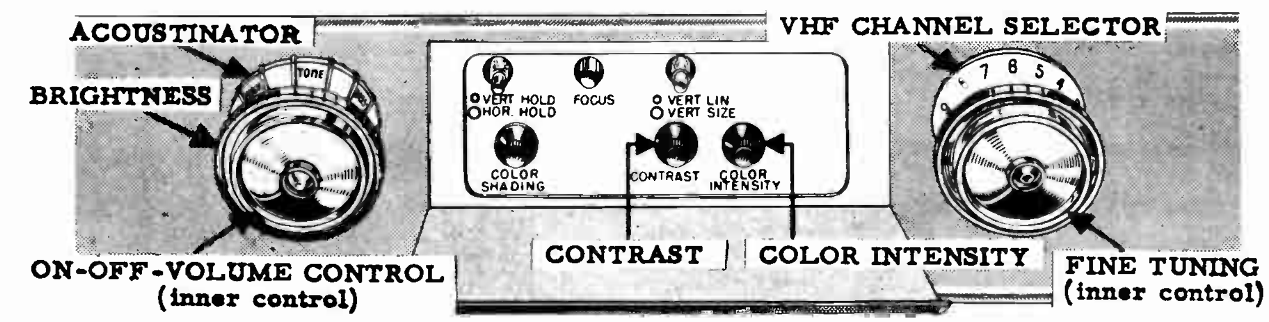
1. Inject a signal from a dot pattern generator or other appropriate source into the receiver.

2. Adjust the three beam positioning magnets and the blue lateral corrector magnet for convergence of the three beams at the center of the screen. (Fig. 1).

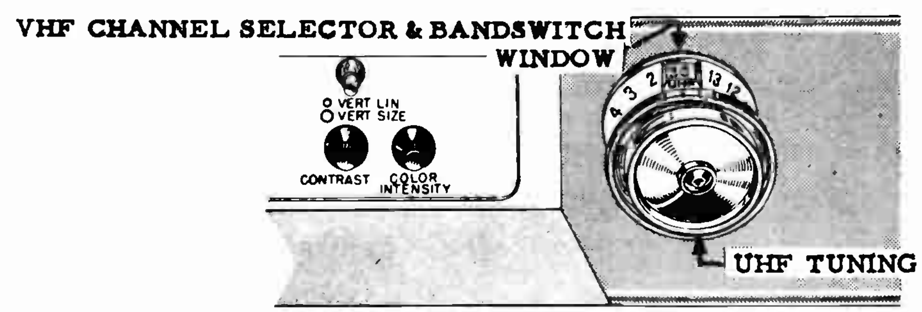
3. Remove all signal to the receiver or switch the channel selector to a vacant channel.
4. Cut off the blue and green guns by grounding their grids into the ground holes of the receptacle. (See vertical chassis, front view.) (Fig. 14).
5. Adjust the BRIGHTNESS control for high raster brightness.
6. Loosen four screws (two screws on each side of bracket) to allow backward-forward movement of yoke. If set has not been previously adjusted for purity, position yoke back as far as the mounting will allow. If set has been adjusted previously for purity, confine yoke adjustment to a minimum. Keep yoke concentric with neck of picture tube.

7. Locate the purity device, consisting of two magnetic rings mounted on the tube neck. The device is between the blue corrector magnet and the dynamic convergence coils. Position the tabs of one ring opposite the tabs of the other ring so that a minimum strength magnetic field is produced. If the correct tabs are opposite each other, rotating both rings of the device together should have no affect on the raster. If the position of the tabs is incorrect, rotate the rings to place the opposite tabs adjacent to each other.

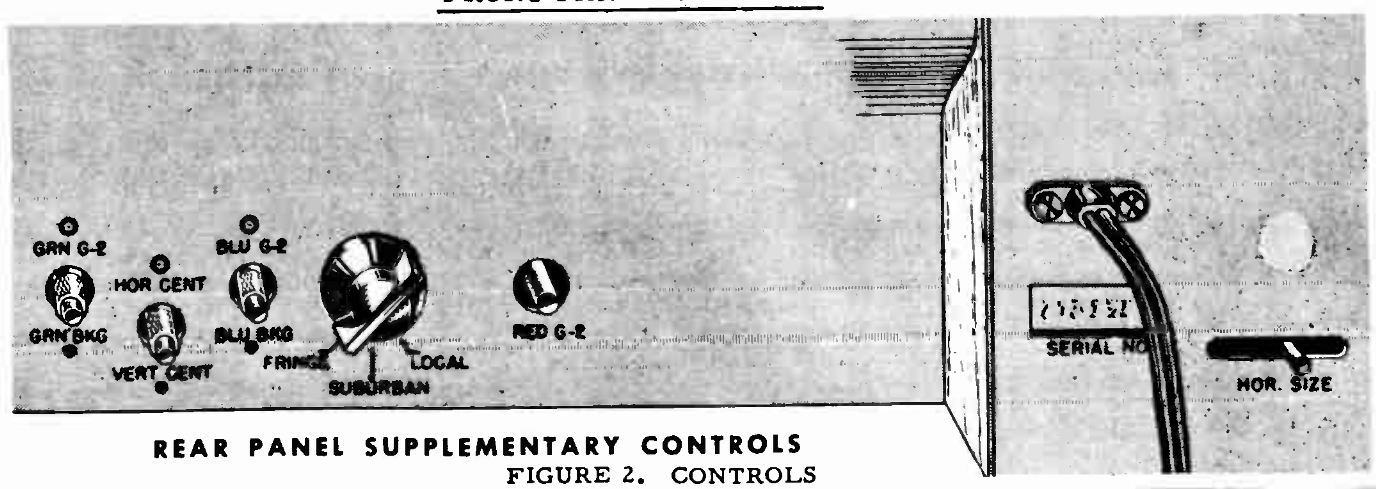
VHF OPERATION (channels 2 through 13)



(Only for sets equipped for channels 14-83)



FRONT PANEL CONTROLS



REAR PANEL SUPPLEMENTARY CONTROLS

FIGURE 2. CONTROLS

8. Check the purity at the center of the screen. If it is not satisfactory:

a. Separate the tabs by a small amount to produce a weak magnetic field.

b. Rotate the purity device to obtain better red purity in the central area of the screen.

c. Continue the process of adjusting the field strength and direction of the magnetic field until the purity in the central area of the screen has been made as large as possible.

NOTE: Use as weak a magnetic field as possible. Avoid shadow due to beam cut-off by the tube neck.

9. Move the yoke forward and backward along the neck of the tube to obtain best edge purity.

10. Re-adjust the purity device for best overall purity.

NOTE: If satisfactory edge purity cannot be obtained, it may indicate either a defective yoke or picture tube.

11. Check the purity of the green and blue fields, one at a time, by keeping the grid of the desired gun inserted into the grid receptacle and grounding the grid plugs of the other two guns. Avoid any shadows due to neck cut-off of the beams.

12. It may be necessary to compromise the setting of the purity device which resulted in best red purity in an effort to obtain best overall purity of all colors. In any compromise setting, however, the red field should always be favored strongly. Re-insert all grid plugs after purity adjustments have been completed.

DYNAMIC CONVERGENCE SYSTEM

Because the phosphor screen is not a true spherical surface, the distance the three beams travel from the center of deflection is greater at the outer areas of the phosphor screen than at the center. At the outer areas, therefore, the beams will cross-over, or converge, before they reach the shadow mask, thus causing over-convergence in these areas. The dynamic convergence coils apply electromagnetic correction to each of the three beams at a horizontal and vertical sweep rate to correct this condition. This correction causes the point of convergence to change according to the sweep rate and beam position so that it always follows the curvature of the shadow mask.

PROCEDURE

1. Turn all dynamic amplitude controls to minimum (fully counterclockwise). (Fig. 14).

2. Turn vertical tilt controls to minimum (mid-position). (Fig. 14).

3. Position shift lever so that convergence coil pole pieces are seated on the neck of the picture tube. (Fig. 1).

4. Use the signal from a dot pattern generator or other suitable source. Adjust the brightness of each beam so that each color dot can be easily observed. (Use the background and G-2 controls.) CAUTION: Maintain picture tube brightness and modulation level of signal source within limits of good focus.

5. Adjust the three beam positioning magnets and the blue lateral magnet for best convergence at center of screen.

6. Using the red field, adjust yoke and purity device for optimum purity. (Refer to purity adjustment instructions.) NOTE: If purity has been adjusted previously, yoke adjustment is unnecessary.

7. Repeat step 5 for best convergence at center of screen.

VERTICAL DYNAMIC ADJUSTMENT

1. Choose a vertical column of dots near the center of the screen. Notice that the dots, while converged at the screen center, become progressively over-converged away from the screen center toward the top and bottom of the screen.

2. Observe the position of the blue dot in each dot trio along this vertical column of dots. Adjust the red and green vertical tilt controls so that the red and green dots are converged and spaced symmetrically from the blue dot in each group (trio). This symmetrical over-convergence should be made to increase uniformly from screen center to top and screen center to bottom.

3. Adjust the blue vertical tilt control so that all blue dots in each trio along a center vertical line have the same relative position with respect to the red and green dots.

4. Adjust the beam positioning magnets for center convergence, if necessary.

5. Adjust the green vertical amplitude control to position the green dots so that they are equally spaced from the blue dots from top to bottom of the screen.

6. Adjust the green beam positioning magnet to reconverge the green dot with the blue dot at the center of the screen.

7. Repeat step 5 for the red dots.

8. Adjust the red beam positioning magnet to converge the red dot with the blue and green dots at the center of the screen.

9. Adjust the blue vertical amplitude control using the same procedure as used for the blue and green amplitude controls.

10. Adjust the blue beam magnet for convergence of the vertical row of dots.

HORIZONTAL DYNAMIC ADJUSTMENT

1. a. Peak each of the horizontal dynamic phase coils one at a time for maximum as follows:

b. Turn the blue horizontal dynamic amplitude control to maximum (fully clockwise). Set the red and green horizontal dynamic amplitude controls to minimum (fully counterclockwise). (Fig. 14).

c. Tune the blue horizontal phase coil so that, over the center portion of the screen, the blue dot is displaced a maximum amount from the other two dots. This displacement, which makes the blue dots appear to follow a parabolic path across the screen, should be such that the blue dots are moved toward a horizontal reference line at edges of the screen.

d. Turn the blue horizontal dynamic amplitude control to minimum (fully counterclockwise).

2. Repeat the foregoing procedure for the green gun only.

3. Repeat the foregoing procedure (steps 1a to 1d) for the red gun only.

4. Select a horizontal row of dots at the center of the screen.

5. Adjust the blue dynamic amplitude and phase together to obtain the same amount of misconvergence of the blue dot at the screen center and the edges of the screen. This will establish a horizontal line across the screen which can be used as reference for positioning the red and green dots.

6. Adjust the blue beam positioning magnet (not the blue lateral corrector magnet) for convergence of the dots at the center of the screen.

7. Adjust the green horizontal dynamic amplitude and phase controls so as to obtain uniform and symmetrical displacement of the green dots away from the blue dots in all horizontal dot trios.

8. Adjust the green beam positioning magnet for center convergence.

9. Adjust the red horizontal dynamic amplitude and phase controls so as to obtain uniform and symmetrical displacement of the red dots away from the blue dots in all horizontal dot trios.

10. Adjust the red beam positioning magnet for center convergence.

11. Check purity and, if necessary, adjust the three beam positioning magnets and blue lateral magnet for center convergence.

12. Make any required touch-up adjustments necessary to give best possible overall convergence of all the dots. The beam positioning magnets and the dynamic controls are used as indicated by a study of the dot pattern. NOTE: It will not be necessary to reset purity when the touch-up adjustments are made since the adjustments should be small enough so as not to upset the purity.

BALANCING THE BACKGROUND AND G-2 CONTROLS

Compensation for differences in the three phosphor efficiencies, the cut-off voltages and the emission characteristics of the three guns is provided as follows: Three G-2 controls adjust the screen voltages for each gun; two BACKGROUND (grid 1) controls adjust the static bias on the blue and green guns. Static bias on the red gun is fixed by circuitry.

Procedure for balancing BACKGROUND and G-2 controls

1. Turn channel selector to a channel transmitting a black and white picture - preferably a test pattern. (Fig. 2).

2. Set BRIGHTNESS and CONTRAST controls for normal picture. Disregard color fringing effects due to misadjustment of the convergence controls.

3. Turn GREEN G-2, BLUE G-2 and RED G-2 controls to maximum clockwise position.

4. Adjust GREEN BACKGROUND, BLUE BACKGROUND and, if necessary, RED G-2 for highlight white on the brightest picture portions.

5. Turn BRIGHTNESS control counterclockwise so that screen becomes less bright (grey). If a color begins to tint the screen as brightness is reduced: Adjust the G-2 control corresponding to this color until the bright portions of the screen are white or grey.

6. Adjust the BRIGHTNESS control for normal brightness on the screen. Re-set the BACKGROUND controls so that brightest portions of picture appear white.

7. Repeat steps 2, 4, 5 and 6 until no color tinting occurs over the usable range of the BRIGHTNESS control. (Maximum brightness setting is not considered part of the usable range.)

OPERATING CONTROLS

Front Panel Operating Controls

The large twin front panel knobs control the basic receiver functions for monochrome reception. Only two additional controls are required on the front panel for color reception. These controls are the COLOR INTENSITY and COLOR SHADING controls, located under the front panel cover. (In some models the color intensity control is labeled "chroma" and the color shading control is labeled "fine phase".) (Fig. 2).

Front Panel Controls Used For Color Reception

COLOR INTENSITY CONTROL

The COLOR INTENSITY control governs the gain of the color system and thus the intensity of the reproduced colors. Turning the COLOR INTENSITY control counterclockwise will remove all color from the picture.

When receiving a black/white picture transmission, always keep the COLOR INTENSITY control turned to the counterclockwise stop. Viewing a black/white transmission with the COLOR INTENSITY control turned up may result in color fringes outlining picture subjects. This gives the appearance of colored "snow" in the picture.

COLOR SHADING CONTROL

The purpose of the COLOR SHADING control is to allow the picture colors to be tinted as desired. The most faithful color reproduction is usually obtained by adjusting the COLOR SHADING control for natural flesh tones. Any object having a familiar color (such as sky or water) may be used for this adjustment.

Front Panel Controls Used For Monochrome (black/white) Reception

1. ON-OFF-VOLUME CONTROL

Turn the receiver on by rotating the ON-OFF-VOLUME control to the right until a click is heard. Allow the receiver to warm up for a few minutes. (NOTE: The warm-up period required for a color television receiver to produce a good picture, either in color or in monochrome, is longer than that required for a black/white receiver.) After the receiver is turned on, allow several minutes for the circuitry to stabilize. Then, advance the ON-OFF-VOLUME control temporarily to mid-position and adjust later as required.

2. COLOR INTENSITY CONTROL (Under front panel cover)

Turn off by rotating counterclockwise until stop is reached.

3. CONTRAST CONTROL (Under front panel cover)

Turn CONTRAST control to about the middle of its range.

4. BRIGHTNESS CONTROL

Turn clockwise until picture screen is lighted. Readjust later in conjunction with CONTRAST as required.

5. VHF CHANNEL SELECTOR

Turn the VHF CHANNEL SELECTOR until the desired channel number appears on top. (VHF channels are numbered 2 through 13).

6. FINE TUNING

Adjust the FINE TUNING control for best picture detail. Readjust CONTRAST and BRIGHTNESS control for most pleasing picture.

7. ACOUSTINATOR

Adjust the ACOUSTINATOR tone control for the most pleasing tone.

Tuning UHF Stations

(Only for sets equipped to receive channels 14 to 83.)

Turn VHF CHANNEL SELECTOR control so that window located between numbers 2 and 13 is at top. This switches receiver to UHF and exposes the UHF dial scale.

With the VHF CHANNEL SELECTOR control set to the UHF position, UHF stations can be tuned with the FINE TUNING control. Tune first to desired channel, then tune for best picture detail. Readjust CONTRAST and BRIGHTNESS controls for most pleasing picture.

Receiving Color Programs

1. Adjust receiver for a satisfactory monochrome picture as outlined under "Front Panel Controls Used For Monochrome (Black/White) Reception".

2. COLOR INTENSITY CONTROL (Under front panel cover)

Advance COLOR INTENSITY control to right (clockwise) until color begins to appear in picture. Adjust COLOR INTENSITY control until desired strength of color is obtained.

3. COLOR SHADING CONTROL (Under front panel cover)
Adjust the COLOR SHADING control for most natural or pleasing flesh tones, or for natural appearance of some object having familiar coloring.

4. FINE TUNING
Readjust for best picture detail and most satisfactory color reproduction. If fine tuning control is not adjusted correctly, the color may be removed from the picture.

Supplementary Controls Located Under Front Panel Cover

The small controls located under the front panel cover are provided for customer use, as required. (These controls are practically independent of critical color and monochrome circuitry.) The more-frequently used supplementary controls are provided with knobs, while those used infrequently have knurled shaft ends. This provides instantaneous recognition of the primary and secondary supplementary controls. (Fig. 2).

It is advisable to adjust these "under-cover" controls while viewing a black/white transmission, preferably a test pattern. This will reduce the possibility of error when analyzing picture defects. During the adjustment of these controls, color effects can be eliminated by turning the COLOR INTENSITY control fully counterclockwise.

HORIZONTAL HOLD

This control locks the picture horizontally. If the picture has a tendency to move across the screen horizontally or appears as a series of sloping lines or bars, this control should be adjusted. This adjustment is very broad and should be set to the center of the range in which the picture remains locked-in, or stationary.

VERTICAL HOLD

When the picture exhibits intermittent or constant vertical movement; when the picture appears to be rolling up or down, the VERTICAL HOLD control should be adjusted. The correct adjustment is in the center of the lock-in range.

VERTICAL SIZE AND VERTICAL LINEARITY

When the size of the picture, from top to bottom, is too large or too small, adjust the VERTICAL SIZE control. Stretching or squeezing of the picture at the top or bottom can be eliminated by adjusting the VERTICAL LINEARITY control. It may be necessary to adjust the VERTICAL SIZE and VERTICAL LINEARITY controls simultaneously until a picture which is balanced in shape from top to bottom (linear) fills the screen. If the picture should roll during these adjustments, reset the VERTICAL HOLD control.

FOCUS

Adjust the FOCUS control for the clearest picture.

Supplementary Controls Located At Rear of Receiver

The supplementary controls located at the rear of the receiver fall into two classifications: those that can be adjusted easily without affecting the color balancing and picture tube set-up controls and those that require careful adjustment in conjunction with one another. The more critical controls are described in the section "Balancing the Background and G-2 Controls". These controls should be adjusted by a trained technician. (These controls should be adjusted when viewing a black/white test pattern.)

HORIZONTAL CENTERING CONTROL

This control shifts the entire raster and the picture, from left to right, on the screen. Adjust this control to get a picture that is well-centered from left to right.

VERTICAL CENTERING CONTROL

This control shifts the entire raster and the picture, from top to bottom, on the screen. Adjust this control to get a picture that is well-centered from top to bottom.

HORIZONTAL DRIVE CONTROL (On models which have a drive control)

This control affects the brightness and width of the picture. Adjust this control until white vertical bars appear on the screen; then back off control to the position where bars just disappear. (NOTE: Adjust HORIZONTAL DRIVE control before making horizontal size adjustment.)

HORIZONTAL SIZE CONTROL

This control varies the width of the picture. Move the horizontal size control to the left until dark edges can be seen on each side of the picture. Then move control to the right until picture is slightly larger than the picture mask.

AREA SELECTOR SWITCH

The quality and stability of the picture is controlled by the area selector switch. Set this switch to the position in which the picture is the clearest and most stable.

SERVICE NOTES

CHANGING OF TUBES

(Refer to TS-902 horizontal chassis top view and BP-902 vertical chassis top view for tube locations.) (See Figs. 11 & 14).

The receiver should be turned off when changing tubes. Indiscriminate changing or interchanging of tubes should be avoided for the following reasons:

1. A change of IF or RF tube, or crystal detector, can cause loss of sensitivity or poor picture quality. Check alignment and sensitivity after making such changes.

2. A change of limiter or ratio detector tubes can cause distorted audio, buzz, or loss of audio sensitivity. Check alignment and sensitivity after changing these tubes.

3. Changing the horizontal oscillator tube can result in poor noise rejection or cause the horizontal hold control to be out of range. This may necessitate re-adjustment of the horizontal oscillator coil.

FUSE REPLACEMENT

B plus and initial surge fuse (special 7.5 ohm resistor R-73)

This fuse is a plug-in type located on the top rear of the horizontal chassis, behind the vertical chassis. It is possible to replace this fuse by removing the back cover. Replacement is facilitated, however, by removing the four bolts from the baseboard and shifting the receiver assembly toward the rear of the cabinet.

Filament fuse (1 inch of #26 copper wire)

This fuse is located beneath the chassis in the area below the filament transformer. The chassis must be removed from the cabinet in order to replace the filament fuse. Replace with a 1 inch length of #26 wire soldered between two lugs of the terminal strip; the connection is in series with the heavy green lead from the filament transformer.

HORIZONTAL OSCILLATOR ADJUSTMENT

The HORIZONTAL HOLD control should have a sync range of approximately 25 degrees rotation. If the control adjustment is overly critical:

1. Increase the BRIGHTNESS and reduce the HORIZONTAL SIZE until the edges of the horizontal blanking pulse (grey vertical bars) are visible on either side of the raster.

2. Shunt the HORIZONTAL OSCILLATOR coil L-43 to ground with a .25 mf 400V, capacitor, and ground the control grid of the horizontal oscillator (pin 4).

3. Adjust the HORIZONTAL HOLD control until the picture is in sync or slowly floating through sync.

4. Remove the capacitor shunting L-43 to ground and adjust the HORIZONTAL OSCILLATOR coil until the picture is again in sync or floating through sync.

5. Remove short from control grid (pin 4) of horizontal oscillator.

REMOVAL OF THE CHASSIS

The chassis and the picture tube are mounted independently to a baseboard which is bolted into the cabinet. The chassis may be removed from the cabinet independently of the picture tube by removing four bolts. When removing only the chassis: disconnect the ground lead between the high voltage cage and the picture tube: disconnect the high voltage lead; disconnect antenna lead-in and unplug speaker plug; unplug the deflection yoke plug from chassis; disconnect yoke leads extending into the high voltage case; on models using a field neutralizing coil, unplug the field neutralizing coil plug.

Both the picture tube and the chassis can be removed by removing the four bolts which hold the baseboard to the cabinet. This operation must include the removal of the antenna from the side of the cabinet, disconnecting the antenna lead-in, unplugging the speaker plug and removing the wire braid from the bezel.

TONE CONTROL LINKAGE SETTING

In the event it becomes necessary to replace the tone control linkage:

1. Turn the tone control maximum counterclockwise.

2. Place the linkage over the TONE and CONTRAST-VOLUME shafts in such a manner that the arms and link are above the shafts.

3. Move the linkage assembly counterclockwise as far as possible.

NOTE: After chassis has been replaced in the cabinet, place the TONE control knob over the CONTRAST-VOLUME shaft so that the lettering on the knob is toward the top.

REMOVAL AND REPLACEMENT OF COLOR PICTURE TUBE

Replacement of the tri-color picture tube necessitates a complete purity and convergence alignment.

To remove the color picture tube:

1. Disconnect the picture tube socket. (Refer to Fig. 1).
2. Remove the blue lateral corrector magnet.
3. Remove the PM purity device.
4. Withdraw the dynamic convergence coils from the neck of the tube by shifting the coil lever toward a vertical position.
5. Remove the fibre picture tube mounting strap.
6. Disconnect the plastic high voltage interlock.
7. Loosen connecting rods between front and rear tube supports.
8. Remove front picture tube retaining brackets. Carefully remove the picture tube out the front of the assembly. Use extreme care while pulling the neck of the picture tube through the dynamic convergence coil assembly and the yoke.
9. Remove the magnetic shield from the flare of the picture tube.
10. Remove plastic insulating sleeve from around picture tube; remove second anode connector.

To install color picture tube:

1. Before installing tube in chassis mounts, clip second anode connector on metal flange of picture tube. Make this connection at a position approximately in line with pin #12 of the picture tube.
2. Place plastic insulating sleeve around picture tube front. Sleeve fold-over should be positioned in line with pin #4 of the picture tube.
3. Place magnetic shield on flare of the tube.
4. Mount picture tube to chassis with pin #4 toward top. Replace the front tube-retaining brackets. Position tube so that plastic sleeve over picture tube face edge is flush against retaining brackets.
5. Replace fibre picture tube strap; tighten connecting rods between front and rear tube supports; connect high voltage interlock.
6. Replace the PM purity device.
7. Replace the blue lateral corrector magnet so that it is directly below the blue gun and then replace tube socket.
8. Move the dynamic convergence coils in close proximity to the tube neck by shifting the dynamic convergence coil lever toward the tuner side of chassis.
9. Proceed with a complete purity and convergence alignment and background tracking set-up.

CIRCUIT DESCRIPTION

OPERATION OF THE COLOR RECEIVER

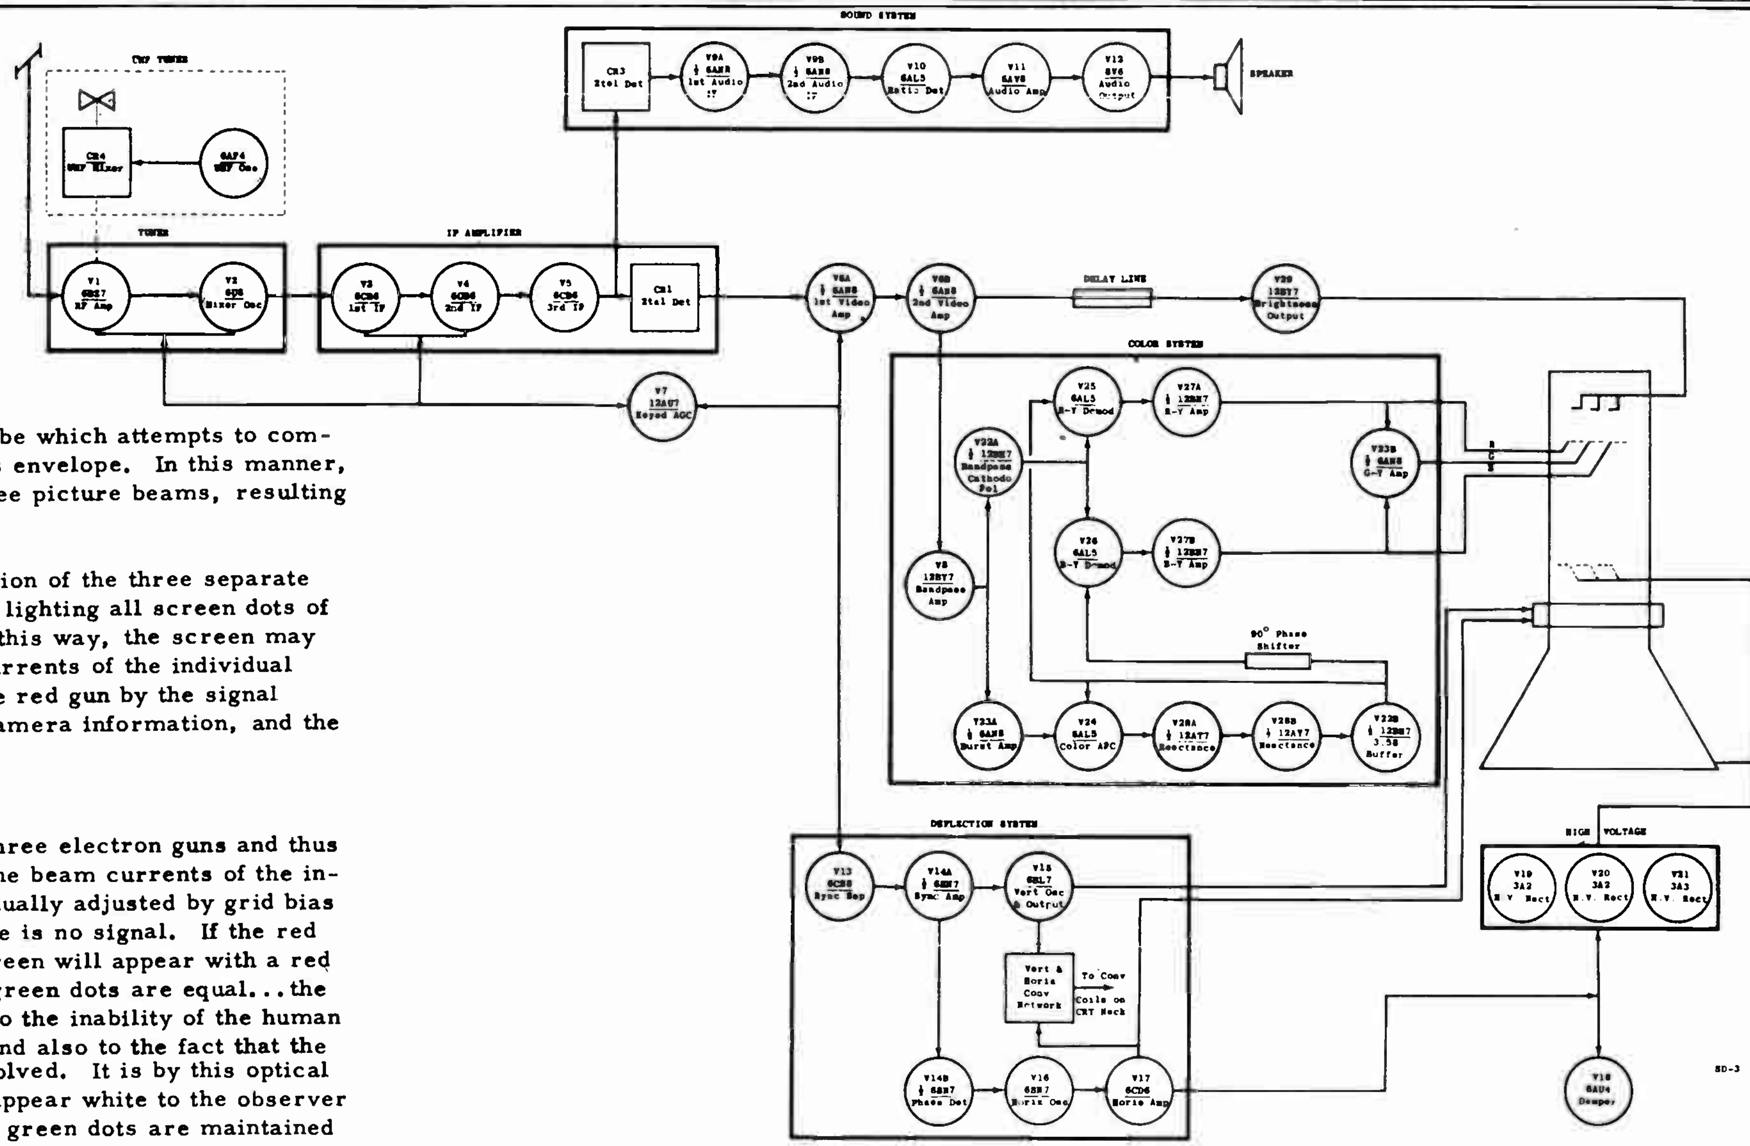
The modern color television receiver is more or less based on the original system in which three separate picture tubes were used. In this three-tube system, each picture tube had a transparent color filter of red, green and blue, respectively. Each tube could be driven with a video signal and, in this case, would show the same scene but, with the picture colored entirely red, green or blue, depending upon which tube was lighted. By a system of color sensitive mirrors and glass screens, it was possible to bring the three pictures together at one focal point in such manner that the viewer would see the three superimposed pictures (one over the other). If just the picture tube with the red filter were used, the result would be a good TV picture....but completely in red. The same would hold true for the blue and green tubes.

By the foregoing method of using three different picture tubes with color filters, it is possible to produce a color television picture provided that a method is available of breaking the picture down at the transmitter so that the red parts of the scene are sent to just the red picture tube, the blue parts of the scene to just the blue picture tube, and the green parts of the picture to just the green picture tube. This can be accomplished by having three cameras at the transmitter viewing the same scene, but with one camera having a color filter so that it can "see" only the red parts of the picture, a second camera with a filter so that it can "see" only the blue parts of the picture and the third camera that can "see" only the green parts of the picture.

If the signals from the individual cameras reach only the appropriate color picture tube, we have a method of taking the picture apart, color by color, at the transmitter and putting it back together correctly at the receiver. For any colors other than those of the color filters, a combination of two or more of the screen colors could be used and mixed to form the desired color.

The system described is possible to construct and was actually used at one time. However, the mechanical, optical and electrical problems involved make it impractical. For example, each picture tube would have to show a picture identical in height, width and linearity in order for them to superimpose perfectly. Experience with obtaining suitable linearity, etc., in just one receiver, gives an insight into the troubles encountered.

FIGURE 3. BLOCK DIAGRAM



One solution to the problem is the three-electron gun picture tube which attempts to combine the three separate picture tubes used previously into one glass envelope. In this manner, the same deflection yoke and sweep system may be used for all three picture beams, resulting in identical height, width and linearity.

The tri-color picture tube is designed to give the equivalent action of the three separate tubes by dividing its screen into extremely small color dots and by lighting all screen dots of any one basic color by a particular electron gun of three used. In this way, the screen may be made completely red, blue, or green by controlling the beam currents of the individual guns. Likewise, color may be added to a picture by controlling the red gun by the signal from the red camera at the transmitter, the blue gun by the blue camera information, and the green gun by the green camera information.

RECEIVING BLACK AND WHITE

All screen dots of any one color are lighted by just one of the three electron guns and thus the light intensity of the three-screen color may be controlled by the beam currents of the individual guns. The beam currents of the three guns may be individually adjusted by grid bias voltages in order to adjust the separate color intensities when there is no signal. If the red dots are made brighter than the blue and green dots, the entire screen will appear with a red tinge, etc. When the light intensity value of all the red, blue and green dots are equal...the entire screen will appear white to the viewer. This is due partly to the inability of the human eye to distinguish individual colors of equal light intensity values and also to the fact that the screen dots are so tiny that the individual color dots cannot be resolved. It is by this optical trick that the screen of the tri-color picture tube may be made to appear white to the observer and as long as the equal-intensity light-values of the red, blue and green dots are maintained (as determined by the gun grid bias and anode voltages).....the entire screen can be made brighter or dimmer and still appear as white or shadings of white. A standard black and white station transmission can now be used to modulate the three electron beams simultaneously and the screen will appear to follow the shadings of black and white necessary to reproduce the picture. Compatibility is thus maintained between black and white and color receivers.

The circuitry of the color receiver used to carry the black/white (brightness) signal from the second detector to the picture tube, is very similar to the standard video system used in conventional receivers. This system consists of the first and second video amplifiers, through the brightness amplifier and on to the cathodes of the three electron guns, so that the beam currents of all three are increased and decreased by the brightness (Y) signal.

ADDING THE COMPLETE COLOR SIGNAL

In the formation of an actual color telecast, three cameras are used for pick-up at the station. One camera is for the red parts of the picture, a second for the blue parts and the third for the green picture information. The outputs of these three cameras are re-combined in the correct proportions to produce a video signal practically identical to that of a conventional black and white camera. This video signal is transmitted as the "Y" signal and contains all the brightness information necessary to reproduce a picture in black and white. It corresponds closely to a standard black/white signal in bandwidth, etc., and may be reproduced on a standard black/white receiver. The "Y" signal will also produce a good definition black and white picture through the "Y" channel of a color receiver. In a sense, a color receiver reproduces a good definition black/white picture through the "Y" channel and then correctly colors this picture by information sent over a separate subcarrier and through the "chroma" channel.

The entire signal, brightness "Y" and color "chroma" is passed through the receiver from the antenna to the second video amplifier. The output of the second video amplifier divides into two paths, the brightness channel for the video signal and the chroma channel for the color signal. The brightness signal continues on through the brightness amplifier and to the cathodes of the tri-color picture tube to produce a good detail monochrome picture. The color information continues on through the bandpass amplifier, bandpass cathode follower and to the demodulators. The demodulators recover the original color signals and pass them on to the grids of the tri-color picture tube guns by way of the R-Y (red), B-Y (blue), and G-Y (green) amplifiers.

The color information from the three cameras at the transmitter is sent over a separate subcarrier of 3.58 megacycles, using a two-phase modulation, suppressed-carrier system. (NOTE: In the suppressed carrier system, the actual 3.58 megacycle carrier is not transmitted......only the upper and lower sidebands, which contain the actual picture color information, reach the receiver. However, for ease of understanding and for all practical purposes, you may assume that a conventional carrier signal and its sidebands is being received. The color subcarrier is modulated in amplitude (same as standard black and white video) as well as in phase (phase may be considered as the amount of lead or lag of one signal as compared to a fixed reference signal standard). The phase of the subcarrier determines the particular color (hue) that is to be reproduced at any particular instant of a horizontal scanning line. The amplitude of the subcarrier determines the strength of this hue in comparison to the black and white signal (brightness) and thus determines its shade or tint (saturation).

THE PHASE ANGLE OF THE SUBCARRIER DETERMINES THE COLOR (HUE)

Two demodulators are used in the receiver to recover the color information brought in by the color subcarrier. Each demodulator can detect a change in the phase of the subcarrier since they are supplied with a signal standard by the local 3.58 megacycle color oscillator (the oscillator signal also effectively re-inserts the 3.58 megacycle subcarrier). A change in phase of the subcarrier can produce a most important action through the demodulators.. it can change the polarity of the output voltage. Depending on the phase angle of the transmitted subcarrier, a positive or negative voltage may be developed at the output of either of the demodulators.

Since the polarity of the output voltage of a demodulator is dependent on the phase of the subcarrier in comparison to the phase of the local oscillator signal supplied this particular demodulator, it should be apparent that the demodulators can be designed to produce different polarity outputs from the same subcarrier merely by shifting the phase of the oscillator signal fed to one of the demodulators. This is accomplished by inserting a phase shifting network between the local oscillator and the B-Y demodulator (the network shifts the phase of the local oscillator fed to the B-Y demodulator by 90 degrees, in respect to the oscillator signal to the R-Y demodulator). In this manner, it is possible to obtain four different polarity output voltages from the two demodulators as the same subcarrier signal is shifted through 360 degrees. The demodulator output voltages may be: both positive, both negative, or one positive and one negative--or one negative and the other positive.

The output voltages of the two demodulators (R-Y & B-Y) are amplified through their respective amplifiers (R-Y and B-Y) and used to drive the control grids of the red and blue picture tube guns, respectively. If we put a positive voltage on the control grid of the blue gun, the blue phosphor dots over the entire picture screen will be more brightly lighted. If we put a negative voltage on the control grid of the green gun, the green phosphor dots over the entire picture screen will be dimmed. Thus we have the first fundamental action required to produce a particular color on the screen, since it is possible to transmit a subcarrier phase angle which will produce a positive voltage on the red electron gun lighting the red dots more brightly; at the same time producing a negative voltage on the blue electron gun reducing the brightness of the blue dots. The second requirement is to get a third negative voltage on the green gun in order to reduce the brightness of the green dots. This is accomplished by feeding some of the positive voltage of the red system and some of the negative voltage from the blue system to a third amplifier (G-Y). The two voltages subtract from each other across the G-Y resistor input system and only the remainder of the larger of the two signals will operate the tube. In this particular case, the red positive signal is the larger and the remainder is amplified and inverted through the G-Y amplifier so that a negative voltage is supplied to the control grid of the green electron gun. (NOTE: In the case of a phase angle producing positive or negative voltage outputs at both demodulators....the G-Y amplifier would add voltages.)

The preceding paragraphs explained how positive and negative voltages are produced by two separate demodulators operating on a single subcarrier and how the control grids of the three electron guns receive the correct polarities to increase or decrease the brightness of the colors. We must now take into consideration the fact that a video signal is being fed to the picture tube cathodes simultaneously with the color signals arriving at the control grids. It should be obvious that the signals at the control grids can either add to or subtract from the video brightness signals at the cathodes, resulting in an increase of brightness of a particular color or no change at all due to cancellation. Using the red signal as an example of this, as before, we find that the R-Y demodulator and amplifier will feed a positive voltage to the red CRT control grid and the B-Y demodulator and amplifier feeds a negative voltage to the blue CRT control grid. The negative B-Y signal feeds into the control grid of the blue gun and cancels the brightness signal (negative) at the cathode of the blue gun, resulting in no change in the blue beam current. The positive R-Y signal feeds into the grid of the red gun and adds to the negative brightness signal at the cathode of the red gun. Thus, the red electron gun increases its emission and colors the area red.

The green electron gun is fed by the signal from the G-Y amplifier and since the G-Y amplifier is receiving a signal from the output of both the R-Y and B-Y amplifiers, it will either add or subtract these signals. In this case, there is a positive signal at the output of the R-Y amplifier and a negative signal at the output of the B-Y amplifier, the G-Y amplifier finds the difference, inverts it, and feeds it to the green gun in the correct polarity to cancel the brightness signal at the cathode of the green gun. Thus, we find that the green gun as well as the blue gun do not change conduction, leaving only the red gun emitting heavily and coloring the area red.

Blue and green signals are formed in the same manner, the only difference being in the phase angle of the 3.58 Mc color subcarrier which, in turn, produces voltages in the demodulators of such polarities that the two unwanted color guns do not change conduction. For example, when transmitting blue, the phase angle of the subcarrier is such that the red electron gun receives a negative signal at the control grid, cancelling the negative brightness signal at the red cathode. The blue electron gun receives a positive signal at the control grid adding to the negative brightness signal at the blue gun cathode. The red and blue signals are fed to the green (G-Y) amplifier and result in a negative output to the green control grid cancelling the negative brightness signal of the cathode. Thus, we find that the red and green guns remain at the same brightness level as when no signal was applied and that the blue gun conducts heavily...coloring the particular area being scanned blue.

A similar action occurs for any green areas, with the exception that the polarities are such that the red and blue signals cancel their portion of the brightness signal, while the green signal adds to the brightness signal giving a green area.

It should be apparent that the phase angle of the color subcarrier determines the polarity output of the demodulators and thus, which signals will add and which will cancel creating the particular color required. As the phase angle of the color subcarrier is shifted, from 0 to 360 degrees, the color of the screen will not only change through the three basic colors of red, blue and green, but also through the entire color spectrum capable of being reproduced by the combinations of these three colors.

Now, let us suppose that the phase of the subcarrier is such that a red area is being produced on the screen and that the voltage of just the color signal alone is reduced. The result is that there is more brightness signal than red color signal and the red takes on a faded tint. In other words, when the amplitude of the color subcarrier is changed in respect to the brightness signal, the shade or tint of the particular color reproduced will change. The change of shade, or tint, of a color is called its saturation. Thus, we find that the amplitude of the color subcarrier in respect to the brightness signal determines the particular shade (saturation) of the basic color and that the phase angle of the subcarrier determines the particular color desired (hue).

In order for the demodulators to be able to detect a change in the phase of the color subcarrier, they must compare the subcarrier against a standard. This standard is the local 3.58 Mc color oscillator in the receiver. However, the local oscillator must have the same phase and frequency as that of the 3.58 Mc oscillator of the transmitter (before the phase of the transmitter subcarrier oscillator is changed by phase shifting). To accomplish this, a color synchronizing signal is sent at the trailing edge of the horizontal synchronizing pulse which is approximately nine cycles of 3.58 megacycles. This signal is called the "burst" signal and its purpose is to pull the receiver's local 3.58 Mc oscillator into the correct phase and frequency. During the horizontal line scanning, the local oscillator maintains its phase and frequency due to the action of the AFC control system. Oscillator stability is achieved by crystal control. Because the oscillator is held to a rigid phase relationship with the burst, a change in the phase of the color subcarrier will result in a change in amplitude or polarity of the demodulator output voltage.

THE BANDPASS AMPLIFIER AND COLOR BURST BOOST SYSTEM

The bandpass amplifier is the first tube stage of the color channel. It receives the color signal from the plate of the second video amplifier through a potentiometer mechanically ganged with the contrast control (cathode of the brightness amplifier). In this manner, the amplitude of the color signal through the chroma channel is tracked with the amplitude of the video signal through the brightness channel. An independent gain control potentiometer, located in the cathode of the bandpass amplifier, regulates the strength of the color signal only. This control is located on the front panel and is labeled "color intensity".

The synchronizing burst signal also travels through the bandpass amplifier, to reach the automatic frequency control (AFC) system of the local 3.58 megacycle oscillator.

To insure constant burst signal to the AFC system, at all settings of the color intensity control; the gain of the bandpass amplifier is automatically increased to maximum during the burst signal by injection of a positive pulse of voltage (burst boost pulse) at its control grid. This positive pulse is generated at the cathode of the damper tube during the retrace time of the horizontal sweep system and, therefore, arrives at the grid of the bandpass amplifier at approximately the time of the burst signal. (NOTE: The burst pulse is transmitted immediately following the horizontal sync pulse: the sync pulse coincides with the retrace of the horizontal system, therefore, the burst and boost pulses should arrive at the grid of the amplifier almost simultaneously.

The burst boost pulse, if of constant amplitude, would always increase the gain of the bandpass amplifier during the burst signal. However, the total amplification factor of the stage would still be dependent on the setting of the color intensity control plus the boost voltage and the burst signal would change amplitude as the setting of this control were changed. Since it is desirable to maintain the burst signal at a constant level for best AFC action in the following circuits, a clamping diode (1N60 crystal) is provided from the boost pulse input to the "hot" end of the color intensity control which varies the amplitude of the boost pulse. The clamping action of the diode is regulated by the voltage produced across the intensity control and thus the amplitude of the boost pulse is regulated by the intensity control setting. In this manner, the amplitude of the boost pulse is always such that the burst signal is amplified by the same amount (maximum gain). The constant amplitude of the burst signal, provided by this circuit, gives superior AFC control action of the 3.58 Mc crystal oscillator.

Inspection of the bandpass stage will show that a type 12BY7 sharp cut-off pentode type tube is used. However, a sharp cut-off type tube does not readily lend itself to gain-controlled circuits due to the fact that, as the bias is increased on the control grid, the tube begins acting as a clipper and the gain of the stage is not appreciably changed. A unique action is achieved in the bandpass amplifier, between the high gain of the sharp cut-off pentode and the variable gain characteristic of the remote cut-off pentode, by the use of a larger-than-normal value of screen dropping resistor (approximately 22K ohms). The screen voltage of the tube varies with the setting of the cathode bias potentiometer since the total tube current is changed in accordance with the bias. For example, as the bias is increased, the total tube current is decreased and the I x R drop, occurring across the screen resistor, is decreased resulting in a higher screen potential. As the screen voltage is increased, the tube becomes harder to cut-off due to the fact that the cut-off voltage and gain of the tube are quite dependent on the screen voltage. Thus, we find that the tube begins to act similar to a remote cut-off type of tube; also that the gain is changed, due to the characteristic curve of the tube changing with the screen voltage.

OPERATION OF THE CLAMP CIRCUIT (BURST BOOST)

Inspection of the schematic diagram shows that a positive pulse (boost signal) is coupled from the damper tube's cathode through a network (R-150, C-140, C-141 and C-142). The signal is fed to the junction of the grid resistors R-101 and R-102 and is developed across resistor R-102 (10K ohms). The resistor R-101 (3300 ohms) and peaking coil L-42 apply the voltage to the control grid. The purpose of the 1 megohm resistor returned to B++ is to counteract any negative voltage developed by the diode's conduction.

The clamping crystal CR-5 connects from the boost signal input point to the "hot" end of the color intensity control. Resistor R-103 is a conventional cathode biasing resistor, as are the cathode bypass capacitors C-105 and C-66C. Capacitor C-66C (100 mfd electrolytic) provides sufficient bypass action to prevent degeneration, with resultant loss of gain, at low frequency signals. Due to the inefficient bypass action of an electrolytic capacitor on higher frequency components, a second paper capacitor (.01 mfd - C-105) parallels the electrolytic.

The crystal CR-5 is connected in the circuit in such manner that a positive pulse voltage at the junction of the grid resistors R-101 and R-102 will cause the crystal to conduct. Considering a case in which the viewer might prefer strong color intensity signals and in which the color intensity control is set to minimum resistance (maximum stage gain), the cathode of CR-5 is at or near chassis ground potential. In this case, the forward resistance of the crystal is effectively shunted across the boost signal input R-102. CR-5 acts as a low resistance path to ground for any positive pulses appearing at this point. Thus, the boost pulse is removed or reduced, since the burst signal is receiving maximum gain and does not require a boost.

Considering the opposite case, in which the viewer might prefer weak color intensity signals, the gain of the bandpass amplifier would be decreased by increasing the resistance of the color intensity control (increased tube bias). Since it is desired to maintain the gain of the bandpass amplifier constant for the burst signal, the boost pulse now is allowed to appear at the tube input. When the resistance of the cathode potentiometer is increased (as the color intensity control is adjusted) the tube current flowing through this resistance will produce a voltage which will be positive at the cathode end, negative at the ground end. This voltage must be overcome by the boost signal before the crystal diode will conduct; therefore, a positive boost pulse will be aiding the signal at the control grid which will give maximum gain to the burst signal. The amplitude of this pulse will nearly equal the DC voltage across the cathode resistor.

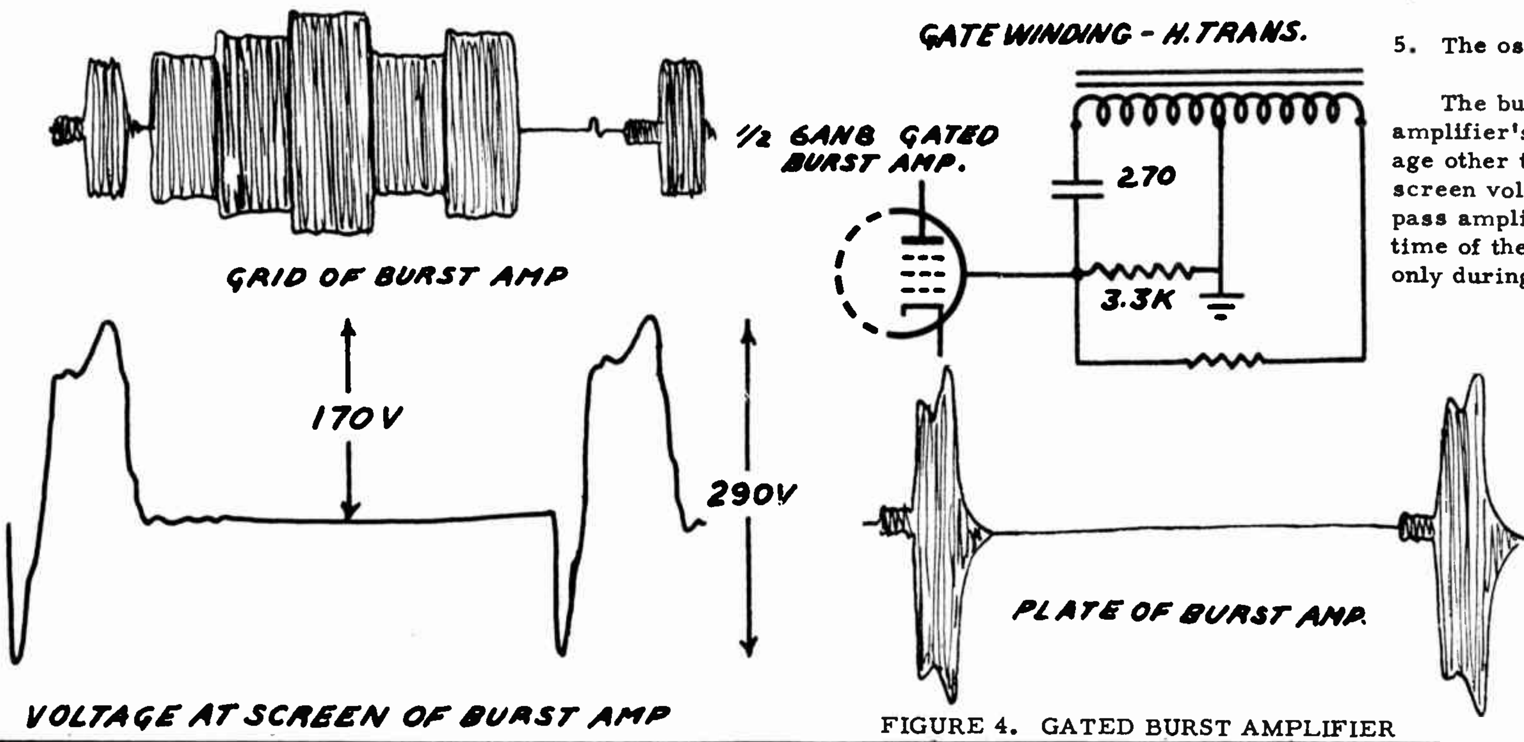
THE 3.58 MC COLOR OSCILLATOR SYSTEM

The path of the synchronizing burst signal, the AFC voltage and local 3.58 Mc oscillator signal is as follows:

From the plate of the second video amplifier to:

1. The burst amplifier
2. The color AFC phase detector
3. The reactance tube
4. The 3.58 Mc crystal oscillator
5. The oscillator buffer stage (output).

The burst amplifier receives the entire color signal, at its control grid, from the bandpass amplifier's output link coupling system. Since the screen of the burst amplifier has no B+ voltage other than that fed from a winding on the horizontal output transformer, the tube is without screen voltage except during retrace of the horizontal sweep circuit. In this manner, the bandpass amplifier is allowed to operate only during horizontal retrace, which corresponds to the time of the burst transmission. In other words, the burst amplifier tube is gated to operate only during the color burst.



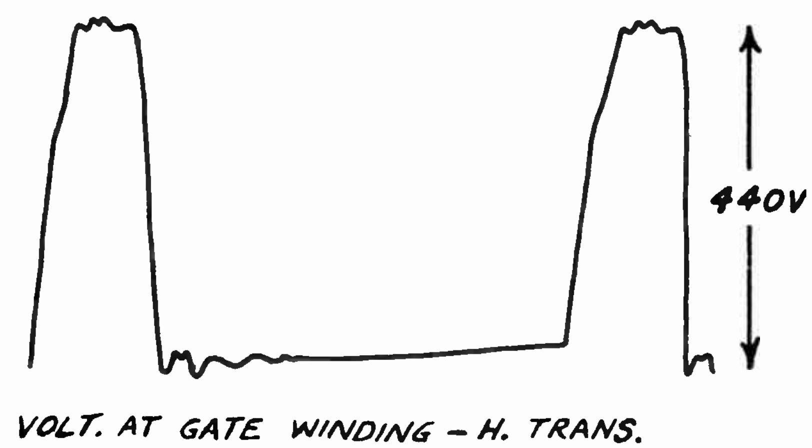


FIGURE 4. GATED BURST AMPLIFIER

The output of the burst amplifier is transformer coupled to the color AFC phase detector and, due to the keying of this stage as explained, allows only the burst to enter the phase detector. A second input to the phase detector is through transformer coupling from the output of the buffer amplifier, which in turn, is driven by the local 3.58 Mc color oscillator.

The phase detector compares the phase and frequency of the incoming burst signal, from the burst amplifier, with that of the local color oscillator. Any difference in phase or frequency results in a DC output from the center tap of the load resistors and is applied to the control grid of the reactance tube.

The reactance tube's plate current then, is under the direct control of the phase detector. Any change in the current of this stage presents varying amounts of capacitance (produced electronically by the reactance tube) to the crystal controlled oscillator and restores the phase and frequency of the oscillator.

THE BURST AMPLIFIER

The burst amplifier performs a similar function in the color system as the sync separator performs in the sync section of the conventional black and white receiver...it separates the color synchronizing burst signal (from the black and white sync as well as from the coloring information). Stated in a different manner, the burst amplifier tube allows only the color sync burst to reach the phase detector for frequency control action.

The burst amplifier is inoperative during the scanning of horizontal picture lines due to the fact that it is not supplied with screen voltage. The tube is made operative during the burst signal by a positive pulse of voltage fed to the screen from an independent gate winding located on the horizontal output transformer. The transformer and gate winding produces sizeable voltages only during the time of horizontal retrace -- during which time the burst amplifier is allowed to conduct.

The burst signal is transmitted during the blanking pedestal immediately following the horizontal sync pulse. In a receiver which is operating properly, retrace of the horizontal sweep system is initiated in close coincidence with the transmitted horizontal sync pulse. Therefore, the time of the horizontal retrace, in the receiver, occurs very close to that of the burst signal. The burst tube is keyed by the pulse fed to its screen during retrace and since the sync burst signal arrives at the grid at approximately the same time, the burst signal only is amplified and passed on to the following stages (see "Gated Burst Amp" drawing).(Fig. 14)

As stated, the burst signal is transmitted after the sync pulse and it is apparent that the keying pulse fed to the burst amplifier screen will slightly lead the burst signal at the grid ...in which case a portion of the last few burst cycles would be lost. To shift the time of the keying pulse so that it more closely coincides with the burst signal, a network (10K ohm resistor, 3300 ohm resistor and 270 mmf capacitor) is utilized to shape and delay the keying pulse.

The grid input system of the burst amplifier consists of a parallel resonant tank to ground. When tuned to 3.58 Mc, the tank will develop maximum burst voltage to the burst amplifier. Inspection of the circuit shows that the tank is adjustable capacitively as well as inductively and that the capacitor is the color shading control located on the front panel of the receiver.

It has been established that the voltage reaching the burst amplifier is that produced across the resonant tank in the grid circuit, and that this voltage represents the burst signal. When the tank is tuned to approximately 3.58 Mc, the signal produced by the tank will have the same phase as that of the incoming burst signal. On the other hand, if the tank circuit is above or below resonance (detuned), as determined by the color shading capacitor...the burst signal developed across the tank will lead or lag the actual burst signal. Since the local color oscillator is synchronized with the burst signal appearing across the burst amplifier grid tank, the local color oscillator will shift its phase to follow that of the tuned tank.

The color oscillator is being used as the standard against which the color subcarrier phase and frequency are being compared. When the phase of the subcarrier changes, the new phase angle represents a specific hue. Therefore, shifting the phase of the local oscillator, by means of the color shading capacitor, is equivalent to shifting all hues by the amount of the oscillator phase shift. This is the method used: to obtain correct, or desired tints and shades of the picture hues; to compensate for phase shift occurring through the chroma channel.

THE COLOR AFC TUBE (Phase Detector)

The purpose of the phase detector is to compare the phase and frequency of the local 3.58 Mc color oscillator against the 3.58 Mc color burst sent from the transmitter. Should a difference in phase or frequency exist between the burst and color oscillator signals, the phase detector (color AFC) will supply a DC voltage to the reactance tube which will pull the color oscillator into the desired phase and frequency with the burst signal. The polarity of this corrective voltage is dependent upon whether the color oscillator is running faster or slower (leading or lagging) than the reference burst signal; the amplitude of the DC voltage depends upon the degree of lead or lag. When both the burst signal, from the station, and the local color oscillator signal are matched in phase and frequency, the phase detector has zero output and no correction takes place.

The color AFC diodes (phase detector) may be considered as two conventional second detectors connected in such manner that one of the detectors will put out a positive rectified voltage while the other detector puts out a negative rectified voltage. Diode V-24A produces a positive rectified voltage at its cathode (junction of the .0015 mfd capacitor and 1 meg resistor). Diode V-24B produces a negative rectified voltage at its plate (junction of the .0015 mfd capacitor and 1 megohm resistor). The local color oscillator signal is fed to the phase detector at all times by the tap on coil L-210. The signal is fed equally to both diodes and both diodes will produce the same amount of rectified DC voltage across their load resistors, positive at top end of R-232 and negative at the bottom end of R-234 (see schematic). Maximum positive voltage will be found at the top end of R-232 and maximum negative voltage will be found at the bottom end of R-234....at some point between these maximum voltage values, a zero point exists. The movable rotor arm of the 250K ohm AFC balance potentiometer can locate this zero point. It should now be clear that when the oscillator signal only, is incoming to the phase detector, a zero DC voltage will be produced at the output.

As stated, the oscillator signal is injected into the phase detector at all times from coil L-210 and by itself produces a zero output voltage. During color reception, the burst signal is also injected into the phase detector; injection is from the tuned transformer T-203. The simultaneous injection of two AC signals into the phase detector create resultant voltages (added vectorially) which affect the two diodes differently. Considering the case when the phase of the burst and oscillator signals are of the required phase, the resultant of the burst and oscillator signal voltages to both diodes V-24A & B are equal and zero output results. If the phase of the oscillator signal, as compared to the burst signal, is not that required, the resultant voltage to diode V-24A would increase while the resultant voltage to diode V-24B would decrease. This would produce increased positive voltage at the cathode of V-24A, as compared to decreased negative voltage at the plate of V-24B, and result in a positive DC output from the detector. This condition results when the phase of the oscillator signal leads the phase of the burst signal. On the other hand, when the phase of the oscillator signal lags the phase of the burst signal, the resultant voltage to diode V-24B would increase and the resultant voltage to diode V-24A would decrease. This results in increased negative voltage at the plate of V-24B and decreased positive voltage at the cathode of V-24A. The phase detector would now have a negative DC output voltage.

SUMMARY: When both the phase of the oscillator and burst signals are that required by the circuitry, a zero DC output voltage is produced by the phase detector. When the phase of the oscillator signal leads the burst signal, V-24A conducts more heavily and diode V-24B conducts less heavily, producing a positive output DC voltage. When the phase of the oscillator signal lags the burst signal, diode V-24B conducts more heavily and diode V-24A conducts less heavily, producing a negative DC output voltage. This DC output voltage is supplied to the control grid of the reactance tube causing a capacitor tuning action to result which, in turn, pulls the oscillator into correct phase and frequency.

THE REACTANCE TUBE

The purpose of the reactance tube is to control the phase and frequency of the local 3.58 Mc color oscillator as dictated by the DC voltage produced by the phase detector (a DC voltage is produced in the phase detector when the phase of the local 3.58 Mc oscillator is not correct).

The reactance tube is connected across the crystal circuit of the oscillator and operates as an electronic capacitor, tuning the resonant crystal circuit to the correct frequency.

The oscillator signal voltage is fed, in reverse manner, to the plate of the reactance tube through the 100 mmf capacitor (C-236) and arrives at the grid of the reactance tube through the internal plate to grid tube capacity (in some chassis a 2 mmf capacitor is connected externally from plate to grid of the tube). The oscillator signal voltage arriving at the grid of the reactance tube leads the oscillator signal applied at the plate, due to the capacitor action. This leading voltage, at the tube's grid, produces a leading plate current through the reactance tube which makes the entire reactance tube circuit appear as a capacitor to the crystal oscillator. If the reactance tube's plate current and output signal are increased by a positive voltage on the control grid, the tube acts as a larger value capacitor and tunes the crystal to a lower frequency. If the reactance tube's plate current and output signal are decreased by a less positive (negative) voltage at its control grid, the tube acts as a smaller value capacity and tunes the crystal to a higher frequency. It should be clear that the apparent capacity presented to the crystal circuit is determined by the reactance tube's output signal and that this AC signal can be controlled by the voltage applied to the reactance tube's grid. A method is now available for controlling the frequency of the crystal oscillator by a DC voltage (as applied to the control grid of the reactance tube). The phase detector produces a DC output voltage when the phase and/or frequency of the local oscillator is not exactly that of the burst synchronizing signal sent from the transmitter. Therefore, a method of complete automatic frequency control of the local 3.58 Mc oscillator is available.

The plate current and output signal of the reactance tube determines the apparent value of capacity that is tuning the crystal to resonance. Therefore, if the reactance tube plate current is cut off by sufficient grid bias, it produces no capacity effect. It is easy to see that if minimum capacity of the tube (as produced by minimum plate current) does not tune the oscillator to the correct frequency before the reactance tube is completely cut off, the reactance tube will lose control of the oscillator. To insure sufficient range of the reactance tube's capacitor action, a tunable inductor (L-215) is incorporated in the plate circuit. This makes it possible to tune the crystal to resonance and still have the reactance tube operate over its most desirable range of voltages and currents.

THE 3.58 MC OSCILLATOR

The 3.58 Mc local color oscillator is basically a tuned plate-tuned grid type of circuit using shunt fed plate tank.

The oscillator is stabilized by a crystal in the grid circuit which replaces the usual L-C tuned tank. The crystal acts as a high "Q" tuned circuit and will operate within a few hundred cycles of the correct frequency, or not at all. The circuit is therefore operating at approximately the correct frequency.

The output of the oscillator increases as the plate L-C tank is tuned toward resonance. However, the circuit will continue to oscillate only when the tank is tuned on the high frequency side of the resonant point (the high frequency side is with the iron core out of the coil and moving into the coil) due to the phase of the feedback voltage required from the plate to grid through the tube's internal capacity. Since the circuit will not operate on the low side of resonance, it can be seen that as the tuning of the plate tank approaches resonance, the oscillator can become unstable, intermittent, or stop oscillating entirely; therefore, the correct point of the oscillator plate tank setting is always below the point of maximum output voltage (resonance) and on the high frequency side of the resonant point.

When operating, the oscillator is controlled by grid leak bias produced by capacitor C-237 (57 mmf) and R-246 (150K ohms) in the grid circuit. This negative voltage may be measured by a VTVM, as in any oscillator, and will give a good indication of the performance of the circuit.

The crystal CR-7, in the grid circuit, replaces the usual L-C tank; however, in action, it is similar to a parallel tuned circuit operating with a very high "Q". The crystal (in conjunction with the extraneous circuit capacities) will determine the frequency at which the oscillator will operate.

The 100 mmf capacitor (C-236) couples the oscillator voltage to the reactance tube V-28A which, in turn, acts as a variable electronic capacitor across the crystal, tuning it to the correct phase and frequency as dictated by the DC voltage produced in the color AFC circuit. The 100 mmf capacitor acts as a coupling from the reactance tube back to the crystal as well as from the crystal to the reactance tube.

The parallel tuned plate tank, consisting of L-216 and C-242 (180 mmf capacitor) is DC isolated from, and "RF" coupled to, the plate of the oscillator by capacitor C-241 (.01 mfd).

The plate receives DC voltage through the 150K ohm resistor R-249. Since the plate current for the oscillator does not flow through the plate L-C tank, it is called a shunt fed oscillator.

A tap on the plate tank coil feeds the oscillator signal to the buffer amplifier which acts as an output amplifier and isolation stage for the oscillator. The tap on the tank matches the impedance of the tank to the grid input impedance of the buffer stage for maximum power transfer.

THE BUFFER AMPLIFIER

The output of the local oscillator is coupled to the buffer amplifier by means of an impedance matching tap on the tuned plate tank of the oscillator. The buffer amplifier increases the oscillator signal and acts as an isolation stage between the oscillator and the demodulators, thus, keeping changes of voltages from affecting the oscillator stability. The output of the buffer amplifier is from the plate through a system of tuned coils. One tuned coil (L-210) feeds the signal to the R-Y demodulator in phase with the oscillator signal. The opposite coil (L-209) feeds the oscillator signal to the B-Y demodulator at a phase shift of 90 degrees. The output of the buffer amplifier is fed to the first tuned coil by the .01 mfd coupling capacitor. Coil L-210, in parallel with capacitors C-212 (180) and C-213 (.002) as well as other extraneous circuit capacities, constitute a parallel resonant tank. Therefore, tuning coil L-210 will result in maximum voltage developed across this circuit and maximum voltage fed to the R-Y demodulator. A portion of this voltage is tapped off by the divider circuit composed of C-212 (180 mmf) and C-213 (.002). The voltage developed across C-213 is fed to the following circuit consisting of C-211 (220), L-209 and C-214 (.01). C-214 is an RF bypass across the blue background control. C-211 and L-209 constitute a series resonant circuit and will develop maximum current through the series path when tuned to resonance. Thus, maximum voltage will be developed across coil L-209 and fed to the B-Y demodulator when properly tuned. However, since the voltage across the inductive portion of a series resonant circuit will lead the current by 90 degrees, the voltage fed to the B-Y demodulator will be 90 degrees out of phase with that fed to the R-Y demodulator. The purpose of these out-of-phase voltages, to the demodulators, is explained in the demodulator section. The oscillator signal into the demodulators is detected in the same fashion as by any peak detector and a DC voltage is developed across the load resistors proportional to peak of the oscillator signal. (This assumes absolutely no other incoming signal.)

On first thought, it would seem that the phasing of this circuit would be quite critical and require complicated and expensive equipment to tune the buffer tank coils for the correct voltage phases. However, an operational characteristic of the circuit makes the job quite easy. This characteristic is that, when the phase shifting coil L-209 is tuned to resonance, it will place maximum load on the parallel tuned tank (L-210). In other words, the voltage developed by coil L-210 will drop below its normal value as the series tank L-209 is tuned to resonance. Thus, we have the effect of the voltage fed to the R-Y demodulators dropping as the voltage to the B-Y demodulator is being increased. The voltage being referred to, is the rectified voltage developed at the junction of the 33 mmf capacitor and the 10K ohm load resistor of the demodulators. This voltage can be measured by use of a VTVM connected from this junction to ground (the hot lead of the meter connects to the junction and the ground lead of the meter connects to chassis).

The method of tuning the phase shifting coils in the output of the buffer amplifier is then to connect the meter to the load side of the R-Y demodulator and tune the first coil (L-210) for maximum voltage reading. Next, tune the phase shifting coil (L-209) for maximum voltage to the B-Y demodulator...this will result in reduced voltage to the R-Y demodulator. Retune coil L-210 for maximum voltage to the R-Y demodulator. Retune coil L-209 for maximum voltage to the B-Y demodulator and minimum voltage to the R-Y demodulator. It is necessary to work between the two coils until minimum interaction is obtained. The procedure is nothing more than tuning both tank coils to resonance and when this is accomplished, the phase shift will automatically be correct...provided there are no component part failures in the system.

THE DEMODULATORS

The function of the demodulators in the receiver's color section is similar to that of the second detector in a standard TV or radio receiver; they demodulate the color subcarrier. The demodulators continuously test the phase and amplitude of the incoming color subcarrier during horizontal picture scanning and produce an output voltage when the phase or amplitude changes. The reference phase during scanning is that of the local 3.58 Mc oscillator.

Two separate demodulators are required in the receiver to demodulate the color subcarrier signal completely. Although both demodulators operate on the same subcarrier signal, each is capable of extracting different signal information. This will be explained in the later paragraphs.

One of the demodulators is labeled the R-Y demodulator and consists of the diodes V-25A and B (see the schematic diagram). The other demodulator (B-Y) consists of the diodes V-26A and B. Considering the diode sections of tube V-25 only (the R-Y demodulator), we may regard the diode sections A and B as two conventional second detectors connected in such manner that one of the diode detectors (A) will produce a positive rectified output voltage at its cathode while the other detector (B) will produce a negative rectified output voltage at its plate. These voltages will be produced across the load resistors R-241 and R-265 (10K ohms) respectively.

The local color oscillator signal is fed to the demodulators (pins 7 and 5) continuously from the output of the buffer amplifier. Since the oscillator signal voltage is fed to both diodes equally (pins 7 and 5 are tied together), both diodes will produce the same value of rectified DC voltage (opposite polarity) across their load resistors. The load resistor voltage will be maximum positive at the top end of R-241 and maximum negative at the bottom end of R-265. The center tap of R-241 and R-265 will be at a zero voltage point since it is at the mid-point of positive and negative voltages. It should now be clear that when the oscillator signal only is incoming to the demodulator, zero output voltage is produced and no signal reaches the R-Y amplifier. An identical action occurs in the B-Y demodulator with the oscillator signal only. As stated, the oscillator signal is injected into the R-Y and B-Y demodulators continuously from the output of the buffer amplifier. During color reception, the color subcarrier is also injected into the demodulators from transformer T-202. The simultaneous injection of two alternating current signals into a demodulator produce resultant voltages that are of quite a different value than either of the injected signals alone. The phase angle between the two injected signals determines the final resultant voltage value that will be applied to each diode (A and B) of any one demodulator. For example, if the phase of the subcarrier signal lags the oscillator signal at the R-Y demodulator, a larger resultant voltage is applied to diode V-25A and a smaller resultant voltage is applied to diode V-25B. Increased conduction current through diode V-25A produces a greater positive voltage at the junction of resistor R-241 and capacitor C-207, in respect to ground. Decreased conduction current through diode V-25B produces a decreased negative voltage at the junction of resistor R-265 and capacitor C-208, in respect to ground. The load voltages are unequal and do not cancel at the center junction. The larger voltage (positive) of the two load voltages will now appear at the output of the R-Y demodulator. If the phase of the subcarrier signal leads the oscillator signal at the R-Y demodulator, the reverse action would occur and the demodulator would have a negative output voltage. The fundamental action of the R-Y demodulator, just explained, is repeated in the B-Y demodulator. The major difference between the R-Y and B-Y demodulator operation is due to a difference in the phase of the local 3.58 Mc oscillator signal fed to each.

In order to understand the action of the two demodulators (R-Y and B-Y) when operating on the same subcarrier, it is necessary to first learn some fundamental characteristics of a demodulator. The important rules are that: when the waveform of the incoming subcarrier leads or lags the oscillator signal (the oscillator is used as the standard) by a quarter of a cycle (90 degrees), the output of the demodulator is zero. When the incoming subcarrier is in phase with the demodulator: maximum positive voltage appears at the output of the demodulator. When the incoming subcarrier is of opposite polarity (180 degrees out of phase) as compared to the local oscillator, the output is maximum negative voltage.

Summary:

1. A demodulator has zero output when the two input signals are a quarter cycle (90 degrees) apart.

2. A demodulator has maximum positive output voltage when the two input signals are in phase.

3. A demodulator has maximum negative output voltage when the two input signals are in phase ...but of opposite polarity (180 degrees apart).

It should now be a simple matter to understand the action of the two demodulators on the same color subcarrier signal. The B-Y demodulator is fed a local 3.58 Mc oscillator signal which is in phase with the subcarrier reference (zero degrees) and if a subcarrier signal were received at this phase, the demodulator would produce maximum positive output voltage. The R-Y demodulator is fed with a local 3.58 Mc oscillator signal which is a quarter cycle (90 degrees) away from the reference phase (zero degrees) and, as explained previously, would have zero output when a signal at zero reference phase is injected into it. In the case just described, the B-Y demodulator would have maximum positive output voltage and the R-Y demodulator would have zero output voltage on the same signal. If the phase of the subcarrier began to shift, the output of the R-Y demodulator would increase and the output of the B-Y demodulator would decrease.... until finally the output of the B-Y demodulator would be zero and the R-Y demodulator would be maximum. This represents a shift of a quarter cycle (90 degrees) of the subcarrier.

When one of the three primary phosphor colors (red, green or blue) is transmitted, the phase angle of the subcarrier is such that it falls somewhere between maximum output voltage of one demodulator and zero output voltage of the other demodulator. In this manner, both demodulators will have some output voltage. Also, the polarity of the voltage out of either of the demodulators will be determined by the phase angle of the subcarrier in reference to the local oscillator. An example of this is the phase angle of the subcarrier for a red picture area (104 degrees leading). In this case, the subcarrier phase slightly leads the oscillator signal into the R-Y demodulator and consequently the R-Y demodulator will have a positive output voltage. The same subcarrier lags the oscillator signal [-(B-Y) 180 degree phase] into the B-Y demodulator and it will have a negative output signal. If the outputs of the demodulators were fed directly into the control grids of the picture tube, the output voltages of the demodulators, as explained, would be correct. However, the signals out of the demodulators must pass through the R-Y and B-Y amplifiers and the polarities of all voltages would be inverted. This presents no problem in the circuit since it is only necessary to interchange the connections to the demodulator diodes to produce opposite polarity outputs for the same phase of input signal.

The final result of the demodulator action is to feed a positive voltage to the red electron gun's control grid (during the scanning of red areas) and a negative voltage to the control grids of the blue and green guns. In this manner, the color signal at the electron gun of the red tube adds to that of the brightness signal at the cathode and lights the red phosphors with greater intensity. In the same way, the negative signal at the blue and green control grids cancels the brightness signal at their cathodes and the blue and green phosphors have no change in brightness. For a review, see "Operation of the Color Receiver".

PURPOSE OF THE DYNAMIC CONVERGENCE SYSTEM

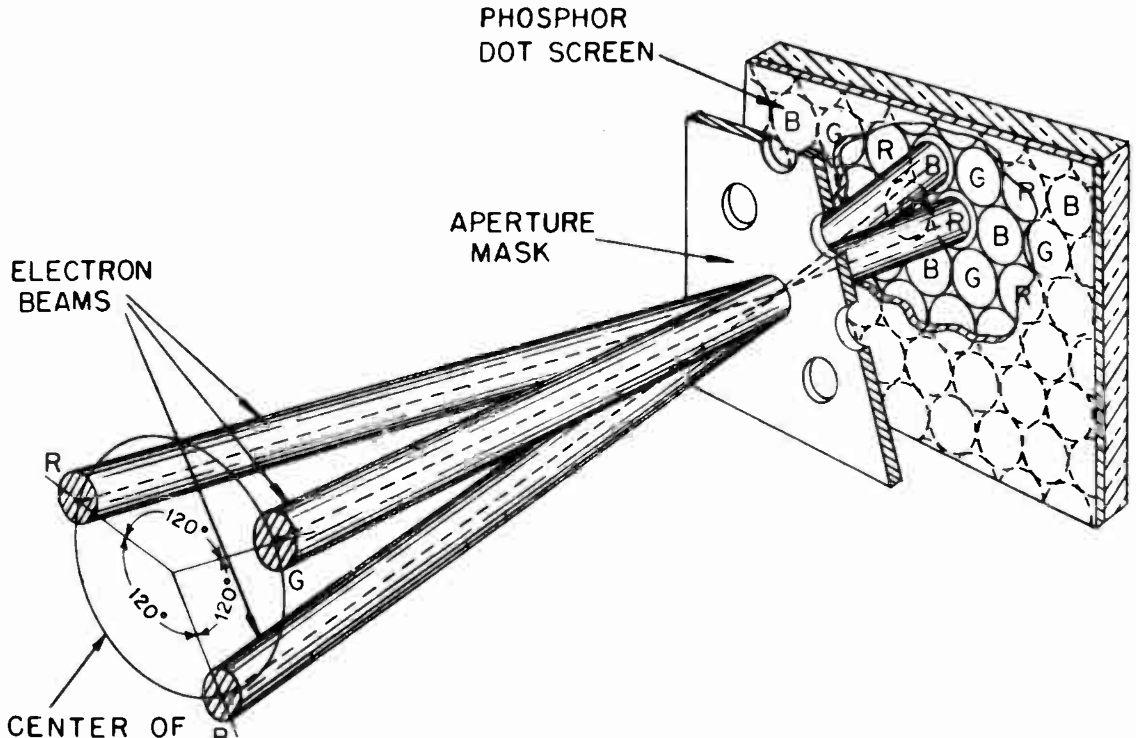
The term convergence refers to the point at which the three electron beams of the tri-color picture tube are made to cross-over before reaching the dot screen. The correct point for convergence of the three beams is at the hole in the aperture mask, which allows the beams to emerge at the correct angle for each beam to strike dots of just one color (see diagramatic illustration of the mask and screen). Convergence of the three beams is accomplished by a physical inward tilt of the electron guns as well as external, individually adjustable, beam bending magnets. This is called the static convergence system. (Fig. 5).

Exact convergence of the three beams over the entire screen cannot be accomplished by the aforementioned methods since the distance to the aperture mask is greater at the edges of the screen. In other words, the beams have to travel farther to reach the screen edges. This is due to the fact that the aperture mask and phosphor dot screen are not spherical and, therefore, do not follow the curve necessary to keep the beams converged at all points. To correct this condition, it is necessary to change the convergence point of the three beams as they are moved to either side of screen center as well as from top to bottom. Horizontal convergence is maintained by the horizontal dynamic convergence system and vertical convergence is maintained by the vertical dynamic convergence system. Since the beams are correctly converged at the center of the screen but are misconverged at the outer edges, the voltage waveform that will correct this condition will be minimum when the beams are at the screen center and maximum at the screen edges. This form of voltage curve is called a parabola.

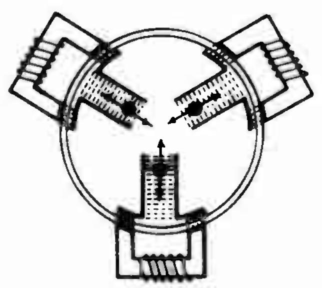
A study of the location of the electron guns in the neck of the tube and the manner in which the three beams are converged to strike dots of just one color will show that as the point of convergence is moved toward the guns (as it will be when the beams are at the edges of the screen and traveling a longer distance) that the angle of approach of the beams to the screen will be greater and that two of the beams will move below the horizontal scanning line while the third dot (blue) will move above the horizontal scan line.

To correct this condition, we must move the dots that fall below the line upward...and the dot that falls above the line downward. To accomplish this, we add a separate magnetic sweep system to each individual electron gun and feed currents into the coils of this sweep system so that they bend the beams back toward the scan line, as all three of the beams move to the screen edges.

The dynamic convergence system consists of three separate coils mounted to the neck of the picture tube. Each coil has an effect on just the electron gun and beam that is directly under the coil and moves the beam by magnetic coupling. To insure that each coil has an effect on only one beam and to obtain the correct movement of the particular beam, vanes of magnetic material are placed on each side of each electron gun (see layout of dynamic convergence coils). Magnetic coupling from the coils is to the magnetic vanes which, in turn, place magnetic lines across the beam path from vane to vane. Each beam will be moved at right angles to the magnetic field produced by the coils and since these coils are spaced at equal distances around the neck of the tube (120 degrees apart) one beam (blue) will be shifted exactly up and down, while the other two beams will be shifted at an angle...in respect to the horizontal scanning lines. The coils are supplied with parabolic currents at the vertical and horizontal sweep rates, thus keeping the beams converged horizontally as well as vertically. The complete system constitutes the dynamic convergence system. (Fig. 5).



Diagramatic illustration of the mask and screen showing the convergence of the three beams at a single hole in the aperture mask. Note that the converged beams pass through the hole and strike their respective phosphor dots.



LAYOUT OF DYNAMIC CONVERGENCE COILS ARROWS SHOW DIRECTION OF BEAM MOTION

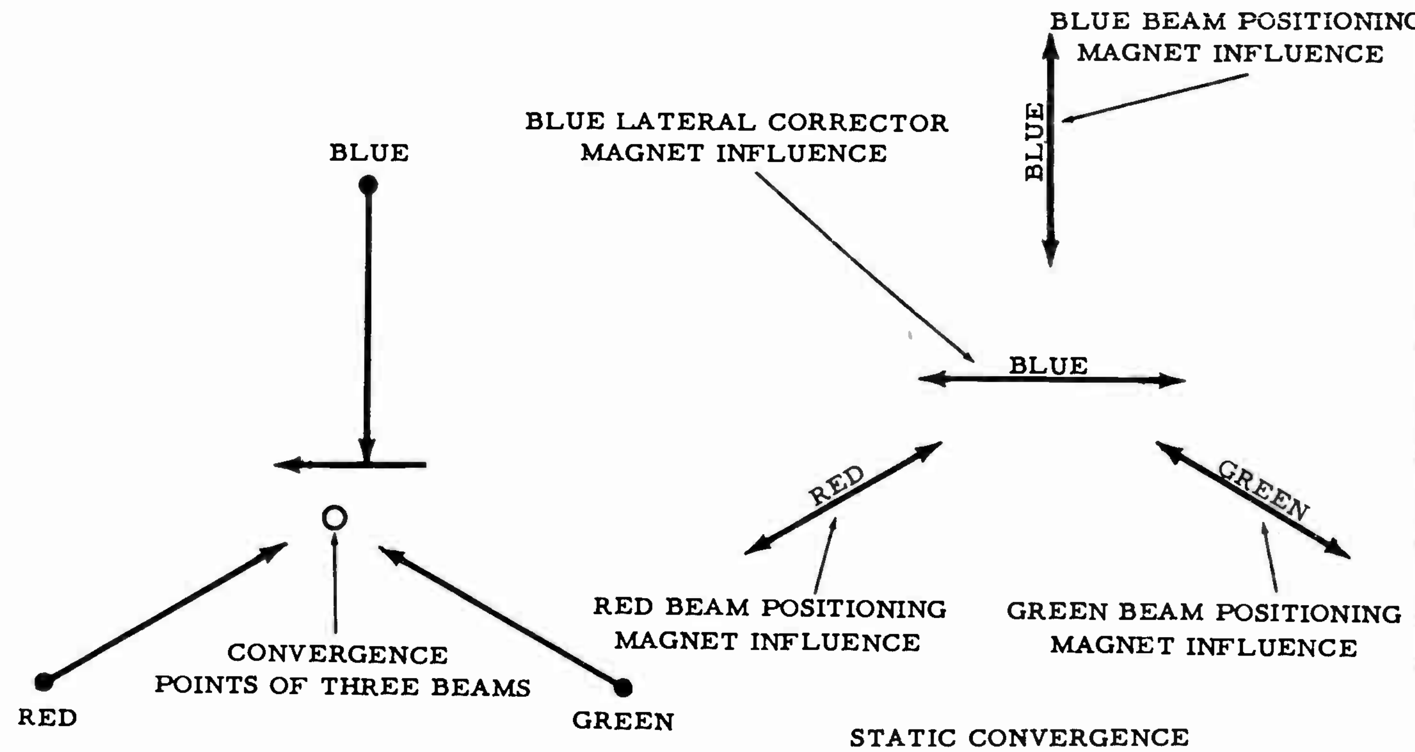
FIGURE 5.



STATIC CONVERGENCE

Direction of beam movement due to adjustment of three beam positioning magnets and blue lateral corrector magnet. (Beams shown overconverged)

SB-1

FIGURE 6. STATIC CONVERGENCE

THE BLUE CORRECTOR MAGNET OF THE STATIC CONVERGENCE SYSTEM

As stated previously, the three beams are made to converge at the center of the screen by a physical inward tilt of the electron guns as well as external, individually adjustable, beam positioning magnets. The beam positioning magnets are illustrated in the drawing of the 19-inch tri-color CRT shown in the "Installation and Operation" section. Notice that the magnets are spaced equally around the neck of the tube to lie directly above the three electron guns (120 degrees apart). The direction of each beam movement is identical to that shown by the arrows in the layout of the dynamic convergence coil drawing. The blue beam is moved in a vertical direction by movement of the blue beam positioning magnet, while the red and green beams are moved at an angle (with reference to a horizontal scanning line) by movement of the red and green beam positioning magnets. It is easy to see that the red and green dots will always have a convergence point since they can be moved toward the screen center at an angle. This is not necessarily true of the blue dot since it can only be moved vertically by the beam positioning magnet, and should it be out of convergence horizontally with the convergence point of the red and green beams...nothing could be done to correct its position. This condition is solved by an internal arrangement of magnetic material in the blue electron gun to provide a field for horizontal movement of the blue beam, provided by a fourth independent blue lateral corrector magnet (see layout of blue lateral corrector poles).

THE HORIZONTAL DYNAMIC CONVERGENCE SYSTEM

An independent secondary winding of the horizontal output transformer supplies a voltage pulse to the horizontal dynamic convergence system during each retrace of the horizontal sweep. The pulse occurs at a repetition rate of 15,750 times a second and represents a 15,750 cycle frequency.

The equivalent electrical circuit of the horizontal dynamic system is shown in the horizontal dynamics drawing (Figure 7). It consists of the 500 ohm horizontal dynamic amplitude potentiometer, a .01 mfd capacitor and the horizontal dynamic phase coil (which form a series resonant circuit) and the horizontal dynamic convergence coil. The 70, 100 and .05 mfd capacitors may be ignored in the equivalent drawing, since the reactance of these capacitors is negligible.

The amount of retrace pulse fed to the convergence circuit from the horizontal output transformer is determined by the 500 ohm horizontal dynamic amplitude potentiometer. The output of the potentiometer feeds into the series resonant circuit composed of the .01 mfd capacitor and the horizontal dynamic phase coil. For the sake of simplicity, it may be considered that the series resonant circuit is excited by the retrace pulse and will then oscillate at its resonant frequency. Since the series circuit must be tuned to 15,750 cycles (the repetition rate of the retrace pulse) it will produce a sine wave of 15,750 cycles (see Fig 7 "Across Horizontal Dynamic Phase Coil" drawing). When the series resonant circuit is tuned to this frequency by adjustment of the phase coil, maximum current will flow through the resonant circuit and maximum voltage will be produced across the phase coil. The phase coil now acts as an AC sine wave generator driving the horizontal dynamic convergence coil with a 15,750 cycle sine wave. The magnetic field produced by the convergence coil penetrates the glass neck of the picture tube and couples the flux lines through the magnetic vanes on either side of the electron beam (see "Layout of Dynamic Convergence Coils"). (Fig. 5).

The electron beam is thus forced to change its deflection angle in accordance with the 15,750 cycle sine wave and thus its convergence point with the other two beams as they move from left to right-hand sides of the screen for one horizontal scanning line. It is now possible to change the point of convergence of the beam on the left and right-hand sides of the screen as compared to the center of the screen and correct convergence of the beam may be maintained over the entire horizontal scan line.

THE VERTICAL DYNAMIC CONVERGENCE SYSTEM

The same physical coil used for the horizontal dynamic convergence system is also used for the vertical dynamic convergence system. The coil on the opposite leg of the core handles tilt voltages only and need not be considered at this time.

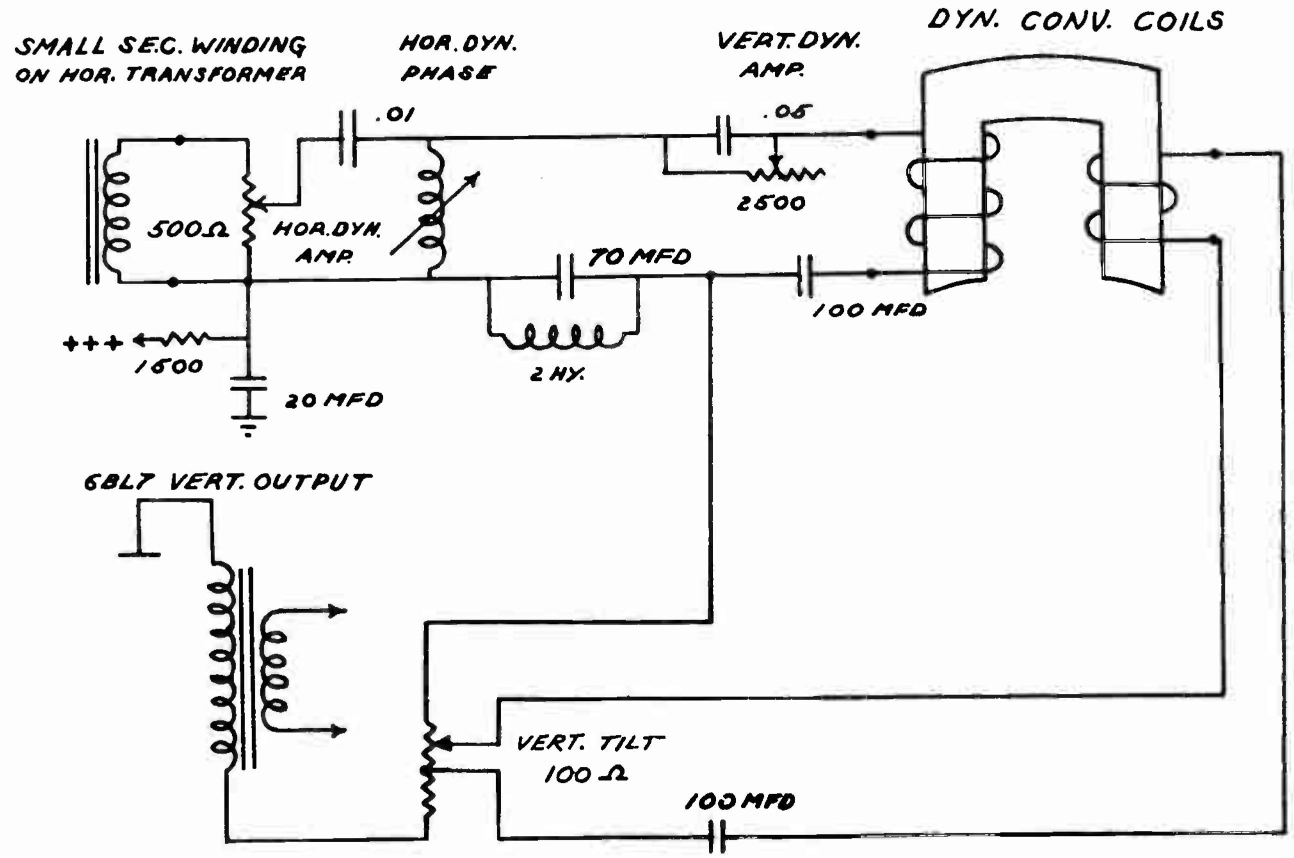
The simplified diagram (simplified convergence circuit) shows that the plate current for the vertical output tube flows through all the tilt potentiometers, through the 2 henry choke (in (Fig. 7). parallel with a 70 mfd capacitor) and finally to the B+++ by way of an 820 ohm resistor (R-164).

The formation of the dynamic parabolic voltage (vertical) is created across the parallel combination of the 70 mfd capacitor and the 2 henry choke. A combination of the charge and discharge time of the capacitor through the choke as well as the shape of the current curve through the capacitor performs the job of changing the sawtooth of current (created during the vertical sweep through the vertical output tube) into the required parabolic voltage. It may be correctly assumed from this point on that the 70 mfd capacitor and the 2 henry choke are acting as the parabolic voltage generator of the system.

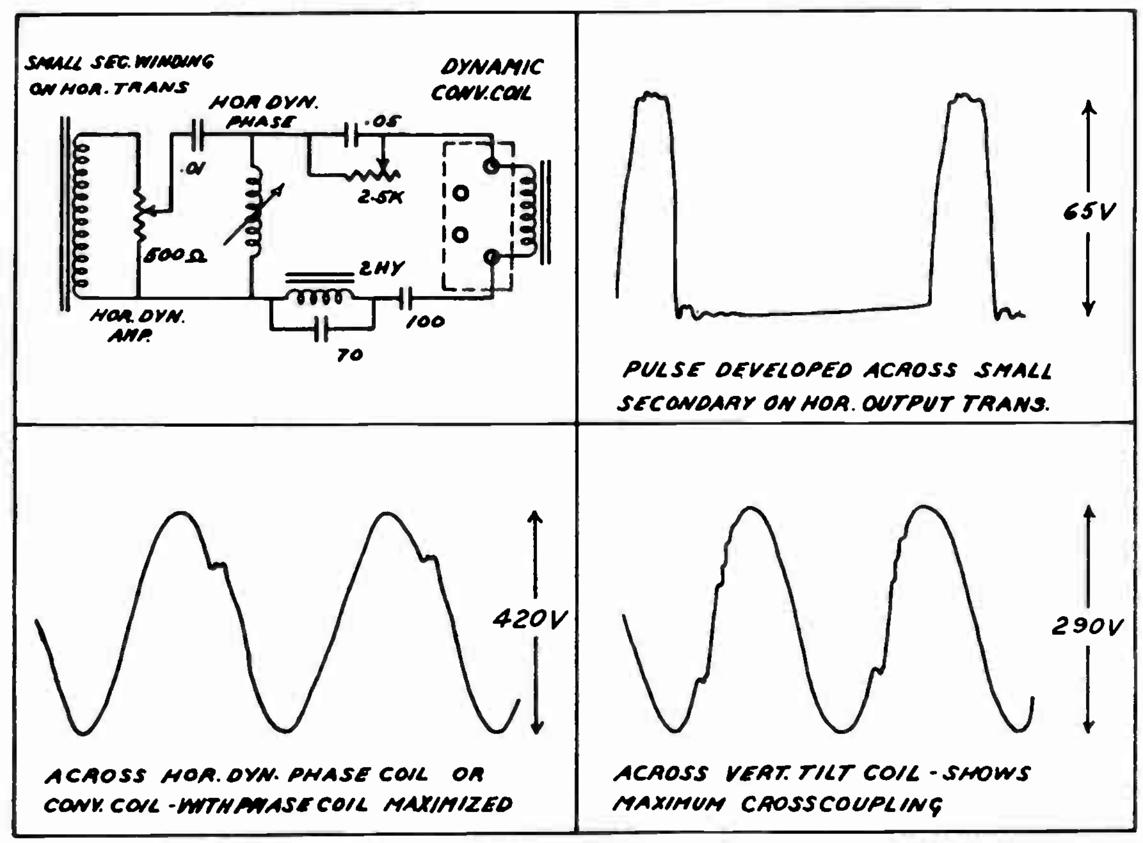
Inspection of the simplified convergence circuit shows that the 70 mfd capacitor and 2 henry choke are connected to the dynamic convergence coil through the following series paths: a 100 mfd capacitor, the horizontal dynamic phase coil and a parallel path of a .05 mfd capacitor and the 2500 ohm vertical dynamic amplitude potentiometer. This diagram may be simplified since the 100 mfd capacitor acts as a short circuit to 60 cycle current and may be replaced with a wire. The horizontal dynamic phase coil has such small reactance to 60 cycle current that it too may be replaced with a shorting wire. However, in the case of the parallel combination of the .05 mfd capacitor and the vertical amplitude potentiometer, the capacitor will not pass 60 cycle current and the 2500 ohm potentiometer is effective in the circuit.

The completely simplified circuit is shown in the drawing "Vertical Dynamics" and we find that the parallel circuit of the 70 mfd capacitor and the 2 henry choke are supplying the vertical dynamic coil with the correct parabolic voltages by way of the dynamic amplitude potentiometer and 100 mmf capacitor. (Fig. 8).

The 60 cycle parabolic voltage fed to the convergence coil creates a magnetic flux which is coupled to the beam by the magnetic vanes described previously. Keep in mind that there is a separate coil located on the tube neck for each electron gun.



SIMPLIFIED CONVERGENCE CIRCUIT



HORIZONTAL DYNAMICS

FIGURE 7.

THE VERTICAL TILT SYSTEM

The current waveform through the vertical tilt potentiometers is in the form of a sawtooth due to the action of the vertical sweep output tube. A voltage drop can occur across the rotor arm of the potentiometer and the center tap when the arm is not at the electrical center. If the arm of the potentiometer is set at the center tap junction, there would be no voltage drop and no voltage would be fed to the tilt coils. If we assume that the arm of the potentiometer is toward the top of the pot, then a sawtooth will be formed between the rotor arm and the tap. Since the point at which current flows into a resistor is the negative voltage end of the resistor; the top end of the potentiometer would have a negative polarity sawtooth. This would create a current flow through the tilt coil in a particular direction and create a sawtooth flux pattern imposed on the electron beam located under the particular coil associated with this potentiometer. Should the arm of the potentiometer be moved below the center tap, the lower end of the potentiometer would be the negative end and a sawtooth would be formed between the rotor arm and the tap... the amplitude of which would be determined by the amount of resistance between the arm and the center tap. In this case, the current through the tilt coil would be reversed and a sawtooth flux pattern would be imposed upon the electron beam of an opposite polarity. In other words, a sawtooth of variable amplitude and positive or negative polarity may be added to the electron beam. The effect of this is to add the sawtooth to the vertical dynamic parabola voltages to shape them as required for best convergence in the vertical plane.

HIGH VOLTAGE POWER SUPPLY

The operating voltages which are used to establish beam intensity and shape (focus) in the tricolor picture tube originate in the retrace (kickback) power supply section. Three high voltage rectifiers (two 3A2's and 3A3) are employed in a voltage doubler network circuit. The horizontal transformer is similar to the conventional type of auto-transformer used in high voltage circuits of black and white receivers. Extra windings are provided, however, to supply pulse voltages to the burst amplifier and the horizontal dynamic convergence system and separate filament voltages to the high voltage rectifiers.

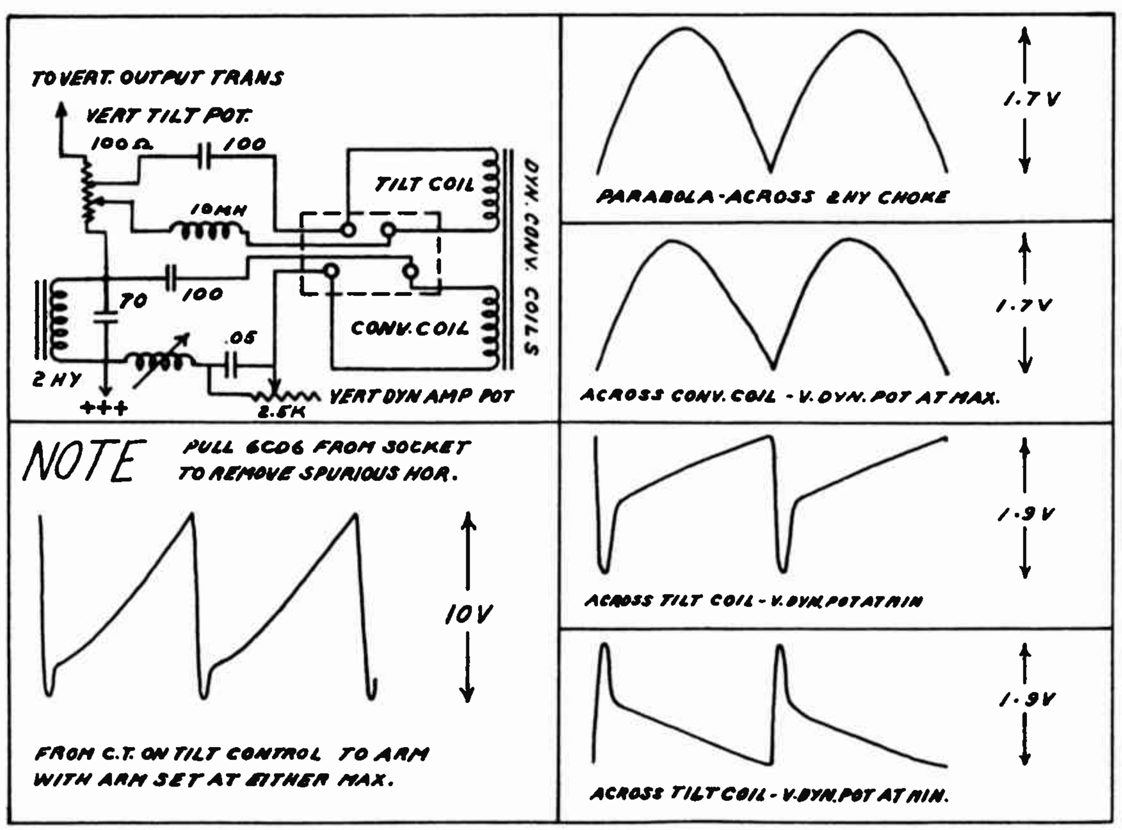


FIGURE 8. VERTICAL DYNAMICS

V-19 (3A2) and V-21 (3A3) conduct during retrace time. V-19 operates from a tap on the primary of T-13 so that the rectified output voltage at the filament of V-19 is approximately 8,000 volts. The focus circuit load drops that 8,000 volts so that approximately 6,000 volts is available at the plate of V-20. R-151 (2.5 meg) is used to adjust the voltage on the focus anode between 6,000 and 8,000 volts. The 6,000 volts at the plate of V-20 is coupled over to the plate of V-21 during the interval between pulses when V-20 conducts. This 6,000 volts plus approximately 19,000 volts, developed across the entire auto-transformer primary, appears at the plate of V-21 during retrace time. A voltage at the filament of V-21 equal to approximately 25,000 volts (developed across C-148) is available as the high voltage to the picture tube second anode.

Regulation of the 25,000 volt supply is obtained by using a regulator tube across the output circuit of the high voltage supply. Part of the output current is shunted through the regulator tube which offers a greater load to the high voltage system during the times when the high voltage tends to increase, with lessened picture tube loading (dark picture portions), and offers less load when the high voltage tends to decrease, due to increased picture tube loading (bright picture portions).

THE 19VP22 TRICOLOR PICTURE TUBE

The 19VP22 tricolor picture tube features an aluminized glass envelope, 62 degree deflection, electrostatic focusing; and is constructed for use with an electromagnetic convergence system. (Refer to diagrams of tricolor picture tube and gun assembly.)

Beam sources of the 19VP22 tricolor picture tube are supplied from a matched three-electron gun assembly. The three individual guns that make up the assembly are arranged 120 degrees apart in a triangular pattern. Each gun is tilted (approximately 1 degree) toward the common tube axis. This tilting of the guns is incorporated into the assembly with the intention of obtaining proper convergence of the beams at the center of the screen.

Aside from the yoke, which functions in the conventional manner, four external components are employed in conjunction with the tube's operation. They are: the purity device, the beam positioning magnets and convergence coils (one assembly) and the blue lateral corrector magnet. The purity device (two magnetic rings) is mounted on the neck of the tube between grid two and the focusing electrode. This device controls all beams simultaneously in an effort to provide color purity on the screen.

Three pairs of pole pieces are attached directly to the anodes of the guns (120 degrees apart). These pole pieces, or vanes, are used in conjunction with three permanent magnets (beam positioning magnets) and three electromagnetic coils (convergence coils), which are mounted directly over the pole pieces on the neck of the tube. In this manner, a means is provided for correction of center misconvergence (static adjustment) due to differences in the mechanical positions of the guns; and for correction of misconvergence at edges, top and bottom of the screen (dynamic adjustment), a natural development resulting from the particular shape of the shadow mask and phosphor-dot screen. A separate pair of pole pieces, or vanes, is attached to the focus electrode of the blue gun. This vane is used in conjunction with the blue lateral corrector magnet placed on the tube neck, directly over the vane; the action gives blue beam correction in the horizontal direction.

The tricolor phosphor-dot screen is placed directly on the inside surface of the face plate. (The opposite side of the face plate is the viewing surface of the tube.) 900,000 phosphor dots, arranged in 300,000 groups of dot trios, are located on the phosphor screen. Every dot trio includes a phosphor dot of each of the three primary colors; red, blue and green. A thin, arched shadow mask is positioned approximately 0.4 of an inch behind the phosphor screen. The shadow mask contains approximately 300,000 uniform-sized holes, precisely positioned in respect to the dot trios on the phosphor screen. Unlike the shadow masks in earlier, smaller-sized tricolor tubes, the shadow mask in the 19VP22 is unstressed, permitting expansion and contraction. High voltage requirements of the 19VP22 tricolor tube are: 25,000 volts at the anode (regulated); 6,500 to 8,000 volts at the focus electrode (adjustable).

ALIGNMENT

NOTE: Circuit connections which are used during receiver alignment are symbolized TP and MTP throughout the alignment instructions. The location of these important test points can be found readily by referring to BP-902 vertical chassis, bottom view for TP number identification and TS-902 horizontal chassis, bottom view for MTP number identification.

IF ALIGNMENT
GENERAL INFORMATION

The three IF transformers of the TS-902 are aligned consecutively starting with the sweep generator at the 3rd IF and moving toward the tuner. The scope is connected across the video detector load resistor (at pin #3 of the SERVICE TEST RECEPTACLE) during the entire IF alignment procedure.

The chassis can be placed on its side, with the SERVICE TEST RECEPTACLE at the top, and positioned so that all connections and adjustments are readily accessible.

The position of the generator and the curve produced for each connection is shown on the IF alignment detail drawing in steps. Follow the steps in sequence. (See Figure 11).

EQUIPMENT REQUIRED

A. Sweep Generator: 38 to 50 Mc, 12 Mc sweep width, linear, and capable of .1 volt output.

B. Cathode-Ray Oscilloscope: preferably with calibrated attenuator

C. Variac: to adjust the line voltage if not 117 volts

NOTES: IMPORTANT

Do not ground the receiver chassis - use an isolation transformer.
Keep generator output as low as possible.
Line voltage must be 117 volts; if not, adjust with variac.
Allow sufficient warm-up time before alignment.
Some coils resonate at two core settings, use the outer end position.
Use a shielded lead for the vertical input of the scope.
Always connect ground end of signal generator, or scope leads, near point of signal input or take-off.
Use the following procedure in sequence for receiver alignment.

STEP #1 PRELIMINARY PROCEDURE

A. Remove the 6CD6 horizontal amplifier (V-17) from its socket.

B. Connect bias battery to place negative 3 volts on the IF AGC bus (MTP-12) or pin #1 of the SERVICE TEST RECEPTACLE (see bottom view of TS-902 horizontal chassis).(Fig. 12).

C. Terminate the sweep generator cable with a 56 or 75 ohm resistor, whichever is applicable. Also connect a 470 mmf capacitor in series with the hot lead of the generator to provide DC blocking.

D. Short RF secondary coils (in tuner) to ground through the hole in side of tuner shield (MTP-1).

OSCILLOSCOPE: Connects to the video detector output (MTP-6) through a 27K ohm isolation resistor or directly to pin #3 of the service test receptacle. Leave in this position for the entire IF procedure.

STEP #2

SWEEP GENERATOR: Connect to the grid of the 3rd IF. (Use the 3rd IF jack). (Refer to TS-902 horizontal chassis top view and bottom view during IF alignment.) (Fig. 11 & 12).

ADJUST

A. Top slug of 3rd IF (primary) to 41.25 Mc trap dip (minimum output).......trap.

B. Bottom slug of 3rd IF (primary) so the 45.75 Mc marker falls at knee of the response curve.

C. Bottom slug of 3rd IF (secondary) for 41.85 Mc marker at lower knee of curve.

STEP #3

SWEEP GENERATOR: Connect to the grid of the 1st IF (Use the 1st IF test receptacle.)

ADJUST

A. Top slug of 1st IF for 47.25 Mc dip (minimum)............................trap.

B. Top slug of 2nd IF for 39.75 Mc dip (minimum)............................trap.

C. Bottom slug of 1st IF for 45.75 Mc marker at the 70% point.

D. Bottom slug of 2nd IF for 41.85 Mc marker at knee (peak) of curve. If it is not possible to position the marker exactly, make certain it is not more than 10% down from the peak.

STEP #4

SWEEP GENERATOR: Connect to the grid of the mixer. (Use the mixer test receptacle.)

ADJUST

A. The mixer primary (L-26) and secondary (L-31) (both are located on top of the chassis) so that 45.75 Mc falls at the 50% point, and 41.85 Mc falls no less than 10% down from maximum.

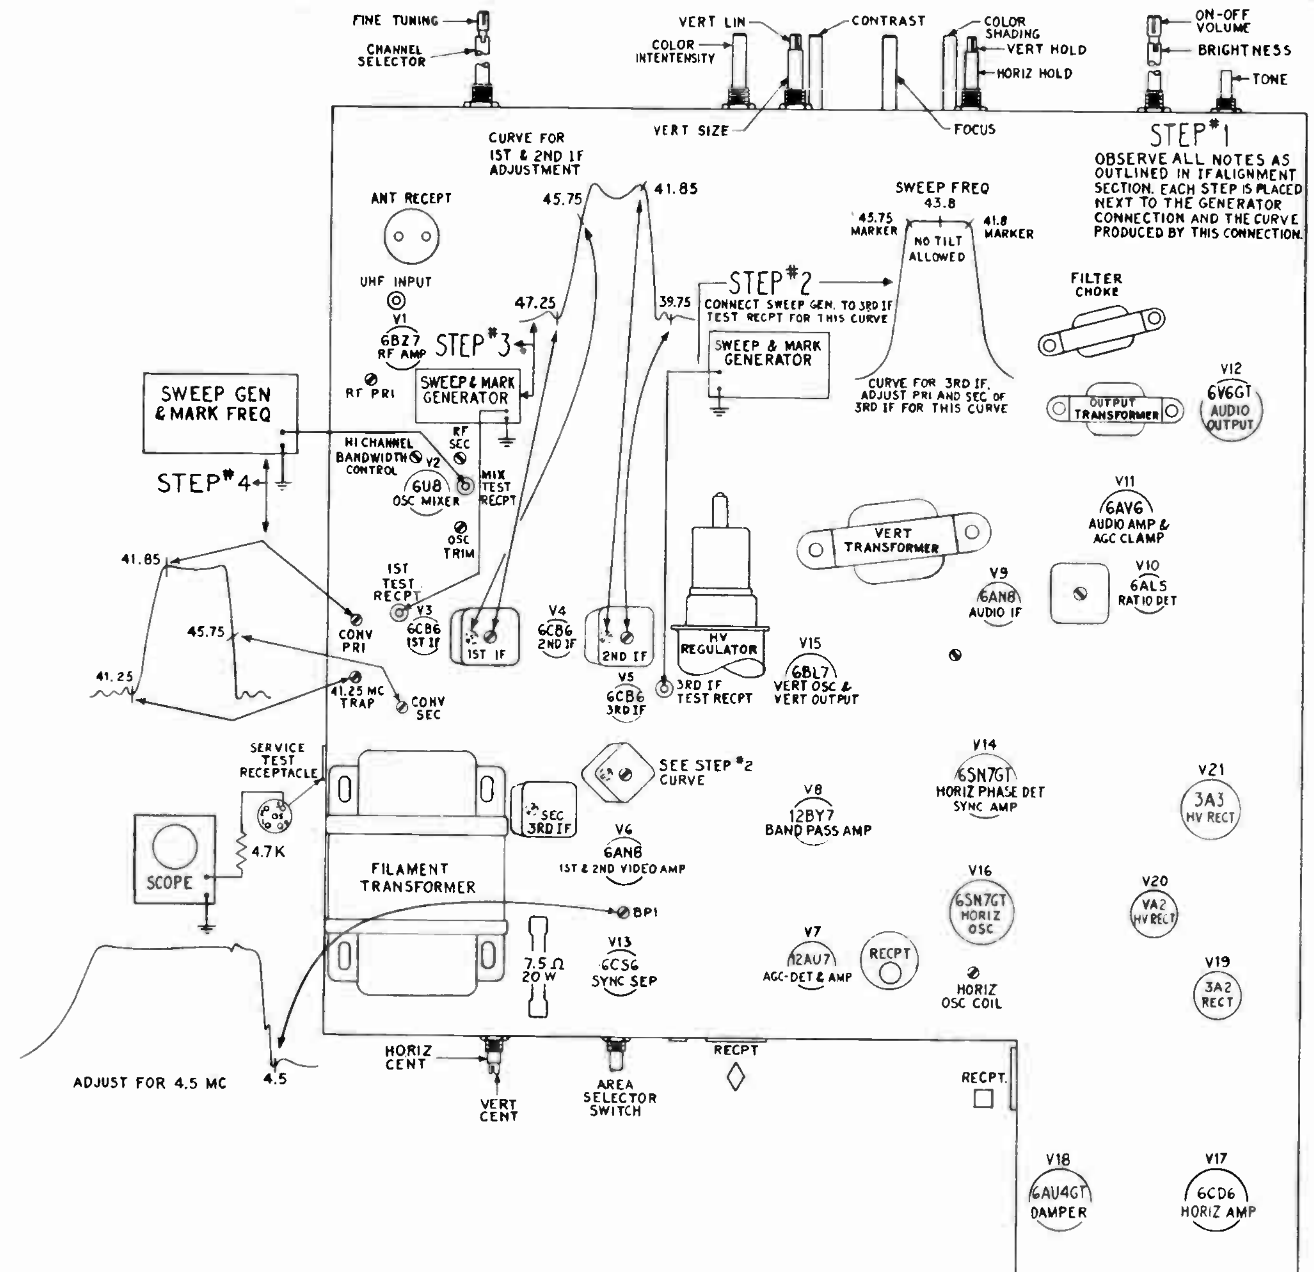

FIGURE 11. TS-902 HORIZONTAL CHASSIS (TOP VIEW)

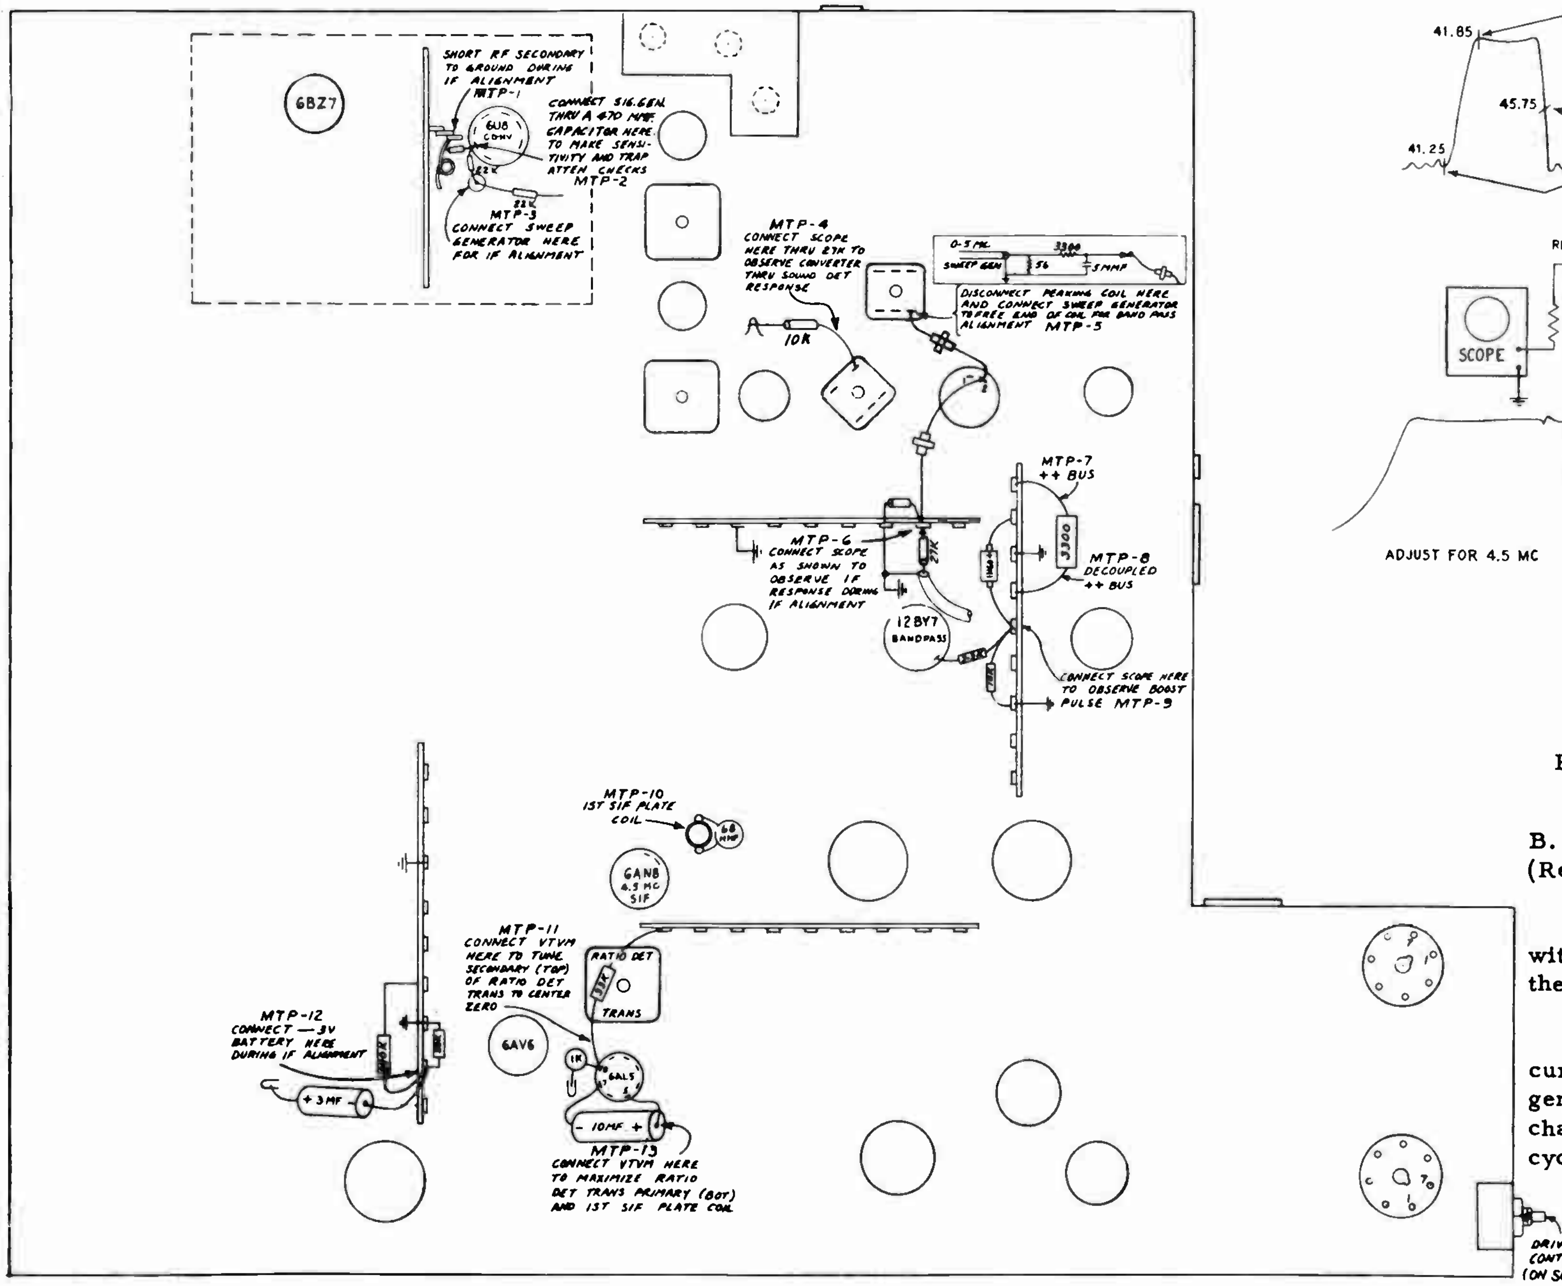

FIGURE 12. TS-902 HORIZONTAL CHASSIS (BOTTOM VIEW)

B. Trap slug in converter plate for the 41.25 Mc dip (minimum)................trap. (Refer to TS-902 horizontal chassis top view for response curve information.)

If adjustment of the converter primary and secondary coils will not put the markers within the stated limits adjust either the 1st IF plate coil or the 2nd IF plate coil to bring the response within limits.

When alignment is completed, remove the 3 volt bias from the IF AGC bus. The curve on the scope should rise appreciably in amplitude. Reduce signal level of the sweep generator to produce approximately the same height curve as obtained with bias (do not change the vertical gain of the scope). Bandwidth must not change more than 200 kilocycles (.2 Mc). There must be no signs of regeneration.

AUDIO IF ALIGNMENT

The following alignment may be made by injecting an accurate 4.5 Mc signal in at the video amplifier grid. However, using the station signal method is much more accurate and should be used whenever possible.

A conventional procedure is used in which the IF transformer, and primary of the ratio detector, are tuned for maximum reading on a VTVM connected across the ratio detector load resistor and electrolytic capacitor (MTP-13). The meter is then moved to the top "hot" end of the volume control (MTP-11) and the secondary of the ratio transformer tuned for the zero reading between the two maximum voltage points.

Refer to bottom view of the TS-902 horizontal chassis for location of the following adjustments: (Fig. 12).

1. With the receiver in good operating condition, tune in a station. Set all controls for normal operation.
2. Connect VTVM to the positive end of the 10 mf electrolytic capacitor located in the 6AL5 ratio detector (pin #5 of the 6AL5) circuit (MTP-13). The ground end of the meter connects to chassis ground.
3. Maintain 5 volts, or below limiting voltage, at the VTVM. It may be necessary to adjust the fine tuner - or to remove the antenna to attain this reading. NOTE: Adjusting the contrast control will not affect this reading.
4. Adjust the coil located in the plate of the 1st sound audio IF stage (1/2 6AN8). (See TS-902 horizontal chassis top view for location) and the primary (bottom) of the ratio detector transformer for maximum reading on the meter.
5. Move the DC lead of the VTVM to pin #8 of the ratio detector (6AL5). This is the "hot" lead of the volume control (MTP-11).
6. Tune the secondary (top) of the ratio detector transformer for the center zero reading on the meter.

TUNER ALIGNMENT

GENERAL INFORMATION

It is very unlikely that the Motorola Tuner will need alignment unless it has been damaged, has been replaced or has had components replaced in the tuner circuits. Tubes may be changed in most cases without realignment.

In the event alignment is necessary, low-band channels (6-2) may be adjusted individually by stretching or compressing coil turns, while high-band channel inductances (7-13) are formed by a stamped metal plate and are adjusted with L-8, L-13, C-10, C-28 and C-19 in the RF section and L-15 and C-21 in the oscillator section. (Fig. 13).

EQUIPMENT REQUIRED:

Sweep generator having:

1. Frequency range 40-220 Mc
2. 12 Mc sweep width
3. Adjustable linear output
4. Crystal calibrated video and sound carrier markers.

AM signal generator having:

1. Frequency range 40-220 Mc
2. Accurate frequency and attenuator calibration
3. 400 cycle modulation

Oscilloscope:

Wide-band, high gain type, preferably with a calibrated input attenuator.

PRE-ALIGNMENT PROCEDURE

1. Remove the horizontal output tube, V-17 (6CD6) to eliminate RF interference in the oscilloscope. Connect a 2500 ohm 25 watt resistor from B triple plus to ground to normalize the bus voltage.

2. Detune the oscillator by setting the fine tuner to minimum capacity.

3. Short the RF AGC bus to ground. (This is the third lug from left on rear of tuner - see main schematic.)

4. Remove the tuner cover.

5. Connect a 470 uuf capacitor from the converter plate to ground, as close as possible to the tube socket.

6. Keep the generator output as low as possible at all times to prevent overloading the receiver.

CONNECTIONS

Sweep generator - Remove the antenna lead-in from the chassis, and connect the sweep generator to the antenna receptacle. Keep the leads from the generator to the socket as short as possible.

Oscilloscope - Connect the scope lead to the mixer test receptacle. (See top view of the TS-902 horizontal chassis drawing.) (Fig. 11).

PROCEDURE

<u>Antenna and RF alignment (high channels 7-13)</u> (Refer to tuner alignment detail during following procedures.)

1. Switch the receiver channel selector to channel 8.

2. Center the sweep generator frequency at 185 Mc (center frequency of channel 8).

3. Adjust the trimmers C-10, C-28 and C-19 for the curve labeled HIGH BAND RF CURVE. (NOTE: C-10 positions the curve. C-19 acts as the jack and determines the tilt of the curve. C-28 adjusts bandwidth.) There should be no more than .05 volts peak-to-peak developed at the mixer test receptacle.

5. Center the sweep generator frequency at 213 Mc (center frequency of channel 13).

6. Adjust the channel 13 coils L-8 and L-13 by spreading or compressing the turns for symmetrical marker positions. (Use the peaks of the curve for reference.) The primary coil L-8 tends to position the curve, while the secondary coil L-13 affects the tilt of the curve.

7. Re-check channel 8 for proper response. Re-adjust trimmers C-10, C-28 and C-19 for correct curve on channel 8, if necessary.

8. Check all channels from 13 through 7 for proper curve with tuner shield on. See HIGH CHANNEL RESPONSE CURVE LIMITS. (Fig. 13).

<u>Antenna and RF alignment (low channels 6-2)</u>

1. Switch the receiver channel selector switch to channel 6.

2. Center the sweep generator frequency at 85 Mc (center frequency of channel 6).

3. Adjust the secondary coil L-12A to position the frequency of the curve and the primary L-9A for least tilt. Adjust for highest gain with least tilt and symmetrical skirts.

4. Adjust the antenna coil secondary L-4A or primary L-3C to remove tilt. Refer to LOW CHANNEL CURVE shown on TS-902 horizontal chassis top view. NOTE: It may be necessary to work between coils L-12A, L-9A, L-4A and L-3C to obtain the greatest gain with the least tilt and with symmetrical skirts.

FM trap

The FM trap L-1 may tune as low as channel 6, causing severe attenuation in part of the curve. Adjust the trap on channel 6 by spreading coil L-1 until no effect of attenuation is seen in the skirts of the response curve.

5. Adjust channel 5, 4, 3, and 2 in sequence by spreading or compressing the coil turns of the respective inductances. MAINTAIN CURVES WITHIN THE LOW CHANNEL RESPONSE LIMITS. (Fig. 13).

6. Re-examine curves on all channels for proper tracking with the tuner shield on.

Oscillator alignment

NOTE: The RF and mixer stages must be aligned before the oscillator is adjusted. Refer to tuner alignment detail during oscillator alignment.

1. Remove tuner shield and 470 uuf capacitor.

2. Set fine tuner to proper center position. (See tuner alignment detail for the fine tuner rotor position.) (Fig. 13).

3. Connect oscilloscope to pin 3 of the service test receptacle (across video load resistor). Connect sweep generator to antenna input socket and adjust for 12 Mc sweep width.

4. Set tuner to channel 8 and sweep generator to 183 Mc center frequency.

5. Adjust C-21 so that 185.75 sound marker falls into the trap dip.

6. Set tuner to channel 13 and sweep generator to 213 Mc center frequency.

7. Spread or compress L-15 so that 215.75 Mc sound marker falls into the trap dip.

8. Check channel 8 response if it was necessary to adjust channel 13.

9. Examine response on channels 13 through 7. On the high channels, a fine tuner rotation of plus or minus 30 degrees is allowable to obtain the required marker positions.

10. Set tuner to channel 6 and sweep generator to 85 Mc center frequency.

11. Spread or compress L-16A so that 87.75 Mc sound marker falls into the trap dip.

12. Adjust channel 5, 4, 3, and 2 in the same manner as channel 6. On low channels, fine tuner rotation of plus or minus 10% is allowable to obtain required marker position.

13. Replace tuner shield and check response on all channels for proper tracking.

IF trap adjustment

Set tuner to channel 2, with fine tuner adjusted properly, and sweep generator to 44 Mc center frequency (through antenna socket). Adjust L-2 for minimum response at approximately 44 Mc, with equal peaks near the video and sound marker.

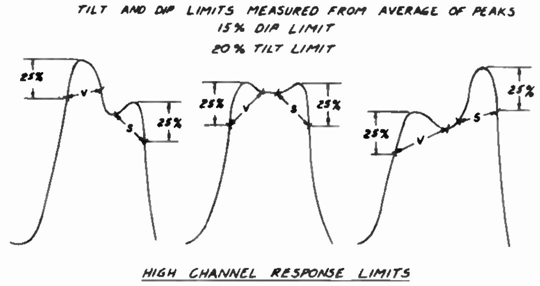
UHF alignment

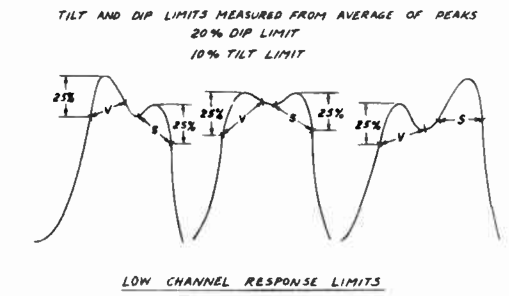
When the channel selector switch is in the UHF position, the RF and mixer stages of the VHF tuner become two additional stages of 40 Mc IF: the VHF antenna circuit is disconnected and grounded; coil L-5 (tuned to the IF range) is inserted into the grid circuit of the RF amplifier; RF primary coil L-10 and secondary coil L-11 are added to the circuit to bring it into the IF range; the oscillator is disabled and B plus is applied to the UHF tuner.

1. Remove tuner shield and connect sweep generator to UHF input receptacle across a total capacity of 33 mmf (including cable capacity). Set generator to 44 Mc center frequency with a 12 Mc sweep width.

2. Adjust L-10 and L-11 to place the 41.25 Mc sound marker and the 45.75 Mc video marker on the two peaks of the response curve. Adjust L-5 to eliminate tilt.

3. With tuner shield on, the overall curve through the IF stages should be identical to the mixer response curve.





FREQUENCY CHART

CHANNEL NUMBER	SWEEP GENERATOR CENTER	SOUND MARKER (RF COILS)	PICTURE MARKER ANT COILS
2	57MC	59.75	55.25
3	63MC	65.75	61.25
4	69MC	71.75	67.25

13	213MC	215.75	211.25

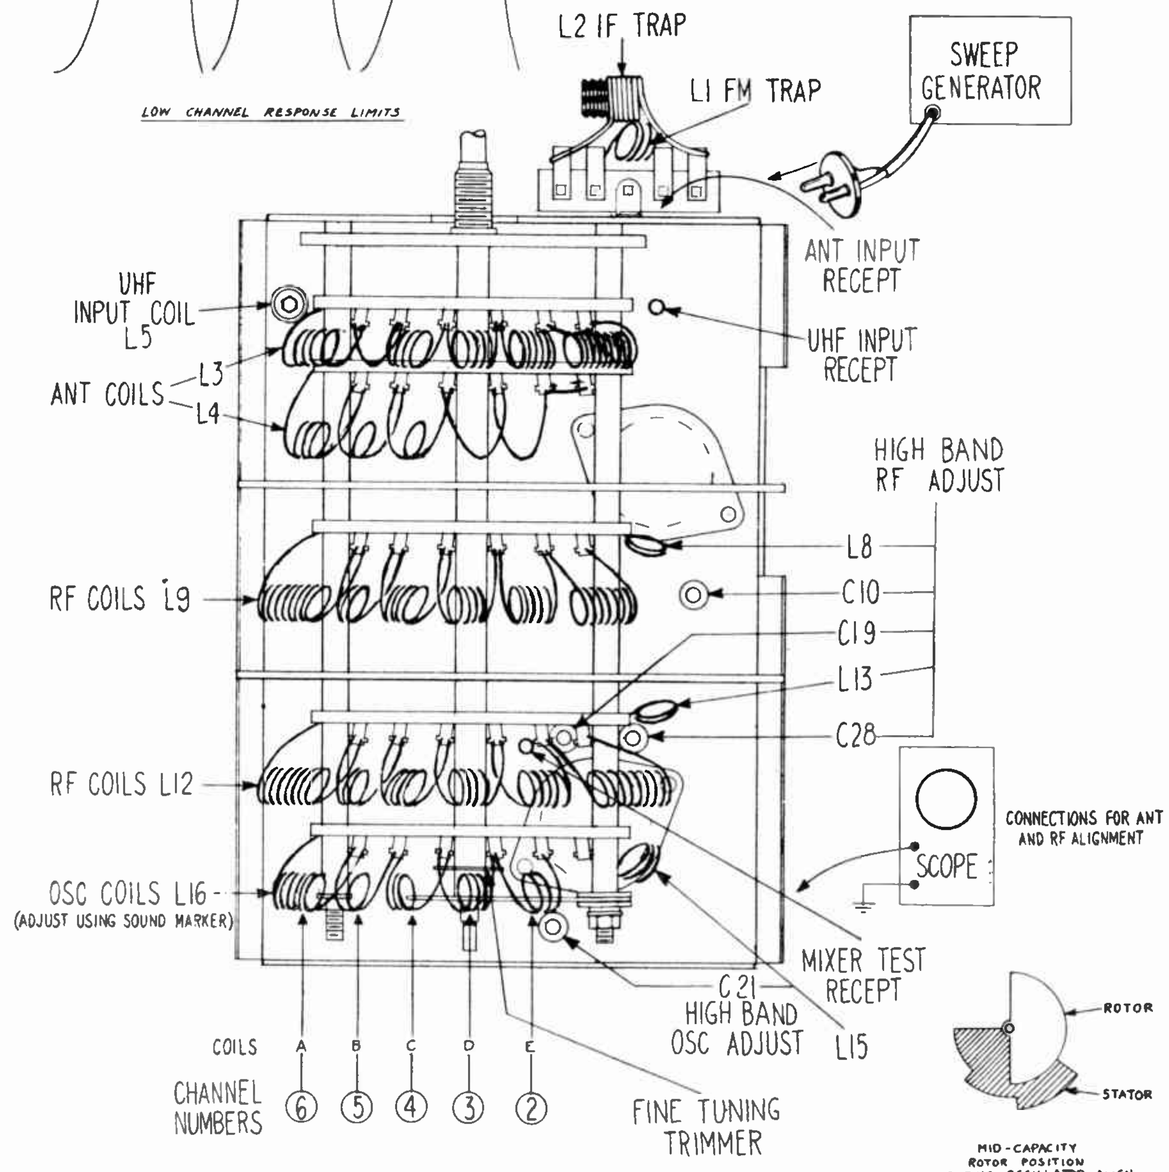

FIGURE 13. TUNER ALIGNMENT DETAIL

ALIGNMENT OF CHROMINANCE BANDPASS SYSTEM

The sections through which the signal will be passed for this alignment are: the first video amplifier, second video amplifier, bandpass amplifier, the bandpass cathode follower and the R-Y demodulator. The sweep generator is injected into 1st video amplifier by unsoldering the grid series peaking coil leading to the 3rd IF transformer and connecting the generator to the loose end. The sweep generator must be terminated with the network shown in diagram of horizontal chassis, bottom view.

The scope connects to the input side of the R-Y demodulator (junction of 33 mmf and 10K ohm resistor TP-11). Use a 100K isolation resistor in vertical input lead. (Fig. 15).

The sections tuned during this procedure are: the 1st video amp 4.5 Mc plate trap coil (L-39), the coupling transformer at the grid of the bandpass cathode follower (T-201) for 2.5 Mc on the bandpass curve and coils in the cathode of the bandpass cathode follower (T-202) for a symmetrical curve (jack action).

PROCEDURE

1. Remove 3.58 Mc color oscillator tube (V-28B, 12AT7).

2. Connect a bypass capacitor of .05 mfd 400V from junction of the 2200 ohm resistor and the delay line to ground (TP-7).

3. Set channel selector switch to channel #1 or unused channel.

4. Set contrast control for maximum (fully clockwise).

5. Set color intensity control to maximum (fully clockwise).

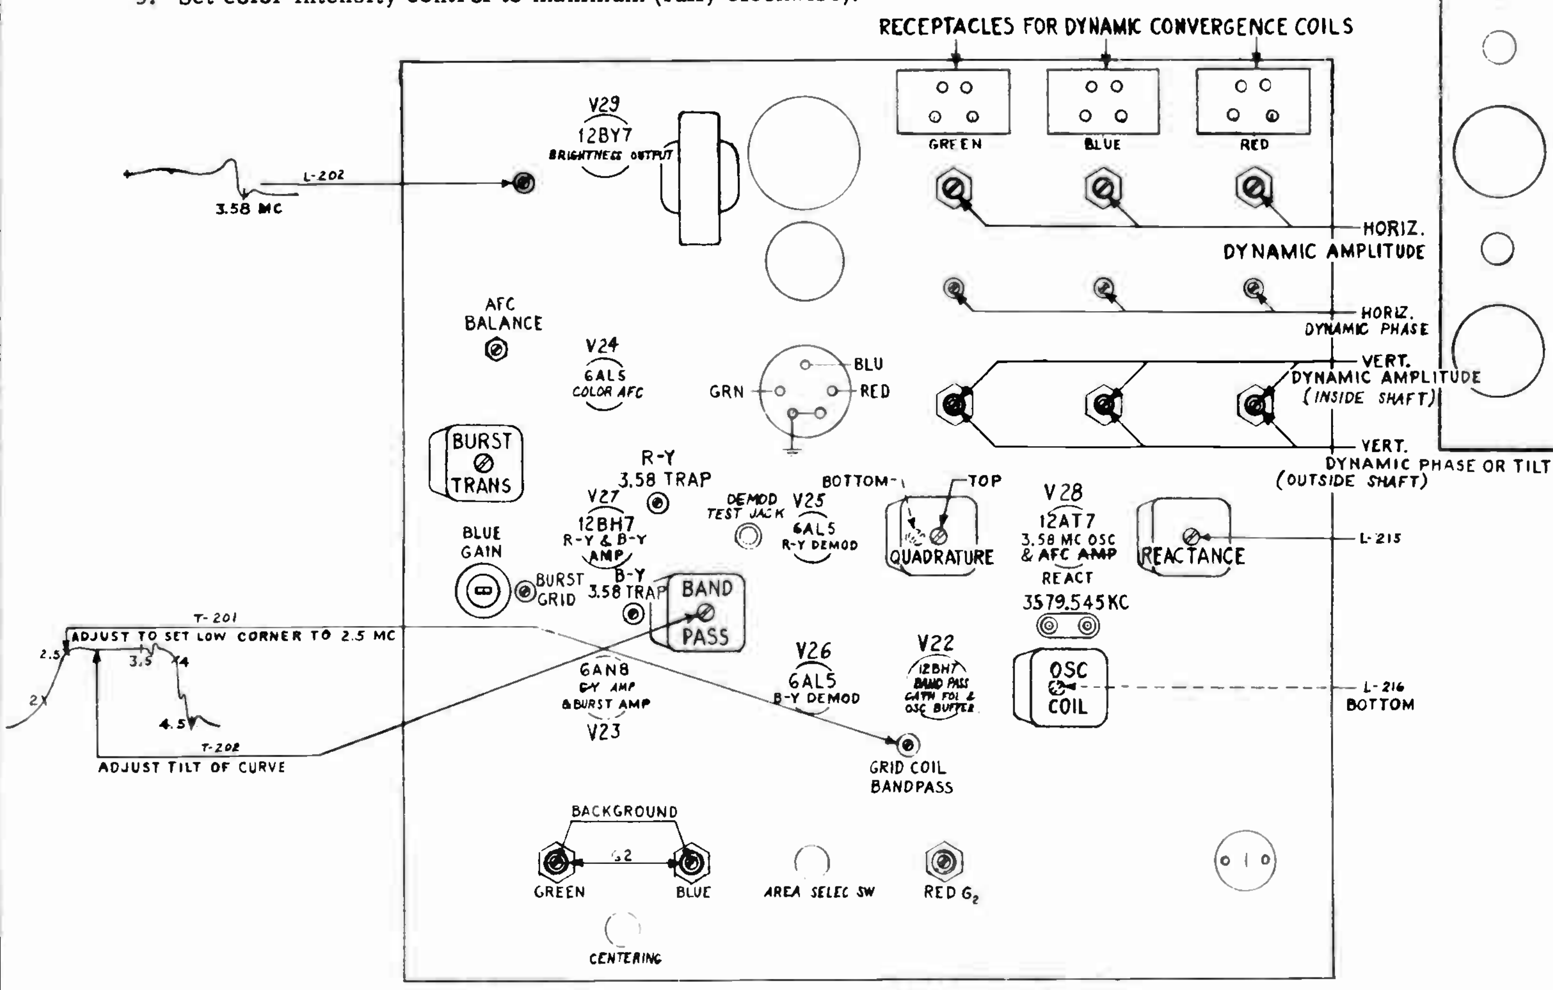

FIGURE 14. BP-902 VERTICAL CHASSIS (TOP VIEW)

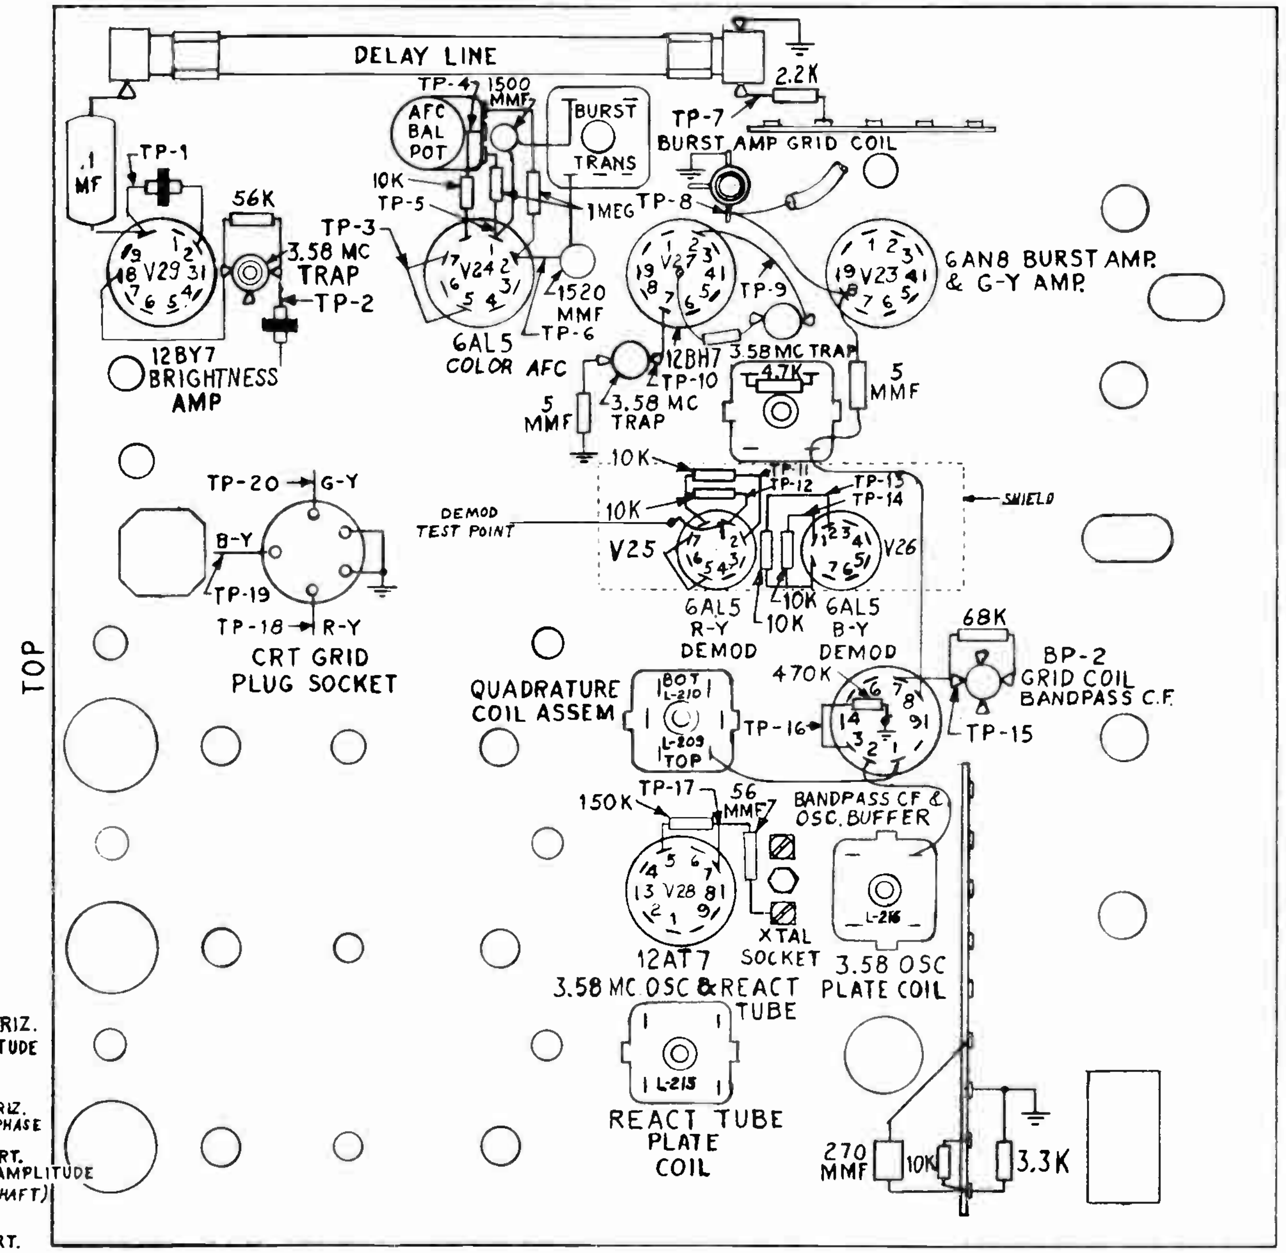

FIGURE 15. BP-902 VERTICAL CHASSIS (BOTTOM VIEW)

6. Connect scope to pin #1 of the R-Y demodulator (V-25, 6AL5) at the junction of the 10K ohm resistor and 33 mmf capacitor (TP-11) through a 100K ohm resistor.

7. Disconnect peaking coil from lug #4 of 3rd IF transformer (MTP-5). Connect sweep generator to loose end of peaking coil. Use decoupling network illustrated in diagram of horizontal chassis, bottom view.

8. Set sweep center frequency to 3 Mc and sweep width for 10 Mc.

9. Set marker generator to 4.5 Mc and adjust 4.5 Mc trap located in the plate circuit (pin #1) of the first video amplifier for the trap dip. (See TS-902 horizontal chassis top view.)(Fig. 11).

10. Set marker generator to 2.5 Mc.

11. Adjust coil in grid circuit of bandpass cathode follower (T-201) to place 2.5 Mc marker at the knee of the curve. (See BP-902 vertical chassis top view.)(Fig. 14).

12. Adjust the coil in the cathode circuit of the bandpass cathode follower (T-202) for least tilt and symmetrical response curve.

Refer to BP-902 vertical chassis top view for curve and slug locations. (Fig. 14)

ADJUSTMENT OF 3.58 MC TRAP IN BRIGHTNESS AMP PLATE

13. Remove .05 mfd capacitor at input to delay line. This is used only in bandpass alignment procedure.

14. Leave sweep generator connected to loose end of peaking coil as before. Move scope lead to cathodes of picture tube (pins #4, 5, and 13). Use crystal detector in scope input lead.

15. Set marker generator to 3.58 Mc and adjust 3.58 Mc trap (plate of the brightness amplifier) for dip.

NOTE: a. Traps must be aligned within + or - 50 Kc of specified frequency.

b. The response curve must show no sign of regenerative peaks.

c. If picture tube is not connected, curve may appear slightly different....with small peaks showing.

ALIGNMENT OF THE 3.58 MC TRAPS IN GRIDS OF THE R-Y and B-Y AMPLIFIER

The series tuned shunt traps located in the grid to ground circuits of the R-Y and B-Y amplifiers are tuned for maximum attenuation (minimum signal) using the normal leakage signal from the 3.58 Mc local color oscillator. A wide band scope must be used as the indicator and may be connected to the control grid of R-Y and B-Y amplifiers consecutively.

PROCEDURE

1. Make certain the 3.58 Mc local color oscillator is operating properly and with sufficient output.

2. Turn the color intensity control to minimum or remove the bandpass amplifier (V-8, 12BY7).

3. Connect scope (wide-band only) to grid of R-Y (TP-10) amplifier (V-27A, 12BH7).(Fig. 15)

4. Align the trap (L-207) located in the R-Y amplifier grid circuit for minimum amplitude of the 3.58 Mc signal as seen on the scope.

5. Connect scope (wide-band only) to grid of B-Y (TP-9) amplifier (V-27B, 12BH7).

6. Align the trap (L-208) located in the B-Y amplifier grid circuit for minimum amplitude of the 3.58 Mc signal as seen on the scope.

3.58 MC COLOR OSCILLATOR AND OSCILLATOR BUFFER STAGE ALIGNMENT

The 3.58 Mc color oscillator tank coil and the oscillator buffer stage coils are tuned using the frequency of the crystal. Therefore, an external signal generator is not required. The R-Y demodulator is used as the RF detector by connecting a VTVM between ground and the junction of the 10K ohm resistor and 33 mmf capacitor load circuit. The bottom slug of the quadrature coil is adjusted for maximum reading on the meter and the top slug for minimum.

3.58 Mc Osc Alignment Procedure

1. Allow set to warm up. Turn channel selector to unused VHF channel or UHF position. Turn color intensity and contrast controls to minimum.

2. Short AFC bus to ground at TP-4.

3. Connect high side of VTVM to TP-11 junction of 33 uuf capacitor and 10K resistor in R-Y demodulator circuit (a test jack is provided in some chassis).(Fig. 15).

Or, as an alternative, hook up VTVM to TP-6 junction of 1500 uuf and 1 meg resistor in AFC diode circuit. Readings made at this point will be approximately half the readings at the demodulator. Short out grid coil of gated burst amplifier TP-8, otherwise spurious incoming signals may give false injection measurement.

4. In each case when tuning coils, start with slug fully retracted from center of coil.

5. Adjust osc plate tank (L-216) for maximum response.

6. Adjust osc buffer plate coil, L-210 (bottom slug T-204) for maximum response.

7. Adjust quadrature coil, L-209 (top slug of T-204) for minimum response.

8. It may be necessary to repeat steps 5, 6 and 7 for best results.

9. Retune osc plate coil (L-216) turning screw (out) so as to retract slug from coil so that 25 volts of injection is measured at R-Y demodulator (TP-11).

or So that approximately 12 volts of injection is measured at AFC diode (TP-6).

ALIGNMENT OF THE COLOR OSCILLATOR AFC SYSTEM

The burst amplifier tube (V-23A, 1/2 6AN8) receives the entire color signal from the output of the bandpass cathode follower. Its screen voltage, however, is keyed from a winding on the horizontal output transformer; the tube operates only during the color burst. The output of the burst amplifier is fed to the color AFC phase detector and the phase and frequency of the burst reference signal is compared with that of the local 3.58 Mc color oscillator. Tuned to the 3.58 Mc burst signal are: a resonant tank in the burst amplifier grid (L-204), the coupling transformer to the AFC phase detector, the plate coil in the reactance tube circuit. An actual transmitted burst signal is used for the alignment; a VTVM is used for the output indicator. The VTVM is connected to either color AFC diode (V-24, 6AL5) at the junction of the 1 meg resistor and 1500 mmf capacitor. Connected at this point, the meter reads the rectified resultant 3.58 Mc burst voltage and the color oscillator injection voltage.

PROCEDURE

1. Allow receiver to warm up. Check the 3.58 Mc oscillator alignment and injection to insure normal operation. To check the injection, connect the VTVM to the junction of the 1500 mmf capacitor and 1 meg resistor in the color AFC phase detector circuit (TP-6). Connect the VTVM ground lead to chassis. Short the control grid of the burst amplifier (V-23A) to ground momentarily to eliminate readings from spurious incoming signals. The VTVM should read approximately 12 volts of injection.

2. Tune in a transmission supplying the standard burst of color sync. Set color intensity control for a normal color picture or near maximum CW rotation.

3. Set the fine phase trimmer (color shading control) at mid-range (on half mesh).

4. Connect a VTVM to TP-6 (jct of a 1500 mmf and 1 meg resistor) at AFC diode circuit.

5. Begin with the slugs fully retracted from the coils and tune the burst amplifier grid coil L-204 and plate transformer T-203 for maximum reading on VTVM.

6. Connect VTVM to the AFC bus at TP-4.

7. Adjust reactance tube plate coil L-215 (to bring oscillator into sync, if necessary) so that VTVM reads 0 volts on AFC bus.

8. Reduce chrominance signal so that it is just barely visible on the screen, by turning fine tuning control (front panel on RF tuner). This is done so that an extremely weak burst signal is supplied to the AFC diodes. The color oscillator may now possibly be out of sync.

9. Adjust AFC balance pot so that 3.58 Mc osc is in sync.

10. Reset RF fine tuning for normal picture so that adequate burst is supplied to the AFC diodes.

11. Connect an oscilloscope to the plate of the R-Y amplifier and retune L-204 the burst amplifier grid coil so that the burst pulse is zero volts as shown on the scope screen.

MEASUREMENTS

IF SENSITIVITY

1. Set channel selector to channel #1.

2. Short the RF secondary coils of the tuner to ground. These coils may be reached through the hole in the tuner cover.

3. No external bias is applied to the AGC line. The AGC is left wide open with normal or residual bias only.

4. Connect VTVM across the video detector load resistor (4700 ohms).

5. Feed a 44 Mc unmodulated signal through a 470 mmf capacitor into the grid of the mixer tube (pin #2 of the 6U8).

6. Less than 300 microvolts should be required for a 1 volt rise above the residual noise voltage at the video detector...as indicated on the meter.

SOUND SENSITIVITY

1. Feed an accurate 4.5 Mc signal across the 10K ohm sound detector load resistor through a 100 uuf capacitor. (Use a terminated Measurements Corp. Model 80 generator or equivalent.)

2. Connect the VTVM through a decoupling resistor to the positive side of the 10 mfd electrolytic capacitor at the ratio detector output. (The VTVM ground lead connects to chassis.)

3. Less than 3500 microvolts should be required for a 4 volt reading on the VTVM.

BANDPASS SENSITIVITY

1. Set the CONTRAST and COLOR INTENSITY controls to maximum.

2. Remove the 6CD6 horizontal amplifier tube (V-17) and the 12AT7, 3.58 Mc oscillator tube (V-28B) from their sockets.

3. Connect the high side of the VTVM through an isolation resistor of 100K ohms to junction of the 33 mmf capacitor and the 10K ohm resistor in the R-Y demodulator circuit. (Set for correct polarity.)

4. Disconnect the video peaking coil, located between lug on 3rd IF can and pin #2 of the 1st video amplifier, at the can end.

5. Connect generator through coupling network (shown on bottom view of horizontal chassis) into the loose end of the peaking coil (MTP-5) and into the first video amplifier grid. Adjust the generator for 3 Mc output. (Fig. 15).

6. Approximately a 15,000 microvolt signal should produce a rise of 1 volt on the VTVM.

VIDEO IF TRAP ATTENUATION MEASUREMENT

1. Set tuner to an unused channel or disable tuner by shorting out the RF secondary coil to ground at the junction of the RF coil and the 22 mmf capacitor.

2. Connect a terminated CW signal generator (such as Measurements Corp. Model 80) through a 470 mmf blocking capacitor directly to the grid of the mixer tube (MTP-2) pin #2 of the 6U8. (Fig. 12).

3. Apply minus 3 volts to the IF AGC bus (pin #1 of service test receptacle). (Fig. 11).

4. Connect VTVM across the video detector load resistor (4700 ohms).

5. Record the signal generator output voltage required to produce 1 volt across the video detector load resistor at the following frequencies: 39.75 Mc, 41.25 Mc, 47.25 Mc and 44 Mc.

6. Calculate the attenuation for each trap, using the following formula:

$$\frac{\text{Generator output at trap frequency}}{\text{Generator output at 44 Mc}} = \text{Attenuation}$$

7. Approximate trap attenuation should be:

At 39.75 Mc - 80
At 41.25 Mc - greater than 300
At 47.25 Mc - 65

MEASUREMENT OF THE SOUND CARRIER TO PICTURE CARRIER RATIO AT THE SOUND DETECTOR

1. Short the RF amplifier secondary coil to ground at the junction of the secondary coil and the 22 mmf capacitor (MTP-1). (Fig. 12).

2. Connect a terminated signal generator (such as Measurements Corp. Model 80) to the grid, pin #2 of the 6U8 (MTP-2).

3. Connect VTVM across the 10K ohm sound detector load resistor (MTP-4).

4. Apply minus 3 volts to the IF AGC bus at pin #1 of the service test receptacle.

5. Record the signal generator output voltage required to produce 1 volt across the sound detector load resistor at 41.25 Mc and 45.75 Mc.

6. Calculate the ratio, using the following formula:

$$\frac{\text{Generator output at 41.25 Mc}}{\text{Generator output at 45.75 Mc}} = \text{Sound to picture carrier ratio}$$

7. The ratio should be no greater than 20.

REPLACEMENT PARTS LIST

NOTE: When ordering parts, specify model number of set in addition to part number and description of part.

These models are nineteen tube direct viewing television receivers differing only in type of cabinet, size of speaker and their use in conjunction with a radio receiver and automatic record changer in the combination models. A 17" electrostatically focused rectangular tube (17HP4) is used in the 17" models and a 21" magnetically focused and rectangular tube {21ZP4B / 21ZP4A} is used in the 21" models. Replacement, in all cases, must be of the identical size and type.

Service information for radio chassis in combination models will be found in the Operating and Service Instructions, which are furnished with each set along with operating instructions for the automatic record changer.

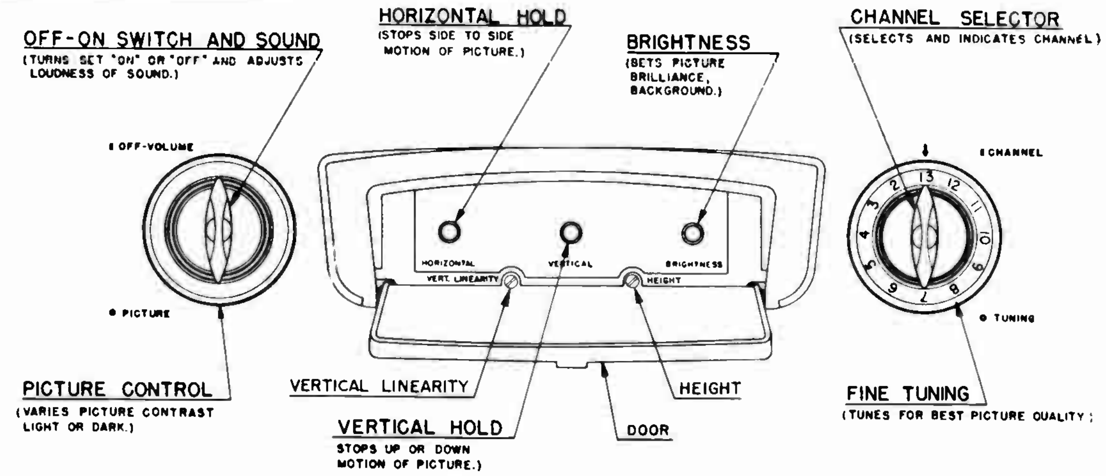

FIG. 1

CIRCUIT DESCRIPTION

GENERAL

The Olympic receivers covered by this manual use the Intercarrier type of Video and Sound IF System. Both Picture and Sound signals are received by the tuner, converted to an IF frequency and then fed, together, through three stages of video IF amplification. At the Video Amplifier stage the two signals are separated. The sound signal is fed into a Sound IF Amplifier and then through a Ratio Detector, an Audio amplifier, an Audio Output stage and ultimately to the speaker. The Video signal with its accompanying Sync pulses are fed through a Video Amplifier after which the Sync pulses are diverted into three Sync Separating and Clipping Stages and from there to the Vertical and Horizontal Sweep Oscillators. The Video information is fed from the Video amplifier to the Cathode of the Cathode Ray (Picture) Tube.

TUNER U CHASSIS

These receivers include the Olympic "Rocket" Tuner which is of the new cascode type. The principal advantages of the Rocket tuner are; greater sensitivity, improved Signal-to-noise ratio, and low radiation. Most of these properties are accomplished through the use of a dual triode (6BQ7 — V1) in which the two sections of the tube are separated by a grounded shield. The first triode is used as grounded cathode amplifier and the AGC voltage, generated later in the Video Detector and AGC Stage, is applied to the grid. The second Triode section of the tube is a Grounded Grid Amplifier and is directly coupled to the first section. The first section is neutralized by a factory adjusted coil to resonate with the grid-cathode capacity of the second section. The overall gain of the two stages is only slightly higher than that of a single pentode but through the use of triodes, which have a smaller amount of tube noise, the signal to noise ratio is greatly improved.

TUNER R-S CHASSIS

These chassis incorporate a Pentode tuner which uses a {6BC5 / 6CB6} tube as an RF Amplifier.

The Oscillator and Mixer stages are essentially the same as earlier Olympic turret type tuners with the addition of a complete shield covering the entire underside of the tuner, internal shielding, and added decoupling, all to minimize radiation.

PICTURE IF SYSTEM

These receivers have three stages of Video IF Amplification. The first IF coil (L301) is located on the tuner and functions as the output coupling of the tuner. The second IF coil (L-5) is followed by the Adjacent Sound Trap (L-6). The adjacent sound trap eliminates interference in the picture which might be caused by the sound signal of the next lowest channel when the lower channel is used in the same area. The Third Picture IF (L7) is followed by an accompanying Sound Trap (L9) but the Fourth Picture IF transformer (L8) has no trap. All coils and traps are adjusted from the top of the chassis. The IF coils are "stagger-tuned" to four frequencies described later in this manual under "RF-IF Alignment Procedure."
Note: Adjacent sound trap is used in "U" only.

VIDEO DETECTOR AND AGC

Both video detection and the development of the AGC voltage are accomplished in the IN64 Germanium diode.

The sound portion of the composite signal is picked off the output of the Video Amplifier by the2nd Sound IF Amplifier. This stage utilizes the 6AU6 tube (V3).

VIDEO AMPLIFIER

The Video information and the Sync and Blanking pulses are amplified at the 12BY7 (V10) Video Amplifier Tube. The Sync is picked off through an "RC" network consisting of R33 and C33 in the Plate circuit and fed to the Sync Separator (V11A) and Clipper stages (V 12A). The Video information goes to the cathode of the Kinescope (V19 — Pin 11) after passing through a 4.5 Mc trap (L1) to eliminate any sound interference in the picture.

SYNC SEPARATOR AND CLIPPERS

The sync system of these receivers employs three stages. Two dual triodes, a 12AX7 & a 12AU7 (VII & V12). The first triode of the first (V11A) is the sync separator stage. This in turn feeds into the second half of the same tube (V11B), the sync amplifier. The sync amplifier supplies pulses to the Horizontal AFC and oscillator (V14) and simultaneously to the Vertical Blocking oscillator (V12B) (through the Vertical Intergrating network). The first half of the second tube (V12A) is the sync clipper and the second half of the second tube (V12B) is the vertical oscillator.

SWEEP SYSTEM — VERTICAL — 6V6GT

The output of the oscillator stage is amplified in the 6V6GT tube (V13) and then fed through the Vertical Output Transformer to the vertical windings of the Deflection Yoke.

SWEEP SYSTEM — HORIZONTAL

The Horizontal Oscillator is essentially of the blocking oscillator type. The operation of the A.F.C. system depends upon a correcting voltage developed in the control section of the Horizontal Oscillator and AFC tube (V14) where the oscillator output and the incoming pulses differ in either phase or frequency. The control tube, (first section V14) is maintained at cut-off until such time as the sync pulse is either ahead or behind the Oscillator sawtooth peak. When either case occurs the control tube develops a voltage which is applied as a bias to the oscillator grid and alters the oscillator frequency to coincide with the frequency of the incoming pulses. The Horizontal Oscillator transformer (L16) has an adjustable core which is a coarse adjustment of the oscillator frequency and the front panel Horizontal Hold Control is a fine adjustment in the same sense.

Note: Many of the components in the horizontal circuits are of critical value and therefore should only be replaced by the exact replacement part. Care should also be taken in dressing leads and locating parts when replacing. This can be accomplished by carefully noting positions of parts and leads before removal.

SOUND SYSTEM

The sound carrier is taken off the plate (Pin 7) of the Video Amplifier tube (V10) and fed into the grid of the 2nd Sound IF Amplifier (V3 — Pin 1) and from there through the Ratio Detector (V4), the Audio Amplifier (V5), the Audio Output tube (V6) and then to the speaker.

HIGH VOLTAGE POWER SUPPLY

The Energy stored in the horizontal windings of the deflection yoke during the forward sweep produces high voltage surges during retrace. This is multiplied by the "Auto Transformer" (primary) winding of the Horizontal Output Transformer (TR 2771) and is then rectified by 1X2B or 1B3/GT (V16) to provide approximately 15 Kilovolts for the picture tube anode (V19).

"B" VOLTAGE POWER SUPPLY

The "B" voltage in these chassis is provided by a standard transformer-rectifier circuit. The secondary of the Power Transformer provides, in addition to a center-tapped "B" voltage winding, a five-volt filament winding for the 5U4G Power Rectifier (V18), and two six-volt windings. One six-volt source is used for the filaments of the Damper Tube (V17) only, and the other for the filaments of all other tubes. A "B" voltage of +140 volts is derived from the cathode of the 6W6/GT Audio Output Tube (V 6). This voltage is utilized primarily in the IF circuits and removal of the 6W6 from its socket will therefore make the entire IF strip inoperative.

ADJUSTMENTS

ION TRAP MAGNET ADJUSTMENT

Turn the brightness control fully clockwise and the contrast control fully counterclockwise. Adjust the ion trap magnet by moving it forward or backward and at the same time rotating it slightly around the neck of the kinescope until the raster on the screen is brightest. Of two possible positions, use the one nearest the tube base. Reduce the brightness control setting until the raster is slightly above average brilliance. Adjust focus control until the line structure of the raster is clearly visible (sharp). Readjust the ion trap magnet again for maximum raster brilliance. The final touches on this adjustment should be made with the brightness control at the maximum position with which good line focus can be maintained. Never correct for a shadowed raster with the ion trap.

DEFLECTION YOKE ADJUSTMENT

If the lines of the raster are not horizontal or squared with the picture mask. Loosen the deflection yoke adjustment screw and rotate the deflection yoke until this condition is obtained, and retighten the yoke adjustment screw. If neck shadow is evident or the corners of the raster are dark, the deflection yoke must be moved forward as far as possible and the wing screw re-tightened.

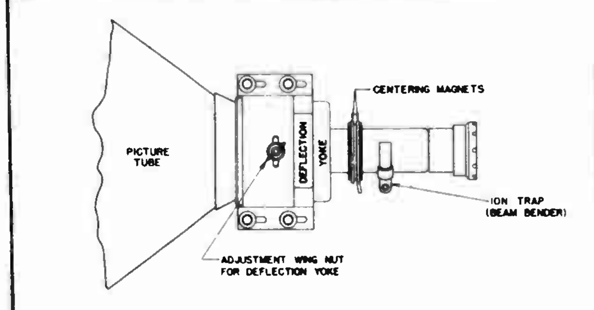

FIG. 2-"R" ONLY

CENTERING MAGNET ADJUSTMENT (17"—"R" ONLY)

The 21" receivers are electromagnetically focused and centering is accomplished by adjusting an arm which extends vertically from the front of the focus coil. This arm may be rotated, for a limited distance, around the neck of the tube and may also be moved up and down. The physical setting of the focus coil itself in relation to the neck of the tube will also affect picture position. Before the adjustment arm is used, it should be ascertained that (1) the focus coil is at right angles to the

CENTERING ADJUSTMENT (21" — S-U — ONLY)

The 21" receivers are magnetically focused and centering is accomplished by adjusting an arm which extends vertically from the front of the focus magnet. This arm may be rotated for a limited distance, around the neck of the tube and may also be moved up and down. The physical setting of the focus coil itself in relation to the neck of the tube will also affect picture position. Before the adjustment arm is used, it should be ascertained that (1) the focus magnet is at right angles to the neck of the tube (by setting the two nuts which tighten the tube support rods) and (2) that the neck of the tube is directly centered in the focus magnet (by loosening the two mounting screws on either side of the focus coil and sliding up or down).

Note: Remove corrugated shipping clip from around neck of pix tube before attempting any adjustments.

ADJUSTMENT OF HORIZONTAL OSCILLATOR

(1) Allow set to warm up to operating temperature. Select station operating normally.

(2) Short out horizontal Phasing Coil (L 17) Terminals C and D.

(3) Set horizontal hold control at maximum clock-wise rotation.

(4) Adjust horizontal frequency screw (L 16) until picture falls into sync. Turning the horizontal frequency screw (L 16) clockwise lowers the frequency, (bars sloping downward to left). Turning the screw counter-clockwise increases frequency (bars sloping downward to right).

(5) Connect vertical input lead of oscilloscope with 5 MMF isolating condenser in series to terminal "C" of horizontal oscillator transformer and ground oscilloscope to chassis. Set frequency of scope to approximately 5 KC.

(6) Remove short from terminals of the horizontal phasing coil (L 17) and adjust screw (L 17) until wave shape as observed on scope is like that shown in sketch. (See Fig. 3.)

(7) Some further adjustment of horizontal frequency screw (L 16) may be necessary to keep picture in sync after adjusting L 17 for proper wave shape.

(8) Remove scope from terminal "C" and retouch L 16, as per "9" below.

(9) Turn horizontal hold control through entire range. Picture should fall out of sync at either end of rotation. At full clockwise rotation blanking bar or jitter should be evident. At full counter-clockwise position picture should fall out to 4½ to 5 bars sloping downward to the left. (If picture stays in sync the tuner switch should be rotated to interrupt signal momentarily)

Caution: It is important that the picture be centered in the mask properly with the horizontal hold control in the mid-position, otherwise the set user may attempt to center the picture by means of the hold control. Under this condition the control may be on "edge" and impulse noise or change of camera will cause the picture to fall out of synchronization. It should also be noted that some manufacturers types of 6SN7GT may perform better than others in the horizontal oscillator socket and excessive drift of the horizontal oscillator circuit may be caused by a weak or defective 6SN7GT tube.

ADJUST FOR EQUAL PEAKS

FIG. 3

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS

For best results it is preferable that these adjustments be made on a transmitted test pattern; although satisfactory results can be obtained from an active picture.

Both controls will affect the height AND linearity of the picture and therefore must be adjusted simultaneously. It will be found that the Height Control has a tendency to affect the bottom of the picture more than the top and the linearity control just the reverse.

Note: It is advisable that both height and width of the picture be adjusted to a size slightly larger than the mask opening, so that during periods of low line voltage adequate picture size is maintained.

HORIZONTAL WIDTH & DRIVE ADJUSTMENT

The Horizontal Drive Trimmer should be screwed tight (clockwise) and then backed off (counter-clockwise) until Horizontal Drive bars appear. Then turn Drive Trimmer in again (clockwise) until drive bars, just disappear. (Note: In some sets no horizontal drive bars will appear regardless of Drive Trimmer adjustment. In these sets the trimmer should be set for proper width.

Important: The horizontal oscillator frequency must be checked for proper range of horizontal control after any adjustment of horizontal drive (C67). Any adjustment of C67 will usually require resetting of the horizontal frequency adjustment coil (L-16).

BUILT-IN ANTENNA

All models are equipped with a built-in antenna which provide satisfactory reception in many locations. In areas of weak reception an outside antenna will substantially improve the performance of the receiver. Antenna binding posts are provided at the rear of chassis and are accessible through the opening in the masonite back to permit the connection of an outside aerial. The built-in antenna is normally connected to the antenna posts and must be disconnected when attaching the outside aerial. To prevent the lead-in wires of the built-in antenna from contacting chassis parts and tubes, it is recommended that the lead-in wire be folded and held in place by tape or a rubber band. In some cases reception can be improved by changing the location of the receiver in the room when set is operating with built-in antenna.

RF-IF ALIGNMENT PROCEDURE

EQUIPMENT REQUIRED

(1) RF signal generator to provide the following accurate frequencies:

(a) 4.5 Mc (Video Amplifier Trap, Sound IF and Ratio Detector)

(b) IF Frequencies

21.75	MC	Accompanying Sound Trap (L9)
27.75	MC	Adjacent Sound Trap (L6) U only
22.5	MC	First Pix IF Transformer (L301)
25.75	MC	Second Pix IF Transformer (L5)
23.5	MC	Third Pix IF Transformer (L7)
25.25	MC	Fourth Pix IF Coil (L8)
21.75	MC	Sound Carrier Marker
26.25	MC	Picture Carrier Marker
23.0	MC	Marker

(c) RF Frequencies

CHANNEL NUMBER	PICTURE CARRIER FREQ. MC	SOUND CARRIER FREQ. MC
2	55.25	59.75
3	61.25	65.75
4	67.25	71.75
5	77.25	81.75
6	83.25	87.75
7	175.25	179.75
8	181.25	185.75
9	187.25	191.75
10	193.25	197.75
11	199.25	203.75
12	205.25	209.75
13	211.25	215.75

(d) Output on these ranges should be adjustable and capable of providing at least .1 volt.

If the accuracy of the generator frequencies is not known, some type of crystal calibrator should be utilized to check the correct settings of the RF generator for each particular frequency.

(2) Electronic Voltmeter

(3) Cathode Ray Oscilloscope, 3" minimum screen.

(4) RF Sweep Generator, meeting the following requirements:

(a) Frequency Ranges:

18 to 30 MC }
40 to 90 MC } 10 MC sweep width
170 to 225 MC }

(b) Output adjustable to .1 volt.

TO REMOVE CHASSIS FROM CABINET

Remove: (1) Line cord from power outlet
(2) Masonite back.
(3) Antenna Lead-in from terminal posts.
(4) Speaker plug from rear of chassis.
(5) Knobs from front of cabinet.
(6) Four mounting screws and washers from bottom of cabinet.

In sliding chassis out of cabinet, be careful that the kinescope tube does not strike against speaker or any other obstruction.

Before proceding it will be necessary to use an extra line (or "cheater") cord to supply AC current to the chassis as the set's line cord is attached to the masonite back of the cabinet.

ORDER OF ALIGNMENT

When complete receiver alignment is necessary, it should be performed in the following sequence:

(1) Accompanying Sound Trap
(2) Adjacent Sound Trap
(3) Pix IF Coils
(4) 4.5 MC Trap
(5) 4.5 MC Sound IF and Ratio Detector
(6) Tuner

After removing chassis from cabinet re-connect power and speaker plugs.

If a local station is not operating on Channel 9 set the tuner to this channel, turn on power switch and proceed as follows: (If 9 is a local station, use Channel 8 or 10.)

ACCOMPANYING AND ADJACENT SOUND TRAPS

Insert a 100,000 ohm 1/2 watt resistor in series with the "Hot Lead" of the electronic voltmeter and connect to the junction of L12 and C25. Meter switch should be set to the lowest negative scale. Ground lead of meter should be connected to chassis.

Remove the shield of the RF Oscillator and Mixer tube (V2) from ground clips leaving shield resting on tube and connect hot lead of the RF Signal Generator to it. This will couple generator output to mixer plate.

Set the generator frequency accurately to 21.75 MC, and adjust (L9) sound trap (See Fig. 6 Tube and Trimmer Layout) for **minimum** reading on voltmeter.

Set the generator frequency accurately to 27.75 MC and adjust (L6) Adjacent Sound Trap for **minimum** reading on voltmeter.

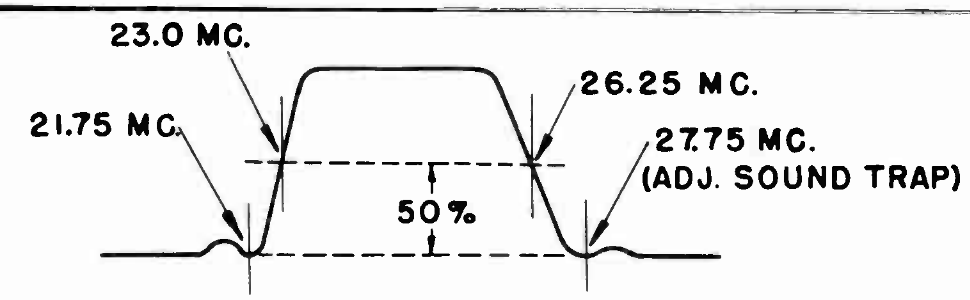

FIG. 4 STANDARD RESPONSE CURVE

PIX IF COIL ADJUSTMENT

Adjust the following slugs for maximum output at frequencies and sequence indicated with meter and generator connected as above: (See Sound Traps above).

L301	22.5 MC
L5	25.75 MC
L7	23.5 MC
L8	25.25 MC

Note: After setting L5 **DO NOT** readjust to improve wave shape.

If oscillation occurs during alignment, temporarily raise frequency of L8 by turning screw counter-clockwise until screw projects approximately 3/4". Oscillation is evidenced by high reading on voltmeter (—5V to —20V) with signal generator OFF and no signal coming in through the antenna terminals. After properly adjusting L301, L5 and L7 reset L8 to proper frequency, if it had been necessary to detune.

Connect hot lead of sweep generator through a 330 uuf condenser to test point on tuner and connect ground lead to chassis.

Connect vertical input terminal of oscilloscope to junction of peaking coil L12 and C25 and connect ground lead of scope to chassis.

Connect 1.5 V flashlight battery with positive terminal to chassis and negative terminal to junction of R13 and C21. This point is AGC bias voltage. Set tuner to Channel 9 unless local station is operating on this frequency, in which case an adjacent channel should be used.

Set Sweep Generator frequency to IF sweep on the 20 to 30 MC range.

Adjust sweep generator output to produce a curve on the scope which is approximately 2/3 of the screen diameter.

Loosely couple output of RF signal generator by using shield on V2 and set frequency of RF signal generator to 26.25 MC (marker).

Curve shown on scope should be similar to the response curve shown in Figure 4. For proper setting of the pix carrier the 26.25 MC marker should appear on the curve at a point approximately 50% of the vertical height of the curve.

To obtain this setting retouch L8.

Reset RF signal generator frequency to 23.O MC and retouch L301 and L7 for correct positioning of marker on curve.

Recheck setting of 26.25 MC marker to make sure that position has not shifted on curve.

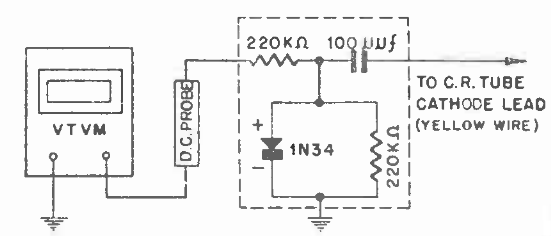
Disconnect bias battery.

Note: If the curve cannot be made to appear as above due to a local station or other interference, or if multiple markers appear, remove (V1 — 6BZ7 or 6BQ7) RF tube from tuner.

TRAP ALIGNMENT

Connect voltmeter lead to Diode crystal rectifier as shown in Fig. 5. Connect Diode crystal rectifier between C.R. Tube Cathode lead (yellow wire) and chassis ground. Signal generator is connected at junction of L12 and C33. Set contrast control at maximum and voltmeter to 3 volt scale (negative). Remove 6CB6 (V9) from socket. Use maximum output of generator at 4.5 MC. Adjust L1, top of TR-3386 for **minimum** reading on meter.

When it is necessary to retouch this trap in the field, proper adjustment can be made by using the local station signal and turning the Fine Tuning Control to bring fine herringbone sound beat into the picture. The 4.5 MC trap (L1) should then be adjusted to minimize this beat interference.



VOLTMETER AND CRYSTAL DIODE CONNECTIONS

FIG. 5

SOUND IF TRANSFORMER, (4.5 MC) AND RATIO DETECTOR ADJUSTMENT

In view of the fact that the transmitted sound signal from a TV station is probably the most accurate available, as far as frequency is concerned, it is recommended that a working signal be used for sound alignment. The set should be connected to an antenna, turned on, allowed to warm up for about 5 to 10 minutes and then tuned for the best picture. A vacuum tube voltmeter should be connected to Pin 2-V4 and the meter set to the minus 30 volt scale. The bottom of the 4.5 MC Sound IF Transformer (L2) and the primary of the Ratio Detector (L4 — bottom of the chassis) should be tuned for maximum deflection of the meter. The vacuum tube voltmeter should then be connected to the junction of R7 and C6 and one side of the volume control and the secondary of the Ratio Detector (L3 — top adjustment) should be adjusted for a zero reading with the meter set to the 3 volt scale. The secondary can also be adjusted by ear tuning L3 for the elimination of buzz in the sound.

TUNER ALIGNMENT FOR MODELS USING TUNER PART CL-2755-2

Note: Before making a complete tuner adjustment it is essential that all the IF, Trap, Sound and Discriminator circuits be aligned to their proper frequencies as described above. WHEN CHANGING THE CONVERTER TUBE IT IS NECESSARY TO REALIGN THE OSCILLATOR ADJUSTMENT ON ALL CHANNELS WITH THE V2 TUBE SHIELD IN PLACE.

A. RF and Converter Alignment

(1) Set Channel Selector switch to #12.

(2) Connect oscilloscope through 10,000 ohms to test point on tuner (bare tinned copper loop wire located between V1 and V2).

(3) Set fine tuning control at approximately midpoint of its tuning range. Temporarily connect jumper wire from Test Point "D" to chassis.

(4) Feed sweep generator into antenna terminals, sweeping channel 12.

(5) Adjust C301, C302 and C304 for flat top response curve. Check picture and sound carrier markers corresponding to frequencies shown in Service Data Section.

(6) Remove jumper from Test Point "D" to chassis.

B. Oscillator Alignment

Note: Oscillator adjustments (which are accessible through the hole in the front of the tuner) are provided for each channel. See "Tube and Trimmer Layout". Any oscillator coil slug can be adjusted without interaction on any other channel since individual coils are used for each of the 12 channels. This adjustment may be made on the station or with sweep generator and signal generator as follows:

(1) Set fine tuning control to midpoint of range. Do not touch during alignment.

(2) Connect sweep generator and marker (signal) generator to antenna terminals.

(3) Connect vertical input lead of scope with 50K resistor in series to test point A.

(4) Refer to following table for frequencies and adjustments.

Couple marker and Sweep Generator as in Section "B", Step 2

Connect Scope Through 10K Isolating Resistor to Test Point "A" and Low Side to Chassis

Step	SIGNAL GENERATOR INPUT Sweep Gen.	Marker Gen.	Channel	Adjust	Procedure
1	207.0 MC.	209.75 MC.	12	L-312	Adjust for placement of 21.25 MC. marker as per response curve Fig. 4.
2	207.0 MC.	209.75 MC.	12	C-301 C-302 C-304	Adjust shape of response curve Fig. 4 for maximum amplitude and bandwidth.
3	213.0 MC.	215.75 MC.	13	L-313	Adjust as in Step 1.
4	201.0 MC.	203.75 MC.	11	L-311	Adjust as in Step 1.
5	195.0 MC.	197.75 MC.	10	L-310	Adjust as in Step 1.
6	189.0 MC.	191.75 MC.	9	L-309	Adjust as in Step 1.
7	183.0 MC.	185.75 MC.	8	L-308	Adjust as in Step 1.
8	177.0 MC.	179.75 MC.	7	L-307	Adjust as in Step 1.
9	85.0 MC.	87.75 MC.	6	L-306	Adjust as in Step 1.
10	79.0 MC.	81.75 MC.	5	L-305	Adjust as in Step 1.
11	69.0 MC.	71.75 MC.	4	L-304	Adjust as in Step 1.
12	63.0 MC.	65.75 MC.	3	L-303	Adjust as in Step 1.
13	57.0 MC.	59.75 MC.	2	L-302	Adjust as in Step 1.

DESCRIPTION OF MODELS:

The Packard-Bell television receivers described in this manual incorporate either chassis type 1840 or 2040. The circuits are much the same, the main difference being that the 1840 uses two crystals in place of the 6AL5 ratio detector and also eliminates one of the low voltage rectifier tubes. For minor differences, see notes under schematics, Figs 15 and 16. The receiver may be equipped with either VHF or VHF/UHF (all-channel) tuning. The following table indicates the different features of the various models.

	VHF Tuner (10534B)	VHF/UHF Tuner (10535C)	Chassis Type	Picture Tube Size	Description	Illustrated in
Model	1841	1941	1840	21 in.	Table Model	Similar to Fig. 1
Model	1842	1942	1840	21 in.	Standard Console	Similar to Fig. 2
Model	2041	2141	2040	21 in.	Table Model	Fig. 1
Model	2042	2142	2040	21 in.	Standard Console	Fig. 2
Model	2043	2143	2040	21 in.	De Luxe Console	Fig. 3
Model	2044	2144	2040	17 in.	Table Model	Fig. 4

CABINET DIMENSIONS, OVERALL (not including tube shield):

	1841/1941	1842/1942	2041/2141	2042/2142	2043/2143	2044/2144
Height	23 in.	37 in.	22½ in.	34 in.	34 in.	19½ in.
Width	24 in.	24 in.	23 in.	24 in.	24½ in.	20½ in.
Depth	22 in.	22 in.	22 in.	23 in.	23½ in.	20 in.
Shipping Wt.	105 lb.	140 lb.	105 lb.	140 lb.	150 lb.	80 lb.

SPECIFICATIONS:

CHASSIS DIMENSIONS:

Chassis 1840 and 2040 are the same size and are designed for horizontal mounting in the cabinet. Dimensions are 17¾ in. square by 4 in. high.

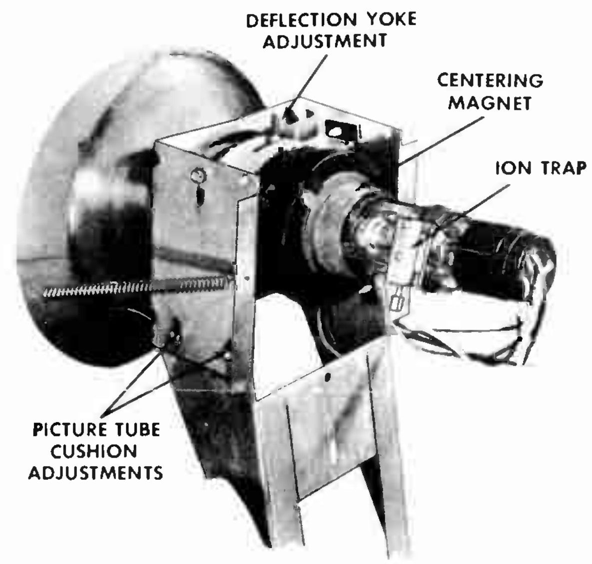

Fig. 5. Picture Tube Yoke Assembly

TELEVISION TUNING FREQUENCY RANGE:

Models using the VHF tuner receive all twelve VHF channels, 2 through 13, and coil strips are available for UHF channels 14 through 83.

All TV channels, 2 through 83, may be received on models using the VHF/UHF tuner. This tuner is available through Packard-Bell service departments for field installation in VHF models if desired.

INTERMEDIATE FREQUENCIES:

Picture Carrier: 45.75 Mc.
Sound Carrier: 41.25 Mc.
Intercarrier Sound: 4.5 Mc.

ELECTRICAL RATINGS:

Line voltage: 110-120 volts, 60 cycles.
Power consumption:
Models 1841/1941 & 1842/1942: 160 watts.
Models 2041/2141, 2042/2142, 2043/2143, and 2044/2144: 210 watts.

SPEAKER DATA:

Type: Permanent magnet dynamic.
Voice coil impedance: 3.2 ohms at 400 cycles.
Cone diameter (all models): 6 inches.

FOCUS:

Electrostatic.

SWEEP DEFLECTION:

Electromagnetic, 70 degree.

TUBE COMPLEMENT, 2040 CHASSIS:

Reference Symbol	Tube	Function

V-17	5U4	L. V. Rectifier
V-18	21YP4	Picture Tube

Picture tube is 17HP4 or 17RP4 on 2044/2144 chassis.

See section on "Radio Frequency Tuner," for remaining tubes.

TUBE COMPLEMENT, 1840 CHASSIS:

The tube complement on the 1840 chassis is identical to that on the 2040 chassis except that V-2 and V-16 are deleted.

PICTURE TUBE ADJUSTMENTS:

The following picture tube adjustments are to be made upon installation or whenever the receiver is serviced. (See Fig. 5, Picture Tube Yoke Assembly.)

1. DEFLECTION YOKE. Loosen deflection yoke adjustment screw and rotate yoke so that raster is square with picture tube frame. Make certain yoke is positioned firmly against cone of tube.
2. ION TRAP. Turn contrast control to minimum. Set brightness control at approximately 90% clockwise. Position ion trap over second opening from tube base, then rotate trap, at the same time turning adjusting screw, to obtain maximum brightness with sharpest focus.
   Reset brightness control to just light tube. Turn contrast control clockwise to 90% of maximum and readjust ion trap for peak brightness and focus.
3. CENTERING. The centering magnet is a dual ring magnet. The centering of the picture is dependent upon the relation of the rings to each other and the relation of both to the tube. To adjust, position the magnet almost against the deflection yoke, then rotate the two sections in relation to each other, and as a whole, until proper centering is obtained. This adjustment is quite stable and will need little attention unless its position is disturbed.

NOTE: If centering magnet is adjusted, repeat adjustment 2 above.

REMOVING PICTURE TUBE:

CAUTION

WEAR GOGGLES OR A MASK AND USE GLOVES WHEN HANDLING TUBE. DO NOT STRIKE OR SCRATCH THE TUBE OR SUBJECT IT TO MORE THAN MODERATE PRESSURE.

The uncoated bulb surface of the picture tube should be kept clean and free from dust or fingerprints. This is to prevent electrical leakage from the high voltage connection.

It is not necessary to remove the picture tube to clean the tube face. Simply remove the three screws in the rail above the tube and remove the safety glass. Clean glass and face of tube with window cleaning fluid on a soft cloth.

The chassis must be removed from the cabinet in order to remove the picture tube. The procedure is as follows:

1. Disconnect power plug and antenna.
2. Remove back and pull out speaker plug.
3. Remove control knobs on front panel.
4. Remove four bolts located under the shelf that the chassis rests on.
5. Take chassis out of cabinet.
6. Remove picture tube socket.
7. Remove ion trap and centering magnet.
8. Disconnect high voltage lead from picture tube.
9. Remove spring harness and unfasten band over top of picture tube.
10. Pull tube forward and out of yoke.

NON-OPERATING CONTROLS:

GENERAL:

The non-operating controls are located in two places. Five of them are under the nameplate escutcheon on the front of the set. They are:

Focus
Height
Vertical Hold
Vertical Linearity
Brightness

To reach these controls open the spring door on the escutcheon.

There are two non-operating controls at the rear of the chassis. They are:

Width
Horizontal Hold

Also at the rear of the chassis there is a "Local/Dist." switch.

All controls are marked. Read the following instructions before making any adjustments.

ADJUSTMENT OF NON-OPERATING CONTROLS:

The following adjustments should be made while observing a station test pattern. Allow receiver to warm up for ten minutes.

The BRIGHTNESS control should be adjusted in conjunction with the CONTRAST control so that each step (usually five) from black to white in the shading blocks is separate and distinct.

The FOCUS control should be adjusted so that the separate lines in the vertical resolution wedge are distinct as far as possible in to the narrow end of the vertical wedge.

Adjust HEIGHT and WIDTH controls in conjunction with VERTICAL LINEARITY control so that the large circles in the test pattern are as round as possible, and so that the test pattern is slightly larger than the mask opening.

The VERTICAL HOLD is adjusted so that the picture does not move up or down.

The HORIZONTAL HOLD control is set about halfway between the points where the picture tears.

LOCAL/DISTANCE SWITCH:

For areas in which there is no difficulty in reception, operate the receiver with this switch on "LOCAL." For fringe area reception, turn the switch to "DIST." This cuts out the auxiliary AGC, increases plate limiting in 1st video, and gives maximum sensitivity.

ALIGNMENT PROCEDURE

GENERAL:

It is important that the service technician read and adhere to the alignment instructions in this section. This point cannot be stressed too strongly, especially in the case of the picture I-F alignment.

Many service technicians have been accustomed to aligning the picture I-F response curve on the oscilloscope alone. This procedure is not recommended because it is actually quite possible to get what appears to be an acceptable curve and still be lacking in horizontal resolution.

It will be noted that in the following procedure the sweep generator is fed in through the antenna terminals. This being the case, the output impedance of the generator must be matched to the 300 ohm input impedance of the set. A matching network to accomplish this is shown in Fig. 6. The values in the illustration are for a generator of 75 ohms output impedance. If the sweep generator has a 50 ohm impedance use 56 ohms for the shunt resistor and 130 ohms for each of the series resistors.

In step 2 of the procedure below it is directed that the generator be loosely coupled to the converter tube. This is done by disconnecting the tube shield from the ground and connecting the generator between the shield and the ground.

Test point locations are shown on the schematic diagrams, Figs. 13, 15 and 16, and on the chassis illustrations, Figs 8, 9, and 12.

Allow set to warm up for ten minutes before alignment.

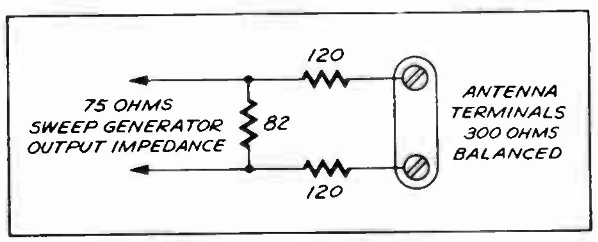

Fig. 6. Matching Network

PICTURE I-F ALIGNMENT:

1. Connect a vacuum tube voltmeter between point "A" and ground.
2. Loosely couple signal generator to mixer tube (6J6) in tuner*, keeping leads short. (See general instructions above.) Set output at maximum.

Step	Sig. Gen. Frequency	Adjust	For
3.	45.50 Mc.	S-15 (Mixer I-F in tuner)	MAXIMUM
4.	45.50 Mc.	S-6	MAXIMUM
5.	41.80 Mc.	S-5	MAXIMUM
6.	43.30 Mc.	S-8	MAXIMUM
7.	44.50 Mc.	S-10	MAXIMUM
8.	39.75 Mc.	S-4 and S-9	Minimum

S-9 later deleted; see production modification 14.

Step	Sig. Gen. Frequency	Adjust	For
9.	47.25 Mc.	S-3 and S-7	Minimum

REPEAT STEPS 3 THROUGH 9

10. Connect oscilloscope to point "B," using a 22,000 ohm isolating resistor in series with the scope probe. Connect an electrolytic capacitor, 5 mfd, 50 volts, between point "A" and ground, the negative lead going to point "A."
11. Connect sweep generator to antenna terminals through an impedance matching network. (See general instructions above.)
12. Rotate tuner to channel 3, and set sweep generator to center frequency of channel, (63 Mc.). With a sweep width of 10 Mc., adjust generator output to develop approximately 2 volts of AGC.
13. With signal generator loosely coupled to converter tube, adjust output to provide the markers shown on the response curve, Fig. 7. Check the position of the markers one at a time.

*In 82-channel tuner, mixer tube is a 6U8.

14. Observe the wave form obtained on the oscilloscope and compare it with the waveform shown in Fig. 7. If the spot frequency alignment has been carefully done, the comparison will be favorable. However, slight retouching of the I-F adjustments may be required. It should not be necessary to change any adjustment appreciably. The markers should be located as follows:

The 47.25 Mc. and the 39.75 Mc. at minimum response. (These markers will be at too low a level to show on scope.)

The 45.75 Mc. marker at 50% response.

The 43.30 Mc. marker at 95% response.

The 45.00 Mc. marker at 97% response.

The 41.25 Mc. marker at a maximum of 12% response.

IMPORTANT: The 45.00 Mc. marker must not exceed 97% response on channel 3 or picture may smear on higher channels.

ALIGNMENT OF 4.5 Mc. TRAP:

1. Connect signal generator between point "B" and ground through a .001 mfd isolating capacitor.
2. Turn contrast control to maximum.
3. Connect a R-F vacuum tube voltmeter to point "C." If an R-F VTVM is not available, connect a germanium diode crystal in series with the positive probe of a conventional VTVM.
4. Set signal generator to 4.50 Mc., exactly, with the output at one volt or more.
5. Adjust trap, S-11, for minimum VTVM reading.

NOTE: If signal generator is not capable of one volt output, it will be necessary to adjust the trap by visual means. To do this, observe the picture and adjust the trap to eliminate the 4.5 Mc. beat.

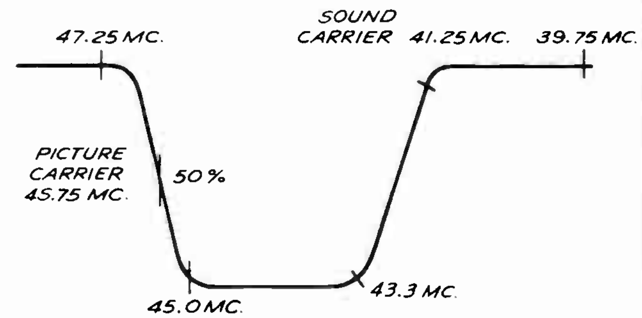

Fig. 7. I-F Response Curve

SOUND I-F AND RATIO DETECTOR ALIGNMENT:

1. Connect signal generator between point "B" and ground through a .001 mfd isolating capacitor.
2. Connect VTVM between point "D" and ground.
3. With generator frequency at 4.50 Mc., adjust S-12 and S-1 for MAXIMUM output.
4. Connect VTVM between points "E" and "F."
5. Adjust Ratio Detector secondary, S-2, for zero between positive and negative peaks.

RADIO FREQUENCY TUNER:

The VHF tuner number 10534B contains two tubes, the R-F amplifier, a 6BZ7 or 6BQ7A, and an oscillator and mixer tube, a 6J6. The 6BZ7 is interchangeable with the 6BQ7A.

Oscillator coil tuning slugs are reached through hole in front of tuner chassis, see Fig. 12. Tuner adjustment other than tuning slug and I-F adjustment (S-15) is not recommended.

UHF OPERATION:

UHF coil strips for the VHF tuner are available at Packard-Bell Factory Service Departments. No tuner adjustment is needed after strip installation except normal slug adjustment.

NOTE: TUBE LOCATIONS, TEST POINTS, AND ADJUSTMENTS ON THE 2040 AND 1840 CHASSIS ARE IDENTICAL EXCEPT THAT THE 1840 DOES NOT USE TUBES V-2 AND V-16.

LIST OF ADJUSTMENTS:

REFERENCE SYMBOL	DESCRIPTION
S-1	Ratio detector primary
S-2	Ratio detector secondary

PRODUCTION MODIFICATIONS, CHASSIS 2040:

The following modifications were made after production of the receivers had begun and are listed to point out variations in early sets from the schematics shown in this manual. The reason for the change is given in each case.

1. Capacitor C-35, now .1 mfd, was .01 mfd. (To improve horizontal linearity.)
2. Resistor R-32, 1200 ohms, is now 12 watts instead of 10 watts. (To prevent overheating of resistor.)

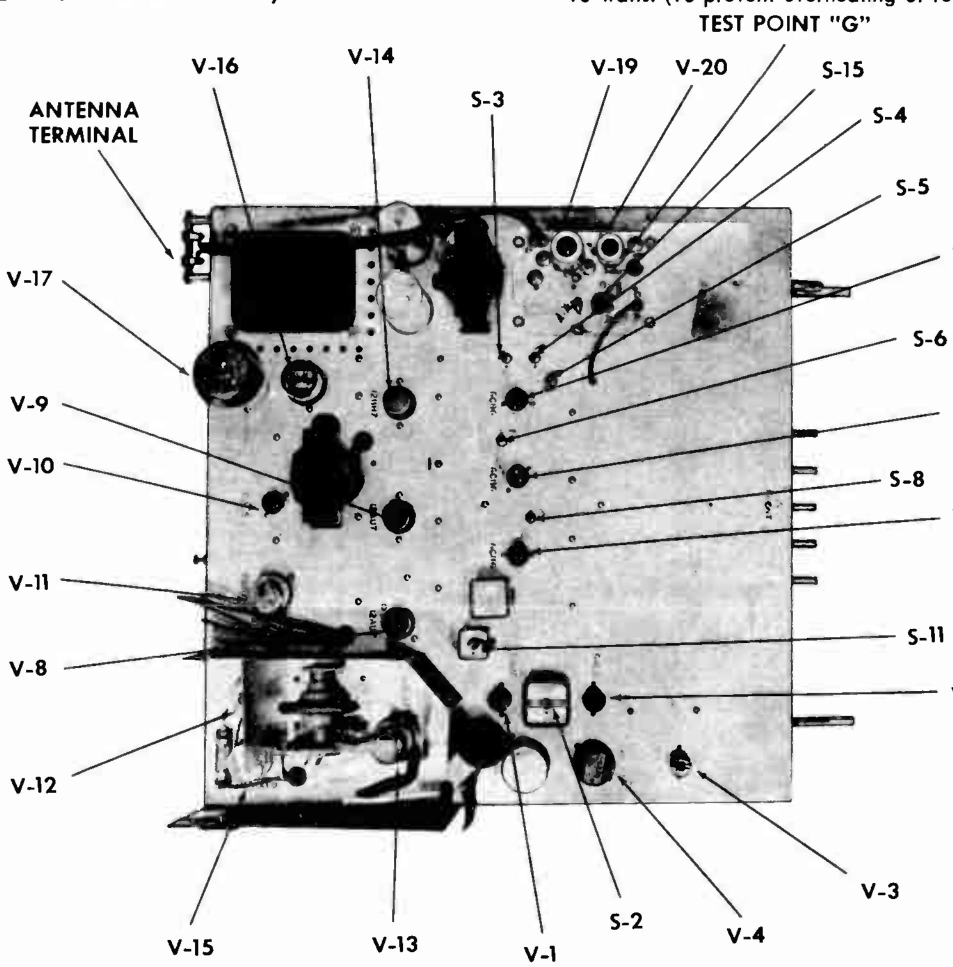

Fig. 8. Chassis 2040, Top View

S-3	Trap, 47.25 Mc.
S-4	Trap, 39.75 Mc.
S-5	1st picture I-F, 41.8 Mc.
S-6	2nd picture I-F, 45.5 Mc.
S-7	Trap, 47.25 Mc.
S-8	3rd picture I-F, 43.3 Mc.
S-9	Trap, 39.75 Mc.
S-10	Detector assembly
S-11	Primary, sound I-F transformer
S-12	Secondary, sound I-F transformer
S-13	Horizontal hold
S-14	Width
S-15	I-F output
S-16	R-F plate trimmer
S-17	Mixer grid trimmer — On R-F tuner 10534
S-18	Antenna trimmer
S-19	Trap

3. Capacitor C-51 added to circuit. (To preclude misalignment of picture I-F due to part variations.)
4. Resistor R-76 added to circuit. This resistor had a value of 1000 ohms originally but now is 10,000 ohms, 2 watts. In the 1840 chassis it has a different value. (To stabilize variations due to part differences.)
5. Resistor R-12 was changed from 1 to 2 watts. (To prevent overheating of resistor.)
6. Capacitor C-33 was changed from 1500 mmf to .01 mfd. (To increase drive on horizintal output tube and increase width.)
7. Resistor R-54 was changed from 18,000 ohms to 15,000 ohms. (To increase drive on horizontal output tube and increase width.)
8. The two triode sections of V-14 were transposed so that terminals 1, 2, and 3 are those of the output triode. Socket was reversed. (To prevent breakdown of socket.)
9. Capacitor C-38, .001 mfd, was removed from the circuit. This originally was connected to secondary of T-3. (To stabilize vertical oscillator.)
10. Resistor R-9, 2.2 megohms, was removed from the circuit. This was connected to pin 6 of V-3. (To increase AGC voltage.)

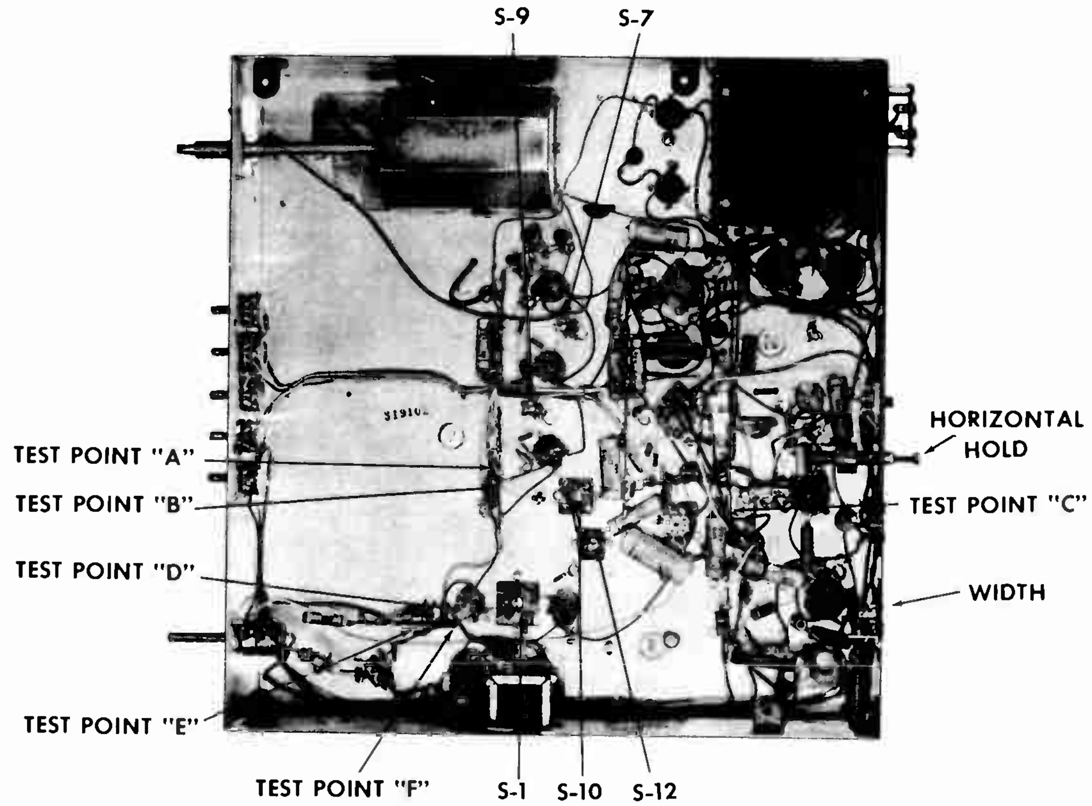

Fig. 9. Chassis 2040, Bottom View

11. Resistor R-77 added to circuit. (To help prevent overloading of 12AU7.)
12. Fuse changed from ¼ amp 250 volts to 3/16 amp 125 volts. (To prevent fuse blowing from possible arc in damper tube.)
13. Resistor R-79 added to circuit. (To prevent high voltage breakdown in areas with high altitude.)
14. Capacitor (no reference symbol) removed from trap L-6B. (S-9), and trap slug backed out. (To increase audio gain in fringe areas.)
15. Capacitor C-52, 56 mmf, 3500 volt (same as C-47) added in parallel with capacitor C-47. Compare production modification 2, in 1840 chassis. (To provide sufficient width at low line voltage.)

PRODUCTION MODIFICATIONS, CHASSIS 1840:

1. Resistor R-30, 100,000 ohms, was removed from the circuit. This was connected to the grid of the second video (pin 7, V-8). (To prevent overload due to variation in 12AU7 tubes.)
2. Capacitor C-47, normally 56 mmf, 3500 volts, was changed to 120 mmf, 2000 volts IF A THERMADOR POWER TRANSFORMER IS USED. If a TRIAD transformer is used, the value remains at 56 mmf, 3500 volts. Compare production modification 15, in 2040 chassis. (To provide sufficient width at low line voltage.)

SOCKET VOLTAGES:

The socket voltages shown were measured on a typical chassis under the following conditions.

1. No signal.
2. Line voltage, 117 volts.
3. Volume and contrast controls set at minimum, other controls at normal operating position.
4. DC voltage measured with a vacuum tube voltmeter.
5. AC voltages measured with a 1000 ohms-per-volt meter.

NOTE: Some voltages depend upon the setting of related controls. Thus the voltages on the vertical oscillator tube V-14 depend on the setting of the vertical hold control and the height control.

The figures below indicate the approximate magnitude of the reading to be expected, rather than the exact voltage.

Tube location is shown in Fig. 11, which is a BOTTOM VIEW of the chassis.

(VOLTAGES FOR CHASSIS 2040 AND CHASSIS 1840 LISTED IN SEPARATE COLUMNS.)

Fig. 14. Waveforms

CONDITIONS: Contrast control set to 50% of maximum; signal developed 3 volts of AGC.

OSCILLOSCOPE: Tektronix type 514D.

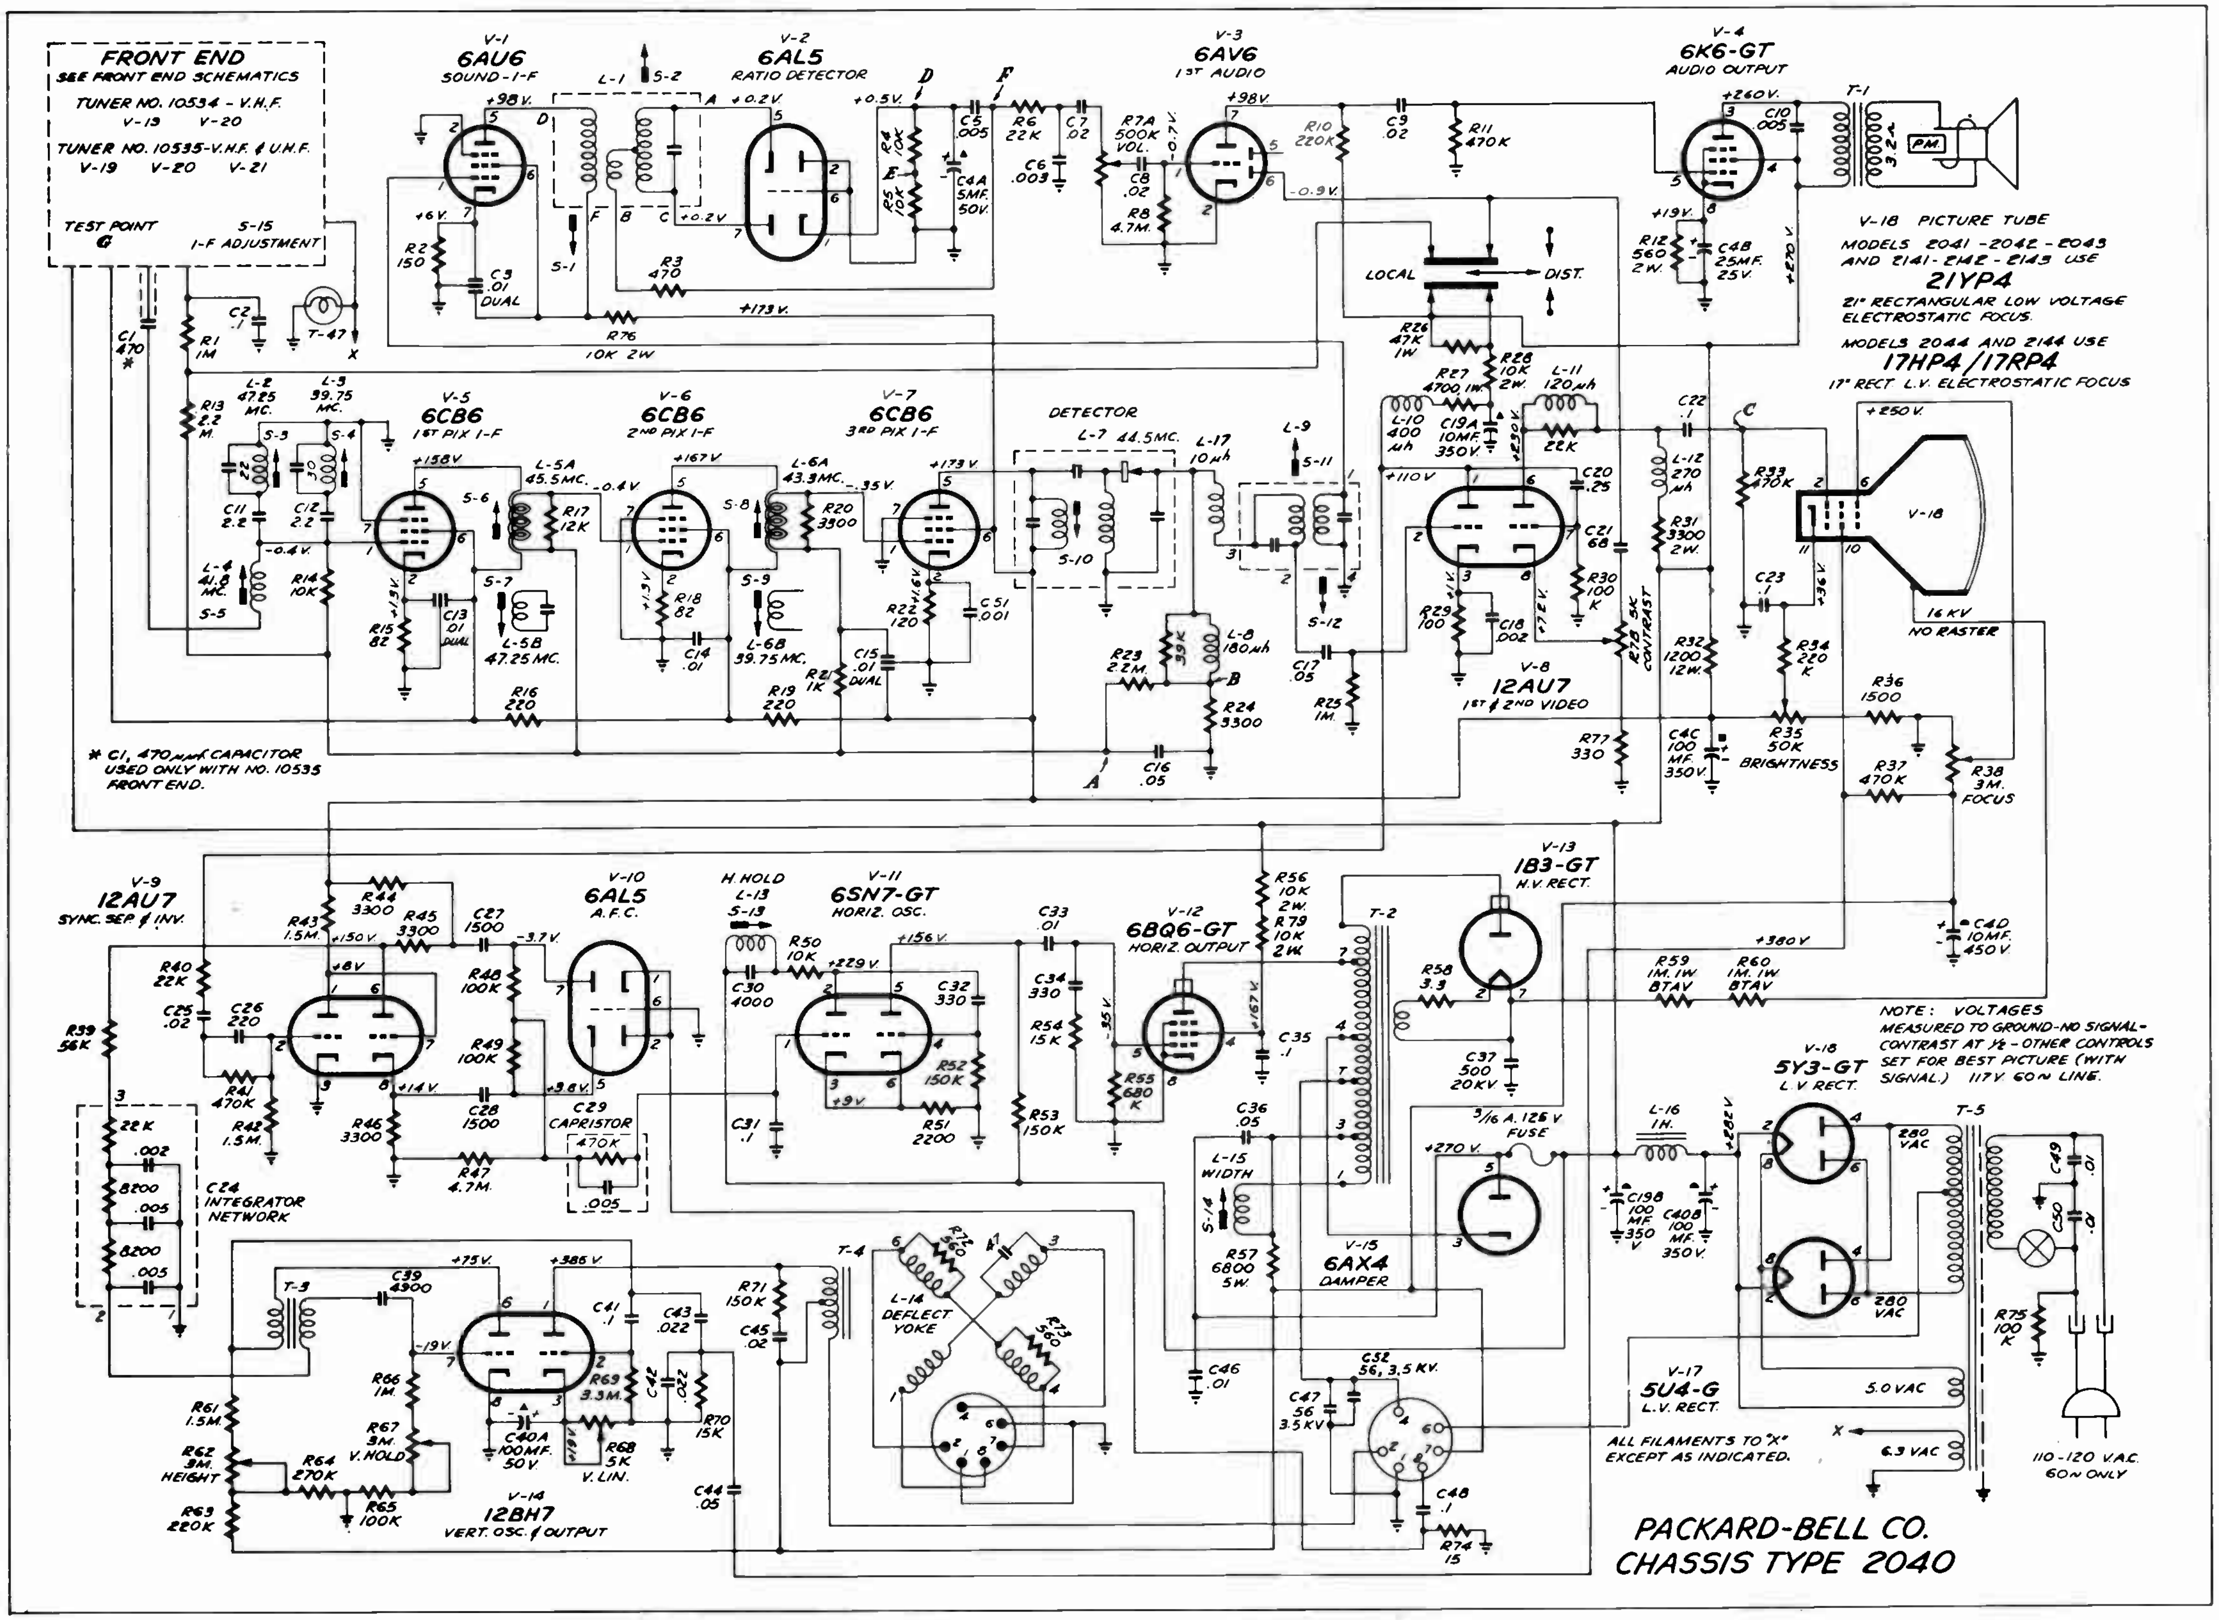

Fig. 15. Schematic Diagram, Chassis 2040

NOTE: TUBE LOCATIONS, TEST POINTS, AND ADJUSTMENTS ON THE 2040 AND 1840 CHASSIS ARE IDENTICAL EXCEPT THAT THE 1840 DOES NOT USE TUBES V-2 AND V-16.

NOTES:
R-9 deleted, see production modification 10
R-30 used in 2040, not in 1840 chassis.
R-56 not the same value on 1840 & 2040 chassis.
R-76 not the same value on 1840 & 2040 chassis.
R-77 used on both chassis, but not in same place.
R-78 used in 1840, not in 2040 chassis.
R-79 used in 2040, not in 1840 chassis.
R-80 used in 1840, not in 2040 chassis.

C-1 used only in sets with UHF-VHF tuner.
C-38 deleted, see production modification 9
C-52 used on 2040, not on 1840 chassis, see production modification 15
C-47, see production modification 15.
V-2 and V-16 used on 2040, not on 1840 chassis.
X-1 and X-2 used on 1840, not on 2040 chassis.

Tucson, Ariz.	745 No. Fourth Ave.
Yakima, Wash.	803 Summitview Ave.

NOTE: TUBE LOCATIONS, TEST POINTS, AND ADJUSTMENTS ON THE 2040 AND 1840 CHASSIS ARE IDENTICAL EXCEPT THAT THE 1840 DOES NOT USE TUBES V-2 AND V-16.

NOTES:
R-9 deleted, see production modification 10
R-30 used in 2040, not in 1840 chassis.
R-56 not the same value on 1840 & 2040 chassis.
R-76 not the same value on 1840 & 2040 chassis.
R-77 used on both chassis, but not in same place.
R-78 used in 1840, not in 2040 chassis.
R-79 used in 2040, not in 1840 chassis.
R-80 used in 1840, not in 2040 chassis.

C-1 used only in sets with UHF-VHF tuner.
C-38 deleted, see production modification 9
C-52 used on 2040, not on 1840 chassis, see production modification 15
C 47, see production modification 15
V-2 and V-16 used on 2040, not on 1840 chassis.
X-1 and X-2 used on 1840, not on 2040 chassis.

CAPACITORS

Notes: (1) "GMV" means capacities listed are Guaranteed Minimum Values over a range of from plus 10 degrees C. to plus 65 degrees C."
(2) Unless otherwise specified, tolerances are:
Paper capacitors, +30%, −10%
Electrolytic capacitors, +50%, −10%
(3) "NPO" denotes zero temperature coefficient.

SYMBOL	DESCRIPTION	PART NUMBER
C-1	Ceramic, 470 mmf. 20%, 350 volt. Note: C-1 used only in sets with 82-channel tuner 10535	23916
C-2	Paper, .1 mfd 200 volt	23019
C-3	Ceramic, dual .01 mfd GMV, 500 volt, disc	23962

CIRCUIT DESCRIPTION

Philco "B" line, Code 147 Television Receivers use two chassis—r-f chassis R-191, containing the r-f, video, audio and sync circuits, and deflection chassis D-197, containing the power and deflection circuits. Since these chassis are not isolated from the 60-cycle power line, all protruding shafts and mounting feet are insulated from the chassis.

CAUTION: See A-C LINE ISOLATION

A separate subchassis contains the r-f amplifier, the oscillator, and the mixer. The r-f amplifier uses a type 6BZ7 tube, V1. The oscillator and the mixer use a type 6X8 tube, V2, the pentode section of the tube being used for the mixer, and the triode section for the oscillator. The output of the mixer is fed to a three-stage, stagger-tuned, i-f amplifier system employing three type 6CB6 tubes, V3, V4, and V5. A type 1N64 crystal diode, CD200, is used for the video detector, the output of which is amplified by a two-stage video amplifier utilizing a type 6AU6 tube, V6, and a type 6AQ5 output tube, V7. The connections at the detector are such as to produce a composite video signal with negative-going sync pulses. The signal, which is subjected to a 360-degree phase shift through the video amplifier, is applied to the grid of the picture tube, V19; therefore the sync pulses at this point are negative-going. A positive-going blanking pulse, taken from the vertical-output stage, is applied to the cathode of the picture tube for suppression of the vertical retrace.

Sound i.f. (intercarrier) is obtained by utilizing the beat frequency produced when the 45.75-mc. video carrier and the 41.25-mc. sound carrier are mixed in the video detector. The 4.5-mc. beat frequency is the difference between 45.75 mc. and 41.25 mc., and contains the FM sound signal. This 4.5-mc. signal contains only a negligible amount of video amplitude modulation, provided that the amplitude of the 41.25-mc. signal is considerably lower than that of the 45.75-mc. signal. The proper relationship between the two carriers is established during the alignment of the receiver. There is sound output only when both the video and sound carriers are present.

The oscillator is tuned primarily to obtain the best picture, since the 4.5-mc. relationship always exists between the two carriers. The 4.5-mc. sound i.f. (intercarrier), which is taken from the plate circuit of the video amplifier, is passed through a 4.5-mc. sound i-f stage using a 6AU6 tube, V8, and is then applied to the FM detector, which utilizes two diode sections of a 6T8 tube, V9A. The triode section of the 6T8, V9B, is used as the first audio amplifier. The power amplifier uses a type 6V6GT tube, V10.

A portion of the video signal appearing at the output of the first video amplifier is applied to grid 3 (pin 7) of the 6CS6 sync separator, V11. Since grid-leak bias is used on grid 3, the tips of the sync pulses are clamped to zero, and the video components swing in a negative direction from zero. Because of the cut-off characteristics of grid 3, the video components are eliminated, and only negative-going sync pulses appear in the plate circuit of the sync separator. At the same time, however, a signal is taken from the video detector and applied to grid 1 (pin 1) of the 6CS6 tube. This grid is returned to B plus, and the bias is maintained close to zero, because of a small grid-current flow. Since the signal applied to grid 1 is composite video with negative-going sync, any noise modulation present in the signal appears in the form of sharp spikes, driving in a negative direction. The circuit constants are chosen to allow grid 1 to cut off plate current whenever the signal goes more negative than the sync pulses. A series grid-limiting resistor, R608, is also incorporated to prevent the video components from appearing in the plate circuit of the sync separator. A-G-C voltage is also developed in the sync separator circuit in the following manner: On tips of the sync pulses, grid 3 (pin 7) of the 6CS6 tube draws current which flows downward through the network R602, R603, R604, R211, and L214, causing capacitors C605, C602, and C603, to assume negative charges proportional to the amount of peak signal applied to grid 3. The tuner a-g-c voltage is delayed by means of a resistor divider network which applies a small positive voltage to the tuner a-g-c circuit. This positive voltage prevents a-g-c action from lowering the tuner gain on weak signals. To prevent the delay voltage from driving the tuner a-g-c voltage positive on weak signals, a diode clamp (part of V9B) is connected across C602.

The negative-going sync pulses appearing in the plate circuit of the sync separator are fed to one half of a 12AU7 tube, V12A, connected as a phase-splitter circuit; positive sync pulses appear in the plate circuit, and negative sync pulses are taken from the cathode.

Proper triggering of the vertical oscillator requires positive synchronizing pulses. The vertical sync signal is separated from the horizontal sync signal by the vertical integrator circuit, and is fed to the grid circuit of the vertical blocking oscillator, one half of a 12AU7 tube (V12B). The output of the vertical oscillator is amplified by a type 12B4 tube, V13, which is employed as the vertical-output amplifier. The output of the amplifier is applied to the vertical-deflection coils through the vertical-output transformer.

The horizontal-sweep circuits require both positive and negative sync pulses. The phase-comparer circuit uses a 6AL5 tube, V14. Positive sync pulses are applied to the plate of V14A, and negative sync pulses are applied to the cathode of V14B. A saw-tooth voltage, taken from the horizontal-output circuit, is fed to the plate of V14B and to the cathode of V14A, for comparison of the sync and horizontal sweep voltages. When the saw-tooth and sync signals are exactly in phase, no voltage is developed across R800, but when the two signals are out of phase, either a positive or a negative voltage is developed, depending upon whether the horizontal-oscillator frequency is lower or higher than the sync-pulse frequency. The grid circuit of the horizontal oscillator, a type 12AU7 tube, V15, operating as a cathode-coupled multivibrator, is connected to R800 through a filter network. When the voltage at this point goes in a positive direction, the frequency of the horizontal oscillator is increased; when the voltage swings negative, the frequency of the oscillator is decreased. In this manner the frequency of the horizontal oscillator is controlled over the lock-in range of the circuit. The horizontal hold control, R811, adjusts the horizontal-oscillator frequency so that it is within the control range of the phase comparer. The output of the horizontal oscillator is fed to the horizontal output amplifier, which makes use of a type 6BQ6GT tube, V16. The screen voltage for the horizontal amplifier is supplied from a voltage-divider network. The network includes R818, R816 (the WIDTH control), R817, R315 (the BRIGHTNESS control), and R316. R816 varies the voltage applied to the screen, thus adjusting for proper picture width. Adjusting R315 for brightness varies the bias on the picture tube. The change in bias causes a change in beam current, and would tend to result in a change in picture width and a variation in the second-anode voltage. However, when the control arm of the BRIGHTNESS control, R315, is moved toward ground, a smaller part of the control is shunted by the 22,000-ohm resistor, R316, and the total resistance of the voltage divider is increased. This increase in resistance results in a decrease in the current through the divider, and the screen voltage on the horizontal amplifier is increased proportionally, thus compensating automatically for the increase in beam current in the picture tube. The horizontal amplifier feeds the deflection coils through the horizontal-output transformer. A 6AX4GT tube, V17, is used as the horizontal damper.

The second-anode voltage for the picture tube is supplied by one 1B3GT high-voltage rectifier tube, V18. The B plus voltage for the receiver is supplied by two selenium rectifiers, CR100 and CR101 in a full-wave, voltage-doubler circuit, operating directly from the power line. Bias voltage is obtained from across a filter choke, which is in series with the negative side of the B plus supply. The B plus boost voltage, derived from the horizontal damper circuit, supplies higher B plus voltage to the vertical oscillator, first audio stage, and the first anode of the picture tube. Filament voltage for all the tubes except the high-voltage rectifier is supplied by a step-down transformer. Filament voltage for the high-voltage rectifier is supplied by a winding of the horizontal-output transformer.

The circuit description, schematic diagram, base layout, and service information for r-f chassis R-191 is given in PR-2507. When this chassis is used with deflection chassis D-197, the filter choke is not mounted on the speaker, and a plain p-m speaker is used. The filter choke is mounted on the D-197 chassis.

IMPORTANT
A-C LINE ISOLATION

CAUTION: One side of the a-c line is connected to the chassis through C101 and L100. The other side of the a-c line is connected to the chassis through F100, R100, CR100, and C103, in series. Grounding the chassis will result in a short circuit across one or the other of these two branches in the voltage-doubler circuit. During servicing and alignment it is desirable that an a-c line isolation transformer capable of handling at least 225 watts (Philco Part No. 45-9600) be used. Failure to use an isolation transformer will greatly increase the shock hazard, and may result in damage to the test equipment or receiver, or both.

SPECIFICATIONS

VHF TUNING ....Twelve channel, 12-position incremental tuner, covering VHF Television Channels 2 through 13; fine tuning of local oscillator

UHF TUNING (if provided).......Continuous tuning, covering UHF Television Channels 14 through 83; fine and coarse tuning

INTERMEDIATE FREQUENCIES
Video Carrier ....45.75 mc.
Sound (intercarrier) ....4.75 mc.

TRANSMISSION LINE ....300-ohm, twin-wire lead

OPERATING VOLTAGE ....110 to 120 volts, 60 cycles, a. c.

POWER CONSUMPTION
Without UHF, 205 watts; with UHF, 210 watts.

TUBE COMPLEMENT

R-F CHASSIS R-191

B SUPPLY FUSE REPLACEMENT

The B supply protective fuse, F100, is wired into the low-voltage section, and is in series with the selenium rectifiers. For replacement, use a 1.6-ampere delayed-action-type fuse, Philco Part No. AD2248-19.

CAUTION: Discharge the circuit before replacing the fuse.

HORIZONTAL-OSCILLATOR ADJUSTMENT

To adjust the horizontal-oscillator circuit, tune in a station and proceed as follows:

1. Reduce the width of the picture until approximately 1 inch of blank screen appears at the right-hand and left-hand sides of the picture.

2. Increase the BRIGHTNESS control setting until the blanking becomes visible. This will appear as a dark vertical bar on each side of the picture.

3. Connect a .1 μf. condenser from the test point, adjacent to TC800, to ground. (The plate side of the horizontal ringing coil, L800, is connected to the test point.)

4. Set the HORIZONTAL HOLD control to the approximate center of its mechanical rotation.

5. Adjust the HORIZ HOLD CENTERING control until equal portions of the blanking bar appear on both sides of the picture.

6. Remove the .1-μf. condenser from the test point.

7. Adjust the horizontal ringing coil, L800, until equal portions of the blanking bar again appear on both sides of the picture.

8. Rotate the HORIZONTAL HOLD control through its range. The picture should fall out of sync on both sides of the center of its rotation. If the picture does not fall out of sync on both sides, readjust the HORIZ HOLD CENTERING control.

9. Rotate the HORIZONTAL HOLD control through its range, and observe the number of diagonal blanking bars that appear just before the picture pulls into sync. The pull-in should occur with from 1 to 2 diagonal bars when the sync position is approached from either direction. If proper pull-in is not obtained, repeat the above procedure.

VIDEO PEAKING-COIL ADJUSTMENT

The video peaking coil, L303, is adjusted at the factory for proper transient response of the video circuits. Ordinarily, this coil will require no further adjustment by the serviceman. On any station where excessive overshoot or excessive smear is present, a slight adjustment of L303 may improve the picture quality on that station; however, this adjustment may sacrifice the quality on other channels. If L303 is replaced in servicing, adjustment will be required.

Before adjusting L303, check the tuner alignment and i-f alignment. (Never adjust L303 until the alignment of the receiver is correct.) Then tune in a station and adjust L303 until there are no trailing whites or smear in the picture. Turning TC301 clockwise reduces trailing whites and overshoot; turning TC301 counterclockwise reduces picture smear and increases trailing whites. The proper position is the point where no smear or trailing whites appear in the picture.

The above procedure for adjustment of TC301 applies to a particular station exhibiting smear or overshoot. After TC301 is adjusted, reception on all the other stations should be checked, to make certain that the adjustment has not impaired the picture quality.

TELEVISION ALIGNMENT

GENERAL

The alignment procedure follows the general pattern of first checking the tuner response with an FM sweep generator and oscilloscope, comparing the response curve with that given in the manual, and aligning the tuner if necessary. After it is established that the tuner is in correct alignment, the video i-f channel is aligned by tuning each coil to its assigned pole frequency, using an AM signal, and then feeding in a sweep signal at the antenna terminals and retouching the i-f adjustments to obtain the desired pass band. Finally, the sound channel is aligned, using an AM signal, by tuning the sound take-off coil and the i-f and ratio-detector transformers.

The over-all response curve (r-f, i-f) of the circuits from the antenna terminals to the video detector, after the i-f stages have been aligned, should appear essentially the same, regardless of the channel under test. If not, the tuner should be aligned.

The video-carrier intermediate frequency is 45.75 mc., and the sound intermediate (intercarrier) frequency is 4.5 mc. Alignment of these circuits requires careful workmanship and good equipment. The following precautions must be observed:

1. There must be a good bond between the receiver chassis and the test equipment. This is most easily obtained by having the top of the workbench metallic. The receiver chassis should be placed tuner-side down on the bench. If the bench has no metallic top, the test equipment and chassis can be bonded by a strip of copper about 2 inches wide. The section of the chassis nearest the tuner should rest on the strip.

2. Do not disconnect the picture tube, picture-tube yoke, or speaker while the receiver is turned on.

3. Allow the receiver and test equipment to warm up for 15 minutes before starting the alignment.

4. The marker (AM) signal generator should be calibrated accurately to the frequencies used and to the sound and video r-f carriers of each channel used during alignment. If Model 7008 is used, the built-in crystal calibrator provides an excellent means of calibration. An alternate method for calibrating the signal generator to the sound and video r-f carrier frequencies is to zero-beat the signal generator with the received signals.

For further information regarding calibration, refer to Philco Lesson PR-1745 (J) entitled "Television Service in the Home."

TEST EQUIPMENT REQUIRED

The following test equipment is recommended for aligning the receiver:

1. Philco Precision Visual Alignment Generator for Television and FM, Model 7008, or equivalent.

2. Vacuum-tube voltmeter, or 20,000-ohms-per-volt voltmeter.

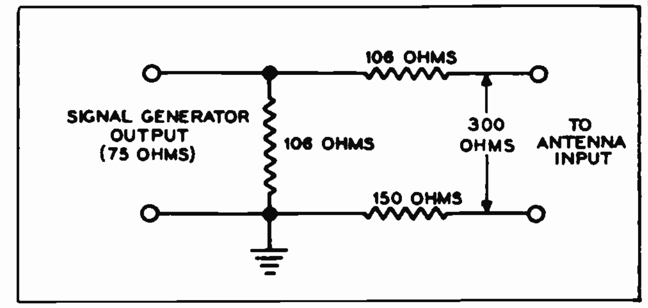

Figure 1. Antenna-Input Matching Network

3. R-F Probe, Philco Part No. 76-3595 (for use with Model 7008 generator).

JIGS AND ADAPTERS REQUIRED

Mixer Jig

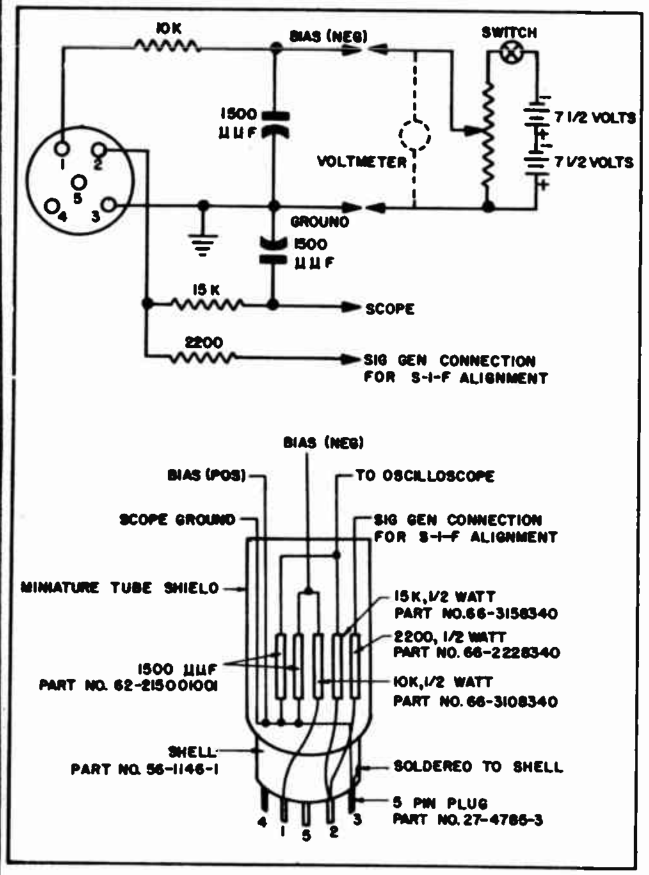
Connections to the grid of the mixer tube may be made through the alignment jack provided for that purpose. To connect the generator to this point, a mixer jig, Philco Part No. 45-1739, and a connecting cable, Philco Part No. 45-1635, may be used. As an alternate, a Philco alligator-clip adapter, Part No. 45-1636, with as short a ground lead as possible, may be used to connect the alignment jack. The ground lead should be connected as close as possible to the mixer tube. It is essential that the signal-generator output lead be terminated with a 68-ohm resistor (carbon), so that regeneration, caused by connection of the lead to the mixer, is held to a minimum.

Antenna-Input Matching Network

Figure 1 shows an impedance-matching network for coupling the signal generator to the antenna-input terminals of the receiver. This network, which is designed to have an input impedance of 75 ohms and an output impedance of 300 ohms, is used to match a 75-ohm generator to a 300-ohm antenna-input circuit. The resistors used in this network should be of carbon-composition construction, and should be chosen from a group to obtain values within 10% of those indicated. The resistors should be placed in a shield can, to prevent variable effects. An antenna matching jig, Philco Part No. 45-1736, which consists of a matching transformer and connecting box, may be used in place of the resistor network.

Video I-F Alignment Jig
(Video Test Jack Adapter)

The alignment jig shown in figure 2 should be used during the i-f alignment, to apply the proper bias to the a-g-c bus, and to provide a convenient oscilloscope connection. This jig consists of a 5-prong plug, a 10,000-ohm potentiometer, two isolating resistors (one 10,000-ohm and one 15,000-ohm), two 1500-



TP3-988

Figure 2. Video I-F Alignment Jig

micromicrofarad capacitors, two 7½-volt batteries and switch. A suggested method of fabricating the jig is also shown. It is suggested that the bias batteries and potentiometer be mounted in a metal box of convenient size.

The potentiometer and switch are connected across the two 7½-volt batteries. The switch is used to disconnect the potentiometer, to prevent the discharge of the battery while not in use.

Sound I-F Alignment Jig

Figure 3 shows the jig that should be used to connect the voltmeter and oscilloscope to the VOLUME CONTROL socket, J400.

TELEVISION TUNER ALIGNMENT

After the tuner is serviced, or if an i-f alignment is required, the tuner alignment should be checked by observing the tuner response curve, as given under Bandpass Alignment. If the response curve does not fall within the limits shown in figure 5, the tuner should be realigned. If realignment is necessary, use the procedure given below.

Since the frequency of the local oscillator affects the tuner response, the local-oscillator alignment should be made first.

Oscillator Alignment

General

Tuning cores are provided in the oscillator coils at channels 13, 11, 9, 7, 6, and 4. By adjusting these tuning cores, all channels may be placed on frequency. This procedure should be carried out with the highest-frequency channel first, since the alignment of each channel affects the alignment of all the channels below it in frequency. The channel adjustments are so arranged that, with one exception, each adjustment corrects the tuning of more than one channel. The coverage of the various adjustments is as follows:

CHANNEL ADJUSTMENT	CHANNELS CORRECTED BY ADJUSTMENT
13	13 and 12
11	11 and 10
9	9 and 8
7	7 only
6	6 and 5
4	4, 3, and 2

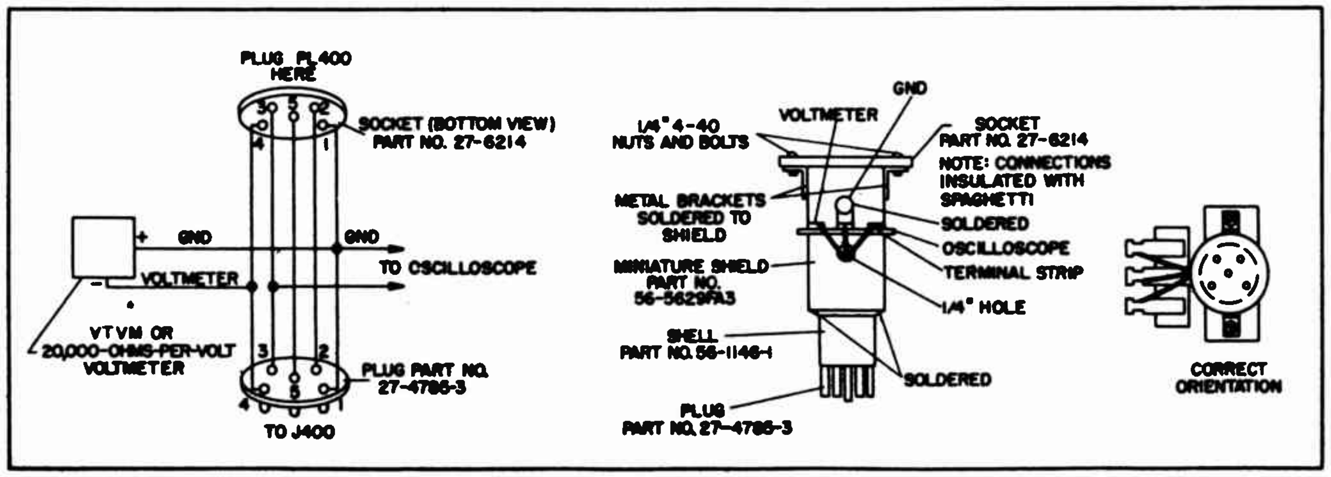


Figure 3. Sound I-F Alignment Jig

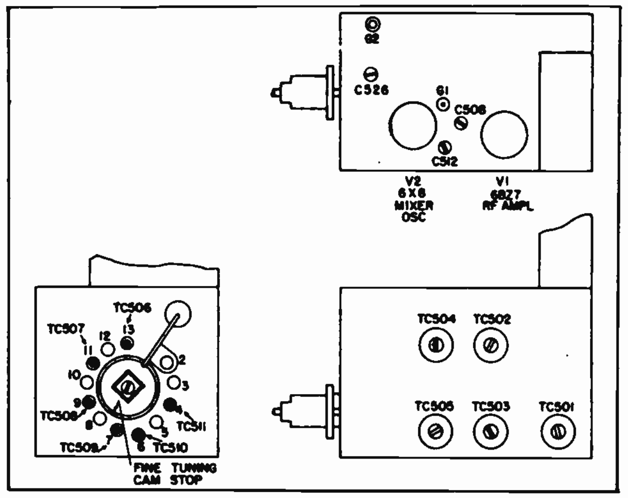
TP2-2200



TP2-2201-1

Figure 4. Television Tuner, Showing Locations of Adjustments

The FINE TUNING cam should be preset for all adjustments by placing the stop on the FINE TUNING cam between the Channel 7 and 8 holes on the front plate of the tuner. See figure 4.

Procedure Using Signal Generator

An r-f signal (unmodulated), at the oscillator frequency, is fed into the antenna input from an AM signal generator, and the oscillator tuning cores are adjusted for zero beat. The r-f signal frequency should be accurately determined. It is preferable that the signal be taken from a crystal-controlled source; if this is not available, the signal generator may be calibrated against the television station.

1. Connect the hot lead of the oscilloscope to the mixer plate test point, G2, through a 1000-ohm resistor, and connect the ground lead of the oscilloscope to the chassis, near the test point. (High oscilloscope gain may be necessary to obtain a visual beat. In this instance, base-line hum may be ignored.)

2. Connect the AM (marker) generator to the 300-ohm antenna-input terminals. For this purpose the antenna-input matching network is not required.

3. Disconnect the white lead from the tuner, and connect it to the negative terminal of a 1½-volt battery. Ground the positive terminal. If regeneration is observed, the bias may be increased to 4 or 5 volts, to reduce the regeneration.

4. Mechanically preset the fine-tuning cam stop as shown in figure 4.

5. Feed in an r-f signal (unmodulated), at the oscillator frequency for Channel 13, with the CHANNEL SELECTOR set for Channel 13.

6. Adjust the tuning core for Channel 13 (see figure 4).

7. Reset the signal-generator frequency and the CHANNEL SELECTOR, and adjust the tuning cores for Channels 11 and 9, respectively.

8. Repeat steps 5, 6, and 7 until Channels 13, 11, and 9 are within plus or minus 500 kc. of the correct frequency.

9. Feed in r-f (unmodulated) signals, at the oscillator frequencies for Channels 7, 6, and 4, consecutively (see NOTE below), and adjust the respective tuning cores (see figure 4).

> NOTE: The exact position of the FINE TUNING cam should be marked when Channel 4 is correctly aligned. This position is to be used in step 4 of the i-f alignment procedure.

Procedure Using Station Signal

The following simplified procedure may be used to align the oscillator when the television i-f alignment is satisfactory and a station signal is available:

1. Mechanically preset the FINE TUNING cam to the center of its range (see figure 4).

2. Tune in the highest-frequency channel to be received.

3. Adjust the tuning core for that channel, or the next higher channel, for the best picture; that is, starting with sound in the picture, turn the tuning core until the sound disappears. Repeat for each channel received in the area.

Bandpass Alignment

General

The bandpass alignment consists of aligning the tuner at Channels 13 and 6, and then making it track down to Channels 7 and 2, respectively.

During the alignment, a fixed bias of 1½ volts is applied to the r-f amplifier tube.

An FM (sweep) signal is applied to the antenna-input circuit, and an oscilloscope is connected to the mixer plate circuit. The oscilloscope gain should be as high as possible, consistent with hum level and "bounce" conditions. Hum conditions will cause distortion of the time base and response. Bounce conditions, which are caused by poor line regulation, will cause the response and time base to jump up and down. The use of too high an oscilloscope gain aggravates these conditions, whereas the use of too low a gain necessitates increasing the generator output to a point where the tuner may be overloaded. Overload may be checked by changing the generator output while observing the shape of the response curve; any change in the shape of the curve indicates overload, in which case a lower generator output and higher oscilloscope gain must be used. The tuner coupling link should be disconnected from the

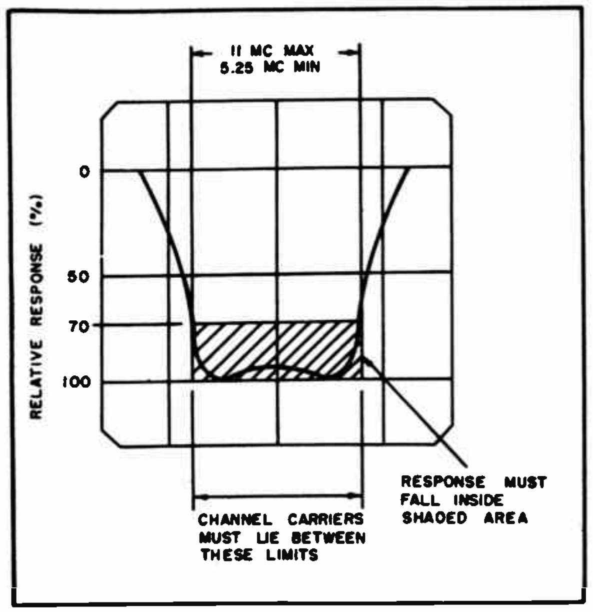


Figure 5. Television Tuner Response Curve, Showing Bandpass

i-f section by removing the plug, PL500, and a 40- to 70-ohm carbon resistor should be connected across the open end of the plug. This is done to eliminate the absorption effect of the tuner link coil, L200, on the response curve.

Procedure

1. Disconnect the white (a-g-c) lead, from the tuner, and connect it to the negative terminal of a 1½-volt battery. Ground the positive terminal.
2. Disconnect the tuner plug, PL500, at terminal board B13 (see figure 33), and connect a 40- to 70-ohm carbon resistor across the plug.
3. Connect a 1000-ohm resistor in series with the hot lead of the oscilloscope. Connect the other end of the resistor to the mixer plate test point, G2, and connect the ground lead of the oscilloscope to the chassis, near the test point.
4. Connect the FM (sweep) generator to the 300-ohm antenna-input terminals through an antenna-input matching network. See figure 1.
5. Set the CHANNEL SELECTOR and FM (sweep) generator to Channel 13 (213 mc.). Adjust the generator for sufficient sweep to show the complete response curve.
6. Establish the channel limits (see figure 5) by using the marker (AM r-f) signal generator to produce marker pips on the response curve. (Set the marker generator first to 210 mc., then to 216 mc.) The curve should be reasonably flat between the limits shown in figure 5.
7. Adjust TC502 and TC504 (figure 4) for a symmetrical, approximately centered pass band.
8. Set the CHANNEL SELECTOR and FM generator to Channel 7 (177 mc.).
9. Establish the channel limits by using the marker generator to produce marker pips on the response curve. (Set the generator first to 174 mc., then to 180 mc.) The curve should be reasonably flat between the limits.
10. On Channel 7, note the response curve, with respect to tilt and center frequency. The curve should be centered in the pass band, and should be symmetrical.
11. If the curve is not symmetrical, and appears unbalanced, as shown in figure 6, leave the generator and tuner set to Channel 7, and adjust C508 and C512 (see figure 4) to obtain a response curve which is the mirror image (tilt in the opposite direction) of the original. This is a form of overcompensation, to allow for the effect of Channel 13 adjustment on Channel 7. For example, if the Channel 7 response appears as in figure 6A, then the trimmer should be adjusted to obtain the response shown in figure 6B.
12. Reset the CHANNEL SELECTOR and generators to Channel 13. Readjust TC502 and TC504 for a symmetrical and centered band pass. See step 4.
13. Set the CHANNEL SELECTOR and generators to Channel 7, and check the response for center frequency and symmetry. Repeat steps 8 and 9 as many times as is necessary to obtain the most symmetrical, centered response curves on Channels 13 and 7. Channels 7 through 13 are now correctly aligned.
14. Set the CHANNEL SELECTOR and sweep generator to Channel 6 (85 mc.).
15. Establish the channel limits, using the marker generator to produce marker pips on the response curve. (Set the generator first to 82 mc., then to 88 mc.)
16. Adjust TC503 and TC505 for a symmetrical, approximately centered pass band. Set the marker generator to 85 mc. Detune TC505 counterclockwise until a single peak appears.

   CAUTION: Do not turn the core of TC505 excessively, or it will fall out of the coil.

   Adjust TC503 until the peak falls on the 85-mc. marker. It may be necessary to increase the output of the generator during this adjustment. Then adjust TC501 for maximum curve height and symmetry of the single peak. The antenna circuit is now tuned for Channels 2 through 6. To prevent overloading, the output of the generator should be reduced after this adjustment is completed.
17. Readjust TC503 and TC505 for a symmetrical response, centered about 85 mc.

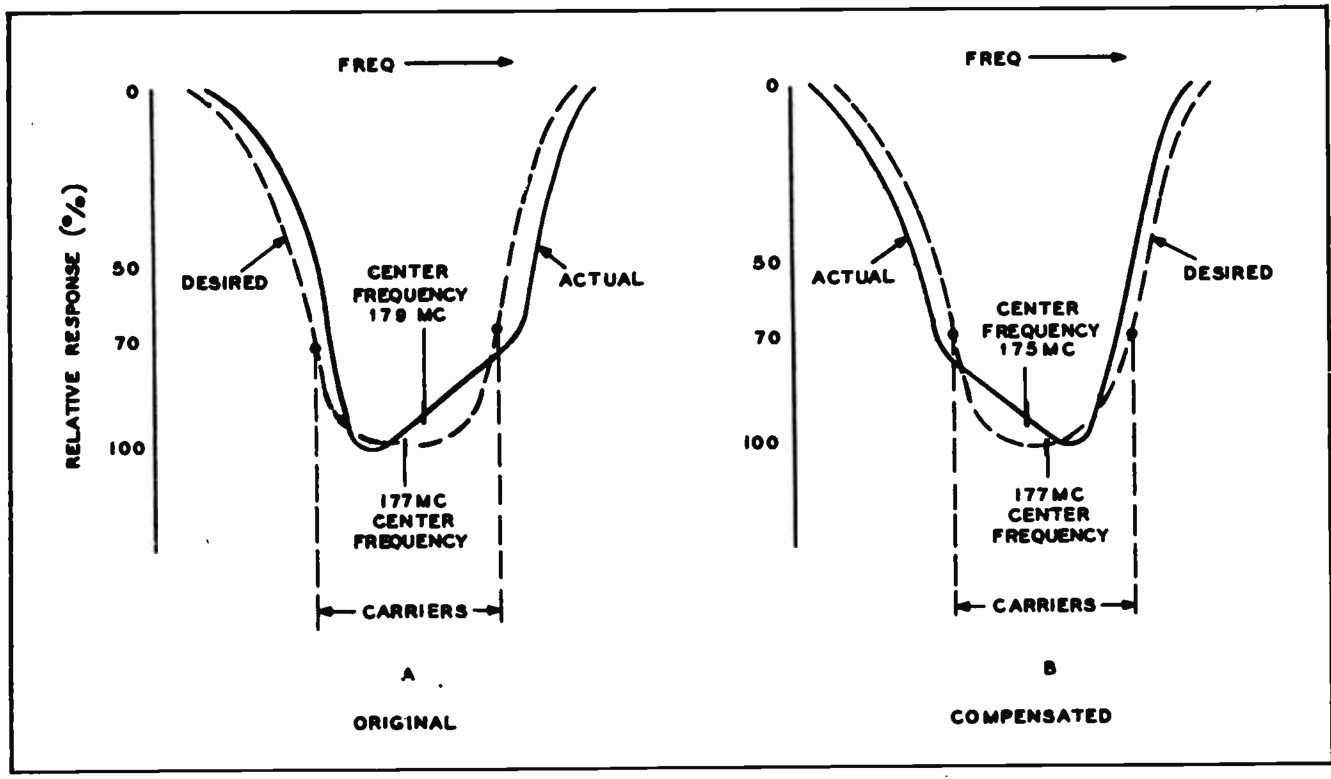

Figure 6. Television Tuner Response Curve, Showing Tracking Compensation

VIDEO I-F ALIGNMENT

Preliminary

Before proceeding with the i-f alignment or making an alignment check, observe the following preliminary instructions:

1. Preset the CONTRAST and BRIGHTNESS controls to the maximum counterclockwise position.
2. Preset the CHANNEL SELECTOR to Channel 4.
3. Insert the video i-f alignment jig (figure 2) into J200.
4. Connect the oscilloscope to the 15,000-ohm resistor from the video i-f alignment jig. Connect the ground lead of the oscilloscope to the ground lead from the adapter.
5. With a voltmeter connected across the points shown in figure 2, set the potentiometer to furnish −6 volts of bias.
6. Connect the AM generator to the mixer test point, G1, through a mixer jig (described in step 4 of procedure given below), and adjust the generator for approximately 30 percent modulation with 400 cycles. Adjust the output of the generator during the alignment to keep the output at the second detector below .6 volt, peak to peak.

   NOTE: If the i-f shield has been removed for repairs, it must be replaced before proceeding with the alignment.

Procedure

1. Preset condenser C526 for minimum capacitance (turn screw counterclockwise).
2. Tune the AM generator to 47.25 mc., and adjust C200 for minimum output, as observed on the oscilloscope. See figure 7.

   NOTE: It is necessary to keep the generator output sufficiently high that a null indication may be observed on the oscilloscope; however, avoid overloading of the receiver by excessive signal.
3. Tune the AM generator to the frequencies indicated below, and adjust the trimmers for maximum output, as observed on the oscilloscope.
   a. 45.7 mc.—adjust C526
   b. 42.6 mc.—adjust C202
   c. 45.0 mc.—adjust C206
   d. 43.2 mc.—adjust C210
   e. 44.3 mc.—adjust C212
4. Connect the sweep generator and r-f marker generator to the antenna terminals through a matching jig. (If a separate oscilloscope is used, connect the sweep output of the generator to the horizontal input of the oscilloscope.) Set the CHANNEL SELECTOR to Channel 4, and tune the sweep generator for output on Channel 4. Tune the r-f marker generator to the video carrier frequency of Channel 4 (67.25 mc.),

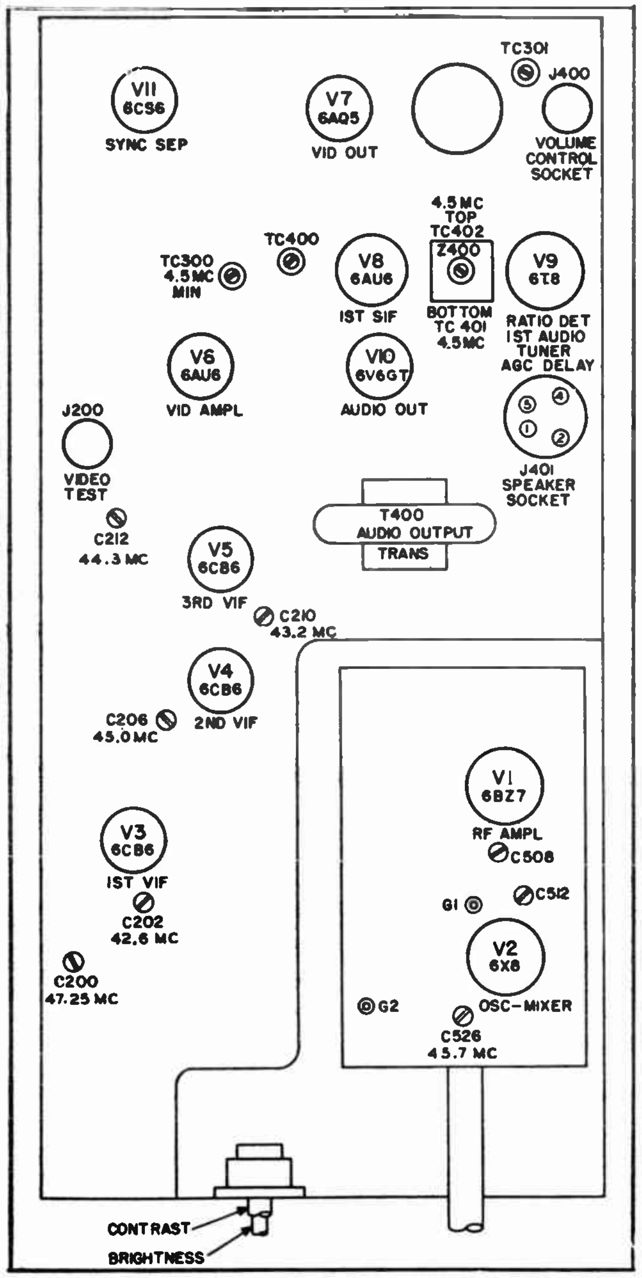

Figure 7. R-F Chassis R-191, Top View, Showing Locations of Adjustments

and tune the i-f marker generator (capacitively coupled to the mixer grid) to 45.75 mc. Note two marker generators are used for this procedure. The r-f marker generator is connected to the antenna terminals, while the i-f marker generator is coupled capacitively to the mixer grid test point, G1. A jig constructed from a piece of fiber tubing, with $\frac{3}{16}$-inch inside diameter, and a brass machine screw which fits tightly into the tubing, is used to couple the generator capacitively to the test point. The screw is adjusted so that its tip clears the test point by approximately $\frac{1}{64}$ inch. The output cable of the marker generator is connected to the head of the brass screw in the jig and to the chassis near the mixer tube. Both marker generators should be adjusted for the minimum output required to make the markers barely visible. Failure to observe this precaution, or the use of excessive output from the sweep generator, will cause misleading results. After the equipment is properly connected, adjust the FINE TUNING control for zero beat of the two markers, as observed on the oscilloscope. When zero beat is obtained, remove the i-f marker.

5. If the response curve does not fall within the limits shown in figure 8, the adjustment of the trimmers may be touched up slightly, while observing the response curve. Do not retouch the setting of C202 at this point. To adjust the curve, first adjust C206 and C212, alternately, until maximum improvement has been obtained. C212 affects the tilt of the curve, and C206 affects the dip of the curve. After C212 and C206 have been adjusted, adjust C210 for proper slope at the 42.5-mc. side of the curve, then adjust C526 for proper level at the video carrier frequency (45.75 mc.). After these adjustments have been made, if the response curve still does not fall within the limits shown in figure 8, a slight readjustment of C202 is permissible.

CAUTION: Do not turn any of the trimmers excessively. To retouch, turn the trimmers only slightly.

SOUND I-F ALIGNMENT

1. Remove the 1st v-i-f tube, and connect a v.t.v.m. or a 20,000-ohms-per-volt voltmeter to the sound i-f alignment jig (figure 3). Adjust the VOLUME control for moderate speaker output.

2. Feed in an accurately calibrated 4.5-mc. AM signal, through the 2200-ohm resistor in the video i-f alignment jig, to pin 2 of J200.

3. Tune TC400, TC401, and TC402 for maximum indications on the meter. The point of maximum meter indication for TC402 should also be the point of minimum speaker output.

4. Tune TC402 for minimum speaker output.

5. Connect an r-f probe or crystal detector to the grid (pin 2) of the picture tube. See NOTE below.

6. Tune TC300 for minimum indication on oscilloscope. (If a crystal detector is not available, TC300 may be adjusted for minimum beat pattern, as observed on the picture tube, with a station picture present.)

7. Replace the 1st v-i-f tube. Tune in a station, using the speaker output as an indication of correct tuning.

8. Turn the FINE TUNING control clockwise to obtain a slightly fuzzy picture.

9. Tune TC402 for minimum AM (noise) output.

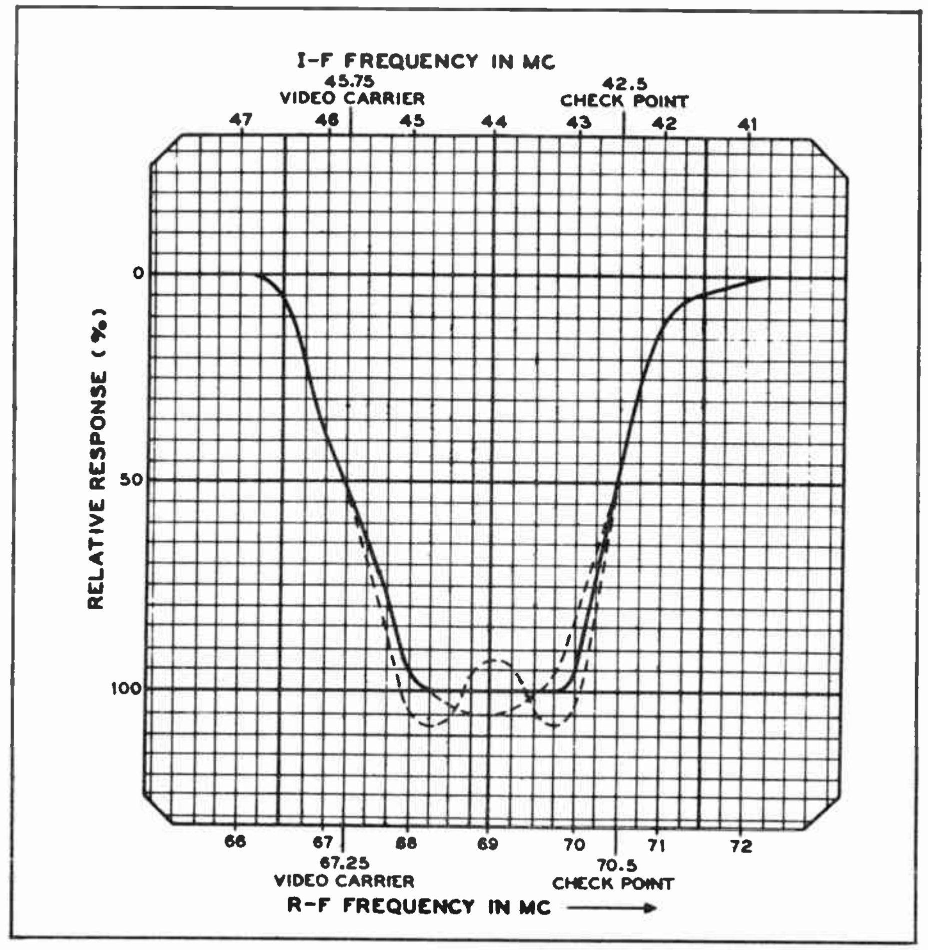

Figure 8. Over-All, R-F, I-F Response Curve, Showing Tolerance Limits

NOTE: The R-F Probe, Part No. 76-3595, is used as a detector of the 4.5-mc. signal, and the oscilloscope is used as an indicating device. An alternate crystal detector may be made up as shown in figure 9.

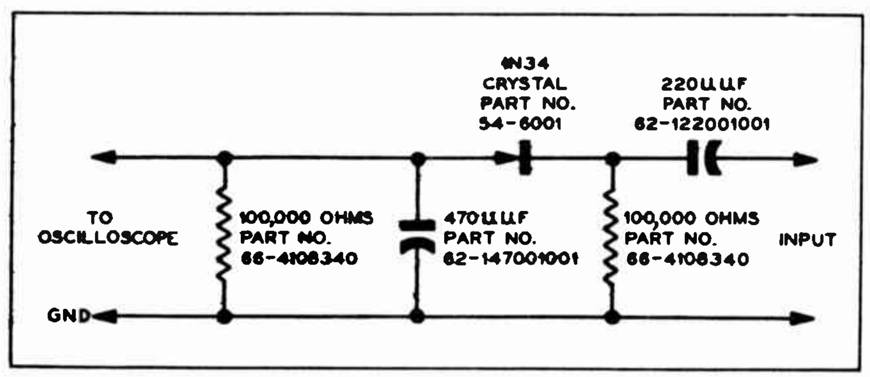

Figure 9. Wiring Diagram of Crystal Detector

OSCILLOSCOPE WAVEFORM PATTERNS

These waveforms were taken with the receiver adjusted for an approximate peak-to-peak output of 2 volts at the video detector. The voltages given with the waveforms are approximate peak-to-peak values. The frequencies shown are those of the waveforms—not the sweep rate of the oscilloscope. The waveforms were taken with an oscilloscope having good high-frequency response. With oscilloscopes having poor high-frequency response, the sharp peaks of the horizontal waveforms will be more rounded than those shown, and the peak-to-peak voltages will differ from those shown.

*** See CAUTION.**

*** CAUTION:** High-voltage pulses are present in the horizontal-output circuit. The waveform in figure 28 was taken with the alligator clip of the oscilloscope lead clipped over the insulation of the lead connected to pin 7 of J800. (To prevent puncture of the insulation of the lead, file off the teeth of the alligator clip, and wrap friction tape around the clip.) Connection to other points in the horizontal-output circuit is dangerous, because of the high voltages present. The peak-to-peak voltage shown for figure 28 is the actual voltage present; however, the amplitude of the scope presentation depends upon the degree of coupling.

VOLTAGE MEASUREMENTS

The voltages given here and on the schematics were taken with a 20,000-ohms-per-volt voltmeter, with a line voltage of 117 volts, and no signal input to the receiver. Since voltage readings taken in the video i-f stages vary widely with different test equipment setups, voltage measurements for these stages are omitted from the diagrams.

UHF TUNER-ADAPTER UT22, PART NO. 43-6703, FOR RECEIVERS USING R-F CHASSIS R-191

UHF Tuner-Adapter UT22, Part No. 43-6703, will provide for the reception of UHF Channels 14 through 83. It is designed for installation in Philco B line television receivers, and is installed on all BU models. These receivers use r-f chassis R-191.

The Tuner-Adapter consists of a UHF tuner, a change-over switch, adapter cables and plugs, a planetary tuner driving assembly, and mounting hardware.

CIRCUIT DESCRIPTION

The incoming UHF signal is coupled through the antenna input line to blocking condensers C1 and C2, leakage resistors R8 and R9, an i-f trap, C5-L1, C6-L2, and a 150-ohm transmission line, to the antenna tank of the tuner. See figure 37. The antenna tank is coupled to the mixer tank by means of the mutual coupling of L2 and L3 and the stray capacitance, C5. The desired signal is selected by tuning the antenna tank and the mixer tank to the correct frequency; this is accomplished by tuning condensers C3A, C3B, C3C, and C3D. These condensers, plus C3E and C3F, located in the oscillator tank circuit, form the manual tuning gang.

The signal is then fed to the crystal mixer circuit by means of the mutual coupling of L4 and L5. The local-oscillator signal is generated by a 6AF4 tube, V1, and its associated circuit. The frequency of oscillation is maintained at 45.75 mc. above the signal frequency in the antenna and mixer tank, in order to effect a 45.75-mc. video carrier intermediate frequency when the two signals are subsequently mixed in the crystal mixer tank.

The output signal from this local oscillator is introduced into the crystal mixer circuit through a 300-ohm, miniature transmission line and the mutual coupling of L7 to L5 and L8 to L6. These four printed inductances, in addition to C7, form the mixer board assembly. The signal is fed into a 6BQ7 preamplifier stage, then to the video i-f circuits, and through the UHF change-over switch, by means of a coaxial connection. On VHF operation, a 150,000-ohm resistor is placed in series with the UHF oscillator plate, rendering this oscillator inoperative.

The two tanks of the UHF tuner, the antenna tank and the mixer tank, are used to prevent the i-f signal from feeding back to the antenna and interfering with other receivers. These two tanks pass incoming signals very readily, but do not pass the i-f signal.

CHANGE-OVER SWITCH

The change-over switch supplied with the Tuner-Adapter is used to switch from VHF to UHF, and vice versa. It is installed on the back of the VHF tuner, and is operated by an actuator mounted on the VHF tuner shaft. When the Channel Selector of the VHF tuner is turned to the UHF position, the change-over switch makes proper connection for UHF operation. In this position, the switch places a 150,000-ohm resistor in series with the VHF B-plus lead, which drops the B-plus voltage applied to the VHF tuner. The antenna is connected to the UHF tuner, the VHF pilot light is turned off, and the UHF pilot lights are turned on; the output of the UHF tuner is connected to the video i-f input circuit.

When the VHF Channel Selector is turned to any VHF position, the change-over switch places a 150,000-ohm resistor in series with the UHF local-oscillator plate circuit, which drops the voltage applied to the plate, and disables the oscillator. The switch also connects the antenna to the VHF tuner, turns off the UHF pilot lights, and turns on the VHF pilot light.

ADAPTER CABLES AND PLUGS

The adapter plugs shown in the schematic diagram are not used in factory-installed units; the cables are wired directly into the chassis at the proper places. The plugs are used only in field-installed units. (Refer to the installation instructions for the proper method of inserting and connecting all plugs and cables.)

PLANETARY DRIVE

The UHF tuner is tuned by means of a 3-gang tuning condenser, which is driven through a specially designed planetary drive. The planetary drive is constructed so that fine tuning and coarse tuning can be accomplished with a single control knob. The tuning shaft is coupled to the driving shaft through three steel balls, which form a planetary drive that produces a slow rotation for fine tuning. See figure 38. After rotating 180 degrees with the tuning shaft, a pin engages the driving shaft, and the two shafts are direct-coupled, for coarse tuning. To re-engage the planetary drive for fine tuning, it is only necessary to reverse the direction of the rotation. The dial pointer

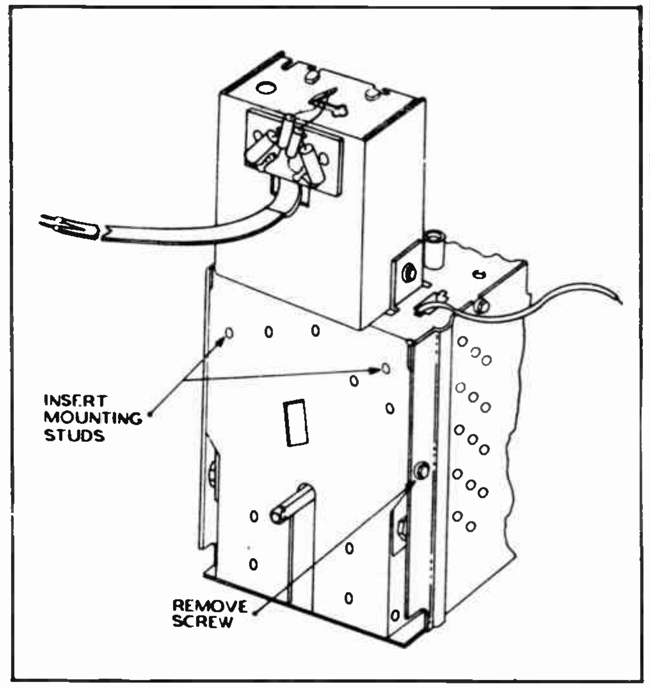
is connected to the tuning gang through a cord drive, and indicates the channel number to which the tuner is tuned.

ALIGNMENT AND REPAIRS

The frequencies at which the Tuner-Adapter operates are extremely high; therefore, it is necessary that the utmost care be taken to safeguard against upsetting the delicate adjustments of the tuner. It is recommended that the serviceman make only minor repairs to the tuner, such as replacement of the tube or crystal and the wiring of external leads. The



TP3-793

Figure 45. Rear View of VHF Tuner

Tuner-Adapter should be returned to the factory for alignment or major repairs, unless the serviceman is properly equipped to perform these jobs. In general, a good rule to follow is not to remove the cover of the Tuner-Adapter, unless so equipped.

NOTE: Replacing the tube with a new one may detune the tuner. If this occurs, try a number of tubes until one is found that will provide the most satisfactory performance.

INSTALLATION INSTRUCTIONS

To install the UHF Tuner-Adapter on the r-f chassis, proceed as follows:

1. Remove the cabinet back and r-f chassis from the cabinet; then remove the nameplate on the control panel by pushing it out from inside the cabinet.
2. Insert the dial scale and bezel assembly into the hole provided in the cabinet. Fasten the assembly in place with the two nuts provided.
3. Remove the UHF tuner assembly from the mounting board with which it was shipped. Keep the three screws for mounting the tuner in the cabinet.
4. Remove the coaxial cables from the two sockets at the side of the VHF tuner. Remove the bracket and socket assembly (J500 and J201) from the back of the VHF tuner, and discard them.
5. Place the switch-actuator assembly on the shaft extending from the rear of the VHF tuner so that the switch-actuator stud points away from the tuner. See figure 44. Place the spacers on the mounting studs

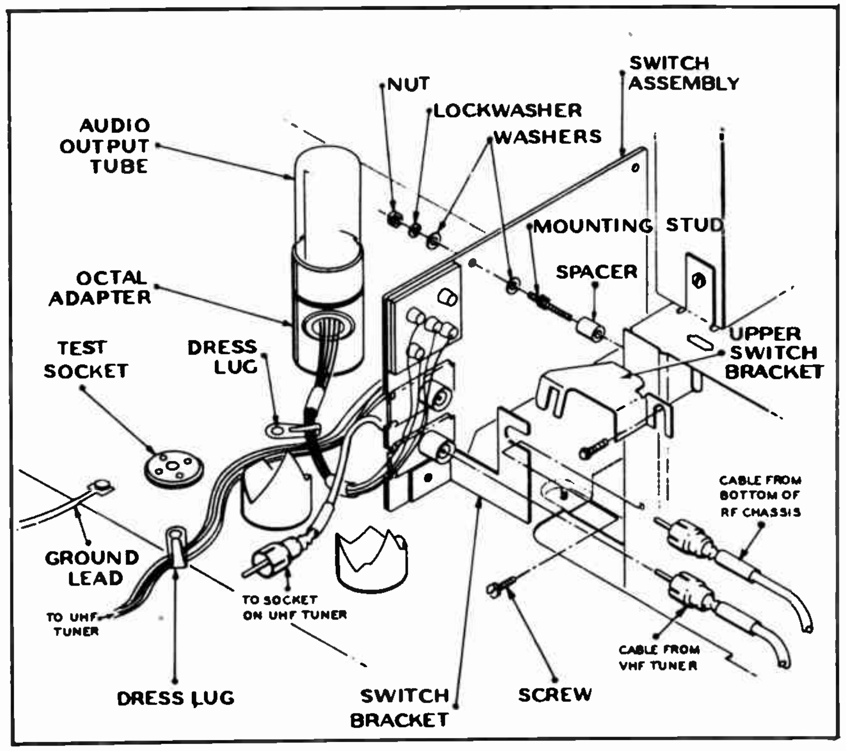


Figure 46. Change-Over Switch Mounting Details and Lead-Dress Details

and attach to the rear of the VHF tuner on the r-f chassis. See figure 45.

6. Remove the screw on the side of the VHF tuner, as shown in figure 41. Place the switch assembly on the two mounting studs, and fasten it in place with the flat washers, lock washers, and nuts provided. See figure 46. Fasten the upper switch bracket in place as shown in figure 46.

7. Put the VHF Channel Selector in the Channel 2 position. Rotate the switch actuator clockwise (as viewed from the rear of the VHF tuner) on the tuner shaft until the actuator touches the fiber cam on the change-over switch. Fasten the switch actuator in this position. Rotate the Channel Selector to the UHF position. Check the switch operation to make sure that the switch is thrown properly. Rotate the Channel Selector to Channel 13 position and check the switch operation to make sure that the switch is not thrown in this position. Fasten the lower switch bracket to the side of the VHF tuner with the screw removed in step 6. Lubricate the switch-actuator stud and switch cam with cup grease.

8. Remove the audio-output tube from its socket, and insert the adapter plug into the socket. Insert the tube into the adapter. See figure 46.

9. Insert the coaxial cable from the VHF tuner into the bottom socket on the change-over switch. Insert the coaxial cable from the r-f chassis into the top socket on the switch. See figure 46.

10. Pull the orange lead from the VHF tuner up out of the r-f chassis, and cut it off at the point where it comes through the chassis. Skin the orange lead attached to the VHF tuner, and solder it to the lug on the change-over switch, as shown in figure 44.

CAUTION: The orange lead supplies B plus to the VHF tuner. Tape the loose end to prevent shorting to the chassis.

11. Remove the pilot lamp from the r-f chassis pilot-light socket. Cut the pilot-light lead from the r-f chassis where it passes through the chassis, and discard the socket and lead. Tape up the lead to prevent the possibility of a short circuit. Mount the new pilot-light socket from the change-over switch with the drive screw provided, as shown in figure 47. Insert the pilot light in the socket, and install the shield provided over it.

12. Remove the antenna lead from the VHF tuner, and solder the short lead from the UHF-VHF change-over switch to the VHF tuner terminals from which the antenna lead was removed. Slide the folded fiber lead holder over the tapered-line coil assembly on the VHF tuner, and dress the twin-wire antenna leads through the holder. See figure 44. The fiber holder will prevent the twin-wire leads from touching the tubes on the r-f chassis.

13. Place the UHF tuner in the cabinet between the r-f and deflection chassis, and fasten the UHF

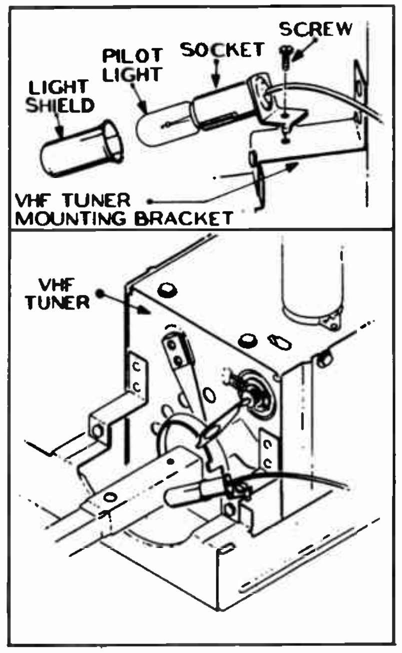

Figure 47. Pilot Light Mounting Details

tuner to the chassis shelf with the three screws removed in step 3. It is important that these screws be tightened securely, so as to hold the UHF tuner in place on the chassis shelf. Turn the UHF tuning shaft to its extreme counterclockwise position, and check the pointer position on the scale. The pointer should be positioned just below the Channel 14 mark on the scale. If the pointer is not properly positioned, loosen the three mounting bolts and move the UHF tuner

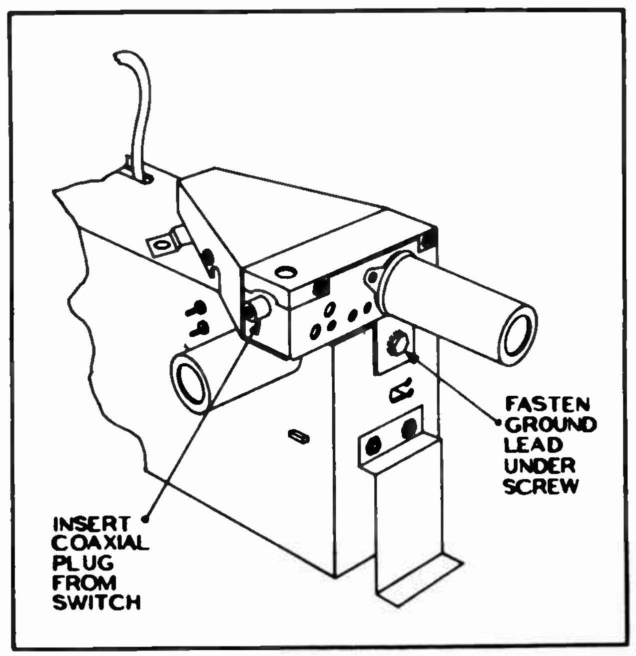

Figure 48. UHF Tuner, Showing Location of Ground Lead and Coaxial Socket

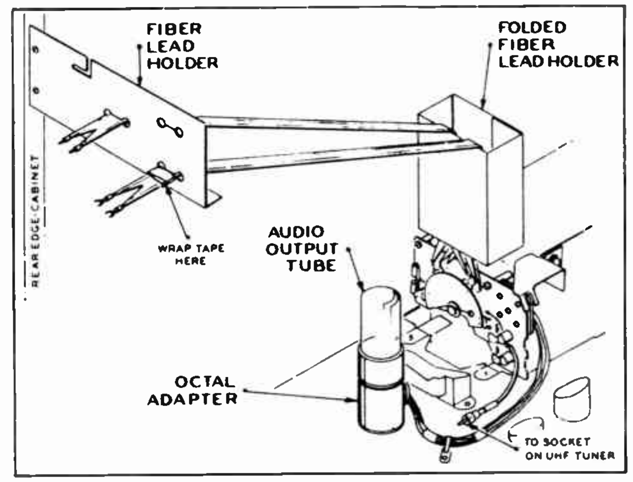

Figure 49. Rear View of VHF Tuner, Showing Lead Dress

assembly to properly position the pointer; then fasten the assembly with the three mounting screws.

14. Fasten the ground lead and the dress lugs to the r-f chassis with drive screws. See figure 46. Install the chassis in the cabinet, and fasten the ground strap under the screw on the UHF tuner as shown in figure 48. Fasten the r-f chassis with the original mounting bolts. Place the original knobs on their shafts, and the felt washer and knob supplied on the UHF tuning shaft.

15. Insert the coaxial plug from the change-over switch into the socket on the UHF tuner. See figure 48. Insert the 5-pin plug from the UHF tuner into the socket on the bracket at the rear of the VHF tuner. Dress the leads under the dress lug as shown in figure 46.

16. Replace the fiber antenna-lead holder with the new holder provided. Fasten the new holder with the nails provided (or screws for metal cabinets), and then pass the twin-wire leads through the holes as shown in figures 49 and 50. Pull the leads through

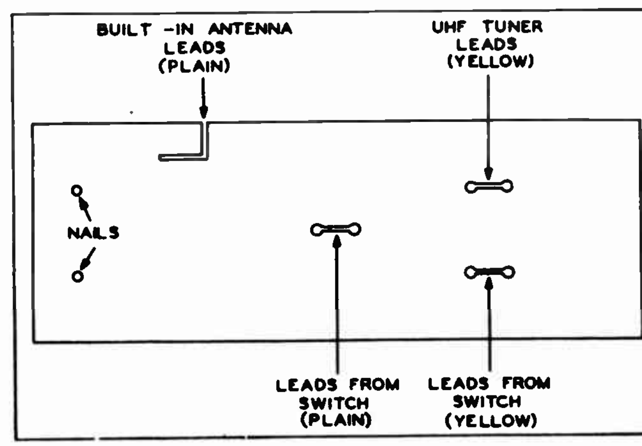

Figure 50. Antenna-Lead Holder

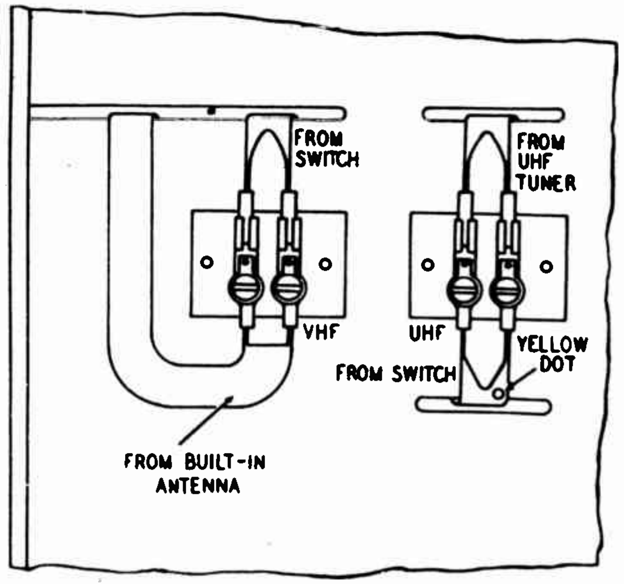

TP2-3170-1

Figure 51. Antenna-Lead Connections, Common Built-In Antenna

the holder until they are tight, making certain that the leads do not contact the tubes or the chassis. Wrap tape around the yellow-marked twin-wire leads with the spade-lug ends, to prevent the leads from passing back through the fiber holder..

17. Fasten the antenna terminal board provided as shown in the illustrations above (figures 51 to 55). Replace the cabinet back, and make the connections as illustrated, according to the type of antenna installation being used.

18. Paste the label provided over the outside-antenna instructions on the cabinet back.

PARTS LIST

IMPORTANT

General replacement items commonly stocked by the serviceman are omitted from this parts list. All condensers are molded-bakelite Philco condensers, with a 600-volt rating, and all resistors are ½ watt, unless otherwise indicated. Parts are listed according to chassis type, and should be ordered in this way rather than by model number. A list of miscellaneous parts is given at the end of the parts list for each chassis type. All parts are symbolized in the schematic diagram and base layout, for identification purposes.

NOTE: Part numbers identified by an asterisk (*) are gèneral replacement items. These numbers may not be identical with those on factory parts. Also, the electrical values of some replacement items may differ from the values indicated in the schematic diagram and parts list. The values substituted in any case are so chosen that the operation will be unchanged. When ordering replacements, use only the "Service Part No."

DEFLECTION CHASSIS D-197

SECTION 1—POWER SUPPLY

Reference Symbol	Description	Service Part No.
C100 and C101	Condensers, filter, electrolytic, 120 μf., 150v	30-2568-61
C102	Condenser, filter, electrolytic, 10 μf., 25v	45-3035-6
C103	Condenser, filter, electrolytic, 100 μf., 300v	30-2584-7
CR100 and CR101	Rectifiers, selenium, 450 ma. ..	34-8003-8
F100	Fuse, line, 1.6 amperes	AD2248-19
F101	Fuse, filament	Piece of #26 wire
J100	Socket, a-c line	27-6240-3
J101	Socket, chassis, connecting ...	27-6274-1
L100	Choke, filter	32-8600-1
PL100	Plug, a-c line	Part of a-c line cord ass'y. (see Misc. "A")
PL101	Plug and cable ass'y., chassis connecting	(See Misc. "B" in PR-2507)
R100	Resistor, current limiting, 5 ohms, 20 watts	33-3448-18
S100	Switch-off-on	Part of VOLUME control
T100	Transformer, filament	32-8643

SECTION 4—SOUND

Reference Symbol	Description	Service Part No.
R414	Potentiometer, VOLUME control, 2 megohms	33-5564-16

SECTION 7—VERTICAL SWEEP

Reference Symbol	Description	Service Part No.
C707	Condenser, screen filter, 20 μf., 200v	Part of C103
L700 and L701	Coils, vertical deflection	Part of deflection yoke ass'y. (see Misc. "A")
R701	Potentiometer, VERT. HOLD control, 250,000 ohms	Part of R810
R704	Potentiometer, HEIGHT control, 2.5 megohms	33-5565-32

SECTION 7—VERTICAL SWEEP (Cont.)

Reference Symbol	Description	Service Part No.
R708	Potentiometer, VERT. LIN. control, 2.5 megohms	33-5565-32
R710	Resistor, screen divider, 22,000 ohms, 2 watts	66-3225340
R711	Resistor, screen divider, 18,000 ohms, 2 watts	66-3185340
R714	Resistor, vertical damping, 680 ohms, 1 watt	66-1684340
T700	Transformer, vertical oscillator	32-8431-2
T701	Transformer, vertical output..	32-8637

SECTION 8—HORIZONTAL SWEEP

Reference Symbol	Description	Service Part No.
C805	Condenser, by-pass, 82 μμf. ...	60-00825437
C806	Condenser, ringing, .0022 μf., ±10%	60-20225434
C807	Condenser, d-c blocking, 390 μμf.	60-10395437
C808	Condenser, charging, 330 μμf. .	60-10335417
C811	Condenser, decoupling, 10 μf., 450v	Part of C103
C813	Condenser, anti-ringing, 82 μμf., 4000v	30-1246-4
C815	Condenser, electrolytic, 20 μf., 300v	Part of C103
J800	Socket, deflection	27-6274-8
J801	Socket, gate pulse	27-6273
L800	Coil, stabilizing, 30—80 mh. ..	32-4557
L801	Coil, r-f choke, horizontal-output plate	Part of T800
L802 and L803	Coils, horizontal deflection ...	Part of deflection yoke ass'y. (see Misc. "A")
L804	Coil, r-f choke, damper cathode	Part of T800
L805	Coil, r-f choke, damper plate..	32-4112-24
L806	Coil, r-f choke, horiz.-output heater	32-4112-18
PL800	Plug, deflection	Part of cable ass'y. (see Misc. "A")

SECTION 8—HORIZONTAL SWEEP (Cont.)

Reference Symbol	Description	Service Part No.
PL801	Plug, gate pulse	Part of cable ass'y. (see Misc. "B")
R810	Potentiometer, HORIZ. HOLD control, 50,000 ohms	33-5563-57
R811	Potentiometer, HORIZ. OSC. FREQ., 250,000 ohms	33-5565-17
R815	Potentiometer, WIDTH control, 15,000 ohms, 2 watts	33-5546-56
R817 and R822	Resistors, feedback, 33,000 ohms, 1 watt	66-3334340
R818	Resistor, voltage divider, 5000 ohms, 7 watts	33-1335-118
R819	Resistor, horiz.-output screen, 470 ohms, 1 watt	66-1474340
R820	Resistor, boost voltage divider, 100,000 ohms, 2 watts	66-4105340
R821	Resistor, boost voltage divider, 100,000 ohms, 1 watt	66-4104340
T800	Transformer, horizontal output	32-8642-1

TV TUNER, PART No. 76-8400 (Cont.)

Reference Symbol	Description	Service Part No.
J500	Socket, tuner link	Part of Connector ass'y., tuner to i-f (see Misc. "C")
L500, L501, L502, and L503	Coils, tapered line	32-4432-3
L504	Coil, FM trap	32-4550-3
L505 to L511 incl.	Coils, antenna tuning	Part of WS500A
L512	Coil, r-f coupling	312-5145-22
L513 to L519 incl.	Coils, r-f plate tuning	Part of WS500B
L520 to L526 incl.	Coils, mixer grid tuning	Part of WS500C
L527	Coil, i-f trap	32-4552-1
L528	Coil, mixer plate	312-5151-10
L530	Coil, filament choke	32-4550-1
L531	Coil, filament choke	32-4550-11
L532 to L538 incl.	Coils, oscillator tuning	Part of WS500D
PL500	Plug, tuner link	Part of Cable and Plug ass'y. (see Misc. "C")
R508	Resistor, oscillator feed, 33,000 ohms	66-3334340
R510	Resistor, mixer plate feed, 10,000 ohms, 1 watt	66-3104540
WS500A(F) and WS500A(R)	Switch, wafer, antenna	76-8410
WS500B(F) and WS500B(R)	Switch, wafer, r-f plate	76-8409
WS500C(F) and WS500C(R)	Switch, wafer, mixer grid	76-8408
WS500D(F) and WS500D(R)	Switch, wafer, oscillator	76-8407
Z500	Tapered line ass'y.	76-8417

MISCELLANEOUS "C"

Description	Service Part No.
Cam and shaft, fine tuning	76-6936-3
Cable and plug, tuner to i-f	41-3754-55
Connector ass'y., tuner to i-f	76-8521
Coupling, fine tuning shaft	54-4912-2
Detent, ball	56-8020
"E" Washer, detent (in back of fine tuning cam)	1W60980FA3

MISCELLANEOUS "C" (Cont.)

Description	Service Part No.
Front panel ass'y.	76-8395
Hairpin, plunger grounding	56-9858
Hairpin, plunger-pivot lever-pin	1W42704FA3
Pivot pin, lever	56-9149
Lever, plunger	56-9148
Plunger	56-8034-1
Retaining ring	1W61043
Shaft	76-6914-4
Shaft extension	56-8358
Shield, tube, 9-pin miniature	56-5629-5
Socket, tube, 9-pin miniature	27-6203-21
Spring, shaft	56-8023
Spring, plunger	56-9628
Spring, detent index	56-9158
Terminal panel, antenna	76-5504-2
Washer, detent (in back of fine tuning cam)	56-9351
Washer, fiber, fine tuning plunger	27-4109-13
Washer, spring, plunger lever	56-9157

CONNECTING CABLES, PLUGS, AND SOCKETS

Reference Symbol	Description	Service Part No.

CIRCUIT DESCRIPTION

Philco B Line, Code 158, Television Receivers use two chassis—the r-f chassis, R-207, containing the r-f, video, audio, and sync circuits, and the deflection chassis, D-207 or D-208, containing the power and deflection circuits.

Since these chassis are not isolated from the 60-cycle power line, all protruding shafts and mounting feet are insulated from the chassis.

CAUTION: See A-C Line Isolation.

The r-f amplifier, oscillator, and mixer section is built on a separate sub-chassis. The r-f amplifier uses a 6BZ7 tube, V1. The oscillator and mixer each use one half of a 12AZ7 tube, V2. The output of the mixer is fed to a four-stage i-f amplifier system employing four 6CB6 tubes, V3, V4, V5, and V6. A 1N64 crystal diode is used for the video detector. One half of a 6U8 tube, V7A, is used as the first video amplifier, which feeds into a 6AQ5 video output amplifier, V8.

Sound i-f (intercarrier) is obtained by utilizing the beat frequency produced when the 45.75-mc. video carrier and the 41.25-mc. sound carrier are mixed in the video detector. The beat frequency, 4.5 mc., is the difference between 45.75 mc. and 41.25 mc., and contains the FM sound signal. This 4.5-mc. signal contains only a negligible amount of the video amplitude modulation, provided that the amplitude of the 41.25-mc. signal is considerably lower than that of the 45.75-mc. signal. The proper relative amplitude of the two carriers is established in the alignment of the receiver. There is sound output only when both the video and sound carriers are present.

The oscillator is tuned primarily to obtain the best picture, since the 4.5-mc. relationship always exists between the two carriers. The 4.5-mc. sound i.f. (intercarrier), which is taken from the video detector, is amplified by a 6BA6 tube, V9, and a 6AU6 tube, V10, and is fed to the FM detector, which utilizes two diode sections of a 6T8 tube, V11A. The triode section of the 6T8 tube, V11B, is used as the first audio amplifier. The power amplifier uses a 6L6GA tube, V12.

A-G-C voltage for the video i-f system and the r-f amplifier is obtained from a keyed a-g-c system which uses a 6AU6 tube, V13, as the a-g-c gate. Composite video from the video amplifier plate circuit, V7A, is fed to the grid of the a-g-c gate tube, while a gating or keying pulse, obtained from a winding on the horizontal-output transformer located on the deflection chassis, is applied to the plate. The signal at the grid of V13 has positive sync polarity; therefore, the a-g-c gate can conduct in proportion to the amplitude of the sync-pulse tips if the gating or keying pulse occurs at the same time as the sync. Because the gate pulse is of constant amplitude (approximately 500 volts peak), the amplitude of the sync pulse determines the amount of conduction in the gate tube. The plate current of the keyed a-g-c gate tube flows through R220, R219, and R218, developing a voltage which is negative with respect to the chassis, and is proportional to the plate current. This negative voltage is used to control the gain of the receiver. Since conduction cannot occur in the a-g-c gate tube unless the sync pulse and gating pulse occur at the same time, noise disturbances that occur during the intervals between sync pulses cannot affect the a-g-c voltage.

Composite video for the sync circuits is taken from the plate circuit of the video amplifier, V7A. The plate load of the video amplifier consists of two sections, R304 and R305. The full output of the amplifier is fed to the grid of the noise inverter, one half of a 12AU7 tube, V14B, and to the grid of the sync separator, one half of a 6U8 tube, V7B. The output developed across R305 only is fed to the grid of the a-g-c gate, V13. The noise inverter is operated with a low value of plate voltage and with high bias (applied to the cathode by a voltage-divider network), which keeps the tube beyond cutoff. When the composite video signal is applied to the grid of the noise inverter through C601, the sync appears as positive pulses, and noise which could affect the sweep circuits also appears as positive pulses. Harmful noise pulses usually have amplitudes far greater than that of the sync pulses, and, therefore, drive the grid of the noise inverter positive sufficiently to allow conduction in the noise inverter plate circuit. To prevent the noise inverter from conducting during the sync-pulse interval, the gated leveler, using one half of a 12AU7 tube, V14A, is used to clamp the sync pulses below the conduction level of the noise inverter. The gated leveler conducts only when the sync pulses and gating pulse occur at the same time, thus leveling the noise-inverter input to the sync-pulse level.

The output of the noise inverter consists of negative-going noise pulses. It should be noted that the noise pulses which exceed the sync level have been passed and their polarity reversed by the noise inverter. The output of the noise inverter is now mixed with the composite video and fed to the grid of the sync separator. Since the composite video fed to the grid of the sync separator has positive sync polarity, the positive noise pulses carried with the composite video would be passed by the sync separator; however, the output of the noise inverter consists of these same noise pulses, but of opposite polarity. Thus, cancellation of the noise pulses is effected. The output of the sync separator contains only the sync pulses, which are fed to the deflection chassis through the connecting cable.

The phase splitter, using one half of a 12AU7 tube, V15A, inverts the sync polarity for proper triggering of the vertical oscillator. The vertical sync is separated from the horizontal sync by the integrator circuits, and is fed to the grid of the vertical blocking oscillator, which uses one half of a 12AU7 tube, V15B. The output of the vertical oscillator is amplified by the vertical-output amplifier, which uses a 6BQ6GT tube, V16. The output of this amplifier is applied to the vertical-deflection coils through the vertical-output transformer.

In addition to the vertical-sync output, two horizontal-sync outputs are taken from the phase splitter, one from the cathode, and the other from the plate circuit. These two outputs are of opposite polarity, and are fed to the two diodes of the phase comparer, a 6AL5 tube, V17; the negative pulses are fed to the cathode of V17B, and the positive pulses, to the the plate of V17A. A portion of the horizontal sweep output voltage is taken from the horizontal-output transformer, and is fed to the plate of V17B and the cathode of V17A, for comparison of the horizontal-sync and horizontal-sweep voltages. When the sweep and sync are in phase, no voltage is developed across R800, but when the two signals are out of phase, a voltage is developed across R800. When this voltage is positive, it increases the frequency of the horizontal oscillator (a 12AU7 tube, V18); when the voltage is negative, it reduces the frequency of the oscillator. This action holds the horizontal oscillator in phase with the sync signal. The horizontal hold control, R810, adjusts the horizontal-oscillator frequency so that it may be controlled by the phase comparer. The output of the horizontal oscillator is fed to the horizontal-output amplifier, which uses a 6CD6G tube, V19. The horizontal-output tube feeds the deflection coils through the horizontal-output transformer. A 6V3A tube, V20, is used as the horizontal damper.

The second-anode voltage for the picture tube is supplied by two 1B3GT high-voltage-rectifier tubes, V21 and V22, connected in a voltage-doubler circuit. The B-plus voltage for the receiver is supplied by two selenium rectifiers, CR100 and CR101, in a full-wave voltage-doubler circuit, operating from the power line through an autotransformer which provides a step-up of the line voltage. Bias voltage is obtained from across the filter choke which is in series with the negative side of the B-plus supply. The B-plus-boost voltage derived from the horizontal-damper circuit supplies higher B-plus voltage to the first anode of the picture tube. Filament current for all the tubes except the high-voltage rectifiers is supplied by a 117-volt, 60-cycle step-down transformer. Filament current for the high-voltage rectifiers is supplied by two windings on the horizontal-output transformer.

NOTE: The D-207 and D-208 chassis incorporate a protective high-voltage shorting switch (located on the rear of the high-voltage cage), which shorts the output of the 1B3GT high-voltage doubler-rectifier (V22) to ground when the cabinet back is removed. Do not attempt to operate the receiver with the cabinet back removed without first disabling this shorting switch. The switch can be disabled temporarily for service work by removing the two self-tapping screws at the bottom edge of the rear cover of the high-voltage cage, and propping up the rear cover.

IMPORTANT

A-C LINE ISOLATION

CAUTION: One side of the a-c line is connected to the chassis through T100, C101, and L100, in series. The other side of the a-c line is connected to the chassis through R100, F100, CR100, and C103, in series. Grounding the chassis will result in a short circuit across one or the other of these two branches in the voltage-doubler circuit. During servicing and alignment, it is desirable that an a-c line isolation transformer capable of handling at least 250 watts (Philco Part No. 45-9600) be used. Failure to use an isolation transformer will greatly increase the shock hazard, and may result in damage to the test equipment, or receiver, or both.

SPECIFICATIONS

VHF TUNING .... Twelve-channel, 13-position wafer switch; Television Channels 2 through 13 and UHF position

UHF TUNING (if provided) ...... Continuous tuning; Channels 14 through 83

INTERMEDIATE FREQUENCIES
Video carrier .... 45.75 mc.
Sound (intercarrier) .... 4.5 mc.

TRANSMISSION LINE .... 300-ohm, twin-wire lead

OPERATING VOLTAGE .... 110 to 120 volts

POWER CONSUMPTION .... VHF only models, 250 watts; VHF and UHF models, 255 watts

TUBE COMPLEMENT

R-F CHASSIS R-207

REMOVING, REPLACING 27LP4 PICTURE TUBE

GENERAL

The Philco 27LP4 picture tube is designed for a maximum of safety. Moreover, when properly mounted in the frame assembly, the picture tube is supported in such a manner as to provide a maximum of protection against breakage. Therefore, it is important that the tube be properly installed in its supporting frame. It is suggested that the service technician protect his eyes and the exposed parts of his body when handling all picture tubes. The removal and installation of the 27LP4 picture tube is quite safe if the procedure given below is followed.

CAUTION: Because of the bulkiness and increased weight of the 27LP4 tube, as compared with that of the smaller picture tubes, replacement of the 27LP4 requires two men. These tubes are not delicate when handled in the proper manner; however, care must be taken not to mar the glass in any way, as surface scratches and chips weaken a glass structure considerably. Also, because of its weight, do not attempt to handle this tube by the neck.

PROCEDURE FOR REMOVING 27LP4 TUBE

1. Remove both the deflection chassis and the r-f chassis from the cabinet.

2. Lay the cabinet face-down on the floor, taking precautions against marring the cabinet.

3. Remove the four nuts and washers that secure the mounting feet of the picture-tube assembly to the front of the cabinet.

4. Remove the two wood screws that secure the rear supporting struts of the tube assembly to the cabinet.

5. Remove the tube assembly (one man on each side of the cabinet).

6. Place the tube assembly face-down on a soft, protective cloth or mat, and slip the beam-bender magnet off the rear end of the tube. Referring to figure 1, loosen clamp ring (A) by means of clamp screw (B), unhook the four clips securing the web straps to the mounting feet, and lift the deflection-yoke housing and strap assembly (containing the deflection yoke and focus assembly) off the neck of the tube.

7. Mark the positions of the four mounting feet on the front band with a pencil or scriber (this is necessary because the mounting feet are free to slide, once the front band is loosened).

8. Loosen the two Allen head clamping screws (C) and (D) with a 5/16-inch Allen wrench, and remove the front band assembly.

PROCEDURE FOR INSTALLING 27LP4 TUBE

1. Place the picture tube face-down on a soft, protective cloth or mat, and position the front band assembly over the tube so that the lateral indentation in the band coincides with the welded seam around the outer edge of the tube's face plate.

Take up slack in the band, tightening both clamping screws (C) and (D) by hand.

NOTE: If the front band is positioned correctly, the distance from the bottom edge of each mounting foot to the surface on which the tube is resting will be 1⅞ inches, as shown in figure 1.

2. Position the mounting feet, on the front band, to coincide with the marks previously made on the front band.

3. Tighten both clamping screws (C) and (D) alternately, using a 5/16-inch Allen wrench.

NOTE: Take up on clamping screw (C) and (D) as tightly as possible. As can be seen from figure 1, the separation between the ends of the bands must be less than ⅛ inch, when tightened.

4. Slip the deflection-yoke housing and strap assembly (containing the deflection yoke and focus assembly) over the neck of the tube, and position it so that clamp screw (B) on clamp ring (A) is on the side of the tube opposite the anode button.

5. Place the clips (on the web straps) over the hooks on the four mounting feet, and tighten clamp ring (A) by means of clamp screw (B).

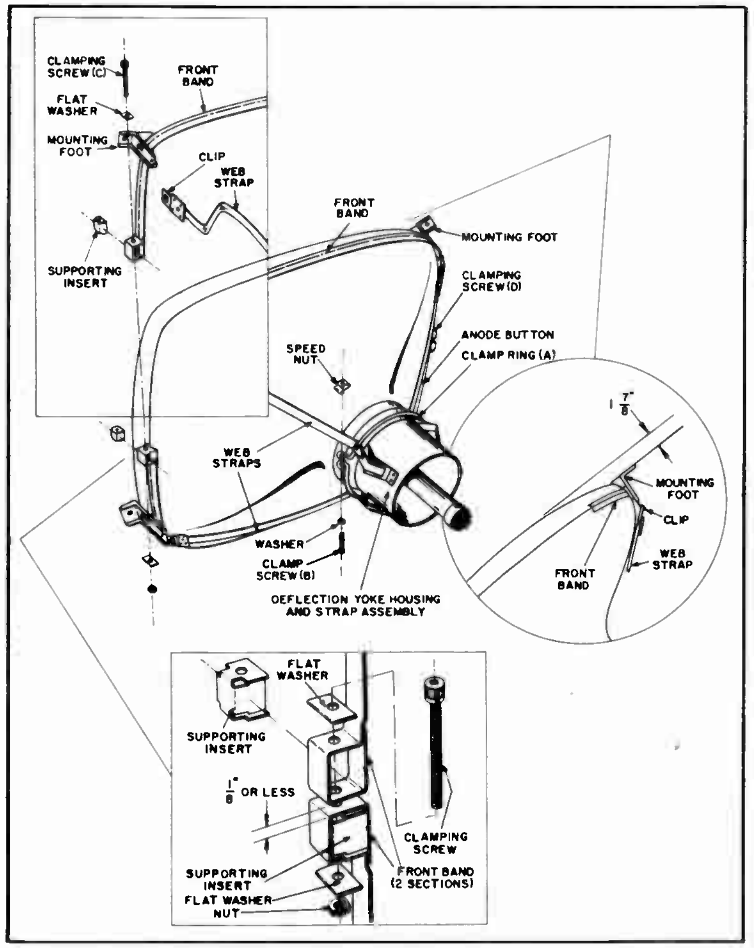
6. With the cabinet face-down on the floor, place the tube assembly in the cabinet (one man on each side of cabinet), and replace the four nuts and washers that secure the mounting feet to the front of the cabinet.

7. Replace the two wood screws that secure the rear supporting struts of the tube assembly to the cabinet.

8. Stand the cabinet upright, and install the r-f chassis, deflection chassis, and beam-bender magnet.

ADJUSTING 27LP4 PICTURE-TUBE ASSEMBLY

1. Mechanically center the focus assembly, over the neck of the tube, by adjusting the centering plate. It is important that the focus assembly and yoke be concentric with the tube neck for best focus and shadow clearance.



TP2-3264

Figure 1. 27LP4 Picture-Tube Assembly

2. Set the HORIZ. CENTERING control (R824) to its extreme counterclockwise position, and set the BRIGHTNESS control for maximum brightness of the picture.

3. Adjust the beam bender for maximum brightness of the picture.

4. If necessary, loosen the wing nuts and rotate the deflection yoke, to correct for picture tilt. Make certain that the deflection yoke is as far forward as possible, and tighten the wing nuts.

5. Adjust the centering plate so that neck shadow is just eliminated on the right-hand side of the screen, at the same time keeping the picture centered vertically. Do not attempt to center the picture horizontally by means of the centering plate.

6. Adjust the FOCUS control (on focus assembly). Set the CONTRAST control for the proper level, and readjust the FOCUS control for the best over-all focus.

7. Repeat steps 3 and 5, if necessary.

8. Adjust the HORIZ. CENTERING control (R824) for proper horizontal centering of the picture.

9. Turn the BRIGHTNESS control slowly toward the minimum position, checking that shadow does not appear at any brightness level. If shadow does appear, repeat steps 5 and 8, and recheck.

B SUPPLY FUSE REPLACEMENT

The B supply protective fuse, F100, is wired into the low-voltage section, and is in series with the selenium rectifiers. For replacement, use a 1.6-ampere delayed-action-type fuse, Philco Part No. 45-2656-23.

CAUTION: Discharge the circuit before replacing the fuse.

HORIZONTAL-OSCILLATOR ADJUSTMENT

To adjust the horizontal-oscillator circuit, tune in a station and proceed as follows:

1. Reduce the width of the picture so that approximately one inch of blank screen appears at the right-hand and left-hand sides of the picture.

2. Increase the BRIGHTNESS control setting so that the blanking time becomes visible. This appears as a dark vertical bar at the right-hand and left-hand sides of the picture.

3. Connect a .1-μf. condenser from Test Point G800 to ground.

4. Set the HORIZ. HOLD control to the center of its mechanical rotation.

5. Adjust the HORIZ. HOLD CENTERING control to bring the picture into the center of the blanking bars. When the picture is centered in the blanking bars, the bars at the left-hand and right-hand sides of the picture will be of equal width.

6. Remove the .1-μf. condenser from the Test Point. (See step 3.)

7. Adjust the horizontal ringing coil, L800, until the picture is again centered in the blanking bars.

8. Rotate the HORIZ. HOLD control through its range. The picture should fall out of sync to both sides of the center of rotation. If the picture does not fall out of sync to both sides, readjust the HORIZ. HOLD CENTERING control to obtain fall-out to either side of sync.

9. Rotate the HORIZ. HOLD control through its range, and observe the number of diagonal blanking bars that are visible just before the picture pulls into sync. The pull-in should occur with from 1 to 2 diagonal bars when the sync position is approached from either direction. If proper pull-in is not obtained, repeat the above procedure.

VIDEO PEAKING-COIL ADJUSTMENT

The video peaking coils, L305 and L307, are adjusted at the factory for proper transient response of the video amplifiers. Ordinarily, these coils will require no further adjustment by the serviceman except in cases where they have been tampered with, or where replacement becomes necessary. Under normal circumstances, when alignment of the tuner or i-f stages is undertaken, the video peaking coils should not require adjustment.

Before adjusting L305 and L307, check both the tuner and i-f alignment. (Never adjust L305 and L307 until the alignment of the receiver is correct.) Then tune in a station and adjust the receiver to give a picture of the best obtainable quality, with medium contrast. Turn the fine tuning control clockwise until a very slight beat pattern appears in the picture. Carefully observe the appearance of the picture regarding smear or overshoot (trailing whites). A small amount of overshoot may be desirable, to produce a sharper picture. Conversely, in weak-signal areas, a small amount of smear may be desirable, to reduce the harsh appearance of "snow". The adjustments of L305 and L307, and their effects on the picture, are as follows:

1. The amount of overshoot may be reduced by turning both TC302 and TC303 counterclockwise.

2. The amount of smear may be reduced by turning both TC302 and TC303 clockwise.

Normally, the point of proper adjustment is where minimum smear and trailing whites appear in the picture; however, a compromise adjustment may be made to suit prevailing conditions. As a rule, when properly adjusted, the adjustment screws (TC302 and TC303) should protrude from the chassis by approximately ½ inch to ¾ inch.

TELEVISION ALIGNMENT

GENERAL

The alignment consists of tuning each i-f coil to a given frequency, using an AM signal, and then feeding in a sweep signal at the antenna terminals and touching up the adjustments to obtain the desired pass band.

The over-all response curve (r-f, i-f) of the circuits from the antenna terminals to the video detector, after the i-f stages have been aligned, should appear essentially the same, regardless of the channel under test. If not, the tuner should be aligned. Before aligning the tuner, refer to the CAUTION given under Procedure in Tuner Bandpass Alignment Procedure.

The video-carrier intermediate frequency is 45.75 mc., and the sound intermediate (intercarrier) frequency is 4.5 mc. Alignment of these circuits requires careful workmanship and good equipment. The following precautions must be observed:

1. There must be a good bond between the receiver chassis and the test equipment. This is most easily obtained if the top of the workbench is metallic. The receiver chassis should be placed tuner-side-down on the bench. If the bench has no metallic top, the test equipment and chassis can be bonded by a strip of copper about two inches wide. The section of the chassis nearest the tuner should rest on the strip.

2. Do not disconnect the picture tube, picture-tube yoke, or speaker while the receiver is turned on.

3. Allow the receiver and test equipment to warm up for 15 minutes before starting the alignment.

4. The marker (AM) signal generator should be calibrated accurately to the frequencies used and to the sound and video r-f carriers of each channel used during alignment. If Philco Model 7008 is used, the built-in crystal calibrator provides an excellent means of calibration. An alternate method of calibrating the signal generator to the sound and video r-f carrier frequencies is to zero-beat the signal generator with the received signals.

For further information regarding calibration, refer to Philco Lesson PR-1745 (J) entitled "Television Service in the Home."

TEST EQUIPMENT REQUIRED

The following test equipment is recommended for aligning the receiver:

1. Philco Precision Visual Alignment Generator for Television and FM, Model 7008, or equivalent.

2. Vacuum-tube voltmeter, or 20,000-ohms-per-volt voltmeter.

3. R-F Probe, Philco Part No. 76-3595 (for use with Model 7008 generator).

JIGS AND ADAPTERS REQUIRED

Mixer Jig

Connections to the grid of the mixer tube may be made through the alignment jack provided for that purpose. To connect the generator to this point, a mixer-grid jig, Philco Part No. 45-1739, and a connecting cable, Philco Part No. 45-1635, may be used. As an alternate, a Philco alligator-clip adapter, Part No. 45-1636, with as short a ground lead as possible, may be used to connect the alignment jack. The ground lead should be connected as close as possible to the mixer tube. It is essential that the signal-generator output lead be terminated with a 68-ohm resistor (carbon) so that regeneration, caused by connection of the lead to the mixer, is held to a minimum.

Antenna-Input Matching Network

An impedance-matching network for coupling the signal generator to the antenna input terminals of the receiver is shown in figure 2. This network, which is designed to have an input impedance of 75 ohms

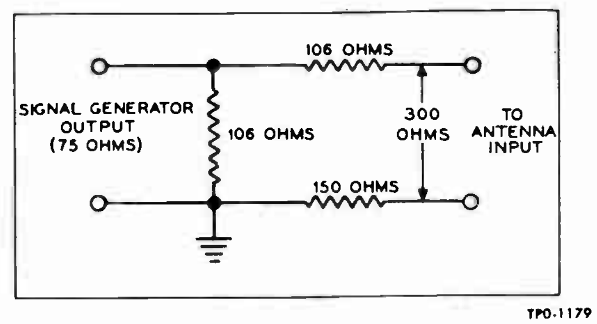


Figure 2. Antenna-Input Matching Network

and an output impedance of 300 ohms, is used to match a 75-ohm generator to a 300-ohm antenna-input circuit. The resistors used in this network should be of carbon-composition construction, and should be chosen from a group to obt in values within ten percent of those indicated. The resistors should be placed in a shield can to prevent variable effects. An antenna-matching jig, Philco Part No. 45-1736, which consists of a matching transformer and connecting box, may be used in place of the resistor network.

Video I-F Alignment Jig

(Video Test Jack Adapter No. 1)

The alignment jig, used at J200, and shown in figure 3, should be used during the i-f alignment to apply the proper bias to the a-g-c bus, and to provide a convenient oscilloscope connection. This adapter consists of a five-pin plug, and two 10,000-ohm resistors and a 1500$\mu\mu$f. condenser for isolation of the bias supply. To isolate the oscilloscope from the receiver circuits, a 15,000-ohm resistor, by-passed by a 1500-$\mu\mu$f. condenser is used. A suggested method of fabricating the jig is also shown in figure 2. This jig should not be used to observe the composite video from the video detector output.

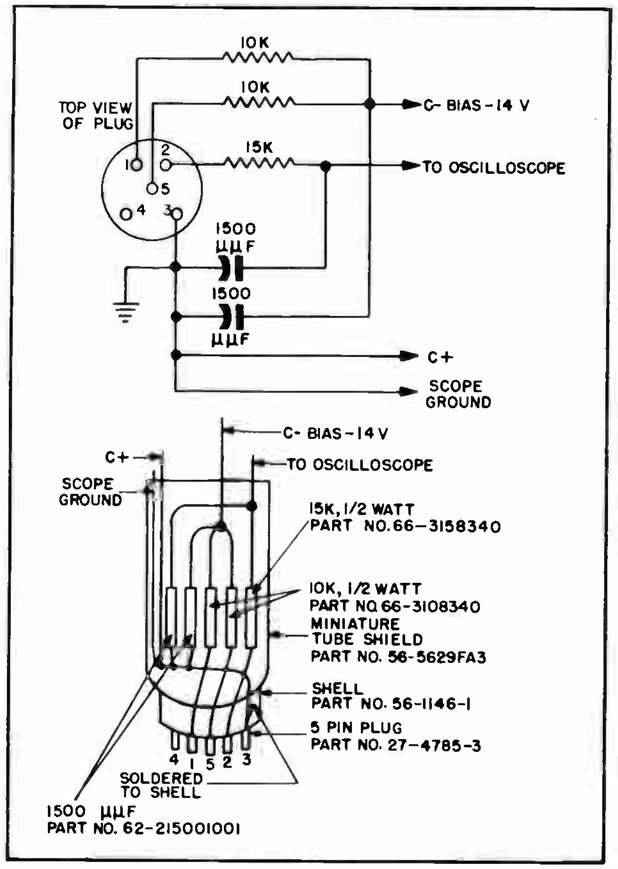

Figure 3. Video I-F Alignment Jig (Video Test Jack Adapter No. 1)

Sound I-F Alignment Jig

(Video Test Jack Adapter No. 2)

To observe the composite video at J200, a jig may be made with a five-pin plug and a 2200-ohm resistor. (See figure 4.) The 2200-ohm resistor should be connected to pin 2 of the plug. A ground lead should be connected to pin 3. To observe the composite video, connect the oscilloscope to the 2200-ohm resistor and the ground lead. This jig is also used for injection of the 4.5-mc. signal during sound i-f alignment.

Sound I-F Alignment Jig (FM Test Point and Volume Control Socket Adapter)

Figure 5 shows the adapter that should be used to connect the voltmeter to the FM detector through the volume control socket (J400) and FM test point (G400). The adapter should be inserted into the volume control socket, and the clip lead from the adapter connected to the FM test point. The volume control cable and plug (PL400) is inserted into the socket on top of the adapter.

TELEVISION TUNER ALIGNMENT

After the tuner is serviced, or if an i-f alignment is required, the tuner alignment should be checked. If realignment is necessary, use the procedure given below.

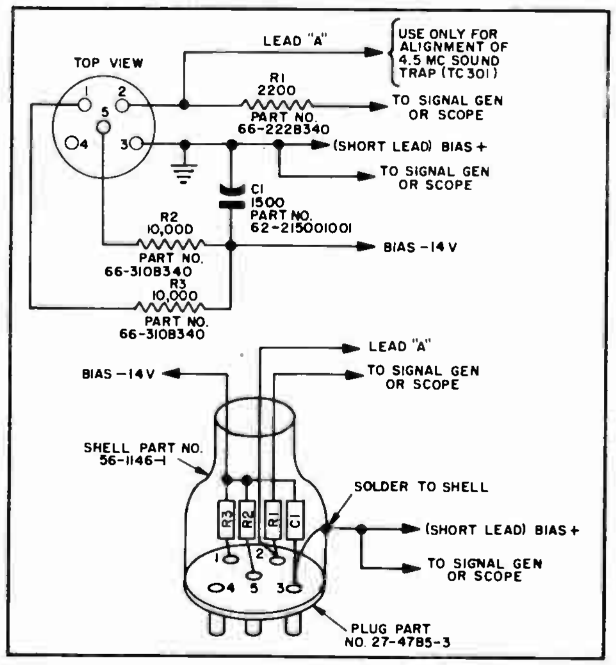

Figure 4. Sound I-F Input Alignment Jig (Video Test Jack Adapter No. 2)

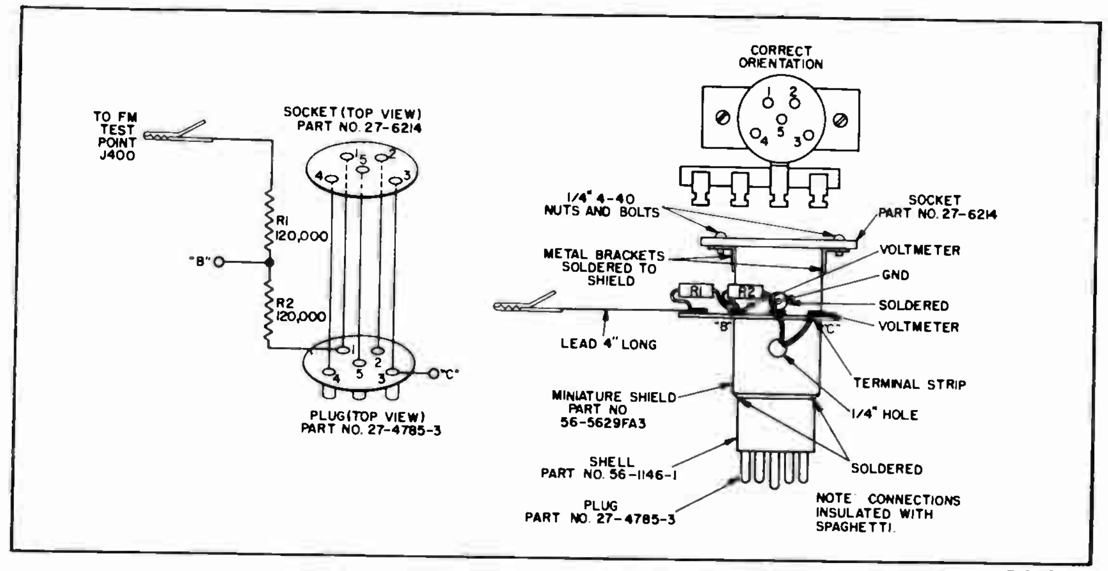

Figure 5. Sound I-F Output Alignment Jig (FM Test Point and Volume-Control Socket Adapter)

Since the frequency of the local oscillator affects the tuner response, the local-oscillator alignment should be made first.

Oscillator Alignment

General

It is possible to place each channel exactly on frequency by adjusting the tuning core of each coil. The adjustment procedure should be carried out with the highest channel (13) first, since the alignment of each channel will affect the alignment of the channels below it in frequency. The FINE TUNING control should be preset for all adjustments by placing the stop on the fine-tuning cam at Channel 8 oscillator tuning core. See figure 6.

Procedure Using Signal Generators

An r-f signal (unmodulated), at the video carrier frequency of the channel, is fed into the antenna input, and an i-f signal, at the i-f carrier frequency, is fed to the first i-f amplifier. Two AM signal generators are used to supply the above signals. An oscilloscope is connected to the video detector output. The oscillator core is then adjusted for zero beat on each channel. The two generators should be accurately calibrated, as described in Philco Lesson Series, PR-1745(J).

To align the oscillator, proceed as follows:

1. To observe the zero beat, connect the oscilloscope to the video detector output through the video i-f alignment jig. See figure 3. Bias the tuner and i-f a-g-c circuits with 1½ volts, and remove the gate-pulse plug, PL801, from the socket, J801. To apply the bias to the tuner, connect the battery to the white lead which comes off the feed-through condenser at the top of the tuner. To make certain that good connection is made to the tuner a-g-c circuit, remove the glyptol coating on this condenser terminal.

2. To feed in the i-f comparison signal, remove the shield from the first v-i-f tube, and wrap several turns of insulated copper wire around the tube. Connect the output leads of the v-i-f signal generator to the two ends of the wire loop, and set the generator for unmodulated output at 45.75 mc.

3. To feed in the signal representing the channel frequency, set the r-f signal generator at the video carrier frequency of Channel 13, and connect the output to the antenna-input terminals of the receiver, through the proper matching jig.

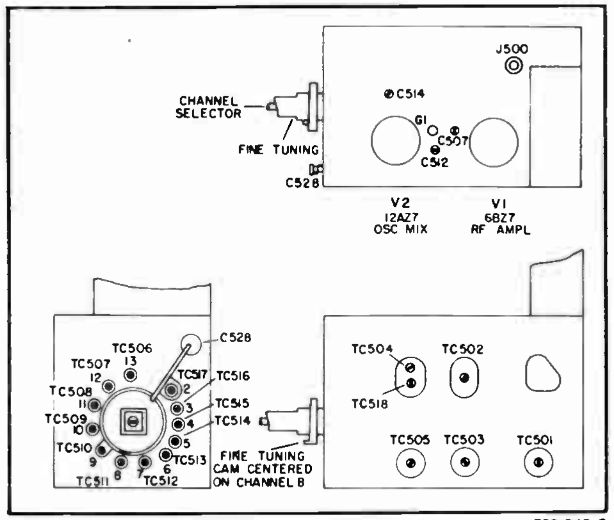
4. Mechanically preset the fine-tuning cam, as shown in figure 6, and set the CHANNEL SELECTOR to Channel 13.

5. Adjust the Channel 13 tuning core for zero beat, as indicated by the oscilloscope.

6. Retune the r-f signal generator and the CHANNEL SELECTOR for Channels 12, then 11, etc., each time adjusting the respective tuning core for zero beat. The tuning cores should be adjusted progressively from the highest-frequency channel to the lowest, because the higher channel adjustments will affect the lower channels.

Procedure Using Station Signal

The following simplified procedure may be used to align the oscillator when the television i-f alignment is satisfactory and a station signal is available. If this



TP3-942-C

Figure 6. Television Tuner Showing Locations of Adjustments

procedure is used in the service shop, signals from all stations which the customer can receive must be available in the service shop.

1. Mechanically preset the fine-tuning cam as shown in figure 6.

2. Tune in the highest-frequency channel to be received, and adjust the tuning core for that channel for the best picture; that is, starting with sound in the picture, turn the tuning core until the sound in the picture just disappears.

3. Repeat step 2 for each channel received in the area, starting with the highest-frequency channel and finishing with the lowest channel.

Tuner Bandpass Alignment

General

The bandpass alignment consists of aligning the tuner at Channel 13 and 6 and then making it track properly.

During the alignment, a fixed bias of 1½ volts is applied to the r-f amplifier tube through the white a-g-c lead.

An FM (sweep) signal is applied to the antenna-input circuit through the proper matching jig, and an oscilloscope is connected to the junction of R518 and the tuner red lead. The oscilloscope gain should be as high as possible, consistent with "hum" level and "bounce" conditions. Hum conditions will cause distortion of the time base and response. Bounce conditions will cause the response and the time base to jump up and down, and are caused by poor line regulation. The use of too high an oscilloscope gain aggravates these conditions, whereas the use of too low a gain necessitates increasing the generator output to a point where the tuner may be overloaded. The scope controls should be adjusted so that the width of the presentation is double the height. Overload may then be checked by changing the generator output while observing the shape of the response curve. When the generator output is changed, the vertical gain of the oscilloscope should be readjusted to keep the scope presentation amplitude the same. Do not readjust the horizontal gain control. Any change in the shape of the curve indicates overload, in which case a lower generator output and higher oscilloscope gain must be used.

The signal-generator output circuit must be properly matched to the antenna input circuit of the tuner. The antenna-input matching network shown in figure 2, or a Philco antenna matching jig, Part No. 45-1637, may be used for this purpose. If a matching jig is not used, the result obtained will be extremely unreliable.

Regeneration or a mismatch in the test setup will also cause poor and unreliable results. To check for regeneration or mismatch move the hand along the generator cable after all equipment is connected, and observe the response curve on the oscilloscope screen. If the response curve on the oscilloscope changes as the hand is moved along the cable, regeneration or mismatch is indicated. Another check may also be made with the VOLUME control advanced until noise can be heard from the speaker. If the level of the noise changes as the hand is moved along the generator cable, regeneration or mismatch is indicated. The symptoms which indicate these conditions may also be caused by failure to use the proper matching jig, as described above.

Procedure

CAUTION: When comparing the response curves from channel to channel, maintain the 2-to-1 width-to-height relationship in the oscilloscope presentation, as described above.

1. Connect the FM (sweep) and AM marker generators to the 300-ohm antenna input terminals through an antenna-input matching jig.

2. Connect the oscilloscope to the junction of R518 (15K, 1w) and the tuner red lead.

3. Apply 1½ volts of bias to the white tuner a-g-c lead.

4. Disconnect the tuner coupling link at wiring panel B-14, terminals 1 and 4, and solder a 68-ohm, one-half watt carbon resistor to the open link coming from the tuner. See figure 9. Remove the first i-f tube from its socket.

5. Set the CHANNEL SELECTOR and FM (sweep) generator to Channel 13 (213 mc.). Adjust the generator for sufficient sweep width to show the complete response curve.

6. Establish the channel limits (see figure 7) by using the marker (AM) r-f signal generator to produce marker pips on the response curve. (Set the marker generator first to 210 mc., and then to 216 mc.) The response curve should be reasonably flat between the limits.

7. Adjust TC502 and TC504 for a symmetrical response, centered about 213 mc., and falling within the specifications, as shown in figure 7.

8. Set the CHANNEL SELECTOR and FM (sweep) generator to Channel 7 (177 mc.). Establish the channel limits by using the marker signal generator to produce marker pips on the response curve. (Set the marker generator first to 174 mc., and then to 180 mc.) The curve should be reasonably flat between the limits.

9. On Channel 7, observe the tilt, and center frequency of the response curve. The curve should be centered on the pass band, and should be symmetrical. If it is not symmetrical and appears unbalanced, as in figure 8, adjust C507 and C512 (figure 6) to obtain a response curve which is the mirror image (tilt in the opposite direction) of the original; for example, if Channel 7 response curve appears as in figure 8A, adjust C507 and C512 until the curve appears as in figure 8B. This adjustment overcompensates to make allowance for the effect of Channel 13 adjustments (to be made in step 10) upon Channel 7 response.

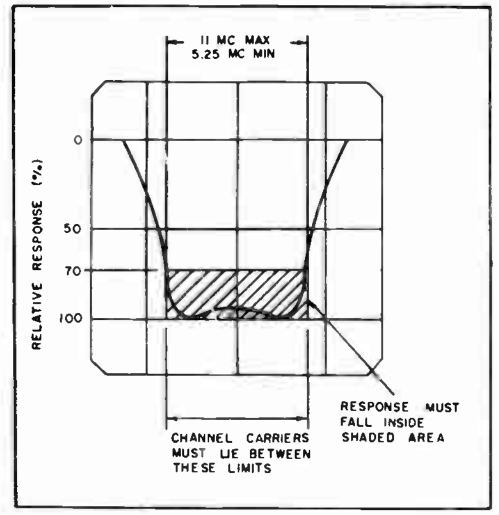
10. Reset the CHANNEL SELECTOR and generators to Channel 13, and repeat steps 8 through 10 as many times as is necessary to obtain the most symmetrical and centered response curves on Channels 13 and 7. Channels 7 through 13 are now correctly aligned.

11. Set the CHANNEL SELECTOR and sweep generator to Channel 6 (85 mc.).

12. Establish the channel limits, using the marker generator to produce marker pips on the response curve. (Set the marker generator first to 82 mc., and then to 88 mc.)

13. Adjust TC503 and TC505 for a symmetrical, approximately centered pass band. Set the marker generator to 85 mc. Detune TC505 counterclockwise until a single peak appears. Adjust TC503 until the peak falls on the 85-mc. marker. It may be necessary to increase the output of the generator during this adjustment. Then adjust TC501 for maximum curve height and symmetry of the single peak. The antenna circuit is now tuned for Channels 2 through 6.

14. Readjust TC503 and TC506 for a symmetrical



TP3-1213-1

Figure 7. Television Tuner Response Curve, Showing Bandpass Limits

response, centered about 85 mc., and falling within the specifications, as shown in figure 7. Channels 2 through 6 are now correctly aligned.

VIDEO I-F ALIGNMENT

Preliminary

Before proceeding with the i-f alignment or making an alignment check, observe the following preliminary instructions:

1. Preset the CONTRAST and BRIGHTNESS controls to the maximum counterclockwise position.

2. Preset the CHANNEL SELECTOR to Channel 4.

3. Insert the video i-f alignment jig into J200.

4. Connect the oscilloscope to the 15,000-ohm resistor from the video i-f alignment jig. Connect the ground lead of the oscilloscope to the ground lead from the adapter.

5. With a voltmeter connected across the points shown in figure 3, set the potentiometer to furnish 14 volts of bias.

6. Connect the AM generator to the mixer test point, G500, through a mixer jig, and adjust the generator for approximately 30 percent modulation at 400 cycles. Adjust the output of the generator during the alignment to keep the output at the second detector below .6 volt, peak to peak.

NOTE: If the i-f shield has been removed for repairs, it must be replaced before proceeding with the alignment.

Procedure

1. Tune the AM generator to 47.25 mc., and adjust C201 for minimum output, as observed on the oscilloscope.

2. Tune the AM generator to 41.25 mc., and

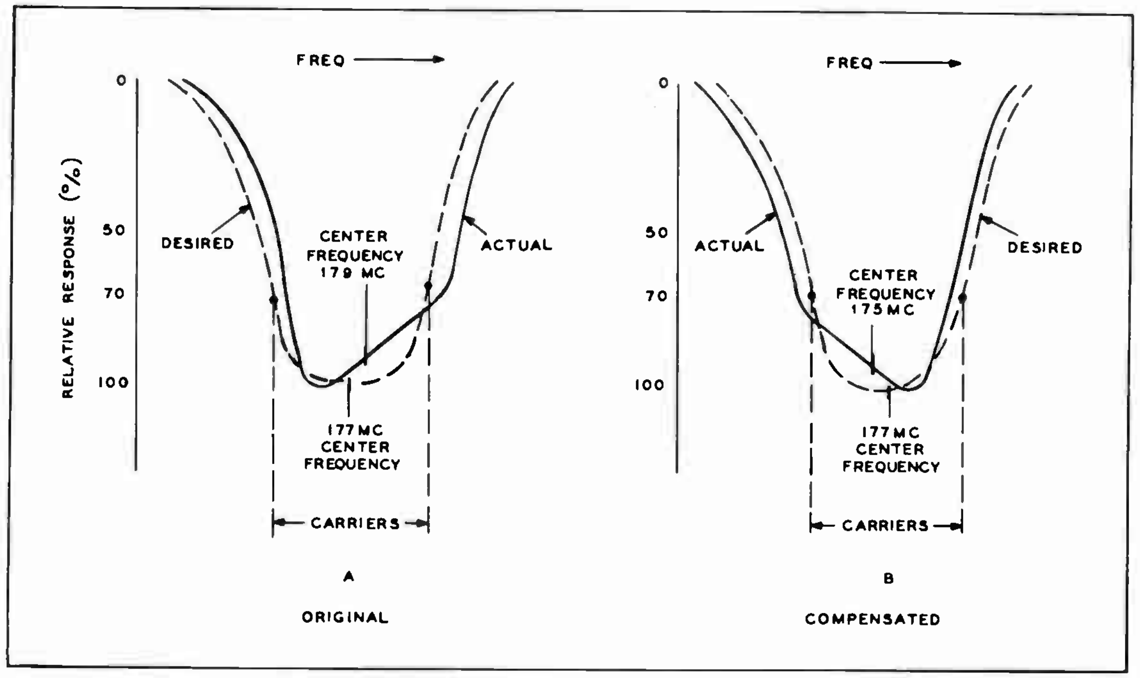


Figure 8. Television Tuner Response Curve, Showing Tracking Compensation

adjust C203 for minimum output, as observed on the oscilloscope.

NOTE: In steps 1 and 2, it is necessary to keep the generator output sufficiently high that a null indication may be observed on the oscilloscope; however, avoid overloading the receiver by excessive signal.

3. Tune the AM generator to the frequencies indicated below, and adjust the trimmers for maximum output.

a. 42.7 mc.—adjust C514
b. 44.75 mc.—adjust C204
c. 45.7 mc.—adjust C210
d. 44.4 mc.—adjust C215
e. 43.0 mc.—adjust C218
f. 42.0 mc.—adjust C206

4. Increase the bias (by means of the potentiometer) until the scope presentation of step f, above, is reduced to 50 percent of its previous amplitude, and retouch C206 for maximum indication on the oscilloscope.

5. Connect the sweep generator and r-f marker generator to the antenna terminals through a matching jig. (If a separate oscilloscope is used, feed the sweep output of the generator to the horizontal input terminals of the oscilloscope.) Set the CHANNEL SELECTOR to Channel 4, and tune the sweep generator for output on Channel 4. Tune the r-f marker generator for the video carrier frequency of Channel 4 (67.25 mc.), and tune the i-f marker generator (connected through jig to mixer grid) to 45.75 mc. Note that two marker generators are used for this procedure. The r-f marker generator is connected to the antenna terminals, while the i-f marker generator is connected capacitively to the mixer grid test point, G500. A jig constructed from a piece of fiber tubing, with 3/16-inch inside diameter, and a brass machine screw which fits tightly into the tubing, is used to connect the generator capacitively to the test point. The screw is adjusted so that it clears the test point by approximately 1/64 inch. The output cable of the marker generator is connected to the head of the brass screw in the jig and to the chassis, near the mixer tube. Both marker generators should be adjusted for the minimum output required to make the markers barely visible. Failure to observe this precaution, or the use of excessive output from the sweep generator, will cause misleading results. After the equipment is properly connected, adjust the FINE TUNING control for zero-beat of the two markers, as observed on the oscilloscope. When zero beat is obtained, remove the i-f marker.

6. If the response curve does not fall within the limits, as shown in figure 10, the adjustment of the trimmers may be touched up slightly, while observing the response curve. Do not retouch the setting of C201, C203, or C206. To adjust the curve, first adjust C215 and C218, alternately, until maximum improvement has been obtained. C215 affects the tilt of the curve, and C218 affects the dip of the curve. After C215 and C218 have been adjusted, adjust C514 for proper slope at the 42.25-mc. side of the curve, and then adjust C204 and C210 for proper level at the video carrier frequency (45.75 mc.).

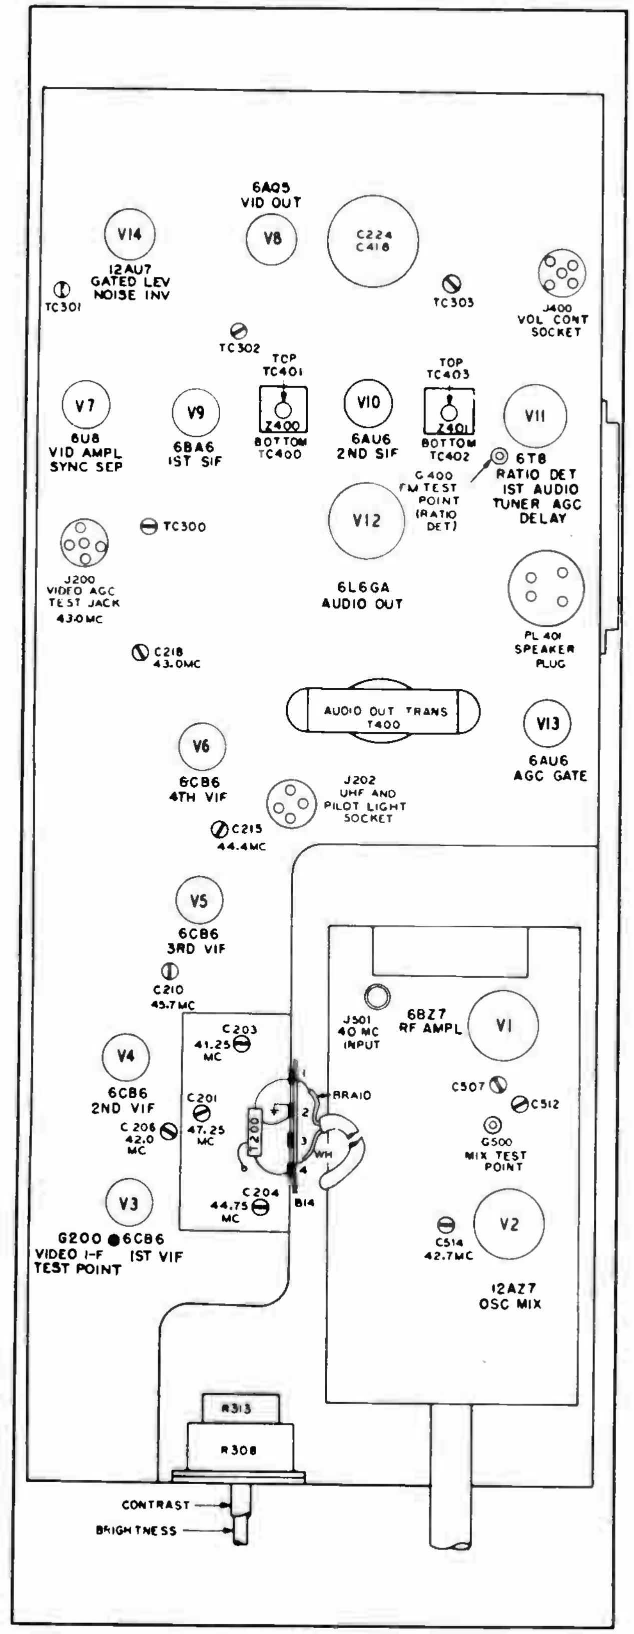

Figure 9. R-F Chassis, Top View, Showing Locations of Adjustments

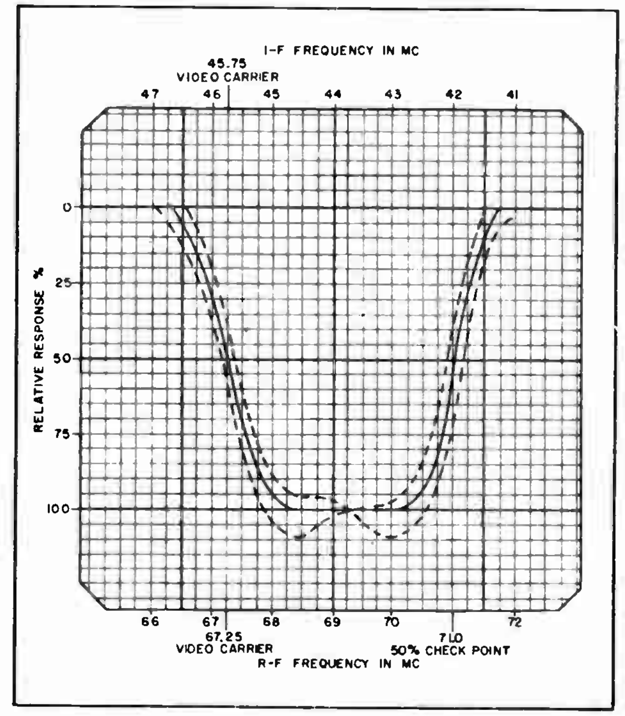

Figure 10. Over-all R-F, I-F Response Curve

CAUTION: Do not turn any of the trimmers excessively. To retouch, only turn the trimmers slightly.

SOUND I-F ALIGNMENT

The sound i-f system may be aligned by the use of a station signal or an accurately calibrated signal generator, for the signal source. If the station signal is used, tune the FINE TUNING control for the best picture, regardless of sound. It will be necessary to reduce the signal input to the receiver, so that the d-c output at the sound detector, as measured with the aid of the sound i-f output alignment jig (between point "B" and ground), is kept below 5 volts maximum, and preferably below 3 volts. To establish this level in strong-signal areas, it may be necessary to short the antenna terminals and to apply bias to the a-g-c circuit. The signal input to the receiver may be adjusted by varying the length of the shorting lead. The bias may be applied to the a-g-c circuit by means of the jig shown in figure 4. The sound i-f output alignment jig shown in figure 5 should be used for convenient connection of the meter to the sound-detector output.

When a signal generator is used, bias should be applied to the a-g-c circuit, to avoid any possibility of regeneration, using the sound i-f input alignment jig (figure 4). In addition, the first video i-f tube should be removed, to aid in the reduction of circuit noises from the i-f system.

1. Connect the generator through the 2200-ohm resistor, in the sound i-f input alignment jig, to pin 2 of J200. The generator should be adjusted for unmodulated output at 4.5 mc.

2. Insert the sound i-f output alignment jig in the volume-control socket (J400), and insert the volume-control plug (PL400) in the top of the jig. Connect the clip lead to the FM test point (G400); connect a 20,000-ohms-per-volt voltmeter between point "B" and the ground lug of the jig, with the negative lead of the meter going to point "B".

3. Adjust TC300, TC400, TC401, and TC402 for maximum output, as indicated on the meter. If the output exceeds 5 volts, reduce the signal input to the receiver.

4. Shift the positive lead of the meter to point "C" on the sound i-f output alignment jig, and adjust TC403 for zero crossover. Zero crossover is indicated by a zero indication on the meter, under the following conditions: when TC403 is turned in one direction from this zero point, the meter will swing positive; turning TC403 in the opposite direction will cause a negative swing. (To aid in reading a positive and negative swing on the meter, set the pointer, by means of its zero-adjustment screw, to a convenient calibration mark on the scale, before connecting the meter to the circuit.)

5. Replace the first video i-f tube, and then tune in a station on the receiver. Turn the FINE TUNING control to obtain a slightly fuzzy picture, and retouch TC403 for minimum AM (noise), using the speaker output as an indication.

ADJUSTMENT OF 4.5-MC. TRAP

To adjust the 4.5-mc trap in the plate circuit of the first video amplifier, proceed as follows:

1. Connect the output of the signal generator to the lead from pin 2 of the sound i-f alignment jig (see figure 3). Adjust the generator for 4.5 mc., 400-cycle modulated output. Set the output attenuator for maximum output from the generator.

2. Connect the input of an r-f probe, shown in figure 11, to the grid of the picture tube, and connect the output leads of the probe to the vertical input terminals of the oscilloscope. Adjust the vertical gain of the oscilloscope to maximum.

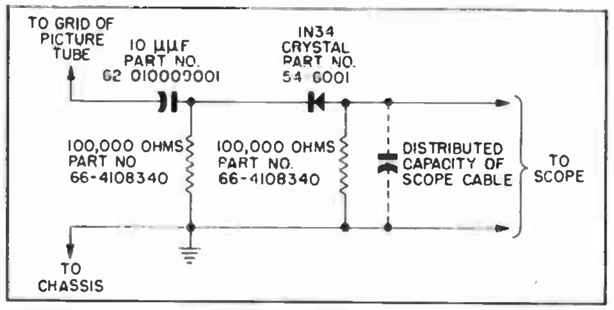
3. Adjust TC301 for minimum indication on the oscilloscope. (The normal setting for TC301 is with the screw approximately ⅝ inch out from the chassis.) An alternate method for adjustment of TC301 may be used if a 4.5-mc. generator is not available. To adjust TC301 without the generator, proceed as follows:

1. Tune in a strong station signal.

2. Turn the FINE TUNING control in a clockwise direction until a fine beat pattern appears in the picture.

3. Adjust TC301 until the beat disappears or is at a minimum. When correctly adjusted, the screw will be out from the chassis approximately ⅝ inch.

4. If more than one station is available, check the setting of TC301 on all stations.



TP2-2670-A

Figure 11. R-F Probe for Sound-Trap Adjustment

OSCILLOSCOPE WAVEFORM PATTERNS

The waveforms shown below were taken with the receiver adjusted for an approximate peak-to-peak output of 2 volts at the video detector. The voltages given with the waveforms are approximate peak-to-peak values. The frequencies shown are those of the waveforms—not the sweep rate of the oscilloscope. The waveforms were taken with an oscilloscope having good high-frequency response. With oscilloscopes having poor high-frequency response, the sharp peaks of the horizontal waveforms will be more rounded than those shown, and the peak voltages will differ from those shown.

TP2-654

Figure 35. Gate-Pulse Socket, Pin 4 of J801 700 volts, 15,750 c.p.s.

*CAUTION: High-voltage pulses are present in the horizontal-output circuit. The waveform in figure 34 was taken with the alligator clip of the oscilloscope lead clipped over the insulation of the lead connected to pin 7 of J800. (To prevent puncture of the insulation of the lead, file off the teeth of the alligator clip, and wrap friction tape around the clip.) Connection to other points in the horizontal-output circuit is dangerous, due to the high voltages present. The peak-to-peak voltage shown for figure 34 is the actual voltage present; however, the amplitude of the scope presentation depends upon the degree of coupling.

VOLTAGE MEASUREMENTS

The voltages given here and on the schematic diagrams were taken with a 20,000-ohms-per-volt voltmeter, at a line voltage of 117 volts, and with no signal input to the receiver. Since voltage readings taken in the video i-f stages vary widely with different test equipment setups, voltage measurements for these stages are omitted from the diagrams.

UHF TUNER-ADAPTER UT20B, PART NO. 43-6701

UHF Tuner-Adapter UT20B, Part No. 43-6701, provides for reception of UHF signals on television Channels 14 through 83. UHF Tuner-Adapter UT20B is designed for installation in Philco B line television receiver and is installed on BU models. These receivers use r-f chassis R-201.

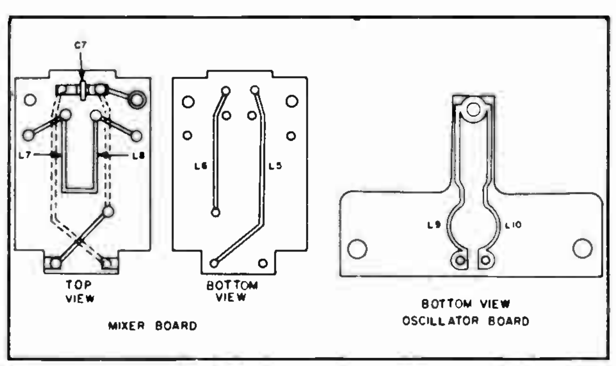
Figure 49. UHF Drive-Cord Stringing Arrangement



TP2-3175-A

Figure 51. Oscillator and Mixer Board Layouts, UHF Tuner

The Tuner-Adapter consists of a UHF Tuner, a VHF-UHF change-over switch, adapter cables and plugs, a planetary tuner driving assembly and mounting hardware.

CIRCUIT DESCRIPTION

The UHF tuner converts the UHF signals to the intermediate frequency of the r-f chassis.

The incoming UHF signal is coupled through the antenna input line, and through two i-f traps, two 680-$\mu\mu$f. condensers, and a 150-ohm transmission line to the antenna tank of the tuner. See figures 50 through 53. The antenna tank is coupled to the mixer tank by means of the mutual coupling of L2 and L3 and the stray capacitance, C5. The desired signal is selected by tuning the antenna tank and the mixer tank to the correct frequency, and the signal is then coupled to the crystal mixer circuit by means of the mutual coupling of L4 and L5. The local-oscillator signal is generated by a 6AF4 tube, V1, and the associated circuit. The oscillator circuit is coupled to the crystal mixer circuit by a 300-ohm, miniature transmission line and the mutual coupling of L7 to L5 and L8 to L6. The r-f signal and the oscillator signal are mixed in the crystal mixer circuit to produce a 45.75-mc. video carrier intermediate-frequency signal. This signal is coupled to the VHF tuner through L18, a coaxial cable, and J500 on the VHF tuner. In UHF operation, the local oscillator of the VHF tuner is inoperative, and the r-f amplifier and mixer tubes of the VHF tuner operate as i-f amplifiers.

The two tanks of the UHF tuner, the antenna tank and the mixer tank, are used to prevent the i-f and oscillator signals from feeding back to the antenna and interfering with other receivers. The two tanks pass incoming signals readily, but do not pass the i-f or oscillator signal.

CHANGE-OVER SWITCH

The change-over switch supplied with the Tuner-Adapter is used to switch from VHF to UHF, and vice versa. It is installed on the back of the VHF tuner, and is operated by an actuator mounted on the VHF tuner shaft. When the Channel Selector of the VHF tuner is turned to the UHF position, the change-over switch makes proper connections for UHF operation. In this position, the switch places a 150,000-ohm resistor in series with the VHF mixer plate, which drops the voltage on the plate of the tube. (In the UHF position, the VHF Channel Selector places extra inductances in the VHF r-f and mixer circuits, permitting them to operate as i-f amplifiers, and it also shunts the VHF oscillator grid circuit with a 10-ohm resistor, putting the oscillator out of operation.) The change-over switch also turns off the VHF pilot light, turns on the UHF dial pilot lights, and connects the antenna to the UHF tuner.

When the VHF Channel Selector is turned to any VHF position, the change-over switch places a 150,000-ohm resistor in series with the UHF local oscillator plate circuit, which drops the voltage applied to the plate, and puts the oscillator out of operation. The switch also turns on the VHF pilot light, turns off the UHF dial pilot lights, and connects the antenna to the VHF tuner.

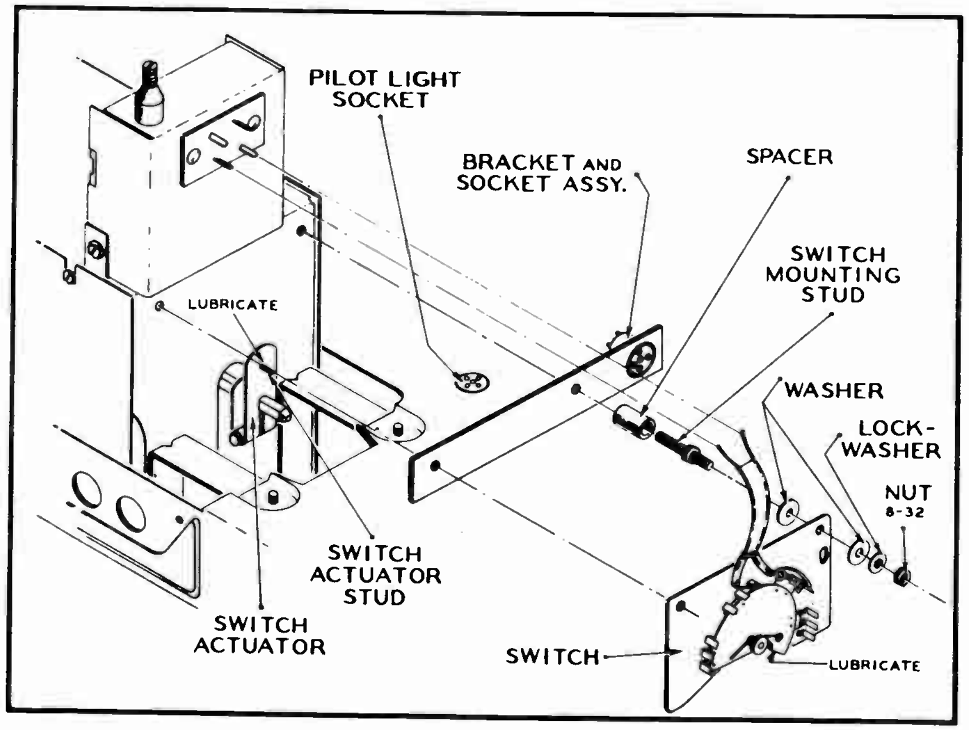
PLANETARY DRIVE

The UHF tuner is tuned by means of a 3-gang tuning condenser, which is driven through a specially designed planetary drive. See figure 48. The planetary drive is so constructed that fine tuning and coarse tuning can be accomplished with a single control knob. The tuning shaft is coupled to the driving shaft through three balls, which form a planetary drive that produces slow rotation for fine tuning. After rotating 180 degrees with the tuning shaft, a pin engages the driving shaft, and the two shafts are direct-coupled, for coarse tuning. To reengage the planetary drive for fine tuning, it is only necessary to reverse the direction of rotation. The dial pointer is connected to the tuning gang through a cord drive, and indicates the channel number to which the tuner is tuned. See figure 49.

ALIGNMENT AND REPAIRS

The frequencies at which the Tuner-Adapter operates are extremely high; therefore, it is necessary that the utmost care be taken to safeguard against upsetting the delicate adjustments of the tuner. It is recommended that the serviceman make only minor repairs to the tuner, such as replacement of the tube or crystal and the wiring of external leads. The Tuner-Adapter should be returned to the factory for alignment and major repairs, unless the serviceman is properly equipped to perform these jobs. In general, a good rule to follow is not to remove the cover of the Tuner-Adapter.

NOTE: Replacing the tube with a new one may detune the tuner. If this occurs, a number of tubes should be tried, until the most satisfactory substitute for the original is found.



TP3-480-A

Figure 54. VHF-UHF Change-Over Switch, Mounting Details

INSTALLATION INSTRUCTIONS FOR UHF TUNER-ADAPTER UT20B

To install the UHF tuner-adapter, proceed as follows:

1. Remove the cabinet back and r-f chassis from the cabinet; then remove the nameplate on the control panel by pushing it out from inside the cabinet.

2. Insert the dial scale and bezel assembly into the hole provided in the cabinet. Fasten the assembly in place with the two 10-32 nuts provided.

3. Remove the tuner assembly from the mounting board with which it was shipped. Keep the three screws for mounting the tuner in the cabinet.

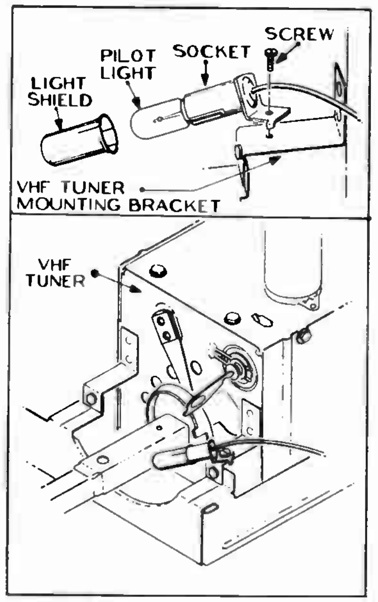
4. Place the spacers on the mounting studs and attach the bracket and socket assembly to the rear of the VHF tuner on the r-f chassis. See figure 54.

5. Place the switch-actuator assembly on the shaft extending from the rear of the VHF tuner so that the switch actuator stud points away from the tuner. See figure 54.

6. Place the switch assembly on the two mounting studs, and fasten it in place with the flat washers, lock washers, and nuts provided. See figure 54.

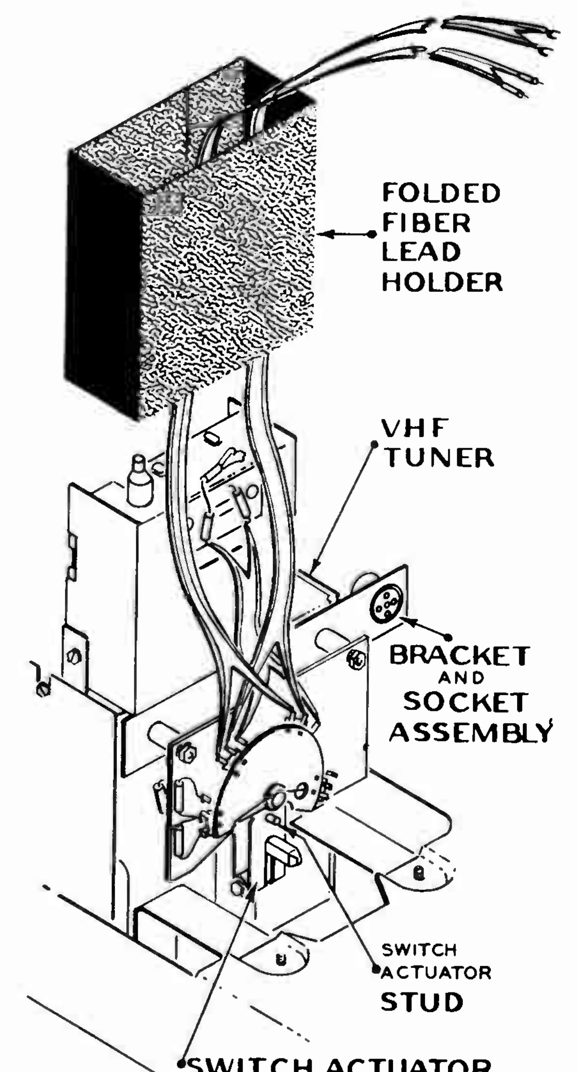
7. Put the VHF Channel Selector in the Channel 2 position. Rotate the switch actuator clockwise on the tuner shaft until the actuator touches the fiber cam on the change-over switch, and fasten the switch actuator in this position. Rotate the VHF Channel Selector to the UHF position. Check the switch operation, to make sure that the switch is thrown properly. Rotate the VHF Channel Selector to Channel 13 position, and check the switch operation, to make sure that the switch is not thrown in this position. Lubricate the switch-actuator stud and switch cam with cup grease.

8. Remove the pilot lamp from the r-f chassis pilot-light socket. Remove and discard the pilot-light socket and cable assembly from the r-f chassis. Insert the plug from the change-over switch into the socket



TP3-755-A

Figure 55. Pilot-Light Socket, Mounting Details



TP3-756-A

Figure 56. Folded Fiber Lead Holder and VHF-UHF Change-Over Switch, Mounting Details

on the r-f chassis from which the pilot-light cable was removed. Mount the new pilot-light socket from the change-over switch as shown in figure 55. Insert the pilot light in the socket, and install the shield provided over it.

9. Remove the antenna lead from the VHF tuner, and solder the short lead from the UHF-VHF change-over switch to the VHF tuner terminals from which the antenna lead was removed. Slide the folded fiber lead holder over the tapered-line coil assembly on the VHF tuner, and dress the twin-wire antenna leads through the holder. See figure 56. The fiber holder will prevent the twin-wire leads from touching the tubes on the r-f chassis.

10. Place the UHF tuner in the cabinet between the r-f and deflection chassis, and fasten the UHF tuner to the chassis shelf with the three screws removed in step 3. It is important that these screws be tightened securely, so as to hold the UHF tuner in place on the chassis shelf.

11. Fasten one end of the ground lead to the r-f chassis with the drive screw. See figure 57. Install the chassis in the cabinet, and fasten the other end of the ground lead to the UHF tuner with the 8-32 x 1/4 inch hex-head machine screw. Fasten the r-f chassis with the original mounting bolts. Place the original knobs on their shafts, and the knob provided on the UHF tuning shaft.

12. Insert the plug from the UHF tuner into the socket on the bracket installed in step 4.

13. Insert the coaxial cable into the jack on the VHF tuner. See figure 57.

14. Replace the fiber antenna-lead holder with the new holder provided. Fasten the new holder with the nails provided, and then pass the twin-wire leads through the holes as shown in figure 58. Pull the leads through the holder until they are tight, making certain that the leads do not contact the tubes or the chassis. Wrap tape around the yellow-marked twin-wire leads with the spade lug ends, to prevent the leads from passing back through the fiber holder.

15. Fasten the antenna terminal board provided as shown in figures 59 through 63. Replace the cabinet back and make the connections illustrated for the type of antenna installation being used.

16. Paste the label provided over the outside-antenna instructions on the cabinet back.

REPLACEMENT PARTS LIST

IMPORTANT

General replacement items commonly stocked by the serviceman are omitted from this parts list. All condensers are molded-bakelite Philco condensers, with a 600-volt rating, and all resistors are ½ watt, ±10%, unless otherwise indicated. Parts are listed according to chassis type, and should be ordered in this way rather than by model number. A list of miscellaneous parts is given at the end of the parts list for each chassis type. All parts are symbolized in the schematic diagram and base layout, for identification purposes.

DEFLECTION CHASSIS D-207

SECTION 1—POWER SUPPLY

Reference Symbol	Description	Service Part No.
C100 and C101	Condensers, filter, electrolytic, 120 μf., 150v.	30-2568-61
C102	Condenser, filter, electrolytic, 10 μf., 25v.	45-3035-6
C103	Condenser, filter, electrolytic, 100 μf., 300v.	30-2584-7
C107 and C108	Condensers, high-voltage rectifier, 500 μμf., 20,000 volts	30-1229-6
CR100 and CR101	Rectifier, selenium, 450 ma.	34-8003-8
F100	Fuse, line, 1.6 amperes	AD2248-19
F101	Fuse, filament	Piece of #26 wire
J100	Socket, a-c line	27-6240-3
J101	Socket, chassis connecting	27-6274-1
L100	Choke, filter	32-8600-1
PL100	Plug, a-c line	Part of a-c line cord ass'y. (See Misc. "A")
PL101	Plug and cable ass'y. chassis connecting	(See Misc. "B")
R100	Resistor, current limiting, 5 ohms, 20 watts	33-3448-18
R101	Resistor, filter, 47,000 ohms, 1 watt	66-3474340
R102	Resistor, filament dropping (piece of #24 wire)	41-4149-2
R105, R106, and R107	Resistor, high-voltage rectifier, 1.5 megohms	33-1352-2
S100	Switch, off-on	Part of VOLUME control
T100	Transformer, filament	32-8597

SECTION 7—VERTICAL SWEEP

Reference Symbol	Description	Service Part No.
C702	Condenser, filter, 10 μf., 450v.	Part of C103
C707	Condenser, screen filter, 20 μf., 200v.	Part of C103
L700 and L701	Coils, vertical deflection	Part of deflection yoke ass'y. (See Misc. "A")
R701	Potentiometer, VERT. HOLD control, 250,000 ohms.	Part of R810
R704	Potentiometer, HEIGHT control, 2.5 megohms	33-5565-32
R708	Potentiometer, VERT. LIN. control, 2.5 megohms	33-5565-32
R710	Resistor, screen divider, 22,000 ohms, 2 watts	66-3225340
R711	Resistor, screen divider, 18,000 ohms, 2 watts	66-3185340
T700	Transformer, vertical oscillator	32-8431-9
T701	Transformer, vertical output	32-8637

SECTION 8—HORIZONTAL SWEEP

C805	Condenser, by-pass, 82 μμf.	60-00825437

R-F CHASSIS R-207

SECTION 4—AUDIO

C405	Condenser, by-pass, 56 μμf.	30-1251-2
C409	Condenser, detector, balancing, 330 μμf.	62-133001001
C412	Condenser, r-f by-pass, 330 μμf.	62-133001001
C413	Condenser, filter, 2 μf.	45-3035
C416	Condenser, plate by-pass, .0033 μf., 1000v.	30-4650-89
C418	Condenser, filter, 60 μf.	Part of C224
J400	Socket, VOLUME control	27-6273*
L405	Coil, filament choke	32-4112-15
PL401	Plug, speaker	27-4785-22
R406	Resistor, voltage divider, 27,000 ohms, 1 watt	66-3124346
R412	Resistor, cathode bias, 180 ohms, 2 watts	66-1185340
R418	Potentiometer, dual	33-5563-56
R418A	Potentiometer, TONE control, 5 megohms	Part of R418
R418B	Potentiometer, VOLUME control, 2 megohms	Part of R418
R419	Resistor, B+ dropping, 400 ohms, 2.6 watts	Part of R224
T400	Transformer, audio output	32-8579
Z400	Transformer, 1st sound i-f	32-4497A
Z401	Transformer, FM detector	32-4450-6A
C220	Condenser, by-pass, 680 μμf.	62-168001001
C221	Condenser, by-pass, 680 μμf.	62-168001001
C223	Condenser, a-g-c filter, 2 μf.	45-3035
C224	Condenser, electrolytic	30-2584-24
C224A	Condenser, filter, 40 μf.	Part of C224
C224B	Condenser, filter, 10 μf.	Part of C224
C224C	Condenser, filter, 10 μf.	Part of C224
C226	Condenser, cathode by-pass, 18 μμf.	62-018400021
CD200	Crystal, video detector	34-8022

SECTION 2—VIDEO I.F.

Reference Symbol	Description	Service Part No.
C200	Condenser, 47.25-mc. trap, 5 μμf.	30-1224-28
C201	Condenser, 47.25-mc. trap, 1 to 5 μμf.	31-6520-9
C202	Condenser, 41.25-mc. trap, 5 μμf.	30-1224-28
C203	Condenser, 41.25-mc. trap, 1 to 5 μμf.	31-6520-9
C204	Condenser, trimmer, 1 to 5 μμf.	31-6520-9
C205	Condenser, d-c blocking, 100 μμf.	30-1224-116
C206	Condenser, trimmer, 1 to 5 μμf.	31-6520-9
C207	Condenser, screen by-pass, 1500 μμf.	62-215001011
C208	Condenser, cathode by-pass, 680 μμf.	62-168001001
C209	Condenser, a-g-c by-pass, 680 μμf.	62-168001001
C210	Condenser, trimmer, 1 to 5 μμf.	31-6520-9
C211	Condenser, screen by-pass, 680 μμf.	62-168001001
C212	Condenser, a-g-c by-pass, 680 μμf.	62-168001001
C215	Condenser, trimmer, 1 to 5 μμf.	31-6520-9
C218	Condenser, trimmer, 1 to 5 μμf.	31-6520-9
C219	Condenser, detector by-pass, 10 μμf.	62-010409001
I200	Lamp, pilot	34-2068
J200	Socket, video test	27-6273
J201	Socket, pilot light	27-6273
L200 and L201	Coils, tuner coupling	Part of T200
L202	Coil, 47.25-mc. trap	32-4597-2
L203	Coil, 41.25-mc. trap	32-4112-31
L204	Coil, 1st video i-f grid	32-4597-3
L205 and L206	Coils, coupling	Part of T201
L207 and L208	Coils, coupling	Part of T202
L209	Coil, filament choke	32-4112-15
L210 and L211	Coils, coupling	Part of T203
L212 and	Coils, coupling	Part of T204
L302	Coil, 4.5-mc. trap	32-4463-2
L305	Coil, shunt peaking, 60—230 μh.	32-4467-20
L306	Coil, picture-tube grid peaking, 40 μh.	32-4480-1
L307	Coil, shunt peaking, 60—230 μh.	32-4467-20
R308	Potentiometer, CONTRAST control, 2500 ohms	33-5563-51
R311	Resistor, plate load, 2500 ohms, 7 watts	33-1335-93
R313	Potentiometer, BRIGHTNESS control, 100,000 ohms.	Part of R308
R316	Resistor, grounding 470,000 ohms, 1 watt	66-4474340

Reference Symbol	Description	Service Part No.
L213		
L214	Coil, series peaking, 10 μh.	32-4422-27
L215	Coil, series peaking 3 μh.	32-4480-17
L216	Coil, shunt peaking, 180 μh.	32-4480-9
L217	Coil, filament choke	32-4112-15
R208	Resistor, voltage dropping, 5600 ohms, 1 watt	66-2564340
R224	Resistor, B+ dropping, 2000 ohms, 7 watts	33-3446-8
T200	Transformer, video i-f input	32-4599-2
T201	Transformer, 1st video i-f	32-4598-5
T202	Transformer, 2nd video i-f	32-4598-3

SECTION 6—SYNC

C604	Condenser, by-pass, 470 μμf.	30-1225-18

SECTION 5—TV TUNER, PART NO. 76-7600-3

C500	Condenser, FM trap, 20 μμf.	62-020309011
C501 and C502	Condenser, antenna isolating, 470 μμf.	30-1225-18
C503	Condenser, i-f trap, 22 μμf.	Part of L505
C504	Condenser, r-f coupling, 39 μμf.	62-039409011
C505	Condenser, neutralizing, 220 μμf.	62-122001001
C506	Condenser, a-g-c decoupling, 1000 μμf.	30-1245-1
C507	Condenser, r-f trimmer, 0.5 to 3.0 μμf.	31-6520-3
C508	Condenser, r-f by-pass, 680 μμf.	62-168001001
C509	Condenser, grid by-pass, .01 μf.	30-1238-2
C510	Condenser, coupling, .59 μμf.	311-5050-3
C511	Condenser, neutralizing, 220 μμf.	62-122001001
C512	Condenser, mixer-grid trimmer, 0.5 to 3.0 μμf.	31-6520-3
C513	Condenser, by-pass, 7.5 μμf.	30-1224-13
C514	Condenser, trimmer, 1 to 5 μμf.	31-6520-11
C515	Condenser, i-f link coupling, 680 μμf.	62-168001001
C516	Condenser, by-pass, 680 μμf.	62-168001001
C517	Condenser, filament decoupling, 220 μμf.	62-122001001
C518	Condenser, filament by-pass, 1000 μμf.	30-1245-1
C519	Condenser, filament decoupling, 220 μμf.	62-122001001
C520	Condenser, by-pass, 1000 μμf.	30-1245-1
C521	Condenser, oscillator injection	30-1221-7
522	Condenser, oscillator plate, 12 μμf.	62-012300001
523	Condenser, grid blocking, 5 μμf.	30-1224-5

Reference Symbol	Description	Service Part No.
C524	Condenser, mixer-grid blocking, 39 μμf.	62-039409011
C525	Condenser, by-pass, 150 μμf.	62-115001011
C528	Condenser, fine tuning	76-6935-1
J500	Connector, 40-mc. input	57-0590-2
L501, L502, L503, and L504	Coils, tapered-line assembly	32-4432-3
L505	Coil, r-f trap (44.75 mc.)	32-4552-1
L506 to L512 inclusive	Coils, r-f grid tuning	Part of WS500E
L513	Coil, 40-mc. channel	312-5146-16
L514	Coil, 40-mc. channel	312-5146-19
L515	Coil, r-f amplifier neutralizing	32-4548-13
L516	Coil, r-f coupling	312-5146-20
L517 to L524 inclusive	Coil, r-f plate tuning	Part of WS500C
L525 to L532 inclusive	Coil, mixer grid	Part of WS500B
L533	Coil, mixer neutralizing	32-4551-1
L534	Coil, mixer plate	312-5146-8
L535	Coil, i-f primary	312-5151-6
L537 to L543 inclusive	Coil, oscillator tuning	Part of WS500A
L544 and L545	Coils, r-f choke	32-4550-1
R518	Resistor, B+ dropping, 15,000 ohms, 1 watt	66-3154340
WS500A(F) and WS500A(R)	Switch wafer, oscillator	76-7604
WS400B(F) and WS400B(R)	Switch wafer, mixer grid	76-7606
WS500C(F) and WS500C(R)	Switch wafer, r-f plate	76-7608
WS500D(F) and WS500D(R)	Switch wafer, r-f grid	76-7612
WS500E(F) and WS500E(R)	Switch wafer, r-f grid	76-7610

UHF TUNER-ADAPTER UT20B, PART NO. 43-6701

Reference Symbol	Description	Service Part No.
C1 and C2	Condenser, antenna coupling, 680 μμf.	Part of Panel, filter
C3	Condenser, tuning:	
	Shaft and rotor ass'y.	76-7481-4
C3A	Stator, r-f, l.h.	56-9595
C3B	Stator, r-f, r.h.	56-9595-1
C3C	Stator, r-f, l.h.	56-9595
C3D	Stator, r-f, r.h.	56-9595-1
C3E	Stator ass'y., oscillator	76-7479
C3F	Stator ass'y., oscillator	76-7479
C4	Condenser, padder ass'y., r-f	76-7472
C5	Condenser	Stray capacitance
C6	Condenser, padder ass'y., r-f	76-7472
C7	Condenser, crystal, mixer tank, 30 μμf.	Part of Board ass'y., mixer
C8	Condenser, temperature compensating, .4 μμf.	30-1224-109
C9	Condenser, oscillator trimmer	31-6525
C10	Condenser, oscillator tank, 2.5 μμf.	Part of Tank ass'y., osc.
C11	Condenser, by-pass	Part of Tank ass'y., osc.
C12	Condenser, grid by-pass, 500 μμf.	30-1245-3
C13	Condenser, temperature compensating, 1.0 μμf.	30-1224-107
C14	Condenser, filament by-pass, 500 μμf.	30-1245-3
C15	Condenser, plate by-pass, 500 μμf.	30-1245-3
C16 and C17	Condenser, 45.75-mc. i-f trap	Part of Panel, filter
CD1	Crystal detector, mixer circuit	34-8026
I1 and I2	Lamp, pilot, UHF	34-2068
L1	Inductor, r-f, l.h.	Part of C3A Stator
L2	Inductor, r-f, r.h.	Part of C3B Stator
L3	Inductor, r-f, l.h.	Part of C3C Stator
L4	Inductor, r-f, r.h.	Part of C3D Stator
L5	Inductor, crystal mixer	Part of Board ass'y., mixer
L6	Inductor, crystal mixer	Part of Board ass'y., mixer
L7	Inductor, oscillator coupling	Part of Board ass'y., mixer
L8	Inductor, oscillator coupling	Part of Board ass'y., mixer
L9	Inductor, oscillator coupling	Part of Board ass'y., osc.
L10	Inductor, oscillator coupling	Part of Board ass'y., osc.
L11	Inductor, oscillator	Part of Tank ass'y., osc.
L12	Inductor, oscillator	Part of Tank ass'y., osc.
L13	Choke, r-f, heater decoupling	32-4556-3
L14	Choke, r-f, cathode decoupling	32-4556-4
L15	Choke, r-f, plate decoupling	32-4556-2
L16 and L17	Coils, 45.75-mc. i-f trap	Part of Panel, filter
L18	Coil, i-f output	32-4558
R1	Resistor, damping, 1000 ohms	66-2108340
R2	Resistor, damping, 220 ohms	66-1228340
R3	Resistor, grid leak, 6800 ohms	66-2688340
R4	Resistor, filament decoupling, 220 ohms.	Part of L13
R5	Resistor, plate decoupling, 10,000 ohms	Part of L15
R6	Resistor, balancing, 470 ohms	66-1478340
R7	Resistor, balancing, 10 ohms	66-0108340
R8 and R9	Resistor, B+ dropping, 150,000 ohms	66-4158340
R10	Resistor, pilot-light dropping, 10 ohms	66-0108340
R11	Resistor, pilot-light dropping, 3.9 ohms	66-9138340
R12	Resistor, B+ dropping, 10,000 ohms, 10 watts	33-1336-58
R13 and R14	Resistor, antenna coupling, 470,000 ohms	66-4478340
	Board ass'y., mixer	76-7475-4
	Board ass'y., oscillator	76-7480
	Panel, filter, i-f trap	76-8078
	Tank ass'y., oscillator	76-7627

THE TV-300 AND TV-301 DIFFERENCE

The TV-301 is similar to the TV-300, the difference being in the picture tube used and the shorting out of one resistor in the TV-300 to make the TV-301 chassis.

The TV-300 chassis uses a 21XP4A picture tube which is an electrostatic focus tube. When this tube is used the 27 ohm resistor in the high voltage transformer is necessary for proper electrical centering of the picture.

The TV-301 chassis uses a 21WP4A picture tube which is an electromagnetic focus picture tube. When this picture tube is used the 27 ohm resistor is shorted out and the chassis is called the 301.

This is the only difference between these two chassis.

TUBE COMPLEMENT — TV-300 CHASSIS

Reference Symbol	Tube Type	Function
	6BQ7A	R.F. amplifier
	6X8	Oscillator mixer
S1	5U4G	Low Voltage rectifier
S2	6AX4G	Horizontal damper
S3	12BH7	Vertical oscillator
S4	12AU7A	Horizontal oscillator
S5	6BQ6GT or GTA	Horizontal output
S6	6CB6	1st V.I.F.
S7	6CB6	2nd V.I.F.
S8	6CB6	3rd V.I.F.
S9	6AU6	Sound I.F.
S10	6T8	Ratio detector - 1st audio
S11	6W6GT	Audio output
S12	12AZ7	Sync sep - phase comp.
S13	12BY7	Video output
S14	1B3GT	High voltage rectifier
	21XP4	
	21XP4A	Picture tube
	21WP4A	Picture tube
	21YP4A	Picture tube

SPECIFICATIONS — TV-300 CHASSIS

VHF TUNER	Twelve channel, 13 position incremental tuner, covering VHF television channels 2 through 13; fine tuning of local oscillator.
UHF TUNING	Continuous tuning, covering UHF channels 14 through 83; fine and coarse tuning.
INTERMEDIATE FREQUENCIES	
VIDEO CARRIER	45.75 Mc.
SOUND CARRIER	4.5 Mc.
TRANSMISSION LINE	300 ohm, twin wire lead
OPERATING VOLTAGE	110 to 120 volts, 60 cycles, AC
POWER CONSUMPTION	Without UHF — 170 watts With UHF — 175 watts

CIRCUIT DESCRIPTION — TV-300

The TV-300 receiver contains a 13 position incremental type VHF tuner, covering VHF channels 2 through 13 with a UHF position. Power and filament voltage for the UHF tuner-adapter are supplied through a switch built into the rear of the VHF tuner. The output of the VHF tuner is a 40 Mc., IF signal which is inductively coupled to three stagger tuned IF stages. A 1N64 crystal serves as the diode detector for the output of the IF stages.

The output of the video detector, a negative phase, composite-video detected signal, is fed through a single video amplifier to the cathode ray tube. Since a single output amplifier is employed a positive going signal is being applied to the picture tube and therefore, is fed to the picture tube cathode.

AGC voltage is developed in the output stages of the video detector and through the bias on the grid of the sync separator. A delay voltage applied to the tuner AGC is effectively clamped by the diode portion of the 6T8 first audio amplifier stage, to prevent the RF grid being driven too far positive under weak signal conditions.

The 4.5 Mc., intercarrier IF sound is taken from the output circuit of the crystal video detector. The 4.5 Mc., sound signal is the resulting difference signal from the beat between the video carrier, 45.75 Mc., and the 41.25 Mc., sound carrier when they are mixed in the video detector. In order for the 4.5 Mc., resultant signal to contain the FM sound with only a negligible amount of video modulation, the sound carrier must be considerably lower than the video. The proper ratio of the two signals is established during alignment of the receiver.

The intercarrier sound IF signal is fed through a sound IF amplifier stage to the ratio detector. A 6AU6 tube is employed in the sound IF stage. The ratio detector employs the duo-diode section of a 6T8 tube and the detected signal is fed to the triode section of the same tube as the first audio amplifier. A 6W6GT tube serves as the audio output stage which drives the speaker. B plus voltage, approximately 260 volts, is fed to the screen grid and plate circuits of the 6W6GT, while a second B plus voltage through a resistor divider network is applied to the grid. The cathode of this tube is connected through the cathode resistor and through decoupling circuits to the plates and screen grids of all of the IF stages and to the screen grids of the video output tube and the horizontal output tube. Thus, the 6W6GT tube is effectively in series with the tubes mentioned and the necessary B plus voltage for these tubes develops due to the current flow through the 6W6GT cathode circuit. The 6W6GT tube since it is in series with the IF tubes, and screen grids of the video output and horizontal output stages, from B plus to ground, forms a large voltage divider network across the power supply, and acts as a voltage regulator for these stages. The voltage drop across the 6W6GT remains approximately 120 volts.

A portion of the composite video signal is taken from the video output circuits to the grid of the sync separator, one half of a 12AZ7 duo-triode tube. The bias of this tube is such that negative going composite sync pulses appear at the plate. The vertical integrator circuit feeds the vertical sync pulses to the vertical blocking oscillator, a 12BH7 tube.

The vertical blocking oscillator requires a positive pulse for triggering purposes and the incoming sync pulse is negative. consequently, the incoming pulse is fed into the cathode lead tap of the oscillator transformer. The action of the transformer circuit causes a large positive overshoot to occur on the sync pulse at the cathode and grid. The grid pulse being larger than that at the cathode, will cause this positive overshoot to trigger the oscillator.

The second half of the 12BH7 duo-triode is used as the vertical output amplifier and the vertical signal is fed to the deflection coils through the vertical output transformer. A retrace suppression circuit from the vertical output transformer to the grid of the picture tube effectively removes vertical retrace lines.

From the plate of the sync separator the horizontal pulses are fed to the cathode circuit of the phase comparer, one-half of a 12AZ7 tube. At the same time, a pulse is taken from a winding on the horizontal output transformer, and fed to the phase comparer plate through a shaping network. The grid of the phase comparer is grounded and the circuits of this stage are such that if the incoming signal and the signal taken from the horizontal output transformer are not in phase a difference voltage results in the plate circuit which is fed to the grid of the horizontal oscillator and controls its frequency.

The horizontal oscillator is a conventional multivibrator type employing a duo-triode 12AU7A tube. The horizontal hold control is placed in the grid circuit of the second triode section of the multivibrator and provides the means of manually adjusting the frequency of the oscillator so that its frequency is within the control range of the phase comparer.

A 6BQ6GT tube is employed as the horizontal output tube. Horizontal width is adjustable by means of a variable resistor in the screen grid circuit. The horizontal output transformer contains a 27 ohm resistor inserted in the center windings to provide electrical centering of the raster. High voltage rectification is performed by a 1B3GT tube, while a 6AX4G tube serves as a damper tube.

A transformer power supply provides B plus voltage. A 5U4G tube is employed in full wave rectification of the B plus voltage. A .7 ampere slow-blow fuse is inserted in the B minus center tap lead of the transformer and is located in the high voltage cage on top of the chassis for easy access.

The picture tube employed with the TV-300 chassis is either the electrostatic fixed focus type with the focus anode returned to ground or the electromagnetic type. The electrostatic employs ring type permanent magnets for centering of the raster.

TELEVISION ALIGNMENT

General

The alignment procedure follows the general pattern of first checking the tuner response with an FM sweep generator and oscilloscope, comparing the response curve with that given in the manual, and aligning the tuner if necessary. After it is established that the tuner is in correct alignment, the video I-F channel is aligned by tuning each coil to its assigned pole frequency, using an AM signal, and then feeding in a sweep signal at the antenna terminals and retouching the I-F adjustments to obtain the desired pass band. Finally, the sound channel is aligned, using an AM signal, by tuning the sound take-off coil and the I-F and ratio-detector transformers.

The over-all response curve (r-f, i-f) of the circuits from the antenna terminals to the video detector, after the I-F stages have been aligned, should appear essentially the same, regardless of the channel under test. If not, the tuner should be aligned.

The video-carrier intermediate frequency is 45.75 mc., and the sound intermediate (intercarrier) frequency is 4.5 mc. Alignment of these circuits requires careful workmanship and good equipment. The following precautions must be observed:

1. There must be a good bond between the receiver chassis and the test equipment. This is most easily obtained by having the top of the workbench metallic. The receiver chassis should be placed tuner-side down on the bench. If the bench has no metallic top, the test equipment and chassis can be bonded by a strip of copper about 2 inches wide. The section of the chassis nearest the tuner should rest on the strip.
2. Do not disconnect the picture tube yoke, or speaker while the receiver is turned on.
3. Allow the receiver and test equipment to warm up for 15 minutes before starting the alignment.
4. The marker (AM) signal generator should be calibrated accurately to the frequencies used and to the sound and video r-f carriers of each channel used during alignment. If model 7008 is used, the built-in crystal calibrator provides an excellent means of calibration. An alternate method for calibrating the signal generator to the sound and video r-f carrier frequencies is to zero-beat the signal generator with the received signals.

For further information regarding calibration, refer to Philco Lesson PR-1745 (J) entitled "Television Service in the Home."

HORIZONTAL OSCILLATOR ADJUSTMENT

1. Center horizontal hold control.
2. Adjust T-1 until the picture comes into sync.

JIGS AND ADAPTERS REQUIRED

Mixer Jig

Connections to the grid of the mixer tube may be made through the alignment jack provided for this purpose. To connect the generator to this point, a mixer-grid jig, Philco Part No. 45-1739, and a connecting cable, Philco Part No. 45-1635, may be used. As an alternate, a Philco alligator-clip adapter, Part No. 45-1636, with as short a ground lead as possible, may be used to connect the alignment jack. The ground lead should be connected as close as possible to the mixer tube. It is essential that the signal-generator output lead be terminated with a 68-ohm resistor (carbon), so that regeneration, caused by connection of the lead to the mixer, is held to a minimum.

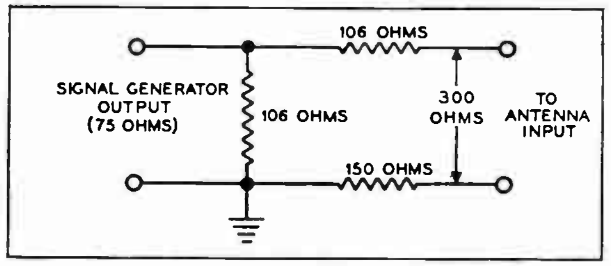

Fig. 1. Antenna-Input Matching Network.

Antenna-Input Matching Network

An impedance-matching network for coupling the signal generator to the antenna input terminals of the receiver is shown in figure 1. This network, which is designed to have an input impedance of 75 ohms and an output impedance of 300 ohms is used to match a 75-ohm generator to a 300-ohm antenna-input circuit. The resistors used in this network should be of carbon-composition construction, and should be chosen from a group, to obtain values within ten percent of those indicated. The resistors should be placed in a shield can, to prevent variable effects. An antenna-matching jig, Philco Part No. 45-1736, which consists of a matching transformer and connecting box, may be used in place of the resistor network.

TUNER OSCILLATOR ALIGNMENT
TABLE 1

AM GENERATOR: Connect to the receiver antenna-input terminals. (No matching network is required.) Use in modulated R-F output.

OSCILLOSCOPE: Connect the vertical-input lead, in series with a 1000-ohm resistor, to the mixer plate test point, TP-2. Connect the scope ground lead to the chassis, near TP-4.

RECEIVER CIRCUIT ALTERATIONS: Disconnect tuner AGC (white) lead from main chassis, and connect a 1.5-volt bias battery, with negative terminal to white lead from tuner, and positive terminal to chassis.

STEP	AM GENERATOR DIAL SETTING	RECEIVER TUNING	ADJUST	REMARKS
1	257 mc.	channel 13	TC-506 for zero beat on scope.	a. If regeneration occurs, increase bias; bias may be increased up to 4 or 5 volts, if necessary. b. Preset fine tuning control to center of its range.
2	251 mc.	channel 12	TC-507 for zero beat on scope.	
3	245 mc.	channel 11	TC-508 for zero beat on scope.	
4	239 mc.	channel 10	TC-509 for zero beat on scope.	
5	233 mc.	channel 9	TC-510 for zero beat on scope.	a. To adjust channel 8 use channel 9 tuning core, then recheck channel 9.
6	221 mc.	channel 7	TC-511 for zero beat on scope.	a. Repeat steps 1 thru 6 and readjust if necessary until channels are within 500 kc. of proper frequency.
7	129 mc.	channel 6	TC-512 for zero beat on scope.	
8	113 mc.	channel 4	TC-513 for zero beat on scope.	
9	101 mc.	channel 2	TC-514 for zero beat on scope.	

VIDEO I-F ALIGNMENT
TABLE 2

A.M. GENERATOR: Connect to mixer test point, TP-2, through a mixer jig, and adjust the generator for approximately 30% modulation at 400 cycles. Adjust the output of the generator during alignment to keep the output at the CRT cathode below 40 volts peak to peak.

SWEEP (FM) GENERATOR: After step 5 connect to antenna-input circuit through antenna-input matching network (see figure ?)

OSCILLOSCOPE: Connect vertical-input lead to pin No. 11 at the cathode ray tube.

PRESET: Contrast control full on. Channel selector to channel position No. 1.

BIAS: Apply 5.0 volts of negative bias into TP-1 (AGC system).

NOTE: I-F shield must be in place.

STEP	AM GENERATOR DIAL SETTING	SWEEP (FM) GENERATOR		ADJUST	REMARKS
		SWEEP DIAL SETTING	MARKER DIAL SETTING		
1	45.5 mc.			TT for maximum indication on scope.	The scope level must not be permitted to exceed 40 volts peak to peak or overloading will occur.
2	43.1 mc.			VC-1 for maximum indication on scope.	
3	42.7 mc.			T-2-IF for maximum indication on scope.	
4	45.0 mc.			T6-IF for maximum indication on scope.	
5	44.4 mc.			T3-IF for maximum indication on scope.	
6		Channel 4 (69 mc. with 6 mc. sweep width).	Run marker along curve checking against curve limits given in figure 6.	If necessary retouch TT, VC1, T2-IF, T6-IF, T3-IF.	Adjust carrier level with TT and T6 level curve with T-3. Position 42.5 mc. slope with VC-1 and T-2. CAUTION: Retouch only slightly.

TUNER BANDPASS ALIGNMENT — *See Table 3 on Page Five*

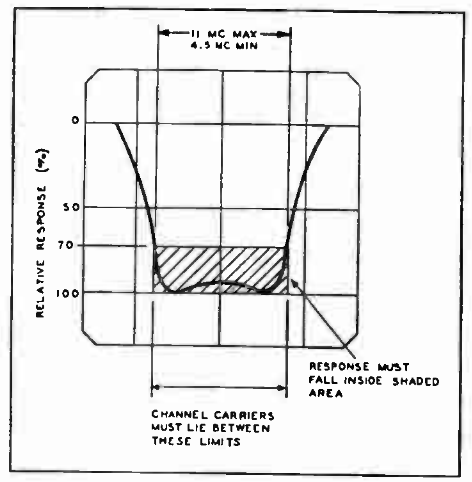

Fig. 2. Television tuner response curve, showing bandpass limits.

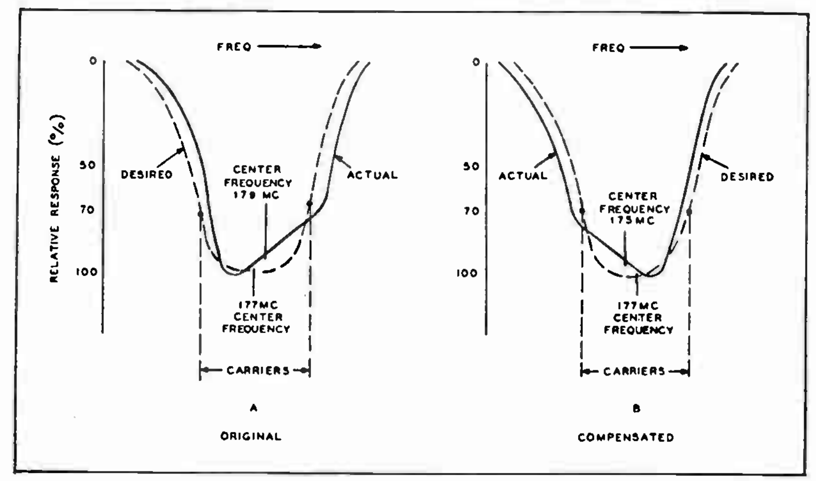

Fig. 3. Television tuner response curve, showing tracking compensation.

TUNER BANDPASS ALIGNMENT
TABLE 3

SWEEP (FM) GENERATOR: Connect to receiver antenna-input circuit through antenna-input matching network (see figure 1).

OSCILLOSCOPE: Same as in Chart 1.

RECEIVER CIRCUIT ALTERATIONS: Bias same as Chart 1. Disconnect the tuner coupling link leads and connect a 40- to 70-ohm carbon resistor across the open end of the lead from the tuner.

STEP	SWEEP (FM) GENERATOR: SWEEP DIAL SETTING	SWEEP (FM) GENERATOR: MARKER DIAL SETTING	RECEIVER TUNING	ADJUST	REMARKS
1	Channel 13 (213 mc., with 10-mc. sweep width.)	Set first to 210 mc. and not position of marker on response curve. Then set to 216 mc. and note position of marker on response curve.	Channel 13		Use oscilloscope gain as high as possible with respect to hum level and "bounce". Pips fix channel limits on curve. Response curve should be flat between limits (see figure 2). If not, proceed with step 2.
2	Channel 13	213 mc.	Channel 13	T-8 — WS2 counter-clockwise until single peak appears.	CAUTION: Care must be taken not to un screw core far enough to make it drop out of the coil.
3	Channel 13	213 mc.	Channel 13	T-15—WS3 until peak falls on 213-mc. marker.	It may be necessary to increase sweep-generator output.
4	Channel 7 (177 mc., with 10-mc. sweep width.)	Set first to 174 mc. and note position of marker on response curve. Set to 180 mc. and note position of marker on response curve.	Channel 7		Note curve with respect to tilt and center frequency. Curve should be centered in pass band and symmetrical. If not, proceed with step 5.
5	Channel 7	174 mc. & 180 mc.	Channel 7	VC-3 and VC-2 to obtain correct tilt on top of curve.	VC3 and VC2 compensate for the tuning effect of Channel 13 adjustment upon Channel 7. (See figure 3.)
6	Channel 13	213 mc.	Channel 13	Retouch T-15 of WS3 and T-8 — WS2 for symmetrical response, centered about 213-mc. marker.	To retouch, only turn cores slightly.
7	Channel 7	117 mc.	Channel 7	Repeat step 5.	Check response curve for correct center frequency and symmetry.
8				Repeat steps 6 and 7.	Repeat Channel 13 and Channel 7 adjustments, alternately, until favorable curves are obtained on both.
9	Channel 6 (85 mc., with 10-mc. sweep width.)	Set first to 82 mc. and note position of marker on response curve. Then set to 88 mc. and note position of marker on response curve.	Channel 6		Curve should be symmetrical and centered in pass band. If not, proceed with step 10.
10	Channel 6	85 mc.	Channel 6	T-14 of WS2 counter-clockwise until single peak appears.	CAUTION: Care must be taken not to unscrew core far enough to make it drop out of the coil.
11	Channel 6	85 mc.	Channel 6	T-21—WS3 until peak falls on 85-mc. marker.	It may be necessary to increase sweep-generator output.
12	Channel 6	85 mc.	Channel 6	T-27 — WS5 for maximum curve height and symmetry of single peak.	After adjusting TC501, recheck as in step 9. If necessary, reduce sweep-generator output to avoid overloading.
13	Channel 6	85 mc.	Channel 6	Retouch T-21 — WS3 and T-14 — WS2 for symmetrical response, centered about 85-mc. marker.	To retouch, only turn cores slightly.

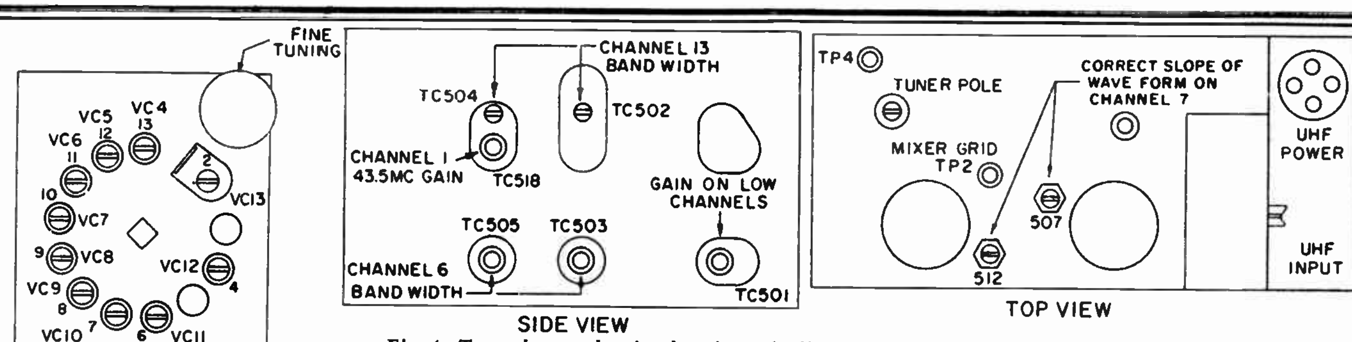

Fig. 4. Tuner layout showing locations of adjustments.

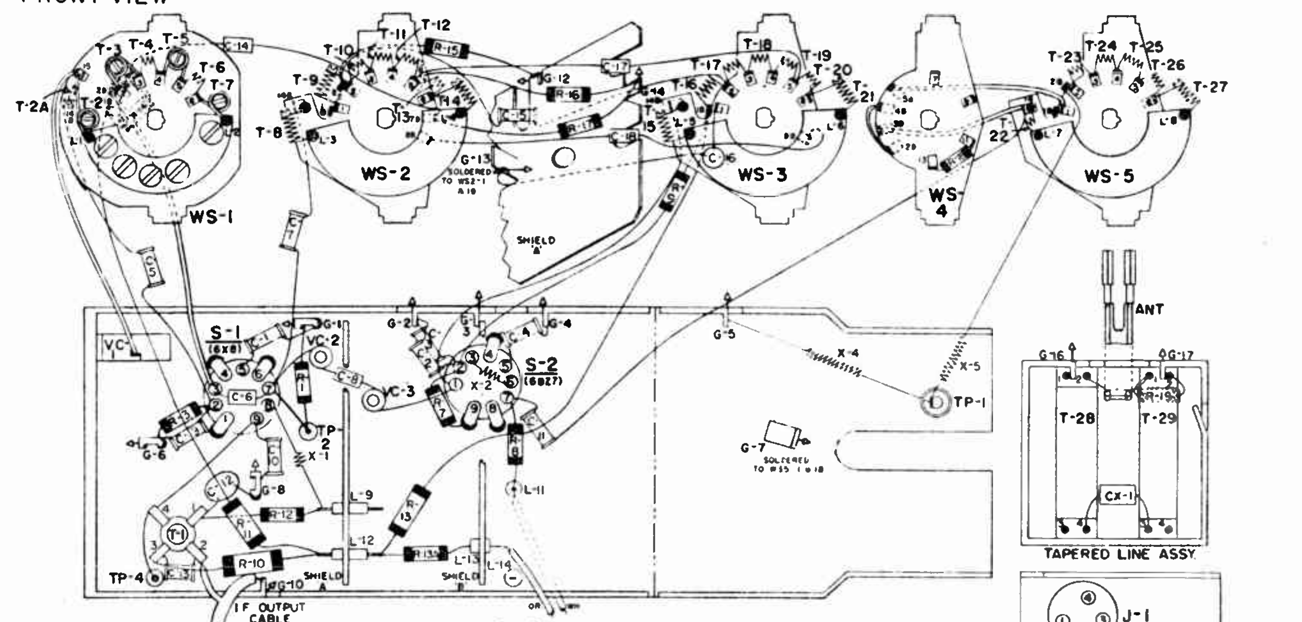

Fig. 5. Tuner Wiring Diagram.

SOUND ALIGNMENT
TABLE 4

A.M. GENERATOR: Connect the "hot" lead through a 2200 ohm resistor to the junction of C-24, X3 and the xtal det. Adjust generator for 400v. modulation at approximately 30% modulation.

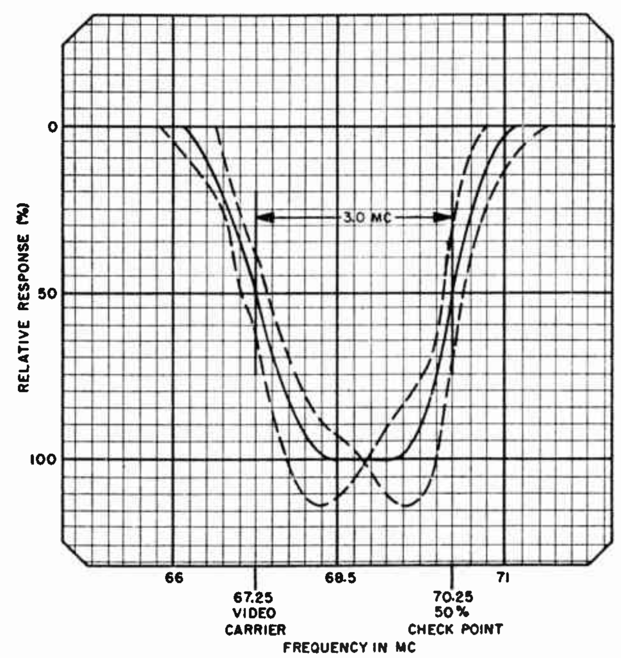

Fig. 6. Over-all R-F, I-F response curve, showing tolerance limits.

VOLTMETER: Use V.T.V.M. on 20,000-ohms-per-volt voltmeter. Connect through a crystal probe to pin No. 11 of the picture tube in step 1 and to pin No. 3 of the 6W6 audio output tube in the remainder of the steps.

STEP	AM GENERATOR DIAL SETTING	ADJUST	REMARKS
1	4.5 mc. modulated	T7-IF for minimum indication.	Voltmeter through xtal probe. Plate of video amplifier.
2	4.5 mc. modulated	T5 top for maximum indication.	a. Volume control full on. b. Voltmeter thru xtal probe to 6W6 pin No. 3. c. Keep generator level low to prevent overload.
3	4.5 mc. modulated	T5 bottom for maximum indication.	
4	4.5 mc. modulated	T4-IF for maximum indication.	

OSCILLOSCOPE WAVEFORM PATTERN — TV-300

These waveforms were taken with the receiver adjusted for an approximate peak-to-peak output of 6 volts at the video detector. The voltages given with the waveforms are approximate peak-to-peak values. The frequencies shown are those of the waveforms — not the sweep rate of the oscilloscope. The waveforms were taken with an oscilloscope having good high-frequency response. With oscilloscopes having poor high-frequency response, the sharp peaks of the horizontal waveforms will be more rounded than those shown, and the peak-to-peak voltages will differ from those shown.

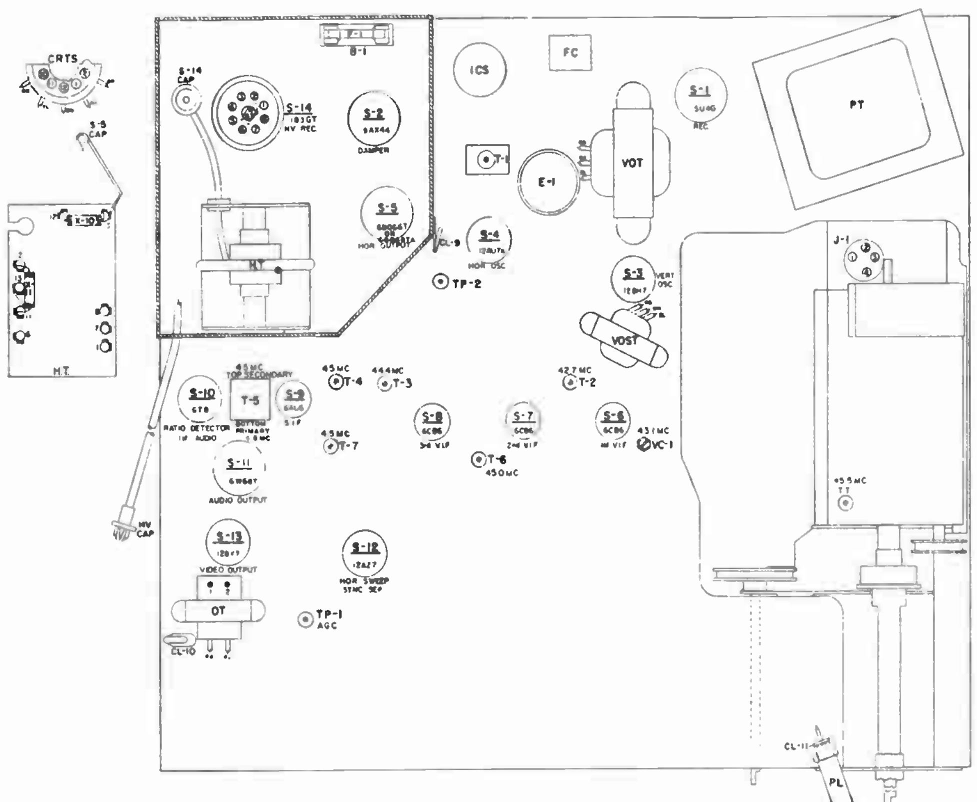

Fig. 7. Base Layout — Top View — TV-300 Chassis.

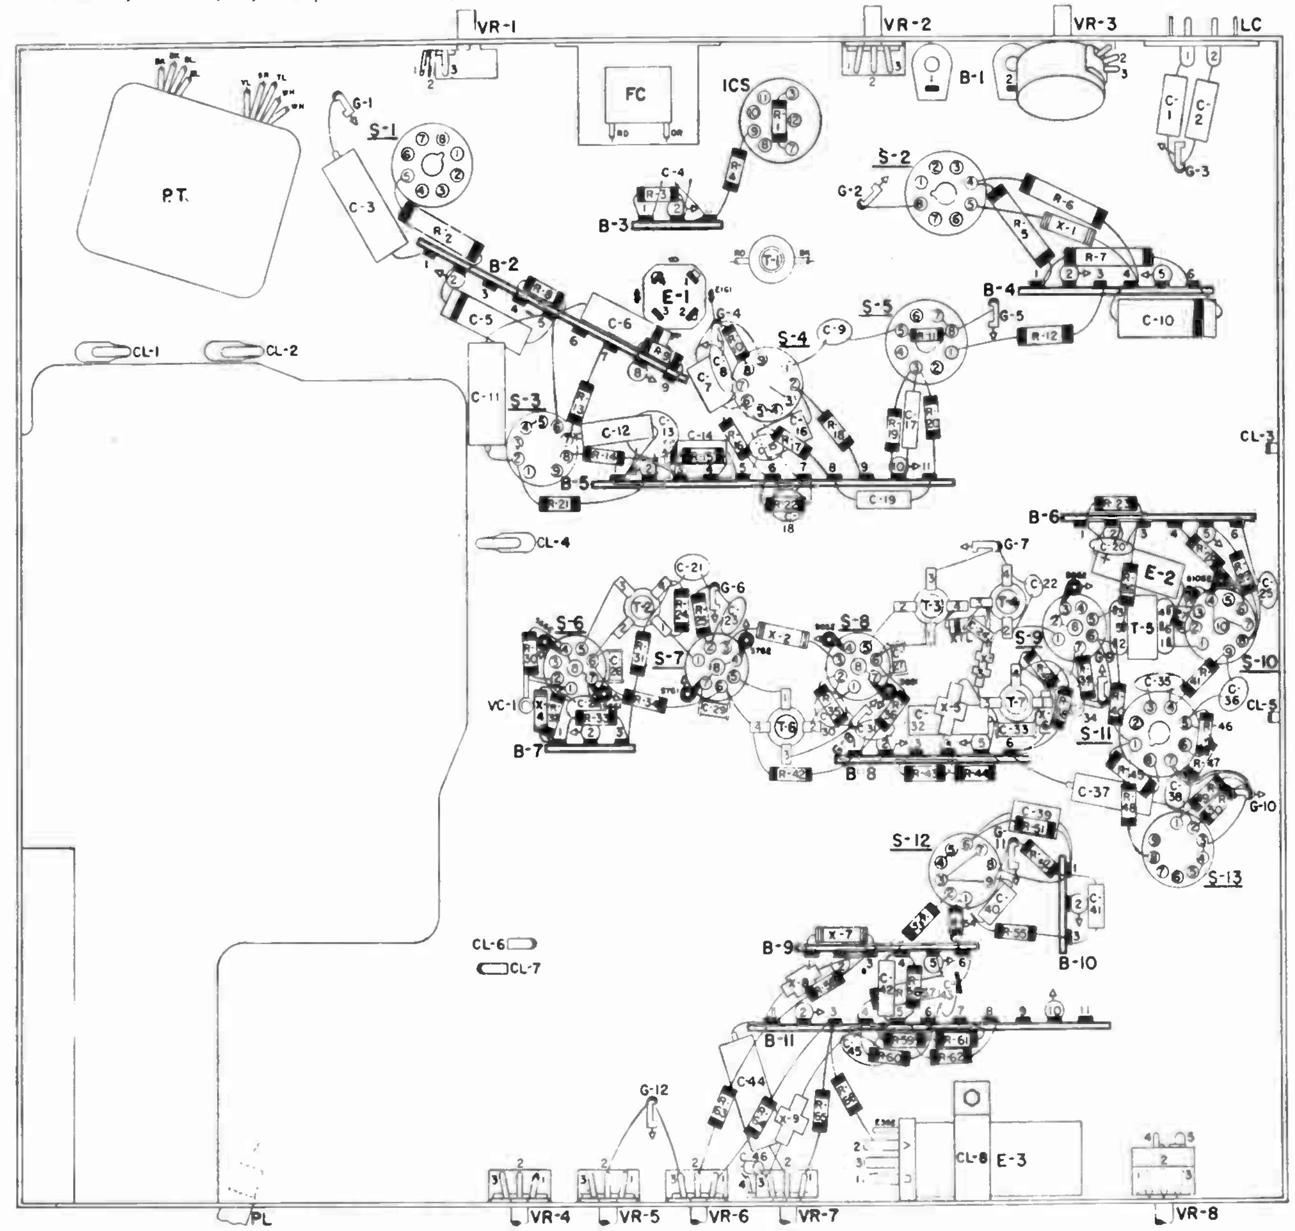

Fig. 22. Wiring Diagram, Bottom View — TV-300.

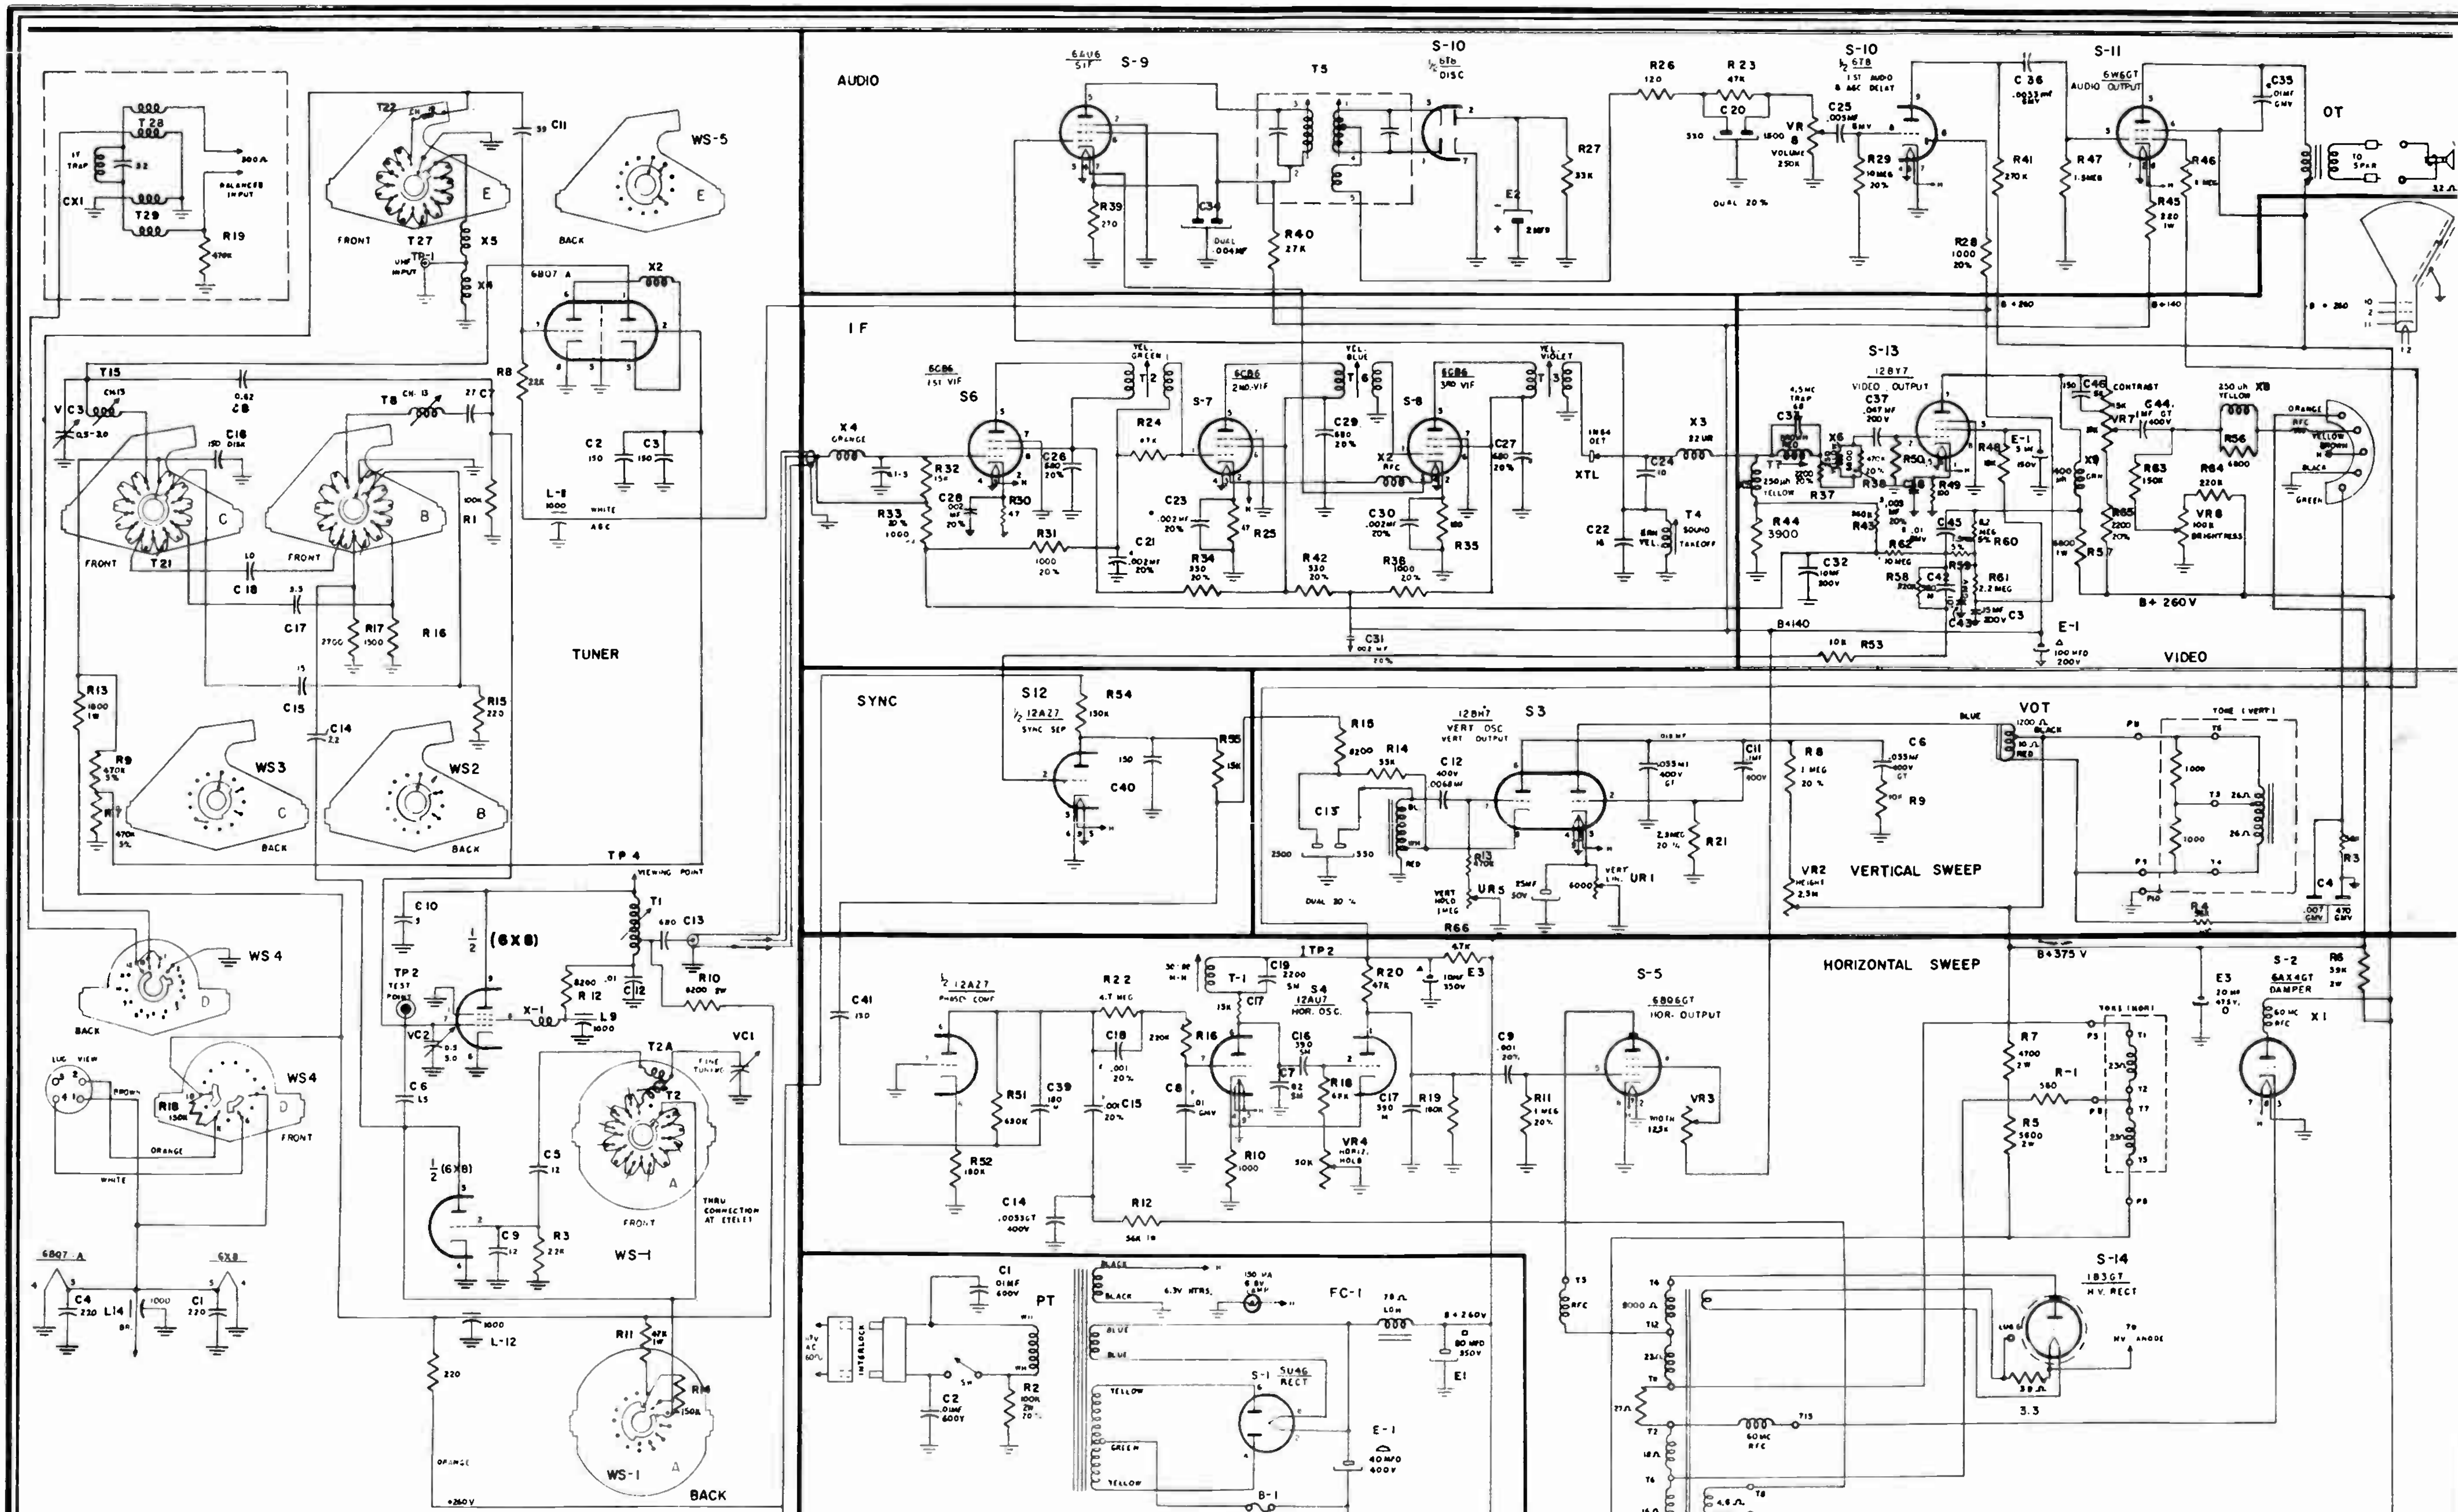

Voltage readings taken with a Philco Model No. 7001: VTVM. All capacity values in micro-microfarads unless otherwise noted. Direction of arrow through control arms indicates clockwise rotation. * All capacitors so marked are of ceramic disc type. Capacitors marked GMV have tolerance of —0% +100%. Letters on tuner switch wafers read from front to back of tuner. All resistors are ½ watt 10% unless otherwise noted. Resistance values noted for coil and transformer windings are D.C. readings. Mica and ceramic capacitors are ±10% unless otherwise noted. For sets with UHF see PR-2811, File C8 for UHF schematic.

SPECIFICATIONS — TV-350 CHASSIS

VHF TUNING .... Twelve channel, 13-position incremental tuner, covering VHF Television channels 2 through 13; plus UHF position, and fine tuning of local oscillator.

UHF TUNING (if provided) .... Continuous tuning, covering UHF Television Channels 14 through 83.

INTERMEDIATE FREQUENCIES
Video Carrier .... 45.75 mc.
Sound (intercarrier) .... 4.5 mc.

TRANSMISSION LINE .... 300-ohm, twin-wire lead

OPERATING VOLTAGE .... 110 to 120 volts, 60 cycles, a.c.

POWER CONSUMPTION .... without UHF, 185 w. with UHF, 190 w.

SPECIFICATIONS — TV-354

VHF TUNING .... Twelve channel, 13-position incremental tuner, covering VHF Television channels 2 through 13; plus UHF position, and fine tuning of local oscillator.

UHF TUNING (if provided) .... Continuous tuning, covering UHF television channels 14 through 83.

INTERMEDIATE FREQUENCIES
Video Carrier .... 45.75 mc.
Sound (intercarrier) .... 4.5 mc.

TRANSMISSION LINE .... 300-ohm, twin-wire lead

OPERATING VOLTAGE ..... 110 to 120 volts, 60 cycles, a.c.

POWER CONSUMPTION without UHF, 240 w. with UHF, 245 w.

CIRCUIT DESCRIPTION OF TV-354

The TV-354 is the same as the TV-350 with the following exceptions. The vertical output tube has been changed from a 6S4 to a 6CM6. The horizontal output tube from a 6BQ6 to a 6CD6. The damper tube in the TV-350 is a 6AX4, while the damper tube in the TV-354 is a 6AU4GT. The power supply in the TV-354 contains two 5U4G rectifiers. These changes have been made in the TV-354 to accommodate the larger picture tube.

CIRCUIT DESCRIPTION — TV-350 CHASSIS

The RF amplifier, oscillator and mixer are contained in a separate tuner sub chassis. The RF amplifier uses a twin triode type 6BZ7 tube. The oscillator is ½ 6X8 and uses the triode side of the tube. The other side of the 6X8, the pentode side, is used for mixing.

The VHF tuner when placed in UHF position is tuned automatically to i-f frequency in the RF amplifier stage as well as the mixer stage. Thus, when this set is used in UHF position it has five I-F stages. The VHF oscillator is made inoperative in the UHF position.

The output of the mixer stage is inductively coupled to the i-f amplifier system. The I-F system consists of three stages, and is stagger tuned, and 40 megacycles, using two 6DE6 tubes and one 6CB6 tube. A type IN64 crystal diode is used for the video detector. The output of the video detector is amplified by a single stage video amplifier using a type 12BY7 tube. The picture tube is cathode driven due to the single video amplifier stage. The grid of the picture tube is returned to ground through a 470 K resistor R 32. A blanking pulse, taken from the vertical output stage is applied to the grid of the picture tube for suppression of the vertical retrace.

Sound I-F (intercarrier) is obtained by utilizing the beat frequency produced when the 45.75 mc. video carrier and the 41.25 mc sound carrier are mixed in the video detector. The 4.5 mc difference signal contains the FM sound. This 4.5 mc signal contains only a negligible amount of video amplitude modulation, provided that the amplitude of the 41.75 mc. signal is considerably lower than that of the 45.75 mc. signal. The proper ratio of the two signals is established during the alignment of the receiver. Sound is present only when the video and sound carriers are transmitted.

The oscillator is tuned primarily to receive the best picture, since the 4.5 mc difference signal is established at the transmitter. The 4.5 mc sound I-F signal is taken from the plate of the video tube and is further amplified in a 4.5 mc tuned amplifier, type 6AU6. The signal is then applied to a ratio detector using a tube type 6AL5. The output of this ratio detector is applied to the triode section of a 6AT6. The output of the 6AT6 drives a 6V6GT which is the power output tube.

A portion of the video signal appearing at the output of the video amplifier is applied to grid 3 (pin 7) of the 6CS6 sync separator. Since grid leak bias is used on grid 3, the tips of the sync pulses are clamped to zero, and the video components swing in a negative direction from zero. Because of the cut-off characteristics of grid 3, the video components are eliminated, and only negative-going sync pulses appear in the plate circuit of the sync separator. At the same time, however, a signal is taken from the video detector and applied to grid 1 (pin 1) of the 6CS6 tube. This grid leak is returned to B plus, and the bias is maintained close to zero, because of a small grid-current flow. Since the signal applied to grid 1 is composite video with negative-going sync, any noise modulation present in the signal appears in the form of sharp spikes, driving in a negative direction. The circuit constants are chosen to allow grid 1 to cut off plate current whenever the signal goes more negative than the sync pulses. The series grid resistance and low grid impedance when the tube is drawing current greatly reduces the amount of video appearing at the grid and therefore the plate of the sync separator. A-G-C voltage is also developed in the sync separator circuit in the following manner: on tips of the sync pulses, grid 3 (pin 7) of the 6CS6 tube draws current which flows downward through the network R64, R62, R76 and R79, causing capacitors C50, C51, and C52, to assume negative charges proportional to the amount of peak signal applied to grid 3. The tuner a-g-c voltage is delayed by means of a resistor divider network which applies a small positive voltage to the tuner a-g-c circuit. This positive voltage prevents a-g-c action from lowering the tuner gain on weak signals. To prevent the delay voltage from driving the tuner a-g-c voltage positive on weak signals, a diode clamp (part of 6AT6) is connected across C52.

The I-F strip also has an A-G-C delay network which allows the i-f strip to operate more efficiently under conditions of weak signals. To prevent the delay voltage from driving the I-F grids positive a diode clamp (part of 6AT6) is connected across C61.

This receiver is equipped with a three position range switch. These positions are referred to as strong signal, normal signal and fringe signal. Under conditions of strong signal, G1 of the 6CS6 sync separator tube is grounded. When this grid is grounded G3 to K looks like a good diode with the result that a maximum A-G-C is developed by grid leak action at G3.

In the normal signal position a slight bias is applied to G1 of this tube and noise will not disturb the bias developed. G3 to K then looks like a rectifier of less efficiency. Under conditions of fringe signal, G1 of the 6CS6 is operating on grid leak bias and the efficiency of rectification is very poor with the result that very little, if any, grid leak bias is developed at G3.

The range switch also changes the tuner and I-F delay.

Proper triggering of the vertical oscillator requires negative synchronizing pulses. The vertical sync signal is separated from the horizontal sync signal by the integrator circuit, and is fed to the grid of the vertical oscillator, a cathode-coupled multivibrator. The output of the vertical oscillator is amplified by a type 6S4 tube which is employed as the vertical output amplifier. The output of the amplifier is applied to the vertical-deflection coils through the vertical-output transformer.

The horizontal sweep circuits require both posiitve and negative sync pulses. The phase-comparer circuit uses a 6AL5 tube. Positive sync pulses are applied to the plate of S4, and negative sync pulses are applied to the cathode of S4. A saw-tooth voltage is fed to the plate of S4 and to the cathode of S4, for comparison of the sync and horizontal sweep voltages. When the saw-tooth and sync signals are exactly in phase, no voltage is developed across R16, but when the two signals are out of phase, either a positive or a negative voltage is developed, depending upon whether the horizontal-oscillator frequency is lower or higher than the sync-pulse frequency. The grid circuit of the horizontal oscillator, a 12AU7 (S-2) cathode-coupled multivibrator, is connected to R17 through a filter network; when the voltage at this point goes in a positive direction, the frequency of the horizontal oscillator is increased, and when the voltage swings negative, the frequency of the oscillator is decreased. In this manner the frequency of the horizontal oscillator is controlled over the lock-in range of the circuit. The horizontal oscillator hold control adjusts the horizontal-oscillator frequency so that it is within the control range of the phase comparer. The output of the horizontal oscillator is fed to the horizontal output amplifier, which makes use of a 6CU6 tube. The screen voltage for the horizontal amplifier is supplied from a voltage-divider network. The horizontal amplifier feeds the deflection coils through the horizontal output transformer. A 6AX4GT tube is used as the horizontal damper.

The second-anode voltage for the picture tube is supplied by a 1B3GT high-voltage rectifier. The B plus voltage is supplied by a power transformer and a full wave rectifier, type 5AW4. All of the filament voltage is supplied from a filament winding on the transformer with the exception of the high voltage rectifier which is supplied by a winding on the horizontal output transformer.

Bias voltage is supplied by isolating the center tap of the secondary of the power transformer away from ground by means of a 1.2 henry choke.

HORIZONTAL-OSCILLATOR ADJUSTMENT

To adjust the horizontal-oscillator circuit, tune in a station and proceed as follows:

1. Reduce the width of the picture until approximately 1 inch of blank screen appears at the right-hand and left-hand sides of the picture.
2. Increase the BRIGHTNESS control setting until the blanking becomes visible. This will appear as a dark vertical bar on each side of the picture.
3. Connect a .1 mf condenser from the test point to ground. (The plate side of the horizontal ringing coil, T1, is connected to the test point.)
4. Set the HORIZONTAL HOLD control to the approximate center of its mechanical rotation.
5. Adjust the HORIZONTAL HOLD CENTERING control until equal portions of the blanking bar appear on both sides of the picture.
6. Remove the .1 mf condenser from the test point.
7. Adjust the horizontal ringing coil, T1, until equal portions of the blanking bar again appear on both sides of the picture.
8. Rotate the HORIZONTAL HOLD control through its range. The picture should fall out of sync on both sides of the center of its rotation. If the picture does not fall out of sync on both sides, readjust the HORIZONTAL HOLD CENTERING control.
9. Rotate the HORIZONTAL HOLD control through its range, and observe the number of diagonal blanking bars that appear just before the picture pulls into sync. The pull-in should occur with from 1 to 2 diagonal bars when the sync position is approached from either direction. If proper pull-in is not obtained, repeat the above procedure.

VIDEO PEAKING-COIL ADJUSTMENT

The peaking coil, T6, is adjusted at the factory for proper transient response of the video circuits. Ordinarily, this coil will require no further adjustment by the serviceman. On any station where excessive overshoot or excessive smear is present, a slight adjustment of T6 may improve the picture quality on that station; however, this adjustment may sacrifice the quality on other channels. If T6 is replaced in servicing, adjustment will be required.

Before adjusting T6, check the tuner alignment and I-F alignment. (Never adjust T6 until the alignment of a receiver is correct.) Then tune in a station and adjust T6 until there are no trailing whites or smear in the picture. Turning T6 clockwise reduces trailing whites and overshoot; turning T6 counter-clockwise reduces picture smear and increases trailing whites. The proper position is the point where no smear or trailing whites appear in the picture.

The above procedure for adjustment of T6 applies to a particular station exhibiting smear or overshoot. After T6 is adjusted, reception on all the other stations should be checked, to make certain that the adjustment has not impaired the picture quality.

TELEVISION ALIGNMENT

General

The alignment procedure follows the general pattern of first checking the tuner response with an FM sweep generator and oscilloscope, comparing the response curve with that given in the manual, and aligning the tuner if necessary. After it is established that the tuner is in correct alignment, the video I-F channel is aligned by tuning each coil to its assigned pole frequency, using an AM signal, and then feeding in a sweep signal at the antenna terminals and retouching the I-F adjustments to obtain the desired pass band. Finally, the sound channel is aligned, using an AM signal, by tuning the sound take-off coil and the I-F and ratio-detector transformers.

The over-all response curve (r-f, i-f) of the circuits from the antenna terminals to the video detector, after the I-F stages have been aligned, should appear essentially the same, regardless of the channel under test. If not, the tuner should be aligned.

The video-carrier intermediate frequency is 45.75 mc., and the sound intermediate (intercarrier) frequency is 4.5 mc. Alignment of these circuits requires careful workmanship and good equipment. The following precautions must be observed:

1. There must be a good bond between the receiver chassis and the test equipment. This is most easily obtained by having the top of the workbench metallic. The receiver chassis should be placed tuner-side down on the bench. If the bench has no metallic top, the test equipment and chassis can be bonded by a strip of copper about 2 inches wide. The section of the chassis nearest the tuner should rest on the strip.

2. Do not disconnect the picture tube yoke, or speaker while the receiver is turned on.

3. Allow the receiver and test equipment to warm up for 15 minutes before starting the alignment.

4. The marker (AM) signal generator should be calibrated accurately to the frequencies used and to the sound and video r-f carriers of each channel used during alignment. If Philco Alignment Generator Model 7008 is used, the built-in crystal calibrator provides an excellent means of calibration. An alternate method for calibrating the signal generator to the sound and video i-f carrier frequencies is to zero-beat the signal generator with the received signals.

For further information regarding calibration, refer to Philco Lesson PR-1745 (J) entitled "Television Service in the Home."

JIGS AND ADAPTERS REQUIRED

Mixer Jig

Connections to the grid of the mixer tube may be made through the test point provided for this purpose. To connect the generator to this point, a mixer-grid jig, Philco Part No. 45-1739, and a connecting cable, Philco Part No. 45-1635, may be used. As an alternate, a Philco alligator-clip adaptor, Part No. 45-1636, with as short a ground lead as possible, may be ued to connect the alignment jack. The ground lead should be connected as close as possible to the mixer tube. It is essential that the signal-generator output lead be terminated with a 68-ohm resistor (carbon), so that regeneration, caused by connection of the lead to the mixer, is held to a minimum.

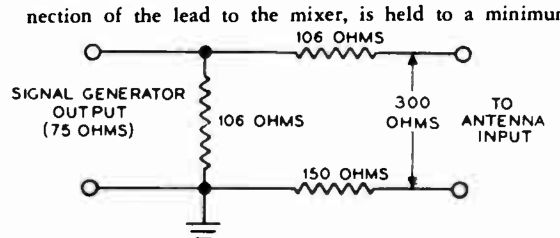

Fig. 1. Antenna-Input matching network.

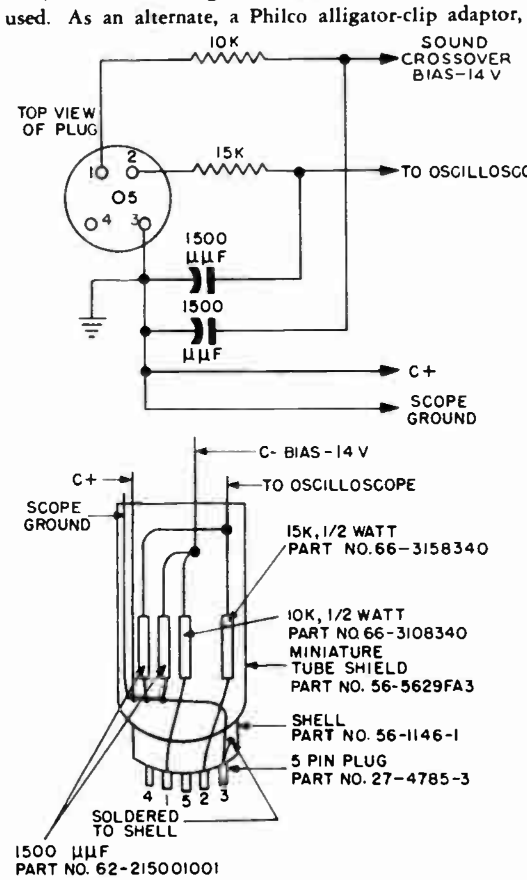

Fig. 2. Video I-F Alignment Jig (Video Test Jack Adapter No. 1).

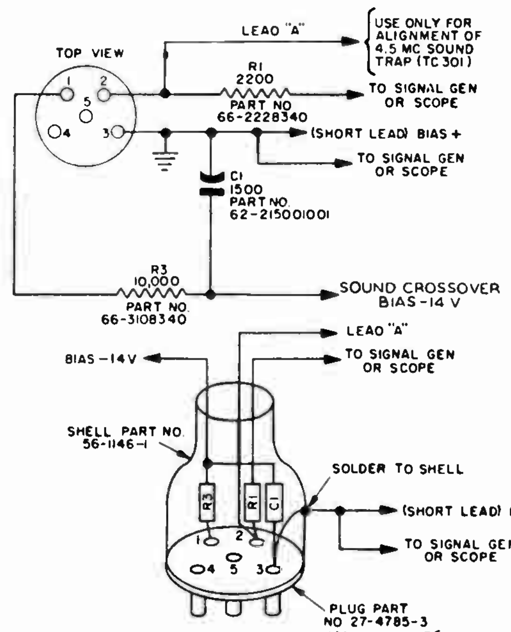

Fig. 3. Sound I-F Input Alignment Jig (Video Test Jack Adapter No. 2).

Sound I-F Input Alignment Jig

(Video Test Jack Adapter No. 2)

To observe the composite video, at TS1, a jig may be made with a five-pin plug and a 2200 ohm resistor. (See figure 3.) The 2200 ohm resistor should be connected to pin 2 of the plug. A ground lead should be connected to pin 3. To observe the composite video, connect the oscilloscope to the 2200 ohm resistor and the ground lead. This jig is also used for injection of the 4.5 mc. signal during s-i-f alignment.

Antenna-Input Matching Network

An impedance-matching network for coupling the signal generator to the antenna input terminals of the receiver is shown in figure 1. This network, which is designed to have an input impedance of 75 ohms and an output impedance of 300 ohms is used to match a 75-ohm generator to a 300-ohm antenna-input circuit. The resistors used in this network should be of carbon-composition construction, and should be chosen from a group, to obtain values within ten percent of those indicated. The resistors should be placed in a shield can, to prevent variable effects. An antenna-matching jig, Philco Part No. 45-1736, which consists of a matching transformer and connecting box, may be used in place of the resistor network.

Video I-F Alignment Jig

(Video Test Jack Adapter No. 1)

The alignment jig used at TS1 and shown in figure 2, should be used during the i-f alignment, to apply the proper bias to the a-g-c bus, and to provide a convenient oscilloscope connection. This adapter consists of a five-pin plug, two 10,000 ohm resistors, and a 1500 mmf condenser for isolation of the bias supply. To isolate the oscilloscope from the receiver circuits, a 15,000-ohm resistor, by-passed by a 1500 mmf. condenser, is used. A suggested method of fabricating the jig is also shown in figure 2. This jig should not be used to observe the composite video from the video detector output.

TUNER BAND PASS ALIGNMENT

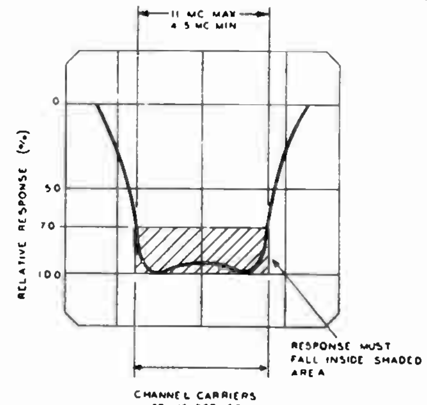

Fig. 4. Television tuner response curve, showing bandpass limits.

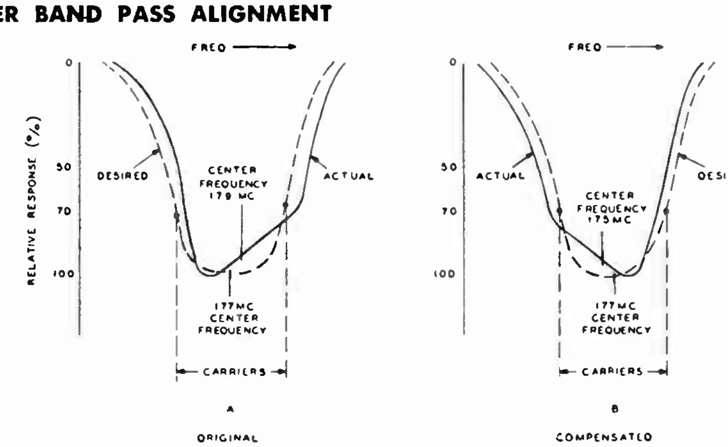

Fig. 5. Television tuner response curve, showing tracking compensation.

TUNER OSCILLATOR ALIGNMENT

AM GENERATOR: Connect to receiver antenna-input terminals. (No matching network is required.) Use unmodulated r-f output.

OSCILLOSCOPE: Connect the vertical-input lead, in series with a 1000-ohm resistor, to the mixer grid test point. Connect the scope ground lead to the chassis, near the test point.

RECEIVER CIRCUIT ALTERATIONS: Disconnect tuner a-g-c (white) lead from main chassis, and connect a 1.5 volt bias battery, with negative terminal to white lead from tuner, and positive terminal to chassis.

TABLE NO. 1

STEP	AM GENERATOR DIAL SETTING	RECEIVER TUNING	ADJUST	REMARKS
1	257 mc.	channel 13	VC4 for zero beat on scope.	a. If regeneration occurs, inject bias; bias may be increased up to 3 volts, if necessary at pin 1 video test jack — TS1. b. Preset fine tuning adjustment so that it is in the middle of its range.
2	251 mc.	channel 12	VC5 for zero beat on scope.	
3	245 mc.	channel 11	VC6 for zero beat on scope.	
4	239 mc.	channel 10	VC7 for zero beat on scope.	
5	233 mc.	channel 9	VC8 for zero beat on scope.	
6	227 mc.	channel 8	VC9 for zero beat on scope.	
7	221 mc.	channel 7	VC10 for zero beat on scope.	
8	64.5 mc.	channel 6	VC11 for zero beat on scope.	2nd harmonic gives 129 mc.
9	113 mc.	channel 4	VC12 for zero beat on scope.	
10	101 mc.	channel 2	VC13 for zero beat on scope.	

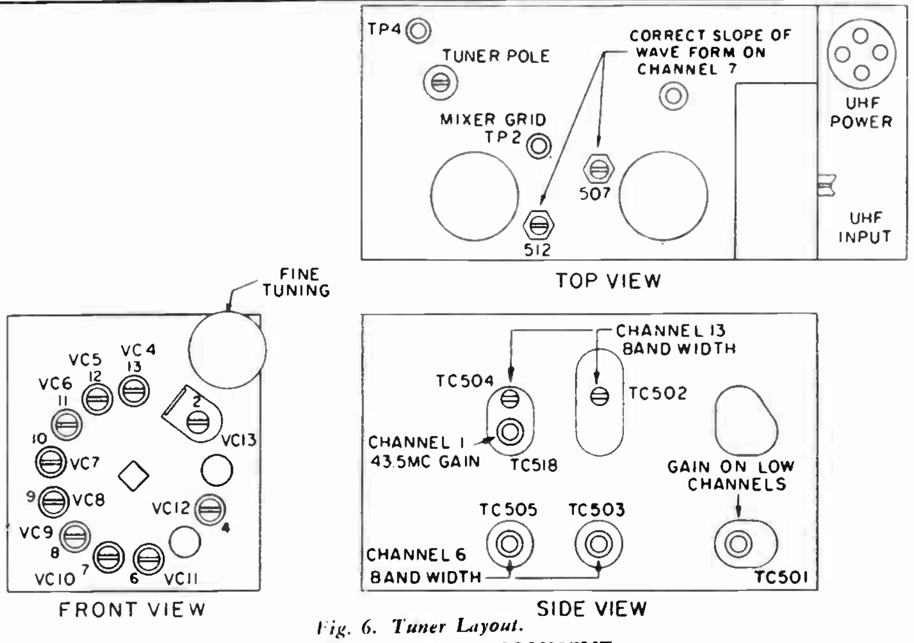

Fig. 6. Tuner Layout.

TUNER BANDPASS ALIGNMENT

SWEEP (FM) GENERATOR: Connect to antenna-input circuit through antenna-input matching network (See figure 1).

OSCILLOSCOPE: Connect the vertical-input lead, in series with a 1000-ohm resistor, to the mixer plate test point, TP4. Connect scope ground lead to the chassis, near TP4.

RECEIVER CIRCUIT ALTERATIONS: Disconnect tuner a-g-c (white) lead from main chassis, and connect a 1.5 volt bias battery, with negative terminal to white lead from tuner, and positive terminal to chassis. Disconnect tuner link from terminal board, B-9, and connect a 40 to 70-ohm carbon resistor across the link.

TABLE NO. 2

STEP	SWEEP (FM) GENERATOR		RECEIVER TUNING	ADJUST	REMARKS
	SWEEP DIAL SETTING	MARKER DIAL SETTING			
1	channel 13 (213 mc. with 10-mc. sweep width.)	Set first to 210 mc. and note position of marker on response curve. Then set to 216 mc. and note position of marker on response curve.	channel 13		Use oscilloscope gain as high as possible with respect to hum level and "bounce". Pips fix channel limits on curve. Response curve should be flat between limits (see fig. 5). If not, proceed with step 2.
2	channel 13	213 mc.	channel 13	TC502 counterclockwise until single peak appears.	CAUTION: Care must be taken not to unscrew core far enough to make it drop out of the coil.
3	channel 13	213 mc.	channel 13	TC504 until peak falls on 213 mc. marker.	It may be necessary to increase sweep-generator output.
4	channel 6 (85 mc. with 10-mc. sweep width.)	Set first to 82 mc. and note position of marker on response curve. Then set to 88 mc. and note position of marker on response curve.	channel 6		Curve should be symmetrical and centered in pass band. If not, proceed with step 5.
5	channel 6	85 mc.	channel 6	TC503 counterclockwise until single peak appears.	CAUTION: Care must be taken not to unscrew core far enough to make it drop out of the coil.
6	channel 6	85 mc.	channel 6	TC505 until peak falls on 85 mc. marker.	It may be necessary to increase sweep-generator output.
7	channel 6	85 mc.	channel 6	TC503 for maximum curve height and symmetry of single peak.	After adjusting TC503, recheck as in step 4. If necessary, reduce sweep-generator output to avoid overloading.
8	channel 6	85 mc.	channel 6	Retouch TC503 and TC505 for symmetrical response, centered about 85 mc. marker.	To retouch, only turn cores slightly.
9	channel 1 (UHF)	44 mc.	channel 1 (UHF)	Retouch TC503 and TC505 for symmetrical response centered about 44 mc.	After this adjustment recheck channel 6 and be sure it is within limits.

NOTE: On channel 7, observe the tilt and center frequency of the response curve. The curve should be centered on the pass band and should be symmetrical. If it is not symmetrical, and appears unbalanced, as in figure 6, adjust C507 and C512 (figure 5) to obtain a response curve which is in the mirror image (tilt in the opposite direction) of the original: for example, if channel 7 response curve appears as in figure 6A, adjust C507 and C512 until the curve appears as in figure 7B. This adjustment over-compensates to make allowance for the effect of channel 13 adjustments upon channel 7 response.

VIDEO I-F ALIGNMENT

AM GENERATOR: Connect to mixer test point, TP2, through a mixer jig, and adjust the generator for approximately 30 percent modulation at 400 cycles. Adjust the output of the generator during alignment, to keep the output at the second detector below 4 volt, peak to peak.

SWEEP (FM) GENERATOR: After step 7, connect to antenna-input circuit through antenna input matching network. (See figure 1.)

OSCILLOSCOPE: Connect the vertical-input lead to the 15K resistor of the video i-f alignment jig. Connect scope ground lead to the ground lead of the jig. Plug jig into TS1.

PRESET: Contrast and Brightness controls fully counterclockwise, and channel selector to channel 4. Adjust AGC switch to normal position.

BIAS: Apply —14 volts of negative bias to pin 1 of video i-f alignment jig; ground positive side of bias supply to pin 3 of jig. (See figure 2.)

NOTE: If the i-f shield has been removed for repairs, it must be replaced before proceeding with the alignment.

TABLE NO. 3

STEP	AM GENERATOR DIAL SETTING	SWEEP (FM) GENERATOR		ADJUST	REMARKS
		SWEEP DIAL SETTING	MARKER DIAL SETTING		
1	47.25	not used	not used	VC1 for minimum indication on scope.	It is necessary to keep the generator output sufficiently high that a null indication may be observed on the oscilloscope; however, avoid overloading of the receiver by excessive signal.
2	41.25	not used	not used	VC2 for minimum indication on scope.	
3	45.4	not used	not used	TT for maximum indication on scope.	Adjust the output of the AM generator, to keep the output at the second detector below 4 volt, peak to peak. (For convenience, the oscilloscope may be calibrated for this purpose beforehand.)
4	45.4	not used	not used	T2 for maximum indication on scope.	
5	43.0	not used	not used	VC3 for maximum indication on scope.	
6	42.7	not used	not used	T3 for maximum indication on scope.	
7	44.4	not used	not used	T4 for maximum indication on scope.	
8	not used	channel 4 (69 mc., with 6-mc. sweep width)	Run marker along curve, checking against the curve limits given in fig. 7.	If necessary, retouch T1, T2, T3, & T4 as directed in REMARKS column. CAUTION: Do not touch settings of VC1 and VC2.	Set Fine Tuning Cam to reference point previously made in step 1 of Table 1. If response curve does not fall within limits shown in fig. 7, retouch T1 & T2 for proper level of curve at video carrier frequency; adjust T4 to level top of curve and T3 for proper slope of low-frequency side of curve. CAUTION: To retouch, only turn the adjustments slightly, particularly T2.

SOUND IF ALIGNMENT

AM GENERATOR: Connect "hot" lead through a 2200 ohm resistor to pin 2 of TS1, using the video i-f alignment jig. Connect ground lead of generator to ground lead of jig.

VOLTMETER: Use v.t.v.m. or 20,000 ohms-per-volt voltmeter. Connect to sound test point.

OSCILLOSCOPE: Connect through crystal probe to cathode (pin 11) of picture tube.

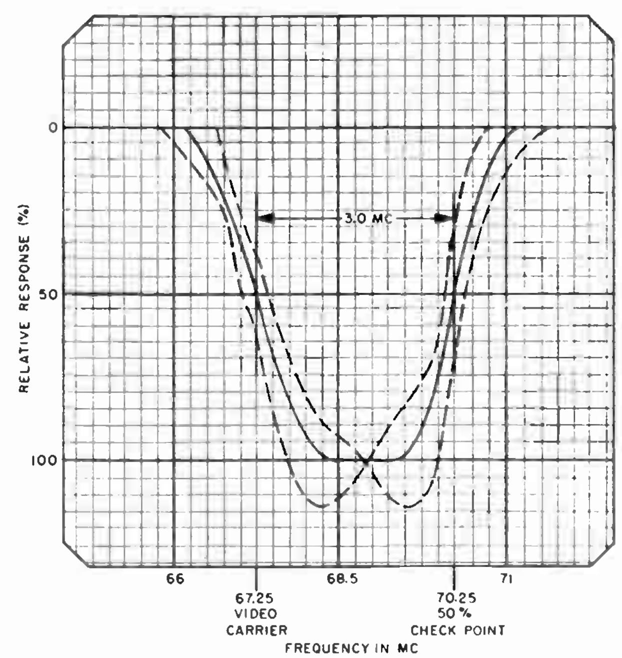

Fig. 7. Over-all R-F, I-F response curve, showing tolerance limits.

STEP	AM GENERATOR DIAL SETTING	ADJUST	REMARKS
1	4.5 mc.	T7 for maximum indication on voltmeter.	Remove 1st video i-f tube, and adjust the volume control for moderate speaker output.
2	4.5 mc.	T5 primary (bottom of T5) for maximum indication on voltmeter.	
3	4.5 mc.	T5 secondary (top of T5) for maximum indication on voltmeter and minimum speaker output.	The point of maximum meter indication for C5 should also be the point of minimum speaker output.
4	4.5 mc.	T8 for minimum indication as view on the oscilloscope.	
5	use station signal	T5 primary (bottom of T5) for minimum AM (noise or buzz), using speaker output for indication.	Replace 1st video i-f tube, and tune in a station, setting fine tuning control to obtain a crisp picture, with a small amount of beat.

OSCILLOSCOPE WAVEFORM PATTERNS

These waveforms were taken with the receiver adjusted for an approximate peak-to-peak output of 3.5 volts at the video detector. The voltages given with the waveforms are approximate peak-to-peak values. The frequencies shown are those of the waveforms — not the sweep rate of the oscilloscope. The waveforms were taken with an oscilloscope having good high-frequency response. With oscilloscopes having poor high-frequency response, the sharp peaks of the horizontal waveforms will be more rounded than those shown, and the peak-to-peak voltages will differ from those shown.

SPECIFICATIONS — TV-400 CHASSIS

VHF TUNING .... Twelve channel, 13 position incremental tuner, covering VHF television channels 2 through 13; plus UHF position, and fine tuning of local oscillator.

UHF TUNING (if provided) Continuous tuning, covering UHF television channels 14 through 83.

INTERMEDIATE FREQUENCIES ....
- Video Carrier .... 45.75 mc.
- Sound (intercarrier) .... 4.5 mc.

OPERATING VOLTAGE .... 100 to 120 volts, 60 cycle, A.C.

POWER CONSUMPTION .... Without UHF, 240 w. With UHF, 245 w.

TRANSMISSION LINE .... 300-ohm, twin-wire lead.

CIRCUIT DESCRIPTION

The TV-400 is the deluxe receiver of the new line employing a single chassis. The VHF tuner used is a 12 channel, 13 position tuner mounted on a separate sub-chassis. The thirteenth position is used for the reception of UHF signals in conjunction with a UT-26 UHF tuner. The R.F. amplifier is a 6BZ7 tube, while the local oscillator and mixer stages use a type 6X8 tube. The pentode section of the 6X8 is used for mixing, while the triode is used as a local oscillator.

The output of the mixer, a 40-MC signal, is link coupled to four stagger tuned video I-F stages employing four 6CB6 tubes. This I-F system is an improved I-F, in that it contains additional trapping to improve the adjacent channel interference. In the grid circuit of the first I-F, we have the 47.25-MC adjacent channel sound trap and the 41.25-MC accompanying sound trap. In the grid circuit of the third Video I-F, we have an additional 47.25-MC adjacent sound trap along with a 39.75-MC adjacent channel picture trap. This 39.75-MC adjacent channel picture trap is something we have not used in quite a long period of time, and the adjustment of this trap along with the other traps is of primary importance in achieving the top performance built into our TV-400 chassis.

A 1N64 crystal diode is used as a video detector. Following the video detector is a video amplifier consisting of two stages. The first stage uses the pentode section of the 6AX8 and the output stage uses a 6AQ5 which drives the grid of the picture tube.

Sound I-F (intercarrier) is obtained by utilizing the beat frequency produced when the 45.75-MC video carrier and the 41.25-MC sound carrier are mixed in the video detector. The beat frequency 4.5-MC is the difference between 45.75-MC and 41.25-MC and contains the FM sound signal. This 4.5-MC signal contains only a negligible amount of the video AM amplitude modulation, provided that the amplitude of the 41.25-MC signal is considerably lower than that of the 45.75-MC signal. The proper relative amplitude of the two carriers is established in the alignment of the receivers. There is sound output only when both the video and sound carriers are present.

A-G-C voltage for the video I-F system and the R-F amplifier is obtained from a keyed a-g-c system which uses a 6AU6 tube, as the a-g-c gate. Composite video from the video-amplifier plate circuit through a cathode follower, is fed to the grid of the a-g-c gate tube, while a gating or keying pulse, obtained from a winding on the horizontal-output transformer, is applied to the plate. The sync-pulse polarity applied to the grid of S12 is positive; therefore, the a-g-c gate can conduct in proportion to the amplitude of the sync-pulse tips if the gating or keying pulse occurs at the same time as the sync. Because the keying or gate pulse is a constant amplitude, approximately 500 volts peak, the amplitude of the sync pulse will determine the amount of conduction in the gate tube. The plate current of the keyed a-g-c gate tube flows through a resistor network, developing a voltage which is negative with respect to the chassis and whose amplitude is proportional to the plate current. This negative voltage is used to control the gain of the receiver. Since conduction cannot occur in the a-g-c gate tube unless the sync pulse and gating pulse occur at the same time, noise disturbances that occur between sync-pulse intervals cannot affect the a-g-c voltage.

Composite video for the sync circuits is taken from the plate of the first video amplifier. The output is fed to a cathode follower which delivers the information into the noise inverter circuit. The noise inverter is operated with a low value of plate voltage and high bias which keeps the tube beyond cut-off. When the composite video signal is applied to the grid of the noise inverter the sync appears as positive pulses: noise which could affect the sweep circuits also appears as positive pulses. Harmful noise pulses usually have amplitudes far greater than the sync pulses, and therefore, drive the grid of the noise inverter positive sufficiently to allow conduction in the noise-inverter plate circuit.

The output of the noise inverter consists of negative-going noise pulses. It should be noted that the noise pulses which exceed the sync level have been passed and their polarity reversed by the noise inverter. The output of the noise inverter is now mixed with the composite video and fed to the grid of the sync separator, the triode section of the 6AX8 tube. Since the composite video fed to the grid of the sync separator has positive sync polarity, the positive noise pulses carried with the composite video would be passed by the sync separator; however, the output of the noise inverter consists of these same noise pulses, but they are of opposite polarity; thus, the noise pulses are cancelled. The output of the sync separator contains only the sync pulses which are fed to the vertical and horizontal circuits. The vertical pulses are fed from the plate of the sync separator to the vertical oscillator through an integrator circuit. The vertical oscillator employs a 12AU7 tube as a cathode coupled multivibrator. A variable resistor in the grid circuit of the second triode adjusts the oscillator frequency and serves as the hold control. A variable resistor in the plate circuit of the same tube provides vertical height adjustment. The vertical output stage employs a 12B4 tube. A variable resistor in the cathode circuit provides adjustment of the vertical linearity. A vertical retrace suppression circuit is connected from one side of the vertical output transformer to the picture tube cathode. The vertical sync is separated from the horizontal sync by the integrator circuit, and is fed to the grid of the vertical oscillator. The output of the vertical oscillator is amplified by the vertical-output amplifier, using a 12B4 tube, and the output of the amplifier is applied to the vertical-deflection coils through the vertical-output transformer.

Horizontal sync information is fed into the phase comparer circuit which controls the frequency of the horizontal oscillator. A 6AL5 tube is employed as the phase comparer in the horizontal circuits. The plate of one diode is grounded, the cathodes of both diodes are tied together and, from a winding on the horizontal output transformer, a pulse is fed, through a shaping network to the plate to the other diode. The horizontal sync pulses from the sync separator are fed to the cathodes. If the incoming sync pulse is not in phase with the pulse from the horizontal output transformer, a difference voltage occurs in the output of the phase comparer which is fed to the horizontal oscillator and is used to control its frequency. A cathode coupled multivibrator using a 12AU7A tube provides the horizontal oscillator signal. Two variable resistors in series to the grid of the second triode section of the oscillator are employed as the horizontal hold control and horizontal hold centering control. With these controls, the horizontal oscillator frequency is adjusted within the range of the phase comparer control voltage.

When the voltage is delivered to the horizontal oscillator grid by the phase comparers circuit is positive, it increases the frequency of the oscillator; when the voltage is negative, it reduces the frequency of the oscillator. This control voltage holds the horizontal oscillator in phase with the sync signal. The HORIZ. HOLD control, adjusts the horizontal oscillator to the proper frequency, so that it may be controlled by the phase comparer. The output of the horizontal oscillator is fed to the horizontal-output amplifier, which uses a 6CU6 tube, V19.

The second anode voltage for the picture tube is furnished by a high-voltage winding of the horizontal-output transformer, and is rectified by a 1B3GT high-voltage rectifier tube.

VIDEO PEAKING-COIL ADJUSTMENT — TV-400

The peaking coil, T5, is adjusted at the factory for proper transient response of the video circuits. Ordinarily, this coil will require no further adjustment by the serviceman. On any station where excessive overshoot or excessive smear is present, a slight adjustment of T5 may improve the picture quality on that station; however, this adjustment may sacrifice the quality on other channels. If T5 is replaced in servicing, adjustment will be required.

Before adjusting T5, check the tuner alignment and I-F alignment. (Never adjust T5 until the alignment of a receiver is correct.) Then tune in a station and adjust T5 until there are no trailing whites or smear in the picture. Turning T5 clockwise reduces trailing whites and overshoot; turning T5 counterclockwise reduces picture smear and increases trailing whites. The proper position is the point where no smear or trailing whites appear in the picture.

The above procedure for adjustment of T5 applies to a particular station exhibiting smear or overshoot. After T5 is adjusted, reception on all the other stations should be checked, to make certain that the adjustment has not impaired the picture quality.

TELEVISION ALIGNMENT

General

The alignment procedure follows the general pattern of first checking the tuner response with an FM sweep generator and oscilloscope, comparing the response curve with that given in the manual, and aligning the tuner if necessary. After it is established that the tuner is in correct alignment, the video I-F channel is aligned by tuning each coil to its assigned pole frequency, using an AM signal, and then feeding in a sweep signal at the antenna terminals and retouching the I-F adjustments to obtain the desired pass band. Finally, the sound channel is aligned, using an AM signal, by tuning the sound take-off coil and the I-F and ratio-detector transformers.

The over-all response curve (r-f, i-f) of the circuits from the antenna terminals to the video detector, after the I-F stages have been aligned, should appear essentially the same, regardless of the channel under test. If not, the tuner should be aligned.

The video-carrier intermediate frequency is 45.75 mc., and the sound intermediate (intercarrier) frequency is 4.5 mc. Alignment of these circuits requires careful workmanship and good equipment. The following precautions must be observed:

1. There must be a good bond between the receiver chassis and the test equipment. This is most easily obtained by having the top of the workbench metallic. The receiver chassis should be placed tuner-side down on the bench. If the bench has no metallic top, the test equipment and chassis can be bonded by a strip of copper about 2 inches wide. The section of the chassis nearest the tuner should rest on the strip.
2. Do not disconnect the picture tube yoke while the receiver is turned on.
3. Allow the receiver and test equipment to warm up for 15 minutes before starting the alignment.
4. The marker (AM) signal generator should be calibrated accurately to the frequencies used and to the sound and video r-f carriers of each channel used during alignment. If model 7008 is used, the built-in crystal calibrator provides an excellent means of calibration. An alternate method for calibrating the signal generator to the sound and video r-f carrier frequencies is to zero-beat the signal generator with the received signals.

For further information regarding calibration, refer to Philco Lesson PR-1745 (J) entitled "Television Service in the Home."

HORIZONTAL-OSCILLATOR ADJUSTMENT — TV-400

To adjust the horizontal-oscillator circuit, tune in a station and proceed as follows:

1. Decenter the picture until blanking can be observed at the right-hand side.
2. Increase the BRIGHTNESS control setting until the blanking becomes visible. This will appear as a dark vertical bar on each side of the picture.
3. Connect a .1 mf condenser from the test point, to ground. (The plate side of the horizontal ringing coil, T6, is connected to the test point.)
4. Set the HORIZONTAL HOLD control to the approximate center of its mechanical rotation.
5. Adjust the HORIZONTAL HOLD CENTERING control until equal portions of the blanking bar appear on both si[redacted] of the picture.

6. Remove the .1 mf condenser from the test point.

7. Adjust the horizontal ringing coil until equal portions of the blanking bar again appear on both sides of the picture.

8. Rotate the HORIZONTAL HOLD control through its range. The picture should fall out of sync on both sides of the center of its rotation. If the picture does not fall out of sync on both sides, readjust the HORIZONTAL HOLD CENTERING control.

9. Rotate the HORIZONTAL HOLD control through its range, and observe the number of diagonal blanking bars that appear just before the picture pulls into sync. The pull-in should occur with from 1 to 2 diagonal bars when the sync position is approached from either direction. If proper pull-in is not obtained, repeat the above procedure.

JIGS AND ADAPTERS REQUIRED — TV-400

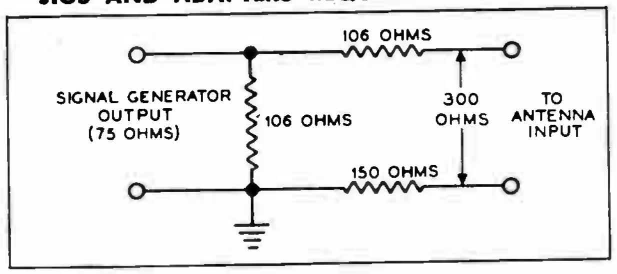

Fig. 1. Antenna-Input matching network.

Mixer Jig

Connections to the grid of the mixer tube may be made through the test point provided for this purpose. To connect the generator to this point, a mixer-grid jig, Philco Part No. 45-1739, and a connecting cable, Philco Part No. 45-1635, may be used. As an alternate, a Philco alligator-clip adapter, Part No. 45-1636, with as short a ground lead as possible, may be used to connect the alignment jack. The ground lead should be connected as close as possible to the mixer tube. It is essential that the signal-generator output lead be terminated with a 68-ohm resistor (carbon), so that regeneration, caused by connection of the lead to the mixer, is held to a minimum.

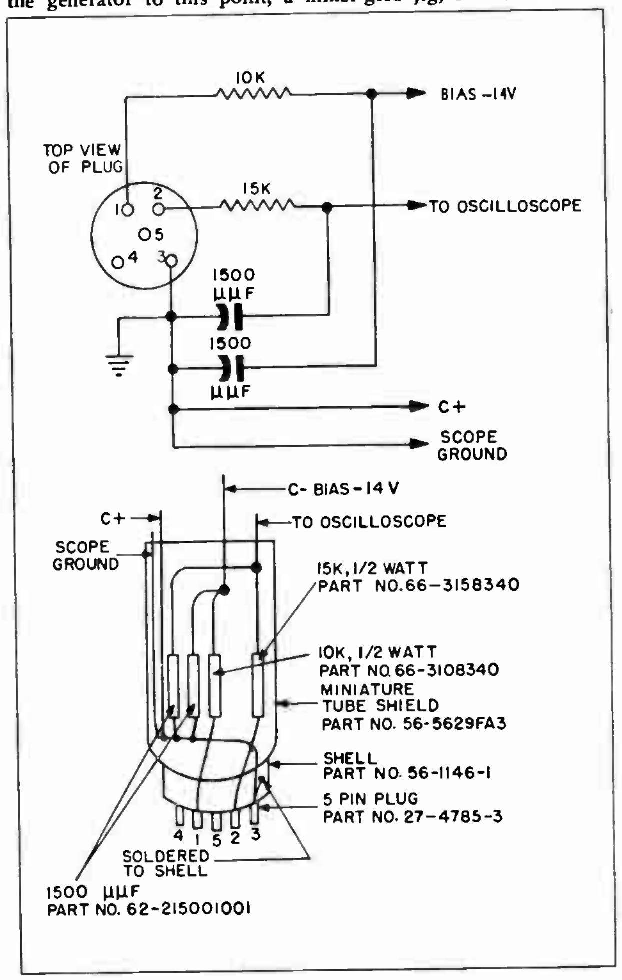

Fig. 2. Video I-F Alignment Jig (Video Test Jack Adapter No. 1).

Antenna-Input Matching Network

An impedance-matching network for coupling the signal generator to the antenna input terminals of the receiver is shown in figure 1.* This network, which is designed to have an input impedance of 75 ohms and an output impedance of 300 ohms is used to match a 75-ohm generator to a 300-ohm antenna-input circuit. The resistors used in this network should be of carbon-composition construction, and should be chosen from a group, to obtain values within ten percent of those indicated. The resistors should be placed in a shield can, to prevent variable effects. An antenna-matching jig, Philco Part No. 45-1736, which consists of a matching transformer and connecting box, may be used in place of the resistor network.

Video I-F Alignment Jig

(Video Test Jack Adapter No. 1)

The alignment jig used at TS1 and shown in figure 2, should be used during the i-f alignment, to apply the proper bias to the a-g-c bus, and to provide a convenient oscilloscope connection. This adapter consists of a five-pin plug, two 10,000 ohms resistors, and a 1500 mmf condenser for isolation of the bias supply. To isolate the oscilloscope from the receiver circuits, a 15,000-ohm resistor, by-passed by a 1500 mmf. condenser, is used. A suggested method of fabricating the jig is also shown in figure 2. This jig should not be used to observe the composite video from the video detector output.

Sound I-F Input Alignment Jig

(Video Test Jack Adapter No. 2)

To observe the composite video, at TS1, a jig may be made with a five-pin plug and a 2200 ohm resistor. (See figure 3.) The 2200 ohm resistor should be connected to pin 2 of the plug. A ground lead should be connected to pin 3. To observe the composite video, connect the oscilloscope to the 2200 ohm resistor and the ground lead. This jig is also used for injection of the 4.5 mc. signal during s-i-f alignment.

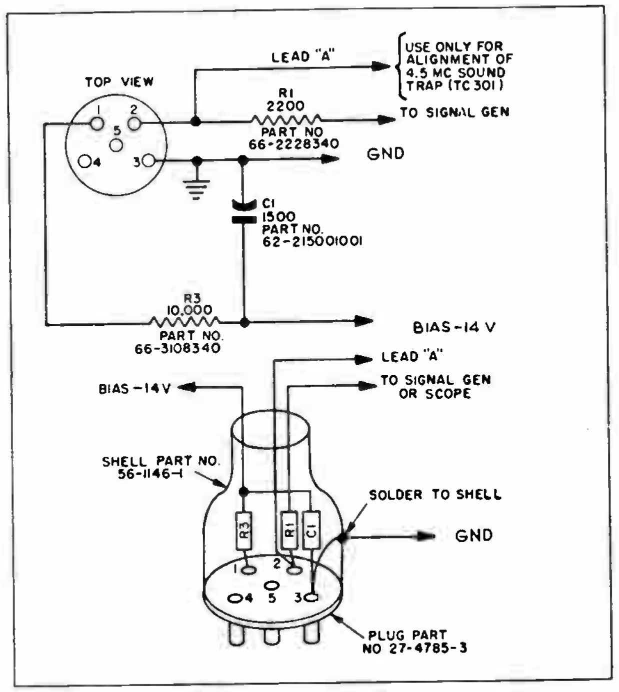

Fig. 3. Sound I-F Input Alignment Jig (Video Test Jack Adapter No. 2).

TUNER BAND PASS ALIGNMENT

(See Table No. 2

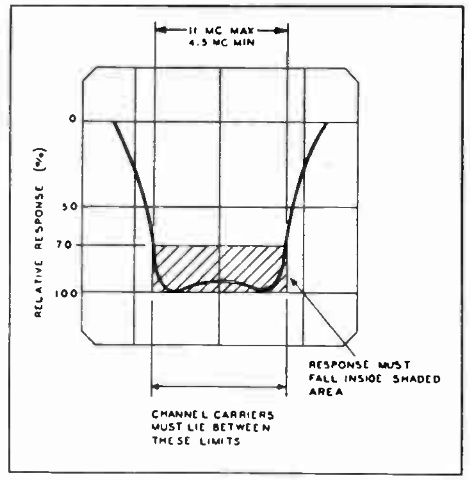

Fig. 4. Television tuner response curve, showing bandpass limits.

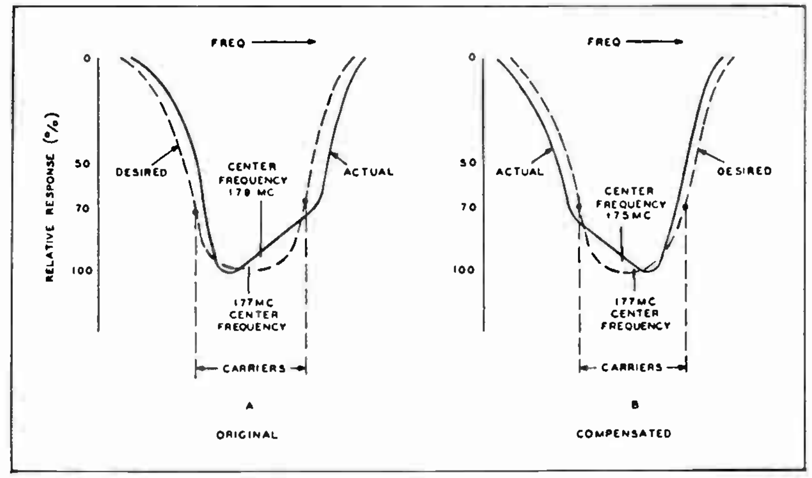

Fig. 5. Television tuner response curve, showing tracking compensation.

TUNER OSCILLATOR ALIGNMENT

TABLE NO. 1

AM GENERATOR: Connect to receiver antenna-input terminals. (No matching network is required.) Use unmodulated r-f output.

OSCILLOSCOPE: Connect the vertical-input lead, in series with a 1000-ohm resistor, to the mixer grid test point. Connect the scope ground lead to the chassis, near the test point.

RECEIVER CIRCUIT ALTERATIONS: Disconnect tuner a-g-c (pink tracer) lead from main chassis, and connect a 1.5 volt bias battery, with negative terminal to white lead from tuner, and positive terminal to chassis.

STEP	AM GENERATOR DIAL SETTING	RECEIVER TUNING	ADJUST	REMARKS
1	257 mc.	channel 13	T2 for zero beat on scope.	a. If regeneration occurs, inject bias; bias may be increased up to 3 volts, if necessary at pin 1 video test jack — TS1. b. Preset fine tuning adjustment so that it is in the middle of its range.
2	251 mc.	channel 12	VC8 for zero beat on scope.	
3	245 mc.	channel 11	VC7 for zero beat on scope.	
4	239 mc.	channel 10	VC6 for zero beat on scope.	
5	233 mc.	channel 9	VC5 for zero beat on scope.	
6	221 mc.	channel 7	VC4 for zero beat on scope.	
7	64.5 mc.	channel 6	T7 for zero beat on scope.	2nd harmonic gives 129 mc.
8	113 mc.	channel 4	T5 for zero beat on scope.	
9	101 mc.	channel 2	T3 for zero beat on scope.	

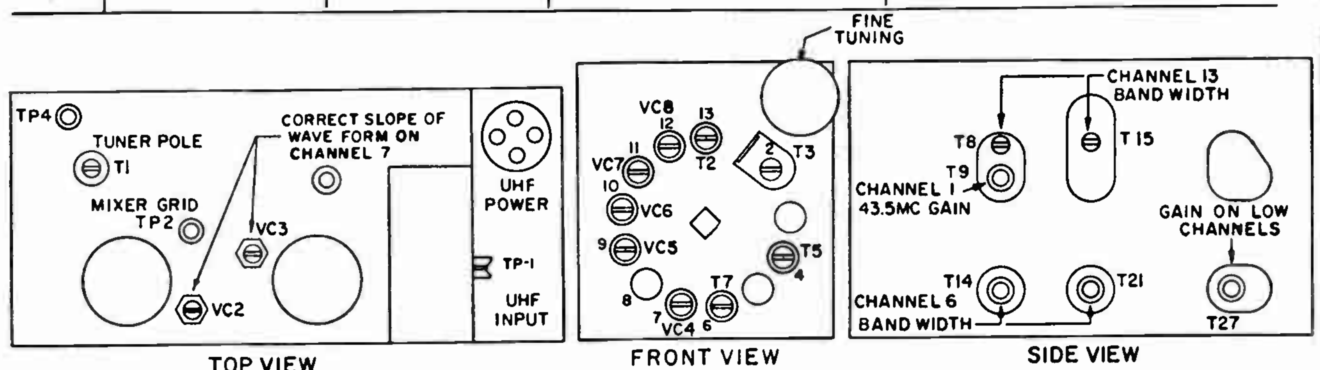

Fig. 6. Tuner Layout.

TUNER BANDPASS ALIGNMENT — TABLE 2

SWEEP (FM) GENERATOR: Connect to receiver antenna-input through Antenna-input Matching Network. (See figure 1.)
OSCILLOSCOPE: Connect the oscilloscope to the junction of R518(15K,1W) and the tuner red lead. Clip ground lead of scope to chassis.

RECEIVER CIRCUIT ALTERATIONS: Disconnect tuner a-g-c (white) lead from main chassis and connect a 1.5-volt bias battery; negative terminal to white lead from tuner, and positive terminal to chassis. Disconnect tuner coupling link leads, and connect a 40- to 70-ohm carbon resistor across the open end of the lead, from the tuner.

STEP	SWEEP (FM) GENERATOR		RECEIVER TUNING	ADJUST	REMARKS
	Sweep Dial Setting	Marker Dial Setting			
1	Channel 13 (213 mc., with 10-mc. sweep width.)	Set first to 210 mc. and note position of marker on response curve. Set to 216 mc. and note position of marker on response curve.	Channel 13		Oscilloscope gain as high as possible with respect to hum level and "bounce". Pips fix channel limits on curve. Response curve to be flat between limits (see figure 4). If not, proceed with step 2.
2	Channel 13	213 mc.	Channel 13	T8 counterclockwise until single peak appears.	CAUTION: Care must be taken not to unscrew core far enough to make it drop out of the coil.
3	Channel 13	213 mc.	Channel 13	T15 until peak falls on 213 mc. marker.	Sweep Generator output may have to be increased.
4	Channel 7 (177 mc., with 10-mc. sweep width.)	Set first to 174 mc. and note position of marker on response curve. Set to 180 mc. and note position of marker on response curve.	Channel 7		Note curve with respect to tilt and center frequency. Curve should be centered in pass-band and symmetrical. If not, proceed with step 5.
5	Channel 7	174 mc. and 180 mc.	Channel 7	VC3 and VC2 to get correct tilt on top of curve.	VC3 and VC2 compensate for the tuning effect of Channel 13 adjustment upon Channel 7. (See figure 5.)
6	Channel 13	213 mc.	Channel 13	Retouch T15 and T8 for symmetrical response centered about 213 mc. marker.	To retouch, only turn cores slightly.
7	Channel 7	117 mc.	Channel 7	Repeat step 5.	Check response curve for correct center frequency and symmetry.
8				Repeat steps 6 and 7.	Repeat Channel 13 and Channel 7 adjustments, alternately, until favorable curves are obtained on both.
9	Channel 6 (85 mc. with 10-mc. sweep width.)	Set first to 82 mc. and note position of marker on response curve. Set to 88 mc. and note position of marker on response curve.	Channel 6		Curve should be symmetrical and centered in pass-band. If not, proceed with step 10.
10	Channel 6	85 mc.	Channel 6	T14 counterclockwise until single peak appears.	CAUTION: Care must be taken not to unscrew core far enough to make it drop out of the coil.
11	Channel 6	85 mc.	Channel 6	T21 until peak falls on 85-mc. marker.	Sweep Generator output may have to be increased.
12	Channel 6	85 mc.	Channel 6	T27 for maximum curve height and symmetry of single peak.	After adjusting T27 recheck as in step 9. If necessary, reduce Sweep Generator output to avoid overloading.
13	Channel 6	85 mc.	Channel 6	Retouch T21 and T14 for symmetrical response centered about 85-mc. marker.	To retouch, only turn cores slightly.
14	43.5 mc. (with 10-mc. sweep width.)	Set first to 45.75 mc. and note position of marker on response curve. Set to 41.25 mc. and note position of marker on response curve.	UHF (Channel 1 position.)		Disconnect sweep (FM) generator from antenna-input terminals and connect to 40-mc. input jack TP1, using a matching network. Curve should be symmetrical and flat-topped. Markers should fall along flat-topped portion of curve. If not, proceed with step 15.
15	43.5 mc. (with 10-mc. sweep width.)	43.5 mc.	UHF (Channel 1 position.)	T9 for most symmetrical flat-topped response curve, centered about 43.5 mc. marker.	Recheck band-pass as in step 14, and repeat adjustment if necessary.

VIDEO I-F ALIGNMENT

AM GENERATOR: Connect to mixer test point, TP-2, through a mixer jig, and adjust the generator for approximately 30 percent modulation at 400 cycles. Adjust the output of the generator during alignment, to keep the output at the second detector below 4 volts peak to peak.

BIAS: Apply 10 volts of negative bias, through 10,000-ohm resistor, to pin 1 of video I-F alignment jig; ground positive side of bias supply to pin 3 of jig. (See figure 2).
NOTE: If the i-f shield has been removed fro repairs, it must be replaced before proceeding with the alignment.

PRESET: Contrast and Brightness controls fully counterclockwise, and channel selector to channel 4.
OSCILLOSCOPE: Connect the vertical-input lead to the 15,000-ohm resistor of the video i-f alignment jig. Connect scope ground lead to the ground lead of the jig. (See figure 2). Plug jig into TS-1.
SWEEP (FM) GENERATOR: After step 9, connect to antenna-input circuit through antenna-input matching network. (See figure 1).

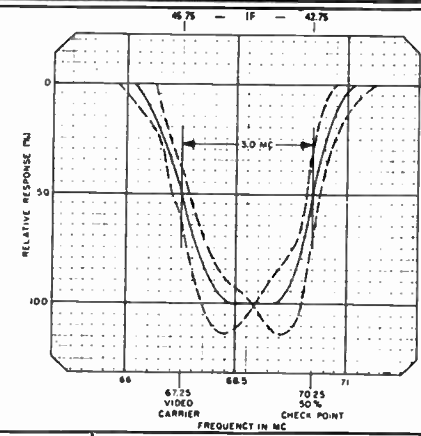

Fig. 7. Over-all R-F, I-F response curve, showing tolerance limits.

STEP	AM GENERATOR DIAL SETTING	SWEEP (FM) GENERATOR		ADJUST	REMARKS
		Sweep Dial Setting	Marker Dial Setting		
1	47.25 mc.	not used	not used	VC3 and VC8 for minimum indication on scope.	
2	41.25 mc.	not used	not used	VC9 for minimum indication on scope.	
3	39.75 mc.	not used	not used	VC4 for minimum indication on scope.	It is necessary to keep the generator output sufficiently high that a null indication may be observed on the oscilloscope; however, avoid overloading of the receiver by excessive signal.
4	42.7 mc.	not used	not used	T1 for maximum indication on scope.	T1 located on tuner. Adjust the output of the AM generator when necessary, to keep the output at the second detector below 4 volt, peak to peak. (For convenience, the oscilloscope may be calibrated for this purpose beforehand.)
5	43.1 mc.	not used	not used	VC1 for maximum indication on scope.	
6	44.4 mc.	not used	not used	VC2 for maximum indication on scope.	
7	42.0 mc.	not used	not used	VC6 for maximum indication on scope.	
8	45.0 mc.	not used	not used	VC5 for maximum indication on scope.	
9	45.7 mc.	not used	not used	VC7 for maximum indication on scope.	
10	not used	Channel 4 (69 mc., with 6 mc., width.)	Run marker along curve checking against the curve limits given in figure 8.	If necessary, retouch T1, VC6, VC7, VC5 and VC1 as directed in REMARKS column. CAUTION: Do not touch the setting 1, 2 and 3.	Set fine tuning cam to middle of range. If response curve does not fall within limits shown in figure 7, retouch VC5 and VC1 alternately. T1, VC5 and VC1 affect dip of curve and VC2 affects tilt of curve. Adjust VC6 for proper slope at 42.0 mc., side of curve, and VC7 for proper level of curve, at video carrier frequency. If curve still does not fall within the limits, a slight readjustment of VC1 is permissible. CAUTION: To retouch, only turn the adjustments slightly.

SOUND I-F ALIGNMENT
TABLE 4

AM GENERATOR: Connect "hot" lead through a 2200-ohm resistor to pin 2 of TS1, using the sound i-f alignment jig. (Figure 3.) Connect ground lead of generator to ground lead of jig.

VOLTMETER: Use v.t.v.m. or 20,000 ohms-per-volt voltmeter. Connect to sound test point and ground.
OSCILLOSCOPE: Connect through crystal probe to grid (pin 2) of picture tube.
BIAS: —15V into AGC system.

STEP	AM GENERATOR DIAL SETTING	ADJUST	REMARKS
1	4.5 mc.	T1 primary (bottom of T-1) for maximum indication on voltmeter.	Remove 1st video i-f tube, and adjust the Volume control for moderate speaker output.
2	4.5 mc.	T2 secondary (top of T2) for maximum indication on voltmeter.	
3	4.5 mc.	T2 primary (bottom) for minimum indication on voltmeter.	
4	4.5 mc.	T3 for maximum indication on voltmeter and minimum speaker output.	
5	4.5 mc.	T4 for minimum indication on oscilloscope.	If scope and crystal probe are not available, T4 may be adjusted for minimum beat pattern on picture tube, using station signal.
6	Use Station Signal	T1 top (secondary) for minimum AM (noise or buzz), using speaker output for indication.	Replace 1st video i-f tube, and tune in a station, setting fine tuning control to obtain a crisp picture, with a small amount of beat.

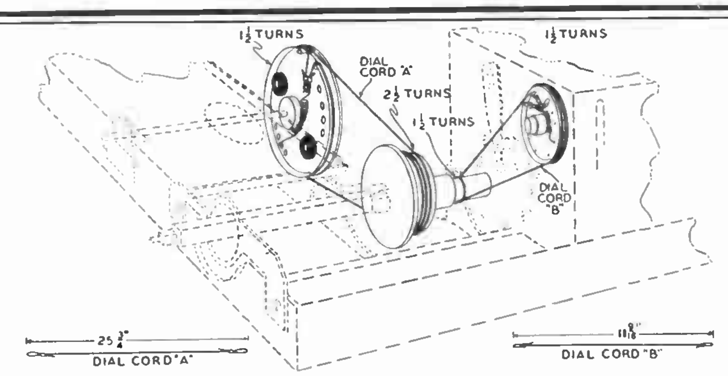

Fig. 25. Dial Cord Stringing Arrangement.

OSCILLOSCOPE WAVEFORM PATTERNS

These waveforms were taken with the receiver adjusted for an approximate peak-to-peak output of 3.5 volts at the video detector. The voltages given with the waveforms are approximate peak-to-peak values. The frequencies shown are those of the waveforms — not the sweep rate of the oscilloscope. The waveforms were taken with an oscilloscope having good high-frequency response. With oscilloscopes having poor high-frequency response, the sharp peaks of the horizontal waveforms will be more rounded than those shown, and the peak-to-peak voltages will differ from those shown.

Fig. 22. Wiring Diagram, Bottom view—TV-400.

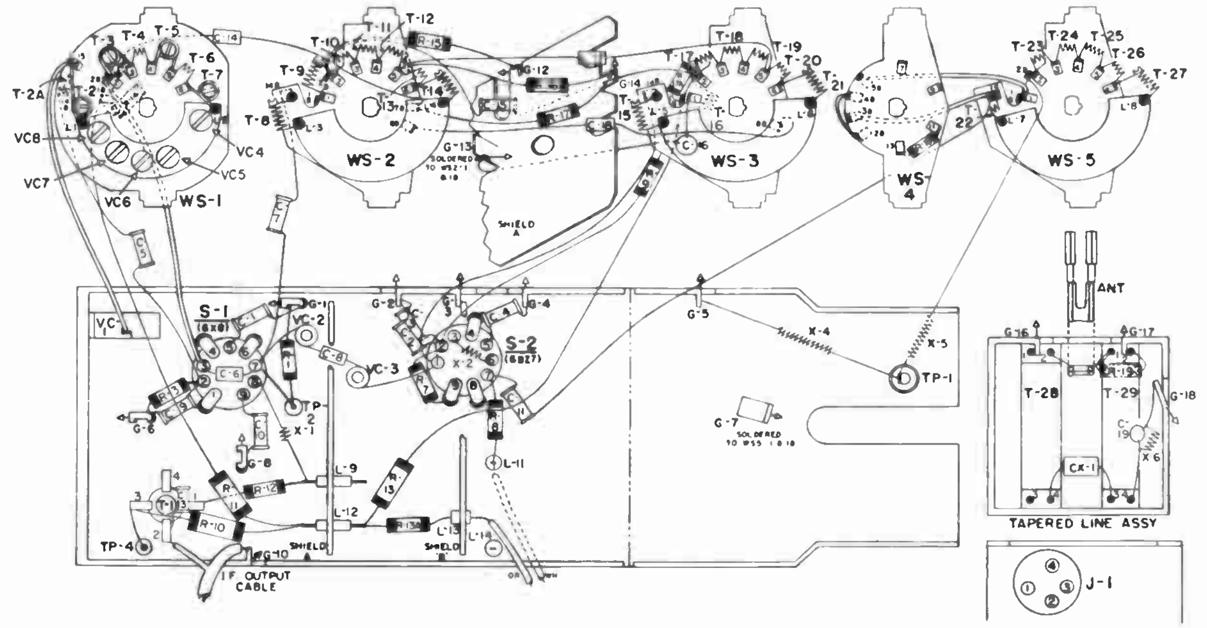

Fig. 23. Tuner Apparatus Layout Drawing.

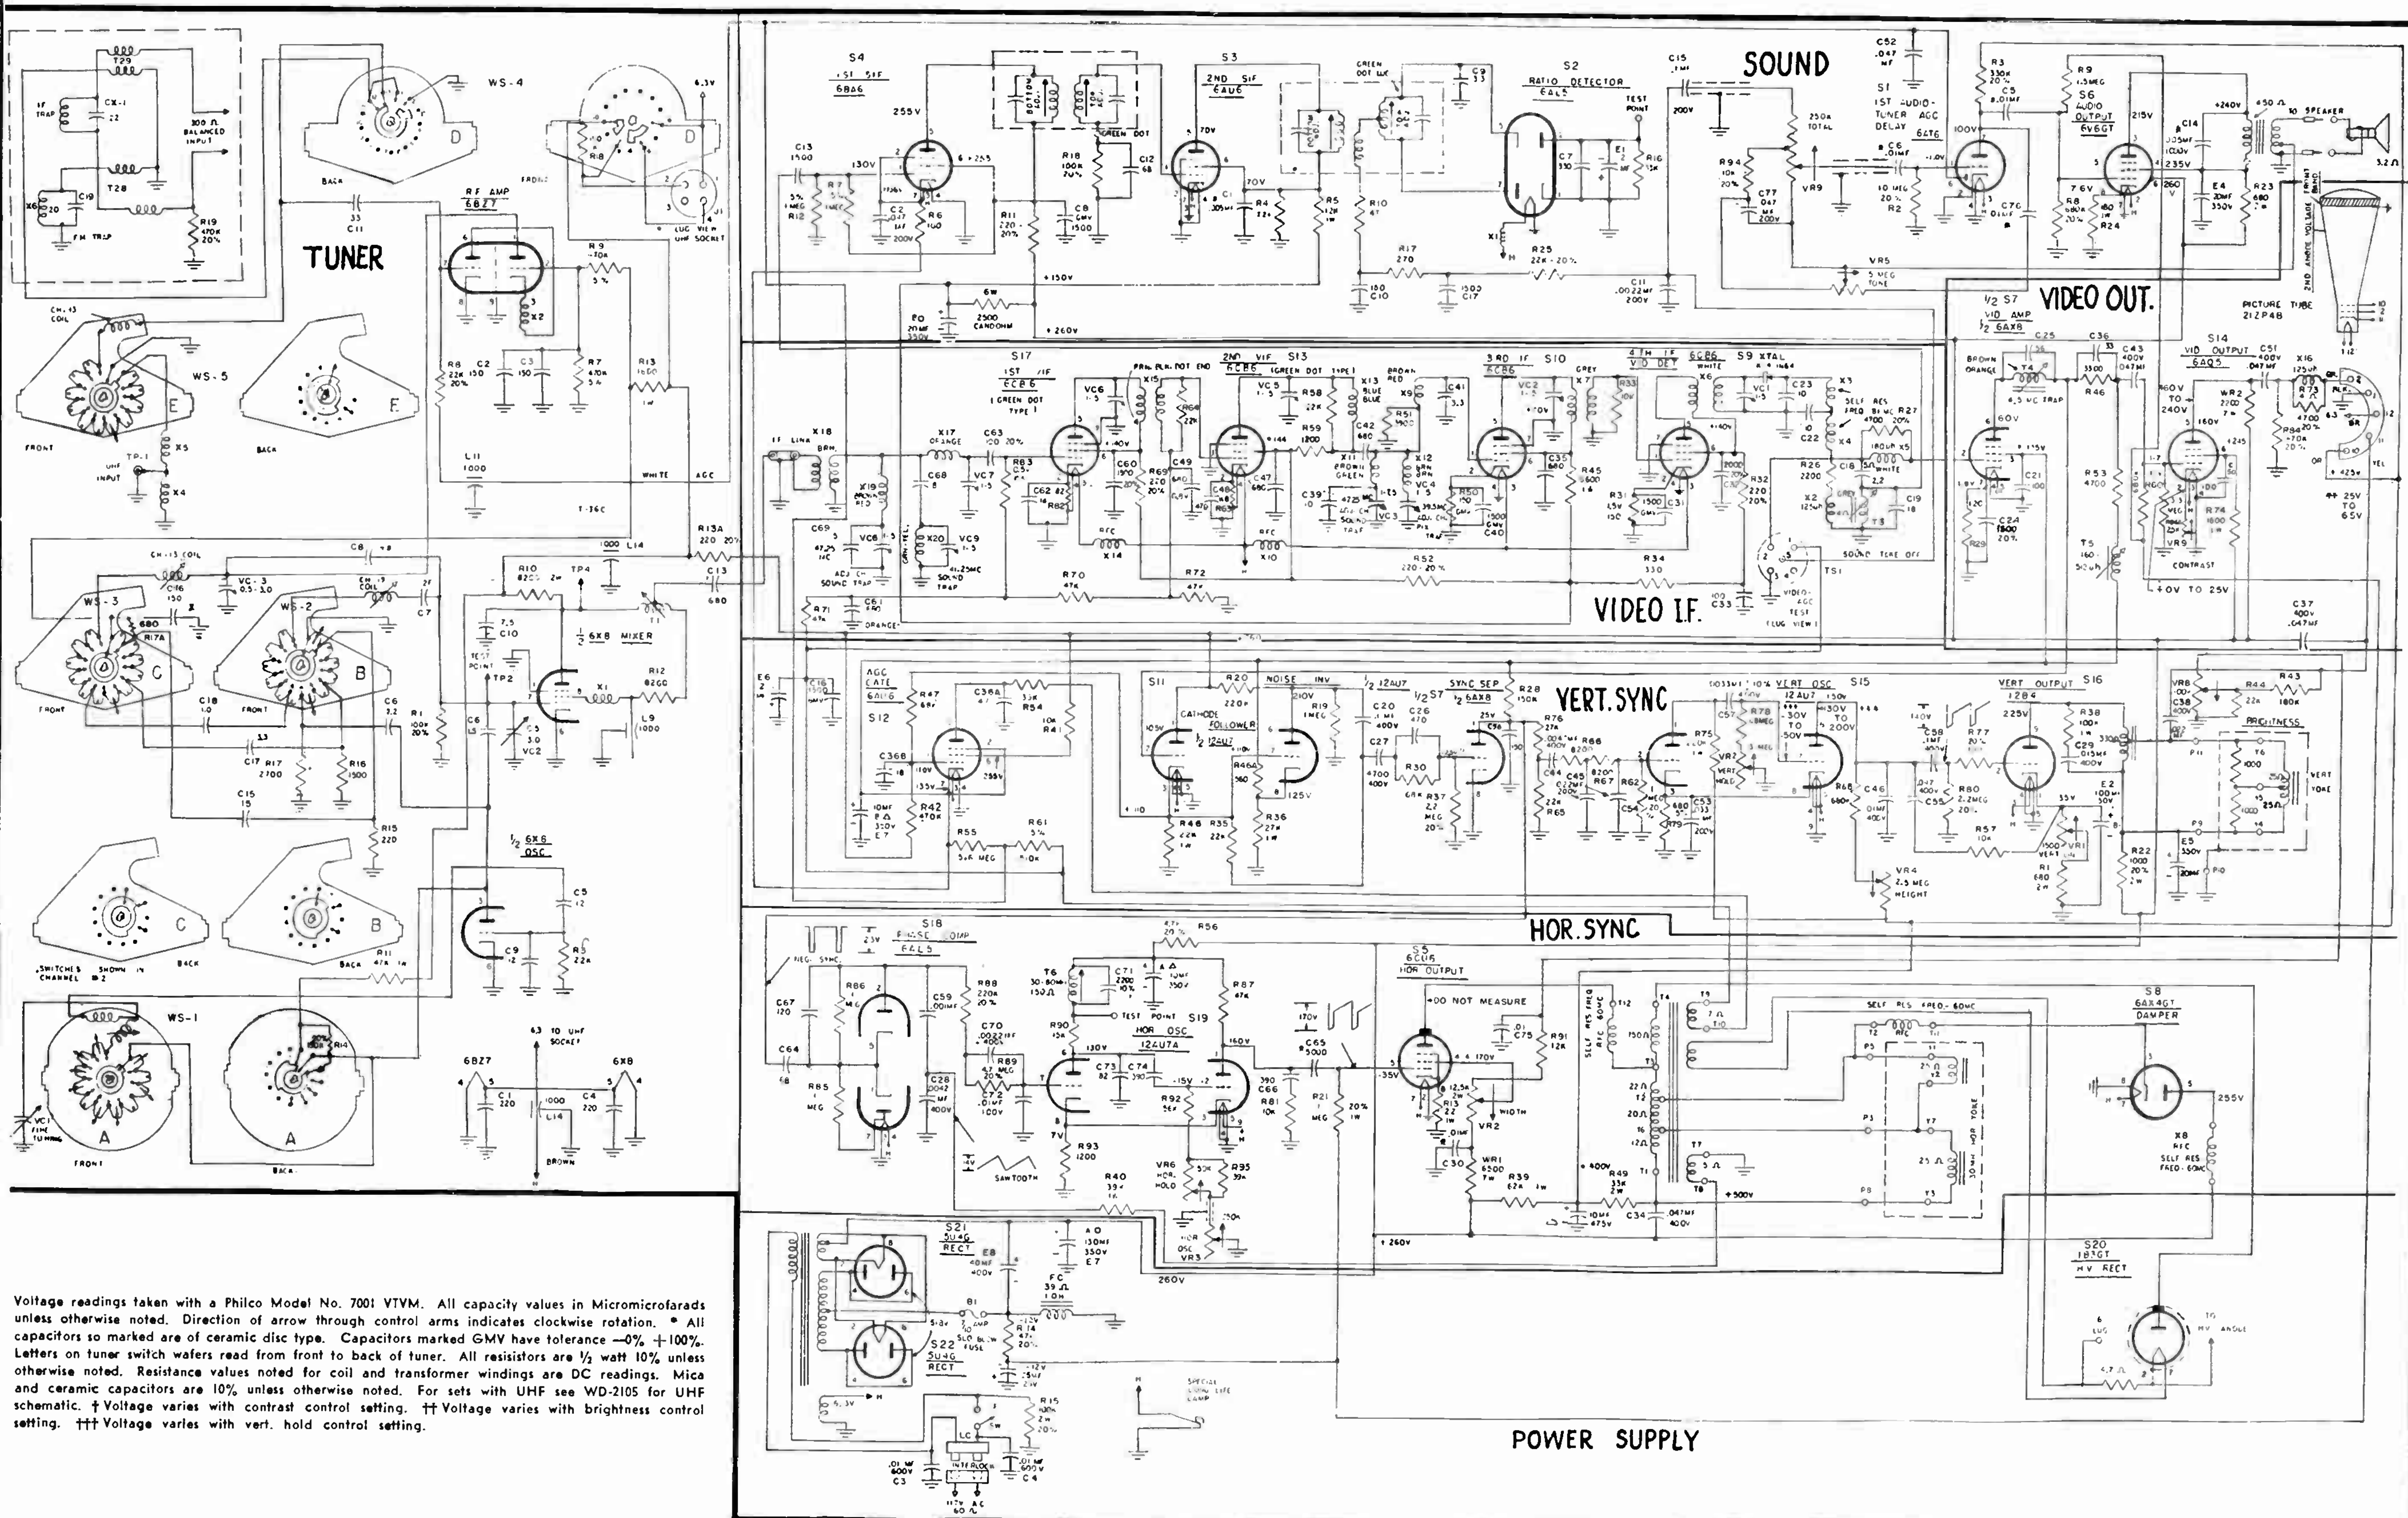

Voltage readings taken with a Philco Model No. 7001 VTVM. All capacity values in Micromicrofarads unless otherwise noted. Direction of arrow through control arms indicates clockwise rotation. • All capacitors so marked are of ceramic disc type. Capacitors marked GMV have tolerance —0% +100%. Letters on tuner switch wafers read from front to back of tuner. All resisistors are ½ watt 10% unless otherwise noted. Resistance values noted for coil and transformer windings are DC readings. Mica and ceramic capacitors are 10% unless otherwise noted. For sets with UHF see WD-2105 for UHF schematic. † Voltage varies with contrast control setting. †† Voltage varies with brightness control setting. ††† Voltage varies with vert. hold control setting.

Alignment Procedure

NECESSARY EQUIPMENT

Television Sweep Generator
Marker Freq. Generator
Vacuum Tube Voltmeter
4.5 Mc fixed freq. Generator or equivalent

I.F. ALIGNMENT

1. Connect VTVM and the input terminal of the scopes' vertical amplifier to the juncture of 8200 ohm resistor and 410 uh choke - this is immediately following the video detector, the 8200 ohms being the resistor portion of the detector load. I.F. signal may be introduced by means of a miniature tube shield floated over the 6AG5 mixer tube.
2. With the sweep off and the marker freq. set to 23.3 mc, adjust the 1st and 3rd I.F. coils for maximum response, as indicated by VTVM. Generator should be attenuated so as not to provide more than threshold sensitivity (1 volt on VTVM at fixed freq., 1/2 volt on sweep.)
3. Re-set marker frequency to 25.6 mc and adjust 2nd and 4th I.F. transformers for maximum VTVM indication, as above.
4. With sweep turned on observe I.F. curve shape on oscilloscope - the knee of the curve should be at approximately 23.5 & 25.5 mc. If original alignment did not produce satisfactory curve, it may be modified by adjusting the I.F. tuning slightly, while observing the curve on the scope. Care must be taken that both peaks are approximately the same height and that the mid-portion of the curve is not down more than about 2 db. The sound rides at 21.6 mc and this point should be checked to make sure that it is at least 26db below the flat top. The picture frequency rides the curve at 26.1 mc and should be 6 db down on the opposite side of the curve. The curve should be about 3 mc wide at 6db down (1/2 way down).

SOUND ALIGNMENT

1. Connect 4.5 mc generator to the grid of the video amplifier tube (there again, low signal level is important, so that limiting action does not occur.) Metering may be accomplished at the sound take-off point of the ratio and detector (at the juncture of the 15,000 ohm resistor and the 3900 mmf capacitor).
2. Adjust the top and bottom slugs on the sound trans for maximum response.
3. Adjust primary of ratio detector (top slug) to maximum.
4. Connect meter ground to the juncture of the two 6800 ohm resistors off the sound detector, and adjust the bottom slug on ratio detector to Zero voltage.

R.F. ALIGNMENT

The R.F. Tuner in this receiver has been pre-aligned by the manufacturer, and it is not recommended that adjustment be made in the field, especially since the fine tuning control will move the oscillator at least 3/4 mc on the low channels and 2 mc on the high channels.

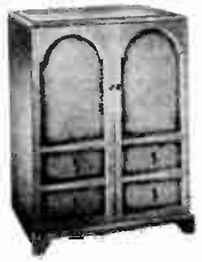
Models 21-T-322, 21-T-322U "Dobson" Mahogany, Oak



Models 21-T-323, 21-T-323U "Lexington" Maple, Red Cherry

Models 21-T-324, 21-T-324U "Stockton" Mahogany, Walnut

GENERAL DESCRIPTION

All models are "21 inch" television receivers. Models 21-T-303, 21-T-313, 21-T-313G, 21-T-314, 21-T-314G, 21-T-315, 21-T-316, 21-T-322, 21-T-323 and 21-T-324 are identical except for cabinets and speakers. Models 21-T-313G and 21-T-314G employ a 21EP4 glass kinescope but are otherwise identical. These receivers feature full twelve channel VHF coverage.

Models 21-T-303U, 21-T-313U, 21-T-313GU, 21-T-314U, 21-T-314GU, 21-T-315U, 21-T-316U, 21-T-322U, 21-T-323U and 21-T-324U are identical except for cabinets and speakers. Models 21-T-313GU and 21-T-314GU employ a 21EP4 glass kinescope but are otherwise identical. These receivers feature full twelve channel VHF coverage plus any four UHF channels.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE 227 sq. ins. on a 21AP4 or a 21EP4 Kinescope

TELEVISION R-F FREQUENCY RANGE

Models 21-T-303, 313, 313G, 314, 314G, 315, 316, 322, 323 & 324
Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

Models 21-T-303U, 313U, 313GU, 314U, 314GU, 315U, 316U, 322U, 323U & 324U
Any desired combination of 16 VHF and/or UHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc., 470 mc. to 890 mc.

PICTURE CARRIER FREQUENCY .... 45.75 mc.

SOUND CARRIER FREQUENCY .... 41.25 mc.

AUDIO POWER OUTPUT RATING ...... 4.0 watts max.

VIDEO RESPONSE .... To 3.5 mc.

SWEEP DEFLECTION .... Magnetic

FOCUS .... Magnetic

POWER SUPPLY RATING

KCS82 and KCS82A chassis ...... *115 volts, 60 cycles, 215 watts*
KCS82B chassis ...... *115 volts, 60 cycles, 230 watts*

RECEIVER ANTENNA INPUT IMPEDANCE

KCS82 chassis (KRK11B Tuner)
Choice: 300 ohms balanced or 72 ohms unbalanced.

KCS82A chassis (KRK22A Tuner)
Choice: 300 ohms balanced or 72 ohms unbalanced.

KCS82B chassis (KRK12 Tuner)
UHF—Choice: 300 ohms balanced or 72 ohms unbalanced.
VHF—300 ohms balanced.

LOUDSPEAKERS

Models 21-T-303, 21-T-303U .... (971636-1) 5" PM, 3.2 ohms
Models 21-T-313, 21-T-313G, 21-T-313U, 21-T-313GU (971490-3) 8" PM, 3.2 ohms
Models 21-T-314, 21-T-314G, 21-T-314U, 21-T-314GU, 21-T-315, 21-T-315U, 21-T-316, 21-T-316U, 21-T-322, 21-T-322U (971692-1) 10" PM, 3.2 ohms
Models 21-T-323, 21-T-323U, 21-T-324, 21-T-324U (92569-12) 12" PM, 3.2 ohms

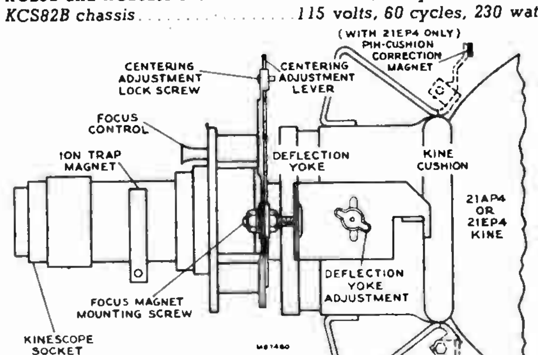


Figure 2—Yoke and Focus Magnet Adjustments

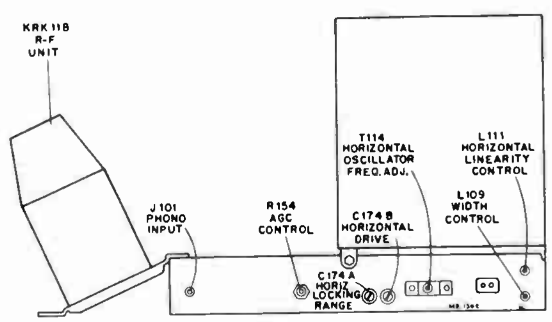

Figure 3—Rear Chassis Adjustments

ADJUSTMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync over the balance of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments.

Horizontal Frequency Adjustment.—Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the T114 horizontal frequency adjustment at the rear of the chassis until the picture is just out of sync and the horizontal blanking appears as a vertical or diagonal black bar in the raster. Then turn the T114 core until the bar moves out of the picture leaving it in sync.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 rear core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C174A slightly clockwise. If less than 2 bars are present, adjust C174A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the conditions specified under each are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If it is impossible to sync the picture at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure on page 16. For field purposes paragraph "B" under Horizontal Oscillator Waveform Adjustment may be omitted.

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R176 under front control panel) until the picture fills the mask vertically. Adjust vertical linearity (R186 under front control panel), until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust centering to align the picture with the mask.

FOCUS.—Adjust the focus control for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

Recheck the position of the ion trap magnet to make sure that maximum brightness is obtained.

Check to see that the yoke thumbscrew and the focus magnet mounting screws are tight.

KRK11B R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 11. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 4. Adjustment for channel 13 is on top of the chassis.

KRK22A R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 13. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 5. Adjustment for channel 13 is C3 on top of the tuner chassis.

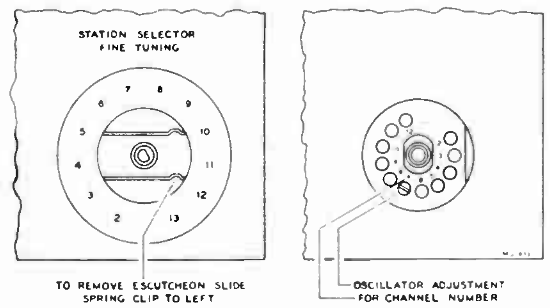

Figure 5—KRK22A R-F Oscillator Adjustments

KRK12 R-F OSCILLATOR ADJUSTMENTS.—Set the fine tuning control to the center of its range on the channel to be adjusted. Adjust the oscillator core for this channel to obtain maximum audio output without distortion. The adjustment location is the same for all channels, see figure 6. The insert in the operating position can be determined by a stamping on the insert drum. This stamping is visible through either the front or rear apertures as shown in figure 6.

AGC THRESHOLD CONTROL.—The AGC threshold control R154 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal and sync the picture. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R154. If the picture requires an appreciable portion of a second to reappear, or bends excessively, R154 should be readjusted.

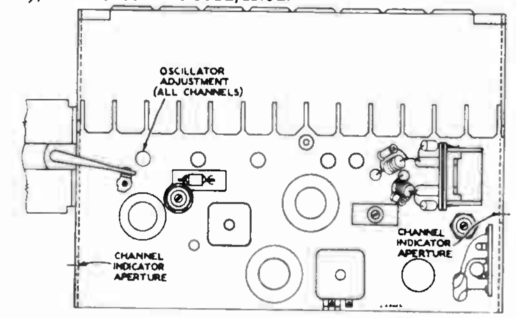

Figure 6—KRK12 Oscillator Adjustment

Turn R154 fully counter-clockwise. The raster may be bent slightly. This should be disregarded. Turn R154 clockwise until there is a very, very slight bend or change of bend in the picture. Then turn R154 counter-clockwise just sufficiently to remove this bend or change of bend.

If the signal is weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R154 clockwise until the snow in the picture becomes more pronounced, then counter-clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far clockwise on a weak signal, then the receiver may overload when a strong signal is received.

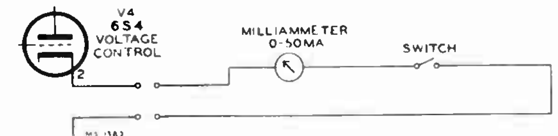

Figure 9—KRK12 Voltage Control Adapter

FM TRAP ADJUSTMENT.—In some instances interference may be encountered from a strong FM station signal. A trap is provided to eliminate this type of interference. To adjust the trap tune in the station on which the interference is observed and adjust the FM trap for minimum interference in the picture. The trap is L58 on KRK11B tuners or L53 on KRK22A tuners and is located on the antenna matching transformer.

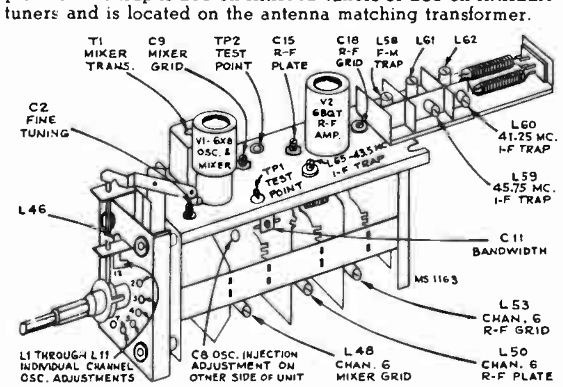

Figure 14—KRK11B Tuner Adjustments

CAUTION.—In some receivers, the FM trap L53 or L58 will tune down into channel 6 or even into channel 5. Needless to say, such an adjustment will cause greatly reduced sensitivity on these channels. If channels 5 or 6 are to be received, check L53 or L58 to make sure that it does not affect sensitivity on these two channels.

The FM trap on models using the KRK12 Tuner is fastened to the receiver antenna cable and is adjusted in the same manner as described above.

Replace the cabinet back and connect the receiver antenna leads to the cabinet back. Make sure that the screws holding it are up tight, otherwise it may rattle or buzz when the receiver is operated at high volume.

21	If the response of any channel (steps 16 through 20) is below 80% at either marker, adjust L41, L44 and L46 as necessary to obtain proper response yet maintain correct response on channel 8.									
22	Repeat steps 14 through 20 until all adjustments are obtained.									

ALIGNMENT TABLE

THE DETAILED ALIGNMENT PROCEDURE BEGINNING ON PAGE 8 SHOULD BE READ BEFORE ALIGNMENT BY USE OF THE TABLE IS ATTEMPTED

Step No.	CONNECT VHF SIGNAL GENERATOR TO	SIGNAL GEN. FREQ. MC.	CONNECT VHF SWEEP GENERATOR TO	SWEEP GEN. FREQ. MC.	CONNECT HETERODYNE FREQ. METER TO	HET. METER FREQ. MC.	CONNECT OSCILLOSCOPE TO	MISCELLANEOUS CONNECTIONS AND INSTRUCTIONS	ADJUST	REFER TO
	KRK11B TUNER ALIGNMENT									
1	If unit is completely out of adjustment, preset all adjustments to center of range with following exceptions. Set C18 so that head is ⅜" above chassis. Set C11 ¼ turn from max. clockwise. Disconnect link from T104 and terminate with 39 ohms. Connect bias supply between AGC terminal on tuner and ground. Adjust bias for −3.5V at terminal 3. Set fine tuning 30 degrees clockwise from mechanical center of its range.									
2	Grid, pin 7 of V2 through 1500 mmf.	43.5 mc. 30% mod.	Not used	—	Not used	—	TP1. Gain to maximum	Set r-f unit on channel 2	L65 for min. indication on scope	Fig. 14
3	Not used	—	Not used	—	Loosely to r-f unit oscillator	227 mc.	Not used	R-F unit on channel 8	C2 for beat on freq. meter	Fig. 14
4	Antenna terminals loosely	181.25 and 185.75	Antenna terminals through pad	Channel 8	Not used	—	TP1. Gain to maximum	R-F unit on channel 8. Set T1 max. counterclockwise	C9, C11, C15 and C18 for response shown in in Fig. 16	Fig. 14 Fig. 16
5	Not used	—	Not used	—	Loosely to r-f unit oscillator	129 mc.	Not used	R-F unit on channel 6	L5 for beat on het. freq. meter	Fig. 17
6	Antenna terminals loosely	83.25 and 87.75	Antenna terminals through pad	Channel 6	Not used	—	TP1. Gain to maximum	"	L48, L50 and L53 for response shown in Fig. 16	Fig. 14 Fig. 16
7	Not used	—	Not used	—	Not used	—	Not used	On channel 6. Connect "VoltOhmyst" to TP1	C8 for −3.5 volts on meter	Fig. 14
8	Antenna terminals loosely	83.25 and 87.75	Antenna terminals through pad	Channel 6	Not used	—	TP1. Gain to maximum	R-F unit on channel 6	Check response. Readjust L48, L50 and L53 if necessary	Fig. 14 Fig. 16
9	Not used	—	Not used	—	Loosely to r-f unit oscillator	227 mc.	Not used	R-F unit on channel 8	C2 for beat on freq. meter	Fig. 14
10	Antenna terminals loosely	181.25 and 185.75	Antenna terminals through pad	Channel 8	Not used	—	TP1. Gain to maximum	"	Check response adjust C9, C11, C15 and C18 if necessary	Fig. 14
11	If C9 was readjusted in step 10, repeat step 7, step 9 and step 10 until the conditions specified in each step are fulfilled without additional adjustments.									
12	Not used	—	Not used	—	Loosely to r-f unit oscillator	257 mc.	Not used	Rec. on channel 13	L46 for beat on het. freq. meter. Overshoot L46 slightly and adjust C2 for beat	Fig. 14
13	Antenna terminals loosely	211.25 215.75	Antenna terminals through pad	Channel 13	Not used	—	TP1. Gain to maximum	Rec. on channel 13 "VoltOhmyst" on TP1	Check to see that response is correct and −3.0 volts of osc. injection is present	Fig. 16
14	"	205.25 209.75	"	Channel 12	Not used	—	"	Rec. on channel 12	"	Fig. 16
15	"	199.25 203.75	"	Channel 11	"	—	"	Rec. on channel 11	"	Fig. 16
16	"	193.25 197.75	"	Channel 10	"	—	"	Rec. on channel 10	"	Fig. 16

TUNER UNIT WIRING DIAGRAMS

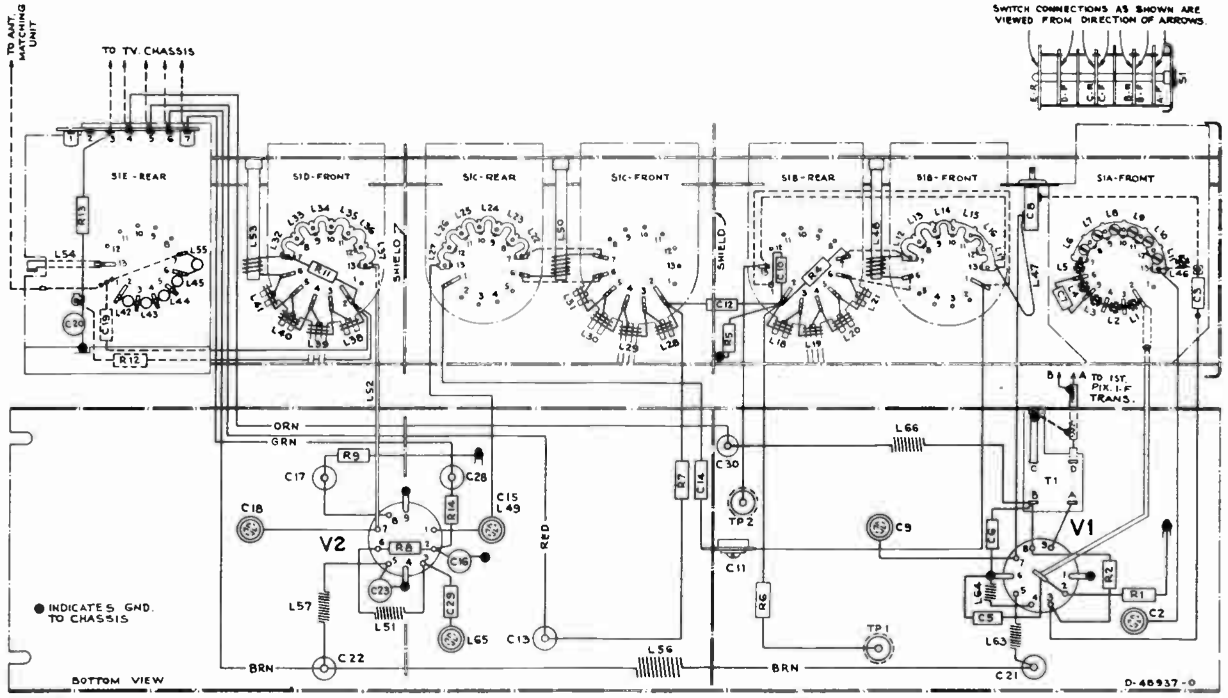

Figure 79—KRK11B Tuner Unit Wiring Diagram

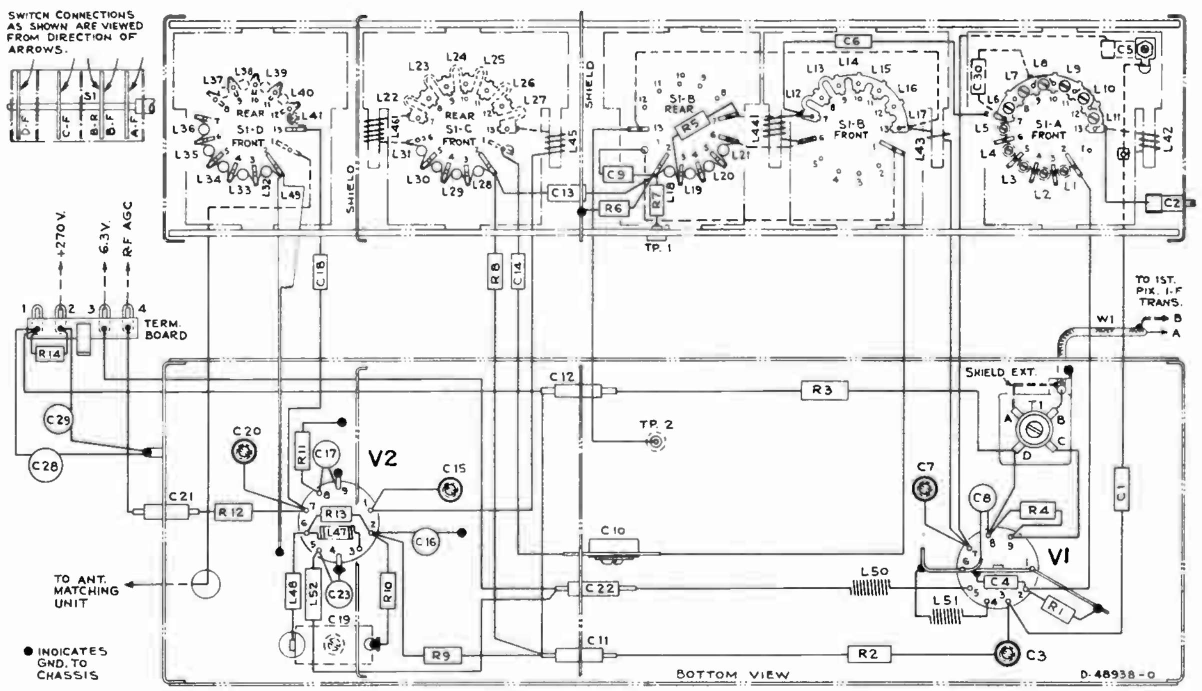

Figure 80—KRK22A Tuner Unit Wiring Diagram

TUNER UNIT WIRING DIAGRAM

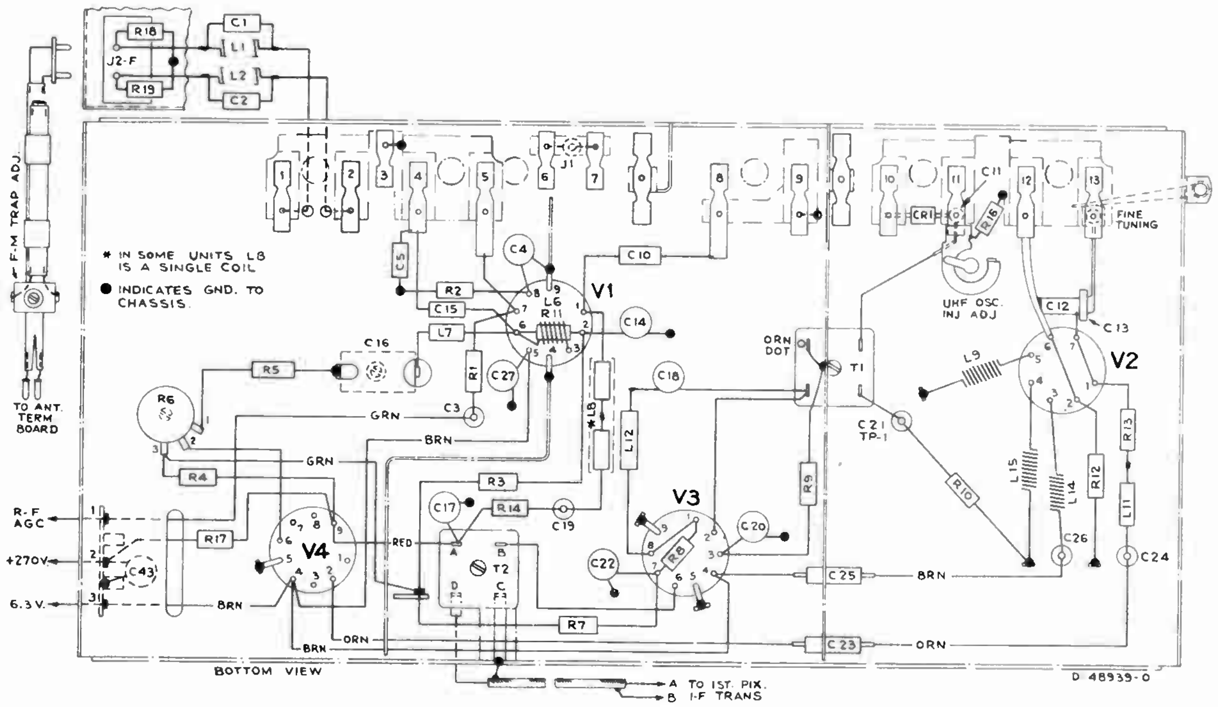

Figure 81—KRK12 Tuner Unit Wiring Diagram

CRITICAL LEAD DRESS

(1) Keep all wiring in the pix i-f, sound i-f and video circuits as short as possible.

(2) Keep the leads on C127, C128, C129, C130, C131, C132, C133 and C135 as short and direct as possible.

(3) Do not run any leads under C119 trimmer capacitor.

(4) Do not change the bus wire connection to pins 2 and 8 of V101 and V102. Sleeving is used on these wires to insure length and to prevent shorting.

(5) Dress C143 close to chassis.

(6) Keep leads on R129 as short and direct as possible.

(7) Keep C134 up and away from chassis with not more than ¼" lead at each end to terminal.

(8) Dress the lead from T106-C to terminal board close to chassis.

(9) Keep all filament leads dressed close to chassis.

(10) Keep leads on R116 as short and direct as possible.

(11) Ground the filaments of sockets V106, V107 and V108 independently of the tube shields (pin 8). Use ground lances provided near each socket.

(12) Keep leads to L105 (4.5 mc. trap) as short as possible.

(13) Do not run any leads other than the 135 v. and 270 v. bus wires under the lead from T105-B to pin 2 of V110.

(14) Dress L104 and L106 peaking coils up from chassis.

(15) Dress R157, R141, R162, R192, R142, L106, L102, L107, C139, C171 and R138 up from chassis.

(16) Do not tape lead to kinescope cathode in with other leads.

(17) Keep leads on C144 short and direct.

(18) Keep the leads on R209 as short and direct as possible.

(19) Dress C183 to provide access to adjustment of T114.

(20) Keep C167 and C169 dressed close to chassis.

(21) Dress all leads in the high voltage compartment away from each other and away from the high voltage transformer.

(22) C109 should be centered and held in place by shield.

(23) Do not change dress of the audio cable.

(24) Do not change grounding of R110A or R110B.

(25) Dress the lead from pin 1 of V111 around power transformer side nearest apron.

(26) Keep C110 and C111 dressed apart from each other.

(27) Keep AC switch leads away from tubes on top of chassis.

(28) Dress all leads away from T104 as far as possible.

(29) Keep leads to pin 1 of V114 up away from chassis.

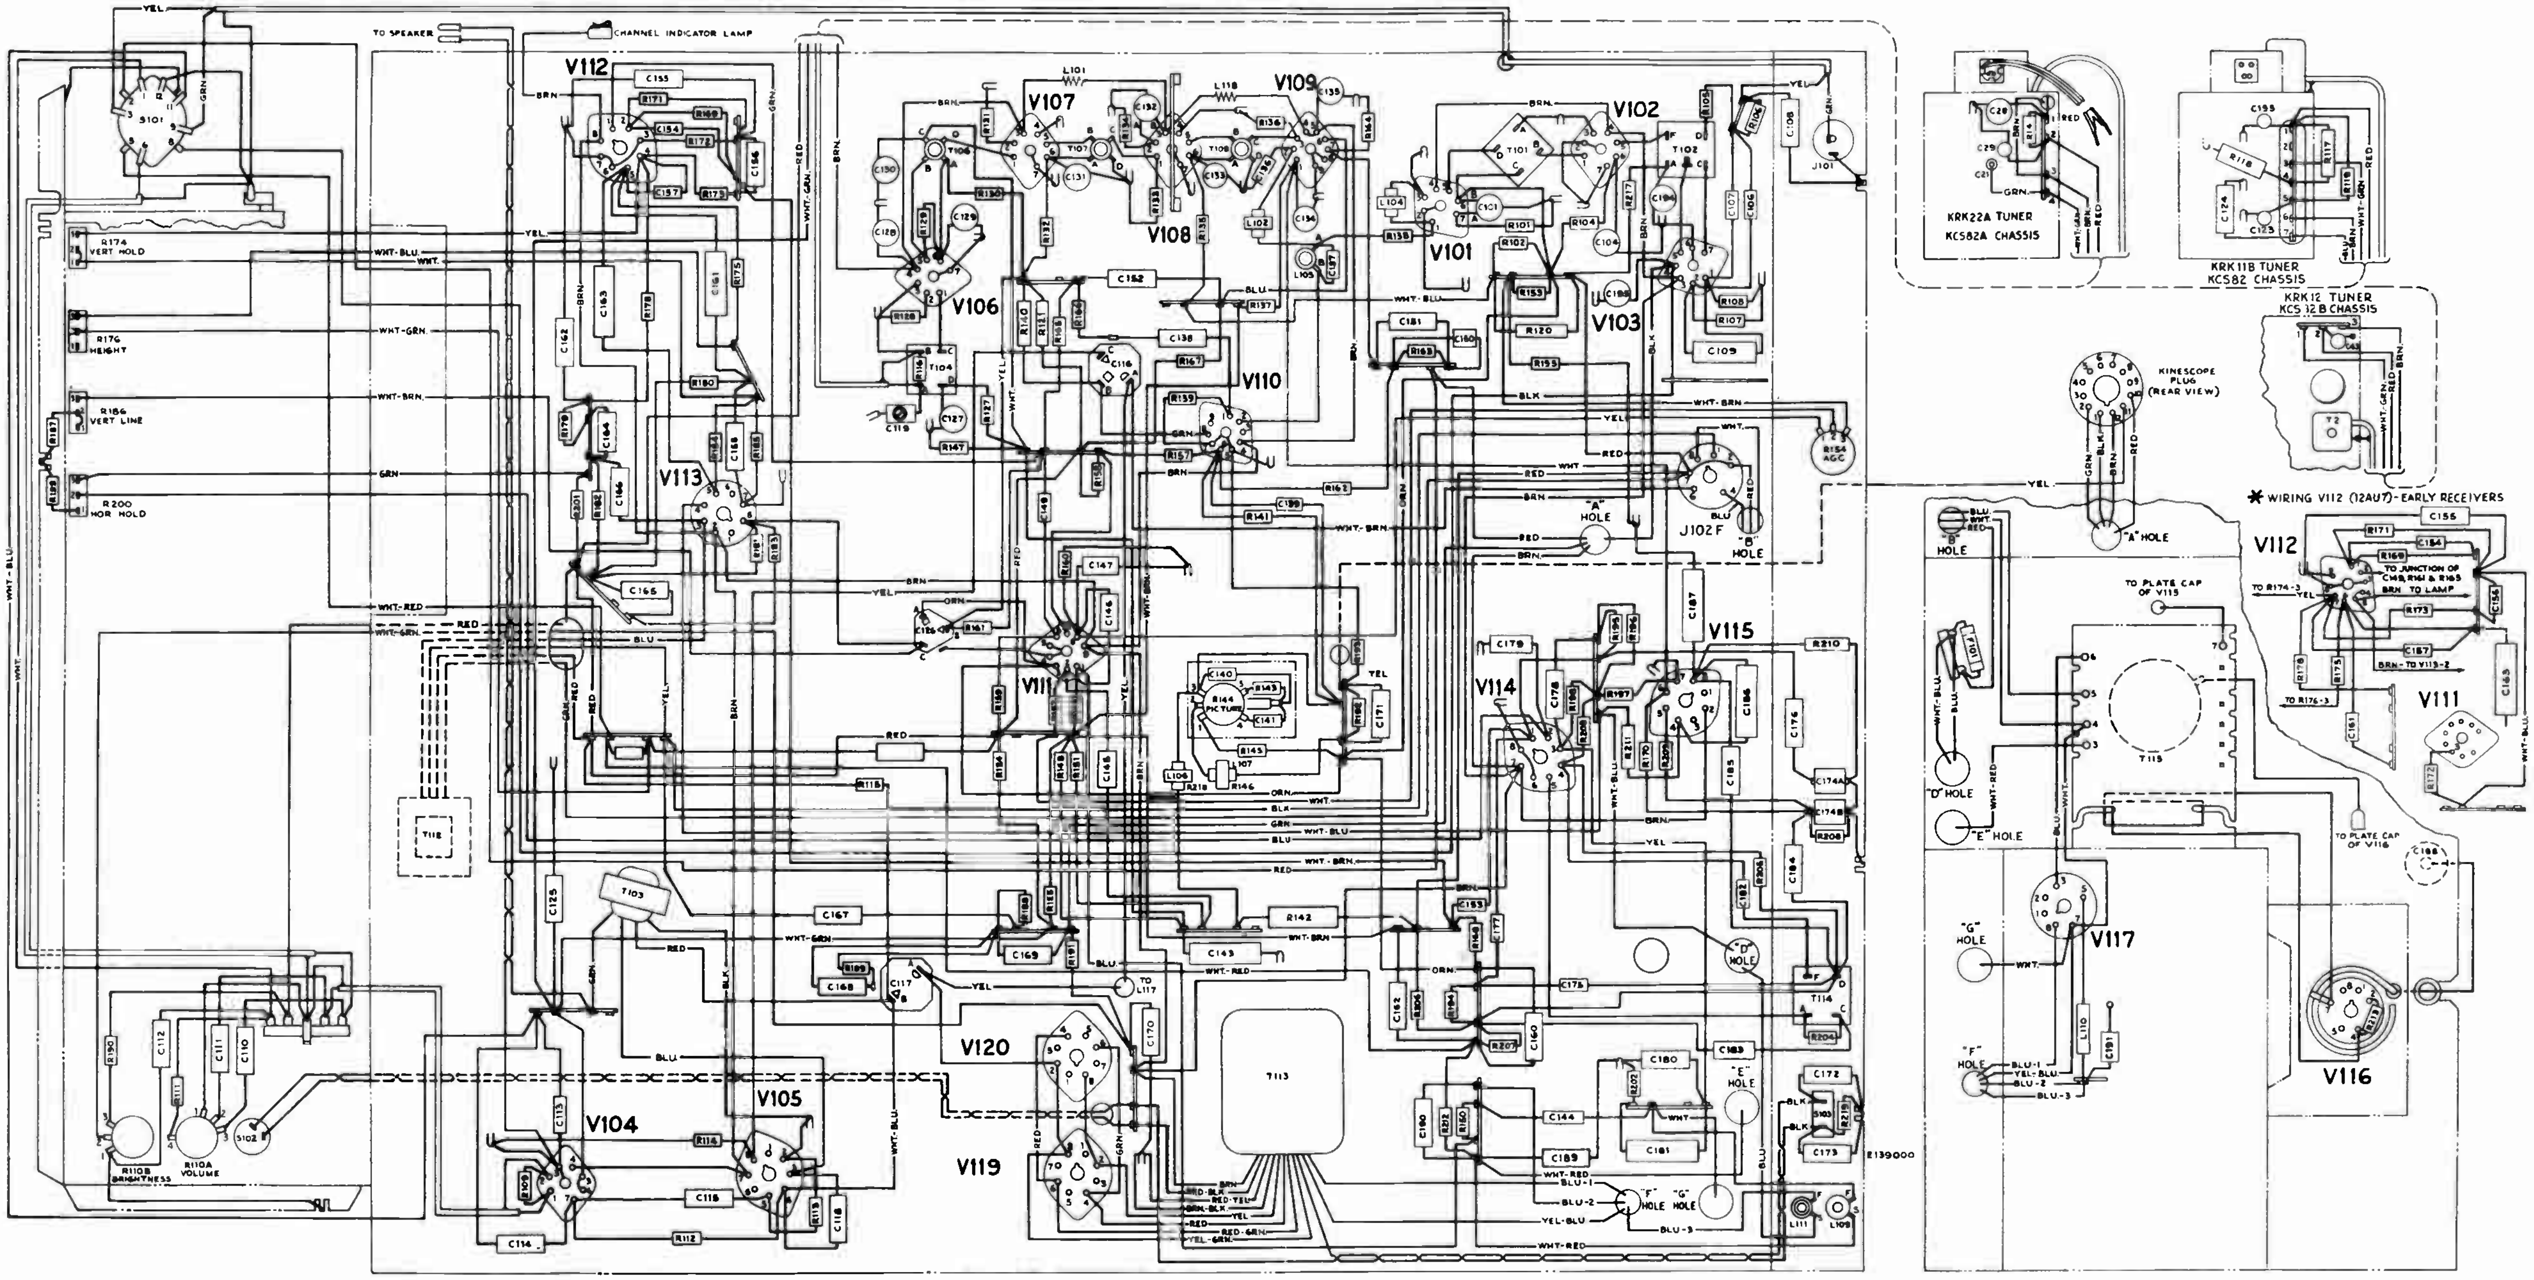

Figure 82—Chassis Wiring Diagram, KCS82, KCS82A & KCS82B

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 15000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

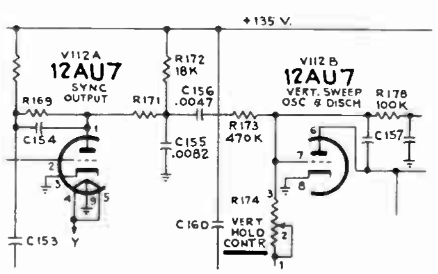
PRODUCTION CHANGES IN KCS82, KCS82A AND KCS82B

The schematics are shown in the latest condition. The note below tells how early receivers differed from the schematics shown above and on pages 38 and 40.

In early production receivers V112 was a 12AU7 and was connected as shown below.



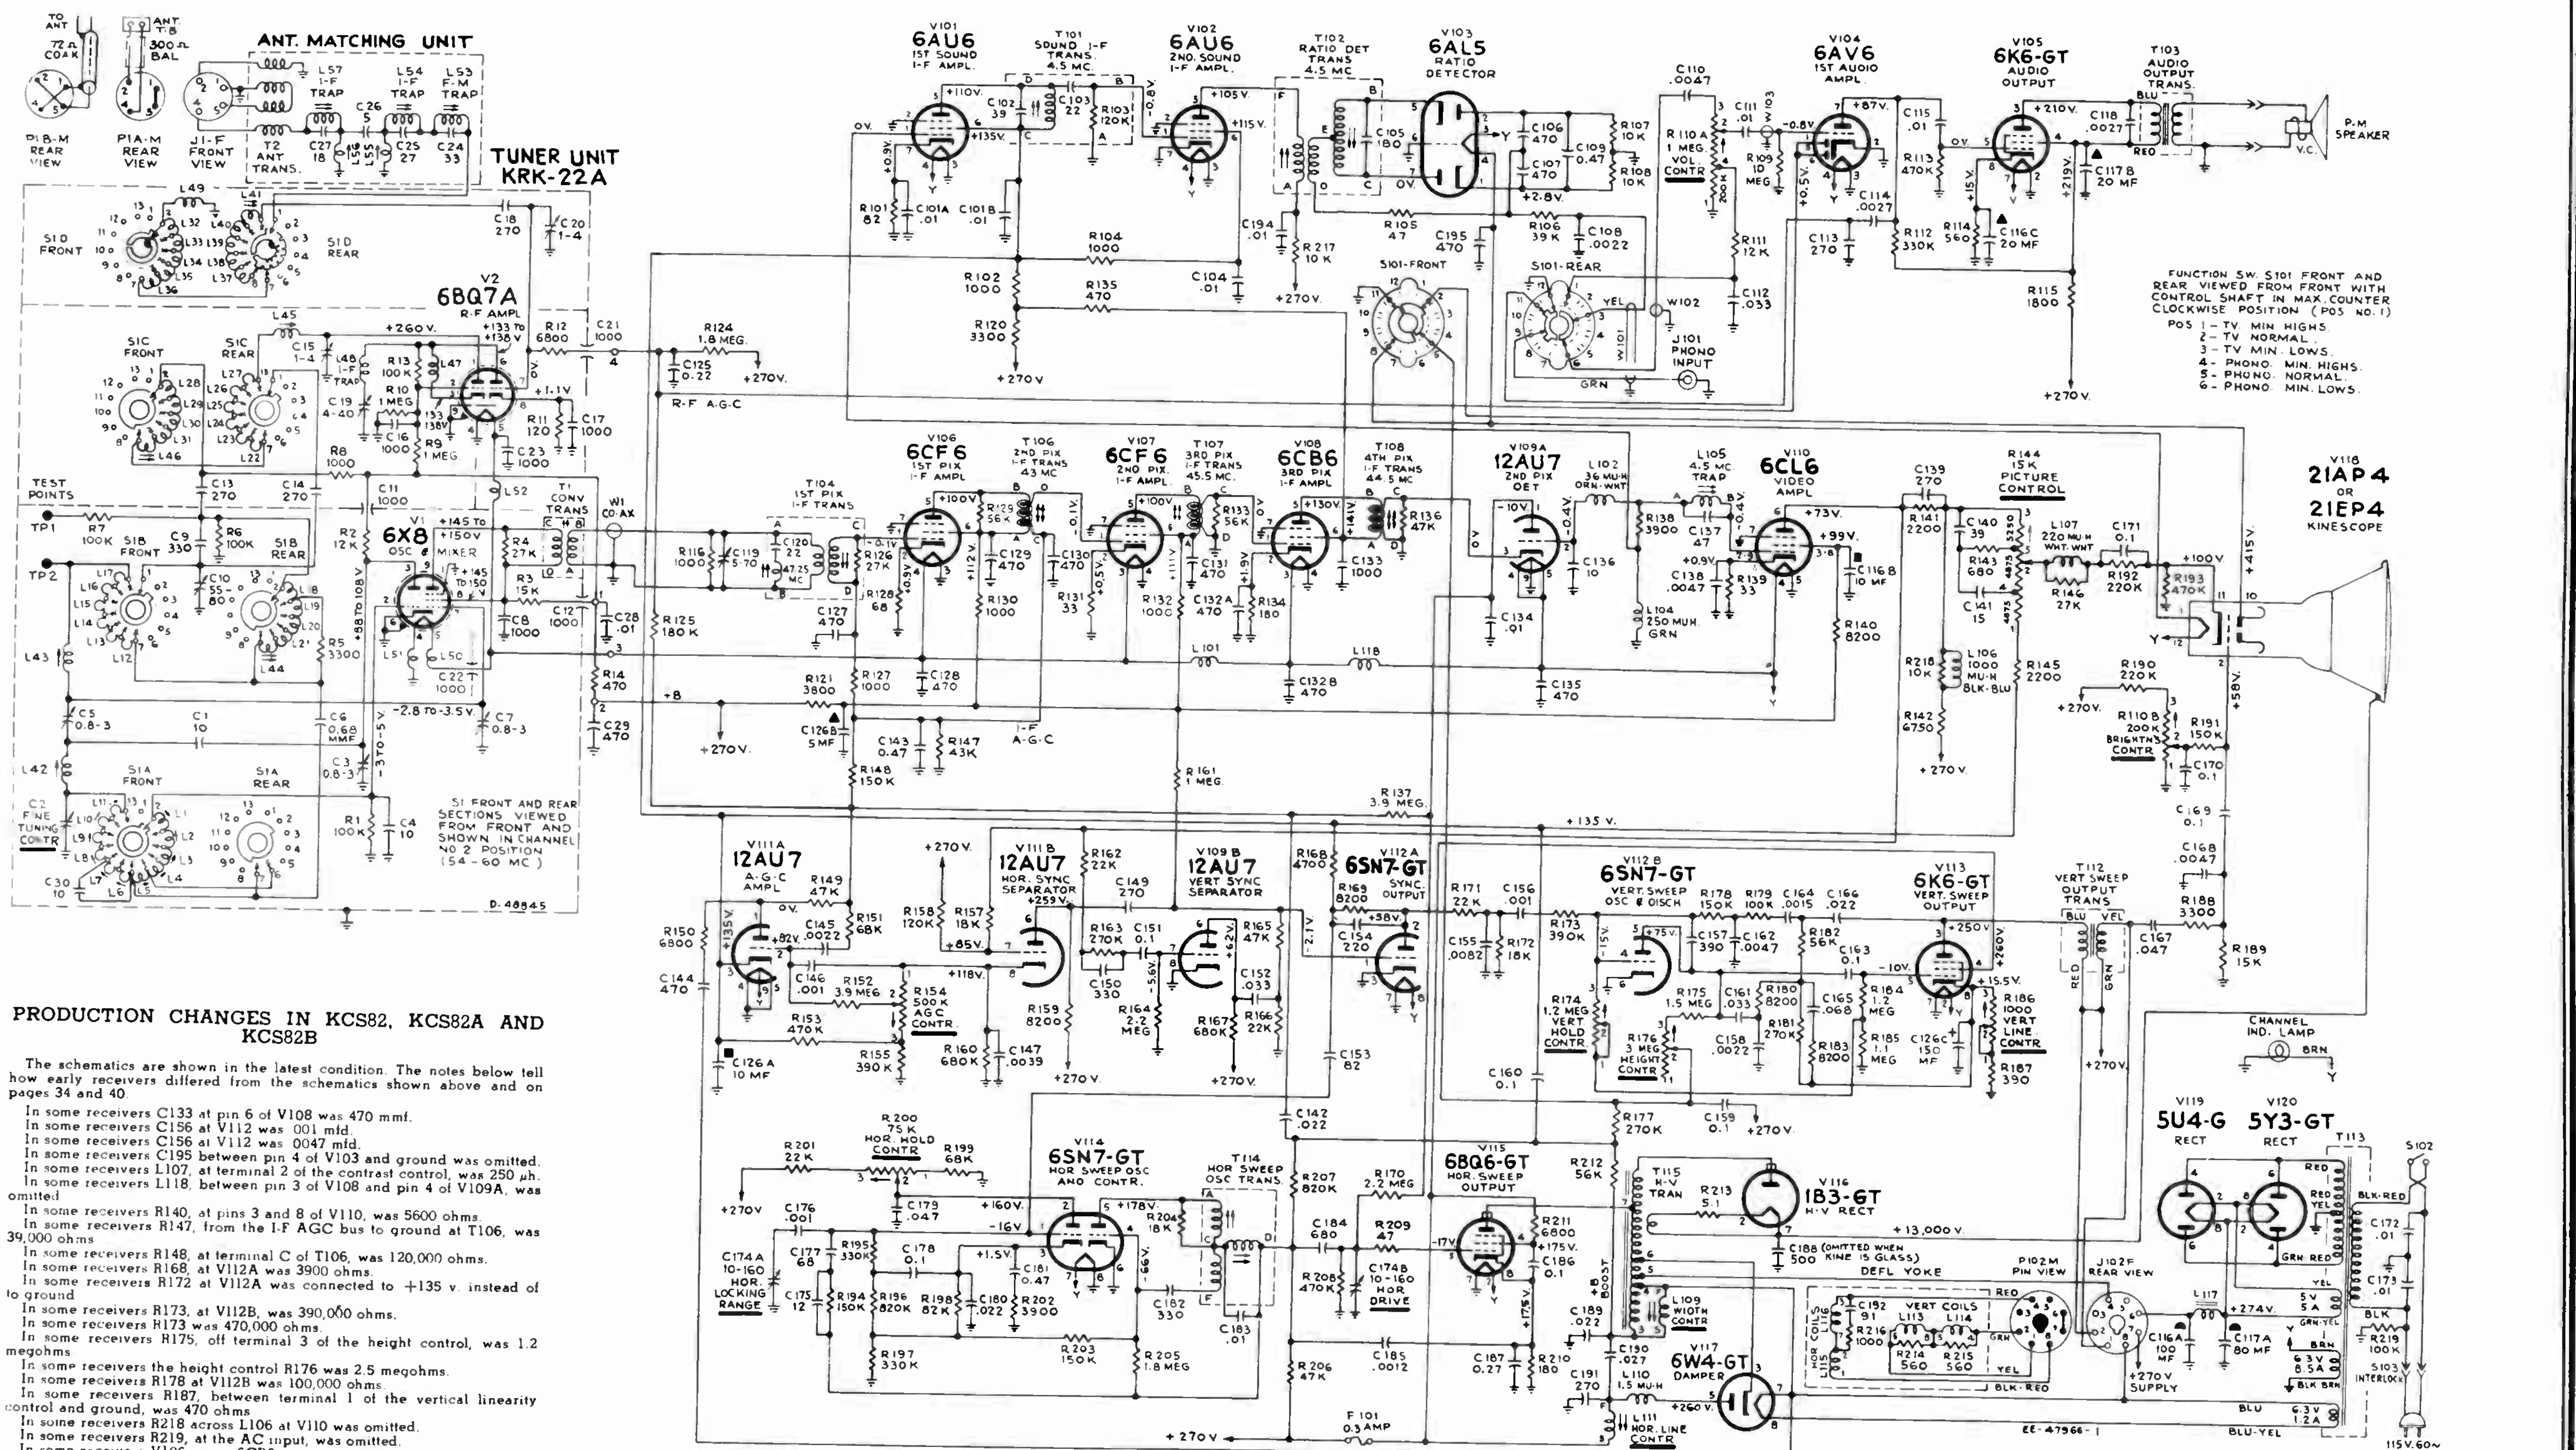
The schematic is shown in the latest condition at the time of printing.
All resistance value in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

Figure 83—Circuit Schematic Diagram KCS82



PRODUCTION CHANGES IN KCS82, KCS82A AND KCS82B

The schematics are shown in the latest condition. The notes below tell how early receivers differed from the schematics shown above and on pages 34 and 40.

In some receivers C133 at pin 6 of V108 was 470 mmf.
In some receivers C156 at V112 was .001 mfd.
In some receivers C156 at V112 was .0047 mfd.
In some receivers C195 between pin 4 of V103 and ground was omitted.
In some receivers L107, at terminal 2 of the contrast control, was 250 μh.
In some receivers L118, between pin 3 of V108 and pin 4 of V109A, was omitted.
In some receivers R140, at pins 3 and 8 of V110, was 5600 ohms.
In some receivers R147, from the I-F AGC bus to ground at T106, was 39,000 ohms.
In some receivers R148, at terminal C of T106, was 120,000 ohms.
In some receivers R168, at V112A was 3900 ohms.
In some receivers R172 at V112A was connected to +135 v. instead of to ground.
In some receivers R173, at V112B, was 390,000 ohms.
In some receivers R173 was 470,000 ohms.
In some receivers R175, off terminal 3 of the height control, was 1.2 megohms.
In some receivers the height control R176 was 2.5 megohms.
In some receivers R178 at V112B was 100,000 ohms.
In some receivers R187, between terminal 1 of the vertical linearity control and ground, was 470 ohms.
In some receivers R218 across L106 at V110 was omitted.
In some receivers R219, at the AC input, was omitted.
In some receivers V106 was a 6CB6.
In some receivers V107 was a 6CB6.
In Models 21-T-313G, 314G, 313GU and 314GU the kinescope V118 is a 21EP4.
In some receivers the heater terminals 2 and 7 of V105 were reversed.
In some receivers V112 was a 12AU7 (see page 33 for wiring).
In some receivers the heater terminals 2 and 7 of V115 were reversed.

The schematic is shown in the latest condition at the time of printing.
All resistance values in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

REPLACEMENT PARTS

STOCK No.	DESCRIPTION
76965	Capacitor—Ceramic, variable, for fine tuning—plunger type (C2)
71504	Capacitor—Fixed, headed-lead type, 0.68 mmf., ±20%, 500 volts (C7)
77151	Capacitor—Tubular, adjustable, steatite, 0.8-3 mmf. (C8)
75184	Capacitor—Ceramic, adjustable, 0.8-3.8 mmf., complete with adjusting stud (C9)
76532	Capacitor—Adjustable trimmer, steatite, 1-4 mmf. (C18)
	Capacitors—Ceramic, fixed, non-insulated:
93056	5 mmf., ±0.5 mmf., 500 volts DC, Temp. coef. = 0 (C26)
70597	8 mmf., ±1 mmf., 500 volts DC, Temp. coef. = 0 (C29)
• 55326	10 mmf., ±1 mmf., 500 volts DC, Temp. coef. = −80 (C3)
54207	18 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C27)
76557	22 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C19)
76558	22 mmf., ±10%, 500 volts DC, Temp. coef. = −750 Special—copper coated (C5)
70935	27 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C25)
76739	33 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C24)
76527	Capacitor—Mica trimmer, 55-80 mmf. (C11)

The schematic is shown in the latest condition at the time of printing.
All resistance value in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

Figure 85—Circuit Schematic Diagram KCS82B

STOCK No.	DESCRIPTION
75199	Capacitor—Fixed, ceramic, insulated, 270 mmf., ±20%, 500 volts DC, High "K" type (C12, C14)
75641	Capacitor—Fixed, ceramic, insulated, 390 mmf., ±10%, 500 volts DC, High "K" type (C10)
75166	Capacitor—Ceramic, 1500 mmf. (stand-off) (C13, C21, C22, C28, C30)
75610	Capacitor—Fixed, ceramic, insulated, 1500 mmf., ±20%, 500 volts DC, High "K" type (C6)
73748	Capacitor—Fixed, ceramic, 1500 mmf., +100%, −0%, 500 volts DC, High "K" disc (C16, C17, C20, C23)
73591	Coil—Antenna matching coil (2 req'd)
73477	Coil—Choke coil (L57)
77206	Coil—Filament choke coil (L56)
76763	Coil—Filament choke coil (L63, L64)
76562	Coil—RF amplifier coupling coil (L51)

STOCK No.	DESCRIPTION
77153	Coil—RF choke coil (L66)
76537	Coil—Shunt coil complete with adjustable core (L61)
76538	Coil—Shunt coil complete with adjustable core (L62)
76529	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r.f. section (L49, C15)
	Resistors—Fixed, composition:
503112	120 ohms, ±10%, ½ watt (R9)
503115	150 ohms, ±10%, ½ watt (R13)
503210	1000 ohms, ±10%, ½ watt (R7, R14)
503233	3300 ohms, ±10%, ½ watt (R4, R11, R12)
503247	4700 ohms, ±10%, ½ watt (R2)
503410	100,000 ohms, ±10%, ½ watt (R1, R5, R6)
503447	470,000 ohms, ±10%, ½ watt (R8)

STOCK No.	DESCRIPTION
76536	Transformer—Antenna matching transformer complete (T2, C24, C25, C26, C27, L58, L59, L60, L61, L62, J1)
77663	Transformer—Convertor transformer complete with adjustable core (T1, R3)
76535	Trap—I.F. trap
76542	Trap—I.F. trap (41.25 MC) complete with core (L60)
76541	Trap—I.F. trap (45.75 MC) complete with core (L59)
76540	Trap—F.M. trap complete with adjustable core (L58)
77853	Capacitor—Ceramic, variable, for fine tuning—plunger type (C2)
77913	Capacitor—Tubular, adjustable, steatite, 0.8-3.0 mmf. (C5)
71504	Capacitor—Fixed, headed-lead type, 0.68 mmf., ±20%, 500 volts DC (C6)
77151	Capacitor—Adjustable, steatite, 0.8-3.0 mmf. (C3, C7)

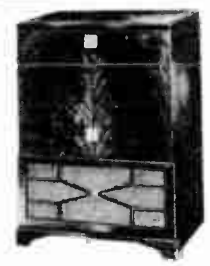
STOCK No.	DESCRIPTION
76532	Capacitor—Adjustable, steatite, 1-4 mmf. (C15, C20)
77616	Capacitor—Adjustable, mica, 4-40 mmf. (C19)
93056	Capacitor—Fixed, ceramic, non-insulated, 5 mmf., ±0.5 mmf., 500 volts DC, Temp. coef. = 0 (C26)
77865	Capacitor—Fixed, ceramic, non-insulated, 10 mmf., ±1.0 mmf., 500 volts DC, Temp. coef. = 0 (C1, C30)
78247	Capacitor—Fixed, ceramic, non-insulated, 10 mmf., ±1.0 mmf., 500 volts, Temp. coef. = −750 (C4)
54207	Capacitor—Fixed, ceramic, non-insulated, 18 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C27)
70935	Capacitor—Fixed, ceramic, non-insulated, 27 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C25)
76739	Capacitor—Fixed, ceramic, non-insulated, 33 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C24)
76527	Capacitor—Mica trimmer, 55-80 mmf. (C10)
75199	Capacitor—Fixed, ceramic, insulated, 270 mmf., ±20%, 500 volts DC, High "K" type (C13, C14, C18)
76552	Capacitor—Fixed, ceramic, insulated, 330 mmf., ±10%, 500 volts DC, High "K" type (C9)
77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, −0%, 500 volts DC, High "K" disc (C29)
77084	Capacitor—Ceramic, feed-thru, 1000 mmf. (C11, C12, C21, C22)
77252	Capacitor—Fixed, ceramic, 1000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C8, C16, C17, C23)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C28)
77854	Clip—Mounting clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T2)
73874	Coil—Channel #6 mixer coil (L44)
73460	Coil—Channel #6 r.f. plate coil (L46)
77915	Coil—Channel #13 oscillator coil (L42)
77919	Coil—Channel #13 mixer coil (L43)
77921	Coil—Channel #13 r.f. plate coil (L45)
77206	Coil—Filament choke coil (L52)
76763	Coil—Heater choke coil (L50, L51)
76562	Coil—RF amplifier coupling coil (L47)
76537	Coil—Shunt coil complete with adjustable core (L55)
76538	Coil—Shunt coil complete with adjustable core (L56)
	Resistor—Fixed, composition:
503112	120 ohms, ±10%, ½ watt (R11)
503147	470 ohms, ±10%, ½ watt (R14)
503210	1000 ohms, ±10%, ½ watt (R8)
503233	3300 ohms, ±10%, ½ watt (R5)
503268	6800 ohms, ±10%, ½ watt (R12)
523312	12,000 ohms, ±10%, 2 watts (R2)
523315	15,000 ohms, ±10%, 2 watts (R3)
502327	27,000 ohms, ±5%, ½ watt (R4)
503410	100,000 ohms, ±10%, ½ watt (R1, R6, R7, R13)
503510	1 megohm, ±10%, ½ watt (R9, R10)
77858	Transformer—Antenna matching transformer complete (T2, C24, C25, C26, C27, J1, L53, L54, L55, L56, L57)
77857	Transformer—Convertor transformer (T1)
76540	Trap—FM trap complete with adjustable core (L53)
77628	Trap—I.F. trap (L48)
76542	Trap—I.F. trap (41.25 MC) complete with core (L57)
76541	Trap—I.F. trap (45.75 MC) complete with core (L54)
77691	Capacitor—Fixed, headed-lead type, 33 mmf., ±10%, 500 volts DC (C33, C35)
77689	Capacitor—Fixed, headed-lead type, .82 mmf., ±10%, 500 volts DC (C37)
77690	Capacitor—Fixed, headed-lead type, 1 mmf., ±10%, 500 volts DC (C40)
71500	Capacitor—Fixed, headed-lead type, 1.5 mmf., ±10%, 500 volts DC (C39)
78047	Capacitor—Fixed, headed-lead type, 2.0 mmf., ±10%, 500 volts DC (C42)
77210	Capacitor—Fixed, ceramic, non-insulated, 2 mmf., ±0.25 mmf., 500 volts DC, Temp. coef. = 0 (C15)
77667	Capacitor—Fixed, ceramic, insulated, comprising 1 section of 2 mmf., and 1 section of 22 mmf., Temp. coef. = −750 (C12, C13)
77616	Capacitor—Adjustable, mica, 4-40 mmf. (C16)
77688	Capacitor—Fixed, ceramic, non-insulated, 5 mmf., ±0.5 mmf., 500 volts DC, Temp. coef. = 0 (C34, C36, C38, C41)
74182	Capacitor—Fixed, ceramic, non-insulated, 6 mmf., ±0.5 mmf., 500 volts DC, Temp. coef. = 0 (C5)
77621	Capacitor—Fixed, ceramic, crystal holder, 22 mmf., ±10%, Temp. coef. = −750 (C11)
71924	Capacitor—Fixed, ceramic, non-insulated, 56 mmf., ±10%, 500 volts DC, Temp. coef. = −750 (C10)
77625	Capacitor—Fixed, ceramic, 220 mmf., +100%, −0%, 500 volts DC, High "K" disc (C18)
77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, −0%, 500 volts DC, High "K" disc (C43)
77624	Capacitor—Fixed, ceramic, 680 mmf., +100%, −0%, 500 volts DC, High "K" disc (C4)
77084	Capacitor—Ceramic, feed-thru, 1000 mmf. (C21, C23, C25)
77615	Capacitor—Ceramic, stand-off, 1000 mmf. (C3, C19, C24, C26)
77252	Capacitor—Fixed, ceramic, 1000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C14, C20, C22, C27)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C17)
77628	Coil—IF trap (L7)
77634	Coil—IF neutralizing coil (L12)
77629	Coil—Oscillator cathode coil (L9)
77632	Coil—Oscillator heater coil (L15)
77631	Coil—Oscillator heater coil (L14)

STOCK No.	DESCRIPTION
78224	Coil—Oscillator plate coil (L11)
77627	Coil—Peaking coil (L6, R11)
77695	Coil—RF plate coil (L8)
77614	Control—Oscillator voltage control (R6)
77617	Control—UHF oscillator injection adjustment control
77489	Rectifier—Germanium rectifier Type IN82 (CR1)
	Resistors—Fixed, composition:
503047	47 ohms, ±10%, ½ watt (R16)
503110	100 ohms, ±10%, ½ watt (R10, R17)
503112	120 ohms, ±10%, ½ watt (R2, R9)
503210	1000 ohms, ±10%, ½ watt (R13, R14)
503310	10,000 ohms, ±10%, ½ watt (R12)
503322	22,000 ohms, ±10%, ½ watt (R1)
503410	100,000 ohms, ±10%, ½ watt (R18, R19)
503412	120,000 ohms, ±10%, ½ watt (R5)
503427	270,000 ohms, ±10%, ½ watt (R4)
503447	470,000 ohms, ±10%, ½ watt (R8)
503582	8.2 megohms, ±10%, ½ watt (R3, R7)
77609	Transformer—Mixer I.F. transformer complete with adjustable cores (T1)
77610	Transformer—Primary I.F. link transformer complete with adjustable cores (T2, R15)
77626	Trap—I.F. trap (L1, C1, L2, C2)
	CHASSIS ASSEMBLIES KCS 82 (KRK11B Tuner Unit) KCS 82A (KRK22A Tuner Unit) KCS 82B (KR12 Tuner Unit)
76456	Bracket—Channel indicator lamp bracket for KCS82
76490	Bracket—Mounting bracket complete with insulator for picture control
71496	Capacitor—Mica trimmer, 5-70 mmf. (C119)
33098	Capacitor—Fixed, ceramic, non-insulated, 10 mmf., ±1.0 mmf., 500 volts DC, Temp. coef. = −750 (C136)
75217	Capacitor—Mica trimmer, dual 10-160 mmf. (C174A, C174B)
33380	Capacitor—Fixed, ceramic, non-insulated, 12 mmf., ±10%, 500 volts DC, Temp. coef. = −750 (C175)
39044	Capacitor—Fixed, ceramic, non-insulated, 15 mmf., ±10%, 500 volts DC, Temp. coef. = −750 (C141)
73664	Capacitor—Fixed, ceramic, non-insulated, 39 mmf., ±10%, 500 volts DC, Temp. coef. = −750 (C140)
76475	Capacitor—Fixed, mica, 68 mmf., 1000 volts (C177)
76474	Capacitor—Fixed, mica, 82 mmf., 1000 volts DC (C153)
39636	Capacitor—Fixed, mica, 220 mmf., 500 volts DC (C154)
39638	Capacitor—Fixed, mica, 270 mmf., 500 volts DC (C139)
47617	Capacitor—Fixed, ceramic, non-insulated, 270 mmf., ±10%, 500 volts DC, Temp. coef. = −750 (C113)
76579	Capacitor—Fixed, mica, 270 mmf., 1000 volts DC (C149, C191)
39640	Capacitor—Fixed, mica, 330 mmf., 500 volts DC (C150)
76476	Capacitor—Fixed, mica, 330 mmf., 1000 volts (C182)
73094	Capacitor—Fixed, mica, 390 mmf., 1000 volts DC (C157)
77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, −0%, 500 volts DC, High "K" disc (C127, C128, C129, C130, C131, C135, C195, C193 for KCS82)
77252	Capacitor—Fixed, ceramic, 1000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C133)
77672	Capacitor—Fixed, ceramic, dual 470 mmf., +100%, −0%, 500 volts DC, High "K" disc (C132A, C132B)
77673	Capacitor—Fixed, ceramic, insulated, 470 mmf., ±10%, 1500 volts DC, Special H.V. (C144)
39644	Capacitor—Fixed, mica, 470 mmf., 500 volts DC (C106, C107)
76461	Capacitor—Ceramic, 500 mmf., 20,000 volts (C188)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C104, C134, C194, C123 for KCS82)
76991	Capacitor—Fixed, ceramic, dual 10,000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C101A, C101B)
75218	Capacitor—Electrolytic, comprising 1 section of 10 mfd., 350 volts, 1 section of 5 mfd., 350 volts and 1 section of 150 mfd., 50 volts (C126A, C126B, C126C)
77644	Capacitor—Electrolytic, comprising 1 section of 80 mfd., 400 volts and 1 section of 20 mfd., 400 volts (C117A, C117B)
76970	Capacitor—Electrolytic, comprising 1 section of 100 mfd., 400 volts, 1 section of 10 mfd., 350 volts and 1 section of 20 mfd., 50 volts (C116A, C116B, C116C)
	Capacitors—Fixed, tubular, oil impregnated:
76479	Moulded, .00068 mfd., 600 volts (C184)
75643	Paper, .001 mfd., 1000 volts (C146, C156, C176)
76995	Moulded, .0012 mfd., 600 volts (C185)
77123	Moulded, .0015 mfd., 1000 volts (C164)
73595	Paper, .0022 mfd., 600 volts (C108, C145, C158)
73599	Paper, .0027 mfd., 600 volts (C114)
73818	Paper, .0027 mfd., 1600 volts (C118)
73796	Paper, .0039 mfd., 600 volts (C147)
73920	Paper, .0047 mfd., 600 volts (C110, C138, C162, C168)
73808	Paper, .0082 mfd., 1000 volts (C155)
73561	Paper, .01 mfd., 400 volts (C111, C115)
73594	Moulded, .01 mfd., 600 volts (C172, C173, C183)
73562	Paper, .022 mfd., 400 volts (C180)
73798	Paper, .022 mfd., 600 volts (C166)
73810	Paper, .022 mfd., 1000 volts (C142, C189)
73811	Paper, .027 mfd., 1000 volts (C190)
73552	Paper, .033 mfd., 400 volts (C112, C152)
73596	Paper, .033 mfd., 1000 volts (C161)
73553	Paper, .047 mfd., 400 volts (C124 for KCS82, C179)
73592	Paper, .047 mfd., 600 volts (C167)

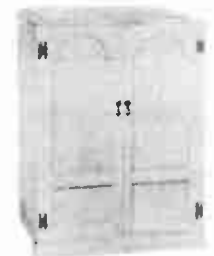
STOCK No.	DESCRIPTION
73792	Paper, .068 mfd., 400 volts (C165)
73784	Paper, 0.1 mfd., 200 volts (C171)
73551	Paper, 0.1 mfd., 400 volts (C151, C159, C169, C170, C178)
73557	Paper, 0.1 mfd., 600 volts (C160, C163, C186)
73794	Paper, 0.22 mfd., 200 volts (C125)
73786	Paper, 0.27 mfd., 200 volts (C187)
73787	Paper, 0.47 mfd., 200 volts (C109, C143, C181)
77676	Choke—Filter choke (L117)
73477	Coil—Choke coil (L101, L118)
76442	Coil—Horizontal linearity coil complete with adjustable core (L111)
76011	Coil—Peaking coil (36 muh) (L102)
71526	Coil—Peaking coil (250 muh) (L104)
77925	Coil—Peaking coil (220 muh) (L107, R146)
77124	Coil—Peaking coil (1000 muh) (L106, R218)
76640	Coil—RF choke coil (1.5 muh) (L110)
76441	Coil—Width coil complete with adjustable core (L109)
76975	Control—AGC control (R154)
77655	Control—Brightness control, volume control and power switch (R110A, R110B, S102)
77924	Control—Height control (R176)
77639	Control—Horizontal hold control (R200)
76445	Control—Picture control (R144)
77642	Control—Vertical hold control (R174)
77643	Control—Vertical linearity control (R186)
77647	Coupling—Coupling (nylon) for picture control
76986	Cover—Back cover for hi-voltage compartment
76985	Cover—Side cover for hi-voltage compartment
77935	Fuse—0.3 amp., 250 volts (F101)
76796	Resistor—Wire wound, 5.1 ohms, 1/3 watt (R213)
76639	Resistor—Wire wound, 180 ohms, 2 watts (R210)
77670	Resistor—Wire wound, 3300 ohms, 7 watts (R120)
77671	Resistor—Wire wound, 3800 ohms, 7 watts (R121)
77668	Resistor—Wire wound, 4000 ohms, 7 watts (R117 for KCS82)
76642	Resistor—Wire wound, 6750 ohms, 10 watts (R142)
77669	Resistor—Wire wound, 10,000 ohms, 5 watts (R118 for KCS82)
	Resistors—Fixed, composition:
30789	33 ohms, ±5%, ½ watt (R131)
503033	33 ohms, ±10%, ½ watt (R139)
503047	47 ohms, ±10%, ½ watt (R105, R209)
34763	68 ohms, ±5%, ½ watt (R128)
503082	82 ohms, ±10%, ½ watt (R101)
502118	180 ohms, ±5%, ½ watt (R134)
503139	390 ohms, ±10%, ½ watt (R187)
503147	470 ohms, ±10%, ½ watt (R119 for KCS82, R135)
513156	560 ohms, ±10%, 1 watt (R114)
503168	680 ohms, ±10%, ½ watt (R143)
503210	1000 ohms, ±10%, ½ watt (R104, R116, R127, R130, R132)
513210	1000 ohms, ±10%, 1 watt (R102)
523218	1800 ohms, ±10%, 2 watts (R115)
503222	2200 ohms, ±10%, ½ watt (R145)
523222	2200 ohms, ±10%, 2 watts (R141)
503223	3300 ohms, ±10%, ½ watt (R188)
502239	3900 ohms, ±5%, ½ watt (R138)
503239	3900 ohms, ±10%, ½ watt (R202)
502247	4700 ohms, ±5%, ½ watt (R168)
513268	6800 ohms, ±10%, 1 watt (R150)
523268	6800 ohms, ±10%, 2 watts (R211)
503282	8200 ohms, ±10%, ½ watt (R159, R169, R180, R183)
513282	8200 ohms, ±10%, 1 watt (R140)
502310	10,000 ohms, ±5%, ½ watt (R107, R108)
513310	10,000 ohms, ±10%, 1 watt (R217)
503312	12,000 ohms, ±10%, ½ watt (R111)
503315	15,000 ohms, ±10%, ½ watt (R189)
503318	18,000 ohms, ±10%, ½ watt (R157, R172, R204)
503322	22,000 ohms, ±10%, ½ watt (R162, R166, R171, R201)
503339	39,000 ohms, ±10%, ½ watt (R106)
70351	43,000 ohms, ±5%, ½ watt (R147)
503347	47,000 ohms, ±10%, ½ watt (R136, R149, R165)
512347	47,000 ohms, ±5%, 1 watt (R206)
502356	56,000 ohms, ±5%, ½ watt (R129, R133)
503356	56,000 ohms, ±10%, ½ watt (R212)
512356	56,000 ohms, ±5%, 1 watt (R182)
503368	68,000 ohms, ±10%, ½ watt (R151, R199)
503382	82,000 ohms, ±10%, ½ watt (R198)
503410	100,000 ohms, ±10%, ½ watt (R219)
513410	100,000 ohms, ±10%, 1 watt (R179)
503412	120,000 ohms, ±10%, ½ watt (R158)
502415	150,000 ohms, ±5%, ½ watt (R148)
503415	150,000 ohms, ±10%, ½ watt (R178, R191, R194)
512415	150,000 ohms, ±5%, 1 watt (R203)
502418	180,000 ohms, ±5%, ½ watt (R125)
503422	220,000 ohms, ±10%, ½ watt (R190, R192)
502427	270,000 ohms, ±5%, ½ watt (R181)
503427	270,000 ohms, ±10%, ½ watt (R163, R177)
503433	330,000 ohms, ±10%, ½ watt (R112, R195, R197)
503439	390,000 ohms, ±10%, ½ watt (R155, R173)
503447	470,000 ohms, ±10%, ½ watt (R113, R153, R193, R208)
503468	680,000 ohms, ±10%, ½ watt (R160, R167)
503482	820,000 ohms, ±10%, ½ watt (R196, R207)
503510	1 megohm, ±10%, ½ watt (R161)

STOCK No.	DESCRIPTION
502511	1.1 megohm, ±5%, ½ watt (R185)
503512	1.2 megohm, ±10%, ½ watt (R184)
503515	1.5 megohm, ±10%, ½ watt (R175)
11769	1.8 megohm, ±5%, ½ watt (R124)
39063	1.8 megohm, ±5%, 1 watt (R205)
503522	2.2 megohm, ±10%, ½ watt (R164, R170)
503539	3.9 megohm, ±10%, ½ watt (R137, R152)
503582	8.2 megohm, ±10%, ½ watt (R122)
503610	10 megohm, ±10%, ½ watt (R109)
76795	Transformer—Hi-voltage transformer (T115)
76440	Transformer—Horizontal oscillator transformer complete with adjustable core (T114)
76997	Transformer—Output transformer (T103)
77635	Transformer—Power transformer, 117 volt, 60 cycle (T113)
77112	Transformer—Ratio detector transformer (T102, C105)
76981	Transformer—Sound I.F. transformer complete with adjustable core (T101, C102, C103, R103)
77636	Transformer—Vertical output transformer (T112)
77637	Transformer—1st pix I.F. transformer complete with adjustable cores (T104, C120, R126)
77638	Transformer—2nd pix I.F. transformer complete with adjustable core (T106)
76433	Transformer—3rd or 4th pix I.F. transformer (T107, T108)
76983	Trap—4.5 MC trap (L105, C137)
77585	Washer—"C" washer for picture control extension shaft (2 req'd)
	YOKE AND MAGNET ASSEMBLIES
77008	Connector—Anode connector complete with contact and eyelet (except Models 21T313G, 21T313GU, 21T314G, 21T314GU
77677	Connector—Anode connector for Models 21T313G, 21T313GU, 21T314G, 21T314GU
75542	Connector—6 contact male connector—part of deflection yoke (P102)
74956	Cushion—Rubber cushion for deflection yoke hood
76654	Hood—Deflection yoke hood—less rubber cushions (except Models 21T313G, 21T313GU, 21T314G, 21T314GU)
76830	Hood—Deflection yoke hood—less rubber cushions for Models 21T313G, 21T313GU, 21T314G, 21T314GU
76168	Magnet—Focus magnet
76141	Magnet—Ion trap magnet
76633	Magnet—Pin cushion connection magnet complete with support arm for Models 21T313G, 21T313GU, 21T314G, 21T314GU
71456	Screw—#8-32 x 7/16" wing screw for mounting deflection yoke
76636	Stud—Adjusting stud complete with guard for focus magnet
77697	Yoke—Deflection yoke complete with male connector (L113, L114, L115, L116, C192, R214, R215, R216, P102)
	SPEAKER ASSEMBLIES 971636-1W RL101C5 RMA-274 (For Models 21T303, 21T303U)
77000	Speaker—5" P.M. speaker complete with cone and voice coil (3.2 ohms)
	SPEAKER ASSEMBLIES 971490-3W 971490-3R RL105E6 RMA-285 RMA-274 (For Models 21T313, 21T313G, 21T313U, 21T313GU)
75024	Cone—Cone and voice coil for speakers stamped 971490-3W
77129	Cone—Cone and voice coil for speakers stamped 971490-3R
75022	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms)
	SPEAKER ASSEMBLIES 971692-1 (For Models 21T314, 21T314G, 21T314U, 21T314GU, 21T315, 21T315U, 21T316, 21T316U, 21T322, 21T322U)
77777	Speaker—10" P.M. speaker complete with cone and voice coil (3.2 ohms)
	SPEAKER ASSEMBLIES 92569-12W RL111A1 RMA-274 (For Models 21T323, 21T323U, 21T324, 21T324U)
75682	Cone—Cone and voice coil
76093	Speaker—12" P.M. speaker complete with cone and voice coil (3.2 ohms)

NOTE: If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to Model number of instrument, number stamped on speaker and full description of part required.

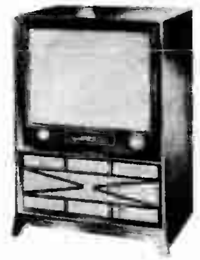


Models 21-D-326, 21-D-326 U
"Staunton"
Mahogany, Oak

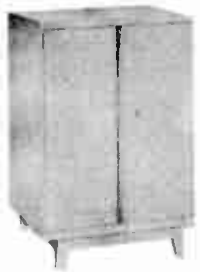


Models 21-D-327, 21-D-327 U
"Yorktown"
Natural Cherry, Red Cherry

Models 21-D-305, 21-D-305 U
"Cabot"
Mahogany, Oak

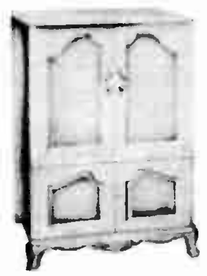


Models 21-D-317, 21-D-317 U
"Merritt"
Mahogany, Oak



Models 21-D-328, 21-D-328 U
"Kenbridge"
Oak, Natural Walnut

Models 21-D-329, 21-D-329 U
"Southbridge"
Mahogany, Walnut



Models 21-D-330, 21-D-330 U
"Claremont"
Maple, Red Cherry

GENERAL DESCRIPTION

All models are "21 inch" deluxe television receivers. Models 21-D-305, 21-D-317, 21-D-326, 21-D-327, 21-D-328, 21-D-329 and 21-D-330 are identical except for cabinets and speakers. These models feature full 12 channel VHF coverage.

Models 21-D-305U, 21-D-317U, 21-D-326U, 21-D-327U, 21-D-328U, 21-D-329U and 21-D-330U are identical except for cabinets and speakers. These models feature full 12 channel VHF coverage plus any 4 UHF channels desired. All models have an auxiliary audio input jack to permit the use of an external record playing attachment.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE .... 227 square inches on a 21AP4 Kinescope

TELEVISION R-F FREQUENCY RANGE

Models 21-D-305, -317, -326, -327, -328, -329, -330

Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

Models 21-D-305U, -317U, -326U, -327U, -328U, -329U, -330U

Any desired combination of 16 VHF and/or UHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc., 470 mc. to 890 mc. may be used.

INTERMEDIATE FREQUENCIES

Picture Carrier Frequency .... 45.75 mc.

Sound Carrier Frequency .... 41.25 mc.

AUDIO POWER OUTPUT RATING .... 4.0 watts max.

VIDEO RESPONSE .... To 4 mc.

POWER SUPPLY RATING

KCS81 and KCS81A chassis .... 115 volts, 60 cycles, 295 watts

KCS 81B chassis .... 115 volts, 60 cycles, 305 watts

RECEIVER ANTENNA INPUT IMPEDANCE

KCS81 chassis (KRK11B Tuner)

Choice: 300 ohms balanced or 72 ohms unbalanced.

KCS81A chassis (KRK22A Tuner)

Choice: 300 ohms balanced or 72 ohms unbalanced.

KCS81B chassis (KRK12 Tuner)

UHF—Choice: 300 ohms balanced or 72 ohms unbalanced.

VHF—300 ohms balanced.

OPERATING CONTROLS (Front)

Channel Selector } .... Dual Control Knobs
Fine Tuning }

Picture .... Single Control under Panel

Picture Horizontal Hold .... Single Control under Panel

Picture Vertical Hold .... Single Control under Panel

Sound Volume and On-Off Switch } .... Dual Control Knobs
Brightness }

NON-OPERATING CONTROLS (under Front Panel)

Height .... screwdriver adjustment

Vertical Linearity .... screwdriver adjustment

CHASSIS DESIGNATIONS

KCS81 Models 21-D-305, -317, -326, -327, -328, -329 and -330 employing a KRK11B Tuner.

KCS81A Models 21-D-305, -317, -326, -327, -328, -329 and -330 employing a KRK22A Tuner.

KCS81B Models 21-D-305U, -317U, -326U, -327U, -328U, -329U and -330U employing a KRK12 Tuner.

SWEEP DEFLECTION .... Magnetic

FOCUS .... Magnetic

HORIZONTAL SWEEP FREQUENCY .... 15,750 cps

VERTICAL SWEEP FREQUENCY .... 60 cps

FRAME FREQUENCY (Picture Repetition Rate) .... 30 cps

LOUDSPEAKERS

Models 21-D-305, 21-D-305U .... (971490-3) 8" PM, 3.2 ohms

All models except 21-D-305 and 21-D-305U .... (92569-12) 12" PM, 3.2 ohms

NON-OPERATING CONTROLS (not including R-F and I-F adjustments)

Picture Centering .... top chassis adjustment

Width .... rear chassis adjustment

Horizontal Drive .... rear chassis screwdriver adjustment

Horizontal Linearity .... rear chassis adjustment

Horizontal Oscillator Frequency .... rear chassis adjustment

Horizontal Oscillator Waveform .... bottom chassis adjustment

Horizontal Locking Range .... rear chassis adjustment

Focus .... top chassis adjustment

Ion Trap Magnet .... top chassis adjustment

Deflection Coil .... top chassis wing nut adjustment

AGC Control .... rear chassis adjustment

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT.—Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel then back. Normally the picture will be out of sync. Turn the control clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 2 or 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. Pull-in should occur before the control has been turned 70 degrees from the extreme counter-clockwise position. The picture should remain in sync for approximately 90 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should just begin to show a black bar in the picture on the left side.

If the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Adjustment of Horizontal Oscillator" and proceed with "Centering Adjustment."

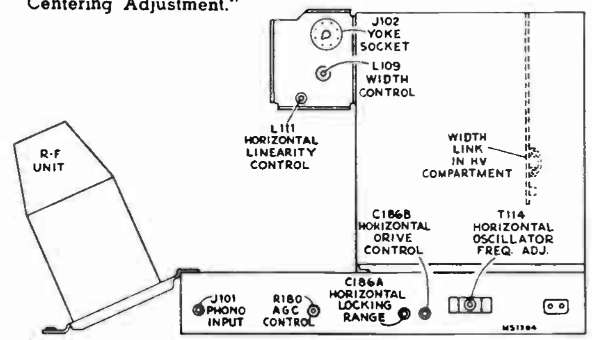


Figure 3—Rear Chassis Adjustments

ADJUSTMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync over 90 degrees of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments.

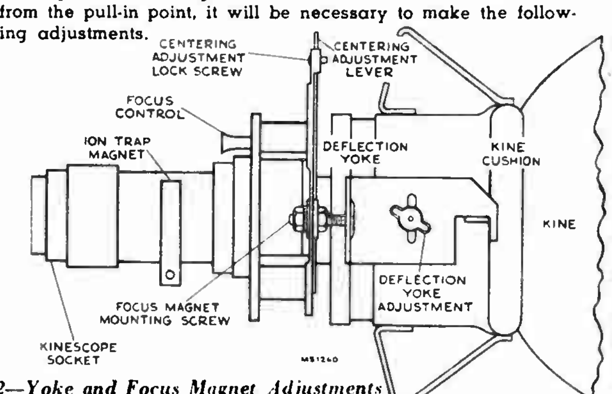

Figure 2—Yoke and Focus Magnet Adjustments

Horizontal Frequency Adjustment.—Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the T114 horizontal frequency adjustment at the rear of the chassis until the picture is just out of sync and the horizontal blanking appears as a vertical or diagonal black bar in the raster. Then turn the T114 core until the bar is just visible at the extreme left side of the picture.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 rear core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 2 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C186A slightly clockwise. If less than 2 bars are present, adjust C186A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the conditions specified under each are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If it is impossible to sync the picture at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure   For field purposes paragraph "B" under Horizontal Oscillator Waveform Adjustment may be omitted.

FOCUS MAGNET ADJUSTMENTS.—The focus magnet should be adjusted so that there is approximately three-eighths inch of space between the rear cardboard shell of the yoke and the flat of the front face of the focus magnet. This spacing gives best average focus over the face of the tube.

The axis of the hole through the magnet should be parallel with the axis of the kinescope neck with the kinescope neck through the middle.

CENTERING ADJUSTMENT.—No electrical centering controls are provided. Centering is accomplished by means of a separate plate on the focus magnet. The centering plate includes a locking screw which must be loosened before centering. Up and down adjustment of the plate moves the picture side to side and sidewise adjustment moves the picture up and down.

If a corner of the raster is shadowed, check the position of the ion trap magnet. Reposition the magnet within the range of maximum raster brightness to eliminate the shadow and re-center the picture by adjustment of the focus magnet plate. In no case should the ion trap magnet be adjusted to cause any loss of brightness since such operation may cause immediate or eventual damage to the tube. In some cases it may be necessary to shift the position of the focus magnet in order to eliminate a corner shadow

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS.—Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage hence the brightest and best focused picture, adjust horizontal drive trimmer C186B for maximum drive (minimum capacity) consistent with a linear raster. Compression of the raster due to excessive drive can be seen as a white vertical bar or bars in the right half of the picture. Besides compression caused by excessive drive, another item to watch for is the change in linearity at the extreme left with changes of brightness control setting. By proper adjustment of the linearity coil, the changes in linearity with changes in brightness can be made negligible. In general, to achieve this condition, the linearity coil should be set slightly on the high inductance side (core slightly clockwise) of the optimum position.

Preset the following adjustments as directed:

A.—Place the width plug P103 in the minimum width position (top).

B.—Set the width control coil L109 in approximately mid position.

C.—Set the linearity control coil L111 near minimum inductance (counter-clockwise).

D.—Set the drive capacitor C186B in the maximum drive position (counter-clockwise).

If the raster is cramped or shows compression bars on the right half of the picture turn C186B clockwise until this condition is just eliminated.

Adjust the linearity control coil L111 clockwise until best linearity and maximum deflection or best compromise are obtained then turn one quarter turn clockwise from this position.

Retouch the drive trimmer C186B if necessary to obtain best linearity and maximum width.

Check the horizontal linearity at various settings of the brightness control R114A. There should be no compression of the right half and no appreciable change of linearity especially at the extreme left of the picture. If objectional change does occur, turn linearity coil L111 slightly clockwise and repeat the test.

Adjust the width control L109 to fill the mask.

If the line voltage is low and it becomes impossible to fill the mask, move the width plug P103 to the bottom position. The width coil L109 is inoperative in this position.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R190 behind front control panel) until the picture fills the mask vertically. Adjust vertical linearity (R197 behind front control panel), until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other.

FOCUS.—Adjust the focus magnet for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

Recheck the position of the ion trap magnet to make sure that maximum brightness is obtained.

If necessary readjust centering to align the picture with the mask.

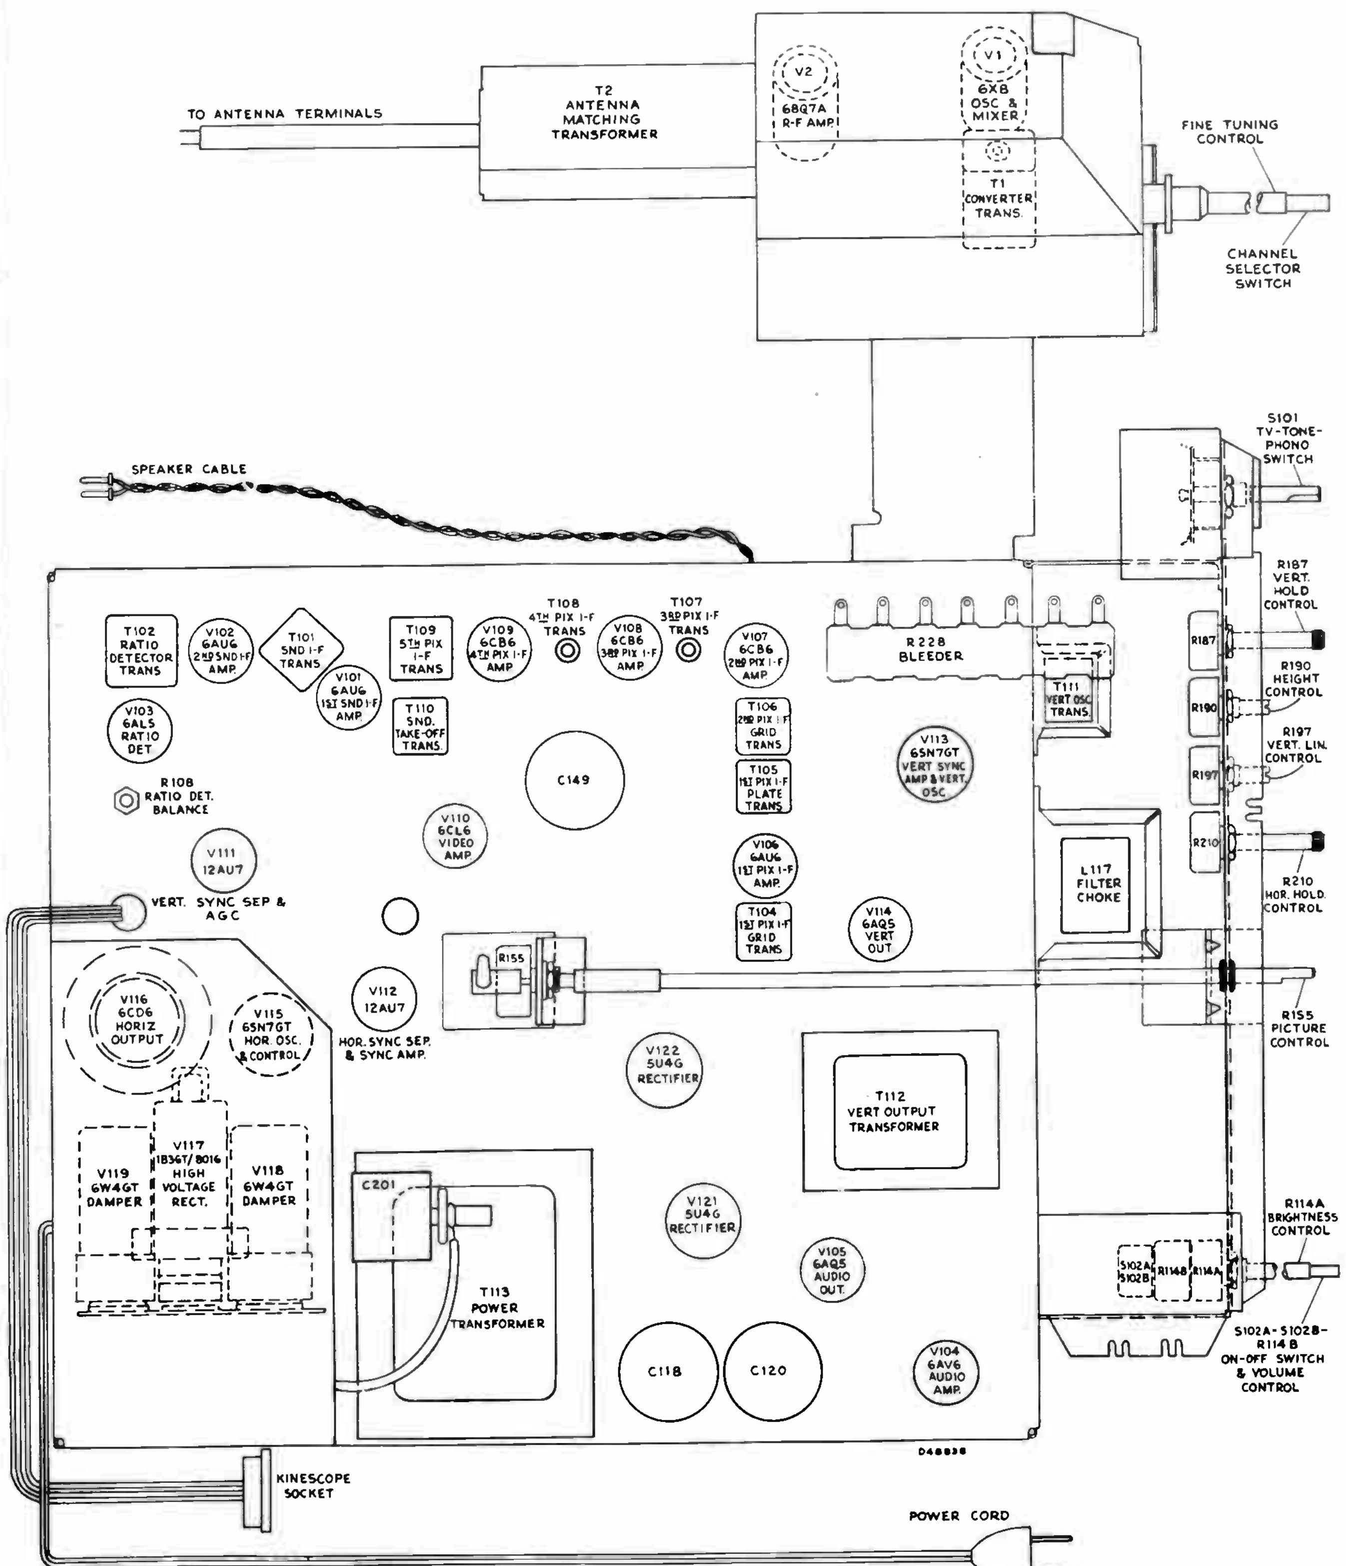

Figure 7—Chassis Top View (shown with KRK11B Tuner)

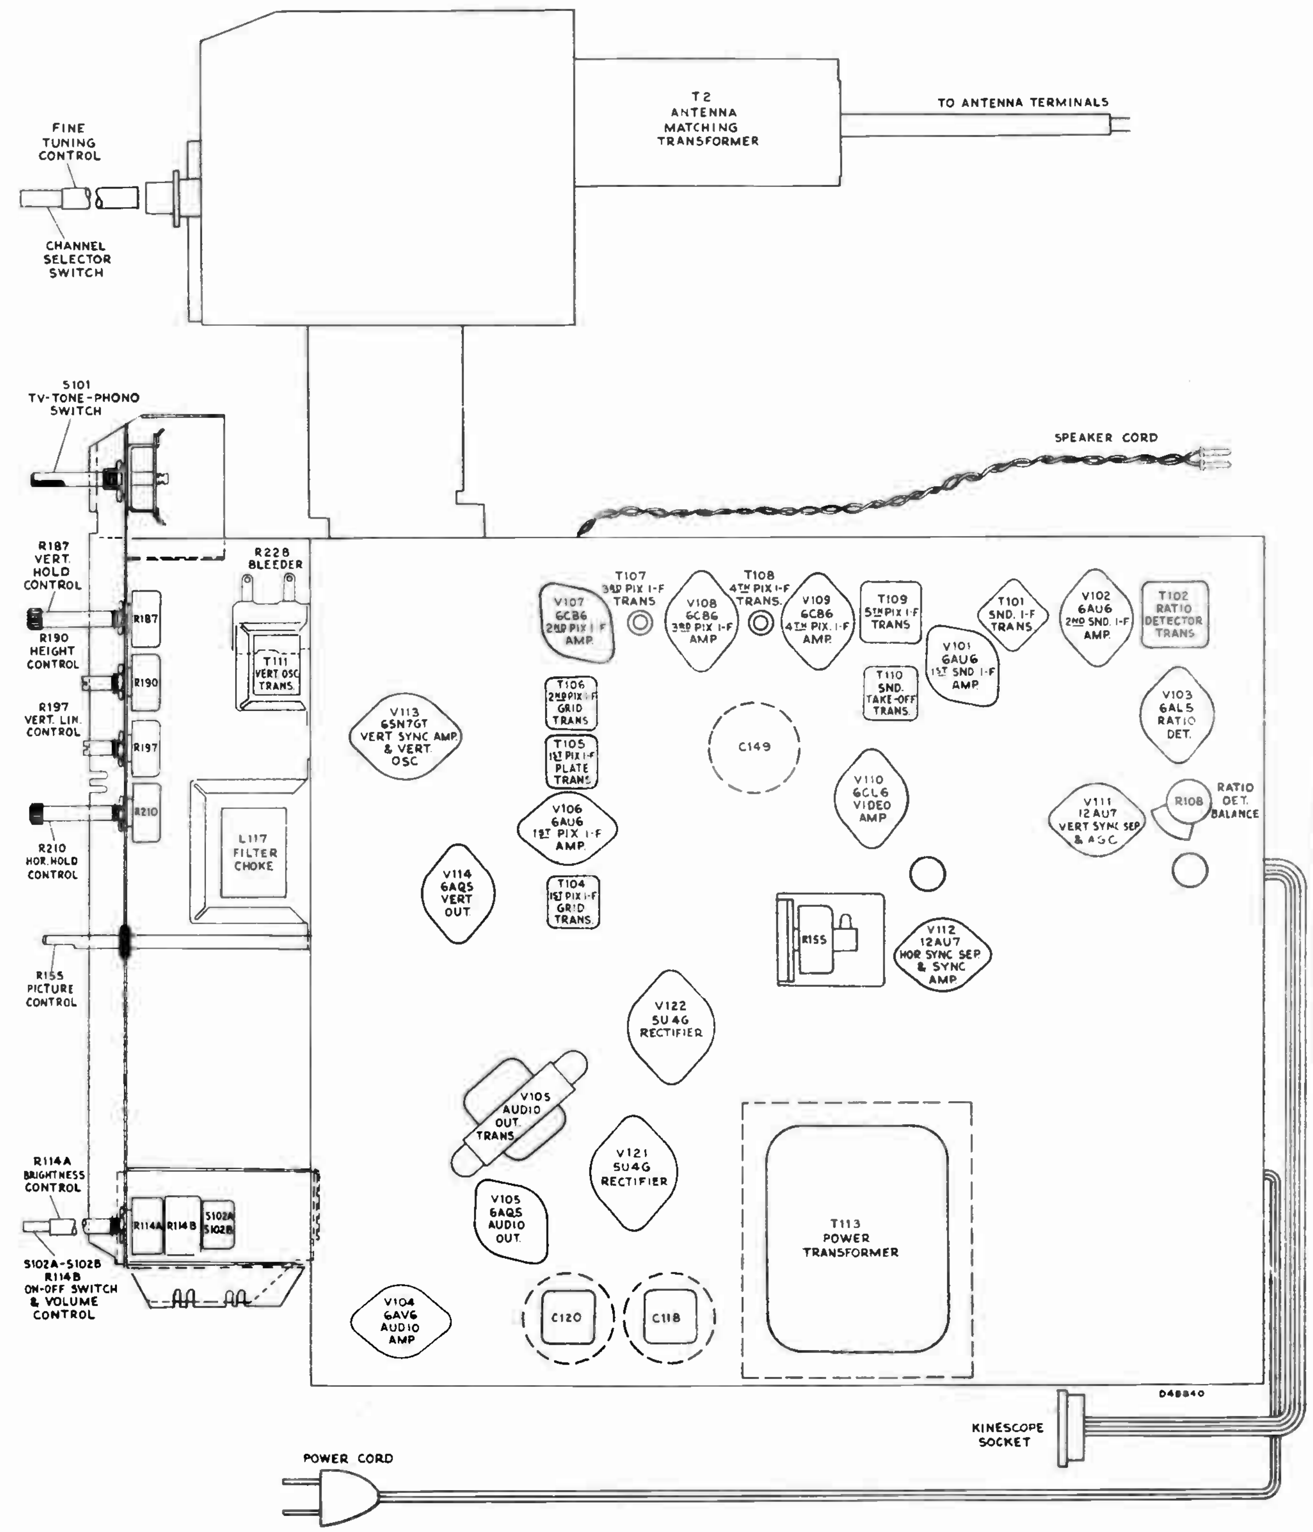

Figure 8—Chassis Bottom View (shown with KRK11B Tuner)

CHECK OF R-F OSCILLATOR ADJUSTMENTS.—

(Models 21-D-305 to 21-D-330 incl. with KRK11B Tuner.)

Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 10. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 4. Adjustment for channel 13 is on top of the chassis.

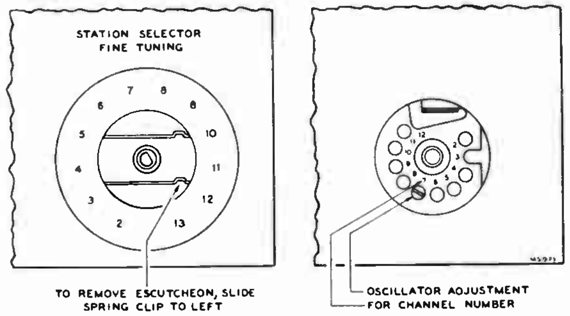

Figure 4—KRK11B R-F Oscillator Adjustments

(Models 21-D-305 to 21-D-330 incl. with KRK22A Tuner.)

Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 13. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 5. Adjustment for channel 13 is C3 on top of the tuner chassis.

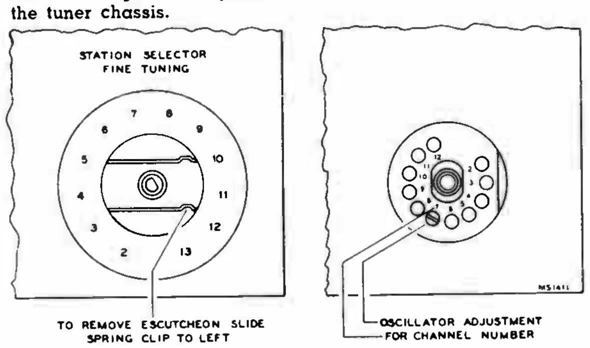

Figure 5—KRK22A R-F Oscillator Adjustments

(Models 21-D-305U to 21-D-330U incl. with KRK12 Tuner.)

Tune in all available VHF stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure

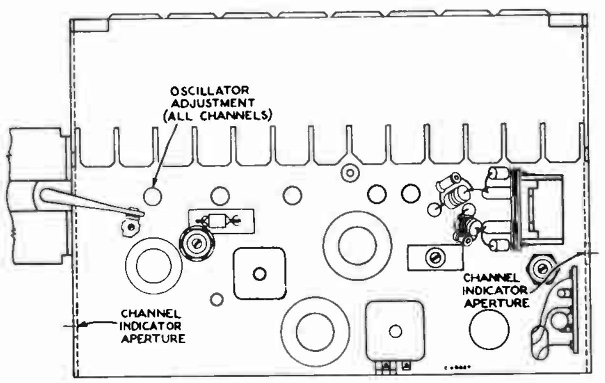

Figure 6—KRK12 Oscillator Adjustment

NOTE.—Some factory prealigned UHF inserts may require minor adjustment when installed in the tuner. This can be accomplished by using the UHF stations as a signal source.

Set the fine tuning control to the center of its range on each UHF channel to be adjusted. Adjust the oscillator core for each UHF channel to obtain maximum audio output without distortion. The adjustment location is the same for all channels, see Figure 6. The insert in the operating position can be determined by a stamping on the insert drum. This stamping is visible through either the front or rear apertures shown in Figure 6.

AGC THRESHOLD CONTROL. — The AGC Threshold Control R180 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal and sync the picture. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not over-loading due to improper setting of R180. If the picture requires an appreciable portion of a second to reappear, or bends excessively, R180 should be readjusted.

Turn R180 fully counter-clockwise. The raster may be bent slightly. This should be disregarded. Turn R180 clockwise until there is a very, very slight bend or change of bend in the picture. Then turn R180 counter-clockwise just sufficiently to remove this bend or change of bend.

If the signal is weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R180 clockwise until the snow in the picture becomes more pronounced, then counter-clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far clockwise on a weak signal, then the receiver may overload when a strong signal is received.

FM TRAP ADJUSTMENT. — In some instances interference may be encountered from a strong FM station signal. A trap is provided to eliminate this type of interference. To adjust the trap tune in the station on which the interference is observed and adjust the FM trap for minimum interference in the picture. The trap is L58 on KRK11B tuners or L53 on KRK22A tuners and is located on the antenna matching transformer.

CAUTION. — In some receivers, the FM trap L53 or L58 will tune down into channel 6 or even into channel 5. Needless to say, such an adjustment will cause greatly reduced sensitivity on these channels. If channels 5 or 6 are to be received, check L53 or L58 to make sure that it does not affect sensitivity on these channels.

The FM trap on Models 21-D-305U to 21-D-330U is attached to the receiver antenna cable and should be adjusted in the same manner as on Models 21-D-305 to 21-D-330.

Replace the cabinet back and connect the receiver antenna leads to the cabinet back. Make sure that the screws holding it are up tight, otherwise it may rattle or buzz when the receiver is operated at high volume.

ALIGNMENT PROCEDURE

TEST EQUIPMENT. — To properly service the television **chassis of these receivers, it is recommended that the following test equipment be available:**

VHF Sweep Generator meeting the following requirements:
(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:
(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.
(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA Types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
14	471.25	475.75	517
15	477.25	481.75	523
16	483.25	487.75	529
17	489.25	493.75	535
18	495.25	499.75	541
19	501.25	505.75	547
20	507.25	511.75	553
21	513.25	517.75	559
22	519.25	523.75	565
23	525.25	529.75	571
24	531.25	535.75	577
25	537.25	541.75	583
26	543.25	547.75	589
27	549.25	553.75	595
28	555.25	559.75	601
29	561.25	565.75	607

83	885.25	889.75	931

Cathode Ray Oscilloscope. — An oscilloscope with a sensitivity of 1 millivolt per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter. — A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

DC Milliammeter. — A milliammeter with a range of 0-50 milliamperes full scale, or 0-100 milliamperes where adapter socket is not used.

Adapter Socket. — An adapter socket is required to meter the cathode current of the 6S4 voltage control tube of the KRK12 Tuner. Wiring of adapter is shown in Figure 9. For an alternate method without the use of an adapter socket refer to alignment procedure

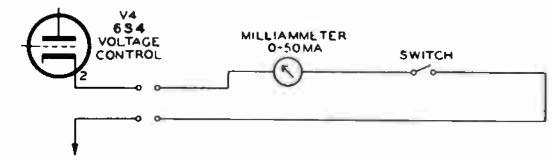

Figure 9—KRK12 Voltage Control Adapter

PICTURE I-F TRAP ADJUSTMENT. — Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R133 and C133B.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the positive terminal of one battery to chassis and the potentiometer arm to the junction of R133 and C133B.

Set the bias to produce approximately −1.0 volt of bias at the junction of R133 and C133B.

Connect the "VoltOhmyst" to pin 9 of V110, the 6CL6 video amplifier.

Set the signal generator to each of the following frequencies and adjust the corresponding circuit for minimum d-c output at pin 9 of V110. Use sufficient signal input to produce 1.0 volt of d-c on the meter when the final adjustment is made.

39.25 mc.	T104 top core
41.25 mc.	T105 bottom core
47.25 mc.	T106 bottom core

PICTURE I-F TRANSFORMER ADJUSTMENTS. —

Models 21-D-305 to 21-D-330 Incl.

Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 1.0 volt of d-c at pin 9 of V110 with −1.0 volt of i-f bias at the junction of R133 and C133B.

43.7 mc.	T109
45.5 mc.	T108
41.8 mc.	T107

To align T105 and T106, connect the sweep generator to the first picture i-f grid, pin 1 of V106 through a 1,000 mmf. ceramic capacitor. Shunt R137, R141 and terminals "A" and "F" of T109 with 330 ohm composition resistors. Set the i-f bias to −1.0 volt at the junction of R133 and C133B.

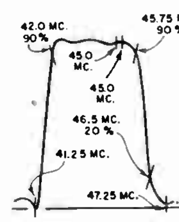

Figure 10—T105 and T106 Response

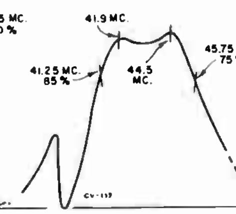

Figure 11—T1 and T104 Response with KRK11B or KRK22A

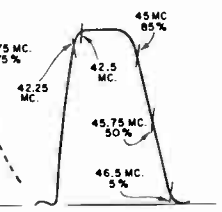

Figure 12—Over-all I-F Response with KRK11B or KRK22A

Connect the oscilloscope to pin 9 of V110.

Adjust T105 and T106 top cores for maximum gain and curve shape as shown in Figure 10. For final adjustment set the output of the sweep generator to produce 0.5 volt peak-to-peak at the oscilloscope terminals.

To align T1 and T104, connect the sweep generator to the mixer grid test point TP2. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable.

Set the channel selector to channel 5.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R131 and C133A.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C121 across terminals A and B of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T1 (top) and T104 (bottom) for maximum gain at 43.5 mc. and with 45.75 mc. at 75% of maximum response.

Adjust C121 until 41.25 mc. is at 85% response with respect to the low frequency shoulder at approximately 41.9 mc. as shown in Figure 11.

Disconnect the diode probe, the 180 ohm and three 330 ohm resistors.

Models 21-D-305U to 21-D-330U Incl.

Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 1.0 volt of d-c at pin 9 of V110 with −1.0 volt of i-f bias at the junction of R133 and C133B.

43.7 mc.	T109
45.5 mc.	T108
41.8 mc.	T107

To align T105 and T106, connect the sweep generator to the first picture i-f grid, pin 1 of V106 through a 1,000 mmf. ceramic capacitor. Shunt R137, R141 and terminals "A" and "F" of T109 with 330 ohm composition resistors. Set the i-f bias to −1.0 volt at the junction of R133 and C133B.

Connect the oscilloscope to pin 9 of V110, the 6CL6 video amplifier.

Adjust T105 and T106 top cores for maximum gain and curve shape as shown in Figure 10. For final adjustment set the output of the VHF sweep generator to produce 0.5 volt peak-to-peak at the oscilloscope terminals.

To align the crystal mixer and T2 and T104, connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1,500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep generator to the tuner case.

Set the channel selector to channel 5.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R131 and C133A.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C121 across terminals A and B of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (bottom) for maximum gain at 43.5 mc. and with 45.75 mc. at 75% of maximum response.

Adjust the shunt trimmer C121 until 41.25 mc. is at 85% response with respect to the low frequency shoulder at approximately 41.9 mc. as shown in Figure 13. Adjust T1 for maximum gain. Readjust T2 and T104 if necessary to obtain proper wave shape, see Figure 13.

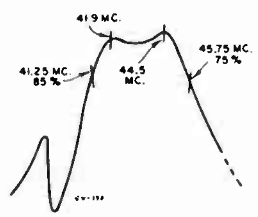

Figure 13—T2 and T104 Response with KRK12

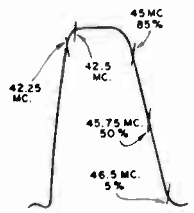

Figure 14—Over-all I-F Response with KRK12

Disconnect the diode probe, the 180 ohm and the three 330 ohm resistors.

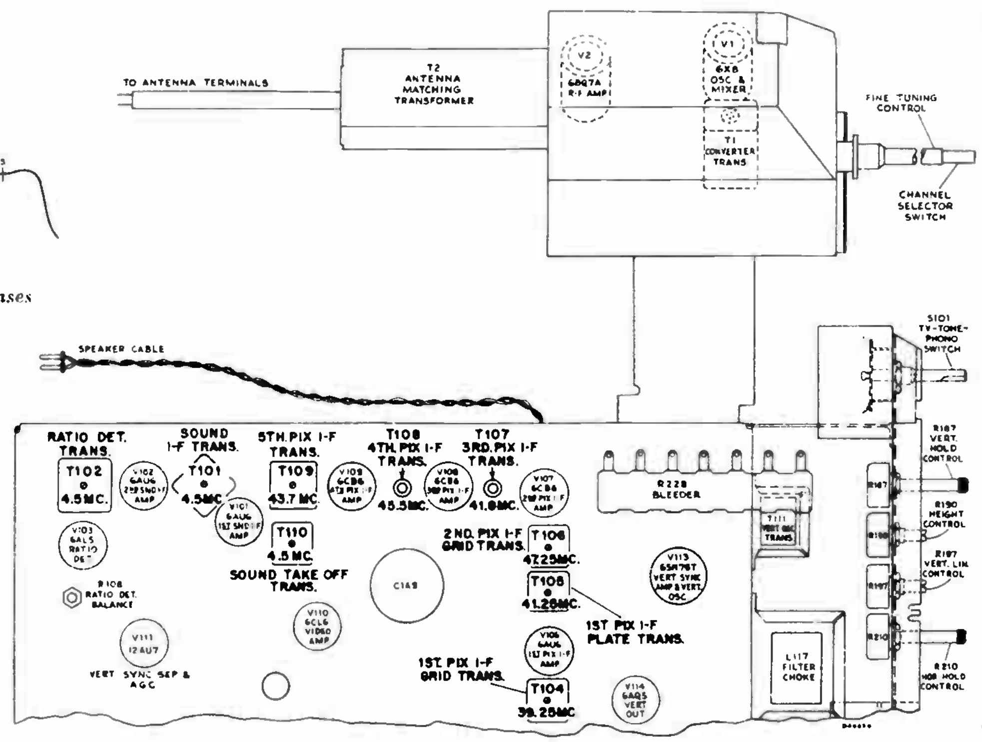

Figure 30—Top Chassis Adjustments (KRK11B Tuner Shown)

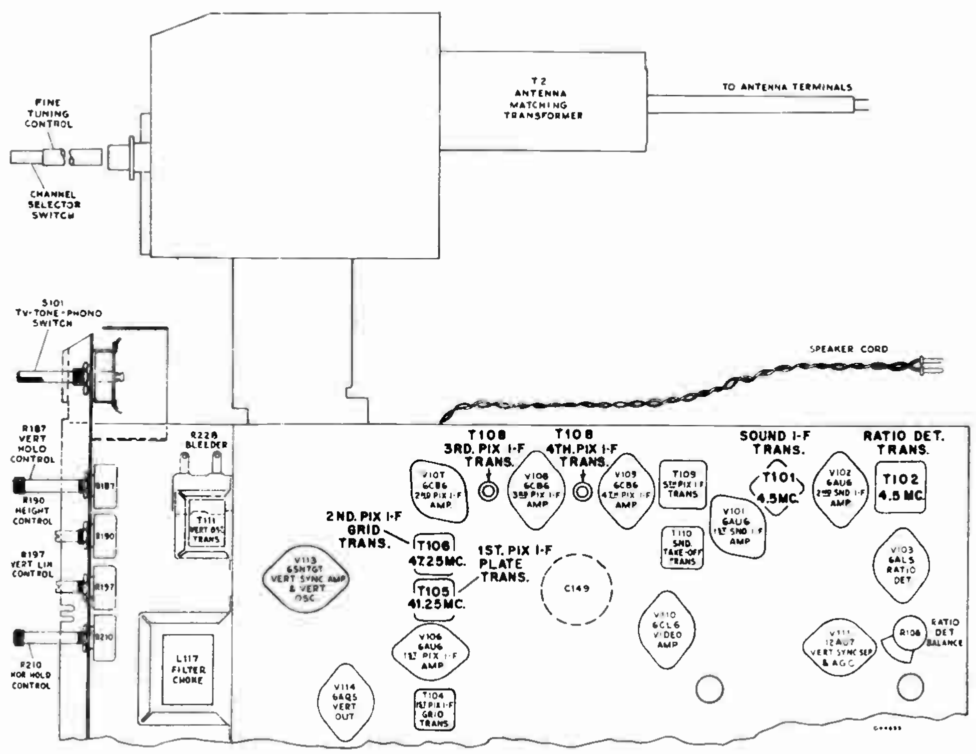

Figure 31—Bottom Chassis Adjustments (KRK11B Tuner Shown)

Following is a list of symptoms of possible failures and an indication of some of the possible faults:

NO RASTER ON KINESCOPE:

(1) Incorrect adjustment of ion trap magnet. Magnet reversed either front to back or top to bottom.

(2) V115 or V116 inoperative. Check waveforms on grids and plates.

(3) No high voltage — if horizontal deflection is operating as evidenced by the correct waveform on terminal 1 of high voltage transformer, the trouble can be isolated to the 1B3GT circuit. Either the T115 high voltage winding is open, the 1B3GT tube is defective, its filament circuit is open or C201 is shorted.

(4) V110 circuit inoperative. Refer to schematic and waveform chart.

(5) Damper tubes (V118 or V119) inoperative.

(6) Defective kinescope.

(7) R114A open.

(8) No receiver plate voltage—filter capacitor shorted—or filter choke open.

NO VERTICAL DEFLECTION:

(1) V113B or V114 inoperative. Check voltage and waveforms on grids and plates.

(2) T111 or T112 open.

(3) Vertical deflection coils open.

SMALL RASTER:

(1) Low Plus B or low line voltage.

(2) V116 defective.

POOR VERTICAL LINEARITY:

(1) If adjustments cannot correct, change V114.

(2) Vertical output transformer T112 defective.

(3) V113B defective. Check voltage and waveforms on grid and plate.

(4) C175, C176, C118D or C120B defective.

(5) Low plate voltage. Check rectifiers and capacitors in supply circuits.

(6) If height is insufficient, try changing V113.

POOR HORIZONTAL LINEARITY:

(1) If adjustments do not correct, change V116, V118 or V119.

(2) T115 or L111 defective.

(3) C203 defective.

WRINKLES ON SIDE OF RASTER:

(1) R227 defective.

(2) Defective yoke.

PICTURE OUT OF SYNC HORIZONTALLY:

(1) T114 incorrectly tuned.

(2) R209, R212 or R210 defective.

TRAPEZOIDAL OR NON-SYMMETRICAL RASTER:

(1) Improper adjustment of focus magnet or ion trap magnet.

(2) Defective yoke.

RASTER AND SIGNAL ON KINESCOPE BUT NO SOUND:

(1) T110 defective.

(2) Sound i-f, ratio detector or audio amplifier inoperative. Check V101, V102, V103 and their socket voltages.

(3) Audio system defective.

(4) Speaker defective.

SIGNAL AT KINESCOPE GRID BUT NO SYNC:

(1) AGC control R180 misadjusted.

(2) V111 inoperative. Check voltage and waveforms at its grid and plate.

SIGNAL ON KINESCOPE GRID BUT NO VERTICAL SYNC:

(1) Check V113B and associated circuit—C171, etc.

(2) Integrating network inoperative. Check.

(3) V111, V112 or V113A defective or associated circuit defective.

(4) Gas current grid emission or grid cathode leakage in V113. Replace.

SIGNAL ON KINESCOPE GRID BUT NO HORIZONTAL SYNC:

(1) T114 misadjusted. Readjust as instructed

(2) V112 inoperative. Check socket voltages and waveforms.

(3) T114 defective.

(4) C165, C186A, C188, C189, C190, C191 or C192 defective.

(5) If horizontal speed is completely off and cannot be adjusted check R209, R212, R210, R214 and R216.

SOUND AND RASTER BUT NO PICTURE OR SYNC:

(1) Picture, detector or video amplifier defective. Check CR101 and V110. Check socket voltages.

(2) Bad contact to kinescope cathode.

PICTURE STABLE BUT POOR RESOLUTION:

(1) CR101 or V110 defective.

(2) Peaking coils defective. Check resistance.

(3) Make sure that the focus control operates on both sides of proper focus.

(4) R-F and I-F circuits misaligned.

PICTURE SMEAR:

(1) R-F or I-F circuits misaligned.

(2) Open peaking coil.

(3) This trouble can originate at the transmitter. Check on another station.

PICTURE JITTER:

(1) AGC control R180 misadjusted.

(2) If regular sections at the left picture are displaced change V116.

(3) Vertical instability may be due to loose connections or noise.

(4) Horizontal instability may be due to unstable transmitted sync.

RASTER BUT NO SOUND, PICTURE OR SYNC:

(1) Defective antenna or transmission line.

(2) R-F oscillator off frequency.

(3) Tuner unit inoperative. Check V1, V2 (V1, V2, V3 or V4 in KRK12 Tuner).

DARK VERTICAL LINE ON LEFT OF PICTURE:

(1) Reduce horizontal drive and readjust width and horizontal linearity.

(2) Replace V116.

LIGHT VERTICAL LINE ON LEFT OF PICTURE:

(1) R227 defective.

(2) V118 or V119 defective.

ALIGNMENT TABLE

THE DETAILED ALIGNMENT PROCEDURE BEGINNING ON PAGE 8 SHOULD BE READ BEFORE ALIGNMENT BY USE OF THE TABLE IS ATTEMPTED

KRK11B TUNER ALIGNMENT

Step No.	Connect VHF Signal Generator To	Signal Gen. Freq. Mc.	Connect VHF Sweep Generator To	Sweep Gen. Freq. Mc.	Connect Heterodyne Freq. Meter To	Het. Meter Freq. Mc.	Connect Oscilloscope To	Miscellaneous Connections and Instructions	Adjust	Refer To
1	If unit is completely out of adjustment, preset all adjustments to center of range with following exceptions. Set C18 so that head is 3/8" above chassis. Set C11 1/4 turn from max. clockwise. Disconnect link from T104 and terminate with 39 ohms. Connect bias supply between AGC terminal on tuner and ground. Adjust bias for —3.5V at terminal 3. Set fine tuning 30 degrees clockwise from mechanical center of its range.									
2	Grid, pin 7 of V2 through 1500 mmf.	43.5 mc. 30% mod.	Not used	—	Not used	—	TP1. Gain to maximum	Set r-f unit on channel 2	L65 for min. indication on scope	Fig. 15
3	Not used	—	Not used	—	Loosely to r-f unit oscillator	227 mc.	Not used	R-F unit on channel 8	C2 for beat on freq. meter	Fig. 15
4	Antenna terminals loosely	181.25 and 185.75	Antenna terminals through pad	Channel 8	Not used	—	TP1. Gain to maximum	R-F unit on channel 8. Set T1 max. counter-clockwise	C9, C11, C15 and C18 for response shown in Fig. 17	Fig. 15 Fig. 17
5	Not used	—	Not used	—	Loosely to r-f unit oscillator	129 mc.	Not used	R-F unit on channel 6	L5 for beat on het. freq. meter	Fig. 18
6	Antenna terminals loosely	83.25 and 87.75	Antenna terminals through pad	Channel 6	Not used	--	TP1. Gain to maximum	"	L48, L50 and L53 for response shown in Fig. 17	Fig. 15 Fig. 17
7	Not used	—	Not used	—	Not used	—	Not used	On channel 6. Connect "VoltOhmyst" to TP1	C8 for —3.5 volts on meter	Fig. 15
8	Antenna terminals loosely	83.25 and 87.75	Antenna terminals through pad	Channel 6	Not used	—	TP1. Gain to maximum	R-F unit on channel 6	Check response. Readjust L48, L50 and L53 if necessary	Fig. 15 Fig. 17
9	Not used	—	Not used	—	Loosely to r-f unit oscillator	227 mc.	Not used	R-F unit on channel 8	C2 for beat on freq. meter	Fig. 15
10	Antenna terminals loosely	181.25 and 185.75	Antenna terminals through pad	Channel 8	Not used	—	TP1. Gain to maximum	"	Check response adjust C9, C11, C15 and C18 if necessary	Fig. 15
11	If C9 was readjusted in step 10, repeat step 7, step 9 and step 10 until the conditions specified in each step are fulfilled without additional adjustments.									
12	Not used	—	Not used	—	Loosely to r-f unit oscillator	257 mc.	Not used	Rec. on channel 13	L46 for beat on het. freq. meter. Overshoot L46 slightly and adjust C2 for beat	Fig. 15
13	Antenna terminals loosely	211.25 215.75	Antenna terminals through pad	Channel 13	Not used	—	TP1. Gain to maximum	Rec. on channel 13 "VoltOhmyst" on TP1	Check to see that response is correct and —3.5 volts of osc. injection is present	Fig. 17
14	"	205.25 209.75	"	Channel 12	Not used	—	"	Rec. on channel 12	"	Fig. 17
15	"	199.25 203.75	"	Channel 11	"	—	"	Rec. on channel 11	"	Fig. 17
16	"	193.25 197.75	"	Channel 10	"	—	"	Rec. on channel 10	"	Fig. 17
17	"	187.25 191.75	"	Channel 9	"	—	"	Rec. on channel 9	"	Fig. 17
18	"	181.25 185.75	"	Channel 8	"	—	"	Rec. on channel 8	"	Fig. 17
19	"	175.25 179.75	"	Channel 7	"	—	"	Rec. on channel 7	"	Fig. 17
20	If the response of any channel (steps 13 through 19) is below 80% at either marker, adjust C9, C11, C15 and C18 as necessary to pull response up on the low channel yet maintain correct response on channel 8.									
21	Repeat step 9. If the oscillator is off frequency overshoot the adjustment of C2 and correct by adjusting L46.									
22	Repeat steps 12 through 21 until all adjustments are obtained.									
23	Not used	—	Not used	—	Loosely to r-f unit oscillator	129 mc.	Not used	Rec. on channel 6	L5 for beat on het. freq. meter	Fig. 15
24	Antenna terminals loosely	55.25 59.75	Antenna terminals through pad	Channel 2	Not used	—	TP1. Gain to maximum	Rec. on channel 2	Adjust T1 core clockwise to a point at which channel 2 response does not change	Fig. 15
25	"	83.25 87.75	"	Channel 6	Not used	—	"	Rec. on channel 6. "VoltOhmyst" on TP1	Check to see that response is correct and —3.5 volts of osc. injection is present	Fig. 15 Fig. 17
26	"	77.25 81.75	"	Channel 5	"	—	"	Rec. on channel 5	"	Fig. 17
27	"	67.25 71.75	"	Channel 4	"	—	"	Rec. on channel 4	"	Fig. 17
28	"	61.25 65.75	"	Channel 3	"	—	"	Rec. on channel 3	"	Fig. 17
29	"	55.25 59.75	"	Channel 2	"	—	"	Rec. on channel 2	"	Fig. 17
30	If excessive tilt in the same direction occurs on channels 2, 3 and 4, adjust C18 on channel 2 to overshoot the correction of this tilt then switch to channel 6 and adjust L53 for max. amplitude of response between carrier markers.									
31	Check r-f response and oscillator injection on channels 7 through 13 steps 23 back up through step 17 stopping on channel 13 for the next step.									
32	Not used	—	Not used	—	Loosely coupled to r-f oscillator	257 mc.	TP1. Gain to maximum	Rec. on channel 13	C2 for beat on het. freq. meter	Fig. 15

43	"	—	"	—	"	101 mc.	"	Rec. on channel 2	L1 as above	Fig. 15
44	Repeat steps 31 through 43 as a check. On completion, remove 39 ohm resistor and reconnect link to terminals A and B of T104.									

KRK11B ANTENNA MATCHING UNIT ALIGNMENT

Step No.	Connect VHF Signal Generator To	Signal Gen. Freq. Mc.	Connect VHF Sweep Generator To	Sweep Gen. Freq. Mc.	Connect Heterodyne Freq. Meter To	Het. Meter Freq. Mc.	Connect Oscilloscope To	Miscellaneous Connections and Instructions	Adjust	Refer To
45	Do not adjust this unit unless fairly certain that it requires adjustment. Disconnect lead from L58 to S1. Connect output of matching unit through 1000 mmf. to pin 1 of V107. Replace cover on matching unit. Remove V106 from socket. Connect bias box to junction of R133 and C133B and set to produce —5 volts.									
46	Antenna terminals	45.75 mc. 30% mod.	Not used	—	Not used	—	Pin 9, V110 Scope gain to max.	—	L59 for min. audio on scope	Fig. 15
47	"	41.25 mc. 30% mod.	"	—	"	—	"	—	L60 for min. audio on scope	Fig. 15
48	Antenna terminals loosely	—	Antenna terminals through pad	45 to 54 mc.	"	—	Scope xtal probe from L58 to gnd.	Connect 300 ohms from L58 to gnd.	L61 and L62 to obtain response of Fig. 19	Fig. 15 Fig. 16 Fig. 19
49	Remove bias supply and 1000 mmf. capacitor. Restore connection between L58 and S1. Replace V106.									

KRK22A TUNER ALIGNMENT

Step No.	Connect VHF Signal Generator To	Signal Gen. Freq. Mc.	Connect VHF Sweep Generator To	Sweep Gen. Freq. Mc.	Connect Heterodyne Freq. Meter To	Het. Meter Freq. Mc.	Connect Oscilloscope To	Miscellaneous Connections and Instructions	Adjust	Refer To
1	If unit is completely out of adjustment, preset all adjustments to center of range with following exceptions. Set T1 and C2 fully counterclockwise. Set channel 7 to 13 oscillator slugs one turn from tight. Disconnect link from T104 and terminate with 39 ohms. Short the AGC terminal to ground. Preset C5 to read —3.0v dc. at TP1.									
2	Junction of L53 and C24 at bottom of L53	43.5 mc. 30% mod.	Not used	—	Not used	—	TP1. Gain to maximum	Set r-f unit on channel 2	C19 for min. indication on scope	Fig. 20
3	Not used	—	Not used	—	Loosely to r-f unit oscillator	227 mc.	Not used	R-F unit on channel 8. Insert —3V bias at AGC terminal	C3 for beat on freq. meter. Fine tuning fully clockwise	Fig. 20
4	"	—	"	—	"	"	"	Return fine tuning to mid-range after adjustment of C2	C2 one turn clockwise past change in beat note	Fig. 20
5	Antenna terminals loosely	181.25 and 185.75	Antenna terminals through pad	Channel 8	Not used	—	TP1. Gain to maximum	R-F unit on channel 8. Set T1 max. counter-clockwise	C7, C10, C15 and C20 for response shown in Fig. 21	Fig. 20 Fig. 21
6	Not used	—	Not used	—	Not used	—	Not used	On channel 8 Connect "VoltOhmyst" to TP1	C5 for —20 volts on meter	Fig. 20
7	Antenna terminals loosely	181.25 and 185.75	Antenna terminals through pad	Channel 8	Not used	—	TP1. Gain to maximum	R-F unit on channel 8	Check response. Readjust C7, C10, C15 and C20 if necessary	Fig. 20 Fig. 21
8	Not used	—	Not used	—	Loosely to r-f unit oscillator	257 mc.	Not used	Rec. on channel 13. Fine tuning fully clockwise	L42 for beat on het. freq. meter. Overshoot L42 slightly and adjust C2 for beat	Fig. 20
9	Antenna terminals loosely	211.25 215.75	Antenna terminals through pad	Channel 13	Not used	—	TP1. Gain to maximum	Rec. on channel 13 "VoltOhmyst" on TP1	L43 and L45 for proper response and osc. injection within limits	Fig. 21
10	If C5 was readjusted in step 9, repeat step 8 and step 9 until the conditions specified in each step are fulfilled without additional adjustments.									
11	Not used	—	Not used	—	Loosely to r-f unit oscillator	227 mc.	Not used	R-F unit on channel 8	C2 for beat on freq. meter	Fig. 20
12	Antenna terminals loosely	181.25 and 185.75	Antenna terminals through pad	Channel 8	Not used	—	TP1. Gain to maximum	"	Check response adjust C7, C10, C15 and C20 if necessary	Fig. 21
13	If C7 was readjusted in step 12 recheck the oscillator injection. Repeat steps 3 to 12 until all conditions are satisfied.									
14	Not used	—	Not used	—	Loosely to r-f unit oscillator	129 mc.	Not used	R-F unit on channel 6. Fine tuning midrange	L5 for beat on het. freq. meter	Fig. 20
15	Antenna terminals loosely	83.25 and 87.75	Antenna terminals through pad	Channel 6	Not used	—	TP1. Gain to maximum	"	L41, L44 and L46 for response shown in Fig. 21	Fig. 20 Fig. 21
16	"	83.25 87.75	"	Channel 6	"	—	"	Rec. on channel 6. "VoltOhmyst" on TP1	Check to see that response is correct and osc. injection is within limits	Fig. 20 Fig. 21
17	"	77.25 81.75	"	Channel 5	"	—	"	Rec. on channel 5	"	Fig. 21
18	"	67.25 71.75	"	Channel 4	"	—	"	Rec. on channel 4	"	Fig. 21
19	"	61.25 65.75	"	Channel 3	"	—	"	Rec. on channel 3	"	Fig. 21
20	"	55.25 59.75	"	Channel 2	"	—	"	Rec. on channel 2	"	Fig. 21
21	If the response of any channel (steps 16 through 20) is below 80% at either marker, adjust L41, L44 and L46 as necessary to obtain proper response yet maintain correct response on channel 8.									
22	Repeat steps 14 through 20 until all adjustments are obtained.									

Step No.	CONNECT VHF SIGNAL GENERATOR TO	SIGNAL GEN. FREQ. MC.	CONNECT VHF SWEEP GENERATOR TO	SWEEP GEN. FREQ. MC.	CONNECT HETERODYNE FREQ. METER TO	HET. METER FREQ. MC.	CONNECT OSCILLOSCOPE TO	MISCELLANEOUS CONNECTIONS AND INSTRUCTIONS	ADJUST	REFER TO
23	Antenna terminals loosely	211.25 215.75	Antenna terminals through pad	Channel 13	Not used	—	TP1. G[illegible] to maximum	Rec. on channel 13 "VoltOhmyst" on TP1	Check to see that response is correct and osc. injection within limits	Fig. 20 Fig. 21

RESPONSE PHOTOGRAPHS

Taken from RCA WO58A Oscilloscope

PICTURE I-F RESPONSE. — At times it may be desirable to observe the individual i-f stage response. This can be achieved by the following method:

For T107, T108 or T109, shunt all i-f transformers with a 330 ohm carbon resistor except the one whose response is to be observed.

Connect a wide band sweep generator to the second pix i-f grid and adjust it to sweep from 38 mc. to 48 mc.

Connect the oscilloscope to pin 9 of V110 and observe the over-all response. The response obtained will be essentially that of the unshunted stage.

To see the response of transformers T1 (T2), T104 and T105, T106, follow the instructions given

Figures 36 through 41 show the response of the various stages obtained in the above manner. The curves shown are typical although some variation between receivers can be expected. Relative stage gain is not shown.

CRITICAL LEAD DRESS

1. Keep all wiring in the pix i-f, sound i-f and video circuits as short as possible.
2. Keep the leads on C108, C109, C111, R107, R109, R110, R111 and R112 as short and direct as possible.
3. Do not change the bus wire connections to pin 2 of V101 and V102. Sleeving is used on these wires to insure length and to prevent shorting.
4. Do not change position of R150 and L104 at pin 9 of V110.
5. Ground R128 to pin 3 of V106 and R134 to pin 7 of V107.
6. Do not change the grounding of R137, R138 and R141.
7. Keep the bus wire from T109-A to C144 (plug-in capacitor) short and direct.
8. Ground the filaments of sockets of V107, V108 and V109 independently of tube shields (pin 8). Use ground lances provided near each socket.
9. Dress C146 straight up to act as a shield between T101-A and V110-9.
10. Dress C153 and R159 (kine cathode) up in the air above the terminal board.
11. Keep the leads connected to T114-C and T114-D (synchroguide) down so that they will not short out when the chassis is placed in the cabinet.
12. Do not reroute any wires between T104 and the terminal board alongside it. Keep all leads on the foot side of the terminal board.
13. Dress all wires routed past T104, under the large lances near T104.
14. Dress black and red leads from S102 through slot in cap of S102.
15. Dress R113 close to the chassis with leads as short as possible.
16. Dress C198, C199 and C200 up in the air and away from all other leads and components.
17. Dress all leads away from bleeder resistor R228.
18. The brown and green leads of the vertical output transformer should be routed from J102 under clamp on high voltage shield and away from all tubes.
19. Keep leads on C145 as short and direct as possible.
20. Do not dress any leads under C121 (5-70) trimmer.
21. Keep the wire from the vertical output transformer T112 away from the 5U4G rectifier tubes.
22. Dress all 2 watt resistors away from each other and all other wires and components.
23. Dress all wires away from damper tubes V118 and V119.
24. Blue wire from pin 1 V111 to terminal board should be routed between V116 and rear apron.
25. Dress all peaking coils up and away from the base.
26. Dress all shielded wires under lances provided.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 5000 microvolt test pattern signal was fed into the receiver, the picture synchronized and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c.

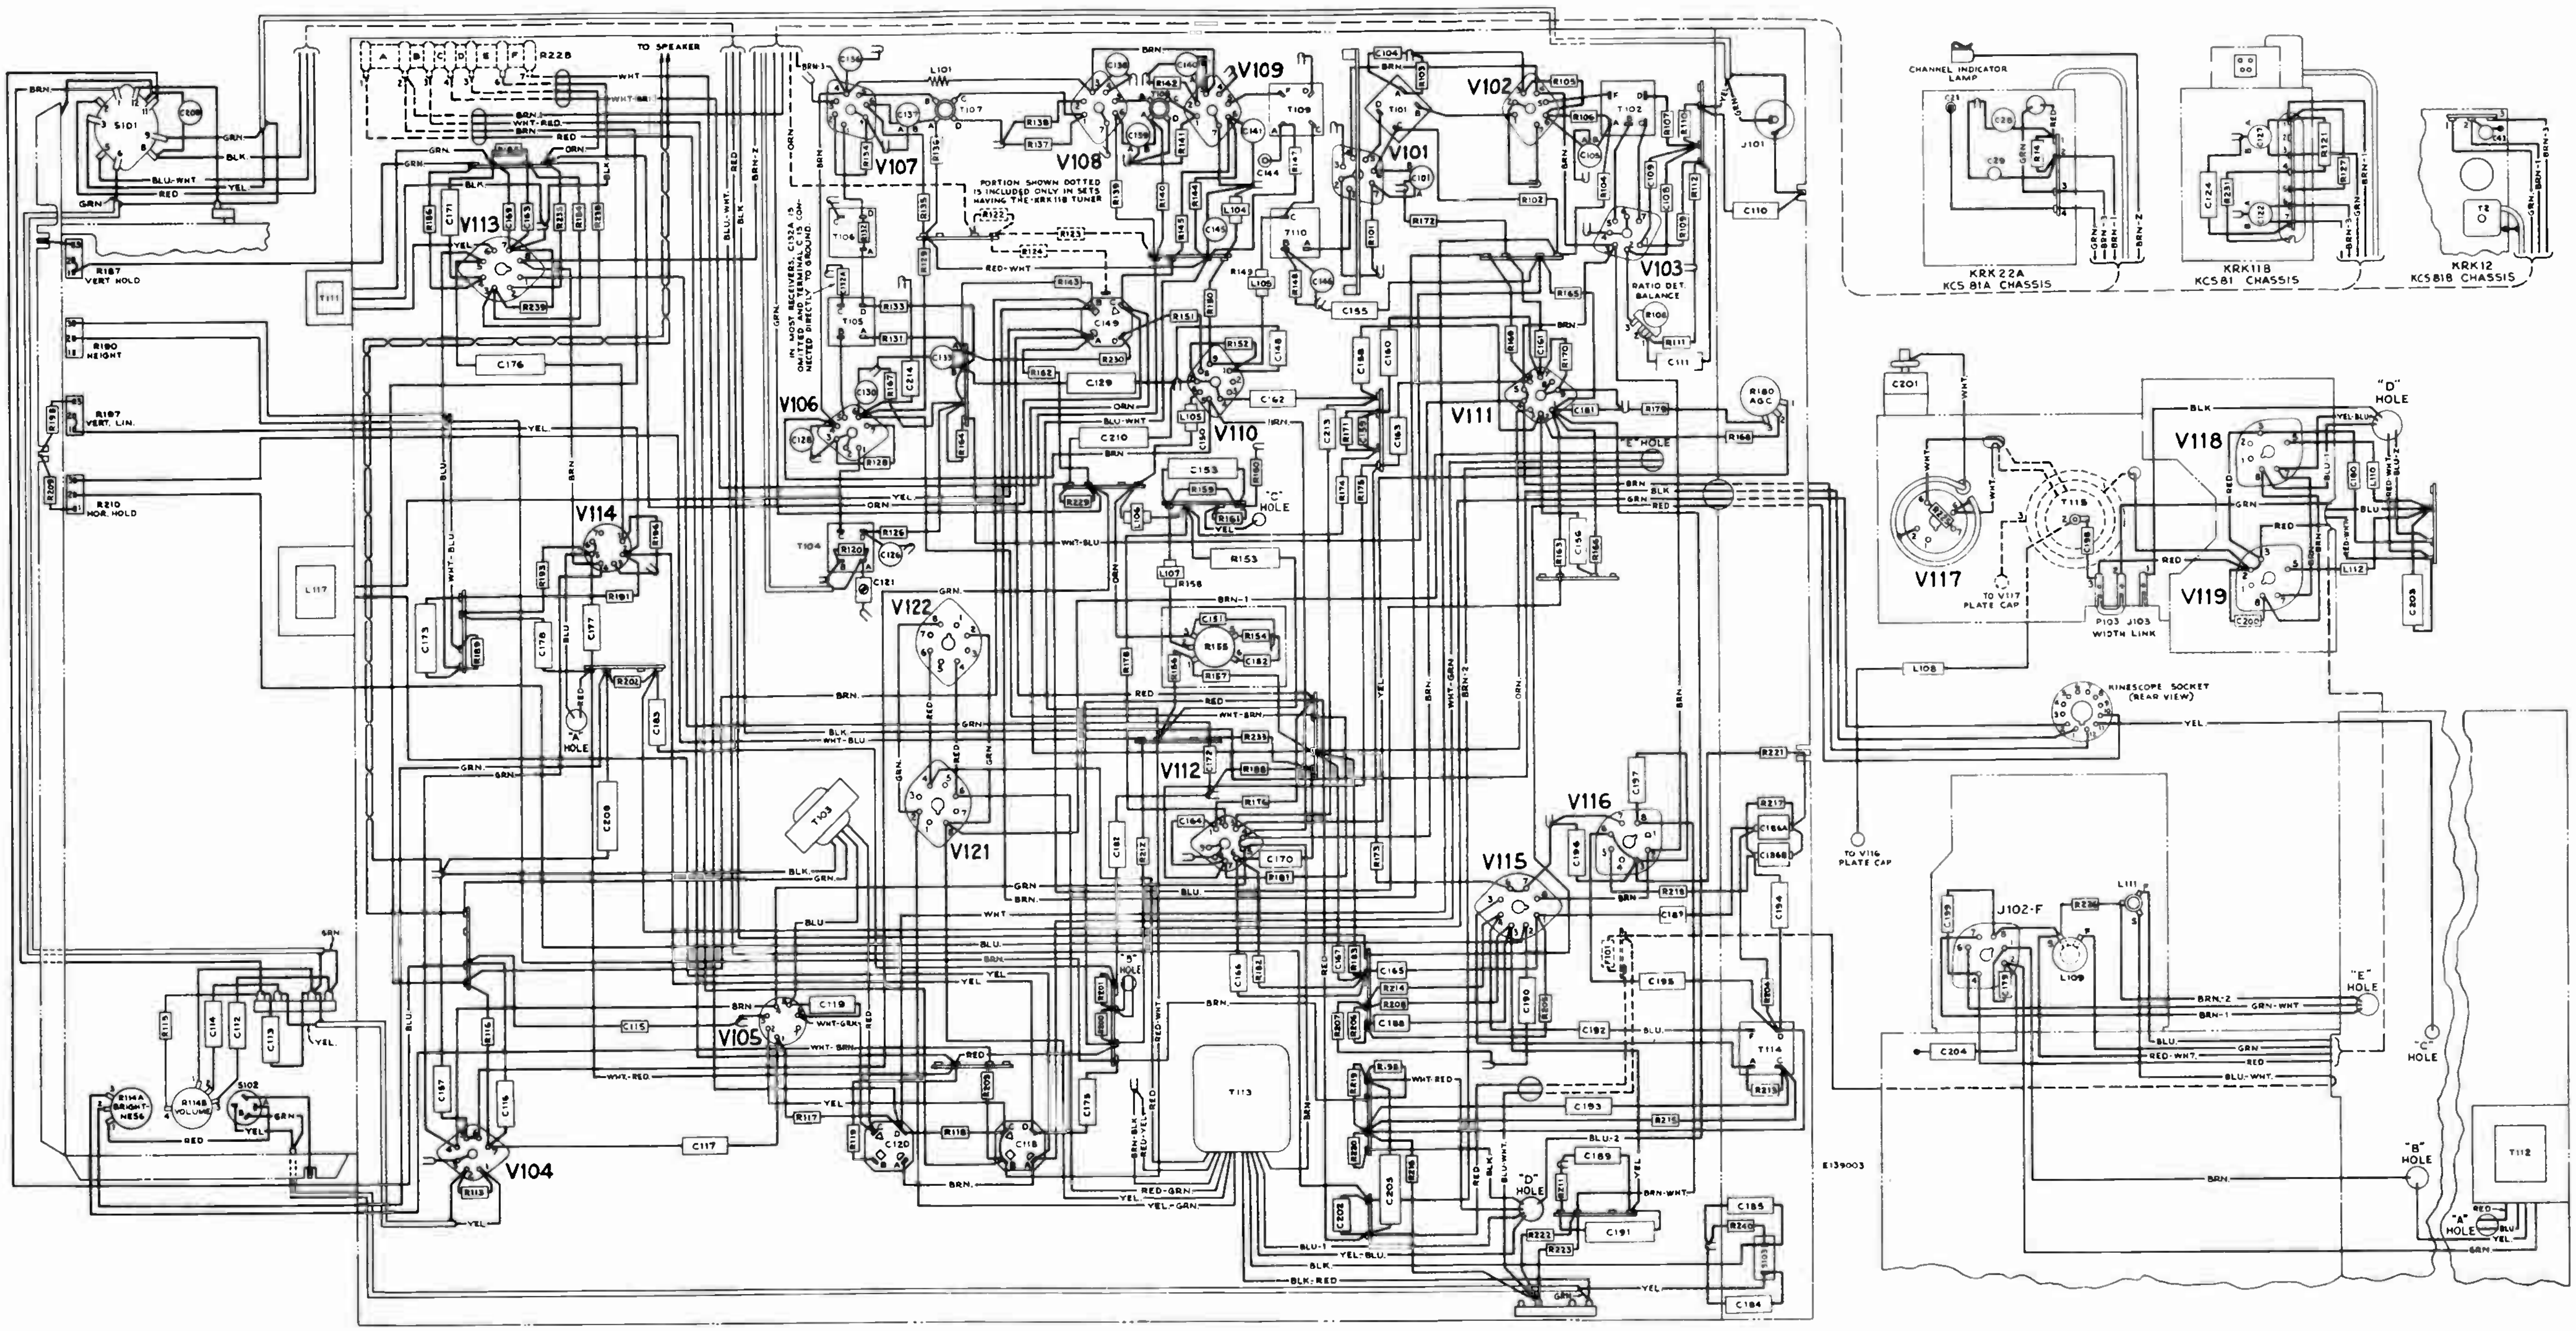

Figure 82—Chassis Wiring Diagram KCS81, KCS81A and KCS81B

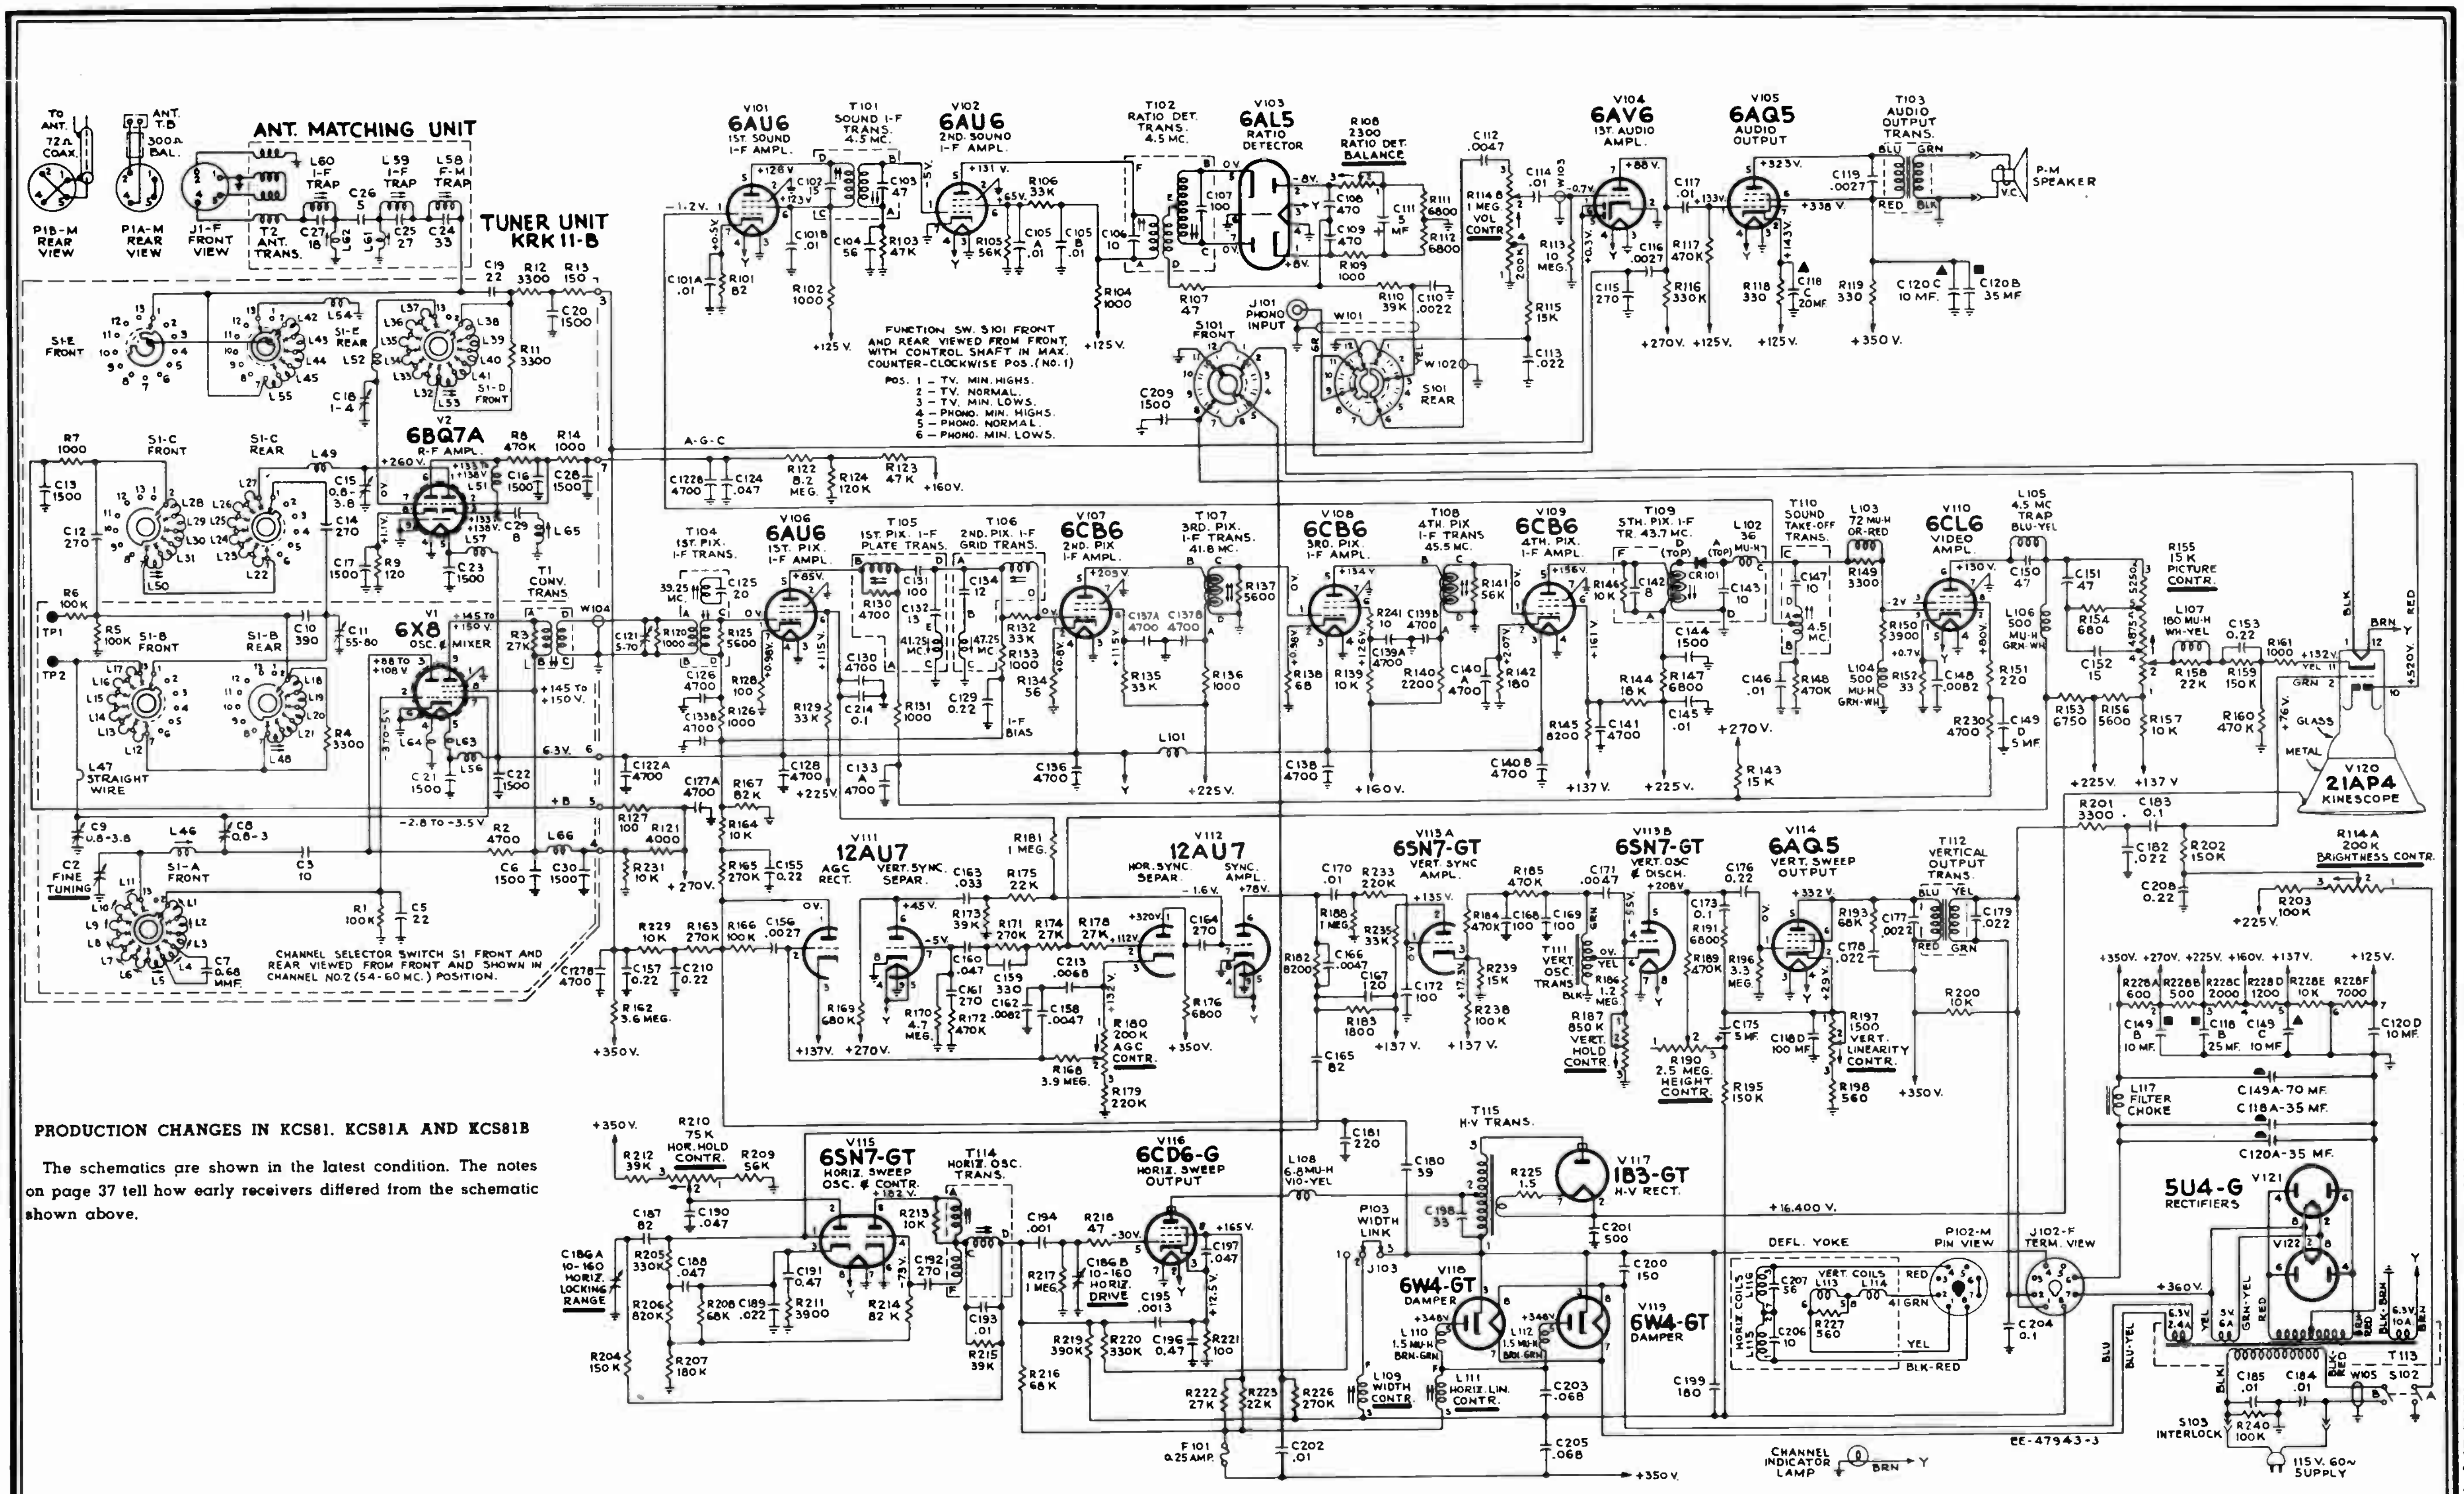

PRODUCTION CHANGES IN KCS81, KCS81A AND KCS81B

The schematics are shown in the latest condition. The notes on page 37 tell how early receivers differed from the schematic shown above.

The schematic is shown in the latest condition at the time of printing.
All resistance value in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

Figure 83—Circuit Schematic Diagram KCS81

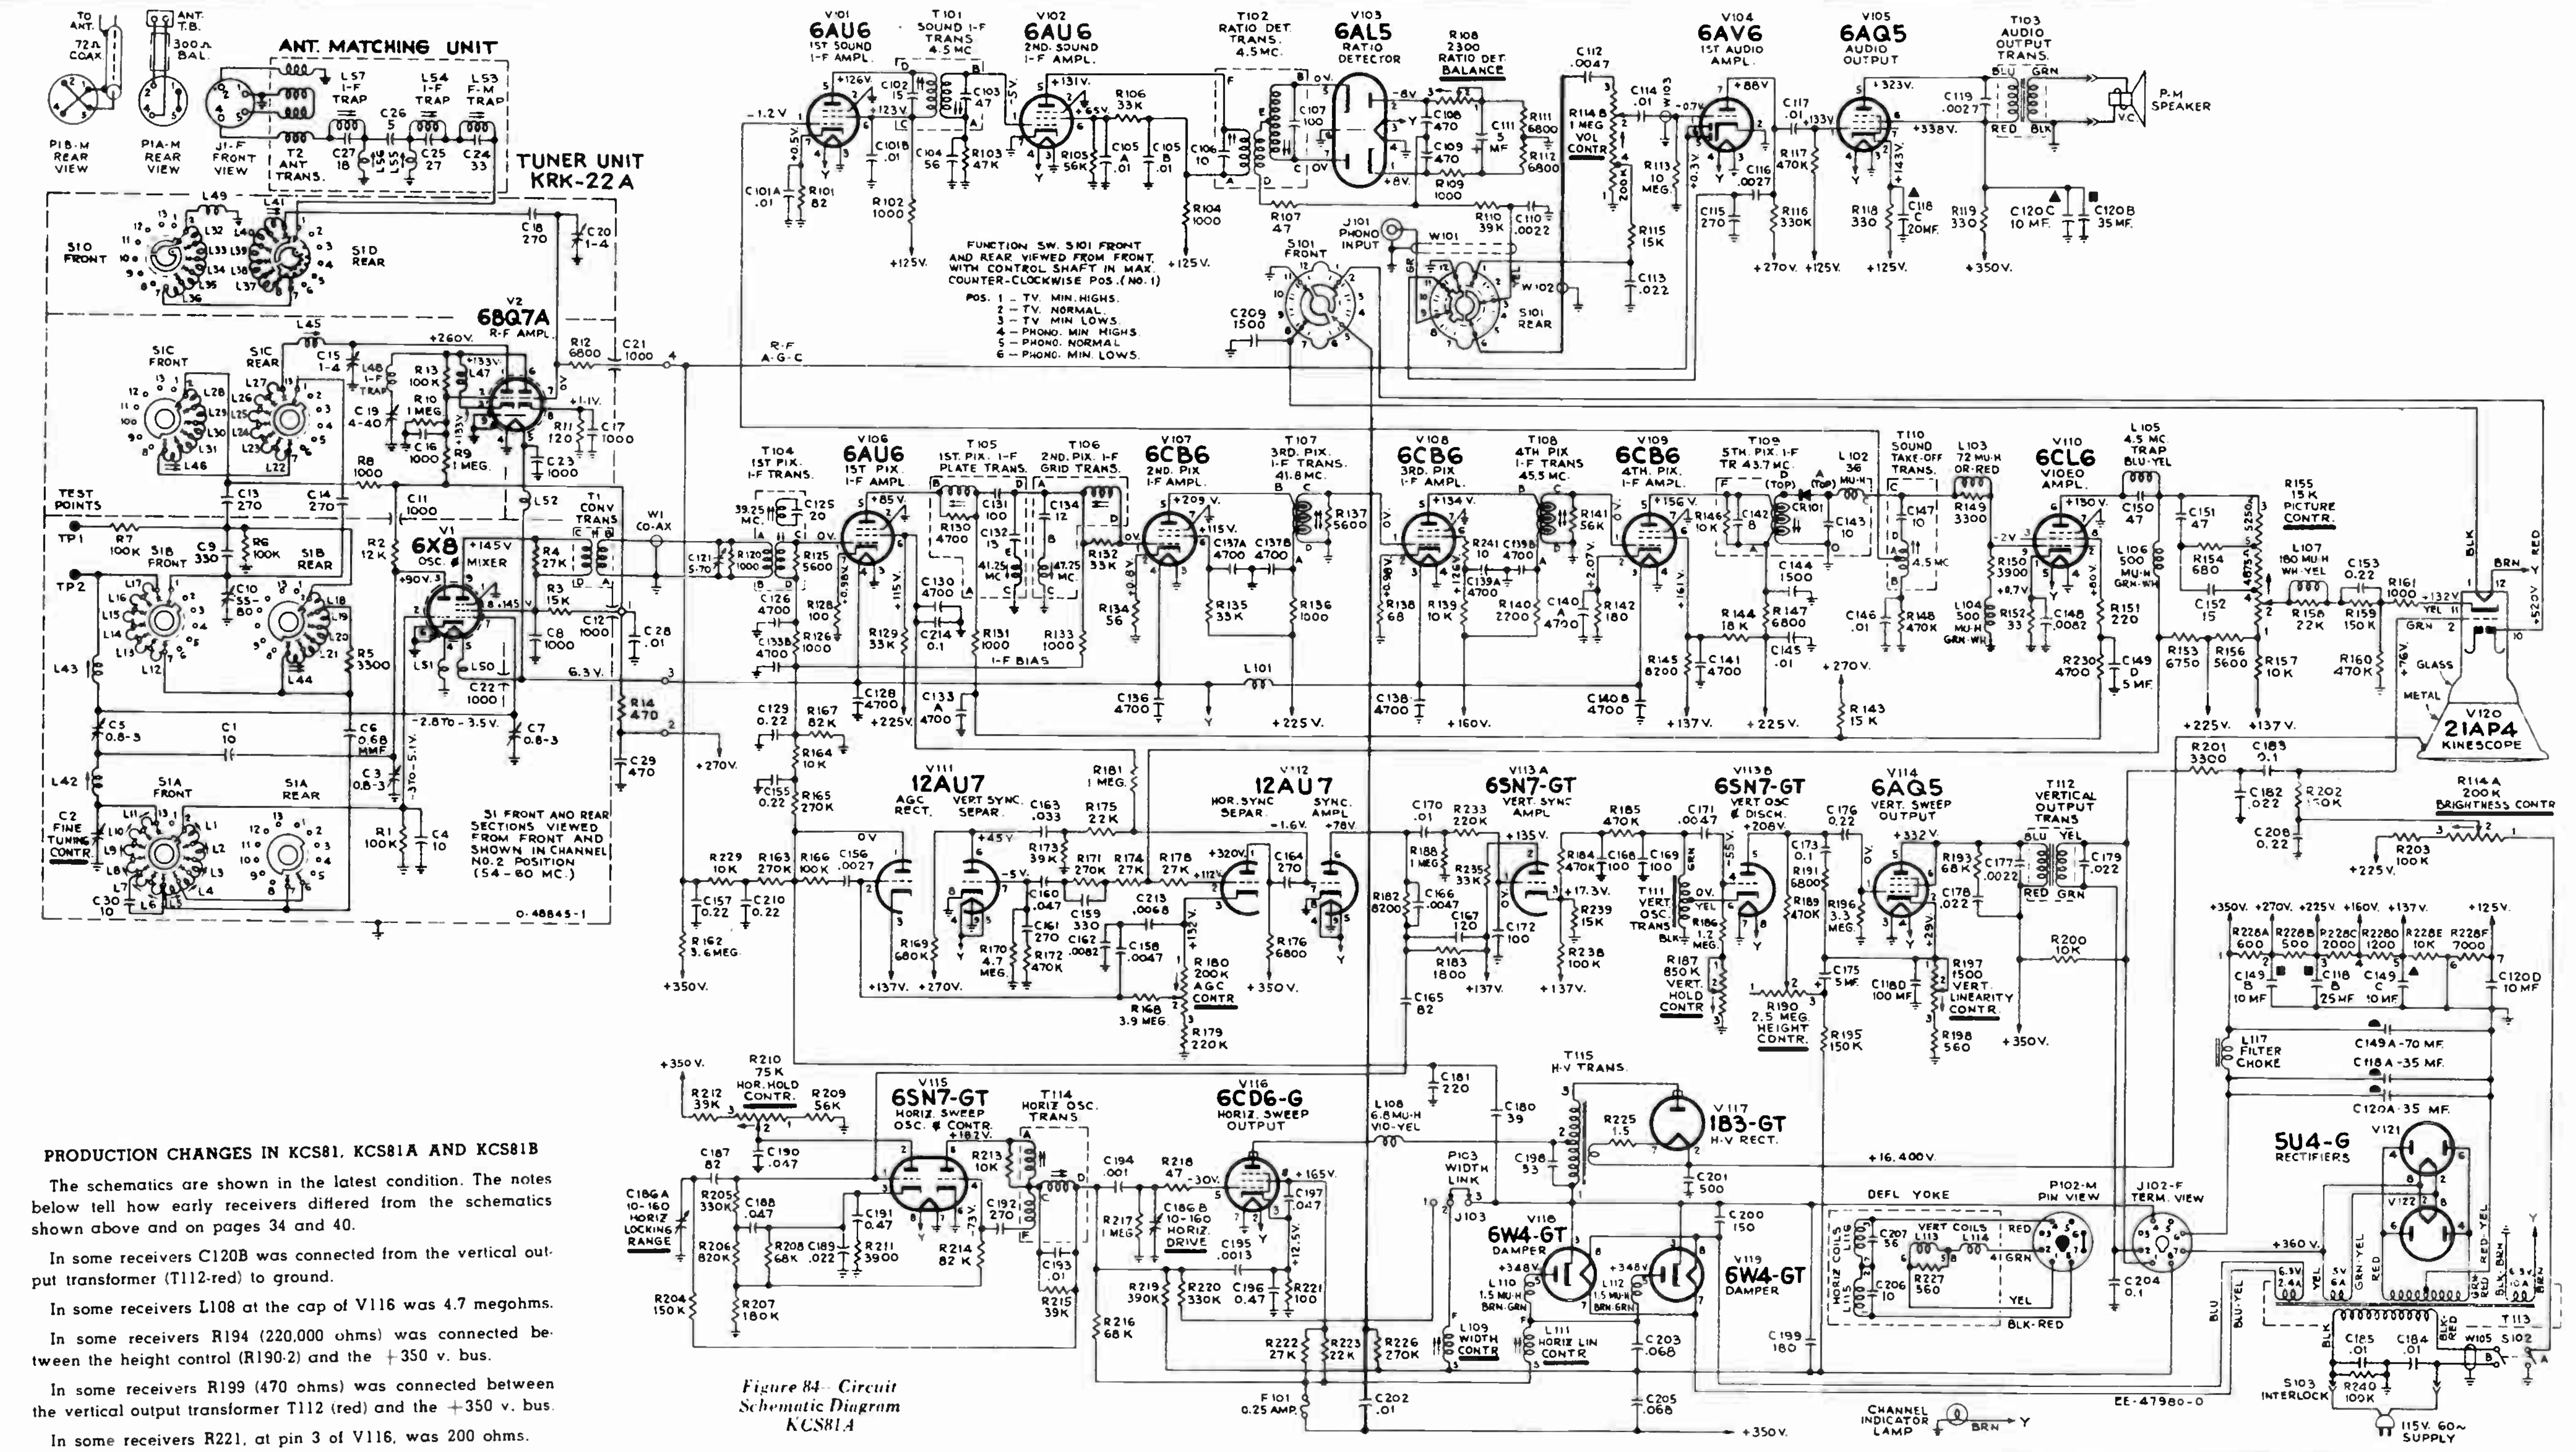

Figure 84—Circuit Schematic Diagram KCS81A

PRODUCTION CHANGES IN KCS81, KCS81A AND KCS81B

The schematics are shown in the latest condition. The notes below tell how early receivers differed from the schematics shown above and on pages 34 and 40.

In some receivers C120B was connected from the vertical output transformer (T112-red) to ground.

In some receivers L108 at the cap of V116 was 4.7 megohms.

In some receivers R194 (220,000 ohms) was connected between the height control (R190-2) and the +350 v. bus.

In some receivers R199 (470 ohms) was connected between the vertical output transformer T112 (red) and the +350 v. bus.

In some receivers R221, at pin 3 of V116, was 200 ohms.

In some receivers R241, at pin 6 of V108, was omitted.

In some receivers terminals 2 and 3 of R190 height control were reversed.

NOTE: In receivers where T105 1st Pix I-F Transformer is stamped 971363-1 (Part No. 76434) an 82 uuf. ceramic capacitor (Part No. 71514) is connected from Terminal "C" of T105 to ground. (For replacement use Part No. 77197 and omit capacitor.)

REPLACEMENT PARTS

STOCK No.	DESCRIPTION
76965	Capacitor—Ceramic, variable, for fine tuning—plunger type (C2)
71504	Capacitor—Fixed, headed-lead type, 0.68 mmf., ±20%, 500 volts (C7)
77151	Capacitor—Tubular, adjustable, steatite, 0.8-3 mmf. (C8)
75184	Capacitor—Ceramic, adjustable, 0.8-3.8 mmf., complete with adjusting stud (C9)

STOCK No.	DESCRIPTION
76532	Capacitor—Adjustable trimmer, steatite, 1-4 mmf. (C18)
	Capacitors—Ceramic, fixed, non-insulated:
93056	5 mmf., ±0.5 mmf., 500 volts DC, Temp. coef. = 0 (C26)
70597	8 mmf., ±1 mmf., 500 volts DC, Temp. coef. = 0 (C29)
55326	10 mmf., ±1 mmf., 500 volts DC, Temp. coef. = -80 (C3)
54207	18 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C27)
76557	22 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C19)
76558	22 mmf., ±10%, 500 volts DC, Temp. coef. = −750 Special—copper coated (C5)

STOCK No.	DESCRIPTION
70935	27 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C25)
76739	33 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C24)
76527	Capacitor—Mica trimmer, 55-80 mmf. (C11)
75199	Capacitor—Fixed, ceramic, insulated, 270 mmf., ±20%, 500 volts DC, High "K" type (C12, C14)
75641	Capacitor—Fixed, ceramic, insulated, 390 mmf., ±10%, 500 volts DC, High "K" type (C10)
75166	Capacitor—Ceramic, 1,500 mmf. (stand-off) (C13, C21, C22, C28, C30)
75610	Capacitor—Fixed, ceramic, insulated, 1,500 mmf., ±20%, 500 volts DC, High "K" type (C6)
73748	Capacitor—Fixed, ceramic, 1,500 mmf., +100%, 0%, 500 volts DC, High "K" disc (C16, C17, C20, C23)
76143	Clip—Tubular clip for mounting stand-off capacitors
73591	Coil—Antenna matching coil (2 req'd)

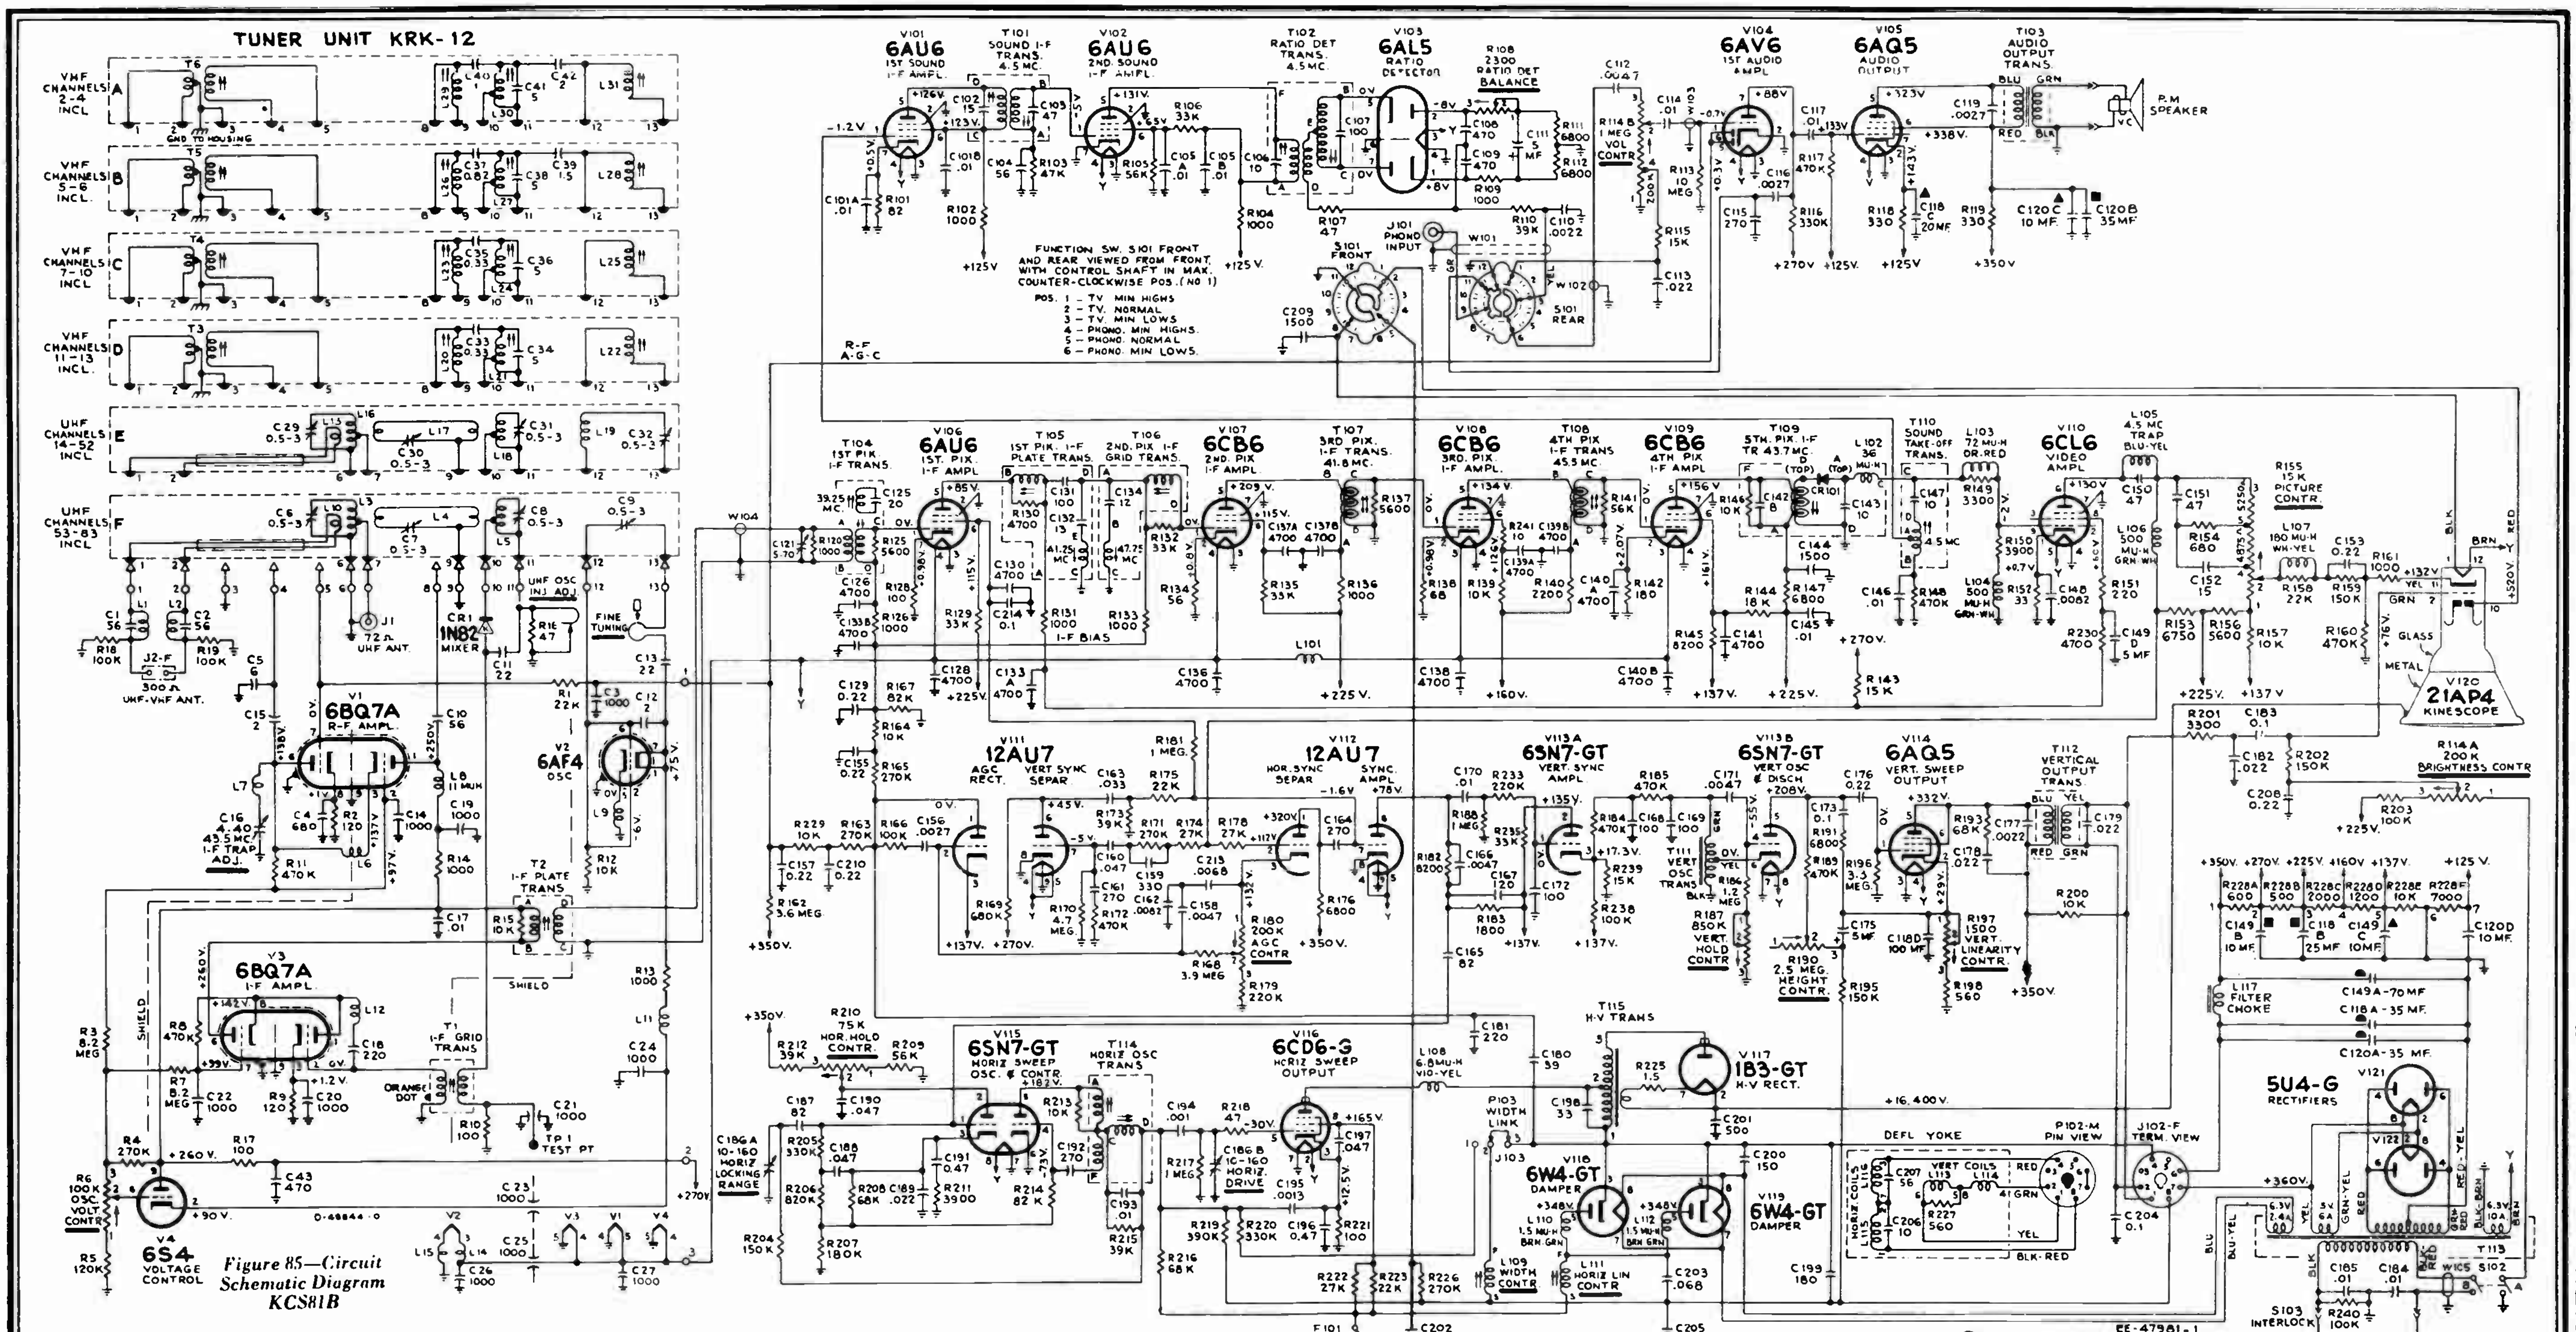

Figure 85—Circuit Schematic Diagram KCS81B

STOCK No.	DESCRIPTION
73477	Coil—Choke coil (L57)
77206	Coil—Filament choke coil (L56)
76763	Coil—Filament choke coil (L63, L64)
76562	Coil—RF amplifier coupling coil (L51)
77153	Coil—RF choke coil (L66)
76537	Coil—Shunt coil complete with adjustable core (L61)
76538	Coil—Shunt coil complete with adjustable core (L62)
76529	Coil—Trimmer coil (3 turns) with adjustable inductance core and capacitor stud (screw adjustment) for r.f. section (L49, C15)
	Resistors—Fixed, composition:
503112	120 ohms, ±10%, ½ watt (R9)
503115	150 ohms, ±10%, ½ watt (R13)
503210	1,000 ohms, ±10%, ½ watt (R7, R14)
503233	3,300 ohms, ±10%, ½ watt (R4, R11, R12)
503247	4,700 ohms, ±10%, ½ watt (R2)
503410	100,000 ohms, ±10%, ½ watt (R1, R5, R6)
503447	470,000 ohms, ±10%, ½ watt (R8)

STOCK No.	DESCRIPTION
76536	Transformer—Antenna matching transformer — complete (T2, C24, C25, C26, C27, L58, L59, L60, L61, L62, J1)
77663	Transformer—Convertor transformer complete with adjustable core (T1, R3)
76535	Trap—I.F. trap
76542	Trap—I.F. trap (41.25 MC) complete with core (L60)
76541	Trap—I.F. trap (45.75 MC) complete with core (L59)
76540	Trap—F.M. trap complete with adjustable core (L58)
77853	Capacitor—Ceramic, variable, for fine tuning—plunger type (C2)
77913	Capacitor—Tubular, adjustable, steatite, 0.8-3.0 mmf. (C5)
71504	Capacitor—Fixed, headed-lead type, 0.68 mmf., ±20%, 500 volts DC (C6)
77151	Capacitor—Adjustable, steatite, 0.8-3.0 mmf. (C3, C7)
76532	Capacitor—Adjustable, steatite, 1-4 mmf. (C15, C20)
77616	Capacitor—Adjustable, mica, 4-40 mmf. (C19)
93056	Capacitor—Fixed, ceramic, non-insulated, 5 mmf., ±0.5 mmf., 500 volts DC, Temp. coef. = 0 (C26)

STOCK No.	DESCRIPTION
77865	Capacitor—Fixed, ceramic, non-insulated, 10 mmf., ±1.0 mmf., 500 volts DC, Temp. coef. = 0 (C1, C30)
78247	Capacitor—Fixed, ceramic, non-insulated, 10 mmf., ±1.0 mmf., 500 volts, Temp. coef. = -750 (C4)
54207	Capacitor—Fixed, ceramic, non-insulated, 18 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C27)
70935	Capacitor—Fixed, ceramic, non-insulated, 27 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C25)
76739	Capacitor—Fixed, ceramic, non-insulated, 33 mmf., ±10%, 500 volts DC, Temp. coef. = 0 (C24)
76527	Capacitor—Mica trimmer, 55-80 mmf. (C10)
75199	Capacitor—Fixed, ceramic, insulated, 270 mmf., ±20%, 500 volts DC, High "K" type (C13, C14, C18)
76552	Capacitor—Fixed, ceramic, insulated, 330 mmf., ±10%, 500 volts DC, High "K" type (C9)
77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, 0%, 500 volts DC, High "K" disc (C29)

STOCK No.	DESCRIPTION
77084	Capacitor—Ceramic, feed-thru, 1,000 mmf. (C11, C14, C21, C22)
77252	Capacitor—Fixed, ceramic, 1,000 mmf., +100%, -0%, 500 volts DC, High "K" disc (C8, C16, C17, C23)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, -0%, 500 volts DC, High "K" disc (C28)
77854	Clip—Mounting clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T2)
73874	Coil—Channel No. 6 mixer coil (L44)
73460	Coil—Channel No. 6 r.f. plate coil (L46)
77915	Coil—Channel No. 13 oscillator coil (L42)
77919	Coil—Channel No. 13 mixer coil (L43)
77921	Coil—Channel No. 13 r.f. plate coil (L45)
77206	Coil—Filament choke coil (L52)
76763	Coil—Heater choke coil (L50, L51)
76562	Coil—RF amplifier coupling coil (L47)
76537	Coil—Shunt coil complete with adjustable core (L55)
76538	Coil—Shunt coil complete with adjustable core (L56)

STOCK No.	DESCRIPTION
	Resistor—Fixed, composition:
503112	120 ohms, ±10%, ½ watt (R11)
503147	470 ohms, ±10%, ½ watt (R14)
503210	1,000 ohms, ±10%, ½ watt (R8)
503233	3,300 ohms, ±10%, ½ watt (R5)
503268	6,800 ohms, ±10%, ½ watt (R12)
523312	12,000 ohms, ±10%, 2 watts (R2)
523315	15,000 ohms, ±10%, 2 watts (R3)
502327	27,000 ohms, ±5%, ½ watt (R4)
503410	100,000 ohms, ±10%, ½ watt (R1, R6, R7, R13)
503510	1 megohm, ±10%, ½ watt (R9, R10)
77858	Transformer—Antenna matching transformer complete (T2, C24, C25, C26, C27, J1, L53, L54, L55, L56, L57)
77857	Transformer—Convertor transformer (T1)
76540	Trap—FM trap complete with adjustable core (L53)
77628	Trap—I.F. trap (L48)
76542	Trap—I.F. trap (41.25 MC) complete with core (L57)
76541	Trap—I.F. trap (45.75 MC) complete with core (L54)
77691	Capacitor—Fixed, headed-lead type, .33 mmf., ±10%, 500 volts DC (C33, C35)
77689	Capacitor—Fixed, headed-lead type, .82 mmf., ±10%, 500 volts DC (C37)
77690	Capacitor—Fixed, headed-lead type, 1 mmf., ±10%, 500 volts DC (C40)
71500	Capacitor—Fixed, headed-lead type, 1.5 mmf., ±10%, 500 volts DC (C39)
78047	Capacitor—Fixed, headed-lead type, 2.0 mmf., ±10%, 500 volts DC (C42)
77210	Capacitor—Fixed, ceramic, non-insulated, 2 mmf., ±0.25 mmf., 500 volts DC, Temp. coeff. = 0 (C15)
77667	Capacitor—Fixed, ceramic, insulated, comprising 1 section of 2 mmf., and 1 section of 22 mmf., Temp. coeff. = −750 (C12, C13)
77616	Capacitor—Adjustable, mica, 4-40 mmf. (C16)
77688	Capacitor—Fixed, ceramic, non-insulated, 5 mmf., ±.5 mmf., 500 volts DC, Temp. coeff. = 0 (C34, C36, C38, C41)
74182	Capacitor—Fixed, ceramic, non-insulated, 6 mmf., ±0.5 mmf., 500 volts DC, Temp. coeff. = 0 (C5)
77621	Capacitor—Fixed, ceramic, crystal holder, 22 mmf., ±10%, Temp. coeff. = −750 (C11)
71924	Capacitor—Fixed, ceramic, non-insulated, 56 mmf., ±10%, 500 volts DC, Temp. coeff. = −750 (C10)
77625	Capacitor—Fixed, ceramic, 220 mmf., +100%, −0%, 500 volts DC, High "K" disc (C18)
77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, −0%, 500 volts DC, High "K" disc (C43)
77624	Capacitor—Fixed, ceramic, 680 mmf., +100%, −0%, 500 volts DC, High "K" disc (C4)
77084	Capacitor—Ceramic, feed-thru, 1,000 mmf. (C21, C23, C25)
77615	Capacitor—Ceramic, stand-off, 1,000 mmf. (C3, C19, C24, C26)
77252	Capacitor—Fixed, ceramic, 1,000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C14, C20, C22, C27)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C17)
77628	Coil—IF trap (L7)
77634	Coil—IF neutralizing coil (L12)
77629	Coil—Oscillator cathode coil (L9)
77632	Coil—Oscillator heater coil (L15)
77631	Coil—Oscillator heater coil (L14)
78224	Coil—Oscillator plate coil (L11)
77627	Coil—Peaking coil (L6, R11)
77695	Coil—RF plate coil (L8)
77614	Control—Oscillator voltage control (R6)
77617	Control—UHF oscillator injection adjustment control
77489	Rectifier—Germanium rectifier IN82 (CR1)
	Resistors—Fixed, composition:
503047	47 ohms, ±10%, ½ watt (R16)
503110	100 ohms, ±10%, ½ watt (R10, R17)
503112	120 ohms, ±10%, ½ watt (R2, R9)
503210	1,000 ohms, ±10%, ½ watt (R13, R14)
503310	10,000 ohms, ±10%, ½ watt (R12)
503322	22,000 ohms, ±10%, ½ watt (R1)
503410	100,000 ohms, ±10%, ½ watt (R18, R19)
503412	120,000 ohms, ±10%, ½ watt (R5)
503427	270,000 ohms, ±10%, ½ watt (R4)
503447	470,000 ohms, ±10%, ½ watt (R8)
503582	8.2 megohm, ±10%, ½ watt (R3, R7)
77609	Transformer—Mixer I.F. transformer complete with adjustable cores (T1)
77610	Transformer—Primary I.F. link transformer complete with adjustable cores (T2, R15)
77626	Trap—I.F. trap (L1, C1, L2, C2)

STOCK No.	DESCRIPTION
71496	Capacitor—Mica trimmer, 5-70 mmf. (C121)
75217	Capacitor—Mica trimmer, dual 10-160 mmf. (C186A, C186B)
39044	Capacitor—Fixed, ceramic, non-insulated, 15 mmf., ±10%, 500 volts DC, Temp. coef = −750 (C152)
76577	Capacitor—Fixed, ceramic, 33 mmf., 6,000 volts (C198)
76574	Capacitor—Fixed, ceramic, 39 mmf., 3,500 volts (C180)
39042	Capacitor—Fixed, ceramic, non-insulated, 47 mmf., ±10%, 500 volts DC, Temp. coef. = −750 (C151)
71924	Capacitor—Fixed, ceramic, non-insulated, 56 mmf., ±10%, 500 volts DC, Temp. coef. = −750 (C104)
76474	Capacitor—Fixed, mica, 82 mmf., 1,000 volts DC (C165, C187)
39396	Capacitor—Fixed, ceramic, non-insulated, 100 mmf., ±10%, 500 volts DC, Temp. coef. = −750 (C168, C169, C172)
71614	Capacitor—Fixed, ceramic, non-insulated, 120 mmf., ±10%, 500 volts DC, Temp. coef. = −750 (C167)
76576	Capacitor—Fixed, ceramic, 150 mmf., 2,000 volts (C200)
76575	Capacitor—Fixed, ceramic, 180 mmf., 3,500 volts (C199)
75248	Capacitor—Fixed, mica, 220 mmf., 1,000 volts (C181)
47617	Capacitor—Fixed, ceramic, non-insulated, 270 mmf., ±10%, 500 volts DC, Temp. coef. = −750 (C115, C164)
39638	Capacitor—Fixed, mica, 270 mmf., 500 volts DC (C161)
76579	Capacitor—Fixed, mica, 270 mmf., 1,000 volts DC (C192)
39640	Capacitor—Fixed, mica, 330 mmf., 500 volts DC (C159)
39644	Capacitor—Fixed, mica, 470 mmf., 500 volts DC (C108, C109)
76488	Capacitor—Ceramic, 500 mmf., 30,000 volts (C201)
75166	Capacitor—Ceramic, stand-off, 1,500 mmf. (C144)
73748	Capacitor—Fixed, ceramic, 1,500 mmf., +100%, −0%, 500 volts DC, High "K" disc (C209)
73473	Capacitor—Fixed, ceramic, 4,700 mmf., +100%, −0%, 500 volts DC, High "K" disc (C126, C128, C130, C136, C138, C141)
76470	Capacitor—Fixed, ceramic, dual 4,700 mmf., +100%, −0%, 500 volts DC, High "K" disc (C122A, C122B, C127A, C127B for KCS81) (C133A, C133B, C137A, C137B, C139A, C139B, C140A, C140B)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C145, C146)
75877	Capacitor—Fixed, ceramic, dual 10,000 mmf., +100%, −0%, 500 volts DC, High "K" disc (C101A, C101B, C105A, C105B)
74521	Capacitor—Electrolytic, 5 mfd., 50 volts (C111)
28417	Capacitor—Electrolytic, 5 mfd., 450 volts (C175)
76485	Capacitor—Electrolytic, comprising 2 sections of 35 mfd., 450 volts, 1 section of 10 mfd., 450 volts and 1 section of 10 mfd., 200 volts (C120A, C120B, C120C, C120D)
76486	Capacitor—Electrolytic comprising 1 section of 35 mfd., 450 volts, 1 section of 25 mfd., 450 volts, 1 section of 20 mfd., 200 volts and 1 section of 100 mfd., 50 volts (C118A, C118B, C118C, C118D)
77657	Capacitor—Electrolytic comprising 1 section of 70 mfd., 450 volts, 2 sections of 10 mfd., 450 volts and 1 section of 5 mfd., 450 volts (C149A, C149B, C149C, C149D)
	Capacitors—Fixed, tubular, oil impregnated:
75643	Paper, .001 mfd., 1,000 volts (C194)
77727	Moulded paper, .0013 mfd., 600 volts (C195)
73595	Paper, .0022 mfd., 600 volts (C110)
73803	Paper, .0022 mfd., 1,000 volts (C177)
73599	Paper, .0027 mfd., 600 volts (C116, C119, C156)

73787	Paper, 0.47 mfd., 200 volts (C191, C196)
77676	Choke—Filter choke (L117)
76143	Clip—Mounting clip for stand-off capacitor
73477	Coil—Choke coil (L101)
76672	Coil—Filament winding only for hi-voltage transformer (Part of T115)

STOCK No.	DESCRIPTION
76483	Coil—Horizontal linearity coil complete with adjustable core (L111)
76646	Coil—Peaking coil (72 muh) (L103, R149)
76647	Coil—Peaking coil (180 muh) (L107, R158)
75252	Coil—Peaking coil (500 muh) (L104, L106)
76640	Coil—RF choke coil (1.5 muh) (L110, L112)
76510	Coil—RF choke coil (4.7 muh) (L108)
76484	Coil—Width coil complete with adjustable core (L109)
77654	Control—AGC control (R180)
77655	Control—Brightness control, volume control and power switch (R114A, R114B, S102A, S102B)
77640	Control—Height control (R190)
76639	Control—Horizontal hold control (R210)
76445	Control—Picture control (R155)
77199	Control—Ratio detector balance control (R108)
77652	Control—Vertical hold control (R187)
77653	Control—Vertical linearity control (R197)
76675	Rectifier—Picture detector crystal rectifier (CR101)
76468	Resistor—Wire wound, 1.5 ohms, 1/3 watt (R225)
76682	Resistor—Wire wound, 200 ohms, 5 watts (R221)
77651	Resistor—Wire wound comprising 1 section of 600 ohms, 16 watts, 1 section of 500 ohms, 6 watts, 1 section of 2,000 ohms, 5 watts, 1 section of 1,200 ohms, 1 watt, 1 section of 10,000 ohms, 5 watts and 1 section of 7,000 ohms, 5 watts (R228A, R228B, R228C, R228D, R228E, R228F)
76642	Resistor—Wire wound, 6,750 ohms, 10 watts (R153)
77668	Resistor—Wire wound, 4,000 ohms, 7 watts (R121 for KCS81)
77669	Resistor—Wire wound, 10,000 ohms, 5 watts (R231 for KCS81)
	Resistors—Fixed, composition:
503033	33 ohms, ±10%, ½ watt (R152)
503047	47 ohms, ±10%, ½ watt (R107, R218)
502056	56 ohms, ±5%, ½ watt (R134)
34763	68 ohms, ±5%, ½ watt (R138)
502082	82 ohms, ±5%, ½ watt (R101)
502110	100 ohms, ±5%, ½ watt (R128)
503110	100 ohms, ±10%, ½ watt (R127 for KCS81)
503118	180 ohms, ±10%, ½ watt (R142)
503122	220 ohms, ±10%, ½ watt (R151)
513133	330 ohms, ±10%, 1 watt (R118, R119)
503156	560 ohms, ±10%, ½ watt (R198)
503168	680 ohms, ±10%, ½ watt (R154)
503210	1,000 ohms, ±10%, ½ watt (R102, R104, R109, R120, R126, R131, R133, R136, R161)
502218	1,800 ohms, ±5%, ½ watt (R183)
503222	2,200 ohms, ±10%, ½ watt (R140)
502233	3,300 ohms, ±10%, ½ watt (R201)
502239	3,900 ohms, ±5%, ½ watt (R150)
503239	3,900 ohms, ±10%, ½ watt (R211)
503247	4,700 ohms, ±10%, ½ watt (R230)
502256	5,600 ohms, ±5%, ½ watt (R137)
513256	5,600 ohms, ±10%, 1 watt (R156)
14659	6,800 ohms, ±5%, ½ watt (R111, R112, R191)
503268	6,800 ohms, ±10%, ½ watt (R176)
513268	6,800 ohms, ±10%, 1 watt (R147)
503282	8,200 ohms, ±10%, ½ watt (R145)
513282	8,200 ohms, ±10%, 1 watt (R182)
503310	10,000 ohms, ±10%, ½ watt (R139, R164, R200, R213, R229)
513310	10,000 ohms, ±10%, 1 watt (R157)
503315	15,000 ohms, ±10%, ½ watt (R115, R239)
523315	15,000 ohms, ±10%, 2 watts (R143)
503318	18,000 ohms, ±10%, ½ watt (R144)
503322	22,000 ohms, ±10%, ½ watt (R175)
522322	22,000 ohms, ±10%, 2 watts (R223)
503327	27,000 ohms, ±10%, ½ watt (R174, R178)
523327	27,000 ohms, ±10%, 2 watts (R222)
503333	33,000 ohms, ±10%, ½ watt (R106, R129, R132, R135, R235)
503339	39,000 ohms, ±10%, ½ watt (R110, R173, R212, R215)
503347	47,000 ohms, ±10%, ½ watt (R103) (R123 for KCS81)
502356	56,000 ohms, ±5%, ½ watt (R141)
503356	56,000 ohms, ±10%, ½ watt (R105, R209)
503368	68,000 ohms, ±10%, ½ watt (R208)
512368	68,000 ohms, ±5%, 1 watt (R193)
513368	68,000 ohms, ±10%, 1 watt (R216)
8064	82,000 ohms, ±5%, ½ watt (R167)
513382	82,000 ohms, ±10%, 1 watt (R214)
503410	100,000 ohms, ±10%, ½ watt (R166, R203, R238, R240)
503412	120,000 ohms, ±10%, ½ watt (R124)
503415	150,000 ohms, ±10%, ½ watt (R159, R195, R202, R204)
503418	180,000 ohms, ±10%, ½ watt (R207)
502422	220,000 ohms, ±5%, ½ watt (R179)
503422	220,000 ohms, ±10%, ½ watt (R233)
502427	270,000 ohms, ±5%, ½ watt (R163, R165)
503427	270,000 ohms, ±10%, ½ watt (R171, R226)

STOCK No.	DESCRIPTION
503433	330,000 ohms, ±10%, ½ watt (R116, R205, R220)
503439	390,000 ohms, ±10%, ½ watt (R219)
503447	470,000 ohms, ±10%, ½ watt (R117, R148, R160, R172, R184, R185, R189)
503468	680,000 ohms, ±10%, ½ watt (R169)
503482	820,000 ohms, ±10%, ½ watt (R206)
503510	1 megohm, ±10%, ½ watt (R181, R188, R217)
503512	1.2 megohm, ±10%, ½ watt (R186)
503533	3.3 megohm, ±10%, ½ watt (R196)
512536	3.6 megohm, ±5%, 1 watt (R162)
503539	3.9 megohm, ±10%, ½ watt (R168)
503547	4.7 megohm, ±10%, ½ watt (R170)
503582	8.2 megohm, ±10%, ½ watt (R122 for KCS81)
503610	10 megohm, ±10%, ½ watt (R113)
77656	Switch—Phono-tone switch (S101)
76463	Terminal—Screw type grounding terminal
77198	Transformer—1st pix I.F. grid transformer complete with adjustable cores (T104, C125, R125)
77197	Transformer—1st pix I.F. plate transformer complete with adjustable cores (T105, C131, C132, R130)
76435	Transformer—2nd pix I.F. grid transformer complete with adjustable cores (T106, C134)
76433	Transformer—3rd or 4th pix I.F. transformer (T107, T108)
76436	Transformer—5th pix I.F. transformer (T109, C142, C143, L102, R146, CR101)
76501	Transformer—Hi-voltage transformer (Part of T115)
76440	Transformer—Horizontal oscillator transformer complete with adjustable cores (T114)
76997	Transformer—Output transformer (T103)
77649	Transformer—Power transformer, 117 volts, 60 cycle (T113)
76439	Transformer—Ratio detector transformer complete with adjustable cores (T102, C106, C107)
76438	Transformer—Sound I.F. transformer complete with adjustable cores (T101, C102, C103)
76437	Transformer—Sound take-off transformer complete with adjustable cores (T110, C147)
77650	Transformer—Vertical oscillator transformer (T111)
76494	Transformer—Vertical output transformer (T112)
76482	Trap—4.5 MC trap (L105, C150)
77585	Washer—"C" washer for picture control extension shaft (2 req'd)

YOKE & MAGNET ASSEMBLIES

STOCK No.	DESCRIPTION
76863	Connector—Anode connector complete with contact and eyelet
75542	Connector—6 contact male connector—part of deflection yoke (P102)
74956	Cushion—Rubber cushion for deflection yoke hood
76654	Hood—Deflection yoke hood—less rubber cushions
76168	Magnet—Focus magnet
76141	Magnet—Ion trap magnet
71456	Screw—No. 8-32 x 7/16" wing screw for mounting deflection yoke
76636	Stud—Adjusting stud complete with guard for focus magnet
76653	Yoke—Deflection yoke complete with male connector (L113, L114, L115, L116, C206, C207, R227, P102)

SPEAKER ASSEMBLIES

971490-3W 971490-3R

RL 105E6 RMA 285

RMA 274

(For Table Models)

STOCK No.	DESCRIPTION
75024	Cone—Cone and voice coil for speakers stamped 971490-3W
77129	Cone—Cone and voice coil for speakers stamped 971490-3R
75022	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms)

SPEAKER ASSEMBLIES

92569-12W

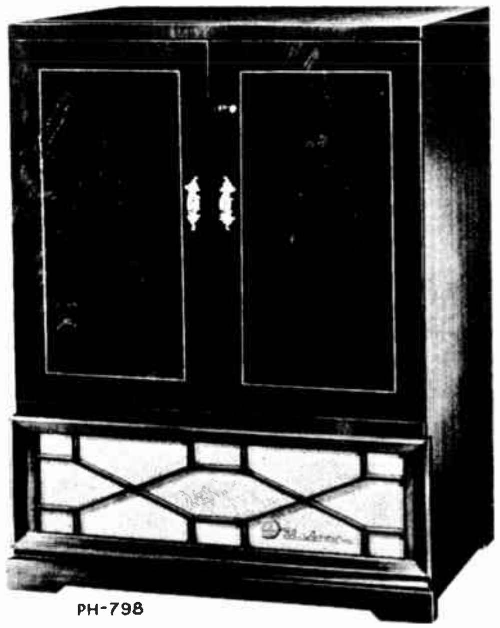
RL 111A1

RMA 274

(For Console Models)

STOCK No.	DESCRIPTION
75682	Cone—Cone and voice coil
76093	Speaker—12" P.M. speaker complete with cone and voice coil (3.2 ohms)

NOTE: If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to Model number of instrument, number stamped on speaker and full description of part required.



Models 27-D-331, 27-D-331U
Mahogany, Oak

GENERAL DESCRIPTION

Models 27-D-331 and 27-D-331U are Deluxe "27 Inch" television receivers. Model 27-D-331 features full 12 channel VHF coverage.
Model 27-D-331U features full 12 channel VHF coverage plus any 4 UHF channels desired. These receivers have an auxiliary audio input jack to permit the use of an external record playing attachment. Both models incorporate two 8" PM speakers.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE....420 square inches on a 27MP4 Kinescope

TELEVISION R-F FREQUENCY RANGE

Model 27-D-331

All 12 VHF channels....54 mc. to 88 mc., 174 mc. to 216 mc.

Model 27-D-331U

Any of 70 UHF channels................470 mc. to 890 mc.

Any of 12 VHF channels 54 mc. to 88 mc., 174 mc. to 216 mc.
(Any desired combination of 16 UHF and/or VHF channels may be used.)

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency....................45.75 mc.

Sound I-F Carrier Frequency.....................41.25 mc.

POWER RATING ....325 watts

AUDIO POWER OUTPUT RATING............4 watts max.

VIDEO RESPONSE ....to 4 mc.

SWEEP DEFLECTION ....Magnetic

FOCUS ....Magnetic

ANTENNA INPUT IMPEDANCE

Model 27-D-331

Choice: 300 ohms balanced or 72 ohms unbalanced.

Model 27-D-331U

UHF—Choice: 300 ohms balanced or 72 ohms unbalanced.

VHF—300 ohms balanced.

CHASSIS DESIGNATIONS

KCS77A ....In model 27-D-331

KCS77B ....In model 27-D-331U

LOUDSPEAKERS..........(971490-4W) 8 Inch PM Dynamic

VOICE COIL IMPEDANCE........................3.2 ohms

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK22A (Model 27-D-331)	
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer
Tuner KRK12 (Model 27-D-331U)	
(1) RCA 6BQ7A	R-F Amplifier (VHF only)
(2) RCA 6AF4	R-F Oscillator
(3) RCA 6BQ7A	I-F Amplifier
(4) RCA 6S4	Voltage Control
A 1N82 crystal is used as a mixer.	
Models 27-D-331 & 27-D-331U	
(1) RCA 6AU6	1st Picture I-F Amplifier
(2) RCA 6CB6	2nd Picture I-F Amplifier
(3) RCA 6CB6	3rd Picture I-F Amplifier
(4) RCA 6CB6	4th Picture I-F Amplifier
(5) RCA 6CL6	Video Amplifier
(6) RCA 6CL6	Peaking Amplifier
(7) RCA 6AL5	Agitation Compressor
(8) RCA 6AU6	1st Sound I-F Amplifier
(9) RCA 6AU6	2nd Sound I-F Amplifier
(10) RCA 6AL5	Ratio Detector
(11) RCA 6AV6	1st Audio Amplifier
(12) RCA 6AQ5	Audio Output
(13) RCA 12AU7	Vert. Sync Separator and AGC
(14) RCA 12AU7	Horiz. Sync Separator and Sync Amplifier
(15) RCA 6SN7GT	Vert. Sync Amplifier and Vert. Sweep Osc. and Dischg.
(16) RCA 6AQ5	Vertical Sweep Output
(17) RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(18) RCA 6BQ6GT (2 tubes)	Horizontal Sweep Output
(19) RCA 6W4GT (2 tubes)	Dampers
(20) RCA 1B3GT/8016	High Voltage Rectifier
(21) RCA 5U4G (2 tubes)	Rectifiers
(22) RCA 27MP4	Kinescope

ELECTRICAL AND MECHANICAL SPECIFICATIONS (Continued)

SCANNING..................Interlaced, 525 line

HORIZONTAL SCANNING FREQUENCY ....15,750 cps

VERTICAL SCANNING FREQUENCY .....60 cps

FRAME FREQUENCY (Picture Repetition Rate)...............30 cps

OPERATING CONTROLS (front panel)

Channel Selector / Fine Tuning ....Dual Control Knobs

Brightness / Sound Volume and On-Off Switch ....Dual Control Knobs

Picture Horizontal Hold / Picture Vertical Hold ... Dual Control (Knurled)

Contrast-Peaking ....Single Control Knob

Tone Switch ....Single Control Knob

Sharpness Switch ....Single Control Knob

NON-OPERATING CONTROLS

Horizontal Centering .....top chassis adjustment
Vertical Centering ....top chassis adjustment
AGC ....rear chassis adjustment
Height ....front panel screwdriver adjustment
Vertical Linearity ...front panel screwdriver adjustment
Horizontal Locking ...rear chassis screwdriver adjustment
Horizontal Drive ......rear chassis screwdriver adjustment
Horizontal Linearity ......rear chassis adjustment
Horizontal Oscillator Frequency ....rear chassis adjustment
Horizontal Oscillator Waveform ....bottom chassis adjustment
Width ....rear chassis adjustment
Width Link ........H.V. compartment adjustment
Focus ....top chassis adjustment
Ion Trap Magnet ....top chassis adjustment
Focus Magnet ....top chassis adjustment
Deflection Coil ....top chassis adjustment

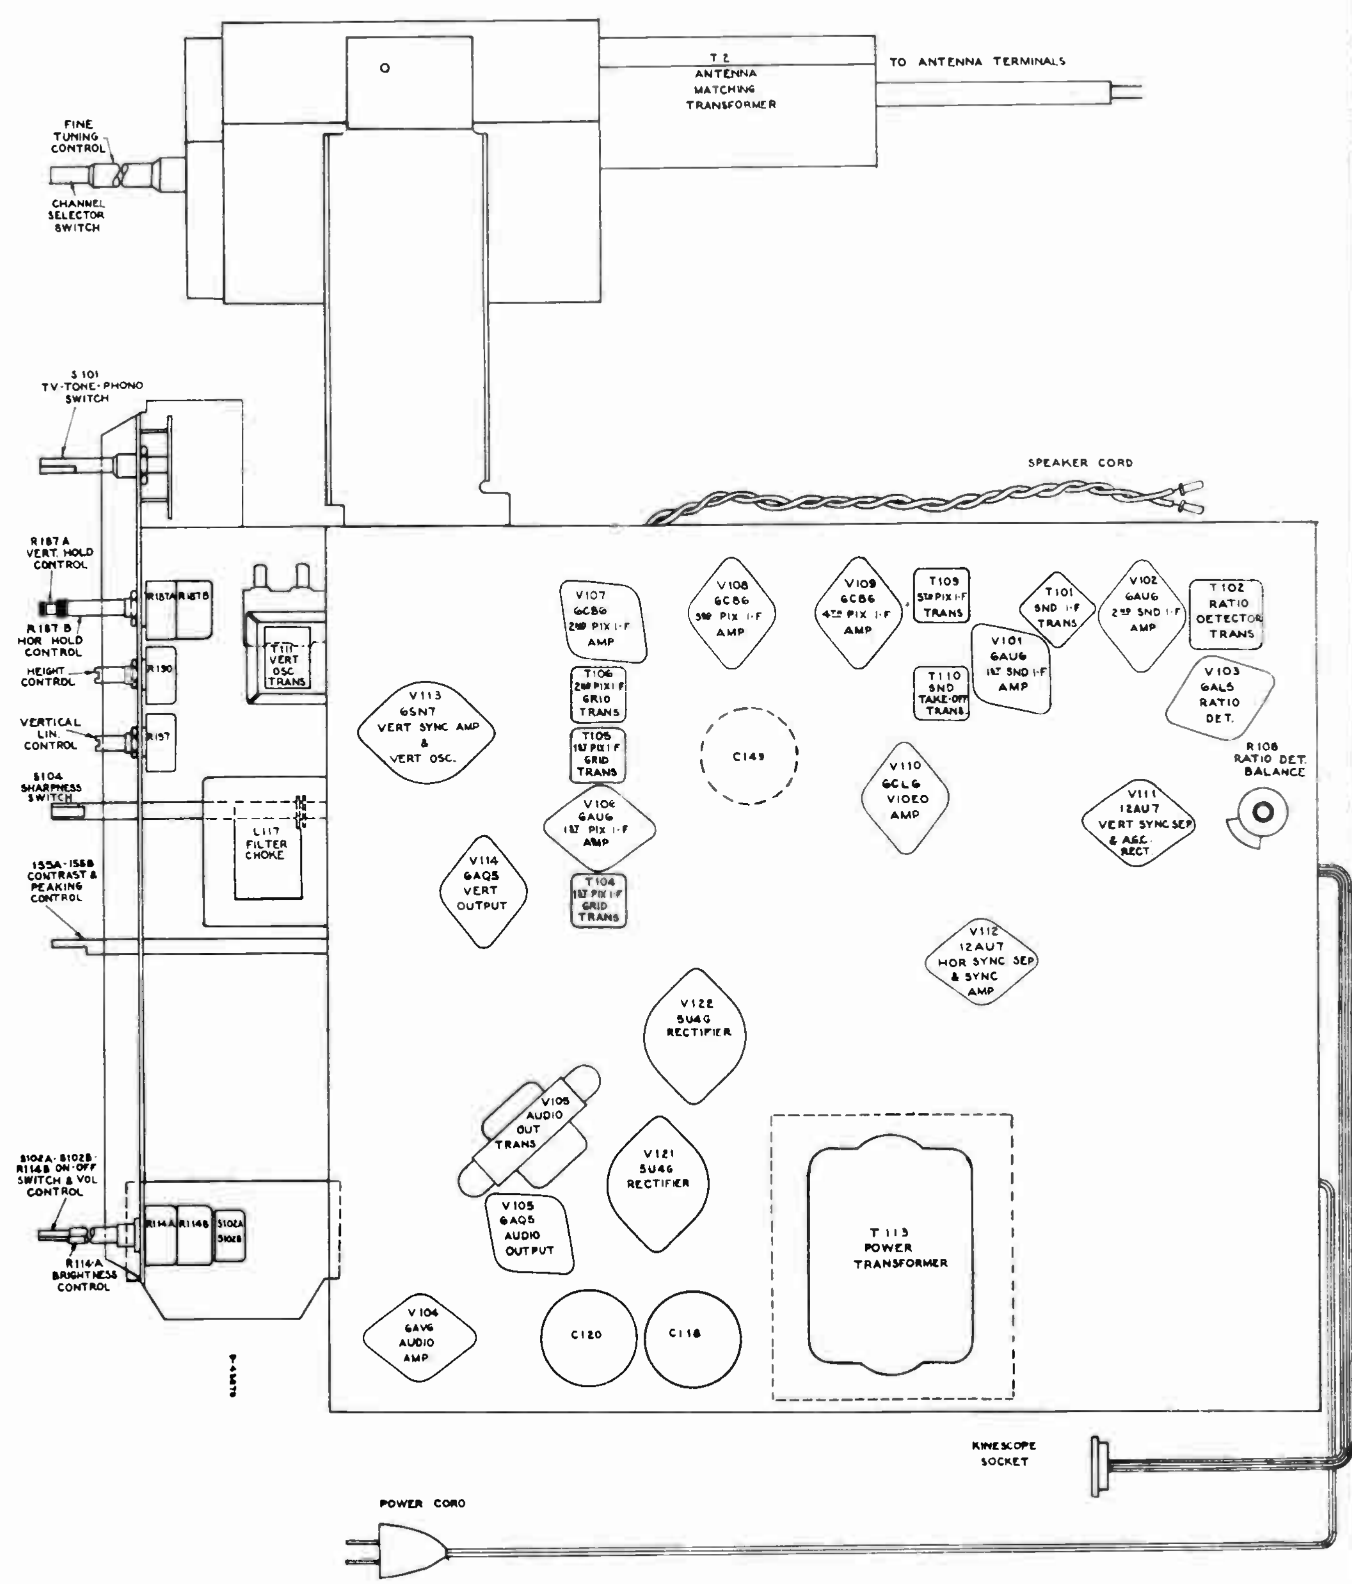

Figure 6—Chassis Bottom View (shown with KRK22A Tuner)

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.
(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA Types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
14	471.25	475.75	517
15	477.25	481.75	523
16	483.25	487.75	529

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 1 millivolt per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

DC Milliammeter.—A milliammeter with a range of 0-50 milliamperes full scale.

Adapter Socket.—An adapter socket is required to meter the cathode current of the 6S4 voltage control tube of the KRK12 Tuner. Wiring of adapter is shown in figure 14.

KRK22A ANTENNA MATCHING UNIT ALIGNMENT.—The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The tuner unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the tuner unit should be re-aligned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L53 to the channel selector switch S4.

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R133 and C133B. Set the potentiometer to produce approximately –5.0 volts of bias at the junction of R133 and C133B.

Connect an oscilloscope to pin 9 of V110 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L54 in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L57 for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

ALIGNMENT PROCEDURE

Connect a 300 ohm ½ watt composition resistor from L53 to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L53 to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 15 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by retuning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L55 and L56 to obtain the response shown in figure 16. L55 is most effective in locating the position of the shoulder of the curve at 52 mc. and L56 should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L53 and S4. Replace V106.

PICTURE I-F TRAP ADJUSTMENT.—Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R133 and C133B.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the positive terminal of one battery to chassis and the potentiometer arm to the junction of R133 and C133B. The second bias supply will be used later.

Set the bias to produce approximately –1.0 volt of bias at the junction of R133 and C133B.

Connect the "VoltOhmyst" to pin 9 of V110, the 6CL6 video amplifier.

Set the signal generator to each of the following frequencies and adjust the corresponding circuit for minimum d-c output at pin 9 of V110. Use sufficient signal input to produce 1.0 volt of d-c on the meter when the final adjustment is made.

39.25 mc.	T104 top core
41.25 mc.	T105 bottom core
47.25 mc.	T106 bottom core

PICTURE I-F TRANSFORMER ADJUSTMENTS.

Model 27-D-331

Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 1.0 volt of d-c at pin 9 of V110 with –1.0 volt of i-f bias at the junction of R133 and C133B.

43.7 mc.	T109
45.5 mc.	T108
41.8 mc.	T107

To align T105 and T106, connect the sweep generator to the first picture i-f grid, pin 1 of V106 through a 1,000 mmf. ceramic capacitor. Shunt R137, R141 and terminals "A" and "F" of T109 with 330 ohm composition resistors. Set the i-f bias to –1.0 volt at the junction of R133 and C133B.

Connect the oscilloscope to pin 9 of V110.

Adjust T105 and T106 top cores for maximum gain and curve shape as shown in figure 20. For final adjustment set the output of the sweep generator to produce 0.5 volt peak-to-peak at the oscilloscope terminals.

To align T1 and T104, connect the sweep generator to the mixer grid test point TP2. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable.

Adjust C121 until 41.25 mc. is at 85% response with respect to the low frequency shoulder at approximately 41.9 mc. as shown in figure 21.

Disconnect the diode probe, the 180 ohm and three 330 ohm resistors.

Model 27-D-331U

Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 1.0 volt of d-c at pin 9 of V110 with –1.0 volt of i-f bias at the junction of R133 and C133B.

43.7 mc.	T109
45.5 mc.	T108
41.8 mc.	T107

To align T105 and T106, connect the sweep generator to the first picture i-f grid, pin 1 of V106 through a 1,000 mmf. ceramic capacitor. Shunt R137, R141 and terminals "A" and "F" of T109 with 330 ohm composition resistors. Set the i-f bias to –1.0 volt at the junction of R133 and C133B.

Connect the oscilloscope to pin 9 of V110, the 6CL6 video amplifier.

Adjust T105 and T106 top cores for maximum gain and curve shape as shown in figure 20. For final adjustment set the output of the VHF sweep generator to produce 0.5 volt peak-to-peak at the oscilloscope terminals.

To align the crystal mixer and T2 and T104, connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1,500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep generator to the tuner case.

Set the channel selector to channel 5.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R131 and C133A.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C121 across terminals A and B of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (bottom) for maximum gain at 43.5 mc. and with 45.75 mc. at 70% of maximum response.

Adjust the shunt trimmer C121 until 41.25 mc. is at 85% response with respect to the low frequency shoulder at approximately 41.9 mc. as shown in figure 12. Adjust T1 for maximum gain. Readjust T2 and T104 if necessary to obtain proper wave shape, see figure 12.

Disconnect the diode probe, the 180 ohm and the three 330 ohm resistors.

SWEEP ALIGNMENT OF PICTURE I.F.—

Connect the oscilloscope to pin 9 of V110.

Adjust the bias potentiometer to obtain –6.0 volts of bias as measured by a "VoltOhmyst" at the junction of R133 and C133B.

Leave the sweep generator connected to the mixer grid test point TP2 on KRK22A Tuner or to the front terminal of the 1N82 crystal holder on KRK12 Tuner. Use the shortest leads possible with not more than one inch of unshielded lead at the end of the sweep cable. If these precautions are not observed, the receiver may be unstable and the response curves obtained may be unreliable.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

ALIGNMENT PROCEDURE

Retouch T108 and T109 to obtain the response shown in figure 2. Do not adjust T107 unless absolutely necessary. If T107 is adjusted too low in frequency it will raise the level of the 41.25 mc. sound i-f carrier and may create interference in the picture. It will also cause poor adjacent channel picture rejection. If T107 is tuned too high in frequency, the level of the 41.25 mc. sound i-f carrier will be too low and may produce noisy sound in weak signal areas.

Remove the oscilloscope, sweep and signal generator connections.

Remove the bias box employed to provide bias for alignment.

KRK22A TUNER ALIGNMENT.

Model 27-D-331

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C2 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T1 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 42.0 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner, at the terminal board, to ground.

Connect the oscilloscope to the test point TP1 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L53 and C24 at the bottom of the FM trap L53.

Tune the signal generator to 42.0 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C19 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C19 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce -3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C5 to read -3.0 volts at the test point TP1, as read on the "VoltOhmyst". The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C3 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C10. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C3 to obtain an audible beat with the signal generator.

Turn C2 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

NOTE.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C3, switch to channel 13 and adjust L42 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L11 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C3 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L42 and back to channel 8 and adjust C3.

Set the T1 core for maximum inductance (core turned counterclockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 15, to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C7, C10, C15 and C20 for approximately correct curve shape, frequency, and band width as shown in figure 17.

The correct adjustment of C20 is indicated by maximum amplitude of the curve midway between the markers. C15 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C7 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C20 has been properly adjusted). C10 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C5 to read -3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C2, C7, C10 and C15 for proper response. Adjust C20 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L42 to obtain an audible beat. Slightly overshoot the adjustment of L42 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C2 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L43 and L45 for proper response as shown in figure 17.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C5, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L43 and L45 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C2 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C7, C10, C15 and C20 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C7 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

ALIGNMENT PROCEDURE

Adjust L5 for an audible beat. Adjust L44, L46 and L41 for proper curve shape as shown in figure 17. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C5 if necessary.

If C5 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C7 for correct curve shape and recheck C2 and C3 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 17 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L44, L46 and L41 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 17 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C15, C7, or C10 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L42 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

KRK12 TUNER ALIGNMENT

Model 27-D-331U

TUNER VHF ALIGNMENT.—Remove the 6S4 voltage control tube from its socket and insert the adapter. Insert the 6S4 in the adapter.

Connect the 0-50 milliampere meter to the adapter socket leads and turn the adapter switch on.

Remove the tuner cover shield.

Rotate the channel selector to a point midway between channels, disengaging the insert contacts, and observe the non-oscillating plate current. Some tubes may oscillate even with the tuned circuits disengaged. To be sure the oscillator is in a non-oscillatory state, short circuit the spring contacts 12 and 13, the two contacts nearest the tuner front.

(NOTE: The contacts are at zero d-c potential.) Should the plate current rise, keep the contacts shorted while adjusting the oscillator plate current. Adjust R6, oscillator voltage control, for a 28 milliampere reading on the meter.

Replace the tuner cover shield.

Connect the VHF sweep generator to the antenna terminals.

Connect the VHF signal generator loosely to the antenna terminals.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Turn off the adapter switch, removing plate voltage from the oscillator. This is required because of RF-IF interaction when a crystal is used as a mixer.

Set the channel selector and the sweep generator to channel 2.

Insert markers of channel 2 picture carrier and sound carrier, 55.25 mc. and 59.75 mc.

Adjust antenna T6, r-f amplifier plate L29 and mixer L30 adjustments for a symmetrical curve with maximum gain at the center of the pass band. The curves will have a deep valley because of no crystal loading and nonlinear detector characteristics. The limits for the 100% response points are shown in figure 10. The proper curve shape is shown in figure 10(b). If the bandwidth is out of tolerance, it can usually be corrected by redressing the coupling capacitor of the double tuned circuit, C40 on insert A. Maximum bandwidth occurs when the capacitor is centered in the insert chamber.

Repeat the above steps for all VHF channels adjusting the appropriate antenna, r-f amplifier plate and mixer slugs for a symmetrical curve with maximum gain at the center of the pass band.

Turn off the sweep generator.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Turn the AGC control fully clockwise and remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce -3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Connect the potentiometer arm of the second bias supply to the junction R133 and C133B, and ground the positive battery terminal. Adjust the bias potentiometer to produce -5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to pin 9 of V110. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to channel 13.

Set the fine tuning control to the center of its range.

Adjust the oscillator slug L22 to proper frequency, 257 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 257 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner through either of the two holes next to the oscillator tube on the right front top corner of the tuner. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust L22 oscillator slug to obtain an audio beat with the signal generator.

Turn on the sweep generator and set to channel 13. Adjust T1 for maximum gain on the oscilloscope. Adjust mixer tank circuit L21 for maximum gain and flat-topped curve. Recheck T1 for maximum gain at center of band with the proper response. Maximum gain and flat-topped response should be obtained simultaneously.

Adjust the oscillator to frequency on all VHF channels by switching the receiver and signal generator to each VHF channel and adjusting the appropriate oscillator slug to obtain a beat with the signal generator. Adjust the appropriate mixer slug where necessary to obtain maximum gain and proper curve shape as explained above.

Adjust the tunable I-F Trap C16-L7. To do this connect the signal generator to the fixed I-F Trap C2-L2 at the end opposite the antenna terminal plug. Set the signal generator to 43.5 mc. and adjust the output of the signal generator to obtain sufficient indication on the oscilloscope. Tune the I-F Trap C16-L7 for minimum marker indication on the oscilloscope.

Remove the signal generator and the oscilloscope.

TUNER UHF ALIGNMENT.—To align the UHF inserts:

Turn off the adapter switch, removing plate voltage from the oscillator.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Connect the UHF sweep generator to the antenna terminals. Use a 10 DB attenuator pad to assure proper alignment.

Connect the UHF signal generator loosely to the antenna terminals.

Set the channel selector to the desired position and the sweep generator to sweep the frequency of the insert being used.

Insert markers of the picture carrier and sound carrier for desired channel.

Adjust the UHF antenna, link coupling and mixer adjustments for a symmetrical curve, with maximum gain, centered about the pass band.

The responses are shown in figure 11. The curve shape will usually vary from figure 11 (a) to figure 11 (c) going higher in frequency, however any of these responses are acceptable.

Repeat the above steps for all UHF inserts used adjusting the appropriate antenna, link coupling and mixer slugs for a symmetrical curve, with maximum gain, centered about the pass band.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce -3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal.

Connect the potentiometer arm of the second bias supply to the junction of R133 and C133B, and ground the positive battery terminal. Adjust the bias potentiometer to produce -5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to pin 9 of V110. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to the lowest UHF channel to be used, and set the fine tuning control to the center of its range.

Adjust the oscillator core to proper frequency. To do this, connect the VHF signal generator to test point TP1 with the shortest leads possible. Insert a 45.75 mc. marker from the VHF generator.

Set the UHF sweep generator to sweep the desired channel, and observe the output of the oscilloscope. If the sweep generator is not sweeping the correct frequency range, it may be necessary to readjust the sweep in order to place the 45.75 marker on the response curve as in figure 13.

Set the UHF marker gen. to the picture carrier of the channel insert being adjusted and connect to test point TP1.

Adjust the oscillator core until the markers for 45.75 mc. and the picture carrier coincide on the sweep pattern on the oscilloscope.

Adjust the mixer core for maximum gain with proper wave shape.

Connect the "VoltOhmyst" to test point TP1, using 1.5 volt DC scale.

Set oscillator injection adjustment to read .1 volts on the "VoltOhmyst."

Repeat the above steps for all UHF inserts adjusting the oscillator injection control only if the reading on the "VoltOhmyst" exceeds .3 volts. Adjust as necessary to read .3 volts or less at TP1.

RATIO DETECTOR ALIGNMENT.—In order to obtain good ratio detector alignment an AM modulated signal generator that is exceptionally free from FM modulation must be employed. Set the signal generator at 4.5 mc. and connect it to the second sound i-f grid, pin 1 of V102. Set the generator for 30% 400 cycle modulation.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. If used, connect it to the grid of the 4th pix i-f amplifier, pin 1, V109. Set the frequency of the calibrator to 45.75 (pix carrier) and modulate with 4.5 mc. crystal. Also turn on the internal AM audio modulation. The 4.5 mc. signal will be picked off at T110A and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to the junction of R111 and C111.

Connect the oscilloscope across the speaker voice coil and turn the volume control for maximum output.

Tune the ratio detector primary T102 top core for maximum DC output on the "VoltOhmyst." Adjust the signal level from the signal generator for minus 10 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R110 and C110.

Adjust the T102 bottom core for zero d-c on the meter. Then, turn the core to the nearest minimum AM output on the oscilloscope.

Repeat adjustments of T102 top for maximum DC and T102 bottom for minimum output on the oscilloscope making final adjustment with the 4.5 mc. input level adjusted to produce 10 volts d-c on the "VoltOhmyst" at the junction of R111 and C111.

Connect the "VoltOhmyst" to the junction of R110 and C110 and note the amount of d-c present. If this voltage exceeds ±1.5 volts, adjust R108 by turning it in until zero d-c is obtained. Readjust the T102 bottom core for minimum output on the oscilloscope. Repeat adjustments of R108 and T102 bottom core until the voltage at R110 and C110 is less than ±1.5 volts when T102 bottom core is set for minimum output on the oscilloscope.

Connect the "VoltOhmyst" to the junction of R111 and C111 and repeak T102 top core for maximum d-c on the meter and again reset the generator so as to have -10 volts on the meter.

Repeat the adjustments in the above two paragraphs until the voltage at R110 and C110 is less than ±1.5 volts when the T102 top core is set for maximum d-c at the junction of R111 and C111 and the T102 bottom core is set for minimum indication on the oscilloscope.

SOUND I-F ALIGNMENT.—Connect the sweep generator to the first sound i-f amplifier grid, pin 1 of V101. Adjust the generator for a sweep width of 1 mc. at a center frequency of 4.5 mc.

Insert a 4.5 mc. marker signal from the signal generator into the first sound i-f grid. With the WR39B or WR39C calibrators the 4.5 mc. crystal signal may be obtained at the R-F out terminal by turning the variable osc. switch off, the calibrate switch to 4.5 mc. and the volume control with mod. off.

Connect the oscilloscope in series with a 10,000 ohm resistor to terminal A of T101.

Adjust T101 top and bottom cores for maximum gain and symmetry about the 4.5 mc. marker on the i-f response. The pattern obtained should be similar to that shown in figure 18.

The output level from the sweep should be set to produce approximately 2.0 volt peak-to-peak at terminal A of T101 when the final touches on the above adjustment are made. It is necessary that the sweep output voltage should not exceed the specified values otherwise the response curve will be broadened, permitting slight misadjustment to pass unnoticed and possibly causing distortion or weak signals.

Connect the oscilloscope to the junction of R110 and C110 and check the linearity of the response. The pattern obtained should be similar to that shown in figure 19.

SOUND TAKE-OFF ALIGNMENT.—Connect the 4.5 mc. generator in series with a 1,000 ohm resistor to terminal "C" of T110. The input signal should be approximately 0.5 volt.

Short the fourth pix i-f grid to ground, pin 1, V109, to prevent noise from masking the output indication.

As an alternate source of signal the RCA WR39B or WR39C calibrator may be used. In such a case, disregard the above two paragraphs. Connect calibrator across link circuit, T104 A, B and modulate 45.75 with 4.5 mc. crystal.

Connect the crystal diode probe of a "VoltOhmyst" to the plate of the video amplifier, pin 6 of V110.

Adjust the core of T110 for minimum output on the meter.

Remove the short from pin 1, V109 to ground, if used.

ALIGNMENT PROCEDURE

HORIZONTAL OSCILLATOR ADJUSTMENT. — Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it cannot be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R187B, then adjust the T114 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T114 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T114 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C186B, the width control L109 and the linearity control L111 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T114 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T114 frequency core (on the rear apron) until the picture falls out of sync and one diagonal black bar sloping down to the right appears on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain one diagonal black bar on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T114 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture begins to fall out of sync with the diagonal bar sloping down to the right. Continue to turn the frequency core in the same direction. Additional bars should not appear on the screen. Instead, the horizontal oscillator should begin to motorboat. Retouch the adjustment of the T114 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T114. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in figure 23. Adjust the waveform adjustment core of T114 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counterclockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C186A slightly clockwise. If less than 2 bars are present, adjust C186A slightly counterclockwise. Turn the horizontal hold control counterclockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T114 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves off the screen leaving the picture in synchronization.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to construct the pad.

RESPONSE CURVES.—The response curves shown on pages 16 and 17 and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, some variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

NOTES ON TUNER ALIGNMENT.—Because of the frequency spectrum involved and the nature of the device, many of the tuner unit leads and components are critical in some respects. Even the power supply leads form loops which couple to the tuned circuits, and if resonant at any of the frequencies involved in the performance of the tuner, may cause serious departures from the desired characteristics. In the design of the receiver these undesirable resonant loops have been shifted far enough away in frequency to allow reasonable latitude in their components and physical arrangement without being troublesome. When the tuner unit is aligned in the receiver, no trouble from resonant loops should be experienced. However, if the unit is aligned in a jig separate from the receiver, attention should be paid to insure that unwanted resonances do not exist which might present a faulty representation of tuner alignment.

The use of a crystal mixer in the KRK12 Tuner makes it necessary to observe the insert responses with the oscillator disabled. This is due to undesirable r-f/i-f interaction if the oscillator was allowed to operate during alignment. Therefore, the responses shown in figure 10 are not a strictly true representation of the insert band pass during actual operation. When an insert is aligned, using an oscilloscope to observe the response, the curve shown in figure 10(b) will be the correct response for reference. In actual operation, the band pass will be such that the sound and picture carriers will be at the tips of the curve. The adjacent channel picture and sound carriers will be in the valleys at each side. Care should be taken not to exceed the limits shown in figures 10(a) and 10(c).

27-D-331, 27-D-331U

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 5000 microvolt test pattern signal was fed into the receiver, the picture synchronized and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c.

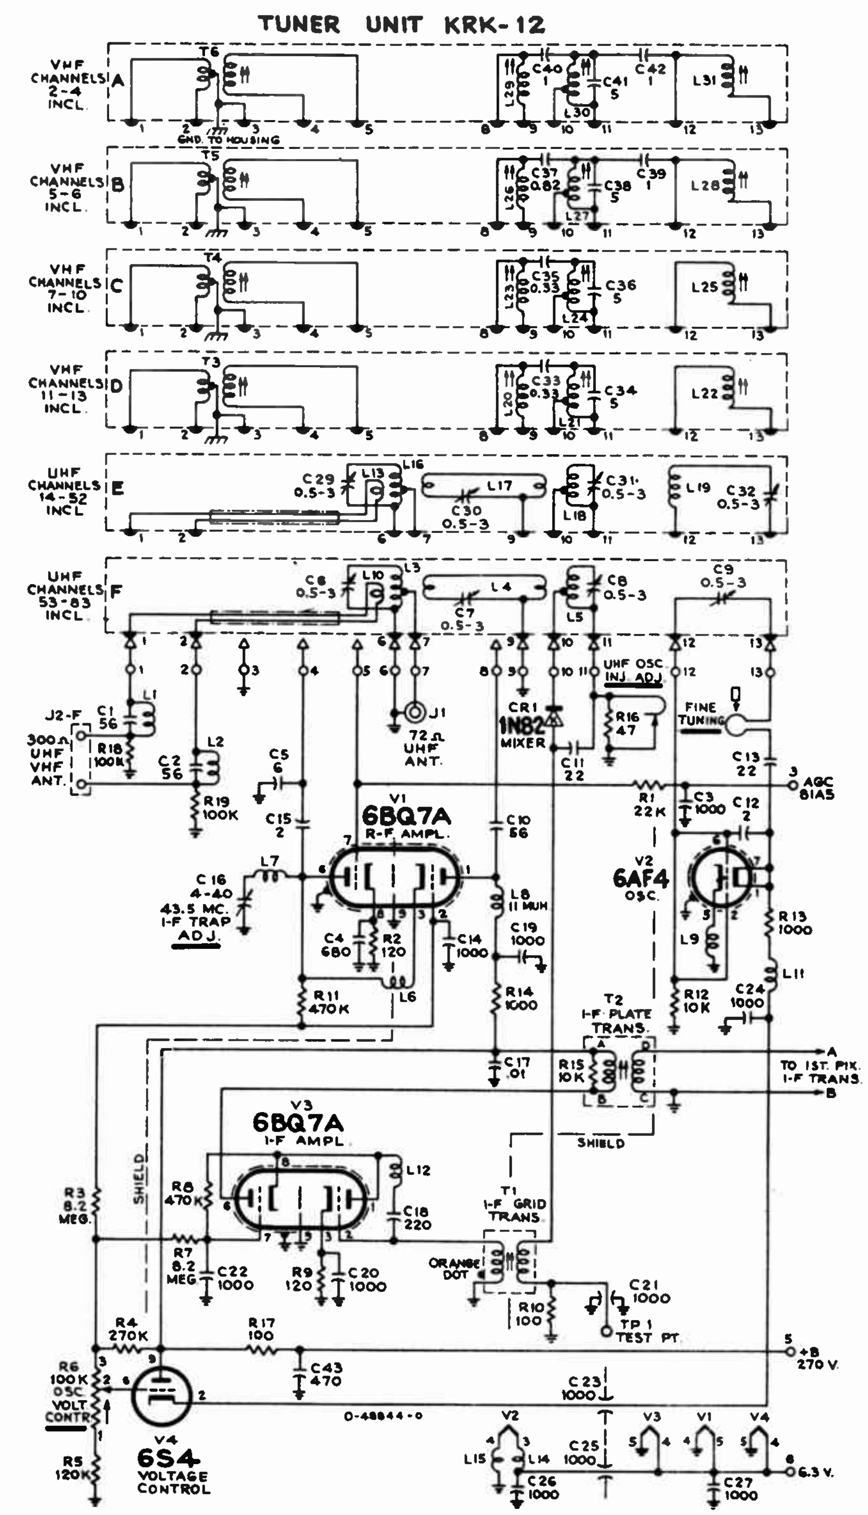

Figure 26—KRK12 Schematic Diagram

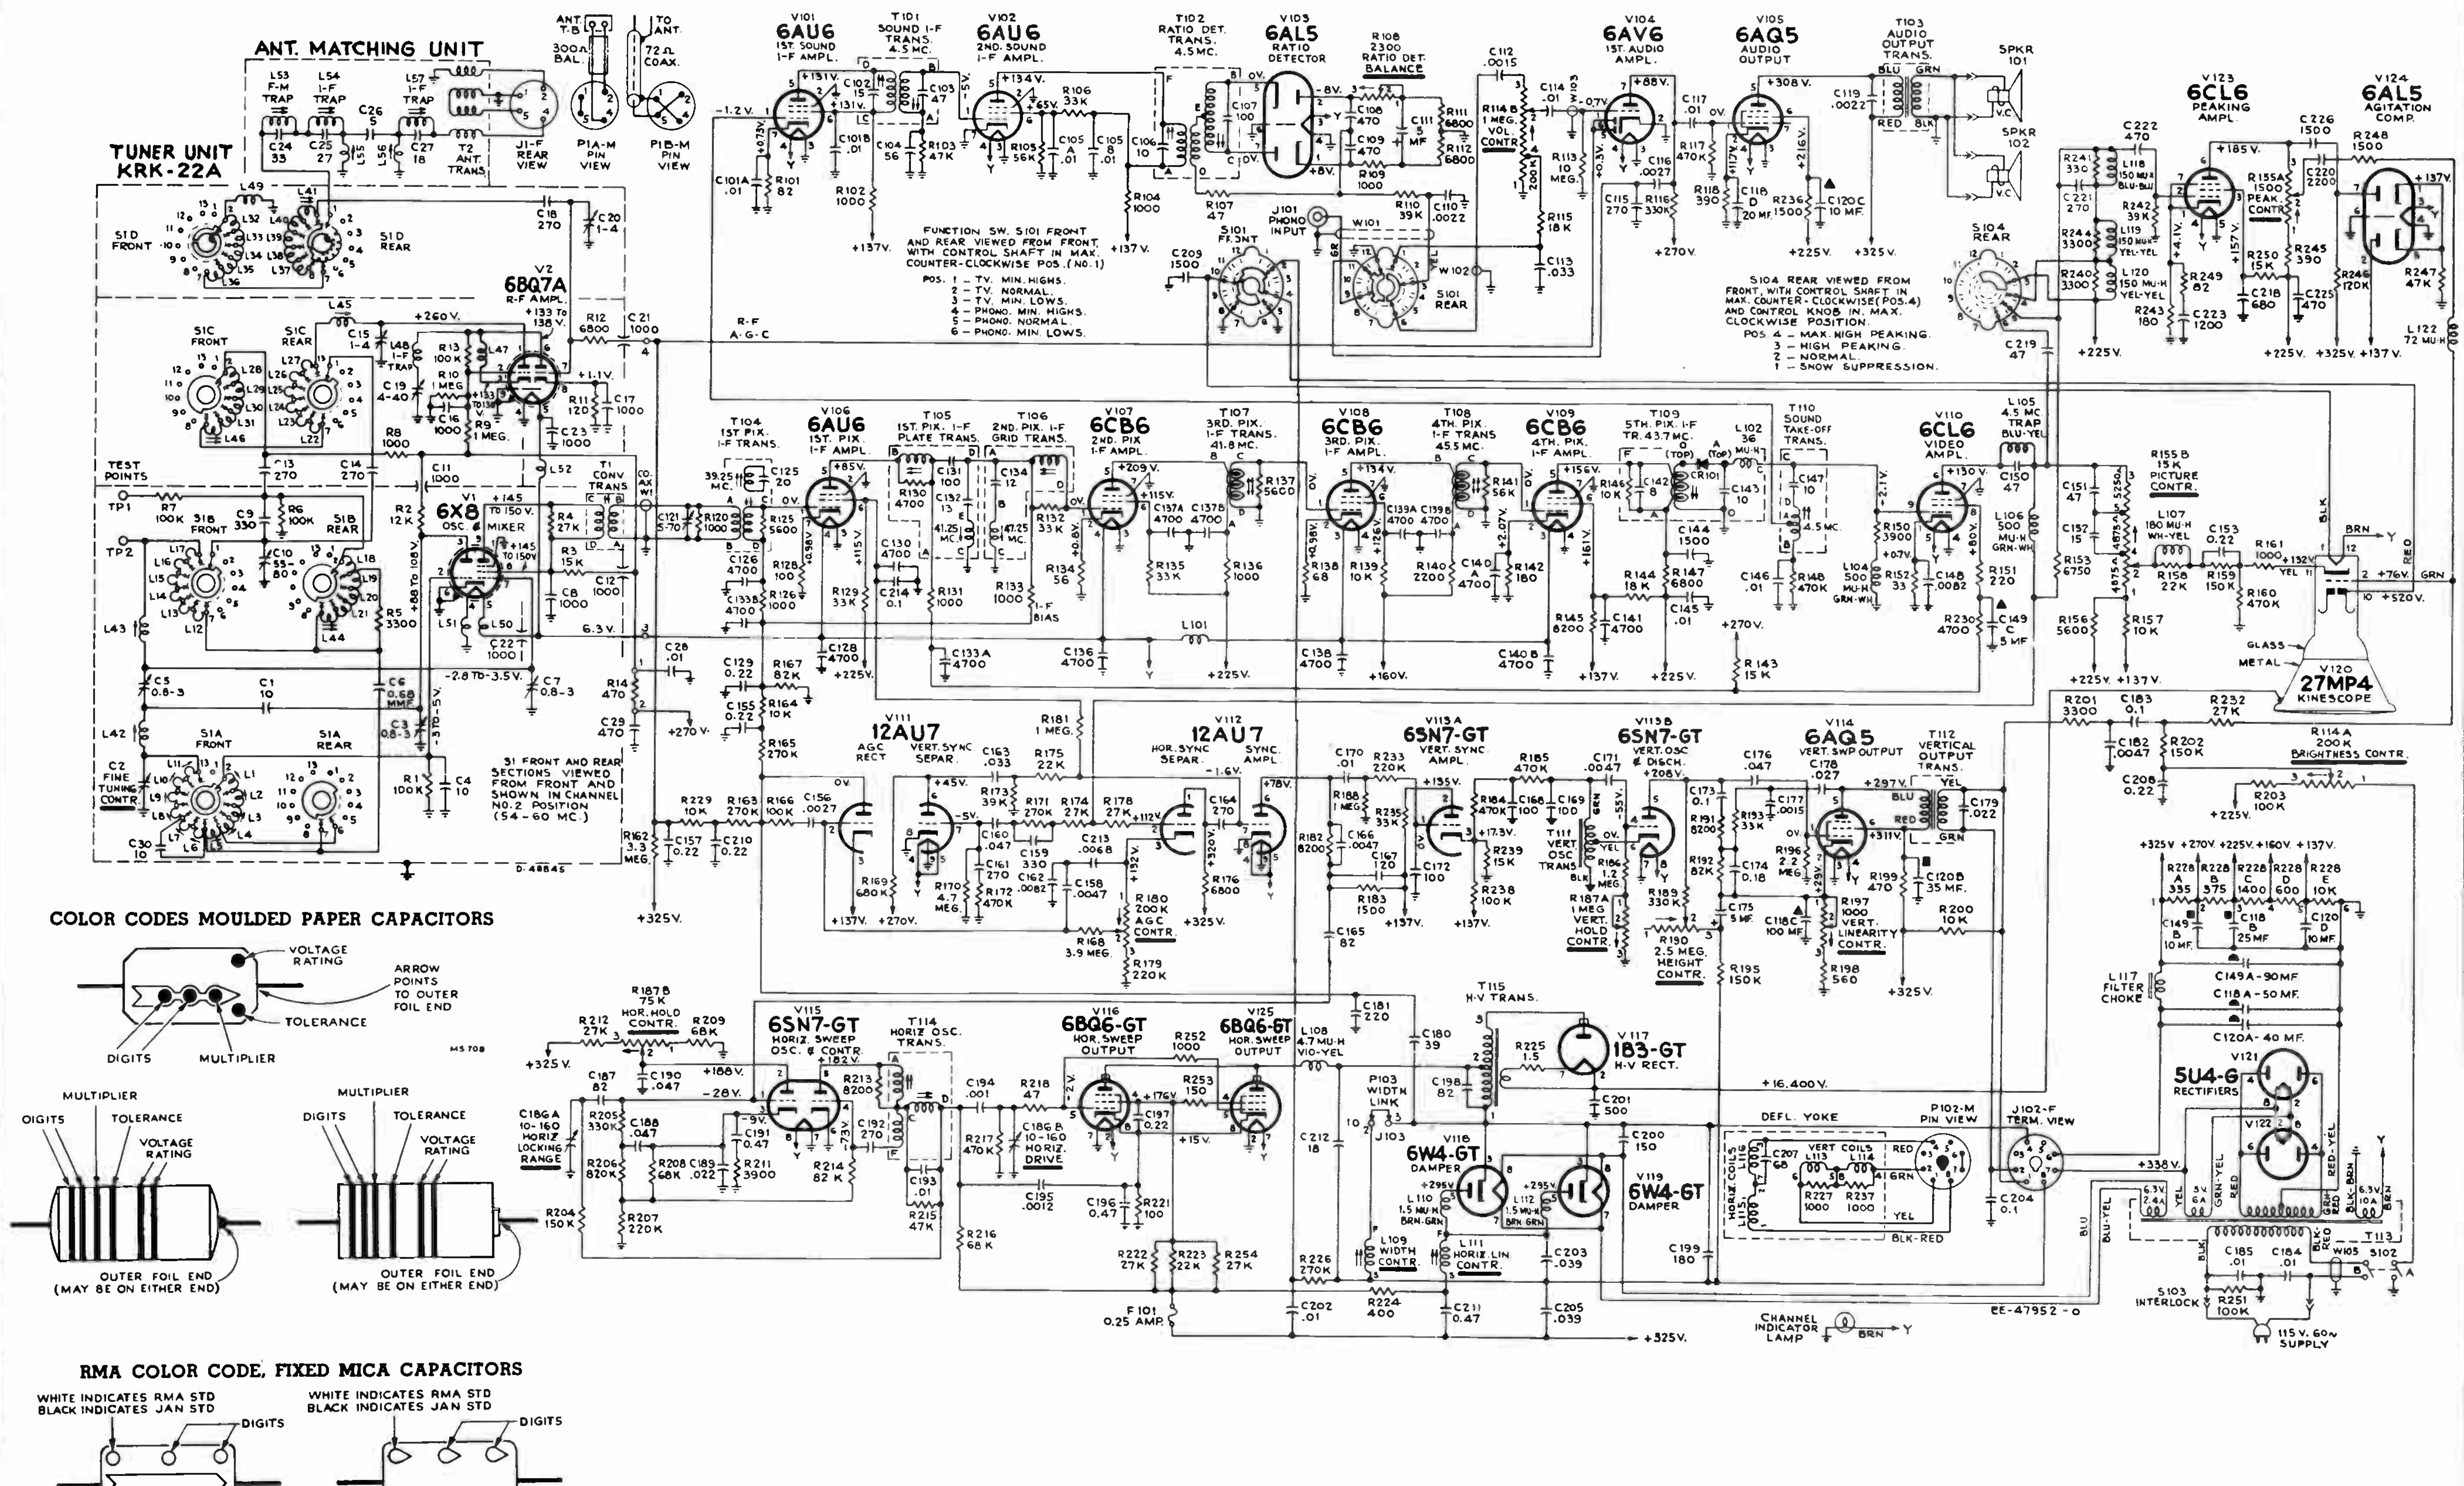

The schematic is shown in the latest condition at the time of printing.
All resistance values in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "Volt-Ohmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

REPLACEMENT PARTS

STOCK No.	PART DESCRIPTION
	RF UNIT ASSEMBLIES KRK22A
76539	Board—Antenna matching transformer terminal board less coils and capacitors
76270	Board—Terminal board—4 contact
77850	Bracket—Side bracket for mounting coil and stators
77855	Can—Shield can for convertor transformer
77853	Capacitor—Ceramic, variable, for fine tuning—plunger type (C2)
77913	Capacitor—Tubular, adjustable, steatite, 0.8-3.0 mmf. (C5)
71504	Capacitor—Fixed, headed-lead type, 0.68 mmf., ±20%, 500 volts DC (C6)
77151	Capacitor—Adjustable, steatite, 0.8-3.0 mmf. (C3, C7)
76532	Capacitor—Adjustable, steatite, 1-4 mmf. (C15, C20)
77616	Capacitor—Adjustable, mica, 4-40 mmf. (C19)
93056	Capacitor—Fixed, ceramic, non-insulated, 5 mmf., ±0.5 mmf., 500 volts DC. Temp. coef. = 0 (C26)
77865	Capacitor—Fixed, ceramic, non-insulated, 10 mmf., ±1.0 mmf., 500 volts DC. Temp. coef. = 0 (C1, C30)
78247	Capacitor—Fixed, ceramic, non-insulated, 10 mmf., ±1.0 mmf., 500 volts. Temp. coef. = -750 (C4)
54207	Capacitor—Fixed, ceramic, non-insulated, 18 mmf., ±10%, 500 volts DC. Temp. coef. = 0 (C27)
70935	Capacitor—Fixed, ceramic, non-insulated, 27 mmf., ±10%, 500 volts DC. Temp. coef. = 0 (C25)
76739	Capacitor—Fixed, ceramic, non-insulated, 33 mmf., ±10%, 500 volts DC. Temp. coef. = 0 (C24)
76527	Capacitor—Mica trimmer, 55-80 mmf. (C10)
75199	Capacitor—Fixed, ceramic, insulated, 270 mmf., ±20%, 500 volts DC. High "K" type (C13, C14, C18)
76552	Capacitor—Fixed, ceramic, insulated, 330 mmf., ±10%, 500 volts DC. High "K" type (C9)
77293	Capacitor—Fixed, ceramic, 470 mmf., ±100%, -0%, 500 volts DC. High "K" disc (C29)
77084	Capacitor—Ceramic, feed-thru, 1,000 mmf. (C11, C12, C21, C22)
77252	Capacitor—Fixed, ceramic, 1,000 mmf., +100%, -0%, 500 volts DC. High "K" disc (C8, C16, C17, C23)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, -0%, 500 volts DC. High "K" disc (C28)
77854	Clip—Mounting clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T2)
73874	Coil—Channel No. 6 mixer coil (L44)
73460	Coil—Channel No. 6 r.f. plate coil (L46)
77915	Coil—Channel No. 13 oscillator coil (L42)
77919	Coil—Channel No. 13 mixer coil (L43)
77921	Coil—Channel No. 13 r.f. plate coil (L45)
77206	Coil—Filament choke coil (L52)
76763	Coil—Heater choke coil (L50, L51)
76562	Coil—RF amplifier coupling coil (L47)
76537	Coil—Shunt coil complete with adjustable core (L55)
76538	Coil—Shunt coil complete with adjustable core (L56)
38853	Connector—4 contact female connector—part of antenna matching transformer (J1)
77860	Connector—Grounding strap connector
77859	Connector—RF grid switch return connector (L49)
76460	Contact—Test point contact
77852	Core—Adjustable core for fine tuning capacitor
76543	Core—Adjusting core for FM trap
77918	Core—¼-20 x ½" adjusting core for L44, L46
77914	Core—No. 8-32 x 27/64" adjusting core for L42, L43
77846	Detent—Detent mechanism and fibre shaft
77917	Form—Channel No. 6 coil form complete with core
77912	Form—Channel No. 13 coil form complete with core
77861	Guide—Bakelite guide for fine tuning lever
77847	Lever—Fine tuning lever
76728	Nut—Speed nut for capacitor 76532
	Resistor—Fixed, composition:
503112	120 ohms, ±10%, ½ watt (R11)
503147	470 ohms, ±10%, ½ watt (R14)
503210	1,000 ohms, ±10%, ½ watt (R8)
503233	3,300 ohms, ±10%, ½ watt (R5)
503268	6,800 ohms, ±10%, ½ watt (R12)
523312	12,000 ohms, ±10%, 2 watts (R2)
523315	15,000 ohms, ±10%, 2 watts (R3)
502327	27,000 ohms, ±5%, ½ watt (R4)
503410	100,000 ohms, ±10%, ½ watt (R1, R6, R7, R13)
503510	1 megohm, ±10%, ½ watt (R9, R10)
14343	Retainer—Fine tuning shaft retainer ring
77849	Retainer—Retainer for fine tuning spring
75176	Screw—No. 4-40 x 7/16" adjusting screw for L5
76549	Screw—No. 4-40 x ⅜" adjusting screw for L1, L2, L3, L4
76547	Screw—No. 4-40 x ¼" adjusting screw for L6, L7, L8, L9, L10, L11
77848	Shaft—Fine tuning shaft and cam
77862	Shield—Front shield
76534	Shield—Tube shield
77851	Shield—"U" shape shield for underside of unit
76336	Socket—Tube socket, 9 pin, miniature, saddle mounted
77856	Spring—Fine tuning spring
78241	Spring—Former spring for fine tuning lever
77916	Stator—Mixer stator complete with rotor, coils, capacitor and resistors (S2, C6, C9, C13, L12, L13, L14, L15, L16, L17, L18, L19, L20, L21, L43, L44, R5, R6, R7)
77911	Stator—Oscillator stator complete with rotor, coils and trimmer (S1, C5, L1, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L42)
77910	Stator—RF grid stator complete with rotor and coils (S4, L32, L33, L34, L35, L36, L37, L38, L39, L40, L41)
77920	Stator—RF plate stator complete with rotor, coils, capacitor and resistor (S3, C14, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L45, L46, R8)
76740	Stud—No. 6-32 x 1" adjusting stud for adjustable capacitor C5
77858	Transformer—Antenna matching transformer complete (T2, C24, C25, C26, C27, J1, L53, L54, L55, L56, L57)
77857	Transformer—Convertor transformer (T1)
76540	Trap—FM trap complete with adjustable core (L53)
77628	Trap—I-F trap (L48)
76542	Trap—I-F trap (41.25 mc) complete with core (L57)
76541	Trap—I-F trap (45.75 mc) complete with core (L54)
75190	Washer—Insulating washer (neoprene) for adjustable capacitor C5
	RF UNIT ASSEMBLIES KRK12
77580	Ball—Steel ball (.125" dia.) (12 required)
77579	Ball—Steel ball (.187" dia.)
77575	Bracket—Drive mechanism mounting bracket
77589	Bracket—Lamp bracket
77619	Bracket—VHF input connector and bracket
76845	Bracket—Vertical bracket for oscillator tube shield
77591	Cam—Fine tuning cam
77691	Capacitor—Fixed, headed-lead type, .33 mmf., ±10%, 500 volts DC (C33, C35)
77689	Capacitor—Fixed, headed-lead type, .82 mmf., ±10%, 500 volts DC (C37)
71500	Capacitor—Fixed, headed-lead type, 1.5 mmf., ±10%, 500 volts DC (C39)
77690	Capacitor—Fixed, headed-lead type, 1.0 mmf., ±10%, 500 volts DC (C40)
78047	Capacitor—Fixed, headed-lead type, 2.0 mmf., ±10%, 500 volts DC (C42)
77210	Capacitor—Fixed, ceramic, non-insulated, 2 mmf., ±0.25 mmf., 500 volts DC. Temp. coef. = 0 (C15)
77667	Capacitor—Fixed, ceramic, insulated, comprising 1 section of 27 mmf., and 1 section of 22 mmf. Temp. coef. = -750 (C12, C13)
77616	Capacitor—Adjustable, mica, 4-40 mmf. (C16)
77688	Capacitor—Fixed, ceramic, non-insulated, 5 mmf., ±.5 mmf., 500 volts DC. Temp. coef. = 0 (C34, C36, C38, C41)
74182	Capacitor—Fixed, ceramic, non-insulated, 6 mmf., ±0.5 mmf., 500 volts DC. Temp. coef. = 0 (C5)
77621	Capacitor—Fixed, ceramic, crystal holder, 22 mmf., ±10%. Temp. coef. = -750 (C11)
71924	Capacitor—Fixed, ceramic, non-insulated, 56 mmf., ±10%, 500 volts DC. Temp. coef. = -750 (C10)
77625	Capacitor—Fixed, ceramic, 220 mmf., +100%, -0%, 500 volts DC. High "K" disc (C18)
77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, -0%, 500 volts DC. High "K" disc (C43)
77624	Capacitor—Fixed, ceramic, 680 mmf., +100%, -0%, 500 volts DC. High "K" disc (C4)
77084	Capacitor—Ceramic, feed-thru, 1,000 mmf. (C21, C23, C25)
77615	Capacitor—Ceramic, stand-off, 1,000 mmf. (C3, C19, C24, C26)
77252	Capacitor—Fixed, ceramic, 1,000 mmf., +100%, -0%, 500 volts DC. High "K" disc (C14, C20, C22, C27)
73960	Capacitor—Fixed, ceramic, 10,000 mmf., +100%, -0%, 500 volts DC. High "K" disc (C17)
77628	Coil—I-F trap (L7)
77634	Coil—I-F neutralizing coil (L12)
77629	Coil—Oscillator cathode coil (L9)
77632	Coil—Oscillator heater coil (L15)
77631	Coil—Oscillator heater coil (L14)
78224	Coil—Oscillator plate coil (L11)
77627	Coil—Peaking coil (L6, R11)
77695	Coil—R-F plate coil (L8)
77633	Connector—Formed grounding connector
77623	Connector—UHF antenna input connector (J1)
77612	Contact—Bracket and spring contact assembly for grounding rotor—assembled to base
77618	Contact—Bracket and spring contact assembly for grounding rotor—assembled to oscillator shield
77606	Contact—Contact and support assembly—"L" shape—complete with two (2) contacts
77622	Contact—Contact and support assembly complete with two (2) contacts and UHF antenna input connector
77620	Contact—Contact and support assembly complete with four (4) contacts and holder for crystal rectifier
77607	Contact—Contact and support assembly complete with five (5) contacts—rear of chassis
77614	Control—Oscillator voltage control (R6)
77617	Control—UHF oscillator injection adjustment control
77583	Core—Fine tuning core
77593	Coupling—Indicator shaft coupling
77596	Ferrule—Ferrule for UHF antenna input cable
77588	Gear—Rotor drive gear—nylon
77602	Insert—VHF coil assembly insert for channels 2, 3 or 4 (Includes C40, C41, C42, L29, L30, L31, T6)
77603	Insert—VHF coil assembly insert for channels 5 or 6 (Includes C37, C38, C39, L26, L27, L28, T5)
77604	Insert—VHF coil assembly insert for channels 7, 8, 9 or 10 (Includes C35, C36, L23, L24, L25, T4)
77605	Insert—VHF coil assembly insert for channels 11, 12 or 13 (Includes C33, C34, L20, L21, L22, T3)
77590	Lever—Actuating lever for fine tuning link
77582	Link—Fine tuning link (.188" dia. plunger) for early production
78245	Link—Fine tuning link (.253" dia. plunger) for late production
77581	Plate—Front plate and ball race
77489	Rectifier—Germanium rectifier 1N82 (CR1)
	Resistor—Fixed, composition:
503047	47 ohms, ±10%, ½ watt (R16)
503110	100 ohms, ±10%, ½ watt (R10, R17)
503112	120 ohms, ±10%, ½ watt (R2, R9)
503210	1,000 ohms, ±10%, ½ watt (R13, R14)
503310	10,000 ohms, ±10%, ½ watt (R12)
503322	22,000 ohms, ±10%, ½ watt (R1)
503410	100,000 ohms, ±10%, ½ watt (R18, R19)
503412	120,000 ohms, ±10%, ½ watt (R5)
503427	270,000 ohms, ±10%, ½ watt (R4)
503447	470,000 ohms, ±10%, ½ watt (R8)
503582	8.2 megohm, ±10%, ½ watt (R3, R7)
30340	Retainer—Retainer ring for fine tuning actuating lever stud
77599	Roller—Rotor detent roller and retainer
77574	Rotor—Rotor frame
77594	Screw—No. 8-32 x ¼" cup point set screw for indicator shaft coupling
77576	Shaft—Channel selector drive shaft complete with two (2) gears
77595	Shaft—Indicator shaft
77611	Shield—Oscillator shield and grounding spring assembly—underside of chassis
77577	Shield—Top shield
76967	Shield—Tube shield for V2
76534	Shield—Tube shield for V1, V3
77613	Sleeve—Insulating sleeve for fine tuning adjustable core
77274	Socket—Tube socket, 7 pin, miniature, saddle mounted, steatite for V2
77608	Socket—Tube socket, 9 pin, miniature, saddle mounted, moulded mica for V1, V3, V4
77578	Spring—Formed spring for holding rotor (on back of unit)
77584	Spring—Fine tuning link adjusting spring (7/32" I.D.)—used with 77582
78246	Spring—Fine tuning link adjusting spring (9/32" dia.)—used with link 78245
76961	Spring—Retaining spring for oscillator tube shield
77598	Spring—Rotor detent spring and roller complete with mounting bracket
77599	Roller—Rotor detent roller and retainer
77587	Stud—Mounting stud for fine tuning link actuating lever
77893	Stud—No. 6-32 x 21/32" adjusting stud for trimmer capacitor C9
77692	Stud—No. 6-32 x 25/32" adjusting stud for trimmer capacitors C6, C7, C8, C29, C30, C31, C32
77694	Stud—No. 10-32 x ⅜" adjusting stud for coils L20, L21, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31 and transformers T3, T4, T5, T6
77609	Transformer—Mixer I.F. transformer complete with adjustable cores (T1)
77610	Transformer—Primary I.F. link transformer complete with adjustable cores (T2, R15)
77626	Trap—I-F trap (L1, C1, L2, C2)
77585	Washer—"C" washer for drive and indicator shafts (3 required) or for fine tuning link spring 78246
77586	Washer—"C" washer for fine tuning link spring 77584
	CHASSIS ASSEMBLIES KCS77A (KRK22A) KCS77B (KRK12)
78238	Cap—Tube connector cap
	Capacitor—Ceramic:
76488	500 mmf., 30,000 volts (C201)
75166	Stand-off, 1,500 mmf. (C144)
	Capacitor—Fixed, ceramic:
77837	18 mmf., 6,000 volts (C212)
76574	39 mmf., 3,500 volts (C180)
77836	82 mmf., 6,000 volts (C198)
76576	150 mmf., 2,000 volts (C200)
76575	180 mmf., 3,500 volts (C199)
	Capacitor—Fixed, ceramic, high "K" disc:
77293	470 mmf., +100%, -0%, 500 volts DC (C225)
77624	680 mmf., +100%, -0%, 500 volts DC (C218)
73748	1,500 mmf., +100%, -0%, 500 volts DC (C209, C226)
77953	2,200 mmf., +100%, -0%, 500 volts DC (C220)
73473	4,700 mmf., +100%, -0%, 500 volts DC (C126, C128, C130, C136, C138, C141)
76470	Dual 4,700 mmf., +100%, -0%, 500 volts DC (C133A, C133B, C137A, C137B, C139A, C139B, C140A, C140B)
73960	10,000 mmf., +100%, -0%, 500 volts DC (C145, C146)
75877	Dual 10,000 mmf., +100%, -0%, 500 volts DC (C101A, C101B, C105A, C105B)
	Capacitor—Fixed, ceramic, insulated, high "K" disc:
77838	270 mmf., ±10%, 500 volts DC (C221)
75198	470 mmf., ±10%, 500 volts DC (C222)
77923	1,200 mmf., ±10%, 500 volts DC (C223)
	Capacitor—Fixed, ceramic, non-insulated, temp. coef. = -750
39044	15 mmf., ±10%, 500 volts DC (C152)
39042	47 mmf., ±10%, 500 volts DC (C151, C219)
71924	56 mmf., ±10%, 500 volts DC (C104)
39396	100 mmf., ±10%, 500 volts DC (C168, C169, C172)
71614	120 mmf., ±10%, 500 volts DC (C167)
47617	270 mmf., ±10%, 500 volts DC (C115, C164)
	Capacitor—Mica, trimmer:
71496	5-70 mmf. (C121)
75217	Dual 10-160 mmf. (C186A, C186B)
	Capacitor—Fixed, mica:
76474	82 mmf., 1,000 volts DC (C165, C187)
75248	220 mmf., 1,000 volts DC (C181)
39638	270 mmf., 500 volts DC (C161)
76579	270 mmf., 1,000 volts DC (C192)
39640	330 mmf., 500 volts DC (C159)
39644	470 mmf., 500 volts DC (C108, C109)
	Capacitor—Electrolytic:
74521	5 mfd., 50 volts (C111)
28417	5 mfd., 450 volts (C175)
77819	Comprising: 1 section of 40 mfd., 400 volts, 1 section of 35 mfd., 400 volts, 2 sections of 10 mfd., 400 volts (C120A, C120B, C120C, C120D)
77817	Comprising: 1 section of 50 mfd., 400 volts, 1 section of 25 mfd., 400 volts, 1 section of 100 mfd., 50 volts, and 1 section of 20 mfd., 25 volts (C118A, C118B, C118C, C118D)
77820	Comprising: 1 section of 90 mfd., 400 volts, 1 section of 10 mfd., 400 volts, and 1 section of 5 mfd., 400 volts (C149A, C149B, C149C)
	Capacitor—Fixed, tubular, paper, oil impregnated:
75643	.001 mfd., 1,000 volts (C194)
76508	.0015 mfd., 600 volts (C112)
73802	.0015 mfd., 1,000 volts (C177)
73595	.002 mfd., 600 volts (C110, C119)
73599	.0027 mfd., 600 volts (C116, C156)
73920	.0047 mfd., 600 volts (C158, C166, C182)
73789	.0068 mfd., 400 volts (C213)
73808	.0082 mfd., 1,000 volts (C148, C162)
73561	.01 mfd., 400 volts (C114, C117, C170, C202)
73562	.022 mfd., 400 volts (C179, C189)
73811	.027 mfd., 1,000 volts (C178)
73552	.033 mfd., 400 volts (C113, C163)
73813	.039 mfd., 1,000 volts (C203, C205)
73553	.047 mfd., 400 volts (C160, C188, C190)
73592	.047 mfd., 600 volts (C176)
73551	0.1 mfd., 400 volts (C183, C214)
73557	0.1 mfd., 600 volts (C173, C204)
77839	0.18 mfd., 200 volts (C174)
73794	0.22 mfd., 400 volts (C129, C153, C155, C157, C208, C210)
74957	0.22 mfd., 600 volts (C197)
73787	0.47 mfd., 200 volts (C191, C196, C211)
	Capacitor—Fixed, tubular, moulded paper, oil impregnated:
76995	.0012 mfd., 600 volts (C195)
73920	.0047 mfd., 600 volts (C171)
73594	.01 mfd., 600 volts (C184, C185, C193)
77824	Choke—Filter choke (L117)

STOCK No.	PART DESCRIPTION
76143	Clip—Mounting clip for stand-off capacitor
73477	Coil—Choke coil (L101)
76772	Coil—Filament winding only for hi-voltage transformer (Part of T115)
78197	Coil—Horizontal linearity coil complete with adjustable core (L111)
77842	Coil—Peaking coil (72 muh) (L122)
77840	Coil—Peaking coil (150 muh) (L118, R241)
77841	Coil—Peaking coil (150 muh) (L119, L120, R240, R244)
76647	Coil—Peaking coil (180 muh) (L107, R158)
75252	Coil—Peaking coil (500 muh) (L104, L106)
76640	Coil—RF choke coil (1.5 muh) (L110, L112)
76510	Coil—RF choke coil (4.7 muh) (L108)
76484	Coil—Width coil complete with adjustable core (L109)
76457	Connector—Second anode lead connector
75474	Connector—Single contact male connector for speaker cable
74594	Connector—2 contact male connector for power cord
50367	Connector—6 contact female connector for yoke leads (J102)
35787	Connector—Phono input connector (J101)
77654	Control—AGC control (R180)
77655	Control—Brightness control, volume control (R114A, R114B, S102)
77640	Control—Height control (R190)
77826	Control—Horizontal and vertical hold control (R187A, R187B)
77818	Control—Contrast and peaking controls (R155A, R155B)
77199	Control—Ratio detector balance control (R108)
77643	Control—Vertical linearity control (R197)
77647	Coupling—Coupling (nylon) for picture control or sharpness switch
77136	Cover—Back cover for hi-voltage compartment
76985	Cover—Side cover for hi-voltage compartment
73600	Fuse—0.25 amp., 250 volts (F101)
76459	Grommet—Rubber grommet for 2nd anode lead exit
76480	Lead—Anode lead complete with eyelet
77829	Link—Link assembly for definition switch shafts
77834	Plate—Bakelite plate for mounting picture control and definition switch
77832	Plate—Hi-voltage plate (bakelite) complete less corona ring, transformer and socket
76675	Rectifier—Picture detector crystal rectifier (CR101)
	Resistor—Wire wound:
76468	1.5 ohms, 1/3 watt (R225)
77835	100 ohms, 4 watts (R221)
78223	400 ohms, 10 watts (R224)
77825	Comprising: 1 section of 335 ohms, 16 watts, 1 section of 375 ohms, 8 watts, 1 section of 1,400 ohms, 7 watts, 1 section of 600 ohms, 2 watts, and 1 section of 10,000 ohms, 5 watts (R228A, R228B, R228C, R228D, R228E)
76642	6,750 ohms, 10 watts (R153)
	Resistor—Fixed, composition:
503033	33 ohms, ±10%, ½ watt (R152)
503047	47 ohms, ±10%, ½ watt (R107, R218)
502056	56 ohms, ±5%, ½ watt (R134)
34763	68 ohms, ±5%, ½ watt (R138)
502082	82 ohms, ±5%, ½ watt (R101)
503082	82 ohms, ±10%, ½ watt (R249)
502110	100 ohms, ±5%, ½ watt (R128)
503115	150 ohms, ±10%, ½ watt (R253)
503118	180 ohms, ±10%, ½ watt (R142, R243)
503122	220 ohms, ±10%, ½ watt (R151)
503139	390 ohms, ±10%, ½ watt (R245)
513139	390 ohms, ±10%, 1 watt (R118)
503147	470 ohms, ±10%, ½ watt (R199)
503156	560 ohms, ±10%, ½ watt (R198)
503210	1,000 ohms, ±10%, ½ watt (R102, R104, R109, R120, R126, R131, R133, R136, R161, R252)
502215	1,500 ohms, ±5%, ½ watt (R183)
503215	1,500 ohms, ±10%, ½ watt (R236, R248)
503222	2,200 ohms, ±10%, ½ watt (R140)
502233	3,300 ohms, ±10%, ½ watt (R201)
502239	3,900 ohms, ±5%, ½ watt (R150)
503239	3,900 ohms, ±10%, ½ watt (R211)
503247	4,700 ohms, ±10%, ½ watt (R230)
502256	5,600 ohms, ±5%, ½ watt (R137)
513256	5,600 ohms, ±10%, 1 watt (R156)
14659	6,800 ohms, ±5%, ½ watt (R111, R112)
503268	6,800 ohms, ±10%, ½ watt (R176)
513268	6,800 ohms, ±10%, 1 watt (R147)
503282	8,200 ohms, ±10%, ½ watt (R145, R191, R213)
513282	8,200 ohms, ±10%, 1 watt (R182)
503310	10,000 ohms, ±10%, ½ watt (R139, R164, R200, R229)

STOCK No.	PART DESCRIPTION
513310	10,000 ohms, ±10%, 1 watt (R157)
503315	15,000 ohms, ±10%, ½ watt (R239)
513315	15,000 ohms, ±10%, 1 watt (R250)
523315	15,000 ohms, ±10%, 2 watts (R143)
503318	18,000 ohms, ±10%, ½ watt (R115, R144)
503322	22,000 ohms, ±10%, ½ watt (R175)
522322	22,000 ohms, ±5%, 2 watts (R223)
503327	27,000 ohms, ±10%, ½ watt (R174, R178, R212, R232)
523327	27,000 ohms, ±10%, 2 watts (R222, R254)
503333	33,000 ohms, ±10%, ½ watt (R106, R129, R132, R135, R235)
28744	33,000 ohms, ±5%, 2 watts (R193)
503339	39,000 ohms, ±10%, ½ watt (R110, R173, R242)
503347	47,000 ohms, ±10%, ½ watt (R103, R215)
512347	47,000 ohms, ±5%, 1 watt (R247)
502356	56,000 ohms, ±5%, ½ watt (R141)
503356	56,000 ohms, ±10%, ½ watt (R105)
503368	68,000 ohms, ±10%, ½ watt (R208, R209)
513368	68,000 ohms, ±10%, 1 watt (R216)
8064	82,000 ohms, ±5%, ½ watt (R167)
503382	82,000 ohms, ±10%, ½ watt (R192)
513382	82,000 ohms, ±10%, 1 watt (R214)
503410	100,000 ohms, ±10%, ½ watt (R166, R203, R238)
513410	100,000 ohms, ±10%, 1 watt (R251)
30180	120,000 ohms, ±5%, ½ watt (R246)
503415	150,000 ohms, ±10%, ½ watt (R159, R195, R202, R204)
502422	220,000 ohms, ±5%, ½ watt (R179)
503422	220,000 ohms, ±10%, ½ watt (R207, R233)
502427	270,000 ohms, ±5%, ½ watt (R163, R165)
503427	270,000 ohms, ±10%, ½ watt (R171, R266)
503433	330,000 ohms, ±10%, ½ watt (R116, R189, R205)
503447	470,000 ohms, ±10%, ½ watt (R117, R148, R160, R172, R184, R185, R217)
503468	680,000 ohms, ±10%, ½ watt (R169)
503482	820,000 ohms, ±10%, ½ watt (R206)
503510	1 megohm, ±10%, ½ watt (R181, R188)
502512	1.2 megohm, ±5%, ½ watt (R186)
503522	2.2 megohm, ±10%, ½ watt (R196)
72632	3.3 megohm, ±5%, 1 watt (R162)
503539	3.9 megohm, ±10%, ½ watt (R168)
503547	4.7 megohm, ±10%, ½ watt (R170)
503610	10 megohm, ±10%, ½ watt (R113)
77660	Shaft—Extension shaft for picture control
77831	Shaft—Definition switch extension shaft
77830	Shaft—Definition switch knob shaft
77661	Shell—Mounting shell for hi-voltage capacitor
73584	Shield—Tube shield for V101, V102, V103, V106, V107, V109
77659	Shield—Tube shield for V105
76741	Shield—Tube shield for V113
75718	Socket—Channel indicator lamp socket
74834	Socket—Kinescope socket
71508	Socket—Tube socket, 6 pin, moulded for V117
50367	Socket—Tube socket, 6 pin, moulded, saddle-mounted for V118, V119
73117	Socket—Tube socket, miniature, 7 pin, wafer for V101, V102, V103, V104, V106, V107, V108, V109, V124
77658	Socket—Tube socket, miniature, 7 pin, moulded, saddle-mounted for V105
71494	Socket—Tube socket, miniature, 7 pin, moulded, saddle-mounted for V114
31251	Socket—Tube socket, octal, wafer for V113, V116, V121, V122, V125)
77645	Socket—Tube socket, octal, wafer for V115
76971	Socket—Tube socket, miniature, 9 pin, wafer for V110, V111, V112, V123
77828	Switch—Definition switch (S104)
77827	Switch—Phono-tone switch (S101)
76463	Terminal—Screw type grounding terminal
77198	Transformer—First pix I.F. grid transformer complete with adjustable cores (T104, C125, R125)
77197	Transformer—First pix I.F. plate transformer complete with adjustable cores (T105, C131, C132, R130)
76435	Transformer—Second pix I.F. grid transformer complete with adjustable cores (T106, C134)
76433	Transformer—Third or fourth pix I.F. transformer (T107, T108)
76436	Transformer—Fifth pix I.F. transformer (T109, C142, C143, CR101, L102, R146)
77833	Transformer—Hi-voltage transformer (Part of T115)
76440	Transformer—Horizontal oscillator transformer complete with adjustable cores (T114)
77821	Transformer—Output transformer (T103)
77822	Transformer—Power transformer, 117 volts, 60 cycle (T113)

STOCK No.	PART DESCRIPTION
76439	Transformer—Ratio detector transformer complete with adjustable cores (T102, C106, C107)
76438	Transformer—Sound I.F. transformer complete with adjustable cores (T101, C102, C103)
76437	Transformer—Sound take-off transformer complete with adjustable cores (T110, C147)
77650	Transformer—Vertical oscillator transformer (T111)
77823	Transformer—Vertical output transformer (T112)
76482	Trap—4.5 MC trap (L105, C150)
77585	Washer—"C" washer for picture control extension shaft (2 required) or sharpness switch shafts (4 required)
	SPEAKER ASSEMBLIES 971490-4W RL 105 E11 RMA — 274
75024	Cone—Cone and voice coil (3.2 ohms)
77872	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms) Note: If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to Model number of instruments, number stamped on speaker and full description of part required.
	MISCELLANEOUS
77877	Back—Cabinet back complete with power cord
76184	Board—Antenna terminal board
77748	Bracket—Mounting bracket for hidden controls cover and case assembly
71807	Capacitor—Mica trimmer, 10-160 mmf. for Model 27D331U
71892	Catch—Bullet catch and strike for door
77755	Clamp—Polystyrene clamp for antenna cable and mount for FM trap for Model 27D331U
X3350	Cloth—Grille cloth for mahogany instruments
X3351	Cloth—Grille cloth for oak instruments
77870	Connector—Anode connector complete with contact and formed terminal
75474	Connector—Single contact male connector—part of antenna cable
77726	Connector—2 contact male connector—part of antenna cable for Model 27D331U
39153	Connector—4 contact male connector—part of antenna cable for Model 27D331
75542	Connector—6 contact male connector—part of deflection yoke (P102)
71457	Cord—Power cord and plug
77878	Cover—Cover and case assembly—brown—for hidden controls for mahogany instruments
77888	Cover—Cover and case assembly—medium beige—for hidden controls for oak instruments
77759	Cover—Cover assembly—maroon—complete with spring for channel markers for mahogany instruments for Model 27D331U
77760	Cover—Cover assembly — sand gray — complete with spring for channel markers for oak instruments for Model 27D331U
77869	Cushion—Rubber cushion for deflection yoke hood
77876	Cushion—Rubber cushion for safety glass
77874	Cushion—Rubber cushion (oyster white) for dust sealing the kinescope for mahogany instruments
77887	Cushion—Rubber cushion (dark tan) for dust sealing the kinescope for oak instruments
77782	Decal—Brightness, volume, fine tuning controls and channel selector switch function decal for mahogany instruments
77781	Decal—Brightness, volume, fine tuning controls and channel selector switch function decal for oak instruments
77756	Disc—Polystyrene indicator disc — maroon — for channel selections for mahogany instruments for Model 27D331U
77757	Disc—Polystyrene indicator disc—sand gray—for channel selections for oak instruments for Model 27D331U
77783	Emblem—"Deluxe" emblem
77700	Escutcheon—Channel marker escutcheon for Model 27D331
77880	Fastener—Fastener for deflection yoke hood support rod
77875	Glass—Safety glass
74308	Hinge—Cabinet door hinge (1 set)
77866	Hood—Deflection yoke hood less rubber cushions
77881	Insulator—Polystyrene support insulator for kinescope
77709	Knob—Brightness control knob—brown—for mahogany instruments (outer)
77718	Knob—Brightness control knob—medium beige—for oak instruments (outer)
77708	Knob—Channel selector knob for Model 27D331 (inner)
77751	Knob—Channel selector knob—brown—for mahogany instruments for Model 27D331U

STOCK No.	PART DESCRIPTION
77968	Knob—Channel selector knob (late type)—brown—for mahogany instruments for Model 27D331U
77752	Knob—Channel selector knob—medium beige—for oak instruments for Model 27D331U
77969	Knob—Channel selector knob (late type)—medium beige—for oak instruments for Model 27D331U
77707	Knob—Fine tuning control knob—brown—for mahogany instruments for Model 27D331 (outer)
77750	Knob—Fine tuning control knob for Model 27D331U
77699	Knob—Picture control knob—brown—for mahogany instruments
77719	Knob—Picture control knob—medium beige—for oak instruments
77735	Knob—Tone control or definition switch knob—brown—for mahogany instruments
77736	Knob—Tone control or definition switch knob—medium beige—for oak instruments
77710	Knob—Volume control and power switch knob
11765	Lamp—Channel marker escutcheon lamp—Mazda 51
77867	Magnet—Focus magnet
76141	Magnet—Ion trap magnet
76633	Magnet—Pin cushion correction magnet complete with support arm
77765	Marker—UHF channels numbers markers for mahogany instruments for Model 27D331U
77766	Marker—UHF channels numbers markers for oak instruments for Model 27D331U
77762	Marker—VHF channels numbers markers for mahogany instruments for Model 27D331U
77763	Marker—VHF channels numbers markers for oak instruments for Model 27D331U
77701	Mask—Channel marker escutcheon light mask—brown—for mahogany instruments for Model 27D331
77873	Mask—Polystyrene masking panel (dark tan) for mahogany instruments
77886	Mask—Polystyrene masking panel (sand) for oak instruments
77784	Medallion—"His Master's Voice" medallion
77871	Nut—No. ¼-20 knurled nut for mounting deflection yoke
73634	Nut—Speed nut for speaker mounting screws
74337	Nut—Speed nut to fasten "Deluxe" emblem
77933	Plate—Back plates (1 set) for door pulls for mahogany instruments
77931	Pull—Cabinet door pull for mahogany instruments
77932	Pull—Cabinet door pull for oak instruments
77928	Retainer—Retainer for channel selector knob for Model 27D331U
77879	Rod—Formed threaded rod for supporting deflection yoke hood assembly
77712	Screw—No. 6 x ½" cross recessed pan head self-tapping screw (black) for fastening hidden controls cover and case to cabinet for mahogany instruments
77725	Screw—No. 6 x ½" cross recessed pan head self-tapping screw (zinc) for fastening hidden controls cover and case to cabinet for oak instruments
74113	Screw—No. 8-32 x 1" trimit head screw for door pull
74307	Screw—No. 8-32 x 1⅛" trimit head screw for door pull
77754	Shade—Channel marker escutcheon lamp shade for Model 27D331U
73643	Spring—Channel marker escutcheon spring clip for Model 27D331
77929	Spring—Formed spring for fine tuning knob for Model 27D331U
76837	Spring—Retaining spring for knobs 77699, 77708, 77709, 77718, 77719, 77735, 77736
30330	Spring—Retaining spring for knob 77710
72845	Spring—Retaining spring for knob 77707 for Model 27D331
74734	Spring—Retaining spring for channel markers covers 77759, 77760 for Model 27D331U
72936	Stop—Door stop
76600	Strap—Grounding strap (.005" soft copper strip)
76636	Stud—Adjusting stud complete with guard for focus magnet
77883	Support—Plywood support (lower R.H.) for polystyrene insulator
77884	Support—Plywood support (lower L.H.) for polystyrene insulator
77885	Support—Plywood support (upper) for polystyrene insulator
75500	Washer—Felt washer for back cover mounting screws
77882	Washer—Metal washer for support rod fastener (.0478" x 25/32" I.D. x 1⅛" O.D.)
77868	Yoke—Deflection yoke complete with 6 contact male connector (L113, L114, L115, L116, C207, P102, R227, R237)

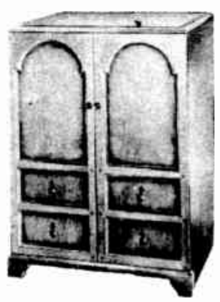
Model 21-T-356U "Bentley" Mahogany

Models 21-T-363, 21-T-363U "Hillsdale" Mahogany

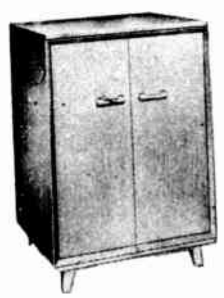
Models 21-T-364, 21-T-364U "Hayward" Mahogany, Oak

Models 21-T-365, 21-T-365U "Latham" Oak, Natural, Walnut

Models 21-T-372, 21-T-372U "Preston" Mahogany, Oak



Models 21-T-373, 21-T-373U "Powell" Maple, Red Cherry



Models 21-T-374, 21-T-374U "Sutton" Oak, Natural Walnut

Models 21-T-375, 21-T-375U "Chadwick" Mahogany, Walnut

GENERAL DESCRIPTION

All models are "21 inch" television receivers. Models 21-T-363, 21-T-364, 21-T-365, 21-T-372, 21-T-373, 21-T-374 and 21-T-375 are identical except for cabinets and speakers. These receivers feature full twelve channel VHF coverage. Models 21-T-356U, 21-T-363U, 21-T-364U, 21-T-365U, 21-T-372U, 21-T-373U, 21-T-374U and 21-T-375U, are identical except for cabinets and speakers. Model 21-T-356U has the additional difference of employing a 21EP4A glass kinescope. These receivers feature full twelve channel VHF coverage plus any four UHF channels desired.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE 227 sq. ins. on a 21AP4 or 21EP4 Kinescope

TELEVISION R-F FREQUENCY RANGE

21-T-363, 364, 365, 372, 373, 374, 375

Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

21-T-356U, 363U, 364U, 365U, 372U, 373U, 374U, 375U

Any desired combination of 16 VHF and/or UHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc., 470 mc. to 890 mc.

Picture Carrier Frequency....................45.75 mc.

Sound Carrier Frequency....................41.25 mc.

RCA TUBE COMPLEMENT

Tube Used	Function
Chassis KCS83 using KRK29 Tuner	
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer
Chassis KCS83B and KCS83E using KRK12A Tuner	
(1) RCA 6BQ7A	R-F Amplifier (VHF only)
(2) RCA 6AF4	R-F Oscillator
(3) RCA 6BQ7A	I-F Amplifier
(4) RCA 6S4	Voltage Control

A 1N82 crystal is used as a mixer.

Tube Used	Function
All Models	
(1) RCA 6CF6	1st Picture I-F Amplifier
(2) RCA 6CF6	2nd Picture I-F Amplifier

RCA TUBE COMPLEMENT

Tube Used	Function
(3) RCA 6CB6	3rd Picture I-F Amplifier
(4) RCA 12AU7	Picture 2nd Det. and Horiz. Sync. Sep.
(5) RCA 6X8	Video Amplifier and Vert. Sync. Sep.
(6) RCA 12AU7	Video Output and AGC
(7) RCA 6AU6	1st Sound I-F Amplifier
(8) RCA 6AU6	2nd Sound I-F Amplifier
(9) RCA 6AL5	Ratio Detector
(10) RCA 6AV6	Audio Amplifier
(11) RCA 6K6GT	Audio Output
(12) RCA 6SN7GT	Vert. Osc. & Dischg. & Sync. Output
(13) RCA 6K6GT	Vertical Sweep Output
(14) RCA 6SN7GT	Horiz. Sweep Oscillator and Control
(15) RCA 6BQ6GT	Horizontal Sweep Output
(16) RCA 6AX4GT	Damper
(17) RCA 1B3-GT/8016	High Voltage Rectifier
(18) RCA 21AP4	Kinescope
21EP4A	Model 21-T-356U only
(19) RCA 5U4G	Rectifier
(20) RCA 5Y3GT	Rectifier

CHASSIS DESIGNATIONS

KCS83 Models 21-T-363-364-365-372-373-374 and 375 employing a KRK29 Tuner.

KCS83B Models 21-T-363U-364U-365U-372U-373U-374U and 375U employing a KRK12A Tuner.

KCS83E Model 21-T-356U employing a KRK12A Tuner. (21EP4A Kinescope).

PICTURE INTERMEDIATE FREQUENCIES

Picture Carrier Frequency....................45.75 mc.

Adjacent Channel Sound Trap....................47.25 mc.

Sound Trap....................4.5 mc.

SOUND INTERMEDIATE FREQUENCIES

Sound Carrier Frequency............41.25 mc. and 4.5 mc.

VIDEO RESPONSE....................To 3.5 mc.

FOCUS....................Magnetic

SWEEP DEFLECTION....................Magnetic

SCANNING....................Interlaced, 525 line

HORIZONTAL SWEEP FREQUENCY....................15,750 cps

VERTICAL SWEEP FREQUENCY....................60 cps

FRAME FREQUENCY (Picture Repetition Rate)........30 cps

OPERATING CONTROLS (Front)

Channel Selector / Fine Tuning	Dual Control Knobs
Brightness	Single Control under Panel
Picture Horizontal Hold	Single Control under Panel
Picture Vertical Hold	Single Control under Panel
Sound Volume and On-Off Switch / Picture	Dual Control Knobs
TV-PH Tone Switch	Single Control under Panel

NON-OPERATING CONTROLS (under Front Panel)

Height	screwdriver adjustment
Vertical Linearity	screwdriver adjustment

NON-OPERATING CONTROLS (not including R-F and I-F adjustments)

Picture Centering	top chassis adjustment
Width	rear chassis adjustment
Horizontal Drive	rear chassis screwdriver adjustment
Horizontal Linearity	rear chassis adjustment
Horizontal Oscillator Frequency	rear chassis adjustment
Horizontal Oscillator Waveform	bottom chassis adjustment
Horizontal Locking Range	rear chassis adjustment
Focus	top chassis adjustment
Ion Trap Magnet	top chassis adjustment
Deflection Coil	top chassis adjustment
AGC Control	rear chassis adjustment

INSTALLATION INSTRUCTIONS

UNPACKING.—These receivers are shipped complete in cardboard cartons. The kinescope is shipped in place in the receiver.

Take the receiver out of the carton and remove all packing material.

Make sure that all tubes are in place and are firmly seated in their sockets.

Check to see that the kinescope high voltage lead clip is in place.

Plug a power cord into the 115 volt a-c power source and into the receiver interlock receptacle. Turn the receiver power switch to the "on" position, the brightness control fully clockwise, and the picture control counter-clockwise.

ANTENNA INPUT

Models with a KRK29 Tuner

These tuner units are designed for VHF reception only. A 300 ohm antenna input is provided, however, by removing the jumper between pins 1 and 5 of the matching unit input jack, a 72 ohm coaxial line may be used. Jumpers must be added between pins 1 and 4 and also between pins 2 and 5 as shown in figure 27. The coaxial line is then fastened directly to pins 1 and 5, with the shield connected to pin 1 and the center conductor to pin 5.

Models with a KRK12A Tuner

The KRK12A tuner unit is designed for UHF-VHF reception. A common 300 ohm input is provided for UHF and/or VHF. When using a UHF antenna only, a VHF antenna only or a combination UHF-VHF antenna, connect the single transmission line to the receiver antenna terminal board. Do not connect the jumper from the crossover network terminal board. (Refer to Figure 28).

Signals from separate UHF and VHF antennas may be fed to the tuner. To do this the 300 ohm Crossover Network mounted on the cabinet back is used to match two 300 ohm lines, from separate UHF and VHF antennas, to the single 300 ohm tuner input.

Connect the short jumper, from the crossover terminal board, to the antenna terminals of the receiver. Connect the transmission lines, from the separate antennas, to their respective terminals on the crossover terminal board as shown in Figure 28.

ION TRAP MAGNET ADJUSTMENT.—Set the ion trap magnet approximately in the position shown in Figure 2. Starting from this position immediately adjust the magnet by moving it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest raster on the screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Turn the focus control (shown in Figure 2) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches of this adjustment should be made with the brightness control at the maximum clockwise position with which good line focus can be maintained.

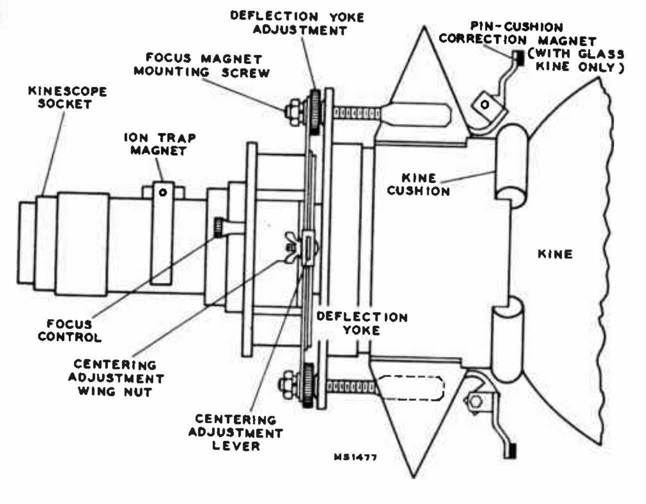


Figure 2—Yoke and Focus Magnet Adjustments

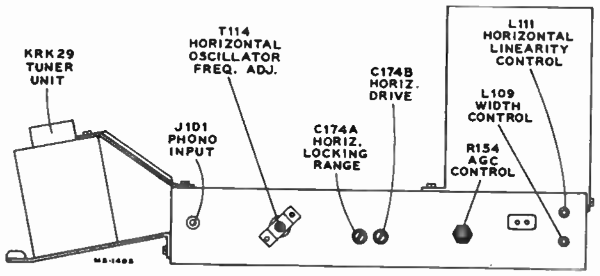

Figure 3—Rear Chassis Adjustments

INSTALLATION INSTRUCTIONS

ALIGNMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync with the hold control at the extreme counter-clockwise position or failed to hold sync over 90 degrees of clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments.

Horizontal Frequency Adjustment.—Turn the horizontal hold control to the extreme clockwise position. Tune in a television station and adjust the T114 horizontal frequency adjustment at the rear of the chassis until the picture is just out of snync and the horizontal blanking appears as a vertical or diagonal black bar in the raster. Then turn the T114 core until the bar moves out of the picture leaving it in sync.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 rear core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C174A slightly clockwise. If less than 2 bars are present, adjust C174A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Repeat the adjustments under "Horizontal Frequency Adjustment" and "Horizontal Locking Range Adjustment" until the conditions specified under each are fulfilled. When the horizontal hold operates as outlined under "Check of Horizontal Oscillator Alignment" the oscillator is properly adjusted.

If it is impossible to sync the picture at this point and the AGC system is in proper adjustment it will be necessary to adjust the Horizontal Oscillator by the method outlined in the alignment procedure on page 13. For field purposes paragraph "B" under Horizontal Oscillator Waveform Adjustment may be omitted.

FOCUS MAGNET ADJUSTMENT.—The focus magnet should be adjusted so that there is approximately three-eighths inch of space between the rear metal plate of the yoke and the flat of the front face of the focus magnet. This spacing gives best average focus over the face of the tube.

The axis of the hole through the magnet should be parallel with the axis of the kinescope neck with the kinescope neck through the center of the opening.

PIN-CUSHION CORRECTION

Model 21-T-356U only

Two pin-cushion correction magnets are employed to correct a small amount of pin-cushion of the raster due to the lens effect of the face of the kinescope. These magnets are mounted on small arms, one on each side of the kinescope as shown in Figure 2. The arms hinge in one plane on self tapping screws which act both as a hinge and an adjustment locking screw. When the magnets are swung towards the tube, maximum correction is obtained. Minimum correction is obtained when the arms are swung away from the tube. To adjust the magnets, loosen the two self tapping screws and position the magnets until the sides of the raster appear straight. Tighten the screws without shifting the position of the magnets. In some cases it may be necessary to twist or bend the magnet support arms to obtain the appearance of straight raster edges.

CENTERING ADJUSTMENT.—No electrical centering controls are provided. Centering is accomplished by means of a separate plate on the focus magnet. The centering plates include a locking screw which must be loosened before centering. Up and down adjustment of the plate moves the picture up and down and sidewise adjustment moves the picture side to side.

If a corner of the raster is shadowed, check the position of the ion trap magnet. Reposition the magnet within the range of maximum raster brightness to eliminate the shadow and recenter the picture by adjustment of the focus magnet plate. In no case should the magnet be adjusted to cause any loss of brightness since such operation may cause immediate or eventual damage to the tube. In some cases it may be necessary to shift the position of the focus magnet in order to eliminate a corner shadow.

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS.—Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage hence the brightest and best focused picture, adjust horizontal drive trimmer C174B counter-clockwise until the picture begins to "wrinkle" in the middle then clockwise until the "wrinkle" disappears.

Turn the horizontal linearity control L111 clockwise until the picture begins to "wrinkle" on the right and then counter-clockwise until the "wrinkle" disappears and best linearity is obtained.

Adjust the width control L109 to obtain correct picture width.

A slight readjustment of these three controls may be necessary to obtain the best linearity.

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R173 behind front control panel) until the picture fills the mask vertically. Adjust vertical linearity (R183 behind front control panel), until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust centering to align the picture with the mask.

FOCUS.—Adjust the focus magnet for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

Recheck the position of the ion trap magnet to make sure that maximum brightness is obtained.

Check to see that the knurled yoke nuts and the focus magnet mounting nuts are tight.

KRK29 R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 11. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 4. Adjustment for channel 13 is on top of the chassis.

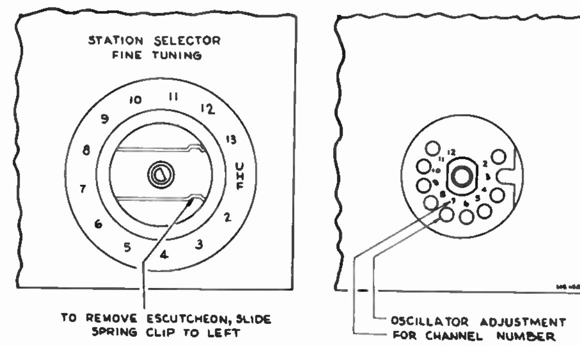

Figure 4—KRK29 R-F Oscillator Adjustments

KRK12A R-F OSCILLATOR ADJUSTMENTS.—Set the fine tuning control to the center of its range on the channel to be adjusted. Adjust the oscillator core for this channel to obtain maximum audio output without distortion. The adjustment location is the same for all channels, see Figure 5. The

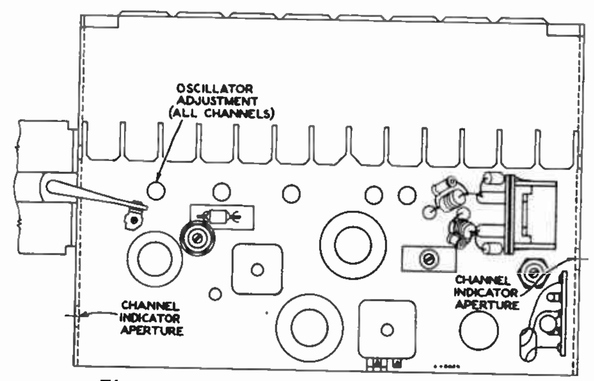

Figure 5—KRK12A Oscillator Adjustment

insert in the operating position can be determined by a stamping on the insert drum. This stamping is visible through either the front or rear apertures shown in Figure 5.

AGC THRESHOLD CONTROL.—The AGC threshold control R154 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal and sync the picture. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R154. If the picture requires an appreciable portion of a second to reappear, or bends excessively, R154 should be readjusted.

Turn R154 fully counter-clockwise. The raster may be bent slightly. This should be disregarded. Turn R154 clockwise until there is a very, very slight bend or change of bend in the picture. Then turn R154 counter-clockwise just sufficiently to remove this bend or change of bend.

If the signal is weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R154 clockwise until the snow in the picture becomes more pronounced, then counter-clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far clockwise on a weak signal, then the receiver may overload when a strong signal is received.

FM TRAP ADJUSTMENT.—In some instances interference may be encountered from a strong FM station signal. A trap is provided to eliminate this type of interference. To adjust the trap tune in the station on which the interference is observed and adjust the FM trap for minimum interference in the picture. The trap is L5 on KRK29 tuners and is located on the antenna matching transformer.

CAUTION.—In some receivers, the FM trap L5 will tune down into channel 6 or even into channel 5. Needless to say, such an adjustment will cause greatly reduced sensitivity on these channels. If channels 5 or 6 are to be received, check L5 to make sure that it does not affect sensitivity on these two channels.

The FM trap on models using the KRK12A Tuner is fastened to the receiver antenna cable and is adjusted in the same manner as described above.

Replace the cabinet back and connect the receiver antenna leads to the cabinet back. Make sure that the screws holding it are up tight, otherwise it may rattle or buzz when the receiver is operated at high volume.

REFLECTIONS.—Multiple images sometimes known as echoes or ghosts, are caused by the signal arriving at the antenna by two or more routes. The second or subsequent image occurs when a signal arrives at the antenna after being reflected off a building, a hill or other object. In severe cases of reflections, even the sound may be distorted. In less severe cases, reflections may occur that are not noticeable as reflections but that will instead cause a loss of definition in the picture.

CABINET ANTENNA.—A cabinet antenna is provided in all models using wooden cabinets and the leads are brought out near the antenna terminal board. The cabinet antenna may be employed for both UHF and VHF reception in place of the outdoor antenna in areas where the signals are strong and no reflections are experienced.

INTERFERENCE.—Auto ignition, street cars, electrical machinery and diathermy apparatus may cause interference which spoils the picture. Whenever possible, the antenna location should be removed as far as possible from highways, hospitals, doctors' offices and similar sources of interference. In mounting the antenna, care must be taken to keep the antenna rods at least ¼ wave length (at least 6 feet) away from other antennas, metal roofs, gutters or other metal objects.

Short-wave radio transmitting and receiving equipment may cause interference in the picture in the form of moving ripples. In some instances it may be possible to eliminate the interference by the use of a trap in the antenna transmission line. However, if the interfering signal is on the same frequency as the television station, a trap will provide no improvement.

RECEIVER LOCATION.—The owner should be advised of the importance of placing the receiver in the proper location in the room.

The location should be chosen—

- —Away from bright windows and so that no bright light will fall directly on the screen. (Some illumination in the room is desirable, however.)
- —To give easy access for operation and comfortable viewing.
- —To permit convenient connection to the antenna.
- —Convenient to an electrical outlet.
- —To allow adequate ventilation.

CHASSIS TOP VIEW

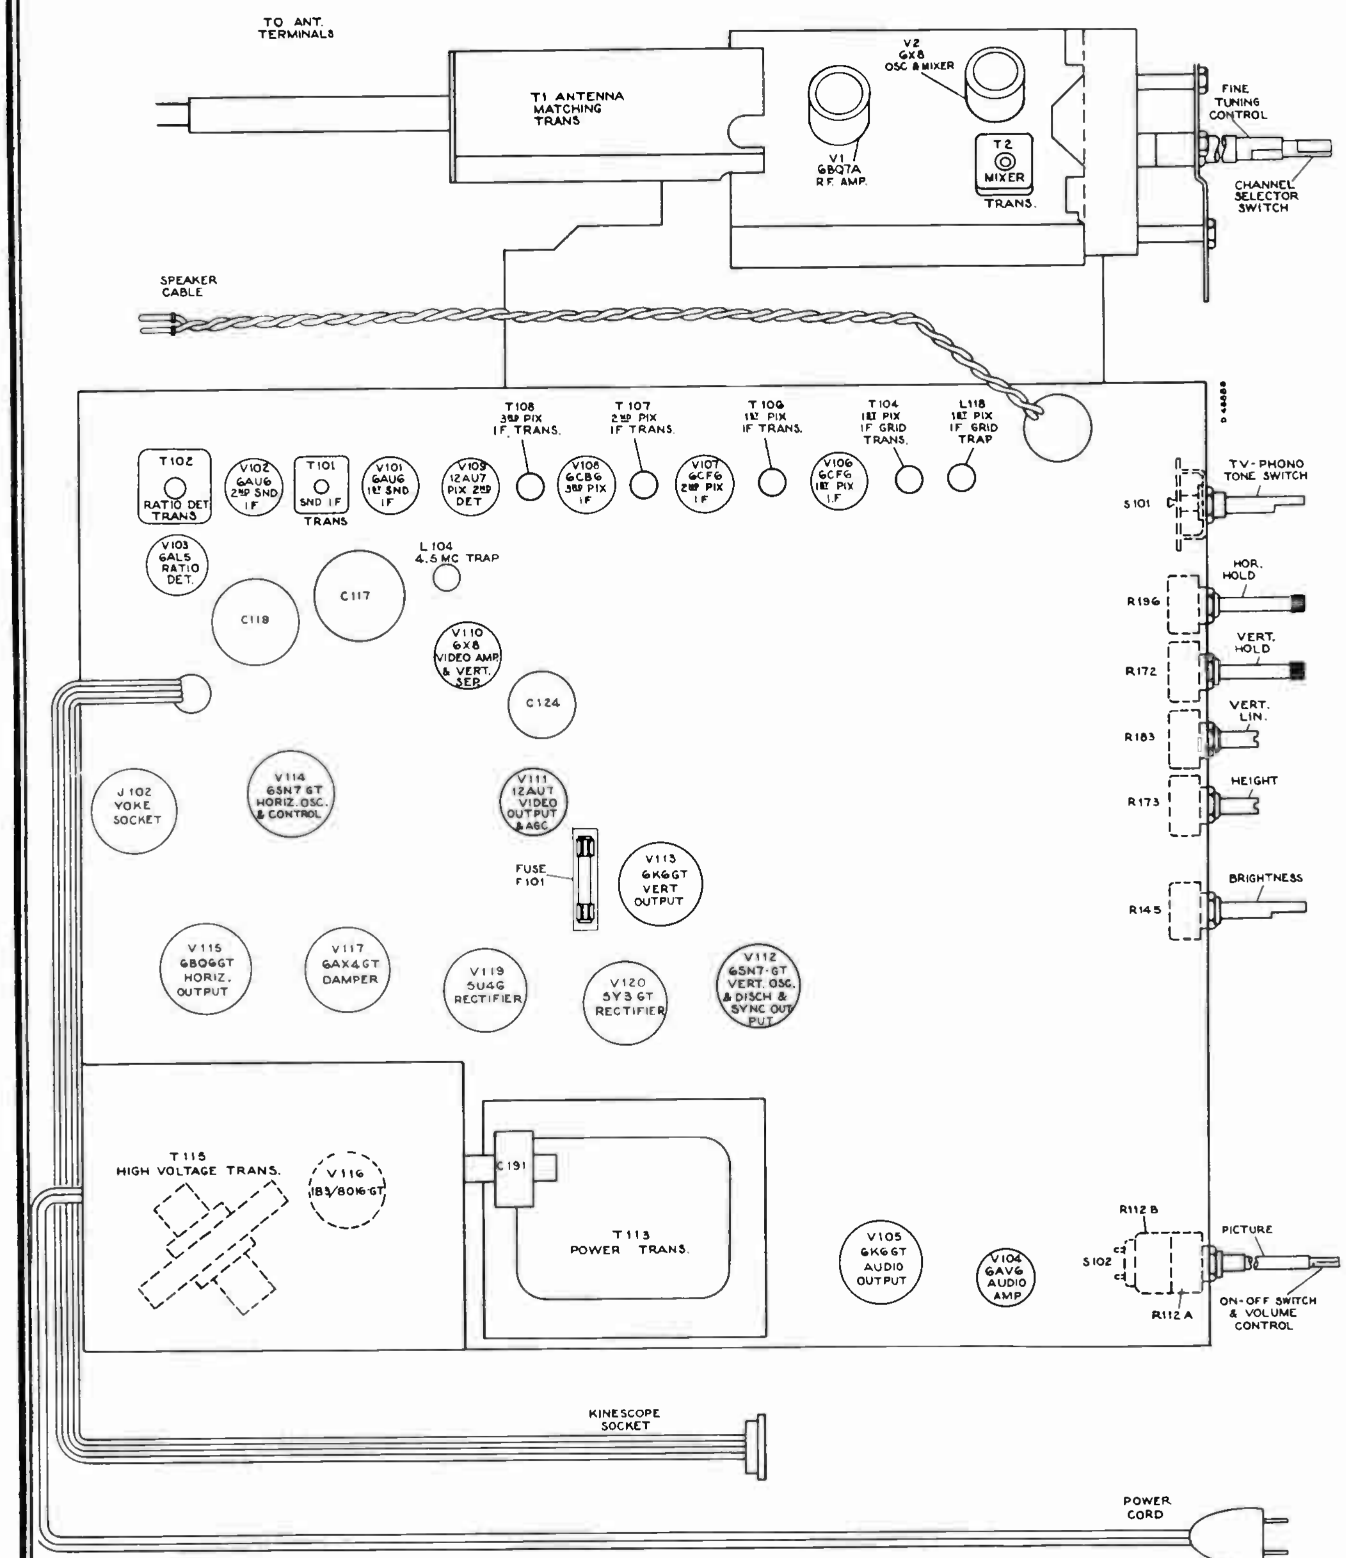

Figure 6—Chassis Top View (shown with KRK29 Tuner)

CHASSIS BOTTOM VIEW

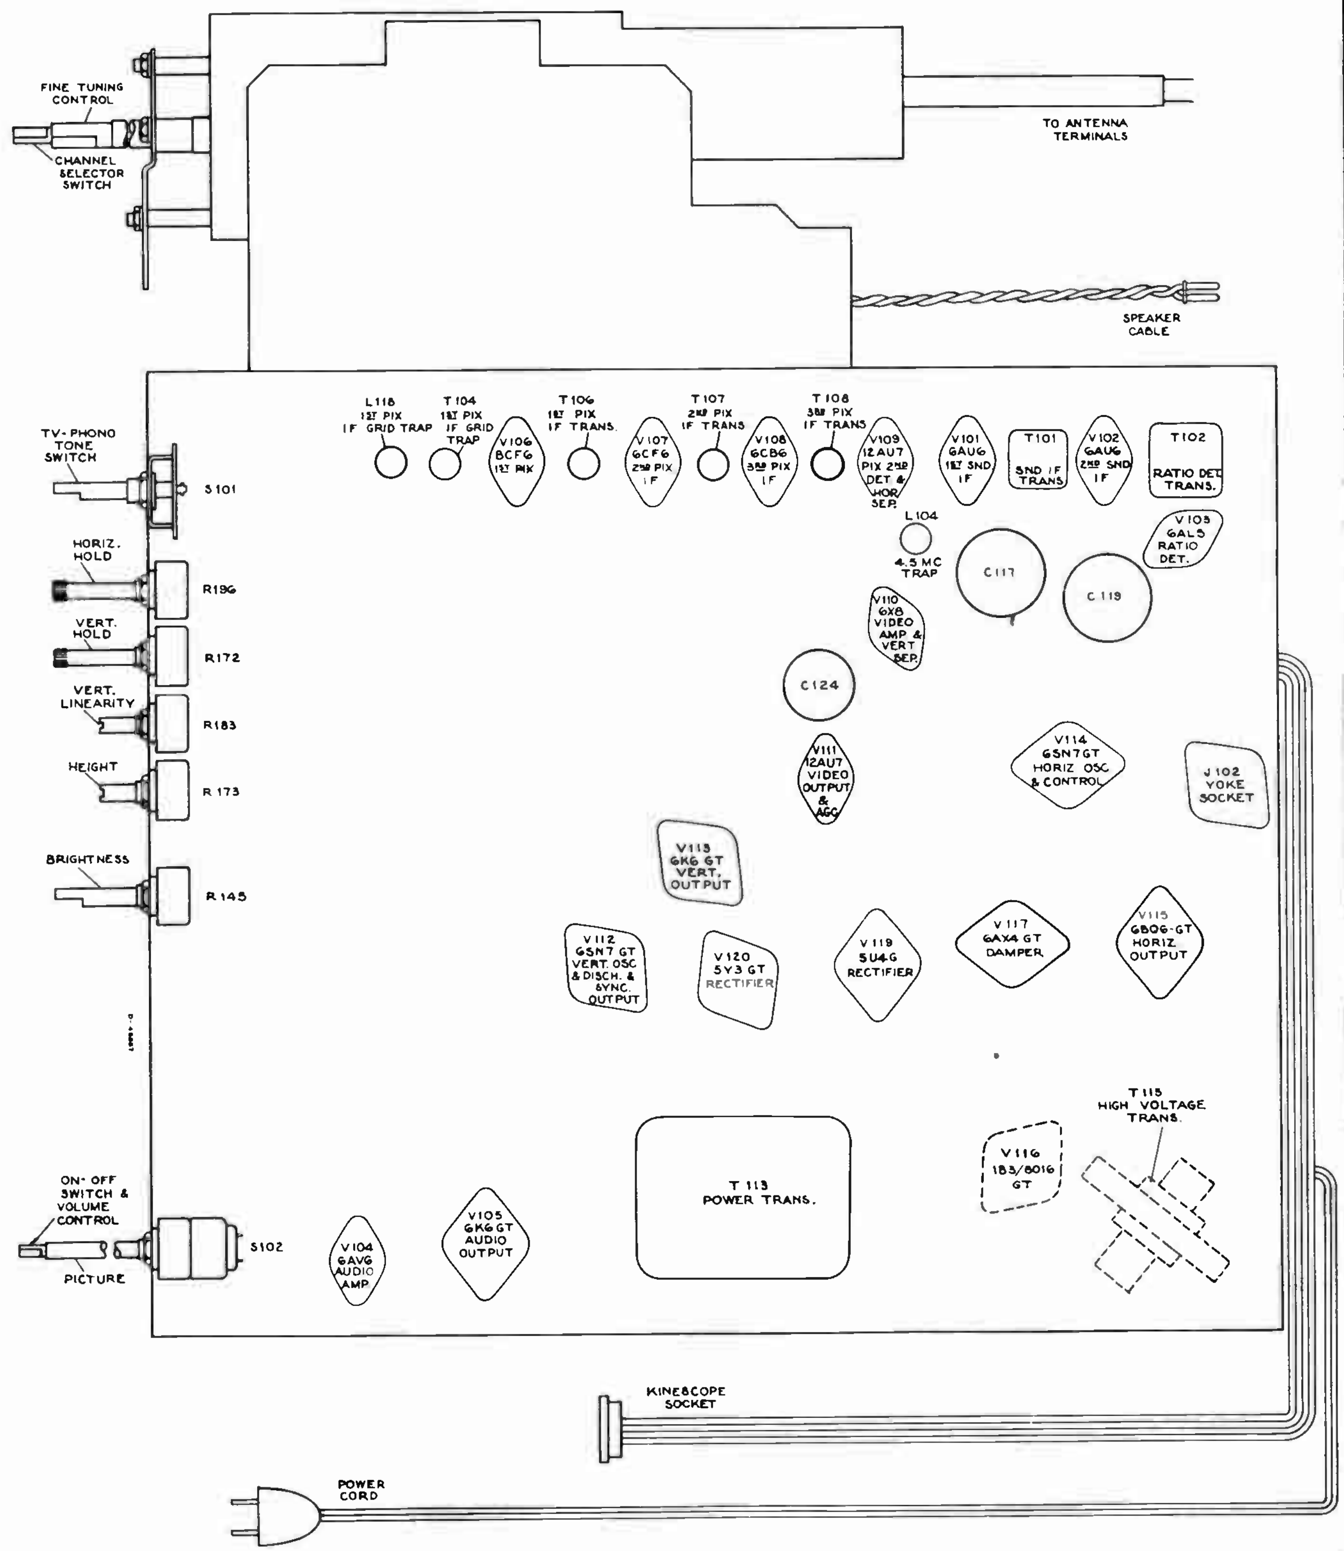

Figure 7—Chassis Bottom View (shown with KRK29 Tuner)

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA Types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
14	471.25	475.75	517
15	477.25	481.75	523
16	483.25	487.75	529
17	489.25	493.75	535
18	495.25	499.75	541
19	501.25	505.75	547
20	507.25	511.75	553
21	513.25	517.75	559
22	519.25	523.75	565
23	525.25	529.75	571
24	531.25	535.75	577
25	537.25	541.75	583

83	885.25	889.75	931

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 1 millivolt per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

DC Milliammeter.—A milliammeter with a range of 0-50 milliamperes full scale.

Adapter Socket.—An adapter socket is required to meter the cathode current of the 6S4 voltage control tube of the KRK12A Tuner. Wiring of adapter is shown in Figure 15

KRK29 ANTENNA MATCHING UNIT ALIGNMENT.—The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L5 to the channel selector switch S1-E.

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R123 and C142. Set the potentiometer to produce approximately —5.0 volts of bias at the junction of R123 and C142.

Connect an oscilloscope to the junction of R135 and L102 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L4 in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L1 for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L5 to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L5 to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 10 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by returning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L2 and L3 to obtain the response shown in figure 19. L3 is most effective in locating the position of the shoulder of the curve at 52 mc. and L2 should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L5 and S1-E. Replace V106.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—

Models 21-T-363 to 21-T-375 incl.

Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R123 and C142. Turn the AGC control fully clockwise.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the battery positive terminal of one to the chassis and the potentiometer arm to the junction of R123 and C142. The second battery will be used later.

Set the bias to produce approximately —5.0 volt of bias at the junction of R123 and C142.

Connect the "VoltOhmyst" to junction of R135 and L102 and to ground.

Set the VHF signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst". During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R123 and L102 with —5.0 volts of i-f bias at the junction of R123 and C142.

44.5 mc.	T108
45.5 mc.	T107
43.0 mc.	T106

Set the VHF signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at R135, L102. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the adjustment is made.

47.25 mc.	L118

Models 21-T-356U to 21-T-375U incl.

Connect the "VoltOhmyst" to the junction of R123 and C142.

Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction R123 and C142. Adjust the potentiometer for —5.0 volts indication on the "VoltOhmyst".

Connect the "VoltOhmyst" to the junction of R135 and L102 and to ground.

Connect the output of the signal generator to the front terminal of the crystal mixer in series with a 1500 mmf. ceramic capacitor.

Set the VHF generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for maximum indication on the "VoltOhmyst". In each instance the generator should be checked against a crystal calibrator to insure that the generator is on frequency.

During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R135 and L102 with —5.0 volts of i-f bias at the junction of R123 and C142.

44.5 mc.	T108
45.5 mc.	T107
43.0 mc.	T106

Set the signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at junction of R135 and L102. Use sufficient signal input to produce 3.0 volts of d-c on the meter when adjustment is made.

47.25 mc.	L118

SWEEP ALIGNMENT OF PICTURE I-F.—

Models 21-T-363 to 21-T-375 incl.

To align T2 and T104, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Preset C122 to minimum capacity.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R135 and C142. Set the AGC control fully clockwise.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T2 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C122 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 22. Maximum allowable tilt is 20%.

Disconnect the diode probe, the 180 ohm and two 330 ohm resistors.

Connect the oscilloscope to the junction of R135 and L102.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 23.

Models 21-T-356U to 21-T-375U incl.

To align the crystal mixer circuit and T2 and T104 connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep generator to the tuner case.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Set the channel selector to channel 5.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C122 across terminals A and B of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (top) for maximum gain at 43.5 mc. and with 45.75 mc. at 75% of maximum response.

ALIGNMENT PROCEDURE

Adjust T1 for maximum gain. Readjust T2 and T104 if necessary to obtain proper wave shape, see Figure 13.

Disconnect the diode probe, the 180 ohm and the two 330 ohm resistors.

Connect the oscilloscope to the junction of R135 and L102.

Adjust the bias potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R123 and C142.

Leave the sweep generator connected to the front terminal of the 1N82 crystal holder with the shortest leads possible and with not more than one inch of unshielded lead at the end of the sweep cable. If these precautions are not observed, the receiver may be unstable and the response curves obtained may be unreliable.

Adjust the output of the sweep generator to obtain 3.0 to 5.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 14.

Remove the oscilloscope, sweep and signal generator connections.

Remove the bias box employed to provide bias for alignment.

KRK29 TUNER ALIGNMENT

Models 21-T-363 to 21-T-375 incl.

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP1 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate if 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst". The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn the C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in Figure 10, to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and band width as shown in Figure 18.

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in Figure 18.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and bandwidth.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L48, and L32 for proper curve shape as shown in Figure 18. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See Figure 18 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48, and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to Figure 18 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21, or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

KRK12A TUNER ALIGNMENT

Models 21-T-356U to 21-T-375U incl.

TUNER VHF ALIGNMENT.—Remove the 6S4 voltage control tube from its socket and insert the adapter. Insert the 6S4 in the adapter.

Connect the 0-50 milliampere meter to the adapter socket leads and turn the adapter switch on.

Remove the tuner cover shield.

Rotate the channel selector to a point midway between channels, disengaging the insert contacts, and observe the non-oscillating plate current. Some tubes may oscillate even with the tuned circuits disengaged. To be sure the oscillator is in a non-oscillatory state, short circuit the spring contacts 12 and 13, the two contacts nearest the tuner front.

(NOTE: The contacts are at zero d-c potential.) Should the plate current rise, keep the contacts shorted while adjusting the oscillator plate current. Adjust R6, oscillator voltage control, for a 28 milliampere reading on the meter.

Replace the tuner cover shield.

Connect the VHF sweep generator to the antenna terminals.

Connect the VHF signal generator loosely to the antenna terminals.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Turn off the adapter switch, removing plate voltage from the oscillator. This is required because of RF-IF interaction when a crystal is used as a mixer.

Set the channel selector and the sweep generator to channel 2.

Insert markers of channel 2 picture carrier and sound carrier, 55.25 mc. and 59.75 mc.

Adjust antenna T6, r-f amplifier plate L29 and mixer L30 adjustments for a symmetrical curve with maximum gain at the center of the pass band. The curves will have a deep valley because of no crystal loading and nonlinear detector characteristics. The limits for the 100% response points are shown in Figure 11. The proper curve shape is shown in Figure 11(b). (See Note on page 13 for detailed explanation of adjustment.) If the bandwidth is out of tolerance, it can usually be corrected by redressing the coupling capacitor of the double tuned circuit, C40 on insert A. Maximum bandwidth occurs when the capacitor is centered in the insert chamber.

Repeat the above steps for all VHF channels adjusting the appropriate antenna, r-f amplifier plate and mixer slugs for a symmetrical curve with maximum gain at the center of the pass band.

Turn off the sweep generator.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Turn the AGC control fully clockwise.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Connect the potentiometer arm of the second bias supply to the junction of R123 and C142, and ground the positive battery terminal. Adjust the bias potentiometer to produce —5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to the junction of R135 and L102. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to channel 13.

Set the fine tuning control to the center of its range.

Adjust the oscillator slug L22 to proper frequency, 257 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 257 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner through either of the two holes next to the oscillator tube on the right front top corner of the tuner. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust L22 oscillator slug to obtain an audio beat with the signal generator.

Turn on the sweep generator and set to channel 13. Adjust T1 for maximum gain on the oscilloscope. Adjust mixer tank circuit L21 for maximum gain at center of band with the proper response. Maximum gain and flat-topped response should be obtained simultaneously.

ALIGNMENT PROCEDURE

Adjust the oscillator to frequency on all VHF channels by switching the receiver and signal generator to each VHF channel and adjusting the appropriate oscillator slug to obtain a beat with the signal generator. Adjust the appropriate mixer slug where necessary to obtain maximum gain and proper curve shape as explained above.

Adjust the tunable I-F Trap C16-L7. To do this connect the signal generator to the fixed I-F Trap C2-L2 at the end opposite the antenna terminal plug. Set the signal generator to 43.5 mc. and adjust the output of the signal generator to obtain sufficient indication on the oscilloscope. Tune the I-F Trap C16-L7 for minimum indication on the oscilloscope.

Remove the signal generator and the oscilloscope.

TUNER UHF ALIGNMENT.—To align the UHF inserts:

Turn off the adapter switch, removing plate voltage from the oscillator.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Connect the UHF sweep generator to the antenna terminals. Use a 10 DB attenuator pad to assure proper alignment.

Connect the UHF signal generator loosely to the antenna terminals.

Set the channel selector to the desired position and the sweep generator to sweep the frequency of the insert being used.

Insert markers of the picture carrier and sound carrier for desired channel.

Adjust UHF antenna, link coupling and mixer adjustments for a symmetrical curve, with maximum gain, centered about the pass band.

The responses are shown in Figure 12. The curve shape will usually vary from Figure 12 (a) to Figure 12 (c) going higher in frequency, however any of these responses are acceptable.

Repeat the above steps for all UHF inserts used adjusting the appropriate antenna, link coupling and mixer slugs for a symmetrical curve, with maximum gain, centered about the pass band.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal.

Connect the potentiometer arm of the second bias supply to the junction of R123 and C142, and ground the positive battery terminal. Adjust the bias potentiometer to produce —5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to junction of R135 and L102. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to the lowest UHF channel to be used.

Set the fine tuning control to the center of its range.

Adjust the oscillator core to proper frequency. To do this, connect the VHF signal generator to test point TP1 with the shortest leads possible. Insert a 45.75 mc. marker from the VHF generator.

Set the UHF sweep generator to sweep the desired channel, and observe the output on the oscilloscope. If the sweep generator is not sweeping the correct frequency range, it may be necessary to readjust the sweep in order to place the 45.75 marker on the response curve as in Figure 14.

Set the UHF marker generator to the picture carrier of the channel insert being adjusted and connect to test point TP1.

Adjust the oscillator core until the markers for 45.75 mc. and the picture carrier coincide on the sweep pattern on the oscilloscope.

Adjust mixer core for maximum gain with proper wave shape.

Connect the "VoltOhmyst" to test point TP1, using 1.5 volt D.C. scale.

Set oscillator injection adjustment to read .1 volt on the "VoltOhmyst."

Repeat the above steps for all UHF inserts adjusting the oscillator injection control only if the reading on the "VoltOhmyst" exceeds .3 volt. Adjust as necessary to read .3 volt or less at TP1.

RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first sound i-f grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. In such a case, connect the calibrator to the grid of the third pix i-f amplifier, pin 1 of V108.

Set the frequency of the calibrator to 45.75 mc. (pix carrier) and modulate with 4.5 mc. crystal. The 4.5 mc. signal will be picked off at L103 and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst". Adjust the signal level from the signal generator for 6 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R108 and C109.

Tune the ratio detector secondary T102 bottom core for zero d-c on the "VoltOhmyst".

Repeat adjustments of T102 top for maximum d-c at pin 2 of V103 and T102 bottom for zero d-c at the junction of R108 and C109. Make the final adjustments with the signal input level adjusted to produce 6 volts d-c on the "VoltOhmyst" at pin 2 of V103.

SOUND I-F ALIGNMENT.—Connect the signal generator to the first sound i-f amplifier grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed as above.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the T101 top core for maximum d-c on the "VoltOhmyst".

The output from the signal generator should be set to produce approximately 6.0 volts on the "VoltOhmyst" when the final touches on the above adjustment are made.

4.5 MC. TRAP ADJUSTMENT.—Connect the signal generator in series with a 100 ohm resistor to pin 2 of V109. Set the generator to 4.5 mc. and modulate it 30% with 400 cycles. Set the output to approximately 0.5 volt.

Short the third pix i-f grid to ground, pin 1, V108, to prevent noise from masking the output indication.

Connect the crystal diode probe of an oscilloscope to the plate of the viedo amplifier, pin 9 of V110.

Adjust the core of L104 for minimum output on the oscilloscope.

Remove the short from pin 1, V108 to ground.

As an alternate method, this step may be ommitted at this point in the alignment procedure and the adjustment made "on the air" after the alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L104 requires no adjustment. If a 4.5 mc. beat is present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L104 for minimum beat.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 9 of V110.

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

HORIZONTAL OSCILLATOR ADJUSTMENT.—Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R196, then adjust the T114 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T114 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T114 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C174B, the width control L109 and the linearity control L111 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T114 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T114 frequency core (on the rear apron) until the picture falls out of sync and three or four diagonal black bars sloping down to the right appear on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain three or four diagonal black bars on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T114 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture falls out of sync with the diagonal bars sloping down to the right. Continue to turn the frequency core in the same direction. No more than three or four bars should appear on the screen. Instead, the horizontal oscillator should begin the motorboat. Retouch the adjustment of the T114 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T114. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 24. Adjust the waveform adjustment core of T114 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C174A slightly clockwise. If less than 2 bars are present, adjust C174A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T114 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves to the left side of the screen leaving the picture in synchronization.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to construct the pad.

RESPONSE CURVES.—The response curves shown on pages 14 and 15 and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, some variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

NOTE ON KRK12A TUNER ALIGNMENT.—The use of a crystal mixer makes it necessary to observe the insert responses with the oscillator disabled. This is due to undesirable r-f/i-f interaction if the oscillator was allowed to operate during alignment. Therefore, the responses shown in Figure 11 are not a strictly true representation of the insert band pass during actual operation. When an insert is aligned, using an oscilloscope to observe the response, the curve shown in figure 11(b) will be the correct response for reference. In actual operation, the band pass will be such that the sound and picture carriers will be at the tips of the curve. The adjacent channel picture and sound carriers will be in the valleys at each side. Care should be taken not to exceed the limits shown in figure 11(a) and 11(c).

The valley in the center of the response curve, may vary from 0 to 50% above the base line for VHF inserts. Adjust the output level of the sweep generator to prevent excessive signal input to the tuner. Excessive signal input will be indicated by the valley rising above the 50% level, particularly on the higher VHF channels.

Oscillator injection voltage is not adjusted on VHF inserts. A check may indicate variations from .08 to .3 volts at TP1, but such readings should not be interpreted as an indication of trouble. On UHF channels, however, the injection voltage should be adjusted to fall within the specified limits.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 15000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

RMA COLOR CODE, FIXED MICA CAPACITORS

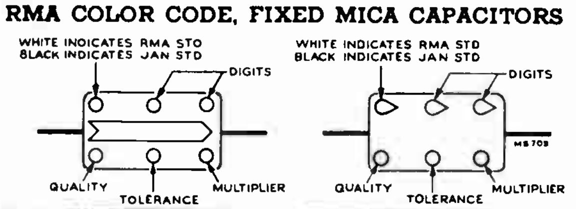

Figure 27—Circuit Schematic Diagram, KCS83

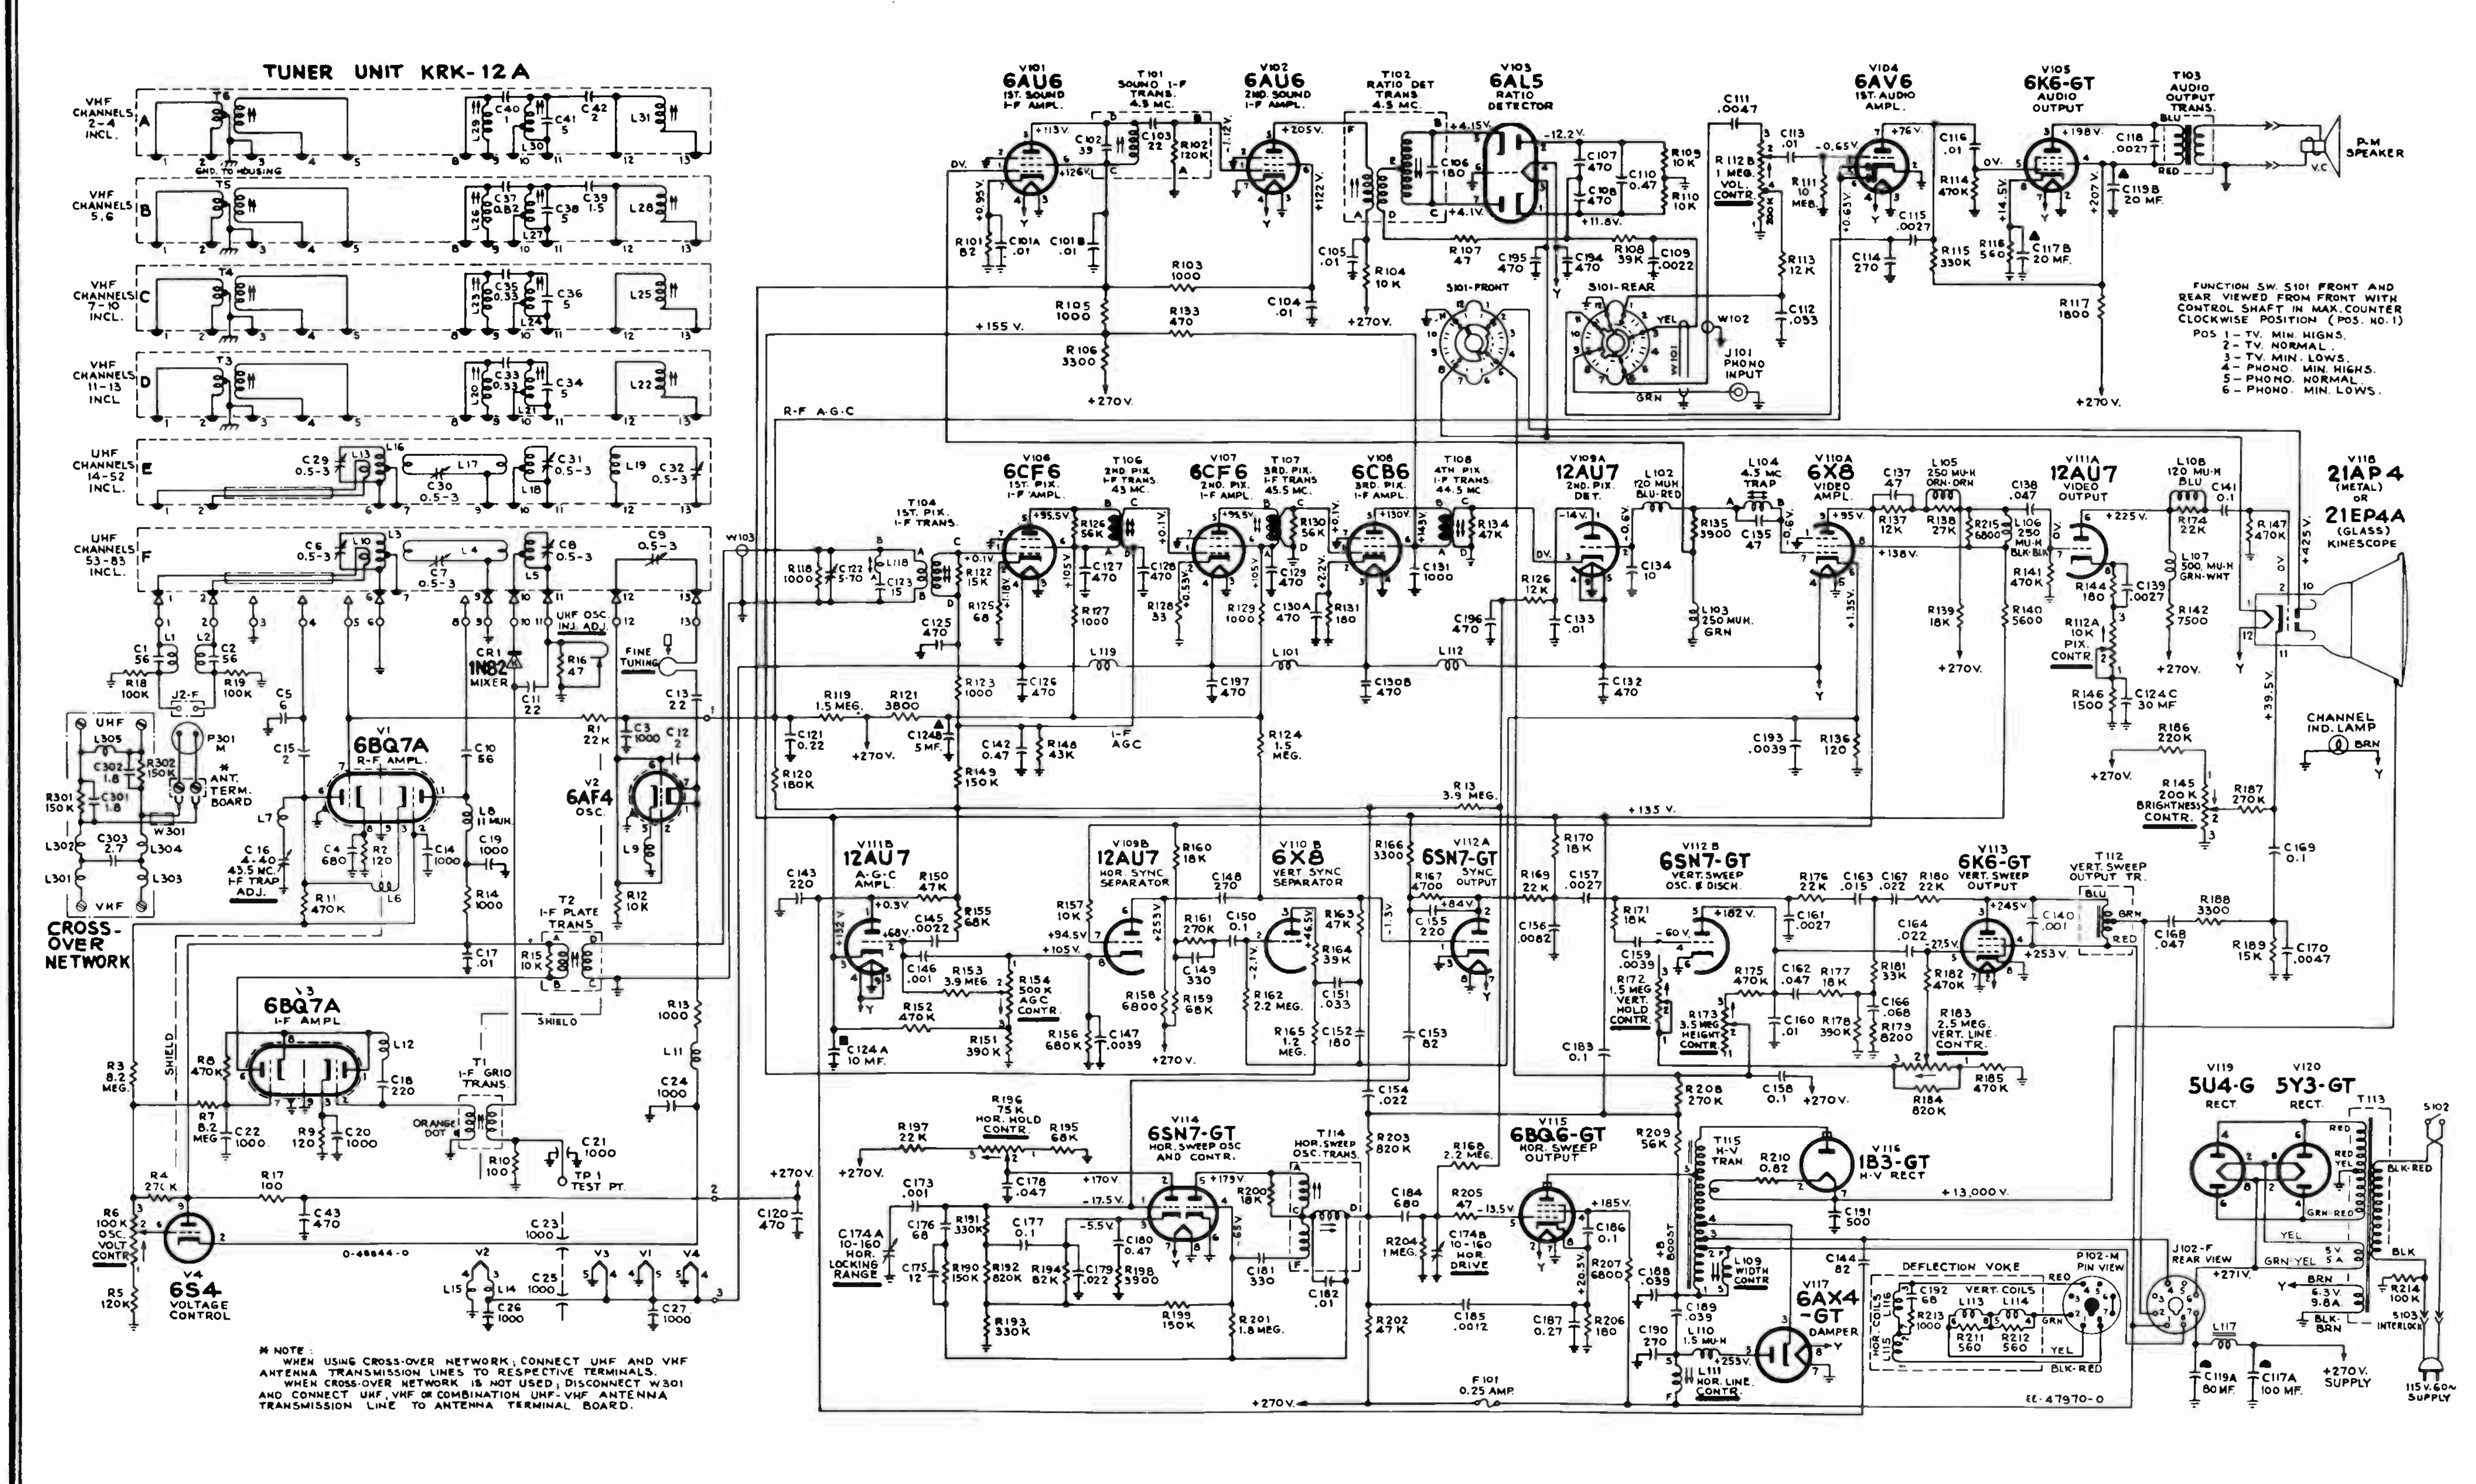
The schematic is shown in the latest condition at the time of printing.
All resistance values in ohms. K = 1000.

All capacitance values less than 1 in FM and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

CIRCUIT SCHEMATIC DIAGRAM, KCS83B (KCS83E with 21EP4A Kinescope)



The schematic is shown in the latest condition at the time of printing. All resistance values in ohms. K = 1000.

All capacitance values less than 1 in FM and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

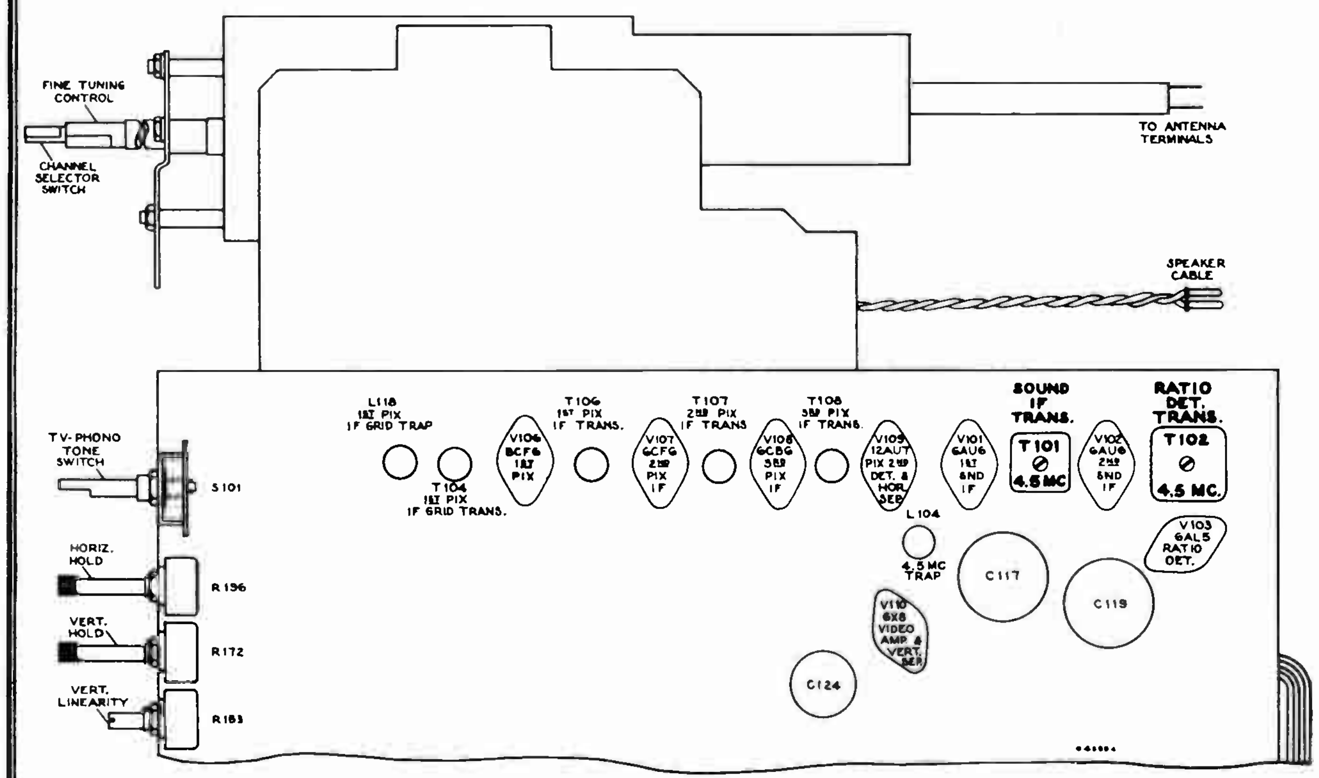

Figure 26—Bottom Chassis Adjustments (KRK29 Tuner shown)

REPLACEMENT PARTS (Continued)

STOCK No.	DESCRIPTION
39153	Connector—4 contact male connector for antenna cable for instruments using KRK29 tuner
75474	Connector—Single contact male connector for antenn cable
71457'	Cord—Power cord and plug
77761	Cover—Cover assembly—brown—complete with spring for channel markers for maple instruments using KRK12A tuner
77759	Cover—Cover assembly—maroon—complete with spring for channel markers for mahogany, red cherry or walnut instruments using KRK12A tuner
77760	Cover—Cover assembly—sand gray—complete with spring for channel markers for blonde or oak instruments using KRK12A tuner
78319	Cover—Cover and case assembly—brown—for hidden controls for mahogany, red cherry or walnut console instruments
78327	Cover—Cover and case assembly—dark red—for hidden controls for mahogany table instruments
78321	Cover—Cover and case assembly—dark tan—for hidden controls for maple instruments
78320	Cover—Cover and case assembly—medium beige—for hidden controls for blonde or oak instruments
77770	Cushion—Adhesive cushion for safety glass retainers for wood console instruments
78313	Cushion—Rubber cushion for dust sealing the kinescope in wood console instruments
77749	Cushion—Rubber cushion for safety glass for wood console instruments
76698	Cushion—Rubber cushion for kinescope masking panel support bracket for wood console instruments
78386	Decal—Volume control, brightness control, fine tuning control and channel selector switch decal for mahogany, natural walnut, red cherry or walnut instruments
78389	Decal—Volume control, brightness control, fine tuning control and channel selector switch decal for oak or maple instruments
77758	Disc—Polystyrene indicator disc—brown—for channel selections for maple instruments using KRK12A tuner
77757	Disc—Polystyrene indicator disc—sand gray—for channel selections for blonde or oak instruments using KRK12A tuner
77756	Disc—Polystyrene indicator disc—maroon—for channel selections for mahogany, red cherry or walnut instruments using KRK12A tuner unit
78315	Escutcheon—Channel marker escutcheon for instruments using KRK29 tuner
74889	Foot—Felt foot for Model 21T356U
77684	Gasket—Glass kinescope mounting strap gasket
78314	Glass—Safety glass for wood console instruments
78329	Glass—Safety glass for metal table instruments
37396	Grommet—Rubber grommet for mounting speaker stamped 92569-12
74308	Hinge—Cabinet door hinge (1 set) for Models 21T372, 21T372U, 21T373, 21T373U, 21T374, 21T374U, 21T375, 21T375U
77699	Knob—Brightness control knob—brown—for mahogany, red cherry or walnut instruments (outer)
77719	Knob—Brightness control knob—medium beige—for blonde or oak instruments (outer)
77738	Knob—Brightness control knob—tan—for maple instruments (outer)
77968	Knob—Channel selector knob—brown—for mahogany, red cherry or walnut instruments using KRK12A tuner
77969	Knob — Channel selector knob — medium beige — for blonde or oak instruments using KRK12A tuner
77970	Knob—Channel selector knob—tan—for maple instruments using KRK12A tuner
77708	Knob—Channel selector knob for instruments using KRK29 tuner (inner)
77750	Knob—Fine tuning control knob for instruments using KRK12A tuner
77707	Knob—Fine tuning control knob—brown—for mahogany, red cherry or walnut instruments using KRK29 tuner (outer)
77717	Knob—Fine tuning control knob—medium beige—for blonde or oak instruments using KRK29 tuner (outer)
77733	Knob—Fine tuning control knob—tan—for maple instruments using KRK29 tuner (outer)
77735	Knob—Function switch knob—brown—for mahogany, red cherry or walnut instruments
77736	Knob—Function switch knob—medium beige—for blonde or oak instruments
77737	Knob—Function switch knob—tan—for maple instruments
77709	Knob—Picture control knob—brown—for mahogany, red cherry or walnut instruments
77718	Knob—Picture control knob—medium beige—for blonde or oak instruments
77734	Knob—Picture control knob—tan—for maple instruments
77710	Knob—Volume control and power switch knob (inner)
11765	Lamp—Channel escutcheon lamp—Mazda 51
77766	Marker—UHF channel number markers for blonde or oak instruments using KRK12A tuner
77765	Marker—UHF channel number markers for mahogany, red cherry or walnut instruments using KRK12A tuner
77767	Marker—UHF channel number markers for maple instruments using KRK12A tuner
77763	Marker—VHF channel number markers for blonde or oak instruments using KRK12A tuner
77762	Marker—VHF channel number markers for mahogany, red cherry or walnut instruments using KRK12A tuner
77764	Marker—VHF channel number markers for maple instruments using KRK12A tuner
78316	Mask—Channel marker escutcheon light mask—brown—for mahogany, red cherry or walnut instruments using KRK29 tuner
78317	Mask—Channel marker escutcheon light mask—medium beige—for blonde or oak instruments using KRK29 tuner
78318	Mask—Channel marker escutcheon light mask—tan—for maple instruments using KRK29 tuner
78311	Mask—Polystyrene masking panel—gray and wine red—for mahogany, red cherry or walnut wood console instruments
78312	Mask—Polystyrene masking panel—pinkish white and light taupe—for oak or maple wood console instruments
78326	Nut—1/4-20 knurled nut for deflection yoke hood support
77683	Nut—Speed nut for glass kinescope mounting strap screw
73634	Nut—Speed nut for speaker mounting screw
76601	Pad—Kinescope edge support pad (rubber) for wood console instruments
78392	Plate—Back plate for upper door pull for Models 21T375, 21T375U
78390	Pull—Door pull for Models 21T372, 21T372U
77795	Pull—Door pull (lower) for Models 21T373, 21T373U (4 req'd)
77794	Pull—Door pull (upper) for Models 21T373, 21T373U (2 req'd)
78391	Pull—Door pull for Models 21T374, 21T374U
78394	Pull—Door pull (lower) for Models 21T375, 21T375U
78393	Pull—Door pull (upper), for Models 21T375, 21T375U (2 req'd)
502415	Resistor—Fixed, composition:— 150,000 ohms, ±10%, 1/2 watt (R1, R2)
77928	Retainer—Retainer for channel selector knob for instruments using KRK12A tuner
78328	Retainer—Safety glass retainer for metal table instruments
78249	Retainer—Side retainer for safety glass for wood console instruments
77952	Retainer—Top or bottom retainer for safety glass for wood console instruments
78322	Rod—Hook shape threaded rod for deflection yoke hood assembly
78388	Screw—#2 x 1/2" round head cross recessed screw for decorative clip for mahogany instruments for Models 21T364, 21T364U
77712	Screw—#6 x 1/2" cross recessed pan head self-tapping screw (black) for mounting hidden controls case and cover to cabinet for mahogany, red cherry or walnut instruments
77725	Screw—#6 x 1/2" cross recessed pan head self-tapping screw (zinc) for mounting hidden controls case and cover to cabinet for blonde, maple or oak instruments
76632	Screw—#8 x 5/8" hex head screw for masking panel support bracket for wood console instruments
74113	Screw—#8-32 x 1" trimit head screw for door pull 78390 for Models 21T372, 21T372U; for door pull 78391 for Models 21T374, 21T374U; for door pull 78393 for Models 21T375, 21T375U
75626	Screw—#8-32 x 1 1/4" trimit head screw for door pull 77794 for Models 21T373, 21T373U
75676	Screw—#8-32 x 3/16" trimit head screw for door pull 77795 for Models 21T373, 21T373U
75623	Screw—#8-32 x 5/8" trimit head screw for door pull for Models 21T375, 21T375U
77682	Screw—#12 x 1 1/2" hex head screw for glass kinescope mounting strap
78447	Shade—Lamp shade for instruments using KRK12A tuner
78324	Spring—Formed spring for glass retainer or back cover
76630	Spring—Formed spring for kinescope masking panel for wood console instruments
76837	Spring—Retaining spring for knobs 77699, 77708, 77709, 77718, 77719, 77734, 77735, 77736, 77737, 77738
72845	Spring—Retaining spring for knobs 77707, 77717, 77733
30330	Spring—Retaining spring for knob 77710
74734	Spring—Retaining spring for channel markers covers 77759, 77760, 77761
78325	Spring—Spring clip for channel marker escutcheon for instruments using KRK29 tuner
74936	Spring—Suspension spring for kinescope socket leads
72936	Stop—Cabinet door stop for Models 21T372, 21T372U, 21T373, 21T373U, 21T374, 21T374U, 21T375, 21T375U
77675	Strap—Top or bottom mounting strap for mounting glass kinescope
75500	Washer—Felt washer for kinescope masking panel mounting screw for wood console instruments

REPLACEMENT PARTS

STOCK No.	DESCRIPTION
	TUNER UNIT ASSEMBLIES KRK29
76539	Board—Antenna matching transformer terminal board less coils and capacitors
78235	Board—Terminal board, 5 contact and ground
78233	Bracket—Side bracket for mounting coil and stators
77853	Capacitor—Ceramic, variable, for fine tuning capacitor—plunger type (C27)
	Capacitor—Adjustable, mica:—
77616	4-40 mmf. (C33)
	Capacitor—Adjustable, steatite:—
77151	0.8—3.0 mmf. (C11, C21, C25)
77913	0.8—3.0 mmf. (C22)
76532	1-4 mmf. (C7)
	Capacitor—Ceramic:—
77084	Feed-thru, 1000 mmf. (C5, C15, C17, C18, C19)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. =0
77865	10 mmf., ±1 mmf., 500 volts (C26, C37)
	Capacitor—Fixed, ceramic, High "K" disc:—
75437	100 mmf., ± 20%, 500 volts (C36)
77293	470 mmf., +100%, −0%, 500 volts (C29, C34, C35)
77252	1000 mmf., +100%, −0%, 500 volts (C8, C9, C14, C20)
73960	10,000 mmf., +100%, −0%, 500 volts (C28)
	Capacitor—Fixed, ceramic, insulated, High "K"
78276	150 mmf., ±10%, 500 volts (C12)
75199	270 mmf., ±20%, 500 volts (C6, C10, C13)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. =0
93056	5 mmf., ±0.5% 500 volts (C2)
54207	18 mmf., ±10%, 500 volts (C1)
70935	27 mmf., ±10%, 500 volts (C3)
76739	33 mmf., ±10%, 500 volts (C4)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = −750
78247	10 mmf., ±10%, 500 volts (C24)
	Capacitor—Fixed, headed-lead:—
71504	0.68 mmf., ±20%, 500 volts (C23)
71502	2.2 mmf., ±20%, 500 volts (C31)
71503	3.3 mmf., ±20%, 500 volts (C32)
	Capacitor—Mica trimmer:—
78397	80-150 mmf. (C16)
77854	Clip—Fine tuning clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T1)
73874	Coil—Channel #6 mixer coil (L48)
73460	Coil—Channel #6 r.f. plate coil (L32)
78401	Coil—Channel #6 antenna coil (L61)
77915	Coil—Channel #13 oscillator coil (L49)
77919	Coil—Channel #13 mixer coil (L36)
77921	Coil—Channel #13 r.f. plate coil (L20)
78224	Coil—Choke coil (.47 muh) (L27)
77206	Coil—Filament choke coil (L33)
76763	Coil—Heater choke coil (L34, L35)
78271	Coil—I.F. input coil complete with adjustable core (L9)
76562	Coil—R.F. amplifier coupling coil (L7)
76537	Coil—Shunt coil complete with adjustable core (L3)
76538	Coil—Shunt coil complete with adjustable core (L2)
	Capacitor—Fixed, ceramic:—
77667	Comprising 1 section of 2 mmf., and 1 section of 22 mmf. (C12, C13)
77621	Crystal holder, 22 mmf., temp. coef. = −750 (C11)
77084	Feed-thru, 1000 mmf. (C21, C23, C25)
77615	Stand-off, 1000 mmf. (C3, C19, C24, C26)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0
77210	2 mmf., ±0.25 mmf., 500 volts (C15)
77688	5 mmf., ±0.5 mmf., 500 volts (C34, C36, C38, C41)
74182	6 mmf., ±0.5 mmf., 500 volts (C5)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = −750
71924	56 mmf., ±10%, 500 volts (C100)
	Capacitor—Fixed, ceramic, High "K" disc:—
77625	220 mmf., +100%, −0%, 500 volts (C18)
77293	470 mmf., +100%, −0%, 500 volts (C43)
77624	680 mmf., +100%, −0%, 500 volts (C4)
77252	1000 mmf., +100%, −0%, 500 volts (C14, C20, C22, C27)
78396	Transformer—Antenna matching transformer complete (T1)
78399	Transformer—Converter transformer (T2, R8)
76540	Trap—FM trap complete with adjustable core (L5)
78466	Trap—IF trap
76542	Trap—IF trap (41.25 mc) complete with core (L1)
76541	Trap—IF trap (45.75 mc) complete with core (L4)
75190	Washer—Insulating washer (neoprene) for capacitor
	TUNER UNIT ASSEMBLIES KRK12A
	Resistor—Fixed, composition:—
503015	15 ohms, ±10%, ½ watt (R19)
503039	39 ohms, ±10%, ½ watt (R18)
503112	120 ohms, ±10%, ½ watt (R2)
503147	470 ohms, ±10%, ½ watt (R14)
503210	1000 ohms, ±10%, ½ watt (R6, R20)
503233	3300 ohms, ±10%, ½ watt (R9)
503268	6800 ohms, ±10%, ½ watt (R1)
523312	12,000 ohms, ±10%, 2 watts (R13)
523315	15,000 ohms, ±10%, 2 watts (R7)
503410	100,000 ohms, ±10%, ½ watt (R3, R10, R11, R12)
503510	1 megohm, ±10%, ½ watt (R4, R5)

STOCK No.	DESCRIPTION
73960	10,000 mmf., +100%, −0%, 500 volts (C17)
	Capacitor—Fixed, headed-lead:—
77691	.33 mmf., ±10%, 500 volts (C33, C35)
77689	.82 mmf., ±10%, 500 volts (C37)
77690	1 mmf., ±10%, 500 volts (C40)
71500	1.5 mmf., ±10%, 500 volts (C39)
78047	2 mmf., ±10%, 500 volts (C42)
77634	Coil—I.F. neutralizing coil (L12)
77628	Coil—I.F. trap (L7)
77629	Coil—Oscillator cathode coil (L9)
77631	Coil—Oscillator heater coil (L14)
77632	Coil—Oscillator heater coil (L15)
78224	Coil—Oscillator plate coil (L11)
77627	Coil—Peaking coil (L6, R11)
77695	Coil—RF plate coil (L8)
77614	Control—Oscillator voltage control (R6)
77617	Control—UHF oscillator injection adjustment control
77489	Rectifier—#1N82 rectifier (CR1)
	Resistor—Fixed, composition:—
503047	47 ohms, ±10%, ½ watt (R16)
503110	100 ohms, ±10%, ½ watt (R10, R17)
503112	120 ohms, ±10%, ½ watt (R2, R9)
503210	1000 ohms, ±10%, ½ watt (R14)
503310	10,000 ohms, ±10%, ½ watt (R12)
503322	22,000 ohms, ±10%, ½ watt (R1)
503410	100,000 ohms, ±10%, ½ watt (R18, R19)
503412	120,000 ohms, ±10%, ½ watt (R5)
503427	270,000 ohms, ±10%, ½ watt (R4)
503447	470,000 ohms, ±10%, ½ watt (R8)
503582	8.2 megohm, ±10%, ½ watt (R3, R7)
77609	Transformer—Mixer I.F. transformer complete with adjustable cores (T1)
77610	Transformer—Primary I.F. link transformer (T2, R15)
77626	Trap—I.F. trap (L1, C1, L2, C2)
	CHASSIS ASSEMBLIES KCS 83—VHF CHASSIS KCS 83B—UHF CHASSIS (CONSOLES) KCS 83E—UHF CHASSIS (TABLES)
	Capacitor—Adjustable, mica:—
78220	5-70 mmf. (C122)
	Capacitor—Fixed, ceramic:—
78225	82 mmf., ±10%, 3500 volts (C144)
76488	500 mmf., 25,000 volts for KCS83, KCS83B (C191)
	Capacitor—Fixed, ceramic, High "K" disc:—
77293	470 mmf., +100%, −0%, 500 volts (C120, C125, C126, C127, C128, C129, C132, C194, C195, C196, C197)
77672	Dual 470 mmf., +100%, −0%, 500 volts (C130A, C130B)
77252	1000 mmf., +100%, −0%, 500 volts (C131)
73960	10,000 mmf., +100%, −0%, 500 volts (C104, C105, C133)
76991	Dual 10,000 mmf., +100%, −0%, 500 volts (C101A, C101B)
	Capacitor—Fixed, ceramic, non-insulated, Temp. Coef. −750
33098	10 mmf., ±1 mmf., 500 volts (C134)
33380	12 mmf., ±10%, 500 volts (C175)
39044	15 mmf., ±5%, 500 volts (C123)
39042	47 mmf., ±5%, 500 volts (C137)
71922	180 mmf., ±10%, 500 volts (C152)
47617	270 mmf., ±10%, 500 volts (C114)
	Capacitor—Fixed, mica:—
76475	68 mmf., ±5%, 1000 volts (C176)
76474	82 mmf., ±5%, 1000 volts (C153)
39636	220 mmf., ±10%, 500 volts (C155)
75248	220 mmf., ±10%, 1000 volts (C143)
78579	270 mmf., ±10%, 1000 volts (C148, C190)
39640	330 mmf., ±10%, 500 volts (C149)
76476	330 mmf., ±5%, 1000 volts (C181)
39644	470 mmf., ±5%, 500 volts (C107, C108)
	Capacitor—Mica trimmer:—
75217	Dual 10-160 mmf. (C174A, C174B)
	Capacitor—Electrolytic:—
78213	Comprising: 1 section of 10 mfd., 350 volts, 1 section of 5 mfd., 350 volts and 1 section of 30 mfd., 50 volts (C124A, C124B, C124C)
77644	Comprising: 1 section of 80 mfd., 400 volts and 1 section of 20 mfd., 400 volts (C119A, C119B)
78212	Comprising: 1 section of 100 mfd., 400 volts and 1 section of 20 mfd., 50 volts (C117A, C117B)
	Capacitor—Fixed, paper, oil impregnated:—
75643	.001 mfd., 1000 volts (C140, C146, C173)
73595	.0022 mfd., 600 volts (C109, C145)
73599	.0027 mfd., 600 volts (C115, C139, C157, C161)
73818	.0027 mfd., 1600 volts (C118)
73796	.0039 mfd., 600 volts (C147, C193)
73920	.0047 mfd., 600 volts (C111, C170)
73808	.0082 mfd., 1000 volts (C156)
73561	.01 mfd., 400 volts (C113, C116)
73565	.01 mfd., 1000 volts (C160)
73797	.015 mfd., 600 volts (C163)
73562	.022 mfd., 400 volts (C179)
73798	.022 mfd., 600 volts (C164, C167)
73810	.022 mfd., 1000 volts (C154)
73552	.033 mfd., 400 volts (C112, C151)
73813	.039 mfd., 1000 volts (C188, C189)
73553	.047 mfd., 400 volts (C178)

STOCK No.	DESCRIPTION
73592	.047 mfd., 600 volts (C138, C162, C168)
73792	.068 mfd., 400 volts (C166)
73551	.1 mfd., 400 volts (C150, C158, C169, C177)
73557	.1 mfd., 600 volts (C141, C183, C186)
73794	.22 mfd., 400 volts (C121)
73786	.27 mfd., 200 volts (C187)
73787	.47 mfd., 200 volts (C110, C142, C180)
	Capacitor—Fixed, moulded paper, mineral oil impregnated:—
76479	.00068 mfd., 600 volts (C184)
76995	.0012 mfd., 600 volts (C185)
78221	.0039 mfd., 600 volts (C159)
73594	.01 mfd., 600 volts (C182)
77676	Choke—Filter choke (L117)
73477	Coil—Filament choke coil (L101, L112, L119)
76442	Coil—Horizontal linearity coil complete with adjustable core (L111)
75253	Coil—Peaking coil (120 muh) (L102)
71529	Coil—Peaking coil (120 muh) (L108, R174)
71526	Coil—Peaking coil (250 muh) (L103)
77674	Coil—Peaking coil (250 muh) (L105, R138)
78222	Coil—Peaking coil (250 muh) (L106, R215)
75252	Coil—Peaking coil (500 muh) (L107)
76640	Coil—RF choke coil (1.5 muh) (L110)
78205	Coil—Width coil complete with adjustable core (L109)
76975	Control—AGC control (R154)
78209	Control—Brightness control (R145)
78206	Control—Height control (R173)
77639	Control—Horizontal hold control (R196)
78208	Control—Picture control, volume control and power switch (R112A, R112B, S102)
78210	Control—Vertical hold control (R172)
78207	Control—Vertical linearity control (R183)
78199	Cover—Hi-voltage compartment cover
78214	Fuse—.3 amps., 250 volts (F101)
76459	Grommet—Rubber grommet for 2nd. anode lead connector
78218	Holder—Fuse holder
78215	Insulator—Polystyrene insulator for hi-voltage socket
78226	Lead—Anode lead complete with eyelet for KCS83, KCS83B
	Resistor—Fixed, wire wound:—
76382	0.82 ohms, 1/3 watts (R210)
76639	180 ohms, 2 watts (R206)
77670	3300 ohms, 7 watts (R106)
77671	3800 ohms, 7 watts (R121)
	Resistor—Fixed, composition:—
502033	33 ohms, ±5%, ½ watt (R127)
503047	47 ohms, ±10%, ½ watt (R107, R205)
502068	68 ohms, ±5%, ½ watt (R128)
503082	82 ohms, ±10%, ½ watt (R101)
503112	120 ohms, ±10%, ½ watt (R136)
502118	180 ohms, ±5%, ½ watt (R131)
503118	180 ohms, ±10%, ½ watt (R144)
503147	470 ohms, ±10%, ½ watt (R133)
513156	580 ohms, ±10%, 1 watt (R116)
503210	1000 ohms, ±10%, ½ watt (R103, R118, R123, R127, R129)
513210	1000 ohms, ±10%, 1 watt (R105)
503215	1500 ohms, ±10%, ½ watt (R146)
523218	1800 ohms, ±10%, 2 watts (R117)
30733	3300 ohms, ±5%, ½ watt (R166)
503233	3300 ohms, ±10%, ½ watt (R188)
502239	3900 ohms, ±5%, ½ watt (R135)
503239	3900 ohms, ±10%, ½ watt (R198)
503247	4700 ohms, ±10%, ½ watt (R167)
503256	5600 ohms, ±10%, ½ watt (R140)
503268	6800 ohms, ±10%, ½ watt (R158)
523268	6800 ohms, ±10%, 2 watts (R207)
512275	7500 ohms, ±5%, 1 watt (R142)
503282	8200 ohms, ±10%, ½ watt (R179)
502310	10,000 ohms, ±5%, ½ watt (R109, R110)
503310	10,000 ohms, ±10%, ½ watt (R157)
523310	10,000 ohms, ±10%, 2 watts (R104)
503312	12,000 ohms, ±10%, ½ watt (R113, R137, R216)
503315	15,000 ohms, ±10%, ½ watt (R122, R189)
502318	18,000 ohms, ±5%, ½ watt (R177)
503318	18,000 ohms, ±10%, ½ watt (R160, R170, R171, R200)
523318	18,000 ohms, ±10%, 2 watts (R139)
502322	22,000 ohms, ±5%, ½ watt (R180)
503322	22,000 ohms, ±10%, ½ watt (R169, R176, R197)
502333	33,000 ohms, ±5%, ½ watt (R181)
503339	39,000 ohms, ±10%, ½ watt (R106, R164)
502343	43,000 ohms, ±5%, ½ watt (R148)
503347	47,000 ohms, ±10%, ½ watt (R134, R163)
512347	47,000 ohms, ±5%, 1 watt (R202)
513347	47,000 ohms, ±10%, 1 watt (R150)
502356	56,000 ohms, ±5%, ½ watt (R126, R130)
503356	56,000 ohms, ±10%, ½ watt (R209)
503368	68,000 ohms, ±10%, ½ watt (R155, R159, R195)
503382	82,000 ohms, ±10%, ½ watt (R194)
503410	100,000 ohms, ±10%, ½ watt (R214)
502415	150,000 ohms, ±5%, ½ watt (R149)
503415	150,000 ohms, ±10%, ½ watt (R190)
512415	150,000 ohms, ±5%, 1 watt (R199)
502418	180,000 ohms, ±5%, ½ watt (R120)
503422	220,000 ohms, ±10%, ½ watt (R186)
503427	270,000 ohms, ±10%, ½ watt (R161, R187, R208)

STOCK No.	DESCRIPTION
503433	330,000 ohms, ±10%, ½ watt (R115, R191, R193)
503439	390,000 ohms, ±10%, ½ watt (R151, R178)
502447	470,000 ohms, ±5%, ½ watt (R185)
503447	470,000 ohms, ±10%, ½ watt (R114, R141, R147, R152, R175, R182)
503468	680,000 ohms, ±10%, ½ watt (R156)
502482	820,000 ohms, ±5%, ½ watt (R184)
503482	820,000 ohms, ±10%, ½ watt (R192, R203)
503510	1 megohm, ±10%, ½ watt (R204)
503512	1.2 megohm, ±10%, ½ watt (R165)
502515	1.5 megohm, ±5%, ½ watt (R119, R124)
512518	1.8 megohm, ±5%, 1 watt (R201)
503522	2.2 megohm, ±10%, ½ watt (R162, R168)
503539	3.9 megohm, ±10%, ½ watt (R132, R153)
503610	10 megohm, ±10%, ½ watt (R111)
78203	Transformer—1st. I.F. pix transformer complete with adjustable core (T104)
76433	Transformer—2nd., 3rd. or 4th. I.F. transformer (T106, T107, T108)
78201	Transformer—Hi-voltage transformer (T115)
76440	Transformer—Horizontal oscillator transformer complete with adjustable core (T114)
76997	Transformer—Output transformer (T103)
78200	Transformer—Power transformer 117 volts, 60 cycle (T113)
77112	Transformer—Ratio detector transformer complete with adjustable core (T102, C106)
76981	Transformer—Sound I.F. transformer complete with adjustable core (T101, C102, C103, R102)
78202	Transformer—Vertical output transformer (T112)
78204	Trap—1st. I.F. grid trap complete with adjustable core (L118)
76983	Trap—4.5 MC trap (L104, C135)
78219	Washer—Vellutex washer for tube socket and shield
	YOKE AND MAGNET ASSEMBLIES
76863	Connector—Anode connector complete with contact and terminal for metal kinescope
75542	Connector—6 contact male connector for deflection yoke (P102)
78309	Cushion—Round rubber cushion for deflection yoke
74956	Cushion—Rubber cushion for deflection yoke hood
78308	Hood—Deflection yoke hood less rubber cushions
76168	Magnet—Focus magnet
76141	Magnet—Ion trap magnet
76633	Magnet—Pin cushion correction magnet complete with support arm for glass kinescope
78307	Plate—Metal plate for deflection yoke
78445	Spring—Grounding spring (coil) for deflection yoke
76310	Strap—Ground strap (formed) for deflection yoke for glass kinescope
76600	Strap—Ground strap (soft copper strip) for metal kinescope
76636	Stud—Adjusting stud complete with guard for focus magnet
76616	Yoke—Deflection yoke complete with 6 contact male connector (L113, L114, L115, L116, P102, C192, R211, R212, R213)
	SPEAKER ASSEMBLIES 971636-1 W RL101C5 RMA-274 (For Model 21T356U)
77000	Speaker—5" P.M. speaker complete with cone and voice coil (3.2 ohms)
	SPEAKER ASSEMBLIES 971490-3 W, 971490-R RL105E6 RMA-274, RMA-285 (For Models 21T383, 21T363U)
75024	Cone—Cone and voice coil for speakers stamped 971490-3W
77129	Cone—Cone and voice coil for speaker stamped 971490-3R
75022	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms)
	SPEAKER ASSEMBLIES 971692-1 (For Models 21T364, 21T364U, 21T365, 21T365U, 21T372, 21T372U, 21T374, 21T374U)
77777	Speaker—10" P.M. speaker complete with cone and voice coil (3.2 ohms)
	SPEAKER ASSEMBLIES 92569-12W RL-111A1 RMA-274 (For Models 21T373, 21T373U, 21T375, 21T375U)
75682	Cone—Cone and voice coil (3.2 ohms)
76093	Speaker—12" P.M. speaker complete with cone and voice coil (3.2 ohms)

NOTE:—If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to Model number of instrument, number stamped on speaker and full description of part required.

Model 17-T-352U "Hayes" Metal-Mahogany Grain

Models 17-T-361, 17-T-361U "Highland" Mahogany, Oak

GENERAL DESCRIPTION

Models 17-T-352U, 17-T-361 and 17-T-361U are "17 inch" television receivers. Models 17-T-352U and 17-T-361U are identical except for cabinets, and speakers. Model 17-T-361 has full 12 channel VHF coverage. Models 17-T-352U and 17-T-361U feature full 12 channel VHF coverage plus any 4 UHF channels desired.

All models include intercarrier FM system; ratio detector; improved picture brilliance; pulsed picture A-G-C; A-F-C horizontal hold; stabilized vertical hold; improved sync separator (3.5 mc. band width for picture channel); and reduced hazard high voltage supply. An auxiliary audio input jack is provided to permit the use of an external record playing attachment.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE....146 square inches on a 17CP4 Kinescope

TELEVISION R-F FREQUENCY RANGE

Model 17-T-361

All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

Models 17-T-352U & 17-T-361U

Any of 70 UHF channels..................470 mc. to 890 mc.

Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

(Any desired combination of 16 UHF and/or VHF channels may be used.)

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency....................45.75 mc.

Sound I-F Carrier Frequency.....................41.25 mc.

POWER RATING........................17-T-361-215 watts
17-T-352U & 17-T-361U-230 watts

AUDIO POWER OUTPUT RATING............4 watts max.

VIDEO RESPONSE.............................To 3.5 mc.

SWEEP DEFLECTION...........................Magnetic

FOCUS.......................................Magnetic

ANTENNA INPUT IMPEDANCE

Model 17-T-361

Choice: 300 ohms balanced or 72 ohms unbalanced.

Models 17-T-352U & 17-T-361U

UHF—300 ohms balanced.
VHF—300 ohms balanced.

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK29 (17-T-361)	
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer
Tuner KRK12B (17-T-352U & 17-T-361U)	
(1) RCA 6BQ7A	R-F Amplifier (VHF only)
(2) RCA 6AF4	R-F Oscillator
(3) RCA 6BQ7A	I-F Amplifier
(4) RCA 6S4	Voltage Control

A 1N82 crystal is used as a mixer.

All Models	
(1) RCA 6CF6	1st Picture I-F Amplifier
(2) RCA 6CF6	2nd Picture I-F Amplifier
(3) RCA 6CB6	3rd Picture I-F Amplifier
(4) RCA 12AU7	Picture 2nd Detector and Vert. Sync. Sep.
(5) RCA 6CL6	Video Amplifier
(6) RCA 6AU6	1st Sound I-F Amplifier
(7) RCA 6AU6	2nd Sound I-F Amplifier
(8) RCA 6AL5	Ratio Detector
(9) RCA 6AV6	1st Audio Amplifier
(10) RCA 6K6GT	Audio Output
(11) RCA 12AU7	Horiz. Sync. Sep. & AGC
(12) RCA 6SN7GT	Vertical Osc. & Sync. Output
(13) RCA 6K6GT	Vertical Sweep Output
(14) RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(15) RCA 6BQ6GT	Horizontal Sweep Output
(16) RCA 6W4GT	Damper
(17) RCA 1B3-GT/8016	High Voltage Rectifier
(18) RCA 17CP4	Kinescope
(19) RCA 5U4G	Rectifier
(20) RCA 5Y3GT	Rectifier

ELECTRICAL AND MECHANICAL SPECIFICATIONS (cont'd)

CHASSIS DESIGNATIONS

KCS78F Model 17-T-361 employing a KRK29 Tuner.

KCS78J Models 17-T-352U and 17-T-361U employing a KRK12B Tuner.

WEIGHT & DIMENSIONS

Model	Shipping Weight	Width Inches	Height Inches	Depth Inches
17-T-352U.... 88 lbs.	105 lbs.	21½	22¾	22
17-T-361..... 87 lbs.	112 lbs.	24¼	35¾	22
17-T-361U... 92 lbs.	117 lbs.	24¼	35¾	22

LOUDSPEAKERS

Model 17-T-352U..... (971636-1) 5" PM Dynamic, 3.2 ohms
Model 17-T-361...... (971490-3) 8" PM Dynamic, 3.2 ohms
Model 17-T-361U..... (971490-3) 8" PM Dynamic, 3.2 ohms

SCANNING............................Interlaced, 525 line

HORIZONTAL SWEEP FREQUENCY............15,750 cps

VERTICAL SWEEP FREQUENCY..................60 cps

FRAME FREQUENCY (Picture Repetition Rate).....30 cps

OPERATING CONTROLS (Front)

Channel Selector / Fine Tuning ....Dual Control Knobs
Picture........................Single Control under Panel
Picture Horizontal Hold ....Single Control under Panel
Picture Vertical Hold ....Single Control under Panel
Sound Volume and On-Off Switch / Brightness .....Dual Control Knobs

NON-OPERATING CONTROLS (under Front Panel)

Height ....screwdriver adjustment
Vertical Linearity ....screwdriver adjustment

NON-OPERATING CONTROLS (not including R-F and I-F adjustments)

Picture Centering ....top chassis adjustment
Width ....rear chassis adjustment
Horizontal Drive ....rear chassis screwdriver adjustment
Horizontal Linearity ....rear chassis adjustment
Horizontal Oscillator Frequency ....rear chassis adjustment
Horizontal Oscillator Waveform...bottom chassis adjustment
Horizontal Locking Range..........rear chassis adjustment
Focus ....top chassis adjustment
Ion Trap Magnet ....top chassis adjustment
Deflection Coil ....top chassis wing nut adjustment
AGC Control ....rear chassis adjustment

Models 27-D-382, 27-D-382U "Swarthmore" Mahogany, Oak

Models 27-D-383, 27-D-383U "Copeland" Mahogany, Walnut

Models 27-D-384, 27-D-384U "Longchamps" Mahogany, Maple

GENERAL DESCRIPTION

Models 27-D-382, 27-D-382U, 27-D-383, 27-D-383U, 27-D-384 and 27-D-384U are Deluxe "27 Inch" television receivers. Models 27-D-382, 27-D-383 and 27-D-384 feature full 12 channel VHF coverage.

Models 27-D-382U, 27-D-383U and 27-D-384U feature full 12 channel VHF coverage plus any 4 UHF channels desired. These receivers have an auxiliary audio input jack to permit the use of an external record playing attachment. All models incorporate two 8" PM speakers.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE ... 420 square inches on a 27MP4 Kinescope

TELEVISION R-F FREQUENCY RANGE
Models 27-D-382, 27-D-383 and 27-D-384
All 12 VHF channels ... 54 mc. to 88 mc., 174 mc. to 216 mc.
Models 27-D-382U, 27-D-383U and 27-D-384U
Any of 70 UHF channels ... 470 mc. to 890 mc.
Any of 12 VHF channels 54 mc. to 88 mc., 174 mc. to 216 mc.
(Any desired combination of 16 UHF and/or VHF channels may be used.)

INTERMEDIATE FREQUENCIES
Picture I-F Carrier Frequency ... 45.75 mc.

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.25	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA Types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
14	471.25	475.75	517

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 1 millivolt per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

DC Milliammeter.—A milliammeter with a range of 0-50 milliamperes full scale.

Adapter Socket.—An adapter socket is required to meter the cathode current of the 6S4 voltage control tube of the KRK12B Tuner. Wiring of adapter is shown in Figure 9.

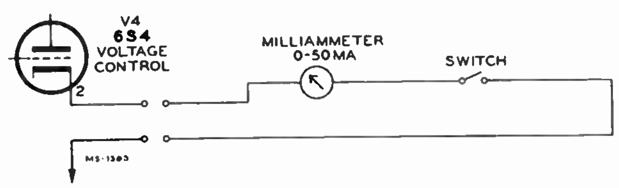

Figure 9—KRK12B Voltage Control Adapter

KRK29B ANTENNA MATCHING UNIT ALIGNMENT.—The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal, especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L5 to the channel selector switch S1-E.

With a short jumper, connect the output of the matching unit through a 1,000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R133 and C133B. Set the potentiometer to produce approximately —5.0 volts of bias at the junction of R133 and C133B.

ALIGNMENT PROCEDURE

Connect an oscilloscope to pin 9, V110 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L4 in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L1 for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L5 to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L5 to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 17 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by retuning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L2 and L3 to obtain the response shown in Figure 10. L3 is most effective in locating the position of the shoulder of the curve at 52 mc. and L2 should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L5 and S1-E. Replace V106.

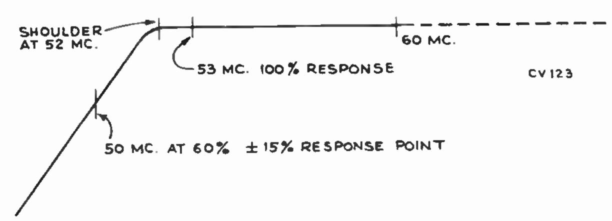

Figure 10—KRK29B Antenna Matching Unit Response

PICTURE I-F TRAP ADJUSTMENT.—Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R133 and C133B.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the positive terminal of one battery to chassis and the potentiometer arm to the junction of R133 and C133B.

Set the bias to produce approximately —1.0 volt of bias at the junction of R133 and C133B.

Connect the "VoltOhmyst" to pin 9 of V110, the 6CL6 video amplifier.

Set the signal generator to each of the following frequencies and adjust the corresponding circuit for minimum d-c output at pin 9 of V110. Use sufficient signal input to produce 1.0 volt of d-c on the meter when the final adjustment is made.

39.25 mc.	T104 top core
41.25 mc.	T105 bottom core
47.25 mc.	T106 bottom core

PICTURE I-F TRANSFORMER ADJUSTMENTS

Models 27-D-382, 27-D-383, 27-D-384

Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 1.0 volt of d-c at pin 9 of V110 with —1.0 volt of i-f bias at the junction of R133 and C133B.

43.7 mc.	T109
45.5 mc.	T108
41.8 mc.	T107

To align T105 and T106, connect the sweep generator to the first picture i-f grid, pin 1 of V106 through a 1,000 mmf. ceramic capacitor. Shunt R137, R141 and terminals "A" and "F" of T109 with 330 ohm composition resistors. Set the i-f bias to —1.0 volt at the junction of R133 and C133B.

Connect the oscilloscope to pin 9 of V110.

Adjust T105 and T106 top cores for maximum gain and curve shape as shown in Figure 11. For final adjustment set the output of the sweep generator to produce 0.5 volt peak-to-peak at the oscilloscope terminals.

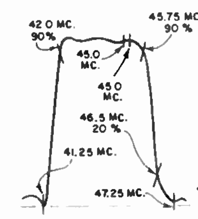

Figure 11—T105 and T106 Response

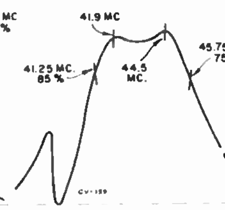

Figure 12—T2 and T104 Response with KRK29B

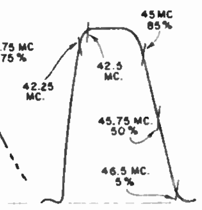

Figure 13—Over-all I-F Response with KRK29B

To align T2 and T104, connect the sweep generator to the mixer grid test point TP2. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R131 and C133A.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C121 across terminals "A" and "B" of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (bottom) for maximum gain at 43.5 mc. and with 45.75 mc. at 70% of maximum response.

Adjust the shunt trimmer C121 until 41.25 mc. is at 85% response with respect to the low frequency shoulder at approximately 41.9 mc. as shown in Figure 12.

Disconnect the diode probe, the 180 ohm and the three 330 ohm resistors.

Models 27-D-382U, 27-D-383U, 27-D-384U

Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 1.0 volt of d-c at pin 9 of V110 with —1.0 volt of i-f bias at the junction of R133 and C133B.

43.7 mc.	T109
45.5 mc.	T108
41.8 mc.	T107

To align T105 and T106, connect the sweep generator to the first picture i-f grid, pin 1 of V106 through a 1,000 mmf. ceramic capacitor. Shunt R137, R141 and terminals "A" and "F" of T109 with 330 ohm composition resistors. Set the i-f bias to —1.0 volt at the junction of R133 and C133B.

Connect the oscilloscope to pin 9 of V110, the 6CL6 video amplifier.

ALIGNMENT PROCEDURE

Adjust T105 and T106 top cores for maximum gain and curve shape as shown in Figure 11. For final adjustment set the output of the VHF sweep generator to produce 0.5 volt peak-to-peak at the oscilloscope terminals.

To align the crystal mixer and T2 and T104, connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1,500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep generator to the tuner case.

Set the channel selector to channel 5.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R131 and C133A.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C121 across terminals "A" and "B" of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (bottom) for maximum gain at 43.5 mc. and with 45.75 mc. at 70% of maximum response.

Adjust the shunt trimmer C121 until 41.25 mc. is at 85% response with respect to the low frequency shoulder at approximately 41.9 mc. as shown in Figure 14. Adjust T1 for maximum gain. Readjust T2 and T104 if necessary to obtain proper wave shape, see Figure 15.

Disconnect the diode probe, the 180 ohm and the three 330 ohm resistors.

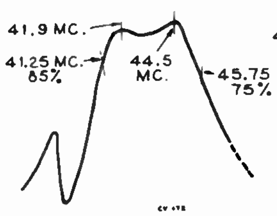

Figure 14—T2 and T104 Response with KRK12B

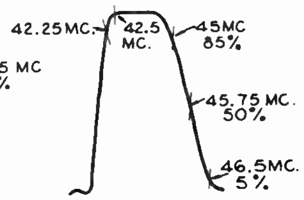

Figure 15—Over-all I-F Response with KRK12B

SWEEP ALIGNMENT OF PICTURE I-F

Connect the oscilloscope to pin 9 of V110.

Adjust the bias potentiometer to obtain —6.0 volts of bias as measured by a "VoltOhmyst" at the junction of R133 and C133B.

Leave the sweep generator connected to the mixer grid test point TP2 on KRK29B Tuners or to the front terminal of the 1N82 crystal holder on KRK12B Tuners. Use the shortest leads possible with not more than one inch of unshielded lead at the end of the sweep cable. If these precautions are not observed, the receiver may be unstable and the response curves obtained may be unreliable.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T108 and T109 to obtain the response shown in Figure 15. Do not adjust T107 unless absolutely necessary. If T107 is adjusted too low in frequency it will raise the level of the 41.25 mc. sound i-f carrier and may create interference in the picture. It will also cause poor adjacent channel picture rejection. If T107 is tuned too high in frequency, the level of the 41.25 mc. sound i-f carrier will be too low and may produce noisy sound in weak signal areas.

Remove the oscilloscope, sweep and signal generator connections.

Remove the bias box employed to provide bias for alignment.

KRK29B TUNER ALIGNMENT

Models 27-D-382, 27-D-383, 27-D-384

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP1 on the side of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

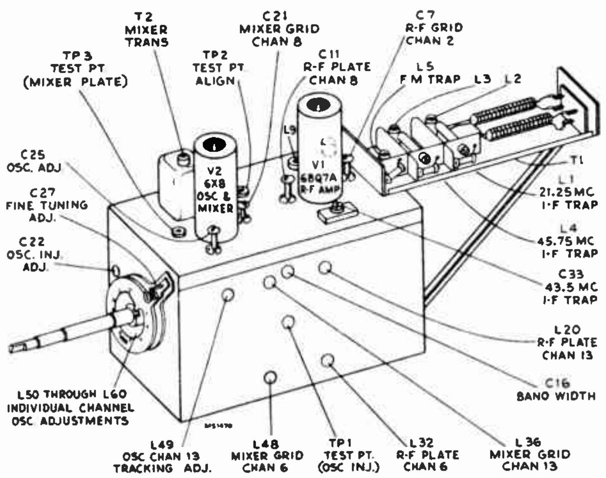

Figure 16—KRK29B Tuner Adjustments

Set the channel selector switch to channel 8.

Preset C22 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

NOTE.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counterclockwise).

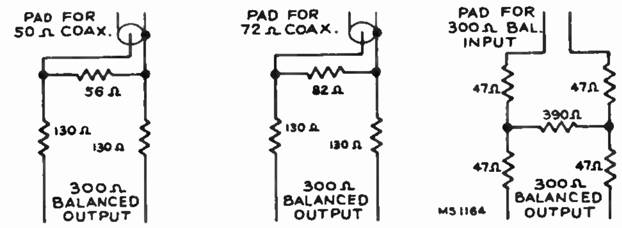

Figure 17—Sweep Attenuator Pads

Connect the sweep generator through a suitable attenuator, as shown in Figure 17 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and bandwidth as shown in Figure 18.

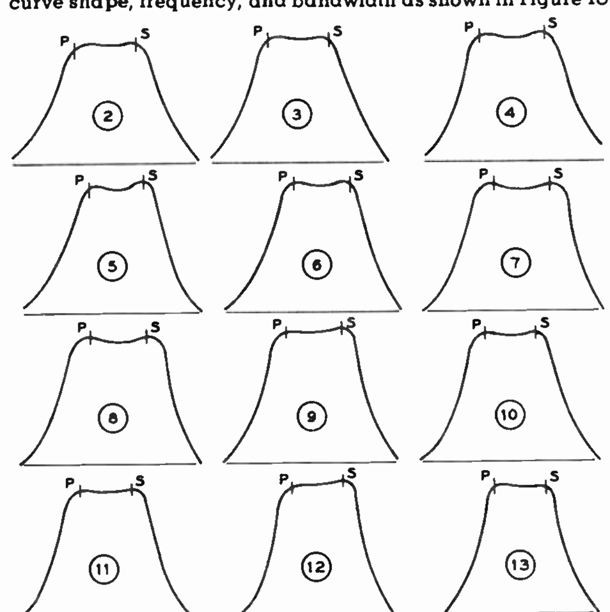

Figure 18—KRK29B R-F Response

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response bandwidth.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in Figure 18.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and bandwidth.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency, 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L48 and L32 for proper curve shape as shown in Figure 18. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See Figure 18 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to Figure 18 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

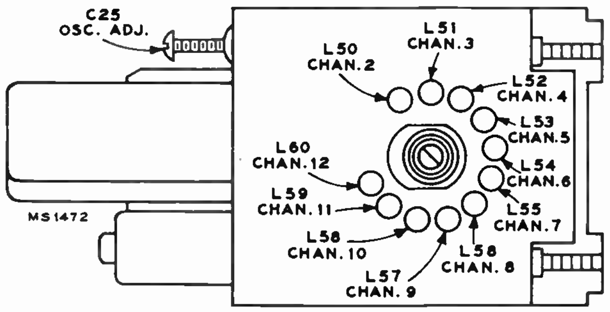

Figure 19—KRK29B R-F Oscillator Adjustments

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

KRK12B TUNER ALIGNMENT

Models 27-D-382U, 27-D-383U, 27-D-384U

TUNER VHF ALIGNMENT.—Remove the 6S4 voltage control tube from its socket and insert the adapter. Insert the 6S4 in the adapter.

Connect the 0-50 milliampere meter to the adapter socket leads and turn the adapter switch on.

Remove the tuner cover shield.

Rotate the channel selector to a point midway between channels, disengaging the insert contacts, and observe the non-oscillating plate current. Some tubes may oscillate even with the tuned circuits disengaged. To be sure the oscillator is in a non-oscillatory state, short circuit the spring contacts 12 and 13, the two contacts nearest the tuner front.

(NOTE: The contacts are at zero d-c potential.) Should the plate current rise, keep the contacts shorted while adjusting the oscillator plate current. Adjust R6, oscillator voltage control, for a 28 milliampere reading on the meter.

Replace the tuner cover shield.

Connect the VHF sweep generator to the antenna terminals.

Connect the VHF signal generator loosely to the antenna terminals.

Connect the oscilloscope through the preamplifier, if needed with oscilloscope used, to test point TP1.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Turn off the adapter switch, removing plate voltage from the oscillator. This is required because of RF-IF interaction when a crystal is used as a mixer.

Set the channel selector and the sweep generator to channel 2.

Insert markers of channel 2 picture carrier and sound carrier, 55.25 mc. and 59.75 mc.

Adjust antenna T6, r-f amplifier plate L29 and mixer L30 adjustments for a symmetrical curve with maximum gain at the center of the pass band. The curves will have a deep valley because of no crystal loading and nonlinear detector characteristics. The limits for the 100% response points are shown in Figure 20. The proper curve shape is shown in Figure 20(b). (Refer to note on page 15 for detailed explanation of adjustments.) If the bandwidth is out of tolerance, it can usually be corrected by redressing the coupling capacitor of the double tuned circuit, C40 on insert A. Maximum bandwidth occurs when the capacitor is centered in the insert chamber.

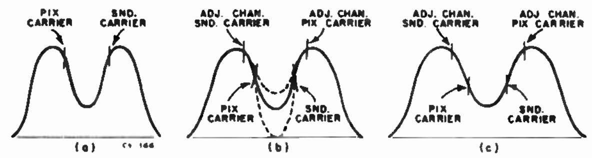

Figure 20—KRK12B VHF Insert Responses

Repeat the above steps for all VHF channels adjusting the appropriate antenna, r-f amplifier plate and mixer slugs for a symmetrical curve with maximum gain at the center of the pass band.

Turn off the sweep generator.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Turn the AGC control fully clockwise and remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Connect the potentiometer arm of the second bias supply to the junction R133 and C133B, and ground the positive battery terminal. Adjust the bias potentiometer to produce —5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to pin 9 of V110. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to channel 13.

Set the fine tuning control to the center of its range.

Adjust the oscillator slug L22 to proper frequency, 257 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 257 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner through either of the two holes next to the oscillator tube on the right front top corner of the tuner. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust L22 oscillator slug to obtain an audio beat with the signal generator.

Turn on the sweep generator and set to channel 13. Adjust T1 for maximum gain on the oscilloscope. Adjust mixer tank circuit L21 for maximum gain and flat-topped curve. Recheck T1 for maximum gain at center of band with the proper response. Maximum gain and flat-topped response should be obtained simultaneously.

Adjust the oscillator to frequency on all VHF channels by switching the receiver and signal generator to each VHF channel and adjusting the appropriate oscillator slug to obtain a beat with the signal generator. Adjust the appropriate mixer slug where necessary to obtain maximum gain and proper curve shape as explained above.

Adjust the tunable I-F Trap C16-L7. To do this connect the signal generator to the fixed I-F Trap C2-L2 at the end opposite the antenna terminal plug. Set the signal generator to 43.5 mc. and adjust the output of the signal generator to obtain sufficient indication on the oscilloscope. Tune the I-F Trap C16-L7 for minimum marker indication on the oscilloscope.

Remove the signal generator and the oscilloscope.

ALIGNMENT PROCEDURE

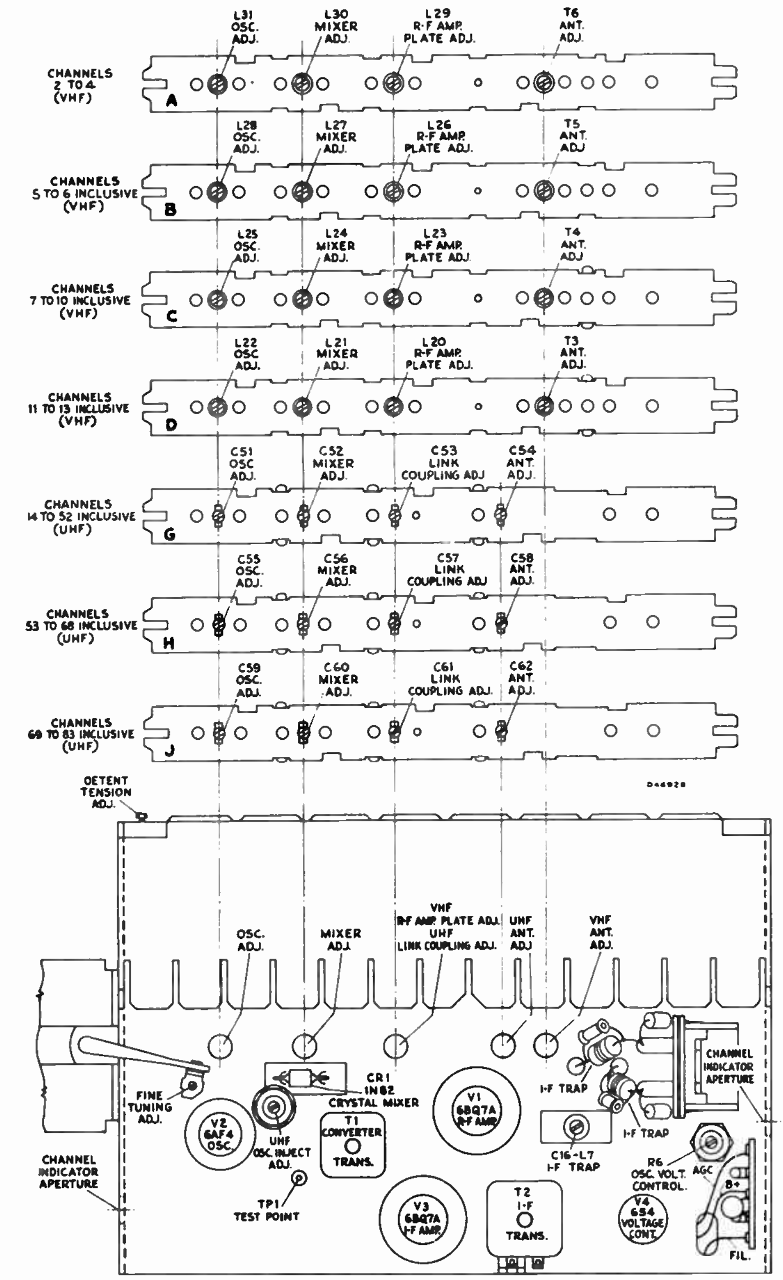

Figure 21—KRK12B Tuner Adjustments

TUNER UHF ALIGNMENT.—To align the UHF inserts:

Turn off the adapter switch, removing plate voltage from the oscillator.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Connect the UHF sweep generator to the antenna terminals. Use a 10 DB attenuator pad to assure proper alignment.

Connect the UHF signal generator loosely to the antenna terminals.

Set the channel selector to the desired position and the sweep generator to sweep the frequency of the insert being used.

Insert markers of the picture carrier and sound carrier frequencies for the desired channel (see Table on page 8).

Adjust the UHF antenna, link coupling and mixer adjustments for a symmetrical curve, with maximum gain, centered about the pass band.

The responses are shown in Figure 22. The curve shape will usually vary from Figure 22 (a) to Figure 22 (c) going higher in frequency; however, any of these responses are acceptable.

Repeat the above steps for all UHF inserts used, adjusting the appropriate antenna, link coupling and mixer slugs for a symmetrical curve, with maximum gain, centered about the pass band.

Remove the oscilloscope and preamplifier, if used, from test point TP1.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal.

Connect the potentiometer arm of the second bias supply to the junction of R133 and C133B, and ground the positive battery terminal. Adjust the bias potentiometer to produce —5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to pin 9 of V110. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to the lowest UHF channel to be used, and set the fine tuning control to the center of its range.

Adjust the oscillator core to proper frequency. To do this, connect the VHF signal generator to test point TP1 with the shortest leads possible. Insert a 45.75 mc. marker from the VHF generator.

Set the UHF sweep generator to sweep the desired channel, and observe the output on the oscilloscope. If the sweep generator is not sweeping the correct frequency range, it may be necessary to readjust the sweep in order to place the 45.75 marker on the response curve as in Figure 15.

Set the UHF marker generator to the picture carrier of the chonnel insert being adjusted and connect to test point TP1.

Adjust the oscillator core until the markers for 45.75 mc. and the picture carrier coincide on the sweep pattern on the oscilloscope.

Adjust the mixer core for maximum gain with proper wave shape.

Connect the "VoltOhmyst" to test point TP1, using 1.5 volt DC scale.

Set oscillator injection adjustment to read .1 volt on the "VoltOhmyst."

Repeat the above steps for all UHF inserts adjusting the oscillator injection control only if the reading on the "Volt-

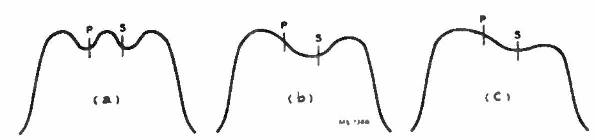

Figure 22—KRK12B UHF Insert Responses

ALIGNMENT PROCEDURE

Ohmyst" exceeds .3 volt. Adjust as necessary to read .3 volt or less at TP1.

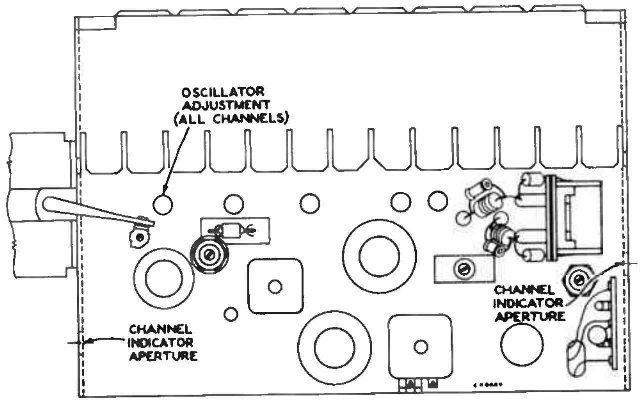

Figure 23—KRK12B Oscillator Adjustment

RATIO DETECTOR ALIGNMENT.—In order to obtain good ratio detector alignment an AM modulated signal generator that is exceptionally free from FM modulation must be employed. Set the signal generator at 4.5 mc. and connect it to the second sound i-f grid, pin 1 of V102. Set the generator for 30% 400 cycle modulation.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. If used, connect it to the grid of the 4th pix i-f amplifier, pin 1, V109. Set the frequency of the calibrator to 45.75 (pix carrier) and modulate with 4.5 mc. crystal. Also turn on the internal AM audio modulation. The 4.5 mc. signal will be picked off at T110A and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to the junction of R111 and C111.

Connect the oscilloscope across the speaker voice coil and turn the volume control for maximum output.

Tune the ratio detector primary, T102 top core for maximum DC output on the "VoltOhmyst." Adjust the signal level from the signal generator for —10 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R110 and C110.

Adjust the T102 bottom core for zero d-c on the meter. Then, turn the core to the nearest minimum AM output on the oscilloscope.

Repeat adjustments of T102 top for maximum DC and T102 bottom for minimum output on the oscilloscope making final adjustment with the 4.5 mc. input level adjusted to produce 10 volts d-c on the "VoltOhmyst" at the junction of R111 and C111.

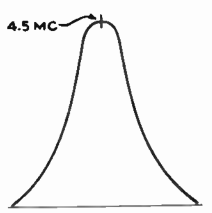

Figure 24—Sound I-F Response

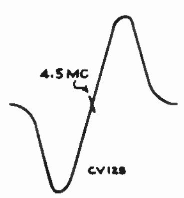

Figure 25—Ratio Det. Response

Connect the "VoltOhmyst" to the junction of R110 and C110 and note the amount of d-c present. If this voltage exceeds ±1.5 volts, adjust R108 by turning it in until zero d-c is obtained. Readjust the T102 bottom core for minimum output on the oscilloscope. Repeat adjustments of R108 and T102 bottom core until the voltage of R110 and C110 is less than ±1.5 volts when T102 bottom core is set for minimum output on the oscilloscope.

Connect the "VoltOhmyst" to the junction of R111 and C111 and repeak T102 top core for maximum d-c on the meter and again reset the generator so as to have —10 volts on the meter.

Repeat the adjustments in the above two paragraphs until the voltage at R110 and C110 is less than ±1.5 volts when the T102 top core is set for maximum d-c at the junction of R111 and C111 and the T102 bottom core is set for minimum indication on the oscilloscope.

SOUND I-F ALIGNMENT.—Connect the sweep generator to the first sound i-f amplifier grid, pin 1 of V101. Adjust the generator for a sweep width of 1 mc. at a center frequency of 4.5 mc.

Insert a 4.5 mc. marker signal from the signal generator into the first sound i-f grid. With the WR39B or WR39C calibrators the 4.5 mc. crystal signal may be obtained at the R-F out terminal by turning the variable osc. switch off, the calibrate switch to 4.5 mc. and the volume control with mod. off.

Connect the oscilloscope in series with a 10,000 ohm resistor to terminal A of T101.

Adjust T101 top and bottom cores for maximum gain and symmetry about the 4.5 mc. marker on the i-f response. The pattern obtained should be similar to that shown in Figure 24.

The output level from the sweep should be set to produce approximately 2.0 volt peak-to-peak at terminal A of T101 when the final touches on the above adjustment are made. It is necessary that the sweep output voltage should not exceed the specified values otherwise the response curve will be broadened, permitting slight misadjustment to pass unnoticed and possibly causing distortion on weak signals.

Connect the oscilloscope to the junction of R110 and C110 and check the linearity of the response. The pattern obtained should be similar to that shown in Figure 25.

SOUND TAKE-OFF ALIGNMENT.—Connect the 4.5 mc. generator in series with a 1,000 ohm resistor to terminal "C" of T110. The input signal should be approximately 0.5 volt.

Short the fourth pix i-f grid to ground, pin 1, V109, to prevent noise from masking the output indication.

As an alternate source of signal the RCA WR39B or WR39C calibrator may be used. In such a case, disregard the above two paragraphs. Connect calibrator across link circuit, T104 A, B, and modulate 45.75 with 4.5 mc. crystal.

Connect the crystal diode probe of a "VoltOhmyst" to the plate of the video amplifier, pin 6 of V110.

Adjust the core of T110 for minimum output on the meter.

Remove the short from pin 1 V109 to ground, if used.

HORIZONTAL OSCILLATOR ADJUSTMENT.—Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

ALIGNMENT PROCEDURE

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R210, then adjust the T114 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T114 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T114 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C186B, the width control L109 and the linearity control L111 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T114 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T114 frequency core (on the rear apron) until the picture falls out of sync and one diagonal black bar sloping down to the right appears on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain one diagonal black bar on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T114 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture begins to fall out of sync with the diagonal bar sloping down to the right. Continue to turn the frequency core in the same direction. Additional bars should not appear on the screen. Instead, the horizontal oscillator should begin to motorboat. Retouch the adjustment of the T114 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T114. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 26. Adjust the waveform adjustment core of T114 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

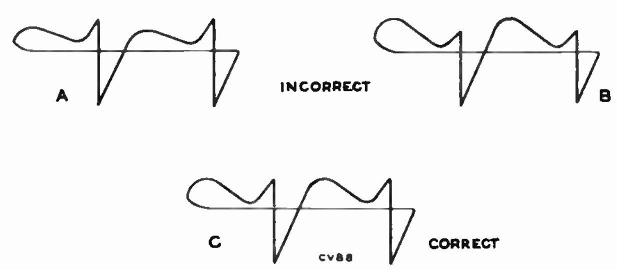

Figure 26—Horizontal Oscillator Waveforms

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counterclockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C186A slightly clockwise. If less than 2 bars are present, adjust C186A counterclockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T114 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves off the screen leaving the picture in synchronization.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

RESPONSE CURVES.—The response curves shown and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, some variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

NOTE ON KRK12B TUNER ALIGNMENT.—The use of a crystal mixer in the KRK12B Tuner makes it necessary to observe the insert responses with the oscillator disabled. This is due to undesirable r-f/i-f interaction if the oscillator was allowed to operate during alignment. Therefore, the responses shown in Figure 20 are not a strictly true representation of the insert band pass during actual operation. When an insert is aligned, using an oscilloscope to observe the response, the curve shown in Figure 20(b) will be the correct response for reference. In actual operation, the band pass will be such that the sound and picture carriers will be at the tips of the curve. The adjacent channel picture and sound carriers will be in the valleys at each side. Care should be taken not to exceed the limits shown in Figures 20(a) and 20(c).

The valley, in the center of the response curve, may vary from 0 to 50% above the base line for VHF inserts. Adjust the output level of the sweep generator to prevent excessive signal input to the tuner. Excessive signal input will be indicated by the valley rising above the 50% level, particularly on the higher VHF channels.

Oscillator injection voltage is not adjusted on VHF inserts. A check may indicate variations from .08 to .3 volts at TP1 but such readings should not be interpreted as an indication of trouble. On UHF channels, however, the injection voltage should be adjusted to fall within the specified limits.

ALIGNMENT DATA

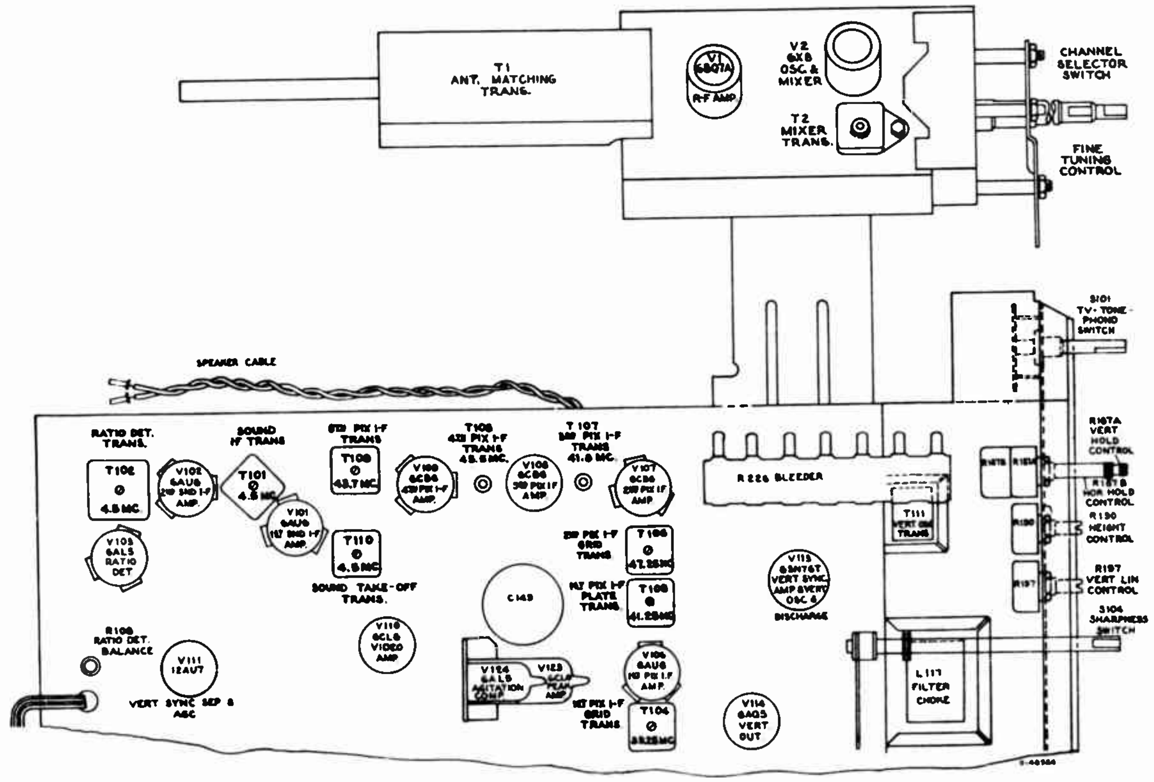

Figure 27—Top Chassis Adjustments (KRK29B Tuner Shown)

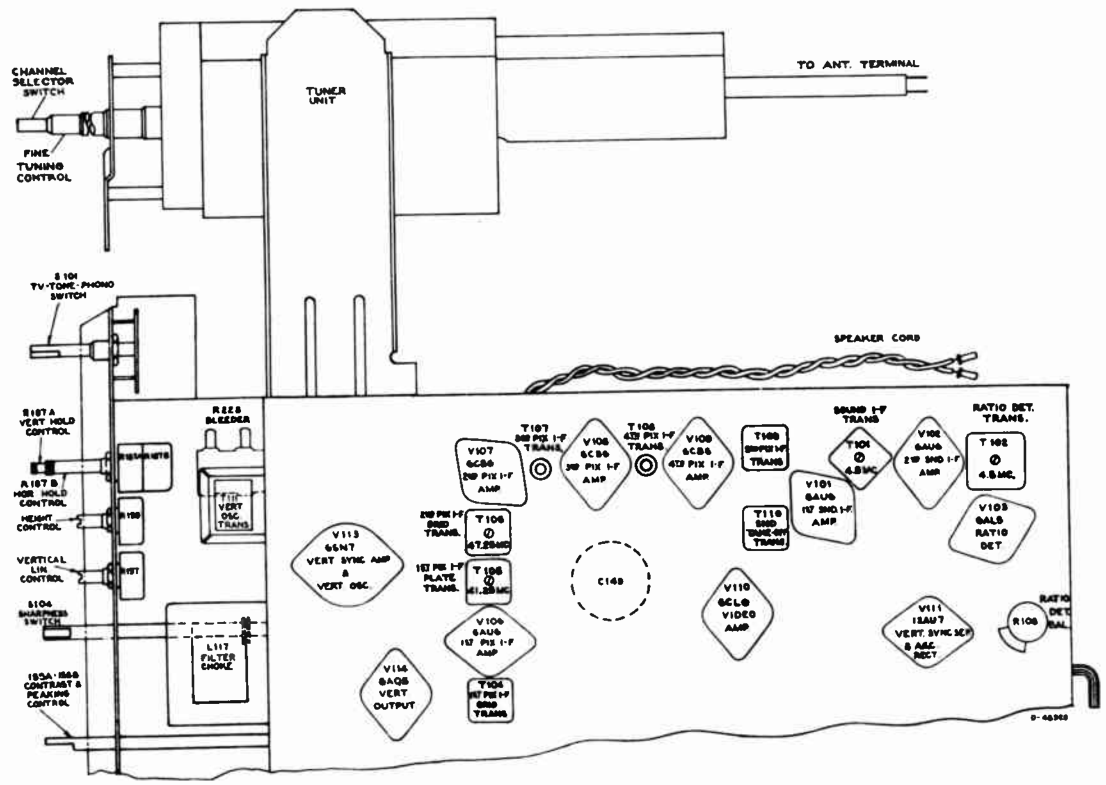

Figure 28—Bottom Chassis Adjustments (KRK29B Tuner Shown)

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 5000 microvolt test pattern signal was fed into the receiver, the picture synchronized and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c.

77616	4-40 mmf. (C33)
	Capacitor—Adjustable, steatite:—
77151	0.8-3.0 mmf. (C11, C21, C25)
77913	0.8-3.0 mmf. (C22)
76532	1-4 mmf. (C7)
	Capacitor—Ceramic:—
77084	feed-thru, 1000 mmf. (C5, C15, C17, C18, C19)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0
77865	10 mmf., ±1 mmf., 500 volts (C26, C37)
	Capacitor—Fixed, ceramic, High "K" disc:—
77293	470 mmf., ±100%, —0%, 500 volts (C29, C34, C35)
77252	1000 mmf., ±100%, —0%, 500 volts (C8, C9, C14)
73960	10,000 mmf., ±100%, —0%, 500 volts (C28)
	Capacitor—Fixed, ceramic, insulated, High "K":—
75437	100 mmf., ±20%, 500 volts (C36)
78276	150 mmf., ±10%, 500 volts (C12)
75199	270 mmf., ±20%, 500 volts (C6, C10, C13)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0
93056	5 mmf., ±0.5 mmf., 500 volts (C2)
54207	18 mmf., ±10%, 500 volts (C1)
70935	27 mmf., ±10%, 500 volts (C3)
76739	33 mmf., ±10%, 500 volts (C4)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750
78247	10 mmf., ±10%, 500 volts (C24)
	Capacitor—Fixed, ceramic, Temp. coef. —N1400
78603	82 mmf., ±10%, 500 volts (C20)
	Capacitor—Fixed, headed-lead:—
71504	0.68 mmf., ±20%, 500 volts (C23)
71502	2.2 mmf., ±20%, 500 volts (C31, C39)
71503	3.3 mmf., ±20%, 500 volts (C38)
	Capacitor—Mica trimmer:—
78397	80-150 mmf. (C16)
77854	Clip—Fine tuning clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T1)
73874	Coil—Channel #6 mixer coil (L48)
73460	Coil—Channel #6 r. f. plate coil (L32)
73458	Coil—Channel #6 r. f. grid coil (L14)
78401	Coil—Channel #6 antenna coil (L61)
77915	Coil—Channel #13 oscillator coil (L49)
77919	Coil—Channel #13 mixer coil (L36)
77921	Coil—Channel #13 r. f. plate coil (L20)
77206	Coil—Filament choke coil (L33)
76763	Coil—Heater choke coil (L34, L35)
78271	Coil—I.F. input coil complete with adjustable core (L9)
78583	Coil—Mixer I.F. coil (L43)
76562	Coil—R.F. amplifier coupling coil (L7)
78584	Coil—R.F. plate I.F. coil (L27)
76537	Coil—Shunt coil complete with adjustoble core (L3)
76538	Coil—Shunt coil complete with adjustable core (L2)
	Resistor—Fixed, composition:—
503033	33 ohms, ±10%, ½ watt (R19)
503112	120 ohms, ±10%, ½ watt (R2)
503147	470 ohms, ±10%, ½ watt (R14)
503210	1000 ohms, ±10%, ½ watt (R6, R20)
503233	3300 ohms, ±10%, ½ watt (R9)
503268	6800 ohms, ±10%, ½ watt (R1)
523312	12,000 ohms, ±10%, 2 watts (R13)
523315	15,000 ohms, ±10%, 2 watts (R7)
503410	100,000 ohms, ±10%, ½ watt (R3, R10, R11, R12)
503510	1 megohm, ±10%, ½ watt (R4, R5)
78396	Transformer—Antenna matching tronsformer complete (T1)
78399	Transformer—Convertor transformer (T2, R8)
76540	Trap—F.M. trap complete with adjustable core (L5)
78466	Trap—I.F. trap
76542	Trap—I.F. trap (41.25 MC) complete with core (L1)
76541	Trap—I.F. trop (45.75 MC) complete with core (L4)
75190	Wosher—Insuloting washer (neoprene) for capacitor
	R.F. UNIT ASSEMBLIES KRK12B
	Capacitor—Ceramic:—
77084	feed-thru, 1000 mmf. (C21, C23, C25)
77615	stand-off, 1000 mmf. (C3, C19, C24, C26)
	Capacitor—Fixed, ceramic, crystal holder, Temp. coef. = —750
77621	22 mmf., ±10% (C11)
	Capacitor—Fixed, ceramic, High "K" disc:—
77625	220 mmf., +100%, —0%, 500 volts DC (C18)
77293	470 mmf., +100%, —0%, 500 volts DC (C43)
77624	680 mmf., +100%, —0%, 500 volts DC (C4)
77252	1000 mmf., +100%, —0%, 500 volts DC (C14, C20, C22, C27)
73960	10,000 mmf., +100%, —0%, 500 volts DC (C17)
	Capacitor—Fixed, ceramic, insulated:—
77667	comprising: 1 section of 2 mmf., and 1 section of 22 mmf. (C12, C13)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0
77210	2 mmf., ±0.25 mmf., 500 volts DC (C15)
77688	5 mmf., ±.5 mmf., 500 volts DC (C34, C36, C38, C41)
74182	6 mmf., ±0.5 mmf., 500 volts DC (C5)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750
71924	56 mmf., ±10%, 500 volts DC (C10)
	Capacitor—Fixed, headed-lead type:—
77691	.33 mmf., ±10%, 500 volts DC (C33, C35)
77689	.82 mmf., ±10%, 500 volts DC (C37)
77690	1.0 mmf., ±10%, 500 volts DC (C40)
71500	1.5 mmf., ±10%, 500 volts DC (C39)
78047	2 mmf., ±10%, 500 volts DC (C42)
77628	Coil—I.F. trap (L7)
77634	Coil—I.F. neutralizing coil (L12)
77629	Coil—Oscillator cathode coil (L9)
77632	Coil—Oscillator heater coil (L15)
77631	Coil—Oscillator heater coil (L14)
78224	Coil—Oscillator plate coil (L11)
77627	Coil—Peaking coil (L6, R11)
77695	Coil—R.F. plate coil (L8)
77489	Rectifier—Germanium rectifier IN82 (CR1)
	Resistor—Fixed, composition:—
503047	47 ohms, ±10%, ½ watt (R16)
503110	100 ohms, ±10%, ½ watt (R10, R17)
503112	120 ohms, ±10%, ½ watt (R2, R9)
503210	1000 ohms, ±10%, ½ watt (R14)
503310	10,000 ohms, ±10%, ½ watt (R12)
503322	22,000 ohms, ±10%, ½ watt (R1)
503410	100,000 ohms, ±10%, ½ watt (R18, R19)
503412	120,000 ohms, ±10%, ½ watt (R5)
503427	270,000 ohms, ±10%, ½ watt (R4)
503447	470,000 ohms, ±10%, ½ watt (R8)
503582	8.2 megohm, ±10%, ½ watt (R3, R7)
77609	Transformer—Mixer I.F. transformer complete with adjustable cores (T1)
77610	Transformer—Primary I.F. link transformer complete with adjustable cores (T2, R15)
77626	Trap—I.F. trap (L1, C1, L2, C2)
77585	Washer—"C" washer for drive and indicator shafts (3 req'd) or for link spring
	CHASSIS ASSEMBLIES KCS77C—VHF Chassis KCS77D—UHF Chassis KCS77F—VHF Chassis KCS77H—UHF Chassis
78238	Cap—Tube connector cap
	Capacitor—Ceramic:—
76488	500 mmf., 30,000 volts (C201)
75166	Stand-off, 1500 mmf. (C144)
	Capacitor—Fixed, ceramic:—
76009	8.2 mmf., 5000 volts (C212)
76574	39 mmf., 3500 volts (C180)
77836	82 mmf., 6000 volts (C198)
76576	150 mmf., 2000 volts (C200)
76575	180 mmf., 3500 volts (C199)
	Capacitor—Fixed, ceramic, High "K" disc:—
77293	470 mmf., +100%, —0%, 500 volts DC (C225)
77624	680 mmf., +100%, —0%, 500 volts DC (C218)
73748	1500 mmf., +100%, —0%, 500 volts DC (C209, C226)
77953	2200 mmf., +10%, —0%, 500 volts DC (C220)
73473	4700 mmf., +100%, —0%, 500 volts DC (C126, C128, C130, C136, C138, C141)
76470	Dual 4700 mmf., +100%, —0%, 500 volts DC (C133A, C133B, C137A, C137B, C139A, C139B, C140A, C140B)
73960	10,000 mmf., +100%, —0%, 500 volts DC (C145, C146)
75877	Dual 10,000 mmf., +100%, —0%, 500 volts DC (C101A, C101B, C105A, C105B)
	Capacitor—Fixed, ceramic, insulated, High "K" type:—
77838	270 mmf., ±10%, 500 volts DC (C221)
75198	470 mmf., ±10%, 500 volts DC (C222)
77923	1200 mmf., ±10%, 500 volts DC (C223)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750
39044	15 mmf., ±10%, 500 volts DC (C152)
39042	47 mmf., ±10%, 500 volts DC (C151, C219)
71924	56 mmf., ±10%, 500 volts DC (C104)
39396	100 mmf., ±10%, 500 volts DC (C168, C169, C172)
71614	120 mmf., ±10%, 500 volts DC (C167)
47617	270 mmf., ±10%, 500 volts DC (C115)
	Capacitor—Fixed, mica:—
76474	82 mmf., 1000 volts DC (C165, C187)
75248	220 mmf., 1000 volts DC (C181)
39638	270 mmf., 500 volts DC (C161)
76579	270 mmf., 1000 volts DC (C164, C192)
39640	330 mmf., 500 volts DC (C159)
39644	470 mmf., 500 volts DC (C108, C109)
	Capacitor—Mica trimmer:—
71496	5-70 mmf. (C121)
75217	Dual 10-160 mmf. (C186A, C186B)
	Capacitor—Electrolytic:—
74521	5 mfd., 50 volts (C111)
28417	5 mfd., 450 volts (C175)

REPLACEMENT PARTS (Continued)

STOCK No.	PART DESCRIPTION
77819	Comprising:—1 section of 40 mfd., 400 volts, 1 section of 35 mfd., 400 volts, 2 sections of 10 mfd., 400 volts (C120A, C120B, C120C, C120D)
77817	Comprising:—1 section of 50 mfd., 400 volts, 1 section of 25 mfd., 400 volts, 1 section of 100 mfd., 50 volts and 1 section of 20 mfd., 25 volts (C118A, C118B, C118C, C118D)
77820	Comprising:—1 section of 90 mfd., 400 volts, 1 section of 10 mfd., 400 volts and 1 section of 5 mfd., 400 volts (C149A, C149B, C149C)
	Capacitor—Fixed, tubular, paper, oil impregnated:—
75643	.001 mfd., 1000 volts (C194)
76508	.0015 mfd., 600 volts (C112)
73802	.0015 mfd., 1000 volts (C177)
73595	.0022 mfd., 600 volts (C110, C119)
73599	.0027 mfd., 600 volts (C116, C156)
73920	.0047 mfd., 600 volts (C158, C166, C182)
73789	.0068 mfd., 400 volts (C213)
73808	.0082 mfd., 1000 volts (C148, C162)
73561	.01 mfd., 400 volts (C114, C117, C170, C202)
73562	.022 mfd., 400 volts (C179)
78311	.027 mfd., 1000 volts (C178)
73552	.033 mfd., 400 volts (C113, C163, C189)
73813	.039 mfd., 1000 volts (C203, C205)
73553	.047 mfd., 400 volts (C160, C188, C190)
73592	.047 mfd., 600 volts (C176)
73551	0.1 mfd., 400 volts (C183, C214)
73557	0.1 mfd., 600 volts (C173, C204)
77839	0.18 mfd., 200 volts (C174)
73794	0.22 mfd., 400 volts (C129, C153, C155, C157, C208, C210)
74957	0.22 mfd., 600 volts (C197)
73787	0.47 mfd., 200 volts (C191, C196, C211)
	Capacitor—Fixed, tubular, moulded paper, oil impregnated:—
76995	.0012 mfd., 600 volts (C195)
73920	.0047 mfd., 600 volts (C171)
73594	.01 mfd., 600 volts (C184, C185, C193)
77824	Choke—Filter choke (L117)
76143	Clip—Mounting clip for stand-off capacitor
73477	Coil—Choke coil (L101)
76672	Coil—Filament winding only for hi-voltage transformer (Part of T115)
78197	Coil—Horizontal linearity coil complete with adjustable core (L111)
77842	Coil—Peaking coil (72 muh) (L122)
77841	Coil—Peaking coil (150 muh) (L119, R244, L120, R240)
77840	Coil—Peaking coil (150 muh) (L118, R241)
76647	Coil—Peaking coil (180 muh) (L107, R158)
75252	Coil—Peaking coil (500 muh) (L104, L106)
76640	Coil—R.F. choke coil (1.5 muh) (L110, L112)
78598	Coil—R.F. choke coil (6.8 muh) (L108)
76484	Coil—Width coil complete with adjustable core (L109)
74594	Connector—2 contact male connector for power cord
76457	Connector—2nd anode lead connector
50367	Connector—6 contact female connector for yoke leads (J102)
35787	Connector—Phono input connector (J101)
75474	Connector—Single contact male connector for speaker cable
77654	Control—AGC control (R180)
77655	Control—Brightness control, volume control and power switch (R114A, R114B, S102)
77640	Control—Height control (R190)
77826	Control—Horizontal and vertical hold control (R187A, R187B)
77818	Control—Picture and peaking control (R155A, R155B)
77199	Control—Ratio detector balance control (R108)
77643	Control—Vertical linearity control (R197)
78627	Coupling—Coupling (metal) for definition switch
77647	Coupling—Coupling (nylon) for picture control
77138	Cover—Back cover for hi-voltage compartment
78487	Cover—Side cover for hi-voltage compartment
73600	Fuse—0.25 amp., 250 volts (F101)
76459	Grommet—Rubber grommet for 2nd anode lead exit
76480	Lead—Anode lead complete with eyelet
77829	Link—Link assembly for definition switch shafts
77634	Plate—Bakelite plate for mounting picture control and definition switch
78485	Plate—Hi-voltage plate (bakelite) complete less corona ring, transformer and socket
76675	Rectifier—Picture detector crystal rectifier (CR101)
76468	Resistor—Wire wound, 1.5 ohms, 1/3 watt (R225)
77835	Resistor—Wire wound, 100 ohms, 4 watts (R221)
77825	Resistor—Wire wound comprising:—1 section of 335 ohms, 16 watts, 1 section of 375 ohms, 8 watts, 1 section of 1400 ohms, 7 watts, 1 section of 600 ohms, 2 watts, and 1 section of 10,000 ohms, 5 watts (R228A, R228B, R228C, R228D, R228E)

STOCK No.	PART DESCRIPTION
78223	Resistor—Wire wound, 400 ohms, 10 watts (R224)
76642	Resistor—Wire wound, 6750 ohms, 10 watts (R153)
	Resistor—Fixed, composition:—
503010	10 ohms, ±10%, ½ watt (R256)
503033	33 ohms, ±10%, ½ watt (R152)
503047	47 ohms, ±10%, ½ watt (R107, R218)
502056	56 ohms, ±5%, ½ watt (R134)
502068	68 ohms, ±5%, ½ watt (R138)
502082	82 ohms, ±5%, ½ watt (R101)
503082	82 ohms, ±10%, ½ watt (R249)
502110	100 ohms, ±5%, ½ watt (R128)
503115	150 ohms, ±10%, ½ watt (R253)
503118	180 ohms, ±10%, ½ watt (R142, R243)
503122	220 ohms, ±10%, ½ watt (R151)
503139	390 ohms, ±10%, ½ watt (R245)
513139	390 ohms, ±10%, 1 watt (R118)
503147	470 ohms, ±10%, ½ watt (R199)
503156	560 ohms, ±10%, ½ watt (R198)
503210	1000 ohms, ±10%, ½ watt (R109, R120, R126, R131, R133, R138, R161, R252)
502215	1500 ohms, ±5%, ½ watt (R183)
503215	1500 ohms, ±10%, ½ watt (R236, R248)
503222	2200 ohms, ±10%, ½ watt (R140)
502233	3300 ohms, ±10%, ½ watt (R104, R201)
502239	3900 ohms, ±5%, ½ watt (R150)
503239	3900 ohms, ±10%, ½ watt (R211)
503247	4700 ohms, ±10%, ½ watt (R230)
502256	5600 ohms, ±5%, ½ watt (R137)
513256	5600 ohms, ±10%, 1 watt (R156)
14659	6800 ohms, ±5%, ½ watt (R111, R112)
503268	6800 ohms, ±10%, ½ watt (R176)
513268	6800 ohms, ±10%, 1 watt (R147)
503282	8200 ohms, ±10%, ½ watt (R145, R191, R213)
513282	8200 ohms, ±10%, 1 watt (R182)
503310	10,000 ohms, ±10%, ½ watt (R139, R164, R200, R229)
513310	10,000 ohms, ±10%, 1 watt (R157)
503315	15,000 ohms, ±10%, ½ watt (R239)
513315	15,000 ohms, ±10%, 1 watt (R250)
523315	15,000 ohms, ±10%, 2 watts (R143, R102)
503318	18,000 ohms, ±10%, ½ watt (R115)
503322	22,000 ohms, ±10%, ½ watt (R175)
522322	22,000 ohms, ±5%, 2 watts (R223, R254)
503327	27,000 ohms, ±10%,½watt(R174,R178,R212,R232,R144)
523327	27,000 ohms, ±10%, 2 watts (R222)
503333	33,000 ohms, ±10%,½watt(R106,R129,R132,R135,R235)
522333	33,000 ohms, ±5%, 2 watts (R193)
503339	39,000 ohms, ±10%, ½ watt (R110, R173, R242)
503347	47,000 ohms, ±10%, ½ watt (R103, R215)
512347	47,000 ohms, ±5%, 1 watt (R247)
502356	56,000 ohms, ±5%, ½ watt (R141)
503356	56,000 ohms, ±10%, ½ watt (R105)
503368	68,000 ohms, ±10%, ½ watt (R208, R209)
513368	68,000 ohms, ±10%, 1 watt (R216)
8064	82,000 ohms, ±5%, ½ watt (R167)
503382	82,000 ohms, ±10%, ½ watt (R192)
513382	82,000 ohms, ±10%, 1 watt (R214)
503410	100,000 ohms, ±10%, ½ watt (R166, R203, R238)
513410	100,000 ohms, ±10%, 1 watt (R251)
30180	120,000 ohms, ±5%, ½ watt (R246)
503415	150,000 ohms, ±10%, ½ watt (R159, R195, R202, R204)
503422	220,000 ohms, ±10%, ½ watt (R207, R233)
502427	270,000 ohms, ±5%, ½ watt (R163, R165, R179)
503427	270,000 ohms, ±10%, ½ watt (R171, R226)
503433	330,000 ohms, ±10%, ½ watt (R116, R189, R205)
503439	390,000 ohms, ±10%, ½ watt (R255)
503447	470,000 ohms, ±10%, ½ watt (R117, R148, R160, R172, R184, R185, R217)
503468	680,000 ohms, ±10%, ½ watt (R169)
503482	820,000 ohms, ±10%, ½ watt (R206)
503510	1 megohm, ±10%, ½ watt (R181, R188)
502512	1.2 megohm, ±5%, ½ watt (R186)
503522	2.2 megohm, ±10%, ½ watt (R196)
72632	3.3 megohm, ±5%, 1 watt (R162)
503539	3.9 megohm, ±10%, ½ watt (R168)
503547	4.7 megohm, ±10%, ½ watt (R170)

77830	Shaft—Definition switch knob shaft
76626	Shaft—Definition switch extension shaft (6" overall)
77660	Shaft—Extension shaft for picture control
77661	Shell—Mounting shell for hi-voltage capacitor
76486	Shield—Hi-voltage shield less side and back covers
73584	Shield—Tube shield for V101, V102, V103, V106, V107, V109
77659	Shield—Tube shield for V105
76741	Shield—Tube shield for V113
75718	Socket—Channel indicator lamp socket
74834	Socket—Kinescope socket
71508	Socket—Tube socket, 6 pin, moulded for V117
50387	Socket—Tube socket, 6 pin, moulded, saddle-mounted for V118, V119

STOCK No.	PART DESCRIPTION
73117	Socket—Tube socket, miniature, 7 pin, wafer for V101, V102, V103, V104, V106, V107, V108, V109
77658	Socket—Tube socket, miniature, 7 pin, moulded, saddle-mounted for V105
71494	Socket—Tube socket, miniature, 7 pin, moulded, saddle-mounted for V114
73117	Socket—Tube socket, miniature, 7 pin, wafer for V124
31251	Socket—Tube socket, octal, wafer for V113, V116, V121, V122, V125
77645	Socket—Tube socket, octal, wafer for V115
76971	Socket—Tube socket, miniature, 9 pin, wafer for V110, V111, V112, V123
76428	Support—Bakelite support only—part of hi-voltage shield
77828	Switch—Definition switch (S104)
77827	Switch—Phono-tone switch (S101)
76463	Terminal—Screw type grounding terminal
77198	Transformer—1st pix I.F. grid transformer complete with adjustable cores (T104, C125, R125)
77197	Transformer—1st pix I.F. plate transformer complete with adjustable cores (T105, C131, C132, R130)
76435	Transformer—2nd pix I.F. grid transformer complete with adjustable cores (T106, C134)
76433	Transformer—3rd or 4th pix I.F. transformer (T107, T108)
78488	Transformer—5th pix I.F. transformer (T109, C142, C143, CR101, L102, R146)
77833	Transformer—Hi-voltage transformer (Part of T115)
76440	Transformer—Horizontal oscillator transformer complete with adjustable cores (T114)
77821	Transformer—Output transformer (T103)
77822	Transformer—Power transformer, 117 volts, 60 cycle (T113)
76439	Transformer—Ratio detector transformer complete with adjustable cores (T102, C106, C107)
76438	Transformer—Sound I.F. transformer complete with adjustable cores (T101, C102, C103)
76437	Transformer—Sound take-off transformer complete with adjustable cores (T110, C147)
77650	Transformer—Vertical oscillator transformer (T111)
77823	Transformer—Vertical output transformer (T112)
76482	Trap—4.5 MC trap (L105, C150)
77585	Washer—"C" washer for picture control, extension shaft (2 req'd) or sharpness switch shafts (4 req'd)

SPEAKER ASSEMBLIES

971490-4W

RL105E1

RMA-274

STOCK No.	PART DESCRIPTION
75024	Cone—Cone and voice coil (3.2 ohms)
77872	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms)

NOTE:—If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to Model number of instrument, number stamped on speaker and full description of part required.

MISCELLANEOUS

STOCK No.	PART DESCRIPTION
76624	Back—Cabinet back complete with power cord and cross-over network board for Models 27D382, 27D382U
78547	Back—Cabinet back complete with power cord and cross-over network board for models 27D383, 27D383U, 27D384, 27D384U
76184	Board—Antenna terminal board
78444	Board—Cross-over network board complete with cable, capacitors, coils and resistors
77748	Bracket—Mounting bracket for hidden controls, cover and case
71807	Capacitor—Adjustable, mica:— 10-160 mmf., for instruments using KRK12B tuner
	Capacitor—Fixed, headed-lead:—
78532	1.2 mmf., ±10%, 500 volts (C4)
78442	1.8 mmf., ±10%, 500 volts (C1, C2)
78443	2.7 mmf., ±10%, 500 volts (C3)
71892	Catch—Bullet catch and strike for doors
77755	Clamp—Polystyrene clamp for antenna cable and mount for F.M. trap for instruments using KRK12B tuner
X3349	Cloth—Grille cloth for mahogany or walnut instruments for Models 27D382, 27D382U, 27D383, 27D383U, or for maple instruments for Models 27D384, 27D384U
X3350	Cloth—Grille cloth for mahogany instruments for Models 27D384, 27D384U
X3371	Cloth—Grille cloth for oak instruments for Models 27D382, 27D382U
77870	Connector—Anode connector complete with contact and formed terminal
75474	Connector—Single contact male connector for antenna cable

GENERAL DESCRIPTION

Models 21-D-395 and 21-D-395U are deluxe "21 inch" television—AM-FM radio phonograph combinations. Model 21-D-395 features full 12 channel VHF coverage. Model 21-D-395U features full 12 channel VHF coverage plus any 4 UHF channels desired.

A three speed record changer is provided to play 33⅓, 45 and 78 RPM records.

The receivers are provided with cabinet antennas for AM, FM and television where local conditions permit their use.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE . 227 square inches on a 21AP4 Kinescope

TELEVISION R-F FREQUENCY RANGE

Model 21-D-395

All 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

Model 21-D-395U

Any of 70 UHF channels .... 470 mc. to 890 mc.

Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

(Any desired combination of 16 UHF and/or VHF channels may be used.)

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency .... 45.75 mc.

Sound I-F Carrier Frequency .... 41.25 mc.

POWER RATING .... 395 watts max.

AUDIO POWER OUTPUT RATING .... 10 watts max.

CHASSIS DESIGNATIONS

Television Chassis .... Model 21-D-395—KCS81H

Model 21-D-395U—KCS81K

Radio Chassis RC1111A

Audio Chassis RS141E

Record Changer 930409-5

Refer to Service Data 930409 for record changer information

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK29—Model 21-D-395	
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer
Tuner KRK12B—Model 21-D-395U	
(1) RCA 6BQ7A	R-F Amplifier (VHF only)
(2) RCA 6AF4	R-F Oscillator
(3) RCA 6BQ7A	I-F Amplifier
(4) RCA 6S4	Voltage Control

A 1N82 crystal is used as a mixer.

RCA TUBE COMPLEMENT

Tube Used	Television Chassis	Function
	All Models	
(1) RCA 6AU6		1st Picture I-F Amplifier
(2) RCA 6CB6		2nd Picture I-F Amplifier
(3) RCA 6CB6		3rd Picture I-F Amplifier
(4) RCA 6CB6		4th Picture I-F Amplifier
(5) RCA 6CL6		Video Amplifier
(6) RCA 6AU6		1st Sound I-F Amplifier
(7) RCA 6AU6		2nd Sound I-F Amplifier
(8) RCA 6AL5		Ratio Detector
(9) RCA 6AV6		1st Audio Amplifier
(12) RCA 12AU7		Vert. Sync. Sep. and AGC
(13) RCA 12AU7		Horiz. Sync. Sep. and Sync. Ampl.

ELECTRICAL AND MECHANICAL SPECIFICATIONS (Continued)

RADIO TUNING RANGE

Broadcast .... 540-1,600 kc.

Frequency Modulation .... 88-108 mc.

Intermediate Frequency—AM .... 455 kc.

Intermediate Frequency—FM .... 10.7 mc.

ANTENNA INPUT IMPEDANCE

Model 21-D-395

Choice: 300 ohms balanced or 72 ohms unbalanced.

Model 21-D-395U

UHF—300 ohms balanced.

VHF—300 ohms balanced.

VIDEO RESPONSE .... To 4 mc.

FOCUS .... Magnetic

SWEEP DEFLECTION .... Magnetic

SCANNING .... Interlaced, 525 line

HORIZONTAL SCANNING FREQUENCY .... 15,750 cps

VERTICAL SCANNING FREQUENCY .... 60 cps

FRAME FREQUENCY (Picture Repetition Rate) .... 30 cps

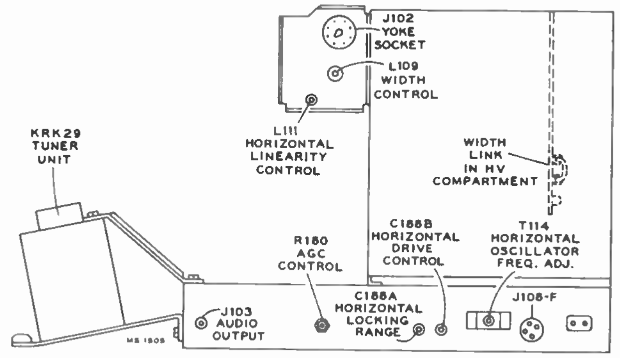

Figure 3—Rear Chassis Adjustments

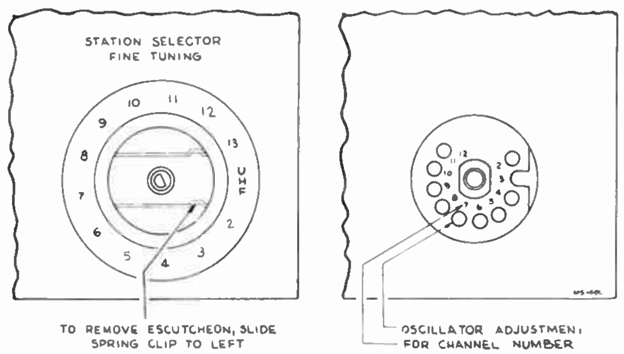

Figure 4—KRK29 R-F Oscillator Adjustments

OPERATING CONTROLS (front panel)

Channel Selector / Fine Tuning .... Dual Control Knobs

Brightness / Sound Volume and On-Off Switch .... Dual Control Knobs

Picture Horizontal Hold .... Single Control (Knurled)

Picture Vertical Hold .... Single Control (Knurled)

Picture .... Single Control Knob

Tone Switch .... Single Control Knob

Radio Tuning .... Single Control Knob

NON-OPERATING CONTROLS

Horizontal Centering .... top chassis adjustment

Vertical Centering .... top chassis adjustment

AGC .... rear chassis adjustment

Height .... front panel screwdriver adjustment

Horizontal Locking .... rear chassis screwdriver adjustment

Vertical Linearity .... front panel screwdriver adjustment

Horizontal Drive .... rear chassis screwdriver adjustment

Horizontal Oscillator Frequency .... rear chassis adjustment

Horizontal Oscillator Waveform .... bottom chassis adjustment

Width Link .... H.V. compartment adjustment

Focus .... top chassis adjustment

Ion Trap Magnet .... top chassis adjustment

Deflection Coil .... top chassis adjustment

Focus Magnet .... top chassis adjustment

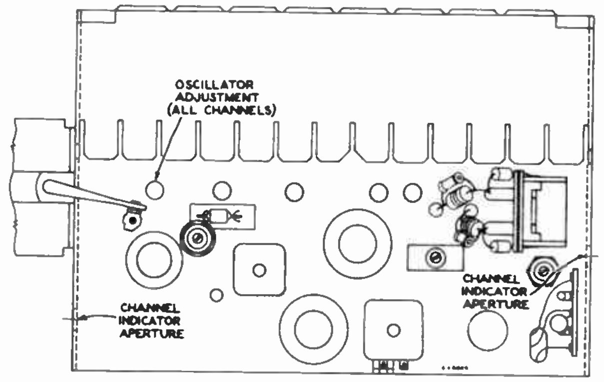

Figure 5—KRK12B Oscillator Adjustment

AGC THRESHOLD CONTROL.—The AGC Threshold Control R180 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal and sync the picture. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not over-loading due to improper setting of R180. If the picture requires an appreciable portion of a second to reappear, or bends excessively, R180 should be readjusted.

Turn R180 fully counter-clockwise. The raster may be bent slightly. This should be disregarded. Turn R180 clockwise until there is a very, very slight bend or change of bend in the picture. Then turn R180 counter-clockwise just sufficiently to remove this bend or change of bend.

If the signal is weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R180 clockwise until the snow in the picture becomes more pronounced, then counter-clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far clockwise on a weak signal, then the receiver may overload when a strong signal is received.

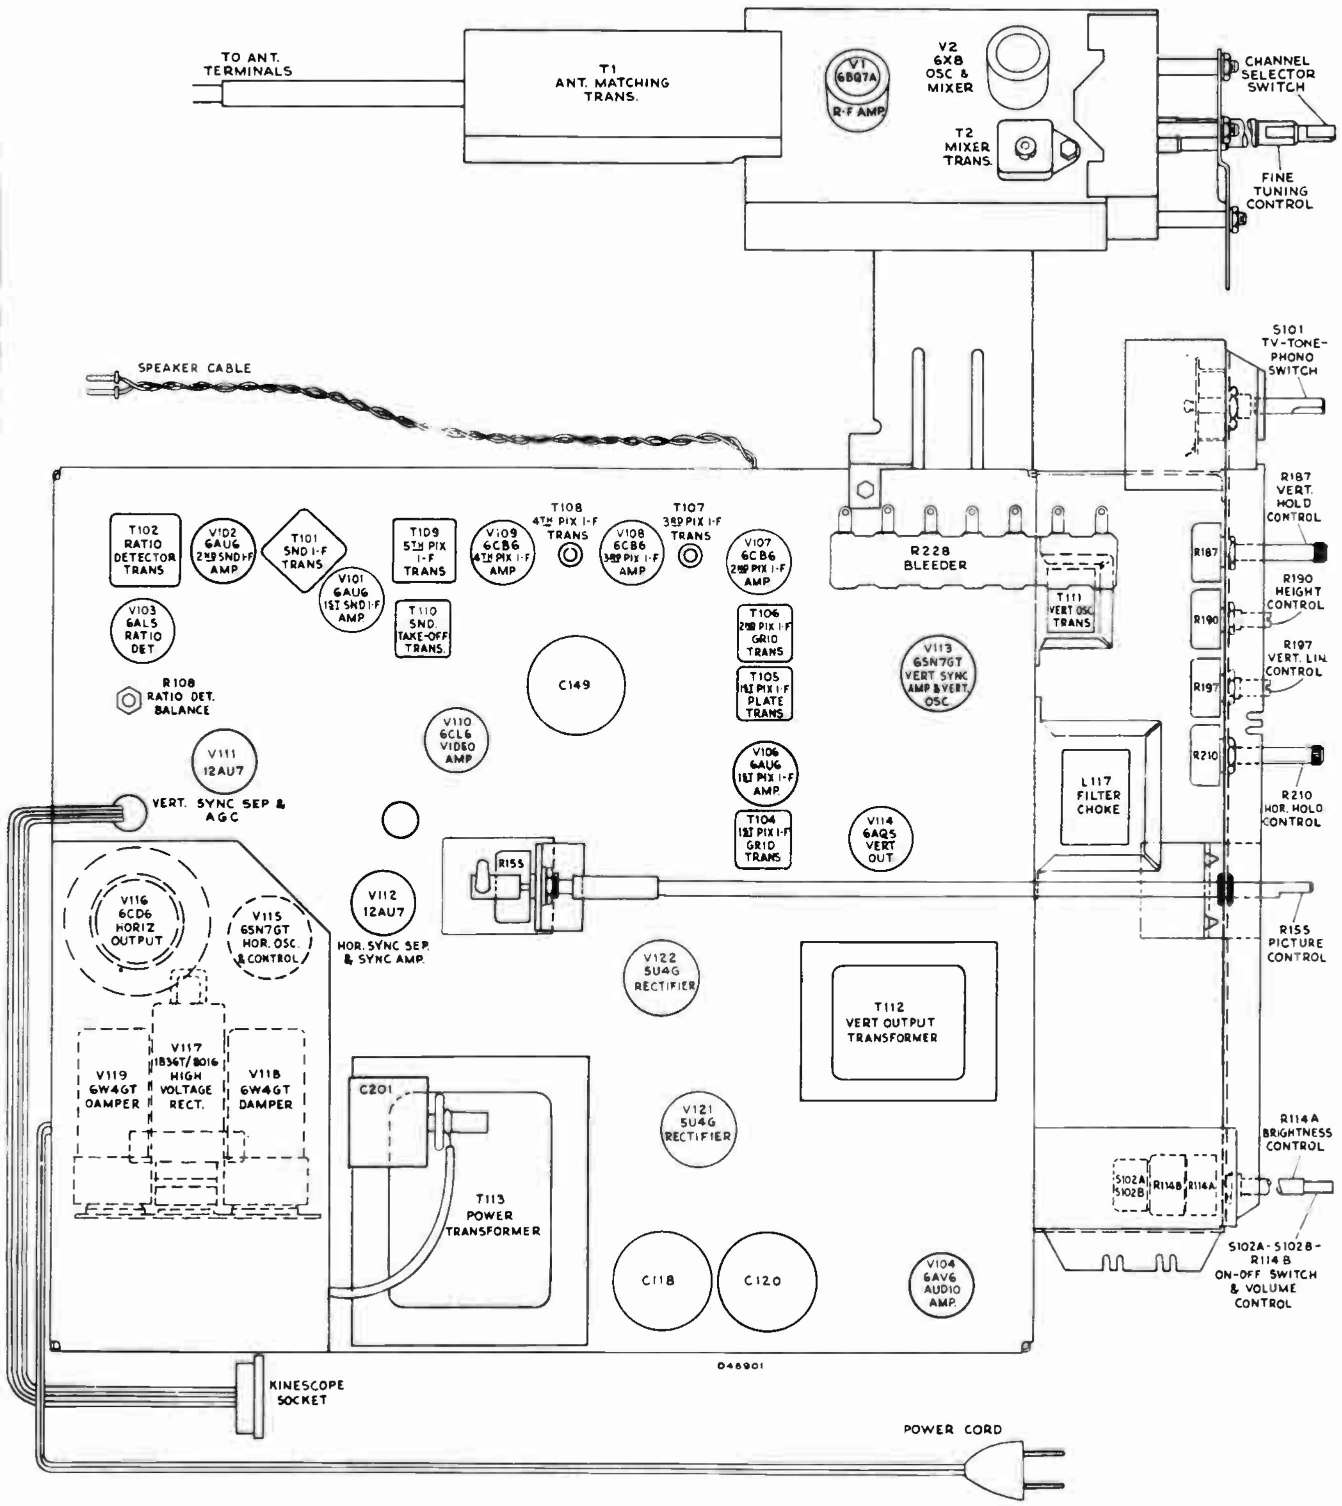

Figure 7—Television Chassis Top View (shown with KRK29 Tuner)

TELEVISION CHASSIS BOTTOM VIEW

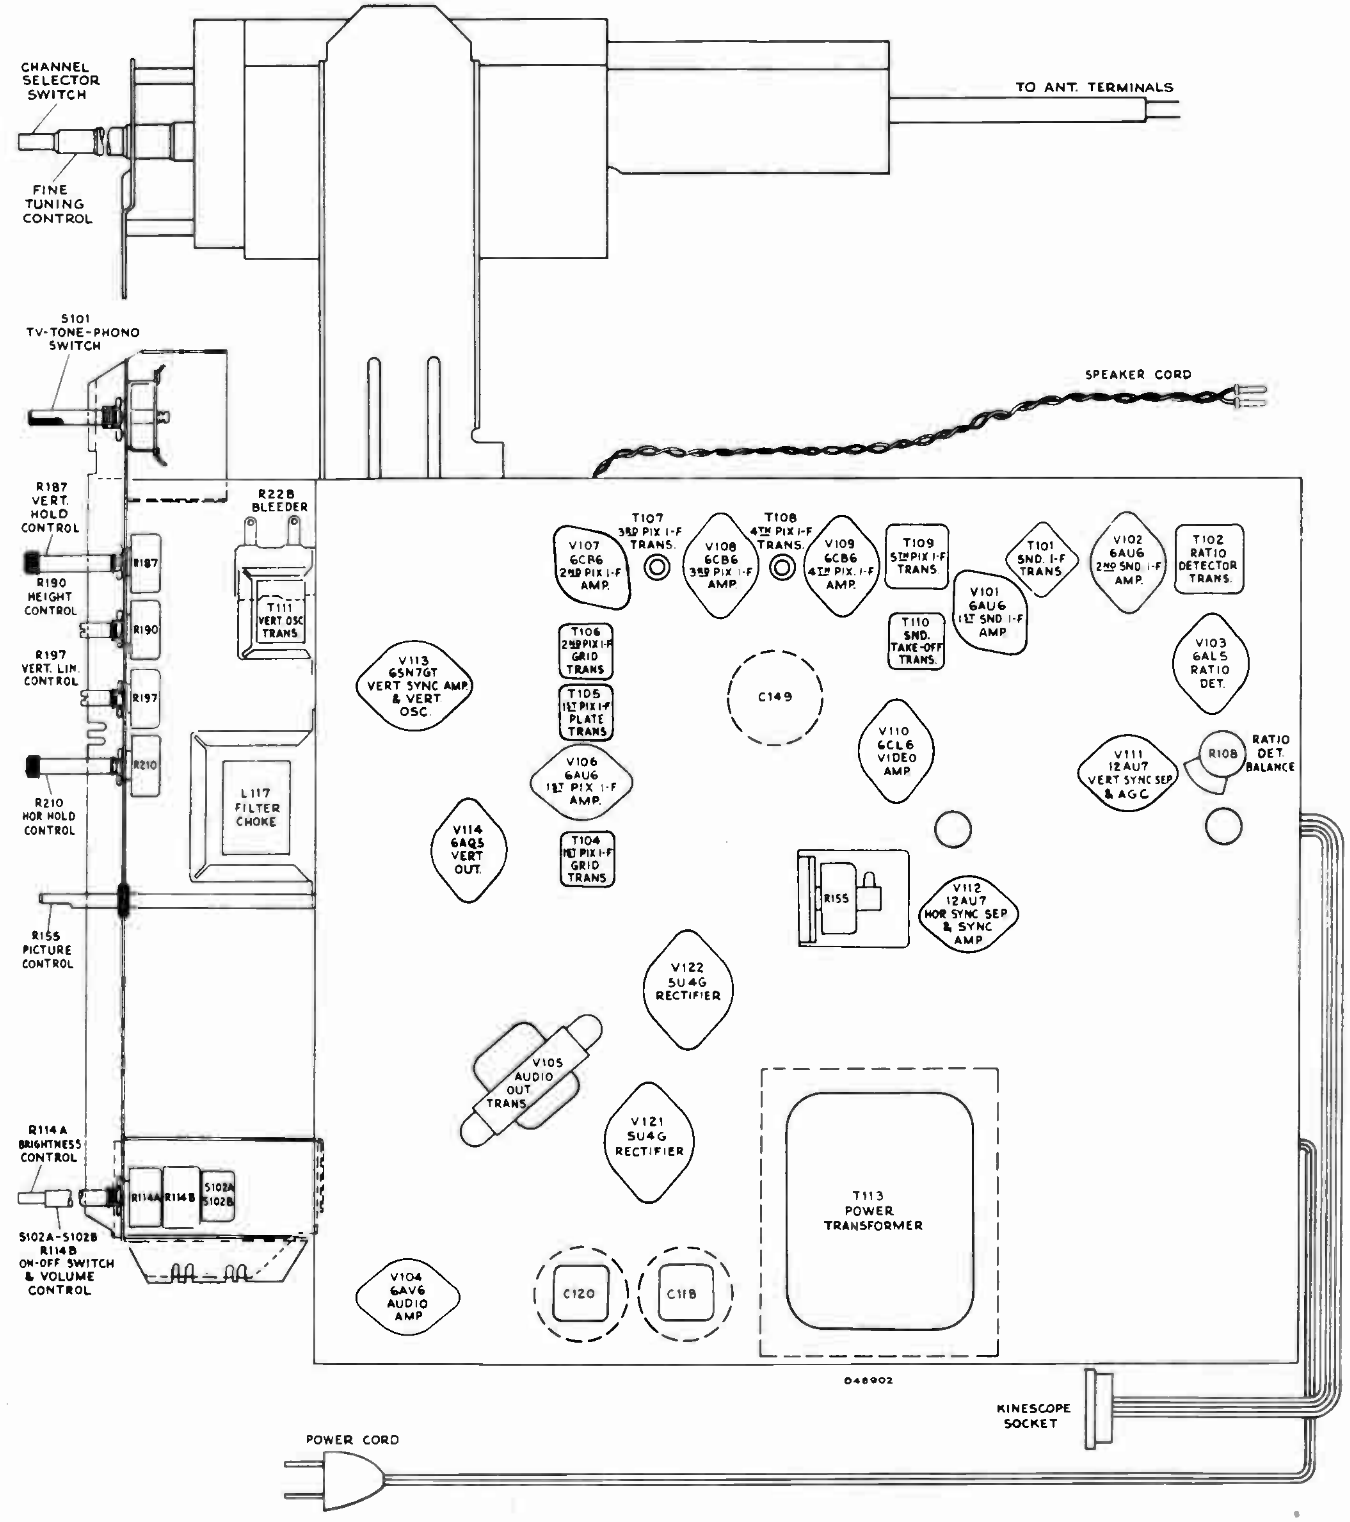

Figure 8—Television Chassis Bottom View (shown with KRK29 Tuner)

TELEVISION ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:
(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:
(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.
(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA Types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 1 millivolt per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

DC Milliammeter.—A milliammeter with a range of 0-50 milliamperes full scale.

Adapter Socket.—An adapter socket is required to meter the cathode current of the 6S4 voltage control tube of the KRK12B Tuner. Wiring of adapter is shown in Figure 9.

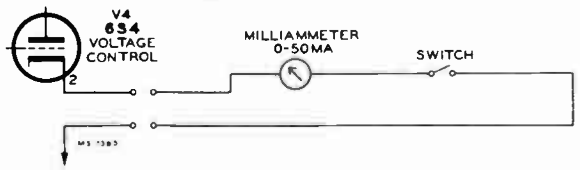

Figure 9—KRK12B Voltage Control Adapter

KRK29 ANTENNA MATCHING UNIT ALIGNMENT.—The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal, especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L5 to the channel selector switch S1-E.

With a short jumper, connect the output of the matching unit through a 1,000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R133 and C133B. Set the potentiometer to produce approximately -5.0 volts of bias at the junction of R133 and C133B.

Connect an oscilloscope to pin 9, V110 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L4 in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L1 for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L5 to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L5 to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 17 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by retuning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L2 and L3 to obtain the response shown in Figure 10. L3 is most effective in locating the position of the shoulder of the curve at 52 mc. and L2 should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L5 and S1-E. Replace V106.

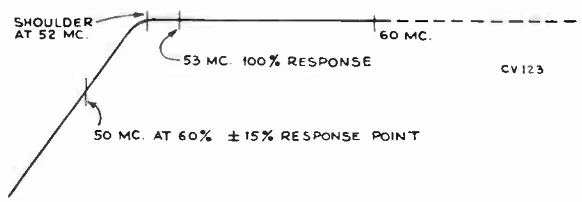

Figure 10—KRK29 Antenna Matching Unit Response

PICTURE I-F TRAP ADJUSTMENT.—Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R133 and C133B.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the positive terminal of one battery to chassis and the potentiometer arm to the junction of R133 and C133B.

Set the bias to produce approximately -1.0 volt of bias at the junction of R133 and C133B.

Connect the "VoltOhmyst" to pin 9 of V110, the 6CL6 video amplifier.

Set the signal generator to each of the following frequencies and adjust the corresponding circuit for minimum d-c output at pin 9 of V110. Use sufficient signal input to produce 1.0 volt of d-c on the meter when the final adjustment is made.

39.25 mc.	T104 top core
41.25 mc.	T105 bottom core
47.25 mc.	T106 bottom core

PICTURE I-F TRANSFORMER ADJUSTMENTS.—
Model 21-D-395

Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 1.0 volt of d-c at pin 9 of V110 with -1.0 volt of i-f bias at the junction of R133 and C133B.

43.7 mc.	T109
45.5 mc.	T108
41.8 mc.	T107

To align T105 and T106, connect the sweep generator to the first picture i-f grid, pin 1 of V106 through a 1,000 mmf. ceramic capacitor. Shunt R137, R141 and terminals "A" and "F" of T109 with 330 ohm composition resistors. Set the i-f bias to -1.0 volt at the junction of R133 and C133B.

Connect the oscilloscope to pin 9 of V110.

Adjust T105 and T106 top cores for maximum gain and curve shape as shown in Figure 11. For final adjustment set the output of the sweep generator to produce 0.5 volt peak-to-peak at the oscilloscope terminals.

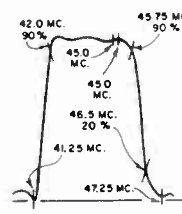

Figure 11—T105 and T106 Response

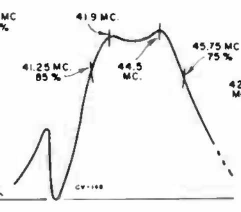

Figure 12—T2 and T104 Response with KRK29

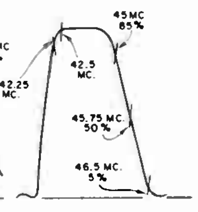

Figure 13—Over-all I-F Response with KRK29

To align T2 and T104, connect the sweep generator to the mixer grid test point TP2. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable.

Connect a 180 ohm composition resistor between terminal "E" of T105 and the junction of R131 and C133A.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C121 across terminals A and B of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (bottom) for maximum gain at 43.5 mc. and with 45.75 mc. at 70% of maximum response.

Adjust C121 until 41.25 mc. is at 85% response with respect to the low frequency shoulder at approximately 41.9 mc. as shown in Figure 12.

Disconnect the diode probe, the 180 ohm and three 330 ohm resistors.

Model 21-D-395U

Set the signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 1.0 volt of d-c at pin 9 of V110 with -1.0 volt of i-f bias at the junction of R133 and C133B.

43.7 mc.	T109
45.5 mc.	T108
41.8 mc.	T107

To align T105 and T106, connect the sweep generator to the first picture i-f grid, pin 1 of V106 through a 1,000 mmf. ceramic capacitor. Shunt R137, R141 and terminals "A" and "F" of T109 with 330 ohm composition resistors. Set the i-f bias to -1.0 volt at the junction of R133 and C133B.

Connect the oscilloscope to pin 9 of V110, the 6CL6 video amplifier.

Adjust T105 and T106 top cores for maximum gain and curve shape as shown in Figure 11. For final adjustment set the output of the VHF sweep generator to produce 0.5 volt peak-to-peak at the oscilloscope terminals.

To align the crystal mixer and T2 and T104, connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1,500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep generator to the tuner case.

Set the channel selector to channel 5.

Connect a 180 ohm composition resistor between terminal "B" of T105 and the junction of R131 and C133A.

Connect the oscilloscope diode probe to terminal "B" of T105 and ground. Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C121 across terminals A and B of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (bottom) for maximum gain at 43.5 mc. and with 45.75 mc. at 70% of maximum response.

Adjust the shunt trimmer C121 until 41.25 mc. is at 85% response with respect to the low frequency shoulder at approximately 41.9 mc. as shown in Figure 14. Adjust T1 for maximum gain. Readjust T2 and T104 if necessary to obtain proper wave shape, see Figure 15.

Disconnect the diode probe, the 180 ohm and the three 330 ohm resistors.

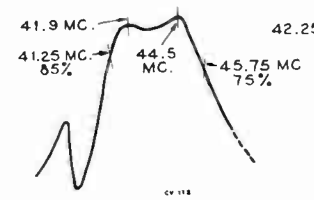

Figure 14—T2 and T104 Response with KRK12B

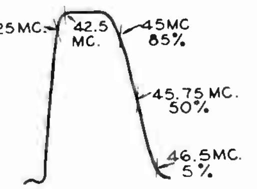

Figure 15—Over-all I-F Response with KRK12B

SWEEP ALIGNMENT OF PIX I-F.—

Connect the oscilloscope to pin 9 of V110.

Adjust the bias potentiometer to obtain -6.0 volts of bias as measured by a "VoltOhmyst" at the junction of R133 and C133B.

Leave the sweep generator connected to the mixer grid test point TP2 on KRK29 Tuner or to the front terminal of the 1N82 crystal holder on KRK12B Tuner. Use the shortest leads possible with not more than one inch of unshielded lead at the end of the sweep cable. If these precautions are not observed, the receiver may be unstable and the response curves obtained may be unreliable.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T108 and T109 to obtain the response shown in Figure 13 for KRK29 or Figure 15 for KRK12B. Do not adjust T107 unless absolutely necessary. If T107 is adjusted too low in frequency it will raise the level of the 41.25 mc. sound i-f carrier and may create interference in the picture. It will also cause poor adjacent channel picture rejection. If T107 is tuned too high in frequency, the level of the 41.25 mc. sound i-f carrier will be too low and may produce noisy sound in weak signal areas.

Remove the oscilloscope, sweep and signal generator connections.

Remove the bias box employed to provide bias for alignment.

KRK29 TUNER ALIGNMENT
Model 21-D-395

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

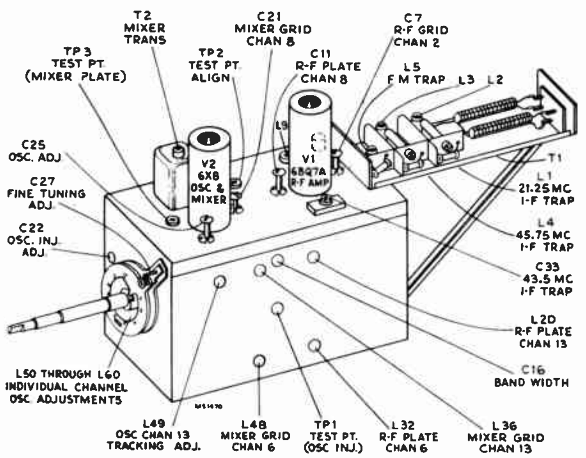

Figure 16—KRK29 Tuner Adjustments

Connect the oscilloscope to the test point TP1 on the side of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce -3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read -3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechnical center of its range.

NOTE.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

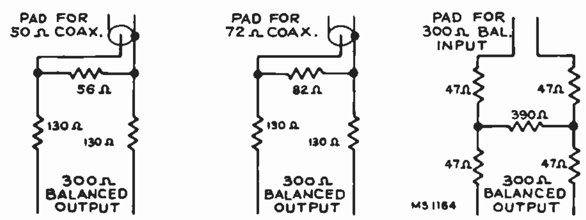

Figure 17—Sweep Attenuator Pads

Connect the sweep generator through a suitable attenuator, as shown in Figure 17 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and bandwidth as shown in Figure 18.

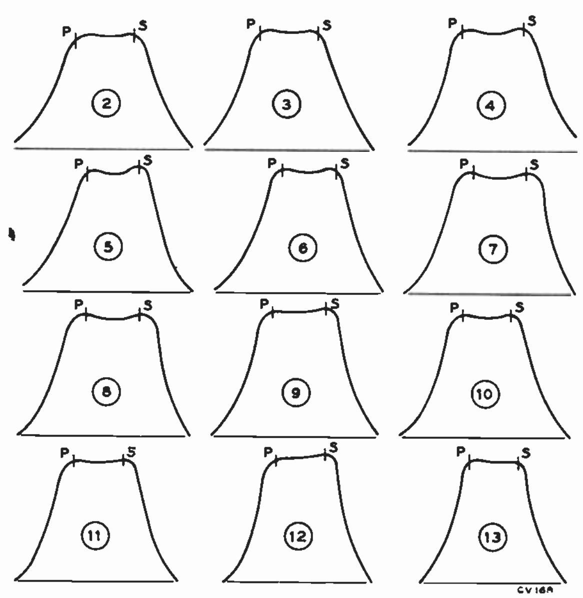

Figure 18—KRK29 R-F Response

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response bandwidth.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read -3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in Figure 18.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and bandwidth.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency, 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L48 and L32 for proper curve shape as shown in Figure 18. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See Figure 18 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to Figure 18 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

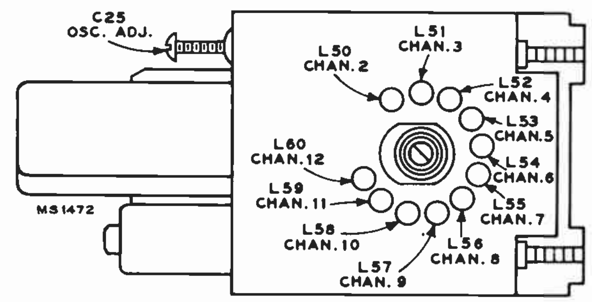

Figure 19—KRK29 R-F Oscillator Adjustments

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

KRK12B TUNER ALIGNMENT
Model 21-D-395

TUNER VHF ALIGNMENT.—Remove the 6S4 voltage control tube from its socket and insert the adapter. Insert the 6S4 in the adapter.

Connect the 0-50 milliampere meter to the adapter socket leads and turn the adapter switch on.

Remove the tuner cover shield.

Rotate the channel selector to a point midway between channels, disengaging the insert contacts, and observe the non-oscillating plate current. Some tubes may oscillate even with the tuned circuits disengaged. To be sure the oscillator is in a non-oscillatory state, short circuit the spring contacts 12 and 13, the two contacts nearest the tuner front.

(**NOTE:** The contacts are at zero d-c potential.) Should the plate current rise, keep the contacts shorted while adjusting the oscillator plate current. Adjust R6, oscillator voltage control, for a 28 milliampere reading on the meter.

Replace the tuner cover shield.

Connect the VHF sweep generator to the antenna terminals.

Connect the VHF signal generator loosely to the antenna terminals.

Connect the oscilloscope through the preamplifier, if needed with oscilloscope used, to test point TP1.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Turn off the adapter switch, removing plate voltage from the oscillator. This is required because of RF-IF interaction when a crystal is used as a mixer.

Set the channel selector and the sweep generator to channel 2.

Insert markers of channel 2 picture carrier and sound carrier, 55.25 mc. and 59.75 mc.

Adjust antenna T6, r-f amplifier plate L29 and mixer L30 adjustments for a symmetrical curve with maximum gain at the center of the pass band. The curves will have a deep valley because of no crystal loading and nonlinear detector characteristics. The limits for the 100% response points are shown in Figure 20. The proper curve shape is shown in Fig-

TELEVISION ALIGNMENT PROCEDURE

use 20(b). (Refer to note on page 15 for detailed explanation of adjustments.) If the bandwidth is out of tolerance, it can usually be corrected by redressing the coupling capacitor of the double tuned circuit, C40 on insert A. Maximum bandwidth occurs when the capacitor is centered in the insert chamber.

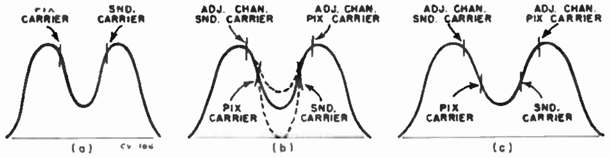

Figure 20—KRK12B VHF Insert Responses

Repeat the above steps for all VHF channels adjusting the appropriate antenna, r-f amplifier plate and mixer slugs for a symmetrical curve with maximum gain at the center of the pass band.

Turn off the sweep generator.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Turn the AGC control fully clockwise and remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce −3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Connect the potentiometer arm of the second bias supply to the junction R133 and C133B, and ground the positive battery terminal. Adjust the bias potentiometer to produce −5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to pin 9 of V110. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to channel 13.

Set the fine tuning control to the center of its range.

Adjust the oscillator slug L22 to proper frequency, 257 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 257 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner through either of the two holes next to the oscillator tube on the right front top corner of the tuner. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust L22 oscillator slug to obtain an audio beat with the signal generator.

Turn on the sweep generator and set to channel 13. Adjust T1 for maximum gain on the oscilloscope. Adjust mixer tank circuit L21 for maximum gain and flat-topped curve. Recheck T1 for maximum gain at center of band with the proper response. Maximum gain and flat-topped response should be obtained simultaneously.

Adjust the oscillator to frequency on all VHF channels by switching the receiver and signal generator to each VHF channel and adjusting the appropriate oscillator slug to obtain a beat with the signal generator. Adjust the appropriate mixer slug where necessary to obtain maximum gain and proper curve shape as explained above.

Adjust the tunable I-F Trap C16-L7. To do this connect the signal generator to the fixed I-F Trap C2-L2 at the end opposite the antenna terminal plug. Set the signal generator to 43.5 mc. and adjust the output of the signal generator to obtain sufficient indication on the oscilloscope. Tune the I-F Trap C16-L7 for minimum marker indication on the oscilloscope.

Remove the signal generator and the oscilloscope.

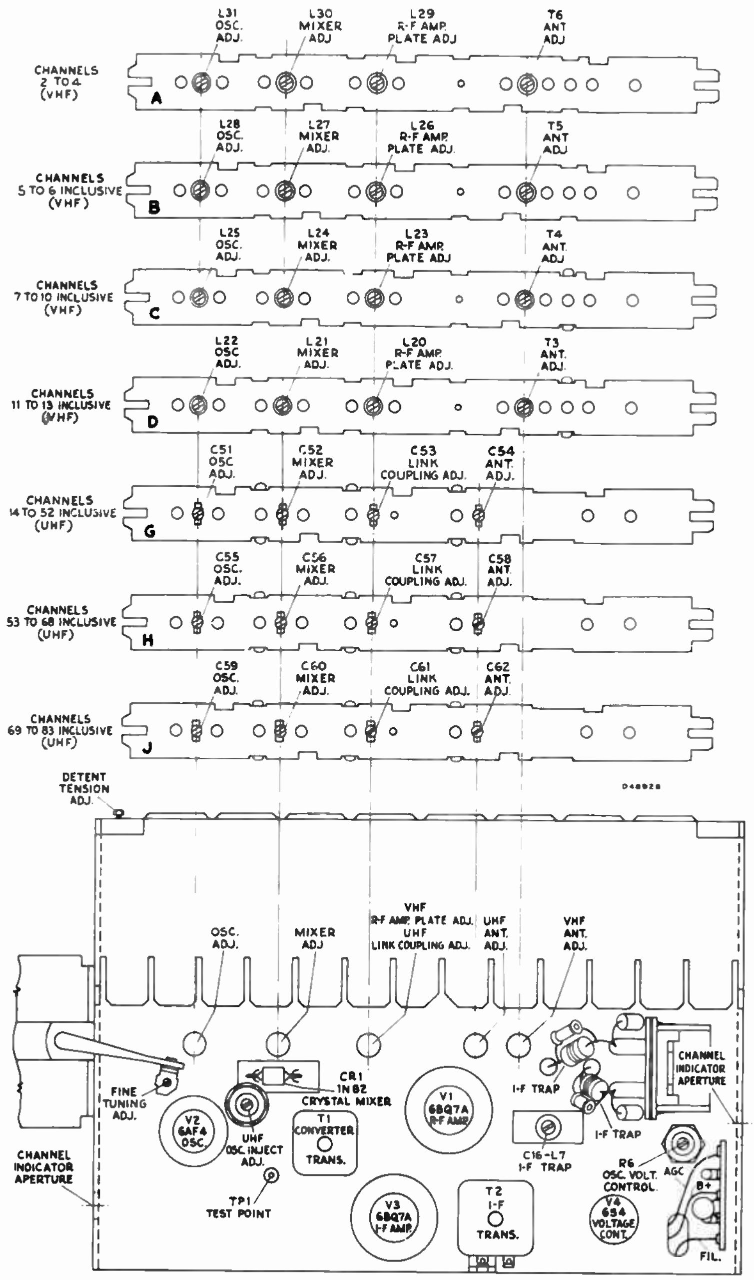

Figure 21—KRK12B Tuner Adjustments

TUNER UHF ALIGNMENT.—To align the UHF inserts:

Turn off the adapter switch, removing plate voltage from the oscillator.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Connect the UHF sweep generator to the antenna terminals. Use a 10 DB attenuator pad to assure proper alignment.

Connect the UHF signal generator loosely to the antenna terminals.

Set the channel selector to the desired position and the sweep generator to sweep the frequency of the insert being used.

Insert markers of the picture carrier and sound carrier frequencies for the desired channel (see Table on page 8).

Adjust the UHF antenna, link coupling and mixer adjustments for a symmetrical curve, with maximum gain, centered about the pass band.

The responses are shown in Figure 22. The curve shape will usually vary from Figure 22 (a) to Figure 22 (c) going higher in frequency; however, any of these responses are acceptable.

Repeat the above steps for all UHF inserts used, adjusting the appropriate antenna, link coupling and mixer slugs for a symmetrical curve, with maximum gain, centered about the pass band.

Remove the oscilloscope and preamplifier, if used, from test point TP1.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce −3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal.

Connect the potentiometer arm of the second bias supply to the junction of R133 and C133B, and ground the positive battery terminal. Adjust the bias potentiometer to produce −5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to pin 9 of V110. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to the lowest UHF channel to be used, and set the fine tuning control to the center of its range.

Adjust the oscillator core to proper frequency. To do this, connect the VHF signal generator to test point TP1 with the shortest leads possible. Insert a 45.75 mc. marker from the VHF generator.

Set the UHF sweep generator to sweep the desired channel, and observe the output on the oscilloscope. If the sweep generator is not sweeping the correct frequency range, it may be necessary to readjust the sweep in order to place the 45.75 marker on the response curve as in Figure 15.

Set the UHF marker generator to the picture carrier of the channel insert being adjusted and connect to test point TP1.

Adjust the oscillator core until the markers for 45.75 mc. and the picture carrier coincide on the sweep pattern on the oscilloscope.

Adjust the mixer core for maximum gain with proper wave shape.

Connect the "VoltOhmyst" to test point TP1, using 1.5 volt DC scale.

Set oscillator injection adjustment to read .1 volt on the "VoltOhmyst."

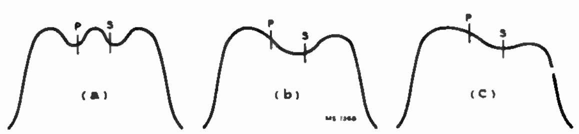

Figure 22—KRK12B UHF Insert Responses

Repeat the above steps for all UHF inserts adjusting the oscillator injection control only if the reading on the "VoltOhmyst" exceeds .3 volts. Adjust as necessary to read .3 volts or less at TP1.

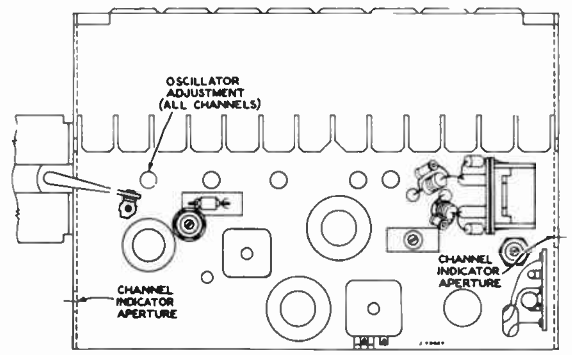

Figure 23—KRK12B Oscillator Adjustment

RATIO DETECTOR ALIGNMENT.—In order to obtain good ratio detector alignment an AM modulated signal generator that is exceptionally free from FM modulation must be employed. Set the signal generator at 4.5 mc. and connect it to the second sound i-f grid, pin 1 of V102. Set the generator for 30% 400 cycle modulation.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. If used, connect it to the grid of the 4th pix i-f amplifier, pin 1, V109. Set the frequency of the calibrator to 45.75 (pix carrier) and modulate with 4.5 mc. crystal. Also turn on the internal AM audio modulation. The 4.5 mc. signal will be picked off at T110A and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to the junction of R111 and C111.

Connect the oscilloscope across the speaker voice coil and turn the volume control for maximum output.

Tune the ratio detector primary, T102 top core for maximum DC output on the "VoltOhmyst." Adjust the signal level from the signal generator for −10 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R110 and C110.

Adjust the T102 bottom core for zero d-c on the meter. Then, turn the core to the nearest minimum AM output on the oscilloscope.

Repeat adjustments of T102 top for maximum DC and T102 bottom for minimum output on the oscilloscope making final adjustment with the 4.5 mc. input level adjusted to produce 10 volts d-c on the "VoltOhmyst" at the junction of R111 and C111.

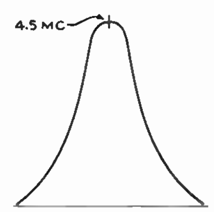

Figure 24—Sound I-F Response

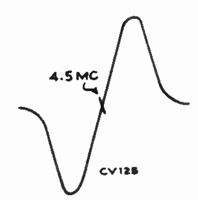

Figure 25—Ratio Det. Response

TELEVISION ALIGNMENT PROCEDURE

Connect the "VoltOhmyst" to the junction of R110 and C110 and note the amount of d-c present. If this voltage exceeds ±1.5 volts, adjust R108 by turning it in until zero d-c is obtained Readjust the T102 bottom core for minimum output on the oscilloscope. Repeat adjustments of R108 and T102 bottom core until the voltage at R110 and C110 is less than ±1.5 volts when T102 bottom core is set for minimum output on the oscilloscope.

Connect the "VoltOhmyst" to the junction of R111 and C111 and repeak T102 top core for maximum d-c on the meter and again reset the generator so as to have –10 volts on the meter.

Repeat the adjustments in the above two paragraphs until the voltage at R110 and C110 is less than ±1.5 volts when the T102 top core is set for maximum d-c at the junction of R111 and C111 and the T102 bottom core is set for minimum indication on the oscilloscope.

SOUND I-F ALIGNMENT.—Connect the sweep generator to the first sound i-f amplifier grid, pin 1 of V101. Adjust the generator for a sweep width of 1 mc. at a center frequency of 4.5 mc.

Insert a 4.5 mc. marker signal from the signal generator into the first sound i-f grid. With the WR39B or WR39C calibrators the 4.5 mc. crystal signal may be obtained at the R-F out terminal by turning the variable osc. switch off, the calibrate switch to 4.5 mc. and the volume control with mod. off.

Connect the oscilloscope in series with a 10,000 ohm resistor to terminal A of T101.

Adjust T101 top and bottom cores for maximum gain and symmetry about the 4.5 mc. marker on the i-f response. The pattern obtained should be similar to that shown in Figure 24.

The output level from the sweep should be set to produce approximately 2.0 volt peak-to-peak at terminal A of T101 when the final touches on the above adjustment are made. It is necessary that the sweep output voltage should not exceed the specified values otherwise the response curve will be broadened, permitting slight misadjustment to pass unnoticed and possibly causing distortion on weak signals.

Connect the oscilloscope to the junction of R110 and C110 and check the linearity of the response. The pattern obtained should be similar to that shown in Figure 25.

SOUND TAKE-OFF ALIGNMENT.—Connect the 4.5 mc. generator in series with a 1,000 ohm resistor to terminal "C" of T110. The input signal should be approximately 0.5 volt.

Short the fourth pix i-f grid to ground, pin 1, V109, to prevent noise from masking the output indication.

As an alternate source of signal the RCA WR39B or WR39C calibrator may be used. In such a case, disregard the above two paragraphs. Connect calibrator across link circuit, T104 A, B, and modulate 45.75 with a 4.5 mc. crystal.

Connect the crystal diode probe of a "VoltOhmyst" to the plate of the video amplifier, pin 6 of V110.

Adjust the core of T110 for minimum output on the meter.

Remove the short from pin 1 V109 to ground, if used.

HORIZONTAL OSCILLATOR ADJUSTMENT.—Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it cannot be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R210, then adjust the T114 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T114 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T114 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C186B, the width control L109 and the linearity control L111 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T114 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T114 frequency core (on the rear apron) until the picture falls out of sync and one diagonal black bar sloping down to the right appears on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain one diagonal black bar on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T114 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture begins to fall out of sync with the diagonal bar sloping down to the right. Continue to turn the frequency core in the same direction. Additional bars should not appear on the screen. Instead, the horizontal oscillator should begin to motorboat. Retouch the adjustment of the T114 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T114. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 26. Adjust the waveform adjustment core of T114 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

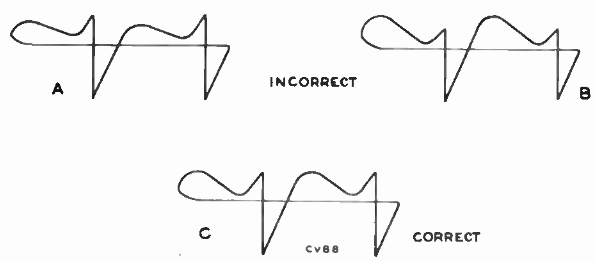

Figure 26—Horizontal Oscillator Wave Forms

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C186A slightly clockwise. If less than 2 bars are present, adjust C186A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T114 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves off the screen leaving the picture in synchronization.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

RESPONSE CURVES.—The response curves shown and referred to throughout the alignment procedure were taken from a production set. Although these curves are typical, some variations can be expected.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

NOTE ON KRK12B TUNER ALIGNMENT.—The use of a crystal mixer in the KRK12B Tuner makes it necessary to observe the insert responses with the oscillator disabled. This is due to undesirable r-f/i-f interaction if the oscillator was allowed to operate during alignment. Therefore, the responses shown in Figure 20 are not a strictly true representation of the insert band pass during actual operation. When an insert is aligned, using an oscilloscope to observe the response, the curve shown in Figure 20(b) will be the correct response for reference. In actual operation, the band pass will be such that the sound and picture carriers will be at the tips of the curve. The adjacent channel picture and sound carriers will be in the valleys at each side. Care should be taken not to exceed the limits shown in Figures 20(a) and 20(c).

The valley, in the center of the response curve, may vary from 0 to 50% above the base line for VHF inserts. Adjust the output level of the sweep generator to prevent excessive signal input to the tuner. Excessive signal input will be indicated by the valley rising above the 50% level, particularly on the higher VHF channels.

Oscillator injection voltage is not adjusted on VHF inserts. A check may indicate variations from .08 to .3 volts at TP1 but such readings should not be interpreted as an indication of trouble. On UHF channels, however, the injection voltage should be adjusted to fall within the specified limits.

RADIO VOLTAGE CHART

Voltages shown are as read with "VoltOhmyst" between indicated terminal and chassis, with receiver operating on 117 volts, and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

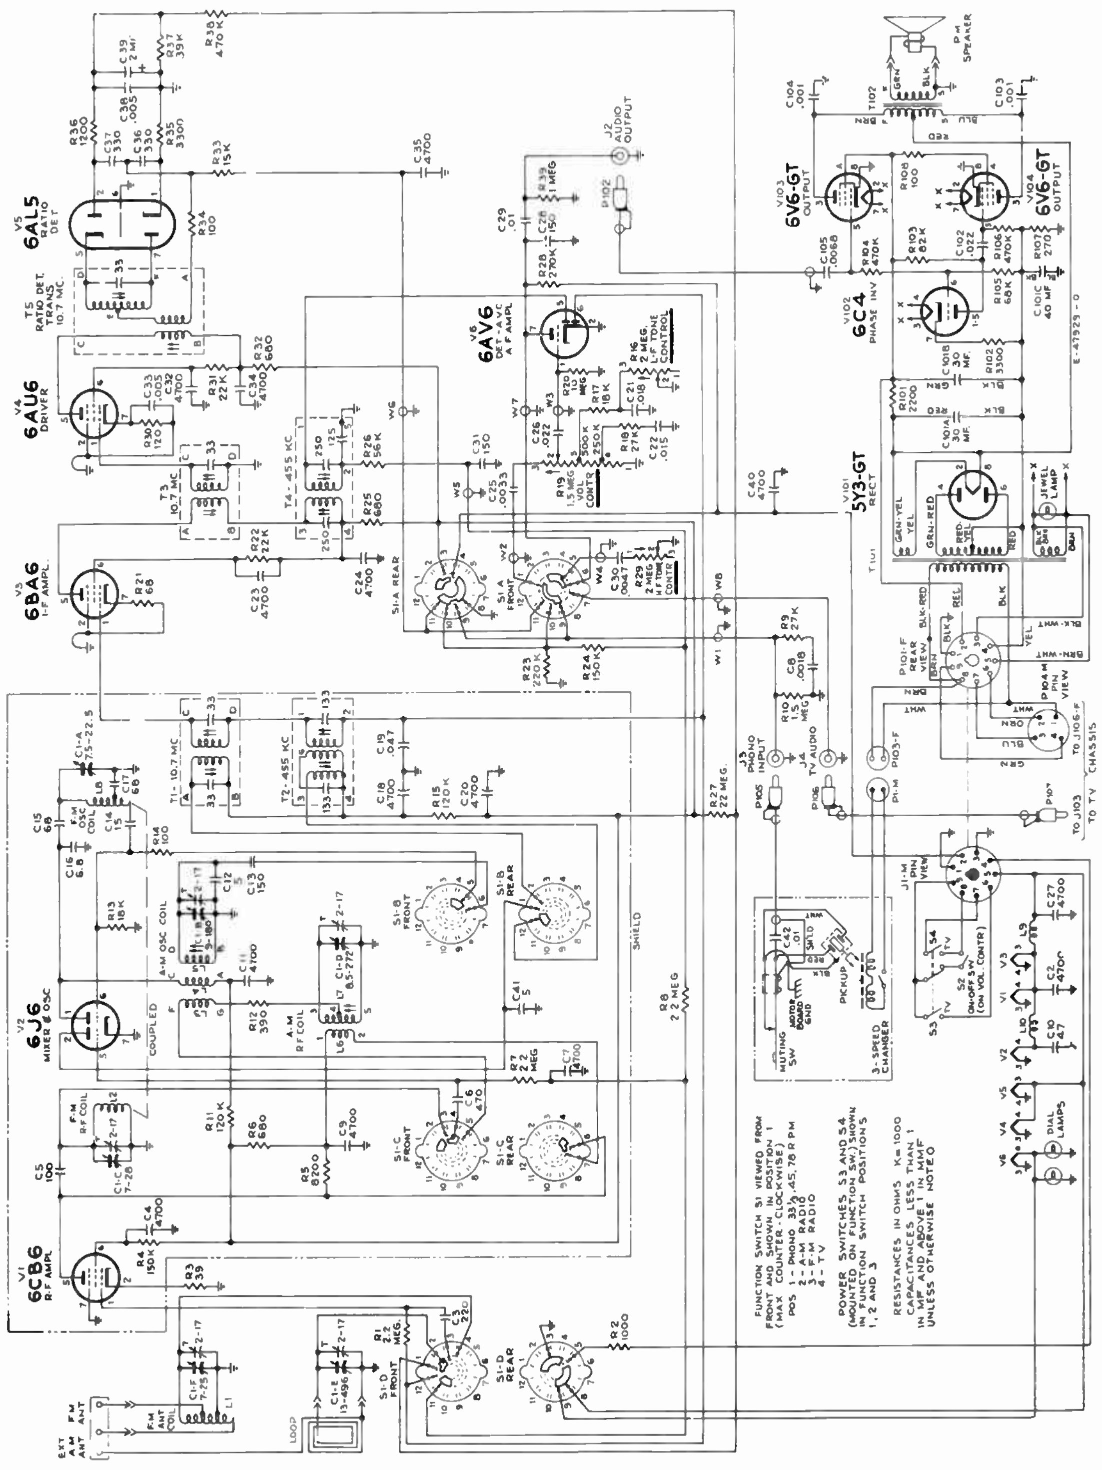
TELEVISION ALIGNMENT PROCEDURE



RADIO SCHEMATIC DIAGRAM

Figure 27—Radio Schematic Diagram

All resistance values in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

CRITICAL LEAD DRESS

1. The 1st F-M i-f plate lead should be dressed away from the r-f amp plate.
2. Dress the 1st AM i-f plate lead to the S2 wafer away from the AM r-f coil.
3. Dress the a-c power switch wires away from all audio components.
4. Dress C26 down toward the base between the terminal board and the side apron.
5. The C18 bypass ground should be as close to the r-f shelf ground strap as possible.
6. Dress C25 away from the arm contact of the volume control.
8. All leads from the r-f shelf leaving through the shields must be kept as short as possible.
9. All leads for FM should be kept short especially on the r-f shelf.
10. Dress the a-c leads in the RS141 chassis away from the audio input leads and components.
11. Dress all leads away from R101 in RS141.

RADIO ALIGNMENT PROCEDURE

Before aligning set, completely mesh the gang and set the dial pointer to the mechanical max. calibration point at extreme left end of dial. When making a complete alignment follow the table below in sequence. Connect the output meter across the speaker voice coil, and turn the receiver volume control to max. Turn tone controls for maximum highs and maximum lows.

"AM" I-F ALIGNMENT

Test-Oscillator.—Connect low side of the test-osc. to the chassis, and keep the output as low as possible to avoid a-v-c action.

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Turn Radio Dial to—	Adjust the following
1	Pin No. 1 of (43) in series with .01 mfd.	455 kc. Modulated	AM	Low Freq. end of Dial	†Top and bot. cores of T4 For max. voltage across voice coil.
2	Stator of C1-D in series with .01 mfd.	455 kc. Modulated	AM	Low Freq. end of Dial	†Top and bot. cores of T2 For max. voltage across voice coil.

†For proper adjustment of the i-f cores start with the cores all the way out. The first peak obtained will be the correct one.

FM ALIGNMENT PROCEDURE

Connect probe of "VoltOhmyst" to negative side of C39 and low side to chassis. Top shield must be on and the bottom shield off.

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Turn Radio Dial to—	Adjust the following
3	Pin No. 1 of V4 in series with .01 mfd.	10.7 mc. 30% AM Modulated	FM	———	Top of Ratio d-c† Trans. T5 for maximum DC on "VoltOhmyst."
4	Pin No. 1 of V4 in series with .01 mfd.		FM	———	Bottom of Ratio d-c† Trans. T5 for minimum audio output on meter.
5	Repeat steps 3 and 4 as necessary making final adjustment with input set to give approx. —4.0 v. on "VoltOhmyst."				
6	Pin No. 1 of V3 in series with .01 mfd.	10.7 mc.	FM	88 mc.	†Top and bottom cores of T3 for maximum d-c across C39.
7	Stator of C1-C in series with .01 mfd.	10.7 mc.	FM	88 mc.	†Top and bottom cores of T1 for maximum d-c across C39.
8	Connect sweep generator cable to antenna terminals through 120 ohms in each side of line.	90 mc. 22.5 kc. FM mod.	FM	90 mc.	OSC, L8 for max. audio output.
9		106 mc. 22.5 kc. FM mod.	FM	Tune to signal	ANT, C1-FT and R-F C1-CT for max. voltage across C39.
10		90 mc. 22.5 kc. FM mod.	FM	Tune to signal	ANT, L1 and R-F L2 for max. voltage across C39.
11	Repeat steps 8, 9 and 10 as required.				
12	Connect a scope to junct. R33 and C35. Check response and linearity. Peak separation should be at least 180 kc.				

†For proper adjustment of the i-f cores start with the cores all the way out. The first peak obtained will be the correct one.

"AM" R-F ALIGNMENT

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Turn Radio Dial to—	Adjust the following
13	External radiating loop and couple loosely to receiver loop.	1,620 kc.	AM	Min. capacity	*Osc. C1-BT for maximum output.
14		1,400 kc.	AM	Tune to signal	*C1-DT and C1-ET for max. output.
15		600 kc.	AM	Tune to signal	‡Osc. L5 for max. output while rocking gang.
16		600 kc.	AM	Tune to signal	***R-F L7 for max. output.
17	Repeat steps 13, 14, 15 and 16 until no additional gain in sensitivity is obtained.				

‡Clip a 10,000 ohm resistor across C1-D when making this adjustment.
***Be sure the resistor employed in step 15 is removed for this adjustment.
*All R-F shields must be in place.

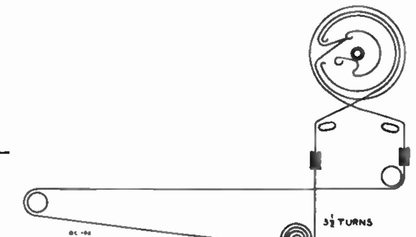

Figure 30—Dial Cord

TELEVISION VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 5000 microvolt test pattern signal was fed into the receiver, the picture synchronized and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c.

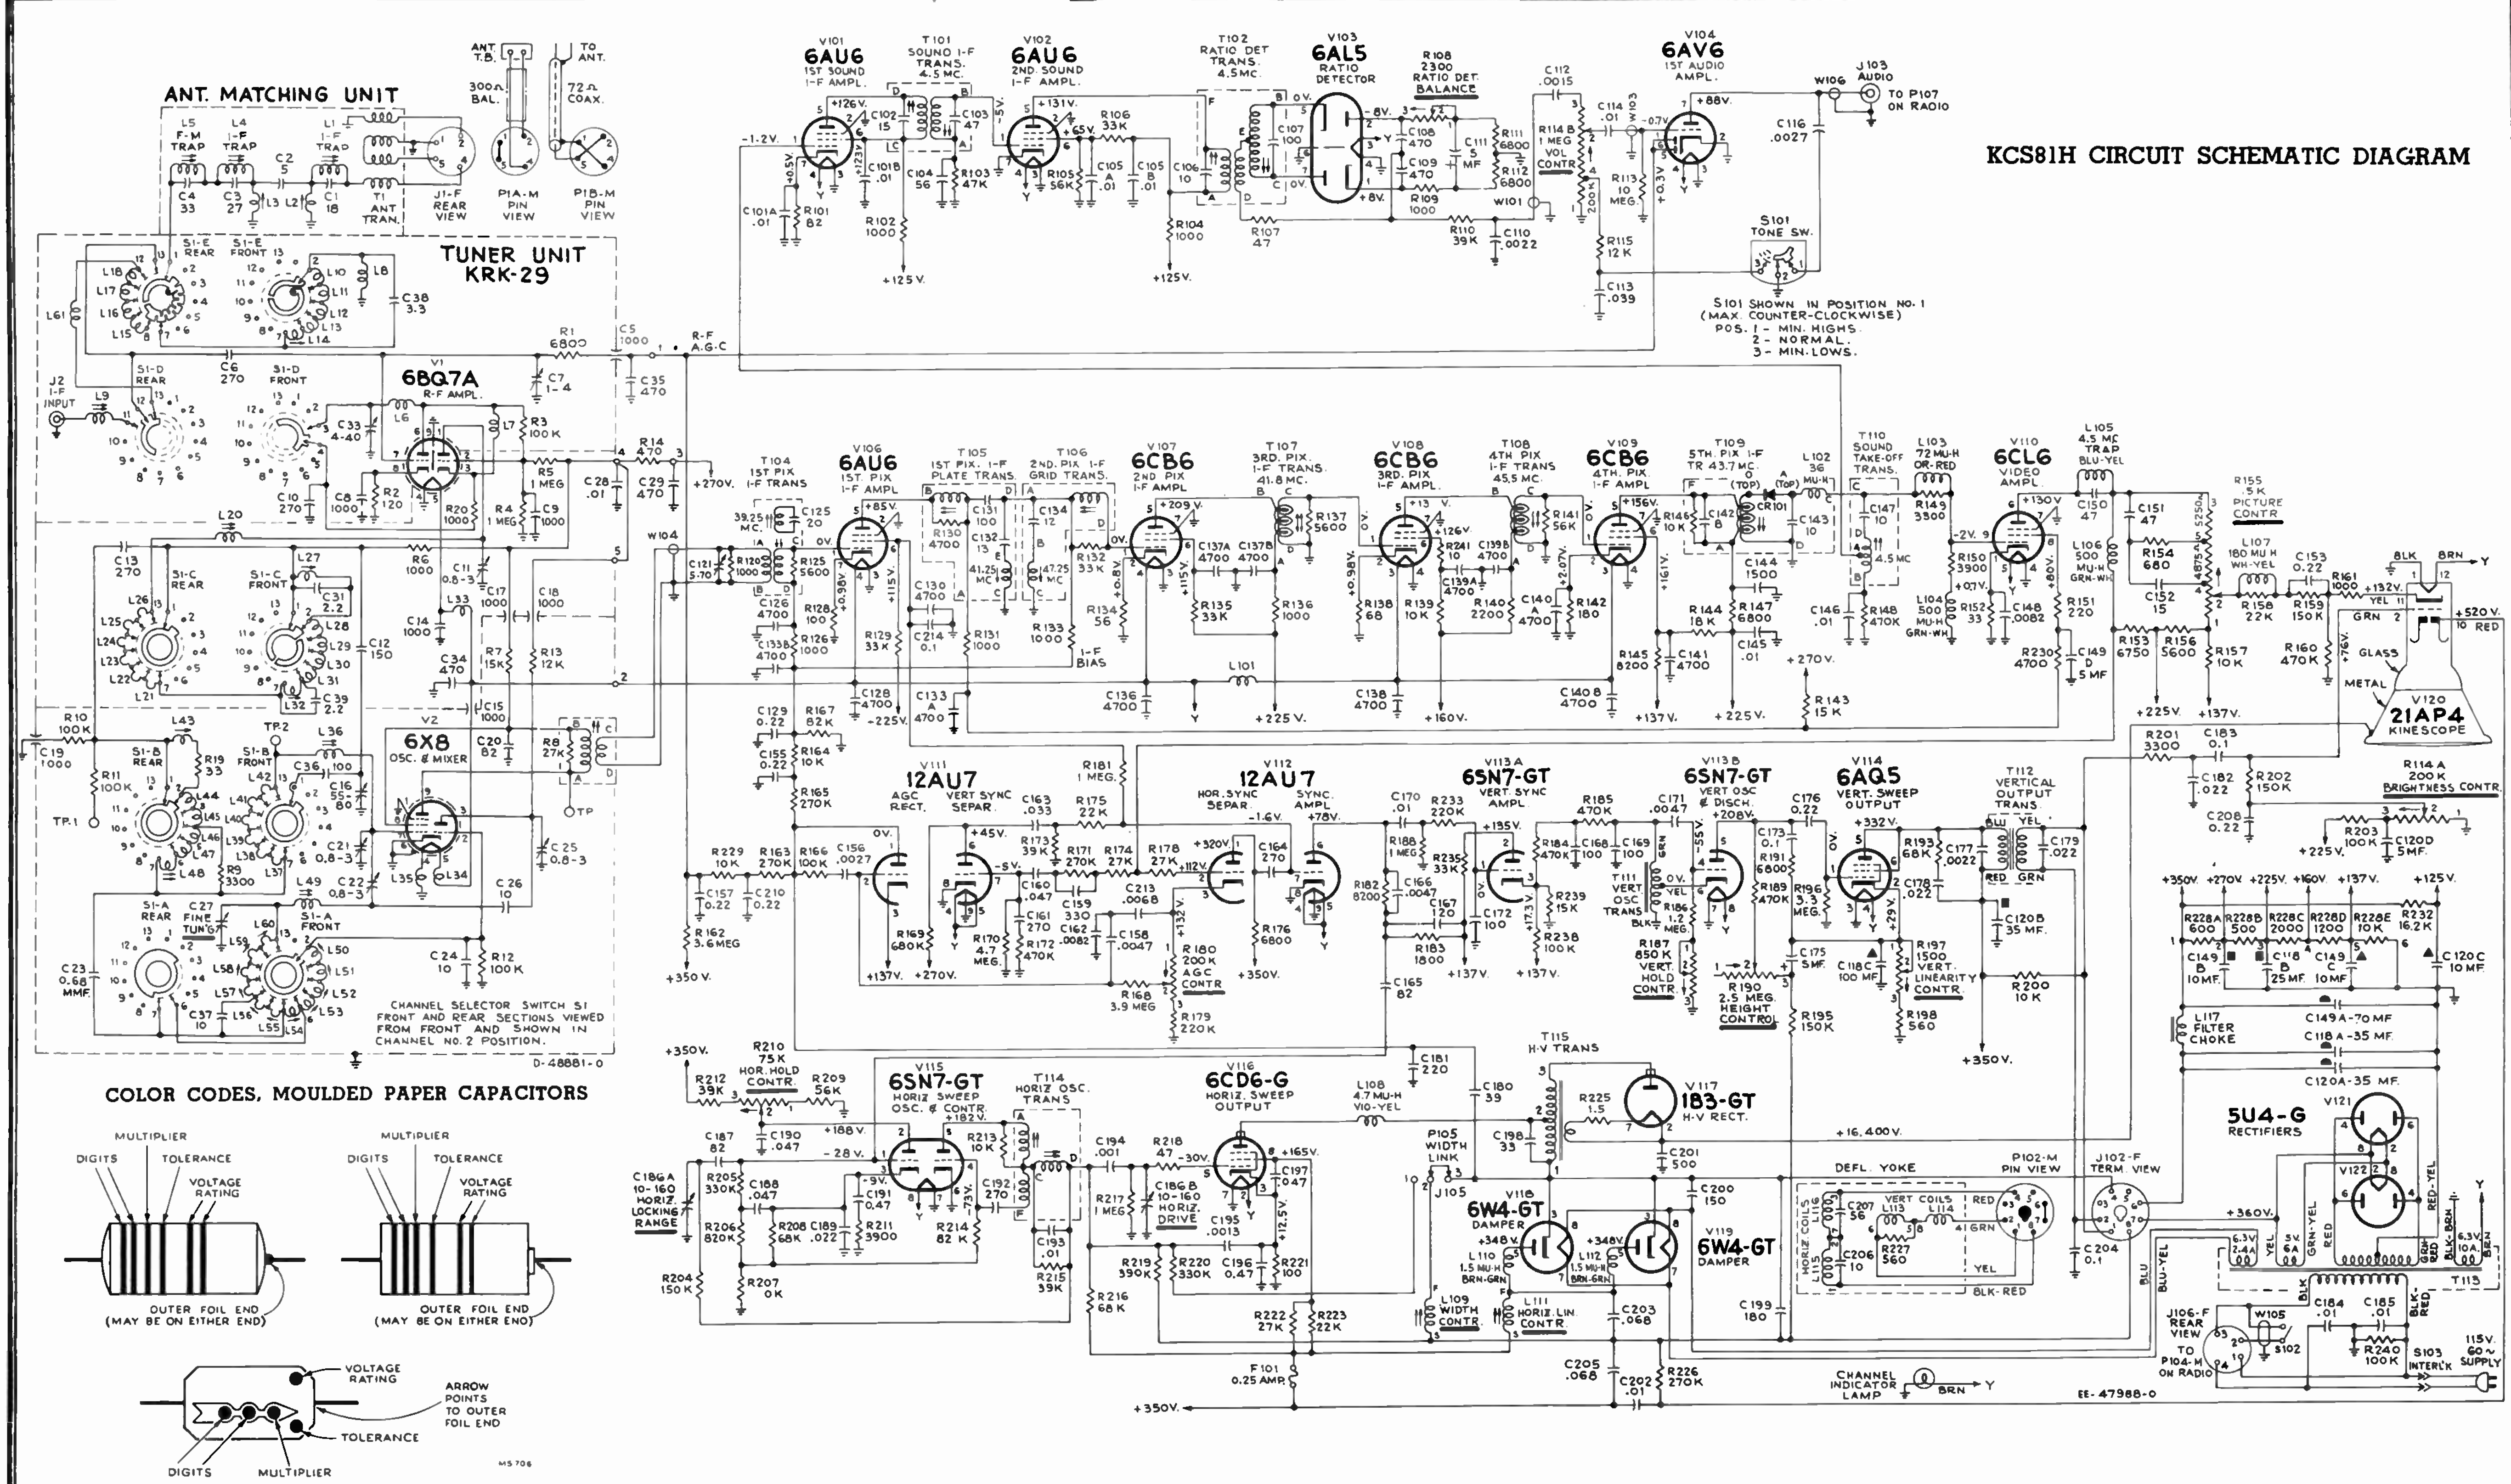
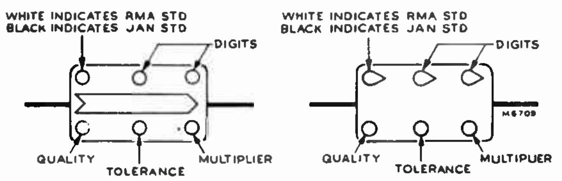
KCS81H CIRCUIT SCHEMATIC DIAGRAM



RMA COLOR CODE, FIXED MICA CAPACITORS



The schematic is shown in the latest condition at the time of printing.
All resistance values in ohms. K = 1000.

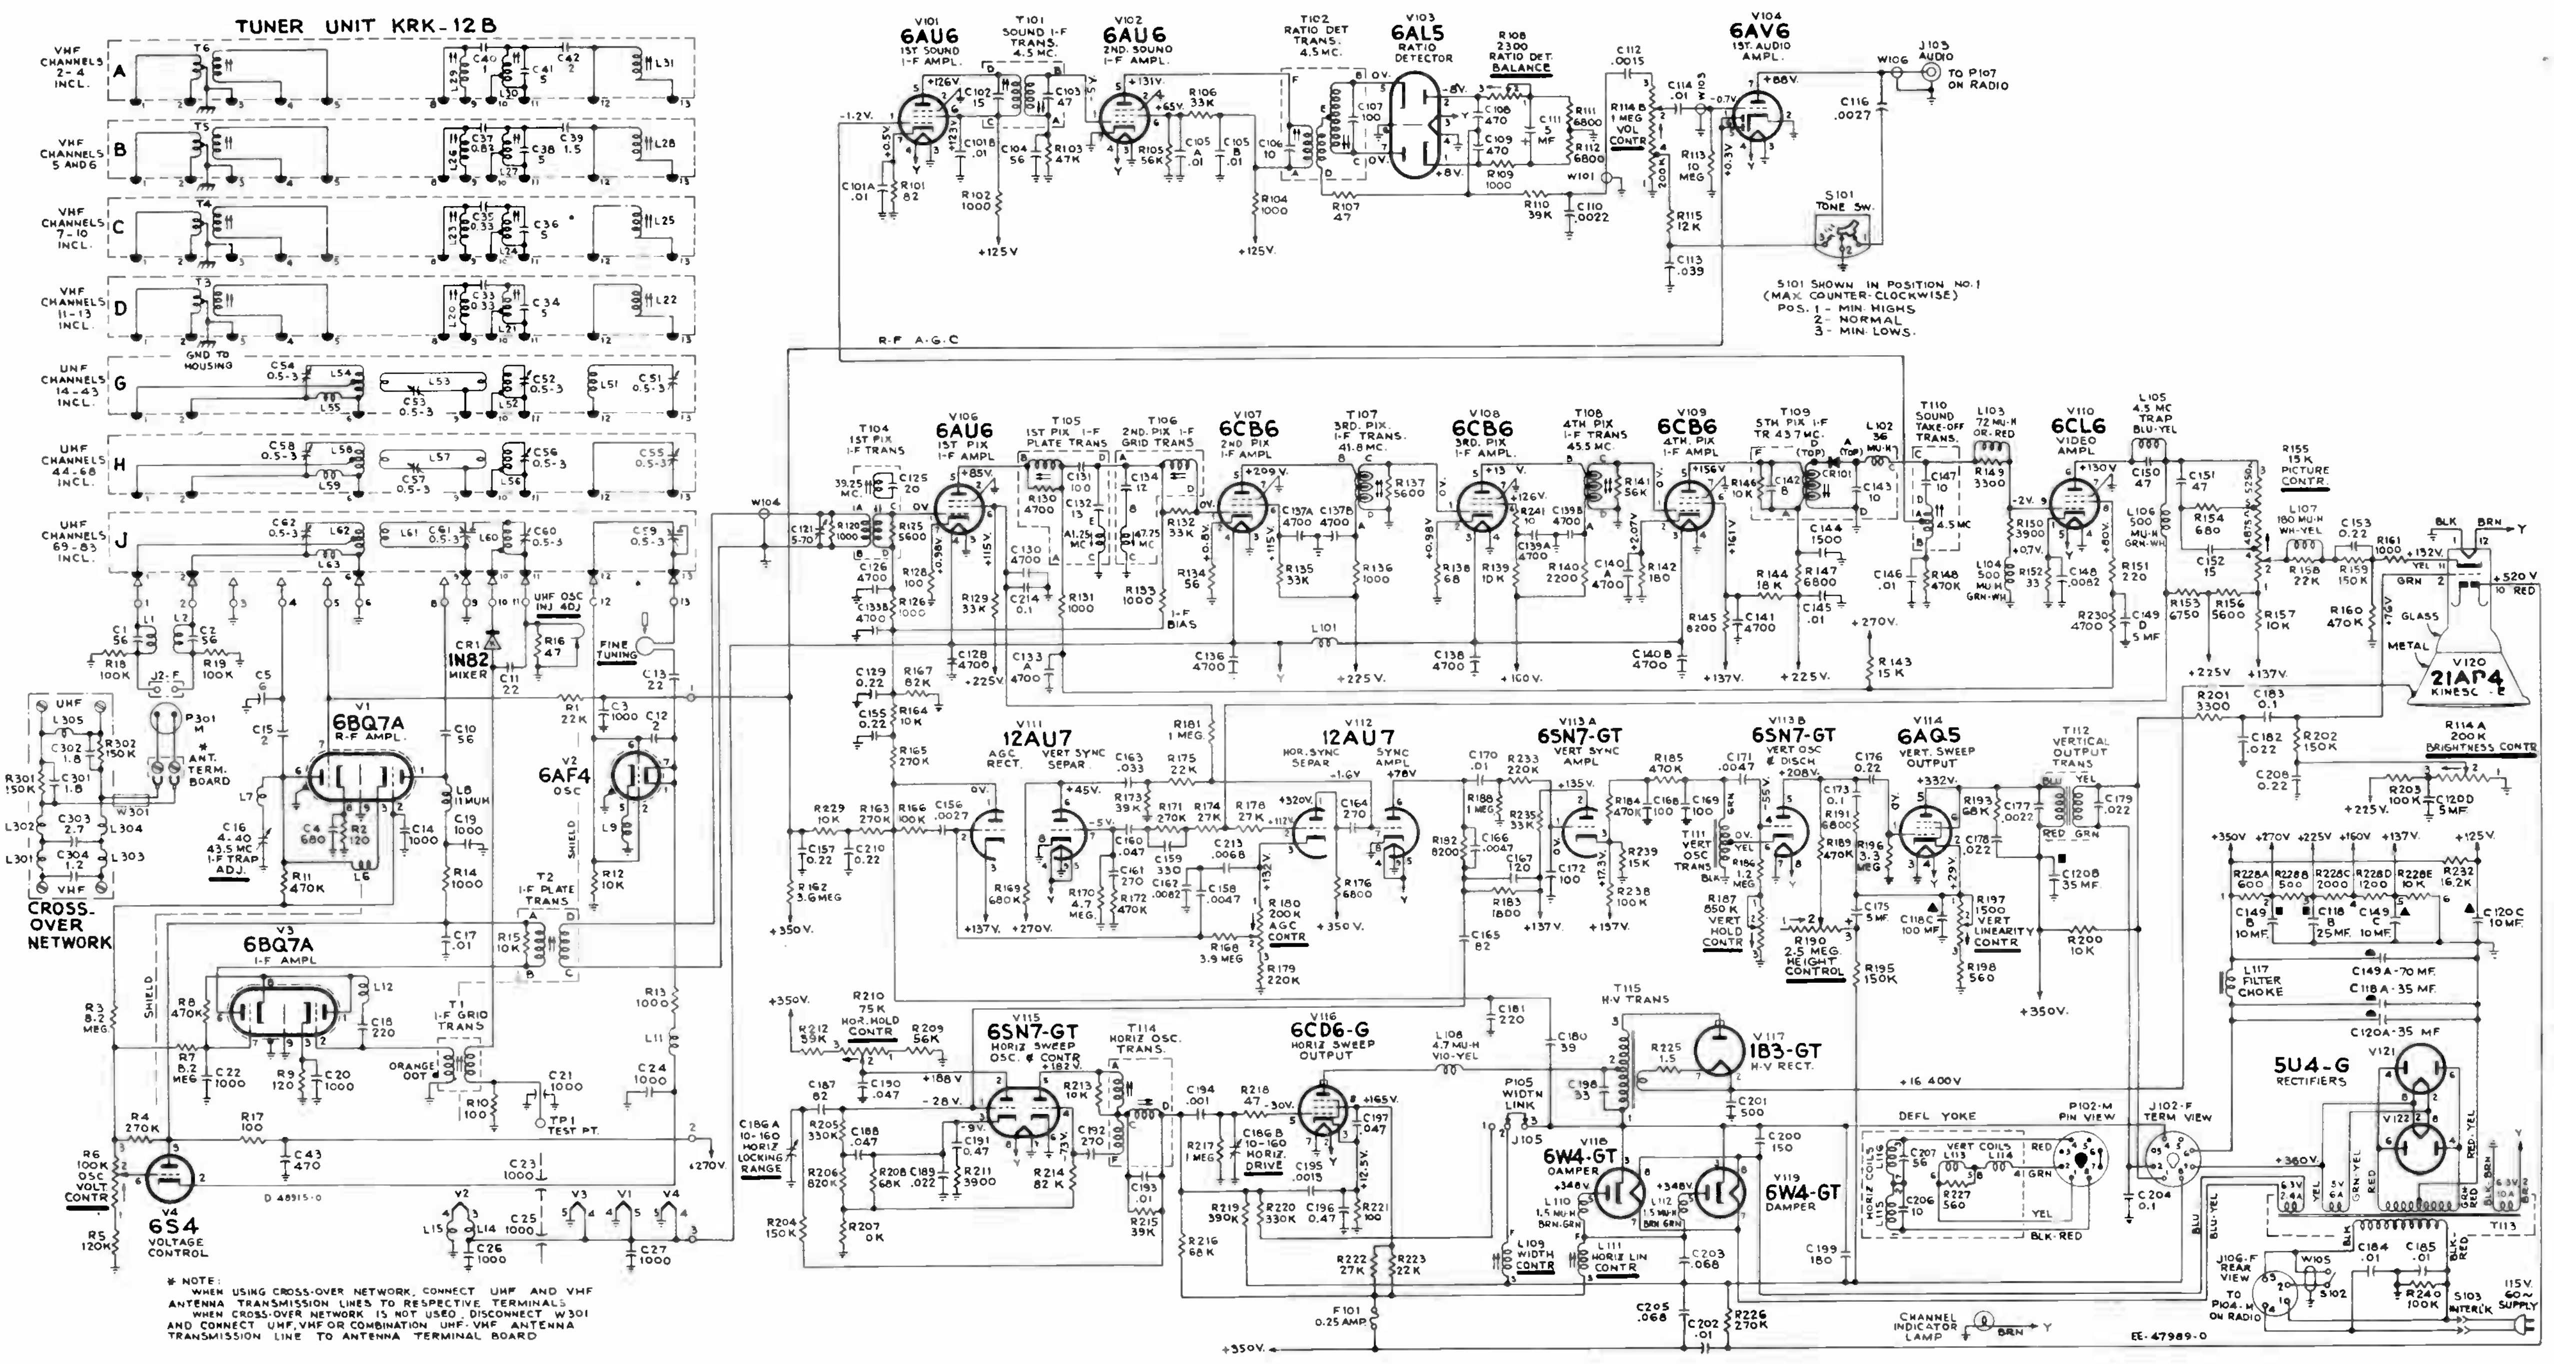
All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "Volt-Ohmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

Figure 33—Circuit Schematic Diagram, KCS81H

KCS81K CIRCUIT SCHEMATIC DIAGRAM



The schematic is shown in the latest condition at the time of printing.
All resistance values in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "Volt-Ohmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

REPLACEMENT PARTS

STOCK No.	DESCRIPTION
	RF UNIT ASSEMBLIES—KRK29
76539	Board—Antenna matching transformer terminal board less coils and capacitors
78235	Board—Terminal board, 5 contact and ground
78233	Bracket—Side bracket for mounting coil and stators
77853	Capacitor—Ceramic, variable, for fine tuning capacitor—plunger type (C27)
	Capacitor—Adjustable, mica:—
77616	4-40 mmf. (C33)
	Capacitor—Adjustable, steatite:—
77151	0.8—3.0 mmf. (C11, C21, C25)
77913	0.8—3.0 mmf. (C22)
76532	1-4 mmf. (C7)
	Capacitor—Ceramic:—
77084	feed thru, 1000 mmf. (C5, C15, C17, C18, C19)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. =0
77865	10 mmf., ±1 mmf., 500 volts (C26, C37)
	Capacitor—Fixed, ceramic, High "K" disc:—
77293	470 mmf., +100%, —0%, 500 volts (C29, C34, C35)
77252	1000 mmf., +100%, —0%, 500 volts (C8, C9, C14)
73960	10,000 mmf., +100%, —0%, 500 volts (C28)
	Capacitor—Fixed, ceramic, insulated, High "K"
75437	100 mmf., ±20%, 500 volts (C36)
78276	150 mmf., ±10%, 500 volts (C12)
75199	270 mmf., ±20%, 500 volts (C6, C10, C13)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. =0
93056	5 mmf., ±0.5 mmf., 500 volts (C2)
54207	18 mmf., ±10%, 500 volts (C1)
70935	27 mmf., ±10%, 500 volts (C3)
76739	33 mmf., ±10%, 500 volts (C4)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750
78247	10 mmf., ±10%, 500 volts (C24)
	Capacitor—Fixed, ceramic, Temp. coef. =N1400
78603	82 mmf., ±10%, 500 volts (C20)
	Capacitor—Fixed, headed-lead:—
71504	0.68 mmf., ±20%, 500 volts (C23)
71502	2.2 mmf., ±20%, 500 volts (C31, C39)
71503	3.3 mmf., ±20%, 500 volts (C38)
	Capacitor—Mica trimmer:—
78397	80-150 mmf. (C16)
77854	Clip—Fine tuning clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T1)
73874	Coil—Channel #6 mixer coil (L48)
73460	Coil—Channel #6 r.f. plate coil (L32)
73458	Coil—Channel #6 r.f. grid coil (L14)
78401	Coil—Channel #6 antenna coil (L61)
77915	Coil—Channel #13 oscillator coil (L49)
77919	Coil—Channel #13 mixer coil (L36)
77921	Coil—Channel #13 r.f. plate coil (L20)
77206	Coil—Filament choke coil (L33)
76763	Coil—Heater choke coil (L34, L35)
78271	Coil—I.F. input coil complete with adjustable core (L9)
78583	Coil—Mixer I.F. coil (L43)
76562	Coil—RF amplifier coupling coil (L7)
78584	Coil—RF plate I.F. coil (L27)
76537	Coil—Shunt coil complete with adjustable core (L3)
76538	Coil—Shunt coil complete with adjustable core (L2)
503033	33 ohms, ±10%, ½ watt (R19)
503112	120 ohms, ±10%, ½ watt (R2)
503147	470 ohms, ±10%, ½ watt (R14)
503210	1000 ohms, ±10%, ½ watt (R6, R20)
503233	3300 ohms, ±10%, ½ watt (R9)
503268	6800 ohms, ±10%, ½ watt (R1)
523312	12,000 ohms, ±10%, 2 watts (R13)
523315	15,000 ohms, ±10%, 2 watts (R7)
503410	100,000 ohms, ±10%, ½ watt (R3, R10, R11, R12)
503510	1 megohm, ±10%, ½ watt (R4, R5)
78396	Transformer—Antenna matching transformer complete (T1)
78399	Transformer—Convertor transformer (T2, R8)
76540	Trap—FM trap complete with adjustable core (L5)
78466	Trap—IF trap
76542	Trap—IF trap (41.25 MC) complete with core (L1)
76541	Trap—IF trap (45.75 MC) complete with core (L4)
75190	Washer—Insulating washer (neoprene) for capacitor
	RF UNIT ASSEMBLIES—KRK12B
77580	Ball—Steel ball (.125" dia.) (12 req'd)
77579	Ball—Steel ball (.187 " dia.)
78601	Bracket—Bracket and spring contact assembly for rotor detent ground for units stamped KRK12B1-M1
77575	Bracket—Drive mechanism mounting bracket for unit stamped KRK12B1
78599	Bracket—Drive mechanism mounting bracket for units stamped KRK12B1-M1
77589	Bracket—Lamp bracket
77619	Bracket—VHF input connector and bracket
76845	Bracket—Vertical bracket for oscillator tube shield
77591	Cam—Fine tuning cam
	Capacitor—Adjustable, mica:—
77616	4-40 mmf. (C16)
	Capacitor—Ceramic:—
77084	feed-thru, 1000 mmf. (C21, C23, C25)
77615	stand-off, 1000 mmf. (C3, C19, C24, C26)
	Capacitor—Fixed, ceramic, crystal holder, temp. coef. = —750
77621	22 mmf., ±10% (C11)
	Capacitor—Fixed, ceramic, High "K" disc:
77625	220 mmf., +100%, —0%, 500 volts DC (C18)
77293	470 mmf., +100%, —0%, 500 volts DC (C43)
77624	680 mmf., +100%, —0%, 500 volts DC (C4)
77252	1000 mmf., +100%, —0%, 500 volts DC (C14, C20, C22, C27)
73960	10,000 mmf., +100%, —0%, 500 volts DC (C17)
	Capacitor—Fixed, ceramic, insulated:— (C12, C13)
77667	comprising: 1 section of 2 mmf., and 1 section of 22 mmf.
	Capacitor—Fixed, ceramic, non-insulated, Temp. Coef. —0
77210	2 mmf., ±0.25 mmf., 500 volts DC (C15)
77688	5 mmf., ±0.5 mmf., 500 volts DC (C34, C36, C38, C41)
74182	6 mmf., ±0.5 mmf., 500 volts DC (C5)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750
71924	56 mmf., ±10%, 500 volts DC (C10)
	Capacitor—Fixed, headed-lead type:—
77691	.33 mmf., ±10%, 500 volts DC (C33, C35)
77689	.82 mmf., ±10%, 500 volts DC (C37)
77690	1.0 mmf., ±10%, 500 volts DC (C40)
71500	1.5 mmf., ±10%, 500 volts DC (C39)
78047	2 mmf., ±10%, 500 volts DC (C42)
77628	Coil—IF trap (L7)
77634	Coil—IF neutralizing coil (L12)
77629	Coil—Oscillator cathode coil (L9)
77632	Coil—Oscillator heater coil (L15)
77631	Coil—Oscillator heater coil (L14)
78224	Coil—Oscillator plate coil (L11)
77627	Coil—Peaking coil (L6, R11)
77695	Coil—RF plate coil (L8)
77489	Rectifier—Germanium rectifier IN82 (CR1)
	Resistor—Fixed, composition:—
503047	47 ohms, ±10%, ½ watt (R16)
503110	100 ohms, ±10%, ½ watt (R10, R17)
503112	120 ohms, ±10%, ½ watt (R2, R9)
503210	1000 ohms, ±10%, ½ watt (R14)
503310	10,000 ohms, ±10%, ½ watt (R12)
503322	22,000 ohms, ±10%, ½ watt (R1)
503410	100,000 ohms, ±10%, ½ watt (R18, R19)
503412	120,000 ohms, ±10%, ½ watt (R5)
503427	270,000 ohms, ±10%, ½ watt (R4)
503447	470,000 ohms, ±10%, ½ watt (R8)
503582	8.2 megohm, ±10%, ½ watt (R3, R7)
77609	Transformer—Mixer I.F. transformer complete with adjustable cores (T1)
77610	Transformer—Primary I.F. link transformer complete with adjustable cores (T2, R15)
77626	Trap—I.F. trap (L1, C1, L2, C2)
77585	Washer—"C" washer for drive and indicator shafts (3 req'd) or for link spring
	CHASSIS ASSEMBLIES KCS 81H—VHF CHASSIS KCS 81K—UHF CHASSIS
76490	Bracket—Mounting bracket complete with insulator for picture control
12118	Cap—Tube connector cap
	Capacitor—Ceramic:—
76488	500 mmf., 30,000 volts (C201)
75166	stand-off, 1500 mmf. (C144)
	Capacitor—Fixed, ceramic:—
76577	33 mmf., 6000 volts (C198)
76574	39 mmf., 3500 volts (C180)
76576	150 mmf., 2000 volts (C200)
76575	180 mmf., 3500 volts (C199)
	Capacitor—Fixed, ceramic, High "K" disc:—
73473	4700 mmf., +100%, —0%, 500 volts DC (C126, C128, C130, C136, C138, C141)
76470	dual 4700 mmf., +100%, —0%, 500 volts DC (C133A, C133B, C137A, C137B, C139A, C139B, C140A, C140B)
73960	10,000 mmf., +100%, —0%, 500 volts DC (C145, A146)
75877	dual 10,000 mmf., +100%, —0%, 500 volts DC (C101A, C101B, C105A, C105B)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750
39044	15 mmf., ±10%, 500 volts DC (C152)
39042	47 mmf., ±10%, 500 volts DC (C151)
71924	56 mmf., ±10%, 500 volts DC (C104)
39396	100 mmf., ±10%, 500 volts DC (C168, C169, C172)
71614	120 mmf., ±10%, 500 volts DC (C167)
	Capacitor—Fixed, mica:—
76474	82 mmf., 1000 volts DC (C165, C187)
75248	220 mmf., 1000 volts (C181)
39638	270 mmf., 500 volts DC (C161)
76579	270 mmf., 1000 volts DC (C164, C192)
39640	330 mmf., 500 volts DC (C159)
39644	470 mmf., 500 volts DC (C108, C109)
	Capacitor—Mica trimmer:—
71496	5-70 mmf. (C121)
75217	dual 10-160 mmf. (C186A, C186B)
	Capacitor—Electrolytic:—
74521	5 mfd., 50 volts (C111)
28417	5 mfd., 450 volts (C175)
75510	comprising:—2 sections of 35 mfd., 450 volts, 1 section of 10 mfd., 450 volts, and 1 section of 5 mfd., 450 volts (C120A, C120B, C120C, C120D)
77474	comprising:—1 section of 35 mfd., 450 volts, 1 section of 25 mfd., 450 volts, and 1 section of 100 mfd., 50 volts (C118A, C118B, C118C)
77657	comprising:—1 section of 70 mfd., 450 volts, 2 sections of 10 mfd., 450 volts, and 1 section of 5 mfd., 450 volts (C149A, C149B, C149C, C149D)
	Capacitor—Fixed, tubular, paper, oil impregnated:—
75643	.001 mfd., 1000 volts (C194)
73851	.0018 mfd., 1600 volts (C112)
73595	.0022 mfd., 600 volts (C110)
73803	.0022 mfd., 1000 volts (C177)
73599	.0027 mfd., 600 volts (C116, C156)
73920	.0047 mfd., 600 volts (C158, C166)
73789	.0068 mfd., 400 volts (C213)
73808	.0082 mfd., 1000 volts (C148, C162)
73561	.01 mfd., 400 volts (C114, C170, C202)
73562	.022 mfd., 400 volts (C178, C179, C189)
73798	.022 mfd., 600 volts (C182)
73552	.033 mfd., 400 volts (C163)
73790	.039 mfd., 400 volts (C113)
73553	.047 mfd., 400 volts (C160, C188, C190)
73592	.047 mfd., 600 volts (C197)
73815	.068 mfd., 1000 volts (C203, C205)
73551	0.1 mfd., 400 volts (C183, C214)
73557	0.1 mfd., 600 volts (C173, C204)
73794	0.22 mfd., 400 volts (C129, C153, C155, C157, C208, C210)
74957	0.22 mfd., 600 volts (C176)
73787	0.47 mfd., 200 volts (C191, C196)
	Capacitor—Fixed, tubular, moulded paper, oil impregnated:—
77727	.0013 mfd., 600 volts (C195)
73920	.0047 mfd., 600 volts (C171)
73594	.01 mfd., 600 volts (C184, C185, C193)
77676	Choke—Filter choke (L117)
76143	Clip—Mounting clip for stand-off capacitor
73477	Coil—Choke coil (L101)
76672	Coil—Filament winding only for hi-voltage transformer (Part of T115)
76483	Coil—Horizontal linearity coil complete with adjustable core (L111)
76646	Coil—Peaking coil (72 muh) (L103, R149)
76647	Coil—Peaking coil (180 muh) (L107, R158)
75252	Coil—Peaking coil (500 muh) (L104, L106)
76640	Coil—RF choke coil (1.5 muh) (L110, L112)
78598	Coil—RF choke coil (6.8 muh) (L108)
76484	Coil—Width coil complete with adjustable core (L109)
35787	Connector—Audio connector (J105)
76457	Connector—Second anode lead connector
75474	Connector—Single contact male connector for speaker cable
74594	Connector—2 contact male connector for power cord
77475	Connector—4 contact female connector for radio power input cable (J104)
50367	Connector—6 contact female connector for yoke leads (J102)
77654	Control—AGC control (R180)
77814	Control—Brightness control, volume control and power switch (R114A, R114B, S102)
77640	Control—Height control (R190)
77639	Control—Horizontal hold control (R210)
76445	Control—Picture control (R155)
77199	Control—Ratio detector balance control (R108)
77652	Control—Vertical hold control (R187)
77653	Control—Vertical linearity control (R197)
77647	Coupling—Coupling (nylon) for picture control
77136	Cover—Back cover for hi-voltage compartment
76985	Cover—Side cover for hi-voltage compartment
73600	Fuse—0.25 amp., 250 volts (F101)
76459	Grommet—Rubber grommet for 2nd. anode lead exit
76480	Lead—Anode lead complete with eyelet
76500	Plate—Hi-voltage plate (bakelite) complete less transformer, socket and lead
76649	Radiator—Heat dissipating radiator for V116
76675	Rectifier—Picture detector crystal rectifier (CR101)
	Resistor—Wire wound:—
76468	1.5 ohms, ⅓ watt (R225)
74015	100 ohms, 2 watts (R221)
77812	comprising:—1 section of 600 ohms, 16 watts, 1 section of 500 ohms, 6 watts, 1 section of 2000 ohms, 5 watts, 1 section of 1200 ohms, 1 watt and 1 section of 10,000 ohms, 5 watts (R228A, R228B, R228C, R228D, R228E)
76642	6750 ohms, 10 watts (R153)
77815	16,200 ohms, 10 watts (R232)
	Resistor—Fixed, composition:—
503010	10 ohms, ±10%, ½ watt (R241)
503033	33 ohms, ±10%, ½ watt (R152)
503047	47 ohms, ±10%, ½ watt (R107, R218)
502056	56 ohms, ±5%, ½ watt (R134)
34763	68 ohms, ±5%, ½ watt (R138)
502082	82 ohms, ±5%, ½ watt (R101)
502110	100 ohms, ±5%, ½ watt (R128)
503118	180 ohms, ±10%, ½ watt (R142)
503122	220 ohms, ±10%, ½ watt (R151)
503156	560 ohms, ±10%, ½ watt (R198)
503168	680 ohms, ±10%, ½ watt (R154)
503210	1000 ohms, ±10%, ½ watt (R102, R104, R109, R120, R126, R131, R133, R136, R161)
502218	1800 ohms, ±5%, ½ watt (R183)
503222	2200 ohms, ±10%, ½ watt (R140)
502233	3300 ohms, ±10%, ½ watt (R201)
502239	3900 ohms, ±5%, ½ watt (R150)
503239	3900 ohms, ±10%, ½ watt (R211)
503247	4700 ohms, ±10%, ½ watt (R230)
502256	5600 ohms, ±5%, ½ watt (R137)
513256	5600 ohms, ±10%, 1 watt (R156)
14659	6800 ohms, ±5%, ½ watt (R111, R112, R191)
503268	6800 ohms, ±10%, ½ watt (R176)
513268	6800 ohms, ±10%, 1 watt (R147)
503282	8200 ohms, ±10%, ½ watt (R145)
513282	8200 ohms, ±10%, 1 watt (R182)
503310	10,000 ohms, ±10%, ½ watt (R139, R164, R200, R213, R229)
513310	10,000 ohms, ±10%, 1 watt (R157)
503312	12,000 ohms, ±10%, ½ watt (R115)
503315	15,000 ohms, ±10%, ½ watt (R239)
523315	15,000 ohms, ±10%, 2 watts (R143)
503318	18,000 ohms, ±10%, ½ watt (R144)
503322	22,000 ohms, ±10%, ½ watt (R175)
522322	22,000 ohms, ±10%, 2 watts (R223)
503327	27,000 ohms, ±10%, ½ watt (R174, R178)
523327	27,000 ohms, ±10%, 2 watts (R222)
503333	33,000 ohms, ±10%, ½ watt (R106, R129, R132, R135, R235)
503339	39,000 ohms, ±10%, ½ watt (R110, R173, R212, R215)
503347	47,000 ohms, ±10%, ½ watt (R102)
502356	56,000 ohms, ±5%, ½ watt (R141)
503356	56,000 ohms, ±10%, ½ watt (R209)
513356	56,000 ohms, ±10%, 1 watt (R105)
503368	68,000 ohms, ±10%, ½ watt (R208)
512368	68,000 ohms, ±5%, 1 watt (R193)
513368	68,000 ohms, ±10%, 1 watt (R216)
8064	82,000 ohms, ±5%, ½ watt (R167)
513368	82,000 ohms, ±10%, 1 watt (R214)
503410	100,000 ohms, ±10%, ½ watt (R166, R203, R238)
513510	100,000 ohms, ±10%, 1 watt (R240)
503415	150,000 ohms, ±10%, ½ watt (R159, R195, R202, R204)
503418	180,000 ohms, ±10%, ½ watt (R207)
502422	220,000 ohms, ±5%, ½ watt (R179)
503422	220,000 ohms, ±10%, ½ watt (R233)
502427	270,000 ohms, ±5%, ½ watt (R163, R165)
503427	270,000 ohms, ±10%, ½ watt (R171, R226)
503433	330,000 ohms, ±10%, ½ watt (R205, R220)
503439	390,000 ohms, ±10%, ½ watt (R219)
503447	470,000 ohms, ±10%, ½ watt (R148, R160, R172, R184, R185, R189)
503468	680,000 ohms, ±10%, ½ watt (R169)
503482	820,000 ohms, ±10%, ½ watt (R206)
503510	1 megohm, ±10%, ½ watt (R181, R188, R217)
503512	1.2 megohm ±10%, ½ watt (R186)
503533	3.3 megohm, ±10%, ½ watt (R196)
512536	3.6 megohm, ±5%, 1 watt (R162)
503539	3.9 megohm, ±10%, ½ watt (R168)
503547	4.7 megohm, ±10%, ½ watt (R170)
503610	10 megohm, ±10%, ½ watt (R113)
77198	Transformer—1st. pix I.F. grid transformer complete with adjustable cores (T104, C125, R125)
77197	Transformer—1st. pix I.F. plate transformer complete with adjustable cores (T105, C131, C132, R130)
76435	Transformer—2nd. pix I.F. grid transformer complete with adjustable cores (T106, C134)
76433	Transformer—3rd. or 4th. pix I.F. transformer (T107, T108)
76436	Transformer—5th. pix I.F. transformer (T109, C142, C143, CR101, L102, R146)
76501	Transformer—Hi-voltage transformer (Part of T115)
76440	Transformer—Horizontal oscillator transformer complete with adjustable cores (T114)
77649	Transformer—Power transformer 117 volts, 60 cycle (T113)
76439	Transformer—Ratio detector transformer complete with adjustable cores (T102, C106, C107)
76437	Transformer—Sound take-off transformer complete with adjustable cores (T110, C147)
76438	Transformer—Sound I.F. transformer complete with adjustable cores (T101, C102, C103)
77650	Transformer—Vertical oscillator transformer (T111)
76494	Transformer—Vertical output transformer (T112)
76482	Trap—4.5 MC trap (L105, C150)
77585	Washer—"C" washer for picture control extension shaft (2 req'd)
	CHASSIS ASSEMBLIES—RC 1111A
77308	Capacitor—Variable tuning capacitor (C1A, C1B, C1C, C1D, C1E, C1F)
	Capacitor—Fixed, ceramic, high K disc:—
73473	4700 mmf., +100%, —0%, 500 volts DC (C2, C4, C7, C9, C11, C18, C20, C23, C24, C27, C32, C34, C35, C40)
	Capacitor—Fixed, ceramic, insulated, high K disc:—
76348	47 mmf., ±10%, 500 volts DC (C10)
75614	150 mmf., ±20%, 500 volts DC (C13, C28, C31)
75611	220 mmf., ±20%, 500 volts DC (C3)
	Capacitor—Fixed, ceramic, non-insulated, temp. coer. = —470, ±15%
77352	6.8 mmf., ±5%, 500 volts DC (C16)
	Capacitor—Fixed, ceramic, non-insulated, temp. coef. = —750
75613	5 mmf., ±1.0 mmf., 500 volts DC (C12, C41)
39044	15 mmf., ±10%, 500 volts DC (C14)
75612	68 mmf., ±10%, 500 volts DC (C15, C17)
39396	100 mmf., ±10%, 500 volts DC (C5)
	Capacitor—Fixed, mica:—
39640	330 mmf., 500 volts (C36, C37)
39644	470 mmf., 300 volts (C6)
	Capacitor—Electrolytic:—
73747	2 mfd., 50 volts (C39)
	Capacitor—Fixed, tubular, paper:—
77468	.0018 mfd., 600 volts (C8)
73795	.0033 mfd., 400 volts (C25)
73920	.0047 mfd., 600 volts (C30)
72490	.005 mfd., 200 volts (C33, C38)
73561	.01 mfd., 400 volts (C29)
73797	.015 mfd., 600 volts (C22)
77469	.018 mfd., 200 volts (C21)
73562	.022 mfd., 400 volts (C26)
73558	.047 mfd., 200 volts (C19)
73935	Clip—Mounting clip for I.F. transformers 75558 and 76328

REPLACEMENT PARTS (Continued)

STOCK No.	DESCRIPTION
77313	Coil—Antenna coil—F.M. (L1)
71942	Coil—Filament choke coil (L9, L10)
75569	Coil—Oscillator coil—AM—complete with adjustable core (L3, L4, L5)
77315	Coil—Oscillator coil—FM (L8)
77305	Coil—RF coil—AM—complete with adjustable core (L6, L7)
77314	Coil—RF coil—FM (L2)
33514	Connector—Dual single contact female connector for phono or TV audio (J3, J4)
35787	Connector—Single contact female connector for audio cable (J2)
74879	Connector—2 contact female connector for antenna leads
75062	Connector—9 contact male connector for power input (J1)
75562	Control—Tone control—HF (R29)
75561	Control—Tone control—LF (R16)
75537	Control—Volume control and power switch (R19, S2)
	Resistor—Fixed, composition:—
503039	39 ohms, ±10%, ½ watt (R3)
503068	68 ohms, ±10%, ½ watt (R21)
503110	100 ohms, ±10%, ½ watt (R14, R34)
503112	120 ohms, ±10%, ½ watt (R30)
503139	390 ohms, ±10%, ½ watt (R12)
503168	680 ohms, ±10%, ½ watt (R6, R25, R32)
503210	1000 ohms, ±10%, ½ watt (R2)
502212	1200 ohms, ±5%, ½ watt (R36)
502233	3300 ohms, ±5%, ½ watt (R35)
503282	8200 ohms, ±10%, ½ watt (R5)
503315	15,000 ohms, ±10%, ½ watt (R33)
503318	18,000 ohms, ±10%, ½ watt (R13, R17)
503322	22,000 ohms, ±10%, ½ watt (R22, R31)
503327	27,000 ohms, ±10%, ½ watt (R9, R18)
503339	39,000 ohms, ±10%, ½ watt (R37)
503356	56,000 ohms, ±10%, ½ watt (R26)
503412	120,000 ohms, ±10%, ½ watt (R11, R15)
503415	150,000 ohms, ±10%, ½ watt (R4, R24)
503422	220,000 ohms, ±10%, ½ watt (R23)
503427	270,000 ohms, ±10%, ½ watt (R28)
503447	470,000 ohms, ±10%, ½ watt (R38)
503510	1 megohm, ±10%, ½ watt (R39)
503515	1.5 megohm, ±10%, ½ watt (R10)
503522	2.2 megohm, ±10%, ½ watt (R1, R7, R8)
503610	10 megohm, ±10%, ½ watt (R20)
504622	22 megohm, ±20%, ½ watt (R27)
75540	Shaft—Tuning knob shaft
73584	Shield—Tube shield for V1, V6
75192	Shield—Tube shield for V2
77310	Slide—Slide mechanism (2 req'd)
31364	Socket—Dial lamp socket
74179	Socket—Tube socket, 7 contact, miniature, for V1, V3, V4, V5
77306	Socket—Tube socket, 7 pin, moulded saddle-mounted for V2
73117	Socket—Tube socket, 7 contact, miniature wafer for V6
77312	Spring—Actuating spring for bottom cover latch
76332	Spring—Drive cord spring
75563	Spring—Retaining spring for function switch extension shaft
76422	Spring—Retaining spring for slide mechanism stop pin
77304	Support—Polystyrene support for FM oscillator coil complete with mounting bracket
77476	Switch—Function switch (S1, S3, S4)
75558	Transformer—1st I.F. transformer—AM—complete with adjustable cores (T2)
75559	Transformer—1st I.F. transformer—FM—complete with adjustable cores (T1)
76328	Transformer—2nd I.F. transformer—AM—complete with adjustable cores (T4)
75560	Transformer—2nd I.F. transformer—FM—complete with adjustable cores (T3)
73743	Transformer—Ratio detector transformer complete with adjustable core (T5)
33726	Washer—"C" washer for tuning knob shaft or drive cord pulley

POWER AMPLIFIER ASSEMBLIES
RS 141E

STOCK No.	DESCRIPTION
74296	Cable—Shielded audio cable complete with pin plug—part of interconnecting cable
72447	Cable—Shielded audio cable complete with two (2) pin plugs—part of interconnecting cable
77324	Capacitor—Electrolytic comprising 1 section of 30 mfd., 450 volts; 1 section of 30 mfd., 350 volts; and 1 section of 40 mfd., 25 volts (C1A, C1B, C1C)
	Capacitor—Tubular, paper:—
73789	.0068 mfd., 400 volts (C5)
73562	.022 mfd., 400 volts (C2)
	Capacitor—Tubular, paper, oil impregnated:—
75643	.001 mfd., 1000 volts (C3, C4)
30868	Connector—2 contact female connector for phono power—part of interconnecting cable (P3)
77478	Connector—4 contact male connector for radio power input—part of interconnecting cable (P4)
75064	Connector—9 contact female connector for interconnecting cable (P1)
72776	Pin—Contact pin for speaker lead (2 req'd)
	Resistor—Wire wound:—
73627	2200 ohms, 5 watts (R1)
	Resistor—Fixed, composition:—
503110	100 ohms, ±10%, ½ watt (R8)
522127	270 onms, ±5%, 2 watts (R7)
802233	3300 ohms, ±5%, ½ watt (R2)
503368	68,000 ohms, ±10%, ½ watt (R5)
503382	82,000 ohms, ±10%, ½ watt (R3)
503447	470,000 ohms, ±10%, ½ watt (R4, R6)
77479	Shell—Shell for 4 contact male connector
31364	Socket—Pilot lamp socket
73117	Socket—Tube socket, 7 pin, miniature, wafer
31251	Socket—Tube socket, octal, wafer
77323	Transformer—Output transformer (T2)
75566	Transformer—Power transformer, 117 volt, 60 cycle (T1)

SPEAKER ASSEMBLIES
92569—12W RL—111A1 RMA—274

STOCK No.	DESCRIPTION
75682	Cone—Cone and voice coil (3.2 ohms)
76093	Speaker—12" PM speaker complete with cone and voice coil (3.2 ohms)

Note:—If stamping on speaker on instruments does not agree with above speaker number, order replacement parts by referring to Model number of instruments, number stamped on speaker and full description of part required.

STOCK No.	DESCRIPTION
	Capacitor—Adjustable, mica:—
71807	10-160 mmf. for instruments using KRK12B tuner
	Capacitor—Fixed, headed-lead:—
78532	1.2 mmf., ±10%, 500 volts (C4)
78442	1.8 mmf., ±10%, 500 volts (C1, C2)
78443	2.7 mmf., ±10%, 500 volts (C3)
	Capacitor—Fixed, tubular, paper:—
73561	.01 mfd., 400 volts
77726	Connector—2 contact male connector for TV antenna cable for instruments using KRK12B tuner
39153	Connector—4 contact male connector for TV antenna cable for instruments using KRK29 tuner
75542	Connector—6 contact male connector for deflection yoke leads (P102)
71457	Cord—Power cord and plug
77864	Cover—Cover and case assembly for hidden controls
77759	Cover—Cover assembly complete with spring for channel markers for instruments using KRK12B tuner
77770	Cushion—Adhesive cushion for safety glass retainer
77749	Cushion—Rubber cushion for safety glass
76698	Cushion—Rubber cushion for masking panel support bracket
78313	Cushion—Rubber cushion for dust sealing the kinescope
74956	Cushion—Rubber cushion for deflection yoke hood
77782	Decal—Brightness, tuning and volume controls and channel selector switch function decal
74273	Decal—"Victrola" decal
77756	Disc—Polystyrene indicator disc for channel selections for instruments using KRK12B tuner
78315	Escutcheon—Channel marker escutcheon for instruments using KRK29 tuner
78314	Glass—Safety glass
37396	Grommet—Rubber grommet for mounting speaker
73420	Hinge—Butt hinge for center door
78504	Hinge—Hinges (1 set) for lower doors
74308	Hinge—Hinges (1 set) for upper doors
78308	Hood—Deflection yoke hood less rubber cushions
77811	Knob—Radio function switch knob
77810	Knob—Radio tuning control, tone controls or volume control and power switch knob
77709	Knob—Television brightness control knob (outer)
77968	Knob—Television channel selector knob for instruments using KRK12B tuner (inner)
77708	Knob—Television channel selector knob for instruments using KRK29 tuner (inner)
77750	Knob—Television fine tuning control knob for instruments using KRK12B tuner (outer)
77707	Knob—Television fine tuning control knob for instruments using KRK29 tuner (outer)
77699	Knob—Television picture control knob
77735	Knob—Television tone switch knob
77710	Knob—Television volume control and power switch knob (inner)
11765	Lamp—Channel escutcheon or pilot lamp—Mazda 51
76167	Magnet—Focus magnet
76141	Magnet—Ion trap magnet
77765	Marker—UHF channel number markers for instruments using KRK12B tuner
77762	Marker—VHF channel number markers for instruments using KRK12B tuner
78316	Mask—Channel marker escutcheon light mask for instruments using KRK29 tuner
78311	Mask—Polystyrene masking panel
77784	Madallion—"His Master's Voice" medallion
77783	Nameplate—"Deluxe" nameplate
78326	Nut—¼-20 knurled nut for deflection yoke hood support rod
73634	Nut—Speednut for speaker mounting screws
74337	Nut—Speednut to fasten "Deluxe" nameplate to cabinet
76601	Pad—Kinescope edge support pad (rubber)
78555	Pull—Door pull for lower doors
78502	Pull—Door pull for upper door
503415	Resistor—Fixed, composition:—150,000 ohms, ±10%, ½ watt (R1, R2)
77928	Retainer—Channel selector knob retainer for instruments using KRK12B tuner
78249	Retainer—Side retainer for safety glass
77747	Retainer—Top or bottom retainer for safety glass
78322	Rod—Hook shape threaded rod for deflection yoke hood assembly
77712	Screw—#6 x ½" cross recessed binder head self tapping screw for mounting hidden control cover and case bracket
76632	Screw—#8 x ⅝" hex head wood screw for kinescope masking panel support bracket
75623	Screw—#8 x ⅝" trimit head screw for door pull #78502
74113	Screw—#8 x 1" trimit head screw for door pull
78447	Shade—Channel indicator lamp shade for instruments using KRK12B tuner
76630	Spring—Formed spring for kinescope masking panel
78324	Spring—Formed spring for safety glass retainer
78445	Spring—Grounding spring for deflection yoke
76837	Spring—Retaining spring for knobs 77699, 77708, 77709, 77735
72845	Spring—Retaining spring for knob 77707
30330	Spring—Retaining spring for knob 77710
78325	Spring—Spring clip for channel marker escutcheon for instruments using KRK29 tuner or for channel indicator lamp shade instruments using KRK12B tuner
74734	Spring—Spring clip for radio control knobs and for channel markers cover assembly
74936	Spring—Suspension spring for kinescope socket leads
75902	Spring—Suspension spring for amplifier cable
72936	Stop—Door stop
76636	Stud—Adjusting stud complete with guard for focus magnet
75500	Washer—Felt washer for back cover or kinescope masking panel mounting screws
78628	Washer—Paper washer—brown—for hidden control knobs
78278	Yoke—Deflection yoke (L113, L114, L115, L116, C206, C207, P102, R227)

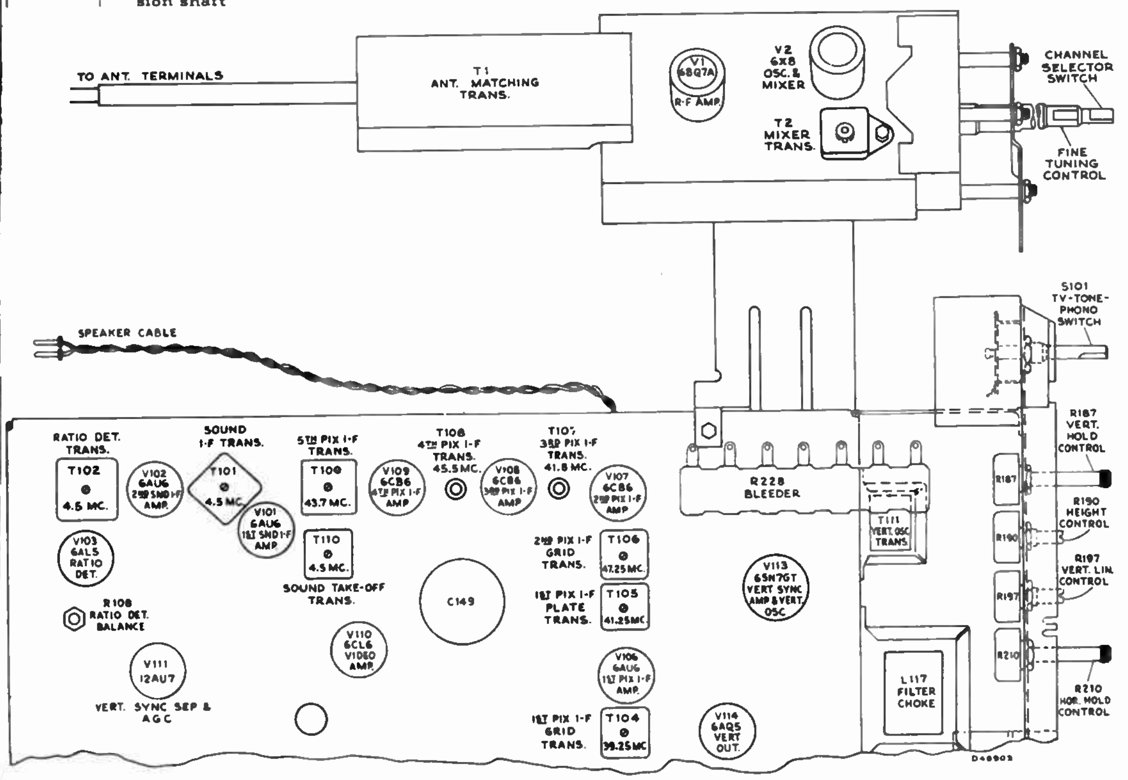

Figure 31—Television Top Chassis Adjustments (KRK29 Tuner Shown)

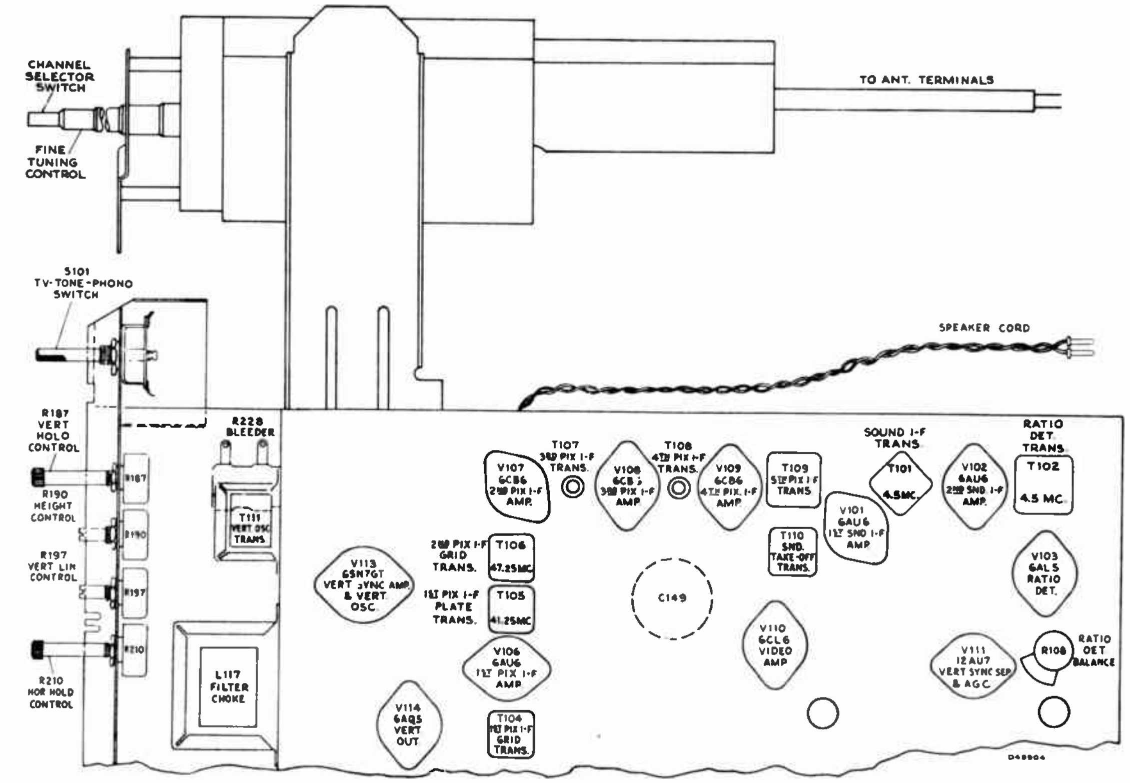

Figure 32—Television Bottom Chassis Adjustments (KRK29 Tuner Shown)

GENERAL DESCRIPTION

Models 21-T-392, 21-T-392U, 21-T-393 and 21-T-393U are "21 inch" television, radio, phonograph combinations. Model 21-T-392 features an AM radio and full 12 channel VHF coverage. Model 21-T-392U features an AM radio and full 12 channel VHF coverage plus any 4 UHF channels desired.

Model 21-T-393 features an AM/FM radio and full 12 channel VHF coverage.

Model 21-T-393U features an AM/FM radio and full 12 channel VHF coverage plus any 4 UHF channels desired. All models employ a three speed record changer and a 12 inch PM dynamic speaker.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE......227 square inches on a 21AP4 Kinescope

TELEVISION R-F FREQUENCY RANGE

Models 21-T-392 and 21-T-393

All 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

Models 21-T-392U and 21-T-393U

Any of 70 UHF channels..................470 mc. to 890 mc.

Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc. (Any desired combination of 16 UHF and/or VHF channels may be used.)

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency......................45.75 mc.

Sound I-F Carrier Frequency.............4.5 mc and 41.25 mc.

VIDEO RESPONSE..............................To 3.5 mc.

SWEEP DEFLECTION..............................Magnetic

FOCUS..............................Magnetic

POWER SUPPLY RATING................115 volts, 60 cycles

21-T-392, 21-T-393............................215 watts max.

21-T-392U, 21-T-393U.........................230 watts max.

CHASSIS DESIGNATIONS

In Model 21-T-392......Television Chassis KCS83F, Radio Chassis RC1117B and Record Changer 930409-5 or -10.

In Model 21-T-393......Television Chassis KCS83F, Radio Chassis RC1111C, Audio Amplifier RS141D and Record Changer 930409-5 (mah.).

In Model 21-T-392U......Television Chassis KCS83H, Radio Chassis RC1117B and Record Changer 930409-5 or -10.

In Model 21-T-393U......Television Chassis KCS83H, Radio Chassis RC1111C, Audio Amplifier RS141D and Record Changer 930409-5 (mah.).

See Service Data 930409 for Record Changer information.

AUDIO OUTPUT RATING.....KCS83F, KCS83H, 4 watts max. RC1117B.......2.4 watts max., RS141D.......10 watts max.

LOUDSPEAKER.......(92569-12W) 12" PM Dynamic, 3.2 ohms

ANTENNA INPUT IMPEDANCE

Models 21-T-392 and 21-T-393

Choice: 300 ohms balanced or 72 ohms unbalanced.

Models 21-T-392U and 21-T-393U

UHF—300 ohms balanced.

VHF—300 ohms balanced.

RCA TUBE COMPLEMENT

Tube Used	Radio Chassis RC1117B Function
(1) RCA 12BE6	Converter
(2) RCA 12BA6	I-F Amplifier
(3) RCA 6AQ6	2nd Det. and Audio Amp.
(4) RCA 6AQ6	Phase Inverter
(5) RCA 35C5	Audio Output (2 tubes)

Radio Chassis RC1111C

(1) RCA 6CB6	R-F Amplifier
(2) RCA 6J6	Oscillator and Mixer
(3) RCA 6BA6	I-F Amplifier
(4) RCA 6AU6	FM Driver
(5) RCA 6AL5	Ratio Detector
(6) RCA 6AV6	AM 2nd Det. and 1st Audio Amp.

Audio Chassis RS141D

(1) RCA 6C4	Phase Inverter
(2) RCA 6V6GT	Audio Output (2 tubes)
(3) RCA 5Y3GT	Rectifier

ELECTRICAL AND MECHANICAL SPECIFICATIONS (Continued)

RCA TUBE COMPLEMENT—TELEVISION CHASSIS

KCS83F—KRK29 Tuner

Tube Used	Function
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer

KCS83H—KRK12A Tuner

(1) RCA 6BQ7A	R-F Amplifier (VHF only)
(2) RCA 6AF4	R-F Oscillator
(3) RCA 6BQ7A	I-F Amplifier
(4) RCA 6S4	Voltage Control

A 1N82 crystal is used as a mixer.

All Models

(1) RCA 6CF6	1st Picture I-F Amplifier
(2) RCA 6CF6	2nd Picture I-F Amplifier
(3) RCA 6CB6	3rd Picture I-F Amplifier
(4) RCA 12AU7	Picture 2nd Det. and Horiz. Sync. Sep.
(5) RCA 6X8	Video Amplifier and Vert. Sync. Sep.
(6) RCA 12AU7	Video Output and AGC
(7) RCA 6AU6	1st Sound I-F Amplifier
(8) RCA 6AU6	2nd Sound I-F Amplifier
(9) RCA 6AL5	Ratio Detector
(10) RCA 6AV6	Audio Amplifier
(11) RCA 6K6GT	Audio Output
(12) RCA 6SN7GT	Vert. Osc. & Dischg. & Sync. Output
(13) RCA 6K6GT	Vertical Sweep Output
(14) RCA 6SN7GT	Horiz. Sweep Oscillator and Control
(15) RCA 6BQ6GT	Horizontal Sweep Output
(16) RCA 6AX4GT	Damper
(17) RCA 1B3-GT/8016	High Voltage Rectifier
(18) RCA 21AP4	Kinescope
(19) RCA 5U4G	Rectifier
(20) RCA 5Y3GT	Rectifier

OPERATING CONTROLS (Front)

Channel Selector / Fine Tuning ....Dual Control Knobs

Sound Volume and On-Off Switch / Picture ......Dual Control Knobs

Brightness.........................Single Control under Panel

Picture Horizontal Hold............Single Control under Panel

Picture Vertical Hold...............Single Control under Panel

TV Tone.............................Single Control under Panel

NON-OPERATING CONTROLS (under Front Panel)

Height..............................screwdriver adjustment

Vertical Linearity...................screwdriver adjustment

NON-OPERATING CONTROLS (not including R-F and I-F adjustments)

Picture Centering......................top chassis adjustment

Width..............................rear chassis adjustment

Horizontal Drive...........rear chassis screwdriver adjustment

Horizontal Linearity..................rear chassis adjustment

Horizontal Oscillator Frequency.......rear chassis adjustment

Horizontal Oscillator Waveform......bottom chassis adjustment

Horizontal Locking Range............rear chassis adjustment

Focus..............................top chassis adjustment

Ion Trap Magnet.....................top chassis adjustment

Deflection Coil................top chassis wing nut adjustment

AGC Control.........................rear chassis adjustment

HORIZONTAL SWEEP FREQUENCY...............15,750 cps

VERTICAL SWEEP FREQUENCY......................60 cps

FRAME FREQUENCY (Picture Repetition Rate)..........30 cps

Models 21-T-392, 21-T-392U "Whitfield" Mahogany, Walnut

Models 21-T-393, 21-T-393U "Birchfield" Mahogany

TELEVISION CHASSIS BOTTOM VIEW

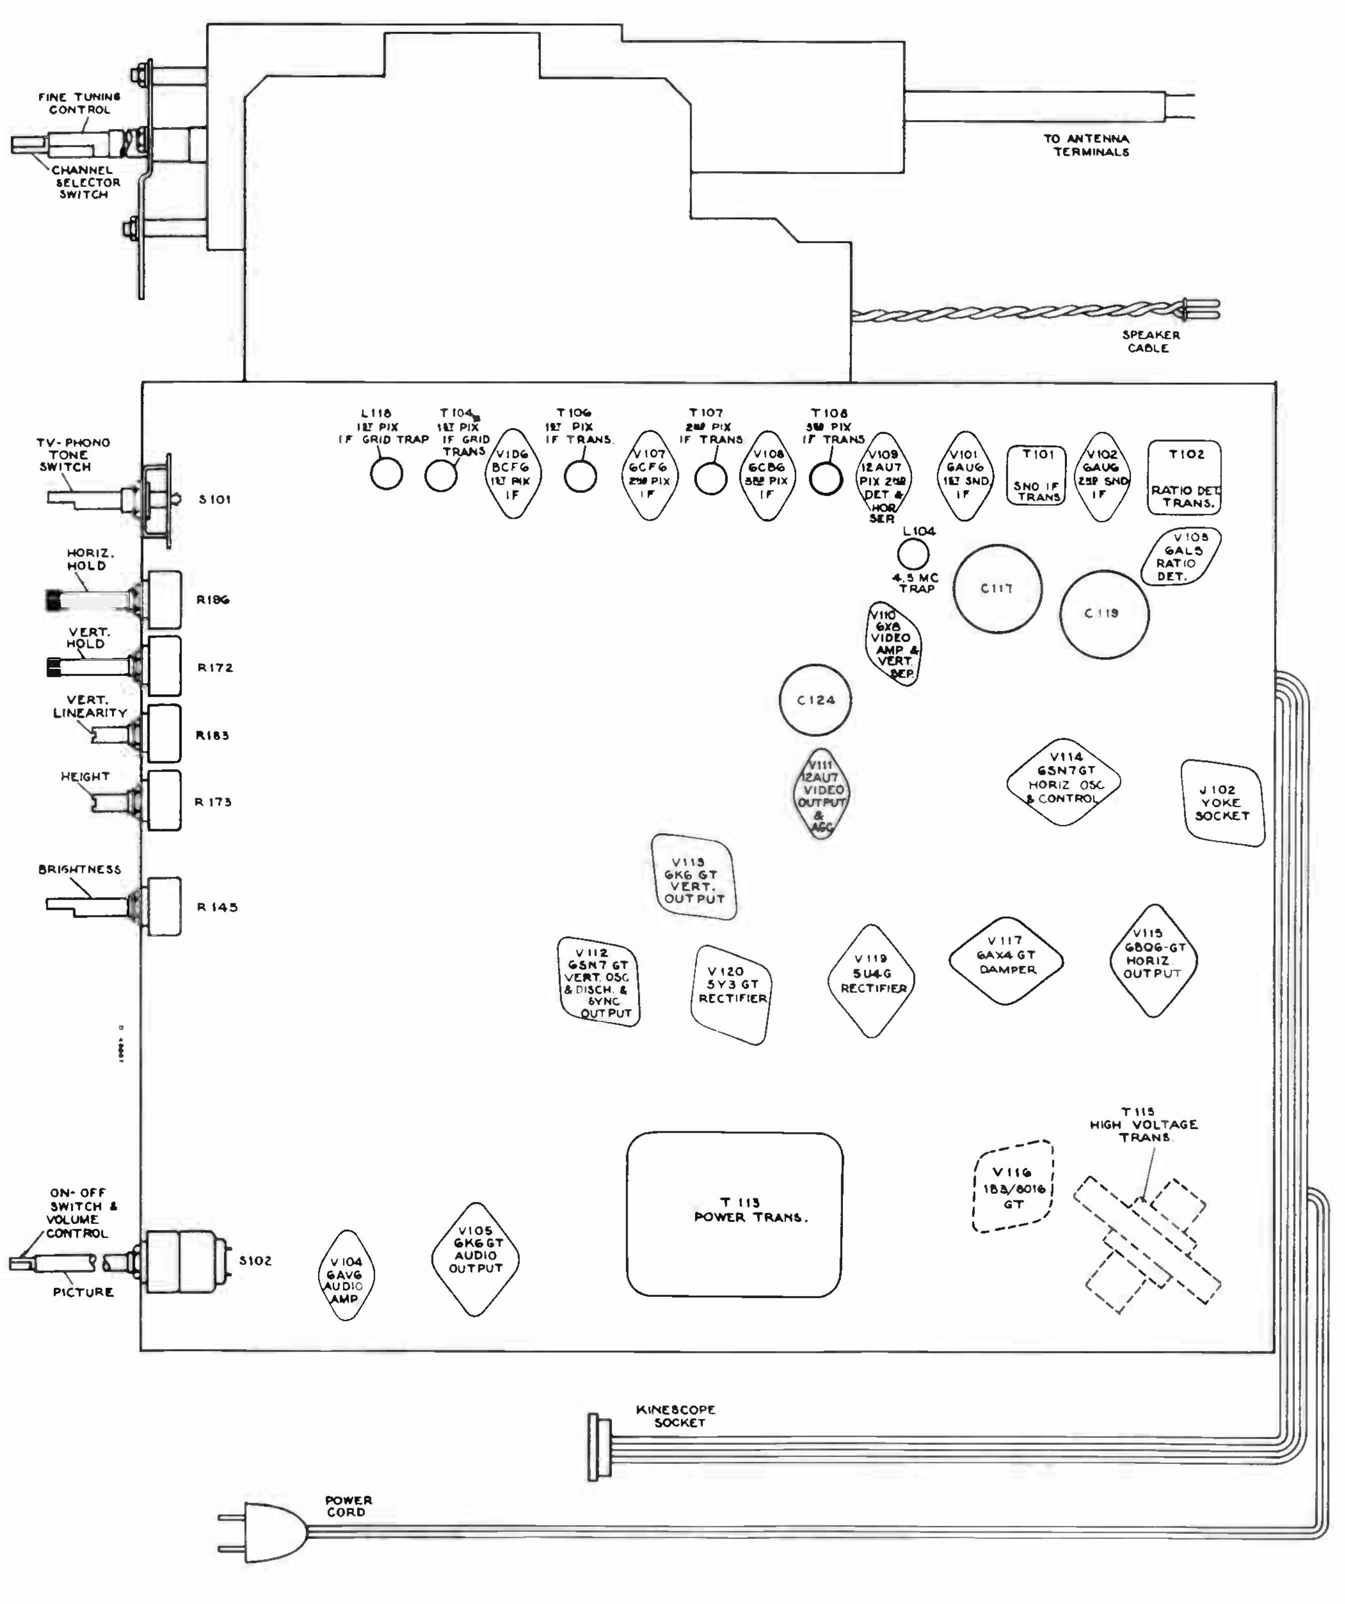

Figure 9—Television Chassis Bottom View (shown with KRK29 Tuner)

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) **Intermediate** frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA Types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 1 millivolt per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

DC Milliammeter.—A milliammeter with a range of 0-50 milliamperes full scale.

Adapter Socket.—An adapter socket is required to meter the cathode current of the 6S4 voltage control tube of the KRK12A Tuner. Wiring of adapter is shown in Figure 10.

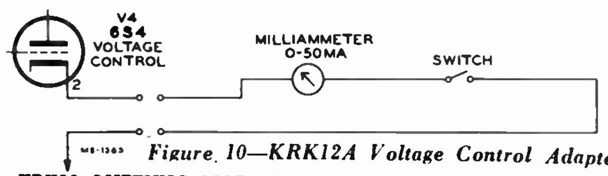

Figure 10—KRK12A Voltage Control Adapter

KRK29 ANTENNA MATCHING UNIT ALIGNMENT.—The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L5 to the channel selector switch S1-E.

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R123 and C142.

TELEVISION ALIGNMENT PROCEDURE

Set the potentiometer to produce approximately —5.0 volts of bias at the junction of R123 and C142.

Connect an oscilloscope to the junction of R135 and L102 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L4 in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L1 for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L5 to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L5 to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order the prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 17 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by returning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L2 and L3 to obtain the response shown in Figure 11. L3 is most effective in locating the position of the shoulder of the curve at 52 mc. and L2 should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L5 and S1-E. Replace V106.

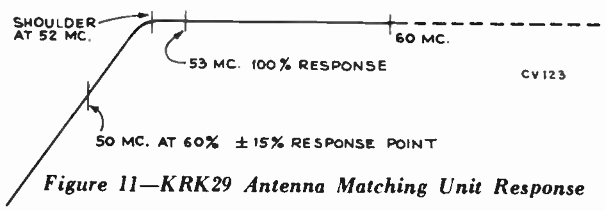

Figure 11—KRK29 Antenna Matching Unit Response

PICTURE I-F TRANSFORMER ADJUSTMENTS

Models 21-T-392 and 21-T-393

Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R123 and C142. Turn the AGC control fully clockwise.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the battery positive terminal of one to the chassis and the potentiometer arm to the junction of R123 and C142. The second battery will be used later.

Set the bias to produce approximately —5.0 volt of bias at the junction of R123 and C142.

Connect the "VoltOhmyst" to junction of R135 and L102 and to ground.

Set the VHF signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R135 and L102 with —5.0 volts of i-f bias at the junction of R123 and C142.

44.5 mc. T108
45.5 mc. T107
43.0 mc. T106

Set the VHF signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at R135, L102. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the adjustment is made.

47.25 mc. L118

Models 21-T-392U and 21-T-393U

Connect the "VoltOhmyst" to the junction of R123 and C142. Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction R123 and C142. Adjust the potentiometer for —5.0 volts indication on the "VoltOhmyst."

Connect the "VoltOhmyst" to the junction of R135 and L102 and to ground.

Connect the output of the signal generator to the front terminal of the crystal mixer in series with a 1,500 mmf. ceramic capacitor.

Set the VHF generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for maximum indication on the "VoltOhmyst". In each instance the generator should be checked against a crystal calibrator to insure that the generator is on frequency.

During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R135 and L102 with —5.0 volts of i-f bias at the junction of R123 and C142.

44.5 mc. T108
45.5 mc. T107
43.0 mc. T106

Set the signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at junction of R135 and L102. Use sufficient signal input to produce 3.0 volts of d-c on the meter when adjustment is made.

47.25 mc. L118

SWEEP ALIGNMENT OF PICTURE I-F

Models 21-T-392 and 21-T-393

To align T2 and T104, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Preset C122 to minimum capacity.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R123 and C142. Set the AGC control fully clockwise.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T2 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C122 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 12. Maximum allowable tilt is 20%.

Disconnect the diode probe, the 180 ohm and two 330 ohm resistors.

Connect the oscilloscope to the junction of R135 and L102.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 13.

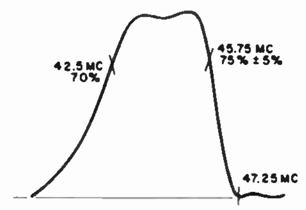

Figure 12—T2 and T104 Response with KRK29

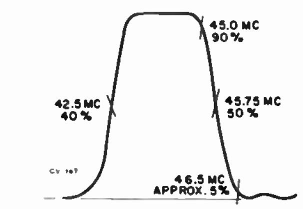

Figure 13—Over-all I-F Response with KRK29

Models 21-T-392U and 21-T-393U

To align the crystal mixer circuit and T2 and T104 connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep generator to the tuner case.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Set the channel selector to channel 5.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

The shunt trimmer C122 across terminals A and B of T104 is variable and is provided as a bandwidth adjustment. Preset the shunt trimmer to minimum capacity. Adjust T2 (top) and T104 (top) for maximum gain at 43.5 mc. and with 45.75 mc. at 75% of maximum response.

Adjust T1 for maximum gain. Readjust T2 and T104 if necessary to obtain proper wave shape, see Figure 14.

Disconnect the diode probe, the 180 ohm and the two 330 ohm resistors.

Connect the oscilloscope to the junction of R135 and L102.

Adjust the bias potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R123 and C142.

Leave the sweep generator connected to the front terminal of the 1N82 crystal holder with the shortest leads possible and with not more than one inch of unshielded lead at the end of the sweep cable. If these precautions are not observed, the receiver may be unstable and the response curves obtained may be unreliable.

Adjust the output of the sweep generator to obtain 3.0 to 5.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 15.

Remove the oscilloscope, sweep and signal generator connections.

Remove the bias box employed to provide bias for alignment.

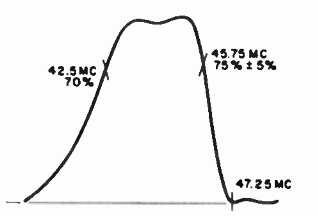

Figure 14—T2 and T104 Response with KRK12A

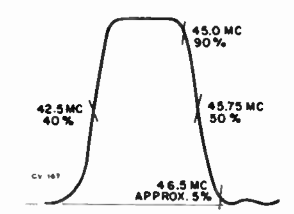

Figure 15—Over-all I-F Response with KRK12A

KRK29 TUNER ALIGNMENT

Models 21-T-392 and 21-T-393

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

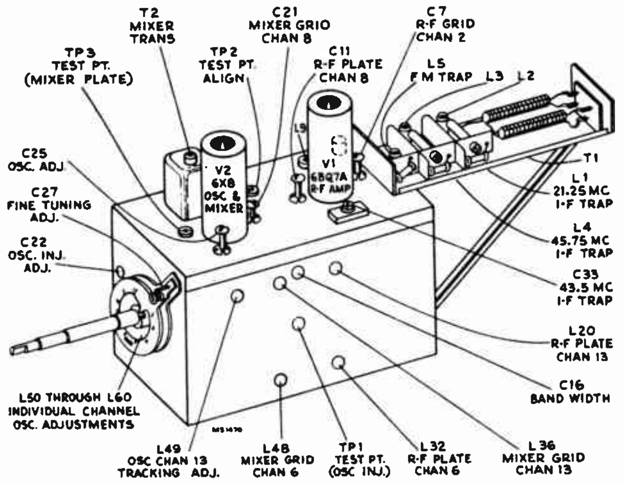

Figure 16—KRK29 Tuner Adjustments

Connect the oscilloscope to the test point TP1 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate if 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce −3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read −3.0 volts at the test point TP1, as read on the "VoltOhmyst". The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn the C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

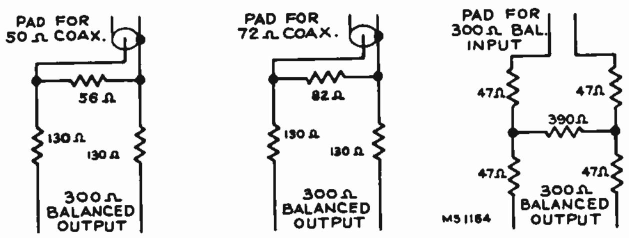

Figure 17—Sweep Attenuator Pads

Connect the sweep generator through a suitable attenuator, as shown in Figure 17, to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and band width as shown in Figure 18.

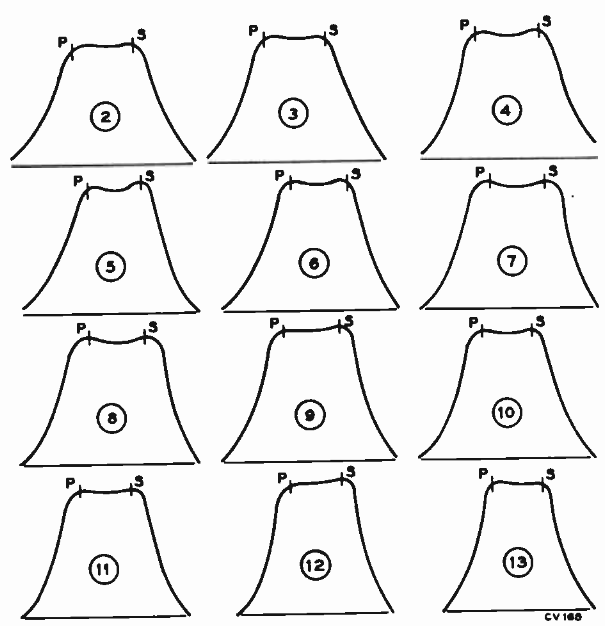

Figure 18—KRK29 R-F Response

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read −3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in Figure 18.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and bandwidth.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L48, and L32 for proper curve shape as shown in Figure 18. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See Figure 18 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48, and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to Figure 18 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21, or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

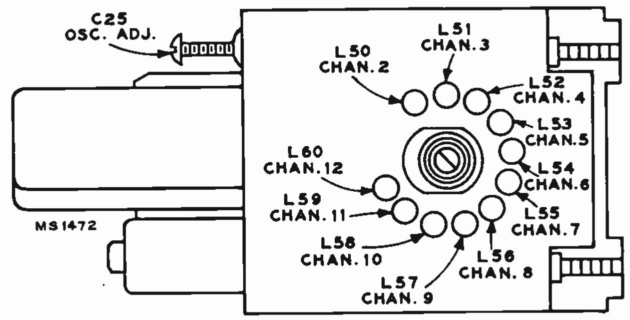

Figure 19—KRK29 R-F Oscillator Adjustments

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

KRK12A TUNER ALIGNMENT

Models 21-T-392U and 21-T-393U

TUNER VHF ALIGNMENT.—Remove the 6S4 voltage control tube from its socket and insert the adapter. Insert the 6S4 in the adapter.

Connect the 0-50 milliampere meter to the adapter socket leads and turn the adapter switch on.

Remove the tuner cover shield.

Rotate the channel selector to a point midway between channels, disengaging the insert contacts, and observe the non-oscillating plate current. Some tubes may oscillate even with the tuned circuits disengaged. To be sure the oscillator is in a non-oscillatory state, short circuit the spring contacts 12 and 13, the two contacts nearest the tuner front.

(NOTE: The contacts are at zero d-c potential.) Should the plate current rise, keep the contacts shorted while adjusting the oscillator plate current. Adjust R6, oscillator voltage control, for a 28 milliampere reading on the meter.

Replace the tuner cover shield.

Connect the VHF sweep generator to the antenna terminals.

Connect the VHF signal generator loosely to the antenna terminals.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Turn off the adapter switch, removing plate voltage from the oscillator. This is required because of RF-IF interaction when a crystal is used as a mixer.

Set the channel selector and the sweep generator to channel 2.

Insert markers of channel 2 picture carrier and sound carrier, 55.25 mc. and 59.75 mc.

TELEVISION ALIGNMENT PROCEDURE

Adjust antenna T6, r-f amplifier plate L29 and mixer L30 adjustments for a symmetrical curve with maximum gain at the center of the pass band. The curves will have a deep valley because of no crystal loading and nonlinear detector characteristics. The limits for the 100% response points are shown in Figure 20. The proper curve shape is shown in Figure 20(b). (See Note on page 15 for detailed explanation of adjustment.) If the bandwidth is out of tolerance, it can usually be corrected by redressing the coupling capacitor of the double tuned circuit, C40 on insert A. Maximum bandwidth occurs when the capacitor is centered in the insert chamber.

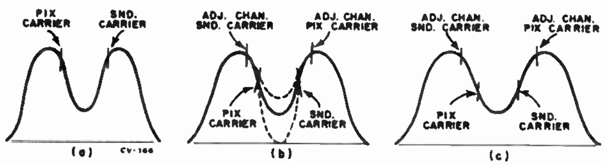

Figure 20—KRK12A VHF Insert Responses

Repeat the above steps for all VHF channels adjusting the appropriate antenna, r-f amplifier plate and mixer slugs for a symmetrical curve with maximum gain at the center of the pass band.

Turn off the sweep generator.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Turn the AGC control fully clockwise.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce –3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Connect the potentiometer arm of the second bias supply to the junction of R123 and C142, and ground the positive battery terminal. Adjust the bias potentiometer to produce –5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to the junction of R135 and L102. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to channel 13.

Set the fine tuning control to the center of its range.

Adjust the oscillator slug L22 to proper frequency, 257 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 257 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner through either of the two holes next to the oscillator tube on the right front top corner of the tuner. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust L22 oscillator slug to obtain an audio beat with the signal generator.

Turn on the sweep generator and set to channel 13. Adjust T1 for maximum gain on the oscilloscope. Adjust mixer tank circuit L21 for maximum gain and flat-topped curve. Recheck T1 for maximum gain at center of band with the proper response. Maximum gain and flat-topped response should be obtained simultaneously.

Adjust the oscillator to frequency on all VHF channels by switching the receiver and signal generator to each VHF channel and adjusting the appropriate oscillator slug to obtain a beat with the signal generator. Adjust the appropriate mixer slug where necessary to obtain maximum gain and proper curve shape as explained above.

Adjust the tunable I-F Trap C16-L7. To do this connect the signal generator to the fixed I-F Trap C2-L2 at the end opposite the antenna terminal plug. Set the signal generator to 43.5 mc. and adjust the output of the signal generator to obtain sufficient indication on the oscilloscope. Tune the I-F Trap C16-L7 for minimum indication on the oscilloscope.

Remove the signal generator and the oscilloscope.

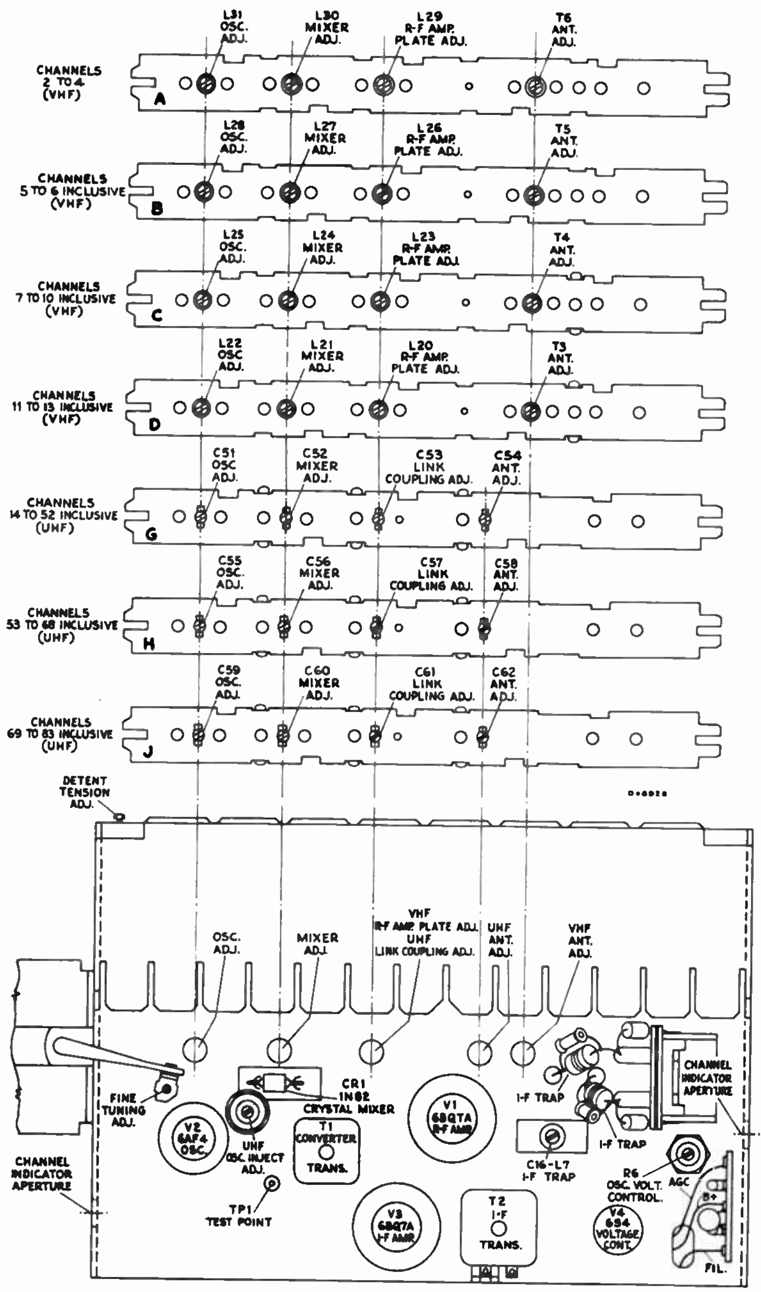

Figure 21—KRK12A Tuner Adjustments

TUNER UHF ALIGNMENT.—To align the UHF inserts:

Turn off the adapter switch, removing plate voltage from the oscillator.

Ground the AGC bias at the tuner terminal board using a clip lead to insure that the bias will remain constant.

Connect the oscilloscope, through the preamplifier if needed with oscilloscope used, to test point TP1.

Connect the UHF sweep generator to the antenna terminals. Use a 10 DB attenuator pad to assure proper alignment.

Connect the UHF signal generator loosely to the antenna terminals.

Set the channel selector to the desired position and the sweep generator to sweep the frequency of the insert being used.

Insert markers of the picture carrier and sound carrier for desired channel.

Adjust UHF antenna, link coupling and mixer adjustments for a symmetrical curve, with maximum gain, centered about the pass band. The responses are shown in Figure 22. The curve shape will usually vary from Fig. 22 (a) to Fig. 22 (c) going higher in frequency, however any of these responses are acceptable.

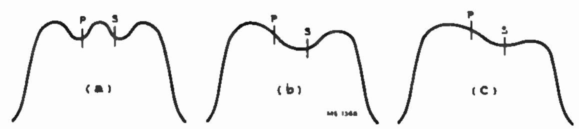

Figure 22—KRK12 UHF Insert Responses

Repeat the above steps for all UHF inserts used adjusting the appropriate antenna, link coupling and mixer slugs for a symmetrical curve, with maximum gain, centered about the pass band.

Remove the oscilloscope and preamplifier if used, from test point TP1.

Remove the clip lead grounding the AGC bias on the tuner terminal board.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce –3.5 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal.

Connect the potentiometer arm of the second bias supply to the junction of R123 and C142, and ground the positive battery terminal. Adjust the bias potentiometer to produce –5 volts of i-f bias as indicated on the "VoltOhmyst" at the junction point.

Connect the oscilloscope to junction of R135 and L102. Use 3 to 5 volts peak-to-peak output on the oscilloscope.

Turn the adapter switch on to apply plate voltage to the oscillator.

Turn the channel selector to the lowest UHF channel to be used.

Set the fine tuning control to the center of its range.

Adjust the oscillator core to proper frequency. To do this, connect the VHF signal generator to test point TP1 with the shortest leads possible. Insert a 45.75 mc. marker from the VHF generator.

Set the UHF sweep generator to sweep the desired channel, and observe the output on the oscilloscope. If the sweep generator is not sweeping the correct frequency range, it may be necessary to readjust the sweep in order to place the 45.75 marker on the response curve as in Figure 15.

Set the UHF marker generator to the picture carrier of the channel insert being adjusted and connect to test point TP1.

Adjust the oscillator core until the markers for 45.75 mc. and the picture carrier coincide on the sweep pattern on the oscilloscope.

Adjust mixer core for maximum gain with proper wave shape.

Connect the "VoltOhmyst" to test point TP1, using 1.5 volt D.C. scale.

Set oscillator injection adjustment to read .1 volt on the "VoltOhmyst."

Repeat the above steps for all UHF inserts adjusting the oscillator injection control only if the reading on the "VoltOhmyst" exceeds .3 volt. Adjust as necessary to read .3 volt or less at TP1.

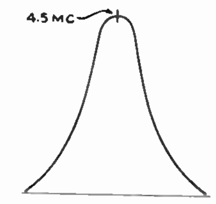

Figure 23—Sound I-F Response

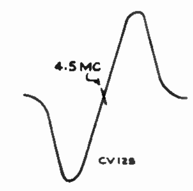

Figure 24—Ratio Det. Response

As an alternate method, this step may be omitted at this point in the alignment procedure and the adjustment made "on the air" after the alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L104 requires no adjustment. If a 4.5 mc. beat is present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L104 for minimum beat.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 9 of V110.

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

HORIZONTAL OSCILLATOR ADJUSTMENT. — Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R196, then adjust the T114 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T114 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T114 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C174B, the width control L109 and the linearity control L111 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

TELEVISION ALIGNMENT PROCEDURE

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T114 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T114 frequency core (on the rear apron) until the picture falls out of sync and three or four diagonal black bars sloping down to the right appear on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain three or four diagonal black bars on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T114 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture falls out of sync with the diagonal bars sloping down to the right. Continue to turn the frequency core in the same direction. No more than three or four bars should appear on the screen. Instead, the horizontal oscillator should begin the motorboat. Retouch the adjustment of the T114 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T114. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 25. Adjust the waveform adjustment core of T114 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

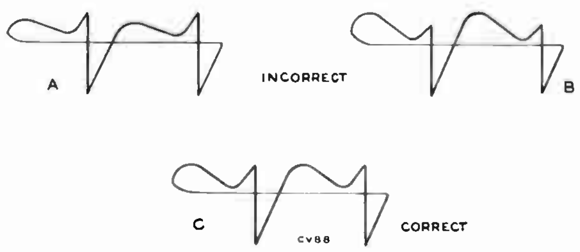

Figure 25—Horizontal Oscillator Wave Forms

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C174A slightly clockwise. If less than 2 bars are present, adjust C174A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T114 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves to the left side of the screen leaving the picture in synchronization.

SENSITIVITY CHECK.—A comparative sensitivity check can be made by operating the receiver on a weak signal from a television station and comparing the picture and sound obtained to that obtained on other receivers under the same conditions.

This weak signal can be obtained by connecting the shop antenna to the receiver through a ladder type attenuator pad. The number of stages in the pad depends upon the signal strength available at the antenna. A sufficient number of stages should be inserted so that a somewhat less than normal contrast picture is obtained when the picture control is at the maximum clockwise position. Only carbon type resistors should be used to construct the pad.

REFLECTIONS.—Multiple images sometimes known as echoes or ghosts, are caused by the signal arriving at the antenna by two or more routes. The second or subsequent image occurs when a signal arrives at the antenna after being reflected off a building, a hill or other object. In severe cases of reflections, even the sound may be distorted. In less severe cases, reflections may occur that are not noticeable as reflections but that will instead cause a loss of definition in the picture.

Under certain extremely, unusual conditions, it may be possible to rotate or position the antenna so that it receives the cleanest picture over a reflected path. If such is the case, the antenna should be so positioned. However, such a position may give variable results as the nature of reflecting surfaces may vary with weather conditions. Wet surfaces have been known to have different reflecting characteristics than dry surfaces.

Depending upon the circumstances, it may be possible to eliminate the reflections by rotating the antenna or by moving it to a new location. In extreme cases, it may be impossible to eliminate the reflection.

INTERFERENCE.—Auto ignition, street cars, electrical machinery and diathermy apparatus may cause interference which spoils the picture. Whenever possible, the antenna location should be removed as far as possible from highways, hospitals, doctors' offices and similar sources of interference. In mounting the antenna, care must be taken to keep the antenna rods at least ¼ wave length (at least 6 feet) away from other antennas, metal roofs, gutters or other metal objects.

Short-wave radio transmitting and receiving equipment may cause interference in the picture in the form of moving ripples. In some instances it may be possible to eliminate the interference by the use of a trap in the antenna transmission line. However, if the interfering signal is on the same frequency as the television station, a trap will provide no improvement.

The response curves are shown in the classical manner of presentation, that is with "response up" and low frequency to the left. The manner in which they will be seen in a given test set-up will depend upon the characteristics of the oscilloscope and the sweep generator. The curves may be seen inverted and/or switched from left to right depending on the deflection polarity of the oscilloscope and the phasing of the sweep generator.

KRK29.—Because of the frequency spectrum involved, many of the tuner leads are critical in some respects. Even the power supply leads form loops which couple to the tuned circuits, and if resonant at any of the frequencies involved in the performance of the tuner, may cause serious departures from the desired characteristics. In the design of the receiver these undesirable resonant loops have been shifted far enough away in frequency to allow reasonable latitude in physical arrangement without being troublesome. When the tuner is aligned in the receiver, no trouble from resonant loops should be experienced. However, if the unit is aligned in a jig separate from the receiver, attention should be paid to insure that unwanted resonance does not exist which might present a faulty representation of alignment.

KRK12A.—The use of a crystal mixer makes it necessary to observe the insert responses with the oscillator disabled. This is due to undesirable r-f/i-f interaction if the oscillator was allowed to operate during alignment. Therefore, the responses shown in Figure 20 are not a strictly true representation of the insert band pass during actual operation. When an insert is aligned, using an oscilloscope to observe the response, the curve shown in Figure 20 (b) will be the correct response for reference. In actual operation, the band pass will be such that the sound and picture carriers will be at the tips of the curve. The adjacent channel picture and sound carriers will be in the valleys at each side. Care should be taken not to exceed the limits shown in Figure 20 (a) and 20 (c).

TELEVISION ALIGNMENT DATA

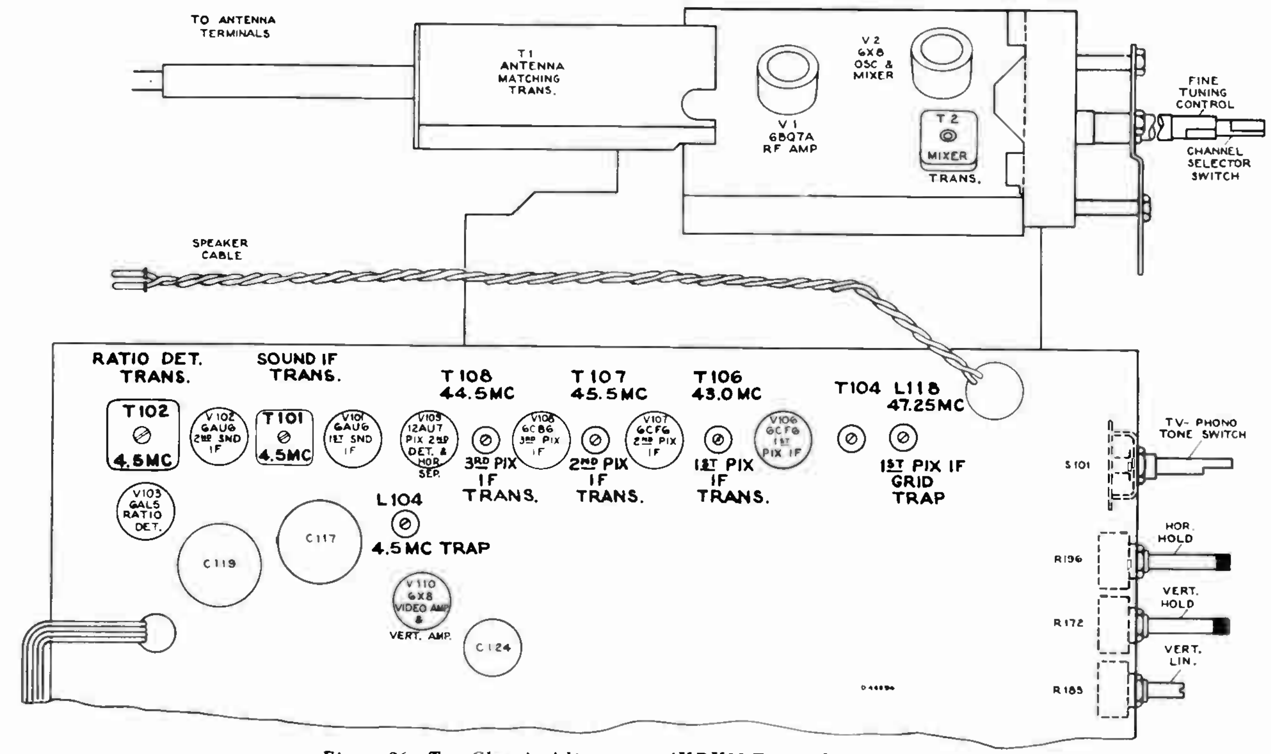

Figure 26—Top Chassis Adjustments (KRK29 Tuner shown)

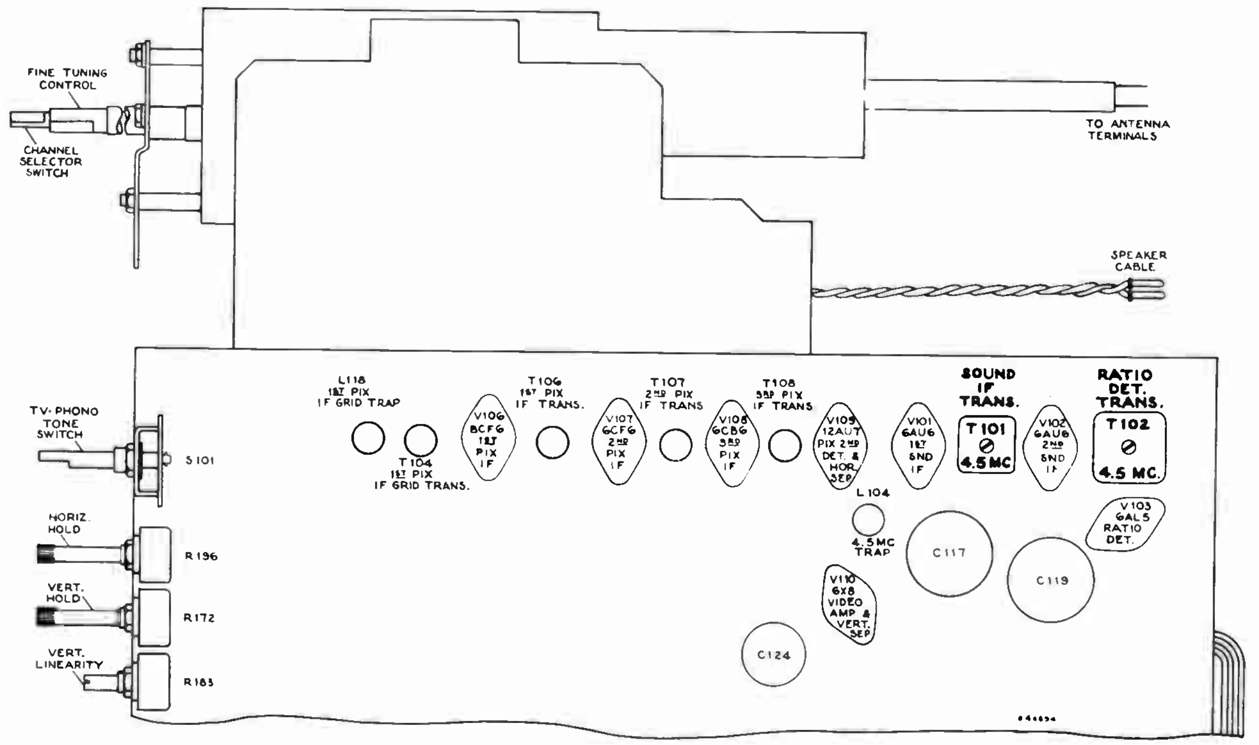

Figure 27—Bottom Chassis Adjustments (KRK29 Tuner shown)

The valley, in the center of the response curve, may vary from 0 to 50% above the base line for VHF inserts. Adjust the output level of the sweep generator to prevent excessive signal input to the tuner. Excessive signal input will be indicated by the valley rising above the 50% level, particularly on the higher VHF channels.

Oscillator injection voltage is not adjusted on VHF inserts. A check may indicate variations from .08 to .3 volts at TP1, but such readings should not be interpreted as an indication of trouble. On UHF channels, however, the injection voltage should be adjusted to fall within the specified limits.

RADIO SCHEMATIC DIAGRAM

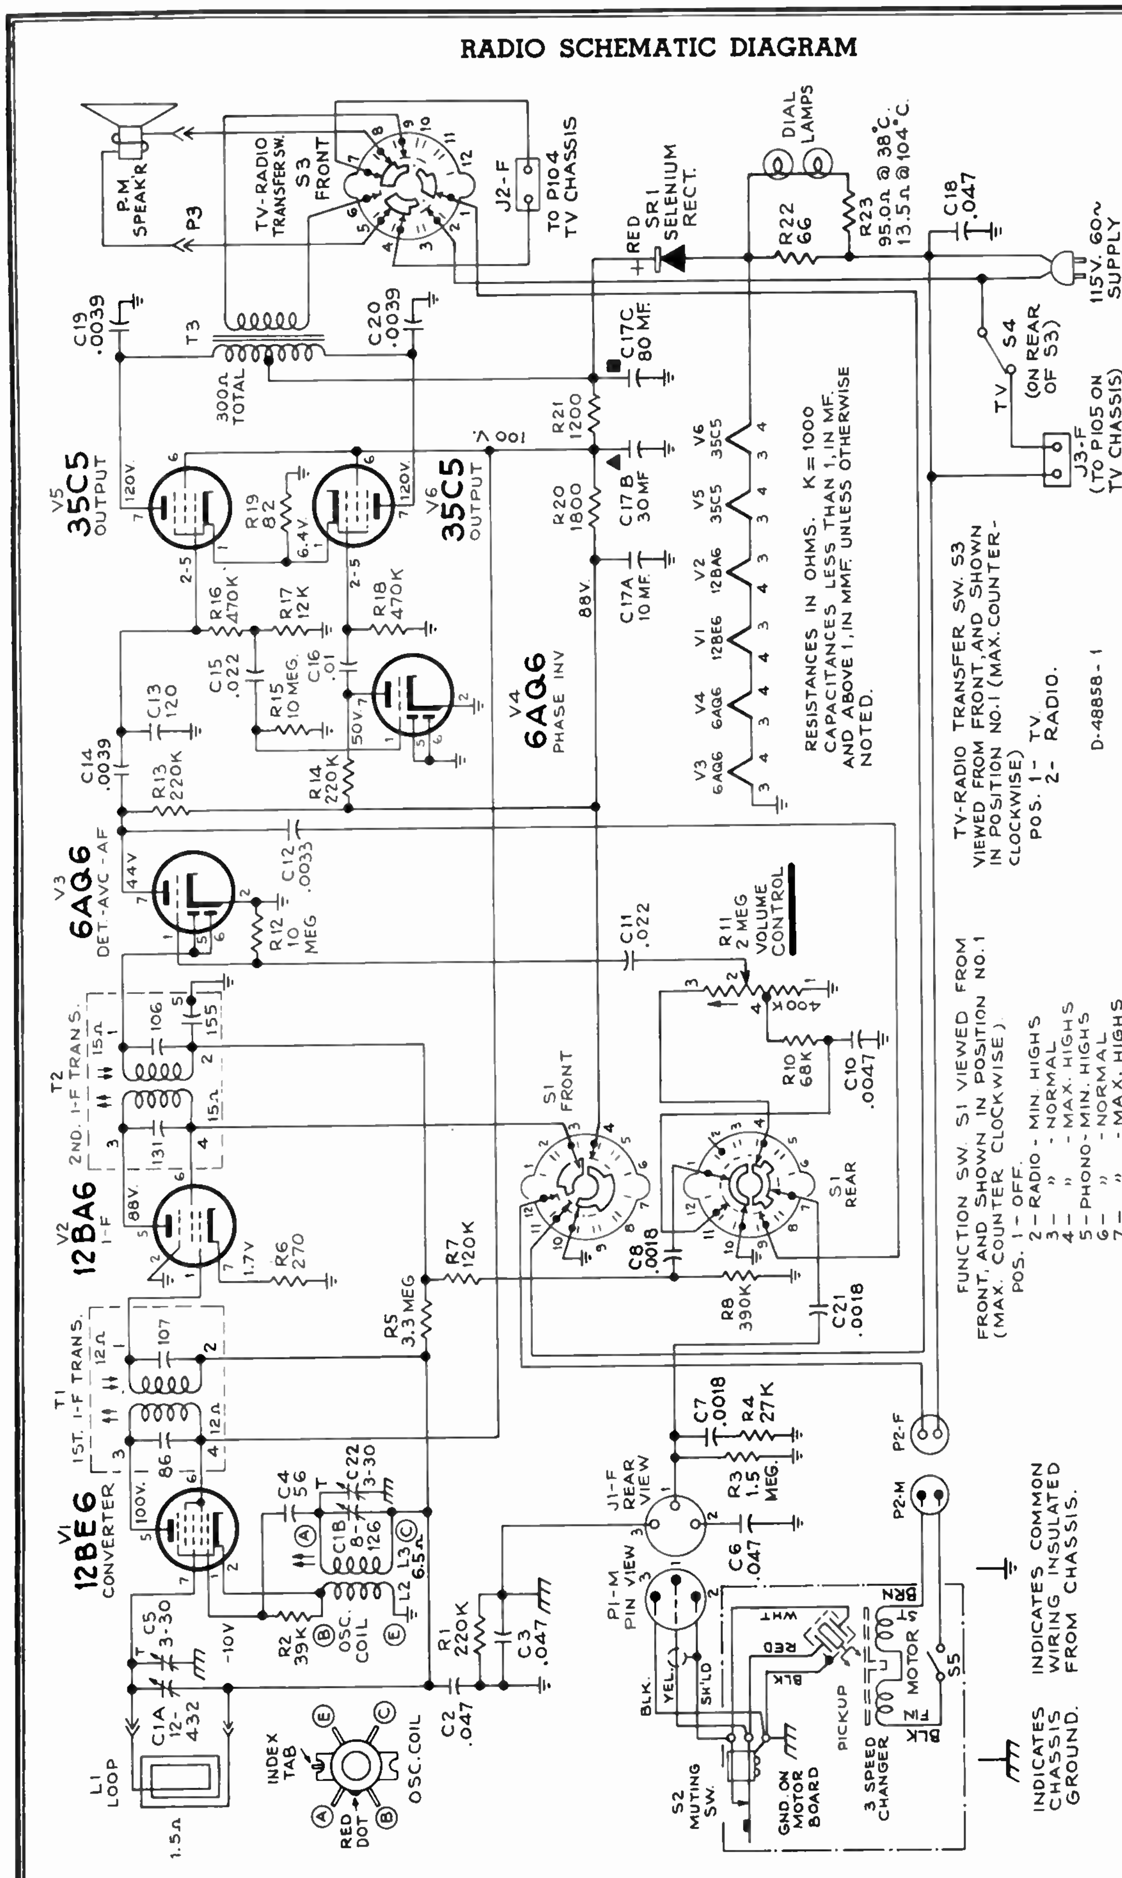

Figure 28—Radio Schematic Diagram Chassis RC1117B

Critical Lead Dress

1. Dress C15 (.022 mfd. at grid of phase inverter) over tube socket away from filament leads.
2. Keep all filament leads close to chassis.
3. Keep leads of R26 (270 ohms at I-F amplifier cathode) short as possible.
4. Connect outside foil of all capacitors as indicated in schematic diagram.
5. Dress output plate bypasses, C19 and C20, as near chassis as possible.

RADIO DATA

Dial Pointer Adjustment.—Rotate tuning condenser fully counter-clockwise (plates fully meshed). Adjust indicator pointer so that it is 3 15/16" from the left hand edge of the dial back plate.

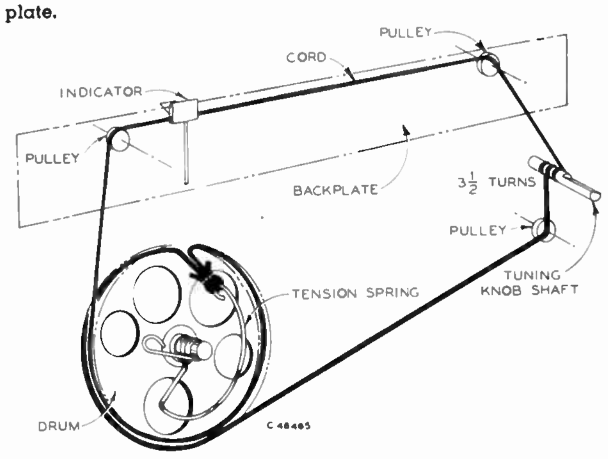

Figure 29—Dial Cord and Drive

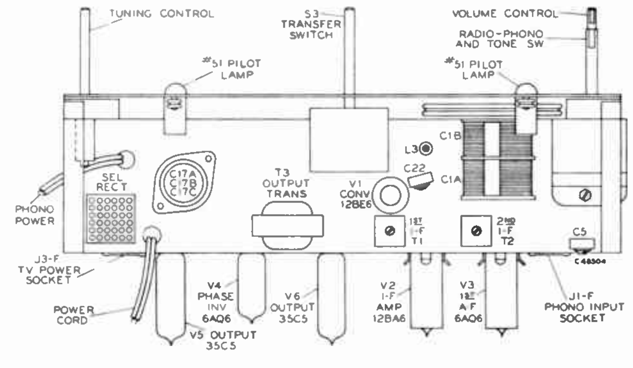

Figure 30—RC1117B Chassis Top View

Alignment Procedure

Output Meter.—Connect meter across speaker voice coil. Turn volume control to maximum.

Test Oscillator.—Connect low side of test oscillator to common wiring in series with a .1 mf. capacitor. If the test oscillator is a-c operated it may be necessary to use an isolation transformer for the receiver during alignment and the low side of the test oscillator connected directly to common wiring at the electrolytic capacitor. Keep the oscillator output low to prevent a-v-c action.

Steps	Connect the high side of test-oscillator to—	Tune test-osc. to—	Turn radio dial to—	Adjust the following for max. output
1	I-F grid, in series with .1 mfd.	455 kc	Quiet point 1,600 kc end of dial	Pri. & Sec. 2nd I-F transformer
2	Converter grid in series with .1 mfd.			Pri. & Sec. 1st I-F transformer
NOTE.—ANTENNA LOOP AND RECORD CHANGER MUST BE IN CABINET FOR THE FOLLOWING				
3	Short wire placed near loop for radiated signal	1,620 kc	Extreme R. H. end (gang open)	C22 (osc.)
4		1,400 kc	1,400 kc	C5 (ant.)
5		600 kc	Tune to Signal	Osc. L3 while rocking gang
6	Repeat steps 3, 4 and 5 if necessary.			

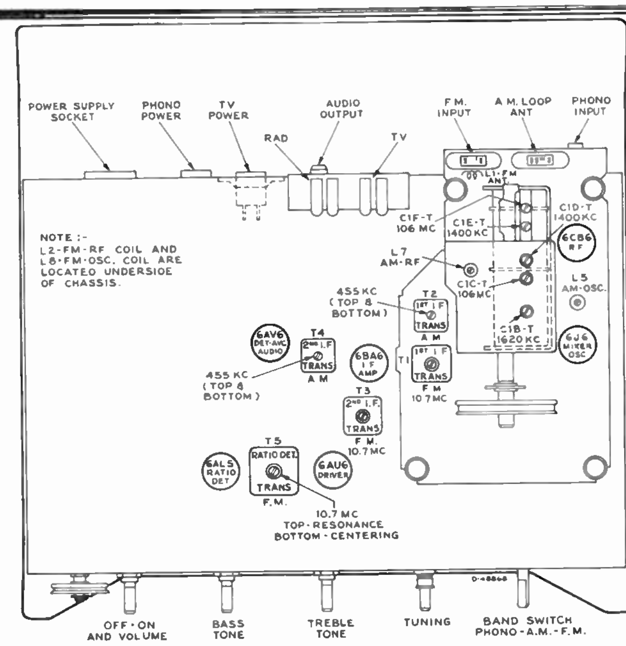

Figure 31—RC1111C Chassis Top View

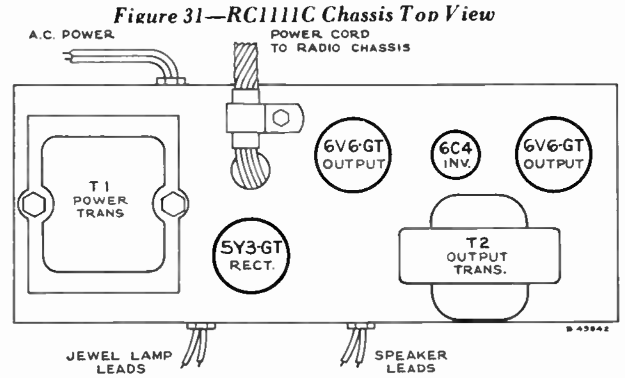

Figure 32—RS141D Chassis Top View

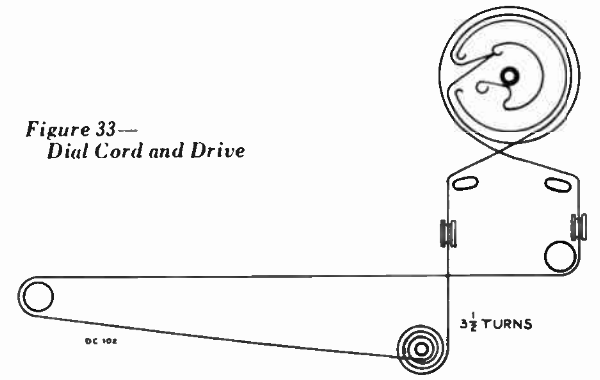

Figure 33—Dial Cord and Drive

CRITICAL LEAD DRESS

1. The 1st FM i-f plate lead should be dressed away from the r-f amp. plate.
2. Dress the 1st AM i-f plate lead to the S2 wafer away from the AM r-f coil.
3. Dress the a-c power switch wires away from all audio components.
4. Dress C26 down toward the base between the terminal board and the side apron.
5. The C18 bypass ground should be as close to the r-f shelf ground strap as possible.
6. Dress C25 away from the arm contact of the volume control.
7. All leads from the r-f shelf leaving through the shields must be kept as short as possible.
8. Dress the a-c leads in the RS141 chassis away from the audio input leads and components.

RADIO ALIGNMENT PROCEDURE

Before aligning set, completely mesh the gang and set the dial pointer to the mechanical max. calibration point at extreme left end of dial. When making a complete alignment follow the table below in sequence. Connect the output meter across the speaker voice coil, and turn the receiver volume control to max. Turn tone controls for maximum highs and maximum lows.

"AM" I-F ALIGNMENT

Test-Oscillator.—Connect low side of the test-osc. to the chassis, and keep the output as low as possible to avoid a-v-c action.

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Turn Radio Dial to—	Adjust the following
1	Pin No. 1 of (V3) in series with .01 mfd.	455 kc. Modulated	AM	Low Freq. end of Dial	†Top and bot. cores of T4 For max. voltage across voice coil.
2	Stator of C1-D in series with .01 mfd.	455 kc. Modulated	AM	Low Freq. end of Dial	†Top and bot. cores of T2 For max. voltage across voice coil.

†For proper adjustment of the i-f cores start with the cores all the way out. The first peak obtained will be the correct one.

FM ALIGNMENT PROCEDURE

Connect probe of "VoltOhmyst" to negative side of C39 and low side to chassis. Top shield must be on and the bottom shield off.

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Radio Dial Tuned to—	Adjust
3	Pin No. 1 of V4 in series with .01 mfd.	10.7 mc.	FM	———	Top of Ratio Det. Trans. T5 for maximum DC on "VoltOhmyst"
4	Pin No. 1 of V4 in series with .01 mfd.	30% AM Modulated	FM	———	Bottom of Ratio Det. Trans. T5 for minimum audio output on meter.
5	Repeat steps 3 and 4 as necessary making final adjustment with input set to give approx. –4.0 v. on "VoltOhmyst."				
6	Pin No. 1 of V3 in series with .01 mfd.	10.7 mc.	FM	88 mc.	†Top and bottom cores of T3 for maximum d-c across C39.
7	Stator of C1-C in series with .01 mfd.	10.7 mc.	FM	88 mc.	†Top and bottom cores of T1 for maximum d-c across C39.
8	Connect sweep generator cable to antenna terminals through 120 ohms in each side of line.	90 mc. 22.5 kc. FM mod.	FM	88 mc.	‡OSC, L8 for max. audio output.
9		106 mc. 22.5 kc. FM mod.	FM	Tune to signal	ANT, C1-FT and R-F C1-CT for max. voltage across C39.
10		90 mc. 22.5 kc. FM mod.	FM	Tune to signal	‡ANT, L1 and R-F L2 for max. voltage across C39.
11	Repeat steps 8, 9 and 10 as required.				
12	Connect a scope to junction R33 and C35, check response and linearity. Peak separation should be at least 180 kc.				

†For proper adjustment of the i-f cores start with the cores all the way out. The first peak obtained is the correct one.
‡Adjustable by increasing or decreasing spacing between turns.

"AM" R-F ALIGNMENT

Steps	Connect the High Side of the Test Osc. to—	Tune Test Osc. to—	Function Switch	Turn Radio Dial to—	Adjust the following
13	External radiating loop and couple loosely to receiver loop.	1,620 kc.	AM	Min. capacity	*Osc. C1-BT for maximum output.
14		1,400 kc.	AM	Tune to signal	*C1-DT and C1-ET for max. output.
15		600 kc.	AM	Tune to signal	‡Osc. L5 for max. output while rocking gang.
16		600 kc.	AM	Tune to signal	***R-F L7 for max. output.
17	Repeat steps 13, 14, 15 and 16 until no additional gain in sensitivity is obtained.				

‡Clip a 10,000 ohm resistor across C1-D when making this adjustment.
***Be sure the resistor employed in step 15 is removed for this adjustment.
*All R-F shields must be in place.

RADIO VOLTAGE CHART

Voltages shown are as read with "VoltOhmyst" between indicated terminal and chassis, with receiver operating on 117 volts, and with no signal input.

RADIO SCHEMATIC DIAGRAM

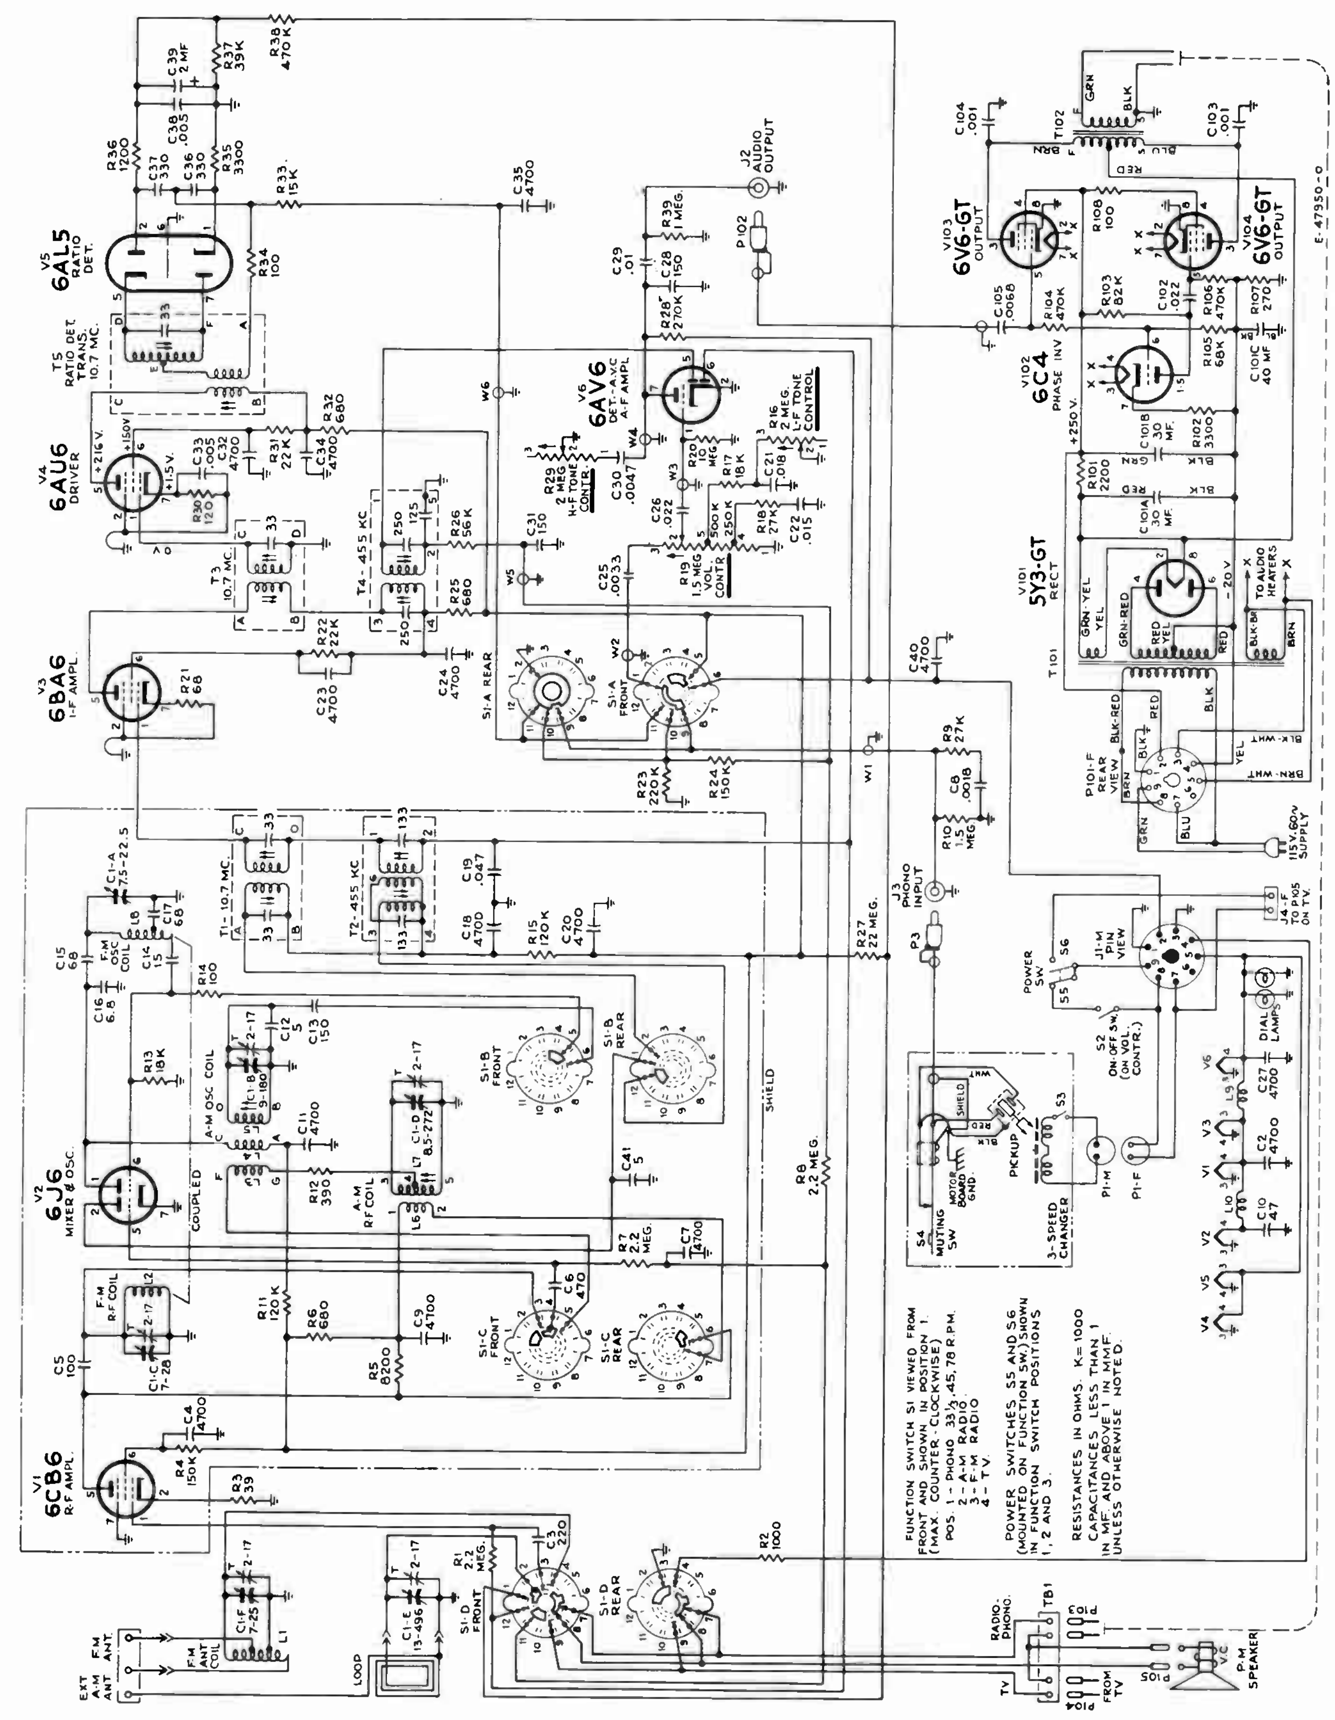

Figure 34—Radio Schematic Diagram Chassis RC1111C

TELEVISION VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 15000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

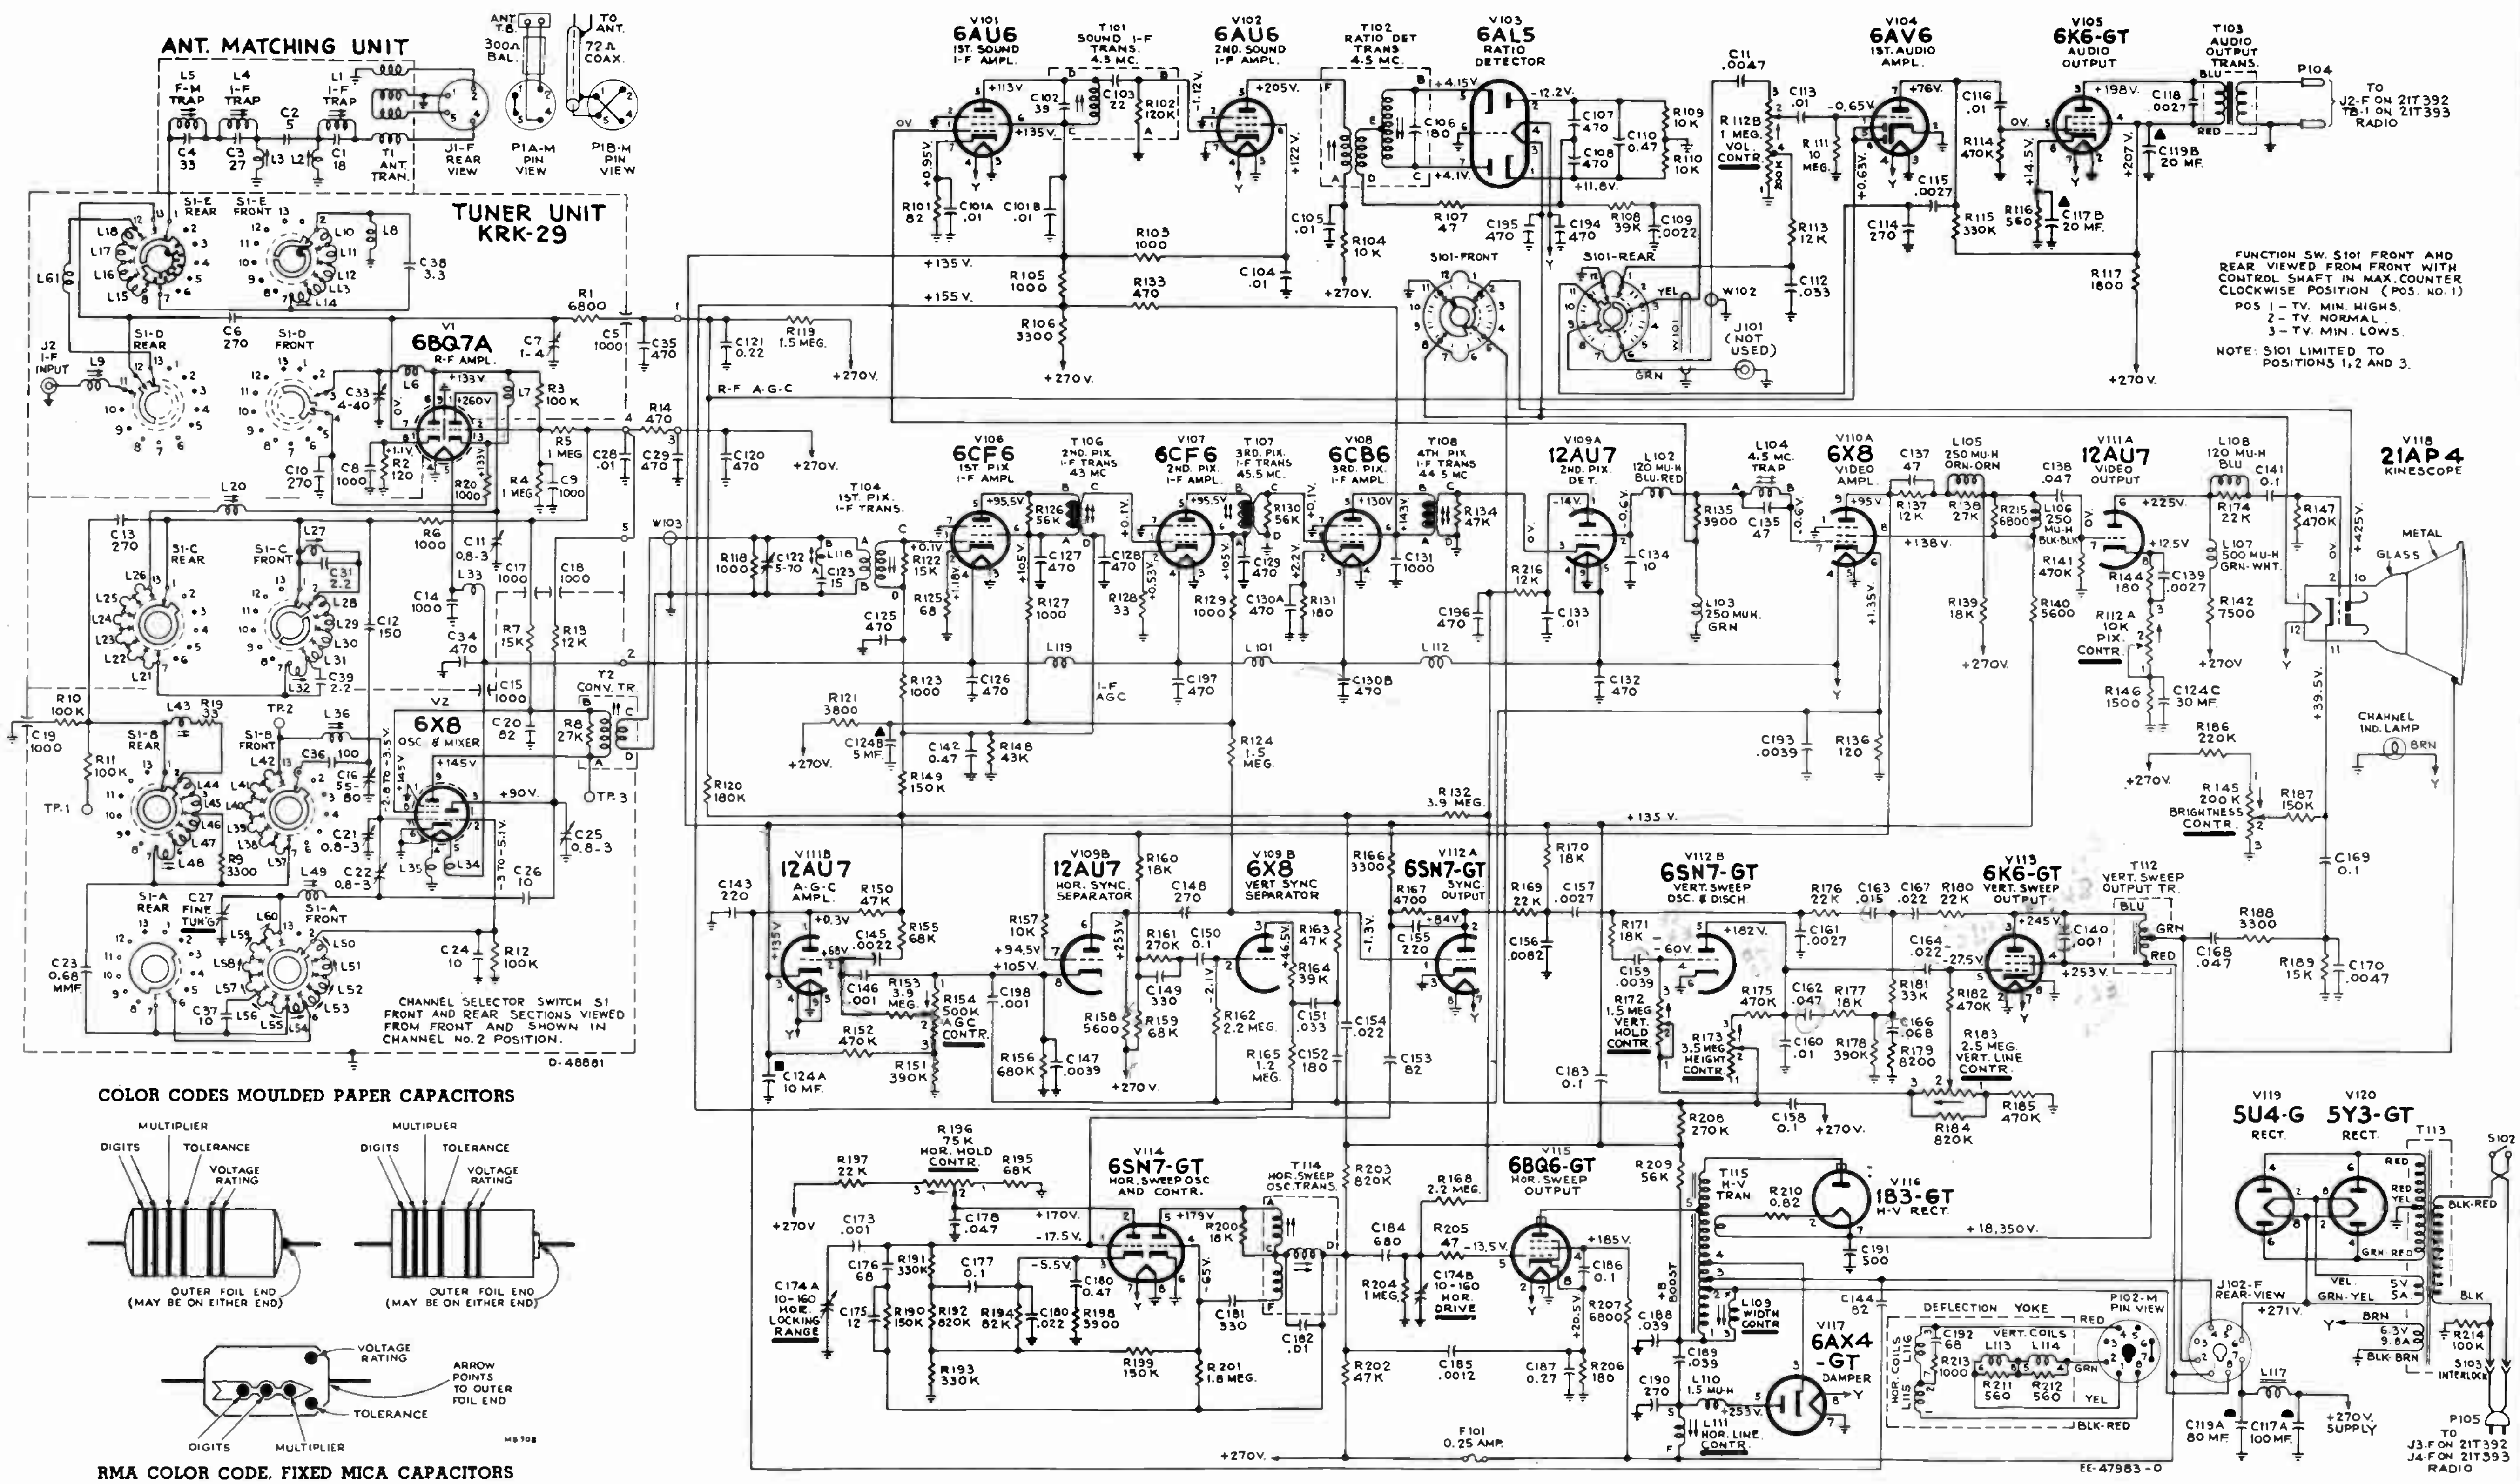
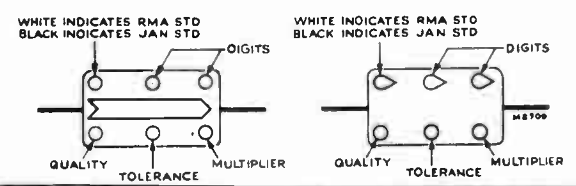
TELEVISION CIRCUIT SCHEMATIC DIAGRAM, KCS83F



COLOR CODES MOULDED PAPER CAPACITORS

RMA COLOR CODE, FIXED MICA CAPACITORS



23

The schematic is shown in the latest condition at the time of printing.
All resistance values in ohms. K = 1000.

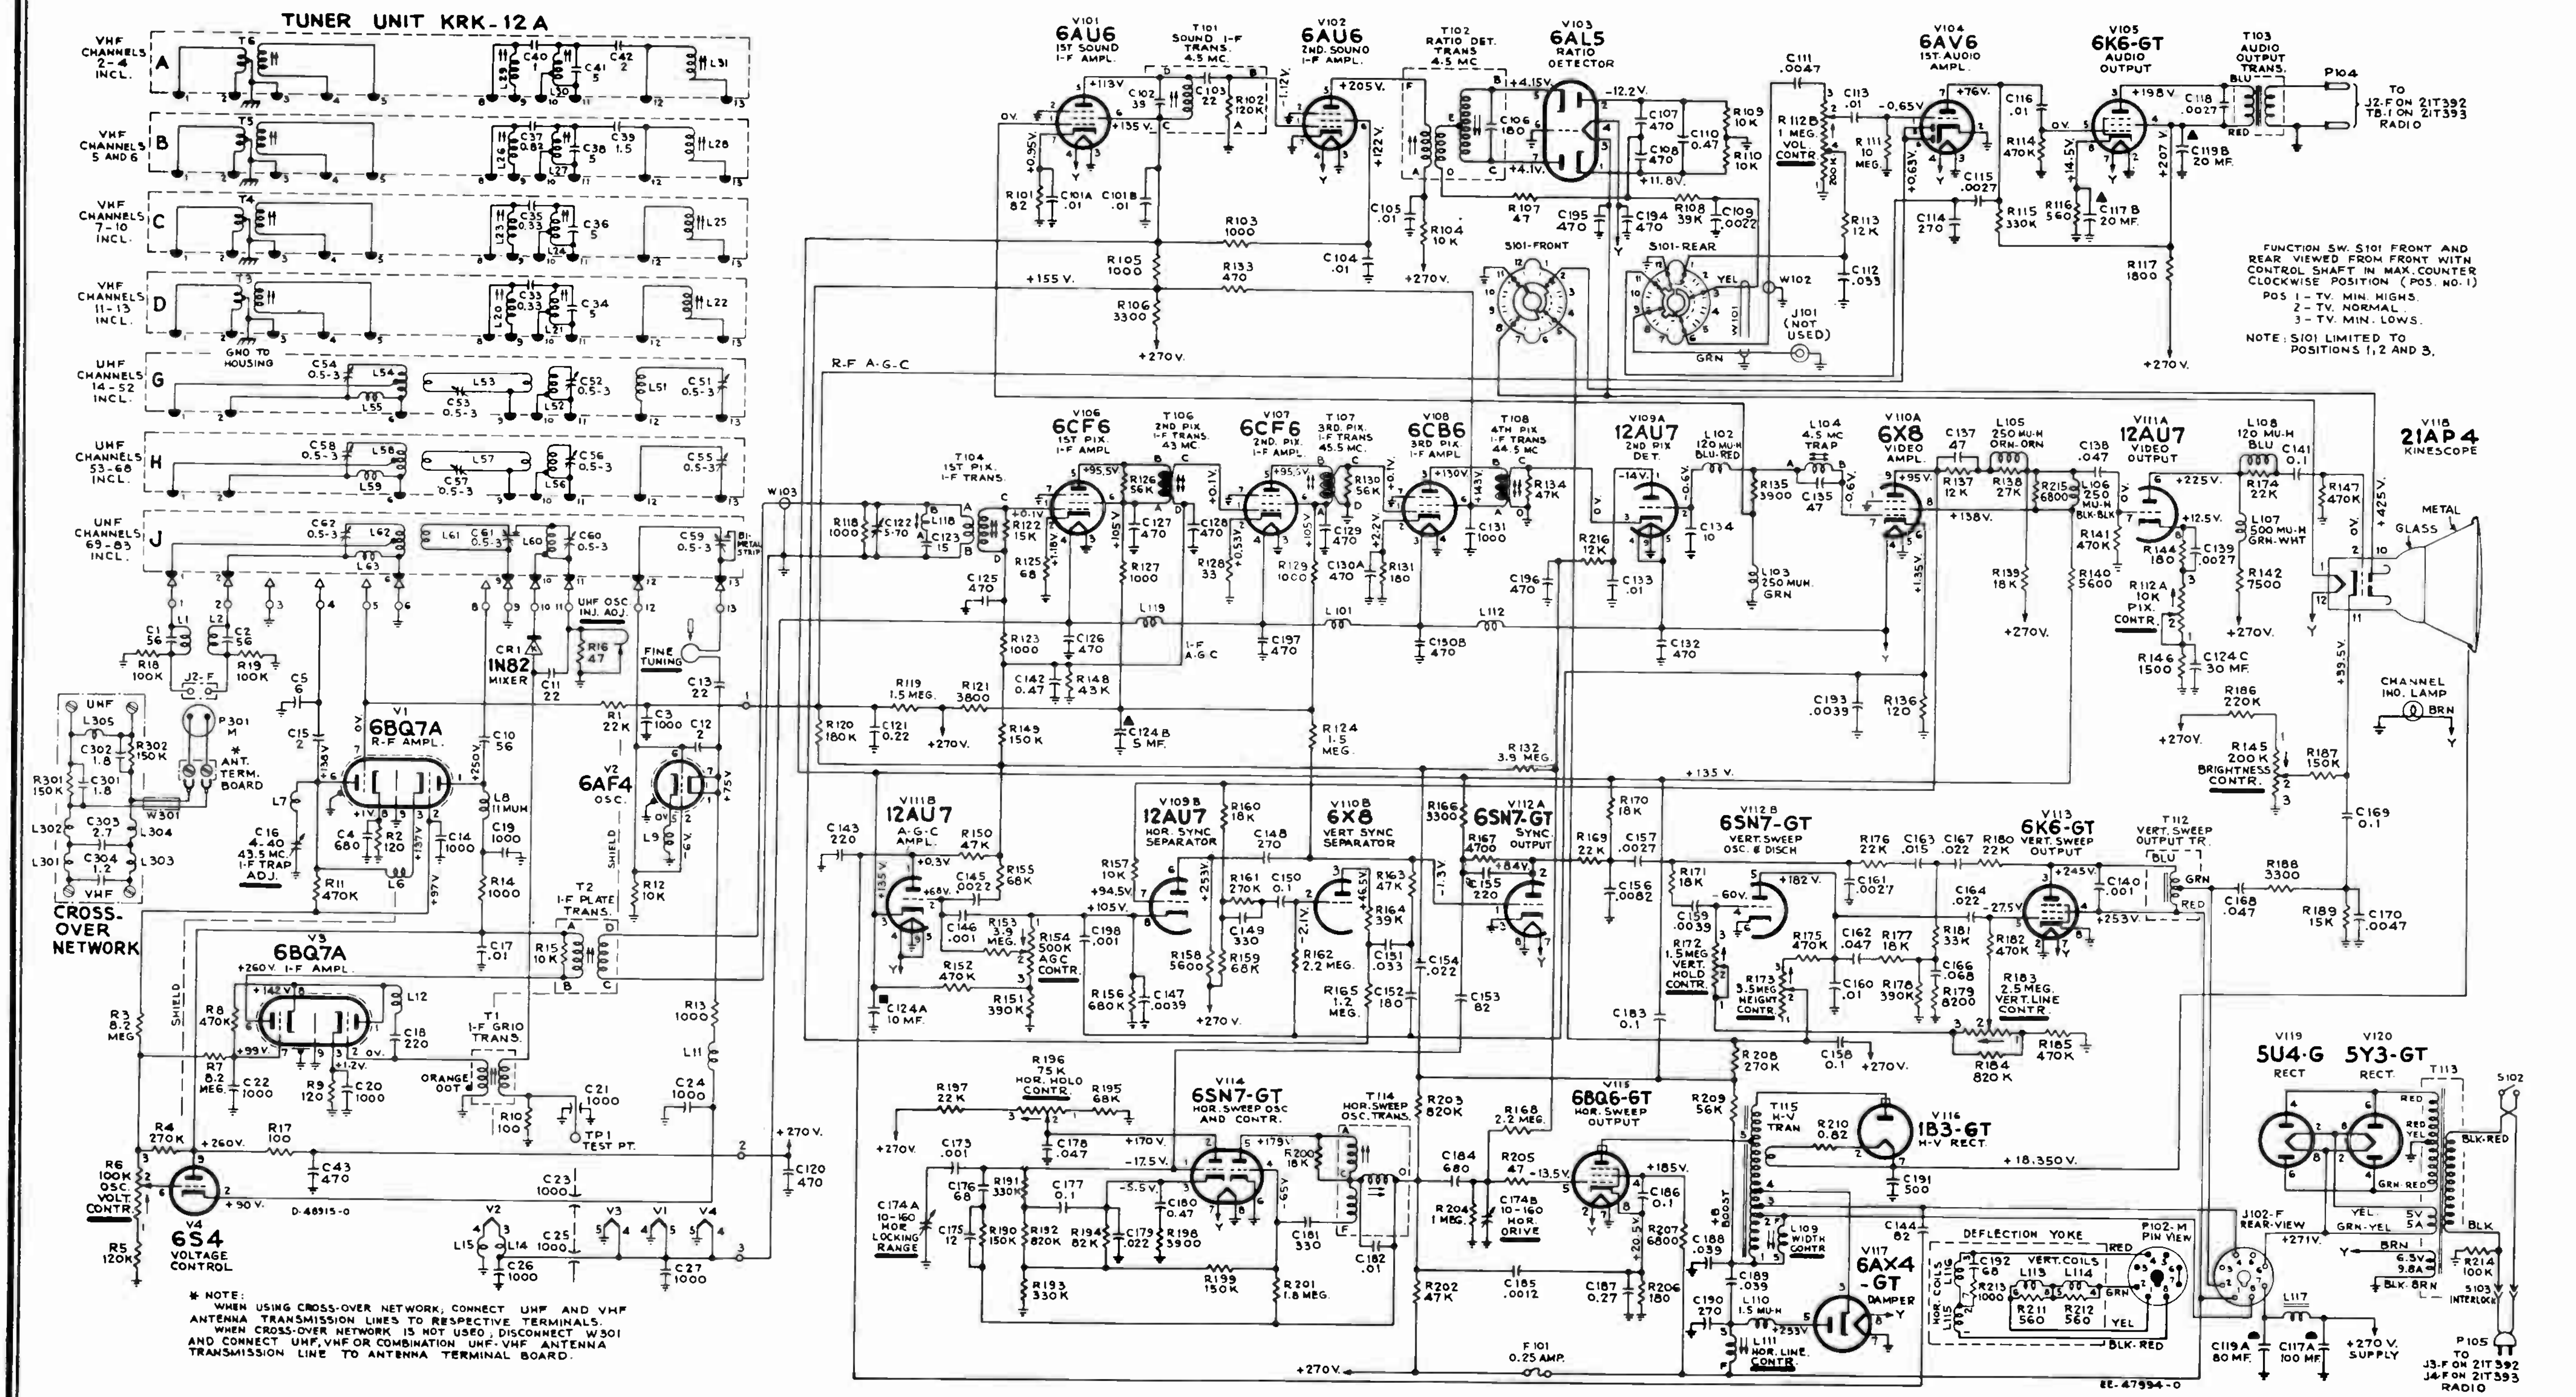
All capacitance values less than 1 in FM and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

Figure 35—Television Circuit Schematic Diagram, KCS83F

TELEVISION CIRCUIT SCHEMATIC DIAGRAM, KCS83H



All resistance values in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

REPLACEMENT PARTS

STOCK No.	DESCRIPTION
	TUNER ASSEMBLIES
	KRK29
76539	Board—Antenna matching transformer terminal board less coils and capacitors
78235	Board—Terminal board, 5 contact and ground
78233	Bracket—Side bracket for mounting coil and stators
77853	Capacitor—Ceramic, variable, for fine tuning capacitor —plunger type (C27)
	Capacitor—Adjustable, mica:
77616	4-40 mmf. (C33)
	Capactior—Adjustable, steatite:
77151	0.8-3.0 mmf. (C11, C21, C25)
77913	0.8-3.0 mmf. (C22)
76532	1-4 mmf. (C7)
	Capacitor—Ceramic:
77084	feed-thru, 1000 mmf. (C5, C15, C17, C18, C19)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0
77865	10 mmf., ±1 mmf., 500 volts (C26, C37)
	Capacitor—Fixed, ceramic, High "K" disc:
77293	470 mmf., +100%, —0%, 500 volts (C29, C34, C35)
77252	1000 mmf., +100%, —0%, 500 volts (C8, C9, C14)
73960	10,000 mmf., +100%, —0%, 500 volts (C28)
	Capacitor—Fixed, ceramic, insulated, High "K"
75437	100 mmf., ±20%, 500 volts (C36)
78276	150 mmf., ±10%, 500 volts (C12)
75199	270 mmf., ±20%, 500 volts (C6, C10, C13)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0
93056	5 mmf., ±0.5% mmf., 500 volts (C2)
54207	18 mmf., ±10%, 500 volts (C1)
70935	27 mmf., ±10%, 500 volts (C3)
76739	33 mmf., ±10%, 500 volts (C4)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. ≠ —750
78247	10 mmf., ±10%, 500 volts (C24)
	Capacitor—Fixed, ceramic, Temp. coef.—N1400
78603	82 mmf., ±10%, 500 volts (C20)
	Capacitor—Fixed, headed-lead:
71504	0.68 mmf., ±20%, 500 volts (C23)
71502	2.2 mmf., ±20%, 500 volts (C31, C39)
71503	3.3 mmf., ±20%, 500 volts (C38)
	Capacitor—Mica trimmer:
78397	80-150 mmf. (C16)
77854	Clip—Fine tuning clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T1)
73874	Coil—Channel #6 mixer coil (L48)
73460	Coil—Channel #6 r.f. plate coil (L32)
73458	Coil—Channel #6 r.f. grid coil (L14)
78401	Coil—Channel #6 antenna coil (L61)
77915	Coil—Channel #13 oscillator coil (L49)
77919	Coil—Channel #13 mixer coil (L36)
77921	Coil—Channel #13 r.f. plate coil (L20)
77206	Coil—Filament choke coil (L33)
76763	Coil—Heater choke coil (L34, L35)
78271	Coil—I.F. input coil complete with adjustable core (L9)
78583	Coil—Mixer I.F. coil (L43)
76562	Coil—RF amplifier coupling coil (L7)
78584	Coil—RF plate I.F. coil (L27)
76537	Coil—Shunt coil complete with adjustable core (L3)
76538	Coil—Shunt coil complete with adjustable core (L2)
503033	33 ohms, ±10%, ½ watt (R19)
503112	120 ohms, ±10%, ½ watt (R2)
503147	470 ohms, ±10%, ½ watt (R14)
503210	1000 ohms, ±10%, ½ watt (R6, R20)
503233	3300 ohms, ±10%, ½ watt (R9)
503268	6800 ohms, ±10%, ½ watt (R1)
523312	12,000 ohms, ±10%, 2 watts (R13)
523315	15,000 ohms, ±10%, 2 watts (R7)
503410	100,000 ohms, ±10%, ½ watt (R3, R10, R11, R12)
503510	1 megohm, ±10%, ½ watt (R4, R5)
78399	Transformer—Convertor transformer (T2, R8)
76540	Trap—FM trap complete with adjustable core (L5)
78466	Trap—IF trap
76542	Trap—IF trap (41.25 MC) complete with core (L1)
76541	Trap—IF trap (45.75 MC) complete with core (L4)
75190	Washer—Insulating washer (neoprene) for capacitor
	TUNER ASSEMBLIES
	KRK12A
77580	Ball—Steel ball (.125" dia.) (12 req'd)
77579	Ball—Steel ball (.187" dia.)
77618	Bracket—Bracket and spring contact assembly for grounding rotor—assembled to oscillator shield
78338	Bracket—Lamp bracket
77619	Bracket—VHF input connector and bracket
76845	Bracket—Vertical bracket for oscillator tube shield
77591	Cam—Fine tuning cam
	Capacitor—Adjustable, mica:
77616	4-40 mmf. (C16)
	Capacitor—Fixed, ceramic:
77667	comprising 1 section of 2 mmf., and 1 section of 22 mmf (C12, C13)
77621	crystal holder 22 mmf., temp. coef. = —750 (C11)
77084	feed-thru, 1000 mmf. (C21, C23, C25)
77615	stand-off, 1000 mmf. (C3, C19, C24, C26)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0
77210	2 mmf., ±0.25 mmf., 500 volts (C15)
77688	5 mmf., ±0.5 mmf., 500 volts (C34, C36, C38, C41)
74182	6 mmf., ±0.5 mmf., 500 volts (C5)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = —750
71924	56 mmf., ±10%, 500 volts (C10)
	Capacitor—Fixed, ceramic, High "K" disc:
77625	220 mmf., +100%, —0%, 500 volts (C18)
77293	470 mmf., +100%, —0%, 500 volts (C43)
77624	680 mmf., +100%, —0%, 500 volts (C4)
77252	1000 mmf., +100%, —0%, 500 volts (C14, C20, C22, C27)
73960	10,000 mmf., +100%, —0%, 500 volts (C17)
	Capacitor—Fixed, headed-lead:
77691	.33 mmf., ±10%, 500 volts (C33, C35)
77689	.82 mmf., ±10%, 500 volts (C37)
77690	1 mmf., ±10%, 500 volts (C40)
71500	1.5 mmf., ±10%, 500 volts (C39)
78047	2 mmf., ±10%, 500 volts (C42)
77634	Coil—I.F. neutralizing coil (L12)
77628	Coil—I.F. trap (L7)
77629	Coil—Oscillator cathode coil (L9)
77631	Coil—Oscillator heater coil (L14)
77632	Coil—Oscillator heater coil (L15)
78224	Coil—Oscillator plate coil (L11)
77627	Coil—Peaking coil (L6, R11)
77695	Coil—RF plate coil (L8)
503047	47 ohms, ±10%, ½ watt (R16)
503110	100 ohms, ±10%, ½ watt (R10, R17)
503112	120 ohms, ±10%, ½ watt (R2, R9)
503210	1000 ohms, ±10%, ½ watt (R14)

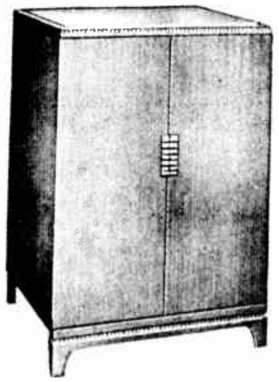
STOCK No.	DESCRIPTION
503310	10,000 ohms, ±10%, ½ watt (R12)
503322	22,000 ohms, ±10%, ½ watt (R1)
503410	100,000 ohms, ±10%, ½ watt (R18, R19)
503412	120,000 ohms, ±10%, ½ watt (R5)
503427	270,000 ohms, ±10%, ½ watt (R4)
503447	470,000 ohms, ±10%, ½ watt (R8)
503582	8.2 megohm, ±10%, ½ watt (R3, R7)
77609	Transformer—Mixer I.F. transformer complete with adjustable cores (T1)
77610	Transformer—Primary I.F. link transformer (T2, R15)
77626	Trap—I.F. trap (L1, C1, L2, C2)
77585	Washer—"C" washer for indicator shaft or fine tuning link spring
	CHASSIS ASSEMBLIES
	KCS 83F—VHF CHASSIS
	KCS 83H—UHF CHASSIS
	Capacitor—Adjustable, mica:
78220	5-70 mmf. (C122)
	Capacitor—Fixed, ceramic:
78225	82 mmf., ±10%, 3500 volts (C144)
76438	500 mmf., 25,000 volts (C191)
	Capacitor—Fixed, ceramic, High "K" disc:
77293	470 mmf., +100%, —0%, 500 volts (C120, C125, C126, C128, C132, C194, C195, C196, C197)
78622	470 mmf., ±20%, 500 volts (C127, C129)
77672	dual 470 mmf., +100%, —0%, 500 volts (C130)
78623	1000 mmf., ±20%, 500 volts (C131)
73960	10,000 mmf., +100%, —0%, 500 volts (C104, C105, C133)
76991	dual 10,000 mmf., +100%, —0%, 500 volts (C101A, C101B)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. —750
33098	10 mmf., ±1 mmf., 500 volts (C134)
33380	12 mmf., ±10%, 500 volts (C175)
39044	15 mmf., ±5%, 500 volts (C123)
39042	47 mmf., ±5%, 500 volts (C137)
71922	180 mmf., ±10%, 500 volts (C152)
47617	270 mmf., ±10%, 500 volts (C114)
	Capacitor—Fixed, mica:
76475	68 mmf., ±5%, 1000 volts (C176)
76474	82 mmf., ±5%, 1000 volts (C153)
39636	220 mmf., ±10%, 500 volts (C155)
75248	220 mmf., ±10%, 1000 volts (C143)
76579	270 mmf., ±10%, 1000 volts (C148, C190)
39640	330 mmf., ±10%, 500 volts (C149)
76476	330 mmf., ±5%, 1000 volts (C181)
39644	470 mmf., ±5%, 500 volts (C107, C108)
	Capacitor—Mica trimmer:
75217	dual 10-160 mmf. (C174A, C174B)
	Capacitor—Electrolytic:
78213	comprising: 1 section of 10 mfd., 350 volts, 1 section of 5 mfd., 350 volts and 1 section of 30 mfd., 50 volts (C124A, C124B, C124C)
77644	comprising: 1 section of 80 mfd., 400 volts and 1 section of 20 mfd., 400 volts (C119A, C119B)
78212	comprising: 1 section of 100 mfd., 400 volts and 1 section of 20 mfd., 50 volts (C117A, C117B)
	Capacitor—Fixed, paper, oil impregnated:
75643	.001 mfd., 1000 volts (C140, C146, C173, C198)
73595	.0022 mfd., 600 volts (C109, C145)
73599	.0027 mfd., 600 volts (C115, C139, C157, C161)
73818	.0027 mfd., 1600 volts (C118)
73796	.0039 mfd., 600 volts (C147, C193)
73920	.0047 mfd., 600 volts (C111, C170)
73808	.0082 mfd., 1000 volts (C156)
73561	.01 mfd., 400 volts (C113, C116)
73551	.01 mfd., 400 volts (C150, C158, C169, C177)
73565	.01 mfd., 1000 volts (C160)
73797	.015 mfd., 600 volts (C163)
73562	.022 mfd., 400 volts (C179)
73798	.022 mfd., 600 volts (C164, C167)
73810	.022 mfd., 1000 volts (C154)
73552	.033 mfd., 400 volts (C112, C151)
73813	.039 mfd., 1000 volts (C188, C189)
73553	.047 mfd., 400 volts (C178)
73592	.047 mfd., 600 volts (C138, C162, C168)
73792	.068 mfd., 400 volts (C166)
73557	.1 mfd., 600 volts (C141, C183, C186)
73794	.22 mfd., 400 volts (C121)
73786	.27 mfd., 200 volts (C187)
73787	.47 mfd., 200 volts (C110, C142, C180)
	Capacitor—Fixed, moulded paper, mineral oil impregnated:
76479	.00068 mfd., 600 volts (C184)
76995	.0012 mfd., 600 volts (C185)
78221	.0039 mfd., 600 volts (C159)
73594	.01 mfd., 600 volts (C182)
77676	Choke—Filter choke (L117)
73477	Coil—Filament choke coil (L101, L112, L119)
76442	Coil—Horizontal linearity coil complete with adjustable core (L111)
75253	Coil—Peaking coil (120 muh) (L102)
71529	Coil—Peaking coil (120 muh) (L108, R174)
71526	Coil—Peaking coil (250 muh) (L103)
77674	Coil—Peaking coil (250 muh) (L105, R138)
78222	Coil—Peaking coil (250 muh) (L106, R215)
75252	Coil—Peaking coil (500 muh) (L107)
76640	Coil—RF choke coil (1.5 muh) (L110)
78205	Coil—Width coil complete with adjustable core (L109).
35787	Connector—Audio input connector (J101)
76457	Connector—Second anode lead connector
75474	Connector—Single contact male connector for speaker leads
74594	Connector—2 contact male connector for power cord
50367	Connector—6 contact female connector for yoke leads (J102)
76975	Control—AGC control (R154)
78209	Control—Brightness control (R145)
78206	Control—Height control (R173)
77639	Control—Horizontal hold control (R196)
78208	Control—Picture control, volume control and power switch (R112A, R112B, S102)
78210	Control—Vertical hold control (R172)
78207	Control—Vertical linearity control (R183)
78199	Cover—Hi-voltage compartment cover
78214	Fuse—.3 amp., 250 volts (F101)
76459	Grommet—Rubber grommet for 2nd anode lead conne
78218	Holder—Fuse holder
78215	Insulator—Polystyrene insulator for hi-voltage socket
78226	Lead—Anode lead complete with eyelet
	Resistor—Fixed, wire wound:
76382	0.82 ohms, 1/3 watt (R210)
76639	180 ohms, 2 watts (R206)
77670	3300 ohms, 7 watts (R106)
77671	3800 ohms, 7 watts (R121)
	Resistor—Fixed, composition:
502033	33 ohms, ±5%, ½ watt (R128)
503047	47 ohms, ±10%, ½ watt (R107, R205)
502068	68 ohms, ±5%, ½ watt (R125)

STOCK No.	DESCRIPTION
503112	120 ohms, ±10%, ½ watt (R136)
502118	180 ohms, ±5%, ½ watt (R131)
503118	180 ohms, ±10%, ½ watt (R144)
503147	470 ohms, ±10%, ½ watt (R133)
513156	560 ohms, ±10%, 1 watt (R116)
503210	1000 ohms, ±10%, ½ watt (R103, R118, R123, R127, R129)
513210	1000 ohms, ±10%, 1 watt (R105)
503215	1500 ohms, ±10%, ½ watt (R146)
523218	1800 ohms, ±10%, 2 watts (R117)
30733	3300 ohms, ±5%, ½ watt (R166)
503233	3300 ohms, ±10%, ½ watt (R188)
502239	3900 ohms, ±5%, ½ watt (R135)
503239	3900 ohms, ±10%, ½ watt (R198)
503247	4700 ohms, ±10%, ½ watt (R167)
503256	5600 ohms, ±10%, ½ watt (R140, R158)
523268	6800 ohms, ±10%, 2 watts (R207)
512275	7500 ohms, ±5%, 1 watt (R142)
503282	8200 ohms, ±10%, ½ watt (R179)
502310	10,000 ohms, ±5%, ½ watt (R109, R110)
503310	10,000 ohms, ±10%, ½ watt (R157)
523310	10,000 ohms, ±10%, 2 watts (R104)
503312	12,000 ohms, ±10%, ½ watt (R113, R137, R216)
503315	15,000 ohms, ±10%, ½ watt (R122, R189)
502318	18,000 ohms, ±5%, ½ watt (R177)
503318	18,000 ohms, ±10%, ½ watt (R160, R170, R171, R200)
523318	18,000 ohms, ±10%, 2 watts (R139)
502322	22,000 ohms, ±5%, ½ watt (R180)
503322	22,000 ohms, ±10%, ½ watt (R169, R176, R197)
502333	33,000 ohms, ±5%, ½ watt (R181)
503339	39,000 ohms, ±10%, ½ watt (R108, R164)
502343	43,000 ohms, ±5%, ½ watt (R148)
503347	47,000 ohms, ±10%, ½ watt (R134, R163)
512347	47,000 ohms, ±5%, 1 watt (R202)
513347	47,000 ohms, ±10%, 1 watt (R150)
502356	56,000 ohms, ±5%, ½ watt (R126, R130)
503356	56,000 ohms, ±10%, ½ watt (R209)
503368	68,000 ohms, ±10%, ½ watt (R155, R159, R195)
503382	82,000 ohms, ±10%, ½ watt (R194)
503410	100,000 ohms, ±10%, ½ watt (R214)
502415	150,000 ohms, ±5%, ½ watt (R149)
503415	150,000 ohms, ±10%, ½ watt (R187, R190)
512415	150,000 ohms, ±5%, 1 watt (R199)
502418	180,000 ohms, ±5%, ½ watt (R120)
503422	220,000 ohms, ±10%, ½ watt (R186)
503427	270,000 ohms, ±10%, ½ watt (R161, R208)
503433	330,000 ohms, ±10%, ½ watt (R115, R191, R193)
503439	390,000 ohms, ±10%, ½ watt (R151, R178)
502447	470,000 ohms, ±5%, ½ watt (R185)
503447	470,000 ohms, ±10%, ½ watt (R114, R141, R147, R152, R175, R182)
503468	680,000 ohms, ±10%, ½ watt (R156)
502482	820,000 ohms, ±5%, ½ watt (R184)
503482	820,000 ohms, ±10%, ½ watt (R192, R203)
503510	1 megohm, ±10%, ½ watt (R204)
503512	1.2 megohm, ±10%, ½ watt (R165)
502515	1.5 megohm, ±5%, ½ watt (R119, R124)
512518	1.8 megohm, ±5%, 1 watt (R201)
503522	2.2 megohm, ±10%, ½ watt (R162, R168)
503539	3.9 megohm, ±10%, ½ watt (R132, R153)
503610	10 megohm, ±10%, ½ watt (R111)
78203	Transformer—1st I.F. pix transformer complete with adjustable core (T104)
76433	Transformer—2nd, 3rd, or 4th, I.F. transformer (T106, T107, T108)
78201	Transformer—Hi-voltage transformer (T115)
76440	Transformer—Horizontal oscillator transformer complete with adjustable core (T114)
76997	Transformer—Output transformer (T103)
78200	Transformer—Power transformer 117 volts, 60 cycle (T113)
77112	Transformer—Ratio detector transformer complete with adjustable core (T102, C106)
76981	Transformer—Sound I.F. transformer complete with adjustable core (T101, C102, C103, R102)
78202	Transformer—Vertical output transformer (T112)
78204	Trap—1st I.F. grid trap complete with adjustable core (L118)
76983	Trap—4.5 MC trap (L104, C135)
78219	Washer—Vellutex washer for tube socket and shield
	RADIO CHASSIS ASSEMBLIES
	RC-1117 B
	(For Models 21T392, 21T392U)
76876	Antenna—Antenna loop complete
76867	Capacitor—Variable tuning capacitor complete with drive drum (C1A, C1B)
76872	Capacitor—Adjustable trimmer, 2.5—30 mmf., (C5, C22)
	Capacitor—Ceramic:—
77116	56 mmf. (C4)
76347	120 mmf. (C13)
73013	Capacitor—Electrolytic comprising 1 section of 80 mfd., 150 volts and 1 section of 30 mfd., 150 volts and 1 section of 10 mfd., 150 volts (C17A, C17B, C17C)
	Capacitor—Tubular, paper:—
73851	.0018 mfd., 1600 volts (C7, C8, C21)
73795	.0033 mfd., 400 volts (C12)
73796	.0039 mfd., 600 volts (C14, C19, C20)
73920	.0047 mfd., 600 volts (C10)
73562	.022 mfd., 400 volts (C11, C15)
73561	.01 mfd., 400 volts (C16)
73553	.047 mfd., 400 volts (C2, C3, C6)
	Capacitor—Tubular, moulded paper:—
75071	.047 mfd., 400 volts (C18)
76871	Rectifier—Selenium rectifier (SR1)
73072	Resistor—Nominal value 95 ohms @ 38°C. with negative temperature coefficient (R23)
77379	Resistor—Wire wound, 66 ohms, 5 watts (R22)
	Resistor—Fixed, composition:—
503082	82 ohms, ± 10%, ½ watt (R19)
503127	270 ohms, ±10%, ½ watt (R6)
513212	1200 ohms, ±10%, 1 watt (R21)
502218	1800 ohms, ±5%, ½ watt (R20)
503312	12,000 ohms, ±10%, ½ watt (R17)
503327	27,000 ohms, ±10%, ½ watt (R4)
503339	39,000 ohms, ±10%, ½ watt (R2)
503368	68,000 ohms, ±10%, ½ watt (R10)
503412	120,000 ohms, ±10%, ½ watt (R7)
503422	220,000 ohms, ±10%, ½ watt (R1, R13, R14)
503439	390,000 ohms, ±10%, ½ watt (R8)
503447	470,000 ohms, ±10%, ½ watt (R16, R18)
503515	1.5 megohm, ±10%, ½ watt (R3)
503533	3.3 megohm, ±10%, ½ watt (R5)
503610	10 megohm, ±10%, ½ watt (R12, R15)
76869	Shaft—Tuning knob shaft
76870	Shield—Tube shield
74697	Socket—Dial lamp socket
77115	Socket—Tube socket, 7 pin, miniature moulded
51955	Socket—Tube socket, 7 pin, miniature moulded saddle-mounted

STOCK No.	DESCRIPTION
76368	Spring—Drive cord spring
76873	Switch—Radio phono switch less volume control (S1)
77377	Switch—"Radio-TV" switch (S3, S4)
77122	Transformer—Output transformer (T3)
74918	Transformer—1st I.F. transformer complete with adjustable cores (T1)
73037	Transformer—2nd I.F. transformer complete with adjustable cores (T2)
33726	Washer—"C" washer for tuning knob shaft
	RADIO CHASSIS ASSEMBLIES
	RC-1111C
	(For Models 21T393, 21T393U)
77332	Antenna—Radio antenna loop complete less cable
77308	Capacitor—Variable tuning capacitor (C1-1, C1-2, C1-3, C1-4, C1-5, C1-6)
	Capacitor—Fixed, ceramic, high "K" disc:—
73473	4700 mmf., +100%, —0%, 500 volts DC (C2, C4, C7, C9, C11, C18, C20, C23, C24, C27, C32, C34, C35, C40)
	Capacitor—Fixed, ceramic, insulated, high "K" disc:—
76348	47 mmf., ±10%, 500 volts DC (C10)
75614	150 mmf., ±20%, 500 volts DC (C13, C28, C31)
75611	220 mmf., ±20%, 500 volts DC (C3)
	Capacitor—Fixed, ceramic, non-insulated, temp. coef. = —750:—
75613	5 mmf., ±1.0 mmf., 500 volts DC (C12, C14)
30944	15 mmf., ±10%, 500 volts DC (C14)
75612	68 mmf., ±10%, 500 volts DC (C15, C17)
39396	100 mmf., ±10%, 500 volts DC (C5)
	Capacitor—Fixed, ceramic, non-insulated, temp. coef. = —470 ±15%:—
77352	6.8 mmf., ±5%, 500 volts DC (C16)
	Capacitor—Fixed, mica:—
39640	330 mmf., 500 volts (C36, C37)
39644	470 mmf., 300 volts (C6)
73747	Capacitor—Electrolytic, 2 mfd., 50 volts (C39)
	Capacitor—Fixed, tubular, paper:—
77468	.0018 mfd., 600 volts (C8)
73795	.0033 mfd., 400 volts (C25)
73920	.0047 mfd., 600 volts (C30)
72490	.005 mfd., 200 volts (C33, C38)
73561	.01 mfd., 400 volts (C29)
73797	.015 mfd., 600 volts (C22)
77469	.018 mfd., 200 volts (C21)
73562	.022 mfd., 400 volts (C26)
73558	.047 mfd., 200 volts (C19)
73935	Clip—Mounting clip for I.F. transformer 75558 & 76328
77313	Coil—Antenna coil—F.M.(L1)
71942	Coil—Filament choke coil (L9, L10)
75569	Coil—Oscillator coil—AM—complete with adjustable core (L3, L4, L5)
77315	Coil—Oscillator coil—FM (L8)
77305	Coil—RF coil—AM—complete with adjustable core (L6, L7)
77314	Coil—RF coil—FM (L2)
75562	Control—Tone control—H.F. (R29)
75561	Control—Tone control—L.F. (R16)
75537	Control—Volume control and power switch (R19, S2)
72953	Cord—Drive cord (approx. 57" overall)
75564	Coupling—Spring coupling for function switch extension shaft
74839	Fastener—Push fastener to fasten RF shelf (4 req'd)
16058	Grommet—Rubber grommet for mounting RF shelf (4 req'd)
11765	Lamp—Dial lamp—Mazda 51
72602	Pulley—Drive cord pulley
35641	Pulley—Drive cord pulley—1⅝" dia.
	Resistor—Fixed, composition:—
503039	39 ohms, ±10%, ½ watt (R3)
503068	68 ohms, ±10%, ½ watt (R21)
503110	100 ohms, ±10%, ½ watt (R14, R34)
503112	120 ohms, ±10%, ½ watt (R30)
503139	390 ohms, ±10%, ½ watt (R12)
503168	680 ohms, ±10%, ½ watt (R6, R25, R32)
503210	1000 ohms, ±10%, ½ watt (R2)
502212	1200 ohms, ±5%, ½ watt (R36)
502233	3300 ohms, ±5%, ½ watt (R35)
503282	8200 ohms, ±10%, ½ watt (R5)
503315	15,000 ohms, ±10%, ½ watt (R33)
503318	18,000 ohms, ±10%, ½ watt (R13, R17)
503322	22,000 ohms, ±10%, ½ watt (R22, R31)
503327	27,000 ohms, ±10%, ½ watt (R9, R18)
503339	39,000 ohms, ±10%, ½ watt (R37)
503356	56,000 ohms, ±10%, ½ watt (R26)
503412	120,000 ohms, ±10%, ½ watt (R11, R15)
503415	150,000 ohms, ±10%, ½ watt (R4, R24)
503422	220,000 ohms, ±10%, ½ watt (R23)
503447	470,000 ohms, ±10%, ½ watt (R38)
503427	270,000 ohms, ±10%, ½ watt (R28)
503510	1 megohm, ±10%, ½ watt (R39)
503515	1.5 megohm, ±10%, ½ watt (R10)
503522	2.2 megohm, ±10%, ½ watt (R1, R7, R8)
503610	10 megohm, ±10%, ½ watt (R20)
504622	22 megohm, ±20%, ½ watt (R27)
75558	Transformer—First I.F. transformer—AM—complete with adjustable cores (T2)
75559	Transformer—First I.F. transformer—FM—complete with adjustable cores (T1)
76328	Transformer—Second I.F. transformer—AM—complete with adjustable cores (T4)
75560	Transformer—Second I.F. transformer—FM—complete with adjustable cores (T3)
73743	Transformer—Ratio detector transformer complete with adjustable core (T5)
33726	Washer—"C" washer for tuning knob shaft or drive cord pulley
	AMPLIFIER ASSEMBLIES
	RS-141D
	(For Models 21T393, 21T393U)
74296	Cable—Shielded audio cable complete with pin plug
77324	Capacitor—Electrolytic comprising 1 section of 30 mfd., 450 volts, 1 section of 30 mfd., 350 volts and 1 section of 40 mfd., 25 volts (C1A, C1B, C1C)
	Capacitor—Tubular, paper:—
73789	.0068 mfd., 400 volts (C5)
73562	.022 mfd., 400 volts (C2)
	Capacitor—Tubular, paper, oil impregnated:—
75643	.001 mfd., 1000 volts (C3, C4)
75064	Connector—9 contact female connector for power input cable (P1)
70392	Cord—Power cord and plug
74838	Grommet—Power cord strain relief (1 set)
72776	Pin—Contact pin for speaker lead (2 req'd)
73637	Resistor—Wire wound, 2200 ohms, 5 watts (R1)
	Resistor—Fixed, composition:—

STOCK No.	DESCRIPTION
503110	100 ohms, ±10%, ½ watt (R8)
522127	270 ohms, ±5%, 2 watts (R7)
502233	3300 ohms, ±5%, ½ watt (R2)
503368	68,000 ohms, ±10%, ½ watt (R5)
503382	82,000 ohms, ±10%, ½ watt (R3)
503447	470,000 ohms, ±10%, ½ watt (R4, R6)
31251	Socket—Tube socket, octal, wafer
73117	Socket—Tube socket, 7 pin, miniature, wafer
77323	Transformer—Output transformer (T2)
75566	Transformer—Power transformer, 117 volt, 60 cycle (T1)
	SPEAKER ASSEMBLIES
	92569-12W
	RL111A1
	RMA-274
75682	Cone—Cone and voice coil (3.2 ohms)
76093	Speaker—12" PM speaker complete with cone and voice coil (3.2 ohms)
	NOTE: If stamping on speaker in instrmuents does not agree with above speaker number, order replacement parts by referring to Model number of instruments, number stamped on speaker and full description of part required.
75696	Bumper—Rubber bumper for record changer carriage stop bracket
74579	Bumper—Rubber bumper for L.H. doors for Models 21T393, 21T393U
74296	Cable—Shielded pickup cable complete with pin plug for Models 21T393, 21T393U
	Capacitor—Adjustable, mica:
71807	10-160 mmf. for instruments using KRK12A tuner
	Capacitor—Fixed, headed-lead:
78532	1.2 mmf., ±10%, 500 volts (C4)
78442	1.8 mmf., ±10%, 500 volts (C1, C2)
78443	2.7 mmf., ±10%, 500 volts (C3)
71892	Catch—Cabinet door bullet catch and strike
77755	Clamp—Polystyrene clamp for antenna cable and mount for FM trap for instruments using KRK12A tuner
70142	Clamp—Radio dial clamp for Models 21T392, 21T392U
X3349	Cloth—Grille cloth for mahogany or walnut instruments
X3371	Cloth—Grille cloth for oak instruments
76863	Connector—Anode connector
75474	Connector—Single contact male connector for antenna cable
77726	Connector—2 contact male connector for antenna cable for instruments using KRK12A tuner
30870	Connector—2 contact male connector for motor cable
74752	Connector—2 contact male connector for AM-FM cable for Models 21T393, 21T393U
74192	Connector—3 contact male connector for pickup cable for Models 21T392, 21T392U
39153	Connector—4 contact male connector for antenna cable for instruments using KRK29 tuner
75542	Connector—6 contact male connector for deflection yoke leads (P102)
77461	Cord—Power cord and plug
77759	Cover—Cover assembly—maroon—complete with spring for channel markers for mahogany or walnut instruments using KRK12A tuner
77760	Cover—Cover assembly—sand gray—complete with spring for channel markers for oak instruments using KRK12A tuner
78538	Cover—Cover and case assembly—brown—for hidden controls for oak instruments
78490	Cover—Cover and case assembly—red—for hidden controls for mahogany or walnut instruments
77770	Cushion—Adhesive cushion for safety glass retainer
76698	Cushion—Rubber cushion for masking panel support bracket
78313	Cushion—Rubber cushion for dust sealing the kinescope
77749	Cushion—Rubber cushion for safety glass
74956	Cushion—Rubber cushion for deflection yoke hood
78309	Cushion—Round rubber cushion for deflection yoke
78386	Decal—Picture, volume, fine tuning controls and channel selector switch function decal for mahogany or walnut instruments
78389	Decal—Picture, volume, fine tuning controls and channel selector switch function decal for oak instruments
77344	Decal—Radio controls function decal for mahogany or walnut instruments for Models 21T392, 21T392U
77906	Decal—Radio controls function decal for Models 21T393, 21T393U
77345	Decal—Radio controls function decal for oak instruments for Models 12A392, 21T392U
74273	Decal—"Victrola" decal
77380	Dial—Radio dial for Models 21T392, 21T392U
77394	Dial—Radio dial for Models 21T393, 21T393U
77756	Disc—Polystyrene indicator disc—maroon—for channel selections for mahogany or walnut instruments using KRK12A tuner
77757	Disc—Polystyrene indicator disc—sand gray—for channel selections for oak instruments using KRK12A tuner unit
78315	Escutcheon—Channel marker escutcheon for instruments using KRK29 tuner
74205	Escutcheons—Radio dial escutcheon less dial for Models 21T392, 21T392U
77392	Escutcheon—Radio dial escutcheon less dial for Models 21T393, 21T393U
78314	Glass—Safety glass
74838	Grommet—Power cord strain relief
37396	Grommet—Rubber grommet for speaker mounting
77402	Handle—Pullout handle for record changer mounting carriage
74308	Hinge—Cabinet door hinge (1 set) for L.H. upper or R.H. upper doors for Models 21T392, 21T392U, 21T393, 21T393U and for R.H. lower door for Models 21T392, 21T392U
78501	Hinge—Cabinet door hinge for L.H. center door for Models 21T393, 21T393U
77346	Hinge—Cabinet door hinge (1 set) for R.H. center door for Models 21T393, 21T393U
78504	Hinge—Cabinet door hinge (1 set) for R.H. lower door for Models 21T393, 21T393U
78308	Hood—Deflection yoke hood less rubber cushions
77802	Knob—Radio-phono tone and power switch knob—brown—for mahogany or walnut instruments for Models 21T392, 21T392U (outer)
77803	Knob—Radio-phono tone and power switch knob—medium beige—for oak instruments for Models 21T392, 21T392U (outer)
77811	Knob—Radio-phono—TV function knob—brown—for Models 21T393, 21T393U
77804	Knob—Radio tuning control knob—brown—for mahogany or walnut instruments for Models 21T392, 21T392U (outer)
77805	Knob—Radio tuning control knob—medium beige—for oak instruments for Models 21T392, 21T392U (outer)

Models 24-T-420, 24-T-420U "Barrett" Mahogany, Oak



Models 24-T-435, 24-T-435U "Sewell" Mahogany, Oak

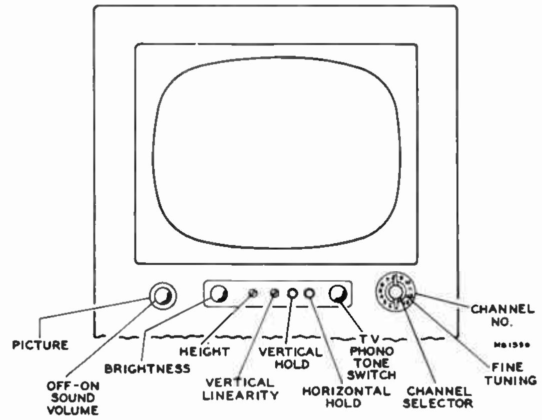


Figure 1—Receiver Operating Controls (VHF Models).

GENERAL DESCRIPTION

Models 24-T-420, 24-T-420U, 24-T-435 and 24-T-435U are "24 inch" television receivers. Models 24-T-420 and 24-T-435 are identical except for cabinets. Models 24-T-420U and 24-T-435U are identical except for cabinets. Models 24-T-420 and 24-T-435 have full 12 channel VHF coverage. Models 24-T-420U and 24-T-435U feature full 12 channel VHF coverage plus any UHF channels desired.

All models include intercarrier FM sound system; ratio detector; improved picture brilliance; pulsed picture A-G-C; A-F-C horizontal hold; stabilized vertical hold; noise saturation circuits; improved sync separator (3.5 mc. band width for picture channel); and reduced hazard high voltage supply. An auxiliary audio input jack is provided to permit the use of an external record playing attachment.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE . . . 327 square inches on a 24CP4A Kinescope

TELEVISION R-F FREQUENCY RANGE

Models 24-T-420 & 24-T-435

All 12 television channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

Models 24-T-420U & 24-T-435U

Any of 70 UHF channels . . . . . 470 mc. to 890 mc.
Any of 12 VHF channels, 54 mc. to 88 mc., 174 mc. to 216 mc.

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency . . . . . 45.75 mc.
Sound I-F Carrier Frequency . . . . . 41.25 mc.

POWER RATING . . . . . 245 watts

AUDIO POWER OUTPUT RATING . . . . . 4 watts max.

VIDEO RESPONSE . . . . . To 3.5 mc.

SWEEP DEFLECTION . . . . . Magnetic

FOCUS . . . . . Magnetic

ANTENNA INPUT IMPEDANCE

Models 24-T-420, 24-T-435

Choice: 300 ohms balanced or 72 ohms unbalanced.

Models 24-T-420U, 24-T-435U

UHF—300 ohms balanced.
VHF—300 ohms balanced.

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK22C (24-T-420 & 24-T-435)	
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer
Tuner KRK29A/27 (24-T-420U, 24-T-435U)	
(1) RCA 6AF4	UHF Oscillator
(2) RCA 6BQ7A	VHF R-F Amplifier; UHF I-F Amplifier
(3) RCA 6X8	VHF R-F Oscillator & Mixer; UHF I-F Amplifier

A IN82 crystal is used as the UHF mixer.

All Models

Tube Used	Function
(1) RCA 6CF6	1st Picture I-F Amplifier
(2) RCA 6CF6	2nd Picture I-F Amplifier
(3) RCA 6CB6	3rd Picture I-F Amplifier
(4) RCA 12AU7	Picture 2nd Det. and Horiz. Sync. Sep.
(5) RCA 6X8	Video Amplifier and Vert. Sync. Sep.
(6) RCA 12AU7	Video Output & AGC
(7) RCA 6AU6	1st Sound I-F Amplifier
(8) RCA 6AU6	2nd Sound I-F Amplifier
(9) RCA 6AL5	Ratio Detector
(10) RCA 6AV6	1st Audio Amplifier
(11) RCA 6AQ5	Audio Output
(12) RCA 12AU7	Vert. Osc. and Disch. & Sync. Output
(13) RCA 6AQ5	Vertical Sweep Output
(14) RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(15) RCA 6CD6G	Horizontal Sweep Output
(16) RCA 6AU4GT	Damper
(17) RCA 1B3-GT/8016	High Voltage Rectifier
(18) RCA 24CP4A	Kinescope
(19) RCA 5U4G	Rectifier
(20) RCA 5Y3GT	Rectifier

CHASSIS DESIGNATIONS

KCS84C Models 24-T-420 and 24-T-435 employing a KRK22C Tuner.

KCS84E Models 24-T-420U and 24-T-435U employing a KRK29A/27 Tuner.

WEIGHT & DIMENSIONS

Model	Shipping Weight	Weight	Width Inches	Height Inches	Depth Inches
24-T-420	138 lbs.	167 lbs.	41¼	29⅛	24¼
24-T-420U	143 lbs.	172 lbs.	41¼	29⅛	24¼
24-T-435	154 lbs.	191 lbs.	41¾	30⅜	28
24-T-435U	159 lbs.	196 lbs.	41¾	30⅜	28

LOUDSPEAKERS

Model 24-T-420 . . . . . (971692-1) 10" PM Dynamic, 3.2 ohms
Model 24-T-420U . . . . . (971692-1) 10" PM Dynamic, 3.2 ohms
Model 24-T-435 . . . . . (971692-1) 10" PM Dynamic, 3.2 ohms
Model 24-T-435U . . . . . (971692-1) 10" PM Dynamic, 3.2 ohms

SCANNING . . . . . Interlaced, 525 line

HORIZONTAL SWEEP FREQUENCY . . . . . 15,750 cps

VERTICAL SWEEP FREQUENCY . . . . . 60 cps

FRAME FREQUENCY (Picture Repetition Rate) . . . . . 30 cps

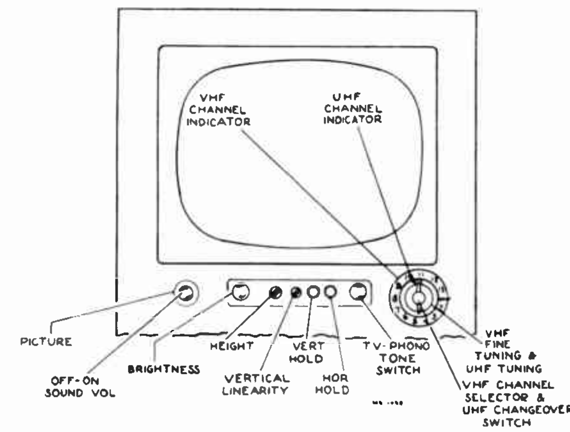

Figure 2—Receiver Operating Controls (UHF-VHF Models)

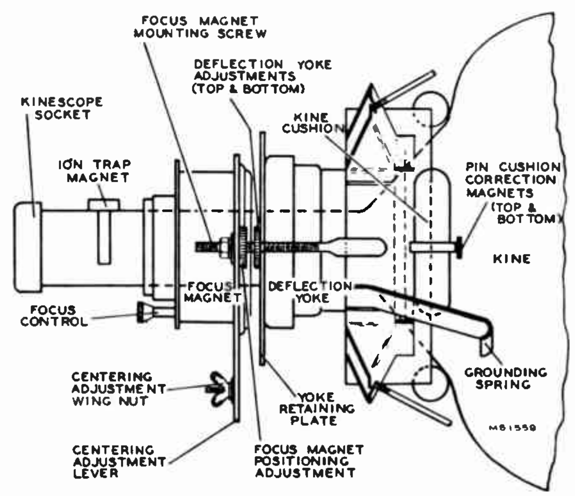

Figure 3—Yoke and Focus Magnet Adjustments

OPERATING CONTROLS (Front)

Models 24-T-420 & 24-T-435

Channel Selector, Fine Tuning . . . . . Dual Control Knobs

Models 24-T-420U & 24-T-435U

VHF Channel Selector and UHF Changeover Switch, VHF Fine Tuning and UHF Tuning . . . Dual Control Knobs

All Models

Brightness . . . . . Single Control under Panel
Picture Horizontal Hold . . . . . Single Control under Panel
Picture Vertical Hold . . . . . Single Control under Panel
Sound Volume and On-Off Switch, Picture . . . . . Dual Control Knobs
TV-PH tone switch . . . . . Single Control under Panel

NON-OPERATING CONTROLS (under Front Panel)

Height . . . . . screwdriver adjustment
Vertical Linearity . . . . . screwdriver adjustment

NON-OPERATING CONTROLS (not including R-F and I-F adjustments)

Picture Centering . . . . . top chassis adjustment
Width . . . . . rear chassis adjustment
Horizontal Drive . . . . . rear chassis screwdriver adjustment
Horizontal Linearity . . . . . rear chassis adjustment
Horizontal Oscillator Frequency . . . . . rear chassis adjustment
Horizontal Oscillator Waveform . . . bottom chassis adjustment
Horizontal Locking Range . . . . . rear chassis adjustment
Focus . . . . . top chassis adjustment
Ion Trap Magnet . . . . . top chassis adjustment
Deflection Coil . . . . . top chassis adjustment
AGC Control . . . . . rear chassis adjustment

CHECK OF HORIZONTAL OSCILLATOR ALIGNMENT.—Turn the horizontal hold control to the extreme counter-clockwise position. The picture should remain in horizontal sync. Momentarily remove the signal by switching off channel then back. Normally the picture will be out of sync. Turn the control clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 2 or 3 bars sloping downward to the left are obtained, the picture will pull into sync upon slight additional clockwise rotation of the control. Pull-in should occur before the control has been turned 120 degrees from the extreme counter-clockwise position. The picture should remain in sync for approximately 90 degrees of additional clockwise rotation of the control. At the extreme clockwise position, the picture should remain in sync and should not show a black bar in the picture.

If the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Alignment of Horizontal Oscillator" and proceed with "Focus Magnet Adjustment."

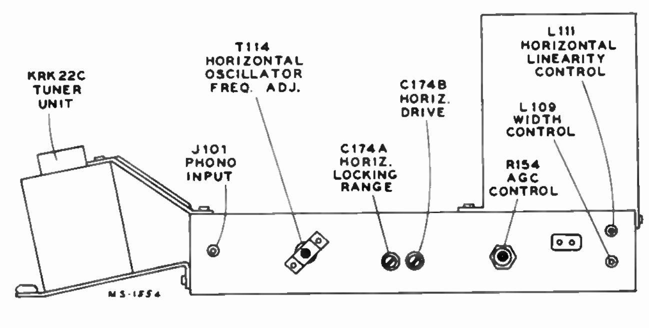

Figure 4—Rear Chassis Adjustments

WIDTH, DRIVE AND HORIZONTAL LINEARITY ADJUSTMENTS.—Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage hence the brightest and best focused picture, adjust horizontal drive trimmer C174B counter-clockwise until the picture begins to "wrinkle" in the middle then clockwise until the "wrinkle" disappears.

Turn the horizontal linearity control L111 clockwise until the picture begins to "wrinkle" on the right and then counter-clockwise until the "wrinkle" disappears and best linearity is obtained.

Adjust the width control L109 to obtain correct picture width.

A slight readjustment of these three controls may be necessary to obtain the best linearity.

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R173 behind front control panel) until the picture fills the mask vertically. Adjust vertical linearity (R183 behind front control panel), until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust centering to align the picture with the mask.

FOCUS.—Adjust the focus magnet for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

Recheck the position of the ion trap magnet to make sure that maximum brightness is obtained.

Check to see that the yoke knurled nuts and the focus magnet mounting screws are tight.

KRK22C OR KRK29A VHF R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 11. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 5 or 6. Adjustment for channel 13 is on top of the chassis. The oscillator for the KRK27 UHF tuner section of the KRK29A/27 tuner should be adjusted by the method outlined on page 12 under Alignment Procedure.

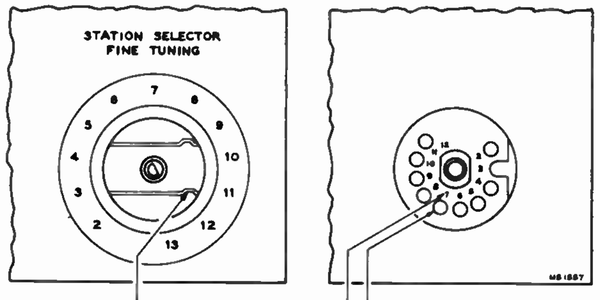

Figure 5—KRK22C R-F Oscillator Adjustments

AGC THRESHOLD CONTROL.—The AGC threshold control R154 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal and sync the picture. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R154. If the picture requires an appreciable portion of a second to reappear, or bends excessively, R154 should be readjusted.

Turn R154 fully counter-clockwise. The raster may be bent slightly. This should be disregarded. Turn R154 clockwise

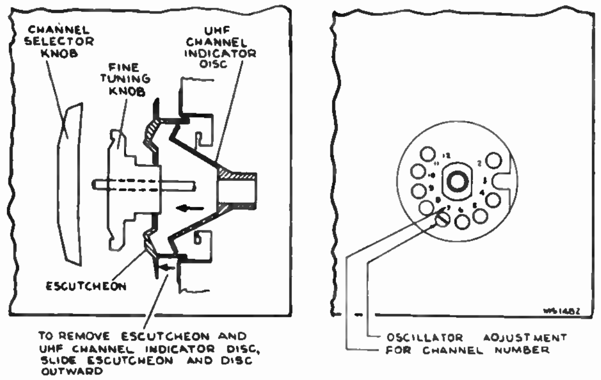

Figure 6—KRK29A/27 VHF R-F Oscillator Adjustment

until there is a very, very slight bend or change of bend in the picture. Then turn R154 counter-clockwise just sufficiently to remove this bend or change of bend.

If the signal is weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R154 clockwise until the snow in the picture becomes more pronounced, then counter-clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far clockwise on a weak signal, then the receiver may overload when a strong signal is received.

FM TRAP ADJUSTMENT.—In some instances interference may be encountered from a strong FM station signal. A trap is provided to eliminate this type of interference. To adjust the trap tune in the station on which the interference is observed and adjust the FM trap for minimum interference in the picture. The trap is L53 on KRK22C and L5 on KRK29A tuners and is located on the antenna matching transformer.

CAUTION.—In some receivers, the FM trap L5 or L53 will tune down into channel 6 or even into channel 5. Needless to say, such an adjustment will cause greatly reduced sensitivity on these channels. If channels 5 or 6 are to be received, check L5 or L53 to make sure that it does not affect sensitivity on these two channels.

Replace the cabinet back and connect the receiver antenna leads to the cabinet back. Make sure that the screws holding it are up tight, otherwise it may rattle or buzz when the receiver is operated at high volume.

CABINET ANTENNA.—A cabinet antenna is provided in all models using wooden cabinets and the leads are brought out near the antenna terminal board. The cabinet antenna may be employed for both UHF and VHF reception in place of the outdoor antenna in areas where the signals are strong and no reflections are experienced.

RECEIVER LOCATION.—The owner should be advised of the importance of placing the receiver in the proper location in the room.

The location should be chosen—

—Away from bright windows and so that no bright light will fall directly on the screen. (Some illumination in the room is desirable, however.)

—To give easy access for operation and comfortable viewing.

—To permit convenient connection to the antenna.

—Convenient to an electrical outlet.

—To allow adequate ventilation.

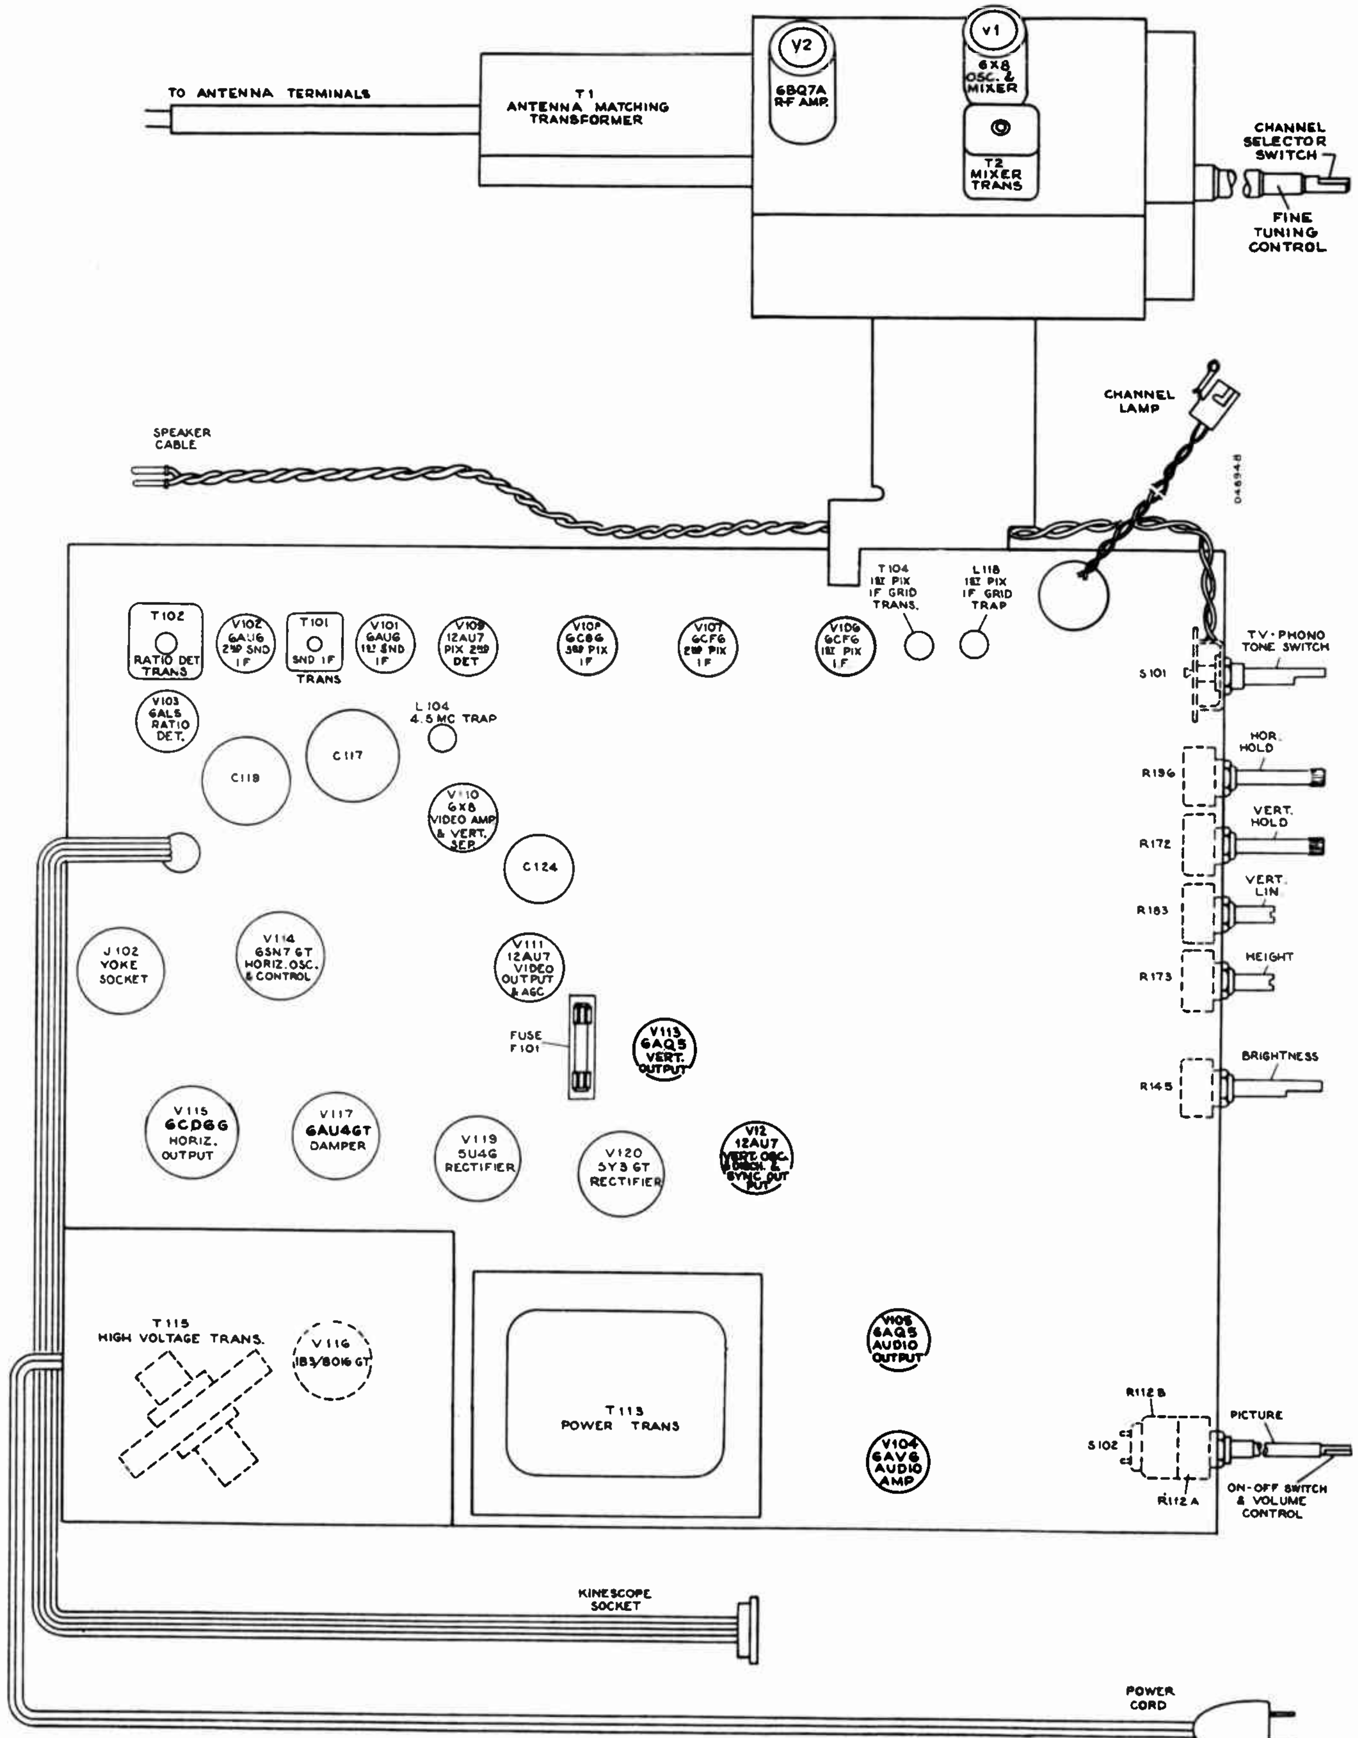

Figure 7—Chassis Top View (shown with KRK22C Tuner)

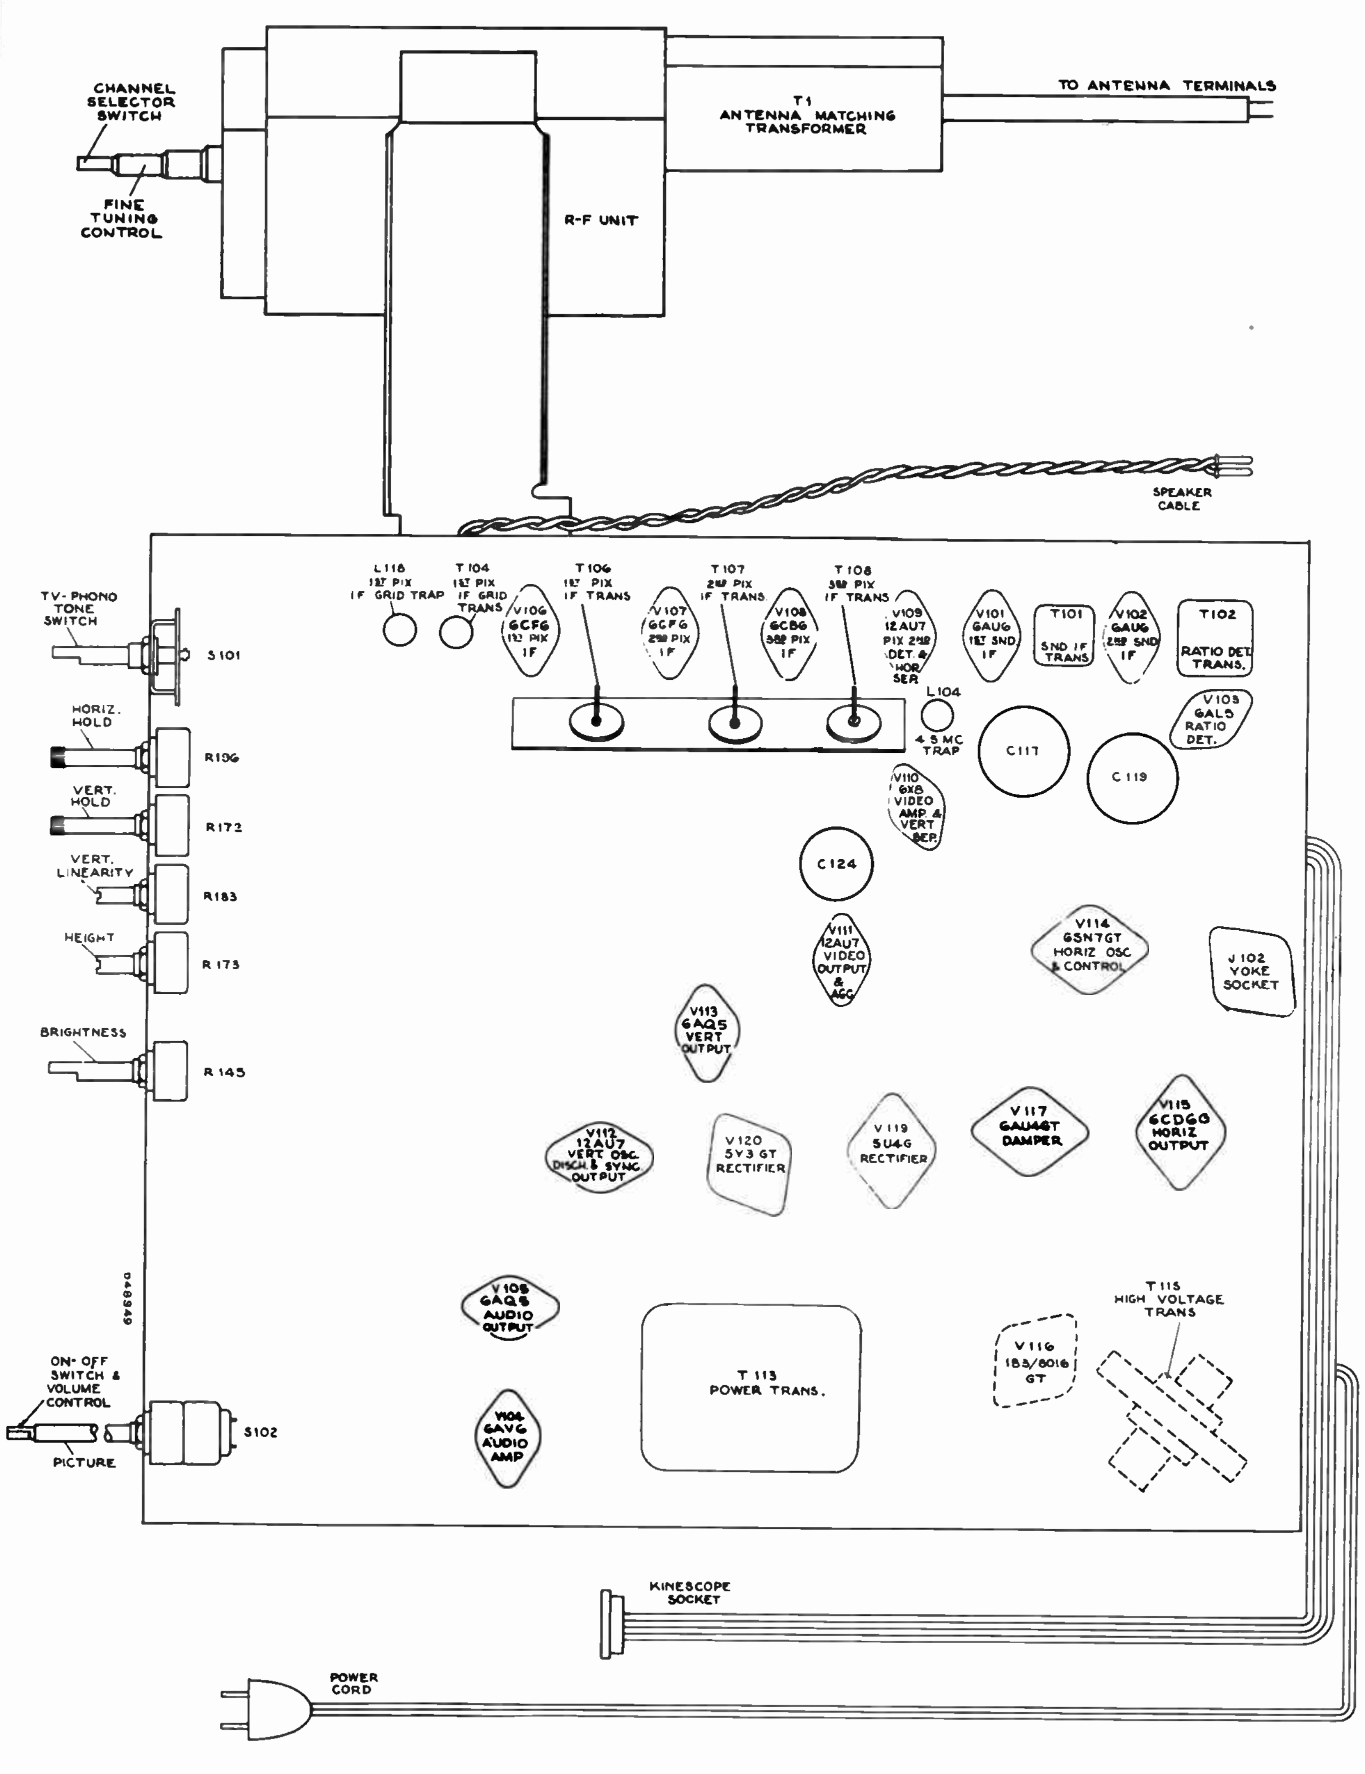

Figure 8—Chassis Bottom View (shown with KRK22C Tuner)

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.
(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
14	471.25	475.75	517
15	477.25	481.75	523
16	483.25	487.75	529
17	489.25	493.75	535
18	495.25	499.75	541
19	501.25	505.75	547
20	507.25	511.75	553

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 5 millivolts per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

KRK22C OR KRK29A ANTENNA MATCHING UNIT ALIGNMENT.—The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L5 (or L53) to the channel selector switch S1-E (or S4).

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R127 and R148. Set the poteniometer to produce approximaely –5.0 volts of bias at the junction of R127 and R148.

Connect an oscilloscope to the junction of R135 and L102 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L4 (or L54) in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L1 (or L57) for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L5 (or L53) to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L5 (or L53) to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 19 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by returning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L2 (or L56) and L3 (or L55) to obtain the response shown in figure 20. L3 (or L55) is most effective in locating the position of the shoulder of the curve at 52 mc. and L2 (or L56) should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L5 (or L53) and S1-E (or S4). Replace V106.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—

Models 24-T-420 and 24-T-435

Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R123 and C142. Turn the AGC control fully clockwise.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the battery positive terminal of one to the chassis and the potentiometer arm to the junction of R123 and C142. The second battery will be used later.

Set the bias to produce approximately —5.0 volt of bias at the junction of R123 and C142.

Connect the "VoltOhmyst" to the junction of R135 and L102 and to ground.

Set the VHF signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R135 and L102 with —5.0 volts of i-f bias at the junction of R123 and C142.

44.5 mc.	T108
45.5 mc.	T107
43.0 mc.	T106

Set the VHF signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at R135, L102. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the adjustment is made.

47.25 mc.	L118

Models 24-T-420U and 24-T-435U

Connect the i-f signal generator across the link circuit on terminals A and B of T104.

Connect the "VoltOhmyst" to the junction of R123 and C142.

Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction R123 and C142. Adjust the potentiometer for —5.0 volts indication on the "VoltOhmyst."

Connect the "VoltOhmyst" to the junction of R135 and L102 and to ground.

Set the VHF generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for maximum indication on the "VoltOhmyst." In each instance the generator should be checked against a crystal calibrator to insure that the generator is on frequency.

During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R135 and L102 with —5.0 volts of i-f bias at the junction of R123 and C142.

44.5 mc.	T108
45.5 mc.	T107
43.0 mc.	T106

Set the signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at junction of R135 and L102. Use sufficient signal input to produce 3.0 volts of d-c on the meter when adjustment is made.

47.25 mc.	L118

SWEEP ALIGNMENT OF PICTURE I-F.—

Models 24-T-420 and 24-T-435

To align T2 and T104, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Preset C122 to minimum capacity.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R123 and C142. Set the AGC control fully clockwise.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T2 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C122 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 23. Maximum allowable tilt is 20%.

Disconnect the diode probe, the 180 ohm and two 330 ohm resistors.

Connect the oscilloscope to the junction of R135 and L102.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 24.

Models 24-T-420U and 24-T-435U

To align T2 and T104, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Clip 330 ohm resistors across terminals A and B of T107 and T108.

Preset C122 to minimum capacity.

Adjust the bias box potentiometer to obtain —5.0 volts of bias as measured by a "VoltOhmyst" at the junction of R123 and C142. Set the AGC control fully clockwise.

Connect a 180 ohm composition resistor from pin 5 of V106 to terminal A of T106. Connect the oscilloscope diode probe to pin 5 of V106 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T2 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C122 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 12.

Disconnect the diode probe, the 180 ohm and two 330 ohm resistors.

Connect the oscilloscope to the junction of R135 and L102.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T106, T107 and T108 to obtain the response shown in Figure 13.

To align the I-F amplifier circuit of the KRK29A/27, connect the VHF sweep generator to the rear terminal of the IN82 crystal holder in series with a 1000 ohms and 1500 mmf ceramic capacitor. Use the shortest leads possible, grounding the sweep ground lead to the tuner case.

Set the UHF CHANGEOVER switch to the UHF position, and the UHF TUNING to channel 47 at 670 mc.

Connect a 180 ohm composition resistor and a 1500 mmf. capacitor in series between test point TP3 and ground with the capacitor connected to TP3 and the resistor to ground. Connect the oscilloscope diode probe to the junction between the resistor and capacitor.

Couple the VHF signal generator loosely to the diode probe in order to obtain markers.

Connect the potentiometer arm of the second bias supply to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the sweep generator to produce 0.3 or less peak-to-peak on the oscilloscope.

Adjust L307, on the KRK27 section, and L9, on the KRK29A section, of the tuner for maximum gain with picture and sound carrier markers as shown in figure 14.

Remove the resistor, capacitor and diode probe from TP3 and connect the oscilloscope to the junction of R135 and L102. Use 3.0v. peak-to-peak on the oscilloscope.

Retouch L307 and L9 slightly, if necessary, to produce the curve shown in figure 14. Do not retouch T2, T104, T106, T107 or T108.

Connect the VHF sweep generator to the antenna terminals. Keep the AGC bias at —3.0 V and the I-F bias at —5.0 volts.

Couple the signal generator loosely to the grid of the first picture I-F amplifier.

Switch through all VHF channels and check for proper curve shape as in figure 13. Retouch T107 and T108 slightly to correct for any overall tilt that is essentially the same on all channels.

Disconnect the VHF sweep generator and connect the UHF sweep generator to the antenna terminals. Check on all UHF channels for proper wave shape as shown in figure 13, retouching T107 and T108 if necessary to correct any overall tilt.

Remove the sweep and marker generators and the bias supplies.

KRK22C TUNER ALIGNMENT

Models 24-T-420 and 24-T-435

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C2 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP1 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L53 and C24 at the bottom of the FM trap L53.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C19 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C19 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C5 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C3 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C10. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C3 to obtain an audible beat with the signal generator.

Turn the C2 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C3, switch to channel 13 and adjust L42 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L11 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C3 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L42 and back to channel 8 and adjust C3.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in Figure 19, to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers, of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C7, C10, C15 and C20 for approximately correct curve shape, frequency, and band width as shown in Figure 18.

The correct adjustment of C20 is indicated by maximum amplitude of the curve midway between the markers. C15 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C7 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C20 has been properly adjusted). C10 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C5 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C2, C7, C10 and C15 for proper response. Adjust C20 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L42 to obtain an audible beat. Slightly overshoot the adjustment of L42 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C2 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L43 and L45 for proper response as shown in Figure 18.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C5, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L43 and L45 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C2 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C7, C10, C15 and C20 for correct curve shape, frequency and bandwidth.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C7 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L5 for an audible beat. Adjust L44, L46, and L58 for proper curve shape as shown in Figure 18. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C5 if necessary.

If C5 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C7 for correct curve shape and recheck C2 and C3 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See Figure 18 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L44, L46 and L58 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to Figure 18 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C15, C7, or C10 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L42 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

KRK29A/27 TUNER ALIGNMENT

Models 24-T-420U and 24-T-435U

VHF ALIGNMENT.—A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP2 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f" in terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

NOTE:—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 19 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for appromixately correct curve shape, frequency, and band width as shown in figure 18.

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in figure 18.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L48 and L32 for proper curve shape as shown in figure 18. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 18 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 18 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

UHF ALIGNMENT.—Ground the I-F transformer L307 by inserting a clip lead through the aperture provided in the top of the tuner. Ground the other end of the clip lead to the tuner case.

Connect the oscilloscope to the test point TP301, employing the preamplifier if needed with the oscilloscope used.

Connect the output of the UHF sweep generator, through a 300 ohm attenuator pad, to the antenna terminals and set the sweep generator to sweep channel 83, centered on 887.5 mc. Adjust the output of the sweep generator to full sweep width.

A test dial made to fit over the split gear on the tuner shaft is necessary for accurate alignment. Scribe marks at 0°, 9° and 168° should be marked on the test dial for reference. The 0° reference point is located with the capacitor plates fully meshed. By placing a 1/16" shim between the stop pin on the tuner and the stop plate on the gear assembly the plates will be in the proper fully meshed position.

Rotate the tuning dial to the 168°, Channel 83, position.

Connect the VHF signal generator in series with a 1000 ohm resistor to the rear terminal of the crystal holder and insert markers for 41.25 mc., 43.5 mc. and 45.75 mc.

Connect the UHF marker generator loosely to the antenna terminals and insert a marker at 887.5 mc.

Adjust R-F trimmer capacitors C315 and C316 for a maximum amplitude overcoupled response curve centered at 887.5 mc. as shown in figure 11(A).

Adjust the oscillator trimmer capacitor C307 until the 43.5 mc. marker coincides with the marker at 887.5 mc. The markers for 41.25 and 45.75 should be symmetrically located on the top of the response curve as in figure 11(A).

Set the UHF sweep and marker generators to 473.5 mc. Rotate the tuning dial to the 9°, Channel 14, position.

Adjust R-F coils L1 and L2 for a maximum amplitude overcoupled curve centered at 473.5 mc. as shown in figure 11(B). Adjust the oscillator trimmer C308 until the 43.5 mc. marker coincides with the 473.5 mc. marker, with the 41.25 and 45.75 markers as shown.

Repeat the above adjustments, as necessary, until the proper responses are obtained. Tune through the entire range and check the tracking. When perfectly tracked the three markers will be on the top of the response curves, however, mistracking to the extent that the 41.25 mc. and 45.75 mc. ride down the sides of the curves to a point not less than 70% will not seriously affect the alignment. Should the markers fall below this level, it will be necessary to knife the RF plates to correct the mistracking. The plates may be knifed through the two holes provided on the left side of the tuner. Always knife the plates while tuning lower in frequency to prevent affecting the tracking above the point of knifing. Check which section requires knifing by touching the plates with the knifing tool while observing the response, then proceed with the knifing of the proper section or of both sections if required.

Connect the "VoltOhmyst" to test point TP301. Set the "VoltOhmyst" to the 1.5v. DC scale. Tune over the entire range observing the reading on the meter. A reading between .05 and .4 volts should be obtained. Voltages outside these limits are an indication of low B voltage, low or high crystal impedence or an oscillator tube outside allowable limits.

Connect the "VoltOhmyst" to the "bias" terminal of the tuner (refer to figure 9). A reading between 0.5 and 2.5 volts should be obtained. Readings above or below this range will cause crystal currents outside allowable limits and in such cases the oscillator tube should be replaced. Replacement of the oscillator tube will require recalibration at the high and low frequency ends of the band as previously outlined.

RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first sound i-f grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. In such a case, connect the calibrator to the grid of the third pix i-f amplifier, pin 1 of V108.

Set the frequency of the calibrator to 45.75 mc. (pix carrier) and modulate with 4.5 mc. crystal. The 4.5 mc. signal will be picked off at L103 and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst." Adjust the signal level from the signal generator for 6 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R108 and C109.

Tune the ratio detector secondary T102 bottom core for zero d-c on the "VoltOhmyst."

Repeat adjustments of T102 top for maximum d-c at pin 2 of V103 and T102 bottom for zero d-c at the junction of R108 and C109. Make the final adjustments with the signal input level adjusted to produce 6 volts d-c on the "VoltOhmyst" at pin 2 of V103.

SOUND I-F ALIGNMENT.—Connect the signal generator to the first sound i-f amplifier grid, pin 1 of V101.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed as above.

Connect the "VoltOhmyst" to pin 2 of V103.

Tune the T101 top core for maximum d-c on the "VoltOhmyst."

The output from the signal generator should be set to produce approximately 6.0 volts on the "VoltOhmyst" when the final touches on the above adjustment are made.

4.5 MC. TRAP ADJUSTMENT.—Connect the signal generator in series with a 100 ohm resistor to pin 2 of V109. Set the generator to 4.5 mc. and modulate it 30% with 400 cycles. Set the output to approximately 0.5 volt.

Short the third pix i-f grid to ground, pin 1, V108, to prevent noise from masking the output indication.

Connect the crystal diode probe of an oscilloscope to the plate of the video amplifier, pin 9 of V110.

Adjust the core of L104 for minimum output on the oscilloscope.

Remove the short from pin 1, V108 to ground.

As an alternate method, this step may be omitted at this point in the alignment procedure and the adjustment made "on the air" after the alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L104 requires no adjustment. If a 4.5 mc. beat is present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L104 for minimum beat.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 9 of V110.

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

HORIZONTAL OSCILLATOR ADJUSTMENT.— Normally the adjustment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned or whenever the horizontal oscillator operation is improper.

Horizontal Frequency Adjustment.—Tune in a station and sync the picture. If the picture cannot be synchronized with the horizontal hold control R196, then adjust the T114 frequency core on the rear apron until the picture will synchronize. If the picture still will not sync, turn the T114 waveform adjustment core (under the chassis) out of the coil several turns from its original position and readjust the T114 frequency core until the picture is synchronized.

Examine the width and linearity of the picture. If picture width or linearity is incorrect, adjust the horizontal drive control C174B, the width control L109 and the linearity control L111 until the picture is correct.

Horizontal Oscillator Waveform Adjustment.—The horizontal oscillator waveform may be adjusted by either of two methods. The method outlined in paragraph A below may be employed in the field when an oscilloscope is not available. The service shop method outlined in paragraph B below requires the use of an oscilloscope.

A.—Turn the horizontal hold control completely clockwise. Place adjustment tools on both cores of T114 and be prepared to make simultaneous adjustments while watching the picture on the screen. First, turn the T114 frequency core (on the rear apron) until the picture falls out of sync and three or four diagonal black bars sloping down to the right appear on the screen. Then, turn the waveform adjustment core (under the chassis) into the coil while at the same time adjusting the frequency core so as to maintain three or four diagonal black bars on the screen. Continue this procedure until the oscillator begins to motorboat, then turn the waveform adjustment core out until the motorboating just stops. As a check, turn the T114 frequency core until the picture is synchronized then reverse the direction of rotation of the core until the picture falls out of sync with the diagonal bars sloping down to the right. Continue to turn the frequency core in the same direction. No more than three or four bars should appear on the screen. Instead, the horizontal oscillator should begin the motorboat. Retouch the adjustment of the T114 waveform adjustment core if necessary until this condition is obtained.

B.—Connect the low capacity probe of an oscilloscope to terminal C of T114. Turn the horizontal hold control one-quarter turn from the clockwise position so that the picture is in sync. The pattern on the oscilloscope should be as shown in Figure 24. Adjust the waveform adjustment core of T114 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the hold control if necessary.

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator becomes more serious. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Locking Range Adjustment.—Set the horizontal hold control to the full counter-clockwise position. Momentarily remove the signal by switching off channel then back. The picture may remain in sync. If so turn the T114 frequency core slightly and momentarily switch off channel. Repeat until the picture falls out of sync with the diagonal lines sloping down to the left. Slowly turn the horizontal hold control clockwise and note the least number of diagonal bars obtained just before the picture pulls into sync.

If more than 3 bars are present just before the picture pulls into sync, adjust the horizontal locking range trimmer C174A slightly clockwise. If less than 2 bars are present adjust C174A slightly counter-clockwise. Turn the horizontal hold control counter-clockwise, momentarily remove the signal and recheck the number of bars present at the pull-in point. Repeat this procedure until 2 or 3 bars are present.

Turn the horizontal hold control to the maximum clockwise position. Adjust the T114 frequency core so that the diagonal bar sloping down to the right appears on the screen and then reverse the direction of adjustment so that bar just moves to the left side of the screen leaving the picture in synchronization.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 15000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

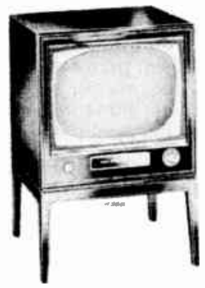
54207	18 mmf., ±10%, 500 volts (C1)
70935	27 mmf., ±10%, 500 volts (C3)
76739	33 mmf., ±10%, 500 volts (C4)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = -750
78247	10 mmf., ±10%, 500 volts (C24)
	Capacitors—Fixed, headed-lead:
71504	0.68 mmf., ±20%, 500 volts (C23)
71502	2.2 mmf., ±20%, 500 volts (C31, C39)
71503	3.3 mmf., ±20%, 500 volts (C38)
77854	Clip—Fine tuning clip for fine tuning core
73591	Coil—Antenna matching coil (Part of T1)
78401	Coil—Channel No. 6 antenna coil (L81)
73874	Coil—Channel No. 6 mixer coil (L48)
73460	Coil—Channel No. 6 r.f. plate coil (L32)
73453	Coil—Channel No. 6 r.f. grid coil (L14)
77919	Coil—Channel No. 13 mixer coil (L36)
77915	Coil—Channel No. 13 oscillator coil (L49)
77921	Coil—Channel No. 13 r.f. plate coil (L20)
77206	Coil—Filament choke coil (L33)
76763	Coil—Heater choke coil (L34, L35)
78271	Coil—I.F. input coil complete with adjustable core (L9)
78583	Coil—Mixer I.F. coil (L43)
76562	Coil—R.F. amplifier coupling coil (L7)
78584	Coil—R.F. plate I.F. coil (L27)
76537	Coil—Shunt coil complete with adjustable core (L3)
76538	Coil—Shunt coil complete with adjustable core (L2)
	Resistors—Fixed, composition:
503033	33 ohms, ±10%, ½ watt (R19)
503112	120 ohms, ±10%, ½ watt (R2)
503147	470 ohms, ±10%, ½ watt (R14, R54)
503210	1,000 ohms, ±10%, ½ watt (R6, R20)
503233	3,300 ohms, ±10%, ½ watt (R9)
503268	6,800 ohms, ±10%, ½ watt (R1)
523312	12,000 ohms, ±10%, 2 watts (R13)
523315	15,000 ohms, ±10%, 2 watts (R7)
523322	22,000 ohms, ±10%, 2 watts (R52)
523327	27,000 ohms, ±10%, 2 watts (R53)
503410	100,000 ohms, ±10%, ½ watt (R3, R10, R11, R12)
503510	1 megohm, ±10%, ½ watt (R4, R5)
78396	Transformer—Antenna matching transformer complete (T1)
78399	Transformer—Convertor transformer (T2, R8)
76540	Trap—FM trap complete with adjustable core (L5)
78466	Trap—I.F. trap (L6)
76542	Trap—I.F. trap (41.25 mc) complete with core (L1)
76541	Trap—I.F. trap (45.75 mc) complete with core (L4)
	TUNER UNIT ASSEMBLIES KRK27
	Capacitor—Adjustable, steatite:
78259	0.6-1.4 mmf. complete with adjustable core (C7, C8)
	Capacitor—Fixed, ceramic:
77084	1,000 mmf., feed-thru (C2, C10, C11, C12)
	Capacitors—Fixed, ceramic, non-insulated, Temp. coef. = 0
78262	7 mmf., ±0.5 mmf., 500 volts DC (C6)
78261	22 mmf., ±5%, 500 volts DC (C5)
70596	33 mmf., ±5%, 500 volts DC (C9)
	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = -750
78263	0.75 mmf., ±0.25 mmf., 500 volts DC (C13)
	Capacitors—Fixed, headed-lead:
78137	0.51 mmf., ±10%, 500 volts DC (C3)
78260	0.62 mmf., ±10%, 500 volts DC (C4)
71502	2.2 mmf., ±10%, 500 volts DC (C14)
78257	Capacitor—Variable tuning capacitor (C1A, C1B, C1C, C1D, C15, C16, L1, L2)
78258	Coil—I.F. coil complete with adjustable core (L7)
78264	Coil—Peaking coil (L3, R1)
72618	Coil—Peaking coil (20 muh) (L4)
78267	Coil—R.F. choke coil (0.15 muh) (L10, L11)
77279	Coil—R.F. choke coil (0.33 muh) (L8, L9)
78269	Connector—Single contact male connector for I.F. output cable
78255	Connector—2 contact female connector for UHF antenna (J1)
78256	Holder—Crystal holder
77489	Rectifier—Crystal rectifier IN82 (CR1)
	Resistors—Fixed, composition:
503110	100 ohms, ±10%, ½ watt (R2)
503215	1,500 ohms, ±10%, ½ watt (R3)
503222	2,200 ohms, ±10%, ½ watt (R5)
503268	6,800 ohms, ±10%, ½ watt (R4)
78268	Transformer—Antenna input transformer (T1)
	CHASSIS ASSEMBLIES KCS84C (KRK22C) KCS84E (KRK29A/27)
	Capacitors—Fixed, ceramic:
33098	10 mmfd., ±10%, 500 volts (C134
39044	15 mmf., ±5%, 500 volts (C123)
39042	47 mmf., ±10%, 500 volts (C137)
71922	180 mmf., ±10%, 500 volts (C152)
47617	270 mmf., ±10%, 500 volts (C114)
	Capacitors—Fixed, ceramic, High "K" disc:
78622	470 mmf., ±20%, 500 volts (C127, C129)
77293	470 mmf., +100%, -0%, 500 volts (C120, C125, C126, C128, C132, C194, C195, C196, C197
77672	470-470 mmf., +100%, -0%, 500 volts (C130A, C130B)
78623	1,000 mmf., ±20%, 500 volts (C131)
76991	10,000 mmf., +100%, -0%, 500 volts (C101)
73960	10,000 mmf., +100%, -0%, 500 volts (C104, C105, C133)
	Capacitors—Fixed, mica:
79063	47 mmf., ±5%, 1,000 volts (C176)
76474	82 mmf., ±5%, 1,000 volts (C153)
76575	180 mmf., 3,500 volts (C144)
39636	220 mmf., ±10%, 500 volts (C155)
76579	270 mmf., ±10%, 1,000 volts (C148, C190)
39640	330 mmf., ±10%, 500 volts (C149)
76476	330 mmf., ±5%, 1,000 volts (C181)
39644	470 mmf., ±5%, 500 volts (C107, C108)
78796	680 mmf., ±10%, 1,000 volts (C143)
	Capacitor—Mica trimmer:
75217	Dual, 10-160 mmf. (C174A, C174B)
	Capacitor—Trimmer, adjustable:
78220	5-70 mmf., 200 volts (C122)
	Capacitors—Electrolytic comprising:
78213	1 section of 10 mfd., 350 volts; 1 section of 5 mfd., 350 volts; and 1 section of 30 mfd., 50 volts (C124A, C124B, C124C)
77644	1 section of 80 mfd., 400 volts; and 1 section of 20 mfd., 400 volts (C119A, C119B)
78212	1 section of 100 mfd., 400 volts; and 1 section of 20 mfd., 50 volts (C117A, C117B)
	Capacitor—Fixed, paper, oil impregnated, 85° operating temperature:
75249	.001 mfd., ±10%, 600 volts (C143, C173, C198)
75643	.001 mfd., ±20%, 1,000 volts (C140)
73595	.0022 mfd., ±10%, 600 volts (C109, C145)
73599	.0027 mfd., ±10%, 600 volts (C115, C139, C157, C161)
79020	.0027 mfd., ±10%, 1,000 volts (C118)
79018	.0039 mfd., ±10%, 400 volts (C193)
78221	.0039 mfd., ±10%, 600 volts (C147)
79017	.0047 mfd., ±20%, 400 volts (C111, C170)
79019	.0082 mfd., ±10%, 400 volts (C156)
79014	.01 mfd., ±20%, 200 volts (C113)
73561	.01 mfd., ±20%, 400 volts (C116)
73594	.01 mfd., ±10%, 600 volts (C160)
73794	.015 mfd., ±10%, 400 volts (C163)
73562	.022 mfd., ±20%, 400 volts (C179)
73798	.022 mfd., ±20%, 600 volts (C164)
73810	.022 mfd., ±20%, 1,000 volts (C154)
75345	.027 mfd., ±10%, 600 volts (C167)
79015	.033 mfd., ±10%, 200 volts (C112)
73552	.033 mfd., ±20%, 400 volts (C151)
73553	.047 mfd., ±20%, 400 volts (C178)
73592	.047 mfd., ±10%, 600 volts (C162, C168)
73597	.047 mfd., ±10%, 1,000 volts (C188, C189)
79016	.068 mfd., ±10%, 200 volts (C166)
73551	0.1 mfd., ±20%, 400 volts (C150, C158, C169, C177)
73557	0.1 mfd., ±20%, 600 volts (C138, C141, C183, C186)
73794	0.22 mfd., ±10%, 200 volts (C121)
73786	0.27 mfd., ±10%, 200 volts (C187)
73787	0.47 mfd., ±20%, 200 volts (C110, C142, C180)
	Capacitors—Fixed, moulded paper, oil impreg.
76479	.00068 mfd., ±10%, 600 volts (C184)
75249	.001 mfd., ±5%, 600 volts (C185)
78221	.0039 mfd., ±5%, 600 volts (C159)
73594	.01 mfd., ±5%, 600 volts (C182)
77676	Choke—Filter choke (L117)
73477	Coil—Choke coil (L101, L112, L119)
76442	Coil—Horizontal linearity coil complete with adjustable core (L111)
78743	Coil—Printed I.F. circuit assemble (PC101)
	Coils—Peaking coils:
75253	(120 muh) (L102)
71529	(120 muh) (L108, R174)
98482	(250 muh) (L103)
77674	(250 muh) (L105, R138)
78222	(250 muh) (L106, R215)
75252	(500 muh) (L107)
76640	Coil—R.F. choke coil (1.5 muh) (L110)
76441	Coil—Width coil complete with adjustable core (L109)
	Resistors—Wire wound:
78795	1.2 ohms, ±5%, 1/3 watt (R210)
78797	47 ohms, ±10%, 2 watts (R206)
77670	3,300 ohms, ±10%, 7 watts (R106)
77671	3,800 ohms, ±10%, 7 watts (R121)
	Resistors—Fixed, composition:
30789	33 ohms, ±5%, ½ watt (R128)
503047	47 ohms, ±10%, ½ watt (R107)
504047	47 ohms, ±20%, ½ watt (R205)
34763	68 ohms, ±5%, ½ watt (R125)
503082	82 ohms, ±10%, ½ watt (R101)
503112	120 ohms, ±10%, ½ watt (R136)
502118	180 ohms, ±5%, ½ watt (R131)
503118	180 ohms, ±10%, ½ watt (R144)
503127	270 ohms, ±10%, ½ watt (R146)
504147	470 ohms, ±20%, ½ watt (R133)
513156	560 ohms, ±10%, 1 watt (R116)
503210	1,000 ohms, ±10%, ½ watt (R118)
504210	1,000 ohms, ±20%, ½ watt (R103, R123, R127, R129)
513210	1,000 ohms, ±10%, 1 watt (R105)
523218	1,800 ohms, ±10%, 2 watts (R117)
502222	2,200 ohms, ±5%, ½ watt (R166)
503233	3,300 ohms, ±10%, ½ watt (R188)
502239	3,900 ohms, ±5%, ½ watt (R135)
503239	3,900 ohms, ±10%, ½ watt (R198)
503256	5,600 ohms, ±10%, ½ watt (R140, R158)
513256	5,600 ohms, ±10%, 1 watt (R167)
522275	7,500 ohms, ±5%, 2 watts (R142)
502310	10,000 ohms, ±5%, ½ watt (R109, R110)
503310	10,000 ohms, ±10%, ½ watt (R157)
523310	10,000 ohms, ±10%, 2 watts (R104)
503312	12,000 ohms, ±10%, ½ watt (R113, R137, R179, R216)
36714	15,000 ohms, ±5%, ½ watt (R177)
503315	15,000 ohms, ±10%, ½ watt (R122, R189, R200)
503318	18,000 ohms, ±10%, ½ watt (R160, R170, R171)
523318	18,000 ohms, ±10%, 2 watts (R139)
503322	22,000 ohms, ±10%, ½ watt (R169, R176)
71989	22,000 ohms, ±5%, 1 watt (R180)
523327	27,000 ohms, ±10%, 2 watts (R207, R217)
502333	33,000 ohms, ±5%, ½ watt (R181)
503339	39,000 ohms, ±10%, ½ watt (R108, R164)
70351	43,000 ohms, ±5%, ½ watt (R148)
503347	47,000 ohms, ±10%, ½ watt (R163)
512347	47,000 ohms, ±5%, 1 watt (R202)
514347	47,000 ohms, ±20%, 1 watt (R150)
502356	56,000 ohms, ±5%, ½ watt (R126)
503356	56,000 ohms, ±10%, ½ watt (R209)
503368	68,000 ohms, ±10%, ½ watt (R155, R159)
503382	82,000 ohms, ±10%, ½ watt (R194)
503410	100,000 ohms, ±10%, ½ watt (R195)
504410	100,000 ohms, ±20%, ½ watt (R187, R214)
502415	150,000 ohms, ±5%, ½ watt (R149)
503415	150,000 ohms, ±10%, ½ watt (R190)
512415	150,000 ohms, ±5%, 1 watt (R199)
11959	180,000 ohms, ±5%, ½ watt (R120)
503422	220,000 ohms, ±10%, ½ watt (R186)
503427	270,000 ohms, ±10%, ½ watt (R161, R208)
503433	330,000 ohms, ±10%, ½ watt (R191, R193)
504433	330,000 ohms, ±20%, ½ watt (R115)
502439	390,000 ohms, ±5%, ½ watt (R184, R185)
503439	390,000 ohms, ±10%, ½ watt (R151, R178)
503447	470,000 ohms, ±10%, ½ watt (R152, R175, R182)
504447	470,000 ohms, ±20%, ½ watt (R114, R141, R147)
30562	680,000 ohms, ±10%, ½ watt (R156)
503482	820,000 ohms, ±10%, ½ watt (R192, R203)
503510	1.0 megohm, ±10%, ½ watt (R204)
503512	1.2 megohm, ±10%, ½ watt (R165)
31449	1.5 megohm, ±5%, ½ watt (R119)
503515	1.5 megohm, ±10%, ½ watt (R124)
39063	1.8 megohm, ±5%, 1 watt (R201)
503522	2.2 megohm, ±10%, ½ watt (R162)
504522	2.2 megohm, ±20%, ½ watt (R168)
502539	3.9 megohm, ±5%, ½ watt (R132, R153)
504610	10 megohm, ±20%, ½ watt (R111)
78203	Transformer—1st I.F. pix transformer complete with adjustable core (T106)
78204	Transformer—1st I.F. grid trap complete with adjustable core (L118)
78810	Transformer—Horizontal deflection output transformer (T115)
76440	Transformer—Horizontal oscillator transformer complete with adjustable core (T114)
76997	Transformer—Output transformer (T103)
78805	Transformer—Power transformer, 117 volts, 60 cycle (T113)
77112	Transformer—Ratio detector transformer (T102, C106)
76981	Transformer—Sound I.F. transformer with adjustable core (T101, C102, C103)
78809	Transformer—Vertical output transformer (T112)
76983	Trap—4.5 MC trap (L104, C135)

Models 21-S-348K, 21-S-348KU
"Master 21"
Ebony, Maroon



Models 21-S-355K, 21-S-355KU
"Cameron"
Brown Maroon

Models 21-S-367K, 21-S-367KU
"Ft. Knox"

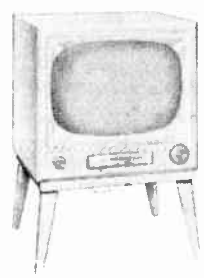
Models 21-S-369K, 21-S-369KU
"Farrell"
Oak



Models 21-S-357K, 21-S-357KU
"Modernette"
Oak

Models 21-S-362K, 21-S-362KU
"Talbot"
Mahogany

GENERAL DESCRIPTION

All models are "21 inch" television receivers. Models without a "U" designation in the model number are receivers with VHF only and feature full 12 channel VHF coverage. Models with the "U" designation in the model number are UHF/VHF receivers and feature full 12 channel VHF coverage plus any UHF channels desired. All models have an auxiliary audio input jack to permit the use of an external record playing attachment except Models 21-S-348K and 21-S-348KU.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE...........227 square inches on a 21ZP4A or 21ZP4B Kinescope

TELEVISION R-F FREQUENCY RANGE

Models 21-S-348K to 21-S-369K Incl.

All 12 VHF channels......54 mc. to 88 mc., 174 mc. to 216 mc.

Models 21-S-348KU to 21-S-369KU Incl.

Any of 70 UHF channels................470 mc. to 890 mc.

Any of 12 VHF channels..54 mc. to 88 mc., 174 mc. to 216 mc.

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency....................45.75 mc.

Sound I-F Carrier Frequency....................41.25 mc.

POWER RATING..............................175 watts

AUDIO POWER OUTPUT RATING...........1.5 watts max.

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK22D (Models with VHF only)	
(1) RCA 6BQ7A	R-F Amplifier
(2) RCA 6X8	R-F Oscillator and Mixer

RCA TUBE COMPLEMENT

Tube Used	Function
Tuner KRK31 (UHF/VHF Models)	
(1) RCA 6AF4	UHF Oscillator
(2) RCA 6BQ7A	VHF R-F Amplifier; UHF I-F Amplifier
(3) RCA 6X8	VHF R-F Oscillator & Mixer; UHF I-F Amplifier
A 1N82 crystal is used as the UHF mixer	
All Models	
(1) RCA 6CB6	1st Picture I-F Amplifier
(2) RCA 6CB6	2nd Picture I-F Amplifier
(3) RCA 6CB6	3rd Picture I-F Amplifier
(4) RCA 6X8	1st Video Amplifier and 1st Sync.
(5) RCA 12AU7	Video Output & AGC
(6) RCA 6AU6	Sound I-F Amplifier
(7) RCA 6AL5	Ratio Detector
(8) RCA 6AV6	1st Audio Amplifier
(9) RCA 6AS5	Audio Output
(10) RCA 12AU7	Vert. Osc. and Disch. & Sync. Output
(11) RCA 6K6GT	Vertical Sweep Output
(12) RCA 6SN7GT	Horizontal Sweep Oscillator and Control
(13) RCA 6BQ6GT	Horizontal Sweep Output
(14) RCA 6AX4GT	Damper
(15) RCA 1B3-GT/8016	High Voltage Rectifier
(16) RCA 21ZP4B; RCA 21ZP4A (Models 21-S-348K(KU) only)	Kinescope
(17) RCA 5U4G	Rectifier

A crystal diode is used for the Picture 2nd Detector

21-S-348K to 21-S-369K incl.
21-S-348KU to 21-S-369KU incl.

ELECTRICAL AND MECHANICAL SPECIFICATIONS (cont'd)

INSTALLATION INSTRUCTIONS

CENTERING ADJUSTMENT.—No electrical centering controls are provided. Centering is accomplished by means of a separate plate on the focus magnet. The centering plate includes a wing nut which must be loosened before centering. Up and down adjustment of the plate moves the picture up and down and sidewise adjustment moves the picture from side to side.

If a corner of the raster is shadowed, check the position of the ion trap magnet. Reposition the magnet within the range of maximum raster brightness to eliminate the shadow and recenter the picture by adjustment of the focus magnet plate. In no case should the magnet be adjusted to cause any loss of brightness since such operation may cause immediate or eventual damage to the tube. In some cases it may be necessary to shift the position of the focus magnet in order to eliminate a corner shadow.

WIDTH AND DRIVE ADJUSTMENTS.—Set the horizontal control at the "pull-in" point. Adjustment of the horizontal drive control affects the high voltage applied to the kinescope. In order to obtain the highest possible voltage hence the brightest and best focused picture, adjust horizontal drive trimmer counter-clockwise until a bright vertical line appears in the middle of the picture then clockwise until the bright line just disappears.

At maximum brightness adjust the width control to obtain correct picture width.

Return the brightness to normal level and readjust the drive trimmer C171 as before.

Adjustments of the horizontal drive control affect horizontal oscillator hold and locking range. If the drive control was adjusted, recheck the oscillator alignment.

HEIGHT AND VERTICAL LINEARITY ADJUSTMENTS.—Adjust the height control (R165 behind front control panel) until the picture fills the mask vertically. Adjust vertical linearity (R174 behind front control panel), until the test pattern is symmetrical from top to bottom. Adjustment of either control will require a readjustment of the other. Adjust centering to align the picture with the mask.

FOCUS.—Adjust the focus magnet for maximum definition in the test pattern vertical "wedge" and best focus in the white areas of the pattern.

AGC THRESHOLD CONTROL.—The AGC threshold control R149 is adjusted at the factory and normally should not require readjustment in the field.

To check the adjustment of the AGC Threshold Control, tune in a strong signal and sync the picture. Momentarily remove the signal by switching off channel and then back. If the picture reappears immediately, the receiver is not overloading due to improper setting of R149. If the picture requires an appreciable portion of a second to reappear, or bends excessively, R149 should be readjusted.

Turn R149 fully counter-clockwise. The raster may be bent slightly. This should be disregarded. Turn R149 clockwise until there is a very, very slight bend or change of bend in the picture. Then turn R149 counter-clockwise just sufficiently to remove this bend or change of bend.

If the signal is weak, the above method may not work as it may be impossible to get the picture to bend. In this case, turn R149 clockwise until the snow in the picture becomes more pronounced, then counter-clockwise until the best signal to noise ratio is obtained.

The AGC control adjustment should be made on a strong signal if possible. If the control is set too far clockwise on a weak signal, then the receiver may overload when a strong signal is received.

PIN-CUSHION CORRECTION

Two pin-cushion correction magnets are employed to correct a small amount of pin-cushion of the raster due to the lens effect of the face of the kinescope. These magnets are mounted on small arms, one on each side of the kinescope as shown in Figure 3. The arms hinge in one plane on self tapping screws which act both as a hinge and an adjustment locking screw. When the magnets are swung towards the tube, maximum correction is obtained. Minimum correction is obtained when the arms are swung away from the tube. To adjust the magnets, loosen the two self tapping screws and position the magnets until the sides of the raster appear straight. Tighten the screws without shifting the position of the magnets. In some cases it may be necessary to twist or bend the magnet support arms to obtain the appearance of straight raster edges.

Recheck the position of the ion trap magnet to make sure that maximum brightness is obtained.

Check to see that the yoke knurled nuts and the focus magnet mounting screws are tight.

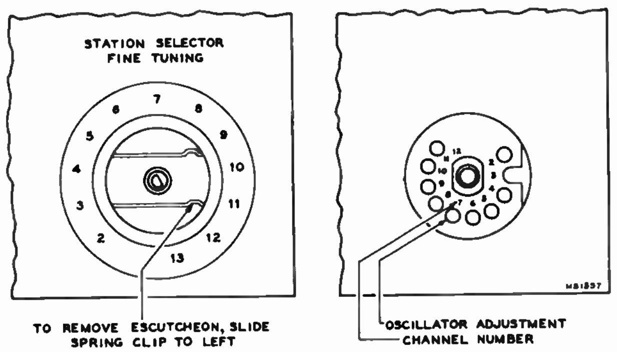

Figure 5—KRK22D R-F Oscillator Adjustments

KRK22D, OR KRK31 VHF R-F OSCILLATOR ADJUSTMENTS.—Tune in all available stations to see if the receiver r-f oscillator is adjusted to the proper frequency on all channels. If adjustments are required, these should be made by the method outlined in the alignment procedure on page 11. The adjustments for channels 2 through 12 are available from the front of the cabinet by removing the station selector escutcheon as shown in Figure 5 or 6. Adjustment for channel 13 is on top of the chassis. The oscillator for the KRK27 UHF tuner section of the KRK31 tuner should be adjusted by the method outlined on page 14 under Alignment Procedure.

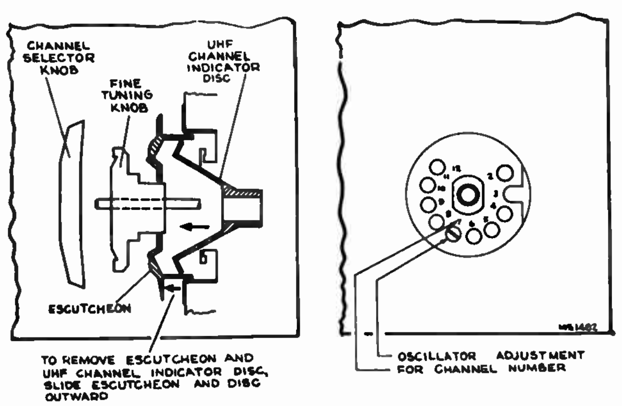

Figure 6—KRK31 VHF R-F Oscillator Adjustment

FM TRAP ADJUSTMENT.—In some instances interference may be encountered from a strong FM station signal. A trap is provided to eliminate this type of interference. To adjust the trap tune in the station on which the interference is observed and adjust the FM trap for minimum interference in the picture. The trap is L58 on KRK22D or L5 on KRK31 tuners and is located on the antenna matching transformer.

CAUTION.—In some receivers, the FM trap L5 or L58 will tune down into channel 6 or even into channel 5. Needless to say, such an adjustment will cause greatly reduced sensitivity on these channels. If channels 5 or 6 are to be received, check L5 or L58 to make sure that it does not affect sensitivity on these two channels.

Replace the cabinet back and connect the receiver antenna leads to the cabinet back. Make sure that the screws holding it are up tight, otherwise it may rattle or buzz when the receiver is operated at high volume.

21-S-348K to 21-S-369K incl.
21-S-348KU to 21-S-369KU incl.

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width
(b) Output adjustable with at least .1 volt maximum.
(c) Output constant on all ranges.
(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.
(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 5 millivolts per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—
Models 21-S-348K to 21-S-369K Incl.

Connect the i-f signal generator, in series with a 1500 mmf. ceramic capacitor, to the mixer grid test point TP2.

Connect the "VoltOhmyst" to the junction of R118, R146 and C120 and to ground. Turn the AGC control fully clockwise.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the battery positive terminal of one to the chassis and the potentiometer arm to the junction of R118, R146 and C120. The second battery will be used later.

Set the bias to produce approximately —4.0 volt of bias at the junction of R118, R146 and C120.

Connect the "VoltOhmyst" to the junction of R129 and L103 and to ground.

Set the VHF signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." (Note: These transformers should be peaked with their cores at the ends of the coils nearest the chassis.) During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R129 and L103 with —4.0 volts of i-f bias at the junction of R118, R146 and C120.

44.5 mc. T107
45.5 mc. T106
43.0 mc. T105

Set the VHF signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at R129, L103. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the adjustment is made.

47.25 mc. L102

(Note: Core should be at end of coil nearest chassis when properly adjusted.)

Models 21-S-348KU to 21-S-369KU Incl.

Connect the i-f signal generator in series with a 1500 mmf. ceramic capacitor, to the mixer grid test point TP2.

Connect the "VoltOhmyst" to the junction of R118, R146 and C120.

CHASSIS TOP VIEW

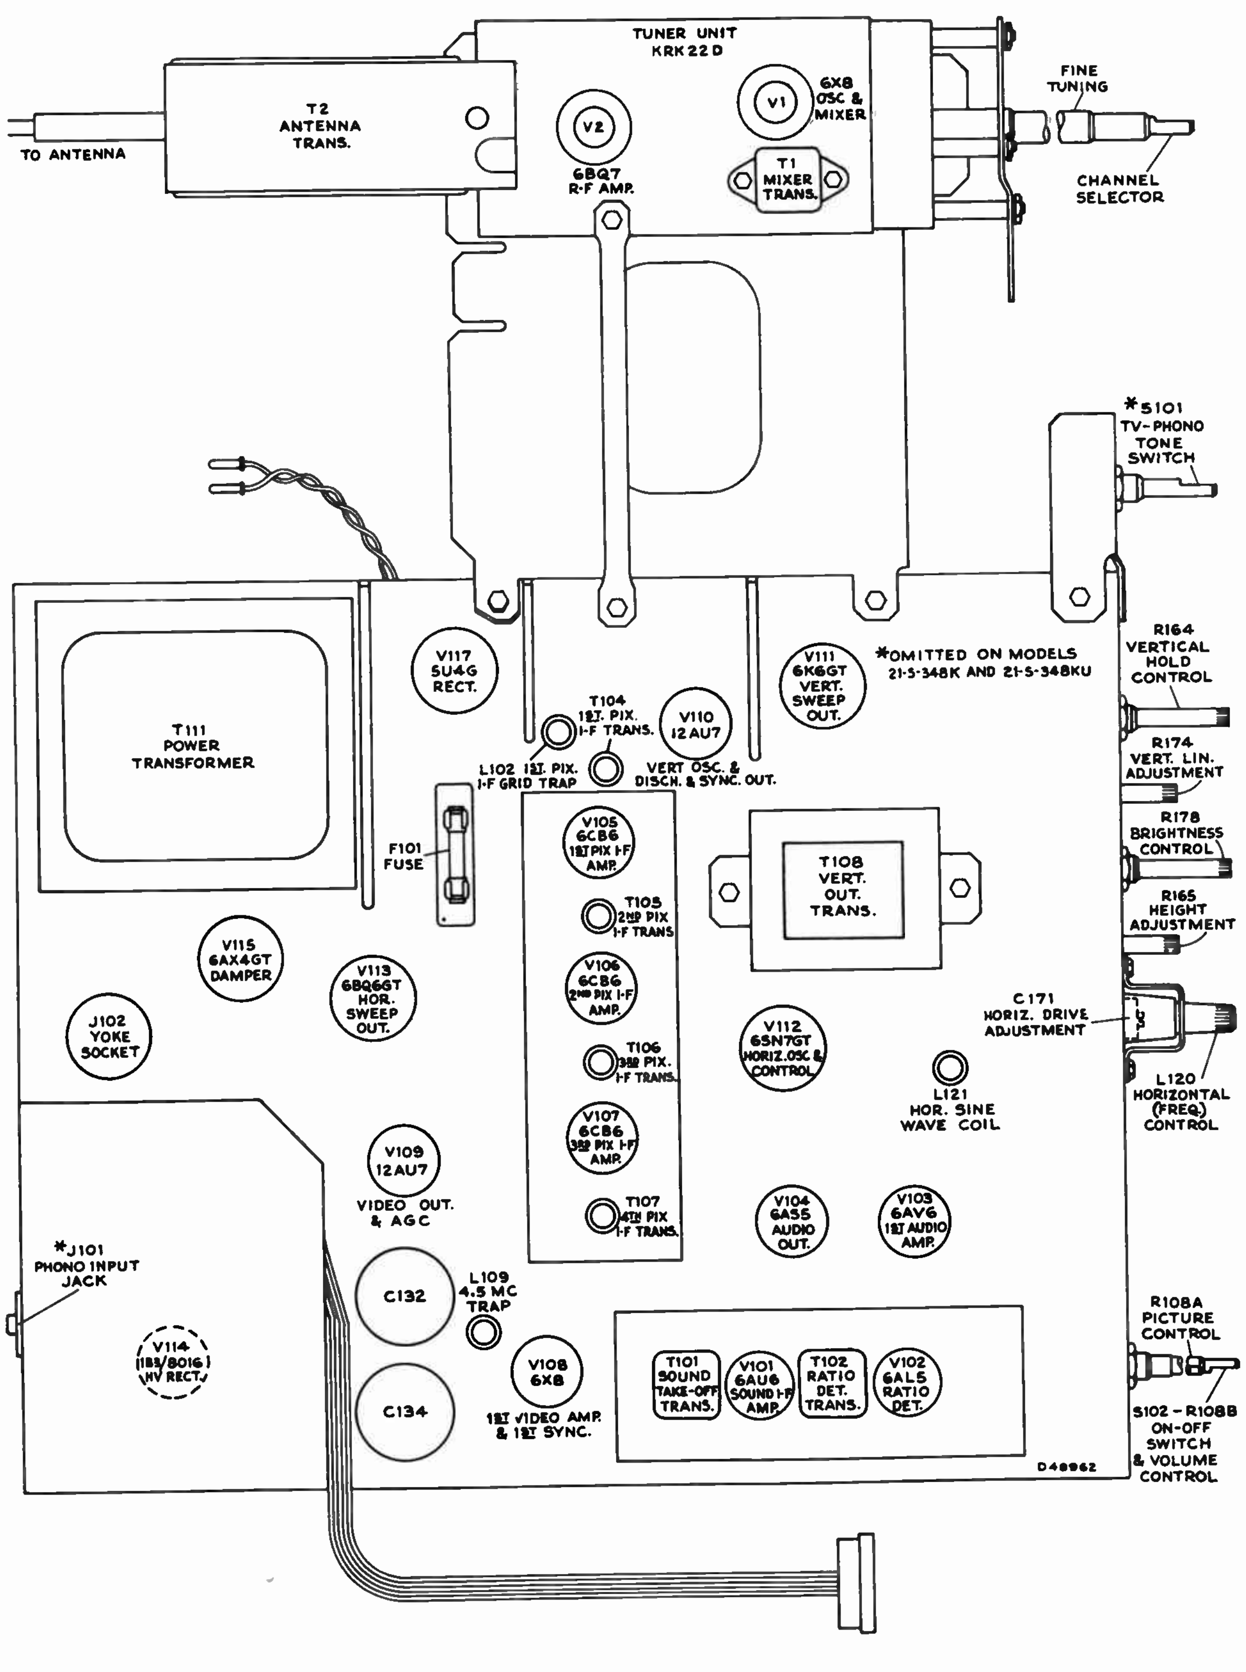

Figure 7—Chassis Top View (shown with KRK22D Tuner)

CHASSIS BOTTOM VIEW

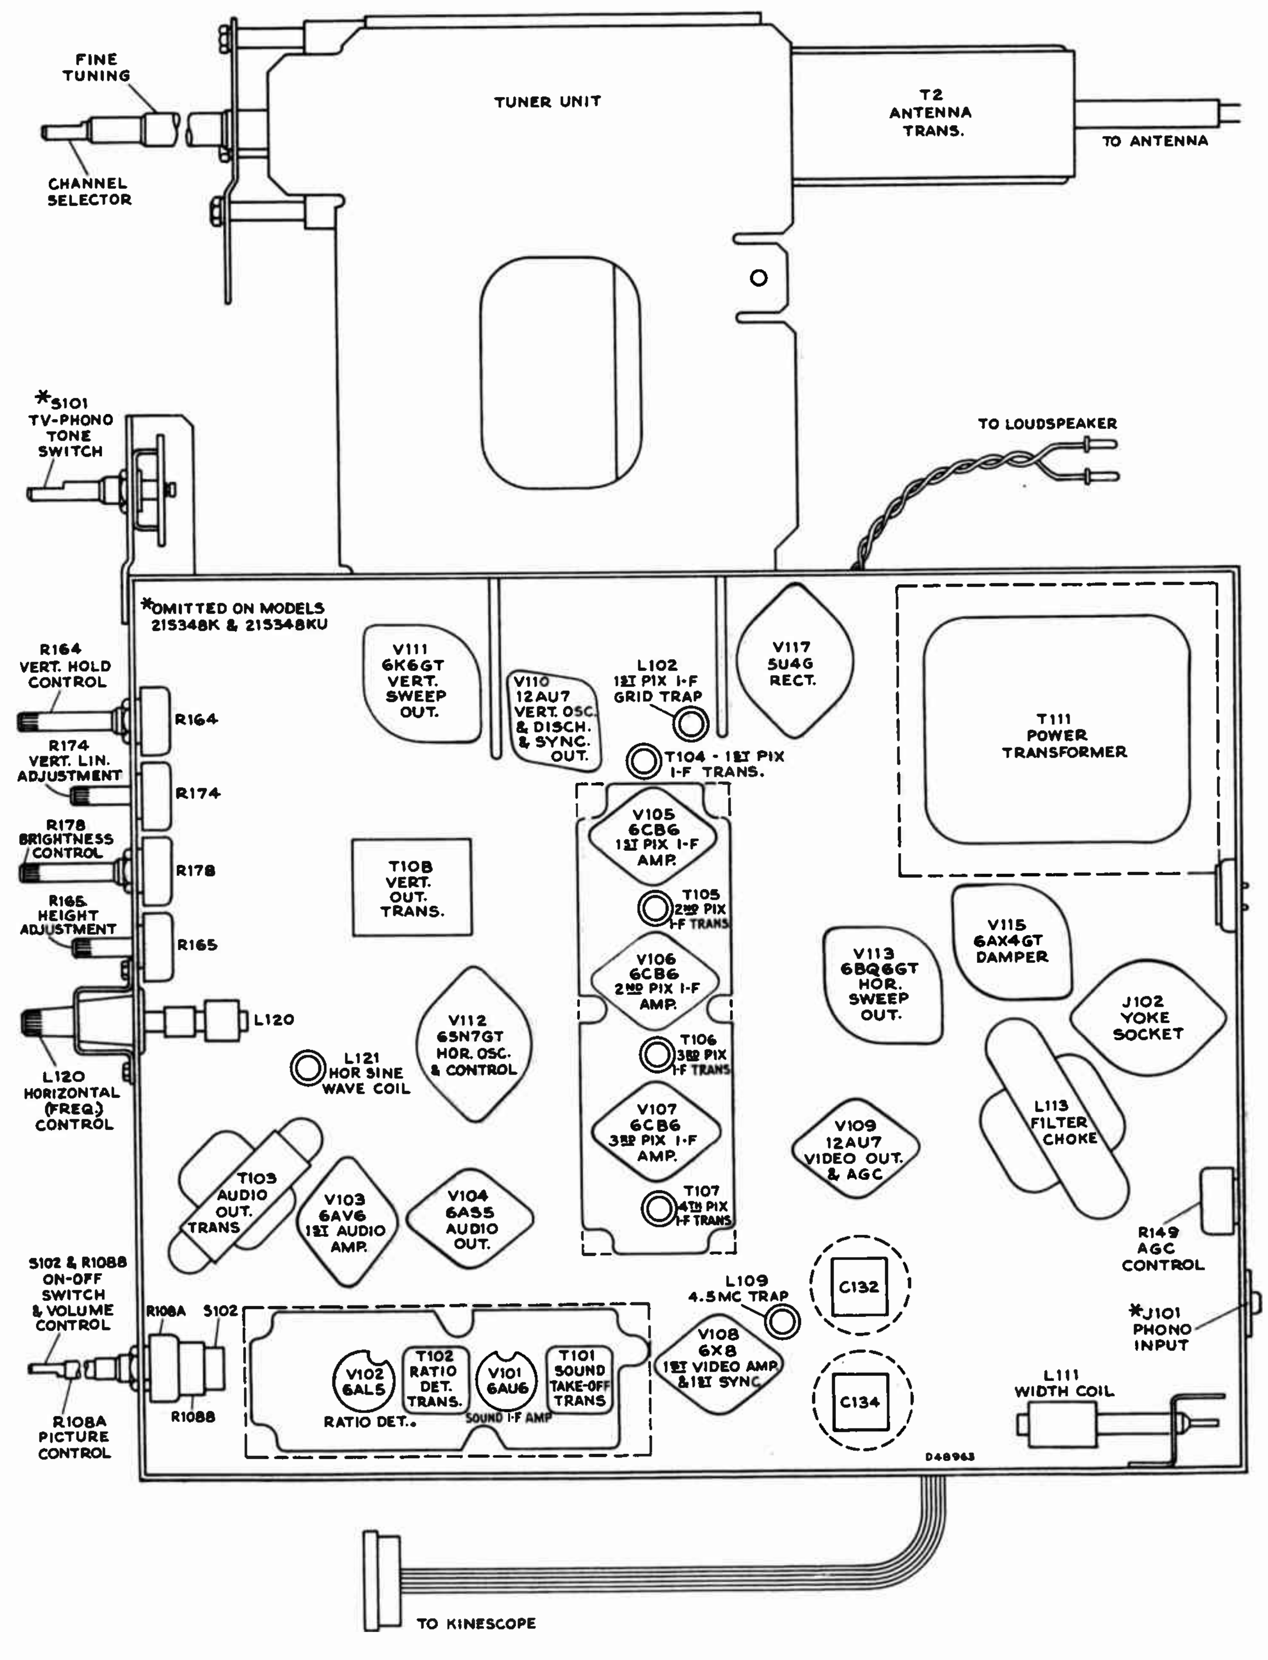

Figure 8—Chassis Bottom View (shown with KRK22D Tuner)

ALIGNMENT PROCEDURE

Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction R118, R146 and C120. Adjust the potentiometer for —4.0 volts indication on the "VoltOhmyst."

Connect the "VoltOhmyst" to the junction of R129 and L103 and to ground.

Set the VHF generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for maximum indication on the "VoltOhmyst." In each instance the generator should be checked against a crystal calibrator to insure that the generator is on frequency.

During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R129 and L103 with —4.0 volts of i-f bias at the junction of R118, R146 and C120.

44.5 mc. T107
45.5 mc. T106
43.0 mc. T105

(Note: Peak transformers with cores at end of coils nearest chassis.)

Set the signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at junction of R129 and L103. Use sufficient signal input to produce 3.0 volts of d-c on the meter when adjustment is made.

47.25 mc. L102

(Note: Core should be at end of coil nearest chassis when properly adjusted.)

SWEEP ALIGNMENT OF PICTURE I-F.—

Models 21-S-348K to 21-S-369K Incl.

To align the mixer plate circuit, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Clip a 330 ohm resistor between pin 1 of V107 and ground.

Preset C116 to minimum capacity.

Adjust the bias box potentiometer to obtain —4.0 volts of bias as measured by a "VoltOhmyst" at the junction of R118, R146 and C120.

Connect a 180 ohm composition resistor from pin 5 of V105 to pin 6 of V105. Connect the oscilloscope diode probe to pin 5 of V105 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T1 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 to 0.5 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C116 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 9. Maximum allowable tilt is 20%.

Disconnect the diode probe, the 180 ohm and the 330 ohm resistors.

Connect the oscilloscope to the junction of R129 and L103.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 to 5.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

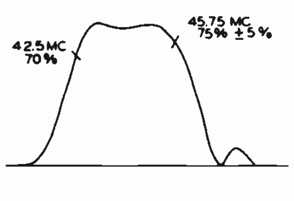

Figure 9— KRK22D T1 and T104 Response

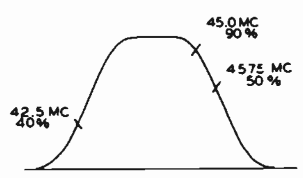

Figure 10— Overall I-F Response with KRK22D

Retouch T105, T106 and T107 to obtain the response shown in Figure 10.

Increase sweep output ten times and check attenuation at 41.25 mc. Adjust T105 and T107 to set 41.25 mc. between 25 and 35 times down with curve as shown in Figure 10.

Move the sweep generator to the antenna terminals. Connect —3.0 volts bias to pin 5 of V103. Adjust T106 and T107 slightly to correct for any overall tilt while switching from channel to channel.

Models 21-S-348KU to 21-S-369KU Incl.

To align the mixer plate circuit, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Clip a 330 ohm resistor between pin 1 of V107 and ground.

Preset C116 to minimum capacity.

Adjust the bias box potentiometer to obtain —4.0 volts of bias as measured by a "VoltOhmyst" at the junction of R118, R146 and C120.

Connect a 180 ohm composition resistor from pin 5 of V105 to pin 6 of V105. Connect the oscilloscope diode probe to pin 5 of V105 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T2 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 to 0.5 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C116 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 11. Maximum allowable tilt is 20%.

Disconnect the diode probe, the 180 ohm and the 330 ohm resistors.

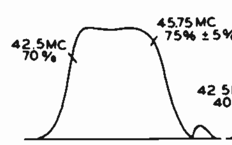

Figure 11— KRK31 T2 and T104 Response

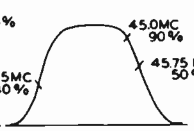

Figure 12— Overall I-F Response with KRK31

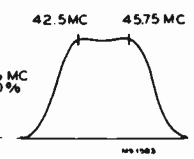

Figure 13— KRK31 L9 and L307 I-F Response

Connect the oscilloscope to the junction of R129 and L103.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 to 0.5 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T105, T106 and T107 to obtain the response shown in Figure 12.

Increase sweep output ten times and check attenuation at 41.25 mc. Adjust T105 and T107 to set 41.25 mc. between 25 and 35 times down with curve as shown in Figure 12.

To align the I-F amplifier circuit of the KRK31, connect the VHF sweep generator to the rear terminal of the 1N82 crystal holder in series with a 1000 ohm resistor and a 1500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep ground lead to the tuner case.

Set the UHF CHANGEOVER switch to the UHF position, and the UHF TUNING to channel 47 at 670 mc.

Connect a 180 ohm composition resistor and a 1500 mmf. capacitor in series between test point TP3 and ground with the capacitor connected to TP3 and the resistor to ground.

Connect the oscilloscope diode probe to the junction between the resistor and capacitor. (See Figure 20.)

Couple the VHF signal generator loosely to the diode probe in order to obtain markers.

Connect the potentiometer arm of the second bias supply to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the sweep generator to produce 0.5 volt or less peak-to-peak on the oscilloscope.

Adjust L307, on the KRK27 section, and L9, on the KRK29D section, of the tuner for maximum gain with 45.75 mc. and 42.5 mc. markers as shown in figure 13.

If necessary adjust L27 to place the 45.75 mc. marker at the peak of the curve. Adjust L43 for minimum tilt of the curve as shown in figure 13.

Remove the resistor, capacitor and diode probe from TP3 and connect the oscilloscope to the junction of R129 and L103. Use 3.0v peak-to-peak on the oscilloscope.

Connect the VHF sweep generator to the antenna terminals. Keep the AGC bias at —3.0 V and the I-F bias at —4.0 volts.

Couple the signal generator loosely to the grid of the first picture I-F amplifier.

Switch through all VHF channels and check for proper curve shape as in figure 12. Retouch T106 and T107 slightly to correct for any overall tilt that is essentially the same on all channels.

Disconnect the VHF sweep generator and connect the UHF sweep generator to the antenna terminals. Check on all UHF channels for proper wave shape as shown in figure 12, retouching L307 and L9 if necessary to correct any overall tilt.

Do not retouch T2, T104, T105, T106 or T107.

Remove the sweep and marker generators and the bias supplies.

KRK22D TUNER ALIGNMENT.—

Models 21-S-348K to 21-S-369K Incl.

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C2 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T1 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" or T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP1 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L53 and C24 at the bottom of the FM trap L53.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C19 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C19 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C5 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst". The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C3 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C10. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C3 to obtain an audible beat with the signal generator.

Turn C2 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

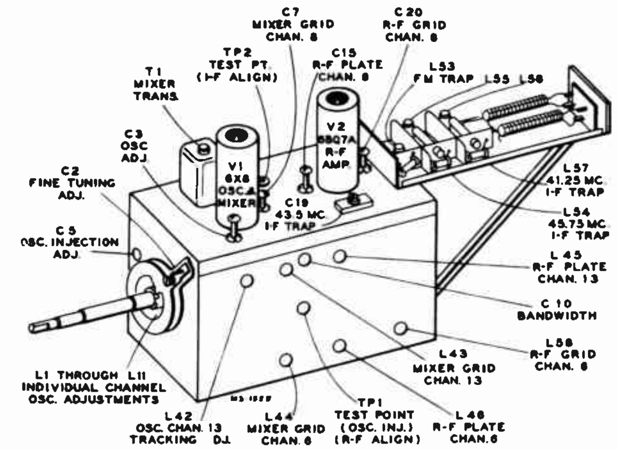

Figure 14— KRK22D Tuner Adjustments

Return the fine tuning control to the mechanical center of its range.

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C3, switch to channel 13 and adjust L42 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L11 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C3 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L42 and back to channel 8 and adjust C3.

Set the T1 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 15, to the input terminals of the antenna matching unit.

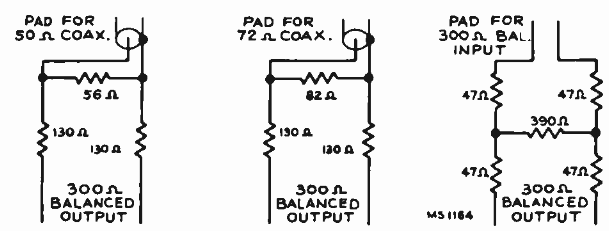

Figure 15—Sweep Attenuator Pads

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

ALIGNMENT PROCEDURE

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C7, C10, C15 and C20 for approximately correct curve shape, frequency, and band width as shown in figure 16.

The correct adjustment of C20 is indicated by maximum amplitude of the curve midway between the markers. C15 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C7 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C20 has been properly adjusted). C10 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C5 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C2, C7, C10 and C15 for proper response. Adjust C20 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

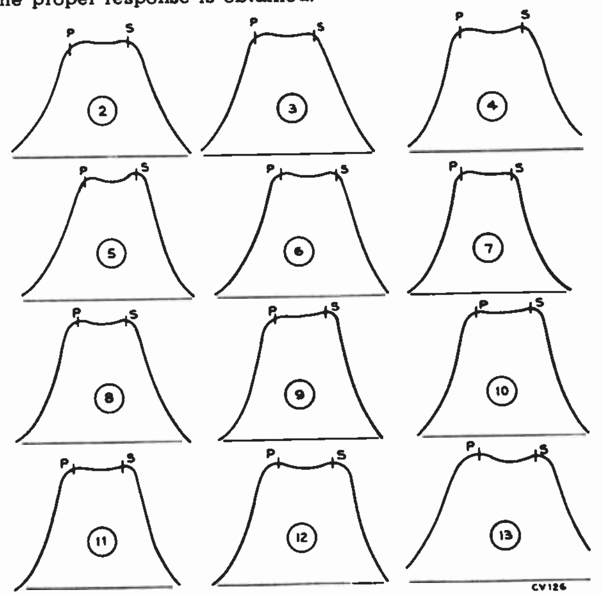

Figure 16—KRK22D R-F Response

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L42 to obtain an audible beat. Slightly overshoot the adjustment of L42 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C2 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L43 and L45 for proper response as shown in figure 16.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C5, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L43 and L45 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C2 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C7, C10, C15 and C20 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C7 was adjusted in the recheck of channel 8 response.

If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L5 for an audible beat. Adjust L44, L46 and L58 for proper curve shape as shown in figure 16. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C5 if necessary.

If C5 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C7 for correct curve shape and recheck C2 and C3 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 16 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L44, L46 and L58 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 16 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C15, C7, or C10 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L42 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

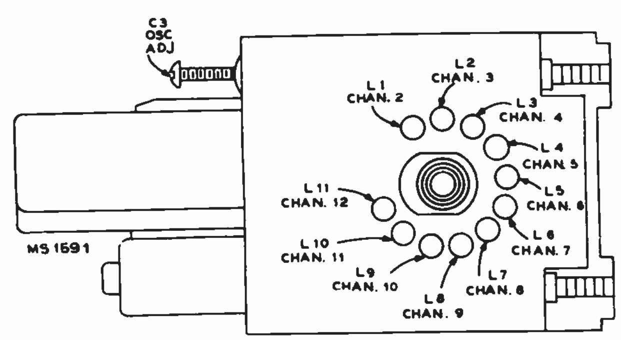

Figure 17—KRK22D Oscillator Adjustments

KRK22D ANTENNA MATCHING UNIT ALIGNMENT. —The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be realigned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L53 to the channel selector switch S4.

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R118, R146 and C120. Set the potentiometer to produce approximately —5.0 volts of bias at the junction of R118, R146 and C120.

Connect an oscilloscope to the junction of R129 and L103 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L54 in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L57 for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L53 to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L53 to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 15 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by retuning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L55 and L56 to obtain the response shown in figure 18. L55 is most effective in locating the position of the shoulder of the curve at 52 mc. and L56 should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Remove the 300 ohm resistor and crystal probe connections. Restore the connection between L53 and S4. Replace V106.

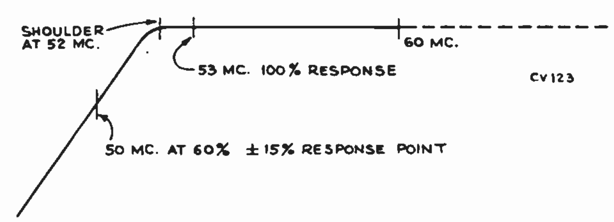

Figure 18—KRK22D Antenna Matching Unit Response

KRK31 TUNER ALIGNMENT

Models 21-S-348K to 21-S-369KU Incl.

VHF ALIGNMENT.—A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP2 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f" in terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

NOTE:—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency of each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 15 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

ALIGNMENT PROCEDURE

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and band width as shown in figure 19.

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read —3.0 volts.dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in figure 19.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

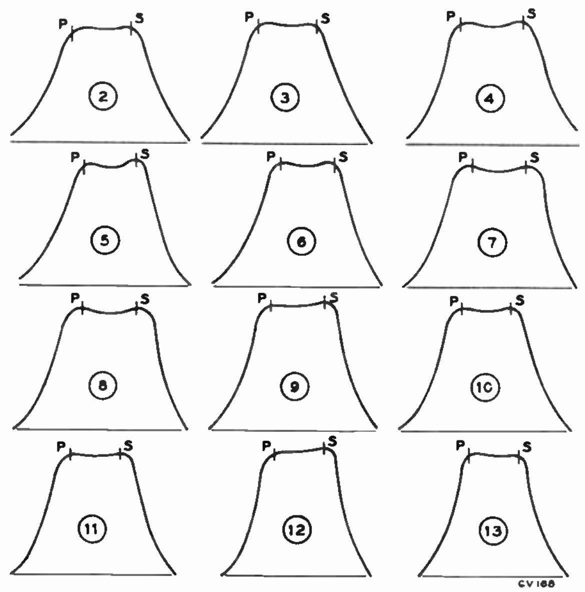

Figure 19—KRK31 VHF R-F Response

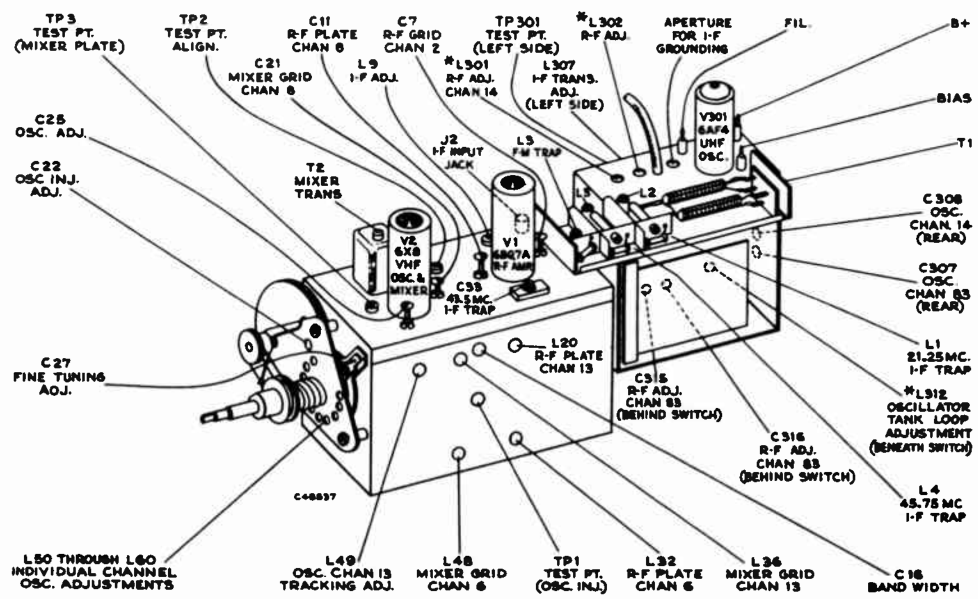
If the initial setting of the oscillator injection trimmer was far off it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.



*ON LATER PRODUCTION, L301 & L302 ARE NOT ADJUSTABLE.– L312 IS ADDED. REFER TO ALIGNMENT PROCEDURE

Figure 20—KRK31 Tuner Adjustments

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L48 and L32 for proper curve shape as shown in figure 19. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 19 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 19 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.

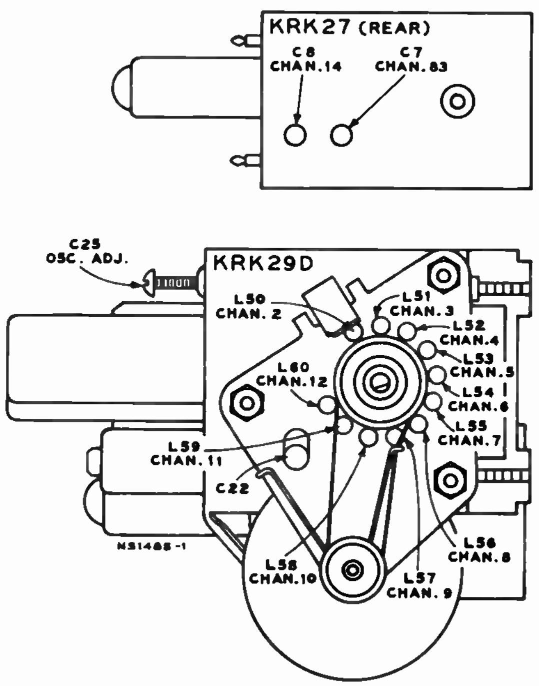


Figure 21—KRK31 VHF Oscillator Adjustments

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

UHF ALIGNMENT.—Ground the I-F transformer L307 by inserting a clip lead through the aperture provided in the top of the tuner. Ground the other end of the clip lead to the tuner case.

Connect the oscilloscope to the test point TP301, employing the preamplifier if needed with the oscilloscope used.

Connect the output of the UHF sweep generator, through a 300 ohm attenuator pad, to the antenna terminals and set the sweep generator to sweep channel 83, centered on 887.5 mc. Adjust the output of the sweep generator to full sweep width.

A test dial made to fit over the split gear on the tuner shaft is necessary for accurate alignment. Scribe marks at 0°, 9° and 168° should be marked on the test dial for reference. The 0° reference point is located with the capacitor plates fully meshed. By placing a 1/16" shim between the stop pin on the tuner and the stop plate on the gear assembly the plates will be in the proper fully meshed position.

Rotate the tuning dial to the 168°, Channel 83, position.

Connect the VHF signal generator in series with a 1000 ohm resistor to the rear terminal of the crystal holder and insert markers for 41.25 mc., 43.5 mc. and 45.75 mc.

Connect the UHF marker generator loosely to the antenna terminals and insert a marker at 887.5 mc.

Adjust R-F trimmer capacitors C315 and C316 for a maximum amplitude overcoupled response curve centered at 887.5 mc. as shown in figure 22(A).

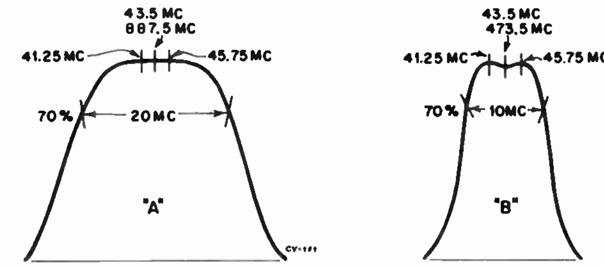

Figure 22—KRK31 UHF R-F Response

Adjust the oscillator trimmer capacitor C307 until the 43.5 mc. marker coincides with the marker at 887.5 mc. The markers for 41.25 and 45.75 should be symmetrically located on the top of the response curve as in figure 22(A).

Set the UHF sweep and marker generators to 473.5 mc. Rotate the tuning dial to the 9°, Channel 14, position.

Adjust the oscillator trimmer C308 until the 43.5 mc. marker coincides with the 473.5 mc. marker, with the 41.25 and 45.75 markers as shown. The inductance loop L312 across the oscillator tank coil, may be repositioned, if necessary, to bring the oscillator trimmer within range. Refer to figure 20 for location of the aperture for making this adjustment.

Repeat the above adjustments, as necessary, until the proper responses are obtained. Tune through the entire range and check the tracking. When perfectly tracked the three markers will be on the top of the response curves, however, mistracking to the extent that the 41.25 mc. and 45.75 mc. ride down the sides of the curves to a point not less than 70% will not seriously affect the alignment. Should the markers fall below this level, it will be necessary to knife the RF plates to correct the mistracking. The plates may be knifed through the two front holes provided on the left side of the tuner. Always knife the plates while tuning lower in frequency to prevent affecting the tracking above the point of knifing. Check which section requires knifing by touching the plates with the knifing tool while observing the response, then proceed with the knifing of the proper section or of both sections if required. Note: The two holes at the rear on the left side of the tuner are for factory use only.

Connect the "VoltOhmyst" to test point TP301. Set the "VoltOhmyst" to the 1.5v. DC scale. Tune over the entire range observing the reading on the meter. A reading between .05 and .4 volts should be obtained. Voltages outside these limits are an indication of low B voltage, low or high crystal impedance or an oscillator tube outside allowable limits.

Connect the "VoltOhmyst" to the "bias" terminal of the tuner (refer to figure 25). A reading between 0.5 and 2.5 volts should be obtained. Readings above or below this range

ALIGNMENT PROCEDURE

will cause crystal currents outside allowable limits and in such cases the oscillator tube should be replaced. Replacement of the oscillator tube will require recalibration at the high and low frequency ends of the band as previously outlined.

RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first video amplifier grid, pin 7 of V108A, in series with a .01 mfd. capacitor.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. In such a case, connect the calibrator to the grid of the third pix i-f amplifier, pin 1 of V107.

Set the frequency of the calibrator to 45.75 mc. (pix carrier) and modulate with 4.5 mc. crystal. The 4.5 mc. signal will be picked off at pin 9 of V108A and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to pin 7 of V102.

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst." (Peak with core at end of coil away from chassis.) Adjust the signal level from the signal generator for 5 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R104 and C107.

Tune the ratio detector secondary T102 bottom core for zero d-c on the "VoltOhmyst." (Adjust with core at chassis end of coil.)

Repeat adjustments of T102 top for maximum d-c at pin 7 of V102 and T102 bottom for zero d-c at the junction of R104 and C107. Make the final adjustments with the signal input level adjusted to produce 5 volts d-c on the "VoltOhmyst" at pin 7 of V102.

SOUND TAKE-OFF ALIGNMENT.—Connect the signal generator to the first video amplifier grid, pin 7 of V108A.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed as above.

Connect the "VoltOhmyst" to pin 7 of V102.

Tune the T101 top core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

The output from the signal generator should be set to produce approximately 5 volts on the "VoltOhmyst" when the final touches on the above adjustment are made.

(Alternate Method for Ratio Detector and Sound I-F Alignment)

Set the signal generator at 4.5 mc. and connect it to the first video amplifier grid, pin 7 of V108A in series with a .01 mfd. capacitor.

Connect the "VoltOhmyst" to pin 7 of V102.

Tune the ratio detector secondary T102 bottom core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst." (Peak with core at end of coil away from chassis.) Adjust the signal level from the signal generator for 5 volts on the "VoltOhmyst" when finally peaked, when making the above adjustments.

Tune the T101 (top) core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

The output from the signal generator should be set to produce approximately 5 volts on the "VoltOhmyst" when the final touches on the T101 adjustment are made.

Connect the "VoltOhmyst" to the junction of R104 and C107.

Tune T102 bottom for zero d-c at the junction of R104 and C107. (Make adjustment with core at chassis end of coil.)

4.5 MC. TRAP ADJUSTMENT.—Connect the signal generator in series with a 1500 mmf. capacitor to pin 7 of V108A. Set the generator to 4.5 mc. and modulate it 30% with 400 cycles. Set the output to approximately 0.5 volt.

Short the third pix i-f grid to ground, pin 1, V107, to prevent noise from masking the output indication.

Connect the crystal diode probe of an oscilloscope to the plate of the video output, pin 6 of V109A.

Adjust the core of L109 for minimum output on the oscilloscope. (Make adjustment with core at chassis end of coil.)

Remove the short from pin 1, V107 to ground.

As an alternate method, this step may be omitted at this point in the alignment procedure and the adjustment made "on the air" after the alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L109 requires no adjustment. If a 4.5 mc. beat is present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L109 for minimum beat.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 6 of V109A.

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

HORIZONTAL OSCILLATOR AND OUTPUT ALIGNMENT.—Normally the alignment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned.

Turn the horizontal drive trimmer C171 fully clockwise then counter-clockwise one full turn. Set the stud of the width coil L111 flush with the inside rear edge of the chassis.

Place a jumper across the terminals of the sine wave coil L121 and adjust the horizontal (frequency) control until the picture pulls into sync. Remove the short across the sine wave coil.

Connect the low capacity probe of an oscilloscope to the junction of L120, L121 and R189. Turn the horizontal (frequency) control clockwise until the picture falls out of sync, then counter-clockwise until the picture just pulls into sync. The pattern on the oscilloscope should be as shown in Figure 23. Adjust the sine wave adjustment core L121 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the horizontal (frequency) control if necessary.

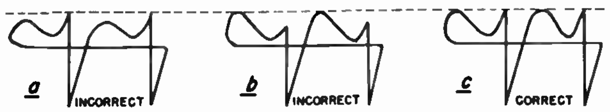

Figure 23—Horizontal Oscillator Waveforms

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator may occur. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Drive Adjustment (for correct locking range). Turn the horizontal (frequency) control until the picture falls out of sync with the diagonal lines sloping down to the right. Slowly turn the horizontal control counter-clockwise and note the number of diagonal bars obtained just before the picture pulls into sync.

Pull-in should occur with one and one-half to three bars present.

With the horizontal control set at the pull-in point, adjust the horizontal drive trimmer C171 counter-clockwise for a bright vertical line in the center of the picture. Turn the trimmer clockwise until the line just disappears.

Set the brightness control to maximum and adjust the width control so the picture fills the mask. Return the brightness control to normal and readjust the horizontal drive trimmer as above.

The picture should pull into sync with one and one-half to three bars present, remain in sync for approximately two full turns counter-clockwise from pull-in, and fall out of sync with between 2 and 5 bars present before interrupted oscillation (motorboating) occurs.

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 30000 microvolt test pattern signal was fed into the receiver the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuit ing the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

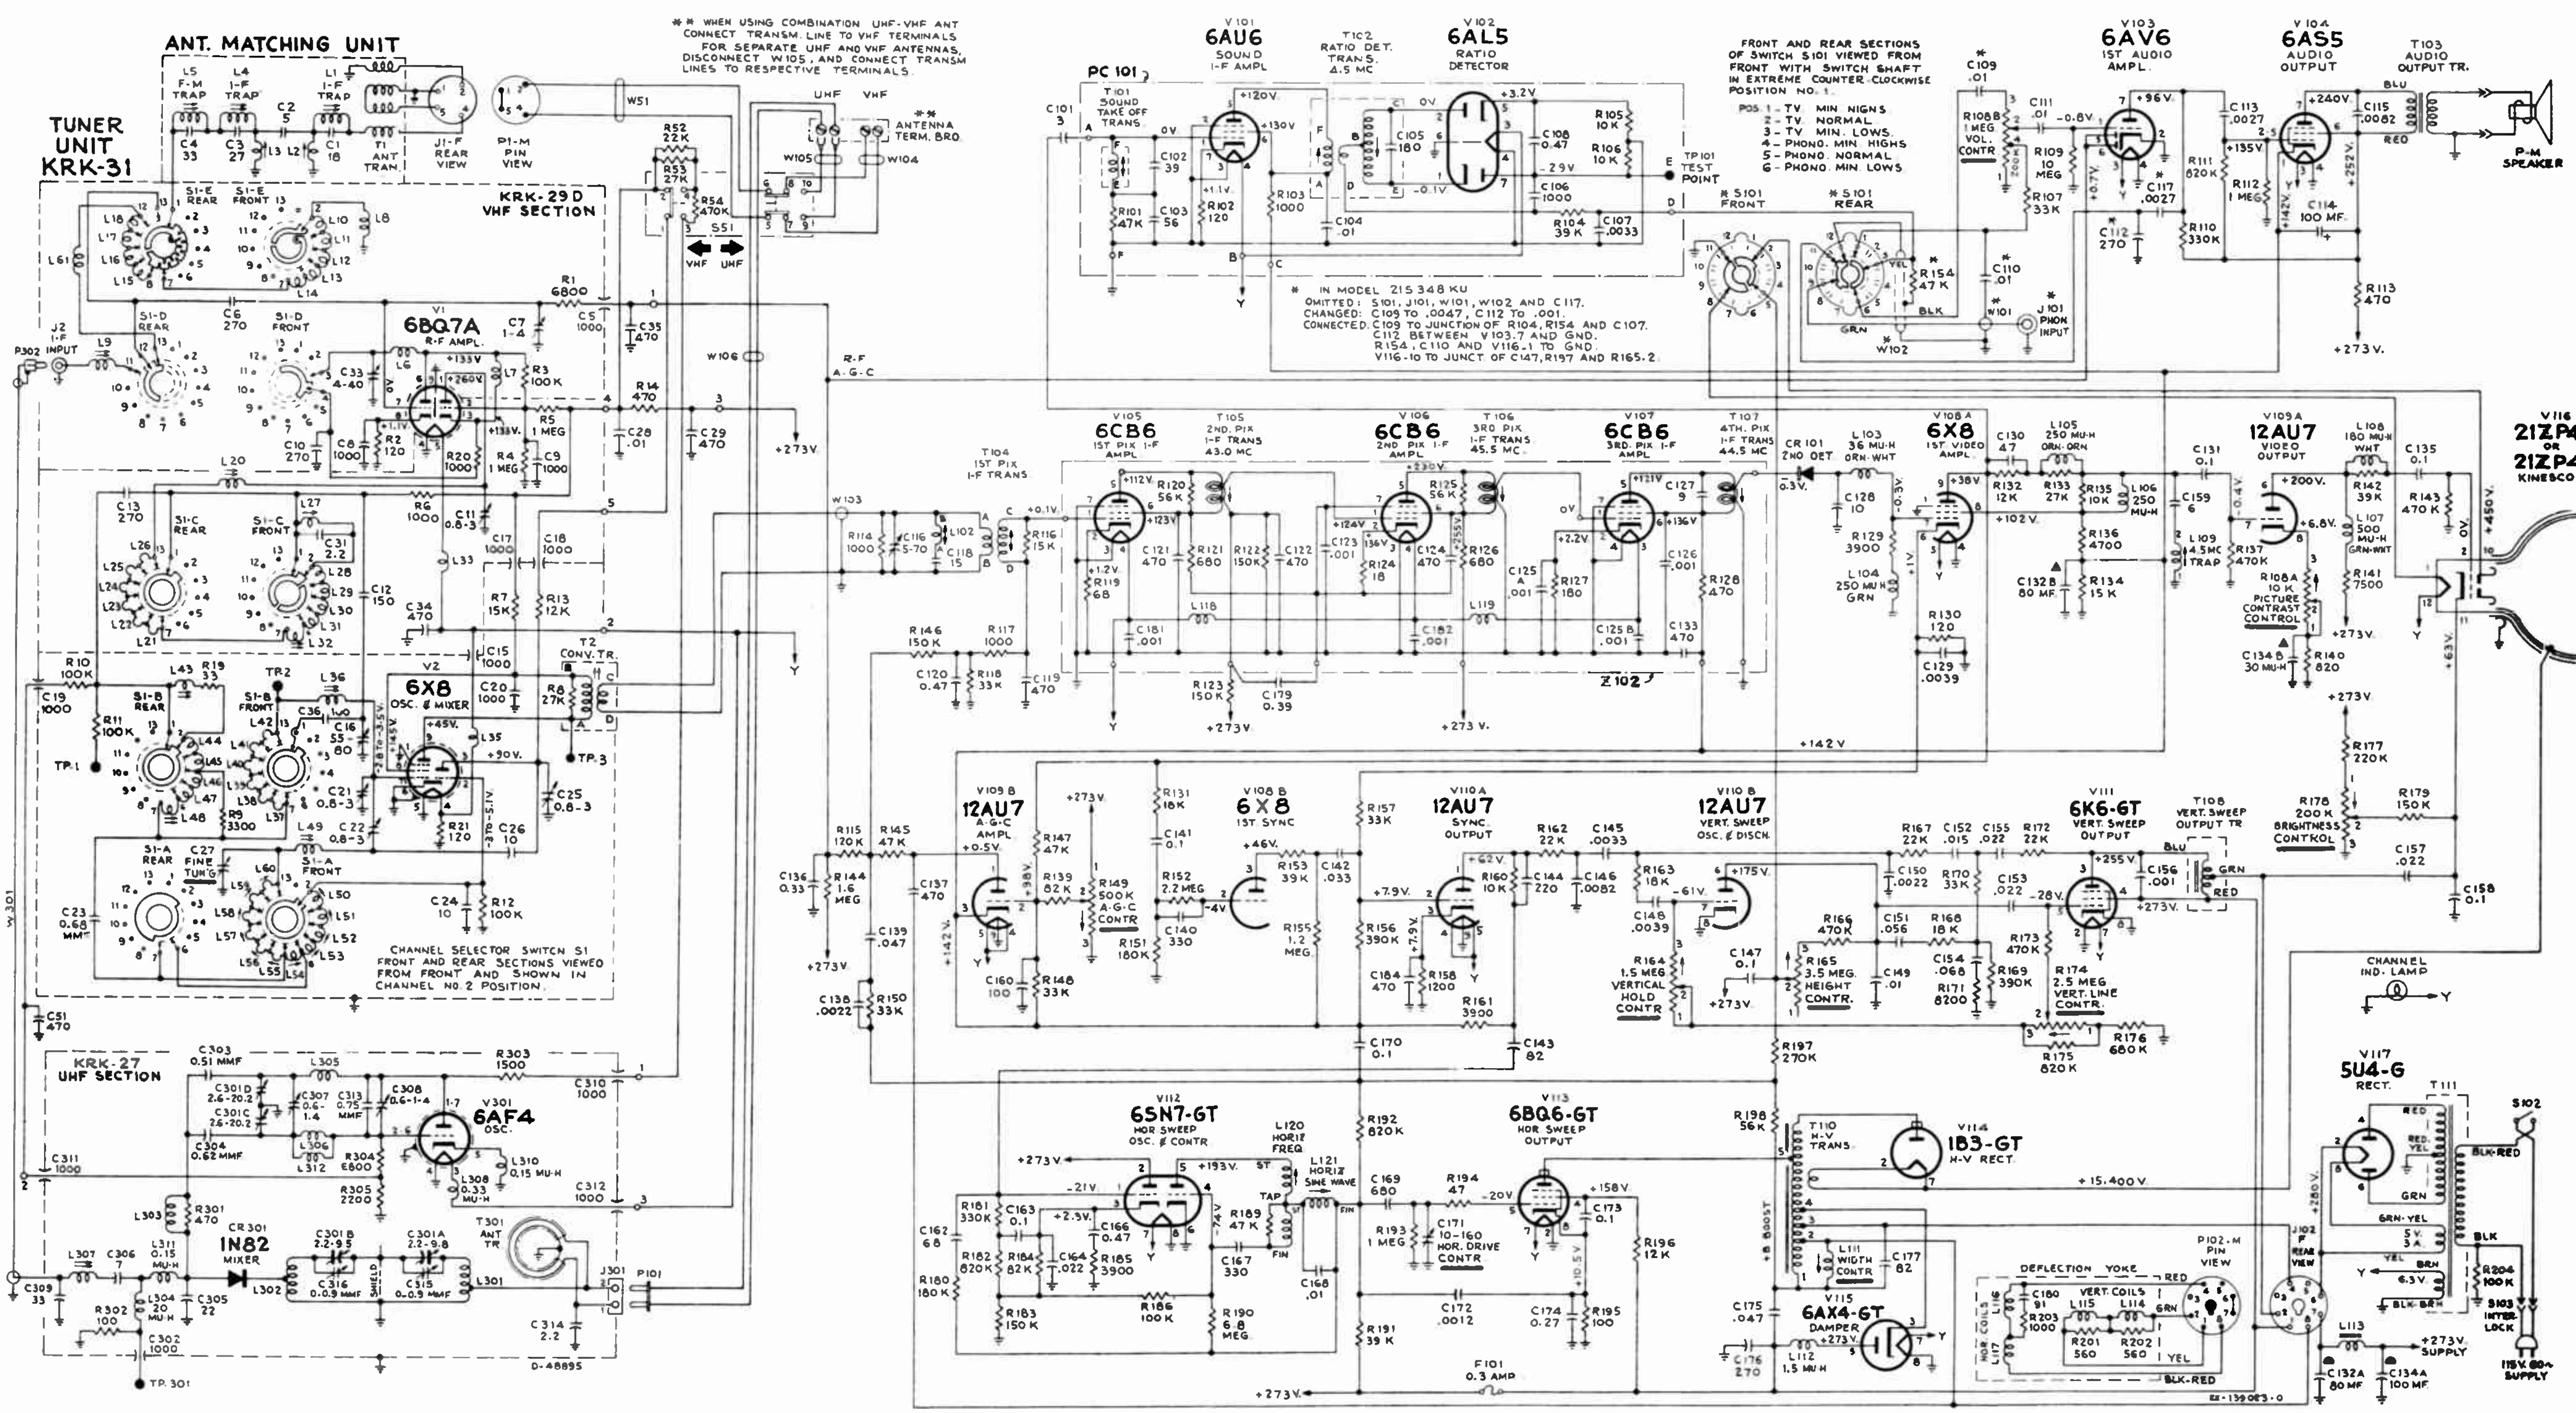
CIRCUIT SCHEMATIC DIAGRAM KCS88F or KCS88H

21-S-348KU to 21-S-369KU incl.



NOTE: Chassis KCS88H is identical to chassis 88F except as noted on schematic diagram.

The schematic is shown in the latest condition at the time of printing.
All resistance value in ohms. K = 1000.

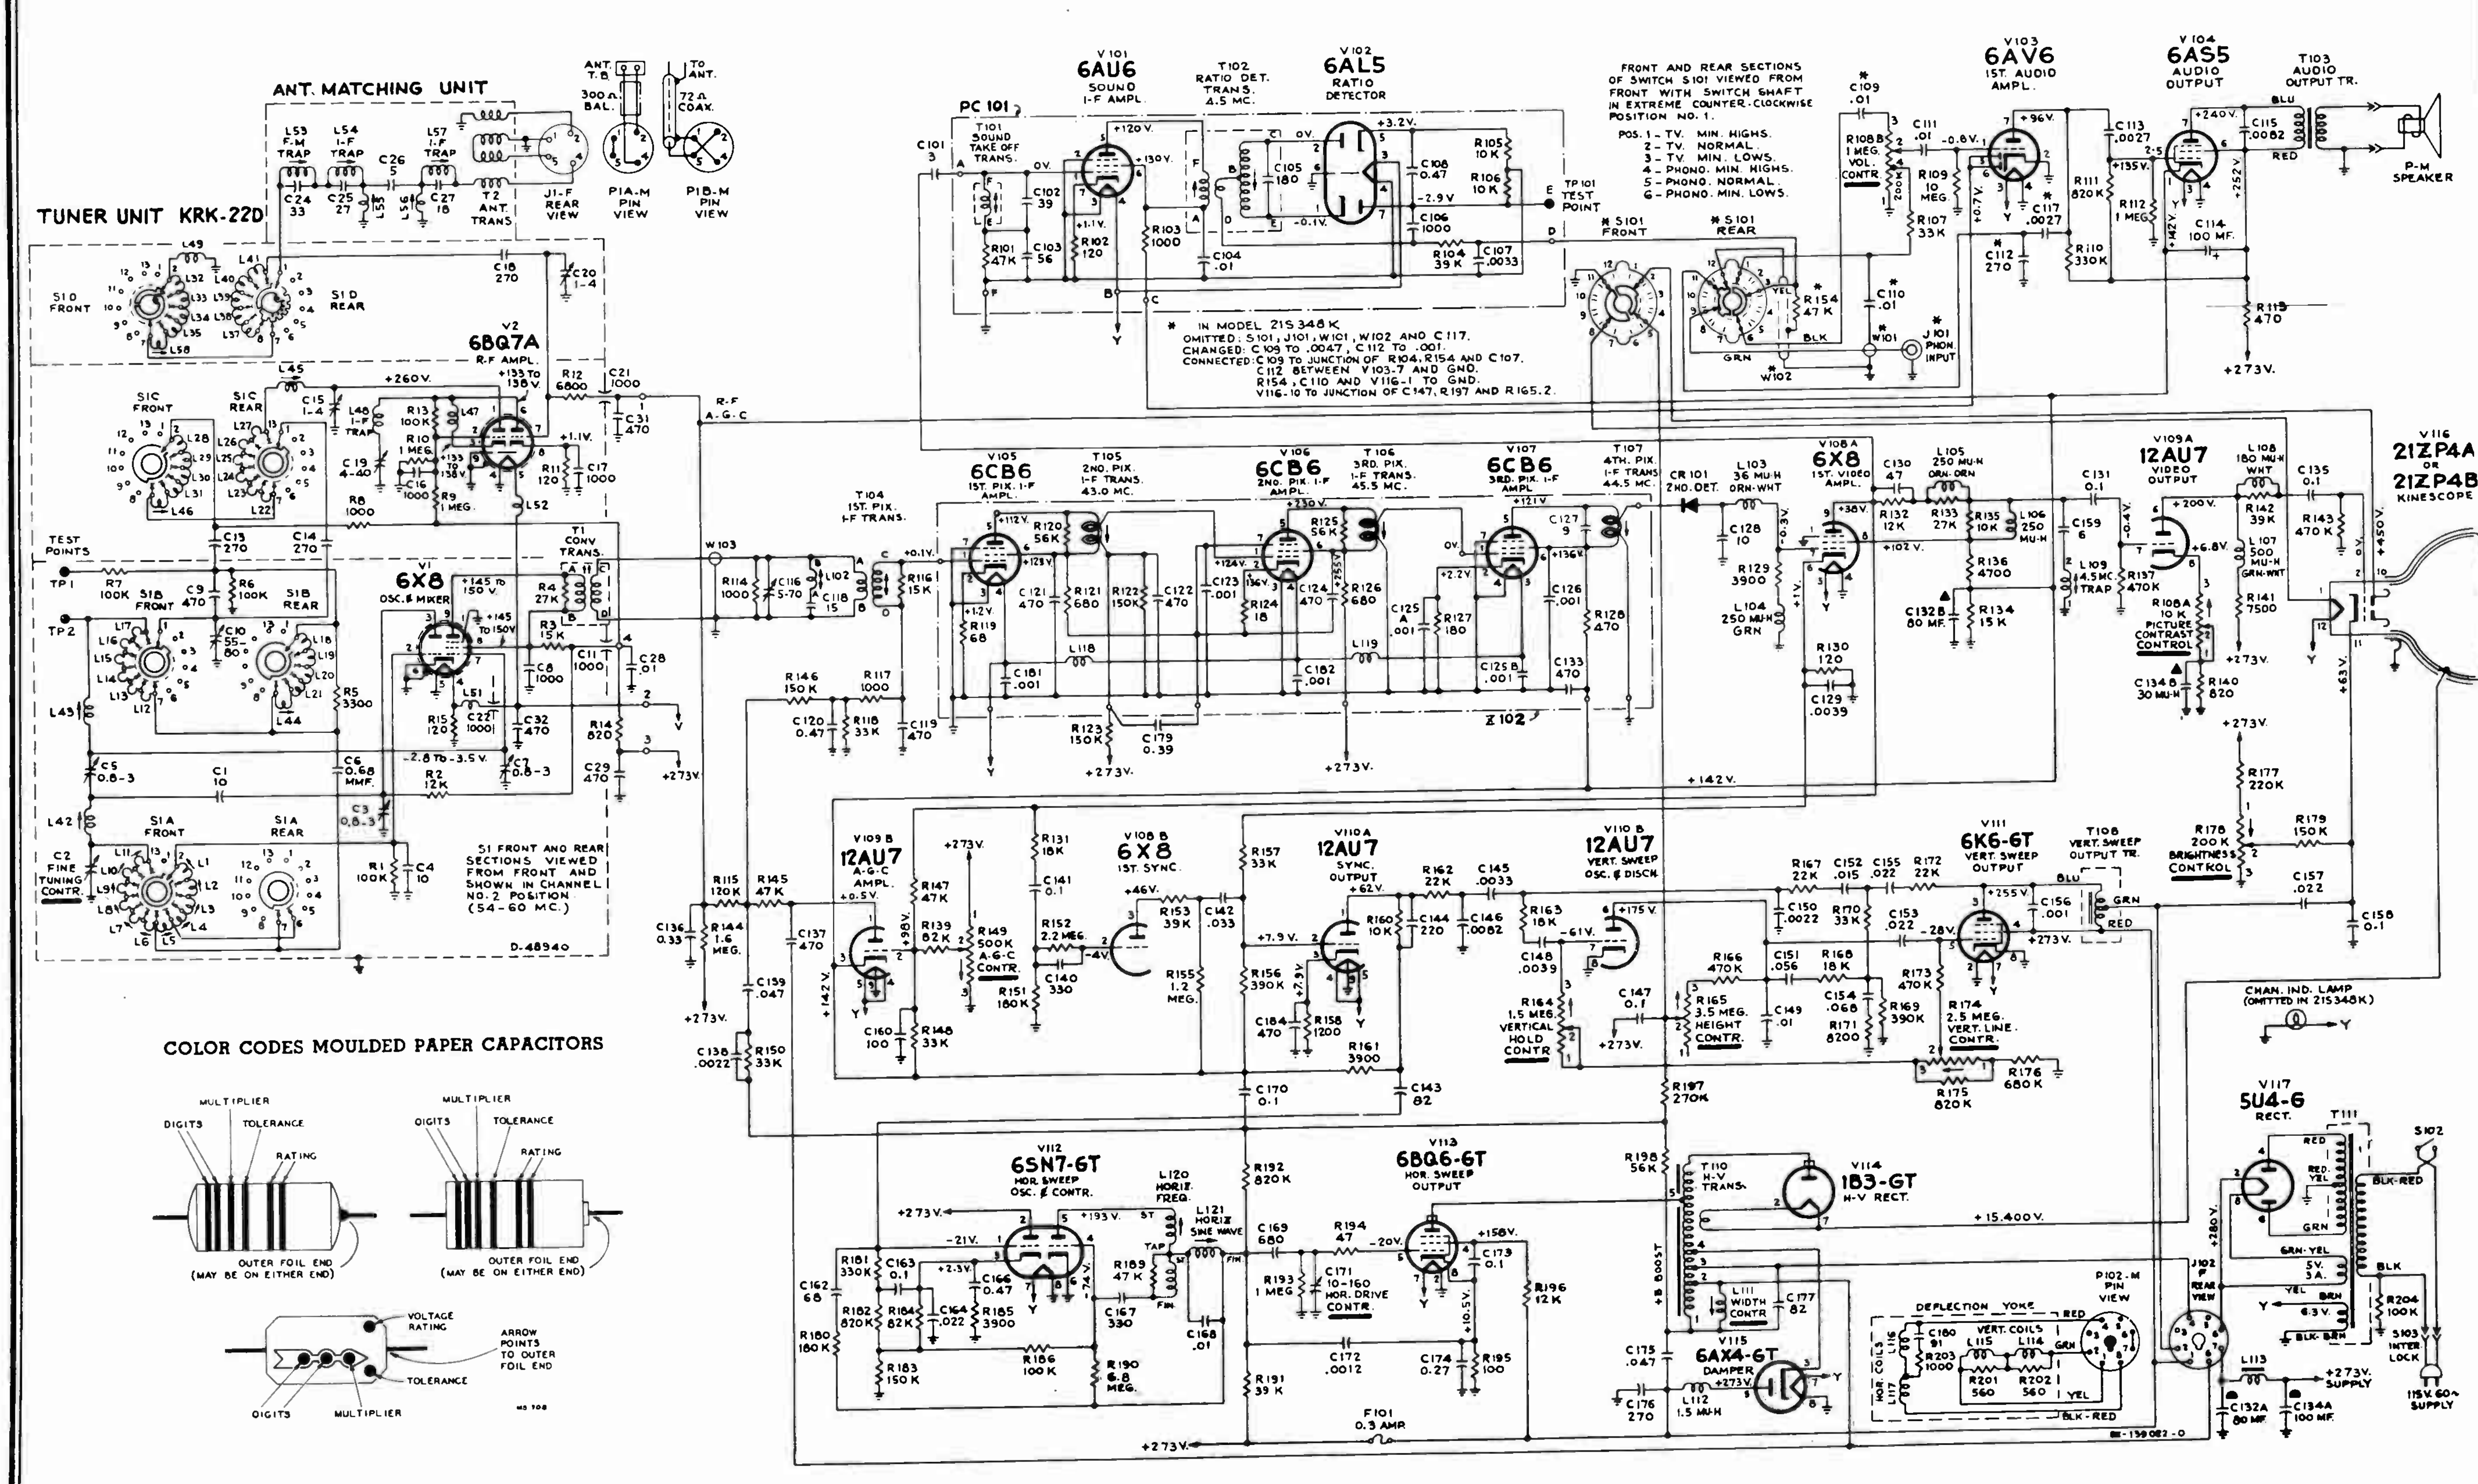
All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

Figure 27—Circuit Schematic Diagram KCS88F or KCS88H

CIRCUIT SCHEMATIC DIAGRAM KCS88 or KCS88A



*NOTE: Chassis KCS88A is identical to chassis KCS88 except as noted on schematic diagram.

The schematic is shown in the latest condition at the time of printing. All resistance value in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "VoltOhmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

Figure 26—Circuit Schematic Diagram KCS88 or KCS88A

REPLACEMENT PARTS

SYMBOL NO.	STOCK NO.	DESCRIPTION
		TUNER UNIT ASSEMBLIES KRK22D
C1	77865	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. −0, 10 mmf., ±1.0 mmf., 500 volts DC
C2	77853	Capacitor—Ceramic, variable, for fine tuning-plunger type
C3	77151	Capacitor—Adjustable, steatite, 0.8-3.0 mmf.
C4	33098	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. −750, 10 mmf., ±1.0 mmf., 500 volts DC
C5		Part of S1A
C6		Part of S1B
C7		Same as C2
C8	77252	Capacitor—Fixed, ceramic, High "K" disc, 1000 mmf., +100%, −0%, 500 volts DC
C9		Part of S1B
C10	76527	Capacitor—Mica trimmer, 55-80 mmf.
C11	77084	Capacitor—Ceramic, feed-thru, 1000 mmf.
C12		Not used
C13		Part of S1B
C14		Part of S1C
C15	76532	Capacitor—Adjustable, steatite, 1-4 mmf.
C16, C17		Same as C8
C18	73199	Capacitor—Fixed, ceramic, insulated, High "K" disc, 270 mmf., ±20%, 500 volts DC
C19	77616	Capacitor—Adjustable, mica, 4-40 mmf.
C20		Same as C15
C21, C22		Same as C11
C23		Not used
C24, C25, C26, C27		Part of T2
C28	73960	Capacitor—Fixed, ceramic, High "K" disc, 10,000 mmf., ±100%, −0%, 500 volts DC
C29	77293	Capacitor—Fixed, ceramic, High "K" disc, 470 mmf., +100%, −0%, 500 volts DC
C30		Not used
C31, C32		Same as C29
J1		Part of T2
L1 to L11 Incl.		Part of S1A
L12 to L21 Incl.		Part of S1B
L22 to L31 Incl.		Part of S1C
L32 to L41 Incl.		Part of S1D
L42		Part of S1A
L43, L44		Part of S1B
L45, L46		Part of S1C
L47	76562	Coil—RF amplifier coupling coil
L48	78466	Coil—RF choke coil
L49	77859	Connector—RF grid switch return connector
L50, L51	79097	Coil—Heater choke coil
L52	77206	Coil—Filament choke coil
L53 to L57 Incl.		Part of T2
R1	504410	Resistor—Fixed, composition, 100,000 ohms, ±20%, ½ watt
R2	523312	Resistor—Fixed, composition, 12,000 ohms, ±10%, 2 watts
R3	523315	Resistor—Fixed, composition, 15,000 ohms, ±10%, 2 watts
R4		Part of T1
R5, R6, R7		Part of S1B
R8		Part of S1C
R9, R10	503510	Resistor—Fixed, composition, 1.0 megohm, ±10 %, ½ watt
R11	503112	Resistor—Fixed, composition, 120 ohms, ±10%, ½ watt
R12	504268	Resistor—Fixed, composition, 6800 ohms, ±20%, ½ watt
R13		Same as R1
R14	503182	Resistor—Fixed, composition, 820 ohms, ±10%, ½ watt
S1A	77911	Stator—Oscillator stator complete with rotors, coils, and trimmer (C5, L1, L2, L3, L4, L5, L6, L7, L8, L9, L10, L11, L42)
S1B	78800	Stator—Mixer stator complete with rotor, coils, capacitors, and resistors (C6, C9, C13, L12, L13, L14, L15, L16, L17, L18, L19, L20, L21, L43, L44, R5, R6, R7)
S1C	78801	Stator—RF plate stator complete with rotor, coils, capacitors and resistors (C14, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L45, L46, R8)
S1D	78802	Stator—RF grid stator complete with rotor and coils (L32, L33, L34, L35, L36, L37, L38, L39, L40, L41)
T1	78399	Transformer—Convertor transformer
T2	78396	Transformer—Antenna matching transformer complete (C24, C25, C26, C27, J1, L53, L54, L55, L56, L57)
	77850	Bracket—Side bracket for mounting coil and stators
	77854	Clip—Mounting clip for fine tuning core
	77860	Connector—Grounding strap connector
	76460	Contact—Test point contact
	77852	Core—Adjustable core for fine tuning capacitor
	79198	Detent—Detent mechanism with steel shaft
	77861	Guide—Bakelite guide for fine tuning lever
	78270	Lever—Fine tuning lever
	14343	Retainer—Fine tuning shaft retainer ring
	77849	Retainer—Retainer for fine tuning spring
	79199	Shaft—Fine tuning shaft and cam
	78236	Shield—Front shield
	76534	Shield—Tube shield
	77851	Shield—"U" shaped shield for underside of unit
	76336	Socket—Tube socket, 9 pin miniature, saddle mounted
	77856	Spring— Fine tuning core spring
	78241	Spring—Formed, for stabilizing fine tuning lever
		TUNER UNIT ASSEMBLIES KRK31 (KRK29D/27)
C1	54207	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0, 18 mmf., ±10%, 500 volts
C2	3056	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0, 5 mmf., ±0.5 mmf., 500 volts
C3	70935	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0, 27 mmf., ±10%, 500 volts
C4	76739	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0, 33 mmf., ±10%, 500 volts
C5	77084	Capacitor—Ceramic, feed-thru, 1,000 mmf.
C6	75199	Capacitor—Fixed, ceramic, insulated, High "K" disc, 270 mmf., ±20%, 500 volts
C7	76532	Capacitor—Adjustable, steatite, 1-4 mmf.
C8, C9	77252	Capacitor—Fixed, ceramic, High "K" disc, 1,000 mmf., +100%, −0%, 500 volts
C10		Same as C6 (Part of S1D)
C11	77151	Capacitor—Adjustable, steatite, 0.8-3.0 mmf.
C12	78276	Capacitor—Fixed, ceramic, insulated, High "K" disc, 150 mmf., ±10%, 500 volts
C13		Same as C6 (Part of S1B)
C14		Same as C8
C15		Same as C5
C16		Not used
C17, C18, C19		Same as C5
C20		Same as C8
C21		Same as C11
C22	77913	Capacitor—Adjustable, steatite, 0.8-3.0 mmf.
C23	71504	Capacitor—Fixed, headed-lead type, 0.68 mmf., ±20 %, 500 volts
C24	78247	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = −750, 10 mmf., ±10%, 500 volts
C25		Same as C11
C26	77865	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0, 10 mmf., ±1 mmf., 500 volts
C27	77853	Capacitor—Ceramic, variable, for fine tuning-plunger type
C28	73960	Capacitor—Fixed, ceramic, High "K" disc, 10,000 mmf., +100%, −0%, 500 volts
C29	77293	Capacitor—Fixed, ceramic, High "K" disc, 470 mmf., +100%, -0%, 500 volts
C30		Not used
C31	71502	Capacitor—Fixed, headed-lead type, 2.2 mmf., ±20%, 500 volts
C32		Not used
C33	77616	Capacitor—Adjustable, mica, 4-40 mmf.
C34, C35		Same as C29
C36	75437	Capacitor—Fixed, ceramic, insulated, High "K" disc, 100 mmf., ±20%, 500 volts
C37		Same as C26 (Part of S1A)
C38	71503	Capacitor—Fixed, headed-lead type, 3.3 mmf., ±20%, 500 volts
C39		Same as C31 (Part of S1C)
C40 to C50 Incl.		Not used
C51		Same as C29
C301-A B, C, D	78257	Capacitor—Variable tuning capacitor
C302	77084	Capacitor—Fixed, ceramic, 1,000 mmf., feed-thru

REPLACEMENT PARTS (Continued)

SYMBOL NO.	STOCK NO.	DESCRIPTION
C303	78137	Capacitor—Fixed, headed-lead type, 0.51 mmf., ±10%, 500 volts DC
C304	78260	Capacitor—Fixed, headed-lead type, 0.62 mmf. ±10%, 500 volts DC
C305	78261	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0, 22 mmf., ±5%, 500 volts DC
C306	78262	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0, 7 mmf., ±0.5 mmf., 500 volts DC
C307, C308	78259	Capacitor—Adjustable, steatite, 0.6-1.4 mmf., complete with adjustable core
C309	70596	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = 0, 33 mmf., ±5%, 500 volts DC
C310, C311 C312		Same as C302
C313	78263	Capacitor—Fixed, ceramic, non-insulated, Temp. coef. = −750 0.75 mmf., ±0.25 mmf., 500 volts DC
C314	71502	Capacitor—Fixed, headed-lead type, 2.2 mmf., ±10%, 500 volts DC
C315, C316		Part of C301 assembly
CR301	77489	Rectifier—crystal rectifier 1N82
J1	38853	Connector—4 contact female connector-part of antenna matching transformer
J2	78237	Connector—Single contact female connector for UHF connection
J301	78255	Connector—2 contact female connector for UHF antenna
L1	76542	Trap—IF trap (41.25 mc) complete with core
L2	76538	Coil—Shunt coil complete with adjustable core
L3	76537	Coil—Shunt coil complete with adjustable core
L4	76541	Trap—IF trap (45.75 mc) complete with core
L5	76540	Trap—FM trap complete with adjustable core
L6	78466	Trap—IF trap
L7	76562	Coil—RF amplifier coupling coil
L8	77859	Connector—RF grid switch return connector
L9	78271	Coil—IF input coil complete with adjustable core
L10, L11, L12, L13		Part of S1E
L14	73458	Coil—Channel 6 RF grid coil (Part of S1E)
L15, L16, L17, L18		Part of S1E
L19		Not used
L20	77921	Coil—Channel 13 RF plate coil (Part of S1C)
L21 to L26 Incl.		Part of S1C
L27	78584	Coil—RF plate IF coil (Part of S1C)
L28 to L31 Incl.		Part of S1C
L32	73460	Coil—Channel 6 RF plate coil (Part of S1C)
L33	77206	Coil—Filament choke coil
L34, L35	76763	Coil—Heater choke coil
L36	77919	Coil—Channel 13 mixer coil (Part of S1B)
L37 to L42 Incl.		Part of S1B
L43	78583	Coil—Mixer IF coil (Part of S1B)
L44 to L47 Incl.		Part of S1B
L48	73874	Coil—Channel 6 mixer coil (Part of S1B)
L49	77915	Coil—Channel 13 oscillator coil (Part of S1A)
L50 to L60 Incl.		Part of S1A
L61	78401	Coil—Channel 6 antenna coil
L301, L302		Part of C301 assembly
L303	78264	Coil—Peaking coil
L304	72618	Coil—Peaking coil, 20 muh.
L305	78265	Strip—Inductance strip
L306	78266	Strip—Inductance strip and plate
L307	78258	Coil—IF coil complete with adjustable core
L308, L309	77279	Coil—RF choke coil, 0.33 muh.
L310, L311	78267	Coil—RF choke coil, 0.15 muh.
P51	39153	Connector—4 contact male connector
R1	503268	Resistor—Fixed, composition, 6800 ohms, ±10%, ½ watt
R2	503112	Resistor—Fixed, composition, 120 ohms, ±10%, ½ watt
R3	503410	Resistor—Fixed, composition, 100,000 ohms, ±10%, ½ watt
R4, R5	503510	Resistor—Fixed, composition, 1 megohm, ±10%, ½ watt
R6	503210	Resistor—Fixed, composition, 1,000 ohms, ±10%, ½ watt
R7	523315	Resistor—Fixed, composition, 15,000 ohms, ±10%, 2 watts
R8		Part of T2
R9	503233	Resistor—Fixed, composition, 3300 ohms, ±10%, ½ watt
R10, R11		Same as R3 (Part of S1B)
R12		Same as R3
R13	523312	Resistor—Fixed, composition, 12,000 ohms, ±10%, 2 watts
R14	503147	Resistor—Fixed, composition, 470 ohms, ±10%, ½ watt
R15 to R18 Incl.		Not used
R19	503033	Resistor—Fixed, composition, 33 ohms, ±10%, ½ watt
R20		Same as R6
R21 to R51 Incl.		Not used
R52	523322	Resistor—Fixed, composition, 22,000 ohms, ±10%, 2 watts
R53	523327	Resistor—Fixed, composition, 27,000 ohms, ±10%, 2 watts
R54		Same as R14
R301		Part of L303
R302	503110	Resistor—Fixed, composition, 100 ohms, ±10%, ½ watt
R303	503215	Resistor—Fixed, composition, 1500 ohms, ±10%, ½ watt
R304	503268	Resistor—Fixed, composition, 6800 ohms, ±10%, ½ watt
R305	503222	Resistor—Fixed, composition, 2200 ohms, ±10%, ½ watt
S1A	77911	Stator—Oscillator coil and stator complete with rotor, coils and trimmer (C22, C37, L49, L50, L51, L52, L53, L54, L55, L56, L57, L58, L59, L60)
S1B	78272	Stator—Mixer stator complete with rotor (C13, C36, L36, L37, L38, L39, L40, L41, L42, L43, L44, L45, L46, L47, L48, R9, R10, R11, R19)
S1C	78274	Stator—RF plate stator complete with rotor, coils, capacitors and resistors (C12, C31, C39, L20, L21, L22, L23, L24, L25, L26, L27, L28, L29, L30, L31, L32, R6)
S1D	78277	Stator—Input selector switching stator complete with rotor and capacitor (C10)
S1E	78398	Stator—RF grid stator complete with rotor and coils (C38, L10, L11, L12, L13, L14, L15, L16, L17, L18)
S51	78429	Switch—Antenna slide switch
T1	78396	Transformer—Antenna matching transformer complete
T2	78399	Transformer—Convertor transformer
T301	78268	Transformer—UHF antenna input transformer
	76539	Board—Antenna matching transformer terminal board less coils and capacitors
	78467	Board—Terminal board-6 contact
	78233	Bracket—Side bracket for mounting coils and stators
	78430	Cam—Actuating cam for antenna slide switch
	78417	Cam—Fine tuning cam for VHF
	77854	Clip—Fine tuning clip for fine tuning core
	73591	Coil—Antenna matching coil (Part of T1)
	77860	Connector—Grounding strap connector
	78269	Connector—Single contact male connector for IF output cable
	76460	Contact—Test point contact
	77852	Core—Adjustable core for fine tuning capacitor
	76543	Core—Adjusting core for FM trap
	77918	Core—½-20 x ½" adjusting core for L14, L32, L48
	77914	Core—8-32 x 27/64" adjustable core for L20, L36, L49
	78582	Core—10-32 x ½" adjustable core for L27, L43
	79328	Detent—Detent mechanism and shaft
	77917	Form—Channel 6 coil form complete with core
	77912	Form—Channel 13 coil form complete with core
	78581	Form—IF coils L27, L43 coil form complete with core
	78406	Gear—Tuner drive gear—20 teeth—for KCS88 chassis
	77861	Guide—Bakelite guide for fine tuning lever
	78256	Holder—Crystal holder
	78431	Insulator—Insulator for antenna slide switch
	78270	Lever—Fine tuning lever
	76728	Nut—Speednut for capacitors C7, C11, C21, C25
	78421	Pin—Clutch mechanism operating pin
	79327	Plate—Mounting plate for shafts (front)
	78404	Pulley—Tuner driven pulley complete with bushing for KCS88 chassis
	78405	Pulley—UHF channel marker escutcheon drive pulley for KCS88 chassis
	78423	Pulley—UHF channel marker escutcheon pulley
	79236	Pulley—UHF channel marker pulley assembly
	78420	Pulley—UHF tuner drive pulley

REPLACEMENT PARTS (Continued)

SYMBOL NO.	STOCK NO.	DESCRIPTION
	14343	Retainer—Fine tuning shaft retainer ring
	77849	Retainer—Retainer for fine tuning spring
	78419	Ring—Retaining ring for UHF channel marker escutcheon pulley
	76547	Screw—No. 4-40 x ½" adjusting screw for L55, L56, L57, L58, L59, L60
	76549	Screw—No. 4-40 x ⅜" adjusting screw for L50, L51, L52, L53
	75176	Screw—No. 4-40 x 1/16" adjusting screw for L54
	79325	Shaft—UHF channel selector knob shaft and clutch disc
	78407	Shaft—Tuner connecting shaft for KCS88 chassis
	78236	Shield—Front shield for KRK29D section
	78252	Shield—Oscillator shield for KRK27 section
	78253	Shield—RF shield for KRK27 section
	78254	Shield—Shield for crystal rectifier
	76534	Shield—Tube shield for KRK29D section
	76967	Shield—Tube shield for KRK27 section
	77851	Shield—"U" shaped shield for underside of KRK29D section
	76336	Socket—Tube socket, 9 pin miniature saddle-mounted (KRK29D)
	77274	Socket—Tube socket, miniature, 7 pin ceramic, saddle-mounted (KRK27)
	78427	Spring—Clutch mechanism operating pin coil spring
	77856	Spring—Fine tuning spring
	78241	Spring—Formed spring for fine tuning lever
	78422	Spring—Formed spring for actuating clutch disc
	78585	Spring—Formed spring for UHF channel marker escutcheon
	78409	Spring—Tuner drive cord tension spring
	78428	Spring—UHF channel marker escutcheon pulley coil spring
	78403	Stop—Metal stop for connecting shaft for KCS88 chassis
	76740	Stud—No. 6-32 x 1" adjusting stud for capacitor C22
	78426	Washer—"C" washer for clutch mechanism
	75190	Washer—Insulating washer (neoprene) for capacitor
	78424	Washer—Retaining washer for knob shaft spring
	78425	Washer—Spring washer for clutch mechanism
		CHASSIS ASSEMBLIES KCS88, KCS88A, (KRK22D) KCS88F, KCS88H (KRK31)
C101	76507	Capacitor—Fixed, ceramic, 3 mmf., ±1 mmf., 500 volts
C102	79323	Capacitor—Fixed, ceramic, 39 mmf., ±10%, 500 volts
C103	79234	Capacitor—Fixed, ceramic, 56 mmf., ±10%, 500 volts
C104	73960	Capacitor—Fixed, ceramic, .01 mfd., +100%, −0%, 500 volts
C105		Part of T102
C106	39652	Capacitor—Fixed, mica, 1000 mmfd., ±5%, 500 volts
C107	79315	Capacitor—Fixed, paper, .0033 mf., ±10%, 400 volts
C108	79148	Capacitor—Fixed, paper, 0.47 mf., ±10%, 200 volts
C109	79017	Capacitor—Fixed, paper, oil impregnated, .0047 mf., ±20%, 400 volts for KCS88A, KCS88H only
C109	79014	Capacitor—Fixed, paper, 0.01 mf., ±20%, 200 volts for KCS88, KCS88F only
C110	79316	Capacitor—Fixed, paper, .01 mf., ±10%, 200 volts
C111	79014	Capacitor—Fixed, paper, .01 mf., ±20%, 200 volts
C112	47617	Capacitor—Fixed, ceramic, 270 mmf., ±10%, 500 volts for KCS88, KCS88F only
C112	75643	Capacitor—Fixed, paper, .001 mf., ±10%, 600 volts for KCS88A, KCS88H only
C113	73599	Capacitor—Fixed, paper, 0.0027 mf., ±10%, 400 volts
C114	79314	Capacitor—Electrolytic, 100 mf., +100%, −10%, 250 volts
C115	73805	Capacitor—Fixed, paper, 0.0047 mf., ±10%, 1000 volts
C116	78220	Capacitor—Adjustable, 5-70 mmf. mica
C117		Same as C113
C118	39044	Capacitor—Fixed, ceramic, 15 mmf., ±5%, 500 volts
C119	77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, −0%, 500 volts

SYMBOL NO.	STOCK NO.	DESCRIPTION
C120	73787	Capacitor—Fixed, paper, 0.47 mf., ±20%, 200 volts
C121	77293	Capacitor—Fixed, ceramic, 470 mmf., ±20%, 500 volts
C122	77293	Capacitor—Fixed, ceramic, 470 mmf., +100%, −0%, 500 volts
C123	77252	Capacitor—Fixed, ceramic, .001 mfd., +100%, −0%, 500 volts
C124		Same as C121
C125A, B	79319	Capacitor—Fixed, electrolytic, 2 sections:—.001 mf., 500 volts
C126	78623	Capacitor—Fixed, ceramic, .001 mf., ±20%, 500 volts
C127	79164	Capacitor—Fixed, ceramic, 9 mmfd., ±0.5 mmf., 500 volts
C128	33098	Capacitor—Fixed, ceramic, 10 mmf., ±1 mmf., 500 volts
C129	79018	Capacitor—Fixed, paper, .0039 mf., ±10%, 400 volts
C130	39042	Capacitor—Fixed, ceramic, 47 mmf., ±10%, 500 volts
C131	79149	Capacitor—Fixed, paper, 0.1 mf., ±20%, 600 volts
C132A, B	79147	Capacitor—Electrolytic comprising: 1 section of 80 mfd., 400 volts and 1 section of 80 mfd., 200 volts
C133		Same as C122
C134A, B	79146	Capacitor—Electrolytic comprising:— 1 section of 100 mfd., 400 volts and 1 section of 30 mfd., 50 volts
C135	73557	Capacitor—Fixed, paper, 0.1 mf., ±20%, 600 volts
C136	76994	Capacitor—Fixed, paper, 0.33 mf., ±20%, 200 volts
C137	59667	Capacitor—Fixed, mica, 470 mmf., ±10%, 1000 volts
C138		Same as C135
C139	73592	Capacitor—Fixed, paper, 0.047 mf., ±10%, 600 volts
C140	39640	Capacitor—Fixed, mica, 330 mmf., ±10%, 500 volts
C141	73551	Capacitor—Fixed, paper, 0.1 mf., ±20%, 400 volts
C142	73552	Capacitor—Fixed, paper, 0.033 mf., ±20%, 400 volts
C143	76474	Capacitor—Fixed, mica, 82 mf., ±5%, 1000 volts
C144	39636	Capacitor—Fixed, mica, 220 mmf., ±10%, 500 volts
C145		Same as C107
C146	79019	Capacitor—Fixed, paper, 0.0082 mf., ±10%, 400 volts
C147		Same as C141
C148	78221	Capacitor—Fixed, paper, 0.0039 mf., ±5%, 600 volts
C149	73594	Capacitor—Fixed, paper, 0.01 mf., ±10%, 600 volts
C150	73595	Capacitor—Fixed, paper, 0.0022 mf., ±10%, 600 volts
C151	79317	Capacitor—Fixed, paper, 0.056 mf., ±10%, 600 volts
C152	73797	Capacitor—Fixed, paper, 0.015 mf., ±10%, 400 volts
C153	73798	Capacitor—Fixed, paper, 0.022 mf., ±20%, 600 volts
C154	73792	Capacitor—Fixed, paper, 0.068 mf., ±10%, 200 volts
C155	73798	Capacitor—Fixed, paper, 0.022 mf., ±10%, 600 volts
C156	78980	Capacitor—Fixed, paper, 0.001 mf., ±20%, 1600 volts
C157		Same as C153
C158		Same as C141
C159	77364	Capacitor—Fixed, ceramic, 6 mmf., ±1.0 mmf., 500 volts
C160	39396	Capacitor—Fixed, ceramic, 100 mmf., ±10%, 500 volts
C162	76475	Capacitor—Fixed, mica, 68 mmf., ±5%, 1000 volts
C163		Same as C141
C164	73562	Capacitor Fixed, paper, 0.022 mf., ±20%, 400 volts
C166		Same as C120
C167	76476	Capacitor—Fixed, mica, 330 mmf., ±5%, 1000 volts
C168	73594	Capacitor Fixed, paper, 0.01 mf., ±5%, 600 volts
C169	76479	Capacitor Fixed, paper, 680 mmf., ±10%, 600 volts
C170		Same as C135
C171	71807	Capacitor Mica trimmer, 10-160 mmf.

REPLACEMENT PARTS (Continued)

SYMBOL NO.	STOCK NO.	DESCRIPTION
C172	76995	Capacitor—Fixed, paper, 0.0012 mf., ±5%, 600 volts
C173		Same as C135
C174	73786	Capacitor—Fixed, paper, 0.27 mf., ±10%, 200 volts
C175	73597	Capacitor—Fixed, paper, 0.047 mf., ±10%, 1000 volts
C176	79022	Capacitor—Fixed, mica, 270 mmf., ±20%, 1000 volts
C177	77836	Capacitor—Fixed, ceramic, 82 mmf., ±10%, 6000 volts
C179	79318	Capacitor—Fixed, paper, 0.39 mf., ±10%, 200 volts
C180		Part of Yoke
C181, C182		Same as C123
C184	78622	Capacitor—Fixed, ceramic, 470 mmf., ±20%, 500 volts
CR101	76675	Crystal—Crystal operating frequency 44.5 M.C.
F101	78214	Fuse—0.3 amp., 250 volts
J101	35787	Connector—Phono input connector for KCS88, KCS88F
J102	68590	Connector—8 contact female connector for yoke leads
L102	78204	Trap—1st. I.F. grid trap complete with adjustable core
L103	76011	Coil—Peaking (36 mh)
L104	98482	Coil—Peaking (250 mh)
L105	77674	Coil—Peaking (250 mh)
L106	79321	Coil—Peaking (250 mh)
L107	75252	Coil—Peaking (500 mh)
L108	71528	Coil—Peaking (180 mh)
L109	79157	Coil—4.5 M.C. video trap with adjustable core (includes C159)
L111	79144	Coil—Width coil complete with adjustable core
L112	76640	Coil—R.F. insul. choke, 1.5 mh
L113	77676	Choke—Filter choke
L114, L115, L116, L117		Part of Yoke
L118, L119	73477	Coil—2nd. and 3rd. I.F. pix choke coils
L120	79160	Coil—Horizontal oscillator coil complete with adjustable core
L121	79161	Coil—Horizontal sine wave coil with adjustable core
PC101	79142	Circuit—Printed I.F. sound assembly (includes C102, C103, C104, C106, C107, C108, R101, R102, R103, R104, R105, R106, T101, T102)
R101	503347	Resistor—Fixed, composition, 47,000 ohms, ±10%, ½ watt
R102	503112	Resistor—Fixed, composition, 120 ohms, ±10%, ½ watt
R103	504210	Resistor—Fixed, composition, 1000 ohms, ±20%, ½ watt
R104	503339	Resistor—Fixed, composition, 39,000 ohms, ±10%, ½ watt
R105, R106	502310	Resistor—Fixed, composition, 10,000 ohms, ±5%, ½ watt
R107	503333	Resistor—Fixed, composition, 33,000 ohms, ±10%, ½ watt
R108A, B	78208	Control—Volume and contrast control
R109	504610	Resistor—Fixed, composition, 10 megohms, ±20%, ½ watt
R110	504433	Resistor—Fixed, composition, 330,000 ohms, ±20%, ½ watt
R111	503482	Resistor—Fixed, composition, 820,000 ohms, ±5%, ½ watt
R112	502510	Resistor—Fixed, composition, 1 megohm, ±5%, ½ watt
R113	524147	Resistor—Fixed, composition, 470 ohms, ±20%, 2 watts
R114	504210	Resistor—Fixed, composition, 1000 ohms, ±20%, ½ watt
R115	30180	Resistor—Fixed, composition, 120,000 ohms, ±5%, ½ watt
R116	503315	Resistor—Fixed, composition, 15,000 ohms, ±10%, ½ watt
R117		Same as R114
R118	502333	Resistor—Fixed, composition, 33,000 ohms, ±5%, ½ watt
R119	502068	Resistor—Fixed, composition, 68 ohms, ±5%, ½ watt
R120	502356	Resistor—Fixed, composition, 56,000 ohms, ±5%, ½ watt
R121	504168	Resistor—Fixed, composition, 680 ohms, ±20%, ½ watt
R122, R123	502415	Resistor—Fixed, composition, 150,000 ohms, ±5%, ½ watt
R124	33568	Resistor—Fixed, composition, 18 ohms, ±5%, ½ watt

SYMBOL NO.	STOCK NO.	DESCRIPTION
R125		Same as R120
R126		Same as R121
R127	502118	Resistor—Fixed, composition, 180 ohms, ±5%, ½ watt
R128	504147	Resistor—Fixed, composition, 470 ohms, ±20%, ½ watt
R129	502239	Resistor—Fixed, composition, 3900 ohms, ±5%, ½ watt
R130	503112	Resistor—Fixed, composition, 120 ohms, ±10%, ½ watt
R131	503318	Resistor—Fixed, composition, 18,000 ohms, ±10%, ½ watt
R132	503312	Resistor—Fixed, composition, 12,000 ohms, ±10%, ½ watt
R133		Part of L105
R134	524315	Resistor—Fixed, composition, 15,000 ohms, ±20%, 2 watts
R135		Part of L106
R136	513247	Resistor—Fixed, composition, 4700 ohms, ±10%, 1 watt
R137	504447	Resistor—Fixed, composition, 470,000 ohms, ±20%, ½ watt
R139	503382	Resistor—Fixed, composition, 82,000 ohms, ±10%, ½ watt
R140	503182	Resistor—Fixed, composition, 820 ohms, ±10%, ½ watt
R141	512275	Resistor—Fixed, composition, 7500 ohms, ±5%, 1 watt
R142		Part of L108
R143		Same as R137
R144	502516	Resistor—Fixed, composition, 1.6 megohm, ±5%, ½ watt
R145	514347	Resistor—Fixed, composition, 47,000 ohms, ±20%, 1 watt
R146		Same as R122
R147	503347	Resistor—Fixed, composition, 47,000 ohms, ±10%, ½ watt
R148		Same as R107
R149	78808	Control—AGC control
R150		Same as R107
R151	503418	Resistor—Fixed, composition, 180,000 ohms, ±10%, ½ watt
R152	503522	Resistor—Fixed, composition, 2.2 megohm, ±10%, ½ watt
R153	503339	Resistor—Fixed, composition, 39,000 ohms, ±10%, ½ watt
R154		Same as R147
R155	503512	Resistor—Fixed, composition, 1.2 megohm, ±10%, ½ watt
R156	503439	Resistor—Fixed, composition, 390,000 ohms, ±10%, ½ watt
R157		Same as R107
R158	503212	Resistor—Fixed, composition, 1200 ohms, ±10%, ½ watt
R160	513310	Resistor—Fixed, composition, 10,000 ohms, ±10%, 1 watt
R161	502239	Resistor—Fixed, composition, 3900 ohms, ±5%, ½ watt
R162	503322	Resistor—Fixed, composition, 22,000 ohms, ±10%, ½ watt
R163		Same as R131
R164	78210	Control—Vertical hold control
R165	78806	Control—Height control
R166	503447	Resistor—Fixed, composition, 470,000 ohms, ±10%, ½ watt
R167	503322	Resistor—Fixed, composition, 22,000 ohms, ±10%, ½ watt
R168	19 32	Resistor—Fixed, composition, 18,000 ohms, ±5%, ½ watt
R169	503439	Resistor—Fixed, composition, 390,000 ohms, ±10%, ½ watt
R170	502333	Resistor—Fixed, composition, 33,000 ohms, ±5%, ½ watt
R171	503282	Resistor—Fixed, composition, 8200 ohms, ±10%, ½ watt
R172	502232	Resistor—Fixed, composition, 22,000 ohms, ±5%, ½ watt
R173		Same as R166
R174	78807	Control—Vertical linearity control
R175		Same as R111
R176	30562	Resistor—Fixed, composition, 680,000 ohms, ±5%, ½ watt
R177	503422	Resistor—Fixed, composition, 220,000 ohms, ±10%, ½ watt
R178	79139	Control—Brightness control
R179	504415	Resistor—Fixed, composition, 150,000 ohms, ±20%, ½ watt
R180	503418	Resistor—Fixed, composition, 180,000 ohms, ±10%, ½ watt

SYMBOL NO.	STOCK NO.	DESCRIPTION
R181	503433	Resistor—Fixed, composition, 330,000 ohms, ±10%, ½ watt
R182	503482	Resistor—Fixed, composition, 820,000 ohms, ±10%, ½ watt
R183	502415	Resistor—Fixed, composition, 150,000 ohms, ±5%, ½ watt
R184	8064	Resistor—Fixed, composition, 82,000 ohms, ±5%, ½ watt
R185	503239	Resistor—Fixed, composition, 3900 ohms, ±10%, ½ watt
R186	512410	Resistor—Fixed, composition, 100,000 ohms, ±5%, 1 watt
R189	503347	Resistor—Fixed, composition, 47,000 ohms, ±10%, ½ watt
R190	503568	Resistor—Fixed, composition, 6.8 megohm, ±10%, ½ watt
R191	513339	Resistor—Fixed, composition, 39,000 ohms, ±10%, 1 watt
R192	503482	Resistor—Fixed, composition, 820,000 ohms, ±10%, ½ watt
R193	503510	Resistor—Fixed, composition, 1 megohm, ±10%, ½ watt
R194	504047	Resistor—Fixed, composition, 47 ohms, ±20%, ½ watt
R195	74015	Resistor—Fixed, wire wound, 100 ohms, ±10%, 2 watts
R196	523312	Resistor—Fixed, composition, 12,000 ohms, ±10%, 2 watts
R197	503427	Resistor—Fixed, composition, 270,000 ohms, ±10%, ½ watt
R198	503356	Resistor—Fixed, composition, 56,000 ohms, ±10%, ½ watt
R201, R202, R203		Part of Yoke
R204	504410	Resistor—Fixed, composition, 100,000 ohms, ±20%, ½ watt
S102	78211	Switch—T.V. phono-tone switch for KCS88, KCS88F
T101	79140	Coil—Sound take-off coil, 4.5 M.C.
T102	79141	Transformer—I.F. ratio detector complete with adjustable cores
T103	79159	Transformer—Audio output transformer
T104	78203	Transformer—1st. pix I.F. grid complete with adjustable core
T105, T106, T107	76433	Transformer—1st., 2nd., and 3rd. pix I.F. transformer
T108	79143	Transformer—Vertical output transformer
T110	79145	Transformer—High voltage transformer
T111	79162	Transformer—Power transformer, 117 volts, 60 cycle
Z102	79156	Plate—I.F. picture plate complete (includes C121, C122, C123, C124, C125A, C125B, C126, C127, C133, C181, C182, L118, L119, R119, R120, R121, R122, R124, R125, R126, R127, R128)
	74594	Connector—2 contact male connector for power cord
	79138	Cover—Back cover for high voltage compartment
	76459	Grommet—Rubber grommet for 2nd. anode lead
	78218	Holder—Fuse holder
	61139	Holder—Tube holder for V117
	78215	Insulator—Polystyrene insulator for high voltage socket
	79150	Knob—Horizontal frequency tuning knob (brown maroon)
	79320	Lead—Anode lead assembly complete
	79155	Plate—I.F. pix mounting plate
	79158	Shield—Side shield for high voltage compartment
	76972	Shield—Tube shield for V108A, B
	73584	Shield—Tube shield for V101, V102 & V107
	79154	Socket—Tube socket, 7 pin, miniature for V102
	73117	Socket—Tube socket, 7 pin, miniature, wafer for V103, V104, V105, V106, V107
	79153	Socket—Tube socket, 7 pin, miniature with jumper bar for V101
	68590	Socket—Tube socket, octal, for V111, V115
	77645	Socket—Tube socket, octal, wafer for V112
	31251	Socket—Tube socket, octal, wafer for V113, V117
	74834	Socket—Tube, kine tube socket assembly
	76971	Socket—Tube socket, 9 pin, miniature wafer for V108A, B, V109A, B, V110A, B
	78243	Strap—Polystyrene strap for 2nd. anode lead

SYMBOL NO.	STOCK NO.	DESCRIPTION
	79239	Washer—Spring washer for horizontal frequency coil knob
	78219	Washer—#8 vellutex washer for high voltage insulator
		SPEAKER ASSEMBLIES 971636-1W RL101C5 RMA-274 (FOR MODELS 21S348K,KU; 21S355K,KU; 21S357K,KU)
	77000	Speaker—5" P.M. speaker complete with cone and voice coil (3.2 ohms)
		SPEAKER ASSEMBLIES 971490-3W RL105-E11 RMA-274 (FOR MODELS 21S362K,KU; 21S367K,KU; 21S369K,KU)
	75024	Cone—Cone and voice coil (3.2 ohms)
	77872	Speaker—8" P.M. speaker complete with cone and voice coil (3.2 ohms)
		NOTE: If stamping on speaker in instruments does not agree with above speaker number, order replacement parts by referring to Model number of instrument, number stamped on speaker and full description of part required.
		MISCELLANEOUS
	79214	Back—Cabinet back complete with power cord for Models 21S348K, 21S355K, 21S357K
	79233	Back—Cabinet back complete with power cord for Models 21S348KU, 21S355KU, 21S357KU
	79236	Back—Cabinet back complete with power cord for Models 21S362K, 21S367K, 21S369K
	79237	Back—Cabinet back complete with power cord for Models 21S362KU, 21S367KU, 21S369KU
	79229	Bracket—Channel marker escutcheon lamp bracket for Models 21S348K, KU; 21S355K, KU; 21S357K, KU
	79297	Bracket—Channel marker escutcheon lamp bracket for Models 21S362K, KU; 21S367K, KU; 21S369K, KU
	X3372	Cloth—Grille cloth for mahogany grain instruments for Models 21S362K, KU; 21S367K, KU
	X3371	Cloth—Grille cloth for oak instruments for Models 21S369K, KU
	79217	Cover—Cover and case assembly—ebony—for hidden controls for 21S348K, KU
	79218	Cover—Cover and case assembly—maroon—for hidden controls for 21S348K, KU
	79232	Cover—Cover and case assembly—maroon—for hidden controls for 21S355K, KU; 21S362K KU; 21S367K, KU
	79225	Cover—Cover and case assembly—oak—for hidden controls for 21S357K, KU; 21S369K, KU
	74956	Cushion—For deflection yoke hood assembly
	78309	Cushion—Rubber cushion for dust sealing the kinescope for maroon and ebony instruments
	79238	Cushion—Rubber cushion for safety glass for Models 21S362K, KU; 21S367K, KU; 21S369K, KU
	79239	Cushion—Rubber cushion for safety glass for Models 21S362K, KU; 21S367K, KU; 21S369K, KU
	77770	Cushion—Safety glass retainer cushion
	78386	Decal—Brightness, volume, fine tuning controls and channel selector switch function decal for mahogany grain instuments for Models 21S362K, KU; 21S367K, KU
	78389	Decal—Brightness, volume, fine tuning controls and channel selector switch function decal for oak instruments for Models 21S369K, KU
	79076	Escutcheon—Channel marker escutcheon for Model 21S348K
	79219	Escutcheon—Channel marker escutcheon for Models 21S348KU, 21S355KU, 21S357KU, 21S362KU, 21S367KU, 21S369KU
	78870	Escutcheon—Channel marker escutcheon for Models 21S355K, 21S357K, 21S362K, 21S367K, 21S369K
	78345	Escutcheon—UHF channel marker escutcheon for instruments using KRK31 tuner unit

SYMBOL NO.	STOCK NO.	DESCRIPTION
	78329	Glass—Safety glass for Models 21S348K, KU
	79322	Glass—Safety glass for Models 21S355K, KU 21S357K, KU
	79235	Glass—Safety glass for 21S362K, KU; 21S367K, KU; 21S369K, KU
	79312	Grille—Metal grille for mahogany instruments for Models 21S362K, KU; 21S367K, KU
	79313	Grille—Metal grille for oak instruments for Models 21S369K, KU
	79234	Hood—Deflection yoke hood assembly
	79221	Knob—Channel selector knob—black—for ebony instruments for Models 21S348K, KU
	79222	Knob—Channel selector knob—brown—for maroon instruments for Models 21S348K, KU
	79230	Knob—Channel selector knob—brown—for maroon instruments for Models 21S355K, KU; 21S362K, KU; 21S367K, KU
	79226	Knob—Channel selector knob—medium beige—for oak & mahogany grain instruments for Models 21S357K, KU; 21S369K, KU
	79077	Knob—Fine tuning control knob—for ebony and maroon instruments for Model 21S348K
	79081	Knob—Fine tuning control knob for ebony and maroon instruments for Model 21S348KU
	77707	Knob—Fine tuning knob—brown—for maroon instruments for Models 21S355K, 21S362K, 21S367K
	78343	Knob—Fine tuning control knob—brown—for maroon instruments for Models 21S355KU, 21S362KU, 21S367KU
	77717	Knob—Fine tuning control knob—medium beige—for oak instruments for Models 21S357K, 21S369K
	78432	Knob—Fine tuning control knob—medium beige—for oak instruments for Models 21S357KU, 21S369KU
	79080	Knob—Picture control knob for ebony & maroon instruments for Models 21S348K, KU
	77709	Knob—Picture control knob for maroon instruments—brown—for Model 21S355K, KU; 21S362K, KU; 21S367K, KU

Models 21-S-526(U) "Carrol" Mahogany, Oak

Models 21-S-537(U) "Bromley" Mahogany, Blonde Tropical Hardwood

GENERAL DESCRIPTION

All models are "21 inch" television receivers. Models without a "U" designation in the model number are receivers with VHF only and feature full 12 channel VHF coverage. Models with the "U" designation in the model number are UHF/VHF receivers and feature full 12 channel VHF coverage plus any UHF channels desired. All models have an auxiliary audio input jack to permit the use of an external record playing attachment except Models 21-S-501(U), 21-S-502(U) and 21-S-518(U). Models 21-S-523(U) and 21-S-537(U) feature dual loudspeakers and Models 21-S-526(U) incorporate three loudspeakers for sound reproduction.

ELECTRICAL AND MECHANICAL SPECIFICATIONS

PICTURE SIZE .... 227 square inches on a 21ZP4A or 21ZP4B Kinescope

TELEVISION R-F FREQUENCY RANGE

Models 21-S-501 to 21-S-537 Incl.

All 12 VHF channels .... 54 mc. to 88 mc., 174 mc. to 216 mc.

Models 21-S-501U to 21-S-537U Incl.

Any of 70 UHF channels .... 470 mc. to 890 mc.
Any of 12 VHF channels .. 54 mc. to 88 mc., 174 mc. to 216 mc.

INTERMEDIATE FREQUENCIES

Picture I-F Carrier Frequency .... 45.75 mc.
Sound I-F Carrier Frequency .... 41.25 mc.

POWER RATING .... 175 watts

AUDIO POWER OUTPUT RATING .... 1.5 watts max.

VIDEO RESPONSE .... to 3.2 mc.

SCANNING .... Interlaced, 525 line

HORIZONTAL SWEEP FREQUENCY .... 15,750 cps.

VERTICAL SWEEP FREQUENCY .... 60 cps.

FRAME FREQUENCY (Picture Repetition Rate) ..... 30 cps.

RCA TUBE COMPLEMENT

Tube Used — Function

Tuner KRK22D (Models with VHF only)

(1) RCA 6BQ7A .... R-F Amplifier
(2) RCA 6X8 .... R-F Oscillator and Mixer

Tuner KRK30 (UHF/VHF Models)

(1) RCA 6AF4 .... UHF Oscillator
(2) RCA 6BQ7A .... { VHF R-F Amplifier / UHF I-F Amplifier }
(3) RCA 6X8 .... { VHF R-F Oscillator & Mixer / UHF I-F Amplifier }

A K3D or 1N82 crystal is used as the UHF mixer

All Models

(1) RCA 6CB6 .... 1st Picture I-F Amplifier
(2) RCA 6CB6 .... 2nd Picture I-F Amplifier
(3) RCA 6CB6 .... 3rd Picture I-F Amplifier
(4) RCA 6X8 .... 1st Video Amplifier and 1st Sync.
(5) RCA 12AU7 .... Video Output & AGC
(6) RCA 6AU6 .... Sound I-F Amplifier
(7) RCA 6AL5 .... Ratio Detector
(8) RCA 6AV6 .... 1st Audio Amplifier
(9) RCA 6AS5 .... Audio Output
(10) RCA 12AU7 .... Vert. Osc. and Disch. & Sync. Output
(11) RCA 6K6GT .... Vertical Sweep Output
(12) RCA 6SN7GT Horizontal Sweep Oscillator and Control
(13) RCA 6BQ6GT .... Horizontal Sweep Output
(14) RCA 6AX4GT .... Damper
(15) RCA 1B3-GT/8016 .... High Voltage Rectifier
(16) RCA 21ZP4B .... Kinescope
RCA 21ZP4A (Models 21-S-501(U) & 21-S-502(U) only)
(17) RCA 5U4G .... Rectifier

A crystal diode is used for the Picture 2nd Detector

CHASSIS DESIGNATIONS

CHASSIS	TUNER	KINE-SCOPE	MODELS	LOUD-SPEAKERS
KCS88B	KRK22D	21ZP4B	21-S-503 21-S-504 21-S-505 21-S-506 21-S-517	1–5 inch
			21-S-519 21-S-521 21-S-522	1–8 inch
			21-S-525 21-S-5251 21-S-5252	1–5 inch
KCS88C (No Phono Jack)	KRK22D	21ZP4A 21ZP4A 21ZP4B	21-S-501 21-S-502 21-S-518	1–5 inch 1–5 inch 1–8 inch

			21-S-525U 21-S-5251U 21-S-5252U	1–5 inch
KCS88K (No Phono Jack)	KRK30	21ZP4A 21ZP4A 21ZP4B	21-S-501U 21-S-502U 21-S-518U	1–5 inch 1–5 inch 1–8 inch
KCS88L	KRK30	21ZP4B	21-S-537U	2–8 inch
KCS88M	KRK30	21ZP4B	21-S-526U	1–8 inch 2–5 inch
KCS88V (Vertical Mounting)	KRK22D	21ZP4B	21-S-523	2–8 inch
KCS88VA (Vertical Mounting)	KRK30	21ZP4B	21-S-523U	2–8 inch

NOTE: Any chassis designation with an "X" stamped after the final letter indicates plate assembly Z102 is used, instead of printed circuit PC102, for picture I-F section. Refer to partial schematic

UNPACKING.—These receivers are shipped complete in cardboard cartons. The kinescope is shipped in place in the receiver.

Take the receiver out of the carton and remove all packing material.

Make sure that all tubes are in place and are firmly seated in their sockets.

Check to see that the kinescope high voltage lead clip is in place.

Plug a power cord into the 115 volt ac power source and into the receiver interlock receptacle.

ANTENNA INPUT
Models 21-S-501 to 21-S-537 Incl.

The KRK22D tuner unit is designed for VHF reception only. A 300 ohm antenna input is provided, however, by removing the jumper between pins 1 and 5 of the matching unit input jack, a 72 ohm coaxial line may be used. Jumpers must be added between pins 1 and 4 and also between pins 2 and 5 as shown in figure 26. The coaxial line is then fastened directly to pins 1 and 5, with the shield connected to pin 1 and the center conductor to pin 5.

Models 21-S-501U to 21-S-537U Incl.

The KRK30 tuner unit is designed for UHF-VHF reception with 300 ohm inputs provided for UHF and VHF use. When using a UHF antenna only or a VHF antenna only connect the single transmission line to the proper receiver antenna terminals. Do not connect the terminal board jumper W105. (Refer to figure 27.)

When a combination UHF-VHF antenna is used, connect the transmission line to the VHF terminals on the terminal board. Connect the jumper W105 to the UHF terminals as shown in figure 27.

Signals from separate UHF and VHF antennas may be fed to the tuner. To do this connect the individual transmission lines to their respective terminals on the terminal board. Do not connect the jumper W105. Where a "crossover network" is employed to match the two separate antennas to a common 300 ohm line, connect the line to the VHF terminals. Connect the jumper W105 to the UHF terminals on the terminal board.

CHECK FOR PROPER OPERATION.—Turn the power switch to the "on" position and check the operation of the receiver.

Each unit has been completely and accurately adjusted at the factory and should operate normally at this point. However, a check of all the various functions should be performed. Adjustment should be made as outlined below, only where an indication of improper operation is evident.

ION TRAP MAGNET ADJUSTMENT.—Set the ion trap magnet approximately in the position shown in Figure 3. Starting from this position immediately adjust the magnet by moving it forward or backward at the same time rotating it slightly around the neck of the kinescope for the brightest raster on the screen. Reduce the brightness control setting until the raster is slightly above average brilliance. Turn the focus control (shown in Figure 3) until the line structure of the raster is clearly visible. Readjust the ion trap magnet for maximum raster brilliance. The final touches of this adjustment should be made with the brightness control at the maximum clockwise position with which good line focus can be maintained.

DEFLECTION YOKE ADJUSTMENT.—If the lines of the raster are not horizontal or squared with the picture mask, rotate the deflection yoke until this condition is obtained. Tighten the knurled yoke adjustment nuts.

PICTURE ADJUSTMENTS.—It will now be necessary to obtain a test pattern or picture in order to make further adjustments.

When the Horizontal Oscillator and AGC System are operating properly, it should be possible to sync the picture at this point. However, if the AGC control is misadjusted, and the receiver is overloading, it may be impossible to sync the picture.

If the receiver is overloading, turn R149 on the rear apron (see Figure 4) counter-clockwise until the set operates normally and the picture can be synced.

CHECK OF HORIZONTAL OSCILLATOR ADJUSTMENT.—Turn the horizontal hold control to the extreme clockwise position. The picture should be out of sync, with approximately twelve bars slanting downward to the right. Turn the control counter-clockwise slowly. The number of diagonal black bars will be gradually reduced and when only 1½ to 3 bars sloping downward to the right are obtained, the picture will pull into sync upon slight additional counter-clockwise rotation of the control. The picture should remain in sync for approximately two full turns of additional counter-clockwise rotation of the control. Continue counter-clockwise rotation until the picture falls out of sync. Rotation beyond fall-out position should produce between 2 and 5 bars before interrupted oscillation (motorboat occurs). Interrupted oscillation (motorboat) should be reached before full counter-clockwise rotation.

When the receiver passes the above checks and the picture is normal and stable, the horizontal oscillator is properly aligned. Skip "Adjustment of Horizontal Oscillator" and proceed with "Focus Magnet Adjustment."

ADJUSTMENT OF HORIZONTAL OSCILLATOR.—If in the above check the receiver failed to hold sync over two full turns of counter-clockwise rotation of the control from the pull-in point, it will be necessary to make the following adjustments.

Turn the horizontal drive trimmer C171 fully clockwise, then counter-clockwise one full turn. Set the width coil L111 with the stud flush with the inside edge of the chassis. Set the sine wave coil L121 fully counter-clockwise.

Adjustment of the horizontal frequency control in the counter-clockwise direction will show a multiple number of bars before "motorboat" occurs. Adjust the sine wave coil L121 until 3 or 4 bars are present before "motorboat" occurs, when the horizontal frequency control is rotated counter-clockwise from the fall out point.

If it is impossible to sync the picture and the AGC system is in proper adjustment it will be necessary to align the Horizontal Oscillator by the method outlined in the alignment procedure on page

FOCUS MAGNET ADJUSTMENT.—The focus magnet should be adjusted so that there is approximately three-eighths inch of space between the rear plate of the yoke and the flat of the front face of the focus magnet. This spacing gives best average focus over the face of the tube.

The axis of the hole through the magnet should be parallel with the axis of the kinescope neck with the kinescope neck centered in the opening.

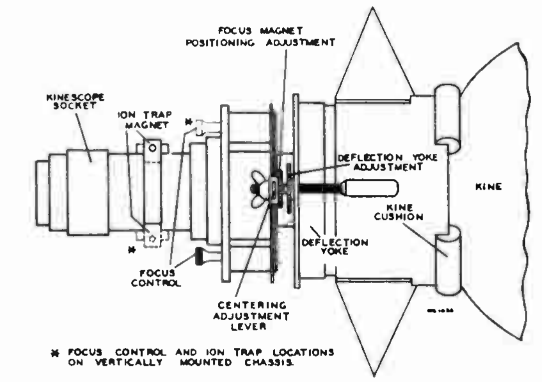

Figure 3—Yoke and Focus Magnet Adjustments

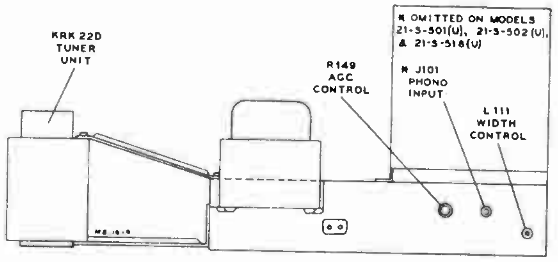

Figure 4—Rear Chassis Adjustments

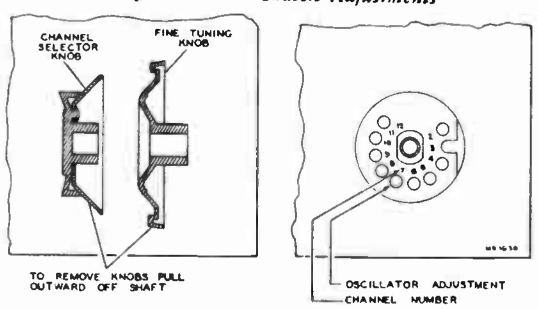

Figure 5—KRK22D R-F Oscillator Adjustments

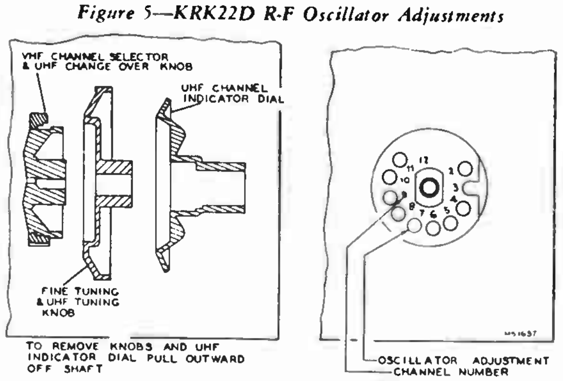

Figure 6—KRK30 VHF R-F Oscillator Adjustment

ALIGNMENT PROCEDURE

TEST EQUIPMENT.—To properly service the television chassis of these receivers, it is recommended that the following test equipment be available:

VHF Sweep Generator meeting the following requirements:

(a) Frequency Ranges
35 to 90 mc., 1 mc. to 12 mc. sweep width
170 to 225 mc., 12 mc. sweep width

(b) Output adjustable with at least .1 volt maximum.

(c) Output constant on all ranges.

(d) "Flat" output on all attenuator positions.

VHF Signal Generator to provide the following frequencies with crystal accuracy:

(a) Intermediate frequencies
4.5 mc., 39.25 mc., 41.25 mc., 43.5 mc., 45.75 mc., 47.25 mc.

(b) Radio frequencies

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
2	55.25	59.75	101
3	61.25	65.75	107
4	67.25	71.75	113
5	77.25	81.75	123
6	83.25	87.75	129
7	175.25	179.75	221
8	181.25	185.75	227
9	187.25	191.75	233
10	193.25	197.75	239
11	199.25	203.75	245
12	205.25	209.75	251
13	211.25	215.75	257

(c) Output of these ranges should be adjustable and at least .1 volt maximum.

VHF Heterodyne Frequency Meter with crystal calibrator if the signal generator is not crystal controlled.

UHF Sweep Generator with a frequency range of 470 mc. to 890 mc. RCA types 40A or 41A or their equivalent.

UHF Signal Generator to provide the following frequencies with crystal accuracy if RCA Type 41A is used.

Channel Number	Picture Carrier Freq. Mc.	Sound Carrier Freq. Mc.	Receiver R-F Osc. Freq. Mc.
14	471.25	475.75	517
15	477.25	481.75	523

83	885.25	889.75	931

Cathode Ray Oscilloscope.—An oscilloscope with a sensitivity of 5 millivolts per inch is required. A suitable pre-amplifier may be employed with oscilloscopes of lesser sensitivity.

Electronic Voltmeter.—A voltmeter with a 1.5 volt DC scale is required. RCA Senior "VoltOhmyst" or equivalent.

PICTURE I-F TRANSFORMER ADJUSTMENTS.—

Models 21-S-501 to 21-S-537 Incl.

Connect the i-f signal generator, in series with a 1500 mmf. ceramic capacitor, to the mixer grid test point TP2.

Connect the "VoltOhmyst" to the junction of R118, R146 and C120 and to ground. Turn the AGC control fully clockwise.

Obtain two 7.5 volt batteries capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across each. Connect the battery positive terminal of one to the chassis and the potentiometer arm to the junction of R118, R146 and C120. The second battery will be used later.

Set the bias to produce approximately —4.0 volt of bias at the junction of R118, R146 and C120.

Connect the "VoltOhmyst" to the junction of R129 and L103 and to ground.

Set the VHF signal generator to each of the following frequencies and peak the specified adjustment for maximum indication on the "VoltOhmyst." (Note: These transformers should be peaked with their cores at the ends of the coils nearest the chassis.) During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R129 and L103 with —4.0 volts of i-f bias at the junction of R118, R146 and C120.

44.5 mc. T107
45.5 mc. T106
43.0 mc. T105

Set the VHF signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at R129, L103. Use sufficient signal input to produce 3.0 volts of d-c on the meter when the adjustment is made.

47.25 mc. L102

(Note: Core should be at end of coil nearest chassis when properly adjusted.)

Models 21-S-501U to 21-S-537U Incl.

Connect the i-f signal generator in series with a 1500 mmf. ceramic capacitor, to the mixer grid test point TP2.

Connect the "VoltOhmyst" to the junction of R118, R146 and C120.

Turn the AGC control fully clockwise.

Obtain a 7.5 volt battery capable of withstanding appreciable current drain and connect the ends of a 1,000 ohm potentiometer across it. Connect the battery positive terminal to chassis and the potentiometer arm to the junction R118, R146 and C120. Adjust the potentiometer for —4.0 volts indication on the "VoltOhmyst."

Connect the "VoltOhmyst" to the junction of R129 and L103 and to ground.

Set the VHF generator to each of the following frequencies and with a thin fiber screwdriver tune the specified adjustment for maximum indication on the "VoltOhmyst." In each instance the generator should be checked against a crystal calibrator to insure that the generator is on frequency.

During alignment, reduce the input signal if necessary in order to produce 3.0 volts of d-c at R129 and L103 with —4.0 volts of i-f bias at the junction of R118, R146 and C120.

44.5 mc. T107
45.5 mc. T106
43.0 mc. T105

(Note: Peak transformers with cores at end of coils nearest chassis.)

Set the signal generator to the following frequency and adjust the picture i-f trap for minimum d-c output at junction of R129 and L103. Use sufficient signal input to produce 3.0 volts of d-c on the meter when adjustment is made.

47.25 mc. L102

(Note: Core should be at end of coil nearest chassis when properly adjusted.)

SWEEP ALIGNMENT OF PICTURE I-F.—

Models 21-S-501 to 21-S-537 Incl.

To align the mixer plate circuit, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Clip a 330 ohm resistor between pin 1 of V107 and ground.

Preset C116 to minimum capacity.

Adjust the bias box potentiometer to obtain —4.0 volts of bias as measured by a "VoltOhmyst" at the junction of R118, R146 and C120.

Connect a 180 ohm composition resistor from pin 5 of V105 to pin 6 of V105. Connect the oscilloscope diode probe to pin 5 of V105 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T1 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 to 0.5 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

Adjust C116 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 9. Maximum allowable tilt is 20%.

Disconnect the diode probe, the 180 ohm and the 330 ohm resistors.

Connect the oscilloscope to the junction of R129 and L103.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 to 5.0 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

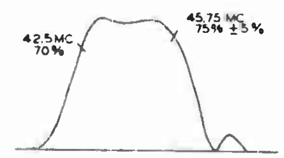

Figure 9—KRK22D T1 and T104 Response

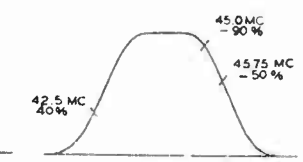

Figure 10—Overall I-F Response with KRK22D

Retouch T105, T106 and T107 to obtain the response shown in Figure 10.

Increase sweep output ten times and check attenuation at 41.25 mc. Adjust T105 and T107 to set 41.25 mc. between 25 and 35 times down with curve as shown in Figure 10.

Move the sweep generator to the antenna terminals. Connect —3.0 volts bias to pin 5 of V103. Adjust T106 and T107 slightly to correct for any overall tilt while switching from channel to channel.

Models 21-S-501U to 21-S-537U Incl.

To align the mixer plate circuit, connect the sweep generator to the mixer grid test point TP2, in series with a 1500 mmf. ceramic capacitor. Use the shortest leads possible, with not more than one inch of unshielded lead at the end of the sweep cable. Connect the sweep ground lead to the top of the tuner.

Set the channel selector switch to channel 4.

Clip a 330 ohm resistor between pin 1 of V107 and ground.

Preset C116 to minimum capacity.

Adjust the bias box potentiometer to obtain —4.0 volts of bias as measured by a "VoltOhmyst" at the junction of R118, R146 and C120.

Connect a 180 ohm composition resistor from pin 5 of V105 to pin 6 of V105. Connect the oscilloscope diode probe to pin 5 of V105 and to ground.

Couple the signal generator loosely to the diode probe in order to obtain markers.

Adjust T2 (top) and T104 (top) for maximum gain and with 45.75 mc. at 75% of maximum response.

Set the sweep output to give 0.3 to 0.5 volt peak-to-peak on the oscilloscope when making the final touch on the above adjustment.

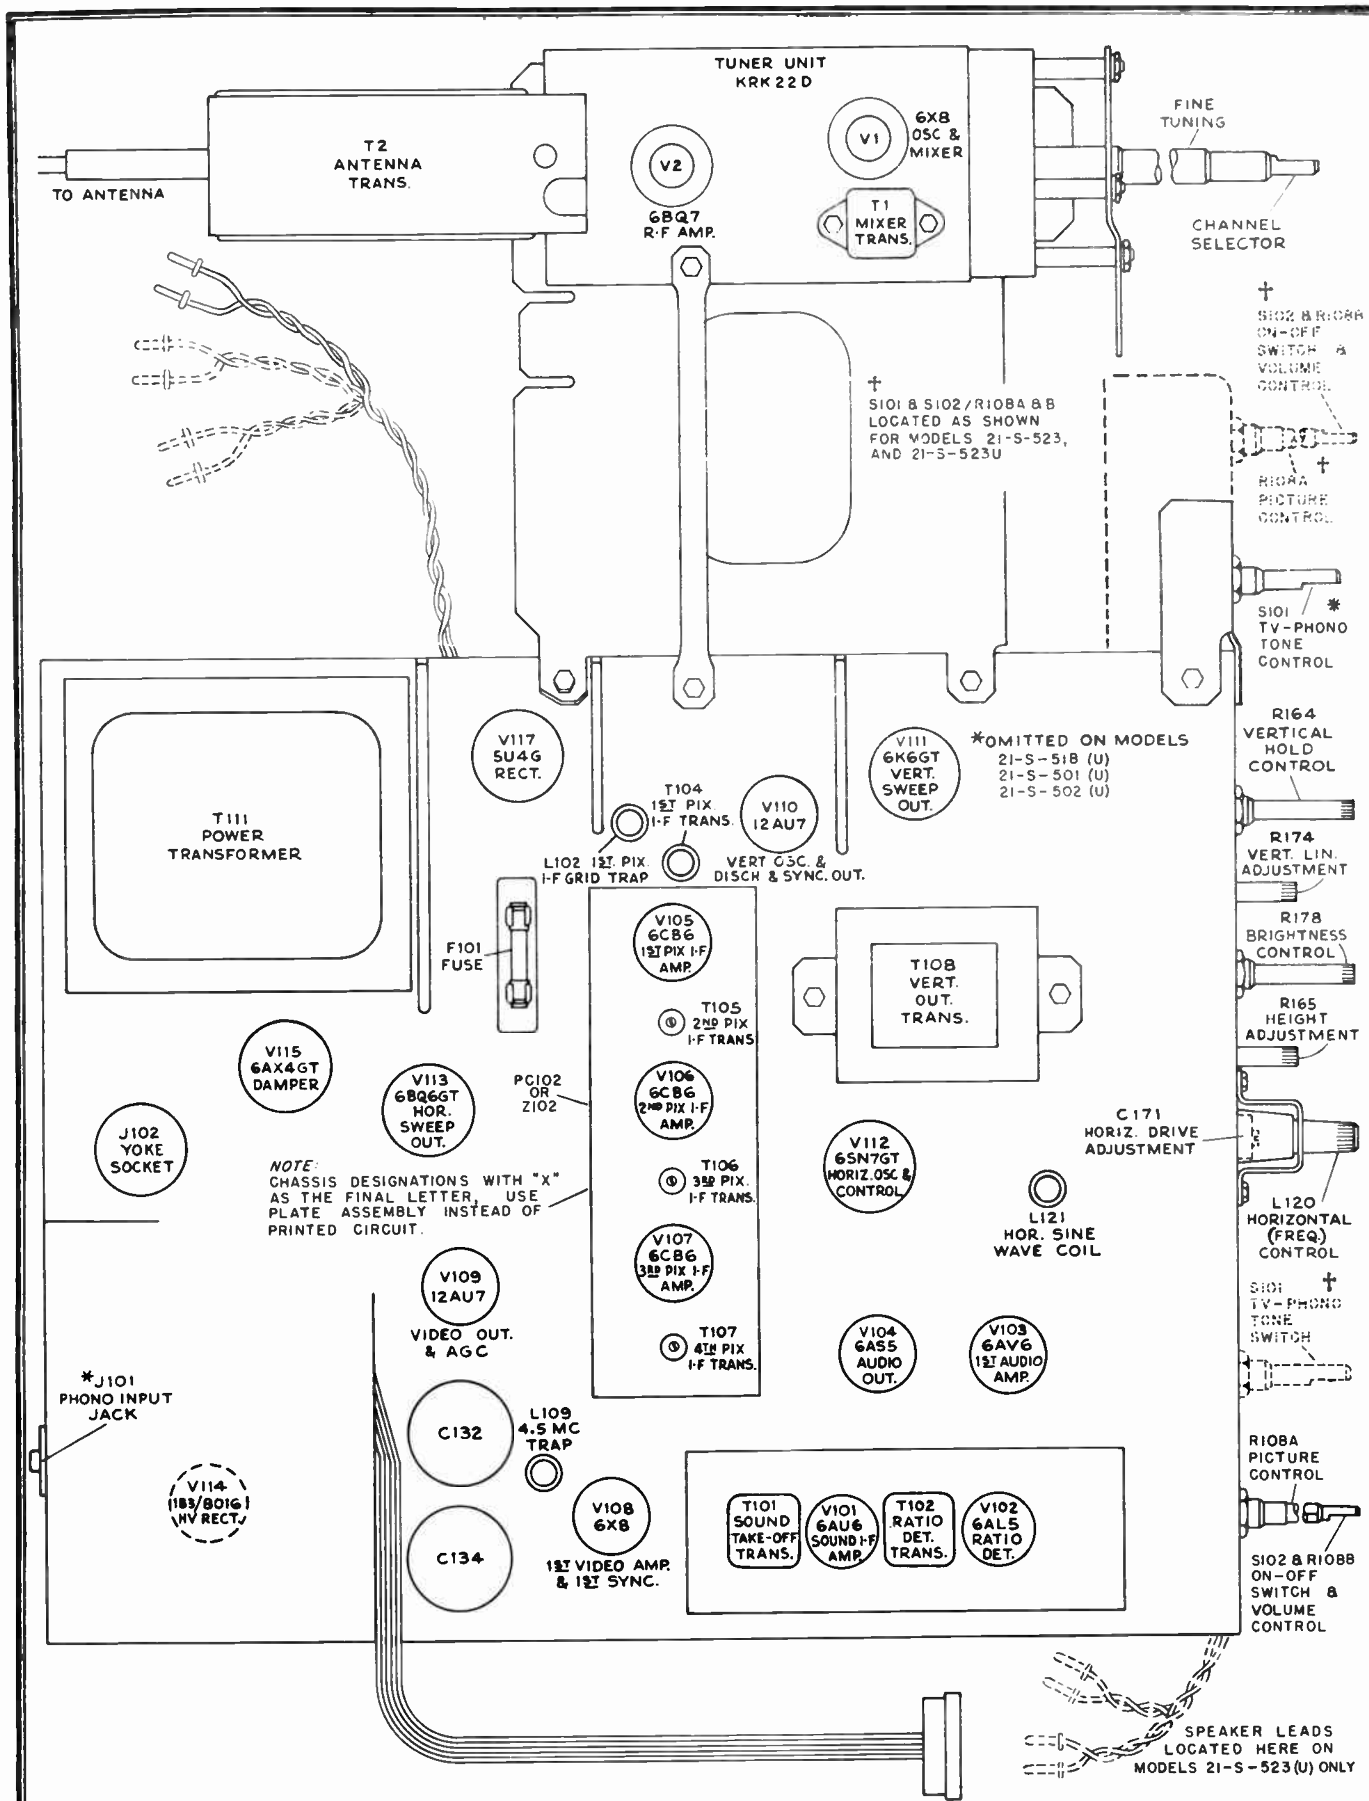

Figure 7—Chassis Top View (shown with KRK22D Tuner)

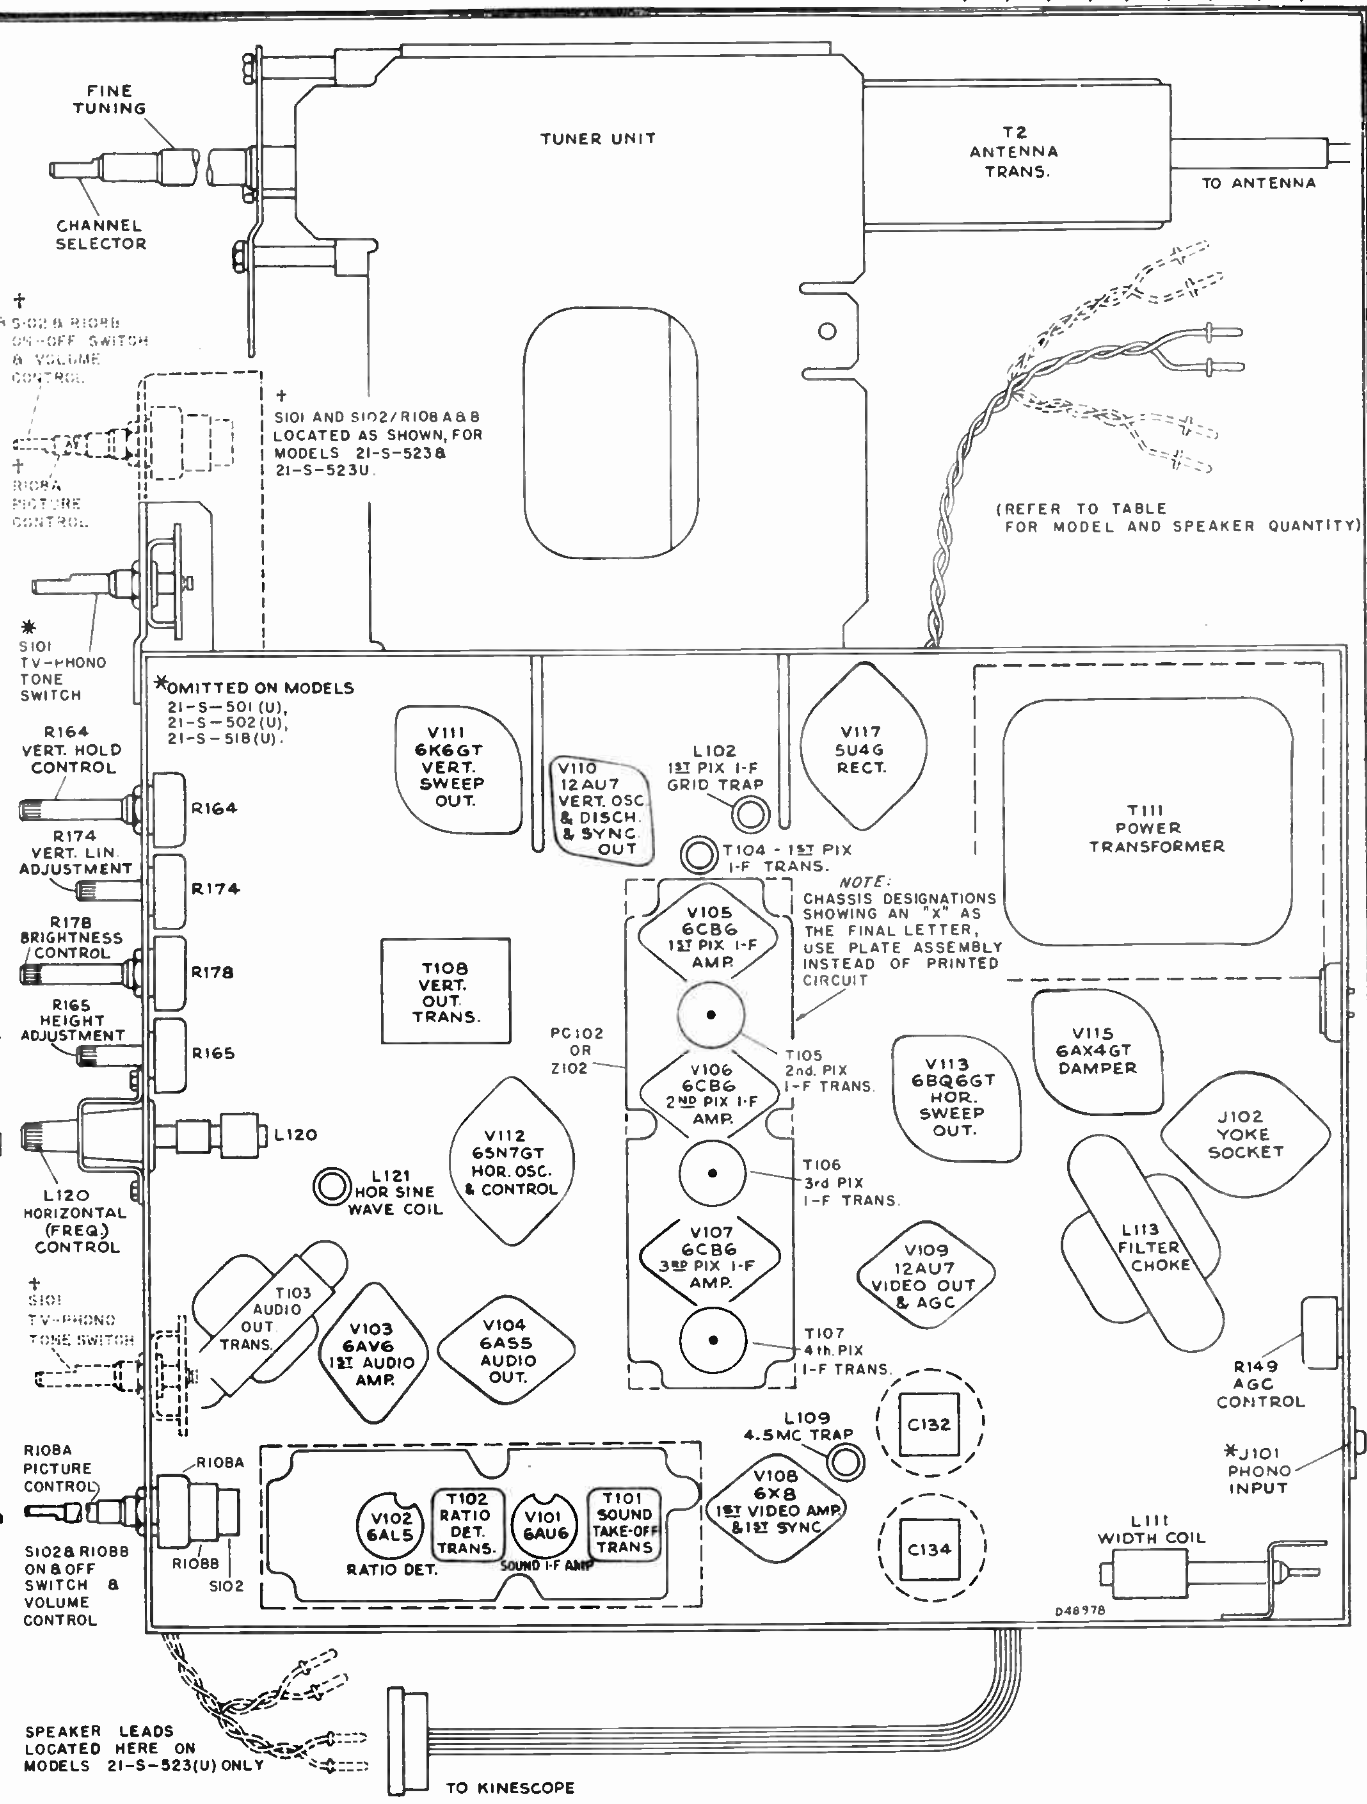

Figure 8—Chassis Bottom View (shown with KRK22D Tuner)

Adjust C116 until 42.5 mc. is at 70% response with respect to the low frequency shoulder of the curve as shown in Figure 11. Maximum allowable tilt is 20%.

Disconnect the diode probe, the 180 ohm and the 330 ohm resistors.

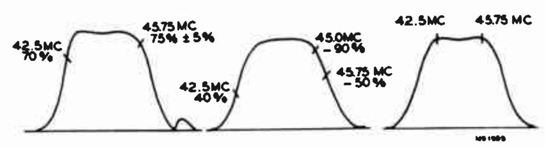

Figure 11—KRK30 T2 and T104 Response

Figure 12—Overall I-F Response with KRK30

Figure 13—KRK30 L9 and C308 I-F Response

Connect the oscilloscope to the junction of R129 and L103.

Leave the sweep generator connected to the mixer grid test point TP2 with the shortest leads possible.

Adjust the output of the sweep generator to obtain 3.0 to 0.5 volts peak-to-peak on the oscilloscope.

Couple the signal generator loosely to the grid of the first pix i-f amplifier. Adjust the output of the signal generator to produce small markers on the response curve.

Retouch T105, T106 and T107 to obtain the response shown in Figure 12.

Increase sweep output ten times and check attenuation at 41.25 mc. Adjust T105 and T107 to set 41.25 mc. between 30 and 40 times down with curve as shown in Figure 12.

To align the I-F amplifier circuit of the KRK30, connect the VHF sweep generator to the front terminal of the 1N82 crystal holder in series with a 1000 ohm resistor and a 1500 mmf. ceramic capacitor. Use the shortest leads possible, grounding the sweep ground lead to the tuner case.

To do this, remove the crystal cover and connect the resistor, after insulating the lead with tubing, to the crystal front terminal.

Set the UHF CHANGEOVER switch to the UHF position, and the UHF TUNING between channels 68 and 69 at 800 mc.

Connect a 180 ohm composition resistor and a 1500 mmf. capacitor in series between test point TP3 and ground with the capacitor connected to TP3 and the resistor to ground.

Connect the oscilloscope diode probe to the junction between the resistor and capacitor. (See Figure 20.)

Couple the VHF signal generator loosely to the diode probe in order to obtain markers.

Connect the potentiometer arm of the second bias supply to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the sweep generator to produce 0.5 volt or less peak-to-peak on the oscilloscope.

Adjust C308, on the UHF section, and L9, on the VHF section, of the tuner for maximum gain with 45.75 mc. and 42.5 mc. markers as shown in figure 13.

If necessary adjust L27 to place the 45.75 mc. marker at the peak of the curve. Adjust L43 for minimum tilt of the curve as shown in figure 13.

Remove the resistor, capacitor and diode probe from TP3 and connect the oscilloscope to the junction of R129 and L103. Use 3.0v peak-to-peak on the oscilloscope.

Connect the VHF sweep generator to the antenna terminals. Keep the AGC bias at —3.0 V and the I-F bias at —4.0 volts.

Couple the signal generator loosely to the grid of the first picture I-F amplifier.

Switch through all VHF channels and check for proper curve shape as in figure 12. Retouch T106 and T107 slightly to correct for any overall tilt that is essentially the same on all channels.

Disconnect the VHF sweep generator and connect the UHF sweep generator to the antenna terminals. Check on all UHF channels for proper wave shape as shown in figure 12, retouching C308 and L9 if necessary to correct any overall tilt.

Do not retouch T2, T104, T105, T106 or T107.

Remove the sweep and marker generators and the bias supplies.

KRK22D TUNER ALIGNMENT.—

Models 21-S-501 to 21-S-537 Incl.

A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C2 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T1 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" or T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP1 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L53 and C24 at the bottom of the FM trap L53.

Tune the signal generator to 43,5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C19 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C19 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C5 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst". The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C3 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C10. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f in" terminal of the signal generator. Adjust C3 to obtain an audible beat with the signal generator.

Turn C2 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

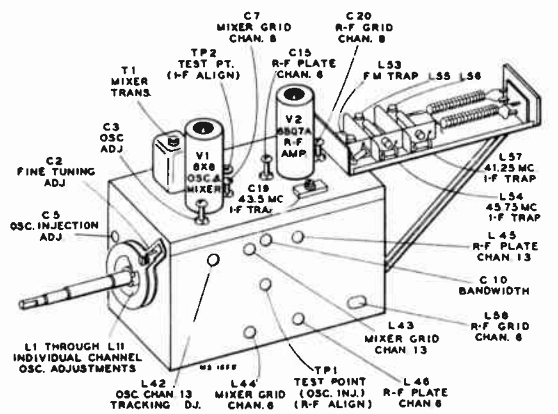

Figure 14— KRK22D Tuner Adjustments

Return the fine tuning control to the mechanical center of its range.

Note.—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C3, switch to channel 13 and adjust L42 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L11 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency on each channel. Then again on channel 8, adjust C3 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L42 and back to channel 8 and adjust C3.

Set the T1 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 15, to the input terminals of the antenna matching unit.

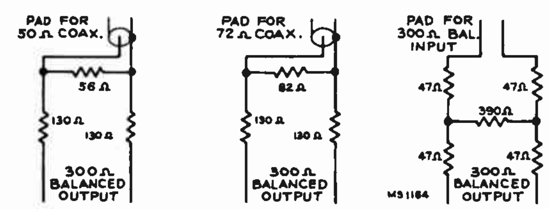

Figure 15—Sweep Attenuator Pads

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C7, C10, C15 and C20 for approximately correct curve shape, frequency, and band width as shown in figure 16.

The correct adjustment of C20 is indicated by maximum amplitude of the curve midway between the markers. C15 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C7 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C20 has been properly adjusted). C10 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C5 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C2, C7, C10 and C15 for proper response. Adjust C20 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

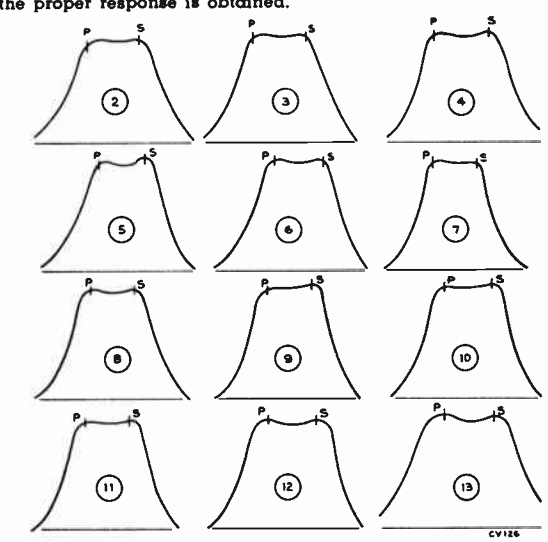

Figure 16—KRK22D Tuner R-F Responses

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L42 to obtain an audible beat. Slightly overshoot the adjustment of L42 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C2 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L43 and L45 for proper response as shown in figure 16.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C5, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L43 and L45 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C2 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C7, C10, C15 and C20 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C7 was adjusted in the recheck of channel 8 response. If the initial setting of the oscillator injection trimmer was far off, it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L5 for an audible beat. Adjust L44, L46 and L58 for proper curve shape as shown in figure 16. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C5 if necessary.

If C5 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C7 for correct curve shape and recheck C2 and C3 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 16 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

If the markers fail to fall within this requirement readjust L44, L46 and L58 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 16 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C15, C7, or C10 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L42 for an audible beat with the signal generator.

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

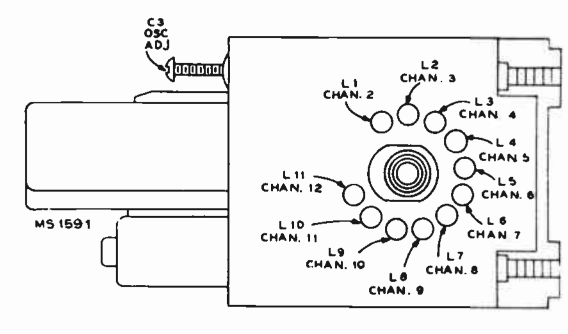

Figure 17—KRK22D Tuner Oscillator Adjustments

KRK22D or KRK30 ANTENNA MATCHING UNIT ALIGNMENT.—The antenna matching unit is accurately aligned at the factory. Adjustment of this unit should not be attempted in the customer's home since even slight misalignment may cause serious attenuation of the signal especially on channel 2. The r-f unit is aligned with a particular antenna matching transformer in place. If for any reason, a new antenna matching transformer is installed, the r-f unit should be re-aligned.

The F-M Trap which is mounted in the antenna matching unit may be adjusted without adversely affecting the alignment of the unit.

To align the antenna matching unit disconnect the lead from the F-M trap L53 (L5) to the channel selector switch S4 (S1E).

With a short jumper, connect the output of the matching unit through a 1000 mmf. capacitor to the grid of the second pix i-f amplifier, pin 1 of V107.

Replace the cover on the matching unit while making all adjustments.

Remove the first pix i-f amplifier tube V106.

Connect the positive terminal of a bias box to the chassis and the potentiometer arm to the junction of R118, R146 and C120. Set the potentiometer to produce approximately —5.0 volts of bias at the junction of R118, R146 and C120.

Connect an oscilloscope to the junction of R129 and L103 and set the oscilloscope gain to maximum.

Connect a VHF signal generator to the antenna input terminals. Modulate the signal generator 30% with an audio signal.

Tune the signal generator to 45.75 mc. and adjust the generator output to give an indication on the oscilloscope. Adjust L54 (L4) in the antenna matching unit for minimum audio indication on the oscilloscope.

Tune the signal generator to 41.25 mc. and adjust L57 (L1) for minimum audio indication on the oscilloscope.

Remove the jumper from the output of the matching unit.

Connect a 300 ohm ½ watt composition resistor from L53 (L5) to ground, keeping the leads as short as possible.

Connect an oscilloscope low capacity crystal probe from L53 (L5) to ground. The sensitivity of the oscilloscope should be approximately 0.03 volts per inch. Set the oscilloscope gain to maximum.

Connect the VHF sweep generator to the matching unit antenna input terminals. In order to prevent coupling reactance from the sweep generator into the matching unit, it is advisable to employ a resistance pad at the matching unit terminals. Figure 15 shows three different resistance pads for use with sweep generators with 50 ohm co-ax output, 72 ohm co-ax output or 300 ohm balanced output. Choose the pad to match the output impedance of the particular sweep employed.

Connect the signal generator loosely to the matching unit antenna terminals.

Set the sweep generator to sweep from 45 mc. to 54 mc. With RCA Type WR59A sweep generators, this may be accomplished by retuning channel number 1 to cover this range. With WR59B sweep generators this may be accomplished by retuning channel number 2 to cover the range. In making these adjustments on the generator, be sure not to turn the core too far clockwise so that it becomes lost beyond the core retaining spring.

Adjust L55 (L3) and L56 (L2) to obtain the response shown in figure 18. L55 (L3) is most effective in locating the position of the shoulder of the curve at 52 mc. and L56 (L2) should be adjusted to give maximum amplitude at 53 mc. and above consistent with the specified shape of the response curve. The adjustments in the matching unit interact to some extent. Repeat the above procedure until no further adjustments are necessary.

Restore the connection between L53 (L5) and S4 (S1E). Replace V106.

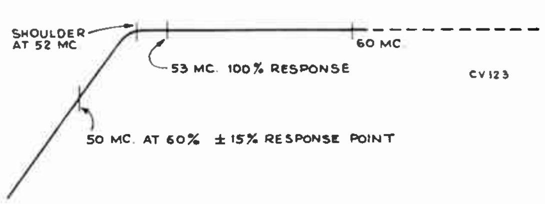

Figure 18—KRK22D or KRK30 Antenna Matching Unit Response

KRK30 TUNER ALIGNMENT

Models 21-S-501U to 21-S-537U Incl.

VHF ALIGNMENT.—A tuner unit which is operative and requires only touch up adjustments, requires no presetting of adjustments. For such units, skip the remainder of this paragraph. For units which are completely out of adjustment, preset C27 all the way out. Set channel 7 to 13 oscillator slugs one turn from tight. Turn T2 slug all the way out. Do not change any of the adjustments in the antenna matching unit.

Disconnect the link from terminals "A" and "B" of T104 and terminate the link with a 39 ohm composition resistor.

Turn the receiver channel selector switch to channel 2.

The 43.5 mc. trap is adjusted with zero bias. To insure that the bias will remain constant, take a clip lead and short circuit the AGC terminal of the tuner at the terminal board to ground.

Connect the oscilloscope to the test point TP2 on top of the tuner unit. Set the oscilloscope to maximum gain.

Connect the output of the VHF signal generator to the output of the antenna matching unit at the junction of L5 and C4 at the bottom of the FM trap L5.

Tune the signal generator to 43.5 mc. and modulate it 30% with a 400 cycle sine wave. Adjust the signal generator for maximum output.

Adjust C33 on top of the tuner, for minimum 400 cycle indication on the oscilloscope. If necessary, this adjustment can be retouched in the field to provide additional rejection to one specific frequency in the i-f band pass. However, in such cases, care should be taken not to tune C33 into channel 2, thereby reducing sensitivity on channel 2.

Connect the potentiometer arm of one of the bias supplies to the AGC terminal on the tuner and ground the battery positive terminal to the tuner case. Adjust the bias potentiometer to produce —3.0 volts of bias, as measured by the "VoltOhmyst" at the AGC terminal on the tuner.

Set the channel selector switch to channel 8.

Preset C22 to read —3.0 volts at the test point TP1, as read on the "VoltOhmyst." The limits for oscillator injection voltage are 2 volts minimum and not exceeding a maximum of 5.5 volts.

Turn the fine tuning control fully clockwise.

Adjust C25 for proper oscillator frequency, 227 mc. This may be done in several ways. The easiest way and the way which will be recommended in this procedure will be to use the signal generator as a heterodyne frequency meter and beat the oscillator against the signal generator. To do this, tune the signal generator to 227 mc. with crystal accuracy. Insert one end of a piece of insulated wire into the tuner unit through the hole provided for the adjustment of C16. Be careful that the wire does not touch any of the tuned circuits as it may cause the frequency of the tuner oscillator to shift. Connect the other end of the wire to the "r-f" in terminal of the signal generator. Adjust C25 to obtain an audible beat with the signal generator.

Turn C27 clockwise until the beat note just begins to change, then turn one full turn in the same clockwise direction.

Return the fine tuning control to the mechanical center of its range.

NOTE:—If on some units, it is not possible to reach the proper channel 8 oscillator frequency by adjustment of C25, switch to channel 13 and adjust L49 to obtain proper channel 13 oscillator frequency as indicated in the table on page 8. Then, switch to channel 12 and adjust L60 to obtain proper channel 12 oscillator frequency. Continue down to channel 8, adjusting the appropriate oscillator trimmer to obtain the proper frequency of each channel. Then again on channel 8, adjust C25 to obtain proper channel 8 oscillator frequency. Switch back to channel 13 and readjust L49 and back to channel 8 and adjust C25.

Set the T2 core for maximum inductance (core turned counter-clockwise).

Connect the sweep generator through a suitable attenuator, as shown in figure 15 to the input terminals of the antenna matching unit.

Connect the signal generator loosely to the antenna terminals.

Set the sweep generator to cover channel 8.

Set the oscilloscope to maximum gain and use the minimum input signal which will produce a usable pattern on the oscilloscope. Excessive input can change oscillator injection during alignment and produce consequent misalignment even though the response as seen on the oscilloscope may look normal.

Insert markers of channel 8 picture carrier and sound carrier, 181.25 mc. and 185.75 mc.

Adjust C21, C16, C11 and C7 for approximately correct curve shape, frequency, and band width as shown in figure 19.

The correct adjustment of C7 is indicated by maximum amplitude of the curve midway between the markers. C11 tunes the r-f amplifier plate circuit and affects the frequency of the pass band most noticeably. C21 tunes the mixer grid circuit and affects the tilt of the curve most noticeably (assuming that C7 has been properly adjusted). C16 is the coupling adjustment and hence primarily affects the response band width.

Connect the "VoltOhmyst" to test point TP1. Adjust C22 to read —3.0 volts dc on the "VoltOhmyst" at TP1. Readjust C27, C21, C16 and C11 for proper response. Adjust C7 for maximum gain at midpoint of the curve. Repeat if necessary until the proper response is obtained.

Set the receiver channel switch to channel 13.

Adjust the signal generator to the channel 13 oscillator frequency 257 mc.

Turn the fine tuning control fully clockwise.

Adjust L49 to obtain an audible beat. Slightly overshoot the adjustment of L49 by turning the slug an additional turn in the same direction from the original setting, then reset the oscillator to proper frequency by adjusting C27 to again obtain the beat.

Set the sweep generator to channel 13.

From the signal generator, insert channel 13 sound and picture carrier markers, 211.25 mc. and 215.75 mc.

Adjust L36 and L20 for proper response as shown in figure 19.

Turn off the sweep and signal generators.

Connect the "VoltOhmyst" to the tuner test point TP1.

Check the oscillator injection voltage to be within limits as previously specified. Adjust if necessary to bring within range.

If it was necessary to readjust C22, turn the sweep and signal generators back on and recheck the channel 13 response. Readjust L36 and L20 if necessary.

Set the receiver channel selector switch to channel 8 and readjust C27 for proper oscillator frequency, 227 mc.

Set the sweep generator and signal generator to channel 8.

Readjust C21, C16, C11 and C7 for correct curve shape, frequency and band width.

Turn off the sweep and signal generators, switch back to channel 13 and check the oscillator injection voltage at TP1 if C21 was adjusted in the recheck of channel 8 response.

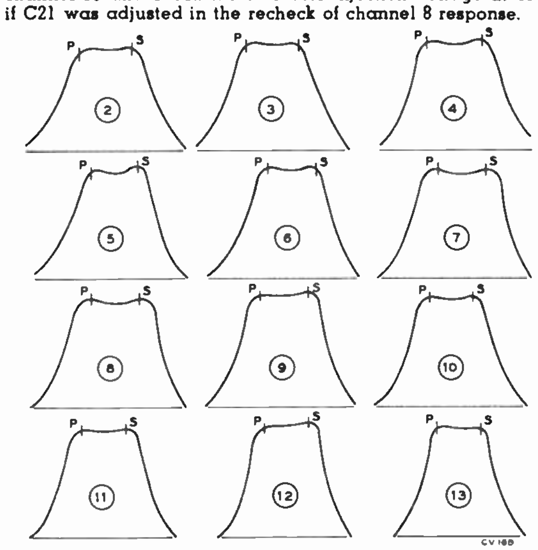

Figure 19—KRK30 Tuner VHF R-F Responses

If the initial setting of the oscillator injection trimmer was far off it may be necessary to adjust the oscillator frequency and response on channel 8, adjust the oscillator injection on channel 13 and repeat the tracking procedure several times before the proper setting is obtained.

Turn off the sweep generator and switch the receiver to channel 6.

Adjust the signal generator to the channel 6 oscillator frequency 129 mc.

Set the fine tuning control to the center of its mechanical range.

Adjust L54 for an audible beat. Adjust L14, L48 and L32 for proper curve shape as shown in figure 19. Recheck the oscillator injection voltage at TP1, to insure that it is within the limits specified. Readjust C22 if necessary.

If C22 required adjustment, switch the receiver and the signal generator to channel 8. Readjust C21 for correct curve shape and recheck C27 and C25 for proper oscillator frequency.

Check the response of channels 2 through 6 by switching the receiver channel switch, sweep generator and marker generator to each of these channels and observing the response and oscillator injection voltage obtained. See figure 19 for typical response curves. It should be found that all these channels have the proper response with the markers above 80% response.

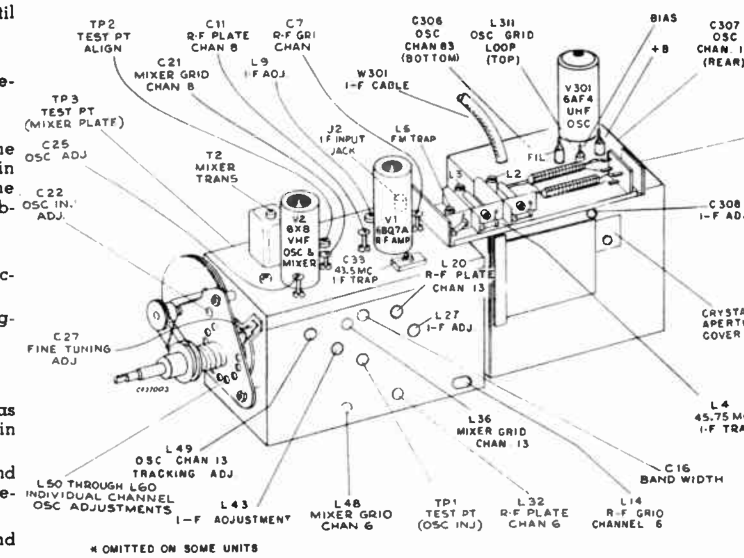

Figure 20—KRK30 Tuner Adjustments

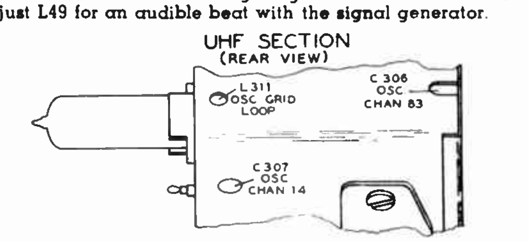
If the markers fail to fall within this requirement readjust L48 and L32 in order to obtain curves within the proper limits.

Switch the channel selector, signal generator and marker generator through channels 7 to 13 and observe the response curves, referring to figure 19 for proper wave shape. Check the injection voltage at each channel to be within limits. If necessary readjust C11, C21 or C16 to obtain the proper response.

With the receiver and signal generator on channel 13 adjust L49 for an audible beat with the signal generator.



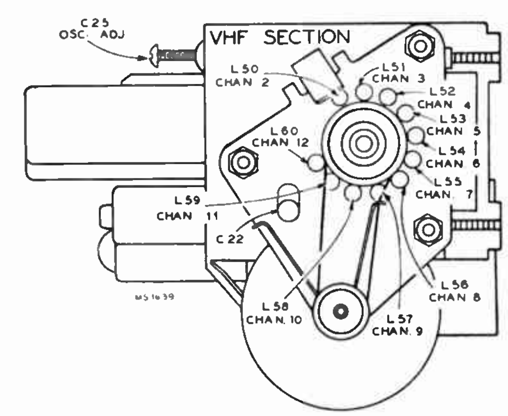


Figure 21—KRK30 Tuner Oscillator Adjustments

Adjust the oscillator to frequency on all channels by switching the receiver and the frequency standard to each channel and adjusting the appropriate oscillator slug to obtain the audible beat. It should be possible to adjust the oscillator to obtain the audible beat on each channel. Recheck the oscillator injection voltage on each channel to verify that the voltage is within the specified limits.

UHF ALIGNMENT R-F.—Alignment of the UHF section of the tuner may only be performed with the UHF section removed from the tuner assembly. RF adjustments require removal of the tuner shield which may only be done with the UHF tuner separate from its mounting.

I-F and oscillator adjustment may be accomplished without removing the tuner.

Connect a 100 ohm composition resistor between the center conductor of the I-F cable W301 and the tuner case.

Connect the oscilloscope to the center conductor of W301 at the 100 ohm resistor, employing the preamplifier if needed with the oscilloscope used. Ground the oscilloscope to the tuner case.

Connect the output of the UHF sweep generator, through a 300 ohm attenuator pad, to the antenna terminals and set the sweep generator to sweep channel 83, centered on 887.5 mc. Adjust the output of the sweep generator to full sweep width.

A test dial made to fit over the split gear on the tuner shaft is necessary for accurate alignment. Scribe marks at 0°, 5° and 164° should be marked on the test dial for reference. The 0° reference point is located with the capacitor plates fully meshed. With the stop pin on the tuner against the stop plate on the gear assembly the plates will be in the proper fully meshed position.

Rotate the tuning dial to the 164°, Channel 83, position.

Connect the VHF signal generator in series with a 1000 ohm resistor to the junction of W301 and L310. This may be done by inserting the lead from the resistor, which should be covered with insulated tubing, through the aperture provided for crystal removal. (See figure 20.) Insert markers for 41.25 mc., 43.5 mc. and 45.75 mc.

Connect the UHF marker generator loosely to the antenna terminals and insert a marker at 887.5 mc.

Adjust R-F trimmer capacitor tabs C304 and C305 for a maximum amplitude overcoupled response curve centered at 887.5 mc. as shown in figure 22(A).

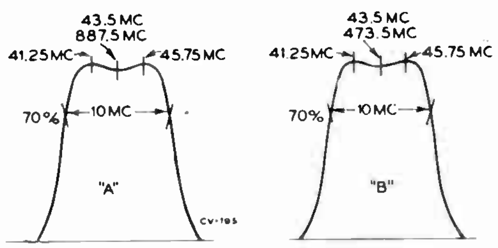

Figure 22—KRK30 Tuner UHF R-F Responses

Adjust the oscillator trimmer capacitor C306 until the 43.5 mc. marker coincides with the marker at 887.5 mc. The markers for 41.25 and 45.75 should be symmetrically located on the top of the response curve as in figure 22(A).

Set the UHF sweep and marker generators to 473.5 mc. Rotate the tuning dial to the 5°, Channel 14, position.

Adjust the oscillator trimmer C307 until the 43.5 mc. marker coincides with the 473.5 mc. marker, with the 41.25 and 45.75 markers as shown. The inductance loop L311 across the oscillator grid coil on some units, may be repositioned, if necessary, to bring the oscillator trimmer within range. Refer to figure 20 for location of the aperture for making this adjustment.

Repeat the above adjustments, as necessary, until the proper responses are obtained. Tune through the entire range and check the tracking. When perfectly tracked the three markers will be on the top of the response curves, however, mistracking to the extent that the 41.25 mc. and 45.75 mc. ride down the sides of the curves to a point not less than 70% will not seriously affect the alignment. Should the markers fall below this level, it will be necessary to knife the RF plates to correct the mistracking. The plates must be knifed with the shield cover removed. Always knife the plates while tuning lower in frequency to prevent affecting the tracking above the point of knifing. Check which section requires knifing by touching the plates with the knifing tool while observing the response, then proceed with the knifing of the proper section or of both sections if required.

Connect the "VoltOhmyst" between the center conductor of W301 and ground. Set the "VoltOhmyst" to the 1.5v. DC scale. Tune over the entire range observing the reading on the meter. A reading between .03 and .35 volts should be obtained. Voltages outside these limits are an indication of low B voltage, low or high crystal impedance or an oscillator tube outside allowable limits. This voltage is an indication of correct crystal current and may be varied by repositioning the flag L309 with respect to L303.

Connect the "VoltOhmyst" to the "bias" terminal of the tuner (refer to figure 20). A reading between 0.5 and 2.5 volts should be obtained. Readings above or below this range will cause crystal currents outside allowable limits and in such cases the oscillator tube should be replaced. Replacement of the oscillator tube will require recalibration at the high and low frequency ends of the band as previously outlined.

RATIO DETECTOR ALIGNMENT.—Set the signal generator at 4.5 mc. and connect it to the first video amplifier grid, pin 7 of V108A, in series with a .01 mfd. capacitor.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed. In such a case, connect the calibrator to the grid of the third pix i-f amplifier, pin 1 of V107.

Set the frequency of the calibrator to 45.75 mc. (pix carrier) and modulate with 4.5 mc. crystal. The 4.5 mc. signal will be picked off at pin 9 of V108A and amplified through the sound i-f amplifier.

Connect the "VoltOhmyst" to pin 7 of V102.

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst." (Peak with core at end of coil away from chassis.) Adjust the signal level from the signal generator for 5 volts on the "VoltOhmyst" when finally peaked. This is approximately the operating level of the ratio detector for average signals.

Connect the "VoltOhmyst" to the junction of R104 and C107.

Tune the ratio detector secondary T102 bottom core for zero d-c on the "VoltOhmyst." (Adjust with core at chassis end of coil.)

Repeat adjustments of T102 top for maximum d-c at pin 7 of V102 and T102 bottom for zero d-c at the junction of R104 and C107. Make the final adjustments with the signal input level adjusted to produce 5 volts d-c on the "VoltOhmyst" at pin 7 of V102.

SOUND TAKE-OFF ALIGNMENT.—Connect the signal generator to the first video amplifier grid, pin 7 of V108A.

As an alternate source of signal, the RCA WR39B or WR39C calibrator may be employed as above.

Connect the "VoltOhmyst" to pin 7 of V102.

Tune the T101 top core for maximum d c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

The output from the signal generator should be set to produce approximately 5 volts on the "VoltOhmyst" when the final touches on the above adjustment are made.

(Alternate Method for Ratio Detector and Sound I-F Alignment)

Set the signal generator at 4.5 mc. and connect it to the first video amplifier grid, pin 7 of V108A in series with a .01 mfd. capacitor.

Connect the "VoltOhmyst" to pin 7 of V102.

Tune the ratio detector secondary T102 bottom core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

Tune the ratio detector primary, T102 top core for maximum d-c output on the "VoltOhmyst." (Peak with core at end of coil away from chassis.) Adjust the signal level from the signal generator for 5 volts on the "VoltOhmyst" when finally peaked, when making the above adjustments.

Tune the T101 (top) core for maximum d-c on the "VoltOhmyst." (Peak with core at chassis end of coil.)

The output from the signal generator should be set to produce approximately 5 volts on the "VoltOhmyst" when the final touches on the T101 adjustment are made.

Connect the "VoltOhmyst" to the junction of R104 and C107.

Tune T102 bottom for zero d-c at the junction of R104 and C107. (Make adjustment with core at chassis end of coil.)

4.5 MC. TRAP ADJUSTMENT.—Connect the signal generator in series with a 1500 mmf. capacitor to pin 7 of V108A. Set the generator to 4.5 mc. and modulate it 30% with 400 cycles. Set the output to approximately 0.5 volt.

Short the third pix i-f grid to ground, pin 1, V107, to prevent noise from masking the output indication.

Connect the crystal diode probe of an oscilloscope to the plate of the video output, pin 6 of V109A.

Adjust the core of L109 for minimum output on the oscilloscope. (Make adjustment with core at chassis end of coil.)

Remove the short from pin 1, V107 to ground.

As an alternate method, this step may be omitted at this point in the alignment procedure and the adjustment made "on the air" after the alignment is completed.

If this is done, tune in a station and observe the picture on the kinescope. If no 4.5 mc. beat is present in the picture, when the fine tuning control is set for proper oscillator-frequency, then L109 requires no adjustment. If a 4.5 mc. beat is present, turn the fine tuning control slightly clockwise so as to exaggerate the beat and then adjust L109 for minimum beat.

AGC CONTROL ADJUSTMENT.—Disconnect all test equipment except the oscilloscope which should be connected to pin 6 of V109A.

Connect an antenna to the receiver antenna terminals.

Turn the AGC control fully counter-clockwise.

Tune in a strong signal and adjust the oscilloscope to see the video waveform.

Turn the AGC control clockwise until the tips of sync begin to be compressed, then counter-clockwise until no compression is obtained.

HORIZONTAL OSCILLATOR AND OUTPUT ALIGNMENT.—Normally the alignment of the horizontal oscillator is not considered to be a part of the alignment procedure, but since the oscillator waveform adjustment may require the use of an oscilloscope, it can not be done conveniently in the field. The waveform adjustment is made at the factory and normally should not require readjustment in the field. However, the waveform adjustment should be checked whenever the receiver is aligned.

Turn the horizontal drive trimmer C171 fully clockwise then counter-clockwise one full turn. Set the stud of the width coil L111 flush with the inside rear edge of the chassis.

Place a jumper across the terminals of the sine wave coil L121 and adjust the horizontal (frequency) control until the picture pulls into sync. Remove the short across the sine wave coil.

Connect the low capacity probe of an oscilloscope to the junction of L120, L121 and R189. Turn the horizontal (frequency) control clockwise until the picture falls out of sync, then counter-clockwise until the picture just pulls into sync. The pattern on the oscilloscope should be as shown in Figure 23. Adjust the sine wave adjustment core L121 until the two peaks are at the same height. During this adjustment, the picture must be kept in sync by readjusting the horizontal (frequency) control if necessary.

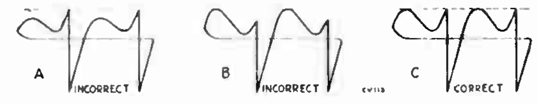

Figure 23—Horizontal Oscillator Waveforms

This adjustment is very important for correct operation of the circuit. If the broad peak of the wave on the oscilloscope is lower than the sharp peak, the noise immunity becomes poorer, the stabilizing effect of the tuned circuit is reduced and drift of the oscillator may occur. On the other hand, if the broad peak is higher than the sharp peak, the oscillator is overstabilized, the pull-in range becomes inadequate and the broad peak can cause double triggering of the oscillator when the hold control approaches the clockwise position.

Remove the oscilloscope upon completion of this adjustment.

Horizontal Drive Adjustment (for correct locking range). Turn the horizontal (frequency) control until the picture falls out of sync with the diagonal lines sloping down to the right. Slowly turn the horizontal control counter-clockwise and note the number of diagonal bars obtained just before the picture pulls into sync.

Pull-in should occur with one and one-half to three bars present.

With the horizontal control set at the pull-in point, adjust the horizontal drive trimmer C171 counter-clockwise for a bright vertical line in the center of the picture. Turn the trimmer clockwise until the line just disappears.

Set the brightness control to maximum and adjust the width control so the picture fills the mask. Return the brightness control to normal and readjust the horizontal drive trimmer as above.

The picture should pull into sync with one and one-half to three bars present, remain in sync for approximately two full turns counter-clockwise from pull-in, and fall out of sync with between 2 and 5 bars present before interrupted oscillation (motorboating) occurs.

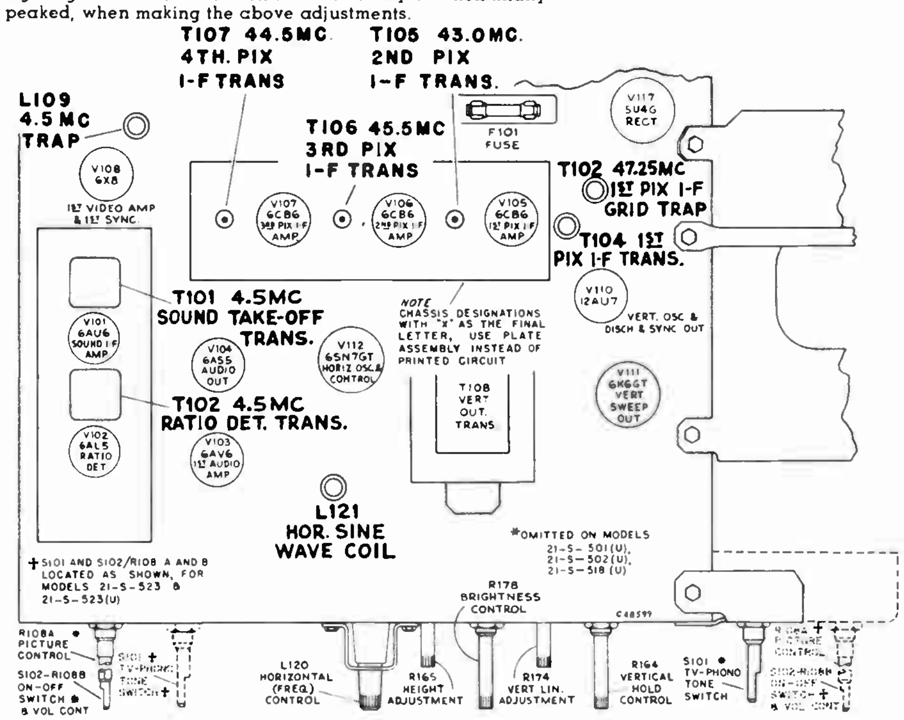

Figure 24—Top Chassis Adjustments

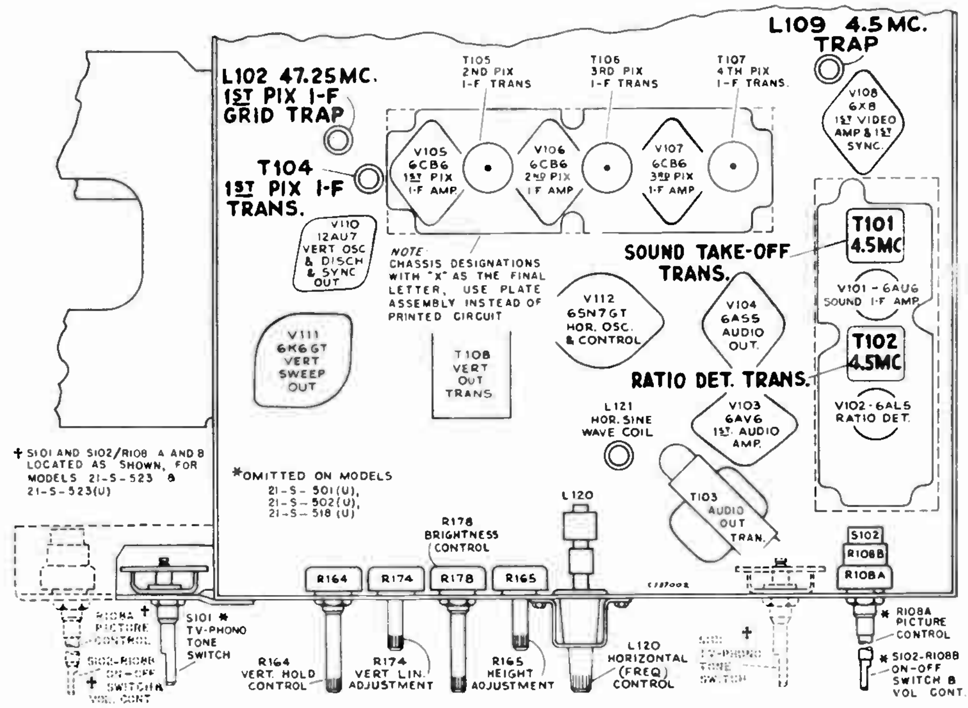

Figure 25—Bottom Chassis Adjustments

VOLTAGE CHART

The following measurements represent two sets of conditions. In the first condition, a 30000 microvolt test pattern signal was fed into the receiver, the picture synced and the AGC control properly adjusted. The second condition was obtained by removing the antenna leads and short circuiting the receiver antenna terminals. Voltages shown are read with a type WV97A senior "VoltOhmyst" between the indicated terminal and chassis ground and with the receiver operating on 117 volts, 60 cycles, a-c. The symbol < means less than.

NOTE: Chassis designations with an "X" as the final letter (such as KCS88CX) use plate assembly Z102, instead of printed circuit PC102, for picture IF section and are connected as shown below.

All chassis listed above are identical except as noted on schematic diagram. The physical location of controls S102/R108A&B and S101 are interchanged on vertically mounted chassis KCS88V.

The schematic is shown in the latest condition at the time of printing.
All resistance value in ohms. K = 1000.

All capacitance values less than 1 in MF and above 1 in MMF unless otherwise noted.

Direction of arrows at controls indicates clockwise rotation.

All voltages measured with "Volt-Ohmyst" and with no signal input. Voltages should hold within ±20% with 117 v. a-c supply.

Figure 26—Circuit Schematic Diagram KCS88B, KCS88C, KCS88D, KCS88E or KCS88V

S5	78398	Stator—RF grid stator complete with rotor, coils and capacitors (C38, L10 to L32)
T1	78396	Transformer—Antenna matching transformer complete
T2	78399	Transformer—Converter transformer (R8)
C301 to C303 Incl.	79553	Capacitor—Variable tuning capacitor
C304, C305	79554	Stator—Oscillator stator assembly
C306	79555	Capacitor—Oscillator trimmer capacitor
C307	79556	Capacitor — Adjustable, ceramic, 0.8-3.5 mmf.
C308	79558	Capacitor—Trimmer, 10-50 mmf.
C309 to C311 Incl.	79559	Capacitor—Feed thru, 1000 mmf.
C312, C313	79560	Capacitor—Fixed, ceramic, 1 mmf., ±0.1 mmf., 500 v. DC, non-insulated
CR301	77489	Rectifier—UHF diode crystal germanium rectifier
L301, L302		Coil—RF tank plate
L303	79557	Tank Assembly—complete with capacitor (C7)
L304	79564	Board—Antenna terminal board assembly
L305 to L307 Incl.	79565	Choke—RF choke
L308, L309		Coil—Mixer coupling coil for oscillator and output section
L310	79567	Coil—I.F. output coil 0.15 microhenries
L311	79566	Coil—Oscillator loop coil
R301	502222	Resistor—Fixed, composition, 2200 ohms, ±10%, ½ w.
R302	512268	Resistor—Fixed, composition, 6800 ohms, ±10%, 1 w.
R303	502268	Resistor—Fixed, composition, 6800 ohms, ±10%, ½ w.
C101	76507	Capacitor—Fixed, ceramic, 3 mmf., ±1 mmf., 500 volts DC
C102 to C108 Incl.		Part of PC101
C109	79014	Capacitor—Fixed, paper, .01 mf., ±20%, 200 volts DC (For KCS-88B, E, J, M only)
C109	79017	Capacitor—Fixed, paper, .0047 mf., ±20%, 400 v. DC (For KCS-88C, K only)
C109	73599	Capacitor—Fixed, paper, 0.0027 mf., ±10%, 600 volts DC (For KCS-88D, L, V, VA only)
C110	79316	Capacitor—Fixed, paper, .01 mf., ±10%, 200 v. DC (For KCS-88B, C, E, J, K, M)
C110	79530	Capacitor—Fixed, paper, .015 mf., ±10%, 200 v. DC (For KCS-88D, L, V, VA only) 85° oper. temp.
C111	79014	Capacitor—Fixed, paper, .01 mf., ±20%, 200 v. DC
C112	47617	Capacitor—Fixed, ceramic, 270 mmf., ±10%, 500 v. DC (For KCS-88B, D, E, J, L, M, V, VA)
C112	75643	Capacitor—Fixed, paper, .001 mf., ±10%, 600 v. DC (For KCS-88C, K only)
C113	73599	Capacitor—Fixed, paper, .0027 mf., ±10%, 600 v. DC (For KCS-88B, C, E, J, K, M)
C113	79531	Capacitor—Fixed, paper, .0018 mf., ±10%, 600 v. DC (For KCS-88D, L, V, VA only)
C114	79314	Capacitor—Fixed, electrolytic, 100 mf., —10%, +100%, 250 v. DC
C115	78979	Capacitor—Fixed, paper, .0082 mf., ±10%, 1000 v. DC
C116	78220	Capacitor—Variable mica, 5-70 trimmer
C117	73599	Capacitor—Fixed, paper, .0027 mf., ±10%, 600 v. DC (For all chassis except KCS-88C, K)
C118	39044	Capacitor—Fixed, ceramic, 15 mmf., ±5%, 500 v. DC
C119	77293	Capacitor — Fixed, ceramic, 470 mmf., +100%, —0%, 500 v. DC
C120	73787	Capacitor—Fixed, paper, 0.47 mf., ±20%, 200 v. DC
C121 to C127 Incl.		Part of Z102 or PC102
C128	33098	Capacitor—Fixed, ceramic, 10 mmf., ±1.0 mmf., 500 volts
C129	79018	Capacitor—Fixed, paper, 0.0039 mf., ±10%, 400 volts
C130	39042	Capacitor—Fixed, ceramic, 47 mmf., ±10%, 500 volts
C131	79149	Capacitor—Fixed, paper, 0.1 mf., ±20%, 600 volts
C132A, B	79147	Capacitor—Fixed, electrolytic, 80 mfd., —10%, +50%, 400 v. DC 80 mfd., —10%, +100%, 200 v. DC

SYMBOL NO.	STOCK NO.	DESCRIPTION
C133		Part of Z102 or PC102
C134A, B	79146	Capacitor—Fixed, electrolytic, 100 mfd., —10%, +50%, 400 v. DC 30 mfd., —10%, +250%, 50 v. DC
C135	73557	Capacitor—Fixed, paper, 0.1 mf., ±20%, 600 volts
C136	76994	Capacitor—Fixed, paper, 0.33 mf., ±20%, 200 volts
C137	76476	Capacitor—Fixed, mica, 330 mmf., ±10%, 1000 volts
C138	73595	Capacitor—Fixed, paper, 0.0022 mf., ±10%, 600 volts
